ELECTRIC UTILITY INTERCONNECTION CONTACT INFORMATION

Interconnection is broadly defined as the connection of a customer's generating equipment to the electric utility's distribution system. This information is provided for electric customer-generators using qualified AEPS alternative energy system-based generation.

The Commission would like to stress the importance of due diligence in the planning phases of alternative energy system installation. It is recommended that a customer contact his/her local electric utility to discuss interconnection, and net metering if applicable, before making any financial or planning decisions regarding system installation. It is also recommended that a customer contact his/her local government to ensure the installation of a system complies with any local ordinances.

Below is an alphabetical list of Pennsylvania's electric utilities, along with the associated interconnection website address or phone number. Additionally, the Commission's contact information is listed should a customer have any questions that an electric utility cannot answer or regarding policies relating to interconnection and alternative energy.

PA Public Utility Commission
Bureau of Technical Utility Services
