

Aug 12 - 2013  
DOC NO  
C-2013-2376443

Glen C Stones

would like to have my fines waived. I haven't worked since I got sick in October, I sold truck and business, I have throat cancer, and have been through 5 operations since January 2013. Most recent was August 1st at Hershey.

I can't speak to anyone on phone, they removed my voice box. I haven't eat or drank anything since January 2013. I did not ever operate without Ins. My truck set here from Oct - March 1st without moving it. Sold truck at auction. I don't even have operator

licence, they were pulled for 6 month because of illness I can't get back until Sept 7TH

Sincerely Glen C Stones

**DOB:** 10/14/1947

**ORDER #:** 1109-0020

**PHONE #:** (717)597-5430

**ADMITTING DIAGNOSIS:** NODES VS. SALIVARY GLANDS

**RADIOLOGIST:** Philip J Sabri M.D.

**ORDERING PHYSICIAN:** Orange, Paul D M.D.

**PATIENT LOC:** CCT

**PATIENT TYPE:** REG CLI H:

**ROOM/BED:** **REPORT #:** 1109-0252

---

**DIAGNOSTIC IMAGING**

**REPORT STATUS:** Signed

**DATE OF SERVICE:** 11/09/2012

**HISTORY:** 65-year-old with left facial and neck swelling.

**CT OF THE NECK:**

Computed tomographic sections of the neck were obtained following intravenous administration of 100 cc of Omnipaque 350 via power injector. There is evidence of jugular chain lymphadenopathy with enlarged and centrally hypodense nodes in the left jugular chain. These nodes are seen from images 28 through 42 of series 2 and measure up to 3.1 x 2 cm in transverse dimension. A couple of them are centrally necrotic. These are nonspecific and could be neoplastic or inflammatory. The parotid and submandibular glands appear unremarkable. There does appear to be some lateral nasopharyngeal wall and upper oropharyngeal wall thickening on the left side. Neoplastic disease should be ruled out. The epiglottis appears unremarkable. There is no prevertebral soft tissue swelling. There are moderate degenerative changes of the cervical spine. The pulmonary apices appear clear.

**IMPRESSION:** Moderate Level II jugulodigastric lymphadenopathy on the left. There appears to be some nasopharyngeal and oropharyngeal thickening on the left side. Consider possible underlying neoplastic change with clinical correlation recommended. No discrete abscess is seen.

**ICD9 Code:**

CT imaging at Summit Health Center is accredited by the American College of Radiology.

**\*\*THIS REPORT HAS POTENTIAL URGENT SIGNIFICANCE AND THE REPORT NEEDS TO BE COMMUNICATED TO THE ORDERING PHYSICIAN IMMEDIATELY!**

DIAGNOSTIC IMAGING

**REPORT STATUS:** Signed

**DATE OF SERVICE:** 12/13/2012.

**HISTORY:** 65-year-old with head and neck cancer. Left submandibular adenopathy, squamous cell carcinoma.

**FINDINGS:**

**PET CT SCAN:**

14.9 millicuries (~116 microcuries) of Fluorine 18 FDG was administered intravenously into the right antecubital vein at 0908 hours. Beginning at 1008 hours PET and low dose CT imaging (3.75 mm slice thickness) were acquired. Comparison with, fusion with, and attenuation correction by the CT images were performed. Image sets reviewed: Attenuated PET, Non attenuated PET, CT, and fused PET-CT. Low dose CT images are not considered to be diagnostic.

Serum blood glucose: 106 mg/dl.

**HEAD AND NECK:** There is abnormal hypermetabolic uptake in the left side of the cervical lymph node in the submandibular region immediately anterior to and deep to the sternocleidomastoid which measures up to 3.3 x 2.0 cm. The peak standardized uptake value of this lesion 9.9. This extends more inferiorly and is inseparable from a second lesion measuring 1.9 x 1.7 cm also likely a lymph node measuring with a peak standardized uptake value of 8.3.

At the base of the tongue/vallecula region on the left side, there is some asymmetry with increased standardized uptake value of 10.2 which likely represents the primary lesion. No right sided hypermetabolic adenopathy is seen. No definite intracranial abnormality is demonstrated.

**CHEST:** There is no area of metabolic hyperactivity in the lungs on either side. There is no area of metabolic hyperactivity in either hilum or mediastinum demonstrated.

**ABDOMEN AND PELVIS:**

**DEPARTMENT:** DIAGNOSTIC IMAGING
