FEASIBILITY STUDY FOR ELIMINATION OF CSO 18

1.0 INTRODUCTION

Gilmore & Associates, Inc. (G&A) has been tasked by the Delaware County Regional Water Quality Control Authority (DELCORA) with investigating the feasibility of removing the stormwater component of the overall sewer flow to Combined Sewer Outfall (CSO) 18. The combined sewer outfall is located on the southern side of the I-95 Bridge over Ridley Creek adjacent to the intersection of Hancock Street and Sun Drive. The removal of stormwater runoff to CSO 18 would permit the elimination of the CSO and permit the remaining sanitary sewer component of the CSO 18 sewer system to be introduced exclusively into the Ridley Creek Interceptor. A map of the general project area is shown in Figure 1. DELCORA has requested that options for redirecting stormwater flow toward both Ship Creek & Chester Creek and Ridley Creek be investigated for feasibility.

Currently, the combined sewer system that discharges to CSO 18 is extensive, with facilities extending to the southwest along I-95, through Widener University, along 13th Street and then northward on Providence Avenue to the vicinity of 22nd street. These facilities include a variety of separate storm sewer components and combined sewer components consisting of various materials, some dating back to the original development of the area. The CSO 18 storm drainage area crosses watersheds with the Providence Avenue portion being directed to Ridley Creek whereas Ship Creek & Chester Creek are the natural discharge points for stormwater runoff. The stormwater drainage area and combined sewer service areas connect to a 68"x43" reinforced concrete pipe (RCP) sewer main that serves as the primary collector of the CSO 18 system. This RCP main has signs of deterioration and is in need of repair in a key location beneath the I-95 highway.

Overall, the removal of CSO 18 from DELCORA's service area would serve to mitigate several issues that exist within the current infrastructure. The multiple benefits of the elimination of stormwater runoff flows from CSO 18 include: 1) reduction of sewage volume required to be conveyed by the Ridley Interceptor and associated conveyance appurtenances; 2) reduction of sewage requiring treatment at the treatment plant; 3) possible mitigation of the 68"x43" combined sewer pipe structural issues, and; 4) overall reduction of untreated combined sewage discharged into natural waterways from the DELCORA sewer network.

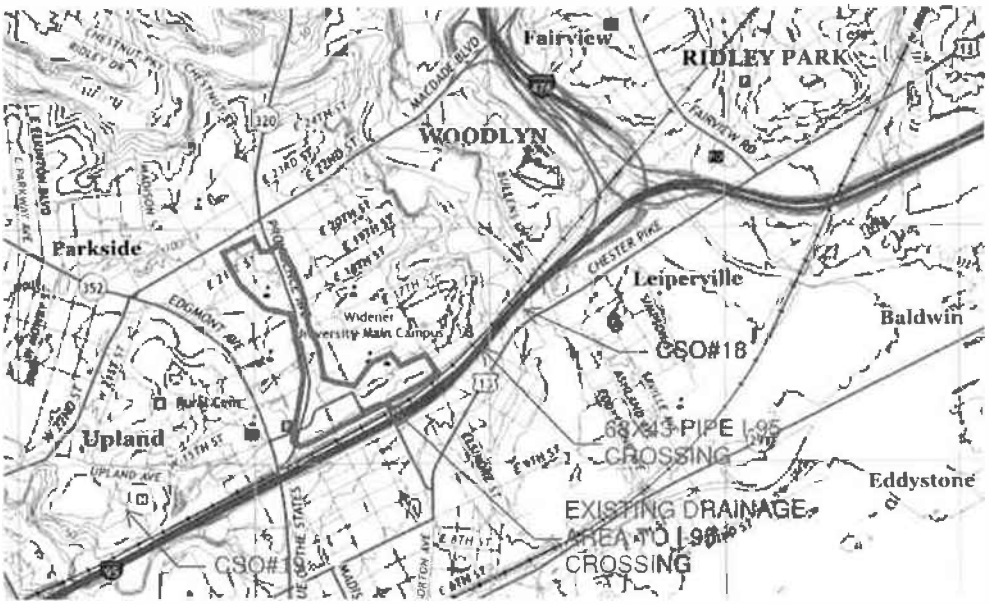

Figure 1 – Project Location Map (Excerpt from U.S.G.S. map)

DRAFT

2.0 PROJECT BACKGROUND

G&A was originally introduced to CSO 18 by DELCORA via our investigation of a structural issue within the 68"x43" sewer main located beneath I-95. However, the combination of potentially complex repair and mitigation options associated with that sewer crossing, and DELCORA's ongoing monitoring of the issue, led to a shift in focus from an immediate structural repair-only solution to a desire by DELCORA for a more comprehensive solution to address global issues inherent with the stewardship of operating and maintaining the current infrastructure considering both the pipe repairs and CSO elimination.

As with most infrastructures, the existing sewer system is subject to long and short term maintenance requirements and updating to meet the requirements of modern regulations and environmental protection standards. The complexity of these issues often hampers planning and global mitigation efforts, but the CSO 18 sewage network appears to contain a unique mix of existing elements that appear to allow for development of a workable solution.

One of the possible design solutions for mitigation involves redirecting storm runoff from Providence Avenue toward the original discharge point of CSO 19. For the preparation of this study, G&A was tasked with investigating portions of the CSO 19 network in order to help delineate the boundary between CSO 18 and 19 and help identify suitable routes for stormwater redirection.

G&A utilized several sources of information for this investigation. None of the sources were comprehensive and each provided only a small portion to add to understanding of the overall system. Two (2) site visits were made by G&A survey crews to determine the as-constructed existing conditions of the pipe networks. It should be noted that information gathered from these survey visits was limited by difficult site conditions including deep manhole depths, live and large active flows, inaccessible manhole lids, and oversized structures with limited access. These survey visits were completed

within a limited time frame for exploratory purposes only.

G&A utilized the following resources and site investigations to obtain information on the existing sewer system(s) within the studied areas of interest for this assignment:

- information provided by DELCORA for the I-95 crossing including video monitoring of pipe run between existing MH-329 and MH-3070;
- June 2, 2016 site visit and June 22, 2016 confined space entry into MH-3070 to investigate pipe condition issues within the I-95 crossing between MH-329 and MH-3070;
- GIS data files provided by DELCORA of their global conveyance network.
- construction plans for S.R. 1018 for original construction of I-95; procured though PennDOT;
- construction plans for S.R. 225, Section 17 (Providence Ave) for road widening and storm sewer improvements; procured through PennDOT;
- 9/14/2016 field survey of various sewer structures with observation of flow and pipe connections when possible;
- 10/5/2016 follow-up field survey of various sewer structures;
- various record plans and construction drawings procured from the Chester City Engineer's office;
- Lidar contour information available from GIS networks;
- aerial mapping provided by Delaware County.

G&A notes that this list is not comprehensive with regard to all information that may be available for the studied areas of interest. Additional information is required to develop a design solution for CSO mitigation and preparation of construction plans & specifications.

The following are descriptions of CSO 18 and CSO 19 networks as currently recognized by G&A:

3.0 GENERAL DESCRIPTION OF CSO 18 and ASSOCIATED FACILITIES

Upon review of the available information regarding CSO 18, networks of combined sewers were noted as being constructed in the early 20th century and generally followed street layout and drainage areas to Ridley Creek and the Delaware River. It appears that some of the local combined sewers in the 13th and Potter/Chestnut/Walnut Street areas may have extended south into 12th Street prior to the construction of the 68"x43" RCP sewer and I-95.

Construction plans for the PennDOT LR 225 project dated 1976-77 indicate that the original sewer system within Providence Avenue was a combined system and may have been connected to both CSO 19 and CSO 18. The improvement plan from this era shows road widening for Providence Avenue with a new separate storm sewer system that was then connected directly to the 68"x43" RCP run to CSO 18. The sanitary portion of the sewer remained within Providence Ave. PennDOT plans show an interconnection of sanitary sewer with both CSO 18 and CSO 19 (Sheet 22 of 29) but G&A field survey observations suggest that the sanitary flows are now directed toward CSO 19 only.

Earlier plans from 1973 indicate that a storm sewer system was installed along Potter Street from 18th Street north of 22nd Street. This system was connected to the Providence Street combined sewer and later tied into the LR 225 project's storm sewer of 1977.

Details contained in the PennDOT SR 1018 plans indicate that the 68"x43" sewer was constructed prior to installation of I-95. The depth of the existing pipe does not appear to have been modified by I-95 construction. Presumably, CSO 18 may have been created in its current form when the 68"x43" sewer was constructed. Although the construction date of the 68"x43" sewer is not identified on the construction plans, the size of this sewer suggests that local combined sewers along 13th Street, and between Potter and Walnut Streets, were connected to CSO 18 prior to I-95 construction.

A portion of the 68"x43" sewer runs between Widener University and the I-95 corridor. Limited information was available for the Widener University site, but the depth of the 68"x43" pipe and the deep cut of I-95 suggest that the southern side of Widener University drains to, and is serviced by, CSO 18.

4.0 GENERAL DESCRIPTION CSO 19 and ASSOCIATED FACILITIES

Similar to CSO 18, networks of combined sewers were constructed in the early 20th century within the CSO 19 drainage area that generally followed street alignment and Ship Creek/Chester Creek drainage areas to the Delaware River. The original eastern portion of the drainage area to CSO 19 appears to have included the Providence Avenue corridor as well as areas farther east near the Widener University Campus. Drainage areas to the north generally include 22nd Street, following Edgemont Ave. in the northwest direction. As previously mentioned, it appears that some of the local combined sewer runs in the 13th Street and Potter/Chestnut/Walnut Street areas may have extended south into 12th Street prior to the construction of the 68"x43" RCP sewer and I-95.

The following is a list of the known components of the CSO 18 combined sewer system. This list is based on information reviewed during this investigation:

1. CSO Regulator 18 and associated outfall to Ridley Creek;
2. the Ridley Creek sanitary sewer interceptor;
3. a 3,000+ foot 68"x43" elliptical RCP pipe, installed with the longer pipe axis in the vertical direction, running from the intersection of 13th Street and Providence Avenue to CSO Regulator 18. This pipe run is the main trunk line of CSO 18;
4. the crossing of the 68"x43" RCP under I-95;
5. the Providence Avenue separate storm sewer system and its connection to the 68"x43" RCP at Providence Avenue and 13th Street;
6. connection of storm and sanitary sewers to the 68"x43" RCP through the

original combined sewer system and within local streets located north of I-95 and east of Providence Avenue;

7. collection of stormwater runoff and sanitary sewage from the Widener University campus;
8. collection of sanitary sewage along Hancock Street, south of the I-95 crossing;
9. collection of stormwater runoff from street inlets along local streets south of the I-95 crossing;
10. connection of a small stormwater runoff network within I-95 that connects to the 68"x43".

The CSO 19 component investigation was limited to facilities along the Upland/14th Streets corridor. The following is a list of the known components of the CSO 19 combined sewer system. This list is based on information procured during this investigation.

1. Ship Creek and its man-made components;
2. CSO Regulator 19 and associated outfall to Ship Creek;
3. the Chester Creek East Interceptor;
4. the combined sewer main within Upland/14th Streets running from Providence Avenue to CSO 19;
5. separate storm facilities within Upland/14th Streets.

5.0 EVALUATION METHODOLOGY

5.1 3-D MODEL

For this study, G&A utilized existing records, survey information, GIS information, LIDAR contour information, and aerial mapping in conjunction with 3-dimensional (3-D) AutoCAD mapping to build a working digital model of existing features. The digital 3-D model is updated continually as new information is gathered, and this model is used as

a tool to evaluate multiple sources of information and create views of the various project conditions and constraints.

G&A evaluated the information that was available for this study to create a 3-D model of existing utilities within the project areas. Survey work performed by G&A was utilized to tie-in data points that were included in the various sources in order to normalize the vertical datum.

The 3-D model of existing utilities was combined with LIDAR and aerial information to create a working digital model and used as the basis for this engineering feasibility study. The working model was used to develop conceptual site plans and profiles to assist with feasibility evaluation. We note that the working model continues to evolve as additional information is obtained. Ideally, if a suitable solution for CSO mitigation is reached and funded, this model can serve as the basis for engineering design.

From the model created for DELCORA, drainage areas to specific points of interest were calculated and pipe sizes determined for feasibility of re-routing storm sewer along select alternate routes.

5.2 IDENTIFICATION OF STUDIED AREAS OF INTEREST

In order to evaluate options for CSO 18, the overall stormwater drainage area and sanitary sewage sources were studied for the areas affecting mitigation options.

Areas for the study included stormwater runoff drainage areas, overall sewer service areas, and pipe networks of CSO 18 as well as CSO 19, located to the west of Providence Avenue. Identification of these areas and layout of pipe networks within these areas were key components of this study. This information contributed to the determination of overall flows to CSOs, pipe sizes for alternate pipe runs, and potential routes for alternate pipe runs. Additionally, the separate storm and sanitary systems

that are located within E. 14th Street and run toward Maggie May's and the Widener ball field were considered during the evaluation. These systems are in the general vicinity of routing options for CSO 18 components.

Based on G&A's investigative effort to date, the areas contributing to CSO 18 appear to be bounded by (clockwise in plan-view starting at CSO 18) Hancock Street, the 68"x43" RCP I-95 crossing, the I-95 highway, Providence Avenue, Upland Avenue, 22nd Street, portions of the block between Walnut and Chestnut Streets, portions of Widener University, the I-95 highway and returning to CSO 18 at Sun Drive and Hancock Street. See Appendix B for additional information regarding this area.

CSO 19 is located within the headwaters of Ship Creek, which is a small tributary to Chester Creek. The CSO 19 drainage area shares its eastern drainage boundary with the western boundary of CSO 18.

5.3 IDENTIFICATION AND EVALUATION OF OPTIONS

Options for CSO 18 mitigation were developed with assistance from and in coordination with DELCORA and are based primarily on the information that was furnished for the study by both DELCORA and obtained G&A from other sources.

A list of options is contained in Section 7.0. Evaluation of each option includes the following considerations:

1. overall level of constructability;
2. overall cost potential;
3. future maintenance considerations;
4. potential permitting issues;
5. overall benefit with regard to DELCORA's consent decree.

6.0 MODEL LIMITATIONS

The working digital 3-D model of existing conditions is based upon limited information and is subject to verification in the field. Some of the known issues with information obtained as part of this study include:

- survey work completed for feasibility was performed on a cursory basis to gain an understanding of the general layout of existing conditions. Most of the structures identified in the field require confined space entry for detailed survey including sizing of structures, confirmation of inverts of pipe connections, sizes and types of connected pipes, information on internal weirs and possible plugs for abandoned pipe systems;
- reference plans obtained from the Chester City Engineer do not represent an exhaustive search of information available from the city records. A complete catalog of city record information was not available and information included in the model is based upon a limited amount of research time;
- some information obtained from the referenced sources conflicts with other information that is available and may not reflect as-constructed conditions. All information included in developing the model should be considered approximate at this feasibility study stage.

Issues for final design consideration include the following:

- full separation of sanitary facilities from the Providence Avenue separate storm sewer system has not been verified;
- historical plans and DELCORA GIS information do not provide definitive flow directions of stormwater runoff or flow directions from existing inlet connections for some areas. Areas of Chestnut Street, 17th Street and Upland Road north of Providence Avenue, but south of 18th Street, are currently areas where the least information is known or verified. The

feasibility study provides assumptions based on known information, but final design is dependent upon collection and evaluation of additional information;

- full connectivity and flow direction of the original combined sewer system within Providence Avenue is assumed to be toward CSO 19 based on DELCORA GIS records and visual observations made in the field. However, there is conflicting information on some of the reference plans that suggest some connectivity may exist with the CSO 18 system;
- a Pennsylvania One-Call notification was made by G&A for feasibility purposes and to help identify major utility conflicts. However, the 3-D model does not include a full investigation of non-sewer utilities such as gas, water, communications, electric and other miscellaneous services that may be present. Additional investigation is required for final design;
- configuration of historical CSO conditions in the vicinity of Upland Avenue and Ship Creek is unknown. This could potentially affect layout of the Route B option.

7.0 PROJECT MITIGATION OPTIONS

Current project direction was driven in part by mitigation options that were investigated for the initial structural issue at the 68"x43" RCP I-95 crossing. Further coordination with DELCORA evolved into including storm re-routing along "Route A" and "Route B" as generally described in Appendix A.

Overall, in order to meet the design goal of CSO 18 elimination, separation of storm runoff is required from any flow that enters the Ridley Creek Interceptor. Route A and Route B were proposed by DELCORA as possible routes for separation of stormwater from the CSO 18 sanitary flow. DELCORA also expressed an interest in eliminating the 68"x43" RCP I-95 crossing altogether. In pursuit of a workable solution the following project mitigation options were considered for storm and sanitary discharge flow within the CSO 18 drainage area:

7.1 DESCRIPTIONS OF MITIGATION OPTIONS

A. The following mitigation options for sanitary sewage separation were considered:

Option 1 - Remove sanitary flow from the 68"x43" sewer main at MH 329 and re-route in a northerly direction to the existing separate sanitary sewer within E 14th Street.

Option 2 - Remove sanitary flow from the 68"x43" sewer main via a pump station, and lift to a point along E 14th Street to the existing separate sanitary sewer within E 14th Street.

Option 3 - Remove storm sewer runoff from the 68"x43" sewer main and route sanitary sewage through the existing 68"x43" RCP I-95 crossing via a new 8" or 12" sanitary sewer installed and grouted within the existing pipe.

B. The following storm sewer separation options were investigated with discharge to Ridley Creek:

Option 4 - As shown in Appendix A, remove storm runoff from the 68"x43" sewer main from a point east of Walnut Street and re-direct along Melrose Avenue to E 14th Street, and then along E 14th Street down to Ridley Creek to a point near the existing I-95 storm outlet located just north of the railroad bridge (a/k/a "Route A").

Option 5 - Remove storm runoff from the entire existing CSO 18 drainage area from the 68"x43" sewer main and re-direct along Melrose Avenue, similar to and following the route described in Option 4.

Option 6 - Separation of storm runoff from the existing 68x43" sewer main above MH329 and place a second pipe, only for storm runoff conveyance, above the new separate sanitary sewer conduit described in Option 3 to fully utilize the existing 68"x43" RCP I-95 crossing and address the existing structural issue. A new storm conduit would be run along Hancock Street to convey the I-95 crossing flows as well as those introduced within Hancock St. The existing headwall along Ridley Creek would be utilized for outfall. Route B would be used in order to limit pipe size for this Option and raise the invert to work with the proposed I-95 crossing modification.

C. The following options are storm routings along Route B. Note that installation of additional storm pipes may be required along Upland Ave and Walnut Streets to separate storm runoff from combined sewers contained in these streets:

Option 7 - Route B as shown in Appendix A without additional separation area from CSO 19.

Option 8 – Option 7 with revised storm runoff routing to follow Upland St. to a discharge point within Ship Creek.

Option 9 – Option 8 including the additional CSO 19 separation drainage area as depicted in Appendix A. There is limited information available for this area at this time. However, a larger pipe size will be necessary than that required for Option 7 and Option 8.

D. The following option is for structural repair of the 68"x43" RCP I-95 crossing only, with no combined sewer flow mitigation other than within the partially collapsed RCP between M.H. 329 and M.H. 3070:

Option 10 – Repair and rehabilitation of the existing 68"x43" RCP crossing under I-95 between M.H. 329 and M.H. 3070. This option includes installation of two

(2) doghouse manholes at strategic locations, to be determined via a detailed study, between existing M.H. 329 and M.H. 3070 and probable modification of both existing manholes to facilitate construction of repairs and rehabilitation of the existing 68"x43" RCP I-95 crossing. Temporary bypass of the sanitary sewer flow will be required during construction of the expected repairs. It is anticipated that the temporary bypass system will be installed within the existing 68"x43" RCP after the pipe is temporary shored internally (and externally where necessary). The existing pipe will be repaired, new casing pipes will be installed and the remaining annular space will be fully grouted between the exterior of the casing pipes and the interior of the existing 68"x43" RCP for the full length of this pipe run between M.H. 329 and M.H. 3070. Significant traffic control will be required along with coordination with the County, City of Chester, the railroad, local property owners, businesses and Widener University. Jurisdictional agency permitting will be required.

7.2 OPTION EVALUATION

Option 1

This option includes removing sanitary sewage flows from MH-329 and re-routing flow via a new gravity sewer to an existing separate sanitary sewer system within E 14th Street.

Pros

This routing would eliminate the need for sanitary sewage to be discharged through the 68"x43" RCP under I-95.

Cons

This option does not appear to be desirable or cost-effective based on the elevations of sanitary services located within the CSO 18 drainage area when compared to the elevation of sanitary facilities within E 14th Street.

Current Study Status

Other sanitary sewage options appear to be less costly and more feasible.

Option 2

This option introduces a pump station to re-route sanitary sewage flows to E. 14th Street and down to DELCORA's existing separated sanitary sewer.

Pros

This option would eliminate the need for sanitary sewage to be discharged through the 68"x43" RCP under I-95.

Cons

Currently, the volume of sanitary sewage required to be lifted via pump station is unknown. Portions of the existing separate system within E. 14th Street would require detailed assessment for adequacy to convey additional flows.

Current Study Status

This option adds long term operations and maintenance costs to the system with the introduction of a pump station. Additional information is required for comprehensive assessment.

Option 3

This option includes making no changes to the conveyance of sanitary sewage except maintaining the existing 68"x43" RCP I-95 crossing with a repair including am 8" to 12" sanitary sewer pipe grouted within the existing 68"x43" main and revising the CSO 18 regulator to eliminate the existing storm outfall to Ridley Creek.

Pros

This option appears to be relatively simple. Grouting of the existing 68"x43" RCP I-95 crossing may be robust enough to reduce long term maintenance issues to tolerable levels.

Cons

Pipe size for sanitary sewer must be verified. The 68"x43" RCP I-95 crossing will remain.

Current Study Status

This is currently the recommended sanitary sewer mitigation option.

Option 4

This option includes collecting overland storm runoff from the parking area behind the Widener University Center and Residence Hall/ROTC building that is located adjacent to I-95 and providing conveyance along Route A. Also, this option would intercept existing conduits that collect drainage from the Widener University grounds.

Pros

The stormwater drainage area is small enough to limit the required size of pipe to 30". Connection to existing conveyance pipes is currently unknown, but connections will be limited to conveyance pipes located behind the referenced Widener Buildings making re-routing of the storm water drainage relatively easy. This option would eliminate the requirement for storm runoff to be directed through the existing 68"x43" RCP I-95 crossing.

Cons

The elevation of the Widener parking lot lowers the overall proposed storm system to a depth that will require shallow pipe slope and 15 ft. – 20 ft. deep cuts in some locations along Melrose Avenue and portions of E. 14th Street. The proposed pipe installation along this route may be hampered by clearance issues at the low end of E. 14th Street (near Maggie May's) and there appears to be a difficult pinch point along the access road to Ridley Creek created by the recently constructed Widener ball field, the Railroad Right-of-Way and two existing sewer conduits - one that conveys I-95 storm runoff and one that conveys separate City sanitary sewage. Also, a new outfall at Ridley Creek may be difficult to permit and construct based upon the steep embankments and existing erosion that are present.

Current Study Status

This option is included in the overall alternate analysis but is currently not preferred over Option 6.

Option 5

This option is similar to Option 4 except that the entire existing CSO 18 drainage area was considered to be conveyed along Route A.

Pros

This option may eliminate the need for Route B to be considered. This option would eliminate the requirement for storm runoff to be directed through the existing 68"x43" RCP I-95 crossing.

Cons

The pipe size required would most likely be large, 54" or 60", and the routing limitations may not permit this large pipe size. A much lower pipe invert would be needed to capture the Providence Avenue system thus increasing the depth of cuts required to install new conduit.

Current Study Status

This option appears to be less desirable than other studied options due to routing and pipe size limitations.

Option 6

This option is similar to Option 4, but includes expanding on the re-use of the existing 68"x43" RCP I-95 crossing and utilization of the existing Ridley Creek outfall in lieu of re-routing storm runoff to E. 14th Street and a new outfall near the ball field.

Pros

Proposed storm pipe size and length is minimized compared to the original Route A; disturbance to residential streets is minimized; re-use of existing outfall will minimize permitting for the Ridley Creek outfall; existing storm sewer within Hancock St. can be replaced with the proposed system.

Cons

Existing 68"x43" RCP I-95 crossing will remain.

Current Study Status

This is currently one of the recommended storm water re-routing options.

Option 7

This option includes re-directing the Providence Ave. storm water system and the storm runoff component of Upland St. and Walnut St. toward Ship Creek via E. 14th Street.

Pros

Providence Avenue runoff would be directed back toward Ship Creek/Chester Creek which appears to replicate the original design of the Providence Ave. storm water system. This routing minimizes construction issues for storm routing toward Ridley Creek.

Cons

It is currently unknown to what extent permitting will be required for this storm water re-direction. FEMA computations for Chester/Ridley Creek may or may not already account for this runoff direction within the "AE" flood zone areas shown on current Flood Insurance Rate Maps (FIRMs). A detailed study is necessary to evaluate this storm flow component for the studied drainage area. The route along 13th Street includes private property and will most likely require easements.

Current Study Status

Option 8 appears to be more desirable.

Option 8

This option is similar to Route B shown in Appendix A but with a routing less likely to require easements and less right-of-way conflicts.

Pros

Same as Option 7 with fewer easement and/or right-of-way conflicts.

Cons

Same as Option 7

Current Study Status

This is currently a recommended option, but additional information is needed to study and address potential FEMA issues.

Option 9

This option adds the "Potential Additional Separation Area" noted for Route B as shown in Appendix A.

Pros
Additional drainage area will be removed from CSO 18 or CSO 19

Cons
The extent of existing facilities and prospective connections are unknown at this time.

Current Study Status
Larger pipe sizes can be used to accommodate more drainage runoff in this direction. More information is required. A detailed study is needed.

Option 10

This option considers repairs, rehabilitation to the partially collapsed 68"x43" RCP I-95 crossing and separation of combined flow only within the existing RCP from M.H. 329 to M.H. 3070.

Pros
This option is the least immediate cost option; combined flow will be separated within the existing pipe; the fully grouted 68"x43" RCP will be relatively maintenance-free after it is repaired and grouted. Storm and sanitary flows are separated within the 68"x43" I-95 crossing and can be conveyed downstream from M.H. 3070 in separate storm water and sanitary sewer if and when that combined flow is eventually separated.

Cons
Combined flow will only be separated within the existing 68"x43" RCP I-95 crossing; extensive traffic control will be necessary particularly at and near the existing M.H. 329 and M.H. 3070 as well as at I-95 and streets feeding I-95; confined space requirements apply for the project; equipment access is restricted; jurisdictional agency, County, State, Federal & Local coordination and approvals are necessary; storm water & sanitary sewer are still conveyed under I-95.

Current Study Status
Detailed information for the pipe sizes for carrier and casing pipes is needed for both the storm water and sanitary sewer pipes. This Option is considered to be a

recommended Alternate due to its least-cost status. A "no Action" option is not viable since the existing pipe is partially collapsed and in need of repair and rehabilitation.

The following includes additional commentary regarding select sanitary and storm sewer Options:

Option 3

Assuming stormwater flow is removed from MH 329, the structural issue within the 68"x43" RCP I-95 crossing can be mitigated by grouting-in a smaller pipe that will accommodate sanitary sewer flows only. This option will require but minimize disruption to the traveling public that use the I-95 corridor. Grouting of the existing pipe will improve the strength of the crossing to a point that future maintenance costs will be reduced as well.

Option 4

From initial feasibility evaluation computations, storm runoff from Route A areas can be conveyed within a single 30" HDPE pipe installed at a minimum of 0.005 ft/ft slope, or a 24" HDPE pipe with a minimum of 0.015 ft/ft slope. With regard to the original "Route A", it appears that such a pipe could be routed via the originally suggested alignment.

However, there are several design, construction and cost issues associated with this mitigation option. Given the elevation of the Widener University Center parking area, the upstream end of the new storm sewer would need to be set at an elevation of approximately 46 ft. Using the 30" HDPE and 0.005 ft/ft slope there would be an extended length of significant trench cut within Melrose Ave. and E 14th St. Excavation depths up to 20 feet +/- with temporary shoring would be required along the collector road and residential street.

The existing condition from Maggie May's to Ridley Creek is such that there may be obstruction issues with existing pipe systems that include a PennDOT storm main and DELCORA sanitary sewer main that connects to the Ridley Interceptor. It also appears

that a recently constructed ball field for Widner University encroaches upon the sewer right(s)-of-way in that area. The ball field, railroad right-of-way and embankment taper to approximately 10 ft to 15 ft for a limited distance (see Figure 2), further restricting access at this location.

Attempting to abate or resolve the issues mentioned above will increase costs and reduce the desirability of proceeding with Option 4.

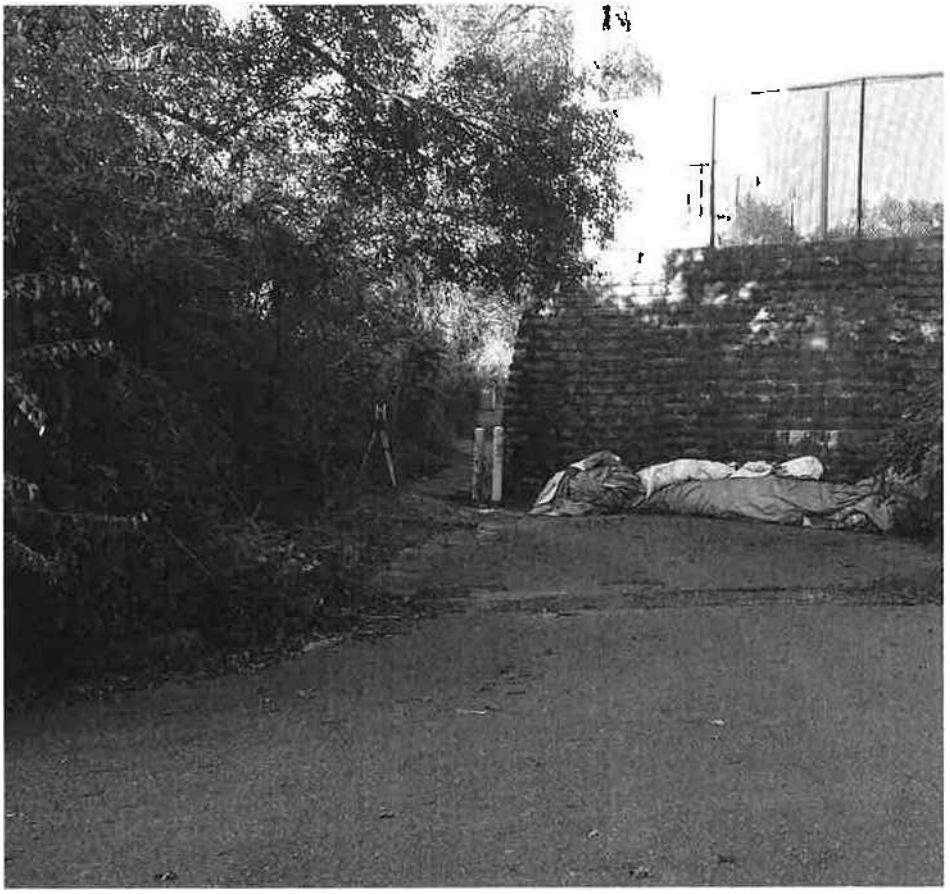

Figure 2 – View from Ridley Creek of ball field/Railroad R.O.W. Restriction for Route A (Option 4)

Option 6

This alternate is similar to Option 4 from Walnut Street to Melrose Avenue. At this point, the proposed route heads toward MH 329 and the existing 68"x43" RCP I-95 crossing. Utilizing a 24" pipe with 0.015 ft/ft slope, it is possible to select a route to place the proposed pipe through the existing 68"x43" RCP I-95 crossing. Additionally, an alternate sanitary sewer pipe of 8"-12" diameter will fit in the same existing I-95 crossing while maintaining virtually the same existing route towards Ridley Creek. New manholes adjacent to MH-329 and MH-3070 would serve as introduction and removal points for the proposed stormwater conduit. Along Hancock Street, this alternate could replace the existing separate stormwater pipes and ultimately utilize the existing CSO 18 outfall along Ridley Creek.

Option 8

Storm sewer runoff toward Route B is anticipated to include (as shown on the Overall Site Plan in Appendix B):

1. storm runoff from the combined sewer system within Potter and Walnut Streets;
2. the existing storm sewer system within Providence Avenue.

From initial feasibility evaluation computations, storm runoff from these areas can be conveyed within a single 48" RCP pipe installed at a minimum of 0.015 ft/ft slope. The initial pipe run from Walnut Street to Upland Street can be conveyed within a 36" diameter at a minimum slope of 0.005 ft/ft.

With regard to "Route B", it appears that such a pipe could be routed utilizing the originally suggested alignment with the exception that Upland Street would be included as part of the proposed alignment in lieu of W. 13th Street.

The outlet of this pipe would be near the original regulator for CSO 19 and within the portion of Ship Creek that remains an open channel.

Note that the introduction of new storm flow to Ship Creek/Chester Creek may potentially increase flood levels in those waterways during certain flood stages. Further investigation is needed to verify FEMA flood computations provided in the FEMA Flood Insurance Study (FIS) and determine what drainage areas were utilized in the preparation of the current Flood Rate Insurance Maps (FIRM). With the re-routing of storm runoff from Route B serving to potentially restore the natural drainage areas, it is possible that the current FIRM may be based upon the assumption that the storm flow from Route B already reaches the proposed location.

8.0 SELECT ALTERNATE ASSESSMENT

From the list of mitigation options and initial option evaluation, select sanitary and storm routing options have been identified as preferred methods for mitigation. More than one option is required in order to achieve full mitigation for CSO 18. Two separate groups of preferred options are combined under Alternate 1 and Alternate 2. These alternatives may provide for full mitigation at CSO 18. For comparison purposes, an additional Alternate 3 is also included for consideration as a least-cost option. Alternate 3 differs from the first two in that it is not a full CSO mitigation option and is limited to be a solution to the structural issue at the existing 68"x43" I-95 crossing. Conceptual layout for the options utilized in Alternate 1 and Alternate 2 are depicted on plans included in Appendix B.

The following is a general description of each Alternate:

Alternate 1

This alternate includes Option 3, Option 4 and Option 8. The target outcome of Alternate 1 is CSO 18 mitigation by removing stormwater inflow from the existing

68"x43" combined sewer main via "Route A" and "Route B" with storm discharge to Ridley Creek and Ship Creek, respectively.

As referenced in Appendix B, the overall scope of work includes removal of Providence Avenue stormwater flow as well as storm flow from the existing local street combined sewer system and conveyance to a new endwall within Ship Creek via either a new 36"or 48" separate storm pipe installed within 13th Street and Upland Street. This referenced inflow area comprises the overall stormwater drainage area of CSO 18 west of Chestnut Street, shown on Sheet 2 of G&A mitigation plans with green hatching. The work scope also includes removal of stormwater runoff from the Widener University area (depicted as red hatched area on Sheet 2) and conveyance via a new 30" conduit along Melrose Avenue, down 14th Street, and through the access road adjacent to the Widener ball field to a new stormwater outfall at Ridley Creek. Additional right-of-way may be required as well as a structural solution to support the encroaching ball field retaining wall along the access road. Route A is depicted in red on Sheet 2.

Sanitary sewage would remain within the existing 68"x43" sewer main. Structural mitigation of the existing partially collapsed 38"x43" RCP I-95 crossing would include introduction of a smaller sized pipes installed within the existing RCP to be sized for existing sanitary flow and grouted into the RCP pipe as a permanent structural repair.

Stormwater within Hancock Street would be redirected to the existing the CSO 18 outfall within the Ridley Creek stream.

The existing CSO regulator would be abandoned or modified to include sanitary sewer outflow exclusively to the Ridley Interceptor.

Alternate 2

This alternate includes Option 3, Option 6 and Option 8. The target outcome of Alternate 2 is CSO 18 mitigation via removal of stormwater inflow from the 68"x43" combined sewer main via a revised "Route A" and "Route B" with stormwater discharge to Ridley Creek and Ship Creek, respectively.

Sanitary sewage would remain within the existing 68"x43" sewer main. Structural mitigation of the existing partially collapsed 38"x43" RCP I-95 crossing would include introduction of a smaller sized pipes installed within the existing RCP to be sized for existing sanitary flow and grouted into the RCP pipe as a permanent structural repair.

As referenced in Appendix B, the work scope includes removal of Providence Avenue stormwater flow as well as stormwater flow from the existing local street combined sewer system and conveyance to a new endwall within Ship Creek via either a new 36" or 48" separate stormwater pipe installed within 13th Street and Upland Street. This referenced inflow area comprises the overall stormwater drainage area of CSO 18 west of Chestnut Street, shown on Sheet 2 of G&A mitigation plans with green hatching. The work scope also includes also includes remove storm runoff from the Widener University area (depicted as the red hatched area on Sheet 2) and conveyance via a new 24" pipe

installed adjacent to the existing 68"x43" sewer main route to a new manhole located adjacent to existing MH 329. The new 24" pipe would then run above the referenced grouted-in sanitary pipe within the existing 68"x43" RCP I-95 crossing and then out to a new manhole located adjacent to existing MH 3070. Re-aligned stormwater pipe would then replace the existing 15" stormwater pipe located within Hancock Street, with new connections for runoff from existing Hancock St., and be routed to the existing CSO 18 outfall. This revised Route A is depicted in blue on Sheet 2.

Stormwater within Hancock Street would be redirected to the existing CSO 18 Endwall within the Ridley Creek stream bank.

The existing CSO regulator would be abandoned or modified to include sanitary sewer outflow exclusively to the Ridley Interceptor.

Alternate 3

This alternate includes Option 10. The target outcome of Alternate 3 includes Structural repairs to partially collapsed 68"x43" RCP at I-95 crossing and combined flow separation in the existing partially collapsed 68"x43" RCP main as part of the repair procedure for this pipe.

Two (2) doghouse manholes would be installed at strategic locations between existing MH 329 and MH 3070 as determined during the design phase for repairs to the existing partially collapsed 68"x43" RCP main. Temporary supports and shoring would then be installed within the existing partially collapsed 68"x43" RCP main. Sanitary sewage

would be temporarily bypassed through a system installed within the existing 68"x43" RCP main so that a new 12" diameter sewer main could be installed within the existing 68"x43" RCP main. The existing 68"x43" RCP main would then be partially grouted to an elevation approximately 6" higher than the top of the new 12" diameter sanitary sewer pipe. A storm sewer pipe would then be installed at an elevation above the 12" diameter pipe. After completing this storm sewer pipe installation, the remaining annular space within the 68"x43" RCP main would be grouted solid. This flow separation would eliminate combined flow within the existing 68"x43" RCP main and serve as the permanent repair to the partially collapsed existing 68"x43" RCP main.

Operation and Maintenance Statement

Future operation and maintenance costs of all three alternatives are anticipated to be similar to existing with the following exceptions:

- the existing 68"x43" RCP I-95 crossing, by virtue of fully-grouting the RCP around the proposed storm and sanitary pipes the repaired RCP, is expected to provide a 100+ year usable life.

- elimination of stormwater flow through existing CSO 18 pipes will be a benefit to future operation and maintenance costs of the sanitary sewer system.

9.0 FEASIBILITY STUDY RECOMMENDATIONS

After review of all of the received documents, known parameters, preliminary calculations, and mitigation options, G&A recommends that Alternate 2 be pursued by DELCORA for further consideration and design. The corresponding stormwater options for this Alternate are depicted in Blue and Green on the plans provided in Appendix B.

DRAFT

10.0 ESTIMATED COSTS

Estimated costs for the three alternates are as follows:

Alternate 1

$5.5-$6.5 million

Alternate 2

$4.5-$5.5 million

Alternate 3

$2.5-$3.4 million

These estimated costs are based upon the current value of construction and projected forward through December 31, 2018. No additional escalation is accounted for in the estimates. Costs of permits and other fees paid to the jurisdictional agencies are excluded from the cost estimate. Taxes are not included.

DRAFT

11.0 STUDY CRITERIA AND ASSUMPTIONS

- unknowns of the existing storm and sanitary facility locations and depths of system components as described in the full report;
- unknown locations of all other existing utilities and potential conflicts for proposed routing Alternates;
- unknown resolution of flood elevation status of Chester Creek and whether Route B can, or must be, justified through: A) existing FEMA Flood Insurance Study means and methods; B) additional Hydrologic and Hydraulic study; C) storage and attenuation of proposed storm discharge from Route B;
- the potential for environmentally sensitive issues (wetlands, bog and/or red-belly turtles, plant species, etc. that may be uncovered with a PNDI search and/or additional site investigation) within Ship Creek that would need mitigation;
- study of the existing enclosed portion of Ship Creek located under the existing railroad and I-95 for flows introduced from Route B;
- acceptance (or lack of acceptance) of new stormwater facilities for dedication to the City of Chester;
- unknown extent of lands (if any) that would require acquisition of right-of-way, construction and/or permanent easements, etc., in order to carry out any of the studied options or alternates;
- granting of applicable jurisdictional agency permits that are required to perform the work contemplated within this study;
- permission of PennDOT, USDOT and affected municipalities to perform the work

via detours, lane outages, lane and ramp restrictions, redirection of traffic, temporary traffic control and work zone traffic control, as may be required to complete the project on and under I-95, Providence Road and local collector roadways;

- permission of the railroad to perform work at or near their facilities;
- permission of local property Owners and Widener University to perform the work contemplated within and/or adjacent to their properties;
- anticipated extensive coordination with existing utility owners and service providers to avoid facility conflicts, obstructions and service interruptions;
- anticipated extensive coordination with local businesses and the general public regarding the project and potential impacts to the local community and traveling public.

2.3 ALTERNATE 3 - I-95 CROSSING SOLUTION WITH NO CSO MITIGATION 4

3.0 OPERATION & MAINTENANCE STATEMENT 5

4.0 STUDY CRITERIA AND ASSUMPTIONS 6

1.0 ISSUE STATEMENT

DELCORA is assessing corrective measures to repair a structural failure issue within a partially collapsed combined sewer main located within the combined sewer system tributary to the outfall designated by DELCORA as CSO 18. The structural issue is located within a portion of a 68"x43" reinforced concrete sewer main that crosses below route I-95.

CSO 18 includes storm runoff from a drainage area of approximately 78 acres and includes sanitary service inflows collected from Providence Avenue to Ridley Creek within an approximate corridor bounded to the north and south by 14th Street & Hancock Street. The CSO 18 area main facility components include:

- the 68"x43" RCP sewer main;
- a combined sewage regulator located at Hancock and Sun Streets;
- the Ridley Creek sewage interceptor;
- the CSO 18 overflow outfall into Ridley Creek;
- inflow networks including:
    - the Providence Avenue storm sewer network;
    - historic combined sewer networks within local streets that connect to the 68"X43" combined sewer main;
    - storm and sanitary connections from Widener University including lawn and parking lot inlets on University grounds.

Gilmore & Associates, Inc. has been tasked with investigating possible solutions to repair structural issues within the I-95 crossing of the 68"x43" main as well as possible elimination of CSO 18. Solutions to be investigated include a structural repair limited to the subject sewer main and possible mitigation (removal) of the entire CSO 18 network by separating storm and sanitary sewer components in accordance with the Consent Decree among DELCORA, the US EPA and the PA DEP.

Several options for mitigation of sanitary sewage flow and stormwater runoff separation have been identified as described in the full report. Three (3) select Alternates are provided herein that combine preferred options from the full report together in order to provide mitigation scenarios that are currently the most feasible based upon our investigation to date.

DRAFT

2.1 ALTERNATE 1 - ROUTE A AND ROUTE B STORMWATER SEPARATION

TARGET OUTCOME

CSO 18 mitigation through removal of stormwater inflow from 68"x43" combined sewer main via "Route A" and "Route B" with storm discharge to Ridley Creek and Ship Creek, respectively.

STUDIED SOLUTION

Option 3, Option 4 and Option 8 from the Feasibility Study

Remove Providence Avenue storm network flow as well as storm flow from the existing local street combined sewer system and convey to a new endwall within Ship Creek via a new 36"/48" separate sewer along 13th Street and Upland street. This referenced inflow area comprises the overall stormwater drainage area of CSO 18 west of Chestnut Street shown on Sheet 2 of G&A mitigation plans with green hatching. Remove storm runoff from the Widener University area (depicted as red hatched area on Sheet 2) and convey via a new 30" conduit along Melrose Avenue, down 14th Street, and through the access road adjacent to the Widener ball field to a new storm endwall at Ridley Creek. Right of way may be required and/or a structural solution to the encroaching ball field retaining wall along the access road. Route A is depicted in red on Sheet 2.

Sanitary sewage would remain within the existing 68"x43" sewer main. I-95 crossing structural mitigation would include introduction of a smaller sized conduit within the crossing to be sized for existing sanitary flows and grouted into the larger pipe as a permanent structural fix.

Stormwater within Hancock Street would be rerouted to the existing CSO 18 Endwall within the Ridley Creek bank.

The existing CSO regulator would be abandoned or revised to include outflow exclusively to the Ridley Interceptor.

ESTIMATED COST RANGE (PRELIMINARY)

$5.5 million to $6.5 million

END OF ALTERNATE 1 SUMMARY

DRAFT

2.2 ALTERNATE 2 – REVISED ROUTE A AND ROUTE B STORMWATER SEPARATION

TARGET OUTCOME

CSO 18 mitigation through removal of stormwater inflow from 68"x43" combined sewer main via a revised "Route A" and "Route B" with storm discharge to Ridley Creek and Ship Creek, respectively.

STUDIED SOLUTION

Option 3, Option 6 and Option 8 from the Feasibility Study

Sanitary sewage would remain within the existing 68"x43" sewer main. I-95 crossing structural mitigation would include introduction of a smaller sized conduit within the crossing to be sized for existing sanitary flows and grouted into the larger pipe as a permanent structural fix.

Remove Providence Avenue storm network flow as well as storm flow from the existing local street combined sewer system and convey to a new endwall within Ship Creek via a new 36"/48" separate storm sewer along 13th Street and Upland street. This referenced inflow area comprises the overall stormwater drainage area of CSO 18 west of Chestnut Street shown on Sheet 2 of G&A mitigation plans with green hatching. Remove storm runoff from the Widener University area (depicted as red hatched area on Sheet 2) and convey via new 24" conduit adjacent to the existing 68"x43" sewer main route to a new manhole located adjacent to existing MH 329. The new 24" conduit would then run above the referenced grouted-in sanitary pipe within the I-95 crossing and then out to a new manhole located adjacent to existing MH 3070. New conduit would then replace the existing 15" storm pipe located within Hancock Street, with new connections for existing Hancock St. runoff, and be routed to the existing endwall of CSO 18. This revised Route A is depicted in blue on Sheet 2.

Stormwater within Hancock Street would be rerouted to the existing CSO 18 Endwall within the Ridley Creek bank.

The existing CSO regulator would be abandoned or revised to include outflow exclusively to the Ridley Interceptor.

ESTIMATED COST RANGE (PRELIMINARY)

$4.5 million to $5.5 million

END OF ALTERNATE 2 SUMMARY

DRAFT

2.3 ALTERNATE 3 - I-95 CROSSING SOLUTION WITH NO CSO MITIGATION

TARGET OUTCOME

Combined flow separation in the existing partially collapsed 68"x43" RCP main as part of the repair procedure for this pipe. Structural repairs to partially collapsed 68"x43" RCP at I-95 crossing

STUDIED SOLUTION

Two (2) doghouse manholes would be installed at strategic locations between existing MH 329 and MH 3070 as determined during the design phase for repairs to the existing partially collapsed 68"x43" RCP main. Temporary supports and shoring would then be installed within the existing partially collapsed 68"x43" RCP main. Sanitary sewage would be temporarily bypassed through a system installed within the existing 68"x43" RCP main so that a new 12" diameter sewer main could be installed within the existing 68"x43" RCP main. The existing 68"x43" RCP main would then be partially grouted to an elevation approximately 6" higher than the top of the new 12" diameter sanitary sewer pipe. A storm sewer pipe would then be installed at an elevation above the 12" diameter pipe. After completing this storm sewer pipe installation, the remaining annular space within the 68"x43" RCP main would be grouted solid. This flow separation would eliminate combined flow within the existing 68"x43" RCP main and serve as the permanent repair to the partially collapsed existing 68"x43" RCP main.

ESTIMATED COST RANGE (PRELIMINARY)

$2.5 million to $3.4 million

END OF ALTERNATE 3 SUMMARY

DRAFT

3.0 OPERATION &MAINTENANCE STATEMENT

Future operation and maintenance (O&M) costs of all three alternates are anticipated to be similar to the existing O&M costs with the following exceptions:

- The I-95 crossing, by virtue of installation of new carrier pipes and fully grouting the existing 68"x43" RCP main, is expected to provide a 100+ year usable life for this component of the system,.

- Elimination of stormwater flow through existing CSO 18 conduits will likely reduce future O&M costs of the sanitary sewer system.

DRAFT

4.0 STUDY CRITERIA AND ASSUMPTIONS

- unknowns of the existing storm and sanitary facility locations and depths of system components as described in the full report;
- unknown locations of all other existing utilities and potential conflicts for proposed routing Alternates;
- unknown resolution of flood elevation status of Chester Creek and whether Route B can, or must be, justified through: A) existing FEMA Flood Insurance Study means and methods; B) additional Hydrologic and Hydraulic study; C) storage and attenuation of proposed storm discharge from Route B;
- the potential for environmentally sensitive issues (wetlands, bog and/or red-belly turtles, plant species, etc. that may be uncovered with a PNDI search and/or additional site investigation) within Ship Creek that would need mitigation;
- study of the existing enclosed portion of Ship Creek located under the existing railroad and I-95 for flows introduced from Route B;
- acceptance (or lack of acceptance) of new stormwater facilities for dedication to the City of Chester;
- unknown extent of lands (if any) that would require acquisition of right-of-way, construction and/or permanent easements, etc., in order to carry out any of the studied options or alternates;
- granting of applicable jurisdictional agency permits that are required to perform the work contemplated within this study;
- permission of PennDOT, USDOT and affected municipalities to perform the work via detours, lane outages, lane and ramp restrictions, redirection of traffic, temporary traffic control and work zone traffic control, as may be required to complete the project on and under I-95, Providence Road and local collector roadways;
- permission of the railroad to perform work at or near their facilities;
- permission of local property Owners and Widener University to perform the work contemplated within and/or adjacent to their properties;
- anticipated extensive coordination with existing utility owners and service providers to avoid facility conflicts, obstructions and service interruptions;
- anticipated extensive coordination with local businesses and the general public regarding the project and potential impacts to the local community and traveling public.

DRAINAGE COMPUTATIONS FOR SELECT OPTIONS

CHAPTER 7, APPENDIX A

FIELD MANUAL FOR PENNSYLVANIA DESIGN RAINFALL INTENSITY CHARTS FROM NOAA ATLAS 14 VERSION 3 DATA

7A.0 INTRODUCTION

Previously used procedures to estimate design rainfall intensities, usually obtained from the *U.S. Weather Bureau Technical Paper No. 40* (Hershfield, 1961) or the *1986 Field Manual of PennDOT Storm-Intensity-Duration-Frequency Charts PDT-IDF* (Aron et al., 1986), have been updated in this appendix. The regional rainfall design curves in this Pennsylvania field manual were developed from frequency analyses based on hourly records from 278 daily and 139 hourly rainfall gages in Pennsylvania plus gages in surrounding states for a period of record from April 1, 1863 through December 31, 2000. The analysis leading to the design curves is fully described in this Appendix.

In performing the PDT-IDF analysis, it was found that there were regional differences in rainfall patterns between storm durations. For example, the lowest intensities and amounts for the five (5) minute storms are located in north central PA, whereas the lowest intensities and amounts for the twenty-four (24) hour storm are located in western PA. It was determined that one rainfall region map would not adequately represent the rainfall patterns. Therefore, the maps were developed based upon storm duration and frequency as shown in Table 7A.1.

7A.1 PROCEDURE FOR FINDING DESIGN INTENSITY VALUES

A. Objective. To obtain the design rainfall or return periods from 1 to 100-years and durations from 5 minutes to 24 hours and to obtain the 500-year, 24-hour precipitation.

Step 1 Determine the rainfall duration of the storm that will need to be analyzed. For the rational method, the required storm duration will be equal to the time-of-concentration.

Step 2 From Table 7A.1, determine what Rainfall Region Map should be utilized for the design storm duration of interest.

Table 7A.1 Appropriate Rainfall Region Map for each Storm Duration and Frequency

	Frequency							
Duration	**1 year**	**2 year**	**5 year**	**10 year**	**25 year**	**50 year**	**100 year**	**500 year**
5 min	C	C	C	C	B	B	B	-
10 min	C	C	C	C	C	C	C	-
15 min	A	A	A	A	C	C	C	-
30 min	A	A	A	A	A	C	C	-
60 min	A	A	A	A	A	C	C	-
2 hr	E	E	E	E	E	E	E	-
3 hr	E	E	E	E	E	E	E	-
6 hr	D	D	D	D	D	D	D	-
12 hr	F	F	F	F	F	F	F	-
24 hr	F	F	F	F	F	F	F	F

Step 3 Locate the area of interest on the Pennsylvania map for the Map determined in Step 2 (Figures 7A.1 through 7A.6) and note the region into which this area falls.

Figure 7A.1 Map A. 15-, 30- and 60-minute durations for storms occurring with an ARI of 1-, 2-, 5-, 10-years and 30- and 60-minute durations for storms occurring with an ARI of 25-years.

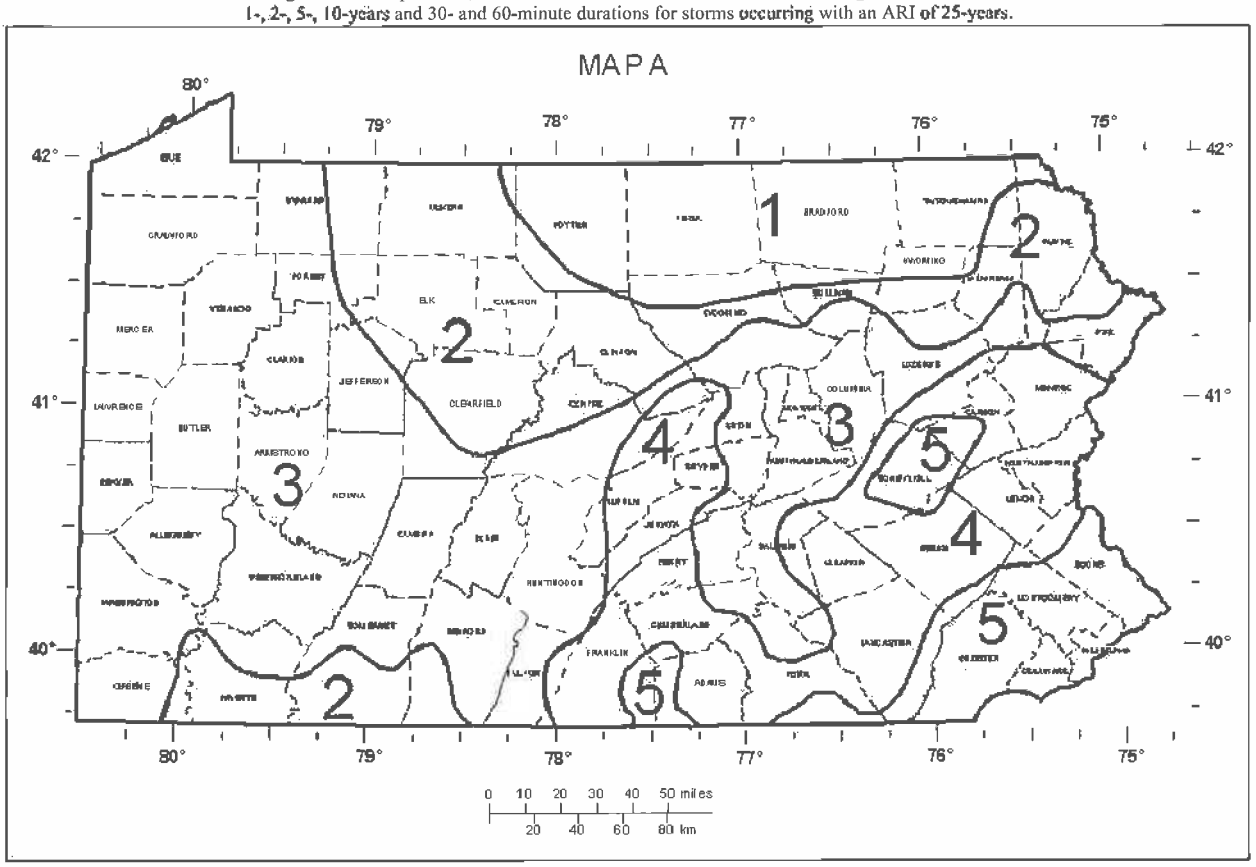

Figure 7A.2 Map B. 5-minute durations for storms occurring with an ARI of 25-, 50- and 100-years.

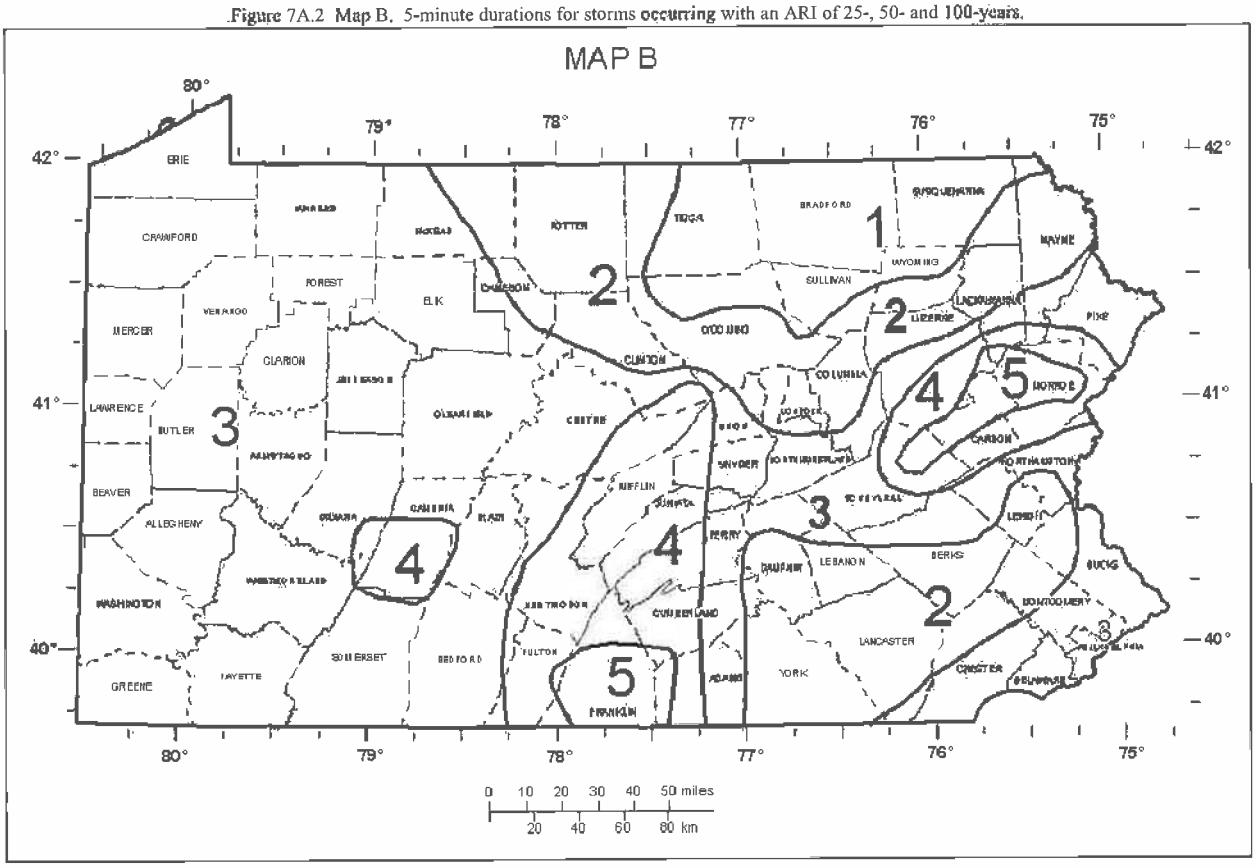

Figure 7A.3 Map C. 5- and 10-minute durations for storms occurring with an ARI of 1-, 2-, 5-, and 10-years, 10- and 15-minute durations for storms occurring with an ARI of 25-years and 10-, 15-, 30-, 60-minute durations for storms occurring with an ARI of 50- and 100-years.

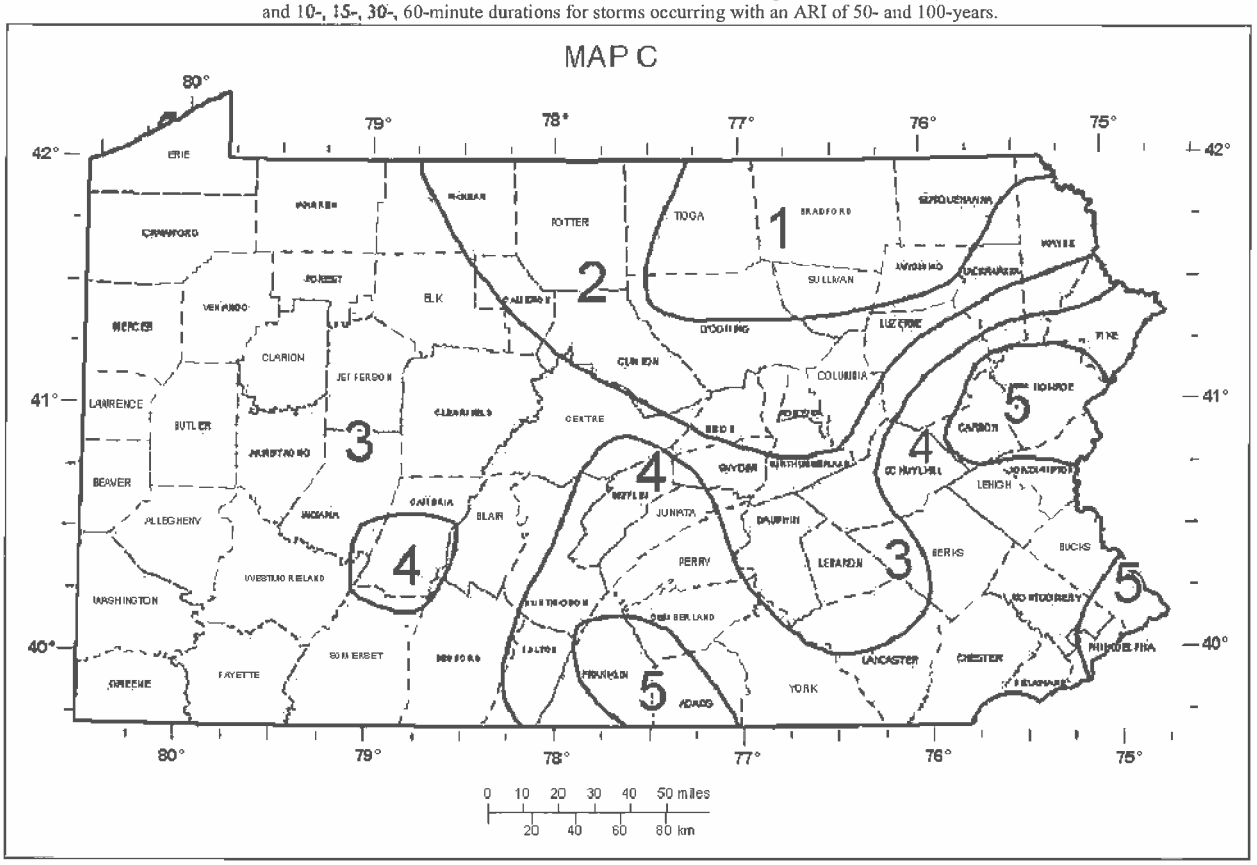

Figure 7A.12(a) Rainfall Intensity for 1- through 100-year Storms for Region 3 (U.S. Customary).

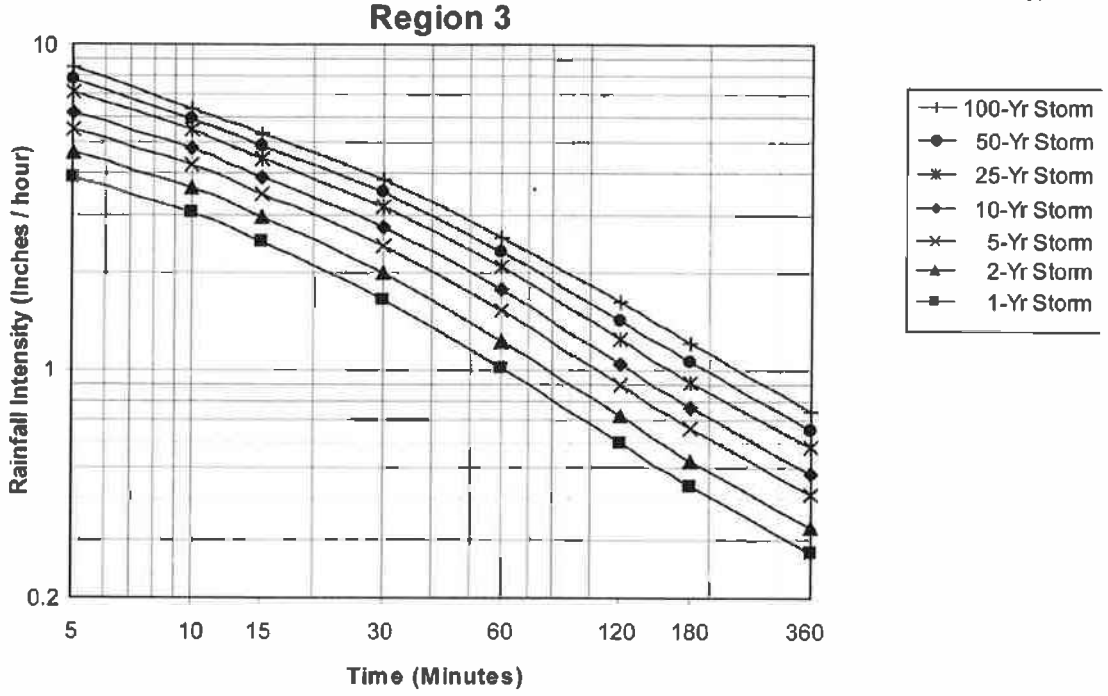

Figure 7A.12(b) Rainfall Amount for 1- through 100-year Storms for Region 3 (U.S. Customary).

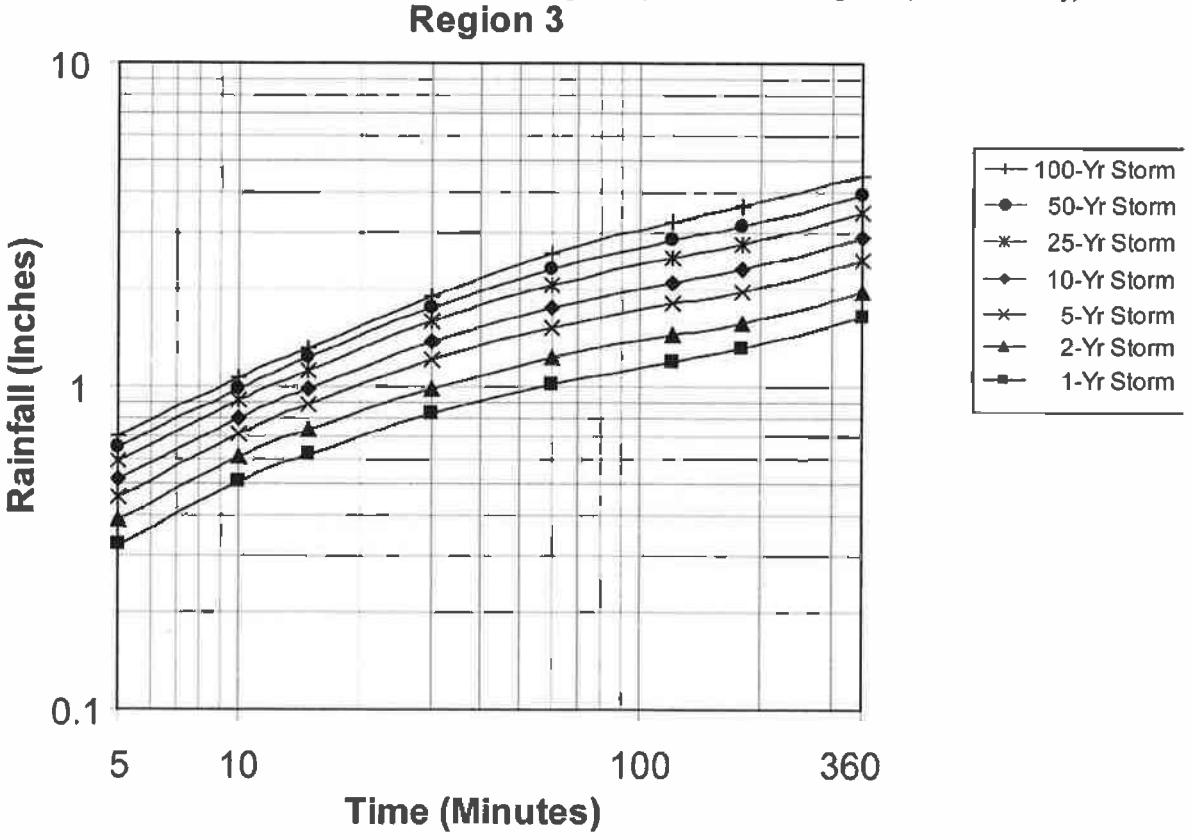

Figure 7A.14(a) Rainfall Intensity for 1- through 100-year Storms for Region 4 (U.S. Customary).

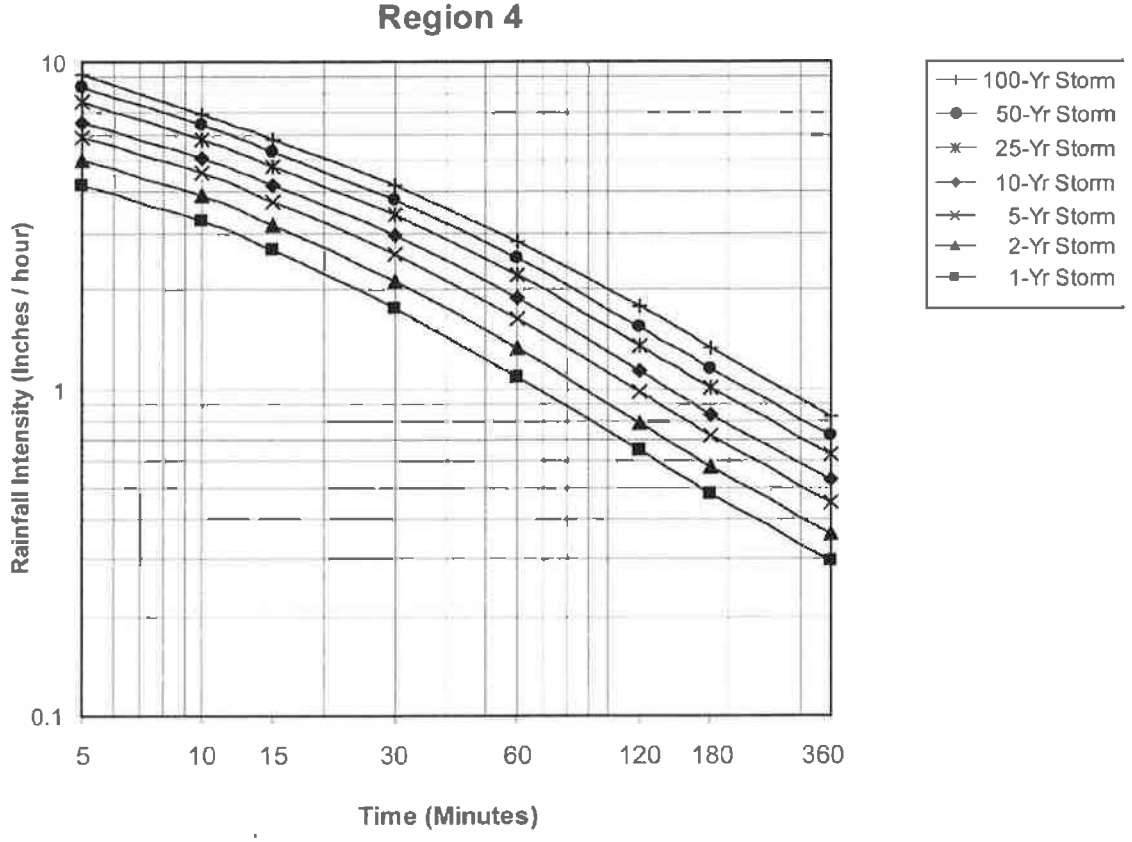

Figure 7A.14(b) Rainfall Amount for 1- through 100-year Storms for Region 4 (U.S. Customary).

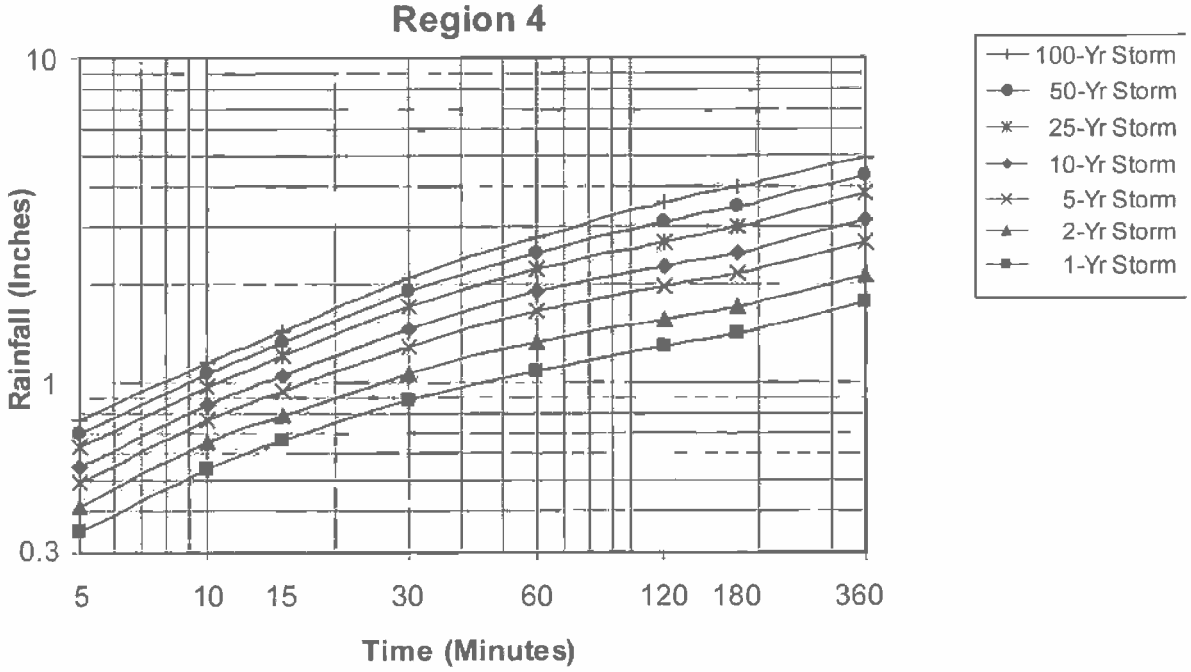

Figure 7A.16(a) Rainfall Intensity for 1- through 100-year Storms for Region 5 (U.S. Customary).

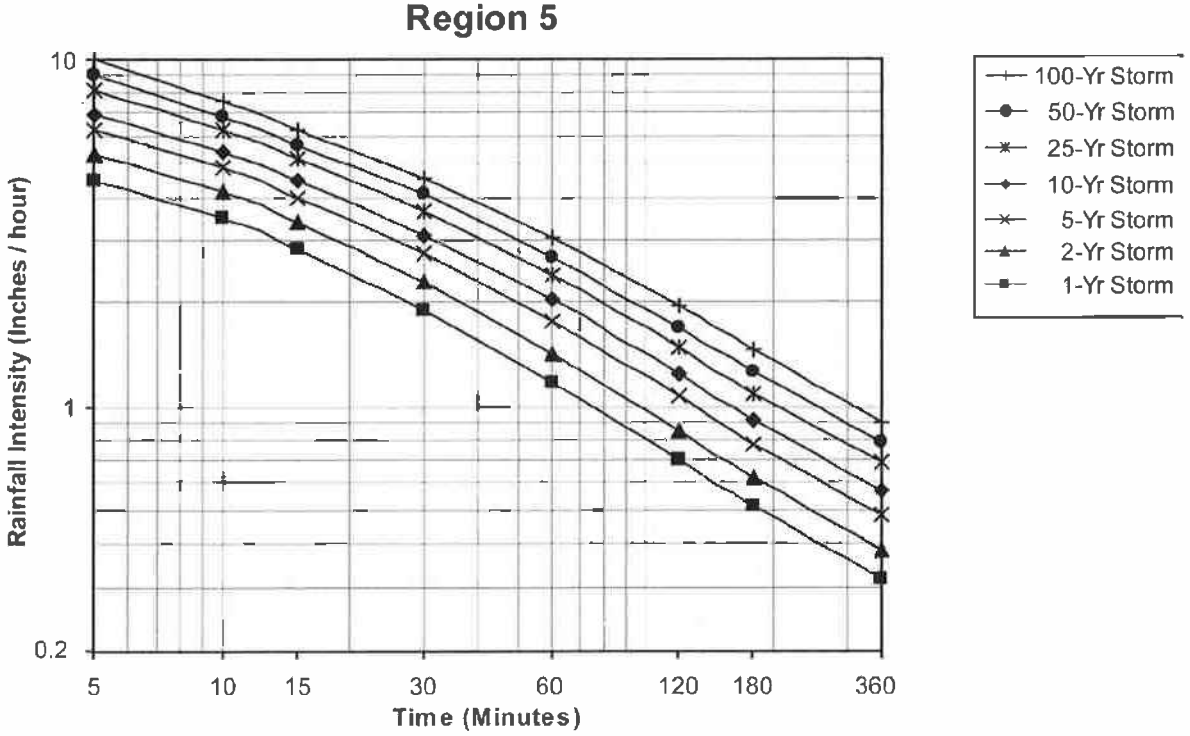

Figure 7A.16(b) Rainfall Amount for 1- through 100-year Storms for Region 5 (U.S. Customary).

Executive Summary

The Delaware County Regional Water Quality Control Authority (DELCORA) is a municipal authority originally organized under the Pennsylvania Municipal Authorities Act of 1945 (P.L. 382), as amended and supplemented, pursuant to action taken by the Delaware County Council on October 20, 1971. Under County of Delaware Ordinance 2002-1, the term of existence of DELCORA was extended to January 15, 2052.

DELCORA prepared and submitted their original Combined Sewer Overflow (CSO) Long Term Control Plan (LTCP) to the PADEP in 1999. This LTCP was subsequently approved by the PADEP, and DELCORA had started to implement the CSO control elements selected in the LTCP. In 2009, the United States Environmental Protection Agency (USEPA) informed DELCORA that the original LTCP was not in compliance with the requirements of the USEPA's CSO Policy. As such, DELCORA prepared and submitted a revised LTCP in February 2012. Subsequent to the receipt of the revised LTCP, DELCORA and the USEPA had corresponded various times including requests for additional information from the USEPA in accordance with Section 308 of the Clean Water Act. A Consent Decree was ultimately executed between DELCORA, the Pennsylvania Department of Environmental Protection (PADEP) and USEPA, and was approved by the Federal District Court on November 10, 2015. The Consent Decree requires a revised LTCP to be prepared based on an agreed upon schedule, which will include interim deliverables and milestones.

Purpose

DELCORA is developing a Long Term Control Plan (LTCP) Update for the Combined Sewer System (CSS) as required by the Consent Decree. The Consent Decree requires the preparation of a Draft Financial Capabilities Assessment (FCA) including information on sewer rate setting, median household income (MHI) and number of households in the LTCP Model Area which must be submitted within nine (9) months of the Date of Lodging of the Consent Decree.

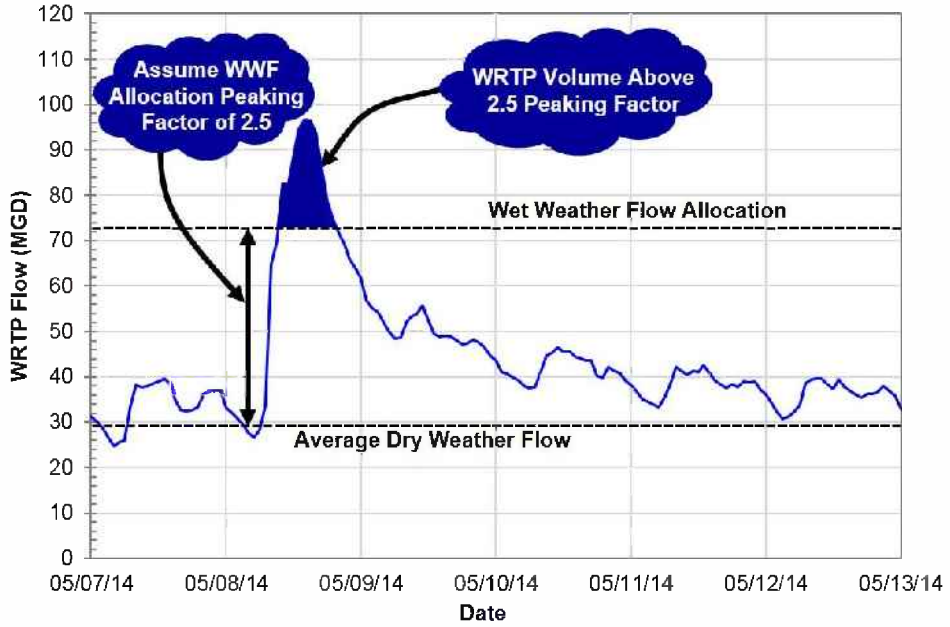
The Draft FCA has been prepared in advance of the completion of the revised LTCP. Therefore, final CSO control alternatives and their associated capital improvement costs have not been determined. The Draft FCA is based on an analysis of the affordability for the affected residential communities as measured by the Residential Index. The Final FCA, which is to be submitted after evaluation of CSO controls, will include planning level estimated costs for the identified alternatives that can then be contrasted with the results of the estimated affordability analysis.

CSO LTCP Cost Allocation to Separate Sewer System

DELCORA's system serves a variety of customers from numerous municipalities in Delaware County, PA. The majority of the sewer systems within the Model Area have separated sanitary sewers, with the exception of a portion of Chester City, which is served by combined sewers. DELCORA has service agreements with the authorities, major industries, and a few municipalities. There are service agreements that indicate that the discharger will not share in any CSO related costs, because there was no direct discharge to the combined sewer system. However, most agreements indicate that authority, industry, or municipality shall not discharge excess wet weather flow to the DELCORA WRTP. Thus, for the purpose of the Draft FCA, the allocation of CSO LTCP costs to the separate sewer system is based on

separate sewer system's share of the total Wet Weather Flow (WWF) volume. The separate sewer system's share is based on WRTP's WWF volume above a peaking factor 2.5. Figure ES-1 shows an example WRTP's WWF volume from a single storm event in May 2014.

Figure ES-1: Basis for Estimating Wet Weather Flow from Separate Sewer Areas



To estimate the total wet weather volumes shown in Table ES-1, the WRTP's WWF volumes from all storms above a peaking factor of 2.5 within the year were totaled and added to the annual CSO volume discharged.

Table ES-1: CSO Volume as Percent of Total Wet Weather Volume

Year	WRTP WWF Volume above 2.5 Peak Factor (MG)	CSO Volume (MG)	Total Wet Weather Volume (MG)	Percent CSO
2009	24.2	785	809.2	97%
2010	39.3	696	735.3	95%
2011	30.0	1144	1174.0	97%
2012	6.6	538	544.6	99%
2013	13.5	744	757.5	98%
Average	22.7	781.4	804.1	97%

Table ES-1 indicates that the separate sewer system has about a 3% to 5% share of the total wet weather volume. Further hydraulic evaluations are required to better understand the separate sewer system flows and refine the separate sewer system share of the CSO LTCP costs. Therefore for this Draft FCA, it is assumed 15 percent of CSO LTCP costs would be allocated to the separate sewer system and 85 percent of the CSO LTCP costs would allocated to combined sewer system in Chester City. For the final FCA, the updated hydrologic and hydraulic (H&H) model will be used to improve the estimate of CSO attributable to Chester City and to the remainder of the Model Area.

Financial Health of Chester City

The City of Chester is a financially distressed municipality as defined by the 1987 Financially Distressed Municipalities Act 47 (Act 47). After several years of budget deficits, Chester City Council adopted the 1996 Recovery Plan, which presented nearly 200 actions steps toward fiscal recovery. Chester City continued to have budget deficits. Subsequent recovery plans have been submitted in 2006 and 2013. While opening the Harrah's Racetrack and Casino in January 2007 has improved the financial conditions in Chester City, the budget problem has not been resolved. The City remains in the Act 47 program until financial health improves.

Financial indicator

In accordance with EPA's 1997 Guidance for Financial Capability, Table ES-2 shows the factors used to develop the financial indicator. The average score for the financial indicator was calculated by dividing the sum of the scores by the number of entries. The overall financial capability for the Model Area corresponds to a "Strong" rating. However, due to financial distressed conditions and consistent with the 2013 Recovery Plan, Chester City's overall financial capability is "Weak". EPA's 1997 Guidance for Financial Capability indicates that Chester City would have a "high burden" if the residential annual sewer bill is between 1.0 percent and 2.0 percent of Median Household Income (MHI). For the purpose of this Draft FCA, Chester City's affordability is based on 85 percent share of the CSO LTCP and a Chester City annual sewer bill at 1.6 percent of MHI.

Table ES-2: Worksheet 9 - Summary of Financial Capability Indicators

Indicator	Chester City			Model Area			Line Number
	Actual Value	Financial Indicator	Score	Actual Value	Financial Indicator	Score	
A. Bond Rating (Line 303)	A (Suspended 1/6/2014)	Mid-Range	2	AA	Strong	3	901
B. Overall Net Debt as a Percent of Full Market Property Value (Line 405)	13.4%	Weak	1	4.0%	Mid-Range	2	902
C. Unemployment Rate (Line 501)	8.6%	Weak	1	4.8%	Mid-Range	2	903
D. Household Income (Line 601)	28,350	Weak	1	71,601	Strong	3	904
E. Property Tax Revenues as a Percent of Full Market Property Value (Line 703)	1.2%	Strong	3	0.4%	Strong	3	905
F. Property Tax Revenue Collection Rate (Line 803)	81.7%	Weak	1	97.5%	Mid-range	2	906
G. Permittee Indicators Score			1.5			2.5	907
H. Financial Indicator			Weak			Strong	

Residential indicator

The CSO LTCP will be designed and constructed as required to meet the Consent Decree deadline of August 2035 to the limit of Chester City's financial capability. Funding for the CSO LTCP is assumed to be through revenue bonds. As defined by Financial Indictor in Table ES-2 above and the Financial Capability Matrix in EPA's 1997 Guidance for Financial Capability (see Table 2-1 below), Chester City's financial capability is considered a "high burden" when the annual sewer bill is 1.25% of MHI. The Chester City annual sewer bill at 1.25% of MHI corresponds to approximately a cost of $25,500,000 for Chester City's share of CSO LTCP improvements. Therefore, assuming that 15% of the CSO LTCP costs are allocated to the separate system, the total cost of the CSO LTCP improvements would be approximately $30,000,000. The Cost per Household for Chester City and the DELCORA Model Area are shown in Table ES-3.

Table ES-3: Worksheet 1 - Cost per Household

Description	2035 Basis		2015 Basis		Line No.
	Chester City	Model Area	Chester City	Model Area	
A. DELCORA's Cost

Financial Capability Matrix Score

Table ES-5 shows the Overall Financial Capability Matrix for Chester City and DELCORA Model Area. In accordance with EPA's 1997 Guidance for Financial Capability, Chester City will have a "high burden" if the CSO LTCP costs are $30,000,000 with an 85 percent Chester City share. The methodology presented herein will be followed for the final FCA and will be submitted with the LTCP Update. The assumed proportion of the CSO program cost for Chester City will be refined during the LTCP Update of the H&H model which will then be used to calculate the fraction of wet weather flow during CSO events attributable to each municipality.

Section 1 Introduction

The Delaware County Regional Water Quality Control Authority (DELCORA) is a municipal authority originally organized under the Pennsylvania Municipal Authorities Act of 1945 (P.L. 382), as amended and supplemented, pursuant to action taken by the Delaware County Council on October 20, 1971. Under County of Delaware Ordinance 2002-1, the term of existence of DELCORA was extended to January 15, 2052.

DELCORA prepared and submitted their original Combined Sewer Overflow (CSO) Long Term Control Plan (LTCP) to the PADEP in 1999. This LTCP was subsequently approved by the PADEP, and DELCORA had started to implement the CSO control elements selected in the LTCP. In 2009, the United States Environmental Protection Agency (USEPA) informed DELCORA that the original LTCP was not in compliance with the requirements of the USEPA's CSO Policy. As such, DELCORA prepared and submitted a revised LTCP in February 2012. Subsequent to the receipt of the revised LTCP, DELCORA and the USEPA had corresponded various times including requests for additional information from the USEPA in accordance with Section 308 of the Clean Water Act. A Consent Decree was ultimately executed between DELCORA, the Pennsylvania Department of Environmental Protection (PADEP) and USEPA, and was approved by the Federal District Court on November 10, 2015. The Consent Decree requires a revised LTCP to be prepared based on an agreed upon schedule, which will include interim deliverables and milestones that must be met.

DELCORA is in the process of revising its Long Term Control Plan (LTCP) Update for the Combined Sewer System (CSS) as part of the 2015 Consent Decree. As part of this comprehensive effort, a Draft Financial Capabilities Assessment (FCA), including information on sewer rate setting, median household income (MHI) and number of households in the LTCP Model Area, must be submitted within nine (9) months of the Date of Lodging. The Consent Decree defines the Model Area as being those areas that are hydraulically connected to the DELCORA Western Regional Treatment Plant (WRTP), as further defined herein. This Draft FCA has been prepared in accordance with the USEPA guidance document entitled Guidance for Financial Capability Assessment and Schedule Development (USEPA, 1997).

1.1 Description of the DELCORA Service Area

DELCORA is responsible for the collection, transmission, treatment and disposal of approximately 65 million gallons per day (MGD) of wastewater generated in southeastern Pennsylvania. DELCORA's facilities serve residential, commercial, institutional, and industrial customers in Delaware County. DELCORA owns and operates an extensive system of pump stations, force mains, and sewers that provide the core infrastructure for the transmission of wastewater to treatment facilities in Delaware County and the City of Philadelphia as shown diagrammatically in Figure 1-1. The total service area served by DELCORA is approximately 82,977 acres, as shown on Figure 1-2, which illustrates that DELCORA serves a significant and widespread portion of Delaware County.

Figure 1-1: DELCORA's Conveyance System

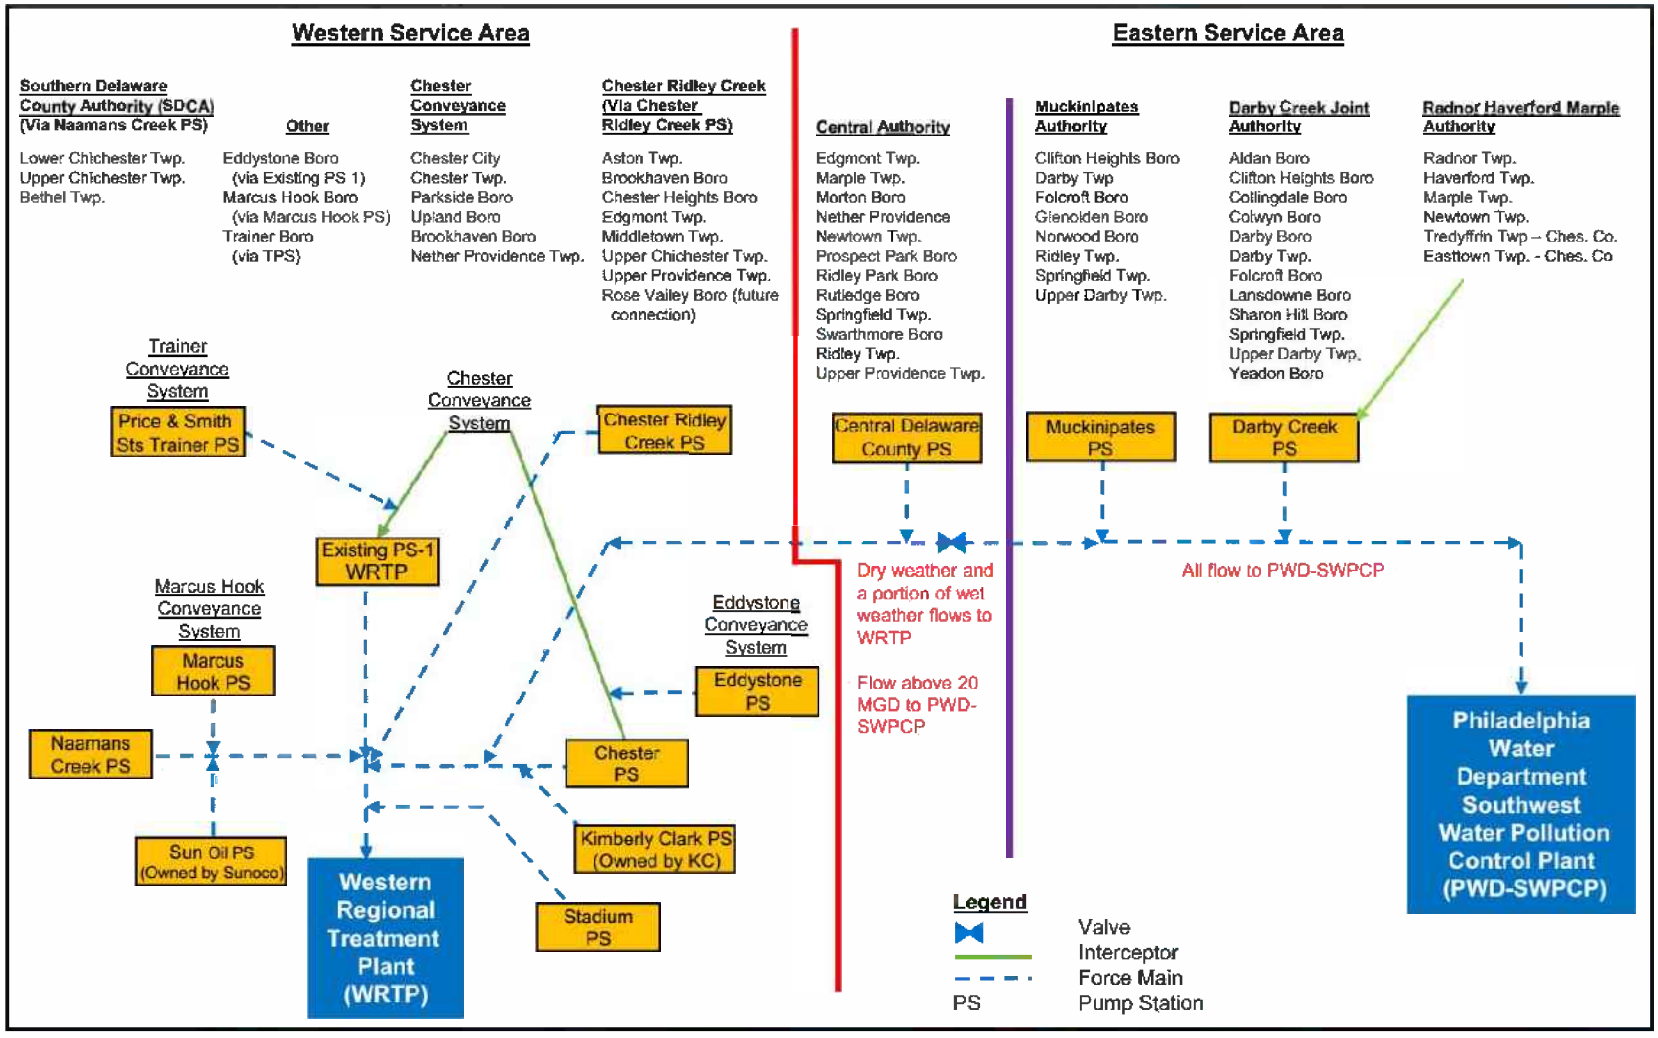

Figure 1-2: DELCORA's Service Area

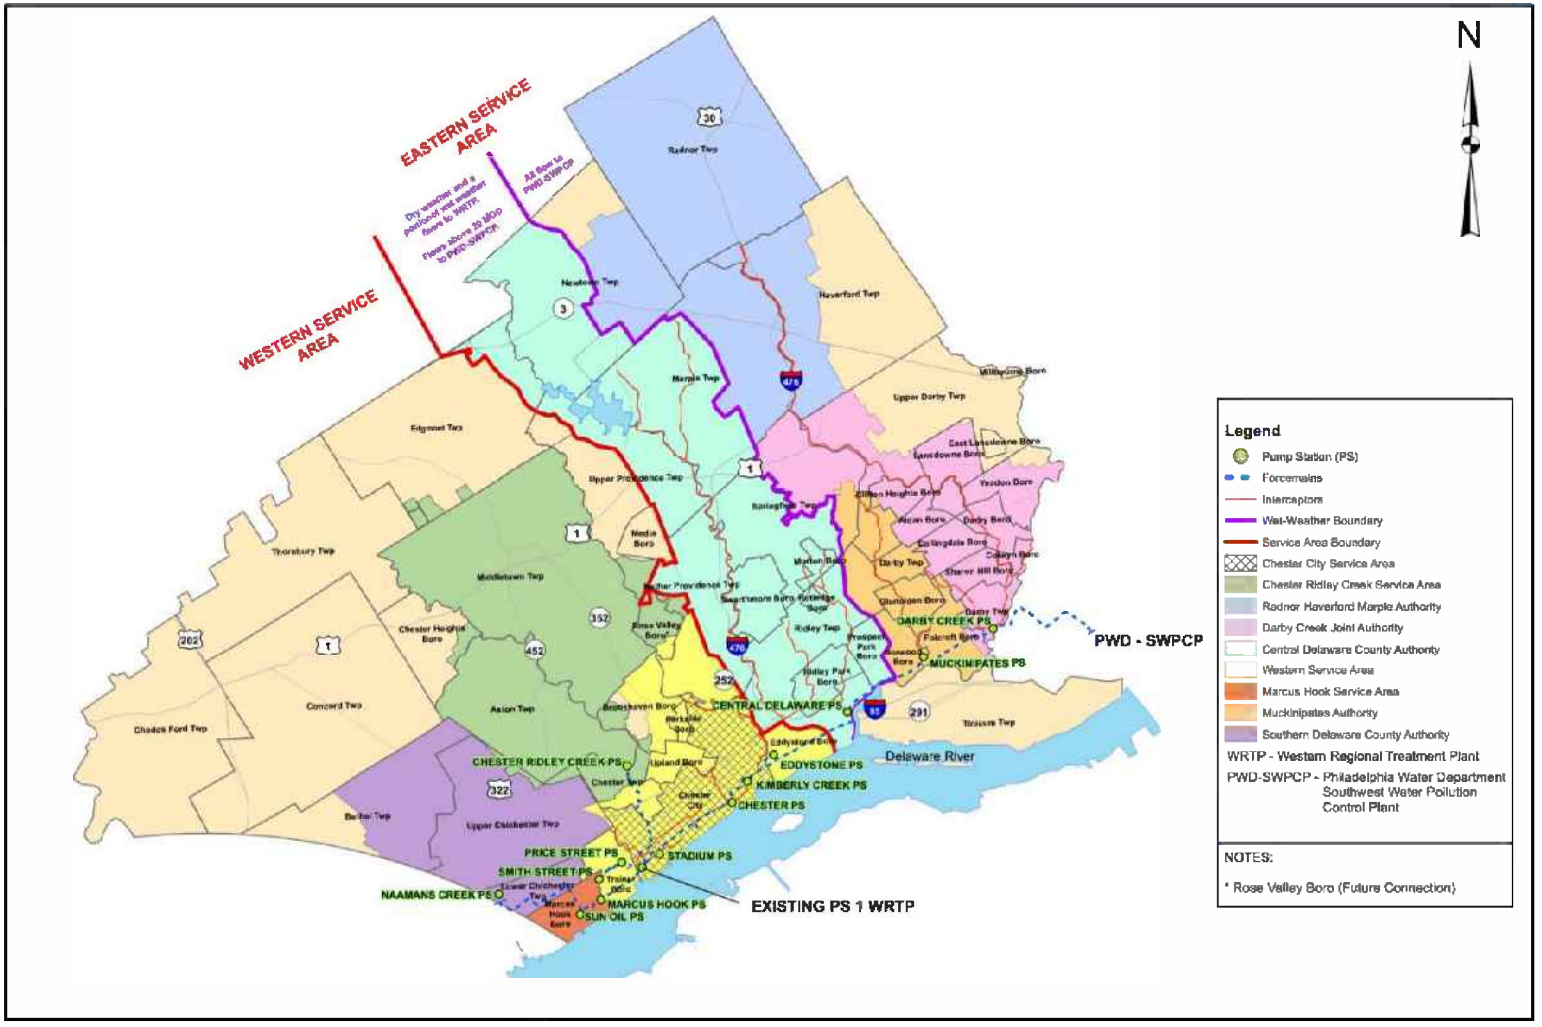

Historically, DELCORA has characterized its service areas as "Eastern" and "Western". The Western service area discharges to DELCORA's WRTP. The Eastern service area discharges to the Philadelphia Water Department's Southwest Water Pollution Control Plant (PWD-SWPCP). Being hydraulically connected to the PWD-SWPCP, the Eastern Service Area will pay $427 million for a portion of the Philadelphia 25 year LTCP. In 2002, DELCORA completed the installation of a force main that connects the Eastern Service Area's Central Delaware Pump Station (CDPS) to the Chester Force Main. This connection allows DELCORA to send flow from the CDPS to the WRTP. Flows above 20 MGD are to be directed to the PWD-SWPCP. As such, dry weather flow and a portion of the wet weather flow from the Central Delaware County Authority in the Eastern Service Area are discharged to the WRTP.

Under National Pollutant Discharge Elimination System (NPDES) Permit No. PA0027103, issued and administered by the PADEP, DELCORA is authorized to discharge from the WRTP (Outfall 001), four storm water outfalls at the WRTP (028-031) and from 26 combined sewer overflow (CSO) outfalls (002-026, 032, 033) that ultimately discharge to the Delaware River, Chester Creek and/or Ridley Creek. There are a total of 26 combined sewer overflow (CSO) outfalls listed with 25 discharge points (Outfalls 009 and 010 both discharge at Outfall 009) in DELCORA's existing NPDES Permit.

The combined sewer area simulated in DELCORA's existing Hydrologic and Hydraulic (H&H) is located within Chester City and consists of a drainage area of approximately 1,150 acres. It comprises approximately half of Chester City's serviced area. To support this service area, DELCORA owns and operates over 129 miles of separate and combined sewers. Included in the 129 miles of sewers are: 11.7 miles of an interceptor system; 3,209 manholes; and twenty-five (25) combined sewer outfall regulators controlling storm overflows. The location of Chester City's service area is illustrated in Figure 1-2.

1.1.1 Model Area

As described in the Consent Decree, this Draft FCA will evaluate the Model Area comprising those areas hydraulically connected to the WRTP. Paragraph 14.b of the Consent Decree describes the Model Area as follows:

> *… all areas tributary to the entire Collection System, as well as all areas tributary to all municipal wastewater collection and transmission systems that are, as of the date the LTCP is submitted, hydraulically connected to, or that directly or indirectly influence flow to, the CSOs and/or the WRTP, regardless of who owns or operates the system(s), including but not limited to the entire "Western Service Area" and "Eastern Service Area" depicted on Figure 1-2 of the Long-Term Control Plan submitted by DELCORA in April 2012, and attached as Appendix A hereto (collectively, the "Model Area").*

As shown in the schematic of DELCORA's conveyance system (see Figure 1-1), the conveyance system is divided into the Western Service Area and the Eastern Service Area. The Western Service Area discharges to DELCORA's WRTP and is therefore included in the Model Area. The Eastern Service Area is served by three pumps stations: the Central Delaware Pump Station, the Muckinipates Pump Station and the Darby Creek Pump Station. Up to 20 MGD (which includes both dry and wet weather flows) from the Central Delaware Pump Station can be pumped to, and thus is hydraulically connected to, DELCORA's WRTP. Therefore, municipalities connected to the Central Delaware Pump Station are considered part of the Model Area. Sewage from the Muckinipates Pump Station and the Darby Creek Pump Station flows to the PWD-SWPCP rather than to the WRTP. Therefore, municipalities connected

to these pump stations are not hydraulically connected to the WRTP and do not directly or indirectly influence CSOs or flow to the WRTP, and, therefore, are not considered part of the Model Area. In summary, the Model Area includes the municipalities in the Western Service Area plus those municipalities in the Eastern Service Area that are connected to the Central Delaware Pump Station, as described in Table 1-1.

Table 1-1: Model Area

Section 2 Consent Decree Requirements and EPA Guidance

2.1 Consent Decree Requirements

The Consent Decree requires DELCORA to submit

> *…a draft Financial Capability Assessment (FCA)in accordance with CSO Control Policy Paragraph II.C.8 and "Combined Sewer Overflows- Guidance for Financial Capability Assessment and Schedule Development," EPA 832-B-97-004, February 1997 ("1997 FCA Guidance"), as such guidance has been interpreted by EPA, including but not limited to information on sewer rate setting and median household income and number of households in the entire Model Area (as defined in Paragraph 14.b above), as well as information on all other financial resources available to DELCORA.*

However, the Consent Decree also recognizes that the draft FCA is not final. Since the draft FCA is being prepared in advance of the revised LTCP, the Consent Decree also includes requirements for a final FCA:

> *Concurrent with the submission of the LTCP, DELCORA shall submit to Plaintiffs for review and approval in accordance with the requirements of Section VI (Review and Approval of Submittals) a proposed final FCA, including an implementation schedule for the proposed CSO controls in accordance with CSO Control Policy Paragraph II.C.8 and the 1997 FCA Guidance.*

2.2 EPA Guidance

Per the EPA's CSO Control Policy (USEPA, 1994), "*EPA recognizes that financial considerations are a major factor affecting the implementation of CSO controls. For that reason, this Policy allows consideration of a permittee's financial capability in connection with the long-term CSO control planning effort, WQS review, and negotiation of enforceable schedules.*" Subsequent to the 1994 CSO Control Policy, EPA developed guidance for financial capability assessment based on a two-phase process described in their Guidance for Financial Capability Assessment and Schedule Development (USEPA, 1997).

2.2.1 Two-phase Assessment

The EPA's 1997 FCA guidance document uses a two-phased approach in the assessment of the financial capability of a municipality. The first phase develops a "Residential Indicator" that determines the financial impact of the current and proposed CSO controls on residential users. The residential indicator is the cost per household (CPH) of current and proposed wastewater treatment and CSO controls divided by Median Household Income (MHI). EPA has established the following financial impact benchmarks for the residential indicator:

Financial Impact	Residential Indicator (CPH as % MHI)
Low	Less Than 1.0 Percent of MHI
Mid-Range	1.0 – 2.0 Percent of MHI
High	Greater than 2.0 Percent of MHI

The second phase in this assessment is used to determine a "Financial Capability Indicator", which shows the overall financial health of the Permittee. The financial capability indicator uses the following six indicators:

- Bond Ratings
- Overall Net Debt as a Percent of Full Market Property Value
- Unemployment Rate
- Median Household Income
- Property Tax Revenues as a Percent of Full Market Property Value
- Property Tax Collection Rate

A numerical score is assigned to each of the above indicators. The overall score is used to develop the overall financial capability indicator. The benchmarks for the overall financial capability indicator established by EPA are as follows:

Financial Impact Financial Capability Indicator	Overall Score
Weak	Below 1.5
Mid-Range	Between 1.5 and 2.5
Strong	Above 2.5

The residential and financial capability indictors are combined to assess the overall burden associated with funding CSO controls. The financial capability matrix, developed by EPA and shown in Table 2-1, is used to determine the overall level of burden on the Permittee and its residents.

Table 2-1: Financial Capability Matrix

Financial Capability Indicator	Residential Indicator (Cost Per Household as a % of MHI)		
	Low (1.0% and Below)	Mid-Range (Between 1.0% and 2.0%)	High (2.0% and Above)
Weak (1.5 and Below)	Medium Burden	High Burden	High Burden
Mid-Range (Between 1.5 and 2.5)	Low Burden	Medium Burden	High Burden
Strong (2.5 and Above)	Low Burden	Low Burden	Medium Burden

2.2.2 EPA FCA Framework (2014)

Subsequent to the 1997 FCA guidance document, EPA released the 2014 Financial Capability Assessment Framework (USEPA, 2014) to clarify the "*…flexibilities built into the existing guidance that local governments or authorities can use in assessing their financial capability, and the relationship between that assessment and consideration of schedules for permit and consent decree implementation.*" In addition to the standard worksheets of the two-phase approach described above, EPA's guidance also allows permittees "*to submit any additional documentation that would create a more accurate and complete picture of their capability.*" The 2014 FCA Framework provides further explanation of this flexibility and of the type of information that may be used to illustrate the financial burdens of a locality.

As described in the 2014 FCA Framework, "*EPA will consider all CWA costs presented in the analysis described in the FCA Guidance"* such as "*…stormwater and wastewater; ongoing asset management or system rehabilitation programs; existing, CWA related capital improvement programs; collection systems and treatment facilities; and other CWA obligations required by state or other regulators. Where the costs of multiple CWA obligations are included in an FCA, each of those costs should be enumerated separately, so as to provide an understanding of how each contributes to the overall analysis."* Additional details of the 2014 FCA framework can be found in Appendix 2.

Section 3 Assumptions

3.1 Schedule and Planning Period

Based on the requirements of the Consent Decree, LTCP CSO control measures must be operational no later than August 2035 (20 years after the Date of Lodging). In alignment with this requirement, the Draft FCA Report assumes a planning period through the year 2035.

3.2 Funding Sources

Funding for the LTCP is assumed to be through revenue bonds. The inception dates described above define the years when a bond is issued and payments must start.

3.3 Interest Rate

The FCA is based on an assumed borrowing period of 20 years with a bond interest rate of 4 percent per year.

3.4 Inflation

3.4.1 Operation and Maintenance Costs

Based on the urban Consumer Price Index (CPI-U) produced by the Bureau of Labor Statistics, the long-term inflation rate (1913 to 2013) has been approximately three percent. For the period 1979-2013, the average annual change in the CPI-U has been 3.65 percent, although more recently (1999-2013) the average annual change in CPI-U has been roughly 2.4 percent. Operation and maintenance costs were assumed to increase at 3 percent per year.

3.4.2 Median Household Income

Compared to the CPI-U, MHIs generally have not kept pace with inflation. When evaluating the affordability of the LTCP program, the impact of wage stagnation should be considered since the buying power of the residential users will be diminished over time, resulting in an increase in the Residential Indicator. Comparing changes in the CPI-U to changes in the MHI shows that the MHI increased at slower rate than the CPI-U (see Table 3-1). For Delaware County, the annualized rise in MHI was 1.7 percentage points lower than the rise in CPI-U for the period 1979-2013 while for the same period, Chester City's MHI rose at 1.05 percentage points less than the CPI-U. For the period 1999-2013, the annualized rise in MHIs with respect to CPI-U was 0.67 percentage points lower for Delaware County and 2.0 percentage points lower for Chester City, respectively.

Table 3-1: Comparison of Rates of Change for CPI-U versus MHI

Time Period	Annualized Rate of Change in CPI-U	Delaware County		Chester City	
		Annualized Rate of Change in Delaware Co. MHI	Difference Between CPI-U and MHI Rates of Change	Annualized Rate of Change in Chester City MHI	Difference Between CPI-U and MHI Rates of Change
1979-2013	3.65%	1.93%	1.72%	2.60%	1.05%
1999-2013	2.44%	1.77%	0.67%	0.44%	2.00%

Overall, Delaware County MHI rose at 0.67-1.72 percentage points slower than the CPI-U, depending on the time period analyzed. Similarly, Chester City's MHI rose at 1.05- 2.00 percentage points lower than the CPI-U. In this Draft FCA, it is assumed that MHI will not keep pace with inflation. Using the long-term average inflation of 3 percent and assuming the MHI lags behind inflation by one percentage point, the assumed inflation rate for MHI will be 2 percent. Additional information regarding historical CPI-U and MHI can be found in Appendices 3 and 4.

3.5 Future Regulatory Requirements

The financial capability assessment is based on currently known regulatory requirements and currently known capital improvement projects. **No allowance has been made for potential costs that may be necessitated by future regulatory requirements that have not yet been enacted. It should be recognized that any such future regulatory requirements create a risk to the permittee's ability to fund future mandates alongside of LTCP requirements**.

Section 4 Financial Capabilities Assessment – Phase 1

This subsection calculates the cost per household and MHI, analyzes the distribution of household income, and develops the residential indicator. Per EPA guidance (EPA, 1997), the Phase 1 analysis includes two worksheets:

- Worksheet 1 – Cost per Household
- Worksheet 2 – Residential indicator

The structure of the worksheets is most suitable for permittees that are municipalities with sole responsibility for wastewater and sewer costs within its service area. DELCORA, however, differs from this situation in that it is a regional authority rather than a municipality. The service area encompasses multiple municipalities and also includes other authorities that act as intermediaries between DELCORA and residents of the municipalities. Each of these entities (DELCORA, intermediary authorities and municipalities) may impose costs on residential consumers. In general, residential billing can be divided into the following categories:

- Residents billed directly by DELCORA, with DELCORA being the sole source of wastewater and sewer costs;
- Residents billed directly by DELCORA, with both DELCORA and the local municipality being sources of wastewater and sewer costs;
- Residents billed by their local municipality, with both DELCORA and the local municipality being sources of wastewater and sewer costs. In this situation, the municipality passes along DELCORA's costs to the resident as part of the local municipality's bill; and
- Residents billed by their local municipality, with DELCORA and the local municipality being sources of wastewater and sewer costs and with an additional Authority located between DELCORA and the municipality also being a source of wastewater and sewer costs. In this situation, the municipality passes along DELCORA's and the intermediary Authority's costs to the resident as part of the local municipality's bill.

4.1 Cost per Household (Worksheet 1)

4.1.1 Current Costs

Current costs are comprised of existing operation and maintenance (O&M) expenses and debt service (principle and interest), while projected wastewater treatment and CSO costs were developed based on assumptions for future O&M and debt service for anticipated capital improvement projects. Costs for DELCORA's operation are based on 2015 rates (see Appendix 5 for description of rate policies). Within areas where DELCORA owns the collection system sewers and bills customers for collection and conveyance, costs are determined by multiplying the 2015 rates by the customer usage.

Determination of wastewater and storm water costs within the Model Area is complicated by the fact that DELCORA is not the only entity responsible for wastewater, sanitary sewer, combined sewer and storm sewer related costs. In some portions of the Model Area, there are additional costs due to other wastewater authorities and municipalities. In general, cost structures can be divided into the following categories:

- Areas where DELCORA is responsible for wastewater, sanitary and combined sewer costs;
- Areas where DELCORA is responsible for wastewater and some sewer costs, with municipalities responsible for additional sewer and storm water costs; and
- Areas where DELCORA is responsible for wastewater and some sewer costs; municipalities responsible for additional sewer and storm water costs; and another authority is responsible for additional sewer costs.

Determining costs at the municipality level is challenging due to the varying methods that each municipality uses for charging users. In some cases, municipality financial reports contain line item entries for wastewater revenues and for storm water revenues. However, some municipalities do not report these individual line items. Some state that costs are subsidized by other budgetary categories. It is possible that such costs are lumped together into line items other than wastewater and storm water and therefore not readily apparent. Given the number of entities imposing charges on the residential consumers and the absence of reported costs in some of the entities' financial reports, an alternative method of estimating current costs will be used.

In areas where DELCORA does not own the local collection sewers, it was assumed that DELCORA's unit costs for collection within the western service area can be used as a surrogate for the collection costs incurred by these municipalities. The unit cost was multiplied by each respective municipality's usage (i.e., flow) to estimate their wastewater collection costs. Current storm water costs have not been included in this analysis due to inconsistent reporting of these costs. However, for the final FCA to be submitted with the revised LTCP, the municipality storm water costs will be further evaluated to determine how they are accounted for and appropriate costs will be added to the final FCA.

4.1.2 Projected Costs

Projected costs are not limited to the costs for the LTCP Program. DELCORA, other Authorities served by DELCORA, and the local municipalities served by DELCORA all have projected costs related to their wastewater, sewer and storm water systems for items such as required improvements, replacement costs, and upgrades due to future regulatory requirements that are not related to the LTCP program. For each of these entities, costs for such projected capital improvement projects may result in additional burdens to the residents in the Model Area and, therefore, must be accounted for in the FCA. Such projected costs would include debt service for future projects as well as additional operation and maintenance (O&M) for any new infrastructure created by future projects. Debt service and O&M for projected costs will be based on the following assumptions:

- Projected Annual O&M: 1.5 percent of Capital Cost
- Project Debt Service: 20 year bond at 4 percent interest.

4.1.2.1 Projected Cost for DELCORA

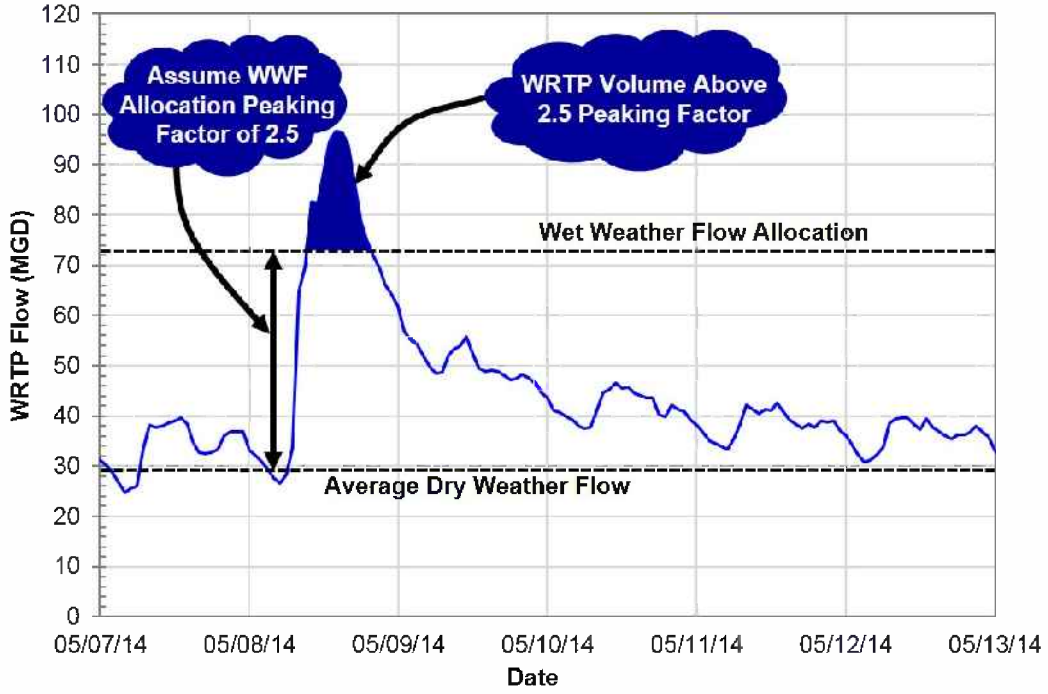
LTCP Costs

Because this Draft FCA is being prepared prior to the completion of the revised LTCP, final LTCP project alternatives have not yet been identified nor have cost estimates for such projects been completed. The approach taken for this Draft FCA is based on an evaluation of affordability as described in Executive Summary. In order to complete EPA's FCA methodology to calculate the residential indicators we need to establish a hypothetical LTCP cost. As derived in the Executive Summary above, LTCP cost estimate of $30,000,000 has been assumed. Associated operation and maintenance costs are based on the assumptions described in Section 3.

DELCORA's prior LTCP allocated all of the costs associated with the CSO projects to Chester City, which is the only customer with a combined sewer system. Per the Consent Decree, this Draft FCA will evaluate the Model Area comprising those areas hydraulically connected to the WRTP (see Section 1 for description of Model Area). Accordingly, allocation of costs for CSO abatement has been revised to distribute costs not to Chester City alone but rather to the Model Area customers in proportion to their contribution to CSO volume as well as excess volume generated from separate sewer communities within the Model Area during wet weather.

DELCORA's system serves a variety of customers from numerous municipalities in Delaware County, PA. The majority of the sewer systems within the Model Area have separated sanitary sewers, with the exception of a portion of Chester City, which is served by combined sewers. DELCORA has service agreements with the authorities, major industries, and a few municipalities. There are service agreements that indicate that the discharger will not share in any CSO related costs, because there was no direct discharge to the combined sewer system. However, most agreements indicate that authority, industry, or municipality shall not discharge excess wet weather flow to the DELCORA WRTP. Thus, for the purpose of the Draft FCA, the allocation of CSO LTCP costs to the separate sewer system is based on separate sewer system's share of the total Wet Weather Flow (WWF) volume. The separate sewer system's share is based on WRTP's WWF volume above a peaking factor 2.5. Figure 4-1 shows an example WRTP's WWF volume from a single storm event in May 2014.

Figure 4-1: Basis for Estimating Wet Weather Flow from Separate Sewer Areas



To estimate the total wet weather volumes shown in Table 4-1, the WRTP's WWF volumes from all storms above a peaking factor of 2.5 within the year were totaled and added to the annual CSO volume discharged.

Table 4-4-1: CSO Volume as Percent of Total Wet Weather Volume

Year	WRTP WWF Volume above 2.5 Peak Factor (MG)	CSO Volume (MG)	Total Wet Weather Volume (MG)	Percent CSO
2009	24.2	785	809.2	97%
2010	39.3	696	735.3	95%
2011	30.0	1144	1174.0	97%
2012	6.6	538	544.6	99%
2013	13.5	744	757.5	98%
Average	22.7	781.4	804.1	97%

Table 4-1 indicates that the separate sewer system has about a 3% to 5% share of the total wet weather volume. Further hydraulic evaluations are required to better understand the separate sewer system flows and refine the separate sewer system share of the CSO LTCP costs. Therefore for this Draft FCA, it is assumed 15 percent of CSO LTCP costs would be allocated to the separate sewer system and 85 percent of the CSO LTCP costs would allocated to combined sewer system in Chester City. For the final FCA, the updated hydrologic and hydraulic (H&H) model will be used to improve the estimate of CSO attributable to Chester City and to the remainder of the Model Area.

DELCORA Capital Improvement Costs

Projected costs for DELCORA's capital improvement programs were developed based on DELCORA's Capital Improvement Plan (CIP) which covers a 20-year planning period. Projected costs for DELCORA's CIP projects are shared by DELCORA customers based on the respective service agreements. Costs for some projects are allocated to specific customers when the project solely addresses the needs of those specific customers. Costs were also evaluated to determine the fraction of costs allocated to residential customers within any larger customer grouping.

4.2 Residential Share of Costs

To estimate the residential cost per household, an average annual water usage rate of 55,000 gallons/ household was used. This value is based on the residential water consumption for the Delaware County municipalities served by the Chester Water Authority (CWA) for the period 2010-2015. This usage multiplied by the number of households was used to estimate the residential share of the total usage for each entity.

4.3 Projected Municipal Separate Storm Sewer System (MS4) Storm Water Costs

Municipalities in DELCORA's service area will be subject to increased storm water (SW) costs as they implement MS4 requirements. No data is currently available from these municipalities. As a placeholder cost based on Richmond, VA annual SW cost of $45 per household (2016 dollars) will be used. Also, it will be assumed that costs will increase at an inflation rate of 3 percent per year. As Pennsylvania's communities develop their MS4 programs, data specific to the municipalities in DELCORA's service area may become available. For the final FCA to be submitted as part of the LTCP Update, SW costs will be re-evaluated and updated.

4.4 Cost per Household

Dividing the residential share of the WWT, CSO control and SW costs by the number of households approximates the annual cost per household as presented in Table 4-2.

Table 4-2: Worksheet 1 - Cost per Household

Description	2035 Basis		2015 Basis		Line No.
	Chester City	Model Area	Chester City	Model Area	
A. DELCORA's Cost					
1. Current WWT and CSO Costs in millions					
a. Annual O&M Expenses (Excluding Depreciation)	$ 3.2	$ 16.7	$ 3.2	$ 16.7	100
b. Annual Debt Service (Principle plus Interest)	$ 0.1	$ 4.5	$ 0.1	$ 4.5	101
c. Current WWT and CSO Costs (Line 100 + Line 101)	$ 3.4	$ 21.3	$ 3.4	$ 21.3	102
2. Projected WWT and CSO Costs in millions (Year 2035 Dollars)					
a. Additional Annual O&M Expenses	$ 3.1	$ 18.2	$ 0.3	$ 3.8	103
b. Additional Annual Debt Service (Principle plus Interest)	$ 2.2	$ 3.5	$ 1.2	$ 2.1	104
c. Projected Additional WWT and CSO Costs (Line 103 + Line 104)	$ 5.3	$ 21.7	$ 1.5	$ 5.9	105
3. Total Current and Projected WWT and CSO Costs in millions (Line 102 + Line 105)	$ 8.7	$ 43.0	$ 4.9	$ 27.2	106a
B. Other Local Collection System Costs (Year 2035 Dollars)	--	$ 24.3	--	$ 15.6	106b
C. Total Current & Projected WWT & CSO Costs (Year 2035 Dollars)	$ 8.7	$ 67.2	$ 4.9	$ 42.7	106c
D. Annual Volume in 1,000 gallons	828,789	8,409,265	828,789	8,409,265	
E. Cost per 1,000 gallons	$ 10.4	$ 8.0	$ 5.9	$ 5.1	
F. Annual Residential Flow Per Household in 1,000 gallons	55	55	55	55	107
G. Equivalent Households	15,069	152,896	15,069	152,896	108
H. WWT and CSO Cost Per Household in dollars	$ 575	$ 440	$ 323	$ 279	109a
I Projected SW Costs Per Household	$ 79	$ 79	$ 44	$ 44	109b
J Total WWT, CSO and SW Cost Per Household	$ 653	$ 519	$ 366	$ 323	109c

WWT - Wastewater Treatment
CSO - Combined Sewer Overflow
SW - Stormwater

4.5 Development of the Residential Indicator (Worksheet 2)

Per USEPA guidance, the Residential Indicator (RI) is developed by dividing the cost per household (CPH) (from Table 4-3) by the median household income (MHI). The RI is intended as a means to judge

the residential economic burden resulting from payments for wastewater, sewer and storm water treatment and services.

4.5.1 Household Income Distribution

Household Income Distribution

Although the benchmark criteria for the residential indicator established by USEPA is based on MHI, the MHI is not representative of the distribution of income for the DELCORA Model Area. According to the U.S. Census Bureau's American Community Survey, 10 percent of the population in the Model Area have annual incomes that are below the poverty level while 33 percent of the population in the City of Chester have annual incomes that are below the poverty level. For the Model Area, this percentage is approximately two-thirds of the national poverty rate of 15.5 percent and approximately three-quarters of the Pennsylvania rate of 13.3 percent. For Chester City, this percentage is significantly higher at more than double compared to the Pennsylvania and the national value. Thus, the Model Area MHI alone may not be the most representative income bracket for determining the financial impact of increased CSO controls on the residential user in the poorer areas served by DELCORA. Therefore, the residential indicator has been developed for Chester City as well as the Model Area.

4.5.2 Median Household Income

The MHI for the City of Chester was estimated to be approximately $27,249 in 2013 dollars by the U.S. Census Bureau's American Community Survey (ACS). This was adjusted to Year 2035 using two percent inflation as described in Section 3 above, resulting in an adjusted MHI of $42,126.

The MHI for the DELCORA Model Area was estimated to be approximately $68,821 in 2013 using data from the ACS. The Model Area MHI is based on a weighted average of individual municipality MHIs using the number of households as the weighting factor. This weighted MHI was adjusted to Year 2035 using two percent inflation as described in Section 3 above, resulting in an adjusted MHI of $106,396.

4.5.3 Residential Indicators

The Median Household Income for Chester City and the DELCORA Model Area are shown in Table 4-3. Based on EPA's 1997 Guidance for Financial Capability, the Chester City residential indicator benchmark rating is "Mid-Range".

Table 4-3: Worksheet 2 - Median Household Income

Description	2035 Basis		2015 Basis		Line No.
	Chester City	Model Area	Chester City	Model Area	
A. Median Household Income (MHI)					
1. MHI Based on 5-yr ACS, in 2013 dollars	$ 27,249	$ 68,821	$ 27,249	$ 68,821	201
2. Year of MHI Estimate: 2013	2013	2013	2013	2013	
3. FCA Analysis Year: 2035	2035	2035	2015	2015	
4. MHI Inflation Rate: 2%					
5. MHI Adjustment Factor	1.55	1.55	1.04	1.04	
6. Adjusted MHI (Line 201 x Line 202)	$ 42,126	$ 106,396	$ 28,350	$ 71,601	203

D. Benchmark	Mid-Range	Low	Mid-Range	Low	

WWT - Wastewater Treatment
CSO - Combined Sewer Overflow
SW - Stormwater

Section 5 Financial Capabilities Assessment – Phase 2

The Phase 2 financial capability indicator was determined by scoring selected indicators that reflect the debt burden, socioeconomic conditions and financial operations. The current debt burden was assessed, as well as the ability to issue new debt to finance CSO controls, by evaluating the bond rating and the overall net debt as a percentage of full market property value. Socioeconomic conditions were evaluated by determining the unemployment rate and MHI. The financial operations were evaluated by assessing the property tax collection rate efficiency and the property tax revenues as a percentage of full market property value. Each of these factors are assigned a rating of "Weak", "Mid-Range" or "Strong" based on national benchmarks identified in the USEPA guidance document.

The scoring system used to develop the financial capability indicator assigns a numerical score to the national benchmarks as follows:

National Benchmark Rating	Score
Weak	1
Mid-Range	2
Strong	3

5.1 Worksheet 3 – Bond Rating

Per USEPA guidance, Worksheet 3 focuses on the bond rating of the permittee (DELCORA). However, the guidance is written as if the permittee is a municipality with taxing authority. DELCORA is an authority established to serve a community comprised of numerous municipalities in Delaware County, PA. As an authority, funding can be raised through revenue bonds, but not general obligation bonds. DELCORA does not have taxing authority nor does it have authority to require the municipalities in its service area to obtain general obligation bonds or to establish taxes for the payment of costs related to DELCORA's LTCP. Therefore, Table 5-1 summarizes Worksheet 3 based on municipalities' general obligation bond rating.

Table 5-1: Worksheet 3 - Bond Rating

Description	DELCORA	Chester City	Model Area	Line No.
A. Most Recent General Obligation Bond Rating				
1. Date		2012		
2. Rating agency		S&P	S&P	
3. Most recent rating		A (Suspended 1/6/2014)	AA	301
B. Most Recent Revenue Sewer Bond				
1. Date	2015			
2. Rating agency (Moody's or S&P)	Moody's			
3. Most recent rating	Aa3			302
C. Summary bond rating	Aa3	A (Suspended 1/6/2014)	AA	303
D. Benchmark				
1. Numerical Financial Indicator	3	2	3	
2. Financial Indicator	Strong	Mid-Range	Strong	

The City of Chester's "A" bond rating was withdrawn by S&P in 2014 due to lack of providing an audit for 2011. Therefore, it is expected that S&P will reduce the bond rating, which will place Chester City in the "Mid-Range" benchmark category. Of the 27 service area municipalities, ten have received bond ratings in the past five years. Table 5-2 below shows the bond ratings for those municipalities which have a bond rating in the past five years. Nine out of ten have a "strong" rating while the other has a "mid-range" rating. The composite rating based on a household weighted average is "strong".

Table 5-2: Summary of General Obligation Bond Ratings

Municipality	General Obligation Bond	Date	Rating Agency	Most Recent Rating	Category
Aston Township		10/1/2013	S&P	AA	3
Bethel Township		2014	Kroll	A+	3
Brookhaven Borough		Jan-14	S&P	AA-	3
City of Chester			S&P	Rating withdrawn 2014	
Eddystone Borough*		6/11/2014	S&P	BBB+	2
Marple		4/9/15	S&P	AA	3
Ridley Township			S&P	A+	3
Swarthmore			S&P	AA	3
Upland Borough	Series 2012 GO Notes	10/29/14	Kroll	A-	3
Upper Chichester Township			S&P	AA-	3
Upper Providence Township			S&P	AA-	3
Weighted Composite Rating					3

5.2 Worksheet 4 - Net Debt as Percent of Full Market Property Value

Worksheet 4 focuses on the debt repaid through property tax with respect to property value within the Model Area and is intended as a measure of a local government's ability to issue additional debt. Although this metric is not directly applicable to DELCORA as the permittee, since DELCORA is not a municipality with taxing power, Worksheet 4 has been prepared based on the methodology described below.

Line 401: Direct Net Debt

The City of Chester's Direct Debt was obtained from their 2012 Independent Audit, which was published in late 2014 (City of Chester, 2014). The other municipality general obligation debt was obtained from Municipal Annual Audit and Financial Reports (MAAFR) available on the State of Pennsylvania web site (PA MunStats, 2015). The most recent year available for most municipalities in the Model Area was for 2013, although there were some cases where 2013 reports were not available.

Where a municipality was only partly enclosed within the Model Area, the data was pro-rated based on the fraction of land area within the Model Area. This assumes that the number of households is evenly distributed within the municipality.

Line 402: Debt of Overlapping Entities

Overlapping entities with the authority to issue general obligation debt funded through property taxes were also included in the analysis of Worksheet 4. In some cases, the overlapping entity's geographic boundaries are not contiguous with a specific municipality. For example, a school district may serve more than one municipality within the Model Area. In these situations, the overlapping entity's debt assigned to a particular municipality was allocated based on the fraction of fair market value within each entity. Also, in cases where a portion of the overlapping entity falls outside of the Model Area, the overlapping entities debt was further pro-rated based on land area within the Model Area.

The overlapping entities identified include Delaware County and local school districts. Debt for Delaware County was obtained from their Comprehensive Annual Financial Report (year ended Dec. 31, 2013). Debt for school districts was based on end of fiscal year 2013-2014 information obtained from Pennsylvania state web site (PA Portal, 2015). Chester-Upland School District debt is based on information found in the 2011 bond statement for Chester Upland School District project (Chester Upland School District, 2011). A list of school districts overlapping with the Model Area is presented in the Table 5-3 below.

Table 5-3: Overlapping Entities – School Districts

Municipality	School District
Aston Township	Penn Delco
Bethel Township	Garnet Valley
Brookhaven Borough	Penn Delco
Chester City	Chester-Upland
Chester Township	Chester Upland
Eddystone Borough*	Ridley
Edgmont Township	Rose Tree Media
Lower Chichester Township	Chi Chester
Marcus Hook Borough	Chi Chester
Marple	Marple Newtown
Middletown Township	Rose Tree Media
Morton	Springfield
Nether Providence Township (partial)	Wallingford - Swarthmore
Newtown Township	Marple Newtown
Parkside Borough	Penn Delco
Prospect Park	Interboro
Ridley Park Borough	Ridley
Ridley Township	Ridley
Rose Valley Borough	Wallingford - Swarthmore
Rutledge	Wallingford Swarthmore
Springfield	Springfield
Swarthmore	Wallingford Swarthmore
Trainer Borough	Chi Chester
Upland Borough	Chester-Upland
Upper Chichester Township	Chi Chester
Upper Providence Township	Rose Tree Media

The results for worksheet 4 are presented in Table 5-4. Chester City has a rating of 1, which is considered "Weak". Viewed as a composite, the Model Area also would have an EPA rating of 2 which is considered mid-range. However, the Model Area is not a municipality and would not be able to incur debt. Individual municipalities within the Model Area would be capable of incurring debt through bonds, but the municipalities are not the permittee.

Table 5-4: Worksheet 4 – Overall Net Debt as a Percent of Full Market Property Value

	Description	Chester City	Model Area	Line No.
A	Direct Net Debt (G.O. Bonds Excluding Double-Barreled Bonds) within service area	$ 22,948,627	$ 83,347,338	401
B.	Debt of Overlapping Entities (Proportionate Share of Multijurisdictional Debt)	$ 46,181,397	$ 527,927,412	402
C.	Overall Net Debt (Line 401 + Line 402)	$ 69,130,024	$ 611,274,750	403
D.	Market Value of Property within Service Area	$ 516,553,848	$ 15,181,969,459	404
E.	Overall Net Debt as a Percentage of Full Market Property Value (Line 403/Line 404*100)	13.4%	4.0%	
F.	Benchmark			
	1. Financial Indicator	Weak	Mid-Range	
	2. Numerical Financial Indicator	**1**	**2**	

5.3 Worksheet 5 – Unemployment Rate

The Bureau of Labor Statistics does not report unemployment for municipalities with populations smaller than 25,000. Because only two of the municipalities in the Model Area are above this size limit, an estimate of the Model Area unemployment could not be developed. Instead, the Delaware County unemployment rate will be used as a surrogate for the Model Area. As shown in Table 5-5, the Delaware County unemployment rate is 0.3 percentage point above than the national unemployment rate, resulting in a mid-range rating. The Chester City's unemployment is 3.5 percentage points higher than the national unemployment. As such, Chester City's rating is considered weak.

Table 5-5: Worksheet 5 - Unemployment Rate

Description	Chester City	Model Area	Line No.
A. Unemployment Rate - Municipality Source: Homefacts, Bureau of Labor and Statistics	8.6%	--	501
B. Unemployment Rate - Delaware County Source: Bureau of Labor and Statistics	4.8%	4.8%	502
C. Average national unemployment rate Source: Bureau of Labor and Statistics	5.1%	5.1%	503
D. Benchmark			
1. Municipality Rate minus National Rate	3.5%	-0.3%	
2. Financial Indicator	Weak	Mid-range	
3. Numerical Financial Indicator	1	2	

5.4 Worksheet 6 – Median Household Income

Worksheet 6 compares the national MHI to the local MHI as a measure of the local community's earning capacity. Communities with an MHI more than 25 percent below the national MHI are rated as weak, communities with 25 percent of the MHI are rated as mid-range and communities more than 25 percent above the national MHI are rated as strong. As shown in Table 5-6, the Model Area is rated as strong with respect to the national MHI. Despite the model area as a whole being strong, this does not accurately portray the financial impact for each municipality. The Model Area has municipalities with a wide range of earning capacity. Chester City, the largest municipality in the Model Area, is rated as weak and falls significantly below the national MHI at almost half of the national value.

Table 5-6: Worksheet 6 - Median Household Income

5.5 Worksheet 7 – Property Tax Revenues as percent of Full Market Value

Worksheet 7 (see Table 5-7) provides a measure of the property tax burden and gives an indication of the ability of the community to support additional debt. While it is recognized that DELCORA does not have the ability to impose taxes to fund the CSO LTCP program, the analysis for Worksheet 7 has been prepared in accordance with EPA's guidance document (USEPA, 1997). The Model Area and Chester City receive a strong rating for this indicator. It should be noted that while Chester City has strong rating, this indicator does not reflect the true ability of Chester City to increase revenue from property taxes. For the purpose of the Draft FCA, Chester City will be shown as strong. However, it is recommended that Chester City be considered weak and studied further in final FCA. The Chester City property tax information is based on the 2012 Independent Audit, which was published in December of 2014 (City of Chester, 2014). For the remaining municipalities, property tax revenues were obtained from the MAAFRs (PA MunStats, 2015).

Table 5-7: Worksheet 7 – Property Tax Revenues as percent of Full Market Value

Description	Chester City	Model Area	Line No.
A. Full Market Property Value (Line 404)	$ 516,553,848	$ 19,803,029,357	701
B. Property Tax Revenue	$ 6,283,197	$ 70,889,731	702
C. Property Tax Revenue as a Percent of Full Market Property Value (702 / 701 x100%)	1.22%	0.36%	703
D. Benchmark			
1. Financial Indicator	Strong	Strong	
2. Numerical Financial Indicator	3	3	

5.6 Worksheet 8 – Property Tax Revenue Collection Rate

Worksheet 8 provides a measure of the property tax collection rate and the efficiency of the tax collection system. It also provides an indication of the acceptability of tax levels to residents. As shown in Table 5-8 the Model Area is rated as strong.

The City of Chester City is empowered by Pennsylvania to perform its own property assessments which results in assessed values that differ from Delaware County's assessment of the property in the City of Chester. Property taxes levied by the City of Chester are based on their own assessed values. The Chester City property tax information is based on the 2012 Independent Audit, which was published in December of 2014 (City of Chester, 2014). Assessments for other municipalities was obtained from the Pennsylvania State Tax Equalization Board web site (PA STEB/TED, 2015).

As shown in Table 5-8, the City of Chester's tax revenue collection rate is rated as weak. The 2013 Recovery Plan (City of Chester, 2013) also indicated that the reported collection rate of about 82 percent was consistent for the years 2005-2010. Therefore, the 2013 Recovery Plan support's Chester City "weak" rating.

Table 5-8: Worksheet 8 – Property Tax Revenue Collection Rate

Description	Chester City	Model Area	Line No.
A. Property Tax Revenues Collected (Line 702)	$ 6,283,197	$ 57,211,528	801
B. Levied Property Tax	$ 7,694,586	$ 58,699,061	802
C. Property Tax Revenue Collection Rate (Line 801/ Line 802 x 100)	81.7%	97.5%	803
D. Benchmark			
1. Financial Indicator	Weak	Mid-range	
2. Numerical Financial Indicator	1	2	

5.7 Worksheet 9 - Summary of Financial Capability Indicators

The average score for the financial indicator was calculated by dividing the sum of the scores by the number of entries. Table 5-9 summarizes the factors used to develop the financial capability indicator. The overall financial capability for the Model Area corresponds to a "Strong" rating. However, due to financial distressed conditions, Chester City's overall financial capability is "Weak".

Table 5-9: Worksheet 9 - Summary of Financial Capability Indicators

Indicator	Chester City			Model Area			Line Number
	Actual Value	Financial Indicator	Score	Actual Value	Financial Indicator	Score	
A. Bond Rating (Line 303)	A (Suspended 1/6/2014)	Mid-Range	2	AA	Strong	3	901
B. Overall Net Debt as a Percent of Full Market Property Value (Line 405)	13.4%	Weak	1	4.0%	Mid-Range	2	902
C. Unemployment Rate (Line 501)	8.6%	Weak	1	4.8%	Mid-Range	2	903
D. Household Income (Line 601)	28,350	Weak	1	71,601	Strong	3	904
E. Property Tax Revenues as a Percent of Full Market Property Value (Line 703)	1.2%	Strong	3	0.4%	Strong	3	905
F. Property Tax Revenue Collection Rate (Line 803)	81.7%	Weak	1	97.5%	Mid-range	2	906
G. Permittee Indicators Score			1.5			2.5	907
H. Financial Indicator			Weak			Strong	

5.8 Worksheet 10 - Overall Financial Capability Matrix

The financial capability assessment combines the results from both the residential and financial capability indicators to determine the overall burden imposed on the residents. The financial capability matrix score is shown in Table 5-10 for the Model Area.

Table 5-10: Worksheet 10 - Overall Financial Capability Matrix

Description	2035 Basis		2015 Basis		Line No.
	Chester City	Model Area	Chester City	Model Area	
1. Residential Indicator Score (Line 205)					
a. Actual Value	1.4%	0.4%	1.1%	0.4%	1001
b. Financial Impact	Mid-Range	Low	Mid-Range	Low	
2. Financial Capability Indictors Score (Line 907)					
a. Actual Value	1.5	2.5	1.5	2.5	1002
b. Financial Indicator	Weak	Strong	Weak	Strong	
3. Financial Capability Matrix Category	High Burden	Low Burden	High Burden	Low Burden	1003

As shown in Table 5-10, the composite Model Area will have a "low" burden, while Chester City residents will have an overall "High Burden".

Section 6 Conclusions

As this Draft FCA is being prepared prior to the start of the LTCP Update, final LTCP project alternatives have not yet been identified nor have cost estimates for such projects been completed. With that in mind and in accordance with EPA's 1997 Guidance for Financial Capability, Chester City will have a "high burden" if the CSO LTCP costs are $30,000,000 with an 85 percent Chester City share. The methodology presented herein will be followed for the final FCA and will be submitted with the LTCP Update. It is recommended that the assumed proportional of the CSO program cost for Chester City be refined during the LTCP Update of the H&H model which will then be used to calculate the fraction of wet weather flow during CSO events attributable to each municipality.

Appendix 2: EPA FCA Framework 2014

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

NOV 2 4 2014

MEMORANDUM

SUBJECT: Financial Capability Assessment Framework for Municipal Clean Water Act Requirements

FROM: Ken Kopocis
Deputy Assistant Administrator
Office of Water (OW)

Cynthia Giles
Assistant Administrator
Office of Enforcement and Compliance Assurance (OECA)

TO: Regional Administrators
Regional Water Division Directors
Regional Enforcement Division Directors

In May of 2012, we distributed the Integrated Municipal Stormwater and Wastewater Planning Approach Framework (Integrated Planning Framework). Since that time, we have made solid progress in promoting integrated approaches to meet Clean Water Act (CWA) obligations. Thanks to the hard work of regional and headquarters staff, and the active engagement of cities, many of our enforcement settlements now embody integrated planning principles in the structure and schedule for injunctive relief or explicitly include integrated planning as part of the settlement. We have also seen an increasing number of municipalities and local authorities moving towards developing integrated plans to support the development of their NPDES permits. We have been working with EPA Regions and States to assist in that process.

As the implementation of the Integrated Planning Framework has progressed and evolved, we have been actively engaged with stakeholders on ways to build on our efforts. Those discussions found a natural focus on issues related to the financial capability of permittees working toward our shared goals of clean water. One consistent theme that emerged was the benefit of more clearly articulating the flexibility available under the existing guidance. EPA continues to be guided by the 1997 "Combined Sewer Overflows – Guidance for Financial Capability Assessment

and Schedule Development" (FCA Guidance) that provides an aid for assessing financial capability as part of negotiating schedules for implementing CWA requirements for municipalities and local authorities. The FCA Guidance also encourages permittees "to submit any additional documentation that would create a more accurate and complete picture of their financial capability" that may "affect the conclusion" of the analysis described in the guidance.

As part of EPA's commitment to implementing CWA objectives in a sustainable manner, we have developed the attached "Financial Capability Assessment Framework" (FCA Framework). The FCA Framework has been greatly informed by the comments and experiences of a variety of stakeholders and financial experts. The FCA Framework identifies the key elements EPA uses in working with permittees to evaluate how their financial capability should influence schedules. In addition, the FCA Framework provides examples of additional information that may help some communities provide a "more accurate and complete picture" of their financial capability as is envisioned in the FCA guidance. We will be posting the FCA Framework to our website as an important next step in the pursuit of integrated planning approaches and in our ongoing work with municipalities and local authorities to achieve our shared goals of protecting our nation's waters. While this memorandum releases the FCA Framework, we know that we will continue to learn and refine our understanding of the issues surrounding financial capability assessments as we use it moving forward. We will continue to look for ways to improve the Framework as we gain new insights and additional information.

We look forward to continue working with the Regions on these important issues and encourage you to contact Deborah Nagle, Director, Water Permits Division (nagle.deborah@epa.gov) and Mark Pollins, Director, Water Enforcement Division (pollins.mark@epa.gov) with any questions you might have.

FINANCIAL CAPABILITY ASSESSMENT FRAMEWORK

November 24, 2014

Purpose

The Environmental Protection Agency (EPA) is committed to working with state and local government partners to assist local municipalities and local authorities to meet Clean Water Act (CWA) obligations in a manner that recognizes the unique financial challenges that local jurisdictions face. This financial capability assessment framework is intended to provide additional examples and greater clarity on the flexibilities built into existing guidance that local governments or authorities can use in assessing their financial capability, and the relationship between that assessment and consideration of schedules for permit and consent decree implementation. This framework builds on the progress already made in the May 2012 "Integrated Municipal Stormwater and Wastewater Planning Approach Framework," and the experience gained from talking with communities about their financial capability in actual, on the ground circumstances. Integrated Planning has been helping in identifying a permittee's relative priorities for projects based on the relative importance of adverse impacts on human health and water quality and the municipality's financial capability.

Background

Local governments and authorities want to provide clean water for their communities, and they play an essential role in providing wastewater and stormwater infrastructure and services for their citizens, businesses and institutions. These municipal functions have been an important part of implementing the CWA to protect public health and improve water quality in streams, lakes, bays, and other waters nationwide. However, significant water quality challenges remain. Public officials remain strong supporters of the CWA goals and objectives by directing the public investments that are necessary to comply with the Act and to provide clean water for their citizens. Many local governments face complex water quality issues that are heightened by the need to address population growth or decline, increases in impervious surfaces, source water supply needs, and aging infrastructure. In recent years, many local governments and authorities have increased investments in their wastewater and stormwater infrastructure through capital projects to rehabilitate existing systems, improve operation and maintenance, and address additional regulatory requirements. As programs are implemented to improve water quality and attain CWA objectives, many state and local government partners find themselves facing difficult economic challenges with limited resources and financial capability. We recognize these challenging conditions and are working with states and local governments to develop and implement new approaches that will achieve water quality goals at lower costs and in a manner that addresses the most pressing problems first.

Long-term approaches to meeting CWA objectives should be sustainable and within a local government or authority's financial capability. The financial capability of these entities and other relevant factors are important to consider when developing appropriate schedules for infrastructure projects in permits or enforcement actions to help protect human health and the environment. EPA's financial capability assessment guidance, "Combined Sewer Overflows:

Guidance for Financial Capability Assessment and Schedule Development" (FCA Guidance) (EPA 832-B-97-004) provides a reference point to aid all parties in negotiating reasonable and effective schedules for implementing CWA requirements, and the flexibility to take into account local considerations that may not be fully captured by the approach detailed in the guidance. As described in more detail in this Framework, the guidance provides for consideration of the impact on residential rate payers and the financial capability of the permittee using a suite of indicators, as well as allowing schedules to be responsive to circumstances unique to that community, while advancing the mutual goal to protect clean water. The FCA Guidance encourages permittees to provide any additional information that would be useful in understanding those unique or atypical circumstances and how they may affect CWA schedules, so that all relevant information presented by a community can be taken into account to ensure that a full understanding of financial capability guides the development of schedules.

Financial Capability Assessment

The following are key elements of EPA's approach to the evaluation of the financial capability of municipalities to inform implementation schedules, both in permits and enforcement actions. The elements are fully compatible with the FCA Guidance, integrated planning approaches, and the flexibility embodied in both.

1. **The 1997 FCA Guidance identifies a valuable assessment that provides a common basis for financial burden discussions between the permittee, EPA and state NPDES authorities. Permittees have the option of submitting additional information that would create a more accurate and complete picture of their financial conditions.** The financial capability assessment described in the 1997 FCA Guidance identifies information that provides a basis for a general comparison of financial conditions between communities across the country and provides a consistent assessment of basic financial indicators as part of the overall analysis. Additional information that the community provides on its unique financial circumstances will be considered so that schedules take local considerations into account. Where appropriate, this information can result in schedules that are different than the schedules suggested by the baseline analysis suggested in the 1997 FCA Guidance.

2. **Financial capability is on a continuum.** Although the FCA Guidance approach categorizes financial burden as "high, medium, or low," this does not mean that schedules will be rigidly set according to the break points between the categories. For example, two communities whose total residential share of costs are 1.1% and 1.9% of median household income (MHI) are both categorized in the FCA Guidance as having a "medium" burden for the Residential Indicator (RI). All other things being equal, the appropriate schedules for those communities are likely to be different. Similarly, all other things being equal, two communities whose residential share of costs are 1.9% and 2.1% of MHI would be more likely to have similar overall compliance timeframes, even though one community is ranked as having a "medium" burden and the other as having a "high" burden. Finally, additional information submitted by the community may affect the length of the schedule regardless of where the community is on the "high, medium, and low" continuum.

3. **EPA will consider all CWA costs presented in the analysis described in the FCA Guidance**. EPA originally published the FCA Guidance to assist in negotiating schedules for communities with combined sewer systems, as these typically represent the most expensive CWA compliance issues. The FCA Guidance has since been recognized as equally suitable for considering other municipal CWA obligations as well, such as those related to separate sanitary sewer systems. With the release of EPA's 2012 Integrated Planning Framework, the Agency clarified that the financial capability analysis could include costs of: stormwater and wastewater; ongoing asset management or system rehabilitation programs; existing, CWA related capital improvement programs; collection systems and treatment facilities; and other CWA obligations required by state or other regulators. Where the costs of multiple CWA obligations are included in an FCA, each of those costs should be enumerated separately, so as to provide an understanding of how each contributes to the overall analysis.

4. **When presented, Safe Drinking Water Act (SDWA) obligations will be considered, primarily as additional information about a permittee's financial capability.** EPA believes that the SDWA obligations of a community can be an important consideration in establishing schedules for implementing integrated plans. EPA recognizes that both clean water and drinking water costs are often covered through charges on a single rate base. One component of a financial capability assessment includes an evaluation of the residential indicator that is based on only CWA costs as this best reflects the intended use of the metric and allows for comparisons with other communities. Drinking water costs may be reflected in other components of a financial capability assessment. For example, the financial capability indicator includes consideration of bond rating of the entity that issues debt to fund the permittee's capital project, which can be impacted by both wastewater and drinking water obligations for a permittee that provides both services. If a community has incurred general obligation debt associated with the SDWA, these obligations would be considered in the indicator "overall net debt as a percent of full market property value." In addition, as discussed below, additional information, including information regarding drinking water obligations, may be submitted for consideration in analyzing financial capability. To the extent that drinking water costs are not fully addressed by these other components, communities are encouraged to provide additional information about these costs.

5. **Communities should demonstrate how the CWA work included as costs in the financial capability assessment will be implemented, including appropriate assurances that those expenditures will be made.**

The Financial Capability Assessment Guidance and Examples of Additional Information that are Relevant to a Consideration of Financial Capability

The specific approaches laid out in the FCA Guidance provide a good foundation for the assessment of financial capability. As stated in the guidance and outlined in this Framework, communities can build on that foundation to include additional relevant information. The FCA Guidance presents a two-phased approach to assessing overall financial capability. The first phase assesses the impact on residential customers, and the first step is to calculate the portion of

the annual costs that would be borne by residential households for both current and projected Clean Water Act related expenses. The residential share of the annual costs of CWA obligations is then compared to the MHI of the service area. MHI is calculated using current census data and may be adjusted based on the current Consumer Price Index. Finally, the CWA compliance costs per household are divided by the adjusted MHI to calculate the residential indicator (RI). The FCA Guidance then identifies various ranges of RI scores as "low, mid-range or high" levels of burden. In situations where there are unique circumstances that would affect the conclusion of the first phase of the assessment, additional information documenting unique financial conditions may be submitted.

The second phase of the financial capability analysis assesses the financial strength of the permittee. Six indicators are used to evaluate the debt, socioeconomic and financial conditions that affect a permittee's financial capability to implement CWA controls necessary for compliance with the Act. These include bond ratings, overall net debt as a percent of full market property value, unemployment rate, median household income, property tax revenue collection rate, and property taxes as a percent of full market property value. In the Guidance, EPA has established benchmarks for each of the six indicators showing whether the indicator reflects a "weak", "mid-range", or "strong" financial capability. These benchmarks are used to generate an overall score of a permittee's financial capability.

The residential indicator calculated in phase one and the permittee capability indicators analyzed in phase two are evaluated together in a Financial Capability Matrix to assess the level of financial burden. The level of burden is then used to inform discussions to establish an appropriate schedule for meeting CWA obligations in permits and enforcement actions. EPA uses these indicators, including the annualized costs as a percent of MHI, to help assess when costs are reaching levels that may represent a high burden on ratepayers and that longer compliance timeframes are likely to be appropriate to spread the cost over a longer period. EPA does not view or use the Financial Capability Matrix as a rigid metric that points to a given schedule length or threshold over which the costs are unaffordable.

Permittees have suggested and the FCA Guidance recognizes that the two step analysis may not provide a complete representation of financial capability. As noted above, other relevant financial or demographic information presented that illustrates the unique or atypical circumstances faced by a permittee will also be considered in evaluating financial capability. The presentation of additional information can be very valuable in analyzing financial capability, and the submission of this type of information has become fairly common practice. For example, in many consent decree negotiations, additional information has resulted in the establishment of schedules that differ from the ones suggested by the baseline analysis described in the FCA Guidance.

Some examples of information that may be relevant in negotiating schedules to be included in permits and consent decrees are given below. In order for such information to adequately illustrate that a permittee's situation is atypical, EPA encourages permittees to compare any additional information on their circumstances to national averages or to that of other permittees.

The examples given below are not intended to be a complete list, nor a list of factors that will be relevant in every community. Rather it provides an illustration of information that may prove useful in some instances.

Examples of Information Related to Residential Impacts:

1. Income distribution by quintile, geography or other breakdown, illustrating how income distribution in the service area differs from comparable data on the national level or for similar cities.

2. Where cities have adopted differential rates for low income customers, the income distribution that led to that rate structure.

3. Information about service area poverty rates and trends.

4. Projected, current and historical sewer, and stormwater fees as a percentage of household income, quintile, geography or other breakdown.

5. Information on sewer and water usage for various classes of ratepayers or by type of dwelling unit.

6. Information on the percent of households who own versus rent.

Examples of Information Related to Financial Strength:

1. Historical population trends or population projections.

2. Service area unemployment data and trends, or other labor market indicators, including unemployment on an absolute basis.

3. Rate or revenue models, including dynamic financial planning models showing the projections of impacts over the program period. All revenue sources tied to CWA obligations may be included as appropriate.

4. Rate determination studies used to develop and support recent rate increases.

5. Data and trends on late payments, disconnection notices, service terminations, uncollectable accounts, or revenue collection rates.

6. Historical increases in rates or other dedicated revenue streams.

7. State or local legal restrictions or limitations on property taxes, other revenue streams or debt levels.

8. Other costs or financial obligations, such as those that relate to drinking water or other infrastructure, that significantly affect a permittee's ability to raise revenue.

9. Circumstances that may affect a permittee's bond rating. For instance, incurring debt beyond certain thresholds may negatively impact the permittee's bond rating, thus reducing the ability to raise capital.

10. Financial plans that show the implications of incurring additional debt for a permittee's ability to secure financing, including projections of metrics such as debt ratios, debt service coverage, debt per customer, days of cash on hand, days

of working capital and other metrics used by rating agencies. Such data should be benchmarked to metrics such as rating agency medians and relative to similar entities. This will be especially relevant where the permittee does not have a bond rating.

11. Extraordinary stressors such as those from natural disasters, municipal bankruptcies, unusual capital market conditions, or other situations which impact a permittee's ability to raise revenue or acquire needed financing. When such stressors occur, they may also provide support for making changes to existing schedules.

Appendix 3: Consumer Price Index Analysis

Appendix 3: Consumer Price Index Analysis

The Consumer Price Index (CPI) as determined by the United States Bureau of Labor Statistics (BLS) can be used as a measure of inflation experienced by consumers in their day-to-day living expenses. The BLS urban CPI (CPI-U) was selected for use in the Draft FCA Report.

The CPI-U is produced monthly and provides a measure of the changes in the prices paid by urban consumers for a representative basket of goods and services. As stated by the BLS, the "CPI represents changes in prices of all goods and services purchased for consumption by urban households. User fees (such as water and sewer service) and sales and excise taxes paid by the consumer are also included. Income taxes and investment items (like stocks, bonds, and life insurance) are not included." Also, "The CPI-U includes expenditures by urban wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees and others not in the labor force."

Long-term inflation trends used in this report are based on CPI-U obtained from the BLS as shown in Table 1.

Appendix 3, Table 1: Historical CPI-U

Year	BLS CPI-U (January)
1913	9.8
1979	68.3
1999	164.3
2013	230.3

The annualized inflation for a given period of years was determined by assuming the inflation will be expressed as an effective annual rate that when compounded over the time period and multiplied by the initial CPI will yield the final year's CPI-U. The formula for determining the annualized inflation rate is:

$$APCC = \left[\left[\left(\frac{CPI_f}{CPI_i}\right)^{\left(\frac{1}{t}\right)}\right] - 1\right] * 100$$

where

APCC = annualized percent change in CPI-U
CPI_f = CPI-U value for final year of time period
CPI_i = CPI-U value for first initial year of time period
t = length of time period in years

Using this formula, the following percent changes in CPI-U were determined:

Appendix 3, Table 2: Change in CPI-U

Period Year	Initial CPI-U (January)	Final CPI-U (January)	Length of Time period in years	Calculated Percent Change in CPI-U as annual compound rate for indicated period
1913 - 2013	9.8	230.3	100	3.21 %
1979-2013	68.3	230.3	34	3.64 %
1999-2013	164.3	230.3	14	2.44 %

Appendix 4: Inflation of Median Household Income

Appendix 4: Inflation of Median Household Income

Long-term income inflation trends used in this report are based on median household income data obtained from the United States Census and American Community Survey as shown in Table 1.

Appendix 4, Table 1: Median Household Income

Year	Delaware County MHI	Chester City MHI
1979	33,430	11,513
1999	50,092	25,703
2013	64,041	27,249

The annualized inflation for a given period of years was determined by assuming the inflation will be expressed as an effective annual rate that when compounded over the time period and multiplied by the initial MHI will yield the final year's MHI. The formula for determining the annualized inflation rate is:

$$APCM = \left[\left[\left(\frac{MHI_f}{MHI_i}\right)^{\left(\frac{1}{t}\right)}\right] - 1\right] * 100$$

where

APCM = annualized percent change in MHI
MHI_f = MHI value for final year of time period
MHI_i = MHI value for first initial year of time period
t = length of time period in years

Using this formula, the following percent changes in MHI were determined:

Appendix 4, Table 2: Change in Delaware County MHI

Period Year	Initial MHI	Final MHI	Length of Time period in years	Calculated Percent Change in MHI as annual compound rate for indicated period
1979-2013	33,430	64,041	34	1.93%
1999-2013	50,092	64,041	14	1.77%

Appendix 4, Table 3: Change in Chester City MHI

Period Year	Initial MHI	Final MHI	Length of Time period in years	Calculated Percent Change in MHI as annual compound rate for indicated period
1979-2013	11,513	27,249	34	2.6%
1999-2013	25,703	27,249	14	0.44%

Appendix 5: Sewer Rate Setting Information

Appendix 5: Sewer Rate Setting Information

DELCORA Sewer Rate Setting Policy

DELCORA's rate setting and cost allocation is based on the following:

- All customers pay an equal rate for commonly shared costs, including Administration, common treatment, common collection, and common capital costs.
- Western customers pay their specific costs for collection and capital costs.
- Eastern customers pay their specific costs for collection, capital, and I&I costs.
- Costs for CSO abatement are allocated to the Model Area customers in proportion to their contribution to CSO volume as well as excess volume generated from separate sewer communities within the Model Area during wet weather.
- Industrial pretreatment is allocated to only the customers that incur those costs.
- Both Trainer and Marcus Hook pay their own specific debt costs
- The Southwest rate includes treatment, billing/admin, debt and debt coverage, an allocation of capital costs, as well as the operation of the pump station.

ELECTED CONTROLLER'S/AUDITOR'S CERTIFIED OPINION

To the: Governing Body of the Municipality

President Judge of the Court of Common Pleas

Secretary of the Department of Community & Economic Development

I/We, the undersigned, the duly elected (or appointed replacement), qualified, and Acting Controller/Auditors of the CHESTER CITY have audited, adjusted and settled the various funds and account groups of the CHESTER CITY for the year ended December 31, 2012. My/Our audit, adjustment and settlement was made in accordance with law rather than with generally accepted auditing standards

(PLEASE CROSS OUT ONLY IF ON MODIFIED ACCRUAL/ACCRUAL BASIS)
This municipality's policy is to prepare its financial statements on the basis of cash receipts and disbursements; consequently, certain revenues and the related assets are recognized when received rather than when earned, and certain expenditures or expenses are recognized when paid rather than when a liability is incurred. Accordingly, the accompanying financial statements are not intended to present the financial position and results of operations of this municipality in conformity with generally accepted accounting principles.

These financial statements do not include all of the disclosures required by generally accepted accounting principles.

In my/our opinion, the aforementioned financial statements present the financial position of the various funds and account groups of the municipality of CHESTER CITY for the year ended December 31, 2012, and the results of operations of such funds in accordance with the law.

SIGNATURE AND VERIFICATION

Signed: Edith Blackwell Controller

Subscribed and sworn to before me this 5 day of January, 2015.

ELECTED CONTROLLER'S/AUDITOR'S CERTIFIED OPINION

To the: Governing Body of the Municipality

President Judge of the Court of Common Pleas

Secretary of the Department of Community & Economic Development

I/We, the undersigned, the duly elected (or appointed replacement), qualified, and Acting Controller/Auditors of the CHESTER TWP have audited, adjusted and settled the various funds and account groups of the CHESTER TWP for the year ended December 31, 2013. My/Our audit, adjustment and settlement was made in accordance with law rather than with generally accepted auditing standards

(PLEASE CROSS OUT ONLY IF ON MODIFIED ACCRUAL/ACCRUAL BASIS)
This municipality's policy is to prepare its financial statements on the basis of cash receipts and disbursements; consequently, certain revenues and the related assets are recognized when received rather than when earned, and certain expenditures or expenses are recognized when paid rather than when a liability is incurred. Accordingly, the accompanying financial statements are not intended to present the financial position and results of operations of this municipality in conformity with generally accepted accounting principles.

These financial statements do not include all of the disclosures required by generally accepted accounting principles.

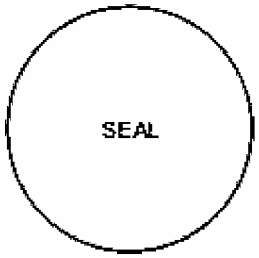
In my/our opinion, the aforementioned financial statements present the financial position of the various funds and account groups of the municipality of CHESTER TWP for the year ended December 31, 2013, and the results of operations of such funds in accordance with the law.

SIGNATURE AND VERIFICATION

Signed: Dorothy Green Elected Auditor

Thelma Newcomb Elected Auditor

Subscribed and sworn to before me this 10 day of September, 2014.



Signed: _____

ELECTED CONTROLLER'S/AUDITOR'S CERTIFIED OPINION

To the: Governing Body of the Municipality

President Judge of the Court of Common Pleas

Secretary of the Department of Community & Economic Development

I/We, the undersigned, the duly elected (or appointed replacement), qualified, and Acting Controller/Auditors of the EDGMONT TWP have audited, adjusted and settled the various funds and account groups of the EDGMONT TWP for the year ended December 31, 2013. My/Our audit, adjustment and settlement was made in accordance with law rather than with generally accepted auditing standards

(PLEASE CROSS OUT ONLY IF ON MODIFIED ACCRUAL/ACCRUAL BASIS)
This municipality's policy is to prepare its financial statements on the basis of cash receipts and disbursements; consequently, certain revenues and the related assets are recognized when received rather than when earned, and certain expenditures or expenses are recognized when paid rather than when a liability is incurred. Accordingly, the accompanying financial statements are not intended to present the financial position and results of operations of this municipality in conformity with generally accepted accounting principles.

These financial statements do not include all of the disclosures required by generally accepted accounting principles.

In my/our opinion, the aforementioned financial statements present the financial position of the various funds and account groups of the municipality of EDGMONT TWP for the year ended December 31, 2013, and the results of operations of such funds in accordance with the law.

SIGNATURE AND VERIFICATION

Signed: Merves Amon & Barsz LLC Appointed Auditor/CPA

Subscribed and sworn to before me this 10 day of September, 2014.

ELECTED CONTROLLER'S/AUDITOR'S CERTIFIED OPINION

To the: Governing Body of the Municipality

President Judge of the Court of Common Pleas

Secretary of the Department of Community & Economic Development

I/We, the undersigned, the duly elected (or appointed replacement), qualified, and Acting Controller/Auditors of the MORTON BORO have audited, adjusted and settled the various funds and account groups of the MORTON BORO for the year ended December 31, 2013. My/Our audit, adjustment and settlement was made in accordance with law rather than with generally accepted auditing standards

(PLEASE CROSS OUT ONLY IF ON MODIFIED ACCRUAL/ACCRUAL BASIS)
This municipality's policy is to prepare its financial statements on the basis of cash receipts and disbursements; consequently, certain revenues and the related assets are recognized when received rather than when earned, and certain expenditures or expenses are recognized when paid rather than when a liability is incurred. Accordingly, the accompanying financial statements are not intended to present the financial position and results of operations of this municipality in conformity with generally accepted accounting principles.

These financial statements do not include all of the disclosures required by generally accepted accounting principles.

In my/our opinion, the aforementioned financial statements present the financial position of the various funds and account groups of the municipality of MORTON BORO for the year ended December 31, 2013, and the results of operations of such funds in accordance with the law.

SIGNATURE AND VERIFICATION

Signed: Ronald R Woodworth CPA Appointed Auditor/CPA

Subscribed and sworn to before me this 10 day of September, 2014.

ELECTED CONTROLLER'S/AUDITOR'S CERTIFIED OPINION

To the: Governing Body of the Municipality

President Judge of the Court of Common Pleas

Secretary of the Department of Community & Economic Development

I/We, the undersigned, the duly elected (or appointed replacement), qualified, and Acting Controller/Auditors of the RUTLEDGE BORO have audited, adjusted and settled the various funds and account groups of the RUTLEDGE BORO for the year ended December 31, 2013. My/Our audit, adjustment and settlement was made in accordance with law rather than with generally accepted auditing standards

(PLEASE CROSS OUT ONLY IF ON MODIFIED ACCRUAL/ACCRUAL BASIS)
This municipality's policy is to prepare its financial statements on the basis of cash receipts and disbursements; consequently, certain revenues and the related assets are recognized when received rather than when earned, and certain expenditures or expenses are recognized when paid rather than when a liability is incurred. Accordingly, the accompanying financial statements are not intended to present the financial position and results of operations of this municipality in conformity with generally accepted accounting principles.

These financial statements do not include all of the disclosures required by generally accepted accounting principles.

In my/our opinion, the aforementioned financial statements present the financial position of the various funds and account groups of the municipality of RUTLEDGE BORO for the year ended December 31, 2013, and the results of operations of such funds in accordance with the law.

SIGNATURE AND VERIFICATION

Signed: Paul S. Garrity Elected Auditor

Catherine A. Myers Elected Auditor

Henry J. Borsch, III Elected Auditor

Subscribed and sworn to before me this 12 day of August, 2014.

ELECTED CONTROLLER'S/AUDITOR'S CERTIFIED OPINION

To the: Governing Body of the Municipality

President Judge of the Court of Common Pleas

Secretary of the Department of Community & Economic Development

I/We, the undersigned, the duly elected (or appointed replacement), qualified, and Acting Controller/Auditors of the SPRINGFIELD TWP have audited, adjusted and settled the various funds and account groups of the SPRINGFIELD TWP for the year ended December 31, 2013. My/Our audit, adjustment and settlement was made in accordance with law rather than with generally accepted auditing standards

(PLEASE CROSS OUT ONLY IF ON MODIFIED ACCRUAL/ACCRUAL BASIS)
This municipality's policy is to prepare its financial statements on the basis of cash receipts and disbursements; consequently, certain revenues and the related assets are recognized when received rather than when earned, and certain expenditures or expenses are recognized when paid rather than when a liability is incurred. Accordingly, the accompanying financial statements are not intended to present the financial position and results of operations of this municipality in conformity with generally accepted accounting principles.

These financial statements do not include all of the disclosures required by generally accepted accounting principles.

In my/our opinion, the aforementioned financial statements present the financial position of the various funds and account groups of the municipality of SPRINGFIELD TWP for the year ended December 31, 2013, and the results of operations of such funds in accordance with the law.

SIGNATURE AND VERIFICATION

Signed: James T. DeLizzio Elected Auditor

Robert B. Simpson Elected Auditor

Joseph T. Rago Elected Auditor

Subscribed and sworn to before me this 11 day of September, 2014.

Amounts reported for governmental activities in the statement of net assets are different because:	
Internal service funds are used by management to charge certain costs to county departments and employees	
The assets, deferred outflows of resources, liabilities and deferred inflows of resources of the internal service funds are included in governmental activities in the STATEMENT OF NET POSITION	
Long-term liabilities and deferred inflows are not due and payable in the current period and therefore are not reported as a fund liability	-431,619,301
The difference in net position between full accrual accounting and modified accrual accounting is due to differing revenue recognition criteria between the two methods	
The difference in net position between full accrual accounting and modified accrual accounting is due to differing expenditure recognition criteria between the two methods	
Capital assets used in government activities are not financial resources and, therefore, are not reported in the funds	344,117,831

RECONCILIATION OF THE STATEMENT OF REVENUES, EXPENDITURES AND CHANGES IN FUND BALANCES OF GOVERNMENTAL FUNDS TO THE STATEMENT OF ACTIVITIES

December 31, 2013

Amounts reported for governmental activities in the statement of activities are different because:

Net changes in fund balances (deficit) - total governmental funds	16,545,353
The net revenue (expense) of certain activities of the internal services fund is reported with governmental activities	-1,292,700
The issuance of long-term debt (e.g. bonds, leases) provides current financial resources to governmental funds, while the repayment of the principal of long-term debt consumes the current financial resources of governmental funds. Neither transaction, however, has any effect on net position. Additionally, various other long-term liabilities and deferred inflows do not require the use of current financial resources and, therefore are not reported as expenditures in governmental funds. This amount is the net effect of the differences in the treatment of long-term liabilities and deferred inflows on the statement of activities	-7,141,911
Other: SEPTA Contribution	7,607,246
Other: Revenues related to Real estate	-209,481
Other: Collections related to Chester City	-133,611
Other: Accrued Interest Payable	109,149
Other: OPEB (Pension) does no tconsume current financial resources	-19,555,000
Other: Early retirement expense	357,713

ELECTED CONTROLLER'S/AUDITOR'S CERTIFIED OPINION

To the: Governing Body of the County

President Judge of the Court of Common Pleas

Secretary of the Department of Community & Economic Development

I/We*, the undersigned, the duly elected (or appointed replacement) and Acting Controller/Auditors* of the County of DELAWARE have audited, adjusted and settled the accounts of the County of DELAWARE for the year ended December 31, 2013. My/Our* audit, adjustment and settlement was made in accordance with Act 103 of 2002 rather than with U.S. generally accepted auditing standards

The County has prepared these financial statements on bases of accounting consistent with U.S. generally accepted accounting principles; consisting of the accrual basis for the government-wide, proprietary fund and fiduciary fund financial statements, and the modified accrual basis for the governmental fund financial statements.

Due to the absence of notes and other disclosures required by U.S. generally accepted accounting principles, these financial statements are not intended to be a complete presentation in accordance with U.S. generally accepted accounting principles.

In my/our* opinion, these financial statements accurately reflect the results of operations and the financial position of the county of DELAWARE for the year ended December 31, 2013

SIGNATURE AND VERIFICATION

Signed: edward olone Controller

Subscribed and sworn to before me this 15 day of April, 2015.

Signed: _____

Witness (Controller)/Auditor (Auditors)

Counties are encouraged to have financial statement audits performed in accordance with U.S. generally accepted auditing standards or the standards applicable to financial audits contained in "Government Auditing Standards", issued by the Comptroller general of the United States. Controllers may submit opinions resulting from such audits in lieu of this page.

Appendix 13: Flow Allocation

Appendix 13

Determination of Chester City's Wet Weather Flow as Fraction of Total Wet Weather Flow

DELCORA's system serves a variety of customers from numerous municipalities in Delaware County, PA, as depicted in the schematic diagram depicted in Figure 1-1. The majority of the sewer systems within the Model Area have separated sanitary sewers, with the exception of a portion of Chester City, which is served by combined sewers. While the combined sewer outfalls in DELCORA's service area are all located within the City of Chester, it is recognized that wet weather flow from customers outside of the City of Chester may influence the conveyance of flow from the City of Chester, thereby affecting the CSO volume discharged from Chester City's outfalls.

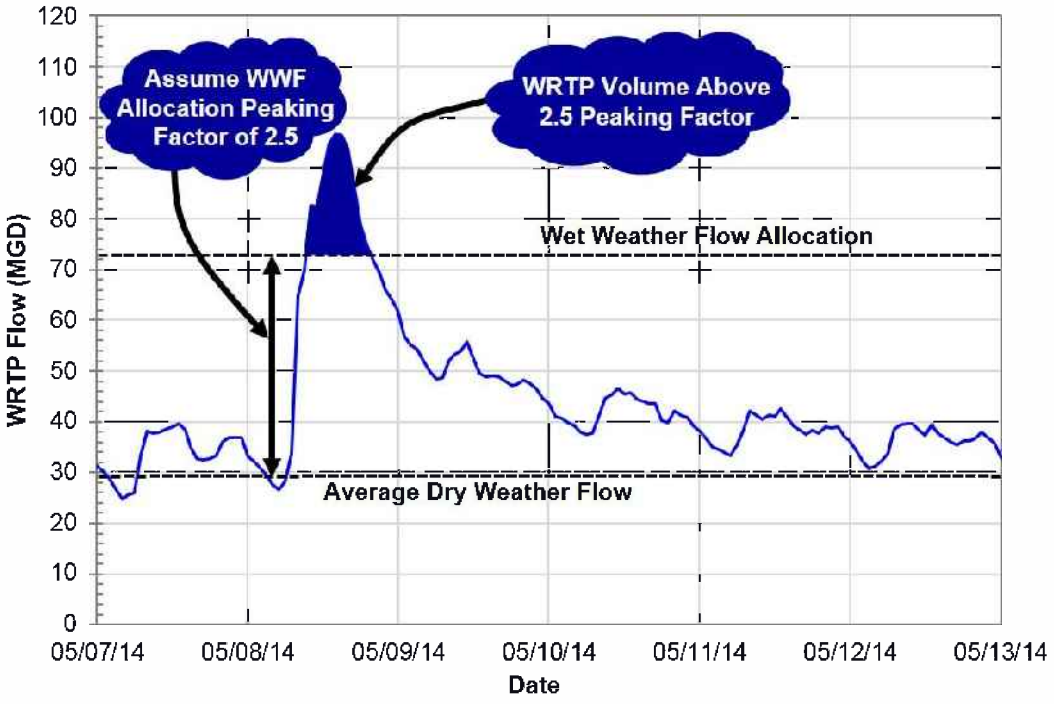
Because the service area includes many municipalities, DELCORA must consider distributing costs among its customers in relation to the services each customer group receives and must set rates in a fair and reasonable manner. Thus, for the purpose of the Draft FCA, the allocation of CSO LTCP costs between Chester City and the separate sewer systems in the Model Area is based on separate sewer system's share of the Model Area's total excess Wet Weather Flow (WWF) volume.

The existing Hydrologic and Hydraulic (H&H) Model focuses on the Chester City collection system. As part of updates to the CSO LTCP, the H&H model will be calibrated and modified to allow for estimation of the relative contributions to wet weather flow from the Model Area customers. At this time, the H&H Model has not yet been updated, so an alternative method for approximating wet weather flow contributions will be used for this Draft FCA as described below.

Excessive wet weather flow is defined as flows exceeding the peaking factor of 2.5 times dry weather flow. In addition, flow that never reaches the plant during wet weather but instead is discharged into a receiving stream would also be characterized as excessive flow. Total excess wet weather flow would then be the sum of these two items.

Dry weather flow was estimated based on an analysis of hourly flow data for the Western Regional Treatment Plant (WRTP). Flow data for the period 2009-2013 was obtained. For each year, dry weather day flow was estimated as the 5^{th} percentile of the WRTP flow (i.e. 5% of the days the flow will be less than the estimated DWF). With the dry weather flow baseline established, the peaking factor of 2.5 was applied and the flow data was re-analyzed to obtain an estimate of excess flow, which was the summed to estimate excess volume for a storm. Figure A13-1 shows an example WRTP's WWF volume from a single storm event in May 2014. The annual sum of excess wet weather volume for the WRTP was assigned to the separate sewer segments of the Model Area.

Figure A13-1: Basis for Estimating Wet Weather Flow from Separate Sewer Areas



CSO discharge data for the same time period (2009-2013) was obtained and analyzed to determine the annual CSO discharge volume. As this flow emanates from Chester City, this wet weather volume was assigned to Chester City.

The relative allocation for Chester City would then be the ratio of Chester City's excess wet weather volume to the total excess wet weather volume for the Model Area. Similarly, the allocation for the remainder of the Model Area (i.e., the separated sewer areas) would be the ration of the excess volume from the separate sewer areas to the total excess wet weather volume.

Conceptually, the allocation can be summarized as:

Vs = Excess WWF Volume from Separate Sewer Areas = Excess WRTP Volume ..... (Eq A13-1)

Vc = Excess Chester City WWF Volume = CSO Discharge..... (Eq A13-2)

Vt = Total Excess WWF Volume = Excess WRTP Volume + CSO Discharge..... (Eq A13-3)

Chester City Allocation = Vc/(Vs + Vc)..... (Eq A13-4)

Separate Sewer System Area Allocation = Vs/(Vs + Vc)..... (Eq A13-5)

Results of the analysis are summarized in Table A13-1, which indicates that the separate sewer system has about a 3 percent to 5 percent share of the total wet weather volume.

Table A13-1: CSO Volume as Percent of Total Wet Weather Volume

Year	WRTP WWF Volume above 2.5 Peak Factor (MG)	CSO Volume (MG)	Total Wet Weather Volume (MG)	Percent CSO
2009	24.2	785	809.2	97%
2010	39.3	696	735.3	95%
2011	30.0	1144	1174.0	97%
2012	6.6	538	544.6	99%
2013	13.5	744	757.5	98%
Average	22.7	781.4	804.1	97%

DISCUSSION

As mentioned above, the existing Hydrologic and Hydraulic (H&H) Model focuses on the Chester City collection system and is in the process of being updated as part of the updates to the CSO LTCP. At this time, the H&H Model has not yet been updated, so the alternative method for approximating wet weather flow contributions described above was used for this Draft FCA. Further hydraulic evaluations are required to better understand the separate sewer system flows and refine the separate sewer system share of the CSO LTCP costs. Therefore for this Draft FCA, it is assumed 15 percent of CSO LTCP costs would be allocated to the separate sewer system and 85 percent of the CSO LTCP costs would allocated to combined sewer system in Chester City. For the final FCA, the updated hydrologic and hydraulic (H&H) model will be used to improve the estimate of CSO attributable to Chester City and to the remainder of the Model Area.

BACKING DATA

Plant flow and CSO discharge data is approximately 800 pages and will be provided upon request.

Appendix 14: Worksheet Details

Explanation for Worksheet 1			
Worksheet Item	**Worksheet Line No.**	**Formula**	**Notes**
A1a	100	Input Data	Existing O&M costs based on DELCORA's cost of service for each customer.
A1b	101	Input Data	Existing debt service based on DELCORA's debt cost for each customer.
A1c	102	101+102	
A2a	103	(1.5% of capital cost) * (1.03)^n	where n = number of years after completion of construction
A2b	104	Input Data	Projected additional costs for non-CSO projects Future CSO LTCP costs are based on annualized costs, assuming total CSO cost is divided into three projects as described in Draft FCA. Allocation to municipalities based on fraction of excess flow as described in the Draft FCA Appendix 13. Annualized costs for captial projects are based on bond term and interest rate described in the Draft FCA. Reported in 2035 dollars.
A2c	105	103+104	
A3	106a	102+105	
B	106b	(Western collection costs for Chester City + Retail I&I for Chester City) / Chester City Usage	Modeled on costs for DELCORA's retail customers.
C	106c	106a+106b	
D	NA	Input Data	Usage from DELCORA records and projections.
E	NA	(106c*10^6) / D	
F	107	input data: 55,000	Residential water usage (typ); based on Chester Water Authority data (2010-15)
G	108	D / F	
H	109a	E * F	
I	109b	Input data	Assumed projected SW cost of $45/Household (2016 dollars). Cost adjusted to the year used for FCA analysis by assuming inflation of 3% per year ($79/HH in 2035 dollars; $44/HH in 2015 dollars)
J	109c	H + I	

Explanation for Worksheet 2			
Worksheet Item	**Worksheet Line No.**	**Formula**	**Notes**
A1	201	Input data	Input based on US Census Bureau's 5-year American Community Survey (ACS), 2009-2013. See Draft FCA Appendix 12.
A2		Input data	Input: Year Ym
A3		Input data	Input: Data year Yf
A4		Input data	Input: MHI Inflation Rate
A5	202	(1+r) ^ (Yf-Ym)	r=MHI inflation rate, Yf=FCA Analysis year, Ym=Year of MHI Estimate. See Draft FCA Appendix 4
A6		Line 201 * Line 202	
B		Line 109c	
C		Line 204 / Line 203 * 100	

Explanation for Worksheet 3			
Worksheet Item	**Worksheet Line No.**	**Formula**	**Notes**
A	301	Input data	DELCORA has no general obligation bond. A weighted composite from the bond rating and number of households of the municipalities was determined. Strong was weighted as a 3 for investment grade, mid-range was weighted 2 for the line of investment grade (Baa, BBB), and weak was weighted 1 for junk bonds.
B	302	Input data	DELCORA's revenue bond as of 2015 from "2015 Official Statement"

Explanation for Worksheet 4			
Worksheet Item	**Worksheet Line No.**	**Formula**	**Notes**
A	401	Input data * pro-rate factor	Input data from Municipal Annual Audit and Financial Reports (MAAFR) in "Excess/Deficit of Revenues" in the "General Obligation Bonds and Notes" section at the end of each city's report. See Draft FCA Appendix 6. **Exception:** City of Chester Debt obtained from 2012 Independent Audit, Note 8 "Long-Term Debt", pg 43 Pro-rated for partial areas based on the fraction of a municipality's land area that is within the DELCORA service area. Land areas were obtained through GIS analysis. (see Table WS4.E below)
B	402	See below for more detail	Input for County Outstanding debt from Delaware County Comprehensive Annual Financial Report. Pro-rated for partial areas. Input for debt of school districts from PA State website.
C	403	Line 401 + Line 402	
D	404	Input data * pro-rate factor	Input from PA State Tax Equalization Board (STEB) - Tax Equalization Division (TED) Pro-rated for partial areas based on the fraction of a municipality's land area that is within the DELCORA service area. Land areas were obtained through GIS analysis. (see Table WS4.E below)
E		Line 403 / Line 404	

Explanation for Worksheet 4, Line 402: Calculation of Proportionate Share of Debt from Overlapping Entities

Overlapping entity: Delaware County

1. Determine Percent chargeable to service area (i.e., pro-rate factor)

Row	Description	Formula	Notes
AA	Municipality Full Market Property Value 2013 (PA STEB)	Input data	See Appendix 9
BB	Delaware County Full Market Property Value 2013 (PA STEB)	Input data	See Appendix 9
CC	Percent chargeable to your service area	Row AA / Row BB	

See Table WS4.A below for example

2. Determine Share of Debt

Row	Description	Formula	Notes
DD	Delaware County Oustanding Debt	Input data	See Appendix 8
EE	Percent chargeable to your service area	Row CC	
FF	Delaware County Debt attributable to permitee's service area	Row DD * Row EE	

See Table WS4.B below for example

Explanation for Worksheet 4, Line 402: Calculation of Proportionate Share of Debt from Overlapping Entities

Overlapping entity: School Districts

1. Identify school districts and their debts (see Table WS4.C below)

2. Determine percent chargeable to service area based on fraction of school district that is within municipality (pro-rate factor 1) and fraction of municipality that is within the service area (pro-rate factor 2).

Row	Description	Formula	Notes
GG	Municipality Full Market Property Value 2013 (PA STEB)	Input data	See Appendix 9
HH	School District Full Market Property Value 2013 (PA STEB)	Sum of FMPV for all municiaplities served by the school district	See Appendix 9
II	Percent of school district chargeable to municipality	Row GG/ Row HH	
JJ	Percent of municipality chargeable to your service area	Input data	Obtained though GIS analysis of municipality land area that is within the service area
KK	Overall percent chargeable to your service area	Row II * Row JJ	

3. Determine Share of Debt

Row	Description	Formula	Notes
LL	School District Oustanding Debt	Input data	See Table WS4.C below
MM	Percent chargeable to your service area	Row KK	
NN	Delaware County Debt attributable to permitee's service area	Row LL * Row MM

Re: *United States and PADEP v. Delaware County Regional Water Quality Control Authority (DELCORA),* Civil Action No. 15-4652, Draft Financial Capability Assessment (Revised April 2017)

Dear Ms. Hill:

Thank you for the revised *Draft Financial Capability Assessment Report*, May 2016 (Revised April 2017) (Draft FCA) submitted on behalf of the Delaware County Regional Water Quality Control Authority (DELCORA), pursuant to the requirements of Paragraph 18 of the Consent Decree entered in the referenced case and in response to U.S. Environmental Protection Agency (EPA) comments in its letter dated February 16, 2017. This letter requests two items required to complete DELCORA's Draft FCA and provides comments on the Draft FCA consistent with Paragraph 18 of the Consent Decree.

Paragraph 18 of the Consent Decree requires DELCORA to prepare a draft Financial Capability Assessment in accordance with CSO Control Policy Paragraph II.C.8 and "Combined Sewer Overflows—Guidance for Financial Capability Assessment and Schedule Development," EPA 832-B-97-004, February 1997 (FCA Guidance), and to submit it to EPA and Pennsylvania Department of Environmental Protection (PADEP) for review and comment. This letter summarizes EPA's comments to date on the revised April 2017 *Draft Financial Capability Assessment Report*. We are requesting that DELCORA amend certain tables and text as soon as practicable. We are also providing comments that DELCORA should keep in mind as it moves forward in preparing the final version of the Financial Capability Assessment and in implementing the Consent Decree.

1. ***Requiring Amendment to the Draft FCA.***
We appreciate that DELCORA's latest revision is responsive to several comments from EPA's letters dated September 15, 2016 and February 16, 2017. DELCORA provided detailed backup for current demographic data; and presented the Residential Indicator results in terms of current dollars and demographic characteristics.

Two related aspects of the Residential Indicator analysis still need to be corrected: the service area and the residential share of costs. These issues are not new, and we discussed them at our last meeting. DELCORA need only to provide the pages corrected and added to its Draft FCA to show its revisions.

a. *Service Area.* DELCORA's April 2017 Draft FCA reflected adjustments to the service area used to calculate the Residential Indicator, but failed to meet the service area definition ("Model Area") explicitly established in Paragraph 14.b of the Consent Decree and used in Paragraph 18. Consistent with the Consent Decree definition of the Model Area and with the FCA Guidance,[1] DELCORA's Residential Indicator calculation must include both the entire "Western Service Area" and the entire "Eastern Service Area." As discussed at our May 22, 2017 meeting and consistent with the FCA Guidance and EPA's 2014 Financial Capability Assessment Framework (FCA Framework), DELCORA needs to incorporate all current and projected costs for all the authorities in the Eastern Service Area for which DELCORA collects and sends wastewater to the Philadelphia wastewater treatment plant. The Residential Indicator calculation should also include DELCORA's expected payments to Philadelphia for treatment and Long Term Control Plan (LTCP) costs based on available documentary evidence.[2]

b. *Residential Share of Costs*. DELCORA also needs to calculate the Residential Share of Costs relative to the entire Model Area as defined above. The Residential Share of Costs defines the share of costs assigned to total number of households in the permittee's total wastewater service area. The Residential Share of Costs must be based on total flows generated by residential users throughout the Model Area relative to the total wastewater flows generated. The Residential Share of Costs is to be estimated by determining the flow billed to households relative to total flow billed overall by the utility.[3] Note that the reference point is households, not residential customers. Generally, we accept residential flow estimates that add residential customer flow plus an estimate of the flow generated by households in multifamily buildings that are commercial customers. The Residential Indicator is not a calculation to set rates, but is used to determine whether CSO controls will produce a possible high, midrange, or low financial impact on the permittee's residential users.

2. ***Comments on the Draft FCA***. A number of issues have arisen in discussions with DELCORA regarding the Draft FCA. We offer the following comments as provided for in the Consent Decree. These comments should help DELCORA as it moves into the identification and

[1] Cost Per Household (CPH) is calculated by dividing residential share of costs by "the total number of households (line 108) in the permittee's total wastewater service area." FCA Guidance, Page 14.
[2] "Communities should demonstrate how the CWA work included as costs in the financial capability assessment will be implemented, including appropriate assurances that those expenditures will be made." FCA Framework, Page 3.
[3] This assumes that infiltration and inflow are allocated to customers in the same proportion as billed flow.

evaluation of technical alternatives to control CSOs and the process for approval of DELCORA's revised and updated LTCP.

a. *Calculating Residential Indicator based on Wet Weather Flow volume.* DELCORA's calculation of the Residential Indicator based on Wet Weather Flow volume assigns the majority of CSO flows to Chester City, when, in fact, Chester City is a small proportion of the entire Model Area relative to the total wastewater flow treated or the number of households in the Model Area. As part of the Residential Indicator calculations from the FCA Guidance, the residential share of total costs is proportionate to the residential portion of "total wastewater flow," not wet weather flow. FCA Guidance, Page 14. In addition, the Cost Per Household (CPH) calculation takes into account the current costs for existing wastewater treatment operations and the projected costs for any proposed wastewater treatment and CSO controls. DELCORA's existing wastewater operations at the Western Regional Treatment Plant include treatment of combined and separate flows during dry and wet weather conditions. Therefore, both dry and wet weather flows need to be considered in the CPH calculation.

b. *Goal of 1997 FCA Guidance and Relationship to CD Requirements:* A Financial Capability Assessment combines the Residential Indicator and Permittee Financial Capability Indicator to give an overall assessment of DELCORA's financial capability. DELCORA's Draft FCA states that "[t]he CSO LTCP will be designed and constructed as required to meet the Consent Decree deadline of August 2035 to the limit of Chester City's financial capability." DELCORA misconstrues the purpose of a FCA. The intent of the 1997 FCA Guidance and its use under the Consent Decree is not to limit the design or scope of the CSO controls to a particular geographic area within the overall permittee service area. This assessment is used to help establish an appropriate CSO control implementation schedule. Pursuant to Paragraph 9 of the Consent Decree, the selected CSO controls set forth in the LTCP shall be designed to meet the overarching goals of bringing all CSO discharge points into full compliance with the technology-based and water quality-based requirements of the CWA and minimizing the impacts of CSOs on water quality, aquatic biota, and human health. Furthermore, Paragraph 19 of the Consent Decree states that available CSO control technologies are not intended to be limited by cost, and requires DELCORA to identify an appropriately broad range of technically feasible CSO controls for detailed evaluation, regardless of the cost of each technically feasible CSO control.

c. *Summary of Previous EPA Comments*: Since DELCORA's April 2017 Draft FCA was submitted, EPA, PADEP, and DELCORA have had one in-person meeting on May 22, 2017, and two phone calls, which took place on June 1, 2017 and June 23, 2017. There were a number of questions exchanged between EPA, PADEP, and DELCORA during those discussions, some of which were outside the scope of the Draft FCA. The following responses provide our reply to those questions:

    i. Kimberly-Clark. DELCORA asked whether Kimberly-Clark would be responsible for LTCP costs proportionate to its flow to the treatment plant. The CSO Control Policy recommends that the municipality consider sources of funding in determining the phasing of construction projects, which can include the availability of grants and loans; previous and current *residential, commercial, and*

industrial sewer user fees and rate structures; and other viable funding mechanisms. Emphasis added. The EPA document, "CSOs: Guidance for Funding Options" (1995) states that "because CSO controls benefit the whole service area, permittees should recognize that, in most cases, it will be necessary to use a fee structure that distributes the CSO control costs among all system customers. Recovering costs through increases to system-wide user fees will distribute the cost increases more broadly." The specific rate design that a utility develops is largely in its discretion. The FCA is a uniform and consistent methodology for evaluating the financial impact of proposed CSO LTCP costs and not appropriate for setting rates. Utility rate structures are designed to generate revenues to cover costs and assure that various financial ratios are met. Utility rate design can range from simple to complex, including charges for concentrated waste discharge or lower cost for higher volume customers. Ultimately, the rate design is up to the permittee, balancing the revenue requirements with allocation of costs to various types of customers.

Further, as part of the CSO Policy's Nine Minimum Controls and LTCP requirements, the permittee's publicly owned treatment works (POTW) options are an integral part of the alternatives evaluation process. Specifically, the CSO Policy states that the LTCP should consider expansion of POTW secondary and primary capacity in the CSO abatement alternative analysis. Thus, the permittee should take into account any industrial flow to the treatment plant relative to the POTW's role in addressing CSOs.

ii. 2014 Framework. DELCORA asked EPA to state its position about the relationship between the FCA Framework and the FCA Guidance. The cover memorandum that EPA issued to accompany the FCA Framework notes that the FCA Guidance provides an aid for assessing financial capability as part of negotiating schedules for implementing CWA requirements for municipalities and local authorities. The FCA Guidance also encourages permittees "to submit any additional documentation that would create a more accurate and complete picture of their financial capability" that may "affect the conclusion" of the analysis described in the guidance. The FCA Framework identifies the key elements EPA uses in working with permittees to evaluate how their financial capability should influence schedules. In addition, the FCA Framework provides examples of additional information that may help some communities provide a "more accurate and complete picture" of their financial capability as is envisioned in the FCA Guidance.

iii. Incorporation of dry weather flow. DELCORA asked whether every EPA-approved FCA requires that all dry weather flow areas be included in the FCA and whether there is any provision in the FCA or LTCP/CSO guidance that supports the position that all areas contributing dry weather flows must be included for FCA purposes. The FCA Guidance does not provide for how DELCORA will apportion costs of the LTCP, other than the Residential Indicator calculations, which identifies the impact of wastewater and CSO control costs on individual households based on a flow-based allocation. As part of the Residential Indicator calculations from the FCA Guidance, the residential share of total costs

is proportionate to the residential portion of "total wastewater flow," not wet weather flow. FCA Guidance, Page 14. In addition, the Cost Per Household portion of the Residential Indicator is calculated by dividing the residential share of WWT and CSO costs by "the number of households in the permittee's total wastewater service area," not just households that contribute dry weather flows. FCA Guidance, Page 12.

iv. Proportionate share. DELCORA asked EPA to consider the CWA principles of "proportionate share." EPA's FCA Guidance was developed, in part, based on the experience of EPA in the Construction Grants program. EPA's Construction Grants regulations require that a grantee's user charge system, if not using ad valorem taxes, "shall provide that each user (or user class) pays its proportionate share of operation and maintenance (including replacement) costs of treatment works within the grantee's service area, based on the user's proportionate contribution to the total wastewater loading from all users (or user classes)." 40 C.F.R. 35.2140(a). The CSO Control Policy states that "each permittee is ultimately responsible for aggressively pursuing financial arrangements for the implementation of its long-term CSO control plan." Placing almost all of the financial responsibility upon the City of Chester for implementing the LTCP is not consistent with the CWA principle of "proportionate share" of the DELCORA's treatment and conveyance costs, given that DELCORA should be examining a broad range of compliance options within its overall system. As noted above, the City of Chester is a relatively small proportion of the overall service area and total wastewater loading. Disproportionately burdening the City of Chester would avoid DELCORA's responsibilities under its NPDES permit, the CSO Policy and the Clean Water Act.

3. ***Response to Information Submitted on August 17, 2017.*** Thank you for providing additional information related to DELCORA's FCA methodology, received by EPA on August 17, 2017. EPA encourages permittees to submit any additional documentation that would create a more accurate and complete picture of their financial capability, but we must stress that the FCA analysis is designed to measure the permittee's, i.e., DELCORA's, financial capability to implement CSO controls and therefore review of other cases is not particularly useful.

The purpose of an FCA is to inform development of a CSO LTCP schedule and is not a cost-allocation or rate setting exercise. As part of the long term planning process, DELCORA is responsible for identifying existing user fees and rate structures for wastewater treatment and then developing a new rate structure to finance and implement CSO controls. While this is related to financial capability, it is not part of the FCA. We also reiterate that the FCA Guidance is meant to provide a common basis for financial burden discussions with the permittee when the permittee has identified its CSO control options. In order to maintain this basis for a general comparison of financial conditions between communities across the country, the FCA Guidance provides straightforward calculations that are intended to assess a permittee's financial capability. As noted in the FCA Framework, EPA allows municipalities to submit other relevant financial or demographic information that illustrates the unique or atypical circumstances the permittee faces, allowing for a case-specific assessment of local considerations, including financing and technical implementation. Given the case-specific nature of each FCA, comparisons are of limited utility.

As noted above, there are two items DELCORA needs to provide to complete its Draft FCA. Please send the information at your earliest convenience. Replacement pages and any additional addendum will be sufficient. Consistent with Paragraph 18 of the Consent Decree, this letter also summarizes EPA comments to date on DELCORA's Draft FCA submittals. EPA intends to review the proposed final FCA in accordance with Paragraphs 18 and 34 of the Consent Decree when it is submitted concurrently with the revised and updated LTCP. If you have any questions concerning this letter, please call Philip Yeany at 215-814-2495 or contact him at yeany.philip@epa.gov.

DOJ Case Number 90-5-1-1-10972
DELCORA CSO Long Term Control Plan Update
Draft Financial Capability Assessment Report May 2016
(Revised April 2017)

Dear Sir/Madam:

By this letter the Delaware County Regional Water Quality Control Authority is providing the following responses to USEPA / PADEP comments related to the above mentioned report in accordance with the requirements of the Consent Decree.

DELCORA Responses to USEPA / PADEP Comments (including referenced attachment):

Two related aspects of the Residential Indicator analysis still need to be corrected: the service area and the residential share of costs. These issues are not new, and we discussed them at our last meeting. DELCORA need only to provide the pages corrected and added to its Draft FCA to show its revisions.

1. ***Requiring Amendment to the Draft FCA***

Comment:

a. *Service Area*. DELCORA's April 2017 Draft FCA reflected adjustments to the service area used to calculate the Residential Indicator, but failed to meet the service area definition ("Model Area") explicitly established in Paragraph 14.b of the Consent Decree and used in Paragraph 18. Consistent with the Consent Decree definition of the Model Area and with the FCA Guidance, DELCORA's Residential Indicator calculation must include both the entire "Western Service Area" and the entire "Eastern Service Area." As discussed at our May 22, 2017 meeting and consistent with the FCA Guidance and EPA's 2014 Financial Capability Assessment Framework (FCA Framework), DELCORA needs to incorporate all current and projected costs

for all the authorities in the Eastern Service Area for which DELCORA collects and sends wastewater to the Philadelphia wastewater treatment plant. The Residential Indicator calculation should also include DELCORA's expected payments to Philadelphia for treatment and Long Term Control Plan (LTCP) costs based on available documentary evidence.

Response:

- ***First, in negotiations with the Department of Justice and EPA, DOJ Counsel Marcello Mollo and EPA acknowledged and agreed that wastewater flows from the Eastern Service Area (excluding the Central Authority flows which can be delivered to the DELCORA WRTP or the Philadelphia WWTP) do not hydraulically connect to, or directly affect or indirectly affect the DELCORA WRTP, and more importantly, that this "fact" would be acknowledged as part of the DELCORA FCA submission. In brief, the government agreed that EPA's FCA Guidance document considers unique circumstances and facts associated with individual wastewater treatment systems. DELCORA incorporated its unique circumstances in the preparation of its draft FCA; specifically, the Eastern Service Area does not discharge, nor can it discharge to the DELCORA WRTP.***

- ***Second, EPA's view is contrary to the unambiguous definition of the "Model Area" because it excludes and ignores certain portions of that definition. In EPA's view, the Model Area includes the entire Western Service Area and Eastern Service Area without exception. Paragraph 14 b. defines the Model Area to include: "hydrologic representation of all areas tributary to the entire Collection System, as well as all areas tributary to all municipal wastewater collection and transmission systems*** that are, as of the date the LTCP is submitted, hydraulically connected to, or that directly or indirectly influence flow to, the CSOs and/or the WRTP, ***regardless of who owns or operates the system(s), including but not limited to the entire "Western Service Area" and "Eastern Service Area" depicted on Figure 1-2 of the Long-Term Control Plan submitted by DELCORA in April 2012, and attached as Appendix A hereto (collectively, the "Model Area").***"

- ***EPA seizes upon the language underlined above in concluding that the applicable Model Area must include the DELCORA's entire service area (Western and Eastern) without any regard to hydraulic connectivity or impacts upon the WRTP or CSOs. This interpretation ignores and renders meaningless the non-bolded language in the definition set forth above and is contrary to DELCORA's and DOJ's intent during negotiations of the Consent Decree. A more reasonable interpretation would give effect to both clauses meaning that the Model Area includes all areas in the Western and Eastern Service Areas to the extent that those areas are hydraulically connected or directly or indirectly influence flow to the CSOs and /or the WRTP.***

- ***It should also be noted that the current version of the FCA is a "Draft". The FCA will continue to be updated and the final version will be included with the completion of the Long Term Control Plan Update.***

Comment:

b. *Residential Share of Costs*. DELCORA also needs to calculate the Residential Share of Costs relative to the entire Model Area as defined above. The Residential Share of Costs defines the share of costs assigned to total number of households in the permittee's total wastewater service area. The Residential Share of Costs must be based on total flows generated by residential users throughout the Model Area relative to the total wastewater flows generated. The Residential Share of Costs is to be estimated by determining the flow billed to households

relative to total flow billed overall by the utility Note that the reference point is households, not residential customers. Generally, we accept residential flow estimates that add residential customer flow plus an estimate of the flow generated by households in multifamily buildings that are commercial customers. The Residential Indicator is not a calculation to set rates, but is used to determine whether CSO controls will produce a possible high, midrange, or low financial impact on the permittee's residential users.

Response:

See the response to "a" above.

2. ***Comments on the Draft FCA.*** *A number of issues have arisen in discussions with DELCORA regarding the Draft FCA. We offer the following comments as provided for in the Consent Decree. These comments should help DELCORA as it moves into the identification and evaluation of technical alternatives to control CSOs and the process for approval of DELCORA's revised and updated LTCP.*

Comment:

a. *Calculating Residential Indicator based on Wet Weather Flow volume. DELCORA's calculation of the Residential Indicator based on Wet Weather Flow volume assigns the majority of CSO flows to Chester City, when, in fact, Chester City is a small proportion of the entire Model Area relative to the total wastewater flow treated or the number of households in the Model Area. As part of the Residential Indicator calculations from the FCA Guidance, the residential share of total costs is proportionate to the residential portion of "total wastewater flow," not wet weather flow. FCA Guidance, Page 14. In addition, the Cost Per Household (CPH) calculation takes into account the current costs for existing wastewater treatment operations and the projected costs for any proposed wastewater treatment and CSO controls. DELCORA's existing wastewater operations at the Western Regional Treatment Plant include treatment of combined and separate flows during dry and wet weather conditions. Therefore, both dry and wet weather flows need to be considered in the CPH calculation.*

Response:

Attached are Responses to USEPA comments received February 23, 2017. See response to Comment No. 2. Totalizing all dry and wet weather flows and dividing that flow per residential customers does not characterize the true residential burden of addressing the excess wet weather flow in the system.

Comment:

b. *Goal of 1997 FCA Guidance and Relationship to CD Requirements.* A Financial Capability Assessment combines the Residential Indicator and Permittee Financial Capability Indicator to give an overall assessment of DELCORA's financial capability. DELCORA's Draft FCA states that "[t]he CSO LTCP will be designed and constructed as required to meet the Consent Decree deadline of August 2035 to the limit of Chester City's financial capability." DELCORA misconstrues the purpose of a FCA. The intent of the 1997 FCA Guidance and its use under the Consent Decree is not to limit the design or scope of the CSO controls to a particular geographic area within the overall permittee service area. This assessment is used to help establish an appropriate CSO control implementation schedule. Pursuant to Paragraph 9 of the Consent Decree, the selected CSO controls set forth in the LTCP shall be designed to meet the overarching goals of bringing all CSO discharge points into full compliance with the technology-based and water quality-based requirements of the CWA and minimizing the impacts of CSOs on water quality, aquatic biota, and human health. Furthermore, Paragraph 19 of the Consent Decree states that available CSO control technologies are not intended to be limited by cost, and requires DELCORA to identify an appropriately broad range of

technically feasible CSO controls for detailed evaluation, regardless of the cost of each technically feasible CSO control.

Response:

DELCORA will provide a full range of level of control alternatives that are consistent with the National CSO Policy and the Consent Decree. The LTCP will include a schedule for implementation based on various factors including construction phasing. Also attached are responses to USEPA comments received February 23, 2017. See response to Comment No. 3.

Comment:

c. *Summary of Previous EPA Comments. Since DELCORA's April 2017 Draft FCA was submitted, EPA, PADEP, and DELCORA have had one in-person meeting on May 22, 2017, and two phone calls, which took place on June 1, 2017 and June 23, 2017. There were a number of questions exchanged between EPA, PADEP, and DELCORA during those discussions, some of which were outside the scope of the Draft FCA. The following responses provide our reply to those questions:*

i. Kimberly-Clark. DELCORA asked whether Kimberly-Clark would be responsible for LTCP costs proportionate to its flow to the treatment plant. The CSO Control Policy recommends that the municipality consider sources of funding in determining the phasing of construction projects, which can include the availability of grants and loans; previous and current *residential, commercial, and industrial sewer user fees and rate structures*; and other viable funding mechanisms. Emphasis added. The EPA document, "CSOs: Guidance for Funding Options" (1995) states that "because CSO controls benefit the whole service area, permittees should recognize that, in most cases, it will be necessary to use a fee structure that distributes the CSO control costs among all system customers. Recovering costs through increases to system-wide user fees will distribute the cost increases more broadly." The specific rate design that a utility develops is largely in its discretion. The FCA is a uniform and consistent methodology for evaluating the financial impact of proposed CSO LTCP costs and not appropriate for setting rates. Utility rate structures are designed to generate revenues to cover costs and assure that various financial ratios are met. Utility rate design can range from simple to complex, including charges for concentrated waste discharge or lower cost for higher volume customers. Ultimately, the rate design is up to the permittee, balancing the revenue requirements with allocation of costs to various types of customers.

Further, as part of the CSO Policy's Nine Minimum Controls and LTCP requirements, the permittee's publicly owned treatment works (POTW) options are an integral part of the alternatives evaluation process. Specifically, the CSO Policy states that the LTCP should consider expansion of POTW secondary and primary capacity in the CSO abatement alternative analysis. Thus, the permittee should take into account any industrial flow to the treatment plant relative to the POTW's role in addressing CSOs.

Response:

The alternatives analysis will include a review of maximizing flow to the POTW. DELCORA agrees that the specific rate design that a utility develops is largely in its discretion and that the rate design is up to the permittee. DELCORA will consider the other rate impacts as part of the development of the LTCP."

ii. 2014 Framework. DELCORA asked EPA to state its position about the relationship between the FCA Framework and the FCA Guidance. The cover memorandum that EPA

issued to accompany the FCA Framework notes that the FCA Guidance provides an aid for assessing financial capability as part of negotiating schedules for implementing CWA requirements for municipalities and local authorities. The FCA Guidance also encourages permittees "to submit any additional documentation that would create a more accurate and complete picture of their financial capability" that may "affect the conclusion" of the analysis described in the guidance. The FCA Framework identifies the key elements EPA uses in working with permittees to evaluate how their financial capability should influence schedules. In addition, the FCA Framework provides examples of additional information that may help some communities provide a "more accurate and complete picture" of their financial capability as is envisioned in the FCA Guidance.

Response:

Additional information was provided to USEPA on August 17, 2017 that describes DELCORA's unique circumstances.

iii. Incorporation of dry weather flow. DELCORA asked whether every EPA-approved FCA requires that all dry weather flow areas be included in the FCA and whether there is any provision in the FCA or LTCP/CSO guidance that supports the position that all areas contributing dry weather flows must be included for FCA purposes. The FCA Guidance does not provide for how DELCORA will apportion costs of the LTCP, other than the Residential Indicator calculations, which identifies the impact of wastewater and CSO control costs on individual households based on a flow-based allocation. As part of the Residential Indicator calculations from the FCA Guidance, the residential share of total costs is proportionate to the residential portion of "total wastewater flow," not wet weather flow. FCA Guidance, Page 14. In addition, the Cost Per Household portion of the Residential Indicator is calculated by dividing the residential share of WWT and CSO costs by "the number of households in the permittee's total wastewater service area," not just households that contribute dry weather flows. FCA Guidance, Page 12.

Response:

See response to Comment 2a above.

iv. Proportionate share. DELCORA asked EPA to consider the CWA principles of "proportionate share." EPA's FCA Guidance was developed, in part, based on the experience of EPA in the Construction Grants program. EPA's Construction Grants regulations require that a grantee's user charge system, if not using ad valorem taxes, "shall provide that each user (or user class) pays its proportionate share of operation and maintenance (including replacement) costs of treatment works within the grantee's service area, based on the user's proportionate contribution to the total wastewater loading from all users (or user classes)." 40 C.F.R. 35.2140(a). The CSO Control Policy states that "each permittee is ultimately responsible for aggressively pursuing financial arrangements for the implementation of its long-term CSO control plan." Placing almost all of the financial responsibility upon the City of Chester for implementing the LTCP is not consistent with the CWA principle of "proportionate share" of the DELCORA's treatment and conveyance costs, given that DELCORA should be examining a broad range of compliance options within its overall system. As noted above, the City of Chester is a relatively small proportion of the overall service area and total wastewater loading. Disproportionately burdening the City of Chester would avoid DELCORA's responsibilities under its NPDES permit, the CSO Policy and the Clean Water Act.

Response:

See responses to Comments 1b and 2a above.

DELCORA LTCPU Task 9: DRAFT Financial Capabilities Assessment Report (rev. Nov. 2016)
Responses to USEPA and PADEP Concerns (Comments received February 23, 2017) DUE April 24, 2017

No.	Reviewer Name	Report Reference	Review Concerns	Response to Concerns
1	EPA/PADEP	Page 1-4	1. Model Area: Consistent with the terms of the Consent Decree, the Model Area must include the entire Eastern Service Area. DELCORA has expanded the FCA's discussion of the basis for having the Model Area include the Western Service Area plus the Central Authority of the Eastern Service Area (Page 1-4, FCA). However, DELCORA's exclusion of the rest of the Eastern Service Area in its assessments is inconsistent with the Consent Decree. Paragraph 18 of the Consent Decree requires that the Financial Capability Assessment include: information on sewer rate setting and median household income and number of households in the entire Model Area (as defined in Paragraph 14.b above), as well as information on all other financial resources available to DELCORA. [Emphasis added.] Paragraph 14.b of the Consent Decree defines "Model Area" to include: all areas tributary to the entire Collection System, as well as all areas tributary to all municipal wastewater collection and transmission systems that are, as of the date the LTCP is submitted, hydraulically connected to, or that directly or indirectly influence flow to, the CSOs and/or the WRTP, regardless of who owns or operates the system(s), including but not limited to the entire "Western Service Area" and "Eastern Service Area." [Emphasis added.]	Paragraph 14.b of the Consent Decree defines the "Model Area" as: all areas tributary to the entire Collection System, as well as all areas tributary to all municipal wastewater collection and transmission systems that are, as of the date the LTCP is submitted, hydraulically connected to, or that directly or indirectly influence flow to, the CSOs and/or the WRTP, regardless of who owns or operates the system(s), including but not limited to the entire "Western Service Area" and "Eastern Service Area." [Emphasis added.] We examined the entire "Western Service Area" and "Eastern Service Area" and found that only the "Western" service area and "Central" portion of the Eastern service area are hydraulically connected to, or directly or indirectly influence flow to the CSOs and/or the WRTP. Therefore, in compliance with the Consent Decree, the entire "Model Area" is defined by the "Western Service Area" and "Central" portion of the "Eastern Service Area," since these areas are hydraulically connected to and/or directly or indirectly influent flow to teh CSOs and/or the WRTP. The remainder of the "Eastern Service Area" flows to the Philadelphia SW plant. This portion of the Eastern Service Area is not hydraulically connected to the WRTP and does not directly or indirectly influence plant flow at the DELCORA WRTP or to CSO outfalls in Chester City.
			1. (cont.) Financially and operationally, DELCORA controls the wastewater flows discharged from the Eastern Service Area and Western Service Area. In the Eastern Service Area, DELCORA owns and operates the three major pumping stations that transmit the wastewater from the Central Delaware County Authority, the Muckinipates Authority and the Darby Creek Authority. DELCORA is responsible for conveying the Eastern Service Area wastewater to DELCORA's WRTP via the DELCORA's central diversion force main or through DELCORA's eastern force mains to the City of Philadelphia's Southwest Water Pollution Control Plant (SWWPCP). DELCORA controls the wastewater flow from the DELCORA's Central Delaware Pump Station that goes either to the WRTP or to the SWWPCP. If flows to the central diversion force main exceed 20 MGD, DELCORA can divert the flow to the SWWPCP. If the flows from the three pump stations to the SWWPCP exceed the limits in the contract with Philadelphia, DELCORA can send more flow to the WRTP up to a maximum of 20 MGD. DELCORA has a contract with Philadelphia to pay for both treatment and a portion of Philadelphia's LTCP costs. As listed above, DELCORA owns the pump stations and force mains located within the Eastern Service Area that transmit wastewater to either the SWWPCP or the WRTP. DELCORA needs to revise the FCA to include the entire Eastern Service area, including the costs of sending wastewater flow to the Philadelphia treatment plant and related Philadelphia LTCP costs.	The Central Delaware Pump Station pumps flow only from the Central Delaware County Authority service area. Normally, flow from this pump station is pumped into the central diversion force main which conveys flow to the WRTP. When flows from this pump station exceed 20 MGD, the excess portion is diverted to the Philadelphia SWWPCP. However, flows from the Muckinipates And Darby Creek Joint Authority service areas do not pass through the Central Delaware Pump Station and cannot be diverted into the central diversion force main. Flows from the Muckinipates and Darby Creek pump stations are conveyed to the Philadelphia SWWPCP only. The only flow that can be diverted from the Eastern Service area to the WRTP is flow originating from the Central Delaware County Authority. As such, this portion of the of the Eastern Service Area is included in the Draft FCA.

DELCORA LTCPU Task 9: DRAFT Financial Capabilities Assessment Report (rev. Nov. 2016) Responses to USEPA and PADEP Concerns (Comments received February 23, 2017) DUE April 24, 2017				
No.	Reviewer Name	Report Reference	Review Concerns	Response to Concerns
2	EPA/PADEP	Pages 4-3 and 4-4	2. Allocation of Financial Capability Based on Wet Weather Flow Relative to Combined Sewers' Documentation. In response to our comment, DELCORA appears to have adjusted the analysis slightly with respect to taking a fuller engineering-based examination of a wide range of options involving the service area beyond Chester City. (Item 4 below also relates to this.) As EPA noted in its letter of September 15, 2016, DELCORA must consider, among other things, "inflow and infiltration to sanitary sewers that may occur during storm events and the impacts of the various control alternatives on such inflow and infiltration." The impact of the calculations described on pages 4-3 and 4-4 of the FCA on DELCORA's ultimate analysis and approach to resolving the CSO and other compliance issues remains unclear. The FCA needs to have a more detailed and transparent explanation of the basis for the calculations and the calculations' impact on the analysis and approach to resolving CSO and other compliance issues.	As described on page 4-3 of the revised report, allocation of costs was based on the customer contribution to CSO volume as well as excess volume generated from separate sewer communities. A review of the WRTP hourly flow records were used to estimate allocation for wet weather flows as the basis to assign costs to communities served by separate sewer systems. The original calculations are based on the hourly records and indicated that 3% of the wet weather flow would have been allocated to other communities and 97% to Chester City. In order to be conservative, this was revised for the draft FCA to be 15% to other communities and 85% to Chester City.The basis for calculation of the allocation along with the backing flow data is included in the revised Appendix. Also, as mentioned in the Draft FCA, the allocation will be revised for the final FCA (to be included as part of the revised LTCP Update) based on the updated, calibrated, and validated hydrologic and hydraulic model. Regarding "...impacts of various control alternatives...," please note that no alternatives have been considered at this time since the Draft FCA is being prepared prior to the LTCP alternative analysis. Alternatives will be presented in the LTCP Update and the FCA will be revised as necessary as part of the LTCP Update.
3	EPA/PADEP	Appendices 6 through 13	3. Backup for Current and Demographic Data. The FCA's Appendices 6 through 13 are partially responsive to EPA's request for detailed backup to the FCA computations. These Appendices include source documents without any explanation or citations of the derivation of the computations in the FCA analysis for the "Model Area." To expedite EPA's review of DELCORA's FCA, we request that DELCORA provide the spreadsheets supporting the FCA calculations, including identification of specific source data and computations. Also note that the Financial Capability Indicator should be for the permit holder, DELCORA, not for Chester City.	Additional explanation for the material in the Appendices has been added. In addition to the Chester City Financial Capability Indicator, the Draft FCA also shows Financial capability indicators for the Model Area.

DELCORA LTCPU Task 9: DRAFT Financial Capabilities Assessment Report (rev. Nov. 2016) Responses to USEPA and PADEP Concerns (Comments received February 23, 2017) DUE April 24, 2017				
No.	Reviewer Name	Report Reference	Review Concerns	Response to Concerns
4	EPA/PADEP		4. Allocation of Costs to Chester City: EPA's September 15, 2016 letter expressed concern that DELCORA was proposing to assign the bulk of the CSO costs to Chester City, an area which accounts for a small percentage of the Model Area households and flow. In the FCA, it appears that DELCORA has slightly adjusted its allocation of costs, but persists in allocating wastewater treatment costs and combined sewer overflow costs specific to Chester City in a proportion greater than Chester City's size relative to the service area flow or households. As a result, Chester's cost per household ($323 on 2015 basis) is significantly higher than the cost per household for the Model Area ($279 on 2015 basis). DELCORA explains the basis for this allocation on page 4-3 of the revised report: "...the allocation of costs for CSO abatement has been revised to distribute costs not to Chester City alone but rather to the Model Area customers in proportion to their contribution to CSO volume as well as excess volume generated from separate sewer communities within the Model Area during wet weather." While EPA accepts the analysis of the potential impact of the LTCP on residents of Chester City, an analysis that allocates all or much of the LTCP costs to Chester City is not acceptable. As the permittee, DELCORA is the responsible party for completing the injunctive relief, not Chester City. Therefore, the concerns EPA expressed in the September 15 letter remain. (EPA requests the underlying basis and calculations supporting the allocations of costs., and notes that the issues raised in Item 2, above, also relate to Item 4.) There are other details, such as cost basis, which EPA has not thoroughly reviewed due to the methodological shortcomings identified above. Thus, EPA may have additional comments on any resubmittals. According to paragraph 35 of the CD, DELCORA has sixty days in which to address these deficiencies and resubmit the revised report to EPA, and/or invoke the Dispute Resolution process set forth in Section XII of the CD.	As described on page 4-3 of the revised report, allocation of costs was based on the customer contribution to CSO volume as well as excess volume generated from separate sewer communities. The basis for calculation of the allocation along with the backing flow data is included in the revised Appendix. Also, as mentioned in the Draft FCA, the allocation will be revised for the final FCA (to be included as part of the revised LTCP Update) based on the revised hydrologic and hydraulic model. DELCORA believes that its “proportional” approach to allocating CSO costs is supported by the Clean Water Act and its implementing regulations. By way of example, when Congress wrote the CWA, it considered the contractual process and financial mechanisms by which wastewater treatment systems are financed and operated by local governmental authorities. By way of example, Section 204(b) of the Clean Water Act states that a wastewater treatment provider can only receive a federal construction grant if it charges the “recipients” of its services a commensurate, or proportional, amount to the services actually received. That section requires an applicant for the grant to have adopted a “system of charges” whereby each “recipient” of waste treatment services be charged its “proportionate share” of the costs of operation and maintenance of any waste water treatment services provided by the applicant. Similarly, the implementing regulations states that a user charge system shall be “based on the users’ proportionate contribution to the total waste water loading from all users.” (40 C.F.R. § 35.939-1). The legislative history to these provisions makes clear that Congress’s intent behind Section 204(b) was to provide localities with flexibility in designing user fee systems. As applied here, any plan to defray CSO costs should be proportionally charged to those who are served by and contribute to the CSO. Conversely, municipalities not contributing to or served by the CSO should not be charged unfairly because they are not serviced by the CSO. The allocation of costs proposed by DELCORA is both proportional and equitable. In addition, it is important that EPA consider the fact that the FCA Guidance states that the two-phase analysis set forth in the FCA Guidance may not provide a complete representation of financial capability, and that other relevant financial or demographic information might demonstrate atypical circumstances. For example, as EPA and DOJ know well, the Eastern Service Area is required to pay the fees associated with the Philadelphia LTCP which has increased substantially from the original amount of $178 Million to over $400 Million (documented in a 2/8/2017 letter to EPA Counsel Yeany). Accordingly, DELCORA will not be considering those municipalities within the Eastern Service Area as responsible towards paying for costs associated with the LTCP for the Western Service Area and plant. In fact, during the consent decree negotiations, both EPA and DOJ were receptive to allowing DELCORA to consider factoring in this specific information into the FCA as supporting DELCORA’s reason not to impose charges on all municipalities.

Appendix D: Basis for Allocating CSO LTCP Costs

Section 1 Introduction

The development of and timing for the implementation of a LTCP should be based upon the true affordability of the community and how the CSO LTCP will be financed, which means that all customers in the wastewater service area must pay their fair share of all the services provided by the Authority, including the wholesale customers. Most communities develop rates based on a cost of service to achieve "approval" from the community and their wholesale customers, especially when significant rate increases are required and all users want to understand why their wastewater bill has doubled or tripled. Most Financial Capability Assessments (FCAs) have not used cost of service as an approach because there was either insufficient information available at the time the FCA was developed or there was not enough time to discuss cost sharing options with wholesale customers. More recently, however, cost of service approach has been developed and used by CSO communities with advanced CSO LTCPs that serve as a "lessons learned" for those communities that will need to prepare a future FCAs.

1.1 Purpose

The DELCORA Financial Capability Assessment incorporates unique financial circumstances requiring local considerations and approaches that require the flexibility offered by EPA's 1997 FCA Guidance and the EPA's 2014 FCA Framework. The two purposes of this technical memorandum and the case studies are (1) to identify precedents for DELCORA's FCA approach and (2) provide lessons learned from how Wholesale Customers actually shared in the LTCP costs that could be incorporated into the DELCORA FCA, which better reflects the true affordability for the communities.

1.2 DELCORA's Financial Capability Assessment Objectives

The complexity of DELCORA's service area, number of municipalities, authorities, and industries, and the DELCORA service agreement with the Philadelphia Water Department (PWD) offers unique challenges. To manage these challenges, DELCORA has developed clear objectives for the development of the FCA and identifies a path to minimize financial risks. The FCA objectives are as follows:

- Objective #1: Comply with DELCORA's 2015 Consent Decree regarding the development and implementation of the Long-Term Control Plan for the CSOs in Chester City.
- Objective #2: Develop the DELCORA LTCP Financial Capability Assessment consistent with current rate making practices which are based on industry standard approaches.
  - Allocate LTCP costs in a fair and equitable manner for all DELCORA customers.
  - Calculate LTCP cost allocations based on each municipality, authority, and industrial customer's contribution to the problem (i.e., share of the wet weather volume discharged).
- Objective #3: Minimize DELCORA's financial risks:
  - Minimize the potential loss of an industrial customer. Since industrial flows are ~24% of DELCORA's WRTP flow, loss of an industrial customer would result in an economic loss for the community as the remaining customers would absorb a larger share of fixed costs.
  - Avoid potential litigation from wholesale and industrial customers associated with unfair rate increases or inequitable rate making practices.
  - Minimize potential withdrawal of municipalities, industries, and authorities from the DELCORA facilities (i.e. municipality, industry, or authority could decide to construct its own new WWTP).
  - Allow for a detailed planning model that will allow DELCORA to predict the need for phased-in rate increases that will not result in any large, one-time increases to rates.

Section 2 Financial Capability Assessment Approach

2.1 Flexibility Allowed by EPA Financial Capability Guidance

2.1.1 EPA's 1997 CSO – Guidance for Financial Capability Assessment and Schedule Development

EPA's 1997 Combined Sewer Overflows – Guidance for Financial Capability Assessment and Schedule Development (EPA 1997 FCA Guidance) provides a basic framework for preparing the CSO community's Financial Capability Assessment, which is used to facilitate discussions between the permittees and the governmental authorities on phasing in CSO controls and establishes a reasonable implementation schedule based in part on the community's affordability. The EPA 1997 FCA Guidance consistently highlights the importance of "flexibility" in the development of the CSO community's LTCP and FCA. Excerpts from EPA 1997 CSO FCA Guidance are provided in **Table 2-1**.

2.1.2 EPA's 2014 Financial Capability Assessment Framework for Municipal Clean Water Act Requirements

EPA's 2014 Financial Capability Assessment Framework for Municipal Clean Water Act Requirements (EPA 2014 FCA Framework) provided greater clarity on the flexibilities that were already built into the existing 1997 CSO FCA Guidance (See highlighted sentence in Item 1 of **Table 2-2**). Excerpts from EPA 2014 FCA Framework, provided in **Table 2-2**, show the flexibility to calculate the financial metrics differently from the schedules in the EPA 1997 CSO FCA Guidance.

2.2 Unique Financial Circumstances for DELCORA's CSO LTCP FCA

The EPA 2014 FCA Framework's purpose was to provide greater clarity on the flexibilities already built into the EPA 1997 FCA Guidance. Accordingly, the approaches to DELCORA's unique financial circumstances, as shown in **Table 2-3**, are consistent with and acceptable under the EPA 1997 CSO FCA Guidance.

Table 2-3 (below) shows the unique features of the DELCORA FCA and describes the approach used in the FCA.

Table 2-1: EPA 1997 CSO FCA Guidance and Example of DELCORA's Unique Financial Circumstances

Item	Flexibility from EPA 1997 FCA Guidance	Example of DELCORA's Unique Financial Circumstance
1	Section I. "Introduction", Page 7; "**It must be emphasized that the financial indicators found in this guidance might not present the most complete picture of a permittee's financial capability to fund the CSO controls.** *(emphasis added)* However, the financial indicators do provide a common basis for financial burden discussions between the permittee and EPA and state NPDES authorities. **Since flexibility is an important aspect of the CSO Policy, permittees are encouraged to submit any additional documentation that would create a more accurate and complete picture of their financial capability**. *(emphasis added)*"	• DELCORA serves 44 municipalities and 14 major industries. There is a risk of losing wholesale or industrial customers if costs are not allocated to all customers in a transparent, fair and equitable manner. • The EPA 1997 CSO FCA Guidance does not present the complete picture of the complexity of allocating all costs for services to all of DELCORA's retail and wholesale customers in a fair and equitable manner.
2	Section II. "CSO Financial Capability Assessment Approach", Page 10; "Since flexibility is an important component of the CSO Policy, WQS authorities, NPDES authorities, EPA personnel, and permittees should communicate throughout the CSO control planning process to coordinate the development of an effective LTCP. **This guidance document provides all CSO participants with a structured yet flexible approach for evaluating the financial burden CSO controls place on permittees, it also recognizes the importance of this financial burden when establishing a CSO control implementation schedule.** *(emphasis added)* The financial capability information developed in this guidance provides a basis for the permittee and the NPDES authorities to negotiate the implementation schedule for the CSO controls. **However, when a permittee believes that there are unique circumstances that would affect the conclusion of this guidance, the permittee may submit documentation of its unique financial conditions to the appropriate EPA or State NPDES authorities for consideration.** *(emphasis added)*"	• Chester City is the only municipality with a combined sewer system and is the poorest municipality in the service area. • The City of Chester is a financially distressed municipality as defined by the 1987 Financially Distressed Municipalities Act 47 (Act 47). Chester City continues to have budget deficits and remains in the Act 47 program until their financial health improves.

Table 2-1: EPA 1997 CSO FCA Guidance and Example of DELCORA's Unique Financial Circumstances (Continued)

Item	Flexibility from EPA 1997 FCA Guidance	Example of DELCORA's Unique Financial Circumstance
3	Section III. "Phase One: The Residential Indicator", Page 19; "**In situations where a permittee believes that there are unique circumstances that would affect the conclusion of the first phase, the permittee may submit documentation of its unique financial conditions to the appropriate state NPDES and EPA authorities for consideration.** *(emphasis added)*"	• DELCORA has several unique circumstances that would affect the conclusion of the first phase (residential indicator), which include; ○ DELCORA serves 44 municipalities and 14 major industries that require fair and equitable cost allocations based on services provided. ○ DELCORA allocates current costs to retail, wholesale, and industrial customers based on annual wastewater volume for each customer and water consumption. ○ Chester City is the only combined sewer system. ○ Chester City is the poorest community. ○ Chester City is located in the Western Service Area. ○ The bedrock principle of rate setting is COST CAUSATION – assigning costs to those customers who cause the costs. ○ DELCORA only operates a few collection systems. Costs for collection systems not operated by DELCORA are accounted for separately. • **Table 2-3** provides approaches to DELCORA's unique circumstances.

Table 2-1: EPA 1997 CSO FCA Guidance and Example of DELCORA's Unique Financial Circumstances (Continued)

Item	Flexibility from EPA 1997 FCA Guidance	Example of DELCORA's Unique Financial Circumstance
4	Section IV. "Phase Two: Permittee Financial Capability Indicators", Page 20; Even though the financial capability analysis reflects current conditions, pending changes in the service area should be considered in development of the second phase indicators. For example, if the current unemployment rate is high, but there is a new plant opening that will stimulate economic growth, the unemployment indicators for the service area would need to be modified to reflect the projected impact of the new plant. The permittee should submit documentation of such conditions to the appropriate EPA and state NPDES authorities for consideration. **When the permittee is a sanitary district, sewer authority or similar entity, the second phase indicators related to property values and tax revenues may not be applicable. In those circumstances, the permittee may simply use the remaining indicators or submit other related documentation that will help assess its financial capability to implement the CSO controls.** *(emphasis added)*"	• As an authority, DELCORA does not have the ability to generate revenue by increasing tax rates on real estate or personal property to fund CSO improvements.
5	Section IV. "Phase Two: Permittee Financial Capability Indicators", Page 36, **In situations where a permittee believes that there are unique circumstances that would affect the conclusion of the second phase, the permittee may submit documentation of its unique financial conditions to the appropriate EPA and state NPDES authorities for consideration.** *(emphasis added)* The purpose of additional information is to clarify unique circumstances which are not fairly represented by the overall scores of the selected indicators. An example could be where a state or community imposes restrictions on property taxes.	• The City of Chester is a financially distressed municipality as defined by the 1987 Financially Distressed Municipalities Act 47 (Act 47). Chester City continues to have budget deficits and remains in the Act 47 program until their financial health improves.

Table 2-2: EPA 2014 CSO FCA Framework and Example of DELCORA's Unique Financial Circumstances

Item	Flexibility from EPA 2014 FCA Framework	Example of DELCORA's Unique Financial Circumstance
1	"**Purpose**", Page 1; "This financial capability assessment framework is intended to provide additional examples and **greater clarity on the flexibilities built into existing guidance that local governments or authorities can use in assessing their financial capability** *(emphasis added)*, and the relationship between that assessment and consideration of schedules for permit and consent decree implementation. This framework builds on the progress already made in the May 2012 "Integrated Municipal Stormwater and Wastewater Planning Approach Framework," and the **experience gained from talking with communities about their financial capability in actual, on the ground circumstances**. *(emphasis added)* Integrated Planning has been helping in identifying a permittee's relative priorities for projects based on the relative importance of adverse impacts on human health and water quality and the municipality's financial capability."	• The EPA 2014 CSO FCA Framework clarifies the flexibilities that are already included in the EPA 1997 FCA Guidance. Therefore, the approaches to DELCORA's unique financial circumstances, as shown in **Table 2-3**, are consistent with and acceptable under the EPA 1997 CSO FCA Guidance.

Table 2-2: EPA 2014 CSO FCA Framework and Example of DELCORA's Unique Financial Circumstances (Continued)

Item	Flexibility from EPA 2014 FCA Framework	Example of DELCORA's Unique Financial Circumstance
2	**"Financial Capability Assessment"**, key element No. 1, Page 2; **"The 1997 FCA Guidance identifies a valuable assessment that provides a common basis for financial burden discussions between the permittee, EPA and state NPDES authorities. Permittees have the option of submitting additional information that would create a more accurate and complete picture of their financial conditions.** The financial capability assessment described in the 1997 FCA Guidance identifies information that provides a basis for a general comparison of financial conditions between communities across the country and provides a consistent assessment of basic financial indicators as part of the overall analysis. **Additional information that the community provides on its unique financial circumstances will be considered so that schedules take local considerations into account. Where appropriate, this information can result in schedules that are different than the schedules suggested by the baseline analysis suggested in the 1997 FCA Guidance."** *(emphasis added)*	• DELCORA has several unique circumstances that affect the conclusion of the residential indicator phase and require slight modifications to schedules in the EPA 1997 CSO FCA Guidance, which include; ○ DELCORA serves 44 municipalities and 14 major industries that require fair and equitable cost allocations based on services provided ○ DELCORA allocates current costs to retail, wholesale, and industrial customers based on annual wastewater volume for each customer and water consumption. ○ Chester City is the only combined sewer system ○ Chester City is the poorest community ○ Chester City is located in the Western Service Area ○ DELCORA only operates a few collection systems. Costs for collection systems not operated by DELCORA are accounted for separately. • **Table 2-3** provides approaches to DELCORA's unique circumstances, which creates a more accurate and complete picture of DELCORA's financial conditions.

Table 2-2: EPA 2014 CSO FCA Framework and Example of DELCORA's Unique Financial Circumstances (Continued)

Item	Flexibility from EPA 2014 FCA Framework	Example of DELCORA's Unique Financial Circumstance
3	**"The Financial Capability Assessment Guidance and Examples of Additional Information that are Relevant to a Consideration of Financial Capability"**, Pages 5 and 6; "The examples given below are not intended to be a complete list, nor a list of factors that will be relevant in every community. Rather it provides an illustration of information that may prove useful in some instances. Examples of Information Related to Residential Impacts: 1. **Income distribution by quintile, geography or other breakdown, illustrating how income distribution in the service area differs from comparable data on the national level or for similar cities.** *(emphasis added)* 2. Where cities have adopted differential rates for low income customers, the income distribution that led to that rate structure. 3. **Information about service area poverty rates and trends.** *(emphasis added)* 4. Projected, current and historical sewer, and stormwater fees as a percentage of household income, quintile, geography or other breakdown. 5. Information on sewer and water usage for various classes of ratepayers or by type of dwelling unit. Examples of Information Related to Financial Strength: 1. Historical population trends or population projections. 2. Service area unemployment data and trends, or other labor market indicators, including unemployment on an absolute basis. 3. **Rate or revenue models, including dynamic financial planning models showing the projections of impacts over the program period. All revenue sources tied to CWA obligations may be included as appropriate."** *(emphasis added)*	• Chester City is the only municipality with a combined sewer system and is the poorest municipality in the service area. • The City of Chester is a financially distressed municipality as defined by the 1987 Financially Distressed Municipalities Act 47 (Act 47). Chester City continues to have budget deficits and remains in the Act 47 program until their financial health improves. • When comparing the median household income for the Chester City between the decennial censuses, Chester City's median household income is not keeping up with rate of inflation. • DELCORA serves 44 municipalities and 14 major industries that require fair and equitable cost allocations based on services provided. Since the DELCORA FY2016 financial model already includes methodologies to allocate conveyance and dry/wet weather treatment costs in an industry standard fair and equitable manner that is consistent with current rate making practices and includes the timeframe when debt service will retire, DELCORA's approach is to use the FY2016 financial model to calculate the Cost per Household by municipality.

Table 2-3: Unique Financial Circumstances for DELCORA's CSO LTCP FCA

Item	Unique Circumstance	Financial Consideration	DELCORA's FCA Approach	Comments
1	DELCORA serves 44 municipalities and 14 major industries.	Approach required to allocate conveyance and dry/wet weather treatment costs in fair and equitable manner that is consistent with current rate making practices.	• Adapt existing FY2016 financial model to calculate the DELCORA's portion of Cost per Household for each municipality/ authority/ industry. • Calculate equivalent residential households based on 55,000 gallons per year per household.	
2	Chester City is the only municipality with a combined sewer system.	Approach required to allocate CSO LTCP costs in fair and equitable manner that minimizes the risk of losing a municipality/ authority/ industry	• Establish Peak Wet Weather Flow Targets for each municipality/ authority/ industry. • Total annual excess wet weather volume is the summation of annual excess wet weather volumes above flow targets plus the annual volumes discharged from the CSO Outfalls. • Municipalities/ authorities/ industries share of CSO LTCP costs would be based on their annual excess wet weather volume above their flow target divided by the total annual wet weather volume.	ALCOSAN is employing a similar approach for sizing their regional wet weather facilities, which will most likely result in updating wholesale customer cost sharing methodology.
3	Chester City is the poorest municipality in service area.	The Chester City MHI is $27,249 in 2013 dollars and is a distressed community.	• Show columns for both Chester City and Model Area in the FCA calculations • Overall affordability should be based on Chester City	
4	Chester City is located in the Western Service Area and flows to the Western Regional Treatment Plant.	Municipalities/ authorities/ industries in Eastern Service Area flow to PWD's SW WPCP, do not contribute flow to DELCORA's WRTP, and therefore are not included in the Model Area.	Exclude from the FCA municipalities/ authorities/ industries in the Eastern Service Area that do not contribute flow to DELCORA's WRTP.	
5	DELCORA does not own or operate all of the wastewater collection systems in the service areas.	• Wastewater collection systems not operated by DELCORA are billed separately to residential customers. • A few municipalities fund wastewater collection systems through their general fund and exact costs to residential customers are not known.	• Add wastewater collection system costs to the Cost per Household calculation for municipalizes / authorities who own and operate their collection system. • If collection system costs are not known, use the same unit charge for collection system renewal / operation as the DELCORA retail customers.	
6	DELCORA does not own or operate the stormwater system	Most municipalities fund stormwater systems through their general fund and exact costs to residential customers are not known.	Added stormwater system costs to the Cost per Household calculation, which is based on the average fee from a national survey.	

2.3 DELCORA's Approach for Allocating LTCP Costs to Municipalities, Authorities, and Industries

System Configuration

DELCORA has two service areas (Western and Eastern) that are served by two wastewater treatment plants; DELCORA's Western Regional Treatment Plant (WRTP) and PWD's Southwest Water Pollution Control Plant (SW-WPCP) as shown in **Figure 2-1**. All the flows (dry and wet weather) in the Western Service Area flow to DELCORA's WRTP. The Eastern Service Area is comprised of four Authorities – Central Delaware County Authority, Muckinipates Authority, Radnor-Haverford-Marple Authority, and Darby Creek Joint Authority. All the flows (dry and wet weather) from the Muckinipates Authority, Radnor-Haverford-Marple Authority, and Darby Creek Joint Authority flow to PWD's SW-WPCP. The first 20 mgd of flow, which includes all of the dry weather flow and a majority of the wet weather flow, from the Central Delaware County Authority is conveyed to DELCORA's WRTP and the remaining flows (primarily high wet weather flows) are conveyed to PWD's SW-WPCP though a valve operation on the Eastern Force main.

Unique Financial Circumstance

Since DELCORA serves 44 municipalities and 14 major industries, only operates a few of the wastewater collection systems (only in the Western Service Area), and fair and equitable cost allocations for industries and authorities are required, DELCORA has developed a financial model to allocate costs for services provided to retail customers and wholesale customers (industries, municipalities, and authorities). The financial model has been modified to serve as the basis to calculate the Cost per Household required under the EPA's 1997 FCA Guidance and the 2014 FCA Framework. The EPA 2014 FCA Framework specifically recognized that schedules/worksheets that account for the local considerations associated with unique financial circumstances may be different from the schedules/worksheets shown in the EPA 1997 FCA Guidance (See EPA 2014 FCA Framework, **"Financial Capability Assessment"**, Key Element No. 1, at Page 2).

Current debt service, O&M costs, and future renewal costs for the facilities that serve all current permitted Clean Water Act requirements have been allocated to all the DELCOA customers in a fair and equitable manner in the base financial model. **Figure 2-2** shows how the two LTCPs (Chester City LTCP and DELCORA's portion of PWD LTCP) will be assigned to the customers in the FCA financial model.

DELCORA has completed the model calibration and has initial flow results from the calibrated model for the climate period of 1994 through 1996. **Appendix D** shows how the separate sewer system flows were calculated from the model results and includes the hydrographs for the period between 1994 and 1996. The horizontal dashed line on the hydrographs represents the collective wet weather flow target for the WRTP model area. **Table 2-4** summarizes the annual CSO volume and the annual excess wet weather volume from the separate sewer system. The separate sewer system is functionally increasing the CSO volume by 8.2% to 11.6%. Therefore, separate sewer system's share of the Chester City CSO problem should remain about 15% for planning purposes. This evaluation should be updated after future dry weather flow projections are added to the model and the recommended CSO control alternatives are selected.

Figure 2-1
DELCORA's Approach to Allocating LTCPs Costs by Service Area

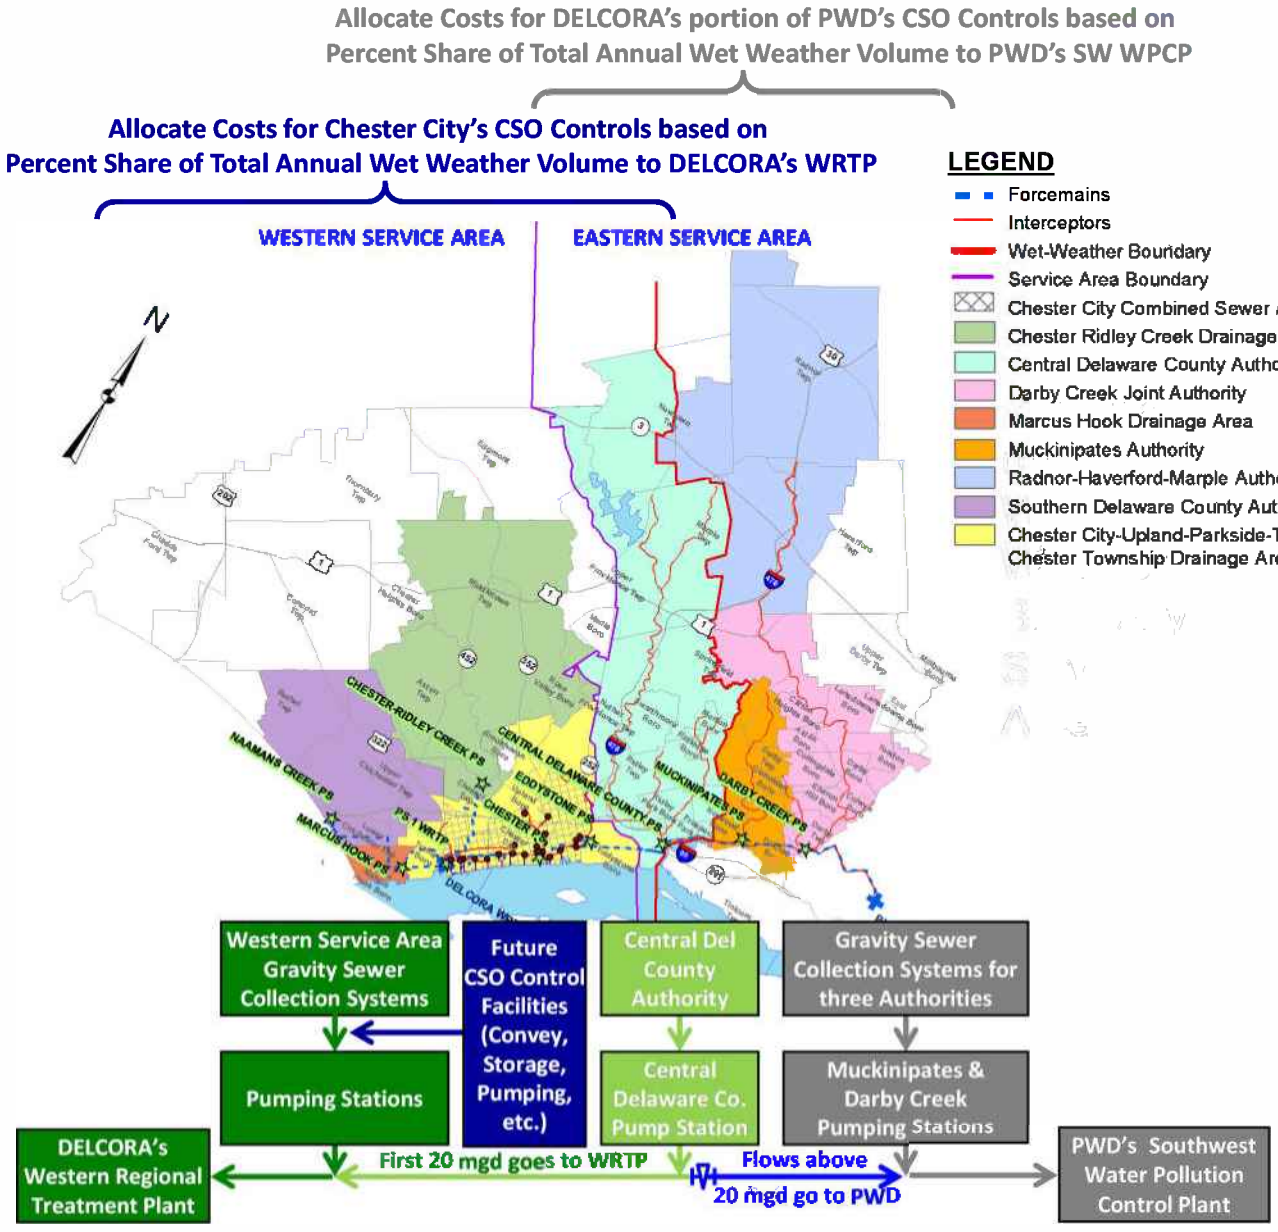

Figure 2-2
DELCORA's Approach to Allocating LTCP Costs by Customer

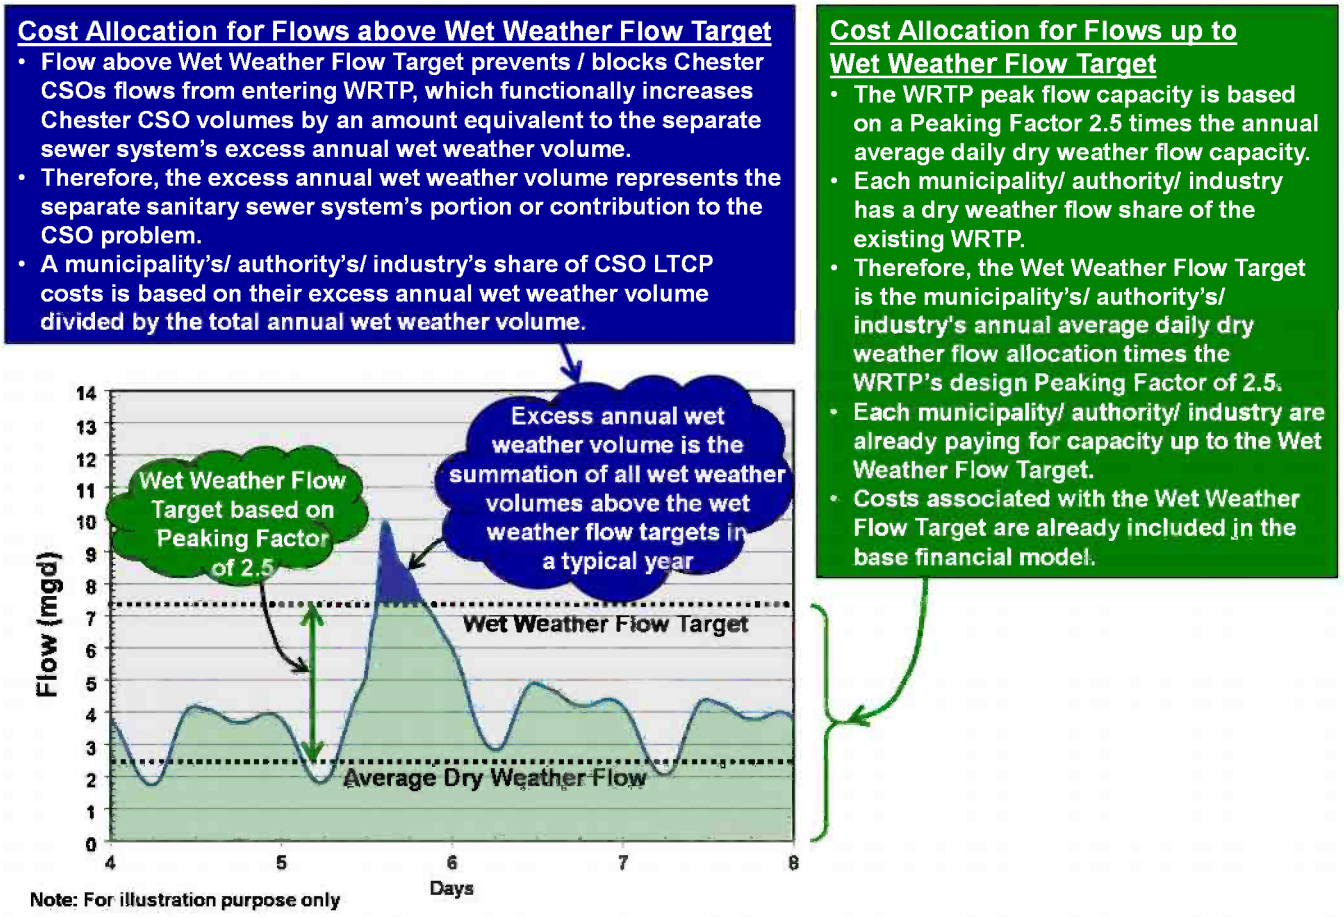

Table 2-4:
Basis for Allocating LTCP Costs for CSOs in Chester City

Year	A Annual CSO Volume (MG)	B Excess Wet Weather Volume from Separate Sewer System (MG)	C = A +B Total Excess Wet Weather Volume (MG)	D = A / C Annual CSO Volume (%)	E = B / C Excess Wet Weather Volume from Separate Sewer System (%)
1994	327	34	361	90.7%	9.3%
1995	201	18	219	91.8%	8.2%
1996	371	49	420	88.4%	11.6%
Average	300	33	333	90.0%	10.0%

Section 3 FCA Case Studies for Precedents and Lessons Learned

The DELCORA FCA has unique financial circumstances requiring local considerations and approaches that require the flexibilities offered in the EPA 1997 FCA Guidance and the EPA 2014 FCA Framework. The two purposes of the case studies are (1) to identify precedents for DELCORA's FCA approaches and (2) provide lessons learned from how Wholesale Customers actually shared in the CSO costs that could be incorporated into the DELCORA FCA, which reflects the true affordability for the communities. CSO Communities were surveyed for the following information:

- Provide CSO Community characteristics
- Summarize the most recent FCA
  - How were Wholesale Customers incorporated into the FCA?
  - Where there any Unique Financial Circumstances or precedent setting approaches that were allowed under the EPA 1997 FCA Guidance or EPA 2014 FCA Framework?
- Describe how the CSO Community paid for the CSO LTCP?
  - Were Municipal Service Agreements re-negotiated?
  - How were CSO LTCP costs allocated to the Wholesale Customers?
  - What was the outcome of allocating CSO costs to the Wholesale Customers?
- Lessons Learned for future FCAs

3.1 Case Study Results

The communities surveyed have advanced CSO control programs with wholesale customers who pay a portion of the CSO LTCP costs. The four CSO case studies have the following relevant features to the DELCORA FCA:

- Case Study #1 – DC Water:
  - Original FCA did not include wholesale customers.
  - Multi-year process to update service agreements where wholesale customers agreed to pay their fair share of the CSO LTCP, which is based on same excess annual wet weather volume approach proposed by DELCORA.
  - 2015 FCA based on financial model that included wholesale customers' cost share.
- Case Study #2 – PWD:
  - PWD's FCA did not include wholesale customers.
  - PWD wholesale customer CSO LTCP cost share is flow based.
  - DELCORA is the major wholesale customer and has direct knowledge of the process to engage a separate sewer community in cost sharing of CSO controls.
- Case Study #3 – Indianapolis:
  - Indianapolis' FCA did not include wholesale customers.
  - Indiana Utility Regulatory Commission required Indianapolis-based Citizens Energy Group to update service agreements such that the Wholesale Customers pay their fair share.

- Case Study #4 – Anderson, Indiana:
  - Anderson FCA rigorously conformed to the EPA 1997 FCA Guidance
  - FCA assigned CSO costs allocated to all residential households, including residential households in wholesale customer service areas.

The CSO case studies are provided in **Appendix A**. A high level summary of the case studies is shown in **Table 3-1**, comparison with DELCORA's FCA approaches are shown in **Table 3-2**, and lessons learned are provided in **Section 3.3**, below.

Table 3-1
Summary of Case Studies

Description	DC Water	PWD	Indiana-polis	Anderson
Combined Sewer System Size in acres	12,400	40,960	35,000	4,700
Total Service Area in acres	464,000	87,040	177,500	10,500
CSO Control Program Capital Costs	$ 2.6 B	$ 3.5 B[1]	$ 2.0 B	$ 161 M
Municipal Service Agreements	8	10	6	2
Industrial Customers	52 SIUs			9
When was FCA prepared?	2002 & 2015	2009	2006	2010
Were Wholesale Customers included latest FCA?	Yes	No	No	Yes
Are Wholesale Customers paying for a portion of the CSO LTCP costs?	Yes	Yes	Yes	Yes
What percentage of CSO LTCP costs are being paid by Wholesale Customers?	7.1%	14.57%	7.95%	Unknown/ Not Calculated
What is the basis for Wholesale Customers share of CSO LTCP costs?	Excess Annual Wet Weather Volume	Peak Flow	Cost of Service based Peak Flow	Number of Households
Have any Wholesale Customers withdrawn from the service area and built their own wastewater treatment plant as result of the request to fund a portion of the CSO LTCP?	No	No[2]	No	Yes

Notes:
1. PWD's 2017 Bond Issue indicated that "As of the most recent projections, the total of the 25-year program is approximately $ 4.5 billion, of which approximately $ 3.5 billion are capital related costs and $ 1 billon are operation and maintenance costs."
2. DELCORA is PWD's largest wholesale customer. Based on the recent $ 4.5 billion estimate, DELCORA is considering other options, including the potential withdrawal from the PWD system and construction of a DELCORA Eastern Service Area Wastewater Treatment Plant.

3.2 Precedent for DELCORA's FCA Approaches

Many of the approaches employed to address the unique circumstances in the DELCORA FCA have been used by other CSO communities. **Table 3-2** shows the precedent of where the approach was used in other FCAs. There are a few circumstances, such as Items 4 and 5 in **Table 3-2**, which are only applicable to DELCORA's FCA and no precedents have been identified.

Table 3-2
Comparison of DELCORA's FCA Approach to other CSO Communities

Item	Unique Circumstance	DELCORA's FCA Approach	DC Water 2015 FCA	PWD 2009 FCA	Indianapolis 2006 FCA	Anderson 2010 FCA
1	DELCORA serves 44 municipalities and 14 major industries	Use Financial Model as basis for FCA calculations (future dollars, inflate MHI differently from O&M/Capital)	Financial Model (future dollars)	Financial Model (future dollars, inflate MHI differently from O&M/ Capital)	Financial Model (future dollars)	Did not use financial model
		Calculate equivalent residential households based on 55,000 gallons per year per household.			Used 65,000 gal per year	
2	Chester City is the only municipality with a combined sewer system.	Assign CSO Costs to Wholesale Customers base on annual wet weather volume above flow targets	Same approach as DELCORA FCA; Included in DC Water's Financial Model for 2015 FCA	Excluded Wholesale Customers from FCA	Excluded Wholesale Customers from FCA	Assigned CSO costs to all residential households
3	Chester City is the poorest municipality in service area.	Show impact on residential customers in most distressed community and overall WWTP service area	Yes	Yes	Yes	No (Only one burden level shown)
4	Chester City is located in the Western Service Area and flows to the Western Regional Treatment Plant.	Exclude municipalities/ authorities/ industries not tributary to Western Regional Treatment Plant	NA	NA	NA	NA
5	DELCORA does not own or operate all of the wastewater collection systems in the service areas.	Add wastewater collection system costs to the Cost per Household calculation for municipalizes / authorities who own and operate their collection system.	NA	NA	NA	NA
6	DELCORA does not own or operate the stormwater system	Add stormwater system costs to the Cost per Household calculation	Included DC specific stormwater fee	No	No	No

3.3 Lessons Learned

To understand the true affordability of the community the FCA should be based on how the LTCP will be financed, which means that all customers in the wastewater service area pay their fair share of all the services provided by the authority, including the wholesale customers. Most communities develop rates based on a cost of service to achieve approval from the community and their wholesale customers, especially when significant rate increases are required and customers want to understand why their wastewater bill double or tripled. Most FCA's have not used cost of service approaches because there was either insufficient information available at the time of the FCA or there was not enough time to discuss cost sharing options with wholesale customers. However, more recently, cost of service approaches have been developed by CSO communities with advanced LTCPs that serve as a "lessons learned" for the development of future FCAs.

3.3.1 Include Wholesale Customers in FCA with Clear / Defensible CSO Cost Share Basis

The Clean Water Act enforcement of EPA's 1994 CSO Control Policy required the larger CSO communities to develop LTCPs with FCAs and these CSO communities either did not have the information or the time to develop an approach for the CSO LTCP cost share with the wholesale customers. Therefore, most of these communities simply excluded the wholesale customers from the FCA, which was the case for DC Water's FCA prepared in 2002 and Indianapolis' FCA prepared in 2006. PWDs 2009 FCA also excluded the wholesale customers from the residential indicator calculation.

In the Indianapolis case, Indianapolis-based Citizens Energy Group (CEG) owns and operates the wastewater collection system, combined sewer system, and the wastewater treatment facilities. CEG sets wastewater rates that are regulated by the Indiana Utility Regulatory Commission. Currently, only Indianapolis City customers are paying for the LTCP. In 2013, CEG updated the cost of service assumptions to include the wholesale customer's share of the CSO LTCP. In the 2013 rate hearings the Indiana Utility Regulatory Commission required CEG to update the service agreements to eliminate the subsidy identified in the 2013 cost of service. In June 2017, CEG successfully re-negotiated new municipal service agreements that incorporated wholesale customer's share of the Indianapolis CSO LTCP costs. It should be noted that updating municipal service agreements was a contentious process, which required significant testimony from all parties involved before the Indiana Utility Regulatory Commission over the four year negotiations. Ultimately, CEG's success was due to transparent cost of service based approaches that allowed for wholesale customer buy-in and regulatory approval. CEG indicated that future FCAs (required by CEG's NDPES permit and Consent Decree) would include wholesale customers 7.98% share of the Indianapolis LTCP costs, which is based on cost of service.

In the DC Water case, the Inter-Municipal Agreement was updated in 2012 and became effective in 2013, which more clearly documented the wholesale customer's share of LTCP. The process to update Inter-Municipal Agreement started in 2008 and required several stakeholder meetings to document to the wholesale customers why and how they contributed to the CSO problem. Ultimately, DC Water was able to convince the wholesale customers that they needed to pay their fair share of the LTCP based on the flow data used to calibrate the hydrologic and hydraulic model and that the wholesale customers were exceeding their contract peak flow requirements (i.e. wet weather flow targets). DC Water recently modified their Consent Decree with EPA/DOJ to include a Green Infrastructure component using the 2012 Integrated Planning Framework. The FCA in DC Water's 2015 "Long Term Control Plan Modification for Green

Infrastructure" was based on the EPA 2014 FCA Framework, which allowed DC Water to show the affordability of the LTCP using methods that are different from EPA 1997 FCA Guidance. DC Water's 2015 FCA was based on a financial model that include the wholesale customer's 7.1% cost share of the LTCP. The approached DC Water used to allocate LTCP costs to the wholesale customers is the same approach proposed by DELCORA.

The lessons learned include:

- FCAs should be based on how the CSO LTCP will be funded and financed.
- Wholesale customers should be included in the FCA based on their share of the CSO problem.
- Industry standard cost of service based approaches are required to achieve wholesale customer buy-in and to understand the true affordability of the community.

3.3.2 Risk Management

Wholesale (industrial and municipal) service agreements are a two way street with benefits to both parties. Each party understands that operating one system results in lower costs for all parties due to economies of scale (i.e. fewer operation staff required to operate a single WWTP, only one WWTP laboratory and administration building is required, etc.). As long as costs for services are shared in a fair and equitable manner all the parities share in the cost savings. However, there are risks associated with not sharing costs in a fair and equitable manner, which are summarized as follows:

- Loss of an industrial customer
  - An industry leaving the community would be an economic loss on multiple fronts.
    - Loss of tax revenue from industry for the local government that fund schools, roads, police, firefighters, etc., would increase taxes on citizens to provide same services.
    - Loss of local jobs may result in people leaving the community, which places further burden on the remaining citizens.
  - Increase wastewater rates due to reduction in wastewater flows.
    - Debt service and the majority of operation and maintenance costs (labor and equipment maintenance, etc.) are fixed costs, and higher wastewater rates would be required to produce the same revenue needed to renew, operate and maintain the constructed facilities.

- Law suits from wholesale and industrial customers regarding unfair or unequitable rate making practices.
  - If wholesale and industrial customers determine that CSO costs are not being allocated in fair and equitable manner, the wholesale and industrial customers could challenge the cost allocations / rates in court.
  - If the court finds that CSO LTCP cost share were unfair or unequitable, then:
    - The CSO LTCP costs would have to be allocated to the remaining customers.
    - The CSO LTCP FCA would have not been a true reflection of community's affordability.

- Withdrawal of municipal wholesale customer
  - A municipality or authority may determine that it is cheaper to construct new WWTP than to continue to participate in the larger system. Similar to loss of industrial customer, higher wastewater rates would be required to produce the same revenue needed to renew, operate and maintain the constructed facilities.
  - Overall impact is that entire community would pay more for wastewater service due to the loss of the economy of scale.

In the case of Philadelphia Water Department (PWD), the 2009 FCA indicated that "residential indicator is based on the retail cost of wastewater service for households in the City of Philadelphia served directly by PWD". However, Table 4 in the City of Philadelphia, Water and Wastewater Revenue Bonds, Series 2017A indicates that wholesale customer share of the PWD's CSO LTCP costs is 14.57%. Table 4 also shows that DELCORA's share is 9.44% of the PWD CSO LTCP costs. PWD is allocating costs to the wholesale customers based on peak flow. DELCORA is currently evaluating if the 9.44% share of the PWD CSO LTCP costs is fair and equitable or if it cheaper to build a new DELCORA owned eastern service area wastewater treatment plant.

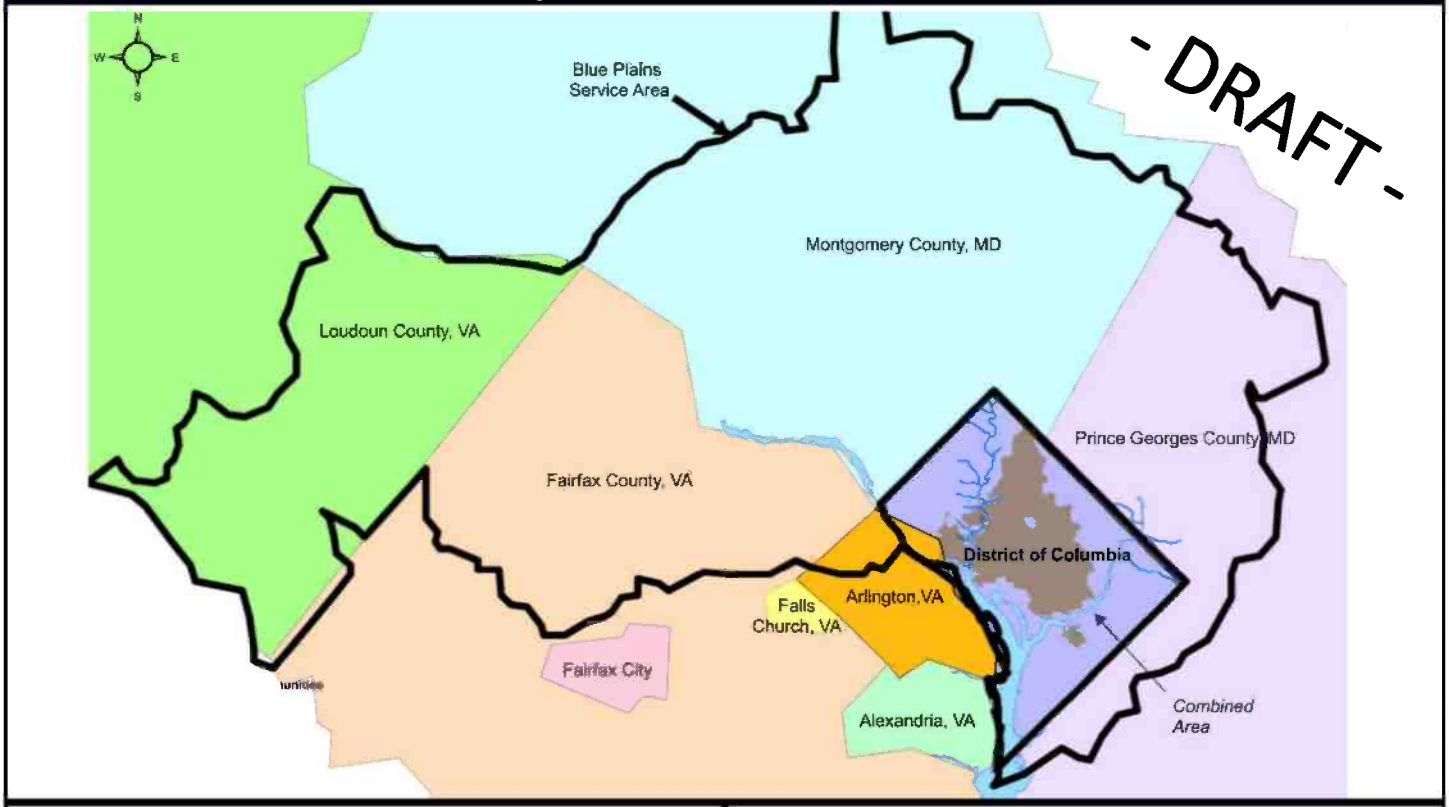
In the case of Anderson, Indiana, the 2010 FCA allocated LTCP costs to all households in the entire service area, including residential households in the wholesale customer service areas. Anderson attempted to incorporate the FCA assumptions into new wholesale customer service agreements. As a result of the re-negotiation process, the Town of Chesterfield decided that it was cheaper to build its own wastewater treatment facility. The decision resulted in higher costs for the remaining City of Anderson customers, because there were fewer households to share the dry weather flow treatment costs (i.e. WWTP facilities are the same size, but Capital, and O&M costs are allocated to fewer customers). Also, there was an increased financial burden on all customers (including Chesterfield) due to loss of economy of scale.

The lessons learned include:

- LTCP costs should be allocated in a fair and equitable manner. Otherwise, Wholesale Customers will consider withdrawal from the CSO community's system to control cost impacts on their customers.
- Cost share decisions need to be incorporated into FCA that minimize long term risks to CSO community.

In closing, the lessons learned from the FCA Case Studies further support DELCORA's approach to allocate LTCP costs in a fair and equitable manner based on current rate making practices that minimizes the risks associated with losing wholesale customer.

Case Study #1: DC Water CSO LTCP



Characteristics

Description	Value
Combined Sewer System	12,400 acres
Totals Service Area	464,000 acres
CSO Control Program Cost	$2.6 billion
Municipal Service Agreements	8
Industrial Customers	52 SIUs
Residential Population in CSS	300,000
Residential Population in Service Area	1.6 million

Financial Capability Analyses

- 2002 FCA for CSO LTCP (Attachment 1-1)
  - ✓ Provided in Section 12 of 2002 CSO LTCP
  - ✓ Consistent with EPA's 1997 financial guidance
  - ✓ Wholesale Customers NOT included in FCA
- 2015 FCA for CD Modification (Attachment 1-2)
  - ✓ Based on EPA's "Financial Capability Assessment Framework for Municipal CWA Requirements"
  - ✓ Used 40th Percentile household income instead of median household income
  - ✓ Wholesale Customers pay 7.1% of DC Water's CSO LTCP due to extra CSO generated due to flows that exceeded their contract amounts.

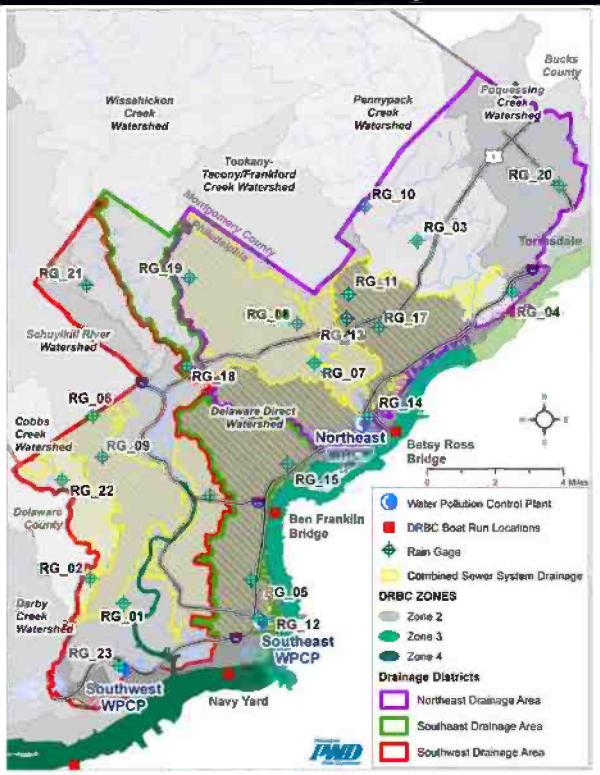
How CSO Community Paid for LTCP?

- In 2012 DC Water re-negotiated Inter-Municipal Agreements (Attachment 1-3)
  - ✓ Made it clear that communities will only pay based on what they use.
  - ✓ Suburbs agreed to pay for some of the LTCP costs only because it was possible to demonstrate they were sending flows greater than their contract allocations to the Blue Plains Wastewater Treatment Plant.

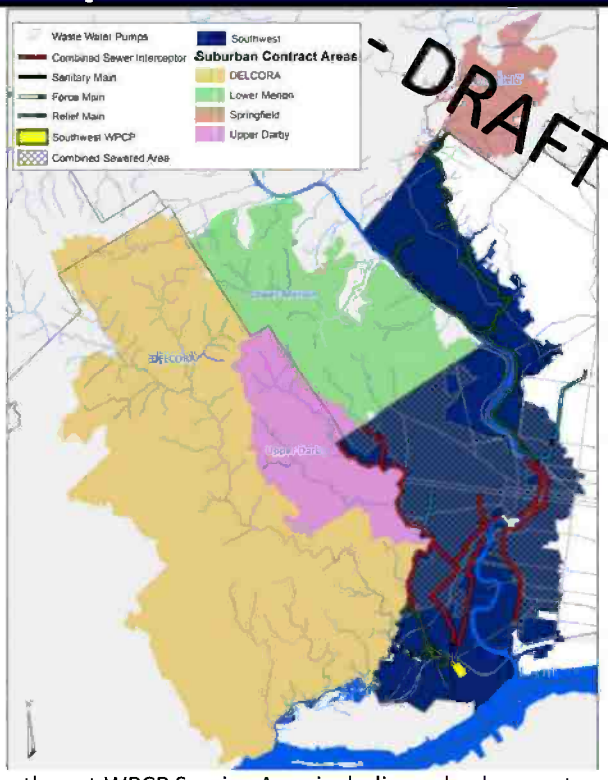
Lessons Learned

- FCA should be based on how the CSO LTCP will be actually financed.
- Demonstrating impact of Separate Sewer System on Combined Sewer Overflows provided evidence required to obtain buy-in from Wholesale Customers.
  - ✓ Required long-term flow monitoring of separate communities
  - ✓ Required updating service agreement to make it clear that community is only paying their fair share
- EPA's 2014 Financial Capability Assessment Framework provided increased flexibility over 1997 FCA guidance

Case Study #2: Philadelphia CSO LTCP



Northeast, Southeast and Southwest WPCP Service Areas



Southwest WPCP Service Area including suburban customers

Characteristics

Description	Value
Combined Sewer System	40,960 acres
Totals Service Area	87,040 acres
CSO Control Program Cost	$3.5 Billion
Municipal Service Agreements	10
Industrial Customers	
Residential Population in CSS	
Residential Population in Service Area	2.2 Million

Financial Capability Analysis

- FCA for CSO LTCP (Attachment 2-1)
  - ✓ Provided in Section 11 of 2009 CSO LTCP Update
  - ✓ Consistent with EPA's 1997 financial guidance
  - ✓ MHI inflated at 2.29%; O&M inflated at 4.7%; Capital inflated at 3.87%
  - ✓ Revenue projections based on PWD's existing cost-of-service based rate structure (future dollars).
  - ✓ Wholesale Customers NOT included in FCA cost share of CSO LTCP Update

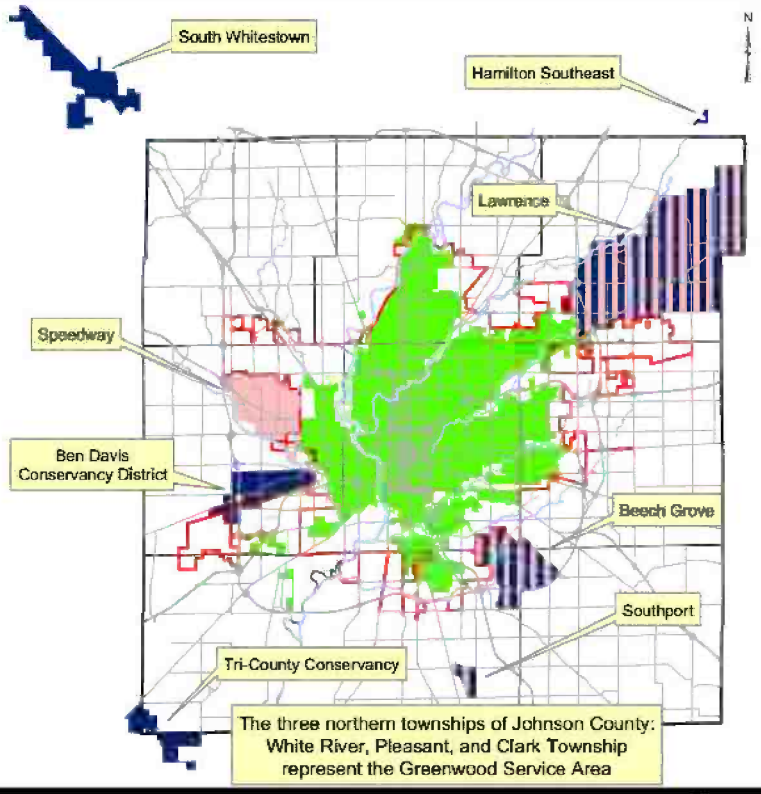
How CSO Community Paid for LTCP?

- Subsequent to 2009 FCA, PWD assigned about 9.44% of PWD's CSO LTCP costs to DELCORA. As a result DELCORA is considering options to control costs:
  - ✓ Option 1: Construct storage facility to reduce peak flow to PWD's Southwest plant
  - ✓ Option 2: Construct new DELCORA WWTP for Eastern Service Area and withdraw from PWD
  - ✓ Option 3: Re-negotiate agreement with PWD for a fair and equitable cost share of PWD's CSO LTCP
- PWD is using a peak wet weather flow as a basis to assess CSO LTCPs to DELCORA.

Lessons Learned

- To determine future impact on residential customers, FCA should be based on how the rates are made and costs are assessed
  - ✓ Inflated MHI, O&M costs, and capital costs at different rates
  - ✓ Revenue projections based on cost-of-service and future dollars
- CSO LTCP costs should be allocated in a fair and equitable manner. Otherwise, Wholesale Customers will consider withdrawal from the CSO community's system to control cost impacts on their customers.

Case Study #3: Indianapolis CSO LTCP



- DRAFT -

Legend

- Wholesale Customers
- Speedway - Not Served by City of Indianapolis
- Wholesale Customers that are Excluded Cities
- Marion County Boundary
- Township Boundary
- Old Indianapolis City Limits
- CSO Area

Characteristics

Description	Value
Combined Sewer System	35,000 acres
Totals Service Area	177,500 acres
CSO Control Program Cost	$ 2.0 billion
Municipal Service Agreements	6
Industrial Customers	
Residential Population in CSS	
Residential Population in Service Area	740,000

Financial Capability Analysis

- FCA for CSO LTCP (Attachment 3-1)
  - ✓ Provided in Section 6 of the 2006 CSO LTCP
  - ✓ Consistent with EPA's 1997 financial guidance
  - ✓ Wholesale Customers NOT included in FCA
  - ✓ Residential share (Cost per Household) was developed using a rate-based methodology.
    - City projects total revenue required,
    - City then estimates future rates,
    - City then estimates Cost per Household based on per-dwelling unit annual water consumption of 65,000 gallons per year (derived from records)

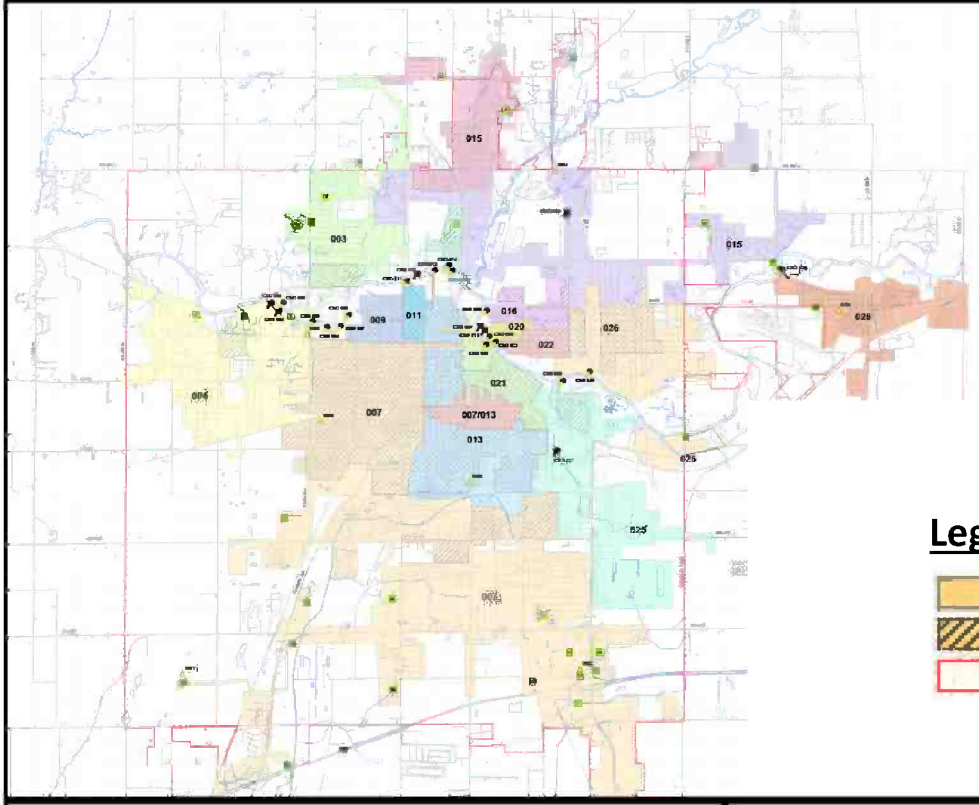
How CSO Community Paid for LTCP?

- Currently, only the Indianapolis City customers were paying for the CSO LTCP.
- In 2013 Indianapolis-based Citizens Energy Group (CEG) updated cost of service assumptions to include Wholesale Customers' share of CSO LTCP
- In 2017, Indiana Utility Regulatory Commission required CEG to update service agreements.
  - ✓ Wholesale Customers' share of CSO LTCP is 7.96%, which was based on the Wholesale Customer's Permitted Capacity for peak wet weather flow.
  - ✓ Surcharge rates if flows above Permitted Capacity

Lessons Learned

- FCA should consider
  - ✓ Wholesale Customers should pay their fair share of CSO LTCP based on cost of service assumptions consistent with Wholesale Customers' share of facilities providing service.
  - ✓ True burden on lower income population of CSO LTCP costs.

Case Study #4: Anderson, Indiana CSO LTCP



Characteristics

Description	Value
Combined Sewer System	4,700 acres
Totals Service Area	10,500 acres
CSO Control Program Cost	$161 million
Municipal Service Agreements	2 (2010)
Industrial Customers	9 (2010)
Residential Population in CSS	
Residential Population in Service Area	63,505

Financial Capability Analysis

- FCA for CSO LTCP (Attachment 4-1)
  - ✓ Provided in Section 7 of 2010 CSO LTCP
  - ✓ Consistent with EPA's 1997 financial guidance
  - ✓ Residential households in Wholesale Customers' service area included in FCA

How CSO Community Paid for LTCP?

- Anderson re-negotiated agreements with wholesale communities to increase rates for Anderson's CSO control and operational requirements.
- Subsequently, the Town of Chesterfield decided to build its own WWTP. Chesterfield cited that it was "cheaper" to build its own treatment facility than to send flows to the Anderson facilities (See Attachment 4-2)

Lessons Learned

- CSO LTCP costs should be allocated to Wholesale Customers equitably or risk losing the Wholesale Customer the system, which results in the following:
  - ✓ Fewer customers to share the dry weather flow treatment costs (i.e. WWTP facilities are the same size, but Capital, and O&M costs are allocated to fewer customers)
  - ✓ Increase financial burden on all customers (including Chesterfield) due to loss of economy of scale
- Cost share decisions need to be incorporated into FCA that minimize long term risks to CSO community.

Section 12
Financial Capability

12.1 INTRODUCTION

Financing CSO programs in a fair and equitable manner without placing an unreasonable burden on ratepayers is one of the most challenging aspects facing CSO communities. CSO control costs can be one of the largest single expenditures made on a public works project for many communities. No dedicated grant programs currently exist to fund CSO control programs. As a result, a detailed affordability analysis is necessary to assess the impact of CSO control costs on the fiscal health of a community. A procedure for assessing financial capability is described in EPA's Guidance Document, *Guidance for Financial Capability Assessment and Schedule Development* (EPA, 1997). This procedure was used to perform the financial capability assessment for WASA.

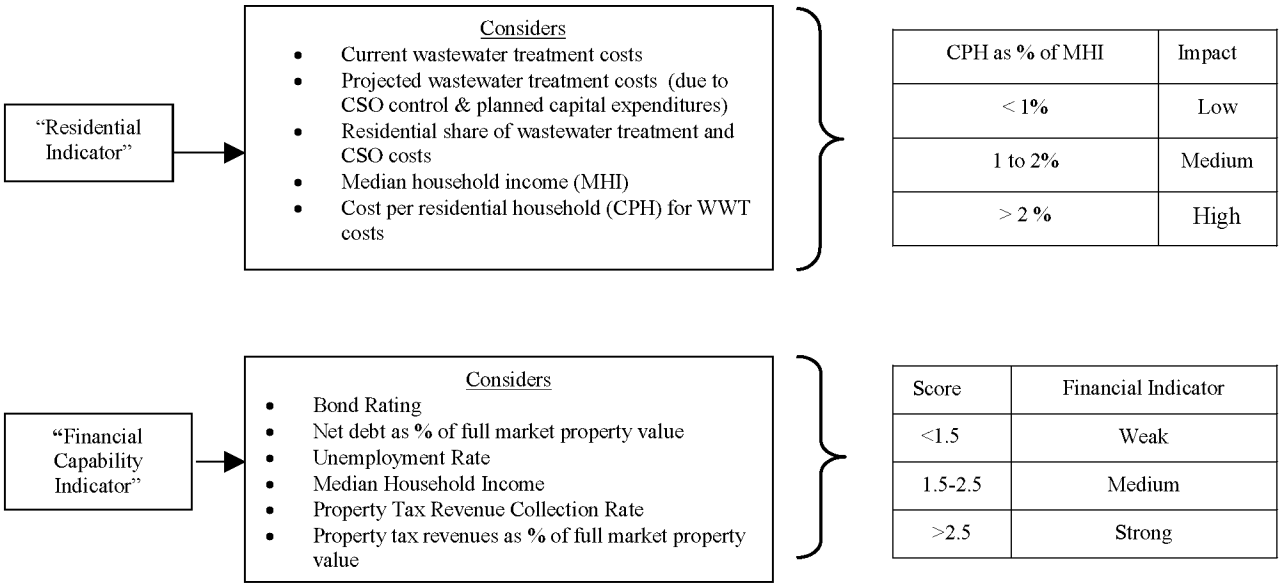
Regulatory agencies are allowed to consider other factors that will have an impact on the ability of a community to finance CSO controls. As a result, this evaluation also considers the District's income distribution, the ability of the District to remain competitive in the greater Washington area, and the effect of WASA's existing capital improvement program on the ability to finance CSO controls.

12.2 METHODOLOGY

In EPA's guidance document, assessment of financial capability entails a two-phase approach. The first phase consists of the calculation of a "Residential Indicator", which measures the financial impact of current and proposed CSO controls on residential users. The residential indicator is calculated by estimating the cost per household (CPH) for current and proposed wastewater treatment and CSO control costs. The CPH is used in conjunction with the median household income (MHI) to estimate residential impacts. Residential impacts are considered by EPA to be 'low' if the CPH is less than 1% of the MHI, 'medium' if the CPH is between 1% and 2% of the MHI, and 'high' if the CPH is greater than 2% of the MHI. Note that the CPH is not strictly equivalent to a monthly or annual sewer user fee. The CPH does not take into account all factors that are included when developing a sewer bill such as project scheduling, industrial vs. residential rates and other factors.

The second phase of the assessment involves calculation of a "Financial Capability Indicator", which assesses the overall financial health of the community. This indicator examines bond rating, debt burden, unemployment rate, property tax collection rates, MHI and other factors to develop a numerical score. The financial capability is considered by EPA to be low if the score is less than 1.5, medium if the score is between 1.5 and 2.5, and strong if the score is greater than 2.5. Figure 12-1 summarizes the development and scoring of the residential and financial capability indicators.

Figure 12-1
EPA's Residential and Financial Capability Indicators



Once the residential and financial capability indicators are calculated, they are combined into a financial capability matrix. The matrix provides EPA's assessment of the overall burden associated with funding CSO controls. This is summarized in Table 12-1.

Table 12-1
EPA's Financial Capability Matrix

Financial Capability Indicator	Residential Indicator (Cost per Household as % of Median Household Income)		
	Low (Below 1.0%)	Medium (Between 1.0% and 2.0%)	High (Above 2.0%)
Weak (Below 1.5)	Medium Burden	High Burden	High Burden
Medium (Between 1.5 and 2.5)	Low Burden	Medium Burden	High Burden
Strong (Above 2.5)	Low Burden	Low Burden	Medium Burden

12.3 RESIDENTIAL INDICATOR

12.3.1 Median Incomes

The CPH for wastewater treatment (WWT) and CSO controls was developed using a three-step process. First, WASA's total WWT and CSO costs were calculated by adding current costs for existing wastewater treatment operations and projected costs for proposed WWT facilities and CSO

controls. Next, the residential share of total WWT and CSO costs was calculated. The final step consists of calculating the CPH by dividing the residential share of total WWT and CSO costs by the number of households in the District.

Current WWT costs consist of current annual wastewater operating and maintenance (O & M) expenses, plus current annual debt service (principal and interest). Planned WWT capital costs were obtained from WASA's ten year Capital Improvement Program (CIP) (WASA, 2000b). The CIP amounts to $1.6 billion for the ten-year period FY2000 through FY2009, of which about $564 million are attributable to wastewater treatment for WASA customers within the District. The remainder of the CIP is attributable to water system improvements or to expenditures to be borne by others such as the surrounding counties whose wastewater is treated at Blue Plains.

The affordability analysis was conducted for a range of CSO control plan capital costs between $100 million and $2 billion in year 2001 dollars. Five cost levels were selected to compute the CPH: $0 million, $100 million; $500 million; $1 billion; and $2 billion. Each of the foregoing CSO control cost levels was assumed to occur in FY2001 to establish a common implementation year for all assumed CSO control cost scenarios as a benchmark for their comparison.

WASA's Board of Directors has adopted financial policies that require maintenance of 140 percent debt service coverage, and maintenance of cash reserves of 180 days O&M expenses, currently approximately $91 million. The present analysis factored in WASA's debt service coverage requirement. CSO control O&M costs will add substantially to the reserve requirement. An interest rate of 7% and a term of 30 years were used in the analysis to determine the capital recovery factor, which are consistent with WASA's assumptions for debt issuance for the CIP (WASA, 2002a). An interest rate of 2.6% was used as a present value adjustment factor based on the past 5 year average annual increase in the Consumer Price Index (CPI) from the Bureau of Labor Statistics (U.S. Bureau of Labor, 2000).

The residential share of total annual WWT and CSO costs is computed by multiplying the percent of total wastewater flow attributable to residential users by the total costs. For FY 1999, the residential share of wastewater flow within the District boundaries was 50% (WASA, 2000c).

The latest median household income (MHI) for the District estimated by the Census Bureau for 2000 is $38,752 (U.S. Census Bureau, 2002). This was adjusted upward to year 2001 using an inflation adjustment factor resulting in an adjusted MHI of $39,760. Dividing this amount by total annual WWT and CSO control costs per household (CPH) yields the Residential Indicator and the financial impact on residential customers.

The annual cost per household and the residential indicator are summarized in Table 12-2.

Table 12-2
Projected Cost Per Household and Residential Indicator

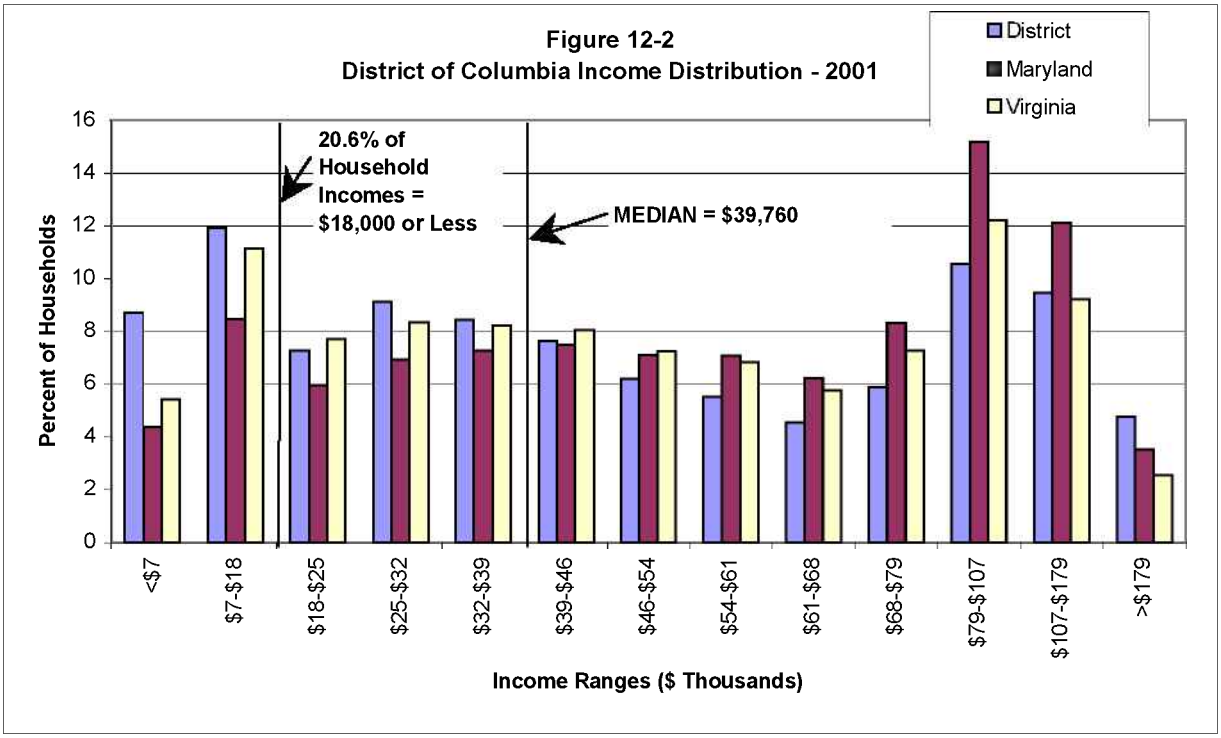
Financial Impact:	**Low**	**Low**	**Mid-Range**	**Mid-Range**	**High**	

12.3.2 Lower Incomes

The financial impact of wastewater treatment and CSO control costs on residential customers in the District is not fully measured by the foregoing method. Because of the demographics of the District, income does not follow a normal statistical distribution, or bell curve, among households across the full range of incomes. In the District, there is a distinct clustering of household incomes at the lower and upper extremes of the income spectrum. This creates a 'u' shaped or upside down income distribution which is shown on Figure 11-2.



Because of the disproportionate number of low income households in the District, the impact of wastewater treatment and CSO control costs on the most well off households in the lowest 20% of income distribution in the District was calculated. The most well off households in this category have incomes of approximately $18,000 per year. The results are presented in Table 12-3, which shows a high impact on this segment of the population for all assumed levels of CSO control costs.

Table 12-3
Projected Cost Per Household and Residential Indicator
Lower 20% of Household Incomes

Category	*CSO Control Costs Year 2001 (ENR=6383)*					*Line No. from EPA Worksheet*

12.4 FINANCIAL CAPABILITY INDICATORS

12.4.1 General

The permittee's financial indicator score was determined by evaluation of selected factors that portray WASA's and the District's debt burden, socioeconomic conditions, and financial operations. WASA's current debt burden was assessed as well as its ability to issue new debt to finance CSO controls by determining bond ratings and overall debt as a percentage of full market property value in the District. Socioeconomic conditions in the District were evaluated by assessing its unemployment rate and median household income (MHI). The District's ability to manage financial operations were evaluated by determining the property tax collection rate and property tax revenues as a percentage of full market property value. A value range for each of these indicators characterizes whether WASA's residential users are in a "Weak", "Mid-Range" or "Strong" position to bear WASA's WWT and CSO control costs relative to national benchmarks according to the EPA guidance document.

12.4.2 Bond Ratings

Ratings of WASA's Public Utility Revenue Bonds, Series 1998, have been upgraded since their issuance by Moody's, Standard & Poors and Fitch IBCA to A1, A, and A+, respectively. Continued compliance with the Board of Directors' 140 percent debt service coverage and 180 day O&M expense cash reserves policies has been critical to these bond rating upgrades. This will ultimately result in lower interest rates on future WASA debt issuance.

When WASA was first created in 1996, it was an unrated utility. WASA started operations with the negative cash position left by its predecessor agency, the Water and Sewer Utility Administration (WASUA). In barely two years WASA reached its 180 day O & M cash reserve goal, 11 months ahead of schedule. Without strong cash reserves and debt service coverage policies, WASA's bond ratings would be significantly lower and its cost of capital significantly higher. WASA has worked hard to implement these policies and achieve their goals. They must be maintained in order to ensure WASA's long-term financial viability and not be compromised by unaffordable new projects.

According to criteria in the guidance document, the rating of the most recent bonds to be issued either by the District or WASA is to be used to determine a bond rating indicator for WASA. Consequently, a rating of Baa1 for the District's General Obligation Bonds (Series 1999A) and General Obligation Bonds (Series 1999B) by Moody's Investor Service has been used, corresponding to a "Mid-Range" indicator rating (WASA 2002a).

12.4.3 Summary of Financial Capability Indicators

An average score for the indicators determined in this phase of the financial capability assessment was calculated. The indicators are compared to national benchmarks to form an overall assessment

of the financial capability and its effect on implementation schedules in the long-term CSO control plan. Each indicator is scored using the following rating scale:

Indicator Ratings	Score
Weak	1
Mid-Range	2
Strong	3

The average score for the indicators was calculated by dividing the sum of the scores by the number of entries. The average score is given on line 907 of Table 12-4 and the overall financial capability rating is given at the bottom of the table. According to this procedure, WASA's overall financial capability corresponds to a "Mid-Range" rating. However, because of the disproportionate number of lower income households in the District previously described, an alternative score is presented using the income of the most well off households in the lowest 20% of income distribution in the District instead of the MHI. This score results in a "Low" overall financial capability rating.

Table 12-4
Financial Capability Indicators

Indicator(Line No. from EPA Worksheet)	*Value*	*Indicator Rating*	*Score Using Median Household Incomes*	*Score Using Lower 24% of Household Incomes*	*Line No. from EPA Worksheet*
Bond Rating (Line 303):	Baa1	Mid-Range	2	2	901

Unemployment Rate (Line 501):	5.1	Weak	1	1	903
Median Household Income (Line 601):	$39,760	Mid-Range	2	0	904
Highest Household Income of Lower 20% of Income Range (Line 601a):	$18,000	Weak	0	1	904a
Property Tax Revenues as a Percent of Full Market Property Value (Line 703):	1.31%	Strong	3	3	905
Property Tax Revenue Collection Rate (Line 803):	86.89%	Weak	1	1	906
Permittee Indicators Score (Sum of Scores/ Number of Entries):			1.67	1.50	907
Financial Capability:			**Mid-Range**	**Low**	

12.5 COMBINED RESIDENTIAL AND FINANCIAL INDICATORS

The Residential Indicator and the Financial Capability Indicators were combined in the Financial Capability Matrix to evaluate the level of financial burden that CSO controls might impose on WASA. The Residential Indicator score is given on line 1001 and the Financial Capability Indicator score is given on line 1002 of Table 12-5.

Table 12-5
Financial Capability Matrix Overall Score

	CSO Control Costs in Year 2001 (ENR-6383)					*Line No. from EPA Worksheet*
	$0	*$100 Million*	*$500 Million*	*$1,000 Million*	*$2,000 Million*	
For Median Incomes						
Residential Indicator Score (Line 205):	0.83%	0.89%	1.14%	1.46%	2.09%	1001
Financial Capability Indicators Score (Line 907 Column B):	1.67	1.67	1.67	1.67	1.67	1002
Financial Capability Matrix Category:	**Low Burden**	**Low Burden**	**Medium Burden**	**Medium Burden**	**High Burden**	**1003**
Lower 20% of Household Incomes						
Residential Indicator Score (Line 205a):	1.83%	1.97%	2.53%	3.22%	4.62%	1001a
Financial Capability Indicators Score (Line 907 Column C):	1.50	1.50	1.50	1.50	1.50	1002a
Financial Capability Matrix Category:	**Medium Burden**	**Medium Burden**	**High Burden**	**High Burden**	**High Burden**	**1003a**

Based on EPA's approach, it would appear that CSO control programs costing between $500 million and $1 billion would impose a "Medium Burden" and a CSO control program costing $2 billion would impose a "High Burden" on WASA and its residential customers.

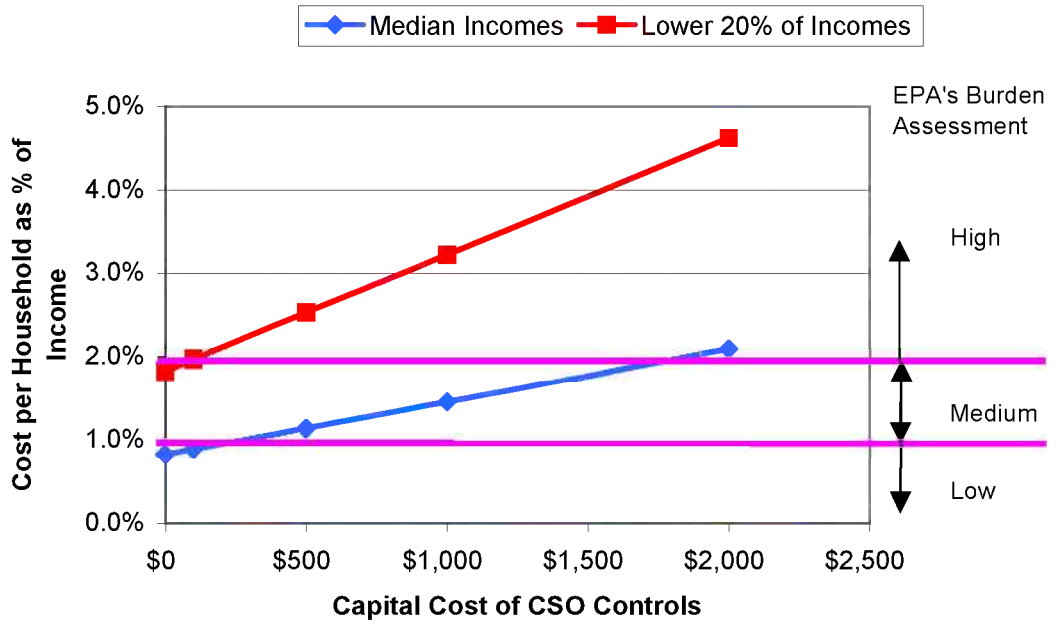
This method of determining a Financial Capability Matrix category for WASA understates the impact of CSO controls on the disproportionately large number of low income households in the District. Therefore, the Financial Capability Matrix Score was also calculated for the most well off households in the lowest 20% of income distribution. This score presents a very different picture of the impact of CSO control costs, indicating that any program above approximately $100 million would impose a "High Burden" on this segment of the population.

Additional analyses were performed to determine the CSO control cost levels that would trigger each of the financial burden categories established by EPA. The results suggest that for median income households, the threshold CSO capital cost for rising into EPA's 'high' burden level is about $1.85 billion. For the upper end of the lower 20% income range, this threshold is only $125 million. These results are summarized in Table 12-6 and on Figure 12-3.

Table 12-6
Summary of CSO Control Cost Impacts on Residential Customers
(Year 2001 Dollars)

EPA's Burden Assessment	*Median Income Households*			*Low Income Households (Income of 18,000)*		
	CPH as a % of MHI	*Wastewater & CSO CPH*	*CSO Control Plan Cost*	*CPH as a % of Income*	*Wastewater & CSO CPH*	*CSO Control Plan Cost*
No Additional CSO Controls (Baseline Condition)	0.83%	$329	$0	1.83%	$329	$0
Medium Burden Threshold	1.0%	$399	$280 million	1.0%	$180	$0
High Burden Threshold	2.0%	$794	$1.85 billion	2.0%	$360	$125 million

Figure 12-3
Impact of CSO Controls on Cost Per Household



12.6 OTHER FACTORS

12.6.1 Baseline Rate Impacts Facing WASA's Rate Payers

The financial assessment and affordability analysis presented in the previous sections uses EPA's standard methodology to assess the financial capability of the Authority and its customers relative to the proposed LTCP. The assessment using EPA's approach results in a finding of an overall "medium impact" on the Authority and its customers; the impact is high when applied to the over 51,000 households that have incomes of less than $18,000. These households approach the medium impact with WASA's existing capital program and financial plan; including CSO costs, their wastewater costs will fall in the very high range. A more accurate and complete picture of the financial capability of the Authority and its customers to fund the proposed LTCP must take into consideration the total cost of wastewater treatment and CSO controls, the rising cost of drinking water services, and, as pointed out earlier, the disparate impact on low income residents of the District of Columbia.

This analysis reflects several important analytical conventions that differ from the analysis presented in earlier sections.

- This rate impact analysis focuses on a typical residential customer with metered water consumption of 100 ccf per year. The EPA approach documented in earlier sections uses the number of households and cost per household (CPH) to evaluate financial capability. Note the two methods are not strictly equivalent. The CPH does not take into account all factors that are included in retail rate making such as project scheduling, varying consumption levels, etc.

- The EPA approach uses cost estimates in current dollars. The plan reflects 2001 values for all cost estimates. This analysis of rate impacts uses "year-of-expenditure" values which reflect the inflationary impact of time on costs and rates.

In January 2002, the Authority adopted a 10-year financial plan that provides for operations, maintenance and capital expenditures for the period of FY 2001 to FY 2010. This 10-year plan continues the Authority's current $1.6 billion water and wastewater capital improvement program (CIP).

Approximately 24 percent of the CIP is for mandated improvements that will enable the Authority to meet its current regulatory requirements. The balance of the program reflects the age and condition of the system and historical disinvestment in the system's infrastructure by predecessor agencies.

- Over half of WASA's pumping stations were constructed before 1940 and are not operating at optimal capacity.
- Half of WASA's pipes were built prior to 1930.
- Preventive maintenance expenditures were extremely low from 1980 to 1996.
- Virtually no technology existed in the Authority's operations prior to 1997.
- Prior to WASA's creation in 1997, annual capital spending averaged less than $40 million per year on total plant in service of over $1.3 billion.

Between FY 2003 and FY 2007, in the peak years of this capital program, WASA's annual capital investments in water and wastewater infrastructure (before consideration of the LTCP) exceed $200 million, a fivefold increase from the average investment only five years ago.

Even with significant capital funding from wholesale customers and grants – about 13% of the CIP's funding will come from EPA grants and 28% from wholesale customers – WASA will need to issue approximately $775 million in new debt between FY 2001 and FY 2010 to finance 47% percent of the program. As a result debt service costs will increase by more than $50 million per year by 2010 over current levels. This rising trend is equivalent to average annual increases of 11% in annual debt service costs.

The majority of the burden of this capital investment falls on the District's retail rate payers. Annual increases in retail rates of approximately 6.5% to 7.0% through FY 2008 followed by 6% annual increases from FY 2009 through FY 2012 will be required to finance the Authority's existing capital program. This projection is consistent with the policy adopted by WASA's Board of Directors to use steady rate increases as a way to mitigate the impacts of rising and mandated costs to customers. The Board established this policy after implementing a critically-needed 42% rate increase in 1997.

Over the long-term, the Authority is projecting that future necessary infrastructure investment will continue to require steady rate increases of at least 5% per year. This longer-term outlook is consistent with national infrastructure studies that document the need for doubling of rates over 20 years for infrastructure investment (see Clean and Safe Water for the 21st Century, Water Infrastructure Network, Washington, D.C.).

Under this "baseline" scenario, in which customer rates are affected by the water and wastewater capital program and routine inflationary increases in the cost of doing business, the annual cost for water and wastewater costs for a typical residential customer with metered consumption of 100 CCF per year prior to consideration of the CSO LTCP will increase from $290 to $617, a 113% increase, in fifteen years.

12.6.2 Substantial Rate Increases Required to Fund LTCP

Implementation of the LTCP will result in substantial additional rate increases and higher costs to the Authority's customers over and above the increases needed to fund the baseline capital program. Through analysis of a range of LTCP implementation schedules WASA has determined that the only rates impacts that are feasible (without substantial outside funding) are those associated with the longest possible implementation schedules. Shorter implementation schedules create too high a burden on the Authority's rate payers in terms of rapid escalation of the cost of wastewater services.

If WASA implemented the proposed LTCP over a 40-year period, a typical residential customer with annual metered water consumption of 100 CCF will see their annual wastewater costs rise from $290 to $722 in 15-years; an increase of 150%. This figure is $105 per year more than the annual bill in the baseline case without any CSO program.

Any shortening of the implementation schedule to less than 40 years will significantly increase the impacts on WASA's rate payers of the CSO controls. A fifteen-year LTCP implementation schedule would result in a more than tripling of wastewater bills to $1002 in fifteen years, and would require multiple peak increases within the next 5 to 10 years exceeding 15%, as described further below. A twenty-year program also has similar peaking impacts during the first 10 years.

Table 12-7 displays the impacts for a 100 CCF customer over 15 years for the baseline and for several LTCP implementation schedules.

Table 12-7
Summary of Rate Impacts of the CSO LTCP on 100 CCF Residential Customer

	FY 2003 Annual Bill	*Annual Bill in 15 Years*	*Average Annual Rate Increases Over 15 Years*
Baseline – No LTCP	$290	$617	6.0%
Baseline Plus LTCP – 40 Years	$290	$722	7.2%
Baseline Plus LTCP – 30 Years	$290	$795	8.0%
Baseline Plus LTCP – 20 Years	$290	$942	9.4%
Baseline Plus LTCP – 15 Years	$290	$1,002	9.9%

12.6.3 True Affordability Measure -- Impacts on Annual Household Budgets

A key indicator of the affordability of the proposed LTCP is the impact on the annual household budgets for District ratepayers as measured by the timing and extent of the required annual rate increases.

The 15 and 20-year LTCP implementation schedules would require a large number of consecutive "double-digit" rate increases when the costs of those programs are added to the demands imposed by the baseline investment in water and wastewater infrastructure. The 15-year program is projected to require 8 consecutive increases over 10% per year. Such rate increases would outpace expected growth in household incomes by two to three times, therefore eroding household resources for other items .

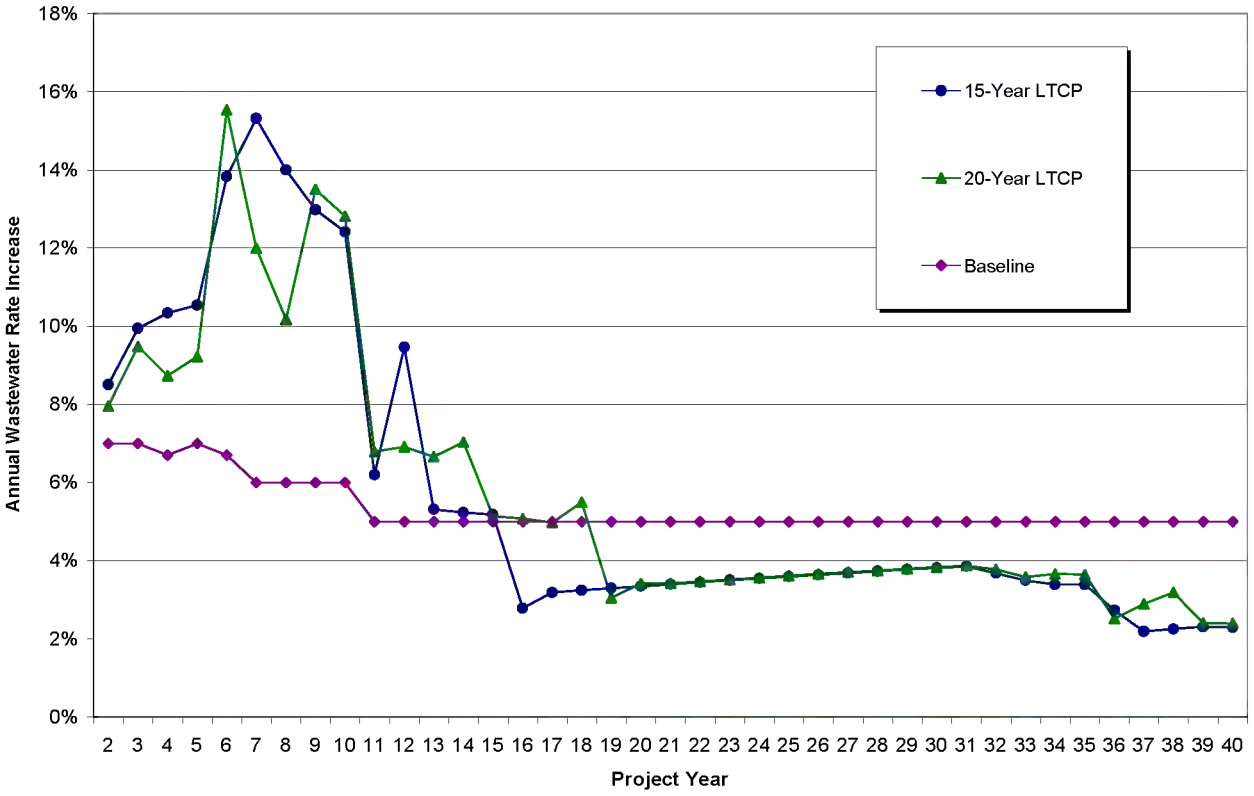
In addition to the extreme peaking of rate increases, the disparity between the rising costs that would be borne by District of Columbia residents and national experience is illustrated by the difference between 9.9% average annual increases associated with the 15-year program and the 3.6% annual rate of growth in consumer expenditures for water and sewer maintenance reported by the Bureau of Labor Statistics (BLS from January 1992 to January 2002.

These burdens will make it increasingly difficult for the District to remain competitive on a "cost of living" or "cost of doing business basis" compared to neighboring jurisdictions or other major cities that are not faced with the same capital investment burden. Currently the Authority's rates are generally competitive with the wastewater rates paid in neighboring jurisdictions in Maryland and Virginia but none of these jurisdictions is faced with the burden of an expensive CSO LTCP. The impact of this program will reduce the ability of the District to attract and retain residents and businesses relative to other locations in the area.

Nationally, a survey conducted by Memphis Gas, Light and Water Division of residential wastewater bills for rates in effect in 2001 found the monthly wastewater bills for residential customers in the District were the sixth highest out of 28 cities surveyed. All of the future rate increases associated with the baseline infrastructure investment needs and the CSO will likely further reduce the District's competitiveness on a cost of living and cost of doing business basis relative to other major cities that do not have the same burdens.

Figure 12-4 shows the annual increase in wastewater rates required for the 15 and 20-year programs as well as the baseline case.

Figure 12–4
Annual Rate Increases Required for 15 and 20-Year LTCP Plans



Another important measure is the total increase in revenue requirement added in each fiscal year, as shown in Figure 12-5. This measure demonstrates the intense peaking requirements of the CSO program as well. A 15-year program would require approximately $20 million of annual rate increases solely for CSO in five out of six years at the height of the program. The highest annual increase in revenue requirement would be approximately $33 million when the total needs of the baseline infrastructure program and the CSO are taken together.

Longer implementation schedules that range from 30 to 40 years greatly minimize peak rate increases: the 15-year schedule required eight consecutive annual increases in excess of 10 percent, while a 40 year schedule will only require one increase that is greater than 10 percent. Fewer peak increases under longer-term implementation schedules minimize the near-term impact on customers, particularly the 51,000 households with incomes less than $18,000 per year, allowing them to plan for more gradual rate increases that are in line with projected salary and other income increases. Figure 12-6 displays the annual rate increases required for 30- and 40-year implementation programs.

Figure 12-5
Annual Increase in Revenue Requirement for 15-Year LTCP and Baseline Needs

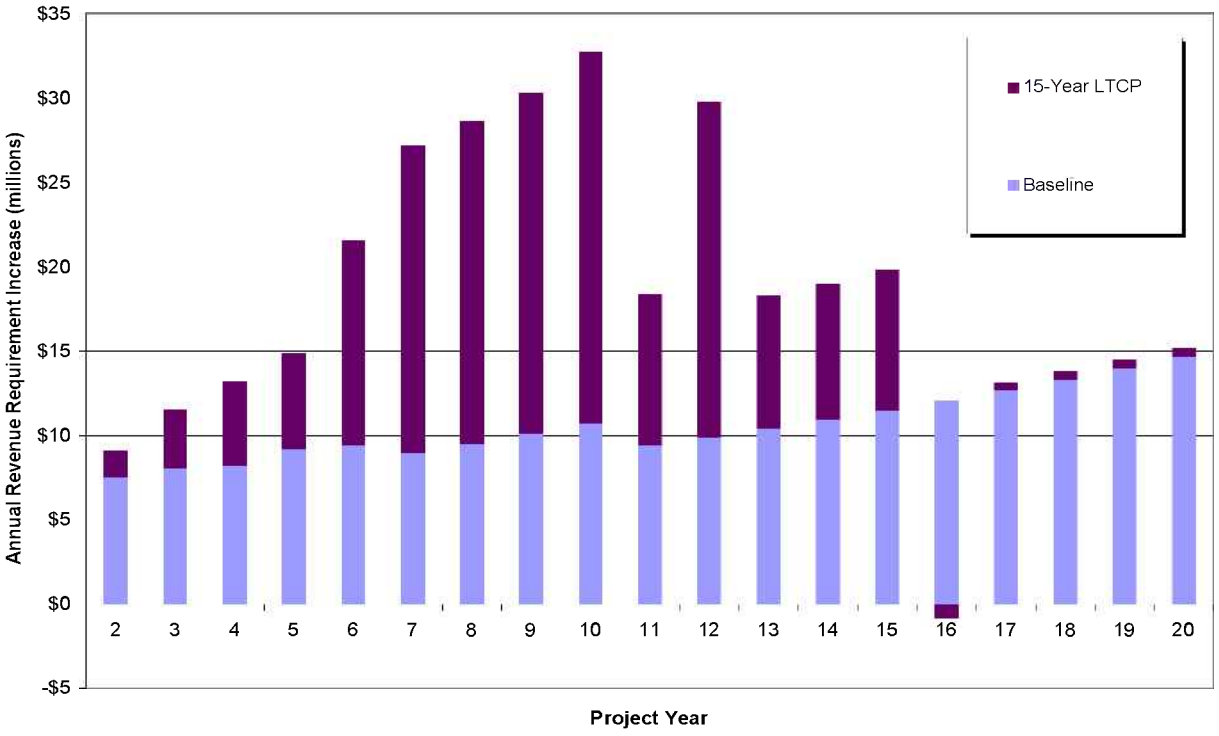


Figure 12-6
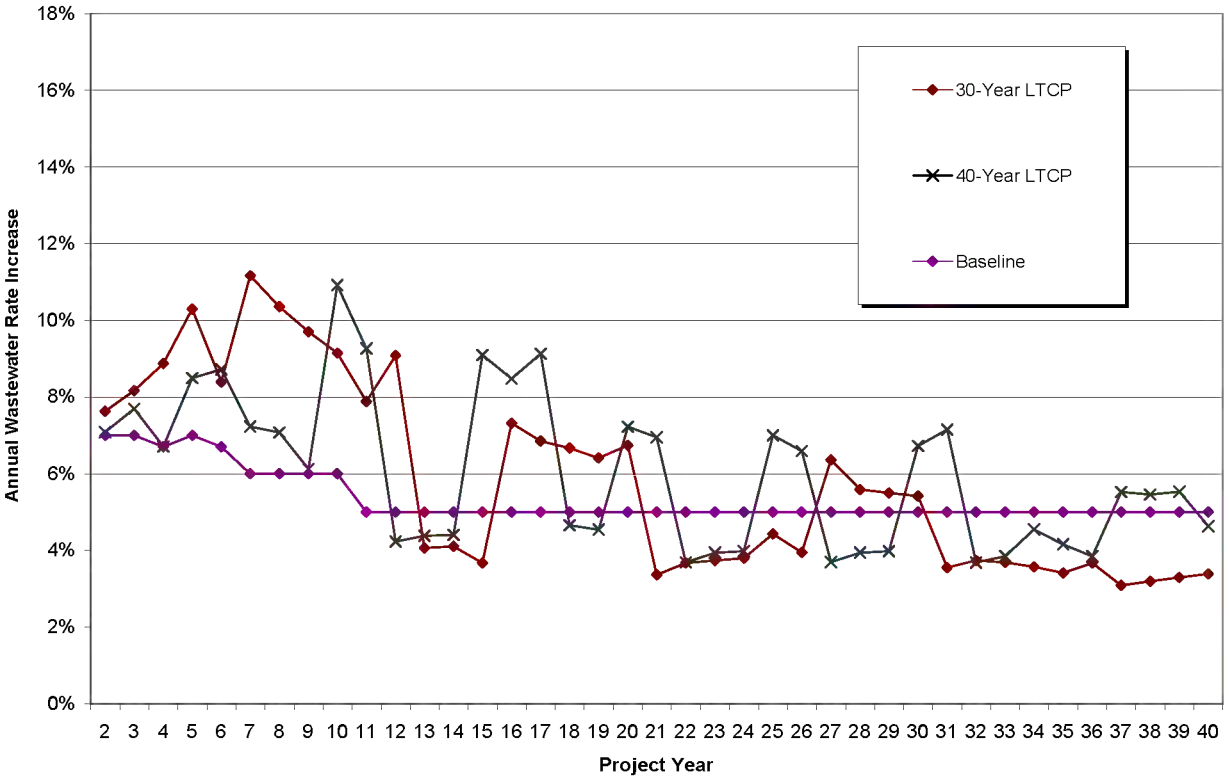
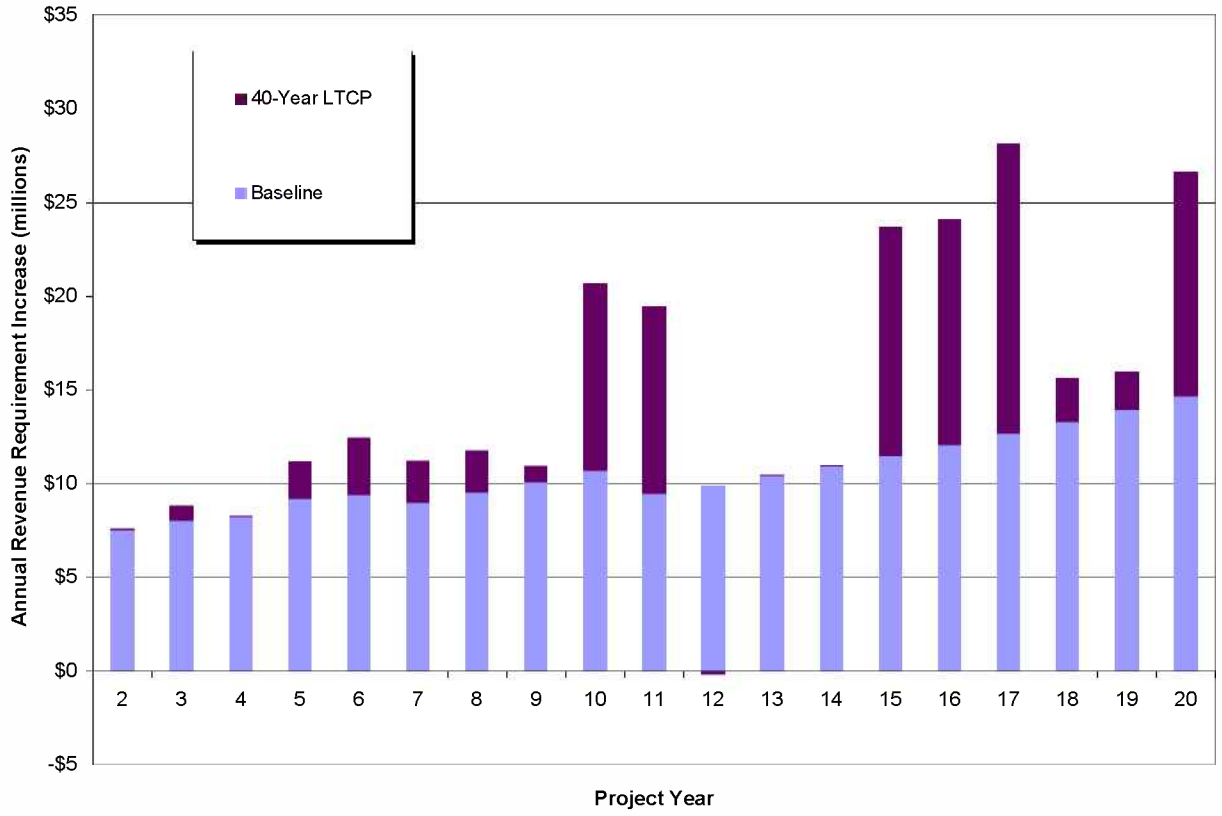
Annual Rate Increases Required for 30 and 40-Year LTCP Plans



Although there are still burdensome peaks, in general the 40-year program requires less annual increases in rate revenues for CSO. As shown in Figure 12-5, a 15-year program will require annual rate revenue increases in excess of $20 million for five out of fifteen years. Figure 12-7 shows that a 40-year schedule will require only one increase in excess of $20 million during the first fifteen years of implementation. This illustrates the minimizing effect of a longer term program on WASA's customers, particularly low income customers.

Figure 12-7
Annual Increases in Revenue Requirements for 40-Year Program



12.6.4 High Degree of Uncertainty in Rate Impacts Should Be Considered

In formulating its rate impact analysis WASA focused on a "most probable" approach to key assumptions that represent the economic and demographic conditions during the foreseeable future in a manner appropriate for this planning document. Nevertheless, the economic and demographic conditions that actually materialize on a year-to-year basis may differ from those associated with the forecast. Some of these considerations are described below:

- Water Consumption - The analysis of rate impacts has assumed that metered water consumption is maintained at current levels over the long-term. Water consumption has declined over the past 2 decades due to technological improvements and shifts in consumer

behavior. Although WASA has taken steps to maintain a high level of meter accuracy and to reduce unbilled water, it is possible that water consumption will continue to decrease over the long-term, particularly in response to increasing rates. It is not unreasonable to expect that the 150% increase in rates over 15 years associated with the 40-year LTCP program will result in some level of reduced consumption. Any reduction in consumption will result in higher impacts have to be offset with further rate increases on the balance of the water sold by the Authority. There exists the potential to initiate a vicious cycle that would be particularly hard on low income households.

- Cost Estimates -The rate impact analysis reflects the cost estimates prepared for this planning document. These costs estimates have a level of confidence of minus-15% to plus-40%. It would be equally likely that the final cost estimates in today's dollars are 40% greater or 15% less than the cost estimates included in this plan. These estimates reflect the level of planning and engineering completed to date on each alternative which is only a portion of the work needed to complete the project. It is very likely that the costs will be higher due to the complexity of the project and the unique risks involved with a mega-project. In recent months many high-profile mega-projects of this type have seen bid amounts far exceed preliminary estimates. Several examples within the Washington region are the Woodrow Wilson Bridge replacement and the I-495/I-395 interchange (the "Mixing Bowl") project. Unlike those projects however, any cost increases or contract overruns would be borne by a relatively small population of wastewater rate payers in the District of Columbia. These are very real risks that should be considered as part of the financial capability assessment.

- Interest Rates - This rate impact analysis assumes that the Authority will be able to borrow for future CSO costs at the same interest rates as it currently pays for its utility revenue debt. Any increase in interest rates due to market conditions will need to be absorbed by WASA's retail customers and will increase the financial burden of all LTCP schedule options. The Authority's future credit rating and the structure of future bond issues could also have negative impacts on the revenue requirements. These risks should also be considered in the financial capability analysis.

- Future Regulatory Requirements - The rates impact analysis reflects the current regulatory horizon that the Authority has used to develop its current capital improvement program and the LTCP for its combined sewer system. The analysis does not provide for additional costs that may be mandated to cover future regulations such as Total Maximum Daily Loads (TMDLs) or additional nitrogen removal requirements at Blue Plains. While the baseline analysis provides substantial capital funding for future reinvestment in infrastructure, any extraordinary capital costs related to future regulation (e.g., disinfection by-products) or

critical infrastructure replacement needs would further increase rates for the Authority's rate payers.

12.6.5 Effect of Federal Funding on Rate Increases

There are two ways to reduce the rate impacts of a shorter LTCP implementation schedule, external funding assistance and deferral of other water and wastewater capital expenditures.

External assistance targeted at limiting peak rate increases can reduce the severe impacts of high annual rate increases associated with the shorter programs. External assistance of 62% of the capital cost of the program could keep rate increases to 8% per year as shown in the following chart. The additional annual revenue required would gradually increase to $11.2 million by year 15.

Total external capital assistance under this scenario would be $960 million over 15 years. The external assistance in this case is targeted at the peaking impacts on wastewater rates and varies from year to year as necessary to limit rate increases to 8% or less. In any case, it is important for external assistance to reflect year-of-expenditure values or the actual "cost to complete" the project. If external assistance is determined on current dollars or on an amount per year, the cost to complete and inflation risks are shifted to ratepayers.

General Manager's Message

I am pleased to announce the completion of the process to modify DC Water's Long Term Control Plan to enable a significant investment in Green Infrastructure. This plan represents an enormous body of work and painstaking analysis performed by DC Water and its contractors. Exploring Green Infrastructure to reduce combined sewer overflows to the Potomac River and Rock Creek was a personal priority for me when I accepted the position of General Manager at DC Water in 2009. Since then, DC Water has invested $14 million in ratepayer funds to further our understanding of this innovative solution to stormwater control that will bring environmental, social, and economic benefits to the residents of the District of Columbia.

DC Water CEO & General Manager
George S. Hawkins

This document is a product of methodical outreach and collaboration with our regulatory, environmental, and community stakeholders. DC Water solicited feedback on its plans for Green Infrastructure by holding multiple summits, more than 14 public meetings, and notifying District residents through a proactive ad campaign. The updated proposal reflects the nearly 500 comments we received from the public, and I am confident will position DC Water as a leader in the responsible use of Green Infrastructure for combined sewer overflows. We are grateful for the comments we received, and we strongly believe that our proposal is much better for it.

The release of this document marks an important moment in DC Water's history. Some argue about the role of Green Infrastructure in comparison to gray. We have learned over this process that embracing both techniques in a complementary manner builds on their relative strengths and yields an outcome that is better than either alone. I want to thank all who have engaged DC Water on this herculean effort, and I look forward to collaborating with the public and our stakeholders as DC Water begins to make this plan a reality in the District of Columbia.

George S. Hawkins

What is the Purpose of this Initiative?

DC Water is proposing to implement **Green Infrastructure** or **GI** as part of our plan to control Combined Sewer Overflows (CSOs). CSOs are one of the sources of pollution

Bioretention in the Public Right of Way

impairing the quality of the District's waterways. The current plan to control overflows in the District's Potomac River and Rock Creek sewersheds relies largely on the construction of large tunnels ("gray" infrastructure) designed to capture CSO during heavy rains and transport it to the Blue Plains Advanced Wastewater Treatment Plant (Blue Plains) for treatment. GI reduces the scope of gray infrastructure needed to control stormwater runoff that contributes to CSOs, and has the potential to provide many environmental, social, and economic benefits to the community. While additional time is needed to effectively implement GI, it will deliver earlier pollutant reductions through phased construction when compared to gray infrastructure. This report explains the basis for this initiative and why a modification to DC Water's plan for controlling CSOs (called the Long Term Control Plan, LTCP or DC Clean Rivers Project) is required to implement it.

What is the Consent Decree?

The Consent Decree is the 2005 agreement among DC Water, the District, the U.S. Environmental Protection Agency (EPA) and the U.S. Department of Justice (DOJ) that establishes schedules for construction of the tunnels and related CSO control facilities, including a 2025 deadline to construct and place the tunnels in operation.

What is Green Infrastructure?

GI, also known as Low Impact Development (LID), uses plants, trees and other measures to mimic natural processes to control stormwater, resulting in cleaned, cooled, and slowed stormwater runoff. These systems promote rainwater detention and infiltration into the soil and include techniques such as rain gardens, porous pavements, green roofs and other technologies.

Typical Green Infrastructure Measures
• Rain Gardens (Bioretention)
• Porous Pavements
• Green Roofs
• Rain Barrels and Downspout Disconnections

By integrating natural processes into the urban environment, GI provides not only stormwater management, but also can support additional benefits such as local job creation, improved air quality, a cooler city, greener public and private spaces, added wildlife habitat, increased property values, and greenhouse gas mitigation.

DC Water's recommended plan is to construct a hybrid green-gray solution to control CSOs while improving the quality of life in the District.

What is a Combined Sewer Overflow?

Like many older cities in the United States, the sewer system in the District is comprised of both combined sewers and separate sanitary sewers. While sanitary sewers carry only sewage, combined sewers carry both sewage and runoff from storms.

Modern practice is to build separate sewers for sewage and stormwater. No new combined sewers have been built in the District since the early 1900's. Approximately one-third of the District is served by combined sewers, the majority of which are in the older, developed sections of the District.

CSO Facts

- "CSO" stands for Combined Sewer Overflow
- About 1/3 of the District is served by combined sewers
- Combined sewers have not been built in the District since the early 1900's
- Combined sewers overflow when stormwater runoff exceeds the sewer capacity

In a combined sewer system, sewage from homes and businesses during dry weather conditions is conveyed to DC Water's Advanced Wastewater Treatment Plant at Blue Plains, located in the southwestern part of the District on the east bank of the Potomac River. There, the wastewater is treated to remove pollutants before being discharged to the Potomac River. When the capacity of a combined sewer is exceeded during storms, the excess flow, which is a mixture of sewage and stormwater runoff, is discharged to the Anacostia and Potomac Rivers, Rock Creek and tributary waters. This excess flow is called Combined Sewer Overflow (CSO). There are 47 active CSO outfalls in the District's combined sewer system.

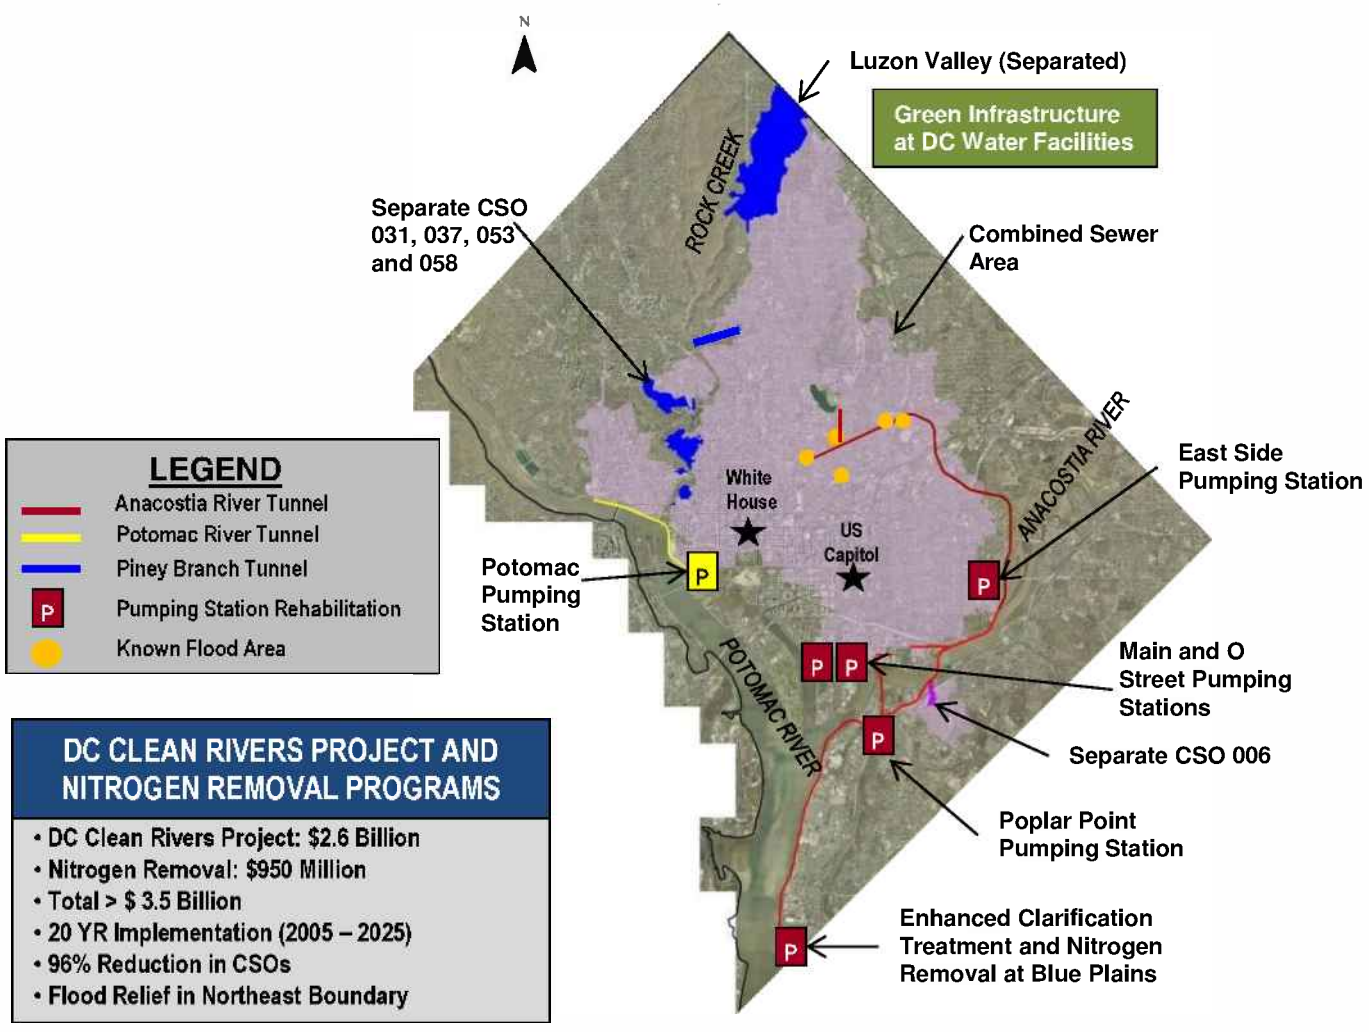
"Lady Bird" Tunnel Boring Machine for the Blue Plains Tunnel

What is the DC Clean Rivers Project?

The DC Clean Rivers Project (DCCR) is DC Water's massive infrastructure program to reduce combined sewer overflows into the District's waterways - the Anacostia and Potomac Rivers and Rock Creek. It includes more than 13 miles of tunnels that are larger than the Metro tunnels and are constructed more than 100 feet below the ground. The tunnels are designed to capture CSO during heavy rains and transport it to Blue Plains for treatment. The tunnels to control CSOs on the Anacostia River are currently under construction.

With the DC Clean Rivers Project, DC Water will improve our waterways by reducing CSOs system-wide by 96% in the average year. The DC Clean Rivers Project will also provide flood relief to neighborhoods in the Northeast Boundary section of the city, such as Bloomingdale, LeDroit Park, Trinidad and Ivy City.

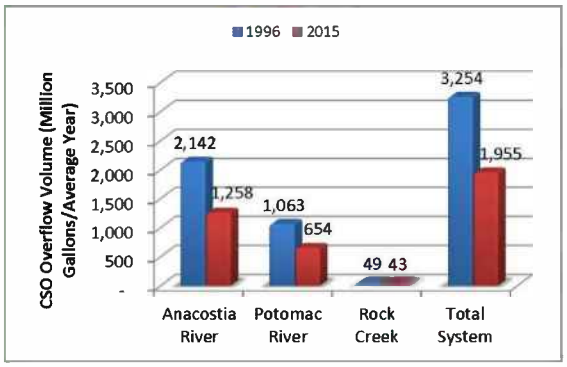
DC Water has reduced CSO overflow volume by approximately 40% since 1996 and has issued more than $1.3 billion in engineering and construction contracts.



Existing Plan

What Progress has already been made in CSO Control?

DC Water has made great strides toward reducing CSOs since the Authority was created in 1996. Since 1996, CSO overflow volume has been reduced by about 40% on a system-wide basis in an average year of rain. DC Water has done this by replacing and upgrading pumping stations and control structures and separating combined sewers in selected sewersheds. The investments have already improved water quality and reduced trash in our waterways.



DC Water has Reduced CSO Overflow Volume by 40% Between 1996 and 2013

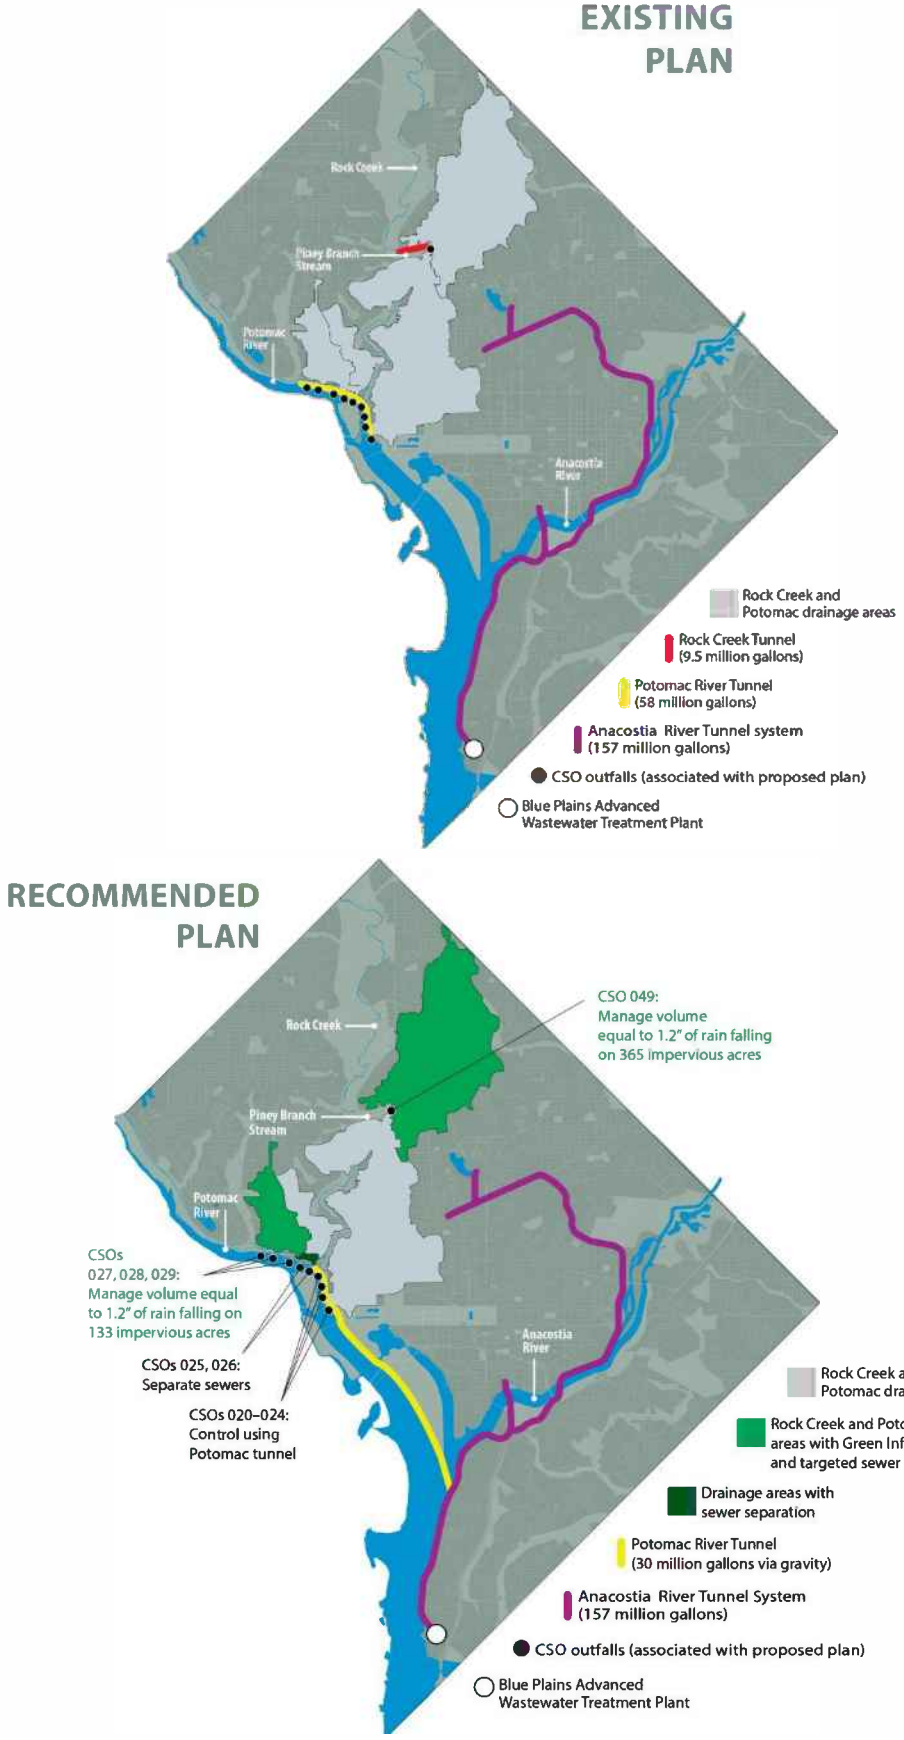
DC Water is currently constructing the tunnel system for the Anacostia River. This will achieve an 81% reduction in CSO volume on the Anacostia by 2018 when the tunnel from Blue Plains to RFK Stadium is placed into operation and a 98% reduction in volume when all Anacostia River controls are placed into service. While the Consent Decree deadline for completion of the Anacostia River Tunnel system is 2025, DC Water is accelerating the work to achieve a completion date of 2022 to provide early flood relief to Bloomingdale and LeDroit Park per the Mayor's Task Force Recommendations.

What is DC Water's Recommended Plan?

On the Anacostia River, DC Water will complete construction of the tunnel system and will meet the existing aggressive schedules. For the Potomac River and Rock Creek, DC Water will implement a hybrid plan of green and gray infrastructure, where each technology will be applied in areas selected to maximize their effectiveness.

For Rock Creek, DC Water will construct GI and targeted sewer separation to manage the volume of runoff produced by 1.2" of rain falling on 365 impervious acres instead of the Rock Creek Tunnel to control the Piney Branch CSO Outfall. This approach is feasible in this sewershed because of its low CSO overflow volumes and because of the lower density of

Receiving Water	Existing Plan	Recommended Plan
Rock Creek	• Construct Rock Creek Tunnel by 2025	• Raise the diversion weir at CSO 049 (Piney Branch) by 2020 • Construct GI and targeted sewer separation to manage the volume of runoff produced by 1.2" of rain falling on 365 impervious acres to control CSO 049 (Piney Branch) by 2030
Potomac River	• Construct Potomac Tunnel by 2025	• For CSOs 027, 028 and 029, construct GI and targeted sewer separation to manage the volume of runoff produced by 1.2" of rain falling on 133 impervious acres by 2027 • For CSO 025 and 026, separate these sewersheds by 2023 • For CSOs 020, 021, 022 and 024, construct a 30 million gallon Potomac Tunnel by 2030. Configure the tunnel to drain by gravity to the Blue Plains Tunnel



EXISTING PLAN
Rock Creek
Piney Branch Stream
Potomac River
Anacostia River
Rock Creek and Potomac drainage areas
Rock Creek Tunnel (9.5 million gallons)
Potomac River Tunnel (58 million gallons)
Anacostia River Tunnel system (157 million gallons)
CSO outfalls (associated with proposed plan)
Blue Plains Advanced Wastewater Treatment Plant
RECOMMENDED PLAN
CSO 049: Manage volume equal to 1.2" of rain falling on 365 impervious acres
CSOs 027, 028, 029: Manage volume equal to 1.2" of rain falling on 133 impervious acres
CSOs 025, 026: Separate sewers
CSOs 020–024: Control using Potomac tunnel
Rock Creek and Potomac drainage areas
Rock Creek and Potomac drainage areas with Green Infrastructure and targeted sewer separation
Drainage areas with sewer separation
Potomac River Tunnel (30 million gallons via gravity)
Anacostia River Tunnel System (157 million gallons)
CSO outfalls (associated with proposed plan)
Blue Plains Advanced Wastewater Treatment Plant

development in the sewershed. GI projects will start in 2017 and will be completed by 2030.

For the Potomac River, DC Water will implement a hybrid green and gray solution. GI and targeted sewer separation will be used to control CSO 027, 028 and 029, while CSO 025 and 026 will be separated because the drainage areas for these outfalls are very small. Implementation will start in 2017 and will be completed by 2027. The largest CSOs are outfalls 020 through 024 and these will be controlled by a modified Potomac Tunnel, with a storage volume of 30 million gallons. The Potomac Tunnel will be drained by gravity to the Blue Plains Tunnel, thereby eliminating the need for a new very large pumping station to empty the tunnel near the National Mall. The Potomac Tunnel will be placed in service by 2030.

For both the Potomac River and Rock Creek, the recommended plan will result in CSO reductions and water quality improvements equivalent to those predicted for the CSO controls in the existing plan.

What are the Benefits of the Recommended Plan?

The hybrid GI plan offers many more benefits than the existing tunnel-only solution. These benefits include:

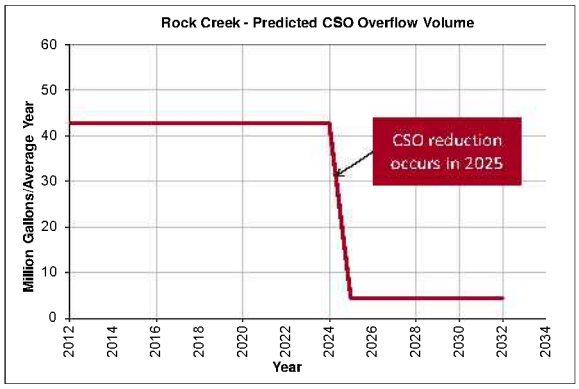
1. *Timing of CSO Reduction*

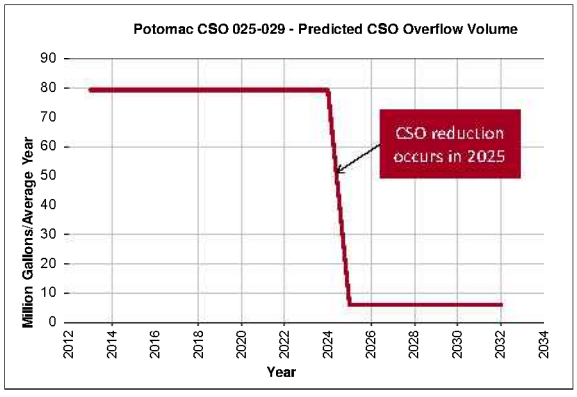
Under the existing plan, the District would need to wait until the tunnels are placed in service in 2025 before any additional CSO reduction is achieved. With the recommended plan, CSO reduction will begin to occur much earlier (in 2017).

Although the controls for Potomac CSOs 020-024 will be placed in operation in 2030

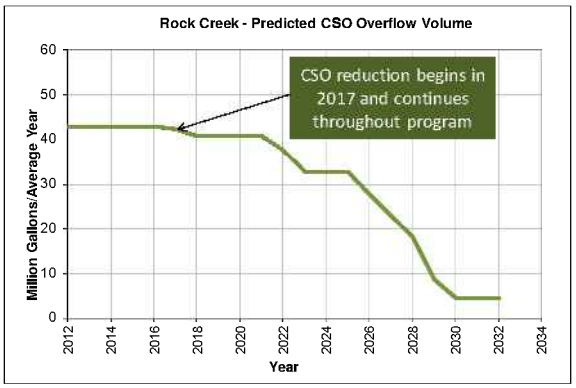
CSO Reduction versus Time

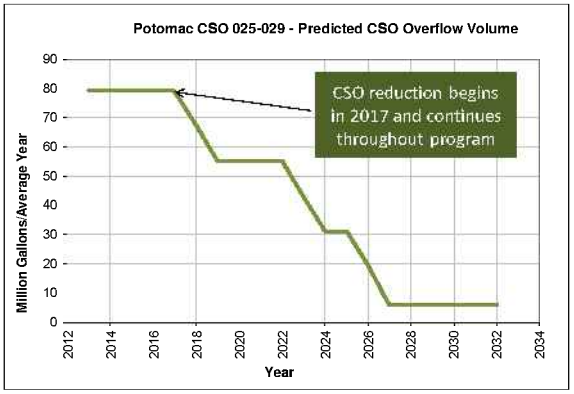
Existing Plan





Recommended Plan





instead of 2025, installation of these controls would likely have been delayed with the existing plan due to several factors including new federal requirements to perform an Environmental Impact Statement, and new planning and location challenges which did not exist when the original Consent Decree was signed. Establishing a new deadline will also mitigate the financial burden on rate payers for the $2.6 billion project.

2. *Added Environmental, Social and Economic Benefits*

GI can offer environmental, social and economic benefits that gray infrastructure does not, including, but not limited to, increased property values, neighborhood beautification, reduced heat island effects, habitat creation, green jobs, and enhanced community gathering spaces.

costs associated with the schedule of the existing plan coupled with other necessary sewer and wastewater improvements are projected to be unaffordable for more than 40% of households by 2018. The analysis also showed that extension of both the Consent Decree schedule and optimization of capital spending for other sewer and wastewater projects is necessary to maintain affordable rates.

To complete the CSO control program as early as possible, DC Water evaluated engineering constraints and determined that extending the Potomac River Tunnel schedule by five years and the GI schedule by five years would result in the earliest affordable, practical, and technically achievable schedules for CSO control. With the Consent Decree extended, DC Water determined that more than $2.5 billion dollars of other sewer and wastewater projects must be considered in an optimization of capital spending between 2015 and 2032 to meet the affordability criteria established by the analysis. As shown in the figure below, extending the

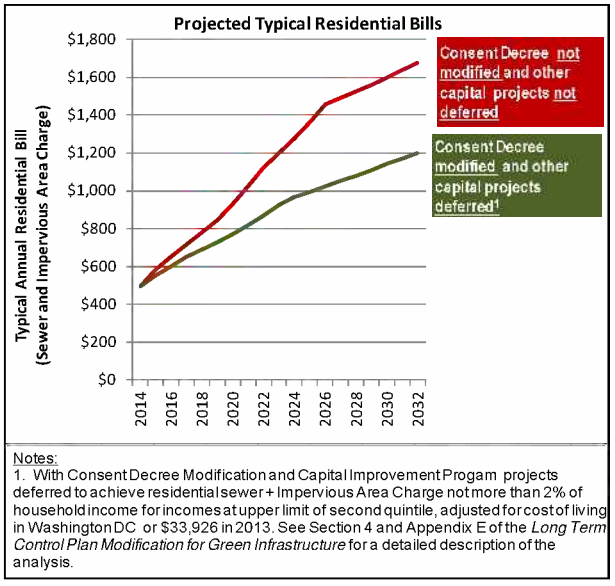
Triple Bottom Line Benefits of Green Infrastructure

3. *Reduced Financial Impact on Ratepayers by Spreading Out Construction*

DC Water updated its 2002 affordability analysis as part of evaluating GI plans for CSO control. The analysis showed that the

Consent Decree schedule and optimizing implementation of other capital projects is projected to reduce typical residential sewer bills from about $1,675 per year to about $1,200 per year.

Given that median sewer age will be approaching nearly 100 years by 2032, optimization of capital spending for other projects inevitably presents risks to customer service, environmental protection, and management of infrastructure. DC Water balanced these risks with our obligations to complete the CSO control program as soon as is practicable when the recommended schedule for CSO control described in this report was developed.



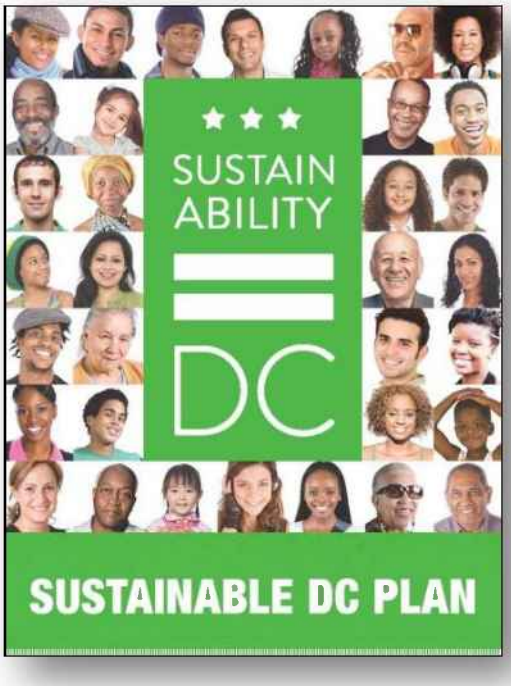
Notes:
1. With Consent Decree Modification and Capital Improvement Progam projects deferred to achieve residential sewer + Impervious Area Charge not more than 2% of household income for incomes at upper limit of second quintile, adjusted for cost of living in Washington DC or $33,926 in 2013. See Section 4 and Appendix E of the *Long Term Control Plan Modification for Green Infrastructure* for a detailed description of the analysis.

4. *Opportunity for Local, Green Jobs*

GI will increase opportunities for local, green jobs both for construction and for long term maintenance of the facilities. DC Water's economic analysis suggests that GI has the potential to create about 190 more local jobs over three decades than the current plan. See Appendix D of the *Long Term Control Plan Modification for Green Infrastructure* for details.

5. *Supports Sustainable DC Plan*

DC Water's GI program supports and advances the District's plan to make it the healthiest, greenest, most livable city in the nation over the next 20 years.



Sustainable DC Plan
(http://sustainable.dc.gov/)

Why is Time Needed to Implement the Hybrid GI Approach for the Potomac River and Rock Creek?

DC Water has determined that an extension of the schedule is required in order to implement the GI hybrid approach in the District's Potomac River and Rock Creek watersheds. Specifically, additional time is needed to implement GI for the following reasons:

- **Large-scale GI is new in the District.** Given the scale of such a project, time will

be needed to select GI technologies suitable for urbanized areas, address planning issues, develop agreements, and perform outreach to ensure successful GI implementation.

- **Adaptive Management.** DC Water will use an Adaptive Management Approach to implement GI. This means that projects will be constructed in a sequential fashion. In between construction phases, the projects will be monitored and assessed to evaluate their performance. Data collected and lessons learned during the monitoring will be used when planning and designing the next round of GI projects. This will ensure that the GI projects are practical and effective for CSO control and the betterment of the community.

Under both the existing and recommended plans, additional time will be needed to implement the Potomac Tunnel, due to the following:

- **New Federal Requirement to Prepare Environmental Impact Statement.** The development of the LTCP and the Consent Decree included a significant public process to select the CSO controls for each receiving water. Since the existing CSOs are located on National Park Service (NPS) property, and the Potomac Tunnel facilities may have a significant impact on their property, the NPS is requiring that an Environmental Impact Statement be prepared for the Potomac Tunnel. This was not envisioned when the schedule in the Consent Decree was entered in 2005. The NPS indicates that at least three years should be allowed for this process.

Green Roof at Eastside Pumping Station

- **Planning and Location Challenges.** The Potomac riverfront has changed significantly since the existing plan was finalized. The NPS has improved and completed facilities along the riverfront such as the Georgetown Waterfront Park, leaving few undeveloped or vacant sites other than valuable parkland in which to construct facilities. As a result, planning and obtaining approval for the Potomac facilities will take considerably longer than previously anticipated. DC Water's GI proposal will allow shortening the Potomac Tunnel, thereby minimizing impacts to riverfront resources such as the

Schedule Comparison – Existing and Recommended Plans

Georgetown Waterfront Park.

Together, the Environmental Impact Statement and planning and location challenges are expected to extend completion of the Potomac Tunnel beyond the 2025 deadline in the existing plan. DC Water's recommended schedule extension accounts for this anticipated extension.

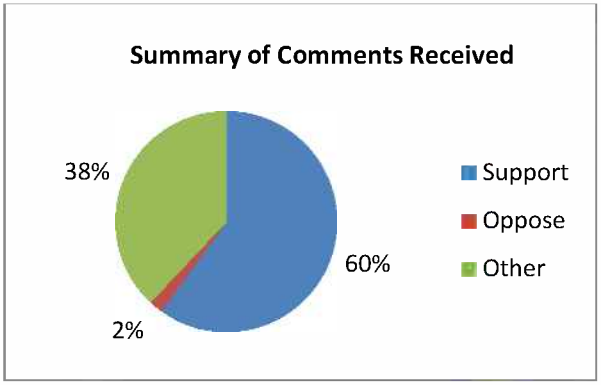
- **Utility Relocation.** Experience gained on the Anacostia River Tunnel System demonstrates that up-front time is needed to identify utilities and arrange for relocation prior to tunnel and shaft construction. This increases the time required to construct the Potomac Tunnel.

Public Comments and Responses

DC Water issued its Proposed Draft LTCP Modification to include GI in January 2014. The public comment period was open from January 12, 2014 through April 14, 2014. An extensive public outreach program was conducted to provide information about the Proposed Draft LTCP Modification and to solicit public comments. In response to the outreach, 366 commenters submitted 471 comments on the draft LTCP Modification for GI. The comments received have been bound in a separate report titled "*Public Comments, Long Term Control Plan Modification for Green Infrastructure,*" DC Water, May 2015 and a detailed response to the comments is provided in Appendix K.

Bioretention at DDOE Headquarters, 1200 First Street NE

The figure shows the disposition of the comments, with the majority of comments supporting the Proposed Draft LTCP Modification.



DC Water has made significant revisions to the draft plan in response to the comments. The key comments received and revisions to the plan are summarized below:

Nature of Commitment

DC Water's Proposed Draft LTCP Modification included committing $60 million for GI in Rock Creek and $30 million for GI for the Potomac CSOs 027, 028 and 029. This magnitude of expenditures was based on the estimated costs of the GI. A limit on the financial commitment was proposed given the uncertainties in terms of the cost to construct GI and in order to manage these risks to ratepayers. There was also precedent for a financial commitment in other enforceable documents such as New York City's order with the State of New York to construct GI.

Some commenters indicated that a financial commitment would not ensure that the

necessary amount of GI was constructed to provide the degree of CSO control required. These commenters suggested that the commitment to GI should be expressed in terms of acres of GI constructed, gallons stored, or a performance standard other than or in addition to a financial commitment.

In response to these comments, DC Water has removed the limit on its financial commitment to GI and expressed the commitment in terms of constructing sufficient GI and targeted sewer separation to manage the volume of runoff produced by 1.2" of rain falling on the number of impervious acres specified for the applicable sewershed. This is a commitment to manage a specified volume of runoff and will ensure that the necessary amount of GI is in place in order to provide the degree of CSO control required.

Feasibility/Effectiveness of GI

Some commenters indicated that GI may not be feasible to construct at a sufficient application rate to provide the degree of CSO control needed, or may not be as effective as anticipated.

Green Roof During Construction at DC Water's East Side Pumping Station

Given the lack of large scale implementation of GI in the District, DC Water has revised the LTCP Modification to provide for constructing the first GI project in the Potomac and Rock Creek sewersheds and then evaluating GI in terms of constructability, operability, efficacy, public acceptability and cost effectiveness. If, based on that evaluation, it is determined that it is impractical to complete all of the specified GI projects by the specified deadlines, then DC Water would be required to construct the gray controls as specified in the LTCP Modification. Should this occur, DC Water would be required to construct the gray controls within the same timeframe allowed for GI so there is no extension of the time allowed for implementation. If GI is determined to be practicable after the first project, then DC Water will continue to implement the remaining GI projects by the specified deadlines.

Schedule

Some commenters suggested that the seven year extension was too long and advocated for a shorter schedule. In addition, some commenters urged DC Water to accelerate individual components of the controls where feasible.

For GI, the schedule extension allows an adaptive management approach to be implemented to ensure that performance of the GI projects is optimized. Adaptive management means early GI projects will be monitored and assessed so that later projects are as practical and effective as possible. In response to comments, DC Water has evaluated the engineering, fiscal and practicality issues and has revised the modification to complete projects as early as practical. In addition, the separation at CSO 025 and 026 and Piney

Facility	Place in Operation Deadline		
	Proposed Draft LTCP Modification	Recommended Final LTCP Modification	Change
Potomac River			
1. Separate CSO 025, 026	2032	2023	9 years earlier
2. Potomac GI	2028	2027	1 year earlier
3. Potomac Tunnel	2030	2030	No change
Rock Creek			
4. Piney Branch Diversion Str. Improvements	2032	2020	12 years earlier
5. Rock Creek GI	2032	2030	2 years earlier

Branch Diversion Structure improvements have been substantially accelerated. The schedule revisions are summarized in the table above.

For the Potomac Tunnel, extra time in the schedule is needed compared to the original LTCP plan due to a new requirement to complete environmental studies, in view of the increased development in recent years along the Potomac River waterfront, and to mitigate the tremendous financial impacts on ratepayers. It is therefore not feasible to shorten the schedule for the Potomac Tunnel earlier than 2030.

Disruption due to Tunnel in Georgetown, NPS Property and Mall area

Some commenters expressed concern about potential disruption caused by tunneling, particularly in the Georgetown and National Park areas.

The Proposed Draft LTCP Modification included a 21 million gallon, approximately 4,500 foot long Potomac Tunnel to capture CSOs 020-024, a new pumping station to empty the tunnel and the addition of 75 million gallon per day of capacity at the Tunnel Dewatering Pumping Station and Enhanced Clarification Facility at Blue Plains. As part of the response to comments, DC Water has evaluated an approximately 23,000 foot long gravity Potomac Tunnel that would run from the Potomac River CSOs to connect to the Blue Plains Tunnel at Joint Base Anacostia-Bolling (formerly Bolling Air Force Base). This would eliminate the need for a tunnel dewatering pumping station for the Potomac Tunnel. This is advantageous because of the complexity of the station, the difficulty in siting such a facility in the vicinity of the National Mall area, long term operational and power requirements and costs and the need for a permanent building associated with a large deep pumping station. The alternative gravity tunnel provides substantially less disruption both

Bioretention Facility

DC Water Bioretention Facility at Irving St NW

during and after construction.

The gravity Potomac Tunnel also allows interconnecting the storage volumes of the Potomac and Anacostia River Tunnel Systems into one tunnel system, allowing any CSO on either water body access to the entire storage volume of both tunnels. DC Water's analyses have demonstrated that a 30 million gallon gravity Potomac Tunnel for CSO 020-024 connected to the Blue Plains Tunnel provides a degree of CSO control equal to the LTCP without the need to expand the Blue Plains Tunnel Pumping Station and wet weather treatment system. The gravity tunnel offers greater reliability and avoids a new pumping station, making it the recommended plan.

Stewardship for Ratepayer Dollars

Some commenters expressed concern over affordability for ratepayers.

DC Water is acutely aware of the heavy financial burden born by District ratepayers to implement the DC Clean Rivers Project and has taken steps to both mitigate and spread out water rate increases over time. Unfortunately, this is not voluntary spending by DC Water but is mandated to comply with the Clean Water Act through a Federal Consent Decree signed by the Department of Justice, EPA, the District of Columbia and DC Water. The Final LTCP Modification will mitigate rates by extending the schedule for the Potomac Tunnel, thereby slowing the rate of increase in rates compared to what otherwise would be required.

Maintenance

Some commenters expressed the importance of maintenance in assuring the GI is effective over the long term.

DC Water will perform maintenance or will arrange for others to perform maintenance of all GI implemented to control CSOs. DC Water will be ultimately responsible to ensure that maintenance is performed adequately to maintain the CSO reduction functions of the GI. DC Water also anticipates that this will be a requirement included in its National Pollutant Discharge Elimination System (NPDES) Permit issued by EPA.

Green Roof at Ft. Reno Reservoir

Support for Green Jobs

Some commenters supported the long term economic benefits of GI, specifically the ability to make jobs more accessible to unemployed local residents. This is especially true considering labor required to construct the facilities, as well as that required for long term maintenance.

GI will increase opportunities for local, green jobs both for construction and for long term maintenance of the facilities. DC Water will work to promote green jobs with a living wage for District residents. Activities may include establishing a certification program for GI jobs, partnering with organizations to provide training that ultimately leads to certification, conducting outreach in the District and partnering with local organizations.

Where Can I Obtain More Information?

More information is available on DC Water's website at www.dcwater.com/green or by contacting DC Water's Office of External Affairs at (202) 787-2200.

1 Introduction

1.1 Purpose

The District of Columbia Water and Sewer Authority (DC Water) is implementing a Long Term Control Plan (LTCP or DC Clean Rivers Project, DCCR) to control combined sewer overflows (CSOs) to the District's waterways. The DCCR is comprised of a variety of projects including pumping station rehabilitations, targeted sewer separation, green infrastructure at DC Water facilities and a system of underground storage/conveyance tunnels to control CSOs. The DCCR is being implemented in accordance with a Consent Decree (LTCP Decree) signed by DC Water, the District and the U.S Government that specifies the schedule for implementation. The Consent Decree is provided in Appendix A. Projects on the Anacostia River are first in the schedule and DC Water is implementing those projects in accordance with the Decree.

The purpose of this document is to provide information to the public on a proposed modification to the LTCP to incorporate Green Infrastructure (GI) on a large scale. The tunnel projects for the Potomac River and Rock Creek are later in the schedule and facility planning for those projects is scheduled to start in 2015 and 2016, respectively. Because of this, there is time to revise the LTCP to allow construction of a hybrid green/gray CSO controls instead of the all gray controls currently planned.

Unlike single-purpose gray infrastructure which uses tanks, tunnels and pipes to store and convey CSO, GI uses vegetation and soil to manage stormwater where it falls. GI has the ability to reduce stormwater and CSOs, and provide multiple environmental, social and economic benefits. Examples of these benefits include improved air quality, reduction in heat island effects, improved property values and local job creation. In addition, GI consists of many small projects which can be brought on line as soon as individual projects are completed. In contrast, gray CSO projects can typically only be brought on line when all the elements are completed. Because of this, GI projects can provide earlier CSO reduction than all-gray projects.

Based on an assessment of the sewersheds, DC Water's recommended plan is to implement hybrid CSO controls for the Potomac and Rock Creek as follows:

- In Rock Creek, construct GI instead of the Piney Branch tunnel to control the Piney Branch CSO
- On the Potomac River, construct a hybrid green and gray control system for the Potomac River CSOs

This document provides the bases and rationale for the proposed change to the LTCP to allow implementation of hybrid green/gray controls.

1.2 Background

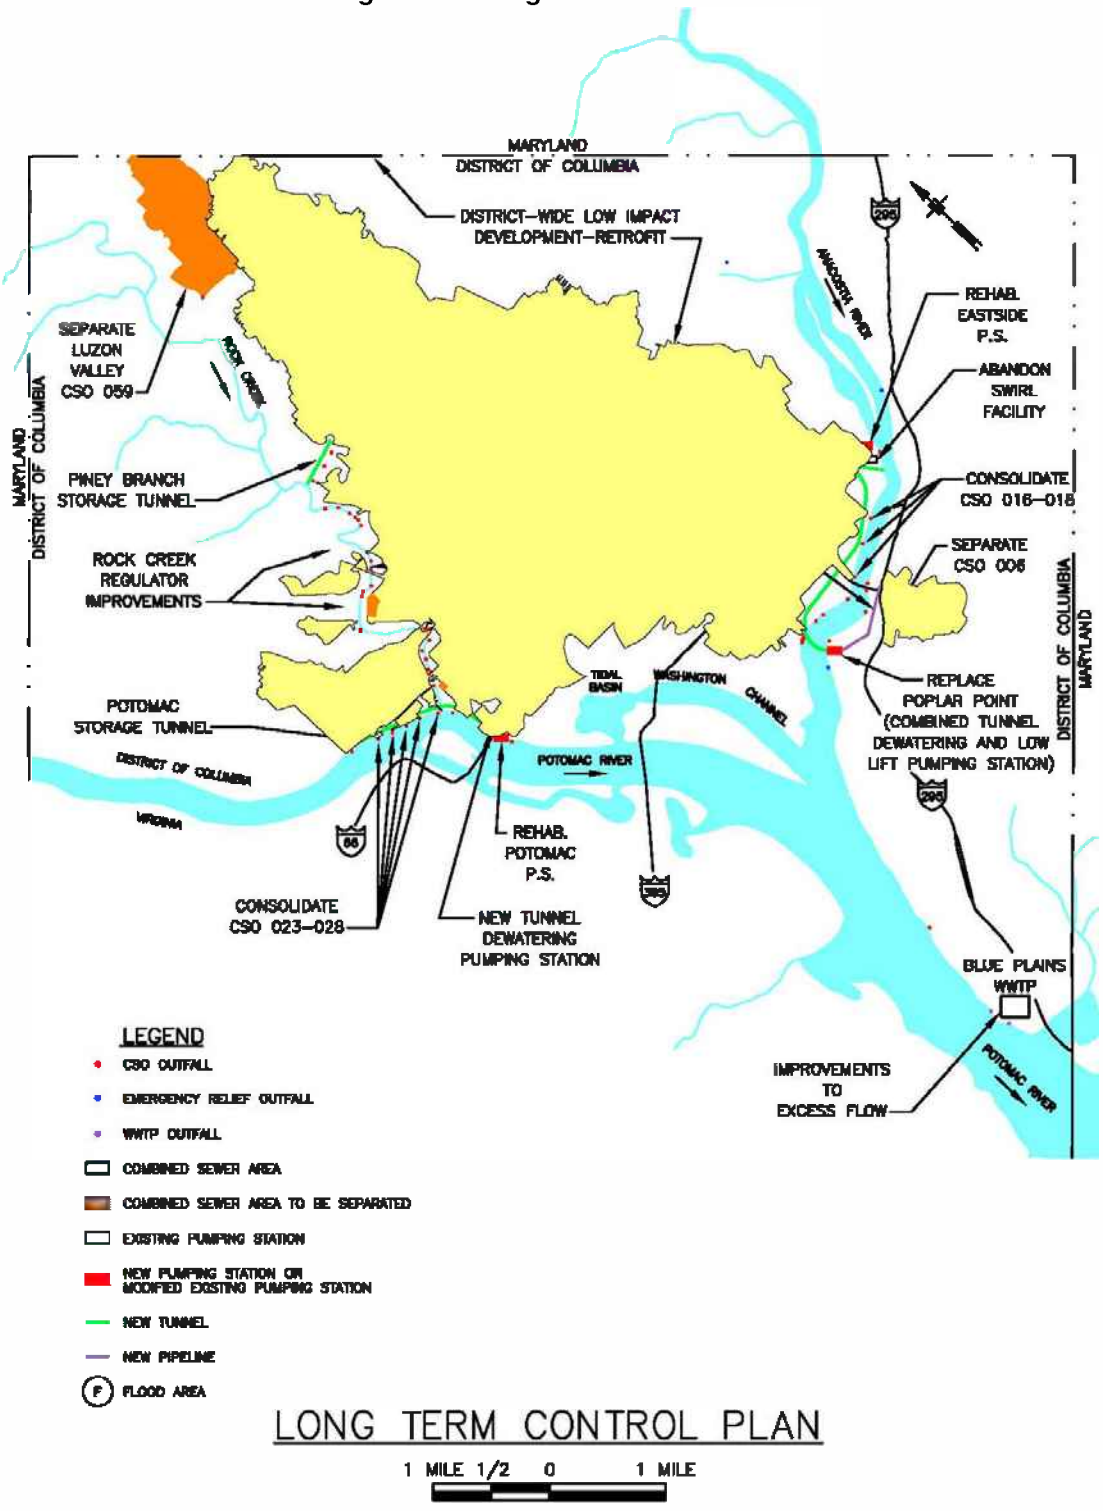
1.2.1 Long Term Control Plan

Like many older cities in the United States, the sewer system in the District is comprised of both combined sewers and separate sanitary sewers. A combined sewer carries both sewage and runoff from storms. Modern practice is to build separate sewers for sewage and stormwater, and no new combined sewers have been built in the District since the early 1900's. Approximately one-third of the District (12,478 acres) is served by combined sewers. The majority of the area served by combined sewers is in the older developed sections of the District.

In the combined sewer system, sewage from homes and businesses during dry weather conditions is conveyed to the District of Columbia's Advanced Wastewater Treatment Plant at Blue Plains (Blue Plains), which is located in the southwestern part of the District on the east bank of the Potomac River. There, the wastewater is treated to remove pollutants before being discharged to the Potomac River. When the capacity of a combined sewer is exceeded during storm events, the excess flow, which is a mixture of sewage and stormwater runoff, is discharged to the Anacostia and Potomac Rivers, in addition to Rock Creek and tributary waters, through outfalls. This excess discharge during storm events is called CSO. A total of 47 active CSO outfalls are listed in DC Water's NPDES Permit issued by the United States Environmental Protection Agency (EPA).

Communities with combined sewer systems are required to prepare long term plans for control of CSOs in accordance with the 1994 CSO Policy at Section 402 (q) of the Clean Water Act. In accordance with the CSO Policy and its NPDES permit requirements, DC Water submitted a Draft LTCP to EPA in 2001. After an extensive public participation program which generated over 2,300 comments on the Draft LTCP, DC Water submitted a Final LTCP to EPA in 2002. The Final LTCP is shown on Figure 1-1. The DC Department of the Environment (formerly Department of Health) and EPA approved the Final LTCP and determined that CSOs remaining after implementation of the plan would not cause or contribute to the exceedance of water quality standards, subject to post construction monitoring. Regulatory agencies also determined that the CSOs remaining after implementation of the plan would comply with total maximum daily loads (TMDLs) established for the receiving waters. An extended executive summary of the LTCP called Control Plan Highlights is provided in Appendix B.

Figure 1-1. Long Term Control Plan



1.2.2 Total Nitrogen Removal/ Wet Weather Plan

On April 5, 2007, EPA issued a modification to DC Water's NPDES permit. The permit modification included a total nitrogen effluent limit for Blue Plains of 4.689 million pounds per year. The total nitrogen limit was developed by EPA to achieve the goals of the Chesapeake Bay Program for nutrient reductions. In addition to meeting the new effluent limit for total nitrogen, DC Water had existing NPDES Permit requirements for treating wet weather flows at Blue Plains. The latter requirement is part of DC Water's LTCP for the combined sewer system.

When the LTCP was finalized in 2002, there was no effluent limit for total nitrogen in DC Water's NPDES permit for Blue Plains and the LTCP. The imposition of the new total nitrogen limit could require a modification to the LTCP and its implementation schedule. DC Water conducted evaluations to assess the impact of adding the new total nitrogen effluent limit on top of the LTCP and existing NPDES permit requirements for treating wet weather flows. On October 12, 2007, DC Water submitted its Final Total Nitrogen Removal/Wet Weather Plan (TN/WW Plan) to EPA. The TN/WW Plan is provided as a companion document to the Consent Decree Modification.

Under the LTCP and the NPDES permit existing at the time, Blue Plains was rated for an annual average flow of 370 mgd. During wet weather events, flows up to 740 mgd receive complete treatment for up to 4 hours. After the first 4 hours, the complete treatment capacity is reduced to 511 mgd to protect the biological process. Additional flows of up to 336 mgd that exceed the complete treatment capacity of the plant receive excess flow treatment, which consists of screening, grit removal, primary treatment and disinfection before being discharged to the Potomac River. This provides a total treatment capacity of 1076 mgd for the first four hours and 847 mgd thereafter.

The TN/WW Plan modified the plant treatment capacities and the handling of flows during wet weather. The major components of the TN/WW Plan are as follows:

- Complete treatment capacity – Blue Plains will provide complete treatment up to 555 mgd for the first four hours and 511 mgd thereafter. In accordance with the existing NPDES permit, combined sewer system flow (CSSF) conditions (i.e., wet weather events) exist and start when plant influent flow is greater than 511 mgd. CSSF conditions stop four hours after plant influent flow drops below 511 mgd or 4 hours has elapsed since the start of CSSF conditions, whichever occurs last.

- Enhanced nitrogen removal (ENR) – ENR facilities will be constructed with capacity to provide complete treatment for the flow rates identified above and to meet the new total nitrogen effluent limit.

- Enhanced Clarification Facility (ECF) – A 225 mgd ECF facility will be constructed at Blue Plains.

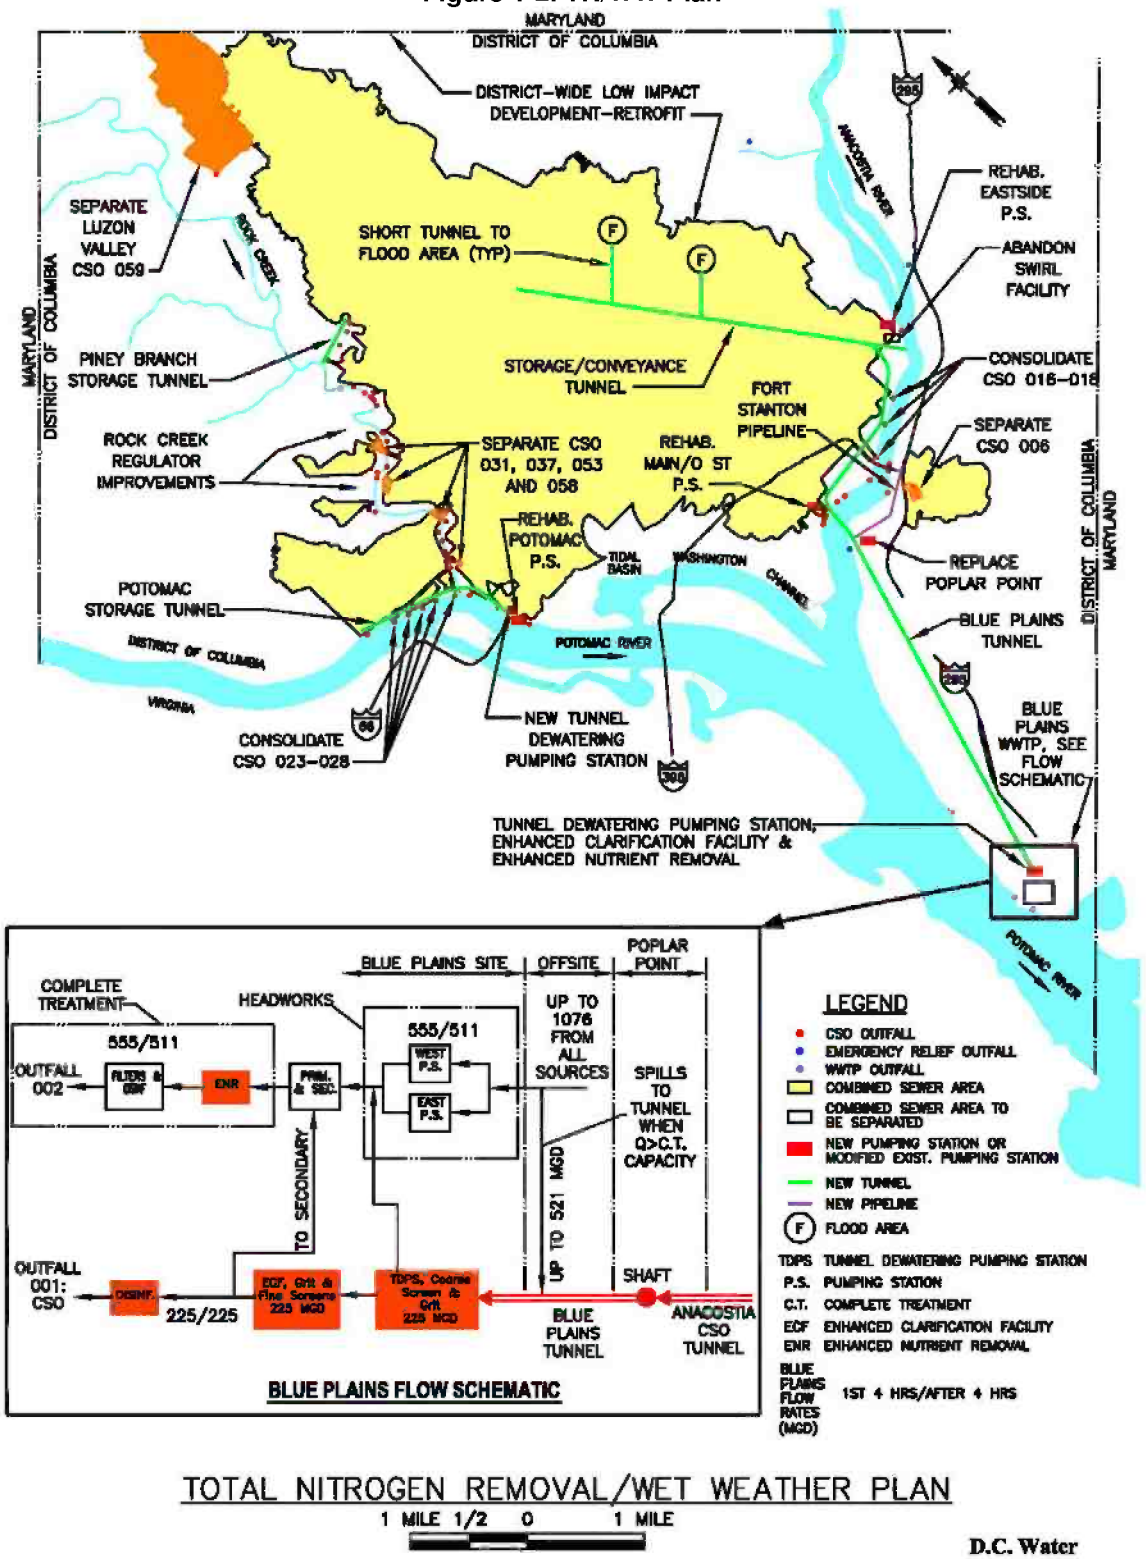
- Tunnel to Blue Plains and System Storage Volume – A new tunnel is being constructed from Poplar Point to Blue Plains. The total tunnels system storage volume will be increased from 126 mg to 157 mg. This new tunnel segment will not only serve as a flow equalization

facility but will also allow a reduction in the required capacity of the ECF and the peak flow rates that receive complete treatment at the Plant.

- Outfall Sewer Overflow to Blue Plains Tunnel – Connections between the existing Outfall sewers on the influent side of Blue Plains and the tunnel to Blue Plains will be constructed. These facilities will allow flow from the collection system that exceeds the complete treatment capacity of the plant to overflow into the tunnel.

- Tunnel Dewatering Pumping Station – Under the Final LTCP, a tunnel dewatering pumping station was proposed to be constructed at the tunnel terminus at Poplar Point. As part of the TN/WW plan, the same tunnel dewatering pumping station is relocated to the new terminus of the tunnel at Blue Plains. The pumping station will be sized to have a minimum firm capacity of 225 mgd, equal to the capacity of the ECF. In addition, the facility will have the ability to dewater the tunnel system up to the new ECF and be able to discharge ECF effluent to complete treatment and discharge at Outfall 002 or at Outfall 001. Figure 1-2 shows the TN/WW plan.

Figure 1-2. TN/WW Plan



1.3 Consent Decrees

DC Water has entered into two consent decrees (CD) related to its CSO program. Each of these decrees is described below:

Three-Party Consent Decree - Civil Action No. 1:00CV00183TFH and No. 02-2511 (TFH)
DC Water and the District of Columbia entered into this CD with the United States Government and certain citizen plaintiffs to resolve allegations regarding the combined sewer system (CSS). The CD was lodged with and entered by the court on June 25, 2003 and October 10, 2003, respectively. The CD provides a schedule for implementation of various operation and maintenance-type items associated with DC Water's Nine Minimum Controls Program. In addition, the CD provides a schedule for replacement of the inflatable dams in the CSS and for rehabilitation of DC Water's pumping stations.

Long Term Control Plan Consent Decree - Civil Action No. 1:CV00183TFH
DC Water and the District of Columbia entered into this CD with the United States Government. The CD was entered by the court on March 23, 2005, and provides a schedule for implementation of the LTCP.

DC Water is proposing to modify the LTCP as described in subsequent sections.

1.4 Partnership Agreement

On December 10, 2012, the EPA, District of Columbia and DC Water signed a Partnership Agreement (PA) to advance Green Infrastructure for urban wet weather pollution control. The PA is included in Appendix C. The PA established a framework and working relationship between the parties to support sustainable stormwater management that can yield multiple benefits for community livability. The PA also demonstrates each party's commitment to GI. The following is a summary of the commitments in the PA:

All Parties (EPA, District, DC Water)

- Implement a Green Design Challenge to engage private sector in demonstrating and advancing GI
- Enlist participation by public and private organizations in a collaborative effort to develop next generation GI designs
- Facilitate participation by local academic institutions in various aspects of the GI Demonstration Project
- Actively involve the environmental community in the GI initiative to facilitate implementation based on an agreed upon course of action
- Review and assess the water quality benefits and impacts of alternative green and gray/green controls compared to the benefits and impacts of the controls now required in the Potomac and Rock Creek watersheds.

DC Water and District

- Consult with each other on a continuing basis to ensure that the GI Demonstration Project, water quality review and assessment, and alternatives analysis conform to EPA's expectations and Clean Water Act requirements.

DC Water

- Once regulatory framework is in place, conduct GI demonstration project
- Prepare EIS required for the Potomac Storage Tunnel

EPA

- Communicate with EPA's Office of Research and Development (ORD) on the progress of the GI Demonstration Project and opportunities for ORD's involvement.
- Assist DC Water in sharing the results of its GI Demonstration Project work so that other communities nation-wide can benefit from DC Water's experiences

The PA also lays out a procedure for modifying the Consent Decree which consists of the following steps:

- DC Water submits draft proposed CD Modification package to EPA
- DC Water public notices proposed CD Modification package within 60 days of receiving EPA comments
- Public Notice the CD Modification package for 60 days
- DC Water responds to comments and submits revised proposed CD Modification Package to EPA in 21 days
- EPA/DOJ determines whether or not to support the proposed CD Modification and makes the corresponding recommendation to the court
- Federal Judge decides whether to accept recommendation from EPA/DOJ
- Consent Decree is modified

Note that in lieu of constructing a demonstration project for GI, DC Water is now proposing to construct hybrid green/gray CSO controls.

1.5 CSO Controls in LTCP Consent Decree

The LTCP Consent Decree specifies the schedule for implementation of the DCCR. The major requirements of the decree are described in the following subsections.

1.5.1 Anacostia River Projects

The Anacostia River Projects components included in the LTCP Consent Decree are summarized in Table 1-1.

Table 1-1. Anacostia River Projects in LTCP Decree

Component	Description
Anacostia River	
Storage Tunnel from Poplar Point to Northeast Boundary Outfall	49 million gallon storage tunnel between Poplar Point and Northeast Boundary. Tunnel will intercept CSOs 009 through 019 on the west side of the Anacostia. Project includes new tunnel dewatering pumping station and low lift pumping station at Poplar Point.
Storage/Conveyance Tunnel Parallel to Northeast Boundary Sewer	77 million gallon storage/conveyance tunnel parallel to the Northeast Boundary Sewer. Also includes side tunnels from main tunnel along West Virginia and Mt. Olivet Avenues NE and Rhode Island and 4th St NE to relieve flooding. Abandon Northeast Boundary Swirl Facility upon completion of main tunnel.
Outfall Consolidation	Consolidate the following CSOs in the Anacostia Marina area: CSO 016, 017 and 018
Separate CSO 006	Separate this CSO in the Fort Stanton Drainage Area
Ft Stanton Interceptor	Pipeline from Fort Stanton to Poplar Point to convey CSO 005, 006 and 007 on the east side of the Anacostia to the storage tunnel.

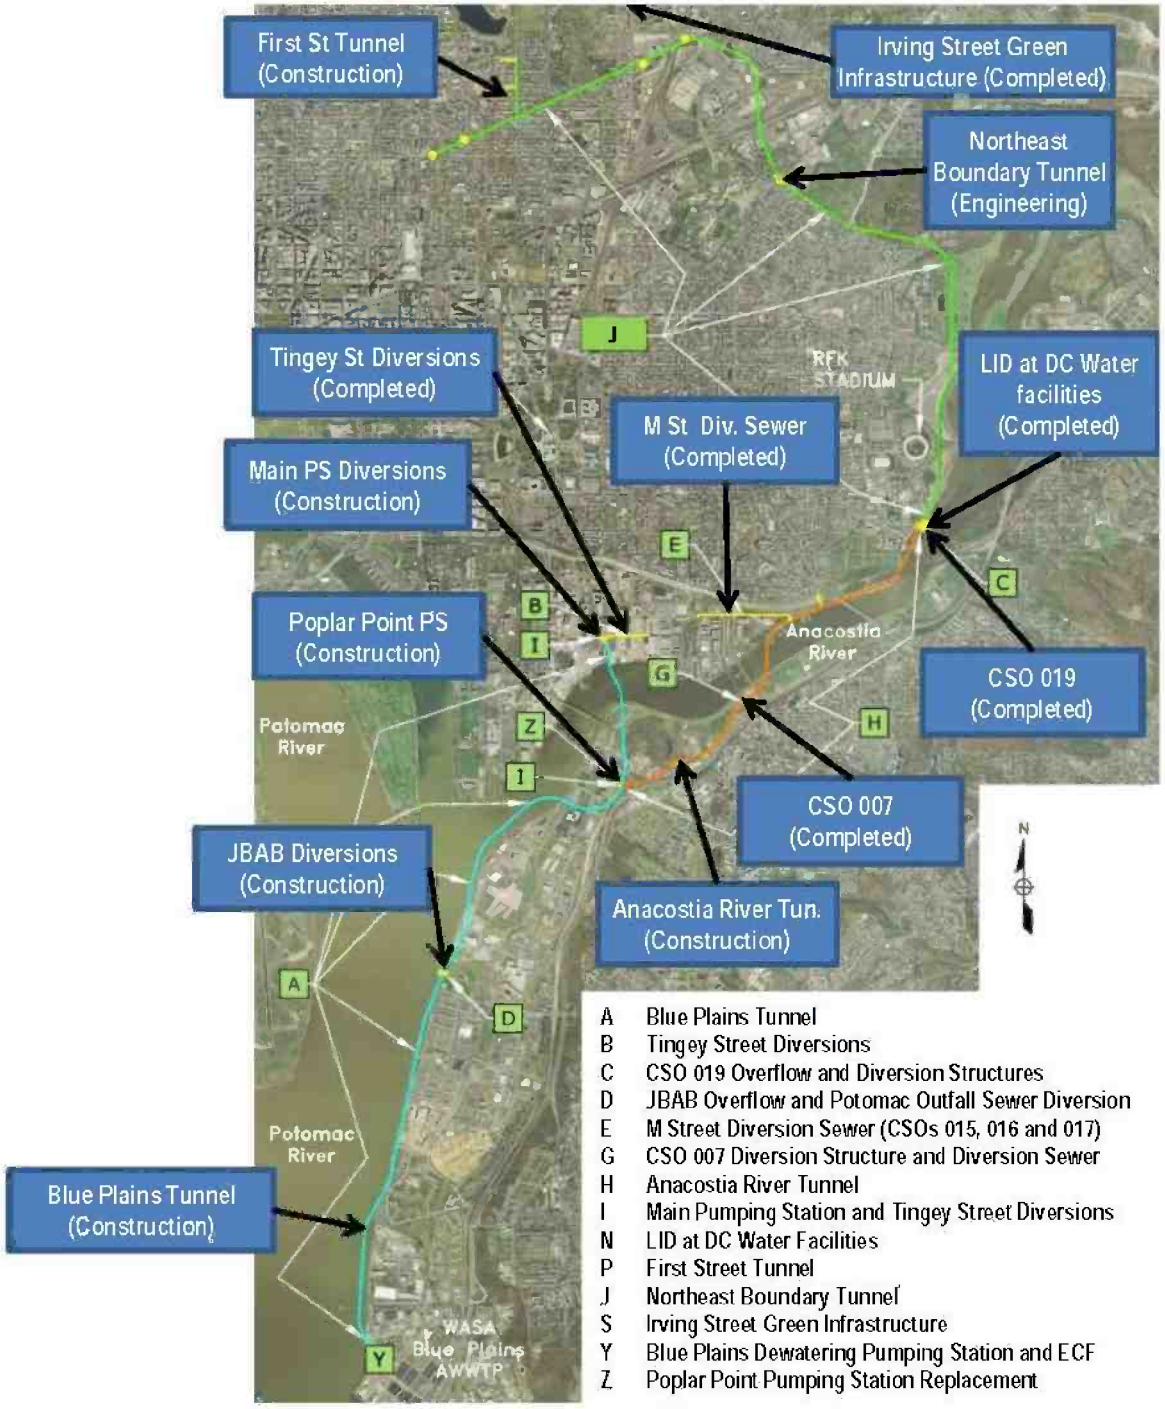
As a result of the TN/WW Plan, DC Water has added 31 mg of storage to the Anacostia Tunnel system for a total of 157 mg of storage. This was accomplished by extending the tunnel from Poplar Point to Blue Plains and constructing the tunnel dewatering pumping station at Blue Plains in lieu of Poplar Point. These and other changes to the LTCP are not reflected in the LTCP Decree. DC Water is proposing to modify the LTCP to conform it to the TN/WW Plan.

Based on the current level of planning, the Anacostia River Projects have been divided into various contract divisions to facilitate implementation. There is one contract division proposed for each of the three major tunnel segments and their associated shafts. The other contract divisions are comprised of near-surface diversion structures, associated diversions, junction sewers and the tunnel overflow structures. The planned contract divisions are listed in Table 1-2. Figure 1-3 shows the contract divisions and the current status of implementation.

Table 1-2. Planned Contract Divisions for Anacostia River Projects

Contract Division	Description
A	Blue Plains Tunnel
B	Tingey Street Diversion Sewer for CSOs 013 and 014
C	CSO 019 Overflow and Diversion Structures
D	Joint Base Anacostia-Bolling Overflow and Diversion Structures
E	M Street Diversion Sewer (CSOs 015, 016, and 017)
G	CSO 007 Diversion Sewer
H	Anacostia River Tunnel
I	Main Pumping Station Diversions
N	Low Impact Development at DC Water Facilities
J	Northeast Boundary Tunnel
P	First Street Tunnel
S	Irving Street Green Infrastructure
Y	Blue Plains Tunnel Dewatering Pumping Station and Enhanced Clarification Facility
Z	Poplar Point Pumping Station Replacement

Figure 1-3. Anacostia River Projects Status (as of May 2015)



1.5.2 Potomac River Projects

The control measures selected for the Potomac River are predicted to limit overflows to four events per average year. The principal control measures include rehabilitation of the Potomac Pumping Station and construction of a storage tunnel from west of the Key Bridge, along the Potomac River waterfront parallel to Georgetown, and terminating at Potomac Pumping Station. The tunnel will intercept the Georgetown CSOs and the large CSOs downstream of Rock Creek. A new pumping station would be constructed to dewater the tunnel. In addition, the LTCP will consolidate and close all CSOs between the Key Bridge and Rock Creek to remove the impact of these CSOs from the Georgetown waterfront area.

The major elements of the Final LTCP for the Potomac River Projects are summarized in Table 1-3 and are shown on Figure 1-4.

Table 1-3. Potomac River Projects

Component	Description	Status (as of May 2015)
Potomac River		
Replace Inflatable Dams (1)	Replace inflatable dams at Potomac River CSOs where these are installed	Completed
Rehabilitate Potomac Pumping Station (1)	Rehabilitate station to firm 460 mgd pumping capacity	Completed
Outfall Consolidation (2)	Consolidate CSOs 023 through 028 in the Georgetown Waterfront Area.	Future work
Potomac Storage Tunnel (2)	58 million gallon storage tunnel from Georgetown to Potomac Pumping Station. Includes tunnel dewatering pumping station	Future work

Notes:
(1). Required by Three Party Consent Decree
(2). Required by LTCP Consent Decree

Figure 1-4. Potomac River Projects

1.5.3 Rock Creek Projects

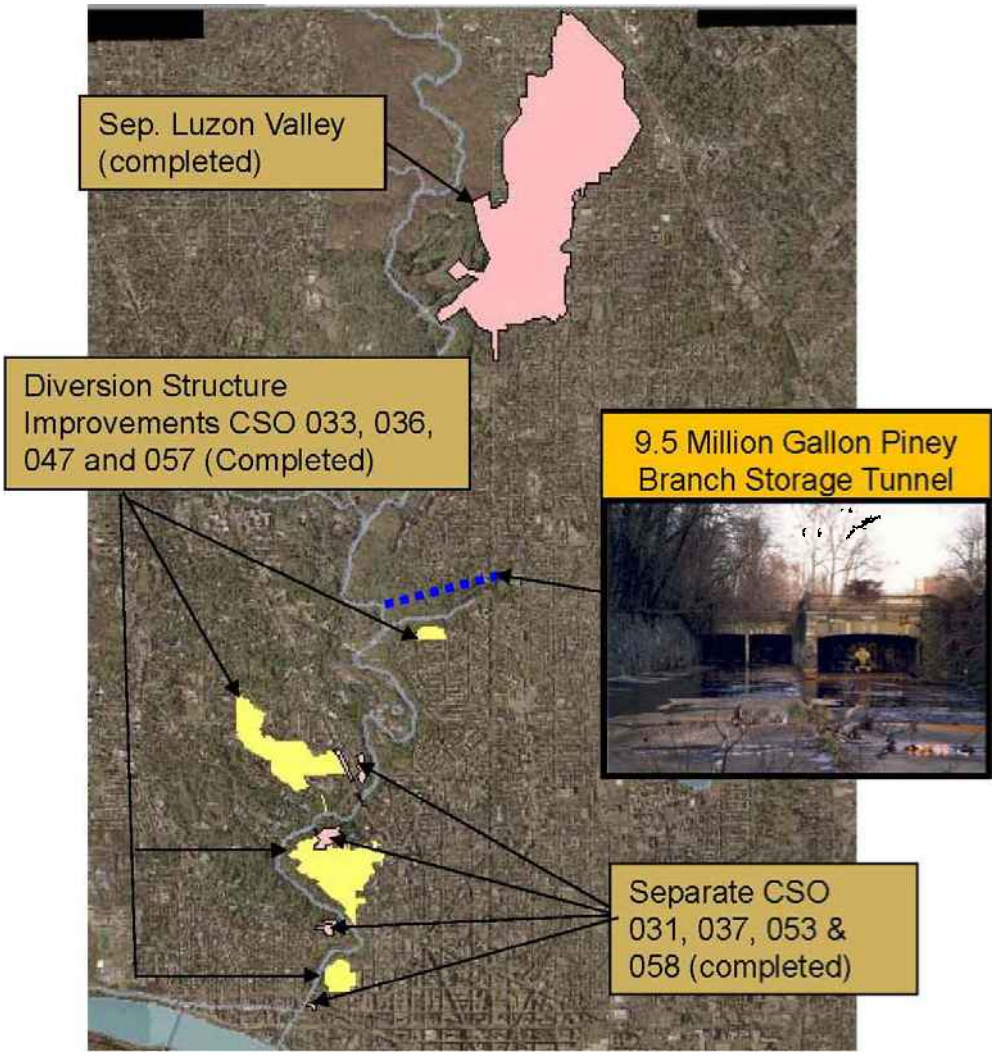
The control measures in the LTCP for Rock Creek are predicted to limit Piney Branch overflows to one per average year. The remaining overflows in Rock Creek will be controlled to 4 events per average year. The principal control measures include separation of four CSOs, construction of a storage tunnel at Piney Branch, and monitoring and regulator improvements to four CSOs south of Piney Branch.

The major elements of the Final LTCP for Rock Creek are summarized in Table 1-4 and are shown on Figure 1-5.

Table 1-4. Rock Creek Projects

Component	Description	Status (as of May 2015)
Rock Creek		
Separate Luzon Valley	Separate CSO 059	Completed
Separation	Separate CSOs 031, 037, 053, and 058.	Completed
Monitoring at CSO 033, 036, 047 and 057	Conduct monitoring to confirm prediction of overflows. If overflows confirmed, then perform the following: • Regulator Improvements: Improve regulators for CSO 033, 036, 047 and 057. • Connection to Potomac Storage Tunnel: Relieve Rock Creek Main Interceptor to proposed Potomac Storage Tunnel when it is constructed	Completed
Storage Tunnel for Piney Branch (CSO 049)	9.5 million gallon storage tunnel	Future work

Figure 1-5. Rock Creek Projects



1.5.4 System-Wide Improvements

The LTCP also includes the following system-wide improvements:

- Low Impact Development Retrofit (LID-R) at DC Water Facilities – the Decree requires DC Water to construct $3 M of LID at DC Water facilities and to evaluate the effectiveness of these measures. The projects are complete.

- Excess Flow Treatment Improvements at Blue Plains – the Decree requires the addition of four new primary clarifiers and improvement to the excess flow treatment control and operations. Because of the TN/WW plan, these improvements have been deleted and are scheduled to be replaced by a new 225 mgd enhanced clarification facility (ECF).

1.5.5 Consent Decree Schedule

There are numerous deadlines and interim milestones in the LTCP Decree. Major deadlines are summarized in Table 1-5.

Table 1-5. Key Deadlines in LTCP Consent Decree

Item	Deadline Type	Deadline
Anacostia River Projects		
CSO 006 Separation	Place in Operation	Completed -2010
Tunnel from Blue Plains to RFK Stadium	Place in Operation	March 23, 2018
Complete System	Place in Operation	March 23, 2025
Potomac River Projects		
Potomac Tunnel	Start Facility Plan	Completed - 2015
	Award Design Contract	March 23, 2018
	Award Construction Contract	March 23, 2021
	Place in Operation	March 23, 2025
Rock Creek Projects		
Separate CSO 059 Luzon Valley		Completed - 2002
Separate CSO 031, 037, 053, 058		Completed - 2011
Rock Creek Regulator Improvements		Completed - 2013
Piney Branch Tunnel	Start Facility Plan	March 23, 2016
	Award Design Contract	March 23, 2019
	Award Construction Contract	March 23, 2022
	Place in Operation	March 23, 2025
System-Wide		
LID-R at DC Water Facilities	Place in Operation	Completed - 2014

1.6 Predicted CSO Reduction

The DC Department of the Environment (formerly Department of Health) and EPA approved the Final LTCP and determined that CSOs remaining after implementation of the plan would not cause or contribute to the exceedance of water quality standards, subject to post construction monitoring. Regulatory agencies also determined that the CSOs remaining after implementation of the plan would comply with total maximum daily loads (TMDLs) established for the receiving waters. Table 1-6 shows the CSOs predicted as a result of implementation of the DCCR.

Table 1-6. Key Deadlines in LTCP Consent Decree

Item	Anacostia River	Potomac River	Rock Creek	Total
CSO Overflow Volume (mg/avg. yr.)				
1996 – DC Water formed	2,142	1,063	49	3,254
2015 – After inflatable Dams and Pumping Station rehabilitations	1,258	654	48	1,960
2025 – LTCP in Place	54	79	5	138
% Reduction	98%	93%	90%	96%
Number of Overflows (#/avg. yr.)				
1996 – DC Water formed	82	74	30	
2015 – After inflatable Dams and Pumping Station rehabilitations	75	74	30	
2025 – LTCP in Place	2	4	1 / 4 (1)	

Notes:

(1) One overflow per average year at Piney Branch, four overflows per average year at other Rock Creek CSOs

THIS PAGE INTENTIONALLY LEFT BLANK

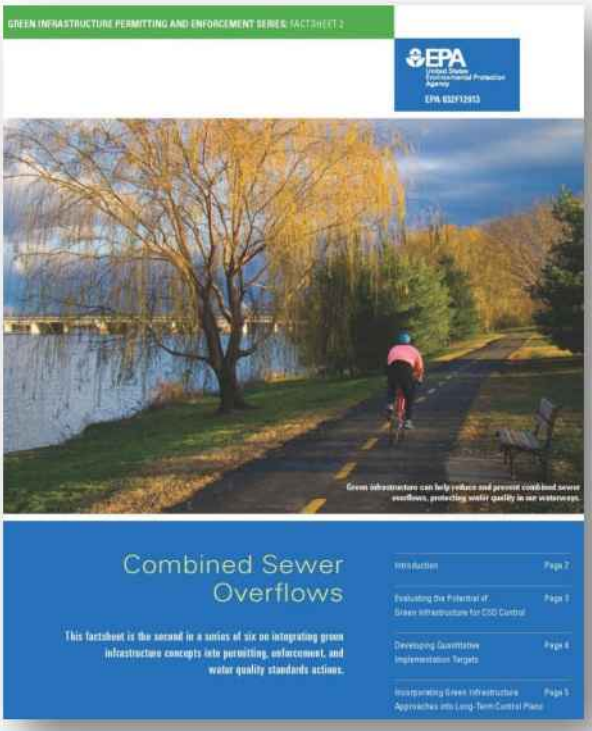
2 Bases for Modification

2.1 New Technology and Recognition by Regulatory Agencies

The LTCP was developed from 1998-2002. At that time, GI was not a well developed and recognized technology for providing CSO control. In addition, there was no formal recognition of the technology by regulatory agencies as a viable method for providing CSO control. Because of this and other factors, GI in the LTCP was limited to a $3 M demonstration project at DC Water facilities.

Since development of the LTCP, GI has been recognized as a potentially viable technology for controlling CSOs. Further, EPA strongly encourages the use of GI approaches to manage wet weather flows. Since 2007, EPA's Office of Water has released the following policy memos and documents supporting the integration of green infrastructure into NPDES permits and CSO programs:

- Memorandum, Achieving Water Quality Through Integrated Municipal Stormwater and Wastewater Plans
  In October 2011, EPA's Office of Water (OW) and Office of Enforcement and Compliance Assurance (OECA) issued a joint memo encouraging EPA Regions to assist their state and local partners in pursuing an integrated planning approach to Clean Water Act waste and stormwater obligations. The memo identifies green infrastructure as one example of a comprehensive solution that can improve water quality while supporting other quality of life attributes that enhance the vitality of communities.



EPA Factsheet 2: CSOs

- Memorandum, Protecting Water Quality with Green Infrastructure in Water Permitting and Enforcement Programs
  In April 2011, EPA OW and OECA jointly issued a memo supporting the use of green infrastructure. The memo reaffirms the commitment of both offices to work with interested communities on incorporating green infrastructure into stormwater permits and into remedies for non-compliance with the Clean Water Act.

- Memorandum, Use of Green Infrastructure in NPDES Permits and Enforcement
  In August, 2007, EPA issued a memo encouraging the incorporation of green infrastructure into National Pollutant Discharge Elimination System (NPDES) stormwater permits and CSO

long term control plans. Additionally, the memo states that green infrastructure can and will be used in future EPA enforcement activities.

- Memorandum, Using Green Infrastructure to Protect Water Quality in Stormwater, CSO, Nonpoint Source and other Water Programs
  In March, 2007, Benjamin Grumbles, EPA's Assistant Administrator for Water, issued this memo to promote green infrastructure as a viable stormwater management solution.

- EPA Permitting and Enforcement Series
  In 2012, EPA issued a Permitting and Enforcement series guide to integrating green infrastructure into NPDES wet weather programs. The series consists of six factsheets and four supplements as follows:

  - Factsheet 1: General Accountability Considerations for Green Infrastructure
  - Factsheet 2: Combined Sewer Overflows
  - Factsheet 3: Sanitary Sewer Overflows
  - Factsheet 4: Stormwater
  - Factsheet 5: Total Maximum Daily Loads
  - Factsheet 6: Water Quality Standards
  - Supplement 1: Consent Decrees that Include Green Infrastructure Provisions
  - Supplement 2: Consent Decree Language Addressing Green for Grey Substitution
  - Supplement 3: Green Infrastructure Models and Calculators
  - Supplement 4: Green Infrastructure in Total Maximum Daily Loads

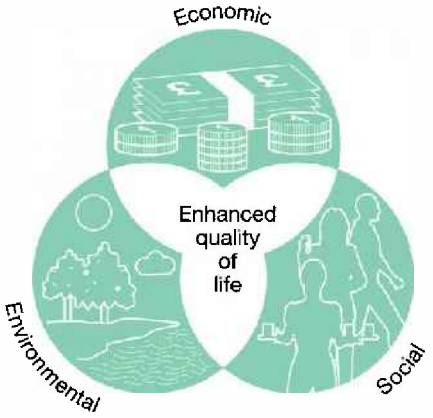
2.2 Added Benefits

Unlike single-purpose gray stormwater infrastructure, which uses tanks, tunnels and pipes to store and convey stormwater, GI uses vegetation and soil to manage stormwater where it falls. GI has the potential to not only reduce stormwater and combined sewer overflows (CSOs), but to provide multiple environmental, social and economic benefits. Known as Triple Bottom Line, the added benefits fall into three categories:

Environmental

- Water Quality and Quantity - By retaining rainfall from small storms, green infrastructure reduces stormwater discharge volumes. Lower discharge volumes translate into reduced combined sewer overflows. Green infrastructure can also mitigate flood risk by slowing and reducing stormwater discharges.

- Air Quality – Increased vegetation can remove pollutants, such as particulate matter and carbon monoxide, thereby improving air quality.



- Urban Heat Island Reduction - The urban heat island (UHI) effect occurs when urban areas replace natural land cover with dense concentrations of pavement, buildings, and other surfaces that absorb and retain heat. Trees, green roofs, and other green infrastructure features can cool urban areas by shading building surfaces, deflecting radiation from the sun, and releasing moisture into the atmosphere.

US Tax Court Green Roof

- Energy Conservation: GI can reduce local temperatures and shade building surfaces, lessening the cooling demand for buildings, thereby reducing energy needs and decreasing emissions from power plants.

- Carbon Sequestration - Since GI includes plants which use carbon dioxide as part of photosynthesis, GI has the potential to reduce carbon load to the atmosphere and assist with mitigation of greenhouse gases.

- Habitat Improvement - GI can provide habitat for birds, mammals, amphibians, reptiles, and insects. Even small patches of vegetation such as green roofs provide habitat for a variety of insects and birds.

Social

- Health Effects - Increased tree canopy has the potential to reduce ozone and particulate pollution levels enough to benefit mortality, hospital admissions, and work loss days due to illness.

- Enhanced Aesthetics - The aesthetic benefits provided by GI have the potential to increase the quality of life in the District by increasing local jobs, decreasing crime and enhancing the enjoyment of the citizenry

- Reduced Disruption during Construction – Since GI involves primarily construction on a small scale, it can reduce large construction impacts (traffic, noise, dust, closures and relocations) associated with heavy civil construction projects.

Economic

- Poverty reduction/job creation - Specialized labor is required for construction of conventional gray infrastructure (e.g., tunneling). Such skilled laborers might typically be already employed in the construction field. GI creates the opportunity to hire local unskilled – and otherwise unemployed – laborers for landscaping and restoration activities. GI thus can provide an economic boost to the local community and can decrease the costs of social

services that would otherwise be required. The economic benefits of GI in the District are described in a report in Appendix D.

- Enhanced Property Values – Improved aesthetics, decreased crime and increased live-ability can improve property values in the areas where GI is installed.

- Enhanced recreation and improved quality of life - The aesthetic benefits provided by GI have the potential to increase the quality of life in the District by increasing local jobs, property values and recreational space. A recent economic study found that when compared to grey infrastructure, a GI program in the District will provide nearly twice as many local jobs.

2.3 DC Water's GI Investigations

DC Water has invested significant resources and funds ($3.5 M) over the past three years to research and analyze GI for CSO control. This work was documented in technical memoranda which are included in the appendices as follows:

- Appendix E: Economic Impact of Alternative CSO Control Strategies
- Appendix F: Technical Memorandum No. 2 - Approach to Hydrologic and Hydraulic Modeling
- Appendix G: Technical Memorandum No. 4 - The District of Columbia's Experience with Green Infrastructure
- Appendix H: Technical Memorandum No. 5 - Green Infrastructure Experience – Foreign and Domestic Case Studies
- Appendix I: Technical Memorandum No. 6 - Green Infrastructure Technologies
- Appendix J: Technical Memorandum No. 7 - Green Infrastructure Screening for the Potomac River and Rock Creek

Technical Memorandum No. 7 (Screening Analysis) assessed the feasibility of implementing GI by itself or in combination with gray infrastructure. The results showed that there are viable green and green/gray hybrid solutions to CSO control. Based in part on this analysis, DC Water has proposed the hybrid green/gray CSO controls summarized in Section 3.

3 Control Plan for Rock Creek and Potomac River

DC Water is recommending a modification of its LTCP to change the CSO control plan for the largest CSO in Rock Creek (Piney Branch, CSO 049) and the Potomac River CSOs. The control plan includes green and green/gray controls. Each control technology will be used where it is the most appropriate. The hybrid green/gray controls are predicted to provide a degree of CSO control equivalent to the gray controls in the LTCP. The hybrid approach will have a higher socio economic benefit to the District, especially in the communities served by GI. Figure 3-1 at the end of this section compares the recommended controls to those in the existing LTCP.

3.1 Green Controls for Rock Creek's Piney Branch Sewershed

3.1.1 Scope

GI will be constructed in the Piney Branch drainage area in Rock Creek sized to manage the volume of runoff produced by 1.2" of rain falling on 365 impervious acres (30% of the impervious acres) in the sewershed. GI projects may include bioretention practices (bioretention cells, bioswales, vegetated filter strips, and tree box filters), rooftop collection practices (green roofs, blue roofs, downspout disconnection, rain barrels, and cisterns) and permeable pavement. These facilities will be constructed in both public and privately-owned spaces. In addition to GI, targeted sewer separation may be utilized to offload storm water from the combined sewer system.

30% GI Implementation in Rock Creek's Piney Branch Sewershed
Total Sewershed area = 2,329 acres
Impervious area = 1,215 acres
30% of impervious acres = 365 acres
Manage volume of runoff produced by 1.2" of rain falling on 365 impervious acres

In addition to GI, the weir height of the existing diversion structure (Structure 70) serving CSO 049 will be raised to increase the capture of combined sewage. The resulting captured sewage will be diverted to the existing East Rock Creek Diversion Sewer for conveyance to Blue Plains for treatment. This control structure modification is not predicted to increase overflow frequency or volume at other downstream CSOs in the Rock Creek sewershed.

3.1.2 Schedule

GI has not been used at a large scale in dense urban areas to provide a high degree of CSO control. Therefore, there is a need to develop basic information regarding permitting, location of facilities, public outreach and involvement, development of design details and maintenance. DC Water will use an adaptive management approach to implement GI. This means that projects will be constructed in a sequential fashion. Lessons learned on early projects will be used to adjust and improve later projects to make GI successful.

DC Water does not own significant property in the District. Construction of GI therefore requires permits and concurrence from the property owner, which is the District or Federal Government in the majority of cases. Siting of GI in public space will require developing and adopting new policies regarding how to organize public space. Examples include establishing standards regarding how

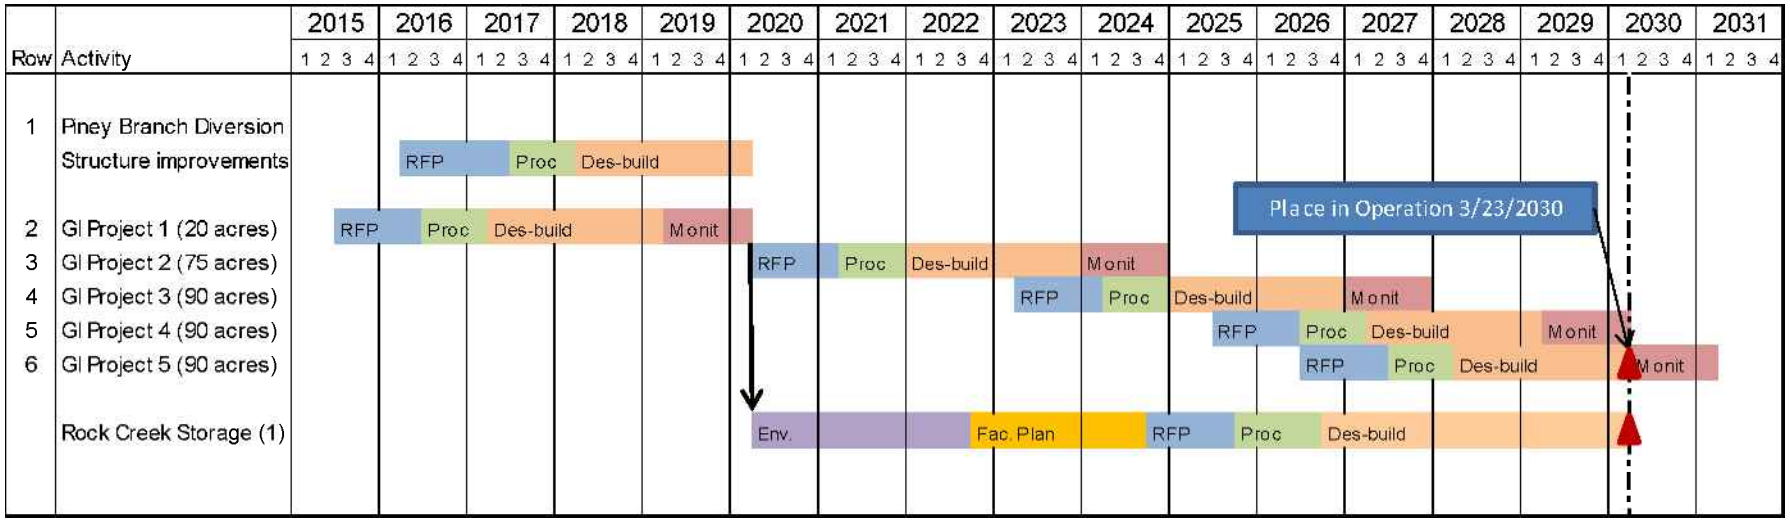
bioretention, parking, cross walks and pedestrian access will coexist in the public right of way. In addition, maintenance standards and responsibilities will need to be established and addressed. Further, codes and regulations will need to be reviewed and possibly revised to encourage and allow GI construction in public space. These institutional and planning issues will need to be addressed in order to have successful implementation of GI.

Because of the items identified above, a schedule extension is required in order to implement GI for CSO control. The current consent decree requires completion of the controls for Rock Creek by March 23, 2025. Based on an adaptive management approach and a review of feasible planning, design and construction schedules, DC Water has determined that an extension of the schedule to March 23, 2030 (5 years) is required in order to implement GI. The Piney Branch diversion structure improvements can be implemented early in the schedule.

Given that there is some uncertainty associated with the ability to implement GI in the District at a large scale, DC Water proposes to construct the first GI project in Rock Creek and then evaluate GI in terms of constructability, operability, efficacy, public acceptability and cost effectiveness. If, based on that evaluation, GI is determined to be impracticable, then DC Water will construct the 9.5 million gallons of storage (gray infrastructure) for the Piney Branch CSO. If GI is determined to be practicable after the first project, then DC Water will continue to implement the remaining GI projects.

Figure 3-2 shows the schedule and the basis for the schedule is summarized below:

- Environmental Approvals: This involves prepare National Environmental Policy Act (NEPA) and District Environmental Policy Act documentation necessary to construct the project.
- Facility Plan: The Facility Plan involves preparing preliminary engineering information necessary for detailed design such as siting, geotechnical data, existing utility, property ownership, design criteria and other information.
- Prepare Request for Proposal (RFP) and Neighborhood Outreach: DC Water anticipates using a design-build process that will require coordination with the District and with neighborhood stakeholders and private property owners. Based on past DC projects, the time needed for outreach and RFP preparation is 12 months for GI projects.
- Procurement: The bidding and award process for GI projects will take 9 months which is typical for DC Water construction contracts. The first contract is anticipated to take only 6 months, accounting for a smaller contract scope.
- Design and Construction: GI and sewer separation projects will be performed using design-build project delivery. Based on the area of coverage and prior DC Water design and construction work under the Anacostia River Projects, each contract will take 2 years.
- Post-Construction Monitoring: The schedule includes 12 months of post construction monitoring. The results will be used to determine the effectiveness in a variety of different rainfall and weather conditions, and to inform the implementation approach for subsequent projects.



Notes:

1. Rock Creek Storage will only be constructed if GI is determined to be impracticable after GI Project 1 in Rock Creek

Figure 3-2. Rock Creek Schedule

3.1.3 Predicted Performance

Hydraulic modeling predictions indicate that GI implementation and modifications to Structure 70 will eliminate the need to construct 9.5 MG of tunnel storage included in the LTCP. The GI program is predicted to provide a degree of CSO control equivalent to the gray controls in the LTCP, as summarized in Table 3-1.

Predicted water quality is summarized in Table 3-2 and the GI controls are predicted to provide a degree of water quality performance in the receiving water equivalent to the gray controls in the LTCP.

Figure 3-3 shows that GI allows earlier reductions in CSO overflow volume than the gray controls because individual GI components provide a benefit as soon as they are placed in operation. This is in contrast to the gray controls which typically require all of the structural components to be completed before the facility provides a CSO reduction benefit.

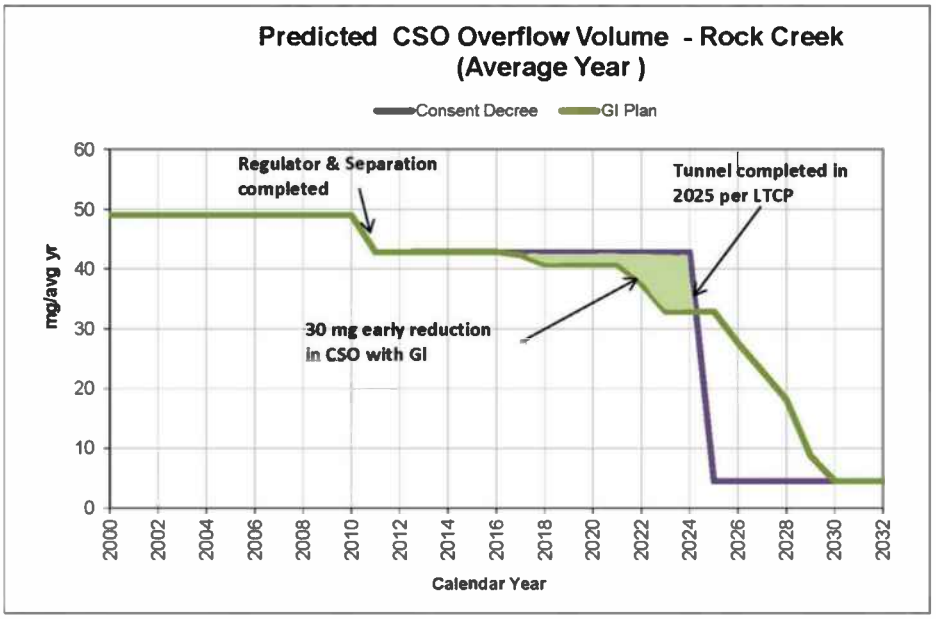


Figure 3-3. Predicted CSO Overflow Volume in Rock Creek

Table 3-1
Piney Branch Predicted CSO Overflows in Average Year

Parameter	Before LTCP[1]	LTCP	Green Controls[2]
No. of Overflows (#/avg yr)	25	1	1
Overflow Volume (mg/avg yr)	39.73	1.41	<1
% reduction from Before LTCP	–	96%	96% or greater

Table 3-2
Predicted Water Quality in
Rock Creek after Piney Branch (Segment 17) in Average Year

Parameter	Before LTCP[1]	LTCP	Green Controls[2]
# Months Fecal Geomean>200 (all loads)	12	12	12
# Months Fecal Geomean>200 (CSO only)	0	0	0
# Days Fecal>200 (all loads)	335	335	335
# Days Fecal>200 (CSO Only)	24	1	1
# Days Fecal>200 (all loads) May - Sept	135	135	135
# Days Fecal>200 (CSO Only) May - Sept	15	1	1
# Months E. Coli Geomean>126 (all loads)	12	12	12
# Months E. Coli Geomean>126 (CSO only)	0	0	0
# Days E. Coli>126 (all loads)	365	365	365
# Days E. Coli>126 (CSO Only)	24	1	1
# Days E. Coli>126 (all loads) May - Sept	153	153	153
# Days E. Coli>126 (CSO Only) May - Sept	15	1	0
# Days D.O.< 5 mg/L (all loads)	0	0	0
# Days D.O.< 5 mg/L (CSO Only)	0	0	0

Notes for Tables 3-1 and 3-2:

1. Results shown for Before LTCP are without Phase1 Controls in place (i.e., without inflatable dams, pumping station rehabilitations and Northeast Boundary Swirl Facility in operation).
2. At the low levels of CSO overflows projected herein, model accuracy is highly dependent on many variables such as the accuracy of rainfall data, information on the drainage area and other factors. Further, additional overflows will occur for rain events which exceed or are not represented in the average year. The model predictions contained herein do not change the level of CSO control determined to be adequate to meet water quality standards which was included by DC Water in its LTCP, and subsequently approved by EPA and the D.C. Department of the Environment.

3.2 Hybrid GI Plan for Potomac River

3.2.1 Scope

DC Water will construct the following controls for the Potomac River CSOs:

- **Potomac Tunnel (CSOs 020 – 024)**
  The Potomac Storage Tunnel will capture CSOs 020 through 024. These outfalls serve the major interceptors draining Rock Creek and the large downtown areas in the Potomac sewershed. Given the large overflow volume produced by these outfalls and the highly urbanized nature of the sewershed, DC Water will construct gray infrastructure to control these CSOs. The tunnel in the LTCP was a 58 million gallon (mg) facility with a tunnel dewatering pumping station at the low end. After rain events, the pumping station would bleed captured flow via the existing system to Blue Plains for treatment. The large size of the tunnel was driven, in part, by the inability to completely dewatering the tunnel during back-to-back rain events.

  As part of this modification, DC Water is proposing to construct a gravity tunnel from CSO 024 to interconnect with the Blue Plains Tunnel on the Anacostia System. The total volume of the Potomac Tunnel will be 30 mg and the tunnel will be emptied by gravity. This configuration will create one interconnected tunnel system. The advantages of this system include:

  - The Potomac and Anacostia Tunnel Systems will be interconnected, with a total system storage volume of 187 mg (30 mg for the Potomac + 157 mg for the Anacostia River Tunnel System). Since rainfall has both geographic and temporal variability, the interconnection of the tunnel system improves the ability of the system to provide CSO control. As an example, intense rain events in one part of the District can utilize the tunnel system volume as needed to control overflows. This, combined with the sewer separation and GI, allows the 30 mg Potomac Tunnel to provide a degree of control equivalent to the gray controls in the LTCP.

  - The gravity tunnel does not require construction of a new pumping station in the National Mall area. This preserves space for other higher value use. In addition, it reduces the need for operation and maintenance associated with a complex mechanical system. Elimination of the pumping station also improves reliability and redundancy since the gravity tunnel does not require electrical power or other mechanical equipment to function.

  - The gravity tunnel improves the reliability and operability of the existing sewer system. The system will be configured such that if the Potomac Pumping Station loses power, then normal sanitary flows in the system will drop into the tunnel by gravity for conveyance to Blue Plains, thereby preventing a dry weather overflow. Further, if the Potomac Pumping Station or the Potomac Force Mains experience

equipment failures or need to be worked on for repair or maintenance, the gravity tunnel can be used as a backup to convey flows to Blue Plains for treatment.

- The gravity Potomac Tunnel is more environmentally responsible because it eliminates the need for an energy intensive pumping station.

- **Separation of Combined Sewers (CSOs 025 – 026)**
  The drainage areas for CSO 025 (17 acres) and CSO 026 (3 acres) are very small and, therefore, it is practical to separate the tributary combined sewers. Separation will result in the elimination of combined sewer overflows from these sewersheds.

CSO 025 Separation
Sewershed = 17 acres

CSO 026 Separation
Sewershed = 3 acres

CSO 027 30% GI Implementation
Sewershed = 164 acres
Impervious = 104 acres
30% GI = 31 acres

CSO 028 30% GI Implementation
Sewershed = 21 acres
Impervious = 13 acres
30% GI = 4 acres

CSO 029 60% GI Implementation
Sewershed = 330 acres
Impervious = 164 acres
60% GI = 98 acres

- **Green Infrastructure (CSOs 027 – 029)**
  GI will be constructed in the CSO 027, 028 and 029 drainage areas sized to provide a retention capacity equivalent to 1.2" of rain falling on 133 impervious acres in the sewersheds. This is equivalent to GI treatment of 30% of impervious areas in the CSO 027 and 028 sewersheds, and 60% of impervious areas in the CSO 029 sewershed. GI projects may include bioretention practices (bioretention cells, bioswales, vegetated filter strips, and tree box filters), rooftop collection practices (green roofs, blue roofs, downspout disconnection, rain barrels, and cisterns), permeable pavement, and large-volume underground storage. In addition to GI, targeted sewer separation may be utilized to offload storm water from the combined sewer system. Diversion structures within the CSO 027, 028, and 029 sewersheds will be modified to increase diversion capacities. The diversion structure improvements coupled with the GI are predicted to provide a degree of CSO control equivalent to the LTCP.

3.2.2 Schedule

As with Rock Creek, an adaptive management approach is recommended for the Potomac River to address institutional and planning challenges for GI. The same issues exist on the Potomac River and DC Water will follow the same approach and schedule for the GI for CSOs 027, 028 and 029. The current consent decree requires completion of the controls for the Potomac River controls by March 23, 2025. DC Water has determined that an extension of the schedule to 2027 (3 years) is required in order to implement GI while addressing adaptive management and institutional and planning challenges.

Given that there is some uncertainty associated with the ability to implement GI in the District at a large scale, DC Water proposes to construct the first GI project in the Potomac and then evaluate GI in terms of constructability, operability, efficacy, public acceptability and cost effectiveness. If, based on that evaluation, GI is determined to be impracticable for CSO 027, 028 and 029, then DC Water will construct the Potomac Tunnel with a 40 million gallon capacity instead of a 30 million gallon capacity and will connect CSOs 027, 028 and 029 to the Potomac Tunnel (9.5 million gallons of storage (gray infrastructure) for the Piney Branch CSO). If GI is determined to be practicable after the first project, then DC Water will continue to implement the remaining GI projects.

For the Potomac Tunnel, the current consent decree requires placing the facilities in operation by March 23, 2025. Because of changes that have occurred since the consent decree was negotiated, the Potomac Tunnel schedule should be extended by five years to 2030. This schedule extension is required for the following reasons:

- Requirement to prepare Environmental Impact Statement – The development of the LTCP and LTCP consent decree included a significant public process to select the controls for receiving water. Because the existing CSOs are located on National Park Service property, the Potomac Tunnel facilities may have a significant impact on Park Property. Because of this, the National Park Service has indicated that an Environmental Impact Statement will need to be prepared for the Potomac Tunnel. This was not envisioned or planned for when the schedule in the original consent decree was established. The NPS indicates that at least three years should be allowed for this process.

- Planning and Siting Challenges – The Potomac River front is essentially completely developed. There are few, if any, undeveloped or open sites absent valuable parkland in which to construct facilities. As a result, planning and obtaining approval for the Potomac facilities will take considerably longer than anticipated. Developing the consensus necessary to site facilities, obtaining land rights and obtaining approvals necessary for construction will add significant time to the project.

- Utility relocation – Experience gained on the Anacostia River Projects demonstrates that up-front time is needed to identify utilities and arrange for them to be relocated prior to tunnel and shaft construction. DC Water has therefore planned for early utility relocation contracts.

- Ability to Expand Tunnel to Include CSO 027, 028 and 029 – Time is required to construct and evaluate the first GI project in the sewersheds for CSO 027, 028 and 029. This is required to determine whether a 30 million gallon or 40 million gallon tunnel is required.

The sewer separation projects for CSO 025 and 026 are independent of the GI and the Potomac Tunnel. These projects can therefore proceed earlier in the schedule and can be completed by 2023.

Figure 3-4 shows the schedule and the basic steps in the schedule are similar to that required for the Rock Creek Projects.

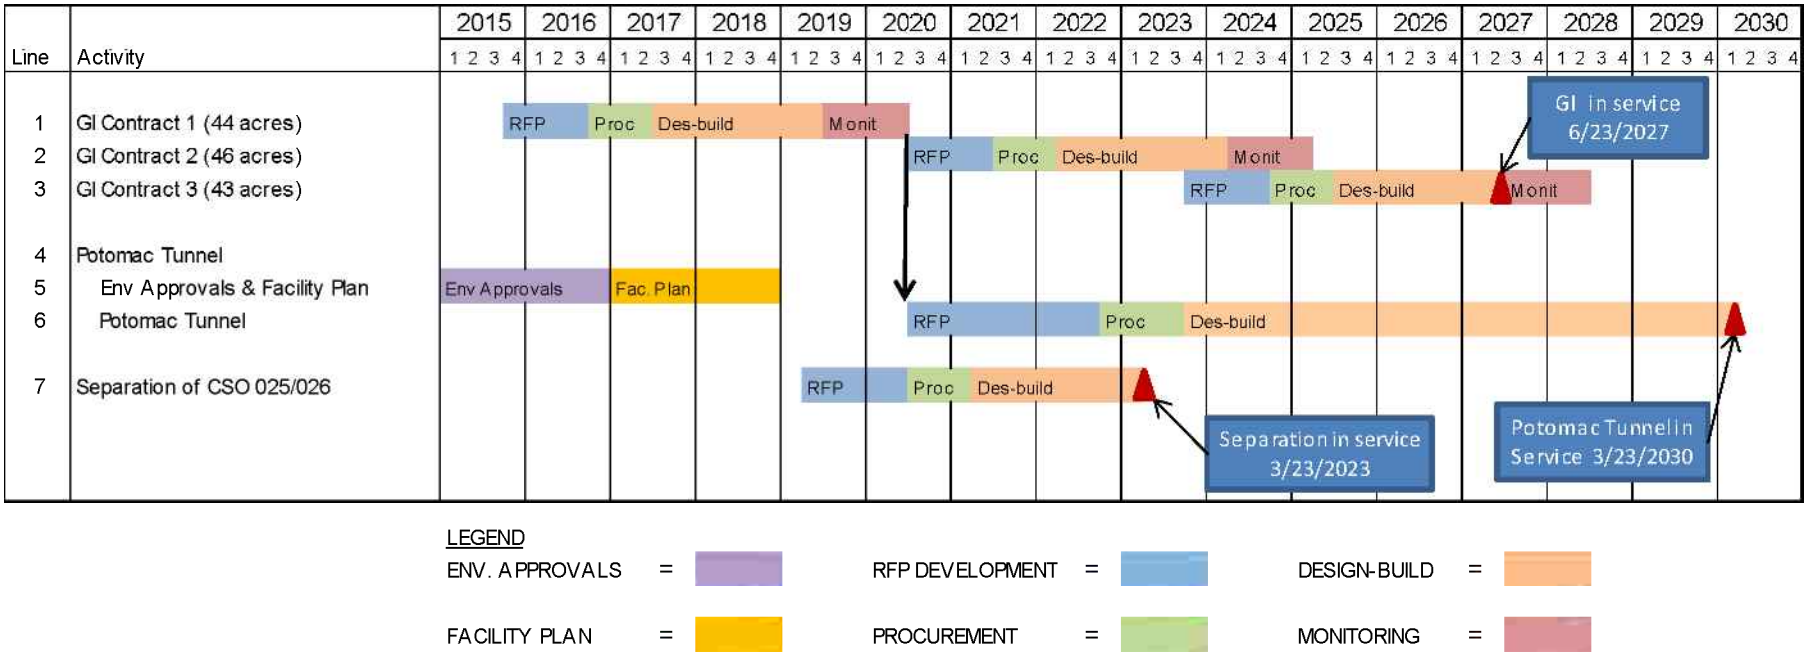

Figure 3-4. Potomac Schedule

3.2.3 Predicted Performance

Once fully implemented, the hybrid green/gray approach will provide the same overall degree of control for the Potomac River as the LTCP, as summarized in Table 3-5 below. Predicted water quality is summarized in Table 3-3, and also meets the improvements predicted for the LTCP. Table 3-4 demonstrates that the pollutant loads to the Potomac River and the water quality in the Potomac River are predicted to be equal to or better than that predicted for the LTCP.

Table 3-3
Potomac River Predicted CSO Overflows
(Average Year)

Parameter	Before LTCP[1]	LTCP	Hybrid GI Plan[2]
No. of Overflows (#/avg yr)	74	4	Equivalent to LTCP
Overflow Volume (mg/avg yr)	953	79	
% reduction from Before LTCP	--	92%	

Notes:
1. Results shown for Before LTCP are without Phase1 Controls in place (i.e. without inflatable dams, pumping station rehabilitations and Northeast Boundary Swirl Facility in operation).

Table 3-4
Potomac River Predicted Water Quality
Memorial Bridge (Segment 6) in Average Year

Parameter	Before LTCP[1]	Original LTCP	Hybrid GI Plan[2]
# Months Fecal Geomean>200 (all loads)	3	1	1
# Months Fecal Geomean>200 (CSO only)	0	0	0
# Days Fecal>200 (all loads)	142	109	109
# Days Fecal>200 (CSO Only)	57	6	3
# Days Fecal>200 (all loads) May - Sept	64	44	44
# Days Fecal>200 (CSO Only) May - Sept	33	4	1
# Months E. Coli Geomean>126 (all loads)	2	0	0
# Months E. Coli Geomean>126 (CSO only)	0	0	0
# Days E. Coli>126 (all loads)	118	77	74
# Days E. Coli>126 (CSO Only)	60	6	3
# Days E. Coli>126 (all loads) May - Sept	57	36	30
# Days E. Coli>126 (CSO Only) May - Sept	35	5	1
# days D.O.< 5 mg/L (all loads)	0	0	0
# days D.O.< 5 mg/L (CSO Only)	0	0	0

Notes:

1. Results shown for Before LTCP are without Phase1 Controls in place (i.e., without inflatable dams, pumping station rehabilitations and Northeast Boundary Swirl Facility in operation).
2. At the low levels of CSO overflows projected herein, model accuracy is highly dependent on many variables such as the accuracy of rainfall data, information on the drainage area and other factors. Further, additional overflows will occur for rain events which exceed or are not represented in the average year. The model predictions contained herein do not change the level of CSO control determined to be adequate to meet water quality standards which was included by DC Water in its LTCP, and subsequently approved by EPA and the D.C. Department of the Environment.

Table 3-5
Blue Plains Facilities, Flows and Loads, and Receiving Water Quality
(Average Year)

Notes:

1. At the low levels of CSO overflows projected herein, model accuracy is highly dependent on many variables such as the accuracy of rainfall data, information on the drainage area and other factors. Further, additional overflows will occur for rain events which exceed or are not represented in the average year. The model predictions contained herein do not change the level of CSO control determined to be adequate to meet water quality standards which was included by DC Water in its LTCP, and subsequently approved by EPA and the D.C. Department of the Environment.
2. FC= fecal coliform
3. DO = dissolved oxygen
4. MPN = Most probable number

Figure 3-5 shows that GI allows earlier reductions in CSO overflow volume for the Georgetown CSOs than the gray controls because individual GI components provide a benefit as soon as they are placed in operation. This is in contrast to the gray controls which typically require all of the structural components to be completed before the facility provides a CSO reduction benefit.

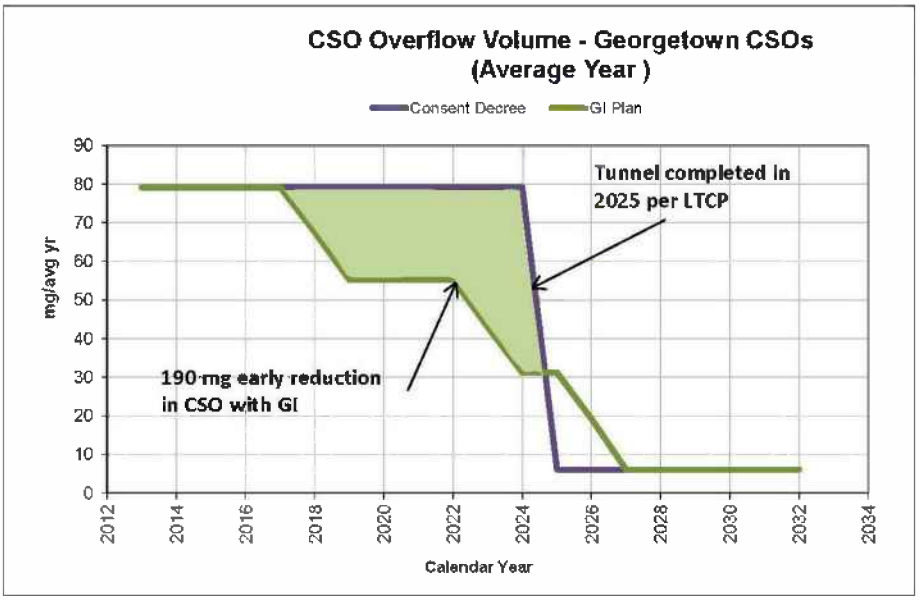

Figure 3-5. Predicted CSO Overflow Volume from Georgetown CSOs

Figure 3-6 shows that for Potomac CSOs 020-024, the recommended plan will result in a delay in CSO control for those outfalls from 2025 until 2030. This additional time is necessary due to new federal requirements to perform an Environmental Impact Statement, new planning and location challenges which did not exist when the original consent decree was signed and to mitigate the financial impact on rate payers.

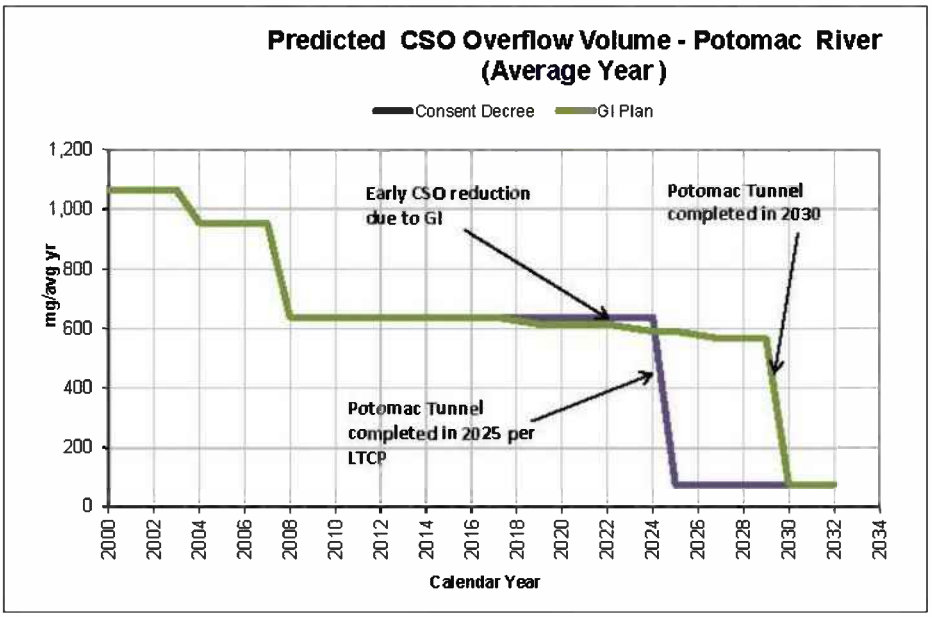

Figure 3-6. Predicted CSO Overflow Volume from all Potomac CSOs

3.3 Change in GI for MS4 Improvements

The District of Columbia recently promulgated stormwater management regulations to address MS4 requirements. The District elected to require that these MS4 regulations apply in the CSO area as well as the MS4 area. In addition to other requirements, the regulations require that land disturbing activities of more than 5000 square feet capture the first 1.2" of runoff volume from the sites. Land disturbing activities in the District public right of way must meet the maximum extent practicable standard. The MS4 regulations require the construction of GI to control storm water volumes.

The new MS4 regulations will therefore require GI to be constructed as a result of redevelopment and other land disturbing activities in the same sewersheds where DC Water will be constructing GI (CSO 027, 028 and 029 on the Potomac and Piney Branch CO 049 on Rock Creek). If this GI is constructed as a result of the MS4 program, it will reduce the GI that DC Water must construct in order to obtain the same degree of CSO control. DC Water will compile the amount of GI actually constructed in the specific targeted sewersheds (CSO 027, 028 and 029 on the Potomac and Piney Branch CSO 049 on Rock Creek) and will reduce the GI required to be constructed based on the retention capacity of the GI constructed pursuant to MS4 requirements.

3.4 Coordination with District

GI can be constructed in public space and private space. DC Water is committed to encouraging GI construction in private space. Possible tactics will be evaluated as part of the GI program but may include review of existing regulations, incentives and partnering with non-profit groups

In public space in the Piney Branch and CSO 027-029 sewersheds, the District of Columbia is the primary public landowner. Coordination and cooperation between the District and DC Water will be important for the success of the GI program for CSO control. The District and DC Water are committed to working together to encourage and make more cost effective the implementation of GI in the District. This coordination is already underway. As an example, the District Department of Transportation is producing engineering design standards and guidelines for construction of GI in the public right of way. DDOE has produced a Stormwater Management Guidebook as part of the MS4 regulations which include design approaches and guides for GI. DC Water has published Utility Protection Guidelines when constructing GI near water and sewer infrastructure. DC Water and the District have provided input and consultation on each other's guidelines and standards to optimize efficiency and ensure consistency.

The District's new MS4 regulations have made considerable progress toward implementing GI and will support DC Water's GI plan. The regulations were issued in July 2013 and require the construction of GI for stormwater control for land disturbing activities that disturb more than 5,000 square feet. This is required in the combined sewer area as well as in the separate MS4 area. These regulations will encourage GI and will make the CSO controls more effective on a City-wide basis.

The District is also implementing the Mayor's Sustainable DC Plan, which lays out a path to make the District the healthiest, greenest, most livable city in the nation over the next 20 years. Improving

the environment and making the District more sustainable are key features of the plan, which is available at http://sustainable.dc.gov/finalplan.

The District and DC Water will continue to work together as GI is implemented to:

- Minimize regulatory and institutional barriers to construction of GI
- Maximize cost effectiveness by looking for opportunities to add GI as part of ongoing DC Government capital projects to minimize costs
- Ensure consistency of design standards as applicable
- Encourage and facilitate GI construction in public and private space.
- Encourage consistency and transfer of ideas and standards between the MS4 program and the CSO program

3.5 Maintenance

DC Water will perform maintenance or will arrange for others to perform it. DC Water will be ultimately responsible to assure that maintenance is performed adequately to maintain the CSO reduction functions of the GI. DC Water also anticipates that this will be a requirement in its National Pollutant Discharge Elimination System (NPDES) Permit issued by EPA.

3.6 Post Construction Monitoring

The NPDES Permit specifies the scope and schedule for post construction monitoring. In accordance with the permit, DC Water will perform post construction monitoring at the completion of the program.

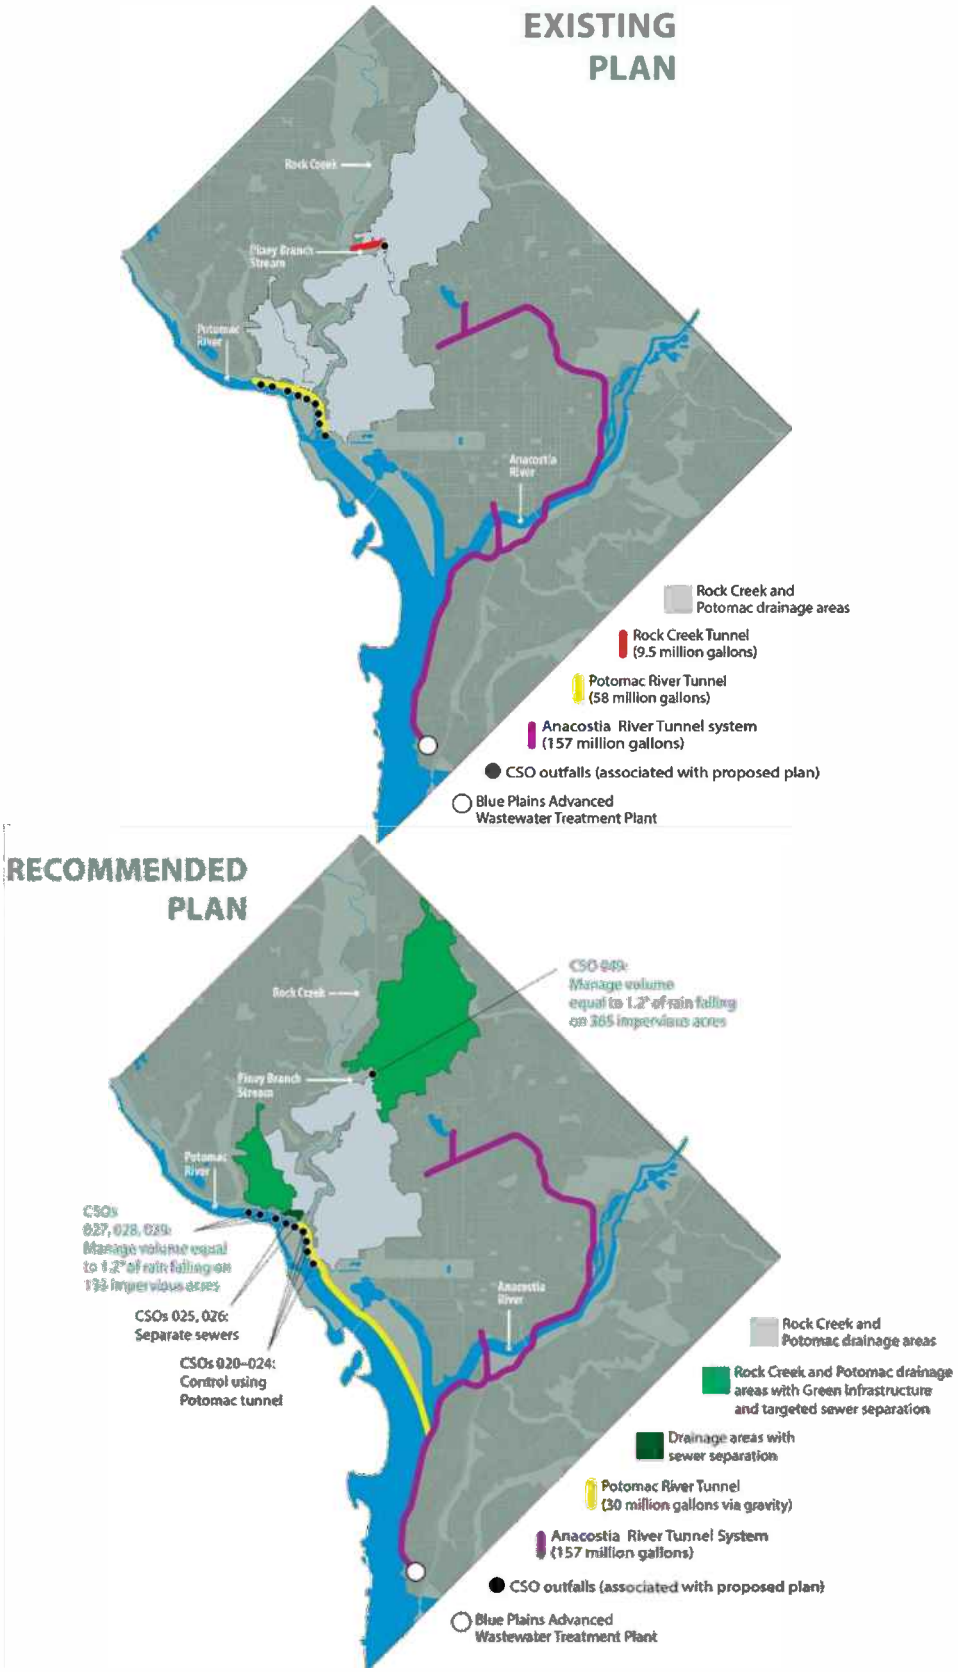
3.7 Compliance with 1994 CSO Policy

The Recommended Final LTCP Modification is in compliance with the CSO Policy. Table 3-6 identifies the key requirements in the CSO Policy and summarizes how the hybrid green/gray approach complies with the Policy.

Table 3-6. Demonstration of Compliance with 1994 CSO Policy

CSO Policy Reference	CSO Policy Requirement	Demonstration of Compliance
II.B.	Implement Nine Minimum Controls	DC Water is implementing a Nine Minimum Controls Plan. Once constructed and in service, the new CSO controls will be operated and maintained in accordance with the nine minimum controls
C.	Long Term Control Plan Development	The CD modifications will modify the LTCP as described in this document
C.1.	Characterization, Monitoring and Modeling	Characterization and monitoring were performed as part of the development of the LTCP. The calibrated models were used to make the performance predictions as part of the GI Screening Analysis.

CSO Policy Reference	CSO Policy Requirement	Demonstration of Compliance
C.2.	Public Participation	Public outreach was conducted as part of the development of the GI Plan and is described in the preceding section.
C.3.	Evaluation of Alternatives	A range of alternatives were considered in the GI Screening Analysis.
C.4.	Cost//Performance Considerations	Cost, performance, efficacy and compliance with water quality standards were evaluated as part of the preparation of the GI Screening Analysis.
C.5.	Operational Plan	The operation and maintenance plan and associated nine minimum controls requirements will be reviewed and adjusted if necessary upon implementation of the controls in the GI Plan.
C.6.	Maximizing Flow at Existing POTW	The LTCP maximizes flow to Blue Plains for treatment. Further, the GI Screening Analysis evaluated maximizing tunnel storage through treatment during wet weather, as described in section 3.2.1 above.
C.7.	Implementation Schedule	An implementation schedule is included.
C.8.	Post Construction Monitoring Program	The NPDES Permit includes detailed provisions requiring post construction monitoring at defined intervals in the implementation of the program.
III.	Coordination with State Water Quality Standards	Subject to post-construction monitoring, the original LTCP was determined to meet water quality standards. The GI Plan is predicted to provide CSO control performance equal to or better than the original LTCP.



EXISTING PLAN
Rock Creek
Piney Branch Stream
Potomac River
Anacostia River
Rock Creek and Potomac drainage areas
Rock Creek Tunnel (9.5 million gallons)
Potomac River Tunnel (58 million gallons)
Anacostia River Tunnel system (157 million gallons)
CSO outfalls (associated with proposed plan)
Blue Plains Advanced Wastewater Treatment Plant
RECOMMENDED PLAN
Rock Creek
CSO 049: Manage volume equal to 1.2" of rain falling on 365 impervious acres
Piney Branch Stream
Potomac River
CSOs 027, 028, 039: Manage volume equal to 1.2" of rain falling on 132 impervious acres
CSOs 025, 026: Separate sewers
CSOs 020–024: Control using Potomac tunnel
Anacostia River
Rock Creek and Potomac drainage areas
Rock Creek and Potomac drainage areas with Green Infrastructure and targeted sewer separation
Drainage areas with sewer separation
Potomac River Tunnel (30 million gallons via gravity)
Anacostia River Tunnel System (157 million gallons)
CSO outfalls (associated with proposed plan)
Blue Plains Advanced Wastewater Treatment Plant

4 Financial Affordability Update

4.1 Background

From 1998 to 2001, DC Water developed its Draft LTCP. Following an extensive public comment period where more than 2,300 comments were received, DC Water finalized its LTCP in July 2002. On March 23, the LTCP Consent Decree was entered with the court requiring implementation of the LTCP.

As part of the development of LTCP, DC Water performed a financial affordability analysis based on information available at the time. The purpose of this document is to update the financial affordability analysis. This update is being performed for the following two main reasons:

Significant Changes Have Impacted the Burden on Ratepayers
Since the LTCP Consent Decree was entered in 2005, there have been significant changes that have impacted the burden on District ratepayers. These include, but are not limited to:

- Nitrogen Removal at Blue Plains' effluent to meet the Chesapeake Bay TMDL - this requirement was added to DC Water's NPDES permit in 2007. As a result of this requirement, DC Water implemented the Total Nitrogen Removal/Wet Weather Plan (TN/WW Plan) at a cost of nearly $950 million

- Biosolids Program – In order to achieve a sustainable program for biosolids from Blue Plains Wastewater Treatment Plant, DC Water is implementing a biosolids program. The program includes construction of Cambi digesters which will allow production of Class A biosolids.

- Increased costs for DC Clean Rivers Project – The DC Clean Rivers Project is a $2.6 billion program. This is more than the original estimate in 2002 when the LTCP was finalized.

- Schedule acceleration of Anacostia River Tunnel – In July and September 2102, severe flooding impacted the Bloomingdale and LeDroit park neighborhoods in the Northeast Boundary Sewershed tributary to the Anacostia River. As a result of this, the Anacostia River Projects tunnel facilities have been accelerated in schedule to provide earlier flood mitigation than originally included in the Decree. The First Street tunnel will be placed in operation in 2016 instead of 2025 and the complete Northeast Boundary Tunnel system is scheduled to be placed in operation in 2022 instead of 2025. This has significantly impacted spending on the program

- Infrastructure renewal – The sewer system in the District is extremely old, with some sewers constructed as early as the 1870's. The median age of sewers in the District is over 70 years old. Given this, a significant rehabilitation and renewal program is underway to preserve and improve the sewer system.

Financial Affordability Guidance has Changed

The financial analysis performed as part of the development of the LTCP was based on EPA's CSO guidance document (*Combined Sewer Overflows - Guidance for Financial Capability Assessment and Schedule Development*, Feb 1997, EPA 832-B-97-004). This approach essentially uses 2% of median household income as the threshold for affordability for sewer rates. This approach to measure ratepayer affordability has come under scrutiny with organizations such as the American Water Works Association (AWWA) and the Water Environmental Federation (WEF) recommending alternative approaches.

In response to these issues including the increased financial burdens imposed on water agencies and communities, EPA has also recognized the need to incorporate greater flexibility in meeting Clean Water Act (CWA) requirements. In a January 13, 2013 Memorandum, the Agency clarified its policy going forward on affordability issues as well on using the integrated planning framework process to provide the regulated community with the necessary flexibility to meet CWA requirements while lessening the financial burden, especially to low income populations.

DC Water's complete affordability update is included in Appendix E and this section presents a summary of the results.

4.2 Affordability Measures for the District.

The 1997 Final EPA guidance presented methods for estimating the annual cost per household (for CSO capital expenditures) and for comparing that estimate against Median Household Income (MHI) to derive a "Residential Indicator" (RI). Although the 1997 guidance document did not prescribe a regulatory threshold ratio, it implied that sewer rates resulting in a typical residential bill exceeding 2 percent of MHI could be considered unaffordable.

EPA has acknowledged the increasing cost burden to communities of complying with the CWA, as well as the methodological limitations of using the RI as an indicator of affordability. As a result of these concerns, EPA issued a memorandum on January 13, 2013 that addressed financial affordability issues and clarified the Agency's policy going forward. The Agency's overall message, as articulated in the memorandum, was that EPA has developed, in cooperation with the regulated community, the "Integrated Planning Approach Framework" that "encourages municipalities to balance CWA requirements in a manner that addresses the most pressing health and environmental protections issues first." The memorandum also attempts to clarify that it is not EPA's policy that the RI, based on expenditures as a percentage of MHI, constitutes the sole measure of affordability. The Agency further emphasized that it is a "common misperception that the EPA requires communities to spend to a level of 2% of MHI to meet CWA obligations." Instead, EPA states that the percent MHI calculation should be considered along with a "suite of other financial indicators to assess the overall burden on a community."

DC Water evaluated the following factors to assess affordability:

- Sources of revenue for DC Water
- Current sewer rates and affordability based on MHI
- Household income distribution in the District\
- Poverty rates in the District

- Distribution of income and poverty by Ward
- Degree of public assistance or food stamp use
- Cost of living in DC compared to the national average

The analysis showed that the income distribution in the District is significantly skewed with a large percentage of households in poverty and in affluence, with lower amounts of households with middle incomes. The analysis also showed that the cost of living in the District is significantly higher than in the U.S., primarily due to elevated housing, transportation and food costs.

Given both the skewed distribution of household income and the high cost of living for District of Columbia residents compared to the national average, using 2 percent of unadjusted MHI as the threshold for unaffordability does not effectively capture the real burden of increasing sewer bill costs on low income populations. Considering affordability across a broader household income distribution provides the most accurate indication of how utility bills pose financial burdens to the population of customers.

Therefore, to assess affordability, DC Water used the following alternative criteria for the affordability measurements

- Unadjusted MHI
- Cost of Living Adjusted (COLA) MHI
- Unadjusted Upper Limit of the Second Quintile for Household Income
- COLA Adjusted Upper Limit of the Second Quintile for Household Income

4.3 Scenarios Evaluated

DC Water used its financial model to assess the impact of capital expenditures on rates. The financial model allows the user to enter annual capital outlays to determine the impact on revenue generation for DC Water and on ratepayer household incomes. The financial model was run for the following scenarios:

- Scenario 1 Original Consent Decree – this is the CIP that existed when the 2002 LTCP Decree was negotiated. This was evaluated using the measures of affordability described above

- Scenario 2 Status Quo CIP – this includes the current CIP with the Anacostia River Projects finishing in 2022, and the Potomac and Rock Creek Tunnels finishing in 2025

- Scenario 3 Constrained CIP – for this scenario, the Anacostia River Projects are completed in 2022, the Potomac Tunnel is completed in 2030, and the Potomac and Rock Creek GI projects are completed in 2032. To meet affordability limits, wastewater and sewer CIP projects were deferred.

4.4 Results

Table 4-1 presents the results of the rate model calculation for the various scenarios. Shaded values indicate wastewater costs more than 2% of income for the various scenarios listed.

Table 4-1
Results Summary - Predicted Sewer Bills as Percent of Income

	Scenario 1- Original Decree			Scenario 2 – Status Quo CIP			Scenario 3 – CIP Constrained by Upper Limits 2nd Quintile		Scenario 3 – CIP Constrained by Adjusted Upper Limit 2nd Quintile

FY2032	1.3	2.2	3.1	1.53	2.42	3.47	2.21	3.17	2.50	1.74

4.5 Conclusions

The following are the conclusions of the affordability update:

- Using a sewer bill threshold of 2 percent of MHI is a poor indicator for assessing affordability. In jurisdictions such as Washington, DC, not only are household incomes highly skewed but there has been an increasing divergence between high income households and low income households. From 2006 to 2012, for example, MHI grew more than 28 percent while household incomes at the upper limit of the second quintile grew only 20 percent. Consequently by 2011 the MHI was 25 percent higher than the upper limit of the second quintile.

- Evaluating the financial impacts of DC Water's CIP on the ratepayer base found that impacts to lower income households become much more apparent when the upper limit of the second quintile is used than when using the 2 percent of MHI threshold. With the COLA factor taken into account, forecasted sewer bills become unaffordable to 40 percent of the households as soon as 2018.

- The impacts on ratepayers for the Status Quo CIP (Scenario 2, CSO Projects completed by 2025) are significantly worse than projected when the LTCP Consent Decree was entered and negotiated.

- The analysis showed that extension of both the Consent Decree schedule and deferment of other sewer and wastewater projects is necessary to maintain affordable rates. To achieve CSO control as early as possible, we evaluated engineering constraints and determined that extending the Potomac River Tunnel schedule by five years and the GI schedule by seven years would result in the earliest practical and technically achievable schedules for CSO control. Given this schedule constraint, DC Water determined that more than $2.5 billion dollars of other sewer and wastewater projects must be deferred between 2014 and 2032 to meet the affordability criteria established by the analysis. Given that average sewer age will be approaching nearly 100 years by 2032, this deferment of other projects inevitably presents risks to customer service, environmental protection, and management of infrastructure. DC Water balanced these risks with our obligations to complete the CSO control program as soon as is practicable when we developed the proposed schedule for CSO control described in this report.

5 Public Comments and Responses

5.1 Introduction

As part of DC Water's proposal for a Long Term Control Plan Modification for Green Infrastructure (LTCP Modification), a public comment period was instituted from January 12, 2014 through April 14, 2014. A public outreach program was conducted to provide information about the proposed modification and to solicit public comments. This section summarizes the outreach conducted, the comments received and the revisions made to the draft plan in response to comments.

5.2 Public Outreach

Public outreach was facilitated via notifications and advertisements disseminated using distribution channels including press releases, print and social media, DC Water's website, emails and mailings. The following summarizes public outreach conducted:

- Washington Post Legal Notice
  A legal notice was placed in the Washington Post on January 12, 2014. The notice described the purpose of the LTCP modification, indicated where additional information could be obtained and the method and deadline for submitting comments. A second legal notice was placed in the Washington Post on March 9, 2014 extending the public comment period to April 14, 2014.

- Public Information Depositories
  Hard copies of the "*Long Term Control Plan Modification for Green Infrastructure*" Document and its Executive Summary, were made available for review from January 22 through April 14, 2014 at the reference desks of the following libraries in District of Columbia neighborhoods:
  - Capitol View Library - 5001 Central Avenue, SE
  - Mount Pleasant Library - 3160 16th Street, NW
  - Rosedale Library - 1701 Gales Street, NE
  - William O. Lockridge/Bellevue Library - 115 Atlantic Street, SW
  - Martin Luther King, Jr. Library Room 307 - 901 G Street, NW
  - Southeast Library - 403 7th Street, SE
  - Shepherd Park Library - 7420 Georgia Avenue, NW
  - Tenley-Friendship Library - 4450 Wisconsin Avenue, NW
  - Lamond-Riggs Library - 5401 South Dakota Avenue, NE

- Web Site
  The proposed modification, public meeting dates and an on-line survey were placed on the DC Water website on a dedicated web page. A link through the DC Water homepage and its rotating banner were also implemented to facilitate easier access. During the comment period, the webpage overall statistics recorded 3,623 sessions and 2527 new users. Visitors to the

site were also provided links to the following:

- YouTube video of General Manager Hawkins' presentation at the January 22, 2014 GI Summit
- Informational presentation slides presented at DC Water sponsored public meetings
- January 22, 2014 GI Summit slides
- February 18 and 20, 2014 GI Public Meetings
- March 5, 2014 Poplar Point and GI Public Meeting
- February 19, 2014 Kojo Nnamdi Show radio interview of General Manager Hawkins describing the proposed LTCP Modification

- Meetings
  DC Water conducted the meetings summarized below to share information regarding the proposed plan and to solicit public comments:
  - On January 22, 2014, DC Water hosted a Public Summit Meeting held at the Metropolitan Washington Council of Governments. Attendees could review a series of 12 stations manned by DC Clean Rivers technical staff discussing various project components graphically represented on presentation boards. The meeting began with an overview of the proposed amendments and supporting justification presented by General Manager George Hawkins, followed by a question and answer period.

  - On Tuesday, February 18, 2014, DC Water hosted a public meeting in support of its Green Infrastructure proposal at Georgetown Visitation Preparatory School, located at 1524 35th Street, NW. The meeting was held in the 2nd floor New Founders Hall. Attendees could review a series of 12 stations manned by DC Clean Rivers technical staff discussing various project components graphically represented on presentation boards. The meeting began with an overview of the proposed amendments and supporting justification presented by General Manager George Hawkins, followed by a question and answer period.

  - On Thursday, February 20, 2014, DC Water hosted a public meeting in support of its Green Infrastructure proposal at Petworth Public Library, located at 4200 Kansas Avenue, NW. Attendees could review a series of 12 stations manned by DC Clean Rivers technical staff discussing various project components graphically represented on presentation boards. The meeting began with an overview of the proposed amendments and supporting justification, followed by a question and answer period.

  - On Thursday, February 27, 2014, DC Water hosted a public meeting in support of its Northeast Boundary Tunnel Project/Green Infrastructure proposal at McKinley Technology High School, located at 151 T Street, NE.

  - On Tuesday, March 4, 2014, DC Water attended the monthly meeting of ANC 2E to discuss its Green Infrastructure proposal for the Georgetown community. The meeting was held at Georgetown Visitation Preparatory School, located at 1524 35th Street, NW, in the 3rd floor Founder's Hall.

- On Tuesday, March 4, 2014, DC Water attended the monthly meeting of ANC 4A to present its Green Infrastructure proposal. The location of the meeting was held at Fort Stevens Recreation Center, located at 1327 Van Buren Street, NW.

- On Wednesday, March 5, 2014, DC Water hosted a public meeting in support of its Poplar Point Pumping Station Replacement Project/Green Infrastructure proposal at United Planning Organization-Ralph Waldo "Petey" Greene Community Service Center, located at 2907 Martin Luther King, Jr. Avenue, SE.

- On Wednesday, March 12, 2014, DC Water attended the monthly meeting of ANC 4C to present its Green Infrastructure proposal. The meeting was held at Petworth Public Library, located at 4200 Kansas Avenue NW.

- On Wednesday, March 12, 2014, DC Water conducted a briefing on its Green Infrastructure plan to the Construction Management Association of America at the Frank D. Reeves Center, located at 2000-14th Street, NW.

- On Thursday, March 13, 2014, DC Water attended the monthly meeting of ANC 3B to discuss the water quality and cost implications of its Green Infrastructure proposal. The meeting was held at Stoddert Elementary School, located at 4001 Calvert Street, NW.

- On Thursday, March 13, 2014, DC Water attended the monthly meeting of ANC 3E to present its Green Infrastructure proposal. The meeting was held at Woodrow Wilson High School, located at 3950 Chesapeake Street, NW.

- On Thursday, April 3, 2014, DC Water's Clean Rivers Project team attended the 5th Annual Ward 2 Town Hall co-hosted by DC Water General Manager George Hawkins and District Councilmember Jack Evans to provide information and address inquiries pertaining to the proposed Green Infrastructure plan. The meeting was held at Francis-Stevens Education Campus, 2425 N Street NW.

- On Wednesday, April 9, 2014, DC Water's Clean Rivers Project team attended the 5th Annual Ward 8 Town Hall Meeting co-hosted by DC Water General Manager George Hawkins and District Councilmember Marion Barry to provide information and address inquiries pertaining to the proposed Green Infrastructure plan. The meeting was held at United Planning Organization's Ralph Waldo "Petey" Greene Community Service Center, 2907 Martin Luther King Jr. Avenue SE.

- On Thursday, April 10, 2014, DC Water's Clean Rivers Project team attended the 5th Annual Ward 4 Town Hall Meeting co-hosted by DC Water General Manager George Hawkins and District Councilmember Muriel Bowser to provide information and address inquiries pertaining to the proposed Green Infrastructure plan. The meeting was held at Shepherd Elementary School, 7800 14th Street NW.

- Social Media
  DC Water posted the Draft LTCP Modification release, meeting notices and the public comment period extension on both DC Water Twitter and Facebook. In addition, two Facebook ads and two promoted tweets were completed to promote the modification to a wider audience. Also, General Manager Hawkins' videotaped presentation at the Green Infrastructure Summit was posted on YouTube (https://www.youtube.com/-watch?v=JkUJH0Tdh3o) and received 167 visits.

- Public Information Materials
  DC Water created multiple dedicated materials for use in the LTCP Modification public comment period including:

  - 600 informational brochures were printed and distributed at public meetings and events
  - Direct mail or ebill inserts were sent to 120,000 DC Water customers between January and April 2014
  - Comment cards were distributed to approximately 600 attendees at the Public Meetings
  - Reference to the LTCP Modification proposal and its comment period was also provided in the "*DC Water Biannual Report April 2014 Combined Sewer Overflow (CSO) Control Activities Clean Rivers Project News*" newsletter which had ongoing mailings to 120,000+ customers between the end of March and end of April, 2014.

- On-Line Survey
  Seventy-one individuals responded to one or more questions and 51 provided narrative comments.

- Earned Media
  Outreach was conducted to several key DC reporters and bloggers to brief them on the proposed Modification. DC Water General Manager George Hawkins was interviewed live on February 19, 2014 by WAMU's Kojo Nnamdi (http://thekojonnamdishow.org/shows-/2014-02-18/dc-water-proposes-green-infrastructure).

  In addition, the following media printed stories about the LTCP modification proposal:

  - *'Green' Modifications Proposed to D.C. Clean-water Plan; Environmentalists are Skeptical*, Mike DeBonis, Washington Post, January 23, 2014 (http://www.washingtonpost.com/local/dc-politics/green-modifications-proposed-to-dc-clean-water-plan-environmentalists-are-skeptical/2014/01/23/e4c43068-8459-11e3-bbe5-6a2a3141e3a9_story.html).

  - *DC Water Proposal Would Swap Tunnels for Green Infrastructure*, Washington City Paper/Housing Complex Blog, posted by Aaron Wiener on January 22, 2014 at 5:35 pm. (http://www.washingtoncitypaper.com/blogs/housingcomplex/2014/01/22/dc-water-proposal-would-swap-tunnels-for-green-infrastructure/).

- *DC Water Modifies Long Term Control Plan to Include Green Infrastructure* Civil+Structural Engineer webpost (http://www.cenews.com/post/2696/dc-water-modifies-long-term-control-plan-to-include-green-infrastructure).

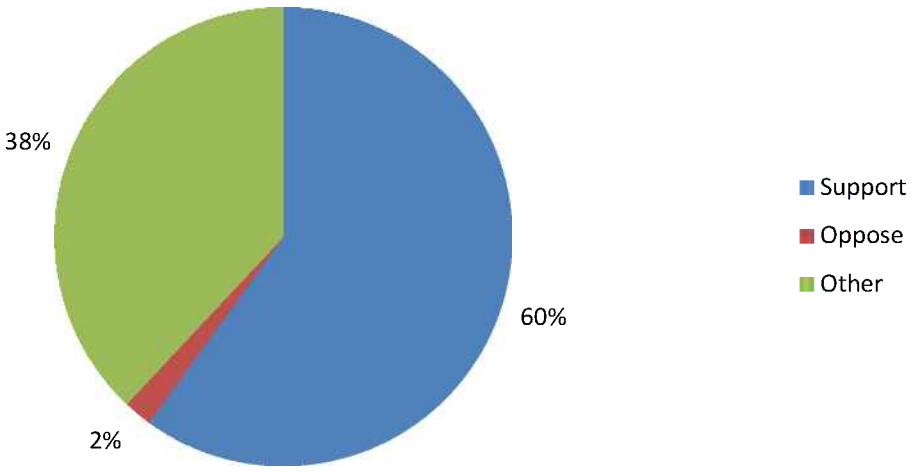
- Key Stakeholder Outreach
  Extensive outreach via phone and email was conducted to stakeholders announcing the LTCP Modification and seeking input including environmental, business and jobs training groups. Briefings were provided to ANCs, Mayor Gray, Congresswoman Norton, DC Councilmember Mary Cheh and key stakeholders. In addition, dedicated email invitations to the January 22, 2014 Green Infrastructure Summit, DC Water February 18 and 20, 2014 Public Meetings and DC Water Town Hall meetings were sent.

5.3 Public Comments

In response to the outreach, 366 commenters submitted 471 comments on the draft LTCP Modification for GI. The comments received have been bound in a separate report titled "*Public Comments, Long Term Control Plan Modification for Green Infrastructure*", DC Water, May 2015.

Figure 5-1 shows the disposition of the comments, with the majority of comments supporting the proposed modification. Comments considered to be "other" in nature covered a variety of topics including comments on other aspects of DC Water's operations, requests for information or suggestions for implementing the program.

Figure 5-1. Summary of Comments



Since a large number of comments were received and because there are significant degrees of overlap and common themes in the comments, the comments were grouped by type and subject matter and addressed together in a commentary type response. The goal of this approach is to produce a commentary that is both readable and comprehensive. The comments were grouped as being related to the following topics:

- Nature of Commitment
- Degree of Control
- Rates/ Financial
- Implementability
- Schedule
- Maintenance
- Implementation Strategies
- Miscellaneous
- General Opposition
- General Support

Appendix K provides a response to each type of comment received.

5.4 Modifications to Draft GI Plan in Response to Comments

As part of finalizing the LTCP Modification for GI, DC Water has made significant revisions to the draft plan. This section describes the major revisions made.

- **Nature of Commitment**
  DC Water's Proposed Draft LTCP Modification included committing $60 million for GI in Rock Creek and $30 million for GI for the Potomac CSOs 027, 028 and 029. This magnitude of expenditures was based on the estimated costs of the GI. A limit on the financial commitment was proposed given the uncertainties in terms of the cost to construct GI and in order to manage these risks to ratepayers. There was also precedent for a financial commitment in other enforceable documents such as New York City's order with the State of New York to construct GI.

  Some commenters indicated that a financial commitment would not ensure that the necessary amount of GI was constructed to provide the degree of CSO control required. These commenters suggested that the commitment to GI should be expressed in terms of acres of GI constructed, gallons stored, or a performance standard other than or in addition to a financial commitment.

  In response to these comments, DC Water has removed the limit on its financial commitment to GI and expressed the commitment in terms of constructing sufficient GI and targeted sewer separation to manage the volume of water produced by 1.2" of rain falling on the number of impervious acres specified for the applicable sewershed. This is a commitment to manage a specified volume of runoff and will ensure that the necessary amount of GI is in place in order to provide the degree of CSO control required.

- **Feasibility/Effectiveness of GI**
  Some commenters indicated that GI may not be feasible to construct at a sufficient application rate to provide the degree of CSO control needed, or may not be as effective as anticipated.

  Given the lack of large scale implementation of GI in the District, DC Water has revised the LTCP Modification to provide for constructing the first GI project in the Potomac and Rock Creek sewersheds and then evaluating GI in terms of constructability, operability, efficacy, public acceptability and cost effectiveness. If, based on that evaluation, it is determined that it is impractical to complete all of the specified GI projects by the specified deadlines, then DC Water would be required to construct the gray controls as specified in the LTCP Modification. Should this occur, DC Water would be required to construct the gray controls within the same timeframe allowed for GI so there is no extension of the time allowed for implementation. If GI is determined to be practicable after the first project, then DC Water will continue to implement the remaining GI projects by the specified deadlines.

- **Schedule**

  Some commenters suggested that the seven year extension was too long and advocated for a shorter schedule. In addition, some commenters urged DC Water to accelerate individual components of the controls where feasible.

  For GI, the schedule extension allows an adaptive management approach to be implemented to ensure that performance of the GI projects is optimized. Adaptive management means early GI projects will be monitored and assessed so that later projects are as practical and effective as possible. In response to comments, DC Water has evaluated the engineering, fiscal and practicality issues and has revised the modification to complete projects as early as practical. In addition, the separation at CSO 025 and 026 and Piney Branch Structure improvements have been substantially accelerated. The schedule revisions are summarized in Table 5-1.

  For the Potomac Tunnel, extra time in the schedule is needed compared to the original LTCP plan due to a new requirement to complete environmental studies, in view of the increased development in recent years along the Potomac River waterfront, and to mitigate the tremendous financial impacts on rate payers. It is therefore not feasible to shorten the schedule for the Potomac Tunnel earlier than 2030.

Table 5-1
Schedule Comparison

Facility	Place in Operation Deadline		Change
	Proposed Draft LTCP Modification	Recommended Final LTCP Modification	
Potomac River			
1. Separate CSO 025, 026	2032	2023	9 years earlier
2. Potomac GI	2028	2027	1 year earlier
3. Potomac Tunnel	2030	2030	No change
Rock Creek			
4. Piney Branch Diversion Structure Improvements	2032	2020	12 years earlier
5. Rock Creek GI	2032	2030	2 years earlier

- **Disruption due to Tunnel in Georgetown, NPS Property and Mall area**
  Some commenters expressed concern about potential disruption caused by tunneling, particularly in the Georgetown and National Park areas.

  The Proposed Draft LTCP Modification included a 21 million gallon, approximately 4,500 foot long Potomac Tunnel to capture CSOs 020-024, a new pumping station to empty the tunnel and the addition of 75 million gallon per day of capacity at the Tunnel Dewatering Pumping Station (TDPS) and Enhanced Clarification Facility (ECF) at Blue Plains. As part of the response to comments, DC Water has evaluated an approximately 23,000 foot long gravity Potomac Tunnel that would run from the Potomac River CSOs to connect to the Blue Plains Tunnel at Joint Base Anacostia-Bolling (formerly Bolling Air Force Base). This would eliminate the need for a tunnel dewatering pumping station for the Potomac Tunnel. This is advantageous because of the complexity of the station, the difficulty in siting such a facility in the vicinity of the National Mall area, long term operational and power requirements and costs and the need for a permanent building associated with a large deep pumping station. Because of the elimination of the pumping station, the gravity tunnel provides substantially less disruption both during and after construction.

  The gravity Potomac Tunnel also allows interconnecting the storage volumes of the Potomac and Anacostia River Tunnel Systems into one tunnel system, allowing any CSO on either water body access to the entire storage volume of both tunnels. DC Water's analyses have demonstrated that a 30 million gallon gravity Potomac Tunnel for CSO 020-024 connected to the Blue Plains Tunnel provides a degree of CSO control equal to the LTCP without the need to expand the Blue Plains Tunnel Pumping Station and wet weather treatment system. Because the gravity tunnel offers greater reliability and avoids a new pumping station, the gravity tunnel is the recommended plan.

- **Stewardship for Ratepayer Dollars**
  Some commenters expressed concern over affordability for ratepayers.

  DC Water is acutely aware of the heavy financial burden bourn by District ratepayers to implement the DC Clean Rivers Project and has taken steps to both mitigate and spread out water rate increases over time. Unfortunately, this is not discretionary spending by DC Water but is mandated to comply with the Clean Water Act through a Federal Consent Decree signed by the Department of Justice, EPA, the District of Columbia and DC Water. The Final LTCP Modification will mitigate rates to the extent possible by extending the schedule for the Potomac Tunnel, thereby slowing the rate of increase in rates compared to what otherwise would be required.

- **Maintenance**
  Some commenters expressed the importance of maintenance in assuring the GI is effective over the long term.

  DC Water will perform maintenance or will arrange for others to perform maintenance of all GI implemented to control CSOs. DC Water will be ultimately responsible to ensure that

maintenance is performed adequately to maintain the CSO reduction functions of the GI. DC Water also anticipates that this will be a requirement included in its National Pollutant Discharge Elimination System (NPDES) Permit issued by EPA.

- **Support for Green Jobs**
  Some commenters supported the long term economic benefits of GI, specifically the ability to make jobs more accessible to unemployed local residents. This is especially true considering labor required to construct the facilities, as well as that required for long term maintenance.

  GI will increase opportunities for local, green jobs both for construction and for long term maintenance of the facilities. DC Water will work to promote green jobs with a living wage for local residents. Activities may include establishing a certification program for GI jobs, partnering with organizations to provide training that ultimately leads to certification, conducting outreach in the District and partnering with local organizations.

6 Proposed LTCP Modifications for Green Infrastructure

6.1 Changes to CSO Controls/Schedule

In order to proceed with the hybrid green/gray controls for the Potomac River and GI for Rock Creek's Piney Branch sewershed, modification of the LTCP is required. Proposed changes to the LTCP are summarized below:

Potomac River CSO Controls

- Require implementation of GI and targeted sewer separation to control CSOs 027, 028, and 029 with the facilities managing volume of water runoff produced by a 1.2" of rain falling on 133 impervious acres. Phased implementation of GI would be required, with all facilities being placed in operation by 2027.
- Indicate that DC Water has awarded a contract for preparation of an Environmental Impact Statement for the Potomac Tunnel.
- Change the deadline for start of the Facility Plan for the Potomac Tunnel from 2015 to 2017
- Require the construction of a 30 million gallon tunnel to control CSOs 020, 021, 022 and 024 with facilities being placed in operation by 2030. Drain the tunnel by gravity to the Blue Plains Tunnel.
- Require the construction and evaluation of the first GI project in the Potomac sewershed to determine its practicability. If, based on that evaluation, GI is determined to be impracticable, require the construction of a 40 million gallon Potomac Tunnel in lieu of the 30 million gallon tunnel and require CSOs 027, 028 and 029 to be controlled by the tunnel. If GI is determined to be practicable after the first project, require the continued implementation of GI.
- Require sewer separation of CSOs 025 and 026 by 2023 to eliminate these outfalls from the combined sewer system.
- Delete the requirement to consolidate CSOs 024 through 028 and replace this requirement with the other CSO controls described above.

Rock Creek CSO Controls

- Delete the requirement to construct the Piney Branch Tunnel.
- Require implementation of GI and targeted sewer separation to control Piney Branch CSO 049 with facilities managing the volume of water runoff produced by a 1.2" of rain falling on 365 impervious acres. Phased implementation of the GI would be required, with all facilities being placed in operation by 2030.
- Require the construction and evaluation of the first GI project in Rock Creek to determine its practicability. If, based on that evaluation, GI is determined to be impracticable, require the construction of 9.5 million gallons of storage for Rock Creek's Piney Branch CSO 049. If GI is determined to be practicable after the first project, require the continued implementation of GI.

Low Impact Development-Retrofit

- Delete the requirement for DC Water to review current LID and LIDR information to determine if the sizes of the Potomac and Piney Branch tunnels can be reduced with the installation of LID and LIDR.

Other

- Require DC Water and the District to cooperate and coordinate efforts to facilitate implementation of GI in the District.

BLUE PLAINS INTERMUNICIPAL AGREEMENT OF 2012

PREAMBLE

THIS BLUE PLAINS INTERMUNICIPAL AGREEMENT OF 2012, is made among the **DISTRICT OF COLUMBIA** (District), the **DISTRICT OF COLUMBIA WATER AND SEWER AUTHORITY** (DC Water), **FAIRFAX COUNTY, Virginia** (Fairfax), **MONTGOMERY COUNTY**, **Maryland** (Montgomery), **PRINCE GEORGE'S COUNTY, Maryland** (Prince George's), and the **WASHINGTON SUBURBAN SANITARY COMMISSION** (WSSC), collectively, "the Parties." This Agreement shall be known as "this IMA" or "the 2012 IMA."

Witness:

WHEREAS, the Parties desire to protect the fish, wildlife, scenic and recreational qualities of the Chesapeake Bay, the Potomac River estuary, the Anacostia River, and other tributary waters, pursuant to the federal Clean Water Act, while providing wastewater collection and treatment services and related biosolids management for the Blue Plains Service Area (BPSA); and

WHEREAS, the District, Fairfax, Montgomery, Prince George's, and WSSC entered into the Blue Plains Intermunicipal Agreement of 1985 (the 1985 IMA) in order to resolve a variety of critical wastewater treatment, biosolids management, and cost allocation issues with the Blue Plains Wastewater Treatment Plant (Blue Plains); and

WHEREAS, much of the wastewater collection and all of the wastewater treatment and related biosolids management required by the 1985 IMA was provided by the District at Blue Plains until 1996, when the District created DC Water as an independent authority with regional responsibilities to provide these and other services through the operation and management of Blue Plains and Other Associated Facilities; and

WHEREAS, the District holds title to the real property, appurtenances, and fixtures of Blue Plains; and

WHEREAS, DC Water is the National Pollutant Discharge Elimination System (NPDES) permit holder for and operates Blue Plains; and

WHEREAS, WSSC is an agency created by the State of Maryland to provide water supply and wastewater collection and treatment and biosolids management services to Montgomery and Prince George's, whose governments each appoint three (3) of WSSC's six (6) Commissioners; WSSC, on behalf of the residents of Montgomery and Prince George's, contributes their allocated share of costs of wastewater services provided by DC Water; and

WHEREAS, the District, Fairfax, Montgomery, and Prince George's are governments, which have cooperated to provide wastewater collection and treatment and biosolids management to protect the public health of their residents and to provide the infrastructure necessary to realize their respective current and long-range planning

and development goals; additionally Fairfax purchases wastewater services directly from DC Water and retails such services to Fairfax customers; and

WHEREAS, the District and DC Water have individual service agreements with other entities, known as Non-Party Users, that have defined Allocated Flow Capacity within the IMA but are not Signatories to the IMA, and Fairfax and WSSC also have individual service agreements with other entities, known as Indirect Users, that share a portion of Fairfax or WSSC's Allocated Flow Capacity within the BPSA; and

WHEREAS, DC Water represents the interests of the Non-Party Users and is responsible for enforcing any Limited Party Agreements with Non-Party Users, whether those agreements are in the name of DC Water or the District, and Fairfax and WSSC are responsible for enforcing any Limited Party Agreements which they have with Indirect Users; and

WHEREAS, the existing institutional arrangements for wastewater treatment, biosolids management, and for Capital Cost and Operating and Maintenance (O&M) Cost allocations among the Parties set forth in the 1985 IMA had their origin in a series of agreements dating back to the 1950s; and

WHEREAS, the Parties have demonstrated their willingness to share in the burdens associated with the demands of regional wastewater collection and treatment and biosolids management for the BPSA; and

WHEREAS, the Parties desire to establish an equitable arrangement for allocating Capital Costs in relationship to their Allocated Flow Capacity and for allocating O&M Costs in relationship to their Actual Flows, with the potential need to allocate certain costs based on factors not linked to capacity allocation or flow (e.g. loadings); and

WHEREAS, the Parties desire to improve and formalize mechanisms for continued cooperation, coordination and communication among the Parties, including capacity planning and technical input regarding Blue Plains and Other Associated Facilities and the BPSA; and

WHEREAS, the Parties desire to provide for a continuing water quality monitoring and evaluation program to address Potomac River estuary, Anacostia River and Chesapeake Bay water quality issues, as well as to recognize the continued need for long-term regional water quality planning, wastewater planning, and biosolids management planning for the BPSA and the region as a whole; and

WHEREAS, the Parties desire to set forth their rights, obligations and responsibilities with respect to the use and management of facilities necessary for wastewater collection and treatment and for biosolids management for the BPSA; and

WHEREAS, the Parties acknowledge that changing conditions may require modifications to Allocated Flow Capacity, Peak Flow Limitations and cost allocations as well as constraints on loadings and potential load allocations; and

WHEREAS, the Parties acknowledge the need for flexibility and expedited responsiveness concerning many issues of wastewater collection and treatment systems and facilities, and biosolids management issues within the BPSA and, to that end, desire to authorize the use of Derivative Agreements to implement the intent of the Parties.

NOW, THEREFORE, the undersigned Parties agree that

1. This Blue Plains Intermunicipal Agreement of 2012 (this IMA) is entered into for the purposes of:
   a. Allocating the wastewater treatment capacity of Blue Plains and Other Associated Facilities and related peak flows for the collection system;

   b. Equitably allocating the Capital Costs of wastewater treatment and biosolids management;

   c. Equitably allocating O&M Costs;

   d. Defining the responsibilities of pretreatment and operational requirements and biosolids management;

   e. Defining the process of making future wastewater capacity planning decisions, including addressing load allocations;

   f. Providing a mechanism for continuing coordination, cooperation and communication; and

   g. Providing environmental stewardship.

2. Upon signing of this IMA by all Parties, this IMA shall replace the 1985 IMA, and as of such date the 1985 IMA shall be of no further force and effect, and the Blue Plains Regional Committee shall become the Regional Committee created by this IMA.

3. The terms used in this IMA are defined in **Section 12. Glossary**.

4. The headings used in this IMA are for reference purposes only.

-END OF PAGE-

SECTION 1. KEY PRINCIPLES

The provisions of this IMA, and the Derivative Agreements created to implement it, are based upon certain Key Principles. This IMA and the Derivative Agreements shall be governed by and consistent with these Key Principles. These Key Principles shall guide any interpretation or dispute resolution process.

1. **Ensure Best Management -** The Parties commit to continued cooperation, coordination and communication to ensure the best possible management of all Multi-Jurisdiction Use Facilities (MJUFs), including Blue Plains and Other Associated Facilities for the benefit of the District, Fairfax, Montgomery and Prince George's and their residents. In this regard, the Parties acknowledge that, irrespective of their individual agreements with Non-Party Users and Indirect Users of Blue Plains, the Parties shall meet their contractual obligations under this IMA.

2. **Capacity Allocations and Peak Flow Limitations** - The wastewater treatment flow capacity and Peak Flow Limitations, and associated loadings for Blue Plains, are defined and allocated among the Parties and Non-Party Users as set forth in this IMA.

3. **Management of Flows and Loads** - The Parties agree to manage their flows in accordance with their Allocated Flow Capacity and associated Peak Flow Limitations, and overall loads in accordance with Blue Plains Design Load Capacities.

4. **Assessment of Capital Costs** - All Capital Costs associated with Blue Plains and Other Associated Facilities which are MJUFs, shall be assessed in relationship to the District's, Fairfax's and WSSC's and Non-Party Users' Allocated Flow Capacity, Peak Flow Limitations, or other approved Usage Allocation as may be agreed among the Parties. The methodologies and tools used to make those determinations are defined in this IMA. DC Water shall assess Capital Costs against Non-Party Users in accordance with applicable contracts. These Capital Costs shall include the costs associated with rehabilitation of or other improvements to existing facilities, as well as construction of new facilities.

5. **Assessment of Operating and Maintenance (O&M) Costs and Other Costs** - All O&M Costs associated with MJUFs and processes shall be assessed in relationship to the Parties' and Non-Party Users' Billing Flows, or other approved Usage Allocation as may be agreed among the Parties; and DC Water shall be responsible for O&M Costs of Non-Party Users. The Parties also bear financial responsibility for certain fines, penalties and claims.

6. **Costs of Biosolids Management** - The Parties accept individual and collective regional responsibility for the long-term viability of management for biosolids generated by Blue Plains, and agree to appropriately share the biosolids management Capital Costs in proportion to their Allocated Flow Capacity, and O&M Costs in proportion to their Billing Flows.

7. **DC Water's Responsibility for Operation of Blue Plains** - While DC Water shall afford the other Parties due opportunity to review and comment on important technical and financial issues that may affect the other Parties' rights and obligations under this IMA, or that may have regional implications, DC Water shall continue to exercise its discretion and judgment with regard to the operation, maintenance and management of Blue Plains and Other Associated Facilities.

8. **Agreement to Cooperate with DC Water -** The Parties have historic, current and future responsibilities for the effective and efficient development of the region, and the provision and maintenance of the region's infrastructure, including wastewater collection and treatment, and biosolids management within the BPSA. These interconnected responsibilities require the close cooperation and collaboration by the other Parties with DC Water.

9. **Assessment of Projected Flow Capacity Needs and Future Expansion** - The Parties recognize that the wastewater flow capacity and loading requirements for all Parties and Non-Party Users within the BPSA must be assessed periodically and plans made to provide adequate wastewater collection and treatment facilities. They further recognize that the District shall always possess wastewater treatment capacity at Blue Plains sufficient to meet its Projected Flow Capacity Needs; and, therefore, that all future Projected Flow Capacity Needs may or may not be able to be met at Blue Plains. The Parties agree to establish procedures to define these Projected Flow Capacity Needs, identify options to provide for these needs, agree on time frames for notification and actions, and agree on the allocation of capacity and costs. The District has no obligation to expand the currently authorized capacity or loadings of Blue Plains, although an expansion option is not precluded. The Parties may decide to expand Blue Plains or Other Associated Facilities, or accommodate such future flows at facilities other than Blue Plains, based on a Jointly Managed Study. The Parties (and Non-Party Users, as appropriate) agree to share the costs of an expansion at Blue Plains or Other Associated Facilities, or at any other facilities, based on agreed upon capacity and loading allocations, and associated Peak Flow Limitations.

10. **Protection of Water Quality** – Stewardship and protection of the water quality of the Potomac River estuary, the Anacostia River, and contributing to the health of the Chesapeake Bay are fundamental values of the Parties. Achieving these goals is an inherent function of Blue Plains, manifested through its NPDES permit.

11. **Effect and Amendment of this IMA and Derivative Agreements** - This IMA remains in effect until June 30, 2111, unless amended, replaced or terminated earlier by mutual consent of all the Parties. The Parties may amend this IMA in accordance with its terms. The Parties may create, amend or terminate any associated Derivative Agreements addressing implementation of this IMA, as provided in this IMA. Certain agreements, set forth in the Appendix, which were suspended, extinguished or superseded by the 1985 IMA, are extinguished and superseded by this IMA.

12. **Dispute Resolution** - The Parties agree to a dispute resolution process to resolve differences regarding interpretation of or disputes regarding this IMA or the Derivative Agreements.

-END OF PAGE-

SECTION 2. GOVERNANCE

A. LEVELS OF AUTHORITY

The physical and financial interdependence of Blue Plains and Other Associated Facilities requires regular forums where technical, policy and financial issues affecting more than one Party can be presented and discussed, and where differences and disputes can be resolved. The Parties agree that they shall make every effort to achieve consensus decisions. In fulfilling these responsibilities, the Parties may proceed or act at three different levels of authority: (1) the policy level, (2) the administrative level or (3) the technical level.

B. AUTHORITY TO ACT AND GENERAL PARTY RESPONSIBILITIES

1. **Basis** - Authority for action or decision by each member of the three (3) bodies identified herein as levels of governance is pursuant to applicable enabling legislation, charter provisions or formal policies of each Party.

2. **General Party Responsibilities**
   a. Unless otherwise stated herein, each Party shall determine which of its officials or staff will act on its behalf.

   b. Unless otherwise stated herein, each Party shall be responsible for any notice to its officials, staff or constituents, pursuant to applicable legislation, charter provisions, or formal or informal policies of the Party.

   c. Consistent with the respective bylaws of the Leadership Committee and the Regional Committee, those Committees may allow observers invited by members of those committees to attend their meetings.

C. POLICY LEVEL: THE IMA SIGNATORIES

1. **Signatory** - The Signatories of this IMA are the highest level of officials of each Party, as designated below:
   a. District of Columbia – Mayor
   b. DC Water – Chairman, Board of Directors
   c. Fairfax County, Virginia – Chairman, Board of Supervisors
   d. Montgomery County, Maryland – President, County Council and County Executive
   e. Prince George's County, Maryland – Chair, County Council and County Executive
   f. Washington Suburban Sanitary Commission – Chair and Vice Chair

2. Each Signatory warrants that its signature is authorized.

3. Written agreement of the Parties, at the Signatory level, is required to revise, amend or terminate this IMA pursuant to **Section 10**.

4. Signatory review shall constitute the last or highest internal level of dispute resolution under **Section 10**.

D. ADMINISTRATIVE LEVEL: THE IMA LEADERSHIP COMMITTEE

1. **Composition** - The IMA Leadership Committee (the Leadership Committee) shall be composed of the governmental Chief Administrative Officers and the Operating Agencies' General Managers, i.e. six (6) members, consisting of one (1) member from each Party as designated below:
   a. District of Columbia – City Administrator
   b. DC Water – General Manager
   c. Fairfax County, Virginia – County Executive
   d. Montgomery County, Maryland – Chief Administrative Officer
   e. Prince George's County, Maryland – Chief Administrative Officer
   f. Washington Suburban Sanitary Commission – General Manager

2. **General Responsibility** - The Leadership Committee shall oversee the implementation of this IMA. The Committee shall convene at least annually to receive briefings and to resolve issues or endorse positions presented by the Regional Committee or a Party, including dispute resolution.

3. **Specific Functions** - The Leadership Committee is charged with overseeing this IMA which function includes, where appropriate or required, authorization, review and approval of:
   a. Derivative Agreements, except for Limited Party Agreements, and amendments to or termination of Derivative Agreements, except for Limited Party Agreements, entered into pursuant to **Section 11**, in order to address routine, procedural or operational elements of this IMA;

   b. Final interpretations of this IMA and Derivative Agreements for matters referred to it by the Regional Committee or when dispute resolution has been invoked;

   c. Action on issues covered by this IMA and Derivative Agreements that have a potential policy or fiscal impact on the Parties, or on the capability of Blue Plains to effectively provide wastewater treatment; and

   d. Other duties as set forth in this IMA.

4. **Procedures**
   a. The Leadership Committee shall act by the unanimous agreement of all of its members and formal action documented in minutes or other documents.

   b. The Leadership Committee may agree that certain decisions or actions implementing this IMA may be made by the unanimous agreement of the respective governmental Chief Administrative Officers or the unanimous agreement of the respective Operating Agency Representatives alone. The Parties acknowledge that Fairfax is both a governmental entity and an Operating Agency, and may participate in either subgroup as appropriate.

c. The Leadership Committee shall select a chair and develop procedures consistent with this IMA.

5. **Regional Committee Input** - The Leadership Committee may seek the recommendation of and request reports from the Regional Committee.

E. TECHNICAL LEVEL: THE IMA REGIONAL COMMITTEE

1. **Composition** - The IMA Regional Committee (the Regional Committee) shall be composed of 12 members, consisting of two (2) members from each Party.

2. **Appointment** - Members of the Regional Committee shall be appointed by the members of the Leadership Committee for their respective Party, and shall consist of professional staff representatives from each of the Parties.

3. **General Responsibilities**
   a. The Regional Committee is created for the purpose of assisting in the interpretation, administration and implementation of this IMA and to resolve issues pertaining to Blue Plains that are within the scope of this IMA and the Derivative Agreements.

   b. The Regional Committee shall identify issues relevant to the implementation and oversight of this IMA, and shall coordinate, review and consider appropriate actions for the effective provision of wastewater collection and treatment and biosolids management to support the current and future Projected Flow Capacity Needs of the BPSA.

   c. The Regional Committee shall make recommendations to the Leadership Committee and, where appropriate, to other entities with respect to the rights and obligations of the Parties.

   d. The Regional Committee shall make decisions and take actions as delegated to it by the Leadership Committee.

4. **Specific Functions** - The Regional Committee is responsible for the following:
   a. Implementing this IMA and Derivative Agreements, including:
      1) Recommendations on policy issues;

      2) Initial resolution of disputes associated with implementation;

      3) Providing recommendations to the Leadership Committee on amendments to this IMA;

      4) Providing recommendations to the Leadership Committee on creation, modification or termination of Derivative Agreements to address routine, procedural or operational elements of this IMA;

5) Providing guidance and recommendations for any other issues that may arise within the scope of this IMA.

b. Evaluating the terms of agreements with Non-Party Users and Indirect Users;

c. Evaluating population impacts, flow projections and service area boundaries;

d. Providing analysis of flow measurement and data collection efforts, as well as flow management programs and their flow capacity impacts;

e. Evaluating the Parties' flows and conformance with Allocated Flow Capacity and Peak Flow Limitations;

f. Defining and assessing the Parties' Projected Flow Capacity Needs, loading requirements and options;

g. Evaluating proposals regarding any capacity reallocation;

h. Evaluating proposed permit conditions, including potential capacity and financial impacts;

i. Establishing cost allocations for Capital Costs and O&M Costs of MJUFs;

j. Evaluating Blue Plains impacts and contributions towards meeting local and regional water quality goals;

k. Providing input and regional support for Blue Plains biosolids management program;

l. Evaluating the Parties' compliance with their requirements under Blue Plains Pretreatment Program;

m. Providing recommendations for DC Water's proposed "Capital Improvements Program Budget" and annual "Operating Budget" as they relate to MJUFs; and

n. Other duties as set forth in this IMA.

5. **Serve as a Forum** - The Regional Committee shall provide a forum for in-depth discussion and coordination regarding the wastewater and biosolids technical, policy and financial issues affecting Parties. Any Party may submit issues to the Regional Committee for review and comment prior to regional action or prior to Implementation by DC Water or any other Party.

6. **Procedures** - The Regional Committee shall act by the unanimous agreement of all of its members and formal action documented in minutes or other documents.

a. The Regional Committee may agree that certain categories of decisions or actions may be made by the unanimous agreement of the representatives of the

governmental entities alone or the unanimous agreement of the Operating Agency Representatives alone. The Parties acknowledge that Fairfax is both a governmental entity and an Operating Agency, and may participate in either subgroup, as appropriate.

b. The Regional Committee shall select its own chair and develop its own procedures consistent with this IMA.

c. The Regional Committee shall meet at least quarterly.

d. The Regional Committee may create standing or ad-hoc subcommittees or work groups to address issues/topics as required. These subcommittees/work groups shall be responsible for addressing issues assigned to them, and for developing recommendations for the Regional Committee.

e. The Operating Agency Representatives are a subset of members of the Regional Committee and shall be a standing work group of the Regional Committee.

7. **Annual Work Program and Budget for Secretariat Services** - The Regional Committee shall recommend, and the Leadership Committee shall approve, an annual work program and budget, and an agreement with an entity to provide secretariat services for the Leadership Committee, the Parties and the Regional Committee to carry out their responsibilities under this IMA, as set forth in a Service Agreement.

8. **Annual Work Program and Budget for a Regional Water Quality Management Program** - The Regional Committee shall recommend, and the Leadership Committee shall approve, an annual work program and budget, and an agreement with an entity to address a regional water quality management program, as set forth in a Service Agreement.

9. **Regional Committee Communication with Parties** - On behalf of the Leadership Committee, the Regional Committee shall prepare an annual report to the Parties regarding the implementation of this IMA, and shall provide such other reports on its activities as the Leadership Committee or Signatories may require.

-END OF PAGE-

SECTION 3. BLUE PLAINS PERMIT RESPONSIBILITIES AND TREATMENT PROCESS REQUIREMENTS

A. DC WATER'S OVERALL PERMIT RESPONSIBILITIES

As operator of Blue Plains and Other Associated Facilities, DC Water is responsible for monitoring pending federal, state and local statutory and regulatory developments; and for anticipating potential impacts on the Blue Plains National Pollution Discharge Elimination System (NPDES) permit, or other permit requirements, as a result of such developments. DC Water is also responsible for monitoring and analyzing other issues that can reasonably be expected to impact Blue Plains permit conditions, programs and process requirements. DC Water's assessment of these impacts shall include, but not be limited to, an assessment of the potential impacts on Blue Plains and Other Associated Facilities and Pretreatment Program requirements.

B. DC WATER'S NOTIFICATION RESPONSIBILITIES

If DC Water determines that any matter or issue in this **Section 3** may result in modification of permit conditions, programs or process requirements at Blue Plains and Other Associated Facilities, it shall determine the anticipated timing and potential financial impacts of such modifications on the Parties and Non-Party Users, and shall inform the Regional Committee. Potential financial impacts include Capital Costs, as well as O&M Costs. Once DC Water identifies the need for additional Capital Costs or O&M Costs, the other Parties shall have an opportunity to comment on the timing and other aspects of the projects prior to the projects proceeding.

C. INDIVIDUAL PARTY RESPONSIBILITIES

Each Party is responsible for its share of any financial commitment, including Capital Costs and O&M Costs, to address any modification of permit conditions, programs or process requirements at Blue Plains, as set forth in **Section 5**.

D. COLLECTIVE PARTY RESPONSIBILITIES

In addition to addressing the financial impacts of regulations, permit conditions, programs, and process impacts determined under this **Section 3**, the Parties agree to evaluate this IMA to determine if any elements, including, but not limited to, cost elements need to be amended.

E. REGIONAL WATER QUALITY MANAGEMENT PROGRAM SUPPORT

1. **Stewardship** - The Parties recognize their collective and regional responsibilities for the long-term protection of the Potomac River estuary and the Anacostia River water quality, and supporting restoration of the Chesapeake Bay; and responding to other environmental requirements impacting Blue Plains and Other Associated Facilities. The Parties agree to fulfill these objectives of regional water quality management planning, monitoring and modeling programs in the most cost-effective manner for Blue Plains.

2. **Program Activities** - The Parties shall actively support regional water quality and environmental programs to monitor and analyze state, federal and local water quality

management policies and regulations, as well as wastewater treatment and biosolids management technologies and permitting issues, and engage in policy and technical advocacy.

F. DERIVATIVE AGREEMENT – Derivative Agreements shall address additional matters set forth in this **Section 3**. They may be replaced or supplemented by successor or other Derivative Agreements.

-END OF PAGE-

SECTION 4. BLUE PLAINS FLOW CAPACITY, LOADS, AND PEAK FLOWS - ALLOCATIONS AND LIMITATIONS

A. BLUE PLAINS ALLOCATED FLOW CAPACITY

1. Basis for Capacity Allocations

a. The Allocated Flow Capacity for the District, Fairfax, WSSC, and Non-Party Users is defined in **Table 4-A** below.

b. The Allocated Flow Capacity is based on Blue Plains current Design Flow Capacity and reflects the ability of Blue Plains to provide treatment of the incoming wastewater under Annual Average Hydrologic Conditions.

c. It is recognized that the Captured Stormwater Flows (CSF) that receive treatment to meet the Combined Sewer Overflow Long-term Control Plan (CSO LTCP) requirements are not part of the District's Allocated Flow Capacity.

TABLE 4-A

BLUE PLAINS ALLOCATED FLOW CAPACITY	
ENTITIES	**ALLOCATIONS (MGD)[1]**
District of Columbia	152.50
Non-Party Users:	
Loudoun County Sanitation Authority, Virginia	13.80
Dulles Airport, Virginia	1.50
Town of Vienna, Virginia	1.50
Naval Ship Research & Development Center, Maryland	0.07
National Park Service, Maryland	0.03
Sub-total	16.90
District of Columbia – Total	**169.40**
WSSC[2] (for Prince George's County & Montgomery County), **Maryland – Total**	**169.60**
Fairfax County, Virginia[3] **- Total**	**31.00**
Grand Total – Blue Plains Design Flow Capacity	**370.00**

[1] Flows represent Annual Average Hydrologic Conditions.
[2] The Allocated Flow Capacity for WSSC is on behalf of Prince George's and Montgomery; with any sub-allocations determined by separate agreements between those entities. The WSSC allocation also includes wastewater from other political jurisdictions with which WSSC has separate agreements.
[3] The Allocated Flow Capacity for Fairfax also includes wastewater from other political jurisdictions with which Fairfax has separate agreements.

2. **Compliance with Capacity Allocations**
   a. The District, Fairfax and WSSC shall comply with their Allocated Flow Capacity.

   b. Compliance with the Allocated Flow Capacity by the District, Fairfax and WSSC shall be assessed based on their Adjusted Flow, and as calculated in **Operating Agreement #3.**

   c. Continued use of this Allocated Flow Capacity by the District, Fairfax, WSSC or Non-Party Users, however, shall be dependent on the respective entity making the financial contribution for its appropriate share of the Capital Cost and O&M Costs of all MJUFs in accordance with **Section 5**.

3. **Assessment of Future Needs** - Assessment of Projected Flow Capacity Needs for the District, Fairfax, WSSC and Non-Party Users, as compared to their Allocated Flow Capacity, shall be in accordance with **Section 7**.

4. **Compliance by Non-Party Users and Indirect Users**
   a. The District and DC Water shall use their best efforts to require Non-Party Users to comply with their Allocated Flow Capacity.

   b. Fairfax and WSSC shall use their best efforts to require Indirect Users to comply with their capacity allocations as defined under Limited Party Agreements with the Indirect Users.

   c. Irrespective of such efforts, all Parties shall be bound by their Allocated Flow Capacity.

5. **Conditions on Limited Party Agreements for a Transfer of Allocated Flow Capacity**
   a. Before a Limited Party Agreement, as permitted by **Section 11**, for a transfer of Allocated Flow Capacity can be executed:
      1) It must include terms which do not change the financial obligations required under this IMA to DC Water for the Allocated Flow Capacity being transferred; and

      2) It shall be reviewed by the Regional Committee to ensure, among other matters, that the proposed transfer does not change the rights and responsibilities of a Party as set forth in this IMA.

   b. Financial arrangements pursuant to a Limited Party Agreement for a transfer of Allocated Flow Capacity shall be determined by the involved parties.

-END OF PAGE-

B. BLUE PLAINS EFFLUENT LOADS AND BLUE PLAINS EFFLUENT LOAD ALLOCATIONS

1. **Basis for Blue Plains Effluent Loads and Blue Plains Effluent Load Allocations** - The Blue Plains Effluent Loads and the associated Blue Plains Effluent Load Allocations shall be consistent with Blue Plains permit and as defined in **Operating Agreement #1**.

2. **Requirements for Transfers of Flow and/or Effluent Load Allocations Outside Blue Plains or BPSA**
   a. If the District, Fairfax or WSSC determine that it will divert any or all of its current or projected wastewater flows originating in the BPSA from Blue Plains, the associated Effluent Load Allocation may be transferred away from Blue Plains.

   b. The transfer of any Effluent Load Allocations away from Blue Plains, whether by the District, Fairfax, WSSC or by others, shall result in a proportionate reduction in the usable Allocated Flow Capacity of the Party(ies) having their Effluent Load Allocations reduced; unless additional Blue Plains Load Allocations or Blue Plains Load Offsets are obtained. This shall not result in a change to the Allocated Flow Capacities defined in **Table 4-A.**

C. BLUE PLAINS INFLUENT LOADS AND INFLUENT DESIGN LOAD CAPACITY

1. **Basis for Blue Plains Influent Loads**
   a. The pollutant loads from all influent wastewater flows to Blue Plains, their concentrations, associated flow characteristics, and related design assumptions are related to Blue Plains Influent Load(s) and are expressed as the Design Load Capacity, as defined in **Operating Agreement #1**.

   b. The Design Load Capacity is based on Blue Plains current Design Flow Capacity and reflects the ability of Blue Plains to provide treatment of the incoming wastewater under maximum year flow conditions.

2. **Compliance with Blue Plains Influent Loads** - The Parties shall work to ensure that pollutant loads from all influent flows do not exceed Design Load Capacity(ies), as defined in **Operating Agreement #1;** unless pollutant loads in excess of the Design Load Capacity(ies) have been determined by DC Water to not pose a potential risk of contributing to Blue Plains Permit violations.

D. MONITORING OF AND RECOMMENDATIONS REGARDING INFLUENT FLOWS AND LOADS

1. DC Water shall routinely sample and monitor influent loads and wastewater process performance, with input from the other Parties, to determine if and when either the collective or individual influent concentrations from each Party appear to exceed normal variations in influent wastewater strength as determined by DC Water.

2. Such assessments shall address, but not be limited to addressing wastewater and Captured Stormwater Flow contributions, as well as Inflow/Infiltration ("I/I") impacts on influent loads.

3. DC Water shall determine whether these variations have the potential to impact Blue Plains plant performance, permit compliance, Allocated Flow Capacity, Effluent Load Allocations, or the Design Load Capacity, and make recommendations to the Regional Committee.

4. DC Water shall review influent flow rates and influent loads compared to Design Flow Capacity and Design Load Capacity values, and recommend whether plant-wide influent loads may need to be sub-allocated to the District, Fairfax, WSSC and Non-Party Users, or if any adjustments to the Allocated Flow Capacities might be required in order to meet NPDES permit requirements.

5. The Regional Committee shall routinely review all of these matters to determine whether the rights and responsibilities of the Parties are affected, and to make necessary recommendations to the Leadership Committee regarding, but not limited to, the following: cost elements, Effluent Load Allocations, and/or Allocated Flow Capacity. These recommendations shall address potential assignments to the District, Fairfax and WSSC, individually or collectively, as well as to Non-Party Users.

E. BLUE PLAINS SERVICE AREA (BPSA) PEAK FLOW LIMITATIONS - GENERAL CONDITIONS

1. **Peak Flow Limitations** - The Peak Flow Limitations for metered points of connection between the collection systems of two (2) or more Parties within the BPSA are defined as follows:
   a. Potomac Interceptor (PI) and other interceptors for WSSC, Fairfax and Non-Party Users' flows to collection systems operated by DC Water - **Table 4-B**.

   b. Interceptors for WSSC flows to collection systems operated by DC Water – **Table 4-C.**

   c. Interceptors for District flows to collection systems operated by WSSC - **Table 4-D.**

-END OF PAGE-

Table 4-B - PEAK FLOW LIMITATIONS[1] FOR WSSC, FAIRFAX COUNTY & NON-PARTY USERS FOR THE POTOMAC INTERCEPTOR & OTHER INTERCEPTORS OPERATED BY DC WATER, FAIRFAX AND WSSC

Jurisdiction / Agency Points of Connection	Flow Capacity (Annual Average in MGD)	Peak Flow Limitation (MGD)	Peak/ Average Ratio
WSSC			
Cabin John (to MUPI)[2]	**10.3**	**23.3**	**2.3**
Cabin John (to PI)	6.1	37.0	6.1
Muddy Branch	8.4	28.3	3.4
Watts Branch	5.8	16.5	2.8
Rock Run	1.3	5.6	4.3
Subtotal to PI	**21.6**	**87.4**	
WSSC Total to PI & UPI[3]	**31.9**	**110.7**	**3.5**
Fairfax County			
Sully Road #1	4.0	14.0	3.5
Sully Road #2	1.1	3.0	2.7
Rock Hill Road	0.9	2.4	2.7
Sugarland Run	4.0	14.0	3.5
Great Falls[4]	8.7	30.0	3.4
Scotts Run	2.9	10.2	3.5
Subtotal to PI	**21.6**	**73.6**	
Pimmit Run	9.4	35.0	3.7
Fairfax Total to PI & Pimmit Run	**31.0**	**108.6**	**3.5**
Loudoun County Sanitation Authority to PI	**13.8**	**31.9**	
Other Non-Party Users to PI	**3.1**	**7.2**	
Grand Total to PI	**60.1**	**200.1**	

-END OF PAGE-

[1] The Peak Flow Limitations and peak flow ratios for the Potomac Interceptor are acknowledged to be greater than design and modeling values.
[2] MUPI - Maryland Upper Potomac Interceptor
[3] UPI - Upper Potomac Interceptor
[4] This excludes the flow from the Town of Vienna, Virginia.

TABLE 4-C – PEAK FLOW LIMITATIONS FOR WSSC FOR OTHER INTERCEPTORS OPERATED BY DC WATER

Jurisdiction / Agency Points of Connection	Flow Capacity (Annual Average in MGD)	Peak Flow Limitation (MGD)
WSSC		
Little Falls Trunk Sewer	7.6	20.8
Rock Creek Main Interceptor[1] and Relief	33.5	56.6
Anacostia Forcemain & Project 89	83.2	185.0
Watts Branch Interceptor (Prince George's County)	1.3	5.9
Upper Oxon Run Trunk Sewer	6.1	15.6
Barnaby Branch	2.8	8.4
Owens Road	1.7	5.5
Indian Head Highway	1.5	5.3
TOTAL	**137.7**	**N/A**

TABLE 4-D – PEAK FLOW LIMITATIONS FOR THE DISTRICT FOR OTHER INTERCEPTORS OPERATED BY WSSC

Jurisdiction / Agency Points of Connection	Flow Capacity (Annual Average in MGD)	Peak Flow Limitation (MGD)
DISTRICT		
Point M-Kennedy St.	0.7	4.4
Point S-Fort Dupont St.	0.4	3.0
Point W-30th St.	0.7	4.8

2. **Basis for Peak Flow Limitations** - The Peak Flow Limitations, defined in **Table 4-B, Table 4-C, and Table 4-D**, have been developed consistent with the Allocated Flow Capacity for the District, Fairfax, WSSC and Non-Party Users, and reflect the maximum flows that have been determined (through modeling and historical observation of system performance) that the BPSA collection systems can convey without exceeding the capacity of the sewer system during wet weather conditions (e.g., rainfall or snowmelt events).

3. **Constraints on Peak Flow Limitations**
   a. The Peak Flow Limitations, defined in **Table 4-B, Table 4-C, and Table 4-D**, are predicated on the assumption that the District, Fairfax, and WSSC shall not make piping/service area modifications that would increase or significantly alter the character of the peak flows delivered to these points of connection.

[1] This includes that portion of Silver Spring Maryland which enters the Rock Creek Main Interceptor Sewer within the District.

b. If the District, Fairfax or WSSC proposes to make such modifications, they shall submit requests to DC Water, and DC Water will evaluate the request to determine whether such modifications can be accommodated.

c. The District, Fairfax and WSSC shall manage their systems or flow management so that the peak flows or sustained peak flows are consistent with historical patterns and assumptions underlying the Peak Flow Limitations, as determined by DC Water.

4. **Adjustments to Peak Flow Limitations**

a. The peak flows from the District, Fairfax or WSSC can exceed their Peak Flow Limitations for any point of connection, as defined in **Table 4-B**, **Table 4-C,** and **Table 4-D,** if their Adjusted Flow does not exceed their Allocated Flow Capacity and if there are no adverse hydraulic impacts to the affected interceptors. Any peak flow shaving facilities or operations must be approved by DC Water with respect to proposed peak flow rates, duration, and overall interceptor system capacity.

b. DC Water shall routinely monitor all peak flows within the BPSA collection system, determine appropriate action for any problems which arise, and make recommendations to the Regional Committee, consistent with **Section 6**. Specific details for how this monitoring and assessment shall be conducted are described in **Operating Agreement #3.**

c. Should future model analysis or observation of system performance indicate a need to revise these Peak Flow Limitations, the affected Parties shall support appropriate modifications to these limits, or to the system to ensure compliance with permit and other legal and Operational Requirements.

5. **Compliance by District, Fairfax and WSSC with Peak Flow Limitations**

a. Except as otherwise provided herein, the District, Fairfax and WSSC shall comply with their Peak Flow Limitations at the various points of connection.

b. Continued use of these Peak Flow Limitations by the District, Fairfax and WSSC, however, shall be dependent on that entity making the financial contribution for its appropriate share of the Capital Cost and O&M Costs of all MJUFs in accordance with **Section 5**.

c. The Parties shall ensure that the District, Fairfax and WSSC's collection systems limit the amount of I/I entering these systems. Collection systems shall be maintained so that I/I volumes do not contribute to exceedances of the Peak Flow Limitations.

6. **Compliance by Non-Party Users & Indirect Users with Peak Flow Limitations**

a. Continued use of these Peak Flow Limitations by the Non-Party Users, however, shall be dependent on that entity making the financial contribution for its appropriate share of the Capital Cost and O&M Costs of all MJUFs in accordance with **Section 5**.

b. The Parties shall use their best efforts to require Non-Party Users and Indirect Users to comply with the defined Peak Flow Limitations.

c. Except as otherwise provided herein, irrespective of such efforts, the Parties shall comply with the Peak Flow Limitations.

d. As appropriate and necessary, collection systems for the Non-Party Users and Indirect Users should limit the amount of I/I entering these systems.
   1) DC Water shall be responsible for ensuring that similar requirements are upheld by the Non-Party Users;

   2) Fairfax and WSSC shall be responsible for ensuring that similar requirements are upheld by the Indirect Users; and

   3) Irrespective of such efforts, and except as provided herein, the Parties shall be bound by these requirements.

7. **Wastewater Collection System Connections**
   a. **Additional Interconnections** - Subject to the conditions imposed by this IMA and any other conditions which might be imposed by the Parties at the time, additional interconnections between the wastewater collection systems of the District, Fairfax, WSSC and Non-Party Users shall be allowed.

   b. **No Requirement to Accept Flow Causing an Exceedance** - The District, Fairfax and WSSC shall not be required to accept flow into its wastewater collection system if that flow exceeds its own or the Non-Party User's Peak Flow Limitations.

   c. **Sewer Connection Approval** - Every connection of a sewer by the District, Fairfax or WSSC, or a Non-Party User, to the sewage collection system of another shall be made only based on prior written approval of the Operating Agency representative for that entity to whom the connection is being made, with notice provided to the Regional Committee.

F. ADDITIONAL BPSA PEAK FLOW LIMITATIONS – POTOMAC INTERCEPTOR (PI) CONDITIONS

1. **Additional Basis for PI Peak Flow Limitations** - These Peak Flow Limitations are based on analysis that indicates that the PI has not overflowed when the sum of the peak flows delivered has been limited to the 220-240 million gallons per day range. This performance is due to the large service area, timing of flows and rainfall variability.

2. **Potential Modifications to Potomac Interceptor Peak Flow Limitations**
   a. DC Water shall monitor flows and the performance of the PI system to determine if overflows do occur; and then shall work with Fairfax and WSSC to identify the reasons and to determine if revisions/reductions to the Peak Flow Limitations presented in **Table 4-B** are required.

   b. If DC Water determines based upon its monitoring and technical analysis that such revisions/reductions are necessary, it can require those reductions until this IMA is amended and Fairfax and WSSC shall comply with such determination.

G. DERIVATIVE AGREEMENT – Operating Agreement #1, Blue Plains Flow Capacity, Loads and Peak Flows – Allocations and Limitations, addresses additional matters set forth in this Section. It may be replaced or supplemented by successor or other Derivative Agreements.

-END OF PAGE-

SECTION 5. FINANCIAL RESPONSIBILITIES OF PARTIES

A. ASSIGNMENT OF RESPONSIBLITIES

1. **Acknowledgements**
   a. The Parties acknowledge their financial responsibility for their respective shares of the Capital Costs and the O&M Costs of all MJUFs, including but not limited to Blue Plains and Other Associated Facilities. The Parties also bear financial responsibility for certain fines, penalties and claims.

   b. The Parties acknowledge that the "*Blue Plains Intermunicipal Agreement of 1985 Equity Payment Study*" (dated February, 1987), and the subsequent "equity payments" required by the 1985 IMA, reconciled all Capital Cost contributions for the Parties prior to 1987 and established a new baseline as of 1988 for calculating and allocating any future Capital Costs associated with Blue Plains.

2. **Leadership Committee** - The Leadership Committee shall ensure that the financial commitments of the Parties and Non-Party Users are met.

3. **Regional Committee**
   a. The Regional Committee shall agree upon MJUFs determinations and cost allocations, with detailed project lists and cost rationales, as well as billing and payment procedures.

   b. The Regional Committee shall address any new cost elements and cost allocation issues.

   c. The Regional Committee shall also ensure that a record is kept of calculations, procedures and agreements which implement this **Section 5**, including financial allocations for Capital Costs, O&M Costs, billing and payment procedures, User Fees, as well as fines, penalties and claims.

B. DETERMINATION OF MULTI-JURISDICTION USE FACILITIES (MJUFs)

1. **Basis for Making MJUF Determinations** - DC Water shall make determinations of the extent to which any facility is utilized by one or more entities and is, therefore, a MJUF; and, based thereon, shall make a recommendation regarding how the cost of building, operating, maintaining, or rehabilitating the facilities might be equitably shared among those entities, as more fully described in **Section 3.B.3**. below.

2. **Parties Commit to Pay Costs** - The District, Fairfax, WSSC and Non-Party Users are responsible for their respective share of all Capital Costs, O&M Costs, and other direct costs and indirect costs associated with MJUFs at Blue Plains and Other Associated Facilities. The costs include those associated with meeting permit requirements, as well as normal wastewater treatment process and biosolids management requirements for Blue Plains and Other Associated Facilities. These costs shall be developed to ensure full cost-recovery for the O&M, construction or

rehabilitation of the specified facilities. District costs are met through direct ratepayer payments.

3. **DC Water to Recommend Cost Allocations**
   a. DC Water shall utilize a methodology and associated technical tools that the Regional Committee has agreed to for making determinations whether a facility is a MJUF.

   b. DC Water shall make recommendations to the Regional Committee regarding MJUFs, and the proposed cost allocations proposed for those facilities, including providing specific project/program details and cost allocation rationale for making the MJUF determinations.

   c. DC Water shall inform the Regional Committee in a timely manner of the potential magnitude and anticipated timing of the necessary financial commitments to address their share of those commitments.

   d. DC Water shall consider Regional Committee input regarding the proposed amount and timing of those financial commitments. This process shall be an iterative process as regulatory requirements, process impacts, and major capital program requirements are defined and subsequently refined. The costs associated with the O&M, rehabilitation, construction or other use of these facilities shall be allocated among the Parties and Non-Party Users.

   e. The methodology and technical tools to be used in making these determinations shall be set out in **Operating Agreement #2**.

4. **Regional Committee to Endorse Cost Allocations and Identify Policy Issues** – The Regional Committee shall review DC Water's recommendations regarding MJUF designations and proposed cost allocations and, if appropriate, endorse the allocations, and identify any resultant policy issues associated with those recommendations.

5. **Regional Committee to Recommend Cost Allocation** - The Regional Committee shall recommend cost allocations to the Leadership Committee for approval.

C. CAPITAL COST RESPONSIBILITIES

1. **General Requirements - DC Water's Responsibility** - DC Water shall be responsible for addressing all of the obligations in this **Section 5** as they pertain to the Non-Party Users. Once DC Water identifies the need for additional Capital Costs, the other Parties shall be provided the opportunity to comment on the timing and other aspects of the projects. DC Water shall assess Fairfax and WSSC for their proportionate share of the Capital Costs incurred for MJUFs. DC Water shall assess District ratepayers using the same basis and reflecting the District's proportionate share of all costs.
2. **Blue Plains Capital Cost Allocations** - The costs for construction, installation, upgrade or expansion of any facilities which are built to manage wastewater, other

than Captured Stormwater Flow, that is treated at Blue Plains, or the biosolids or other residuals from Blue Plains shall be allocated to the District, Fairfax, WSSC, and Non-Party Users, based on the methodology set forth in **Operating Agreement #2.**

3. **Other Associated Facilities' Capital Cost Allocations** – Except as provided herein, the costs for construction, installation, upgrade or expansion of any Other Associated Facilities shall be allocated to the District, Fairfax, WSSC and Non-Party Users in proportion to their Allocated Flow Capacity or other Usage Allocations.

4. **Capital Equipment Cost Allocations Relating to MJUFs** - Capital Equipment Costs, that are incurred to replace, extend the life of or increase capacity of Blue Plains assets, will be allocated consistent with Allocated Flow Capacity, Actual Flows or other Usage Allocations, as defined in **Operating Agreement #2**.

5. **Basis for Cost Allocations for Fairfax or WSSC MJUFs** - The District, Fairfax, WSSC, and Non-Party Users shall pay the costs for construction, installation, upgrade or expansion of any MJUFs which are built by Fairfax or WSSC for wastewater treatment or biosolids management, or management of residuals from Blue Plains, in proportion to their Allocated Flow Capacity or other Usage Allocations, or as otherwise may be provided by this IMA or Derivative Agreements.

6. **Basis for Non-Standard Cost Allocations** – Projects, whose basis of design or operation DC Water has determined are not inherently linked to standard systems developed for flow or capacity as otherwise set forth in this IMA, may have their Capital Costs allocated based on a Usage Allocation agreed upon by the Parties. Such cost methodologies and rationale shall be consistent with the Key Principles.

D. OPERATING AND MAINTENANCE (O&M) COST RESPONSIBILITIES

1. **Blue Plains O&M Cost Allocations**
   a. **Assessments for Proportionate Treatment Costs** - DC Water shall assess Fairfax and WSSC for their proportionate share of the O&M Costs incurred for MJUFs. DC Water shall assess District ratepayers using the same basis and reflecting the District's proportionate share of all costs. All O&M costs incurred shall include all direct costs and indirect costs as agreed by the Regional Committee.

   b. **Assessments for Blue Plains** -The District's, Fairfax's and WSSC's proportion of the annual Blue Plains O&M Costs shall be as defined in **Operating Agreement #2.**

   c. **Process to Address Differential Treatment Costs** - If it is determined, based on a Jointly Managed Study, that there is a significant financial impact and, therefore, a basis for having differential treatment costs applied to the flows from various Parties and Non-Parties (i.e., based on strength of wastewater or other flow parameters), the Regional Committee shall be responsible for assessing and

recommending how cost allocations should be borne by the Parties, and making recommendations to the Leadership Committee.

d. **Use of Revenue** - Any revenue earned from the by-products from the wastewater treatment and/or biosolids processes at Blue Plains shall be used to offset overall O&M expenses, and be attributed, as appropriate, in proportion to the Capital Cost and/or O&M Cost allocations for those associated MJUFs. Revenue shall include, but not be limited to, any revenue generated by: water reuse, methane gas, electricity, carbon trading, compost and any other biosolids-derived products.

2. **Pipelines and Appurtenances O&M Cost Allocations** – The District, Fairfax and WSSC shall each be assessed by DC Water for their proportionate share of the O&M costs for any MJUFs as defined in **Operating Agreement #2**.

3. **Other Associated Facilities' O&M Cost Allocations** – The District, Fairfax and WSSC shall each be assessed by DC Water for their proportionate share of the O&M Costs associated with these Other Associated Facilities, based on the proportion of their Actual Flow versus Total Flow through facilities, or based on other Usage Allocations as defined in **Operating Agreement #2**.

E. USER FEE RESPONSIBILITIES

1. **Annual User Fee** – Fairfax, WSSC and Non-Party User Loudoun County Sanitation Authority (LCSA or Loudoun Water) shall pay to DC Water an annual User Fee on behalf of the District. The initial fee was set at $1,500,000 per annum, effective July 1, 1986; with subsequent payments compounded annually by one and one half percent (1.5%).

2. **Apportionment** - DC Water shall annually calculate the User Fee for Fairfax, WSSC and LCSA, based in proportion to their share of the Allocated Flow Capacity at Blue Plains.

3. **DC Water's Use of the User Fee** - DC Water shall utilize the User Fee payments from Fairfax, WSSC and LCSA as a credit to the District's share of Blue Plains O&M Costs.

F. FINES, PENALTIES AND CLAIMS RESPONSIBILITIES

1. **Joint Responsibility** - The Parties shall have joint responsibility for and shall pay their respective shares of such fines, penalties or claims in accordance with their agreed shares of the O&M Costs or Capital Costs as appropriate for MJUFs or programs, provided that the following criteria are met:
   a. The fines, penalties or claims are associated with MJUFs;

b. The Party incurring the fines, penalties or claims demonstrated a reasonable effort to avoid imposition of such fines, penalties or claims, and dispute or contest any unreasonable charges; and

c. There is no judicial or adjudicative determination that the fines, penalties or claims are the result of gross negligence or willful misconduct of an employee or agent of the Party incurring the fine, penalty or claim.

2. **Reimbursement of Litigation Costs** - If litigation is filed against a Party for injuries to a third party resulting from operation of a MJUF, the Parties shall share the costs of defense or judgment in accordance with their proportionate shares of the associated O&M Costs or Capital Costs, as appropriate, as long as there is no determination by a court or arbitrator that any such judgment is the result of gross negligence or willful misconduct of an employee or agent of the defendant Party. If a determination is made that there has been gross negligence or willful misconduct of an employee or agent of the defendant Party, the defendant Party shall be solely responsible for the costs of defense and judgment.

3. **Review and Dispute Resolution** - The Regional Committee shall be responsible for reviewing these fines, penalties or claims and their associated costs, when they relate to billing disputes, and concurring with their applicability to the Parties. If there are disagreements regarding the responsibility of any of the appropriate Parties to pay for such costs, the Regional Committee shall address the issues in a timely manner, including, if necessary, referring the matter to the Leadership Committee for resolution.

G. ESTIMATES, BILLINGS, PAYMENTS, AND RECONCILIATION PROCEDURES

1. **General Requirements for Addressing DC Water Capital Costs and O&M Costs** – In accordance with the procedures outlined in Operating Agreement #2, DC Water shall:
   a. Assess costs based on estimated annual expenses;
   b. Prepare quarterly billings;
   c. Receive quarterly payments; and
   d. Reconcile all costs with payments.

2. **DC Water's Responsibility for Assessing Capital Costs and O&M Costs for MJUFs for Party and Non-Party Users** – DC Water is responsible for assessing all Capital Costs and O&M Costs associated with MJUFs for the District, Fairfax, WSSC and Non-Party Users. Assessments for each user will be based on their Allocated Flow Capacity or Billing Flows, or other approved Usage Allocations as appropriate.

3. **Fairfax's and WSSC's Responsibility for Assessing Capital Costs and O&M Costs for MJUFs for Party and Non-Party Users** – Fairfax and WSSC are responsible for assessing all Capital Costs and O&M Costs associated with MJUFs that they construct on behalf of the District, Fairfax, WSSC and Non-Party Users. Assessments for each user will be based on their Allocated Flow Capacity or Billing Flows, or other approved Usage Allocation as appropriate.

4. **Allocation Method for Capital and O&M Costs for MJUFs** - The method for allocating project-specific Capital Costs and O&M Costs associated with all MJUFs, and the associated billing procedures are as defined in **Operating Agreement #2**.

5. **Party Rights to Documents** – The Parties have the right to audit DC Water's or another Party's billings, and access to all existing, relevant financial documents for any billing for which such Party is wholly or partially responsible. Upon written request by a Party, the billing Party shall make the supporting documentation for such billing available for inspection, copy or review by, or on behalf of, the requesting Party.

H. DERIVATIVE AGREEMENT – Operating Agreement #2, Financial Responsibilities of Parties, addresses additional matters set forth in this Section. It may be replaced or supplemented by successor or other Derivative Agreements.

-END OF PAGE-

SECTION 6. FLOW AND LOAD MEASUREMENT AND MANAGEMENT

A. WASTEWATER FLOW AND LOAD MEASUREMENT, REPORTING AND MANAGEMENT

1. **Parties' Responsibility to Manage Flows** - The Parties shall take all reasonable actions to maintain their flows within their Allocated Flow Capacity, Peak Flow Limitations, and consistent with any load constraints for Blue Plains, as defined in **Section 4**. These actions shall include, but not be limited to, minimizing extraneous flows and loads in order to preserve capacity at Blue Plains and in the various wastewater collection systems within the BPSA. Based on recommendations from the Regional Committee, the Leadership Committee shall consider and recommend to any or all of the Parties programs, procedures or actions which will minimize wastewater flow and, therefore, preserve these capacities.

2. **Derivative Agreement to Address Procedures** - The methods for measuring monitoring, reporting and assessing Actual Flows within the BPSA and Billing Flows are described in **Operating Agreement #3** and shall include, but not be limited to addressing:
   a. An assessment of the quantity and timing of any flow management actions that any Party has committed to in order to ensure that they do not exceed their Allocated Flow Capacity, as defined in **Section 4,** and consistent with the long-term planning assumptions described in **Section 7**;

   b. The methods and frequency of reporting and assessing Actual Flows and Billing Flows;

   c. The process by which DC Water shall monitor and address any exceedances by the Non-Party Users, and by which Fairfax and WSSC shall monitor and address any exceedances by the Indirect Users as defined in **Operating Agreement #3**; and

   d. The Regional Committee shall routinely monitor and assess these methods and procedures and make recommendations to the Leadership Committee.

3. **Non-compliance** - If the District, Fairfax or WSSC, or Non-Party User does not comply with its Allocated Flow Capacity, Peak Flow Limitations or load allocations, as defined in **Section 4**; or fails to meet its flow management obligations, the Regional Committee shall address these issues on behalf of all of the Parties, including through use of dispute resolution, as necessary.

4. **District Commitment Regarding Management of Captured Stormwater Flows** - The District shall not expand the service area of its combined sewer system or take other actions that result in significantly increased Captured Stormwater Flow to Blue Plains above the amount set forth in **Operating Agreement #3** except as required for DC Water to meet its NPDES permit. If such actions are required, DC Water shall make recommendations to the Regional Committee, and the other Parties shall address any resultant cost implications consistent with **Section 3**.

B. CONTROL OF INFLOW AND INFILTRATION (I/I)

1. **Parties' Responsibility to Manage I/I** - The Parties shall manage their collection systems to minimize the amount of I/I entering their systems. Collection systems shall be maintained so that the I/I volume does not contribute to or cause exceedances of capacities and assumptions defined for:
   a. Blue Plains,

   b. The Potomac Interceptor and other wastewater collection system capacities, and

   c. Facilities associated with the Combined Sewer Overflow Long-term Control Plan.

2. **Non-Party User and Indirect Users' Responsibility to Manage I/I** - DC Water shall work with the Non-Party Users to manage their collection systems to meet the requirements of **Subsection B.1.** above; and Fairfax and WSSC shall work with the Indirect Users to meet the same requirements. Irrespective of arrangements with Non-Party Users or Indirect Users, the Parties shall comply with the flow projection assumptions.

C. DERIVATIVE AGREEMENT – Operating Agreement #3, Flow and Load Measurement and Management, addresses matters set forth in this Section. It may be replaced or supplemented by successor or other Derivative Agreements.

-END OF PAGE-

SECTION 7. WASTEWATER PROJECTED FLOW CAPACITY NEEDS AND FUTURE OPTIONS

A. RATIONALE FOR CONDUCTING ANALYSIS OF PROJECTED FLOW CAPACITY NEEDS

1. **Major Regional Investment** - The Parties recognize that the scale of the BPSA and the associated wastewater collection system, the importance of wastewater treatment provided to the region, and the contributions to local water quality improvements that are provided by Blue Plains constitute a major regional investment by the Parties.

2. **Planning Required** - The Parties also recognize that the planning needed to address future wastewater needs for the BPSA, manage wastewater flows to Blue Plains and respond to evolving water quality issues and regulatory developments will require the Parties to continue to work together to address these interdependent matters.

3. **Commitment to District** – The Parties recognize that, due to the limited options available to the District, the Parties have an obligation to ensure that the District's wastewater flow capacity needs are addressed in a timely manner.

B. CONDUCTING PROJECTED FLOW CAPCITY NEEDS ANALYSIS

1. **Analysis and Determination of Options** - In order to assess wastewater flow capacity and loading requirements and define how future flows and loads will be treated, the Regional Committee shall routinely analyze future capacity and loading requirements. Once it has been determined that the facilities and processes at Blue Plains are not sufficient to meet those Projected Flow Capacity Needs, the Regional Committee shall conduct a thorough analysis which includes the following criteria:

   a. Options for managing and/or treating flows at Blue Plains, as well as other sites;

   b. A time frame for triggering management actions (including diverting flows and/or rental/sale of capacity);

   c. A process for notification of all entities potentially affected by those options, and

   d. A basis and formula for compensation, which includes development costs and the allocation of those costs among the Parties, and Non-Party Users, as appropriate.

2. **Process for Adjustments** - The Regional Committee shall analyze options, and recommend to the Leadership Committee any proposed construction or flow management options, associated cost allocations, and any necessary adjustments to this IMA or the Derivative Agreements. These planning elements shall be conducted consistent with the requirements detailed in the following subsection C.

C. DETERMINATION OF PROJECTED FLOW CAPACITY NEEDS

1. **Respective Roles of Regional Committee and DC Water**
   a. **Regional Committee**
      1) Shall address the technical, policy and financial interests of the Parties when defining and assessing the Parties' flow capacity and loading requirements and options.
      2) Shall routinely evaluate and analyze projected flows and loads as compared with Actual Flows, Adjusted Flows and Allocated Flow Capacity, and confirm any potential permit or process implications.

   b. **DC Water** – DC Water shall represent the interests of and assess the future flow capacity and loading requirements of the Non-Party Users, and identify if there are any potential permit or process implications.

2. **Jointly Managed Study of Projected Flow Capacity Needs** - The Regional Committee shall also periodically and at least every five (5) years, assess and determine the individual and collective Projected Flow Capacity Needs of the Parties, and Non-Party Users, through a Jointly Managed Study. This Study shall project the Parties and Non-Party Users' future flow capacity and loading requirements and shall utilize the most recently approved projection methodology for the BPSA. The BPSA flow projection methodology shall be determined and shall include, but not be limited to, application and utilization of:

   a. The latest approved version of the BPSA Flow Forecast Model and COG's latest approved Cooperative Forecast demographic data, or other agreed upon methods; and

   b. The latest agreed upon wastewater flow factors and flow management assumptions of the Parties, including those programs, procedures or actions that minimize wastewater flow and, therefore, preserve capacity.

3. **Time Frame for Assessment of Future Projections** - A Jointly Managed Study for determining Projected Flow Capacity Needs will project both short-term (approximately 5-15 years) and long-term (approximately 20-30 years) flow capacity and loading requirements. This study must confirm all assumptions related to projecting future flows and loads, including but not limited to: growth, flows and loads, flow management, and flow factors. This study shall also evaluate whether projected peak flows may trigger additional capacity needs beyond current limitations. It will also project whether changes in climatalogical, system conditions, or any other conditions might cause potential capacity or permit exceedances.

-END OF PAGE-

D. DETERMINATION OF OPTIONS

1. Flow Management Options to Address Projected Flow Exceedances

a. If, within the time frame of the long-term projections, the District, Fairfax, WSSC, or any Non-Party User's projected annual average flow is anticipated to exceed its Allocated Flow Capacity, or the associated peak flows exceed their Peak Flow Limitations, then the District, Fairfax or WSSC shall have the option of committing to specific flow management actions and a schedule that reconciles its projected flows with its Allocated Flow Capacity and Peak Flow Limitations.

b. These flow management actions may include the temporary or permanent diversion of wastewater flows out of the BPSA.

c. The BPSA flow projections shall then be adjusted to reflect such actions, and the Regional Committee shall be responsible for monitoring and assessing compliance with those actions, as defined in **Section 6**.

2. Additional Options to Address Projected Flow Exceedances

a. If, after all flow management adjustments are accounted for, the projection results of a Jointly Managed Study for projected flow capacity requirements demonstrate that either the overall flows to Blue Plains generated within the BPSA exceed the plant's Design Flow Capacity or that one or more Parties' projected wastewater capacity requirements exceed their individual Allocated Flow Capacity (as defined in **Section 4**), the Regional Committee shall consider alternative technical and/or programmatic options to address these unmet Projected Flow Capacity Needs.

b. These options may include, but are not limited to:
   1) Reduction of or improved management of wastewater flows to reduce I/I or any other flow or load contributions;
   2) Modification of treatment processes at Blue Plains;
   3) Diverting flows from the BPSA to other facilities;
   4) Sale or rental of excess capacity at Blue Plains between the Parties;
   5) Expansion of existing treatment facilities or the addition of new treatment facilities, whether in or out of the BPSA; and
   6) Construction of new wastewater treatment and/or storage facilities, whether in or out of the BPSA.

3. Jointly Managed Studies to Develop Options

a. The development of specific technical and programmatic options and potential construction projects shall generally be based upon a Jointly Managed Study that includes participation of all of the Parties.

b. The Regional Committee may determine, however, that a Jointly Managed Study is not required, and that development of specific technical or programmatic options and potential construction projects may be conducted by one or more of the Parties.

c. If the Regional Committee makes such a determination, the Party(ies) conducting the evaluation shall ensure that the Regional Committee has an opportunity to review and evaluate the resulting options in order to confirm that the proposed approach will adequately address the flow management requirements, and that the Allocated Flow Capacity of the other Parties not involved in the proposed approach are not modified or altered.

d. Each Jointly Managed Study to develop options shall include a recommendation on cost allocations.

4. **Regional Committee to Make Recommendation** – Based on a Jointly Managed Study, the Regional Committee shall recommend to the Leadership Committee those technical and/or programmatic options that address the individual and collective Projected Flow Capacity Needs of the Parties. The Regional Committee's recommendations shall include, but not be limited to, addressing:
   a. The proposed time frame for taking specific actions (whether due to changes in existing facilities or processes, or due to the construction of new facilities);

   b. The estimated cost of these actions;

   c. The proposed flow, load, and cost allocations and implications for each Party (and Non-Party User) associated with any options; and

   d. Whether a facility is to be a MJUF.

5. **Regional Committee to Develop Plan** - Once the Leadership Committee approves the proposed options and resulting allocations, the Regional Committee shall develop a plan to address those Projected Flow Capacity Needs that includes the costs associated with any agreed upon treatment options.

E. COST CONSIDERATIONS

1. The plan developed pursuant to **Section D.5** shall address at a minimum the following criteria:
   a. The estimated Capital Costs and O&M Costs and cost basis of any proposed facilities (whether new or modified at Blue Plains or at any other facilities or sites) shall be consistent with the MJUFs and cost allocations, as defined in **Section 5**;

   b. The proposed allocation of Capital Costs and O&M Costs;

   c. The anticipated schedule for when funds to support these actions are likely to be needed.

2. The rental or sale of Allocated Flow Capacity shall be at the discretion of the Party which is providing the Allocated Flow Capacity for rent or sale.

3. The Parties to the rental or sale transaction shall mutually agree on the cost basis for the rental or sale of Allocated Flow Capacity.

F. IMPLEMENTATION OF PLAN TO ADDRESS PROJECTED FLOW CAPACITY NEEDS

1. The Leadership Committee shall review and consider the Regional Committee's options and allocation recommendations on behalf of the Parties.

2. Once an option or set of options and allocations are agreed upon to meet the future Projected Flow Capacity Needs, the Parties shall, if necessary, amend this IMA, and the Leadership Committee shall create or modify the Derivative Agreement(s). For example, if any of the options that are selected result in revisions to the Design Flow Capacity for Blue Plains, or Allocated Flow Capacity defined in **Section 4**, or to reconcile the associated Capital Costs and O&M Costs, as defined in **Section 5**, and any associated Derivative Agreements, the Parties shall make appropriate amendments to this IMA, and the Leadership Committee shall create or modify the Derivative Agreement(s).

3. Any Party which requests additional Allocated Flow Capacity is responsible for securing additional Blue Plains Effluent Load Allocations, or Blue Plains Effluent Load Offsets in proportion to the additional Allocated Flow Capacity which the Party seeks.

G. DERIVATIVE AGREEMENT – Operating Agreement #4, Wastewater Projected Flow Capacity Needs and Future Options, addresses matters set forth in this Section. It may be replaced or supplemented by successor or other Derivative Agreements.

-END OF PAGE-

SECTION 8. PRETREATMENT AND OPERATIONAL REQUIREMENTS

A. PRETREATMENT PROGRAM REQUIREMENTS

1. **Fairfax and WSSC Pretreatment Program Responsibilities**
   a. **Implementation of Programs** - Fairfax and WSSC shall adopt, implement and enforce Pretreatment Programs as required and approved by the United States Environmental Protection Agency (EPA). The Pretreatment Programs shall comply with federally imposed discharge limitations, prohibitions, and controls, as well as any Local Limits defined by DC Water, as needed to protect the collection system and treatment processes at Blue Plains and its biosolids management program requirements. Fairfax and WSSC shall set their Pretreatment Program standards to match or exceed any standards specifically required by DC Water.

   b. **Compliance and Recordkeeping** – Fairfax and WSSC shall conduct annual on-site inspections and obtain samples, and shall maintain documentation to verify compliance with, the Pretreatment Program and shall provide DC Water access to the pretreatment records. They shall also provide DC Water with reasonable access to all pretreatment records required by federal, state, and local regulations.

   c. **Indirect User Compliance** - To the extent applicable, Fairfax and WSSC shall ensure that the applicable Pretreatment Program terms and conditions which they impose on Indirect Users are consistent with those placed on the Parties.

2. **DC Water's Responsibilities**
   a. **Compliance by Fairfax and WSSC** - DC Water shall have the right to conduct sampling of the Fairfax and WSSC collection systems tributary to Blue Plains to ensure compliance with the provisions of these Pretreatment Programs. The Fairfax and WSSC Pretreatment Programs shall provide that, in the event of discovery of a case of noncompliance, they shall take corrective action, and Fairfax and WSSC, as applicable, shall compensate DC Water for the cost of sampling to identify and track resolution of the problem.

   b. **Non-Party User Compliance** - DC Water shall ensure that the applicable Pretreatment Program terms and conditions imposed upon the Non-Party Users are consistent with those placed upon the other Parties.

B. OPERATIONAL REQUIREMENTS

1. **Basis for Requirement** - The Parties recognize that, in addition to formal regulatory Pretreatment Program requirements, additional Operational Requirements are necessary to protect the operation and maintenance of Blue Plains wastewater, biosolids, residuals and other plant processes, facilities, and equipment.

2. **DC Water's Responsibility for Non-Party User Compliance** - DC Water shall ensure that the applicable Operational Requirements and conditions imposed upon the Non-Party Users are consistent with those placed upon the other Parties. Irrespective of such efforts, DC Water shall be bound by the additional Operational Requirements.

3. **Fairfax and WSSC Responsibility for Indirect User Compliance** - Fairfax and WSSC shall ensure that the applicable Operational Requirements terms and conditions imposed upon Indirect Users within the BPSA are consistent with those placed upon the other Parties. Irrespective of such efforts, Fairfax and WSSC shall be bound by the additional Operational Requirements.

C. DERIVATIVE AGREEMENT – Operating Agreement #5, Pretreatment and Operational Requirements, addresses additional matters set forth in this Section. It may be replaced or supplemented by successor and other Derivative Agreements.

-END OF PAGE-

SECTION 9. BIOSOLIDS MANAGEMENT COMMITMENTS

A. BIOSOLIDS UTILIZATION AND DISPOSAL

1. **Collective Commitment to Blue Plains Biosolids Management Program** - The Parties recognize their collective interests in the sound management of all biosolids produced at Blue Plains and its regional implications, and commit to continued planning and coordination in all aspects of biosolids management.

2. **Legislative Support to DC Water** - The Parties shall provide regional coordination and support to DC Water to address proposed legislation, regulations and other related activities that may impact the Blue Plains biosolids management program.

3. **Support for DC Water's Efforts** - The Parties shall actively support DC Water's efforts to ensure that biosolids produced at Blue Plains can be managed in a cost-effective, equitable and environmentally sound manner, and in compliance with all Blue Plains permit requirements and applicable regulations.

4. **Contracting Responsibilities** - DC Water is responsible for the Blue Plains biosolids management program; however, the Parties may determine that Fairfax County or WSSC may also be responsible for portions of the biosolids management. Specific details regarding such contractual or programmatic responsibilities shall be as set forth in **Operating Agreement #6**.

5. **Allocation of Value from Sale of Biosolids or By-Products** - All benefits (including revenue, and cost savings derived from products recycled or generated at Blue Plains) are to first offset the biosolids program and, then to offset Blue Plains operating costs, thereby reducing costs for all Parties.

B. EMERGENCY CONDITIONS

1. **Emergency Conditions** – An "emergency condition" shall mean situations when various actions or events occur (or have the potential to occur) such as acute weather conditions, abrupt changes in regulatory or legal requirements, or unavoidable contract complications, that will or are likely to impact the normal wastewater treatment processes.

2. **Basis for Emergency Planning** - The Parties recognize that emergency conditions require DC Water take prompt action to protect the Blue Plains processes and permit, to quickly implement alternative management or disposal options for Blue Plains biosolids, or to take other actions, in order to ensure that wastewater operations at Blue Plains and Other Associated Facilities, or the biosolids management program, are not compromised and that all permit conditions continue to be met.

3. **Notice** - As part of its their shared biosolids management responsibilities, DC Water and/or any other Party sharing biosolids management responsibilities on behalf of the Parties, shall alert the other Parties when an emergency condition is likely to or has occurred.

4. **Measures to be Taken** - Once the Parties are alerted that an emergency condition has been designated, the Parties shall work collectively, and in a timely manner, to provide active support to DC Water to address the situation and ensure that the Parties' collective and individual wastewater treatment needs at Blue Plains can continue to be provided, including, but not limited to, the following:
   a. Utilizing other existing contract mechanisms to handle management of all or portions of the biosolids;

   b. Working to identify additional land application or other management sites;

   c. Working with local and state regulatory officials to obtain land application or other management permits;

   d. Working with local and state regulatory officials to change regulations, legislation or legal action that are deemed harmful to the effective and environmentally sound management of biosolids; and

   e. Invoking the Parties' political leadership and other elected officials to support actions necessary to mitigate the impact of the designated emergency condition.

C. DERIVATIVE AGREEMENT – Operating Agreement #6, Biosolids Management Commitments, addresses additional matters set forth in this Section. It may be replaced or supplemented by successor or other Derivative Agreements.

-END OF PAGE-

SECTION 10. ADMINISTRATIVE PROVISIONS AND PROCEDURES

A. DURATION OF AGREEMENT

1. This IMA shall become effective upon the date the last Party executes it, as set forth below, subject to any orders of the United States District Court for the District of Columbia in State Water Control Board, et al., vs. Washington Suburban Sanitary Commission, et al., Civil Action No. 1813-73.

2. This IMA may be executed in counterparts, which together shall be regarded as one original.

3. This IMA remains in force and effect until June 30, 2111, unless amended, replaced or terminated earlier by mutual consent of the Parties.

B. SEVERABILITY

Should any provision(s) of this IMA or a Derivative Agreement be deemed illegal or unenforceable by a Court of competent jurisdiction, the remainder of this IMA or the Derivative Agreement shall remain in full force and effect. Provided, however, that within 60 days of the date that such ruling becomes final, including appeals if any, the Signatories or Leadership Committee, as appropriate, shall determine, directly or through the Leadership Committee whether this IMA, or the applicable Derivative Agreement, must be amended to fulfill the original intent of the Parties and to maintain, insofar as possible, the service and financial relationships created by this IMA. Should a determination be made to amend this IMA or the applicable Derivative Agreements, the Parties or Leadership Committee, respectively, shall promptly act on the amendments.

C. AUTHORITY

Each Party represents that it has the authority to enter into this IMA, and that the individuals signing this IMA on its behalf, have the authority to bind the Party to the terms and conditions of this IMA. This IMA shall apply to, and be binding upon, the Parties hereto, their elected officials, officers, agents, employees, successors and assigns, all persons, firms and corporations acting under, through or for them, and upon those persons, firms and corporations in active concert with them in any matter affected by this IMA.

D. AMENDMENTS TO THIS IMA

This IMA may be amended in whole, or in part, by the Parties as follows:

1. Proposed amendments to this IMA may be offered by any Party, directly, or through the Regional Committee, which shall make its recommendations to the Leadership Committee and to the Parties; and

2. If the Leadership Committee unanimously recommends an amendment to this IMA, it shall be submitted in writing to the Parties and shall become effective upon approval and execution by the Signatories of all of the Parties.

E. DISPUTE RESOLUTION

1. **Goal** - On occasion the Parties may differ on matters including but not limited to: a) their interpretation of terms and conditions of this IMA; b) the implementation of this IMA; c) whether any Derivative Agreement should be created, revised or terminated; and d) whether an IMA amendment should be adopted. If the Parties are unable to reach consensus through their normal coordination processes, in order to promote continued regional cooperation, and to avoid litigation when possible, the Parties shall first utilize the informal dispute resolution process. If the Parties are unable to resolve the dispute through the informal process, the formal dispute resolution process set forth herein shall be implemented.

2. **Informal Resolution** - If disagreements regarding the interpretation or implementation of this IMA surface during its routine business, and the Regional Committee cannot reach a consensus, the Regional Committee shall refer the matter to the Leadership Committee for advice, comment or suggested direction, or if appropriate, for direct resolution of the matter.

3. **Formal Resolution** - Any Party may initiate the formal dispute resolution process if it believes an issue has not been adequately addressed through normal coordination processes or an informal dispute resolution process.

   The formal resolution process includes the following requirements:

   a. The aggrieved Party shall provide written notice to the Regional Committee that it has an issue for dispute resolution. The notice must contain the aggrieved Party's rationale, together with the assumptions, supporting documents and computations necessary for an understanding and potential resolution of the dispute.

   b. The Regional Committee must address this issue directly or refer it for non-binding arbitration or third-party mediation within 30 days, or other reasonable time agreed to by the aggrieved Party. The Regional Committee may ask for additional written analysis from the aggrieved Party or from any Party which objects to or disagrees with the aggrieved Party's submission.

   c. The Regional Committee may use a non-binding arbitration or third-party mediation process to resolve the dispute if the aggrieved Party agrees to bear the cost of such non-binding arbitration or third-party mediation services, or the Parties otherwise agree to share costs.

   d. If after consideration by the Regional Committee or, as a result of non-binding arbitration or third-party mediation, agreement is not reached, the Regional Committee shall refer the matter to the Leadership Committee.

   e. If the Regional Committee fails to resolve the issue or refer the matter to non-binding arbitration or third-party mediation within the prescribed time, and the matter is not resolved, the aggrieved Party may then forward the issue to the Leadership Committee for resolution.

f. The Leadership Committee must address the matter within 30 days, or other reasonable time agreed to by the aggrieved Party, after receiving formal notice from the aggrieved Party. This notice should include the documentation previously submitted by the aggrieved Party to the Regional Committee.

g. The Leadership Committee may utilize non-binding arbitration or third-party mediation to assist it in reaching a unanimous decision on the dispute presented; if the aggrieved Party agrees to bear the costs of the non-binding arbitration or third-party mediation services, or the Parties otherwise agree to share costs.

h. If the Leadership Committee cannot resolve the issue within 30 days after presentation, or other reasonable time agreed to the aggrieved Party, the aggrieved Party may then inform the other Parties of the dispute, the inability to reach agreement, and its intention to seek legal or other resolution, including injunctive, declaratory or other relief. Upon receipt of such notice, the Parties agree to meet before any such litigation or other resolution is commenced by any Party or Parties against any other Party. No meeting shall be required as a condition precedent to litigation if such a meeting cannot be held within 30 days after the date on which the written notice was sent to all Parties or within in such other reasonable time agreed to by the aggrieved Party.

i. No Party may seek independent state or federal litigation or other resolution, including federal legislative assistance, of a dispute that has not yet completed this formal dispute resolution process.

F. NOTICES

1. **To Parties** - Whenever any formal notice is required to be given to any Party under this IMA, it shall be in writing and deemed to be given on the date of actual delivery (or rejection) if delivered by nationally recognized overnight service or by personal delivery. Notices shall be directed to the following officials at their officially designated business addresses:
   a. District of Columbia - City Administrator
   b. DC Water – General Manager
   c. Fairfax County, Virginia - County Executive
   d. Montgomery County, Maryland - Chief Administrative Officer
   e. Prince George's County, Maryland - Chief Administrative Officer
   f. Washington Suburban Sanitary Commission, Maryland - General Manager

2. **To Secretariat/Administrative Entity** - A copy of any formal notice shall also be sent to the offices of the secretariat/administrative entity, designated by the Leadership Committee, and to the Regional Committee.

3. **Responsibility** - Where notice is required to be given by this IMA or a Derivative Agreement and a specific Party is not designated to give notice, the notice shall be given by the secretariat/administrative entity.

4. **Timing** - Where time deadlines are given, all days are calendar days unless otherwise indicated.

5. **Electronic Notice** – In addition to service by U.S. mail or hand-delivery, the Parties may be served with notice electronically if the Party to be served has given written notice to the other Parties of its email address. Provided, however, that notices of changes to this IMA or a Derivative Agreement, court action or formal dispute resolution shall also be served in accordance with **Section F.1.**

G. PRIOR AGREEMENTS - As set forth in the introductory paragraphs of this IMA and in the Appendix, certain agreements preceded the 1985 IMA. Those agreements, which are set forth in the Appendix, as well as the 1985 IMA, are extinguished and superseded by this IMA.

H. ANTI-DEFICIENCY ACTS PROVISIONS

1. Relating to the District and DC Water

Notwithstanding any other provisions of this IMA and the Derivative Agreements:

a. Pursuant to the provisions of (i) the federal Anti-Deficiency Act, 31 U.S.C. §§ 1341, 1342, 1349-1351 1511-1519 (2008), and D.C. Official Code §§ 1-206.03(e) and 47-105; (ii) the District of Columbia Anti-Deficiency Act, D.C. Official Code §§ 47-355.01 – 355.08 (collectively, as amended from time to time, the "Anti-Deficiency Acts"); and (iii) Section 446 of the District of Columbia Home Rule Act, D.C. Official Code § 1-204.46, the District and DC Water cannot obligate themselves to any financial obligation or expenditure (including capital obligations and expenditures, operating and maintenance obligations and expenditures, and obligations and expenditures related to fines, penalties, and claims) in any present or future year unless the necessary funds to pay that obligation or expenditure have been appropriated by the Congress of the United States (the "Congress") and are lawfully available for the purpose of the obligation or expenditure. Pursuant to the Anti-Deficiency Acts, nothing in this IMA or the Derivative Agreements creates an obligation of the District or DC Water in anticipation of an appropriation by Congress for such purpose, and the District's or DC Water's legal liability for the payment of any amount under this IMA and the Derivative Agreements does not and may not arise or obtain in advance of the lawful availability of appropriated funds for the applicable fiscal year as approved by Congress. No District of Columbia or DC Water official or employee is authorized to obligate or expend any amount under this IMA or the Derivative Agreements unless such amount has been appropriated by Act of Congress and is lawfully available.

b. The amount of the DC Water Board of Directors', or its successors', annual budget estimate approved by Congress shall serve as the basis for, and the limit on, the billing, payments, and expenditures described in this IMA and the Derivative Agreements. If no appropriation or a smaller appropriation than requested is made by Congress to pay any amount under this IMA, or if appropriated funds for such purposes are not otherwise lawfully available, the legal obligations of all of the Parties under this IMA shall be limited to the amount of any lawfully available appropriation. The District's right to continued use of its Allocated Flow Capacity, nonetheless, remains subject to the limitations provided in Section 4(A)(2)(c) of the IMA.

2. Relating to WSSC

Notwithstanding any other provisions of this IMA and the Derivative Agreements: The financial obligations (including capital obligations and expenditures, operating and maintenance obligations and expenditures, and obligations and expenditures related to fines, penalties, and claims) of WSSC in any present or future year are subject to any applicable laws regarding appropriation by its governing body and any applicable anti-deficiency or non-appropriation laws. WSSC's right to continued use of its Allocated Flow Capacity, nonetheless, remains subject to the limitations provided in Section 4(A)(2)(c) of the IMA.

3. Relating to Fairfax, Montgomery and Prince George's

Notwithstanding any other provisions of this IMA and the Derivative Agreements: The financial obligations (including capital obligations and expenditures, operating and maintenance obligations and expenditures, and obligations and expenditures related to fines, penalties, and claims) of Fairfax, Montgomery or Prince George's counties in any present or future year are subject to any applicable laws regarding appropriation by their respective governing or legislative body and any applicable anti-deficiency or non-appropriation laws. Fairfax, Montgomery and Prince George's counties' right to continued use of their respective Allocated Flow Capacity, nonetheless, remains subject to the limitations provided in Section 4(A)(2)(c) of the IMA.

-END OF PAGE-

SECTION 11. DERIVATIVE AGREEMENTS UNDER THIS IMA

A. USE AND PROCESS FOR DERIVATIVE AGREEMENTS

1. **Purpose** - Derivative Agreements are intended to implement the intent of the Parties in an efficient and effective manner without reopening or renegotiating the terms of this IMA. Derivative Agreements are limited to addressing issues that are authorized by this IMA. A Derivative Agreement shall not modify, negate or adversely impact any right or obligation of the Parties set forth in this IMA.

2. **Types** - Three (3) kinds of Derivative Agreements may implement this IMA: Operating Agreements, Service Agreements and Limited Party Agreements. These agreements are designed to address procedural, technical, operational and service issues.

3. **Amendments to Derivative Agreements or Supplemental or Successor Derivative Agreements** – Where this IMA refers to a Derivative Agreement such reference shall include any amendment(s) to that Derivative Agreement or supplemental or successor Derivative Agreement(s).

B. OPERATING AGREEMENTS

1. **Purpose** - Operating Agreements are made among all the Parties, but deal with a specific function or group of like functions. Specifically authorized functions for Operating Agreements include but are not limited to:
   a. Allocation and management of flow capacity, loads and peak flows and their associated allocations and limitations;
   b. Parties' financial responsibilities;
   c. Flow and load measurement and management;
   d. Pretreatment and operational requirements; and
   e. Biosolids management commitments.

2. **Current Agreements** - The Operating Agreements which are executed simultaneously with the execution of this IMA are:
   a. Blue Plains Flow Capacity, Loads and Peak Flows – Allocations and Limitations;
   b. Financial Responsibilities of Parties;
   c. Flow and Load Measurement and Management;
   d. Wastewater Projected Flow Capacity Needs and Future Options;
   e. Pretreatment and Operational Requirements; and
   f. Biosolids Management Commitments.

3. **Development and Approval Process** - The Regional Committee shall recommend Operating Agreements for Leadership Committee approval. The Leadership Committee must unanimously approve Operating Agreements, amendments thereto, or termination thereof, before they are effective.

4. **Notification to Parties and Effective Date** - Once the Leadership Committee approves a new/amended Operating Agreement, or termination thereof, it shall be forwarded to the Parties by the secretariat entity and be subject to a 60-day review period by the Signatories.

   a. If a Party objects in writing to the Operating Agreement or the amendment or termination thereof within the 60 day period, the Operating Agreement, or the amendment or termination of the Operating Agreement shall not be approved, and, the dispute resolution process may be commenced, as defined in **Section 10.E**.

   b. If no Party objects in writing within the 60 day period, the new or amended Operating Agreement or termination of an existing Operating Agreement shall take effect upon expiration of the 60 day period and the signature of the chair of the Leadership Committee.

C. SERVICE AGREEMENTS

1. **Purpose** - Service Agreements provide for specific function(s) for the benefit of regional wastewater treatment or for implementation of this IMA.

2. **Development and Approval Process** - The Regional Committee shall recommend Service Agreements for Leadership Committee approval. The Leadership Committee must unanimously approve Service Agreements, amendments thereto, or termination thereof, before they are effective.

3. **Effective Date** - Once the Leadership Committee approves a Service Agreement, the Agreement is effective. Service Agreements are not subject to the 60 day review period for Operating Agreements.

4. **Service Agreements -** Include, but are not limited to:

   a. **For Secretariat Services** - A Service Agreement pursuant to **Section 2** with an entity on behalf of the Parties to provide secretariat support; and

   b. **For Regional Water Quality Management Program** - A Service Agreement pursuant to **Sections 2 and 3** with an entity on behalf of the Parties to provide water quality monitoring and evaluation support to address Potomac River estuary, the Anacostia River, and Chesapeake Bay water quality issues.

D. LIMITED PARTY AGREEMENTS

1. **Purpose** – Limited Party Agreements include, but are not limited to, agreements to provide wastewater treatment services and transfers of capacity to satisfy Projected Flow Capacity Needs originating in the BPSA. Such transfers of capacity shall not modify any requirements of or allocations defined under this IMA.

2. **Permitted Limited Party Agreements** – Limited Party Agreements may be between the following entities: a) two (2) or more Parties; b) a Party(ies) and Non-

Party User(s); or c) a Party(ies) and Indirect User(s). These include, but are not limited to:

a. **DC Water and/or the District and Non-Party Users** – Agreements between DC Water and/or the District and Non-Party Users to provide wastewater treatment services using capacity allocated by this IMA, as defined in **Section 4**.

b. **Fairfax and WSSC and Indirect Users** – Agreements between Fairfax or WSSC and Indirect Users to provide wastewater treatment services using capacity within their respective Allocated Flow Capacity, as defined in **Section 4**.

3. **Limited Party Agreements in Effect Upon Execution of this IMA** - Limited Party Agreements between DC Water and/or the District and Non-Party Users, or Fairfax or WSSC and Indirect Users which are in existence as of the execution of this IMA, and the rights given in those agreements, are valid under this IMA.

4. **Limited Party Agreements Convey No Rights in IMA -** Limited Party Agreements with Non-Party Users or Indirect Users do not convey any IMA rights to those Users.

5. **Regional Committee to Review Limited Party Agreements** – Limited Party Agreements shall be submitted to the Regional Committee for review to ensure that the terms and conditions do not negatively impact the other Parties' rights or responsibilities under the IMA.

6. **Notification to Parties and Effective Date for Limited Party Agreements** - Once the Regional Committee reviews a Limited Party Agreement, and does not object, the Agreement is effective. Limited Party Agreements are not subject to the 60 day review period for Operating Agreements. Once the Regional Committee has reviewed a Limited Party Agreement and not objected, the Limited Party Agreement becomes part of the IMA record.

-END OF PAGE-

SECTION 12. GLOSSARY

This Glossary defines terms that have a specific meaning and are used in this IMA.

Actual Flow(s) – Wastewater flow that is contributed by the District, Fairfax and WSSC, as well as by Non-Party Users and Indirect Users, that is delivered through various points of connection (both metered and unmetered flows) to Blue Plains for treatment.

Adjusted Flow(s) – Actual Flows for only the District, Fairfax and WSSC (less Captured Stormwater Flow in the case of the District), that have been normalized to reflect Annual Average Hydrologic Conditions in order to compare the values to their respective Allocated Flow Capacity.

Allocated Flow Capacity – Blue Plains annual average Design Flow Capacity that is apportioned among the District, Fairfax, WSSC, and Non-Party Users (expressed as annual average MGD under Annual Average Hydrologic Conditions).

Annual Average Hydrologic Conditions – Conditions based on an average amount of rainfall in a year developed based upon the available historical rainfall and groundwater level records.

Billing Flow(s) – Actual Flow for the District, Fairfax, WSSC, and Non-Party Users that has been calculated to account for any differential treatment cost impacts as have been defined or permitted in this IMA, and that is billed by DC Water.

Blue Plains - The wastewater treatment plant located at 5000 Overlook Avenue, S.W., Washington, D.C.

Blue Plains Effluent Load(s) – A maximum quantity of pollutants assigned to Blue Plains in its NPDES permit and associated Fact Sheet that may be discharged from Outfall #001 and/or Outfall #002 (generally expressed as pounds/day or pounds/year).

Blue Plains Effluent Load Allocation(s) – Blue Plains Effluent Load(s) that have been sub-allocated into District, Maryland and Virginia portions.

Blue Plains Effluent Load Offset(s) – An allocation of pollutants that can be secured by a Blue Plains User to increase its proportionate share of Blue Plains Effluent Load Allocation to compensate for any additional increase in wastewater flow that it wants to have treated at Blue Plains.

Blue Plains Influent Load(s) – Quantity of pollutants that are conveyed to Blue Plains in the incoming wastewater that may or may not be associated with Blue Plains Effluent Loads or any Blue Plain Effluent Load Allocations.

Blue Plains Service Area (BPSA) – The combined areas of all sewersheds within all jurisdictions that have historically been authorized to discharge wastewater flows to Blue Plains. This includes wastewater sources (metered or unmetered) that flow by gravity, as well as those that may be pumped into the system.

Capital Cost(s) - Costs incurred in the acquisition, construction, modification, replacement, enlargement, rehabilitation, or upgrade of fixed assets. Fixed assets shall include buildings and appurtenances, pipelines, and equipment. Capital Costs must expand facility capacity, improve the efficiency or output of a facility, or extend the useful life of an asset.

Captured Stormwater Flow (CSF) – Stormwater flow in the District's "Combined Sewer System" that is captured within the collection system and conveyed to Blue Plains for treatment in accordance with the CSO LTCP.

Chief Administrative Officers (CAOs) – Highest level non-elected government executive in the District of Columbia, Fairfax, Montgomery, and Prince George's Counties.

Combined Sewer Overflow Long-term Control Plan (CSO LTCP) – The approved plan controlling combined sewer overflows from the District that was prepared pursuant to the 1994 Combined Sewer Overflow Policy (55 Fed. Reg. 18688, issued 4/19/94 by the EPA) and Section 402(q) of the Clean Water Act and any supplements thereto.

Derivative Agreement(s) (DA) - A formal document, authorized by this IMA, which sets forth technical and procedural details as part of the implementation of this IMA.

Design Flow Capacity(ies) – The wastewater flow rates (expressed as MGD) used as the basis of wastewater treatment design for Blue Plains under various flow conditions (e.g., annual average, maximum 30-day, maximum year).

Design Load Capacity(ies) – The maximum quantity of pollutants in influent wastewater (expressed as pounds per day, or pounds per year) that is used as the basis of wastewater treatment design for Blue Plains.

Diversion(s) – Specific management actions taken by DC Water, Fairfax, WSSC, or Non-Party User to cause wastewater flows generated within the BPSA to be rerouted, pumped, or otherwise redirected from a BPSA sewershed with the result that that the Blue Plains User's flows are or will be reduced. These actions are generally taken to ensure that a Blue Plains User's flow does not or will not exceed either its Allocated Flow Capacity and/or its Peak Flow Limitations, but may also become appropriate to ensure the District's long-term wastewater treatment needs can be met at Blue Plains.

General Managers – Highest level executive in DC Water and WSSC.

Indirect User(s) – Those entities that send wastewater flow to Blue Plains pursuant to service agreements with WSSC or Fairfax. These entities have no direct rights under this IMA, but the Parties have the responsibility to ensure that any agreements and activities associated with the Indirect Users do not infringe or threaten the rights of the Parties under this IMA.

Intermunicipal Agreement (this IMA) – The formal agreement that defines the rights, obligations, and relationships of the Parties.

Jointly Managed Study(ies) – A formal study that is conducted in order to address issues related to the interests of the Parties under this IMA where the Regional Committee: a) has direct input on preparing the scope of work; b) has input on selection of consultant/contractor (whether through contracting mechanisms of the Regional Committee, DC Water or any Party); and c) is actively involved in the review and acceptance of the work products from that study (e.g., the BPSA Long-term Planning Study, 2003).

Key Principle(s) - Statements of general philosophy and intent that govern this IMA and Derivative Agreements, and shall be used to guide any interpretation or dispute resolution process.

Leadership Committee – A committee established pursuant to **Section 2** of this IMA to oversee the implementation of this IMA, the members of which are the Chief Administrative Officer or General Manager of each Party.

Local Limit(s) – Specific discharge limits developed and enforced by DC Water, Fairfax and WSSC upon industrial or commercial facilities to implement the general and specific discharge prohibitions listed in 40 CFR 403.5(a)(1) and (b), as amended.

Multi-Jurisdiction Use Facility(ies) (MJUFs) – A term that recognizes that more than one jurisdiction's flows are treated by or pass through a facility(ies) and that the costs associated with those facilities are shared among the Parties. It is comprised of those facilities that have something to do with wastewater collection or treatment or biosolids management that have some relationship to Blue Plains. Although such facilities are generally managed by DC Water, some facilities are operated by Fairfax or WSSC on behalf of the Parties. The term refers to any facilities that any of the Parties are operating/managing on behalf of all or some subset of the Parties.

Non-Party User(s) - Those entities that contribute wastewater flows to Blue Plains that are managed through separate service agreements either by DC Water directly or on behalf of the District. These include: Loudoun County Sanitation Authority (LCSA or Loudoun Water), Virginia; Town of Vienna, Virginia; Dulles Airport, Virginia; National Park Service, Maryland; and Naval Ship Research and Development Center, Maryland. These entities do not have contractual rights under the IMA; and their interests under this IMA are represented by DC Water.

Operating Agency(ies) – DC Water, Fairfax and WSSC (i.e., those Parties that have operational responsibility for wastewater collection and/or treatment within the BPSA, and the associated billing and payment responsibilities).

Operating Agency Representative(s) – The members of DC Water, Fairfax and WSSC on the Leadership or Regional Committee, as applicable.

Operating and Maintenance Cost(s) (O&M) - Costs incurred by DC Water, Fairfax or WSSC in providing wastewater collection, treatment, and biosolids management and disposal services. Such costs include labor, materials and the repair and upkeep of equipment, but do not include Capital Costs. Costs shall be recognized in accordance

with generally accepted accounting principles. These costs include direct costs, indirect costs and overhead costs.

Operational Requirements – Constraints placed on the wastewater sent to Blue Plains that DC Water has determined are required in order to protect DC Water's wastewater collection system, or equipment, or the processes and equipment at Blue Plains, with which the District, Fairfax, WSSC and, as appropriate, the Non-Party Users and Indirect Users, must comply. These are in addition to any regulatory Pretreatment Program requirements.

Other Associated Facilities – All the other facilities, pipelines, and appurtenances within the District, and the Potomac Interceptor sewer system which are managed by DC Water, and are used for the storage and collection of wastewater sent to, or the management of biosolids generated by Blue Plains.

Party(ies) – Collectively those entities governed by and signatory to this IMA, being: the District of Columbia (District), the District of Columbia Water and Sewer Authority (DC Water), Fairfax County, Virginia (Fairfax), Montgomery County, Maryland (Montgomery), Prince George's County, Maryland (Prince George's), and the Washington Suburban Sanitary Commission (WSSC).

Peak Flow Limitation(s) – Maximum wastewater flow rate (MGD) allowed to be transmitted between the wastewater collection systems of two (2) of the Parties using Blue Plains, i.e. the District, Fairfax or WSSC.

Potomac Interceptor (PI) - The major wastewater interceptor built as a result of Public Law 86-0515 passed by Congress (June 12, 1960) that conveys wastewater from portions of suburban Virginia and Maryland to the District boundary and hence to Blue Plains for treatment.

Potomac Interceptor User(s) – Fairfax, Loudoun County Sanitation Authority (LCSA or Loudoun Water), Town of Vienna, and Dulles Airport, in Virginia; and WSSC, the National Park Service, the Naval Ship Research and Development Center, in Maryland, which utilize portions of the PI to transmit their wastewater flows to Blue Plains.

Pretreatment Program(s) – Formal programs established by the District, Fairfax and WSSC in compliance with the Clean Water Act, as amended, to reduce the amount of pollutants or that alter the nature of pollutant properties in wastewater to a less harmful state prior to discharging such wastewater into the sewer system discharging to Blue Plains.

Projected Flow Capacity Need(s) – The formal determination, based on a Jointly Managed Study, of the long-term wastewater flows and associated treatment requirements (in MGD) that the District, Fairfax and WSSC and Non-Party Users are anticipated to generate within the BPSA, during or at the end of the agreed upon planning period. These projected wastewater flows are calculated as annual average flows under Annual Average Hydrologic Conditions and therefore do include an inherent contribution from Inflow and Infiltration, but do not include any Captured Stormwater Flow contributions, which are determined through separate processes.

Regional Committee - A committee established for the purpose of assisting in the interpretation, administration and implementation of this IMA and to resolve issues pertaining to Blue Plains and Other Associated Facilities that are within the scope of this IMA, its amendments and its associated Derivative Agreements.

Signatory(ies) – The representatives for the Parties that have the legal authority to bind their entities to the terms and conditions of this IMA.

Usage Allocation(s) - The basis for apportioning Capital Costs and O&M Costs of Multi-Jurisdiction Use Facilities (MJUFs) to the District, Fairfax, WSSC or Non-Party User that is not linked directly to the user's share of Allocated Flow Capacity or measured flow. This basis may include consideration of flow rates, percentage volume, modeled contributions, pollutant loadings (such as nutrients), or other methods for determining the District's, Fairfax's, WSSC's, or Non-Party User's portion of facilities, pipelines, and appurtenances and their associated costs.

User Fee(s) – A fee paid by Fairfax, WSSC and Non-Party User Loudoun County Sanitation Authority (LCSA or Loudoun Water) to DC Water, on behalf of the District, in accordance with **Section 5** of this IMA.

APPENDIX

HISTORICAL AGREEMENTS (These agreements are inapplicable as of the execution of this IMA. They are mentioned here solely for historical context)

1. The 1985 Blue Plains Intermunicipal Agreement (IMA).

2. Accordingly, except as otherwise provided herein and subject to any orders of the U.S. District Court for the District of Columbia in State Water Control Board, et al. vs. WSSC, et al., Civil Action No. 1813-73, this Agreement shall extinguish and supersede the following agreements, which were also previously suspended, extinguished or superseded by the 1985 IMA:
   a. Agreement No. DCF-A-766, dated August 12, 1954, between the District and WSSC;
   b. Agreement No. DCF-A-1357, dated April 28, 1959, between the District and Fairfax County;
   c. Memorandum of Understanding on Washington Metropolitan Regional Water Pollution Control Plan of October 1970 among the District, WSSC and Fairfax County;
   d. Interim Treatment Program Agreement, dated October 18, 1971, among the District, WSSC and Fairfax;
   e. The 1974 Blue Plains Sewage Treatment Plant Agreement, as amended;
   f. Agreement No. DCF-A-766, dated February 11, 1965, between the District and Fairfax County;
   g. Agreement No. DCF-A-2824, dated July 6, 1967, between the District and WSSC; and
   h. Agreement No. DCF-A-145-DES, dated April 21, 1976, between the District and WSSC.

2012 IMA
LIST OF DERIVATIVE AGREEMENTS

OPERATING AGREEMENTS		
NO.	**TITLE**	**EFFECTIVE DATE**
1.	BLUE PLAINS FLOW CAPACITY, LOADS AND PEAK FLOWS - ALLOCATIONS AND LIMITATIONS	4/3/13
2.	FINANCIAL RESPONSIBILITIES OF PARTIES	4/3/13
3.	FLOW AND LOAD MEASUREMENT AND MANAGEMENT	4/3/13
4.	WASTEWATER PROJECTED FLOW CAPACITY NEEDS AND FUTURE OPTIONS	4/3/13
5.	PRETREATMENT AND OPERATIONAL REQUIREMENTS	4/3/13
6.	BIOSOLIDS MANAGEMENT COMMITMENTS	4/3/13

OPERATING AGREEMENT #1

PARTIES' AGREEMENT REGARDING: BLUE PLAINS FLOW CAPACITY, LOADS, AND PEAK FLOWS - ALLOCATIONS AND LIMITATIONS

THIS OPERATING AGREEMENT ("Agreement"), made among the **DISTRICT OF COLUMBIA** (the District), the **DISTRICT OF COLUMBIA WATER AND SEWER AUTHORITY** (DC Water), **FAIRFAX COUNTY, Virginia** (Fairfax), **MONTGOMERY COUNTY, Maryland** (Montgomery), **PRINCE GEORGE'S COUNTY, Maryland** (Prince George's), and the **WASHINGTON SUBURBAN SANITARY COMMISSION** (WSSC),

Witness:

WHEREAS, the Parties have entered into the Blue Plains Intermunicipal Agreement (2012 IMA); and

WHEREAS, the Parties have agreed to comply with the Allocated Flow Capacity values for the Blue Plains Wastewater Treatment Plant (Blue Plains), which apportion capacity among the District, Fairfax, WSSC and Non-Party Users, as set forth in the 2012 IMA, **Section 4**; and

WHEREAS, the Parties agree to comply with nutrient loads for Blue Plains effluent discharged through two Blue Plains effluent points, designated Outfall #001 and Outfall #002; and

WHEREAS, the Parties agree to routinely monitor their Actual Flows, Adjusted Flows and the associated nutrient loads to Blue Plains to ensure that all allocations and/or limitations for Blue Plains are not exceeded; and

WHEREAS, the Parties have agreed to regularly monitor all wastewater process, permit, regulatory and other developments that have the potential to impact either flow capacity, nutrient loads or other parameters that may affect Blue Plains and its ability to comply with its permit or process requirements as defined in **Section 6**; and

WHEREAS, the Parties recognize that the Blue Plains NPDES permit, applicable Total Maximum Daily Load (TMDLs) for the Potomac River Watershed, and associated state Watershed Implementation Plans (WIPs) must all be complied with, and that the load limits in Blue Plains' permit are applied to Outfall #001 and #002; and

WHEREAS, the Parties have agreed to regularly monitor their peak flows at the point of connection to the collection system owned by the District and operated by DC Water, and to comply with their Peak Flow Limitations, as set forth in the 2012 IMA, **Section 6**; and

WHEREAS, the Parties acknowledge their responsibility to ensure that the Non-Party Users and Indirect Users also comply with the terms of this Agreement as applicable;

and

WHEREAS, Section 2 of the 2012 IMA authorizes the Leadership Committee to create, modify or terminate an Operating Agreement to implement the terms of the IMA consistent with **Section 11.**

NOW, THEREFORE, the Parties agree as follows:

PURPOSE: The purpose of this Agreement is to address matters relating to **Section 4** of the 2012 IMA

A. BLUE PLAINS EFFLUENT LOADS AND ALLOCATIONS

1. The Blue Plains Effluent Loads and Blue Plains Effluent Load Allocations (for Outfalls #001 and #002) are defined in **Table OA 1-A** below**.**

2. The Parties acknowledge that these Effluent Load Allocations are based on various state and District flow and concentration assumptions.

Table OA 1-A

BLUE PLAINS EFFLUENT LOADS[1],[2]		
ENTITIES WITH ALLOCATIONS	**LOAD ALLOCATIONS (LBS/YR)**	
	Total Nitrogen	**Total Phosphorus**
District of Columbia's Blue Plains Load Allocation[3] - Total	**2,114,542.00**	**87,993.54**
WSSC	*Not specified*	*Not specified*
Naval Ship Research & Development Center	*Not specified*	*Not specified*
National Park Service	*Not specified*	*Not specified*
Maryland's Blue Plains Load Allocation-Total[4]	**1,993,000.00**	**89,694.91**
Fairfax County	*Not specified*	*Not specified*
Loudoun County Sanitation Authority	*Not specified*	*Not specified*
Dulles Airport	*Not specified*	*Not specified*
Town of Vienna	*Not specified*	*Not specified*
Virginia's Blue Plains Load Allocation-Total	**581,458.00**	**26,166.00**
Blue Plains Effluent Loads (Grand Total)[1]	**4,689,000.00**	**203,854.45**

[1] Loads for Blue Plains and sub-allocations are as documented in EPA's Final TMDL (December 29, 2010), Section Q.
[2] Use of Allocated Flow Capacity is contingent on providing an allocation equivalent to at least 4.0 mg/L for TN and 0.18 mg/L for TP for Allocated Flow Capacity plus Captured Stormwater Flow, i.e. all flow out of Outfall 002. The District must also provide an allocation for flow discharged to Outfall 001.
[3] The load allocations shown for the District only address that portion associated with District flows to Blue Plains. Allocations for other Non-Party Users are reflected in the respective state allocations.
[4] WSSC use of allocated flow capacity is limited to 163.6 mgd due to diversion of nitrogen and phosphorus load allocations to the Seneca WWTP (i.e., loads associated with 6 mgd).

B. BLUE PLAINS INFLUENT DESIGN LOAD CAPACITY

1. Influent loads to Blue Plains must be limited so that the Blue Plains effluent loads meet permit requirements. The Parties agree that the Design Load Capacities are set forth in **Table OA 1-B**. If there are potential problems with meeting plant permits then the load capacities set forth in **Table OA 1-B** will apply.

2. The Design Load Capacity reflects Complete Treatment requirements for those flows that are discharged through Outfall #002, under Maximum Design Flow Capacity flows.

Table OA 1-B

BLUE PLAINS DESIGN LOAD CAPACITY FOR INFLUENT FLOWS[1]		
Parameters	**Loads (lb/day)**	
	Annual Average	**Maximum 30-Day Rolling Average**
BOD	525,977	694,290
TSS	562,282	747,836
TKN	104,940	137,471
NH_3,	55,390	64,252
TP	14,108	18,340
Associated Maximum Design Flow Capacity – Basis (mgd)		
Flow, Average Year	**384**	**485**
Flow, Maximum Year	**431**	**485**

GLOSSARY TERMS FOR OPERATING AGREEMENT #1

This Glossary identifies terms that have a specific and defined meaning for purposes of interpreting this Operating Agreement. Additional terms that are also used in the 2012 IMA Core Agreement are defined in the Glossary included in the IMA.

Complete Treatment – Flow that is discharged out of Outfall #002 and receives the following treatment: screening, grit removal, primary treatment, secondary treatment, nutrient reduction, disinfection, and de-chlorination.

Maximum Design Flow Capacity – Design flow capacity figures, used to develop design loads for complete treatment out of Outfall #002, that reflects flow assumptions during specific wet weather conditions (i.e., 60 inch Rain Year and after full implementation of the CSO LTCP and the Total Nitrogen and Wet Weather Plan).

[1] *Source: "Design - Level Plant Influent Flows and Loads Technical Memorandum", AECOM May 2009 and "Projected Flows and Sources – NT/Wet Weather Plan", Greeley and Hansen, July 2010.

EXECUTION

This Agreement is executed on behalf of the Parties by the Members of the IMA Leadership Committee who, by affixing their signatures, confirm the authorization of their respective Party to be bound thereby. It shall be effective on the date indicated by the Chair below.

OPERATING AGREEMENT #2

PARTIES' AGREEMENT REGARDING: FINANCIAL RESPONSIBILITIES OF PARTIES

THIS OPERATING AGREEMENT (Agreement), made among the **DISTRICT OF COLUMBIA** (the District), the **DISTRICT OF COLUMBIA WATER AND SEWER AUTHORITY** (DC Water), **FAIRFAX COUNTY, Virginia** (Fairfax), **MONTGOMERY COUNTY, Maryland** (Montgomery), **PRINCE GEORGE'S COUNTY, Maryland** (Prince George's), and the **WASHINGTON SUBURBAN SANITARY COMMISSION** (WSSC),

Witness:

WHEREAS, the Parties have entered into the Blue Plains Intermunicipal Agreement (2012 IMA); and

WHEREAS, the Parties recognize their collective and mutual interests under the 2012 IMA include the authorization, review, or approval of actions that have a potential fiscal impact on the Parties, including, but not limited to billing, auditing and fiscal management; and

WHEREAS, the Parties agree to their collective and individual responsibility for complying with the fiscal allocations for Capital Costs, Operating and Maintenance (O&M) Costs, billing and payment procedures, User Fees, as well as fines, penalties and claims; and

WHEREAS, the Parties agree that their financial responsibilities and payment obligations for Capital Costs and O&M Costs of facilities include those implemented by DC Water and by Fairfax or WSSC, to the extent that those facilities are deemed to be Multi-Jurisdiction Use Facilities (MJUFs); and

WHEREAS, the Parties agree to work with DC Water and, as applicable, Fairfax and WSSC, to ensure that MJUF determinations and associated cost allocations are consistent with the 2012 IMA; and

WHEREAS, the Parties recognize that any significant changes in the wastewater flows, peak flows, and/or loads could require modification to the terms of the 2012 IMA, **Section 5,** and this Operating Agreement**;** and

WHEREAS, Section 2 of the 2012 IMA authorizes the Leadership Committee to create, modify or terminate an Operating Agreement to implement the terms of the IMA consistent with **Section 11.**

NOW, THEREFORE, the Parties agree as follows:

PURPOSE: This Operating Agreement shall set forth additional matters implementing **Section 5** of the 2012 IMA:

A. General Cost Responsibilities;
B. Capital Cost Responsibilities;
C. Operation and Maintenance Costs Responsibilities;
D. User Fees Responsibilities;
E. Fines, Penalties and Claims Responsibilities; and
F. Billing and Payment Procedures.

A. GENERAL COST RESPONSIBILITIES

1. **Timing** - Following agreement of the directly involved Operating Agency Representatives regarding the needs, location, size, allocation of capacity, and allocation of cost for new or expanded collection facilities, such facilities shall be constructed as promptly as needs require.

2. **Contingent Obligations**
   a. Construction of new or improved MJUFs shall be contingent on funding; however, failure to fund will result in a loss of allocation to the non-paying Party.

   b. No Operating Agency shall be obligated to commence construction or installation of any additional pipelines and appurtenances until:

      1) DC Water, Fairfax and WSSC have made their share of the cost available to the constructing Operating Agency or have otherwise satisfied the constructing Operating Agency that funds will be available as expended; and

      2) The constructing Operating Agency has available sufficient funds, including funds which the other Operating Agencies have made available or will make available as expended, to pay for all estimated costs of such facility.

3. **Cost Basis** – The cost basis for Capital Costs shall be actual incurred Capital Costs associated with the MJUFs. The cost basis for O&M costs shall be actual incurred O&M costs associated with the MJUFs.

4. **Billing Disputes** – If disputes regarding billings cannot be resolved through routine procedures, the affected Operating Agency Representatives shall endeavor to reach a consensus with DC Water and/or others involved. If a consensus cannot be reached, the dispute resolution process outlined in **Section 10** of the 2012 IMA will be used.

-END OF PAGE-

B. CAPITAL COST RESPONSIBILITIES

1. **Blue Plains Capital Cost Allocations** - Capital Costs for Blue Plains and Other Associated Facilities shall be allocated proportionate to the District, Fairfax, WSSC, and Non-Party Users' Allocated Flow Capacity or other Usage Allocations as defined in the 2012 IMA **Section 5**. Cost allocations for all Blue Plains wastewater treatment and biosolids management are as set forth in **Table OA 2-A** below.

TABLE OA 2-A

BLUE PLAINS ALLOCATED FLOW CAPACITY AND RESULTING COST ALLOCATIONS		
ENTITIES	**CAPACITY ALLOCATIONS (MGD)**	**COST ALLOCATIONS (Percent)**
District of Columbia	152.50	**41.216**
Non-Party Users:		
LCSA, Virginia	13.80	**3.730**
Dulles Airport, Virginia	1.50	**0.405**
Town of Vienna, Virginia	1.50	**0.405**
Naval Ship Research & Development Center, Maryland	0.07	**0.019**
National Park Service, Maryland	0.03	**0.008**
Sub-total	16.9	N/A
District of Columbia - Total[1]	**169.40**	45.783
WSSC[2] (for Prince George's County & Montgomery County), **Maryland – Total**	**169.60**	**45.838**
Fairfax County, Virginia[3] **- Total**	**31.00**	**8.378**
Grand Total	**370.00**	**100.000**

[1] Pursuant to the 2012 IMA, the District is responsible for costs on behalf of the Non-Party Users, which it then recovers through separate agreements with those entities.

[2] The Allocated Flow Capacity for WSSC is on behalf of Prince George's and Montgomery; with any sub-allocations determined by separate agreements between those entities. The WSSC allocation also includes wastewater from other political jurisdictions, including some within those Counties with which WSSC has separate agreements.

[3] The Allocated Flow Capacity for Fairfax also includes wastewater from other political jurisdictions with which Fairfax has separate agreements.

2. **Pipelines and Appurtenances Capital Cost Allocations Methodology for Determining MJUF Portions of Pipelines & Appurtenances** - Capital Costs associated with constructing, replacing, or rehabilitating the wastewater collection systems and facilities shall be allocated utilizing the MJUF capital cost allocation methodology. This methodology uses a computer model to calculate a percentage of use by each entity for each project, and for each portion of the facility being evaluated (i.e., node-to-node). This assessment determines the MJUF portion for every project and its components.

3. **CSO Long-term Control Plan (LTCP) Capital Cost Allocations**
   a. **Parties Agree to Pay MJUF Portion** - The Parties agree to pay proportionate shares of the Capital Costs of that portion of the CSO LTCP that has been determined to be a MJUF, as defined in **Table OA 2-B**.

   b. **Basis for Determining MJUF Portion of CSO LTCP Cost Allocations** - The MJUF portion of the approved CSO LTCP and resulting Capital Cost allocations are based on the modeling used in the development and assessment of the CSO LTCP**.** These Capital Cost allocations shall apply to the District, Fairfax, WSSC and Non-Party Users. Sub- allocations of those Capital Cost allocations for Fairfax, WSSC and the Non-Party Users shall be in proportion to their Allocated Flow Capacity.

   c. **Modification of the CSO LTCP** - DC Water shall evaluate performance assumptions associated with any modifications to the CSO LTCP to determine if the Capital Cost allocations should be modified; and present the findings to the Regional Committee.

   d. **Leadership Committee to Approve Modifications** - The Leadership Committee, after reviewing recommendations from the Regional Committee and determining that such modifications are desirable or required, shall approve and adopt revisions. The revisions may supplant the established Capital Cost allocations.

TABLE OA 2-B

COMBINED SEWER OVERFLOW LONG-TERM CONTROL PLAN CAPITAL COST ALLOCATIONS FOR MJUF DESIGNATED PORTIONS ONLY	
USER	**PERCENT**
District of Columbia	92.90
Fairfax County	1.01
WSSC	5.54
Non-Party Users	0.55
Sub-Total: Fairfax, WSSC & Non-Party Users	7.10
TOTAL	100.00

4. **Capital Equipment Capital Cost Allocations**
   a. Cost allocations for all capital equipment are set forth in **Table OA 2-C.**

   b. Those capital equipment assets which reflect capital that has a shorter life span (such as information technology equipment and fleet, etc.), will be allocated using capacity or flow rates. See **Table OA 2-C** for a list of items included in capital equipment costs and designation as to the cost allocation basis.

   c. Funding of the MJUF portion of capital equipment is derived by first allocating each pool of capital equipment costs to one or more agreed upon cost drivers. (These cost drivers include the number of full time employees, departmental budgets, etc.)

   d. Changes to these cost drivers can be proposed by DC Water, Fairfax or WSSC and are subject to future evaluation by the Regional Committee.

-END OF PAGE-

TABLE OA 2-C

CAPITAL EQUIPMENT COST ALLOCATION METHODOLOGY		
SERVICE AREA	**PROJECT**	**ALLOCATION METHODOLOGY**
Wastewater Treatment	Plant Model	Allocated Capacity
	Laboratory Equipment	Allocated Capacity
Maintenance Services	Maintenance	Allocated Capacity
	Pump Repairs/Replacement	Allocated Capacity
	Turbine, Aerator & Methanol	Allocated Capacity
	Maintenance Management System	Actual Flows
	Large Electric Motors	Allocated Capacity
	Potomac Sewage Pumping Station	Allocated Capacity
	High Priority Rehabilitation Program	Allocated Capacity
	Large Meter Testing	Allocated Capacity
	Centrifuge Repair/Replace	Allocated Capacity
Fleet	Vehicles	Actual Flows
	Indirect Fleet Allocation	Actual Flows
Information Technology	Financial Management	Actual Flows
	Radio Equipment	Actual Flows
	General IT Infrastructure	Actual Flows
	Payroll/HR System	Actual Flows
Facilities & Security	HVAC at Various Locations	Actual Flows
	Doors, Signage, Fencing, etc.	Actual Flows

-END OF PAGE-

5. **Other Capital Cost Allocation Calculations - Indirect Labor Cost Pools** – DC Water will segregate its Blue Plains indirect labor cost pool from its non-Blue Plains indirect labor cost pool. The Blue Plains indirect labor cost pool's allocation base will be the total costs of Blue Plains project/activities managed by DC Water's Engineering Department or its successor. The non-Blue Plains indirect labor cost pool's allocation base will be the total cost of all non-Blue Plains projects/activities managed by DC Water's Engineering Department or its successor.

C. OPERATION AND MAINTENANCE (O&M) COST RESPONSIBILITIES

1. **Determination of Billing Flow**
   a. Each of the District, Fairfax and WSSC's proportion of the annual MJUF O&M Costs shall be its Billing Flow divided by the Total Billing Flow. The Billing Flow will be the Actual Flow for each entity; except that the District Actual Flow is adjusted to account for any differential treatment cost impacts to calculate the District Billing Flow. The procedures for calculating these Billing Flows are set forth below in **Table OA 2-D**. For purposes of this calculation, all Actual Flows reflect Allocated Flow Capacities, and the Captured Stormwater Flow represents total estimated flows once the CSO LTCP is fully implemented.

   b. **Differential Treatment Cost Impacts** - Consistent with 2012 IMA **Section 5**, the calculation of Billing Flow from Actual Flow shall take into account any differential treatment cost impacts that have been determined based on a Jointly Managed Study.

   c. **District Billing Flows** - As of the date of this Agreement, the only agreed upon differential treatment cost applies to the District's CSF. The cost of treating CSF has been determined to be 49.28% of the cost of treating average strength wastewater (consistent with a technical review of DC Water analysis, 3/22/10). This percentage will be reviewed and updated periodically for changed conditions.

   d. **Annual Adjustment of Billing Flow** - The Billing Flow for any year will, therefore, be adjusted as follows:
      1) DC Water will calculate the CSF treated at Blue Plains using the measured rainfall and the CSO LTCP model. The CSO LTCP model, this calculation, and the nomograph in the **Appendix of OA #3** will be reviewed periodically by the Regional Committee.
      2) The calculated CSF will be subtracted from the Actual Flow.
      3) The CSF will be multiplied by the CSF cost ratio (i.e. the cost per gallon of treating CSF divided by the cost per gallon of treating average strength wastewater). This is the Adjusted CSF.
      4) The Billing Flow is calculated by adding the Adjusted CSF to the Actual Flow less the CSF.

-END OF PAGE-

NOTE: For purposes of this calculation, all Actual Flows reflect Allocated Flow Capacities, and the Captured Stormwater Flow represents total estimated flows once the CSO LTCP is fully implemented. Numbers are rounded for purposes of the example.

TABLE OA 2-D

Actual Flow			
Flow Sources	Flows (MGD)	Outfalls	
		#001	#002
MD			
WSSC	169.60		
Navy	0.07		
NPS	0.03		
Sub-Total MD	**169.70**		
VA			
Fairfax	31.00		
Loudoun	13.80		
Dulles	1.50		
Vienna	1.50		
Sub-Total VA	**47.80**		
Suburb Total	**217.50**		
DC			
DC	152.5		
CSF	21		
Total DC	173.5		
Grand Total	**391.00**	**7.30**	**383.70**

2. **Blue Plains & Associated Facility O&M Cost Allocations**
   a. The District, Fairfax and WSSC and Non-Party Users shall be assessed by DC Water for their proportionate share of the cost of operating and maintaining Blue Plains.

   b. The DC Water Central Operations Facility (COF) building O&M Costs allocated to wastewater services shall be 54%. However, all Parties have the right to request a detailed analysis of this agreed allocation percentage if a circumstance occurs that materially changes the assumptions used in developing this ratio. Where practicable, DC Water will continue to segregate COF related costs from other cost pools in the Facilities Department or its successor.

3. **Pipelines and Appurtenances O&M Cost Allocations**
   a. The District, Fairfax and WSSC and Non-Party Users shall be assessed by DC Water for their proportionate share of the cost of operating and maintaining the interceptors (including the Potomac Interceptor) and appurtenances, and including wastewater pumping stations at locations other than Blue Plains which are determined to be MJUFs.

   b. WSSC shall assess DC Water, as appropriate, for its proportionate share of the cost of O&M of the interceptors, wastewater pumping stations, screen chambers and wastewater Flow meters that are operated and maintained by WSSC or any of the other parties to handle BPSA flows that are directed to Blue Plains.

   c. The District, Fairfax and WSSC's share of these O&M Costs shall be based on a node-to-node assessment methodology.

4. **CSO LTCP O&M Cost Allocations** – The District, Fairfax, WSSC and Non-Party Users shall be assessed by DC Water for their proportionate share of the cost of operating and maintaining that portion of the CSO LTCP that has been determined to be a MJUF by the Regional Committee based on the proportion of their Actual Flow versus Total Flow through the facility or based on other Usage determinations. Any methodology used shall be approved by the Regional Committee.

Billing Flow – Example Calculation		
1	Metered Plant Flow (Actual Flow), MGD	391
2	Metered **WSSC** (Actual Flow = Billing Flow), MGD	169.6
3	Metered **Fairfax** (Actual Flow = Billing Flow) MGD	31
4	Metered **Loudoun** (Actual Flow = Billing Flow)MGD	13.8
5	**Other PI Users** (Actual Flow = Billing Flow), MGD	3.1
6	Total Suburban (Actual Flow = Billing Flow), MGD	217.5
7	**District** (Actual Flow), MGD	391 – 217.5 =173.5
8	Captured Stormwater Flow (CSF) (from LTCP model), MGD	21
9	CSF Cost Ratio (from AECOM cost study)	49%[1]
10	Adjusted CSF Flow, MGD	(21)(.49) = 10.3
11	District Billing Flow, MGD	173.5 - 21 + 10.3 = 162.8
12	Total Billing Flow, MGD	217.5 + 162.8 = 380.3

[1] Cost ratio applied to Captured Stormwater Flow is based on determination cited in **Subsection C.1.c**.

D. USER FEE RESPONSIBILITIES

1. **Payment** - The WSSC and Fairfax shall pay to the District an annual User Fee in accordance with **Section F.2**. of this Agreement. This fee shall be proportionately adjusted if the Allocated Flow Capacities defined in **Section 4** of the 2012 IMA are reduced.

2. **Annual Estimate** - In accordance with **Section 5** of the 2012 IMA, DC Water shall prepare an estimate of the User Fee prior to the beginning of each DC Water fiscal year and include it in the next billings rendered to Fairfax, Loudoun County Sanitation Authority (LCSA or Loudoun Water) and WSSC.

E. FINES, PENALTIES AND CLAIMS RESPONSIBILITIES

1. **Proportionate Allocation for Capital Projects** - Except as otherwise provided in the 2012 IMA, all fines, penalties and claims relating to Capital Projects will be allocated proportionately to the District, Fairfax and WSSC, and Non-Party Users based on Allocated Flow Capacity.

2. **Proportionate Allocation for O&M Activities** -Except as otherwise provided in the 2012 IMA, all fines, penalties and claims relating to O&M Activities will be allocated based on the Actual Flows of District, Fairfax, WSSC and Non-Party Users.

F. BILLING AND PAYMENT PROCEDURES

1. **DC Water to Annually Estimate Costs** - Before October 1 of each year, DC Water shall prepare an annual estimate of the Capital Costs and O&M Costs expected to be incurred during the following year and the estimated share of these costs for the District, Fairfax and WSSC. These estimates will be allocated in accordance with **Section 5.C. and 5.D**. As appropriate, the estimated share of the annual costs for each of these Parties shall be offset by each Party's estimate of the costs that it will incur in operating and maintaining its share of MJUFs for managing BPSA flows, or its share of managing Blue Plains biosolids or other residuals.

2. **Billing and Payment** - DC Water shall bill Fairfax and WSSC quarterly for Capital Costs and O&M Costs. Fairfax and WSSC shall remit quarterly payments to DC Water to cover 25% of their share of estimated annual Blue Plains O&M Costs and User Fees. Payments shall be made within 30 days of receipt of the invoices. If quarterly payments are not made on time, interest shall be charged at the Federal Reserve Bank's Discount Rate in effect on the due date of the bill. The Federal Reserve Bank Discount Rate will be determined quarterly at the end of each quarter.

3. **Reconciliation of Annual Bills**
   a. **Capital Costs** – DC Water shall submit a reconciled quarterly invoice, including the estimate for the following quarter.

b. **O&M Costs -** No later than 90 days after the completion of the annual independent audit or March 31st, DC Water shall prepare an annual bill for the purpose of reconciling payments made during the year by Fairfax and WSSC. This bill shall be based upon the actual costs incurred by each Party; such information to be provided to DC Water by Fairfax and WSSC within 30 days after the close of each DC Water fiscal year.

c. **Capital Costs and O&M Costs** - Any overpayments or underpayments shall be equally prorated to each quarterly payment date and simple interest calculated from the date the quarterly payment was paid until the overpayment is refunded or the underpayment is paid. See **Table OA 2-E** for an example of the computation of the interest discussed in this sub-section

TABLE OA 2-E

FEDERAL RESERVE DISCOUNT RATE INTEREST CALCULATION EXAMPLE
(For illustrative purposes only)

Quarter	Interest Rate[1]	In Thousand Dollars			Period Outstanding[2] (Months)
		Payment[3]	Over/ <Under>[4]	Interest Owed[5]	
1	2.00%	7,500.00	625.00	14.06	13.5
2	2.00%	7,500.00	625.00	10.94	10.5
3	2.50%	7,500.00	625.00	9.77	7.5
4	3.00%	7,500.00	625.00	7.03	4.5
Total Annual Payment		30,000.00	2,500.00	41.8	
Total Annual Actual		(27,500.00)			
Over/<Under>[4]		2,500.00			

* ** Assumes refund/payment received end of subsequent year Quarter 1.

4. **Maintenance and Review of Records -** DC Water, Fairfax and WSSC shall maintain books, accounts, records, documents and other evidence, employing generally accepted accounting principles and practices sufficient to show properly

[1] Federal Reserve Discount Rate in effect at end of each Quarter.
[2] Number of months between making payment and time of refund/payment (true up). Assumes quarterly payment made in mid-quarter. Assumes true up received end of subsequent year Quarter 1. This would be 13.5 months for Quarter 1, 10.5 months for Quarter 2, etc.
[3] Quarterly payments based upon annual budget.
[4] Over or Underpayment equally prorated over each quarter. Annual difference is divided evenly between the quarters.
[5] Example interest calculation for the first quarter: (625) x (0.02) x (13.5/12) = 14.06

all direct and indirect costs of whatever nature they claim to have incurred or anticipate incurring. The foregoing records shall be subject at reasonable times to audit, examination, inspection or reproduction by DC Water, Fairfax or WSSC or a duly authorized representative of these Parties. Upon request, the Party shall provide a mutually acceptable electronic data processing medium containing all available computerized cost data to support the billing. Records shall be preserved for a period of at least three (3) years from the end of the fiscal year in which payment was made.

5. **Right to Audit** - All cost elements charged to DC Water, Fairfax, WSSC, or any Non-Party User may be audited by any Party. These cost elements include, but are not limited to: Capital Costs, O&M Costs, direct costs, indirect costs and flow data. Any adjustments made to DC Water, Fairfax or WSSC's bill as the result of an audit shall also automatically be made, as applicable, to other entities.

6. The right of any Party to any sum due pursuant to this Agreement shall not be barred by any statute of limitations.

7. **Biosolids Management Cost Procedures** - WSSC will incur Blue Plains biosolids management costs in accordance with **Operating Agreement #6, Biosolids Management Commitments**. The payment procedures for these costs shall be as follows:
   a. DC Water shall credit WSSC for all Blue Plains related biosolids costs incurred by WSSC less the share allocated to WSSC.
   b. DC Water shall then collect the share of these costs allocated to Fairfax by adding these costs to the regular payments due from Fairfax.
   c. DC Water shall also recover the costs paid on behalf of the Non-Party Users.

-END OF PAGE-

EXECUTION

This Agreement is executed on behalf of the Parties by the Members of the IMA Leadership Committee who, by affixing their signatures, confirm the authorization of their respective Party to be bound thereby. It shall be effective on the date indicated by the Chair below.

OPERATING AGREEMENT #3

PARTIES' AGREEMENT REGARDING: FLOW AND LOAD MEASUREMENT AND MANAGEMENT

THIS OPERATING AGREEMENT (Agreement), among the **DISTRICT OF COLUMBIA** (the District), the **DISTRICT OF COLUMBIA WATER AND SEWER AUTHORITY** (DC Water), **FAIRFAX COUNTY, Virginia** (Fairfax), **MONTGOMERY COUNTY, Maryland** (Montgomery), **PRINCE GEORGE'S COUNTY, Maryland** (Prince George's), and the **WASHINGTON SUBURBAN SANITARY COMMISSION** (WSSC),

Witness:

WHEREAS, the Parties have entered into the Blue Plains Intermunicipal Agreement (2012 IMA); and

WHEREAS, the Parties agree to routinely monitor and assess their Actual Flows, Adjusted Flows, and the associated Pollutant/Nutrient Loads to Blue Plains to ensure that all allocations and/or limitations for Blue Plains are not exceeded, as set forth in **Section 4** of the 2012 IMA; and

WHEREAS, the Parties agree to regularly monitor and assess their Peak Flows at the point of connection to the BPSA's collection system; and comply with Peak Flow Limitations, as set forth in **Section 4** of the 2012 IMA and **Operating Agreement #1**; and

WHEREAS, the Parties acknowledge their responsibility to ensure that the Non-Party Users and Indirect Users also comply with the terms of this Operating Agreement; and

WHEREAS, Section 2 of the 2012 IMA authorizes the Leadership Committee to create, modify or terminate an Operating Agreement to implement the terms of the 2012 IMA consistent with **Section 11.**

NOW THEREORE, the Parties agree as follows:

PURPOSE: The purpose of this Agreement is to address matters related to **Section 6** of the 2012 IMA, including:

A. Flow Measurement, Reporting and Assessment;
B. Load Measurement, Reporting and Assessment; and
C. Load Management.

A. FLOW MEASUREMENT, REPORTING AND ASSESSMENT

1. Flow Measurement

a. For each sewer of a Party that has, or is expected to have, a discharge of 60,000 GPD or greater which discharges from a sewer of the District, Fairfax or WSSC into a sewer owned or operated by the District, DC Water, Fairfax or WSSC; the owner/manager of such discharging sewer(s) shall provide and install wastewater flow meters of the maximum practicable accuracy, at its own expense. The receiving Party directly involved shall mutually approve all such meter installations, shall designate who shall read, test, operate and maintain all such meters, and shall determine the methods and procedures to be followed. DC Water, Fairfax and WSSC may jointly read, test and inspect such meters at reasonable times at the request of any Party.

b. DC Water shall provide, operate and maintain metering of the total Blue Plains wastewater Flow, as well as Intra-plant Flows[1], in order to implement this agreement. DC Water, Fairfax and WSSC may jointly read, test and inspect such meters at reasonable times at the request of any Party.

c. In case a wastewater flow meter fails to function for any reason, the meter shall be repaired as expeditiously as possible. Wastewater flow for the period of such failure shall be deemed to be equal to the flow during the most recent equivalent period that the meter was in satisfactory operation. If there is no such corresponding period, the flow shall be determined or estimated in such a manner as shall be agreed upon by the Parties involved.

d. **Wastewater Units** - For each sewer that has, or is expected to have, a discharge of less than 60,000 GPD which discharges from a sewer of the District, Fairfax or WSSC into a sewer of another entity, the total annual estimated wastewater flow shall be calculated based upon the number of wastewater units connected to or discharging into such sewer. A wastewater unit shall equate to an annual discharge of 125,000 gallons. Each service connection shall be counted as one or more wastewater units depending upon the use of the premises served through such connections as follows:
   1) Each single family dwelling unit, whether detached or attached, shall constitute one (1) wastewater unit;
   2) Each apartment unit shall constitute one-half (0.5) of a wastewater unit;
   3) Wastewater units for premises used for other than residential purposes shall be determined by multiplying the annual water consumption by one and one-half (1.5)[2] and dividing by 125,000 gallons[3].

---

[1] Wastewater flow meters that are located within the Blue Plains WWTP that are used to help calculate District Flows.

[2] Ratio of 1.5 accounts for contributions from I/I sources to the estimated flows.

[3] 125,000 gallon figure reflects conversion of flows (water consumption and I/I) to estimated wastewater units.

e. The monthly computation of the District, Fairfax, WSSC, and Non-Party User's Actual Flow shall include both its metered and unmetered flow entering the District's sewer system.
f. The District's Actual Flow shall be calculated by subtracting the sum of Fairfax, WSSC and Non-Party Users' Actual Flows from the total plant Actual Flow.

g. Additional long-term flow meters to monitor flows to the Potomac Interceptor are critical to ensuring that there is adequate and detailed flow data to evaluate how well the PI system is functioning under various flow conditions; and to ensure that individually and collectively that the flows into and through the PI are consistent with those values set forth in **Section 4** of the IMA.

h. In order to address flow limitations necessary to ensure the proper performance of the Potomac Interceptor, the Regional Committee shall evaluate the need for developing a long-term rain gauge network, adding meters near Manholes #7 or #18 (i.e., section of PI where surcharging occurs), and addressing any other technical issues that would aid in this effort. The Regional Committee shall develop a plan to identify, fund, and implement this evaluation; which shall include defining specific tasks, roles and responsibilities, and a schedule for accomplishing this work.

2. **Flow Reporting**
   a. No later than 15 days after the end of each month, Fairfax, WSSC and each Non-Party User shall prepare and send to DC Water a report on the status of its Actual Wastewater Flows and commitments. DC Water shall compile these reports into a single report and distribute this report to the Parties no later than 30 days after the end of the month. DC Water shall also prepare an annual summary report for each calendar year and distribute this report to the Parties no later than February 15th of the following year.
   b. Fairfax, WSSC and Non-Party Users' report shall include at least the following information:
      1) The measured average flow and Peak Flow rate and duration during the month of the report for each metered point of connection between two (2) entities in the wastewater collection systems;
      2) The measured Actual Flow and the Peak Flow rate and duration for each metered point of connection between two (2) entities' wastewater collection systems for the 12 month period ending with the month for which the report is prepared;
      3) The estimated Actual Flow for the unmetered points of connection between the two (2) entities' wastewater collection systems, and the method used to estimate the annual average;
      4) The User's total daily average of all Actual Flows (i.e. the sum of all metered and unmetered flows) during the month for which the report is prepared;
      5) The total rainfall, as measured at Washington National Airport, during the 12 months ending with the month for which the report is prepared;
      6) The Highest Rolling Annual Average for its Actual Flow during the 12 months ending with the month for which the report is prepared;

7) Such other related information/data as may be deemed necessary to implement the 2012 IMA.

c. DC Water shall be responsible for ensuring that the Non-Party Users comply with these reporting requirements.
d. DC Water's monthly and annual summary reports shall include Actual Flow data at Blue Plains, including total flow through the plant, and the distribution of the flow to Outfall #001 and Outfall #002; and such other related information/data as may be deemed necessary to implement the 2012 IMA.

e. The District's Actual Flow for the purposes of flow management within the context of this Agreement shall be the total flow to Blue Plains less flows reported by Fairfax and WSSC and the Non-Party Users. The Parties recognize that a portion of the District's Actual Flow to Blue Plains is stormwater flow from its Combined Sewer area.

3. **Flow Assessment**
   a. DC Water shall monitor reported flows and calculate Adjusted Flows from Actual Flows provided by Fairfax, WSSC and Non-Party Users (i.e., to present normalized flows that reflect average hydrologic conditions). **Table OA 3-A** shows Adjusted Flow –Calculation Example.
   b. DC Water shall monitor the flow trends and any potential allocation or limit exceedances and alert the Parties each month if any reported flows or peak flow values indicate problems.
   c. DC Water shall prepare an annual BPSA flow report for the Regional Committee that assesses flow trends, as well as noting any instances where Adjusted Flows and/or Peak Flow values indicate that flows are or have the potential to exceed Allocated Flow Capacity and/or Peak Flow Limitations, as defined in **Section 4** of the 2012 IMA**.**
   d. DC Water shall also be responsible for assessing all flows, analyzing data and modeling flows as needed to make recommendations what and where peak flow reductions are required in the system and for potential modifications to the Peak Flows in the Potomac Interceptor defined in the **Section 4** of the 2012 IMA.
   e. The Regional Committee is responsible for reviewing the BPSA flow report and assessing what actions, if any, are required. These actions may include, but are not limited to, determining if additional flow management or documentation of flow management efforts are required from the District, Fairfax, WSSC and/or the Non-Party Users; and determining whether a comprehensive BPSA Long-term Planning Study and updated BPSA Flow Projections are needed in advance of their regularly scheduled 5-year update. These efforts will be used to formally assess Adjusted Flow and Peak Flow trends against Allocated Flow Capacity and Peak Flow Limitations, as well as flow management actions. The procedures for conducting this BPSA work are outlined in **Operating Agreement #4**.
   f. The Regional Committee shall report to and make recommendations to the Leadership Committee based on the results of the BPSA Long-term Planning Study.

4. **Flow Management**
   a. The District's, Fairfax's, WSSC's and Non-Party Users' Adjusted Flow shall at no time exceed its Allocated Flow Capacity as defined in **Section 4** of the 2012 IMA.
   b. If the Adjusted Flow of the District, Fairfax or WSSC exceeds the Allocated Flow Capacity for any reason, the District, Fairfax or WSSC shall immediately stop making any further commitments for hookups, connections and extensions to its sewage system tributary to Blue Plains until three (3) consecutive months have passed during which the sum of the entity's Adjusted Flow shall not have exceeded its Allocated Flow Capacity. The sole exceptions to this prohibition shall be:
      1) To eliminate an alternative method of wastewater disposal that has been certified by a duly constituted health officer in the District, Fairfax or WSSC's BPSA, or his designated local representative, to constitute a public health hazard. This certification shall be on a parcel by parcel basis;
      2) For public service buildings, which include schools, hospitals, nursing homes, medical and dental clinics, and other structures used by public agencies in providing essential services for public health and welfare;
      3) If the User has a plan approved by the Regional Committee to bring its Adjusted Flow within its Allocated Flow Capacity.

B. LOAD MEASUREMENT, REPORTING AND ASSESSMENT

1. DC Water shall be responsible for sampling, monitoring and assessing the influent flows to Blue Plains. If there are exceedances that create problems with the Blue Plains permit or other issues, then the Load Capacities set forth in **Table OA 1-B** of **Operating Agreement #1** will apply.

2. DC Water shall be responsible for providing annual reports to the Regional Committee regarding the results of these assessments and recommending any potential actions, including conducting detailed strength of influent wastewater studies.

3. The Regional Committee shall participate in DC Water-required Jointly Managed Studies to assess the strength of influent wastewater and to determine what changes, if any are required to Allocated Flow Capacity, Peak Flow Limitations or any Load Limitations in order to ensure that Blue Plains continues to have the ability to comply with all of its process and permit requirements.

4. Based on the results of such studies, the Regional Committee shall make recommendations to the Leadership Committee regarding changes that may be required to the flow, load and/or financial obligations of the Parties.

A. LOAD MANAGEMENT

1. The Regional Committee shall review options for managing loads in influent wastewater flows, including but not limited to, assessing the increase in loadings that

result from extensive Inflow/Infiltration reductions in sewer collection system, use of garbage disposals, and potential Pretreatment requirements for commercial, household or other activities.

2. Based on the results of such studies, the Regional Committee may make recommendations to the Leadership Committee regarding any potential changes to the Flow Management responsibilities, Pretreatment obligations, and any other obligations of the Parties.

APPENDIX

Table OA 3-A

Adjusted Flow - Calculation Example
(for comparing to Allocated Flow Capacity)

1) **Actual Flows, Rainfall and Well Depths**

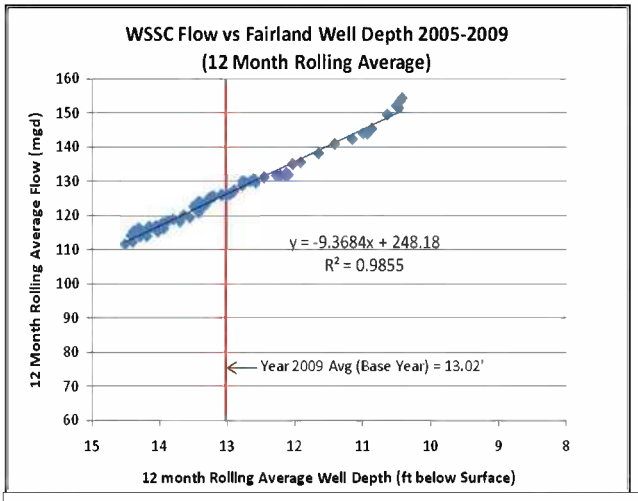
a) Assume it was a wet year and annual averages of Actual Flows were measured as follows:

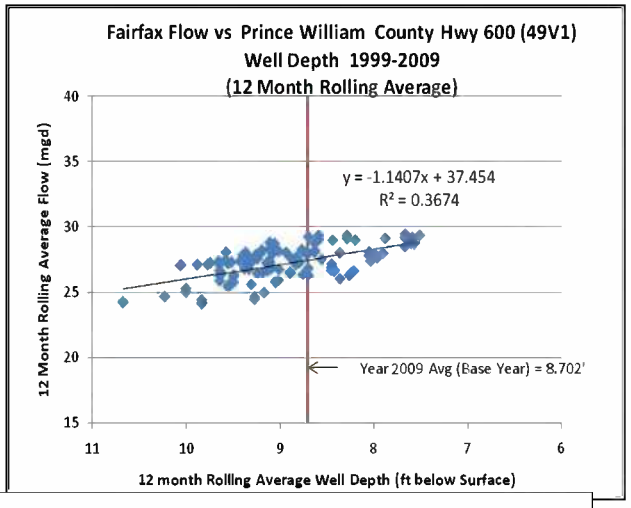
Line	Item	Value (MGD)	Calculation
1	Blue Plains Outfall #002	400.00	
2	Blue Plains Outfall # 001	8.00	
3	Total Blue Plains	408.00	Lines 1 + Line 2
4			
5	Maryland		
6	WSSC	175.00	
7	Navy	0.07	
8	NPS	0.03	
9	**Sub-Total Maryland**	175.10	Sum of Lines 6,7,9
10			
11	Virginia		
12	Fairfax	30.00	
13	Loudoun	13.80	
14	Dulles	1.50	
15	Vienna	1.50	
16	**Sub-Total Virginia**	46.80	Sum of Lines 12 to 15
17			
18	**Total Suburban Flow**	221.9	Line 9 + Line 16
19			
20	**Total District Flow**	186.10	Line 3 minus Line 18

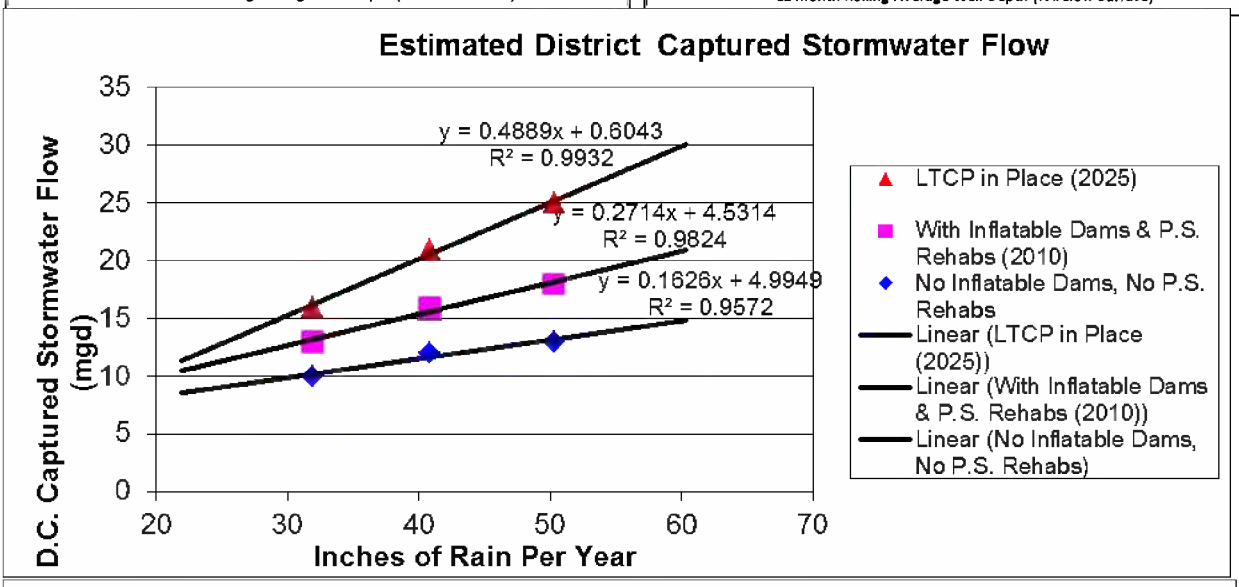
b) **Rainfall and Well Depths**
Assume 12 month rolling average rainfall and well depths were as follows:

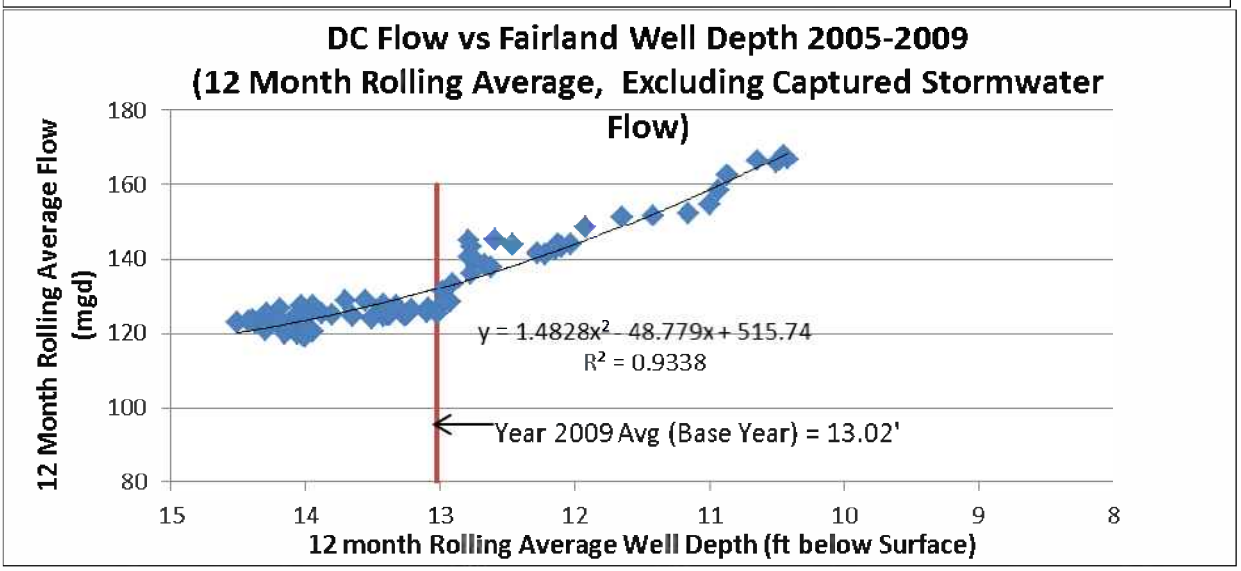
Item	Value	Notes
Rainfall at National Airport	48 in.	12 month rolling average
Fairland Well Depth	11.5 ft	12 month rolling average
Prince William County Highway 600 Well Depth	7.50 ft	12 month rolling average

Nomographs Used to Calculate Flow Adjustments[1]









[1] These nomographs shall be reviewed periodically by the Regional Committee for accuracy and adjusted accordingly.

SAMPLE CALCULATIONS

2) **WSSC Flow Calculation**
   a) Assume Actual Flow = 175.00 MGD (metered)

   b) Make adjustment to average hydrologic conditions using Fairland Well depth
      i) Assume actual 12 month rolling average Fairland well depth = 11.50 ft
      ii) Nomograph flow: y = - 9.3684 *(11.50) + 248.18 = 140.4 MGD
      iii) Base year (2009) 12 month rolling average Fairland well depth = 13.02 ft
      iv) Nomograph flow: y = - 9.3684 *(13.02) + 248.18 = 126.2 MGD
      v) Adjustment = 126.2-140.4 = - 14.2 MGD

   c) WSSC Adjusted Flow = 175.00 – 14.2 =160.8 MGD

3) **Fairfax Flow Calculation**
   a) Assume Actual Flow = 30 MGD (metered)

   b) Make adjustment to average hydrologic conditions using Prince William County Highway 600 Well depth
      i) Assume actual 12 month rolling average Prince William County well depth = 7.50 ft
      ii) Nomograph flow: y = -1.1407*(7.5) + 37.454= 28.9 MGD
      iii) Base year (2009) 12 month rolling average Prince William County well depth = 8.702 ft
      iv) Nomograph flow: y = -1.1407*(8.702) + 37.454= 27.5 MGD
      v) Adjustment = 27.5 – 28.9 = - 1.4 MGD

   c) Fairfax Adjusted Flow = 30 – 1.4 = 28.6 MGD

4) **District Flow Calculation**
   a) Assume Actual Flow = 186.1 MGD

   b) Make adjustment to average hydrologic conditions using Fairland Well depth
      i) Assume actual 12 month rolling average Fairland well depth = 11.50 ft
      ii) Nomograph flow: y = 1.4828*(11.50^2)-48.779*(11.50)+515.74 = 150.9 MGD
      iii) Base year (2009) 12 month rolling average Fairland well depth = 13.02 ft
      iv) Nomograph flow: y = 1.4828*(13.02^2)-48.779*(13.02)+515.74 = 132.0 MGD
      v) Adjustment = 132.0 – 150.9 = - 18.9 MGD

   c) Make adjustment for Captured Stormwater Flow (CSF)
      i) Assume LTCP is in place and 48" rainfall
      ii) CSF = 0.4889 *(48)+0.6043 = 24.1

   d) District Adjusted Flow = 186.1 – 18.9 - 24.1 = 143.1

5) Comparison of Actual Flow and Adjusted Flow

Line	Item	Actual Flow (MGD)	Adjusted Flow (MGD)
1	Blue Plains Outfall #002	400.00	
2	Blue Plains Outfall #001	8.00	
3	**Total Blue Plains**	408.00	349.40
4			
5	Maryland		
6	WSSC	175.00	160.80
7	Navy	0.07	0.07
8	NPS	0.03	0.03
9	**Sub-Total Maryland**	175.10	160.90
10			
11	Virginia		
12	Fairfax	30.00	28.60
13	Loudoun	13.80	13.80
14	Dulles	1.50	1.50
15	Vienna	1.50	1.50
16	**Sub-Total Virginia**	46.80	45.40
17			
18	**Total Suburban Flow**	221.9	206.30
19			
20	**Total District Flow**	186.10	143.10

-END OF PAGE-

EXECUTION

This Agreement is executed on behalf of the Parties by the Members of the IMA Leadership Committee who, by affixing their signatures, confirm the authorization of their respective Party to be bound thereby. It shall be effective on the date indicated by the Chair below.

OPERATING AGREEMENT #4

PARTIES' AGREEMENT REGARDING: WASTEWATER PROJECTED FLOW CAPACITY NEEDS AND FUTURE OPTIONS

THIS OPERATING AGREEMENT (Agreement), among the **DISTRICT OF COLUMBIA** (the District), the **DISTRICT OF COLUMBIA WATER AND SEWER AUTHORITY** (DC Water), **FAIRFAX COUNTY, Virginia** (Fairfax), **MONTGOMERY COUNTY, Maryland** (Montgomery County), **PRINCE GEORGE'S COUNTY, Maryland** (Prince George's), and the **WASHINGTON SUBURBAN SANITARY COMMISSION** (WSSC),

Witness:

WHEREAS, the Parties have entered into the Blue Plains Intermunicipal Agreement (2012 IMA); and

WHEREAS, the Parties recognize their collective and mutual interests under the 2012 IMA, which includes the management of Wastewater flows generated in the Blue Plains Service Area (BPSA) and sent to the Blue Plains Wastewater Treatment Plant (Blue Plains); and

WHEREAS, the Parties recognize that the District has limited options available to it to address its own Projected Flow Capacity Needs; and

WHEREAS, the Parties agree to work together to address their individual and collective Projected Flow Capacity Needs for flows generated within the BPSA, including development of Jointly Managed Studies to determine these Projected Flow Capacity Needs and to develop alternatives for addressing these Projected Flow Capacity Needs as defined in **Section 7**; and

WHEREAS, Section 2 of the 2012 IMA authorizes the Leadership Committee to create, modify or terminate an Operating Agreement to implement the terms of the IMA consistent with **Section 11.**

NOW, THEREFORE, the Parties agree as follows:

PURPOSE: The purpose of this Agreement is to address matters relating to **Section 7** of the 2012 IMA, including:

A. Long-term Planning for BPSA;
B. Development of Options and Proposed Actions; and
C. Assessment and Notification Requirements.

A. LONG-TERM PLANNING FOR BPSA

1. **Jointly Managed Study** - The Regional Committee shall be responsible for conducting a Jointly Managed Study to produce a BPSA Long-term Planning Study at least every five (5) years, unless flow or load or other issues require this

assessment to be done sooner. It is anticipated that 5-year updates for an approximately 30-year planning horizon are adequate to assess and take necessary actions to protect the Parties' rights under this Agreement. As flows to the Blue Plains approach its Design Flow Capacity, the frequency of conducting such assessments may be increased.

2. **Flow Projection Methodology**
   a. The BPSA Long-term Planning Study shall address at a minimum:
      1) Updated flow projections for the District, Fairfax and WSSC, as well as for Non-Party Users and Indirect Users as well as for the overall BPSA, including:
         a) Incorporation of MWCOG's most recently adopted Cooperative Forecast, which includes regionally developed demographic data, or other mutually agreed forecast;
         b) Updates to all Parties' wastewater flow management actions and plans;
         c) Confirmed or updated wastewater flow factors;
         d) Confirmed or updated Inflow and Infiltration assumptions; and
         e) Updated base year flow figures (i.e. flow defined or calculated that best reflects annual average flows under average hydrologic conditions), that are used to develop Projected Flow Capacity Needs of the BPSA for each jurisdiction/entity that contributes flow to Blue Plains;

      2) Updated information regarding water quality issues, loading limits, state or federal regulations, and any other activities or initiatives that will or have the potential to impact the Blue Plains' permit and/or treatment process requirements;

      3) Updated information and assessments about peak flows generated in the BPSA; and

      4) Trend data and analysis as needed to assess the potential impacts all of these factors will or could have on the Allocated Flow Capacity, Peak Flow Limitations and/or load assumptions for the BPSA.

   b. As a result of this periodic assessment, the Parties agree to reconcile any differences between the total and individual projected Annual Average Design Capacity requirements and with each of the Parties' and Non-Party User's Allocated Flow Capacity. This reconciliation may include, but is not limited to, the application of the following:
      1) Flow management projects/programs that reduce and/or increase flows;
      2) Load management programs that reduce or increase loads; and
      3) Reallocation (via sale or rental) of Allocated Flow Capacity.

   c. Evaluation of projected Annual Average Design Flow Capacity requirements will address the associated flow allocations, limitations, definitions, and assumptions set forth in the Derivative Agreement(s), to determine if any flow parameters, allocations, and/or limitations require modification to reflect the new projections.

B. DEVELOPMENT OF OPTIONS AND PROPOSED ACTION

1. Based on the results of any Jointly Managed Study, as defined in **Section 7** of the 2012 IMA, the Regional Committee shall develop options (for the Parties and Non-Party Users, as appropriate) that address at a minimum the following elements and criteria:
   a. Provide wastewater capacity at Blue Plains to meet the District's Projected Flow Capacity Needs unless other options better meet the District's Projected Flow Capacity Needs;

   b. Give priority to the reallocation of annual average wastewater flow capacity that is not expected to be needed for more than 15 to 20 years;

   c. Use the following hierarchy for considering the location of any proposed new or expanded treatment options: at Blue Plains, at WSSC's facilities, or at Fairfax's facilities, all of which shall be deemed to be Multi-Jurisdiction Use Facilities (MJUF) as defined in **Section 5** of the 2012 IMA, unless the Regional Committee agrees to alternative site considerations;

   d. Evaluate storage options to identify any potential impacts on the peak flows and Allocated Flow Capacity defined in **Section 4** of the 2012 IMA;

   e. Evaluate the rental or sale of capacity to ensure it would be consistent with the terms and assumptions in **Sections 4** and **6** of the 2012 IMA, and the associated Derivative Agreement(s), considering that the rental or sale of capacity shall be at the discretion of the Party allocated the capacity.

   f. Consider that rental of capacity shall be viewed as a short-term solution and must be reassessed at least every five (5) years;

   g. Consider that the Non-Party Users' Projected Flow Capacity Needs may have unique contractual agreements and there may be limited options available for them to address their capacity requirements outside of Blue Plains;

2. The options developed during a Jointly Managed Study shall address the following elements for each Party and Non-Party User, as appropriate:
   a. The resulting Allocated Flow Capacities;
   b. The resulting Peak Flow Limitations; and
   c. The impact on Design Flow Capacities and Design Load Capacities.

3. The Regional Committee shall recommend to the Leadership Committee technical and/or programmatic options that address the individual and collective Projected Flow Capacity Needs of the Parties under **Section 7** of the 2012 IMA. These recommendations shall include, but not be limited to, addressing:
   a. The proposed time frame for taking specific actions (whether operational or construction);
   b. The estimated cost of these actions; and

c. The proposed flow, load, and cost allocations and implications for each Party (and Non-Party User) associated with any options.

4. If suburban flows are diverted, nutrient loads associated with the diverted flows go with those flows and the District is responsible for finding nutrient offsets.

5. Any jurisdiction that requires additional flow capacity shall be responsible for finding nutrient offsets for that flow.

C. ASSESSMENT AND NOTIFICATION REQUIREMENTS

1. The Regional Committee shall periodically assess the Adjusted Flows set forth in **Section 6** and the flow projections set forth in **Section 7** of the 2012 IMA, and as set forth in this Agreement, to determine if the timing or the scope of the agreed upon actions are being implemented in a manner that protects the interests of all the Parties.

2. The Regional Committee shall develop an implementation plan that outlines the proposed actions to be taken and associated schedule and defines the Parties' responsibilities. For those options which require that additional flow or load capacity be provided at Blue Plains or at other sites, this implementation plan shall include, but not be limited to:
   a. A timeline with periodic milestones (generally every 5 to 10 years) that ensures that the necessary flow and/or load capacity is available when the Projected Flow Capacity Need is required;

   b. A reassessment of Projected Flow Capacity Needs versus agreed upon actions, whether addressed via flow management, rental/sale of capacity, or construction projects;

   c. A minimum 15-year advance notification period for any proposed action that requires capital funding.

3. Any Party that requires additional capacity in the BPSA in order to meet its Projected Flow Capacity Needs, which it cannot meet through its own flow management actions or are not being addressed through a Jointly Managed Study, shall provide 15-year advance notification to the Regional Committee that it requires such capacity, define those actions it must undertake to manage its future flows, and outline a schedule for those actions.

4. Unless otherwise agreed to by the Regional Committee, any diversions or reallocation of flow capacity by Fairfax or WSSC greater than five (5) MGD to meet District Projected Flow Capacity Needs shall occur at least one (1) year before the projected requirement for those flows.

EXECUTION

This Agreement is executed on behalf of the Parties by the Members of the IMA Leadership Committee who, by affixing their signatures, confirm their authorization of their respective Party to be bound thereby. It shall be effective on the date indicated by the Chair below.

OPERATING AGREEMENT #5

PARTIES' AGREEMENT REGARDING: PRETREATMENT & OPERATIONAL REQUIREMENTS

THIS OPERATING AGREEMENT (Agreement), among the **DISTRICT OF COLUMBIA** (the District), the **DISTRICT OF COLUMBIA WATER AND SEWER AUTHORITY** (DC Water), **FAIRFAX COUNTY, Virginia** (Fairfax), **MONTGOMERY COUNTY, Maryland** (Montgomery), **PRINCE GEORGE'S COUNTY, Maryland** (Prince George's), and the **WASHINGTON SUBURBAN SANITARY COMMISSION** (WSSC),

Witness:

WHEREAS, the Parties have entered into the Blue Plains Intermunicipal Agreement (2012 IMA); and

WHEREAS, the 2012 IMA authorizes and requires the IMA Leadership Committee (the Leadership Committee), to set forth specific pretreatment and operational requirements, as well as monitoring and reporting processes, that they determine are appropriate to implement the provisions of **Section 8**;

WHEREAS, the Parties recognize their legal obligations to comply with all state, federal and local pretreatment requirements applicable to the Blue Plains Wastewater Treatment plant (Blue Plains) and its collection systems and their need to establish operational requirements for wastewater coming into Blue Plains as necessary to preclude damage to Blue Plains' wastewater and biosolids processes and equipment, to meet permit requirements, to avoid contributing any pollutants which cause or have the ability to cause wastewater, air, and/or biosolids permit exceedances, or that have any negative impacts at the plant;

WHEREAS, the Leadership Committee hereby agrees on behalf of the Parties to set forth specific requirements and monitoring and reporting processes necessary to protect the wastewater collection lines within the Blue Plains Service Area (BPSA), as well as the wastewater treatment processes and biosolids management programs at Blue Plains; and

WHEREAS, Section 2 of the 2012 IMA authorizes the Leadership Committee to create, modify or terminate an Operating Agreement to implement the terms of the IMA consistent with **Section 11.**

NOW, THEREFORE, the Parties agree as follows:

A. SCOPE

The requirements of this Agreement are intended to apply to only those regulations, requirements, and discharges in the BPSA and/or to the Blue Plains WWTP.

B. REGULATORY AUTHORITY

The Parties recognize their legal obligations to comply with all state, federal and local pretreatment requirements applicable to Blue Plains and its collection systems.

C. EXISTING AGREEMENTS

In addition to the 2012 IMA, the following agreements are applicable to this Agreement

1. **Agreements among Parties**
   a. **District & Fairfax,** *Wastewater Pretreatment Agreement* (June 27, 1986)
   b. **District & WSSC,** *Wastewater Pretreatment Agreement* (June 30, 1986)

2. **Agreements among Parties and Non-Party Users, and Parties and Indirect Users**

   Indirect User Agreements
   a. **Fairfax Co. & Herndon**, *Interjurisdictional Wastewater Pretreatment Agreement* (October 10, 1995)
   b. **Fairfax Co. & Arlington Co.,** *Sewage Conveyance, Treatment and Disposal* (October 03, 1994)
   c. **Fairfax Co. & Arlington Co.,** *Interjurisdictional Pretreatment Agreement* (June 17, 1994)

   Non-Party User Agreements
   a. **District & LCSA,** *Wastewater Pretreatment Agreement* (September 12, 1989)
   b. **District & LCSA**, *Amendment to the Agreement* (November, 11, 1998)
   c. **District & Vienna,** *Wastewater Pretreatment Agreement* (April 20, 1986)
   d. **District & US FAA,** General Agreement (January 1966)
   e. **District & the Navy,** General Agreement (April 27, 1965)
   f. **District & Fairfax County Park Authority,** General Agreement (January 23, 1964)
   g. **District & National Park Services,** General Agreement (August 18, 1964)

Copies of these agreements and all future agreements relating to Pretreatment and operational requirements between and among the Parties and Non-Party Users shall be maintained at the offices of DC Water and the IMA Secretariat. As these agreements are replaced or amended, their successor agreements will be appended to and incorporated by reference into this Derivative Agreement.

D. PRELIMINARY TREATMENT AND OPERATING REQUIREMENTS

1. Coarse screening shall be provided at any pumping station pumping more than an average of 2.5 mgd of flow, unless coarse screening is provided at a downstream facility. Screenings shall not be ground and returned to the wastewater flow under normal operations.

2. If necessary to bypass screens for more than four (4) hours, DC Water shall be notified within 24 hours.

3. If conditions arise requiring screening to be ground and returned to the wastewater flow, DC Water shall be notified within 24 hours.

4. Fairfax and WSSC shall generate a screenings report semi-annually which documents the location and total tonnage of screenings removed during each month within the six (6)-month period (January to June and July to December). The reports shall be due by the 30th of the month following the end of the reporting period (i.e., by July 30 and January 30) and shall be submitted to the DC Water Wastewater Treatment Manager:
   DC Water Wastewater Treatment Manager
   5000 Overlook Ave., SW, Washington, DC 20032
   202-787- 4008

E. TRUCKED WASTE MONITORING REQUIREMENTS

1. Trucked waste shall only be discharged at monitored location(s). Access control or surveillance cameras shall be required for unmanned stations.

2. Within 12 months of the 2012 IMA Agreement, all septage receiving stations that send waste to the BPSA shall have access control or surveillance cameras in operation, except when units are out of service for routine maintenance – a time period not to exceed one (1) week.

3. Surveillance camera records or gate records shall be reviewed as necessary to verify discharge activity. Camera records shall be maintained for 72 hours.

4. After proper notification and review, DC Water reserves the right to prohibit any wastes that are deemed to cause, or have the potential to cause, operational or system problems, and/or which cause or have the ability to cause wastewater, air, and/or biosolids permit exceedances.

5. DC Water shall be notified prior to the establishment of any new septage receiving sites in the BPSA.

6. Periodic self-monitoring data shall be required for existing discharges of non-domestic trucked waste, landfill leachate, or trucked waste containing sludge or other residuals. The Party shall determine the list of requested parameters and frequency of self-monitoring. Data shall be submitted to DC Water in the quarterly pretreatment program reports.

7. Each Party shall conduct random sampling of the trucked wastes at least semi-annually for all parameters. Data shall be submitted to DC Water in the quarterly pretreatment program reports.

F. PROHIBITED TRUCKED WASTES

Prohibited wastes shall not be discharged to the BPSA unless conditionally authorized under the terms outlined in Subsection G of this Agreement. Prohibited wastes include:

1. Trucked wastes that are generated outside of the counties included in the BPSA (i.e., out-of-state and out-of-county wastes), unless the out-of-state and/or out-of county waste is incidental to other waste collected from within the counties included in the BPSA;

2. Hazardous waste, as defined by EPA in 40 CFR 261 and/or in District of Columbia Code § 8-1302(2);

3. Wastes that are specifically prohibited by DC Water's prohibited discharge standards;

4. Wastes that exceed DC Water's local discharge standards or EPA's gas/vapor toxicity screening levels (EPA 812-B92-001), if measured in mg/L; or wastes that exceed EPA's Part 503 biosolids quality standards or applicable State biosolids standards, if measured in mg/kg; and

5. Portable toilet waste, where formaldehyde and 1,4-dichlorobenzene are used in deodorizer/sanitizer products. The prohibition of these products shall be implemented within 90 calendar days from the effective date of this Agreement.

G. CONDITIONALLY AUTHORIZED TRUCKED WASTES

DC Water may conditionally accept the following trucked wastes:

1. Grease trap waste – if no blockages or significant grease accumulation in the collection system or other issues arise;

2. Car wash waste – if no blockages or significant solids accumulation in the collection system or other issues arise;

3. Non-hazardous non-domestic waste - if characterized and approved by DC Water in advance;

4. Leachate from domestic landfills – if characterized and approved by DC Water in advance; and

5. Sludge or other residuals - if characterized and approved by DC Water in advance, and no blockages or significant solids accumulation in the collection system or other issues arise.

H. AUTHORIZED TRUCKED WASTES

DC Water will accept the following trucked wastes:

1. Portable toilet waste, where formaldehyde and 1,4-dichlorobenzene are not used in deodorizer/sanitizer products; and

2. Domestic septage.

I. CHARACTERIZATION AND MONITORING OF NEW TRUCKED WASTES

Any Party proposing to accept hauled waster from a new non-domestic source (i.e., those that have not already been approved by DC Water) shall submit a request for approval to DC Water for new discharges of non-domestic trucked waste, landfill leachate, or trucked waste containing sludge or other residuals. DC Water shall respond with a determination on such a request within 30 calendar days. DC Water shall hold Non-Party Users to these same conditions for requesting new discharges of non-domestic trucked waste, landfill leachate, or trucked waste containing sludge or other residuals. The request may include:

1. Analytical data representative of the discharge, including, but not limited to:
   a. pH,
   b. Total Solids,
   c. Total Suspended Solids,
   d. Volatile Suspended Solids,
   e. Biochemical Oxygen Demand,
   f. Total Phosphorus,
   g. Total Kjeldahl Nitrogen,
   h. Total Metals (i.e., arsenic, cadmium, chromium, copper, lead, mercury, molybdenum, nickel, selenium, silver, and zinc),
   i. Total Petroleum Hydrocarbon/Oil and Grease, and
   j. Polychlorinated Biphenyls (PCBs).

2. Estimates of volume and frequency of discharge that DC Water will use to evaluate the effect of the loading on the wastewater and sludge treatment plant processes.
   a. If the sewage strength and/or load impacts warrant consideration of differential treatment cost, this will be negotiated among the Parties.
   b. If the discharge is accepted, periodic monitoring may be required, with frequency and parameters to be agreed upon by the affected Party and DC Water.
   c. If the discharge is prohibited, the limitations of **Subsection F.** apply.

J. TREATMENT PLANT RESIDUALS

Other Wastewater Treatment Plants or Water Treatment Plants within the BPSA shall not directly discharge sludge or other residuals into the Blue Plains sewage system, unless characterized and approved by DC Water in advance.

K. PRETREATMENT PERMITS

1. Significant Industrial Users (SIU) in the BPSA must obtain a pretreatment permit from DC Water, Fairfax, or WSSC, unless the SIUs are regulated through Limited Party Agreements with Non-Party Users or Indirect Users.

2. Permits must contain, at a minimum, effluent limitations that match or exceed DC Water's discharge standards, monitoring and reporting requirements, a statement of duration, a statement of non-transferability, a statement of applicable civil and criminal penalties, and any other conditions requested to be included in the permit by DC Water.

3. Permits shall require immediate notification to DC Water of a spill, slug, or other unplanned emergency discharge (such as decontamination Wastewater) to the sewer at 202-612-3400 (24 hours per day, 7 days a week), and written notification to the DC Water Pretreatment Supervisor within five (5) days following the event, to the:

   DC Water Pretreatment Supervisor
   5000 Overlook Ave., SW, Washington, DC 20032
   202-787- 4177

4. Such notification shall include:
   a. Name and address of the premises where the discharge occurred or is occurring;
   b. The precise location of the discharge at the premises;
   c. Type of waste discharged or being discharged;
   d. Volume and concentration of Wastewater discharged;
   e. Corrective actions conducted or planned to mitigate the incident and prevent reoccurrence; and
   f. Contact name and phone number.

5. Permits shall require immediate notification to DC Water of any changes at its facility affecting the potential for a slug discharge.

6. Permits shall indicate that DC Water has right of entry and inspection of pretreatment and sewer facilities, observation, measurement, sampling, testing, and access to (with the right to copy) all pertinent compliance records located on the premises of the SIU. Whenever DC Water exercises this right, advance reasonable notice shall be given to the Operating Agencies. The Operating Agencies shall make all necessary legal and administrative arrangements for these inspections.

L. REPORTING

1. Quarterly Pretreatment Program Reports

a. Reports shall be due to DC Water 45 days following the last day of the quarter for the 1st, 2nd, 3rd and 4th quarters. However, the 4th quarter report due date may be extended an additional 30 days (if necessary, to allow additional time for completing the annual report).
b. Reports shall be prepared in accordance with a format to be developed by DC Water. For example, report all violations during the quarter, compliance status of each SIU, the date enforcement action is taken or is anticipated to be taken, identify any SIUs with a substantial change in volume or character of pollutants, etc.
c. Each Operating Agency/Jurisdiction shall submit all requested hauled waste documentation to DC Water in the quarterly report. Documentation shall include, but not be limited to:
   1) A current list of haulers (or changes to the list from the previous report), including approved sources (types) of waste, permitted vehicle information, and truck volume for each hauler;

2) Results of all analytical monitoring done on the hauled waste during that quarter (either by the Operating Agency/Jurisdiction or the waste hauler);
3) Where possible, flow estimates or number of loads of each waste type received during the quarter; and
4) If requested, gate records or security camera records, for verification of discharge activity.

2. **Annual Pretreatment Program Reports**
   a. In addition to the quarterly reports, an annual report shall be prepared. However, if the fourth quarter report is expanded to incorporate all the requirements of the annual report noted below, that report will suffice to meet both reporting obligations
   b. Reports shall be prepared in accordance with instructions from EPA Region III. If a Party does not receive 'new or updated' guidance from DC Water by January 5, the same report format/procedures used the previous year shall apply.
   c. The annual report shall include a master list of permitted waste haulers. At a minimum, the list shall include hauler name, contact information, list of vehicles, permitted truck capacities, and permitted waste type. The master list can reference the list provided in the fourth quarter report, as long as it notes any subsequent changes.
   d. Reports shall be due to DC Water 45 days following the last day of the year (i.e., by February 15th), unless an alternate date is established in writing by DC Water.
   e. Reports shall be accurate and complete upon submittal. Allowable exceptions to this include the following:
      1) Significant Non-Compliance (SNC) for the July to December period shall be submitted no later than March 15).
      2) The publication of the SNC violators shall occur no later than June 30, when required, and proof of publication shall be submitted to DC Water immediately following publication.

3. Follow-up comments from DC Water and/or EPA Region III shall be addressed as soon as practicable or as required by a comment letter.

M. ENFORCEMENT

1. The Parties shall, in accordance with their approved Enforcement Response Plans, take escalating enforcement action against any industrial user or waste hauler in the BPSA that violates any provision of the approved DC Water or Parties' pretreatment program. If EPA Region III, or the delegated state agency for the Parties, reviews the enforcement action taken by the Party and requests further action, the Party shall comply with the request or show just cause why such action is not warranted.

2. If DC Water does not agree with a decision made by a Party regarding specific enforcement action against a SIU or waste hauler, the issue shall be raised to the Regional Committee for dispute resolution pursuant to the 2012 IMA.

N. REVISIONS TO LEGAL AUTHORITY

1. DC Water shall forward a copy of proposed revisions to its legal authority (DC Code § 8-105) and/or implementation regulations (21 DCMR Chapter 15), to the Parties prior to or at the time of submittal to EPA Region III. Similarly, whenever the Parties revise their legal authority and/or implementation regulations, they shall forward a copy of the proposed revisions to DC Water prior to or at the time of submittal to their state approval authority. If there are significant changes to the regulations, EPA Region III review and approval may also be required.

2. Adopted Final Rulemaking or regulations shall be submitted to the Parties (or to DC Water, if the Parties adopted new regulations) within 30 days of the adoption date.

3. As necessary, the Parties shall adopt revisions (either directly or by reference) to their Sewer Use Ordinances (SUOs) pertaining to industrial waste pretreatment that are at least as stringent as those adopted by DC Water pertaining to industrial waste pretreatment. Proposed SUO revisions will be forwarded to DC Water within 180 days of receipt of DC Water's Final Rulemaking. If this schedule cannot be met, the Party shall notify DC Water in writing, and provide an alternate due date and reason why the schedule cannot be met. The Party shall then proceed to adopt the final regulations.

4. DC Water shall provide the Parties an opportunity to provide comments prior to making any revisions or additions to its Local Limits. Once DC Water makes any revisions or additions to its Local Limits, the Parties shall adopt any such revisions or additions and incorporate the new limits into all applicable SIU permits as soon as practical following receipt of the Final Rulemaking.

O. COMPLIANCE BY NON-PARTY USERS

DC Water shall require and enforce the same compliance by Non-Party Users, as applicable, with the substantive provisions of Subsections C through M**,** above, as is required of the Parties.

P. PERIODIC REVIEW OF PRETREATMENT AND OPERATIONAL REQUIREMENTS

1. The Regional Committee, as part of the review for its Annual Report, shall consider the efficiency and effectiveness of the practices and procedures of this Agreement. This review will include technical input from any appropriate Regional Committee work group(s). The Regional Committee will also consider, in a timely manner, any concerns that are raised by DC Water or any other Party over these practices and procedures or proposed modifications required by EPA or any state agency.

2. If the Regional Committee determines these requirements, practices or procedures should be modified, the Regional Committee shall recommend to the Leadership Committee any revisions that may be required to this Operating Agreement, the 2012 IMA or any associated Derivative Agreements.

EXECUTION

This Agreement is executed on behalf of the Parties by the Members of the IMA Leadership Committee who, by affixing their signatures, confirm the authorization of their respective Party to be bound thereby. It shall be effective on the date indicated by the Chair below.

OPERATING AGREEMENT #6

PARTIES' AGREEMENT REGARDING: BIOSOLIDS MANAGEMENT COMMITMENTS

THIS OPERATING AGREEMENT (Agreement), among the **DISTRICT OF COLUMBIA** (the District), the **DISTRICT OF COLUMBIA WATER AND SEWER AUTHORITY** (DC Water), **FAIRFAX COUNTY, Virginia** (Fairfax), **MONTGOMERY COUNTY, Maryland** (Montgomery), **PRINCE GEORGE'S COUNTY, Maryland** (Prince George's), and the **WASHINGTON SUBURBAN SANITARY COMMISSION** (WSSC),

Witness:

WHEREAS, the Parties have entered into the Blue Plains Intermunicipal Agreement (2012 IMA); and

WHEREAS, DC Water, Fairfax and WSSC recognize their obligations to comply with all state, federal and local biosolids preparation and land application regulations applicable to the Blue Plains Wastewater Treatment plant (Blue Plains); and the need to remove biosolids from the sewage generated within the Blue Plains Service Area (BPSA); and

WHEREAS, DC Water, Fairfax and WSSC recognize the need to establish operational requirements for the manufacturing of biosolids products at Blue Plains or offsite; and

WHEREAS, the Parties desire to manage the biosolids resource by the most practical, sustainable, environmentally sound, and economically beneficial means;

WHEREAS, the 2012 IMA authorizes and requires the Leadership Committee to set forth specific operational processes and contractual support for biosolids management that they determine are appropriate to implement the provisions of **Section 9** of the 2012 IMA;

WHEREAS, Section 2 of the 2012 IMA authorizes the Leadership Committee to create, modify or terminate an Operating Agreement to implement the terms of the IMA consistent with **Section 11.**

NOW, THEREFORE, the Parties agree as follows:

PURPOSE: The purpose of this Agreement is to address matters relating to **Section 9** of the 2012 IMA. This Agreement confers no rights upon any person other than the Parties to this Agreement.

A. REGULATORY AUTHORITY

The Parties recognize their legal obligations to comply with all state, federal and local biosolids preparation and land application regulations applicable to Blue Plains.

B. REGIONAL COMMITTEE ASSIGNMENT AND REPORTING RESPONSIBILITIES

The Regional Committee shall periodically review and analyze the biosolids management activities of the Parties. The Regional Committee may request the assistance of Party experts and biosolids contractors in performing these analyses. The Regional Committee shall make recommendations to the Leadership Committee to maintain or improve the management of biosolids, including:

1. Utilizing contract mechanisms to handle management of all or portions of the biosolids;

2. Identification of additional land application or other management sites;

3. Working with local and state officials to obtain land application or other management permits;

4. Working with local and state officials to change regulations, legislation, or legal actions that are deemed harmful to the effective and environmentally sound management of biosolids;

5. Requesting support of the Leadership Committee and elected officials as necessary to support these efforts; and

6. Contracting for research that supports the biosolids management activities of the Parties.

C. BIOSOLIDS REUSE AND DISPOSAL OPTIONS – ALLOCATION, MATERIAL RESPONSIBILITY AND CONTRACTS

1. DC Water and WSSC shall independently contract for services related to reuse or disposal (if necessary) of biosolids produced at Blue Plains. The percentage of biosolids reuse and disposal managed by DC Water shall be no less than 50% and no greater than 70%. WSSC will manage the remainder. The percentages within these limits are to be based on a balance between financial and contractual security, and on programmatic needs as determined by the Regional Committee.

2. DC Water and WSSC may also, with concurrence of the Regional Committee, allocate tonnage to a user or a regional entity that has the opportunity to contract for sustainable reuse of biosolids. DC Water and WSSC shall separately issue one or more contracts for the sustainable reuse of biosolids resources for use in agriculture, mine reclamation, silviculture, composting, soil blending, energy production, or any other sustainable and economically feasible technology.

3. Other options, such as landfilling, may also be included in contracts by DC Water and WSSC for backup and emergency purposes or as recommended by the Regional Committee. In all scenarios, the Parties shall meet the biosolids management commitments set forth in the 2012 IMA. The Parties may consider regional contractual coordination, if another entity outside of DC Water is willing and interested in such collaboration. A recommendation in this direction would allow for

diversification of reuse options and geography, but should only be done if it furthers the biosolids commitments in the 2012 IMA.

D. PREPARATION OF CONTRACT SOLICITATIONS

1. DC Water and WSSC shall be responsible for the issuance and administration of their contract solicitations for the reuse of biosolids generated at Blue Plains.

2. The specifications, terms, conditions, and evaluating criteria for any biosolids reuse contract solicitations shall be developed by DC Water and WSSC with input from the Regional Committee.

3. The Regional Committee, either directly or through technical staff, may participate in the review of technical proposals or other contract documents for the hauling and reuse of biosolids received, pursuant to contract solicitations issued by DC Water and WSSC, and make recommendations for award to the respective contracting officers.

E. CONTRACT REVIEW

1. DC Water and WSSC shall each execute contracts awarded pursuant to the contract solicitations. They shall appoint contracting officers for such contracts and, in consultation with the other participating parties, administer all aspects of contract performance in accordance with their respective procurement laws and regulations.

2. With respect to DC Water and WSSC's contracts, the Regional Committee's functions and responsibilities shall include the following:
   a. Provide information, recommendations and requests to the contracting officer to remedy or avoid existing or potential problems caused by any contractors or subcontractors operating within any of the Parties' jurisdictions or caused by their operation in other areas that are or will adversely impact a Party; and

   b. Monitor the performance and administration of all contracts awarded and provide the contracting officer with the recommendations of the other participating jurisdictions on administrative actions that should be taken to protect the interests of such other parties in all such biosolids contracts; and

   c. Receive and assess progress and other relevant reports relating to the performance and administration of all biosolids contracts and reports on proposed actions contemplated by the contracting officers in the administration of such contracts; and

   d. Review research findings funded through the Regional Committee.

F. COST AND PAYMENT

All costs, including administrative costs, of managing the biosolids program will be borne by the Parties and shared based upon the methods and procedures described in **Section 5** of the 2012 IMA. The Parties will receive monthly reports of tonnage allocations to each contract and a final cost accounting at the end of the DC Water fiscal year.

G. EMERGENCY PROVISIONS

1. If any contractors for Blue Plains biosolids reuse and/or disposal service unexpectedly cease operations for any reason, all Parties shall cooperate in order to continue transportation and management of the quantities of Blue Plains biosolids defined in the 2012 IMA and this Agreement.

2. All Parties shall assist in making available, to the extent possible, disposal and reuse options in the region (landfills, incinerators, etc.). If necessary, all Parties shall commit to investigating regional cooperation on biosolids reuse with other parties. This investigation shall include, but not be limited to, other land application programs, composting, incineration, soil blending, etc., and emergency plans shall consider all these options.

3. Separately, or as part of the BPSA Emergency Operating Plan, the Parties shall include emergency back-up contingency plans for removal and transport of biosolids generated at Blue Plains.

H. PRODUCT MARKETING AND REVENUE

1. DC Water will produce into the foreseeable future a Class B stabilized biosolids cake products, as well as a Class A biosolids cake suitable (with further conditioning or mixing) for marketing. DC Water and WSSC shall market and reuse this material for all of the Parties in a manner advantageous to DC Water, Fairfax and WSSC. This marketing will promote the product's use and, if successful, will generate revenue. Potential products from the Blue Plains biosolids program include compost, blended soil, dried product, green energy/carbon credits, and electrical power. DC Water and WSSC will use all revenue to first offset biosolids program and, then, Blue Plains' operating costs thereby reducing costs for all Parties.

2. Each Party shall provide data monthly regarding the revenue or credits generated by DC Water and WSSC. At the end of each fiscal year, DC Water and WSSC shall calculate annual totals for each product, and calculate the percentage of each product for which each Party may take credit. These credits are not for monetary purposes (as the revenue will be used to offset biosolids program costs) but for the purposes of informing rate payers and regulators of efforts to produce valuable products, clean energy, and carbon credits.

3. DC Water and WSSC shall separately be responsible for preparing, negotiating and managing all contracts and agreements related to the sale or use biosolids products. Other products such as steam, electricity, and/or carbon/renewable energy credits produced at Blue Plains shall be managed by DC Water.

4. The Regional Committee shall cooperate in these distribution and marketing efforts with the DC Water biosolids manager to determine if there are markets and/or distribution points in their respective jurisdiction. The region has many potential uses for a Class A biosolids product, and the Parties shall work to maximize reuse within the BPSA. All users will work to inform end-users of the benefits and limited risks of using these products.

5. DC Water shall develop an agency-wide carbon footprint model and establish a baseline for registration with a certified entity. This model will be updated and audited, as necessary, to maintain certification. As improvements occur at Blue Plains (digesters, fine bubble diffusers, energy efficiency projects, etc.) the DC Water carbon footprint will shrink, possibly making carbon credits available for sale or trade. The production of energy from a renewable source (biosolids) may also make available Renewable Energy Credits (REC's) for sale or trade.

-END OF PAGE-

EXECUTION

This Agreement is executed on behalf of the Parties by the Members of the IMA Leadership Committee who, by affixing their signatures, confirm the authorization of their respective Party to be bound thereby. It shall be effective on the date indicated by the Chair below.

Case Study #2: Philadelphia CSO LTCP
Attachment 2-1
PWD's 2009 FCA

11 FINANCIAL CAPABILITY

11.1 INTRODUCTION

The United States Environmental Protection Agency (US EPA) suggests that a financial capability assessment should be included in the CSO Long Term Control Plan (LTCP) in order to establish the burden of compliance on both ratepayers and the permittee. The assessment in this section follows the guidelines and methodology as described in the US EPA's "Combined Sewer Overflows – Guidance for Financial Capability Assessment and Schedule Development," published February 1997. The purpose of the financial capability assessment is twofold.

First, the affordability process contemplates balancing the pace of environmental improvement with the financial and economic capability of the permittee. The process allows flexibility in scheduling completion of CSO compliance measures, based on the financial capability of the area served. Second, a financial capability can support the determination of funding needs by agencies providing loan and grant monies for capital projects.

The financial capability assessment is a two phased process. The residential indicator is the percentage of median household income (MHI) expended on wastewater management. The financial capability indicator is an assessment of the permittee's debt burden, socioeconomic conditions, and financial operations. These two measures are subsequently entered into a financial capability matrix, suggested by US EPA, to determine the level of financial burden that the existing wastewater management system and the CSO control measures will place on residential customers and the permittee. The US EPA matrix appears in Table 11-8 at the end of this section.

In addition to following guidelines for these two measures, US EPA encourages inclusion of any information that would have a financial impact on CSO compliance by the permittee in the capability report. This assessment, therefore, includes extensive discussion of socioeconomic trends in the Philadelphia area because of the financial challenges that the City and the region faces.

11.2 PHASE 1 - CALCULATION OF THE RESIDENTIAL INDICATOR

PWD has projected future revenue requirements and associated rates, taking into account current and future costs to operate, maintain, and replace the PWD's system, currently outstanding debt service, and future debt service resulting from anticipated and identified capital improvements. The focus for evaluating the impact of the residential indicator is the next 20 years (FY 2029)[1], however it is anticipated that elements of the LTCPU implementation program will continue well beyond this 20 year timeframe.

PWD has developed its financial projections consistent with the manner in which it develops rate projections, with expenses, revenues and capital costs stated in future year dollar terms

1 The City of Philadelphia's fiscal year runs from July 1st through June 30th.

(*i.e.*, inflated to the future year). Thus, household bills in 2015 (for example), reflect what PWD estimates households are projected to pay in that year. For purposes of the affordability analysis, these future household rates are compared to projected household incomes (also projected to future year dollars) in those specific years. The approach keeps all cost figures on a consistent basis and provides PWD with a realistic picture of actions required to raise needed revenue and comply with its ultimate requirements.

In developing these projections, PWD has sought to estimate the future burden of the LTCPU in addition to the full utility system's long term needs for wastewater and water service, as currently understood. Although PWD provides both water and wastewater (including stormwater) service, they have traditionally maintained separate water and wastewater rates, in accordance with standard cost-of-service criteria. PWD has evaluated the impact of the LTCPU by estimating those capital and operation and maintenance (O&M) costs in conjunction with an estimate of other costs anticipated to be incurred by the utility over the next 20-plus years. The associated rates for wastewater and stormwater are then estimated on an average household basis. The residential indicator is based on that average annual cost per household relative to projected MHI for each year over the forecast period.

11.2.1 Key Assumptions

The key assumptions used to develop these projections are:

- The combined sewer area is located within the City limits of Philadelphia, therefore the determination of the residential indicator is based on the retail cost of wastewater service for households in the City of Philadelphia served directly by PWD. The cost of contract sales to wholesale customers outside of the City is anticipated to increase in response to increased costs of service for non-LTCPU related activities
- The projected average growth in MHI is 2.29%. Since 1989, MHI in Philadelphia has grown at a rate which is below both those of the state (2.94%) and national (3.18%) levels. This appears to be a consistent and long-term trend resulting from structural elements of the Philadelphia's demographic and economic makeup, rather than just being the result of cyclical or outlying occurrences. Metered sales (for water/wastewater customers) and associated billable discharges to the wastewater system have been trending downward (*e.g.*, billed water consumption declined approximately 5.4% for FY 2000 to FY 2008). To provide for a conservative estimate, the residential indicator projections assume that consumption will stabilize at current levels
- Costs associated with O&M (including labor and materials) are anticipated to grow at rates experienced in recent years. The costs for O&M of PWD's existing wastewater system are estimated to increase at 4.7% per year throughout the planning period. The inflation rate for the O&M costs for LTCPU related projects is projected to be 3.87%
- Future costs for capital projects are inflated at an annual rate of 3.87%. For the most recent 10 year period, the Engineering News Record City Cost Index – Philadelphia construction cost index and the building cost index have increased at an average annual rate of 4.1% and 3.9% respectively

- The PWD's capital improvement program for non-LTCPU related projects reflects continued investments in facility upgrades and replacements throughout the entire system. The estimated costs for the non-LTCPU capital improvements are approximately $3.7 billion (water and sewer - 2009 dollars) through Philadelphia's FY 2029 (ending June 30, 2029). The primary capital expenditures generally consist of the following: improvements to water and wastewater treatment plants; rehabilitations and replacement of water mains; rehabilitation and replacement of old sewers and construction of new sewers to relieve unsanitary conditions; and construction of new storm flood relief sewers and storage tanks
- PWD assumes the funding for its capital program will be financed primarily through the issuance of revenue bonds through the municipal bond market, supplemented through PennVest financings. PWD will also utilize pay-as-you-go funding and, to the extent available, miscellaneous grants. Best practices vis-à-vis the municipal bond market requires that PWD's capital debt be structured with various interest rates and maturities. Therefore, rather than specifying an assumed interest rate and bond duration, PWD's Financial Capability analysis utilizes long term experience in defining an annual cost per unit of principal borrowed. PWD has determined that a capital cost factor of 8.059% is appropriate. Costs of O&M associated with the LTCPU were synchronized with the implementation schedule and with escalation factors generally resembling historical cost escalation for PWD's overall O&M program
- Revenue projections for this financial capability assessment rely on PWD's existing cost-of-service based rate structure with forecast revisions reflecting the proportional increase in wastewater and stormwater costs due to implementation of the LTCPU as well as a continuation of the non-rate revenues the City currently generates

As detailed in Section 10 of this report, PWD is proposing green infrastructure with targeted traditional infrastructure as its preferred alternative. The recommended plan seeks to reduce CSO frequency and volume through a range of land-based stormwater management techniques or source controls. As described in previous sections, this option will be implemented in stages through 2029. The total capital need for the LTCPU program is $902 million (Table 11-1), and the total O&M need through 2029 for the LTCPU as it is implemented is $98 million, both stated in 2009 dollars.

The LTCPU capital program will be implemented within the context of PWD's overall capital improvement program, also summarized in Table 11-1. Total capital expenditures through 2029 of approximately $4.6 billion (2009 dollars) for improvements to the water and wastewater systems are projected. Of these projected capital expenditures, around $3.4 billion or 73 % are projected for wastewater and wet weather; including $902 million for the implementation of the recommended LTCPU through 2029. The remaining projected wastewater expenditures go towards system renewal, replacement, rehabilitation and improvements necessary for adequate and compliant services.

PWD assumes the continuation of its ongoing program related to water main and sewer rehabilitation and replacement and treatment plant upgrades throughout the 20 year period. PWD will also pursue an aggressive storm flood relief program that is intended to be completed within the next decade. The cost of that program is not included in the estimate

Table 11-1 PWD Capital Improvements Program (in billion $) 2010-2029

Capital Program	Present Dollar Value (2009 Dollars)
Water Treatment and Distribution	$1.22
Wastewater Treatment and Collection	$2.12
Storm Flood Relief	$0.36
Long Term Control Plan	$0.90
Total Capital Cost	**$4.60**

for the LTCPU, although it is expected to have a beneficial impact on the City's ability to manage wet weather flows in the future.

11.2.2 Projected Revenue Requirements and Rate Impacts

For FY 2009 through FY 2029, the annual revenue requirement for PWD's wastewater system is expected to increase by about $720 million, from approximately $350 million to $1.07 billion in 2029. Annual wastewater system debt service in 2029 is projected to be approximately $366 million. This amount compares to current (2009) annual wastewater system debt service costs of approximately $130 million.

PWD is empowered and required under the Philadelphia Home Rule Charter to establish rates for water, wastewater and stormwater at levels that provide sufficient revenue to meet all operating expenses of the water, wastewater and stormwater systems, including interdepartmental charges for services provided to the PWD, and debt service requirements on all obligations issued for the PWD, including specific bond ordinance covenants.

PWD estimates that the typical household in the City currently pays approximately $400 annually for wastewater services, including stormwater. The most recently available U.S. Census data for MHI in Philadelphia is $35,431 for 2007. Based upon the projected annual MHI growth of 2.29%, the estimated 2009 MHI would be $37,072. PWD customers are currently (2009) paying approximately 1.10% of their income for wastewater charges. In addition to the general rates, special rates are applicable to certain properties or customer groups as prescribed by ordinance. Charges are also administered for municipal fire protection and private fire protection and for industrial dischargers of high strength wastewater. Service to customers located outside the City is on a wholesale basis through contracts with various municipalities, authorities and townships. Each wholesale contract has been negotiated on a case-by-case basis, and has a different cost structure and variations in the method for adjusting those wholesale charges to reflect changes in their cost of service.

Under the US EPA guidance, a key measure of affordability is the residential indicator: the ratio of the wastewater cost per household to MHI. The residential indicator is compared to US EPA-defined criteria to determine whether costs impose a low, mid-range, or high impact on residential users. Table 11-2 shows US EPA's residential indicator criteria, which define a "low" impact as a cost per household less than 1.0% MHI, a "mid-range" impact between 1.0 and 2.0%, and "high" impact as greater than 2.0% of MHI.

Table 11-2 US EPA Residential Indicator

Residential Indicator	Cost per Household
Low	Less than 1.0% of MHI
Mid-Range	1.0-2.0% of MHI
High	Greater than 2.0% of MHI

Implementation of the PWD's LTCPU projects along with other necessary wastewater system capital improvements require wastewater system rates to be increased at an annualized rate of approximately 6.18%. The cumulative effects of these increases are shown graphically on Figure 11-1. The primary measure of the affordability (wastewater cost as percent of MHI), the residential indicator, is currently around 1.1%. The residential indicator is expected to rise to approximately 2.27% by 2029); based upon projected average annual household wastewater costs of approximately $1,321 and a projected MHI of approximately $58,305. As may be noted in Figure 11-1, the cost, demographic and economic trends will result in continued increases in the percentage of household income to be expended on wastewater services well beyond 2029.

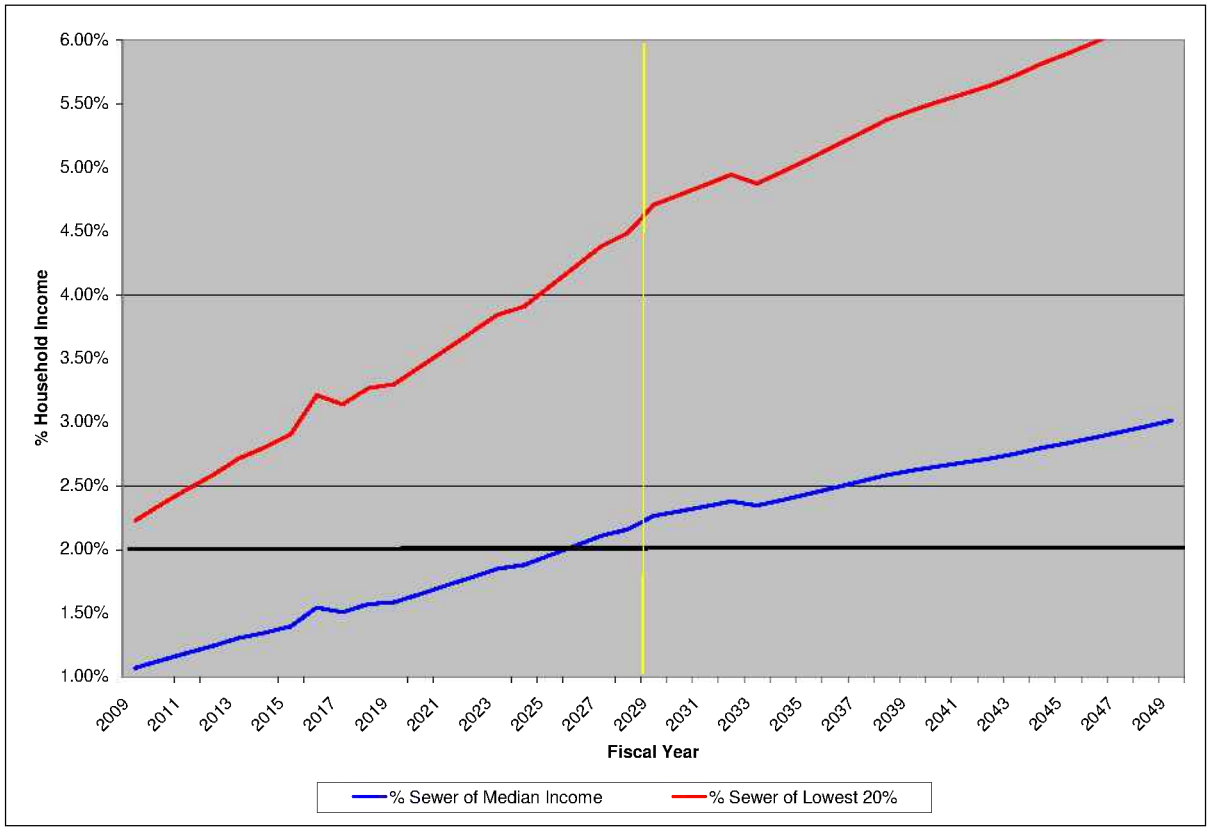

Figure 11-1 Residential Indicator, 2009-2029 Recommended Plan, 2009-2020 Implementation

US EPA's residential indicator is based upon the City's MHI. By definition, one half of the households (approximately 279,000) have household incomes that are less than the current $37,072 median and will be less than the $58,305 MHI that is projected for 2029. At an average of approximately 2.5 residents per household, the lower half of the MHI population for the City would total approximately 698,000. Therefore, a group that would comprise the 16th largest cities within the U.S., (exceeding major cities such as Boston, Baltimore, Washington D.C., and Seattle), would be paying more than 2.27% of their incomes for wastewater services in 2029.

The financial impact of the LTCPU implementation and other LTCPU costs on the lower income population of Philadelphia will be significant. The projected 2029 MHI for the lowest 20% MHI group is less than $38,000. This group would be paying between 3.5% of their MHI (upper limit of the second quintile) to 7.0% MHI (first quintile) in 2029. This group includes around 158,000 households representing a population of around 396,000. This number is larger than the populations of major cities such as Cincinnati, Minneapolis, Honolulu, Pittsburgh, and Toledo. The disparate impact of the implementation of the LTCPU and other necessary wastewater capital improvements upon the City's varying income areas is shown on Figure 11-2. The map shows the projected Residential Indicators for the 368 census tracts within the City of Philadelphia in 2029.

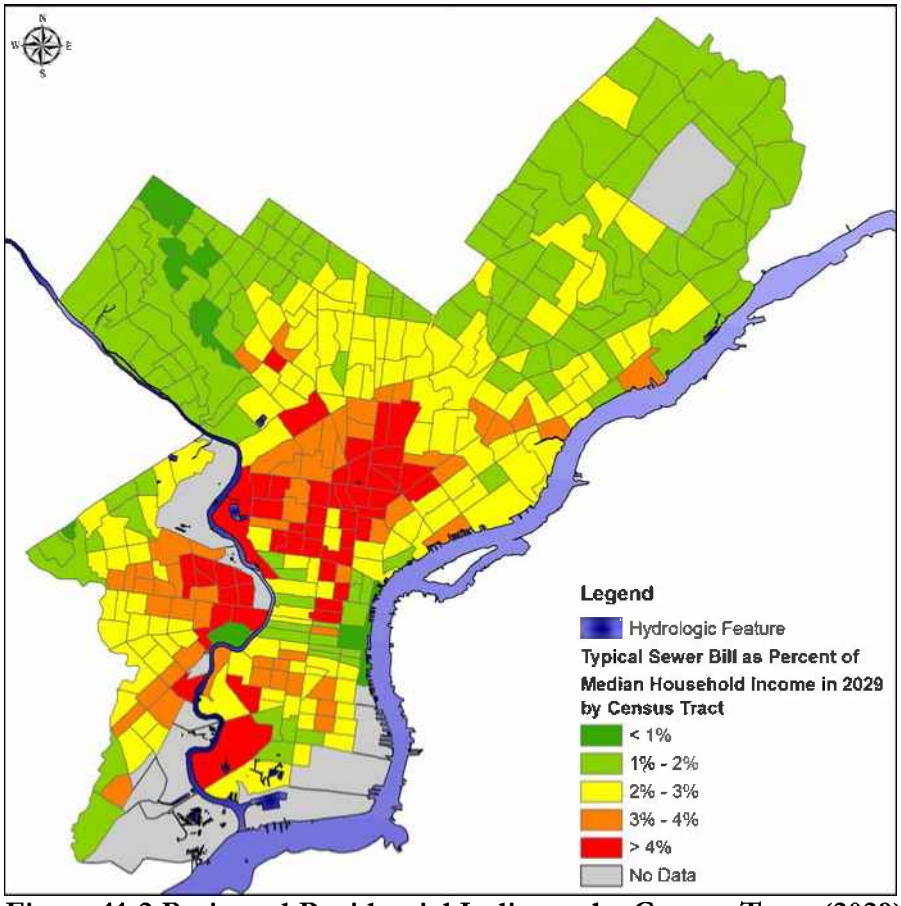

Figure 11-2 Projected Residential Indicator by Census Tract (2029)

11.2.3 Financing Assumptions

The projections of burden and the residential indicator are sensitive to assumptions regarding debt financing. PWD has traditionally funded its capital programs with a combination of traditional debt (revenue backed bonds), existing reserve funds, grant funding (when available), and the state revolving fund (PennVEST). Although this combination of funding mechanisms may continue to be available, it is assumed that the predominant funding source will be traditional debt (revenue bonds issued through the municipal bond market) supplemented by pay as you go funding and limited grants.

11.2.4 Grant Availability

Although PWD will pursue available grant programs, the financial analysis does anticipate grant funding for CSO controls. The amount of grant funding that may become available is expected to be relatively minor in comparison to the projected capital expenditures for the LTCPU.

11.3 PHASE 2 - CALCULATION OF PERMITTEE FINANCIAL CAPABILITY INDICATORS

The second phase of the financial capability assessment - calculation of the financial capability indicator for the permittee – includes six items that fall into three general categories of debt, socioeconomic, and financial management indicators. The six items are:

- Bond rating
- Total net debt as a percentage of full market real estate value
- Unemployment rate
- MHI
- Property tax revenues as a percentage of full market property value
- Property tax revenue collection rate

Each item is given a score of three, two, or one, corresponding to ratings of strong, mid-range, or weak, according to US EPA-suggested standards. The overall financial capability indicator is then derived by taking a simple average of the ratings. This value is then entered into the financial capability matrix to be compared with the residential indicator for an overall capability assessment). Table 11-3 contains the six criteria and the ratings that categorize the permittee as strong, mid-range, or weak in each category. Shaded areas of this table indicate the City of Philadelphia's position in each category. Indicators with shading in two ratings such as the bond rating category reflect a score between the two ratings. A discussion of each item follows.

Table 11-3 US EPA Permittee Financial Capability Indicator Benchmarks

Indicator	Strong	Mid-Range	Weak
Bond rating	AAA-A (S&P) or Aaa-A (Moody's)	BBB (S&P) Baa (Moody's)	BB-D (S&P) B-C (Moody's)
Overall net debt as a percent of full market property value	< 2%	2% to 5%	> 5%
Unemployment rate	> one percentage point below the national average	± one percentage point of national average	> one percentage point above the national average
MHI	More than 25% above adjusted national MHI	± 25% of adjusted national MHI	> 25% below adjusted national MHI
Property tax revenues as a percent of full market property value	< 2%	2% to 4%	> 4%
Property tax collection rate	> 98%	94% to 98%	< 94%

(Blue areas indicate City of Philadelphia ratings)

Bond Rating – Indicator 1

General obligation debt, which is debt backed by the full faith, credit, and taxing power of the City of Philadelphia, has been rated by Moody's Investors Service at Baa1, by Standard & Poor's Corporation at BBB, and by Fitch Investors Service at BBB+.

The PWD issues debt pursuant to the City's Restated General Water and Wastewater Revenue Bond Ordinance of 1989 ("General Ordinance"), which superseded the General Water and Wastewater Revenue Bond Ordinance of 1974 ("Prior Ordinance"). PWD's debt is a special obligation of the City, secured along with previously issued water and wastewater revenue bonds, by a pledge of and security interest in all project revenues established in various funds and accounts, all as defined in the General Ordinance.

PWD's debt is currently rated as A3 by Moody's Investors Service, A by Standard and Poor's and A- by Fitch.[2] Based on the current credit rating of the City and PWD the overall bond rating is between strong and mid-range.

Net Debt as Percent of Full Market Value – Indicator 2

Total net debt includes overlapping debt, which is the indebtedness of the School District of Philadelphia and the City of Philadelphia General Bonded Debt in addition to the City of Philadelphia. School District debt totaled $2,634 million and bonded debt totaled $4,136 million on June 30, 2008, for total overlapping debt of $6.77 billion. The percent of total net debt to full market value was 37.30%. The calculation of the above percentage is based on a deduction of $255.7 million in sinking fund monies from outstanding debt. Self-sustaining debt (*i.e.*, revenue-backed bonds) are also excluded from total debt outstanding. Overall net debt as a percent of full market property value places the City of Philadelphia in the weak range on this measure.

[2] Source: OFFICIAL STATEMENT relating to $140,000,000 City of Philadelphia, Pennsylvania Water and Wastewater Revenue Bonds, Series 2009A (page 59)

Unemployment Rate – Indicator 3
The unemployment rate for the City of Philadelphia was 7.2% in 2008. The unemployment rate for the Commonwealth of Pennsylvania in 2008 was 5.4%, and the national rate for 2008 was 5.8%.

According to US EPA guidelines, a local variance of greater than 1% from the national rate indicates a weak financial capability. Philadelphia maintained an unemployment rate greater than 1% of the national average for the year 2008. Most recent data from the Department of Labor, Bureau of Labor Statistics shows the unemployment rate for Philadelphia to be as high as 9.7% in March 2009, its highest rate since 1993 and remaining ahead of the state and national averages.

MHI – Indicator 4
The most recent data (2007) from the Census Bureau estimate Philadelphia's MHI to be $35,431. US EPA guidelines suggest that a variance of greater than 25% below the national MHI figure constitutes a weak rating. Pennsylvania's MHI estimate was $47,913 and the national estimate was $50,007 over the same period of time, percent differences of nearly 32 and 36%, respectively.

Property Tax Revenues as a Percent of Full Market Property Value – Indicator 5
The City of Philadelphia assessed valuation is 29.22% of the full market value of real estate. A tax of 33.05 mills is levied on the assessed valuation. Therefore, the property tax levy is 3.305% of assessed valuation, or approximately 1.0% of full market value set by the State Tax Equalization Board. The projected full market value for 2008 was $41.67 billion. The result shows current year real estate collections to be approximately 0.85% of full market value. Table 11-4 shows assessed valuation, full markets value, tax levy and current year tax collections for real estate taxes.

The US EPA financial capability assessment makes no provision for measuring a local tax burden other than the real estate tax. This gives Philadelphia an artificially strong rating in the property tax revenues as a percent of full market value category.

However, the City of Philadelphia is somewhat unique in that real estate collections are not its primary source of income. The earned income tax levied by the City comprised 23% of the operating revenues in FY 2008, while the property tax only accounted for 6% of revenue. The City's current earned income tax rate is 4.22% of residents' wages. Although real estate taxes are comparatively low, Philadelphia taxpayers are heavily burdened by other local levy, including a Philadelphia sales tax.

Analysis by a Pew Foundation study[3] documents that the total tax burden per household in Philadelphia are about double the average for comparable large cities. For a family of three earning $50,000 annually, the tax burden in Philadelphia is 17.3% compared to the large city average of 8.8%. The total tax burdens for ten cities in the Pew study are shown on Table 11-5.

Source: Philadelphia 2009 – The State of The City The Pew Charitable Trusts – Philadelphia Research Initiative; page 13 (http://www.pewtrusts.org)

The residential indicator is a national screening parameter and does not account for localized factors which erode the effective household income. The high total tax burden facing Philadelphia households reduces their effective household income. Consequently, measuring the household burden imposed by wastewater costs as a percentage of the MHI (estimated in 2009 to be $37,072 and projected to be $58,305 in 2029) may underestimate the financial burden of the projected wastewater costs per household. As was noted in an analysis of the impacts of CSO controls in the Boston region:

> *"The greater are the costs of other necessities as a share of MHI, the greater will be the economic burden associated with sewer charges equal to a given percent of MHI."* [4]

[4] Assessment of the Economic Impact of Additional Combined Sewer Overflow Controls in the Massachusetts Water Resource Authority Service Area (page 13) prepared by Robert N. Stavins, Genia Long, and Judson Jaffee. Analysis Group Incorporated, August 2004.

The impacts of the tax burden in Philadelphia are further exacerbated by the relatively high cost of living in Philadelphia. The American Chamber of Commerce Researchers Association Cost of Living Index for Philadelphia was 1.249 in 2006[5] (*i.e.*, the cost of living in Philadelphia is approximately 25% higher than the national average). The estimated U.S. MHI in 2009 is approximately $52,500 or 41% higher than the Philadelphia MHI. Thus, the household at the median Philadelphia income faces costs of living that are 25% higher than the national average while earning an income that is about 71% of the national median income.

Property Tax Collection Rate – Indicator 6
Real estate tax collections had shown a pattern of increase since the rate was lowered to 34.74 mills on assessed valuation in 2003, however, the collection rate dropped below 90% for 2006 and 2007. The US EPA criterion for a strong rating in this category is a collection rate of more than 98%. Philadelphia's rate is estimated to be 91%, which places it in the weak range for real estate tax collections.

Summary of the Six Municipal Financial Capability Indicators
The City of Philadelphia received a financial capability rating of 1.58, according to the scores on the six items included in the assessment. This is based on a strong-to-mid-range rating of "2.5" on its bond rating; weak ratings of "1" on overall net debt as a percent of full market property value, unemployment rate, MHI, and property tax collection rate; and the strong rating of "3" on its property tax revenues as a percent of full market value of real estate. The 1.58 rating represents the simple average of those scores.

11.4 ADDITIONAL SOCIO-ECONOMIC TRENDS IN THE PWD SERVICE AREA

In addition to following US EPA guidelines for completion of the financial capability assessment matrix, a discussion of socioeconomic trends in the PWD service area is essential to the consideration of scheduling and compliance levels with CSO guidelines. Approximately 70% of the service area population consists of City of Philadelphia residents, and neighboring counties served are limited in the flows that can be sent to PWD's wastewater treatment plants. Therefore, this discussion includes socioeconomic trends in Bucks, Delaware, and Montgomery Counties, but it is focused primarily on demographic and employment conditions and projections for Philadelphia.

Philadelphia's Demographic and Economic Trends
This section advances an analysis of demographic and economic changes that have taken place in Philadelphia and the surrounding suburban counties during the years 1980 to 2008 and for the forecast period of 2010 to 2035. Emphasis is placed upon demographic and economic changes as they impact Philadelphia County. Demographic and economic trends that are analyzed include population, age of population, the number of households, household composition, and income levels.

5 American Chamber of Commerce Research Association Cost of Living Index, http://www.coli.org.

Population

Population levels are a significant indicator in any analysis of demographic and economic changes. Philadelphia's population is depicted in Table 11-6 for the historic period 1980 through 2007 and the forecast period of 2010 through 2035. During the period 1990 to 2000, the population of Philadelphia decreased significantly from 1,585,577 to 1,517,549, a 4.5% decline. As illustrated in Table 11-6, the Delaware Valley Regional Planning Commission (DVRPC) has projected a small increase in the City of Philadelphia's population for the forecasted period 2010-2035. However, most recent census data indicates that the City's population has continued its dramatic decline with a currently estimated population of 1,454,382. Therefore, unless there is a reversal of this trend, the estimated projections for the year 2035 would need to be adjusted significantly downward. In this event, the PWD would anticipate a reduction in the number of residential customers and a corresponding increase in the burden on the remaining households. The Philadelphia County population trend is a reasonable basis for predicting that residential demand for wastewater service in Philadelphia County is not likely to increase significantly during the forecast period.

Table 11-6 Philadelphia County Population Levels 1980-2035

1980 Census	1,688,210
1990 Census	1,585,577
2000 Census	1,517,549
2005 – 2007 Census Estimate	1,454,382
2010 Forecast	1,475,613
2020 Forecast	1,474,268
2030 Forecast	1,478,065
2035 Forecast	1,480,023

Source: DVRPC, Analytical Data report "Regional, County, and Municipal Population and Employment Forecasts, 2005-2035," July 2007

Minority Population

The proportion of minority population in the PWD service area varies between 8.9% in Bucks County and 57.3% in Philadelphia based on most recent Census data. Philadelphia's minority population is over 31% higher than the national average and over 41% higher than the state average. A portion of that population experiences lower incomes, slower growth in income, and greater difficulty meeting the increased burden of utility costs.

Age of Population

The age of the local population is also a significant factor in this analysis. In this regard, it should be noted that in 1980, approximately 14% of all Philadelphians were 65 years of age or older (elderly), and in 1990 the number rose to 15.2%. In 2000, the percentage of elderly in the local population decreased to 14.1%, and the most recent data estimate a 13.0% elderly population. The national average is estimated to be 12.5%, so despite the decrease in elderly population within the City, it still remains above average.

An increase in the elderly population is evident in the suburban counties served by the permittee. The elderly population in the surrounding counties increased from 13.8% to

14.3% during the 1990 to 2000 time period. According to the DVRPC[6], based on population forecasts and the current age distribution, the percent of elderly within Philadelphia and its surrounding communities will increase to roughly 19% of the population by 2025. The DVRPC estimates that the elderly population within Philadelphia will be around 15%, and as high as 22% in Bucks County. As the baby boomer generation ages, the percentage of elderly should increase dramatically.

This trend of the locally aging population is alarming since there appears to be a historic positive correlation in Philadelphia between the percentage of the elderly population and the percentage of the population living in poverty. This is evident in Philadelphia County, based upon population and demographic trends observed between 1970 and 2000. Along with the increased percentage of elderly population, the number of residents living in poverty went from just less than 12% to more than 22%.[7]

It can be reasonably projected, based on the foregoing, that the permittee's customer base will consist of an increasing number of elderly persons, who in many instances are living on limited incomes. Further, an aging customer base indicates limits on future economic expansion.

Number of Households

Another significant factor in this analysis of demographic and economic trends is the number of established households in Philadelphia County. In 1980, 1990, and 2000, there were 634,665, 600,740, and 590,238 households in Philadelphia, respectively. Most recent Census data estimates 557,985 households. The consistent decrease in the number of households is not surprising given the general decline in Philadelphia's population. However, this trend is more alarming when viewed in conjunction with the changes in local household composition, addressed in the following section. These factors suggest that significant income growth in Philadelphia will be unlikely during the forecast period.

Household Composition

Family households in Philadelphia numbered 352,331 in 2000, compared to 378,048 in 1990 and 415,891 in 1980. In 2000, 189,291 such households were headed by two parents, compared to 227,187 in 1990 and 280,619 in 1980. The number of female-headed households in this mix was 131,332 in 2000, compared to 122,370 in 1990 and 113,489 in 1980. This is significant because two parent households tend to have higher incomes than non-family households and family households headed by single parents[8]. Illustrative of this point is in the 12 months prior to the last census estimates, 34% of female-headed families in Philadelphia were below the poverty line compared to only 8.5% of married couple families.

---

6 DVRPC, "The Aging of the Baby Boomers: Elderly and Near-Elderly Population Characteristics," January 2007.

7 In this same context, it should be noted that a significant percentage of children in Philadelphia County live in poverty. In 2006, roughly 35 percent of all children in Philadelphia lived in poverty. This is also an indicator that many households served by the permittee operate under severe economic constraints at present.

8 US Census Bureau, "Income, Poverty, and Health Insurance Coverage in the United States: 2007."

As noted previously, recent trends reflect a drop in total number of households, which includes an 18% decrease in family households. However, most recent census data estimates that the decrease in the number of married couple families is over 16% since 2000, while the female-headed households have barely dropped 10%. Combined with an increase in non-family households of nearly 17%, the result is a proportional increase in households with historically lower earning potential.

Taken together with the above average population of elderly in the service area, these household composition trends do not forecast significant income growth. An examination of the historical and recent income levels further illustrates this point.

Income Levels

Personal income per capita in Philadelphia decreased from $17,430 in 1990 to $16,509 in 2000, compared to a regional increase from $18,383 to $27,789 over the same period of time. Recent census estimates show that Philadelphia's per capita income has increased to $19,875, still significantly lower than the regional and national per capita income estimates of $34,019 and $26,178, respectively. Despite the increase in per capita income, 16.5% of the families in Philadelphia, including 136,277 households, must sustain themselves on incomes below $15,000.

As shown in Figure 11-3, MHI in Philadelphia has significantly lagged behind the national level since the 1970s. Since 1989, MHI in Philadelphia has grown at a rate which is below both those of the state (2.94%) and national (3.18%) levels. This appears to be a consistent and long-term trend resulting from structural elements of the Philadelphia's demographic and economic make-up, rather than being the result of cyclical or outlying occurrences. It is reasonable to expect that this trend in income levels and growth will continue into the future.

From 1990 to 2000, the percentage of all persons with incomes below the poverty level in Philadelphia increased from 20.3% to 22.9%. This trend has continued with the most recent census figure at 24.5%. Given the local increase in unemployment due to the recent economic climate, it is possible that in the near future the number of Philadelphians living in poverty could increase dramatically.

Employment Trends in Philadelphia

Future income growth in Philadelphia is dependent upon prospective economic trends, driven in large part by employment. The affordability of PWD's LTCPU is tied to such economic trends.

The data assembled by the DVRPC in their study entitled "Regional, County, and Municipal Population and Employment Forecasts, 2005-2035", indicates that Philadelphia will experience minimal growth in employment during the forecast period. This estimate focuses on long-term trends and assumptions, and should be evaluated with actual data as available to address any potential long-term shifts that may occur due to the current economic climate and eroding job market. The projected changes in job numbers by employment sector for Philadelphia appear in Table 11-7.

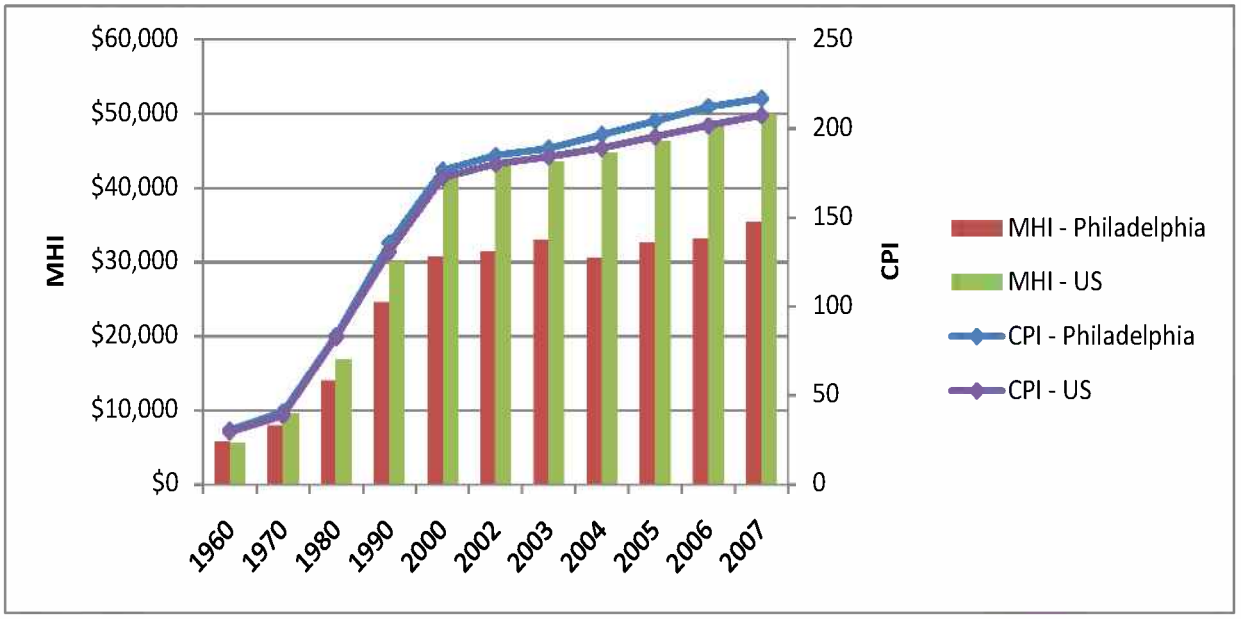

Figure 11-3 MHI Trends and Comparisons

Employment composition in Philadelphia is also not substantially changed in any employment sector during the forecast period, as shown in Table 11-7, although small increases and decreases are shown in some job sectors. Total job forecasts and employment sector forecasts indicate a reversal of past trends, in which employment levels dropped overall. It bears emphasis, however, that Philadelphia County has yet to experience the sizable upward employment trend projected in the above data and the current uncertainty in the job market will negate short-term growth estimates and may potentially hinder long term employment level growth.

11.5 THE FINANCIAL CAPABILITY MATRIX

It was established previously in the Phase One (Residential Indicator) analysis that Philadelphia's residential indicator is projected to fall into the high-range category on the financial capability matrix. The Phase two analysis on the assessment of the financial capability indicators placed Philadelphia in the mid-range category for current conditions. The intersection of these two ratings on the EPA financial capability matrix places the City of Philadelphia in the category of high financial burden, as shown on Table 11-8.

In addition to these strictly numerical measures, socioeconomic trends in the Philadelphia area require careful consideration as level and scheduling of CSO control expenditures are determined.

11.6 CONCLUSIONS AND IMPLICATIONS

PWD will be implementing the innovative approach to combined sewer overflow controls detailed elsewhere within this document within the context of its financial and demographic reality. This reality may be summarized by the unprecedented needs for capital reinvestments in the City's water and sewer systems juxtaposed with structural economic and

demographic changes that will continue to erode both PWD's ability to finance required capital investments and the citizen's ability to afford them.

As noted above, PWD's current capital improvements for its water and sewer systems total $4.6 billion through 2029. This includes $3.7 billion for its current systems required to maintain current levels of service and regulatory compliance; and approximately $900 million (2009 dollars) in new capital expenditures for the implementation of the LTCPU recommended alternatives.

The anticipated tripling of the PWD's annual wastewater system revenue requirements from approximately $350 million in 2009 to over $1 billion in 2029 will be paid for by a rate base whose income is projected to increase by less than 60% during the same period. The results of this will be burden measured as the residential indicator of 2.27% of the median income. A population equivalent to cities larger than Boston, Washington D.C., Baltimore and Seattle will pay more than 2.27% of their household income for wastewater services. The lowest quintile of the households, a population larger than cities such as Cincinnati, Minneapolis,

Pittsburgh or Toledo will face annual wastewater costs totaling between 3.55 to upwards of 7% of their household incomes.

It is reasonable to expect that an implementation schedule (through 2029) imposing residential burdens well above 2.27% for populations the size of major American cities is untenable. The municipal financing market likely would agree with such a conclusion. PWD might face insurmountable difficulties in financing their capital needs as outlined above.

These realities suggest an implementation schedule extending beyond the 2029 deadline. Indeed, through its Green Infrastructure approach to CSO control, PWD fully intends to continue to expand the green features within the City so that control levels will increase and improve well beyond 2029. PWD's Green Infrastructure approach is uniquely suited for incremental and modular implementation and the scheduling context is a completely different paradigm than that of a traditional infrastructure control strategy. A storage and conveyance tunnel, for example, would be of little or marginal benefit before it is fully constructed and operated. CSO control and the resulting water quality benefits would not occur until initiation of operation of at least large portions of the program. In such cases, the regulatory and environmental imperatives might push towards a discrete short term (ten to twenty) year timeframe. PWD's approach however provides for immediate compliance and water quality benefits that will grow annually. The proposed implementation schedule will allow the City of Philadelphia and its watersheds to achieve these benefits within the constraints that the nation's changing economics and demographics have dealt it.

Case Study #3: Indianapolis CSO LTCP

6.0 Financial Capability Assessment

Contents:

6.1 Introduction
6.2 Key Assumptions
6.3 Projected Revenue Requirements, Financing and Rate Impacts
6.4 U.S. EPA Financial Capability Analysis
6.5 Summary

6.1 Introduction

Financial capability is a significant factor affecting a community's CSO long-term control plan (LTCP). According to U.S. EPA's 1994 *CSO Guidance for Long-Term Control Plan:*

> As part of LTCP development, the ability of the municipality to finance the final recommendations should be considered. The CSO Control Policy[1] "...recognizes that financial considerations are a major factor affecting the implementation of CSO controls...[and]...allows consideration of...financial capability in connection with the [LTCP] effort...and negotiation of enforceable schedules." The CSO Control Policy also specifically states that "...schedules for implementation of the CSO controls may be phased based on...financial capability."[2]

This section describes the methodology and results of applying U.S. EPA's financial capability process to the Indianapolis long-term control plan. The focus of this effort is to estimate the cost per household for Indianapolis' customers, assess how that cost will compare to future household income, and then determine and discuss financial capability factors set forth in the U.S. EPA guidance document. This guidance document is not binding and the resulting analysis may not fully capture the fiscal stress and/or ability of Indianapolis residents to fund CSO controls. The city has projected future revenue requirements and associated rates, taking into account current costs to operate the city's system, how those costs will change over time, existing debt service, and future debt service resulting from anticipated and identified capital improvements. The city's planning horizon for evaluating the impacts of the LTCP exceeds 20 years.

The city has developed its financial projections consistent with the way it will develop rate projections, with expenses, revenues and capital costs stated in future year dollar terms. Thus, household bills in 2015 reflect what the city estimates households will actually pay in that year. For purposes of the affordability analysis, these future household rates are compared to projected household incomes in those specific years. This is consistent with the approach used by a number of other municipal sewer agencies. The approach keeps all cost figures on a consistent basis and gives the city a realistic picture of actions required to raise needed revenue.

In developing these projections, the city has sought to estimate the future burden of the CSO program in addition to the full wastewater system's long-term needs, as currently understood by the city. The city has evaluated the impact of the long-term control plan and other wastewater needs by estimating long-term revenue requirements and then estimating typical household sanitary sewer costs based on estimated rates. The residential indicator is based on that average annual cost per household relative to projected median household income for each year over the forecast period.

6.2 Key Assumptions

The key assumptions used to develop these projections are:

- Using U.S. Census data for the Consolidated City best captures the city's retail service area. Most customers outside the Consolidated City are served through wholesale contracts, which hinder the ability of the city to readily pass through rate increases and where the wholesale customer has little or no responsibility for combined sewers. See Section 6.3.1 for further discussion of the Consolidated City and wholesale customers.
- Based on a review of historical flow data, the city does not anticipate increases in billable flows over the forecast period due to the historic trend of commercial and industrial conservation measures being implemented as rates increase. But the city does anticipate that the number of households connected to the system will increase slowly as the city moves forward with septic conversions, and experiences limited infill of undeveloped areas.
- Labor costs for the existing system are projected to increase at an average annual rate of 2.5 percent, except for the period from 2008 to 2018, when they are expected to increase at 4.5 percent. The period 2008 to 2018 is anticipated to be a peak construction period in the Indianapolis area. The city anticipates increased labor price competition due to concurrent and significant infrastructure programs occurring in the city during this period, which will increase costs beyond industry standard escalation. Pension costs are assumed to increase at a 5.8 percent rate. Contract operations costs are assumed to increase at a 4 to 6 percent an-

[1] 59 Fed Register, 18688
[2] U.S. EPA, Office of Water, EPA 832-B-95-002, September 1995, p. 3-66.

nual rate, consistent with the city's history under the existing agreements. In addition, it is assumed that there will be a step up in costs of approximately 5 percent at the time operations contracts are renewed, based upon experience with these types of operational contracts.

- Capital costs are projected to increase consistent with the 25-year average national Engineering News Record (ENR) construction cost index. However, during the peak construction period of 2008 to 2018, the city assumes that the costs will increase at 2 percent per year above the historical national ENR index due to the very high anticipated level of construction.
- The city's repair and replacement and capital maintenance activities are assumed to increase over time, reflecting the increased attention the systems will require as they age.
- The city's capital improvement program assumes that the city will move forward during the forecast period with the following plans and projects: LTCP, the Large and Mid-Diameter Combined Sewer Master Plans, the Sanitary Sewer Master Plan, the Basin Master Plan, septic conversion program, as well as other projected wastewater improvements and maintenance needs within the collection system and at the city's two treatment plants. The current estimated cost of this capital improvement program (CIP) is approximately $5.5 billion at the time of construction, including LTCP costs. The above costs do not include the costs of complying with state and federal stormwater management requirements, which are expected to become more stringent during the 20-year planning period.
- The city assumes that it will finance this CIP with a combination of State Revolving Fund (SRF), revenue bonds and 'pay-as-you-go' funds. The city is hoping to obtain SRF financing for 10 percent of this CIP. Over the 20-year LTCP implementation period, the city has assumed that all debt issued will have a term of 20 years with an average interest rate of 6.0 percent.
- Consistent with revenue bond requirements, it is assumed that the city will set rates to comply with a debt service coverage ratio of 130 percent. This has no impact on future rates, since the revenues generated through coverage are used to fund pay-as-you-go capital and other system expenses.
- Operating and maintenance costs for new infrastructure were incorporated based on projects that would directly result in new system components or improved performance. These costs were summarized into five major categories: labor, power, chemicals, infrastructure, and materials and supplies. The indexed annual costs were synchronized with the capital program implementation schedule and were compared to historical expenses and published rates for accuracy and consistency.
- Revenue projections for this Financial Capability Assessment rely on the city's current rate policy and structure and assume that the share of revenues derived from industrial and commercial customers remains stable, despite a history of declines in base flow over time.

The total capital needed by the City of Indianapolis over the next 20 years is estimated at nearly $5.5 billion (future dollars) to fund both CSO improvements required by this LTCP and other projected wastewater collection and treatment needs. The details of the long-term control plan are described in Section 7.0 of this report. For purposes of the financial capability analysis, the city analyzed LTCP Plan 1 at 97 percent capture on Fall Creek and 95 percent capture on the remaining streams, implemented over 20 years. The total capital needed for the LTCP is estimated at $1.6885 billion in current dollars or $2.459 billion in future dollars (**Table 6-1**).

The Wastewater Improvements CIP assumes that the city implements the various master plans that have been prepared for the city, together with other wastewater improvement and maintenance needs. These include unspent por-

Table 6-1
CIP Capital Costs by Program

Capital Program	Present Dollar Value (2004 dollars)	Future Dollar Value (at time of construction)
Long-Term Control Plan	$1.6885 billion	$2.459 billion
Wastewater Improvements CIP	$1.546 billion	$2.548 billion
Septic Tank Elimination Program	$319 million	$474 million

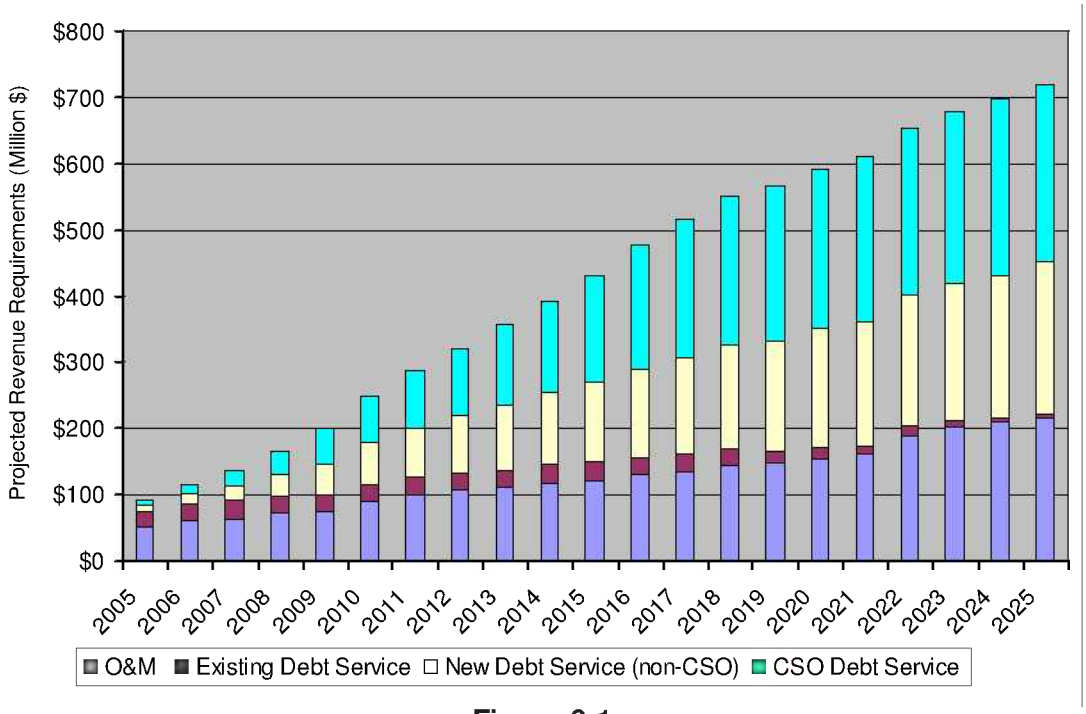

Figure 6-1
Projected Revenue Requirements

tions of the Sanitary Sewer Master Plan, the Large and Mid-Diameter Combined Sewer Master Plans, Basin Master Plan and other projected capital improvements and maintenance needs at the AWT plants and collection system. Since the costs published in the various master plans were developed at different times, all costs were converted to a common dollar base (2004 dollars). The total remaining capital need for the Wastewater Improvements CIP is estimated at $1.6885 billion in current dollars or $2.459 billion in future dollars (**Table 6-1**). Finally, the city is assumed to accelerate extension of sanitary sewers to replace the approximately 18,000 failing septic systems within the retail service area.

The total capital needed for the first 18,000 homes in the Septic Tank Elimination Program is estimated at $319 million in current dollars or $474 million in future dollars (**Table 6-1**).

6.3 Projected Revenue Requirements, Financing and Rate Impacts

Figure 6-1 displays the projected revenue requirements for the wastewater system over the forecast period.

For the period 2005 to 2015, the average annual increase in revenue requirements will exceed 18 percent. On average, through the end of 2025, the city's revenue requirements will increase by approximately 12 percent per year. As the figure shows, new debt service to ensure the long-term integrity of the system and LTCP compliance causes the greatest increases in revenue requirements. CSO debt service will increase from less than 5 percent of total revenue requirements in 2005 to nearly 30 percent in 2025. Similarly, debt service to fund ongoing improvements to the existing sanitary system is projected to increase from 25 percent of the existing revenue requirement to more than 50 percent.

6.3.1 Impact on Future Rates and Affordability

The city's current rate structure includes both a minimum charge per month and a volume-based charge. The volume-based charge is allocated among retail customers based on metered water consumption. (A small number of retail customers do not have centralized water service, and therefore pay a flat rate). Each wholesale contract has been negotiated on a case-by-case basis, over time; and has a different rate, rate structure methodology and process for adjusting those wholesale charges to reflect changes in the cost of service. Furthermore, the city does not control how retail rates are set inside the wholesale customer's service area. While the city has assumed that wholesale customers will pay a proportionate share of the increased costs, this assumption may prove to be optimistic.

The 2005 baseline city retail rate consisted of a monthly billing charge of $2.39 and a commodity rate of $1.33 per 1,000 gallons. There was also a minimum charge, such that no customer paid less than $6.40 per month. For the average residential customer using approximately 64,800 gallons per year, the annual bill in 2005 was approximately $115 per year.

Residential bills are projected to increase by an annual average exceeding 12 percent during the LTCP implementation period. The City-County Council approved a new rate structure on Oct. 31, 2005, that will raise rates approximately 29 percent annually in the years 2006-2008.

Under the U.S. EPA guidance, a key measure of affordability is the Residential Indicator: the ratio of the wastewater cost per household to median household income (MHI). The Residential Indicator is compared to EPA-defined criteria to determine whether costs impose a low, mid-range or high impact on residential users. **Figure 6-2** shows U.S. EPA's Residential Indicator criteria, which define a "low" impact as a cost per household less than 1.0 percent of MHI, a "mid-range" impact between 1.0 and 2.0 percent, and "high" impact as greater than 2.0 percent of MHI. For the forecast period, the residential indicator for Indianapolis is projected over time in **Figure 6-3**.

Figure 6-3 presents the data for three "classes" of households. The first is the Consolidated City, which best represents the city's retail service area. As described earlier in Section 5.0, the consolidation of city and county governments in Marion County left four "excluded cities" that retained some local control. Marion County also contains an independent conservancy district (Ben Davis). Lawrence, Beech Grove and the Ben Davis Conservancy District have wholesale contracts with the City of Indianapolis for sewage treatment services. Southport does not own its collection or treatment systems. Its residents are simply billed as retail customers of the Indianapolis sewer system. The fourth excluded city, Speedway, operates its own sewage collection system and wastewater treatment plant. Several smaller communities outside Marion County also receive wholesale sewage treatment services from the City of Indianapolis. **Figure 6-4** provides a map of Marion County, showing the excluded cities, Ben Davis Conservancy District, township boundaries and out-of-county wholesale customers. U.S. Census data for the Consolidated City includes all of Marion County except the excluded cities of Lawrence, Beech Grove, Southport and Speedway.

Figure 6-3 also shows residential indicators for the median household in Center Township and for a household at or below the poverty level. The Residential Indicator and financial impact on these low-income segments of the service area are significantly greater than they are for the consolidated city service area as a whole.

For the median Consolidated City household, the residential indicator will increase from below 0.5 percent in 2005 to nearly 1.0 percent by 2010 and over 1.5 percent by 2018. This median household will bear a sewer bill exceeding 1 percent of income for 13 years of the forecast period. For Center Township, the city's most populous township, the residential indicator will grow from approximately 0.5 percent in 2005 to approximately 1.30 percent by 2010 and over 2.5 percent (high impact) by 2018. For poverty-level households, the situation is more severe. The residential indicator will rise from nearly 1 percent in 2005 to over 4 percent in 2018.

Based on these projections and using the U.S. EPA guidance, the city anticipates that the residential burden will reach the high end of the medium burden range for the service area's median household in or about 2018. That burden level is projected to persist through the end of the forecast period (2025) and beyond. For the other classes of the city's residential base (Center Township and poverty level households), the burden is projected to be well within the high burden category beginning in approximately 2014 for Center Township and 2010 for poverty-level households. That burden will remain throughout the forecast period and a significant period after December 2025.

The city believes that these projections are reasonable. However, they assume that the share of billable flow allocated to residential customers will remain flat and that wholesale customers will pay a proportionate share of the cost increases. The projections also assume that the share of revenues generated from industrial and commercial customers remains stable, despite a history of declines in base flow over time. Finally, these projections are subject to actual construction costs, which may vary from the city's current projections.

6.3.2 Impacts of Future Competition and Inflation of Capital Costs

Program affordability may be negatively impacted if inflation of the capital costs increases dramatically during this 20-year timeframe. Based on currently available plans, the regional construction market will face significant competition given the large amount of public and private construction anticipated to occur. The city believes this will result in significant price increases for technical services, construction workers, materials and supplies in excess of that in the national construction market. The anticipated level of construction is summarized in **Figure 6-5**. Significant projects include:

- Indianapolis Airport Expansion
- Interstate 465 rehabilitation/reconstruction
- Interstate 69 construction
- New sports stadium/convention center expansion
- Market Square Arena site residential/commercial development
- Indianapolis Rapid Transit investments

Financial Impact	Cost per Household
Low (3)	Less than 1.0 percent of MHI
Mid-Range (2)	1.0 - 2.0 percent of MHI
High (1)	Greater than 2.0 percent of MHI

Note: Low impact equates to strong financial capability; high impact equates to weak financial capability.

Figure 6-2
Residential Indicator Criteria - U.S. EPA Guidance

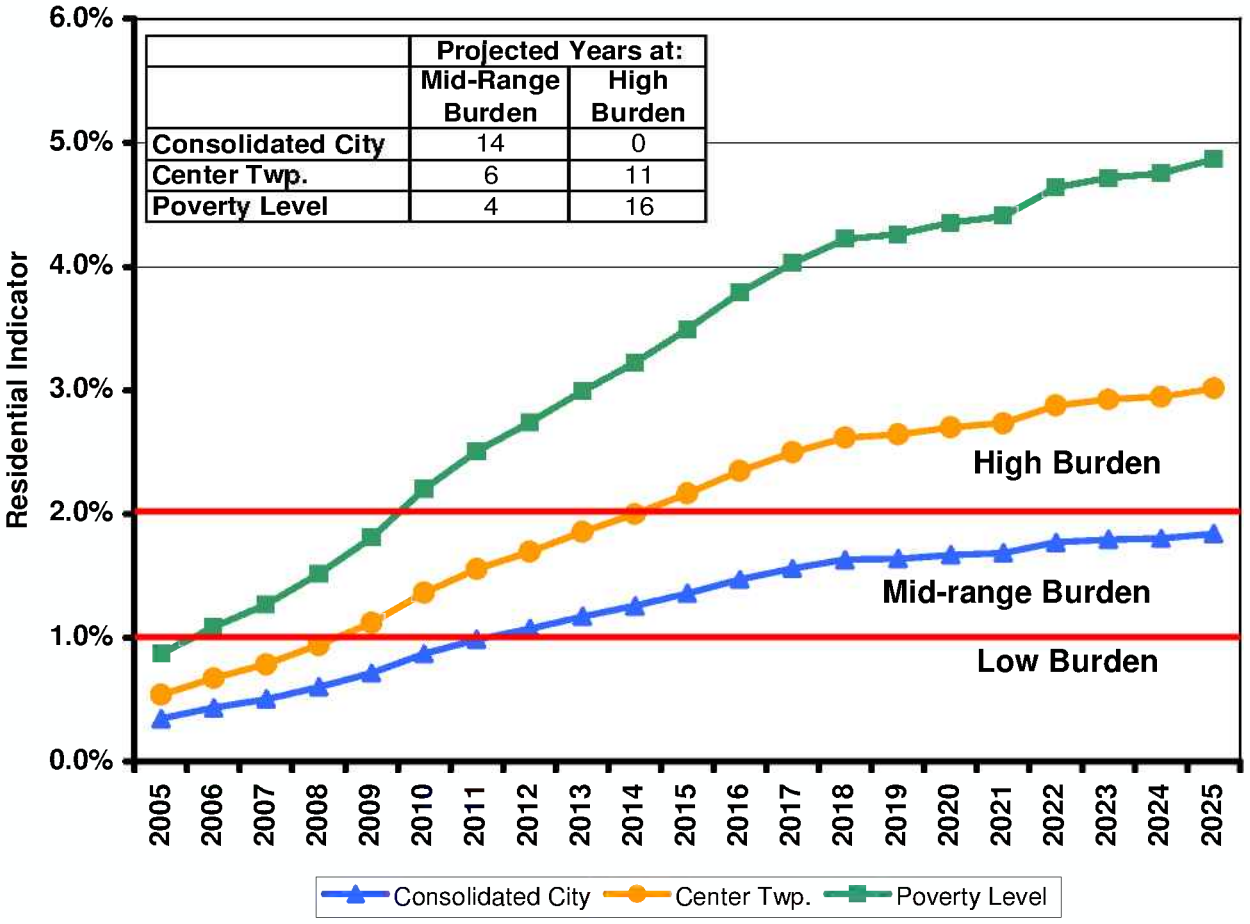

Figure 6-3
Residential Indicator, 2005-2025
Recommended Plan, 20-Year Implementation

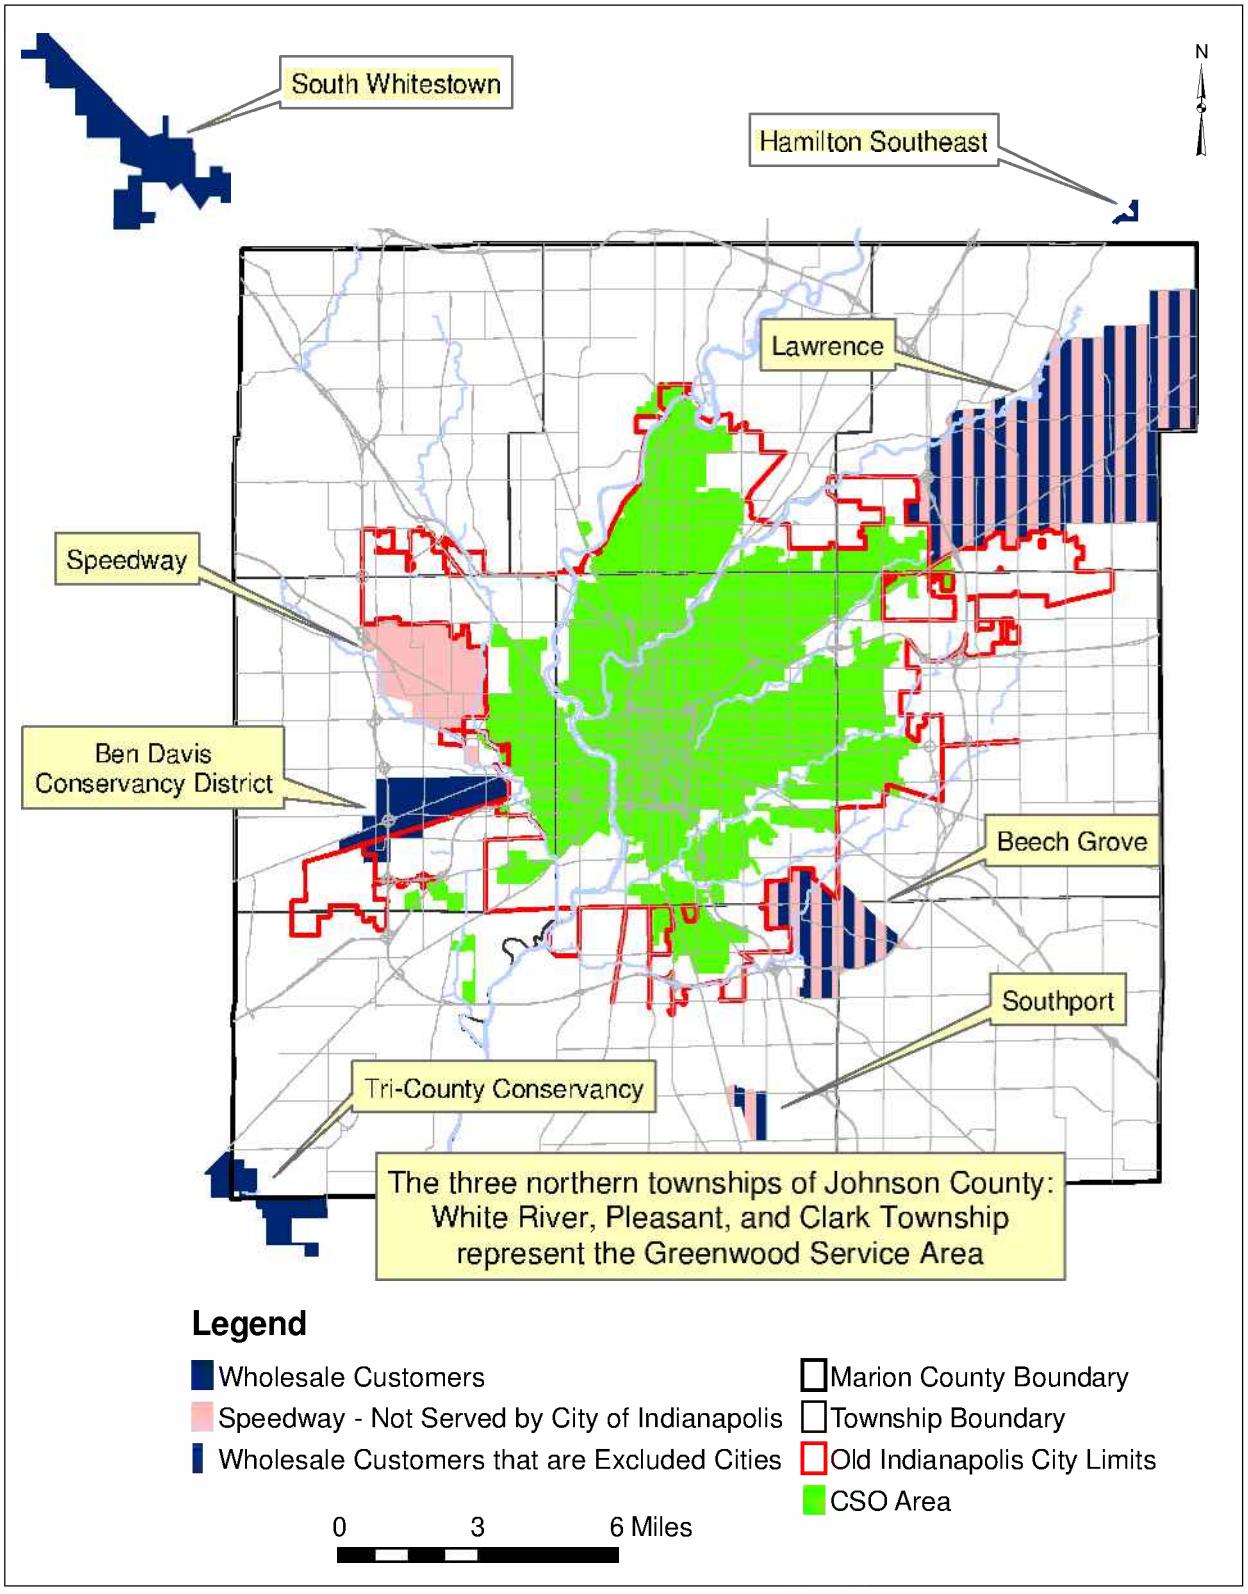

Figure 6-4
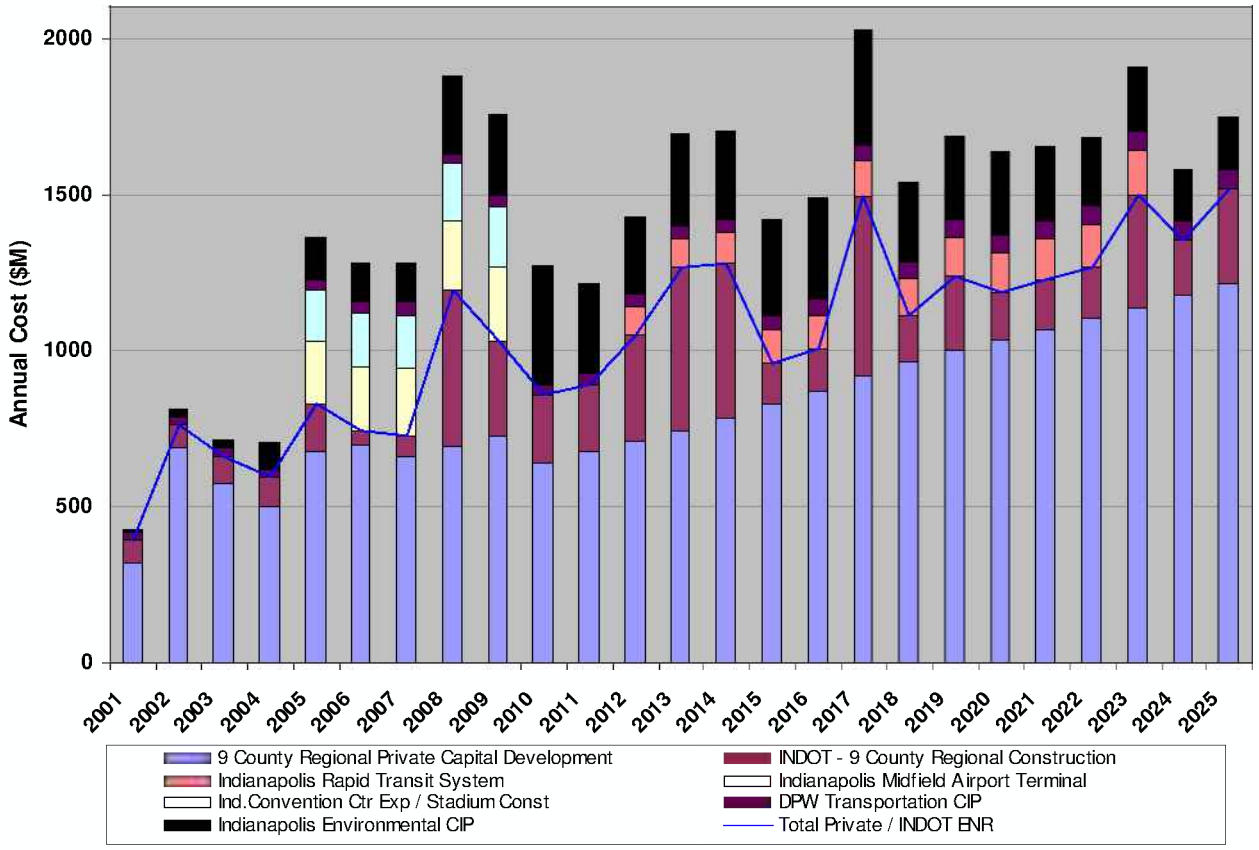
Wholesale Customers



Notes:
Costs shown on this chart are expressed in terms of estimated Engineering News Record Construction Cost Index (ENRCCI) over the 20-year project period.

Figure 6-5
Indianapolis Regional Major Capital Investment Programs / Projects 2001 - 2025
(20-year ENR Indexed)

These projects are in addition to standard infrastructure expenditures in the sectors of roads and bridges, transit and water. The volume of work generated by these projects, along with the city's CSO, sanitary, and transportation programs, will stretch local construction firms to the limits of their equipment and manpower resources. As seen in **Figure 6-5**, construction spending is projected to increase from the historical average of approximately $650 million per year in 2001-04 to more than $1.5 billion per year – nearly tripling on an annual basis.

In addition, the city is concerned that the large number of CSO programs underway at the same time in the Midwest will stretch the specialized construction resources associated with these types of programs. The concern is especially true for tunneling-related activities. **Table 6-2** shows eight Midwestern cities that have estimated CSO control programs totaling approximately $10.6 billion. This is in addition to

Table 6-2
Midwest Cities' CSO Control Programs:
Estimated Costs

City	Estimated CSO Control Program ($Billion)
Cincinnati	$1.50
Toledo	$0.80
Detroit	$1.40
Cleveland	$1.60
Akron	$0.40
Columbus, Ohio	$1.50
Youngstown	$0.40
Pittsburgh	$3.00

the City of Indianapolis's CSO program, and excludes the 103 other CSO plans being implemented by smaller Indiana communities.

Given this high concentration of similar programs in the region, the city expects considerable regional competition for engineering and construction resources. Construction resources can be the most critical component for achieving required implementation schedules.

Given the large amount of anticipated construction and the concentration of CSO-related programs, as well as similar impacts in other areas of the country, the city believes that its capital costs will increase faster than the historic national ENR index. Therefore, these projections assume that capital costs will increase at a rate two percentage points higher than the projected national ENR index during the period 2008 to 2018. In addition, the city anticipates upward pressure on its labor costs for operating and maintaining the sewer system and has assumed that these costs will increase at a rate two percentage points higher than the consumer price index during the same time period.

6.3.3 Financing Assumptions

The projections of burden and the residential indicator are extremely sensitive to assumptions regarding debt. The city has assumed that it will finance its program with a combination of state revolving fund loans and city-issued revenue bonds. The city is assuming that this debt will carry a weighted average interest rate of 6.0 percent with 20-year debt. This assumption is extremely sensitive to:

- The proportion of debt actually placed with the SRF
- Actual market rates over the forecast period

The city's projections assume that the city will fund 10 percent of its CIP through the SRF at an average interest rate of approximately 4.75 percent. This would amount to roughly $25 million per year in SRF loan funding, which is consistent with information provided to the city by representatives of the Indiana SRF program. If the city obtains less than the 10 percent that is assumed, actual rates will increase from current estimates.

The city is also assuming that over the 20-year implementation period, market interest rates do not increase significantly from current levels, and that its general obligation bond rating will not drop below AAA. The weighted average rate of 6.0 percent provides a cushion of approximately 100 to 125 basis points above current market rates. The city acknowledges that in the short term this interest rate assumption is conservative. However, current rates are at historically low levels. Given recent Federal Reserve Board actions, it is clear that rates will be moving up, not down. If the weighted average rates were to increase to 7.0 percent from the current assumption of 6.0 percent, the average cost per household could increase by approximately $60 per year.

6.3.4 Grant Availability

Although Indianapolis will pursue available grant programs, the city's financial analysis does not rely on significant grants to fund CSO controls. The amount of grant funding that may become available is expected to be relatively minor in comparison to the projected capital expenditures for the program. The city encourages the State of Indiana to issue substantial grants for CSO abatement projects, as has been the practice in other states. We also call on Congress to halt the federal disinvestment in grants and loans for municipal wastewater projects.

6.3.5 Income Growth

The city has assumed that incomes in the service area will continue to grow at their historical rate relative to inflation. The city believes that this is an aggressive assumption given changing demographics and other factors impacting income. These are discussed in more detail in the next section.

6.4 U.S. EPA Financial Capability Analysis

U.S. EPA Guidance documents set forth an approach for evaluating financial capability. This section presents the results of that assessment, including replicas of the worksheet/forms contained in the U.S. EPA Guidance. It is important to understand that since the CSO program will most likely be funded by revenue bonds and not general obligation bonds, most of these indicators do not reflect the financial capability of issuing revenue bonds.

The assessment is performed in two phases. Phase 1 determines the "Residential Indicator," described earlier, and Phase 2 develops the "Permittee Financial Capability Indicators," which include six indicators in the sub-categories of Debt Indicators, Socioeconomic Indicators, and Financial Management Indicators.

The U.S. EPA guidance also encourages a community to include additional factors or alternative assessment methods in assessing its financial capability and negotiating the CSO program implementation schedule. Therefore, the city has provided some supplemental information below related to population, employment and property tax reassessments.

As noted earlier, the city's retail service area is essentially the same as the Indianapolis Consolidated City boundaries

Table 6-3
Cost Per Household
U.S. EPA Guidance Worksheet 1

Row	Item	Unit	Peak
	Residential share of total wastewater treatment and CSO costs		
107	Total Revenue Requirement in Peak Year	($)	$ 718,370,000
	Current Revenue Requirement	($)	$65,586,000
	Total Increase	%	995.31%
	2005 Monthly bill	($)	$ 9.57
	2005 Annual bill	($)	$ 114.84
109	Projected Annual Cost per Household ("CPH")	($)	$ 1,258

shown on **Figure 6-4**. All data, unless specifically noted, is for the Indianapolis Consolidated City.

6.4.1 Phase One: The Residential Indicator

The city's methodology and projections described in Sections 6.1 through 6.3 set forth the calculations for the residential indicator.

6.4.1.1 Cost Per Household

Cost per household is summarized in **Table 6-3**.

As described in Section 6.1, the city's projection of the cost per household is a rates-based methodology. That is, the city projects total revenue requirements throughout the forecast period, estimates future rates and then estimates the cost per household based on per-dwelling unit annual water consumption of 65,000 gallons (this estimate is derived from the city's billing records). The determining factors are the revenue requirements and total billable flow. The city is assuming that the volume of billable flow remains relatively constant and that the average consumption per household remains at 65,000 gallons per year.

Table 6-4 calculates the Consolidated City's Residential Indicator: cost per household as a percentage of median household income. As a result of this process, the city has determined that the selected plan (Plan 1-storage/conveyance) at 95/97 percent capture would create a medium burden on residents in the Consolidated City, according to U.S. EPA's definitions.

6.4.1.2 Sub-Area Consideration

The Consolidated City is the city's retail service area, where it has direct control over the rates charged for wastewater service. Like most urbanized areas in the United States, the city has experienced a loss of population, income and employment to surrounding communities.

Table 6-5 shows that Center Township has the largest proportion of households at or below poverty level in the service area. Based on historical trends, the city anticipates that this concentration will continue.

Table 6-5 also shows that 9 percent of households in Indiana live at or below the poverty level, compared to 12 percent in Indianapolis and 24 percent in Center Township. The national percentage is 12.4 percent.

U.S. Census data show that the Indianapolis Consolidated City population grew 6 percent and the number of households grew 9 percent between 1990 and 2000. During this same period, the Center Township population declined about 9 percent and households declined 6 percent, while some other townships showed vigorous growth. However, Center Township continues to be the most populous township, with 159,527 people and 21 percent of the city's households. During this same time period, the Indiana population grew 9 percent and the national population grew 12 percent, indicating that the Consolidated City is lagging behind the state as well as the nation in growth.

Center Township residents, on average, have lower incomes and will experience more economic hardship associated with the CSO Program. The median household income in Center Township in 1999 (latest Census) was $26,435, compared to $40,154 for Indianapolis consolidated city, as shown in **Table 6-5**. The cost per household divided by the lower MHI yields a higher peak year Residential Indicator for Center Township: 2.92 percent vs. 1.78 percent for Indianapolis as a whole. This places residents in Center Township in the high burden category.

Table 6-4
Residential Indicator
U.S. EPA Guidance Worksheet 2

Row	Item	Unit	Indianapolis Value

State of Indiana	$ 41,567	5,334,811	559,484	5,894,295	9%

6.4.2 Phase Two: Permittee Financial Indicators

In the Phase 2 assessment, financial capability is determined by factors assessing a community's financial health and ability rather than by the residential financial burden estimated in Phase 1. The Phase 2 assessment computes six benchmarks, two in each of the following subcategories:

- Debt Indicators,
- Socioeconomic Indicators, and
- Financial Management Indicators.

Figure 6-6 shows U.S. EPA Financial Capability Benchmarks used to evaluate the six indicators. The benchmarks are shown in the left-hand column. A value of "3", "2", or "1" is assigned to a benchmark whose value assessments are "strong," "mid-range," or "weak," respectively.

6.4.2.1 Debt Indicators

The two Debt Indicators are Bond Rating and the Overall Net Debt as a percent of full market property value in the city's service area.

6.4.2.1.1 Bond Rating

This indicator is intended to address a community's general capacity to undertake debt. In January 2005, Standard & Poor's and Moody's Investors Service both rated the city's general obligation credit to be AAA: Negative Outlook. The agencies were concerned about the city's current operating deficit and the growing unfunded pension liability.

Overall the outstanding debt of the city is rated to be sound, and this indicator is considered strong by U.S. EPA criteria, as shown in **Table 6-6**. Standard & Poor's rated the city's revenue bonds AA in December 2004. The city's Sanitary District has outstanding General Obligation and revenue bonds and SRF loans. The 2003 revenue bonds were rated by Fitch Ratings and Standard & Poor's and received a AAA rating based on bond insurance. The SRF loans are rated AA by Standard & Poor's and, in some cases, also by Fitch.

6.4.2.1.2 Net Debt

Net debt is the amount of tax-backed bond debt for all taxing units, including the City of Indianapolis, Marion County, townships, libraries, and schools, that is not supported by revenue from user fees.

Information from the January 19, 2005 research report by Moody's Investors Service was used to develop **Table 6-7**. According to Moody's, the net direct debt as of January 2005 for the City of Indianapolis was $867,475,000. The overlapping debt of the other taxing units attributable to the residents and businesses in the city was $1,439,320,000. Moody's used the assessed value of property in the consolidated city from the 2004 Comprehensive Annual Financial Report statistical section. Because the percent ratio of

Indicator	Strong (3)	Mid-Range (2)	Weak (1)
Bond Rating	AAA-A (S&P) or Aaa-A (MIS)	BBB-A (S&P) or Baa-A (MIS)	BB-D (S&P) or Ba-C (MIS)
Net Debt/Property Value	Below 2%	2% - 5%	Above 5%
Unemployment Rate	>1% below National Ave.	±1% of National Ave.	>1% above National Ave.
Median Household Income	>25% above adj. Nat'l MHI	±25% of adj. Nat'l MHI	>25% below adj. Nat'l MHI
Property Tax/Property Value	Below 2%	2% - 4%	Above 4%
Prop. Tax Collection Rate	Above 98%	94% - 98%	Below 94%

net debt to property value is in excess of 5 percent, this indicator is considered weak by U.S. EPA criteria, as shown in **Table 6-7**.

6.4.2.2 Socioeconomic Indicators

The two Socioeconomic Indicators are Unemployment Rate and Household Income.

6.4.2.2.1 Unemployment Rate

The Unemployment Rate indicator is shown in **Table 6-8**. The Indianapolis monthly unemployment rate for 2004 was 5.63 percent, according to the U.S. Department of Labor, Bureau of Labor Statistics. The national unemployment rate was 5.50 percent and the State of Indiana's was 5.1 percent.

Because local unemployment is between one percentage point more than or less than the national unemployment rate benchmark, this indicator is considered mid-range, according to U.S. EPA criteria.

Table 6-9 shows employment increases and decreases in Indianapolis for various industries between 1990 and 2000. **Figure 6-7** shows the loss of employment from some key Indianapolis employers during the past four years due to closures and downsizing. The transportation decreases are predominantly related to the airline cutbacks.

6.4.2.2.2 Household Income

The Household Income indicator is related to the Residential Indicator in that both consider MHI. While the Residential Indicator compares MHI with the cost per household, here the Household Income indicator compares MHI with national MHI as a benchmark measurement of relative wealth or poverty as of the date of the General Census. Both MHI calculations are adjusted to 2025 numbers.

The MHI shown in **Table 6-10** is the same value used in **Table 6-4** for the Residential Indicator. National MHI is adjusted by the same factor, also as shown in **Table 6-10**.

Because local MHI is more than 75 percent of national MHI and less than 25 percent greater than national MHI, this indicator is judged to be mid-range and assigned a value of "2" according to the U.S. EPA benchmark criteria.

6.4.2.3 Financial Management Indicators

The two Financial Management indicators are Property Tax Revenues and Tax Collection Efficiency. Property tax revenues are collected by multiple taxing jurisdictions for residents within the consolidated city, including the City of Indianapolis, Marion County, the libraries, Marion County Health and Hospital Corporation, the townships, and the school districts.

6.4.2.3.1 Property Tax Revenues as Percent of Full Market Value

In the city's service area, property tax revenues collected in the 2004 fiscal period were $1,135.5 million. Property value shown in **Table 6-11** is about $36.8 billion. This information was obtained from the Marion County Auditor's Office, based on the Certified Assessed Valuations provided by the Indiana Department of Local Government Finance.

The calculated property tax revenue indicator for the city's service area is between 2 and 4 percent, suggesting a mid-range local financial capability under the U.S. EPA criteria.

In December 1998, the Indiana Supreme Court ruled that the state's method of property tax assessment was unconstitutional and required that the state implement a more market-based approach to valuation. The new rules for assessment

were implemented in 2003, resulting in a substantial shift in tax burden from business to residential taxpayers.

In 2002, the Indiana General Assembly adopted a significant tax reform package, including provisions to phase out certain business personal property taxes, place caps on certain local tax levies, and institute property tax relief measures for homeowners to mitigate the impact of the new assessment methodology. As a result of the combined impact of reassessment, appeals and tax reform, the city has seen a real decline in both assessed value and property tax revenue.

6.4.2.3.2 Tax Collection Efficiency

The final U.S. EPA Financial Guidance Phase 2 indicator is the rate of property tax collection. The 2004 property tax collection rate presented in **Table 6-12** represents the current taxes collected divided by property taxes levied for the Consolidated City. These amounts were provided by the Marion County Auditor's Office.

In the city's service area, tax collection efficiency is 102.79 percent. Because this figure is above 98 percent, it is indicative of a strong financial capability and receives a score of "3." However, the 102.79 percent efficiency rate includes collections for delinquent taxes. Without delinquencies, the collection rate in 2004 was 97.17 percent, which would result in a mid-range score of "2."

6.4.2.4 Summary of Phase 2 Indicators

The values and scores of the six Phase 2 Evaluation indicators are compared in **Table 6-13**. Overall, the unweighted average score for the Phase 2 Evaluation is 2.167.

6.4.3 Summary of Financial Capability Indicators

The Phase 1 Residential Indicator has a value of 1.84 percent of adjusted MHI and the Phase 2 Permittee Financial Capability Indicators have an unweighted average of 2.167, as shown in **Table 6-14**. These two converge on the Financial Capacity Matrix (**Figure 6-8**) and indicate a medium burden for the service area. However, due to the lower MHI in Center Township, residents in this area face a high burden.

Strong (above 2.5)	Low Burden	Low Burden	Medium Burden

Service Area-wide indicates a medium burden.

Center Township indicates a high burden.

Figure 6-8
Summary of Financial Capability Indicators: U.S. EPA Guidance

6.5 Summary

Implementing the long-term control plan will place a financial and economic burden on the City of Indianapolis. During the next 20 years, the city's wastewater revenue requirements will increase by approximately 12 percent per year, on average. This will significantly impact industrial, commercial and residential sewer rates. The impact on disadvantaged residents in Center Township and those living below the poverty level also must be considered. Based upon U.S. EPA guidance, the residential burden for the retail service area will reach the medium burden category. In Center Township and for people living below poverty, the burden will fall into the high burden category.

Following U.S. EPA's guidance document, the city is facing a medium to high burden, which is an important factor in the plan's implementation schedule of 20 years. A more aggressive schedule is impracticable for constructability reasons and would further increase the financial burden on residential customers.

Based upon this analysis, the city has selected a level of control for the Plan 1 systemwide alternative and developed a 20-year implementation schedule. The selected plan's individual components, projected costs and benefits, and implementation schedule are further described in Section 7.

Case Study #4: Anderson, Indiana CSO LTCP
Attachment 4-1
Anderson 2010 FCA

Section 7 Financial Capability Assessment

7.1 Introduction

The Indiana Department of Environmental Management (IDEM) and the United States Environmental Protection Agency (EPA) recognize that meeting the requirements of the Clean Water Act and the state water quality standards will present major challenges for most Combined Sewer Overflow (CSO) communities. One of the most significant challenges is finding a way to finance CSO controls without placing an undue burden on citizens and industries. In many communities, including the City of Anderson ("City"), the requirements contained in the Long-Term Control Plan (LTCP) can represent the single most costly public works project ever undertaken or likely to be undertaken by the current generation. Although EPA has provided communities with grants for wastewater projects in the past, no dedicated grant programs for CSO control are currently available.

The regulators also realize that among the many factors affecting the financial evaluation, the implementation and scheduling of the CSO-related projects is directly tied to a community's ability to reasonably afford proposed remediation activities. Consequently, both agencies require a comprehensive affordability analysis within the LTCP to determine its effect on both the current and future fiscal well being of any CSO community.

Therefore, the following affordability analysis discussion will focus on numerous integrated financial and socioeconomic issues such as:

- Median household income
- Total annual wastewater and CSO costs per household as a percent of the median household income
- Fixed service costs in addition to wastewater and CSO costs that impact affordability
- Residential Indicator as a percent of the median household income
- Overall net debt of the City as a percent of full market property value
- Term of current total bond indebtedness

- The City's current bond rating
- The City's ability to assume more debt
- Property tax revenues as a percent of full market property value
- Property tax collection rate
- City unemployment rate.

7.2 Factors Determining What Residents Can Afford

Federal CSO guidance documents suggest that the financial capability assessment be developed in two phases. The first phase involves calculating a Residential Indicator, and the second phase involves analyzing the City's Financial Capability Indicator.

The Residential Indicator considers the cost per household expended on wastewater collection and treatment, expressed as a percentage of median household income (MHI). The Financial Capability Indicator assesses community-wide factors such as the City's debt burden, socioeconomic conditions, and financial operations. Once these two financial indicators are developed, they are entered into a financial capability matrix (developed by EPA) to assess the overall financial burden placed on individual households and the City by the wastewater/stormwater treatment and CSO compliance measures. These two values, the Residential Indicator and the Financial Capability Indicator, are merely indicators used to assist the communities and regulators in making decisions. These indicators are based on standard calculations developed by EPA to compare the financial impacts of the CSO program for different communities across the nation. The Residential Indicator's cost per household should not be confused with a monthly or annual sewer user fee. The cost per household does not take into account all factors that are incorporated into an actual sewer rate study, such as project scheduling, account balances, debt service coverage, and industrial vs. residential rates. For these reasons, the cost per household should be considered simply an indicator of the financial impact that the current and proposed wastewater and CSO controls will have on residential users.

The regulatory agencies also encourage the City to report any information that will have a financial impact on CSO compliance.

7.2.1 Phase 1: Calculation of the Residential Indicator

Developing the residential indicator requires determining the current and proposed wastewater treatment and CSO project costs on a per-household basis. Once the total costs are developed, the cost per household is calculated as a percent of median household income. In addition, in the case of the City, certain other service and utility costs that significantly impact the affordability for residents must be taken into account. These other factors, further discussed below, include, sixteen percent (16%) decrease in population since 2000 and a significant loss of large employers. This Residential Indicator is then used in an EPA matrix to determine whether the CSO control program will produce a high, medium, or low impact on the community's residential users (Table 7-1).

Table 7-1 EPA Residential Indicator Financial Impacts

Financial Impact	Residential Indicator (CPH as % MHI)
Low	Less than 1.0 Percent of MHI
Mid-Range	1.0 - 2.0 Percent of MHI
High	Greater than 2.0 Percent of MHI

In the case of the City, the calculation of the Residential Indicator, based upon estimated project scenarios revealed that the estimate of various ranges of project costs resulted in a residential indicator score that was greater than the EPA "high" level guidance of two percent (2%) of MHI. This provides a conclusion that the estimated ranges of project cost were not affordable for the residents of the City. We therefore analyzed the range of projects that could be provided through a cost per household equal to no more than 2% of MHI for the City of Anderson.

7.2.1.1 Residential Indicator Calculation

The residential indicator represents the annual wastewater and CSO control costs per household as a percent of adjusted median household income. It is typically calculated as an amount of projected cost per household (CPH) as a percentage of the average adjusted MHI. In the case of the City of Anderson, because the residential indicator calculated under the normal methodology resulted in an analysis that showed the projected project costs to be unaffordable, the City determined to calculate the project costs that could result from a residential indicator of 1% to 2%, which is the "Mid–Range" in the EPA guidance.

EPA guidelines suggest that the financial impact on a city is low if the CSO and wastewater treatment costs per household fall below one percent (1%) of median household income. Impacts are in the mid-range if costs fall between 1% and 2% of MHI. Costs are considered high when they exceed 2% of the adjusted MHI. While 1-2% of MHI may appear to be a relatively small number, the impacts may be quite large. For example, the average family only saves about 3% of disposable household income each year. Therefore, 2% of household income represents two-thirds of family savings that could otherwise be used for new homes, college educations, or a secure retirement. These levels can hardly be considered insignificant.

The City and the project team analyzed the amount of capital investment dollars that would trigger the 2% residential indicator for the City. These calculations show that City residents would reach the 2% threshold at approximately $161 million in capital costs (Table 7-2).

Table 7-2 Calculation of Cost Per Household Estimate and Residential Indicator

ANDERSON MUNICIPAL SEWAGE WORKS
Anderson, Indiana

Calculation of the Cost Per Household Estimate and Residential Indicator

Line No.	Current Wastewater Costs - Excluding Revenue Funded Capital Projects	Sensitivity Analysis Financial Impact Baseline - Low	2%

	Annual Sanitary District Bond Service	743,861	743,861
	Annual Energy Audit Lease Payment	59,630	59,630
	HELP Program Lease Payment	14,344	14,344
102	Total Current Wastewater Costs	12,050,360	12,050,360
	Projected CSO Costs (Current Dollars)		
103	Estimated Annual Operation and Maintenance Expenses (3)	-	2,039,720
104	Annual Debt Service on CSO Projects to be Funded (4)	-	12,913,121
105	Total Projected CSO Costs (Current Dollars)	-	14,952,841
106	Total Current and Projected Wastewater and CSO Annual Costs	$ 12,050,360	$ 27,003,201
	Residential Factor Calculation		
	Total Annual Residential Wastewater Flow (Gallons) (5)	1,349,442,864	1,349,442,864
	Divided by: Total Annual Wastewater Flow (Gallons) (5)	2,049,409,296	2,049,409,296
	Residential Factor	0.6585	0.6585
107	Residential Share of Wastewater and CSO Annual Costs	$ 7,935,162	$ 17,781,608
108	Total Number of Households in Service Area (6)	22,246	22,246
109	Annual Wastewater Cost Per Household (CPH)	$ 356.70	$ 799.32
	Divide by: Twelve	12	12
	Total Monthly "Cost" Per Residential User	$ 29.73	$ 66.61
	Calculation of Residential Indicator		
	Adjusted Median Household Income (MHI) of the City of Anderson Service Area	$ 39,937	$ 39,937
205	Residential Indicator (CPH as a Percent of Adjusted MHI)	0.89%	2.00%
	Financial Impact	Low	High
	CSO Projects to be Funded		$ 160,926,000
	Present Worth of Operation and Maintenance Expenses	To be provided by Greely & Hansen	
	Total Present Value of CSO Plan		$ 160,926,000

IDEM specifies that a calculation similar to the EPA Residential Indicator be performed to derive the benchmark calculation. The State refers to this benchmark as the Municipal Affordability Screener, which is calculated as follows:

MAS = *[Annualized Project Cost per Household / Annualized Median Household Income] x 100%*

Solving for a MAS of 2% and using the MHI of the City's Service Area of $39,937, results in annual "high" level affordable monthly costs of $66.61.

7.2.1.2 Cost Per Household

Under EPA guidance, developing the cost per household (CPH) begins by adding current annual wastewater treatment (WWT) costs to the projected annual costs for proposed wastewater and CSO controls. In addition, the City has incorporated other fixed service and utility costs affecting City residents. Once the total annual costs are determined, the residential portion was calculated based on the percentage of flow attributed to the residential customers or other appropriate allocation factors.

Current WWT Costs: EPA defines current WWT costs as the current annual wastewater operating and maintenance expenses (excluding depreciation) plus current annual debt service. Expenses for funded depreciation, capital replacement funds, or other type of capital reserve funds are not to be included in the current WWT costs since they represent a type of savings account rather than an actual operation and maintenance expense. The annual debt service for the Sanitary District is also included because the projects funded by the Sanitary District's bond issue were for improvements to the Anderson Municipal Sewage Works and Stormwater Utility. In Table 7-2, column 1, line 102, the City's annual operation and maintenance (O & M) expenses (excluding depreciation) are shown.

Projected Additional WWT and CSO Costs: The projected total WWT and CSO costs for various levels of CSO control were developed in Section 4.0 of this report. As shown earlier, the City

developed its level of project by estimating the supportable amount of project costs as shown on Table 7-2. For purposes of this analysis, we have shown an estimated project cost of $161 million in capital project costs.

Line 104 column 2 on Table 7-2 calculates the annualized debt service costs for a $161 million capital project, financed over 20 years at five percent (5%) interest. Recently, the City has been able to issue debt in the four percent interest range, however, statistics show that the typical interest rate range over time averages to five percent. For the purposes of this analysis a rate of five percent has been used and, therefore, annualized debt service would be calculated as follows:

Annual Debt Service Costs (line 104)

$$= \text{Total CIP Cost} \times \text{Annualization Factor}$$

$$= \$1.0\ B \times \frac{\text{Interest Rate}}{(1 + \text{Interest Rate})^{\text{Years}} - 1} + \text{Int. Rate}$$

$$= \$1.0\ B \times \frac{.05}{(1+.05)^{20} - 1} + .05$$

$$= \mathbf{\$12,913,121}$$

Based on engineering and operation experience, an estimate of the annual operation and maintenance (O & M) costs were developed and entered on Line 103 of Table 7-2

Residential Share of Total WWT and CSO Costs: EPA guidance suggests computing the residential share of total costs by multiplying the percent of total wastewater flow attributable to residential users by the total costs:

Residential Share of Costs (line 107)

$$= \text{Total Costs} \times \frac{\text{Residential Wastewater Flow}}{\text{Total Wastewater Flow}}$$

The project team calculated the percentage of residential flow to total flow based upon consumption data collected from December 2006 through November 2007. Based upon this data, the calculation determined that the Annual Residential Wastewater Flow percentage was 65.85%. In order to calculate the residential portion of the costs, the team used the following formula:

Residential Share of Costs (line 107)

= (*Annual Residential Wastewater Flow / Total Annual Wastewater Flow) x (Current WWT O & M + Estimated CSO O & M + Projected CSO Debt Service)*

= *(1,349,442,864 M / 2,049,409,296 M) x ($12,050,360+$2,039,720+ $12,913,121)*

= **$17,781,608**

Total Annual WWT and CSO Cost per Household (CPH): The cost per household is calculated by dividing the Residential Share of Costs by the total number of households served by the system. For this reason, Line 109 column 2 of Table 7-2 is calculated as follows:

Annual Cost per Household (line 109)

= *Residential Share of Cost / Households Served*

= *$17,781,608/22,246*

= **$799.32**

The annual cost per household can be converted to a monthly CPH by simply dividing by 12:

Monthly CPH = $799.32 / 12 months = **$66.61**

In addition to WWT and CSO CPH, additional pressures exist on the residents of the City that create an impact on the affordability of the overall CSO project. Recent shortages in electricity and gas have caused intense pressures on local residents who cannot meet their utility bill obligations. Anderson Municipal Light and Power has seen recent summer spikes in spot market electricity costs which are directly passed through to the consumer. The Anderson

Utility Office reports that they have recently had to readjust their budget and guidelines due to the increased number of cases and size of transfer payments necessary through the Energy Assistance Program due to increased gas bills and fuel oil bills for winter heating. From calendar year 2006 to 2007, the amount of revenue received by the City from energy assistance increased by 32%. The increase in revenue continued from 2007 to 2008 by an additional 6%. The current economic situation will likely cause this to increase again from 2008 to 2009.

7.2.1.3 Median Household Income

The second step in developing the Residential Indicator is determining an adjusted median household income (MHI) for the sewer service area. Guidance documents suggest two methods for calculating the Median Household Income: averaging and weighting.

Averaging Method: This method uses the most recent MHI and inflates it to the current year according to the Consumer Price Index. The sewer service area for the City of Anderson includes the communities of Anderson, Chesterfield, Edgewood and Daleville. The MHI for all households in the City's sewer service area, based on information supplied by the U.S. Bureau of Census, was $33,739 in 2000. Using Consumer Price Index increases of approximately 3 percent per year, the adjusted 2007 MHI for the service area would be approximately $39,937. (See Table 7-3.)

Table 7-3 2007 Median Household Income for Anderson

	United States	City of Anderson	Line No.
Census Year 2000 MHI (1)	$ 41,994	$ 33,739	201
MHI Adjustment Factor	1.2101	1.1837	202
Adjusted MHI	$ 50,817	$ 39,937	203

(1) 2000 Census MHI is based on 1999 Income

The EPA guidelines also suggest comparing the City's MHI with the United States MHI. The United States MHI in 2000 was $41,994. When updated to 2007 values, the national MHI would be approximately $50,817. Table 7-3 shows the adjusted Anderson MHI compared to the national MHI for 2007.

7.2.2 Phase 2 – Calculation of Financial Capability Indicators

The second phase of the financial capability assessment involves calculating a Financial Capability Indicator for the City of Anderson. The indicator includes six factors that assess debt, socioeconomic, and financial management conditions in the community. The six factors are:

- Bond rating
- Total net debt as a percentage of full market property, and real estate value
- Unemployment rates
- Median household income
- Property tax revenues as a percentage of full market property value
- Property tax collection rate

For each measure, the City was given a score of three (strong), two (mid-range), or one (weak), according to EPA-suggested standards. Table 7-4 presents the six factors and the criteria that determine whether a community is strong, mid-range, or weak in each category.

Table 7-4 Financial Capability Indicator Benchmarks

Indicator	Strong (1)	Mid-Range (2)	Weak (1)
Bond Rating	AAA_A (S&P) or Aaa-A (Moody's)	BBB (S&P) or Baa (Moody's)	BB-D (S&P) or BaC (Moody's)
Overall Net Debt as a % of Full Property Value	Below 2%	2% - 5%	Above 5%
Unemployment Rate	More than 1% Point Below National Average	Plus/minus 1% Point of National Average	More than 1% Point Above National Average
Median Household Income (MHI)	More than 25% Above Adjusted National Average	25% of Adjusted National Average	More than 25% Above Adjusted National Average
Property Tax Revenues as a % of Full Markety Property Value	Below 2%	2% - 4%	Above 4%
Property Tax Collection Rate	Above 98%	94% - 98%	Below 94%

The Matrix was provided in the EPA Combined Sewer Overflows - Guidance for Financial Capability Assessment and Schedule Development

An overall indicator is then derived by scoring each indicator for each category, and then dividing the sum by six to develop a single value. The resulting Financial Capability Indicator is then used to determine the level of financial burden on the City as a whole. The following section analyzes each of the six factors for the City of Anderson.

Bond Rating: According to Crowe Horwath LLP ("Crowe"), the City's financial advisor for the City has recently been rated by several bond-rating agencies. Standard & Poors (S&P) gave Anderson a "BBB+" rating and Moody's Investor Services ("Moody's") an "A3" rating for sewage revenue bonds in 2007. S&P downgraded the Sewage Works bonds ratings in November 2005 and affirmed the BBB+ rating in May 2007. Due to this recent downgrade and the split in ratings between Moody's and S&P, Anderson will receive a mid-range score for this indicator.

Total Net Debt as a Percentage of Full Market Property and Real Estate Value: Table 7-5 presents the direct and overlapping debt as a percent of the full market value of property in the

City. This indicator is often referred to as the "property tax burden" since it indicates the funding capacity available to support debt based on the wealth of the community. The City receives a weak score for this factor since the calculated percentage is 9.43%.

Unemployment Rates: According to EPA guidelines, the seasonally adjusted unemployment rate for the municipality should be compared to the adjusted rate for the U.S. A variance of greater than 1 percent from the national rate indicates a weak financial capability. The City maintained an unemployment rate of 5.5 percent for 2006, compared to a seasonally adjusted national unemployment rate of 4.3 percent. This gives the City a weak score for unemployment (See Table 7-5).

Median Household Income: Median household income was discussed earlier in calculations of the Residential Indicator. EPA guidelines require a comparison of the community's MHI to the adjusted national MHI. The City of Anderson's average median household income is $39,937 Because the City of Anderson's MHI is within + 25 percent the national MHI of $50,817, Anderson receives a mid-range score for this factor (See Table 7-5).

Property Tax Revenues as a Percentage of Full Market Property Value: The assessed valuation of property in Anderson is approximately equal to the full market value. Therefore, the total real estate and property tax levy for all tax districts is approximately 2.9 percent of full market value. The financial capability assessment makes no provision for measuring a local tax burden other than the personal property and real estate taxes. The City receives a mid-range rating for this factor (See Table 7-5).

Property Tax Collection Rate: Personal property and real estate tax collections are reported to be approximately 94.95 percent in 2006, as presented on Table 7-5. This collection rate is classified as mid-range by the EPA property tax collection rating criteria.

7.2.2.1 Summary of Permittee Financial Capability Indicator

Table 7-5, Summary of Financial Capability Indicators, summarizes the financial indicators for the City of Anderson. Therefore, the City of Anderson received a financial capability rating of 1.67. The City falls in the mid-range category for the financial capability indicator.

Table 7-5 Financial Capability Indicators

ANDERSON MUNICIPAL SEWAGE WORKS
Anderson, Indiana

Financial Capability Indicators

		Value	Weak, Mid-Range or Strong	Score
Bond Rating		Moody's "A3", S&P "BBB+"	Mid-Range	2
Overall Net Debt as a Percent of Full Market Property Value				
Direct Net Debt as of December 1, 2006	$	1,530,000		
Add: Debt of Overlapping Entities as of December 1, 2006		151,743,670		
Overall Net Debt as of December 1, 2006	$	153,273,670		
Divided by: Estimated Market Property Value (True Tax Value) Payable Year 2006	$	1,625,046,142		
Overall Net Debt as a Percent of Full Market Property Value Payable Year 2006		9.43%	Weak	1
Average Unemployment Rates for 2006				
City of Anderson Average Unemployment Rates for 2006		5.5%		
Less: National Average Unemployment Rates for 2006		4.3%		
Difference of Anderson to the National Average Unemployment Rates for 2006		1.2%	Weak	1
Median Household Income (MHI)				
City of Anderson Adjusted MHI from 2000 Census	$	39,937		
National Adjusted MHI from 2000 Census	$	50,817		
Service Area MHI Comparison to National MHI		-21.41%	Mid-Range	2
Property Tax Revenue as a Percent of Full Market Property Value

Financial Capability Indicators Matrix Average			Mid-Range	1.67

7.3 Financial Capability Assessment Summary

Under EPA guidelines, the results of the residential indicator and permittee financial capability indicator analyses are combined in a Financial Capability Matrix to evaluate the financial burden that CSO controls may impose on a permittee. The matrix is used by permittees and EPA and state authorities to establish "reasonable and workable CSO control implementation schedules." The Financial Capability Matrix is presented on Table 7-6. It demonstrates that spending $161 million in CSO control costs would impose a financial burden on the City that is on the border between the medium and high ranges. Any increase in costs, which are anticipated as the project progresses, would put the financial burden squarely in the high range. IDEM draft guidance suggests that further analysis is needed for communities facing a medium burden to determine the extent of the social and economic impacts of CSO controls. Additional analysis of financial conditions in Anderson is provided in the following text.

Table 7-6 Financial Capability Matrix

Permittee Financial Capability Indicators Score	Residential Indicator (Cost per Household as a percentage of MHI)		
	Low (below 1.0 %)	Mid-Range (between 1.0 and 2.0 %)	High (greater than 2.0 %)
Weak (Below 1.5)	Medium Burden	High Burden	High Burden
Mid-Range (Between 1.5 and 2.5)	Low Burden	Medium Burden	High Burden
Strong (Above 2.5)	Low Burden	Low Burden	Medium Burden

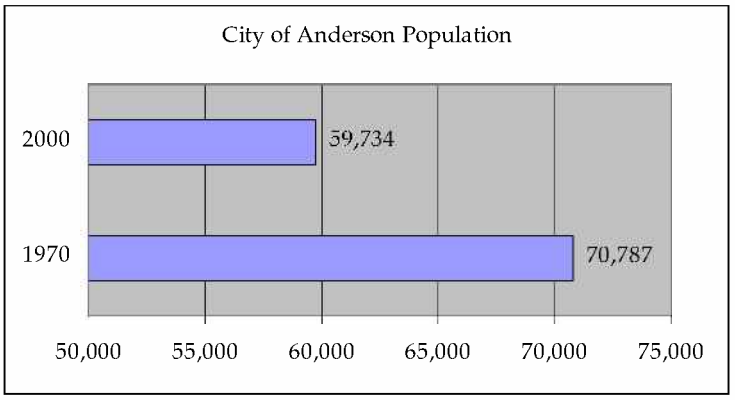
7.4 Anderson Demographics

The State and Federal CSO guidance documents recognize the need to consider a community's demographics when assessing its citizens' ability to afford improvements to wastewater treatment plants and sewers. The following demographic analysis includes discussions of the City of Anderson to accurately portray the socioeconomic, demographic, and employment conditions within the sewer service area.

7.4.1 Population of Anderson

U. S. Census data show that the City of Anderson's population decreased sixteen percent (16%) between 1970 and 2000, from 70,787 persons to 59,734. The estimated population for 2006 based upon U.S. Census statistics is 57,496 (Table 7-7).

Table 7-7 Anderson Population per U.S. Census



7.4.2 Employment Trends

Future income growth in the City and the surrounding communities depends upon prospective economic trends, driven in large part by employment. The affordability of CSO compliance is tied to such economic trends. If the economy is robust because of increased employment, median household income levels could rise, and the City would be able to afford higher compliance costs. If employment falls in a weak economy, residential households will bear a greater financial burden.

In the past few years, the City has lost many large employers. The City has recently attracted Nestle to the area. The large investment by Nestle is anticipated to add jobs to the community. While such investments indicate a recovering economy for the City, it is important at this time that the City is competitive with other communities in order to attract such investment. Undue burden in the form of utility rate increases may impact the City's ability to attract additional investments and therefore additional jobs.

7.5 Implementation Schedule

Both the EPA and IDEM have allowed ratepayers and permittees who are highly burdened by CSO compliance costs 15 to 20 years to fully address and complete capital projects. In cases where a high burden on the community is proven, permittees have been allowed a 20-year compliance schedule. The City believes that more than $161 million (including capital and O & M) will be spent to meet CSO control goals. As a result, the community burden from the Financial Capability Matrix would be pushed into the high range. In order to control the burden on the residential sewer users, the City of Anderson is proposing a 20-year implementation schedule for CSO controls.

The City realizes that the final CSO control schedule must be negotiated among the City, IDEM, and EPA. These negotiations will be based on the specific circumstances of the City's environmental and financial situation, plus the specific nature of any engineering and construction requirements that have been outlined in this LTCP. It is vital to develop an LTCP schedule that considers the overall increased financial burden on Anderson.

7.6 Funding

Funding of the CSO-related projects could be obtained through a number of different avenues. Not all projects need to utilize the same avenue of funding. The funding options available to the City could include the following:

Bonds: Bonds are promissory notes that could be issued, or sold, by the City to raise the funds to pay for the CSO project. This type funding is typically used for projects requiring large amounts of capital. Bonds typically have fixed payment schedules of 20 years, with the payments of interest and principal being made semi-annually. Interest rates of bonds are affected by the City's indebtedness and perceived ability to repay the bond. Several forms of bonds are available such as revenue bonds, general obligation bonds, moral obligation bonds, double-barreled bonds, and bonds available through state bond banks. Each bond type has specific advantages and disadvantages to the community.

Loans: Loans are another means of funding CSO-related programs. Loan interest rates vary according to each loan program. Loan programs vary in type, with some loan programs available primarily to small to mid-sized communities. Loan availability is based, in part, on the ability of a community to repay the funds it borrows. Depending on the specific municipality, loans are available from the state revolving fund (SRF) program, rural utility service, CoBank, and other commercial lending institutions. Each source of loans has different requirements, benefits, and limitations.

Grants: Traditionally, EPA grants were used for wastewater project funding. However, this funding source is very limited and the program has been replaced with a reliance on SRF loans and other funding options. Most current grant programs are designed to provide assistance for small and economically disadvantaged communities. While grants do not have to be repaid, they are not a reliable source of project funding, their requirements are extremely lengthy and complex, and they typically add both conditions and cost to projects. While the City plans to pursue both state and federal grant sources, grants are not likely to play a major role in funding the CSO program, given the project cost.

7.6.1 Grant and Loan Availability

As previously discussed, grant programs have been reduced significantly over the years and those programs currently still in place are very restrictive. Although the City is reviewing the availability of grant programs, at this time the City is not placing significant reliance on grants to

fund CSO controls. The amount of grant funding available is relatively minor in comparison to the anticipated capital expenditures for the program.

Ideally, the City of Anderson would prefer to use SRF loans to finance most CSO program projects. The SRF program would make funds available to the City at relatively low interest rates. However, there are no guarantees by the State of Indiana that SRF monies (or amounts in excess of $161 million) will be available for the City to finance the entire proposed program. Therefore, this financial capability assessment has been based on the assumption that the City will finance the project under the current bond rate.

Additionally, the City's Sewage Works currently has an "A3" and "BBB+" bond rating. The bond rate is based on the current outstanding debt, the economic condition of the City, and ability of the City to repay the debt. If the City incurs significant amounts of additional debt, the debt rating of the City and/or Sewage Works could be reduced, which could increase the interest rates paid for the bonds. A preliminary sensitivity analysis on the project indicates significant financial impacts as higher interest rates are incurred. This net effect would negatively impact sewer users in addition to potentially increasing interest costs to all other non-related projects that the City might fund through bonding programs.

7.6.2 Other Viable Funding Mechanisms

Few other viable funding mechanisms are available to fund wastewater projects. Some communities use a portion of property taxes to supplement user fee funding of capital improvements. However, the use of property taxes in this application does not place the burden of repayment equitably on the sewer system users. As an example, a single-family residence having a higher value, and consequently paying a higher amount of property tax, would not necessarily create a larger burden on the sewer system than a smaller single-family residence. In addition, property taxes would impose costs on property owners who are not connected to the sewer system, such as residences on septic systems. Therefore, the use of property taxes to fund wastewater system improvements does not provide a direct link between services and costs as does a system based on water usage and type of discharge.

7.6.3 Projected Residential, Commercial, and Industrial User Fee Impacts

The actual impact of the CSO controls on sewer user fees will depend on many factors. To cover anticipated design, engineering and construction costs during the first five years of the project, the City implemented a rate increase. The funds generated by this increase will help fund initial treatment plant upgrades as well as design and engineering work for CSO controls recommended in this LTCP. Beyond the initial five-year period, the impact on sewer user fees is difficult to predict. Actual user fees will depend on the final plan approved by IDEM and EPA, sources of funding, the interest rate and time allowed to repay any loans, and potential changes in technology that might reduce costs over time.

Crowe, the City's rate consultant, has analyzed potential impacts on residential sewer user rates based upon a 20-year implementation schedule using a variety of assumptions. This analysis estimates that residential sewer user fees would rise from their current average of $30.09 per 700 cubic feet to $121.01 per 700 cubic feet by 2029.

Because of rate increases, the largest industrial dischargers may evaluate the installation of on-site treatment or recycling facilities, which would both reduce wastewater flow in the sewer system and also reduce the projected cash flow to the City for the CSO project. If industrial rates are not comparable to other cities, some industries may re-evaluate expansion or new business startups in the City's service area. Loss of existing industrial revenue and lack of new growth could lower projected revenues, causing the project to be scaled back or causing rates to rise more than expected for the remaining ratepayers.

7.7 Summary

Using EPA and IDEM guidelines, the project team has analyzed the City's financial capability to bear the costs of proposed CSO controls. This included developing the EPA-defined cost per household as an indicator of the project's burden on citizens. In general, EPA and IDEM guidelines suggest that CSO control costs place a medium burden on a community if the cost per household is between 1% and 2% percent of the median household income (MHI). Controls are considered a high burden if the cost per household exceeds 2% of MHI.

Based on an estimated $161 million project cost, the City would face a financial burden on the border between the medium and high ranges. With anticipated capital cost increases, however, including O&M costs, the true burden is expected to push into the high range. In order to control the burden on the residential sewer users, the City is proposing a 20-year implementation schedule for CSO controls.

The City realizes that the final CSO control schedule must be negotiated among the City, IDEM, and EPA. These negotiations will be based on the specific circumstances of the City's environmental and financial situation, plus any engineering and construction constraints related to scheduling such a complex wastewater project. It is vital to develop an LTCP schedule that considers the overall increased financial burden on City of Anderson residents.

The actual impact of the CSO controls on sewer user fees will depend on many factors, including 1) the final plan approved by IDEM and EPA, 2) sources of funding (whether grants or loans), 3) the interest rate and time allowed to repay any loans, and 4) potential changes in technology that might reduce costs over time. The City also must carefully consider the relative impacts of sewer rate increases on residential, commercial and industrial users in developing a fair and equitable rate schedule.

Chesterfield wants sewer plant in wake of rate hike

By Brandi Watters, Herald Bulletin Staff Writer

May 18, 2009 11:41 pm

— CHESTERFIELD — Town Council members took a step toward building a wastewater treatment plant by approving the order for a preliminary engineering report, or PER, with Commonwealth Engineering Monday night.

Richard Lautz of Commonwealth told the board that a recent feasibility study showed that the town would save more money if it built its own wastewater treatment plant rather than continuing its contract with Anderson.

Chesterfield currently sends its wastewater to Anderson for treatment and Anderson has raised sewer rates. Last month, Anderson changed its rates, bringing rates up in increments over the next three years.

By 2011, Chesterfield residents will be expected to pay over $8.22 per 1,000 gallons under Anderson's new rate plan, according to Lautz.

Chesterfield residents currently pay $1.11 per 1,000 gallons.

Lautz was unable to give a specific rate estimate for residents if the plant was built, but said it was expected to be significantly cheaper than if the town continued its contract with Anderson.

The preliminary engineering report approved Monday will allow Commonwealth Engineers to complete an environmental impact study and gather data regarding the need for the sewer system as required by the state revolving loan fund, which will provide a loan for the construction of the plant.

Lautz estimated that the cost of a plant that treats up to 500,000 gallons of wastewater per day would be roughly $5.3 million, including all administrative and land acquisition costs.

Mark and Max Abrell of the Delaware County Regional Waste District attended the meeting to discuss the possibility of Daleville joining forces with Chesterfield in the operation of the plant.

Daleville will also be affected by Anderson's rate hike and the sewer lines are maintained by the Delaware County waste district.

Mark Abrell said joining forces "makes the most sense unless Anderson decides that it has made a mistake on the rates."

"It's definitely clear that it's cheaper," Lautz said.

If Chesterfield decides to go ahead with the project, with or without the cooperation of Delaware County, it will still be another two years before the town has its own plant, Lautz said.

I. INTRODUCTION

Background

Combined sewer systems (CSSs) are wastewater collection systems designed to carry sanitary sewage (consisting of domestic, commercial and industrial wastewater) and storm water (surface drainage from rainfall or snow melt) in a single pipe to a treatment facility. CSSs serve about 43 million people in approximately 1,100 communities nationwide. Most of these communities are located in the Northeast and Great Lakes regions. During dry weather, CSSs convey domestic, commercial, and industrial wastewater. In periods of rainfall or snow melt, total wastewater flows can exceed the capacity of the CSS and/or treatment facilities. When this occurs, the CSS is designed to overflow directly to surface water bodies, such as lakes, rivers, estuaries, or coastal waters. These overflows - called combined sewer overflows (CSOs) - can be a major source of water pollution in communities served by CSSs.

Because CSOs contain untreated domestic, commercial, and industrial wastes, as well as surface runoff, many types of contaminants can be present. Contaminants may include pathogens, oxygen-demanding pollutants, suspended solids, nutrients, toxics, and floatable matter. Because of these contaminants and the volume of the flows, CSOs can cause a variety of adverse impacts on the physical characteristics of surface water, impair the viability of aquatic habitats, and pose a potential threat to drinking water supplies. CSOs have been shown to be a major contributor to use impairment and aesthetic degradation of many receiving waters and have contributed to shellfish harvesting restrictions, beach closures, and even occasional fish kills.

History of the CSO Control Policy

Historically, the control of CSOs has proven to be extremely complex. This complexity stems partly from the difficulty in quantifying combined sewer overflow (CSO) impacts on receiving water quality and the site specific variability in the volume, frequency, and characteristics of CSOs. In addition, the financial considerations for communities with CSOs can be significant. The U.S. Environmental Protection Agency (EPA) estimates the CSO abatement costs for the 1,100 communities served by CSSs to be approximately $41.2 billion.

To address these challenges, EPA's Office of Water issued a National Combined Sewer Overflow Control Strategy on August 10, 1989 (54 *Federal Register* 37370). This Strategy reaffirmed that CSOs are point source discharges subject to National Pollutant Discharge Elimination System (NPDES) permit requirements and Clean Water Act (CWA) requirements.

The CSO Strategy recommended that all CSOs be identified and categorized according to their status of compliance with these requirements. It also set forth three objectives:

- Ensure that if CSOs occur, they are only as a result of wet weather
- Bring all wet weather CSO discharge points into compliance with the technology-based and water quality-based requirements of the CWA
- Minimize the impacts of CSOs on water quality, aquatic biota, and human health.

In addition, the CSO Strategy charged all States with developing state-wide permitting strategies designed to reduce, eliminate, or control CSOs.

Although the CSO Strategy was successful in focusing increased attention on CSOs, it fell short in resolving many fundamental issues. In mid-1991, EPA initiated a process to accelerate implementation of the Strategy. The process included negotiations with representatives of the regulated community, State regulatory agencies, and environmental groups. These negotiations were conducted through the Office of Water Management Advisory Group. The initiative resulted in the development of a CSO Control Policy, which was published in the *Federal Register* on April 19, 1994 (59 *Federal Register* 18688). The intent of the CSO Control Policy is to:

- Provide guidance to permittees with CSOs, NPDES permitting and enforcement authorities, and State water quality standards (WQS) authorities
- Ensure coordination among the appropriate parties in planning, selecting, designing, and implementing CSO management practices and controls to meet the requirements of the CWA
- Ensure public involvement during the decision-making process.

The CSO Control Policy contains provisions for developing appropriate, site-specific NPDES permit requirements for all CSSs that overflow due to wet weather events. It also announces an enforcement initiative that requires the immediate elimination of overflows that occur during dry weather and ensures that the remaining CWA requirements are complied with as soon as possible.

Key Elements of the CSO Control Policy

The CSO Control Policy contains four key principles to ensure that CSO controls are cost-effective and meet the requirements of the CWA:

- Provide clear levels of control that would be presumed to meet appropriate health and environmental objectives

- Provide sufficient flexibility to municipalities, especially those that are financially disadvantaged, to consider the site-specific nature of CSOs and to determine the most cost-effective means of reducing pollutants and meeting CWA objectives and requirements

- Allow a phased approach for implementation of CSO controls considering a community's financial capability

- Review and revise, as appropriate, WQS and their implementation procedures when developing long-term CSO control plans to reflect the site-specific wet weather impacts of CSOs.

In addition, the CSO Control Policy clearly defines expectations for permittees, State WQS authorities, and NPDES permitting and enforcement authorities. These expectations include the following:

- Permittees should immediately implement the nine minimum controls (NMC), which are technology-based actions or measures designed to reduce CSOs and their effects on receiving water quality, as soon as possible but no later than January 1, 1997. More information on the NMC can be found in the EPA document *Combined Sewer Overflows Guidance for Nine Minimum Controls* (EPA 832-B-95-003)

- Permittees should give priority to environmentally sensitive areas

- Permittees should develop long-term control plans (LTCPs) for controlling CSOs. A permittee may use one of two approaches: 1) demonstrate that its plan is adequate to meet the water quality-based requirements of the CWA ("demonstration approach"), or 2) implement a minimum level of treatment (e.g., primary clarification of at least 85 percent of the collected combined sewage flows) that is presumed to meet the water quality-based requirements of the CWA, unless data indicate otherwise ("presumption approach")

- WQS authorities should review and revise, as appropriate, State WQS during the CSO long-term planning process

- NPDES permitting authorities should consider the financial capability of permittees

when reviewing CSO control plans.

Table 1 illustrates the roles and responsibilities of permittees, NPDES permitting and enforcement authorities, and state WQS authorities.

In addition to these key elements and expectations, the CSO Control Policy also addresses important issues such as ongoing or completed CSO control projects, public participation, small communities and watershed planning.

ROLES AND RESPONSIBILITIES
Table 1

Permittee	NPDES Permitting Authority	NPDES Enforcement Authority	State WQS Authorities
• Evaluate and implement NMC • Submit documentation of NMC implementation by January 1, 1997 • Develop LTCP and submit for review to NPDES permitting authority • Support the review of WQS in CSO-impacted receiving water bodies • Comply with permit conditions based on narrative WQS • Implement selected CSO controls from LTCP • Perform post-construction compliance monitoring • Reassess overflows to sensitive areas • Coordinate all activities with NPDES permitting authority, State WQS authority, and State watershed personnel	• Reassess/revise CSO permitting strategy • Incorporate into Phase I permits CSO-related conditions (e.g., NMC implementation and documentation and LTCP development) • Review documentation of NMC implementation • Coordinate review of LTCP components throughout the LTCP development process and accept/approve permittee's LTCP • Coordinate the review and revision of WQS as appropriate • Incorporation into Phase II permits CSO-related conditions (e.g., continued NMC implementation and LTCP implementation) • Incorporate implementation schedule into an appropriate enforceable mechanism • Review implementation activity reports (e.g., compliance schedule progress reports)	• Ensure that CSO requirements and schedules for compliance are incorporated into appropriate enforceable mechanisms • Monitor compliance with Jan 1, 1997, deadline for NMC implementation and documentation • Take appropriate enforcement action against dry weather overflows • Monitor compliance with Phase I, Phase II, and post-Phase II permits and take enforcement action as appropriate	• Review WQS in CSO-impacted receiving water bodies • Coordinate review with LTCP development • Revise WQS as appropriate Development of site-specific criteria Modification of designated use to - Partial use reflecting specific situations - Define use more explicitly Temporary variance from WQS

Guidance to Support Implementation of the CSO Control Policy

To help permittees and NPDES permitting and WQS authorities implement the provisions of the CSO Control Policy, EPA has developed the following documents:

- *Combined Sewer Overflows—Guidance for Long-Term Control Plan* (EPA 832-B-95-002)
- *Combined Sewer Overflows—Guidance for Nine Minimum Controls* (EPA 832-B-95-003)
- *Combined Sewer Overflows—Guidance for Screening and Ranking* (EPA 832-B-95-004)
- *Combined Sewer Overflows—Guidance for Monitoring and Modeling* (EPA 832-B-97-001)
- *Combined Sewer Overflows—Guidance for Financial Capability Assessment and Schedule Development* (EPA 832-B-97-004)
- *Combined Sewer Overflows—Guidance for Funding Options* (EPA 832-B-95-007)
- *Combined Sewer Overflows—Guidance for Permit Writers* (EPA 832-B-95-008)

Goal of this Guidance

The CSO Policy recognizes the need to address the relative importance of environmental and financial issues when developing an implementation schedule for CSO controls to be contained in the LTCP and the NPDES permit or other enforceable mechanism. According to the CSO Policy, an implementation schedule "may be phased based on the relative importance of adverse impacts upon WQS and designated uses, priority projects identified in the long-term plan, and on a permittee's financial capability."

This guidance has two goals. The first goal is to provide a planning tool for evaluating the financial resources a permittee has available to implement CSO controls. This assessment will involve the use of the following financial capability indicators listed in the CSO Policy:

- Total annual wastewater and CSO control cost per household as a percent of median household income
- Bond ratings
- Overall net debt as percent of full market property value

- Unemployment rate
- Median household income
- Property tax revenue collection rate
- Property tax revenues as a percent of full market property value

It must be emphasized that the financial indicators found in this guidance might not present the most complete picture of a permittee's financial capability to fund the CSO controls. However, the financial indicators do provide a common basis for financial burden discussions between the permittee and EPA and state NPDES authorities. Since flexibility is an important aspect of the CSO Policy, permittees are encouraged to submit any additional documentation that would create a more accurate and complete picture of their financial capability.

Although this guidance focuses on the role of financial capability for development of an implementation schedule for CSO controls, the financial capability analysis process can be useful for the identification and evaluation of long-term control alternatives in the LTCP.

The second goal is to assist the permittee, EPA and state NPDES authorities in cooperatively developing CSO control implementation schedules. This will involve an evaluation of the following environmental and financial considerations listed in the CSO Policy:

- Eliminating overflows to sensitive areas
- Use impairment
- Financial capability
- Grant and loan availability
- Previous and current sewer user fees and rate structures
- Other viable funding mechanisms and sources of financing

This guidance does not recommend specific schedules for implementation of the CSO controls based on financial capability or other considerations identified in the CSO Policy. It does, however, provide general boundaries to aid all parties in negotiating reasonable and effective schedules for implementation of the CSO controls.

It is important to recognize that scheduling flexibility is not the only form of relief available to permittees. The CWA and EPA regulations provide mechanisms for the review and revision of WQS. The CSO Policy also encourages the "review and revision, as appropriate, of water quality standards and their implementation procedures when developing CSO control plans to reflect the site-specific wet weather impacts of CSOs." During the process of developing the

LTCP, the permittee should consult with NPDES and WQS authorities to share information on the water quality impacts of CSOs, the attainability of WQS, and the appropriate water quality-based requirements of the permit. It may be appropriate to conduct a use attainability analysis and revisit existing designated uses in order to ensure that the LTCP selected will be sufficient to attain WQS. EPA's "Interim Economic Guidance for Water Quality Standards-Workbook"(EPA-823-B-95-002) provides an approach for assessing whether a water pollution project will impose "substantial and widespread social and economic impacts," as defined in EPA regulations.

Organization of Guidance

Section II summarizes a two phase approach for assessing a permittee's financial capability to implement CSO controls. Section III describes the first phase which calculates the financial impact of wastewater and CSO controls on individual households. Section IV describes the second phase used to calculate a permittee's debt, socioeconomic and financial conditions. The results of the first and second phases are combined to give an overall assessment of a permittee's financial capability to be used in CSO schedule development. Although financial capability is only one factor in schedule development, a major portion of this guidance is devoted to financial capability assessment because of the complexity of the process and its importance. Section V describes the schedule development process for implementing CSO controls, and details how environmental and financial considerations influence schedule development.

Audience

This guidance is designed for use by permittees, EPA and state NPDES authorities, and other personnel with CSO planning and permitting responsibilities. It is written in a format that allows individuals with limited municipal financial assessment experience to conduct CSO financial capability assessments and negotiate reasonable CSO implementation schedules. Individuals with experience in establishing schedules for enforcement orders and reviewing financial capability assessments under the Water Quality Standards, Construction Grants and State Revolving Fund (SRF) programs will be able to quickly and efficiently conduct the assessment detailed in this guidebook.

II. CSO FINANCIAL CAPABILITY ASSESSMENT APPROACH

This section describes a process for evaluating parameters that measure a permittee's financial capability to implement CSO controls. The process reflects the experience of EPA in the Water Quality Standards (WQS) program, Construction Grants program, State Revolving Fund (SRF) program and the water enforcement program. Experience with these programs provides the foundation upon which EPA has built the CSO financial capability assessment approach.

In the WQS program, economic factors are considered in the process of modifying WQS. State WQS authorities conduct economic analysis of the impacts that will result from treatment levels beyond the technology-based requirements of the Clean Water Act. EPA's "Interim Economic Guidance for Water Quality Standards" (EPA 823-B-95-002) provides an approach for assessing substantial and widespread social and economic impacts of specific water pollution control projects. The process to identify "substantial" impacts is similar to the process used in this guidance to analyze financial capability and its implications for scheduling CSO controls.

Under the Construction Grants Program, financial capability assessments were conducted by municipalities and reviewed by EPA to demonstrate that municipalities had the ability to pay for the capital investments and the costs for operation and maintenance of the wastewater facilities. The assessments measured the financial conditions of the municipality and the financial burden the proposed projects imposed on households. Some of the financial indicators used in the demonstrations were similar to those used in this guidance. The demonstration procedure is described in EPA's "Financial Capability Guidebook" (1984).

As part of SRF program implementation, states devised financial capability assessment procedures for loan applicants. Often the procedures include a review of the same financial indicators described in this document.

The Agency's water enforcement program conducts detailed evaluations of a permittee's current financial conditions to assess the amount of penalty that can be borne by the permittee for violations of the CWA. The evaluations frequently include financial indicators used in this guidance.

The CSO financial capability assessment process also reflects the approach taken by bond rating agencies and other investment industry firms to assess a municipality's or wastewater utility's overall financial condition and credit capacity. The bond rating agencies generally use the same types of financial information when they evaluate specific bond issues. Rating agencies evaluate this information to determine the overall financial health of an issuer and identify any factors that could make it difficult for the permittee to repay its bonds. The approach developed for the CSO financial capability assessment incorporates the principles used by the rating agencies.

The Two-Phase Approach

The guidance presents a two-phase approach to assessing a permittee's financial capability. The first phase identifies the combined impact of wastewater and CSO control costs on individual households. The second phase examines the debt, socioeconomic, and financial conditions of a permittee. The results of the two-phase analysis are combined in a Financial Capability Matrix. Permittees and the WQS and NPDES authorities can use this matrix to assess the financial burden of the CSO control costs and establish reasonable schedules to implement the CSO controls.

Phase one determines a Residential Indicator. This indicator is the permittee's average cost per household (CPH) for wastewater treatment (WWT) and CSO controls as a percentage of the local median household income (MHI). It reflects the residential share of current and planned WWT and CSO controls needed to meet the requirements of the CWA. A value range for this indicator characterizes whether the costs impose a "low," "mid-range" or "high" financial impact on residential users.

The second phase develops the Permittee Financial Capability Indicators. Six indicators are used to evaluate the debt, socioeconomic, and financial conditions that affect a permittee's financial capability to implement the CSO controls. These indicators serve as the basis for a second phase analysis that will characterize the permittee's financial capability as "weak," "mid-range" or "strong."

A Financial Capability Matrix combines the Residential Indicator (first phase) and Permittee Financial Capability Indicators (second phase) to give an overall assessment of the permittee's financial capability. This assessment can be used to help establish an appropriate CSO control implementation schedule.

Since flexibility is an important component of the CSO Policy, WQS authorities, NPDES authorities, EPA personnel, and permittees should communicate throughout the CSO control planning process to coordinate the development of an effective LTCP. This guidance document provides all CSO participants with a structured yet flexible approach for evaluating the financial burden CSO controls place on permittees. It also recognizes the importance of this financial burden when establishing a CSO control implementation schedule. The financial capability information developed in this guidance provides a basis for the permittee and the NPDES authorities to negotiate the implementation schedule for the CSO controls. However, when a permittee believes that there are unique circumstances that would affect the conclusion of this guidance, the permittee may submit documentation of its unique financial conditions to the appropriate EPA or State NPDES authorities for consideration.

Financial Benchmarks and Information Sources

The information used to develop the indicators needed for the financial assessment is drawn from several different sources. In general, this information should be available through a combination of local, state, and Federal sources. Project cost information is available in the LTCP. Socioeconomic information, such as median household income, is available from census data. Detailed financial information is available from a community's annual financial statements. Financial statements may be obtained directly from a community or, in most states, from the state auditor's office which maintains a central file of audited reports. When the permittee's service area involves more than one jurisdiction, it will be necessary to examine data for each jurisdiction to develop the necessary data.

III. PHASE ONE: THE RESIDENTIAL INDICATOR

The Residential Indicator measures the financial impact of the current and proposed WWT and CSO controls on residential users. Development of this indicator starts with the determination of the current and proposed WWT and CSO control costs per household (CPH). Second, the service area's CPH estimate and the median household income (MHI) are used to calculate the Residential Indicator. Finally, the Residential Indicator is compared to established financial impact ranges to determine whether CSO controls will produce a possible high, mid-range or low financial impact on the permittee's residential users. Worksheets are provided to aid in developing the Residential Indicator.

Developing CPH Estimate

The first step in developing the CPH is to determine the permittee's total WWT and CSO costs by adding together the current costs for existing wastewater treatment operations and the projected costs for any proposed WWT and CSO controls. The next step is to calculate the residential share of the total WWT and CSO costs. The final step is to calculate the CPH by dividing the residential share of total WWT and CSO costs by the number of households in the permittee's total wastewater service area.

Current WWT costs are defined as current annual wastewater operating and maintenance expenses (excluding depreciation) plus current annual debt service (principal and interest). This fairly represents cash expenses for current wastewater treatment operations. (Expenses for funded depreciation, capital replacement funds, or other types of capital reserve funds are not included in current WWT costs, because they represent a type of savings account rather than an actual operation and maintenance expense.)

Estimates of projected costs are made for any proposed WWT projects and the CSO controls. Any concerns about including specific proposed WWT projects or CSO controls in the projected costs, or the length of the planning period, should be discussed with the appropriate NPDES permitting and enforcement authorities. These costs are adjusted to current dollars (i.e., deflated). These include projected operation and maintenance expenses plus projected debt service costs for any proposed WWT and the CSO controls. The residential or household costs exclude the portion of expenses attributable to commercial, governmental and industrial wastewater discharges. The information and calculations used to develop the CPH and the Residential Indicator are presented in Worksheets 1 and 2 and their instructions.

Worksheet 1 Instructions

Enter the requested data on lines 100 through 109. The operation and maintenance costs on lines 100 and 103 should include all significant cost categories, such as labor, chemicals, utilities, administration, and equipment replacement. Do not include depreciation on line 100 or line 103. Adjust the projected annual WWT and CSO costs to current dollars using the average annual national Consumer Price Index (CPI) inflation rate for the past five years available from the Bureau of Labor Statistics. The CPI is used as a simple and reliable method of indexing projected WWT costs and household income. For example, if the most recent five year average CPI is 4 percent, and the projected annual O& M and debt service costs will begin in 2 years, adjust the projected costs with the following formula:

$$Adjusted\ Projected\ Costs\ (Current\ Dollars) = Projected\ Costs \times Adjustment\ Factor$$

The adjustment factor can be calculated using the following formula or the present value factor from the table on page 55:

$$Adjustment\ Factor = \frac{1}{(1+CPI)^{years}} = \frac{1}{(1+.04)^2} = .925$$

The annualized debt service cost information for the projected WWT facilities and projected CSO controls (Line 104) can be calculated using an annualization factor obtained from the table on page 56, which reflects the local borrowing interest rate and borrowing term of the permittee. For example, if the adjusted projected debt costs (current dollars) are $25,000,000 and typical borrowing terms include an interest rate of eight percent over 20 years, then costs can be annualized with the following calculation:

$$Annual\ Debt\ Service\ Costs = Adjusted\ Debt\ Costs \times Annualization\ Factor$$

$$Annual\ Debt\ Service\ Cost = \$25,000,000 \times .1019 = \$2,547,500$$

The annualization factor can be calculated using the following formula:

$$Annualization\ Factor = \frac{Interest\ Rate}{(1+Interest\ Rate)^{years} - 1} + Interest\ Rate = \frac{.08}{(1+.08)^{20} - 1} + .08 = .1019$$

The annualized debt service cost for the projected WWT facilities and projected CSO controls is entered on line 104. Add the current and projected wastewater treatment and projected CSO control costs to estimate the total WWT and CSO costs (line 102 + line 105).

Calculate the residential share of the total cost (line 106) and enter on line 107. The residential share of total costs (line 107) is computed by multiplying the percent of total wastewater flow including infiltration and inflow attributable to residential users by the total costs (line 106). For example, for a permittee with the following characteristics:

Total Costs:	$12,000,000
Residential Flow:	10.5 Million Gallons per Day
Total Flow:	13.1 Million Gallons per Day

The residential share of the total cost is:

$$\textit{Residential Share of Costs} = \textit{Total Costs} \times \frac{\textit{Residential Wastewater Flow}}{\textit{Total Wastewater Flow}}$$

$$\textit{Residential Share of Costs} = \$12{,}000{,}000 \times \frac{10.5\ \textit{Million Gallons Per Day}}{13.1\ \textit{Million Gallons Per Day}}$$

$$\$9{,}600{,}000$$

Calculate the CPH (line 109) by dividing total residential share costs (line 107) by the total number of households (line 108) in the permittee's total wastewater service area.

Data Sources

The permittee's latest financial reports should be available to develop the current wastewater treatment costs. In order to comply with accounting requirements, most permittees develop a combined statement of revenues, expenses, and changes in fund balance. These reports should be available directly from the permittee, or, in some states, from central records kept by the state auditor or other state offices. (Many states conduct audits and generate financial reports - i.e., balance sheet, statement of revenues, expenses, and changes in fund balance, and statement of cash flows, for each permittee.) Projected costs and households in the wastewater service area should be available through planning documents. The Bureau of Labor Statistics frequently has data on the number of households in the service area.

The Consumer Price Index rate (CPI) should be the average rate for the previous five years. The CPI is available through the Bureau of Labor Statistics.

COST PER HOUSEHOLD
Worksheet 1

		Line Number
Current WWT Costs		
• Annual Operations and Maintenance Expenses (Excluding Depreciation)	_____	100
• Annual Debt Service (Principal and Interest)	_____	101
Subtotal (Line 100 + Line 101)	_____	102
Projected WWT and CSO Costs (Current Dollars)		
• Estimated Annual Operations and Maintenance Expenses (Excluding Depreciation)	_____	103
• Annual Debt Service (Principal and Interest)	_____	104
Subtotal (Line 103 + Line 104)	_____	105
Total Current and Projected WWT and CSO Costs (Line 102 + Line 105)	_____	106
Residential Share of Total WWT and CSO Costs	_____	107
Total number of Households in Service Area	_____	108
Cost Per Household (Line 107 ÷ Line 108)	_____	109

Developing the MHI Estimate

The second step in developing the Residential Indicator is to determine the adjusted median household income (MHI) for the permittee's entire wastewater service area. Information and calculations used to develop the adjusted MHI value are presented in Worksheet 2 and its instructions.

Worksheet 2 Instructions

Enter the requested information on Worksheet 2, lines 201 through 203. MHI from the latest census year should be adjusted to current year dollars with the average CPI inflation rate from the latest census year to the current year using the following formula.

$$Adjusted\ MHI = MHI \times Adjustment\ Factor$$

The MHI adjustment factor can be calculated using the following formula or the inflation adjustment factor from the table on page 58:

$$MHI\ Adjustment\ Factor = (1+CPI)^{Current\ Year-Census\ Year}$$

For example, if a permittee's MHI was $30,000 in the 1990 census year, the average annual CPI since 1990 was 4 percent and the current year is 1992, the following calculation would be made to adjust the MHI to current dollars:

$$Adjustment\ Factor = (1+.04)^{1992-1990} = 1.0816$$

$$Adjusted\ MHI = \$30,000 \times 1.0816 = \$32,448$$

On Worksheet 2, calculate the adjusted MHI by entering the latest census MHI value on line 201. Then enter the MHI Adjustment Factor on line 202. Finally, multiply the MHI (line 201) by the Adjustment Factor (line 202) and enter the Adjusted MHI on line 203.

RESIDENTIAL INDICATOR
Worksheet 2

Median Household Income (MHI)		Line Number
• Census Year MHI	_____	201
• MHI Adjustment Factor	_____	202
• Adjusted MHI (Line 201 x Line 202)	_____	203
Annual WWT and CSO Control Cost Per Household (CPH) (Line 109)	_____	204
Residential Indicator:		
Annual Wastewater and CSO Control Costs per Household as a percent of Adjusted Median Household Income (CPH as % MHI) (Line 204 ÷ Line 203 x 100)	_____	205

If the permittee's service area includes more than one jurisdiction, it may be necessary to develop a weighted MHI for the entire service area. The Bureau of Census's designated MHI areas generally encompass most permittees' service areas. For this reason, the calculation of a weighted MHI usually will not be necessary to reasonably represent the permittee's MHI. When a weighted MHI must be acquired, a weight would be assigned to each jurisdiction to reflect its share of the total households.

The following example illustrates how to develop a weighted MHI value before adjusting it to current year dollars. If a permittee is a regional authority that serves three local jurisdictions, the weighted average MHI would be calculated as follows:

Jurisdiction	MHI	Number of Households (HH)
A	$30,000	100,000
B	$45,000	25,000
C	$25,000	50,000
		175,000

$$\text{Weighted MHI} \quad MHI_A\left(\frac{HH_A}{\text{Total HH}}\right) + MHI_B\left(\frac{HH_B}{\text{Total HH}}\right) + MHI_C\left(\frac{HH_C}{\text{Total HH}}\right)$$

$$\$30{,}000\left(\frac{100{,}000}{175{,}000}\right) + \$45{,}000\left(\frac{25{,}000}{175{,}000}\right) + \$25{,}000\left(\frac{50{,}000}{175{,}000}\right)$$

$$\$17{,}143 + \$6{,}429 + \$7{,}143$$

$$\$30{,}715$$

Data Sources

Median household income is available for most communities from the latest census. In the few cases where a local jurisdiction's MHI is not available, the surrounding county's MHI may be sufficient. Each state has a state data center that serves as a local source of census data for public use. This center may be contacted to obtain the information available from the Bureau of Census for use during this assessment (see Appendix B).

Developing the Residential Indicator

Worksheet 2 Instructions

To calculate the Residential Indicator (line 205 of Worksheet 2), divide the annual WWT and CSO control cost per household (line 109 transferred to line 204) by the Adjusted MHI (line 203) and multiply by 100.

Analyzing the Residential Indicator

The Residential Indicator will be used in the Financial Capability Matrix in Section IV to help permittees, and EPA and state NPDES authorities determine reasonable and workable long-term CSO control schedules. (The Residential Indicator does not provide special recognition for low income groups since their influence is automatically reflected in the median household income component of the indicators.)

To assess the financial impact CSO controls may have on the permittee's residential users, the Residential Indicator is compared to the financial impact ranges that reflect EPA's previous experience with water pollution control programs. These ranges are as follows:

Financial Impact	Residential Indicator (CPH as % MHI)
Low	Less than 1.0 Percent of MHI
Mid-Range	1.0 - 2.0 Percent of MHI
High	Greater than 2.0 Percent of MHI

When the Residential Indicator is less than 1.0 percent, between 1.0 and 2.0 percent, and greater than 2.0 percent, the financial impact on residential users to implement the CSO controls will be characterized as "low," "mid-range," and "high," respectively. Unless there are significant weaknesses in a permittee's financial and socioeconomic conditions, second phase reviews for permittees that have a low residential indicator score (less than 1.0) are unlikely to result in longer implementation schedules. Permittees with low residential indicators may wish to forego the second phase analysis and proceed with the normal engineering and construction implementation schedule developed as part of the CSO planning process.

In situations where a permittee believes that there are unique circumstances that would affect the conclusion of the first phase, the permittee may submit documentation of its unique financial conditions to the appropriate state NPDES and EPA authorities for consideration.

IV. PHASE TWO: PERMITTEE FINANCIAL CAPABILITY INDICATORS

In the second phase, selected indicators are assessed to evaluate the financial capability of the permittee. These indicators will examine the permittee's debt burden, socioeconomic conditions, and financial operations. The second-phase review examines three general categories of financial capability indicators for the permittee:

- Debt Indicators - Assess current debt burden of the permittee or the communities within the permittee's service area and their ability to issue additional debt to finance the CSO controls. The indicators selected for this purpose are:
  - Bond Ratings (General Obligation and/or Revenue Bond Fund)
  - Overall Net Debt as a Percent of Full Market Property Value
- Socioeconomic Indicators - Assess the general economic well-being of residential users in the permittee's service area. The indicators selected for this purpose are:
  - Unemployment Rate
  - Median Household Income
- Financial Management Indicators - Evaluate the permittee's overall ability to manage financial operations. The indicators selected for this purpose are:
  - Property Tax Revenue Collection Rate
  - Property Tax Revenues as a Percent of Full Market Property Value

Even though the financial capability analysis reflects current conditions, pending changes in the service area should be considered in development of the second phase indicators. For example, if the current unemployment rate is high, but there is a new plant opening that will stimulate economic growth, the unemployment indicators for the service area would need to be modified to reflect the projected impact of the new plant. The permittee should submit documentation of such conditions to the appropriate EPA and state NPDES authorities for consideration. When the permittee is a sanitary district, sewer authority or similar entity, the second phase indicators related to property values and tax revenues may not be applicable. In those circumstances, the permittee may simply use the remaining indicators or submit other related documentation that will help assess its financial capability to implement the CSO controls.

DEBT INDICATORS

The debt indicators described below were selected to assess the current debt burden conditions and the ability to issue new debt. These indicators are the bond rating and overall net debt as a percent of full market property value. When these indicators are not available for the permittee, other financial data which illustrates debt burden and debt issuing capacity may be used to assess the permittee's financial capability in this area.

Bond Rating

The information needed to evaluate the bond ratings is presented in Worksheet 3. Recent bond ratings for the permittee and service area communities summarize a bond rating agency's assessment of a permittee's or community's credit capacity. General obligation (G.O.) bonds are bonds issued by a local government and repaid with taxes (usually property taxes). They are the primary long-term debt funding mechanism in use by local governments. General obligation bond ratings reflect financial and socioeconomic conditions experienced by the community as a whole.

"Revenue bond" ratings, by comparison, reflect the financial conditions and management capability of the wastewater utility. They are repaid with revenues generated from user fees. Revenue bonds are sometimes referred to as water or sewer bonds. In some cases these bonds may have been issued by the state on behalf of local communities. (Additional information on bonds is contained in EPA's Combined Sewer Overflows—Guidance For Funding Options (EPA 832-B-95-007).

Bond ratings normally incorporate an analysis of many financial capability indicators. These analyses evaluate the long term trends and current conditions for the indicators. The ultimate bond ratings reflect a general assessment of the current financial conditions. However, if security enhancements like bond insurance have been used for a revenue bond issue, the bond rating may be higher than justified by the local conditions.

Many small and medium-sized communities and permittees have not used debt financing for projects and, as a result, have no bond rating. The absence of bond rating does not indicate strong or weak financial health. When a bond rating is not available, this indicator may be excluded from the financial analysis.

Worksheet 3 Instructions

Enter the most recent bond ratings on Worksheet 3, lines 301 and 302. Note that ratings are requested for general obligation bonds and revenue bonds. When there are several different bond ratings, enter the most recent bond rating on Line 303 as the summary bond rating.

Data Sources

Municipal bond reports from rating agencies (e.g., Moody's Bond Record, Standard & Poor's Corporation) provide recent ratings.

Benchmarks

Moody's Investor Services

"Baa" is the minimum investment grade rating. See *Moody's on Municipals - an Introduction to Issuing Debt* for a description of bond ratings.

Moody's Investor Services' Ratings

- Weak: Ba, B, Caa, Ca, C
- Mid-Range: Baa
- Strong: Aaa, AA, A

Standard & Poor's

"BBB" is the minimum investment grade rating. See Standard & Poor's *Municipal Finance Criteria* for a description of bond ratings.

Standard and Poor's Ratings

- Weak: BB, B, CCC, CC, C, D
- Mid-Range: BBB
- Strong: AAA, AA, A

Overall Net Debt as a Percent of Full Market Property Value

Description

Overall net debt is debt repaid by property taxes in the permittee's service area. It excludes debt which is repaid by special user fees (e.g., revenue debt). This indicator provides a measure of the debt burden on residents within the permittee's service area and measures the ability of local governmental jurisdictions to issue additional debt. It includes the debt issued directly by the local jurisdiction and debt of overlapping entities, such as school districts. This indicator compares the level of debt owed by the service area population with the full market value of real property used to support that debt and serves as a measure of financial wealth in the permittee's service area. Information needed to develop overall net debt as a percent of full market value is identified on Worksheet 4.

Worksheet 4 Instructions

Enter requested data on Worksheet 4, lines 401 - 405.

Line 401 - Direct Net Debt - Enter the amount of each jurisdiction's general obligation debt outstanding that is supported by the property in the permittee's service area. General obligation bonds are secured by the "full faith and credit" of the community and are payable from general tax revenues. This debt amount excludes general obligation bonds that are payable from some dedicated user fees or specific revenue source other than the general tax revenues. These general obligation bonds are called "double-barreled bonds."

Line 402 - Debt of Overlapping Entities - Calculate the permittee's service area's share of any debt from overlapping entities using the process illustrated below.

1. Identify in Column A below each overlapping entity that has incurred debt that must be partially supported by the permittee's service area. (Check the State assessor's office for this information).
2. Identify the total amount of tax-supported outstanding debt for each overlapping entity in Column B. Money in a sinking fund is not included in the outstanding debt since it represents periodic deposits into an account to ensure the availability of sufficient monies to make timely debt service payments.
3. Identify the percentage of each overlapping entity's outstanding debt charged to persons or property in the permittee's service area in Column C. The percentage is based on the estimated full market value of real property of the respective jurisdictions.

4. Multiply the total outstanding debt of each overlapping entity by the percentage identified for the permittee's service area (Column B x C).
5. Add the figures in Column D to arrive at total overlapping debt for permittee's service area.

(A) Overlapping Entities	(B) Outstanding Debt (less Sinking Fund)	(C) Percent Chargeable to Permittee's Service Area	(D) Outstanding Debt Attributable to Permittee's Service Area
County	$10,500,000	25%	$2,625,000
School District	16,800,000	95%	15,960,000
Total Overlapping Debt			$18,585,000

Line 403 - Overall Net Debt - Add lines 401 and 402.

Line 404 - Market Value of Property - The property value should reflect the full market value of property within the permittee's service area. It is possible that the tax assessed property value will not reflect full market value. This occurs when the tax assessment ratio is less than one. In such cases the full market value of property is computed by dividing the total tax assessment value by the assessment ratio (the assessment ratio represents the percentage of the full market value that is taxed at the established tax rate). For example, if the assessed value is $1,000,000 and the assessment ratio is 50 percent then the full market value of real property is $1,000,000/.50= $2,000,000.

Line 405 - Overall Net Debt as a Percent of Full Market Property Value - Divide line 403 by line 404 and multiply by 100.

Data Sources

Debt information is available from the financial statements of each community. In most cases the most recent financial statements are on file with the state (e.g., State Auditor's Office). Overlapping debt may or may not be provided in a community's financial statements. The property assessment data should be readily available through the community or the State's assessor office. The boundary of most permittees' service areas generally conforms to one or more community boundaries. Therefore, prorating community data to reflect specific service area boundaries is not normally necessary for evaluating the general financial capability of the permittee.

Benchmarks

- Weak: Above 5%
- Mid-range: 2-5%
- Strong: Below 2%

OVERALL NET DEBT AS A PERCENT OF FULL MARKET PROPERTY VALUE
Worksheet 4

		Line Number
• Direct Net Debt (G.O. Bonds Excluding Double-Barreled Bonds)	_____	401
• Debt of Overlapping Entities (Proportionate Share of Multijurisdictional Debt)	_____	402
• Overall Net Debt (Lines 401+402)	_____	403
• Market Value of Property	_____	404
• Overall Net Debt as a Percent of Full Market Property Value (Line 403 divided by Line 404 x 100)	_____	405

SOCIOECONOMIC INDICATORS

The socioeconomic indicators are used to assess the general economic well-being of residential users in the permittee's service area. The indicators used to assess economic conditions are unemployment rate and median household income. When the permittee has additional socioeconomic data, it may want to submit the data to the appropriate EPA and state NPDES authorities to facilitate a better understanding of the permittee's unique economic conditions. Several examples of this type of socioeconomic data could be poverty rate, population growth, and employment projections.

Unemployment Rate

Unemployment information is entered on Worksheet 5. The unemployment rate is defined as the percent of a permittee's service area residents on the unemployment rolls.

Worksheet 5 Instructions

Unemployment values are entered on lines 501 - 503 on Worksheet 5. If the unemployment rate for a permittee's service area is not available, the unemployment rate for the county in which the service area is located may be used as a substitute. On line 503, enter the average national unemployment rate.

Data Sources

The Bureau of Labor Statistics (BLS) maintains current unemployment rate figures for municipalities and counties over 25,000 population. National and state unemployment data are also available for comparison purposes. This information can be obtained from the BLS by request at (202) 606-6392.

Benchmarks

Compare the permittee's unemployment values with the national average values. National averages are readily available through the Bureau of Labor Statistics.

- Weak: More than 1 percentage point above the National Average
- Mid-range: ± 1 percentage point of the National Average
- Strong: More than 1 percentage point below National Average

For example, if the national average unemployment rate is 6 percent, an unemployment rate greater than 7 percent would be considered weak, while an unemployment rate less than 5 percent would be considered strong.

Median Household Income

Median household income (MHI) is defined as the median amount of total income dollars received per household during a calendar year in a given area. It serves as an overall indicator of community earning capacity. Worksheet 6 is used to present information for this indicator.

Worksheet 6 Instructions

Median household income was discussed during the first phase assessment and is presented on Worksheet 2. On line 601 of Worksheet 6, enter the adjusted MHI from Worksheet 2 (line 203). Use the MHI adjustment factor from Worksheet 2 (line 202) to calculate the adjusted national MHI from the latest census, national MHI value (line 602) and enter the value on Line 604.

Data Sources

Median household income is available through state data centers. Refer to Worksheet 2 for MHI of the permittee's service area. Refer to Appendix B for the address and telephone number of the state's data center to acquire the latest census national MHI value.

Benchmarks

Compare the permittee's MHI to the adjusted national MHI:

- Weak: More than 25% below Adjusted National MHI
- Mid-Range: ± 25% of the Adjusted National MHI
- Strong: More than 25% above Adjusted National MHI

FINANCIAL MANAGEMENT INDICATORS

The financial management indicators used to evaluate a permittee's financial management ability are property tax revenue as a percent of full market value of real property and property tax revenue collection rate.

Property Tax Revenues as a Percent of Full Market Property Value

This indicator can be referred to as the "property tax burden" since it indicates the funding capacity available to support debt based on the wealth of the community. It also reflects the effectiveness of management in providing community services.

Worksheet 7 Instructions

Property tax burden is computed on Worksheet 7. The full market value of real property was calculated in Worksheet 4, line 404. Enter the full market value on line 701. Enter the most recent year's property tax revenue on line 702. General fund revenues are primarily property tax receipts.

Data Sources

The property assessment data should be readily available through the community or the State's assessor office (see Worksheet 4, Line 404). Property tax revenues are available in communities' annual financial statements. Occasionally, the assessment and tax revenue data of communities partially serviced by the permittee may have to be prorated to provide a clearer picture of the permittee's property tax burden.

Benchmarks

- Weak: Above 4%
- Mid-range: 2%-4%
- Strong: Below 2%.

PROPERTY TAX REVENUES AS A PERCENT OF FULL MARKET PROPERTY VALUE

Worksheet 7

		Line Number
• Full Market Value of Real Property (Line 404)	_____	701
• Property Tax Revenues	_____	702
• Property Tax Revenue as a Percent of Full Market Property Value (702 ÷ 701 x 100)	_____	703

Property Tax Revenue Collection Rate

The property tax revenue collection rate is an indicator of the efficiency of the tax collection system and the acceptability of tax levels to residents.

Worksheet 8 Instructions

The property tax revenue collection rate is calculated on Worksheet 8. The property tax revenues collected was listed in Worksheet 7, Line 702. Enter this value on line 801. Enter the property taxes levied on line 802. Divide the property tax revenue collected by the property taxes levied and multiply by 100 to present the collection rate as a percentage on line 803.

Data Sources

Property taxes levied can be computed by multiplying the assessed value of real property by the property tax rate, both of which are available from a community's financial statements or the state assessor's office (see Worksheet 4, Line 404). Property tax revenues are available in communities' annual financial statements. Occasionally, the assessment and tax revenue data of communities partially serviced by the permittee may have to be prorated to provide a clearer picture of the permittee's property tax revenue collection rate.

Benchmarks

- Weak: Below 94%
- Mid-range: 94-98%
- Strong: Above 98%.

PROPERTY TAX REVENUE COLLECTION RATE

• Property Taxes Levied	_____	802
• Property Tax Revenue Collection Rate (line 801 ÷ line 802 x 100)	_____	803

Analyzing Permittee Financial Capability Indicators

This section describes how the indicators in the second phase may be used to generate an overall score of a permittee's financial capability. The indicators are compared to national benchmarks to form an overall assessment of the permittee's financial capability and its effect on implemention schedules in the long-term CSO control plan.

In situations where a permittee believes that there are unique circumstances that would affect the conclusion of the second phase, the permittee may submit documentation of its unique financial conditions to the appropriate EPA and state NPDES authorities for consideration. The purpose of additional information is to clarify unique circumstances which are not fairly represented by the overall scores of the selected indicators. An example could be where a state or community imposes restrictions on property taxes.

Worksheet 9 Instructions

The indicators generated from the worksheets are compared to the state, national or industry benchmarks presented in Table 2. Information compiled from Worksheets 3 through 8 is summarized in Column A on Worksheet 9. Score each of these values using the rating standards in Table 2 and the following score benchmarks and enter the appropriate number in Column B. The score definitions are:

Benchmarks	Score
• Weak	1
• Mid-Range	2
• Strong	3

To calculate an average score for the indicators, total the values in Column B and divide by the number of entries. Enter the average score on Line 907.

If it is not possible to develop one or more of the six indicators, the permittee should explain why the indicator is inappropriate or unavailable. Since the point of the analysis is to measure the overall financial burden of the CSO controls, the debt and socioeconomic indicators are generally better measures of this burden than the financial management indicators. Consequently, if one of the debt or socioeconomic indicators is not available, the two financial management indicators should be averaged and used as a single indicator to average with the available debt and socioeconomic indicators. This averaging is necessary so that undue weight is not given to the financial management indicators.

PERMITTEE FINANCIAL CAPABILITY INDICATOR BENCHMARKS

Table 2

Indicator	Strong	Mid-Range	Weak
Bond Rating	AAA-A (S&P) or Aaa-A (Moody's)	BBB (S&P) Baa (Moody's)	BB-D (S&P) Ba-C (Moody's)
Overall Net Debt as a Percent of Full Market Property Value	Below 2%	2% - 5%	Above 5%
Unemployment Rate	More than 1 Percentage Point Below the National Average	± 1 Percentage Point of National Average	More than 1 Percentage Point Above the National Average
Median Household Income	More than 25% Above Adjusted National MHI	±25% of Adjusted National MHI	More than 25% Below Adjusted National MHI

The Financial Capability Matrix

The results of the Residential Indicator and the Permittee Financial Capability Indicators analyses are combined in the Financial Capability Matrix to evaluate the level of financial burden the CSO controls may impose on a permittee. This matrix can be used by permittees, EPA and state NPDES authorities to establish reasonable and workable CSO control implementation schedules.

Worksheet 10 Instructions

First, enter the value of the Residential Indicator (Cost Per Household as a % of MHI) from Line 205 (Worksheet 2) on Line 1001 of Worksheet 10. Enter the Permittee Financial Capability Indicators score from Line 907 (Worksheet 9) on Line 1002. With this information, find the financial burden category for the permittee in the Financial Impact Matrix (Table 3). Enter the category on line 1003.

For example, if the Residential Indicator from Line 1001 is 1.3% and the Permittee Financial Capability Indicators score from Line 1002 is 2.1, the Financial Capability Matrix would indicate that implementation of the CSO control would be "Medium Burden" for the permittee.

The result from the Financial Capability Matrix is used to develop a CSO implementation schedule as described in Section V: CSO Schedule Development.

FINANCIAL CAPABILITY MATRIX SCORE

V. CSO SCHEDULE DEVELOPMENT

The CSO Policy recognizes that the causes and impacts of CSOs are site-specific water pollution control problems. Identification of CSO controls involves evaluation of significant technical, environmental, and financial issues. Therefore, the CSO Policy provides an opportunity for flexible, phased implementation of CSO controls to achieve compliance with the technology-based and water quality based requirements of the Clean Water Act.

Under the CSO Policy, permittees with combined sewer systems are expected to implement the nine minimum CSO controls as expeditiously as possible but no later than January 1, 1997. The nine minimum controls are technology-based controls that can reduce the magnitude, duration, and frequency of CSOs and their effects on receiving waters (See guidance: *Combined Sewer Overflows—Guidance for Nine Minimum Controls* (EPA, 832-B-95-003)). These minimum controls are not intended to require significant engineering activities or major construction.

Permittees with combined sewer systems are also expected to develop long-term control plans (LTCPs) that include provisions for public participation, monitoring of CSOs and their impacts, evaluation and selection of control alternatives, and implementation schedules for long-term controls. A permittee is expected to develop its LTCP as soon as practicable, but generally within two years after a requirement to develop an LTCP has been specified in its NPDES permit or other enforceable mechanism. The development and implementation of an LTCP will be coordinated with implementation of the nine minimum controls. Development of the LTCP involves negotiations with the EPA and state NPDES authorities and if appropriate, state WQS authorities. Among other components the LTCP contains fixed-date implementation and financing schedules to design and construct the needed CSO controls.

The CSO Policy recognizes the need to address the relative importance of environmental and financial issues when developing an implementation schedule for CSO controls to be contained in the LTCP and the NPDES permit or other enforceable mechanism. According to the CSO Policy, an implementation schedule "may be phased based on the relative importance of adverse impacts on WQS and designated uses, priority projects identified in the long-term plan, and on a permittee's financial capability." The CSO Policy identifies the following environmental and financial considerations that may affect the phasing of an implementation schedule for CSO controls:

- Eliminating overflows to sensitive areas
- Use impairment
- Financial capability
- Grant and loan availability
- Previous and current sewer user fees and rate structures

- Other viable funding mechanisms and sources of financing.

These factors, may warrant phasing the CSO control implementation schedules in a manner other than would be prescribed by logical engineering sequencing and normal construction practices. This section illustrates how these considerations may affect scheduling and provides some general scheduling boundaries to aid all parties in negotiating the final implementation schedule for CSO controls.

Scheduling is first considered during the permittee's development of an LTCP. The LTCP should assess CSO control alternatives including estimated design and construction time requirements for various components of the CSO controls. In general, CSO controls should be implemented as expeditiously as possible.

The permittee should first develop a tentative implementation schedule based on logical engineering sequencing and normal construction practices. The permittee should complete a critical path analysis to identify the shortest implementation schedule that will achieve the control objectives identified in the LTCP (See guidance: *Combined Sewer Overflows-Guidance for Long-term Control Plan (EPA 832-13-95-002)).* As a result of negotiations with state NPDES and EPA authorities, it may be appropriate to modify the tentative design and construction schedule based on the environmental and financial considerations listed above.

In general, the final negotiated schedule for CSO controls would reflect two types of modifications to the engineering and construction schedule. First, where CSOs discharge to sensitive or significantly use-impaired water bodies, the final schedule would provide for expedited implementation of the controls for these discharges. Second, the schedules may be phased or extended to reflect the significance of various financial considerations, particularly financial capability. The number of years to implement the CSO controls would be negotiated between the permittee, EPA and state NPDES authorities.

The following discussion provides more information on environmental and financial considerations that affect implementation schedules for CSO controls..

ENVIRONMENTAL CONSIDERATIONS

Discharges to Sensitive Areas

The CSO Control Policy states that a permittee's LTCP should give the highest priority to "sensitive areas." Sensitive areas are identified by the NPDES permitting authorities. They include the following:

- Outstanding National Resource Waters
- National Marine Sanctuaries
- Waters with threatened or endangered species and their habitat
- Waters with primary contact recreation
- Public drinking water intakes or their designated protection areas
- Shellfish beds.

For discharges to sensitive areas, the CSO Control Policy provides the following approaches:

- Prohibit new or significantly increased overflows
- Eliminate or relocate overflows
- Where elimination or relocation is not feasible, provide treatment to meet WQS and regularly reassess the feasibility of prohibition, elimination, or relocation.

During the planning process the permittee should characterize existing CSO conditions and identify receiving waters that are sensitive areas. The LTCP should give priority to sensitive areas and any implementation schedule should sequence projects to mitigate impacts on sensitive areas as early as possible. Giving high priority to sensitive areas might mean in some cases that discharges to non-sensitive areas would be addressed later in the implementation schedule than would be the case under a normal engineering and construction schedule.

Use Impairment

Long-term control plans should also give priority to receiving waters that experience recurring adverse impacts from CSOs on aquatic life, human health or aesthetics. Such waters may be the subject of public or media concern.

As a result of public participation and discussion with the permitting authority, the permittee should develop an implementation schedule that gives high priority to waters with impaired uses

and addresses them as soon as possible. As was the case for sensitive areas, giving high priority to certain use-impaired waters might mean that discharges to other waters would be addressed later in the implementation schedule than would be the case under a normal engineering and construction schedule.

The EPA document *Combined Sewer Overflows –Guidance for Screening and Ranking (EPA-832-B-95-004)* can provide assistance in identifying which CSO discharge points are likely to have the greatest adverse impact on water quality, aquatic life, or human health.

PRIMARY FINANCIAL CONSIDERATIONS

Financial Capability

The CSO Control Policy recognizes that financial capability is a significant factor in schedule development. A permittee's financial capability is assessed according to where the permittee falls on the Financial Capability Matrix calculated in worksheet 10. The matrix characterizes the financial burden on the permittee to implement CSO controls as either "Low Burden," "Medium Burden," or "High Burden."

To aid permittees, and EPA and state NPDES authorities during the negotiations necessary to establish implementation schedules for CSO controls, general time periods are presented in Table 4 that correspond with the permittee's Financial Capability Matrix Score summarized in Worksheet 10. The general implementation schedule time boundaries provide a basis for developing consistent and reasonably uniform implementation schedules across the nation in situations where permittee's CSO controls impose similar financial burdens. The time boundaries are not intended to replace the negotiations and deliberations necessary to balance all of the environmental and financial considerations that influence the site specific nature of the controls and implementation schedules.

FINANCIAL CAPABILITY GENERAL SCHEDULING BOUNDARIES
Table 4

Financial Capability Matrix Category	Implementation Period
Low Burden	Normal Engineering/Construction
Medium Burden	Up to 10 years
High Burden	Up to 15 Years*
	*(Schedule up to 20 years based on negotiation with EPA and state NPDES authorities)

Generally, a permittee in the "Low Burden" category would be expected to implement CSO control projects based on a normal engineering and construction schedule. In all cases, discharge to sensitive areas and impaired waters would be addressed on a high priority basis.

For permittees in the "Medium Burden" category, an implementation schedule up to 10 years might be appropriate. A permittee in the "High Burden" category is likely to incur substantial financial impacts to implement CSO controls; in such cases, an implementation schedule up to 15 years might be appropriate. In unusually "High Burden" situations, an implementation schedule up to 20 years may be negotiated with state NPDES and EPA authorities.

SECONDARY FINANCIAL CONSIDERATIONS

The three financial considerations--grant and loan availability, sewer user fees, and other viable funding mechanisms--are normally investigated early in the process of establishing CSO controls. They are described in more detail in the EPA document *Combined Sewer Overflows—Guidance for Funding Options* (EPA-832-B-95-007). They are typically addressed and resolved in the development of the financial schedule for the LTCP prior to design and construction. Therefore, these considerations normally do not have a significant impact on the length of time needed to implement CSO controls. An exception could occur in a case where a permittee's CSO controls can be constructed quickly but where the only available CSO funding source takes an inordinately long time to implement.

Grant and Loan Availability

During the long-term planning process, the permittee should develop a financing plan that identifies sources of capital funds. Generally, these will include some form of loan or grant. Typically, availability of grants and loans will not have a significant impact on the implementation schedule. In evaluating the effect of grant and loan availability on the permittee's schedule, the following funding sources would be considered:

- State wastewater treatment grant programs
- SRF Program
- State loan program (other than SRF program)
- Rural Utility Services Program (formerly: Rural Development Administration loan program)
- CoBank loan program
- Commercial loans
- Local revenue bonds
- Local general obligation bonds

Sewer User Fees

As part of the long-term planning process, the permittee should identify existing user fees and rate structures for wastewater treatment and then develop a new rate structure that includes recovery of the costs for CSO controls. Depending upon how CSO user fees are apportioned among residential, commercial, and industrial users, implementation of the LTCP may cause fees to increase significantly. In most cases, construction of the CSO controls occurs over an extended period allowing time for an orderly increase in the user fees. Thus, user fees typically are unlikely to have a significant impact on the implementation schedule. Combining increases in user fees with an ongoing public education program can help ease the effects of "rate shock" related to the higher user fees. The EPA document "Building Support for Increasing User Fees," (EPA 430/09-89-006) provides specific details on creating a public education program to successfully raise user fees.

Other Viable Funding Mechanisms and Sources of Funding

The permittee may have to consider alternate sources of funding if loans and grants are not available or if a need exists to reduce the financial impact of CSO controls on the users. In some cases, alternative funding mechanisms or financing sources may require additional time to set up. To evaluate the scheduling impacts of other viable funding mechanisms and sources of financing, the permittee's ability to accomplish the following actions would be assessed:

- Establish special assessment districts
- Increase user fees
- Impose/increase taxes (such as income taxes, sales taxes, or property taxes)
- Privatize wastewater treatment.

Most permittees would be expected to have several of these options available; therefore other viable funding mechanisms and sources of funding typically are not likely to have a significant impact on the implementation schedule.

SCHEDULING CONSIDERATIONS

Establishing an implementation schedule for the CSO controls is a negotiating process involving the permittee and EPA and state NPDES authorities. Normally, the time period for the CSO control implementation schedule is defined by the time required for normal engineering and construction practices. However, environmental and financial considerations can influence the time allowed to complete the CSO controls. The implementation schedule would always give high priority to addressing the environmental considerations involving discharges to sensitive areas and use-impaired water bodies. The CSO controls for these discharges would be constructed as expeditiously as possible. The implementation schedule can lengthen by phasing construction of the CSO controls when financial considerations create a financial burden. The primary financial

consideration which usually results in an extended implementation schedule with phased construction is the financial capability consideration.

Application of environmental and financial considerations to the development of implementation schedules for three hypothetical permittees is presented in Table 5.

Permittee number 1 required an eight year normal engineering/construction schedule to implement the CSO controls. Negotiations between the permittee and EPA and the state NPDES authorities resulted in agreement that four years would be allowed for the special circumstances of the permittee's low-burden financial capability category. Therefore, the eight-year engineering schedule took precedence over the financial consideration (therefore were no environmental considerations), and the schedule for implementation of CSO controls was eight years.

Permittee number 2 required three years to implement long-term controls under a normal engineering/construction schedule. Negotiations with the NPDES and WQS authorities concluded that four years would be necessary to obtain SRF loans. A four-year implementation schedule for CSO controls was established by the NPDES permitting authority to accommodate the most time consuming funding option.

Implementation of permittee number 3's CSO controls required a six-year normal engineering/construction schedule. However, the following environmental and financial considerations affected the final schedule:

- One of the permittee's CSO outfalls discharges to a bathing beach. Bathing beaches are defined as sensitive areas in the CSO Control Policy. Although a normal engineering/construction schedule would have eliminated this outfall in four years, it was determined that the schedule could be modified to eliminate this outfall in two years.

- The permittee's cost per household as percent of median household income is 2.2 percent, yielding a Residential Indicator of "Weak." The other socioeconomic, debt, and financial indicators yield a Permittee Indicators score of 1.7, or "Mid-Range." According to Table 3, these two indicators place the permittee in the "High-Burden" category for financial capability.

- User fees will have to increase significantly.

The unusual nature of permittee number 3's "high burden" financial capability category resulted in a sixteen-year schedule for this financial consideration after negotiations with the EPA and state NPDES authorities. Therefore, the permittee would receive a sixteen-year schedule to implement all CSO controls, with a special requirement that the CSO discharge to the bathing beaches be removed in the first two years of the schedule.

It is important to note that the final CSO control implementation schedule established for each permittee should be a time period that is negotiated between the permittee and EPA and state NPDES authorities based on the specific circumstances of each permittee's environmental and financial situation, plus the specific nature of any engineering and construction requirements.

SCHEDULING CONSIDERATION FOR HYPOTHETICAL PERMITTEES
Table 5

Scheduling Consideration	**Permittee #1**	**Permittee #2**	**Permittee #3**
Engineering/ Construction Schedule	8 years	3 years	6 years
Sensitive Areas	n/a	n/a	2 years to remove discharges from sensitive areas
Use Impairment	n/a	n/a	16 years
Financial Capability	4 years	0 years	0 years
Grant/Loan Availability	0 years	4 years	0 years
User fees/rate Structures	0 years	0 years	0 years
Other Funding Mechanisms	0 years	0 years	0 years
Schedule:	8 years	4 years	16 years (removal of discharge from sensitive area would occur within first 2 years)

The time periods presented in this guidance should be viewed as general boundaries to aid all parties in establishing reasonable and effective CSO control implementation schedules.

It is important to note that the final CSO control implementation schedule established for each permittee should be a time period that is negotiated between the permittee and EPA and state NPDES authorities based on the specific circumstances of each permittee's environmental and financial situation, plus the specific nature of any engineering and construction requirements. The time periods presented in this guidance should be viewed as general boundaries to aid all parties in establishing reasonable and effective CSO control implementation schedules.

NOV 2 4 2014

MEMORANDUM

SUBJECT: Financial Capability Assessment Framework for Municipal Clean Water Act Requirements

FROM: Ken Kopocis
Deputy Assistant Administrator
Office of Water (OW)

Cynthia Giles
Assistant Administrator
Office of Enforcement and Compliance Assurance (OECA)

TO: Regional Administrators
Regional Water Division Directors
Regional Enforcement Division Directors

In May of 2012, we distributed the Integrated Municipal Stormwater and Wastewater Planning Approach Framework (Integrated Planning Framework). Since that time, we have made solid progress in promoting integrated approaches to meet Clean Water Act (CWA) obligations. Thanks to the hard work of regional and headquarters staff, and the active engagement of cities, many of our enforcement settlements now embody integrated planning principles in the structure and schedule for injunctive relief or explicitly include integrated planning as part of the settlement. We have also seen an increasing number of municipalities and local authorities moving towards developing integrated plans to support the development of their NPDES permits. We have been working with EPA Regions and States to assist in that process.

As the implementation of the Integrated Planning Framework has progressed and evolved, we have been actively engaged with stakeholders on ways to build on our efforts. Those discussions found a natural focus on issues related to the financial capability of permittees working toward our shared goals of clean water. One consistent theme that emerged was the benefit of more clearly articulating the flexibility available under the existing guidance. EPA continues to be guided by the 1997 "Combined Sewer Overflows – Guidance for Financial Capability Assessment

and Schedule Development" (FCA Guidance) that provides an aid for assessing financial capability as part of negotiating schedules for implementing CWA requirements for municipalities and local authorities. The FCA Guidance also encourages permittees "to submit any additional documentation that would create a more accurate and complete picture of their financial capability" that may "affect the conclusion" of the analysis described in the guidance.

As part of EPA's commitment to implementing CWA objectives in a sustainable manner, we have developed the attached "Financial Capability Assessment Framework" (FCA Framework). The FCA Framework has been greatly informed by the comments and experiences of a variety of stakeholders and financial experts. The FCA Framework identifies the key elements EPA uses in working with permittees to evaluate how their financial capability should influence schedules. In addition, the FCA Framework provides examples of additional information that may help some communities provide a "more accurate and complete picture" of their financial capability as is envisioned in the FCA guidance. We will be posting the FCA Framework to our website as an important next step in the pursuit of integrated planning approaches and in our ongoing work with municipalities and local authorities to achieve our shared goals of protecting our nation's waters. While this memorandum releases the FCA Framework, we know that we will continue to learn and refine our understanding of the issues surrounding financial capability assessments as we use it moving forward. We will continue to look for ways to improve the Framework as we gain new insights and additional information.

We look forward to continue working with the Regions on these important issues and encourage you to contact Deborah Nagle, Director, Water Permits Division (nagle.deborah@epa.gov) and Mark Pollins, Director, Water Enforcement Division (pollins.mark@epa.gov) with any questions you might have.

FINANCIAL CAPABILITY ASSESSMENT FRAMEWORK

November 24, 2014

Purpose

The Environmental Protection Agency (EPA) is committed to working with state and local government partners to assist local municipalities and local authorities to meet Clean Water Act (CWA) obligations in a manner that recognizes the unique financial challenges that local jurisdictions face. This financial capability assessment framework is intended to provide additional examples and greater clarity on the flexibilities built into existing guidance that local governments or authorities can use in assessing their financial capability, and the relationship between that assessment and consideration of schedules for permit and consent decree implementation. This framework builds on the progress already made in the May 2012 "Integrated Municipal Stormwater and Wastewater Planning Approach Framework," and the experience gained from talking with communities about their financial capability in actual, on the ground circumstances. Integrated Planning has been helping in identifying a permittee's relative priorities for projects based on the relative importance of adverse impacts on human health and water quality and the municipality's financial capability.

Background

Local governments and authorities want to provide clean water for their communities, and they play an essential role in providing wastewater and stormwater infrastructure and services for their citizens, businesses and institutions. These municipal functions have been an important part of implementing the CWA to protect public health and improve water quality in streams, lakes, bays, and other waters nationwide. However, significant water quality challenges remain. Public officials remain strong supporters of the CWA goals and objectives by directing the public investments that are necessary to comply with the Act and to provide clean water for their citizens. Many local governments face complex water quality issues that are heightened by the need to address population growth or decline, increases in impervious surfaces, source water supply needs, and aging infrastructure. In recent years, many local governments and authorities have increased investments in their wastewater and stormwater infrastructure through capital projects to rehabilitate existing systems, improve operation and maintenance, and address additional regulatory requirements. As programs are implemented to improve water quality and attain CWA objectives, many state and local government partners find themselves facing difficult economic challenges with limited resources and financial capability. We recognize these challenging conditions and are working with states and local governments to develop and implement new approaches that will achieve water quality goals at lower costs and in a manner that addresses the most pressing problems first.

Long-term approaches to meeting CWA objectives should be sustainable and within a local government or authority's financial capability. The financial capability of these entities and other relevant factors are important to consider when developing appropriate schedules for infrastructure projects in permits or enforcement actions to help protect human health and the environment. EPA's financial capability assessment guidance, "Combined Sewer Overflows:

Guidance for Financial Capability Assessment and Schedule Development" (FCA Guidance) (EPA 832-B-97-004) provides a reference point to aid all parties in negotiating reasonable and effective schedules for implementing CWA requirements, and the flexibility to take into account local considerations that may not be fully captured by the approach detailed in the guidance. As described in more detail in this Framework, the guidance provides for consideration of the impact on residential rate payers and the financial capability of the permittee using a suite of indicators, as well as allowing schedules to be responsive to circumstances unique to that community, while advancing the mutual goal to protect clean water. The FCA Guidance encourages permittees to provide any additional information that would be useful in understanding those unique or atypical circumstances and how they may affect CWA schedules, so that all relevant information presented by a community can be taken into account to ensure that a full understanding of financial capability guides the development of schedules.

Financial Capability Assessment

The following are key elements of EPA's approach to the evaluation of the financial capability of municipalities to inform implementation schedules, both in permits and enforcement actions. The elements are fully compatible with the FCA Guidance, integrated planning approaches, and the flexibility embodied in both.

1. **The 1997 FCA Guidance identifies a valuable assessment that provides a common basis for financial burden discussions between the permittee, EPA and state NPDES authorities. Permittees have the option of submitting additional information that would create a more accurate and complete picture of their financial conditions.** The financial capability assessment described in the 1997 FCA Guidance identifies information that provides a basis for a general comparison of financial conditions between communities across the country and provides a consistent assessment of basic financial indicators as part of the overall analysis. Additional information that the community provides on its unique financial circumstances will be considered so that schedules take local considerations into account. Where appropriate, this information can result in schedules that are different than the schedules suggested by the baseline analysis suggested in the 1997 FCA Guidance.

2. **Financial capability is on a continuum.** Although the FCA Guidance approach categorizes financial burden as "high, medium, or low," this does not mean that schedules will be rigidly set according to the break points between the categories. For example, two communities whose total residential share of costs are 1.1% and 1.9% of median household income (MHI) are both categorized in the FCA Guidance as having a "medium" burden for the Residential Indicator (RI). All other things being equal, the appropriate schedules for those communities are likely to be different. Similarly, all other things being equal, two communities whose residential share of costs are 1.9% and 2.1% of MHI would be more likely to have similar overall compliance timeframes, even though one community is ranked as having a "medium" burden and the other as having a "high" burden. Finally, additional information submitted by the community may affect the length of the schedule regardless of where the community is on the "high, medium, and low" continuum.

3. **EPA will consider all CWA costs presented in the analysis described in the FCA Guidance**. EPA originally published the FCA Guidance to assist in negotiating schedules for communities with combined sewer systems, as these typically represent the most expensive CWA compliance issues. The FCA Guidance has since been recognized as equally suitable for considering other municipal CWA obligations as well, such as those related to separate sanitary sewer systems. With the release of EPA's 2012 Integrated Planning Framework, the Agency clarified that the financial capability analysis could include costs of: stormwater and wastewater; ongoing asset management or system rehabilitation programs; existing, CWA related capital improvement programs; collection systems and treatment facilities; and other CWA obligations required by state or other regulators. Where the costs of multiple CWA obligations are included in an FCA, each of those costs should be enumerated separately, so as to provide an understanding of how each contributes to the overall analysis.

4. **When presented, Safe Drinking Water Act (SDWA) obligations will be considered, primarily as additional information about a permittee's financial capability.** EPA believes that the SDWA obligations of a community can be an important consideration in establishing schedules for implementing integrated plans. EPA recognizes that both clean water and drinking water costs are often covered through charges on a single rate base. One component of a financial capability assessment includes an evaluation of the residential indicator that is based on only CWA costs as this best reflects the intended use of the metric and allows for comparisons with other communities. Drinking water costs may be reflected in other components of a financial capability assessment. For example, the financial capability indicator includes consideration of bond rating of the entity that issues debt to fund the permittee's capital project, which can be impacted by both wastewater and drinking water obligations for a permittee that provides both services. If a community has incurred general obligation debt associated with the SDWA, these obligations would be considered in the indicator "overall net debt as a percent of full market property value." In addition, as discussed below, additional information, including information regarding drinking water obligations, may be submitted for consideration in analyzing financial capability. To the extent that drinking water costs are not fully addressed by these other components, communities are encouraged to provide additional information about these costs.

5. **Communities should demonstrate how the CWA work included as costs in the financial capability assessment will be implemented, including appropriate assurances that those expenditures will be made.**

The Financial Capability Assessment Guidance and Examples of Additional Information that are Relevant to a Consideration of Financial Capability

The specific approaches laid out in the FCA Guidance provide a good foundation for the assessment of financial capability. As stated in the guidance and outlined in this Framework, communities can build on that foundation to include additional relevant information. The FCA Guidance presents a two-phased approach to assessing overall financial capability. The first phase assesses the impact on residential customers, and the first step is to calculate the portion of

the annual costs that would be borne by residential households for both current and projected Clean Water Act related expenses. The residential share of the annual costs of CWA obligations is then compared to the MHI of the service area. MHI is calculated using current census data and may be adjusted based on the current Consumer Price Index. Finally, the CWA compliance costs per household are divided by the adjusted MHI to calculate the residential indicator (RI). The FCA Guidance then identifies various ranges of RI scores as "low, mid-range or high" levels of burden. In situations where there are unique circumstances that would affect the conclusion of the first phase of the assessment, additional information documenting unique financial conditions may be submitted.

The second phase of the financial capability analysis assesses the financial strength of the permittee. Six indicators are used to evaluate the debt, socioeconomic and financial conditions that affect a permittee's financial capability to implement CWA controls necessary for compliance with the Act. These include bond ratings, overall net debt as a percent of full market property value, unemployment rate, median household income, property tax revenue collection rate, and property taxes as a percent of full market property value. In the Guidance, EPA has established benchmarks for each of the six indicators showing whether the indicator reflects a "weak", "mid-range", or "strong" financial capability. These benchmarks are used to generate an overall score of a permittee's financial capability.

The residential indicator calculated in phase one and the permittee capability indicators analyzed in phase two are evaluated together in a Financial Capability Matrix to assess the level of financial burden. The level of burden is then used to inform discussions to establish an appropriate schedule for meeting CWA obligations in permits and enforcement actions. EPA uses these indicators, including the annualized costs as a percent of MHI, to help assess when costs are reaching levels that may represent a high burden on ratepayers and that longer compliance timeframes are likely to be appropriate to spread the cost over a longer period. EPA does not view or use the Financial Capability Matrix as a rigid metric that points to a given schedule length or threshold over which the costs are unaffordable.

Permittees have suggested and the FCA Guidance recognizes that the two step analysis may not provide a complete representation of financial capability. As noted above, other relevant financial or demographic information presented that illustrates the unique or atypical circumstances faced by a permittee will also be considered in evaluating financial capability. The presentation of additional information can be very valuable in analyzing financial capability, and the submission of this type of information has become fairly common practice. For example, in many consent decree negotiations, additional information has resulted in the establishment of schedules that differ from the ones suggested by the baseline analysis described in the FCA Guidance.

Some examples of information that may be relevant in negotiating schedules to be included in permits and consent decrees are given below. In order for such information to adequately illustrate that a permittee's situation is atypical, EPA encourages permittees to compare any additional information on their circumstances to national averages or to that of other permittees.

The examples given below are not intended to be a complete list, nor a list of factors that will be relevant in every community. Rather it provides an illustration of information that may prove useful in some instances.

Examples of Information Related to Residential Impacts:

1. Income distribution by quintile, geography or other breakdown, illustrating how income distribution in the service area differs from comparable data on the national level or for similar cities.

2. Where cities have adopted differential rates for low income customers, the income distribution that led to that rate structure.

3. Information about service area poverty rates and trends.

4. Projected, current and historical sewer, and stormwater fees as a percentage of household income, quintile, geography or other breakdown.

5. Information on sewer and water usage for various classes of ratepayers or by type of dwelling unit.

6. Information on the percent of households who own versus rent.

Examples of Information Related to Financial Strength:

1. Historical population trends or population projections.

2. Service area unemployment data and trends, or other labor market indicators, including unemployment on an absolute basis.

3. Rate or revenue models, including dynamic financial planning models showing the projections of impacts over the program period. All revenue sources tied to CWA obligations may be included as appropriate.

4. Rate determination studies used to develop and support recent rate increases.

5. Data and trends on late payments, disconnection notices, service terminations, uncollectable accounts, or revenue collection rates.

6. Historical increases in rates or other dedicated revenue streams.

7. State or local legal restrictions or limitations on property taxes, other revenue streams or debt levels.

8. Other costs or financial obligations, such as those that relate to drinking water or other infrastructure, that significantly affect a permittee's ability to raise revenue.

9. Circumstances that may affect a permittee's bond rating. For instance, incurring debt beyond certain thresholds may negatively impact the permittee's bond rating, thus reducing the ability to raise capital.

10. Financial plans that show the implications of incurring additional debt for a permittee's ability to secure financing, including projections of metrics such as debt ratios, debt service coverage, debt per customer, days of cash on hand, days

of working capital and other metrics used by rating agencies. Such data should be benchmarked to metrics such as rating agency medians and relative to similar entities. This will be especially relevant where the permittee does not have a bond rating.

11. Extraordinary stressors such as those from natural disasters, municipal bankruptcies, unusual capital market conditions, or other situations which impact a permittee's ability to raise revenue or acquire needed financing. When such stressors occur, they may also provide support for making changes to existing schedules.

Phil
As discussed, I am sending relevant information to support DELCORA's approach to the Draft FCA which was submitted to EPA.

We would appreciate your review, and as previously requested, the opportunity to meet with EPA as soon as you are available to discuss this submission.

This is a follow-up to our continued dialogue following the May 22nd meeting.

Regards, Peg

Phil

Since our call on June 23rd, we have been reviewing several FCAs prepared for or by other POTWs. We are preparing some relevant information related to how the FCAs were prepared by those entities in light of our discussions related to: DELCORA's draft FCA and EPA's FCA Guidance (1997 and 2014). We will be submitting a memorandum to you for your review as soon as we have finalized our review of the FCAs. There is clearly a varied pattern and practice in how the FCAs have been prepared.
Regards, Peg

SANITARY SEWER IMPROVEMENTS AGREEMENT, DATED MARCH 2016

SANITARY SEWER IMPROVEMENTS AGREEMENT

This **SANITARY SEWER IMPROVEMENTS AGREEMENT** (this "Agreement") is made and entered into this ___ day of March, 2016, by and between **BROOKHAVEN ACQUISITION LP**, a Pennsylvania limited partnership, ("Brookhaven Acquisition"), and **THE DELAWARE COUNTY REGIONAL WATER QUALITY CONTROL AUTHORITY**, a municipal authority organized and existing under and pursuant to the laws of the Commonwealth of Pennsylvania ("Delcora").

BACKGROUND

WHEREAS, Brookhaven Acquisition is the owner of that certain parcel of real property located within the jurisdictional limits of the Borough of Brookhaven, Delaware County (the "Borough") and more fully described by metes and bounds on **Exhibit A** attached hereto (the "Brookhaven Acquisition Parcel"); and

WHEREAS, on April 6, 2015, Borough Council of the Borough granted Conditional Final Subdivision and Land Development Approval with regard to subdivision and development of the Brookhaven Acquisition Parcel (the "Brookhaven Acquisition Land Development Approval"); and

WHEREAS, pursuant to the Brookhaven Acquisition Land Development Approval, Brookhaven Acquisition is presently developing the Brookhaven Acquisition Parcel as a retail center known as The Shoppes at Brookhaven, together with certain public, quasi-public and private improvements with regard thereto (collectively, the "Brookhaven Acquisition Development"); and

WHEREAS, Delcora is the municipal authority having jurisdiction and responsibility over and for sanitary sewage collection, conveyance and treatment within the geographic region in which the Borough is located; and

WHEREAS, Brookhaven Acquisition contemplates that sanitary sewage effluent from the Brookhaven Acquisition Development will flow from the Brookhaven Acquisition Parcel to the Delcora Western Regional Wastewater Treatment Facility (the "Delcora Wastewater Treatment Facility") through infrastructure owned and maintained by Delcora (the "Delcora Wastewater Conveyance Infrastructure"); and

WHEREAS, the tapping fee for connection to the Delcora Wastewater Conveyance Infrastructure and treatment of sanitary sewage effluent at the Delcora Wastewater Treatment Facility as of the date of this Agreement is One Thousand and 00/100 Dollars ($1,000.00) per EDU (the "Delcora Tapping Fee"); and

WHEREAS, the Brookhaven Acquisition Development requires eighty-five (85) EDUs, such that the Delcora Tapping Fee applicable to the Brookhaven Acquisition Development is Eighty-Five Thousand and 00/100 Dollars ($85,000.00) (the "Brookhaven Acquisition Development Tapping Fee"); and

WHEREAS, the Delcora Wastewater Conveyance Infrastructure is a combined sewer system within the bed of Blossom Avenue between East Parkway Avenue and East Avon Avenue within the jurisdictional limits of the City of Chester, Delaware County (the "City"), as the existing condition thereof is such that stormwater flowing from properties within the Borough enters into the Delcora Wastewater Conveyance Infrastructure and intermixes with sanitary sewage effluent flowing through the Delcora Wastewater Conveyance Infrastructure; and

WHEREAS, Delcora requested that, in conjunction with each of the Brookhaven Acquisition Development and the Radio Park Development (as hereinafter defined), Brookhaven Acquisition and Radio Park (as hereinafter defined), respectively, complete the separation of the existing sanitary sewer line from the existing stormwater conveyance line within the bed of Blossom Avenue between East Parkway Avenue and East Avon Road within the jurisdictional limits of the City, all as more fully depicted on that certain plan by Catania Engineering Associates entitled Storm Sewer Separation for Delcora Blossom Ave – E. Avon to E. Parkway, dated October 15, 2015, and attached hereto as **Exhibit B** (the "Blossom Avenue Wastewater Conveyance Infrastructure Improvements"), in order to disconnect the flow of some stormwater from such portion of the Delcora Wastewater Conveyance Infrastructure and, thereby, preclude to a limited extent intermixing of stormwater and sanitary sewage effluent, as aforesaid, while increasing the hydrological capacity at the Delcora Wastewater Treatment Facility (the "Delcora Sewer Separation Requests"); and

WHEREAS, pursuant to that certain Letter of Intent dated April 29, 2015, by and between Hartford Properties, LLC ("Hartford Properties"), Daniel Schempp ("Schempp") and Delcora (the "Letter of Intent"), those parties contemplated the division amongst them of the responsibilities and obligations with regard to the Delcora Sewer Separation Requests; and

WHEREAS, Brookhaven Acquisition is the successor-by-assignment of Hartford Properties' right, title, and interest, duties, responsibilities, and obligations in, to, and under the Letter of Intent; and

WHEREAS, Radio Park is the successor-by-assignment of Schempp's right, title, and interest, duties, responsibilities, and obligations in, to, and under the Letter of Intent; and

WHEREAS, though Schempp executed the Letter of Intent, Radio Park is presently unable to perform the financial obligations which Shempp undertook pursuant to the Letter of Intent; and

WHEREAS, notwithstanding Radio Park's inability to perform the financial obligations which Shempp undertook pursuant to the Letter of Intent, on and subject to the terms, conditions and provisions expressly set forth in this Agreement, Brookhaven Acquisition is willing to complete the Blossom Avenue Wastewater Conveyance Infrastructure Improvements; and

WHEREAS, notwithstanding Radio Park's present inability to perform the financial obligations which Shempp undertook pursuant to the Letter of Intent, on and subject to the

express terms, conditions, and provisions set forth in that certain Sanitary Sewer Cost Sharing Agreement dated March ____, 2016, by and between Brookhaven Acquisition and Radio Park (the "Cost Sharing Agreement"), Brookhaven Acquisition is willing to allow Radio Park to participate in the benefits arising out of this Agreement and Brookhaven Acquisition's performance of the Blossom Avenue Wastewater Conveyance Infrastructure Improvements; and

WHEREAS, Brookhaven Acquisition is, and shall be, entitled to a credit against the Brookhaven Acquisition Development Tapping Fee on a dollar-for-dollar basis for eighty-two and five-tenths percent (82.5%) of the Blossom Avenue Wastewater Conveyance Infrastructure Improvements Cost (as hereinafter defined) (the "Brookhaven Acquisition Development Tapping Fee Credit").

NOW, THEREFORE, for and in consideration of the mutual promises set forth in this Agreement and other good and valuable consideration, the receipt and legal sufficiency of which is hereby acknowledged, Brookhaven Acquisition and Delcora hereby agree as follows:

1. Incorporation of Recitals. The recitals set forth in the Background Section of this Agreement are incorporated herein as if here set forth in their entirety.

2. Incorporation of Exhibits. All Exhibits attached to this Agreement are incorporated herein by reference.

3. Completion of Improvements. Under and pursuant to the terms, conditions and provisions expressly set forth in this Agreement, Brookhaven Acquisition shall complete the Blossom Avenue Wastewater Conveyance Infrastructure Improvements.

4. Grant of Permission to Perform Work. Delcora heretofore reviewed the plans and specifications with regard to the Blossom Avenue Wastewater Conveyance Infrastructure Improvements, and hereby confirms that it heretofore granted to Brookhaven Acquisition all necessary right and authority to access and modify that portion of the Delcora Wastewater Conveyance Infrastructure as necessary in order to complete the Blossom Avenue Wastewater Conveyance Infrastructure Improvements. Delcora hereby acknowledges Brookhaven Acquisition's receipt from the City of that certain Permit for Street Opening No. 11386 dated January 21, 2016, a true, correct, and compete copy of which is attached hereto as **Exhibit C** (the "City Permit"), and that no further permits or approvals are necessary for Brookhaven Acquisition to complete the Blossom Avenue Wastewater Conveyance Infrastructure Improvements.

5. Confirmation of Satisfaction of Requests. Delcora hereby confirms and acknowledges that execution and delivery of this Agreement by Brookhaven Acquisition constitutes full and complete satisfaction by Brookhaven Acquisition of the Delcora Sewer Separation Requests. Furthermore, Delcora hereby confirms and acknowledges that, unless and until Radio Park satisfies its obligations under and pursuant to the Cost Sharing Agreement including, without limitation, the obligation to remit the Radio Park Share (as hereinafter defined) to Brookhaven Acquisition, Radio Park shall not, and shall not be deemed to have, satisfied the Delcora Sewer Separation Requests.

6. Brookhaven Acquisition to Complete Work; Radio Park to Reimburse.

A. Completion of Work. Brookhaven Acquisition shall complete the Blossom Avenue Wastewater Conveyance Infrastructure Improvements, for which Brookhaven Acquisition heretofore entered into a construction contract with N. Abbonizio Contractors, Inc., a Pennsylvania corporation ("N. Abbonizio"), and, pursuant the Cost Sharing Agreement, Radio Park is and shall be responsible to, *inter alia*, pay over to Brookhaven Acquisition certain amounts as more fully set forth therein.

B. Costs. The cost of the Blossom Avenue Wastewater Conveyance Infrastructure Improvements (the "Blossom Avenue Wastewater Conveyance Infrastructure Improvements Cost") does and shall include all sums payable by Brookhaven Acquisition to N. Abbonizio, or otherwise, for or towards completion of the Blossom Avenue Wastewater Conveyance Infrastructure Improvements, and shall also include, but shall not necessarily be limited to, (i) the cost(s) paid or payable by Brookhaven Acquisition for negotiation of this Agreement, (ii) the cost(s) paid or payable by Brookhaven Acquisition with regard to the City Permit, (iii) the cost(s) payable by Brookhaven Acquisition of any and all insurance carried by Brookhaven Acquisition with regard to the Blossom Avenue Wastewater Conveyance Infrastructure Improvements; (iv) the cost(s) payable by Brookhaven Acquisition of any fees or other premiums charged to Brookhaven Acquisition for any inspection or financial security required to be posted to secure completion of the Blossom Avenue Wastewater Conveyance Infrastructure Improvements; and (v) the cost(s) for which Brookhaven Acquisition is, or may become, responsible arising out of or in any manner or form related to Brookhaven Acquisition's enforcement of this Agreement including, without limitation, attorneys' fees and court costs.

C. Developer Agreement. Declora acknowledges that Brookhaven Acquisition heretofore entered into an agreement with the City establishing the terms, conditions and provisions pursuant to which Brookhaven Acquisition shall complete the Blossom Avenue Wastewater Conveyance Infrastructure Improvements (as the same may be executed and amended from time to time, the "Blossom Avenue Wastewater Conveyance Infrastructure Improvements Developer Agreement"). In furtherance, and not in limitation, of Section 6.A. of this Agreement, Radio Park acknowledges that the Blossom Avenue Wastewater Conveyance Infrastructure Improvements Cost does and shall include any and all expenses arising out of or in any manner or form related to the Blossom Avenue Wastewater Conveyance Infrastructure Improvements Agreement and Brookhaven Acquisition' discharge of its duties, responsibilities and obligations under and pursuant to the Blossom Avenue Wastewater Conveyance Infrastructure Improvements Developer Agreement.

7. Radio Park.

A. Identification of Radio Park; Radio Park Development. Each of Brookhaven Acquisition and Delcora acknowledges that (i) that Radio Park, L.P., a Pennsylvania limited partnership ("Radio Park"), is the owner of those certain parcels of real property located within the jurisdictional limits of the Borough and more fully described by metes and bounds on **Exhibit D** attached hereto (collectively, the "Radio Park Parcels"), and (ii) that Radio Park (or,

as applicable, its successor) intends to develop the Radio Park Parcels as an eighteen (18) townhouse development known as Society Hill at Brookhaven, together with certain public, quasi-public and private improvements with regard thereto (collectively, the "Radio Park Development").

B. Sanitary Sewer Needs; Tapping Fee. Each of Brookhaven Acquisition and Delcora acknowledges (i) that Radio Park contemplates that sanitary sewage effluent from the Radio Park Development will flow from the Radio Park Parcels to the Delcora Wastewater Treatment Facility through the Delcora Wastewater Conveyance Infrastructure, and (ii) that the Radio Park Development requires eighteen (18) EDUS (the "Radio Park Capacity"), such that the Delcora Tapping Fee applicable to the Radio Park Development is Eighteen Thousand and 00/100 Dollars ($18,000.00) (the "Radio Park Development Tapping Fee").

C. Possible Credit for Radio Park Tapping Fee. Delcora acknowledges that if, and only if, Radio Park fully complies with its obligations under and pursuant to the Cost Sharing Agreement and Brookhaven Acquisition provides to Delcora written confirmation of such compliance, Radio Park shall be entitled to a credit against the Radio Park Development Tapping Fee for an amount not to exceed Eighteen Thousand and 00/100 Dollars ($18,000.00) and to be applied on a dollar-for-dollar basis for monies actually paid by Radio Park to Brookhaven Acquisition pursuant to the Cost Sharing Agreement (the "Radio Park Development Tapping Fee Credit").

D. Radio Park Not Intended Third-Party Beneficiary. Notwithstanding anything to the contrary set forth in this Agreement, each of Brookhaven Acquisition and Delcora acknowledges that Radio Park is not, and shall not for any intents or purposes whatsoever be deemed to be, an intended third-party beneficiary of this Agreement.

8. Reservation of Capacity; Purchase of Capacity; Administration of Credit.

A. Reservation. Prior to its execution of this Agreement, Brookhaven Acquisition did pay over to Delcora the sum of Eight Thousand Five Hundred and 00/100 Dollars ($8,500.00) (the "Capacity Reservation Fee"), the receipt of which Delcora acknowledged pursuant to that certain letter dated October 21, 2015, attached hereto as **Exhibit E**, such that, as of the execution of this Agreement, the remaining outstanding amount of the Brookhaven Acquisition Development Tapping Fee is, and for all intents and purposes whatsoever shall be deemed to be Seventy-Six Thousand Five Hundred and 00/100 Dollars ($76,500.00). Delcora does reserve, and for all intents and purposes whatsoever shall be deemed to have reserved, for Brookhaven Acquisition eighty-five (85) EDUs of capacity at the Delcora Wastewater Treatment Facility (the "Brookhaven Acquisition Capacity"), which such Brookhaven Acquisition Capacity is, and for all intents and purposes whatsoever shall be deemed to be, reserved to and for the benefit of the Brookhaven Acquisition Development.

B. Purchase of Capacity. Simultaneously with its full execution and delivery of this Agreement, Brookhaven Acquisition does purchase, and for all intents and purposes whatsoever shall be deemed to have purchased, from Delcora the Brookhaven Acquisition Capacity, and Delcora does and shall take any and all steps necessary to record in its records

such purchase and ownership by Brookhaven Acquisition of the Brookhaven Acquisition Capacity. Delcora hereby represents and warrants to Brookhaven Acquisition that no further approvals or actions whatsoever are necessary for such purchase and ownership to be final and complete for all intents and purposes whatsoever.

C. Representation of Ability to Sell EDUs and Permit Discharge of Effluent. Notwithstanding anything to the contrary set forth in this Agreement, or elsewhere, Delcora does hereby represent and warrant to Brookhaven Acquisition that Delcora has all legal approval, authority and ability necessary to sell to Brookhaven Acquisition the Brookhaven Acquisition Capacity for use at the Brookhaven Acquisition Development, and that there are no legal or factual impediments whatsoever to the issuance to Brookhaven Equities, or anyone claiming by, through or on behalf of Brookhaven Equities, any and all such permits as may be necessary to permit the discharge of eighty-five (85) EDUs worth of sanitary sewage effluent from the Brookhaven Acquisition Development through the Delcora Wastewater Conveyance Infrastructure for treatment at the Delcora Wastewater Treatment Facility and that, upon presentation to Delcora of applications with regard to such permits, Delcora shall issue the same without delay or condition.

D. Administration of Credit. Brookhaven Acquisition is and shall be entitled to the Brookhaven Acquisition Development Tapping Fee Credit to be applied on dollar-for-dollar basis against the Brookhaven Acquisition Development Tapping Fee. If, upon and within thirty (30) days following completion of the Blossom Avenue Wastewater Conveyance Infrastructure Improvements, it shall be determined that the amount of the Brookhaven Acquisition Development Tapping Fee Credit shall have exceeded the amount of the Brookhaven Acquisition Development Tapping Fee, Brookhaven Acquisition shall, within thirty (30) days of receipt of written demand from Delcora, remit to Delcora an amount equal to the difference between the amount of the Brookhaven Acquisition Development Tapping Fee Credit and the Brookhaven Acquisition Development Tapping Fee. Notwithstanding anything to the contrary set forth in this Agreement, however, in the event that the amount of the Brookhaven Acquisition Development Tapping Fee Credit shall exceed the amount of the Brookhaven Acquisition Development Tapping Fee, Brookhaven Acquisition shall not be entitled to any refund or other credit, or to purchase from Delcora any capacity at the Delcora Wastewater Treatment Facility in excess of the Brookhaven Acquisition Capacity.

9. Radio Park Purchase of Capacity; Administration of Credit.

A. Requirement to Pay. Notwithstanding anything to the contrary set forth in this Agreement, or elsewhere, Radio Park is not, and shall not, be entitled to purchase from Delcora (and Delcora shall not sell to Radio Park, or otherwise for use at the Radio Park Parcels) any EDUs, and Delcora shall not issue any permits as may be necessary to permit the discharge of sanitary sewage effluent from the Radio Park Parcels through the Delcora Wastewater Conveyance Infrastructure for treatment at the Delcora Wastewater Treatment Facility without, in each instance, ten (10) Business Days' (as hereinafter defined) prior written notice to Brookhaven Acquisition, and either (i) Brookhaven Acquisitions' written confirmation to Delcora that Radio Park shall have paid to Brookhaven Acquisitions such sums as shall by then have become due and payable under and pursuant to the Cost Sharing Agreement or (ii) the

passage of such ten (10) Business Days' without notice from Brookhaven Acquisitions that Radio Park shall have failed to pay the Radio Park Share.

B. Administration of Credit. If, as and when Radio Park (or, as applicable, its successor or assign) shall seek to purchase EDUs from Delcora with regard to the Radio Park Development (which such purchase is, and shall be, subject to the provisions of Section 9.A. of this Agreement and the Cost Sharing Agreement), Delcora shall apply the Radio Park Development Tapping Fee Credit on dollar-for-dollar basis against the Radio Park Development Tapping Fee provided, however, that it shall be determined that the amount of the Radio Park Development Tapping Fee Credit shall exceed the amount of the Radio Park Development Tapping Fee, Delcora shall require Radio Park (or, as applicable, its successor or assign) to remit to Delcora an amount equal to the difference between the amount of the Radio Park Development Tapping Fee Credit and the Radio Park Development Tapping Fee, the obligation for which Radio Park acknowledges by its execution of this Agreement. Notwithstanding anything to the contrary set forth in this Agreement, however, in the event that the amount of the Radio Park Development Tapping Fee Credit shall exceed the amount of the Radio Park Development Tapping Fee, Delcora shall not allow any refund or other credit against the Radio Park Development Tapping Fee, or allow Radio Park to purchase from Delcora any capacity at the Delcora Wastewater Treatment Facility in excess of the Radio Park Capacity.

10. Notices. Any and all notices required or desired to be given pursuant to this Agreement shall be sent via hand delivery or via first-class mail or via a nationally recognized courier service guaranteeing next Business Day delivery, in any event to the addresses set forth below or such other address(es) as the recipient(s) may designate from time to time:

if to Brookhaven Acquisition:

Brookhaven Acquisition, L.P.
c/o Retail Sites, LLC
Tall Oaks Corporate Center
1000 Lenola Road
Building Two, Suite 100
Maple Shade, New Jersey 08052
Attn: Mr. Robert M. Hill

with a required copy in all instances to:

Buckley, Brion, McGuire & Morris LLP
118 West Market Street
West Chester, Pennsylvania 19382
Attn: Joseph E. Brion, Esquire
Michael S. Gill, Esquire

if to Delcora:

The Delaware County Regional Water Quality Control Authority
100 East Fifth Street
Post Office Box No. 999
Chester, Pennsylvania 19013
Attn: Robert J. Willert, Executive Director

with a required copy in all instances to:

McNichol, Byrne & Matlawski , PC
1223 North Providence Road
Media, Pennsylvania 19063
Attn: J. Adam Matlawski, Esquire

All such notices, requests and other communications shall be deemed to have been sufficiently given for all purposes hereof as follows: if made by hand delivery then upon such delivery, if made by overnight delivery then on the next Business Day following deposit thereof properly addressed and delivery fees paid with a nationally recognized courier guaranteeing overnight delivery and providing package tracking capability and, if made by first-class mail then on the fifth (5^{th}) Business Day following deposit thereof with the United States Postal Service properly addressed and postage prepaid. When used in this Agreement, the term "Business Day" does and shall mean any day other than a Saturday, Sunday or legal holiday in the Commonwealth of Pennsylvania.

11. No Joint Venture, Partnership or Other Association. Except as expressly set forth in this Agreement, nothing set forth in this Agreement or elsewhere shall, or shall be deemed to, create any joint venture, partnership or other association by or between Brookhaven Acquisition and Delcora.

12. Governing Law. This Agreement shall be interpreted and construed in accordance with the laws of the Commonwealth of Pennsylvania without regard to principles of conflicts of law.

13. Jurisdiction; Venue. Jurisdiction for any dispute arising out of or in any manner or form related to this Agreement shall be with the courts of the Commonwealth of Pennsylvania. Initial venue for any such dispute is and shall lay with the Court of Common Pleas of Delaware County.

14. Entire Agreement. This Agreement embodies and constitutes the entire understanding between the parties with respect to the subject matter hereof and all prior or contemporaneous agreements, understandings, representations and statements, oral or written, are merged into this Agreement. Neither this Agreement nor any provision hereof may be waived, modified, amended, discharged or terminated except by an instrument in writing signed by the party against which the enforcement of such waiver, modification, amendment, discharge or termination is sought, and then only to the extent set forth in such instrument.

15. Provisions Severable. In case any one or more of the provisions contained in this Agreement shall, for any reason, be held invalid, illegal or unenforceable in any respect by a court of competent jurisdiction such invalidity, illegality or unenforceability shall not affect any other provision of this Agreement, and this Agreement shall be construed as if the invalid, illegal or unenforceable provision had never been contained herein.

16. Radio Park Acknowledgment. Radio Park does and shall execute this Agreement in the space provided below for the purpose of acknowledging the terms, conditions, and provisions hereof including, without limitation, Section 6. of this Agreement, Section 7. of this Agreement, and Section 9. of this Agreement.

[*REMAINDER OF THIS PAGE INTENTIONALLY LEFT BLANK*]

[INSERT PLANS AND DESCRIPTION OF BLOSSOM AVENUE WASTEWATER CONVEYANCE INFRASTRUCTURE IMPROVEMENTS]

PA ONE CALL No. 20152233123

CALL BEFORE YOU DIG!
PENNSYLVANIA LAW REQUIRES
3 WORKING DAYS NOTICE FOR
CONSTRUCTION PHASE AND 10 WORKING
DAYS IN DESIGN STAGE – STOP CALL 8-1-1

Pennsylvania One Call System, Inc.
1-800-242-1776
8-1-1 (WITHIN PA.)

THE LOCATIONS OF ALL UTILITIES SHOWN ON THE PLANS ARE APPROXIMATE AND MUST BE VERIFIED IN THE FIELD BY THE CONTRACTOR PRIOR TO CONSTRUCTION. THE CONTRACTOR SHALL CONTACT PA ONE-CALL AT 811 AT LEAST 3-DAYS BEFORE PROCEEDING WITH ANY EXCAVATION. IT IS ALSO THE CONTRACTOR'S RESPONSIBILITY TO OBTAIN ACCURATE FIELD LOCATIONS OF ALL EXISTING UNDERGROUND AND AERIAL UTILITIES FROM BOTH THE UTILITY COMPANIES AND/OR BY TEST PITS PRIOR TO BEGINNING WORK. ALL UTILITY SERVICES WITHIN THE LIMITS OF WORK MUST ALSO BE FIELD LOCATED PRIOR TO EXCAVATION WORK. CONTRACTORS ARE TO IMMEDIATELY NOTIFY THE ENGINEER OF ANY DEVIATIONS FROM THE PLAN INFORMATION. THE CONTRACTOR SHALL BE RESPONSIBLE TO TAKE ALL PREVENTIVE MEASURES TO PROTECT THE LINES IN ACCORDANCE WITH THE PA ONE-CALL ACT. PA ONE-CALL SERIAL NUMBER 20152233123.

TEMPORARY SEEDING SPECIFICATIONS:

SEEDING: 100% COMMON RYEGRASS AT 5 LBS./1000 S.F.
FERTILIZER: 10-5-5 OR EQUAL AT 40 LBS./1000 S.F.
LIME: GROUND LIMESTONE AT 100 LBS./1000 S.F.

UNFORESEEN EROSIVE CONDITIONS

1. SHOULD UNFORESEEN EROSIVE CONDITIONS DEVELOP DURING CONSTRUCTION, THE CONTRACTOR SHALL TAKE ACTION TO REMEDY SUCH CONDITIONS AND TO PREVENT DAMAGE TO ADJACENT PROPERTIES AS A RESULT OF INCREASED RUNOFF AND/OR SEDIMENT. STOCKPILES OF WOODCHIPS, HAY BALES, CRUSHED STONE AND OTHER MULCHES SHALL BE HELD IN READINESS TO DEAL IMMEDIATELY WITH EMERGENCY PROBLEMS OF EROSION.
2. THE CONTRACTOR IS ADVISED TO BECOME THOROUGHLY FAMILIAR WITH THE PROVISIONS OF APPENDIX E-6, EROSION CONTROL RULES AND REGULATIONS, TITLE 25, PART I, DEPARTMENT OF ENVIRONMENTAL RESOURCES, SUB-PART C, PROTECTION OF NATURAL RESOURCES, ARTICLE III, WATER RESOURCES, CHAPTER 102, EROSION CONTROL.
3. PROTECTION TO EXISTING TREES AND SHRUBS SHALL BE TAKEN BY THE CONTRACTOR TO ELIMINATE UNNECESSARY DAMAGE.

PERMANENT SEEDING SPECIFICATIONS: GRASS AREAS

ALL AREAS DESIGNATED FOR GRASS COVER SHALL BE PREPARED AND SEEDED AS FOLLOWS AND THE MATERIALS SHALL BE APPLIED AT THE RATES INDICATED AND INCORPORATED INTO THE UPPER LAYER OF SOIL:

AGRICULTURAL GROUND LIMESTONE – 190 LBS./1000 S.F.
FERTILIZER – 9-20-20 FORMULA – 20 LBS./1000 S.F.
FERTILIZER – 10-5-5 FORMULA – 23 LBS./1000 S.F.

PREPARED AREAS SHALL BE SEEDED WITH A PERENNIAL RYEGRASS MIXTURE SOWN AT THE RATE OF 10 LBS./1000 S.F.OF SURFACE AREA AND ROLLED WITH A LIGHT WEIGHT ROLLER. (PERENNIAL RYEGRASS MIXTURE AS PREPARED BY THE SWEENEY SEED COMPANY, KING OF PRUSSIA, PA OR APPROVED EQUAL.)

MULCH – HAY OR STRAW

ALL AREAS WHICH ARE SEEDED WITH EITHER TEMPORARY OR PERMANENT SEED MIXTURES SHOULD BE MULCHED. MULCH IS A LOOSE LAYER 3/4" TO 1" DEEP OF HAY OR STRAW. MULCH REDUCES SOIL EROSION, AIDS SEED GERMINATION, AND CONSERVES MOISTURE. HAY OR STRAW SHOULD NOT BE CHOPPED OR FINELY BROKEN DURING APPLICATION. MULCH SHOULD BE APPLIED AS FOLLOWS:

MULCH – 3 TONS PER ACRE, 140 LBS. PER 1000 S.F.

GENERAL NOTES:

1. STRUCTURES AND PIPES AS SHOWN ON THE PLANS ARE GRAPHICAL DEPICTIONS ONLY. ACTUAL SIZE, CONFIGURATIONS, AND LOCATIONS OF MANHOLES, INLETS, AND STRUCTURES ARE THE CONTRACTOR'S RESPONSIBILITY.
2. CONTRACTOR TO BE RESPONSIBLE FOR COORDINATION OF ALL UTILITY CROSSINGS. PROTECTION OF HOUSE SERVICES DURING CONSTRUCTION TO BE THE CONTRACTOR'S RESPONSIBILITY. UTILITIES HAVE BEEN NOTIFIED OF PENDING CONSTRUCTION BY THE PA ONE CALL SYSTEM. LOCATIONS OF UTILITIES ARE APPROXIMATE AND ARE PLOTTED FROM RECORDS OBTAINED FROM THE UTILITY COMPANIES. CONTRACTOR TO VERIFY HORIZONTAL AND VERTICAL LOCATIONS OF ALL UTILITIES AND REPORT ANY DISCREPANCIES TO THE ENGINEER PRIOR TO ANY CONSTRUCTION.
3. IT IS THE CONTRACTOR'S RESPONSIBILITY FOR PROTECTING AND PREVENTING DAMAGE TO ALL EXISTING (OVERHEAD AND UNDERGROUND) UTILITIES AND ADJACENT PRIVATE PROPERTY.
4. THE CONTRACTOR SHALL PROTECT THE PROPOSED STORM SEWER PER THE PIPE BEDDING AND PROTECTION DETAIL UNTIL A MINIMUM 2 FT. COVER IS PROVIDED.
5. CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING ALL REQUIRED LICENSE AND PERMITS FOR THE PROPOSED WORK, AS REQUIRED BY THE CITY OF CHESTER.
6. TRAFFIC MAINTENANCE AND WORK ZONE PROTECTION TO BE THE RESPONSIBILITY OF THE CONTRACTOR. ALL CONSTRUCTION AREAS TO BE SECURED AND PROPERLY BARRICADED FROM VEHICULAR AND PEDESTRIAN TRAFFIC. ALL OPEN TRENCHES SHALL BE PROPERLY SECURED WITH HIGH VISIBILITY ORANGE SAFETY FENCE AND LIGHTED BARRICADES. ALL CONSTRUCTION AREAS INCLUDING STAGING AND MATERIAL STORAGE AREAS SHALL BE CONFINED TO THE LIMITS OF THE RIGHT-OF-WAY, AND BE PROPERLY PROTECTED WITH LIGHTED BARRICADES. CONTRACTOR MUST MAINTAIN ACCESS TO ALL RESIDENTS' DRIVEWAYS THROUGH THE PROGRESS OF WORK. ACCESS TO FIRE HYDRANTS, MAIL BOXES, ETC. SHALL ALSO BE MAINTAINED.
7. ALL DISTURBED AREAS TO BE RESTORED TO ORIGINAL OR BETTER CONDITION. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL NECESSARY RESTORATION WORK, AS REQUIRED, FOR THE PROPER COMPLETION OF THE WORK. ANY CURB OR SIDEWALK DAMAGED AS A RESULT OF THIS WORK SHALL BE REPLACED BY THE CONTRACTOR.
8. THE PROJECT SITES SHALL BE KEPT IN CLEAN AND ORDERLY CONDITION. ALL DEBRIS AND EXCESS MATERIALS SHALL BE REMOVED FROM SITE ON A DAILY BASIS. ALL STREETS TO BE BROOM SWEPT AS NECESSARY TO PREVENT EXCESS DUST NUISANCE TO RESIDENCE. FAILURE TO PROPERLY MAINTAIN SITES CAN RESULT IN DELAY OF WORK UNTIL AREAS ARE PROPERLY CLEANED.
9. KEEP ALL ROADWAYS, ADJACENT PROPERTIES, DRAINAGE FACILITIES AND WATER COURSES FREE FROM ALL DEBRIS, DROPPINGS AND SEDIMENT. IMMEDIATELY REMOVE ANY SUCH OCCURRENCES.
10. TEMPORARY INLET PROTECTION SHALL BE PROVIDED AT EACH INLET AND SHALL BE MAINTAINED BY THE CONTRACTOR UNTIL PERMANENT RESTORATION IS COMPLETED. WHEN FINAL RESTORATION IS COMPLETED, CONTRACTOR MUST REMOVE INLET PROTECTION FROM INLETS.
11. PROTECTION OF EXISTING TREES AND SHRUBS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO ELIMINATE UNNECESSARY DAMAGE.
12. ALL RESIDENTIAL PROPERTY BORDERS ARE APPROXIMATE AND NOT INTENDED FOR LEGAL PURPOSES.

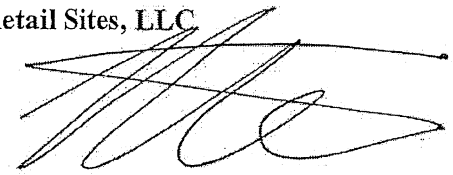
Re: City of Chester
Blossom Avenue Storm Sewer Separation
File #PDCCP026, Account #81

Dear Sir/Madam:

Enclosed please find check #1519 in the amount of $6,924.03 on behalf of Brookhaven Acquisition LP for the inspection escrow for the Blossom Avenue Storm Sewer Separation work in Brookhaven, PA, as set forth in the October 2, 2015 review letter from Michael Galante to Retail Sites, LLC (attached).

Sincerely,

Retail Sites, LLC



Robert Hill
President

Re: City of Chester
Blossom Avenue Storm Sewer Separation
Our File #PDCCP026 (First Review)

Dear Mr. Hill:

At your request, our office has received the following submission materials for the above referenced plan submission:

- Storm Sewer Separation Plan – Blossom Avenue, One (1) sheet1 prepared by Catania Engineering Associates, Inc., Milmont Park, PA dated 7/29/2015.

I. Submission Information

Owner & Applicant:	Robert hill, President Retail Sites, LLC 1000 Lenola Road Building Two, Suite 100 Maple Shade, NJ 08052 856-778-4900
Engineer:	Catania Consulting Engineers 520 West MacDade Boulevard Milmont Park, PA 19033-3311 610-532-2884 Fax 610-532-2923
Proposal:	The Applicant proposes to separate the storm sewer from the sanitary sewer system at Blossom Avenue between East Parkway Avenue and Avon Road. The proposed improvements will be owned and operated by the City of Chester when completed and the Developer is completing these improvements in accordance with an agreement with Delcora.

Based on our review, we have the following comments that must be addressed by the design professional. Please note that underlined statements are items that must be addressed by the design professional prior to final plan approval.

II. Engineering Comments

1. The applicant is proposing to utilize 12" HDPE Pipe. The size and material of the pipe shall be modified to 15" Reinforced Concrete Pipe.

2. The applicant is proposing to connect into an existing stormwater inlet at the Northeast corner of E. Avon Road. The application shall upgrade the inlet by adding a PENNDOT Approved bicycle safe grate and the applicant shall clean and parge the interior of the inlet. A detail shall be provided on the plans.

3. The applicant is proposing to modify the existing inlet located at the Southwest corner of East Parkway Avenue. The applicant shall clean and parge the inlet and fill the bottom of the inlet with concrete to the proposed pipe invert. This shall be detailed on the plans.

4. The applicant is proposing the abandon inlet at the Northwest corner of East Parkway Avenue. This inlet represents a low point and if the inlet is removed the street will not drain adequately. Therefore, the applicant shall consider keeping this inlet and connecting it into the proposed inlet.

5. The proposed pipe location along Blossom Avenue will most likely require new curb. A curb detail shall be added to the plans. Additionally, the pipe is located within close proximity to street trees and the applicant shall provide written justification that there will be no impacts to existing street trees.

6. The applicant shall provide a detail and type for the two (2) proposed inlets on Blossom Avenue.

7. All abandoned pipe shall be capped and both ends and filled with flowable fill.

8. Prior to construction, it is recommended that the applicant coordinate potential utility conflicts to ensure an efficient construction schedule and reduce impacts to the local residents.

9. The applicant shall perform a half mill and pave the roadway.

10. A road opening permit is required for all work.

11. Prior to the start of construction, the applicant shall enter into a developer's agreement with the City and pay all engineering review and inspection fees incurred by the City.

Our approval is contingent upon the design professional addressing and responding to each underlined item in the letter by return correspondence using the same numbering. Should you have any questions please feel free to contact me directly at (610) 940-1050, extension 3002.

Very truly yours,
Remington, Vernick & Beach Engineers

EXHIBIT D

[INSERT METES AND BOUNDS DESCRIPTIONS OF RADIO PARK PARCELS]

First American Title™	Commitment for Title Insurance
	ISSUED BY **First American Title Insurance Company**
Exhibit A	

File No. **PAFA15-3034 MC**

ALL THOSE CERTAIN lots or parcels of land and the buildings thereon situate in Brookhaven Borough, Delaware County, Pennsylvania, as more particularly described as follows:

PREMISES "A"

ALL THAT CERTAIN lot or piece of ground with the buildings and improvements thereon erected, Hereditaments and Appurtenances, SITUATE in the Brookhaven Borough, County of Delaware and State of Pennsylvania, bounded and described according to a Plan of property of Simon Carman prepared by G.D. Houtman & Son, Civil Engineers and Land Surveyors, dated December 8th, 1960 and last revised August 10th, 1978 as follows, to wit:

BEGINNING at a point in the title line at or near the centerline of Brookhaven Road (33 feet wide), the said point being 336.08 feet North 54 degrees 39 minutes 40 seconds East from the point of intersection of the title line at or near the center line of Brookhaven Road with the centerline of Edgmont Avenue; thence from said point of beginning and along the title line at or near the centerline of Brookhaven Road North 44 degrees 39 minutes 40 seconds East 137.66 feet to a point; thence leaving Brookhaven Road South 38 degrees 48 minutes 20 seconds East 368.86 feet to a pipe; thence South 52 degrees 35 minutes 40 seconds West 107.2 feet to a point; thence along Lot No. 1 North 43 degrees 37 minutes 44 seconds West 351.83 feet to the first mentioned point and place of beginning.

PREMISES "B"

ALL THAT CERTAIN lot or piece of ground with the buildings and improvements thereon erected, Hereditaments and Appurtenances, SITUATE at Brookhaven, in Brookhaven Borough (formerly Chester Township), County of Delaware and State of Pennsylvania, bounded and described as follows, to wit:

BEGINNING at a point in the center line of Brookhaven Road, a corner of lands now or late of Theodore R. Dix; thence by the center line of the said Brookhaven Road, North 48 degrees, 8 minutes East, 101.35 feet to a point, a corner of other lands now or late of Wallace R. Michaels, Jr. and wife; thence by the last mentioned lands, South 32 degrees, 31 minutes East, 387.77 feet, more or less, to a point in line of lands now or late of John P. Crozer, deceased; thence by the last mentioned lands, South 58 degrees, 10 minutes West, 100.01 feet to a point, a corner of said mentioned lands of the said Theodore R. Dix; thence by last mentioned lands, North 32 degrees, 31 minutes West, 370.01 feet, more or less, to the center line of the said Brookhaven Road , the point or place of beginning.

PREMISES "C"

ALL THAT CERTAIN lot or piece of land, Hereditaments and Appurtenances, SIUATE in the Borough of Brookhaven, formerly the Township of Chester, County of Delaware and State of Pennsylvania, and bounded and described according to survey thereof made by Joseph S, White, of Philadelphia on August 5th, 1947, as follows to wit:

BEGINNING at a point in the center line of Brookhaven Road, a corner of lands now or late of George M. Merchant, et ux; extending thence along the center line of said Brookhaven Road, North 48 degrees, 8 minutes East 65.35 feet to a point a corner of lands of Wallace R. Michaels, Jr. et ux, about to be conveyed to Frank H. Bozman, et ux; thence along said lands, South 32 degrees 5 minutes East 399.09 feet to a point in line of lands now or late of the Estate of John P. Crozer deceased; thence along last mentioned lands, South 58 degrees, 10 minutes West 61.37 feet to a corner of lands now or late of said George M. Merchant, to ux; and thence along last mentioned lands, North 32 degrees, 31 minutes West 387.77 feet to the center line of said Brookhaven Road, the first mentioned point and place of beginning.

EXCEPTING THEREFROM AND THEREOUT FROM PREMISES C:

ALL THAT CERTAIN lot or piece of land, Situate in the Borough of Brookhaven, County of Delaware and State of Pennsylvania, and bounded and described in accordance with a "Preliminary/Final Record Plan", prepared for Harvin Properties, LLC, dated July 15th, 2005, last revised October 11th, 2006 prepared by R&T Associates, LLC, Chaddsford, Pennsylvania, being more fully described as follows, to wit:

BEGINNING at a point on the easterly right-of-way of Brookhaven Road (60 feet wide), said point being the common corner of lands nor or formerly of Lot 19 and lands now or formerly of Harvin Properties, LLC; THENCE extending along the easterly right-of-way of Brookhaven Road (60 feet wide), North 44 degrees 39 minutes 9 seconds East, 64.60 feet to a point, a common corner of Lot 19 and lands now or formerly of Business and Industrial Plant and Office Investors, South 38 degrees 28 minutes 20 seconds East, 147.08 feet to a point; THENCE leaving said line of lands and extending along the common line of lands between Lot 19 and lands now or formerly of Harvin Properties, LLC, South 53 degrees 38 minutes 33 seconds West 63.12 feet to a point; THENCE continuing along a common line of lands of Lot 19 and lands now or formerly of Harvin Properties, LLC North 38 degrees 48 minutes 20 seconds West 138.01 feet to a point on the easterly right-of-way of Brookhaven Road (60 feet wide), the first mentioned point and place of BEGINNING.

AND NOW AS TO RESIDUE OF PARCEL C BEING DESCRIBED AS: DESCRIPTION OF PROPERTY KNOWN AS PREMISES "C" RESIDUE NOW OR FORMERLY OF HAM/1N PROPERTIES, LLC (SOURCE OF TITLE DEED RECORD BOOK 3477, PAGE 549), LOCATED AT SOCIETY HILL AT BROOKHAVEN, AND MORE PARTICULARLY SHOWN ON A PLAN FOR WILMINGTON SAVINGS FUND SOCIETY PREPARED BY TRANSITION ENGINEERING SURVEYING LLC, DATED AUGUST 8TH, 2014, REVISED THROUGH AUGUST 25TH, 2014, PROHECT NO. WSFS: 033.54.08. SITUATED IN BROOKHAVEN BOROUGH, DELAWARE COUNTY, PENNSYLVANIA.

BEGINNING at a point in line lands known as #125 Brookhaven Road now or formerly of Business and Industrial Plant and Office Investors (Deed Book 1564, Page 13999), said point being a common corner for the (residue) parcel herein described and Lot No. 19 known as #123 Brookhaven Road now or formerly of Robert P. Martin and Brenda J. Martin (Deed Record Book 4020, Page 59), and further located along the division line between Lot No. 19 known as #123 Brookhaven Road and said lands known as #125 Brookhaven Road, S 44° 43' 40" E (State Plan bearing), S 38° 28' 20" E (Society Hill at Brookhaven plat bearing), and crossing over a capped rebar set at 28.94', a total distance of 148.07 from its point of intersection thereof with the title line at or near the centerline of Brookhaven Road at 60' wide THENCE from said point of beginning, along said lands known as #125 Brookhaven Road, S 44° 43' 40" E (State Plane bearing), a distance of 250.61' to a point (iron pipe found) in the rear line of lands known as #246 Radio Park Lane now or formerly of Clara N. Williams (Deed Book 4813, Page 262); THENCE by the same, in part, and along the rear line of lands known as #244 Radio Park Lane now or formerly of Kenneth Ulerick and Deborah Ulerick (Deed Book 4531, Page 1331), S 46° 09' 05" W (State Plane bearing), and crossing over a found rebar at 26.07', a total distance of 61.88' to a point (metal post found at grade), a corner of Premises "B" known as #121 East Brookhaven Road now or formerly Harvin Properties LLC (Deed Record Book 3286, Page 865); THENCE by the same, N 45° 03' 40" W (State Plane bearing), a distance of 252.00' to a point, a rear corner for said Lot No. 19 known as #123 Brookhaven Road;

THENCE along the rear lot line of said Lot No. 19 known as #123 Brookhaven Road, N 47° 23' 13" E (State Plane bearing), a distance of 63.38' to a point in said line of lands known as #125 Brookhaven Road, the first mentioned point and place of beginning.

CONTAINGING with said described metes and bounds 0.3612 acre of land, be the same more or less.

File No. **PAFA15-3034 MC**

PREMISES "D"

ALL THAT CERTAIN parcel of ground, Hereditaments and Appurtenances, SITUATE in Brookhaven Borough, County of Delaware and State of Pennsylvania, and described according to a field survey performed by G.D. Houtman & Son, Inc., Civil Engineers and Land Surveyors dated November 15th, 2004, as follows, to wit:

BEGINNING at a found pipe on the Northwesterly Right-of-Way Line of Radio Park Lane (50 feet wide), the aid found pipe being measured 304.68 feet along the said Right-of-Way Line South 44 degrees, 21 minutes, 0 seconds West, from a point of curve; the said point of curve being measured along an arc of a circle to the right of radius of 50 feet an arc distance of 78.55 feet from a point of tangency on the Northeasterly Right-of-Way Line of Williams Avenue (50 feet wide); thence from the point of beginning and along the Northwesterly Right-of-Way Line of Radio Park Lane, South 44 degrees, 21 minutes, 0 seconds West, 73.20 feet to a point; thence North 41 degrees, 9 minutes, 12 seconds West, 147 feet to a point; thence along lands now or late of Harvin Properties, LLC, North 52 degrees, 35 minutes, 40 seconds East, 62.32 feet to a found iron pin; thence along lands now or late of Carmen and Karen Lombardo, South 45 degrees, 39 minutes, 0 seconds East, 137.62 feet to a found pipe on the Northwesterly Right-of-Way Line of Radio Park Lane, being the first mentioned point and place of beginning.

ALSO BEING DESCRIBED AS TO THE WHOLE in a Plan by the Transition Engineering Survey dated August 8th, 2014, Project #WSFS:033.54.08, as:

DESCRIPTION OF THE OVERALL BOUNDARY OF THE SUBDIVISION OF SOCIETY HILL AT BROOKHAVEN (RESIDUE) CONSISTING OF PREMISES "A", PREMISES "B", PREMISES "C" RESIDUE AND PREMISES "D" NOW OR FORMERLY OF HARVIN PROPERTIES, LLC, LOCATED AT SOCIETY HILL AT BROOKHAVEN, AND MORE PARTICULARLY SHOWN ON A PLAN FOR WILMINGTON SAVINS FUND SOCIETY PREPARED BY TRANSITION ENGINEERING SURVEYING LLC, DATED AUGUST 8TH, 2014, PROJECT NO. WSFS: 033.54.08. SITUATED IN BROOKHAVEN BOROUGH, DELAWARE COUNTY, PENNSYLVANIA.

BEGINNING at a point in the title line at or near the center line of Brookhaven Road at 60' wide, said point being a common corner for the lands herein being described and lands now or formerly of Marie Carman and Bohdan Carman (Deed Book 753, Page 1276), and further located along the said title line at or near the centerline of Brookhaven Road, in a northeasterly direction, a distance of 336.08' from its point of intersection thereof with the centerline of Edgemont Avenue.

THENCE from the said point of beginning, continuing along the said title line at or near the centerline of Brookhaven Road, the two following described courses and distances:

1. N 38° 27' 47" E (State Plane bearing), 137.16' to an angle point; and,

2. N 35° 39' 02" E (State Plane bearing), 101.56' to a point, a corner for Lot No. 19 known as #123 Brookhaven Road now or formerly of Robert P. Martin and Brenda J. Martin (Deed Book 4020, Page 59);

THENCE by the same, the two (2) following described courses and distances:

1. S 45° 03' 40" E (State Plane bearing), and crossing over an iron pipe found on a line at 31.13', a total distance of 134.86' to a point; and,

2. N 47° 23' 13" E, a distance of 63.38' to a point in line of lands known as #125 Brookhaven Road now or formerly of Business and Industrial Plant and Office Investor (Deed Book 1564, Page 1399);

THENCE by the same, S 44° 43' 40" E, a distance of 250.61' to a point (iron pipe found) in the rear line of lands known as #246 Radio Park Lane now or formerly Clara N. Williams (Deed Book 4813, Page 262);

THENCE by the same, in part, and along the rear line of lands known as #244 Radio Park Lane now or formerly of Kenneth Ulerick and Deborah Ulerick (Deed Book 4531, Page 1331), S 46° 09' 05" W (State Plane bearing) and crossing over a rebar found at 2607', and a metal post found at grade at 61.88', a total distance of 94.78' to a point (rebar found),

THENCE still along said lands known as #244 Radio Park Lane, S 52° 05' 35" E (State Plane bearing), a distance of 137.61' to a point in the northwesterly side of Radio Park Lane at 50' wide;

THENCE by the same, S 37° 54' 25" W (State Plane bearing), a distance of 73.20' to a point, a corner for the remaining part of #24 Radio Park Lane now or formerly Brookhaven First Church of God (Deed Book 1605, Page 40);

THENCE by the same, the two (2) following described courses and distances:

1. N 47° 35' 47" (State Plane bearing), a distance of 147.00' to a point; and,

2. S 46° 09' 05" W (State Plane bearing), and crossing over a lath set at 4.33', a total distance of 112.09' to a point (iron pipe found), a corner for said lands shown as #115 Brookhaven Road;

THENCE by the same, N 49° 49' 44" W (State Plane bearing) and crossing over a mag nail set at 316.16', a total distance of 351.83' to a point in the said title line at or near the centerline of Brookhaven Road, the first mentioned point and place of beginning.

CONTAINING with said described metes and bounds 2.4568 acres of land, be the same more or less.

SUBJECT to any easements, agreements and restrictions of record.

BEIGN Know as 4000-4020 Grady Collier Lane, Society Hill at Brookhaven
