1. The construction of a regional pump station in place of the existing temporary pump station currently serving the Cockerham Tract Development. This regional pump station will be designed to accommodate total average annual flows of 151,325 gallons of sewage per day (gpd), which accounts for the existing flows to the Frame Avenue pump station, including flows from the Cockerham Tract and Celia Tract developments, and for flows from the properties currently served by individual on-lot disposal systems along and adjacent to Planebrook Road. The sewer service area for the regional pump station is delineated in the East Whiteland Township Regional Pump Station Planning Area plan found in Appendix C of the Special Study. The permitting and construction of the proposed regional pump station shall be completed consistent with the implementation schedule received by DEP on March 29, 2017.

2. The construction of an 8-inch force main that will extend from the proposed regional pump station through a sewer easement within the Cockerham Tract development, through an easement between existing homes near Planebrook Road, and along Planebrook Road to the point of connection with the existing Whiteland Village Interceptor north of the intersection of Planebrook Road and Swedesford Road. The permitting and construction of the proposed force main shall be completed consistent with the implementation schedule received by the DEP on March 29, 2017.

3. The decommissioning of the existing Frame Avenue Pump Station and the abandonment of the existing Frame Avenue force main that extends from the Frame Avenue pump station along Frame Avenue, through various properties to the point of connection to the existing gravity sewer within Lancaster Avenue (Route 30).

4. Commitment for additional sewage facilities planning for the proposed collection system to serve the properties currently served by on-lot disposal systems along and adjacent to Planebrook Road. This additional sewage facilities planning will be required to be adopted by the Township and approved by DEP prior to the connection of these properties to public sewer. The timing of this future planning effort will be triggered by the start of construction of the Planebrook Road Regional Pump Station and force main consistent with the implementation schedule received by the DEP on March 29, 2017.

The Special Study states that construction is currently ongoing on the sanitary sewer "connector" that will allow wastewater to be conveyed from the Whiteland Village Interceptor to the Mill Lane Pump Station. The Special Study also states that the Township is currently performing maintenance on the Whiteland Village Interceptor in preparation of placing the interceptor into service. As the proposed regional pump station and force main will be connecting the existing sewer system via the Whiteland Village Interceptor, construction of the proposed regional pump station and force main must be coordinated with the construction and completion of the missing link "connector" sewer.

The approved project will also require East Whiteland Township to secure a Water Quality Management (Part II) permit for the construction and operation of the proposed sewage collection and conveyance facilities. Issuance of a Part II permit will be based upon a technical evaluation of the permit application and supporting documentation. Starting construction prior to obtaining a Part II permit is a violation of the Pennsylvania Clean Streams Law (CSL).

Other DEP permits may be required for construction if encroachment to streams or wetlands will result. Information regarding the requirements for such permits or approvals can be obtained from DEP's Watershed Management Program at the letterhead address, by telephone at 484.250.5970 or downloaded from the Internet at www.dep.state.pa.us/dep/deputate/watermgt/wqp/forms/forms_home.htm.

Please note that any new land developments associated with this plan will not be eligible for exemptions from sewage facilities planning under Chapter 71, Section 71.51(b)(2), until after the receiving facilities have been constructed. Applicants proposing projects that will coordinate new development construction with the construction of municipal conveyance or treatment facilities must submit Sewage Facilities Planning Modules for adoption by the municipality and approval by the DEP.

We note that the Chester County Health Department, in their letter of October 7, 2016, advised the Township of issues with the existing on-lot sewage disposal system serving the Chester Valley Golf Club. In response, the Township noted that the golf course property lies outside of the planning area of the Special Study but that the property was included in the public sewer service area in the Township's Mill Lane Pumping Station Special Study. The Township anticipates that future extension of the sanitary sewer system to serve Church Road will provide a connection for the golf course property. As the timing of this future sanitary sewer extension is currently unknown, we recommend that the Township work with the Chester Valley Golf Club to explore the possibility of connecting to Manhole 126F once the missing link "connector" sewer construction is complete and in operation.

Any person aggrieved by this action may appeal, pursuant to Section 4 of the Environmental Hearing Board Act, 35 P.S. Section 7514, and the Administrative Agency Law, 2 Pa.C.S. Chapter 5A, to the Environmental Hearing Board, Second Floor, Rachel Carson State Office Building, 400 Market Street, P.O. Box 8457, Harrisburg, PA 17105-8457, 717-787-3483. TDD users may contact the Board through the Pennsylvania Relay Service, 800-654-5984. Appeals must be filed with the Environmental Hearing Board within 30 days of receipt of written notice of this action unless the appropriate statute provides a different time period. Copies of the appeal form and the Board's rules of practice and procedure may be obtained from the Board. The appeal form and the Board's rules of practice and procedure are also available in braille or on audiotape from the Secretary to the Board at 717-787-3483. This paragraph does not, in and of itself, create any right of appeal beyond that permitted by applicable statutes and decisional law.

IF YOU WANT TO CHALLENGE THIS ACTION, YOUR APPEAL MUST REACH THE BOARD WITHIN 30 DAYS. YOU DO NOT NEED A LAWYER TO FILE AN APPEAL WITH THE BOARD.

IMPORTANT LEGAL RIGHTS ARE AT STAKE; HOWEVER, SO YOU SHOULD SHOW THIS DOCUMENT TO A LAWYER AT ONCE. IF YOU CANNOT AFFORD A LAWYER, YOU MAY QUALIFY FOR FREE PRO BONO REPRESENTATION. CALL THE SECRETARY TO THE BOARD (717-787-3483) FOR MORE INFORMATION.

If you have any questions, please contact Ms. Kelly Boettlin of this office at 484.250.5184.

Sincerely,

Jenifer Fields, P.E.

Re: WQM Permit - Sewage
Planebrook Road Regional Pump Station
Permit No. 1517401
Authorization ID No. 1170374
East Whiteland Township
Chester County

Dear Mr. Nagel:

Your Water Quality Management (WQM) permit is enclosed. You must comply with all Standard and Special Conditions attached to this Permit. Construction must be done in accordance with the permit application and all supporting documentation. Please review the permit conditions and the supporting documentation submitted with your application before starting construction.

Please note that you are responsible for securing all other required permits, approvals and/or registrations associated with the project, if applicable, under Chapters 102 (erosion and sedimentation control), 105 (stream obstructions and encroachments) and 106 (floodplains) of DEP's regulations. Construction may not proceed until all other required permits have been obtained.

Enclosed is the "Water Quality Management Post Construction Certification" form. A Pennsylvania-registered Professional Engineer must sign and complete this form prior to startup of the facilities. You or your authorized representative must also sign the form. This certification and other post-construction documentation must be submitted to DEP within 30 days of completion of the project and must be received by DEP prior to commencing operation of the facilities.

Any person aggrieved by this action may appeal, pursuant to Section 4 of the Environmental Hearing Board Act, 35 P.S. Section 7514, and the Administrative Agency Law, 2 Pa.C.S. Chapter 5A, to the Environmental Hearing Board, Second Floor, Rachel Carson State Office Building, 400 Market Street, P.O. Box 8457, Harrisburg, PA 17105-8457, 717.787.3483. TDD users may contact the Board through the Pennsylvania Relay Service, 800.654.5984. Appeals must be filed with the Environmental Hearing Board within 30 days of receipt of written notice of this action unless the appropriate statute provides a different time period. Copies of the appeal form and the Board's rules of practice and procedure may be obtained from the Board. The appeal form and the Board's rules of practice and procedure are also available in braille or on audiotape from the Secretary to the Board at 717.787.3483. This paragraph does not, in and of itself, create any right of appeal beyond that permitted by applicable statutes and decisional law.

IF YOU WANT TO CHALLENGE THIS ACTION, YOUR APPEAL MUST REACH THE BOARD WITHIN 30 DAYS. YOU DO NOT NEED A LAWYER TO FILE AN APPEAL WITH THE BOARD.

IMPORTANT LEGAL RIGHTS ARE AT STAKE, HOWEVER, SO YOU SHOULD SHOW THIS DOCUMENT TO A LAWYER AT ONCE. IF YOU CANNOT AFFORD A LAWYER, YOU MAY QUALIFY FOR FREE PRO BONO REPRESENTATION. CALL THE SECRETARY TO THE BOARD (717.787.3483) FOR MORE INFORMATION.

If you have any questions, please contact Mr. James Roth at 484.250.5169.

WATER QUALITY MANAGEMENT PERMIT

A. PERMITTEE (Name and Address): CLIENT ID#: 78789 East Whiteland Township 209 Conestoga Road Frazier, PA 19355-1633	B. PROJECT/FACILITY (Name): Planebrook Road Regional Pump Station
C. LOCATION (Municipality, County): East Whiteland Township, Chester County	SITE ID#: 527339

D. THIS PERMIT APPROVES THE CONSTRUCTION AND OPERATION OF SEWAGE FACILITIES CONSISTING OF: a pump station and force main.

Pump Stations: Planebrook Road	Manure Storage:	Sewage Treatment Facility:
Design Capacity: 394 GPM	Volume: _____ MG	Annual Average Flow: _____ MGD
ACT 537 Flow: 151,325 GPD	Freeboard: _____ inches	Design Hydraulic Capacity: _____ MGD
		Design Organic Capacity: _____ lb/day

E. APPROVAL GRANTED BY THIS PERMIT IS SUBJECT TO THE FOLLOWING:

1. **New Permits:** All construction, operations and procedures shall be in accordance with the Water Quality Management Permit application dated 1/13/2017, its supporting documentation and addendums dated _____, which are hereby made a part of this permit.

   Amendments: All construction, operations and procedures shall be in accordance with the Water Quality Management Permit Amendment application dated _____ and its supporting documentation and addendums dated _____, which are hereby made a part of this amendment.

   Except for any herein approved modifications, all terms, conditions, supporting documentation and addendums approved under Water Quality Management Permit No. _____ dated _____ shall remain in effect.

   Transfers: Water Quality Management Permit No. _____ dated _____ and conditions, supporting documentation and addendums are also made part of this transfer.

2. Permit Conditions Relating to Sewerage are attached and made part of this permit.
3. Special Conditions _____ are attached and made part of this permit.

F. THE AUTHORITY GRANTED BY THIS PERMIT IS SUBJECT TO THE FOLLOWING FURTHER QUALIFICATIONS:

1. If there is a conflict between the application or its supporting documents and amendments and the attached conditions, the attached conditions shall apply.
2. Failure to comply with the rules and regulations of DEP or with the terms or conditions of this permit shall void the authority given to the permittee by the issuance of this permit.
3. This permit is issued pursuant to the Clean Streams Law Act of June 22, 1937, P.L. 1987, as amended 35 P.S. §691.1 *et seq.* Issuance of this permit shall not relieve the permittee of any responsibility under any other law.

PERMIT CONDITIONS RELATING TO SEWERAGE

For use in Water Quality Management Permits

(Check boxes that apply)

General

☒ 1. The Department of Environmental Protection (DEP) considers the licensed Professional Engineer whose seal is affixed to the design documents to be fully responsible for the adequacy of all aspects of the facility design.

☐ 2. The permittee shall adopt and enforce an ordinance requiring the abandonment of privies, cesspools or similar receptacles for human waste and onlot sewage disposal systems on the premises of occupied structures accessible to public sewers. All such structures must be connected to the public sewers.

☐ 3. The outfall sewer or drain shall be extended to the low water mark of the receiving body of water. Where necessary to ensure proper mixing and waste assimilation, an outfall sewer or drain may be extended with appurtenances below the low water mark and into the bed of a navigable stream provided that the permittee has secured an easement, right-of-way, license or lease from DEP in accordance with Section 15 of the Dam Safety and Encroachments Act, the Act of November 26, 1978, P.L. 1375, as amended.

☒ 4. The approval is specifically made contingent on the permittee acquiring all necessary property rights, by easement or otherwise, providing for the satisfactory construction, operation, maintenance and replacement of all sewers or sewerage structures in, along or across private property with full rights of ingress, egress and regress.

☐ 5. When construction of the approved sewerage facilities is completed and before they are placed in operation, the permittee shall notify DEP in writing so that a DEP representative may inspect the facilities.

☒ 6. The approval of the plans, and the authority granted in this permit, if not specifically extended, shall cease and be null and void 2 years from the issuance date of this permit unless construction or modification of the facilities covered by this permit has begun on or before the second anniversary of the permit date.

☒ 7. If, at any time, the sewerage facilities covered by this permit create a public nuisance, including but not limited to, causing malodors or causing environmental harm to waters of the Commonwealth, DEP may require the permittee to adopt appropriate remedial measures to abate the nuisance or harm.

☐ 8. If, after the issuance of this permit, DEP approves a municipal sewage facilities official plan or an amendment to an official plan under Act 537 (Pennsylvania Sewage Facilities Act, the Act of January 24, 1966, P.L. 1535 as amended) in which sewage from the herein approved facilities will be treated and disposed of at other planned facilities, the permittee shall, upon notification from the municipality or DEP, provide for the conveyance of its sewage to the planned facilities, abandon use and decommission the herein approved facilities including the proper disposal of solids, and notify DEP accordingly. The permittee shall adhere to schedules in the approved official plan, amendments to the plan, or other agreements between the permittee and municipality. This permit shall then, upon notice from DEP, terminate and become null and void and shall be relinquished to DEP.

☒ 9. This permit does not relieve the permittee of its obligations to comply with all federal, interstate, state or local laws, ordinances and regulations applicable to the sewerage facilities.

☒ 10. This permit does not give any real or personal property rights or grant any exclusive privileges, nor shall it be construed to grant or confirm any right, easement or interest in, on, to or over any lands which belong to the Commonwealth.

☐ 11. The authority granted by this permit is subject to all effluent requirements, monitoring requirements and other conditions as set forth in NPDES Permit No. _____ and all subsequent amendments and renewals. No discharge is authorized from these facilities unless approved by an NPDES Permit.

Construction

☒ 12. This permit is issued under the authorization of The Clean Streams Law and 25 Pa. Code Chapter 91. The permittee shall obtain all necessary permits, approvals and/or registrations under 25 Pa. Code Chapters 102, 105 and 106 prior to commencing construction of the facilities authorized by this permit, as applicable. The permittee should contact the DEP office that issued this permit if there are any questions concerning the applicability of additional permits.

☒ 13. The facilities shall be constructed under the supervision of a Pennsylvania licensed Professional Engineer in accordance with the approved reports, plans and specifications.

☒ 14. A Pennsylvania licensed Professional Engineer shall certify that construction of the permitted facilities was completed in accordance with the application and design plans submitted to DEP, using "Post Construction Certification" form (3800-PM-WSFR0179a). It is the permittee's responsibility to ensure that a Professional Engineer is on-site to provide the necessary oversight and/or inspections to certify the facilities. The certification must be submitted to DEP before the facility is placed in operation. As-built drawings, photographs (if available) and a description of all deviations from the application and design plans must be submitted to DEP within 30 days of certification.

☒ 15. Manhole inverts shall be formed to facilitate the flow of the sewage and to prevent the stranding of sewage solids. The manhole structure shall be built to prevent undue infiltration, entrance of street wash or grit and provide safe access to facilitate manhole maintenance activities.

☐ 16. The local Waterways Conservation Officer of the Pennsylvania Fish and Boat Commission (PFBC) shall be notified when the construction of any stream crossing and/or outfall is started and completed. A written permit must be secured from the PFBC if the use of explosives in any waterways is required and the permittee shall notify the local Waterways Conservation Officer when explosives are to be used.

Operation and Maintenance

☒ 17. The permittee shall maintain records of "as-built" plans showing all the treatment facilities as actually constructed together with facility operation and maintenance (O&M) manuals and any other relevant information that may be required. Upon request, the "as-built" plans and O&M manuals shall be filed with DEP.

☒ 18. The sewers shall have adequate foundation support as soil conditions require. Trenches shall be back-filled to ensure that sewers will have proper structural stability, with minimum settling and adequate protection against breakage. Concrete used in connection with these sewers shall be protected from damage by water, freezing, drying or other harmful conditions until cured.

☒ 19. Stormwater from roofs, foundation drains, basement drains or other sources shall not be admitted directly to the sanitary sewers.

☒ 20. The approved sewers shall be maintained in good condition, kept free of deposits by flushing or other cleaning methods and repaired when necessary.

☒ 21. The sewerage facilities shall be properly operated and maintained to perform as designed.

☒ 22. The attention of the permittee is called to the highly explosive nature of certain gases generated by the digestion of sewage solids when these gases are mixed in proper proportions with air and to the highly toxic character of certain gases arising from such digestion or from sewage in poorly ventilated compartments or sewers. Therefore, at all places throughout the sewerage facilities where hazard of fire, explosion or danger from toxic gases may occur, the permittee shall post conspicuous permanent and legible warnings. The permittee shall instruct all employees concerning the aforesaid hazards, first aid and emergency methods of meeting such hazards and shall make all necessary equipment and material accessible.

☐ 23. An operator certified in accordance with the Water and Wastewater Systems Operator Certification Act of February 21, 2002, 63 P.S. §§1001, *et seq.* shall operate the sewage treatment plant.

☐ 24. The permittee shall properly control any industrial waste discharged into its sewerage system by regulating the rate and quality of such discharge, requiring necessary pretreatment and excluding industrial waste, if necessary, to protect the integrity or operation of the permittee's sewerage system.

☒ 25. There shall be no physical connection between a public water supply system and a sewer or appurtenance to it which would permit the passage of any sewage or polluted water into the potable water supply. No water pipe shall pass through or come in contact with any part of a sewer manhole.

☒ 26. All connections to the approved sanitary sewers must be in accordance with the official Act 537 Plan and, if applicable, a corrective action plan as contained in the approved Title 25 Pa. Code Chapter 94 Municipal Wasteload Management Annual Report.

☒ 27. Collected screenings, slurries, sludge and other solids shall be handled and disposed of in compliance with Title 25 Pa. Code Chapters 271, 273, 275, 283 and 285 (related to permits and requirements for land filling, land application, incineration and storage of sewage sludge), Federal Regulations 40 CFR 257 and the Federal Clean Water Act and its amendments.

EAST WHITELAND TOWNSHIP – ACT 537 PLAN DOCUMENTS
(PLANNING MODULES)

pennsylvania
DEPARTMENT OF ENVIRONMENTAL PROTECTION

SENT VIA ELECTRONIC MAIL ONLY

February 26, 2021

Mr. John Nagel, Manager
East Whiteland Township
209 Conestoga Road
Frazer, PA 19355-1699

Re: Approval Letter – Minor Act 537 Plan Update
Planebrook Road Area Sewer Extension
Component 3m
Status: ISSUED
APS No. 38912, Site ID No. 518980
East Whiteland Township
Chester County

Dear Mr. Nagel:

We have completed our review of your municipality's Minor Act 537 Update Revision for Planebrook Road Area Sewer Extension Component 3m for East Whiteland Township ("Township"), Chester County, as prepared by ARRO Consulting, Inc. The plan was received by the Department of Environmental Protection ("DEP") on July 30, 2020. Additional information in support of this plan was received by DEP on October 19, 2020 and January 25, 2021. This plan is being submitted to the Department in accordance with the provisions set forth by Section 5 of the Pennsylvania Sewage Facilities Act and Chapter 71, the Administration of Sewage Facilities Program. The review was conducted in accordance with the provisions of the Pennsylvania Sewage Facilities Act.

Approval of the plan is hereby granted.

The plan provides for a connection of 84 residential and commercial properties along Planebrook Road, Prospect Avenue, Golfview Circle, Bracken Avenue, Davis Avenue, Elk Avenue and Fairview Drive. Elk Drive and Fairview Drive will connect via low-pressure force mains. Gravity sewer mains will be extended along the remaining roads. The proposed collection system will connect to an existing manhole in Planebrook Road that is tributary to the new Planebrook Regional Pump Station.

This project will be connected to the Township's collection system and will generate 29,425 gallons of sewage per day to be treated at the Valley Forge Sewer Authority Wastewater Treatment Facility.

The proposed collection system will be owned by the Township and will serve the Planebrook Road service area as described above. Properties that will connect to the proposed low-pressure sewers within Elk Drive and Fairview Drive will connect via grinder pumps and force main laterals which will be owned by the respective property owners.

The approved project will require a Water Quality Management (Part II) permit for the construction and operation of the proposed common force mains. The permit application must be submitted in the name of the Township. Issuance of a Part II permit will be based upon a technical evaluation of the permit

application and supporting documentation. Starting construction prior to obtaining a permit is a violation of the Clean Streams Law.

This plan approval does not include approval of the system design for the proposed conveyance system. The system design will be evaluated and approved as part of the Water Quality Management (Part II) permit application review.

The permitting and construction of the proposed collection system shall be completed consistent with the implementation schedule received by DEP on October 19, 2020.

This approval is specifically made contingent upon the applicant acquiring all necessary property rights by easement or otherwise, providing for the satisfactory construction, operation, maintenance, and replacement of all sewerage structures associated with the approved discharge in, along, or across private property, with full rights of ingress, egress and regress.

Any person aggrieved by this action may appeal the action to the Environmental Hearing Board (Board), pursuant to Section 4 of the Environmental Hearing Board Act, 35 P.S. § 7514, and the Administrative Agency Law, 2 Pa.C.S. Chapter 5A. The Board's address is:

Environmental Hearing Board
Rachel Carson State Office Building, Second Floor
400 Market Street
P.O. Box 8457
Harrisburg, PA 17105-8457

TDD users may contact the Environmental Hearing Board through the Pennsylvania Relay Service, 800-654-5984.

Appeals must be filed with the Board within 30 days of receipt of notice of this action unless the appropriate statute provides a different time. This paragraph does not, in and of itself, create any right of appeal beyond that permitted by applicable statutes and decisional law.

A Notice of Appeal form and the Board's rules of practice and procedure may be obtained online at http://ehb.courtapps.com or by contacting the Secretary to the Board at 717-787-3483. The Notice of Appeal form and the Board's rules are also available in braille and on audiotape from the Secretary to the Board.

IMPORTANT LEGAL RIGHTS ARE AT STAKE. YOU SHOULD SHOW THIS DOCUMENT TO A LAWYER AT ONCE. IF YOU CANNOT AFFORD A LAWYER, YOU MAY QUALIFY FOR FREE PRO BONO REPRESENTATION. CALL THE SECRETARY TO THE BOARD AT 717-787-3483 FOR MORE INFORMATION. YOU DO NOT NEED A LAWYER TO FILE A NOTICE OF APPEAL WITH THE BOARD.

IF YOU WANT TO CHALLENGE THIS ACTION, YOUR APPEAL MUST BE FILED WITH AND RECEIVED BY THE BOARD WITHIN 30 DAYS OF RECEIPT OF NOTICE OF THIS ACTION.

If you have any questions, please contact Ms. Kelly Boettlin of this office at 484.250.5184 or at kboettlin@pa.gov.

Sincerely,

Mr. Thomas Magge
Regional Manager

RE: East Whiteland Township Act 537 Component 3m
Response to November 19, 2020 Review Comments.
Planebrook Road Area Sanitary Sewer Extension.
ARRO# 10310.36

Dear Ms. Boettlin:

We would like to take this opportunity to provide you with the requested information and responses to your review comments for the above referenced Act 537 Component 3m for the proposed Planebrook Road public sewer extension. We are submitting one (1) copy of the enclosed documentation in addition to the electronic copy provided to you via email.

Comment 1:

A plan of the Township's sewer system was provided but it did not provide the information requested in Item 5 of our September 24, 2020 review letter. Specifically, it did not show the location of the new Planebrook Regional Pump Station or its associated force main which is proposed to convey the sewage from the proposed collection sewers. Please provide a general map showing the path of the sewage from the point at which it connects into the existing sewer system to the receiving treatment plant.

Response:

Please see the attached plans for your reference.

Comment 2:

DocuSign Envelope ID: 7DC5C824-79C6-4C38-9EA4-0449A91B3B1B

In addition, it appears that the proposed collection system will connect to the Township's existing sewer system via a single point of connection from a manhole in Planebrook Road that is tributary to the new Planebrook Regional Pump Station. Please confirm.

Response:

That is correct.

Comment #3:

As requested by Item 7.c. of our September 24, 2020 review letter please state whether this area has experienced a high rate of on-lot malfunctions.

Response:

The land uses adjacent to the planning area are residential, office/business, and commercial. In item #2 above, the planned extension of the sanitary sewer system (to serve these properties) extends back to planning (and Department approval of this planning) to make this a future public sewer service area. Residents in this area have expressed and interest in having public sewer service and have been given an opportunity to express their desires (once in the 2000's and again in 2019). The selected alternative was chosen over the no action alternative since this area was previously defined and approved as a public sewer service area in prior planning (2011).ndic

To date, the Township has not received any formal notifications or complaints regarding failing on-lot systems. That said, the Township has received some inquiries from residents asking when the project will be built. This is, in part, because some residents' systems have expressed concern that their on-lot systems are showing signs of deterioration with the potential to fail.

Comment #4:

Section K requires that permittees of the receiving collection, conveyance and treatment facilities certify capacity for the project flows. As requested by Item 10 of our September 24, 2020 review letter, please have Section K completed by Aqua Resources, Inc., the permittee of the Valley Creek Trunk Sewer and Wilson Road Pump Station.

Response:

Please see the attached Section K completed by Aqua Resources, Inc.

Comment #5:

DocuSign Envelope ID: 7DC5C824-79C6-4C38-9EA4-0449A91B3B1B

The Township has requested in response to Item 13 of our September 24, 2020 review letter that they not have to republish for this project. DEP understands that the current pandemic has placed restrictions on typical municipal operations and has accepted alternate means of providing access to planning documents to the general public. However, while the Township's May 28, 2020 public notice in the Daily Local News provided access to the planning document on the Township's website, the notice did not state the address of the Township's website. In addition, the May 28, 2020 public notice directed written comments to be addressed to Mr. John Nagel, Township Manager, but the notice did not provide contact information for Mr. Nagel in either the form of a mailing address or an electronic mail address. Without the website and municipal contact information, the May 28, 2020 public notice does not meet the public notice requirements. As such, this project will need to be republished to include this information. We also continue to recommend that an alternative for viewing in addition to the Township's website also be provided for those people that may not have access to the internet. A copy of the public notice in the form of a notarized Proof of Publication should be submitted with the official planning module resubmission along with copies of any written comments received during the 30-day public comment period. Please also include the municipal response to these comments. If no comments are received, you may submit a letter to that effect and check the appropriate box in Section O of the Component 3m planning module.

Response:

Please see the attached notarized proof of publication and the letter stating that no public comments were received. The appropriate box in Section O has been checked.

Please let us know if you have any additional questions or would like further clarification. Thank you again for your attention to the review of the Act 537 Planning document.

Sincerely,

Donna Wikert

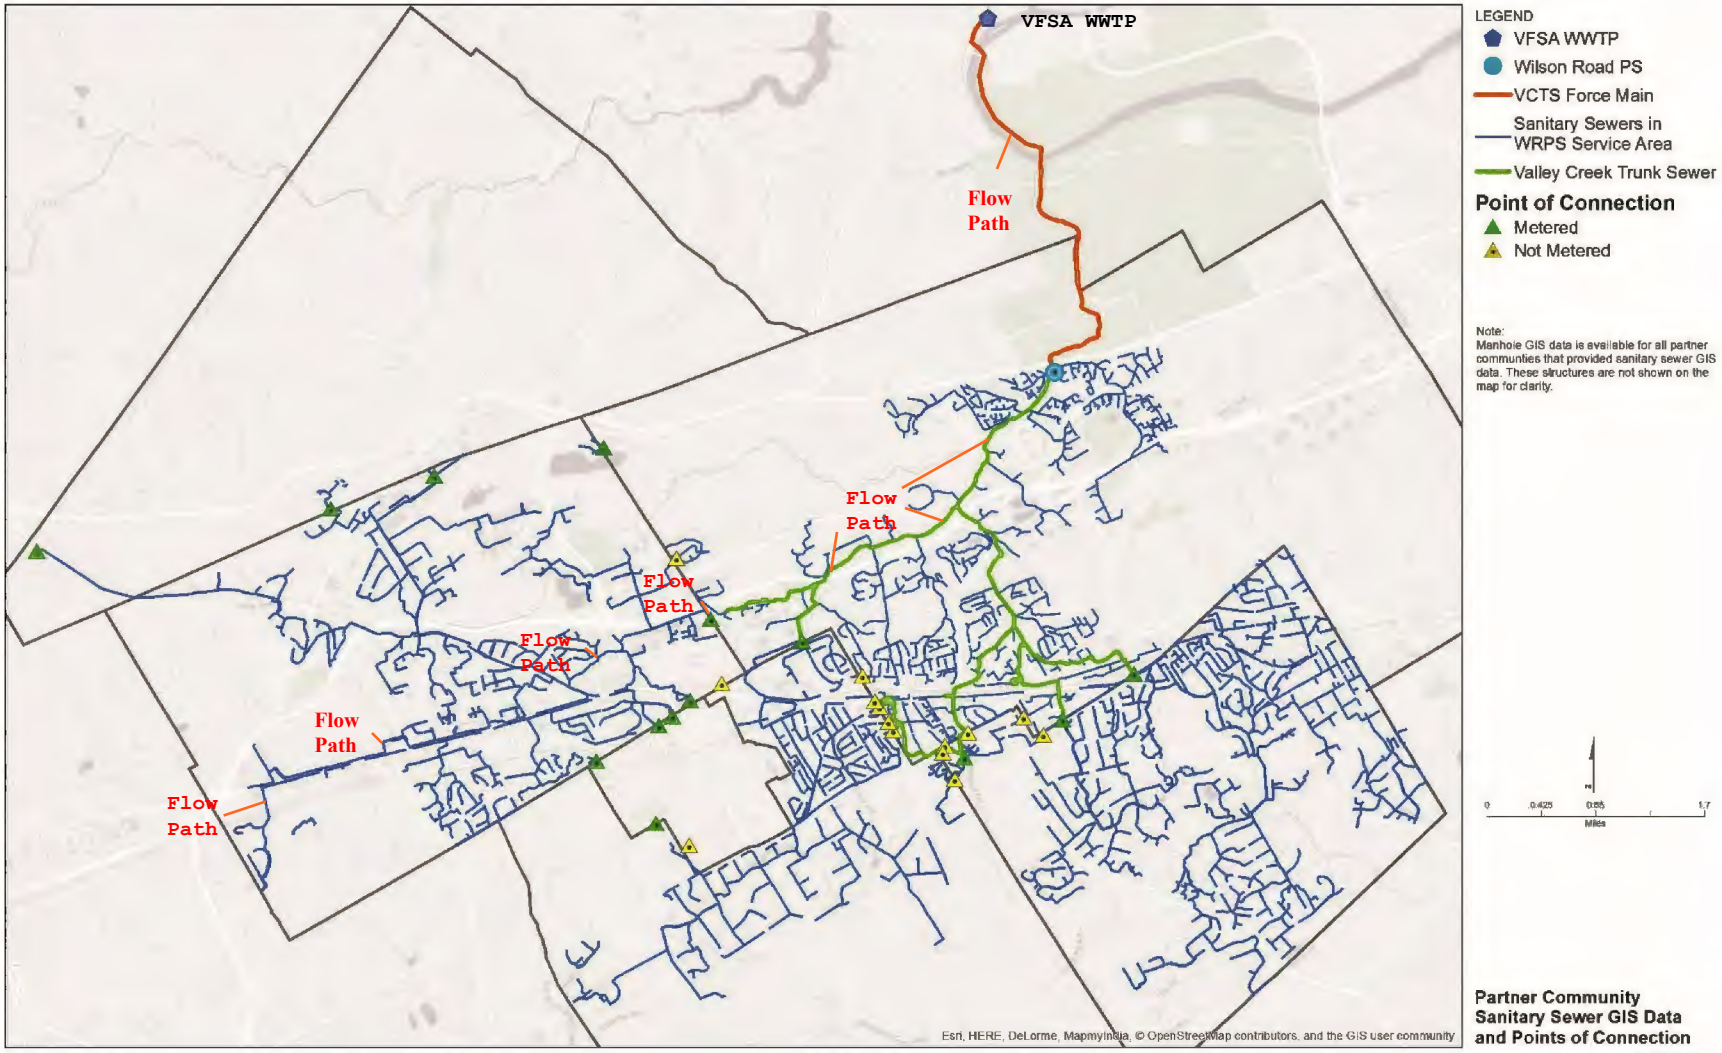
MAP NOTES:



Mapping information was derived from various planning documents including Schoor DePalma's Sanitary Sewer Meter Location Plan, Kohl Associates Township plan, Roy F. Weston's Master Sanitary Sewer System Plan, Chester County Recorder of Deeds Plans, and township as -built plans received by ARRO. The mapping is incomplete and will be improved as as-built and other plan information is updated into the GIS. This GIS database will provide a framework for modeling the collection system to analyze capacity issues and make recommended improvements to mitigate capacity deficiencies.

9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS:**

☐ A copy of the additional information is attached. If PENNVEST funding is to be sought for the project, address these additional items in terms of any project impacts and measures to avoid or mitigate same.

- Cost Effectiveness
- Air quality
- Floodplains
- Wild and scenic rivers
- Coastal zone management
- Socio-economic impacts
- Water supplies
- Other environmentally sensitive areas

J. ALTERNATIVE SEWAGE FACILITIES ANALYSIS (See Section J of instructions)

☐ An alternative sewage facilities analysis has been prepared as described in Section J of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section J of the instructions.

K. CHAPTER 94 CONSISTENCY DETERMINATION (See Section K of instructions)

☒ Projects that propose the use of existing municipal collection, conveyance or wastewater treatment facilities, or the construction of collection and conveyance facilities to be served by existing municipal wastewater treatment facilities must be consistent with the requirements of Chapter 94 of DEP's rules and regulations (relating to Municipal Wasteload Management). If more than one municipality or authority will be affected by the project, please obtain the information required in this section for each. Additional sheets may be attached for this purpose.

1. Project Flows 29,425 gpd

2. Total Sewage Flows to Facilities

   a. Enter average and peak sewage flows for each proposed or existing facility as designed or permitted.

   b. Enter the present average and peak sewage flows for the critical sections of existing facilities.

   c. Enter the average and peak sewage flows projected for 5 years through the critical sections of existing facilities which includes existing, proposed, or future projects.

   To complete the table, refer to Section K of instructions.

	a. Design and/or Permitted Capacity (gpd)		b. Present Flows (gpd)		c. Projected Flows in 5 years (gpd)	
	Average	**Peak**	**Average**	**Peak**	**Average**	**Peak**
Collection	20772000	20772000	5193000	11943900	6076000	13974800
Conveyance	20160000	20160000	5654000	13004200	6631000	15251300
Treatment						

3. Collection and Conveyance Facilities

   The questions below are to be answered by the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities. These questions should be answered in coordination with the latest Chapter 94 annual report and the above table.

   This project proposes sewer extensions or tap-ins. Will these actions create a hydraulic overload within five years on any existing collection or conveyance facilities that are part of the system? ☐ Yes ☒ No

   a. If yes, this sewage facilities planning module will not be accepted for review by the municipality, delegated local agency and/or DEP until all inconsistencies with Chapter 94 are resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the module package.

b. If no, the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities must sign below to indicate that the collection and conveyance facilities have adequate capacity and are able to provide service to the proposed development in accordance with Chapter 94 requirements and that this proposal will not affect this status.

c. Collection System

Name of Agency, Authority, Municipality Aqua Resources, Inc.

Name of Responsible Agent Kyle Roberts

Agent Signature

Date 12/3/2020

d. Conveyance System

Name of Agency, Authority, Municipality Aqua Resources, Inc.

Name of Responsible Agent Kyle Roberts

Agent Signature

Date 12/3/2020

K. CHAPTER 94 CONSISTENCY DETERMINATION (continued)

4. Treatment Facility

The questions below are to be answered by the facility permittee in coordination with the information in the table and the latest Chapter 94 report.

This project proposes the use of an existing wastewater treatment plant for the disposal of sewage. Will this action create a hydraulic or organic overload within 5 years at that facility? ☐ Yes ☐ No

a. If yes, this planning module for sewage facilities will not be reviewed by the municipality, delegated local agency and/or DEP until this inconsistency with Chapter 94 is resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the planning module.

b. If no, the treatment facility permittee must sign below to indicate that this facility has adequate treatment capacity and is able to provide wastewater treatment services for the proposed development in accordance with Chapter 94 requirements and that this proposal will not impact this status

c. Name of Agency, Authority, Municipality

Name of Responsible Agent

Agent Signature

Date

L. INSTITUTIONAL EVALUATION (See Section L of instructions)

☐ An institutional evaluation is attached. Identify the entity which will design, obtain necessary permits, construct, own and operate the proposed facilities. If a low pressure vacuum or effluent sewer are proposed, discuss purchase, installation, operation and maintenance responsibilities for the individual pumping, valves, tanks, etc.

PUBLIC NOTICE

A "Sewage Facilities Planning Module for Minor Act 537 Update Revisions" (Plan) has been prepared for East Whiteland Township (Township), Chester County, Pennsylvania. The Plan addresses the planning requirements necessary for the construction a sanitary sewer extension to provide public sewer service to residential properties and some commercial properties located on and adjacent to Planebrook Road south of the Route 202 overpass.

The purpose of the sewer extension is to provide public sewer service properties that currently have on-lot disposal systems.

The primary alternatives for this plan include: (1) Continue to utilize the existing on-lot disposal systems and do nothing, or (2) Extend public sewer service to the respective properties and abandon the on-lot systems. The alternative for the extension of public sewer service was selected. To achieve this, the proposed sewer main will be a combination of gravity sewer. The sewer main extension will serve Planebrook Road, Elk Drive, Fairway Drive, Golf View Lane, Bracken Avenue, David Avenue, and Prospect Avenue. It will extend from the existing sanitary sewer manhole in Planebrook Road with flow directed to the newly constructed regional pump station.

Each property owner will be responsible for installing a service lateral or grinder pump and service lateral to connect to the proposed sewer main.

The engineer's planning-level opinion of probable construction cost for extending public sewer service is $1,740,000

This project will be paid for by the Township. Tapping fees and plumbers fees will be the responsibility of the property owners.

In accordance with Chapter 71.3(c) of the Pennsylvania Code, the Authority is providing a 30-day public comment period. This planning document is available, for review, on the Township's website at www.eastwhiteland.org and at the Township Building located at 209 Conestoga Road, Frazer, PA 19355. Viewing of the document at the Township Building is by appointment only. To schedule an appointment, please call 610-648-0600. When visiting the Township Building, all CDC COVID19 Safety Protocols shall be followed. Comments shall be addressed, in writing, to Mr. John Nagel, Township Manager at the Township Building address noted above and are due no later than 30 days from the date of this notice.

RE: Planebrook Road Act 537 Component 3m;
East Whiteland Township, Chester County;
Public Comment (Readvertisement; January 2021)
No Comments Received;

Dear Mr. Bohner:

In accordance with Title 25, Chapter 71 of the Pennsylvania Code, a 30-day public comment period was conducted for the sanitary sewage facilities Act 537 Component 3m prepared for the extending of public sewer to the Planebrook Road planning area in East Whiteland Township (Township). The public comment period began on December 21, 2020 and ended on January 20, 2021. During that period, no public comments were received by the Township.

Sincerely,

John Nagel

Resolution of Adoption

RESOLUTION NO. _____

Resolution for Plan Revision
DRAFT

RESOLUTION OF EAST WHITELAND TOWNSHIP, CHESTER COUNTY, PENNSYLVANIA (hereinafter "the Township").

WHEREAS, Section 5 of the Act of January 24, 1966, P.L. 1535, No. 537 known as the "Pennsylvania Sewage Facilities Act", as Amended, and the Rules and Regulations of the Pennsylvania Department of Environmental Protection (PADEP) adopted thereunder, Chapter 71 of Title 25 of the Pennsylvania Code, require the Township to adopt an Official Sewage Facilities Plan providing for sewage services adequate to prevent contamination of waters and/or environmental health hazards with sewage wastes, and to revise said Plan whenever it is necessary to meet the sewage disposal needs of the Township.

NOW, THEREFORE, BE IT RESOLVED, that the Township hereby adopts and submits to the Pennsylvania Department of Environmental Protection for its approval, as a revision to the "Official Plan" of the Township, this Act 537 Planning Module; Component 3m.

The Township hereby approves and adopts this Act 537 Planning Module; Component 3m, which provides the basis to implement the selected alternative for the construction of a sanitary sewer extension to provide public sewer service to 107 properties located in the Planebrook Road Area. These properties currently have on-lot disposal systems. Key implementation activities include planning module approval, project bidding, and project construction. These activities shall be implemented in accordance with the implementation schedule detailed in Exhibit Q of the Sewage Facilities Planning Module.

The Township finds that this Act 537 Planning Module; Component 3m, described above, conforms to applicable zoning, subdivision, other municipal ordinances and plans, and to a comprehensive program of pollution control and water quality management.

I, _____, Secretary, East Whiteland Township, hereby certify that the foregoing is a true copy of Township Resolution No. _____, adopted _____, 2020.

SEWAGE FACILITIES PLANNING MODULE FOR MINOR ACT 537 UPDATE REVISION

Component 3m. Municipal or Authority Sponsored Minor Sewage Collection Project

(Return completed module package to appropriate municipality)

DEP USE ONLY				
DEP CODE #	**CLIENT ID #**	**SITE ID #**	**APS ID #**	**AUTH ID #**

This document provides a simplified planning format for municipalities and municipal authorities proposing the construction of a sewer extension primarily serving existing development. Typically, this format would be used for projects involving the extension of sewer service to no more than 100 equivalent dwelling units (EDUs) and where the majority of the project serves existing development. For projects where more than 50 percent of the proposed customers will result from new land development, a Component 3 Sewage Facilities Planning Module would typically be used. For larger projects or if the project would involve the construction or modification of a wastewater treatment facility, then a general Act 537 Update Revision, meeting all of the requirements of Title 25 Pennsylvania Code, Chapter 71 § 71.21, is appropriate.

DEP staff will make a final determination as to the appropriate type of planning for a given project based on the review of a plan of study. Eligibility for a grant to offset the cost of planning will be determined by DEP staff based upon review of a *Task/Activity Report* (3800-FM-BPNPSM0005). The project sponsor submits both documents. **DO NOT** use this form without coordinating with your local DEP staff. Refer to the instructions.

This planning document, along with any other documents specified in the cover letter, must be completed and submitted to the municipality with jurisdiction over the project site for review and approval. All required documentation must be attached for the Sewage Facilities Planning Module to be complete. Refer to the instructions for help in completing this component.

A. PROJECT INFORMATION (See Section A of instructions)

1. Project Name

   East Whiteland Township; Planebrook Road Area Sanitary Sewer Extension

2. Brief Project Description

   Extend public sewer service to existing properties located along, adjacent to, and near Planebrook Road.

E. AVAILABILITY OF DRINKING WATER SUPPLY (See Section E of instructions)

The project will be provided with drinking water from the following source: (Check appropriate box)

☐ Individual wells or cisterns.

☐ A proposed public water supply.

☒ An existing public water supply.

If existing public water supply is to be used, provide the name of the water company and attach documentation from the water company stating that it will serve the project.

Name of water company: Aqua PA

F. PROJECT NARRATIVE (See Section F of instructions)

☒ A narrative has been prepared as described in Section E of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section E of the instructions.

☐ G. SEWAGE DISPOSAL NEEDS IDENTIFICATION (See Section G of instructions)

Conduct sanitary and water supply surveys per DEP's publication entitled *Sewage Disposal Needs Identification*. This is highly recommended for all projects. It is required if PENNVEST funding is to be sought for the project, or if required by DEP as indicated by the checked box opposite this item.

H. EXISTING WASTEWATER FACILITIES (See Section H of instructions)

1. **COLLECTION SYSTEM**

Provide requested information concerning the existing treatment facility.

a. Name of existing collection system East Whiteland Twp. System

Clean Streams Law Permit Number 1515402

b. Name of interceptor Whiteland Village Sewer Extension/Interceptor

Clean Streams Law Permit Number 1515402

2. **WASTEWATER TREATMENT FACILITY**

Provide requested information concerning the existing treatment facility.

Name of existing facility Valley Forge Sewer Authority WWTP

NPDES Permit Number for existing facility 43974

I. PROPOSED WASTEWATER FACILITIES (See Section I of instructions)

1. Provide an estimate of the immediate and five year projected flow from the proposed sewer extension. Address the capacity for this flow in the existing conveyance and treatment facilities in terms of the most recent wasteload management annual report for these facilities.

2. **PLOT PLAN**

The following information is to be submitted on a plot plan or map of the proposed project that clearly reflects the relationship between the proposed facilities and the identified features.

a. Existing and proposed buildings.

b. Lot lines and lot sizes.

c. Adjacent lots.

d. Existing and proposed sewerage facilities.

e. Show tap-in or sewer extension to the point of connection to existing collection system.

f. Existing and proposed water supplies and surface water (wells, springs, ponds, streams, etc.)

g. Existing and proposed rights-of-way.

h. Existing and proposed streets, roadways, access roads, etc.

i. Any designated recreational or open space area

j. Wetlands - from National Wetland Inventory Mapping and USGS Hydric Soils Mapping.

k. Flood plains or Floodprone area soils, floodways, watercourses, water bodies (from Federal Flood Insurance Mapping)

l. Prime Agricultural Land.

m. Any other facilities (pipelines, power lines, etc.)

n. Orientation to north.

I. PROPOSED WASTEWATER FACILITIES (continued)

3. **WETLAND PROTECTION**

	YES	NO	
a.	☐	☒	Are there wetlands in the project area? If yes, indicate these areas on the plot plan as shown in the mapping or through on-site delineation.
b.	☐	☒	Are there any construction activities (encroachments, or obstructions) proposed in, along, or through the wetlands? If yes, Identify any proposed encroachments on wetlands and identify whether a General Permit or a full encroachment permit will be required. If a full permit is required, address time and cost impacts on the project. Note that wetland encroachments should be avoided where feasible. Also note that a feasible alternative **MUST BE SELECTED** to an identified encroachment on an exceptional value wetland as defined in Chapter 105. Identify any project impacts on HQ or EV streams and address impacts of the permitting requirements of said encroachments on the project.

4. **PRIMARY AGRICULTURAL LAND PROTECTION**

a.	☐	☒	Will your project involve the disturbance of any prime agricultural lands? If "yes" indicate any alternatives to this disturbance that were considered and the reasons they were not deemed feasible. Identify any primary or secondary impacts of the project on the Commonwealth's prime agricultural lands. Evaluate alternatives to avoid or mitigate undesirable impacts. The selected sewage facilities plan must be consistent with local measures in place to protect prime agricultural lands.

5. **STORMWATER MANAGEMENT IMPACTS:**

a.	☐	☒	Will the project impact an area covered by a DEP approved County Stormwater Management Plan? If yes show that the proposed facilities are consistent with that plan.

6. **PENNSYLVANIA NATURAL DIVERSITY INDEX (PNDI) CONSISTENCY:**

Check one:

☒ The "Pennsylvania Natural Diversity Inventory (PNDI) Project Environmental Review Receipt" resulting from my search of the PNDI database and all supporting documentation from jurisdictional agencies (when necessary) is/are attached.

☐ A completed "Pennsylvania Natural Diversity Inventory (PNDI) Project Planning & Environmental Review Form," (PNDI Form) available at www.naturalheritage.state.pa.us , and all required supporting documentation is attached. I request DEP staff to complete the required PNDI search for my project. I realize that my planning module will be considered incomplete upon submission to the Department and that the DEP review will not begin, and that processing of my planning module will be delayed, until a "PNDI Project Environmental Review Receipt" and all supporting documentation from jurisdiction agencies (when necessary) is/are received by DEP.

Applicant or Consultant Initials WLB

7. **COMPREHENSIVE PLAN CONSISTENCY:**

☒ A narrative and mapping to show that the proposed project is consistent with any comprehensive plan developed under the Pennsylvania Municipalities Planning Code (Act 247) is attached. Document that the proposed project is consistent with land use and all other requirements stated in the comprehensive plan.

8. **COOPERATION WITH PA. HISTORICAL AND MUSEUM COMMISSION (PHMC):**

☒ A copy of DEP's "Cultural Resource Notice" and map which were sent to the Commission and a copy of the Commission's response are attached. Note that the Commission may require archeological surveys if federal funds, including PENNVEST, will be used in the project. If PENNVEST funds are to be used, DEP cannot recommend the project to PENNVEST for consideration until any required surveys have been done and the project has been "cleared" by the Commission.

9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS:**

☐ A copy of the additional information is attached. If PENNVEST funding is to be sought for the project, address these additional items in terms of any project impacts and measures to avoid or mitigate same.

- Cost Effectiveness
- Air quality
- Floodplains
- Wild and scenic rivers
- Coastal zone management
- Socio-economic impacts
- Water supplies
- Other environmentally sensitive areas

J. ALTERNATIVE SEWAGE FACILITIES ANALYSIS (See Section J of instructions)

☒ An alternative sewage facilities analysis has been prepared as described in Section J of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section J of the instructions.

K. CHAPTER 94 CONSISTENCY DETERMINATION (See Section K of instructions)

☒ Projects that propose the use of existing municipal collection, conveyance or wastewater treatment facilities, or the construction of collection and conveyance facilities to be served by existing municipal wastewater treatment facilities must be consistent with the requirements of Chapter 94 of DEP's rules and regulations (relating to Municipal Wasteload Management). If more than one municipality or authority will be affected by the project, please obtain the information required in this section for each. Additional sheets may be attached for this purpose.

1. Project Flows 29425 gpd

2. Total Sewage Flows to Facilities

   a. Enter average and peak sewage flows for each proposed or existing facility as designed or permitted.

   b. Enter the present average and peak sewage flows for the critical sections of existing facilities.

   c. Enter the average and peak sewage flows projected for 5 years through the critical sections of existing facilities which includes existing, proposed, or future projects.

   To complete the table, refer to Section K of instructions.

	a. Design and/or Permitted Capacity (gpd)		b. Present Flows (gpd)		c. Projected Flows in 5 years (gpd)

3. Collection and Conveyance Facilities

   The questions below are to be answered by the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities. These questions should be answered in coordination with the latest Chapter 94 annual report and the above table.

   This project proposes sewer extensions or tap-ins. Will these actions create a hydraulic overload within five years on any existing collection or conveyance facilities that are part of the system? ☐ Yes ☒ No

   a. If yes, this sewage facilities planning module will not be accepted for review by the municipality, delegated local agency and/or DEP until all inconsistencies with Chapter 94 are resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the module package.

b. If no, the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities must sign below to indicate that the collection and conveyance facilities have adequate capacity and are able to provide service to the proposed development in accordance with Chapter 94 requirements and that this proposal will not affect this status.

K. CHAPTER 94 CONSISTENCY DETERMINATION (continued)

4. Treatment Facility

The questions below are to be answered by the facility permittee in coordination with the information in the table and the latest Chapter 94 report.

This project proposes the use of an existing wastewater treatment plant for the disposal of sewage. Will this action create a hydraulic or organic overload within 5 years at that facility? ☐ Yes ☐ No

a. If yes, this planning module for sewage facilities will not be reviewed by the municipality, delegated local agency and/or DEP until this inconsistency with Chapter 94 is resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the planning module.

b. If no, the treatment facility permittee must sign below to indicate that this facility has adequate treatment capacity and is able to provide wastewater treatment services for the proposed development in accordance with Chapter 94 requirements and that this proposal will not impact this status

c. Name of Agency, Authority, Municipality Valley Forge Sewer Authority

Name of Responsible Agent _____

Agent Signature _____

Date _____

L. INSTITUTIONAL EVALUATION (See Section L of instructions)

☒ An institutional evaluation is attached. Identify the entity which will design, obtain necessary permits, construct, own and operate the proposed facilities. If a low pressure vacuum or effluent sewer are proposed, discuss purchase, installation, operation and maintenance responsibilities for the individual pumping, valves, tanks, etc.

M. PROJECT COST AND FUNDING ANALYSIS (See Section M of instructions)

☒ A detailed cost estimate and present worth analysis for the project is attached. Provide a financing plan for the project, identifying the funding source(s) and identifying estimated tap fees and user rates. For projects proposing the use of PENNVEST funds, see Section I. 9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS**. Complete the following table:

Cost and Funding Information (Estimated)	
COST	
Construction cost	$ 1531200
Administrative, legal, engineering cost	$ 208800
Total project cost	$ 1740000
Annual O/M cost	$ 6000
FUNDING	
Tap-in fees ($ per EDU X no. EDUs)	$ 428000
Proceeds from primary funding source	$ 1312000
Proceeds from other funding sources	$ 0
USER COSTS	
Initial user base	107 EDUs
Monthly debt service per EDU	$ 0
Monthly O/M cost per EDU	$ 50
Total estimated monthly user cost per EDU	$ 50

N. PROJECT IMPLEMENTATION SCHEDULE (See Section N of instructions)

☒ A project implementation schedule showing milestone dates for submission of DEP permit applications, initiation and completion of construction and any other milestones significant to this particular project is attached to this component

O. PUBLIC NOTIFICATION REQUIREMENT (See Section O of instructions)

☒ Attached is a copy of the public notice. All comments received as a result of the notice are attached.

☐ Municipal response to these comments is attached.

☒ No comments were received. A copy of the public notice is attached.

☐ P. ADDITIONAL CHAPTER 71 PLANNING ELEMENTS (See Section P of instructions)

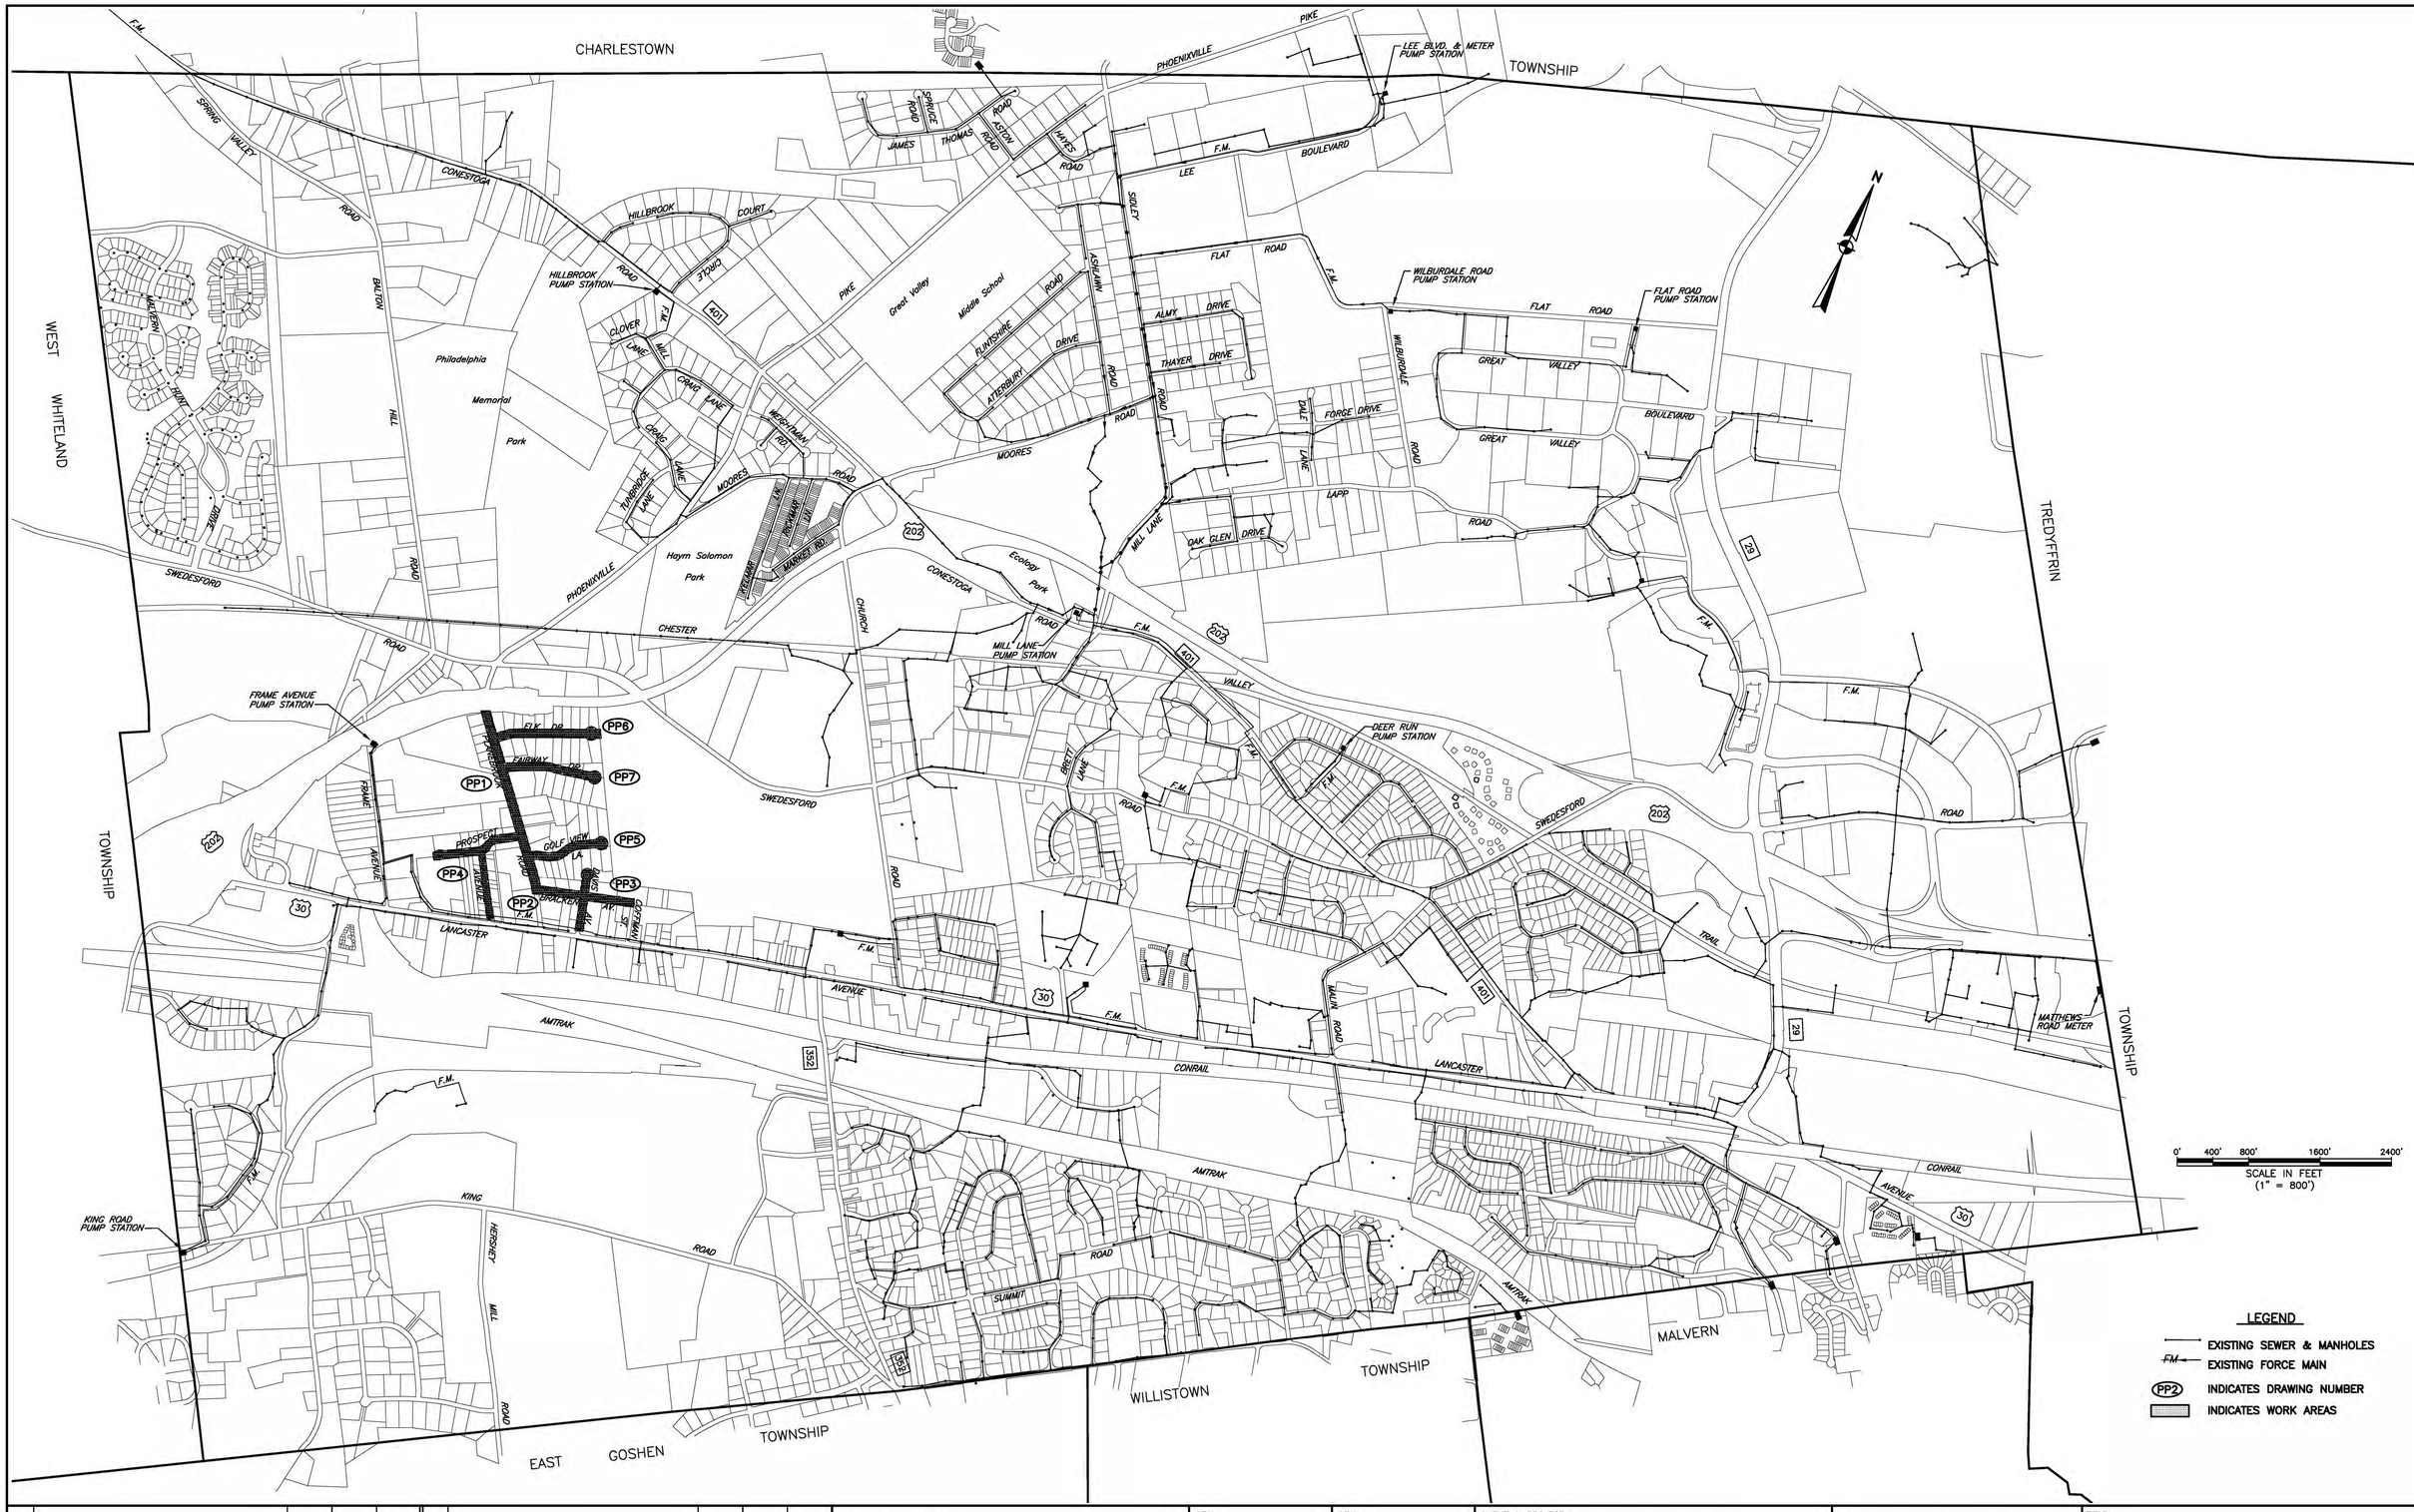
a. Additional planning elements are required by DEP.

- _____
- _____
- _____
- _____
- _____

Q. PLANNING AGENCY REVIEW (See Section Q of instructions)

☒ Local Planning Commission comments or Component 4a are attached.

☒ County, Area, Or Region Planning Commission comments or Component 4b are attached.



☒ County or Joint County Health Department comments (if appropriate) or Component 4c are attached.

R. RESOLUTION OF ADOPTION (See Section R of instructions)

☒ An **original**, **signed**, and **sealed** Resolution of Adoption is attached.

9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS:**

☐ A copy of the additional information is attached. If PENNVEST funding is to be sought for the project, address these additional items in terms of any project impacts and measures to avoid or mitigate same.

- Cost Effectiveness
- Air quality
- Floodplains
- Wild and scenic rivers
- Coastal zone management
- Socio-economic impacts
- Water supplies
- Other environmentally sensitive areas

J. ALTERNATIVE SEWAGE FACILITIES ANALYSIS (See Section J of instructions)

☒ An alternative sewage facilities analysis has been prepared as described in Section J of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section J of the instructions.

K. CHAPTER 94 CONSISTENCY DETERMINATION (See Section K of instructions)

☒ Projects that propose the use of existing municipal collection, conveyance or wastewater treatment facilities, or the construction of collection and conveyance facilities to be served by existing municipal wastewater treatment facilities must be consistent with the requirements of Chapter 94 of DEP's rules and regulations (relating to Municipal Wasteload Management). If more than one municipality or authority will be affected by the project, please obtain the information required in this section for each. Additional sheets may be attached for this purpose.

1. Project Flows 29,245 gpd

2. Total Sewage Flows to Facilities

   a. Enter average and peak sewage flows for each proposed or existing facility as designed or permitted.

   b. Enter the present average and peak sewage flows for the critical sections of existing facilities.

   c. Enter the average and peak sewage flows projected for 5 years through the critical sections of existing facilities which includes existing, proposed, or future projects.

   To complete the table, refer to Section K of instructions.

	a. Design and/or Permitted Capacity (gpd)		b. Present Flows (gpd)		c. Projected Flows in 5 years (gpd)	
	Average	Peak	Average	Peak	Average	Peak
Collection	29425	110344	0	0	29425	110344
Conveyance	151325	567469	68,000	255,000	74,000	277,500
Treatment	0	0	0	0	0	0

lanebrook oad PS

3. Collection and Conveyance Facilities

The questions below are to be answered by the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities. These questions should be answered in coordination with the latest Chapter 94 annual report and the above table.

This project proposes sewer extensions or tap-ins. Will these actions create a hydraulic overload within five years on any existing collection or conveyance facilities that are part of the system? ☐ Yes ☒ No

   a. If yes, this sewage facilities planning module will not be accepted for review by the municipality, delegated local agency and/or DEP until all inconsistencies with Chapter 94 are resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the module package.

b. If no, the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities must sign below to indicate that the collection and conveyance facilities have adequate capacity and are able to provide service to the proposed development in accordance with Chapter 94 requirements and that this proposal will not affect this status.

c. Collection System

Name of Agency, Authority, Municipality East Whiteland Township

Name of Responsible Agent William Steele

Agent Signature Will- A. Steele

Date 2-11-2020

d. Conveyance System

Name of Agency, Authority, Municipality East Whiteland Township

Name of Responsible Agent William Steele

Date 2-11-2020

K. CHAPTER 94 CONSISTENCY DETERMINATION (continued)

4. Treatment Facility

The questions below are to be answered by the facility permittee in coordination with the information in the table and the latest Chapter 94 report.

This project proposes the use of an existing wastewater treatment plant for the disposal of sewage. Will this action create a hydraulic or organic overload within 5 years at that facility? ☐ Yes ☐ No

a. If yes, this planning module for sewage facilities will not be reviewed by the municipality, delegated local agency and/or DEP until this inconsistency with Chapter 94 is resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the planning module.

b. If no, the treatment facility permittee must sign below to indicate that this facility has adequate treatment capacity and is able to provide wastewater treatment services for the proposed development in accordance with Chapter 94 requirements and that this proposal will not impact this status

c. Name of Agency, Authority, Municipality Valley Forge Sewer Authority

Name of Responsible Agent

Agent Signature

Date

L. INSTITUTIONAL EVALUATION (See Section L of instructions)

☒ An institutional evaluation is attached. Identify the entity which will design, obtain necessary permits, construct, own and operate the proposed facilities. If a low pressure vacuum or effluent sewer are proposed, discuss purchase, installation, operation and maintenance responsibilities for the individual pumping, valves, tanks, etc.

SEWAGE FACILITIES PLANNING MODULE FOR MINOR ACT 537 UPDATE REVISION

Component 3m. Municipal or Authority Sponsored Minor Sewage Collection Project

(Return completed module package to appropriate municipality)

DEP USE ONLY				
DEP CODE #	**CLIENT ID #**	**SITE ID #**	**APS ID #**	**AUTH ID #**

This document provides a simplified planning format for municipalities and municipal authorities proposing the construction of a sewer extension primarily serving existing development. Typically, this format would be used for projects involving the extension of sewer service to no more than 100 equivalent dwelling units (EDUs) and where the majority of the project serves existing development. For projects where more than 50 percent of the proposed customers will result from new land development, a Component 3 Sewage Facilities Planning Module would typically be used. For larger projects or if the project would involve the construction or modification of a wastewater treatment facility, then a general Act 537 Update Revision, meeting all of the requirements of Title 25 Pennsylvania Code, Chapter 71 § 71.21, is appropriate.

DEP staff will make a final determination as to the appropriate type of planning for a given project based on the review of a plan of study. Eligibility for a grant to offset the cost of planning will be determined by DEP staff based upon review of a *Task/Activity Report* (3800-FM-BPNPSM0005). The project sponsor submits both documents. **DO NOT** use this form without coordinating with your local DEP staff. Refer to the instructions.

This planning document, along with any other documents specified in the cover letter, must be completed and submitted to the municipality with jurisdiction over the project site for review and approval. All required documentation must be attached for the Sewage Facilities Planning Module to be complete. Refer to the instructions for help in completing this component.

A. PROJECT INFORMATION (See Section A of instructions)

1. Project Name

   East Whiteland Township; Planebrook Road Area Sanitary Sewer Extension

2. Brief Project Description

   Extend public sewer service to existing properties located along, adjacent to, and near Planebrook Road.

B. CLIENT (MUNICIPALITY) INFORMATION (See Section B of instructions)

Municipality Name	County	City	Boro	Twp
East Whiteland Township	Chester	☐	☐	☒

E. AVAILABILITY OF DRINKING WATER SUPPLY (See Section E of instructions)

The project will be provided with drinking water from the following source: (Check appropriate box)

☐ Individual wells or cisterns.

☐ A proposed public water supply.

☒ An existing public water supply.

If existing public water supply is to be used, provide the name of the water company and attach documentation from the water company stating that it will serve the project.

Name of water company: Aqua PA

F. PROJECT NARRATIVE (See Section F of instructions)

☒ A narrative has been prepared as described in Section E of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section E of the instructions.

☐ G. SEWAGE DISPOSAL NEEDS IDENTIFICATION (See Section G of instructions)

Conduct sanitary and water supply surveys per DEP's publication entitled *Sewage Disposal Needs Identification*. This is highly recommended for all projects. It is required if PENNVEST funding is to be sought for the project, or if required by DEP as indicated by the checked box opposite this item.

H. EXISTING WASTEWATER FACILITIES (See Section H of instructions)

1. **COLLECTION SYSTEM**

Provide requested information concerning the existing treatment facility.

a. Name of existing collection system East Whiteland Twp. System

Clean Streams Law Permit Number 1515402

b. Name of interceptor Whiteland Village Sewer Extension/Interceptor

Clean Streams Law Permit Number 1515402

2. **WASTEWATER TREATMENT FACILITY**

Provide requested information concerning the existing treatment facility.

Name of existing facility Valley Forge Sewer Authority WWTP

NPDES Permit Number for existing facility 43974

I. PROPOSED WASTEWATER FACILITIES (See Section I of instructions)

1. Provide an estimate of the immediate and five year projected flow from the proposed sewer extension. Address the capacity for this flow in the existing conveyance and treatment facilities in terms of the most recent wasteload management annual report for these facilities.

2. **PLOT PLAN**

The following information is to be submitted on a plot plan or map of the proposed project that clearly reflects the relationship between the proposed facilities and the identified features.

a. Existing and proposed buildings.

b. Lot lines and lot sizes.

c. Adjacent lots.

d. Existing and proposed sewerage facilities.

e. Show tap-in or sewer extension to the point of connection to existing collection system.

f. Existing and proposed water supplies and surface water (wells, springs, ponds, streams, etc.)

g. Existing and proposed rights-of-way.

h. Existing and proposed streets, roadways, access roads, etc.

i. Any designated recreational or open space area

j. Wetlands - from National Wetland Inventory Mapping and USGS Hydric Soils Mapping.

k. Flood plains or Floodprone area soils, floodways, watercourses, water bodies (from Federal Flood Insurance Mapping)

l. Prime Agricultural Land.

m. Any other facilities (pipelines, power lines, etc.)

n. Orientation to north.

I. PROPOSED WASTEWATER FACILITIES (continued)

3. **WETLAND PROTECTION**

	YES	NO	
a.	☐	☒	Are there wetlands in the project area? If yes, indicate these areas on the plot plan as shown in the mapping or through on-site delineation.
b.	☐	☒	Are there any construction activities (encroachments, or obstructions) proposed in, along, or through the wetlands? If yes, Identify any proposed encroachments on wetlands and identify whether a General Permit or a full encroachment permit will be required. If a full permit is required, address time and cost impacts on the project. Note that wetland encroachments should be avoided where feasible. Also note that a feasible alternative **MUST BE SELECTED** to an identified encroachment on an exceptional value wetland as defined in Chapter 105. Identify any project impacts on HQ or EV streams and address impacts of the permitting requirements of said encroachments on the project.

4. **PRIMARY AGRICULTURAL LAND PROTECTION**

a.	☐	☒	Will your project involve the disturbance of any prime agricultural lands? If "yes" indicate any alternatives to this disturbance that were considered and the reasons they were not deemed feasible. Identify any primary or secondary impacts of the project on the Commonwealth's prime agricultural lands. Evaluate alternatives to avoid or mitigate undesirable impacts. The selected sewage facilities plan must be consistent with local measures in place to protect prime agricultural lands.

5. **STORMWATER MANAGEMENT IMPACTS:**

a.	☐	☒	Will the project impact an area covered by a DEP approved County Stormwater Management Plan? If yes show that the proposed facilities are consistent with that plan.

6. **PENNSYLVANIA NATURAL DIVERSITY INDEX (PNDI) CONSISTENCY:**

Check one:

☒ The "Pennsylvania Natural Diversity Inventory (PNDI) Project Environmental Review Receipt" resulting from my search of the PNDI database and all supporting documentation from jurisdictional agencies (when necessary) is/are attached.

☐ A completed "Pennsylvania Natural Diversity Inventory (PNDI) Project Planning & Environmental Review Form," (PNDI Form) available at www.naturalheritage.state.pa.us , and all required supporting documentation is attached. I request DEP staff to complete the required PNDI search for my project. I realize that my planning module will be considered incomplete upon submission to the Department and that the DEP review will not begin, and that processing of my planning module will be delayed, until a "PNDI Project Environmental Review Receipt" and all supporting documentation from jurisdiction agencies (when necessary) is/are received by DEP.

Applicant or Consultant Initials WLB

7. **COMPREHENSIVE PLAN CONSISTENCY:**

☒ A narrative and mapping to show that the proposed project is consistent with any comprehensive plan developed under the Pennsylvania Municipalities Planning Code (Act 247) is attached. Document that the proposed project is consistent with land use and all other requirements stated in the comprehensive plan.

8. **COOPERATION WITH PA. HISTORICAL AND MUSEUM COMMISSION (PHMC):**

☒ A copy of DEP's "Cultural Resource Notice" and map which were sent to the Commission and a copy of the Commission's response are attached. Note that the Commission may require archeological surveys if federal funds, including PENNVEST, will be used in the project. If PENNVEST funds are to be used, DEP cannot recommend the project to PENNVEST for consideration until any required surveys have been done and the project has been "cleared" by the Commission.

9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS:**

☐ A copy of the additional information is attached. If PENNVEST funding is to be sought for the project, address these additional items in terms of any project impacts and measures to avoid or mitigate same.

- Cost Effectiveness
- Air quality
- Floodplains
- Wild and scenic rivers
- Coastal zone management
- Socio-economic impacts
- Water supplies
- Other environmentally sensitive areas

J. ALTERNATIVE SEWAGE FACILITIES ANALYSIS (See Section J of instructions)

☒ An alternative sewage facilities analysis has been prepared as described in Section J of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section J of the instructions.

K. CHAPTER 94 CONSISTENCY DETERMINATION (See Section K of instructions)

☒ Projects that propose the use of existing municipal collection, conveyance or wastewater treatment facilities, or the construction of collection and conveyance facilities to be served by existing municipal wastewater treatment facilities must be consistent with the requirements of Chapter 94 of DEP's rules and regulations (relating to Municipal Wasteload Management). If more than one municipality or authority will be affected by the project, please obtain the information required in this section for each. Additional sheets may be attached for this purpose.

1. Project Flows 29425 gpd

2. Total Sewage Flows to Facilities

   a. Enter average and peak sewage flows for each proposed or existing facility as designed or permitted.

   b. Enter the present average and peak sewage flows for the critical sections of existing facilities.

   c. Enter the average and peak sewage flows projected for 5 years through the critical sections of existing facilities which includes existing, proposed, or future projects.

   To complete the table, refer to Section K of instructions.

	a. Design and/or Permitted Capacity (gpd)		b. Present Flows (gpd)		c. Projected Flows in 5 years (gpd)	
	Average	Peak	Average	Peak	Average	Peak
Collection						
Conveyance						
Treatment						

3. Collection and Conveyance Facilities

   The questions below are to be answered by the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities. These questions should be answered in coordination with the latest Chapter 94 annual report and the above table.

   This project proposes sewer extensions or tap-ins. Will these actions create a hydraulic overload within five years on any existing collection or conveyance facilities that are part of the system? ☐ Yes ☒ No

   a. If yes, this sewage facilities planning module will not be accepted for review by the municipality, delegated local agency and/or DEP until all inconsistencies with Chapter 94 are resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the module package.

b. If no, the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities must sign below to indicate that the collection and conveyance facilities have adequate capacity and are able to provide service to the proposed development in accordance with Chapter 94 requirements and that this proposal will not affect this status.

c. Collection System

Name of Agency, Authority, Municipality East Whiteland Township

Name of Responsible Agent William Steele

Agent Signature _____

Date _____

d. Conveyance System **Sign Here**

Name of Agency, Authority, Municipality Tredyffrin Township

Name of Responsible Agent _____

Agent Signature _____

Date _____

K. CHAPTER 94 CONSISTENCY DETERMINATION (continued)

4. Treatment Facility

The questions below are to be answered by the facility permittee in coordination with the information in the table and the latest Chapter 94 report.

This project proposes the use of an existing wastewater treatment plant for the disposal of sewage. Will this action create a hydraulic or organic overload within 5 years at that facility? ☐ Yes ☐ No

a. If yes, this planning module for sewage facilities will not be reviewed by the municipality, delegated local agency and/or DEP until this inconsistency with Chapter 94 is resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the planning module.

b. If no, the treatment facility permittee must sign below to indicate that this facility has adequate treatment capacity and is able to provide wastewater treatment services for the proposed development in accordance with Chapter 94 requirements and that this proposal will not impact this status

c. Name of Agency, Authority, Municipality Valley Forge Sewer Authority

Name of Responsible Agent _____

Agent Signature _____

Date _____

L. INSTITUTIONAL EVALUATION (See Section L of instructions)

☐ An institutional evaluation is attached. Identify the entity which will design, obtain necessary permits, construct, own and operate the proposed facilities. If a low pressure vacuum or effluent sewer are proposed, discuss purchase, installation, operation and maintenance responsibilities for the individual pumping, valves, tanks, etc.

M. PROJECT COST AND FUNDING ANALYSIS (See Section M of instructions)

☒ A detailed cost estimate and present worth analysis for the project is attached. Provide a financing plan for the project, identifying the funding source(s) and identifying estimated tap fees and user rates. For projects proposing the use of PENNVEST funds, see Section I. 9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS**. Complete the following table:

Cost and Funding Information (Estimated)	
COST	
Construction cost	$
Administrative, legal, engineering cost	$
Total project cost	$
Annual O/M cost	$
FUNDING	
Tap-in fees ($ per EDU X no. EDUs)	$
Proceeds from primary funding source	$
Proceeds from other funding sources	$
USER COSTS	
Initial user base	EDUs
Monthly debt service per EDU	$
Monthly O/M cost per EDU	$
Total estimated monthly user cost per EDU	$

N. PROJECT IMPLEMENTATION SCHEDULE (See Section N of instructions)

☒ A project implementation schedule showing milestone dates for submission of DEP permit applications, initiation and completion of construction and any other milestones significant to this particular project is attached to this component

O. PUBLIC NOTIFICATION REQUIREMENT (See Section O of instructions)

☒ Attached is a copy of the public notice. All comments received as a result of the notice are attached.

☐ Municipal response to these comments is attached.

☒ No comments were received. A copy of the public notice is attached.

☐ P. ADDITIONAL CHAPTER 71 PLANNING ELEMENTS (See Section P of instructions)

a. Additional planning elements are required by DEP.

- _____
- _____
- _____
- _____
- _____

Q. PLANNING AGENCY REVIEW (See Section Q of instructions)

☒ Local Planning Commission comments or Component 4a are attached.

☒ County, Area, Or Region Planning Commission comments or Component 4b are attached.

☒ County or Joint County Health Department comments (if appropriate) or Component 4c are attached.

R. RESOLUTION OF ADOPTION (See Section R of instructions)

☒ An **original**, **signed**, and **sealed** Resolution of Adoption is attached.

RE: East Whiteland Township
Planebrook Road Area
Act 537 Component 3m Planning Module
Conveyance Capacity
ARRO #10310.21

Dear Mr. Goldberg:

On behalf of East Whiteland Township (Township), we are submitting a copy of the enclosed Component 3m Planning Module. The Township is preparing this module to address the planning needs for the extension of sanitary sewer service to existing properties in the Planebrook Road area of the Township located immediately south of the point where Route 202 crosses over Planebrook Road. The planned average daily wastewater flow from this area is projected to be 29,425 gpd (110,344 gpd Peak).

The wastewater will ultimately be conveyed to East Whiteland Township's Mill Lane Pump Station and discharged from that pump station via the existing force main to the gravity system. It will then proceed to discharge to Tredyffrin Township at their Matthews Road Flow Meter. It is important to note that the capacity of the pumps at the Mill Lane Pump Station shall remain the same. No upgrades are needed to accommodate the proposed flow from the Planebrook Road area.

Please review this planning module component as it relates to available treatment capacity at the VFSA Wastewater Treatment Plant. If there are no capacity concerns, please complete the Table in Section J for 'Treatment', sign the module at the noted location and return it to my attention.

If you have any questions or concerns, please contact me at 610.495.2102 or email me at bill.bohner@arroconsulting.com. Thank you for your assistance with the review of this planning document.

Sincerely,

William L. Bohner, Jr., P.E.

SEWAGE FACILITIES PLANNING MODULE FOR MINOR ACT 537 UPDATE REVISION

Component 3m. Municipal or Authority Sponsored Minor Sewage Collection Project

(Return completed module package to appropriate municipality)

DEP USE ONLY				
DEP CODE #	CLIENT ID #	SITE ID #	APS ID #	AUTH ID #

This document provides a simplified planning format for municipalities and municipal authorities proposing the construction of a sewer extension primarily serving existing development. Typically, this format would be used for projects involving the extension of sewer service to no more than 100 equivalent dwelling units (EDUs) and where the majority of the project serves existing development. For projects where more than 50 percent of the proposed customers will result from new land development, a Component 3 Sewage Facilities Planning Module would typically be used. For larger projects or if the project would involve the construction or modification of a wastewater treatment facility, then a general Act 537 Update Revision, meeting all of the requirements of Title 25 Pennsylvania Code, Chapter 71 § 71.21, is appropriate.

DEP staff will make a final determination as to the appropriate type of planning for a given project based on the review of a plan of study. Eligibility for a grant to offset the cost of planning will be determined by DEP staff based upon review of a *Task/Activity Report* (3800-FM-BPNPSM0005). The project sponsor submits both documents. **DO NOT** use this form without coordinating with your local DEP staff. Refer to the instructions.

This planning document, along with any other documents specified in the cover letter, must be completed and submitted to the municipality with jurisdiction over the project site for review and approval. All required documentation must be attached for the Sewage Facilities Planning Module to be complete. Refer to the instructions for help in completing this component.

A. PROJECT INFORMATION (See Section A of instructions)

1. Project Name

   East Whiteland Township; Planebrook Road Area Sanitary Sewer Extension

2. Brief Project Description

   Extend public sewer service to existing properties located along, adjacent to, and near Planebrook Road.

B. CLIENT (MUNICIPALITY) INFORMATION (See Section B of instructions)

E. AVAILABILITY OF DRINKING WATER SUPPLY (See Section E of instructions)

The project will be provided with drinking water from the following source: (Check appropriate box)

☐ Individual wells or cisterns.

☐ A proposed public water supply.

☒ An existing public water supply.

If existing public water supply is to be used, provide the name of the water company and attach documentation from the water company stating that it will serve the project.

Name of water company: Aqua PA

F. PROJECT NARRATIVE (See Section F of instructions)

☒ A narrative has been prepared as described in Section E of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section E of the instructions.

☐ G. SEWAGE DISPOSAL NEEDS IDENTIFICATION (See Section G of instructions)

Conduct sanitary and water supply surveys per DEP's publication entitled *Sewage Disposal Needs Identification.* This is highly recommended for all projects. It is required if PENNVEST funding is to be sought for the project, or if required by DEP as indicated by the checked box opposite this item.

H. EXISTING WASTEWATER FACILITIES (See Section H of instructions)

1. **COLLECTION SYSTEM**

Provide requested information concerning the existing treatment facility.

a. Name of existing collection system East Whiteland Twp. System

Clean Streams Law Permit Number 1515402

b. Name of interceptor Whiteland Village Sewer Extension/Interceptor

Clean Streams Law Permit Number 1515402

2. **WASTEWATER TREATMENT FACILITY**

Provide requested information concerning the existing treatment facility.

Name of existing facility Valley Forge Sewer Authority WWTP

NPDES Permit Number for existing facility 43974

I. PROPOSED WASTEWATER FACILITIES (See Section I of instructions)

1. Provide an estimate of the immediate and five year projected flow from the proposed sewer extension. Address the capacity for this flow in the existing conveyance and treatment facilities in terms of the most recent wasteload management annual report for these facilities.

2. **PLOT PLAN**

The following information is to be submitted on a plot plan or map of the proposed project that clearly reflects the relationship between the proposed facilities and the identified features.

a. Existing and proposed buildings.

b. Lot lines and lot sizes.

c. Adjacent lots.

d. Existing and proposed sewerage facilities.

e. Show tap-in or sewer extension to the point of connection to existing collection system.

f. Existing and proposed water supplies and surface water (wells, springs, ponds, streams, etc.)

g. Existing and proposed rights-of-way.

h. Existing and proposed streets, roadways, access roads, etc.

i. Any designated recreational or open space area

j. Wetlands - from National Wetland Inventory Mapping and USGS Hydric Soils Mapping.

k. Flood plains or Floodprone area soils, floodways, watercourses, water bodies (from Federal Flood Insurance Mapping)

l. Prime Agricultural Land.

m. Any other facilities (pipelines, power lines, etc.)

n. Orientation to north.

I. PROPOSED WASTEWATER FACILITIES (continued)

3. WETLAND PROTECTION

YES NO

a. ☐ ☒ Are there wetlands in the project area? If yes, indicate these areas on the plot plan as shown in the mapping or through on-site delineation.

b. ☐ ☒ Are there any construction activities (encroachments, or obstructions) proposed in, along, or through the wetlands? If yes, Identify any proposed encroachments on wetlands and identify whether a General Permit or a full encroachment permit will be required. If a full permit is required, address time and cost impacts on the project. Note that wetland encroachments should be avoided where feasible. Also note that a feasible alternative **MUST BE SELECTED** to an identified encroachment on an exceptional value wetland as defined in Chapter 105. Identify any project impacts on HQ or EV streams and address impacts of the permitting requirements of said encroachments on the project.

4. PRIMARY AGRICULTURAL LAND PROTECTION

a. ☐ ☒ Will your project involve the disturbance of any prime agricultural lands? If "yes" indicate any alternatives to this disturbance that were considered and the reasons they were not deemed feasible. Identify any primary or secondary impacts of the project on the Commonwealth's prime agricultural lands. Evaluate alternatives to avoid or mitigate undesirable impacts. The selected sewage facilities plan must be consistent with local measures in place to protect prime agricultural lands.

5. STORMWATER MANAGEMENT IMPACTS:

a. ☐ ☒ Will the project impact an area covered by a DEP approved County Stormwater Management Plan? If yes show that the proposed facilities are consistent with that plan.

6. PENNSYLVANIA NATURAL DIVERSITY INDEX (PNDI) CONSISTENCY:

Check one:

☒ The "Pennsylvania Natural Diversity Inventory (PNDI) Project Environmental Review Receipt" resulting from my search of the PNDI database and all supporting documentation from jurisdictional agencies (when necessary) is/are attached.

☐ A completed "Pennsylvania Natural Diversity Inventory (PNDI) Project Planning & Environmental Review Form," (PNDI Form) available at www.naturalheritage.state.pa.us , and all required supporting documentation is attached. I request DEP staff to complete the required PNDI search for my project. I realize that my planning module will be considered incomplete upon submission to the Department and that the DEP review will not begin, and that processing of my planning module will be delayed, until a "PNDI Project Environmental Review Receipt" and all supporting documentation from jurisdiction agencies (when necessary) is/are received by DEP.

Applicant or Consultant Initials WLB

7. COMPREHENSIVE PLAN CONSISTENCY:

☒ A narrative and mapping to show that the proposed project is consistent with any comprehensive plan developed under the Pennsylvania Municipalities Planning Code (Act 247) is attached. Document that the proposed project is consistent with land use and all other requirements stated in the comprehensive plan.

8. COOPERATION WITH PA. HISTORICAL AND MUSEUM COMMISSION (PHMC):

☒ A copy of DEP's "Cultural Resource Notice" and map which were sent to the Commission and a copy of the Commission's response are attached. Note that the Commission may require archeological surveys if federal funds, including PENNVEST, will be used in the project. If PENNVEST funds are to be used, DEP cannot recommend the project to PENNVEST for consideration until any required surveys have been done and the project has been "cleared" by the Commission.

9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS:**

☐ A copy of the additional information is attached. If PENNVEST funding is to be sought for the project, address these additional items in terms of any project impacts and measures to avoid or mitigate same.

- Cost Effectiveness
- Air quality
- Floodplains
- Wild and scenic rivers
- Coastal zone management
- Socio-economic impacts
- Water supplies
- Other environmentally sensitive areas

J. ALTERNATIVE SEWAGE FACILITIES ANALYSIS (See Section J of instructions)

☒ An alternative sewage facilities analysis has been prepared as described in Section J of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section J of the instructions.

K. CHAPTER 94 CONSISTENCY DETERMINATION (See Section K of instructions)

☒ Projects that propose the use of existing municipal collection, conveyance or wastewater treatment facilities, or the construction of collection and conveyance facilities to be served by existing municipal wastewater treatment facilities must be consistent with the requirements of Chapter 94 of DEP's rules and regulations (relating to Municipal Wasteload Management). If more than one municipality or authority will be affected by the project, please obtain the information required in this section for each. Additional sheets may be attached for this purpose.

1. Project Flows 29,425 gpd

2. Total Sewage Flows to Facilities

   a. Enter average and peak sewage flows for each proposed or existing facility as designed or permitted.

   b. Enter the present average and peak sewage flows for the critical sections of existing facilities.

   c. Enter the average and peak sewage flows projected for 5 years through the critical sections of existing facilities which includes existing, proposed, or future projects.

   To complete the table, refer to Section K of instructions.

	a. Design and/or Permitted Capacity (gpd)		b. Present Flows (gpd)		c. Projected Flows in 5 years (gpd)	
	Average	Peak	Average	Peak	Average	Peak
Collection						
Conveyance						
Treatment	11.75 MGD	32 MGD	7.512 MGD	13.898 MGD	7.681 MGD	9.212 MGD

3. Collection and Conveyance Facilities

The questions below are to be answered by the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities. These questions should be answered in coordination with the latest Chapter 94 annual report and the above table.

This project proposes sewer extensions or tap-ins. Will these actions create a hydraulic overload within five years on any existing collection or conveyance facilities that are part of the system? ☐ Yes ☒ No

   a. If yes, this sewage facilities planning module will not be accepted for review by the municipality, delegated local agency and/or DEP until all inconsistencies with Chapter 94 are resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the module package.

b. If no, the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities must sign below to indicate that the collection and conveyance facilities have adequate capacity and are able to provide service to the proposed development in accordance with Chapter 94 requirements and that this proposal will not affect this status.

c. Collection System

Name of Agency, Authority, Municipality East Whiteland Township

Name of Responsible Agent William Steele

Agent Signature _____

Date _____

d. Conveyance System

Name of Agency, Authority, Municipality East Whiteland Township

Name of Responsible Agent William Steele

Agent Signature _____

Date _____

K. CHAPTER 94 CONSISTENCY DETERMINATION (continued)

4. Treatment Facility

The questions below are to be answered by the facility permittee in coordination with the information in the table and the latest Chapter 94 report.

This project proposes the use of an existing wastewater treatment plant for the disposal of sewage. Will this action create a hydraulic or organic overload within 5 years at that facility? ☐ Yes ☑ No

a. If yes, this planning module for sewage facilities will not be reviewed by the municipality, delegated local agency and/or DEP until this inconsistency with Chapter 94 is resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the planning module.

b. If no, the treatment facility permittee must sign below to indicate that this facility has adequate treatment capacity and is able to provide wastewater treatment services for the proposed development in accordance with Chapter 94 requirements and that this proposal will not impact this status

Sign Here

c. Name of Agency, Authority, Municipality Valley Forge Sewer Authority

Name of Responsible Agent Martin F. Goldberg

Agent Signature Martin F Goldberg

Date 01/28/20

L. INSTITUTIONAL EVALUATION (See Section L of instructions)

☒ An institutional evaluation is attached. Identify the entity which will design, obtain necessary permits, construct, own and operate the proposed facilities. If a low pressure vacuum or effluent sewer are proposed, discuss purchase, installation, operation and maintenance responsibilities for the individual pumping, valves, tanks, etc.

M. PROJECT COST AND FUNDING ANALYSIS (See Section M of instructions)

☒ A detailed cost estimate and present worth analysis for the project is attached. Provide a financing plan for the project, identifying the funding source(s) and identifying estimated tap fees and user rates. For projects proposing the use of PENNVEST funds, see Section I. 9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS**. Complete the following table:

Cost and Funding Information (Estimated)	
COST	
Construction cost	$
Administrative, legal, engineering cost	$
Total project cost	$
Annual O/M cost	$
FUNDING	
Tap-in fees ($ per EDU X no. EDUs)	$
Proceeds from primary funding source	$
Proceeds from other funding sources	$
USER COSTS	
Initial user base	EDUs
Monthly debt service per EDU	$
Monthly O/M cost per EDU	$
Total estimated monthly user cost per EDU	$

N. PROJECT IMPLEMENTATION SCHEDULE (See Section N of instructions)

☒ A project implementation schedule showing milestone dates for submission of DEP permit applications, initiation and completion of construction and any other milestones significant to this particular project is attached to this component

O. PUBLIC NOTIFICATION REQUIREMENT (See Section O of instructions)

☒ Attached is a copy of the public notice. All comments received as a result of the notice are attached.

☐ Municipal response to these comments is attached.

☒ No comments were received. A copy of the public notice is attached.

☐ P. ADDITIONAL CHAPTER 71 PLANNING ELEMENTS (See Section P of instructions)

a. Additional planning elements are required by DEP.

Re: Water Availability
Frame and Planebrook
East Whiteland Twp, Chester County

In response to your request, this letter will serve as confirmation that the above referenced property is situated within Aqua Pennsylvania Inc. service territory.

Domestic and fire water service is available to this property and will be provided in accordance with Aqua Pennsylvania, Inc. Rules and Regulations. For further details, visit www.aquaamerica.com.

With regard to our capacity for domestic and fire service for this area, flow data information can be obtained upon written request to Ms. Lisa Thomas-Oliva of our Control Center. Ms. Thomas-Oliva can be reached at (610) 645-1067 but requests must be made in writing. Her fax number is (610) 645-1162.

Should you have any further questions or need to request an application for service, contact me at (610) 541-4160 or dlciotti@aquaamerica.com.

Regards,

Deanna L. Ciotti

INSTRUCTIONS FOR COMPLETING COMPONENT 4B
COUNTY PLANNING AGENCY REVIEW
(or Planning Agency with Areawide Jurisdiction)

Remove and recycle these instructions prior to mailing component to the approving agency.

Background

This component, Component 4, is used to obtain the comments of planning agencies and/or health departments having jurisdiction over the project area. It is used in conjunction with other planning module components appropriate to the characteristics of the project proposed.

Who Should Complete the Component?

The component should be completed by any existing municipal planning agency, county planning agency, planning agency with areawide jurisdiction, and/or health department having jurisdiction over the project site. It is divided into sections to allow for convenient use by the appropriate agencies.

The project sponsor must forward copies of this component, along with supporting components and data, to the appropriate planning agency(ies) and health department(s) (if any) having jurisdiction over the development site. These agencies are responsible for responding to the questions in their respective sections of Component 4, as well as providing whatever additional comments they may wish to provide on the project plan. After the agencies have completed their review, the component will be returned to the applicant. The agencies have 60 days in which to provide comments to the applicant. If the agencies fail to comment within this 60 day period, the applicant may proceed to the next stage of the review without the comments. The use of registered mail or certified mail (return receipt requested) by the applicant when forwarding the module package to the agencies will document a date of receipt.

After receipt of the completed Component 4 from the planning agencies, or following expiration of the 60 day period without comments, the applicant must submit the entire component package to the municipality having jurisdiction over the project area for review and action. If approved by the municipality, the proposed plan, along with the municipal action, will be forwarded to the approving agency (Department of Environmental Protection or delegated local agency). The approving agency, in turn, will either approve the proposed plan, return it as incomplete, or disapprove the plan, based upon the information provided.

Instructions for Completing Planning Agency and/or Health Department Review Component

Section A. Project Name

Enter the project name as it appears on the accompanying sewage facilities planning module component (Component 2, 3, 3s or 3m).

Section B. Review Schedule

Enter the date the package was received by the reviewing agency, and the date that the review was completed.

Section C. Agency Review

1. Answer the yes/no questions and provide any descriptive information necessary on the lines provided. Attach additional sheets, if necessary.

2. Complete the name, title, and signature block.

Section D. Additional Comments

The Agency may provide whatever additional comment(s) it deems necessary, as described in the form. Attach additional sheets, if necessary.

Project Name

Planebrook Road Area Sanitary Sewer Extension

SECTION B. REVIEW SCHEDULE (See Section B of instructions)

1. Date plan received by county planning agency _____
2. Date plan received by planning agency with areawide jurisdiction _____

   Agency name _____
3. Date review completed by agency _____

SECTION C. AGENCY REVIEW (See Section C of instructions)

Yes	No		
☐	☐	1.	Is there a county or areawide comprehensive plan adopted under the Municipalities Planning Code (53 P.S. 10101 *et seq.*)?
☐	☐	2.	Is this proposal consistent with the comprehensive plan for land use?
☐	☐	3.	Does this proposal meet the goals and objectives of the plan? If no, describe goals and objectives that are not met _____
☐	☐	4.	Is this proposal consistent with the use, development, and protection of water resources? If no, describe inconsistency _____
☐	☐	5.	Is this proposal consistent with the county or areawide comprehensive land use planning relative to Prime Agricultural Land Preservation? If no, describe inconsistencies: _____
☐	☐	6.	Does this project propose encroachments, obstructions, or dams that will affect wetlands? If yes, describe impact _____
☐	☐	7.	Will any known historical or archeological resources be impacted by this project? If yes, describe impacts _____
☐	☐	8.	Will any known endangered or threatened species of plant or animal be impacted by the development project? If yes, describe impacts _____
☐	☐	9.	Is there a county or areawide zoning ordinance?
☐	☐	10.	Does this proposal meet the zoning requirements of the ordinance? If no, describe inconsistencies _____

SECTION C. AGENCY REVIEW (continued)

Yes	No		
☐	☐	11.	Have all applicable zoning approvals been obtained?
☐	☐	12.	Is there a county or areawide subdivision and land development ordinance?
☐	☐	13.	Does this proposal meet the requirements of the ordinance?
			If no, describe which requirements are not met _____
☐	☐	14.	Is this proposal consistent with the municipal Official Sewage Facilities Plan?
			If no, describe inconsistency _____
☐	☐	15.	Are there any wastewater disposal needs in the area adjacent to this proposal that should be considered by the municipality?
			If yes, describe _____
☐	☐	16.	Has a waiver of the sewage facilities planning requirements been requested for the residual tract of this subdivision?
☐	☐		If yes, is the proposed waiver consistent with applicable ordinances.
			If no, describe the inconsistencies _____
☐	☐	17.	Does the county have a stormwater management plan as required by the Stormwater Management Act?
☐	☐		If yes, will this project plan require the implementation of storm water management measures?
		18.	Name, Title and signature of person completing this section:
			Name: _____
			Title: _____
			Signature: _____
			Date: _____
			Name of County or Areawide Planning Agency: _____
			Address: _____
			Telephone Number: _____

SECTION D. ADDITIONAL COMMENTS (See Section D of instructions)

This component does not limit county planning agencies from making additional comments concerning the relevancy of the proposed plan to other plans or ordinances. If additional comments are needed, attach additional sheets.

The county planning agency must complete this component within 60 days.

This component and any additional comments are to be returned to the applicant.

INSTRUCTIONS FOR COMPLETING COMPONENT 4A
MUNICIPAL PLANNING AGENCY REVIEW

Remove and recycle these instructions prior to mailing component to the approving agency.

Background

This component, Component 4, is used to obtain the comments of planning agencies and/or health departments having jurisdiction over the project area. It is used in conjunction with other planning module components appropriate to the characteristics of the project proposed.

Who Should Complete the Component?

The component should be completed by any existing municipal planning agency, county planning agency, planning agency with areawide jurisdiction, and/or health department having jurisdiction over the project site. It is divided into sections to allow for convenient use by the appropriate agencies.

The project sponsor must forward copies of this component, along with supporting components and data, to the appropriate planning agency(ies) and health department(s) (if any) having jurisdiction over the development site. These agencies are responsible for responding to the questions in their respective sections of Component 4, as well as providing whatever additional comments they may wish to provide on the project plan. After the agencies have completed their review, the component will be returned to the applicant. The agencies have 60 days in which to provide comments to the applicant. If the agencies fail to comment within this 60 day period, the applicant may proceed to the next stage of the review without the comments. The use of registered mail or certified mail (return receipt requested) by the applicant when forwarding the module package to the agencies will document a date of receipt.

After receipt of the completed Component 4 from the planning agencies, or following expiration of the 60 day period without comments, the applicant must submit the entire component package to the municipality having jurisdiction over the project area for review and action. If approved by the municipality, the proposed plan, along with the municipal action, will be forwarded to the approving agency (Department of Environmental Protection or delegated local agency). The approving agency, in turn, will either approve the proposed plan, return it as incomplete, or disapprove the plan, based upon the information provided.

Instructions for Completing Planning Agency and/or Health Department Review Component

Section A. Project Name

Enter the project name as it appears on the accompanying sewage facilities planning module component (Component 2, 2m, 3, 3s or 3m).

Section B. Review Schedule

Enter the date the package was received by the reviewing agency, and the date that the review was completed.

Section C. Agency Review

1. Answer the yes/no questions and provide any descriptive information necessary on the lines provided. Attach additional sheets, if necessary.

2. Complete the name, title, and signature block.

Section D. Additional Comments

The Agency may provide whatever additional comment(s) it deems necessary, as described in the form. Attach additional sheets, if necessary.

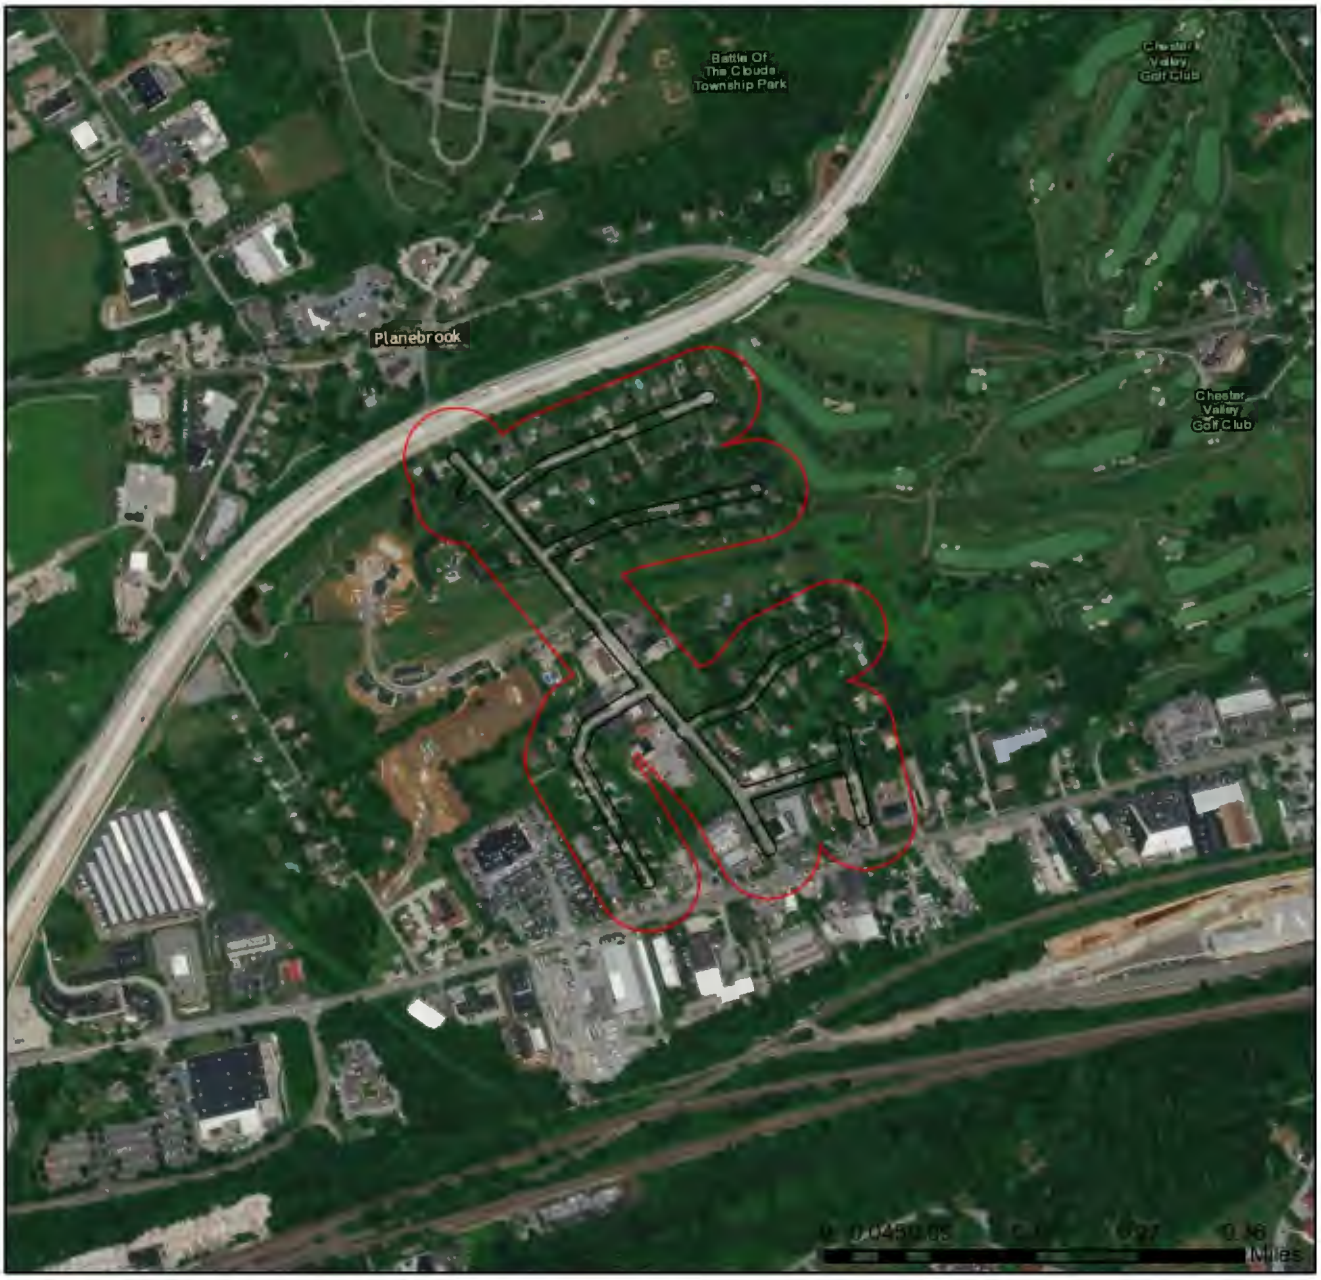
SHPO REVIEWER: DM for Douglas McLearen **DATE:** 2.10.2020

1. PROJECT INFORMATION

Project Name: **Planebrook Road Area Sanitary Sewer Extension**
Date of Review: **12/31/2019 10:30:27 AM**
Project Category: **Waste Transfer, Treatment, and Disposal, Liquid waste/Effluent, Sewage module/Act 537 plan**
Project Area: **11.26 acres**
County(s): **Chester**
Township/Municipality(s): **EAST WHITELAND**
ZIP Code: **19355**
Quadrangle Name(s): **MALVERN**
Watersheds HUC 8: **Schuylkill**
Watersheds HUC 12: **Little Valley Creek-Valley Creek**
Decimal Degrees: **40.037688, -75.572765**
Degrees Minutes Seconds: **40° 2' 15.6780" N, 75° 34' 21.9528" W**



2. SEARCH RESULTS

Agency	Results	Response
PA Game Commission	No Known Impact	No Further Review Required
PA Department of Conservation and Natural Resources	No Known Impact	No Further Review Required
PA Fish and Boat Commission	No Known Impact	No Further Review Required
U.S. Fish and Wildlife Service	**Avoidance Measure**	**See Agency Response**

As summarized above, Pennsylvania Natural Diversity Inventory (PNDI) records indicate there may be potential impacts to threatened and endangered and/or special concern species and resources within the project area. If the response above indicates "No Further Review Required" no additional communication with the respective agency is required. If the response is "Further Review Required" or "See Agency Response," refer to the appropriate agency comments below. Please see the DEP Information Section of this receipt if a PA Department of Environmental Protection Permit is required.

Note that regardless of PNDI search results, projects requiring a Chapter 105 DEP individual permit or GP 5, 6, 7, 8, 9 or 11 must comply with the bog turtle habitat screening requirements of the PASPGP.

RESPONSE TO QUESTION(S) ASKED

Q1: Will this project or any project-related activities require any in-stream work, or a permanent or temporary crossing of a waterway (stream, river, creek, tributary)?
Your answer is: No

Q2: Describe how wastewater (effluent) will be handled (select one). For the purpose of this question, wastewater/effluent does not include stormwater runoff. If the project involves solely the renewal or modification of an existing discharge permit (e.g., NPDES permit), select from options 3, 4, 5, or 6 below.
Your answer is: All wastewater/effluent from this project/activity will be routed to an existing municipal wastewater treatment plant.

Q3: Accurately describe what is known about wetland presence in the project area or on the land parcel by selecting ONE of the following. "Project" includes all features of the project (including buildings, roads, utility lines, outfall and intake structures, wells, stormwater retention/detention basins, parking lots, driveways, lawns, etc.), as well as all associated impacts (e.g., temporary staging areas, work areas, temporary road crossings, areas subject to grading or clearing, etc.). Include all areas that will be permanently or temporarily affected -- either directly or indirectly -- by any type of disturbance (e.g., land clearing, grading, tree removal, flooding, etc.). Land parcel = the lot(s) on which some type of project(s) or activity(s) are proposed to occur.
Your answer is: The entire project and associated discharge, plus a 300-foot buffer around the project area, all occur in or on an existing building, parking lot, driveway, road, road shoulder, street, runway, paved area, railroad bed, or crop agriculture field.

3. AGENCY COMMENTS

Regardless of whether a DEP permit is necessary for this proposed project, any potential impacts to threatened and endangered species and/or special concern species and resources must be resolved with the appropriate jurisdictional agency. In some cases, a permit or authorization from the jurisdictional agency may be needed if adverse impacts to these species and habitats cannot be avoided.

These agency determinations and responses are **valid for two years** (from the date of the review), and are based on the project information that was provided, including the exact project location; the project type, description, and features; and any responses to questions that were generated during this search. If any of the following change: 1) project location, 2) project size or configuration, 3) project type, or 4) responses to the questions that were asked during the online review, the results of this review are not valid, and the review must be searched again via the PNDI Environmental Review Tool and resubmitted to the jurisdictional agencies. The PNDI tool is a primary screening tool, and a desktop review may reveal more or fewer impacts than what is listed on this PNDI receipt. The jursidictional agencies **strongly advise against** conducting surveys for the species listed on the receipt prior to consultation with the agencies.

PA Game Commission
RESPONSE:

No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Department of Conservation and Natural Resources
RESPONSE:

No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Fish and Boat Commission
RESPONSE:

No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

U.S. Fish and Wildlife Service
RESPONSE:

Avoidance Measure: Do not conduct this project/activity within 50 feet of any streams, rivers, creeks, or tributaries. This includes both perennial and intermittent waterways.

As the project proponent or applicant, I certify that I will implement the above Avoidance Measure:
_____(Signature)

SPECIAL NOTE: **If you agree to implement the above Avoidance Measure, no further coordination with this agency regarding threatened and endangered species and/or special concern species and resources is required.** If you are not able to comply with the Avoidance Measures, you are required to coordinate with this agency - please send project information to this agency for review (see "What to Send" section).

WHAT TO SEND TO JURISDICTIONAL AGENCIES

If project information was requested by one or more of the agencies above, upload* or email* the following information to the agency(s). Instructions for uploading project materials can be found here. This option provides the applicant with the convenience of sending project materials to a single location accessible to all three state agencies. Alternatively, applicants may email or mail their project materials (see AGENCY CONTACT INFORMATION).
***Note:** U.S.Fish and Wildlife Service requires applicants to mail project materials to the USFWS PA field office (see AGENCY CONTACT INFORMATION). USFWS will not accept project materials submitted electronically (by upload or email).

Check-list of Minimum Materials to be submitted:
____Project narrative with a description of the overall project, the work to be performed, current physical characteristics of the site and acreage to be impacted.
____A map with the project boundary and/or a basic site plan(particularly showing the relationship of the project to the physical features such as wetlands, streams, ponds, rock outcrops, etc.)
In addition to the materials listed above, USFWS REQUIRES the following
____**SIGNED** copy of a Final Project Environmental Review Receipt

The inclusion of the following information may expedite the review process.
____Color photos keyed to the basic site plan (i.e. showing on the site plan where and in what direction each photo was taken and the date of the photos)
____Information about the presence and location of wetlands in the project area, and how this was determined (e.g., by a qualified wetlands biologist), if wetlands are present in the project area, provide project plans showing the location of all project features, as well as wetlands and streams.

4. DEP INFORMATION

The Pa Department of Environmental Protection (DEP) requires that a signed copy of this receipt, along with any required documentation from jurisdictional agencies concerning resolution of potential impacts, be submitted with applications for permits requiring PNDI review. Two review options are available to permit applicants for handling PNDI coordination in conjunction with DEP's permit review process involving either T&E Species or species of special concern. Under sequential review, the permit applicant performs a PNDI screening and completes all coordination with the appropriate jurisdictional agencies prior to submitting the permit application. The applicant will include with its application, both a PNDI receipt and/or a clearance letter from the jurisdictional agency if the PNDI Receipt shows a Potential Impact to a species or the applicant chooses to obtain letters directly from the jurisdictional agencies. Under concurrent review, DEP, where feasible, will allow technical review of the permit to occur concurrently with the T&E species consultation with the jurisdictional agency. The applicant must still supply a copy of the PNDI Receipt with its permit application. The PNDI Receipt should also be submitted to the appropriate agency according to directions on the PNDI Receipt. The applicant and the jurisdictional agency will work together to resolve the potential impact(s). See the DEP PNDI policy at https://conservationexplorer.dcnr.pa.gov/content/resources.

5. ADDITIONAL INFORMATION

The PNDI environmental review website is a preliminary screening tool. There are often delays in updating species status classifications. Because the proposed status represents the best available information regarding the conservation status of the species, state jurisdictional agency staff give the proposed statuses at least the same consideration as the current legal status. If surveys or further information reveal that a threatened and endangered and/or special concern species and resources exist in your project area, contact the appropriate jurisdictional agency/agencies immediately to identify and resolve any impacts.

For a list of species known to occur in the county where your project is located, please see the species lists by county found on the PA Natural Heritage Program (PNHP) home page (www.naturalheritage.state.pa.us). Also note that the PNDI Environmental Review Tool only contains information about species occurrences that have actually been reported to the PNHP.

PROJECT REVIEW FORM

Request to Initiate SHPO Consultation on State and Federal Undertakings

SHPO USE ONLY	Reviewers: ____/____
DATE RECEIVED:	DATE DUE:
ER NUMBER:	HRSF: _____

REV: 06/2018

SECTION A: PROJECT NAME & LOCATION

Is this a new submittal? ◯ YES ◯ NO **OR** ◯ **This is additional information for ER Number:**

Project Name: Planebrook Road Area Act 537 Planning | County: Chester | Municipality: East Whiteland Township

Project Address: Planebrook Road | City/State/ Zip: Malvern, PA 19355

SECTION B: CONTACT INFORMATION & MAILING ADDRESS

Name: William L. Bohner, Jr. P.E. | Phone: (610) 495-2102

Company: ARRO Consulting, Inc. | Fax: (610) 495-5855

Street/PO Box: 350 West Main Street; Suite 200 | Email: bill.bohner@thearrogroup.com

City/State/Zip: Trappe, PA 19426

SECTION C: PROJECT DESCRIPTION

This project is located on: (check all that apply) ☐ Federal property ☐ State property ☑ Municipal property ☐ Private property

List all federal and state agencies and programs providing funds, permits, licenses.	**Agency Type**	**Agency/Program/Permit Name**	**Project/Permit/Tracking Number (if applicable)**

Proposed Work – Attach project description, scope of work, site plans, and/or drawings

Project includes (check all that apply): ☑ Construction ☐ Demolition ☐ Rehabilitation ☐ Disposition

Total acres of project area: 1.5 Acres | Total acres of earth disturbance: 1.5 Acres

Are there any buildings or structures within the project area? ◯ Yes ◯ No | Approximate age of buildings: 30-40 yrs.

Does this project involve properties listed in or eligible for the National Register of Historic Places, or designated as historic by a local government?	Yes	No	Unsure	Name of historic property or historic districts
	◯	◯	◯	

Please print and mail completed form and all attachments to:

PHMC
State Historic Preservation Office
400 North St.
Commonwealth Keystone Building, 2nd Floor
Harrisburg, PA 17120-0093

Attachments – Please include the following information with this form

- ☑ **Map –** 7.5' USGS quad showing project boundary and Area of Potential Effect
- ☑ **Description/Scope –** Describe the project, including any ground disturbance and previous land use
- ☑ **Site Plans/Drawings –** Indicate past and present land use, location and dates of buildings, and proposed improvements
- ☑ **Photographs –** Attach prints or digital photographs showing the project site, including images of all buildings and structures keyed to a site plan

SHPO DETERMINATION (SHPO USE ONLY)

- ☐ There are **NO HISTORIC PROPERTIES** in the Area of Potential Effect
- ☐ The project will have **NO EFFECT** on historic properties
- ☐ The project will have **NO ADVERSE EFFECTS** on historic properties:
- ☐ The project will have **NO ADVERSE EFFECTS WITH CONDITIONS** (see attached)
- ☐ **SHPO REQUESTS ADDITIONAL INFORMATION** (see attached)

Stormwater Management Narrative

Stormwater Management Impacts

County Stormwater Management Plan

The Chester County Planning Commission currently has a stormwater management plan in place. Most of East Whiteland Township (and all of the planning area for this 537 Plan) is situated in Valley Creek Watershed. The "Valley Creek Watershed Stormwater Management Plan" was approved by PADEP February 2011.

It should be noted that an Act 167 Plan is not a land use plan. Runoff controls developed in the plan are not based upon controlling the location, type, density or rate of development throughout the watersheds. The stormwater runoff performance standards are based on the assumptions that development will occur throughout the watersheds. The plan is designed to provide for new development yet control the associated storm runoff impacts. The most important aspect of an Act 167 (Stormwater Management) Plan is that it establishes a process for decision making…the peak flows and timing relationships provide for development for a runoff control philosophy geared toward minimizing the storm runoff impacts of new development."

This particular stormwater management plan addresses the impacts of stormwater quality and quantity on groundwater and surface water resources, geomorphology, and aquatic habitat of the Valley Creek watershed.

The reason for preparing this Plan is to satisfy the requirements of the Pennsylvania Stormwater Management Act, Act 167 of 1978, and to establish scientifically-based stormwater management implementation strategies that restore and protect the water resources and maintain safe and productive communities.

From a consistency perspective, it appears that the plan to provide public sewer service to the Planebrook Road Planning Area is consistent with the stormwater management plan.

The stormwater ordinance does not regulate the development. It simply regulates how the stormwater will be managed. As a consequence, prior to construction of this project, the appropriate stormwater and E&S measures will be taken. An E&S plan will be submitted to the Chester County Conservation District for review and approval.

Exhibit N

Comprehensive Plan Consistency

Comprehensive Plans

The Chester County Planning Commission (CCPC) Comprehensive Plan, entitled "Landscapes3," was adopted in November of 2018. The alternatives to provide public sanitary sewer service to accommodate needs areas in the planning area is consistent with the implementation strategy, policies and goals of the current Landscapes3 as shown in the Utilities and Infrastructure section of the plan.

East Whiteland Township adopted their Comprehensive Plan in July 2016. This plan emphasizes the importance of public utilities to Township infrastructure. The Planebrook Road Area is identified in this comprehensive plan as a future public sewer service area.

This Component 3m is consistent with the objectives set forth in Watersheds as well as the Township's Comprehensive Plan.

Exhibit O

Alternative Analysis

Alternative Analysis

This Act 537 Planning Module (Component 3m) has been prepared for East Whiteland Township (Township) at the request of the Pennsylvania Department of Environmental Protection (PA DEP) in accordance with Act 537 entitled the Pennsylvania Sewage Facilities Act, Title 25, Chapter 71 of the Pennsylvania Code and the Pennsylvania Department of Environmental Protection Act 537 Plan Content and Environmental Assessment Checklist. This planning module addresses the planning requirements necessary for the Township to provide public sanitary sewer service to existing developed properties.

For this planning module, the following pertinent information applies:

1. Project Name: Sanitary Sewer Service Extension.
2. Project Description:

    - Extend public sanitary sewer service from existing sanitary manhole located on Planebrook Road to existing properties located along Planebrook Road, Elk Drive, Fairview Drive, Prospect Avenue, Golfview Circle, Bracken Avenue, and Davis Avenue.

3. Applicant Name: East Whiteland Township
4. Applicant Contact: William Steele; 209 Conestoga Road, Frazer, PA 19355
5. Site Location: Planebrook Road Area
6. Municipality/County: East Whiteland Township/Chester County

The primary focus of the planning module is to establish the means and methods for providing public sewer service to existing properties in the Planebrook Road area south of Route 202.

Flow projections identified in the planning module show the ultimate wastewater flow of 29,425 gpd, which encompasses 107 equivalent dwelling units.

In considering alternatives for this project, there are two primary alternatives:

1. Do nothing and continue to utilize the existing on-lot disposal systems.
2. Provide public sewer service to the identified properties.

Due to the proximity of the existing pubic sewer, many local residents have expressed interest in the ability to make connection to the public system. Currently, sanitary sewer mains are located adjacent to the planning area, serving the new development on the Cockerham property.

To provide this type of service a connection will need to be made at the existing sanitary manhole located at Planebrook Road. All work shall be within the roadway and existing public right-of-way. The total disturbed area will be approximately 1.5 acres for the proposed sewer main.

Copies of the mailers returned by local residents are included in this section and the text from the Act 537 Planning for the Planebrook Road Regional Pump Station is also included for your reference.

.

Exhibit P

Institutional Evaluation

Institutional Evaluation

For the proposed sewer extension, the East Whiteland Township will prepare the design. In addition, the Township will obtain all of the necessary permits and pay for the construction of the sewer extension.

The individual property owners shall be responsible for contracting with a plumber and installing their own lateral to connect to the sewer main.

For those properties that will connect to low pressure sewers, the Township will purchase and supply grinder pumps to each property owner that will need one. The Township will not keep any spare grinder pump systems on-hand in the event of a failure.

Property owners will received their pump system, they will have their plumber install and connect to the lateral at the right of way line. Operation and maintenance will be the responsibility of the property owner.

Exhibit Q

Project Implementation Schedule

Implementation Schedule

Initiate Act 537 Sewage Facilities Planning Module	December 2019
Submit to Planning Commissions and Health Dept. for Review	March 2020
Advertise for Public Comment	April/May 2020
Respond to Comments (Public and County)	May 2020
Adopt Resolution	June 2020
Submit Planning Module to PA DEP for review	June 2020

Project Narrative

Project Narrative

This Act 537 Planning Module (Component 3m) has been prepared for East Whiteland Township (Township) at the request of the Pennsylvania Department of Environmental Protection (PA DEP) in accordance with Act 537 entitled the Pennsylvania Sewage Facilities Act, Title 25, Chapter 71 of the Pennsylvania Code and the Pennsylvania Department of Environmental Protection Act 537 Plan Content and Environmental Assessment Checklist. This planning module addresses the planning requirements necessary for the Township to provide public sanitary sewer service to existing developed properties.

For this planning module, the following pertinent information applies:

1. **Project Name**: Sanitary Sewer Service Extension.
2. **Project Description**:

    - Extend public sanitary sewer service from existing sanitary manhole located on Planebrook Road to existing properties located along Planebrook Road, Elk Drive, Fairview Drive, Prospect Avenue, Golfview Circle, Bracken Avenue, and Davis Avenue.

3. **Applicant Name**: East Whiteland Township
4. **Applicant Contact**: William Steele; 209 Conestoga Road, Frazer, PA 19355
5. **Site Location**: Planebrook Road Area
6. **Municipality/County**: East Whiteland Township/Chester County

The primary focus of the planning module is to establish the means and methods for providing public sewer service to existing properties in the Planebrook Road area south of Route 202.

Flow projections identified in the planning module show the ultimate wastewater flow of 29,425 gpd, which encompasses 107 equivalent dwelling units.

In considering alternatives for this project, there are two primary alternatives:

1. Do nothing and continue to utilize the existing on-lot disposal systems.
2. Provide public sewer service to the identified properties.

Due to the proximity of the existing pubic sewer, local residents have expressed interest in the ability to make connection to the public system. Currently, sanitary sewer mains are located adjacent to the planning area, serving new development recently constructed on the Cockerham property.

To provide this type of service, a connection will need to be made at the existing sanitary manhole located at Planebrook Road. Public Sewer service will be via gravity sewer for Planebrook Road, Prospect Avenue, Golfview Circle, Bracken Avenue, and Davis Avenue. Elk Drive and Fairview Drive will require low-pressure sewer service. Wastewater will ultimately be collected and conveyed by the Planebrook Regional Pump Station to the Whiteland Village Interceptor Extension which has the capacity to handle the proposed peak flow. From this interceptor, flow will be conveyed to the Mill Lane Pump Station. Wastewater will exit East Whiteland Township at the Matthews Road meter.

SEWAGE FACILITIES PLANNING MODULE FOR MINOR ACT 537 UPDATE REVISION

Component 3m. Municipal or Authority Sponsored Minor Sewage Collection Project

(Return completed module package to appropriate municipality)

DEP USE ONLY				
DEP CODE #	CLIENT ID #	SITE ID #	APS ID #	AUTH ID #

This document provides a simplified planning format for municipalities and municipal authorities proposing the construction of a sewer extension primarily serving existing development. Typically, this format would be used for projects involving the extension of sewer service to no more than 100 equivalent dwelling units (EDUs) and where the majority of the project serves existing development. For projects where more than 50 percent of the proposed customers will result from new land development, a Component 3 Sewage Facilities Planning Module would typically be used. For larger projects or if the project would involve the construction or modification of a wastewater treatment facility, then a general Act 537 Update Revision, meeting all of the requirements of Title 25 Pennsylvania Code, Chapter 71 § 71.21, is appropriate.

DEP staff will make a final determination as to the appropriate type of planning for a given project based on the review of a plan of study. Eligibility for a grant to offset the cost of planning will be determined by DEP staff based upon review of a *Task/Activity Report* (3800-FM-BPNPSM0005). The project sponsor submits both documents. **DO NOT** use this form without coordinating with your local DEP staff. Refer to the instructions.

This planning document, along with any other documents specified in the cover letter, must be completed and submitted to the municipality with jurisdiction over the project site for review and approval. All required documentation must be attached for the Sewage Facilities Planning Module to be complete. Refer to the instructions for help in completing this component.

A. PROJECT INFORMATION (See Section A of instructions)

1. Project Name

   East Whiteland Township; Swedesford Road Low Pressure Sewer Extension

2. Brief Project Description

   Extend low pressure sewer service to properties on Swedesford Road.

B. CLIENT (MUNICIPALITY) INFORMATION (See Section B of instructions)

Municipality Name	County	City	Boro	Twp
East Whiteland Township	Chester	☐	☐	☒

Municipality Contact - Last Name	First Name	MI	Suffix	Title

E. AVAILABILITY OF DRINKING WATER SUPPLY (See Section E of instructions)

The project will be provided with drinking water from the following source: (Check appropriate box)

☐ Individual wells or cisterns.

☐ A proposed public water supply.

☒ An existing public water supply.

If existing public water supply is to be used, provide the name of the water company and attach documentation from the water company stating that it will serve the project.

Name of water company: Aqua PA

F. PROJECT NARRATIVE (See Section F of instructions)

☒ A narrative has been prepared as described in Section E of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section E of the instructions.

☐ G. SEWAGE DISPOSAL NEEDS IDENTIFICATION (See Section G of instructions)

Conduct sanitary and water supply surveys per DEP's publication entitled *Sewage Disposal Needs Identification.* This is highly recommended for all projects. It is required if PENNVEST funding is to be sought for the project, or if required by DEP as indicated by the checked box opposite this item.

H. EXISTING WASTEWATER FACILITIES (See Section H of instructions)

1. COLLECTION SYSTEM

Provide requested information concerning the existing treatment facility.

a. Name of existing collection system East Whiteland Twp. System

Clean Streams Law Permit Number 1515402

b. Name of interceptor Whiteland Village Sewer Extension/Interceptor

Clean Streams Law Permit Number 1515402

2. WASTEWATER TREATMENT FACILITY

Provide requested information concerning the existing treatment facility.

Name of existing facility Valley Forge Sewer Authority WWTP

NPDES Permit Number for existing facility 43974

I. PROPOSED WASTEWATER FACILITIES (See Section I of instructions)

1. Provide an estimate of the immediate and five year projected flow from the proposed sewer extension. Address the capacity for this flow in the existing conveyance and treatment facilities in terms of the most recent wasteload management annual report for these facilities.

2. PLOT PLAN

The following information is to be submitted on a plot plan or map of the proposed project that clearly reflects the relationship between the proposed facilities and the identified features.

a. Existing and proposed buildings.

b. Lot lines and lot sizes.

c. Adjacent lots.

d. Existing and proposed sewerage facilities.

e. Show tap-in or sewer extension to the point of connection to existing collection system.

f. Existing and proposed water supplies and surface water (wells, springs, ponds, streams, etc.)

g. Existing and proposed rights-of-way.

h. Existing and proposed streets, roadways, access roads, etc.

i. Any designated recreational or open space area

j. Wetlands - from National Wetland Inventory Mapping and USGS Hydric Soils Mapping.

k. Flood plains or Floodprone area soils, floodways, watercourses, water bodies (from Federal Flood Insurance Mapping)

l. Prime Agricultural Land.

m. Any other facilities (pipelines, power lines, etc.)

n. Orientation to north.

I. PROPOSED WASTEWATER FACILITIES (continued)

3. WETLAND PROTECTION

YES NO

a. ☐ ☒ Are there wetlands in the project area? If yes, indicate these areas on the plot plan as shown in the mapping or through on-site delineation.

b. ☐ ☒ Are there any construction activities (encroachments, or obstructions) proposed in, along, or through the wetlands? If yes, Identify any proposed encroachments on wetlands and identify whether a General Permit or a full encroachment permit will be required. If a full permit is required, address time and cost impacts on the project. Note that wetland encroachments should be avoided where feasible. Also note that a feasible alternative **MUST BE SELECTED** to an identified encroachment on an exceptional value wetland as defined in Chapter 105. Identify any project impacts on HQ or EV streams and address impacts of the permitting requirements of said encroachments on the project.

4. PRIMARY AGRICULTURAL LAND PROTECTION

a. ☐ ☒ Will your project involve the disturbance of any prime agricultural lands? If "yes" indicate any alternatives to this disturbance that were considered and the reasons they were not deemed feasible. Identify any primary or secondary impacts of the project on the Commonwealth's prime agricultural lands. Evaluate alternatives to avoid or mitigate undesirable impacts. The selected sewage facilities plan must be consistent with local measures in place to protect prime agricultural lands.

5. STORMWATER MANAGEMENT IMPACTS:

a. ☐ ☒ Will the project impact an area covered by a DEP approved County Stormwater Management Plan? If yes show that the proposed facilities are consistent with that plan.

6. PENNSYLVANIA NATURAL DIVERSITY INDEX (PNDI) CONSISTENCY:

Check one:

☒ The "Pennsylvania Natural Diversity Inventory (PNDI) Project Environmental Review Receipt" resulting from my search of the PNDI database and all supporting documentation from jurisdictional agencies (when necessary) is/are attached.

☐ A completed "Pennsylvania Natural Diversity Inventory (PNDI) Project Planning & Environmental Review Form," (PNDI Form) available at www.naturalheritage.state.pa.us , and all required supporting documentation is attached. I request DEP staff to complete the required PNDI search for my project. I realize that my planning module will be considered incomplete upon submission to the Department and that the DEP review will not begin, and that processing of my planning module will be delayed, until a "PNDI Project Environmental Review Receipt" and all supporting documentation from jurisdiction agencies (when necessary) is/are received by DEP.

Applicant or Consultant Initials WLB

7. COMPREHENSIVE PLAN CONSISTENCY:

☒ A narrative and mapping to show that the proposed project is consistent with any comprehensive plan developed under the Pennsylvania Municipalities Planning Code (Act 247) is attached. Document that the proposed project is consistent with land use and all other requirements stated in the comprehensive plan.

8. COOPERATION WITH PA. HISTORICAL AND MUSEUM COMMISSION (PHMC):

☒ A copy of DEP's "Cultural Resource Notice" and map which were sent to the Commission and a copy of the Commission's response are attached. Note that the Commission may require archeological surveys if federal funds, including PENNVEST, will be used in the project. If PENNVEST funds are to be used, DEP cannot recommend the project to PENNVEST for consideration until any required surveys have been done and the project has been "cleared" by the Commission.

9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS:**

☐ A copy of the additional information is attached. If PENNVEST funding is to be sought for the project, address these additional items in terms of any project impacts and measures to avoid or mitigate same.

- Cost Effectiveness
- Air quality
- Floodplains
- Wild and scenic rivers
- Coastal zone management
- Socio-economic impacts
- Water supplies
- Other environmentally sensitive areas

J. ALTERNATIVE SEWAGE FACILITIES ANALYSIS (See Section J of instructions)

☒ An alternative sewage facilities analysis has been prepared as described in Section J of the instructions and is attached.

The applicant may choose to include additional information beyond that required by Section J of the instructions.

K. CHAPTER 94 CONSISTENCY DETERMINATION (See Section K of instructions)

☒ Projects that propose the use of existing municipal collection, conveyance or wastewater treatment facilities, or the construction of collection and conveyance facilities to be served by existing municipal wastewater treatment facilities must be consistent with the requirements of Chapter 94 of DEP's rules and regulations (relating to Municipal Wasteload Management). If more than one municipality or authority will be affected by the project, please obtain the information required in this section for each. Additional sheets may be attached for this purpose.

1. Project Flows 3025 gpd

2. Total Sewage Flows to Facilities

   a. Enter average and peak sewage flows for each proposed or existing facility as designed or permitted.

   b. Enter the present average and peak sewage flows for the critical sections of existing facilities.

   c. Enter the average and peak sewage flows projected for 5 years through the critical sections of existing facilities which includes existing, proposed, or future projects.

   To complete the table, refer to Section K of instructions.

	a. Design and/or Permitted Capacity (gpd)		b. Present Flows (gpd)		c. Projected Flows in 5 years (gpd)	
	Average	Peak	Average	Peak	Average	Peak
Collection	3025	7563	0	0	3025	7563
Conveyance	319000	797502	224460	561600	282210	705525
Treatment						

3. Collection and Conveyance Facilities

   The questions below are to be answered by the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities. These questions should be answered in coordination with the latest Chapter 94 annual report and the above table.

   This project proposes sewer extensions or tap-ins. Will these actions create a hydraulic overload within five years on any existing collection or conveyance facilities that are part of the system? ☐ Yes ☒ No

   a. If yes, this sewage facilities planning module will not be accepted for review by the municipality, delegated local agency and/or DEP until all inconsistencies with Chapter 94 are resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the module package.

b. If no, the sewer authority, municipality, or agency responsible for completing the Chapter 94 report for the collection and conveyance facilities must sign below to indicate that the collection and conveyance facilities have adequate capacity and are able to provide service to the proposed development in accordance with Chapter 94 requirements and that this proposal will not affect this status.

c. Collection System

Name of Agency, Authority, Municipality East Whiteland Township

Name of Responsible Agent John Neild

Agent Signature _____

K. CHAPTER 94 CONSISTENCY DETERMINATION (continued)

4. Treatment Facility

The questions below are to be answered by the facility permittee in coordination with the information in the table and the latest Chapter 94 report.

This project proposes the use of an existing wastewater treatment plant for the disposal of sewage. Will this action create a hydraulic or organic overload within 5 years at that facility? ☐ Yes ☐ No

a. If yes, this planning module for sewage facilities will not be reviewed by the municipality, delegated local agency and/or DEP until this inconsistency with Chapter 94 is resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the planning module.

b. If no, the treatment facility permittee must sign below to indicate that this facility has adequate treatment capacity and is able to provide wastewater treatment services for the proposed development in accordance with Chapter 94 requirements and that this proposal will not impact this status

c. Name of Agency, Authority, Municipality Valley Forge Sewer Authority

Name of Responsible Agent _____

Agent Signature _____

Date _____

L. INSTITUTIONAL EVALUATION (See Section L of instructions)

☒ An institutional evaluation is attached. Identify the entity which will design, obtain necessary permits, construct, own and operate the proposed facilities. If a low pressure vacuum or effluent sewer are proposed, discuss purchase, installation, operation and maintenance responsibilities for the individual pumping, valves, tanks, etc.

M. PROJECT COST AND FUNDING ANALYSIS (See Section M of instructions)

☒ A detailed cost estimate and present worth analysis for the project is attached. Provide a financing plan for the project, identifying the funding source(s) and identifying estimated tap fees and user rates. For projects proposing the use of PENNVEST funds, see Section I. 9. **ADDITIONAL REQUIREMENTS FOR PENNVEST PROJECTS**. Complete the following table:

Cost and Funding Information (Estimated)		
COST		
Construction cost	$	450000
Administrative, legal, engineering cost	$	67500
Total project cost	$	517500
Annual O/M cost	$	6000
FUNDING		
Tap-in fees ($ per EDU X no. EDUs)	$	44000
Proceeds from primary funding source	$	473500
Proceeds from other funding sources	$	0
USER COSTS		
Initial user base	11	EDUs
Monthly debt service per EDU	$	0
Monthly O/M cost per EDU	$	50
Total estimated monthly user cost per EDU	$	50

N. PROJECT IMPLEMENTATION SCHEDULE (See Section N of instructions)

☒ A project implementation schedule showing milestone dates for submission of DEP permit applications, initiation and completion of construction and any other milestones significant to this particular project is attached to this component

O. PUBLIC NOTIFICATION REQUIREMENT (See Section O of instructions)

☒ Attached is a copy of the public notice. All comments received as a result of the notice are attached.

☐ Municipal response to these comments is attached.

☒ No comments were received. A copy of the public notice is attached.

☐ P. ADDITIONAL CHAPTER 71 PLANNING ELEMENTS (See Section P of instructions)

a. Additional planning elements are required by DEP.

- _____
- _____
- _____
- _____
- _____

Q. PLANNING AGENCY REVIEW (See Section Q of instructions)

☒ Local Planning Commission comments or Component 4a are attached.

☒ County, Area, Or Region Planning Commission comments or Component 4b are attached.

☒ County or Joint County Health Department comments (if appropriate) or Component 4c are attached.

R. RESOLUTION OF ADOPTION (See Section R of instructions)

☒ An **original**, **signed**, and **sealed** Resolution of Adoption is attached.

4. Treatment Facility

The questions below are to be answered by the facility permittee in coordination with the information in the table and the latest Chapter 94 report.

This project proposes the use of an existing wastewater treatment plant for the disposal of sewage. Will this action create a hydraulic or organic overload within 5 years at that facility? ☐ Yes ☐ No

a. If yes, this planning module for sewage facilities will not be reviewed by the municipality, delegated local agency and/or DEP until this inconsistency with Chapter 94 is resolved or unless there is an approved plan and schedule granting an allocation for this project. A letter granting allocations to this project under the plan and schedule must be attached to the planning module.

b. If no, the treatment facility permittee must sign below to indicate that this facility has adequate treatment capacity and is able to provide wastewater treatment services for the proposed development in accordance with Chapter 94 requirements and that this proposal will not impact this status

Date 1/22/21

L. INSTITUTIONAL EVALUATION (See Section L of instructions)

☒ An institutional evaluation is attached. Identify the entity which will design, obtain necessary permits, construct, own and operate the proposed facilities. If a low pressure vacuum or effluent sewer are proposed, discuss purchase, installation, operation and maintenance responsibilities for the individual pumping, valves, tanks, etc.

William L Bohner
Arro Consulting

Re: Water Availability
Swedesford Rd properties between Bacton Hill and Rt 202
East Whiteland Twp, Chester County

In response to your request, this letter will serve as confirmation that the above referenced properties are situated within Aqua Pennsylvania Inc. service territory.

Domestic and fire water service is available and will be provided in accordance with Aqua Pennsylvania, Inc. Rules and Regulations. For further details, visit www.aquaamerica.com.

With regard to our capacity for domestic and fire service for this area, flow data information can be obtained upon written request to Lisa Thomas of our Control Center at LATHOMAS@AQUAAMERICA.COM. Include the address with town or township and the nearest intersecting street.

Should you have any further questions or need to request an application for service, contact me at (610) 541-4160 or dlciotti@aquaamerica.com.

Regards,

Deanna L. Ciotti
Special Services Coordinator-New Business Applications
Aqua Pennsylvania, Inc

COMPONENT 4B - COUNTY PLANNING AGENCY REVIEW
(or Planning Agency with Areawide Jurisdiction)

Note to Project Sponsor: To expedite the review of your proposal, one copy of your completed planning package and or copy of this ***Planning Agency Review Component*** should be sent to the existing county planning agency or planning agency with areawide jurisdiction for their comments.

SECTION A. PROJECT NAME (See Section A of instructions)

Project Name & Municipality Swedesford Road Low Pressure Sewer Extension, East Whiteland Township

SECTION B. REVIEW SCHEDULE (See Section B of instructions)

1. Date plan received by county planning agency. February 26, 2021
2. Date plan received by planning agency with areawide jurisdiction **N/A** Agency name **N/A**
3. Date review completed by agency April 19, 2021

SECTION C. AGENCY REVIEW (See Section C of instructions)

Yes	No		
[X]	[ ]	1.	Is there a county or areawide comprehensive plan adopted under the Municipalities Planning Code (53 P.S. 10101 *et seq.*)? **Landscapes3**, the Chester County Comprehensive Plan, was adopted in 2018. **Watersheds**, the Chester County Comprehensive Plan Integrated Water Resources Element, was adopted in 2002.
[X]	[ ]	2.	Is this proposal consistent with the comprehensive plan for land use? According to the Landscapes map adopted in 2018, the proposed subdivision/land development includes land designated as the Suburban Landscape. The vision for the Suburban Landscape is predominantly residential communities with locally-oriented commercial uses and facilities, accommodating growth at a medium density that retains a focus on residential neighborhoods, with enhancements in housing diversity and affordability. Both on-lot and public sewer systems are supported in this landscape.
[X]	[ ]	3.	Does this proposal meet the goals and objectives of the plan? If no, describe goals and objectives that are not met
[X]	[ ]	4.	Is this proposal consistent with the use, development, and protection of water resources? If no, describe inconsistency Landscapes3 Protect Objective A states: "Guide development away from sensitive natural resources and toward areas appropriate for accommodating growth." According to PA Code Title 25, Chapter 93, this proposal is located in a watershed or sub-watershed that has a stream use designated as Exceptional Value Waters, Valley Creek. These streams are given high priority when considering watershed protection measures. The applicant may need to conduct further coordination with DEP or other agencies in order to comply with the water quality standards set forth in this regulation.
[X]	[ ]	5.	Is this proposal consistent with the county or areawide comprehensive land use planning relative to Prime Agricultural Land Preservation? If no, describe inconsistencies:
[ ]	[X]	6.	Does this project propose encroachments, obstructions, or dams that will affect wetlands? If yes, describe impact:
[ ]	[ ]	7.	Will any known historical or archaeological resources be impacted by this project? **Not Known.** If yes, describe impacts
[ ]	[X]	8.	Will any known endangered or threatened species of plant or animal be impacted by the development project?
[ ]	[X]	9.	Is there a county or areawide zoning ordinance?
[ ]	[ ]	10.	Does this proposal meet the zoning requirements of the ordinance? **N/A**

Yes No SECTION C. AGENCY REVIEW (continued)

Yes	No		
☐	☐	11.	Have all applicable zoning approvals been obtained? **N/A**
☐	☒	12.	Is there a county or areawide subdivision and land development ordinance? **No**
☐	☐	13.	Does this proposal meet the requirements of the ordinance? **N/A** If no, describe which requirements are not met
☒	☐	14.	Is this proposal consistent with the municipal Act 537 Official Sewage Facilities Plan? If no, describe inconsistency
☐	☐	15.	Are there any wastewater disposal needs in the area adjacent to this proposal that should be considered by the municipality? **Not known** If yes, describe
☐	☐	16.	Has a waiver of the sewage facilities planning requirements been requested for the residual tract of this subdivision? If yes, is the proposed waiver consistent with applicable ordinances. **Not Known** If no, describe inconsistencies
☒	☐	17.	Does the county have a stormwater management plan as required by the Stormwater Management Act? If yes, will this project plan require the implementation of storm water management measures? According to our records, all municipalities have updated their stormwater management ordinances to be consistent with Chester County's PA DEP approved stormwater management (SWM) plan, dated July 2, 2013.
		18.	Name, Title and signature of person completing this section:

Name: Carrie J. Conwell
Title: Senior Environmental Planner Signature: Carrie J Conwell
Date: 4/19/2021
Name of County or Areawide Planning Agency: Chester County Planning Commission
Address: Government Services Center, Suite 270

Telephone Number: (610) 344-6285

SECTION D. ADDITIONAL COMMENTS (See Section D of instructions)

This submission ☒ does ☐ does not indicate that the Planning Module is consistent with Township planning. Please be advised that DEP may require additional information from the municipality and/or applicant to determine consistency with local planning and/or to show references to Act 537 planning and applicable municipal ordinances.

Per discussion with the project consultant, PA DEP has not assigned a Code # for this Component 3m.

PC53-04-21-16720

The county planning agency must complete this Component within 60 days.
This Component and any additional comments are to be returned to the applicant.

RESPONSE TO QUESTION(S) ASKED

Q1: Will this project or any project-related activities require any in-stream work, or a permanent or temporary crossing of a waterway (stream, river, creek, tributary)?
Your answer is: Yes

Q2: Accurately describe what is known about wetland presence in the project area or on the land parcel by selecting ONE of the following. "Project" includes all features of the project (including buildings, roads, utility lines, outfall and intake structures, wells, stormwater retention/detention basins, parking lots, driveways, lawns, etc.), as well as all associated impacts (e.g., temporary staging areas, work areas, temporary road crossings, areas subject to grading or clearing, etc.). Include all areas that will be permanently or temporarily affected -- either directly or indirectly -- by any type of disturbance (e.g., land clearing, grading, tree removal, flooding, etc.). Land parcel = the lot(s) on which some type of project(s) or activity(s) are proposed to occur.
Your answer is: Someone qualified to identify and delineate wetlands has investigated the site, and determined that NO wetlands are located in or within 300 feet of the project area. (A written report from the wetland specialist, and detailed project maps should document this.)

3. AGENCY COMMENTS

Regardless of whether a DEP permit is necessary for this proposed project, any potential impacts to threatened and endangered species and/or special concern species and resources must be resolved with the appropriate jurisdictional agency. In some cases, a permit or authorization from the jurisdictional agency may be needed if adverse impacts to these species and habitats cannot be avoided.

These agency determinations and responses are **valid for two years** (from the date of the review), and are based on the project information that was provided, including the exact project location; the project type, description, and features; and any responses to questions that were generated during this search. If any of the following change: 1) project location, 2) project size or configuration, 3) project type, or 4) responses to the questions that were asked during the online review, the results of this review are not valid, and the review must be searched again via the PNDI Environmental Review Tool and resubmitted to the jurisdictional agencies. The PNDI tool is a primary screening tool, and a desktop review may reveal more or fewer impacts than what is listed on this PNDI receipt. The jursidictional agencies **strongly advise against** conducting surveys for the species listed on the receipt prior to consultation with the agencies.

PA Game Commission
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Department of Conservation and Natural Resources
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Fish and Boat Commission
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

U.S. Fish and Wildlife Service
RESPONSE:
Avoidance Measure: Avoid in-stream impacts by spanning the waterway or going under it (e.g., via horizontal boring or directional drilling). If in-stream impacts cannot be avoided, carry out instream work -- including installation of permanent structures (e.g., pipelines, livestock crossings, riprap), or installation, use, and removal of temporary structures (e.g., temporary road crossings) -- between October 1 and March 31.

As the project proponent or applicant, I certify that I will implement the above Avoidance Measure:
_____(Signature)

SPECIAL NOTE: **If you agree to implement the above Avoidance Measure, no further coordination with this agency regarding threatened and endangered species and/or special concern species and resources is required.** If you are not able to comply with the Avoidance Measures, you are required to coordinate with this agency - please send project information to this agency for review (see "What to Send" section).

WHAT TO SEND TO JURISDICTIONAL AGENCIES

If project information was requested by one or more of the agencies above, upload* or email* the following information to the agency(s). Instructions for uploading project materials can be found here. This option provides the applicant with the convenience of sending project materials to a single location accessible to all three state agencies. Alternatively, applicants may email or mail their project materials (see AGENCY CONTACT INFORMATION).
***Note:** U.S.Fish and Wildlife Service requires applicants to mail project materials to the USFWS PA field office (see AGENCY CONTACT INFORMATION). USFWS will not accept project materials submitted electronically (by upload or email).

Check-list of Minimum Materials to be submitted:
____Project narrative with a description of the overall project, the work to be performed, current physical characteristics of the site and acreage to be impacted.
____A map with the project boundary and/or a basic site plan(particularly showing the relationship of the project to the physical features such as wetlands, streams, ponds, rock outcrops, etc.)
In addition to the materials listed above, USFWS REQUIRES the following
____**SIGNED** copy of a Final Project Environmental Review Receipt

The inclusion of the following information may expedite the review process.
____Color photos keyed to the basic site plan (i.e. showing on the site plan where and in what direction each photo was taken and the date of the photos)
____Information about the presence and location of wetlands in the project area, and how this was determined (e.g., by a qualified wetlands biologist), if wetlands are present in the project area, provide project plans showing the location of all project features, as well as wetlands and streams.

4. DEP INFORMATION

The Pa Department of Environmental Protection (DEP) requires that a signed copy of this receipt, along with any required documentation from jurisdictional agencies concerning resolution of potential impacts, be submitted with applications for permits requiring PNDI review. Two review options are available to permit applicants for handling PNDI coordination in conjunction with DEP's permit review process involving either T&E Species or species of special concern. Under sequential review, the permit applicant performs a PNDI screening and completes all coordination with the appropriate jurisdictional agencies prior to submitting the permit application. The applicant will include with its application, both a PNDI receipt and/or a clearance letter from the jurisdictional agency if the PNDI Receipt shows a Potential Impact to a species or the applicant chooses to obtain letters directly from the jurisdictional agencies. Under concurrent review, DEP, where feasible, will allow technical review of the permit to occur concurrently with the T&E species consultation with the jurisdictional agency. The applicant must still supply a copy of the PNDI Receipt with its permit application. The PNDI Receipt should also be submitted to the appropriate agency according to directions on the PNDI Receipt. The applicant and the jurisdictional agency will work together to resolve the potential impact(s). See the DEP PNDI policy at https://conservationexplorer.dcnr.pa.gov/content/resources.

5. ADDITIONAL INFORMATION

The PNDI environmental review website is a preliminary screening tool. There are often delays in updating species status classifications. Because the proposed status represents the best available information regarding the conservation status of the species, state jurisdictional agency staff give the proposed statuses at least the same consideration as the current legal status. If surveys or further information reveal that a threatened and endangered and/or special concern species and resources exist in your project area, contact the appropriate jurisdictional agency/agencies immediately to identify and resolve any impacts.

For a list of species known to occur in the county where your project is located, please see the species lists by county found on the PA Natural Heritage Program (PNHP) home page (www.naturalheritage.state.pa.us). Also note that the PNDI Environmental Review Tool only contains information about species occurrences that have actually been reported to the PNHP.

RE: Planebrook Road Area Sanitary Sewer Expansion
PA DEP Joint Permit – Small Projects Registration
East Whiteland Township, Chester County, PA
ARRO No.: 10310.36

Dear Reviewer,

ARRO Consulting, Inc. (ARRO) is submitting a Joint Permit – Small Project application package to the Pennsylvania Department of Environmental Protection (PA DEP) on behalf of East Whiteland Township, for the installation of new sanitary sewer systems in the Planebrook Road area in East Whiteland, Chester County, Pennsylvania. The area surrounding the proposed sanitary sewer systems installation comprises of roadway, residential properties containing maintained lawn, a number of small businesses and unnamed tributaries to Valley Creek, designated by the Pennsylvania Code Title 25, Chapter 93, as Exceptional Value–Migratory Fish (EV-MF).

Project Description:

The project involves extending public sanitary sewer service to existing properties in the area from existing sanitary manholes located on Planebrook Road and the Whiteland Village Interceptor, located just north of Swedesford Road.

The project scope involves installation of new gravity sanitary sewer services for properties along Planebrook Road (11 properties), Golf View Lane (13 properties), Bracken Avenue, Davis Avenue and Coffman Street (10 properties), and Prospect Avenue (19 properties), and low pressure sanitary sewer services for properties along Elk Drive (20 properties), Fairway Drive (11 properties) and Swedesford Road east and west of the Planebrook Road/Phoenixville Pike intersection (13 commercial/residential/vacant lots).

The discharge line of the gravity sewer (8" PVC pipe) in Golf View Lane and the low pressure sewer systems in Elk Drive, Fairway Drive and Swedesford Road (2" SDR11 HDPE pipe) will require crossing of tributaries of Valley Creek, designated as an exceptional value stream.

Wastewater will ultimately be collected and conveyed to the Whiteland Village Interceptor Extension which has the capacity to handle the proposed peak flow. From this interceptor, flow will be conveyed to the Mill Lane Pump Station. Wastewater will exit East Whiteland Township at the Matthews Road meter.

Enclosed are Project Review Form, Topographic Map, Natural Resources Map, Site Plans, site visit photographs, and a CRGIS Map.

Please complete a PHMC review for this project and provide us with your findings. Please do not hesitate to contact me should you have any questions or require any additional information.

Sincerely,
ARRO Consulting, Inc.

Name: Mikah Schlesinger | Phone: 610-999-6150

Company: ARRO Consulting, Inc. | Fax:

Street/PO Box: 1450 E. Boot Road, Building 100-B | Email: mikah.schlesinger@arroconsulting.com

City/State/Zip: West Chester | PA | 19380

SECTION C: PROJECT DESCRIPTION

This project is located on: (check all that apply) ☐ Federal property ☐ State property ☑ Municipal property ☐ Private property

List all federal and state agencies and programs providing funds, permits, licenses.

Agency Type	Agency/Program/Permit Name	Project/Permit/Tracking Number (if applicable)

Proposed Work – Attach project description, scope of work, site plans, and/or drawings

Project includes (check all that apply): ☑ Construction ☐ Demolition ☐ Rehabilitation ☐ Disposition

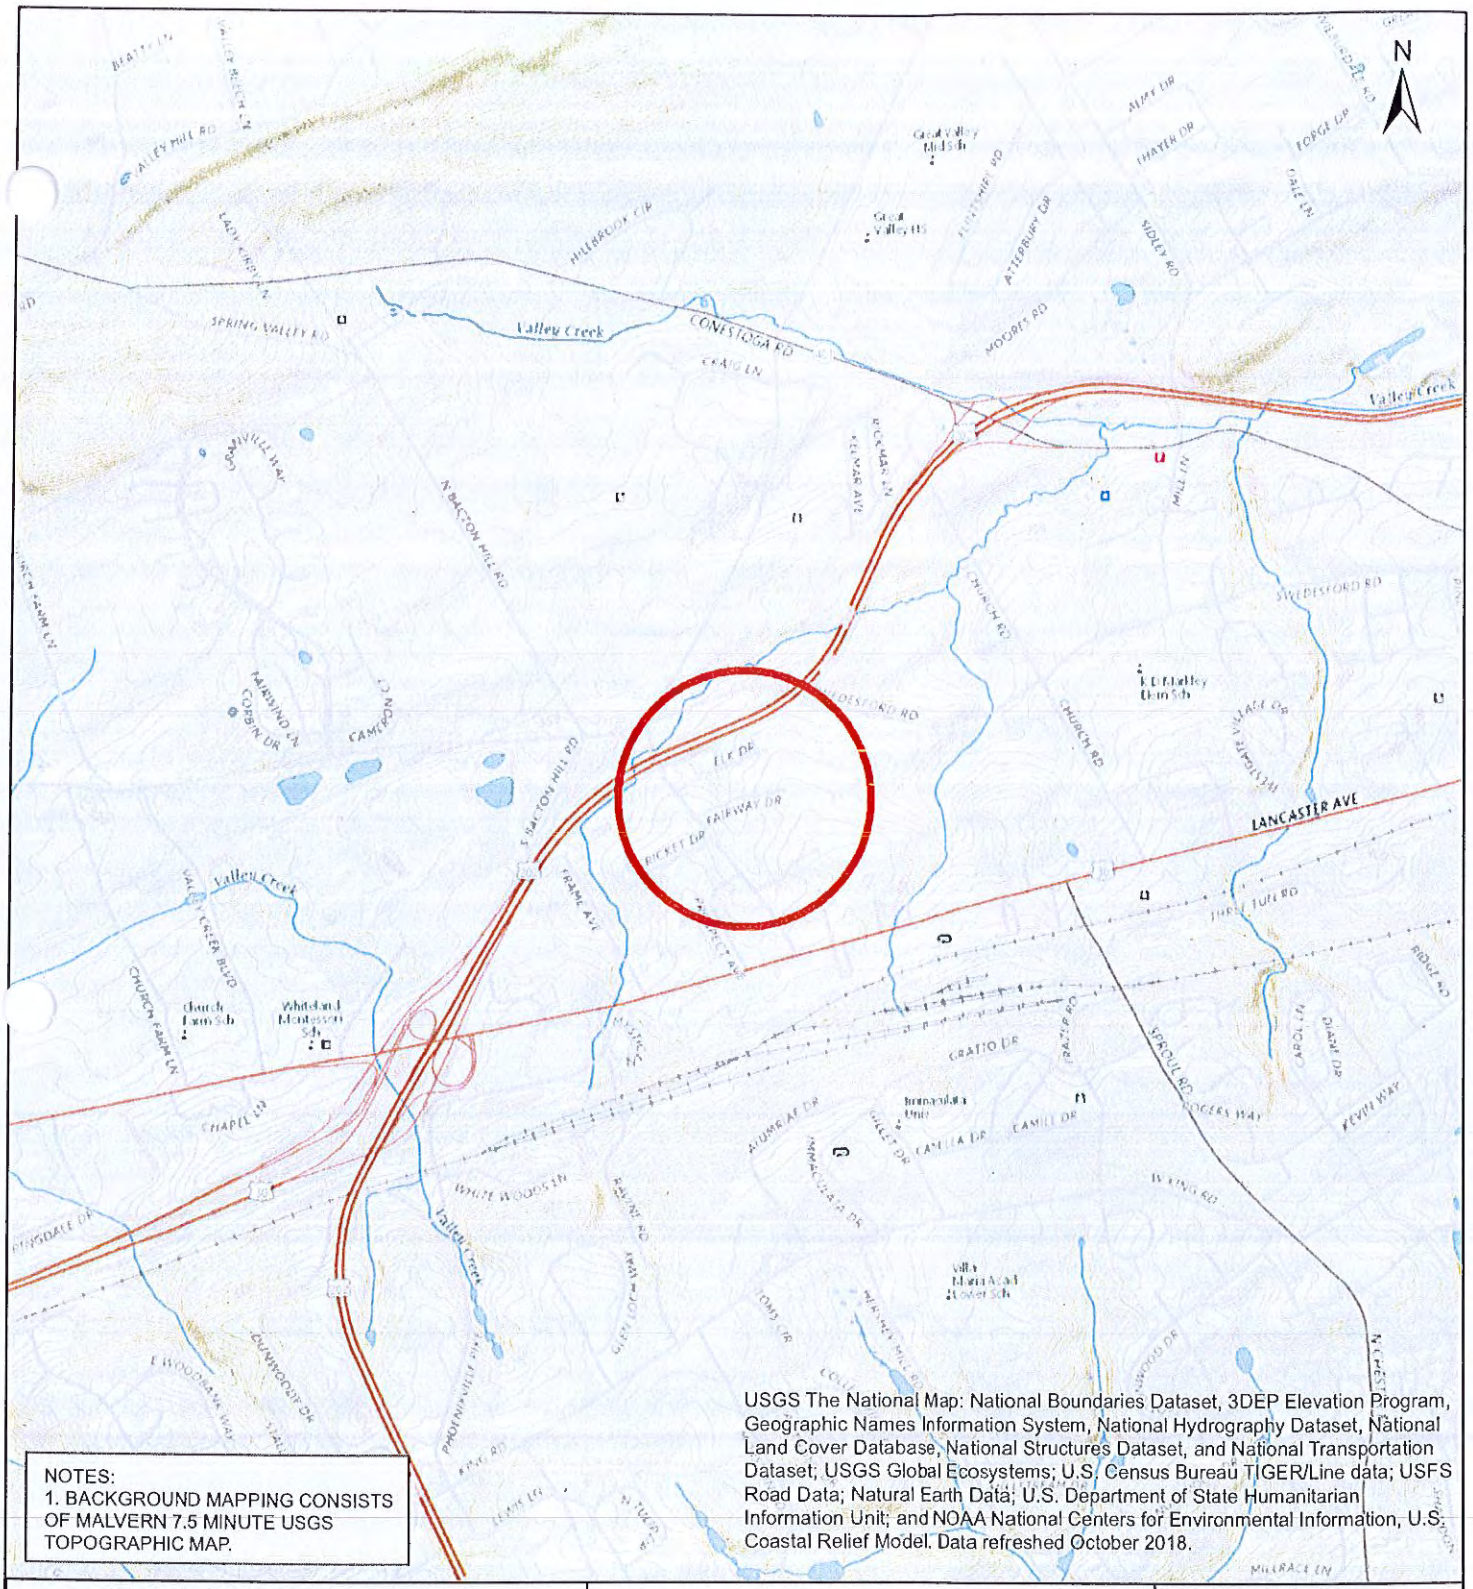
Total acres of project area: 1.5 | Total acres of earth disturbance: 1.5

Are there any buildings or structures within the project area? (•) Yes ( ) No | Approximate age of buildings: 30-40 years

Does this project involve properties listed in or eligible for the National Register of Historic Places, or designated as historic by a local government?	Yes	No	Unsure	Name of historic property or historic districts
	( )	(•)	( )	

Please print and mail completed form and all attachments to:

PHMC
State Historic Preservation Office
400 North St.
Commonwealth Keystone Building, 2nd Floor
Harrisburg, PA 17120-0093



Attachments – Please include the following information with this form

- ☑ **Map** – 7.5' USGS quad showing project boundary and Area of Potential Effect
- ☑ **Description/Scope** – Describe the project, including any ground disturbance and previous land use
- ☑ **Site Plans/Drawings** – Indicate past and present land use, location and dates of buildings, and proposed improvements
- ☑ **Photographs** – Attach prints or digital photographs showing the project site, including images of all buildings and structures keyed to a site plan

SHPO DETERMINATION (SHPO USE ONLY)

- ☐ There are **NO HISTORIC PROPERTIES** in the Area of Potential Effect
- ☐ The project will have **NO EFFECT** on historic properties
- ☐ The project will have **NO ADVERSE EFFECTS** on historic properties:
- ☐ The project will have **NO ADVERSE EFFECTS WITH CONDITIONS** (see attached)
- ☐ **SHPO REQUESTS ADDITIONAL INFORMATION** (see attached)

PROJECT REVIEW FORM

Request to Initiate SHPO Consultation on State and Federal Undertakings

SHPO USE ONLY	Reviewers: MS ED
DATE RECEIVED: 3/2/20	DATE DUE: 3/31/20
ER NUMBER: 2016-1123-029-D	HRSF:

REV: 06/2018

SECTION A: PROJECT NAME & LOCATION

Is this a new submittal? (●) YES ( ) NO OR ( ) This is additional information for ER Number:

Project Name: Planebrook Road Area Sanitary Sewer Expansior | County: Chester | Municipality: East Whiteland Townhip

Project Address: Planebrook Road | City/State/ Zip: Malvern | PA | 19355

SECTION B: CONTACT INFORMATION & MAILING ADDRESS

Name: Mikah Schlesinger | Phone: 610-999-6150

Company: ARRO Consulting, Inc. | Fax:

Street/PO Box: 1450 E. Boot Road, Building 100-B | Email: mikah.schlesinger@arroconsulting.com

City/State/Zip: West Chester | PA | 19380

SECTION C: PROJECT DESCRIPTION

This project is located on: (check all that apply) ☐ Federal property ☐ State property ☑ Municipal property ☐ Private property

List all federal and state agencies and programs providing funds, permits, licenses.	Agency Type	Agency/Program/Permit Name	Project/Permit/Tracking Number (if applicable)

Proposed Work – Attach project description, scope of work, site plans, and/or drawings

Project includes (check all that apply): ☑ Construction ☐ Demolition ☐ Rehabilitation ☐ Disposition

Total acres of project area: 1.5 | Total acres of earth disturbance: 1.5

Are there any buildings or structures within the project area? (●) Yes ( ) No | Approximate age of buildings: 30-40 years

Does this project involve properties listed in or eligible for the National Register of Historic Places, or designated as historic by a local government?	Yes	No	Unsure	Name of historic property or historic districts
	( )	(●)	( )	

Please print and mail completed form and all attachments to:

PHMC
State Historic Preservation Office
400 North St.
Commonwealth Keystone Building, 2nd Floor
Harrisburg, PA 17120-0093

Attachments – Please include the following information with this form

- ☑ **Map** – 7.5' USGS quad showing project boundary and Area of Potential Effect
- ☑ **Description/Scope** – Describe the project, including any ground disturbance and previous land use
- ☑ **Site Plans/Drawings** – Indicate past and present land use, location and dates of buildings, and proposed improvements
- ☑ **Photographs** – Attach prints or digital photographs showing the project site, including images of all buildings and structures keyed to a site plan

SHPO DETERMINATION (SHPO USE ONLY)

- ☐ There are **NO HISTORIC PROPERTIES** in the Area of Potential Effect
- ☒ The project will have **NO EFFECT** on historic properties
- ☐ The project will have **NO ADVERSE EFFECTS** on historic properties:
- ☐ The project will have **NO ADVERSE EFFECTS WITH CONDITIONS** (see attached)
- ☐ **SHPO REQUESTS ADDITIONAL INFORMATION** (see attached)

Stormwater Management Narrative

Stormwater Management Impacts

County Stormwater Management Plan

The Chester County Planning Commission currently has a stormwater management plan in place. Most of East Whiteland Township (and all of the planning area for this 537 Plan) is situated in Valley Creek Watershed. The "Valley Creek Watershed Stormwater Management Plan" was approved by PADEP February 2011.

It should be noted that an Act 167 Plan is not a land use plan. Runoff controls developed in the plan are not based upon controlling the location, type, density or rate of development throughout the watersheds. The stormwater runoff performance standards are based on the assumptions that development will occur throughout the watersheds. The plan is designed to provide for new development yet control the associated storm runoff impacts. The most important aspect of an Act 167 (Stormwater Management) Plan is that it establishes a process for decision making...the peak flows and timing relationships provide for development for a runoff control philosophy geared toward minimizing the storm runoff impacts of new development."

This particular stormwater management plan addresses the impacts of stormwater quality and quantity on groundwater and surface water resources, geomorphology, and aquatic habitat of the Valley Creek watershed.

The reason for preparing this Plan is to satisfy the requirements of the Pennsylvania Stormwater Management Act, Act 167 of 1978, and to establish scientifically-based stormwater management implementation strategies that restore and protect the water resources and maintain safe and productive communities.

From a consistency perspective, it appears that the plan to provide public sewer service to the Swedesford Road Area (to be served by low-pressure sewers) is consistent with the stormwater management plan.

The stormwater ordinance does not regulate the development. It simply regulates how the stormwater will be managed. As a consequence, prior to construction of this project, the appropriate stormwater and E&S measures will be taken. An E&S plan has been submitted to the Chester County Conservation District for review and approval.

Exhibit N

Comprehensive Plan Consistency

Comprehensive Plans

The Chester County Planning Commission (CCPC) Comprehensive Plan, entitled "Landscapes3," was adopted in November of 2018. The altematives to provide public sanitary sewer service to accommodate needs areas in the planning area is consistent with the implementation strategy, policies and goals of the current Landscapes3 as shown in the Utilities and Infrastructure section of the plan.

East Whiteland Township adopted their Comprehensive Plan in July 2016. This plan emphasizes the importance of public utilities to Township infrastructure. The Swedesford Road Area is identified in this comprehensive plan as a future public sewer service area.

This Component 3m is consistent with the objectives set forth in Watersheds as well as the Township's Comprehensive Plan.

Exhibit O

Alternative Analysis

Alternative Analysis

This Act 537 Planning Module (Component 3m) has been prepared for East Whiteland Township (Township) at the request of the Pennsylvania Department of Environmental Protection (PA DEP) in accordance with Act 537 entitled the Pennsylvania Sewage Facilities Act, Title 25, Chapter 71 of the Pennsylvania Code and the Pennsylvania Department of Environmental Protection Act 537 Plan Content and Environmental Assessment Checklist. This planning module addresses the planning requirements necessary for the Township to provide public sanitary sewer service to existing developed properties.

For this planning module, the following pertinent information applies:

1. **Project Name:** Low-pressure Sanitary Sewer Service Extension.
2. **Project Description**:

    - Extend public low-pressure sanitary sewer service from a sanitary manhole to be located on Swedesford Road (just east of the intersection with North Bacton Hill Road) to existing properties located along Swedesford Road, east and west of its intersection with Planebrook Road.

3. **Applicant Name**: East Whiteland Township
4. **Applicant Contact**: John Neild; 209 Conestoga Road, Frazer, PA 19355
5. **Site Location**: Swedesford Road Area
6. **Municipality/County**: East Whiteland Township/Chester County

The primary focus of the planning module is to establish the means and methods for providing public sewer service to existing properties along Swedesford Road, immediately east and west of its intersection with Planebrook Road.

Flow projections identified in the planning module show the ultimate wastewater flow of 3,025 gpd, which encompasses 11 equivalent dwelling units.

In considering alternatives for this project, there are two primary alternatives:

1. Do nothing and continue to utilize the existing on-lot disposal systems.

2. Provide public sewer service (via a low-pressure sewer extension) to the identified properties.

To provide this type of service, a connection will need to be made at a new sanitary manhole located just east of the intersection of Swedesford Road and North Bacton Hill Road. All work shall be within the roadway and existing public right-of-way.

Wastewater will ultimately be collected and conveyed to the Whiteland Village Interceptor Extension which has the capacity to handle the proposed peak flow. From this interceptor, flow will be conveyed to the Mill Lane Pump Station. Wastewater will exit East Whiteland Township at the Matthews Road meter.

The extension of the low-pressure sewer was chosen over the no action alternative. This area was previously defined and approved as a public sewer service area in approved Act 537 Planning in 2011. To accommodate the public sewer needs for the above referenced parcels, low pressure sewer is necessary.

Exhibit P

Institutional Evaluation

Institutional Evaluation

For the proposed low-pressure sewer extension, the East Whiteland Township will prepare the design. In addition, the Township will obtain all of the necessary permits and pay for the construction of the sewer extension.

The individual property owners shall be responsible for contracting with a plumber and installing their own lateral to connect to the sewer main.

The Township will purchase and supply grinder pumps to each property owner that will need one. The Township will not keep any spare grinder pump systems on-hand in the event of a failure.

Property owners will receive their pump system, they will have their plumber install and connect to the lateral at the right of way line. Operation and maintenance will be the responsibility of the property owner.

Project Narrative

Project Narrative

This Act 537 Planning Module (Component 3m) has been prepared for East Whiteland Township (Township) at the request of the Pennsylvania Department of Environmental Protection (PA DEP) in accordance with Act 537 entitled the Pennsylvania Sewage Facilities Act, Title 25, Chapter 71 of the Pennsylvania Code and the Pennsylvania Department of Environmental Protection Act 537 Plan Content and Environmental Assessment Checklist. This planning module addresses the planning requirements necessary for the Township to provide public sanitary sewer service to existing developed properties.

For this planning module, the following pertinent information applies:

1. **Project Name:** Low-pressure Sanitary Sewer Service Extension.
2. **Project Description**:
    - Extend public low-pressure sanitary sewer service from a sanitary manhole to be located on Swedesford Road (just east of the intersection with North Bacton Hill Road) to existing properties located along Swedesford Road, east and west of its intersection with Planebrook Road.
3. **Applicant Name**: East Whiteland Township
4. **Applicant Contact**: John Neild; 209 Conestoga Road, Frazer, PA 19355
5. **Site Location**: Swedesford Road Area
6. **Municipality/County**: East Whiteland Township/Chester County

The primary focus of the planning module is to establish the means and methods for providing public sewer service to existing properties along Swedesford Road, immediately east and west of its intersection with Planebrook Road.

Flow projections identified in the planning module show the ultimate wastewater flow of 3,025 gpd, which encompasses 11 equivalent dwelling units.

In considering alternatives for this project, there are two primary alternatives:

1. Do nothing and continue to utilize the existing on-lot disposal systems.
2. Provide public sewer service to the identified properties.

To provide this type of service, a connection will need to be made at a new sanitary manhole located just east of the intersection of Swedesford Road and North Bacton Hill Road. All work shall be within the roadway and existing public right-of-way.

Wastewater will ultimately be collected and conveyed to the Whiteland Village Interceptor Extension which has the capacity to handle the proposed peak flow. From this interceptor, flow will be conveyed to the Mill Lane Pump Station. Wastewater will exit East Whiteland Township at the Matthews Road meter.

Please refer to the enclosed plan sheet that identifies the area to be served. The parcels in the planning area are located in the residential zoning districts with some parcels in the Village Mixed Use district. The Q in some of the parcel numbers refers to 'Village Mixed Use'.

Currently, 11 parcels are to be served. There is collection and conveyance capacity for the planned flow of 3,025 gpd (based on 275 gpd/EDU). Affected parcels are in the blue box below.

A. PLAN SUMMARY

This Regional Act 537 Plan presents the basis for establishing and implementing the long-term wastewater treatment needs for the areas served by the Valley Forge Authority (VFSA). The VFSA is comprised of the Townships of Schuylkill, East Pikeland and Charlestown and provides wastewater treatment services to Easttown, East Whiteland, Tredyffrin and Willistown Townships and Malvern Borough. Herein, this group of eight (8) Municipalities is referred to as the Service Area Municipalities. The Pennsylvania Department of Environmental Protection (PADEP) approved a two-part process whereby the individual municipalities would assess service area needs and determine wastewater flow projections. Once approved by the municipalities and the PADEP, this information would be used by the VFSA to perform an alternative analysis and select an alternative for serving the long-term needs of the communities in their service area. The goal of the process was to best meet the needs of the communities while addressing the PADEP rules and regulations along with local issues. The VFSA has been actively addressing the many and varied issues of this process since the mid 1990's.

In 1993 the VFSA determined that wet weather flows revealed a potential hydraulic overload of the plant by 1995. The PADEP required the VFSA to adopt a management plan to "ration" EDUs to the municipalities. The PADEP also required the initiation of the regional planning process to address the future wastewater treatment needs of the VFSA service area.

The preparation of the Regional Plan began in 1994. The VFSA retained a consultant to compile the information prepared by the communities and address the long term conveyance and treatment needs of the region. Sections 1 through 3 of this Plan were based on information that originally was prepared in 1993 and earlier by Gannett Fleming, Inc. Due to the nature of the regional planning process, it has taken to the year 2006 to complete the process, which is elaborated in Section 5 authored by the VFSA staff and their engineer of record, Buchart Horn, Inc. (B-H). Obviously population projections made in 1993 are now actual numbers and differ, some less some more, from the original projections. In order to keep this plan as current as possible, the sections dealing with wastewater flows and loadings have utilized up-to-date flow projection information from the individual municipalities which can be seen in Table 4-8 and

Appendix H. Sections 5 through 8 reflect those numbers. The PADEP recognizes the issues associated with having to redo the first portion of the Plan and has indicated that as long as the flow projection data is as current as possible, no revision to the first four (4) sections is required. For clarity, minor updates have been interjected into the first three (3) sections, and Section 4 has been updated based on the latest growth estimates in each community served. In these instances, dates of pertinent data are included so that the update is apparent.

Associated Planning

Wastewater from portions or all of Charlestown, Easttown, East Whiteland, Tredyffrin, and Willistown Townships and Malvern Borough is transported through the Valley Creek Trunk Sewer (VCTS), which is owned and operated by Tredyffrin Township, to the VFSA wastewater treatment plant. Tredyffrin Township is conducting Act 537 planning for the VCTS and the Wilson Road Pumping Station, which is a critical component of the VCTS, to determine if the conveyance facilities have adequate capacity to convey the projected wastewater flows to the VFSA wastewater treatment plant.

With the exception of the Wilson Road Pumping Station, the VCTS has adequate capacity to convey the projected wastewater flows for the next five years. The capacity of the Wilson Road Pumping Station, however, will need to be expanded within the next 5 or 6 years. Act 537 planning for the Wilson Road Pumping Station and VCTS is nearing completion and is expected to be approved in March 2007.

Various alternatives were considered for increasing the capacity of the Wilson Road Pumping Station, including installing larger pump impellers, installing larger pump impellers and motors, installing a fourth pump and motor, peak flow storage and off-peak pumping of excess flows, locating and removing excessive infiltration/inflow, and no action. The recommended alternative is to install larger pump impellers and motors. The changes will increase pumping station capacity to 20.16 mgd (peak flow rate), which will be sufficient to meet the wastewater conveyance needs of the municipalities through the year 2025. The increased pumping station capacity matches the current capacity of the Wilson Road Pumping Station force main.

B. Sewage Treatment Plant Expansion Alternatives

Three (3) main alternatives and nine (9) subalternatives were identified as viable options or interim options to satisfy the wastewater management needs established by the Service Area Municipalities. The following alternatives were considered for treatment and discharge of a portion or all on the additional projected wastewater flow from the VFSA member municipalities.

1. Divert flow to other existing treatment facilities.

1A. Divert French Creek Pump Station discharge to Phoenixville.

1B. Divert Pickering Creek Pump Station discharge to Phoenixville.

2. Construct satellite wastewater treatment facilities.

2A. Locate a satellite plant at Cromby and divert French Creek Pump Station discharge.

2B. Locate a satellite plant at French Creek Pump Station and divert effluent to Cromby outfall.

3. Upgrade/expand the existing wastewater treatment facilities.

3A. Upgrade existing plant with step feed, primary chemical feed and UV disinfection.

3B. Same as alternative 3A but add a 4th final clarifier.

3C. Same as alternative 3E but add a 3rd primary clarifier.

3D. Innovative alternatives

3E. Same as alternative 3B but add a 3rd aeration tank.

These alternatives can be implemented individually or in combination to meet the wastewater treatment needs of the study area. Section 5 provides descriptions and preliminary analyses of each of the nine (9) subalternatives identified.

The selected alternative from Section 5 is 3E (Expand the existing wastewater treatment plant by upgrade it with complete mix, activated sludge, UV disinfection, adding a 3rd aeration tank, and a

4th final clarifier). A PADEP approved screening process of the alternatives was utilized for evaluation. The reasons for elimination of the other alternatives are presented in Section 5.

Cost of Implementation

Table 6-4 includes a present worth evaluation of the forward flow portions of the alternatives considered. Conceptual level capital costs based on 2006 dollars for upgrading capacity for treating forward flow, sludge processing, and plant improvements are $10.35 million, $3.62 million, and $6.91 million, respectively. Capital expenditures for expansion and improvements identified in this Plan will be shared by the Partners on a flow based cost allocation. The Partners will provide funds for the pending project from funds on hand or through loans or bond issues.

C. Project Implementation Schedule

Table E-1. Implementation Schedule

Date	Task
November 2006	VFSA Approval (November Board Meeting)
December 2006	Submit 537 Plan to Municipalities and County Planning Agencies and Health Department
February 2006	Public Advertisement of Plan
March 2007	Approval obtained from all Agencies
May 2007	VFSA Adopts
July 2007	Submit to PADEP
October 2007	PADEP approval
January 2008	Design Contract
December 2008	Complete Design
April 2008	Obtain Permits
August 2009	Award Contract
September 2009	Begin Construction
December 2010	Begin Operations

The VFSA is committed and has the organizational structure in place to implement this project. The individual municipalities have expressed their desire to finalize this planning document, adopt, and implement the selected alternatives.

D. Original, signed sealed Resolution of Adoption by Municipalities

The partner and member municipalities were provided the opportunity to review and adopt the recommendations of this Plan Update. Appendix K provides copies of each municipal Resolution of Plan Adoption.

E. Comments from the various planning agencies

The VFSA has submitted this plan and requested comments from the various municipal and county planning agencies. Correspondence documenting plan submission and responses are provided in Appendix I of this Plan Update.

F. Proof of Public Notice and results of 30 day written comment period

On XX/XX/XXXX the recommendations of this Plan Update are to be listed in The Phoenix. Proof of this publication, which also established a 30 day written public comment period is provided in Appendix J of this Plan Update. Any written comments received as a result of the publication of the Plan Update will be addressed and included in Appendix J.

G. Resolution of Inconsistencies

As documented in Section 6 of this report, the recommendations of this Plan Update are basically consistent with the environmental regulations associated with wastewater disposal and plan development.

A. Introduction and Planning Objectives

History

The Valley Forge Sewer Authority (VFSA) was organized in the late 1960s by the Townships of Schuylkill, East Pikeland, and Charlestown in Chester County, Pennsylvania for the purposes of acquiring, constructing, maintaining, owning or leasing sewer systems and sewage treatment works. On November 1, 1970 VFSA entered into an agreement to provide wastewater treatment services to the following municipalities in Eastern Chester County: Easttown Township, East Whiteland Township, Malvern Borough, Tredyffrin Township and Willistown Township (Valley Creek Trunk Sewer (VCTS) Municipalities). The VFSA and each VCTS Municipality has a specific reserved capacity at the Valley Forge Sewage Treatment Plant (STP), located in Schuylkill Township. The initial reserve capacities were established in the Valley Forge STP Agreement of 1970. The VCTS Municipalities and the municipalities comprising the VFSA are hereafter defined and referred to as the Service Area Municipalities.

The Valley Forge STP is the largest wastewater treatment plant in terms of treatment capacity in Chester County. The plant was constructed in 1977 to meet a projected design year (1985) capacity requirement of 8.0 million gallons per day (MGD). The construction of the treatment plant and collection and conveyance systems resulted in cleaning up the surface water and groundwater in the region by collecting domestic wastes from malfunctioning and failing on-lot sewage disposal systems. The wastewater facilities were designed to correct this situation first in the areas where the problems were most severe, and then to eliminate the existing and potential water quality problems in other areas within the Service Area Municipalities. These facilities were also intended to eliminate severe odors, which had been arising from saturated leach fields and cesspools. The construction of public sewers substantially mitigated these problems in the Service Area Municipalities.

Through the mid 1980s, the Valley Forge STP's average daily flows remained below its maximum treatment capacity. The original design flow was not realized in 1985 due to a general regional slow down in development in the early 1980's, but as development within the Service Area Municipalities increased during the later part of the 1980's, the VFSA recognized the importance of initiating a regional planning process to examine future wastewater needs.

The Regional Planning Process

In October 1987, a two-part regional planning process was developed and agreed upon by the Service Area Municipalities. In the first part of the planning process, the Service Area Municipalities were asked to prepare individual Act 537 Sewage Facilities Plans for the purpose of providing the VFSA and the Pennsylvania Department of Environmental Protection (PADEP) with information concerning development potential, proposed expansions to the service area boundaries, and other documentation related to the development of wastewater flow projections. The intent was to allow each individual Service Area Municipality to evaluate its development potential and determine its wastewater needs and priorities within the Act 537 framework. One of the VFSA's policies is that it will not, on its own, initiate extension of the service area boundaries; each municipality must initiate any service area revisions.

In the second part of the process, the information prepared by the Service Area Municipalities would be used by the VFSA to prepare a regional wastewater facilities plan which in turn, would be adopted by each Service Area Municipality. PADEP approved this two part plan in a letter dated May 31, 1988. The municipalities also approved this approach through a series of documents, copies of which are included in Appendix A. From 1987 to the present, each of the Service Area Municipalities prepared Act 537 plans, and they have either initiated the approval process within their own municipality, or have submitted plans to the PADEP for approval. The status of the Service Area Municipalities' plans at is summarized in Table 1-1.

Table 1-1. Status of Municipal Act 537 Plans Valley Forge Sewer Authority Partner Municipalities

Municipality	Plan Reviewed	Municipal Adoption	DEP Status	Comments
Charlestown Township	4/1989	6/05/1989	Approved 6/17/2002	Plan indicates that no additional capacity needed based on projected development until 1999.
Easttown Township	3/07/88, rev. to 9/92	7/06/1992 last approval	Approved 3/13/2000	Agreement with Tredyffrin for transmission of 1.484 MGD through Valley Creek Trunk Sewer (VCTS).
East Pikeland Township	8/26/1991	1/1991	Submitted 12/2/1991 – conditionally approved 12/9/1994	Plan does not clearly indicate how flow projections were estimated.
East Whiteland Township	8/12/91	No	Approved 11/27/2002	Township plans to obtain further capacity when VFSA increases treatment capacity at plant.
Malvern Township	11/1993	11/16/1993	Approved 5/12/1995	Borough plans to sell 85,000 gpd of its reserved capacity to Easttown Township.
Schuykill Township	10/1994	Yes	Approved 1996	DEP granted conditional approval in 1996 because of the incomplete regional plan.
Tredyffrin Township	5/1993	12/13/1993	Approved 12/12/1994	Township maintains agreements with Easttown, E. Whiteland, and Malvern for use of VCTS.
Willistown Township	7/03/1990 rev. to 2/06/1991	5/1991	Approved 3/28/2000	Plan notes that Township has elected to purchase an additional allocation of 200,000 gpd to provide buffer against any changes in land use policy.

In the spring of 1993, the VFSA reviewed the flow projections provided by the Service Area Municipalities in the 1992 Chapter 94 Report and determined they did not portray a realistic projection of wet weather flows. Average daily flows exceeded 8.0 MGD (the then current capacity) during early 1993. On September 22, 1993, the VFSA provided revised hydraulic loading projections to PADEP. These projections indicated a potential hydraulic overload by 1995. In response to the revised projections, PADEP acknowledged the projected overload and directed the VFSA to follow a planning module processing procedure based upon individual Service Area Municipalities' EDU commitment lists, first developed in 1991. PADEP also directed the VFSA to submit a schedule for the preparation and implementation of the regional Act 537 Plan. The schedule was submitted in December 1993, and the VFSA initiated the second part of the regional planning process.

The VFSA continues to monitor the remaining STP capacity, and work with the Service Area Municipalities to encourage infiltration/inflow (I/I) reduction. The I/I reduction effort has been successful and is having a tangible positive effect upon the VFSA system. This is especially true in Easttown where the projected capacity requirements have been reduced down to their original reserve capacity of about 1.5 mgd. The planning module procedure plan approved by the Service Area Municipalities and required by PADEP continued until the STP was rerated to 9.2 MGD in 2000. Since the rerate, new planning modules have been processed on a first come, first serve basis and are incorporated into each municipalities current Chapter 94 Report.

Planning Objectives

In accordance with the approved plan of study, this Act 537 Regional Plan is being prepared to meet the following objectives:

1. Identify wastewater planning related to the VFSA that has been previously undertaken or is planned.
2. Address future treatment plant capacity requirements for the VFSA Service Area Municipalities.
3. Analyze the existing conveyance system owned and operated by the VFSA to identify available capacity and problem areas in the system.

4. Gather and analyze data supporting wastewater flow projections to the VFSA system for short and long-term planning horizons, prepared by the municipalities.
5. Identify future public sewer service areas in the overall region, based on Service Area Municipalities' Act 537 plans.
6. Analyze alternatives for additional VFSA conveyance facilities and VFSA wastewater treatment facilities.
7. Evaluate the feasibility of implementing alternative treatment and disposal methods.
8. Recommend a plan and its implementation schedule.

The VFSA was selected by the municipalities as the lead agency to develop the regional plan, and after PADEP approval, implement it. The intent of the regional planning process is to produce a regionally approved and viable document, which supersedes previous wastewater planning, documents and provides a tool for wastewater facilities management. Toward this end, the Authority has made every effort to address the comments, suggestions, and concerns of the Service Area Municipalities, as well as the numerous parties, agencies and groups who have expressed an interest in this process.

Additionally the VFSA is coordinating their planning efforts with the Service Area Municipalities involved with the Valley Creek Trunk Sewer System.

B. Identify and summarize all existing wastewater planning and management activities previously undertaken and determine consistency status.

Existing Wastewater Planning Documents

- **Master Sewer Plan, Revised Edition 1970, for Chester County, Pennsylvania**
  The Chester County Master Sewer Plan, 1970 revised edition, was prepared by Roy F. Weston Engineers. It was originally published in 1968 and was revised, in part, to address the planning of a regional system to serve Tredyffrin, Easttown, Willistown, and East Whiteland Townships and Malvern Borough.

The alternative proposed was the construction of a new wastewater treatment plant in Upper Merion Township, Montgomery County, PA. It was estimated that the proposed regional wastewater treatment plant would receive a flow of 3.53 MGD by 1978 and 5.97 MGD by 1988.

Due to the relatively great distance of three (3) of the western most municipalities (East Whiteland Township, Willistown Township and Malvern Borough) from the proposed regional plant, an alternative plan was suggested. The alternative proposed that Tredyffrin and Easttown Townships follow the regional plan and have Willistown, East Whiteland, and Malvern share a joint plant on Little Valley Creek. An additional alternative proposed for Easttown Township involved conveying sewage to the Radnor-Haverford-Marple Authority facilities.

As stated previously in this report, the VFSA was organized in the late 1960's by the Townships of Schuylkill, East Pikeland, and Charlestown and on November 1, 1970 VFSA entered into an agreement to provide wastewater treatment services to the communities of Easttown Township, East Whiteland Township, Malvern Borough, Tredyffrin Township, and Willistown Township. All of these Service Area Municipalities have portions of their township served by the Valley Forge STP, which was constructed in 1977.

- **Final Environmental Impact Statement (EIS), Valley Forge Area Wastewater Treatment Facility, Chester County, Pennsylvania (September, 1974)**

  An Environmental Impact Statement was prepared for the Valley Forge STP in September 1974 by the United States Environmental Protection Agency (USEPA), Region Three. The purpose of the EIS was to give meaningful consideration to the environmental issues involved in the project, rather than dictate the ultimate solution to water quality management for the area. The EIS examined the relationship of the proposed treatment plant to land use plans, policies and controls of the affected area. The report presents population and growth assumptions used to support the project and to determine secondary population and growth impacts resulting from the proposed action

and its alternatives. The EIS also addresses how the project would conform or conflict with the objectives of approved or proposed Federal, state and local land use plans, policies and controls, and the positive and negative impacts of the project on the environment.

As a result of the analysis of all possible alternatives, including environmental effects, costs, and risks of each such alternative, the EPA concluded that the most appropriate alternative was an 8 MGD wastewater treatment plant utilizing a completely mixed activated sludge process with the processed sludge to be landfilled. The report further concluded that the proposed systems would alleviate existing health hazards, prevent surface and subsurface water contamination, and with adequate planning of land use and the publicly owned treatment facilities, provide ways to prevent urban sprawl and insure orderly future growth.

- **Individual Act 537 Sewage Facilities Plans - Summary of VFSA Participation Information**

  The following are excerpts from or summaries of the information provided in the most recent versions of the VFSA Service Area Municipalities' Act 537 Plans. Please note that as of this writing; only three of the VFSA Service Area Municipalities have plans approved by PADEP. Therefore, there may be minor revisions to the information presented in this document, as each municipality moves closer to approval; however, this will not impact upon the conclusions of this Regional Plan.

  Charlestown Township (Approved 6/17/2002)
  Wastewater disposal needs will be primarily related to future residential land use and industrial development in areas zoned for Planned Residential Development (PRD) and industrial and commercial land use in the southern portion of the Township near and primarily south of the Turnpike. This area is projected to be serviced by the VFSA sewer system.

The majority of Charlestown's residences and businesses will continue to employ conventional or alternate subsurface absorption area systems. As the cost of extending community sewerage systems outside the original VFSA Service Area is appreciably higher than within the VFSA Service Area, reliance on the on-lot methods will continue during the major part of the time frame considered in their Plan.

East Pikeland Township (Approved 12/9/1994)

East Pikeland is a member municipality of the VFSA. The public sewer system in the Township is designed, monitored, maintained and owned by the VFSA. The majority of residents in East Pikeland Township are connected to the VFSA. With the exception of two community systems, the remaining residents rely on individual on-site systems. A minor portion of West Vincent enters the VFSA system through East Pikeland. This was approved by agreement in order to alleviate potential public health issues from on-lot system malfunctions from existing homes outside VFSA's service area.

Easttown Township (Approved 3/13/2000)

Easttown Township's Act 537 Plan was last revised September, 1992 and adopted by the Township July 6, 1992. It was approved by PADEP on November 6, 1992.

Easttown Township is well established with respect to sanitary sewage facilities. The Township areas planned for eventual public sewer service include a number of residential infill developments, institutional or school facilities, and households currently using on-lot disposal systems. The majority of the collection systems in the Township drain to a network of 13 pump stations for conveyance through Tredyffrin Township to the Valley Forge STP. Some small peripheral areas of the Township drain by gravity to Tredyffrin and Radnor Townships.

Approximately sixty percent of the remaining parcels in the Township that are planned for eventual inclusion into the public sewer system are in the planning or construction phases. The development of these parcels necessitates the retrofitting and/or expansion of some pump stations in the system and associated gravity line extensions.

All multi-family dwelling areas are connected, or are planned for connection, to the public sewer system. That being the case, and since all other undeveloped areas in the Township are zoned for single-family dwellings on very large lots, there is no necessity for any community on-lot systems.

East Whiteland Township (Approved 11/27/2002)
East Whiteland Municipal Authority owns the sewage collection system and leases its operation to East Whiteland Township. The eastern two-thirds of the Township including all of Route 30 is now served by the public sewer system. The Township needs more capacity to accommodate development in western areas of the Township.

Seven private package treatment plants operate in East Whiteland Township. These treatment plants are generally located in the southern and western portions of the Township. One community on-lot sewage disposal system is operated at the K.D. Markley Elementary and Intermediate School.

Approximately one third of the East Whiteland Township land area relies on individual on-lot disposal systems. The two concentrated areas of on-lot disposal systems are: the area between Swedesford Road and U.S. Route 30 from Penflex to the Township line, and the area east of PA Route 352, and north of Summit Road.

Malvern Borough (Approved 5/12/1995)
Malvern Borough's Act 537 Plan was last revised November 1993 and adopted by the Borough on November 16, 1993. It was submitted to PADEP and is currently under review. The Borough is almost completely served by the public sewer system. The Valley Forge STP treats all wastewater flows.

There are no public sewage facilities provided south of First and Second Avenue. This area, which is made up of the property owned by Malvern Prep and Malvern Retreat and a few single-family residential units, is served by on-lot sewage disposal systems. The Borough does not intend to construct a public sewer system in this specific area.

There are also unsewered areas located in the northeast and northwest corners of the Borough. There are no dwelling units located in these areas. Future wastewater flow from both of these areas is proposed to be connected to the public sewer system and conveyed to the Valley Forge STP. The remainder of the Borough is connected to the public sewer system, which is maintained by the Borough.

Schuylkill Township (Approved 1996)

Schuylkill Township's Act 537 Plan was last updated in October 1994. The Plan describes anticipated township development by watershed area from 1998 to 2002. In addition, the Plan describes the number of equivalent dwelling units (EDU's) expected to be added to the VFSA system.

Two treatment plants serve the public sewage areas of the Township. The majority of sewered EDUs (approximately 96%) are treated by the Valley Forge STP. Approximately four percent (4%) of the sewered EDU's are treated at the Phoenixville Borough's STP.

Overall, seventy percent (70%) of existing dwelling units located within Schuylkill Township are connected to public sewers. The balance of the Township's residential units is served by individual on-lot disposal systems.

Tredyffrin Township (Approved 12/12/1994)

Tredyffrin Township's Act 537 Plan was revised in May 1993, adopted by the Township on December 13, 1993 and approved by PADEP. The Tredyffrin Township Municipal Authority's Paoli Area sewerage project (public sewers connected to the VFSA system) was completed and placed into operation in 1978, thereby eliminating many documented, malfunctioning on-lot sewage disposal systems and providing that area of Tredyffrin Township with public wastewater facilities. The Paoli Area project, the Authority's largest to date, included over 30 miles of sewers and four wastewater pumping stations. Many miles of sewers, and an additional pumping station, have been constructed in this area since 1978 by various developers.

In 1987, to help alleviate a hydraulic overload at a treatment plant in Upper Merion, the Cassatt Road pumping station was constructed to divert flow from the Township's Trout Run drainage area to the Valley Forge STP. This flow has been redirected back to the Upper Merion plant.

Furthermore, a small portion of the northern section of the Township, which is currently served by individual on-lot disposal systems, may be connected to the public sewer system.

Willistown Township (Approved 3/28/2000)
Willistown Township's Act 537 Plan was last revised February 6, 1991 and adopted by the Township in May, 1991. It was conditionally approved by PADEP on October 16, 1991.

The Township's public sewer system connected to the Valley Forge STP is located in the northern portion of the Township. The system crosses the ridge separating the Crum and Valley Creek Watersheds. In addition to this system the Township has nine private or community treatment facilities. Those areas not served by public or community system rely on private on-lot disposal systems. According to the Chester County Health Department (CCHD) there is evidence of on-lot malfunctions in these areas.
The plan recommends that additional capacity be acquired from the VFSA necessary to meet the future wastewater treatment needs of the northern portion of the Township.

- **Municipal Wasteload Management Annual (Chapter 94) Reports**
  Municipal Wasteload Management Annual Reports are intended to provide a review of the hydraulic and organic loads on sewerage facilities for the past year and insure that there is sufficient time to plan and construct needed additions to wastewater treatment plants. Each Chapter 94 Report provides wastewater flow estimates for a five year planning horizon.

The VFSA maintains current records regarding the future growth expectations of the eight communities that are served. Near term growth projections are identified by the communities and utilized to project the five year future needs, described in the Chapter 94 reports prepared by the VFSA and submitted to the PADEP on a yearly basis. Each community's submittal is included as an appendix to VFSA's yearly submittal to the PADEP.

The eight communities have maintained a dialogue with the VFSA in order to prepare for the longer term wastewater needs that are addressed in this Act 537 Plan. Although these communities are not entirely built out, the future growth courses of these municipalities have been fairly well defined over the years, and therefore, although the rates of development may vary based on market conditions, the EDU estimates summarized and presented in this subsection provide a high degree of confidence.

Adequacy of Previous Planning for Service Area

The Chester County Sewage Plan of 1970 recognized the need to provide regional systems to serve the entire Pickering Creek, French Creek, and Valley Creek Drainage Basins. The recommended feasibility studies for the individual municipalities were completed. Due to the age and general scope of this document, this regional plan will replace the 1970 study as the official Act 537 Planning study for the VFSA Service Area.

The Valley Forge STP EIS noted that, "the provision of less than 8 MGD capacity for the treatment plant would not be prudent." In addition it recommended that revised comprehensive land use plans and 537 sewage facility plans should be completed as soon as possible to guide development in the Design Service Area to meet projected 1985 sewer service demands. The plant was constructed and each of the Service Area Municipalities has prepared revisions to their individual Act 537 Plans. Although the EIS provides valuable information on the natural and physical characteristics of the service area, its main emphasis was to evaluate impacts of the plant at its design year of 1985. Therefore, this document will not be utilized for evaluating future capacity needs of the service area.

Sewage facilities planning which has been implemented through official plan revisions (planning modules) and addenda are referenced in the individual municipal Act 537 Plans, where appropriate.

C. Identify and summarize all existing municipal and county planning documents, including land use plans and zoning maps and regulations.

Municipal Planning Documents

The population and wastewater flow estimates prepared by the individual Service Area Municipalities reflect a number of different variables which impact local development. These variables include each community's comprehensive land use plan, zoning ordinance, and land development and subdivision regulations. Each municipality designates a sewer service area boundary or boundaries, depending on the number of public sewer service areas and infrastructure needs. The basis for this regional plan is the projections and wastewater facilities needs identified by the Service Area Municipalities in their Act 537 Plans. As part of the regional planning process these projections and methods were reviewed for consistency with the Act 537 planning guidelines and the protection of environmentally sensitive areas. Issues concerning individual plans were discussed with the municipal representatives during the development of the regional plan.

County Planning Documents

- **Landscapes: Managing Land in Chester County (1996-2020)**
  Landscapes is the land use policy plan for Chester County and was first adopted in 1996, which includes the County's vision for the year 2020. Landscapes and its associated Livable Landscapes map were updated in 2000. It recommends that development be encouraged in designated "Suburban" and "Urban" Landscapes, or "Suburban" or "Rural Centers" instead of in "Rural" and "Natural" Landscapes.

  The Suburban Landscape is to contain a mix of uses and higher densities of development than those found in the Rural Landscape. In order for this pattern to occur, Landscapes

supports the provisions of infrastructure and public services, such as public sewer systems. VFSA's draft Regional Plan supports Landscapes Policies to:

- Encourage coordination between municipalities and authorities to ensure consistency with land use plans.
- Maintain or expand existing sewer and water facilities to support development in Urban and Suburban Landscapes.

- **Sewage Facilities Inventory - 1991**

  The Chester County Planning Commission prepared this document to update its Community Facilities Inventory of 1985. The inventory shows the geographic location of sewage collection, conveyance, and treatment facilities in the County, as of 1991 (see Figure 1-1). According to the document, approximately 60% of the Chester County population relies on public sewage facilities for the collection, treatment and disposal of wastewater (1990 Census). The inventory also notes that the most thoroughly sewered areas of the County are in the central and eastern sections of the County along Routes 30 and 202. The Valley Forge STP is noted as being the largest treatment facility in the County in terms of sewage flows.

  Growth has been significant in recent years. Whereas VFSA Service Area sewered EDUs totaled 19,400 in December of 1993, the VFSA now services 25,540 as of year end 2005.

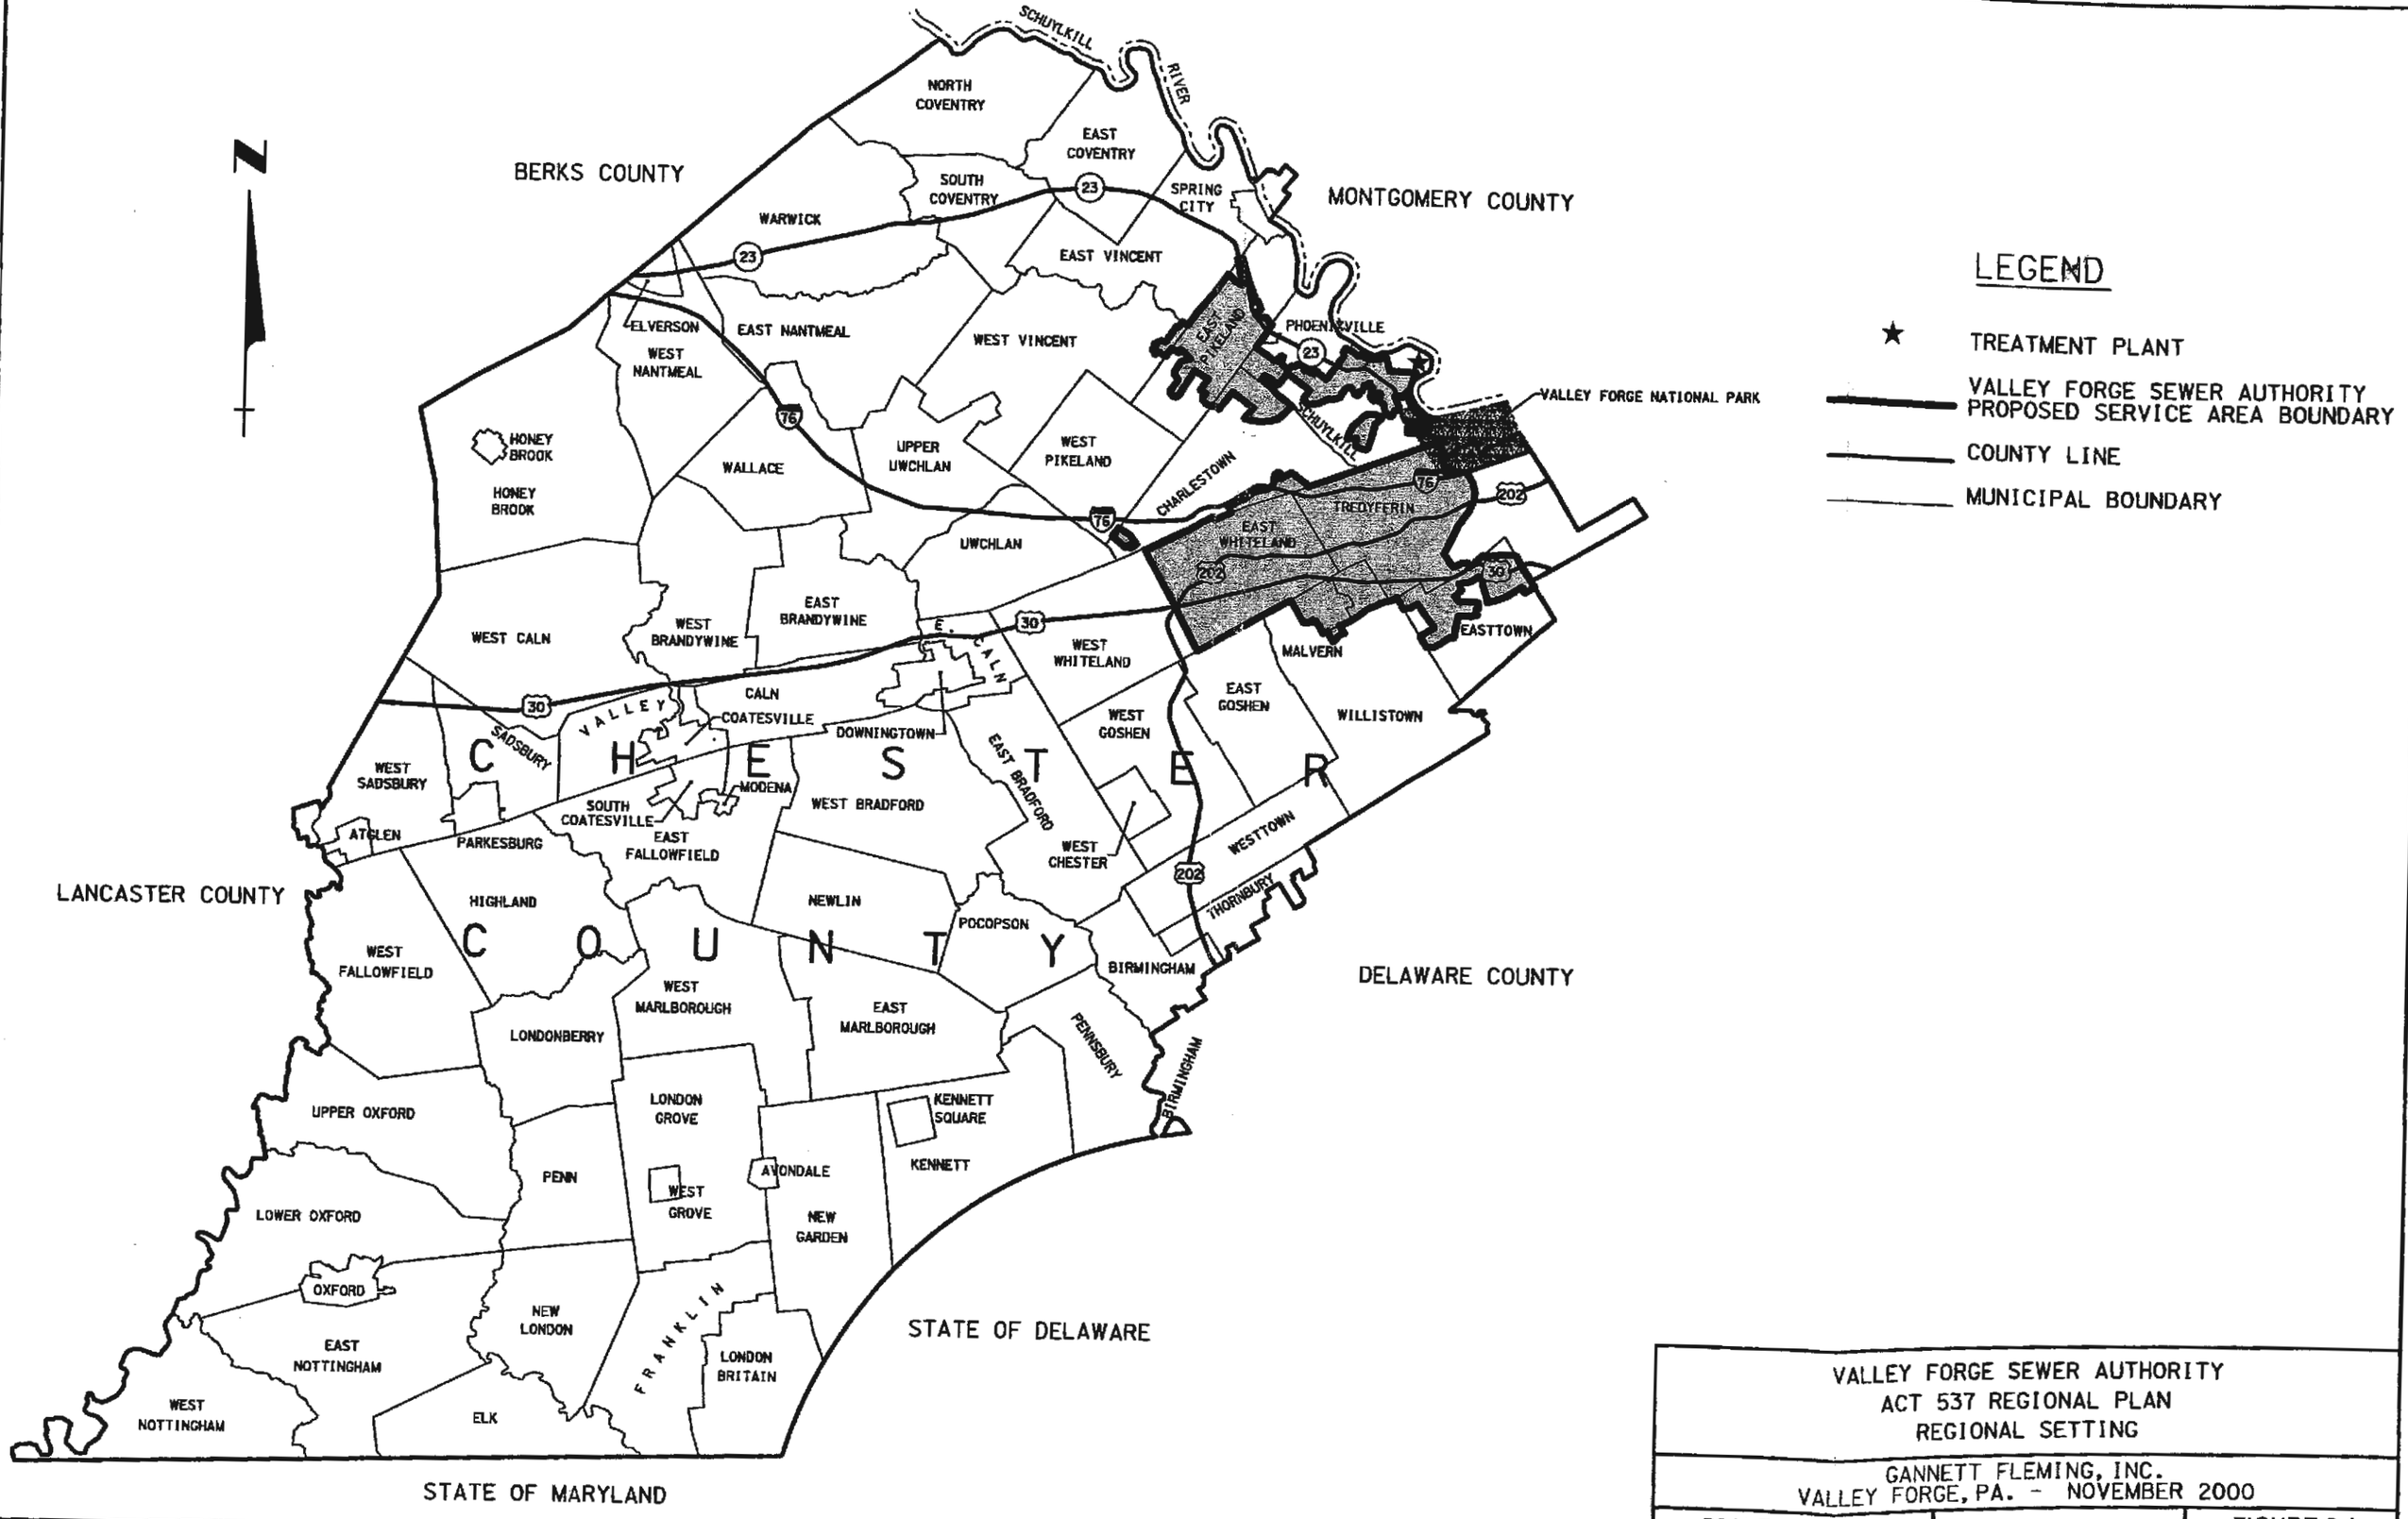
Regional Setting



The VFSA Service Area is regionally located in Eastern Chester County, adjacent to Montgomery and Delaware Counties in Southeastern Pennsylvania. Figure 2-1 shows the regional setting of the VFSA service area and illustrates the area's proximity to the Schuylkill River, Valley Forge National Historical Park and major transportation routes such as the Pennsylvania Turnpike, Schuylkill Expressway, and State Routes 202, 422 and 23. The area's proximity to the City of Philadelphia and its access to a major transportation network have contributed to its desirability for residential as well as commercial/office development.

Sewer Service Area

The extent of the VFSA Service Area is shown in more detail on Figure 2-2 and includes areas currently designated or proposed by the Service Area Municipalities for connection to and treatment by the Valley Forge STP. Prior to construction of the STP in 1977, the U.S. Environmental Protection Agency (USEPA) prepared an Environmental Impact Statement (EIS) to address the plant's projected impacts and to define areas requiring corrective action. The EIS identified two service areas: The Initial Service Area and the Design Service Area. The Initial Service Area contains the most severe health hazards and activities that were degrading water quality in the area. The Design Service Area was defined as the minimum area to which service was intended to be extended by 1985, the design year of the treatment plant. A few areas within Charlestown Township and a small area in West Vincent Township are the only changes to the Design Service Area projected in the 1974 EIS.

At the start-up of the plant, in October 1977, the estimated number of equivalent dwelling units (EDUs) to be connected was approximately 3,000. As of December 1993, the VFSA Service Area included approximately 19,400 EDUs.

The 2005 year end EDUs totaled 25,540.

C. Soils

The service area has six soil associations, or general groups. The following gives the typical characteristics of these associations:

- Penn-Croton-Bucks Association - Deep, silty soil.
- Glenelg-Manor-Chester Association - Generally shallow to deep, silty and channery soils, ranging from level to steep, but primarily gently to moderately sloping.
- Edgemont Association - Moderately deep, well drained.
- Hagerstown-Conestoga-Guthrie Association - Deep, silty soils.
- Neshaminy-Chrome-Conowings Association - Moderately deep and silty.
- Neshaminy-Glenelg Association - Moderately deep to deep, well-drained, silty, channery and gravelly.

The soil types are influenced by the geologic formation(s) which underlie them. Graphitic gneisses and grandiorite are generally overlain by deep and well-drained soils like those in the Glenelg-Manor Soil Association. The Stockton Formation is primarily overlain by a thin soil layer, typically of the Penn-Croton-Bucks series. Due to the solution channels which form in limestone and dolomite in Chester Valley, the soils overlying the Conestoga, Elbrook and Ledger Formations are generally well-drained and of the Hagerstown-Conestoga-Guthrie Association. The Chickies Formation is overlain by deep, often strong, well-drained soils, e.g., the Edgemont Association. The Serpentinite and Wissahickon Schist have deeply weathered rock which generally improves the percolation characteristics of the overlying soil. Soils such as those in the Neshaminy-Chrome-Conowings Association overlay these formations.

Specific descriptions of the local soil types found in the VFSA Service Area Municipalities may be found in the individual municipalities' plans.

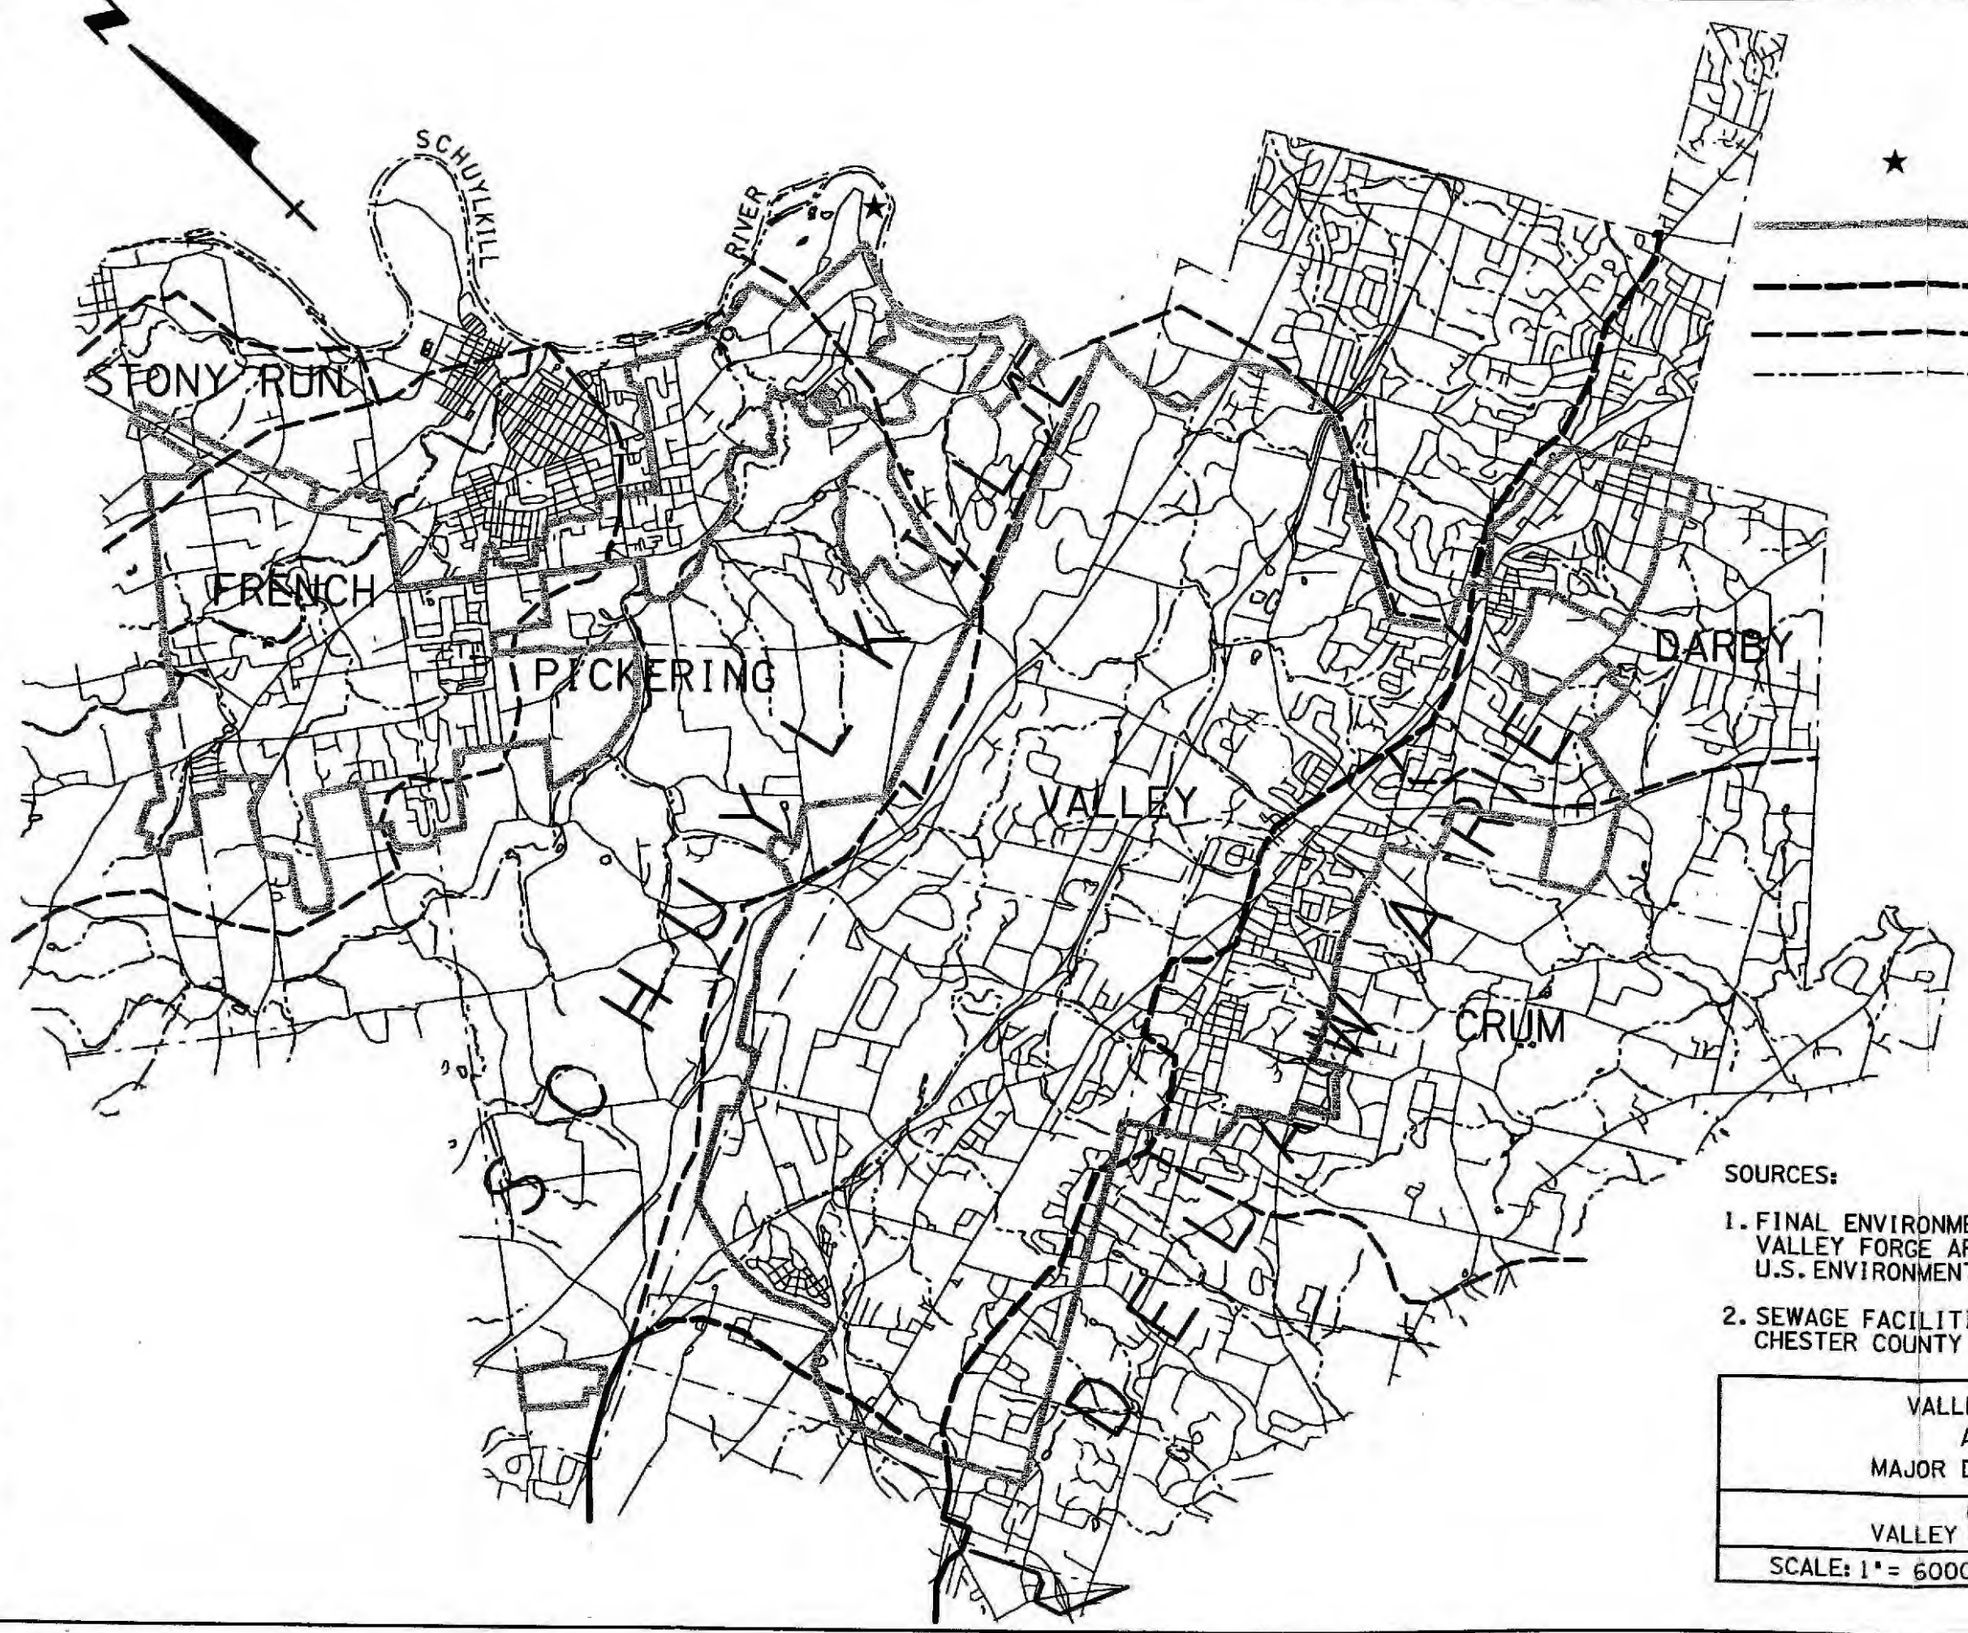
Major Drainage Basins

The VFSA service area is divided into two major drainage basins. The majority of the service area is within the Schuylkill River Basin with the smaller southern portion within the Delaware River Basin. The area is further divided into sub-major drainage basins: French Creek, Pickering

Creek, Valley Creek, Darby Creek, Crum Creek, and Stony Run. The major surface water bodies and drainage basins are shown on Figure 2-3.

The French and Pickering Creeks are located in the northern portion of the service area. French Creek flows in an east, southeast direction through the central portions of West Vincent and East Pikeland Townships and through the northern portion of Schuylkill Township. Pickering Creek flows eastward through the southern portion of East Pikeland and the northern portion of Charlestown Township, and then eastward, then north through the central portion of Schuylkill Township. Flow from these creeks empties into the Schuylkill River. The Valley Creek watershed flows in a northeast direction through East Whiteland and Tredyffrin Townships and empties into the Schuylkill River.

The Darby and Crum Creek watersheds are located in the southern portion of the service area. Darby Creek flows southeasterly through the central portion of Easttown Township. Crum Creek flows southeasterly through the central and eastern portions of Willistown Township. Both creeks continue to flow in a southeasterly direction and empty into the Delaware River.



The Stony Run Drainage Basin is found in the northwestern edge of the service area, adjacent to French Creek and located in East Pikeland Township.

Descriptions of the smaller streams, lakes and impoundments located in the VFSA Service Area Municipalities may be found in the individual plans.

D. Geologic Features

The geologic features underlying the service area are made up of complex, folded and altered rocks of varying ages and of igneous, metamorphic and sedimentary origins. The following is a brief summary of the major rock formations underlying the service area.

The northwestern portion of the sewer area is primarily underlain by graphitic gneiss and granodiorite. These formations characteristically have low permeability. The Stockton

SCALE: 1" = 6000'		FIGURE 2-3

Formation is located in the northeastern portion of the service area and is comprised of layers of sandstone, siltstone and conglomerates. It has moderate to high porosity and permeability, and provides good surface drainage.

The central portion of the service area is underlain primarily by the Conestoga, Elbrook and Ledger Formations, which are comprised of limestone and dolomite. These formations commonly contain solutions channels. The north-central portion of the service area is underlain by Chickies Formation, which is composed of quartzite, which resists erosion and weathers very slowly.

The southeastern portion of the VFSA service area is underlain by felsic gneiss, which is highly resistant to weathering. The central southern portion of the VFSA service area is predominately underlain by the Wissahickon Formation and Serpentine. Wissahickon Schist and Serpentinite are moderately to high weathered rocks that provide good surface drainage.

The above-mentioned formations and rocks underlay the majority of the service area. More detailed descriptions of the underlying geologic formations may be found in the individual municipalities' plans along with the required mapping.

E. Topography

The service area lies within the Piedmont Province of the Appalachian Highlands. Most of the ridges tend northeast-southwest. The Piedmont is an area of fairly deep, sharp valleys. The service area's most steeply sloping land is primarily along the North and South Valley Hills. The moderately sloping land is predominately in the Pickering Creek Basin. The gentle slopes are located mainly within Chester Valley.

The service area is comprised of three major physiographic regions: the Schuylkill Valley, Triassic Lowland, Chester Valley, and West Chester-Paoli Plain. The Schuylkill Valley and Triassic Lowland, which includes portions of the French and Pickering Creek drainage basins, is characterized by relatively level, gentle lowlands. Chester Valley, which includes the Little Valley Creek and Valley Creek drainage basins, extends northeast and southwest across the

middle of Chester County. In particular, the southern portions of Charlestown, East Whiteland, Tredyffrin, and the northern-most portions of Malvern Borough and Willistown Township fall in the Chester Valley. The West Chester-Paoli Plain, which includes the Crum and Darby Creek drainage basins, consists of gently rolling terrain.

The topography in the study area is affected by the geologic formation underlying the area. The topography of the land overlying the graphitic gneiss and granodiorite depends upon the local variation of the rock hardness, but is generally hilly with medium relief and has natural slopes which are fairly steep and stable. The Stockton Formation is comprised of rock which erodes easily and therefore forms gently rolling hills or relatively flat lowlands.

The Conestoga, Elbrook and Ledger formations provide topography with rolling valleys, hills of low relief, and natural, gentle and stable slopes. Felsic gneiss provides topography of rough hills of medium to high relief, and natural slopes, which are fairly steep and stable. Serpentinite weathers easily and has topographic characteristics including undulating hills of low relief having gentle, stable slopes. The Wissahickon Formation provides undulating hills of medium relief, and natural slopes which are moderately steep and stable.

Detailed local topography and, in particular, identification of steep slopes in the VFSA Service Area Municipalities is provided in the individual plans.

F. Potable Water Supplies

The population in the VFSA Service Area obtains drinking water from public water suppliers and private wells. Major water supply systems in the VFSA Service Area are summarized in Table 2-1.

Groundwater availability in the VFSA Service Area is limited by the low porosity and permeability of most of the underlying rock formations. These crystalline rock formations in the county provide some available groundwater in the fractures and fissures. The Triassic sediments located in the Stockton Formation provide the best groundwater yields in the area. Groundwater

pollution is possible in areas where the sandstones are particularly permeable. The limestone underlying the Chester Valley has variable groundwater yields. The channels create the potential for groundwater contamination to be carried long distances in unpredictable patterns.

Table 2-1. Major Water Systems Servicing VFSA Service Area Municipalities

Major Water Supply Systems	Location of Supply Area within VFSA Service Area	Population Served	Water Source(s)
Philadelphia Suburban Water Company	Easttown, Tredyffrin, Schuylkill, Charlestown East Whiteland and Willistown Townships	N/A (Serves more than VFSA Service Area Municipalities)	Crum, Perkiomen, and Neshaminy Creeks and Schuylkill River intakes

G. Wetlands

A review of the National Wetland Inventory quadrangles that include the VFSA Service Area (Phoenixville, Collegeville, Malvern, Valley Forge, West Chester and Media) has shown that Palustrine wetlands are scattered throughout the Service Area due to the presence of a number of surface water bodies. The individual municipalities' plans provide more detailed information on the wetlands located in the Service Area.

VFSA Wastewater Treatment System

The Valley Forge STP is owned and operated by the VFSA and is located in Schuylkill Township, Chester County, Pennsylvania. A site plan of the treatment plant is included as Figure 3-1. The VFSA finances, owns and operates the Valley Forge STP in accordance with the provision of the agreements signed on November 1, 1970; the Valley Forge Sewage Treatment Plant Agreement; the Valley Creek Trunk Sewer Agreement; and the East Whiteland Trunk Line Agreement.

Treated effluent is discharged into the Schuylkill River at a point located approximately 2000 feet upstream from Pawling Road. The plant's National Pollutant Discharge Elimination System (NPDES) Permit No. 0043974 is dated July 19, 2004 and expires on July 31, 2009. It states that the average monthly flow of effluent discharged from the plant shall not exceed 9.2 MGD. The permit also establishes effluent discharge limits and requirements. These parameters are summarized in Table 3-1.

TABLE 3-1. Discharge Parameters for the Valley Forge Wastewater Treatment Plant

Discharge Parameter	Average Monthly (lbs/day)	Average Weekly (lbs/day)	Average Monthly (mg/l)	Average Weekly (mg/l)
CBOD-5 (5-1 to 10-31)	1535	2302	20.0	30

Fecal Coliform	(200 colonies/100 ml as a geometric average)			
pH	(Within limits of 6.0-9.0 standard units at all times)			
Dissolved Oxygen	(Minimum of 5.0 mg/l at all times)			
Total Residual Chlorine	---	---	0.5	---

In addition, the following parameters are required to be monitored only: total lead, zinc, arsenic, cadmium, selenium, silver, mercury, copper, free cyanide, and hex chromium.

Description of Treatment Process

The Valley Forge Sewer Authority Sewage Treatment Plant (STP) was constructed in the mid-1970's with a design hydraulic capacity of 8.0 MGD. Design constituents loadings were 16,680 lbs/day [250 mg/L] for carbonaceous biochemical oxygen demand (CBOD-5); 16,680 lbs/day [250 mg/L] for total suspended solids [TSS]; and 2,000 lbs/day [30 mg/L] for ammonia nitrogen (NH_4-N). Presently, the plant is permitted at a not-to-exceed monthly average flow of 10.4 MGD, and a not-to-exceed average annual flow of 9.2 MGD. Hydraulic capacity is defined as "the rated hydraulic capacity of the treatment facility and is used to help determine whether a

hydraulic overload exists. Monthly average effluent discharge limitations are 20/25 mg/L for CBOD-5; 30 mg/L for TSS; and 8/16 mg/L for NH_4-N.

Mainstream wastewater processing as depicted in Figure 3-2, consists of influent metering/distribution, primary clarification, mechanically aerated activated sludge, final clarification, and chlorination for effluent disinfection. Sludge stream processing consists of primary underflow degritting, gravity co-thickening of primary and waste activated sludge, centrifuge dewatering, and dewatered cake stabilization via post-lime addition. Stabilized bio-solids disposal is by contracted hauling/disposal services.

The original plant design is unique in that it allows for operation of two parallel mainstream treatment trains. At the influent/metering structure, control gates and two parallel Parshall flumes distribute and measure flow to Side No. 1 and Side No. 2 of the plant, each side consisting of a primary clarifier, aeration tank, and final clarifier in the original design. In 1992, a third, larger final clarifier was built and is aligned with Side No. 2 and the original two final clarifiers are now aligned with Side No. 1. The aeration tanks effluent distribution chamber was also modified to accommodate flow splitting to the final clarifiers, and a new return activated sludge distribution chamber was constructed to maintain segregation of RAS for the two treatment trains. A weir box was added to the influent/metering structure to allow for distribution of in-plant recycle flow to Side No. 1 and Side No. 2 by weir gate settings. Previously, the side-stream recycle flow was dedicated to Side No. 2.

The original designed and constructed plant included a pressure filtration system for clarified effluent suspended solids removal and a heat treatment system for biosolids stabilization. These have since been decommissioned. The pressure filtration tanks are in place in the Operations Building basement and are available for reuse for hauled-in wastewater storage/feeding. Most of the heat treatment equipment has been removed. The decant tank (DT) and the decant aeration tank (DAT) have been retained and serve as receiving/storage tanks for hauled-in wastewaters. Original piping/pumping equipment associated with these tanks remains and serves for transport of the stored hauled-in wastewaters to the process application points.

FLOW SCHEMATIC

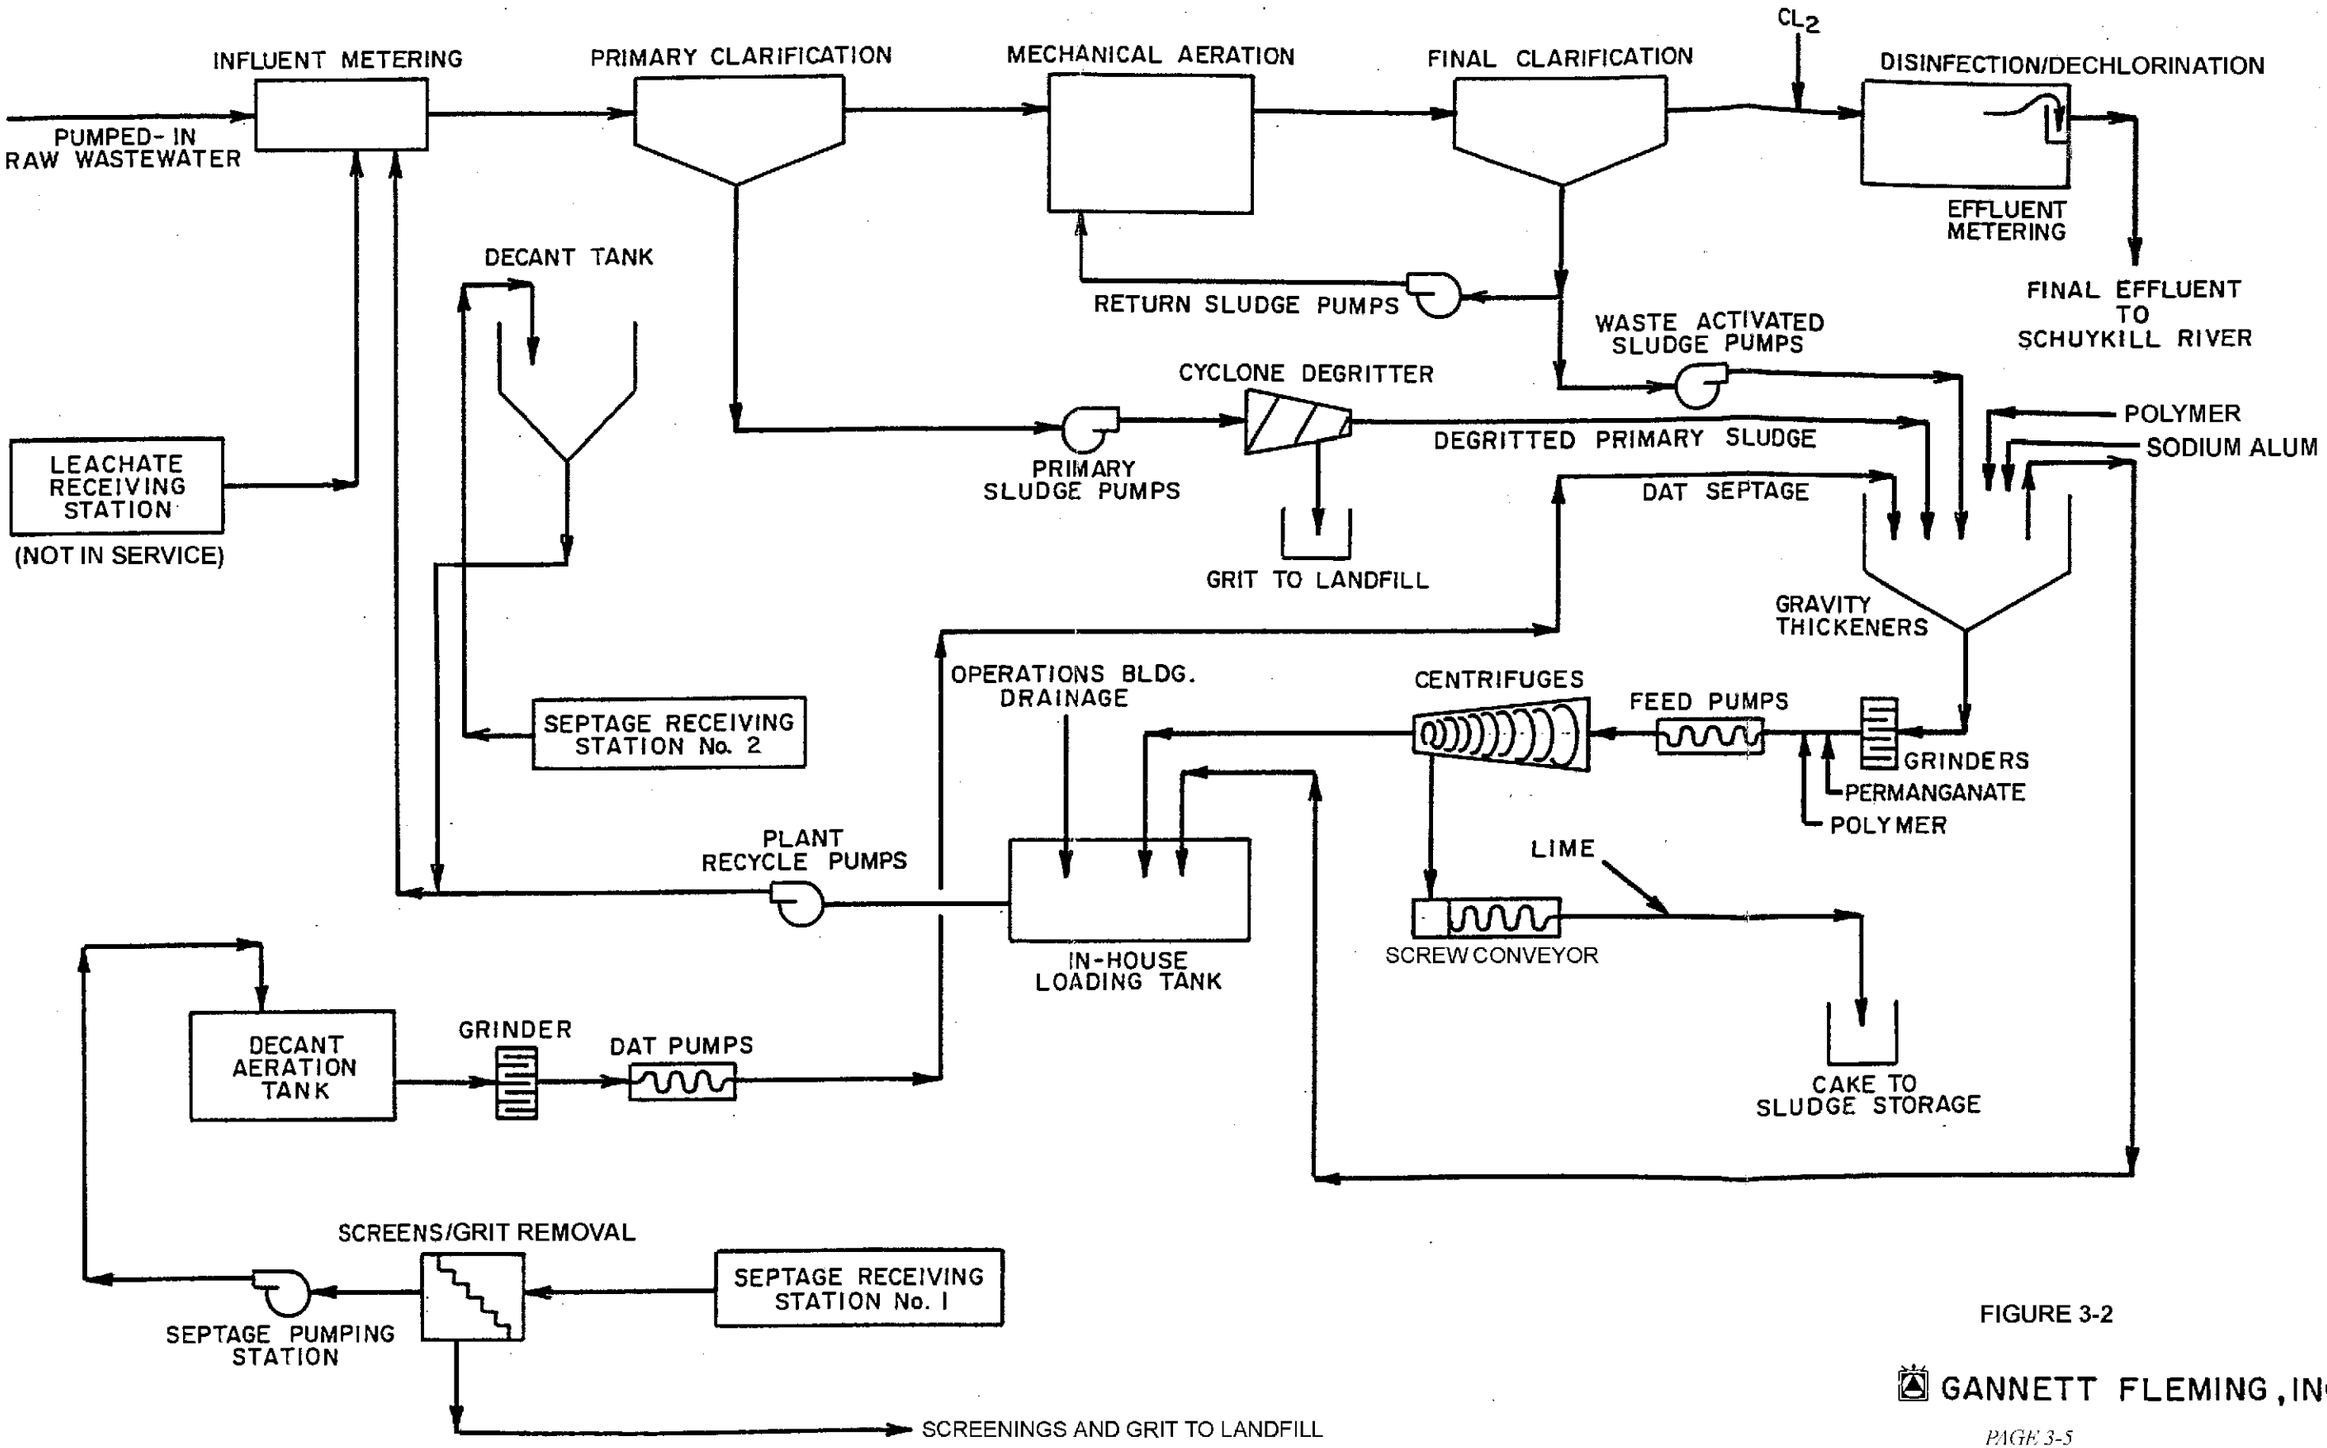

FIGURE 3-2

GANNETT FLEMING, INC.

Influent wastewater streams enter the plant through an influent metering chamber. Compatible liquid wastewaters are accepted from tank trucks at a septage acceptance facility where this wastewater receives pretreatment consisting of screening and grit removal. Following equalization it is pumped to the existing gravity thickening. Trucked wastes are accepted during normal working hours.

Description of Problems

There were no significant problems with the existing facilities at the Valley Forge STP during 2005 and this excellent performance was documented in the 2005 Engineer's Annual Report.

Upgrading or Expansion of Treatment Facilities

The Valley Forge STP was upgraded by the addition of a final clarifier and upgrading the chlorine contact tanks. This work was completed during 1992 and placed into service in December of 1992. The clarifier and contact tank remained in service in 1993 and refinement of the operation of the instrumentation occurred in 1993. Since the initial preparation of this document, the VFSA has accomplished the plant re-rate to 9.2 mgd, which was completed in 2000. Several improvements have been made in recent years including:

- Upgrading plant controls with improvements such as variable frequency drives (VFDs), and process logic controllers (PLCs).
- Adding a biosolids mixing and conveyance system to mix hydrated lime with bio-solids cake and convey the material from centrifuges to tractor trailers.
- Replacement of the plant's main motor control centers with new modern equipment.

Description of Operation and Maintenance Requirements

According to the VFSA's 2005 Engineer's Annual Report, operation and maintenance of the Valley Forge STP was performed adequately. The treatment plant is staffed 16 hours per day, five days per week. The operation of the treatment plant is monitored on weekends and staffed five hours per day on Saturday and Sunday. Remote alarms acknowledge emergency conditions that alert the staff to respond to the facility during unattended hours.

The plant's Operations and Maintenance Manual is routinely maintained. Ongoing improvements to the preventive/predictive maintenance and annual treatment unit inspection programs are continuing. Short and long-range planning is formalized for machinery rehabilitation, upgrades and replacements; facility repair and upgrades; and vehicle replacement and upgrades. The implementation of a computerized Operations and Maintenance Management System is complete. This system automatically creates schedules for planned and preventative maintenance work.

Major VFSA Service Area Sewer System Components (Collection System)

The VFSA finances, owns and operates its collection and transmission facilities in East Pikeland, Charlestown and Schuylkill Townships' independent of the 1970 Agreement. The other VFSA Service Area Municipalities are responsible for the financing, ownership and operation of their collection and conveyance system independent of any agreements, and are also parties to agreements where they use facilities in downstream municipalities.

Two major agreements have been signed with respect to sewer system components within the VFSA Service Area: the Valley Creek Trunk Sewer (VCTS) Agreement and the East Whiteland Trunk Line (EWTL) Agreement. In accordance with the VCTS Agreement, Tredyffrin is responsible for financing, ownership and operation of the VCTS within Tredyffrin, the main pumping station and the force main to the Valley Forge STP. East Whiteland, in accordance with the EWTL Agreement, is responsible for the financing, ownership and operation of the EWTL within East Whiteland.

Trunk Lines

The two major wastewater trunk lines that convey flow to the Valley Forge STP are the VCTS and EWTL. The portion of the VCTS located in Tredyffrin Township was financed, and is owned and operated by Tredyffrin. All of the wastewater flow to the Valley Forge STP from Tredyffrin, Easttown, East Whiteland, Willistown Townships, Malvern Borough, and a portion of the VFSA flow from Charlestown is conveyed to the plant via Tredyffrin's VCTS facilities. These facilities include gravity sewers and force mains, the Little Valley Intercepting Sewer and the Wilson Road Pumping Station and force main. The 1993 flow through the Wilson Road

Pumping Station was 5.192 mgd. The 2005 flow through the Wilson Road pumping station was 6.126 mgd.

The EWTL is financed, owned, and operated by East Whiteland Township. The EWTL conveys flow from East Whiteland, Malvern and Charlestown. The 1993 flow through the EWTL was 1.67 mgd.

Pumping Stations

Wastewater generated by the sewered service areas in East Whiteland, Easttown, Malvern, Tredyffrin, Willistown, West Vincent, Charlestown, East Pikeland, and Schuylkill Township is ultimately discharged to the common influent chamber of the plant's influent/metering structure from two main pumping stations --- the Wilson Road Pump Station in Tredyffrin (30-inch force main) and the Pickering Creek P.S. in Schuylkill Township (20-inch force main). **Note:** The Wilson Road Pumping Station is the subject of a separate Act 537 Plan by Tredyffrin Township.

Pickering Creek P.S. has a firm discharge capacity of 5.6 MGD, and an installed pumping capacity of 12.6 MGD. Comminutors at these pumping stations macerate solids prior to pumping. A composite sampler at the plant's influent/metering structure samples the combined pumped-in raw wastewater.

The major pumping stations within the area have been identified in the following table. Their locations have been identified on Figure 2-2, Existing Sewage Facilities.

Table 3-2. Major Service Area Pumping Stations

Pumping Station	Owner	Rated Maximum Daily Capacity (MGD)	1993 Average Daily Flow (MGD)	2005 Average Daily Flow (MGD)
Pickering Creek	VFSA	4.750	0.780	1.165
White Horse Road	VFSA	4.600	0.681	0.874
Pot House Road	VFSA	3.200	0.592	0.690
French Creek	VFSA	2.900	0.440	0.600
Mill Lane	East Whiteland	2.073	0.415	0.967
Station 3	Malvern	1.710	0.396	0.269
Berwyn	Easttown	1.526	0.630	0.858
Wilson Road P.S.	Tredyffrin	16.272	1.706	6.131
Darby Road	Tredyffrin	1.008	0.479	0.385

* Major pumping stations were identified as those having a rated capacity of 1.0 mgd or more.

Force Mains

The Wilson Road force main receives wastewater flow from Tredyffrin, Easttown, East Whiteland, Willistown Townships, Malvern Borough, and a portion of the VFSA flow from Charlestown. The design capacity of the force main is 8.393 MGD.

VFSA System Compliance with Municipal Wasteload Management Regulations

According to the VFSA 1993 Chapter 94 Report, none of the 1993 average daily flows at the major pumping stations within the VFSA exceeded their rated capacities. Also, none of the highest daily flows exceeded the major pumping stations' capacities. The projected maximum daily flows for the major pumping stations were determined for ultimate build out of the service areas.

More recently the report entitled, "Validation of the Member Municipality Collection System Portion of the Regional Act 537 Plan," November 2005, stated that the VFSA flow projections do not exceed the flow allocation of any pump station capacity. Any long term capacity Issues may be addressed as the 30-plus-year-old pumps stations are modernized.

Description of Operation and Maintenance Requirements of Major VFSA Service Area Sewer System Components

A formal predictive/preventative maintenance program covers all VFSA-owned pumping stations, which are visited routinely, several times per week. Each pumping station has on-site emergency power and portable bypass pumping capability. All stations have auto transfer electrical back up systems.

In the VFSA owned collection system, problem sewer lines are routinely flushed. The VFSA has annual contracts for right-of-way clearing and I/I correction. The annual I/I study and corrective action plan includes: key manhole monitoring, plug and weir testing in problem areas, internal video inspection and cleaning and grouting where necessary.

VFSA has sufficient staffing assigned to maintain the collection system. Repair maintenance activities are supported by a plant maintenance staff assigned to duties at the VFSA treatment plant and collection system.

B. Identify, map, and describe areas that utilize individual and community onlot sewage discharge and, unpermitted collection and disposal systems.

The following are summaries of or excerpts from the municipalities' most recent Act 537 plans regarding on-lot sewage disposal systems. More detailed information can be found in the individual plans.

Charlestown Township

A large portion of the Township is serviced by on-lot disposal or alternative systems. The greatest concentration of the sewage disposal problem areas was in the northern portion of the Township in the Tyrone Farms neighborhood, an area which was served by a community sewerage system. Further discussion on malfunctions of the systems and soil limitations in the Township is included in Sections 3 (C) and (D) of the Township's Act 537 Plan.

East Pikeland Township

The majority of residents in East Pikeland Township are connected to the VFSA. With the exception of two community systems, the remaining residents rely on individual on-site systems. According to East Pikeland's Act 537 Plan, after considering the cost of extending sewer lines, many Township residents will not be connected to the VFSA. These residents, for the most part, will utilize individual on-lot systems. The Township has been divided into five study areas in the Plan. The Plan provides information on the current wastewater disposal methods used and the alternatives and proposed recommendations for future wastewater planning in each of the study areas.

Easttown Township

Four areas in the Township are not planned for public sewers. All are large lot zoning (80,000 sf) and all have soils suitable for on-site sewage. The first area is Waynesborough Country Club. The second area is the YMCA tract, located in the northwest portion of the Township. These two tracts have existing uses served by public sewer. However, future use and capacity issues dictate that on-lot systems be considered. The other two areas are in the southern portion of the Township. One is the southwest corner of the Township around White Horse Road. The second is in the south central portion of the Township in the vicinity of the easterly portion of Waterloo Road. All multi-family (community) systems are already connected, or are planned for connection, to the public sewer system.

East Whiteland Township

Approximately one third of East Whiteland Township relies on individual on-lot disposal systems. Existing systems have operated with few reports of malfunction. According to the Act 537 Plan, the Chester County Health Department reported two concentrations of on-lot disposal system malfunctions in the Township: the area east of PA Route 352, north of Summit Road, and the area between Swedesford Road and U.S. Route 30 from Penflex to the Township line. The malfunctions are primarily due to shallow depth to bedrock and other soil characteristics which prevent adequate percolation.

Malvern Borough

The area in the Borough that does not have public sewers is owned by Malvern Prep, Malvern Retreat, and a few single-family residential units located along Paoli Pike and on South Warren Avenue just south of Second Avenue. These areas utilize on-lot sewage disposal facilities for wastewater disposal. A small area of ground located in the far northeast corner of the Borough that abuts Willistown Township and an area of ground in the northwest corner of the Borough that is located north of the railroad tracks and that abuts East Whiteland Township both do not have public sewers. Currently, there are no buildings on the latter two parcels of land. There are no known malfunctioning on-lot sewage disposal facilities in the Borough.

Schuylkill Township

According to the Township's Act 537 Plan Update, approximately 30% of the residential units located within Schuylkill Township utilize individual on-lot disposal systems. These systems include cesspools, conventional septic system with absorption fields, and elevated sand mounds.

There is one area in the Township which is experiencing on-lot system malfunctions. Approximately four to five existing malfunctioning units are located in the vicinity of Route 29 and Creek Road. The Plan indicates that these units will be connected to the planned Charlestown Hunt interceptor.

The Township is currently updating its 1976 holding tank ordinance and intends to adopt an individual on-lot management ordinance and implement an on-lot management program this year.

Tredyffrin Township

There are approximately 500 on-lot sewage systems in Service Area A of Tredyffrin Township. All but about 10 to 15 of the 500 serve individual homes. It has been assumed, based on permit records that approximately half of these systems were constructed since Act 537 and Chapter 73 regulations were enacted. Most of the malfunctions occurred due to the age of the systems and because over one-half of the original systems predated present design standards and are approaching the end of their life expectancies. In 1991, Gannett Fleming, Inc. met with

representatives of the Chester County Health Department to discuss the existing problem areas in Service Area A. As a result of these discussions, ten specific areas were identified as having permitting problems or malfunctions. More detailed information can be found in Section 6.1.1 of Tredyffrin Township's 1993 Act 537 Update.

Willistown Township

The distribution of on-lot system malfunctions shows a concentration in the central portion of the township directly south of Malvern Borough. Comparing the soil suitability for on-lot disposal systems to the concentration of failing systems indicates soils, which are severely limited by flood plain and high water table areas. Remaining sites of on-lot malfunctions were not concentrated in any one area although most occur in the northern half of the municipality. These failures can be attributed to poor soil conditions, age of systems, and a lack of maintenance.

C. Identify wastewater bio-solids and septage generation, transport, and disposal methods.

Primary bio-solids, waste activated sludge, and hauled-in-septage are co-thickened in the plant's two gravity thickeners, which supply thickened bio-solids to the centrifuge feed pumping system. Concentrated bio-solids from each thickener flows through an in-line grinder prior to pumping by its associated progressive-cavity feed pump. Two solid-bowl centrifuges located on the upper level of the Operations Building dewater thickened bio-solids. Centrate from the dewatering operation is discharged to the plant's side stream storage tanks, referred to as the in-house loading tanks (IHLT). Centrate is returned to the head of the plant for processing. Centrifuge feed bio-solids is conditioned prior to dewatering by polymer addition from the dry-polymer/solution makeup and feed system. Dewatered bio-solids cake discharged from the centrifuges drops down to a screw conveyor system whose purpose it is to mix the bio-solids cake with the hydrated lime while carrying it outside of the building to a trailer attached to a jockey truck. The lime conditioned bio-solids are piped to a trailer located on a jockey truck. Trailers are removed from the site on a daily basis so as to minimize odors. The trailers are transported by tractor-trailer by a private contractor to permitted farmland where it is used as a natural fertilizer.

VFSA secures its own landfill disposal approvals. The current biosolids disposal contractor, Synagro, hold permits for agricultural, landfill, and compost disposal sites. Synagro is responsible for coordinating biosolids disposal to any of these sites to satisfy its overall biosolids management program.

A. Identify and briefly summarize all municipal and county planning documents adopted pursuant to the Pennsylvania Municipalities Planning Code.

See Section 1 for summaries of this information.

B. Future growth areas and EDU projections

The VFSA Service Area includes parts of eight (8) municipalities and provided wastewater collection, conveyance and treatment to approximately 25,511 EDUs as of the end of 2005. The Service Area is located in Eastern Chester County, an area whose growth continues to be influenced by suburban expansion outward from Philadelphia through Chester, Delaware, and Montgomery Counties.

The VFSA maintains current records regarding the future growth expectations of the eight (8) communities that are served. Near term growth projections are identified by the communities and utilized to project the five-year future needs, described in the Chapter 94 reports prepared by the VFSA and submitted to the PADEP on a yearly basis. Each community's submittal is included as an appendix to VFSA's yearly submittal to the PADEP. The eight (8) communities have maintained a dialogue with the VFSA in order to prepare for the longer term wastewater needs that are addressed in this Act 537 Plan. Although these communities are not entirely built out, the future growth courses of these municipalities have been fairly well defined over the years, and therefore, although the rates of development may vary based on market conditions, the EDU estimates summarized and presented in this subsection provide a high degree of confidence. The following discussion provides a summary of these short and long term estimates of growth rates which were used to establish the EDU and long term capacity needs of the VFSA.

Some historical perspective on development patterns and growth is provided in Appendix B, which is from the draft Act 537 report prepared in 1994.

Partner Municipalities (Easttown, East Whiteland, Malvern, Tredyffrin, Willistown)

Easttown Township

As of the end of 2005 Easttown had a total of 3,511 EDUs contributing about 1.4 mgd to the VFSA wastewater treatment plant. Easttown estimates that by 2010, there will be an additional 240 EDUs served by the VFSA. The compilation of the near term subdivision growth is listed in Easttown's latest Chapter 94 Report Submittal. The corresponding average daily flow rate projected in 2010 is 1.423 mgd. Thirty years later, by year 2035, Easttown Township projects a total of 4,115 EDUs that will contribute 1.523 mgd to the VFSA system roughly equaling its current treatment plant reserve capacity. Therefore, Easttown projects that additional capacity is not needed to serve their long term growth needs. Table 4-1 is the long term EDU and average daily flows projected by Easttown Township for the next 30 years.

Table 4-1. Easttown EDU/Flow Growth Estimates

Year	Easttown EDU's	Average Daily Flow (mgd)
2005	3,511	1.357
2010	3,751	1.423
2015	3,824	1.443
2025	3,973	1.484
2035	4,115	1.523

It is noted that Easttown has made and is making significant progress is reducing infiltration and inflow (I/I) within their service area.

East Whiteland

At the end of 2005 East Whiteland had a total of 5,393 EDUs contributing about 1.97 mgd to the VFSA wastewater treatment plant. East Whiteland estimates that by 2010, there will be an additional 1,622 EDUs served by the VFSA. The compilation of the near term subdivision growth is listed in Easttown latest Chapter 94 Report Submittal. Virtually the entire area encompassed by East Whiteland will be served by the VFSA at total build out, and East Whiteland expects that the growth rate will be relatively steady for the next 30-years.

Table 4-2 presents East Whiteland's projected EDU and average daily flow rates to the VFSA treatment plant.

Table 4-2. East Whiteland EDU/Flow Growth Estimates

Year	East Whiteland EDU's	Average Daily Flow (mgd)
2005	5,393	1.963
2010	7,015	2.409
2015	8,469	2.809
2025	10,288	3.309
2035	12,469	3.909

The current reserved capacity for East Whiteland is 1.940 mgd compared to an average daily flow of 3.909 mgd. Therefore at build out, East Whiteland will require an additional 1.97 mgd of treatment plant reserve capacity to serve their long term needs.

Malvern Borough

As of the end of 2005 Malvern Borough had a total of 1,658 EDUs contributing about 0.329 mgd to the VFSA wastewater treatment plant. Malvern estimates that by 2010, there will be an additional 52 EDUs served by the VFSA. The compilation of the near term subdivision growth is listed in Malvern's latest Chapter 94 Report Submittal. Malvern's future growth rates are outlined below in Table 4-3.

Table 4-3. Malvern EDU/Flow Growth Estimates

Year	Malvern EDU's	Average Daily Flow (mgd)
2005	1,658	0.329
2010	1,710	0.352
2015	1,730	0.358
2025	1,850	0.391
2035	1,973	0.425

Malvern's current reserve capacity is 0.543 mgd; therefore at build out, Malvern Borough will not exceed its current reserve capacity.

Tredyffrin

At the end of 2005, the total number of EDU's connected to the VFSA system from Tredyffrin was 5,967.

By 2035, Tredyffrin expects additional growth to result in an average daily flow 2.1 mgd resulting from EDU growth of an additional approximate 2,900 EDUs. Tredyffrin's current reserve capacity at the VFSA treatment plant is 2.001 mgd; therefore Tredyffrin will require an additional 0.099 mgd of reserve capacity.

Willistown

As of the end of 2005, the total number of EDU's connected to the VFSA system was 2,521, contributing an average daily flow of about 1.2 mgd. Most of Willistown's growth is expected to occur over the next 5 years and the specific developments are described in Willistown's latest Chapter 94 report. The growth is expected to occur as detailed in Table 4-4.

Table 4-4. Willistown EDU Growth Estimates

Year	Additional Willistown EDUs
2006	285.5
2007	208
2008	242
2009	240.5
2010	59

In the longer term, Willistown estimates their ultimate EDU count to increase by about 10% to 3,075 EDU's in 2035, resulting in an average daily flow rate of 1.348 mgd. The current reserve capacity for Willistown Township is 1.064 mgd, resulting in the need for an additional 0.284 mgd of reserve capacity at the treatment plant.

Member Municipalities (Charlestown, East Pikeland, and Schuylkill Townships)

Charlestown

The VFSA treatment plant serves approximately 549 EDU's in Charlestown Township. Projected future growth in Charlestown Township is outlined by subdivision in Table 4-5. It is expected that by 2015, there will be an additional 336 EDUs and by 2020 there will be another additional 409 EDUs resulting in a total of 1,294 EDUs by 2020. At build out, expected to occur by 2025, it is estimated that there will be another 389 EDUs added, resulting in a total of 1,683 EDUs served by the VFSA treatment plant.

Zoning Amendment under consideration by Charlestown Twp.

East Pikeland

The VFSA treatment plant serves approximately 2,600 EDU's in East Pikeland. Projected future growth in East Pikeland Township is outlined by subdivision in Table 4-6. It is expected that by 2015, there will be an additional 260 EDUs and by 2020 there will be an additional 157 EDUs resulting in a total of 3,015 EDUs by 2020. At build out, expected to occur by 2025, there will be a total of 3,117 EDUs served by the VFSA treatment plant.

Schuylkill

The VFSA treatment plant currently serves approximately 3,058 EDUs in Schuylkill Township. Consistent with the Draft Regional Plan, the Board of Schuylkill Township approved amending EDU projections to include an additional 294 EDUs at build out, plus an additional 63 EDU's for commercial development resulting in about 360 additional EDU's at build out. The Plan estimates this growth to occur at the rate shown in Table 4-7.

Table 4-7. Schuylkill EDU Growth

Time Frame	Additional Schuylkill Twp. EDUs
2005-2010	149
2010-2015	132
2015-2035	76
Total	357

Member Municipality Reserve Capacity

The Member Municipalities' projected capacity requirement at build out of 1.957 mgd, based on the historical flow rate of 240 gpd per EDU, is less than the current reserve capacity of 2.128 mgd. Therefore the Member Municipalities will not require additional reserve capacity at the treatment plant at build out.

Summary

Table 4-8 summarizes the projected EDU counts and corresponding flow rates for the 5, 10, 20 and 30-year projections. Based on the growth estimates presented in the foregoing discussion, in 10-years the capacity required at the treatment plant of approximately 9.73 mgd will exceed the existing plant rated capacity of 9.2 mgd by about 0.5 mgd. Similarly, the plant's rated capacity will be exceeded by 1.41 mgd in 20 years and by 2.24 mgd in 30 years. At that time the capacity needed will be 11.44 mgd.

A.1. Perform an evaluation to address the potential for providing sewage treatment service to future development areas and existing development areas, not currently served by public sewer, within the planning areas for the wastewater treatment and disposal facilities.

and

A.2. Perform an evaluation to address the potential for extension of existing Borough conveyance facilities to provide sewer service to future development areas and existing developed areas, not currently served by public sewer, within the planning area.

See section 4 of the Regional Act 537 Plan for the summary of each individual municipality's Act 537 Plan, and refer to each report for more in-depth information.

A.3. Perform an evaluation of the potential for continued use of existing sewage treatment facilities through repair, upgrading, reduction of hydraulic or organic loadings, or improved operation and maintenance practices.

and

A.4. Perform an evaluation to address the potential need for the construction of new sewage treatment or conveyance facilities.

and

A.5. Perform an evaluation to address the potential for repair or replacement of existing collection and conveyance system components.

Background

Section 5 of the Regional Act 537 Plan describes and evaluates a number of alternatives, which would satisfy the future wastewater management needs of the Valley Forge Sewer Authority (VFSA). This section was originally completed in April 2003. Due to age of the flow projections when the Regional Plan was completed, the flow projections of the Member and Partner

municipalities needed to be reviewed and updated. In conjunction with the flow analysis, the Authority elected to review, update and supplement the various wastewater management alternatives previously presented in Section 5 of the 2003 Plan. Due to the comprehensive nature of the new evaluation, Section 5 was completely rewritten.

In 2005, an Ad Hoc committee was formed for the purpose of reviewing and assisting the VFSA in establishing future capacity needs in accordance with the Act 537 planning process, and in the selection of the optimal strategy for subsequent engineering and implementation. The committee consisted of representatives from Schuylkill Township as well as VFSA staff, Authority members, and the engineer of record, Buchart-Horn, Inc.

Flow projections have been updated in Section 4 of this Regional Act 537 Plan and describe the projected capacity needs over the next 30-years. The original design of the VFSA wastewater treatment plant was based on a capacity of 8 MGD. In 2000, the plant was rerated to 9.2 MGD. Future average flow rates are projected by this Act 537 Plan to be as follows:

Table 5-3. Projected Average Flowrates.

Years	Projected Flow Capacity Needed (MGD)
Current	7.6
10	9.7
20	10.6
30	11.52

Section 5 describes the process by which the concept strategy for the optimal alternative was determined. A series of committee meetings were held in 2005 for the purpose of identifying potential alternatives for the required capacity. This list, known as the "long list", was finalized at a committee meeting on June 29, 2005.

Screening of Alternatives

Following the establishment of the "long list", the committee met Thursday, August 11, 2005 at VFSA with the objective of reviewing the draft flow projections and screening out those alternatives which were not worthy of further study because they were either not feasible, too costly, or in some other way, not practical. The result of this work was a manageable "short list" of alternatives requiring a more detailed technical evaluation.

Technical reasons for screening from the long list were identified and discussed to assure that there were no alternatives eliminated unless the committee could say with reasonable certainty, that further evaluation was not warranted. The long list is summarized below along with the results of the screening evaluation performed on August 11, 2005. The alternatives are presented in two categories: Eliminated Alternatives, and Retained Alternatives (those considered viable for further evaluation).

Eliminated Alternatives

Alternative 1 - Enter into an agreement for a privately owned and operated wastewater treatment plant (partial capacity need alternative)

This alternative consists of utilizing a privately owned treatment plant to provide service to VFSA customers. While developers have constructed such facilities elsewhere, there are no such treatment plants that can provide the needed capacity to the VFSA at the present time. Plans for any such future facilities are too undefined to evaluate in detail. Accordingly, Alternative 4 was eliminated from further evaluation.

Alternative 2 - Construct a satellite facility at Church Farm School and spray irrigate the property

This alternative consists of a new satellite wastewater treatment plant to be located at the location of the Church Farm School near Route 30 in East Whiteland Township. The treated wastewater effluent would be used to spray irrigate the property.

This alternative was eliminated from further evaluation for the following reasons:

1. Conveyance distances would require significant construction costs.
2. The amount of property needed to meet spray irrigation requirements and store wastewater during the winter is significant and would not be cost effective or practical.
3. Public acceptance of such a facility will be difficult to obtain due to concerns for airborne aerosols from wind action.

Alternative 3 - Encourage the sale of capacity among partner municipalities

This alternative consists of selling or exchanging existing treatment capacity from those partners with excess capacity to those who require capacity. Such exchanges would make more efficient use of the existing STP's capacity. This alternative was eliminated from further consideration, because even if the most efficient use of capacity were accomplished through agreements between partners, this alternative would not provide a sufficient amount of needed capacity to meet the VFSA's future needs.

Alternative 4 - Encourage the partner municipalities to divert their flows to other Townships

This alternative consists of partner municipalities (East Whiteland, Easttown, Malvern, Tredyffrin, and Willistown Townships) diverting wastewater flows that would have otherwise been conveyed to the VFSA for treatment, to other townships that are not part of the VFSA. Based on conversations with Partner representatives it does not appear that the partners of the VFSA would support such an alternative. Accordingly, this alternative was eliminated from further consideration.

Retained Alternatives

The following alternatives identified by the Ad-Hoc committee were considered feasible for further evaluation.

Alternative 1 – Purchase Capacity at another Wastewater Treatment Plant

Alternative 1 consists of diverting wastewater from the VFSA to another treatment plant owned and operated by a nearby authority. This alternative would be accomplished by diverting existing

wastewater pumping station flow through a new conveyance line toward the treatment facilities of the nearby authority. An inter-municipal agreement for the required conveyance and treatment service would be established with the nearby authority.
Authorities considered as candidates for a municipal agreement consisted of Phoenixville, Oaks, Spring City, Upper Merion, and East Vincent.

Advantages

- The existing VFSA wastewater treatment plant stays essentially the same. Rented capacity means that the VFSA will be paying for another authority to treat some or all of our additional wastewater treatment capacity needs.
- Odor potential can be kept to existing locations where it can be most cost effectively controlled. Odors resulting from the additional flows are off loaded to a "landlord."
- Bureaucratic and siting difficulties may be minimized, since the treatment plant for which the VFSA would be purchasing capacity already exists.

Disadvantages

- Costs will be established by the "landlord," and will escalate based on their management capability. VFSA would lose this degree of cost control. Costs will potentially escalate at a higher rate than those alternatives where VFSA operates all of their own wastewater treatment facilities for the needed capacity.
- Depending on the specific alternative, significant capital costs will be incurred for new wastewater conveyance lines and pumping station modifications.
- Right-of-Ways and condemnation costs for new wastewater conveyance could be significant and time consuming.
- This alternative may not provide sufficient capacity to meet the VFSA's long term needs.

Alternative 1 – Results of Screening

Capacity from Phoenixville was retained for further evaluation. Phoenixville's management staff indicated that they would supply the required information for the VFSA to do a feasibility study. Flows may be diverted from either VFSA's French Creek Pump Station or the Pickering Creek

Pump Station to Phoenixville, resulting in capacity of about 0.6 MGD or 1.0 MGD, respectively. Eliminated from further evaluation were the following variations of Alternative 1:

- Lower Perkiomen Valley Regional Sewer Authority (Oaks)
  Although discharging some or part of the wastewater flow to the Lower Perkiomen Valley Regional Sewer Authority (LPVRSA) would be feasible, the LPVRSA Board of Directors decided that they were not interested in pursuing this option in detail. Their position is documented in a Letter from Barbara Cepko to the VFSA dated August 15, 2005.
- Upper Merion
  The pumping distance was (approximately 6.8 miles) considered too great to make this option economically feasible.
- East Vincent
  The pumping distance (approximately 5.8 miles) was considered too great to make this option economically feasible.
- Spring City
  This treatment facility does not have the capacity to accommodate the quantities of wastewater that would be needed if the French Creek Pump Station (FCPS) were diverted to Spring City. The FCPS is the closest VFSA pumping facility to the Spring City plant.
- Wilson Road Pumping Station Location
  Treated wastewater would have to be discharged into a high quality stream (Valley Creek), or a new conveyance line leading to a Schuylkill River outfall would have to be constructed at a considerable expense. This option would not be economically feasible compared to the other available alternatives.

Alternative 2 – Construct a Satellite Treatment Facility – Discharge near Cromby

This alternative consists of constructing a satellite wastewater treatment plant at a location that is separate from the existing plant and in one of the incorporating municipalities. Potential sites consist of the area around the FCPS and at or near the Cromby electrical power generating plant. If the satellite treatment plant were constructed near the FCPS, then the treated effluent would be pumped to the Cromby site where it would be discharged to the Schuylkill River after being combined with the treated discharge from the electrical power plant. If the treatment plant were

constructed at the Cromby site, untreated wastewater would be pumped from the FCPS to the Cromby site where it would be combined with the power plant's untreated wastewater and treated by a new satellite wastewater treatment plant.

Constructing a new treatment plant near the FCPS with discharge to the French Creek was considered as a separate alternative, but it was not considered to be feasible because of the higher quality requirements for the treated wastewater that would be imposed for new treated wastewater discharges to the French Creek. Accordingly, this alternative was eliminated from further consideration.

Advantages

- The VFSA would maintain control of all its capacity and does not relinquish this to a "landlord." This assures stability of management and control.
- The existing wastewater treatment plant would stay essentially the same for a period of time until the capacity of the existing plant and the Cromby plant is exceeded. The expected time period is approximately 10 years. All initial improvements would be at the new location.
- Some electrical and other operating costs would be saved because pumping distances and "cascade" pumping would be reduced. Currently, the FCPS discharge is pumped through three additional pumping stations before it reaches the existing VFSA treatment plant.

Disadvantages

- There would be administrative considerations to locating a new wastewater treatment plant such as permitting and siting.
- The new treatment plant location would only address a portion of the ultimate needs of the VFSA. Approximately 0.6 MGD could be delivered from the FCPS compared to the capacity needs of about 3 MGD as outlined in Replacement Section 5.
- There would be significant capital costs for construction of a new wastewater treatment plant, which would probably be greater on a cost per gallon basis than most of the plant expansion strategies outlined in the description of Alternative 3.

- Odors could be a potential problem from two locations and not just one. This is especially true if the satellite wastewater treatment plant were constructed near the FCPS, which is in close proximity to an outdoor shopping mall and a fished stream.
- The scale economy of one large treatment plant would not be enjoyed; instead, the Authority would be constrained to two separate facilities, including a smaller plant that would be generally less efficient on the cost to treat per gallon.
- Laboratory services would have to practically double in number of analysis performed. In addition, samples would have to be transported to the existing laboratory.
- Transport of sludge to the existing treatment plant would result in additional truck traffic, labor costs, and additional operating costs for the VFSA versus alternatives that do not include two wastewater treatment plants.
- In general, operating costs would be higher with two treatment plants versus one treatment plant.

Alternative 2 - Results of Screening

Alternative 2 was retained for further evaluation.

Alternative 3 - Increase capacity at the existing treatment plant maintaining a single discharge point

This alternative consists of providing additional capacity to the existing treatment plant through some combination of newly installed and constructed process equipment, or technological improvements to existing equipment. Several variations on this approach could be used to meet either long term or short-term capacity needs depending on the time frame of implementation. Variations on this alternative could be implemented to provide either partial or the total additional capacity needed. The options within this approach may range from converting the existing process to a more efficient process thereby gaining more capacity without adding in kind additional tanks and process equipment thereby gaining capacity while using the same technology.

Advantages

- The operating costs are likely to be less than those alternatives that are being evaluated which include a satellite plant. Maintenance costs will be reduced since all preventative and repair functions will be carried out in one location with a smaller staff.
- Management control would be kept in the hands of the VFSA. This is an advantage versus those alternatives that include an inter-municipal agreement where future pricing would be in the control of those providing the service.
- Sludge processing would be operated and maintained at the one existing location where there is existing capacity versus other alternatives where sludge may have to be processed at a separate location.
- Odor potential resulting from VFSA wastewater can be kept to one location where it can be most cost effectively controlled. This is an advantage over alternatives that include a satellite treatment plant where expenses and problems resulting from odors may result from two separate treatment plant locations.
- Potential for permit violations is minimized with one discharge point and one permit. Similarly environmental liability is limited to one location and controlled entirely by VFSA.
- Laboratory analysis and monitoring/permitting administration efforts are minimized. Assuming that the discharge permits conditions for monitoring would be similar to VFSA's existing permit, the monitoring requirements and associated expense for a satellite plant may nominally double.
- Discharge to the Schuylkill River is the least restrictive alternative from a regulatory perspective.

Disadvantages

- The existing wastewater treatment plant would get marginally larger depending on the specific alternative that is selected.
    - There could be as many as one more primary clarifier, aeration tank and secondary clarifier.
    - A third primary clarifier, assuming no additional process changes, may result in the potential of creating more odors.

- Additional sludge processing would result in the potential of generating additional odors, although these sources can be readily controlled.

Alternative 3 - Results of Screening

Alternative 3 was retained for further evaluation. It was decided to evaluate a broad range of Alternative 3 capacity upgrade strategies - from those that upgrade the technology to provide additional capacity while minimizing additional tankage and mechanical equipment, to those that use the same technology and expand upon the existing plant "in kind".

Evaluation of Retained Alternatives

The results of the evaluation identified alternatives that would be evaluated in further detail. This section presents the analysis of the retained alternatives, which are as follows:

Alternative 1 – Pump wastewater from the member municipalities (Schuylkill, East Pikeland, and Charlestown Townships) to the existing Phoenixville wastewater treatment facility for treatment. Such a strategy would require that appropriate conveyance facilities be constructed by VFSA at their expense. A contract for service would be negotiated and executed between the VFSA and Phoenixville. The two (2) options considered within this study include:

Alternative 1a - Diversion of flows from the French Creek Pump Station to Phoenixville's French Creek Interceptor, and

Alternative 1b - Diversion of VFSA's Pickering Creek Pump Station flow directly to the Phoenixville Wastewater Treatment Plant.

Alternative 2 – Construction of a new "satellite" wastewater treatment plant. Two options were considered within the Alternative 2 strategy.

Alternative 2a - Locating the plant near the French Creek Pump Station and conveying the treated wastewater to the Exelon's Cromby Facility for commingling and discharge with Exelon's existing wastewater treatment plant effluent.

Alternative 2b - Conveying the untreated wastewater from the French Creek Pump Station to the Cromby site. The new satellite treatment plant would be located at the Cromby site.

Alternative 3 – Expand the capacity of the existing VFSA wastewater treatment plant by providing the improvements and capacity upgrades that would be required to meet additional capacity requirements. Within Alternative 3, this study considers a range of capacity upgrade strategies ranging from conversion of the existing complete mix process to step feed, to expansion of the existing treatment process in kind by way of adding more primary, aeration, and secondary settling tanks. The sub-alternatives are described as alternatives 3a, through 3e.
Alternative 3a - Conversion of the existing complete mix activated sludge process to a step feed process.

Alternative 3b - Conversion of the existing complete mix activated sludge process to a step feed process and add a 4^{th} secondary clarifier.

Alternative 3c -Add a 2^{nd} aeration tank, a 4^{th} secondary clarifier, and a 3^{rd} primary settling tank.

Alternative 3d - Innovative alternatives such as the use of media processes

Alternative 3e - Add a 2^{nd} aeration tank and a 4^{th} secondary clarifier.

The alternatives described above are general strategies intended to provide a technically sound basis for a conceptual evaluation. Once a general strategy is selected, the specific concept needs to be developed to an appropriate level of detail prior to beginning implementation and the detailed design.

For this evaluation, the preliminary effluent criteria provided by PADEP, included in Appendix D, is used for evaluation of the alternatives. The present treatment plant's discharge permit has requirements for the removal of carbonaceous biochemical oxygen demand (BOD), total suspended solids (TSS), and ammonia. These limits require nitrification to take place in the

treatment plant and nitrification is the current limiting factor in the biological treatment process at the Authority's existing facility.

At this time, the Authority understands that PADEP has not imposed denitrification requirements on any wastewater treatment plants located along the Schuylkill River. However the potential for additional denitrification was considered in the detailed evaluation of alternatives.
It is important to note that the existing gravity thickeners are generally overloaded on the basis of solids load mainly as a result of trucked wastewaters. Sludge thickening and dewatering capacity is discussed later in Section 5. In spite of the present shortfall condition in thickening capacity because of trucked in wastewaters, the VFSA has been routinely meeting its discharge permit requirements. However it is noted that the current shortfall in thickening capacity is an item that should be addressed in any expansion capacity strategy. In 2005, approximately one-half (½) of all solids processed at the VFSA wastewater treatment plant originate from trucks discharging to the treatment plant's septic dump station. Accordingly any plant expansion alternative should consider in detail, the impact that trucked wastewaters have on the treatment process. At a minimum, additional gravity thickening and a 3rd dewatering device should be utilized if VFSA is to expand its capacity while maintaining or growing its current level of trucked wastewaters accepted at the plant.

Such consideration of solids handling and processing should also include a detailed evaluation of what ancillary upgrades, if any, need to be implemented if a technology upgrade is to be utilized for biological wastewater treatment. For example, use of Integrated Fixed Film Activated Sludge (IFAS), discussed in a following subsection may be optimal; however this option may require additional separate treatment of septage, and pretreatment to eliminate screenable wastes. Such factors need to be considered in greater detail than what is provided in the context of this conceptual alternatives analysis.

VFSA also has the ability to reduce the amount of trucked wastes accepted at the treatment facility. Although this may not be preferred, but it offers the Authority some flexibility in the evaluation of alternatives associated with solids handling.

Existing Wastewater Treatment Plant Capacity

PADEP approved capacity of the VFSA STP at 9.2 MGD. This capacity was the result of the plant rerate from 8.0 MGD to 9.2 MGD approved by the PADEP in 2000. To support the rerate to 9.2 MGD, Buchart-Horn (B-H) prepared a report entitled, "Re-rate Feasibility Evaluation for the Valley Forge Sewer Authority, July 1997". The evaluation included an assessment of the capacity and recommended upgrades of each individual component of the existing wastewater treatment plant to achieve a capacity upgrade from 8.0 MGD to 9.2 MGD. The results of the assessment are summarized in Table 7 of the report, reprinted as Table 5-1, below.

Table 5-1. Process Unit Capacity

Process Unit	Actual Capacity	Proposed Capacity for Re-rate	Comments
Influent Structure	21.4 MGD	9.2 MGD	No modifications required
Primary Clarifiers	10.0 MGD	9.8 MGD	No modifications required
Aeration Basins	12.0 MGD	9.5 MGD	Requires additional oxygen supply to satisfy nitrification requirements. Consideration to be given to baffling the tank to provide plug flow versus complete mix.
Final Clarifiers	10.3 MGD	9.5 MGD	Modify return sludge drawoff nozzles on FC Nos. 1 and 2.
Chlorine Contact Tank	11.0 MGD	9.4 MGD	Raise effluent weir to increase sidewater depth and use additional available tankage and pipe at tank inlet for contact time.
Gravity Thickeners	44,964 ppd 2.997MGD	34,847 ppd 0.66 MGD	Convert the existing decant tank for use as a third gravity thickener.
Primary Sludge Pumps	10.5+ MGD	9.6 MGD	No modifications required
Return Sludge Pumps	84%	45-70%	No modifications required
Waste Sludge Pumps	10.5+ MGD	9.5 MGD	No modifications required
Sludge Dewatering	43,200 ppd	31,657 ppd	No modifications required

The 1997 evaluation included recommended upgrades to be considered or needed to rerate the plant to 9.2 MGD, as follows:

1. Consider baffling the aeration tanks to achieve more efficient plug flow conditions versus the existing complete mix system.
2. Modify the return sludge draw off nozzles on final clarifiers No. 1 and 2.
3. Convert the existing decant tank for use as a third gravity thickener.
4. Raise the effluent weir of the chlorine contact tank to increase side water depth and use additional available tankage and tank inlet pipe to provide additional contact time.

Following that evaluation, a field study was performed to document that there is sufficient aeration capacity for a rated treatment plant capacity of 9.2 MGD with no tank modifications. The results of this evaluation, indicating that no additional aeration tanks were needed at an average daily flow of 9.2 MGD, were approved by PADEP.

Items 2 through 4, above were designed by B-H for the VFSA and installed under a construction permit issued by PADEP. Following the conversion of the decant tank (DT) to a thickener, this tank was then converted to a septage holding tank for better solids equalization capacity for trucked in wastewaters. This conversion reduced thickening capacity back to pre-rerate levels. As a sludge thickener, the DT tank did not achieve underflow sludge concentration sufficient for its continued use as a thickener.

After completion of the re-rate improvements, the "actual" capacities of the individual process units within the existing plant range from 9.2 MGD to 21.4 MGD. The current limiting processes consist of the aeration tanks, final clarifiers, and chlorine contact tank, each with an "actual" capacity of about 9.5 MGD. The next limiting process is the primary clarifiers, which have an "actual" capacity of 9.8 MGD. However starting in 2002 through mid-April of 2004, the VFSA operated consistently at an annual average flowrate of about 7 MGD with only one primary clarifier in service while producing effluent that consistently met effluent requirements.

For the purposes of this plant expansion evaluation, it is assumed that all alternatives would include new ultraviolet (UV) disinfection to replace the existing chlorination/dechlorination

system. Although VFSA has operated the chlorination system with no major incidents since the facility was started up in the mid-70s, future regulatory requirements relating to risk management have motivated many similar facilities to upgrade to UV disinfection. VFSA would require additional chlorination/dechlorination capacity to meet its long term future needs, and it would therefore be timely to upgrade their disinfection system concurrent with the capacity expansion.

Alternative 1 – Construct a New Satellite Wastewater Treatment Plant

Alternative 1 consists of constructing a new wastewater treatment facility that would treat wastewater flows from the French Creek pumping station's service area. This treatment plant would contain all capability to treat wastewater and discharge the treated wastewater into the Schuylkill River at or near the existing Exelon Cromby wastewater treatment plant outfall. Because of the relatively small size of the satellite treatment plant, there would be no solids treatment other than thickening to about three (3) percent solids. The solids from the satellite plant would be trucked to the existing plant for processing and dewatering. Processing and dewatering of sludge at the satellite plan would require additional facilities. It would also require more operating labor to manage biosolids processing at two separate locations, and therefore this option was not considered in detail.

For purposes of defining the costs associated with this alternative, it is assumed that:

- A fully automated sequencing batch reactor treatment plant would be utilized at the satellite facility. This is a fairly common technology for new wastewater treatment facilities of this size.
- Liquid sludge at a production rate of about 5,000 gallons per day would be trucked from the satellite plant to the VFSA treatment plant for processing.
- The existing plant laboratory would perform routine effluent analysis, and the VFSA would have to maintain a second discharge permit for the satellite facility, resulting in additional laboratory labor and supply costs.

For estimating lifecycle costs, it has been assumed that Alternative 1a would require the following upgrades at the existing VFSA plant after 10 years of operation:

- New UV disinfection.

- A fourth secondary clarifier.
- Conversion of the aeration system to step feed similar to Alternative 3a.

Further, it was assumed that operating costs would not vary significantly between this alternative and Alternative 3 (existing plant expansion) because of increased flows from growth that would occur 10 years into the future and beyond.

Advantages

- The major advantage of this alternative is that there would be less expansion needed at the existing plant.
- There would be some marginal power savings associated with pumping wastewater from the French Creek pumping station to the new satellite plant instead of to the existing VFSA treatment plant by way of four pumping stations in a cascading series.

Disadvantages

- The costs to operate and maintain two treatment plants would be greater than one treatment plant. The potential economy of scale of one treatment plant versus two would be lost. Additional operating cost items consist of:
  1. Trucking sludge from the satellite plant to the existing plant. This operation would require either VFSA to pay a licensed tank truck driver or contract for this service.
  2. Travel time for personnel to operate and maintain the satellite plant.
  3. Maintenance of two discharge permits, including the required laboratory services and the related regulatory risks.
  4. The potential of the satellite plant as a second odor source. In addition, the existing Pothouse, Whitehorse, and Pickering pump stations would have to be modified to accept flow rates that were well below their design capacity. Failure to adequately address this problem would result in the pumping stations becoming problematic sources of odor and potential increase in corrosion of concrete wet wells and other concrete structures.
  5. An average flow of only about 0.7 MGD could be delivered from the French Creek station. This rate is not sufficient to meet VFSA's long-term needs. Such an

approach would be marginal in meeting VFSA's 10-year needs and is a disadvantage of this alternative.

Alternative 2 – Pump Wastewater to Phoenixville for Treatment

Alternative 2 consists of rerouting the wastewater that is currently pumped to the existing VFSA WWTP to the existing Phoenixville Wastewater treatment plant. There are 2 subalternatives considered:

Alternative 2a – Pump wastewater from the existing French Creek Pump Station to Phoenixville's French Creek Intercepting Sewer, which feeds the Phoenixville Wastewater Treatment Plant

Alternative 2b – Pump wastewater from the existing Pickering Creek Pump Station to the Phoenixville Wastewater Treatment Plant.

Alternative 2a - Pump Wastewater from the Existing French Creek Pump Station to Phoenixville's French Creek Intercepting Sewer which feeds the Phoenixville Wastewater Treatment Plant

Alternative 2a would require the following components:

- Construction of a conveyance line from the existing French Creek Pump Station to Phoenixville's French Creek Intercepting Sewer.
- Modifications of the VFSA's French Creek pump station to divert flows to the new conveyance line.
- Construction of additional capacity at the Phoenixville WWTP.

Buchart-Horn estimates that the construction costs for the conveyance line and pump station modification would be approximately $2 million. All detailed cost estimates are in Appendix D.

In addition, an average flow of only about 0.7 MGD could be delivered from the French Creek station to Phoenixville. This would be insufficient to meet VFSA's long-term needs. Such an

approach would be only marginal at best in meeting VFSA's 10-year needs, and inadequate for long-term needs without additional capacity from another source.

Phoenixville provided the following estimates for connection and treatment costs for their system:

Tapping Fee	$7.40/gallon
Treatment Cost	$2.56/1000 gallons

These costs were used in calculating this alternatives capital and life cycle cost. For estimating lifecycle costs, it has been assumed that Alternative 2a would require the following upgrades at the VFSA plant after 10 years of operation:

- New UV disinfection.
- A fourth secondary clarifier.
- Conversion of the aeration system to step feed similar to Alternative 3a (plant expansion).

Further, it was assumed that operating costs would not vary significantly between this alternative and Alternative 3 because of increased flows from growth that would occur 10 years into the future and beyond.

Advantage

- VFSA's needs for expansion at the existing treatment plant would be delayed. As discussed above, it does not appear as if there would be sufficient capacity provided from diverting wastewater flows from the French Creek Station away from the VFSA treatment plant.
- There would be some marginal savings in operating costs related to power saved from eliminating the multiple pumping of the French Creek Pump Station flow through the VFSA cascading system.

Disadvantages

- A major disadvantage of this alternative is the higher capital and operating cost. The commercial rates charged by Phoenixville based on their rate schedule results in capital

and operating cost that are prohibitive relative to the alternatives that include an expansion in capacity at the VFSA treatment plant.

- As a customer of another municipality, VFSA would lose some control over the service that is provided to their customers. There is a risk that cost for service would escalate at a higher rate than for those alternatives where VFSA provides all of the wastewater conveyance and treatment service.
- This alternative does not completely satisfy the long-term wastewater management needs of the VFSA without providing future expansion facilities at the VFSA plant.

Alternative 2b - Pump Wastewater from the Existing Pickering Creek Pump Station to the Phoenixville Wastewater Treatment Plant

Alternative 2b would require the following components:

- Construction of a conveyance line from the existing Pickering Creek Pump Station to Phoenixville's Wastewater Treatment Plant.
- Modifications of the VFSA's Pickering Pump Station to divert flows to the new conveyance line.
- Construction of additional capacity at the Phoenixville WWTP.

Buchart-Horn estimates that the construction costs for the conveyance line and pump station modification would be approximately $2 million. If flow were diverted from the Pickering Creek Station, adequate capacity would exist for VFSA's service capacity for more than 10 years. The total capacity of the existing plant and the Pikering diversion provides 10.6 MGD and the 10-year need is 9.9 MGD. This only provides a marginal amount of safety factor at best.

The cost to connect and treat wastewater at Phoenixville under this alternative is the same as that for Alternative 2a.

For estimating lifecycle costs, it has been assumed that Alternative 2b would require the following upgrades at the VFSA Plant after 10 years of operation:

- New UV disinfection.

- A 4th secondary clarifier.

Further, it was assumed that operating costs would not vary significantly between this alternative and Alternative 3 because of increased flows from growth that would occur 10 years into the future and beyond.

Advantages

The advantages of Alternative 2b are that the VFSA's needs for expansion at the existing treatment plant would be delayed and reduced.

Disadvantages

- A major disadvantage of this alternative is the higher capital and operating cost. The commercial rates charged by Phoenixville as indicated in their rate schedule would result in capital and operating costs that were prohibitive relative to the alternatives that include an expansion in capacity at the existing VFSA treatment plant.
- As a customer of another municipality, VFSA would lose some control over the service that is provided to their customers. There is a risk that cost for service would escalate at a higher rate than for those alternatives where VFSA provides all of the wastewater conveyance and treatment service.
- Unlike Alternative 2a, there would not be any savings resulting from lower power usage at the pump stations. All four components of the cascade pumping system (i.e., French Creek, Pothouse, Whitehorse, and Pickering Creek pump stations) would still be necessary.

Alternative 3 – Expand Capacity of Existing VFSA STP

As noted previously, there are a number of ways that capacity expansion can be achieved, ranging from conversion to step feed, the use of fixed media processes, use of membrane processes, and/or provisions of additional tanks in kind. For this study, the following options were included for evaluation:

Alternative 3a - Conversion of the existing complete mix activated sludge process to a step feed process.

Alternative 3b - Conversion of the existing complete mix activated sludge process to a step feed process and add a 4th secondary clarifier.

Alternative 3c - Add a 2nd aeration tank, a 4th secondary clarifier, and a 3rd primary settling tank.

Alternative 3d - Innovative alternatives such as media processes.

Alternative 3e - Add a 2nd aeration tank and a 4th secondary clarifier.

Alternative 3a – Step Feed Process Conversion

Alternative 3a consists of the converting the existing complete mix process to step feed. As described in the "Biological Process Evaluation" by BCM Engineers prepared August 2004, "Step feed is a modified operating procedure that is feasible in the existing activated sludge tankage."

A similar strategy was proposed by Buchart-Horn in their "Rerate Feasibility Study". The BCM study concluded that if the existing process were converted to step feed, then the existing treatment plant could adequately treat up to 11 MGD of wastewater with the same or more operating flexibility as exists at present. However, while this is readily possible from a biological kinetics perspective, an increase of influent flow beyond current levels will present difficulties in the operation of the secondary clarifiers. Conversion to step feed would require that the current mixed liquor suspended solids (MLSS) concentrations be maintained at approximately the same levels while average daily influent flows increased to 11 MGD. There would be potential losses in operating flexibility in the secondary clarification process which is likely to result in risks to consistently meeting effluent permit requirements for total suspended solids (TSS).

It is noted that if the treatment plant were converted to a step feed process, according to the PADEP's "Domestic Wastewater Facilities Manual", additional secondary clarification will be necessary to treat an average daily flow of 11 MGD.

As discussed previously, trucked wastewaters also present potential impact to the aeration and secondary clarification process that would not exist if the treatment plant only treated its connected customers. Alternative 3a is the plant expansion alternative with the least operating flexibility and as a result would be impacted the greatest.

While the potential for loss of operating flexibility exists, implementation and testing of the step feed process can be performed well before the time additional capacity is actually needed. By implementing this alternative in the near future, the VFSA will be able to gain a better idea as to whether the loss of operating flexibility will be significant.
Alternative 3a may be feasible for flow rates of up to 10 MGD if chemical precipitation is added in the primary tanks in addition to a conversion to step feed. Ferric chloride can be added to the treatment plant influent. Chemical addition with appropriate detention time and mixing upstream of the primary settling process would serve to precipitate additional amounts of colloidal biochemical oxygen demand material which would normally pass through the primary settling process and require biological treatment in the aeration system. Instead of passing through the primary treatment process, these precipitated solids would be settled, collected, and removed upstream of the biological process thereby reducing the biochemical oxygen demand on the downstream secondary system. This strategy would provide additional biological treatment capacity without an increase in additional new tanks and their associated capital cost. However, the operating costs associated with chemical addition are significant.

Enhanced primary treatment by chemical addition will reduce the amount of waste activated sludge (WAS) that is produced in the process since the loading to the aeration system is reduced. WAS is generally difficult to dewater, however the additional precipitated metal-containing solids that occur in the primary settling process are similarly difficult to dewater. For this evaluation, it was assumed that these two changes would offset each other. However, the specific impact that plant expansion has on the solids processing would need to be evaluated in detail in the context of the long-term solids management plan at VFSA.

For estimating lifecycle costs, it has been assumed that Alternative 3a would require the addition of a fourth secondary clarifier after 10 years of operation.

Advantages

- The advantage of this alternative is that it may be initially implemented without the addition of new tanks and their associated capital cost up to an average daily flow of 10 MGD. According to the evaluation performed by BCM engineers, the process will provide 11 MGD of rated capacity for the aeration tank, not including any additional capacity that may be gained by improvement to primary settling via chemical addition. According to the Regional Act 537 flow projections, 11 MGD would provide for VFSA's capacity needs up to about 2030. However, treating influent flow beyond 10 MGD (about 2020) without a fourth secondary clarifier poses an unacceptable risk.
- Capital costs are delayed or avoided for an extended period of time if growth projections do not materialize as planned.
- Alternative 3a utilizes technologies that are the same or similar to those currently used at the wastewater treatment plant. No major operating or maintenance changes would need to be implemented.
- Alternative 3a may be implemented and tested before the capacity is actually needed. If it is found to be acceptable to meet the VFSA's intermediate term capacity needs, then additional wastewater treatment plant upgrades may be postponed or only constructed when long-term development occurs. Implementation of Alternative 3a may enable VFSA to meet its long-term capacity needs without additional tanks and with minimal chemical addition for an extended period of time; especially if development growth does not occur at the rate that is projected. However, it is important to evaluate whether this alternative will be able to consistently meet effluent quality requirements.

Disadvantages

- From an operating perspective, Alternative 3a may be acceptable as an interim step, however, assuming that long-term growth projections materialize as projected, plant additions beyond those included in Alternative 3a would be needed in the future.
- This alternative has the least operating flexibility and therefore is the Alternative with the most risk. It is also subject to negative effects resulting from the trucked wastewater business.

- Alternative 3a is unlikely to provide sufficient treatment plant capacity if a future regulatory requirement for denitrification is imposed by PADEP. A significant plant upgrade would be needed at that time.
- Operating costs would increase due to chemical costs which are significant. Process optimization may result in lower costs for chemicals, however increases in chemical costs, due to increasing commodity prices may also offset this process optimization.
- The potential for chemical costs to increase over time are a disadvantage compared to those alternatives that include higher capital cost but lower operating costs. The chemical sludge could also impact upon VFSA's successful land application program for biosolids.
- The biological treatment process increase in capacity would be gained from conversion by a complete mix to step feed. Although the gain in capacity would be achieved according to biological kinetics, the step feed process is not as resistant to upsets compared to the present complete mix process which is the optimal process for avoiding process upsets. Some loss of operating flexibility would occur.
- This alternative may be subject to upsets in the biological system from trucked wastewaters due to fluctuating organic loads. The present complete mix system is more forgiving to inconsistent influent characteristics as compared to step-feed.

Alternative 3b - Conversion of the existing complete mix activated sludge process to a step feed process and add a 4th secondary clarifier.

Alternative 3b is the same as 3a, except that Alternative 3b includes the addition of a 4th secondary clarifier that is similar in capacity to secondary clarifier No. 3. With the fourth clarifier there would not be a loss in operating flexibility from additional hydraulic loading to the secondary clarification system. Provided the conversion to step feed maintains nitrification with no loss of operating flexibility, the VFSA would be able to achieve a rated capacity of 11.3 MGD which is sufficient to meet its capacity needs until about 2030.

Advantages

- Alternative 3b includes all of the advantages as Alternative 3a. The process would utilize processes that are similar to those that are currently practiced at the present wastewater

treatment plant. Alternative 3b would readily achieve the capacity needed through 2024 of 11.3 MGD.

- Alternative 3b is not expected to require chemical addition to the primary tanks, and therefore these significant operating costs could be avoided.
- The presence of a 4th secondary clarifier provides a considerable amount of operating flexibility, which would not exist with alternative 3a. Therefore it is inherently less risky.

Disadvantages

- The biological treatment process increase in capacity would be gained by conversion from a complete mix to step feed. Although the gain in capacity would be achieved according to biological kinetics, the step feed process is not as resistant to upsets compared to the present complete mix process. Some loss of operating flexibility would likely occur.
- Alternative 3b which includes conversion to step feed, would be subject to upsets to the biological system from trucked wastewaters. To some extent the impacts would be partially mitigated by additional secondary settling capacity, but not entirely. The present complete mix system is more forgiving to inconsistent influent characteristics compared to step-feed.
- The inclusion of a fourth secondary settling tank is a significant capital cost compared to Alternative 3a.
- Alternative 3b would not provide the capability of denitrification. If future denitrification were required, additional aeration tank capacity would have to be provided in the future.
- Alternative 3b does not include additional primary settling capacity. However, it is noted that in 2002 through mid April of 2004, the VFSA STP routinely operated with one of the two primary clarifiers out of service at an annual average daily flow of about 7 MGD. Therefore the operating data suggests that additional primary clarification is not needed.

Alternative 3c - Add a 2nd aeration tank, a 4th secondary clarifier, and a 3rd primary settling tank

Alternative 3c is the same as Alternative 3e except that it includes the addition of a third primary clarifier. This alternative would essentially increase the primary clarification capacity by 50%,

aeration capacity by 50%, and the secondary clarification capacity by 33%. This alternative nominally provides the treatment plant with a rated capacity that is well beyond the 30-year projected capacity requirement. It would do so utilizing the same flexible technology extended air activated sludge that was part of the original plant design. No significant different O&M procedures would be needed.

Advantages

- Alternative 3c would enable VFSA to upgrade to a denitrification plant with minimum future changes, should this become a future effluent permit requirement.
- Of all the options considered within Alternative 3, 3c is the alternative that features the maximum amount of operating flexibility.
- If Alternative 3c is implemented, it is unlikely that VFSA would ever need to add additional tanks into the foreseeable future.

Disadvantages

- Although providing the maximum operational flexibility, Alternative 3c would have the highest capital cost.
- The addition of a 3rd primary clarifier may result in the potential for more odors since primary clarifiers are more likely to be sources of odor.
- For a future conversion to a denitrification plant, it may be desirable to maintain BOD loadings to the aeration system by reducing BOD removal in the primary clarifiers.

Alternative 3d - Innovative Alternatives

Alternative 3d consists of an upgrade of the current complete mix activated sludge system to an innovative process designed to increase system capacity without the construction of additional tanks. Integrated Fixed Film Activated Sludge (IFAS) is a process that may be applicable to a capacity expansion at the VFSA. The IFAS process combines fixed and suspended biological growth in one reactor by adding fixed or suspended media to an existing activated sludge basin. The suspended growth continues to behave like a conventional activated sludge process, while the fixed growth on the added media effectively increases sludge age, so complete nitrification

can occur. The fixed growth remains in the reactor, so solids loading on the final clarifiers are not increased. Essentially the concept includes making the aeration system more concentrated while using the media for increasing activated sludge age. While the concept would work well for increasing capacity without the increase of the aeration tanks a 4th secondary clarifier should be provided. In addition, there would need to be several capital changes to the existing treatment plant to make it work effectively.

Such changes include:

- Improved influent screening and grit removal. This system would also require odor control.
- Replacement of the existing surface aeration system with a diffused air blower system, either coarse or fine bubble. Some of the existing surface aeration may be usable as a supplement.
- Plant hydraulics must be evaluated in detail. There may be changes required to make the process work hydraulically.
- The optimal IFAS process must be evaluated and selected.
- It is likely that the plant instrumentation would need significant upgrades.
- Changes in biosolids characteristics could impact the solids handling processes.
- Trucked waste characteristics would have the potential to adversely affect the process; therefore, additional monitoring and/or regulation of loads may be required. Alternatively separate facilities to treat trucked wastes may be required thereby reducing the capital cost advantage of this alternative. It is likely that implementation of an IFAS process would need to be implemented only concurrent with a reduction of trucked wastewaters or the installation of separate facilities to biologically treat trucked wastewaters.

If VFSA were to pursue Alternative 3d, it would be necessary to perform a detailed conceptual study to establish the optimal IFAS process and equipment additions and upgrades that would be required.

For this evaluation a detailed analysis of the various IFAS processes and associated capital costs was not performed. These processes are typically used where a capacity increase and/or effluent

requirement upgrade of an existing facility are needed and additional tanks cannot be constructed because of space requirements or some other reason. It appears that the VFSA has adequate space for the plant expansion alternatives described above; however, if there is an objective to upgrade the plant's capacity without adding tanks, then it would be appropriate to evaluate the various IFAS alternatives in detail along with the supplemental process changes and trucked wastewater acceptance changes that would be needed to accommodate IFAS.

Advantages

The advantage of an IFAS process is that it would be designed to make use of the existing treatment plant footprint. In concept, the required additional capacity could be added without adding any additional large process tanks.

Disadvantages

- The IFAS strategy would result in significant changes from the current activated sludge process and the overall stability of the system could potentially be lessened compared to other expansion strategies.
- Implementation of an IFAS process would require a detailed evaluation as to the optimal specific process, ancillary equipment and instrumentation changes needed to make it work dependably. There is the potential that the trucked waste would need to be more carefully regulated or pretreated so as to maintain the stability of the treatment process. Alternatively separate treatment facilities could be added for trucked wastewaters.
- While it has not yet been rigorously established, the costs for conversion of the present process to an IFAS process are expected to be significant. In their August 2004 process evaluation, the engineering firm BCM estimated the equipment costs to convert the current WWTP aeration basins to a Moving Bed Biological Reactor (MBBR) system at $1.8 million for equipment alone. This estimate did not include the equipment necessary to upgrade the pretreatment system. Total capital costs to convert to an IFAS process may be more than $5 million.

Alternative 3e - Add a 2nd aeration tank and a 4th secondary clarifier – Retain the current complete mix activated process

Alternative 3e maintains the current treatment process and includes the addition of a 3rd aeration tank and 4th secondary clarifier. The 3rd aeration tank will enable VFSA to maintain the stable complete mix system while providing the needed capacity for its future growth. For this evaluation, it is assumed that the new aeration tank would be sized similarly to the two existing aeration tanks and the 4th secondary clarifier would be sized to match secondary clarifier No. 3, therefore maintaining hydraulic symmetry throughout the treatment plant.

Advantages

- Alternative 3e would enable VFSA to maintain the same technologies that are currently used to treat its influent wastewaters. With excess tank capacity resulting from expanding with similarly sized tanks, the VFSA would meet its future capacity needs and maintain operating a sufficient level of flexibility.
- The additional aeration tank, although a significant capital cost, will enable VFSA to take tanks out of service for routine maintenance without a significant amount of risk of effluent permit violations.
- As with Alternative 3b, 3e would not require chemical addition to the primary clarifiers thus avoiding significant chemical costs.
- Primary clarifiers have a higher potential for odors compared to secondary clarifiers and aeration tanks. The lack of an additional primary clarifier assures that odor potential will not increase.
- If there were a future requirement to provide denitrification, Alternative 3e should have sufficient aeration tank capacity to provide denitrification without the addition of more tankage by utilizing one of the integrated fixed film activated sludge systems.

Disadvantages

- Alternative 3e does not include additional primary settling capacity. However, it is noted that in 2002 through mid April of 2004, the VFSA STP routinely operated with one of two primary clarifiers out of service, an annual average daily flow of about 7 MGD thereby indicating an excess of operating capacity on a routine basis. This capacity would need to be documented and approved by the PADEP.

- The inclusions of a fourth secondary clarifier and a third aeration tank are significant capital costs.

Alternative 4 – No Action

The final alternative considered was the "no action" alternative. This would not allow for the treatment of any of the additional projected flow to be generated in the VFSA Service Area.

Table 5-2. Advantages and Disadvantages of Alternative 4.

Advantages	Disadvantages
- No cost.	- Future wastewater flows in the service area indicate that additional wastewater facilities will be necessary to address the needs of the service area municipalities.

Selected Alternative

Alternative 3e is the recommended alternative because it is the alternative that provides the optimal combination of operating flexibility, minimal risk, and appropriate capital costs considering the short and long term capacity needs of the VFSA.

Solids Thickening and Dewatering Capacity

In addition to the need to address the liquid treatment capacity, it is also necessary to address the capacity of the sludge and biosolids treatment processes. This section provides a summary of the solids thickening and dewatering needs of the VFSA wastewater treatment plant. Additional capacity and upgrades are recommended as follows:

- Provide an additional gravity thickener for a total of three (3) gravity thickeners.
- Provide two (2) new state-of-the-art dewatering devices that each have a capacity of 1,350 lb/hour.
- Provide all associated appurtenances to accommodate this equipment.

The existing solids thickening and dewatering system consists of a splitter box, two (2) 40-foot diameter gravity thickening tanks with mechanical sludge withdrawal, two centrifuge feed pumps, a bulk polymer tank, two (2) centrifuges (each with a polymer feed system), a hydrated lime storage silo, two (2) lime day tanks with feed conveyors, and a dewatered biosolids conveyor/mixing system.

When the plant was rerated from an average daily design capacity of 8.0 to 9.2 MGD in 2000, there was no additional dewatering equipment installed. Extending the hours that the equipment was operated accommodated dewatering additional biosolids beyond the original design intent. Extended hours of dewatering equipment operation were also used to accommodate services for the septage and trucked wastewater hauling service. Thickening was address by converting an existing decant tank (DT) to a thickener.

The existing equipment was well built and is well maintained; however, the existing centrifuges have been in continuous service for over 30 years and are not state-of-the-art technology. Based on the original plant design concept, the expansion of the gravity thickening capacity would be approximately 53% to accommodate an increase in average flow from 8.0 to the long-term projected flow. This increase would result in the need for a 3rd gravity thickener that is approximately the same diameter as the existing thickeners. A larger new thickener could be added at a relatively small increase in construction cost to provide additional operational flexibility. Such a larger thickener would also enable VFSA to more easily accommodate trucked wastewaters, as well as maintenance outages without significant process disruption.

The VFSA currently operates two (2) centrifuges to dewater the gravity thickened biosolids. Each centrifuge has a capacity of approximately 900 dry pounds per hour, resulting in a total plant capacity of 1,800 dry pounds per hour. Similarly, assuming additional thickening capacity and future acceptance of trucked wastewaters, the VFSA would have to operate up to 3 shifts per day with existing dewatering equipment. Without trucked wastewaters, VFSA could meet its long term future dewatering needs without additional capacity, and overtime levels could actually be reduced versus current levels. The continued acceptance of various types of trucked

wastewaters is a decision. The VFSA needs to make this decision based on the overall operating philosophy and market conditions. Such factors have the potential to change over time.

Since the existing centrifuges are over 30-years old, it would be beneficial to add new state-of-the-art equipment, which could provide additional capacity and increased efficiency thereby reducing operating and maintenance costs in the long run. In addition to modernizing the plant, new equipment would enable VFSA to provide excess dewatering capacity, which would both provide operating flexibility as well as enable VFSA to accept trucked wastewaters, while reducing operating costs for overtime..

Based on the original plant design concept, the expansion of the dewatering capacity would be approximately 50% to accommodate an increase in average flow from 8.0 to the long-term projected flow. Replacement of the 2 centrifuges with new dewatering devices with 50% additional capacity each would result in providing the needed capacity while also upgrading the dewatering equipment to the most modern technology.

Thickening

The VFSA currently operates two (2) gravity thickeners, each 40 feet in diameter. An analysis of the hydraulic and solids' loading to the thickener indicates that sufficient hydraulic capacity exists, but the thickeners have inadequate solids loading capacity. This solids loading thickening capacity shortfall exists whether or not the VFSA continued acceptance of trucked wastewaters; however, because solids from the trucked wastewater business amounts to almost half (½) of the total solids processed, the capacity shortfall will be much greater with the continued future acceptance of trucked wastewaters.

Hydraulics

On a daily average basis (based on May 2005 through April 2006 data) VFSA's thickeners receive a typical loading of 675,000 gpd. The two (2) tanks have an area of approximately 2,500 square ft, resulting in a hydraulic loading of 240 gpd/square foot. According to WPCF MOP 8, "thickeners generally are designed on a rise rate of 400 to 800 gpd/square foot. Excessive liquid detention time is to be avoided as septic conditions can result and cause odors." Therefore our

current loading of 240 gpd/square foot is well below the design criterion of 400 to 800 gpd/square foot, and additional hydraulic capacity is not needed.

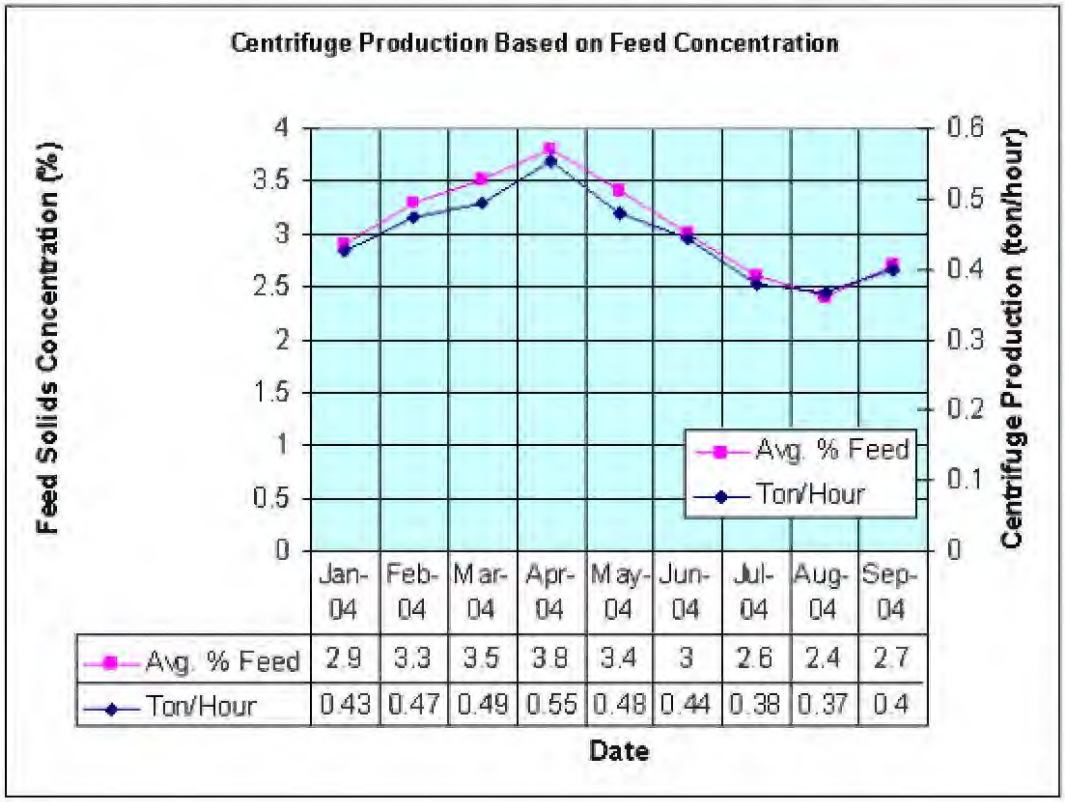
Solids Loading

Below are the VFSA's average solids loadings from May 2005 through April 2006 data, along with design criteria per the Water Environment Federation's Manual of Practice for Design (WEF MOP 8):

Table 5-4. VFSA's Average Solids Loading, May 2005 – April 2006.

Source	Average lb/day	Required Area lb/ft^2 (Per WEF MOP 8)	Required Area (ft^2)
Waste Activated Sludge	6,143	Secondary Sludge 2.65	2,318
Primary Sludge	5,463	Primary Sludge 10	546
Subtotal (Waste Activated and Primary Sludge	11,606		2,864
Trucked Waste (DAT/DT)	17,704	Primary sludge 10	1,770
Total Required (includes trucked waste)	24,947		4,634
Available with DT			3,210
Available w/o DT			2,500

The current capacity with the DT utilized as a thickener is 3,210 square feet of surface area. Even if the VFSA eliminated trucked waste receipt and put the DT into service as a thickener, the present solids loading requirement would only be met only marginally. Please note that the DT tank does not contribute very much capacity because of its relatively small diameter. The thickener system is overloaded in terms of solids loading and additional capacity is needed.



The VFSA is able to operate the treatment plant successfully at present loadings, because of the excess of organic capacity that currently exists in the remainder of the treatment system. Overloading the thickeners results in excess organic discharge over the thickener effluent weirs into the plant internal recycle stream. This organic discharge is recycled back to the head of the

plant for treatment. Although this operating flexibility enables VFSA to manage the capacity shortfall in an acceptable manner, their may be negative implications with regard to odor. As the numbers of connected customers increase according to the growth projected in this Act 537 plan, this excess organic treatment capacity will decrease and the deficit of thickening capacity will result in substantial risk of process upsets. As a result, effluent quality will suffer.

The recommended thickening capacity is 4,045 square feet of surface area for a connected flow of 11.3 MGD with no trucked waste. To include the existing trucked waste business volume and an assumed increase of 10% overall growth of the business, the recommended thickening surface area is 6,045 square feet. The two 40-foot diameter units and one (1) additional 57.5-foot diameter unit are needed to meet this requirement. Without inclusion of the septage business, the existing gravity thickening capacity is marginal, and a third thickener is recommended to allow for maintenance outages of one thickening tank to prevent solids handling disruptions.

Furthermore, additional gravity thickening capacity could improve the efficiency of the centrifuges by providing higher centrifuge feed solids concentrations. This claim is clearly demonstrated in the chart below of monthly 2004 data. The correlation of higher thickened solids content to dewatered cake solids is clear.

Figure 5-1. Centrifuge Production Based on Feed Concentration.

In summary:

- The existing thickening capacity is marginal at present without inclusion of trucked wastewaters. With the presence of trucked wastewaters, the VFSA's thickening capacity is insufficient for current loadings.
- Additional thickening capacity is needed to accommodate future connected customers.
- A third thickener sized at about 57.5 feet in diameter could accommodate future growth while providing the necessary flexibility to handle maintenance outages with a minimum of operational disruption.
- To add operational flexibility, a thickener could be added.

Dewatering Capacity

The available dewatering capacity is 17,520 hours per year based on both centrifuges operating continuously. The actual 2005 dewatering hours was approximately half (½) of that total or 8,790 hours. The actual operating hours include both machines operating 5 days per week

between two (2) and three (3) shifts per day, depending upon trucked waste loading. During 2005, the VFSA processed approximately 4,700 dry tons of biosolids products.

Based on data from the last 5 years recorded in the "Valley Forge Sewer Authority Annual Summary", the average solids production from connected customers versus trucked waste are as follows:

Table 5-5. Average Solids Production From Connected Customers Versus Trucked Waste.

Year	Dewatered Solids from Connected Customers (dry tons per day)	Dewatered Solids from Trucked Wastewater Business (dry tons per day)	Total Dewatered Solids (dry tons per day)
2005	6.2	5.9	12.1
2004	10.1**	5.5	15.6**
2003	7.2	5.7	12.9
2002	7.0	4.2	11.2
2001	6.3	4.2	10.5
Average	6.7	5.1	11.8

**Outlier. Not included in average

The data indicates that about 43 percent of the solids dewatered at VFSA originate from the septage business.

The following are the estimated sludge dewatering capacity requirements for the projected growth estimated to occur 10, 20, and 30 years into the future:

Table 5-6. Estimated Sludge Dewatering Capacity Requirements.

Years	Projected Flow Capacity Needed (MGD)	Dewatered Solids From Connected Customers (dry tons per day)	Dewatered Solids From Trucked Waste Business (dry tons per day)	Total Dewatered Solids (dry tons per day)
Current	7.6	5.8	5.1	10.9
10	9.7	7.4	6.0	13.4
20	10.6	8.1	6.0	14.1
30	11.4	8.7	6.0	14.7

Table 5-6 above indicates the VFSA can meet its dewatering capacity requirements into the distant future for its connected customers if the current operating time is maintained. If the septage business is maintained, additional run time is required or the dewatering capacity per hour must be increased with an additional machine or with machines of greater capacity.

Considering the existing centrifuges are over 30 years old, there may be benefit in replacing the units with new larger units. Such an upgrade will provide the operating flexibility to maintain or even grow the trucked wastewater business. Increased dewatering capacity will also provide VFSA with the flexibility to reduce operating hours to less than two (2) full shifts.

Replacement of the two (2) centrifuges with new dewatering devices each with 50 percent additional capacity would provide the needed capacity while also upgrading the dewatering equipment to the most modern technology.

Plant Improvements

This section outlines the improvements that would logically be made to the VFSA STP concurrently with an expansion of the existing STP. The items described in this section are not required to meet future connected capacity needs; however, these items will serve to upgrade and modernize the plant. The improvements described in this section are considered conceptual and subject to more detailed engineering evaluation.

The existing STP, constructed in the mid-1970's, was well-built and has been well-maintained. However, the available technology features and advancement in equipment have improved over the last 30 years and it would be appropriate to upgrade the treatment in order to provide state-of-the-art equipment and automation. Some of these improvements, if implemented, will also provide savings in operating and maintenance costs.

In summary, the recommended upgrades are as follows:

- Influent chamber modifications
- New centralized plant automation.
- Upgrades to the existing chlorine building.
- Additions and modifications to the Control Building odor control system.
- Additions and modifications to the influent and primary influent odor control system.
- Operations and Maintenance Building upgrades.
- In-house loading tank system and recycle stream handling improvements.
- A day bin for biosolids.
- A blend tank for dewatering feed.
- Existing biosolids conveyor system upgrade.

The following describes in conceptual terms, the recommended improvements and rational basis for these recommendations.

Influent Chamber Modifications

Several modifications are needed to be conducted to prepare for the increased flows in the future. These constructions items include but are not limited to:

- Forcemain changes and upgrades
- Bypassing around influent meters and channels, and connection to existing site piping downstream
- Gate replacement

Centralized Plant Automation

The existing treatment control system consists of the original 1970's technology plus advances that were made by the VFSA staff in recent years. Allen Bradley process logical controllers (PLCs) are used to control the aeration, dewatering, and polymer systems. To modernize, centralize and expand the plant's control systems, the following upgrades are recommended:

- Ethernet data highway. Graphical interface with the network, which includes indication of parameters and control. Access to data highway via the internet for access of data as well as control.
- Implementation of a user-friendly graphical interface package such as Wonder Wear®
- Monitoring parameters online such as pH, temperature, D.O. (upgraded technology for measurement) TSS, Organic Load (or other BOD derivative), Ammonia, others as required. And indication on network graphic interface.
- Wireless data transmission from remote plant locations where this is found to be cost effective and needed.
- Capability to easily access key process data for analysis from authorized PCs.
- An upgraded maintenance software package.

Chlorine Building Renovation

The existing building contains three rooms that house chlorine and sulfur dioxide storage, chlorine and sulfur dioxide feed equipment, effluent sampling equipment, and utility water (treated effluent) pumps.

The plant expansion alternative includes the conversion from gaseous chlorine disinfection to ultraviolet light (UV) disinfection. This conversion will allow renovation of the building use to include the following:

- UV system maintenance room for UV module lifting hoists, a space to clean UV bulbs, spare parts storage area, local instrument indicators and controls.
- Chemical storage of liquid sodium hypochlorite and feed equipment for periodic return sludge chlorination.
- The utility water pump system is 1970 technology and has been a source of maintenance problems. It should be replaced with more modern equipment with increased capacity.

- A new effluent monitoring station with appropriate online analyzers is also recommended.

Added Odor Control for Control Building

The off gasses from the Control Building recycle tanks, existing centrifuges, degrit area, DT tank, and DAT tank are treated in an activated carbon treatment system. This system is effective in removing the compounds that cause most of the odor from the treatment plant – sulfur containing compounds (including hydrogen sulfide). However, the more complex compounds and those derived from ammonia (amines) are not entirely removed by the existing system. Therefore, additional controls are recommended for treating odors from the Operations Building. For the purposes of this study, a two stage chemical wet scrubber system is considered as the needed improvement. The specific components and design will be evaluated in further detail prior to implementation.

Permanent Installation of Primary Settling Tank Odor Control

Previous odor studies suggest that a significant portion of the potential odors associated with the normal operation of the STP may come from the quiescent surfaces of the primary tanks. The VFSA staff has conducted tests utilizing iron salts to oxidize hydrogen sulfide and thereby reduce odors in the influent to the WWTP. These tests showed promise in the summer of 2005. The additional testing being conducted in the spring and summer of 2006, indicates that potential for excess light solid precipitants from the process. Accordingly alternate odor control chemicals that do not produce precipitated solids are being evaluated.

It is recommended that upgrades to this system be added concurrently with the required capacity upgrades. Such upgrades would consist of a permanent installation of chemical addition equipment, including chemical storage tanks and metering equipment.

Additionally, covers for the open sections of the tanks could be added to the primary clarifiers; however, these must be designed to enable safe and easy routine maintenance of the tanks, as well as providing ventilation that is adequate to prevent corrosion beneath the covers of the tanks.

The specific type of odor control upgrades for the influent should be evaluated in more detail. If a permanent system for odor control chemical addition is decided upon, then an optimal dosing philosophy should be established that balances considerable chemical costs with the potential for odor in the surrounding communities.

Upgrade Operations Building

The existing Operations Building is over 30 years old and there has not been a renovation of the building since the plant was commissioned. Renovating the building would update the operations and maintenance areas while providing a safe and pleasant working environment for the VFSA employees. The renovation would encompass the existing Control Room, lunch room, locker room, and maintenance shop. It would include upgrading the appearance and ventilation system in these rooms as well as providing better functionality therein. Such renovations would include upgrading lifting cranes, compressors, and equipment.

In addition, there is a large potential work area that is currently occupied by pressure filters that were built but never commissioned. These filters were converted to trucked wastewater storage, but this converted system has not been used to date due to lack of need. Improvements to the Operations Building should include the removal of these large pressure filters and conversion of the space to a usable workspace for maintenance activities and parts storage.

In-House Loading Tank Improvements

Recycle flows consisting of gravity thickener overflow and centrifuge centrate are routed by gravity to a sloped-bottom rectangular "in-house" loading tank located below the ground level of the operations building. There is a larger operating tank and a smaller spare tank. Four (4) pumps operated in parallel to return the internal wastewater flows back to the plant influent structure. These tanks were originally designed to store treated water as part of the pressure filter system. However, they were converted to handle these generally high strength wastewater streams. Off gas from the in-house is presently routed to the existing Phoenix activated carbon system. This odor control system also treats odors from the degrit cyclone area, conveyor system and centrifuge vent.

Although the system works satisfactorily, it is not without certain operating and maintenance problems. The ceilings of these tanks, which are a portion of the buildings first floor, were not designed for high strength wastewater. Corrosion of the ceiling has occurred and it must be coated on a regular basis. There is some risk of structural failure.

In addition, these tanks do not have a means for easily removing solids that accumulate at the bottom and top of the tank. As a result, the VFSA must pay a contractor to clean the tank on a yearly basis, and this could cost about $15,000 per cleaning, or more.
The recommended improvement for this system includes:

- Adding a pumped mixing system.
- Replacing the concrete ceiling.
- Adding larger access hatches
- Improving the ventilation.

Solids Processing Improvements

The current solids processing consists of gravity thickening followed by centrifuge dewatering, mixing with hydrated lime, and daily loading onto trailers for hauling to land application sites. This appears to be a viable means of processing and utilization into the foreseeable future.

In addition to adding capacity via new state-of-the-art dewatering devices, there are several improvements to this system that are recommended:

Day Bin for Biosolids

Currently, dewatered biosolids fall from the centrifuges into an existing shaftless screw conveyor system. There, the solids are mixed with hydrated lime and conveyed into a 40 cubic yard contractor-owned trailer that is positioned with a VFSA-owned Jockey Truck. This system requires the trailer to be jockeyed every 20 minutes or so to evenly load the biosolids. This operation is a labor-intensive task. The installation of the new day bin would eliminate this task as trailers could be loaded by the contractor's drivers. This improvement would free up an operator for other O&M duties. In addition, with appropriate odor controls, a day bin could practically eliminate the truck loading operation as a significant source of plant odor.

The day bin would be sized for the volume of biosolids that would be generated over a two or three day period, resulting in a capacity of about 200 wet tons.

The day bin would contain additional mechanical equipment such as the loading mechanisms on the bottom that would require normal maintenance. This additional maintenance would be offset by the reduced O&M costs for the existing jockey truck.

In addition to the day bin, modifications to the existing conveyor system would be necessary to properly load the bin. At the least, one of the existing conveyors would have to be extended in order to reach the top of the bin.

Blend Tank for Dewatering Feed

The existing gravity thickener bottoms are used to feed the centrifuges. The gravity thickeners are subjected to variability in their influent characteristics that result from three separate sources of influent (primary, waste activated and trucked sources). The variability in influent characteristics also affects the consistency of the thickener bottoms, and makes it more difficult to produce a consistently dry cake and optimize use of chemicals. The function of a blend tank will be to take in thickener bottoms, and mix it thereby producing a consistent dewatering process feed.

Conveyor Modifications

The existing conveyor system has adequate capacity to meet the additional dewatering equipment that is being considered. An extension, as described in the forgoing subsection would be needed to feed the day bin. As with VFSA's existing system, most conveyor system designs used at other plants do not include replication of the conveying equipment, because any failure could be fixed relatively quickly. However, some replication of equipment would provide a margin of safety to keep the dewatering process operating during conveyor liner replacement and repair activities. Appropriate conveyor modifications should be considered as part of the specific changes that are being considered to increase and upgrade the solids handling system.

Figure 5-2 depicts a general aerial view of the existing treatment plant with the proposed modifications.

Figure 5-2. Proposed wastewater treatment plant layout

No Action Alternative

The No Action Alternative is rejected, because it fails to satisfy objectives of Act 537 Plan, and it is inconsistent with objectives and policies of municipal planning documents and state regulations.

A. Perform an evaluation of all viable alternatives identified in the previous section of the Plan for consistency with all related municipal, county, and state planning documents and programs including copies of notification and responses from all appropriate planning agencies.

As discussed in Section 5, Alternative 3e was the selected alternative, which involved the construction of a second aeration tank and a fourth secondary clarifier.

Table 6-1. Consistency Evaluation of Selected Alternative from Section 5.

Evaluation Category	Consistency		Comments
	Yes	No	
Plans developed under the Clean Streams Law or Section 208	X		All water discharged into the waters of the Commonwealth must satisfy the requirements assigned by Pennsylvania Department of Environmental Resources (DEP). Alternative 3e will be constructed and operated within the requirements of DEP. The selected alternative is consistent with the objectives of the Clean Stream Laws.
Municipal Wasteload Management Plans (Chapter 94)	X		The alternative is associated with treatment of projected flow not the creation of new flow. This alternative will aid in the prevention of an overload hydraulically or organically resulting from the projected connections; therefore, the alternative does not conflict with Chapter 94. The selected alternative is consistent with the objectives of the Chapter 94.
Plans developed under the Clean Water Act	N/A		Not applicable. No federal funding anticipated.
Chester County Landscapes 1996-2020-Comprehensive Plan – Policy Element.	X		The Comprehensive Plan indicates that improvements shall be consistent with land use policy to maintain and upgrade existing sewer and water facilities, to address problems, and to support revitalization and development activities. The alternative should not adversely impact that plan. The selected alternative is consistent with the objectives of Chester County's Comprehensive Plan.
Municipal Comprehensive Plans	X		This Act 537 Plan addresses the maximum wastewater load associated with the eight Townships that comprise the region in the vicinity of VFSA. The values associated with the plan were determined from the zoning requirements of each township. The selected alternative is consistent with Municipal Comprehensive Plans.

Evaluation Category	Consistency		Comments
	Yes	No	
Antidegradation requirements (Chapters 93, 95, 102)	X		No exceptional or high quality streams will be impacted by the alternatives. Construction activities associated with expansion of existing facilities would be subject to statewide Erosion and Sedimentation controls. Preliminary effluent criteria have been established by PADEP and are included in Appendix E. The selected alternative is consistent with Antidegradation requirements.
State Water Plan (Subbasin #2)	X		The Schuylkill River in the vicinity of the proposed improvements is listed as impaired in the State Water Plan. The impact of this listing is not yet known because TMDLs for the river have not been established. PADEP will control the TMDL by the limits established for the permit. The selected alternative will not produce non-point pollution. Therefore, the alternative will not adversely impact the intent of the State Water Plan. The selected alternative is consistent with the State Water Plan.
Pa. Prime Agricultural Land Policy	X		All of the construction associated with the selected alternative would occur on property owned by the VFSA. Therefore, agricultural land will not be impacted. The selected alternative is consistent with the PA Prime Agricultural Land Policy.
Chester County Stormwater Management Plans (Act 167)	X		All construction will be permitted in accordance with applicable stormwater management plans. Currently, there is no reason to suspect that the selected alternative cannot satisfy the requirements of these plans. Therefore, there will be no impact upon the stormwater management plans Each alternative is consistent with Chester County Stormwater Management Plan.
Wetland Protection (Chapter 105)	X		A review of the wetlands maps indicated that there are no wetlands in the vicinity of construction. Therefore, the impact upon wetland should be none. Additionally, all construction will be designed and permitted in accordance with Chapter 105. The selected alternative is consistent with Chapter 105.
PNDI Review	X		A PNDI Project Environmental Review was conducted on March 27, 2006 and the results showed three (3) potential impacts with the U.S. Fish and Wildlife Service, PA Department of Conservation and Natural Resources, and PA Fish and Boat Commission. The receipt of this search is included in Appendix F. Information was sent to these agencies for further review and responses were received indicating no potential effect as long as there is no disturbance within any wetland. For the PA Fish and Boat Commission, if there will be any direct or indirect on any wetland, a habitat suitability assessment for bug turtles must be completed. The responses are included also in Appendix F. The selected alternative is consistent with the PNDI.

Evaluation Category	Consistency		Comments
	Yes	No	
PHMC Review	X		A request was sent to the Pennsylvania Historical and Museum Commission for analysis of potential impacts on archaeological resources as a result of the construction activities. A reply was received indicating a high probability exists that archaeological resources may occur with the proposed permit area, and can be seen in Appendix G. If federal funding were being pursued for the construction an appropriate survey would need to be conducted to determine the exact potential of effect. There is no federal funding being pursued for the construction of the selected alternative; therefore, the selected alternative is consistent with the requirements of PHMC.

B. Provide copies of correspondence indicating resolution of any inconsistencies with appropriate planning agencies.

No inconsistencies were noted. All correspondence regarding the PNDI and PHMC can be seen in Appendix F and G, respectively.

C. Perform and evaluation of all identified viable alternatives with respect to applicable water quality standards, effluent limitations, other technical, legislative, or legal requirements.

The VFSA STP currently discharges effluent to the Schuylkill River under NPDES Permit No. PA 0043974. In preparation for the evaluation of alternatives to expand the STP, a request was made to PADEP for effluent criteria at the new design flow rate. Preliminary effluent limits for the expanded STP were provided by PADEP, as referenced previously and are included in Appendix D. The selected alternative is capable of meeting the specified criteria.

D. Prepare opinions of probable construction costs, including allowances for soft costs such as engineering, legal, and administrative costs, for each of the identified viable alternatives. Prepare operating cost estimates for each alternative and perform a present worth analysis to finance the alternative.

and

E. Prepare an analysis of funding methods available to finance the identified viable alternatives, including documentation to support which alternatives and financing scheme, in combination, is most cost effect.

Expansion Alternative Capital Costs

Conceptual level construction costs for each alternative were estimated by Buchart-Horn and included a 25% contingency. Buchart-Horn's documentation to support these estimates is included as Appendix D. Note that the estimates do not include Alternative 3d, which is the construction of an IFAS process. A more detailed evaluation would be necessary to establish reliable construction costs for IFAS. Table 6-2, below summarizes the estimated project costs for the expansion alternative. All of the alternatives listed as "Alternative 3" (i.e., b, c, d) include the addition of UV disinfection. Estimated project costs for a 3rd thickener, dewatering devices and other plant improvements are presented in separate tables later in this section. For evaluating capital costs and the present worth of alternatives, a 25% factor is applied for associated project costs such as engineering, legal, finance and other administrative expenses.

The capital cost comparison is based on a flow rate of 11.4 MGD. The cost of delayed expansion items for each alternative is added in so an equal comparison can be made.

Table 6-2. Estimated Project Cost for the Expansion Alternatives

Alternative No.	Alternative Description	Estimated 2006 Construction Cost (million $)	Associated Project Cost @ 25% of Construction	Estimated Total Capital Cost (2006)
1a	Locate a Satellite Plant at Cromby	$10.02	$2.50	$12.52
1b	Locate a Satellite Plant at French Creek, Discharge at Cromby	$10.65	$2.66	$13.31
2a	Divert French Creek pump station and discharge to Phoenixville, including Phoenixville Tapping Fee	$7.43	$1.86	$9.29
2b	Divert Pickering Creek pump station to Phoenixville, including Phoenixville Tapping fee.	$6.46	$1.62	$8.08
3b	Alt. 1a plus add a 4th Clarifier	$4.65	$1.16	$5.81
3c	Alt 1c plus add a 3rd Primary Clarifier	$10.10	$2.53	$12.63
3e	**Current process plus add a 3rd Aeration Tank and 4th Clarifier**	**$8.28**	**$2.07**	**$10.35**

Based on the conceptual project cost estimates, Alternative 3b is the least costly.

Expansion Alternatives Estimated Operating Costs

Table 6-3, presents the estimated operating costs of each expansion alternative. This comparison was based on the projected 10-year flow rate of 10 MGD to provide the expected average annual cost for the 20-year period. Beyond the 10-year flow projection, the alternatives that include flow diversion of the French Creek pump station (Alternatives 1a, 1b, and 2a) would require additional capital and operating costs to meet longer term capacity requirements. This is because an average flow of only about 0.7 MGD could be delivered from the French Creek station. This would be insufficient to meet VFSA's long-term (20-year) needs. In addition, such an approach would be only marginal in meeting VFSA's 10-year needs.

Table 6-3. Estimated 2006 Annual Operating Costs (Expressed per $1,000 unless otherwise noted)

NULL = OPERATIONS BASED ON CURRENT PLANT CONDITIONS (2006)

Operating costs for alternative 3d were not developed.

Highlights of the operating cost summary include:

- Operating cost increases for various alternatives that include modifications and upgrades of the wastewater treatment plant are generally related to treating additional wastewater flows such as increased power, chemical addition, and solids transportation and disposal.
- Alternative 3d - IFAS processes should be considered in further detail. Operating costs (not presented in Table 6-3) are likely to be competitive with the other plant expansion alternatives.

- Relatively higher operating costs for the Phoenixville wastewater diversion (Alts. 2a & 2b) are due to the high-metered rates charged by the Borough. These are the rates listed in their rate schedule.
- There is some pump station power operating cost savings in Alternatives 1a, 1b, and 2a that include diverting wastewaters from the French Creek pump station; however, this is not enough to offset other increased operating costs.
- The satellite treatment plant alternatives' higher operating costs are related to increased O&M labor (2 additional O&M employees were estimated); laboratory costs (in order to accommodate 2 separate permits and associated monitoring); and solids transport and disposal (routine trucking from the satellite plant to the existing STP would be needed).
- For alternatives requiring additional capacity 10-years into the future, it was assumed that operating costs would escalate similarly (differences between alternatives are likely to be negligible), and therefore incremental operating cost differences between alternatives in the distant future are not considered in this comparison.

Present Worth Comparison

Table 6-4 presents a summary of the capital, operating and present worth of each alternative using a 20-year project life and 4 percent annual discount rate. The summary is shown in graphic form in Figure 1. Alternatives 3b, and 3e appear to be the most cost effective from a present worth perspective. Note that although alternatives 1a and 1b are comparable in present worth to Alternative 3e, but they would only provide the capacity that is needed for a limited time frame. After that time, additional capacity may be needed.

Table 6-4. 2006 Present Worth Analysis (Costs are in million dollars)

Alternative No.	Null	1a	1b	2a	2b	3a	3b	3c	3e
Construction Cost ($million)	0	4.57	5.2	1.98	2.01		4.65	10.1	8.28

Capital Cost (MM$)	0	**5.75**	**6.5**	**8.38**	**8.41**		**5.81**	**12.63**	**10.35**
Additional Operating Cost ($million/year)	0	0.56	0.56	0.83	0.95		0.32	0.33	0.32
Present Worth Factor (P/A, 4.0%, 20 years)	13.6	13.6	13.6	13.6	13.6		13.6	13.6	13.6
Present Worth of Annual Costs	0	**7.69**	**7.69**	**11.3**	**13**		**4.38**	**4.46**	**4.4**
Annualized Cost Factor (A/P, 4%, 20 years)	0.07	0.07	0.07	0.07	0.07		0.07	0.07	0.07
Annualized Capital Cost	0	0.37	0.42	0.59	0.59		0.38	0.82	0.67
Future Construction Cost in 10-years	0	6.45	6.45	6.45	5.27		0	0	0
Future Capital Cost (includes 25% Eng and Admin)	0	8.07	8.07	8.07	6.59		0	0	0
Present Worth Factor (P/F, 4% 20 years)	0.676	0.676	0.676	0.676	0.676		0.676	0.676	0.676
Present Worth of Future Costs		**5.45**	**5.45**	**5.45**	**4.45**				
Present Worth Cost of Alternative ($million)	**0**	**18.84**	**19.63**	**25.16**	**25.83**		**10.19**	**17.08**	**14.75**

Although alternative 3e is more costly in present worth than 3a and 3b, it would provide additional operating flexibility while meeting all long-term capacity needs. Alternative 1d provides the most operating flexibility, but at the highest capital cost of the plant expansion alternative. IFAS costs are expected to be at the higher range of the plant alternatives and this

strategy would warrant further study if additional tanks at the plant was not considered to be a viable option.

While IFAS is promising, an additional study would be required to establish whether such a design (including all pretreatment components that would be required) is the optimal design in terms of reliability and cost.

While Alternatives 1 and 2 have some favorable aspects, they would only provide some of the long-term future capacity needed. Accordingly the need to expand the existing plant in the future results in these alternatives being higher in present worth costs compared to alternatives consisting of expansion of the existing plant.

Biosolids Handling Capacity Improvements

Table 6-5 below outlines the estimated capital costs for additional gravity thickening and dewatering. The construction estimates are conceptual and include a 25 percent contingency. When additional engineering is performed, the capital costs can be estimated to a higher degree of accuracy. The associated project costs for engineering, legal, finance and other administration fees are estimated at 25 percent of construction. Documentation of construction cost estimates is included in the Appendix D.

Table 6-5. Estimated 2006 Capital Costs – Solids Thickening and Dewatering

Thickening and Dewatering Addition	Estimated 2006 Construction Cost ($ million)	Associated Project Cost @ 25% of Construction	Estimated Total Project Cost (2006) ($M)
One Additional Gravity Thickener including ancillary equipment	$0.9	$0.22	$1.12
Two New Dewatering Devices including ancillary equipment	$2.0	$0.50	$2.50
Subtotal	**$2.9**	**$0.72**	**$3.62**

Plant Upgrades

Table 6-6 outlines the estimated capital costs for the improvements described in Section 5. The construction estimates are conceptual and include a 25 percent contingency. When additional engineering is performed, the capital costs can be estimated to a higher degree of accuracy. The associated project costs for engineering, legal, finance, and other administration fees are estimates at 25 percent of construction. Documentation of capital cost estimating is included the in Appendix D.

Table 6-6 Estimated Capital Costs – Wastewater Treatment Plant Improvements

Proposed WWTP Improvement	Estimated 2006 Construction Cost ($ million)	Associated Project Cost @ 25% of Construction	Estimated Total Project Cost (2006) ($M)
Influent Chamber Modifications	$0.80	$.200	$1.000
Centralized Plant Automation.	$0.66	$0.165	$0.825
Renovation of Chorine Building	$0.08	$0.020	$0.100
Utility Water System Replacement and Upgrade	$0.31	$0.076	$0.386
Control Building Odor Control System	$0.47	$0.118	$0.588
Influent Odor Control System (chemical addition, assumed)	$0.10	$0.025	$0.125
Upgrade Operations Building	$0.90	$0.226	$1.126
Improve Recycle Stream Handling	$0.22	$0.056	$0.276
Day Bin for Biosolids Staging and Truck Loading	$1.00	$0.250	$1.250
Addition of a Blend Tank for Dewatering Feed	$0.366	$0.0925	0.458
Replicate Biosolids Conveyor System	$0.62	$0.155	$0.775
Subtotal – Plant Improvements	**$5.53**	**$1.384**	**$6.909**

Conclusions

This section presented a conceptual analysis of the capacity expansion alternatives that were retained for evaluation as well as other non-capacity-related plant improvements. Conclusions of this analysis:

- The alternatives that include expansion of capacity at the existing VFSA treatment plant appear to be the most viable, because they are the lowest in present worth cost and allow for meeting both the short and long-term future capacity needs.
- The specific plant expansion strategy needs to be determined. In general, those alternatives that include the additional aeration tank provide more operating flexibility at a higher capital cost.
- Any expansion strategy should include the impact that trucked wastewaters have on the treatment process. At a minimum, additional gravity thickening and dewatering capacity should be provided if VFSA is to expand its service capacity while maintaining (or growing) its current level of trucked wastewaters at the plant.

The cost analysis presented in Section 6 is conceptual only and should not be used as stand alone budget for the anticipated expansion project. It does, however, provide the necessary comparative analysis to identify focus in on the most cost effective solution for the expansion.

Project Funding Sources

The selected alternative will be financed by tax-exempt municipal bonds. The individual municipalities will be given the option to make capital contributions to offset the borrowing. The cost sharing for each partner municipality and the VFSA can be seen in Table 6-7.

Table 6-7. Project Cost Sharing

Plant expansion

Estimated total		$13,970,000		
	MGD *		Percent of expansion	Est. $ share expansion cost
Easttown	0.000		0.00	$0
East Whiteland	1.969		80.30	$11,217,768
Malvern	0.000			
Tredyffrin	0.199		8.12	$1,133,942
Valley Forge	0.000			
Willistown	0.284		11.58	$1,618,290
	2.460		100.00	$13,970,000

Plant upgrade

Estimated total		$5,909,000		
			Percent of upgrade	Est. $ share upgrade cost
Easttown	1.523		0.1655	$1,143,740
East Whiteland	1.940		0.2109	$1,456,898
Malvern	0.544		0.0591	$408,532
Tredyffrin	2.001		0.2175	$1,502,708
Valley Forge	2.128		0.2313	$1,598,082
Willistown	1.064		0.1157	$799,041
	9.200			$6,909,000

Grand total	**Upgrade**	**Expansion**	**Total Contribution**	**Overall Percent of the Project**
Easttown	$1,143,740	$0	$ 1,143,740	0.055
East Whiteland	$1,456,898	$11,217,768	$ 12,674,666	0.607
Malvern	$408,532		$ 408,532	0.020
Tredyffrin	$1,502,708	$1,133,942	$ 2,636,650	0.126
Valley Forge	$1,598,082		$ 1,598,082	0.077
Willistown	$799,041	$1,618,290	$ 2,417,331	0.116
	$6,909,000	$13,970,000	$ 20,879,000	1

1. MGD* = Projected ultimate capacity less current owned

Example: East Whiteland projected need 3.909 less current reserved capacity 1.940 equals 1.969 mgd

2. Overall percent of the project is to be utilized in calculating planning and engineering expenses
3. The cost estimates presume that the existing treatment plant is expanded and upgraded utilizing existing technology

F. Prepare an analysis of the need for immediate or phased implementation of each identified viable alternative including descriptions for any activities to abate critical public health hazards, or for any advantages to phasing implementation of the sewage management program.

No immediate actions are necessary to abate critical public health hazards. There is no need for phased implementation according to connection projections.

G. Evaluate administrative organizations and legal authority necessary for plan implementation. Provide a narrative description.

Refer to Section 7A for evaluation of administrative organizations and legal authority necessary for plan implementation.

A. Provide a narrative description of the Authority's financial status, operating, and administrative resources and legal authority to implement the selected alternative based upon information provided by the Authority.

Overview of the VFSA

The Townships of Schuylkill, East Pikeland, and Charlestown in Chester County, Pennsylvania organized the Valley Forge Sewer Authority (VFSA) in the late 1960s for the purposes of acquiring, constructing, maintaining, owning or leasing sewer systems and sewage treatment works. On November 1, 1970 VFSA entered into an agreement to provide wastewater treatment services to the following municipalities in Eastern Chester County: Easttown Township, East Whiteland Township, Malvern Borough, Tredyffrin Township and Willistown Township (VCTS Municipalities). These five municipalities, along with the three VFSA organizing municipalities are collectively referred to as the VFSA Partner municipalities. The VFSA and each VCTS Municipality has a specific reserved capacity at the 9.2 million gallons per day (MGD) Valley Forge Sewage Treatment Plant (STP), located in Schuylkill Township.

Table 7-1 Current Capital Cost Sharing Summary for 2005

Partner Municipality	Reserve Capacity Available		2005 Capacity Utilized (MGD)	2005 Capacity Rented (MGD)
	Percentage	MGD		
Easttown	16.55%	1.523	1.357	0
East Whiteland	20.87%	1.94	1.963	0.023
Malvern	6.13%	0.564	0.329	0
Tredyffrin	21.75%	2.001	1.128	0
V.F.S.A.	23.13%	2.128	1.480	0
Willistown	11.57%	1.064	1.221	0.157
Total	**100.00%**	**9.2**	**7.478**	**0.180**

The 1970 Agreement authorizes the VFSA to provide capacity for the Partners. The cost sharing of capital improvement expenditures to date have been based on allocated percentages identified in Table 7-1. Capital expenditures for expansion and improvements identified in this Plan will be shared by the Partners by a revised cost allocation. Refer to Section 6 for the cost sharing of the selected alternative and improvements.

The VFSA finances, owns and operates its collection and transmission facilities in East Pikeland, Charlestown and Schuylkill Townships' independent of the 1970 Agreement. The other VFSA Service Area Municipalities are responsible for the financing, ownership and operation of their collection and conveyance system independent of any agreements, and are also parties to agreements where they use facilities in downstream municipalities.

Two major agreements have been signed with respect to sewer system components within the VFSA Service Area: the Valley Creek Trunk Sewer (VCTS) Agreement and the East Whiteland Trunk Line (EWTL) Agreement. In accordance with the VCTS Agreement, Tredyffrin is responsible for financing, ownership and operation of the VCTS within Tredyffrin Township, which means the main pumping station and the force main to the Valley Forge STP. East Whiteland, in accordance with the EWTL Agreement, is responsible for the financing, ownership and operation of the EWTL within East Whiteland Township.

Financial Statement

In 2004, the Authority called its bond issue which financed the original construction of the Authority's facilities as well as several upgrade projects. The bond issue was refinanced with a bank note saving the Authority $487,000 in interest over the life of the note. The remaining fee in this note is $ 1,800,000 and will be completely satisfied by 2010. The Authority will finance its share of the pending project from its Capital Improvement Fund which currently has a balance of $ 16,610,107.

The Partners will provide funds for the pending project from funds on hand or thorough loans or bond issues.

B. Provide a narrative description of the various institutional alternatives necessary to implement the selected alternative.

The selected alternative can be fully implemented by the current organization of the VFSA. The VFSA has a total of 27 employees combining full-time and part-time employees. Operation,

maintenance, collection system, and laboratory consist of 15 employees, and the other 12 employees are involved in administration and engineering. Therefore, no changes are proposed to the existing arrangement to implement the recommendations of this plan.

C. Provide a narrative description of the necessary administrative and legal activities required to ensure implementation of the selected alternative.

The VFSA, via agreements with the VFSA member municipalities has the Authority to implement the plan and has successfully undertaken projects in the past.
The following legal activities are necessary for plan implementation:

1. Obtain necessary permits including, but not limited to:
    a. Part I – NPDES permit for discharge criteria
    b. Part II – NPDES permit for construction
    c. Sediment and Erosion Control Plan (approval)
2. Obligate funds for the overall project and collect accordingly from the Partner Municipalities.

D. Identify the chosen institutional alternative for implementing the selected alternative and provide justification considering administrative issues, organizational needs and legal authority.

As stated previously, there are no proposed changes to the current institutional arrangement since Agreements already exist that allow the planning and implementation of this pending project.

The following institutional activities must be accomplished for plan implementation:

1. Obtain municipal adoptions for this plan.
2. Initiate design and permitting processes for proposed project.

A. Recommended Technical Wastewater Disposal Alternative 8-1

B. Recommended Capital Financing Plan 8-2

Appendices:

None

Figures:

None

Exhibits:

None

A. Prepare a narrative to identify the recommended technical wastewater disposal alternative with justification for the recommendations based upon needs, cost effectiveness, and environmental considerations.

Based on this evaluation the following summarizes recommendations for VFSA to proceed with meeting the wastewater disposal needs established by the Service area Municipalities.

- Alternative 3e, expansion of the existing wastewater treatment plant from 9.2 MGD to a permitted capacity of 11.52 MGD is the recommended alternative. This alternative is comprised of the upgrade and expansion of the exiting wastewater treatment plant including UV disinfection and the addition of a 4th clarifier and a 3rd aeration basin. Alternative 3e provides an adequate amount of operational flexibility, with a minimal amount of risk, and the capital cost is appropriate to the level of capacity that will be added. It meets VFSA's capacity needs into the distant future. It will also enable VFSA to upgrade to a denitrification plant if needed due to future regulatory requirements without major structural additions.
- Capacity additions that are required for dewatering should be added. The analysis presented in this report suggests that two new dewatering devices, each at a capacity of 150% of the existing centrifuges are appropriate. This will provide VFSA with sufficient dewatering capacity to dewater its connected customers' solids during a one-shift working day. This was the same basis as was used for sizing the existing wastewater treatment plant and will provide adequate capacity into the long-term future.
- Additional gravity thickening capacity is marginal at the present time and therefore more capacity is needed and should be added in a timely manner.

  Potential plant improvements are presented with a discussion of the benefits in terms of operating flexibility and the potential of upgrading the existing plant from mid-1970s to state-of-the-art technology. Implement plant improvements based on an analysis of the benefits and costs.

Alternative 3e (increase Capacity at Existing Plant) was selected because it is the most cost efficient, satisfies ultimate-treatment demand for the affected area in and of itself, is consistent with objectives and policies of municipal planning documents and regulations, and is easily implemented.

The selected alternative satisfies the guidelines established in Section 6. Discharge to high quality or exceptional streams and disturbance of recreational and historical areas are avoided, and construction is minimized. All flow stays within the Schuylkill River Basin, maintaining the water balance there.

B. Prepare a narrative to identify the recommended capital financing plan selected to implement the recommended alternative.

This alternative will be financed by tax-exempt municipal bonds. The individual municipalities will be given the option to make capital contributions to offset the borrowing. A breakdown of the cost estimate is included in Appendix D. The proposed implementation schedule for this project is presented in Table 8-1.

Table 8-1. Implementation Schedule

Date	Task
November 2006	VFSA Approval (August Board Meeting)
December 2006	Submit 537 Plan to Municipalities and County Planning Agencies and Health Department
February 2006	Public Advertisement of Plan
March 2007	Approval obtained from all Agencies
April 2007	VFSA Adopts
July 2007	Submit to PADEP
October 2007	PADEP approval
January 2008	Design Contract
December 2008	Complete Design
April 2008	Obtain Permits
August 2009	Award Contract
September 2009	Begin Construction
December 2010	Begin Operations

APPENDIX A

Valley Forge Sewer Authority

Article of Incorporation

Commonwealth of Pennsylvania

Department of State

3-1-69.03 16

Office of The
Secretary of the Commonwealth

To all to whom these Presents shall come, Greeting:

WHEREAS, In and by the provisions of the Municipality Authorities Act approved May 2, 1945, P. L. 382, as amended, the Secretary of the Commonwealth is authorized and required to issue a

CERTIFICATE OF INCORPORATION

evidencing the incorporation of an authority under the provisions of said Act.

AND WHEREAS, The stipulations and conditions of said Act have been fully complied with by the Municipal Authorities of the Charlestown Township, East Pikeland Township, and Schuylkill Township, all of the County of Chester

Commonwealth of Pennsylvania desiring the organization of

VALLEY FORGE SEWER AUTHORITY

THEREFORE, KNOW YE, That subject to the Constitution of this Commonwealth, and under the authority of Act No. 164, approved the second day of May, Anno Domini one thousand nine hundred and forty-five, P. L. 382, as amended, I DO BY THESE PRESENTS, which I have caused to be sealed with the Great Seal of the Commonwealth, declare and certify the creation, erection and incorporation of

VALLEY FORGE SEWER AUTHORITY

into a body politic and corporate in deed and in law by the name chosen hereinbefore specified, now to become operative with authority to transact business, and which shall exist for a term of fifty years unless sooner dissolved according to law.

Such corporation shall have and enjoy and shall be the subject to all the powers, duties, requirements, and restrictions, specified and enjoined in and by the above Act of Assembly and all other applicable laws of this Commonwealth.

GIVEN under my Hand and the Great Seal of the Commonwealth, at the City of Harrisburg, this 6th day of February, in the year of our Lord one thousand nine hundred and sixty-nine and of the Commonwealth the one hundred and ninety-third

ARTICLES OF INCORPORATION

TO THE SECRETARY OF THE COMMONWEALTH OF PENNSYLVANIA:

In compliance with the requirements of the Municipality Authorities Act of 1945, approved May 2, 1945, P. L. 382, as amended, Charlestown Township, East Pikeland Township and Schuylkill Township, all of which are Second Class Townships situated in Chester County, Pennsylvania, pursuant to duly adopted resolutions expressing the intention and desire of the municipal authorities of said townships to organize an Authority under said Act, do hereby certify:

(a) The name of the Authority shall be VALLEY FORGE SEWER AUTHORITY.

(b) The Valley Forge Sewer Authority is formed under the Municipality Authorities Act of 1945, May 2, P. L. 382, as amended.

(c) The following authorities have been organized under the Municipality Authorities Act of 1945 or the Municipality Authorities Act of 1935 and are in existence in or for the incorporating municipalities:

Charlestown Township Municipal Authority

Schuylkill Township Sewer Authority

(d) The names of the incorporating municipalities are Charlestown Township, East Pikeland Township and Schuylkill Township. The names and addresses of their municipal authorities, being the members of the boards of supervisors of said townships are as follows:

Charlestown Township

Charles D. Glackin	27 Marion Road, Phoenixville, Pennsylvania
Charles E. Ott	Charlestown Road, R.D. #1, Malvern, Pennsylvania
Harold F. Pyle	Yellow Springs Road, R.D. #1, Malvern, Pennsylvania

East Pikeland Township

John F. Yeager	Western Road, R.D. #2, Phoenixville, Pennsylvania
William A. McCord	Valley Dell Road Phoenixville, Pennsylvania
Earl F. Emery	Cold Stream Road Phoenixville, Pennsylvania

Schuylkill Township

C. W. Bothwell, Jr.	City Line Avenue, Phoenixville, Pennsylvania
H. Brent Bamberger	87 Rossiter Avenue, Phoenixville, Pennsylvania
Charles E. Rammel	Country Club Road, Valley Forge, Pennsylvania

(e) The names, addresses and terms of office of the first members of the Board of Valley Forge Sewer Authority are:

	Name	Address	Appointing District	Term of Office Expiring
1	Michael Stevens	Mary Hill Road Phoenixville, Pa.	Charlestown Township	12/31/1969
2	Andrew Nesspor, Jr.	Route 29, R.D.#2 Phoenixville, Pa.	Charlestown Township	12/31/1970
3	John A. Gubanich	6 Glaicia Drive Phoenixville, Pa.	East Pikeland Township	12/31/1971
4	William J. Walker	1251 Township Line Rd., Phoenixville, Pa.	East Pikeland Township	12/31/1972
5	Joseph Weinstock	1234 Pothouse Road Phoenixville, Pa.	Schuylkill Township	12/31/1973
6	Richard Leeson	Ferry Lane & Pawling Road Phoenixville, Pa.	Schuylkill Township	12/31/1969

There shall be six members of the Board of said Authority. Subject to existing and future provisions of law, each Board of Supervisors of the incorporating townships shall continue to appoint two members of the Board of the said Authority.

(f) The purposes for which said Authority is organized are to acquire, hold, construct, improve, maintain, operate, own and lease, either in the capacity of lessor or lessee, sewers, sewer systems or parts thereof, sewage treatment works, including works for treating and disposing of

industrial waste, and such other purposes provided by said Municipality Authorities Act as may be incidental to the above enumerated purposes.

IN WITNESS WHEREOF, the undersigned have executed these Articles of Incorporation on behalf of the Townships above named and have caused the seals thereof to be affixed hereto as of the 28th day of October, 1968.

MEMBER MUNICIPALITY COLLECTION SYSTEM

INTRODUCTION

The Valley Forge Sewer Authority (VFSA) is an operating Authority created in 1968 by Charlestown Township, East Pikeland Township and Schuylkill Township, all northern Chester County communities. This Authority is the owner and operator of the 8 million gallon per day regional wastewater treatment plant as well as an extensive sewage collection and transmission system. In addition to providing service to the creating Townships, the Authority provides wastewater treatment services for Easttown Township, East Whiteland Township, Malvern Borough, Tredyffrin Township and Willistown Township, all of which are located in Chester County, south of the Valley Forge Sewer Authority Service Area along U.S. Route 30. Recently, the VFSA has also extended sewer service to a small portion of West Vincent Township.

The three Townships forming the Valley Forge Sewer Authority are called the Member Municipalities. The other municipalities originally connected to the regional wastewater system are the Partner Municipalities.

This report is limited to the evaluation of the Valley Forge Sewer Authority collection system which serves the Member Municipalities. It is intended to serve as an appendix to the Regional Act 537 Plan which addresses the wastewater needs of both the Partner and Member Municipalities. To accomplish the Regional Act 537 Plan, each Member and Partner Municipality was requested to either develop or update its municipal Act 537 Plan detailing the community's wastewater disposal needs. The Member Municipalities each accomplished this task. As a part of the Act 537 planning process, Charlestown, East Pikeland , and Schuylkill Townships designated a sewer service boundary within their municipality. All development, existing and proposed, which is within this boundary is to be provided with public sewage collection facilities for conveyance of wastewater to the regional treatment plant for processing and disposal. The Act 537 Sewer Boundary as designated by the Member Municipalities is displayed on Exhibit No. 1.

EXISTING CONDITIONS

The member municipality collection system currently consists of approximately 68 miles of gravity sewer with pipe diameters ranging in size from 6" to 42", four major pump stations, and six minor pump stations. See Exhibit 2. The sewerage network also includes approximately 3,000 LF of low pressure sewer systems. The majority of the collection system transmits wastewater to the VFSA wastewater treatment plant, via the four major pump stations which operate in series. A small portion of the collection system, located in the southern end of Charlestown Township, transmits wastewater to the regional treatment plant via the Valley Creek Trunk Sewer and Wilson Road Pump Station in Tredyffrin Township.

Pump Stations

Four of the minor pump stations pump to the four major pump stations. The remaining two minor pump stations pump directly to the wastewater treatment plant. The relationship between the various pump stations is described below and depicted in Figure 1.

Minor Pump Stations	Major Pump Stations
Kimbel Drive Pump Station discharges to	FRENCH CREEK PUMP STATION discharges to
Sandra La. & Charlestown Rd. Pump Station discharge to	POTHOUSE RD. PUMP STATION discharges to WHITEHORSE RD. PUMP STATION discharges to
Country Club Rd. Pump Station discharges to	PICKERING CREEK PUMP STATION discharges to VFSA WWTP
Valley Creek Pump Station discharges to	WILSON RD. PUMP STA. FORCE MAIN discharges to VFSA WWTP
Perkiomen Pump Station discharges to	PICKERING CREEK P. S. FORCE MAIN discharges to VFSA WWTP

Table No. 1 lists the capacity of each metered pump station and the average daily flow and maximum daily flow recorded at each pump station over the last three years. The gallons per day per dwelling unit for average and maximum daily flows are also provided in Table No. 1. Where known, the results of pump station drawdown testing is noted.

The Valley Forge Region experienced drought conditions in 1991 and 1992 considerably reducing the average daily flows. Therefore, the flow data for 1991 and 1992 would skew the analysis herein, so the discussion is limited to a three year duration (1993 - 1995). Additionally, in January 1996 the Valley Forge Region experienced severe flooding. Watertight manhole inserts had been removed by a contractor in French Creek Drainage Basin invalidating flow data at the four major pump stations, however, the January 1996 flow data has been incorporated into this report for Perkiomen and Valley Creek pump stations.

ADF - Annual average daily flow
MDF - Maximum flow day recorded for the year

MGD - Million gallons per day
GPD/EDU - Gallons per day per equivalent dwelling unit

All of the Valley Forge Sewer Authority Pump Stations are wet well/dry well configured. Each has two centrifugal pumps operating in a lead/lag mode. Pickering Creek Pump Station also has a jockey pump which handles normal average daily flows. Each of the major pump stations are equipped with variable pump speed control systems (Flow Matcher), however, these variable speed systems are set to run the pumps at the maximum constant speed. The VFSA determined the electric consumption compared to the power utility's rate structure resulted in no benefit to operating in a variable speed mode.

All of the pump stations are equipped with an emergency generator and with reliable auto transfer switch systems. In addition, each pump station includes an alarm monitoring system with automatic dialer to alert maintenance personnel of operating problems. Each pump station also has connection facilities for portable bypass pumping.

Operations

A formal predictive/preventative maintenance program covers all collection system pumping stations which are visited seven (7) days a week. The program includes routine wet well cleaning.

VFSA assigns two (2) staff members to maintain the sewage collection system. One staff member is the designated collection system maintenance supervisor, and the second position is filled by weekly rotating operators from the wastewater treatment to the collection system. This rotation expands the experience and knowledge base of the overall staff to address emergencies, vacations, and sick leave. Repair maintenance activities are supported by nine (9) plant maintenance staff and outside contractors. The wastewater treatment plant is staffed sixteen (16) hours per day, five (5) days per week. The operation of facilities is monitored on weekends and the WWTP is staffed five (5) hours per day Saturday, Sunday, and holidays. Remote alarms acknowledge emergency conditions and alert VFSA staff to respond to the facility during unattended hours.

The metered pump stations are equipped with twenty-four hour circular charts and totalizer. The metered data is recorded during the daily site visit. Although the operators usually read the meters at approximately the same time each day, various circumstances may cause readings to be delayed or shortened by several hours. Since the totalizer data is used for evaluation, the total flow, typically based on a 24 hour period, may actually cover anywhere from a 20 to 30 hour period. The 6 metered pump stations in the VFSA system need to be read on a consistent schedule. This could be resolved by reading the meter results electronically. The data could also be transmitted back to the wastewater treatment plant, considerably reducing the labor required to visit the pump stations on a daily basis. Conceptual cost $9,000 for first installation, $6,500 for subsequent installations. A pump station alarm system upgrade was accomplished in 1995. The only effort necessitating daily visits now that the alarm upgrade is complete is obtaining the flow data. The pump stations would still be routinely visited to accomplish wet well cleaning and verify system operation.

Collection System

The member municipality collection system is in satisfactory operating condition. Repairs are promptly conducted when problems are identified.

In the collection system, trouble sewer lines are routinely flushed. The VFSA has annual contracts for right-of-way clearing and I/I correction (sewer rehabilitation). The I/I study and corrective action plan includes: key manhole monitoring, plug and weir testing in problem areas, internal video inspection and cleaning and grouting where necessary.

CONNECTIONS TO THE MEMBER MUNICIPALITY COLLECTION SYSTEM

The number of connected equivalent dwelling units, EDUs, is computed quarterly by pump station drainage basin and municipality. Table No. 2 provides the number of EDUs by pump station for the past three years. The EDUs listed are exclusive of EDUs from upstream pump stations.

TABLE NO. 2
YEAR END EDUs BY PUMP STATION①

Major Pump Station②	1993 EDUs	1994 EDUs	1995 EDUs
French Creek	1,859	1,922.5	1,978

Charlestown Road	115.5	119.5	128
Country Club Road	0	27	72
②Lee Boulevard	116	154	169
Total	**3,852.5**	**4,084**	**4,096**

①Year End EDUs as counted on the first day of the following year.
② Lee Boulevard is not a pump station. It meters the flow that passes through the Valley Creek Trunk Sewer and Wilson Rd. Pump Station.

As previously noted, only three years of data are presented because 1991 and 1992 were drought years. It was determined that the earlier years would skew the projections developed herein.

The number of EDUs is also reported by member municipality. The number of EDUs connected by municipality for 1993 through 1995 is listed in Table No. 3.

TABLE NO. 3

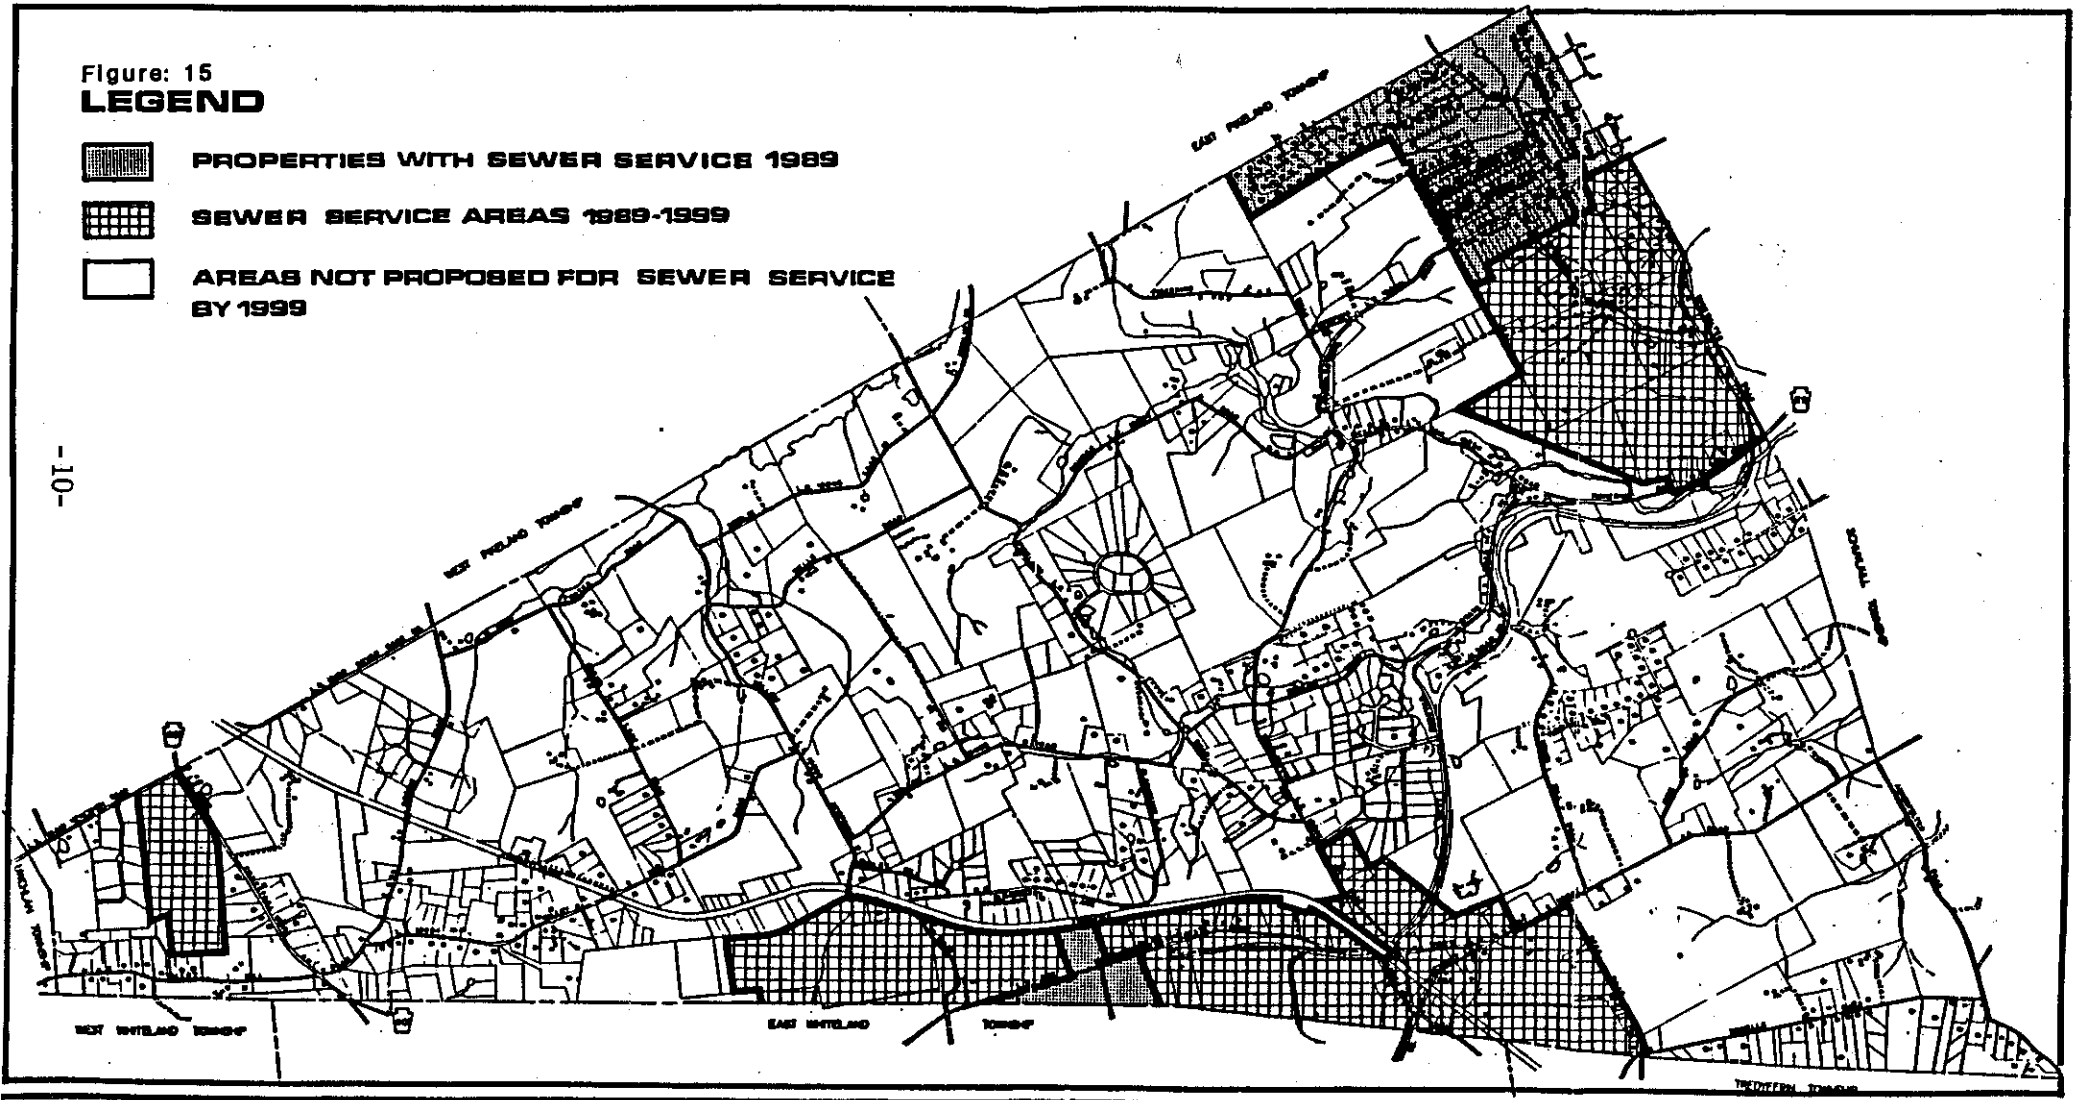
Schuylkill Township	1,664.0	1,789.0	1,717.0
West Vincent Township	0.0	22.0	27.0
Total	**3,852.5**	**4,084.0**	**4,096.0**

FUTURE CONNECTIONS



Each of the member municipalities and the Valley Forge Sewer Authority have carefully monitored development within the sewer service area. To ensure an orderly growth, sewage facilities proposed to serve new developments are sized to consider the ultimate needs of the area which the members have designated to be served. The proposed sewer routing must be situated to serve the overall sewerage objective of the Township within which the project is located. New development is typically evaluated by drainage basin. An analysis of the proposed routing is performed to determine whether adjacent properties within the Township's designated sewer service area may ultimately obtain public sewerage service through the proposed sewer. This determination may require the construction of a deeper sewer or provisions for future sewer connections, however, the intent is to eliminate the need for pump station construction in the future. Whenever possible, gravity alternatives are pursued. The Valley Forge Sewer Authority has had considerable success in evaluating proposed sewer extensions by drainage basin rather than just individual developments. Only one additional pump station has been required within the member municipality collection system since the original collection system construction.

Each of the Member Municipalities evaluated the future wastewater disposal needs of its community. As a result of this evaluation, Act 537 planning boundaries were developed. These boundaries are depicted in Exhibit 1. Additionally, each municipality identified proposed and active subdivisions within their political boundary including a development schedule. These subdivisions are depicted in Exhibit 3. This Member Municipality Act 537 Plan uses the 1995 data for the base year. The five year projection is 2000 and the ten year projection is 2005. Because of the varying time tables in which the three member plans were prepared, some adjustments to the growth projections were necessary for consistency.

Charlestown Township

Charlestown Township designated all property within its entire Act 537 sewer service boundary for public sewage service within a 10 year horizon. Figure 2 herein is a copy of Figure 15 of the April 1989 Official Plan Under the Pennsylvania Sewage Facilities Act prepared for Charlestown Township. The ten (10) year horizon depicted thereon is 1989-1999, basically the five year horizon of this document. Therefore, to be consistent with the time frame of the Member Municipality Act 537 Plan, the Township's projections are designated as a 5 year projection on Table No. 4. The developments which are indicated with an asterisk on Table No. 4 are already in some stage of planning or construction and the EDUs are based on approved planning module documentation. The remaining development EDUs were calculated by applying the Township's maximum zoning criteria to the developable acreage within the 537 sewerage boundary defined by the Township. Although there was considerable development planning activity in 1989, the momentum of some of the identified developments has slowed down. Therefore, this plan modifies growth projection to reflect the current development activity.

1 Charlestown Township projected all growth within its Act 537 boundary to occur by 1999 (5 year horizon for this plan). The number of EDUs is based on the Township's zoning criteria.

2 Developments in some stage of planning or construction.

East Pikeland Township

The growth projections provided in the East Pikeland Township Act 537 Wastewater Facilities Plan, Phase III, dated August 26, 1991 are based on the 1989 Wasteload Management Report - Chapter 94. The Member Municipality portion of the Chapter 94 for 1989 is furnished in whole as Appendix A to East Pikeland Township's plan. Per page 43 of East Pikeland Township's Act 537 Plan, 800 EDUs were projected to develop within the Township from 1989-1994. Due to a slow down in growth, only 321 of these EDUs were developed by 1994. Although most of the projects identified in 1989 have not developed as planned, they are still active viable projects. This plan updates the East Pikeland Township growth projections based on the Act 537 sewer service boundary defined by the Township and current zoning criteria to create 5 year, 10 year and ultimate growth projections. See Table No. 5.

The East Pikeland Township Act 537 Plan also refers to an 850,000 gpd ultimate growth projection from the 201 Study, prepared in the early 1970's. The ultimate projection used in this Plan considers all potential growth in the remaining developable areas within the 537 boundary set forth by East Pikeland Township.

Schuylkill Township

Schuylkill Township's Act 537 Plan Update includes a Table of Anticipated Development on page 1 of the Plan Summary. It includes projections for both a five year (1995-1999) and ten year (2000-2004) planning horizon. The Township's Plan and this Plan differ by one year in their time table. Therefore, the Township's information has been updated to coincide with the planning period of this Plan. See Table No. 6. Additionally, the time frame for the MacAvoy, Rhinehart and Maisfield projects were extended to a 10 year duration due to the slow down in growth experienced in recent years.

Schuylkill Township's Act 537 boundary map titled "Act 537 Comprehensive Wastewater Plan Showing Development - 1993 - 2002, Exhibit No. 1" is included herein as Exhibit No. 5.

Future Flows

Appendix B provides the backup for these projections. Looking at the first page in Appendix B, the year end connected EDUs are as furnished from the VFSA billing department. The EDU count used was prepared as of 1/1/95, see Appendix A.

The second column in Appendix B, "remaining plotted EDUs" is EDUs predicted to develop within the next five (5) years and establish the five (5) year planning horizon.

The column titled "proposed EDUs" includes specific projects that have been identified and are in some stage of the subdivision approval process. It also includes portions of previously identified projects not expected to fully develop in the next five years. These EDUs establish the t%n (10) year planning horizon utilized in this report.

Finally, the "undeveloped land" column was created by determining developable acreage. Various maps were reviewed and site views accomplished to confirm pockets of developable land within the Act 537 sewer service boundaries designated by the Member Municipalities. The areas are identified on the second page of Appendix B. The maximum allowed zoning condition was used to quantify the development in these areas.

Each subdivision and tract of land identified was assigned an anticipated point of connection to the sewage collection network in order to analyze its impact to the system through the computer model. Identified subdivisions are depicted on Exhibit 3.

NEEDS ANALYSIS

Existing Flows

VFSA flows from the Member Municipality network over the last three years and the GPD/EDU are listed in Table No. 8.

TABLE NO. 8
MEMBER MUNICIPALITY SYSTEM FLOWS

Year	Average Daily Flow (MGD)	GPD/EDU
1995	0.815	201
1994	0.879	226
1993	0.855	223

Infiltration and Inflow

The average GPD/EDU for the entire Member Municipality system indicates flows attributed to infiltration and inflow (I/I) are minimal. Field experience, however, finds that there is still considerable inflow in the system. In 1994, the maximum day flow for French Creek Pump Station (PS) was 3.5 times the annual average daily flow; 5.3 times at Pothouse Road PS; 5.7 times at Whitehorse Rd. PS; 3.3 times at Pickering Creek PS; 3.8 times at Perkiomen PS; and 5.5 times at Valley Creek PS. These peaks are based on daily flows. Hourly peaks may be considerably greater.

During a previous review of the collection system, Buchart-Horn noted several manhole lids that were not properly bolted down and/or missing the gasket. In 1995, VFSA staff corrected many of these deficiencies in the French Creek Drainage Basin. The remainder of the system should be inspected and further corrections made.

Other inflow reduction efforts are much more difficult to implement. These include inspecting existing services for connection of sumps, roof drains and/or floor drains. At this time, effort should be concentrated on manhole repairs and sewer and lateral inspection and testing.

As previously indicated, VFSA has dedicated resources to ensure the proper upkeep of the Member Municipality collection system. With time, however, system deficiencies which lead to excessive infiltration and inflow, I/I must be expected. A cursory review of the collection system by drainage basin was performed to determine where excessive I/I might be entering the system.

Appendix C provides the tables and graphs used to evaluate the collection system. The graphs compare maximum day flows by month specified as gpd/in-dia-mi to the average, 3 month maximum, and 3 month minimum gpd/in-dia-mi for each pump station drainage basin. The

following table lists the number of months by pump station drainage basin where the gpd/in-dia-mi exceeded 3,500 gpd/in-dia-mi.

TABLE NO. 9
NUMBER OF MONTHS WHERE FLOW RATES EXCEEDED 3,500 GPD/IN-DIA-MI

	1993	1994	1995	Total
French Creek	2	1	1	4
Pothouse	4	5	2	11
Whitehorse	3	2	1	6
Pickering	2	0	1	3
Perkiomen	2	2	1	5
Valley Creek	2	1	0	3

Pothouse Road Pump Station has experienced the most flow events in excess of 3,500 gpd/in-dia-mi. It has also experienced the highest gpd/in-dia-mi flow rates; 9,854 gpd/in-dia-mi in December 1993 and 11,323 gpd/in-dia-mi in March 1994.

Whitehorse Road Pump Station and Perkiomen have the next highest quantity of flow events in excess of 3,500 gpd/in-dia-mi. I/I reduction efforts should be concentrated in these three pump station drainage basins based on average gpd/in-dia-mi flow rates as well as monthly maximum flow rates with the following priority:

1. Pothouse Rd. Pump Station
2. Perkiomen Pump Station
3. Whitehorse Rd. Pump Station

A considerable amount of I/I reduction effort has been put forth in the Pothouse Road Pump Station drainage basin and is reflected in the decrease of months with high gpd/in-dia-mi flow rates in 1995. The success of these efforts should be determined by evaluating the 1996 data for the recent wet months.

VFSA performs an annual I/I analysis of various parts of the collection system which includes flow monitoring. Where flow data indicates a high level of inflow in a particular drainage basin, a more concentrated effort to reduce inflow ***is*** accomplished with night weiring and televising.

Table No. 7 lists the projected number of EDUs for the Member Municipalities by various growth horizons. Table No. 10 provides average daily wastewater flow projections for the member municipalities.

TABLE NO. 10
WASTEWATER FLOW PROJECTIONS
FOR THE MEMBER MUNICIPALITIES

Growth Horizon	Total EDUs	Flow * Projection (MGD)
Existing	4,084	1.123
5 Yr.	5,151	1.417
10 Yr.	6,337	1.743
Ultimate	7,515	2.067

* flows based on 275 GPD/EDU

Since the creation of the Valley Forge Sewer Authority, the Member and Partner Municipalities have used 275 gallons per day as the base flow for an EDU. The historic GPD/EDU factor for VFSA has been well below 275 GPD/EDU since 1985. The ten year average, 1985-1994, is 218 GPD/EDU. Therefore, the 275 GPD/EDU flow rate is considered conservative when computing flow projections for the Member Municipality collection system and is used throughout this planning document.

The flow allocation of 2.124 MGD assigned to the Member Municipalities is adequate for all growth horizons.

Sewers

In 1986, Buchart-Horn developed nine models which analyze the member municipality collection system by pump station drainage basin. The data from upstream pump stations is incorporated into the downstream pump station's model. The model is used to simulate a "worst case" wet weather scenario. The model then identifies which sewer segments would become surcharged and by how much under this scenario.

The model was developed by entering defining data for each sewer segment. Data entry included upstream and downstream manhole number and invert, pipe diameter and slope, and the number of equivalent dwelling units connected to each pipe section.

The manhole numbering was established by subdrainage basin. There are four major drainage basins within the three municipalities, numbered 1 through 4. Each of the major drainage basins is subsequently divided into subdrainage basins. These drainage division identifications form the first three numbers of any manhole. Each manhole with a subdrainage basin is then numbered beginning with 100. Therefore, manhole 2.16-100 is manhole 100 in drainage basin 2, subdrainage basin 16.

Table No. 11 provides the drainage and subdrainage basin assignment by pump station.

TABLE NO. 11
DRAINAGE AND SUBDRAINAGE BASIN ASSIGNMENT BY PUMP STATION

Pump Station	Associated Subdrainage Basins
French Creek	2.01, 2.02, 2.03, 2.04 2.05, 2.06, 2.07, 2.08 3.02, 3.06
Pothouse Road	2.09
Whitehorse Road	3.04
Pickering Creek	2.00, 3.01, 3.02, 3.03
Perkiomen	4.02
Valley Creek	4.05
Kimbel Drive	3.07
Charlestown Road	3.06
Sandra Lane	3.05
Country Club Road	3.15

The sewer model is updated to reflect new connections and new sewer segments added to the collection system. Buchart-Horn uses a spreadsheet to track projects proposed in the VFSA system. Appendix A includes a table of connections by pump station drainage basin. This data, in conjunction with the quarterly listing of EDUs prepared by the Authority, also furnished in Appendix A, is used to establish the existing conditions for the model.

To simulate the worst case scenario, the lowest monthly average daily flow and maximum day flow in the analysis year are determined by pump station drainage basin. The lowest month average daily flow, considered the dry weather flow, is subtracted from the maximum day flow. The difference is then divided by the linear feet of sewer in the pump station drainage basin to develop an infiltration/inflow, I/I, factor expressed in gallons per day per linear feet, GPD/LF. The I/I factor and lowest monthly average daily flow are compared to the values used for the previous year's model and the highest of each of these is entered into the computer model; thus establishing the wettest event that might be seen in a 24 hour period. This event could occur once a year or might not occur for several years. This worst case scenario is used to evaluate available capacity of each sewer segment within the collection system.

Once the existing conditions are evaluated, the model is then used to determine the impact of new connections to the collection system. The model was used to evaluate the available capacity within the collection system over the 5 and 10 year growth horizons and ultimately. For each analysis period, the projected growth was entered into the computer model at the expected point of connection. The projected growth was expressed as a peak flow value and was based on the number of EDUs multiplied by 275 GPD/EDU and a peaking factor of 2.5.

Sewer segments which will surcharge under the worst case scenario were identified by drainage basin and growth horizon. Table Nos. 12A through D identify those segments. The tables also provide a conceptual construction estimate to increase the sewer capacity by planning horizon. The costs listed are construction costs only and do not include additional project costs such as engineering and legal fees. Where applicable, the future development which causes the surcharge is also identified. Appendix D provides a detailed description of the sewer segments including length, slope, diameter, capacity, and basis for the cost estimate.

Exhibit 4 depicts the sewer segments predicted to surcharge. It also identifies the planning horizon that will cause the surcharge.

TABLE NO. 12A
SEWER SECTIONS PREDICTED TO SURCHARGE
BASED ON CURRENT WET WEATHER CONDITIONS

Drainage Basin	Surcharged Section		Enlargement Detail on Exhibit 4	Conceptual Construction Est. (Present yr cost)
French Creek	2.08	118-102	3	$ 39,500
	2.04	109-108	4	24,900
	2.04	106-105	4	26,500
Pothouse Rd.	2.09	105-104	5	$ 54,500

	① 3.15	108-106	10	---

① Surcharge under ultimate scenario is minimal. Recommend monitoring prior to upgrade.

A list of the sewer segments identified in Table Nos. 12A through D were submitted to VFSA for field verification. VFSA identified known problems near Pothouse Rd. Pump Station, (segments 2.09 105-104 and 2.09 102-100a).

VFSA questioned the validity of the surcharge prediction of section 3.03 325-324. This sewer is identified for surcharge under ultimate conditions only. It appears that the slope may be steeper than that noted on the as-built plans. Before any action is taken on this section, the slope should be field verified.

Where there is no visible indication of surcharging, VFSA should monitor the identified segments during wet weather conditions. This may be accomplished by installing surcharge indicators in each manhole. It is recommended that indicators be installed in all segments identified in Table Nos. 12A through C. For estimating purposes, it is assumed that 10 indicators will be purchased allowing 5 segments to be monitored at a time. The indicators would be relocated after a significant wet weather event. Based on the extent of the surcharge identified, the sewer upgrade projects may then be prioritized. Cost $1,100. Currently, VFSA is making their own surcharge indicators for use in the system.

For the purpose of this study, it is assumed that all of the sewer segments identified as surcharging under current wet weather scenario, Table No. 12A, will require upgrade. The new pipe diameters recommended in Appendix D are sized to ensure the ultimate flow projection can be accommodated. Appendix B lists the developments predicted to occur in the five (5) and ten (10) year planning horizon and their associated drainage basin. As these developments commence, the sewer segments identified in Table Nos. 12B and C should be equipped with surcharge indicators. When surcharging is noted, a priority may be assigned for upgrading the sewer segments. In some instances, the extent of the surcharging may be insignificant compared to the cost of upgrading. The surcharge indicators will allow this to be determined. Decisions to upgrade sewer segments will be based on the field conditions observed.

The VFSA, in their field observations, has indicated that the sewer segments in the Pothouse Rd. drainage basin; 2.09 105-104 and 2.09 102-101-100a require upgrade. Simultaneously, the sharp change in flow direction at manhole 102 should be corrected. See enlargement detail 5 on Exhibit 4. It is recommended that manhole 2.09-102 be relocated 35 LF upstream of its current position for a smoother transition at both manhole 2.09-102 and 2.09-101 on the pump station site. Upgrading sewer section 2.09 105-104 would be accomplished as a part of the same project, conceptual construction cost in 1996 dollars - $77,800.

Similarly, when designed, the routing of sewer segments 2.04 110-122-109 should be evaluated to see if a smoother transition may be accomplished. See enlargement detail 4 on Exhibit 4. Manhole 2.04-110 could possibly tie directly into manhole 2.04-109 instead of 2.04-122. Sewer segment 2.04-122 would continue to flow to 2.04-109. Under the 10 year planning horizon, sewer section 2.05-101-2.04-110 is identified for potential surcharge. Although not considered a necessary project at this time, the segment should be closely monitored in conjunction with the 2.09 110-122-109 series. It could be beneficial to combine these projects if the surcharge indicators do not identify an immediate need to upgrade the 2.09 110-122-109 series.

The conceptual construction estimate to resolve the existing sewer capacity problems as well as the problems just prior to Pothouse Road pump station is $216,900 in 1996 dollars. Project costs, those additional costs required to accomplish a project including administrative, engineering and legal fees are discussed under the implementation section of this report and are not included in the conceptual construction estimate.

Metered Pump Stations

As previously stated, the flows developed in the computer model are used to predict a worst case scenario in order to ensure adequate carrying capacity within each sewer segment. These flows are considered excessive for the evaluation of pump station capacity. Therefore, a computation was developed to predict a reasonable peak flow condition for each pump station. The flow projections are presented in Tables Nos. 13-18. The methodology developed to

project pump station flows requires flow meter records. Therefore, the unmetered pump stations will be discussed separately.

For each metered pump station, the maximum GPD/EDU rate experienced within any day over the past three years was determined. See the column titled MAX GPD/EDU on Table Nos. 13-18. As previously stated, a three year analysis is being performed. The 1991 and 1992 flow data would skew the analysis due to drought conditions experienced in the region. Where available, the flow data from the flood of 1996 was incorporated into the analysis. (Note: This data was used for Perkiomen and Valley Creek pump stations only. There were several circumstances which invalidated the flow data for the four major pump stations.)

The second value necessary for the flow projections is the GPD/EDU rate for the annual average daily flow. See the column titled AVG GPD/EDU.

Existing wet weather flow conditions were established by multiplying the current EDUs by the MAX GPD/EDU. (Note: The net maximum GPD/EDU factor was used for Pothouse, Whitehorse and Pickering Pump Stations since there is a considerable flow contribution from the upstream pump stations.)

The pump station flows for the planning horizons were calculated by multiplying the EDU growth projection by the AVG GPD/EDU and by a peaking factor of 2.5. This flow was then added to the current flow calculation. Where upstream pump stations are involved, two flow projections were developed. The first projection was developed by adding the flow projection from the upstream pump station to the flow projection developed for the specific pump station. The second projection was developed by adding the actual pump rate of the upstream pump station to the projection for the specific pump station. Where the projected flow exceeds the rated capacity of the upstream pump station, the projected flow was added to the downstream pump station. Both individual pump station and cumulative EDU counts are provided for those pump stations which operate in series on Table Nos. 14-16.

To allow comparison, the flow projections developed by the computer model are presented in each table. These values were compared to the drawdown capability of the pump station, if known as a second comparison.

1996 flood -
In 1996 the wet well flooded to approximately 2' below the top of the wet well structure, however the meters were not working and the actual flow is unknown. This event occured when several manhole watertight inserts in the drainage basin had been removed. Therefore, the flow data from this event has not been used for any of the four major pump stations.

1994 -
The maximum day flow data was considered invalid because high flow and moving ice sheared off a manhole in the drainage basin on that day. The second highest flow day in 1994 was used for the four major pump stations.

As discussed previously, two flow projections were developed for each pump station. The first is considered more realistic based on existing pump station flow data and field observations by VFSA staff. For example, although French Creek Pump Station may be pumping at 2.88 mgd, all of the maximum day flows for Pothouse Road pump station are less than 2.88 mgd, see Table No. 14. Additionally, it was reported by VFSA operations staff that the lag pump at Pothouse Road pump station turns on approximately once a year.

Based on this discussion and the data from Table Nos. 13-18, the following statements may be made.

1. **French Creek Pump Station** is not projected to exceed its rated capacity for any of the planning horizons, see Table No. 13.

2. **Pothouse Road Pump Station** is not projected to exceed its rated capacity until the ultimate growth planning horizon. When French Creek Pump Station is in operation at 2.88 mgd, even the current wet weather flow scenario projects flows in excess of the pump station rated capacity. However, Pothouse Road Pump Station can apparently handle the extreme wet weather events. The increase in flows projected from the current scenario has minimal impact to the flow projections. All of the flow projections are less than the drawdown capacity of the pump station, see Table No. 14.

3. **Whitehorse Road Pump Station** is not projected to exceed its rated capacity at all under the first projection scenario and not until the ultimate planning horizon for the second growth scenario, see Table No. 15.

4. **Pickering Creek Pump Station** is not projected to exceed its rated capacity under either growth scenario. It may experience flow problems when Whitehorse Road Pump Station operates at drawdown, see Table No. 16.

5. **Perkiomen Pump Station** could actually exceed its rated capacity based on current wet weather conditions. The majority of the additional capacity problem will be caused by the proposed MacAvoy development, the Meadows at Valley Forge, see Table No. 17.

6. **Valley Creek Pump Station** will not reach its rated capacity under any of the planning horizons presented herein, however, the projections are very close to the rated capacity, see Table No. 18.

Both Pothouse Rd. and Perkiomen Pump Stations require further evaluation to address potential capacity problems during wet weather flow conditions. Valley Creek Pump Station must also be considered as the pump station flows almost reached the rated capacity in 1993.

The Country Club Road Pump Station serves the new Valley Forge Woods and Fernleigh Townhomes project. The pump station was completed in 1994 and currently has 120 connections. Although the pump station will be metered, good meter data is not available at this time. The pump station's rated capacity of 0.454 MGD was established to serve the ultimate growth projected for the subdrainage basin. No action is required for this pump station.

The drawdown capacity of some of the pump stations was recently computed by VFSA staff. This data is included where known on Table Nos. 13-18. It is recommended that VFSA conduct additional drawdown tests at Pothouse Rd. and Valley Creek pump stations before any upgrade activities are implemented. Procedures for performing the drawdown tests are provided in Appendix E.

Unmetered Pump Stations

The three unmetered pump stations are small tributaries to the major pump stations. Kimbel Drive Pump Station feeds the French Creek Drainage Basin. Sandra Lane and Charlestown Road Pump Stations feed the Pothouse Road drainage basin. These smaller pump stations were evaluated based on same conditions as the drainage basin which they are a part of. The computer model was run for each pump station and no surcharged sewer sections were identified.

As presented in Table Nos. 13 through 18, the available capacity for each tributary pump station was calculated. See Table No. 19.

TABLE NO. 19

PUMP STATION ALTERNATIVES

Perkiomen Pump Station

Perkiomen pump station is located just outside of the VFSA wastewater treatment plant in the parking lot for the administration building. The pumps discharge to the Pickering Creek force main. The 7.5 HP pumps are rated for 150 GPM at 64 ft. TDH. The pumps were replaced in 1993 to facilitate pumping against a higher head.

The pump station is completely below the ground and is located within the floodway or flood fringe of the Schuylkill River. The Schuylkill River floodway was reevaluated due to the replacement of the Pawling Rd. bridge, just downstream of the site. In a conversation with the firm who prepared the hydrologic and hydraulic report for the bridge replacement, it was learned that the new bridge caused no change to the water surface elevations at the site.

It is anticipated from field observation that the first floor elevation of any above ground structure will have to be raised several feet to keep it from flooding.

The Perkiomen Pump Station has experienced surcharge conditions in the past. The pump station meter bypass had to be opened three times in 1993, five times in 1994, once in 1995 and four times as of May 1996 due to the flood conditions. The pump station capacity needs to be increased based on existing wet weather conditions experienced at the pump station.

Approximate 194 EDUs from the proposed MacAvoy Subdivision, the Meadows at Valley Forge are scheduled for connection to this pump station. A preliminary sewer layout for the subdivision was submitted to VFSA for review in 1995. In a recent conversation with the developer, VFSA learned that the developer hopes to receive final subdivision approval by the summer of 1996. VFSA signed Section H, Chapter 94 consistency determination for the Meadows at Valley Forge planning module in May 1995. The module predicts flows in excess of the Perkiomen Pump Station's rated capacity. The developer was notified that the final design of the sanitary sewer must include an upgrade of the Perkiomen Pump Station. VFSA intends to model the pump station upgrade after the recent Country Club Rd. (Fernleigh) pump station design. The pump station should be designed to accommodate at least the projected flows from the 10 year planning horizon. The design must also incorporate the ability to expand to the ultimate design flow. Most specifically, power, emergency power, wet well volume and force main diameter should be based on the ultimate flows. The pumps and remaining equipment may be based on the 10 year flows.

The details of the pump station upgrade will be handled as a part of the Meadows at Valley Forge project. The implementation will be based on the implementation schedule of the subdivision. **No connections to this pump station should be allowed until the upgrade is accomplished.**

Valley Creek Pump Station

Valley Creek Pump Station appears to be adequate for the flow projections developed herein. Two issues, however, must be noted.

1. There is a discrepancy in the EDU growth projections developed by VFSA and Schuylkill Township. There are several tracts of land in this area noted by Schuylkill Township for public sewer service, that if connected will cause a capacity problem at the Valley Creek Pump Station. As with any other development within the Member Municipality Collection System, the downstream facilities, specifically Valley Creek Pump Station, will have to be upgraded by the development causing the capacity problem. The tracts of land identified by Schuylkill Township should be reviewed so that a proper ultimate flow projection may be developed for this pump station. These discrepancies, once resolved, will not alter the conclusions and long-term recommendations of this plan.

2. In August of 1995, VFSA collection personnel noted that it may, on occasion, take considerable time (almost 15 minutes) to discharge the wet well volume through the force main. The Valley Creek force main running at 100 GPM rated capacity discharges into the Wilson Rd. force main. The Wilson Rd. Pump Station includes three (3) 250 HP pumps with a design point of 16.3 MGD; two pumps operating at 5,650 GPM each. When the three Wilson Rd. pumps and the two Valley Creek pumps are operating, the line pressure on the Valley Creek pumps increases and the check valves shut. There does not appear to be a problem when one pump from each pump station operates; the typical mode of operation. Based on existing conditions and future conditions at Valley Creek, this mode of operation does not present a problem, however, this does not consider any upgrade that may be under #onsideration for the Wilson Rd. Pump Station. Should an upgrade at Wilson Rd. be considered, the new head conditions on the Valley Creek pumps must be evaluated to ensure they will be capable of discharging to the Wilson Rd. force main.

   An appropriate evaluation of the Valley Creek Pump Station cannot be performed until an analysis of the Wilson Road Pump Station is accomplished. On April 11, 1996, the engineer for the Regional Act 537 indicated an analysis cannot be completed until the Partner Municipalities finalize their flow requirements, due by the end of April. Once this data is received, several alternatives must be evaluated should the Wilson Road Pump Station require upgrade. These alternatives may include:

   - redirecting some flow away from the Pump Station and VFSA WWTP
   - expanding Wilson Road Pump Station thus increasing the head in the force main
   - constructing a parallel force main

If an upgrade is not required or if either the first or third option is implemented, there should not be an operational problem with the Valley Creek Pump Station exclusive of increased flows to the pump station (see item *1* above). Should the second alternative be selected, an evaluation of the Valley Creek Pump Station pumps will be necessary. It must be determined whether the pumps will be capable of operating against increased head conditions in the force main.

Pothouse Road Pump Station

The Pothouse Pump Station is a wet well/dry well sewage pumping station. The station was built in 1977. The dry well portion of the pump station has three levels. Two sewage pumps, sewage piping and a seal water system are located on the lowest level. The pump electrical control panel and the discharge flow meter are located on the intermediate level. The upper level contains a lavatory and auto dialer panel. The three levels are interconnected with stairs.

The wet well consists of two hopper shaped tanks. A comminutor was originally installed in the influent channel but was later removed. The influent channel contains two bar screen racks. Originally, a blower was used to supply air to the wet well to prevent the sewage from going septic. The blower has since been removed.

The pumps are manufactured by Fairbanks Morse. They are vertical centrifugal pumps with a design point of 2200 gallons per minute (GPM) at 130 feet of head (TDH). The two pumps have 8 inch diameter suction flanges and a 5 inch diameter discharge flanges. The motors are manufactured by Continental and are 125 horsepower (HP). The motors have a totally enclosed drip proof housing.

The pumps were designed to be controlled by variable speed adjustments based on the influent flow rate. The controller is a liquid rheostat manufactured by "Flowmatcher". The "Flowmatcher" has recently been rebuilt. The pumps motors are the heavy duty slip ring wound rotor type.

The seal water system located in the lower level of the dry well consists of two pumps with a water storage tank. The seal water pumps are manufactured by Aurora and are of the centrifugal type.

Flows

The Pothouse Pump Station has a rated capacity (one pump operating) of 3.17 MGD and a drawdown capacity (two pumps operating) of 3.96 MGD. As discussed previously, the drawdown capacity must be field verified.

The flow projections developed in Table 14 are summarized in Table No. 20.

TABLE NO. 20
WET WEATHER FLOW PROJECTIONS
AT POTHOUSE ROAD PUMP STATION

Typical Wet Weather Flow	Current	5 Years	10 Years	Ultimate
MGD	2.738	2.951	3.075	3.250
GPM	1,901	2,049	2,135	2,257
Wet Weather Flow With FC P.S. in Operation				
MGD	3.760	3.762	3.762	3.769
GPM	2,611	2,613	2,613	2,617

Under a typical wet weather scenario, Pothouse Road Pump Station will be capable of accommodating the projected daily flow. It is anticipated, however, that there will be instances when the incoming flow will exceed the pump station rated capacity. Two pumps operating will accommodate these instances. As previously noted, the VFSA operators indicate the lag pump in Pothouse Road pump station turns on approximately once a year. VFSA continues to implement I/I reduction programs which should reduce the severity of the wet weather events previously experienced and predicted herein.

Further field analysis of the pump station should be accomplished to verify the conclusions drawn herein. Specifically, the impact of French Creek Pump Station flows should be evaluated by monitoring Pothouse Road Pump Station flows in 15 minute intervals over an extended wet weather period.

Upgrade of the Pumps

Should the evaluation warrant, additional capacity may be gained by upgrading the pumps. The existing Fairbanks Morse Pumps have 14.68 inch diameter impellers with a design point of 2,200 GPM at 130 ft TDH. These pumps can accept, larger impellers that would increase the pump capacity to 2,350 GPM at 150 ft TDH.

The construction cost to install the larger impellers is estimated at $9,200 in 1996 dollars.

Before the option of larger impellers would be implemented, a field study should verify the actual system curve and actual pump rate of the existing pumps with the existing impellers. The reason for this study is to identify whether or not pump cavitation would occur with the larger impellers. Based on the calculated system curve, the pumps using the existing impellers and larger impellers operate very near the end of the pump curve raising a concern for possible cavitation.

The field work requires the isolation of a pump to one of the two wet wells and a timed volume drawdown test conducted at known pump speeds. From discharge pressure readings, pump speed and calculated pump rate, the actual system curve would be determined. This actual system curve would then be used in verifying the design condition for the larger impeller.

Generator

The existing generator is a Fremont DCA, 305 KW, 480/277 volt, 3 phase diesel generator. It has an Allis-Chalmers engine. This manufacturer is no longer making engines and there is no technical information readily available for this generator.

The present wiring from the generator is eight 350 MCM wires in a 3 ½ inch conduit. This installation does not meet current code requirements and the wires should be split between two 3 ½ inch conduits. The approximate cost for this is $1,800.

EVALUATION OF ALTERNATIVES

Upon completion of the needs analysis, a draft Act 537 Plan for the Member Municipality collection system was submitted to the Authority for review. Table No. 21 was submitted to the Authority staff to facilitate an evaluation of the alternatives available for the needs identified in this plan.

TABLE NO. 21
ALTERNATIVES FOR VFSA CONSIDERATION

Issue	Alternatives
Sewer segment with existing capacity issues.	1. Upgrade all at once. 2. Upgrade by drainage basin. 3. Monitor for surcharge and meter flows.
Five Year sewer segments.	1. Monitor for surcharge now. 2. Meter flows. 3. Monitor for surcharge after development occurs.
I/I reduction efforts.	1. Determine areas of concentration. 2. Work on the sewers themselves. 3. Work on illegal connections (drains/pumps). 4. Upgrade current programs i.e. more monitoring/televising.
Install telemetry for pump station flow meters.	1. Complete all or individual pump stations. Receiver will be for all pump stations. 2. Complete major or minor pump stations. 3. Include Pothouse telemetry with pump station project.
Pothouse Change impellers.	1. Field test pumps, first. 2. Skip and perform an upgrade. 3. Intensify I/I reduction efforts.
Pothouse Upgrade.	1. Evaluate capacity - field test pumps (with new impellers if applicable). 2. Accomplish design now and hold until upgrade is absolutely necessary. (Must determine the criteria.)

Valley Creek	1. Field test pumps. 2. Wait for Gannett Fleming evaluation of Wilson Road Pump Station. 3. Resolve EDU discrepancies (developer issue).
Perkiomen	Developer issue.

Based on the alternatives presented, the Authority staff is planning the following:

1. Existing Sewer Segments with capacity issues - upgrade over the next five years. The Pothouse Road pump station segments will be first.

2. Five Year Sewer Segments - build surcharge indicators and begin to monitor these segments.

3. I/I reduction efforts - Agree on areas of concentration. (Pothouse Road, Perkiomen and Whitehorse Road pump station drainage basins are recommended.) Concentrate on those portions of the sewer within VFSA ownership.

4. Install flow meter telemetry for pump stations over the next five years.

5. Pothouse Road pump station - perform field testing of pump operation/capacity. Determine I/I reduction that can be accomplished in the drainage basin. Based on field testing, possibly upgrade pumps with larger impellers.

6. Valley Creek Pump Station - evaluate further if Wilson Road pump station is to be expanded. Confirm Schuylkill Township future growth projections in this drainage basin.

CONCLUSIONS AND RECOMMENDATIONS

This plan reviewed the operation and capacity of the Valley Forge Sewer Authority Member Municipality collection system. The overall system was found to be properly maintained by the Authority. Operation and maintenance efforts are well planned and ongoing training enhances operations. Annual contracts allow Authority staff to properly maintain the collection network and I/I studies target noted problem areas. Preventive maintenance at the pump stations keeps downtime to a minimum.

Overall, the system capacity is adequate to meet the wastewater flows projected in this report. The ultimate flow projection developed for the Member Municipalities is 2.120 mgd as stated in Table No. 10. This flow is just below the 2.124 mgd flow allocated to the Member Municipalities. Therefore, the Member Municipalities do not require any change to their flow allocation.

The majority of the pump stations have adequate capacity to handle the flow projections developed herein. Perkiomen Pump Station is operating at its capacity and will require upgrade in conjunction with the Meadows at Valley Forge Project. No connections should be allowed at this pump station until the upgrade is complete. Valley Creek may need further evaluation should Wilson Road Pump Station in Tredyffrin Township require upgrade. Pothouse Road Pump Station should be further evaluated through field flow tests prior to implementing any upgrade activities.

Some sewer segments require upgrade to accommodate the projected flows, as identified by the computer model. Surcharges should be field confirmed with surcharge indicators prior to implementing any upgrade projects. VFSA staff are in the process of making surcharge indicators for this activity.

This report includes the following specific recommendations. Note: All construction costs are listed in 1996 dollars. The implementation schedule identifies the anticipated action year and Appendix F develops the project costs.

1. Provide flow meter telemetry at each of the pump stations.
   Conceptual construction cost = $9,000 for first installation, $6,500 for subsequent installations

2. Continue the annual I/I reduction program with efforts concentrated in Pothouse Road and Perkiomen drainage basins. Evaluate the success of existing I/I efforts in Pothouse Road pump station by calculating maximum month gpd/in-dia-mi factors over the wet events experienced in 1996 and in subsequent years. Whitehorse Road pump station drainage basin is the third priority area for I/I reduction efforts. Gpd/in.dia.mi factors should be calculated over the next several years to monitor the situation. An I/I

reduction program for this drainage basin should be scheduled toward the end of the next five years.

3. Make and/or procure several surcharge indicators for use in the collection system.

4. Upgrade the following sewer segments:

	Drainage Basin	MH Segment	Projects Costs
- French Creek Drainage Basin:	2.08	118-102	$ 53,325
	2.08	109-108	33,615
	2.04	106-105	35,775
- Pothouse Road Drainage Basin:	2.09	105-104	73,575
	2.09	102-100A	31,455
- Pickering Creek Drainage Basin:	3.03	353-352	25,920
	3.03	317-358	39,150
Total - including 35% associated project costs			**$ 292,815**

5. Ensure Perkiomen pump station is appropriately upgraded as a part of the Meadows at Valley Forge development project.

6. Reevaluate Valley Creek pump station if the Wilson Road pump station is to be upgraded. Perform pump tests to verify capacity. Confirm Schuylkill Township future growth projections in this drainage basin.

7. Field verify Pothouse Road pump station operation when French Creek is in operation. Based on the field test results, consider installing larger impellers on the pumps to gain additional capacity. Conceptual construction cost $9,200.

8. Upgrade the wiring for the Pothouse Road pump station generator Conceptual construction cost $1,800.

IMPLEMENTATION

The Valley Forge Sewer Authority maintains a comprehensive plan for the member municipality collection system which plans specific maintenance and construction activities over the upcoming five years. The comprehensive plan includes system enhancements which are not a part of this Act 537 Plan; however, the projects set forth in the following implementation schedule will be incorporated into the Comprehensive Plan for budgeting and implementation. Projects are budgeted annually. The projects noted herein will be funded by the Authority from the Bond Redemption Improvement Fund.

All estimates developed in this report were based on the work being accomplished in the current year, (1996). Appendix F develops the project costs based on the year of implementation.

IMPLEMENTATION PLAN FOR PROPOSED IMPROVEMENTS
TO THE VFSA SEWER NETWORK

1996

1. Build surcharge indicators and install in the following sewer segments:

   - 2.08 118-102
   - 2.04 106-105
   - 2.04 109-108
   - 3.03 353-352
   - 3.03 317-358

2. Perform pump testing at Pothouse Road Pump Station in accordance with the procedures set forth in Appendix E.

3. Perform I/I reduction in Pothouse Road and Perkiomen pump station drainage basins:

   - Main line and manhole testing and inspection
   - Lateral testing and inspection
   - Install water tight lids
   - Flow metering
   - Televising
   - Grouting & repairs

4. Calculate and evaluate 1996 gpd/in.dia.mi data for Pothouse Road pump station.

1997

1. Subject to the results of the pump tests, upgrade Pothouse Road pump station by increasing the impeller size. Change the generator wires.

2. Upgrade the following sewer segments:

   - 2.09 105-104
   - 2.09 120-100A

3. Continue I/I reduction in Pothouse and Perkiomen pump station drainage basins.

4. Perform pump testing at Valley Creek Pump Station and reevaluate based on the outcome of the Wilson Road Pump Station Study.

2000

1. Install flow meter telemetry at all of the pump stations.

2. Upgrade the following sewer segments:

   - 2.08 118-102
   - 2.04 106-105
   - 2.04 109-108
   - 3.03 353-352
   - 3.03 317-358

3. Initiate I/I reduction efforts in Whitehorse Road pump station.

4. Install surcharge indicators in the following sewer segments:

   - 2.06 102-101
   - 2.04 110-102
   - 2.04 122-109
   - 3.04 446A-446
   - 3.03 353A-353
   - 2.05 101 - 2.04 110

Notes:

1. Perkiomen flows adjusted due to by pass being open: 1/94, 3/94, & 8/94
   Factor = 1.27 - based on pump operation when bypass is open - 260 gpm/205 gpm.
2. FC, PH, WH, & PI data for 1/28/94 considered invalid due to sheared off manholes in French Creek contributing considerable amounts of water.

Note: Perkiomen bypass opened 1/93, 11/93, & 12/93
This table assumes the bypass was open on the max day reading.
Therefore the Perkiomen max day flowsfor Jan, Nov, & Dec have been multiplied by 1.27 (260 GPM/205 GPM based on pump operation when bypass is open).

APPENDIX E

Pump Drawdown Test Procedures

PUMP DRAWDOWN TEST PROCEDURE

A. PREPARATION

1. Measure inside dimensions of wet well and calculate gallons per inch of drawdown that wet well provides.

$$\text{Gal/In} = \frac{\text{Lgth (ft)} \times \text{Width (Ft)} \times \text{1 Ft Depth} \times 7.48\ \text{Gal/Ft}^3}{12\text{"/Ft}}$$

2. Install pressure gauges on pump suction and discharge lines and measure vertical distance between centerline of gauges and the floor. Also, record static pressure on discharge gauge with pumps off.

3. Choose reference point for measuring sewage level in wet well. Usually edge of hatch opening or grating frame. Determine the elevation of this point relative to gauges and pump room floor. Obtain this from pump station drawings or measure it.

4. Flow matcher panel usually has a wet well level gauge. This level gauge could be used during test if the relationship of level gauge reading to the wet well level measuring reference point described in Item 3 above is determined. This relationship can be determined by measuring from reference point to the sewage level and at the same time have someone record the level gauge reading. Then record this relationship. Example: "37.5" on level gauge = 87.5" to W.L. from reference point". You will then be able to calculate actual wet well level relative to the pump suction and discharge pressure gauge centerlines and will be able to calculate drawdown during testing. However, the accuracy of the level gauge will now come into play. It is best to use a tape measure for calculating drawdowns, however, by checking the level gauge reading versus taped measurements at several wet well levels the level gauge accuracy can be determined.

5. Overfill the side of the wet well to be tested several feet above the pumps maximum speed operating level. The feet required is equal to the pumps theoretical capacity times two (2) minutes divided by the wet well capacity in gallons per inch. The two (2) minute run time is preferred, if available. The run time should be at least one (1) minute minimum.

6. Run several preliminary tests to:

   a. Check how long it takes from time pump is turned on to reach its maximum speed.

   b. Check pump actual maximum obtainable speed with a tach and record it. Record measured speed versus percent speed being indicated on the flow matcher panel.

   c. To verify how far the wet well must be filled to obtain the 1-2 minute run time at maximum speed required.

d. Time required to fill and isolate one of the wet wells to run the test.

e. To check pump shutoff head, slowly close its discharge valve when operating at maximum speed and record the suction pressure gauge, discharge pressure gauge and wet well level gauge readings. Make sure pump is at maximum speed.

7. Hopefully, pump will only require 10-20 seconds to reach maximum speed from a dead stop. It if takes several minutes, there may not be enough wet well volume to run the test.

B. RUNNING DRAWDOWN TESTS

1. Two or three drawdown tests should be performed. If one looks way off from the others, discard it and run another.

2. Testing:

a. Fill wet well to be tested to level that will provide sufficient run time and close influent gate. Also, isolate common suction line from the other wet well.

b. Measure distance from reference point to wet well level.

c. Start pump and stop watch.

If pump comes up to maximum speed in several seconds, continue test.

If pump takes more than 5 seconds to come up to speed, do not take initial reading and do not start the stop watch when starting pump. Wait until pump reaches 100% speed then take a level reading. Once a level is established, immediately start the stop watch.

d. Allow pump to run for 1-2 minutes, if possible, while watching pump speed making sure its always at maximum speed.

e. Record with pump running:

1) Suction Pressure
2) Discharge Pressure
3) Flow Meter Reading

f. After 1-2 minutes run time, take a level reading. Once you get a solid level reading, immediately record the stop watch reading. If you stopped the pump, it will slowly decelerate before turning off and, therefore, will affect the accuracy of the test.

g. Calculate the volume of drawdown that occurred and pump capacity =

$$GPM = \frac{\text{Wet Well Cap (Gal/In) [2nd reading (Inches)-1st reading (Inches)]}}{\text{Stop Watch Reading (Total Seconds)} \over \text{60 Sec/Min}}$$

h. Calculate pump TDH.

TDH = (Disch. press.-Suct. Press.) (2.31 Ft/PSI) + (Elev. Diff. suct. & Disch. Press. Gauges)

i. Adjust TDH by adding friction losses through pump suction piping and discharge piping up to the point where discharge gauge is mounted (This friction loss will have to be calculated).

TEST NO. _____

1. Wet Well Level at Test Stop - _____ In.
2. Wet Well Level at Test Start- _____ In.

Drawdown- _____ In.

Volume = _____ Gal/In x _____ In Drawdown = _____ Gal

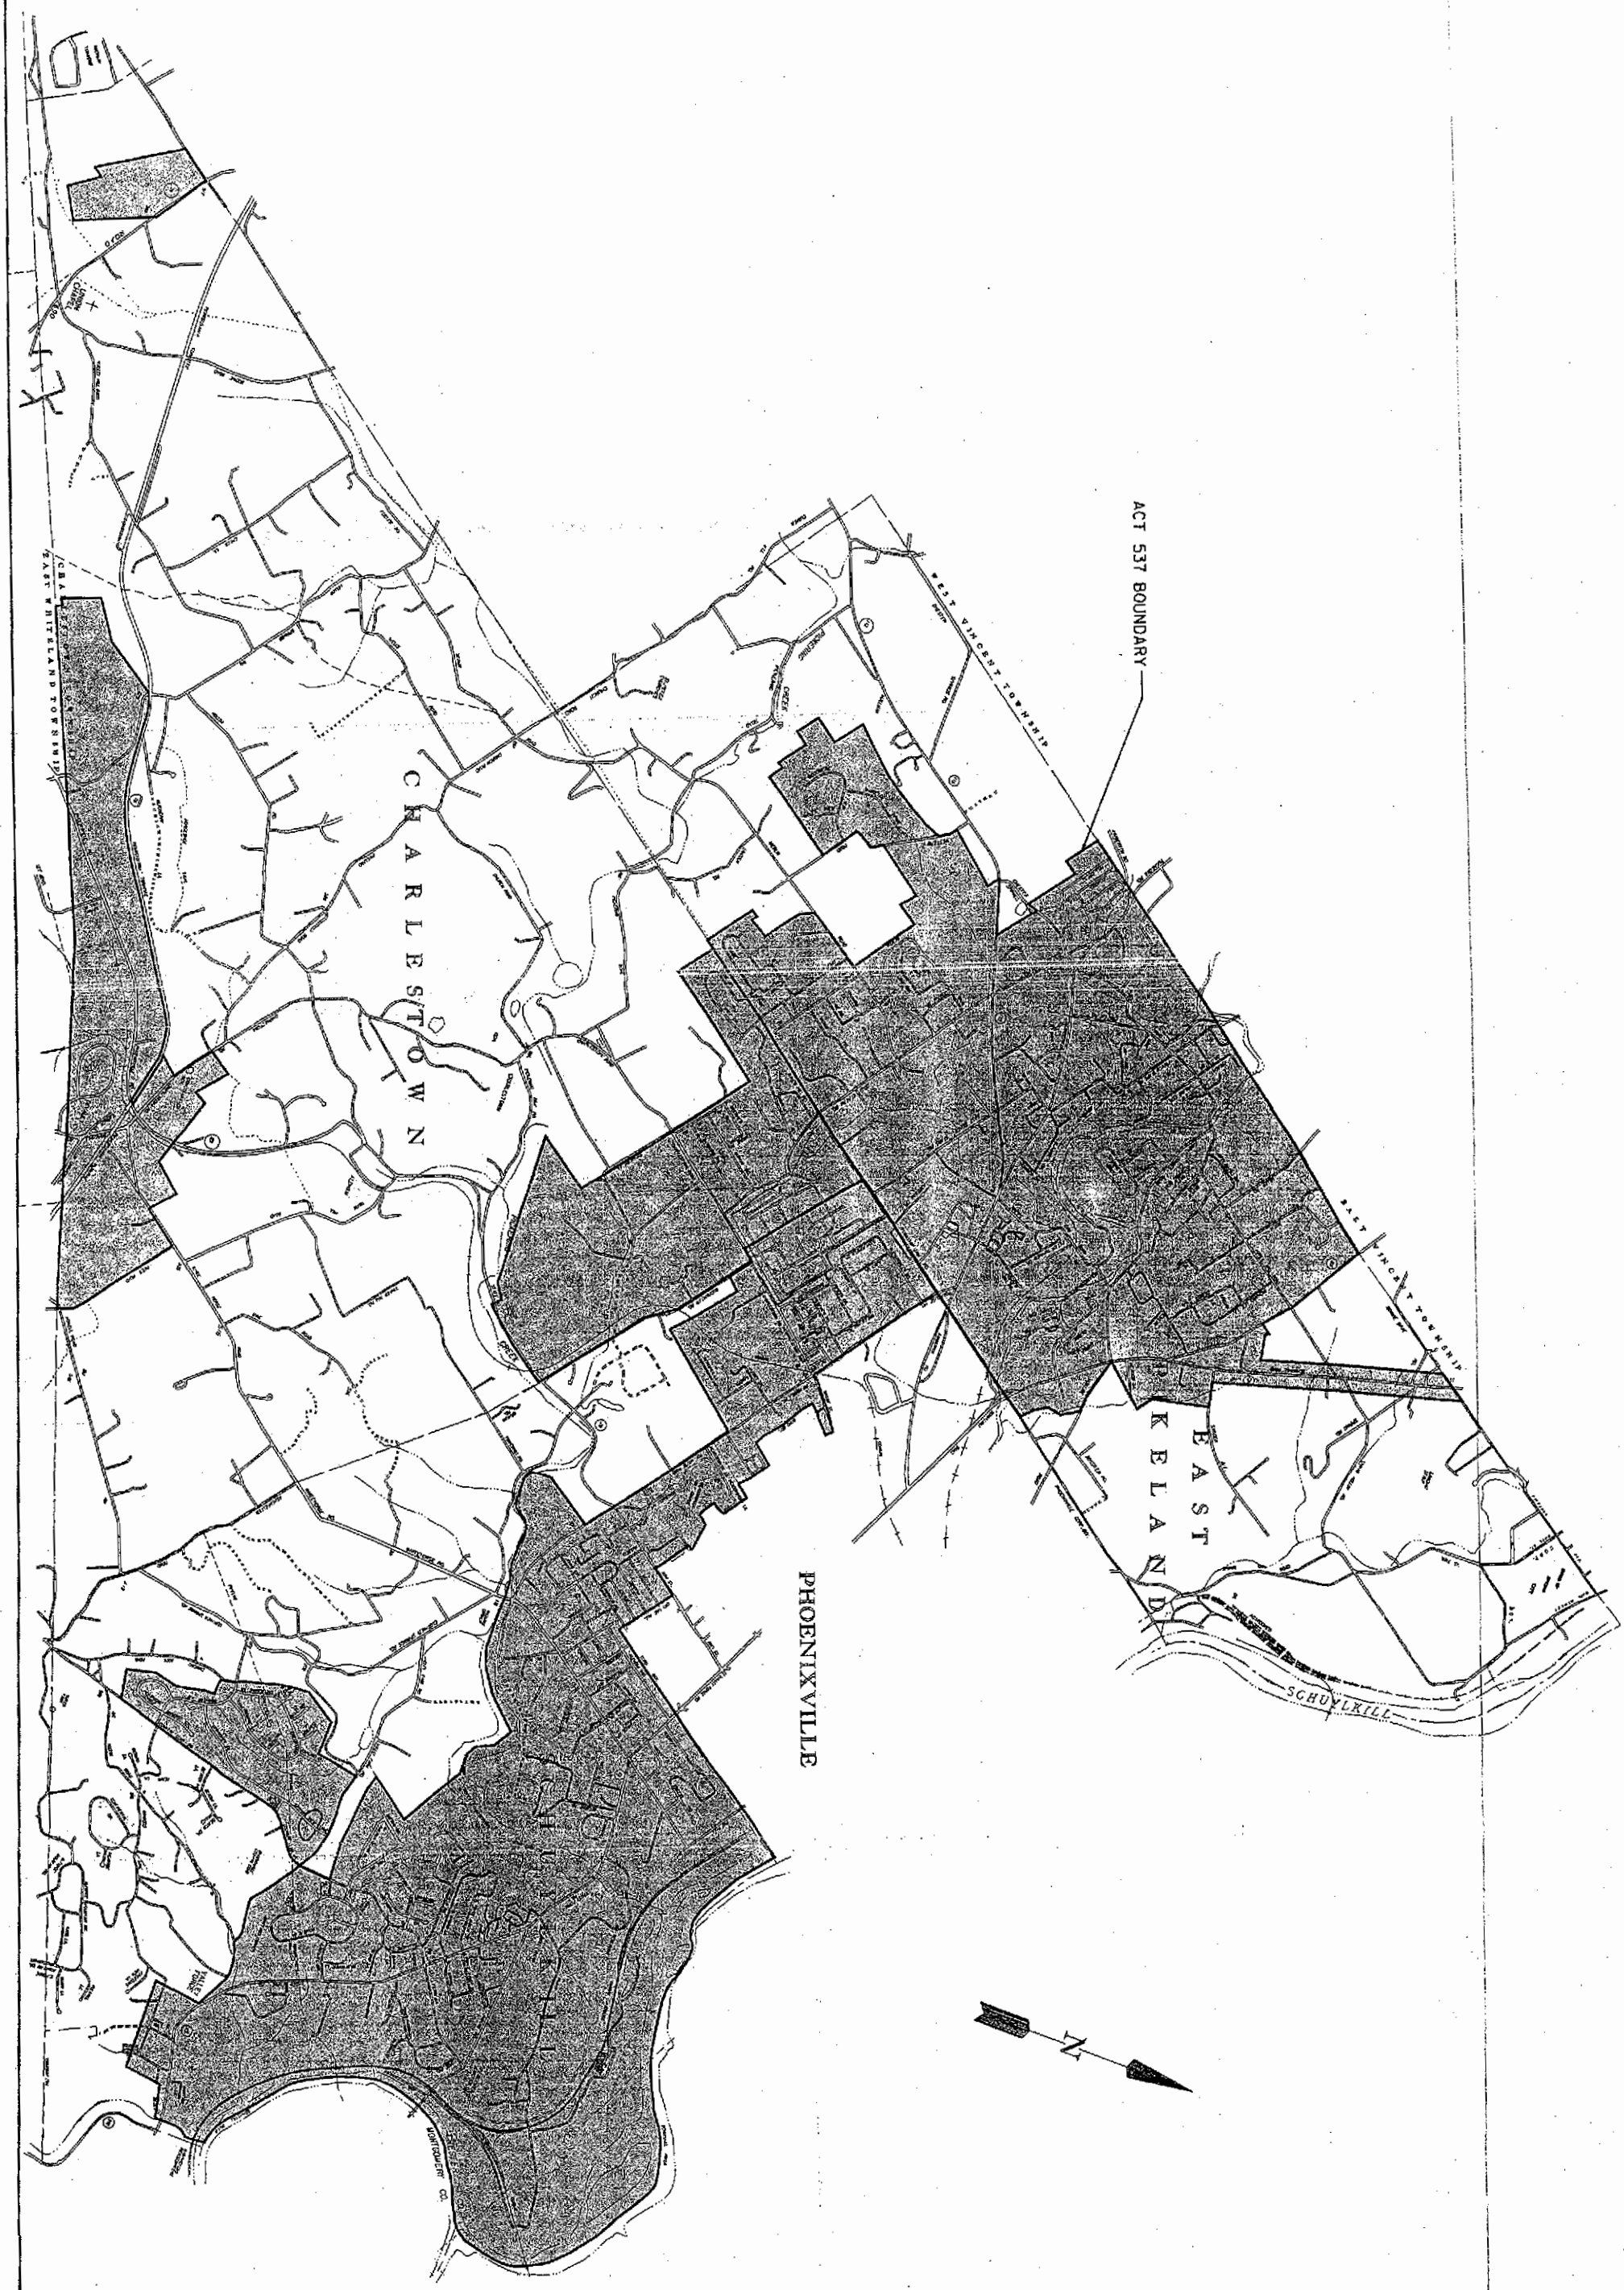
3. Testing Duration: Minutes _____
   Seconds _____

$$\text{Pumping Rate} = \frac{\text{_____ Gal _____}}{\text{_____ Min} + \frac{\text{_____ Sec}}{60 \text{ Sec/Min}}} = \text{_____ GPM}$$

4. Discharge Pressure _____ PSI
   minus
   Suction Pressure _____ PSI

   Theoretical TDH = _____ PSI x 2.31 = _____

   Theoretical TDH _____
   Diff. Gauge Elev. + _____
   Frict. Losses + _____
   Pump THD _____



5. Flow Meter Reading (Used to check meter accuracy)

Revisions made to the VFSA Member Municipality Act 537 Plan
as approved by the Authority April 14, 1997

1. Revised text on pages 8, 9, 11, 12 and 15.

2. Table No. 6, page 16, to VFSA BH/Projections

   - added Reeves-Mainwaring 5 EDUs to 10 yr. projection
   - deleted Patrick Henry - 47 EDUs
   - adjusted Rhinehart to 130 EDUs

3. The revisions to Table No. 6 on page 16 result in changes to:

   page 17, Table No. 7 - 10 yr. & ultimate EDUs for Pickering Creek P.S. and tot totals

   page 21, Table No. 10 - 10 yr. & ultimate EDUs and Flow Projections.

   page 25, Table No. 12D - Deleted reference to Patrick Henry Drive.

   page 31, Table No. 16 - revised 10 yr., ultimate and drawdown flow projections. Revised 10 yr. and ultimate EDUs.

   Appendix A, page 3, Pickering Creek Drainage Basin
   - deleted Charlestown Crossing
   - adjusted Rhinehart EDUs to 130

   Appendix B, page 1, Pickering Creek - Adjusted Rhinehart to 130 EDUs. Added Reeves-Mainwaring - 5 EDUs, adjusted undeveloped land to 73 EDUs.

   Appendix B, page 2 - deleted Reeves property and Patrick Henry Drive from Pickering (1003)

4. Added Schuylkill Township's Act 537 planning map as Exhibit No. 5. It is referenced on page 15 of the Plan.

The number of EDUs is also reported by member municipality. The number of EDUs connected by municipality for 1993 through 1995 is listed in Table No. 3.

TABLE NO. 3
YEAR END EDUs BY MEMBER MUNICIPALITY

	1993 EDUs	1994 EDUs	1995 EDUs
Charlestown Township	302.5	345.5	377.0
East Pikeland Township	1,886.0	1,927.5	1,975.0
Schuylkill Township	1,664.0	1,789.0	1,717.0
West Vincent Township	0.0	22.0	27.0
Total	**3,852.5**	**4,084.0**	**4,096.0**

FUTURE CONNECTIONS

Each of the member municipalities and the Valley Forge Sewer Authority have carefully monitored development within the sewer service area. To ensure an orderly growth, sewage facilities proposed to serve new developments are sized to consider the ultimate needs of the area which the members have designated to be served. The proposed sewer routing must be situated to serve the overall sewerage objective of the Township within which the project is located. New development is typically evaluated by drainage basin. An analysis of the proposed routing is performed to determine whether adjacent properties within the Township's designated sewer service area may ultimately obtain public sewerage service through the proposed sewer. This determination may require the construction of a deeper sewer or provisions for future sewer connections, however, the intent is to eliminate the need for pump station construction in the future. Whenever possible, gravity alternatives are pursued. The Valley Forge Sewer Authority has had considerable success in evaluating proposed sewer extensions by drainage basin rather than just individual developments. Only one additional pump station has been required within the member municipality collection system since the original collection system construction.

Each of the Member Municipalities evaluated the future wastewater disposal needs of its community. As a result of this evaluation, Act 537 planning boundaries were developed. These boundaries are depicted in Exhibit 1. Additionally, each municipality identified proposed and active subdivisions within their political boundary including a development schedule. These subdivisions are depicted in Exhibit 3. This Member Municipality Act 537 Plan uses the 1995 data for the base year. The five year projection is 2000 and the ten year projection is 2005. Because of the varying time tables in which the three member plans were prepared, some adjustments to the growth projections were necessary for consistency.

Charlestown Township

Charlestown Township designated all property within its entire Act 537 sewer service boundary for public sewage service within a 10 year horizon. Figure 2 herein is a copy of Figure 15 of the April 1989 Official Plan Under the Pennsylvania Sewage Facilities Act prepared for Charlestown Township. The ten (10) year horizon depicted thereon is 1989-1999, basically the five year horizon of this document. Therefore, to be consistent with the time frame of the Member Municipality Act 537 Plan, the Township's projections are designated as a 5 year projection on Table No. 4. The developments which are indicated with an asterisk on Table No. 4 are already in some stage of planning or construction and the EDUs are based on approved planning module documentation. The remaining development EDUs were calculated by applying the Township's maximum zoning criteria to the developable acreage within the 537 sewerage boundary defined by the Township. Although there was considerable development planning activity in 1989, the momentum of some of the identified developments has slowed down. Therefore, this plan modifies growth projection to reflect the current development activity.

[1] Charlestown Township projected all growth within its Act 537 boundary to occur by 1999 (5 year horizon for this plan). The number of EDUs is based on the Township's zoning criteria.

[2] Developments in some stage of planning or construction.

East Pikeland Township

The growth projections provided in the East Pikeland Township Act 537 Wastewater Facilities Plan, Phase III, dated August 26, 1991 are based on the 1989 Wasteload Management Report - Chapter 94. The Member Municipality portion of the Chapter 94 for 1989 is furnished in whole as Appendix A to East Pikeland Township's plan. Per page 43 of East Pikeland Township's Act 537 Plan, 800 EDUs were projected to develop within the Township from 1989-1994. Due to a slow down in growth, only 321 of these EDUs were developed by 1994. Although most of the projects identified in 1989 have not developed as planned, they are still active viable projects. This plan updates the East Pikeland Township growth projections based on the Act 537 sewer service boundary defined by the Township and current zoning criteria to create 5 year, 10 year and ultimate growth projections. See Table No. 5.

The East Pikeland Township Act 537 Plan also refers to an 850,000 gpd ultimate growth projection from the 201 Study, prepared in the early 1970's. The ultimate projection used in this Plan considers all potential growth in the remaining developable areas within the 537 boundary set forth by East Pikeland Township.

Schuylkill Township

Schuylkill Township's Act 537 Plan Update includes a Table of Anticipated Development on page 1 of the Plan Summary. It includes projections for both a five year (1995-1999) and ten year (2000-2004) planning horizon. The Township's Plan and this Plan differ by one year in their time table. Therefore, the Township's information has been updated to coincide with the planning period of this Plan. See Table No. 6. Additionally, the time frame for the MacAvoy, Rhinehart and Maisfield projects were extended to a 10 year duration due to the slow down in growth experienced in recent years.

Schuylkill Township's Act 537 boundary map titled "Act 537 Comprehensive Wastewater Plan Showing Development - 1993 - 2002, Exhibit No. 1" is included herein as Exhibit No. 5.

Future Flows

Table No. 7 lists the projected number of EDUs for the Member Municipalities by various

growth horizons. Table No. 10 provides average daily wastewater flow projections for the member municipalities.

TABLE NO. 10
WASTEWATER FLOW PROJECTIONS
FOR THE MEMBER MUNICIPALITIES

Growth Horizon	Total EDUs	Flow * Projection (MGD)
Existing	4,084	1.123
5 Yr.	5,151	1.417
10 Yr.	6,337	1.743
Ultimate	7,515	2.067

* flows based on 275 GPD/EDU

Since the creation of the Valley Forge Sewer Authority, the Member and Partner Municipalities have used 275 gallons per day as the base flow for an EDU. The historic GPD/EDU factor for VFSA has been well below 275 GPD/EDU since 1985. The ten year average, 1985-1994, is 218 GPD/EDU. Therefore, the 275 GPD/EDU flow rate is considered conservative when computing flow projections for the Member Municipality collection system and is used throughout this planning document.

The flow allocation of 2.124 MGD assigned to the Member Municipalities is adequate for all growth horizons.

Sewers

In 1986, Buchart-Horn developed nine models which analyze the member municipality collection system by pump station drainage basin. The data from upstream pump stations is incorporated into the downstream pump station's model. The model is used to simulate a "worst case" wet weather scenario. The model then identifies which sewer segments would become surcharged and by how much under this scenario.

The model was developed by entering defining data for each sewer segment. Data entry included upstream and downstream manhole number and invert, pipe diameter and slope, and the number of equivalent dwelling units connected to each pipe section.

APPENDIX C

Member Municipality Validation Report

VALLEY FORGE SEWER AUTHORITY

VALIDATION OF THE MEMBER MUNICIPALITY COLLECTION SYSTEM PORTION OF THE REGIONAL ACT 537 PLAN

INTRODUCTION AND SUMMARY OF FINDINGS

The purpose of this report is to develop current 5 and 10 year flow projections based on updated member municipality growth projections and validate / update the ultimate flow projections established in the previous 1997 Report.

On April 14, 1997, the Valley Forge Sewer Authority (VFSA) approved the "Member Municipality Collection System Supplement to the VFSA Regional Act 537 Plan." The purpose of the plan was to evaluate the portion of the VFSA collection system that supports the three member municipalities, Charlestown Township, East Pikeland Township and Schuylkill Township. Additionally, the plan presented the future growth projections of the member municipalities as documented within the individual municipal Act 537 Plans and the calculated wastewater flow projections based on the 5 year, 10 year and ultimate growth horizons. The 5 and 10 year planning horizons developed in the 1997 plan were for the years 2000 and 2005 and based on year-end 1994 data.

The following summarizes the recommendations resulting from this study:

1. Sewer expansions or upgrades are **not** recommended as a result of this analysis.
2. Ongoing monitoring of key system locations is recommended.
3. Address project pump station capacity issues as the pump stations are modernized.
4. Identify and elevate all manholes located in or beside creeks.

This Plan Validation is divided into five sections:

- Section 1 summarizes the flow projections and recommendations presented in the 1997 Report.
- Section 2 describes improvements and changes to the VFSA collection system since the 1997 Report.
- Section 3 presents updated EDU and resulting flow projections for the 5 year, 10 year, 15 year and ultimate growth scenarios.
- Section 4 presents the computer results of wet weather flow analysis for the VFSA collection system based on the 10-year and ultimate growth scenarios.

Based on the evaluation performed the following summarizes the overall findings:

Future average daily flow projections for the member municipalities are: (correct per new table).

- 5 year flow: 1.651 MGD
- 10 year flow 1.780 MGD
- 20 year flow 1.916 MGD
- Ultimate flow (30-yr) 1.916 MGD

The flow projections do not exceed the Member Municipalities' flow allocation of 2.124 MGD.

Flow Projections do not exceed Flow Allocation

Wet weather flow analysis identified sewer segments that will be at or approaching capacity based on a desk top static model for three different rain event scenarios: small, average, and large. However, the VFSA staff has visited and evaluated the portions of the system where the static model indicates the potential for flows that are greater than 100% of design capacity and has found no evidence of surcharging. The field installation of surcharge indicators is recommended to monitor the extent of any potential sewer surcharging in these areas over a long term period of time.

As growth occurs and if / when surcharging or sewer capacity issues are identified, then it is recommended that the affected areas be evaluated in more detail. Where necessary, appropriate sewer capacity upgrades should be provided before service is adversely affected.

According to the model, all four major pump stations, French Creek, Pothouse Road, Whitehorse Road and Pickering Creek, already experience some minor capacity issues under average and very heavy rain/wet weather conditions. Conditions where a second (lag) pump kicked on have been confirmed in VFSA's flow records. However, for the most part, flow rates just exceed the pump station capacity with one pump operating. Yet strict adherence to PADEP regulations indicates that pump stations must be adequately sized to transfer the expected flows without requiring a standby (in this case, the lag) pump.

Both Pothouse Road and Pickering pump stations are predicted to exceed the overall pump station capacity with two pumps running under the ultimate growth scenario during heavy rain events and/or snow melts. Although this condition is well beyond the growth horizons that apply to this 537 Plan, these projections should be considered when the applicable pump stations are upgraded. Buchart-Horn understands that VFSA is considering modernizing their pump stations from existing Flow Matcher controls to variable frequency drives (VFD) and VFD-rated motors Buchart-Horn, Inc. (B-H) concurs with this long-term strategy and recommends that the PADEP capacity requirements be incorporated into the pump station modernization projects as they occur.

SECTION 1
SUMMARY OF FLOW PROJECTIONS & REVIEW OF THE 1997 REPORT

The April 1997 report projected an ultimate average daily flow (ADF) of 2.120 MGD compared to the Member Municipalities Allocated Capacity of 2.124 MGD. Therefore, no change in the Allocated Capacity was proposed.

VFSA has been actively executing the recommendations from the 1997 Plan.

The 1997 plan also reported that the majority of the pump stations had adequate capacity to handle the projected flows. The following recommendations were made:

- Perkiomen P.S. to be upgraded in conjunction with the Meadows Subdivision construction
- Valley Creek P.S. to be evaluated in light of a potential upgrade to the Wilson Road Pump Station
- Pothouse Road P.S. to be field-tested to determine capacity prior to implementing any upgrading activities.

The pump stations were evaluated based on the maximum daily GPD/EDU measured in each pump station drainage basin with future flows based on a long term average GPD/EDU peaked 2.5 times. Table 1.1 summarizes the maximum day and average daily flow rates utilized in the 1997 pump station and collection system analysis.

Table 1.1
PUMP STATION FLOWS
for analysis per the1997 Member Report

Pump Station	Max Day Flowrate	Average Daily Flowrate
French Creek	919	239
Pothouse	1650	254
Whitehorse	1458	250
Pickering	536	224
Perkiomen	1346	236
Valley Creek	2635	260
Kimble	919 (based on FC)	
Charlestown	1650 (based on PH)	

* Maximum average daily flow – applied to existing system EDUs
** Average daily flow – multiplied by 2.5 and applied to future system EDUs

The collection system was evaluated using the Authority's original computer model. The wet weather analysis was based on the same flowrates calculated for the various pump station drainage basins listed in Table 1.1. The model identified specific sewer segments for monitoring.

An implementation plan was developed by B-H and executed as appropriate by VFSA.

Upgrades to the VFSA collection system have been documented by B-H in the respective yearly Engineer's Reports for the VFSA system. The improvements that have been accomplished since 1997 are summarized in Section 2. The remainder of this report addresses updated 5 year, 10 year, and ultimate flow projections and provides recommendations for system monitoring activities in the future.

SECTION 2
IMPROVEMENTS & CHANGES TO THE VFSA COLLECTION SYSTEM SINCE 1997

Improvements to the VFSA collection system, primarily associated with capacity issues, that have occurred since the original Member Municipality Act 537 Plan was approved include:

- Prior to 2000 - Expanded and realigned sewer feeding Pothouse Road Pump Station
- 2000 – Performed Drawdown Testing of Pickering Creek Pump Station
- 2001 – Decommissioned Sandra Lane Pump Station. This area is now served by gravity sewers
- 2001 – Replaced pump #1 impeller – Pothouse Road Pump Station
- 2001 –2003 Performed aggressive I/I reduction in the Sandra Lane / Pothouse Road Pump Station drainage basins.
- 2002 - Upgraded Perkiomen Pump Station, which was required to accommodate additional EDU connections from the Meadows Subdivision. (Primarily Developer Funded)
- 2002 – Replaced French Creek P.S. – Pump No. 1
- 2003 – Upgraded Valley Creek Pump Station. Replaced both pumps with higher head pumps which was required to allow flow to enter the Wilson Road force main
- 2004 - Replaced Pump No.2 - Pothouse Road Pump Station

SECTION 3
EDU GROWTH & RESULTING FLOW PROJECTIONS

Table 3.1 provides an historic summary of EDU growth and corresponding flows. The table also presents the 5 year and 10 year connection and flowrate averages. These averages were utilized to develop the growth and flow projections presented herein.

Table 3.1
Historic summary of EDU Growth and Corresponding Flows

Year	Year-end EDUs	No. of Connections	Average Flow (MGD)	Flowrate GPD/EDU

Table 3.2 is an update to the 1997 Member Municipality Report, Appendix B, Basis of EDU Growth Projections. This table is presented by pump station drainage basin to facilitate further evaluation of the Member Municipality Collection System and Pump Stations which is discussed in Section 4. The Table provides the following information:

- 2004 year-end EDUs as reported by the VFSA billing department.
- 2009 (5-year) EDU growth projection as reported in the Member Municipality Act 537 Plan. This projection is at a growth rate of 142 EDUs per year.
- 2014 (10 year) EDU growth projection based on an annual average growth rate of 101 EDUs per year.
- 2024 (20 year & Ultimate) EDU growth projection based on an annual average growth rate of 91 EDUs per year. The ultimate growth projection is based on the current Act 537 Sewer Service Boundary, developable land and expanding industry, and vacant land reviewed per Member Municipality zoning.

Table 3.2 presents a slower growth than has been experienced in previous years but is considered reasonable based on the current development activity and the reduced creation of new developments. However, should an acceleration of growth be experienced, it is expected that it will be contained within the total number of EDUs identified in Table 3.2. Therefore the flow projections and wet weather analysis consider not only the 10-year EDU growth projection, but also the 20-year / ultimate growth projection, so that the necessary collection / conveyance facilities may be constructed where required as the development occurs.

The ultimate growth projection of 7,989 EDUS is approximately 470 EDUs greater than that projected in the 1997 Member Municipality Plan and in general is attributed to the following:

- The inclusion of the Route 724 area north of Route 23 in the 537 Boundary covering Phoenixville Crossing and Kimberton Meadows *+ 200 EDUS*
- Greater industrial growth within the Lee Tire Drainage Basin *+ 110 EDUs*
- Christopher Crossing & Heritage Coricia *+ 160 EDUs*

The ultimate growth projection presented herein is not expected be exceeded unless one of the Member Municipalities would elect to revise their established sewer service boundary. Should this occur, a Revision to the Act 537 Plan would be required to accommodate such changes.

As presented in Table No. 3.1, the 5-year and 10- year average flow rates are 238 gpd/edu and 253 gpd/edu respectively. Since 1993, the highest average daily flowrate has been 286 gpd/edu experienced in 1996 and 2003. The lowest flowrate, 201 gpd/edu, was experienced in 1995 and 2002. Table 3.3 presents future ultimate average daily flow projections within the Member Municipality Act 537 Plan Drainage basin based on the 10-year average 253 gpd/edu flowrate and the more conservative highest annual average flowrate of 286gpd/edu. These flowrates have been applied to the projected EDUs and then added to the current 2004 average flow.

Table 3.3
Ultimate Flow Projections in Million Gallons per Day (MGD)

Year	Total EDUs	ADF based on 253 gpd/edu	ADF based on 286 gpd/edu
Current - 2004	6,160	1.480	1.480
2009 – 5 year	6,870	1.651	1.683
2014 – 10 year	7,172	1.780	1.769
2024 – 20 year & Ultimate	7,989	1.916	2.003

In either instance, the ultimate flow projection remains within the VFSA member municipality flow allocation of 2.124 MGD, concluding that additional capacity is not required.

SECTION 4
WET WEATHER ANALYSIS OF THE MEMBER MUNICIPALITY COLLECTION SYSTEM

Section 3 of this report projects future average daily flows within the VFSA collection system for the established growth horizons. The evaluation is appropriate to establish the overall capacity required by the Member Municipalities for Wastewater Treatment Capacity. The flow projections however are based on system averages and the overall collection system will experience flow rates much greater and much less that these averages based on a number of factors, primarily diurnal flows and wet weather / high ground water conditions. The collection system (pipe network and pump stations) must be capable of transmitting these higher flows at any time to avoid possible overflows within the system. Therefore, this section evaluates the wet weather capacity of the collection system based on the 10-year and ultimate growth data developed within Section 3.

In 1999, VFSA performed a detailed analysis of the collection system utilizing a computer model of the system. Although the Authority has been evaluating the collection system using a computer model for over 10 years, the installation of telogers has allowed the VFSA to capture detailed flow data of the system at the various pump stations throughout the collection system. Based on the data that was available at that time, a rain event that occurred in 1999 provided good meteromg data to allow a wet weather analysis of the collection system. Based on an analysis of wet weather in the region, the March 1999 rain event appeared to represent a 10-year storm event. This analyzed rain event indicated that the collection system needed to be able to transmit approximately 900 gpd/edu during the storm event.

To support this Plan Validation, the Authority's 2003 and 2004 flow data was analyzed. Based on the rain gage data as well as the peak hourly and peak daily flows that have been experienced in 2003 and 2004, it is apparent that the March 1999 rain event previously studied is more representative of a typical rain event which will be experienced by the VFSA system on a regular basis. Over the past 2 years, 12 rain events were analyzed. The Large Pump Stations chart on the following page depicts the recorded flows at the 4 major pump stations during these 12 rain events. As depicted, Pickering Creek Pump Station experienced 4 rain events during which its discharge rate was approximately 7 MGD for several hours. There are 4 more rain events where Pickering Creek Pump Station discharged at a rate over 5 MGD. The three largest wet weather events where Pickering Creek Pump Station exceeded a pumping rate of 7 MGD were not utilized in the system analysis because:

- Extenuating circumstances impacted one of these excessive rain events. This occurred when French Creek exceeded the rim elevation of an interceptor manhole allowing Creek water to enter the system. The rim elevation of manholes located in and beside Creeks should be reviewed and elevated to avoid this type of occurrence.
- Two of the rain events occurred in hurricane weather conditions which the system could not be expected to handle.

Four flow scenarios were developed for wet weather system analysis utilizing both 10-year and ultimate EDU growth projections. For each event described, the flowrate experienced by Pickering

Creek Pump Station was applied to all four major pump stations (Pickering Creek, Whitehorse Road, Pothouse Road and French Creek) and the two minor pump stations feeding that system(Charlestown Road and Kimble Drive). The flowrates for each scenario are:

- Small rain event experienced in March 1999 – 900 gpd/edu.
- Average rain event based on Pickering Creek Pump Station operating at 5.6 MGD (occurring 7 times in past 2 years) – 1090 gpd/edu
- Large Rain event based on Pickering Creek Pump Station operating at 6.8 MGD (occurring 4 times in past 2 years) – 1314 gpd/edu
- Small rain event with French Creek Pump Station operating at capacity (4.65 MGD).

Perkiomen and Valley Creek pump station were evaluated separately as they do not contribute flows to the Pickering Creek drainage basin and due to location appear to be influenced by other rain events than those affecting the eastern portion of the system. Again, based on a review of the flow data, flowrates were assigned to these pump stations for three types of rain events. The flowrates used are as follows:

Perkiomen Pump Station

- Small rain event (average of data from 2/22/03, 10/29/03, 11/28/04 rain events)– 943 gpd/edu
- Average rain event (average data from 6/20/2003 rain event) – 1200 gpd/edu
- Large rain event (average data from, 9/28/2004 rain event) – 1507 gpd/edu

Valley Creek Pump Station

- Small rain event (average of data from 12/14/03 & 12/17/03 rain events)– 343 gpd/edu
- Average rain event (average of data from 12/11/03 & 11/28/04 rain events) – 537 gpd/edu
- Large rain event – (average data from 9/28/04 rain event - 722 gpd/edu

Note: Valley Creek pump station flowrates are less than other system flows. As noted in Section 2, the Valley Creek pump station pumps were replaced in 2003 with higher head pumps allowing the flow to overcome high head from the Wilson Road pump station. Since the pumps have been replaced, a drastic reduction in flows has been noted. Therefore, all data prior to the pump replacement was excluded from this evaluation.

In all instances, the future EDUs are assumed to not contribute further system inflow, and therefore only a diurnal flow has been projected for these EDUs. Since 1993, the maximum annual system wide average daily flowrate of about 285 gpd/edu occurred twice. This flowrate, peaked 2.5 times, (712.5 gpd/edu) was therefore applied to all future EDUS in these wet weather analyses.

The Tables 4.1, 4.2 and 4.3 summarize the results of this analysis for a small rain event, an average rain event and a large rain event respectively. Exhibits 4.1, 4.2 and 4.3 depict the information presented in these tables. The tables provide a summary of those pipe segments that, according to the sewer model are at capacity now under the described wet weather condition or that will exceed the theoretical capacity under the 10 year and ultimate EDU growth scenarios. Hydraulically a pipeline is flowing full when it reaches 80% of its design capacity and therefore, all segments at greater than 80% capacity are included in the tables. Several points must be made prior to reviewing and discussing the results in these tables.

Insert Pickering 12 rain event flow chart here – see PDF file forwarded with e-mail

- According to the static model, a sewer segment that is over its capacity may experience some surcharging within the manhole; however this does not mean that the manhole is overflowing its rim. A "capacity" condition is established as a pipe flowing full according to the static model.
- The desk top analysis was performed using a static sewer model which cannot evaluate flows as they move through a dynamic network of gravity sewers.
- VFSA staff has inspected the manholes identified to be greater than 100% of their design capacity as indicated by the static model and has observed no signs of surcharging. This confirms the results obtained by the VFSA staff using surcharge indicators over the last few years.
- The model, however, does identify the segments within the system that, as a result of anticipated growth, warrant attention in the context of long-term facilities planning.

Table 4.4 and accompanying Exhibit 4.4 summarize a fourth flow scenario that was evaluated. In this instance, the system was analyzed based on French Creek pump station operating at capacity during a small rain event. This scenario has occurred on several occasions and identifies some additional interceptor segments where the static model indicates flows may exceed their theoretical design capacity. Again, system inspections of actual field conditions suggest that manhole surcharging **does not** occur.

	2.06.108-107	8	80%

No sewer upgrades or expansions are recommended as a result of this analysis. As previously noted, VFSA staff has inspected most of the segments that have been identified as having flows of greater than 100% of their design capacity according to the static model and has found no signs of surcharging. It is therefore recommended that those segments identified as "at capacity now" under all types of wet weather events should either have surcharge indicators placed in the upstream manhole or be inspected during a significant rain event. In addition, monitoring of these segments is recommended as the anticipated growth occurs. Upgrade of the larger diameter interceptor pipes is a costly endeavor and could have significant impact on the surrounding community. Therefore these activities should be planned well in advance. Proper monitoring of the sewer segments of concern as well as reevaluating the sewer system when new developments are constructed will facilitate the planning and implementation process.

Dynamic modeling of the system interceptors could also be accomplished as a part of the monitoring process. The model would calculate the hydraulic grade line depicting the liquid level in the manholes under various rain events. The modeling effort would also require extensive system flow monitoring to validate flows entering the various portions of the interceptor. Because of the significant time, effort and costs required to validate these models, it is recommended that system surcharge indicators and inspections be implemented as the first step in monitoring any areas of concern. If surcharges are noted, dynamic sewer modeling would be performed as the next step to determine the extent of surcharging and the effect of anticipated future growth. The data collected from the surcharge indicators would be used to help calibrate the dynamic sewer model. The modeling would also assist in determining the necessary pipe diameter for any sewer line expansions if any are required.

The affect of system flows (from the various rain events under the 10 year and ultimate growth scenarios) on the major pump station was also evaluated. Table 4.5 summarizes this information. Under average and heavy rain and snow melt events, existing EDUs, all four of the major pump stations have some capacity concerns with 1 pump operating. VFSA data indicates that the lag pump has been required during significant rain events. Per PADEP requirements, a pump station must be adequately sized to be able to pump the expected flows without the operation of the standby (in this case, the lag) pump. As a practical matter, VFSA's current routine practice of assuring that both lead and lag pumps are serviceable 100% of the time should be continued. During major maintenance events, VFSA's practice of renting a back up pump assures that adequate and uninterrupted service is provided to its customers at all times.

Both Pothouse Road and Pickering pump stations are predicted to exceed the overall pump station capacity with two pumps running under the ultimate growth scenario during large rain events. Although this is well beyond the growth horizons that apply to this 537 Plan, these projections should be considered when the applicable pump stations are upgraded and/or modernized. It is recommended that VFSA begin to plan / budget for the upgrade of each of the four major pump stations within the next 10 years. These upgrade recommendations are focused on the system pumps only. Other upgrades / improvements, such as those to improve energy usage, monitoring, and controls could be accomplished simultaneously.

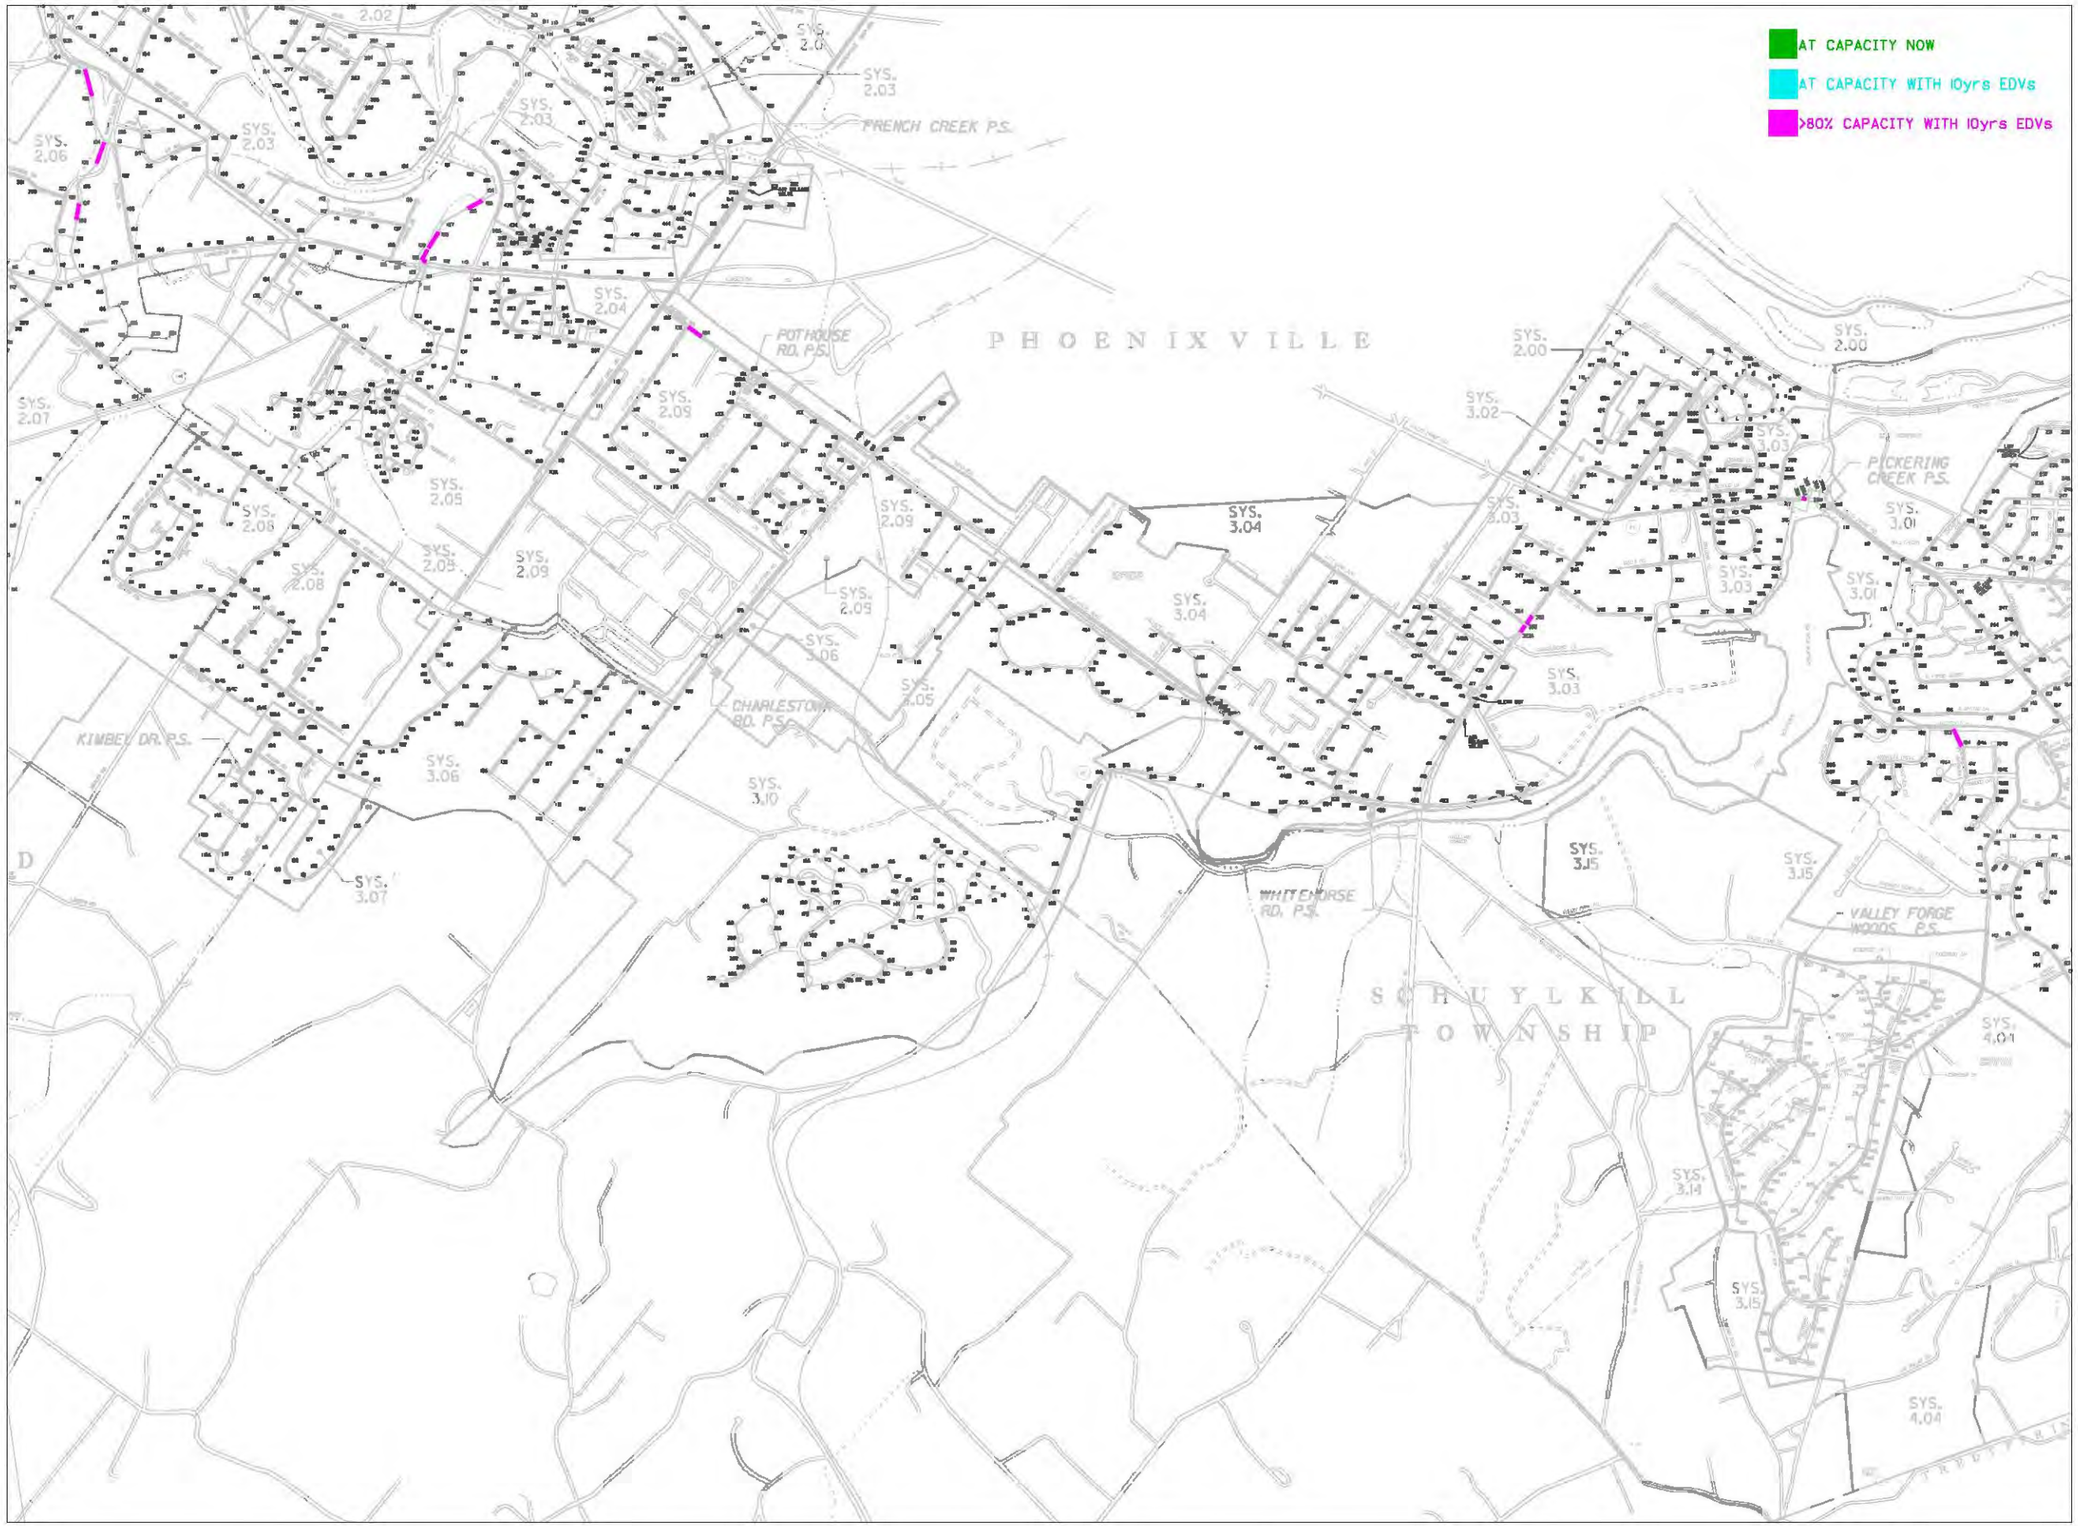

Table 4.5
Pump Stations with Capacity Concerns

	Station Capacity *		Observed Peak Hourly		Flows From Model Runs (MGD)									
			(2003-2004)		Small Rain Event			Average Rain Event			Large Rain Event			FC @ 2-pump on

All station capacity values are from drawdown tests except:

- Pickering Pump Station – Two pump capacity is from measured peak pumping rates during several rain events.
- Country Club, Perkiomen and Valley Creek Pump Stations - capacity based on design curves. Drawdown testing has not been performed

Note: Shaded values indicate those flows in excess of pump station capacity (1 pump operating). Shaded values with bold text indicate those flows that are in excess of the pump station 2-pump operating flow rates.

Re: Preliminary Treatment Requirements
Valley Forge Sewer Authority
Schuylkill Township
Chester County

Dear Mr. Woyden:

This is in reply to your May 12, 2006, request for Preliminary Treatment Requirements for a discharge of expanded flow of 11.3 MGD from 9.2 MGD to the Schuylkill River, with a proposed expansion of the treatment plant on 333 Pawling Road, Phoenixville, PA.

NPDES Permit PA0043974 was issued on July 19, 2004, for the flow of 9.2 MGD. Effluent limits were calculated based on "the Schuylkill River Reallocation Study" for POTWs in the reach from Black Rock Dam to Norristown Dam stream segment of the Schuylkill River.

A summary of the Department of Environmental Protection's (Department) preliminary treatment requirements for flow of 11.3 MGD are as follows:

$CBOD_5$ (05/01-10/31) = 19.3 mg/l
$CBOD_5$ (11/01-04/30) = 25 mg/l
TSS = 30 mg/l
NH_3-N (05/01-10/31) = 7.7 mg/l
NH_3-N (11/01-04/30) = 16.0 mg/l
DO – 5 mg/l, minimum
Fecal Coliform = 200/100 ml geometric mean
Total Residual Chlorine = 0.5 mg/l

RECEIVED
JUL 28 2006
GANNETT FLEMING
ENGINEERS & PLANNERS

Note: All limits above are monthly average limits, unless otherwise noted.

Please note that these limits are preliminary in a nature and are subject to review based on a detailed review of the information provided in a formal application for an NPDES permit.

If you have any questions, please call Mr. Ketan Thakor at 484-250-5193. You may also wish to contact the Sewage Planning Specialist for information on Act 537 sewage facilities planning requirements for this project.

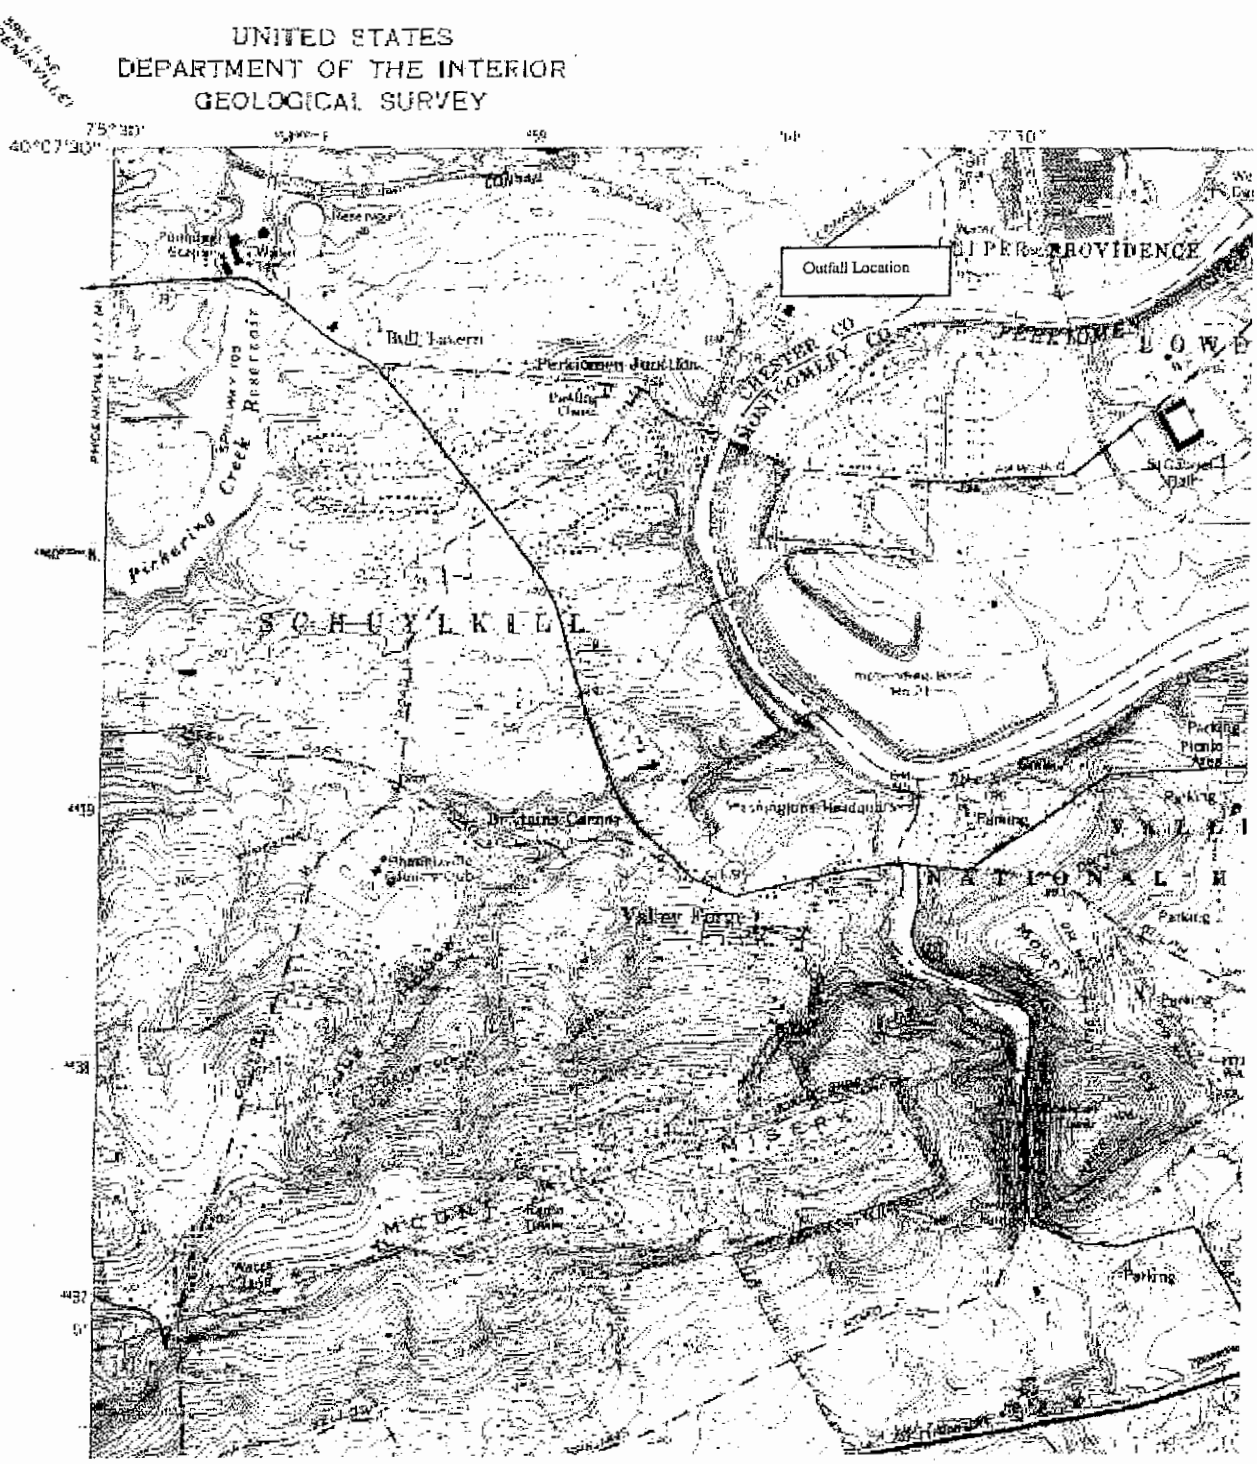
RE: Valley Forge Sewer Authority
Wastewater Treatment Plant – Act 537
Preliminary Discharge Criteria

Dear Sohan:

The Valley Forge Sewer Authority has been in the process of preparing a regional Act 537 Plan. The Plan is nearing completion and submission to the PADEP. One of the short listed options being investigated is expansion of the existing facility. Based on the projected flows, we anticipate that the plant will have to be expanded to increase the capacity from 9.2 MGD to approximately 11.3 MGD (AADF). This corresponds to the AADF capacity projected to be needed in approximately 20 years. The plant's hydraulic capacity is currently 10.4 MGD.

We are writing this letter to request preliminary discharge criteria for the expanded plant. The outfall discharges to the Schuylkill River at Latitude 40°07'05" and Longitude 75°27'56". We have attached a portion of the Valley Forge USGS quadrangle with the outfall location indicated.



If you have any questions or require any additional information, please contact me.

Very truly yours,

GANNETT FLEMING, INC.

Edward L. Woyden

Pennsylvania Natural Diversity Inventory (PNDI) records indicate there are potential impacts on special concern species and resources within the project area. If the project is pursued, the jurisdictional agency/agencies indicated require that the instructions below regarding potential impacts and/or avoidance measures be followed in their entirety.

Q1: Aquatic habitat (stream, river, lake, pond, etc.) is located on or adjacent to the subject property and project activities (including discharge) may occur within 300 feet of these habitats
Your answer is: **1. Yes**
Please initial here signifying that you have provided the most accurate answer to the question as possible.

APPLICANT INITIALS: _____

Q2: Accurately describe what is known about wetland presence in the project area or on the land parcel. "Project" includes all features of the project (including buildings, roads, utility lines, outfall and intake structures, wells, stormwater retention/detention basins, parking lots, driveways, lawns, etc.), as well as all associated impacts (e.g., temporary staging areas, work areas, temporary road crossings, areas subject to grading or clearing, etc.). Include all areas that will be permanently or temporarily affected -- either directly or indirectly -- by any type of disturbance (e.g., land clearing, grading, tree removal, flooding, etc.). Land parcel = the lot(s) on which some type of project(s) or activity(s) are proposed to occur .
Your answer is: **2. The project area (or land parcel) has not been investigated by someone qualified to identify and delineate wetlands, or it is currently unknown if the project or project activities will affect wetlands.**
Please initial here signifying that you have provided the most accurate answer to the question as possible.
APPLICANT INITIALS: _____

These determinations were based on the project-specific information you provided, including the exact project location; the project type, description, and features; and any responses to questions that were generated during this search. If any of the information you provided does not accurately reflect this project, or if project plans change, DEP and the jurisdictional agencies require that another PNDI review be conducted.

This response represents the most up-to-date summary of the PNDI data files and is <u>good for one(1) year</u> from the date of this PNDI Project Environmental Review Receipt.

 APPLICANT INITIALS: _____

1 potential impact
The Applicant should MAIL a copy of this Project Environmental Review Receipt, a cover letter with project narrative, acreage to be impacted, how construction/maintenance activity is to be accomplished, township/municipality and county where project is located, and a USGS 7.5 minute quadrangle with project boundary and quad name marked on the map.

Please mail only one (1) copy of the project review request. Do not email the project information. Allow 30 days for completion of the project review from the date of PFBC receipt of the project review request.

DISCLAIMER

The PNDI environmental review website is a preliminary environmental screening tool. It is not a substitute for information obtained from a field survey of the project area conducted by a biologist. Such surveys may reveal previously undocumented populations of species of special concern. In addition, the PNDI only contains information about species occurrences that have actually been reported to the Pennsylvania Natural Heritage Program.

Pennsylvania State Programmatic General Permit (PASPGP)

Please note that regardless of PNDI search results, projects requiring a Chapter 105 DEP individual permit or GP 5, 6, 7, 8, 9 or 11 in certain counties (Adams, Berks, Bucks, Chester, Cumberland, Delaware, Franklin, Lancaster, Lebanon, Lehigh, Monroe, Montgomery, Northampton, Schuylkill and York) are required by DEP to comply with the bog turtle habitat screening requirements of the PASPGP.

 APPLICANT INITIALS: _____

TERMS OF USE

Upon signing into the PNDI environmental review website, and as a condition of using it, you agreed to certain terms of use. These are as follows:

The web site is intended solely for the purpose of screening projects for potential impacts on resources of special concern in accordance with the instructions provided on the web site. Use of the web site for any other purpose or in any other way is prohibited and subject to criminal prosecution under federal and state law, including but not limited to the following: Computer Fraud and Abuse Act of 1986, as amended, 18 U.S.C. § 1030; Pennsylvania Crimes Code, § 4911 (tampering with public records or information), § 7611 (unlawful use of computer and other computer crimes), § 7612 (disruption of service), § 7613 (computer theft), § 7614 (unlawful duplication), and § 7615 (computer trespass).

The PNHP reserves the right at any time and without notice to modify or suspend the web site and to terminate or restrict access to it.

The terms of use may be revised from time to time. By continuing to use the web site after changes to the terms have been posted, the user has agreed to accept such changes.

This review is based on the project information that was entered. The jurisdictional agencies and DEP require that the review be redone if the project area, location, or the type of project changes. If additional information on species of special concern becomes available, this review may be reconsidered by the jurisdictional agency.

PRIVACY and SECURITY

This web site operates on a Commonwealth of Pennsylvania computer system. It maintains a record of each environmental review search result as well as contact information for the project applicant. These records are maintained for internal tracking purposes. Information collected in this application will be made available only to the jurisdictional agencies and to the Department of Environmental Protection, except if required for law enforcement purposes—see paragraph below.

This system is monitored to ensure proper operation, to verify the functioning of applicable security features, and for other like purposes. Anyone using this system consents to such monitoring and is advised that if such monitoring reveals evidence of possible criminal activity, system personnel may provide the evidence to law enforcement officials. See Terms of Use.

In order for this project to be considered for subsequent review, a signed and initialed copy of this receipt is required by the agency or agencies indicated. DEP requires that a signed and initialed copy of this receipt, along with any required documentation from jurisdictional agencies concerning resolution of potential impacts, be submitted in applications for permits requiring PNDI review. See DEP PNDI policy at www.naturalheritage.state.pa.us or visit the following websites for further information.

PROJECT NARRATIVE

Valley Forge Sewer Authority is in the process of updating its Regional Act 537 Sewage Facilities Plan. The Authority's existing treatment facilities which are located in Schuylkill Township, Chester County along the Schuylkill River serve 8 surrounding Townships and Boroughs. Several of the alternatives presently under evaluation include the potential for constructing additional treatment tanks on the existing site in an area situated between the existing tankage and the Authority's administrative facilities. Should all of the tankage need to be constructed, it is anticipated that the disturbed area will be a 350' x 1100' area just southwest of the existing tankage as depicted on the attached USGS quad (Valley Forge) and site plan.

RE: Species Impact Review (SIR) – Rare, Candidate, Threatened and Endangered Species
PNDI Search Number: 20060327026464
VALLEY FORGE SEWER AUTHORITY REGIONAL ACT 537 PLAN
SCHUYLKILL Township, CHESTER County, Pennsylvania

Dear Ms. VESELY:

I have reviewed the maps for the above-referenced project. Based on records maintained in the Pennsylvania Natural Diversity Inventory (PNDI) database and our own files, the bog turtle (*Glyptemys muhlenbergii*, state endangered, federal threatened) and red-bellied turtle (*Pseudemys rubriventris*, state threatened) are known from the vicinity of the proposed project site.

The bog turtle (*Glyptemys muhlenbergii*) is a small (up to a 4 inch carapace) semi-aquatic, omnivorous turtle that prefers open marshy wetlands associated with springs and groundwater, specific vegetative communities and mucky soils for burrowing. This species is restricted to the southcentral and southeast portions of Pennsylvania. However, due to the lack of pristine habitat found in its range from disturbance and successional processes, the bog turtle has had in some case become accustomed to disturbed, low quality wetland complexes often with semi-closed canopies. Bog turtles are also known to be transients in forested habitat that are associated with springs and small streams leading to more open marshes. They use these habitats as dispersal corridors to other wetlands. The bog turtle is threatened by habitat destruction, poor water quality and poaching.

Based on the proximity of your proposed project to known bog turtle habitat, there may also be suitable bog turtle habitat on the proposed project site. **Therefore, if there will be *any* direct (e.g., filling; earth disturbance) or indirect (e.g., runoff) impacts to any wetlands within or adjacent to the project area (including access roads), we request that a habitat suitability assessment (Phase 1 survey) for bog turtles be conducted by a qualified herpetologist.** A list of qualified surveyors is enclosed for your convenience. Bog turtle habitat surveys are to be conducted in accordance with the methods outlined in the enclosed "*Guidelines for Bog Turtle Surveys*."

Upon completion of the Phase 1 bog turtle survey, the herpetologist is to send a report documenting the survey results to this office (Natural Diversity Section) for our review and comment. The report should include the following information: descriptions of the wetland vegetation, soils, and hydrology on the site; color photographs and maps of suitable habitat; and a list of all herpetofauna observed during the survey. If

any bog turtles are observed during the survey, their location(s) should be mapped, and they should be photographed, aged, sexed, and measured. Following our review of the habitat survey, an additional biological survey to determine bog turtle presence (Phase 2) may be required. **However, if there will be no direct or indirect impacts to wetlands from the proposed project, then I do not foresee any adverse impacts to the bog turtle.**

Due to the federal status of the bog turtle, future correspondence should also be directed to the Endangered Species Biologist of the U.S. Fish and Wildlife Service at their field office in State College, Pennsylvania. Also, please note that the Pennsylvania Fish & Boat Commission conducts Species Impact Reviews only for reptiles, amphibians, fishes and aquatic invertebrates. Reviews concerning other natural resources should be directed to the appropriate agencies.

The PNDI and file search of rare species in the project vicinity also detected the red-bellied turtle (PA threatened) in the vicinity of the proposed project. The red-bellied turtle is one of Pennsylvania's largest native aquatic turtles. This turtle species is known to inhabit relatively large, deep streams, rivers, ponds, lakes and marshes with permanent water and ample basking sites. Red-bellied turtles are restricted to the southcentral and southeastern regions of the Commonwealth. The existence of this turtle species is threatened by habitat destruction, poor water quality, and competition with aggressive non-native turtle species that share its range and habitat (e.g., red-eared slider, *Trachemys scripta elegans*).

Red-bellied turtles are known from near the project area. It is possible that they could also occur in any wetlands and water bodies on-site. **Therefore, if wetlands with open water areas, streams or ponds are to be disturbed from the project activity, we will need to conduct a more thorough evaluation of the potential adverse impacts to the red-bellied turtle.** Items including detailed project plans, project narrative, aerial photographs of the general area, general habitat descriptions, and color photographs of the project area, wetlands identification and delineation, stream characterization (flow velocity, width, depth, substrate type, pools and riffles, identification of basking areas, logs, woody debris, presence of aquatic vegetation) would expedite our review process. Pending the review of this information, a survey targeting the presence of the species of concern may be warranted.

However, if wetlands or water bodies are not to be disturbed in any way by the proposed activity, and provided that best management practices are employed and strict erosion and sedimentation measures are maintained, I do not foresee any adverse impacts to red-bellied turtle or any other rare or protected species under Pennsylvania Fish & Boat Commission jurisdiction. If no wetlands or waterways will be disturbed, no further action on your part will be necessary.

Note that this office performed no field inspection of the project area. Consequently, comments in this letter are not meant to address other issues or concerns that might arise concerning matters under Pennsylvania Fish and Boat Commission jurisdiction or that of other authorities. If you have any questions regarding this response, please contact Nevin Welte at 814-359-5234 and refer to the SIR number at the top of this letter. Thank you for your cooperation and attention to this matter of endangered species conservation and habitat protection.

Sincerely,

Christopher A. Urban, Chief
Natural Diversity Section

U.S. FISH AND WILDLIFE SERVICE
& PENNSYLVANIA FISH AND BOAT COMMISSION

QUALIFIED BOG TURTLE SURVEYORS

The following list includes persons known by the U.S. Fish and Wildlife Service and Pennsylvania Fish and Boat Commission to have the skills and experience to search for and successfully find bog turtles and their habitat. Any individuals handling or conducting surveys for bog turtles must first obtain a Scientific Collector's Permit from the Commission. All permitted collector's encounters with bog turtles must be reported in writing to the Commission and Service within 48 hours. Bog turtle surveys and research should be overseen by a qualified surveyor, who should be present in the field at all times during the investigation. Surveys should be carried out in accordance with the Service's *Guidelines for Bog Turtle Surveys* (dated May 2001); exceptions should be reviewed and approved by the Service and Commission.

This information is not to be construed as an endorsement of individuals or firms by the Service, Commission, or any of their employees. Persons not on this list, but who have documented experience in conducting scientific studies of, or successful searches for, bog turtles and their habitat may submit their qualifications to the Service and Commission for review. The submission must include documentation that the requestor has experience successfully locating and identifying bog turtle habitat, and successfully locating and identifying bog turtles in their wetland habitat. Additions to and deletions from this list are at the sole discretion of the Service and Commission. This list is subject to revision at any time without prior notice.

GUIDELINES FOR BOG TURTLE SURVEYS[1]

(revised April 2006)

RATIONALE

A bog turtle survey (when conducted according to these guidelines) is an attempt to determine presence or probable absence of the species; it does not provide sufficient data to determine population size or structure. Following these guidelines will standardize survey procedures. It will help maximize the potential for detection of bog turtles at previously undocumented sites at a minimum acceptable level of effort. Although the detection of bog turtles confirms their presence, failure to detect them does not absolutely confirm their absence (likewise, bog turtles do not occur in all appropriate habitats and many seemingly suitable sites are devoid of the species). Surveys as extensive as outlined below are usually sufficient to detect bog turtles; however, there have been instances in which additional effort was necessary to detect bog turtles, especially when habitat was less than optimum, survey conditions were less than ideal, or turtle densities were low.

PRIOR TO CONDUCTING ANY SURVEYS

If a project is proposed to occur in a county of known bog turtle occurrence (see attachment 1), contact the U.S. Fish and Wildlife Service (Service) and/or the appropriate State wildlife agency (see attachment 2). They will determine whether or not any known bog turtle sites occur in or near the project area, and will determine the need for surveys.

- If a wetland in or near the project area is *known* to support bog turtles, measures must be taken to avoid impacts to the species. The Service and State wildlife agency will work with federal, state and local regulatory agencies, permit applicants, and project proponents to ensure that adverse effects to bog turtles are avoided or minimized.

- If wetlands in or adjacent to the project area are *not* known bog turtle habitat, conduct a bog turtle habitat survey (Phase 1 survey) if:

  1. The wetland(s) have an emergent and/or scrub-shrub wetland component, or are forested with suitable soils and hydrology (see below), *and*

  2. Direct and indirect adverse effects to the wetland(s) cannot be avoided.

  See *Bog Turtle Conservation Zones*[2] for guidance regarding activities that may affect bog turtles and their habitat. In addition, consult with the Fish and Wildlife Service and/or appropriate State wildlife agency to definitively determine whether or not a Phase 1 survey will be necessary.

---

[1] These guidelines are a modification of those found in the final "Bog Turtle (*Clemmys muhlenbergii*), Northern Population, Recovery Plan" (dated May 15, 2001). Several minor revisions were made to facilitate survey efforts and increase searcher effectiveness. As additional information becomes available regarding survey techniques and effectiveness, these survey guidelines may be updated and revised. Contact the Fish and Wildlife Service or one of the state agencies listed in Attachment 1 for the most recent version of these guidelines.

[2] See Appendix A of the "Bog Turtle (*Clemmys muhlenbergii*), Northern Population, Recovery Plan" (dated May 15, 2001).

however, that one or more of these criteria may be absent from portions of a wetland or wetland complex supporting bog turtles. Absence of one or more criteria does not preclude bog turtle use of these areas to meet important life functions, including foraging, shelter and dispersal.

- If these criteria (suitable soils, vegetation and hydrology) are present in the *wetland*, then the *wetland* is considered to be potential bog turtle habitat, regardless of whether or not that portion of the wetland occurring within the project boundaries contains all three criteria. If the *wetland* is determined to be potential habitat and the project will directly or indirectly impact *any portion* of the wetland (see *Bog Turtle Conservation Zones*), then either:
  - Completely avoid all direct and indirect effects to the wetland, in consultation with the Service and appropriate State wildlife agency, OR
  - Conduct a Phase 2 survey to determine the presence of bog turtles.
- The Service and appropriate State wildlife agency (see list) should be sent a copy of survey results for review and comment including: a USGS topographic map indicating location of site; project design map, including location of wetlands and stream and delineation of wetland type (PEM, PSS, PFO, POW) and "designated survey areas"[3]; color photographs of the site; surveyor's name; date of visit; opinion on potential/not potential habitat; a description of the hydrology, soils, and vegetation. A phase 1 report template and field form are available from the States and Service.

BOG TURTLE SURVEY (= Phase 2 survey)

If the wetland(s) are identified as potential bog turtle habitat (see Phase 1 survey), and direct and indirect adverse effects cannot be avoided, conduct a bog turtle survey in accordance with the specifications below. Note that this is *not* a survey to estimate population size or structure; a long-term mark/recapture study would be required for that.

Prior to conducting the survey, contact the appropriate State agency (see attached list) to determine whether or not a scientific collector's permit valid for the location and period of the survey will be required.

The Phase 2 survey will focus on the areas of the wetland that meet the soils, hydrology and vegetation criteria, as defined under the Phase 1 survey guidelines. Those areas that meet the criteria are referred to as "designated survey areas" for Phase 2 and Phase 3 survey purposes.

I. Surveys should only be performed during the period from April 15-June 15. For the Lake Plain Recovery Unit (see Recovery Plan), surveys should only be performed during the period from May 1 to June 30. This coincides with the period of greatest annual turtle activity (spring emergence and breeding) and before vegetation gets too dense to accurately survey. While turtles may be found outside of these dates, a result of no turtles would be considered inconclusive. Surveys beyond June also have a higher likelihood of disruption or destruction of nests or newly hatched young.

[3] "Designated survey areas" are those areas of the wetland that meet the soils, hydrology and vegetation criteria for potential bog turtle habitat. These areas may occur within the emergent, scrub-shrub or forested parts of the wetland.

8. Walk quietly through the wetland. Bog turtles will bask on herbaceous vegetation and bare ground, or be half-buried in shallow water or rivulets. Walking noisily through the wetland will often cause the turtles to submerge before they can be observed. Be sure to search areas where turtles may not be visible, including under mats of dead vegetation, shallow pools, underground springs, open mud areas, vole runways and under tussocks. Do not step on the tops of tussocks or hummocks because turtle nests, eggs and nesting microhabitat may be destroyed. Both random opportunistic searching and transect surveys should be used at each wetland.

   The following survey sequence is recommended to optimize detection of bog turtles:

   - Semi-rapid walk through the designated survey area using visual encounter techniques.
   - If no bog turtles are found during visual survey, while walking through site identify highest quality habitat patches. Within these highest quality patches, begin looking under live and dead vegetation using muddling and probing techniques.
   - If still no bog turtles are found, the rest of the designated survey area should be surveyed using visual encounter surveys, muddling and probing techniques.

9. Photo-documentation of each bog turtle located will be required; a macro lens is highly recommended. The photos should be in color and of sufficient detail and clarity to identify the bog turtle to species and individual. Therefore, photographs of the carapace, plastron, and face/neck markings should be taken of each individual turtle. Do not harass the turtle in an attempt to get photos of the face/neck markings; if gently placed on the ground, most turtles will slowly extend their necks if not harassed. If shell notching is conducted, do the photo-documentation after the notching is done.

10. The following information should be collected for each bog turtle: sex, carapace length-straight line and maximum length, carapace width, weight, and details about scars/injuries. Maximum plastron length information should also be collected to differentiate juveniles from adults as well as to obtain additional information on recruitment, growth, and demography.

11. Each bog turtle should be marked (*e.g.*, notched, PIT tagged) in a manner consistent with the requirements of the appropriate State agency and/or Service. Contact the appropriate State wildlife agency prior to conducting the survey to determine what type of marking system, if any, should be used.

12. All bog turtles must be returned to the point of capture as soon as possible on the same day as capture. They should only be held long enough to identify, measure, weigh, and photograph them, during which time their exposure to high temperatures must be avoided. No bog turtles may be removed from the wetland without permission from the Service and appropriate State agency.

13. The Fish and Wildlife Service and appropriate State agency should be sent a copy of survey results for review and concurrence, including the following: dates of site visits; time spent

QUALIFIED RED-BELLIED TURTLE BIOLOGISTS

The following list includes persons known to the Pennsylvania Fish and Boat Commission whom possess skills and have experience in properly searching for and finding red-bellied turtles (*Pseudemys rubriventris*) and in identifying their critical habitat. This information is not to be construed as an endorsement of individuals or firms by the Pennsylvania Fish and Boat Commission or any of its employees. Persons not on this list but who have documented experience in conducting scientific studies of, or successful searches for, red-bellied turtles and their critical habitat may submit their qualifications to the Natural Diversity Section for review and possible inclusion as a recognized biologist/surveyor. Each person added to or deleted from this list shall be at the sole discretion of the Pennsylvania Fish and Boat Commission. This list is subject to revision at any time without prior notice. Any individuals handling, collecting, or otherwise removing red-bellied turtles from their natural habitat, even if on a temporary basis for relocation, must first obtain a Scientific Collector's Permit from the Pennsylvania Fish and Boat Commission. All permitted collector's encounters with red-bellied turtles must be reported in writing to the Pennsylvania Fish and Boat Commission's Natural Diversity Section.

U.S. FISH AND WILDLIFE SERVICE

315 South Allen Street, Suite 322, State College, PA 16801

This responds to your inquiry about a PNDI Internet Database search that resulted in a potential conflict with a federally listed, proposed or candidate species.

PROJECT LOCATION INFORMATION

County: Chester

Township: Schuylkill

Quad: Valley Forge

MISC INFORMATION

Date of PNDI search: 3-27-06

Date received by FWS: 3-31-06

Project Type (FWS code #): NT - sewer lines

Status: ☑ IC ☐ IP FA: ☐ none ☑ UND ☐ _____

USFWS COMMENTS ☐ FAXED ☑ MAILED

To: Martin Goldberg

Fax #: _____

Affiliation: Valley Forge Sewer Authority

SPECIFIC PROJECT: VFSA Regional Act 537 Plan

FISH AND WILDLIFE SERVICE COMMENT(s):

√ ***NOT LIKELY TO ADVERSELY AFFECT***

The federally listed bog turtle occurs or may occur in or near the project area. However, based on our review of the information provided, including the project description and location, no adverse effects to this species are likely to occur if the following recommendations are implemented:

- No wetland impacts

If there is any change in the location, scale, scope, layout or design of the project, further consultation or coordination with the Service will be necessary.

___ This response supersedes our comments of _____, based on our review of the additional project information that was submitted to us on _____.

The above determination is valid for two years from the date of this letter. In addition, this response relates only to federally listed, proposed, and candidate species under our jurisdiction, based on an office review of the proposed project's location and anticipated impacts. No field inspection of the project area has been conducted by this office. Consequently, comments on this form are not to be construed as addressing other Service concerns under the Fish and Wildlife Coordination Act or other authorities. *Please reference the above PNDI # and USFWS Project # in any future correspondence regarding this project.*

This review was conducted by the biologist listed below. He/she can be contacted at 814-234-4090.

√ Pamela Shellenberger (x241) ___ Jennifer Dombroskie (x 242) ___ Bonnie Dershem (x 234)

FAX: 717-852-1615 (hard copy will NOT follow)

***Pennsylvania Natural Diversity Inventory Review, PNDI* Number**	**20060327026464**
VSFA Regional Act 537 Plan Schuylkill Twp; Chester County	

Dear Ms. Vesely,

This responds to your request about a Pennsylvania Natural Diversity Inventory (PNDI) ER Tool "Potential Impact" or a species of special concern impact review. **We screened this project for potential impacts to species and resources of special concern under the Department of Conservation and Natural Resources' responsibility, which includes plants, natural communities, terrestrial invertebrates and geologic features only.**

☒ ***NO PROJECT IMPACT ANTICIPATED***

☐ PNDI records indicate that no known occurrences of species or resources of special concern under DCNR's jurisdiction occur in the vicinity of the project. Therefore, we do not anticipate the project referenced above will impact plants, natural communities, terrestrial invertebrates and geologic features of special concern. No further coordination with DCNR is needed for this project.

☒ PNDI records indicate special concern species or resources are located in the vicinity of the project. However, based on the information submitted to us concerning the nature of the project, the immediate location, and our detailed resource information, we determined that no impact is likely. No further coordination with DCNR is needed for this project.

☐ ***POTENTIAL PROJECT IMPACT - UNDER FURTHER REVIEW***

Based on our PNDI map review we determined potential impacts to species and/or resources of special concern. This project has been passed on to our review committee. The committee will contact the applicant/consultant directly if more information is needed to assess the project's potential impacts. Response time is typically less than a month after the date on this notification.

COMMENTS:

This response represents the most up-to-date summary of the PNDI data files and is good for one (1) year from the date of this letter. An absence of recorded information does not necessarily imply actual conditions on-site. A field survey of any site may reveal previously unreported populations. Should project plans change or additional information on listed or proposed species become available, this determination may be reconsidered.

This finding applies to impacts to plants, natural communities, terrestrial invertebrates and geologic features only. To complete your review of state and federally-listed species of special concern, please be sure the U.S. Fish and Wildlife Service, the PA Game Commission and the Fish and Boat Commission has been contacted regarding this project either directly or by performing a search with the online PNDI ER Tool found at www.naturalheritage.state.pa.us

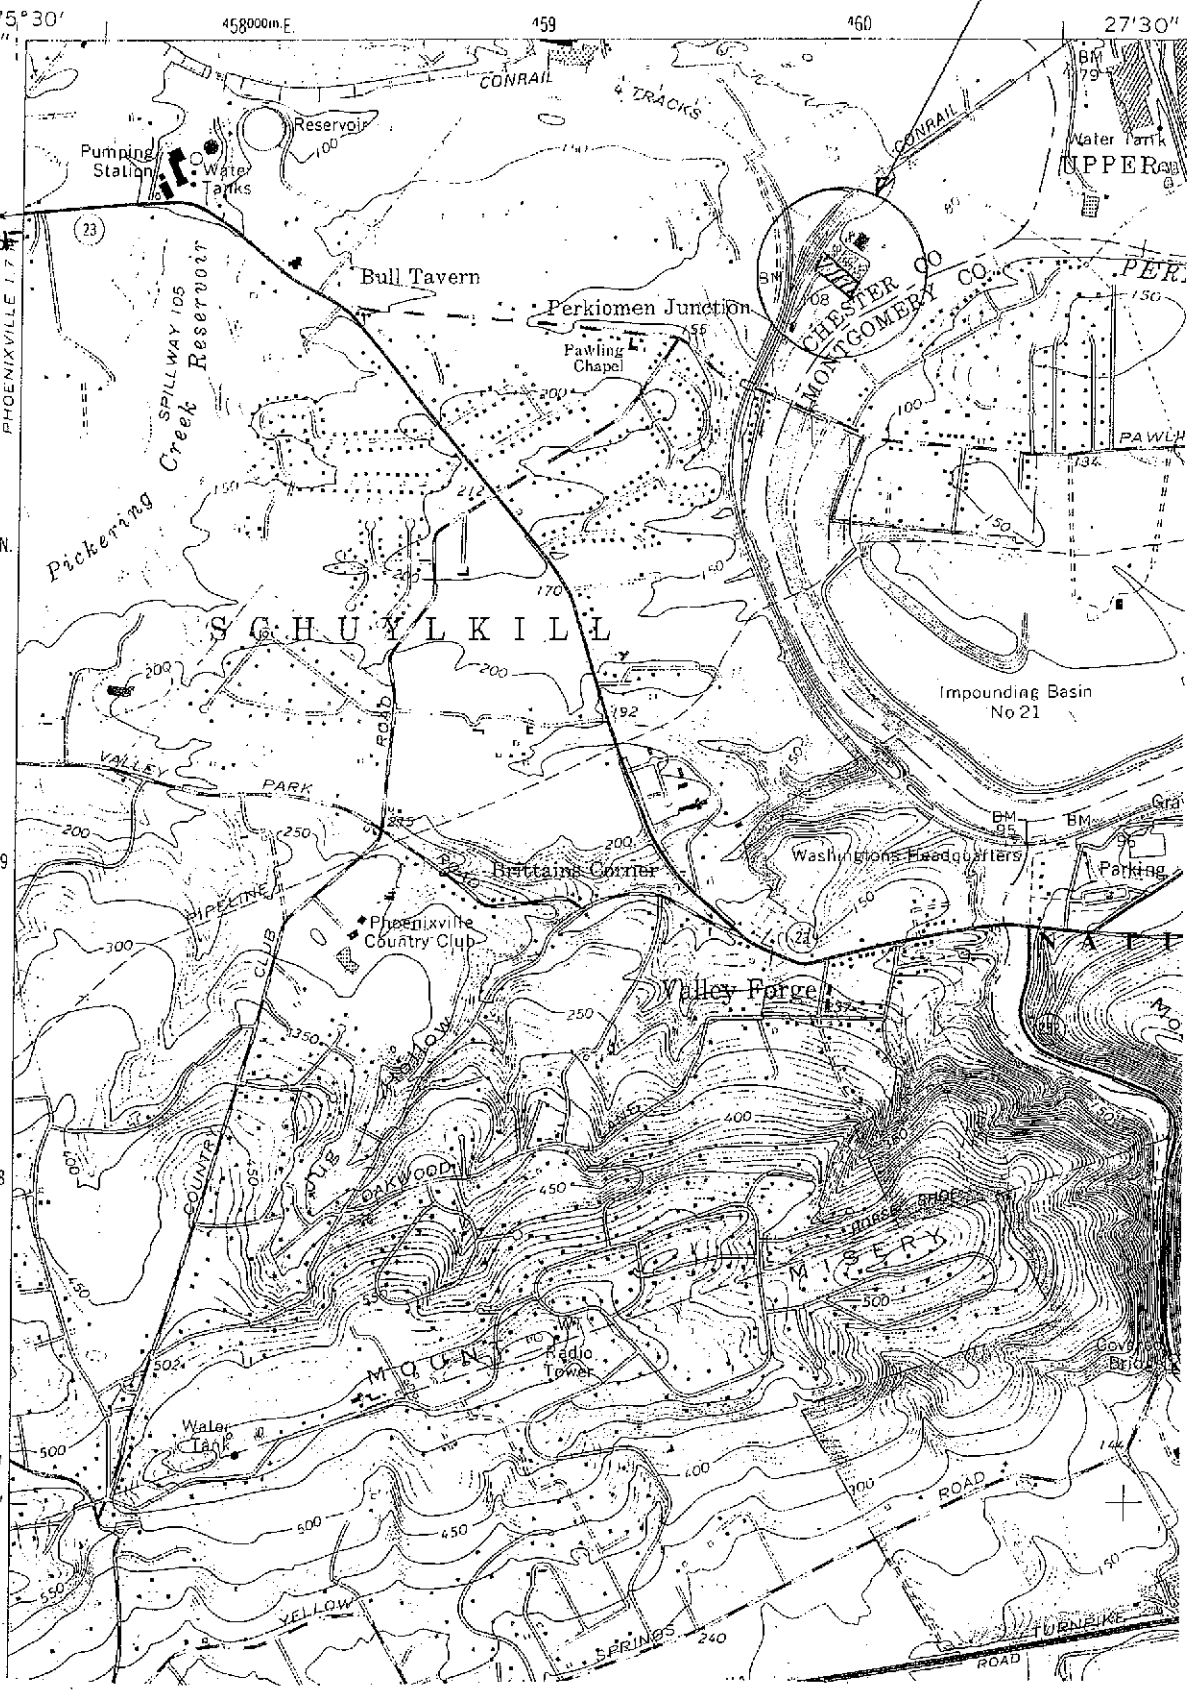
PROJECT NARRATIVE



Valley Forge Sewer Authority is in the process of updating its Regional Act 537 Sewage Facilities Plan. The Authority's existing treatment facilities which are located in Schuylkill Township, Chester County along the Schuylkill River serve 8 surrounding Townships and Boroughs. Several of the alternatives presently under evaluation include the potential for constructing additional treatment tanks on the existing site in an area situated between the existing tankage and the Authority's administrative facilities. Should all of the tankage need to be constructed, it is anticipated that the disturbed area will be a 350' x 1100' area just southwest of the existing tankage as depicted on the attached USGS quad (Valley Forge) and site plan.

Re: File No. ER 06-1641-029-A
DEP 537 PROGRAM: Act 537 Sewage Facilities Plan Approval, Regional Act 537 Plan-Valley Forge Sewer Authority, Schuylkill Twp., Chester Co.

Dear Sir:

The Bureau for Historic Preservation has reviewed the above named project under the authority of the Environmental Rights amendment, Article 1, Section 27 of the Pennsylvania Constitution and the Pennsylvania History Code, 37 Pa. Cons. Stat. Section 500 et seq. (1988). This review includes comments on the project's potential effect on both historic and archaeological resources.

A HIGH PROBABILITY EXISTS THAT ARCHAEOLOGICAL RESOURCES MAY OCCUR WITHIN THE PROPOSED PERMIT AREA

Based on an evaluation by our staff, there is a high probability that significant archaeological sites are located in this project area and could be adversely affected by project activities. Although there are no recorded archaeological sites within the project boundaries, the soil type, topographic setting, slope direction, and distance to water of the project area are similar to the settings of known archaeological sites in the vicinity. A Phase I archaeological survey of the project area to locate potentially significant archaeological resources is recommended but not required.

If a survey is not conducted and you encounter archaeological resources during construction, you must stop the project, notify the Pennsylvania Historical and Museum Commission's Bureau for Historic Preservation and the Department of Environmental Resources and allow the Bureau for Historic Preservation 60 days to conduct a survey to determine the significance of the archaeological resources. If the Bureau determines that the resources are significant, you must submit a mitigation plan to protect the significant resources on the site. We will review the plan within 30 days.

There may be historic buildings and/or structures eligible for the National Register of Historic Places located in the project area. However, due to the nature of the activity, it is our opinion that there will be no effect on these properties. Should the applicant become aware, from any source, that unidentified historic resources are located at the project site, or that the project activities will have an effect on these properties, the Bureau for Historic Preservation should be contacted immediately.

FOR YOUR INFORMATION

Pennsylvania Historical and Museum Commission will keep the Determination Notice and the materials you submitted in its files. Please attach this letter to your copy of the Notice and materials then submit the entire package of materials to DEP.

If this project will require any federal permits or will receive federal funding, the federal agency, under the National Historic Preservation Act of 1966, may require the appropriate surveys to be conducted. If the project will need an Army Corp of Engineers permit, this would be a **Category III** activity. We suggest that you consider conducting the survey early in the development or planning process to avoid delays in the future. Guidelines and instructions for conducting Phase I surveys are available from our office upon request.

Thank you for notifying us of your proposed activity.

If you need further information in this matter please consult Mark Shaffer at (717) 783-9900.

Sincerely,

Douglas C. McLearen, Chief
Division of Archaeology &
Protection

Wastewater Flow Projections - Act 537 Planning

Dear Mr. Brown,

As per your September 7, 2006 letter to Malvern Borough, I have reviewed the Malvern Borough Wastewater Flow Projections indicated on Table 6 of the letter. The flows projections provided to Gannett Fleming on June 21, 2006 for the Wilson Road Pump Station Act 537 Planning are the flows that should be utilized for Malvern Borough in the Valley Creek Trunk Sewer Act 537 Planning.

If you should have any questions or require additional information, please do not hesitate to contact me.

Very truly yours,

Dear Mr. Bateman:

Please be advised that the Borough of Malvern has reviewed the information contained in the April 2003 version of the Draft Regional Act 537 Plan as it pertains to our municipality. We are satisfied with this information and with the flow projections contained in this draft and do not wish to make any additions or corrections.

We look forward to completion and adoption of the Regional Act 537 Plan.

Sincerely,

Sandra L. Kelley
Borough Manager

Re: Tredyffrin Township Flow Estimates through 2036

Dear Mr. Bateman:

The flow estimates, including EDU counts, through 2039, are as follows:

	2009	**2019**	**2929**	**2039**
MGD (AADF)	1.54	1.84	1.97	2.10
EDU's	6853	7849	8432	8904

2004 reported EDU's: 5973.3

Based on yesterday's conversation, the estimated EDU requirement does not match the estimated flow, based on an EDU equivalent of 275 gpd. This is due to the method used in calculating Tredyffrin Township's annual flow, among other factors. As stated yesterday, if this discrepancy between EDU's and AADF causes a problem in your submission to DEP, let me know and I can re-evaluate the estimates.

Sincerely,

Stephen F. Norcini
Director of Authority Operations

Re: Valley Forge Sewer Authority Regional Act 537
Flow Estimates

Dear Mr. Bateman:

Our studies have indicated Tredyffrin Township's estimated flows to the VFSA STP are as follows:

2009 - 1.54 MGD (AADF)
2019 - 1.84 MGD (AADF)
2029 - 1.97 MGD (AADF)

The Township's current treatment plant capacity allocation of 2.01 MGD (AADF) is adequate for the time period through construction of the plant expansion and beyond. We will not purchase additional capacity through the plant expansion.

It is my understanding that in the event of a plant upgrade, the Township is contractually bound to pay for our proportional share of that upgrade. Subsequently, we will receive our proportional share of additional capacity acquired through the upgrade.

I can be reached at 610-408-3623 with any questions.

Sincerely,

Stephen F. Norcini

Re: Valley Forge Sewer Authority Regional Act 537 Plan

Dear Mr. Goldberg:

The Chester County Planning Commission (CCPC) has reviewed the Draft 537 Plan dated November 2006, as required by Section 71.31 (b) of the Pennsylvania Sewage Facilities Act (Act 537). The Plan was prepared by Buchart Horn, Inc. and Gannett Fleming. The Plan was received on December 15, 2006.

This Plan was prepared to identify and select an appropriate alternative to increase the wastewater disposal capabilities of the Valley Forge Sewer Treatment Plant (VFSTP), Schuylkill Township, to meet the long-term growth needs of the communities Valley Forge Sewer Authority (VFSA) serves.

The CCPC supports the corrective measures of this Plan as they relate to the Treatment Plant expansion to accommodate the needs of the Service Area Municipalities. The CCPC would like to commend both the VFSA and its Service Area Municipalities for satisfying the requirements of Act 537, by requiring municipalities to initiate service area revisions through the municipal planning process and needs analysis evaluations. The CCPC recommends the Plan be adopted after addressing comments in this letter.

The following comments are offered based on review of the draft Plan:

A. Consistency with the County Plan – ***Landscapes***:

1. ***Landscapes***, through use of the *Livable Landscapes Map*, identifies four general land patterns, or Landscapes, of future development in the County – urban, suburban, rural and natural. The Suburban Landscape, in which the Service Area Municipalities and the VFSTP are located, is to contain a mix of uses and higher densities of development than those found in the Rural Landscape. In order for this pattern to occur, ***Landscapes*** supports the provision of infrastructure and public services, such as public sewer systems. VFSA's draft Regional Plan supports ***Landscapes*** Policies:

6.1.1 Encourage coordination between municipalities and authorities to ensure consistency with land use plans.

6.1.2 Maintain or expand existing sewer and water facilities to support development in Urban and Suburban Landscapes.

2. ***Watersheds***, through its goals and objectives, identifies Part 6, *Planning for Future Water and Wastewater Needs*, as a means to assist municipalities and utilities providers to consider and develop Integrated Water Resources Planning to more effectively integrate infrastructure and land use planning. Objective 6-9 of ***Watersheds*** states, "Locate large water withdrawals and wastewater effluent disposal facilities where they provide the greatest benefit and least impact to watershed aquifers and streamflows." The VFSA Service Area is located in portions of the Valley Creek and Pickering Creek, and tributaries to the Schuylkill River, where the treated effluent for the VFSA is disposed of through stream discharge. Though it is unclear in the Plan where water is being drawn from, the CCPC recommends that the VFSA discharge only the amount of treated effluent equivalent to the amount of water drawn from any one watershed to maintain the stream flow and water balance for that watershed, through groundwater recharge of the aquifer, where possible.

B. Selection of Alternative:

1. We commend the VFSA and its member municipalities for addressing the need for increased capacity at the VFSTP to the year 2025, and beyond. In June 1999, the CCPC supported the re-rating of the VFSTP from 8.0 million gallons per day (mgd) to 9.2 mgd, just as we support the expansion of the treatment plant (Alternative 3e) to accommodate 11.52 MGD, to meet the needs of the VFSA municipalities and their partner municipalities, as outlined in section 4 "Future Growth and Land Development."

C. General Comments

1. For clarity, please include in the Plan Summary what the existing capacity of the VFSA treatment plant is, as well as what the proposed capacity will be.

2. Please include information as to the location of the discharge point into the Schuylkill and its proximity to both the Philadelphia Water Department's drinking water intake.

3. If applicable, please include information as to the VFSA withdrawal point and its relationship to the Aqua PA intake.

4. Please include in the Appendices the actual sections of the municipal Act 537 Plans that outlines their Needs Analysis that is included in Section 3 of the Regional Plan.

5. Page E-1. Plan Summary. Please clarify the difference between the VFSA Townships and the Member Municipalities, as they relate to the overall Service Area Municipalities.

6. Page E-1. Plan Summary. While the CCPC is aware that the planning efforts for this regional plan began in 1994, and that projections are considered up-to-date, please include any information as to the sources and dates that information was obtained for clarity and correctness.

7. Page E-2. Plan Summary. Please provide any information from DEP, as to why the first four sections did not require revision. The CCPC feels that population projections as well as additional needs and up-to-date information on on-lot systems on behalf of the Service Area Municipalities should have been considered in this portion of the plan where information available is more recent than 1994.

8. Page E-2. Associated Planning. The Plan states that Tredyffrin Township is conducting Act 537 Planning for the Valley Creek Trunk Sewer (VCTS) to determine if the conveyance facilities have adequate capacity to convey the projected wastewater flows to the VFSA treatment plant. Has the VFSA considered how the selected alternative will be affected if this planning effort shows that the conveyance facilities cannot handle the proposed capacity? If so, please include this information in the body of the Plan.

9. Page E-2. Associated Planning. The Plan states that Act 537 planning for the Wilson Road pumping station and the VCTS are near completion and expected to be approved in March of 2007. The CCPC has not reviewed this Plan to date. If there is a delay in the approval process, is the VFSA in a position to wait for the planning efforts to come to a close before needing additional capacity in these systems, and how will this planning effort be incorporated into the Regional Plan?

10. Page E-4. Cost of Implementation. The Plan states that the Partners will share the cost of the expansion and improvements; please clarify whether the Partners are the VFSA municipalities, the Member municipalities, or both.

11. Page E-5. The text specifies that the partner and member municipalities were provided the opportunity to review and adopt the recommendations of the Update. For clarity, CCPC recommends changing the text to read the Service Area Municipalities.

12. Page 1-2. The Regional Planning Process. The CCPC would like to commend the VFSA for satisfying the requirements of Act 537, by requiring municipalities to initiate service area revisions through the planning process and needs analysis evaluations.

13. Page 1-3. Table 1-1 Please include the date that this table was compiled to ensure that the most up-to-date information has been included for review in the development of this Regional Act 537 Plan.

14. Page 1-4. Previous Wastewater Planning. The CCPC would like to commend the VFSA for examining ways to reduce I/I in the system.

15. Page 1-7. Individual Act 537 Sewage Facilities Plans – Summary of VFSA Participation Information. The text states that "as of this writing; only three of the VFSA Service Area Municipalities have plans approved by PADEP." However, Table 1-1 shows that all of the municipalities have full or conditional approval from DEP, with dates ranging from 1994-2002. Please clarify this discrepancy.

16. Pages 1-7 to 1-11. Individual Act 537 Sewage Facilities Plans – Please include the dates of the municipal plans as they were approved by DEP for reference and clarity.

17. Page 1-9. Individual Act 537 Sewage Facilities Plans – The information for Malvern Borough does not reflect that the Plan was adopted in 1995 as Table 1-1 shows. Please clarify this discrepancy.

18. Page 1-10. Individual Act 537 Sewage Facilities Plans – Schuylkill Township. This section states that the Plan describes the number of EDU's expected to be added to the VFSA system, in the 1996 DEP approved plan, but does not clearly state how many EDU's it expects the Authority to treat. Please clarify this information, as it affects the total flows to the VFSA treatment plant.

19. Page 1-13. County Planning Documents. For reference purposes, the Livable Landscapes map was last updated in 2003. Please update the text to reflect this change.

20. Page 1-13. County Planning Documents. ***Watersheds***, through its goals and objectives, identifies Part 6, *Planning for Future Water and Wastewater Needs*, as a means to assist municipalities and utilities providers to consider and develop Integrated Water Resources Planning to more effectively integrate infrastructure and land use planning. Please include consistency information with ***Watersheds*** in this section of the Plan.

21. Page 1-14. Sewage Facilities Inventory 1991. Please clarify in the 2nd paragraph as to what the VFSA is equating 1 EDU to, in gallons per day, so that it is clear what the gallons per day is for the 25,540 EDU's being served by the VFSA.

22. Page 2-4. Major Drainage Basins. Please include text stating that the Darby Creek has a DEP approved Act 167 Plan for the watershed.

23. Page 2-8. Potable Water Supplies. ***Watersheds*** Objective 3-2 deals with natural instream resources and includes key strategies regarding base stream flow and the impacts of withdrawals and discharges. Please include information on the overall water balance and how both the receiving waters as well as the source waters, if not public water, will be affected by the discharge and withdrawal of an additional 2.3 MGD.

24. Page 3-1. VFSA Wastewater Treatment System. The text states that effluent is discharged into the Schuylkill River upstream from Pawling Road. For clarity, please include language stating that Pawling Road is where the VFSA treatment plant is located.

25. Page 3-1. VFSA Wastewater Treatment System. Please include text that states where the water that is being used for the system is being drawn from.

26. Page 3-7. Major VFSA Service Area Sewer System Components. Please include additional text outlining how the funding for the proposed expansion will be divided amongst the Service Area Municipalities.

27. Pages 3-10 to 3-13. For clarity, please include the adoption dates for all municipal plans or their approval dates from DEP.

28. Pages 3-10 to 3-13. For clarity, please include the total EDU's that each municipality is currently using.

29. Page 3-10. Charlestown Township. The text states that the Tyrone Farms neighborhood was served by a community sewer system. Please clarify how this neighborhood is currently being treated, whether it is through a replacement system, through a tie-in to the VFSA system, or otherwise.

30. Page 3-11. East Whiteland Township. Please include in the text the number of failing systems reported by the Chester County Health Department, as well as whether these two areas are planned for connection to the VFSA system.

31. Page 3-12. Malvern Borough. Although there are no current developments planned for the latter two parcels of land, please include any information as to what will be required if these parcels are ever planned for development. If public sewer connections will be required, please include information as to how that connection will be funded.

32. Page 3-12. Schuylkill Township. Please include any additional information on the holding tank ordinance that the Township is intending to adopt, as well as which year the on-lot management program is to be implemented. The CCPC recommends that all municipalities adopt an ordinance requiring regular management, inspection and pump-out of individual sewage systems, established in a legally enforceable manner.

33. Page 3-13. Willistown Township. Please include the number of failing systems, as well as the date the information was obtained. If this information is outdated, it is possible that the systems have since been repaired.

34. Page 3-14. The text states that VFSA has its own landfill disposal approvals. Please include any agreements or permitting information in the Appendix.

35. Page 4-1. Please include information as to what the VFSA is using as 1 EDU in gallons per day, so that it is clear what the gpd is for the 25,511 EDU's being served by the VFSA at the end of 2005.

36. Page 4-2 to 4-4-7. Please define what the VFSA defines "build out" to be. Is this the total capacity allocated to the municipalities before the VFSA would need to explore additional capacity and expansion option? Or is this build out for municipalities? Please clarify.

37. Page 4-2 to 4-4-7. For clarity, please format this section to have the EDU projections and the associated narrative for the municipalities appear together on the same page.

38. Page 4-3. Malvern Borough. For clarity, please include information on the most recent Chapter 94 Report submitted by the Borough and any information on its approval.

39. Page 4-7. Summary. Please clarify the discrepancy between the use of 2025 and 2035 as the end point of this study. This summary identifies 2035 as the end point of this study, but earlier points use the date of 2025.

40. Page 5-2. The Plan states that an Ad Hoc committee was formed for the purpose of reviewing and assisting the VFSA in establishing future needs. Please include information concerning the members of this committee and what their affiliations are - to the Authority, the Service Area Municipalities, or other groups.

41. Page 5-3. This draft Regional Plan lists the option of spray irrigation and satellite facilities as an eliminated alternative. While the CCPC realizes the associated issues with constructing a land disposal facility, we feel that further consideration should be given to drip irrigation, if not for all the additional flows, for new developments that are being proposed, where conditions are appropriate. We understand the need to provide additional sewage treatment capacity to meet future needs, and support your efforts in this regard. The CCPC realizes that this draft Regional Plan has been under development for over 10 years and that the Service Area Municipalities would like to see the completion of the Plan, however, we feel that further consideration should be given to this alternative. Not only has the technology and understanding of land application of wastewater progressed in the 11 years since VFSA sent out letters to municipalities assessing the viability of obtaining lands for spray irrigation, there have been changes in the members of the municipal boards and current board members may be more open to the idea of land application of wastewater, especially with the option of drip irrigation versus spray irrigation.

42. Page 5-12. Alternative 3. The CCPC would like to commend the VFSA for examining additional denitrification measures, even though they have not been imposed. We recommend that the VFSA continue to explore these options for Total Maximum Daily Load (TMDL) purposes.

43. Page 5-13. Existing Wastewater Treatment Plant Capacity. The text states that there was an assessment of the capacity and recommended upgrades of each individual component of the existing plant. Please provide information on who assessed the system.

44. Page 6-1. Table 6-1. Consistency Evaluation of Selected Alternative from Section 5. Please update the table to include consistency with ***Watersheds***.

45. Page 6-1. Table 6-1. Consistency Evaluation of Selected Alternative from Section 5. Please update the table to include the adoption/approval dates of the municipal comprehensive plans.

46. Page 6-2. Table 6-1. Consistency Evaluation of Selected Alternative from Section 5. Under the Evaluation Category for Antidegradation requirements, no information is provided as to the source of water supplied to the VFSA for their system. If it is Valley Creek or French Creek, then an HQ/EV stream is being impacted and this information should be included.

47. Page 6-2. Table 6-1. Consistency Evaluation of Selected Alternative from Section 5. Under the Evaluation Category for Chester County Stormwater Management Plans (Act 167). At the current time, Chester County Act 167 Plans have been prepared and adopted by the Chester County Commissioners for the Chester Creek Watershed Stormwater Management Plan, the Darby-Cobbs Creek Watershed Stormwater Management Plan, and the Conestoga River Watershed Stormwater Management Plan, and Act 167 Plans are underway for the Valley Creek Watershed and the Crum Creek Watershed. Portions of the Service Area lie within the Darby Creek watershed. The CCPC recommends referring to municipal documents to ensure that all up-to-date stormwater ordinances are being followed.

48. Page 6-6. Table 6-3. Estimated 2006 Annual Operating Costs. The Plan states that no operating costs for alternative 3d were developed. Please explain why no estimates were prepared for this alternative.

49. Page 6-8. Table 6-4. 2006 Present Worth Analysis. The Table shows that a present worth analysis was not created for alternative 3a. Please explain why an analysis was not prepared for this alternative.

50. Page 6-12. Table 6-7 Project Cost Sharing Based on 2006 Dollars. Please include in this section any letters of agreement from the municipalities, in particular East Whiteland Township, to show that they agree and are willing to fund their portion of the expansion, at approximately $12.4 million.

We trust that these comments will be of assistance to you as you prepare the final document for submission to PADEP. Thank you for the opportunity to offer comments on this plan.

Sincerely,

Ronald T. Bailey, AICP
Secretary

Responses to Chester County Planning Commission General Comments

Comment 1. The existing plant capacity is 9.2 MGD, and the proposed capacity is 11.52 MGD.

Comment 2. The Philadelphia Water Department's intake for the Queen Lane Plant is on the Schuylkill River approximately 0.5 miles below the confluence with the Wissahickon Creek and on the bank of the same side of the Schuylkill River as the Wissahickon Creek. The Belmont Plant is located in Wynnefield and its water also comes from the Schuylkill River. Its intake is located along Martin Luther King, Jr. Drive (formerly West River Drive).

The WWTP's discharge to the Schuylkill River is at:
Latitude - 40° 07' 05" Longitude - 75° 27' 56"

Comment 3. See Table 2-1, page 2-9 for information on withdrawl points.

Comment 4. The Valley Forge Sewer Authority's (VFSA) Act 537 Plan Update is a compilation of the Service Area Municipalities (SAM) individual Act 537 Plans. For information from the SAM 537 plans, see the approved plans.

Comment 5. The member municipalities are: Charlestown, East Pikeland, and Schuylkill Township. The partner municipalities are: Easttown, East Whiteland, Malvern, Tredyffrin, and Willistown. The SAM's are the combination of the member and partner municipalities.

Comment 6. The flow projections for this Act 537 Plan were validated by the individual municipalities as included in Appendix H.

Comment 7. This Act 537 Plan is based solely on information from the individual SAM Act 537 Plans, so the information in this plan is updated based on information provided by the individual municipalities.

Comment 8. See information related to the Valley Creek Trunk Sewer (VCTS) and Wilson Road Pump Station on page E-2.

Comment 9. The VFSA is in a position to wait for the planning efforts to come to a close before needing additional capacity in these systems. The VFSA's 537 Plan Update addresses treatment of the wastewater once it reaches the WWTP. The individual municipalities are responsible for the planning for the system.

Comment 10. Both the partner municipalities and the member municipalities will share the cost of the expansion and improvements. The Partners requiring additional capacity will share in the cost of the expansion.

Comment 11. This recommendation is accepted.

Comment 12. No response is required.

Comment 13. The table is current as of November 2006.

Comment 14. No response is required.

Comment 15. The table was updated to show the approval dates, but the text of the section was not updated.

Comment 16. See Table 1-1 for the dates that the municipal plans were approved by the Pennsylvania Department of Environmental Protection (PADEP).

Comment 17. Section one was not updated per PADEP, and at the time of the initial writing, the Malvern Borough plan was submitted and under review. The Borough's plan was then later approved after the VFSA's plan was written.

Comment 18. Schuylkill Township expects a growth of 357 EDU's between 2005 and 2035.

Comment 19. The comment that the Livable Landscapes map was last updated in 2003 is noted.

Comment 20. The Act 537 Plan Update is consistent with the County planning document, Watersheds.

Comment 21. The sentence is referring to the number of billing records for EDU count as opposed to actually flows.

Comment 22. The comment that Darby Creek has a PADEP approved Act 167 Plan for the watershed is so noted.

Comment 23. The water balance will stay consistent with the amount of water withdrawn and the amount discharged.

Comment 24. For clarification, the VFSA WWTP is located on Pawling Road.

Comment 25. The water that is being used for the system is drawn from locations throughout the VFSA service area as identified in Table 2-1.

Comment 26. See Section 6 of the Act 537 Plan Update for information on how the funding for the proposed expansion will be divided amongst the Service Area Municipalities.

Comment 27. See Table 1-1 for the individual Act 537 Plan approval dates by PADEP.

Comment 28. See Table 4-8 for the total EDU's that each municipality is currently using.

Comment 29. Tyrone Farms is not serviced by a community service system. The Charlestown Road and Coldstream area have their sewer linked to the Charlestown Road Pump Station in Schuylkill Township. The sewer servicing the dwellings in the Maryhill Road and Pine Drive neighborhoods are linked to the Kimble Drive Pump Station in East Pikeland Township.

Comment 30. East Whiteland Township does not know the number of failing onlot systems. However, due to the age of systems and soils, the area adjacent to Bacton Hill Road, Planebrook area, and areas around the intersection of Rt. 352 and King Road are susceptible to failure. There were five (5) onsite replacements and 13 onsite repairs between June 2002, and July 2006, within the above noted areas.

Comment 31. The developer will be required to connect the sewer system of the development to the existing conveyance system.

Comment 32. Schuylkill Township does not have a holding tank ordinance. With regard to on-lot sewage disposal, the Township has always deferred to the Chester Co. Health Department concerning permitting and enforcement of on-lot systems. The Township does get involved with making sure that the pump & haul systems that are used in the winter by developers meets all the necessary requirements.

Comment 33. Failing connections in Willistown Township is estimated at between 10 and 20 according to Ross Fisher, of the Chester Co. Health Dept.

Comment 34. As of last year, the VFSA was approved for disposal at the following landfills, but please note the VFSA has not disposed of biosolids in any landfill since the May-June reporting period of 1998:

A) Chester County Solid Waste Authority (Lanchester Landfill), PO Box 476, Honey Brook, PA, 19344.
B) BFI-Conestoga Landfill, 420 Quarry Road, PO Box 128, Morgantown, PA, 19543.
C) Waste Management (G.R.O.W.S. Landfill, Pottstown Landfill), 1000 New Ford Mill Road, Morrisville, PA, 19067.

Comment 35. Each municipality uses billing records for their EDU counts, as the actual flow the WWTP is approximately 300 gpd/EDU. Each municipality is responsible for their own flow projections.

Comment 36. The VFSA defines "build out" in terms of build out of the Act 537 service area in each municipality, not in regard to the total capacity allocated to the municipalities at the WWTP.

Comment 37. The comment is noted about formatting, see Table 4-8 for the overall projections.

Comment 38. At the time of this Act 537 Plan Update, the most recent information from Malvern Borough's Chapter 94 Report is included.

Comment 39. 2025 projections were prepared for the study, but design of the WWTP upgrade and expansion, and cost breakdown is based on 2035 projections.

Comment 40. The committee consisted of representatives of Schuylkill Twp, the VFSA, and their engineer of record, Buchart-Horn Inc.

Comment 41. Comment and suggestions noted.

Comment 42. Comment noted, as no response is required.

Comment 43. The assessment of the capacity and recommended upgrades of each individual component of the existing plant was completed by Buchart-Horn, Inc. of York, PA.

Comment 44. The Act 537 Plan Update is consistent with the concepts of the County document, Watersheds.

Comment 45. The individual Act 537 Plan's for the Service Area Municipalities are consistent with their comprehensive plans, therefore the VFSA Act 537 Plan Update is consistent with the comprehensive plans as it is a compilation of all the individual plans.

Comment 46. The water systems that feed the VFSA system is provided in Table 2-1.

Comment 47. The comment is noted.

Comment 48. No operation costs were developed for alternative 3d, because it would be difficult to assess the costs for innovative alternatives that are still in developmental stages. Insufficient information is available on their systems to make a reasonable cost estimation.

Comment 49. The present worth of alternative 3a is the same as 3b without adding the cost of the 4th secondary clarifier.

Comment 50. Municipalities have agreed to pay their portion of the upgrade and expansion, and no comments were received from the municipalities in regard to this question during their review of the Plan.

Re: **Regional Act 537 Plan for**
Valley Forge Sewer Authority
Dated November, 2006

Dear Terry:

I have reviewed the above referenced document and found that the EDU/Flow Growth Estimates as noted in Table 4-2 are in compliance with our projected flows submitted with my letter dated October 3, 2006, and are satisfactory. The Plan notes (see Page E-2 – Associated Planning) that Act 537 planning for the Valley Creek Trunk Sewer and the Wilson Road Pumping Station is a critical component of the VCTS, to determine if the conveyance facilities have adequate capacity to convey the projected wastewater flows to the Valley Forge Sewer Authority wastewater treatment plant.

It is further noted that Act 537 planning for the Wilson Road Pumping Station and VCTS is nearing completion and is expected to be approved in March, 2007. As conveyance is a critical component, it is important that the 537 Plan for VFSA and VCTS be reviewed simultaneously. No information regarding the VCTS Act 537 Plan has been submitted.

Table 1-1, Page 1-3, under Municipal Adoption for East Whiteland Township, shall be revised to note the adopted date of June 12, 1995.

Page 4-2, 4th line under "East Whiteland," shall be revised to read, East Whiteland latest Chapter 94, In lieu of Easttown.

Under Eliminated Alternatives, Alternate 1 on Page 5-3 shall be revised to note Alternative 1 was eliminated in lieu of Alternative 4. I would recommend that you review the Project Cost Sharing as shown on Table 6-7, Institutional Evaluation Section 7, and Capitol Financing Plan Section 8 for their acceptability.

If you have any further questions, please contact me.

Very truly yours,

Surender S. Kohli, P.E.

Re: VFSA Regional Act 537 Plan

Dear Mr. Goldberg:

On behalf of Tredyffrin Township, we have reviewed the referenced Act 537 Plan. We have the following comments:

1. On page 1-3, Table 1-1, on the Tredyffrin Township line, add Willistown Township as one of the municipalities with which Tredyffrin maintains an agreement.

2. On page 3-9, the Force Main paragraph: The design capacity of the Wilson Road force main is as follows:

    a. Instantaneous peak flow rate = 20.2 mgd

    b. Equivalent average daily flow = 8.78 mgd

3. Tredyffrin and Gannett Fleming have revised Tredyffrin's flow projection from what is shown in the Act 537 Plan. The anticipated 2035 wastewater flow is 2.3 mgd, rather than 2.1 mgd. The revised flow projection table is attached.

If you have any questions about our comments, please contact me.

Very truly yours,
GANNETT FLEMING, INC.

Thomas S. Brown, P.E.

Re: Wilson Road Pumping Station and
Valley Creek Trunk Sewer
Act 537 Plans
Charlestown Township Flows

Dear Mr. Goldberg:

We are incorporating Tredyffrin Township's comments into the Wilson Road Pumping Station Act 537 Plan. The revised Plan will be distributed to the Valley Forge Sewer Authority (VFSA) and the Valley Creek Trunk Sewer (VCTS) municipalities within the next few weeks.

We are still uncertain, however, as to how much of Charlestown's wastewater flow is expected to be conveyed through the VCTS. Charlestown's ultimate wastewater flow projection to the Valley Forge Wastewater Treatment Plant will be approximately 404,000 gallons per day (gpd) by 2035, according to information contained in VFSA's Regional Act 537 Plan. We understand that part of the flow is and will be conveyed through the East Whiteland Trunk Line to the VCTS and the remainder will be conveyed to the Valley Forge WWTP by other means.

Please provide an estimate of the projected Charlestown wastewater flow that is to be conveyed through the VCTS for the years 2010, 2015, 2025, 2035. This is needed for the refinement of the Wilson Road Pumping Station and VCTS capacity evaluations.

If you have any questions about our data request, please contact me.

Very truly yours,
GANNETT FLEMING, INC.

Thomas S. Brown, P.E.
Senior Project Manager

Comment from Municipalities Review

East Whiteland Township – Kohli and Associates, Inc.

1. Table 1-1, Page 1-3, under Municipal Adoption for East Whiteland Township, shall be revised to note the adopted date of June 12, 1995.
2. Page 4-2, 4th line under "East Whiteland," shall be revised to read, East Whiteland's latest Chapter 94, in lieu of Easttown.
3. Under Eliminated Alternatives, Alternative 1 on Page 5-3 shall be revised to note Alternative 1 was eliminated in lieu of Alternative 4. Project cost sharing, institutional evaluation, and capital financing have all be reviewed for acceptability.

Charlestown Township – Kohli and Associates, Inc.

Comment noted that Charlestown Township accepts the EDU numbers presented in Table 4-5.

Schuylkill Township – Mary Bird

Email received On February 15th stating that no comments are made by the Supervisors of Schuylkill Township.

Tredyffrin Township - Gannett Fleming, Inc.

1. On page 1-3, Table 1-1, on the Tredyffrin Township line, add Willistown Township as one of the municipalities with which Tredyffrin maintains an agreement.
2. On page 3-9, add the design capacity of the Wilson Road force main is as follows:
    a. Instantaneous peak flow rate = 20.2 mgd
    b. Equivalent average daily flow = 8.78 mgd
3. The revised flow projection for Tredyffrin affects the cost sharing for the plant expansion. See revised Table 6-7 attached for the updated cost sharing.

Wilson Road Pumping Station and Valley Creek Trunk Sewer - Gannett Fleming, Inc.

The projected wastewater flow from Charlestown Township that is to be conveyed through the VCTS in gpd is listed below. It is clarified that 578 existing EDUs allocated to East Pikeland and Schuylkill Townships are actually Charlestown Township EDUs. The correction to Table 4-8 as presented below does not impact the flow projections or cost allocation to the Member Municipalities.

Table 4-8 EDU and flow projection (Present – 2035) as revised

Municipality	Current Reserved Capacity	Present (2005)		5-Year (2010)		10-year (2015)		20 & 30 Year (2025 / 2035)	
		gpd	EDU	gpd	EDU	gpd	EDU	gpd	EDU
Member Municipalities									
Charlestown	n/a		1,127	351,120	1,463	449,280	1,872	542,640	2,261
East Pikeland	n/a		2,488	659,520	2,748	697,200	2,905	721,680	3,007
Schuylkill	n/a		2,590	657,360	2,739	689,040	2,871	707,280	2,947
VFSA Subtotal	2,128,000	1,479,635	6,205	1,668,000	6,950	1,835,520	7,648	1,971,600	8,215
Member flow to VCTS			549	212,400	885	310,560	1,294	403,920	1,683

Table 6-7. Project Cost Sharing Based on 2006 Dollars

Plant expansion

Estimated total	$13,970,000		
	MGD *	Percent of expansion	Est. $ share expansion cost
Easttown	0.000	0.00	$0
East Whiteland	1.969	73.99	$10,336,403
Malvern	0.000		
Tredyffrin	0.299	11.24	$1,570,228
Valley Forge	0.000		
Willistown	0.393	14.77	$2,063,369
	2.661	100.00	$13,970,000

Plant upgrade

Estimated total	$5,909,000		
		Percent of upgrade	Est. $ share upgrade cost
Easttown	1.523	0.1655	$978,196
East Whiteland	1.940	0.2109	$1,246,028
Malvern	0.544	0.0591	$349,402
Tredyffrin	2.001	0.2175	$1,285,208
Valley Forge	2.128	0.2313	$1,366,777
Willistown	1.064	0.1157	$683,389
	9.200		$5,909,000

Grand total	**Upgrade**	**Expansion**	**Total Contribution**	**Overall Percent of the Project**
Easttown	$978,196	$0	$ 978,196	0.049
East Whiteland	$1,246,028	$10,336,403	$ 11,582,431	0.583
Malvern	$349,402		$ 349,402	0.018
Tredyffrin	$1,285,208	$1,570,228	$ 2,855,436	0.144
Valley Forge	$1,366,777		$ 1,366,777	0.069
Willistown	$683,389	$2,063,369	$ 2,746,758	0.138
	$5,909,000	$13,970,000	$ 19,879,000	1

1. MGD* = Projected ultimate capacity less current owned

Example: East Whiteland projected need 3.909 less current reserved capacity 1.940 equals 1.969 mgd

2. Overall percent of the project is to be utilized in calculating planning and engineering expenses
3. The cost estimates presume that the existing treatment plant is expanded and upgraded utilizing existing technology

Reference: **Act 537 Sewage Facilities Plan Update**
BH #75297-61

Dear Mr. Goldberg:

Provided are the comments received from Malvern Borough, and the corresponding responses prepared by Buchart-Horn on behalf of the Authority. These comments and responses are to be inserted into Appendix I of the Act 537 Sewage Facilities Plan Update. These comments and responses should be inserted behind the comments and responses with a cover letter dated March 12, 2007.

Respectfully yours,

BUCHART-HORN, INC.

Malvern Borough Engineers

SUBJECT: VFSA Regional Act 537 Plan

As requested, the Borough and my office has reviewed the Regional Act 537 Plan for the Valley Forge Sewer Authority, dated November 2006, prepared by Buchart Horn, Inc. and Gannett Fleming. As requested by Malvern Borough, the following minor comments are offered for your consideration:

- Page 1-3: Malvern Township should be Malvern Borough.
- Page 1-9: 5th paragraph indicates the PADEP is currently reviewing the Borough's 537 plan. In accordance with Page 1-3, the Borough's 537 plan was approved in May of 1995.
- Page 2-9: Reference to Philadelphia Suburban Water Co. should be changed to Aqua Pennsylvania, Inc.
- Page 3-12: Paragraph #1 indicates the Malvern Prep and Malvern Retreat do not have public sewer. Both sites have connected to public sewers within the last ten years or so. Malvern Prep has 15 EDU's that flow into Willistown Township and Malvern Retreat has 19 EDU's that connect into the Borough's sewer system. Page 1-9 also references these two parcels as being served by on-lot facilities.
- As an FYI, a developer is currently considering a significant amount of condominium units on a four lot parcel that originally had 5 EDU's. We will know by mid-week next week how many units they will be proposing. These additional units were not included in our original flow estimates.

If you require any additional information, please do not hesitate to contact me.

Responses to Municipalities Comments

Malvern Borough - Edward B. Walsh & Associates, Inc.

1. On page 301, Malvern Township shall be revised to be Malvern Borough.
2. In relation to page 1-9, 5th paragraph, the Borough's plan was approved in May of 1995 as seen in Table 1-1, but the text of Section 1 was not updated per PADEP.
3. The reference to Philadelphia Suburban Water Co. on page 2-9 shall be revised to Aqua Pennsylvania, Inc.
4. It is recognized that Malvern Prep and Malvern Retreat are connected to public sewers, and that their flows have been accounted for in the projections approved by Malvern Borough.
5. It is noted that a developer is currently considering a significant amount of condominium units on a four lot parcel that originally consisted of 5 EDU's, and that these additional EDU's were not included in the original flow estimates. Even with these additional units, Malvern Borough will remain within their reserved capacity.

RESOLUTION NO. 2007-01

RESOLUTION OF THE BOARD OF VALLEY FORGE SEWER AUTHORITY, CHESTER COUNTY, PENNSYLVANIA (hereinafter "the Authority").

WHEREAS, Section 5 of the Act of January 24, 1966, P.L. 1535, No. 537, known as the "Pennsylvania Sewage Facilities Act," as amended, and the Rules and Regulations of the Department of Environmental Protection (Department) adopted hereunder, Chapter 71 of Title 25 of the **Pennsylvania Code,** requires municipalities to adopt an Official Sewage Facilities Plan providing for sewage services adequate to prevent contamination of waters and/or environmental health hazards with sewage wastes, and to revise said plan whenever it is necessary to meet the sewage disposal needs of the municipality, and

WHEREAS, Schuylkill Township is the host community since it contains the wastewater treatment plant which meets wastewater treatment needs of Malvern Borough, and Charlestown, East Pikeland, Tredyffrin, Easttown, East Whiteland, Schuylkill and Willistown Townships, and;

WHEREAS, Malvern Borough, and Charlestown, East Pikeland, Tredyffrin, Easttown, East Whiteland, Schuylkill and Willistown Townships agreed to a two-part regional planning process whereby the municipalities each prepared and adopted an individual municipal Act 537 Plan and then charged the authority to develop a regional wastewater facilities plan that would be adopted by each of the municipalities and the authority; and

WHEREAS, the authority has prepared an Act 537 Sewage Facilities Plan Update dated November 2006 which provides conceptual descriptions for sewage facilities in Malvern Borough, and Charlestown, East Pikeland, Tredyffrin, Easttown, East Whiteland, Schuylkill and Willistown Townships, and;

WHEREAS, the Plan includes expansion, additions and improvements to an existing wastewater treatment plant located in Schuylkill Township, and;

WHEREAS, the alternative of choice to be implemented is an upgrade and expansion of the existing wastewater treatment plant including primary chemical feed, UV disinfection, and the addition of a 4th clarifier and a 2nd aeration basin, and;.

WHEREAS, the authority finds that the Facility Plan described above conforms to a comprehensive program of pollution control and water quality management, and;

WHEREAS, the authority has agreed that the facilities will comply with all zoning, subdivision, and other ordinances, not withstanding any exemptions in Act 167 or otherwise;

NOW, THEREFORE, BE IT RESOLVED that the Board of the Valley Forge Sewer

Authority hereby adopt and submit to the Department of Environmental Protection for its approval as a revision to the "Official Plan" of the authority, the above referenced Facilities Plan provided such plan provides for compliance with all municipal ordinances. The authority hereby assures the Department of the complete and timely implementation of the said plan as required by law. (Section 5, Pennsylvania Sewage Facilities Act as amended).

RESOLUTION 2007- 683

1. Section 5 of the Pennsylvania Sewage Facilities Act , Act of January 24, 1966, P.L. 1535, No. 537, as amended, and the Rules and Regulations of the Pennsylvania Department of Environmental Protection adopted thereunder, Chapter 71 of Title 25 of the Pennsylvania Code requires municipalities to adopt an Official Sewage Facilities Plan providing for sewage services adequate to prevent contamination of waters and/or environmental health hazards with sewage wastes, and to revise said plan whenever it is necessary to meet the sewage disposal needs of any municipality; and

2. Charlestown Township has enacted an Official Sewage Facilities Plan under the Pennsylvania Sewage Facilities Act dated June 5, 1989, as revised (the "Township Act 537 Plan"); and

3. Valley Forge Sewer Authority has prepared an Act 537 Sewage Facilities Plan Update dated November 2006 (the "Authority's Act 537 Sewage Facilities Plan Update"), which provides for sewage facilities in a portion of Charlestown Township and implements an update and expansion of the Authority's existing wastewater treatment plant including primary chemical feed, UV disinfection, and the addition of a 4th clarifier and a 3rd aeration basin.

4. Charlestown Township is a member municipality of the Valley Forge Sewer Authority; and

5. Charlestown Township has determined that the Authority's Act 537 Sewage Facilities Plan Update is consistent with and conforms to the Township Act 537 Plan, the Charlestown Township Zoning Ordinance, the Charlestown Township Subdivision Ordinance and all other applicable ordinances and plans of the Township.

BE IT AND IT IS HEREBY RESOLVED that the Board of Supervisors of Charlestown Township, Chester County, Commonwealth of Pennsylvania, adopts and submits to the DEP the Authority Act 537 Sewage Facilities Plan Update and submits the same to the DEP as a revision to the Charlestown Township Act 537 Plan. The Township hereby assures the DEP of the complete and timely implementation of the said Plan as required by law. (Section 5, Pennsylvania Sewage Facilities Act, as amended)

BE IT FURTHER RESOLVED that this Resolution shall be effective immediately upon adoption.

Re: Act 537 Plan Update
East Goshen Township
Chester County

Dear Mr. Smith:

We have completed our review of your municipality's updated official sewage facilities plan entitled East Goshen Township Act 537 Plan Update as prepared by SMC Environmental Services Group, dated December 1992, Revised June 1994. The review was conducted in accordance with the provisions of the Pennsylvania Sewage Facilities Act.

Approval of the plan is hereby granted.

1. Implementation of the on-lot and community sewage system management program

2. Diversion of sewages flows for New Kent Apartments from the Ridley Creek sewage treatment plant to the West Goshen sewage treatment plant.

3. Immediate initiation of further planning in conjunction with West Goshen for the "West Goshen Alternative". A plan of study must be submitted that outlines the study area and proposed plan content and that includes a Task Activity Report or equivalent cost document.

4. Initiation of further planning to evaluate the need for the proposed Line Road Interceptor. A plan of study must be submitted that outlines the study area and proposed plan content and that includes a Task Activity Report or equivalent cost document.

5. Initiation of further planning to evaluate the possible connection of the Bryn Mawr Rehabilitation Hospital tot he Ridley Creek sewage treatment plant. A plan of study must be submitted that outlines the study area and proposed plan content and that includes an Task Activity Report or equivalent cost document.

6. Utilization of new EDU wastewater ratings:

Single family detached dwellings	- 275 gpd
Townshouses	- 225 gpd
Apartments	- 200 gpd

7. Initiation of further planning to further evaluate other alternatives if the "West Goshen Alternative" does not meet East Goshen Township needs. The spray irrigation alternative would have to be evaluated in more detail. A plan of study must be submitted that outlines the study area and proposed plan content and that includes a Task Activity Report or equivalent cost document.

If you have any questions regarding this matter, please feel free to contact me at the above number.

Re: Act 537 Plan Update
East Goshen Township
Chester County, Pennsylvania

Dear Mr. Rehm:

East Goshen Township and SMC Environmental Services Group have completed the Township's 537 Plan Update and enclose three (3) copies with this letter.

You will see that the format is somewhat different than the current format dictates. This plan was 98-99% complete when the Township and SMC were advised of the revised format and checklist. A June 30, 1993 meeting between Glenn Stinson and John Veneziale of your office and Fred Turner, SMC, Sue Fish, and myself resulted in agreement that our plan could be submitted as it was as long as the check list was completed and made reference to the location of the required material. All new material and addenda are shown on the blue and yellow pages; text highlighting indicates 1994 changes.

Please contact this office if you have any questions.

Very truly yours,

Louis F. Smith, Jr.
Township Manager

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

For specific details covering the ACT 537 Planning Requirements, refer to Chapters 71 and 73 of the Department's Regulations.

A COPY OF THIS COMPLETED CHECKLIST MUST BE INCLUDED WITH YOUR ACT 537 PLAN. THE DEPARTMENT WILL USE THE "DER USE ONLY" COLUMN DURING THE COMPLETENESS EVALUATION OF THE PLAN. THIS COLUMN MAY ALSO BE USED BY THE DEPARTMENT DURING THE PREPLANNING MEETING WITH THE MUNICIPALITY TO IDENTIFY PLANNING ELEMENTS WHICH WILL NOT BE REQUIRED TO BE INCLUDED IN THE PLAN. ALL THE PLANNING ELEMENTS REQUIRED BY THE DEPARTMENT MUST BE ADDRESSED IN YOUR PLAN OR THE PLAN WILL BE RETURNED AS INCOMPLETE. THE PAGE NUMBER OR OTHER REFERENCE MUST BE LISTED IN COLUMN 2 OF THE CHECKLIST PRIOR TO PLAN SUBMITTAL. IF THE MUNICIPALITY DETERMINES THAT ANY ITEMS LISTED IN THIS CHECKLIST DO NOT APPLY, OR CONDITIONS STATED IN A CERTAIN PART OF THIS CHECKLIST DO NOT EXIST IN AN AREA, A COMMENT MUST BE INCLUDED IN COLUMN 2 WHICH STATES THAT THE PARTICULAR CHECKLIST ITEM WILL HAVE NO IMPACT ON THE PLAN OR THAT IT DOES NOT EXIST IN THE PLANNING AREA. WHEN INFORMATION REQUIRED AS PART OF AN OFFICIAL PLAN UPDATE REVISION HAS BEEN DEVELOPED SEPARATELY OR IN A PREVIOUS UPDATE REVISION, INCORPORATE THE INFORMATION BY REFERENCE TO THE PLANNING DOCUMENT AND PAGE. THREE COPIES OF THE COMPLETED PLAN WITH ALL ATTACHMENTS MUST BE SUBMITTED TO THE DEPARTMENT.

Consultant: SMC Environmental Services Consultant's Telephone Number: 610-265-2700

Consultant's Contact Person: Frederick J. Turner, Vice President

Title of Submission: Act 537 Plan Update-1994 Date Submitted: _____

☐ 3 copies of Plan submitted to the Department (including supporting documentation)

COMPLETENESS CHECKLIST

DER Use Only	Indicate Page #(s) in Plan	Item Required
_____	A-1 & B-1 to B-7	1. Table of Contents
		2. Plan Summary
_____	A-2 to A-4	A. Identify the proposed service areas and major problems evaluated in the plan. (Reference-Title 25, § 71.21.a.7.i)
_____	A-4 to A-6	B. Identify the alternative(s) chosen to solve the problems and serve the areas of need identified in the plan. Also, include any institutional arrangements necessary to implement the chosen alternative(s). (Reference-Title 25, § 71.21.a.7.ii)
_____	A-6 to A-8	C. Include the cost of implementing the proposed alternative (including the user fees) and the proposed funding method to be used. (Reference-Title 25, § 71.21.a.7.ii)
_____	A-8	D. Identify the municipal commitments necessary to implement the plan. (Reference-Title 25, § 71.21.a.7.iii)

DER Use Only	Indicate Page #(s) in Plan	Item Required
	A-8	E. Provide a schedule of implementation for the project which identifies the major milestones with dates necessary to accomplish the project to the point of operational status. Other milestones in the project implementation schedule should be indicated as occurring a finite number of days from a major milestone. (Reference-Title 25, § 71.21.a.7.iv)
	A-9	F. Include dates for the future initiation of feasibility evaluations in the project's implementation schedule for areas proposing completion of sewage facilities for planning periods in excess of five years. (Reference-Title 25, § 71.21.b)
	A-9-A	3. Original, signed and sealed Resolution of Adoption by the Municipality which contains, at a minimum, alternatives chosen and a commitment to implement plan as stated in the implementation schedule. (Reference-Title 25, § 71.31.f) Section V.F of Guidance.
	A-9 to A-12	4. Evidence that the municipality has requested, reviewed, and considered comments by appropriate official: planning agencies of the municipality, planning agencies of the county, planning agencies with areawide jurisdiction (where applicable), and existing county or joint county departments of health. (Reference-Title 25, § 71.31.b) Section V.E.1. of guidance.
	A-12-A	5. Proof of Public Notice which documents proposed plan adoption, plan summary, and the establishment of a 30 day comment period. (Reference-Title 25, § 71.31.c) Section V.E.2 of guidance.
	FOLLOWING A-	6. Copy of ALL written comments received and municipal response to each comment in relation to the proposed plan. (Reference-Title 25, 71.31.c) Section V.E.2 of guidance.
	A-8 to A-9	7. Project Implementation Schedule. (Provide projected milestone dates and be detailed for each existing and future needs area). (Reference - Title 25, § 71.31.d) Section F of Guidance.
	FOLLOWING A-13	8. Project Implementation Ordinances (Provide existing ordinances or include the development of new ordinances in the schedule of implementation.) (Reference-Title 25, § 71.21.a.5.vi.D) Section V.F of guidance.
	FOLLOWS COVER SHEET	9. Written documentation indicating that the appropriate agencies have received, reviewed and concurred with the method proposed to resolve identified inconsistencies within the proposed alternative and consistency requirements in 71.21.(a)(5)(i)-(iii). (Reference-Title 25, § 71.31.e) Appendix B of guidance.

GENERAL PLAN

I. Previous Wastewater Planning

A. Identify and analyze all existing wastewater planning that:

	A-1 to A-3	1. Has been previously undertaken under the Sewage Facilities Act (Act 537). (Reference-Act 537, Section 5, § d.1)
	ALL 1981-1985 PLANS EXECUTED	2. Has not been carried out according to an approved implementation schedule contained in the plans. (Reference-Title 25, § 71.21.a.5.i.A - D) Section V.F of Guidance.

DER Use Only	Indicate Page #(s) in Plan	Item Required
	2-2 & 3-17 & 3-20	3. Is anticipated or planned by applicable sewer authorities. (Reference-Title 25, § 71.21.a.5.i.A) Section V.D. of Guidance.
	ALL	4. Has been done through official plan revisions (planning modules) and addenda. (Reference-Title 25, § 71.21.a.5.i.A)
		B. Identify all municipal and county planning documents adopted pursuant to the Pennsylvania Municipalities Planning Code (Act 247) including:
	3-6 to 3-14	1. All land use plans and zoning maps which identify residential, commercial, industrial, agricultural, recreational, and open space areas. (Reference-Title 25, § 71.21.a.3.iv)
	3-6 to 3-14	2. A comparison of proposed land use as allowed by zoning and existing sewage facility planning. (Reference-Title 25, § 71.21.a.3.iv)
	3-9 to 3-14	3. Zoning or in the absence of zoning subdivision regulations that establish lot sizes predicated on sewage disposal methods. (Reference-Title 25, § 71.21.a.3.iv)
	3-8, 3-13, top of p. 1-7	4. All limitations and plans related to floodplain and stormwater management and special protection areas. (Reference-Title 25, § 71.21.a.3.iv) Appendix B, Section II.F.
	1-6 to 1-14, 1-18 to 1-19 AND 1-17. ALSO SEE 3-1, 3-8 AND 3-9,	5. An analysis of land use planning and zoning and its consistency with protecting environmentally sensitive areas, with special attention to: (Reference-Title 25, § 71.21.a.3.iv) - public ground/surface water supply sources - recreational water use areas - groundwater recharge areas - industrial water use - wetlands
		II. Pbysical and Demographic Analysis utilizing written description and mapping:
		A. Base line mapping (All maps should show all current lots and structures).
	1-4 to 1-6	1. Identification of Planning Area(s), Municipal Boundaries, Sewer Authority/ Management Agency service area boundaries. (Reference-Title 25, § 71.21.a.1.i)
	1-6 to 1-14 & 3-1 to 3-5	2. Identification and Mapping of Physical Characteristics (streams, lakes, impoundments, natural conveyance channels, drainage basins in the planning area). (Reference-Title 25, § 71.21.a.1.ii)
	1-7 to 1-14	3. Soils - Analysis with description by soil type and soils mapping (with any topographic limitations) showing areas suitable for conventional on-lot systems, elevated sand mounds, and areas unsuitable for on-lot systems. (Reference-Title 25, § 71.21.a.1.iii). Mapping of Prime Agricultural Soils and locally protected agricultural soils. (Reference - Title 25, § 71.21.a.5.i.K)
	1-7 to 1-9	4. Geologic Features - Identification through analysis, mapping and their relation to existing (including areas where existing nitrate-nitrogen levels are in excess of 5 mg/l) or potential nitrate-nitrogen pollution and drinking water sources. (Reference-Title 25, § 71.21.a.1.iii)

DER Use Only	Indicate Page #(s) in Plan	Item Required
_____	1-6A & 3-13	5. Topography - Showing slopes that are suitable for conventional systems; slopes that are suitable for elevated sand mounds and slopes that are unsuitable for on-lot systems. (Reference-Title 25, § 71.21.a.1.ii)
_____	1-18 to 1-20 & 3-9 (5th para.)	6. Potable Water Supplies - Identification through mapping, description and analysis to include available public water supply capacity and aquifer yield for groundwater supplies. (Reference-Title 25, § 71.21.a.1.vi) Section V.C. of the Guidance.
_____	1-17 to 1-18 & 1-8	7. Wetlands - Identify wetlands as defined in Title 25, Chapter 105 by description, analysis and mapping. Proposed collection, conveyance and treatment facilities and lines must be located and labeled, along with the identified wetlands, on the map. (Reference-Title 25, § 71.21.a.1.v) Appendix B, Section II.I.
_____	1-15 to 1-17 3-14 to 3-15	8. Population - List historical, current and future population figures and projections of the municipality. Discuss and evaluate any discrepancies between municipal, county, state (DER), and federal population projections as they relate to sewage facilities. (Reference-Title 25, § 71.21.a.1.iv)

III. Existing Sewage Facilities in the Planning Area.

A. Identify, map and describe municipal and nonmunicipal, individual and community sewerage systems in the planning area including:

_____	2-1 to 2-6	1. Location, size and ownership of treatment facilities, main intercepting lines, pumping stations and force mains including their size, capacity, point of discharge. Also include the name of the receiving stream, drainage basin, and the facility's effluent discharge requirements. (Reference-Title 25, § 71.21.a.2.i.A)
_____	2-1 to 2-6 2-6 to 2-12 2-23 to 2-29	2. A narrative and schematic diagram of the facility's basic treatment processes including the facility's NPDES permitted capacity, any remaining reserve capacity and the policy concerning the allocation of reserve capacity. (Reference-Title 25, § 71.21.a.2.i)
_____	2-6, 3-25 to 3-26,	3. A description of problems with existing facilities, including existing or projected overload under Title 25, Chapter 94 (relating to municipal wasteload management) or violations of a national pollutant discharge elimination system (NPDES) permit, Clean Streams Law permit, or other permit, rule or regulation of the Department. (Reference-Title 25, § 71.21.a.2.i.B)
_____	3-14 to 3-26	4. Details of scheduled or in-progress upgrading or expansion of treatment facilities and the anticipated completion date of the improvements. Also discuss the compatibility of the rate of growth to existing and proposed wastewater treatment facilities. (Reference-Title 25, § 71.21.a.4.i & ii)
_____	2-1 to 2-13 2-23 to 2-32	5. A detailed description of operation and maintenance requirements and the status of past and present compliance with these requirements and any other requirements relating to sewage management programs. (Reference-Title 25, § 71.21.a.2.i.C)
_____	4-1 to 4-28 3-25 & 3-26 A-2 to A-6	6. Ultimate disposal areas, if other than stream discharge (land application) and any applicable groundwater limitations. (Reference-Title 25, § 71.21.a.4.i & ii)

DER Use Only	Indicate Page #(s) in Plan	Item Required
		B. Identify, map and describe areas that utilize individual and community on-lot sewage disposal and retaining tank systems in the planning area including:
	2-21 & 2-22	1. The type of systems in use. (Reference-Title 25, § 71.21.a.2.ii.A)
	2-15 - 2-21	2. A description of documented and potential public health pollution, and operational problems (including malfunctioning systems) with the systems, including violations of local ordinances, the Sewage Facilities Act, the Clean Streams Law or regulation promulgated thereunder. (Reference-Title 25, § 71.21.a.2.ii.B)
	2-15 to 2-23 2-30 to 2-32	3. A comparison of the types of on-lot sewage systems installed in an area with the types of systems which are appropriate for the area according to soil, geologic conditions, topographic limitations, sewage flows, and Title 25 Chapter 73 (relating to standards for sewage disposal facilities). (Reference-Title 25, § 71.21.a.2.ii.C)
	NOT APPLICABLE	4. Conducting a well water survey to identify possible contamination by malfunctioning on-lot sewage disposal systems. Approximately 15% of the wells in the study area should be sampled. (Reference-Title 25, § 71.21.a.2.ii.B)
		C. Identify wastewater sludge and septage generation, transport, and disposal methods as it relates to sewage facilities alternative analysis including:
	2-3	1. Location of sources of wastewater sludge or septage (Septic tanks, holding tanks, wastewater treatment facilities). (Reference-Title 25, § 71.71)
	2-3 to 2-6	2. Quantities of the types of sludges or septage generated. (Reference-Title 25, § 71.71)
	2-3	3. Present disposal methods, locations, capacities, and transportation methods. (Reference-Title 25, § 71.71)
	NONE	D. Identify, map and describe areas in the municipality where unpermitted collection and disposal systems ("wildcat" sewers, borehole disposal, etc.) are in use. (Reference-Title 25, § 71.21.a.2.i.B)
		IV. Future Growth and Development
		A. Delineate and describe the following through map, text and analysis:
	3-1 to 3-15 3-16 to 3-26	1. Areas with existing development or plotted subdivisions. Include the name, location, description, total number of EDU's in development, total number of EDU's currently developed, and total number of Equivalent Dwelling Units (EDUs) remaining to be developed (include time schedule for EDU's remaining to be developed). (Reference-Title 25, § 71.21.a.3.i)
	3-2 & 3-6 to 3-9	2. Land use designations established under the Pennsylvania Municipalities Planning Code (35 P.S. 10101-11202), including residential, commercial and industrial areas. (Reference-Title 25, § 71.21.a.3.ii)
	3-14 to 3-26	3. Future growth areas and population and EDU projections for these areas. (Reference-Title 25, § 71.21.a.3.iii)

DER Use Only	Indicate Page #(s) in Plan	Item Required
	3-9 to 3-14	4. Zoning, subdivision regulations; local, county or regional comprehensive plans; and existing plans of a Commonwealth agency relating to the development, use and protection of land and water resources. (Reference-Title 25, § 71.21.a.3.iv)
	3-7 & 3-20 3-14 to 3-26 4-1 to 4-16	5. Sewage planning required to provide adequate wastewater treatment for areas of the municipality and related to: a. Five-year population and growth impacts on existing and proposed wastewater collection and treatment facilities which support the need for expansions of facilities within the five-year time frame. (Reference-Title 25, § 71.21.a.3.v)
	3-7 & 3-20 3-14 to 3-26 4-16 to 4-20	b. Ten-year population and growth impacts on existing and proposed wastewater collection and treatment facilities which support the need for expansions of facilities within the ten-year time frame. (Reference-Title 25, § 71.21.a.3.v)

V. Alternatives to Provide New or Improved Wastewater Disposal Facilities

A. Identify alternatives available to provide for new or improved sewage facilities for each area of need including, but not limited to: (Reference-Title 25, § 71.21.a.4)

	A-3 & A-4 3-25 to 3-26	1. Regional Wastewater Treatment Concepts. (Reference-Title 25, § 71.21.a.4)
	4-1 to 4-27	2. The potential for extension of existing municipal or non-municipal sewage facilities to areas in need of new or improved sewage facilities. (Reference-Title 25, § 71.21.a.4.i)
		3. The potential for the continued use of existing municipal or non-municipal sewage facilities through one or more of the following: (Reference-Title 25, § 71.21.a.4.ii)
	4-19 to 4-24	a. Repair. (Reference-Title 25, § 71.21.a.4.ii.A)
	4-19 to 4-24	b. Upgrading. (Reference-Title 25, § 71.21.a.4.ii.B)
	2-3 to 2-6 & 4-19 to 4-24	c. Improved operation and maintenance. (Reference-Title 25, § 71.21.a.4.ii.C)
	A-1 to A-5	d. Other applicable actions that will resolve or abate the identified problems. (Reference-Title 25, § 71.21.a.4.ii.D)
	4-1 to 4-18	4. The need for new community sewage systems. (Reference-Title 25, § 71.21.a.4.iii)
	6-1 to 6-14	5. The construction of new wastewater treatment facilities. (Reference-Title 25, § 71.21.a.4.iii)
	2-12 & 6-1 to 6-14	6. Repair or replacement of collection and conveyance system components. (Reference-Title 25, § 71.21.a.4.ii.A)
	6-1 to 6-16 & A-1 to A-7	7. Use of alternative methods of collection/conveyance to serve needs areas using existing wastewater treatment facilities. (Reference-Title 25, § 71.21.a.4.ii.B)

DER Use Only	Indicate Page #(s) in Plan	Item Required
		8. The continual and future use of individual and community subsurface sewage disposal system alternatives based on:
	1-9 to 1-14 2-23 & 6-14	a. Soil suitability. (Reference-Title 25, § 71.21.a.2.ii.C)
	NOT APPLICABLE	b. Preliminary hydrogeological evaluation. (Reference-Title 25, § 71.21.a.2.ii.C)
	A-8 & A-11 & 4-21	c. The establishment of a sewage management program. (Reference-Title 25, § 71.21.a.4.iv)
		9. The repair, replacement or upgrading of existing malfunctioning systems in areas suitable for on-lot disposal considering: (Reference-Title 25, § 71.21.a.4)
	4-20 to 4-24	a. Existing technology and sizing requirements of Title 25 Chapter 73. (Reference-Title 25, § 73.31 - 73.72)
	2-27, 2-31, 2-32 4-21 & 4-22	b. Use of expanded absorption areas or alternating absorption areas. (Reference-Title 25, § 73.16)
	3-9 - 5th para.	c. Use of water conservation devices. (Reference-Title 25, § 71.73.b.2.iii)
		10. The use of small flow sewage treatment facilities, land treatment alternatives, or package treatment facilities to serve individual homes or clusters of homes based on: (Reference-Title 25, § 71.21.a.4)
	A-4 PRIORITY 6	a. Discharge Requirements. (Reference-Title 25, § 71.64.d)
	N. A.	b. Soil Suitability. (Reference-Title 25, § 71.64.c.1)
	N. A.	c. Preliminary Hydrogeologic Evaluation. (Reference-Title 25, § 71.64.c.3)
	A-8	d. Agency or other controls over operation and maintenance requirements. (Reference-Title 25, § 71.64.d)
		11. The use of retaining tank altornatives including: (Reference-Title 25, § 71.21.a.4)
	A-4 - PRIORITY 7	a. Commercial, residential and industrial use. (Reference-Title 25, § 71.63.e)
	ORDINANCE # 105	b. Designated conveyance facilities (pumper trucks). (Reference-Title 25, § 71.63.b.2)
	ORDINANCE # 105	c. Designated treatment facilitiee or disposal site. (Reference-Title 25, § 71.63.b.2)
	ORD. # 105	d. Implementation of a retaining tank ordinance by the municipality. (Reference-Title 25, § 71.63.c.3)
	ORD # 105	e. Financial guarantaee when retaining tanks are used ae an interim sewage disposal measure. (Reference-Title 25, § 71.63.c.2)
	ORD # 105	f. Temporary or permanent use.

DER Use Only	Indicate Page #(s) in Plan	Item Required
	NOT ADDRESSED	12. A no-action alternative which includes both short-term and long-term impacts on: (Reference-Title 25, § 71.21.a.4)
		a. Water Quality/Public Health. (Reference-Title 25, § 71.21.a.4)
		b. Growth potential (residential, commercial, industrial). (Reference-Title 25, § 71.21.a.4)
		c. Community economic conditions. (Reference-Title 25, § 71.21.a.4)
		d. Recreational opportunities. (Reference-Title 25, § 71.21.a.4)
		e. Drinking water sources. (Reference-Title 25, § 71.21.a.4)
		f. Other environmental concerns. (Reference-Title 25, § 71.21.a.4)
	4-20 to 4-24	13. Discuss the need for and implementation of a sewage management program to assure the future operation and maintenance of existing and proposed sewage facilities through:
	4-21	a. Municipal ownership or other management control over the operation and maintenance of individual on-lot sewage disposal systems, small flow treatment facilities, or other non- municipal treatment facilities. (Reference-Title 25, § 71.21.a.4.iv)
	ORDINANCE # 105	b. Requiring scheduled inspection of on-lot sewage disposal systems. (Reference-Title 25, § 71.73.h.1)
	4-20 to 4-24	c. Requiring scheduled maintenance of septic and aerobic treatment tanks and associated system components. (Reference-Title 25, § 71.73.b.2)
	ORDINANCE # 105 & 4-21	d. Aggressive enforcement of ordinances which require operation and maintenance and prohibit malfunctioning systems. (Reference-Title 25, § 71.73.b.5)
	A-5 to A-8	e. Repair, replacement or upgrading of malfunctioning on-lot sewage systems. (Reference-Title 25, § 71.21.a.4.iv)
	6-7 & 6-8	f. Establishment of joint municipal sewage management programs. (Reference-Title 25, § 71.73.b.8)
	4-22 & ORD. # 105	g. Reduction of organic or hydraulic loading to existing wastewater treatment facilities. (Reference-Title 25, § 71.71)
		h. Requirements for bonding, escrow accounts, management agencies or associations to assure proper operation and maintenance for non-municipal facilities. (Reference-Title 25, § 71.71)
		14. Non-structural comprehensive planning alternatives that can be undertaken to assist in meeting existing and future sewage disposal needs including: (Reference-Title 25, § 71.21.a.4)
	NEW (1992) 3-6 to 3-9	a. Modification of existing comprehensive plans involving:
		1. Land use designations. (Reference-Title 25, § 71.21.a.4)

DER Use Only	Indicate Page #(s) in Plan	Item Required
	3-6	2. Densities. (Reference-Title 25, § 71.21.a.4)
	3-9 to 3-14	3. Municipal ordinances and regulations. (Reference-Title 25, § 71.21.a.4)
	3-1 to 3-14	4. Improved enforcement. (Reference-Title 25, § 71.21.a.4)
	1-18 & 1-19	5. Protection of drinking water sources. (Reference-Title 25, § 71.21.a.4)
	3-6 to 3-14	b. Need for a comprehensive plan to assist in producing sound economic and consistent land development. (Reference-Title 25, § 71.21.a.4)
	ORD. # 105	c. Alternatives for creating or changing municipal subdivision regulations to assure long-term use of on-site sewage disposal. (Reference-Title 25, § 71.21.a.4)
	4-23 & 4-24	d. Evaluation of existing local agency programs and the need for technical or administrative training. (Reference-Title 25, § 71.21.a.4)

VI. The Evaluation of Alternatives

A. Each technically feasible alternative identified in Section V of this check-list must be evaluated for consistency with respect to the following: (Reference-Title 25, § 71.21.a.5.i)

	5-1 to 5-3	1. Applicable plans developed and approved under Sections 4 and 5 of the Clean Streams Law or Section 208 of the Clean Water Act (33 U.S.C.A. 1288). (Reference-Title 25, § 71.21.a.5.i.A) Appendix B, Section II.A.
	5-3	2. Municipal wasteload management plans developed under PA Code, Title 25, Chapter 94. (Reference-Title 25, § 71.21.a.5.i.B) The municipality's recent Wasteload Management (Chapter 94) Reports should be examined to determine if the proposed alternative is consistent with the recommendations and findings of the report. (Appendix B, Section II.B.
	5-4 & 5-5	3. Plans developed under Title II of the Clean Water Act (33 U.S.C.A. 1281-1299) or Titles II and VI of the Water Quality Act of 1987 (33 U.S.C.A. 1251-1376). (Reference-Title 25, § 71.21.a.5.i.C) Appendix B, Section II.E.
	5-5	4. Comprehensive plans developed under the Pennsylvania Municipalities Planning Code. (Reference-Title 25, § 71.21.a.5.i.D) The municipality's comprehensive plan must be examined to assure that the proposed wastewater disposal alternative is consistent with land use and all other requirements stated in the comprehensive plan. Appendix B, Section II, D.
	5-5 to 5-6	5. Antidegradation requirements as contained in PA Code, Title 25, Chapters 93, 95 and 102 (relating to water quality standards, wastewater treatment requirements and erosion control) and the Clean Water Act. (Reference-Title 25, § 71.21.a.5.i.E) Appendix B, Section II, F.
	5-4 & 5-5	6. State water plans developed under the Water Resources Planning Act (42 U.S.C.A. 1962-1962 d-18). (Reference-Title 25, § 71.21.a.5.i.F) Appendix B, Section II, C.

DER Use Only	Indicate Page #(s) in Plan	Item Required
	5-6	7. Pennsylvania Prime Agricultural Land Policy contained in Title 4 of the Pennsylvania Code, Chapter 7, Subchapter W. Provide narrative on local municipal policy and an overlay map on prime agricultural soils. (Reference-Title 25, § 71.21.a.5.i.G) Appendix B Section II.G.
	5-6	8. County Stormwater Management Plans approved by the Department under the Storm Water Management Act (32 P.S. 680.1-680.17). (Reference-Title 25, § 71.21.a.5.i.H) Conflicts created by the implementation of the proposed wastewater alternative and the existing recommendations for the management of stormwater in the County Stormwater Management Plan must be evaluated and mitigated. If no plan exists, no conflict exists. Appendix B, Section II.H.
	5-6 & 5-7	9. Wetland Protection under PA Code, Title 25, Chapter 105. Map wetland areas using Federal National Wetlands Inventory Mapping and Soils Mapping. (Reference-Title 25, § 71.21.a.5.i.I) Identify and provide mitigative measures for any encroachments on wetlands from the construction or operation of any wastewater facilities proposed by the alternative. Appendix B, Section II.I.
	5-7	10. Protection of rare, endangered or threatened plant and animal species as identified by the Pennsylvania National Diversity Inventory (PNDI). (Reference-Title 25, § 71.21.a.5.i.J) Provide the Department with a copy of the completed Request For PNDI Search document. Also provide a copy of the response letter from the Department's Bureau of Forestry regarding the findings of the PNDI search. Appendix II. J.
	5-7	11. Historical and Archaeological Resource Protection under P.C.S. Title 37, Section 507 relating to cooperation by public officials with the Pennsylvania Historical and Museum Commission. (Reference-Title 25, § 71.21.a.5.i.K) Provide the Department with a completed copy of Form "A" and its attachments requesting the Bureau of Historic Preservation (BHP) to provide a listing of known historical sites and potential impacts on known archaeological and historical sites. Also provide a copy of the response letter from the BHP. Appendix B, Section II. K.
	5-7 to 5-10	B. Provide for the resolution of any inconsistencies in any of the points identified in Section VI.A. of this checklist by submitting written documentation that the appropriate agency has received, reviewed, and concurred with the method proposed to resolve identified inconsistencies. (Reference-Title 25, § 71.21.a.5.ii) Appendix B
	5-9 & 5-10	C. Evaluate each alternative identified in Section V of this checklist with respect to applicable water quality standards, effluent limitations or other technical, legislative or legal requirements. (Reference-Title 25, § 71.21.a.5.iii)
	5-10 to 5-14	D. Provide cost estimates using present worth analysis for construction, financing, ongoing administration, operation and maintenance and user fees for each alternative identified in Section V of this checklist. Estimates shall be limited to areas identified in the plan as needing improved sewage facilities within 5 years from the date of plan submission. (Reference-Title 25, § 71.21.a.5.iv)
	5-14 to 5-16	E. Provide an analysis of the funding methods available to finance each of the proposed alternatives evaluated in Section V of this checklist. Also provide documentation to demonstrate which alternative and financing scheme combination is the most cost-effective; and a contingency financial plan to be used if the preferred method of financing cannot be implemented. The funding analysis shall be limited to areas identified in the plan as needing improved sewage facilities within five years from the date of the plan submission. (Reference-Title 25, § 71.21.a.5.v)

		F. Analyze the ability of the municipality to implement each alternative proposed in Section V of this report including: (Reference-Title 25, § 71.21.a.5.vi)
	4-23 & 4-24	1. The activities necessary to abate critical public health hazards pending completion of sewage facilities or sewage management programs. (Reference-Title 25, § 71.21.a.5.vi.A)
	A-7 to A-9	2. The phased development of the facilities or sewage management program. (Reference-Title 25, § 71.21.a.5.vi.B)
	A-8 & A-9	a. Provide time schedules for implementing each phase. (Reference-Title 25, § 71.21.a.5.vi.C)
	4-21 & 5-14	3. The administrative organization and legal authority necessary for plan implementation. (Reference-Title 25, § 71.21.a.5.vi.D)
		VII. Institutional Evaluation
		A. Provide an analysis of all existing wastewater treatment authorities, their past actions and present performance including:
	5-14 & 5-15 & 5-16	1. Financial & debt status. (Reference-Title 25, § 71.61.d.2.)
	4-23 & 4-24	2. Available staff and administrative resources. (Reference-Title 25, § 71.61.d.2.)
	SEC. 5, ACT 537	3. Existing legal authority to:
	A-9-A & 5-14	a. Implement wastewater planning recommendations. (Reference-Title 25, § 71.61.d.2.)
	4-23 & 5-14	b. Implement system-wide operation and maintenance activities. (Reference-Title 25, § 71.61.d.2.)
	5-14 - 5-15	c. Set user fees and take purchasing actions. (Reference-Title 25, § 71.61.d.2.)
	ORD # 105 - SEC. VII	d. Take actions against adopted ordinance violators. (Reference-Title 25, § 71.61.d.2.)
	SECOND CLASS TWSP. CODE	e. Negotiate agreements with other parties. (Reference-Title 25, § 71.61.d.2.)
	SECOND CLASS TWSP. CODE & PA. MUNICIPAL AUTH. ACT	f. Raise capital for construction and operation and maintenance of facilities. (Reference-Title 25, § 71.61.d.2.)
		B. Provide an analysis and description of the various institutional alternatives necessary to implement the proposed alternative including:
	NONE	1. Need for new authorities. (Reference-Title 25, § 71.61.d.2.)
	4-23 & 4-24, 5-10	2. Functions of existing and proposed organizations (sewer authorities, etc.). (Reference-Title 25, § 71.61.d.2.)
	5-10	3. Cost of administration, implementability, and the capability of the authority to react to future needs. (Reference-Title 25, § 71.61.d.2.)

DER Use Only	Indicate Page #(s) in Plan	Item Required
		C. Describe all necessary administrative and legal activities to be completed and adopted to ensure the implementation of the recommended alternative including:
	NOT APPLICABLE - EXISTING	1. All legal authorities of incorporation. (Reference-Title 25, § 71.61.d.2.)
	ORD # 105 ADOPTED	2. All required ordinances, regulations, standards, and inter-municipal agreements. (Reference-Title 25, § 71.61.d.2.)
	A-1 TO A-7	3. Activities to provide rights-of-way, easements, and land transfers. (Reference-Title 25, § 71.61.d.2.)
	N.A.	4. Other municipal sewage facilities plan adoptions. (Include the development of Items 1-4 on the project's schedule of implementation). (Reference-Title 25, § 71.61.d.2.)
	A-8	5. Any other legal documents. (Reference-Title 25, § 71.61.d.2.)
	A-1 to A-8	D. Identify the chosen institutional alternative for implementing the chosen wastewater disposal alternative. Provide justification for choosing the specific alternative. (Reference-Title 25, § 71.61.d.2.)

VIII. Selected Wastewater Treatment & Institutional Alternatives

		A. Select one technical wastewater disposal alternative which best meets the wastewater treatment needs of each area of the municipality studied. Justify the choices by providing documentation which shows that they are the best alternative(s) based on:
	A-2 to A-7	1. Wastewater disposal needs. (Reference-Title 25, § 71.21.a.6.)
	4-23 to 4-24	2. Technical and administrative needs. (Reference-Title 25, § 71.21.a.6.)
	5-10 to 5-16 A-7 & A-8	3. Cost-effectiveness. (Reference-Title 25, § 71.21.a.6.)
	4-23 & 4-24	4. Management and administration systems available. (Reference-Title 25, § 71.21.a.6.)
	5-10 to 5-16	5. Financing methods available. (Reference-Title 25, § 71.21.a.6.)
	6-1 to 6-16	6. 5 and 10 year planned growth areas. (Reference-Title 25, § 71.21.a.6.)
	5-1 to 5-10	7. Environmental soundness and compliance with natural resource planning and preservation programs. (Reference-Title 25, § 71.21.a.6.)
	5-10 to 5-16 A-7 to A-8	B. Describe the capital financing plan chosen to implement the selected alternative(s).

EAST GOSHEN TOWNSHIP

ACT 537 PLAN UPDATE

DECEMBER 1992

REVISED JUNE 1994

SMC Environmental Services Group

P.O. Box 859

Valley Forge, PA 19482

September 14, 1994

FINAL ADDENDUM TO THE EAST GOSHEN TOWNSHIP ACT 537 PLAN UPDATE AS A RESULT OF THE MOST RECENT CHESTER COUNTY PLANNING AGENCY REVIEWS

As a result of the Chester County Planning Commission and Health Department reviews and the comments received from adjacent municipalities, the East Goshen Township Act 537 Plan was substantially revised in several ways. First, Addenda reports were prepared and attached to selected sections of the original report. The Plan Summary and the various Addenda are printed on yellow paper in this report. Further text modifications are "highlighted" to show the various response items and text changes required by comments from the Planning agencies.

A meeting with the County agencies was held at the East Goshen Township building on July 7, 1994 to review the basic plan addenda, text changes, and changes in concept.

The Chester County Health Department responded under date of August 11, 1994. This latest review requires three basic comments. First, the reported "confusion" regarding text/tables has been eliminated. Within this addendum, Table 3.6a, Table 3.7a, and Table 3.8 have been prepared to address the County Health Department's comment regarding text/table confusion.

The second comment regards this submission to PaDER as being premature since West Goshen Township has not yet amended their Act 537 Plan to accommodate the plant expansion. Further, the Health Department points out that there is no commitment from West Goshen to accept the additional flows from the Township. The County Health Department clearly indicates that it would support East Goshen's first selected alternative should West Goshen complete their planning and gain approval from PaDER.

The final comment from the County Health Department review addresses a pro-active role in the management of the Willow Pond COLDS. The adoption of Ordinance 105 during June 1994 now fully involves East Goshen Township in the monitoring/management of the Willow Pond COLDS. Monthly monitoring reports are now received and reviewed by East Goshen Township.

East Goshen Township fully concurs with the comments contained in the County Health Department letter.

The Chester County Planning Commission responded to the latest revised plan on August 19, 1994. The basic position of the County Planning Commission is the same as that of East Goshen Township. The Planning Commission points out that "The Township will find itself in a difficult position if the West Goshen Alternative cannot be implemented." The County also believes that this submission to PaDER is premature without West Goshen concurrence. East Goshen Township is fully aware that agreements must be reached with West Goshen in order to properly effectuate this updated 537 Plan.

As in the County Health Department review, the County Planning Commission specifically requested an updating of the Tables 3.6 and 3.7. The Township has responded in part by preparing the aforementioned Table 3.6a, Table 3.7a, and Table 3.8. The additional mapping requested by the County Planning Commission cannot be prepared until East Goshen agrees with West Goshen as to the specific service areas within East Goshen Township and possibly East Whiteland Township which would be served under an agreement between the two Townships. The Township will respond to the request for additional mapping after reaching some form of agreement with West Goshen Township.

The Township is in agreement with the County Planning Commission's suggestion as to the minor modification in the rank order of priority of treatment methods selected by East Goshen Township. The Township has already expressed within this plan a requirement that the developers of the Woods/Sherman property will be required to exhaust prioritized alternatives before the consideration of public sewer extensions to this area is approved.

In summary, East Goshen Township feels that it has adequately responded to both of the County agency review letters.

New Tables 3.6a, 3.7a, and 3.8

The Township has prepared new allocation tables dated August 30 and August 31, 1994 which reflect a number of changes. Table 3.6a (which is a facsimile of Table 3.6), now utilizes the updated 1993 average daily flow. In addition, the new EDU daily flow figures recommended in the plan have been utilized in lieu of the higher previous figures. Further, all of the projects indicated under the column "GPD Committed or in Process" in the prior Table 3.6 have been updated and incorporated in the column related to "online facilities."

Table 3.6a still shows a distinct difference between the 937,274 gpd based on expected theoretical flows and the 1993 average daily flow of 815,192 gpd which was based on actual recorded figures. In essence, this means that there is still a

% TOTAL ON–LINE VS ACTUAL GPD = 87%

)JECTED ON LINE/COMMITTED &)BABLE 1,193,045

FACTORS USED:
SFD = 275 GPD
TOWNHOUSE = 225 GPD
APARTMENTS = 200 GPD

daily flow difference of 122,000 gpd between theoretical and actual flow, and the ratio for total online sewage flow is 87 percent of project theoretical flow.

Table 3.6a also contains a figure for the conversion of daily flow from the New Kent Apartments (76,800 gpd) showing removal from the Ridley Creek Watershed and being diverted to Chester Creek Watershed.

With regard to Table 3.7a, which is a facsimile of the original Table 3.7, the reduced daily flows for each type of EDU have now been incorporated for use in this table. The New Kent Apartments, currently connected to the Ridley Creek plant, have been removed from Table 3.7a and now appear in Table 3.6a. Also, those projects or properties previously reflected as being "committed and/or in process" have now been properly shown in the column where online conditions have been established.

It is noteworthy that the gpd online is very consistent with the average 1993 plant flow. In addition, certain projects shown in Table 3.7a have been shifted to the future connections considered necessary beyond the year 2002. This has been done based upon the adoption of Ordinance 105 which may remove the future need for public sewers for the four projects or properties depicted.

Although 40,000 gpd is still shown for future connection for the Bryn Mawr Rehabilitation facility, a recent letter from that agency requested only 25,000 gpd for future treatment at the Ridley Creek STP.

West Goshen Alternative

Table 3.8 has been developed as a new allocation alternative which would be based on primarily on approval of the "West Goshen Alternative" described in this plan update. The distinct difference between Table 3.8 and Table 3.6a is that approximately 231,000 gpd in additional flows would be added which is directly related to facilities currently located in East Whiteland Township (William Henry Apartments and Immaculata College). Again, as in Table 3.6a, the reduced EDU daily flow factors have been utilized.

It should be noted that Tables 3.6a, 3.7a, and 3.8 were actually published in September 1994. Most of the text material contained in this 1994 Plan was developed during 1992 through 1994. There will now be some differences in text as compared with the newly-updated tables. With this in mind, the new tables contained in this addendum will govern the current estimates or allocations of flows to Ridley Creek and to Chester Creek.

RE: East Goshen Township Act 537 Plan Update

Dear Mr. Smith:

The Chester County Health Department has reviewed the document entitled "East Goshen Township Act 537 Plan Update" as prepared by SMC Environmental Services Group last revised June 1994. The plan proposes to utilize the West Goshen wastewater treatment plant to serve the majority of the sewage needs of East Goshen Township. This involves re-routing of some flows which presently flow into the East Goshen Ridley Creek wastewater plant. Additionally, the township has adopted an ordinance requiring routine maintenance of individual and community on-lot sewage disposal systems.

The document as presented is very confusing and unclear as text has been changed but corresponding figures and tables have not. It would be beneficial to update the tables and provide a clear graphic interpretation on the areas to be serviced by the respective wastewater plants.

It appears that this submission may be premature as the selected alternative does not seem to be implementable as West Goshen has not amended their 537 plan to accommodate the plant expansion necessary to implement the recommendations of this planning document. Additionally, there is not a commitment from West Goshen to accept the additional flows from the township.

Should West Goshen complete their planning and gain approval from DER to expand the plant, then this Department would support East Goshen's choice of the selected alternative. However, we still feel it should be necessary for the developers of the larger tracts of land to explore the possible use of spray irrigation when these areas are developed.

East Goshen Township should also take a proactive role in the management of the Willow Pond COLDS which is presently being operated by the homeowner's association. It is unclear in this report exactly what East Goshen is doing in regards to overseeing that this system is being properly operated. Additionally it appears the township misinterpreted the recommendations concerning this issue in our previous review. It is this Department's view that the township should become a partner in the operation of this community system. This does not necessarily mean that we feel it should be connected to the municipal sewerage system. In fact, with proper operation and maintenance this system may not need to be connect to the municipal system at all.

Should you have any questions concerning this review, please feel free to contact me at 344-6239 or the above address.

Sincerely,
Maria T. Goman

Re: Revisions to the Act 537 Sewage Facilities Plan Update

Dear Mr. McDonough:

The Chester County Planning Commission has completed its review of the above referenced revisions to the revised Sewage Facilities Plan of the Township as required by Act 537, the Pennsylvania Sewage Facilities Act. We offer the following comments for your consideration.

The County Planning Commission believes that the Township Board of Supervisors and their engineering consultant have adequately addressed, with a few minor exceptions, our comments of May 1993. Most notable are the Individual On-lot and Community On-lot System Management Ordinances adopted by the Township Board of Supervisors this past June. We commend you for committing to this program.

We believe that, while a considerable amount of time and effort have been devoted to this revised Plan, the Township will find itself in a difficult position if the "West Goshen Alternative" can not be implemented. The submittal of this Plan is premature in that is difficult see how PaDER could approve the Plan of East Goshen without first reviewing the Plan of West Goshen. Since your Plan is heavily dependent upon the plans and actions of West Goshen Township, it is better to wait until you are able to execute an agreement with West Goshen for the additional treatment plant capacity before submitting this Plan to PaDER. Alternately, East Goshen could wait to submit their plan until West Goshen has completed their Plan Update, and then submit both plans to PaDER together as a regional plan.

The revisions to the Plan Update as prepared are somewhat confusing. We feel this may be due to the fact that while the text of the Plan was modified, certain key graphic elements were not. It would very helpful to update the tables (Tables 3.6 and 3.7) which indicate the allocation of sewage flows from various areas in the Township to the two treatment facilities under the "West Goshen Alternative". Additionally, a map similar to Exhibit II which indicates the areas of the Township to be served by the facilities in the designated time frames should be included. This map could be keyed or coded to the areas listed in Tables 3.6 and 3.7, and would greatly clarify the intent of the Plan.

A third issue that the County Planning Commission feels should be clarified in the Plan is the overall priority for types of sewerage systems preferred by the Township to be used in new land developments. The third priority listed is "Public sewer connections where **feasible**". Some type of public sewer system is technically feasible in almost all areas. There may be cost, environmental, or other reasons that would make a public system **undesirable**; this distinction should be made in the Plan. We suggest this priority statement could be amended to state: "Public sewer connections in service areas described in this official municipal document".

Related to this issue is the selection of sewerage facilities for the two large undeveloped properties in the northeast section of the Township, the Woods and the Sherman properties. The Plan states that at the time of any development proposals for these properties the developers will first be **encouraged** to utilize community-type spray irrigation systems as the preferred alternative. We believe that the one way to "encourage" this is for the Township is to state, as part of the official Plan, the type of system desired and leave it to a developer to show that this type of system is not technically feasible on the property. Another method would be to amend the municipal zoning ordinance so that a density bonus could be granted the developer if this type of system is technically feasible and incorporated into the site design.

These comments are offered by staff prior to formal action by the Planning Commission. If the Commission should have additional comments on the revised Plan Update, their comments will be forwarded to you.

If you have any questions regarding this review, please call me at 344-6285.

Very truly yours,

George W. Fasic
Secretary

7.	Project Implementation Schedule for Chosen Alternatives	A-13
8.	Project Implementation Ordinance (Municipal Onlot and Community Sewage Systems)	A-13
9.	Response from Reviewing Agencies	A-13

2. PLAN SUMMARY

A. Proposed Service Area and Major Problems Evaluated in this Plan

1. Chester Creek Watershed. Within the Chester Creek Watershed, all projects and properties depicted in Table 3.6, as contained on page 3-17, will be connected to the West Goshen Sewage Treatment Plant (STP). The one major subdivision of concern, the Charter Chase subdivision, was reevaluated in the field during 1993. As a result of the additional field survey, ten residential properties reflected current malfunctions out of a total of 98 dwelling units. It is the Township's conclusion that this subdivision can be adequately managed by the newly-adopted Sewage Management Program Ordinance for East Goshen Township without any connection to the public sewer system prior to the year 2002.

Other reported, scattered malfunctions within the Chester Creek Watershed will be monitored under the newly-adopted Sewage Management Program Ordinance with mandatory three-year septic tank pumping cycles. In the event that the Charter Chase subdivision shows a need for public sewer connections after 2002, these units would be connected to the West Goshen STP.

The New Kent Apartments, which is partially located within the Chester Creek Watershed, but which is currently connected to the Ridley Creek STP, will be shifted to the West Goshen STP during the period 1995-1996.

In addition, East Goshen Township is now carefully evaluating the "West Goshen Alternative" which involves the potential availability of 780,000 gpd in additional treatment capacity at the West Goshen STP. As noted in the following section, the "West Goshen Alternative" has been selected for the Ridley Creek Watershed which in turn may cause additional connections to the West Goshen STP.

2. Ridley Creek Watershed. Within the Ridley Creek Watershed, all existing onlot systems and any future subdivisions developed with onlot systems will be managed under the Township's new Sewage Management Ordinance. The properties identified in Table 3-7 on page 3-20 of this Updated Act 537

Plan will continue to be considered for direct connection to the Ridley Creek STP.

The December 1992 draft of the East Goshen Act 537 Plan Update called for an expansion of the Ridley Creek STP from 0.4 MGD to 0.7 MGD. Based upon potential difficulties in such plant expansion with direct stream discharge to Ridley Creek, other alternatives have been evaluated including the possibility of a municipal spray irrigation system on nearby properties. Because of cost factors, potential wetland encroachment, and for other valid reasons, the municipal spray irrigation alternative is no longer considered viable since it is not cost effective and available land would require condemnation of a substantial estate.

A new alternative identified in this study as the "West Goshen Alternative" will involve a considerable number of changes to the Township's December 1992 draft Act 537 Plan Update. Specifically, if the Ridley Creek STP cannot be expanded as a stream discharge facility, then the following changes would occur:

- New Kent Apartments - transfer 84,420 gpd to the West Goshen STP

- The Immaculata College flow at 137,000 gpd, the William Henry Apartments at 96,000 gpd, and possibly the Bryn Mawr Rehabilitation Hospital at 40,000 gpd would all be transferred to the West Goshen STP <u>if</u> the West Goshen Municipal Authority accepts these facilities and if East Goshen agrees to construct the "pass-through" conveyance facilities. The balance of the properties identified as future problem areas as reflected in Table 3-7 would be handled at the Ridley Creek STP without creating an overload of this facility. It should be noted that Christ Memorial Lutheran Church, a previous requestor of sewage service, has indicated by way of a recent letter that such service is no longer required.

- In addition, regarding the SmithKline Beecham property, the future reservation for 55,000 gpd would be canceled and Beecham would be required to provide on-site sewage disposal for any future development extending

beyond the present 40,000 gpd which has been committed and paid by Beecham.

In summary, the current commitments to the Ridley Creek STP would be continued without the exclusions and transfers noted above. If the "West Goshen Alternative" is not capable of being executed for numerous reasons, then East Goshen Township must commence the socio-economic study immediately for the expansion of the Ridley Creek STP.

B. Selected Alternatives and Institutional Arrangements Required for the Chosen Alternatives

The wastewater alternatives chosen to solve the various problems within the Chester Creek Watershed and the Ridley Creek Watershed are identified below. The preferred priority of type of system to be used in both watersheds throughout East Goshen Township is as follows:

1. Individual onlot systems
2. Individual elevated sand mound systems
3. Public sewer connections where feasible
4. Community-type spray irrigation systems
5. Community-type in-ground disposal systems
6. Individual stream discharge systems
7. Retaining tanks

ALTERNATIVES CHOSEN FOR THE CHESTER CREEK WATERSHED

Charter Chase Subdivision

After further field work was conducted in 1993, it was determined that seven existing malfunctions and three graywater discharge violations out of 98 existing residential units did not warrant further pursuit at this time for public sewers. Charter Chase will remain with individual onlot systems throughout the 5-year and 10-year planning cycles. This subdivision will be carefully monitored under the newly-adopted Sewage Management Ordinance to assure that an increase in violations does not occur. Individual lot owners will be directed to correct malfunctioning systems. Future public sewer availability will be reserved at the West Goshen STP should it become necessary to connect this subdivision to public sewers after 2002.

For all remaining existing individual onlot systems, the Township's 1994 Sewage Management Ordinance will be utilized to constantly monitor such systems.

The remaining properties listed on Table 3-6 (reference page 3-16 of General Plan text) will be connected to the West Goshen STP generally in accordance with the time scheduled listed within said table.

New Kent Apartments

The 84,420 gpd now on-line at the Ridley Creek STP will be switched to the West Goshen STP when necessary to make additional capacity available at the Ridley Creek STP. This project sits on the ridge line and is partially in the Chester Creek Watershed and partially within the Ridley Creek Watershed.

Ridley Creek Watershed

The primary chosen alternative for the Ridley Creek Watershed is to execute the West Goshen Alternative for required sewage commitments and service areas which exceed the 0.4 MGD permit capacity at the Ridley Creek STP. The West Goshen Alternative will involve the construction of gravity conveyance systems to transport wastewater from East Whiteland Township to Greenhill Road and a new pumping station which will discharge to West Goshen and be treated at the West Goshen STP.

Facilities such as Immaculata College (137,000 gpd) and the William Henry Apartments (96,000 gpd) would be handled by such a conveyance system. The facilities would be located partially in East Whiteland Township and fall within the Act 537 responsibility of that Township to work jointly with East Goshen should these conveyance facilities be required. West Goshen Township will require a binding sewer services agreement with East Whiteland prior to the design of such facilities.

On June 8, 1994, the Christ Memorial Lutheran Church and School located on Line Road indicated in a letter to the East Goshen Township Manager that they have solved their problem and they are not interested in public sewer connections at this time. Recent letters directed to the Bryn Mawr Rehabilitation Hospital regarding their continued interest in connecting 40,000 gpd to the East Goshen system have not been answered. If the Bryn Mawr Rehabilitation Hospital decides later to connect with the East Goshen system, either a method of conveying to West Goshen will be considered or a reevaluation of connecting at the Ridley Creek plant will be made.

SmithKline Beecham

Beecham has purchased and paid for 40,000 gpd at the Ridley Creek plant which will be reserved for that property. The 55,000 gpd listed in Table 3.7 of the General Plan (refer to page 3-20) will now be removed from further consideration. Beecham has demonstrated the ability to handle additional wastewater discharge within its property limits, possibly utilizing spray irrigation. Beecham has indicated no development is contemplated until well after the year 2000.

The Woods Property/Sherman Property

When the Woods property (86 acres) and the Sherman property (38 acres) are developed, the developers of these properties will be directed to explore community-type systems utilizing spray irrigation which might be possible because of the sizable acreage related to each site. If community-type systems cannot be approved for these properties, the need for the Line Road interceptor will be instituted by the Township which would connect the Woods/Sherman properties and the Willow Pond community system to the Ridley Creek STP. The reservations for wastewater treatment will continue to be shown at the Ridley Creek STP in accordance with Table 3.7 to assure that these sites are not denied access to public sewers.

All other property subdivisions and facilities listed in Table 3.7 will be connected to the Ridley Creek STP.

Reduction in EDU Ratings for both Chester Creek and Ridley Creek Watersheds

East Goshen Township will immediately commence to use the following new EDU wastewater flow generation standards for residential units which are much closer to "actual" rather than continuing the use of "theoretical" EDU flow rates which distort estimated flows at both the West Goshen STP and the Ridley Creek STP:

Single-family detached dwellings -	275 gpd
Townhouses or townhomes -	225 gpd
Apartments -	200 gpd

C. Cost of Implementing the Proposed Alternatives

Table 5.1 (refer to page 5-12 of General Plan text) lists and discusses all costs related to providing public sewer facilities discussed under this report.

When and if applicable, the cost of connecting the Charter Chase community to the public sewers via a gravity collection system and a force main is estimated at $925,000.

Appropriate construction costs only are also shown for future connections for the Mill Valley subdivision and the Millstream subdivision. The construction cost for the Line Road interceptor is estimated at $395,000 to eventually connect Willow Pond/Woods property/Sherman property to the Ridley Creek STP.

The Township conducted an alternative analysis for spray irrigation related to the treatment costs for the additional 0.3 MGD at the Ridley Creek STP in lieu of stream discharge for the additional effluent. The resulting estimated cost of $5,125,000 (in excess of $17/per gallon) was deemed far too expensive to be considered further. In addition, the use of the Grace Estate would involve partial and probable total condemnation driving the cost to even higher levels per gallon of wastewater treated.

Estimated Costs for the West Goshen Alternative

East Goshen Township has decided not to spend substantial dollars in designing a collection system for potential customers located in East Whiteland Township. Specifically, to service the Immaculata College facilities and the William Henry Apartments would require a gravity sewer extending from King Road to Hersheys Mill Road at a nominal estimated cost of $614,000. In addition, a pumping station located at Greenhill Road and Hersheys Mill Road with a force main extending approximately 10,000 linear feet into West Goshen would cost an additional $804,000 to $1,074,000. In summary, a conveyance system to service two external facilities having daily wastewater flows of 233,000 gpd would cost between $1,418,000 to $1,688,000. This cost would represent the conveyance cost only. In addition, the treatment cost would require negotiation with West Goshen Township, and it is estimated that such cost will range between $5 to $6/gallon of wastewater treated. These tentative estimated costs may prove to be too costly for these external facilities.

Any user fees related to the West Goshen Alternative would be borne solely by the users, i.e., Immaculata College and the William Henry Apartments. The only East Goshen subdivision which could possibly be served by a gravity sewer for these external users would be the Millstream Drive residential area containing

25 EDUs. It would be more cost effective to connect the Millstream Drive units to nearby existing gravity sewers.

There is no estimated cost for switching the New Kent Apartments from the Ridley Creek STP to the West Goshen STP since these connections already exist.

D. Municipal Commitments Necessary for Plan Implementation

The first major commitment has been made by the adoption of the 1994 Municipal Sewage Management Ordinance which was adopted on June 7, 1994. This Ordinance will adequately control existing and future individual onlot and community-type systems within East Goshen Township.

The next major municipal commitment required is to enter negotiations with West Goshen Township regarding the "West Goshen Alternative." To date, East Goshen Township has officially responded to West Goshen Township by requesting the entirety of 780,000 gpd in possible available capacity. As of June 1994, no official response had been received from West Goshen Township. New agreements must be arranged including all cost factors related to expansion of the West Goshen STP. East Goshen Township is prepared to commence these negotiations during 1994.

E. Schedule for Implementation

1. Adopt Township-Wide Sewage Management Ordinance - Completed June 7, 1994 and now in effect.

2. Enter negotiations with West Goshen Township to implement the "West Goshen Alternative" - estimated date September 1994.

3. Switch New Kent Apartments from Ridley Creek STP to West Goshen STP - estimated target date Fall 1995.

4. Conduct additional walk-through inspections on a property-by-property basis within the Charter Chase subdivision during the spring of 1996 and 1998.

F. Future Initiation of Feasibility Evaluation

Evaluate the need for the Line Road Interceptor and authorize further studies during 1997-1998, or at the time of any development proposal for the Woods property and/or Sherman property. (The developers of the Woods property and/or Sherman property will first be encouraged to utilize community-type spray irrigation as a preferred alternative to connecting with the Ridley Creek STP.)

Reevaluate the Possibility of Connecting the Bryn Mawr Rehabilitation Hospital to the Ridley Creek STP in 1998 should this Willistown Township facility express a need for such connection, and if capacity is available.

3. RESOLUTION OF ADOPTION BY EAST GOSHEN TOWNSHIP

This resolution is now being prepared for Board of Supervisors' approval and incorporation on the following page.

4. TOWNSHIP EVALUATION OF COMMENTS BY COUNTY AGENCIES AND ADJACENT MUNICIPALITIES

East Goshen Township has responded to the best of its ability to the Municipal and County Agency review letters which are attached in Section 6 below. Specifically, Willistown Township requested that further consideration be given to spray irrigation and to elimination of any additional discharge to Ridley Creek. The Township has accomplished this request by all of the foregoing changes to the December 1992 Act 537 Plan Update.

East Whiteland Township requested consideration for serving Immaculata College, the William Henry Apartments, and other nearby facilities. The West Goshen Alternative is the response to this request.

With respect to the Chester County Health Department review letter dated April 15, 1993, the Township has responded as follows:

a) The County suggested an additional walk-through evaluation of the Charter Chase community. This was accomplished and the actual results depict little if any need for providing public sewers at this time.

Charter Chase will be constantly monitored under the 1994 Sewage Management Ordinance. In addition, the details requested by the Health Department regarding the Township-wide onlot management program are clearly expressed in the adopted Ordinance No. 105, enclosed herein.

b) It is the Township's position that they will not take over the Willow Pond community system until the newly-constructed system exhibits that it cannot be successfully operated as a community in-ground system. The Township engineer and Municipal Authority engineer are constantly advised of the status of this privately-operated system and this is sufficient for the time being. It is the Township's position that the construction cost of the Line Road Interceptor cannot be justified solely on the basis of taking over the Willow Pond community system. This community, located partly in Willistown Township, will continue to be monitored annually. The new community Sewage Management Ordinance also addresses COLDS responsibilities on the part of the Township. This Ordinance and other legal documentation will allow a takeover at any time deemed necessary by East Goshen Township.

c) With respect to the social and economic justification for the increased discharge at the Ridley Creek STP, East Goshen Township believes that this is not necessary if the West Goshen Alternative is pursued and approved.

With respect to the Chester County Planning Commission comments as expressed in a letter dated May 10, 1993, the following response comments are considered appropriate:

a) As noted above, the Township will not conduct the social and economic justification study for the Ridley Creek STP expansion at this time. This will be done only if the West Goshen Alternative is not capable of implementation and the Township is forced to return to its former primary alternative of expanding the Ridley Creek STP as a stream discharge facility. This is not likely.

b) The goals and action plans of East Goshen Township are clearly expressed in this Plan Summary and the various amendments to the appropriate sections of the General Plan.

c) This Plan Summary states the Township's position with respect to the use of various types of systems and the preferred ranking order for use of those systems.

d) The individual onlot System Management Ordinance and the COLDS Management Ordinance has been adopted by way of Ordinance No. 105 dated June 7, 1994.

e) The table of contents has been expanded to add a list of figures, exhibits, and tables. In addition, Exhibit 2 in the General Plan was not revised since this was an historical document developed from a prior Act 537 Plan Update. The Ashbridge Firethorne (170 EDUs) is appropriately as shown in Table 3.6 as being on-line and "pumped" from Ridley Creek to the West Goshen STP (refer to page 3-17).

f) The Township appreciates the advice of the County Planning Commission regarding the proportion of wastewater being applied to the ground water system. It must be recognized that the entirety of the Hersheys Mill Village and the Lockwood Chase subdivision currently utilize spray irrigation. In addition, the Willow Pond community utilizes a community in-ground system which is currently functioning. The Township's adopted preference for future subdivisions relies on a number one priority for individual onlot systems, where feasible. Many new subdivisions in future years will be built utilizing such systems. In addition, the Township has expressed a preference for community-type spray irrigation systems for the Woods property and the Sherman property as a first alternative followed by a second preferred alternative (a connection to the public sewers).

g) East Goshen Township is aware of the inter-basin transfer of wastewater. Since a predominant part of the Township is serviced by the Philadelphia Suburban Water Company and the West Chester Area Municipal Authority, a concern over the inter-basin transfers of wastewater may not be difficult to achieve. There may be some future concern on the part of DRBC with respect to transferring the Immaculata College wastewater flow (137,000 gpd) from Valley Creek to Chester Creek. This concern will have to be addressed by East Whiteland Township as the responsible party.

h) The external facilities in East Whiteland and Willistown Townships have been thoroughly evaluated. The Township has communicated (in writing) with Immaculata College, the William Henry Apartment owners or operators, the Christ Memorial Lutheran Church, and

the Bryn Mawr Rehabilitation Hospital. Only the Christ Memorial Lutheran Church has responded indicating no further needs.

i) The Township has thoroughly evaluated the possibility of designing a municipal spray irrigation alternative for the 0.3 MGD in additional capacity originally determined as being necessary for the Ridley Creek STP. This alternative would have involved in excess of $5,000,000 in cost and the possible condemnation of a major parcel within the Township. The extent of wetland intrusions and the high estimated condemnation cost for part or all of this parcel led to a determination that municipal spray irrigation is not feasible.

In addition, an analysis was made to utilize a part of the Beecham property. The extraordinary conveyance cost and purchase cost for land dictated that this alternative could not be made cost effective.

Further, the Township has prioritized the Woods and Sherman properties as an expressed first alternative for community-type spray irrigation before any possible connection to the public sewer system could be made.

j) The Township has fully and thoroughly explored the Hersheys Mill spray irrigation system including its operating, maintenance, and capital budgets and its management system. While it might be desirable ten years hence to utilize any remaining capacity at this facility, it is the Township's position that this is a well-managed, well-operated facility which needs no Township interference at this point. In summary, the Township believes it has fully responded to the County Planning Commission comment.

5. PROOF OF PUBLIC NOTICE

Attached is a copy of the public notice originally advertised in the Chester County Daily Local news for public comment regarding this plan.

6. WRITTEN COMMENTS RECEIVED FROM COUNTY REVIEW AGENCIES AND ADJACENT MUNICIPALITIES

Attached hereto are each of the comments received from West Goshen Township, Willistown Township, Westtown Township, East Whiteland Township, the Chester County Health Department, and the Chester County Planning Commission. These letters are all attached in this section.

7. PROJECT IMPLEMENTATION SCHEDULE

The Township's project implementation schedule is appropriately covered in Sections 2.E and 2.F above.

8. PROJECT IMPLEMENTATION ORDINANCES

Attached following this page is the "Sewage Management Program Ordinance for East Goshen Township" adopted June 7, 1994.

9. REVIEW AGENCY RESPONSES

Attached hereto are the updated Chester County Health Department and the Chester County Planning Commission response letters regarding revisions and amendments to this Updated Act 537 Plan. (To be added when received.)

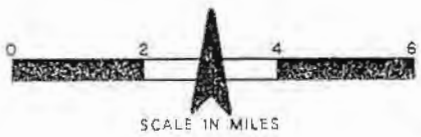
1.0 INTRODUCTION AND PHYSICAL DESCRIPTION OF PLANNING AREA AND DEMOGRAPHICS

1.1 Introduction and Political and Planning Area Boundaries

East Goshen Township has a long history of sewage facilities planning. At the time of publication of the Chester County Master Sewer Plan dated September 1970, as prepared by Roy F. Weston Environmental Scientists and Engineers, East Goshen Township was treated almost solely as a contributor to the West Goshen Regional Sewage Treatment Plant.

The County Sewer Master Plan reported in 1968 that 500 persons were being served by a private treatment facility which was in the process of being phased out with anticipated connections to the West Goshen STP. The County study further projected that by 1978, East Goshen Township would have 6,500 persons serviced by the West Goshen facility with an estimated flow of 650,000 gpd. The study further projected that by 1988 12,600 persons would be served requiring 1.26 MGD at the West Goshen facility. Ultimately, East Goshen Township received only 1.0 MGD in its agreement with West Goshen Township. The County study proposed to serve most areas within the Chester Creek Watershed by gravity connections and pumping to the West Goshen system. The study also showed a proposed 16-inch interceptor extending along Ridley Creek to a major pumping station located on Ridley Creek just below Strasburg Road and east of Dutton Mill Road with a force main extending back to Reservoir Road.

Appropriate references to East Goshen's sewage needs are contained on page 53 of the County study, and graphics depicting the service area are listed under the "West Chester Area Existing and Proposed Sewage Systems."



COWAMP/208 WATER QUALITY MANAGEMENT PLAN

The COWAMP/208 Regional Water Quality Management Plan was published by the Delaware Valley Regional Planning Commission on April 30, 1978. This regional study treated both East Goshen and West Goshen Townships as a part of the Delaware County Subbasin. Figure J18, as extracted from the COWAMP study shows four major areas of East Goshen Township with reported major areas of septic tank malfunctions and one area of surface water quality problems adjacent to Ridley Creek. This figure is reproduced on the following page for historical purposes.

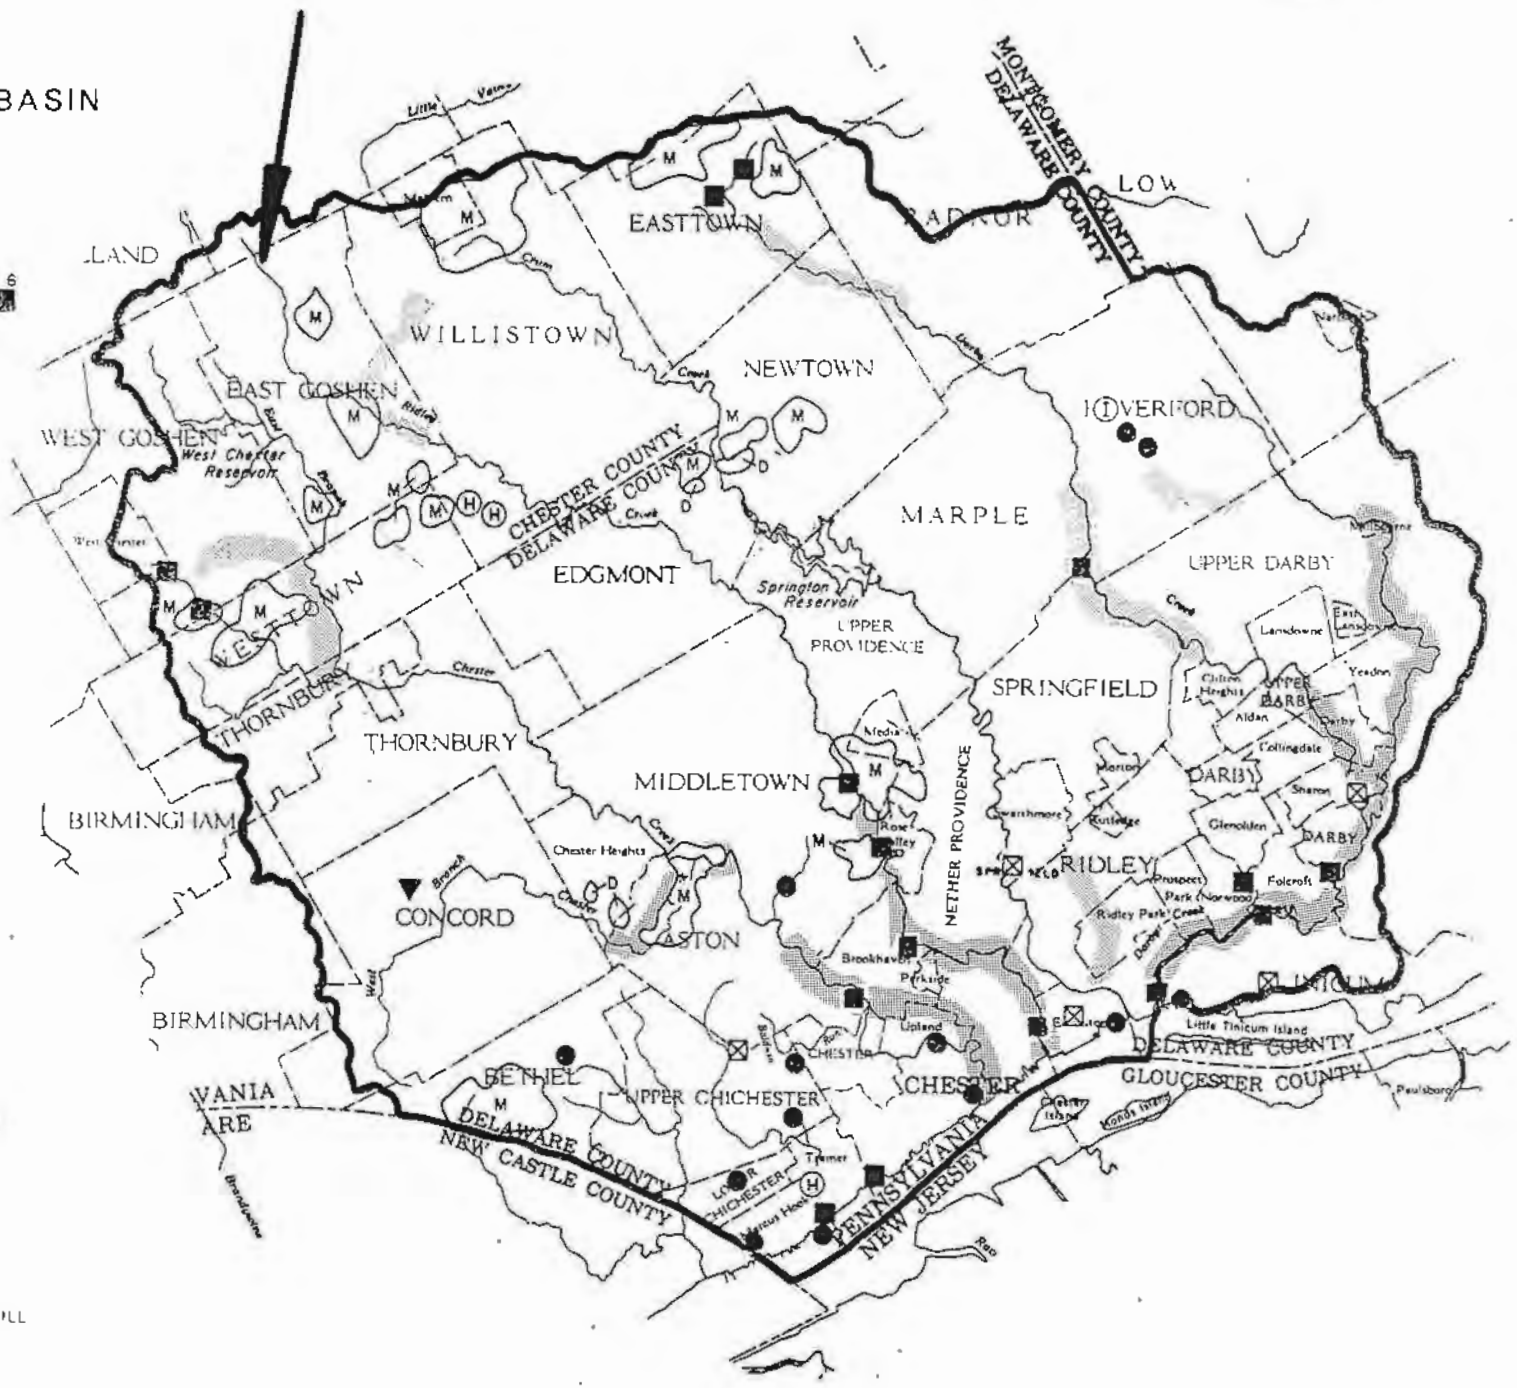


Figure J-18

DELAWARE COUNTY SUB-BASIN

SEPTEMBER, 1977

The only other relevant reference to East Goshen Township appears in Appendix Table D-2 which lists East Goshen Township as being a contributor to the West Goshen STP. There is no breakdown for the East Goshen contribution to the West Goshen system.

One other reference which appears on Appendix Table C-3 of the COWAMP study includes East Goshen Township as being a part of the 31,743 persons to be served by the West Goshen STP with a rated sewage flow of 4.045 MGD. In summary, the COWAMP/208 study did not specifically call out the water quality management needs for East Goshen Township.

1978 WASTEWATER FACILITY PLANNING STUDY

The first major effort at local wastewater planning was completed in 1978. The purpose of this study was to develop and initiate an environmental monitoring program within the Ridley Creek Watershed in anticipation of the design and construction of a Ridley Creek wastewater facility.

1981 REVISED SEWAGE FACILITIES PLAN FOR EAST GOSHEN TOWNSHIP

In March 1981, the Township published first a comprehensive major update of the Act 537 Plan which was prepared by Walter B. Satterthwaite Associates, Inc. The 1981 study followed closely on the heels of a study identified as the Ridley Creek Sewerage Study prepared by Yerkes Associates, Inc., in 1980. The Satterthwaite plan, which is cited frequently in this 1992 update, concentrated on a prime objective in developing and evaluating alternative wastewater treatment approaches for the Ridley Creek Watershed. The 1981 study concentrated on sewage service for the following areas:

- Ashbridge Firethorne Area
- Vista Farms
- Highland-Taylor Area
- Warrior-Raewyck Area
- Boot Road and Route 352
- Township Building and Elementary School
- New Kent Apartments
- Colonial and Cornwallis Drive Areas
- Meadowbrook Drive Area

The 1981 Act 537 Plan Update also contained extensive discussion of low pressure grinder pump installations. The primary areas resolved as a result of the 1981 update study included resolutions for the Ashbridge Firethorne area, the Vista Farms area, and the Elementary School property.

1985 ACT 537 REVISION

Another revision to the Township's Act 537 Plan was concluded in November 1985 as prepared by Yerkes Associates. This particular update noted that the Ridley Creek Treatment Plant was about to be placed on line in August 1985 and addressed the following subdivisions or facilities in the Township which were to be served by the new Ridley Creek system:

- Bow Tree Farms Subdivision - 460 single family units
- Smith-Kline-Beckman (now Beecham) - 40,000 gpd
- Vista Farms
- Ashbridge Firethorne Area
- Hunt Country Subdivision
- Albrecht Land (under study)
- Elementary School Site

The 1985 study also contained references to the following community on-site systems:

- Hersheys Mill Village
- Lockwood Chase Subdivision
- Fairway Village Subdivision
- The Willow Ponds Subdivision

The 1985 Act 537 Plan Update also discussed several miscellaneous sewage systems including the New Kent Apartments (90,000 gpd) and the Hersheys Mill Estates development comprising 143 units under construction. At the time of this report (November 1985), the Hersheys Mill Estates area was in the process of being connected to a new pump station and force main connected to the West Goshen system.

Attached following this page is an exhibit prepared by Yerkes Associates in July 1985 which summarized sewage facilities planning considerations through that data. This exhibit is also discussed in several sections of this Plan.

POLITICAL AND PLANNING AREA BOUNDARIES FOR THE 1992 ACT 537 PLAN UPDATE

Following this page is Exhibit 1 (which has been updated through February 1992) reflecting the political and planning area boundaries for areas discussed in this 1992 update of the Act 537 Plan. Sections 3.3 through 3.5 of this report discuss certain areas which are external to East Goshen Township and are discussed for possible inclusion for sewage treatment by East Goshen Township at the Ridley Creek Treatment Plant. These additional facilities are located on the periphery of the East Goshen Municipal boundaries. This plan update discusses expansion of the Ridley Creek Treatment Plant and other

alternatives to accommodate new Township growth and existing problem areas located on the periphery of the Township boundaries.

For example, consideration is being given for the possible inclusion of sewage flow from the Bryn Mawr Rehabilitation Hospital located in Willistown Township. Other external facilities located in East Whiteland Township, which are being considered under this plan, include the William Henry Apartments and portions of the Immaculata College Complex.

1.2 Physical Characteristics of Planning Area

East Goshen Township, in late 1992, is approaching the point wherein reasonably accurate build-out forecasts can be made. A new updated Comprehensive Plan for the Township was adopted in October 1992 and reflects in Appendix Table A-1 that 67 percent of the land area within the Township is developed, another 12 percent is committed for development, and only 21 percent of the remaining area of the Township (1,321 acres) remains for future development. More than half of this remaining undeveloped 1,321 acres is expected to be developed during the time frame of this Act 537 Plan Update (1993 to 2002).

Two of the exhibits contained in the preceding section clearly identify the physical characteristics of the planning area comprising all of East Goshen Township. First, the 1985 exhibit prepared by Yerkes Associates clearly shows how the Township is divided into the Chester Creek Watershed and the Ridley Creek Watershed including the respective streams and natural conveyance channels. The 1992 updated development plan for the Township also contained in Section 1.1 shows the extent of development through early 1992. In addition, the Natural Areas and Constraints to Development Exhibit published as page 26 of the new 1992 Comprehensive Plan clearly depicts all remaining areas of the Township which are subject to major development constraints including floodplain areas, areas containing alluvial soils, the areas of the Township which are subject to steep slopes, and the major woodlands.

There are two water bodies located within the Township, including the Township owned Reservoir Road recreation facility comprising approximately seven acres. This facility is located south of Strasburg Road and north of West Chester Pike and is not impacted in any way by this Act 537 Plan Update. The other former water body (now drained) is located on the Grace Estate property and is situated north of Strasburg Road and west of Line Road. There are other smaller water bodies within the Township including farm ponds and small privately-owned ponds similar to the facility owned by the Charter Chase community located west of Waterford Road and to the west of Wexford Circle.

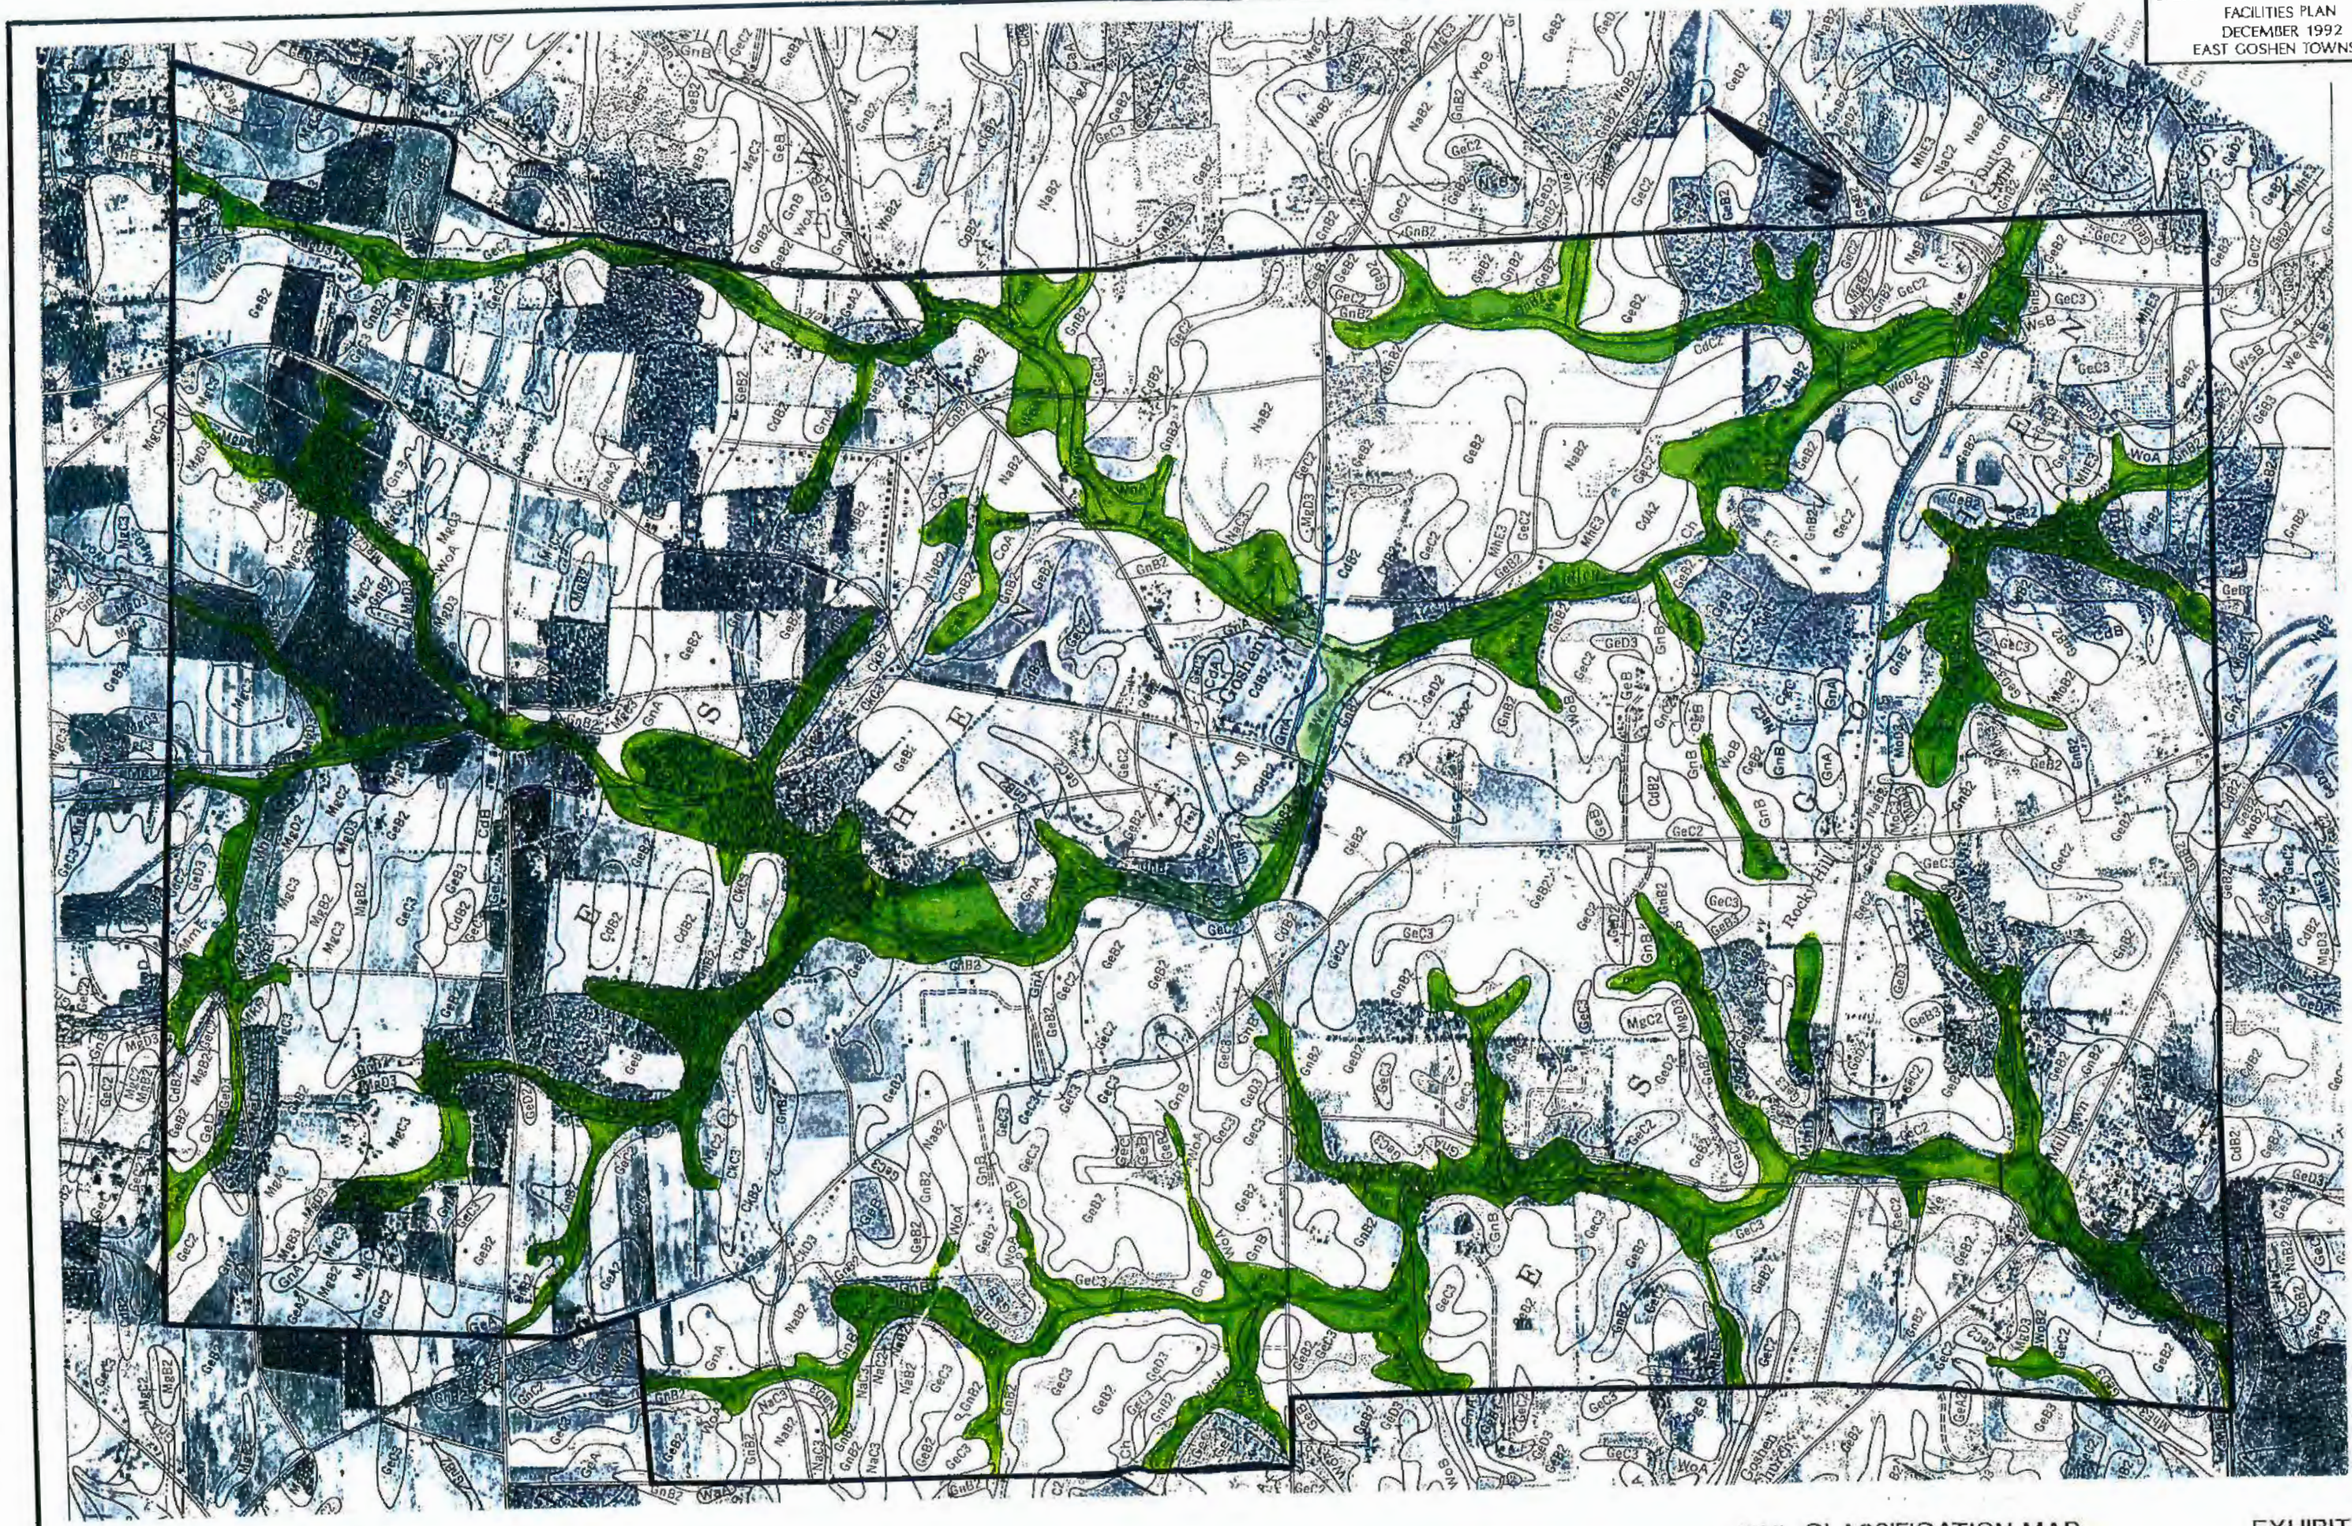
None of the farm pond and privately owned water facilities will be impacted by this Act 537 Plan Update.

These physical characteristics are all acknowledged in the new 1992 Comprehensive Plan which serves as the basis for regulatory controls adopted in the Township Zoning Ordinance and the Township Subdivision and Land Development Ordinance. It is estimated that 35 percent of the remaining undeveloped land in the Township (1,321 acres) will be subject to such natural constraints as floodplains, wetlands, areas containing alluvial soils or soils with high seasonal ground water, and areas of steep slopes. Thus, it is estimated that of the remaining undeveloped ground within the Township only about 860 acres will be subject to any form of new development as controlled by present zoning.

1.3 Description of Geology and Soils Within the Planning Area

The March 1, 1981 Act 537 Plan Revision contained an excellent description of the Township geology and the Township soils characteristics. This information prepared by Satterthwaite Associates is still relevant and is incorporated herein. In addition, Exhibit 2 depicting the detailed soils classification for the entire Township has been prepared and incorporated on the following page. The following descriptions of the existing geology and existing soils are credited to Walter B. Satterthwaite Associates.



TOWNSHIP GEOLOGY

East Goshen Township is underlain by a series of igneous and metamorphic rocks which are pre-existing rocks (sedimentary and igneous) which have been altered by exposure to intense heat and pressure. Igneous rocks are formed under high temperature and pressure in a molten or partially molten state. All of these rocks have been deeply weathered and dissected by streams to form a generally rolling topography.

There are five different rock formations in the Township: Gabbro, Gabbroic Gneiss, Serpentine, Peters Creek Schist, and the Wissahickon Schist. There is also a small area consisting of Matadiabase/Pegmatite dike within the Township.

Most of the southern portion of the Township is underlain by gabbroic gneiss and gabbro. Gabbro is a medium grained igneous rock with a high percentage of dark minerals giving the stone an overall gray to black color. Gabbroic gneiss is distinctly marked by alternating light and dark bands. This formation covers the entire width of the Township and extends northward to a point above Cornwallis Drive where a discontinuous band of

UPDATED ACT 537 WASTEWATER
FACILITIES PLAN
DECEMBER 1992
EAST GOSHEN TOWNSHIP

HYDRIC SOILS

SOIL CLASSIFICATION MAP

EXHIBIT 2

Serpentine rock crosses the length of the Township in an east-west direction.

Serpentine is a fibrous to massive magnesium rich igneous rock. This rock is easily identified by its dark to light green color. This formation has been intruded along a fault trending in the same direction across the Township, and occurs as ridges which form minor topographic highs. Associated with the Serpentine formation are two dikes or intrusive layers of rock. One dike is pegmatite, the other a metadiabase. In the Township, these dikes are very narrow and of limited length.

Extending northward above the Serpentine ridge is a metamorphic series of rocks consisting of two phases of the Wissahickon schist. The mica phase occupies the area just north of the Serpentine ridge and is comprised of schist and gneiss of bluish-gray to gray color. A schist is a well-foliated metamorphic rock with visible mica (muscovite), a thin clear shiny sheet-like mineral.

The second phase of the Wissahickon formation, the chlorite phase, occupies the very northern and northwest corners of the Township. The chlorite phase, containing phyllite and schist, appears as a bluish or greenish gray rock with a satiny luster produced by the minerals chlorite and mica.

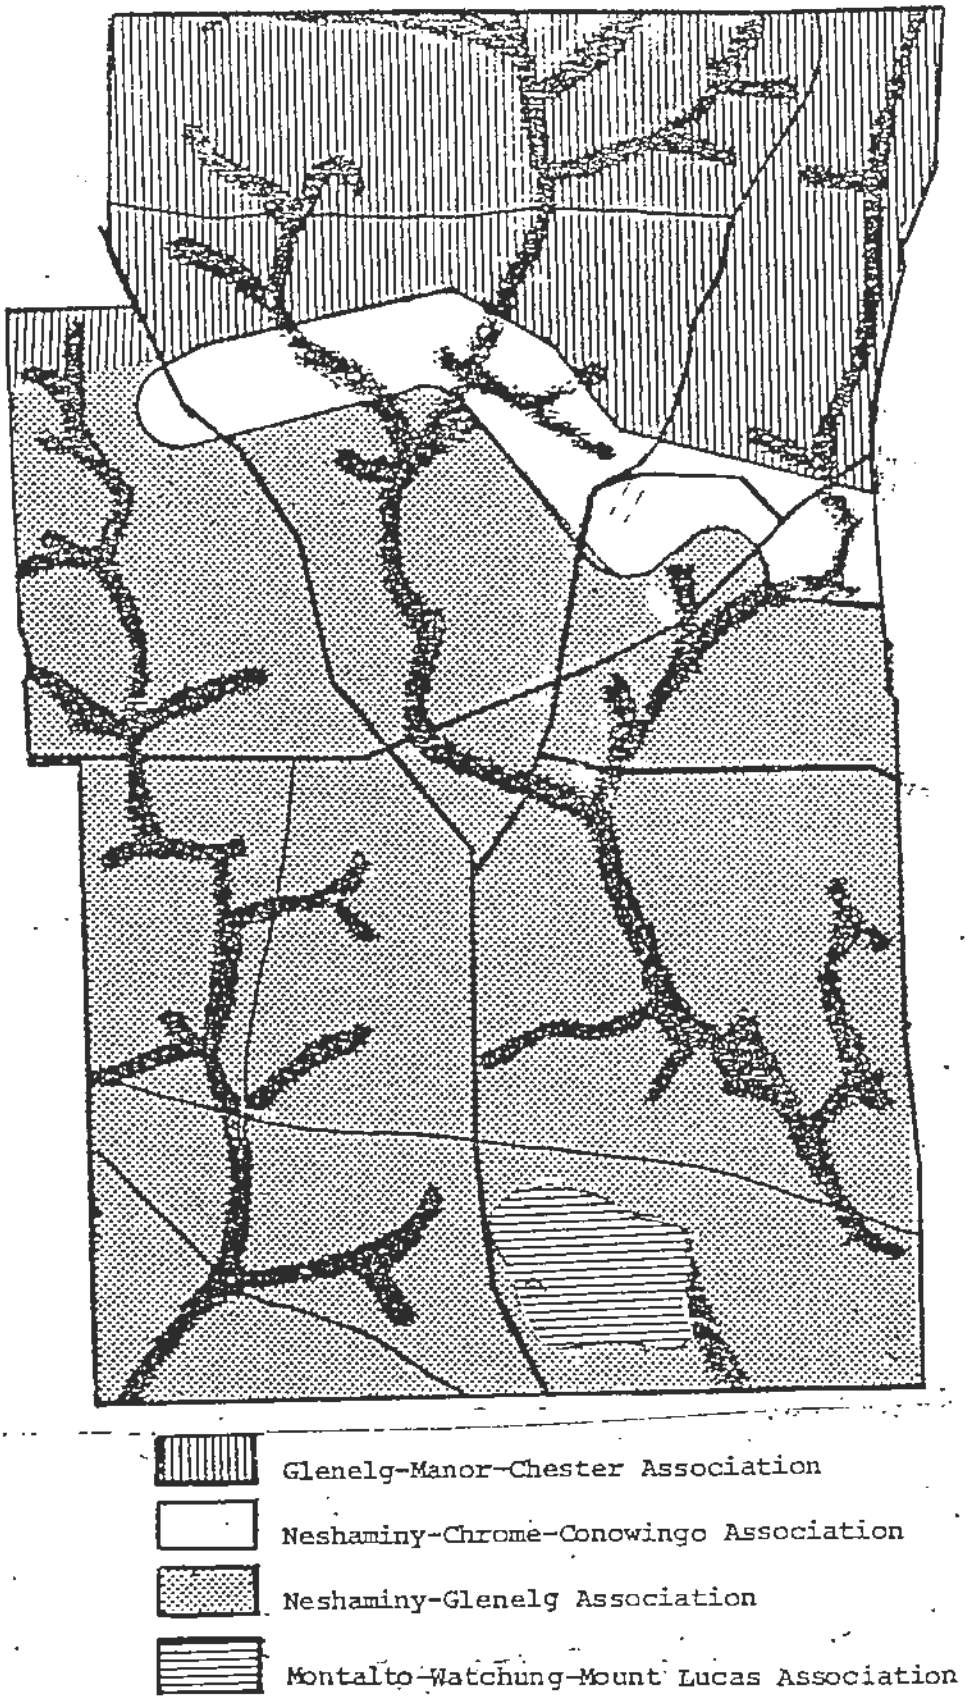
The rocks in the Township have been deeply weathered and altered from their original character. Although the structural geology of the Township is complex, there are several important factors that should be reviewed. The major bedding planes and foliations are oriented in an east-west to northeast-southwest direction. While major joint sets are oriented in the same direction as bedding and/or foliation, a secondary joint set extends nearly perpendicular to bedding. These joints (secondary openings) dip at nearly vertical angles extending to the base of the weathered zone. Each of the rock types are structural conditions resulting in a variable surface expression which can be observed in East Goshen Township.

Soils in East Goshen Township

While many soil series exist in nature, the rates and patterns of soil development are all dependent on a number of interrelated factors which include parent materials, climate, organisms/vegetation, and relief.

The mineralogical composition of the soil profiles or its soil texture is directly related to the parent material that underlies the soil, as well as how easily this material weathers or breaks down. For example, in East Goshen Township the unaltered igneous rocks of gabbro, quartz, and serpentine weather down to form silt loams and silty clay loams. The metamorphoses

rocks consisting mostly of schist and gneiss, form thick silt loam profiles, usually five to ten feet or greater. Finally, the materials laid down along streams are geologically recent alluvial deposits. They are usually deep soils that show very little profile development.



An influential factor regarding soil development is climate. Chester County has a humid temperature climate with an average annual temperature of 50°F and 46 inches of precipitation. Soils in this area are generally moist with seasonal variations. Temperature and precipitation have the ability to alter the physical and chemical weathering processes of the parent materials. The accumulation of organic matter also is affected by climate. Where low temperatures and high moisture percentage occur, the organic matter content is increased. As an example, soils formed under a forest cover have a more defined horizon development than soils formed under a grass cover. Also, they have only half as much organic matter content, are more acidic, and have more downward movement of clay particles.

The relief of slope of the land governs the direction and rate of water moving through the soil profile. This, in turn, affects soil drainage characteristics, soil weathering, soil depth, and a leaching of soil minerals.

In East Goshen Township, the soils on gentle slopes are considered to be mature and old because of their stabilized state, thick organic layer, and heavy clay movement down through the profile. In contrast, the floodplain soils and soils located on steep slopes are considered young because they have not yet developed well-drained profiles.

The above factors interact in varying degrees to produce different soils with different final characteristics. The present soil conditions have been summarized on Figure 2.

To identify the soils in any area, a soil association map is generally used as a preliminary guide. A soil association represents a grouping of a few major soils found in particular locations and is then named after the most prevalent soil series. The soils in an association are generally weathered from the same type of underlying materials, and therefore, their soil textures may be similar due to their characteristics concerning depth, stoniness, and natural drainage. The soils found in East Goshen Township can be classified into four soil associations: 70 percent as Neshaminy-Glenelg Association, 25 percent as Glenelg-Manor-Chester Association, and 5 percent as the Neshaminy-Chrome-Conowingo Association, and Montaldo-Watshung-Mount Lucas Association combined (see Figure 2).

Manor (Loam)	Baltimore Gneiss	5'+	2' - 7'	Well Suited
Neshaminy (Gravelly Silt Loam)	Baltimore Gneiss	5'+	4' - 6'	Well Suited
Wehadkee (Silt Loam)	Upland Alluvium	0' - 1'	5' - 8'	High Water Table
Worsham (Silt Loam)	Baltimore Gneiss Wissahickon Schist	0' - 1'	3' - 5'	Slow Permeabil-ity & Seasonal Water Table
Montalto (Channery Silt Loam)	Triassic Diabase	5'+	3' - 5'	Slow Permeability

Neshaminy-Glenelg Association. The Neshaminy-Glenelg Association includes soils that are deep to moderately deep, moderately permeable, well-drained, and located on gentle to steep slopes. The Neshaminy soils developed mainly from weathered Gabbro and Granodiorite. The presence of igneous rock produces a bright reddish coloration in the subsurface horizons.

Also included in this association are the Glenville, Worsham, Chewacla, and the Wehadkee soils. The Glenville and Worsham soils are developed mainly from granite,schist, and gneiss. They are deep, moderately well-drained and poorly-drained, respectively. These soils occur in low-lying areas, in depressions, and at the bases of slopes. The Worsham can also be found in seepy areas and along streams. The Chewacla and Wehadkee are also floodplain soils developed in alluvium materials from upland soils. The Chewacla are deep soils, moderately permeable, and moderately well-drained. Mottling typically occurs between 12 and 30 inches from the surface. The Wehadkee are poorly-drained soils, and their surface layer is dark and mottled.

Glenelg-Manor-Chester Association. The principal soils in the association are the Glenelg, Manor, Chester, Brandywine, Worsham, and Glenville. There are also less extensive areas which include the Wehadkee, Chewacla, and Congaree floodplain soils. This association basically consists of soils that are moderately deep to deep, are well-drained, and have developed from weathered igneous bedrock of schist and gneiss.

The Glenelg soils are moderately deep, moderately permeable upland soils. The Glenelg soils are similar to Chester soils, but are more shallow with generally shallow depths to rock. The Chester soils are usually deep, well-drained and shallow soils. They are generally located on hilly or steep areas with 15-20% slopes. The slope and porous structure causes the soils to have moderately rapid permeability and become droughty.

The Worsham and Glenville soils are deep, and poorly-drained and moderately-drained, respectively. These soils generally occur in low-lying areas, in depressions and at the base of slopes. The Worsham soils can be found in seepy areas and along streams.

The Congaree, Chewacla, and Wehadkee are all floodplain soils developed from upland alluvium materials. The Congaree soils have a thick silty surface horizon, and a deep profile that is well-drained and is moderately permeable. Mottling typically occurs between 30 and 60 inches below the surface, and these soils are occasionally flooded. The Chewacla are better drained, more permeable, and deeper than the Wehadkee with mottling 12 to 30 inches below the surface.

Neshaminy-Chrome-Conowingo Association. The Neshaminy-Chrome-Conowingo Association are soils developed mainly over formations of serpentine and from Gabbro and Granodiorite. These soils are predominantly located on moderate slopes, however, the Chroma soils have been found on very steep grades.

The Neshaminy soils are deep, well-drained, moderately permeable and their subsurface horizons are reddish colored from the weathered Gabbro. The Chrome soils range from shallow to moderately deep and are well-drained. They range from a dark, gravelly silty clay loam to a dark yellowish-brown clay. The soils are developed from acid rocks, and depth to bedrock is quite variable. The soils are free of mottling, but the heavy texture and shallow profile tend to restrict drainage. In the steep areas, the soils are severely eroded.

Similar to the Chrome soils, the Conowingo soils are developed in materials weathered from igneous rocks. Their profile ranges from deep to moderately deep, and they are moderately well-drained to somewhat poorly-drained soils. Typically, mottling occurs in the subsoil at about 15 to 25 inches from the surface.

Montaldo-Watshung-Mount Lucas Association. The soils in this association have been typically developed on igneous rocks. These soils are described as being deep, silty and channery soils as found in other part of Chester County. The Montaldo channery silt loams, however, which are found in the southern part of the Township, exhibit a severely eroded profile. This soil has lost nearly all of its original surface layers to the point where the underlying subsoil is now exposed. The silty clay loam subsoil contains more clay than the soils in the Neshaminy-Glenelg Association. (The presence of this soil in Ashbridge-Firethorne area explains the unusually high failure of onlot systems within this area which resulted in the provision of public sewers for the homes in this vicinity in 1986.)

Soils Renovation Ability

The effective operation of a subsurface sewage disposal system is dependent on proper installation, site selection, and more specifically, on good soil characteristics. The criteria used to judge the suitability of a site includes the size of the area, the slope, the soil properties and soil depth, permeability. texture and structure. A verification of these soil properties is necessary to insure the satisfactory renovation of the sewage effluent physically, chemically and biologically, and to prevent the hazards of system malfunction or ground water contamination.

Soil permeability affects the rate of water movement through the soil. The factors that affect permeability are soil texture and structure.

Soil texture factors include the mineralogical composition and physical size distribution of sand, silt or clay-sized particles. A soil with a high percentage of coarse sands is rapidly permeable, so that water drains quickly through the profile. Conversely, if the soil has a high percentage of clay, the water becomes perched in the soil at shallow depths. In an on-site disposal system, such soils may result in surface outbreaks around the system, causing the disposal area to be saturated and marshy.

The physical renovation of sewage optionally occurs in a soil with moderate depth and permeability as well as gently sloped. The ability to chemically renovate sewage is dependent on soils with a proper clay content in as much as the clay particles will attract and react with the chemicals in the effluent to cleanse it. The majority of biological renovation is performed by the organic matter and by the micro-organisms that occur in the top 18 inches of the soil.

Suitable Soils in East Goshen Township

The soils in East Goshen Township that meet all of the criteria to suitably renovate sewage include the following series: Chester, Glenelg, Manor, and Neshaminy. Although there may be some exceptions due to specific site characteristics, for the most part, these soils have an appropriate depth, slope, permeability, texture, and structure, and are capable of supporting the physical, chemical, and biological activities that will insure the satisfactory renovation of sewage effluent.

In general, the majority of the upland soils in the northern portion of the Township are well suited to long-term use of on-site systems for single family units, community systems, and spray irrigation. To define feasibility of any site, a detailed evaluation is necessary since soils, slope, texture, and evidence of seasonal high water table are variable.

The area which is underlain by and/or adjoins the serpentine typically has shallow soil depths, tight rock and shallow water tables which make it unsuitable for on-site disposal options. The southern area of the Township displays a much more varied soils sequence which is often characterized by heavier soils, shallow depth to mottling and water table. It is recommended that all future investigations to define soil suitability for on-site disposal must be more carefully evaluated since the soils exhibit this degree of variability.

1.4 Existing and Projected Population Data

East Goshen Township has grown from a population of 1,039 persons in 1950 to 15,138 persons in 1990 according to the US Census results. The growth since 1970 has averaged a 5,000-person increase during each of the 10-year periods. The Township adopted a new Comprehensive Plan in October 1992, which contains all relevant data regarding historical population growth and projected ultimate population at the time of build-out for all uncommitted land development as of 1992. Table 1.1 depicts the Population Change between 1950 and 1990. Table 1.2, Population Characteristics, depicts all relevant factors in the population characteristics as measured between 1980 and 1990.

Table 1.1

TABLE 1.2

Based on the 1990 population of 15,138 persons, the 1992 Township Comprehensive Plan projects further population growth which should reach an ultimate projected population of 21,434 persons. This would include projected and estimated growth for uncommitted land, land currently under construction, and committed population in approved subdivisions but not yet under construction. These figures are shown in Table 1.3.

Table 1.3

ESTIMATE OF ULTIMATE POPULATION

CATEGORY	POPULATION	% OF ULTIMATE POPULATION
1980 Population	10,021	
Population increase - 1980 to 1990	5,117	
1990 POPULATION	15,138	71%
Estimated Population in Committed Residential Developments But Not Under Construction	576	3%
Estimated Population of Residential Developments Under Construction	1,101	5%
Estimated Population on Uncommitted Land	4,619	21%
PROJECTED ULTIMATE POPULATION	21,434	100%

The 1992 Comprehensive Plan also notes that if East Goshen Township continues to grow at the same rate as measured between 1979 and 1990, then population build-out could occur within approximately nine years or the year 2001.

1.5 Wetlands Identification

Enclosed in Section 1.3 is Exhibit 2 which is taken directly from the Chester County Soils Map for East Goshen Township and shows separately the hydric soils. The hydric soils are identified on Exhibit 2 as follows:

- CH - Chewacla silt loam
- CAA & CAB - Calvert silt loam
- GNA & GNB - Glenville silt loam

- WE - Wehadkee silt loam
- WOA & WOB - Worsham silt loam

As a part of the routine Township planning process, all wetlands must be delineated and shown on any land development plan and/or subdivision plan submitted to East Goshen Township. Wetlands must be excluded from development unless permits are obtained under the joint permit process administered by PaDER. There are exceptions which may be permitted for utility crossings, minor road crossings, and for wetlands intrusions for which mitigation plans are submitted and approved by permit. Generally, intrusion into wetlands, other than as permitted by law, is not expected to be a major problem within East Goshen Township.

1.6 Public Water Services and Other Potable Water Supplies

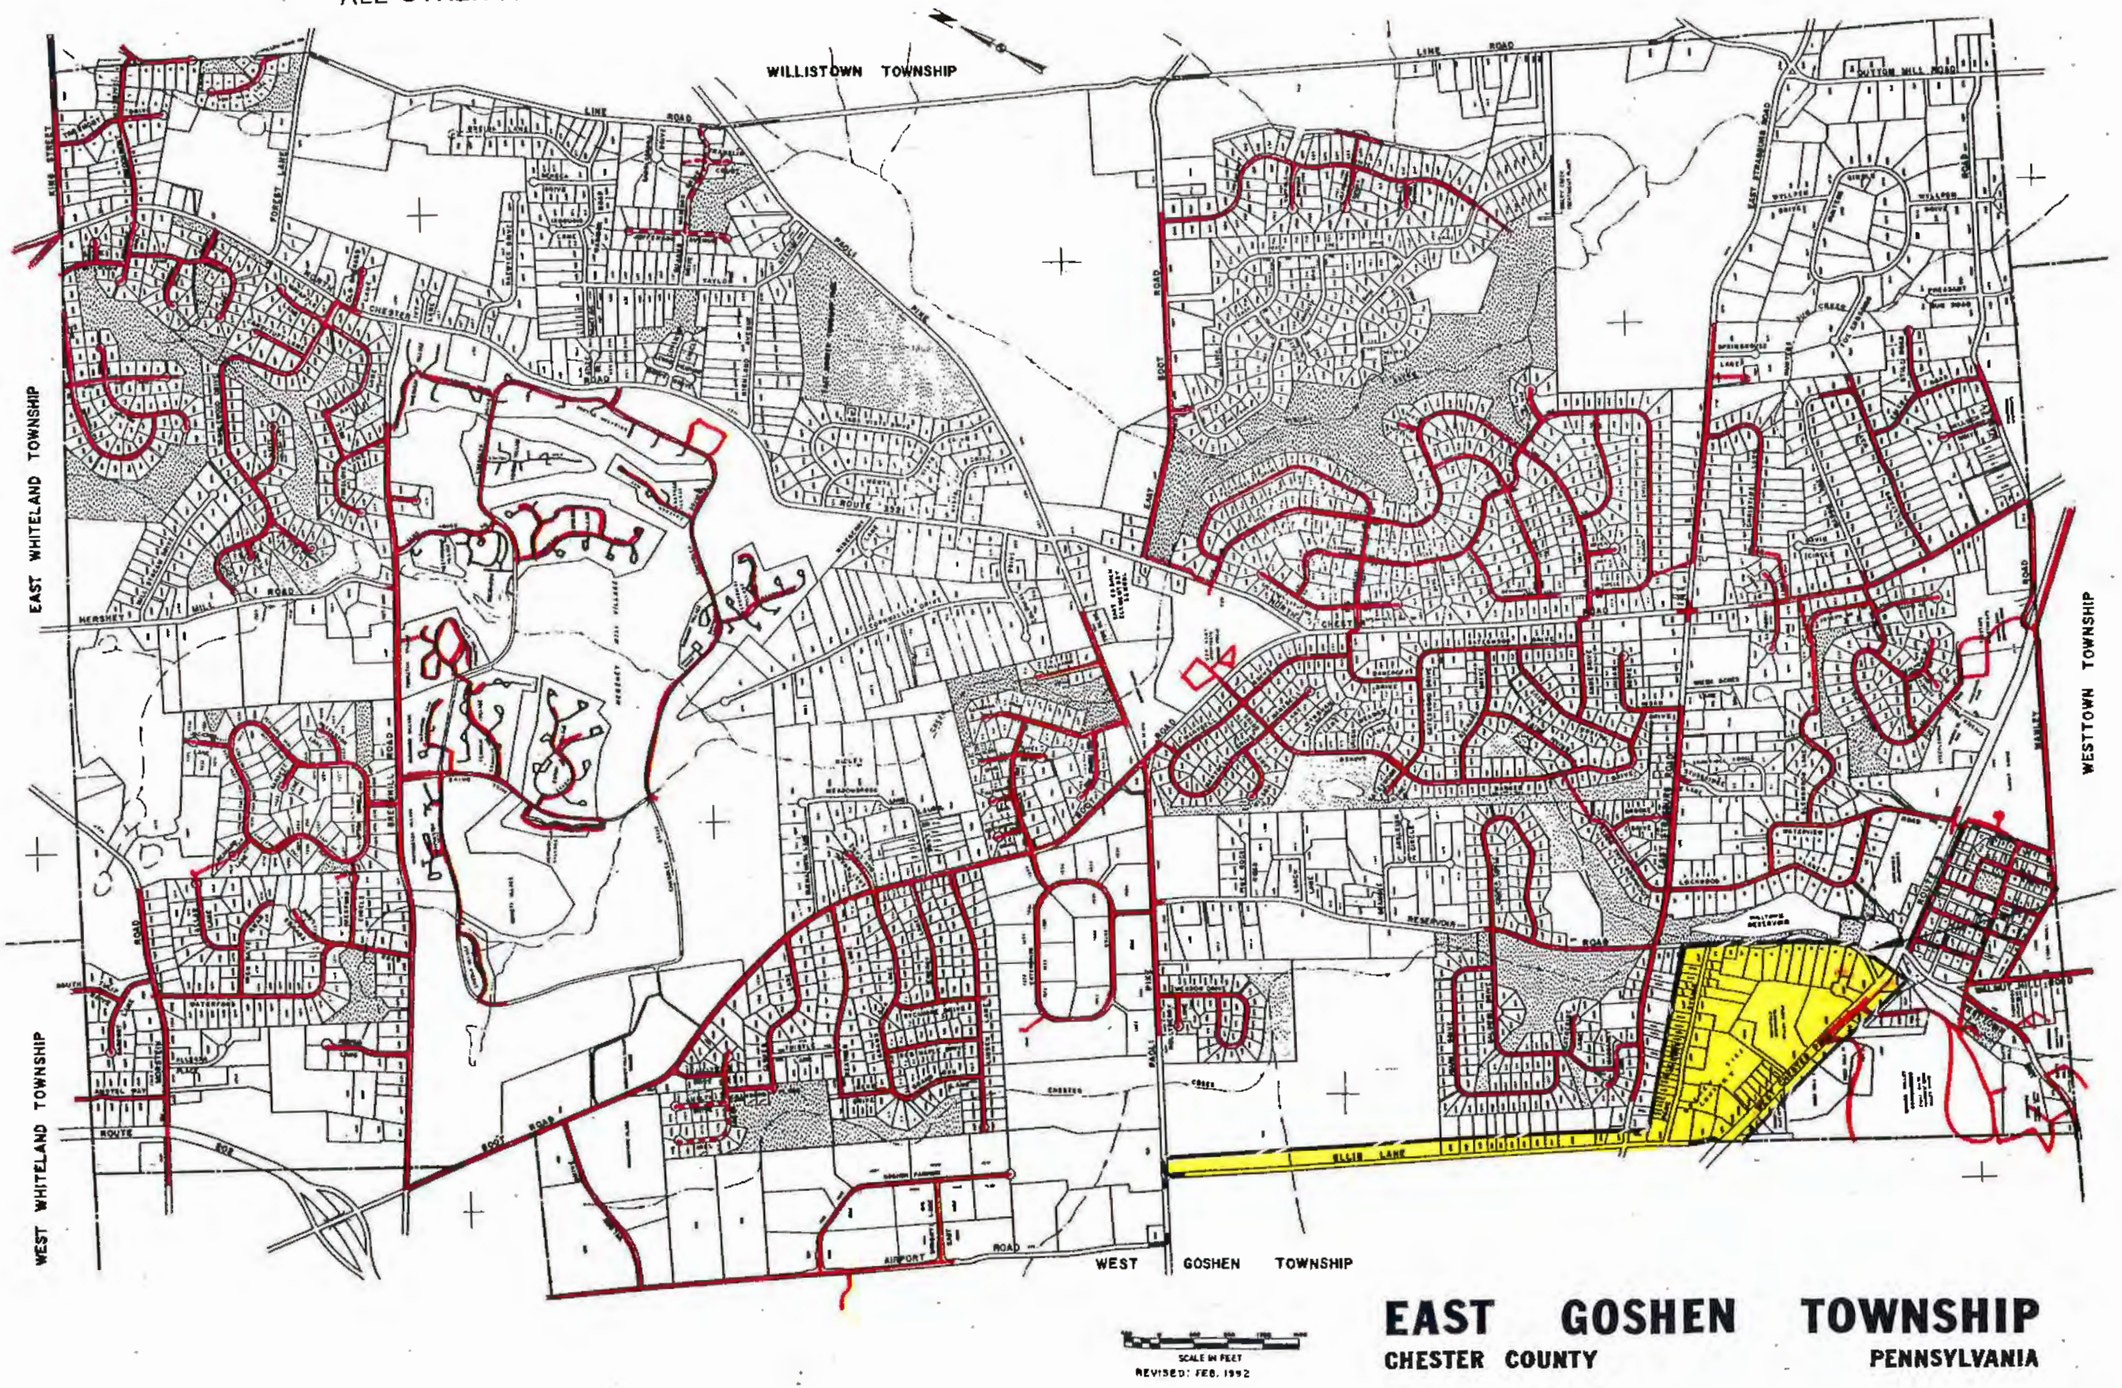
Exhibit 3 depicts areas located within East Goshen Township which are provided with public water service by the West Chester Area Municipal Authority and by the Philadelphia Suburban Water Company. Table 1.4 incorporates an estimate of the number of customers or connections served by the WCAMA and the Philadelphia Suburban Water Company. However, the two public water companies or authorities could not provide an accurate estimate of the number of EDUs served or the specific number of residential units for which public water is provided. (The estimated range was 95 to 89 percent residential units as being customers.)

The balance of potable water utilized within East Goshen Township is provided by private wells. The general quality of ground water resources serving private dwellings, commerce and industry is excellent within East Goshen Township. A complete summary of the ground water resources of East Goshen Township is already documented on pages 23 to 26 of the 1981 Act 537 Plan Update prepared by Walter B. Satterthwaite Associates and has not changed substantially since 1981.

It is expected that Philadelphia Suburban Water Company will gradually expand its public water service similar to expansions which have occurred since 1980.

TABLE 1.4

PUBLIC WATER SERVICE - 1992



West Chester Area Municipal Authority	40 customers
Philadelphia Suburban Water Company	2,300 customers

The West Chester Area Municipal Authority expects to extend service along Park Avenue beyond the Goshen Fire Company building in 1993-1994.

The PSWCO does not have an available forecast for the precise number of new connections to be made during each of the five-year planning cycles covered by this Act 537 Plan Update. However, it is expected that all new residential units constructed after 1992 will be provided with public water service.

2.0 EVALUATION OF EXISTING SEWAGE TREATMENT FACILITIES/SYSTEMS

2.1 Evaluation of Ridley Creek Wastewater Treatment Facility

The need for a sewage treatment facility located along Ridley Creek within East Goshen Township was first discussed in the mid-1960s with serious planning efforts made during the 1970s. During 1978, an update of the Township's Act 537 Plan studied the environmental concerns along Ridley Creek.

The first site chosen for the location of the Ridley Creek STP was located on the Grace Estate property just north of Strasburg Road and along the stream valley. The initial application for capacity for the Ridley Creek STP was 1.2 MGD. Challenges to the location and proposed capacity of this STP eventually led to relocation just north of the Grace Estate property to a site within the Bow Tree Development. The design capacity for the STP was also scaled back from 1.2 MGD to 0.4 MGD although portions of the STP were initially designed to handle up to 0.7 MGD

The treatment plant was designed during 1983-1984 and was built in 1984-1985 with the first units going on-line during 1985.

The Township and the Municipal Authority participated heavily in the design, construction, and inspection of the new Ridley Creek STP which was offered to East Goshen Township as its first public wastewater treatment facility. The STP was dedicated to and accepted by East Goshen Township during 1990. The Township and its Municipal Authority have operated the facility since that date. Many of the initial properties considered for connection to the STP have been designed and constructed. The Bow Tree Farms development has 338 EDUs connected to the STP with guaranteed or committed future EDU connections totalling 166. Another initial participant in the reduced 0.4 MGD STP plant construction was SmithKline Beecham with direct connection rights totalling 40,000 GPD and an option to purchase an additional 12,000 GPD within the remaining capacity of the plant (the option has now expired).

The various developments which were connected by 1992 and those for which commitments were made by the Township for connection to the Ridley Creek STP appear in Table 2.1.

Table 2.1 shows that the Ridley Creek STP (up to October 1992) had a hydraulic flow loading of 333,127 GPD in theoretical sewage flow. However, the average 1992 plant flow of 230,475 GPD (through October 1992) shows that only 69.19 percent of the theoretical flow actually reaches the treatment facility. In

TABLE 2.1

COMMITTED AND ON-LINE SEWAGE FLOWS TO
RIDLEY CREEK SEWAGE PLANT
AS OF OCTOBER 28, 1992

Area to be Served	GPD On-Line	GPD Committed Or In Progress
Bow Tree Farms	115,500	52,200*

Philadelphia Suburban Water Company	157	0
New Kent Apartment Complex	84,420	0
Totals	333,127	160,900

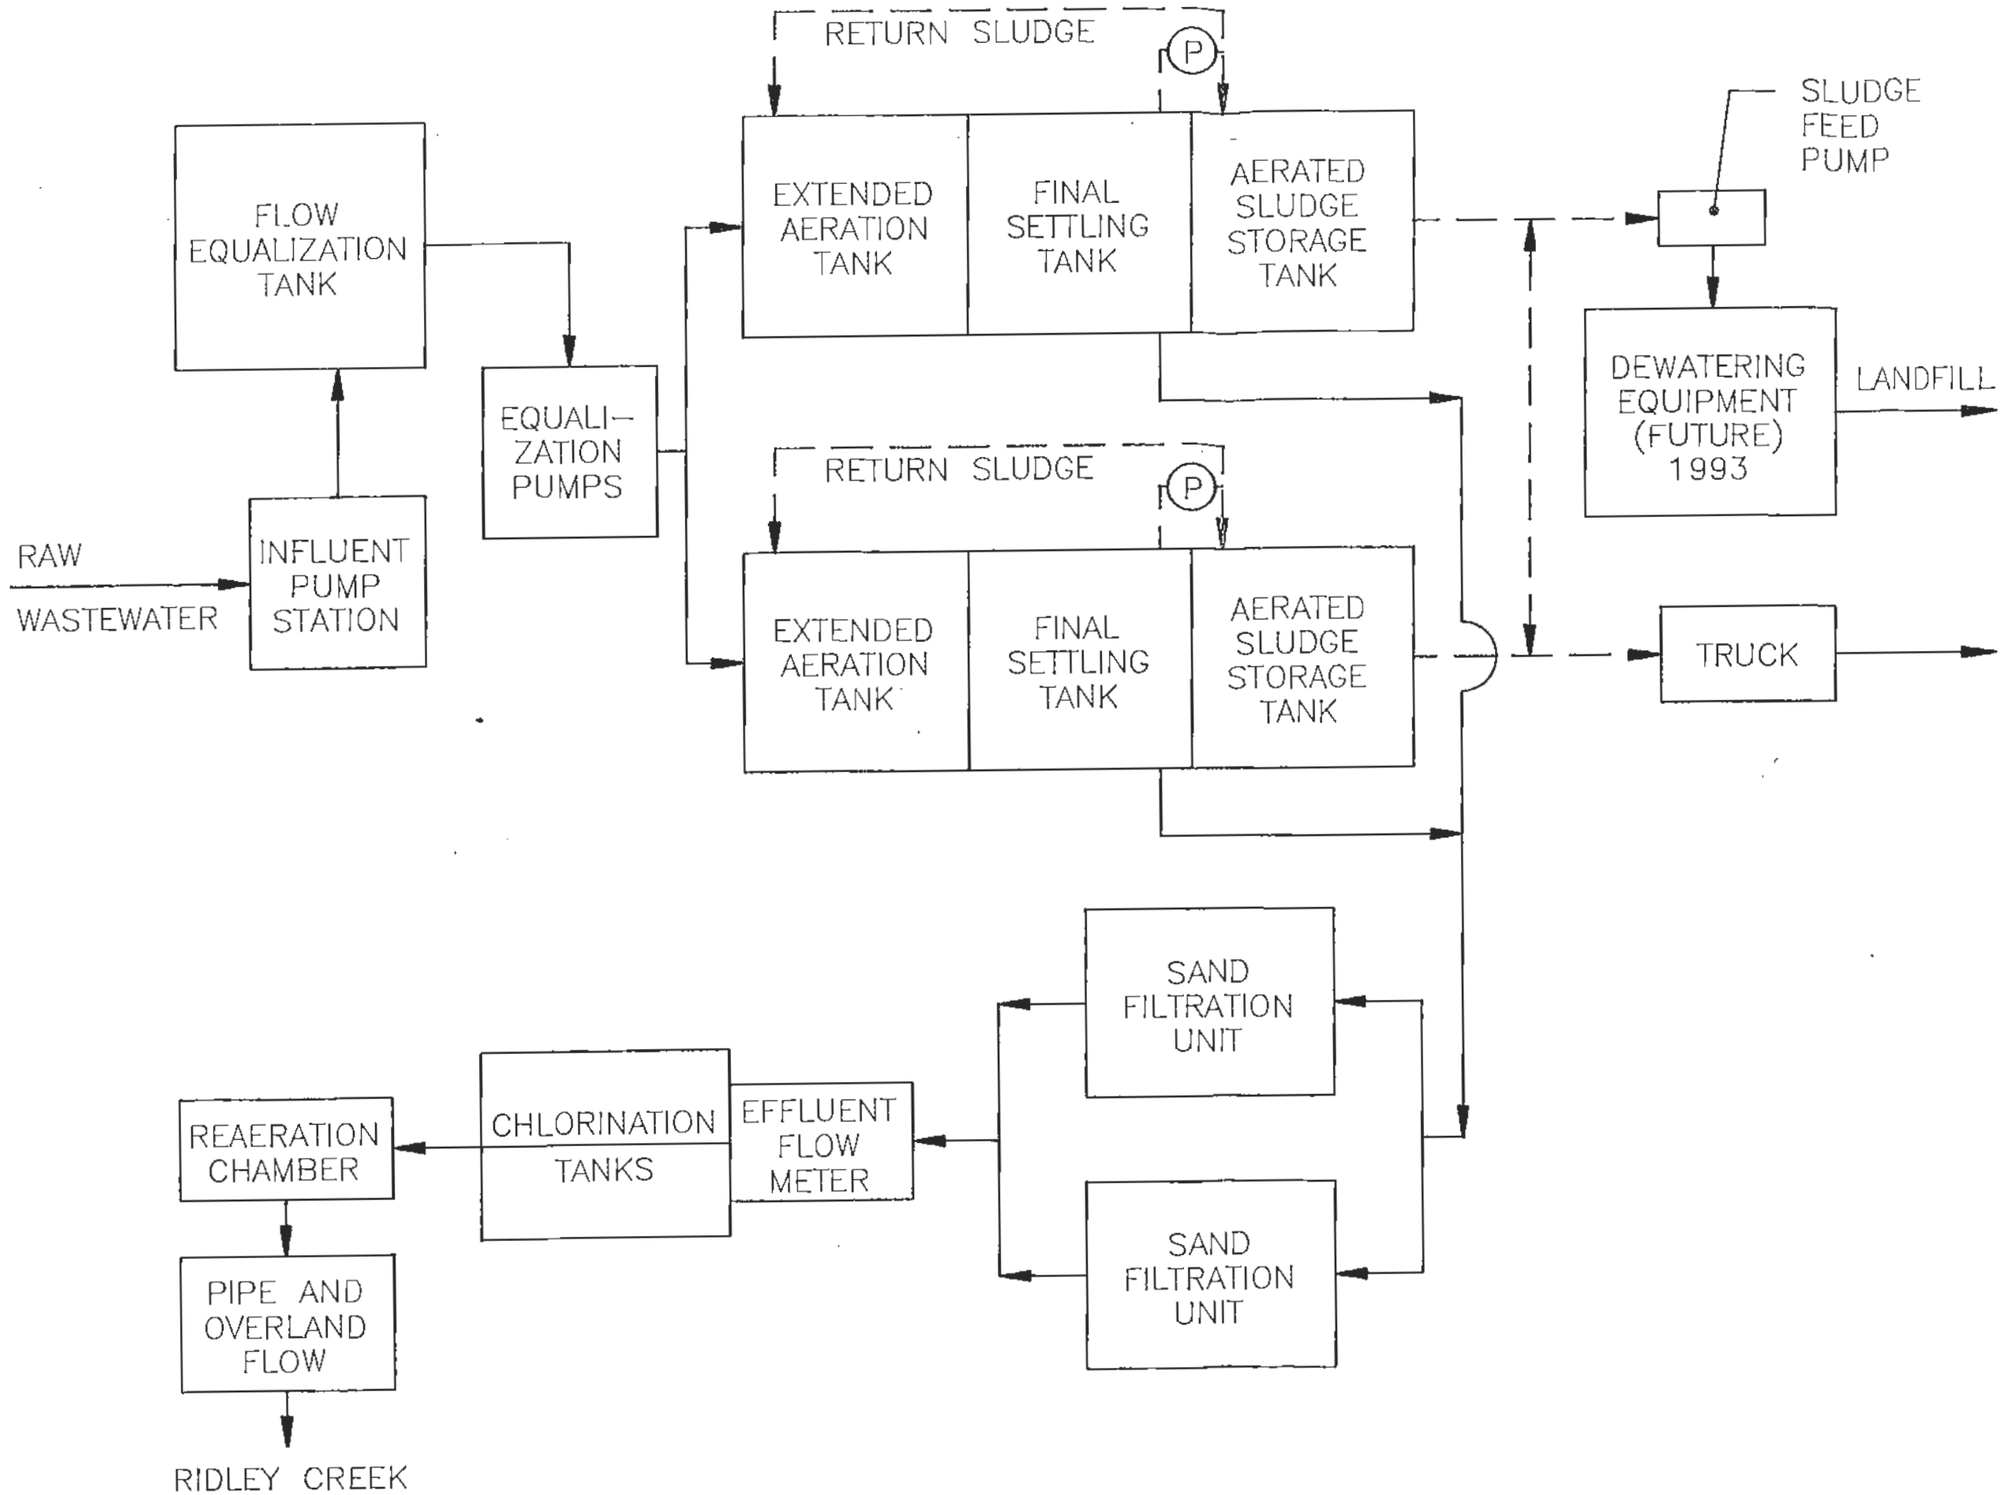
Note: Average 1992 (to October) Plant flow = 230,475 GPD which equals 69.19% of theoretical EDU flow

Note: * = Committed and paid for

Note (1)= SKB also has an option to purchase an additional 12,000 GPD (now expired).

Factors used: SFD = 350 GPD/unit and Apt. (apartment) = 200 GPD/unit.

addition to the theoretical gallons per day actually on line, the Township has made commitments as depicted in Table 2.1 for an additional 160,900 GPD (theoretical flow) which would bring the total sewage flow at the STP to 494,027 GPD (351,113 GPD actual flow) when these committed connections are made. The actual flow is substantially below the 0.4 MGD reflected on the PaDER permit for this facility. If the New Kent Apartment Complex is shifted to Chester Creek, the above figures are reduced by 84,420 gpd.



Wastewater Treatment Facility

The treatment plant site is located below the Bow Tree Subdivision, Section IV, and primarily provides capacity for developments located within the Ridley Creek drainage area. The treatment plant is nominally designed to handle 400,000 gallons per day (gpd) and discharges to Ridley Creek. It is currently operated under an NPDES permit which expires in October 1995.

The treatment plant is an extended aeration system followed by filtration, chlorination, and reaeration prior to discharge to the Ridley Creek. A schematic flow diagram of the facility is enclosed as Figure 2-1. The facility consists of an influent pumping station pumping with flow directed to a flow equalization tank (120,000 gallons) which is then pumped to two packaged-steel (DAVCO) aeration systems each having 250,000 gallons of aeration capacity. This is followed by clarification with each unit having a 25,000-gallon aerated storage tank with the effluent from the clarifiers going through two sand filtration units rated at two gallons per square foot per day. This is followed by chlorination, reaeration, and discharge. The treated wastewater discharges via header pipes into a wetland for overland flow prior to discharge to the creek.

The sludge is currently trucked off site. In 1993, dewatering equipment (a belt filter press) is scheduled to be installed which will permit the future option of land application or landfill disposal. The Authority has requested a long-term commitment from the Chester County Solid Waste Authority for dewatered sludge disposal at the Lanchester Landfill.

The treatment plant discharge criteria are enclosed as Figure 2-2, which is a copy of the Part A, NPDES permit for this facility. Effluent standards differ dependent upon the period of the year. From May 1 to October 31, the $CBOD_5$ monthly average is 10 mg/l in conjunction with 30 mg/l suspended solids, and 4 mg/l of ammonia as nitrogen. In the winter months (November 1 through April 30), the $CBOD_5$ is 20 mg/l with suspended solids of 30 mg/l, and ammonia at 12 mg/l.

I. EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS FOR DISCHARGE 001; LOCATED AT LATITUDE 39°59'10", LONGITUDE 75°31'43"

A. During the period beginning at issuance and lasting through expiration, the Permittee is authorized to discharge.
B. The average monthly flow of effluent discharged from the wastewater treatment facility shall not exceed 400,000 gallons per day.
C. The quality of effluent shall be limited at all times as specified in Footnote (3) and as follows:

DISCHARGE PARAMETER	DISCHARGE LIMITATIONS						MONITORING REQUIREMENTS		
	MASS UNITS (lbs/day)		CONCENTRATIONS (mg/l)						
	AVERAGE MONTHLY	AVERAGE WEEKLY	AVERAGE ANNUAL	AVERAGE MONTHLY	AVERAGE WEEKLY	INSTANTANEOUS MAXIMUM	MEASUREMENT FREQUENCY	SAMPLE TYPE	24 HOUR REPORT UNDER PART A.II.D
FLOW (MGD)							Continuous	Recorded	
CBOD-5 (5-1 to 10-31)	33	50		10	15	20	1/Week	24 HC	
CBOD-5 (11-1 to 4-30)	67	100		20	30	40	1/Week	24 HC	
SUSPENDED SOLIDS	100	150		30	45	60	1/Week	24 HC	
AMMONIA as N (5-1 to 10-31)	13	20		4	6	8	1/Week	24 HC	
AMMONIA as N (11-1 to 4-30)	40	60		12	18	24	1/Week	24 HC	
FECAL COLIFORM (5-1 to 9-30)			See Footnote (2)				1/Week	Grab	
FECAL COLIFORM (10-1 to 4-30)			Same Limits as in Footnote (2) for Period 5-1 to 9-30				1/Week	Grab	
DISSOLVED OXYGEN			Minimum of 5 mg/l at all times				Daily	Grab	
pH	Within limits of 6 to 9 Standard Units at all times						Daily	Grab	

FOOTNOTES: 1. Samples taken in compliance with the monitoring requirements specified above shall be taken at the following location(s):

(NPDW).4

BK 2232 PG 582

FIGURE 2.2

Presented in Table 2.2 is the average monthly flow to the treatment plant for the years 1988, 1989, 1990, through 1991. This table indicates that the flow to the treatment plant averages 220,000 gpd to 240,000 gpd, which is well below its hydraulic capability. Table 2.3 presents the influent BOD_5 and suspended solids averages for the years 1990 and 1991. Table 2.4 provides the effluent results for the period 1988 to September 1991. These results indicate that the treatment plant is providing a significantly higher degree of treatment with typical BODs being less than 5, suspended solids less than 5, and ammonia less than 1 mg/l.

The plant appears in excellent operating condition and, based upon the 1991 Chapter 94 Report, is not anticipated to reach capacity until the mid to late 1990s. The plant has experienced only two minor violations over the last several years related to electrical malfunctions of the equalization tank and transfer pumps. According to modifications made, this problem of tank overflow has apparently been corrected. This STP was initially overdesigned and most components have the capability of expansion to 0.7 mgd utilizing the A/O process.

2.2 West Goshen (Chester Creek) Treatment Facility

During the period 1991/1992, an average of approximately 974,599 GPD in theoretical sewage flow from East Goshen Township properties was treated at the West Goshen Wastewater Treatment facility under a long-standing municipal agreement with West Goshen Township. However, the above figure is based upon theoretical flows for each type of unit (SFD = 350 GPD - Apt = 200 GPD - TH = 250 GPD), and the actual monitored sewage flow was 754,769 GPD or 77.44 percent of the theoretical flow.

The relative importance of the daily volume of actual sewage treated during 1991 is reflected in Table 2.5.

TABLE 2.5

COMPARISON OF 1991 THEORETICAL AND ACTUAL SEWAGE FLOWS BETWEEN RIDLEY CREEK STP AND WEST GOSHEN STP

Treatment Facility	Theoretical Flow in GPD	Actual Monitored Flow in GPD
Ridley Creek STP	333,127	230,475 (69.2%)
West Goshen STP	974,599	754,769 (77.4%)
Totals	1,307,726	985,244

Source: Township 1991 Sewage Flow Records

Therefore, approximately 76.6 percent of the actual daily sewage flow from East Goshen Township (in 1991) was treated at the West Goshen Wastewater Treatment facility (refer to 1993 Chapter 94 Report for updated flow records).

The West Goshen STP was constructed as a secondary treatment plant during the early 1960s. During 1977 and 1978, the STP was upgraded to a tertiary treatment level. East Goshen has been a participant with West Goshen Township in supporting the operation of this facility and since 1977 as a direct financial participant in the expansion construction related to the tertiary level of treatment.

It is important to note that the actual agreement with West Goshen Township calls for West Goshen to treat up to 1.0 MGD in actual sewage effluent and not 1.0 MGD in theoretical sewage flow. There are several intra-municipal connections where physical areas of West Goshen Township flow into East Goshen and thence sewage flows are rerouted to either gravity or pump station connections leading to the West Goshen STP.

There are actually 49 developments or facilities located in East Goshen Township which are serviced by the West Goshen Wastewater Treatment facility. These individual connections and their theoretical rated sewage flows are contained in Section 3 of this report in Table 3.6. In addition, East Goshen Township has made commitments for 15 properties or developments which will eventually contribute an additional 88,295 GPD in future theoretical sewage flows to be treated at the West Goshen facility. It should be noted that the above additional 88,295 gpd could be substantially increased if East Goshen

Township accepts a possible offer made in late 1993 by the Consultant to West Goshen Municipal Authority to treat up to 780,000 gpd at the expanded West Goshen STP.

The West Goshen Wastewater Treatment facility is located near South Concord Road and discharges into Goose Creek. The West Chester Borough Goose Creek treatment plant also discharges to this same tributary to Chester Creek. The West Goshen STP is operated under a PaDER permit for treatment of up to 4.5 MGD. Of this permitted treatment capacity, 1.0 MGD in actual flow is reserved for exclusive East Goshen Township use.

During the course of preparation of this updated Act 537 Study, telephone interviews were conducted with various West Goshen Township officials including the Township Manager, the West Goshen Sewage Treatment Plant operator, and the consulting engineer to West Goshen Township and its Municipal Authority. These interviews provided the source of the following information.

PaDER has notified West Goshen Township that it must commence planning for future expansion of the West Goshen STP. The plant has a current permit for 4.5 MGD. An Act 537 Plan Update for West Goshen Township is in the process of completion and may be completed during December 1992. The latest target date for completion of the West Goshen Act 537 Plan Update is May 1994.

Typical flows for the West Goshen STP ranged between 4.0 to 4.1 MGD during 1988. Substantial infiltration and inflow (I&I) remediation between 1988 and 1992 has substantially reduced the average daily flow at this STP to 3.5 to 3.8 MGD. East Goshen Township has also conducted extensive I&I remediation for sewer lines and manholes which lead to the West Goshen STP. Jointly, the two townships and other municipalities have reduced the average daily flow by nearly 0.5 MGD in four years. Officials from both West Goshen Township and East Goshen Township estimate that the average actual flow per EDU in West Goshen Township is approximately 334 gallons per EDU and for East Goshen Township the average daily flow is 218 gallons per EDU. It was also estimated that more than 75 percent of the constructed dwelling units in West Goshen Township are connected to the public sewer system. West Goshen Township has cooperative sewage treatment agreements with other adjacent townships including a current agreement with West Whiteland Township for treatment of up to 420,000 GPD and a similar agreement with Westtown Township for treatment of up to 230,000 GPD.

In the current Act 537 Update Study for West Goshen Township consideration is being given to expanding the plant under two options. The first option would expand the rated capacity of the plant from 4.5 MGD to 6.0 MGD at an estimated cost of $6,700,000.

Under this option, the entire 1.5 MGD in additional capacity would be reserved for exclusive use within West Goshen Township.

The second option being studied by West Goshen Township would extend the rated capacity of the STP to 7.0 MGD at a total estimated cost of $7,700,000. This option would allow 1.0 MGD in additional capacity for surrounding townships, including East Goshen Township, if additional capacity was required. In August 1993, East Goshen Township received correspondence from the Consultant representing West Goshen Township stating that "approximately up to 780,000 gpd in reserve capacity...could be allocated to West Whiteland and/or East Goshen Township." East Goshen Township responded, by letter, in September 1993 requesting that the entire 780,000 gpd of additional capacity be reserved for East Goshen Township. Some of this capacity would be utilized to serve properties outside of East Goshen Township. In March 1994, East Goshen Township has not received a response to the request for this allocation.

Table 3.6 which appears in the next section of this Plan depicts 49 developments or facilities located within East Goshen Township which are currently served by the West Goshen STP. The 1991/1992 average daily flow for the 49 developments totals 974,599 GPD (theoretical flow) and 754,769 GPD in actual average daily flow.

There are six existing subdivisions/developments where sewage flow is treated at the West Goshen STP where such effluent is being pumped from locations within the Ridley Creek Watershed. As depicted in the next section of this plan in Table 3.6, the developments include: Hershey Mill Estates; Fairway Village; the Ashbridge/Firethorne Area; Hunters Run; and the Windermere Apartments with such units averaging 136,200 GPD in theoretical flow.

In summary, the West Goshen STP will continue to provide sewage treatment services to East Goshen Township to the extent of 1.0 MGD in actual flow which includes the 49 existing developments which are on-line or committed and three additional developments (Ardleigh Estates, the Brandolini development, and the Wilson property) which are not currently on-line but are committed for connections. As noted above, East Goshen Township has requested in writing a reservation of up to 780,000 gpd at the West Goshen STP based on current expansion plans identified by West Goshen Township.

2.3 Existing Individual Onlot Systems

East Goshen Township has expended considerable funds and effort in constantly monitoring the status of existing onlot systems located within the Township boundaries. The Township has computer files for all known addresses for each onlot system.

This is an on-going process in East Goshen Township although the Township has not yet adopted an ordinance mandating minimum pumping cycles for existing onlot systems. However, the Township frequently publishes educational information regarding the proper maintenance of individual onlot systems in the Township newsletters.

Recent History Regarding Malfunctioning Onlot Systems

The last major Township-wide study of malfunctioning onlot sewage disposal systems was conducted by Walter B. Satterthwaite Associates, Inc., and was published in March 1981. At that time infrared aerial photography was used to screen on-site malfunction areas which was followed by field investigations of suspicious areas.

Table 2.6 below depicts the summary of results of the 1981 survey which can be used to show a correlation with the reported number of malfunctioning onlot systems in 1991.

TABLE 2.6

1981 SURVEY OF Onlot SYSTEM MALFUNCTIONS

	Homes Surveyed	Observed Surface Failures	%	Other Possible Failures
Ashbridge-Firethorne	125	36*	29	1
Vista Farms	58	13	22	--
Charter Chase	98	1	1	4
Brookmont-Tremont Drives	41	1	2	1

Totals/Percentage	510	64	12.5%	8

* Including community system connections

Source: 1981 Act 537 Plan Revision Study, Page 39

Many of the reported surface failures and potential failures identified in Table 2.6 have now been connected to public sewers including the Ashbridge-Firethorne area, the Vista Farms area, and the Grand Oak (Bittersweet) area. However, there are still a number of existing malfunctioning systems noted during 1991 for which no public sewer systems have yet been constructed. For example, in 1981, within the Charter Chase subdivision, there was one observed surface malfunction and four additional potential malfunctions. During the November 1991 Township-wide survey, there were 11 self-reported current or prior malfunctioning systems with one additional graywater discharge for a total of 12 prior or current malfunctions. This represents a very substantial increase during the intervening 10-year period. Please refer to Addendum at the end of this section regarding 1993 updated information for the Charter Chase subdivision.

Another interesting comparison involves the Cornwallis Drive-Colonial Drive area where in 1981 two onlot malfunctions were reported, or a seven percent failure rate. By 1991, the Meadowbrook/Cornwallis area had eight malfunctioning onlot systems reported with four additional onlot graywater discharges noted representing a substantial increase in failed systems during the 10-year period.

In contrast, the 1981 survey of 95 dwellings in the Indian Hills area reflected three observed failures and one additional possible failure. During the 1991 survey, 38 remaining dwellings not served by public or private sewers were surveyed with no reported malfunctions or other onlot discharges.

1991 Onlot Sewage Facilities Survey

As a part of the 1992 update for the Township's Act 537 Plan, a Township-wide survey was prepared for all known remaining dwelling units within the Township which currently have onlot sewage disposal means. The questionnaires were prepared jointly by SMC staff and the Township staff and were mailed in early November 1991 to 699 residential or institutional units. A 20 to 25 percent response was expected. A 69 percent response was received, which represents one of the highest return mail response levels of this type achieved in recent years. The summary results of the findings for the 1991 survey are depicted in Table 2.7.

The overall results depicted in the Township-wide survey of 1991 reflect 55 malfunctioning onlot systems with 14 of the same properties affected also showing additional graywater surface discharge violations. In addition, 19 residential units reported separate graywater discharge violations only. This represents a total of 74 dwellings with known malfunctions and/or separate washing machine/dishwater discharges to the ground surface, or 15 percent of the total responses received.

TABLE 2.7

1991 SURVEY OF ON-LOT SYSTEM MALFUNCTIONS AND GRAYWATER DISCHARGES

9829:FTTB32J.WP

The highest number of reported onlot malfunctions occurred in the Charter Chase subdivision where 11 owners reported current and prior system failures with one additional graywater discharge. Please refer to the 1993 Addendum at the end of this section regarding the Charter Chase subdivision.

The area reflecting the second highest number of malfunctions is the Taylor Avenue/Highland Avenue area with nine malfunctions (four of which had additional surface water discharges) and five individual residential properties showing separate surface graywater discharges. When combined, this represents 28 percent of the responding homeowners reporting either a malfunction or a graywater discharge.

As expected, the Meadowbrook/Cornwallis area reflected eight malfunctioning systems (with three graywater discharges on the same properties) plus four additional separate graywater discharges or a 25 percent rate of violation using the combined reported rates.

The Wyllpen subdivision reported three malfunctions and reflected an approximate 14 percent rate of failed systems.

The miscellaneous area surveys reported in Table 2.7 involved 288 residential units and generated 213 returned survey forms indicating a response rate of 74 percent. There were 20 random malfunctioning systems (four of which also reported graywater discharges) and an additional seven reports of separate graywater discharge violations only. The malfunctioning systems and separate graywater violations constitute approximately 13 percent of the responding residential units.

The miscellaneous surveys were distributed to all known units having on-lot disposal systems on the following streets or roads: Atlee Drive; Boot Road; East Boot Road; Bramble Lane; Brookmont Drive; East Strasburg Road; Ellis Lane; Forest Lane; Gates Drive; Greenhill Road; Green Acres Lane; Hershey Mill Road; Ivy Lane; King Road; Larch Lane; Line Road; Manley Road; Mill Stream Drive; Morstein Road; North Chester Road; North Dutton Mill Road; Old Orchard Lane; West Chester Pike; Paoli Pike; Pine Rock Road; Raewyck Drive; Reservoir Road; and Tremont Drive.

The 20 reported malfunctions for the miscellaneous surveys are quite scattered and do not constitute any particular concentration or pattern of serious malfunctions except in the vicinity of North Chester Road south of Atlee Drive.

Exhibit 3-A reflects the generalized locations of the malfunctioning on-lot systems and the additional graywater discharge violations reported in the 1991 survey. These locations correspond with the data reflected in Table 2.7.

EXHIBIT 3-A

LEGEND

MAL. - MALFUNCTION
DIS. VIOL. - DISCHARGE VIOLATION (GRAYWATER)

Field Surveys Conducted in March 1991

During late March 1991, members of the Township administration, a member of the Meadowbrook/Cornwallis Homeowners Association, and a representative of the Chester County Health Department conducted field surveys within the Meadowbrook/ Cornwallis community to determine the extent of visible malfunctions and the graywater discharges visible on the ground. This survey involved a total of 36 properties along Meadowbrook Lane and Boot Road and 41 additional properties in the Cornwallis Drive/Colonial Drive area. A total of 77 properties were viewed in the field.

The categories for field classification of violations/non-violations are listed below:

1) Not Surfacing - No evidence of septic tank overflow or existing evidence of surfacing.

2) Washwater Discharge - Visible current evidence that graywater was being discharged on the ground.

3) Must Pump - Homeowner verified that frequent pumping was required to prevent sewage from backing up into the dwelling or overflowing onto the ground.

4) Surfacing in the Past - Visible field evidence that the wastewater system had overflowed recently. Also includes property where waste remnants were found at the cleanout or on the ground around the septic tank cleanout.

5. Surfacing Now - Visible evidence of sewage effluent running onto and across the ground surface.

Table 2.8 indicates the results of the Meadowbrook/ Cornwallis field survey.

TABLE 2.8

1991 FIELD SURVEY - MEADOWBROOK/CORNWALLIS

	Meadowbrook Lane/Boot Road	Cornwallis Area	Combined
Not Surfacing	24	25	44
Washwater Discharge	2	5	7
Must Pump	1	0	1
Surfacing past	4	7	11
Surfacing	5	4	9
TOTAL	36	41	77

This field study indicated a total of nine dwelling units depicting current wastewater surfacing and seven additional washwater or graywater discharges. A comparison with the results of the mail survey depicted in Table 2.7 for the Meadowbrook/ Cornwallis area reflects eight malfunctioning systems (compared with nine in the field survey) and four separate graywater violations (compared with seven similar violations noted in the March 1991 field survey).

By carefully comparing the results of the field survey on a lot-by-lot basis with the responses received in the November 1991 mail survey, it is noted that five of the properties reflecting malfunctions or discharge violations did not respond to the survey. This adds considerable weight to the field survey results depicted in Table 2.8.

In summary, there are probably four or five additional residential properties in the Meadowbrook/Cornwallis area which have current malfunctioning sewage systems or graywater discharge violations which were not reflected by the current owners. This is attributable to no response to the mail survey and/or ignorance of what constitutes a graywater discharge violation.

The property-by-property comparison of the Meadowbrook/ Cornwallis area further confirms that: the field survey showed nine current malfunctions whereas the mail survey respondents reported only eight such violations; the field survey detected seven graywater discharge violations whereas the mail survey disclosed only four such violations; of 16 properties with

definite field surveyed violations, five of such property owners did not respond to the survey; and only one homeowner reported a definite current malfunction which was not detected in the March 1991 field survey. This adds substantial credence to the accuracy of the field survey and also gives a general level of comfort that the mail survey results are reasonably accurate for sewage facility planning purposes.

It is the opinion of SMC, the consultant, that if field surveys were conducted for all 699 dwelling units having on-lot disposal systems, the results would indicate wastewater system malfunctions approximately ten percent higher than reflected in Table 2.7 and that the graywater discharges for the same number of dwelling units would be approximately 15 percent higher than reported in the mail survey.

Reported Type of System Installed for Survey Respondents

Table 2.9 depicts the type of onlot system installed based upon the 483 respondents to the mail survey of November 1991. The primary importance for the information depicted in Table 2.9 is that at least ten percent (and possibly more) of the 483 residents responding, do not know what type of onlot disposal system serves their property. Further, of the 483 persons responding to the survey, 33 residential occupants reported that they had "never pumped their system." This means seven percent of the reporting owners are not aware that they have to pump or alternatively they have lived in the residential unit for a short period of time. These specific dwelling units can be monitored by the Township staff for future potential onlot malfunctions. Hopefully, the public educational program and proposed onlot management system will alert the residential owners as to the frequency of need for pumping their conventional septic tanks and/or cesspools to avoid failures.

TOTAL	483	

Follow-up Field Study - Charter Chase Area

As a result of the November 1991 township-wide survey results, the Charter Chase Subdivision was subjected to a walkthrough field survey which was conducted on April 13 and April 20, 1992. Included in the field survey team were one member of the Township Public Works staff, two members of the Chester County Health Department staff, and two representatives from SMC Environmental Services Group, the consultants for the Act 537 Plan Update. Three Sewage Enforcement Officers (SEOs) were present during the two days of field investigation.

The results of the November 1991 mail survey depicted eleven malfunctioning systems and one separate graywater discharge for a total of 12 dwelling units with prior or current violations out of 76 mail responses.

The actual April 1992 field investigation depicted ten additional prior or current malfunctioning units not previously reported in the mail survey and three additional suspected graywater discharges not previously noted in the mail response survey. Therefore, based upon a combination of the self-reported malfunctioning and separate graywater discharges, and the field investigation conducted in April 1992, it is evident that there are 21 existing or past malfunctioning systems and four additional graywater violations within the 98 individual single family detached dwellings located in this area of the Township. Please refer to Addendum at the end of this section regarding a 1993 update for the Charter Chase subdivision.

As a result of the April 1992 field survey, seven letters were forwarded by the Township on April 28, 1992 to various homeowners where additional violations were noted. These notification letters included three residential units where cesspool and/or septic tank covers were considered to be unsafe; two additional graywater discharges; and two homeowners where raw sewage was noted as flowing across the ground surface. The owners of two of the residential units where the additional graywater discharges were noted promptly notified the Township that these were "sump pump discharges" and did not contain any wastewater.

Also as a result of the survey, the Chester County Health Department inspection team members were to follow-up immediately with two homeowners where suspected replacement systems had been installed without a valid County Health Department permit. Of major concern regarding the 97 residential units surveyed (one dwelling was missed in the survey) was the fact that approximately 35 percent of the existing homes within the area showed definite evidence of past overflows or cesspools/septic tanks which were full to near ground level on the dates of the survey. This is indicative of homeowner negligence regarding proper pumping of tanks for existing onlot systems and does not necessarily imply that the systems were malfunctioning.

As a result of the above surveys and other surveys conducted by the Township during the past three years, a Township-wide onlot sewage management program is being recommended as a part of this Act 537 Plan Update. Such a management system will hopefully be adopted by ordinance during late 1994 and will apply to all existing onlot systems regardless of type. In view of the 25 percent prior and current malfunction/graywater problems noted, the Charter Chase area will be analyzed further for possible public sewer needs during the 1998-2002 time period.

2.4 Existing Community-Type and Spray Irrigation Systems

There are several community-type onlot discharge systems and/or spray irrigation systems located in East Goshen Township. Listed below is a discussion of each.

Lockwood Chase Treatment Facility

In February 1981, PaDER issued Permit #1580430 for the construction and operation of a sewage treatment facility and spray irrigation system serving the Malvern Golf Club subdivision now known as the Lockwood Chase subdivision. The permit was issued for the construction of a sewage treatment facility and spray irrigation system for 103 total EDUs, 23 of which are located in East Whiteland Township. This subdivision is located along the northerly border of East Goshen Township to the west of North Chester Road and to the west and north of Fairway Village.

The treatment and spray irrigation system was designed by Tatman & Lee Associates for Ferguson & Flynn Enterprises, the developers of Lockwood Chase.

The treatment system consists of an influent 8-inch ductile iron pipe (D.I.P.) to a bar screen and comminutor; this then feeds to an aerated lagoon with 8-inch D.I.P. influent and effluent lines. The effluent then feeds to a polishing pond thence to a chlorine contact tank, and thence to a discharge pump located within the control building. The final effluent is then pumped to the numerous spray irrigation fields some of which are open areas and some of which are in the wooded areas to the west of the treatment facility.

The permit, as originally issued, requires the following condition which now applies to the East Goshen Municipal Authority which acquired title to this system on January 25, 1988. The restriction, among others, is as follows:

> "The proposed application rates for the spray irrigation areas have been approved based on the assumption of an annual average of 11 mg/l of total nitrogen in the polishing pond effluent which results in the nitrogen loading applied to the wooded area being within the required 200 lbs. N/acre/year. The reason for this restricted nitrogen loading is to insure that the nitrate/nitrogen (NO_3N) level in the ground water does not exceed 10 mg/l. If actual data indicates that the total nitrogen concentration in the effluent is greater than assumed and the (NO_3N) concentration in the ground water is approaching or exceeding 10 mg/l, provisions must be made to reduce the application rates and expand the spray irrigation area to lower the nitrogen loading in the wooded area."

In order to support the above condition, PaDER restricted the use and sale of Lots #52, #53, #54, and #55 for two years or until the above operating conditions were achieved. These lots have now been sold and built upon and thus the spray irrigation areas are limited to those in the original design concept.

Since the East Goshen Municipal Authority acquired ownership and operational responsibility for the Lockwood Chase treatment system, monthly laboratory samples have been provided by the operator for both influent and effluent flows. Although numerous operational problems occurred during the period 1990 to early 1992, it appears that these problems have been resolved and the facility is now being operated within permitted standards.

Table 2.10 depicts the pumped effluent flows for the Lockwood Chase treatment facility for 1991 and for most of 1992. Table 2.10 shows that the peak month for pumped effluent during

		PEAK MONTH -	25,603

Source: Township/Authority Records

1991 was 29,419 GPD average and for 1992, a peak month discharge of 25,603 GPD average daily flow is shown. Numerous pump failures and electrical failures occurred between January 1991 and February 1992 which were all corrected in a timely fashion.

On June 30, 1991, the comminutor pit was discovered as being in an overflow condition because a large broken piece of PVC lateral vent cap had worked its way through the collection system

to the comminutor. TMH Environmental Services, Inc., the operator of the facility for the Municipal Authority, reported the spillage to PaDER.

One of the vital components of this facility is the final effluent spray pump. Based on one failure, the Authority now maintains a spare pump to assure that effluent can be discharged without excessive pond overloading.

It is the opinion of SMC, the consultants for this Act 537 Plan Update, that the Lockwood Chase treatment facility should not receive any additional effluent from surrounding or nearby areas. The treatment facility operation is now stabilized and is working well and within permit limits. If one or two emergency malfunctions of nearby onlot systems were to occur, it would be appropriate to consider the use of the Lockwood Chase system. However, to assure against overloading of this facility, it is recommended that this plant remain at its current service use of 103 EDUs without additional effluent being introduced.

It should be noted that the average daily flow for a given month from each EDU includes approximately 243 GPD which is higher than the daily flow for equivalent EDUs connected to the West Goshen STP and the Ridley Creek STP. For example, in May 1992, the average daily effluent treated was 25,006 GPD which equates to 243 GPD per connected EDU.

Now that the treatment facility is under a routine maintenance program, the operation should continue smoothly for many years. No extended useful life for this facility has been published, but it is the consultant's best estimate that this facility should provide at least 20 to 25 years of adequate treatment for the Lockwood Chase area.

Willow Pond Community Onlot Treatment System

The Willow Pond treatment facility is a privately-owned treatment plant located to the north of Forest Lane and to the west of Line Road. The treatment facility serves 28 dwellings or EDUs, 15 of which are located in East Goshen Township and 13 being located in Willistown Township. The treatment facility is maintained solely by the Willow Pond Homeowners Association.

This treatment facility was designed by Momenee-King Associates in September 1984. The design flow for this treatment facility is based upon 28 EDUs at 3.2 persons per unit at 75 gal/day/person, or 6,720 GPD. This equates to 240 GPD per dwelling unit. The peak design flow, according to the engineer's report is 56 GPM compared with the engineer's estimated 4.67 GPM in average flow. The system uses two aerobic tanks for treatment which provides assumed tertiary level treatment before pumping to an inground absorption bed area located north of Forest Lane.

During 1991, the original absorption beds failed because excess solids had entered the inground absorption area. A new sewage bed area was installed in mid-1992. The useful life of this new absorption bed is unknown. It is assumed by the owners that the original bed may be returned to service within one to two years after self-renovation.

Several engineering evaluations of the Willow Pond system suggest that the sewage effluent absorption beds are more than adequate, but the treatment tanks tend to introduce excess solids into the effluent. It is doubtful that the homeowners association could or would afford the cost of a replacement treatment plant facility (estimated at $200,000 in 1991 by Yerkes Associates). Therefore, it is assumed that this system may suffer additional malfunctions during the 10-year planning cycle 1993-2002. Although it may be possible to again install replacement or alternate inground sewage absorption areas, this will be a very costly process for the homeowners association.

It is also assumed that the homeowners association will eventually approach the East Goshen Municipal Authority with a request for a Township takeover of this existing community onlot system. A reference to Table 3.7 in the following section of this report indicates that the Willow Pond subdivision is being considered for possible connection to the Ridley Creek STP during the period 1998-2002. However, this can only occur if gravity sewers are extended 4,600 L.F. to the Saddlebrook Farm subdivision at a cost in excess of $400,000.

2.5 Hersheys Mill Spray Irrigation System

The Hersheys Mill development represents one of the largest land areas in East Goshen Township now being developed under a unified plan or planned residential development. The land area comprising Hersheys Mill Village generally extends from Boot Road to North Chester Road and is bounded on the north by Green Hill Road and on the south by the Meadowbrook/Cornwallis area.

The ultimate permitted density for Hersheys Mill Village is 2,032 EDUs. As of August 1992, there were 1,155 occupied dwelling units, which implies there will be an additional 877 units to ultimate build out. However, due to changes in market conditions, the style and type of unit now being marketed and other factors, it is expected that the ultimate EDUs will be slightly less than 2,032 occupied units.

During February 1992, there were 1,133 occupied EDUs with an estimated 1.6 persons per unit contributing approximately 115 GPD per EDU or 130,295 GPD in sewage flow. In addition, it was estimated that the various community facilities at Hersheys Mill contributed an additional 5,000 GPD for an approximate total of

135,000 GPD in average daily influent. The supervisor and plant operator for Hersheys Mill Village estimated that infiltration and inflow (I&I) constituted less than three percent per day of the daily effluent treated. The existing PaDER permit for the entire sewage treatment and spray irrigation system is limited to 325,000 GPD which included 50,800 GPD for Hersheys Mill Estates which has been taken off-line via the Hersheys Mill Village pump station, and this effluent is now treated at the West Goshen STP.

The lagoon system for the Hersheys Mill Village treatment system was designed in the mid-1970s and reportedly the first units were placed on-line during 1976 and 1977. During 1991, a new commercial center was approved for the Hersheys Mill Village complex which will also be connected to the Hersheys Mill treatment facility. However, a November 1993, letter from Wooldridge Construction of Pennsylvania, Inc. expressed interest in reserving 15,000 gpd should additional capacity at West Goshen (or some other source) become available.

Until January 1, 1994, the treatment facility will continue to be owned and operated by Wooldridge Construction, the current developer. In 1994, the Hersheys Mill Homeowners Association will take over the entire system. The current monthly fees charged include $16.50 per EDU which produces an estimated 1992 annual operating budget of $230,000. Of this amount, $47,000 or 20 percent is reserved for capital improvements which is used for lagoon sludge removal, new lagoon liners and normal replacement for pumps and operating equipment. It is the opinion of the consultant and the Township Sewage Administrator that this system is in excellent condition both physically and financially, and there is little need for Township intervention in a system which operates with few, if any, problems.

It is noteworthy that there has not been a PaDER violation in almost 13 years of continuous operation. During 1991, BFI removed 280,000 gallons of sludge/slurry from one lagoon which was trucked to Wilmington, Delaware for disposal. This was the first time that sludge removal had been required since the sewage system was placed in operation. The other lagoons are scheduled for similar sludge removal by 1995-1996. One lagoon is scheduled for installation of a new liner during 1993. Although no liner failures have been noted, this is considered to be a routine replacement.

The three lagoons within the treatment system have a total storage capacity of 40,000,000 gallons. The facility operators have experienced no problems in applying the effluent by spray irrigation for 365 days per year. The spray irrigation area includes 100 acres of which 70 acres of the existing golf course is used for spray fields and 30 acres of permanent open space outside of the golf course is used for winter spraying only. An additional 6.5 acres is reserved for expanded spray areas if

outside of the golf course is used for winter spraying only. An additional 6.5 acres is reserved for expanded spray areas if required at any time in the future. All facilities within the plant operation are served by emergency generators and all pumps and aerating equipment are dual facilities or have backup systems on-line. The plant operators currently apply the treated effluent at a rate of approximately two inches per week which is carefully monitored.

In summary, this treatment plant is operating at 41 percent of its permitted treatment capacity. The current population and/or EDUs during August 1992 constitutes 57 percent of the build out capacity at Hersheys Mill Village. Therefore, it is estimated that there will be some reserve capacity in the treatment system when build out occurs (70,000 to 85,000 GPD), which is estimated to be in eight to ten years.

This is a facility which the East Goshen Municipal Authority could take over at any time should there be a need for such. There is no evidence or desire on the part of the ownership and management of Hersheys Mill Village and the directors of the Hersheys Mill Homeowners Association to have public participation in its sewage treatment system or operations at this time.

Within the 10-year planning cycle, 1993-2002, there is no apparent need for intervention on the part of East Goshen Township or its Municipal Authority. At the estimated time of build out, which could be as early as the year 2000, there should be a remaining unused treatment capacity of 70,000 to 85,000 gallons per day. If at that time there is a need for public ownership, the Township and the Authority could certainly take a look at a possible takeover of the system. If the Hersheys Mill treatment system was publicly owned in the future, the additional unused treatment capacity could be used to serve the adjacent Charter Chase community and other nearby subdivisions if such needs were apparent at that time.

1994 ADDENDUM
AMENDING SECTION 2.3 EXISTING INDIVIDUAL ONLOT SYSTEMS
CHARTER CHASE SUBDIVISION REVISED SUMMARY

Section 2.3 of the preceding text describes the existing status of individual onlot systems in various areas of the Township. The only existing subdivision within East Goshen Township which was scheduled for additional field walk-through surveys was the Charter Chase Subdivision. As a result of the Chester County Health Department review of the December 1992 final draft of this Act 537 Plan Update, strong recommendations were made by the Health Department that an additional walk-through be conducted to confirm the status of onlot malfunctions and graywater discharges.

In compliance with the County Health Department request, additional field walk-through surveys were scheduled and conducted on July 23 and July 27, 1993. A representative of the County Health Department participated in this study which included the Township Manager and a representative of the consultant. The same physical observation process was utilized as in the April 1992 field walk-through surveys. The following information represents a comparison of the 1992 and the 1993 field surveys for the Charter Chase Subdivision:

RESULTS OF APRIL 1992 WALK-THROUGH

a.	Lots malfunctioning - 1992 or reported malfunctioning prior to 1992	21
b.	Lots showing evidence of graywater - 1992	4
c.	Lots reported with no current or prior malfunction or current or prior graywater discharge	73
	Total	98

The following information summarizes the July 1993 walk-through results:

RESULTS OF JULY 1993 WALK-THROUGH

a.	Lots malfunctioning now (1993)	7
b.	Lots with 1993 graywater discharge	3
c.	Lots showing evidence of prior overflow, prior malfunction, or prior graywater discharge, but now renovated	25
	Total	35
d.	Lots which never experienced any problem	63
	Total Lots	98

There are several final conclusions drawn from a careful analysis of the Township-wide 1991 mail survey, the April 1992 field walk-through survey, and the identical 1993 field walk-through survey.

The first conclusion is that many of the people who responded to the Township-wide 1991 mail survey apparently misinterpreted the wording in the survey which related to "discharge on the ground" when the homeowners apparently interpreted the question as being "discharged into the ground." This became evident when comparing the actual returned field surveys for specific dwellings or specific street addresses in Charter Chase where a reported "prior malfunction" had occurred when in fact almost brand-new systems were evident in the field for newly-occupied units and no field malfunctions were evident in either walk-through. Therefore, greater credibility is attached to the 1993 and the prior 1992 walk-through surveys.

The summary of the 1993 field survey depicted seven widely scattered malfunctioning systems and three additional graywater discharge violations representing a total of ten dwelling units with sewage discharge problems as based on a total of 98 residential units surveyed. This represents an approximate ten percent malfunction rate and is considered the most credible evidence to date for this area of the Township.

In addition to the ten percent of widely scattered malfunctioning units, most of the evidence related to the 25 dwelling units reported above for the 1993 survey as "showing evidence of overflow, prior malfunction or prior graywater discharge, but not renovated" should not be considered as current malfunctions. Further, the field surveys indicated conditions where the homeowner simply failed to pump the cesspool or septic

system in a timely fashion. Even though prior evidence of an overflow existed, there was no physical evidence whatever which would show that these units are in violation of current standards.

It is very evident that the Township's administrative staff effort to inform all homeowners in the Charter Chase area of the need for frequent pumping of onlot systems has substantially diminished the reported problems in the Charter Chase Subdivision. There was also ample evidence that many homeowners have responded by having replacement systems installed which have cured or corrected previously reported malfunctions.

In summary, it is the opinion of the Township that there are currently ten widely scattered malfunctioning onlot conditions in the Charter Chase Subdivision. This does not warrant further consideration for providing public sewers at this time. The Charter Chase Subdivision will be kept under scrutiny with suggested follow-through field surveys in 1995 and 1997. It is not expected that there will be any major changes for deterioration of onlot sewage disposal conditions in this area so long as the homeowners continue appropriate and timely pumping and maintenance of their onlot systems.

3.0 EXISTING DEVELOPMENT, PROPOSED LAND USE, FUTURE GROWTH, ZONING, AND FIVE AND TEN-YEAR SEWAGE EXPANSION PLANS

3.1 Existing Developed Areas

Exhibit 1 contained in Section 1.1 of this report depicts the extent of existing development in 1992 including some lots which are committed for development but not yet fully built. The majority of the developed land area within East Goshen Township involves single family detached housing. However, there is a good mix of multi-family development along the West Chester Pike corridor and the new Kent Apartment Complex at Boot Road and North Chester Road.

In terms of extent of development, approximately 67 percent of the 6,400 acres comprising the Township land area is now developed for residential, industrial, commercial, and public purposes. This is reflected in Table 3.1 which appears as Table A-1 in the newly adopted 1992 Comprehensive Plan for the Township. With 4,318 acres developed as of 1990 and an additional 761 acres committed to various developments, this represents 79 percent of the total land area of East Goshen Township. Table 3.1 also depicts approximately 1,321 acres of undeveloped land, or 21 percent of the land area which is subject to future development. An estimate contained within the Comprehensive Plan suggests that approximately one-third of the undeveloped land will not be capable of supporting development due to environmental constraints. A maximum of approximately 65 percent of this land can be expected in the future land development mix, or approximately 860 acres.

TABLE 3.1

LAND DEVELOPMENT CHARACTERISTICS
EAST GOSHEN TOWNSHIP, 1990

CATEGORY	ACRES	PERCENT
Developed Land	4,318	67
Committed for Development	761	12
Undeveloped Land	1,321	21
Township Total:	6,400	100

Source: 1992 Comprehensive Plan

Another important forecast is the probable distribution of future land uses based upon current or 1990 zoning for the Township. This information was also obtained from the 1992 Comprehensive Plan Update. In Table 3.2, the remaining undeveloped land has been incorporated in a development scenario as if the Township was fully and completely developed. This analysis was based upon the 1990 zoning which has not been changed substantially and is not likely to change in the near future.

TABLE 3.2

DISTRIBUTION OF LAND USES
AS CURRENTLY ZONED
EAST GOSHEN TOWNSHIP, NOVEMBER 1990

LAND USE	ACRES	% OF AREA
Single-Family Residential*	4,351	68
Multi-Family Residential	999	16

Business Park	113	2
Public Open Space	206	3
Churches/Schools	73	1
	6,400	100

* Includes privately owned open space.

Source: 1992 Comprehensive Plan

Table 3.2 gives an excellent breakdown of the percentages of Township area which will be devoted to each major use group including 68 percent for single family residential and 16 percent of the land area for multi-family residential. The remaining 16 percent of the Township land area will, at some future date, be developed in accordance with Table 3.2 for various commercial, industrial, public and semi-private uses.

The 1992 Comprehensive Plan also contains an Existing Land Use Map which is reproduced here as Exhibit 4. The Existing Land Use Map describes November 1990 existing land use conditions. The existing multi-family residential units in the West Chester Pike corridor are clearly shown as are the other multi-family

developments within the Township. Hersheys Mill Village is depicted as a multi-family residential community even though most of the units developed there are attached single family dwellings. The present developed area of Hersheys Mill Village, one of the most predominant residential developments within the Township, shows the extent of development representing approximately 1,100 occupied units as compared with a projected total number of 2,032 dwelling units at the time of build-out or completion. The existing land use map is very helpful in depicting where those additional units might be located.

The industrial developed areas of the Township are also clearly shown with the Goshen Corporate Center, located north of Paoli Pike, being closest to a built-out condition. The Goshen Corporate Park West, located generally along Airport Road, is not yet fully developed but is expected to achieve build-out within ten years or less. Another vital source of information as contained in the 1992 Comprehensive Plan appears in Table 3.3.

	219	519	1,101

Source: 1992 Comprehensive Plan

This Table depicts developments which are committed by the Township as of 1992 and are under construction but are not fully occupied or built-out. These various developments include approximately 219 acres which represents 519 new dwelling units with an estimated population of 1,101 persons. Of the 519 proposed new dwelling units contained in Table 3.3, the Windermere development, the Bellingham development, and the Hersheys Mill developments listed would total 406 of the 519 dwelling units which are not single family detached dwellings.

Table 3.4 depicts five pending developments which have been committed as of 1992 but are not yet under construction. The source of this table is the 1992 Comprehensive Plan.

TABLE 3.4

(Oakmont)	5	25	62
	260	233	576

* Based on 2.47 people per dwelling unit

Source: 1992 Comprehensive Plan

All of the units depicted in Table 3.4 represent single family detached dwellings except for the Hersheys Mill (Oakmont) development. According to this table, another 233 dwelling units will be added in the foreseeable future consuming an additional 260 acres of currently undeveloped land.

In summary, expected new development within the Township will affect approximately 65 percent of the remaining undeveloped land as depicted in Table 3.1 or about 860 acres. The future land use plans and the appropriate zoning requirements are discussed in the following section for this remaining undeveloped land.

3.2 Proposed Land Use and Zoning

East Goshen Township spent almost two years in developing the new 1992 Comprehensive Plan for the Township. This plan is well thought out and does not represent any radical departures from the existing zoning intentions which have been in effect for many years. Frequently, a Comprehensive Plan Update makes drastic changes and causes major changes in the Township's build-out potential. There are some innovative features of the new Comprehensive Plan which, in overlay format, will cause better development patterns for the remaining undeveloped land within the Township.

Exhibit 5, as taken from the 1992 Comprehensive Plan, describes A Plan for Future Land Use which appropriately balances an excellent mix of residential, commercial, industrial, and public/semi-public uses.

The following classes of use are recommended on Exhibit 5 for the future land use development of East Goshen Township:

Residential

- Low density suburban residential (one DU per acre)
- Low density open space suburban residential (1-3 DUs per acre)
- Medium density suburban residential (2-3 DUs per acre)
- High density suburban residential (4-14 DUs per acre)
- Urban residential (7-14 DUs per acre)

These five classes of recommended residential use compare favorably with the present zoning categories for the Township and are consistent with the build-out densities discussed in this report. The following commercial and office categories have been adopted within the 1992 Comprehensive Plan:

Commercial and Office

- Community commercial and local convenience commercial
- Planned highway commercial and business
- Government, finance, and office

These commercial and office uses are generally confined to the West Chester Pike corridor and to the Paoli Pike frontage between Boot Road and North Chester Road. The 1992 Comprehensive Plan recognizes that the predominant supporting commercial needs

EXHIBIT 5

of the Township will continue to be served by the commercial corridor located in West Goshen Township extending west from the West Goshen Shopping Center. The following industrial uses have been adopted for both local and regional employment purposes:

Industrial

- Planned business, research, limited industrial park, and residential
- Business park
- Light industrial

The planned business, research, limited industrial park, and residential area is limited to the SmithKline Beecham property located south of Paoli Pike, north of Boot Road, and west of Line Road. This 312-acre parcel may be developed in the future for a combination of the above uses and cluster residential development the details of which are currently under study between the Township and SmithKline Beecham. Business park use is partially developed and consists primarily of the Goshen Corporate Park and the Hicks property. The balance of the light industrial uses planned for future growth in the Township include the Goshen Corporate Park West as depicted along Airport Road. The Comprehensive Plan also recommends the following open space and parkland uses:

Community Facilities

- Open space conservation
- Parkland

The Comprehensive Plan also recommends several unique Land Use Planning overlays which will be very helpful in achieving conservation oriented land use patterns as the Township approaches its potential ultimate build-out:

Overlay Areas

- CR - Cluster single family residential development
- Traditional neighborhoods
- Planned campus development
- Village development
- Natural resource protection areas on undeveloped tracts
- Greenway buffer

The above overlays must now be translated into a zoning format in order to preserve the remaining environmentally constrained areas not yet developed.

In summary East Goshen Township has adopted a forward thinking Comprehensive Plan which will allow ultimate build-out of remaining undeveloped areas in a most orderly fashion. Fortunately, the extent of resulting zoning changes required to implement the above Land Use Plan are minimal since the land use classes recommended are very consistent with present zoning except for the adoption of the above overlay districts.

EXISTING ZONING

East Goshen Township has followed a rigorous program of zoning implementation since the mid-1950s by carefully correlating the zoning classifications with the most recent Comprehensive Plan Land Use Updates. This has resulted in a high degree of land use/zoning conformity with minimal non-conforming development. The Township has continually updated or amended its Zoning Ordinance in accordance with changing conditions and changing needs for its residents.

Exhibit 6 depicts the official Zoning Map of East Goshen Township as last revised in October 1986. Two minor zoning district changes have occurred as follows:

- Expansion of the C2 Local Convenience Commercial District to include newly acquired land for the Township Municipal Building expansion.

- Rezoning from R2 to R3 Residential District for a small parcel located south of Morstein Road and west of U.S. Route 202.

The various classes of existing zoning districts are clearly depicted on Exhibit 5. With regard to permitted development densities, there are numerous options available within several of the districts depending upon the availability of public water and/or sewage facilities. The Township has recently adopted a new ordinance requiring that all residential construction (other than single family detached dwellings located on a lot of one acre or larger) be connected to a central, public water system.

Table 3.5, Summary of Existing Zoning Density Requirements, provides an overview of how the Township manages and regulates its existing and future development. It should be noted that there are provisions within the Ordinance, as amended, which allow for different area and bulk regulations which cannot be expressed in a summary table such as Table 3.5.

TABLE 3.5

SUMMARY OF EXISTING ZONING DENSITY REQUIREMENTS

ZONING DISTRICT	TYPE OF USE	MIN. LOT SIZE PER DU OR MAX. DENSITY	EQUIVALENT RESIDENTIAL DENSITY AND/OR MAX. BUILDING COVERAGE PERCENTAGE
RESIDENTIAL

EXHIBIT 6

Virtually all development contemplated by or covered by the Township Zoning Ordinance is expressed in Table 3.5 either by a stipulated density of dwelling units per acre, or by the minimum lot size established. Where possible, the equivalent number of residential dwelling units per acre have been listed in the last column of Table 3.5 to bring all residential development to one common denominator expressed in dwelling units per acre.

Single family detached residential cluster options are available in both the R2 and the R4 Residential Districts. This option can be useful in the R2 District but not necessarily as useful in the R4 District where the basic minimum lot size of 14,500 square feet per DU is substantially less than the 25,000-square foot minimum lot area for single family cluster developments.

The density and development parameters shown in the last column of Table 3.5 have been used in forecasting EDUs for future growth area. it is expected that there will be future amendments to the Zoning Ordinance to accommodate the new overlay areas recently adopted as a part of the 1992 Comprehensive Plan.

3.3 Growth Areas and Population Projections

The future growth areas within East Goshen Township include numerous projects which have already commenced development but which are not yet complete and future developments which have not yet been submitted to the Township for purposes of subdivision or land development approval and/or for the purposes of sewage facilities planning. For example, Bow Tree Farms, Section IV, is already approved and sewage treatment commitments have been made; therefore, projects which have been committed are not discussed in this section.

The locations within the Township where new growth or expansion of present growth can occur are listed below:

- Price Property - 130 acres - Paoli Pike at Ellis Lane
- Reservoir Road Vicinity - approximately 53 new dwelling units possible from subdivided properties
- Fire House Property Development - 13 acres for development
- Fedor Property - West Chester Pike - approximately 175 apartments or townhouses
- Miscellaneous West Chester Pike Properties - 12.9 acres
- Balance of the Hicks Property including the milk store - approximately 76 acres

- o SmithKline Beecham Property - preliminary subdivision plan approval granted August 1991 - plan withdrawn
- o The Woods Property near Forest Lane - approximately 86 acres
- o The Sherman Property near Forest Lane - approximately 38 acres
- o The Grace Estate Property at Strasburg and Line Roads - development intentions not identified

As noted in the 1992 Comprehensive Plan, there may also be additional "infilling" of existing properties which because of their present size are capable of further subdivision and development activity. The Updated Act 537 Plan has attempted to recognize such development potential except for the Grace Estates for which there is no known development intention.

Population Projections

The projected ultimate population for the Township has been previously discussed in Section 1.4 of this report. Specifically, Table 1.4.3 describes an estimated projected ultimate population of 21,434 persons of which 4,619 persons would ultimately reside on land parcels which are not yet committed for development or subdivision activity. It is most likely that East Goshen Township will reach its ultimate population during the time frame 2001-2010. The rate of future Township growth and the expansion of the present population will be dependent in part on economic conditions, the market absorption rate for new dwelling units within the Township and, to some degree, the ability to expand existing sewage treatment facilities.

3.4 Five-Year (1993-1997) Sewage Expansion Areas

This section covers the anticipated sewage needs and the areas requiring expansion of sewage service for East Goshen Township during the period 1993 to 1997 (the five-year planning area). The sewage treatment needs are broken down into the two separate watersheds. The first is the Chester Creek Watershed where all existing and projected sewage needs are treated at the West Goshen Sewage Treatment Plant.

Chester Creek Sewage Flows (West Goshen Sewage Treatment Plant)

The long-standing agreement between East Goshen Township and West Goshen Township allows 1.0 MGD of actual sewage flow to be treated by West Goshen. During 1991 and 1992, all such sewage flow has been carefully monitored and checked by each Township. The results indicate that approximately 77.4 percent of

theoretical flow (based on EDU allocations) actually reaches the West Goshen STP.

Table 3.6, Allocation of Sewage Flow to West Goshen Sewage Treatment Plant, dated October 28, 1992, describes the status of theoretical sewage flows which are on-line as of the date of this report. In addition, the estimated sewage flows which are now committed but in the process of being connected are also depicted in column 2 of Table 3.6.

The third column 2 of Table 3.6 describes the probable connections to be made during the period 1993 to 1997.

It must be noted that the East Goshen Township Sewage Administration Office carefully monitors the status of all sewage connections including the comparison of actual on-line flows versus the theoretical flows and any variations in this ratio to assure that the daily flow to the West Goshen STP does not exceed the 1.0 MGD agreement factor.

The existing areas of the Township which have been provided with reserved sewage capacity and which might be developed within the five years include the following:

o	Park Avenue - Goshen Fire Company - 13 acres -	7,000 gpd
o	Fedor Property West Chester Pike - 175 apartments -	35,000 gpd
o	West Chester Pike - miscellaneous R5 connections - 7.3 acres -	7,700 gpd
o	West Chester Pike - C4 Commercial area - 12.9 acres -	7,500 gpd
o	Hicks Property - 14.9 acres - Tax Parcel 53 - 3-1.2B -	4,544 gpd
	Total	61,744 gpd

Careful comparison of the current theoretical gallons per day on-line to the West Goshen STP reflects a total of 974,599 gallons and an additional 88,295 gpd committed and in progress for connections. With the addition of 61,744 gallons expected during the period 1993-1997, the aggregate daily theoretical flow would be 1,124,638 gpd. However, it is expected that the continued monitoring of the above aggregate flows would be approximately 79 percent or approximately 884,306 gpd at the end of the 1997 planning cycle. The increased ratio between current theoretical and real flow will be increased because of

certain commitments made by the Township which are based on gallons and not standard EDU flows. Please note that the potential additional connections for the next five-year planning cycle (1998 to 2002) are discussed in the next section of this plan but utilizing the same information as depicted on Table 3.6. Please refer to 1994 Addendum at the end of this section which refers to a new "West Goshen Alternative" not previously discussed or analyzed in this section.

Expected New Service Areas for the Ridley Creek Sewage Treatment Plant

Table 3.7 depicts the allocation of sewage flow to the Ridley Creek Sewage Treatment Plant as of October 28, 1992. The East Goshen Township Sewage Administration also monitors on a monthly basis all connections which have been placed on-line and those which are committed and in progress or various stages of construction.

As of October 28, 1992, the theoretical flow connected to the Ridley Creek Plant totaled 333,127 gpd. Other commitments which have been made by the Township, which are in the process of being constructed, or consist of future construction approved by the Township includes a total of 157,400 gpd reflected in column 2 of Table 3.7 (plus the Spinozzi and McCloskey reserved connections which are committed but not paid).

It must be noted that the monitored daily/monthly average flows reflect approximately 69.2 percent of the theoretical on-line flows. Accordingly, the on-line flows and the committed flows in progress for connection would total 490,527 gpd (theoretical flow) whereas the estimated actual flow, when such connections are completed, will be approximately 349,363 gpd, based upon actual gallons committed and EDUs committed. If the new Kent Apartment connection is removed from the Ridley Creek STP and redirected to the West Goshen STP, this would reduce the Ridley Creek STP flow noted above by 84,420 gpd.

The areas of the Township and areas external to the Township which might be connected to the Ridley Creek Plant during the five-year sewage planning cycle (1993-1997) include the following:

- Spinozzi & McCloskey Properties - 5 EDUs - connections can be made only when Taylor Highland receives public sewers — 1,750 gpd
- Bryn Mawr Rehabilitation Hospital - Willistown Township - — 40,000 gpd

- Christ Memorial Lutheran Church - Willistown Township - 1,000 gpd

Total 42,750 gpd

Based on the above possible additions, the aggregate on-line sewage flow in combination with the committed additional sewage flow and the probable 1993-1997 flow total 533,277 gpd (theoretical) and an estimated true flow of approximately 391,573 gpd. There are two other areas of the Township depicted in Table 3.7 within the column noting committed sewage capacity in progress. These areas include the Meadowbrook/Cornwallis area which is being designed for 76 EDUs and an estimated theoretical flow of 26,600 gpd. The other area scheduled for the design of public sewer extensions is the Taylor Highland area covering 64 EDUs which committed are at 22,400 gpd. Section 2.3 of this plan and Section 4.5 of this plan cover the urgency of need regarding these areas of East Goshen Township.

Also shown in the committed and in progress column of Table 3.7 is a 30,000 gpd reservation for SmithKline Beecham. It must be noted that SmithKline Beecham (SKB) has already purchased 40,000 gpd in sewage treatment capacity at the Ridley Creek plant and SKB also has an option to purchase 12,000 gpd in additional capacity. This option has now expired. The inclusion of the 30,000 gpd and the status of the future dates of connection will be totally dependent upon future development plans to be formulated and submitted to East Goshen Township. At the time of publication of this report, there are no pending construction plans for any sewage capacity beyond the existing 10,000 gpd now on-line. Since SmithKline Beecham has withdrawn its approved subdivision plan, the 55,000 gpd shown in Table 3.7 could be eliminated at this time for treatment at the Ridley Creek STP.

Subsequent to the publication of the original draft of this Act 537 Update, Immaculata College directed a letter to East Goshen Township requesting that the Township consider sewage treatment for approximately 137,000 gpd (with 132,000 gpd of this projected flow being in the Valley Creek Watershed) to service major portions of the college facilities. Immaculata College is located in the Valley Creek Watershed in East Whiteland Township. Table 3.7 in this report shows a future reservation of only 5,000 gpd for Immaculata College which would occur after the year 2002. Apparently, East Whiteland Township has indicated to Immaculata College that it cannot handle the college's wastewater needs. Although it would be very costly to divert the Immaculata College wastewater flows to East Goshen Township, this may be a need which must be recognized under the new "West Goshen Alternative" discussed as an Addendum to this section.

Summary of Sewage Expansion Plans for 1993-1997

Most of scheduled "committed and in progress" connections will probably be made during the 1993 to 1997 planning cycle. In addition, approximately 61,744 gallons of new sewage flow could be generated for the West Goshen Treatment Plant. Please refer to 1994 Addendum contained at the end of this section.

Regarding the Ridley Creek Sewage Treatment Plant, most of the "committed and in progress" connections will probably be made during the five-year planning cycle 1993-1997. However, the EDUs reserved for Spinozzi and McCloskey will be made only upon need. Further, any external connections made for facilities located in Willistown Township will be considered when approval is received to expand the Ridley Creek Treatment Plant beyond its present committed capacity of 400,000 gpd.

3.5 Ten-Year (1998-2002) Sewage Expansion Areas

Again, referencing Table 3.6 which describes the allocation of sewage flows to the West Goshen STP, the fourth column of this table describes potential properties which might be connected during the next five-year planning cycle. These areas include:

o	The Price Property - 129.6 acres - approximately 50 EDUs now and 79 EDUs at a later date	17,500 gpd
o	Park Avenue - Goshen Fire Company Property	9,517 gpd
o	Hicks Property - The balance of 34.8 and 36.7 acre parcels	21,807 gpd
o	Sts. Peter and Paul Church (upon need)	1,150 gpd
o	Green Acres - 3 EDUs	1,050 gpd
o	Strasburg/Route 352 - approximately 20 EDUs	7,000 gpd
o	Charter Chase Subdivision - 93 EDUs	32,550 gpd
o	Mill Valley Area - 25 EDUs	8,750 gpd
o	Mill Stream Drive - 25 EDUs	8,750 gpd
	Total	108,074 gpd

Ridley Creek Sewage Treatment Plant

The fourth column of Table 3.7 describes the probable expansion of public sewers and or new connections to the Ridley Creek STP during this five-year planning cycle as follows:

o	SmithKline Beecham - estimated 55,000 gpd (estimated by SKB consultants). This need can now be eliminated.	55,000 gpd
o	Spinozzi & McCloskey - balance of 5 EDUs - upon need	1,750 gpd
o	The Woods Property - 85.9 acres - dependent on new sewer construction for adjacent areas	30,100 gpd
o	Willow Pond - 28 EDUs - existing community system - dependent on other area sewer extensions	9,800 gpd
o	The Sherman Property - 37.8 acres - dependent on new sewer construction on adjacent areas	12,950 gpd
o	William Henry Apartments - East Whiteland Township - totally dependent upon approval to expand Ridley Creek STP or divert to West Goshen STP	59,000 gpd
	Total	168,600 gpd
	(less SKB)	-55,000 gpd
		113,600

Summary

The probable connections during the period 1998 to 2002 for the West Goshen Sewage Treatment Plant total 108,074 gpd and the probable expansion areas and/or new connections for the Ridley Creek Sewage Treatment Plant total 168,600 gpd for the same five-year planning cycle. The above figures could be substantially revised based upon the new "West Goshen Alternative" discussed in the Addendum at the end of this section.

It must be noted that the expansion areas discussed in this section for the year 1998 to the year 2002 could move forward by five years based upon need, or could be delayed beyond the year 2002 if the anticipated needs do not develop. For example, the immediate development of the 129.6-acre Price property at Paoli Pike and Ellis Lane could result in the immediate need for

approximately 129 EDUs or 45,150 gpd for the Chester Creek/West Goshen STP.

In a similar fashion, the existing onlot conditions within the Charter Chase subdivision may actually improve under the Township Onlot Sewage Facility Management Program which could delay public sewer connections for Charter Chase beyond the year 2002 or if conditions improve sufficiently could negate the need for extending public sewers to Charter Chase. A constant monitoring of on-going sewage needs for the municipality and the urgent needs within areas immediately adjacent to the Township boundaries is required.

3.6 Sewage Expansion Areas Beyond Year 2002

Table 3.6 also contains a fifth column which depicts two possible sewage service areas beyond the five and ten-year planning cycles. For the Chester Creek/West Goshen STP, there are approximately 53 EDUs along Reservoir Road which might require eventual public sewer connections if existing onlot systems exhibit malfunctions over the next ten years. In addition, the balance of the development of the Price property located at Paoli Pike and Ellis lane would probably be developed beyond the five-year and ten-year planning cycles. A reservation of 79 EDUs or 27,650 gpd has been noted for such potential future development. These two areas would add approximately 46,250 gpd to the West Goshen STP.

With regard to ultimate future sewage treatment at the Ridley Creek STP as shown in Table 3.7, appropriate reservations have been made in future years for the Indian Hills area of the Township containing approximately 43 EDUs. However, this would be totally dependent upon sewer connections being made to the Willow Pond area and adjacent properties which may or may not occur. In addition, the Brookmont/Tremont area contains approximately 44 EDUs which should be considered for future sewer service when and if public sewers are needed in this area.

Along North Chester Road, the are approximately 82 miscellaneous single family detached EDUs which could be considered for future sewer service and totalling an addition of 28,700 gpd to the Ridley Creek Treatment Plant. Also, the Old Orchard/Ivy/Raewyck area has approximately 29 EDUs which should be considered for extension of public sewers if the existing onlot systems exhibit malfunctions.

In correspondence with the Township, the management of the William Henry apartment complex has indicated that if the Ridley Creek STP is allowed to expand and if the apartment complex is permitted to connect to the East Goshen Sewer system, then additional land at the apartment complex could be developed

contributing an additional 11,000 gpd over and above the 59,000 gpd previously requested in writing from this group.

Also, Immaculata College has indicated to East Goshen Township that it might have future sewage treatment needs comprising approximately 5,000 gpd which could be considered if the above stated assumptions for Ridley Creek STP expansion and external Township service are approved.[1]

The above areas, if ultimately approved for connection to the Ridley Creek STP, would contribute an additional 85,300 gpd. The bottom line totals for sewage flow to the West Goshen STP including on-line, committed, the two five-year planning cycles extending from 1993 to the year 2002, and, the future potential connections beyond 2002 would bring the total theoretical flow to Chester Creek to a figure of 1,278,962 gpd. If the same ratio of actual flow versus theoretical flow is maintained for residential EDUs (77.4 percent), and the gallons of sewage treated are maintained per the developer agreements, the ultimate aggregate flow to the West Goshen STP would be 1,008,994 gpd. Please refer to 1994 Addendum contained at the end of this section.

In a similar calculation for the Ridley Creek STP, and assuming that approvals are received to expand this plant to 700,000 gpd, the aggregate flows at present and into the 21st century would be 787,177 gpd (theoretical flow) with an estimated actual flow of 607,299 gpd. If further consideration is given to the November 1992 request from Immaculata College for an additional 132,000 gpd to be treated at the Ridley Creek STP, the ultimate total for the estimated actual flow could be as high as 739,299 gpd.

---

[1] Correspondence received by East Goshen Township in November 1992 suggests that the total request for Immaculata College sewage treatment is 137,000 gpd and not 5,000 gpd as previously reported.

1994 ADDENDUM
AMENDING SECTION 3.0, FUTURE GROWTH,
AND 5- AND 10-YEAR SEWAGE EXPANSION PLANS

After completion of the East Goshen Act 537 Plan Update dated December 1992, copies of this document were circulated to each surrounding Township and to the Chester County Planning Commission and Chester County Health Department. During the spring of 1993, both County agencies suggested further exploration of a spray irrigation alternative to the proposed expansion of the Ridley Creek STP using stream discharge methods. Willistown Township, in its review of the same draft, strongly urged that East Goshen Township look at other alternatives to the proposed 0.3 MGD expansion of the Ridley Creek STP, using stream discharge.

During late June 1993, a meeting was convened at the PaDER offices regarding a number of matters. At this time, the PaDER representatives also suggested to the East Goshen officials present that stream discharge of any additional effluent at the Ridley Creek STP would be difficult if not impossible to obtain. A spray irrigation alternative was again suggested.

The Township has investigated a spray irrigation alternative for the 0.3 MGD discharge at the Ridley Creek STP as reported in the Addendum to Section 4 of this updated plan. The cost factors and other problems related to major wetland intrusions makes spray irrigation an unacceptable alternative for East Goshen Township.

In August 1993, the Consultant to the West Goshen Municipal Authority and West Goshen Board of Supervisors provided a letter to the Manager of East Goshen Township outlining the availability of all or portions of up to 780,000 gpd in future sewage treatment capacity. This offer was predicated upon current expansion plans now contemplated by West Goshen Township and its Municipal Authority.

In September 1993, a letter was directed from East Goshen Township to the Consultant for West Goshen Township expressing interest in all of the available 780,000 gpd in future capacity. No written response has been received as of May 1994. However, this offer and this possibility presents a new alternative which is hereafter identified in this Updated Plan as the "West Goshen Alternative." The letter from East Goshen Township to the West Goshen Consultant accepting all of a major part of the 780,000 gpd was predicated upon: 1) confirming the interest of potential users by way of detailed discussions; 2) developing the cost feasibility of the transfer of the wastewater to the Chester Creek basin; 3) developing specific cost factors for the additional capacity which would be cost effective; and

4) verifying that East Goshen's trunklines would be capable of handling the additional wastewater flows.

East Goshen Township is anxious to conclude its Act 537 Plan update and without further commitment from West Goshen Township will not spend additional funds to develop any feasibility studies for the West Goshen Alternative. If and when a commitment is received from West Goshen Township, a supplement to the Act 537 Plan Update will be submitted to PaDER.

4.0 PLANNING AND FACILITIES ALTERNATIVES, EXPANDED FACILITIES, AND SEWAGE MANAGEMENT OPTIONS

4.1 Areas Requiring Public Sewer Connections - 1993 to 2002

4.1.1 Chester Creek Drainage Area (West Goshen STP) Alternatives for the Five-Year Planning Period 1993-1997

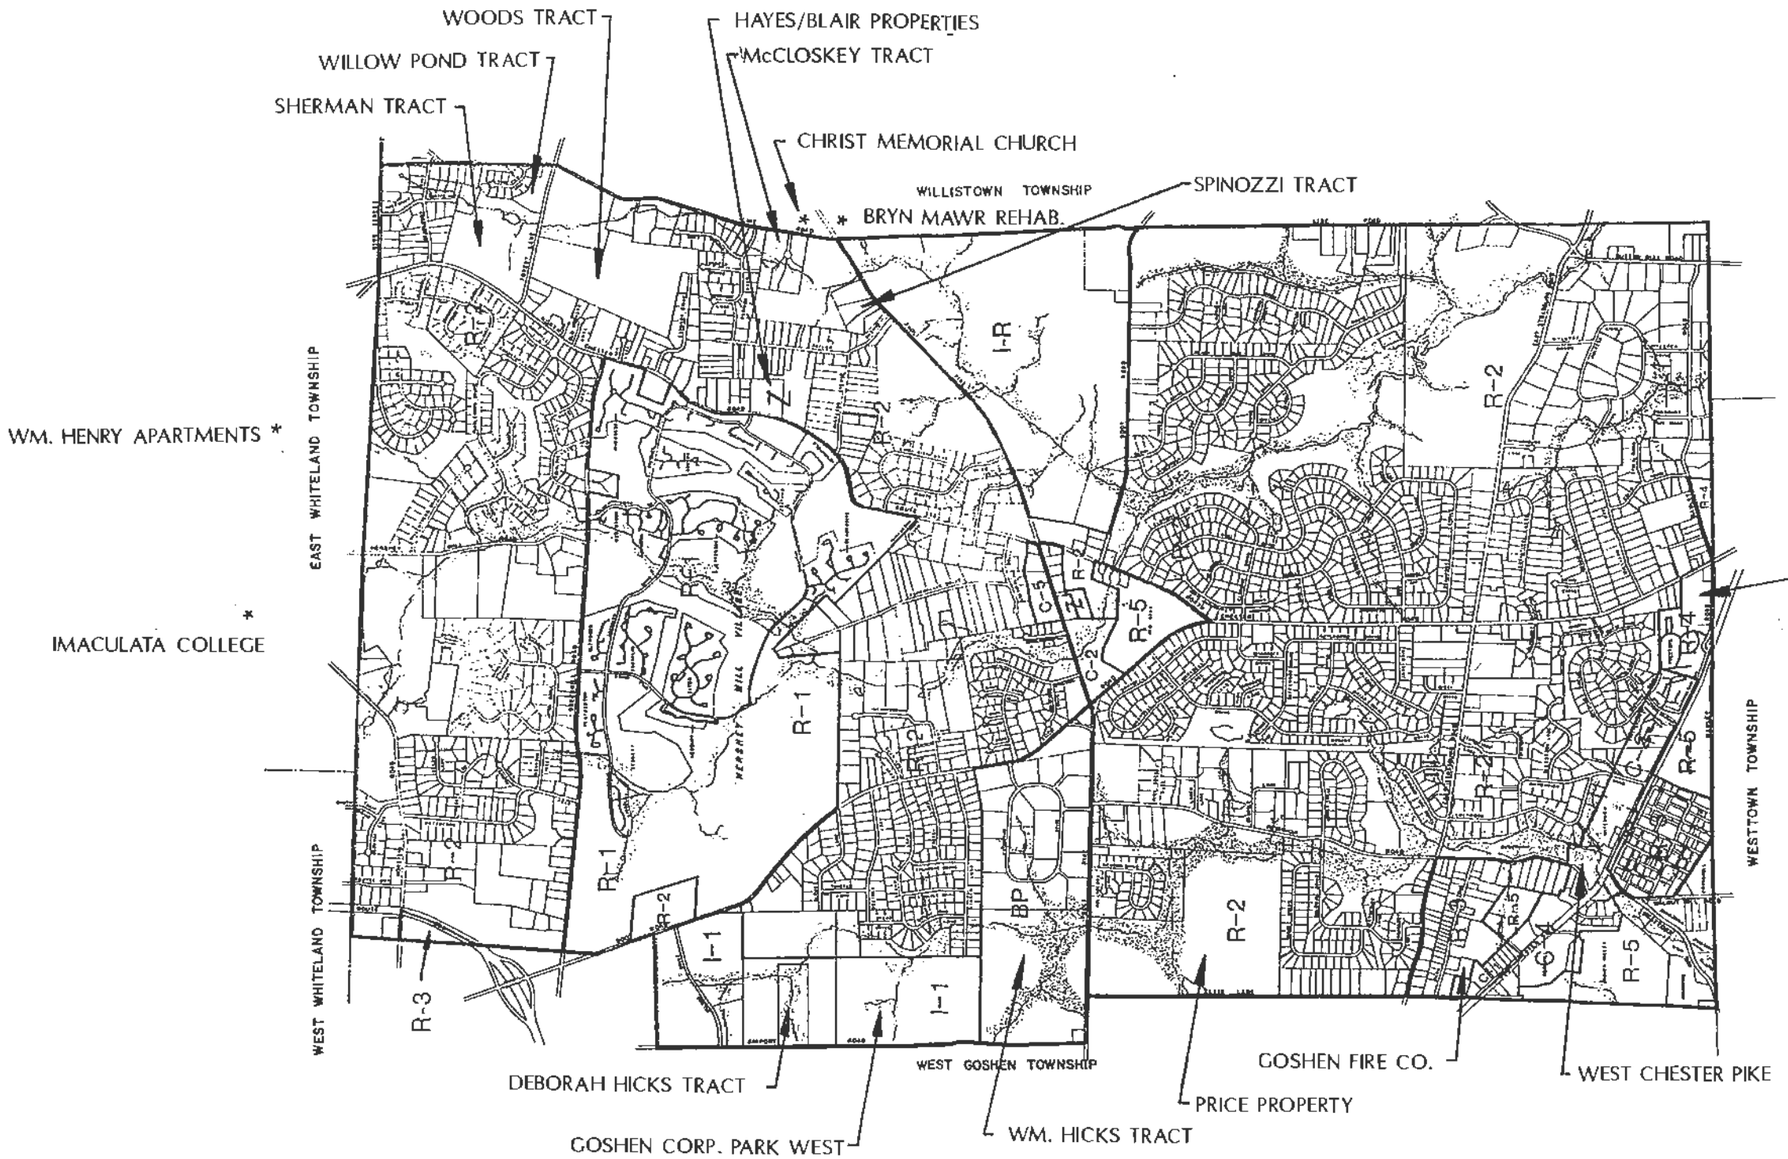

Table 3.6 in the preceding section identifies 15 existing developments, or areas titled "Committed/In Progress", which were previously committed for connection to the West Goshen STP. These facilities are expected to be connected to the public sewer system during the period 1993-1997 and are not subject to any further alternative sewage facility analysis.

Table 3.6 also identifies five additional areas titled "Probable" which represent future potential public sewer connections during the period 1993-1997. The alternatives for these five areas are discussed immediately below:

Park Avenue - Goshen Fire Company Property. This property contains 13 acres, is zoned for R-3 Residential use, and has a future potential under present zoning for the generation of 16,517 gpd in sewage flow. There are no immediate plans for development of this property which is currently used as open space and is used as the site of the Goshen Country Fair. Onlot sewage disposal is not recommended as a viable alternative in view of the permitted density available under the R-3 zoning options. Approximately 7,000 gpd in sewage flow has been reserved for the period 1993-1997 with the balance representing 9,517 gpd in future sewage flow being reserved for the period 1998-2002.

Fedor Property - West Chester Pike Corridor. This property is currently zoned R-4 Residential and has the maximum potential for approximately 175 apartments. There are no pending development plans for this site. However, it is expected that the property could be developed prior to 1997, and thus 35,000 gpd in sewage flow is reserved to service the facility when developed. The permitted density under the R-4 zoning district would mandate connection to public sewers. Therefore, onlot sewage facility alternatives are not feasible for the subject property.

UPDATED ACT 537 WASTEWATER
FACILITIES PLAN
DECEMBER 1992
EAST GOSHEN TOWNSHIP

AREAS DISCUSSED FOR PUBLIC SEWER NEEDS

1993-2002

EXHIBIT 4-0

Miscellaneous High-Density Residential. Within the West Chester Pike Corridor, there are 7.3 acres of miscellaneous land zoned for R-5 Urban Residential use which mandates connection to a public sewer system. Therefore, 7,700 gpd in sewage flow has been reserved for such development which is expected to occur prior to 1997. The permitted density and the location of this property indicate that onlot sewage alternatives would not be feasible if the property is developed as zoned. Therefore, a public sewer connection appears to be the only realistic alternative.

West Chester Pike Commercial Properties. There are 12.9 acres of undeveloped property in the C-4 Commercial district along the West Chester Pike Corridor. It is estimated that these properties would contribute approximately 7,500 gpd in sewage flow when developed. It is expected that the majority of this property would be developed prior to 1997. Onlot sewage management alternatives do not appear to be feasible and public sewer connections are available within the vicinity.

Deborah Hicks Property. It is estimated that this 14.9 acres of the Hicks property could be developed during the period 1993-1997 which would require approximately 4,544 gpd in additional sewage flow. This property is zoned I-1 Light Industrial and would require connection to the public sewer system.

Summary. In addition to the 15 properties or developments already committed and in progress, as reflected on Table 3-6, if the above five areas are developed prior to 1998, they would contribute 61,744 gpd in new, theoretical sewage flow during the period 1993-1997. In addition, it should be noted that any decision by property owners to develop other parcels depicted in Table 3-6 could accelerate the need for additional public sewer connections which is discussed in Section 4.1.2 below.

4.1.2 Planning Alternatives for Areas Requiring Connections to the Chester Creek (West Goshen STP) Sewage System - 1998-2002

Table 3.6 in the preceding section shows nine additional areas of the Township which could require connection to public sewers during the period 1998-2002. These nine areas are discussed below:

Price Property. The Price property, currently in agricultural use, contains 129.6 acres and is located south of Paoli Pike and east of Ellis Lane. There are no pending plans for development of this tract although development pressures are increasing along the Paoli Pike Corridor. The new 1992 Comprehensive Plan recommends that the developable portion of this tract be considered as a traditional neighborhood with possible cluster single-family residential development. Large portions of the property are affected by the Worsham and Wehadkee hydric soils with substantial flood plain areas in the center of the tract. The balance of the site is affected by the Glenville and Glenelg soils. It is expected that the property would be developed in accordance with R-2 zoning requirements with a cluster residential overlay applied which could produce 129 dwelling units or less.

It is projected during the period 1998-2002 that approximately 50 EDUs could be developed within the Price property. It is not likely that community onlot sewage systems would be proposed for reduced lot sizes under the cluster residential development concept although the Glenelg soils in the northwest corner of the property are appropriate for such sewage disposal methods. The balance of the Price property, which is capable of containing an additional 79 EDUs, would probably be developed after the year 2002. However, this potential for 27,650 gpd in additional sewage flow could be realized during the ten-year planning cycle if development pressures along Paoli Pike continue.

Park Avenue - Goshen Fire Company Property. The ultimate development of the Goshen Fire Company property was discussed in Section 4.1.1 above. No development plans are pending for this property. However, an additional 9,517 gpd in sewage flow is reserved for the period 1998-2002 because the R-3 Zoning District requires connection to public sewers.

Hicks Property - Balance of Land Including 34.8- and 36.7-Acre Properties. The aggregate 71.5 acres within the Hicks property is currently zoned for BP-Business Park Use and would generate the need for 21,807 gpd in new sewage flow when developed. It should be noted that the committed sewer connections for this property could be accelerated to the 1993-1997 five-year planning cycle if development pressures required earlier development. Although this property is seriously affected by flood plain and hydric soil/potential wetlands, the property does have reasonable access from Airport Road and from Paoli Pike

to each developable portion of the site. Public sewer connections would be mandated due to the current zoning requirements. Therefore, 21,807 gpd in potential new sewage flow is anticipated for connection to the West Goshen STP by the year 2002.

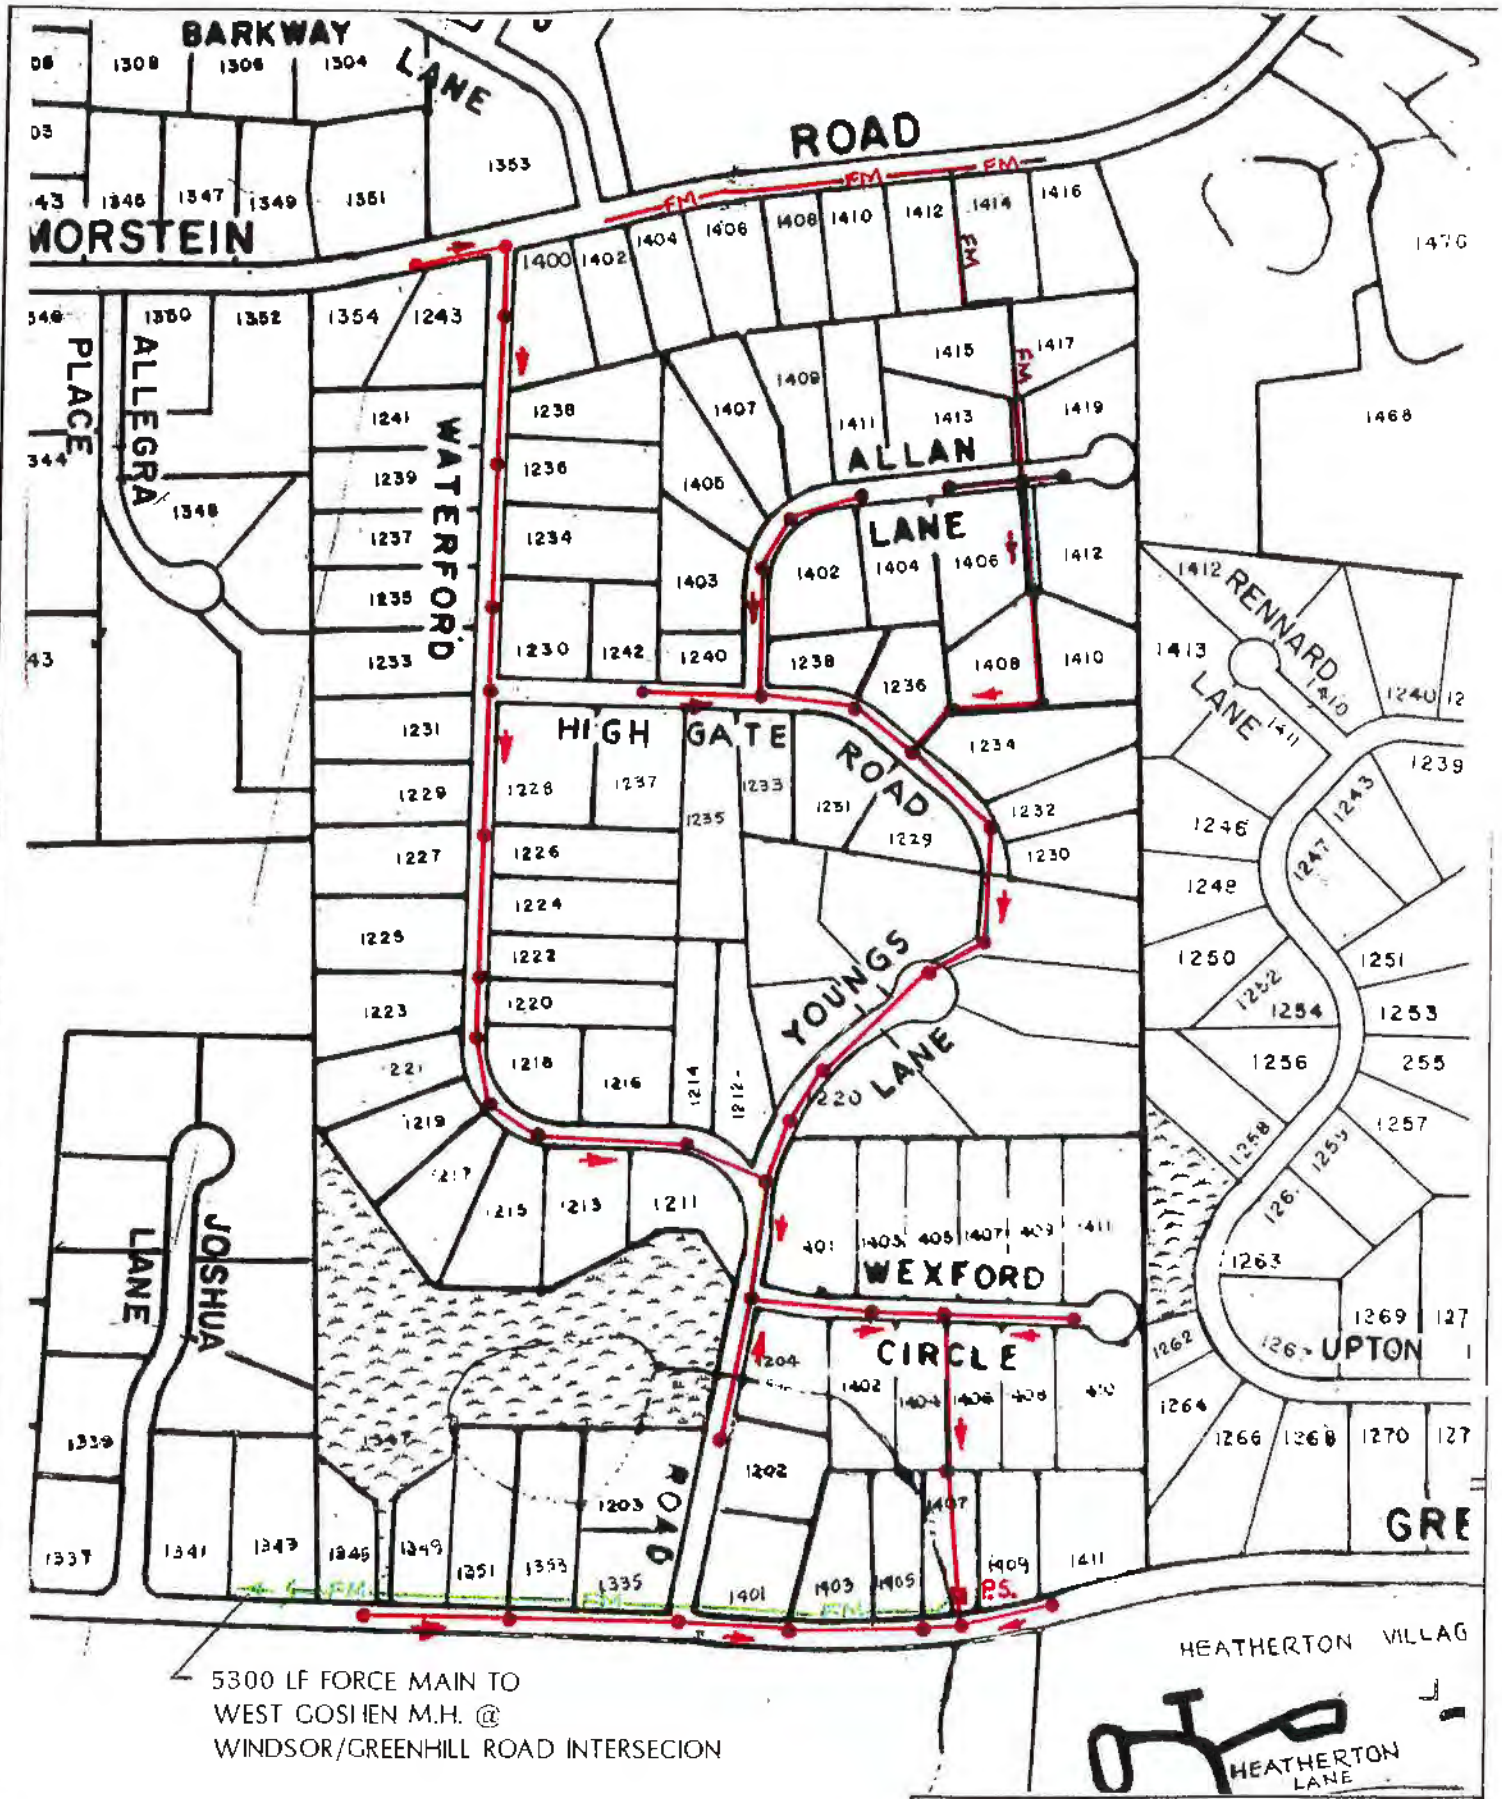
Saints Peter & Paul Church. It is very likely that the existing onlot sewage disposal system for Saints Peter & Paul Church can be continued indefinitely. However, in the 1991 township-wide survey of all facilities served by onlot systems, prior problems were reported for this facility. The entire property is zoned for R-2 Residential use. There are ample areas within the 30-acre site to allow a continuation of onlot disposal. Public sewers are available on Wilson Drive immediately opposite the Church's location on Boot Road. Another alternative would involve a grinder pump connection to the existing gravity sewer located in Windsor Drive in West Goshen Township to the west of Boot Road, but again opposite the Church property. It is most likely that the Church will continue to be served by its present onlot system subject to any future renovations required. However, the reservation for 1,150 gpd will be kept within the future public sewer service needs, and this site will be monitored periodically under the Township's onlot management program.

Green Acres Area and Strasburg Road - Route 352 Vicinity. In the vicinity of the Green Acres subdivision along Strasburg Road, there are three single-family detached dwellings which could be connected by gravity to the Chester Creek Sewage System. These units are currently served by onlot systems. In addition, along Strasburg Road in the vicinity of Route 352, there are 20 additional single-family detached units which may require connections to the Chester Creek (West Goshen STP) system during the next ten years. These units are currently served by existing onlot systems. Several nearby properties have been connected by low-pressure grinder pump connections to the public sewers. Although it is possible that many of these dwellings can continue with individual onlot systems, the possibility exists that many of the total 23 units will be connected to public sewers over the next ten-year period.

Charter Chase Subdivision. The 1991 survey of onlot system conditions showed a 14.5 percent malfunction rate for this area (refer to Table 2.7 in Section 2.3 of this report). The actual responses showed 11 prior or current malfunctions and one additional graywater

discharge. A separate walk-through field survey conducted in the Charter Chase area during April 1992 revealed a total of 21 existing or past malfunctioning systems and four additional graywater violations within 98 individual single-family detached dwellings located in this area of the Township. Many of the prior malfunctions reflected evidence of correction by the construction of new seepage beds and other remedial efforts.

Since the Charter Chase area, which contains 98 single-family detached dwellings, reflects a very high percentage (25 percent) of past and prior malfunctions, it must be monitored continuously over the next ten years. There are a number of alternatives available for the Charter Chase subdivision which are briefly discussed below:



- Allow the onlot systems to remain while applying a rigorous inspection system of constant monitoring of pumping cycles and rehabilitation of failed systems.

- Analyze the possibility of utilizing sand mounds for the three to five dwelling units which have already received new seepage beds but which appear to be not working.

- Connect the entire subdivision to public sewers by the year 2002 using a combination of gravity sewers for 87 dwellings and grinder pump/low pressure installations for 11 additional dwellings. The wastewater would be collected at a pump station located on Greenhill Road where sewage would be pumped west along Greenhill Road across Boot Road to the first existing manhole in West Goshen Township at Windsor Drive.

It appears that the Charter Chase area can be stabilized and that the number of malfunctioning systems can be reduced with more frequent pumping, and repair of the existing systems and the removal, relocation or reconstruction of five to eight seepage beds currently located in the Worsham soil series.

The Charter Chase subdivision will continue to be shown in Table 3.6 with a future anticipated sewage flow of 32,550 gpd for the 98 dwelling units located in this area of the Township. Exhibit 4-1 depicts a feasible combination gravity/grinder pump/pumping station scenario for providing public sewers for the entire

Charter Chase area which would be pumped to the West Goshen STP. Please refer to the 1994 Addendum amending Section 2.3 of this report related to the Charter Chase subdivision.

Mill Valley Area. The Mill Valley area, including Barkway Lane and South Tulip Drive, is located adjacent to the West Whiteland Township municipal boundary north of Morstein Road. This area has existing capped sewers. This area contains 25 single-family detached units all served by onlot systems. During the 1991 survey of onlot systems, 16 of the 25 EDU owners responded to the survey, and only one prior malfunction was noted. There is no long history of malfunction or problems in this sector of the Township. However, a long-term reservation has been made for 8,750 gpd to assure that the Mill Valley subdivision could be served by public sewers and connected to the West Goshen STP if required. If this happened, this area would be connected near the year 2002 or possibly beyond the year 2002.

Another possible option or alternative for the Mill Valley area would be that West Whiteland Township would ultimately provide public sewers for the portion of Mill Valley located within their Township. If this alternative occurs, the 25 residential units located within East Goshen Township could be considered for connection to West Whiteland's sewer system.

Mill Stream Drive Area. The Mill Stream Drive area also contains 25 single-family detached residential units served by onlot systems. During the 1991 mail survey, there was one reported malfunctioning system and one graywater discharge or a total of two past or present violations. Mill Stream Drive should also be carefully monitored under the Township's onlot sewage facility monitoring program. The most appropriate way to provide public sewer service to the Mill Stream Drive area would be a gravity collection system to the Hersheys Mill Estates collection system where the sewage effluent would be pumped to West Goshen Township. A long-term potential reservation has been noted for this area should the need arise to provide public sewers.

In summary, the above nine described areas, if all connected to the West Goshen Sewage Treatment Plant, would add a theoretical daily flow of 108,074 gpd by the year 2002, or an expected 88,872 gpd in actual daily flow.

4.1.3 Areas Within the Ridley Creek Drainage Basin Requiring Possible Sewage Service During the Period 1993-1997

Sections 3.4 and 3.5 of this report indicate the urgent need to expand the existing Ridley Creek STP beyond its present permitted capacity of 400,000 gpd. Table 3.7 in the prior section of this report indicates the current projects, subdivisions, or facilities which are on-line to the Ridley Creek STP as of October 1992. These 13 facilities have a connected on-line use of 333,127 gpd in theoretical flow and a metered actual daily flow of 230,490 gpd. In addition, the Township has committed nine additional projects, areas, or facilities for connection to the Ridley Creek STP most of which will probably occur during the period 1993-1997. The nine additional connections would total 157,400 gpd in theoretical flow which, if all connected, would add approximately 109,000 gpd in actual flow during the five-year planning period. It should be noted within Table 3.7 of this report that the diversion of 84,420 gpd from the New Kent Apartments to the West Goshen STP would substantially reduce the above wastewater flows.

There are two particular areas of the Township which must be discussed in this Act 537 Plan Update although planning modules have been submitted and approved for public sewer connections for both areas. These are the Meadowbrook/Cornwallis area and the Highland/Taylor area which are discussed below.

Meadowbrook/Cornwallis Area. East Goshen Township previously reserved 26,600 gpd for the eventual connection of the Meadowbrook/Cornwallis area. This area of the Township first exhibited sewage malfunctions as recorded in the 1981 Act 537 Plan Update. The area was further noted as having increased sewage malfunctions in the 1985 Act 537 Plan Update. The results of the 1991 Township-wide survey of onlot system malfunctions, as reported in this report in Table 2.7, reflected eight malfunctioning systems, three other illegal discharges on the same property, and four graywater discharge violations or 31 percent violations reported by 48 homeowners.

In a 1991 field survey conducted within the Meadowbrook/Cornwallis area, members of the Township staff, the Chester County Health Department, and a representative of the homeowners' association completed a survey of 77 dwelling units within the area. The results are depicted in Table 2.8 of this report. Thirty-six percent of the 77 dwelling units reflect current or past sewage system malfunction and combined graywater discharge. In 1992, the Board of Supervisors approved the planning modules for the Meadowbrook/

Cornwallis area and directed the Municipal Authority to proceed with the design and construction of public sewers for the area.

A great deal of controversy has been generated by residents in the area who would prefer to have an all gravity sewer system instead of the proposed low pressure sewer system. Six years of engineering study resulted in a conclusion by the Board of Supervisors in 1992 that the area should be connected to the Ridley Creek STP as soon as possible. An outside engineering consultant was retained by the Civic Association to study the alternative cost formulas for the gravity system versus the low pressure sewer system. In addition, a third independent engineering consultant was selected by the Municipal Authority to study each of the proposals. It was clear that the low pressure system represented the most cost effective public sewer system for the area.

The low pressure sewer system for the Meadowbrook/ Cornwallis area is currently under design by the Authority Consulting Engineer. Therefore, detailed final plans are not available to depict the exact location of the low pressure sewer pipes which will serve the Meadowbrook/Cornwallis area. However, a reasonable facsimile of the low pressure sewer system design which is to be built for the Meadowbrook/ Cornwallis area is depicted in the recently approved planning module as Exhibit B24. Also a Plot Plan contained as the last page of the recently approved planning module depicts in greater detail all topographic details for both subdivisions and the intended pressure sewer system. Exhibit 4-2 is a reproduction of this Plot Plan.

For the Meadowbrook portion of the proposed new pressure system, the pressure sewer will discharge into an existing gravity sewer line located at the end of East Grand Oak Lane. The proposed pressure system for the Cornwallis Drive/Colonial Drive/Wineberry Lane area will discharge to an existing gravity sewer located between Colonial Drive and Paoli Pike.

The planning modules approved by PaDER on July 2, 1992 include provisions for providing public sewer service via the pressure sewer method for 73 single-family homes or 25,550 gpd, which is three dwelling units less than the reservation for sewage flow for this area as depicted in Table 3.7.

ALL LOCATIONS OF EXISTING UTILITIES SHOWN ON THE PLAN HAVE BEEN DEVELOPED FROM EXISTING UTILITY RECORDS AND/OR ABOVE GROUND EXAMINATION OF THE SITE. COMPLETENESS OR ACCURACY OF LOCATION AND DEPTH OF UNDERGROUND UTILITIES ON STRUCTURES CANNOT BE GUARANTEED. CONTRACTOR MUST VERIFY LOCATION AND DEPTH OF ALL UNDERGROUND UTILITIES AND FACILITIES BEFORE START OF WORK, AS PER ACT 187.

NOTES

1. Existing topography on this plan is prepared by Air-Cography, Inc., by aerial means and is not by Yerkes Associates, Inc. Contours and elevations in areas of dense vegetation may not be to National Map Accuracy standards. It is recommended that field checks be made of contours and elevations prior to start of construction.
2. Existing houses are served by individual on-site sanitary systems and individual wells.
3. Floodplain from U.S. Department of Housing and Urban Development Flood Hazard Boundary Map H-01, July 8, 1977.
4. Wetlands from U.S. Inventory Maps.
5. Proposed sanitary sewer system is a low pressure system, each home to connect to system by a simplex grinder pump.
6. Location of proposed Low Pressure System is preliminary. Final location will be determined in the field to avoid trees, shrubs, and roadway paving. Final design will be submitted with Part 31 - Water Quality Management Permit. Estimated sewer length is 9,750 Feet.

EXHIBIT 4

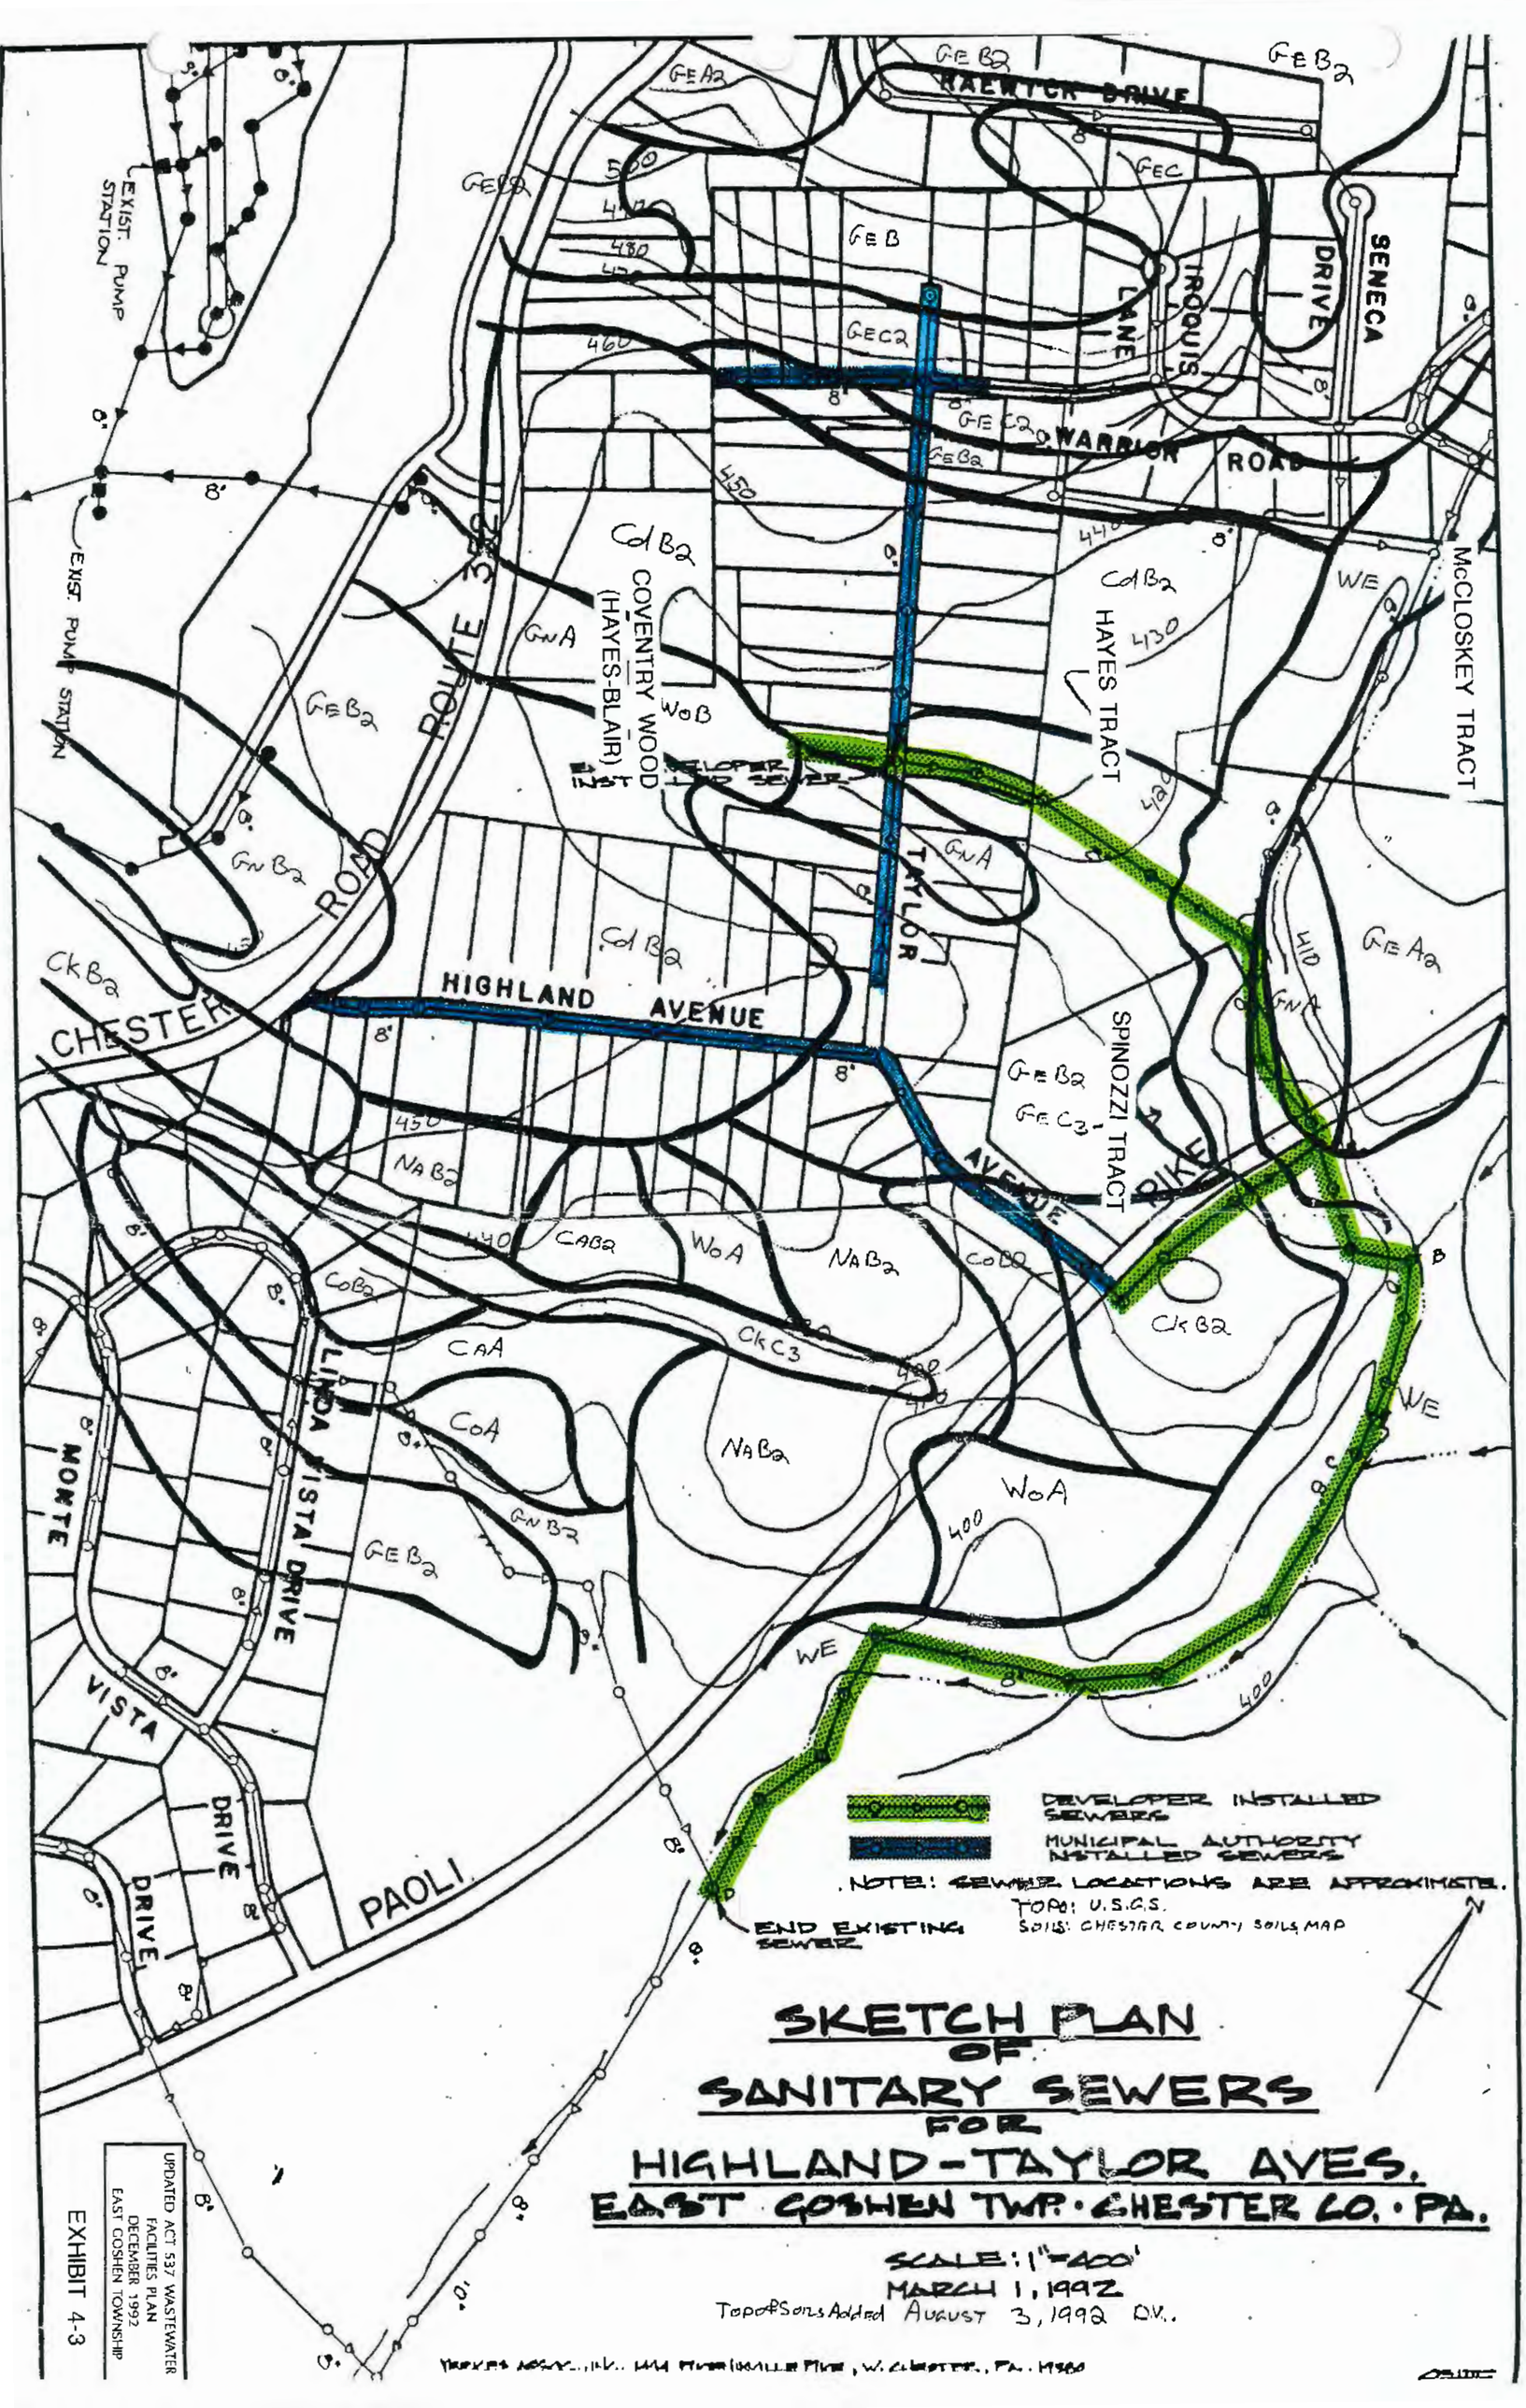
The recent appeal by the Meadowbrook/Cornwallis Civic Association to the Pennsylvania Environmental Quality Board is based upon the PaDER approval of the planning modules for a low pressure grinder pump system and the decision of the Municipal Authority to proceed with the installation of the pressure sewer system versus an all gravity system desired by the residents. Table 4.1 depicts a summary of estimated costs or expenses per unit as prepared by Yerkes Associates, Inc., as extracted from a memorandum to the East Goshen Municipal Authority from John B. Yerkes, Jr., dated January 31, 1992.

This table depicts the estimated cost per dwelling unit for the low pressure sewer system as compared with the Yerkes Associates' estimate for a gravity system serving both neighborhoods. Also incorporated in Table 4.1 is an estimate utilizing actual bid prices for a similar low pressure system now under construction in Wallace Township.

TABLE 4.1

MEADOWBROOK/CORNWALLIS AREA
SUMMARY OF EXPENSES PER UNIT

ITEMS	AUTHORITY	HOMEOWNER	TOTAL
Grinder Pump*	$ 1,820		
Pump Installation		$ 350	
House Lateral		872	
Electrical Installation		510	
Septic Tank Fill		220	
Authority Force Main	3,357		
Engineering	671		
Tapping Fee	(1,500)	1,500	
LOW PRESSURE SYSTEM ESTIMATE USING WALLACE TOWNSHIP PRICING	$ 4,348	$3,452	$ 7,800
YERKES ASSOCIATES, INC. ESTIMATE FOR GRAVITY SYSTEM (1990)	$14,700	$3,680	$18,380
YERKES ASSOCIATES, INC. ESTIMATE FOR LOW PRESSURE SYSTEM	$ 4,650	$3,780	$ 8,430



* Assumes that the $2,170 grinder pump costs break down to $350 for installation and $1,820 for pump unit cost.

In summary, SMC acting as Consultants for the Act 537 Plan Update, concurs with Yerkes Associates that the low pressure system is by far the most cost effective and that this system should be fully designed and constructed as planned.

Highland/Taylor Area. The Highland/Taylor area, containing 62 dwelling units has one of the highest reported rates of malfunctioning systems as determined in the 1991 survey of Township-wide onlot systems. Table 2.7 of this report depicts a response of 49 of 62 homeowners or 79 percent. Nine prior or present malfunctioning systems and four additional graywater discharge problems were reported representing more than 26 percent of the residential owners responding to the survey. This area has been under study by the Township and the Municipal Authority for almost ten years. The revised planning modules for providing gravity sewer service to 64 existing single-family dwellings was resubmitted to PaDER on August 4, 1992 and was approved by PaDER in January 1993. Attached on the following page as Exhibit 4-3 is a sketch plan for the proposed gravity sanitary sewer system for the Highland/Taylor area. The system, which is now under design by the Authority consulting engineer, will have minor modifications at the intersection of Warrior Road and Taylor Avenue, but otherwise will be constructed as depicted and connected to the SmithKline Beecham sewer extension now being constructed by Realen Homes, the developer of the Hayes tract.

Highland Avenue will be served by a basic gravity sewer system extending eastwardly to Taylor Avenue, thence across Paoli Pike and again eastwardly within the SmithKline Beecham property to the trunkline. Portions of Warrior Road and all of Taylor Avenue above Highland Avenue will be serviced by a gravity sewer system collecting at the streambed and flowing eastwardly to the Hayes property to Paoli Pike and thence into the SmithKline Beecham property.

The construction of public sewers in the Highland/ Taylor area will represent a significant improvement in public health and safety conditions in this vicinity of the Township. During 1991, one homeowner, whose onlot system could not be certified, working with the Township's cooperation, constructed a private sewer lateral to the existing gravity sewer in Linda Vista Drive in order to sell his dwelling. Other severe cases of continued onlot malfunctions will be cured with the construction of this new sewer system which is estimated to go on-line to the Ridley Creek Treatment plant during the period 1993-1997. Of all areas within East Goshen Township requiring immediate public sewers, the Highland/Taylor area is by far the most urgent.

EAST GOSHEN TOWNSHIP

EXHIBIT 4-3

In addition to the nine properties or facilities depicted in Table 3.7 as being committed and in progress, there are three additional properties or facilities which may require connection to public sewers during the period 1993-1997. These three properties or facilities are discussed below:

Spinozzi and McCloskey Properties. Each of these properties has a future reservation for five EDUs each or a total of ten EDUs representing 3,500 gpd in future sewage flow. The connection of these properties would be dependent primarily upon need (which is not evident at this time) and the completed construction and availability of adjacent sewer connections between the Hayes/Blair property and within the Highland/Taylor area. A sewer easement is in place from the McCloskey property to the Hayes property. The Municipal Authority will construct a sewer line from the Hayes property to Highland Avenue and will be reimbursed when the Hayes/Blair property is developed. Five EDUs have been reserved for the 1993-1997 planning period and five additional EDUs have been reserved for the balance of the ten-year sewage planning cycle extending to the year 2002.

Bryn Mawr Rehabilitation Center. The Bryn Mawr Rehabilitation Hospital and Center has been on record for a number of years requesting the ability to connect to the Ridley Creek Treatment plant because of current problems being experienced at the Rehabilitation Center site. Although this facility is located in Willistown Township, this need for 40,000 gpd is considered to be extremely valid and necessary. In order to serve the Bryn Mawr Rehabilitation facility, a gravity sewer would be required along Paoli Pike connecting to the SmithKline Beecham sewer system extension now under construction. East Goshen Township can consider this request for external municipal sewage service only when approval has been received for the needed expansion of the Ridley Creek STP beyond its present limit of 400,000 gpd.

Christ Memorial Lutheran Church. The Christ Memorial Lutheran Church located on the east side of Line Road and north of Paoli Pike has been on record for several years requesting a connection to the Ridley Creek STP. This facility is also located in Willistown Township. Alternative sewage connections for this Church facility could occur as a result of a gravity sewer along Line Road, to Paoli Pike in connection with a future connection for the Bryn Mawr Rehabilitation Center, or another alternative is a connection through the Realen property currently being developed. Since this

facility is also located in Willistown Township and is external to the current service area of the Ridley Creek STP, this provision of requested sewer service can only be considered upon approval of expansion of the Ridley Creek STP, or other alternatives now under study by East Goshen Township.

The addition of the above properties, when and if needed and approved, would add a total of 42,750 gpd in theoretical sewage flow or approximately 42,210 gpd in estimated actual sewage flow.

4.1.4 Areas Within the Ridley Creek Drainage Basin Requiring Possible Sewage Service During the Period 1998-2002.

Table 3.7, contained in the prior section of this report, outlines six additional properties which could require connection to public sewers during the period 1998-2002. All of the connections would be totally dependent upon the expanded capacity of the Ridley Creek STP to 700,000 gpd. These facilities, areas, or developments are discussed below:

SmithKline Beecham. The SmithKline Beecham facility, known currently as the Applebrook Research facility, is the second largest land holding within East Goshen Township. SmithKline Beecham currently holds (and has paid for) 40,000 gpd in reserved capacity at the Ridley Creek STP. In addition, Beecham holds an option for purchase of a 12,000 gpd future connection when required.

SmithKline Beecham prepared its own Sewage Facilities Planning and Environmental Site Analysis for the entirety of its property under date of August 8, 1991. This study was prepared by Cahill Associates. Table 1 of the above cited study depicts a total project wastewater need for the SmithKline Beecham property as being 95,080 gpd at the time of ultimate development. Since 40,000 gpd has been reserved and is either on-line or committed and in progress, an additional 55,000 gpd is depicted as being needed during the period 1998-2002. A summary statement is contained in this report which indicates "If additional capacity in excess of the currently allocated 40,000 gpd becomes available in that (the municipal) system during the interim period, all wastewaters will be discharged to the public system." Although the SmithKline Beecham report indicates that total sewage needs would not occur until the year 2005, it is more expedient to assume that development will occur on this site during the next ten years and may be predicated in part upon the approval of an expanded Ridley Creek STP.

SmithKline Beecham does have an alternative to handle any excess wastewater flow beyond its present 52,000 gpd reservation and option which would involve land application of effluent within the 312-acre parcel. However, it is clearly stated that the preferred option is to discharge all wastewaters to the Ridley Creek STP. SmithKline Beecham and East Goshen Township recently settled litigation involving zoning matters resulting in SmithKline Beecham's withdrawal of their subdivision plan and sewer capacity reservation request. Based upon current information, it does not appear that SmithKline Beecham will need additional wastewater capacity beyond the 40,000 gpd currently reserved (and paid) at the Ridley Creek STP. The 12,000 gpd option for additional future wastewater service has expired.

Spinozzi and McCloskey. The balance of the Spinozzi and McCloskey five EDUs could require connection to the Ridley Creek STP during the five-year period ending in the year 2002. The need and timing of such connection was discussed in the prior section of this report.

Woods Property. This R2 zoned property is located south of Forrest Lane and west of Line Road. The site is currently undeveloped. No development plans have been submitted to the Township for this property which contains 85.9 acres. In order to provide public sewer service for this site when developed, a gravity sewer would have to be constructed south along Line Road possibly in conjunction with a future gravity sewer line serving the Willow Pond subdivision which currently utilizes a community onlot system. No studies have been worked out as to whether such a gravity system would follow the streambed or be constructed within the right-of-way of Line Road. This alternative to provide public sewers for this undeveloped property would have to be worked out by the Township in conjunction with the adjacent Sherman property (37.8 acres) which abuts the Willow Pond subdivision. A future sewer service need of 30,100 gpd is projected, assuming development will occur prior to the year 2002. A small portion of the Woods property is affected by hydric soils and flood plain, but the predominant part of the property contains the Glenelg soil series.

As an alternative, portions of the property might be developed with conventional onlot sewage disposal systems with capped sewers for future connection to the Ridley Creek STP. Community-type onlot wastewater disposal facilities are not recommended for this property in view of the failure of a similar system

immediately to the north of this site associated with the Willow Pond development.

Willow Pond Subdivision. This facility has 28 existing single-family detached dwellings (15 in East Goshen and 13 in Willistown) and has been discussed previously in Section 2.4 of this report. The 28 EDUs are currently served by a community onlot system. The initial sewage beds malfunctioned and were replaced during 1992 by the Homeowners Association. It is apparent that this community-type in-ground system may have to be ultimately replaced and connected to the Ridley Creek STP in conjunction with future potential development of the Woods property and possibly the adjacent Sherman property. A future projected need of 9,800 gpd is indicated for the ten-year planning period ending in the year 2002.

Sherman Property. This 37.8-acre tract zoned for R2 Residential Use has a potential, when developed, of producing 12,950 gpd. The Sherman property is affected by hydric soils and flood plain to a limited extent but has the similar soils associated with the Willow Pond development located to the east. The Sherman property is located just north of Forrest Lane and to the west of Willow Pond. If this property is developed prior to the availability of public sewer extensions to the area, it is recommended that capped sewers be installed because of anticipated poor soil conditions in this vicinity. A future public sewer service need for 12,950 gpd is depicted as being necessary prior to the year 2002.

William Henry Apartments. The William Henry apartment complex is currently located in East Whiteland Township. The facility currently has a wastewater treatment facility handling 59,000 gpd which discharges directly to Ridley Creek. In addition, adjacent zoned property would allow additional apartments contributing an additional 11,000 gpd. Since this facility is located outside of East Goshen Township, the requested sewage service needs would be considered only after the approval of the expansion of the Ridley Creek STP. In the alternative, the future connection for the William Henry apartments might be considered under the "West Goshen Alternative" now under study by East Goshen Township.

The above six facilities when and if approved for connection to the Ridley Creek STP would add approximately 168,600 gpd in theoretical sewage flow. One important addition has occurred just as this report was being published.

Previously, Immaculata College contacted East Goshen Township with a request interpreted as being a need to treat approximately 5,000 gpd in sewage flow from one facility at the college. This was based upon a returned onlot sewage disposal survey form related to the Villa Maria House which reflected average daily sewage generation of 5,000 gpd. Initial information suggested that a holding tank was in use but an NPDES Sewage Permit No. 0050423 was attached. The permit is for discharge into an unnamed tributary to Ridley Creek.

On November 6, 1992, the Township received a written request from legal counsel representing Immaculata College/ Camilla Hall/Villa Maria House of Studies requesting consideration of connecting 137,700 gpd in wastewater flow from the above facilities to the Ridley Creek STP. This additional external need from East Whiteland Township is being discussed by the Municipal Authority and East Goshen Township for possible inclusion in the Ridley Creek STP, as expanded. If expansion is not possible, the "West Goshen Alternative" must be considered. Please note that only 5,000 gpd is shown as a future need beyond the year 2002 for Immaculata College, and this may be subject to change if further studies warrant.

4.2 Areas to Remain with Individual Onlot Systems - 1993 to 2002

At the time of the 1991 Township-wide survey of onlot systems, 699 such systems were known to be in existence within the Township boundaries. The number of dwelling units which would be removed from the individual onlot disposal category would include the following over the next ten-year period:

Ridley Creek Drainage Area

o	Meadowbrook/Cornwallis Area -	73	dwellings
o	Highland/Taylor Area -	63	dwellings
o	Spinozzi-McCloskey -	10	dwellings
	Subtotal -	146	

Chester Creek

o	Charter Chase -	98	dwellings
	Total	244	Potential Conversions

Based upon 1993 field survey results, it does not appear necessary at this time to provide public sewers for the Charter Chase subdivision noted above.

It was previously noted that the Charter Chase subdivision may not require connection to public sewers if the Township-wide

onlot management program is successful. As a minimum, the 136 EDUs located within the Meadowbrook/Cornwallis area and the Highland/Taylor area will eventually be removed when served by public sewers. In addition, the Spinozzi and McCloskey property could also be connected in the next ten years. If all of the above dwelling units are connected, the remaining individual onlot sewage systems would total 455 dwellings, plus any additional dwellings which might be approved in the future for individual onlot systems.

4.3 Individual Onlot System Onlot Management

East Goshen Township has learned through experience and recent walk-throughs of major properties during the last two years that some homeowners within the Township totally neglect their onlot sewage disposal systems. The Township is in agreement that an onlot disposal system management program is vital and necessary to assure that widespread future malfunctions are diminished and/or eliminated where possible.

The need to monitor individual residential pumping cycles of septic tanks and cesspools has become very evident during the period 1989-1992. Many homeowners reported in the November 1991 Township-wide study that they had "never pumped" their septic system or cesspool. It was obvious from the returned survey forms that many people were not even aware that they were serviced by onlot systems.

This can be quickly corrected with a rigorous onlot management program supported by a proposed new ordinance to be adopted by the Township during 1994. The consultant has provided a draft copy of a model ordinance now in use in other municipalities and the Municipal Authority has obtained additional draft copies of similar ordinances which appear to be more suited to use within East Goshen Township.

It is also the consultant's recommendation that the Township adopt an ordinance requiring mandatory capped sewers for new construction in areas where poor soil conditions exist and where land owners/developers are currently entitled to the use of individual onlot sewage disposal facilities as a matter of law and PaDER regulation. It is strongly recommended that the capped sewer ordinance carry a ten-year time frame for anticipated connections to proposed public sewer extensions.

The consultant has also recommended that an increased public awareness program be instituted by the Township and the Municipal Authority providing the remaining owners of individual onlot systems with specific written and graphic information depicting the need to pump all systems and particularly failing systems, to limit the use of garbage grinders within the households where failures are apparent, and to secure professional design advice

regarding the rehabilitation of questionable onlot systems. All new incoming residents of the Township acquiring dwelling units served by onlot sewage disposal facilities must be placed on notice that they are not connected to a public sewer system and that their onlot system will require frequent attention and monitoring.

4.3.1 Areas Covered by East Goshen Onlot Management Program

The East Goshen Individual Onlot Management Program will cover the entire Township. However, the Township has previously identified the residential address for every known individual onlot system located within the Township. These addresses were used during the Township-wide mailing of the 1991 Sewage System Mail Survey. All such addresses for residential and other onlot systems will be monitored continuously.

4.3.2 Periodic Inspections and Maintenance Required

As a minimum the East Goshen Onlot Sewage Management Program will require pumping of all septic systems and all cesspools not less than once during each three-year period. The program will contain provisions for annual pumping for selected residential units identified as having prior malfunctions and periodic high-water levels in tanks or systems previously noted during field inspections or as reported in the 1991 Township-wide survey results. Septage haulers will be required to register with the Township Sewage Enforcement Office annually. Each authorized septage contractor will be required to report specific results of the condition of the system at the time of required pumping. The Township will require periodic inspections for properties having systems which report continued problems, malfunctions and/or violations.

4.3.3 Legal Authority for Enforcement

East Goshen Township will adopt, in 1994, a specific Onlot Sewage Management Ordinance which will establish the legal authority for the Township to execute this program. The Township will create the authority for issuing "warnings and potential violation notices." The legal authority for enforcement of violations will be delegated to the Chester County Health Department, the current agency having jurisdiction for violation enforcement.

4.3.4 Standards for Operation, Maintenance, Repair and Replacement

East Goshen Township will require, under the Onlot Sewage Management Program, that all existing septic systems, cesspools, and similar methods of sewage disposal be maintained without malfunctions or violations on a continuous basis.

Existing systems, which show continued potential for pollution and those systems which are classified as malfunctioning under current state regulations, will be required to be replaced.

4.3.5 Fee Schedules and Revenues

The Chester County Health Department has already established a fee schedule for permits related to systems requiring repair, renovation, or replacement. The Board of Supervisors of East Goshen Township will establish a uniform fee schedule to offset anticipated costs related to monitoring systems, maintenance of systems, and administrative fees for notices of violation referred to the Chester County Health Department. A separate fee schedule will be considered by the Township related to building permits and certificates of occupancy for all new EDUs having individual onlot systems. This fee will be related to notices attached to each certificate of occupancy requiring specific maintenance standards for the new onlot system.

4.3.6 Bonding or Financial Assurances

East Goshen Township has decided to adopt a new Individual Onlot Sewage Management Program which will also cover community onlot disposal systems (COLDS). This Ordinance may be adopted by June 1994. A copy of this Ordinance is incorporated in the Plan Summary.

4.3.7 Individual Onlot Sewage Management Program Ordinance

A copy of the draft Ordinance being considered for adoption by East Goshen Township is enclosed in Section 8 of the Plan Summary at the front of this document.

4.3.8 Other Factors Considered

East Goshen Township has already adopted appropriate building code requirements related to water conservation devices for all new construction. In addition, the Township will require appropriate storm water management diversions away from all new inground systems and appropriate remedies for similar storm water problems related to existing chronic malfunctioning systems. Where aerobic tanks are in use, appropriate maintenance and safety requirements will be regulated including alarms, electrical, mechanical, and chemical injection devices required. The Township will not attempt to regulate the location of septage disposal since most existing septage haulers have existing arrangements at local STPs.

4.4 Private Community Systems

As noted in Section 2.4 of this report, there are two remaining private community-type systems located within the Township. The Lockwood Chase facility is now under the ownership and operational control of the Municipal Authority.

The Willow Pond community onlot treatment system is fully discussed in Section 2.4. However, it is apparent that during the ten-year planning cycle 1993-2002, it may be necessary to connect this system to the Ridley Creek STP and place it under the operational control of the Municipal Authority. In the Willow Pond scenario, any decision to develop nearby undeveloped parcels may stimulate or cause an earlier connection to the public sewer system.

It is the opinion of the consultant and the administrative staff of East Goshen Township that the Hersheys Mill Village spray irrigation system is well designed, operating efficiently, is well funded with a more than adequate capital reserve budget, and need not be considered for take over by the municipality during the ten-year planning period 1993-2002. However, the Township will be prepared, by whatever form of legal agreement required, to consider a municipal takeover of this system if the Hersheys Mill Homeowners Association depicts any signs of change in attitude, which is currently to retain ownership and operational control of this sewage system. The Township will keep an open mind on the subject of a potential municipal takeover of the Hersheys Mill Village community system and will review this subject again in 1997 or sooner if warranted.

4.5 Sewage Facilities Management

East Goshen Township has one of the most efficient sewage facility management programs existing within Chester County. The Municipal Authority is a non-operating authority and all facilities are operated by East Goshen Township. The Board of Supervisors has always been responsive to major sewage facility planning needs as evidenced by its frequent investments in Act 537 Plan Updates and future sewage facilities planning.

The Municipal Authority engineer currently works directly for both the Municipal Authority and the Township Board of Supervisors. All capital needs are promptly addressed and requests for new sewage treatment service is considered fairly by the Township within its means to provide such service. The Township staff spends a considerable amount of time and effort in administering the sewage facilities program including monthly monitoring of public sewage flows and the status of cooperative agreements with adjacent townships. It is expected that this

method of management will continue through the sewage facilities planning period of 1993-2002.

It is recognized that the undertaking of the onlot individual sewage facilities monitoring program on a Township-wide basis may add the need for additional staff time in the monitoring of pumping records and the notification to residents for timing and follow-up based on sewage pumping record recommendations. There are no recommended major institutional changes to the sewage management program now in place within East Goshen Township.

4.6 Spray Irrigation Alternative for Ridley Creek STP

The Ridley Creek STP must be expanded to 0.7 MGD. An alternative involving spray irrigation of the additional 0.3 MGD shows that 65 acres of land would be required for spray fields and lagoons. An assumed cost of $55,000 per acre plus $400,000 for pumps, piping and lagoons would cost $3,975.000.

When added to the cost of the STP expansion ($1,200,000), the total cost for a spray irrigation option would be $5,175,000, or $17.25 per gallon of new treatment capacity. This could never be cost effective. In addition, there is no available land for consideration of the spray alternative. Please refer to the Addendum to Section 4.6 following this page.

ADDENDUM TO SECTION 4.6
SPRAY IRRIGATION ALTERNATIVE FOR RIDLEY CREEK STP

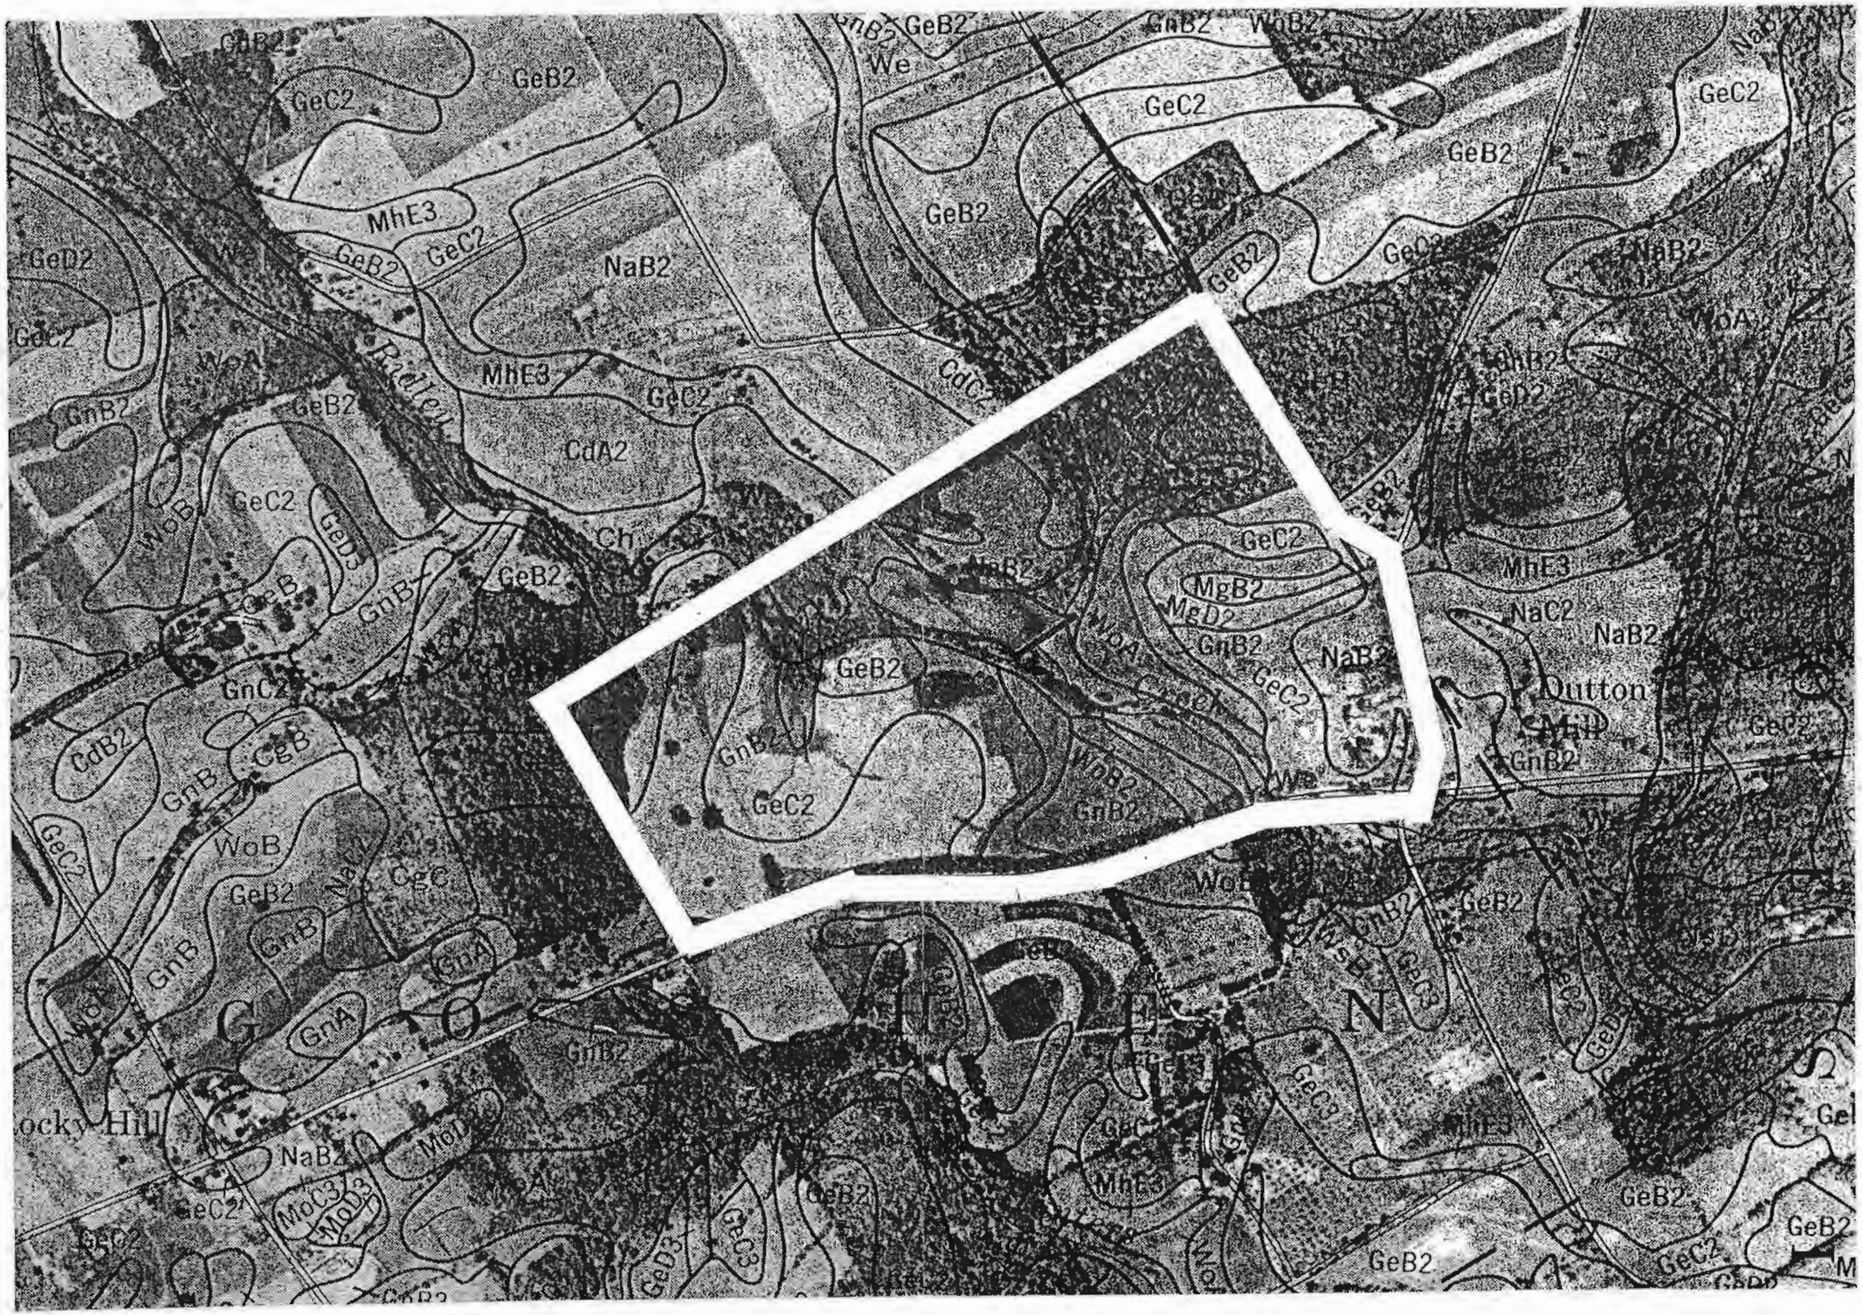
The December 1992 Final Draft for the Act 537 Plan Update was distributed to each adjacent municipality and to the County reviewing agencies during February 1993. The Chester County Planning Commission review as well as the Chester County Health Department review and the Willistown Township letter of comments all encouraged the possible use of a spray irrigation alternative for the estimated 300,000 gallons per day (gpd) in additional wastewater effluent projected for the Ridley Creek STP. The Township has investigated the possibility of the use of spray irrigation techniques with the following summary results.

Table 6.1 as contained on page 6-2 of Section 6.0 of this report clearly establishes an ultimate need for 670,299 gpd for potential wastewater treatment needs at the Ridley Creek plant. When the additional 132,700 gpd requested by Immaculata College is added, the actual anticipated wastewater flow under current plan update conditions would be approximately 740,000 gpd. For future design and discussion purposes only, a figure of 300,000 gpd has been utilized in this Plan Update as the need for expansion of treatment availability at the Ridley Creek STP.

Since a good part of the infrastructure and collection system is already in place for treatment at the Ridley Creek STP, it is logical to assume continued use of the expanded collection system and treatment at the STP. Other sections of this report discuss the viability of use of the A/O system as a means of expanding the current treatment capability from 400,000 gpd to 700,000 gpd. This option would continue to be utilized under a spray irrigation alternative at an estimated cost of $1,200,000 for the STP upgrading.

In lieu of stream discharge into Ridley Creek for the additional 300,000 gpd, a potential alternative would be to acquire nearby property, if available, for spray irrigation purposes.

Only two properties exist within the Ridley Creek watershed which contain sufficient acreage to handle the facilities and spray fields necessary for the discharge of 0.3 MGD. These include the SmithKline Beecham property located north of Boot Road and the additional possibility of use of all or part of the Grace Estate property located immediately adjacent to and south of the Ridley Creek STP.



SmithKline Beecham Site

SmithKline Beecham (herein Beecham) currently owns 312 acres bounded by Paoli Pike, Boot Road, and Township Line Road. In August 1991, Beecham presented to the Township a Sewage Facilities Planning and Environmental Site Analysis for Land Application of Wastewater Effluent based on a proposed development of the entire site. The Land Development Plan that accompanied the Sewage Facilities Study was withdrawn. However, Sewage Facilities Study remains a valuable tool in the evaluation of the tract of land. Figure 13 contained in this study shows the proposed land application areas and winter storage lagoons for a spray irrigation alternative. This carefully prepared study documents by way of percolation tests and soil profiles the areas within the site which are suitable for spray irrigation. Such areas are depicted in Figure A-1 of the Beecham report. According to the report, Beecham could handle its ultimate wastewater generated on the site by using the effluent spray areas and the winter storage ponds depicted on Figure 13.

The Township recently reached a settlement with Beecham for the rezoning and future use of this tract for combined residential or office park purposes. The centroid of the Beecham effluent spray areas is located 1.1 miles north of the Ridley Creek STP. A pumping station located at the Ridley Creek STP conveying treated effluent 1.1 miles north to the Beecham property could never be cost-effective, particularly in view of the assumed necessary condemnation of approximately 75 acres of suitable effluent spray area and storage pond area. Therefore, the use of the Beecham property for future spray irrigation purposes is dismissed as a possible alternative because of the need to pump treated effluent more than 1.1 miles and the high expected cost of condemnation per acre (assumed to be in excess of $60,000 per acre) in addition to the burden of exceptionally high operating costs for future years.

Grace Estate

The Grace Estate property, comprising 182 acres, is located immediately south of the Ridley Creek STP and is bounded on the south by East Strasburg Road and on the east by Township Line Road. The site is currently undeveloped. It is possible that the entirety of this adjacent property (or major portions thereof) could be suitable for spray effluent areas. The attached exhibit depicting the soils for the entirety of the Grace Estate property is shown on the following page as Exhibit 4-4. The soils paralleling Ridley Creek are predominately Worsham series and Wehadkee series with Glenville silt loam and Glenelg silt loam occupying substantial portions of the property to the west of Ridley Creek. It is estimated that it would be necessary to acquire the entire westerly half of this property (west of Ridley Creek) and perhaps suitable portions of

GRACE ESTATE SOILS

EXHIBIT 4-4

the property east of Ridley Creek in order to meet the estimated physical area needs of 75 acres required for application of spray effluent for an additional 300,000 gpd.

The Township believes that the acquisition of any portion of this property would most likely involve condemnation procedures. The best available estimate is that this property would carry an approximate raw land value of $55,000 per acre since acquisition of these major portions of the site would destroy the utility of the balance of the site. Thus, the estimated cost for acquiring approximately 75 acres of the Grace Estate parcel would involve a cost of approximately $4,125,000 and possible additional consequential damages to the balance of the site.

Spray Irrigation Alternative Spatial Needs

The following alternative design assumptions have been utilized in determining the physical or spatial needs for spray field effluent involving 300,000 gpd. Assuming that soil testing would allow the discharge of the above amounts, the following data is relevant.

Land Area Required

- One inch of effluent/week equals 77.3 acres plus buffer and storage pond
- One and one-half inches of effluent/week equals 51.5 acres plus buffer and storage pond
- Three quarters of an inch of effluent/week equals 103.1 acres plus buffer and storage pond

Several design alternatives for an assumed required need for a 60-day winter storage pond are indicated below.

- Eight-foot deep pond equals 9 acres including slope limits
- Six-foot deep pond equals 12.2 acres including slope limits
- Ten-foot deep pond equals 7 acres including slope limits

An average 8-foot depth of pond was assumed for this design alternative. A 1-1/2-inch per week effluent application rate was selected (assuming this is possible) which would require 51.5 acres of spray field area plus a required 100-foot nominal buffer comprising 14.6 acres or a total of 66 acres for spray effluent use. When combined with the 9 acres required for a 60-day storage pond at a average depth of 8 feet, the resulting

required land area is 75 acres. Assuming that 75 acres represents the physical land area requirement at an average price of $55,000 per acre, this would result in an estimated $4,125,00 in costs. Under the Chester County Spray Irrigation Grant Program, utilizing Chester County Open-Space funding, the Township might be entitled to a maximum grant of $600,000 since multiple municipality involvement is anticipated.

Thus, the net cost of $3,525,000 plus an additional $400,000 of estimated cost for the spray field piping and pumping system, plus the $1,200,000 in estimated cost for expansion of the treatment plant would bring the total cost for this alternative to $5,125,000. When equated to the 300,000 gpd of anticipated new wastewater effluent, this results in an estimated cost in excess of $17 per gallon of wastewater treated as compared with the estimated $4.50 per gallon for expanding the STP and allowing stream discharge to Ridley Creek.

It is the Township's position that this spray irrigation alternative, under the above assumed conditions, is not a viable alternative from the initial cost factors and in view of the possibility that the land cost listed above could be higher (based on consequential damages).

5.0 EVALUATION OF EACH ALTERNATIVE PROPOSED

5.1 Evaluation of Consistency of Alternatives Proposed

The purpose for an Act 537 Plan Update is to provide a 10-year blueprint for upgrading existing areas of the Township which are experiencing or exhibiting both major and minor problems with respect to wastewater treatment. The ultimate goal is to make provisions for the safest possible wastewater treatment methods without ignoring the environmental standards already in effect at the local, county, state, and federal levels.

Another purpose of the Act 537 Plan Update is to evaluate the potential future development needs of the Township and to provide the best possible alternative for wastewater treatment facilities within such projected growth areas notwithstanding the existing environmental standards which are applicable including the water quality standards for Chester Creek and Ridley Creek extending to the Delaware River. It should be noted that the water quality standards for Chester Creek are controlled primarily by West Goshen Township for certain sewage treatment needs within East Goshen Township. East Goshen Township proposes no additional stream discharge requirement within the Chester Creek area.

There are numerous mandatory requirements for evaluation of each alternative proposed within this plan, only a few of which are impacted by the proposed new or extended public sewers recommended in this Act 537 Plan Update.

A. Plans Developed and Approved Under Sections 4 and 5 of the Clean Streams Law (35 P.S. Section 691.4 and 691.5) and Under Section 208 of the Clean Water Act (33 U.S.C.A Section 1288).

The primary water quality plan prepared under the provisions of the above statutes is the COWAMP 208 Water Quality Management Plan which was published in April 1978. A synopsis of the requirements of the COWAMP/208 Water Quality Management Plan is contained on pages 1-1 to 1-3 of this updated Act 537 Plan. The COWAMP/208 plan does not identify any wastewater treatment facility located within East Goshen Township. East Goshen Township is a part of the Delaware River Subbasin and occupies the uppermost headwaters of both Chester Creek and Ridley Creek.

Page J-40 of the COWAMP/208 plan describes in paragraph 2 the 1977 baseline conditions for water quality within Chester Creek and emphasizes that the nitrate-nitrogen levels are consistently predicted

above 10 mg/l which would be in excess of PaDER's proposed criteria throughout the 22-mile length of the stream. There are no STP discharge facilities existing or proposed into Chester Creek located within East Goshen Township. The expanded West Goshen STP must meet PaDER current water quality standards established for Chester Creek, including any major additional flow from East Goshen now being contemplated as the "West Goshen Alternative."

Page J-40 of the COWAMP/208 study describes the water quality in Ridley Creek as being "generally good to excellent above Media Borough." The dissolved oxygen violations noted and predicted for the year 2000 all occurred below the Media Borough treatment plant.

Since all of the proposed new sewer extensions and areas to be served within the Chester Creek (West Goshen) STP are within the 1.0 MGD allowed by present agreement with West Goshen Township, the water quality standards maintained within Chester Creek will be reflected in the stream discharge requirements for Chester Creek established by PaDER at the STP discharge point.

Within the Ridley Creek drainage basin, the Ridley Creek STP is operated under a current NPDES permit with discharge limitations depicted in Figure 2.2 of this updated Act 537 Plan. The plant is currently operated well below the discharge limitation. Through the end of the two 5-year planning cycles (1993-1997 and 1998-2002), the Ridley Creek treatment plant should be expanded to a range of 0.6 to 0.7 MGD by the year 2002. Ridley Creek was classified as a high quality stream after the original permit was issued for the STP in 1984. Therefore, the current (1992) water quality standards as established by PaDER must be accommodated in any stream discharge expansion for the Ridley Creek STP. In the alternative, if the Ridley Creek STP cannot be expanded due to stream discharge limitations, and since a spray irrigation alternative for the same discharge is not economically or environmentally feasible, then appropriate wastewater flows must be directed or diverted to the West Goshen STP under the "West Goshen Alternative."

The Bryn Mawr Rehabilitation Center, located in Willistown Township and the William Henry Apartments located in East Whiteland Township, are both currently serviced by existing package plants which discharge directly to Ridley Creek. The current level of discharge for these external facilities does not meet

the required treatment levels as established for the Ridley Creek STP. If these external facilities were eventually taken off-line and each facility was connected to the Ridley Creek STP, the water quality for Ridley Creek would be improved. If the expansion of the Ridley Creek STP is prohibited above 0.4 MGD, another alternative must be considered including the possibility of diverting these flows to the West Goshen STP.

Chester County Sewer Plan - Revised Edition - 1970

The above document is quite ancient and does not adequately describe present or projected conditions for East Goshen Township. Section 1.1 of this Act 537 Plan Update discusses the original county-wide wastewater treatment provisions through 1988. This study projected that by 1988, 12,600 persons residing in East Goshen Township would be served at the West Goshen facility requiring 1.26 MGD at that site. The County plan noted that most of East Goshen Township, including portions of the Ridley Creek drainage area, would be provided with wastewater service via pumping station to the West Goshen STP.

The Chester County master sewer plan is considered to be irrelevant because of its age and because East Goshen Township has provided at least three municipal updates superseding the 1970 Chester County document.

B. Consistency with Chapter 94 Municipal Wasteload Management Plans.

The projected public sewer needs for the Ridley Creek STP, as contained in Table 3.7 of this Act 537 Plan Update, will exceed the present permitted discharge capacity (0.4 MGD) for the STP. The most recent 1991 Chapter 94 report indicates that the existing and the projected connections would cause the plant to reach its hydraulic loading discharge capacity in the mid-1990s. The 1992 Chapter 94 report should reflect 5-year and 10-year additions for projected wastewater needs through the year 2002 and beyond. This will depict a possible need to expand the Ridley Creek STP to a minimum of 0.6 MGD and possibly 0.7 MGD. This would include all known facilities located within East Goshen Township requiring sewage service needs for the next ten years and four external facilities located in Willistown Township and East Whiteland Township which could be connected to the Ridley Creek STP provided the STP is allowed to expand as noted above.

C. State Plans developed Under Title II of the Clean Water Act (33 U.S.C.A. Sections 1281, 1299 or Title II and VI of the Water Quality Act of 1987 (33 U.S.C.A. Sections 1251-1376).

State Water Plan

The Pennsylvania State Water Plan--SWP4-Subbasin 3 for the Lower Delaware River strongly encourages and promotes the recharge of ground water and discourages the direct discharge of wastewater and surface waters. East Goshen Township is in compliance, in part, with the State Water Plan in that the Hersheys Mill Village development containing an ultimate 2,032 dwelling units at build-out will continue to utilize spray irrigation and ground water recharge. Similarly, the Lockwood Chase spray irrigation facility will continue as a municipally-operated facility for 103 total EDUs, 23 of which are located in East Whiteland Township. Therefore, approximately 2,135 ultimate dwelling units will be in compliance with State Water Plan SWP4 for Subbasin 3 in the Lower Delaware River.

The facilities scheduled for additional connections to the West Goshen STP located within the Chester Creek drainage area will continue to be discharged from the West Goshen STP which is currently a stream discharge facility. One of the possible options expected to be contained in the 1992-1993 update of the West Goshen Act 537 Plan is the possibility of spray irrigation for a portion of the effluent to be generated as a result of expansion of the West Goshen STP. It is not expected that any of the additional wastewater effluent (up to 1.0 MGD from East Goshen Township through the year 2002) would be other than direct stream discharge after tertiary treatment (under the present municipal agreement). If the "West Goshen Alternative" is selected by East Goshen Township and is approved by West Goshen Township, up to 1.78 MGD in wastewater flow could be directed to the West Goshen STP.

The possible expansion of the Ridley Creek STP involves increasing an existing point of discharge by up to 0.2 to 0.3 MGD at the site of the present STP. Report 4.0 contained in this ACT 537 Update shows that the spray irrigation of the above 0.2 to 0.3 MGD required at the Ridley Creek STP cannot be made cost effective under any spray irrigation alternative. Therefore, an additional stream discharge permit expansion could be required to accommodate existing developments and future developments within East Goshen Township and those previously identified facilities located outside

of East Goshen Township through the year 2002. If the Ridley Creek STP cannot be expanded beyond 0.4 MGD, a substantial portion of the wastewater flows previously contemplated at the Ridley Creek STP may require diversion under the "West Goshen Alternative."

Water Quality Act of 1987

It is not expected by East Goshen Township that any federal financial assistance will be available to the Township or to the Municipal Authority during the 10-year planning cycle ending in the year 2002. It is possible that some financial assistance may be available for the ultimate connection of facilities located external to the boundaries of East Goshen Township (such as Immaculata College, Bryn Mawr Rehabilitation Hospital, etc.) which are listed for possible ultimate connection at the Ridley Creek STP. It is assumed and expected that East Goshen Township will not qualify for direct Pennvest financial grant assistance but individual residents may qualify for future low interest loans related to connection of existing facilities.

D. East Goshen Township Updated Comprehensive Plan of 1992

All of the proposed additional properties, subdivisions and land developments contemplated within reports 3.0 and 4.0 of this Act 537 Plan are in compliance with the recently-adopted 1992 Comprehensive Plan for East Goshen Township. The existing and amended zoning requirements of East Goshen Township are consistent with the newly-adopted Comprehensive Plan, and this Act 537 Plan Update identifies the sewage facility needs through the estimated time period of Township build-out, currently estimated as being beyond the year 2000.

E. Anti-Degradation Requirements of Chapters 93, 95, and 102

The proposed new sewer service areas identified in Sections 3.0 and 4.0 of this report will be in compliance with the above chapters within the Chester Creek watershed. Any new development within East Goshen Township requires approval under the current Subdivision and Land Development Ordinance and the Chester County Conservation District approval regarding erosion and sediment control (Chapter 102).

Within the Ridley Creek drainage area there is no proposed new point of discharge for municipal or private wastewater treatment facilities. The only

element requiring extensive state approvals will involve the possible expansion of the existing stream discharge permit for the Ridley Creek STP to the extent of 0.2 MGD or 0.3 MGD at site of the present facility. This will not involve any construction external to the 1.0-acre site currently occupied by the STP.

If an application is made to expand the Ridley Creek facility, the current (or higher) stream discharge criteria will be met in the design of the expansion of the Ridley Creek STP. It is also expected that the ultimate future connection of four facilities which are external to the Township boundaries will improve the overall stream quality of Ridley Creek thus resulting in an improvement of the water quality below the Ridley Creek STP.

F. State Water Plans

The consistency requirement with the State Water Plan were discussed in paragraph C above.

G. Preservation of Prime Agricultural Lands Under Title 4 of the Pennsylvania Code, Chapter 7, Subchapter W.

None of the development activities identified in this Act 537 Plan Update located within the Chester Creek drainage area or the Ridley Creek drainage area will affect prime agricultural lands as identified in the heading above and as reflected in the Chester County Soil Survey where such soils are depicted on Exhibit 1B of this Act 537 Update.

H. County/State Stormwater Management Plans

To date (December 1992), Chester County has not prepared or adopted a stormwater management plan for any portion of East Goshen Township. Therefore, this requirement is not applicable. However, the Township enforces rigorous stormwater management requirements in the administration of its Subdivision and Land Development Ordinance for all properties scheduled for development.

I. Wetland Protection Under Chapter 105

East Goshen Township has extensive wetlands as depicted by the hydric soil overlay shown on Exhibit 1B of this Updated Act 537 Plan. The expansion of the Ridley Creek STP will not involve any encroachment into existing wetlands since the stream discharge facilities are already constructed. However, a spray irrigation

alternative would cause wetlands encroachment on or adjacent to the Grace Estate property. East Goshen Township currently reviews each development proposal (including any proposed public sewer extensions) under the Chapter 105 requirements utilizing the current Joint Permit procedures established by PaDER.

Virtually all proposed future public sewer extensions aligned with tributaries of both Chester Creek and Ridley Creek will have some wetland intrusions which are permitted for municipal utility construction. All encroachments are designed as minimal encroachments under the Township's current wetland review process. At this point, it is the belief of East Goshen Township that its need to provide public waste water services to malfunctioning areas and to future development sectors of the Township outweighs any potential degradation.

J. Protection under the Pennsylvania Natural Diversity Inventory

Correspondence has been forwarded to the Bureau of Forestry, PaDER, requesting a PNDI search for the areas outlined under this Act 537 Plan Update in an attempt to provide protection for rare, endangered, or threatened plant and animal species. The response letter is contained in Appendix A. A supplemental request has been made for a PNDI search based on revisions to this Plan.

K. Pennsylvania Historic Preservation Act

It is not expected that any of the proposed public sewer extensions or expansion of the Ridley Creek STP will involve any impact regarding identified historical preservation requirements. Correspondence has been forwarded to the Pennsylvania Historic District Commission noting the recommendations contained in this Act 537 Plan Update. The response from the Commission in contained in Appendix B.

5.2 Resolution of Inconsistencies

It appears that there are two inconsistencies between the proposed public sewer service extensions listed in this updated Act 537 Plan and the regulatory or statutory requirements discussed in Section 5.1 of this report.

The first inconsistency will involve wetland encroachments to extend the public sewer system for certain areas of the Township. First, within the Chester Creek watershed, certain

portions of the recommended gravity sewer system for development of the two (2) Hicks properties in the I-1 and BP Zoning District will involve minor wetland encroachment for gravity sewers. This is permissible under a Section (12) nationwide permit for wetland encroachment or a BDWM-GP-5 permit where an absolute need exists for extension of municipal utility crossings and/or trunk sewer connections. Also, if the Charter Chase subdivision should require an extension of public sewers during the next ten years or beyond, the main pumping station at Green Hill Road and approximately 800 linear feet of gravity sewer to service this subdivision would be built in definite wetlands areas. This inconsistency would also be resolved by obtaining a Section (12) nationwide permit under the Joint Permit procedure.

In addition, when the 129-acre Price property is developed south of Paoli Pike, it is likely that minor sewer extensions will be required in a portion of wetland area in order to connect this property with the existing municipal sewer system. Further, if gravity sewers are provided for Mill Stream Drive along the streambed to Tanglewood Drive, a minor wetland encroachment for public sewer construction would be required and a Section (12) nationwide permit would be required under the Joint Permit procedure.

Ridley Creek Sewer Extensions

Table 3.7 contained in this report identifies several areas which are currently developed or will be developed in the future which may require public sewer extensions north of the Saddlebrook Farms subdivision. A 4,600-foot gravity sewer extension north of Saddlebrook Farms could be constructed in the extreme northeasterly quadrant of the Township and would be connected to the current Willow Pond existing community inground disposal system but would also provide future service connections, if needed, for the Woods property; the Sherman property; portions of the Indian Hills area, if required; the Brookmont/Tremont area; and portions of the miscellaneous areas along north Chester Road.

Portions of the 4,600-foot gravity sewer would necessarily be built within the tributary to Ridley Creek. Another possible alignment along Line Road would avoid extensive intrusions into the adjacent wetlands associated with Ridley Creek but would be less desirable. The resolution of this future wetland inconsistency requires the obtaining of a Section (12) nationwide permit for public sewer extensions.

The other major inconsistency identified in Section 5.1 of this report relates to the permitted stream discharge characteristics and requirements for Ridley Creek and the "protected stream status" of Ridley Creek which prohibits additional wastewater discharge within Ridley Creek unless justified by an

adequate socio-economic study and other factors. In 1992, East Goshen Township felt that a socio-economic study would justify the stream discharge expansion required for the Ridley Creek STP. After more than a year of local review with County agencies and adjacent Townships, it does not appear feasible to undertake the required studies to justify additional stream discharge at this STP.

5.3 Water Quality Standards

The present water quality standards for discharge at the Ridley Creek treatment facility are listed in Figure 2.2 as contained in Section 2.1 of this report. These are the discharge standards currently in effect and the monitoring requirements currently in effect based upon the renewal of the NPDES permit for this facility through October 1995. Generally, the effluent standards differ dependent upon the period of the year. From May 1 to October 31, the $CBOD_5$ monthly average is 10 mg/l in conjunction with 30 mg/l for suspended solids, and 4 mg/l of ammonia as nitrogen. During the winter months (from November 1 through April 30), the $CBOD_5$ is 20 mg/l with suspended solids of 30 mg/l and ammonia at 12 mg/l.

In anticipation of the possibility of expanding the Ridley Creek treatment facility, the Township directed a letter to PaDER during June 1990 requesting expansion discharge criteria. The PaDER response letter dated July 2, 1990 indicates the following information:

> "Preliminary treatment requirements for an increase of discharge (0.4 MGD to 0.7 MGD) into Ridley Creek from the Township's Bowtree facility have been developed.
>
> As per my letter of May 30, 1990, an increase in discharge to a stream designated as High Quality cannot be considered unless your report on necessary economic or social development of significant public value is approved. Given approval, the alternative of increased stream discharge can be reviewed.
>
> Tertiary treatment ($CBOD_5$ is 15 mg/l or less) with a high degree of nitrification (NH_3-N 5 mg/l or less) plus suspended solids of 10 mg/l are the estimates. Please note that these requirements are preliminary in nature. They are offered only to aid in the preparation of the required alternatives analysis."

In December 1992, it was considered possible by the Consultant, the Township administration and the Municipal Authority consulting engineer that the above quoted preliminary stream discharge standards could be obtained and maintained at

the time of expansion of the Ridley Creek treatment facility. However, based on later preliminary reviews with PaDER personnel and consultation with other review agencies and adjacent Townships, it now believed in 1994 that obtaining an additional stream permit for the Ridley Creek STP may not be feasible.

5.4 Preliminary Cost Estimates for New Construction, Authority Financing On-Going Administration, Operation and Maintenance

Attached hereto as Appendix C is a copy of the Municipal Authority's Operation and Maintenance budget for 1992 and for 1993. These budgets show that the Authority, working under the financial direction of the Township Administration, has ample revenues for continued operations of the municipal sewerage system. It can be expected that there will be a need for increased revenues during the two five-year planning cycles, 1993-1997 and again for 1998-2002.

The increased revenues will be required to support an increased operating budget expected as a result of the need to expand the Ridley Creek treatment plant or to direct flows to West Goshen Township, to monitor approximately 500 existing individual onlot systems, to monitor existing community onlot and spray irrigation systems, and to provide the design coordination and environmental studies required to provide appropriate wastewater treatment facilities for existing properties. Sections 3.4 and 3.5 of this report outline the future sewer needs for each of the five-year planning periods ending in the year 2002. Tables 3.6 and 3.7 depict the future probable public sewer connections for each five-year planning period and certain facilities which will have a need for access to public sewers beyond 2002.

It is the Township's policy that the design costs and construction costs for all public sewer extensions to service new land developments and new subdivisions will be totally paid by the respective developers of each such property. The Township provides assistance to the extent of local review and local approval of such public sewer extensions including the proper coordination of design to service future adjacent extensions.

For example, in reference to Table 3.6, when the Price property located at Paoli Pike and Ellis Lane is developed, the developer/applicant will bear all costs of design, permits, and construction including municipal escrow costs for proper inspection. The Township and Municipal Authority costs would be negligible for this type of development and for most of the extensions noted in Tables 3.6 and 3.7.

The same logic applies for existing developments which are located externally from the boundaries of East Goshen Township,

such as the Bryn Mawr Rehabilitation Hospital located in Willistown Township along Paoli Pike. If this facility is ultimately connected based on the approval of expansion of the Ridley Creek STP, the Bryn Mawr Rehabilitation Center will pay all design costs and construction costs for the necessary gravity sewer extension along Paoli Pike and connection to the extended SmithKline Beecham gravity sewer.

There are several existing developed properties within the Township where the Authority and the Township may have to pay for initial design and permit costs but subject to an appropriate reimbursable financial formula assessing the residents of that particular development for all costs directly related to the public sewer extensions. In other areas of the Township, particularly north of Oneida Lane up to and including the Brookmont/Tremont Drive area, there is a need for the Township to do some initial design and coordination with various property owners to assure that public sewers are extended when needed.

For example, a direct gravity extension from the existing Willow Pond community system along Forest Lane to the stream and along the stream paralleling Line Road to the Saddlebrook Farms gravity sewer would cost approximately $400,000. The 28 residents of the existing subdivision could not afford $14,285 per dwelling unit to make an immediate connection to the Ridley Creek STP facility. However, the cost for such a gravity sewer extension would be cost effective if the cost for such an interceptor sewer was paid proportionately by the future developers of the Woods property, the Sherman property, including a proportionate distribution for future connections to the Brookmont/Tremont Drive area of the Township. For future reference, this proposed gravity interceptor is called the "Line Road Interceptor" although the piping system would be closely aligned with the tributary of Ridley Creek crossing Forest Lane and extending in a northerly direction towards the Brookmont/Tremont Drive area.

Table 5.1 shows preliminary costs estimates for selected new public sewer extensions within the Chester Creek and Ridley Creek watersheds. Within Table 5.1, if the Millstream Drive area required public sewer connection during the next ten-year planning period, this all-gravity system would connect with existing gravity sewers within Tanglewood Drive above Bell Flower Lane and would service an estimated 25 EDUs at an estimated cost of $7,200 per unit (1992 dollars).

If the Mill Valley area of the Township required connection to the Chester Creek system in the next ten years, the estimated cost would be $110,000 using the existing (capped) gravity collection system and a pump station/force main at an estimated

TABLE 5.1

PRELIMINARY COST ESTIMATES FOR SELECTED
NEW PUBLIC SEWER EXTENSIONS

Chester Creek

Area	Total Cost No Tap Fee (Construction Costs Only)	Type of System	Timing
Charter Chase	$925,000[1]	Gravity/GP Force Main	1998-2002
Mill Valley	$110,000	Gravity/ Force Main	1998-2002
Millstream	$180,000	Gravity	1998-2002

(1) The cost of the total collection and force main system ($925,000), less the cost of pump station and force main ($270,000) plus the cost of a gravity sewer through Hersheys Mill ($528,000) would increase the cost to $1,183,000.

Ridley Creek

Willow Pond/ Woods Property/ Sherman Property (Line Road Interceptor)	$395,000	Gravity	1998-2002
Ridley Creek STP Expansion (Stream Discharge)	$1,200,000[2]	Convert to A/O Process	1998-2002 (start 1993)

(2) $5,175,000 if spray irrigation was possible using 65 acres for spray fields

cost of $4,400 per EDU (1992 dollars). However, this system could not be connected at this cost unless a force main system was designed and in place for the Charter Chase subdivision. If the Charter Chase area remains viable with continued use of onlot individual systems through the year 2002, the cost of providing sewers to the Mill Valley area of the Township would be increased since the force main would have to be extended westwardly to the Brandolini property now under development at the southwest corner of Route 202 and Morstein Road.

For the Charter Chase area, the estimated cost for a combined gravity/grinder pump collection system and a major pumping station with a 5,300-foot force main extending westwardly along Greenhill Road and across Boot Road to Windsor Drive in West Goshen Township would cost approximately $925,000 or approximately $9,500 per EDU. If in the alternative, a gravity sewer was designed through the Hersheys Mill area from Green Hill Road to a point located 600 feet east of the end of Meadowbrook Lane, the cost of such a gravity system would be approximately $528,000 (1992 costs) with no additional EDUs. With the cost of the major pumping station and 5,300 linear feet of force main deleted ($270,000) and with the cost of the gravity system added ($528,000), the estimated cost to service Charter Chase would be $1,183,000 (1992 costs) or $12,070 per EDU. This latter option is not economically feasible or cost effective.

Ridley Creek Watershed

Within the Ridley Creek watershed, there is one major need which will require an analysis by the Township and the Municipal Authority related to the proposed "Line Road Interceptor." Sewer extensions are planned for construction to service the Saddlebrook Farms subdivision. An interceptor paralleling Line Road but following the basic streambed alignment and extending to Forest Lane and into the Sherman property would be required to serve a number of future sewer service needs. First, it is desirable to consider connecting the Willow Pond system to the Ridley Creek STP during the next ten years. The Willow Pond community system malfunctioned during recent years and the absorption beds were rebuilt in 1992 by the Homeowners' Association. It cannot be determined at this time if this community-type system will remain viable for any extended period of time. Portions of the Woods property and the Sherman property may be proposed for development during the same ten-year time frame. A 4,600-linear foot Line Road interceptor could service all three properties and would allow for a future extension to service the Brookmont/Tremont Drive area if needed. The Line Road interceptor would require a cost of approximately $395,000 (1992 dollars) and it has the potential to service 151 potential EDUs, 28 of which are built within the Willow Pond community.

Also depicted in Table 5.1 is an estimate of the cost of increasing the capacity of the Ridley Creek STP from 0.4 MGD to 0.7 MGD, if permitted. This basic cost is estimated at $4/gallon although the cost of the mechanical conversion process is slightly over $3/gallon for the additional capacity. The conversion process from an extended aeration stream discharge plant facility to the anaerobic/oxic process requires a great deal of design which is proportionately higher than the design of a new system. In addition, the Township would be required to prepare and/or review extensive socio-economic benefit studies and analyses to qualify for any additional stream discharge capacity into Ridley Creek.

It should also be noted that if PaDER or any other agency required East Goshen Township to design the 0.3 MGD expansion of the Ridley Creek STP using the AO process but with the spray irrigation of the additional effluent, the cost could exceed $5,175,000 for this expansion. This additional cost is related to a need to purchase or condemn up to 75 acres of land (which is not available) at an estimated cost of $55,000 per acre plus the additional cost of $400,000 for spray field pumps and piping. Thus, a cost in excess of $17.25 per gallon of additional effluent treated could never be made cost effective.

5.5 Methods of Financing Alternatives

The East Goshen Township Municipal Authority is not an operating authority but has an Authority operating budget which is funded by various sources of revenue. The "Lease-Back Arrangement" with the East Goshen Township Board of Supervisors allows the Authority to conduct its operations without impacting upon the Township's revenues and expenditures. In short, the Municipal Authority's operating budget is totally offset by the revenues derived from tapping fees, sewer rental fees, and miscellaneous permit income sources.

Appendix C contains a summary of the revenues for 1991 and 1992 and the operating budgets for those years. Appendix C also depicts the projected 1993 revenue and 1993 operating budget.

The current (October 1993) sewer tapping fee is $2,113 per EDU except for pre-1991 agreement/commitments which will be collected at the rate of $1,500/EDU for the Chester Creek system and $2,975/EDU for the Ridley Creek system.

The source of revenue for the Township's sewer operating budget is the sewer rental charge of $54 per quarter for single-family DUs (or $216/DU per year) and $46 per quarter for apartment units ($184/DU per year).

The resulting total sewer revenue for 1991 and 1992 was $749,616 and $803,075, respectively.

The actual sewage facility operations expenditures for 1991 totalled $813,258 with a projected $1,036,450 for 1992. The projected operating budget for 1993 is reflected as $1,798,671. The Municipal Authority has a bonded indebtedness of $221,000 as of December 31, 1992, which requires annual debt service payment of approximately $(30,000+/-). In addition, the Authority has annual fixed payments based upon the amended agreement with West Goshen Township which requires annual payments of $20,472. Therefore, the Authority is in excellent operating financial condition.

Table 5.1 in this report lists five areas which have to be given consideration under financing alternatives available. Based upon the per capita income levels for various sectors of the Township and the entirety of East Goshen Township as established in 1990, it is not likely that the Municipal Authority will be able to take advantage of direct Pennvest grants and/or low interest loans. Therefore, all financing for future facilities during the period 1993-2002 must be based upon: a) increased sewer rentals if required; b) increased sewer tapping fees within the permitted limits of the Pennsylvania Statutes, as amended; and/or c) additional bond issues.

Chester Creek Sewer System

Table 5.1 lists three areas located in the northerly portion of the Township which may require public sewer construction between 1998 and 2002. Under current Township and Municipal Authority policies, the total cost of providing sewers, if required, to Charter Chase, Mill Valley, and the Mill Stream areas would be directly offset by assessments to each DU served, and based upon the most cost effective design achievable at the time of need.

It is now likely that East Goshen Township will need additional capacity at the West Goshen Treatment Plant. Section 2.2 of this report outlines estimated costs for the West Goshen STP expansion. If West Goshen opts to expand to 7.0 MGD (a 2.5 MGD expansion) and at an estimated cost of $7,700,000, this would equate to an approximate cost of $3.00/gallon. If the additional sewage treatment capacity need (possibly 100,000 to 780,000 gpd) should arise during 1993-1994 with all parties being agreeable as to need and timing, the Municipal Authority and the Township could contemplate an expenditure of $400,000 to $3,000,000 in the mid to late 1990s which could require a separate bond issue for financing in advance of construction.

Ridley Creek Treatment Plant

The expansion of the Ridley Creek STP would cost approximately $1,200,000. Since the asset comprising the expansion of the STP is not realized until completion of the project, this expansion will also have to be financed through a municipal bond issue with some advance funding for design, permits and environmental studies provided by the Authority.

The Line Road Interceptor which would eventually serve the Willow Pond Development, the Woods property, and the Sherman property, and other northerly areas of the Township is currently anticipated as being financed entirely by developer contributions and/or Homeowner Association contributions (Willow Pond). Some initial design expense, possibly $50,000 to $75,000, may have to be funded by the Municipal Authority which could be recovered in direct assessments to the ultimate users of the facility.

In summary, the East Goshen Township Municipal Authority's financing capabilities are adequate, and it is within the ability of the Authority to fund and carry the appropriate debt service.

6.0 SELECTED WASTEWATER TREATMENT ALTERNATIVES FOR THE PERIOD 1993-2002

6.1 Selected Alternatives Within the Ridley Creek Treatment Plant Expansion

All of the evidence collected and conclusions reached in the preceding sections of this 1992/1994 Act 537 Plan Update suggest that the Ridley Creek STP should be expanded beyond the present discharge permit requirements which now total 400,000 gpd. The STP has now been dedicated and accepted by the East Goshen Municipal Authority and has been under the operational control of the Township since 1985.

The wastewater treatment requirements within the Ridley Creek STP service area within East Goshen Township and including peripheral areas located adjacent to the Township boundaries in Willistown Township and East Whiteland Township show a need to expand to approximately 787,000 gpd in theoretical wastewater flow extending beyond the year 2002. Table 6.1 depicts the wastewater treatment needs within this entire wastewater service area up to the year 2002 and including potential needs beyond this period.

The individual areas of the Township and the future subdivisions, land developments, etc. are depicted in Table 3.7 which provides the basis for the information depicted in Table 6.1. As of October 1992, the Ridley Creek STP handled the wastewater needs totalling 333,127 gpd in theoretical effluent flow with actual estimated October 1992 wastewater flows of 230,475 gpd. Thus, the STP was operating at 83 percent of its permitted theoretical hydraulic flow and at a level of 58 percent of its permitted discharge limits at the end of 1992.

The "committed" additional flows depicted in Table 6.1 would account for an additional 157,400 gpd in theoretical EDU wastewater flow and approximately 118,888 gpd in projected actual committed additional treatment needs. It must be noted that 93,700 gpd of the committed 157,400 gpd is already pre-paid by the respective parties and/or property owners depicted in Table 3.7 of this report.

If the Township made no further commitments whatever, the theoretical hydraulic loading of the Ridley Creek STP would be 490,527 gpd and the estimated actual flow from connected and committed additional units would be 349,363 gpd. This would represent 123 percent of permitted theoretical daily flow and 87 percent of the maximum permitted discharge limit of 400,000 gpd.

TABLE 6.1

WASTEWATER TREATMENT NEEDS
RIDLEY CREEK STP SERVICE AREA
1992-2002 AND BEYOND

STATUS/NEED		THEORETICAL WASTEWATER FLOW	GPD ESTIMATED ACTUAL WASTEWATER FLOW
October 1992 On-Line Avg. Daily Treatment		333,127 GPD [1]	230,475
Committed additional flow	Subtotal	157,400 GPD 490,527 GPD	118,888 349,363 GPD
Probable New Needs 1993-1997	Subtotal	42,750 GPD[2] 533,277	42,210 391,573
Probable Additional Needs 1998-2002	Subtotal	168,600 GPD[2] 701,877 GPD	151,777 543,350
Potential Needs Beyond 2002	Total	85,300 GPD 787,177 GPD[3]	63,949 607,299[3] [4]

Notes:

(1) Theoretical Flow Based on 350 GPD for SF-EDUs and 200 GPD per Apartment EDU per Table 3.7

(2) SF and Apartment EDUs are Estimated at 69% of Theoretical GPD Flow. All Other Uses are 100% of GPD shown in Table 3.7.

(3) Does not Include Additional 132,700 GPD for Immaculata College Requested in November 1992.

(4) Does not Include 26,000 in additional capacity requested by William Henry Apartments on April 13, 1994.

The probable additional treatment needs for the period 1993-1997 would add an additional 42,750 gpd in theoretical flow and 42,210 gpd in estimated actual flow. This would extend the Ridley Creek STP to a level of 133 percent of its rated theoretical hydraulic capacity and 98 percent of its permitted hydraulic discharge capacity. This data will be altered based on the West Goshen Alternative.

Table 6.1 also projects the probable wastewater treatment needs for the period 1998-2002. The projected needs as derived from Table 3.7 of this report would add an additional 168,600 gpd in theoretical flow to the Ridley Creek STP and an estimated actual hydraulic loading of 151,777 gpd. In summary, by the year 2002, the Ridley Creek STP would be required to treat 701,877 gpd in theoretical flow and 543,350 gpd in estimated actual wastewater flow. These respective figures represent 175 percent of current permitted theoretical wastewater loading and 136 percent of the estimated actual discharge based on current discharge permit requirements.

In addition, the Township has opted to look at the wastewater treatment needs just beyond the 10-year planning cycle ending in the year 2002 with such needs also being portrayed in Table 6.1. If such facilities were needed, the Ridley Creek STP would have an additional 85,300 gpd in theoretical flow needs and 63,949 gpd in estimated actual wastewater flows. In summary, the final totals for the ultimate wastewater treatment needs in the Ridley Creek STP service area would approximate 787,000 gpd in theoretical wastewater flows and just over 600,000 gpd in actual wastewater flows. It is expected that current infiltration and inflow for the present and future sewer systems would increase slightly extending the needs well beyond 600,000 gpd in actual treatment capacity and discharge rating for this STP. In addition, footnote 3 to Table 6.1 clearly notes that the recently requested additional treatment availability for 132,700 gpd as received from Immaculata College in November 1992, is not included in Table 6.1. The above data will be altered by the West Goshen Alternative.

Based upon environmental concerns and possible PaDER rejection of the expansion of the Ridley Creek STP beyond its current permitted discharge of 4.0 MGD, the "West Goshen Alternative" must be given consideration at this point to avoid an overload at this STP. The figures shown in Table 6.1 were correctly stated for the period ending in 1992. Since 1992, Immaculata College, located in East Whiteland Township has confirmed its request for a total of 137,700 gpd in sewage treatment capacity. Also, the owners of the William Henry Apartments, located at King and Frazer Roads in East Whiteland Township have increased their requested total treatment from the current 59,000 gpd now being discharged to Ridley Creek to a total of 96,000 gpd (based on correspondence dated April 13,

1994). This would add approximately 158,200 gpd to the bottom line figures shown in Table 6.1. The Eryn Mawr Rehabilitation Hospital, located in Willistown Township, has not responded to recent requests from East Goshen Township as to their continued interest in connecting to the East Goshen facilities. However, this need still exists and will be carried forward.

However, if in fact, the Ridley Creek STP cannot and will not be expanded beyond 4.0 MGD, the 607,299 gpd reflected in the last column of Table 6.1, in addition to the additional 158,200 gpd expected from the William Henry Apartments and the Immaculata College complex, or 765,499 gpd could not be handled at the Ridley Creek facility. In summary, approximately 365,500 gpd in ultimate actual wastewater flow for the year 2002 and beyond would have to be diverted to West Goshen Township by the most appropriate conveyance means.

Regarding Table 3.7 in Section 3.0 of this report, there are a number of changes which could be made in transferring wastewater flows to Chester Creek. For example, the 84,420 gpd (New Kent Apartments) currently on line at Ridley Creek STP could be immediately transferred to the West Goshen STP with little additional cost and no major impact other than increasing the present 1.0 MGD limitation with West Goshen Township. In addition, the 55,000 gpd shown for SmithKline Beecham in Table 3.7 could be removed from future consideration for treatment at the Ridley Creek STP since Beecham has no building plans during this century. Beecham has already pre-paid for 40,000 gpd in reserved sewage capacity at the Ridley Creek STP. The above two facilities would result in a reduction of 55,000 gpd for Beecham, and an immediate transfer to Chester Creek of 84,420 gpd, or a total wastewater flow reduction of 139,420 gpd at the Ridley Creek STP. By deducting out the New Kent Apartments which could be transferred to Chester Creek, and eliminating the additional 55,000 gpd requested by Beecham, the resulting excess sewage flow to Ridley Creek as depicted in Table 6.1 would be approximately 226,000 gpd.

The Selected Alternative for Ridley Creek Wastewater Treatment Area

Based upon the above analyses and all preceding documentation contained in this report and the 1993-1994 changes noted herein, the primary selected alternative for the Ridley Creek wastewater treatment area is to:

A) Limit ultimate EDU connections to the Ridley Creek STP to an actual discharge limit of 0.4 MGD.

B) Convey all excess wastewater generated within the Ridley Creek Watershed (including East Whiteland and Willistown flows) to the West Goshen STP by way of new and future conveyance systems.

C) Consider the Ridley Creek STP expansion as the best secondary alternative in the event the West Goshen STP cannot be expanded for reasons not yet identified.

D) Retain a third preference alternative which would involve utilizing spray irrigation methods for all excess wastewater generated at the Ridley Creek STP beyond 0.4 MGD. This would represent the least cost effective method of wastewater treatment and could involve condemnation or purchase of the entire Grace Estate parcel.

Only the primary and secondary alternatives above are discussed further in this Section and in the Plan Summary.

PRIMARY SELECTED ALTERNATIVE - LIMITING RIDLEY CREEK STP TO 0.4 MGD

Under this primary selected alternative, the Ridley Creek STP would be voluntarily limited to 0.4 MGD using the figures depicted in Table 6.1 and Table 3.7 of this report. The following would also be required:

- Redirect the sewage flows from the New Kent Apartments to the West Goshen system (diverts 84,420 gpd).
- Eliminate the SmithKline Beecham "future probable flows" beyond present purchased and committed capacity (deletes 55,000 gpd).
- Continue to provide treatment service for all facilities shown in Table 3.7 including all committed and on-line (less New Kent Apartments), and all EDUs committed or in progress for connection containing an actual (not theoretical) daily flow of 264,943 gallons. In addition, the following properties listed below all located within the Township would be provided future service at the Ridley Creek STP:

- Committed	264,943 gpd
- Spinozzi and McCloskey -	3,500 gpd
- The Woods Property -	30,100 gpd
- Willow Pond -	9,800 gpd
- Indian Hills -	15,050 gpd
- Sherman Property -	12,950 gpd
- Brookmont/Tremont -	15,400 gpd
- North Chester Road - 82 miscellaneous EDUs	28,700 gpd
- Old Orchard/Ivy/Raewyck -	10,150 gpd
Total Future Flow -	390,593 gpd

- o Retain the "Line Road Interceptor" as a conveyance method for connecting the Northeast Quadrant of the Township to the Ridley Creek STP.

- o Require East Whiteland Township as the sponsor and Immaculata College (137,200 gpd) and the William Henry Apartments (96,000 gpd) to collectively design, fund, and construct a gravity sewer extending from King Road near Frazer Road along the Ridley Creek tributary which crosses Mill Stream Drive to Hershey Mill Road and thence along Hershey Mill Road to Greenhill Road.

- o At Hershey Mill Road and Greenhill Road, construct a major new pumping station adjacent to the Hersheys Mill Estates pumping station with a force main extending westwardly along Greenhill Road, across Boot Road and to the most appropriate gravity connection where 233,000 gpd or more can be handled by the existing gravity system. This pump station force main option would allow for future service from both Immaculata College, the William Henry Apartments, as expanded, and other East Whiteland Township EDUs which may be identified in the future to be conveyed directly to the Chester Creek STP. There is a distinct advantage in that should public sewers be needed within Charter Chase or Goshen Downs, pressure connections could be made from future gravity sewers for either subdivision. This would also allow for a future interconnection with the Hersheys Mill Estates pumping facility should there be a need for temporary alternative pumping.

If all of the above options are executed, substantial additional flows would be conveyed to the West Goshen STP. However, should West Goshen Township be prevented for any reason from expanding the Chester Creek STP based on a change in stream quality discharge criteria within Chester Creek, then East Goshen Township should be prepared to look carefully at its second selected alternative.

THE SECOND SELECTED ALTERNATIVE - EXPANSION OF THE RIDLEY CREEK WASTEWATER TREATMENT FACILITY

If the West Goshen alternative cannot be effectuated either by way of excessive cost, environmental constraints for expansion of the Chester Creek facility, or other reasons, East Goshen Township must still be prepared to move forward with a means of providing additional sewage service. This would involve an expansion of the Ridley Creek STP as originally outlined in the December 1992 version of this Updated Plan. If expansion of the Ridley Creek STP becomes the only alternative available, a number of important steps must be taken in order to expand this facility.

The greatest hurdle in accomplishing this STP expansion will involve the preparation of the required socio-economic studies needed to justify an increase in stream discharge permit capabilities for Ridley Creek at the site of the present STP. It may take five years or more of concentrated effort to properly design and obtain the necessary permits for the additional treatment required within the Ridley Creek wastewater treatment area.

Detailed studies prepared by and for the external facilities which are requesting direct connections to the Ridley Creek STP will undoubtedly show an overall improvement of the water quality within Ridley Creek. Specifically, the current Ridley Creek tributary stream discharge characteristics for the Bryn Mawr Rehabilitation Hospital, the William Henry Apartment Complex, and the portion of Immaculata College all currently discharging to Ridley Creek undoubtedly would have higher treatment levels at the Ridley Creek STP as compared with the current package plant discharges associated with these facilities. It must be shown conclusively that the ultimate water quality of Ridley Creek above and below the Ridley Creek STP will be maintained or improved as a result of expansion of the Township sewage treatment facility.

Ridley Creek has a protected high quality stream status and no additional discharge is currently permitted without approval of the required socio-economic study showing the specific benefits which will be derived as a result of expansion of the Ridley Creek STP.

Initial analyses show that the Ridley Creek STP can be expanded within the present site from 400,000 gpd to 700,000 gpd without duplicating the facilities now existing on the site. The manufacturer of the major components at the STP (Davco) concurs that the plant facility can be expanded to a maximum of 700,000 gpd using the Anaerobic/Oxic A/O process. The spray irrigation alternative for any additional effluent above 400,000 gpd in permitted discharge capacity is not and cannot be

made cost effective because of lack of available land facilities, potential high condemnation costs, and the added additional pumping costs to spray irrigate such additional effluent south of the site of the present STP. Therefore, the Township should proceed with the design/expansion options which are available.

A great deal of effort will also be required in resolving the high BOD loading at the current plant which is directly attributable to the dilution factor of wastewater influent at the plant. The Ridley Creek STP cannot be allowed to reach its BOD discharge limits prior to reaching the permitted hydraulic discharge limits of 400,000 gpd. Also, for all additional future wastewater treatment needs at the Ridley Creek STP, the excess BOD loading limits must be resolved at the present permit levels prior to proceeding to plant expansion.

6.2 West Goshen (Chester Creek) Wastewater Treatment Selected Alternative as Amended by the "West Goshen Alternative"

The selected wastewater treatment alternative for the Chester Creek (West Goshen) sewage treatment plant service area is to continue in making permitted connections in accordance with the commitments and future probable needs depicted in Table 3.6 of this report plus the new needs identified in the "West Goshen Alternative." The current and long-standing agreement with West Goshen Township to treat 1.0 MGD in actual wastewater flow will continue through the year 2002 and beyond. Table 6-2 depicts the 1992 status and future needs for additional wastewater treatment in accordance with the five-year and ten-year planning cycles and beyond the year 2002. Table 6-2 reflects the latest observed theoretical average daily flows to the West Goshen STP and the estimated or actual monitored average daily flow which is approximately 77.44 percent of theoretical flow.

In 1992, theoretical flows were approximately 974,600 gpd with estimated monitored flow of 754,769 gpd. The committed additional projects requiring wastewater treatment, as depicted in Table 3.6 of this report, would generate 88,295 gpd in theoretical flow and 80,737 gpd in estimated actual flow. At this point, when all such connections are made, the theoretical wastewater flow to the West Goshen STP would be 1,062,894 gpd, but the actual estimated flow will be 835,466 gpd.

The probable new treatment needs as derived from Table 3.6 of this report would add an additional 61,744 gpd and an estimated actual average daily flow of 48,840 gpd.

In summary, at the end of 1997, the theoretical wastewater flow to the West Goshen plant would be 1,124,638 gpd and real flow would be 884,306 gpd. However, it is assumed, in accordance with footnote 1, that the current ratio of actual to theoretical

TABLE 6.2

WASTEWATER TREATMENT NEEDS
CHESTER CREEK (WEST GOSHEN) STP SERVICE AREA
1992-2002 AND BEYOND

STATUS/NEED		THEORETICAL WASTEWATER FLOW	GPD ESTIMATED ACTUAL WASTEWATER FLOW
October 1992 On-Line Avg. Daily Treatment		974,599 GPD	754,769 GPD[1]
Committed additional flow	Subtotal	88,295 GPD 1,062,894 GPD	80,737 GPD 835,466 GPD
Probable New Needs 1993-1997	Subtotal	61,744 GPD 1,124,638 GPD	48,840 GPD 884,306 GPD
Probable Additional Needs 1998-2002	Subtotal	108,074 GPD 1,232,712 GPD	88,832 GPD 973,178 GPD
Potential Needs Beyond 2002	Total	46,250 GPD 1,278,962 GPD	35,816 GPD 1,008,994 GPD [2]

Notes:

(1) Current 77.4% actual vs. theoretical flow ratio is assumed to continue for EDU commitments only with positive I&I control and water conservation devices now mandatory.

[2] Does not include 432,620 gpd in additional basin transfers under the "West Goshen Alternative" which emerged in late 1993.

flow of 77.4 percent can be maintained for EDU connections with rigorous infiltration and inflow (I&I) control and based on the fact that water conservation devices are now mandatory for new EDU connections.

Table 6.2 also projects the probable additional wastewater treatment needs between 1998-2002 as being 108,074 gpd in theoretical sewage flow and 88,832 gpd in estimated actual flow. At this future date, or by the year 2002, East Goshen will probably be utilizing approximately 97 percent of the Township's available treatment capacity at the West Goshen STP. The wastewater treatment needs beyond the year 2002 would potentially add 35,816 gpd in additional estimated actual wastewater flow bringing the East Goshen wastewater treatment needs to 100 percent of the 1.0 MGD treatment availability permitted by present agreement.

It is expected that West Goshen Township, by way of an updated Act 537 Plan, will announce in 1994 that design studies are underway to expand the West Goshen STP from 4.5 MGD to a minimum of 6.0 MGD. As noted previously within this study, the West Goshen STP expansion to 6.0 MGD will allow no additional sewage treatment capabilities outside of the West Goshen needs. An alternative expansion plan is expected to be presented which would allow the West Goshen STP to be expanded to 7.0 or 7.5 MGD. Information provided by West Goshen Township suggests that if the 7.0 or 7.5 MGD option is made, that up to 1.0 or 1.5 MGD in additional treatment capacity would be available to surrounding Townships. It is not known at the time of publication of this report if the latter 7.0 or 7.5 MGD option will be approved.

The Township has within its control the ability to constantly monitor and reduce both infiltration and inflow in gravity sewers connected to the West Goshen facility. The Industrial Park contributors are monitored carefully as to their actual flow versus their agreed contribution of daily wastewater per the formula established for industrial and business park facilities. This monitoring should be continued to assure both West Goshen and East Goshen that agreed upon wastewater treatment flows are at or below committed levels.

One of the areas of the Township, the Charter Chase Subdivision containing 98 EDUs, is listed in Table 3.6 as being reserved for ultimate future connection to the West Goshen STP. However, as noted elsewhere in this report, the 32,550 gpd reservation may not be needed if the Township-wide onlot sewage facility monitoring program is successful. This would eliminate 32,550 gpd from the sewage flows depicted in Table 6.2 and would provide a more comfortable margin between actual wastewater flows and the agreed upon 1.0 MGD in maximum daily effluent to be treated. If a new Agreement with West Goshen is negotiated for

up to 780,000 gpd in new capacity under the "West Goshen Alternative," Charter Chase would be included.

The PaDER will soon review both the West Goshen Act 537 Plan Update and the East Goshen Act 537 Plan Update. The PaDER may recommend to East Goshen Township that a "cushion or buffer" is necessary to serve future but yet unknown needs beyond the year 2002. East Goshen Township should be prepared for such a directive during 1994. Notwithstanding any directives from the PaDER, East Goshen Township could complete its build-out within the Chester Creek wastewater treatment area without exceeding the current 1.0 MGD agreement with West Goshen Township. However, if additional capacity can be acquired at a reasonable cost, it should be pursued (under the West Goshen Alternative).

Since late 1993, East Goshen Township has been seriously evaluating the "West Goshen Alternative." This alternative would involve a substantial diversion of flows from the Ridley Creek Watershed to the Chester Creek Watershed. Since the Township has now selected the West Goshen Alternative as the primary alternative, it is important to note here the impact that this alternative will have on the overall sewage collection and treatment plans for the Township.

One of the most important features of this alternative would be preserving the sewage flows for properties located within East Goshen Township for ultimate treatment at the Ridley Creek STP while diverting other flows (including East Whiteland facilities) to West Goshen. This Section 6.2 of the report contains new material describing how the external flows would be directed to West Goshen. Specifically, all of the probable external flows depicted in Table 3.7 including potential needs beyond 2002 would go to the Chester Creek treatment facility. In addition to the 1,009,000 gpd shown in Table 6.2, and the individual properties identified in Table 3.6 of this report, the following diversions or possible interbasin transfers would be made:

- Pre-planned flow to West Goshen per Table 6.2 — 1,009,000 gallons
- New Kent Apartment diversion — 84,429 gpd
- Immaculata College — 137,200 gpd
- William Henry Apartments — 96,000 gpd
- Hersheys Mill Commercial — 15,000 gpd
- East Goshen Township Reserve for Infiltration/Inflow — 100,000 gpd

Total Flows to West Goshen Township — 1,441,620 gpd

The major external facility not covered above is the Bryn Mawr Rehabilitation Hospital (Willistown Township) at 40,000 gpd which may not be economically feasible to pump from Line Road to a gravity sewer in West Goshen Township. If the Bryn Mawr Rehabilitation Hospital decides that they have a future need to tie in to East Goshen, the 40,000 gpd may be worked out at the Ridley Creek STP rather than create a pump station/force main scenario exceeding two miles in length.

Based on the flows shown above and based upon known developments and future developments identified in Table 3.6, it is possible to convey a total of 1,441,620 gpd to West Goshen Township. This would require an amended agreement with West Goshen Township to the extent of approximately 450,000 gpd. West Goshen has indicated a potential availability of 780,000 gpd. Other East Whiteland properties in the Ridley Creek Watershed may increase this need.

During April 1994, information has been received by the consultant that West Goshen has placed a hold on publishing its Act 537 Plan Update until the East Goshen projections and projections by other townships are received. Further, West Goshen Township wants to establish binding agreements before proceeding to design. This may require direct agreements between West Goshen and East Whiteland Townships and possibly Willistown Township. It is certain that a new agreement must be negotiated with East Goshen Township under the West Goshen Alternative.

It was indicated in April of 1994 that the cost for expansion at the West Goshen STP might reach $6.00 per gallon. Based on the figures shown above, and assuming that 441,620 gpd in excess treatment capacity is required by East Goshen Township and the external facilities, this would represent a cost of approximately $2,650,000 in treatment costs alone plus an

estimated $900,000 for a new Greenhill Road pumping station and force main to West Goshen. It may ultimately be too expensive for the East Whiteland facilities (Immaculata College and William Henry Apartments) to reasonably connect to the West Goshen facility, based on combined treatment and conveyance costs.

6.3 The Selected Alternative for the Hersheys Mill Community (Spray Irrigation) System

Based upon the conclusions reached in Section 4.0 of this report, it is the Township's selected alternative that the Hersheys Mill Community system be continued for at least the next ten years as a privately owned facility. There is ample capacity within the Hersheys Mill treatment facility to handle the ultimate 2,032 maximum permitted EDUs with an estimated additional reserve capacity at the time of build-out of 70,000 to 85,000 gpd.

This facility is well designed, well built, is currently under excellent operational control, and has more than ample capital reserve funding for individual component replacement. East Goshen Township has physically evaluated the plant condition, the management and operation, and has considered the fact that the Homeowners association will assume operational authority in January 1994. The Township sees no need to intervene in this private treatment facility during five-year and ten-year planning cycles extending to the year 2002. However, the Township is fully prepared to monitor this facility on an annual basis, or as deemed necessary, and to continue dialogue with the Board of Directors of the Greenhill Sewer Association during the next ten years.

If, beyond the ten-year planning cycle (beyond 2002), East Goshen Township finds it necessary to have the Municipal Authority take over the Hersheys Mill system for any reason, and if the Charter Chase subdivision has not responded to a rigorous onlot sewage facility monitoring program, there would be possible capacity within the Hersheys Mill system to accommodate the Charter Chase community at a greatly reduced cost factor.

6.4 The Selected Alternative for the Willow Pond Community System

It is assumed that the Willow Pond community comprising 28 single-family detached units will be disconnected from the current community onlot system during the time frame 1998-2002 and will be connected to the Ridley Creek STP subject to the construction of an extended intercepting sewer (the Line Road Interceptor) south of Willow Pond. Although it is possible that the newly constructed inground sewage beds will last beyond this

period, it is prudent to consider a public sewer connection now. The timing of such connection will be totally dependent upon the coordination of construction of gravity sewers south of Willow Pond to the nearest gravity public sewer connection near Saddlebrook Drive.

6.5 The Selected Alternative for Continued Use of Individual Onlot Systems

East Goshen Township will continue the use of individual onlot systems within areas of the Township which are not schedule to receive public sewer extensions by the year 2002. The Township has approved (copy of Ordinance attached) a Township-wide onlot sewage management program during 1994 under the previously described onlot management program. This program will provide for continuous monitoring, reporting and recording procedures, and compliance with mandatory renovations of isolated failed systems. The scheduled public sewer extensions for the Meadowbrook/Cornwallis area and the Highland/Taylor area will reduce the number of onlot individual systems from 699 to 563 such systems. Other potential connections to public sewers are listed in Section 4.2 of this report. It is expected that the condition of such individual onlot systems will actually improve under the jurisdiction of the Township individual onlot management program. Other than the Charter Chase area, already discussed in various sections of this Updated Act 537 Plan, there are no other major areas of the Township which exhibit a need for connection to public sewers prior to the year 2002.

6.6 Selected Alternatives for Public Sewer Service Areas within Chester Creek

The following areas have been selected to be handled as noted:

- Park Avenue (fire house) - Gravity sewer extension.
  Time frame - 1993-2002 - zoned R-3

- Fedor Property - Gravity sewer extension.
  Time frame - 1993-1997 - zoned R-4

- West Chester Pike - Miscellaneous gravity sewer extensions - zoned R-5
  Time frame - 1993-1997

- West Chester Pike Commercial - Gravity sewer extensions - zoned C-4
  Time frame - 1993-1997

- Hicks Property (14.9 Ac.) - Gravity sewer extensions.

Time frame - 1993-1997 - zoned I-1

- Hicks Property (71.5 Ac.) - Gravity sewer extensions.
  Time frame - 1998-2002 - zoned BP

- Price Property - Gravity sewer extensions - zoned R-2
  Time frame - 50 EDUs 1993-1997
  79 EDUs 1998-2002

- Saints Peter and Paul Church - Remain as onlot system to 1997 - possible grinder pump connection by 2002 - zoned R-2

- Green Acres Area and Strasburg Road/Route 352 Area - Remain as individual onlot systems - connect by pump or gravity (as available) after 1998 - zoned R-2

- Charter Chase - Remain as individual onlot systems through 1997 - Reevaluate - possible gravity, grinder pump and force main connection after 1998 - zoned R-2

- Mill Valley - Remain as individual onlot systems through 1997 - possible gravity/force main connection after 1998 - zoned R-2

- Millstream Drive - Same as Mill Valley - zoned R-2

- Divert New Kent Apartments to West Goshen STP

- Immaculata College Complex

- William Henry Apartment Complex

- Hersheys Mill Commercial Area

6.7 Selected Alternatives for Areas Located within Ridley Creek Service Areas.

- Meadowbrook/Cornwallis Area (approved prior to this Act 537 Plan Update) - Low pressure system.
  Time frame - 1993-1995

- Highland/Taylor Area - Gravity sewer extension.
  Time frame - 1993-1995

- Spinozzi-McCloskey - Remain as individual onlot systems - allow for 10 EDU connections (upon need) from 1993-2001.

- SmithKline Beecham - Retain 40,000 gpd (paid and committed).

- Woods/Sherman Properties - Capped sewers - some possible individual onlot systems - public gravity sewer extensions after 1998 or when developed.

- Willow Pond Area - Connect to gravity public sewers 1998 to 2002 or when available.

- Bryn Mawr Rehabilitation Hospital - Gravity sewer extension to SmithKline Beecham system only after STP expansion is approved (or possible force main/pump to West Goshen) may be considered at Ridley Creek STP if other Township properties are deleted.

- Christ Memorial Lutheran Church - Gravity connection through Realen site to Ridley Creek STP.

- William Henry Apartments/Immaculata College - Gravity or force main connections only when STP expansion is approved. This alternative is amended to require disposal at West Goshen STP via Greenhill Road future pump station/force main.

FILE

RESOLUTION FOR PLAN REVISION

RESOLUTION NO. 97-38

WHEREAS, Section 5 of the Act of January 24, 1966, P.L. 1535, No. 537, known as the "Pennsylvania Sewage Facilities Act", as amended, and the Rules and Regulations of the Department of Environmental Resources (Department) adopted thereunder, Chapter 71 of Title 25 of the Pennsylvania Code, requires the municipality to adopt an official Sewage Facilities Plan providing for sewage services adequate to prevent contamination of waters and/or environmental health hazards with sewage wastes, and to revise said plan whenever it is necessary to meet the sewage disposal needs of the municipality, and

WHEREAS, the Board of Supervisors of East Goshen Township has adopted a 537 Plan Update approved by the Pennsylvania Department of Environmental Protection in June, 1995, and

WHEREAS, the municipality has now prepared a Special Study to determine the best alternative for obtaining additional sewage capacity projected to serve the ultimate needs of the municipality, and

WHEREAS, the Special Study considered three alternatives to accomplish the acquisition of the projected needed sewage capacity, and

WHEREAS, the recommended alternative determined through this Special Study is to use two phases to increase the discharge permit limits of the Ridley Creek Sewage Treatment Plant (PA NPDES # 0050504) from the existing permit limit of 0.400 MGD to 0.750 MGD, and

WHEREAS, the Plan proposes to reduce the wastewater ratings per equivalent dwelling unit for new construction only,

AND NOW THEREFORE, be it resolved that the Act 537 Special Study for East Goshen Township dated May, 1997 and prepared by Yerkes Associates, Inc. is hereby approved and adopted on this 21st day of October, 1997.

EXHIBIT 5	Cost Analysis of Treatment Costs

VOLUME I

EXECUTIVE SUMMARY

The objective of this Act 537 Plan Revision for a Special Study Area is two fold:

1. To obtain approval to increase the current discharge permit limits of the Ridley Creek Sewage Treatment Plant NPDES permit, PA 0050504, from 0.400 MGD to 0.750 MGD. If approved, the expansion would take place in two phases. The plant was designed to treat 0.500 MGD, therefore the Phase I increase of the discharge capacity to 0.500 MGD would only involve minor modification of existing equipment. The Phase II would increase the discharge capacity an additional 0.250 MGD for a total of 0.750 MGD.

The Township is extremely cognizant of the high quality rating given to the Ridley Creek. It is the intention of this Special Study and the Socio-economic Study attached, to assure the Department that the quality of the stream has not and will not be affected.

2. To obtain approval to reduce the current wastewater ratings, for new construction only, in the following manner:

Type of Use	Current Rating	Proposed Rating
Single Family Dwelling	275 gpd/EDU	225 gpd/EDU
Townhouse	225 gpd/EDU	200 god/EDU
Apartment	225 gpd/EDU	175 gpd/EDU

This request is based on an evaluation of the current flows when compared to the actual number of equivalent dwelling units (EDUs) on line. The request is made for new construction based on the water saving devices that are being required in today's construction.

Upon approval of this Special Study, Phase I of the expansion and implementation of the new wastewater ratings would be used immediately.

A. PLAN SUMMARY

This Act 537 Plan Special Study looks at the alternatives available to East Goshen for obtaining additional sewage capacity to serve the ultimate needs of the Township. The Plan recommends that the Ridley Creek Sewage Treatment Plant be expanded, in two phases, from the existing permitted capacity of .400 MGD/day to .500 MGD in Phase I and to .750 MGD in Phase II. The Consulting Engineer believes the first phase can be accomplished at minimal cost and time since most of the existing equipment was originally sized to treat .500 MGD.

To accomplish this goal, some Ridley Creek Watershed flows currently being pumped to the West Goshen Sewage Treatment Plant (WGSTP) will be diverted to the Ridley Creek Sewage Treatment (RCSTP) and some flows from the Chester Creek Watershed will be diverted to the RCSTP. These transfers should eliminate the need for additional capacity at the WGSTP. The Township has calculated that construction and treatment costs at the RCSTP are more economical than at the WGSTP.

The Department's June 30, 1995 approval of the current Sewage Facilities Plan included several recommendations to be addressed prior to the Township submitting a recommendation for a plan to increase the sewage capacity at the RCSTP to serve the Township's ultimate needs. The following list is a summary of the actions taken pursuant to the approval letter (full details can be found in Volume II).

- The On-lot Management Plan was implemented in July, 1994
- The diversion of flows for New Kent Apartments from the Ridley Creek to the Chester Creek has not been done and is not expected to be done because it flows to Ridley Creek by gravity and would have to be pumped to be treated at the West Goshen Treatment Plant. In addition, treatment costs are lower at the Ridley Creek Plant than at the Chester Creek treatment facility (West Goshen Township Sewage Treatment Plant).
- The "West Goshen Alternative" has been studied and found to be not economically feasible
- The proposed "Line Road Interceptor" has been installed by a developer
- The future connection of the Bryn Mawr Rehab Hospital has been included in the Ridley Creek Sewage Treatment Plant capacity allocations
- The new EDU wastewater ratings are being used

- Studies of alternatives other than the "West Goshen Alternative" have been completed

- Spray Irrigation - This option has been re-examined and still found to be economically unfeasible based on the current cost of raw land in East Goshen Township - See Supporting Documents #13.

B. PLANNING OBJECTIVES

An Act 537 Plan Update for the entire township was completed and approved in June, 1995. That update suggested that the township would need additional capacity to meet its ultimate needs and that expansion of the Ridley Creek Sewage Treatment Plant appeared to be the most cost effective and logical means of obtaining the projected capacity needs. As mentioned previously, the Department's approval recommended that other alternatives be investigated, namely obtaining additional capacity from West Goshen Township and spray irrigation. This Act 537 Plan Special Study has addressed those other alternatives.

Identification of the Study Area

Ridley Creek Watershed - The Ridley Creek Watershed includes all of the area within the Township east of Boot and North Chester Roads.

Chester Creek Watershed - The Chester Creek Watershed includes all of the area within the Township west of Boot and North Chester Roads.

Current Sewage Usage within the Study Area

Ridley Creek Watershed - The Ridley Creek Sewage Treatment Plant (RCSTP) is designed and permitted to treat 0.400 MGD. The total number of EDUs connected at the end of 1996 was 1,165 contributing an adjusted (see 1996 Chapter 94 Report) average daily flow of 275,451 gallons per day or 205 gpd per unit. The currently approved EDU wastewater rating is 275 gpd per EDU.

In addition to the average daily flow of 275,451 gallons, there are 134,850 gallons committed or sold and 1,375 gallons of potential need in the next five years. The projected total of these existing and future needs will exceed the current plant permit by 11,676 gallons per day.

Chester Creek Watershed - The Township/Authority have an agreement for treatment of 1.0 MGD of capacity at the West Goshen Sewage Treatment Plant. The 1996 actual annual average daily flow was 863,503 gpd (including 109,350

gallons is from the Ridley Creek Basin). An additional 276,896 gallons has been committed or sold. These allocations bring the theoretical flow to the WGSTP over the 1,000,000 gallon per day allotment by 140,399 gallons per day.

Estimated Five and Ten Year Projections

(Sewage Needs Based on Land Use permitted under the Existing Zoning with an EDU rating of 275 gpd)

Ridley Creek Watershed - In the 0 - 5 year range, an estimated 79,600 gpd will be needed. In the 5 years and beyond range, there is an estimated need for an additional 166,050 gallons. These projections include the potential needs of the two institutional facilities in Willistown Township (Bryn Mawr Rehab and Christ Memorial Church). These projected needs are illustrated on Exhibit 2-B.

Chester Creek Watershed - Exhibit 3-A illustrates that an estimated 125,262 gpd will be needed in the 0 - 5 year range and an additional 87,725 gpd in the 5 years and beyond range.

Future Capacity Needs

Using the proposed wastewater rating of 225 gpd/EDU:

Ridley Creek Basin	Flow	Chester Creek Basin	Flow
Current Flow to RCSTP	275,451	Current Flow to WGSTP	863,503
Pumped to Chester Creek	-0-	Pumped from Ridley Creek	-109,350
Current Basin Flow	408,182	Current Basin Flow	754,153
0 - 5 year needs	80,000	0 - 5 years needs	63,909
Total Basin Flow 0 - 5 Years	488,182	Total Basin Flow 0 - 5 Years	818,062
5 years and beyond needs	166,050	5 years and beyond needs	87,725
Total Ultimate Basin Flow	654,232	Total Ultimate Basin Flow	905,787

Use of New EDU Wastewater Ratings - In order to gain the maximum amount of capacity at both the RCSTP and the WGSTP, we have reviewed the actual average daily uses for new construction in both basins. The actual average daily flows from both basins have consistently been 75 - 90% of the EDU Wastewater Ratings used to develop the capacity allocations. The Plan proposes to reduce the EDU rating for new construction only from 275 GPD for single family dwellings to 225 GPD; from 225 GPD for townhouses to 200 GPD and from 200 GPD for apartments to 175 GPD.

Out of Basin Flows

Ridley Creek Watershed - There are no out of basin flows being treated at the RCSTP. The currently approved 537 Plan shows that New Kent flows are treated at the West Goshen Treatment Plant, when, in fact, they are part of the Ridley Creek Watershed and are treated at the RCSTP

Chester Creek Watershed - There are 109,350 gpd being pumped from the Ridley Creek Watershed to the Chester Creek Watershed for treatment at the West Goshen Sewage Treatment Plant. An additional 44,000 gpd is currently projected to be pumped to the Chester Creek in the 5 year and beyond range.

C. ALTERNATIVES

Alternative #1

Obtain additional sewage treatment capacity at the West Goshen Sewage Treatment Plant.

Discussions between the East Goshen and West Goshen Board of Supervisors regarding the possibility of East Goshen purchasing an additional 200,000 gpd capacity at the WGSTP took place in Spring, 1996. The purchase of this amount of capacity was found to be not economically feasible; therefore this Alternative has been eliminated. Copies of all correspondence and data can be found in Volume II.

Alternative #2

Feasibility of obtaining treatment capacity from other sources - Westtown Sewer Company - Pursuant to a court order, on December 15, 1996 Westtown Township took over operation of the Westtown Sewage Treatment Plant located on Westtown Road in Westtown Township. The plant has had many problems over the years and has been cited by the Department for violations of operations and maintenance of the plant and the system. At this time, there are too many unknowns for East Goshen Township and Authority to look for additional capacity at this facility. A copy of the article from the Daily Local News pertaining to the take-over is included in Volume II Exhibits.

West Chester Borough Goose Creek Treatment Plant - The Township was recently asked by the Borough about any capacity the Township may need at the Goose Creek Treatment Plant. The Township responded with a need for

approximately 0.200 MGD however there is no economically feasible method of getting any of that sewage to the Goose Creek Sewage Treatment Plant.

These two alternatives have been eliminated from further study.

Alternative #3

For purposes of this Special Study, the findings of the 1995 Plan Update regarding the feasibility of Spray Irrigation are still valid.

According to the June, 1995 study, only two properties exist within the Ridley Creek watershed which contain sufficient acreage to handle the facilities and spray filed necessary for the calculated discharge need of 0.3 MGD. These include the Pfizer (formerly SmithKline Beecham) property located north of Boot Road and the additional possibility of use of all or part of the Grace Estate property located immediately adjacent to and south of the Ridley Creek STP.

The use of the Pfizer property was dismissed for future spray irrigation purposes because of the need to pump treated effluent more than 1.1 miles and the high expected cost of condemnation per acre (assumed to be in excess of $60,000 per acre) in addition to the burden of exceptionally high operating costs for future years.

The Grace Estate, comprising 182 acres, where soils are suitable, could be acceptable for spray effluent areas in its entirety. The June, 1995 Act 537 Plan Update estimated that it would be necessary to acquire the entire westerly half of this property (west of Ridley Creek) and perhaps suitable portions of the property east of the Ridley Creek in order to meet the estimated physical area needs of 75 acres required for the application of spray effluent for an additional 0.3 MGD.

The 1995 study assumed a cost of $55,000[1] per acre for this raw land since acquisition of these major portions of the site would destroy the utility of the balance of the site. A recent sale of raw ground in the township reflected $60,000[2] per acre for development of the entire site. With that in mind, the Grace Estate ground may cost even more than that on today's market.

Using $60,000 per acre, the costs for spray irrigation would be $4,500,000. Additional costs for spray field piping and pumping were estimated at $400,000 for a total of $4,900,000 before the plant expansion costs are even considered.

A complete copy of the 1995 Act 537 Plan Update section pertaining to spray irrigation is included with the Supporting Documents of this submission.

---

[1] Information taken from page 4-28 of the June, 1995 Act 537 Plan Update
[2] Based on average land cost for the Wood Estate, sold in 1996

This alternative has been dismissed from further evaluation since it is not cost effective.

Alternative #4

Increase the RCSTP NPDES Permit to 0.750 MGD

This alternative proposes to increase existing NPDES Permit to .750 MGD in two phases.

Phase I - Increase the Treatment Plant to 0.500 MGD -

This phase will take care of the existing on-line and committed or sold capacity. There are no projected additional needs in the Ridley Creek Basin within the 0 - 5 year range however there are projected potential needs in the 5 years and beyond range unless flows are diverted from the Chester Creek treatment facility (WGSTP) to the RCSTP. When the flows at the RCSTP reach the 0.400 MGD the application process with the Department will be started to obtain permission to begin construction to complete the expansion of the treatment facility to 0.750 MGD.

The 5 year and beyond projections consist of existing developments whose on-lot systems are being monitored through the Township's On-Lot Sewage Management Program. These developments are Charter Chase, Mill Valley, Millstream Drive, Indian Hills and the areas of Broookmont/Treemont, North Chester Road and Old Orchard/Raewyck Drives. Capacity must be allocated for public sewers should these on-lot areas fail. Previous walks through the Charter Chase area indicated that some systems were malfunctioning. Notices were sent to the homeowners advising them to repair the systems. A follow-up inspection showed that the repairs were made.

This Plan also recommends that the Potential 5 year and beyond flow that is currently included in the Chester Creek allocations be moved to the Ridley Creek Basin allocations. Since additional capacity is unavailable at the WGSTP, these changes will go toward reducing the capacity projections at the WGSTP.

Accomplishing the Phase I expansion should be more of a "fine tuning" than construction. Most of the equipment currently in place at the RCSTP was originally sized to handle 0.500 MGD therefore only minor modifications should be needed. It is not anticipated that any additional land will be required.

The flows from New Kent Apartments (calculated at 76,800 gpd using 225 gpd/unit) would continue to be treated at the RCTP and be deleted from the Chester Creek allocation.

The flows from Hershey Mill Estates and Fairway Village (49,500 gallons), currently being pumped to the Chester Creek (WGSTP) through the Hershey Mill Pump Station will be pumped to the RCSTP. Approximately 600 feet of force main extension would be required to make this change, starting at a point just beyond the end of Cornwallis Drive to a connection point at the last manhole on Cornwallis Drive where it would reach the RCSTP by gravity. Implementation of these changes will be made if and when the current capacity limit at the West Goshen Treatment Plant appears to be in danger of being exceeded.

An additional 8,250 gallons could be diverted from the Chester Creek Marydell Pump Station which serves 30 single family dwellings. Approximately 500 feet of force main would need to be constructed from the Marydell Pump Station to a manhole in the Ridley Creek system.

Exhibits 3B - 3D illustrate the proposed EDU wastewater allocations for both the Ridley Creek and Chester Creek Basins.

Phase II - Increase the Treatment Plant to .750 MGD

As discussed in Phase I, when the need for additional sewage capacity becomes a reality, it will be necessary to expand the RCSTP an additional .250 MGD to the ultimate .750 MGD. Construction needs to accomplish this expansion are not known at this time. The existing plant is on one acre of land owned by the East Goshen Municipal Authority. A small portion of land may be required from the adjacent open space. Since the open space is owned by the Township, it is assumed a mutually acceptable agreement could be reached by the Township and Authority for acquisition of the needed land.

The ultimate Ridley Creek Sewer Area is shown on Exhibit 4. This plant expansion should serve the township through its ultimate needs as well as provide needed capacity for the adjoining municipality.

Stream Quality Analysis - The RCSTP is permitted as a stream discharge plant; however it is not a direct stream discharge. It should be more aptly labeled an aquaculture treatment system since the treated effluent is filtered through wetlands before entering the stream. An Aquaculture system has been described as those which include natural and artificial wetlands as well as other aquatic systems for the production of algae and higher plants, invertebrates, fish and integrated polyculture foodchain systems. Swamps and bogs are successfully

being utilized as managed "nutrient sinks" for polishing partially treated, or fully treated in the case of RCSTP, effluent.[3]

The RCSTP filtration system was originally accomplished through a manifold system which diffuses the effluent for a distance of several hundred feet above and below the assumed center of the mixing zone. Based on the nature of this type of stream discharge and the results of periodic stream samples taken over the years, the Township, Authority and Consulting Engineer have formed the opinion that the stream quality has not been degraded as a result of the effluent discharge into it.

To further illustrate this point, the Municipal Authority authorized the plant operator to take random samples from the stream at four locations upstream and downstream of the Plant outfall in November, 1996. The samples were taken below the mixing zone, 400 feet below the next tributary, at the outfall of the Ridley Creek and at the point of outfall from the plant. The test samples concluded that the discharge of effluent into the stream had no measurable effect of any type on the stream quality.

The original discharge area has expanded considerably since the treatment plant was put into service in 1985. Further, these specific wetlands are extremely beneficial because they are artificially fed with a constant supply of water and are unaffected by seasonal changes or drought conditions.

The Plant Operator's memo and the complete laboratory report can be found in Volume II. As a point of interest, on the day the samples were taken, a representative of the Department was present and offered suggestions to the operator on sample locations.

Ridley Creek Greenway Project Plan

In November, 1996 the Township Board of Supervisors endorsed the Ridley Creek Greenway Project Plan. This Plan notes that the Ridley Creek Plant filters effluent through the wetlands to the creek. The Greenway Project Committee was impressed with how the RCSTP is run and did not have any comments on the quality of the stream as a result of the stream discharge from the Plant.

D. RECOMMENDED ALTERNATIVE

Alternative #4 is the recommended alternative of this Plan Study.

[3] Innovative and Alternative Technology Assessment Manual, United States Environmental Protection Agency, February, 1980, page A-26

E. IMPLEMENTATION PLAN

The first goal of this 537 Plan Special Study is to increase the Sewage Treatment Plant NPDES Permit limit from 0.400 to 0.750 MGD in two phases. Upon approval of this 537 Plan Special Study, NPDES Permit application Parts I and II will be submitted to the Department to increase the capacity to 0.500 MGD. When the plant flows reach a daily flow of 0.400 MGD, applications will be submitted to the Department to implement Phase II which will be to increase the plant discharge limit to 0.750 MGD.

The second goal is to immediately utilize the revised wastewater ratings for new construction only.

Volume II

Background and Supporting Documents

A. Plan Summary

This Act 537 Plan Special Study looks at the alternatives available to East Goshen for obtaining the projected additional sewage capacity to serve the ultimate needs of the Township. The Plan recommends that the Ridley Creek Sewage Treatment Plant be expanded, in two phases, from the existing permitted capacity of 0.400 MGD/day to 0.750 MGD.

Phase I - increase to 0.500 MGD
Phase II - increase to 0.750 MGD

The Consulting Engineer believes the first phase can be accomplished at minimal cost and time since most of the existing equipment was originally sized to treat 0.500 MGD.

Some Ridley Creek Watershed flows currently being pumped to the West Goshen Sewage Treatment Plant (WGSTP) would be diverted to the Ridley Creek Sewage Treatment (RCSTP) and some flows from the Chester Creek Watershed would be diverted to the RCSTP. These transfers should eliminate the need for additional discharge capacity at the WGSTP.

The Township has calculated that treatment costs at the RCSTP are more economical than at the WGSTP (see Volume I, Exhibit 5).

The Department's June 30, 1995 approval of the current Sewage Facilities Plan included several recommendations to be addressed prior to the Township submitting a recommendation for a plan to increase the sewage capacity at the RCSTP to serve the Township's ultimate needs. A summary of the actions taken can be found in the Plan Summary, Volume II and again following the letter in Volume II - Section F. - Supporting Documents.

B. Alternatives

For the purposes of this Special Study, four alternatives were studied.

Alternative #1

Obtain additional sewage treatment capacity at the West Goshen Sewage Treatment Plant - The June, 1995 Department approval of the 537 Plan Update recommended that further investigation of the "West Goshen Alternative" would be the preferred way of obtaining additional capacity for East Goshen's ultimate needs.

East Goshen Township Supervisors and Municipal Authority were invited to attend a meeting at the West Goshen Treatment Plant for the purpose of discussing the costs associated with the purchase of an additional 0.200 MGD capacity at the WGTP. In addition to the calculated cost per gallon of $6.00 plus $.50 administrative charge, West Goshen presented an "Analysis of Plant Allocation Costs" to East Goshen. The Analysis determined that East Goshen would have to pay $981,000 for "past due cost" allocations prior to any agreement on the sale of additional capacity.

East Goshen Township Supervisors, Municipal Authority, Authority Consulting Engineer and financial consultant discussed the West Goshen proposal at two joint meetings and determined that the premises upon which the alleged past due costs were determined were inaccurate. They felt that all costs paid over the years to West Goshen were determined by the Agreement signed by both townships in 1977 and since modified periodically by amendments. Based on the advice of its consultants, a letter dated May 9, 1996 was sent to West Goshen advising that East Goshen was interested in discussing purchasing capacity for a proportionate share of the estimated $6.00 per gallon and administrative cost but would not consider paying for any past allocation costs. West Goshen's response of May 10, 1996, confirmed that the previously stated terms were non-negotiable and that West Goshen was only looking for a yes or no answer. East Goshen replied on May 30, 1996 and repeated their willingness to discuss purchasing additional capacity for a proportionate share of the estimated cost per gallon and administrative charge. The Township did not receive a reply to that letter. Copies of all correspondence and documents relating to these discussions has been included with Section F - Supporting Documents.

This Alternative has been eliminated from further consideration.

Alternative #2

Feasibility of obtaining treatment capacity from other sources -

Westtown Sewer Company - Pursuant to a court order, on December 15, 1996 Westtown Township took over the operation of the Westtown Sewage Treatment Plant located on Westtown Road in Westtown Township. The plant has had many problems over the years and been cited by the Department for various violations.

This alternative has been eliminated from further consideration as there are too many unknowns for East Goshen Township and Authority to seek additional discharge capacity at this facility.

A copy of the article from the Daily Local News pertaining to the take-over is included in Section F - Supporting Documents.

West Chester Borough Goose Creek Treatment Plant - The Township was recently asked by the Borough, about any capacity the Township may need at the Goose Creek Treatment Plant. The Township responded with a need for approximately .200 MGD but also determined that there is no economically feasible method of getting any of that sewage to the Goose Creek Plant.

This alternative has been eliminated from further consideration.

Alternative #3

Spray Irrigation

Spray Irrigation was discussed in detail in the June, 1995 act 537 Plan Update and is repeated in Section 13 of the Supporting Documents of this Special Study.

Two parcels were discussed: the Pfizer property (previously owned by SmithKline Beecham) and the Grace Estate. The Pfizer property was dismissed for future spray irrigation purposes due, in part, to the need to pump the treated effluent more than 1 mile.

The Grace Estate, comprising 182 acres, was discussed in more detail. SMC determined that 55.5 acres would be needed for spray fields, in addition to the required buffer and storage pond acreage, to treat 300,000 gpd using a percolation rate of 1.5 inches per week per acre. The total acreage estimated by SMC was 75 acres.

Yerkes Associates concurs with the conclusions set forth in the SMC study. For this Special Study, the amount of acreage that will be required has been calculated based on the need to spray 350,000 gpd. Using the same parameters of 1.5 inches per week per acre, a total of 60.15 acres would be required for spray fields plus the buffer and storage pond needs. The total acreage for spray discharge of 350,000 gpd would be 83.75 acres.

The soils on the Grace Estate are primarily made up of Worsham, Wehadkee, Glenville

and Glenelg. Worsham and Wehadkee soils are poorly drained and generally not suitable for subsurface systems. The Glenville and Glenelg soils are categorized as moderately deep and well drained, making them more suitable. However these soils on the Grace Estate are found in areas where the slope ranges from 3 - 8%. The areas with the higher percentages do not lend themselves to a practical spray irrigation system.

Consequently, it appears that not only is the estimated cost of a spray irrigation system not economically feasible, but also the quality of the land under consideration.

Based on the information available, this alternative has been eliminated from consideration at this time.

Alternative #4

Increase the Ridley Creek Sewage Treatment Plant NPDES Permit (#00505404) to 0.750 MGD

This alternative would be accomplished in two phases. Phase I would expand the capacity to 0.500 MGD which will take care of the existing dwellings that are on-line and the capacity that has been committed or sold. There are no current projections for capacity need in the 0 - 5 years; however there is a projected potential need in the 5 years and beyond range. That is the period of time when the second phase would be considered.

As part of Phase I, the changes shown on Table I would be made in the Ridley Creek and Chester Creek capacity allocations.

The 5 year and beyond projections consist primarily of areas whose on-lot systems are older and have had problems in the past. Any malfunctions found in the walk through completed during the preparation of the existing Act 537 Plan Update have been repaired and are being monitored by the Township's Sewage Management Program.

Allocations for Bryn Mawr Rehab, Christ Memorial Lutheran Church and Fox Ridge Farms, all in Willistown Township, will be placed in the 5 Year and Beyond Range. Methods of getting the sewage to the RCSTP will be the full responsibility of the individual users but must be reviewed and approved by East Goshen Municipal Authority's Consulting Engineer.

Phase II (expansion to .750 MGD) will be designed when the need for public sewers

for any or all of the areas in the 5 Year and Beyond becomes apparent.

Phase II may involve the installation of a new package plant. Sufficient land for the expansion may be available on the current site, however, if it is not, it is assumed that land from the adjacent Township owned open space, could be obtained at a reasonable cost or at no cost.

C. USE OF NEW EDU WASTEWATER RATING

In order to gain the maximum amount of capacity at both the RCSTP and the WGSTP, we have reviewed the actual average daily uses for new construction in both basins. The actual average daily flows from both basins have consistently been 75 - 90 % below the EDU Wastewater Ratings used to develop the capacity allocations (please refer to the Chapter 94 Report).

This Plan proposes to reduce the EDU rating for new construction only from 275 GPD for single family dwellings to 225 GPD; from 225 GPD for townhouses to 175 GPD and from 200 GPD for apartments to 175 GPD.

Table I

Table 1, on the following page, charts the flows that will be transferred to the Ridley Creek Sewage Treatment Plant if and when the permitted capacity at the West Goshen Treatment Plant appears to be in danger of being exceeded. The exception is the flow from New Kent Apartments which is planned for continuing treatment at the RCSTP.

TABLE 1

FLOWS TO BE TRANSFERRED FROM CHESTER CREEK ALLOCATIONS TO RIDLEY CREEK ALLOCATIONS

AREA	GPD	HOME BASIN	CURRENTLY PART OF CHESTER ALLOCATIONS	CURRENTLY PART OF RIDLEY ALLOCATIONS	WILL REMAIN OR BE PUMPED TO

MARYDELL (30 SFD) PUMP STATION	8,250	CHESTER	YES		RIDLEY

TOTAL 181,250 gallons per day

Table 2 illustrates the estimated sewage needs based on the 5 and 10 year Land Use.

TABLE 2

Estimated Sewage Needs Based on 5 and 10 Year Land Use

Ridley Creek Watershed - There are three undeveloped properties with 35 or more acres

Grace Estate	182 acres	E. Strasburg and Dutton Mill Roads	Recommended for on-lot disposal
Pfizer	300 acres	Paoli Pike	total of 40,000 gpd reserved in RCSTP - balance would be by on-lot disposal
Sherman Property	37.8 acres	N. Chester/Forest Lane	capacity reserved in RCSTP

Chester Creek Watershed - There is one undeveloped property with 35 or more acres - the Price Property at Ellis Lane and Paoli Pike. Capacity is reserved in the Chester Creek allocations for treatment at the West Goshen Treatment Plant.

TABLE 3 - ESTIMATED COST OF ALTERNATIVES AND SPRAY IRRIGATION

Alternative #1 **West Goshen Alternative**	**Alternative #2 Obtain Capacity from Other Sources**	**Alternative #3 Spray Irrigation**	**Alternative #4 Phase I Increase RCSTP Permit to 0.500 MGD**	**Phase II Increase Plant Capacity to 0.750 MGD**
Past Due Allocations $980,000 .200 MGD Capacity $1,300,000 Total Cost $2,228,000	Unknown	Purchase 75 acres @ $89,000/acre $6,675,000 Spray System $150,000 Increased tankage equipment $1,000,000	New Kent Apts $0 Hershey Mill Estates & Fairway Village approx 600 LF Force Main @ $35/LF $21,000 Marydell Pump Station (inst. In shoulder) approx. 500 LF Force Main @$75 $37,500 Modify existing plant equipment $150,000	Increase capacity to 0.750 MGD $1,000,000
$2,228,000	**UNKNOWN**	**$7,825,000**	**$208,500**	**$1,000,000**

D. RECOMMENDED ALTERNATIVE

This Plan recommends Alternative #4 as the plan of choice. Taking the outcome of discussions surrounding Alternative #1 (West Goshen Alternative) and the economics of the other alternatives, including the estimated costs of spray irrigation, it is our opinion that Alternative #4 is the best choice to fill the capacity needs of the Township for the next five years and beyond.

E. IMPLEMENTATION

The goal of this 537 Plan Special Study is to increase the permitted discharge limits of the Ridley Creek Sewage Treatment Plant from 0.400 MGD to 0.750 MGD in two phases. Upon receipt of the Department's approval of this 537 Plan Special Study, NPDES Part I and Part II applications will be submitted to the Department requesting approval of the increase in discharge limits from 0.400 MGD to 0.500 MGD. When the RCSTP flows reach 0.400 MGD, NPDES Part I and Part II applications will be submitted to the Department requesting approval of an increase in the discharge permit limits from 0.500 MGD to 0.750 MGD. If and when it appears that the current capacity limits at the West Goshen Treatment Plant will be exceeded, plans will be prepared to divert the flows from Hershey's Mill Estates, Fairway Village and the Marydell Pump Station from treatment at West Goshen Treatment Plant to treatment at the RCSTP.

The second goal of this submission is to obtain approval for the new wastewater ratings for new construction.

DRAFT

RESOLUTION FOR PLAN REVISION

RESOLUTION NO. _____

WHEREAS, Section 5 of the Act of January 24, 1966, P.L. 1535, No. 537, known as the "Pennsylvania Sewage Facilities Act", as amended, and the Rules and Regulations of the Department of Environmental Resources (Department) adopted thereunder, Chapter 71 of Title 25 of the Pennsylvania Code, requires the municipality to adopt an official Sewage Facilities Plan providing for sewage services adequate to prevent contamination of waters and/or environmental health hazards with sewage wastes, and to revise said plan whenever it is necessary to meet the sewage disposal needs of the municipality, and

WHEREAS, the Board of Supervisors of East Goshen Township has adopted a 537 Plan Update approved by the Pennsylvania Department of Environmental Protection in June, 1995, and

WHEREAS, the municipality has now prepared a Special Study to determine the best alternative for obtaining additional sewage capacity projected to serve the ultimate needs of the municipality, and

WHEREAS, the Special Study considered three alternatives to accomplish the acquisition of the projected needed sewage capacity, and

WHEREAS, the recommended alternative determined through this Special Study is to use two phases to increase the discharge permit limits of the Ridley Creek Sewage Treatment Plant (PA NPDES # 0050504) from the existing permit limit of 0.400 MGD to 0.750 MGD, and

WHEREAS, the Plan proposes to reduce the wastewater ratings per equivalent dwelling unit for new construction only,

AND NOW THEREFORE, be it resolved that the Act 537 Special Study for East Goshen Township dated May, 1997 and prepared by Yerkes Associates, Inc. is hereby approved and adopted on this _____day of _____, 1997.

RE: East Goshen Township 537 Plan

RE[illegible]
JUL 23 1997
YERKES ASSOC.

Dear Rick:

As requested, the Chester County Health Department has reviewed the "East Goshen Township Revision to the Official Plan Act 537 for a Special Study Area" (plan) as prepared by Yerkes Associates, Inc and dated May, 1997.

The plan proposes to increase the capacity of the East Goshen Township Ridley Creek sewage treatment plant from .4MGD to .75MGD. The expansion will occur in two phases. The first phase will rerate the plant to .5MGD and the second phase will expand it to .75MGD. The plan also proposes to revise the design flow figures from new construction.

The following comments are offered:

1. There is no supporting documentation to justify the use of the revised flows for new construction. The supporting documentation should be included in the report.

2. This Department will not object to the re-rate of the existing plant to .5MGD. The Township should be aware that Ridley Creek is a high quality stream and, as such, the Department of Environmental Protection ragulations require that a social and economic justification be provided for any new or increased discharge. No justification has been provida in the plan.

3. Regarding the sewage treatment plant expansion to .75MGD; DEP will again require that a social and economic justification be submitted. Additionally, this Department recommends that the township re-evaluate the need for the expansion when growth in the township warrants the increase.

This Department generally supports the recommendations contained in the plan but believe addition documentation to support the chosen alternatives are necessary.

Should you have any questions concerning this review please contact me at 344-6239 or the above address.

Sincerely,

Maria

Re: East Goshen Township
Act 537 Plan, Special Study
CCHD Review of July 21, 1997

Dear Maria:

We are in receipt of your July 21, 1997 review of the May, 1997 draft of the Act 537 Sewage Facilities Special Study Plan for East Goshen Township. We offer the following responses:

1. COMMENT: There is no supporting documentation to justify the use of the revised flows for new construction. The supporting documentation should be included in the report.

   The 1996 Chapter 94 report for the Ridley Creek Plant is included as Addendum #1. Page 1 of this report showed that the volume of the system in 1996 indicated a usage of 205 gpd per connection. There have been 44 new single family homes constructed and occupied in the township in the past five years. An analysis was made of the actual water usage of these homes with a resulting average usage of 211 gpd. All of the homes used in the analysis are 3,000 + square feet. A copy of the analysis results is included in this addendum.

2. COMMENT: This Department will not object to the re-rating of the existing plant to 0.500 MGD. The Township should be aware that Ridley Creek is a high quality stream and, as such, the Department of Environmental Protection regulations require that a socio-economic justification be provided for any new or increased discharge. No justification has been provided in the plan.

Glen Stinson of the regional office of DEP has advised that preliminary treatment requirements for the Ridley Creek Sewage Treatment Plant. have been ordered in-house. Mr. Stinson said that DEP will advise East Goshen if a socio-economic justification will be required.

3. COMMENT: Regarding the sewage treatment plant expansion to .75 MGD, DEP will again require that a social and economic justification will be submitted. Additionally, this Department recommends that the township re-evaluate the need for the expansion when growth in the township warrants the increase.

   See answer to Comment #2 with regard to the need for a socio-economic justification. The August, 1997 revision of the plan explains the need to expand to 0.750 MGD in more detail.

We trust we have satisfactorily responded to your concerns. Please contact me if you have any questions or additional comments.

Very truly yours,

Suzanne K. Fish

Re: Revision to Official Sewage Plan - Act 537 for a Special Study Area

Dear Mr. Shane:

The Chester County Planning Commission (CCPC) has reviewed the Plan Revision dated May 1997, as required by Section 71.53(a)(2) of the Pennsylvania Sewage Facilities Act (Act 537). One of the purposes of our review is to highlight issues we believe the PA Department of Environmental Protection (DEP) will raise in their review. We suggest that approval of your plan will be facilitated if our comments are addressed in writing by the Township and included with the document when it is sent to DEP for their review and action.

Recently CCPC sent to the Township a memorandum containing our Final Consistency Review Report and Summary of Findings related to the County Vision Partnership Program. In that memorandum we stated that there are no major areas of inconsistency between the current Township Sewage Facilities Plan and the landscape designations contained in the Chester County Comprehensive Policy Plan Element ***Landscapes***. We realize that as primarily a suburban landscape, the Township will eventually need additional infrastructure capacity to meet future needs. The proposed re-rating of the sewage treatment plant from 0.4 to 0.5 million gallons per day (mgd) may be necessary to meet immediate and short term needs. However, the Plan Revision document submitted for our review does not appear to clearly document the need to expand the capacity to 0.750 mgd.

The first objective stated for the Plan Revision contained in the Executive Summary is to obtain approval to reduce the current wastewater ratings. However, little information is presented in the document to support the proposal to reduce equivalent dwelling (EDU) flows by the type of housing unit. We believe DEP will want to see more detailed information to consider approving the proposed EDU ratings.

The second stated objective of the Plan Revision is to obtain approval to increase the discharge permit limits of the Ridley Creek Sewage Treatment Plant from 0.400 million gallons per day (mgd) to 0.750 mgd. We find that the document only partially supports your objective for the following reasons:

- There is no specific mention of any previous wastewater facilities planning efforts.
- There are no maps or other graphics to clearly show the division of sewage flows in the two watersheds.
- A copy of the 1996 Chapter 94 Report would help support other information contained in the document.

We offer the following additional comments about the information contained in the document:

- On page 3 it is stated that the total Ridley Creek Watershed basin flow is 392,000 gallons per day (gpd). This information is not consistent the document Exhibits and conflicts with the table on page 4 that indicates the basin flow to be 408,182 gpd.
- The table on page 4 also indicates that there is 80,000 gpd of needs in this watershed within the next 5 years and 166,050 gpd beyond the next 5 years. This information appears to be different from that contained in the document Exhibits.
- For the Chester Creek Basin, the table on page 4 indicates that 87,725 gpd will be needed beyond the next 5 years. This information appears to be different from data contained in the document Exhibits.
- On page 4 it is stated the flows from the New Kent Apartments are currently being treated at the Ridley Creek STP. This flow is not included in Exhibit 1.

A major omission from the proposed Act 537 Plan Revision is any mention of the fact that the entire Ridley Creek Watershed in East Goshen Township is designated by the Commonwealth of Pennsylvania as High Quality Waters. This water quality designation has special implications for new or increased discharges to the Waters of the Commonwealth. The Act 537 Plan adopted by the Township in 1992 recognized the need to conduct a socio-economic study to justify the proposed increase in discharge to the Ridley Creek. To the best of our knowledge, this is still a PADEP requirement for proposed discharges to High Quality Waters.

CCPC is concerned that the Township still has not given the spray irrigation (land application) alternative a thorough analysis. Land application is the primary alternative emphasized by DEP for proposed discharges to High Quality Waters. We do agree that this alternative would be more expensive than other alternatives if the Township were to purchase in fee simple land that would be used only for that purpose. The County Planning Commission recommends that the Township investigate other possibilities for the land application of effluent, including long term lease arrangements at suitable sites and/or combining land application with other uses of existing and proposed municipal open space sites.

CCPC is very concerned that the Township, the Municipal Authority and DEP have approved or committed sewage treatment plant capacity to proposed land developments over and above the capacity currently available to the Township. We suggest there is a need to institutionalize plan approval procedures between the Township and its Authority to prevent this from happening in the future.

Please contact me if you have any questions regarding this review. If the Township makes significant changes to the Plan Revision document, please send us a copy for our files.

Sincerely,

William H. Fulton, AICP

Re: East Goshen Township
Act 537 Plan Special Study

Dear Mr. Ihlein:

We are in receipt of the July 29, 1997 review of the May, 1997 draft of the Special Study referenced above. The following responses are offered to your comments:

1. COMMENT: The proposed re-rating of the sewage plant from 0.4 to 0.5 million gallons per day (mgd) may be necessary to meet immediate and short term needs. However, the Plan Revision document submitted for our review does not appear to clearly document the need to expand the capacity to 0.750 MGD.

Addendum #3 addresses the estimated needs leading to the expansion to .0750 MGD.

2. COMMENT: However, little information is presented in the document to support the proposal to reduce equivalent dwelling (EDU) flows by the type of housing unit. We believe DEP will want to seen more detailed information to consider approving the proposed EDU ratings.

The 1996 Chapter 94 report for the Ridley Creek Plant is included as Addendum #1. Page 1 of this report showed that the volume of the system indicated a usage of 205 gpd per connection. In addition, an analysis was made of the actual water usage of 44 single family dwellings built within the past five years. The results of this analysis

show that the average usage is 211 gpd. All of the homes used in the analysis are 3,000 + square feet in size. A copy of the analysis can be found in this Addendum.

3. COMMENT: There is no specific mention of any previous wastewater facilities planning efforts.

   Volume I, page 2, refers to the current township sewage facilities plan that was approved as an update in June, 1995. The reference has been elaborated on so that it stands out more.

4. COMMENT: There are no maps or graphics to clearly show the division of sewage flows in the two watersheds.

   Exhibit 4 has been revised to show individual lots more clearly, where those lots are treated or whether they have on-lot disposal systems.

5. COMMENT: Paragraph, page 2....several comments regarding discrepancies between chart numbers and text language.

   Revisions have been made to the document to correct these discrepancies.

6. COMMENT: Page 2, second paragraph regarding the High Quality Waters classification of the Ridley Creek and the need to conduct a socio-economic study to justify the proposed increase to the Ridley Creek. Chester County Planning Department feels this is a PaDEP requirement for proposed discharges to High Quality Waters.

   The Department has advised me that preliminary treatment requirements for the proposed expansion have been ordered. The Department will review those requirements and advised the Township if a Socio-Economic Justification should be prepared.

7. COMMENT: Page 2, third paragraph, referencing CCPC concerns regarding spray irrigation.....

The revised document addresses this concern.

8. COMMENT: Page 2, fourth paragraph. Regarding the County's concerns regarding the Township, Municipal Authority and DEP having approved or committed sewage treatment capacity to proposed land developments over and above the capacity currently available to the Township.

   The Township and Municipal Authority keep very detailed records regarding actual flow and committed capacity and the resulting available capacity. The "paper" flows shown on Exhibits 1 - Existing Ridley Creek Treatment Plant Allocations and Exhibit 3 - Existing Conveyance to West Goshen Treatment Plant, are in compliance with available capacity. As part of the 537 Sewage Facilities Planning to serve the ultimate needs of the Township, allocation modifications and additional capacity will be needed.

Please contact me if you have any questions or additional comments.

Very truly yours,

Suzanne K. Fish
Project Manager

Re: Revision to Official Sewage Plan
Act 537 For A Special Study Area

Dear Board Members:

At their meeting on Monday, July 14, 1997 the Municipal Authority reviewed the Revision to the Official Sewage Plan Act 537 for A Special Study, Volumes I and II and have the following comments:

1) On page 3, Volume I, paragraph 5, the flow numbers should be provided so that the Ridley Creek Balance can be calculated.

2) On page 4 in both Volumes I and II, the wording should be changed from "75-90% **below** the EDU Wastewater Ratings" to "75-90% **of** the EDU Wastewater Ratings".

3) On page 5, Volume I, the date in paragraph 1 should be "Spring, 1996".

4) On page 7, Volume I, paragraph 3, the proposal for construction of 500 feet of force main to divert 8,250 gallons from the Chester Creek Marydell Pump Station to the Ridley Creek system should be reviewed for cost effectiveness.

5) On page 9, Volume I, "$55 per acre" should be changed to "$55,000 per acre".

Very truly yours,

Marie D. Clevenger

RE: Revision to Official Sewage Plan - Act 537
Planning Commission Review

Dear Board Members:

At their meeting on July 2, 1997, the Planning Commission reviewed the "Revision to Official Sewage Plan - Act 537" prepared by Yerkes Associates, Inc. After a discussion and explanation period the consensus of the members was that they (the Planning Commission) did not have any significant comments or revisions to make to the proposed plan.

Very truly yours,

Jo Ann Kelton
Chairman

Re: Act 537 Plan Update
East Goshen Township
Chester County

Dear Mr. Smith:

We have completed our review of your municipality's updated official sewage facilities plan entitled East Goshen Township Act 537 Plan Update as prepared by SMC Environmental Services Group, dated December 1992, Revised June 1994. The review was conducted in accordance with the provisions of the Pennsylvania Sewage Facilities Act.

Approval of the plan is hereby granted.

1. Implementation of the on-lot and community sewage system management program

2. Diversion of sewages flows for New Kent Apartments from the Ridley Creek sewage treatment plant to the West Goshen sewage treatment plant.

3. Immediate initiation of further planning in conjunction with West Goshen for the "West Goshen Alternative". A plan of study must be submitted that outlines the study area and proposed plan content and that includes a Task Activity Report or equivalent cost document.

4. Initiation of further planning to evaluate the need for the proposed Line Road Interceptor. A plan of study must be submitted that outlines the study area and proposed plan content and that includes a Task Activity Report or equivalent cost document.

5. Initiation of further planning to evaluate the possible connection of the Bryn Mawr Rehabilitation Hospital tot he Ridley Creek sewage treatment plant. A plan of study must be submitted that outlines the study area and proposed plan content and that includes an Task Activity Report or equivalent cost document.

6. Utilization of new EDU wastewater ratings:

Single family detached dwellings	- 275 gpd
Townshouses	- 225 gpd
Apartments	- 200 gpd

7. Initiation of further planning to further evaluate other alternatives if the "West Goshen Alternative" does not meet East Goshen Township needs. The spray irrigation alternative would have to be evaluated in more detail. A plan of study must be submitted that outlines the study area and proposed plan content and that includes a Task Activity Report or equivalent cost document.

If you have any questions regarding this matter, please feel free to contact me at the above number.

Sincerely,

Joseph A. Feola

ANSWERS TO THE JUNE 30, 1995 LETTER FROM THE DEPARTMENT

1. The Township's On-Lot Management Plan was implemented in July, 1994.

2. The diversion of flows for New Kent Apartments from the Ridley Creek to the Chester Creek has not been done.

3. The "West Goshen Alternative" has been studied and found not to be economically feasible.

4. The proposed "Line Road Interceptor" has been installed by a developer.

5. The new EDU wastewater readings are being used.

6. Studies of alternatives other than the "West Goshen Alternative" have been completed.

as of 2/76

West Goshen Sewer Authority
Analysis of Plant Capacity Allocation Costs

The objective of this analysis is to compare the value of the investments made by West Goshen (the Principal), and East Goshen, West Whiteland, and Westtown (the Investors) to guarantee treatment capacity provided by the West Goshen Sewage Treatment Plant (the Plant) with actual capacity allocated. The capacity allocations are based on agreements between the Investors and the Principal. The value of the investments made by the Investors is based on a financial analysis of historic payments and future payment obligations. The value of the investments made by the Principal is based on the original cost of the various plant assets.

The comparison is based on current investment values. The investments have been made over a 32 year period. It is therefore necessary to convert the historic investment dollars to current dollars. This has been done using construction cost indices published by Engineering News Record (ENR). The cost of the plant assets are multiplied by the appropriate index to achieve current value measurements.

In order to determine the current value of the Investors' contributions, it is first necessary to determine the original values of the payment obligations. Rather than pay a lump sum for future capacity, the Investors have been making semi-annual payments to the Principal. A series of payments can be translated into a lump sum value through a financial process called "discounting". This process provides a "present value" measurement as of the date of the first payment. Once computed, each value is converted to a current value by applying the appropriate ENR cost index.

Exhibit I, the Historic Plant Cost Schedule, presents a listing of the plant assets along with the year acquired and the original cost. The schedule then shows the conversion of the historic amounts to a current dollar basis. The original cost basis of $3.4million converts to $11.3million. Over 82% of this difference, $6.5 million, is attributed to the conversion of the initial cost of the plant in 1963. The cost index of 6.028 reflects the current value of a dollar spent in 1963.

Exhibit II, the Contribution Analysis, presents the discounted "present" value of each investment made by the Investors, with the term present value representing the value of the payment stream at the date presented in the Initial Year column. These present values have been converted to a current cost value based on the scheduled cost index. The West Whiteland Township and Westtown Township payments have been constant semi-annual amounts and have therefore been valued as annuities using standard financial annuity computations. The payments made by East Goshen have not been constant amounts. These payments have been valued through a discounting model presented as Exhibits III and IV. This model discounts each payment separately and then adds the results to achieve a single value measurement.

The results of the analysis carry forward to Exhibit V, the Sewer Plant Investment Allocation Analysis. The first column presents the allocated capacity stated as gallons per day. The second column restates these capacity allocations in terms of percentages to total capacity. The current investment total of $11.3million has been brought forward from the Historic Plant Cost schedule and represents the total current value of the plant. The Investors' "Current Investment" amounts are those values computed in the Contribution Analysis schedule. The difference of $8.04million is the residual current value attributed to West Goshen. The Allocated Investment amounts are computed by multiplying the total current investment value by the percent capacity and the difference is derived by subtracting the allocated investment from the current investment.

The results indicate that the current value of the investments made by each party do not reflect the actual capacity allocated. One of the investors, Westtown, has slightly overpaid for its allocation. East Goshen and West Whiteland Townships have received a capacity allocation greater than their current investment value. West Goshen Township has subsidized East Goshen and West Whiteland Townships' allocations. If the grants for the original plant construction in 1963 and the expansion completed in 1980 were included as investment by West Goshen, the current plant value would be almost double its current value. Therefore, all the municipalities are sharing in the benefits of West Goshen obtaining these grants.

Historic Plant Cost Schedule
Indexed to June 1995

Cost Item:	Year Acq.	Original Cost Basis	Cost Index	Indexed Cost Basis
Initial cost (net)	1963	~~$ 1,293,324~~ ≈ 783,127	6.028	~~$ 7,823,570~~ ≈ 4,720,690
Additional costs				
Garage storage	1967	$ 24,568	5.057	$ 124,754
Gas detection	1968	$ 9,884	4.703	$ 46,481
Plant upgrade	1980	$ 1,793,032	1.678	$ 3,008,632
Digester roof	1983	$ 172,733	1.336	$ 230,745
Roof replacement	1985	$ 32,670	1.295	$ 42,300
Addtl. land purchase	1990	$ 24,538	1.148	$ 28,166
Belt filter	1991	$ 0	0	$ 0
Covers	1993	$ 0	0	$ 0
Admin/garage	1993	$ 0	0	$ 0
Grit/scum removal	1994	$ 0	0	$ 0
Total costs		$ 3,356,149		$ ~~11,309,648~~ ← ≈ 8,201,768

Notes:

1) An economic development grant (PL660) in the amount of $212,137 has not been included in the capital costs of the original treatment facility. If the grant were included in the original capital cost based on the construction cost index, the additional current capital costs would be $1,278,762.

2) An EPA grant in the amount of $4,603,264 has not been included in the original capital cost. Based on the construction cost index the additional current capital costs would be $7,724,277.

3) Computational differences result because more significant figures than are presented in the cost index were actually used.

MAY 16 '96 11:36AM GLACE ASSOCS.

Exhibit II

West Goshen Sewer Authority
Contribution Analysis

	Initial Year	Term Years	Discount Rate	Annual Payment	Present Value	Cost Index	Current Cost Value
East Goshen Payment I	1977	25	5.56%	Various	$ 296,629	~~2.109~~ 2.684	~~$ 625,448~~ 796,1
East Goshen Payment II	1978	30	5.90%	Various	$ 463,527	~~1.957~~	~~$ 906,942~~ 1,282
West Whiteland Township	1985	30	9.18%	$ 64,710.00	$ 657,180	1.295	$ 850,895 2,078.
Westtown Township	1979	30	6.39%	$ 37,000.00	$ 491,293	1.809 2.766	$ 888,606

East Goshen Payment I - Payment amounts made towards the costs of the original plant have varied from 1977 through 1980 and have been constant at $20,472 per year in semi-annual payments of $10,236.

East Goshen Payment II - These payments varied with the amortization schedule of debt payments for West Goshen. The payments were adjusted for refinancings of the debt in 1985 and again in 1991.

Westtown Township - These payments have been consistent since 1979 - $37,000 per year in semi-annual payments of $18,500.

West Whiteland Township - These payments have been consistent since 1985 at $90,000 per year in semi-annual payments of $45,000. Only $64,710 per year is actually attributed towards the sewage treatment plant as $25,290 per year is attributed to the collection system from the Taylor Run Interceptor through the Taylor Run Pumping Station and Washington Street Pumping Station to the treatment plant.

Notes:

(1) The discount rate represents the cost of funds expressed as an annual interest rate. The scheduled rate is based on Municipal Bond yields as reported by the Federal Reserve Board.

(2) The present value is computed using standard financial computations which discount actual payment streams to the present value based on the payment term, the discount rate, and the payment amounts.

(3) The cost index is computed from cost information provided by Engineering News Record based on relative costs of construction over time. Computational differences result because more significant figures than are presented in the schedule were actually used.

East Goshen	1,000,000	22.2%	~~$ 1,532,390~~	~~$ 2,513,004~~	~~(980,614)~~ ← 255,835
West Whiteland	420,000	9.3%	$ 850,895	$ 1,055,190	(204,295)
Westtown	230,000	5.1%	$ 888,606	$ 577,923	310,683
Totals	4,500,000	100.0%	$ 11,309,648	~~$ 11,309,648~~ 8,201,768	$ -

Allocated Capacity: Gallonage of treatment plant capacity in accordance with current intermunicipal agreements.

Percent Capacity: Percentage of each municipality's share of total treatment plant capacity based on current intermunicipal agreements.

Current Cost Value: Based on actual investment values which have been restated to current value based on Engineering News Record Construction Cost indices as computed in Exhibits I and II.

Allocated Cost Value: Based on each municipality sharing equally the costs of the treatment plant as if they were utilizing their share of the capital costs of the plant starting in 1963.

Difference: Current Cost Value less allocated cost value. A positive number indicates overpayment or subsidizing of plant capital costs and a negative value indicates a shortfall or a subsidized amount if all parties share equally in the plant's capital costs.

Re: Additional Sewage Capacity

Dear Board Members:

At a joint meeting held on May 2, 1996, the East Goshen Board of Supervisors and Municipal Authority discussed your proposal of the costs related to the acquisition of additional capacity at the West Goshen Treatment Plant.

East Goshen would be willing to discuss a proportionate fair share of the estimated $6.00 per gallon and administrative charge for the expansion project as detailed in the Estimated Construction Costs for the Phase I expansion.

However, based on reviews by legal, accounting and engineering consultants, the members of both boards agree that they can not pay for the Sewer Plant Investment Allocation Costs of $1,240,942 as outlined in Exhibit V.

Please advise if you are interested in discussing this matter further.

Very truly yours,

E. Martin Shane /SKF

Mr. Rick Smith, Manager
East Goshen Township
1580 Paoli Pike
West Chester, PA 19380

Dear Rick,

As per our phone conversation on Friday morning 5/10/96, my board will extend the cut-off date for East Goshen's answer for additional sewage capacity until 5/31/96 at 12:00 Noon.

As previously stated, our final terms are $980,000 past capital expenses, 20,000 administrative costs, and a unified O&M on collections. These are non-negotiable terms for your additional capacity. The only discussion is if Max Stoner's numbers are in error. We are looking for a yes or no answer.

I will be available, as well as John Scott, to answer your questions. Be advised that all of our foreign capacity is now spoken for. What is being offered would be taken from West Goshen's allotment.

Remember, good times disappear fast when no toilets are available.

Robert S. White, Member
For Board of Supervisors

RE: West Goshen Sewage Treatment Plant

Gentlemen:

I am enclosing our estimate of the depreciated worth of the West Goshen Sewage Treatment Plant.

In 1963 dollars it is $264,620.

Please call with any questions.

Very truly yours,

May 29, 1996

East Goshen Township
Board of Supervisors
Municipal Authority

Dear Board Members:

We have recalculated the alleged shortfall of East Goshen's payments towards its share of the capital costs of the West Goshen Sewage Treatment Plant, as originally calculated by Max Stoner of Glace Associates, Inc. Our recalculation of the alleged shortfall does not in any way endorse or express agreement with the logic, facts or methods used in Mr. Stoner's original analysis.

East Goshen did not become a user of the West Goshen Plant until 1970. From 1970 until 1977 East Goshen paid West Goshen to treat sewage from East Goshen on a fixed price per "unit of service" basis. In 1977, East Goshen and West Goshen entered into an agreement which provided for the sharing of operating and capital costs by both Townships to the extent each used the other's facilities. Mr. Stoner's analysis did not give recognition to the fact that from 1963 to 1977 East Goshen either did not use the plant, or when it did, paid a fixed fee per unit of service which was not allocated between capital and operating costs.

Our recalculation provides for depreciation of the West Goshen Plant from 1963 to 1977 when East Goshen began paying a charge for useage of the plant which separately identified capital and operating charges. The depreciation of the plant is based on an analysis by Yerkes Associates, Inc.

Working with the revised analysis received from West Goshen:

1. On "Exhibit I" the "Original Cost Basis" of the 1963 initial cost ($1,298,624) is replaced by the net book value of $783,127 from the attached depreciation schedule.

2. This causes the "Indexed Cost Basis" for 1963 to change from $7,828,570 to $4,720,690 and the total costs to change from $11,309,648 to $8,201,768.

3. The change in "total costs" from 2, above, is then carried to Exhibit V where the total of the "Allocated Cost Value" of $11,309,648 is changed to $8,201,768.

4. East Goshen's 22.22% share of the "Allocated Cost Value" then changes from $2,513,004 to $1,822,433.

5. The "difference" betwen the "Current Cost Value" and "Allocated Cost Value" for East Goshen then becomes $(290,043), which is the revised alleged shortfall.

Additionally, there is an inconsistency in the way East Goshen's payments are discounted to a 1977/1978 present value in Exhibits III and IV at one discount rate and then "future valued" to current values at a different rate. For example, the 7/1/95 payment on Exhibit III of $10,236.00 is present valued to $3,814.35, and then restated on Exhibit II to June 1995 value of $8,044.46 ($3,814.35 x 2.109), losing $2,191.54 in the process.

If the same discount rates were used on Exhibit II to compute the "Current Cost Value" as were used on Exhibits III and IV, then the "Cost Index" for East Goshen Payments I and II would be 2.684 and 2.766, and the "Current Cost Values" would be $796,152 and $1,282,116, reducing the alleged shortfall by $545,878.

The combination of the two adjustments to Mr. Stoner's analysis, providing for depreciation on the original plant and using the same factors to present value and future value the East Goshen payments, completely eliminates the alleged shortfall in East Goshen's payments towards its share of the capital costs of the West Goshen Sewage Treatment Plant.

Please feel free to contact me if you have any questions.

Very truly yours,

Jeffrey S. Rolfe

Re: Additional Sewage Capacity

Dear Board Members:

We are in receipt of your letter of May 10, 1996 signed by Supervisor Robert S. White. We have not abandoned the position stated in our letter of May 9, 1996 but appreciate the opportunity to review your calaculations.

East Goshen's engineering and financial consultants have examined the calculations of the alleged shortfall in the capital costs paid to West Goshen by East Goshen. Our consultants believe depreciation should be factored into the calculations for the years 1963 - 1977. Additionally, our calculations use the same index factor to discount the 1977/1978 present values and the "future values" shown in Exhibits II, III and IV which are enclosed. We are also enclosing letters from our engineer, John B. Yerkes, Jr., dated May 28, 1996, and auditor Jeffrey S. Rolfe, dated May 29, 1996, supporting our position. Our conclusion is that there is no shortfall due to West Goshen. We are willing to discuss with you the basis for this conclusion.

We feel that both townships have mututally benefited from the 1977 Agreement and look forward to a continuing partnership with West Goshen. To this end, we are willing to discuss purchasing additional capacity for a proportionate fair share of the estimated $6.00 per gallon and administrative charge for the expansion project as detailed in the Estimated Construction Costs for the Phase I expansion.

Very truly yours,

Local Municipal Official LOUIS F. SMITH, JR. | Telephone # of Official: (610) 692-7171

Consultant: YERKES ASSOC., INC. | Consultant's Phone #: (610) 644-4254

Consultant's Contact Person: DAVID V. LINAHAN, P.E.

Title of Submission: SPECIAL STUDY AREA - RIDLEY CREEK SEWAGE TREATMENT PLANT EXPANSION | Date Submitted: OCTOBER 1997

x☐ **3 copies of Plan submitted to the Department (including supporting documentation)**

COMPLETENESS CHECKLIST

	Vol I, pg I Vol II pg I	**1. Table of Contents**
		2. Plan Summary
	Vol I, pg 2	A. Identify the proposed service areas and major problems evaluated in the plan. (Reference: Title 25, § 71.1.a.7.i)
	Vil I, pgs 3-4	B. Identify the alternative(s) chosen to solve the problems and serve the areas of need identified in the plan. Also, include any institutional arrangements necessary to implement the chosen alternative(s). (Reference: Title 25, § 71.21.a.7.ii)
	N/A	C. Include the cost of implementing the proposed alternative (including the user fees) and the proposed funding method to be used. (Reference: Title 25, § 71.21
	Vol I, pg 5	D. Identify the municipal commitments necessary to implement the plan. (Reference: Title 25, § 71.21.a.7.iii)
	Vol I, pg 6	E. Provide a schedule of implementation for the project which identifies the major milestones with dates necessary to accomplish the project to the point of op status. Other milestones in the project implementation schedule should be indicated as occurring a finite number of days from a major milestone. (Reference: Title 25, § 71.21.a.7.iv)
	Vol I, pg 6	F. Include dates for the future initiation of feasibility evaluations in the project's implementation schedule for areas proposing completion of sewage facilities for planning periods in excess of five years. (Reference: Title 25, § 71.21.b)
	Vol II, Section F	3. Original, signed and sealed Resolution of Adoption by the Municipality which contains, at a minimum, alternatives chosen and a commitment to implement plan as stated in the implementation schedule. (Reference: Title 25, § 71.31.f) Section V.F of Guidance.
	Vol II, Section F	4. Evidence that the municipality has requested, reviewed, and considered comments by appropriate official: planning agencies of the municipality, planning agencies of the

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
		county, planning agencies with areawide jurisdiction (where applicable), and existing county or joint county departments of health. (Reference: Title 25, § 71.31.b) Section V.E. 1. of guidance.
	Vol II, Section F	5. Proof of Public Notice which documents proposed plan adoption, plan summary, and the establishment of a 30 day comment period. (Reference: Title 25. § 71.31.c) Section V.E.2 of guidance.
	Vol II, Section F	6. Copy of ALL written comments received and municipal response to each comment in relation to the proposed plan. (Reference: Title 25, § 71.31.c) Section V.E.2 of guidance.
	Vol II, Section E pg 6	7. Project Implementation Schedule. (Provide projected milestone dates and be detailed for each existing and future needs area). (Reference: Title 25, § 71.31.d) Section F of Guidance.
	N/A	8. Project Implementation Ordinances (Provide existing ordinances or include the development of new ordinances in the schedule of implementation.) (Reference: Title 25, § 71.21.a.5.vi.D) Section V.F of guidance.
	Vol II, Section F	9. Written documentation indicating that the appropriate agencies have received, reviewed and concurred with the method proposed to resolve identified inconsistencies within the proposed alternative and consistency requirements in 71.21.(a)(5)i)-(iii). (Reference: Title 25, § 71.3 1.e) Appendix B of guidance.
		GENERAL PLAN
		1. Previous Wastewater Planning
	See Act 537 Plan appvd 6/95	A. Identify and analyze all existing wastewater planning that:
	See Act 537 Plan appvd 6/95	1. Has been previously undertaken under the Sewage Facilities Act (Act 537). (Reference: Act 537, Section 5, section d.1)
	See Act 537 Plan appvd 6/95	2. Has not been carried out according to an approved implementation schedule contained in the plans. (Reference: Title 25, § 71.21.a.5.i.A - D) Section V.F of Guidance.
	See Act 537 Plan appvd	3. Is anticipated or planned by applicable sewer authorities. (Reference: Title 25, § 71.21.a.5.i.A) Section V.D. of Guidance.

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
	6/95	
	See Act 537 Plan appvd 6/95	4. Has been done through official plan revisions (planning modules) and addenda. (Reference: Title 25, § 71.21.a.5.i.A)
	See Act 537 Plan appvd 6/95	B. Identify all municipal and county planning documents adopted pursuant to the Pennsylvania Municipalities Planning Code (Act 247) including:
	See Act 537 Plan appvd 6/95	1. All land use plans and zoning maps which identify residential, commercial, industrial, agricultural, recreational, and open space areas. (Refe Title 25, § 71.21.a.3.iv)
	See Act 537 Plan appvd 6/95	2. A comparison of proposed land use as allowed by zoning and existing sewage facility planning. (Reference: Title 25, § 71.21.a.3.iv)
	See Act 537 Plan appvd 6/95	3. Zoning or in the absence of zoning subdivision regulations that establish lot sizes predicated on sewage disposal methods. (Reference: Title 25, § 71.21.a.3.iv)
	See Act 537 Plan appvd 6/95	4. All limitations and plans related to floodplain and stormwater management and special protection areas. (Reference: Title 25, § 71.21.a.3.iv) Appendix B, Section II.F.
	See Act 537 Plan appvd 6/95	5. An analysis of land use planning and zoning and its consistency with protecting environmentally sensitive areas, with special attention to: (Reference: Title 25, § 71.21.a.3.iv) - public ground/surface water supply sources - recreational water use areas - groundwater recharge areas - industrial water use - wetlands
		II. Physical and Demographic Analysis utilizing written description and mapping:
		A. Base line mapping (All maps should show all current lots and structures).
	Vol I, Exhibit 5	1. Identification of Planning Area(s). Municipal Boundaries, Sewer Authority/ Management Agency service area boundaries. (Reference: Title 25, § 71.21.a.1.i)
	See Act 537 Plan appvd 6/95	2. Identification and Mapping of Physical Characteristics (streams, lakes, impoundments, natural conveyance channels, drainage basins in the planning area). (Reference: Title 25, § 71.21.a.I.ii)

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
	See Act 537 Plan appvd 6/95	3. Soils - Analysis with description by soil type and soils mapping with any topographic limitations) showing areas suitable for conventional on-lot systems, elevated sand mounds, and areas unsuitable for on-lot systems. (Reference: Title 25, § 71.21.a.1.iii). Mapping of Prime Agricultural Soils and locally protected agricultural soils. (Reference: Title 25, § 71.21.a.5.i.K)
	See Act 537 Plan appvd 6/95	4. Geologic Features - Identification through analysis, mapping and their relation to existing (including areas where existing nitrate-nitrogen levels are in excess of 5 mg/l) or potential nitrate-nitrogen pollution and drinking water sources. (Reference: Title 25, § 71.21.a.1.iii)
	See Act 537 Plan appvd 6/95	5. Topography - Showing slopes that are suitable for conventional systems; slopes that are suitable for elevated sand mounds and slopes that are unsuitable for on-lot systems. (Reference: Title 25, § 71.21.a.1.ii)
	See Act 537 Plan appvd 6/95	6. Potable Water Supplies - Identification through mapping, description and analysis to include available public water supply capacity and aquifer yield for groundwater supplies. (Reference: Title 25, § 71.21.a.1.vi) Section V.C. of the Guidance.
	See Act 537 Plan appvd 6/95	7. Wetlands - Identify wetlands as defined in Title 25, Chapter 105 by description, analysis and mapping. Proposed collection, conveyance and trea facilities and lines must be located and labeled, along with the identified wetlands, on the map. (Reference: Title 25, § 71.21.a.1.v) Appendix B, Section II.I.
	See Act 537 Plan appvd 6/95	8. Population - List historical, current and future population figures and projections of the municipality. Discuss and evaluate any discrepancies between municipal, county, state (DER), and federal population projections as they relate to sewage facilities. (Reference: Title 25, § 71.21.a.1.iv)
	See Act 537 Plan appvd 6/95	**III. Existing Sewage Facilities in the Planning Area.**
	See Act 537 Plan appvd 6/95	**A. Identify, map and describe municipal and non-municipal, individual and community sewerage systems in the planning area including:**
	See Act 537 Plan appvd 6/95	1. Location, size and ownership of treatment facilities, main intercepting lines, pumping stations and force mains including their size, capacity, point of discharge. Also include the name of the receiving stream, drainage basin, and the facility's effluent discharge requirements. (Reference: Title 25, § 71.21.a.2.i.A)
	See Act 537 Plan appvd 6/95	2. A narrative and schematic diagram of the facility's basic treatment processes including the facility's NPDES permitted capacity, any remaining reserve capacity and the policy concerning the allocation of reserve capacity. (Reference: Title 25, § 71.21.a.2.i)

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
	See Act 537 Plan appvd 6/95	3. A description of problems with existing facilities, including existing or projected overload under Title 25, Chapter 94 (relating to municipal wasteload management) or violations of a national pollutant discharge elimination system (NPDES) permit, Clean Streams Law permit, or other permit, rule or regulation of the Department. (Reference: Title 25, § 71.21.a.2.i.B)
	See Act 537 Plan appvd 6/95	4. Details of scheduled or in-progress upgrading or expansion of treatment facilities and the anticipated completion date of the improvements. Also discuss the compatibility of the rate of growth to existing and proposed wastewater treatment facilities. (Reference: Title 25, § 71.21.a.4.i & ii)
	See Act 537 Plan appvd 6/95	5. A detailed description of operation and maintenance requirements and the status of past and present compliance with these requirements and any other requirements relating to sewage management programs. (Reference: Title 25, § 71.21.a.2.i.C)
	See Act 537 Plan appvd 6/95	6. Ultimate disposal areas, if other than stream discharge (land application) and any applicable groundwater limitations. (Reference: Title 25, § 71.21.a.4.i & ii)
	See Act 537 Plan appvd 6/95	**B. Identify, map and describe areas that utilize individual and community on-lot sewage disposal and retaining tank systems in the planning area including.**
		1. The type of systems in use. (Reference: Title 25, § 71.21.a.2.ii.A)
	N/A	2. A description of documented and potential public health pollution, and operational problems (including malfunctioning systems) with the systems, including violations of local ordinances, the Sewage Facilities Act, the Clean Streams Law or regulation promulgated thereunder. (Reference: Title 25, § 71.21.a.2.ii.B)
	N/A	3. A comparison of the types of on-lot sewage systems installed in an area with the types of systems which are appropriate for the area according to soil, geologic conditions, topographic limitations, sewage flows, and Title 25 Chapter 73 (relating to standards for sewage disposal facilities). (Reference: Title 25, § 71.21.a.2.ii.C)
	N/A	4. Conducting a well water survey to identify possible contamination by malfunctioning on-lot sewage disposal systems. Approximately 15% of the wells in the study area should be sampled. (Reference: Title 25, § 71.21.a.2.ii.B)
		C. Identify wastewater sludge and septage generation, transport, and disposal methods as it relates to sewage facilities alternative analysis including:
	See Act 537 Plan appvd 6/95	1. Location of sources of wastewater sludge or septage (Septic tanks, holding tanks, wastewater treatment facilities). (Reference: Title 25, § 71.71)
	See Act 537 Plan appvd 6/95	2. Quantities of the types of sludges or septage generated. (Reference: Title 25,§ 71.71)

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
	See Act 537 Plan appvd 6/95	3. Present disposal methods, locations, capacities, and transportation methods. (Reference: Title 25, Section 71.71)
	N/A	**D. Identify, map and describe areas in the municipality where unpermitted collection and disposal systems ("wildcat" sewers, borehole disposal. etc.) are in use. (Reference: Title25,§ 71.21.a.2.i.B)**
	See Act 537 Plan appvd 6/95	**IV. Future Growth and Development**
		A. Delineate and describe the following through map, text and analysis:
	EXHIBITS 1 - 3 A	1. Areas with existing development or plotted subdivisions. Include the name, location, description, total number of EDU's in development, total number of EDU's currently developed, and total number of Equivalent Dwelling Units (EDUs) remaining to be developed (include time schedule for EDU's remaining to be developed). (Reference: Title25, Section 71.21.a.3.i)
	JUNE, 1995 PLAN EXHIBIT 6 (ZONING MAP)	2. Land use designations established under the Pennsylvania Municipalities Planning Code (35 P.S. 10101-11202), including residential, co and industrial areas. (Reference: Title25, Section 71.21.a.3.ii)
	EXHIBITS 1 - 3 A	3. Future growth areas and population and EDU projections for these areas. (Reference: Title25, Section 71.21.a.3.iii)
	N/A	4. Zoning, subdivision regulations; local, county or regional comprehensive plans; and existing plans of a Commonwealth agency relating to the development, use and protection of land and water resources. (Reference: Title25,§71.21.a.3.iv)
	EXHIBITS 1 - 3 A	5. Sewage planning required to provide adequate wastewater treatment for areas of the municipality and related to:
	Vol II, pg 2	a. Five-year population and growth impacts on existing and proposed wastewater collection and treatment facilities which support the need for expansions of facilities within the five-year time frame. (Reference: Title 25, section 71.21.a.3.v)
	Vol I, pg 2	b. Ten-year population and growth impacts on existing and proposed wastewater collection and treatment facilities which support the need for expansions of facilities within the ten-year time frame. (Reference: Title 25, Section 71.21.a.3.v)

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
		V. Alternatives to Provide New or Improved Wastewater Disposal Facilities
	Vol I, pg 3	A. Identify alternatives available to provide for new or improved sewage facilities for each area of need including, but not limited to: (Reference: Title 25,§ 71.21.a.4)
	See Act 537 Plan appvd 6/95	1. Regional Wastewater Treatment Concepts. (Reference: Title 25, § 71.21.a.4)
	N/A	2. The potential for extension of existing municipal or non-municipal sewage facilities to areas in need of new or improved sewage facilities. (Reference: Title25, Section 71.21.a.4.i)
	N/A	3. The potential for the continued use of existing municipal or non-municipal sewage facilities through one or more of the following: (Reference: Title 25, § 71.21.a.4.ii)
	N/A	a. Repair. (Reference: Title 25, § 71.21.a.4.ii.A)
	N/A	b. Upgrading. (Reference: Title 25, Section 71.21.a.4.ii.B)
	N/A	c. Improved operation and maintenance. (Reference: Title 25,§ 71.21.a.4.ii.C)
	N/A	d. Other applicable actions that will resolve or abate the identified problems. (Reference: Title 25, § 71.21.a.4.ii.D)
	N/A	4. The need for new community sewage systems. (Reference: Title 25, § 71.21.a.4.iii)
	Vol I, pg3 Vol II, pg 8	5. The construction of new wastewater treatment facilities. (Reference: Title 25, § 71.21.a.4.iii)
	N/A	6. Repair or replacement of collection and conveyance system components . (Reference: Title 25,§ 71.21.a.4.ii.A)
	N/A	7. Use of alternative methods of collection/conveyance to serve needs areas using existing wastewater treatment facilities. (Reference: Title 25, § 71.21.a.4.ii.B)
	N/A	8. The continual and future use of individual and community subsurface sewage disposal system alternatives based on:
	N/A	a. Soil suitability. (Reference: Title 25, § 71.21.a.2.ii.C)
	N/A	b. Preliminary hydrogeological evaluation. (Reference: Title 25, § 71.21.a.2.ii.C)
	N/A	c. The establishment of a sewage management program. (Reference: Title 25, § 71.21.a.4.iv) **See Township Ordinance 166 and Authority Rules Chapter VI & VII**
	See Act 537 Plan appvd	9. The repair, replacement or upgrading of existing malfunctioning systems in areas suitable for on-lot disposal considering: (Reference: Title 25, § 71.21.a.4)

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
	6/95	
	N/A	a. Existing technology and sizing requirements of Title 25 Chapter 73. (Reference: Title 25, § 73.31 - 73.72)
	N/A	b. Use of expanded absorption areas or alternating absorption areas. (Reference: Title 25, § 73.16)
	N/A	c. Use of water conservation devices. (Reference: Title 25, § 71.73.b.2.iii)
	N/A	10. The use of small flow sewage treatment facilities, land treatment alternatives, or package treatment facilities to serve individual homes or clusters of homes based on: (Reference: Title 25, § 71.21.a.4)
	N/A	a. Discharge Requirements. (Reference: Title 25, § 71.64.d)
	N/A	b. Soil Suitability. (Reference: Title25, Section 71.64.c.1) c. Preliminary Hydrogeologic Evaluation. (Reference: Title 25, §71.64.c.3)
	N/A	d. Agency or other controls over operation and maintenance requirements. (Reference: Title 25, § 71.64.d)
	N/A	11. The use of retaining tank alternatives including: (Reference: Title 25, § 71.21.a.4)
	N/A	a. Commercial, residential and industrial use. (Reference: Title 25, § 71.63.e)
	N/A	b. Designated conveyance facilities (pumper trucks). (R Title 25, § 71.63.b.2)
	N/A	c. Designated treatment facilities or disposal site. (Reference: Title 25, § 71.63.b.2)
	N/A	d. Implementation of a retaining tank ordinance by the municipality. (Reference: Title 25, § 71.63.c.3)
	N/A	e. Financial guarantees when retaining tanks are used as an interim sewage disposal measure. (Reference: Title 25, § 71.63.c.2)
	N/A	f. Temporary or permanent use.
	N/A	12. A no-action alternative which includes both short-term and long-term impacts on: (Reference: Title 25, § 71.21.a.4)
	N/A	a. Water Quality/Public Health. (Reference: Title 25,§ 71.21.a.4)
	N/A	b. Growth potential (residential, commercial, industrial). (Ref Title 25, § 71.21.a.4)
	N/A	c. Community economic conditions. (Reference: Title 25 § 71.21.a.4)
	N/A	d. Recreational opportunities. (Reference: Title 25, § 71.21. a.4)
	N/A	e. Drinking water sources. (Reference: Title 25, § 71.21. a.4)

ACT 537 PLAN CONTENT AND ENVIRONMENTAL ASSESSMENT CHECKLIST

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
	N/A	f. Other environmental concerns. (Reference: Title 25, § 71.21.a.4)
	See Act 537 Plan appvd 6/95	13. Discuss the need for and implementation of a sewage management program to assure the future operation and maintenance of existing and proposed sewage facilities through:
	N/A	a. Municipal ownership or other management control over the operation and maintenance of individual on-lot sewage disposal systems, small flow treatment facilities, or other non- municipal treatment facilities. (Reference: Title 25, § 71.21.a.4.iv)
	N/A	b. Requiring scheduled inspection of on-lot sewage disposal systems. (Reference: Title 25, § 71.73.b.1)
	N/A	c. Requiring scheduled maintenance of septic and aerobic treatment tanks and associated system components. (Reference: Title 25, § 71.73.b.2)
	N/A	d. Aggressive enforcement of ordinances which require operation and maintenance and prohibit malfunctioning systems. (Reference: Title 25, § 71.73.b.5)
	N/A	e. Repair, replacement or upgrading of malfunctioning on-lot sewage systems. (Reference: Title 25,§ 71.21.a.4.iv)
	N/A	f. Establishment of joint municipal sewage management programs. (Reference: Title 25, § 71.73.b.8)
	N/A	g. Reduction of organic or hydraulic loading to existing wastewater treatment facilities. (Reference: Title 25, § 71.71)
	N/A	h. Requirements for bonding, escrow accounts, management agencies or associations to assure proper operation and maintenance for non-municipal facilities. (Refer Title 25, § 71.71)
	N/A	14. Non-structural comprehensive planning alternatives that can be undertaken to assist in meeting existing and future sewage disposal needs including. (Reference: Title 25, § 71.21.a.4)
	N/A	a. Modification of existing comprehensive plans involving:
	N/A	1. Land use designations. (Reference: Title 25, § 71.21.a.4)
	N/A	2. Densities. (Reference: Title 25, § 71.21.a.4)
	N/A	3. Municipal ordinances and regulations. (Reference: Title 25, § 71.21.a.4)
	N/A	4. Improved enforcement. (Reference: Title 25, §

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
		71.21.a.4)
	N/A	5. Protection of drinking water sources. (Reference: Title 25, § 71.21.a.4)
	N/A	b. Need for a comprehensive plan to assist in producing sound economic and consistent land development. (Reference: Title 25, § 71.21.a.4)
	N/A	c. Alternatives for creating or changing municipal subdivision regulations to assure long-term use of on-site sewage disposal. (Reference: Title 25, § 71.21 .a.4)
	N/A	d. Evaluation of existing local agency programs and the need for technical or administrative training. (Reference: Title 25, § 71.21.a.4)
		VI. The Evaluation of Alternatives
	N/A	**A. Each technically feasible alternative identified in Section V of this checklist must be evaluated for consistency with respect to the foll (Reference: Title25, § 71.21.a.5.i)**
	N/A	1. Applicable plans developed and approved under Sections 4 and 5 of the Clean Streams Law or Section 208 of the Clean Water Act (33 U.S.C.A. 1288). (Reference: Title25, § 71.21.a.5.i.A) B, Section II.A.
	N/A	2. Municipal wasteload management plans developed under PA Code, Title 25, Chapter 94. (Reference: Title25, § 71.21.a.5.i.B) The municipality's recent Wasteload Management (Chapter 94) Reports should be examined to determine if the proposed alternative is consistent with the recommendations and findings of the report. (Appendix B, Section II.B.)
	N/A	3. Plans developed under Title II of the Clean Water Act (33 U.S.C.A. 1281-1299) or Titles 11 and VI of the Water Quality Act of 1987 (33 U.S.C.A. 1251-1376). (Reference: Title25, § 71.21.a.5.i.C) Appendix B, Section II.E.
	N/A	4. Comprehensive plans developed under the Pennsylvania Municipalities Planning Code. (Reference: Title25, § 71.21.a.5.i.D) The municipality's comprehensive plan must be examined to assure that the proposed wastewater disposal alternative is consistent with land use and all other requirements stated in the comprehensive plan. Appendix B, Section 11, D.
	N/A	5. Antidegradation requirements as contained in PA Code, Title 25, Chapters 93, 95 and 102 (relating to water quality standards, wastewater treatment requirements and erosion control) and the Clean Water Act. (Reference: Title25, § 71.21.a.5.i.E) Appendix B, S II,F.
	N/A	6. State water plans developed under the Water Resources Planning Act (42 U.S.C.A 1962-1962 d-18). (Reference: Title25, §

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
		71.21.a.5.i.F) Appendix B, Section 11, C.
	N/A	7. Pennsylvania Prime Agricultural Land Policy contained in Title 4 of the Pennsylvania Code, Chapter 7, Subchapter W. Provide on local municipal policy and an overlay map on prime agricultural soi (Reference: Title 25, § 71.21.a.5.i.G) Appendix B Section II.G.
	N/A	8. County Stormwater Management Plans approved by the Department under the Storm Water Management Act (32 P.S. 680.1-680.17). (Reference: Title25, § 71.21.a.5.i.H) Conflicts created by the implementation of the proposed wastewater alternative and the existing recommendations for the management of stormwater in the County Stormwater Management Plan must be evaluated and mitigated. If no plan exists, no conflict exists. Appendix B, Section II.H.
	N/A	9. Wetland Protection under PA Code, Title 25, Chapter 105. Map wetland areas using Federal National Wetlands Inventory Mapping and Soils Mapping. (Reference: Title 25, § 71.21.a.5.i.1) identify and provide mitigative measures for any encroachments on wetlands from the construction or operation of any wastewater facilities proposed by the alternative. Appendix B, Section II.I.
	N/A	10. Protection of rare, endangered or threatened plant and animal species as identified by the Pennsylvania National Diversity Inventory (PNDI). (Reference: Title 25, § 71.21.a.5.i.J) Provide the Department with a copy of the completed Request For PNDI Search document. Also provide a copy of the response letter from the Department's Bureau of Forestry regarding the findings of the PNDI search. Appendix II. J.
	N/A	11. Historical and Archaeological Resource Protection under P.C.S. Title 37, Section 507 relating to cooperation by public officials with the Pennsylvania Historical and Museum Commission. (Reference: Title 25, § 71.21.a.5.i.K) Provide the Department with a completed copy of Form "A" and its attachments requesting the Bureau of Historic Preservation (BHP) to provide a listing of known historical sites and potential impacts on known archaeological and historical sites. Also provide a copy of the response letter from the BHP. Appendix B, Section II. K.
	N/A	**B. Provide for the resolution of any inconsistencies in any of the points identified in Section VIA. of this checklist by submitting written documentation that the appropriate agency has received, reviewed, and concurred with the method proposed to resolve identified inconsistencies. (Reference: Title25, § 71.21.a.5.ii) Appendix B**
		C. Evaluate each alternative identified in Section V of this

D.E.P. USE ONLY	PAGE #	ITEM REQUIRED
		checklist with respect to applicable water quality standards, effluent limitations or other technical, legislative or legal requirements. (Reference: Title25, § 71.21.a.5.iii)
	N/A	**D. Provide cost estimates using present worth analysis for construction, financing, ongoing administration, operation and maintenance and user fees for each alternative identified in Section V of this checklist. Estimates shall be limited to areas identified in the plan as needing improved sewage facilities within 5 years from the date of plan submission. (Reference: Title25,§ 71.21.a.5.iv)**
	N/A	**E. Provide an analysis of the funding methods available to finance each of the proposed alternatives evaluated in Section V of this checklist Also provide documentation to demonstrate which alternative and financing scheme combination is the most cost effective; and a contingency financial plan to be used if the preferred method of financing cannot be implemented. The funding analysis shall be limited to areas identified in the plan as needing improved sewage facilities within rive years from the date of the plan submission. (Reference: Title25,§ 71.21.a.5.v)**
	N/A	**F. Analyze the ability of the municipality to implement each alternative proposed in Section V of this report including: (Reference: Title25, § 71.21.a.5.vi)**
	N/A	1. The activities necessary to abate critical public health hazards pending completion of sewage facilities or sewage management programs. (Reference: Title 25, § 71.21.a.5.v.A)
	N/A	2. The phased development of the facilities or sewage management program. (Reference: Title25, § 71.21.a.5.vi.B)
	N/A	a. Provide time schedules for implementing each phase. (Reference: Title25, § 71.21.a.5.vi.C)
	N/A	**3. The administrative organization and legal authority necessary for plan implementation. (Reference: Title25, § 71.21.**
		VII. Institutional Evaluation
	N/A	**A. Provide an analysis of all existing wastewater treatment authorities, their past actions and present performance including:**
	N/A	1. Financial & debt status. (Reference: Title25,§ 71.61.d.2.)
	N/A	2. Available staff and administrative resources. (Reference: Title25, § 71.61.d.2.)
	N/A	3. Existing legal authority to:
	N/A	a. Implement wastewater planning recommendations. (Reference: Title 25, § 71.61.d.2.)
	N/A	b. Implement system-wide operation and maintenance

Daily Local 12/3/96

Westtown Sewer to be taken over

By BILL THOMPSON
Special to the Local News

WESTTOWN — Supervisors have announced what can be considered a Christmas present to some residents but may prove a headache for the board.

The township will be in the sewage disposal business effective Dec. 15.

The township will take over the operation of the privately owned Westtown Sewer Company, as ordered by the courts on Oct. 15.

In the interim, the sewer company's owner, Peter DeFeo, appealed the decision in a protective appeal, which, according to township Secretary/Treasurer Evelyn Groff, does not stay the order to take over the plant.

The effect facing the board is primarily a financial one. It has already affected the final resolution of the 1997 budget.

"The impact at this time is a large unknown, and there is a lot of work to be done by the board in the immediate future," said Groff.

As far as the operation is concerned, Groff noted that the first decision is whether or not to keep the present operator, American Commonwealth, which has a contract with DeFeo to operate the facility until April.

"The board has had discussions with American, but has not yet reached a decision," said Groff.

"One major item which should be made known to all of DeFeo's customers is that the township will be collecting all bills as of the 15th.

"A number of steps were outlined by the court, which must be completed by various deadlines, including a plan to upgrade and increase plant capacity," she said.

Groff summarized by saying the board will start to pursue the various objectives as ordered.

The board has until the end of the year to approve 1997 budget.

As had been decided earlier, sewer rates will be increased.

The takeover order is the result of a suit by the state Department of Environmental Protection against the township and the sewer company to resolve the plant's many operating problems.

The action did not mean that the township was at fault, but it was the only way for the DEP to guarantee responsibility for the plant.

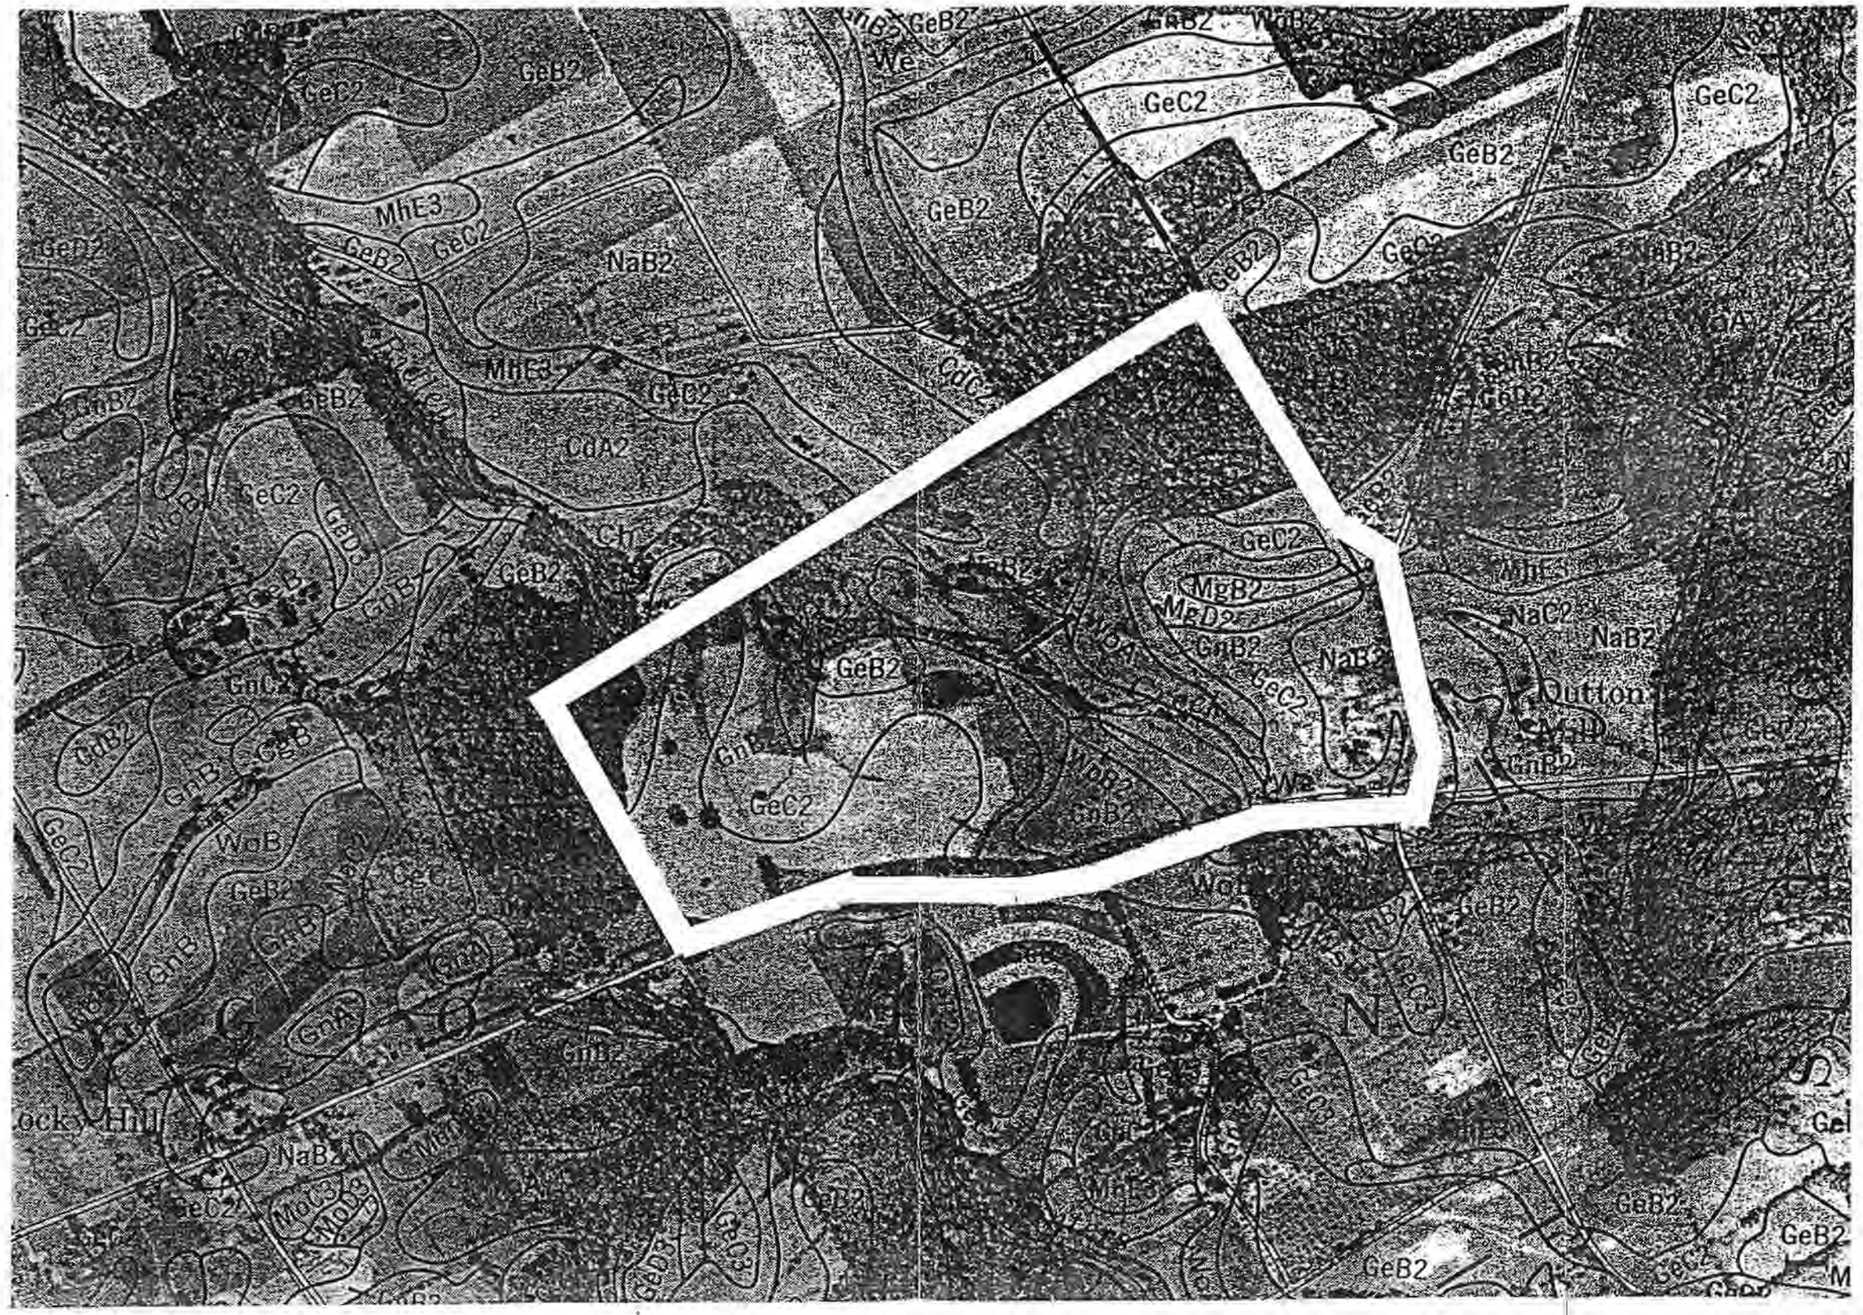
In other business, Groff noted that the board had filed an appeal of the recent zoning hearing board decision granting various exceptions and variances to Amoco Corporation in its proposed multipurpose site at Route 3, old Routo 352, and Route 352.

One condition of approval was the barring of pedestrian or vehicle access to old Route 352 from the site.

The board's appeal asks that such a one-way access be required, subject to approval by the Pennsylvania Department of Transportation.

SUPPORTING DOCUMENTS

ADDENDUM TO SECTION 4.6
SPRAY IRRIGATION ALTERNATIVE FOR
RIDLEY CREEK STP



The December 1992 Final Draft for the Act 537 Plan Update was distributed to each adjacent municipality and to the County reviewing agencies during February 1993. The Chester County Planning Commission review as well as the Chester County Health Department review and the Willistown Township letter of comments all encouraged the possible use of a spray irrigation alternative for the estimated 300,000 gallons per day (gpd) in additional wastewater effluent projected for the Ridley Creek STP. The Township has investigated the possibility of the use of spray irrigation techniques with the following summary results.

Table 6.1 as contained on page 6-2 of Section 6.0 of this report clearly establishes an ultimate need for 670,299 gpd for potential wastewater treatment needs at the Ridley Creek plant. When the additional 132,700 gpd requested by Immaculata College is added, the actual anticipated wastewater flow under current plan update conditions would be approximately 740,000 gpd. For future design and discussion purposes only, a figure of 300,000 gpd has been utilized in this Plan Update as the need for expansion of treatment availability at the Ridley Creek STP.

Since a good part of the infrastructure and collection system is already in place for treatment at the Ridley Creek STP, it is logical to assume continued use of the expanded collection system and treatment at the STP. Other sections of this report discuss the viability of use of the A/O system as a means of expanding the current treatment capability from 400,000 gpd to 700,000 gpd. This option would continue to be utilized under a spray irrigation alternative at an estimated cost of $1,200,000 for the STP upgrading.

In lieu of stream discharge into Ridley Creek for the additional 300,000 gpd, a potential alternative would be to acquire nearby property, if available, for spray irrigation purposes.

Only two properties exist within the Ridley Creek watershed which contain sufficient acreage to handle the facilities and spray fields necessary for the discharge of 0.3 MGD. These include the SmithKline Beecham property located north of Boot Road and the additional possibility of use of all or part of the Grace Estate property located immediately adjacent to and south of the Ridley Creek STP.

GRACE ESTATE SOILS

SmithKline Beecham (herein Beecham) currently owns 312 acres bounded by Paoli Pike, Boot Road, and Township Line Road. In August 1991, Beecham presented to the Township a Sewage Facilities Planning and Environmental Site Analysis for Land Application of Wastewater Effluent based on a proposed development of the entire site. The Land Development Plan that accompanied the Sewage Facilities Study was withdrawn. However, Sewage Facilities Study remains a valuable tool in the evaluation of the tract of land. Figure 13 contained in this study shows the proposed land application areas and winter storage lagoons for a spray irrigation alternative. This carefully prepared study documents by way of percolation tests and soil profiles the areas within the site which are suitable for spray irrigation. Such areas are depicted in Figure A-1 of the Beecham report. According to the report, Beecham could handle its ultimate wastewater generated on the site by using the effluent spray areas and the winter storage ponds depicted on Figure 13.

The Township recently reached a settlement with Beecham for the rezoning and future use of this tract for combined residential or office park purposes. The centroid of the Beecham effluent spray areas is located 1.1 miles north of the Ridley Creek STP. A pumping station located at the Ridley Creek STP conveying treated effluent 1.1 miles north to the Beecham property could never be cost-effective, particularly in view of the assumed necessary condemnation of approximately 75 acres of suitable effluent spray area and storage pond area. Therefore, the use of the Beecham property for future spray irrigation purposes is dismissed as a possible alternative because of the need to pump treated effluent more than 1.1 miles and the high expected cost of condemnation per acre (assumed to be in excess of $60,000 per acre) in addition to the burden of exceptionally high operating costs for future years.

Grace Estate

The Grace Estate property, comprising 182 acres, is located immediately south of the Ridley Creek STP and is bounded on the south by East Strasburg Road and on the east by Township Line Road. The site is currently undeveloped. It is possible that the entirety of this adjacent property (or major portions thereof) could be suitable for spray effluent areas. The attached exhibit depicting the soils for the entirety of the Grace Estate property is shown on the following page as Exhibit 4-4. The soils paralleling Ridley Creek are predominately Worsham series and Wehadkee series with Glenville silt loam and Glenelg silt loam occupying substantial portions of the property to the west of Ridley Creek. It is estimated that it would be necessary to acquire the entire westerly half of this property (west of Ridley Creek) and perhaps suitable portions of

the property east of Ridley Creek in order to meet the estimated physical area needs of 75 acres required for application of spray effluent for an additional 300,000 gpd.

The Township believes that the acquisition of any portion of this property would most likely involve condemnation procedures. The best available estimate is that this property would carry an approximate raw land value of $55,000 per acre since acquisition of these major portions of the site would destroy the utility of the balance of the site. Thus, the estimated cost for acquiring approximately 75 acres of the Grace Estate parcel would involve a cost of approximately $4,125,000 and possible additional consequential damages to the balance of the site.

Spray Irrigation Alternative Spatial Needs

The following alternative design assumptions have been utilized in determining the physical or spatial needs for spray field effluent involving 300,000 gpd. Assuming that soil testing would allow the discharge of the above amounts, the following data is relevant.

Land Area Required

- One inch of effluent/week equals 77.3 acres plus buffer and storage pond
- One and one-half inches of effluent/week equals 51.5 acres plus buffer and storage pond
- Three quarters of an inch of effluent/week equals 103.1 acres plus buffer and storage pond

Several design alternatives for an assumed required need for a 60-day winter storage pond are indicated below.

- Eight-foot deep pond equals 9 acres including slope limits
- Six-foot deep pond equals 12.2 acres including slope limits
- Ten-foot deep pond equals 7 acres including slope limits

An average 8-foot depth of pond was assumed for this design alternative. A 1-1/2-inch per week effluent application rate was selected (assuming this is possible) which would require 51.5 acres of spray field area plus a required-100-foot nominal buffer comprising 14.6 acres or a total of 66 acres for spray effluent use. When combined with the 9 acres required for a 60-day storage pond at a average depth of 8 feet, the resulting

required land area is 75 acres. Assuming that 75 acres represents the physical land area requirement at an average price of $55,000 per acre, this would result in an estimated $4,125,00 in costs. Under the Chester County Spray Irrigation Grant Program, utilizing Chester County Open-Space funding, the Township might be entitled to a maximum grant of $600,000 since multiple municipality involvement is anticipated.

Thus, the net cost of $3,525,000 plus an additional $400,000 of estimated cost for the spray field piping and pumping system, plus the $1,200,000 in estimated cost for expansion of the treatment plant would bring the total cost for this alternative to $5,125,000. When equated to the 300,000 gpd of anticipated new wastewater effluent, this results in an estimated cost in excess of $17 per gallon of wastewater treated as compared with the estimated $4.50 per gallon for expanding the STP and allowing stream discharge to Ridley Creek.

It is the Township's position that this spray irrigation alternative, under the above assumed conditions, is not a viable alternative from the initial cost factors and in view of the possibility that the land cost listed above could be higher (based on consequential damages).

Date: March 10, 1997

RIDLEY CREEK ANNUAL WASTELOAD MANAGEMENT REPORT March 10, 1997

ITEM 1 - HYDRAULIC AND ORGANIC LOADING CONTRIBUTION

The total number of Equivalent Dwelling Units (EDU's) connected at the end of 1996 was 1,165. They contributed an average daily flow of 309,937 gallons per day (gpd). The past year was unusually wet from snow and rain, raising groundwater levels to new records. Based on that information and the Treatment Plant Operator's reports of faulty meter readings, we have taken the average daily flow and subtracted what we feel is I/I to come up with an actual flow of 275,451 gpd. That number is used for all projections in this report.

The number of Equivalent Dwelling Units was derived in the following manner: The total average water usage from nonresidential users plus the 384 New Kent Apartments units is 105,678 gpd (38,904 gpd + 66,674 gpd), based on actual water meter readings provided from the Philadelphia Suburban Water Company. It is estimated that 85% of water used is returned as wastewater. Subtracting 85% of the water usage (89,826 gpd) from the actual average daily flow of 275,451 represents the total average daily flow from the single residential users. This result (169,673 gpd), is then divided by 825, the actual number of single residential connections, for the average flow per single residential connection. The average flow per residential connection for this system is approximately 205 gpd, which defines the volume of an EDU of the system. The total number of EDU's of the system is determined by dividing the average daily flow by 205gpd. However, in accordance with the Township Act 537 Plan, 275 gpd /EDU will be used for estimated future flows.

The following table lists the actual average monthly flows and estimated organic load for 1996

Table 1

MONTH	FLOW (average GPD)	BOD LOAD (ppd)
JAN	305,358	531
FEB	299,824	522
MARCH	312,668	544
APRIL	327,320	570
MAY	302,161	526
JUNE	309,160	538
JULY	292,122	508
AUGUST	289,858	504
SEPTEMBER	304,057	529
OCTOBER	313,907	546
NOVEMBER	258,003	449
DECEMBER	**404,808**	**704**
ACTUAL FLOW	309,937	539
MINUS I/I	-34,486	
BASE FLOW	275,451	

Three Month Maximum (3MM) average flow is 314,050 gpd and the Peak Organic load is 704 ppd.

The monthly average flows are based on the total gallons treated as recorded by the flow meter at the plant effluent divided by the number of days in the month. The flows in **Shaded** type in Table 1 are the flows that have been averaged together for the 3MM flow. The 3MM is the calculated hydraulic load. The permitted hydraulic load is 400,000 gpd.

The Peak Organic load or the BOD load is estimated by using influent data from a 24 hour composite sample taken once monthly and analyzed for CBOD. The ratio of BOD and CBOD is assumed to be 1:2. The monthly samples were combined for an annual average influent BOD concentration of 208.5 mg/l. The estimated monthly organic loading is determined by the following: Monthly Average Flow in million gallons per day (mgd) times 208.5 mg/l times 8.345 pounds per million gallons per mg/l. The Peak Organic load is the highest monthly load for the calendar year and is presented in **Shaded** type in Table 1. The plant was designed to treat an organic load of 830

pounds per day (ppd), however there is no permit limit on the maximum organic load nor have any studies been performed to determined the plant's actual "As-built" efficiency.

During the next five (5) years, the number of EDU's is projected to increase. Projected peak loads for future years is calculated by multiplying the historical average ratio of the 3MM over the annual average flow times the projected load for that year. Hydraulic peak load ratio (last year's 3MM 295,731 gpd + this year's 3MM 314,050 gpd)/(last year's average 271,171 gpd + this year's average 275,451 gpd) = 1.08. Organic peak load ratio (last year's peak 568 ppd + this year's peak 704/last year's average 472 ppd + this year's average 462 ppd) = 1.15. The following chart uses 275 gpd/EDU for future connections in accordance with the Township's current Act 537 Plan. Also, an allowance of 25,000 gpd for inflow and infiltration is added to the current year base flow has been added.

TABLE 2

1996 Base Flow in GPD + 25,000 gal = 300,451

YEAR	ADDITIONAL # EDUs	ADDITIONAL ESTIMATED FLOW at 275 gpd	TOTAL ESTIMATED AVG FLOW	TOTAL ESTIMATED PEAK FLOW (gpd) (AVG X 1.08)
1997	62	17,050	317,501	342,901
1998	61	16,775	334,276	361,018
1999	55	15,125	349,401	377,353
2000	24	6,600	356,001	384,481
2001	6	1,650	357,651	386,263
2002	6	1,650	359,301	388,045

As can be seen in Table 2, after the year 2000 there is potential to exceed the permitted hydraulic loading of the treatment plant when using 275 gpd/EDU for future flows. The current average flow per residential unit is approximately 225 gpd however we feel it is much higher than previously recorded flows due to the unusually wet year and the numerous leaks discovered by the Public Works Department. We will continue to use 225 gpd for planning. The flow figure of 225 gpd has been approved for use for planning, using a per capita flow figure of 75 gpd with an average of 3 persons per dwelling. Using the proposed revised flow figure of 225 gpd the following may be expected.

TABLE 3

1996 BASE FLOW OF 275,451 +
25,000 GPD for I/I ALLOWANCE = 300,451

YEAR	ADDITIONAL # EDUs	ADDITIONAL ESTIMATED FLOW AT 275 GPD	PROJECTED ANNUAL AVG HYDRAULIC LOADING	TOTAL ESTIMATED PEAK FLOW (AVG X 1.08)
1996			300,451	338,421
1997	62	13,950	314,401	339,553
1998	61	13,725	328,126	354,376
1999	55	12,375	340,501	367,741
2000	24	5,400	345,901	373,573
2001	6	1,350	347,251	375,031
2002	6	1,350	348,601	376,489

The estimated average organic load, in pound per day (ppd) is calculated by multiplying estimated average flows, in mgd, from Table 2 times 208.5 mg/l times 8.345 pounds/mgals/mg/l. The estimated peak organic load is 1.15 times estimated average organic load.

The increase in the number of connections was derived in the following manner using 275 gpd per EDU:

Actual connections for 1996:

Authority Sponsored Projects (1996)		
The Lane	6 EDU	
Miscellaneous	6 EDU	
Existing Subdivisions		
Willow Pond	28 EDU	(Includes lots in Willistown Twp.)
Land Developments in progress		
Clocktower (Bow Tree Ph4)	31 EDU	
Oakwood	4 EDU	
Wood Estate	2 EDU	
Total for 1996	**77 EDU**	**21,175 gpd**

Projected connections for 1997:

Authority Sponsored Projects (1997)		
None	0 EDU	
Land Developments in progress		
Clocktower	31 EDU	
Oakwood	6 EDU	
Wood Estate	21 EDU	
Total for 1997	**62 EDU**	**17,050 gpd**

Projected connections for 1998:

Authority Sponsored Projects (1998)		
None	0 EDU	
Land Developments in progress		
Miscellaneous	4 EDU	
Clocktower	31 EDU	
Oakwood	6 EDU	
Wood Estate	20 EDU	
Total for 1998	**61 EDU**	**16,775 gpd**

Projected connections for 1999:

Authority Sponsored Projects (1999)		
None	0 EDU	
Land Developments in progress		
Miscellaneous	4 EDU	
Clocktower	31 EDU	
Wood Estate (complete)	20 EDU	
Total for 1999	**55 EDU**	**15,125 gpd**

Projected connections for 2000:

Miscellaneous	6 EDU	
Clocktower	18 EDU	
Total for 2000	**24 EDU**	**6,600 gpd**
Total for 2001	**6 EDU**	**1,650 gpd**
Total for 2002	**6 EDU**	**1,650 gpd**

Over the past year there was a marked increase in flow due to an extremely wet year causing I/I. The entire system was televised, during which several leaks were discovered and repaired. A large break occurred in the line for the Pfizer property and was the responsibility of the owner to repair. The repair was not made until December, 1996. The Sewer Operating Budget contains $25,500 for maintenance and repairs; an allowance of 25,000 gpd is included in the projected flow estimates.

ITEM 2 - PLAN TO REDUCE OVERLOADS

In the event that Item I flows exceed the allocated or permitted capacity, a plan would be required to indicate what action would be anticipated to relieve this condition. In fact, the Township is currently preparing a Revised Act 537 of the Special Study Area of the Ridley Creek Sewage Treatment for an expansion of the RCSTP to .750 MGD in two phases. The first phase would be to 0.500 MGD and the second phase when needed. The expansion is being pursued because additional capacity at the West Goshen Treatment Plant is not economically feasible and because treatment costs in the Ridley Creek system are lower than the Chester Creek system. Until the RCSTP expansion is approved by the Department, the system will continue to be monitored and televised as necessary to control any I/I. Residents will again be advised that lateral

caps need to be in place and the connection of sump pumps to the public system is prohibited.

ITEM 3 - SEWER EXTENSIONS

During 1996, a total of 6 EDUs were added to the system as a municipal sponsored project. There are no planned municipal projects for the coming years.

ITEM 4 - OPERATING AND MAINTENANCE PROGRAM

A discussion of the practices employed for monitoring, maintaining and inspecting the sewerage system follows. Of particular interest may be the procedures for emergency maintenance, as well as the methods used to detect and remedy excess infiltration and inflow. A description of routine and preventative maintenance programs is given as well as the number of maintenance employees and their availability and effectiveness in the event of a system malfunction is also discussed.

East Goshen Township has engaged the services of TMH Environmental Services Inc. to operate the treatment plant. This contract includes daily maintenance, recording data and submitting all reports to the Township that are required under N.P.D.E.S. Permit No. Pa-0050504.

Although there are presently no industrial waste contributors on system, the Township's Ordinance #95 addresses the strength of industrial waste and permits only discharges of domestic strength.

The treatment plant alarm system is tied into an auto dialer which has the ability to dial five (5) numbers in succession. It begins with treatment operator and ends with the Township Maintenance staff.

The Township constantly monitors daily influent flow readings and monitors daily rainfall with a rain gauge located at the Township building. Should daily flows increase Township staff then would inspect the system for leaks. All sewer lines are routinely cleaned and inspected by Television cameras. The Township, during billing to the users, reminds the users against discharging sump pumps into the sewer system.

Of the Township's Maintenance staff, the Township has approximately eight (8) people along with sundry equipment, all of which can be made available under emergency conditions. The Authority has retained the services of Yerkes Associates, Inc. an engineering consulting firm that has a staff of professional engineers and certified treatment operators should technical assistance be needed.

ITEM 5 - CONDITION OF EXISTING SYSTEM

A discussion of the overall condition of the system with emphasis on any plans to upgrade, repair or rehabilitate the system follows:

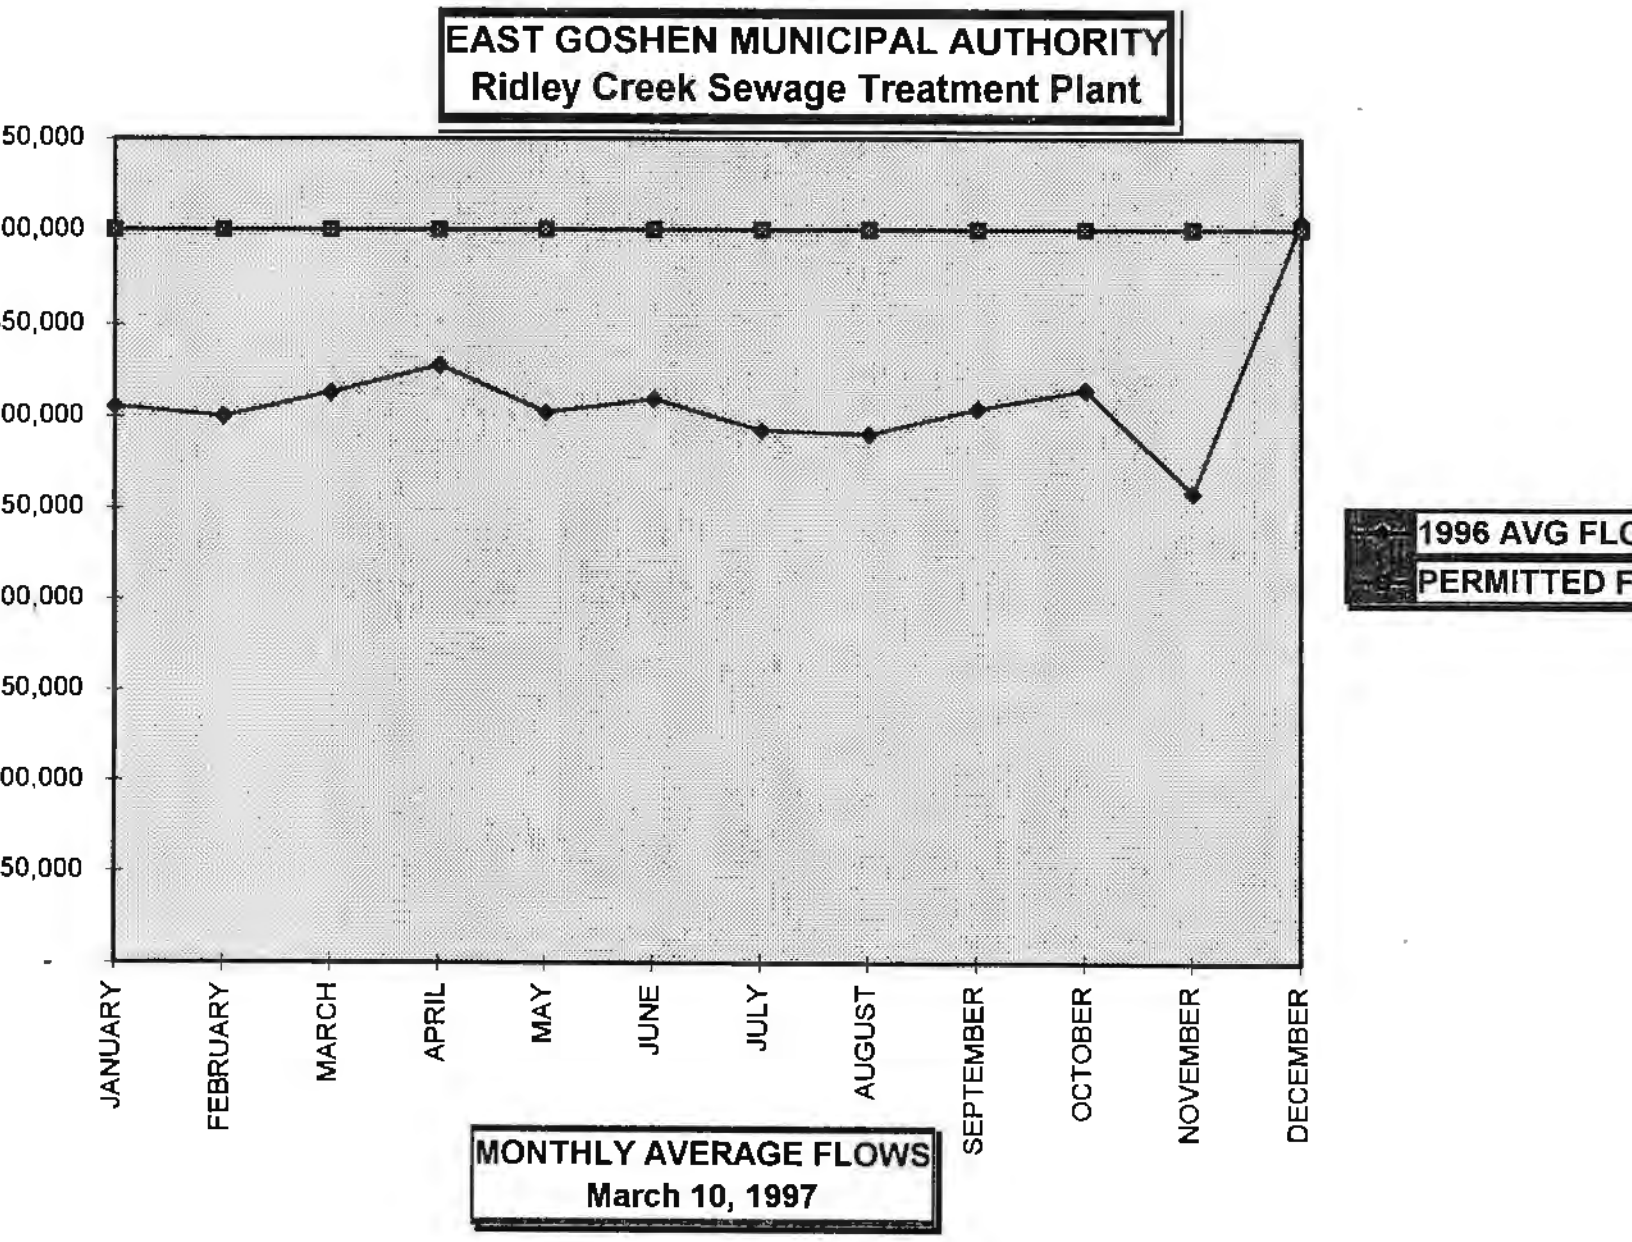
The system was installed in 1985 in accordance with Township Specifications and under professional inspection and surveillance of the Authority's Engineer. All of the lines were air tested and lamped and are in excellent condition. Until 1996, there was practically no I/I. The past year (1996) was one of record snow and rain fall bringing groundwater levels to record highs. These high levels caused homes, which are normally dry, to have water problems that they would not normally have. We feel that more sump pumps were installed and probably connected to the sewer lines because it was impossible to direct the flow otherwise due to the heavy snows on the ground for the majority of the winter. In addition, high levels probably caused some infiltration into manholes that normal conditions would not. Based on flow records from the past five years, we estimate that sump pumps and I/I contributed 34,486 gpd.

ITEM 6 - PUMPING STATIONS

There is one pumping station in the system.

	STATION 1
RATED MAXIMUM DAILY CAPACITY	25,000; 71 HOMES (HUNT COUNTRY)
CURRENT MAXIMUM DAILY FLOW	19,525
MAXIMUM DAILY FLOW WHEN AREA SERVED BY THE PUMP STATION IS FULLY DEVELOPED	19,525
TWO YEAR MAXIMUM DAILY FLOW	SAME AS MAXIMUM
CURRENT AVERAGE DAILY FLOW:	19,525 GPD; BASED ON 71 HOMES AT 275 GPD
PEAK INSTANTANEOUS FLOW DURING WET WEATHER	APPROXIMATELY SAME AS

MAXIMUM



ITEM 7 - AMENDMENTS TO THE SEWER ORDINANCE

No amendments to the Sewer Ordinance this year.

Re: Acquisition of East Whiteland Township's Sanitary Sewer System by Aqua Pennsylvania Wastewater, Inc.

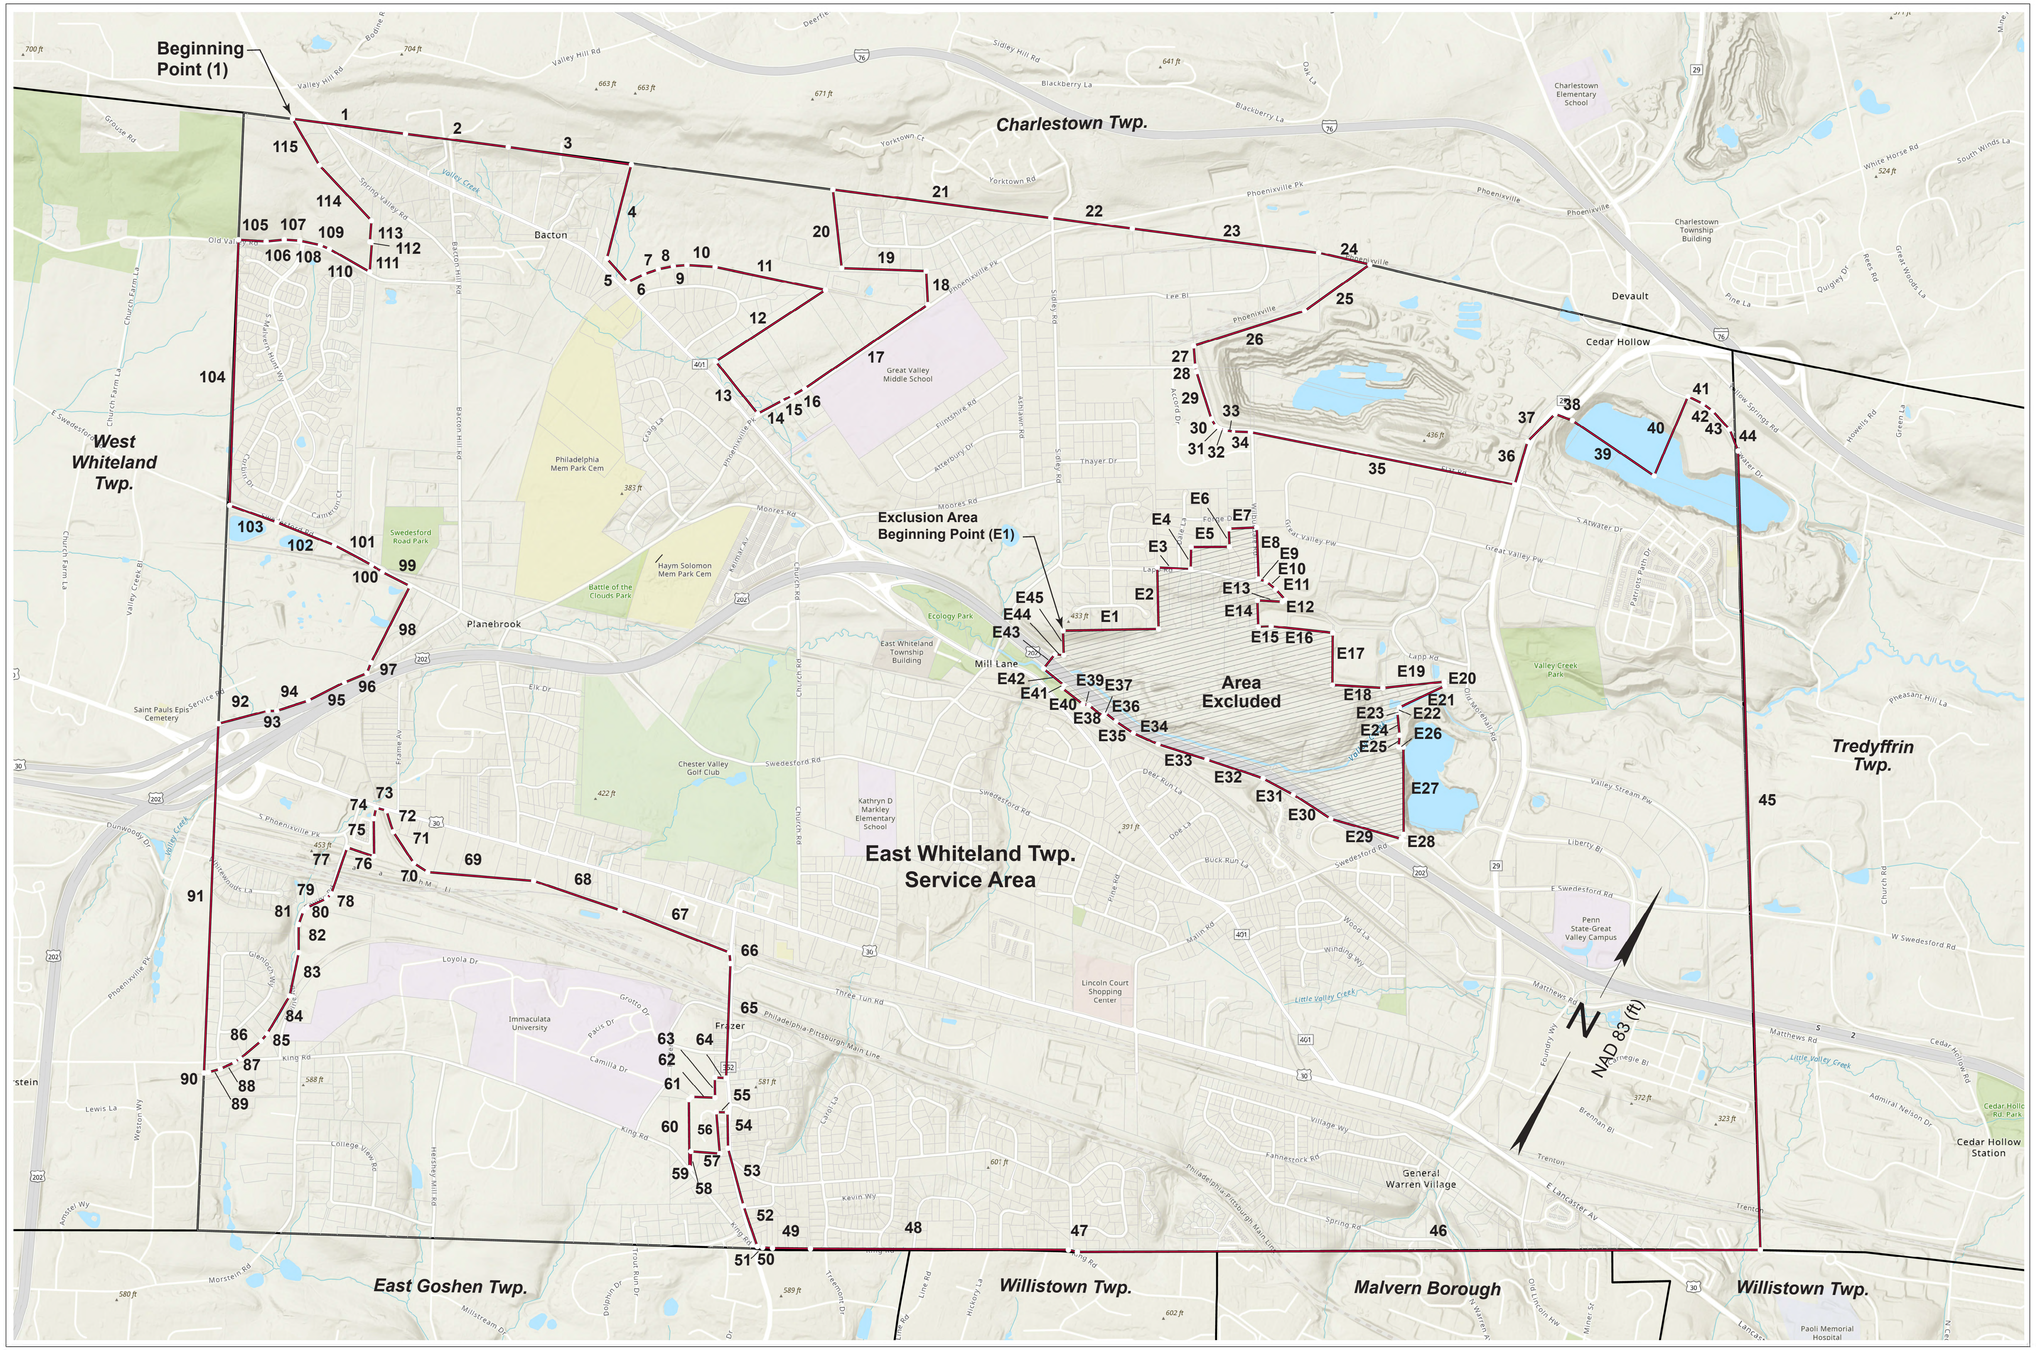
Dear Sir or Madam:

Aqua Pennsylvania Wastewater, Inc. (Aqua) is submitting an application with the Pennsylvania Public Utility Commission (PUC) to approve the right to offer, render, furnish, or provide sanitary service to the public in areas which are now served by East Whiteland Township.

As part of the application process, the PUC requested that Aqua seek the Chester County Planning Commission's input for the purpose of determining if Aqua's application complies with the County's Comprehensive Plan known as "Landscapes3."

Specifically, the PUC requires that we provide in our application, "evidence the filing is consistent with the affected municipality and county comprehensive plans if the filing proposes to expand service beyond the existing plant footprint."

The existing service area for East Whiteland Township's sanitary sewer system is shown on **Exhibit A** to this letter. The areas shaded in yellow on the map attached as **Exhibit B** to this letter identifies areas within the Township where new sewer service is in the design or construction phase.



Accordingly, Aqua is requesting a letter from the Planning Commission confirming that the expansion of sanitary sewer service into the areas shaded in yellow on Exhibit B is consistent with Landscapes3. Please do not hesitate to contact me with any questions. Thank you.

Very truly yours,

/s/

Vincent T. Donohue, Esq.
Counsel to Aqua Pennsylvania Wastewater, Inc.

MAP NOTES:

Mapping information was derived from various planning documents including Schoor DePalma's Sanitary Sewer Meter Location Plan, Kohli & Associates Township plan, Roy F. Weston's Master Sanitary Sewer System Plan, Chester County Recorder of Deeds Plans, and township as -built plans received by ARRO. The mapping is incomplete and will be improved as as-built and other plan information is updated into the GIS. This GIS database will provide a framework for modeling the collection system to analyze capacity issues and make recommended improvements to mitigate capacity deficiencies.

Data Sources: East Whiteland Township, Schoor DePalma, Kohli & Associates, Roy F. Weston, Chester County Recorder of Deeds and ARRO.

Re: Fair Market Value Appraisal

Dear Mr. Packer:

In accordance with your request, we have prepared a fair market value appraisal of East Whiteland Township's wastewater system assets ("Wastewater System") as of May 20, 2021.

Fair market value is defined as "the price, expressed in terms of cash equivalents, at which property would change hands between a hypothetical willing and able buyer and a hypothetical willing and able seller, acting at arm's length in an open and unrestricted market, when neither is under compulsion to buy or sell and when both have reasonable knowledge of the relevant facts."

Based on our analysis, as described in the attached appraisal report, the estimate of the fair market value of the Wastewater System as of May 20, 2021 is $55,668,000 (rounded).

Our appraisal was developed consistent with the Uniform Standards of Professional Appraisal Practices. Our fair market value appraisal of the Wastewater System was based on the Cost, Market, and Income Approaches to valuation. We used seven methods under the Cost, Market, and Income Approaches to valuation: Original Cost Method, Replacement Cost Method, Capitalization of Earnings Method, Market Multiple Discounted Cash Flow Method, Capitalization Discounted Cash Flow Method, Market Multiples Method, and the Selected Transactions Method.

The attached narrative appraisal presents our findings and conclusions regarding the fair market value of the Wastewater System's assets of May 20, 2021. The report describes the valuation methodologies employed and the Exhibits that present the valuation results.

The results of the analyses and calculations completed for each applicable approach are detailed throughout the report and the Exhibits and are summarized as follows:

Valuation Approach	Indicated Value
Cost Approach	$59,118,924
Income Approach	61,147,544
Market Approach	46,741,589

We thank Aqua for this opportunity to provide valuation services in connection with the fair market value appraisal of the Wastewater System's assets.

Respectfully Submitted,

GANNETT FLEMING VALUATION

INTRODUCTION

Introduction and Summary. The following narrative report presents our findings and conclusions regarding the fair market value of the wastewater system assets of the East Whiteland Township as of May 20, 2021. The report describes the valuation methodologies employed and the Exhibits that present the valuation results. Based upon the analyses, we believe the fair market value of the East Whiteland Township's wastewater system assets is $55.7 million. This conclusion is based upon the values suggested by the Cost, Income, and Market approaches. During our analysis we found indications of value that ranged from $46.7 million to $61.1 million. However, most of the appropriate indicated values approximated $55.7 million.

Description of the Assignment. Gannett Fleming Valuation and Rate Consultants, LLC was retained by Aqua Pennsylvania Wastewater, Inc. ("Aqua") to estimate the fair market value of East Whiteland Township's wastewater system assets ("Wastewater System") as of May 20, 2021.

Standard and Premise of Value. The fair market value appraisal of the Wastewater System complies with the Uniform Standards of Professional Appraisal Practices, employing the cost, market, and income approaches. Fair market value is defined as "the price, expressed in terms of cash equivalents, at which property would change hands between a hypothetical willing and able buyer and a hypothetical willing and able seller, acting at arm's length in an open and unrestricted market, when neither is under compulsion to buy or sell and when both have reasonable knowledge of the relevant facts."[1]

1 The International Glossary of Business Valuation Standards

As stated, the standard of value for this engagement is fair market value. The premise of value is the going concern. The going concern premise of business value assumes that the business will continue running normally using all its assets to produce income and will continue operating beyond the valuation date.

We valued the Wastewater System's assets as a group under the premise that the assets collectively comprise an ongoing operating business enterprise. Additionally, in accordance with 66 Pa. C.S. Section 1329, the original source of funding for any part of the Wastewater System's assets was not relevant to the determination of the value of said assets.

Intended Use of the Valuation. The intended use of the valuation is to comply with 66 Pa. C.S. Section 1329, Valuation of Acquired Water and Wastewater Systems and conduct a fair market value appraisal of the Wastewater System in compliance with the Uniform Standards of Professional Appraisal Practices, employing the cost, market, and income approaches.

Client and Users. The client is Aqua Pennsylvania Wastewater, Inc. The intended users of the valuation are Aqua Pennsylvania Wastewater, Inc., and the Pennsylvania Public Utility Commission ("PUC").

Extraordinary Assumptions. There were no extraordinary assumptions required for this appraisal.

Hypothetical Conditions. There were no hypothetical conditions assumed for this appraisal.

Limiting Conditions. We accepted all information and data provided by the East Whiteland Township and/or Aqua as it pertains to this assignment "as is" after a limited review. That is, we neither audited nor verified any data, engineering assessment, financial record or operating data provided for this assignment. We assumed all title to all assets included in the

appraisal is good and marketable, no hidden defects in the property or soil and no hazardous conditions or materials exist which could affect the assets.

Site Inspection. We viewed or observed the Wastewater System's facilities on June 15, 2021. We also relied on engineering assessment of the Wastewater System's facilities report, "East Whiteland Township Sewerage Facilities Engineering Assessment and Original Cost" and related files prepared by Pennoni Associates Inc., to confirm the condition of the Wastewater System's property and equipment.

Sources of Information. The following sources of information were reviewed during the assignment:

"East Whiteland Township Sewerage Facilities Engineering Assessment and Original Cost" and related files prepared by Pennoni Associates Inc.;

Township/Aqua provided electronic files (e.g., PDF and Excel);

Wastewater System's Customer data;

Wastewater System's Fee Schedule;

Wastewater System's 537 Plan;

Wastewater System's Chapter 94 Reports;

Wastewater System's Sewage Service and Treatment Agreements;

Wastewater System's Municipal Wasteload Management Program Reduction Plan;

Asset Purchase Agreement;

East Whiteland Township's Audited Financials (2016 - 2019);

East Whiteland Township's Budgets for Wastewater System (2020 - 2021);

Blue Chip Financial Forecasts;

US Census Bureau, various data files;

Value Line Investment Survey; and

S&P Capital IQ.

Description of the East Whiteland Township. East Whiteland Township is located in east-central Chester County, in southeastern Pennsylvania. East Whiteland Township borders Malvern Borough and the Townships of Tredyffrin, Willistown, East Goshen, West Whiteland, and Charlestown, all located in Chester County. East Whiteland Township is the 35th largest land mass of Chester County's 73 municipalities and was the 20th most populous with 10,702 people (2015) and 3,551 housing units (2015). East Whiteland Township consists of 10.9 square miles and lies approximately 29 miles northwest of Philadelphia, Pennsylvania. According to U.S. Census figures, East Whiteland Township's population grew 14.1% from 2000 to 2010, while population in Pennsylvania grew 3.4% and 15.1% in Chester County.

East Whiteland Township has a diverse and dynamic economy, boasting over 900 payroll establishments. "With more than 20,000 persons employed in the municipality, the number of people who work in the Township is much greater than the resident population. The present ratio of employed persons to residents, more than two to one, is likely to continue, with several large office complexes slated for construction during the coming years."[2]

Description of the Wastewater System. East Whiteland Township owns and operates the Wastewater System which consists of 12 pump stations, about 329,072 linear feet of mains, approximately 1,506 manholes, associated infrastructure and appurtenances, and related land and land rights. The Wastewater System accepts flows and collects sewer rental fees from the adjoining municipalities of East Goshen Township, Charlestown Township and Malvern Borough.

2 https://www.eastwhiteland.org/244/Demographics , 6/14/21

The Wastewater System, in turn, pays sewer rental fees to neighboring Tredyffrin Township and East Goshen Township, and a public utility company for conveyance and to the Valley Forge Sewer Authority Wastewater Treatment Plant for which the Township has purchased capacity.

The Wastewater System's 12 pump stations are: Deer Run; Flat Road; Hillbrook Circle; King Road; Lapp Road; Lee Boulevard; Malvern Hunt; Meadowview; Mill Lane; Planebrook Road; Westgate; and Wilburdale. The Wastewater System has approximately 26,300 linear feet of force mains ranging in size from 4 to 14 inches diameter and were installed between 1976 to 2017. The force mains consist of asbestos-cement ("ACP"), ductile iron ("DIP") and polyvinyl chloride ("PVC") pipe.

The Wastewater System's 302,772 linear feet of gravity sewer collection mains consist of 8-inch, 10-inch, 12-inch, 15-inch, 16-inch, 18-inch, 20-inch, 24-inch, 27-inch and 36-inch diameter pipe which was installed between 1951 to 2020. About 41% of the gravity mains were installed in the 1970s, 27% between 1980 and 1999, and 21% after 1999. The mains consist of ACP, cast iron ("CIP"), corrugated steel ("CSP"), DIP and PVC pipe. There are 1,506 manholes and 3,895 service laterals in the system.

East Whiteland Township utilizes one enterprise fund to account for the Wastewater System's operations. East Whiteland Township's audited financial statements reflect the use of the full accrual accounting, which measures revenues when earned and expenses when a liability is incurred, regardless of the timing of related cash flows. For the year ended December 31, 2019, (shown on Exhibit 1) the Wastewater System had reported revenues of $4.444 million and expenses of $3.848 million. At the same point in time, the Wastewater System was capitalized with $26.447 million of fund equity and East Whiteland Township's long-term debt attributable

to the Wastewater System was $16.065 million. At the same point in time, the Wastewater System had total assets of $45.379 million, including $34.143 net utility plant.

The Wastewater System is exempt from PUC regulation as a municipal utility. The Wastewater System's rate requirements are established by the needed funds to run the system. Most municipalities, including Wastewater System, use a Government Accounting Standards Board ("GASB") process of accounting or the PA Department of Community and Economic Development ("DCED") versus Financial Accounting Standards Board ("FASB") method of accounting used by investor-owned utilities ("IOU"). Municipalities are not typically concerned with the return on and the return of their investments of their utility systems since they deem they are providing a public service to their taxpayers. Municipalities typically expense (i.e., maintenance expense) renewals replacement, and customer collection services capital expenditures and they do not typically fully account for the replacement of all capital assets which are all typically capitalized (i.e., construction of capital asset, construction expenditure, etc.) and "booked" at original cost by IOUs. For these reasons, we do not believe Wastewater System's financial statements should be fully relied upon without recognizing their limitations.

As shown on Exhibit 2, the Wastewater System provides service to 3,895 customers within a population of 14,720 people and services approximately 7,908 Equivalent Dwelling Units ("EDU"). EDUs are estimated to increase by 2,443 EDUs through 2025.

Demographics and Growth for the Wastewater System. As shown on Exhibit 3, Table 3.1, according to U.S. Census figures, the U.S. population grew 9.7% from 2000 to 2010, and the population in Pennsylvania grew 3.4%. During this same period, Chester County's population grew 15.1% and East Whiteland Township's population grew 14.1% (Exhibit 3, Table 3.2). East

Whiteland Township's population growth was ranked 323 of the 2,572 municipalities in Pennsylvania.

The Census Bureau and planning agencies provide population projections for future time periods. Population projections are a primary indicator of expected future growth, and they help determine predictable demand for utility services, housing, roads, business services and facilities. The Delaware Valley Regional Planning Commission ("DVRPC") publishes population projections and employment projections for East Whiteland Township and the nine Delaware Valley counties ("Nine DVRPC Counties"). The DVRPC counties include Bucks County, Chester County, Delaware County, Montgomery County and Philadelphia County, in Pennsylvania, and Burlington County, Camden County, Gloucester County, and Mercer County, in New Jersey.

As shown on Page 2 of Exhibit 3, Table 3.3, East Whiteland Township's population growth is projected to be about 507% the growth rate projected for the Nine DVRPC Counties during each five-year period from 2015 through 2045. East Whiteland Township's project population growth places them in the upper 81 percent or 81st percentile of the 369 municipalities analyzed by DVRPC. Page 3 of Exhibit 3, Table 3.4 shows East Whiteland Township's employment growth is projected to be about 262% the growth rate projected growth rate projected for the Nine DVRPC Counties during each five-year period from 2015 through 2045.

Currently, there are approximately 14,720 people (Exhibit 2) in the Wastewater System's service area. There are 5,085 housing units in the Wastewater System's service area, and the ratio of people to households is 2.89 persons per household. The Wastewater System's service area density is 3.8 people per customer based on an estimated population of 14,720 and 3,895 customers. The Wastewater System's service area density is higher than the 3.6 per customer

density of water and wastewater systems (see Table 2 in this report) indicating lower market penetration.

HISTORY AND NATURE OF THE BUSINESS

Economic Outlook. The valuation date (May 20, 2021) is the specific date at which the value of the Wastewater System is based. Generally, only the circumstances existing at the valuation date and events occurring up to the valuation date are considered. Events which could affect the value may occur after the valuation date.

An outbreak of a new strain of coronavirus was first reported in Wuhan, China in late 2019 and quickly spread around the world. A coronavirus is a kind of common virus that causes an infection in sinuses, or upper throat. The World Health Organization ("WHO") declared the spread of the infection a pandemic. The WHO named the virus SARS-CoV-2, and the disease COVID-19.

We do not believe the appraised value of the long-lived Wastewater System assets is materially impacted by the COVID-19 or its related relatively short-term events. The Wastewater System's customer base is not heavily dependent on customers from sectors of the economy providing tourism and travel, employment services, mining/oil and gas (energy), and leisure and hospitality which have been most impacted by COVID-19's related short-term events. Therefore, even on a short-term basis, the Wastewater System's revenues and cash flows should not be materially impacted on a relative basis.

Nevertheless, we have included subsequent information in Appendix B (Known Impact of COVID-19) regarding COVID-19's known impact for informational purposes only and does not affect the determination of value as of the specified valuation date of May 20, 2021.

In the valuation of any company, the general economic outlook as of the valuation date is important since it influences how investors perceive alternative investment opportunities at that point in time. As part of our analysis, we considered the forecasts for the U.S. economy that prevailed as of May 20, 2021. We focused on the forecasts and economic commentary presented in Blue Chip Financial Forecasts in the May 1, 2021 edition. Some of these economic forecasts are presented in Table 1.

Economic Indicators

	Latest Qtr	Consensus Forecasts	
	1Q 2021	2Q 2021	3Q 2021
Key Assumptions			
Real GDP	6.4	9.0	7.1

State & Local Bonds	2.68	2.7	2.8
Home Mortgage Rate	2.88	3.2	3.3

Table 1

Industry Review. A review of the industry in which the company operates is important in determining value. The trends and stability of the specific economic environment affecting operations need to be reviewed to gain further insight regarding the prospects and risks associated with the industry and each company.

The wastewater utility industry has a Standard Industrial Classification ("SIC") code of 4952 (Sewerage Systems), has sewer utilities, and includes establishments primarily engaged in the collection and disposal of wastes conducted through a sewer system, including such treatment processes as may be provided. There are currently 2,104 U.S. Businesses with a SIC code of 4952.

The wastewater utility industry is a fragmented industry, although not as fragmented as the water supply industry. According to the U.S. Environmental Protection Agency's ("EPA") most recent survey of publicly owned wastewater treatment facilities in 2012, there are approximately 15,000 such facilities in the nation, serving approximately 76% of the U.S. population. Eighty percent of domestic wastewater systems are government owned rather than IOUs. Currently, there are no wastewater utility companies that have actively traded stock.

A comparative industry to the wastewater utility industry is the water supply industry. A comparative industry to the wastewater utility industry is the water supply industry. The water utility industry has a Standard Industrial Classification ("SIC") code of 4941 (Water Supply), has water utilities, and includes establishments primarily engaged in distributing water for sale for residential, commercial, and industrial uses. Government controlled establishments such as municipal service districts and public utilities dominate the industry. Private companies or IOUs are active in the construction and improvement of water supply facilities and infrastructure. There are currently 11,283 U.S. Businesses with a SIC code of 4941.

The water supply industry is the most fragmented of the major utility industries with more than 53,000 community water systems in the U.S. (82% of which serve less than 3,300 customers). The nation's water systems range in size from large municipally owned systems, such as the New York City water system that serves approximately 9 million people, to small systems, where a few

customers share a common well.

An estimated 14% of all water suppliers are managed or owned by IOUs. IOUs consist of companies with common stock that is either actively traded or inactively traded, as well as companies that are closely held, or not publicly traded. Currently (May 20, 2021), there are only about nine investor-owned water utility companies with publicly traded stock in the U.S.

The water utility industry and wastewater utility industry's increased compliance with state and federal water purity levels and large infrastructure replacements are driving consolidation of the wastewater utility and water utility industries. Because many wastewater utility and water utility operations do not have the means to finance the significant capital expenditures needed to comply with these requirements, many have been selling their operations to larger, financially stronger operations.

The larger IOUs have been following an aggressive acquisition program to expand their operations by acquiring smaller wastewater and water systems. Generally, they enter a new market by acquiring one or several wastewater or water utilities. After their initial entry into a new market, the larger investor-owned water utility companies continually seek to expand their market share and services through the acquisition of wastewater and water utility businesses and operations that can be integrated with their existing operations. Such acquisitions may allow a company to expand market share and increase asset utilization by eliminating duplicate management, administrative, and operational functions.

Acquisitions of small, independent utilities can often add earning assets without necessarily incurring the costs associated with the Safe Drinking Water Act ("SDWA") if such acquisitions are contiguous to the potential purchaser.

In summary, the result of increased capital spending, to meet the SDWA requirements[3] and to replace the aging infrastructure of many systems, has moved the wastewater and water industries toward consolidation. Moreover, Federal and State regulations and controls concerning water quality are still in the process of being developed and it is not possible to predict the scope or the enforceability of regulations or standards which may be established in the future, or the cost and effect of existing and potential regulations and legislation upon the sewer and water systems. However, as a small to medium sized wastewater system, the Wastewater System faces the cost of compliance with significantly limited financial resources when compared to larger IOU water utilities.

QUANTITATIVE AND QUALITATIVE ANALYSIS

Comparison Review. The comparison review considers the financial and operating statistics for the Wastewater System, and a group of companies ("Comparable Group") that operate in the same basic or similar industry as the Wastewater System. Since no marketplace exists for the common stock of the Wastewater System, an alternative to estimate the value of the Wastewater System is to analyze the price investors are willing to pay for the publicly traded common stock of companies that are like the Wastewater System. We list the Comparable Group chosen for study in Table 2.

The companies in the Comparable Group were selected based upon: (1) the availability of financial information; (2) inclusion in the S&P Capital IQ database; (3) a May 20, 2021 market

3 The SDWA, or Safe Drinking Water Act, is the principal federal law in the United States intended to ensure safe drinking water for the public. Pursuant to the act, the EPA is required to set standards for drinking water quality and oversee all states, localities, and water suppliers who implement these standards. The CWA, or Clean Water Act, is the primary federal law in the United States governing water pollution. The CWA's objective is to restore and maintain the chemical, physical, and biological integrity of the nation's waters by preventing point and nonpoint pollution sources, providing assistance to publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands.

value of common stock, the product of multiplying the closing stock price by the number of common shares outstanding, greater than $200.0 million; (4) a May 20, 2021 total enterprise value (the sum of market value, preferred stock and total debt) greater than $450.0 million; (5) were not the subject of a known acquisition at May 20, 2021; (6) with a Standard Industrial Classification (SIC) of 4941 (i.e., Water Supply Facilities and Infrastructure) and (7) with a North American Industry Classification System (NAICS) of 221310 (i.e., Water Supply and Irrigation Systems). The eight companies ("Comparable Group") that met the criteria for selection are listed in Table 2.

Acquisition Date Size Statistics

	Revenues (Mill. $)	Customers	Population	Customer Density
East Whiteland Township Wastewater System Assets	$4.328	3,895	14,720	3.8
Comparable Group				
American States Water Co	$473.869	286,341	1,000,000	3.5
American Water Works Co Inc	3,610.000	3,496,000	15,000,000	4.3
Artesian Resources -CL A	83.595	95,640	300,000	3.1
California Water Service Gp	714.557	543,000	2,000,000	3.7
Essential Utilities, Inc.	889.692	1,798,803	5,000,000	2.8
Middlesex Water Co	134.598	122,200	500,000	4.1
SJW Corp	420.482	389,293	1,614,866	4.1
York Water Co	51.578	72,681	202,000	2.8
Median	$447.176	337,817	1,307,433	3.6

Table 2

We believe that similar economic, industry and business risks have affected the Comparable Group as those faced by the Wastewater System. However, consideration must be

given to the fact that no two companies are exactly alike. Table 2 presents comparative statistics regarding total revenues, customers, population of the area served, and customer density (population ÷ customers). On average, the Comparable Group are larger than the Wastewater System. The relative size difference between the group and the Wastewater System suggests that the risk of the Wastewater System is greater than the Comparable Group. We will discuss the difference in risk resulting from size later in this report.

Financial Review. We conducted a financial review that considered the financial and operating statistics for the Wastewater System and the Comparable Group for the three-year period, 2017 to 2019. It is our opinion that the economic, industry and business risks affecting the Comparable Group selected are similar to those faced by the Wastewater System. However, consideration must be given to the fact that no two companies are exactly alike.

The determination of reasonable water rates and sewer rates for the Comparable Group is subject to rate regulation. For the Comparable Group, rate regulation serves as a substitute for competition in the marketplace since utility companies are precluded from exercising complete control over the price to be charged their customers. Under rate regulation, a cost of service formula is used to set the price for service charged to customers. The cost of service formula equates revenues to the sum of annual operating expenses, taxes other than income, depreciation expense, income taxes, and the product of the rate base times a fair rate of return.

It is the responsibility of the utility seeking changes in rates to present sufficient evidence to their regulators in support of their request. Historically, the Wastewater System's rates have not considered a fair rate of return nor taxes. That is, the Wastewater System's rates would have been higher and their financial results would have been healthier if they included a provision for a fair rate of return and taxes. Additionally, after comparing the Wastewater System's historical

financial performance to budgeted numbers we believe the Wastewater System's historical financial performance (pre-transfers) may not include all expenses. Therefore, the results of the Wastewater System's historical financial performance shown on Exhibits 4 and 6 should be viewed with this knowledge.

Financial Benchmark Analysis. To gain insight into the risk differences between the Wastewater System and the Comparable Group, we reviewed financial ratios and coverages. Unfortunately, there is no single measure that best indicates investment risk from an investor's perspective. However, from a creditor's viewpoint, the best measure of investment risk is debt rating. The debt rating process generally provides a good measure of investment risk for common stockholders because the factors considered in the debt rating process are usually relevant factors that a common stock investor would consider in assessing the risk of an investment.

The types of financial benchmarks applied by credit rating agencies such as Standard and Poor's ("S&P") for rating IOU public utility debt are broader than the traditional measure of financial risk, leverage. Besides reviewing the amounts of leverage employed (i.e., percentage of debt used in the capital structure), S&P also focuses on earnings protection and cash flow adequacy. During the period 2017-2019, the Wastewater System's financial benchmark ratios show (Exhibit 4) higher investment risk than the Comparable Group based on coverage and cash flow.

Risk Analysis. From an operations standpoint, the Wastewater System and the Comparable Group are indistinguishable. Both are required to meet SDWA and CWA requirements and are also required to provide safe and reliable services to their customers.

A basic premise of finance is the tradeoff between risk and return. That is, the higher the perceived risk, the higher the required return. Conversely, the lower the perceived risk, the lower the required return.

As mentioned previously, size is a determinant of risk. Based on size, the Wastewater System's risk is higher than the Comparable Group given Wastewater System's relatively small size. Table 2 details the size difference between the Wastewater System and the Comparable Group. As shown on Table 2, the Wastewater System is many times smaller than the Comparable Group.

Size is a determinant of risk because the loss of a large customer impacts a small company much more than a large company because a large customer of a small company usually accounts for a larger percentage of the small company's sales. Further, a larger company has much more diversification in customer mix, economic conditions, source of supplies, weather, demographic, and financing than the Wastewater System. Because the larger Comparable Group has a more diverse geographic operation than the Wastewater System, it enables them to sustain earnings fluctuations caused by adverse weather conditions in one portion of its service territory. Further, the larger Comparable Group has a more diverse customer base and is less susceptible to local downturns associated with regional economic conditions than the Wastewater System.

Exhibit 5, Table 5.1, provides an illustration which shows company size has been inversely related to returns and the volatility of their common stock. Specifically, Ibbotson Associates sorted 3,113 publicly traded common stocks based on size of market value (market price multiples by the number of shares) and placed them into four different portfolios (quartiles). The common stock quartile return and the resultant size premium, column B, increased at an increasing rate as you move from a larger stock quartile to a smaller stock quartile. Similarly, the total risk, or

standard deviation of annual returns (a measure of risk), also increased with decreasing company size (column C).

The Comparable Group's market value on May 20, 2021 ranged from $381 million to $28,022 million as shown on Table 5.2 of Exhibit 5. Based on their market value, the Comparable Group's median market quartile was 3. Wastewater System's market value would place them in quartile 4 based upon Wastewater System's financial statements and since the largest company in quartile 4 on Table 5.1 had a market value of $728 million.

The change in risk adjusted common stock return rate between quartile 3 and quartile 4 (column J) is 97 basis points. The results of the illustration shown on Exhibit 5 suggests the Wastewater System's common equity cost rate could be about 97 basis points higher than the Comparable Group. The history of common stock returns indicates small company stocks are riskier than large company stocks because as one moves from the larger to smaller quartiles, the standard deviation (a measure of risk) of returns increases. Historically, common stock investors have been compensated for taking on this additional risk by the higher returns provided by small company stocks.

In general, it is reasonable to expect small companies to be more risky than large ones. Exhibit 5 shows small company stocks have been riskier over a long period of time than larger company stocks due to the various advantages that larger companies have over smaller companies. For example, small capitalized firms generally have less access to capital and, overall, not as many financial resources. Further, small capitalized stocks have lower trading liquidity than larger ones.

The bond market, particularly the corporate bond market, also differentiates between large and small bond issues, where many large institutional investors such as pension funds and

insurance companies require large blocks of bonds for liquidity and performance. Because of this size preference, smaller bond issuers often pay a cost rate premium when compared to larger bond issuers.

A higher return requirement for companies the size of Wastewater System translates into a higher capitalization rate. All else being equal, a higher capitalization rate will produce a lower value. However, all things are seldom equal as shown by the array of market multiples for the companies that comprise the Comparable Group (Exhibit 17, page 2). As shown on Exhibit 17, the Comparable Group's current market multiples do not suggest a higher capitalization rate due to size as there are numerous other risks affecting the Comparable Group's market values.

Property Plant and Equipment Analysis. The Wastewater System can best be characterized as a wastewater collection system with treatment rights. The Wastewater System does not have the number of large treatment facilities that the Comparable Group has. The Wastewater System's gross property, plant and equipment is in relatively good condition given its age (Exhibit 6, Table 6.1) with 76% of their gross property, plant and equipment remaining undepreciated while 78% of the Comparable Group's gross property, plant and equipment remained undepreciated.[4]

Property Plant and Equipment Analysis for Contributions. Most regulatory commissions determine rates for utilities based on a cost of service formula reflective of gross plant, property, and equipment less accumulated depreciation (i.e., net property, plant, and equipment) being roughly equal to investor provided capital (i.e., debt and equity capital) plus "cost free" capital such as customer contributions. Under 66 Pa. C.S. Section 1329 (Valuation of Acquired Water

4 The Wastewater System's gross and net property, plant and equipment is developed on Exhibit 7.

and Wastewater Systems), the original source of funding for any part of the assets of a selling utility is not relevant to determining the value of a selling utility's assets.

We found a 20% (100% - 80%) difference between the Comparable Group's net property, plant and equipment and the Comparable Group's investor provided capital on the valuation date (Exhibit 6, page 1, Table 6.2). The difference between the Comparable Group's net property, plant and equipment and the Comparable Group's investor provided capital is comprised of "cost free" capital such as customer contributions.[5] This is evidenced by the 20% difference in the Comparable Group's net property, plant and equipment and the Comparable Group's investor provided capital (Exhibit 6, page 1, Table 6.2). Additionally, we verified known components of the Comparable Group's "cost free" capital by reviewing their individual balance sheets (Exhibit 6, page 1, Table 6.2) at year-end 2020.

We did not analyze the Wastewater System's property, plant, and equipment for "cost free" capital, or customer contributions, because the original source of funding for any part of the assets of a selling utility is irrelevant to the valuation process under 66 Pa. C.S. Section 1329.

Capital Expenditures Analysis. The level of capital expenditures required for business purposes is an indicator of risk. Over the last four years, the Comparable Group had annual capital expenditures of about 9% of net plant (Exhibit 6, page 2, Table 6.3). During this same time, 2016-19, the Wastewater System had annual capital expenditures of about 3% of net plant. Therefore, the Wastewater System historical capital spending was less than the Comparable Group's average.

Growth Rate Analyses. Higher growth rates are an indication of less risk. A review of

5 Under rate regulation "cost free" capital, such as customer contributions, is subtracted from plant assets in determining the dollar amount of property on which a utility may earn a "fair rate of return" and therefore, "cost free" capital has no economic value to investors.

the growth rates in revenue, operating income plus depreciation and operating income, reveal that the Wastewater System's revenues have been growing more than the Comparable Group (Exhibit 6, page 4, Table 6.4) over the last three years, as has operating income plus depreciation. Conversely, the Wastewater System's operating income has been growing less than the Comparable Group. Prospectively, the Wastewater System's growth rates should lag without increased rates and a higher level of planned capital additions.

Profit Margin Analyses. Higher profit margins are an indication of less risk. We compared earnings before interest and taxes ("EBIT") to revenues to see how successful the Wastewater System's management has been at generating income from the operation of the business. We also compared operating profitability or earnings before interest, tax, depreciation, and amortization ("EBITDA") divided by total revenue to gain a clearer view of the Wastewater System's core profitability. The Wastewater System's EBITDA profit margins are higher than the Comparable Group's indicating less risk, while the EBIT profit margins are lower indicating more risk (Exhibit 6, page 5, Table 6.5).

VALUATION

The purpose of this valuation is to comply with 66 Pa. C.S. Section 1329 (Valuation of Acquired Water and Water Systems) and conduct a fair market value appraisal of the Wastewater System's assets as of May 20, 2021 in compliance with the Uniform Standards of Professional Appraisal Practices, employing the cost, market, and income approaches. Consequently, three basic valuation approaches were considered in this analysis: the cost approach, the income approach, and the market approach.

The Cost Approach. In general terms, the cost approach measures value by determining the amount of money required to replace the future service capability of an asset. The cost approach is based on the premise that an informed purchaser will not pay more for a property than the cost of constructing an equally desirable substitute property, minus applicable depreciation, and assuming no undue delay.

The cost approach can include the use of the: original cost method; trended original cost method; reproduction cost method; and replacement cost method. From these cost bases, the calculated accrued depreciation (accumulated depreciation) is subtracted.

The original cost method begins with determining the original cost new ("OCN") measure of the cost of the assets when first constructed. The OCN is based on (1) a review and summary of the utility's accounting records, contractors' invoices and bid tabulations to determine the most appropriate data sources of each type of asset; (2) and the "pricing out" of assets using unit costs for each vintage year that property was placed in service.

Under the trended cost method, the trended original cost ("TOC") measures the reproduction cost by multiplying the OCN by specific cost indices. The TOC is based on (1) a review and summary of the OCN at each location to determine those elements that would be replaced-in-kind, those that would be replaced with current methods and technologies and those that would not be replaced; (2) the selection of cost indexes and the calculation of trended original cost for those elements that would be replaced-in-kind; and (3) the estimation of the cost to purchase or construct those elements that would be replaced with current methods and technologies. The TOC is a procedure for estimating reproduction cost new of property and is sometimes used as a substitute for reproduction cost method and may be considered a form of the reproduction cost method, though not as precise.

The reproduction cost method begins with determining the reproduction cost new ("RPCN") by determining the current cost of constructing identical new property. The replacement cost method begins with estimating the replacement cost new ("RCN") based on approximating the current cost of replacing service of existing property with similar new property having the nearest equivalent utility to the property being valued (as defined by the *International Glossary of Business Valuation Terms*).

The RPCN and the RCN methods include the research and verification of the inventory of a company's tangible personal property. Upon verification of the inventory, current material costs, current construction costs, engineering costs, administration costs, interest during construction, and entrepreneurial profit[6] are applied to the inventory listing in order to determine the RPCN and to determine the RCN.

The RPCN method assumes the assets would be recreated under the conditions existing at the date certain or valuation date, using the exact materials, standards, design, layout, and quality of workmanship used to create the original assets. The RCN assumes the assets would be recreated under the conditions existing at the date certain or valuation date, using similar materials, current standards, under current conditions with similarly functional property.

From these cost bases (i.e., OCN, TOC, RPCN and RCN), the calculated accrued depreciation (accumulated depreciation) is subtracted ("LD"). The calculated accrued depreciation is based on the assets' attained ages, and the service life of the assets. The cost bases of depreciable assets are reduced annually by the accumulated depreciation to reflect the loss in the service value of the assets since being constructed.

6 The administration costs and entrepreneurial profit are those of the contractors and engineers. The cost of overhead of the entity having the assets constructed can also be included. Generally overhead costs are allocated as part of an asset's cost, and usually represent at least 5% to 15% of infrastructure asset total costs.

Depreciation represents the loss in property value from: physical deterioration; functional obsolescence; and external obsolescence. The accrued depreciation represents the sum of the annual depreciation amounts that would have been charged for depreciation at a point in time. Accrued depreciation is a calculated amount that would be in the book reserve account at a point in time using the current depreciation parameters (i.e., average service life). The average service lives of depreciable assets are based on the materials used for construction and how long the depreciable assets are likely to meet service demands.

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized "survivor curves" known as the Iowa type curves. The accrued depreciation ratio from a survivor curve is a concept that is used to estimate the consumed service capacity of plant at a point in time. The survivor curve is used to find the applicable accrued depreciation factors of the assets to result in the total accumulated depreciation.

The Original Cost Method. For this report, East Whiteland Township/Aqua provided us a copy of the Engineer's assessment report "East Whiteland Township Sewerage Facilities Engineering Assessment and Original Cost" and related files prepared by Pennoni Associates Inc., to confirm the condition of the Wastewater System's property and equipment. We utilized the Engineering Assessment and calculated the Original Cost and Related Accrued Depreciation of the Wastewater System as of May 20, 2021 ("OCNLD Study") shown on Exhibit 7.

Page 1 of Exhibit 7 summarizes the original cost and related accrued depreciation by account for the Wastewater System as of May 20, 2021. The original cost was brought forward from page 2 of Exhibit 7 and the accrued depreciation from page 3 of Exhibit 7.

The original cost of the Wastewater System was determined from the Engineering Assessment and is summarized on page 2 of Exhibit 7. A summarizing analysis of the original

cost of the Wastewater System by account and vintage year is shown on Exhibit 10.

The accrued depreciation calculation, shown on page 3 of Exhibit 7, was based on recognized methods using estimated survivor characteristics and the straight-line depreciation method. The estimated survivor curves are those used by other Pennsylvania wastewater companies and the material and age of the assets. The average service life procedure was used to apply the methods of depreciation to group properties for which a survivor curve was used to recognize the existence of life dispersion. The detailed calculations of accrued depreciation applicable to original cost by account and vintage are included in Exhibit 8.

The results of the OCNLD Study established that the OCN of the Wastewater System's utility plant in service as of May 20, 2021 was not less than $43.4 million ($43,447,309 rounded). The OCNLD Study also determined a theoretical calculated accrued depreciation reserve of the utility plant in service of $10.5 million ($10,491,713 rounded) as of May 20, 2021. After factoring in the OCNLD Study's accrued depreciation reserve, the OCNLD of Wastewater System's utility plant in service as of May 20, 2021 was determined to be $33.0 million ($43,447,309 - $10,491,713 = $32,955,596).

The Replacement Cost Method. We utilized the OCN to calculate the trended original cost (TOC) measures, or the replacement cost of the depreciable assets (RCN), by multiplying the OCN by specific transition factors.[7] The result of this analysis is shown in the Replacement Cost and Related Accrued Depreciation of the Wastewater System as of May 20, 2021 ("RCNLD Study") shown on Exhibit 9.

Page 1 of Exhibit 9 summarizes the replacement cost new and related accrued depreciation

7 We used the TOC method because the mandated use of the Engineering Assessment's original cost essentially dictates the use of TOC over the reproduction cost or the replacement cost methods.

by account for the Wastewater System as of May 20, 2021. The replacement cost new was brought forward from page 2 of Exhibit 9 and the accrued depreciation from page 3 of Exhibit 9.

The replacement cost new of the Wastewater System (see Exhibit 10) was calculated by trending the original cost measures by multiplying the OCN by Handy-Whitman indices and obsolescence factors. A summarizing analysis of the replacement cost new of the Wastewater System by account and vintage year and related transition factors is shown on Exhibit 10.[8]

The accrued depreciation calculation, shown on page 3 of Exhibit 9, was based on recognized methods using estimated survivor characteristics and the straight-line depreciation method. The estimated survivor curves are those used in the OCNLD Study. The average service life procedure was used to apply the methods of depreciation to group properties for which a survivor curve was used to recognize the existence of life dispersion. The detailed calculations of accrued depreciation applicable to replacement cost new by account and vintage are included in Exhibit 11.

The results of the RCNLD Study established that the RCN of the Wastewater System's utility plant in service as of May 20, 2021 was not less than $92.7 million ($92,712,337 rounded). The RCNLD Study also determined a theoretical calculated accrued depreciation reserve of the utility plant in service of $33.6 million ($33,593,413 rounded) as of May 20, 2021. After factoring in the RCNLD Study's accrued depreciation reserve, the RCNLD of Wastewater System's utility plant in service as of May 20, 2021 was determined to be $59.1 million ($92,712,337 - $33,593,413 = $59,118,924).

8 All land and land rights were valued at original cost.

The results of the OCNLD and RCNLD Cost Approaches show a range of value for the Wastewater System of $33.0 million to $59.1 million and collectively, indicated value of $59.1 million ($59,118,924 rounded) for the Wastewater System based on the results of the RCNLD.

Benchmark Metrics. Besides providing an indication of value based upon a cost method, the OCN and OCNLD can also provide a meaningful metric to evaluate the reasonableness of other indications of value produced by other valuation methods. For example, the Comparable Group's market value of common equity plus minority interest, preferred stock, and total debt net of cash and cash equivalents ("Enterprise Value") is currently 1.88-times (Exhibit 17, page 2) their OCNLD or net property, plant and equipment. Similarly, the Comparable Group's Enterprise Value is currently 1.49-times (Exhibit 17, page 2) their OCN or gross property, plant and equipment.

The above-mentioned property, plant and equipment "multiples" understate the multiple applicable to the Wastewater System because some of the Comparable Group's property, plant and equipment includes assets that were originally financed with "cost free" capital such as customer contributions.[9] Subtracting customer contributions ("CIAC") from the Comparable Group's property, plant and equipment (Exhibit 17, page 3) based on differences between investor provided capital and OCN results in CIAC adjusted multiples of 2.06-times OCNLD and 1.63-times OCN for the Comparable Group.

Multiplying the Wastewater System's OCN of $43.4 million by the Comparable Group's 1.49-times OCN multiple or the 1.63-times contributions adjusted OCN multiple indicates a range of market value of $64.7 million to $70.7 million for the Wastewater System, similar to the

9 Under rate regulation "cost free" capital, such as customer contributions, is subtracted from plant assets in determining the dollar amount of property on which a utility may earn a "fair rate of return" and therefore, "cost free" capital has no economic value to investors.

RCNLD of $59.1 million. Further, multiplying the Wastewater System's OCNLD of $33.0 million by the Comparable Group's 1.88-times OCNLD multiple or the 2.06-times contributions adjusted OCNLD multiple indicates a range of market value of $62.0 million to $68.0 million for the Wastewater System, similar to the RCNLD of $59.1 million.[10] The aforementioned range of market values for the Wastewater System are not a substitute for an appraisal. However, the referenced range of market values for the Wastewater System can be a meaningful metric to evaluate the reasonableness of other indication of value produced by other valuation methods.

Comparing the results of the OCNLD method and RCNLD method to the benchmark metrics indicates that the value indicated by the OCNLD method of $33.0 million is inconsistent with the benchmark metrics. Therefore, the results of $59.1 million RCNLD method form the basis for our Cost Approach conclusion of $59.1 million ($59,118,924 rounded) and is used as the Cost Approach as part of our fair market value determination for the Wastewater System.

The Income Approach. Capitalizing or discounting a future income stream to a present value provides an indication of the value of a business. The capitalization or discount rate reflects future growth, business risk, economic factors, financial risk, and industry risk of the assets. The theory behind the income approach is that the value of a business is the future economic benefit that ownership will provide.

The two most common methods of the income approach to valuation are the capitalization of earning or cash flow method and the discounted cash flow method ("DCF"). The capitalization of earning method converts a single base economic income number to a value by dividing it by a capitalization rate. The capitalization of earnings is best suited when the future earnings, or cash

10 Similarly, multiplying the Wastewater System's number of customers of 3,895 by the Comparable Group's $10,014-times customer multiple indicates a market value of $39.0 million, similar to the RCNLD of $59.1 million.

flow, can be predicted. The implicit assumption in the capitalization of earning method is that the cash flow is a perpetuity, and the capitalization rate is a constant.

The DCF method uses estimates of future free cash flow and discounts them to arrive at a present value or price of the cash flows. Generally, the DCF analysis begins with an estimate of the Debt Free Net Cash Flow over the next five to twenty years along with a terminal value. In each year, the Debt Free Net Cash Flow is comprised of projected EBIT, minus income taxes, plus projected depreciation, and amortization, plus or minus projected changes in net cash working capital, less projected capital expenditures. The second element of the DCF analysis is the determination of an appropriate discount rate.

The capitalization rate used in the capitalization of earnings method and the discount rate used in the DCF method are related. The discount rate is the opportunity cost rate related to the risk of the cash flows. For the Wastewater System, the appropriate discount rate is the current municipal revenue bond yield on May 20, 2021 of 3.09%. The appropriate IOU discount rate is the current net of tax overall cost of capital (weighted average cost of capital) on May 20, 2021 and ranges from 6.57% to 7.79%.[11] The capitalization rate is simply the discount rate minus the expected growth rate. If no growth is assumed, the capitalization rate is equal to the discount rate.

The capitalization of earnings method is generally a reasonable approach for valuing the Wastewater System as it is currently owned (i.e., non-IOU) and operated. However, change in ownership of the Wastewater System to another large regional municipal authority ("MUNI") or IOU produces a myriad of problems for both the capitalization of earnings method and the DCF

11 Both the American Society of Appraisers, ASA Business Valuation Standards, 2009, and the National Association of Certified Valuation Analysts, Professional Standards, 2007, use the same definition: "Weighted Average Cost of Capital (WACC). The cost of capital (discount rate) determined by the weighted average, at market values, of the cost of all financing sources in the business enterprise's capital structure."

Method because any future cash flow estimates would be hypothetical or estimated due to the uncertain nature that would accompany new ownership including future rates, future expenses, future capital expenditures, taxes, and regulation.

For a MUNI, the appropriate discount rate is the current municipal revenue bond, 3.09%, because debt is the only major source of capital available to finance an acquisition (Exhibit 20, pages 2-6). Although a MUNI likely carries equity on their books (balance sheet), all existing equity is already invested in other assets and therefore, cannot be used to finance an acquisition.[12] For valuation purposes, an embedded cost of debt, or the historical cost of all debt issuances outstanding is not used because this capital is already invested in assets. Whereas the marginal cost of debt, 3.09%, at the valuation date is used in accordance with accepted valuation practices and used for market valuation purposes.

As discussed previously, for an IOU, the appropriate discount rate is the net of tax overall cost of capital (weighted average cost of capital), 6.57% to 7.79% (Exhibit 20, pages 2-8). In this instance, the net of tax overall cost of capital (weighted average cost of capital) is based on the Comparable Group's market value capital structure of 23.9% debt and 76.1% equity, a market cost of debt of 3.37% and a range of market cost of equity of 7.87% to 9.47%.[13] The Comparable Group's net of tax overall cost of capital (weighted average cost of capital) is used as a proxy to conform to the "hypothetical buyer" or "hypothetical seller" of fair market valuation. Use of the buyer's net of tax overall cost of capital (weighted average cost of capital) would produce an

12 For example, when a municipal or government entity, such as the Commonwealth of Pennsylvania, finance construction of a road or bridge, they only consider the marginal debt cost despite having "equity" reflected on their books (balance sheet).

13 For example, see http://www.investinganswers.com/financial-dictionary/financial-statement-analysis/weighted-average-cost-capital-wacc-2905. Also see http://www.wallstreetmojo.com/weighted-average-cost-capital-wacc/ , or http://accountingexplained.com/misc/corporate-finance/wacc .

investment valuation, not a fair market valuation.[14]

We began the Income Approach for the Wastewater System by first determining the Debt Free Net Cash Flow to be capitalized or discounted. The Debt Free Net Cash Flow is comprised of EBIT, minus income taxes, plus depreciation and amortization, plus or minus projected changes in net cash working capital, less projected capital expenditures. The development of Wastewater System's Debt Free Net Cash Flow begins on Exhibit 1 and ends on Exhibits 12 through 16.

Differences in accounting practices exist between GASB, DCED and FASB because there are differences in their purpose. The GASB's and DCED's impetuses are to make sure government entities are accountable for the money they receive from the public or taxpayers, while the FASB's focus is to help investors and creditors make decisions. These differences in accounting objectives between GASB, DCED and FASB can present a problem when it comes to comparing the financial statements of entities that are either publicly or privately owned, such as the Wastewater System and the Comparable Group.

Exhibit 1 presents the Wastewater System's financial information contained in their financial statements, so it is more consistent with the Comparable Group and more practical for valuation purposes. The information on Exhibit 1 was used to develop Exhibits 12 through 16. As noted previously, the Wastewater System's financial statements and their rates did not include taxes nor a fair rate of return. Accordingly, on Exhibits 13 through 16 we adjusted the Wastewater System's post-2020 financial information for pro forma expenses and returns to be reflective of a

14 We did not use the 6.33% Comparable Group's DSIC (distribution system improvement charge) related net of tax overall cost of capital in our valuation because a "hypothetical buyer" cannot finance an acquisition at such a rate and therefore, its use would provide a meaningless result. Where the 6.33% DSIC related cost was determined based the Comparable Group's book value capital structure of 47.4% debt and 52.6% equity, a cost of debt of 3.37% and a DSIC cost of equity of 9.85%. We note the 6.33% Comparable Group's DSIC related net of tax overall cost of capital falls below the 6.57% to 7.79% range of discount rates used in our Income Approach.

MUNI or IOU ownership.

The Capitalization of Earnings Method. The capitalization of earnings method begins with an estimate of the income or cash flow producing capabilities of the business (Exhibit 12) for a recent time period and assumes current ownership and operations. We began the capitalization of earnings method for the Wastewater System by first determining the Debt Free Net Cash Flow to be capitalized. The Debt Free Net Cash Flow is comprised of current EBIT, minus income taxes, plus current depreciation, and amortization, plus or minus projected changes in net cash working capital, less projected capital expenditures. Specifically, our capitalization of earnings method capitalizes Wastewater System's current (2021) budgeted Debt Free Net Cash Flow. The second element of the capitalization of earnings method is the determination of an appropriate capitalization rate. Our analysis uses the current municipal revenue bond yield on May 20, 2021 of 3.09% (Exhibit 12, line 24) as a capitalization rate.

We computed the Wastewater System's indicated value based on the capitalization of earnings method by dividing the projected Debt Free Net Cash Flow by the capitalization factor. The capitalization factor is equal to the discount rate minus assumed growth in projected Debt Free Net Cash Flow. We considered ranges of growth in the capitalization of earnings method. Based on the current level of rates we concluded a no growth scenario is the most probable for the Wastewater System based on current ownership and operations.

Exhibit 12 shows the results of the capitalization of earnings method. For the Wastewater System, the capitalization of earnings method using a 3.09% capitalization rate (no growth) indicates a value of –$30.5 million (without rate increases) due to the existence of negative debt free net cash flow. Negative debt free net cash flow is indicative of a system which requires adjustments to their rates if they plan to remain operational.

The DCF Method. For the Wastewater System, the DCF method considers two types of discounted cash flow analyses, the EBIT and EBITDA terminal value model ("Market Multiple DCF") and the capitalization of terminal value model ("Capitalization DCF"). We show the results of these models on Exhibits 13 through 16.

The DCF method begins with an estimate of the income or cash flow producing capabilities of the business. Specifically, our DCF methods use estimates of the results of the Wastewater System's operations over the next 24 years. We use two different assumptions for the Wastewater System's future operations in the DCF methods: MUNI ownership shown on Exhibits 13 and 15; and IOU ownership shown on Exhibits 14 and 16.

Under the MUNI ownership the discount rate is the current 3.09% municipal revenue bond yield and under the IOU ownership the discount rate is the current net of tax overall cost of capital, reflecting the upper and lower range of the net of tax overall cost of capital for the Comparable Group of 6.57% to 7.79%. For the Capitalization DCF, the capitalization rate reflects a scenario of no additional growth (i.e., discount rate = capitalization rate) and a scenario of minimal growth of 0.2% (i.e., discount rate – 0.2% growth = capitalization rate) under MUNI ownership and 0.2% growth (i.e., discount rate – 0.2% growth = capitalization rate) under IOU ownership based on inflation, changes in Debt Free Net Cash Flows and the projected population growth.

We computed the Market Multiple DCF terminal values by multiplying the Wastewater System's projected EBIT and EBITDA by the Comparable Group's adjusted multiples of 23.5-times and 16.3-times, respectively. We computed the Capitalization DCF terminal value by dividing the projected Debt Free Net Cash Flow by the capitalization factor. The capitalization factor is equal to the discount rate minus assumed growth in projected Debt Free Net Cash Flow.

Exhibit 13 shows the results of the DCF method under the MUNI ownership scenario. The results of the Capitalization DCF shown on Exhibit 13 show a range of value for the Wastewater System of $49.5 million to $51.1 million. The results of the Market Multiple DCF shown on Exhibit 13 show a value of $44.9 million. Collectively, the DCF method based on the MUNI ownership scenario indicates a value of $48.0 million for the Wastewater System based on the 0.2% growth assumption.

Exhibit 14 shows the results of the DCF method under the IOU ownership scenario. The results of the Capitalization DCF shown on Exhibit 14 show a range of value for Wastewater System of $30.3 million to $36.5 million. The results of the Market Multiple DCF shown on Exhibit 14 show a range of value of $38.0 million to $45.0 million. Collectively, the DCF method based on the IOU ownership scenario and a 0.2% growth assumption indicates a value of indicates a value of $37.3 million for the Wastewater System.[15]

The DCF method based on the MUNI ownership scenario indicates a value of $48.0 million and the DCF method based on the IOU ownership scenario indicates a value of $37.3 million. Collectively, the DCF method indicates a value of $42.6 million based on OCNLD.

Change in ownership of the Wastewater System to a MUNI or an IOU produces a myriad of problems for the DCF Method. Under a MUNI purchase, future cash flow estimates are uncertain because they would reflect the actual price paid for the acquisition. Under an IOU purchase and the associated regulation by the PUC, future cash flow estimates are uncertain since

15 If we used the 6.33% Comparable Group's DSIC (distribution system improvement charge) related net of tax overall cost of capital in our valuation shown on Exhibit 14, the results of the Capitalization DCF would show a value for Wastewater System of $37.7 million. Further, the results of the Market Multiple DCF would show a value of $46.5 million and collectively, the DCF method based on the IOU ownership scenario and a 0.2% growth assumption would indicates a value of $42.3 million for the Wastewater System. The DCF method based on the MUNI ownership scenario indicates a value of $48.0 million and the DCF method based on the IOU ownership scenario indicates a value of $42.3 million. Collectively, the DCF method indicates a value of $45.1 million based on OCNLD.

regulation by the PUC would result in an unknown determination of rate base and the related depreciation and authorized/achieved earning levels. In the current instance, we know the Market Approach and the Cost Approach (RCNLD) indicate values considerably higher than the OCNLD value.

Therefore, Exhibits 13 and 14 are recalculated on Exhibits 15 and 16 to reflect revenues and cash flows derived from an earnings base between OCNLD and RCNLD. Exhibit 15 shows the results of the DCF method under the MUNI ownership scenario. The results of the Capitalization DCF shown on Exhibit 15 show a range of value for the Wastewater System of $68.3 million to $70.7 million. The results of the Market Multiple DCF shown on Exhibit 15 show a value of $63.6 million. Collectively, the DCF method based on the MUNI ownership scenario indicates a value of $67.1 million for the Wastewater System based on the 0.2% growth assumption.

Exhibit 16 shows the results of the DCF method under the IOU ownership. The results of the Capitalization DCF shown on Exhibit 16 show a range of value for Wastewater System of $44.4 million to $53.7 million. The results of the Market Multiple DCF shown on Exhibit 16 show a range of value of $56.5 million to $67.2 million. Collectively, the DCF method based on the IOU ownership scenario and a 0.2% growth assumption indicates a value of $55.1 million for the Wastewater System.[16]

16 If we used the 6.33% Comparable Group's DSIC (distribution system improvement charge) related net of tax overall cost of capital in our valuation shown on Exhibit 16, the results of the Capitalization DCF would show a value for Wastewater System of $55.5 million. Further, the results of the Market Multiple DCF would show a value of $69.6 million and collectively, the DCF method based on the IOU ownership scenario and a 0.2% growth assumption would indicates a value of $62.8 million for the Wastewater System. The DCF method based on the MUNI ownership scenario indicates a value of $67.1 million and the DCF method based on the IOU ownership scenario using DSIC indicates a value of $62.8 million. Collectively, the DCF method indicates a value of $65.0 million when DSIC is considered.

The DCF method based on the MUNI ownership scenario indicates a value of $67.1 million and the DCF method based on the IOU ownership scenario indicates a value of $55.1 million. Collectively, the DCF method indicates a value of $61.1 million based on the Income Approach.

The Market Approach. There are two methods of doing the Market Approach to valuation: the market multiples method; and the selected transaction method. We developed both the market multiples method and the selected transaction method in our valuation analysis.

The Market Multiples Method. The market multiples method valuation begins by reviewing market price data of corporations engaged in the same or a similar line of business as the Wastewater System. We relied upon market data for the Comparable Group for these purposes since they are equally affected by similar economic, industry, and business risks as the Wastewater System. Since no marketplace exists for the common stock of the Wastewater System, an alternative to estimate the value of the Wastewater System is to analyze the price investors are willing to pay for the publicly traded common stock of companies that are similar to the Wastewater System. The specific market price data reviewed includes the market value of common equity plus minority interest, preferred stock, and total debt net of cash and cash equivalents (i.e., Enterprise Value). Where the market value of common equity is the product of multiplying the closing stock price by the number of common shares outstanding. The Enterprise Value provides an indication of the value of the entire business. The Enterprise Value multiples ("Market Multiples") are shown on Exhibit 17. For the Comparable Group, the Market Multiples were calculated as of May 20, 2021 based on the latest twelve months of financial data available at the appraisal date.

We used the Comparable Group's Enterprise Value at May 20, 2021 and calculated Market Multiples of: revenue ("Revenue"); EBITDA; EBIT; gross property plant and equipment

("GPPE"); net property plant and equipment ("NPPE"); investor provided capital ("ICAP"); utility customers ("Customers"); and population of the area served ("Population").

The next step in the market multiples method valuation was applying the Comparable Group's Market Multiples to corresponding financial and operating statistics of the Wastewater System. The Comparable Group's Market Multiples reflect their capitalization rate of each financial and operating statistic. For example, a Market Multiple of EBIT of 16.14 times equates to a capitalization of EBIT of 6.20% (1 ÷ 16.14 = 6.20%). Each capitalization rate is unique to the entity and the statistic being evaluated and reflects the growth and investment risk of the entity.

We believe that similar economic, industry and business risks have affected the Comparable Group as those faced by the Wastewater System. However, consideration must be given to the fact that no two companies are exactly alike. On average, the utilities in the Comparable Group are larger than the Wastewater System. The relative size difference between the Comparable Group and Wastewater System suggests that the risk to investors of the Wastewater System is higher than the Comparable Group. Further, based upon our quantitative and qualitative analysis, we concluded that the Wastewater System has more risk than the Comparable Group.

Accordingly, the Comparable Group's Market Multiples are not directly applicable to the Wastewater System. We assumed the higher risk due to the Wastewater System's size is added to the higher risk found in our quantitative and qualitative analysis. This combined risk was assumed to result in the Wastewater System being 20% more risky than the Comparable Group and produces an 80% (100% - 20%) base risk adjustment to the Comparable Group's Market Multiples. We applied the 80% base risk adjustment to all financial multiples. For example, the

Comparable Group's ICAP multiple was multiplied by 80% to produce a lower multiple applicable to the Wastewater System to account for risk differences.

The Comparable Group's Market Multiples of Revenue, EBITDA, and EBIT were adjusted for the base risk adjustment to produce multiples applicable to the Wastewater System (Exhibit 17, page 3). The Comparable Group's Market Multiples of GPPE and NPPE were adjusted for the base risk adjustment and for their percentage of property plant and equipment (Exhibit 17, page 3) financed with "cost free" capital such as contributions because "cost free" capital should not be part of this valuation process. The Comparable Group's Market Multiples of Customers and Population were adjusted for the type of assets of the Wastewater System, earnings rate, and growth.

The net risk adjustments to the Comparable Group's Market Multiples are shown on page 1 of Exhibit 17. The adjustments to the Comparable Group's Market Multiples are: 80% of ICAP (more risk/less growth), 88% of GPPE (more risk/lower growth and contributions), 87% of NPPE (more risk/lower growth and contributions), 80% of Revenue (more risk/lower growth); 80% of EBIT and 80% EBITDA (more risk/lower growth); and 88% of Customers and Population (growth, earning rate, and contributions).

Page 1 of Exhibit 17 shows the market multiples method indicated values based on: Revenue, EBIT and EBITDA (collectivity called "Income Statement Items"); ICAP, GPPE and NPPE (collectivity called "Capital Items"); and Customers and Population (collectivity called "Demographics Items"). For most municipal utilities, the indicated values based on Income Statement Items are far below the indicated values that are based on Capital Items and those based on Demographics Items. We attribute this to the dollars of Revenue, EBIT and EBITDA do not

reflect any provision for taxes while the multiples for the Comparable Group do.[17] Consequently, we do not believe the results of the multiples of Revenue, EBIT and EBITDA are meaningful and should not be used for municipal utilities.

In the market multiples method, the meaningful Market Multiples of the Comparable Group are used to develop an indicated value of the Wastewater System. This is accomplished by multiplying the Wastewater System's financial and operating data by the Comparable Group's median Market Multiples (Exhibit 17, page 1). The results of the market multiples method (Exhibit 17, page 1) show a range of value for the Wastewater System of $36.6 million to $62.1 million and collectively, indicate value of $49.3 million based on the meaningful Market Multiples.

The Selected Transactions Method. The selected transactions method entails analyzing certain public information relating to selected transactions involving the purchase or sales of businesses involved in the same or similar business line. The number of selected transactions available for review is limited because most acquisitions in the water and wastewater industry involve small acquisitions for which no public information exits. Additionally, not all transactions are comparable since some purchase prices may only involve the acquisition of the common stock, purchase prices may be net of cash and others may only involve assets. In any of these instances, the derived multiples (e.g., purchase price as a multiple of: Revenues; EBITDA; EBIT; etc.) would understate (overstate) the multiples involving a purchase price for an entire business enterprise (common stock) or business assets.

17 The Revenue, EBIT and EBITDA for the Wastewater System also do not include a fair rate of return.

The selected transactions method provides a valuation of a business, or assets, at the time the acquisition of that business was completed, rather than the appraisal date market value (May 20, 2021). The change in the Comparable Group's market multiples of NPPE and ICAP, shown in Figure 1, shows the change in market valuation over a recent 72-month period. In Figure 1 the Comparable Group's market multiples of NPPE and ICAP were indexed to May 20, 2021 valuation multiples so that the May 20, 2021 valuation multiples have an index value of 100.

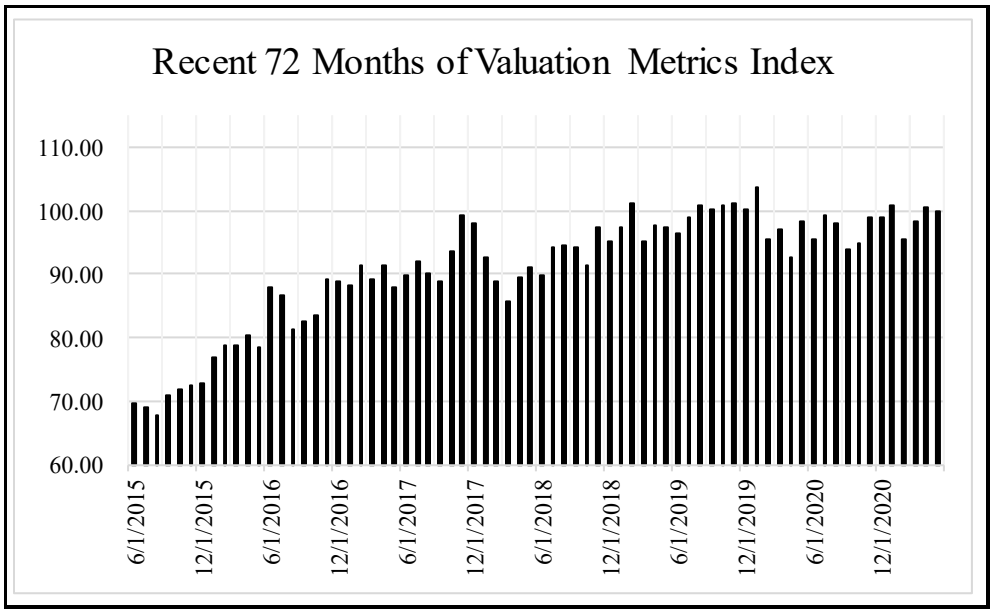

Figure 1

The index of the Comparable Group's appraisal date (May 20, 2021) valuation multiples is 4% above the 2021's lowest levels and 1% below 2021's highest levels and 7% above the 2020's lowest levels and 4% below 2020's highest levels. The index of the Comparable Group's May 20, 2021 valuation multiples is 7% higher than 2019's lowest levels and 1% below 2019's highest levels, are 14% higher than 2018's lowest levels and 3% above 2018's highest levels, are 14% to higher than 2017's lowest levels and 1% above 2017's and are 11% to 23% higher than 2016's multiples' index.

Because of the rapid rise in valuation multiples since early 2016 we limited our search for selected transactions to: (1) those that occurred in 2016 or later; (2) purchases of water or sewer systems; (3) assets being purchased; and (4) those that did not discount "cost free" capital/customer contributions in the valuation. The selected transactions that met the stated selection criteria are shown on pages 2 and 3 of Exhibit 18.

Using certain public information, we calculated sales price multiples of selected transactions involving the purchase or sale of businesses that met the stated selection criteria. The calculated sales price multiples included transactions multiples of: ICAP; GPPE; NPPE; Revenue; EBITDA; EBIT; Customers; and Population. As shown on pages 2 and 3 of Exhibit 18, the selected transactions method indicated values based on the Income Statement Items are far different than the Wastewater System's selected transactions method indicated values based on Capital Items and those based on Demographics Items. We attribute this to the fact the selling utilities' dollars of Income Statement Items do not reflect any provision for taxes.[18] Consequently, we do not believe the results of the multiples of Income Statement Items are meaningful.

The selected transaction method relies on and reflects information that was known, ex-ante, at the time the winning purchase bid (price) was offered, and the metrics used are time period sensitive. For example, bids made in 2016 only reflects metrics from 2015 since the results of 2016 could not be known at the time of the bids. The selected transaction method ex-ante information (metrics) is shown on page 2 of Exhibit 18. Complete information only exists for a few of the transactions, with only Customers and Population having ample data for all transactions

18 Further, Revenue, EBIT and EBITDA for the Wastewater System also do not include a fair rate of return.

as is evident from the information shown (Exhibit 18, page 2). Therefore, we supplemented the ex-ante data with ex-post information of GPPE and NPPE (collectivity called "Asset Items") as shown on page 3 of Exhibit 18.

In the selected transactions method, the significant selected transactions multiples of the selling utilities are used to develop an indicated value of the Wastewater System. This is accomplished by multiplying the Wastewater System's financial and operating data by the selling utilities' transactions multiples (Exhibit 18, pages 2 and 3). The results of the selected transactions method (Exhibit 18, page 1) show a range of value for the Wastewater System of $35.5 million to $63.2 million when all transactions are considered and a range of value of $19.2 million to $58.7 million when mostly collection/distribution assets are solely considered. Collectively, the selected transactions method indicates a value of $44.1 million after giving additional weight to the collection/distribution assets selected transactions multiples.

In 2018 two IOUs, Connecticut Water Service, Inc and SJW Group, announced a planned merger with Connecticut Water being acquired by SJW through a stock purchase. SJW Group's purchase of Connecticut Water was approved in late 2019. Although this acquisition is not directly applicable to the Wastewater System, it does provide a range of indicated value for the Wastewater System (Exhibit 18, page 4) which we relied on as a check. In this selected transaction, the significant selected transactions multiples of the selling utilities (Connecticut Water) are used to develop an indicated value of the Wastewater System. This is accomplished by multiplying the Wastewater System's financial and operating data by the selling utilities' transactions multiples. The results of the Connecticut Water selected transactions show a range of value for the Wastewater System of $50.3 million when the reported significant selected transactions multiples are considered and a value of $56.1 million when the reported significant

selected transactions multiples have been adjusted for "cost free" capital. Since the Connecticut Water transaction was a stock transaction, we believe it may understate the value of an asset purchase. However, we also note that Connecticut Water was a fully integrated company, was publicly traded which the Wastewater System is not, and therefore, may overstate the value of the Wastewater System.

The results of the market multiples method shown on Exhibit 17 indicate value of $49.3 million. The results of the selected transactions method shown on Exhibit 18 indicate value of $44.1 million. Based on the aforesaid results, the Market Approach to valuation indicates a value of $46.7 million for the Wastewater System based on the results of the market multiples method and the selected transactions method.

Conclusion. We summarize our findings for the Wastewater System on Exhibit 19. Our finding for the Wastewater System is based on the Cost, Market, and Income Approaches to valuation. We used seven methods under the Cost, Market, and Income Approaches to valuation: Original Cost Method, Replacement Cost Method, Capitalization of Earnings Method, Market Multiple Discounted Cash Flow Method, Capitalization Discounted Cash Flow Method, Market Multiples Method, and the Selected Transactions Method.

The results from the market multiple discounted cash flow method and the capitalization discounted cash flow method form the basis for our Income Approach. Our Market Approach is supported by the market multiples method and selected transactions method. The results from the original cost method form the basis for our replacement cost method, and both methods form the basis for our Cost Approach.

We considered the results of each approach as an indicator of value individually, or as independent indicators of value. Therefore, all three approaches to valuation were given

consideration in arriving at our estimate of the fair market value conclusion. Based on these facts, our conclusion regarding the fair market value is $55.7 million. Our conclusion regarding the fair market value can be described by the weights and the specific results of the three approaches to valuation that are shown on Exhibit 19. The results of our analyses, shown on Exhibit 19, indicate a range of value for the Wastewater System of $46.7 million to $61.1 million and collectively indicate a fair market value of $55,668,000 for the Wastewater System.

APPENDIX A - QUALIFICATIONS

APPENDIX A

Professional Qualifications
of
Harold Walker, III
Manager, Financial Studies
Gannett Fleming Valuation and Rate Consultants, LLC.

EDUCATION

Mr. Walker graduated from Pennsylvania State University in 1984 with a Bachelor of Science Degree in Finance. His studies concentrated on securities analysis and portfolio management with an emphasis on economics and quantitative business analysis. He has also completed the regulation and the rate-making process courses presented by the College of Business Administration and Economics Center for Public Utilities at New Mexico State University. Additionally, he has attended programs presented by The Institute of Chartered Financial Analysts (CFA).

Mr. Walker was awarded the professional designation "Certified Rate of Return Analyst" (CRRA) by the Society of Utility and Regulatory Financial Analysts. This designation is based upon education, experience, and the successful completion of a comprehensive examination. He is also a member of the Society of Utility and Regulatory Financial Analysts (SURFA) and has attended numerous financial forums sponsored by the Society. The SURFA forums are recognized by the Association for Investment Management and Research (AIMR) and the National Association of State Boards of Accountancy for continuing education credits.

Mr. Walker is also a licensed Municipal Advisor Representative (Series 50) by Municipal Securities Rulemaking Board (MSRB) and Financial Industry Regulatory Authority (FINRA).

BUSINESS EXPERIENCE

In 1996, Mr. Walker joined Gannett Fleming Valuation and Rate Consultants, LLC. In his capacity as Manager, Financial Studies and for the past 25 years, he has continuously studied rates of return requirements for regulated firms. In this regard, he supervised the preparation of rate of return studies in connection with his testimony and in the past, for other individuals. He also assisted and/or developed dividend policy studies, nuclear prudence studies, calculated fixed charge rates for avoided costs involving cogeneration projects, financial decision studies for capital budgeting purposes and developed financial models for determining future capital requirements and the effect of those requirements on investors and ratepayers, valued utility property and common stock for acquisition and divestiture, and assisted in the private placement of fixed capital securities for public utilities.

Head, Gannett Fleming GASB 34 Task Force responsible for developing Governmental Accounting Standards Board (GASB) 34 services and educating Gannett Fleming personnel and

Gannett Fleming clients on GASB 34 and how it may affect them. The GASB 34 related services include inventory of assets, valuation of assets, salvage estimation, annual depreciation rate determination, estimation of depreciation reserve, asset service life determination, asset condition assessment, condition assessment documentation, maintenance estimate for asset preservation, establishment of condition level index, geographic information system (GIS) and data management services, management discussion and analysis (MD&A) reporting, required supplemental information (RSI) reporting, auditor interface, and GASB 34 compliance review.

In 2004, Mr. Walker was elected to serve on the Board of Directors of SURFA. Previously, he served as an ex-officio directors as an advisor to SURFA's existing President. In 2000, Mr. Walker was elected President of SURFA for the 2001-2002 term. Prior to that, he was elected to serve on the Board of Directors of SURFA during the period 1997-1998 and 1999-2000. Currently, he also serves on the Pennsylvania Municipal Authorities Association, Electric Deregulation Committee.

Prior to joining Gannett Fleming Valuation and Rate Consultants, LLC., Mr. Walker was employed by AUS Consultants - Utility Services. He held various positions during his eleven years with AUS, concluding his employment there as a Vice President. His duties included providing and supervising financial and economic studies on behalf of investor owned and municipally owned water, wastewater, electric, natural gas distribution and transmission, oil pipeline and telephone utilities as well as resource recovery companies.

Mr. Walker was also the Publisher of C.A. Turner Utility Reports from 1988 to 1996. C.A. Turner Utility Reports is a financial publication which provides financial data and related ratios and forecasts covering the utility industry. From 1993 to 1994, he became a contributing author for the Fortnightly, a utility trade journal. His column was the Financial News column and focused mainly on the natural gas industry.

EXPERT TESTIMONY

Mr. Walker has submitted testimony or been deposed on various topics before regulatory commissions and courts in 26 states including: Arizona, California, Colorado, Connecticut, Delaware, Hawaii, Idaho, Illinois, Indiana, Kentucky, Maryland, Massachusetts, Michigan, Missouri, New Hampshire, Nevada, New Jersey, New York, North Carolina, Oklahoma, Pennsylvania, Rhode Island, South Carolina, Vermont, Virginia, and West Virginia. His testimonies covered various subjects including: fair market value, the taking of natural resources, appropriate capital structure and fixed capital cost rates, depreciation, fair rate of return, purchased water adjustments, synchronization of interest charges for income tax purposes, valuation, cash working capital, lead-lag studies, financial analyses of investment alternatives, benchmarking, and fair value.

APPENDIX B - KNOWN IMPACT OF COVID-19

APPENDIX B

Known Impact of COVID-19

On March 11, 2020, the World Health Organization ("WHO") declared a quickly spreading coronavirus infection a pandemic ("COVID-19"). A coronavirus is a kind of common virus that causes an infection in sinuses, or upper throat. An outbreak of a new strain of coronavirus was first reported in Wuhan, China in late 2019 and quickly spread around the world. The WHO named the virus SARS-CoV-2, and the disease COVID-19. A pandemic is a disease outbreak that spreads widely across countries or continents. Categorizing a disease as a pandemic does not signify lethality nor economic calamity. Rather, labeling a disease as a pandemic indicates its spread over a wide geographic area and affecting a high proportion of the population.

The valuation date (May 20, 2021) is the specific date at which the value of the Wastewater System is based. Generally, only the circumstances existing at the valuation date and events occurring up to the valuation date are considered. Events which could affect the value may occur after the valuation date but have no bearing on an appraised value.

Nevertheless, we have included subsequent information since the valuation date in this appendix (Appendix B) regarding COVID-19's known impact for informational purposes only and this information does not affect the determination of value as of our valuation date of May 20, 2021.

The United States Environmental Protection Agency ("EPA") is providing information on drinking water and wastewater to provide clarity to the public regarding COVID-19. According to EPA, the COVID-19 virus has not been detected in drinking-water supplies. Based on current

evidence, the risk to water supplies is low.[19] EPA has also stated that wastewater treatment plants treat the COVID-19 virus, "wastewater treatment plants treat viruses and other pathogens. Coronavirus, which causes COVID-19, is a type of virus that is particularly susceptible to disinfection. Standard treatment and disinfectant processes at wastewater treatment plants are expected to be effective."[20] EPA sent a "letter to Governors in all 50 states, territories, tribes and Washington, DC, requesting that water and wastewater workers, as well as the manufacturers and suppliers who provide vital services and materials to the water sector, are considered essential workers and businesses by state authorities when enacting restrictions to curb the spread of COVID-19."[21]

In response to COVID-19 the Federal Reserve has provided monetary and fiscal stimulus to increase liquidity in the form of new fiscal stimulus programs and rate cuts. "For context, new fiscal stimulus and total fiscal deficits in the US are roughly double the levels seen in 2008-2009, and the US fiscal deficit we project for 2020 of 15%-18% is only matched by deficits seen at the height of WWII in 1942-1943."[22] The combined result of these actions by the Federal Reserve and investors' flight to quality have resulted in artificial and historically low risk-free rates as measured by the 30-year treasury bond yield. Public utility bond yields have not fluctuated to the degree which yields of 30-year treasury bonds have. This is evident by the initial widening of the yield spread or default spread shown in **Table 3** (below) from pre-COVID-19 levels compared to the 30-year treasury bond yield low of 0.99% on March 9, 2000. Recently, the yield spread, or default spread, has returned much closer to the pre-COVID-19 levels.

Table 3

Before the COVID-19 pandemic the previous all-time market high for the S&P 500 Index occurred on February 19, 2020. After February 19, 2020, the COVID-19 pandemic resulted in large-scale economic shutdowns, produced widespread stock market turbulence, and generally resulted in decreased financial asset prices for some sectors of the economy. As a result, by March 23, 2020 the S&P 500 index had decline by 34% from its February 19, 2020 peak. More recently, between May 20, 2021 and June 22, 2021, the S&P 500 Index reached several new all-time highs and is currently 90% above its March 23, 2020 closing price. During this entire period of widespread stock market turbulence, the asset prices reflected in water utility and wastewater utility market valuations have remained relatively steady as demonstrated by the Comparison

Group's market multiples shown in **Table 4** below.[23]

	Water Utility Comparsion Group Enterprise Value as a Multiple of

Table 4

Even though most of the US may likely be affected by COVID-19's related economic effects, we believe those effects will vary greatly from place-to-place dependent on the nature of

23 The first six spot dates and the related multiples shown in the market multiples Table 4 were taken from recent Gannett Fleming appraisals filed with the PA PUC.

the business sectors which comprise each local economy and their concentration within the local economy. We do not believe the appraised value of the long-lived Wastewater System assets will be materially impacted by the COVID-19 or its related relatively short-term events. The Wastewater System's customer base is not heavily dependent on customers from sectors of the economy providing tourism and travel, employment services, mining/oil and gas (energy), and leisure and hospitality which have been most impacted by COVID-19's related short-term events. Therefore, even on a short-term basis, the Wastewater System's revenues and cash flows should not be materially impacted on a relative basis.

COMPLIANCE & APPRAISAL CERTIFICATION

Compliance with Uniform Standards of Professional Appraisal Practice (USPAP) 2020-2021

Fulfillment of Requirements for a Personal Property Appraisal and Report

- **State the identity of the client and any intended users, by name or type:**

  The client is Aqua Pennsylvania Wastewater, Inc. The intended users of the valuation are Aqua Pennsylvania Wastewater, Inc., and the Pennsylvania Public Utility Commission.

- **State the intended use of the appraisal**

  The intended use of the valuation is to comply with 66 Pa. C.S. Section 1329, Valuation of Acquired Water and Wastewater Systems and conduct a fair market value appraisal of East Whiteland Township's Wastewater System assets in compliance with the Uniform Standards of Professional Appraisal Practices, employing the cost, market, and income approaches.

- **Describe information sufficient to identify the property, real, personal, and intangible, involved in the appraisal, including the physical and economic property characteristics relevant to the assignment.**

  East Whiteland Township owns and operates the Wastewater System which consists of 12 pump stations, about 329,072 linear feet of mains, approximately 1,506 manholes, associated infrastructure and appurtenances, and related land and land rights. The Wastewater System accepts flows and collects sewer rental fees from the adjoining municipalities of East Goshen Township, Charlestown Township and Malvern Borough. The Wastewater System, in turn, pays sewer rental fees to neighboring Tredyffrin Township and East Goshen Township, and a public utility company for conveyance and to the Valley Forge Sewer Authority Wastewater Treatment Plant for which the Township has purchased capacity.

  The Wastewater System's 12 pump stations are: Deer Run; Flat Road; Hillbrook Circle; King Road; Lapp Road; Lee Boulevard; Malvern Hunt; Meadowview; Mill Lane; Planebrook Road; Westgate; and Wilburdale. The Wastewater System has approximately 26,300 linear feet of force mains ranging in size from 4 to 14 inches diameter and were installed between 1976 to 2017. The force mains consist of asbestos-cement ("ACP"), ductile iron ("DIP") and polyvinyl chloride ("PVC") pipe.

  The Wastewater System's 302,772 linear feet of gravity sewer collection mains consist of 8-inch, 10-inch, 12-inch, 15-inch, 16-inch, 18-inch, 20-inch, 24-inch, 27-inch and 36-inch diameter pipe which was installed between 1951 to 2020. About 41% of the gravity mains were installed in the 1970s, 27% between 1980 and 1999,

and 21% after 1999. The mains consist of ACP, cast iron ("CIP"), corrugated steel ("CSP"), DIP and PVC pipe. There are 1,506 manholes and 3,895 service laterals in the system.

East Whiteland Township's Wastewater System land and land rights include land used for wastewater collection and transmission, about 63 miles of mains, 12 pump stations and multiple easements and rights-of-way necessary to operate the Wastewater System.

- **State the type and definition of value and cite the source of the definition, including whether the opinion of value is in terms of cash or of financing terms equivalent to cash, or based on non-market financing or financing with unusual conditions or incentives**

  Fair market value is defined as:

  > "The price, expressed in terms of cash equivalents, at which property would change hands between a hypothetical willing and able buyer and a hypothetical willing and able seller, acting at arm's length in an open and unrestricted market, when neither is under compulsion to buy or sell and when both have reasonable knowledge of the relevant facts." The International Glossary of Business Valuation Standards

- **State the effective date of the appraisal and the date of the report**

  The effective date of the appraisal is as of May 20, 2021 and the appraisal report date is June 2021.

- **Describe sufficient information to disclose to the client and any other intended users of the appraisal the scope of work used to develop the appraisal**

  Conduct a fair market value appraisal of the East Whiteland Township's Wastewater System assets in compliance with the Uniform Standards of Professional Appraisal Practices, employing the cost, market, and income approaches.

  The premise of value is going concern and the assets are valued as a group under the premise that they collectively comprise an ongoing operating business enterprise.

We accepted all information and data provided by the East Whiteland Township and Aqua Pennsylvania Wastewater, Inc. as it pertains to this assignment "as is" after a limited review. That is, we neither audited nor verify any data, original cost data, financial records or operating data provided for this assignment.

The appraisal considered all three approaches to value: the cost, income and market. Briefly the scopes of work for each are as follows:

The cost approach utilized the original cost method and replacement cost method. The reproduction cost method was calculated by trending (trended cost method) the asset inventory developed by Pennoni Associates Inc. from its original cost new inventory. The original cost method determined the original cost new measure of the cost of the assets when first constructed. The original cost new inventory was trended using the Handy Whitman Index of Public Utility Construction Costs for the water industry to produce the reproduction cost new and converted to replacement cost new after obsolescence was factored. The calculated accrued depreciation was determined for the original cost new and for the replacement cost new. The calculated accrued depreciation was based on the assets' attained ages, and the service life of the assets. The cost basis of depreciable assets was reduced annually by the accumulated depreciation to reflect the loss in the service value of the assets since being constructed. All land and land rights were valued at original cost.

Income Approach - The income approach utilized the capitalization of earning (cash flow) method and the discounted cash flow method. The capitalization of earning method converted a single base economic income number to a value by dividing it by a capitalization rate. The discounted cash flow method used estimates of future debt free net cash flow and discounted them to arrive at a present value or price of the cash flows. The capitalization rate and the discount rate were developed based on market debt and equity rates at the appraisal date. The discounted cash flow method reflected two types of discounted cash flow analyses, the EBIT and EBITDA terminal value model and a capitalization of terminal value model.

Market Approach - The market approach was developed based on the market multiples method and the selected transaction method. The market multiples method was based on the market price data of publicly traded corporations engaged in the same or a similar line of business as the Wastewater System. The market price data of these comparable publicly traded corporations was used to calculate the market multiples for the comparable publicly traded corporations at the appraisal date. The selected transactions method used certain public information relating to the purchase or sales of businesses involved in the same or a similar business line as the Wastewater System to calculated market multiples at the time

of transaction (sale/purchase). The calculated market multiples determined by the market multiples method and the selected transaction method were then multiplied by the corresponding the Wastewater System financial and operating statistic to produce an indicated value for the Wastewater System.

Reconciliation of the Valuation Approaches - The fair market value conclusion was based on reconciliation of each of the three approaches to value and the intended purpose of the appraisal.

- **Clearly and conspicuously:**
  - **State all extraordinary assumptions and hypothetical conditions;**

    There were no extraordinary assumptions required or hypothetical conditions in this appraisal.

  - **State that their use might have affected the assignment results**

    Not applicable.

- **Clearly and accurately disclose all assumptions, extraordinary assumptions, hypothetical conditions, and limiting conditions used in the assignment**

  Not applicable.

- **Describe the information analyzed, the appraisal procedures followed, and the reasoning that supports the analyses, opinions, and conclusions**

  See scope of work above.

- **State the use of the real estate existing as of the date of value and the use of the real estate reflected in the appraisal**

  East Whiteland Township's Wastewater System land and land rights include land used for wastewater collection and transmission, about 63 miles of mains, 12 pump stations and and multiple easements and rights-of-way necessary to operate the Wastewater System.

The East Whiteland Township Wastewater System's land and land rights were assumed to be used for the operation of the Wastewater System for the appraisal.

- **State and describe the support and rationale for the appraiser's opinion of the highest and best use of the real estate**

  All land and land rights were assumed to be used for the operation of the Wastewater System for the appraisal, were valued at original cost, and not at highest and best use of the real estate.

- **State and explain any permitted departures from specific requirements of STANDARD 1 and the reason for excluding any of the usual valuation approaches. The appraisal then becomes a limited appraisal - a limited appraisal report must contain a prominent section that clearly identifies the extent of the appraisal process performed and the departures taken**

  No departures for Standard 1 were made.

- **Include a signed certification in accordance with Standards Rule 2-3**

  See attached for signed certification.

Income Approach
East Whiteland Township Wastewater System Assets
Pro Forma Operations
Earnings Capitalization Model

Notes: (1) Assumptions:

Charges for services - Pre-2022 are actual or budget. Post-2021 based on customer growth (EDU) and average revenue per customer.

OPERATING EXPENSES - increase at 2.5% annually after 2021 unless noted elsewhere. Assumed economies of scale are shown on lines below.

(2) Depreciation - Pre-2022 based on actual depreciation rate plus same rate on half of CAPX. Post-2021 based on depreciation rate plus same rate on half of CAPX.

(3) Line 5.

(4) Line 12 + line 10.

(5) Line 12.

(6) Capital Expenditures - Pre-2028 based on financials/budget. Post-2027 years are estimates at 1.63% of prior year-end GROSS Property, plant and equipment.

(7) Changes in Working Capital - based on water industry 0.21% of revenues.

(8) Discount rate is the the current MUNI discount rate. Capitalization rate (K) at 5/20/2021 equal to discount rate, where capitalization rate = K - g.

(9) Discount rate is the current MUNI discount rate. Capitalization rate (K) at 5/20/2021 adjusted for stated growth (g) where capitalization rate = K - g.

(10) Final year shown, line 22.

Terms:

CAPX - Capital Expenditures
CIP - Capital improvement plan
Dep - Depreciation expense
GROSS PPE - GROSS Property, plant and equipment
IOU - Investor owned utility
MUNI - Large regional municipally owned utility
NET PPE - NET Property, plant and equipment

Income Approach
East Whiteland Township Wastewater System Assets
Pro Forma and Estimted Operations With MUNI Ownership
DCF With Capitalization of Terminal Value Model and
DCF With EBIT & EBITDA Terminal Value Model

Notes: (1) Assumptions:

Charges for services - Pre-2022 are actual or budget. Post-2021 based on customer growth (EDU) and average revenue per customer. Rate increases (Other rate increase line item) are added year after they occur.

Other (Rate Increase) - Assumed purchase by MUNI at end of 2021 with shown rate increases.

OPERATING EXPENSES - increase at 2.5% annually after 2021 unless noted elsewhere. Assumed economies of scale are shown on lines below.
Wages & Benefits - Post-2021 assumed 15% savings due to economies of scale. Increase at 2.5% afterwards.

Professional Services - Post-2021 assumed 50% savings due to economies of scale. Increase at 2.5% afterwards.

No Additional O&M.

(2) Depreciation - Pre-2022 based on actual depreciation rate plus same rate on half of CAPX. Post-2021 based on depreciation rate plus same rate on half of CAPX.

(3) Line 6.

(4) Line 18 + line 16.

(5) Line 18.

(6) Capital Expenditures - Pre-2028 based on financials/budget. Post-2027 years are estimates at 1.63% of prior year-end GROSS Property, plant and equipment.

(7) Changes in Working Capital - based on water industry 0.21% of revenues.

(8) Discount rate is the the current MUNI discount rate. Capitalization rate (K) at 5/20/2021 equal to discount rate, where capitalization rate = K - g.

(9) Discount rate is the current MUNI discount rate. Capitalization rate (K) at 5/20/2021 adjusted for stated growth (g) where capitalization rate = K - g.

(10) Final year shown, line 28.

(11) Final year shown, line 30.

(12) Final year shown, line 30.

(13) Developed on Market Multiples EXHIBIT 17.

Terms:

CAPX - Capital Expenditures
CIP - Capital improvement plan
Dep - Depreciation expense
GROSS PPE - GROSS Property, plant and equipment
IOU - Investor owned utility
MUNI - Large regional municipally owned utility
NET PPE - NET Property, plant and equipment

Income Approach
East Whiteland Township Wastewater System Assets
Pro Forma and Estimted Operations With IOU Ownership
DCF With Capitalization of Terminal Value Model and
DCF With EBIT & EBITDA Terminal Value Model

Notes: (1) Assumptions:

Charges for services - Pre-2022 are actual or budget. Post-2021 based on customer growth (EDU) and average revenue per customer. Rate increases (Other rate increase line item) are added year after they occur.

Other (Rate Increase) - Assumed purchase by IOU at end of 2021 with shown rate increases.

OPERATING EXPENSES - increase at 2.5% annually after 2021 unless noted elsewhere. Assumed economies of scale are shown on lines below.
Wages & Benefits - Post-2021 assumed 15% savings due to economies of scale. Increase at 2.5% afterwards.

Professional Services - Post-2021 assumed 50% savings due to economies of scale. Increase at 2.5% afterwards.

No Additional O&M.

PURTA & Reg Assessment - 2021 assumed due to IOU purchase at the end of 2020.

(2) Depreciation - Pre-2022 based on actual depreciation rate plus same rate on half of CAPX. Post-2021 based on depreciation rate plus same rate on half of CAPX.

(3) Line 6.

(4) Line 19 + line 17.

(5) Line 19.

(6) Capital Expenditures - Pre-2028 based on financials/budget. Post-2027 years are estimates at 1.63% of prior year-end GROSS Property, plant and equipment.

(7) Changes in Working Capital - based on water industry 0.21% of revenues.

(8) Discount rate is the current lower end of the IOU discount rate. Capitalization rate (K) at 5/20/2021 adjusted for stated growth (g) where capitalization rate

(9) Discount rate is the current upper end of the IOU discount rate. Capitalization rate (K) at 5/20/2021 adjusted for stated growth (g) where capitalization rate

(10) Final year shown, line 29.

(11) Final year shown, line 31.

(12) Final year shown, line 33.

(13) Developed on Market Multiples EXHIBIT 17.

Terms:

CAPX - Capital Expenditures
CIP - Capital improvement plan
Dep - Depreciation expense
GROSS PPE - GROSS Property, plant and equipment
IOU - Investor owned utility
MUNI - Large regional municipally owned utility
NET PPE - NET Property, plant and equipment

Income Approach
East Whiteland Township Wastewater System Assets
Pro Forma and Estimted Operations With MUNI Ownership
DCF With Capitalization of Terminal Value Model and
DCF With EBIT & EBITDA Terminal Value Model

Notes: (1) Assumptions:

Charges for services - Pre-2022 are actual or budget. Post-2021 based on customer growth (EDU) and average revenue per customer. Rate increases (Other rate increase line item) are added year after they occur.

Other (Rate Increase) - Assumed purchase by MUNI at end of 2021 with shown rate increases.

OPERATING EXPENSES - increase at 2.5% annually after 2021 unless noted elsewhere. Assumed economies of scale are shown on lines below.
Wages & Benefits - Post-2021 assumed 15% savings due to economies of scale. Increase at 2.5% afterwards.

Professional Services - Post-2021 assumed 50% savings due to economies of scale. Increase at 2.5% afterwards.

No Additional O&M.

(2) Depreciation - Pre-2022 based on actual depreciation rate plus same rate on half of CAPX. Post-2021 based on depreciation rate plus same rate on half of CAPX.

(3) Line 6.

(4) Line 18 + line 16.

(5) Line 18.

(6) Capital Expenditures - Pre-2028 based on financials/budget. Post-2027 years are estimates at 1.60% of prior year-end GROSS Property, plant and equipment.

(7) Changes in Working Capital - based on water industry 0.21% of revenues.

(8) Discount rate is the the current MUNI discount rate. Capitalization rate (K) at 5/20/2021 equal to discount rate, where capitalization rate = K - g.

(9) Discount rate is the current MUNI discount rate. Capitalization rate (K) at 5/20/2021 adjusted for stated growth (g) where capitalization rate = K - g.

(10) Final year shown, line 28.

(11) Final year shown, line 30.

(12) Final year shown, line 30.

(13) Developed on Market Multiples EXHIBIT 17.

Terms:

CAPX - Capital Expenditures
CIP - Capital improvement plan
Dep - Depreciation expense
GROSS PPE - GROSS Property, plant and equipment
IOU - Investor owned utility
MUNI - Large regional municipally owned utility
NET PPE - NET Property, plant and equipment

Income Approach
East Whiteland Township Wastewater System Assets
Pro Forma and Estimted Operations With IOU Ownership
DCF With Capitalization of Terminal Value Model and

Income Approach
East Whiteland Township Wastewater System Assets
Pro Forma and Estimted Operations With IOU Ownership
DCF With Capitalization of Terminal Value Model and
DCF With EBIT & EBITDA Terminal Value Model

Notes: (1) Assumptions:

Charges for services - Pre-2022 are actual or budget. Post-2021 based on customer growth (EDU) and average revenue per customer. Rate increases (Other rate increase line item) are added year after they occur.

Other (Rate Increase) - Assumed purchase by IOU at end of 2021 with shown rate increases.

OPERATING EXPENSES - increase at 2.5% annually after 2021 unless noted elsewhere. Assumed economies of scale are shown on lines below.
Wages & Benefits - Post-2021 assumed 15% savings due to economies of scale. Increase at 2.5% afterwards.

Professional Services - Post-2021 assumed 50% savings due to economies of scale. Increase at 2.5% afterwards.

No Additional O&M.

PURTA & Reg Assessment - 2021 assumed due to IOU purchase at the end of 2020.

(2) Depreciation - Pre-2022 based on actual depreciation rate plus same rate on half of CAPX. Post-2021 based on depreciation rate plus same rate on half of CAPX.

(3) Line 6.

(4) Line 19 + line 17.

(5) Line 19.

(6) Capital Expenditures - Pre-2028 based on financials/budget. Post-2027 years are estimates at 1.60% of prior year-end GROSS Property, plant and equipment.

(7) Changes in Working Capital - based on water industry 0.21% of revenues.

(8) Discount rate is the current lower end of the IOU discount rate. Capitalization rate (K) at 5/20/2021 adjusted for stated growth (g) where capitalization rate

(9) Discount rate is the current upper end of the IOU discount rate. Capitalization rate (K) at 5/20/2021 adjusted for stated growth (g) where capitalization rate

(10) Final year shown, line 29.

(11) Final year shown, line 31.

(12) Final year shown, line 33.

(13) Developed on Market Multiples EXHIBIT 17.

Terms:

CAPX - Capital Expenditures
CIP - Capital improvement plan
Dep - Depreciation expense
GROSS PPE - GROSS Property, plant and equipment
IOU - Investor owned utility
MUNI - Large regional municipally owned utility
NET PPE - NET Property, plant and equipment

Aqua America's Pennsylvania Subsidiary Enters Agreement to Purchase Cheltenham Township Wastewater System

July 02, 2018 07:00 AM Eastern Daylight Time

BRYN MAWR, Pa.--(BUSINESS WIRE)--Aqua America announced today that its Pennsylvania subsidiary has signed an asset purchase agreement with Cheltenham Township to purchase its wastewater system, which serves approximately 10,500 connections in Montgomery County, for $50.25 million. The agreement must be approved by the Pennsylvania Public Utility Commission.

The transaction will be Aqua Pennsylvania's fourth acquisition application referred to the Pennsylvania PUC since Act 12, commonly referred to as fair market value legislation, was enacted last year. Aqua Pennsylvania has asset purchase agreements with the 2,100-customer New Garden Township wastewater system in Chester County and the 5,400-customer Limerick Township wastewater system in Montgomery County. The company also has an agreement, signed in December 2017, with East Bradford Township in Chester County to purchase its 1,200-customer wastewater collection system. Aqua already provides water service to East Bradford, as it does with Cheltenham.

These four systems, including Cheltenham, total more than 19,000 wastewater connections and would nearly double Aqua Pennsylvania's current 22,000-customer wastewater operation.

The new law encourages a consolidation of the fragmented industry for the benefit of customers, the environment, and local governments. This transaction will benefit customers by leveraging compliance expertise, purchasing power gained through economies of scale and operational efficiencies to ultimately benefit service to our customers at affordable rates.

"We are pleased with the momentum we are gaining to reach agreements with municipal systems," said Aqua America Chairman and CEO Christopher Franklin. "Act 12 is having its intended impact, allowing municipalities to be compensated for the fair value of their water and wastewater assets and enabling utility professionals to bring expertise to systems in need."

Aqua Pennsylvania President Marc Lucca says his team is ready to work with the Cheltenham community on making needed system improvements.

"As with our pending agreements with New Garden, East Bradford and Limerick, the Aqua Pennsylvania team is looking forward to assuming Cheltenham's sewer utility responsibilities so the township can direct its attention and capital to other priorities," said Lucca. "We are anxious to begin the work necessary to help the township meet the requirements of an outstanding Pennsylvania Department of Environmental Protection consent order, specifically related to inflow and infiltration issues there."

In total, Aqua has plans to spend nearly $50 million over the next 10 years to improve Cheltenham's wastewater system.

Aqua America is one of the largest U.S.-based, publicly traded water utilities and serves nearly 3 million people in Pennsylvania, Ohio, North Carolina, Illinois, Texas, New Jersey, Indiana and Virginia. Aqua America is listed on the New York Stock Exchange under the ticker symbol WTR. Visit AquaAmerica.com for more information.

Forward-Looking Statements

This release contains forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995 including, among others: the company's ability to successfully close the acquisition of the wastewater systems noted in this release. There are important factors that could cause actual results to differ materially from those expressed or implied by such forward-looking statements including: general economic business conditions, the successful integration of the customers and the facilities, the success of the company's growth efforts including its ability to utilize Act 12, and other factors discussed in our Annual Report on Form 10-K, which is on file with the Securities and Exchange Commission.

The Regulated Companies own various small, discrete parcels of land that are no longer required for water supply purposes. At December 31, 2017 , this land totaled over 600 acres. Over the past several years, we have been disposing of these land parcels through sales and/or donations, primarily to towns and municipalities. For more information, please refer to *Segments of Our Business* below.

Additional information on land dispositions can be found in Item 7 – "Management's Discussion and Analysis of Financial Conditions and Results of Operations – Commitments and Contingencies".

Competition

Our Regulated Companies face competition from a few small privately-owned water systems operating within, or adjacent to, our franchise areas and from municipal and public authority systems whose service areas in some cases overlap portions of our franchise areas.

Employees

As of December 31, 2017 , we employed a total of 294 people. Our employees are not covered by collective bargaining agreements.

SJW Group makes $1.1 billion all-cash offer for Connecticut Water

3 MIN READ

NEW YORK (Reuters) - SJW Group (SJW.N) and Connecticut Water Service Inc (CTWS.O) said on Monday they were changing from a merger to an acquisition agreement, with SJW offering to buy the New England utility for $1.1 billion in cash instead of combining stock.

The switch to an all-cash offer is worth $70 per Connecticut Water share, a 33 percent premium to Connecticut Water's share price prior to the original deal announced in March, according to a joint statement.

It was also higher than the implied $61.86 per share value of the Clinton, Connecticut-based firm under the merger-of-equals transaction, which would have created a combined company in which existing SJW shareholders would hold 60 percent of the stock.

SJW closed 2.3 percent lower, while Connecticut Water was 9 percent higher at $68.50.

ADVERTISEMENT

To pay for the acquisition, SJW will initially utilize a $975 million bridge loan from financial adviser JP Morgan Chase (JPM.N). Ultimately, the purchase would be covered by debt and between $450 million and $500 million of equity finance.

The new deal aims to conclude in the first quarter of 2019, subject to approvals from Connecticut Water's shareholders, as well as regulators in Connecticut and Maine.

The duo's original all-stock merger announcement in March triggered competing offers from Eversource Energy (ES.N) and California Water Service Group (CWT.N).

ADVERTISEMENT

ADVERTISING

"We have converted from a stock-for-stock deal to a cash offer, which will resolve any further market distractions from the inferior proposals," SJW Chief Executive Eric Thornburg told Reuters, in reference to the actions by Eversource and CalWater.

Switching to an acquisition, versus a merger structure, means that SJW shareholders will no longer be required to vote on approving the deal, the statement said.

CalWater has an open tender offer to acquire SJW that runs until Sept. 28.

However, asked if the change was aimed at heading off any shareholder challenge to the deal, Thornburg told Reuters it "wasn't a consideration" and it had received nothing but support from its shareholders.

RBS sounds alarm over Brexit

CalWater declined to comment. A spokesman for Eversource said the company was evaluating developments but, as it has made clear, it will be disciplined in pursuing this or any other transaction.

MORE FROM REUTERS

Wastewater treatment is provided by the Borough of West Chester pursuant to a Sewer Capacity Agreement dated November 14, 2017, by and between the Borough and East Bradford Township. Copies of West Chester's 2017 Chapter 94 Reports to DEP for the Goose Creek WWTP and for the Taylor Run WWTP are attached hereto as **Exhibit E3** and **Exhibit E4**.

15. The Goose Creek WWTP has a permitted treatment capacity of 1.672 MGD. The Taylor Run WWTP has a permitted treatment capacity of 1.50 MGD. The elevation of the Goose Creek WWTP is generally about EL 370. The elevation of the Taylor Run WWTP is generally about EL 260. The elevation of the Requested Territory ranges from approximately EL 365 to EL 280.

16. Water service in the Requested Territory is provided by both Aqua Pennsylvania, Inc. and private wells.

17. The original cost, by year and major plant category, of the East Bradford Township used and useful plant in service is $8,294,931 with a related calculation depreciation reserve of $2,820,983. The original cost value includes a series of capped sewers along the North Benjamin Drive area of the Township. The capped sewers include approximately 3,300 linear feet of 8" Gravity PVC pipe and 20 manholes, with an estimated original cost value of approximately $100,000 as estimated by Aqua. The pipe and manholes are included in the totals on page 2-11 and 2-12 of Exhibit W. Aqua will categorize the capped sewer pipe and manholes as plant held for future use in its asset allocation upon closing. The area of capped sewers along North Benjamin Drive is not included in the Requested Territory.

18. Tentative journal entries to record the transaction are presented in Section IV.

IV. ASSET PURCHASE AGREEMENT

19. The *Assets Purchase Agreement* is dated December 20, 2017. The *First Amendment to Assets Purchase Agreement* is dated April 18, 2018. The purchase price is Five Million Dollars

($5,000,000.00). In addition to the purchase price, Section 1.5 of the Agreement provides that Aqua will assume certain defined liabilities and pay certain out-of-pocket costs incurred by East Bradford Township.

20. The purchase price and Agreement are based on arm's length negotiations. Aqua and East Bradford Township are not affiliated with each other. Aqua will use short term debt initially for the purchase of the assets with the expectation that the short term debt will be converted to long term debt and equity capital at a later date.

21. The wastewater system assets to be acquired are the "Assets" and have the meaning specified in Section 1.1 of the Agreement. The Assets include the assets, properties and rights of East Bradford Township that comprise the wastewater system or that are owned by East Bradford Township and used by it solely in connection with operation of the system.

22. "Excluded Assets," which are those assets not being transferred to Aqua, have the meaning specified in Section 1.4 of the Agreement. Excluded Assets include customer service laterals that run from the curb area to individual customer residences or structures; piping and fixtures internal to each customer residence or structure; cash and cash equivalents; and the items set forth in Schedule 1.4 of the Agreement.

23. "Assumed Liabilities" has the meaning specified in Section 1.6 of the Agreement and include the liabilities and obligations under the Assumed Contracts that arise after Closing, liabilities incurred or arising from and after Closing under or from failure to comply with permits, approvals or licenses related to the system that are transferred to Aqua and the obligation to provide wastewater service after Closing. The Assumed Contracts, which are listed in Schedule 1.6 of the APA and attached hereto as **Exhibit F1** and **Exhibit F2**, are the Sewer Capacity Agreement dated November 14, 2017, by and between the Borough of West Chester and East Bradford Township and the Intergovernmental Cooperation Agreement dated March 15, 1999, between East Bradford and Birmingham Township.

Q. How many customers will the acquisition add?

A. The acquisition of East Norriton will add 4,966 customers to Aqua's existing 28,000 wastewater customers. This is an increase in customers of 17.7% (or about 20%).[23]

Q. Will the acquisition increase rates for the customers to be acquired?

A. Yes. Aqua witness Packer states that he reasonably expects that rates for East Norriton customers will increase under Aqua ownership.[24] As discussed above, Aqua calculates that if the entire revenue deficiency resulting from the acquisition is applied to East Norriton Township customers, the adjusted average bill for customers using four thousand gallons per month would increase from approximately $39 per month to $52 per month, which would be a 35% rate increase.[25]

Q. Will the acquisition increase rates for existing Aqua customers?

A. Yes. Mr. Packer's testimony shows that, as a result of the acquisition, rates for existing Aqua water customers and existing Aqua wastewater customers will increase if the revenue deficiency is not fully borne by the East Norriton Township customers. Mr. Packer's schedules show estimated increases to existing total Aqua water and wastewater customers ranging from $0.17 per month to $1.66 per month ($2.04 per year to $19.92 per year).[26] If the costs were spread to only existing wastewater customers, and not water customers, the

[24] Exhibit U, Direct Testimony of William C. Packer, p. 18, lines 17-20 and Appendix A, p.1; Response to OCA-II-4, Attachment 1, p. 22 (attached as OCA Exhibit DJG-12).

[25] Exhibit U, Direct Testimony of William C. Packer, Appendix A, pp. 1-2 ($38.52 + $13.42 = $51.94). ($13.42 ÷ $38.52) x 100 = 34.84%.

[26] Exhibit U, Direct Testimony of William C. Packer, Appendix A, p. 1.

Q. Describe the scope and organization of your testimony.

A. My testimony addresses the application filed by Aqua Pennsylvania Wastewater, Inc. ("Aqua" or the "Company") for the acquisition of the East Norriton Township (the "Township") wastewater collection system assets. My testimony responds to the fair market value ("FMV") approaches addressed in the testimonies of Harold Walker, III of Gannett Fleming, who sponsors the FMV appraisals commissioned by the Company, and Jerome C. Weinert, who sponsors the appraisal commissioned by the Township. I also discuss the sufficiency of the notices sent to the customers of Aqua and the Township regarding the impact on rates of the proposed acquisition.

II. EXECUTIVE SUMMARY

A. Overview

Q. Please summarizes Aqua's application in this proceeding.

A. Aqua's application proposes to acquire the Township's wastewater assets under Sections 1102 and 1329 of the Public Utility Code (the "Code"). According to Section 1329(c)(2) of the Code, the ratemaking rate base is the lesser of the negotiated purchase price and the average of two FMV appraisals. The FMV estimated by Gannett Fleming and AUS Consultants is $24.2 million and $25.1 million, respectively. The purchase price negotiated by Aqua and the Township is $21 million. Thus, the proposed rate base in the application is $21 million.

Exeter Township supervisors agree to sell municipal wastewater system for $96 million

readingeagle.com/news/article/exeter-township-supervisors-agree-to-sell-municipal-wastewater-system-for-96-million

Share

Adjust font size: A A A

The sale to Pennsylvania American Water Co. will keep taxes steady for 10 years and do other things for Exeter, the township manager said.

Written by Mike Urban

Exeter Township, PA —

The Exeter Township supervisors have agreed to sell the township's wastewater treatment plant and system to a private company for $96 million, a move they expect will save taxpayers money and put the township on much better financial footing.

The supervisors voted 4-1 on April 23 to approve the sale to Pennsylvania American Water Co., which supplies water to the township and operates 15 wastewater treatment systems statewide.

The two sides must finalize the asset purchase agreement, and the sale will require Pennsylvania Utility Commission approval, meaning the earliest the company is likely to take ownership would be early next year.

Township Manager John A. Granger said that if the sale goes through as planned, it will allow the township to hold real estate taxes steady for 10 years or more; pay for future capital projects including equipment replacement, township building relocation and storm sewer improvements; and still leave $48 million in the bank.

The current property tax rate is 2.14 mills, but that would have increased 32.6 percent to 2.8 mills in 2019 if the township retained ownership of the plant, he said.

The township is expected to raise sewer rates 29 percent before the sale is completed, but that rate hike would likely have been higher if the township held onto the system and made necessary upgrades, said Supervisor John Cusatis.

And the supervisors plan to enact a homestead tax exemption that would more than cover the rate increase for most homeowners, he said.

There are about 9,000 properties in Exeter connected to the wastewater system, and Pennsylvania American spokesman Terry M. Maenza said that they shouldn't notice any changes in sewer service once the company takes control of the system.

"It should be seamless," he said.

The company plans to retain the township's six wastewater employees, he said.

Cusatis and fellow Supervisors Lisa VanderLaan, William F. White and David G. Speece Jr. voted for the sale, saying it was a tough decision but the economic benefits were too good to turn down.

"The sale will pay off the library and sewer debt, stabilize the tax base and improve the township's credit rating," Cusatis said.

Supervisor Gary E. Lloyd Jr. voted against the sale, saying he didn't want to lose the valuable asset.

Cusatis said that most Exeter residents he spoke with support the move, but at the April 23 meeting several expressed concern about selling public property to private industry and giving up control of the wastewater system.

A written handout from resident Sherrie Greene noted that: "I have done some research and read that many municipalities have taken this route, then regretted it later. Once our sewer system is sold, it is gone forever and we cannot get it back."

Pennsylvania American, headquartered in Hershey, is a subsidiary of American Water Works Co., based in Vorhees, N.J.

This would be Pennsylvania American's first wastewater treatment system in Berks.

(Correspondent Valdis I. Lacis contributed to this story.)

1. The collection of a DSIC prior to inclusion of the acquired assets in a base rate case;
2. The accrual of Allowance for Funds Used During Construction (AFUDC) on non-DSIC eligible post-acquisition improvements; and
3. The deferral of depreciation for book and ratemaking purposes on non-DSIC eligible post-acquisition improvements.

Q. Please briefly summarize the Acquisition Transaction that the Joint Applicants are proposing.

A. Under the terms of the Proposed Transaction, PAWC would acquire the wastewater utility assets of Kane for $17.56 million.

Q. Please describe the Kane wastewater utility.

A. Kane owns and operates a sanitary wastewater collection system that provides sanitary wastewater service to approximately 2,019 customers in Kane Borough and a portion of Westmore Township in McKean County. The breakout of Kane's customer count is: 1,847 residential, 162 commercial, 3 industrial, and 7 municipal. The $17.56 million purchase price for a wastewater utility assets serving 2,019 customers equates to a cost of approximately $8,700 per customer.

Q. Does the Application provide the terms of the Proposed Transaction?

A. Yes, the Asset Purchase Agreement ("APA") dated November 4, 2019 was included with the Application. The APA states that the purchase price is Seventeen Million, Five Hundred Sixty Thousand Dollars ($17,560,000). The Application indicates that the purchase price is based on arm's length negotiations. PAWC and Kane Borough are not affiliated with each other.

ASSET PURCHASE AGREEMENT

7. Aqua and Limerick are parties to an Asset Purchase Agreement dated November 16, 2016. Aqua Exhibit 1, Application ¶ 5 and ¶ 18; *see also* Aqua Exhibit No. 1, Exhibit C.

8. The negotiated purchase price, which is based on arms' length negotiation, is Seventy-Five Million One Hundred Thousand Dollars ($75,100,000.00). Aqua and Limerick are not affiliated with each other. Aqua Exhibit No. 1, Application ¶ 18 and Aqua St. No. 1 at 6, lines 6 through 10.

9. Aqua will use short term credit lines to fund the transaction. The short term credit funding will be converted to a mix of long-term debt and equity capital shortly after closing. Aqua St. No. 1 at 7, lines 18 through 20; *see also* Aqua Exhibit No. 1, Application ¶ 18.

ASSETS BEING TRANSFERRED

10. The wastewater system assets to be transferred are the "Acquired Assets" and have the meaning specified in Section 2.01 of the Agreement. The Acquired Assets include all real property Limerick owns and uses in the operation of the wastewater system and all sanitary wastewater related treatment and conveyance facilities, including the Possum Hollow Waste Water Treatment Plant ("PHWWTP"), the King Road Waste Water Treatment Plant ("KRWWTP") and all pipes, pumping stations, manholes and pipelines and billing and collections related assets necessary to run the system. Aqua Exhibit No. 1, Application ¶ 19.

11. Acquired Assets also include the contracts identified on Schedule 4.15 of the Agreement to which Limerick is a party (the "Assigned Contracts"). Since contract parties, other than Limerick, are identified by name, Schedule 4.15 and the Assigned Contracts are considered CONFIDENTIAL. Copies of CONFIDENTIAL Schedule 4.15 and the CONFIDENTIAL Assigned Contracts were included with the Application as Confidential Exhibit F and admitted into evidence as CONFIDENTIAL Aqua Exhibit No. 4. Aqua Exhibit No. 1, Application ¶ 20 and Tr. 13 and 20.

$5,572,770. Exh. A-14-a, SWPA St. 1 at 11-12. The allocated purchase price for the water system is $4,734,800 and the wastewater system is $4,765,200. Appendix A-14, SWPA St. 2 at 4-5.

The valuation experts were paid $59,145 for the Fair Market Value Appraisal Reports for both the water and wastewater systems. Exh. A-8-a. SWPA also indicates that it will incur transaction and closing costs of approximately $1,000,000 between the Water System and the Wastewater System, which will be included in rate base. Appendix A-14, SWPA St.1 at 5-6; Appendix A-12.

OCA will examine the ratemaking rate base claims to determine if the claims are reasonable and appropriate for ratemaking purposes.

2. Proposed Rates: SWPA proposes to charge customers of the Mahoning Township system the Mahoning Township water and wastewater rates in effect at closing. Application at 6, 11; Appendix A-13. Those rates will remain in effect until SWPA's next base rate case but SWPA may impose any fee or surcharge permitted by its Commission-approved tariff. Id.

The proposed rates do not appear to match the existing Mahoning Township rates. The OCA will investigate this apparent discrepancy. The OCA will investigate the impacts on the current customers as well as on Mahoning Township customers of the various assumptions and proposals.

3. The OCA submits that additional information is necessary to determine how the transaction will substantially and affirmatively benefit Suez's existing customers.

4. Conditions: Whether any conditions should be imposed upon the proposed transfer to ensure that Suez's customers are treated in a fair and just manner in accord with Pennsylvania law and Commission rules and regulations.

21. Second, Ms. Vicari used inconsistent purchase price values to calculate the average costs per customer. Id. at 21-22.

(a) Incorrect Use of Projected Customers

Ms. Vicari used an incorrect number of customers for MACM. In Appendix A-17-a, it states that MACM has 12,780 customers, yet Ms. Vicari used 21,953 customers. OCA St. 1 at 20-21. She explained that she used that number because she counted the individual connections for each bulk customer. Id. She never supplied her calculation of the individual connections for the four bulk customers. Id.

Ms. Vicari does not necessarily apply that logic to the other acquisitions in her sample group by reflecting individual connections for any bulk customers. OCA St. 1S at 16-17. By using the actual number of customers for the other systems, she achieved a higher average cost per customer. She then multiplied this overstated cost per customer times the unsupported number of bulk customers' individual connection, compounding the error. Ms. Everette was not able to confirm whether all of the customer numbers in Ms. Vicari's sample group were consistently counted. She therefore used the 21,953 customer number used by Ms. Vicari to minimize the issues in the proceeding.

(b) Inconsistent Purchase Price Values

Similar to the problem with the customer count, MACM witness Vicari did not use consistent purchase price values. OCA St. 1 at 21-22. For the comparative acquisitions, she used the purchase price plus the value of capital improvements required by the agreement of sale. For MACM, however, she uses only the purchase price and does not consider the $62.7 million of capital investments that PAWC anticipates making over the next 10 years. Including the cost

McKeesport sewer system to be sold for $156 million

September 16, 2016 12:00 AM

By Deana Carpenter

The Municipal Authority of the City of McKeesport has agreed to sell its sewer system to Pennsylvania American Water for approximately $156 million.

The sale is needed to bring the city to more stable financial ground and avoid Act 47, the program for financially distressed municipalities, or municipal bankruptcy, McKeesport Mayor Michael Cherepko said at the Sept. 7 council meeting.

“It became very clear to this administration that the only way to save our community from municipal bankruptcy, while continuing to offer the same level of services our residents deserve, would be to transfer our local sewage system to a regional or national utility company,” Mr. Cherepko said in a news release.

A purchase agreement was signed by both parties last Friday following votes by city council and the municipal authority to sell the sewer system. The sale is expected to be finalized in the second half of next year pending regulatory approvals and other closing conditions.

The system serves 22,000 customers in McKeesport and the communities of Dravosburg, Duquesne, East McKeesport, Elizabeth Township, Glassport, Liberty, Lincoln, North Versailles, Port Vue, Versailles and White Oak.

“We look forward to closing the proposed acquisition and to providing wastewater services that reflect our commitment to environmental stewardship and quality customer service,” said

Kathy L. Pape, president of Pennsylvania American Water, said that after the deal is closed, the company looks forward “to welcoming the Municipal Authority of the City of McKeesport’s employees and customers to the Pennsylvania American Water family.”

She said the company also looks forward to “providing wastewater services that reflect our commitment to environmental stewardship and quality customer service.”

The next step is approval of the acquisition by the Pennsylvania Public Utility Commission along with other approvals, such as from the state Department of Environmental Protection.

In June, state Auditor General Eugene DePasquale said McKeeesport erred when it accidentally spent $729,275 in state funds earmarked for pension costs and subsequently couldn't pay its $2.3 million annual pension obligation last year.

McKeesport officials said then they would remedy the shortfall through "the sale of an asset in the near future."

“The total proceeds of the pending sale of the Municipal Authority of the City of McKeesport will solidify the City of McKeesport’s financial position for years to come,” Mr. Cherepko said this week. “The down payment associated with this

sale will generate enough revenue to cover all of the city's outstanding financial obligations, including the minimum municipal obligations associated with the city's pension funds."

Dilworth Paxson LLP

The PA PUC Approves First Wastewater Sale Under New Act 12

06/14/2017

June 14, 2017 (Philadelphia, PA) - On June 14, 2017, the Pennsylvania Public Utility Commission approved, in a four-to-one vote, Aqua Pennsylvania Wastewater, Inc.'s application to acquire the wastewater system of New Garden Township and its Sewer Authority, and to begin providing wastewater service to the residents of New Garden and Kennett Townships in Chester County. The transaction is the first to be approved using the fair market valuation approach established by the Pennsylvania State Legislature and Governor Tom Wolf with Act 12 of 2016 (Act of Apr. 14, 2016, P.L. 76, No. 12, 66 Pa. C.S. § 1329).

Act 12 is changing the landscape for municipal sales of water and wastewater systems to PUC-regulated public utility companies. The new law allows the parties to the transaction to opt in to a new method of valuation, which takes the value of the system for ratemaking purposes as either the lower of the average of two independent fair market value appraisals—one obtained by the utility buyer and one by the municipal seller—or by the negotiated purchase price. Prior to Act 12, system value for ratemaking was based on depreciated original cost, which would likely always result in a lower sale price than fair market value. In addition, the new law requires the PUC to act within six months of the acceptance of the application.

Act 12 became effective mid-June 2016, and the PUC issued its final implementation order in October 2016. The New Garden transaction was the first Act 12 application, submitted for approval in December 2016. Aqua, New Garden, and the Authority agreed to a negotiated purchase price of $29,500,000, which turned out to be less than the average of the two appraisals commissioned by Aqua and New Garden. The valuation for ratemaking purposes was therefore set at $29,500,000.

A protest to Aqua's application for PUC approval pursuant to Act 12 in the New Garden transaction was filed by the Bureau of Investigation and Enforcement, which sought a review of both of the fair market appraisals used, additional information about the proposed rate freeze agreed to by the parties, and a determination of whether the transaction was in the public interest under Section 1102 of the Public Utility Code.

An additional protest was filed by the Office of Consumer Advocates requesting further information to determine whether supplementary conditions should be imposed on the transaction to ensure that Aqua's existing customers are treated in a fair and just manner; how the transaction will substantially and affirmatively benefit Aqua's existing customers; and whether the agreement sufficiently provides for safe, adequate, and reasonable service at just and reasonable rates.

An evidentiary hearing was held before an administrative law judge on February 16, 2017. After the hearing, the judge recommended the denial of Aqua's application, concluding that Aqua had failed to demonstrate by a preponderance of the evidence that the acquisition was in the public interest because it failed to demonstrate that the transaction will result in affirmative public benefits to its existing customers. The judge also concluded that Aqua had failed to support its rate stabilization plan with evidence to show its basis and impact. The judge did

invest in necessary capital improvements and resources, and experienced managerial and operating personnel necessary to provide safe and reliable sewer services to the residents of the TOS and surrounding areas. PAWC is currently the water provider within TOS and is the operator of TOS's System pump station.

Q. PLEASE DESCRIBE PAWC'S HISTORICAL RELATIONSHIP WITH TOS.

A. Since PAWC's acquisition of the water and wastewater assets of the City of Coatesville Authority ("CCA") in March 2001, PAWC has been the regional wastewater (and water) provider in the City of Coatesville and surrounding communities. . PAWC's treats the wastewater from the communities of Sadsbury Township, City of Coatesville, East Fallowfield Township, Caln Township, West Caln Township, Valley Township, West Sadsbury Township, Highland Township, West Brandywine Township and Parksburg Borough. TOS has been a bulk wastewater customer of PAWC since PAWC's acquisition of CCA's water and wastewater system assets. We maintain a relationship with TOS and other local municipalities by participating in local events, providing environmental and firefighting grants, offering the "H2O Assistance Program," and supporting economic growth through infrastructure improvements in the communities we serve.

Q. HOW MANY CUSTOMERS DOES THE TOS SYSTEM CURRENTLY SERVE AND HOW MANY CUSTOMERS DOES PAWC CURRENTLY SERVE?

A. As of December 31, 2016, TOS furnished wastewater services to 998 customers. This number includes 950 residential and 48 commercial customer connections. Of these

interest in discussing the potential acquisition of the System and the use of Section 1329, the fair market value approach. TOS's representatives executed the Letter of Interest on December 6 and 7, 2016 and returned it to PAWC. This "Letter of Interest" was extended through amendments on March 9, 2017, May 2, 2017, June 6, 2017, and July 5, 2017 to allow the parties to enter into a definitive agreement. Through these extensions, PAWC and TOS jointly retained the services of Herbert E. MacCombie, Jr., P.E., of Media Pennsylvania to complete the Engineer's Assessment of Tangible Assets pursuant to Section 1329. The Engineer's Assessment of Tangible Assets is included as **Schedule 1.1** of the APA and included with the UVE fair market valuation reports at **Appendix A-5**. PAWC, pursuant to Section 1329, retained the services of AUS Consultants of Greenfield Wisconsin to complete an appraisal of the System. TOS retained the services of Herbert, Rowland & Grubic, Inc. of Harrisburg, Pennsylvania to also complete an appraisal of the System. These appraisals accompany the Application at **Appendix A-5** (together with electronic working documents at **Appendix A-4**) and are included as **Schedule 2.2** of the APA. After receipt of the two appraisals and subsequent arms-length negotiations, on May 1, 2018 TOS's Board of Supervisors approved the APA, which was subsequently executed by PAWC and TOS that day too. This APA includes a negotiated purchase price of $9,250,000.

Q. CAN YOU PLEASE PROVIDE AN OVERVIEW OF THE APA?

A. Yes. The APA is attached as **Appendix A-24-a** to the Application **(PAWC Exhibit KEG-1)**. The APA sets forth the terms and conditions pursuant to which the TOS will sell, and PAWC will purchase, the System, as well as substantially all assets, properties and rights

The sale of Steelton's water system is one step closer to completion.

Pennsylvania American Water announced today it has signed an agreement to acquire the water assets of the Steelton Borough Authority for $22.5 million.

The two will next seek approval of the acquisition from the Pennsylvania Public Utility Commission and other necessary approvals from the Pennsylvania Department of Environmental Protection, according to the company.

permitted under Law and the terms of any applicable contract that is a Nonassignable Asset, as agent or subcontractor for Seller, pay, perform and discharge the liabilities and obligations of Seller thereunder from and after the Closing Date, but only to the extent that such liabilities and obligations would be Assumed Liabilities if the applicable consent or approval had been obtained on or before the Closing Date and such Nonassignable Asset had been assigned to Buyer at Closing. To the extent permitted under Law, Seller shall hold in trust for and pay to Buyer promptly upon receipt thereof, such Nonassignable Asset and all income, proceeds and other monies received by Seller with respect to such Nonassignable Asset in connection with the arrangements under this Article II.

(c) If, following the Effective Date and before the Closing, Buyer identifies any contract to which Seller is a party which is not set forth on Schedule 4.15, and Buyer reasonably determines such contract is necessary or useful to the operation of the System, Buyer shall notify Seller of such determination and Seller shall, promptly following receipt of such notice, deliver to Buyer an updated Schedule 4.15 reflecting the addition of such contract, and such contract will be an "Assigned Contract" for all purposes hereunder.

(d) If during the twelve (12) month period following the Closing, Buyer identifies any contract to which Seller was a party as of the Closing and which (i) was not set forth on Schedule 4.15 (as may be updated pursuant to (c)) and (ii) Buyer reasonably believes is necessary or useful to the operation of the System, Seller shall, promptly following Buyer's written request therefor, execute, acknowledge and deliver, or cause to be executed, acknowledged and delivered, such other instruments of conveyance and transfer and other documents, and perform or cause to be performed such further acts, as may be reasonably required to evidence or effectuate, or more fully evidence or effectuate the assignment of such contract to Buyer for no additional consideration, and upon such assignment, such contract is deemed an Assigned Contract for all purposes hereunder.

ARTICLE III.

PURCHASE PRICE

Section 3.01. Purchase Price. The purchase price for the Acquired Assets is Thirteen Million Dollars ($13,000,000) (the "Purchase Price") which Buyer shall pay as follows at Closing:

(a) Buyer shall provide for payment in full of the total amount of Outstanding Indebtedness directly to Seller's obligees on account of the Purchase Price;

(b) Buyer shall pay, subject to any adjustment pursuant to Section 3.01(c), to Seller by wire transfer of immediately available funds the balance of the Purchase Price (remaining after the debt repayment pursuant to Section 3.01(a)) to one or more accounts that Seller designates and provides to Buyer at least three (3) Business Days before the Closing Date; and

(c) Final Billing: The Buyer is entitled to all customer billings with respect to sanitary wastewater customers services for the period on or after the Closing Effective Time, and Seller is entitled to all such billings for the period before the Closing Effective Time. The Parties

SJW Group makes $1.1 billion all-cash offer for Connecticut Water

3 MIN READ

NEW YORK (Reuters) - SJW Group (SJW.N) and Connecticut Water Service Inc (CTWS.O) said on Monday they were changing from a merger to an acquisition agreement, with SJW offering to buy the New England utility for $1.1 billion in cash instead of combining stock.

The switch to an all-cash offer is worth $70 per Connecticut Water share, a 33 percent premium to Connecticut Water's share price prior to the original deal announced in March, according to a joint statement.

It was also higher than the implied $61.86 per share value of the Clinton, Connecticut-based firm under the merger-of-equals transaction, which would have created a combined company in which existing SJW shareholders would hold 60 percent of the stock.

SJW closed 2.3 percent lower, while Connecticut Water was 9 percent higher at $68.50.

ADVERTISEMENT

To pay for the acquisition, SJW will initially utilize a $975 million bridge loan from financial adviser JP Morgan Chase (JPM.N). Ultimately, the purchase would be covered by debt and between $450 million and $500 million of equity finance.

The new deal aims to conclude in the first quarter of 2019, subject to approvals from Connecticut Water's shareholders, as well as regulators in Connecticut and Maine.

The duo's original all-stock merger announcement in March triggered competing offers from Eversource Energy (ES.N) and California Water Service Group (CWT.N).

ADVERTISEMENT

ADVERTISING

"We have converted from a stock-for-stock deal to a cash offer, which will resolve any further market distractions from the inferior proposals," SJW Chief Executive Eric Thornburg told Reuters, in reference to the actions by Eversource and CalWater.

Switching to an acquisition, versus a merger structure, means that SJW shareholders will no longer be required to vote on approving the deal, the statement said.

CalWater has an open tender offer to acquire SJW that runs until Sept. 28.

However, asked if the change was aimed at heading off any shareholder challenge to the deal, Thornburg told Reuters it "wasn't a consideration" and it had received nothing but support from its shareholders.

RBS sounds alarm over Brexit

CalWater declined to comment. A spokesman for Eversource said the company was evaluating developments but, as it has made clear, it will be disciplined in pursuing this or any other transaction.

MAP NOTES:

Mapping information was derived from various planning documents including Schoor DePalma's Sanitary Sewer Meter Location Plan, Kohl & Associates Township plan, Roy F. Weston's Master Sanitary Sewer System Plan, Chester County Recorder of Deeds Plans, and township as-built plans received by ARRO. The mapping is incomplete and will be improved as as-built and other plan information is updated into the GIS. This GIS database will provide a framework for modeling the collection system to analyze capacity issues and make recommended improvements to mitigate capacity deficiencies.

PART I

Item 1. Business

This annual report on Form 10-K is a combined report being filed by two separate Registrants, American States Water Company ("AWR") and Golden State Water Company ("GSWC"). References in this report to "Registrant" are to AWR and GSWC, collectively, unless otherwise specified. GSWC makes no representations as to the information contained in this report relating to AWR and its subsidiaries, other than GSWC.

AWR makes its periodic reports, Form 10-Q and Form 10-K, and current reports, Form 8-K, available free of charge through its website, www.aswater.com, as soon as material is electronically filed with or furnished to the Securities and Exchange Commission ("SEC"). Such reports are also available on the SEC's website at www.sec.gov. AWR also makes available free of charge its code of business conduct and ethics, its corporate governance guidelines and the charters of its Nominating and Governance Committee, Compensation Committee and Audit and Finance Committee through its website or by calling (877) 463-6297. AWR and GSWC have filed the certification of officers required by Section 302 of the Sarbanes-Oxley Act as Exhibits 31.1 and 31.2 to its Form 10-K for the year ended December 31, 2020.

Overview

AWR is the parent company of GSWC, Bear Valley Electric Service, Inc. ("BVESI") and American States Utility Services, Inc. ("ASUS") (and its wholly owned subsidiaries: Fort Bliss Water Services Company ("FBWS"), Terrapin Utility Services, Inc. ("TUS"), Old Dominion Utility Services, Inc. ("ODUS"), Palmetto State Utility Services, Inc. ("PSUS"), Old North Utility Services, Inc. ("ONUS"), Emerald Coast Utility Services, Inc. ("ECUS") and Fort Riley Utility Services, Inc. ("FRUS")). On July 1, 2020, GSWC completed the transfer of the electric utility assets and liabilities from its electric division to BVESI, in exchange for common shares of BVESI. GSWC then immediately distributed all of BVESI's common shares to AWR, whereupon BVESI became wholly owned directly by AWR. This reorganization did not result in any substantive changes to AWR's operations and business segments.

AWR has three reportable segments: water, electric and contracted services. Within the segments, AWR has three principal business units, water and electric service utility operations conducted through its regulated utilities GSWC and BVESI, respectively, and contracted services conducted through ASUS and its subsidiaries. FBWS, TUS, ODUS, PSUS, ONUS, ECUS and FRUS may be referred to herein collectively as the "Military Utility Privatization Subsidiaries."

GSWC is a public water utility engaged in the purchase, production, distribution and sale of water in 10 counties in the State of California. GSWC is regulated by the California Public Utilities Commission ("CPUC"). BVESI is a public electric utility that distributes electricity in several San Bernardino County mountain communities in California, and is also regulated by the CPUC. Additional information regarding public utility regulation is discussed in Item 7. "*Management's Discussion and Analysis of Financial Condition" and Results of Operation*" under the section titled "*Regulatory Matters*."

AWR's regulated utilities served 261,796 water customers and 24,545 electric customers at December 31, 2020, or a total of 286,341 customers, compared with 260,708 water customers and 24,420 electric customers at December 31, 2019, or a total of 285,128 customers. Both GSWC's and BVESI's operations exhibit seasonal trends. Although both have diversified customer bases, residential and commercial customers account for the majority of water and electric sales and revenues. Revenues derived from commercial and residential customers accounted for approximately 90% of total water and electric revenues for the years ended December 31, 2020, 2019 and 2018.

ASUS, itself or through the Military Utility Privatization Subsidiaries, has contracted with the U.S. government to provide water and/or wastewater services at various military installations. ASUS operates, maintains and performs construction activities (including renewal and replacement capital work) on water and/or wastewater systems at various U.S. military bases pursuant to 50-year firm, fixed-price contracts. Each of the contracts with the U.S. government is subject to termination, in whole or in part, prior to the end of its 50-year term for convenience of the U.S. government or as a result of default or nonperformance by the ASUS subsidiary performing the contract. The price for each of these contracts is subject to annual economic price adjustments. Contracts are also subject to modifications for changes in circumstances, changes in laws and regulations, and additions to the contract value for new construction of facilities at the military bases. AWR guarantees performance of ASUS's military privatization contracts.

AMERICAN STATES WATER COMPANY AND SUBSIDIARIES
NOTES TO CONSOLIDATED FINANCIAL STATEMENTS

Note 1 — Summary of Significant Accounting Policies

Nature of Operations: American States Water Company ("AWR") is the parent company of Golden State Water Company ("GSWC"), Bear Valley Electric Service Inc. ("BVESI"), and American States Utility Services, Inc. ("ASUS") (and its wholly owned subsidiaries, Fort Bliss Water Services Company ("FBWS"), Terrapin Utility Services, Inc. ("TUS"), Old Dominion Utility Services, Inc. ("ODUS"), Palmetto State Utility Services, Inc. ("PSUS"), Old North Utility Services, Inc. ("ONUS"), Emerald Coast Utility Services, Inc. ("ECUS"), and Fort Riley Utility Services, Inc. ("FRUS")). AWR and its subsidiaries may be collectively referred to as "Registrant" or "the Company." The subsidiaries of ASUS are collectively referred to as the "Military Utility Privatization Subsidiaries." On July 1, 2020, GSWC completed the transfer of the electric utility assets and liabilities from its electric division to BVESI, a separate legal entity and wholly owned subsidiary of AWR (Note 20). This reorganization did not result in any substantive changes to AWR's operations and business segments. AWR, through its wholly owned subsidiaries, serves over one million people in nine states.

GSWC and BVESI are both California public utilities, with GSWC engaged in the purchase, production, distribution and sale of water throughout California serving approximately 261,800 customers, while BVESI distributes electricity in several San Bernardino County mountain communities in California serving approximately 24,500 customers. The California Public Utilities Commission ("CPUC") regulates GSWC's and BVESI's businesses in matters including properties, rates, services, facilities, and transactions between GSWC, BVESI, and their affiliates.

ASUS, through its Military Utility Privatization Subsidiaries, operates, maintains and performs construction activities (including renewal and replacement capital work) on water and/or wastewater systems at various U.S. military bases pursuant to 50-year firm fixed-price contracts. These contracts are subject to annual economic price adjustments and modifications for changes in circumstances, changes in laws and regulations and additions to the contract value for new construction of facilities at the military bases.

There is no direct regulatory oversight by the CPUC over AWR or the operations, rates or services provided by ASUS or the Military Utility Privatization Subsidiaries.

Basis of Presentation: The consolidated financial statements and notes thereto are presented in a combined report filed by two separate Registrants: AWR and GSWC. References in this report to "Registrant" are to AWR and GSWC, collectively, unless otherwise specified.

AWR owns all of the outstanding Common Shares of GSWC, BVESI and ASUS. ASUS owns all of the outstanding common shares of the Military Utility Privatization Subsidiaries. The consolidated financial statements of AWR include the accounts of AWR and its subsidiaries. These financial statements are prepared in conformity with accounting principles generally accepted in the United States of America. Intercompany transactions and balances have been eliminated in the AWR consolidated financial statements.

Related-Party Transactions: GSWC, BVESI and ASUS provide and/or receive various support services to and from their parent, AWR, and among themselves. GSWC also allocates certain corporate office administrative and general costs to its affiliates using allocation factors approved by the CPUC. During the years ended December 31, 2020, 2019 and 2018, GSWC allocated to ASUS approximately $4.9 million, $4.7 million and $4.2 million, respectively, of corporate office administrative and general costs. During the year ended December 31, 2020, GSWC allocated corporate office administrative and general costs to BVESI of approximately $1.3 million.

Furthermore, AWR borrows under a credit facility, which expires in May 2023, and provides funds to GSWC and ASUS in support of their operations. The interest rate charged to GSWC and ASUS is sufficient to cover AWR's interest expense under the credit facility. The CPUC requires GSWC to pay down all intercompany borrowings from AWR within a 24-month period, which was required by November 2020. In October 2020, the Board of Directors authorized AWR to invest equity in GSWC to enable the subsidiary to pay down all its intercompany borrowings. During the fourth quarter of 2020, AWR invested $60 million of equity in GSWC and received five shares of GSWC common stock. The majority of the proceeds from this stock issuance were used by GSWC to pay down its intercompany borrowings from AWR, satisfying the CPUC's requirement. As a result, GSWC had no intercompany borrowings from AWR as of December 31, 2020.

In October 2020, AWR issued an interest bearing promissory note to GSWC, which expires in May 2023. Under the terms of the note, AWR may borrow from GSWC amounts up to $30 million for working capital purposes. AWR agrees to pay any unpaid principal amounts outstanding under this note, plus accrued interest. In November 2020, AWR borrowed $6 million from GSWC under the terms of the note, which was subsequently repaid in December. As of December 31, 2020, there were no amounts outstanding under this note.

PART I

Item 1. Business

This annual report on Form 10-K is a combined report being filed by two separate Registrants, American States Water Company (“AWR”) and Golden State Water Company (“GSWC”). References in this report to “Registrant” are to AWR and GSWC, collectively, unless otherwise specified. GSWC makes no representations as to the information contained in this report relating to AWR and its subsidiaries, other than GSWC.

AWR makes its periodic reports, Form 10-Q and Form 10-K, and current reports, Form 8-K, available free of charge through its website, www.aswater.com, as soon as material is electronically filed with or furnished to the Securities and Exchange Commission (“SEC”). Such reports are also available on the SEC’s website at www.sec.gov. AWR also makes available free of charge its code of business conduct and ethics, its corporate governance guidelines and the charters of its Nominating and Governance Committee, Compensation Committee and Audit and Finance Committee through its website or by calling (877) 463-6297. AWR and GSWC have filed the certification of officers required by Section 302 of the Sarbanes-Oxley Act as Exhibits 31.1 and 31.2 to its Form 10-K for the year ended December 31, 2020.

Overview

AWR is the parent company of GSWC, Bear Valley Electric Service, Inc. ("BVESI") and American States Utility Services, Inc. (“ASUS”) (and its wholly owned subsidiaries: Fort Bliss Water Services Company (“FBWS”), Terrapin Utility Services, Inc. (“TUS”), Old Dominion Utility Services, Inc. (“ODUS”), Palmetto State Utility Services, Inc. (“PSUS”), Old North Utility Services, Inc. (“ONUS”), Emerald Coast Utility Services, Inc. (“ECUS”) and Fort Riley Utility Services, Inc. (“FRUS”)). On July 1, 2020, GSWC completed the transfer of the electric utility assets and liabilities from its electric division to BVESI, in exchange for common shares of BVESI. GSWC then immediately distributed all of BVESI's common shares to AWR, whereupon BVESI became wholly owned directly by AWR. This reorganization did not result in any substantive changes to AWR's operations and business segments.

AWR has three reportable segments: water, electric and contracted services. Within the segments, AWR has three principal business units, water and electric service utility operations conducted through its regulated utilities GSWC and BVESI, respectively, and contracted services conducted through ASUS and its subsidiaries. FBWS, TUS, ODUS, PSUS, ONUS, ECUS and FRUS may be referred to herein collectively as the “Military Utility Privatization Subsidiaries.”

GSWC is a public water utility engaged in the purchase, production, distribution and sale of water in 10 counties in the State of California. GSWC is regulated by the California Public Utilities Commission (“CPUC”). BVESI is a public electric utility that distributes electricity in several San Bernardino County mountain communities in California, and is also regulated by the CPUC. Additional information regarding public utility regulation is discussed in Item 7. "*Management's Discussion and Analysis of Financial Condition" and Results of Operation*" under the section titled "*Regulatory Matters*."

AWR's regulated utilities served 261,796 water customers and 24,545 electric customers at December 31, 2020, or a total of 286,341 customers, compared with 260,708 water customers and 24,420 electric customers at December 31, 2019, or a total of 285,128 customers. Both GSWC’s and BVESI's operations exhibit seasonal trends. Although both have diversified customer bases, residential and commercial customers account for the majority of water and electric sales and revenues. Revenues derived from commercial and residential customers accounted for approximately 90% of total water and electric revenues for the years ended December 31, 2020, 2019 and 2018.

ASUS, itself or through the Military Utility Privatization Subsidiaries, has contracted with the U.S. government to provide water and/or wastewater services at various military installations. ASUS operates, maintains and performs construction activities (including renewal and replacement capital work) on water and/or wastewater systems at various U.S. military bases pursuant to 50-year firm, fixed-price contracts. Each of the contracts with the U.S. government is subject to termination, in whole or in part, prior to the end of its 50-year term for convenience of the U.S. government or as a result of default or nonperformance by the ASUS subsidiary performing the contract. The price for each of these contracts is subject to annual economic price adjustments. Contracts are also subject to modifications for changes in circumstances, changes in laws and regulations, and additions to the contract value for new construction of facilities at the military bases. AWR guarantees performance of ASUS’s military privatization contracts.

PART I

ITEM 1. BUSINESS

The Company

With a history dating back to 1886, American Water is the largest and most geographically diverse, publicly-traded water and wastewater utility company in the United States, as measured by both operating revenues and population served. A holding company originally incorporated in Delaware in 1936, the Company employs approximately 7,000 professionals who provide drinking water, wastewater and other related services to over 15 million people in 46 states. The Company conducts the majority of its business through regulated utilities that provide water and wastewater services, collectively presented as the "Regulated Businesses." The Company also operates market-based businesses that provide complementary services. Individually, these businesses do not meet the criteria of a reportable segment in accordance with generally accepted accounting principles in the United States ("GAAP"), and are collectively presented as the "Market-Based Businesses," which is consistent with how management assesses the results of these businesses.

Throughout this Form 10-K, unless the context otherwise requires, references to "we," "us," "our," the "Company," and "American Water" mean American Water Works Company, Inc. and its subsidiaries, taken together as a whole. References to "parent company" mean American Water Works Company, Inc., without its subsidiaries.

Regulated Businesses

The Company's primary business involves the ownership of utilities that provide water and wastewater services to residential, commercial, industrial, public authority, fire service and sale for resale customers. The Company's utilities operate in over 1,700 communities in 16 states in the United States, with 3.5 million active customers in its water and wastewater networks. Services provided by the Company's utilities are subject to regulation by multiple state utility commissions or other entities engaged in utility regulation, collectively referred to as public utility commissions ("PUCs"). Federal, state and local governments also regulate environmental, health and safety, and water quality and water accountability matters. The Company reports the results of the services provided by its utilities in the Regulated Businesses segment. Operating revenues for the Regulated Businesses were $3,255 million for 2020, $3,094 million for 2019 and $2,984 million for 2018, accounting for 86%, 86% and 87%, respectively, of the Company's total operating revenues for the same periods.

Presented in the table below is a geographic summary of the Regulated Businesses' operating revenues and the number of customers the Company serves, by type of service, for and as of the year ended December 31, 2020:

	Operating Revenues (in millions)				Number of Customers (in thousands)			
	Water (a)	Wastewater	Total	% of Total	Water	Wastewater	Total	% of Total
New Jersey	$ 753	$ 43	$ 796	24.5 %	657	55	712	20.4 %
Pennsylvania	663	70	733	22.5 %	673	77	750	21.6 %
Missouri	335	11	346	10.6 %	472	15	487	13.9 %
Illinois	293	32	325	10.0 %	292	68	360	10.3 %
California	247	3	250	7.7 %	183	3	186	5.3 %
Indiana	234	2	236	7.3 %	318	2	320	9.2 %
West Virginia	164	1	165	5.1 %	168	1	169	4.8 %
Total—Top Seven States (b)	2,689	162	2,851	87.7 %	2,763	221	2,984	85.5 %
Other (c)	381	23	404	12.3 %	481	31	512	14.5 %
Total Regulated Businesses	$ 3,070	$ 185	$ 3,255	100.0 %	3,244	252	3,496	100.0 %

(a) Includes other operating revenues consisting primarily of miscellaneous utility charges, fees and rents.

(b) The Company's "Top Seven States" are determined based upon operating revenues.

(c) Includes the Company's utility operations in the following states: Georgia, Hawaii, Iowa, Kentucky, Maryland, Michigan, New York, Tennessee and Virginia and other revenue attributable collectively to the Regulated Businesses.

ITEM 7. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

The following discussion should be read together with the Consolidated Financial Statements and the Notes thereto included elsewhere in this Form 10-K. This discussion contains forward-looking statements that are based on management's current expectations, estimates and projections about the Company's business, operations and financial performance. The cautionary statements made in this Form 10-K should be read as applying to all related forward-looking statements whenever they appear in this Form 10-K. The Company's actual results may differ materially from those currently anticipated and expressed in such forward-looking statements as a result of a number of factors, including those that are discussed under "Forward-Looking Statements," Item 1A—Risk Factors and elsewhere in this Form 10-K. The Company has a disclosure committee consisting of members of senior management and other key employees involved in the preparation of the Company's SEC reports. The committee is actively involved in the review and discussion of the Company's SEC filings. For a discussion and analysis of the Company's financial statements for fiscal 2019 compared to fiscal 2018, please refer to Item 7—Management's Discussion and Analysis of Financial Condition and Results of Operations in the Company's Annual Report on Form 10-K for the year ended December 31, 2019, filed with the SEC on February 18, 2020.

Overview

American Water is the largest and most geographically diverse, publicly-traded water and wastewater utility company in the United States, as measured by both operating revenues and population served. The Company employs approximately 7,000 professionals who provide drinking water, wastewater and other related services to over 15 million people in 46 states. The Company's primary business involves the ownership of utilities that provide water and wastewater services to residential, commercial, industrial, public authority, fire service and sale for resale customers, collectively presented as the "Regulated Businesses." The Company's utilities operate in over 1,700 communities in 16 states in the United States, with 3.5 million active customers with services provided by its water and wastewater networks. Services provided by the Company's utilities are subject to regulation by PUCs. The Company also operates market-based businesses that provide water, wastewater and other services to residential and smaller commercial customers, the U.S. government on military installations, as well as municipalities and utility customers, collectively presented as the "Market-Based Businesses." These Market-Based Businesses are not subject to economic regulation by state PUCs. See Item 1—Business for additional information.

Novel Coronavirus (COVID-19) Pandemic Update

American Water has been monitoring the global impact of COVID-19 pandemic and has taken steps to mitigate adverse impacts to the Company. The Company has three main areas of focus as part of its response to COVID-19: the care and safety of its employees; the safety of its customers and the communities it serves; and the execution of its business continuity plan. American Water continues to work with its vendors to prevent disruptions in its supply chain, and, at this time, has not experienced, and does not anticipate, any material negative impacts. The Company has also been monitoring the impacts of the pandemic on its access to the capital markets, and to the extent such access is adversely affected, American Water may need to consider alternative sources of funding for its operations and for working capital, any of which could increase its cost of capital.

This pandemic continues to evolve, and American Water continues to monitor developments affecting its employees, customers, contractors and vendors and will take additional actions as warranted. To date, the Company has experienced COVID-19 financial impacts, including an increase in uncollectible accounts expense, additional debt costs, and certain incremental operation and maintenance ("O&M") expenses. The Company has also experienced decreased revenues as a result of the suspension of late fees and foregone reconnect fees. These impacts are collectively referred to as "financial impacts." See Note 3—Impact of Novel Coronavirus (COVID-19) Pandemic in the Notes to Consolidated Financial Statements for additional information. The extent to which COVID-19 may further impact American Water, including without limitation, its liquidity, financial condition, and results of operations, will depend on future developments, which presently cannot be predicted.

Page 72 of 295

agreement, the expenditure in 2020 was $0.1 million. Tank painting expense for 2020, 2019 and 2018 was $155,000, $447,000, and $658,000, respectively.

Budgeted mandatory utility plant expenditures, due to planned governmental highway projects, which require the relocation of Artesian Water's water service mains, expected to be incurred in 2021 through 2023 are as follows:

In thousands	
2021	$ 3,020
2022	3,020
2023	3,020
	$ 9,060

The exact timing and extent of these relocation projects is controlled primarily by the Delaware Department of Transportation.

NOTE 12

GEOGRAPHIC CONCENTRATION OF CUSTOMERS

Artesian Water, Artesian Water Maryland and Artesian Water Pennsylvania provide water utility service to customers within their established service territory in all three counties of Delaware and in portions of Maryland and Pennsylvania, pursuant to rates filed with and approved by the DEPSC, the MDPSC and the PAPUC. As of December 31, 2020, Artesian Water was serving approximately 90,300 customers, Artesian Water Maryland was serving approximately 2,500 customers and Artesian Water Pennsylvania was serving approximately 40 customers.

Artesian Wastewater provides wastewater utility service to customers within its established service territory in Sussex County, Delaware pursuant to rates filed with and approved by the DEPSC. As of December 31, 2020, Artesian Wastewater was serving approximately 2,800 customers, including one large industrial customer that comprises approximately 24% of the outstanding accounts receivable balance at year end. All wastewater customers are located in Sussex County, Delaware.

NOTE 13

REGULATORY PROCEEDINGS

Overview

Our water and wastewater utilities generate operating revenue from customers based on rates that are established by state Public Service Commissions through a rate setting process that may include public hearings, evidentiary hearings and the submission of evidence and testimony in support of the requested level of rates by the Company.

We are subject to regulation by the following state regulatory commissions:

- The DEPSC, regulates both Artesian Water and Artesian Wastewater.
- The MDPSC, regulates both Artesian Water Maryland and Artesian Wastewater Maryland.
- The PAPUC, regulates Artesian Water Pennsylvania.

Our water and wastewater utility operations are also subject to regulation under the federal Safe Drinking Water Act of 1974, or Safe Drinking Water Act, the Clean Water Act of 1972, or the Clean Water Act, and related state laws, and under federal and state regulations issued under these laws. These laws and regulations establish criteria and standards for drinking water and for wastewater discharges. Capital expenditures and operating costs required as a result of water quality standards and environmental requirements have been traditionally recognized by state regulatory commissions as appropriate for inclusion in establishing rates.

Water and Wastewater Rates

Our regulated utilities periodically seek rate increases to cover the cost of increased operating expenses, increased financing expenses due to additional investments in utility plant and other costs of doing business. In Delaware, utilities are permitted by law to place rates into effect, under bond, on a temporary basis pending completion of a rate increase proceeding. The first temporary increase may be up to the lesser of $2.5 million on an annual basis or 15% of gross water sales. Should the rate case not be completed within seven months, by law, the utility may put the entire requested rate relief, up to 15% of gross water sales, in effect under bond until a final resolution is ordered and placed into effect. If any such rates are found to be in excess of rates the DEPSC finds to be appropriate, the utility must refund customers the portion found to be in excess with interest. The timing of our rate increase requests is therefore dependent upon the estimated cost of the administrative process in relation to the investments and expenses that we hope to recover through the rate increase. We can provide no assurances that rate increase requests will be approved by applicable regulatory agencies and, if approved, we cannot guarantee that these rate increases will be granted in a timely or sufficient manner to cover the investments and expenses for which we initially sought the rate increase.

Artesian Resources Corporation 2020 Annual Report Available Electronically to Shareholders

April 08, 2021 17:28 ET | Source: Artesian Resources Corporation

NEWARK, Del., April 08, 2021 (GLOBE NEWSWIRE) -- Artesian Resources Corporation (NASDAQ: ARTNA), a leading provider of water, wastewater services and related services on the Delmarva Peninsula today announced that its 2020 Annual Report is available electronically to shareholders through its website at https://www.artesianwater.com/investor-relations/annual-report/. If any shareholder would like to receive a print copy of the 2020 Annual Report, they can request one free of charge by writing or calling Artesian Resources Corporation, 664 Churchmans Road, Newark, Delaware 19702, Attention Laura Slayman (Phone Number: 302-453-6900).

About Artesian Resources

Artesian Resources Corporation operates as a holding company of wholly-owned subsidiaries offering water and wastewater services, and related services, on the Delmarva Peninsula. Artesian Water Company, the principal subsidiary, is the oldest and largest regulated water utility on the Delmarva Peninsula and has been providing water service since 1905. Artesian supplies 8.3 billion gallons of water per year through 1,311 miles of main to over 300,000 people.

Effective June 30, 2011, the CPUC adopted new rules related to the provision of non-regulated services using utility assets and employees. As a result, nearly all California non-regulated activities are now considered NTPS. The prescribed accounting for these NTPS is incremental cost allocation plus revenue sharing with regulated customers. Non-regulated services determined to be "active activities" require a 10% revenue sharing, and "passive activities" require a 30% revenue sharing. The amount of non-regulated revenues subject to revenue sharing is the total billed revenues less any authorized pass-through costs. Some examples of CPUC authorized pass-through costs are purchased water, purchased power, and pump taxes. All of our non-regulated services, except for leasing communication antenna sites on our properties, are "active activities" subject to a 10% revenue sharing. Leasing communication antenna sites on our properties are "passive activities" subject to a 30% revenue sharing. Cal Water's annual revenue sharing with regulated customers was $2.5 million, $2.7 million, and $2.6 million in 2020, 2019, and 2018, respectively.

Operating Segment

We operate in one reportable segment, the supply and distribution of water and providing water-related utility services. For information about revenue from external customers, net income and total assets, see "Item 8. Financial Statements and Supplementary Data."

Growth

We intend to continue exploring opportunities to expand our regulated and non-regulated water and wastewater activities, particularly in the western United States. The opportunities could include system acquisitions, lease arrangements similar to the City of Hawthorne and City of Commerce contracts, full service system operation and maintenance agreements, meter reading, billing contracts and other utility-related services.

Geographical Service Areas and Number of Customer Connections at Year-end

Our principal markets are users of water within our service areas. The approximate number of customer connections served in each regulated district, the City of Hawthorne and the City of Commerce, at December 31 is as follows:

(rounded to the nearest hundred)	2020	2019
SAN FRANCISCO BAY AREA/NORTH COAST		
Bay Area Region (serving South San Francisco, Colma, Broadmoor, San Mateo, San Carlos, Lucerne, Duncans Mills, Guerneville, Dillon Beach, Noel Heights and portions of Santa Rosa)	56,000	55,900
Bear Gulch (serving portions of Menlo Park, Atherton, Woodside and Portola Valley)	19,000	18,900
Los Altos (including portions of Cupertino, Los Altos Hills, Mountain View and Sunnyvale)	19,000	19,000
Livermore	18,900	18,900

Rates and Regulation

The Commissions have plenary powers setting both rates and operating standards. As such, the Commissions' decisions significantly impact the Company's revenues, earnings, and cash flows. The amounts discussed herein are generally annual amounts, unless otherwise stated, and the financial impact to recorded revenue is expected to occur over a 12-month period from the effective date of the decision. In California, water utilities are required to make several different types of filings. Certain filings, such as General Rate Case (GRC) filings, escalation rate increase filings, and offset filings, may result in rate changes that generally remain in place until the next GRC. As explained below, surcharges and surcredits to recover balancing and memorandum accounts as well as GRC interim rate relief are temporary rate changes which have specific time frames for recovery.

The CPUC follows a rate case plan which requires Cal Water to file a GRC for each of its regulated operating districts every three years. In a GRC proceeding the CPUC not only considers the utility's rate setting requests, but may also consider other issues that affect the utility's rates and operations. The CPUC is generally required to issue its GRC decision prior to the first day of the test year or authorize interim rates. In accordance with the rate case plan, Cal Water will file its next GRC application in July of 2021.

Between GRC filings, Cal Water may file escalation rate increases, which allow Cal Water to recover cost increases, primarily from inflation and incremental investments, during the second and third years of the rate case cycle. However, escalation rate increases are district specific and subject to an earnings test. The CPUC may reduce a district’s escalation rate increase if, in the most recent 13-month period, the earnings test reflects earnings in excess of what was authorized for that district.

In addition, California water utilities are entitled to make offset requests via advice letter. Offsets may be requested to adjust revenues for construction projects authorized in GRCs when those capital projects go into service (these filings are referred to as "rate base offsets"), or for rate changes charged to Cal Water for purchased water, purchased power, and pump taxes (which are referred to as "expense offsets"). Rate changes approved in offset requests remain in effect until the next GRC is approved.

- restrictive covenants in or changes to the credit ratings on our current or future debt that could increase our financing costs or affect our ability to borrow, make payments on debt or pay dividends; and
- the risks set forth in "Risk Factors" included elsewhere in this annual report.

In light of these risks, uncertainties and assumptions, investors are cautioned not to place undue reliance on forward-looking statements, which speak only as of the date of this annual report or as of the date of any document incorporated by reference in this annual report, as applicable. When considering forward-looking statements, investors should keep in mind the cautionary statements in this annual report and the documents incorporated by reference. We are not under any obligation, and we expressly disclaim any obligation, to update or alter any forward-looking statements, whether as a result of new information, future events or otherwise.

Overview

California Water Service Group is a holding company with six operating subsidiaries: California Water Service Company (Cal Water), New Mexico Water Service Company (New Mexico Water), Washington Water Service Company (Washington Water), Hawaii Water Service Company, Inc. (Hawaii Water), and CWS Utility Services and HWS Utility Services LLC (CWS Utility Services and HWS Utility Services LLC being referred to collectively in this annual report as Utility Services). Cal Water, New Mexico Water, Washington Water, and Hawaii Water are regulated public utilities. The regulated utility entities also provide some non-regulated services. Utility Services holds non-utility property and provides non-regulated services to private companies and municipalities outside of California. Cal Water was the original operating company and began operations in 1926.

Our business is conducted through our operating subsidiaries and we provide utility services to approximately two million people. The bulk of the business consists of the production, purchase, storage, treatment, testing, distribution and sale of water for domestic, industrial, public and irrigation uses, and for fire protection. In some areas, we provide wastewater collection and treatment services, including treatment which allows water recycling. We also provide non-regulated water-related services under agreements with municipalities and other private companies. The non-regulated services include full water system operation, billing and meter reading services. Non-regulated operations also include the lease of communication antenna sites, lab services and promotion of other non-regulated services.

During the year ended December 31, 2020, there were no significant changes in the kind of products produced or services rendered by our operating subsidiaries, or in the markets or methods of distribution.

Annual reports on Form 10-K, quarterly reports on Form 10-Q, current reports on Form 8-K and amendments to these reports are available free of charge through our website at www.calwatergroup.com. The reports are available on our website as soon as reasonably practicable after such reports are filed with the SEC.

The content on any website referred to in this annual report is not incorporated by reference in this annual report unless expressly noted.

Regulated Business

California water operations are conducted by Cal Water, which provides service to approximately 492,600 customer connections in approximately 100 California communities through 21 separate districts, which are subject to regulation by the California Public Utilities Commission (CPUC). California water operations accounted for approximately 90.7% of our total customer connections and 93.8% of our total consolidated operating revenue.

We operate the City of Hawthorne and the City of Commerce water systems under lease agreements. In accordance with the lease agreements, we receive all revenues from operating the systems and are responsible for paying the operating costs. The City of Hawthorne and the City of Commerce lease revenues are governed through their respective city councils and are considered non-regulated because they are

patterns by our customers, resulting from such causes as increased water conservation and the installation of water saving devices and appliances that can result in decreased water usage. It is estimated that in the event we experience a 0.50% decrease in residential water consumption it would result in a decrease in annual residential water revenue of approximately $2,800,000 and would likely be partially offset by a reduction in incremental water production expenses such as chemicals and power.

Our natural gas utility customer base is diversified among residential gas, commercial gas, industrial gas, gas transportation, and other utility (consisting of miscellaneous service revenue from gas distribution operations; gas processing and handling revenue; sales of natural gas at market-based rates and contracted fixed prices; sales of gas purchased from third parties; and other gas marketing activities). The Regulated Natural Gas segment operating revenues are reported for the period since closing on the Peoples Gas Acquisition on March 16, 2020. Substantially all of our natural gas utility customers are metered, which allows to measure and bill for our customers' natural gas usage. Natural gas usage per customer is affected by local weather conditions during the year, especially during the fall, winter, and early spring. These patterns reflect the higher demand for natural gas for heating purposes during the colder months.

Our growth in revenues over the past five years is primarily a result of the 2020 Peoples Gas Acquisition, increases in water and wastewater rates and customer growth. See *Economic Regulation* for a discussion of water, wastewater and natural gas rates. The increase in our utility customer base has been due to customers added through acquisitions, partnerships with developers, and organic growth (excluding dispositions) as shown below:

Year	Utility Customer Growth Rate
2020	42.9%
2019	2.1%
2018	2.3%
2017	1.1%
2016	1.6%

In 2020, 2019, and 2018, our customer count increased by 772,099, 21,108, and 22,741 customers, respectively, primarily due to the addition of approximately 750,000 natural gas utility customers from the Peoples Gas Acquisition, water and wastewater utility systems that we acquired, and organic growth. Overall, for the five year period of 2016 through 2020, our utility customer base, adjusted to exclude customers associated with utility system dispositions, increased at an annual compound rate of 13.4%. During the five year period ended December 31, 2020, our utility customer base including customers associated with utility system acquisitions and dispositions increased from 957,866 at January 1, 2016 to 1,798,803 at December 31, 2020.

Acquisitions and Other Growth Ventures

We believe that acquisitions will continue to be an important source of customer growth for us. We intend to continue to pursue acquisitions of government-owned and regulated water and wastewater systems that provide services in areas near our existing service territories or in new service areas. We engage in continuing activities with respect to potential acquisitions, including calling on prospective sellers, performing analyses of and due diligence on acquisition candidates, making preliminary acquisition proposals, and negotiating the terms of potential acquisitions. Further, we are also seeking other potential business opportunities, including but not limited to, partnering with public and regulated utilities to invest in infrastructure projects, growing our market-based activities by acquiring businesses that provide water and wastewater or other utility-related services, and investing in infrastructure projects.

Based on the 2019 U.S. Census American Housing Survey, approximately 89% of the U.S. population obtains its water from public or private water utility systems, and 11% of the U.S. population obtains its water from individual wells. With approximately 50,000 public or private water systems in the U.S. (81% of which serve less than 3,300 customers), the water industry is the most fragmented of the major utility industries (telephone, natural gas, electric, water and wastewater). The majority of these community water systems are government-owned. The nation's water systems range in size from large government-owned systems, such as the New York City water system, which serves approximately 8.3 million people, to small systems, where a few customers share a common well. In the states where we operate regulated water utilities, we believe there are approximately 14,000 public or private water utility systems of widely-varying size, with the majority of the population being served by government-owned water systems.

SPECIAL NOTE REGARDING FORWARD-LOOKING STATEMENTS

Certain statements in this Annual Report on Form 10-K, or this Annual Report are forward-looking statements within the meaning of Section 27A of the Securities Act of 1933 and Section 21E of the Securities Exchange Act of 1934 that are made based upon, among other things, our current assumptions, expectations, plans, and beliefs concerning future events and their potential effect on us. These forward-looking statements involve risks, uncertainties and other factors, many of which are outside our control that may cause our actual results, performance or achievements to be materially different from any future results, performance or achievements expressed or implied by these forward-looking statements. In some cases you can identify forward-looking statements where statements are preceded by, followed by or include the words "believes," "expects," "estimates", "anticipates," "plans," "future," "potential," "probably," "predictions," "intends," "will," "continue," "in the event" or the negative of such terms or similar expressions. Please refer to the Summary in Item 1A – Risk Factors in this Annual Report for a description of the types of Forward-looking statements in this Annual Report.

Given these risks and uncertainties, you should not place undue reliance on any forward-looking statements. You should read this Annual Report completely and with the understanding that our actual future results, performance and achievements may be materially different from what we expect. These forward-looking statements represent assumptions, expectations, plans, and beliefs only as of the date of this Annual Report. Except for our ongoing obligations to disclose certain information under the federal securities laws, we are not obligated, and assume no obligation, to update these forward-looking statements, even though our situation may change in the future. For further information or other factors which could affect our financial results and such forward-looking statements, see *Item 1A – Risk Factors*. We qualify all of our forward-looking statements by these cautionary statements.

PART I

Item 1. *Business*

The Company

Essential Utilities, Inc. (referred to as "Essential Utilities", the "Company", "we", "us", or "our"), a Pennsylvania corporation, is the holding company for regulated utilities providing water, wastewater, or natural gas services to an estimated five million people in Pennsylvania, Ohio, Texas, Illinois, North Carolina, New Jersey, Indiana, Virginia, West Virginia, and Kentucky under the Aqua and Peoples brands. One of our largest operating subsidiaries, is Aqua Pennsylvania, Inc., ("Aqua Pennsylvania") accounted for approximately 55% of operating revenues and approximately 67% of income for our Regulated Water segment in 2020. As of December 31, 2020, Aqua Pennsylvania provided water or wastewater services to approximately one-half of the total number of water and wastewater customers we serve. Aqua Pennsylvania's service territory is located in the suburban areas in counties north and west of the City of Philadelphia and in 27 other counties in Pennsylvania. Our other regulated water utility subsidiaries provide similar services in seven additional states. Additionally, pursuant to the Company' growth strategy, commencing on March 16, 2020 with the completion of the Peoples Gas Acquisition, the Company began to provide natural gas distribution services to customers in western Pennsylvania, Kentucky, and West Virginia. Approximately 93% of the total number of natural gas utility customers we serve are in western Pennsylvania. Lastly, the Company's market-based activities are conducted through Aqua Infrastructure, LLC and Aqua Resources Inc., and certain other non-regulated subsidiaries of Peoples. Prior to our October 30, 2020 sale of our investment in a joint venture, Aqua Infrastructure provided non-utility raw water supply services for firms in the natural gas drilling industry. Following the October 30, 2020 closing, Aqua Infrastructure does not provide any services to the natural gas drilling industry. Aqua Resources offers, through a third-party, water and sewer line protection solutions and repair services to households.

Essential Utilities, which prior to its name change on February 3, 2020 was known as Aqua America, Inc., was formed in 1968 as a holding company for its primary subsidiary, Aqua Pennsylvania, formerly known as Philadelphia Suburban Water Company. In the early 1990s, we embarked on a growth through acquisition strategy. Our most significant transactions to date have been the merger with Consumers Water Company in 1999, the acquisition of the regulated water and wastewater operations of AquaSource, Inc. in 2003, the acquisition of Heater Utilities, Inc. in 2004, the acquisition of American Water Works Company, Inc.'s regulated water and wastewater operations in Ohio in 2012, and the Peoples Gas

PART I

Item 1. Business.

Overview

Middlesex Water Company (Middlesex) was incorporated as a water utility company in 1897 and owns and operates regulated water utility and wastewater systems primarily in New Jersey and Delaware. Middlesex also operates water and wastewater systems under contract on behalf of municipal and private clients primarily in New Jersey and Delaware.

The terms "the Company," "we," "our," and "us" refer to Middlesex Water Company and its subsidiaries, including Tidewater Utilities, Inc. (Tidewater) and Tidewater's wholly-owned subsidiaries, Southern Shores Water Company, LLC (Southern Shores) and White Marsh Environmental Systems, Inc. (White Marsh). The Company's other subsidiaries are Pinelands Water Company (Pinelands Water) and Pinelands Wastewater Company (Pinelands Wastewater) (collectively, Pinelands), Utility Service Affiliates, Inc. (USA), Utility Service Affiliates (Perth Amboy) Inc., (USA-PA), Tidewater Environmental Services, Inc. (TESI) and Twin Lakes Utilities, Inc. (Twin Lakes).

The Company's principal executive offices are located at 485C Route 1 South, Suite 400, Iselin, New Jersey 08830. Our telephone number is (732) 634-1500. Our website address is http://www.middlesexwater.com. Information contained on our website is not part of this Annual Report on Form 10-K. We make available, free of charge through our website, reports and amendments filed or furnished pursuant to Section 13(a) or 15(d) of the Securities Exchange Act of 1934, after such material is electronically filed with or furnished to the United States Securities and Exchange Commission (the SEC).

Middlesex System

The Middlesex System in New Jersey provides water services to approximately 61,000 retail customers, primarily in eastern Middlesex County, New Jersey and provides water under wholesale contracts to the City of Rahway, Townships of Edison and Marlboro, the Borough of Highland Park and the Old Bridge Municipal Utilities Authority. The Middlesex System treats, stores and distributes water for residential, commercial, industrial and fire protection purposes. The Middlesex System also provides water treatment and pumping services to the Township of East Brunswick under contract. The amount of water supply allocated to the Township of East Brunswick is granted directly to the Township by the New Jersey Water Supply Authority. The Middlesex System produced approximately 59% of our 2020 consolidated operating revenues.

The Middlesex System's retail customers are located in an area of approximately 55 square miles in Woodbridge Township, the City of South Amboy, the Boroughs of Metuchen and Carteret, portions of the Township of Edison and the Borough of South Plainfield, all in Middlesex County, and a portion of the Township of Clark in Union County. Retail customers include a mix of residential customers, large industrial concerns and commercial and light industrial facilities. These customers are located in generally well-developed areas of central New Jersey.

The contract customers of the Middlesex System comprise an area of approximately 110 square miles with a population of over 200,000. Contract sales to the Townships of Edison and Marlboro, the City of Rahway and the Old Bridge Municipal Utilities Authority are supplemental to the water systems owned and operated by these customers. Middlesex is the sole source of water for the Borough of Highland Park and the Township of East Brunswick.

Middlesex provides water service to approximately 300 customers in Cumberland County, New Jersey. This system is referred to as Bayview, and is not physically interconnected with the Middlesex System. Bayview produced less than 1% of our 2020 consolidated operating revenues.

Tidewater System

Tidewater, together with its wholly-owned subsidiary, Southern Shores, provides water services to approximately 52,000 retail customers for residential, commercial and fire protection purposes in over 430 separate communities in New Castle, Kent and Sussex Counties, Delaware. The Tidewater System produced approximately 28% of our 2020 consolidated operating revenues.

USA-PA

USA-PA operates the City of Perth Amboy, New Jersey's (Perth Amboy) water and wastewater systems under a 10-year agreement, which expires in December 2028. There are approximately 12,000 customers comprised of residential, commercial and industrial connections, most of which are served by both the water and wastewater systems. In addition to performing day-to day operations, USA-PA is also responsible for emergency responses and management of capital projects funded by Perth Amboy. USA-PA produced approximately 5% of our 2020 consolidated operating revenues.

Pinelands Systems

Pinelands Water provides water services to approximately 2,500 residential customers in Burlington County, New Jersey. Pinelands Water is not physically interconnected with the Middlesex System. Pinelands Water produced approximately 1% of our 2020 consolidated operating revenues.

Pinelands Wastewater provides wastewater collection and treatment services to approximately 2,500 residential customers. Under contract, it also services one municipal wastewater system in Burlington County, New Jersey with approximately 200 residential customers. Pinelands Wastewater produced approximately 1% of our 2020 consolidated operating revenues.

USA

Tidewater System

Tidewater, together with its wholly-owned subsidiary, Southern Shores, provides water services to approximately 52,000 retail customers for residential, commercial and fire protection purposes in over 430 separate communities in New Castle, Kent and Sussex Counties, Delaware. The Tidewater System produced approximately 28% of our 2020 consolidated operating revenues.

USA-PA

USA-PA operates the City of Perth Amboy, New Jersey's (Perth Amboy) water and wastewater systems under a 10-year agreement, which expires in December 2028. There are approximately 12,000 customers comprised of residential, commercial and industrial connections, most of which are served by both the water and wastewater systems. In addition to performing day-to day operations, USA-PA is also responsible for emergency responses and management of capital projects funded by Perth Amboy. USA-PA produced approximately 5% of our 2020 consolidated operating revenues.

Pinelands Systems

Pinelands Water provides water services to approximately 2,500 residential customers in Burlington County, New Jersey. Pinelands Water is not physically interconnected with the Middlesex System. Pinelands Water produced approximately 1% of our 2020 consolidated operating revenues.

Pinelands Wastewater provides wastewater collection and treatment services to approximately 2,500 residential customers. Under contract, it also services one municipal wastewater system in Burlington County, New Jersey with approximately 200 residential customers. Pinelands Wastewater produced approximately 1% of our 2020 consolidated operating revenues.

USA

USA operates the Borough of Avalon, New Jersey's (Avalon) water utility, sewer utility and storm water system under a ten-year operations and maintenance contract expiring in 2022. USA serves approximately 6,400 retail customers in Avalon, most of which are served by both the water system and wastewater collection system. In addition to performing day-to-day operations, USA is responsible for billing, collections, customer service, emergency responses and management of capital projects funded by Avalon.

USA operates the Borough of Highland Park, New Jersey's (Highland Park) water utility and sewer utility under a ten-year operations and maintenance contract expiring in 2030. USA serves approximately 3,300 mostly retail customers in Highland Park. The contract commenced July 1, 2020.

USA also provides unregulated water and wastewater services under contract with several other smaller New Jersey municipalities.

Under a marketing agreement with HomeServe, USA offers residential customers in New Jersey and Delaware various water and wastewater related home maintenance programs. HomeServe is a leading national provider of such home maintenance service programs. USA receives a service fee for the billing, cash collection and other administrative matters associated with HomeServe's service contracts. The agreement expires in July 2021 and renewal discussions are underway.

USA produced approximately 2% of our 2020 consolidated operating revenues.

TESI System

TESI provides wastewater collection and treatment services to approximately 3,900 retail customers in Sussex County, Delaware. TESI produced approximately 2% of our 2020 consolidated operating revenues.

White Marsh

White Marsh operates or maintains water and/or wastewater systems that serve approximately 1,900 retail customers under more than 36 separate contracts. White Marsh also owns two commercial properties that are leased to Tidewater for its administrative office campus and its field operations center. White Marsh produced approximately 1% of our 2020 consolidated operating revenues.

Financial Information

Consolidated operating revenues, operating income and net income are as follows:

	(Thousands of Dollars) Years Ended December 31, 2020	2019	2018
Operating Revenues	$ 141,592	$ 134,598	$ 138,077
Operating Income	$ 37,420	$ 35,520	$ 37,142
Net Income	$ 38,425	$ 33,888	$ 32,452

FOR IMMEDIATE RELEASE

Middlesex Water Company Declares Quarterly Cash Dividend

ISELIN, N.J., Jan. 28, 2021 -- Middlesex Water Company (NASDAQ:MSEX) announced today that its Board of Directors has declared a cash dividend of $0.2725 per share on its common stock payable on March 1, 2021 to holders of record as of February 12, 2021. Middlesex Water has paid cash dividends in varying amounts continually since 1912 and has increased its annual dividend rate for 48 consecutive years.

Organized in 1897, Middlesex Water provides regulated and unregulated water and wastewater utility services primarily in New Jersey and Delaware through various subsidiary companies. To learn more about Middlesex Water, including information about its Investment Plan, visit the Investor Relations section at www.middlesexwater.com.

ABOUT MIDDLESEX WATER COMPANY

Middlesex Water Company serves as a trusted provider offering life-sustaining high quality water service for residential, commercial, industrial and fire protection purposes. The Company offers a full range of water, wastewater utility and related services. An investor-owned public utility, Middlesex Water is a professional services provider specializing in municipal and industrial contract operations and water and wastewater system technical operations and maintenance. The company and its subsidiaries form the Middlesex Water family of companies, which collectively serve a population of nearly half a million people in New Jersey and Delaware. Named a 2020 Top Workplace in New Jersey, Middlesex is focused on meeting the needs of our employees, customers, and shareholders. We invest in our people, our infrastructure and the communities we serve to support reliable and resilient utility services, economic growth and quality of life. To learn more about Middlesex Water, visit https://www.middlesexwater.com Please follow us on Facebook, Twitter and LinkedIn.

This release contains forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, including, among others, our long-term strategy and expectations, the status of our acquisition program, the impact of our acquisitions, the impact of current and projected rate requests and the impact of our capital program on our environmental compliance. There are important factors that could cause actual results to differ materially from those expressed or implied by such forward-looking statements including: general economic business conditions, unfavorable weather conditions, the success of certain cost containment initiatives, changes in regulations or regulatory treatment, availability and the cost of capital, the success of growth initiatives and other factors discussed in our filings with the Securities and Exchange Commission.

Page 87 of 295

Lead and copper may enter drinking water primarily through plumbing materials. The Company is required to comply with the Lead and Copper Rule established by the EPA and administered by the DEP. The Company must monitor drinking water at customer taps for compliance with this rule. If lead concentrations exceed an action level, the Company must undertake a number of additional actions to control corrosion, inform the public about steps they should take to protect their health and may be required to replace lead service lines under its control. See "Management's Discussion and Analysis – Environmental Matters" for a discussion of the Company's compliance with the Lead and Copper rule.

The DEP and the Susquehanna River Basin Commission, or SRBC, regulate the amount of water withdrawn from streams in the watershed to assure that sufficient quantities are available to meet the needs of the Company and other regulated users. Through its Division of Dam Safety, the DEP regulates the operation and maintenance of the Company's impounding dams. The Company routinely inspects its dams and prepares annual reports of their condition as required by DEP regulations. The DEP reviews these reports and inspects the Company's dams. The DEP most recently inspected the Company's dams in 2019.

Since 1980, the DEP has required any new dam to have a spillway that is capable of passing the design flood without overtopping the dam. The design flood is either the Probable Maximum Flood, or PMF, or some fraction of it, depending on the size and location of the dam. PMF is very conservative and is calculated using the most severe combination of meteorological and hydrologic conditions reasonably possible in the watershed area of a dam.

The Company engaged a professional engineer to analyze the spillway capacities at the Lake Williams and Lake Redman dams and validate the DEP's recommended flood design for the dams. Management presented the results of the study to the DEP in December 2004, and DEP then requested that the Company submit a proposed schedule for the actions to address the spillway capacities. Thereafter, the Company retained an engineering firm to prepare preliminary designs for increasing the spillway capacities to pass the PMF through armoring the dams with roller compacted concrete. Management has met with the DEP on a regular basis to review the preliminary design and discuss scheduling, permitting, and construction requirements. Recently, DEP expressed concern regarding the stability of the Lake Williams spillway in light of current design standards. The Company is currently completing the final design and the permitting process to armor and replace the spillway of the Lake Williams dam. The Company expects to finalize its plans in 2021 and begin construction in 2022 at a total cost of approximately $27 million. The Lake Redman dam will be reviewed following the completion of the work on the Lake Williams dam.

Capital expenditures and operating costs required as a result of water quality standards and environmental requirements have been traditionally recognized by state public utility commissions as appropriate for inclusion in establishing rates. The capital expenditures currently required as a result of water quality standards and environmental requirements have been budgeted in the Company's capital program and represent less than 15% of its expected total capital expenditures over the next five years. The Company is currently in compliance with wastewater environmental standards and does not anticipate any major capital expenditures for its current wastewater business.

Growth

(All dollar amounts are stated in thousands of dollars)

The Company continues to grow its number of customers and distribution facilities.

The growth in the number of customers of the Company is due primarily to the acquisition of water and wastewater systems and organic growth. During the year ended December 31, 2020, the Company increased its number of customers from 71,411 to 72,681. See "Management's Discussion and Analysis – Acquisitions and Growth" for a discussion of the Company's recent acquisitions.

The Company continues to grow its water distribution and wastewater collection systems to provide reliable service to its expanding franchised service territory and the increasing population within that territory. During the year ended December 31, 2020, the Company installed an additional 14,950 feet of water distribution mains and acquired an additional 32,593 feet of wastewater collection mains resulting in 987 miles of water mains and 36 miles of wastewater mains as of December 31, 2020.

The Company's growth in revenues is primarily a result of customer growth and increases in water and wastewater rates. During the year ended December 31, 2020, the Company recognized revenue of $53,852, an increase of $2,274, or 4.4%, as compared to $51,578 during the year ended December 31, 2019. In 2020, operating revenue was derived from the following sources and in the following percentages: residential, 66%; commercial and industrial, 26%; and other, 8%, which is primarily from the provision for fire service but includes other water and wastewater service-related income. See "Management's Discussion and Analysis – Rate Matters" for a discussion of the Company's rate case management.

THE YORK WATER COMPANY

PART I

Item 1. Business.

The York Water Company (the "Company") is the oldest investor-owned water utility in the United States and is duly organized under the laws of the Commonwealth of Pennsylvania. The Company has operated continuously since 1816. The primary business of the Company is to impound, purify to meet or exceed safe drinking water standards and distribute water. The Company also owns and operates two wastewater collection systems and five wastewater collection and treatment systems. The Company operates within its franchised water and wastewater territory, which covers portions of 51 municipalities within three counties in south-central Pennsylvania. The Company is regulated by the Pennsylvania Public Utility Commission, or PPUC, for both water and wastewater in the areas of billing, payment procedures, dispute processing, terminations, service territory, debt and equity financing and rate setting. The Company must obtain PPUC approval before changing any practices associated with the aforementioned areas.

Water service is supplied through the Company's own distribution system. The Company obtains the bulk of its water supply from both the South Branch and East Branch of the Codorus Creek, which together have an average daily flow of 73.0 million gallons. This combined watershed area is approximately 117 square miles. The Company has two reservoirs, Lake Williams and Lake Redman, which together hold up to approximately 2.2 billion gallons of water. The Company supplements its reservoirs with a 15-mile pipeline from the Susquehanna River to Lake Redman which provides access to an additional supply of 12.0 million gallons of untreated water per day. The Company also owns nine wells which are capable of providing a safe yield of approximately 597,000 gallons per day to supply water to the customers of its satellite systems in Adams County. As of December 31, 2020, the Company's average daily availability was 35.6 million gallons, and average daily consumption was approximately 19.9 million gallons. The Company's service territory had an estimated population of 202,000 as of December 31, 2020. Industry within the Company's service territory is diversified, manufacturing such items as fixtures and furniture, electrical machinery, food products, paper, ordnance units, textile products, air conditioning systems, laundry detergent, barbells, and motorcycles.

The Company's water business is somewhat dependent on weather conditions, particularly the amount and timing of rainfall. Revenues are particularly vulnerable to weather conditions in the summer months. Prolonged periods of hot and dry weather generally cause increased water usage for watering lawns, washing cars, and keeping golf courses and sports fields irrigated. Conversely, prolonged periods of dry weather could lead to drought restrictions from governmental authorities. Despite the Company's adequate water supply, customers may be required to cut back water usage under such drought restrictions which would negatively impact revenues. The Company has addressed some of this vulnerability by instituting minimum customer charges which are intended to cover fixed costs of operations under all likely weather conditions.

The Company's business does not require large amounts of working capital and is not dependent on any single customer or a very few customers for a material portion of its business. Increases in revenues are generally dependent on the Company's ability to obtain rate increases from the PPUC in a timely manner and in adequate amounts and to increase volumes of water sold through increased consumption and increases in the number of customers served. The Company continuously looks for water and wastewater acquisition and expansion opportunities both within and outside its current service territory as well as additional opportunities to enter into bulk water contracts with municipalities and other entities to supply water.

The Company has agreements with several municipalities to provide sewer billing and collection services. The Company also has a service line protection program on a targeted basis in order to further diversify its business. Under this optional program, customers pay a fixed monthly fee, and the Company will repair or replace damaged customer service lines, as needed, subject to an annual maximum dollar amount. The Company continues to review and consider opportunities to expand both initiatives.

Table of Contents

Competition

As a regulated utility, the Company operates within an exclusive franchised territory that is substantially free from direct competition with other public utilities, municipalities, and other entities. Although the Company has been granted an exclusive franchise for each of its existing community water and wastewater systems, the ability of the Company to expand or acquire new service territories may be affected by currently unknown competitors obtaining franchises to surrounding systems by application or acquisition. These competitors may include other investor-owned utilities, nearby municipally-owned utilities and sometimes competition from strategic or financial purchasers seeking to enter or expand in the water and wastewater industry. The addition of new service territory and the acquisition of other utilities are generally subject to review and approval by the PPUC.

TRENDS OF PUBLIC UTILITY CONSTRUCTION COSTS

GEOGRAPHIC REGIONS

FOREWORD

Tradition of Quality

The Handy-Whitman Index of Public Utility Construction Costs has been published continuously since 1924. Formerly the Handy Index, Bulletin Nos. 1 through 15 were developed by William W. Handy of Baltimore who had wide valuation experience in public utilities. *He believed that valuation studies should not be confined to rate cases but should be kept alive to the benefit of the utility industry.* He began publishing index numbers for electric and gas construction cost trends. Carrying on with the *tradition of quality*, after Mr. Handy's death, we continued publication for his estate beginning with Bulletin 16. Then, January 1, 1950, Whitman, Requardt and Associates, LLP purchased rights to the publication and have since been the sole publishers.

The name Handy-Whitman Index was adopted for Bulletin No. 53 and succeeding issues to combine the names of Mr. Handy and Ezra B. Whitman, a well-known valuation engineer. In 1957 an index of water utility construction costs was added. Mr. Whitman was a consultant on the publication of the Index until his death in 1963.

Whitman, Requardt and Associates, LLP

Ezra B. Whitman, a well-known valuation engineer was one of the founders of our firm. Major Whitman, as he was known from his World War I service, had already made a name for himself. Prior to the founding of the firm in 1915, Major Whitman had been President and Chief Engineer of the Water Board of the City of Baltimore. He designed the first rapid sand filtration plant serving a major city while he was the Baltimore Water Engineer. He was also president of the American Society of Civil Engineers and of the American Institute of Consulting Engineers and a chairman of the Public Service Commission of Maryland.

The Handy-Whitman Index is prepared especially for electric, gas and water utilities and is the only known publication of its kind available to the public. The list of subscribers is international and includes operating utilities, regulatory bodies, valuation engineers, equipment industries, insurance companies and reference libraries.

Tradition of Quality Continued

Since 1915, Whitman, Requardt and Associates, LLP, has been an independent consulting engineering firm organized to serve government, industry and private enterprise.

The firm has steadily expanded its engineering capabilities, providing complete services for civil, sanitary, structural, mechanical and electrical engineering and architectural projects from job inception through construction management. Construction cost data from utility projects of all types are available from design and valuation assignments. The staff is composed of specialists in these and related disciplines who bring a diverse professional and academic expertise to each assignment. A full-time staff is maintained specifically for preparing the Handy-Whitman Index.

Methods of Preparation of Indexes

An index number is a percentage ratio between the cost of an item at any stated time and its cost at a base period, or:

$$\text{Index Number} = \frac{\text{cost at stated time}}{\text{cost at base period}} \times 100$$

Index numbers have been prepared for many items, including wage rates, cost-of-living, material and equipment costs, and financial transactions. In the Handy-Whitman Index, index numbers have been developed for Building Construction, Electric Utility Construction, Gas Utility Construction and Water Utility Construction. Prices of basic materials such as cement, sand, gravel, cast iron pipe, wire, etc., are obtained from publications such as Engineering News-Record and checked against prices actually being paid for such materials. Labor cost trends are computed from labor rates obtained from sources such as the Construction Labor Research Council. Prices and cost trends of equipment are obtained from nationally recognized manufacturers, and operating utilities.

Handy-Whitman Index numbers are developed from wage rates and prices prevailing on January 1 and July 1 each year. The index numbers are generally based on 1973 = 100, although those items of recent origin are based on a later year.

The proportions of basic materials, labor, equipment and other cost components used in the Handy-Whitman Index are based on analyses developed during valuation and design assignments and on data furnished by utilities and industrial sources willing to assist with the Index. These data are reviewed continuously, and weightings and components are revised as required. This review assures that the indexes published reflect current construction practice.

Geographic Regions

To reflect differing cost trends throughout the 48 contiguous states, the index has been divided into six geographical regions of similar characteristics. They are shown on the accompanying map.

Use of Index Numbers

Handy-Whitman Index numbers have been widely used to trend earlier valuations and original cost records to estimate reproduction cost at prices prevailing at a certain date. The use of indexes for an appropriate property item or group will provide a reliable guide to changes in cost. Cost trends are given for all the important items of property. The electric and gas groups are arranged by the Federal Energy Regulatory Commission Uniform System of Accounts. The water property accounts are arranged to follow the classification of the National Association of Regulatory Utility Commissioners and the American Water Works Association.

The Handy-Whitman Index will furnish a yardstick for the fluctuations in value of property which will be satisfactory for many purposes. In rate cases, when a more exact determination of value is desired, however, the Index must be used carefully. Average prices and cost trends are used to develop the Index, and any direct application of cost trends without checking with actual local experience may not be accepted without controversy. When local experience is compared with the index and the correlation between the two trends is determined, the result is satisfactory. Costs trended by such a method are used to assist in establishing a rate base.

Indexes in these bulletins are used to trend earlier valuations or original cost records for insurance purposes.

The Handy-Whitman Index has a general application in valuations of all types of property. The building construction cost trends may be used wherever similar items of property are to be compared. Many of the other trends may be used for related items in other industries because of their similarity.

State-of-the-art changes often affect costs independently of inflation. New regulatory and environmental requirements, changes in work rules and improved design standards, for instance, increase construction costs even though the price of wages, materials and equipment may be static. Trended construction costs will not reflect such changes. However, trended costs are a reasonably accurate measure of the cost of reproducing actual plant.

Although every effort is made to maintain accuracy, Whitman, Requardt and Associates, LLP disclaim any responsibility for the use of these indexes, because local conditions may vary.

No guarantee or warranty of any kind is made in the sale of the Handy-Whitman Index. Published numbers are occasionally subject to change based upon receipt of new or different information. These numbers will be bolded.

Further inquiries on electric, gas and water indexes should be addressed to Whitman, Requardt and Associates, LLP.

Total Electric Plant and Function

Three indexes are provided for total plant. The first is for all steam generation and the other two for weighted combinations of steam and nuclear, and steam and hydro generation. Indexes are also provided for each function.

Indexes are not maintained for plant accounts 323,324,325,341,345 and 346. We believe that indexes for comparable accounts in other functions are sufficiently accurate for these accounts.

The indexes for total nuclear production and total other production incorporate comparable indexes from the steam production function for the accounts not listed.

Value of Index Numbers

We believe that present-day reproduction cost of any property can be calculated more accurately using index numbers than by repricing a complete inventory.

Trending the controlling items of property in any utility by the index method saves time and effort in arriving at a valuation. Analyzing and determining cost trends for all of the great numbers of articles of plant that represent only a very small proportion of the value of the utility is not necessary. They may be assumed to follow in general the trend of the controlling items, and the fluctuations in value above or below the trends of the controlling items will tend to offset each other and have a very slight effect on the total value.

Comments on Bulletin No. 193

During the twelve-month period ending January 1, 2021, the average index of all geographical regions for Total Gas Plant increased 0.9%, and the comparable index for Electric Plant-All Steam Generation increased 4.5%.

DELAWARE VALLEY dvrpc REGIONAL PLANNING COMMISSION

ADR 022 I July 2016

Analytical Data Report

County- and Municipal-Level Population Forecasts, 2015–2045

The Delaware Valley Regional Planning Commission is dedicated to uniting the region's elected officials, planning professionals, and the public with a common vision of making a great region even greater. Shaping the way we live, work, and play, DVRPC builds consensus on improving transportation, promoting smart growth, protecting the environment, and enhancing the economy. We serve a diverse region of nine counties: Bucks, Chester, Delaware, Montgomery, and Philadelphia in Pennsylvania; and Burlington, Camden, Gloucester, and Mercer in New Jersey. DVRPC is the federally designated Metropolitan Planning Organization for the Greater Philadelphia Region — leading the way to a better future.

DELAWARE VALLEY dvrpc REGIONAL PLANNING COMMISSION

The symbol in our logo is adapted from the official DVRPC seal and is designed as a stylized image of the Delaware Valley. The outer ring symbolizes the region as a whole while the diagonal bar signifies the Delaware River. The two adjoining crescents represent the Commonwealth of Pennsylvania and the State of New Jersey.

DVRPC is funded by a variety of funding sources, including federal grants from the U.S. Department of Transportation's Federal Highway Administration (FHWA) and Federal Transit Administration (FTA); the Pennsylvania and New Jersey departments of transportation; and DVRPC's state and local member governments. The authors, however, are solely responsible for the findings and conclusions herein, which may not represent the official views or policies of the funding agencies.

The Delaware Valley Regional Planning Commission (DVRPC) fully complies with Title VI of the Civil Rights Act of 1964, the Civil Rights Restoration Act of 1987, Executive Order 12898 on Environmental Justice, and related nondiscrimination statutes and regulations in all programs and activities. DVRPC's website, www.dvrpc.org, may be translated into multiple languages. Publications and other public documents can be made available in alternative languages and formats, if requested.

DVRPC public meetings are always held in ADA-accessible facilities and in transit-accessible locations when possible. Auxiliary services can be provided to individuals who submit a request at least seven days prior to a meeting. Requests made within seven days will be accommodated to the greatest extent possible. Any person who believes they have been aggrieved by an unlawful discriminatory practice by DVRPC under Title VI has a right to file a formal complaint. Any such complaint may be in writing and filed with DVRPC's Title VI Compliance Manager and/or the appropriate state or federal agency within 180 days of the alleged discriminatory occurrence. For more information on DVRPC's Title VI program, or to obtain a Title VI Complaint Form, please call (215) 592-1800 or email public_affairs@dvrpc.org.

As the region's metropolitan planning organization, DVRPC provides technical assistance and services to its member state and local governments. *Delaware Valley Data* is our periodic series of free data bulletins, analytical data reports, data reference guides, and data snapshots.

Background

Population and employment forecasts are a critical component of long-range land use and transportation planning. As a part of the Delaware Valley Regional Planning Commission's (DVRPC's) long-range planning activities, the Commission is required to maintain forecasts with at least a 20-year horizon, or to the horizon year of the long-range plan. DVRPC last adopted forecasts through the year 2040 in January 2012. Since that time, the Census Bureau has released 2015 population estimates, and both the nation and the region have continued to recover from the significant economic recession that officially began in December 2007 and ended in June 2009.

In order to incorporate the 2015 Census estimates and maintain a 30-year planning horizon, DVRPC has prepared 2045 population forecasts for its member counties and municipalities. These forecasts were formally adopted by the DVRPC Board on July 28, 2016, and serve as the basis for DVRPC planning and modeling activities. Employment forecasts in five-year increments through 2045 are scheduled to be adopted in October 2016.

Three alternative sets of county- and municipal-level 2045 population forecasts were developed based on the method described below, and sent to the county planning staffs for review and comment. Agreement was first reached on the county- and municipal-level 2045 population forecasts; forecasts for 2020, 2025, 2030, 2035, and 2040 were then calculated by DVRPC, based on the population growth rate predicted over each five-year increment by the Commission's age-cohort survival model. These mid-cycle forecasts were again sent to the counties for review, and their suggested revisions were incorporated to produce the final set of 2045 forecasts.

Method for Calculating County-Level 2045 Population Forecasts

Three alternative 2045 population forecasts were calculated for each county based on three separate methods, the results of which define a reasonable range of values within which each county's 2045 population total is expected to fall. This process replicates the process employed in 2007 and again in 2011, to develop the Commission's adopted 2035 and 2040 population forecasts. The three alternative methods are as follows:

- An initial set of draft county-level 2045 forecasts was obtained by running the traditional age-cohort survival model used in the previously forecasted round, but updating the model to incorporate 2000, 2005, 2010, and 2015 population data in five-year age/sex cohorts. When the analysis for this report was conducted, the Census Bureau had released 2015 estimates of the total population in each county, but had not yet released 2015 estimates by age/sex cohorts. The percentage of the population in each age/sex cohort in 2014 was therefore applied to the 2015 county estimates, to approximate 2015 age/sex breakdowns. The model incorporates birth, death, survival, and migration rates as follows:

- **Birth rate**: The model uses the number of live births per 1,000 women by five-year age cohort in New Jersey in 2013, assuming that New Jersey state-wide data is a better proxy for the Greater Philadelphia region's fertility rate than state-wide data from Pennsylvania (which has many non-metropolitan counties).

- **Survival rate**: Survival rate data (and, conversely, mortality rate data) was obtained from the National Vital Statistics System of the Center for Disease Control and Prevention (CDC). Future survival rates were adjusted to account for expected improvements in mortality related to medical advances and lifestyle changes, based on average increases in life expectancy over the past 20 years.

- **Migration**: The model assumes that migration (the change in the population that cannot be accounted for through births and deaths) in future years will be the same as the average migration rate experienced by each five-year age/sex cohort in each county between 2000 and 2015. Using the average migration rates between 2000 and 2015 accounts for changes in migration experienced prior to the economic recession, during the recession, and post-recession.

This age-cohort model replicates the model used in 2007 and again in 2011, but incorporates recent data to more accurately portray recent demographic trends. These trends include higher in-migration of seniors to certain areas of the region, declining overall fertility rates but higher fertility rates among women over age 35, and in-migration to Philadelphia and some of the region's older suburbs.

- A second set of county-level forecasts was developed utilizing the region-wide 2045 population forecast from the age-cohort model described above, but redistributing the total 2045 regional population to each of the nine counties based on the county percentages from the adopted 2040 forecasts. This alternative acknowledges that the longer-term development trends agreed upon during the process of developing the 2040 forecasts may be more important in some counties than the age-cohort births/deaths and shorter-term migration trends reflected in the county-level age-cohort method described above. It therefore continues those longer-term growth trends by reassigning the 2045 regional population among the nine counties, essentially adjusting migration rates to compensate for birth-death effects.

- A third alternative set of county-level forecasts was developed by applying the growth rates between each five-year time period from DVRPC's adopted 2040 forecasts to the previous five-year total, but using 2015 American Community Survey data as the base. The expected growth rate between 2040 and 2045 was based on the average change in the forecasted growth rate for each five-year increment between 2015 and 2040.

  This alternative ignores the results of the most recent age-cohort model and simply extends to 2045 the growth rates agreed upon during the process of developing the 2040 forecasts, as applied to the new 2015 base. This method assumes future population growth will follow previously adopted trends but adjusts for the differences in growth that actually occurred between 2010 and 2015.

The two alternatives to the age-cohort model incorporate the value of local planning knowledge and recognize that the adopted 2040 forecasts did not simply reflect the age-cohort results, but included significant input from the county planning staffs. Based on the above steps, three alternative sets of 2045 forecasts were developed for each of the nine counties, creating expected minimum and maximum 2045 county-level forecasts.

Method for Calculating Municipal-Level 2045 Population Forecasts

Each set of alternative county-level 2045 forecasts was disaggregated to the municipal level using the following method:

- The difference between the municipal-level 2015 Census population estimate and DVRPC's 2015 population forecast was calculated for each municipality.
- These differences were added or subtracted as appropriate from the adopted municipal-level 2040 forecasts. These adjusted 2040 forecasts were then used as a base for the calculation of the 2045 municipal forecasts.
- The adjusted 2040 population forecasts were summed and, for each set of alternatives, the percentage of the population forecasted to live in each municipality in 2040 (based on the adjusted 2040 forecasts) was applied to each of the 2045 county-level alternatives to create preliminary 2045 municipal forecasts, with the sum of all municipalities within each county matching the county-level 2045 forecast for each of the three alternatives.

This method assumes that the proportion of the county's population living in each municipality in 2040 will remain the same in 2045 and, when applied to the three alternative county-level forecasts, produced three alternative sets of municipal-level 2045 forecasts. These alternatives were sent to DVRPC's member counties' planning staff for review and comment, and consensus was reached on a full set of 2045 county and municipal forecasts.

Method for Developing Mid-Year Population Forecasts

Once agreement was reached on the county- and municipal-level 2045 population forecasts, forecasts for 2020, 2025, 2030, 2035, and 2040 were developed by DVRPC, based on the population growth predicted for each mid-year increment by the regional age-cohort survival model. The age-cohort model predicted a slight curve (rather than a straight line), with slightly more growth in the early years and a slight slowing near the end.

Obviously, the population of every municipality is not going to increase at exactly the same rate during each five-year interval. These mid-year numbers were simply intended to provide a logical starting point for discussion, and were sent to the county planning staffs for final review, based on their local knowledge of pending and approved development proposals and population growth trends. Their suggested revisions were incorporated to produce the final set of 2045 forecasts. Table 1 summarizes DVRPC's adopted regional and county forecasts in five-year increments through 2045, and municipal-level forecasts are provided in Appendix A.

EXHIBIT 20
Page 126 of 295

Table 2 identifies the 20 municipalities expected to gain the most residents between 2015 and 2045, and Table 3 identifies municipalities with the highest forecasted percentage change in population. Figure 1 illustrates the 2040 population forecasts by municipality, with concentrations of population seen in Philadelphia and the region's mature suburbs and along major highway corridors, including Route 422, Route 30, Mercer County's Route 1 corridor, and the Route 55 in Gloucester County and southern Camden County. Figures 2 and 3 illustrate absolute and percent change in population by municipality between 2015 and 2045, respectively.

Figure 4 illustrates the absolute increase in population per square mile in each of the region's 352 municipalities. This map illustrates not just where the population is increasing, but also the impact of relatively small population increases on the population density in specific municipalities. Significant increases in density are forecast not just in the City of Philadelphia, but also in many of the region's smaller boroughs, including Phoenixville, Atglen, Parkesburg, Oxford, Avondale, West Grove, and Kennett Square in Chester County; Bridgeport and Conshohocken in Montgomery County; and Riverside and Beverly in Burlington County.

Highlights

- The DVRPC region is forecast to gain over 658,000 residents between 2015 and 2045 (an 11.5 percent increase).

- As it has since the mid-2000s, the population of the City of Philadelphia increased between 2010 and 2015, with the city adding more than 41,000 residents. This trend is forecast to continue, with the city's population expected to increase by over 8 percent by 2045, adding over 128,000 residents. The share of the region's population living in the city is expected to increase slightly by 2045, from 26 percent, in 2015, to 27 percent.

- The population of the region's five southeastern Pennsylvania counties is forecast to increase by 11.8 percent between 2015 and 2045, while the population of the four New Jersey counties is expected to increase by 10.7 percent.

- The largest percentage increases in population are expected in municipalities in Gloucester County, New Jersey (where the county's population is forecast to increase by over 29 percent) and Chester County, Pennsylvania (where the population is forecast to increase by more than 28 percent).

- The largest absolute increase in population is forecast for Chester County, which is expected to gain over 146,000 residents and surpass Delaware County to become the region's fourth most populous county by 2045. Other counties forecast to see a significant number of additional residents include Philadelphia (as mentioned above), Montgomery County (with a forecasted increase of over 113,000 people), and Gloucester County, New Jersey (forecast to add almost 85,000 residents).

Summary

This report summarizes the method used to develop 2045 and interim-year population forecasts, which were adopted by the DVRPC Board on July 28, 2016. The population of the nine-county DVRPC region is forecast to increase by 11.5 percent between 2015 and 2045, with much of this growth concentrated in the suburbs, particularly in Chester County, Pennsylvania, and Gloucester County, New Jersey. The population of the City of Philadelphia is expected to increase by over 8 percent by 2045, and the share of the region's population living in the city is expected to increase slightly, from 26 percent in 2015 to 27 percent in 2045.

Population and employment forecasts are a critical component of long-range land use and transportation planning. The adopted population forecasts provided in this report will serve as the basis for DVRPC's planning and modeling activities. Employment forecasts in five-year increments through 2045 will be prepared and adopted in October 2016. The population and employment forecasts will be included in and support *Connections 2045*, the region's long-range plan update, scheduled for adoption in July 2017.

Report Title: **Analytical Data Report # 022: County- and Municipal-Level Population Forecasts, 2015-2045**

Publication No.: ADR 022

Date Published: July 2016

Geographic Area Covered: DVRPC's 9-county region, including Burlington, Camden, Gloucester, and Mercer counties in New Jersey, and Bucks, Chester, Delaware, Montgomery, and Philadelphia counties in Pennsylvania.

Key Words: population, population forecasts, age-cohort survival model, birth rates, survival rates, migration, Connections 2045, long-range plan

ABSTRACT: This report presents the Delaware Valley Regional Planning Commission's (DVRPC's) adopted 2045 county- and municipal-level population forecasts and describes the method used to develop them. Population and employment forecasts are a critical component of long-range land use and transportation planning. As a part of DVRPC's long-range planning activities, the Commission is required to maintain forecasts with at least a 20-year horizon, or to the horizon year of the long-range plan. DVRPC last adopted forecasts through the year 2040 in January 2012. Since that time, the Census Bureau has released 2015 population estimates, and both the nation and the region have continued to recover from the significant economic recession that officially began in December 2007 and ended in June 2009.

In order to incorporate the 2015 Census estimates and maintain a 30-year planning horizon, DVRPC has prepared 2045 population forecasts for its member counties and municipalities. These forecasts were formally adopted by the DVRPC Board on July 28, 2016, and serve as the basis for DVRPC planning and modeling activities. Employment forecasts in five-year increments through 2045 are scheduled to be adopted in October 2016.

DELAWARE VALLEY dvrpc REGIONAL PLANNING COMMISSION

ADR 023 I October 2016

Analytical Data Report

Regional, County, and Municipal Employment Forecasts, 2015–2045

DELAWARE VALLEY li..data

The Delaware Valley Regional Planning Commission is dedicated to uniting the region's elected officials, planning professionals, and the public with a common vision of making a great region even greater. Shaping the way we live, work, and play, DVRPC builds consensus on improving transportation, promoting smart growth, protecting the environment, and enhancing the economy. We serve a diverse region of nine counties: Bucks, Chester, Delaware, Montgomery, and Philadelphia in Pennsylvania; and Burlington, Camden, Gloucester, and Mercer in New Jersey. DVRPC is the federally designated Metropolitan Planning Organization for the Greater Philadelphia Region — leading the way to a better future.

DELAWARE VALLEY dvrpc REGIONAL PLANNING COMMISSION

The symbol in our logo is adapted from the official DVRPC seal and is designed as a stylized image of the Delaware Valley. The outer ring symbolizes the region as a whole while the diagonal bar signifies the Delaware River. The two adjoining crescents represent the Commonwealth of Pennsylvania and the State of New Jersey.

DVRPC is funded by a variety of funding sources, including federal grants from the U.S. Department of Transportation's Federal Highway Administration (FHWA) and Federal Transit Administration (FTA); the Pennsylvania and New Jersey departments of transportation; and DVRPC's state and local member governments. The authors, however, are solely responsible for the findings and conclusions herein, which may not represent the official views or policies of the funding agencies.

The Delaware Valley Regional Planning Commission (DVRPC) fully complies with Title VI of the Civil Rights Act of 1964, the Civil Rights Restoration Act of 1987, Executive Order 12898 on Environmental Justice, and related nondiscrimination statutes and regulations in all programs and activities. DVRPC's website, www.dvrpc.org, may be translated into multiple languages. Publications and other public documents can be made available in alternative languages and formats, if requested.

DVRPC public meetings are always held in ADA-accessible facilities and in transit-accessible locations when possible. Auxiliary services can be provided to individuals who submit a request at least seven days prior to a meeting. Requests made within seven days will be accommodated to the greatest extent possible. Any person who believes they have been aggrieved by an unlawful discriminatory practice by DVRPC under Title VI has a right to file a formal complaint. Any such complaint may be in writing and filed with DVRPC's Title VI Compliance Manager and/or the appropriate state or federal agency within 180 days of the alleged discriminatory occurrence. For more information on DVRPC's Title VI program, or to obtain a Title VI Complaint Form, please call (215) 592-1800 or email public_affairs@dvrpc.org.

As the region's metropolitan planning organization, DVRPC provides technical assistance and services to its member state and local governments. *Delaware Valley Data* is our periodic series of free data bulletins, analytical data reports, data reference guides, and data snapshots.

Introduction

As a part of our long-range planning activities, DVRPC is required to maintain forecasts with at least a 20-year horizon, or to the horizon year of the long-range plan. Population forecasts in five-year increments between 2015 and 2045 were adopted by the DVRPC Board on July 28, 2016. This document presents employment forecasts in five-year increments between 2015 and 2045, developed by DVRPC in coordination with its member county planning staffs. These population and employment forecasts will support the region's 2045 long-range plan, scheduled for adoption in July 2017, and serve as the basis for DVRPC's planning and modeling activities.

2010 and 2013 Employment Base

DVRPC has traditionally based its long-range employment forecasts on employment data from the American Association of State Highway and Transportation Officials' (AASHTO) Census Transportation Planning Products (CTPP). However, 2010 CTPP data was not released until mid-2013, too late to be used for forecasting purposes prior to the 2013 adoption of the current Connections 2040 Long Range Plan. Additionally, changes in the method for calculating CTPP data has increased the margins of error and made it a less reliable source of employment data for small geographies. Subsequently, DVRPC staff researched and compared several sources of employment data, including government sources (such as ES-202 data, the BLS' Quarterly Census of Employment and Wages, and the Current Employment Statistics survey) and private proprietary sources (including Dun and Bradstreet). The National Establishment Time-Series (NETS), produced by Walls and Associates, was determined to be superior to other sources in terms of coverage, accuracy, and the provision of locational data.

The NETS database is essentially a "cleaned-up" version of the Dun and Bradstreet database. Using each company's unique DUNS number (or numbers, in cases where separate divisions within a company have unique DUNS numbers), Walls and Associates creates a time series for each business and then screens the data to eliminate duplicates and identify anomalies. If a file contains suspicious information, the data is cross-checked with previous annual records and adjusted or eliminated as appropriate, based on information collected from other sources (including government and non-profits). One advantage of the establishment-based NETS Database is that all employment, sales, and other activity is reported at the actual facility—not the headquarters.

Unlike government sources of employment data, the NETS database includes sole proprietors, part-time jobs, and farm operations, and has been found to be more accurate in reporting data for small privately-owned firms and public sector employers such as post offices and public schools. Employment from the NETS database is therefore generally higher than many of these other sources. As a base for the 2040 forecasts, DVRPC and county planning staffs reviewed 2000 and 2010 employment data from a NETS database that was acquired in 2013.

In March 2016, DVRPC acquired an updated NETS dataset that included both revised 2010 and 2013 employment data. All corrections made to the previous NETS database by DVRPC and county planning staffs, either during the previous forecasting round or as a result of ongoing DVRPC land

use and transportation studies, were incorporated in to the new database. DVRPC staff reviewed the revised 2010 data and the 2013 data to eliminate any remaining duplicates and correct obvious errors, using resources that included CoStar, company web sites, and on-line business directories. The data was then reviewed by the region's county planning staffs, and further corrections were made based on local knowledge (including errors in location and missing large employers).

The NETS database used by DVRPC includes the street address and the most current latitude-longitude for each establishment as well as the origin and destination latitude-longitudes for all significant moves, at the four-decimal-place-level. In order to assign each employer to a specific municipality, every employer in the NETS database was geocoded. Based on an internal review by DVRPC staff, several spatially inaccurate results were identified, and numerous adjustments were made to improve the accuracy of the dataset before the results were sent to the counties for review. While the counties were reviewing the employment data, DVRPC staff continued to refine the NETS GIS dataset, by comparing TomTom results with other geocoding services, and by manually checking the location of hundreds of significant employers.

2015 Employment Estimates

Estimates of the 2015 employment were then calculated, based on both the changes in NETS employment by sector in each county between 2010 and 2013, and the employment change in each county between 2010 and 2015 released by the BLS in September 2016. The estimated 2015 county employment was allocated to municipalities based on the proportion of the county's employment that was present in each municipality in 2013.

2045 Employment Forecasts

Employment forecasts in five-year increments through 2045 were developed using a similar method as was used in previous forecasting rounds. Various studies and past experience have shown that there is a direct relationship between the number of workers living in a region (which is a function of population) and the number of jobs. To forecast future employment, DVRPC determined an expected future ratio of employment to population for each county, based on the known ratio in 2015. These ratios were applied to the Commission's adopted 2045 population forecasts, to create employment forecasts for each county, in five-year increments through 2045.

County-level employment forecasts between 2020 and 2040 were disaggregated to the municipal level based on the proportion of each county's employment that was expected to be in each municipality by DVRPC's adopted 2040 forecasts, as adjusted by the differences between the Commission's adopted 2015 forecast and the 2015 NETS employment estimates. The proportion of each county's employment expected to be in each municipality in 2045 was forecast based on the linear trend in the proportion from 2015 to 2040. The draft employment forecasts in five-year increments were then reviewed by county planning staffs, and final revisions were made based on their recommendations.

Military employment, which DVRPC staff believes was not accurately reflected in the NETS database, was accounted for by adding the military employment in each municipality reported in the 2006–2010 five-

year CTPP estimates to the 2015 employment estimate and the future employment forecasts. Given the difficulty of forecasting future military employment, the number of military employees was kept stable in future years.

Table 1 summarizes regional and county employment forecasts in five-year increments through 2045, and municipal-level forecasts are provided in Appendix A. Table 2 identifies the 20 municipalities expected to gain the most employees between 2015 and 2045 in absolute numbers, while Table 3 identifies municipalities with the highest forecast percentage change in employment. Figure 1 illustrates the DVRPC region's 2045 municipal employment forecasts, and Figures 2 and 3 illustrate absolute and percent change in employment by municipality between 2015 and 2045.

Figure 4 illustrates the absolute increase in employment per square mile in each of the region's 352 municipalities and 18 City of Philadelphia planning districts. This map highlights not only where employment is increasing, but also the impact of relatively small increases on employment density in many of the region's centers. Employment density is forecast to increase not only in the City of Philadelphia, but also in many of the region's smaller boroughs, including Conshohocken and West Conshohocken boroughs in Montgomery County; Dublin, Penndel, and Ivyland boroughs in Bucks County; and Kennett Square, Phoenixville, and Downingtown boroughs in Chester County.

Highlights include the following:

- The DVRPC region is forecast to gain almost 373,000 jobs between 2015 and 2045 (an increase of almost 12 percent), with much of this growth concentrated in the suburbs.
- The region's five southeastern Pennsylvania counties are forecast to experience a 12.6 percent increase in employment, while employment in the four New Jersey counties is expected to increase by 9.8 percent.
- The largest percent increases are forecast in Gloucester County in New Jersey and Chester County in Pennsylvania, where employment is forecast to increase by 29 and 28 percent, respectively.
- The largest absolute increase in employment is forecast for Chester County, expected to gain 87,800 employees. Other counties forecast to see a significant number of additional employees include Montgomery County (expected to gain almost 82,000 employees) and Philadelphia (with a forecasted increase of almost 64,000 jobs).
- Both Philadelphia and Camden City, New Jersey, are forecast to gain employment, with forecasted percentage increases of 8.3 percent and 10.1 percent, respectively. The region's other two core cities are expected to see their employment stabilize and increase slightly, with a 2.8 percent increase in employment in Trenton, New Jersey, and a 2.6 percent increase in Chester City, Pennsylvania.

Summary

Population and employment forecasts are a critical component of long-range land use and transportation planning. This report presents the method used to develop 2045 and interim year employment forecasts, adopted by the DVRPC Board on October 27, 2016.

Data from the National Establishments Time Series (NETS) database served as the base for the 2045 employment forecasts. In March 2016, DVRPC acquired an updated NETS database that included 2013 employment data and revised 2010 data. The 2010 and 2013 employment data was reviewed and revised by DVRPC staff, utilizing resources that included CoStar, on-line business directories, company websites and, when appropriate, direct telephone calls. The revised data was then sent to the county planning staffs for additional revision. Additionally, during the summer of 2016, DVRPC acquired improved geocoding resources that allowed staff to further correct the spatial locations of employers.

Based on changes in the NETS employment between 2010 and 2013, and changes in employment in each county between 2010 and 2015 as reported by the U.S. Bureau of Labor Statistics (BLS), 2015 employment was estimated by county and municipality. Given that studies have shown that there is a direct relationship between the number of workers living in an area and the number of jobs, employment forecasts were calculated in five-year increments through 2045, by estimating a future ratio of population to employment in each county and applying it to DVRPC's adopted population forecasts.

Employment in the nine-county region is forecast to increase by almost 12 percent between 2015 and 2045, with the greatest absolute increases in employment expected in Chester, Montgomery, and Philadelphia counties and the greatest percentage increases forecast in Gloucester County, New Jersey, and Chester County, Pennsylvania. Together with the 2045 population forecasts adopted by the DVRPC Board in July 2016, these employment forecasts will serve as the basis for DVRPC's planning and modeling activities, and support the region's 2045 long-range plan, scheduled for adoption in July 2017.
