### LEAD IN DRINKING WATER

Lead is a common metal found in the environment. Historically, because it is so common and because it has a number of qualities that make it easy to work with, lead was used extensively for many things, including construction and plumbing.

Lead is toxic to humans, and consuming it or being exposed to it at high levels can lead to a number of serious health concerns. While it is not safe for anybody, exposure to lead poses the greatest risk of health problems to pregnant women and children ages 6 and under, as studies have shown that it can slow normal mental and physical development.

### RESOURCES

Visit <http://lead.pgh2o.com/resources/lead-filters-and-other-products> to request a free lead test kit for your home. If your test comes back with elevated lead levels, we will send you a Zero Water Filter free of cost.

Discount coupons for Zero Water Filters are also available.
