Mechanicsburg, PA 17055

Attention Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant. The results of our study as of June 30, 2024 are presented in the attached report. The results of our study as of June 30, 2023 are presented in our report, "2023 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of June 30, 2023." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2024.

Respectfully submitted,

GANNETT FLEMING VALUATION  
AND RATE CONSULTANTS, LLC

## **PART I. INTRODUCTION**

# **PENNSYLVANIA-AMERICAN WATER COMPANY**

## **WATER OPERATIONS**

### **DEPRECIATION STUDY**

#### **PART I. INTRODUCTION**

##### **SCOPE**

This report presents the results of the depreciation study prepared for Pennsylvania-American Water Company (the Company) as applied to water plant in service as of June 30, 2024. The study results include annual depreciation rates and amounts for regulatory reporting. The regulatory rates and amounts are based on the straight line remaining life method of depreciation. The report also describes the concepts, methods and basic judgments which underlie recommended annual depreciation accrual rates and amounts related to current water plant in service.

##### **PLAN OF REPORT**

Part I, Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and the methods used in the service life and net salvage studies. Part III, Service Life Considerations, presents the factors and judgment utilized in the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents a summary by depreciable group of annual depreciation accrual rates and amounts. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates; Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation; and Part VIII, Experienced and Estimated Net Salvage, presents the cost of removal and gross salvage recorded for the period 2019-2023.

## **BASIS OF THE STUDY**

### **Depreciation**

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

For most accounts, the annual depreciation was calculated by the straight line remaining life method using the equal life group procedure. For certain General Plant accounts, the annual depreciation is based on amortization accounting. Both types of calculations were based on original cost, attained ages of plant in service and the estimated service life characteristics of each depreciable group.

### **Service Life Estimates**

The service life estimates used in the depreciation and amortization calculations were based on informed judgment which incorporated a review of management's plans,

policies and outlook, a general knowledge of the water utility industry, and comparisons of the service life estimates from our studies of other water utilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for water plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and estimates of future experience yielded estimated survivor curves from which the average service lives were derived.

The Company's service life estimates used in the depreciation calculation incorporated historical data compiled through December 2021 from the property records of the Company. This represents the last service life study approved. Such data included plant additions, retirements, transfers and other activity. Generally, retirement data for the years through 2021 were used in the actuarial life table computations which were the primary statistical support of the service life estimates.

A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirement was obtained through discussions with operating and management personnel conducted during the course of the service life study. Information regarding plans for the future was incorporated in the interpretation and extrapolation of the statistical analyses.

## **DEVELOPMENT OF NET ORIGINAL COST**

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting customer advances, contributions in aid of construction and excluded property.

The excluded property consists of: (1) a portion of the cost of the White Deer filter plant excluded pursuant to the Commission's Order at R-832511 adopted July 20, 1984 in the amount of \$942,914; (2) the cost of utility plant in the Berwick District excluded in compliance with recommendations made by the Commission Bureau of Audits in a continuing property records audit completed in 1989 in the amount of \$180,764; and (3) an exclusion to reflect the removal of contractor retention balances from amounts on which an Allowance for Funds Used During Construction was calculated in the amount of \$434,336 pursuant to the Commission's Order at R-932670 adopted July 21, 1994.

The development of net original cost by plant account is set forth in Table 1 on pages V-5 and V-6.

---

## **PART II. ESTIMATION OF SURVIVOR CURVES**

## **PART II. ESTIMATION OF SURVIVOR CURVES**

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

### **SURVIVOR CURVES**

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

### **Iowa Type Curves**

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

**FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES**

**FIGURE 2. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES**

**FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES**

**FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES**

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."<sup>1</sup> In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

### **Retirement Rate Method of Analysis**

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"<sup>2</sup> "Engineering Valuation and Depreciation,"<sup>3</sup> and "Depreciation Systems."<sup>4</sup>

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

## **Schedules of Annual Transactions in Plant Records**

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 2010 were retired in 2015. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024

<sup>a</sup> Transfer Affecting Exposures at Beginning of Year

<sup>b</sup> Transfer Affecting Exposures at End of Year

<sup>c</sup> Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

**Schedule of Plant Exposed to Retirement**

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

**SCHEDULE 3. PLANT EXPOSED TO RETIREMENT**  
**JANUARY 1 OF EACH YEAR 2015-2024**  
**SUMMARIZED BY AGE INTERVAL**

Year Placed	Exposures, Thousands of Dollars										Total at		Age Interval

<sup>a</sup>Additions during the year

Experience Band 2015-2024

Placement Band 2010-2024

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

### **Original Life Table**

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15	
Exposures at age 4½	=	3,789,000	
Retirements from age 4½ to 5½	=	143,000	
Retirement Ratio	=	143,000 ÷ 3,789,000	= 0.0377
Survivor Ratio	=	1.000 - 0.0377	= 0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	= 84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE  
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024

Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)

13.5	<u>167</u>	<u>26</u>	0.1557	0.8443	42.24
Total	<u>44,780</u>	<u>1,606</u>			35.66

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.

Column 3 from Schedule 1, Column 12, Retirements for Each Year.

Column 4 = Column 3 Divided by Column 2.

Column 5 = 1.0000 Minus Column 4.

Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

### **Smoothing the Original Survivor Curve**

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

## **PART III. SERVICE LIFE CONSIDERATIONS**

## PART III. SERVICE LIFE CONSIDERATIONS

### FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips are conducted for each service life study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the past field trips.

#### January 28, 2020

- McKeesport Wastewater Treatment Plant
- West Shore Pump Station
- 28<sup>th</sup> Street Pump Station
- Long Run Pump Station
- Dravosburg Wastewater Treatment Plant
- Duquesne Wastewater Treatment Plant

#### August 22, 2012

- Capital Operations Center (Mechanicsburg)
- Slate Hill Road Tank
- Slate Hill Road Booster Station
- Westport Booster Station
- Silver Springs Water Treatment Plant
- Hershey Corporate Office
- Hershey Water Treatment Plant (G. C. Smith)
- Swatara Creek Raw Water Pump Station
- Westford Crossing Booster Station and Tank

## **SERVICE LIFE CONSIDERATIONS**

The service life estimates were based on judgment which considered a number of factors. The primary factors were the statistical analyses of data, current Company policies and outlook as determined during field reviews of the property and other conversations with management, and the survivor curve estimates from other water companies.

For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group. The judgments for a life span group were made by

estimating the life of the major facility in the group and assigning lives to the related items of property which terminate at the probable retirement date of the major facility.

The life span estimates for structures and equipment in Accounts 303, 304, 305, 306 and 320 were based on the type of construction, attained age and specific plans of management. The following tabulation sets forth the estimated life span for each life span group.

<u>Life Span Group</u>	<u>Life Span</u>
<u>Account 303.35, Waste Handling and Treatment Land</u>	
Sanitary Landfill	50
<u>Account 304.20, Power and Pumping Structures</u>	
Booster Stations	50,60
<u>Account 304.30, Purification Buildings</u>	
Filter Plants	60-80
Tank Painting	10
Waste Handling and Treatment Structures	50
<u>Account 304.61, Office Buildings</u>	
Regional Offices	45
Corporate Office	65
<u>Account 304.62, Stores, Shop and Garage Structures</u>	
Distribution Centers	45, 50
<u>Account 305.00, Collecting and Impounding Reservoirs</u>	
Large Reservoirs	100, 120, 150
<u>Account 306.00, Lake, River and Other Intakes</u>	
Intakes	80

<u>Life Span Group</u>	<u>Life Span</u>
<u>Account 320.10, Purification System - Large Structures</u>	
Filters and Related Structures	55-75
Painting	10

For capitalized painting, the expectation is that there will be very minor retirements prior to the final retirement of the group. A square survivor curve, that is, no dispersion of retirements, was estimated for these groups. For the reservoirs, intakes, structures and filters, the expectation is that there will be retirements prior to the final retirement of the plant. Interim survivor curves were estimated for the plant based on prior studies and judgment. The interim survivor curves are as follows:

<u>Account</u>		<u>Interim Survivor Group</u>
303.35	Waste Handling and Treatment Land	100-R3
304.20	Power and Pumping Structures	75-S0.5
304.30	Purification Buildings	55-S1
304.36	Waste Handling and Treatment Structure	55-S1
304.61	Office Buildings	55-S0
304.62	Stores, Shop and Garage Structures	55-S0.5
305.00	Collecting and Impounding Reservoirs	130-R2
306.00	Lake, River and Other Intakes	55-S1.5
320.10	Purification System - Large Structures	50-S1

The average survivor curves estimated for depreciable groups with numerous similar items were based on statistical analyses, Company policies, and previous estimates made for this and other companies. For 28 of the mass plant accounts and subaccounts for which survivor curves were estimated, the statistical analysis resulted in good indications of the survivor patterns experienced. Generally, the statistical analyses were the primary bases for the estimates for the following accounts:

	<u>Property Group</u>	<u>Survivor Curve</u>
304.15	Other Water Source Structures	50-S0.5
304.63	Miscellaneous Structure and Improvements	35-S0.5
307.00	Wells and Springs	55-S0
310.00	Power Generation Equipment	45-S0.5
311.20 - 311.54	Electric Pumping Equipment	39-S0
320.20	Purification System – Chemical Treatment	42-R0.5
320.30	Granular Activated Carbon	11-L0.5
320.37	Waste Handling and Treatment – Equipment	30-R3
330.00 - 330.40	Distribution Reservoirs and Standpipes	65-S0.5
331.00	Mains and Accessories	90-R2
333.00	Services	65-R2.5
334.00	Meters and Meter Installations	20-L1.5
335.00	Fire Hydrants	60-R2
341.00 - 341.40	Transportation Equipment	10-L2.5
345.00	Power Operated Equipment	21-S0.5

The average survivor curve estimate for Account 334.00, Meters and Meter Installations, is the 20-L1.5 which reflects the Company policy that retirements of installations will be based on the retirement of the meter.

The average survivor curves for the remaining minor depreciable accounts and subaccounts were based on judgment incorporating the size and nature of the property and the previous studies for this and other companies.

The amortization periods selected for general plant Accounts 340.00, 342.00, 343.00, 346.00, 347.00 and 348.00 are discussed in the section, “Amortization of General Plant Accounts.”

---

**PART IV. CALCULATION OF ANNUAL AND  
ACCRUED DEPRECIATION**

## PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

### BOOK RESERVE

The book reserve as of June 30, 2023, is the result of a bringforward of the book reserves established by the Commission for each of the companies that were merged to become Pennsylvania-American Water Company in the following rate orders:

<u>Company</u>	<u>Order Entered</u>	<u>Docket No.</u>
Keystone Water Company	March 29, 1985	R-842755
Riverton Consolidated Water Company	March 21, 1985	R-842675
Western Pennsylvania Water Company	January 24, 1985	R-842621

The book reserve activity subsequent to those dates consists of accruals, retirements, cost of removal, gross salvage and other debits and credits recorded to the book reserve through June 30, 2023. The actual reserve as recorded on the books of Pennsylvania Gas & Water and previously used for ratemaking purposes, was recorded as a credit to the Company's book reserve at the date of acquisition. The projected book reserve as of June 30, 2024, is a bringforward of the June 30, 2023 book reserve based on projected accruals, retirements, cost of removal, gross salvage and other credits.

### CALCULATION OF DEPRECIATION

The annual depreciation accruals as of June 30, 2024, are based on the straight line remaining life method and the equal life group procedure. For the purpose of calculating the remaining life accruals as of June 30, 2024, the book reserve is allocated among vintages in proportion to the calculated accrued depreciation as of June 30, 2024.

**Group Depreciation Procedures.** A group procedure for depreciation is appropriate when considering more than a single item of property. Normally, the items within a group do not have identical service lives, but have lives that are dispersed over a range of time.

In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

In the equal life group procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. This procedure eliminates the need to base depreciation on average lives, inasmuch as each group is equivalent to a unit having a single life. The full costs of short-lived units are accrued during their lives, leaving no deferral of accruals required to be added to the annual costs associated with long-lived units. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

**Remaining Life Annual Accruals.** For the purpose of calculating remaining life accrual rates as of June 30, 2024, the estimated book depreciation reserve for each plant

account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation based on the equal life group procedure follow. The detailed calculations are set forth in the Results of Study section of the report.

**Equal Life Group Procedure.** In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\sum \left( \frac{\text{Book Cost}}{\text{Life}} \times \text{Remaining Life} \right)}{\sum \frac{\text{Book Cost}}{\text{Life}}}$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining Life} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost} - \text{Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$Ratio = 1 - \left( \frac{Remaining\ Life}{Service\ Life} \right)$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$Ratio = \left( \frac{Age}{Service\ Life} \right)$$

## **CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION**

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most

of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is appropriate for certain General Plant accounts that represent numerous units of property, but a very small portion of depreciable water plant in service. The accounts and their amortization periods are as follows:

Account	Amortization Period, Years
340, Office Furniture and Equipment	
Furniture	20
Computers and Peripheral Equipment	5
Computer Software	5
Computer Software – Enterprise Solutions	10
Other Office Equipment	10
342, Stores Equipment	20
343, Tools and Work Equipment	20
344, Laboratory Equipment	20
346, Communication Equipment	
Equipment	15
Non-Telephone	15
Remote Control and Instrumentation	10
Telephone	10
347, Miscellaneous Equipment	25
348, Other Tangible Equipment	25

The annual amortization amount is determined by dividing the original cost for vintages whose age is less than the amortization period by the period of amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period.

### **NET SALVAGE**

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2019 through

June 30, 2023, and estimated for the period July 1, 2023 through December 31, 2023. The calculation of the amortization is shown in Table 5 on page V-16. The amounts of gross salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

---

## **PART V. RESULTS OF STUDY**

## **PART V. RESULTS OF STUDY**

### **QUALIFICATION OF RESULTS**

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and net salvage and for the change of the composition of property in service. The annual accrual rates were calculated in accordance with the straight line remaining life method of depreciation, using the equal life group procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

The annual depreciation accrual rates are applicable specifically to the water plant in service as of June 30, 2024. For most plant accounts, the application of such rates to future balances that reflect additions subsequent to June 30, 2024, is reasonable for a period of three to five years.

### **DESCRIPTION OF DETAILED TABULATIONS**

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2024 of the book reserve as of June 30, 2023. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months

ended June 30, 2024. Table 5 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2019-2023. The total amortization amount is incorporated in the total annual accrual in Table 2.

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2019-2023 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2019-2023, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to

develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 5, which presents the five-year amortization of net salvage.

Mechanicsburg, PA 17055

Attention: Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant as of June 30, 2025. The results of our study as of June 30, 2024 are presented in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of June 30, 2024". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

**DEPRECIATION STUDY**

**RESULTS OF STUDY**

**DESCRIPTION OF SUMMARY TABULATIONS**

Tables 1 through 5 presented on pages 3 through 14 summarize the results of the depreciation study as of June 30, 2025. Table 1 sets forth the development of the net original cost by account as of June 30, 2025. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2025, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2025. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2025. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2012 through 2024.

**DESCRIPTION OF DETAILED TABULATIONS**

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-7. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2020 through 2024, beginning on pages III-2 through III-6.

Mechanicsburg, PA 17055

Attention Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2023. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 through 3, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2024".

Respectfully submitted,

## **PART I. RESULTS OF STUDY**

**PENNSYLVANIA-AMERICAN WATER COMPANY**  
**WASTEWATER SSS GENERAL OPERATIONS**

**DEPRECIATION STUDY**

**PART I. RESULTS OF STUDY**

**DESCRIPTION OF SUMMARY TABULATIONS**

Table 1 presents the development of net original cost used in the study. The net original cost is the original cost of wastewater plant less advances and contributions. The results of the depreciation study are summarized in Table 2, which sets forth the book reserve and the calculated annual depreciation related to net original cost as of June 30, 2023, and the annual amortization of net negative salvage. Table 3 presents the calculation of the amortization of experienced net salvage, by account, based on the five-year period, 2018 through 2022.

**DESCRIPTION OF DETAILED TABULATIONS**

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2018 through 2022, on pages III-2 through III-5.

Mechanicsburg, PA 17055

Attention Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2024 are presented in the attached report. The results of our study as of June 30, 2023 are presented in our report, "2023 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2023." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2024.

Respectfully submitted,

GANNETT FLEMING VALUATION

## **PART I. INTRODUCTION**

# **PENNSYLVANIA-AMERICAN WATER COMPANY**

## **WASTEWATER SSS GENERAL OPERATIONS**

### **DEPRECIATION STUDY**

#### **PART I. INTRODUCTION**

##### **SCOPE**

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2024. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2024.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates, Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation and Part VIII, Experienced and Estimated Net Salvage, presents the cost of removal and gross salvage recorded for the period 2019-

2023.

## **BASIS OF THE STUDY**

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2024. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of lowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

## **DEVELOPMENT OF NET ORIGINAL COST**

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

---

## **PART II. ESTIMATION OF SURVIVOR CURVES**

## **PART II. ESTIMATION OF SURVIVOR CURVES**

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

### **SURVIVOR CURVES**

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

### **Iowa Type Curves**

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

**FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES**

**FIGURE 2.. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES**

**FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES**

**FIGURE 4.. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES**

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."<sup>1</sup> In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

### **Retirement Rate Method of Analysis**

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"<sup>2</sup> "Engineering Valuation and Depreciation,"<sup>3</sup> and "Depreciation Systems."<sup>4</sup>

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

## **Schedules of Annual Transactions in Plant Records**

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 2010 were retired in 2015. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024  
SUMMARIZED BY AGE INTERVAL

<sup>a</sup> Transfer Affecting Exposures at Beginning of Year

<sup>b</sup> Transfer Affecting Exposures at End of Year

<sup>c</sup> Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

**Schedule of Plant Exposed to Retirement**

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

**SCHEDULE 3. PLANT EXPOSED TO RETIREMENT**  
**JANUARY 1 OF EACH YEAR 2015-2024**  
**SUMMARIZED BY AGE INTERVAL**

Year Placed	Experience Band 2015-2024										Placement Band 2010-2024

<b>Total</b>	<b>1,975</b>	<b>2,382</b>	<b>2,824</b>	<b>3,318</b>	<b>3,872</b>	<b>4,494</b>	<b>5,247</b>	<b>6,017</b>	<b>6,852</b>	<b>7,799</b>	<b>44,780</b>	

<sup>a</sup>Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

### **Original Life Table**

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15	
Exposures at age 4½	=	3,789,000	
Retirements from age 4½ to 5½	=	143,000	
Retirement Ratio	=	143,000 ÷ 3,789,000	= 0.0377
Survivor Ratio	=	1.000 - 0.0377	= 0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	= 84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE  
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024

Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93
1.5	5,719	151	0.0264	0.9736	96.62
2.5	4,955	150	0.0303	0.9697	94.07
3.5	4,332	146	0.0337	0.9663	91.22
4.5	3,789	143	0.0377	0.9623	88.15
5.5	3,057	131	0.0429	0.9571	84.83
6.5	2,463	124	0.0503	0.9497	81.19
7.5	1,952	113	0.0579	0.9421	77.11
8.5	1,503	105	0.0699	0.9301	72.65
9.5	1,097	93	0.0848	0.9152	67.57
10.5	823	83	0.1009	0.8991	61.84
11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	<u>167</u>	<u>26</u>	0.1557	0.8443	42.24
Total	<u>44,780</u>	<u>1,606</u>			35.66

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.

Column 3 from Schedule 1, Column 12, Retirements for Each Year.

Column 4 = Column 3 Divided by Column 2.

Column 5 = 1.0000 Minus Column 4.

Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

### **Smoothing the Original Survivor Curve**

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

---

## **PART III. SERVICE LIFE CONSIDERATIONS**

## PART III. SERVICE LIFE CONSIDERATIONS

### FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips are conducted for each study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during our recent field trips.

#### September 14, 2016

Blue Mountain Lake Wastewater Plant  
Winona Lake Lift Station  
Saw Creek Wastewater Plant  
Marcel Lake Wastewater Plant  
Pocono Wastewater Plant

#### September 6, 2016

Clarion Wastewater Plant  
Paint Elk Wastewater Plant  
Shippensville Wastewater Plant

#### September 1, 2016

Franklin Wastewater Plant  
Hamilton Ban Pump Station  
Franklin Sand Mound Facility  
Fairview North Wastewater Plant  
South Fairview Wastewater Plant

#### March 16, 2010

Coatesville Wastewater Plant  
Lehman Pike Wastewater Plant  
Winona Lake Lift Station

#### July 28, 2008

Claysville Treatment Plant

**Judgments.** The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of the predecessor wastewater systems, as well as other wastewater companies. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

Account 363.00, Services, is used to illustrate the manner in which the study was conducted for the accounts in the preceding list. Aged plant accounting data have been compiled for the years through 2019. These data have been coded according to account or property group, type of transaction, year in which the transaction took place, and year in which the utility plant was placed in service. The retirements, other plant transactions and plant additions were analyzed by the retirement rate method.

The survivor curve estimate for this account is the 47-R3 and is based on the statistical indication for the period 1999-2019. The 47-R3 is a good fit of the significant portion of the original survivor curve as set forth on page VI-25, is consistent with management outlook for a continuation of the historical experience and is within the typical service life range of 40 to 55 years for services.

The amortization periods selected for general plant Accounts 390.00, 392.00, 393.00, 394.00, 396.00, 397.00 and 398.00 are discussed in the section, "Amortization of General Plant Accounts."

---

**PART IV. CALCULATION OF ANNUAL AND  
ACCRUED DEPRECIATION**

## **PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION**

### **BOOK RESERVE**

The book reserve as of June 30, 2023, is the result of a bringforward of the book reserves established by the Commission for all Wastewater SSS Operations systems. The projected book reserve as of June 30, 2024, is a bringforward of the June 30, 2023 book reserve based on projected accruals, retirements, cost of removal, gross salvage and other credits.

### **GROUP DEPRECIATION PROCEDURES**

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

### **Single Unit of Property**

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a \$1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1,000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1,000 \left(1 - \frac{6}{10}\right) = \$400.$$

### **Remaining Life Annual Accruals**

For the purpose of calculating remaining life accruals as of June 30, 2024, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2024, are set forth in the Results of Study section of the report.

### **Equal Life Group Procedure**

In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\sum \left( \frac{\text{Book Cost}}{\text{Life}} \times \text{Remaining Life} \right)}{\sum \frac{\text{Book Cost}}{\text{Life}}}$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining Life} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost} - \text{Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$\text{Ratio} = 1 - \left( \frac{\text{Remaining Life}}{\text{Service Life}} \right)$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$\text{Ratio} = \left( \frac{\text{Age}}{\text{Service Life}} \right)$$

## **AMORTIZATION OF GENERAL PLANT ACCOUNTS**

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390.00, 392.00, 393.00, 394.00, 396.00, 397.00 and 398.00, amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts are that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for

each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

<u>Account Number</u>	<u>Description</u>	<u>Amortization Period, Years</u>
390.00	Office Furniture and Equipment	20
390.20	Computers and Peripheral	5
392.00	Stores Equipment	25
393.00	Tools, Shop and Garage Equipment	20
394.00	Laboratory Equipment	15
396.00	Communication Equipment	15
397.00	Miscellaneous Equipment	15
398.00	Other Tangible Plant	25

## **NET SALVAGE**

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2019 through June 30, 2023, and estimated for the period July 1, 2023 through December 31, 2023. The calculation of the amortization is shown in Table 5 on page V-8. The amounts of salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

---

## **PART V. RESULTS OF STUDY**

## **PART V. RESULTS OF STUDY**

### **DESCRIPTION OF SUMMARY TABULATIONS**

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2024 of the book reserve as of June 30, 2023. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2024. Table 5 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2019-2023. The total amortization amount is incorporated in the total annual accrual in Table 2.

### **DESCRIPTION OF DETAILED TABULATIONS**

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2019-2023 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2019-2023, are presented in the section beginning on

page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 5, which presents the five-year amortization of net salvage.

Attention Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2025. The results of our study as of June 30, 2024 are presented in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2024". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION  
AND RATE CONSULTANTS, LLC

**PART I. RESULTS OF STUDY**

**PENNSYLVANIA-AMERICAN WATER COMPANY**  
**WASTEWATER SSS GENERAL OPERATIONS**

**DEPRECIATION STUDY**

**PART I. RESULTS OF STUDY**

**DESCRIPTION OF SUMMARY TABULATIONS**

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2025. Table 1 sets forth the development of the net original cost by account as of June 30, 2025. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2025, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2025. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2025. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2020 through 2024.

**DESCRIPTION OF DETAILED TABULATIONS**

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2020 through 2024, beginning on pages III-2 through III-4.

Attention Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2024 are presented in the attached report. The results of our study as of June 30, 2025 are presented in our report, "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2025." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2024.

Respectfully submitted,

GANNETT FLEMING VALUATION

## **PART I. INTRODUCTION**

# **PENNSYLVANIA-AMERICAN WATER COMPANY**

## **BASA WASTEWATER OPERATIONS**

### **DEPRECIATION STUDY**

#### **PART I. INTRODUCTION**

##### **SCOPE**

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2024. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2024.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates and Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation.

## **BASIS OF THE STUDY**

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2024. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of lowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

## **DEVELOPMENT OF NET ORIGINAL COST**

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

---

## **PART II. ESTIMATION OF SURVIVOR CURVES**

## **PART II. ESTIMATION OF SURVIVOR CURVES**

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

### **SURVIVOR CURVES**

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

### **Iowa Type Curves**

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

**FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES**

**FIGURE 2.. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES**

**FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES**

**FIGURE 4.. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES**

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."<sup>1</sup> In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

### **Retirement Rate Method of Analysis**

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"<sup>2</sup> "Engineering Valuation and Depreciation,"<sup>3</sup> and "Depreciation Systems."<sup>4</sup>

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

## **Schedules of Annual Transactions in Plant Records**

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 2010 were retired in 2015. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

<sup>a</sup> Transfer Affecting Exposures at Beginning of Year

<sup>b</sup> Transfer Affecting Exposures at End of Year

<sup>c</sup> Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

**Schedule of Plant Exposed to Retirement**

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

**SCHEDULE 3. PLANT EXPOSED TO RETIREMENT**  
**JANUARY 1 OF EACH YEAR 2015-2024**  
**SUMMARIZED BY AGE INTERVAL**

<sup>a</sup>Additions during the year

Experience Band 2015-2024

Placement Band 2010-2024

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

**Original Life Table**

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15	
Exposures at age 4½	=	3,789,000	
Retirements from age 4½ to 5½	=	143,000	
Retirement Ratio	=	143,000 ÷ 3,789,000	= 0.0377
Survivor Ratio	=	1.000 - 0.0377	= 0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	= 84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE  
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024

Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)

12.5	323	44	0.1362	0.8638	48.90
13.5	<u>167</u>	<u>26</u>	0.1557	0.8443	42.24
					35.66
Total	<u>44,780</u>	<u>1,606</u>			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.

Column 3 from Schedule 1, Column 12, Retirements for Each Year.

Column 4 = Column 3 Divided by Column 2.

Column 5 = 1.0000 Minus Column 4.

Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

### **Smoothing the Original Survivor Curve**

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

## **PART III. SERVICE LIFE CONSIDERATIONS**

## **PART III. SERVICE LIFE CONSIDERATIONS**

### **JUDGMENTS**

The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of other Pennsylvania-American wastewater systems. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

The amortization periods selected for general plant amortization accounts are discussed in the section, "Amortization of General Plant Accounts."

---

**PART IV. CALCULATION OF ANNUAL AND  
ACCRUED DEPRECIATION**

## **PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION**

### **BOOK RESERVE**

The book reserve as of June 30, 2023, is the result of a bringforward of the book reserves established by the Commission for the BASA wastewater operation at the time of acquisition during the fourth quarter of 2023. The projected book reserve as of June 30, 2024, is a bringforward of the June 30, 2023 book reserve based on projected accruals, retirements, cost of removal, salvage and other credits.

### **GROUP DEPRECIATION PROCEDURES**

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

### **Single Unit of Property**

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a \$1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1,000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1,000 \left(1 - \frac{6}{10}\right) = \$400.$$

### **Remaining Life Annual Accruals**

For the purpose of calculating remaining life accruals as of June 30, 2024, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2024, are set forth in the Results of Study section of the report.

### **Average Service Life Procedure**

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics

are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$\text{Ratio} = 1 - \frac{\text{Average Remaining Life}}{\text{Average Service Life}}$$

## **AMORTIZATION OF GENERAL PLANT ACCOUNTS**

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390, 393, 396 and 397; amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts is that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in

these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

<u>Account Number</u>	<u>Description</u>	<u>Amortization Period, Years</u>
390.00	Office Furniture and Equipment	20
390.20	Computer and Peripheral Equipment	5
393.00	Tools, Shop and Garage Equipment	20
396.00	Communication Equipment	15
397.00	Miscellaneous Equipment	15

---

## PART V. RESULTS OF STUDY

## **PART V. RESULTS OF STUDY**

### **DESCRIPTION OF SUMMARY TABULATIONS**

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2024 of the book reserve as of June 30, 2023. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2024. The total amortization amount is incorporated in the total annual accrual in Table 2.

### **DESCRIPTION OF DETAILED TABULATIONS**

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2019-2023 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life

derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section.

Attention: Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2025. The results of our study as of June 30, 2024 are presented in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2024". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

**PART I. RESULTS OF STUDY**

**PENNSYLVANIA-AMERICAN WATER COMPANY**

**BASA WASTEWATER OPERATIONS**

**DEPRECIATION STUDY**

**PART I. RESULTS OF STUDY**

**DESCRIPTION OF SUMMARY TABULATIONS**

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2025. Table 1 sets forth the development of the net original cost by account as of June 30, 2025. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2025, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2025. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2025. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2020 through 2024.

**DESCRIPTION OF DETAILED TABULATIONS**

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2020 through 2024 on page III-2.

Attention Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2024 are presented in the attached report. The results of our study as of June 30, 2025 are presented in our report, "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2025." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2024.

Respectfully submitted,

GANNETT FLEMING VALUATION

## **PART I. INTRODUCTION**

# **PENNSYLVANIA-AMERICAN WATER COMPANY**

## **BRENTWOOD WASTEWATER OPERATIONS**

### **DEPRECIATION STUDY**

#### **PART I. INTRODUCTION**

##### **SCOPE**

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2024. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2024.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates and Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation.

## **BASIS OF THE STUDY**

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2024. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of lowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

## **DEVELOPMENT OF NET ORIGINAL COST**

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

---

## **PART II. ESTIMATION OF SURVIVOR CURVES**

## **PART II. ESTIMATION OF SURVIVOR CURVES**

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

### **SURVIVOR CURVES**

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

### **Iowa Type Curves**

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

**FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES**

**FIGURE 2.. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES**

**FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES**

**FIGURE 4.. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES**

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."<sup>1</sup> In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

### **Retirement Rate Method of Analysis**

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"<sup>2</sup> "Engineering Valuation and Depreciation,"<sup>3</sup> and "Depreciation Systems."<sup>4</sup>

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

## **Schedules of Annual Transactions in Plant Records**

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 2010 were retired in 2015. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

<sup>a</sup> Transfer Affecting Exposures at Beginning of Year

<sup>b</sup> Transfer Affecting Exposures at End of Year

<sup>c</sup> Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

**Schedule of Plant Exposed to Retirement**

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

**SCHEDULE 3. PLANT EXPOSED TO RETIREMENT**  
**JANUARY 1 OF EACH YEAR 2015-2024**  
**SUMMARIZED BY AGE INTERVAL**

Year Placed	Exposures, Thousands of Dollars												Total at		Age Interval	Age Interval
	Annual Survivors at the Beginning of the Year												Beginning of			
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2023	2024	Age Interval	Age Interval

<sup>a</sup>Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

**Original Life Table**

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15	
Exposures at age 4½	=	3,789,000	
Retirements from age 4½ to 5½	=	143,000	
Retirement Ratio	=	143,000 ÷ 3,789,000	= 0.0377
Survivor Ratio	=	1.000 - 0.0377	= 0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	= 84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE  
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024

Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval

11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	<u>167</u>	<u>26</u>	0.1557	0.8443	42.24
Total	<u>44,780</u>	<u>1,606</u>			35.66

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.

Column 3 from Schedule 1, Column 12, Retirements for Each Year.

Column 4 = Column 3 Divided by Column 2.

Column 5 = 1.0000 Minus Column 4.

Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

### **Smoothing the Original Survivor Curve**

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

## **PART III. SERVICE LIFE CONSIDERATIONS**

## **PART III. SERVICE LIFE CONSIDERATIONS**

### **JUDGMENTS**

The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of other Pennsylvania-American wastewater systems. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

The amortization periods selected for general plant Accounts 390 and 393 are discussed in the section, "Amortization of General Plant Accounts."

---

**PART IV. CALCULATION OF ANNUAL AND  
ACCRUED DEPRECIATION**

## **PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION**

### **BOOK RESERVE**

The book reserve as of June 30, 2023, is the result of a bringforward of the book reserves established by the Commission for the Brentwood wastewater operation at the time of acquisition during the first quarter of 2024. The projected book reserve as of June 30, 2024, is a bringforward of the June 30, 2023 book reserve based on projected accruals, retirements, cost of removal, salvage and other credits.

### **GROUP DEPRECIATION PROCEDURES**

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

### **Single Unit of Property**

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a \$1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1,000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1,000 \left( 1 - \frac{6}{10} \right) = \$400.$$

### **Remaining Life Annual Accruals**

For the purpose of calculating remaining life accruals as of June 30, 2024, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2024, are set forth in the Results of Study section of the report.

### **Average Service Life Procedure**

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics

are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$\text{Ratio} = 1 - \frac{\text{Average Remaining Life}}{\text{Average Service Life}}$$

## **AMORTIZATION OF GENERAL PLANT ACCOUNTS**

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390 and 393, amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts is that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss.

For equipment in these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage is amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

<u>Account Number</u>	<u>Description</u>	<u>Amortization Period, Years</u>
390.00	Office Furniture and Equipment	20
393.00	Tools, Shop and Garage Equipment	20

---

## PART V. RESULTS OF STUDY

## **PART V. RESULTS OF STUDY**

### **DESCRIPTION OF SUMMARY TABULATIONS**

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2024 of the book reserve as of June 30, 2023. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2024.

### **DESCRIPTION OF DETAILED TABULATIONS**

Supporting statistical data for the estimates of average service lives and survivor curves and the annual depreciation calculations are presented in two sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life

derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Attention: Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2025. The results of our study as of June 30, 2024 are presented in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2024". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

**PART I. RESULTS OF STUDY**

**PENNSYLVANIA-AMERICAN WATER COMPANY**

**BRENTWOOD WASTEWATER OPERATIONS**

**DEPRECIATION STUDY**

**PART I. RESULTS OF STUDY**

**DESCRIPTION OF SUMMARY TABULATIONS**

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2025. Table 1 sets forth the development of the net original cost by account as of June 30, 2025. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2025, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2025. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2025. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2020 through 2024.

**DESCRIPTION OF DETAILED TABULATIONS**

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2020 through 2024 on page III-2.

Attention: Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2023. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 through 3, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2024".

Respectfully submitted,

GANNETT FLEMING VALUATION

**PART I. RESULTS OF STUDY**

**PENNSYLVANIA-AMERICAN WATER COMPANY**

**WASTEWATER CSS OPERATIONS**

**DEPRECIATION STUDY**

**PART I. RESULTS OF STUDY**

**DESCRIPTION OF SUMMARY TABULATIONS**

Table 1 presents the development of net original cost used in the study. The net original cost is the original cost of wastewater plant less advances and contributions. The results of the depreciation study are summarized in Table 2, which sets forth the book reserve and the calculated annual depreciation related to net original cost as of June 30, 2023, and the annual amortization of net negative salvage. Table 3 presents the calculation of the amortization of experienced net salvage by account, based on the five-year period, 2018-2022.

**DESCRIPTION OF DETAILED TABULATIONS**

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2018 through 2022, on pages III-2 through III-4.

Pennsylvania-American Water Company  
852 Wesley Drive  
Mechanicsburg, PA 17055

Attention Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2024 are presented in the attached report. The results of our study as of June 30, 2023 are presented in our report, "2023 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2023." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2024.

Respectfully submitted,

GANNETT FLEMING VALUATION

## **PART I. INTRODUCTION**

# **PENNSYLVANIA-AMERICAN WATER COMPANY**

## **WASTEWATER CSS OPERATIONS**

### **DEPRECIATION STUDY**

#### **PART I. INTRODUCTION**

##### **SCOPE**

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2024. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2024.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates, Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation and Part VIII, Experienced and Estimated Net Salvage, presents the cost of removal and gross salvage recorded for the period 2019-2023.

## **BASIS OF THE STUDY**

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2024. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of lowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

## **DEVELOPMENT OF NET ORIGINAL COST**

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

---

## **PART II. ESTIMATION OF SURVIVOR CURVES**

## **PART II. ESTIMATION OF SURVIVOR CURVES**

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

### **SURVIVOR CURVES**

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

### **Iowa Type Curves**

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

**FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES**

**FIGURE 2.. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES**

**FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES**

**FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES**

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."<sup>1</sup> In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

### **Retirement Rate Method of Analysis**

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"<sup>2</sup> "Engineering Valuation and Depreciation,"<sup>3</sup> and "Depreciation Systems."<sup>4</sup>

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

## **Schedules of Annual Transactions in Plant Records**

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 2010 were retired in 2015. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024  
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

<sup>a</sup> Transfer Affecting Exposures at Beginning of Year

<sup>b</sup> Transfer Affecting Exposures at End of Year

<sup>c</sup> Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

**Schedule of Plant Exposed to Retirement**

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

**SCHEDULE 3. PLANT EXPOSED TO RETIREMENT**  
**JANUARY 1 OF EACH YEAR 2015-2024**  
**SUMMARIZED BY AGE INTERVAL**

<sup>a</sup>Additions during the year

Experience Band 2015-2024

Placement Band 2010-2024

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

### **Original Life Table**

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15	
Exposures at age 4½	=	3,789,000	
Retirements from age 4½ to 5½	=	143,000	
Retirement Ratio	=	143,000 ÷ 3,789,000	= 0.0377
Survivor Ratio	=	1.000 - 0.0377	= 0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	= 84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE  
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024

Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93
1.5	5,719	151	0.0264	0.9736	96.62
2.5	4,955	150	0.0303	0.9697	94.07
3.5	4,332	146	0.0337	0.9663	91.22
4.5	3,789	143	0.0377	0.9623	88.15
5.5	3,057	131	0.0429	0.9571	84.83
6.5	2,463	124	0.0503	0.9497	81.19
7.5	1,952	113	0.0579	0.9421	77.11
8.5	1,503	105	0.0699	0.9301	72.65
9.5	1,097	93	0.0848	0.9152	67.57
10.5	823	83	0.1009	0.8991	61.84
11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	<u>167</u>	<u>26</u>	0.1557	0.8443	42.24
Total	<u>44,780</u>	<u>1,606</u>			35.66

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.

Column 3 from Schedule 1, Column 12, Retirements for Each Year.

Column 4 = Column 3 Divided by Column 2.

Column 5 = 1.0000 Minus Column 4.

Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

### **Smoothing the Original Survivor Curve**

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

## **PART III. SERVICE LIFE CONSIDERATIONS**

## PART III. SERVICE LIFE CONSIDERATIONS

### FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips have been conducted for the system. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the recent field trips.

#### January 28, 2020

McKeesport Wastewater Treatment Plant  
West Shore Pump Station  
28<sup>th</sup> Street Pump Station  
Long Run Pump Station  
Dravosburg Wastewater Treatment Plant  
Duquesne Wastewater Treatment Plant

#### March 27, 2017

Keyser Valley Pump Station  
Parrott Avenue Pump Station  
Scranton Wastewater Treatment Facility

**Judgments**. The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of other Pennsylvania-American wastewater systems. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

The amortization periods selected for general plant Accounts 390.00, 392.00, 393.00, 394.00, 396.00 and 397.00 are discussed in the section, "Amortization of General Plant Accounts."

---

**PART IV. CALCULATION OF ANNUAL AND  
ACCRUED DEPRECIATION**

## **PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION**

### **BOOK RESERVE**

The book reserve as of June 30, 2023, is the result of a bringforward of the book reserves established by the Commission for the CSS wastewater operations. The projected book reserve as of June 30, 2024, is a bringforward of the June 30, 2023 book reserve based on projected accruals, retirements, cost of removal, gross salvage and other credits.

### **GROUP DEPRECIATION PROCEDURES**

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

### **Single Unit of Property**

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a \$1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1,000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1,000 \left( 1 - \frac{6}{10} \right) = \$400.$$

### **Remaining Life Annual Accruals**

For the purpose of calculating remaining life accruals as of June 30, 2024, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2024, are set forth in the Results of Study section of the report.

### **Equal Life Group Procedure**

In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\sum \left( \frac{\text{Book Cost}}{\text{Life}} \times \text{Remaining Life} \right)}{\sum \frac{\text{Book Cost}}{\text{Life}}}.$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining Life} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost} - \text{Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$\text{Ratio} = 1 - \left( \frac{\text{Remaining Life}}{\text{Service Life}} \right)$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$\text{Ratio} = \left( \frac{\text{Age}}{\text{Service Life}} \right)$$

## **AMORTIZATION OF GENERAL PLANT ACCOUNTS**

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390, 392, 393, 394, 396 and 397; amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts are that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for

each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

<u>Account Number</u>	<u>Description</u>	<u>Amortization Period, Years</u>
390.00	Office Furniture and Equipment	20
392.00	Stores Equipment	25
393.00	Tools, Shop and Garage Equipment	20
394.00	Laboratory Equipment	15
396.00	Communication Equipment	15
397.00	Miscellaneous Equipment	15

#### **NET SALVAGE**

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2019 through June 30, 2023, and estimated for the period July 1, 2023 through December 31, 2023. The calculation of the amortization is shown in Table 5 on page V-8. The amounts of gross salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

---

## **PART V. RESULTS OF STUDY**

## **PART V. RESULTS OF STUDY**

### **DESCRIPTION OF SUMMARY TABULATIONS**

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2024 of the book reserve as of June 30, 2023. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2024. Table 5 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2019-2023. The total amortization amount is incorporated in the total annual accrual in Table 2.

### **DESCRIPTION OF DETAILED TABULATIONS**

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2019-2023 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2019-2023, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 5, which presents the five-year amortization of net salvage.

Attention: Ms. Stacey Gress  
Director, Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2025. The results of our study as of June 30, 2024 are presented in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2024. The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

**DEPRECIATION STUDY**

**PART I. RESULTS OF STUDY**

**DESCRIPTION OF SUMMARY TABULATIONS**

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2025. Table 1 sets forth the development of the net original cost by account as of June 30, 2025. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2025, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2025. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2025. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2020 through 2024.

**DESCRIPTION OF DETAILED TABULATIONS**

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2020 through 2024, beginning on pages III-2 through III-4.

**ON BEHALF OF PENNSYLVANIA-AMERICAN WATER COMPANY**

**CONCERNING**

**COST OF SERVICE ALLOCATION**

**DOCKET NOS.  
R-2023-3043189 (WATER)  
R-2023-3043190 (WASTEWATER)**

**DATE: November 8, 2023**

**DIRECT TESTIMONY OF  
CONSTANCE E. HEPPESTALL**

1 **Q. Please state your name and address.**

2 A. My name is Constance E. Heppenstall. My business address is 1010 Adams  
3 Avenue, Audubon, PA 19403.

4 **Q. By whom are you employed?**

5 A. I am employed by Gannett Fleming Valuation and Rate Consultants, LLC.

6 **Q. Please describe your position with Gannett Fleming Valuation and Rate  
7 Consultants, LLC, and briefly state your general duties and responsibilities.**

8 A. My title is Senior Project Manager. My duties and responsibilities include the  
9 preparation of accounting and financial data for revenue requirement, the allocation  
10 of cost of service to customer classifications, and the design of customer rates in  
11 support of public utility rate filings.

12 **Q. Have you presented testimony in rate proceedings before a regulatory agency?**

13 A. Yes. I have testified before the Pennsylvania Public Utility Commission  
14 (“Commission” or “PUC”), the Kentucky Public Service Commission, the Arizona  
15 Corporation Commission, the Missouri Public Service Commission, the Virginia  
16 State Corporation Commission, the Hawaii Public Utility Commission, the West  
17 Virginia Public Service Commission, the New Jersey Board of Public Utilities, the  
18 Indiana Utility Regulatory Commission, the Public Utilities Commission of Ohio,  
19 the Nevada Public Utility Commission, and the California Public Utility  
20 Commission concerning revenue requirements, cost of service allocation, rate design

1 and revenue requirements. A list of cases in which I have testified is attached to my  
2 testimony.

3 **Q. What is your educational background?**

4 A. I have a Bachelor of Arts degree from the University of Virginia, Charlottesville,  
5 Virginia and a Master of Science in Industrial Administration from the Carnegie-  
6 Mellon University Tepper School of Business, Pittsburgh, Pennsylvania.

7 **Q. Would you please describe your professional affiliations?**

8 A. I am a member of the American Water Works Association (“AWWA”), the  
9 Pennsylvania Municipal Authorities Association and the National Association of  
10 Water Companies.

11 **Q. Briefly describe your work experience.**

12 A. I joined the Valuation and Rate Division of Gannett Fleming (formerly Gannett  
13 Fleming, Inc.) in August 2006, as a Rate Analyst. Prior to my employment at  
14 Gannett Fleming, I was a Vice President of PriMuni, LLP where I developed  
15 financial analyses to test proprietary software to ensure its pricing accuracy in  
16 accordance with securities industry conventions. From 1987 to 2001, I was  
17 employed by Commonwealth Securities and Investments, Inc. as a public finance  
18 professional where I created and implemented financial models for public finance  
19 clients to create debt structures to meet clients’ needs. From 1986 to 1987, I was a  
20 public finance associate with Mellon Capital Markets.

21 **Q. What is the purpose of your testimony in this proceeding?**

22 A. The purpose of my testimony is to explain the cost of service allocation studies  
23 conducted under my direction and supervision for Pennsylvania-American Water

1 Company (“PAWC” or the “Company”) and to describe the results produced by  
2 those studies.

3 **Q. What revenue requirement data did you use to prepare PAWC’s cost of service**  
4 **studies?**

5 A. The cost of service studies (“COSS”) I performed are based on data from PAWC’s  
6 separate revenue requirement studies for the following operations: (1) Water  
7 Operations; (2) Wastewater (“WW”) Sanitary Sewer System (“SSS”) General  
8 Operations; (3) WW SSS Butler Area Operations; (4) WW SSS Brentwood  
9 Operations; and (5) Wastewater Combined Sewer System (“CSS”) Operations. The  
10 Company’s revenue requirements for each of those operations are developed in  
11 PAWC Exhibit 3-A, which is sponsored by PAWC witness Ashley E. Everette and  
12 discussed in her direct testimony.

13 **Q. Have you prepared exhibits presenting the results of your studies?**

14 A. Yes. The exhibits identified below accompany my testimony and are described in  
15 detail further in my testimony.

Exhibit Number	Type of Study	Operation	Rate Zones
12-A Confidential (Pgs. A35- A37)	Cost of Service	Water Operations	Water Zones 1-5
12-B	Cost of Service	WW SSS General Operations	Wastewater Zones 1, 2, 5, 7, 8 and 9
12-C	Cost of Service	Wastewater CSS Operations	Wastewater Zones 3, 4 and 6
12-D	Cost of Service	WW SSS Brentwood Operations	Acquisition
12-E	Cost of Service	WW Butler Area Operations	Acquisition

16

1 **Q. Is the Company presenting separate cost of service and rate design studies for**  
2 **CSS and SSS wastewater operations?**

3 A. Yes. A CSS collects and conveys a wastewater stream that consists of flows of  
4 sewage from homes and businesses, infiltration and in-flow (“I&I”) and storm water.  
5 As explained by Ms. Everette in PAWC Statement No. 1, as part of the settlement of  
6 PAWC’s last base rate case approved by the Commission at Docket Nos. R-2022-  
7 3031672 and R-2022-3031673 (the “2022 Rate Case Settlement”), the Company  
8 agreed to provide in its next base rate filing a separate revenue requirement study for  
9 CSS systems it owns and a cost of service study that separately identifies all storm  
10 water costs for CSS operations. Accordingly, I prepared a separate cost of service  
11 study to identify the cost of collecting, treating, and disposing of storm water in the  
12 CSS wastewater systems PAWC acquired from the Municipal Authority of the City  
13 of Scranton in 2016, the Municipal Authority of the City of McKeesport in 2017,  
14 and the Borough of Kane Authority in 2020.

15 **Q. Why is the Company presenting separate cost of service studies for PAWC’s**  
16 **Butler Area and Brentwood wastewater operations?**

17 A. PAWC currently has applications pending before the Commission to acquire the  
18 wastewater assets of the Butler Area Sewer Authority (“BASA”) and the Borough of  
19 Brentwood under Section 1329 of the Public Utility Code (“Code”), 66 Pa. C.S.  
20 § 1329. The Company anticipates a Commission decision in both matters prior to the  
21 close of the record in this rate case. On August 14, 2023, PAWC filed a unanimous  
22 settlement of all issues with the active parties in the BASA acquisition proceeding,  
23 which includes a settlement term requiring the Company to submit a separate cost of

1 service study in this proceeding . I prepared a separate cost of service study for the  
2 SSS wastewater system currently owned and operated by the Brentwood Borough,  
3 which PAWC expects to obtain PUC approval to acquire in 2024, consistent with the  
4 proposed settlement for the BASA acquisition and past practice for systems acquired  
5 pursuant to Section 1329. Company witness Christopher Abruzzo provides a  
6 detailed description of these pending acquisitions in his direct testimony.

7 **COST OF SERVICE ALLOCATION – WATER OPERATIONS**

8 **Q. Please describe the revenue requirements included in the cost of service study**  
9 **for PAWC’s water operations being presented in this case.**

10 A. The cost of service study for Water Operations prepared for this case is based upon  
11 the Company’s revenue requirement for the fully projected future test year  
12 (“FPFTY”) ending June 30, 2025, including a portion of the revenue requirement of  
13 PAWC’s wastewater operations, as authorized by Section 1311(c) of the Code. The  
14 development of the revenue requirements for Water Operations, including the  
15 revenue requirement allocated to Water Operations from the Company’s Wastewater  
16 Operations, is explained by Ms. Everette in PAWC Statement No. 1.

17 Using the total revenue requirement for the FPFTY developed by the  
18 Company in the manner described by Ms. Everette, I prepared the cost of service  
19 study set forth in Exhibit No. 12-A (Water Operations). The cost of service study  
20 presented in Exhibit No. 12-A allocates among customer classes: (1) the entire  
21 revenue requirement of the Company’s Water Operations; and (2) the portion of the  
22 revenue requirement of the Company’s Wastewater Operations that will not be  
23 recovered from wastewater customers under the Company’s proposed wastewater

1 rates, which I will refer to, collectively, as the cost of service or total revenue  
2 requirement for the FPFTY.

3 **Q. Briefly describe the purpose of your cost of water service allocation study.**

4 A. The study applies generally accepted cost of service principles and procedures to  
5 allocate the total revenue requirement to the residential, commercial, industrial,  
6 public, other water utilities, private fire protection and public fire protection  
7 classifications. The results of the cost of service study indicate the relative cost  
8 responsibilities of each class of customers. The allocated cost of service is one of  
9 several criteria that are appropriately considered in designing customer rates to  
10 produce the required revenues.

11 **Q. Have you prepared exhibits that set forth the results of your study?**

12 A. Yes. As I previously noted, Exhibit No. 12-A sets forth the results of my allocation  
13 of the pro forma cost of service for Water Operations as of June 30, 2025.

14 **Q. Please describe the method of cost allocation that was used in your study.**

15 A. For Exhibit No. 12-A, the base-extra capacity method, as described in the 2017  
16 (seventh edition) and prior editions of the Water Rates Manual published by  
17 AWWA, was used to allocate the pro forma costs that comprise the total revenue  
18 requirement. It is a recognized method for allocating the cost of providing water  
19 service to customer classifications in proportion to each classification's use of the  
20 commodity, facilities, and services of a water utility and has been accepted by this  
21 Commission for that purpose. Indeed, it is the method that was used in the  
22 Company's prior rate cases, including its last base rate case at Docket No. R-2022-

1 3031672, and has been accepted by the Commission for use by the Company and  
2 other water utilities in the Commonwealth.

3 **Q. Is the base-extra capacity method described in Exhibit No. 12-A?**

4 A. Yes. It is described on pages 3 and 4 of the exhibit.

5 **Q. Please describe the procedure followed in the cost allocation studies.**

6 A. Each identified category of cost in the pro forma cost of service was allocated to the  
7 customer classifications using appropriate allocation factors. This allocation is  
8 presented in Schedule D of Exhibit No. 12-A. The categories of cost, which consist  
9 of operation and maintenance expenses, depreciation expense, taxes and income  
10 available for return, are identified in columns 1 and 2 of Schedule D. The costs in  
11 each category, shown in column 4, are allocated to the several customer  
12 classifications based on allocation factors referenced in column 3. The development  
13 of the allocation factors is presented in Schedule E of each exhibit.

14 I will use some of the larger cost items to illustrate the principles and  
15 considerations used in the cost allocation methodology. Purchased water, purchased  
16 electric power and treatment chemicals are examples of costs that tend to vary with  
17 the amount of water consumed and are, therefore, considered base costs. These costs  
18 are allocated to the several customer classifications in direct proportion to the  
19 average daily consumption of those classifications using Factor 1. The development  
20 of Factor 1 is shown in Schedule E of Exhibit No. 12-A.

21 Other source of supply, water treatment and transmission costs are associated  
22 with meeting usage requirements more than the average. This means that these costs  
23 are incurred generally to meet maximum day requirements. Costs of this nature

1 were allocated to customer classifications partially as base costs (i.e., in proportion  
2 to average daily consumption, pursuant to Factor 1), partially as maximum day extra  
3 capacity costs (i.e., in proportion to maximum day extra capacity, pursuant to Factor  
4 2) and, for certain pumping stations and transmission mains, partially as fire  
5 protection costs (i.e., pursuant to Factor 3). Factors 2 and 3 are developed in  
6 Schedule E of Exhibit No. 12-A.

7 Costs associated with storage facilities and the capital costs of distribution  
8 mains were allocated partly based on average consumption and partly based on  
9 maximum hour extra demand, including the demand for fire protection service,  
10 because these facilities are designed to meet maximum hour and fire demand  
11 requirements. The development of Factor 4, which is used for these allocations, is  
12 shown in Schedule E of Exhibit No. 12-A. Fire demand costs were allocated to  
13 public and private fire protection service and to general service in proportion to the  
14 relative potential demands on the system from hydrants and fire services and from  
15 commercial service lines sized to provide both fire protection and general service.

16 Costs associated with pumping facilities and the operation and maintenance  
17 of mains were allocated on the combined bases of maximum day and maximum hour  
18 extra capacity because these facilities serve both functions. The relative weightings  
19 of Factor 3 (maximum day) and Factor 4 (maximum hour) for pumping facilities and  
20 the operation and maintenance of mains were based on the functional use of pumps  
21 and footage of mains, respectively, serving maximum day and maximum hour  
22 functions. The weighted factors, identified as Factor 5, Factor 5A and Factor 8, are  
23 developed on Schedule E of Exhibit No. 12-A.

1                   Costs associated with meters and services were allocated to customer  
2                   classifications in proportion to the capital costs of the sizes and quantities of meters  
3                   and services serving each classification. The factors for allocating the cost of meters  
4                   and services, identified as Factor 10 and Factor 11, are developed on Schedule E of  
5                   Exhibit No. 12-A.

6                   The costs of customer accounting, billing and collections were allocated  
7                   based on the number of customers for each customer classification. The costs of  
8                   meter reading were allocated based on the pro forma number of meters by  
9                   classification. These factors, identified as Factor 14 and Factor 15, are developed on  
10                  Schedule E of Exhibit No. 12-A. Bad debt expense, except for bad debt expenses  
11                  related to the Company's Arrearage Management Program, was allocated based on  
12                  the average net write-offs for 2020, 2021 and 2022 (Factor 22). The bad debt  
13                  expense related to the Company's Arrearage Management Program was directly  
14                  assigned to the Residential class.

15                  Administrative and general costs (except those that are directly assignable to  
16                  the Residential class, such as Customer Assistance Program costs) were allocated  
17                  based on allocated direct costs excluding those costs that require little administrative  
18                  and general expense, such as purchased water, power, chemicals, and waste disposal.  
19                  The factor for this allocation is identified as Factor 16.

20                  Annual depreciation accruals were allocated based on the function of the  
21                  facilities in each plant account to which depreciation expense is recorded. The  
22                  original cost less accrued depreciation of utility plant in service was also allocated  
23                  based on the function of the plant recorded in each account for the purpose of

1 developing Factor 19, which is used to allocate items such as return and income  
2 taxes.

3 **Q. What was the source of the total cost of service data set forth in column 4 of**  
4 **Schedule D of Exhibit No. 12-A?**

5 A. The pro forma costs of service were furnished by the Company and are the same as  
6 those set forth in PAWC Exhibit No. 3-A for Water Operations.

7 **Q. Refer to Schedule E of Exhibit No. 12-A and explain the source of the system**  
8 **maximum day and maximum hour ratios used in the development of Factors 2,**  
9 **3 and 4.**

10 A. The ratios were based on a review of experienced Company data. The maximum  
11 day ratio of 1.4 times the average day approximates the ratio of maximum daily  
12 send-out experienced by the Company in 1988, 1995, 1996, 1999 and 2003. The  
13 maximum hour ratio of 2.1 times the average hour approximates the results of an  
14 analysis that was performed to determine the peak hour consumption experienced by  
15 the Company's three largest operating districts.

16 **Q. These maximum day and maximum hour ratios were recorded 20 years ago.**  
17 **Why are you using these ratios rather than more recent ones?**

18 A. A water system must be designed to meet the highest peak demand that potentially  
19 could be experienced – not just the highest peak demand that was experienced within  
20 a recent historical period. Peak demands can vary based on contingencies that do not  
21 reoccur on a regular or predictable basis. The facilities needed to produce and  
22 distribute water have a long lead-time to design and construct and have a  
23 correspondingly long service life. Given those inherent characteristics of water

1 utility facilities, responsible waterworks practice necessitates building a system that  
2 can meet peak demands whenever they may occur because the system cannot be  
3 expanded (or contracted) to meet only those demands that appear within a limited  
4 historical study period, such as a ten-year look-back. Additionally, the water usage  
5 on the maximum days in areas within the Company's overall water operations are  
6 often more than 1.4 times the average usage for that year. Given PAWC's obligation  
7 to furnish safe and reliable service, the Company must be prepared to meet  
8 customers' peak demands whenever they occur and, therefore, it is not reasonable to  
9 ignore the maximum day ratios that the Company has actually experienced.

10 **Q. Does the AWWA M1 Manual, Seventh Edition, address system wide maximum**  
11 **day demand factors for use in the base extra capacity method?**

12 A. The AWWA M1 Manual does not directly prescribe specific a system wide  
13 maximum day factor. However, Appendix A to the manual addresses the diversity  
14 ratio, which is calculated using the system wide peaking factor. Specifically, the  
15 diversity ratio is the non-coincident peaking factor divided by the system peaking  
16 factor. In Appendix A, the manual recommends that a reasonable diversity ratio  
17 should be between 1.1 and 1.4. The 1.4 system wide maximum day demand factor  
18 employed in the Water COSS produces a diversity factor that is reasonable based on  
19 the range recommended in the AWWA manual.

20 **Q. Please explain the calculation of a diversity ratio using the Company's system**  
21 **wide maximum day factor.**

22 A. The Company's non-coincident peaking factor (the dividend, which is divided by the  
23 system wide maximum day factor to derive the diversity factor) is calculated based

1 on the non-coincident maximum day volumes found on Schedule E, in Exhibit 12-A.  
2 The total average daily consumption (in 100 gallons) shown in this schedule totals  
3 1,169,719. The maximum day extra capacity (in 100 gallons) totals 1,126,999. The  
4 factors (column 3) that produce this amount were obtained from a demand study  
5 completed by the Company from January 2013 through October 2015. If these  
6 volumes of average day and maximum day extra capacity are added together, the  
7 sum equals the non-coincident maximum day volume (in 100 gallons) of 2,296,718.  
8 The ratio of the non-coincident peak volume (in 100 gallons) of 2,296,718 to  
9 average day volume (in 100 gallons) of 1,169,719 equals 1.96. This non-coincident  
10 ratio is then divided by the system wide peaking factor (coincident peaking factor) to  
11 develop the diversity ratio. The Company's system wide peaking factor of 1.4  
12 produces a diversity factor of 1.41 (1.97/1.40), which is reasonable based on the  
13 recommended range of diversity ratios set forth in the AWWA Manual. In short,  
14 calculating the diversity ratios using the system wide maximum day factors of  
15 PAWC, fully supports the reasonableness of the system wide maximum day factor  
16 used in the COSS.

17 **Q. Are the system maximum day and maximum hour ratios the same as those used**  
18 **in studies presented on behalf of the Company in prior proceedings before this**  
19 **Commission?**

20 A. Yes, they are.

21 **Q. Are the customer class extra capacity factors the same as those used in the**  
22 **most recent prior study for the Company?**

1 A. Yes, the extra capacity factors used in Exhibit No. 12-A reflect the results of  
2 PAWC's most recent customer class demand study submitted in the Company's  
3 2017 base rate case. A detailed explanation of the methods and procedures used, the  
4 sampling techniques, the areas and customers monitored, the results of the  
5 monitoring during the 2013-2015 period, and the conclusions from the study results  
6 are described in the text of the study provided in Appendix A of Exhibit No. 12-A.

7 **Q. For Exhibit No. 12-A, did you make any adjustments to the cost allocation**  
8 **study?**

9 A. Yes, four adjustments were made to the study. I will describe each adjustment and  
10 explain why it was made.

11 **Q. Please explain the first adjustment.**

12 A. The first adjustment was made to exclude the volume of contract sales under Riders  
13 DIS (Demand Industrial Sales) and DRS (Demand Resale Sales) in developing the  
14 allocation factors for the industrial classification and the sales for resale – Group A  
15 classification. As a result, costs are allocated only to the non-Rider DIS and non-  
16 Rider DRS customers. Correspondingly, the revenues received from those contract  
17 sales were deducted from the total cost of service and from each of the classes of  
18 service, as shown on Schedule D of Exhibit No. 12-A.

19 **Q. Why did you make this adjustment?**

20 A. This adjustment was made to provide a more meaningful comparison of allocated  
21 costs and revenues. Including contract sales would inappropriately reduce the  
22 relative rate of return for the applicable class because revenues from the contract  
23 sales reflect contract rates that, to address competitive situations and avoid loss of

1 load (or gain incremental load), are lower than the non-Rider DIS and non-Rider  
2 DRS rates. By excluding contract sales, as I have done, the resulting cost of service  
3 and revenues properly reflect the costs and the rates for non-contract customers. The  
4 Commission, in approving Riders DIS and DRS, found that those riders create  
5 benefits for all the Company's customers by preserving or attracting incremental  
6 sales that, because of competitive forces, could not otherwise be made. Accordingly,  
7 the revenues derived from Rider DIS and Rider DRS customers are reflected as  
8 deductions from all classes' cost of service.

9 **Q. Please describe the second adjustment.**

10 A. The second adjustment excludes from the extra capacity portion of Factors 2, 3 and 4  
11 the curtailment volumes associated with service provided under the Company's  
12 industrial curtailment rate schedule. This adjustment properly accounts for the fact  
13 that curtailment volumes are interruptible and that a customer, to be eligible for this  
14 service, is required to meet certain minimum load factor requirements and have  
15 sufficient on-site storage capacity to meet its demands during periods of curtailment  
16 or interruption. This adjustment reflects the fact that a customer on this rate does not  
17 impose extra-capacity demand costs.

18 **Q. Are the volumes associated with curtailment service included in the base**  
19 **portion of Factors 2, 3 and 4 in Exhibit No. 12-A?**

20 A. Yes, they are.

21 **Q. Please describe the third adjustment.**

22 A. The third adjustment reallocates the unrecovered portion of public fire protection  
23 costs to the residential, commercial, industrial and public classifications. This was

1 done to comply with Section 1328 of the Code, which provides that public fire  
2 hydrant rates may only recover 25% of the cost of public fire protection service and  
3 that the unrecovered portion should be recovered in the fixed charges of other  
4 customer classifications.

5 **Q. How did you allocate the unrecovered portion of public fire service costs in**  
6 **Exhibit No. 12-A?**

7 A. Consistent with the statutory requirement that these costs are to be recovered in fixed  
8 charges, I allocated the unrecovered public fire costs using Factor 21, which is based  
9 on the meter equivalents of the residential, commercial, industrial and public  
10 classifications.

11 **Q. Please describe the fourth adjustment.**

12 A. The fourth adjustment to the water cost of service study in Exhibit No. 12-A  
13 allocates a portion of the Company's total wastewater cost of service to the  
14 Company's water operations. The wastewater cost of service allocated to Water  
15 Operations is the cost of wastewater service less the revenues the Company's  
16 proposed wastewater rates are expected to produce.

17 **Q. What is the total amount of wastewater revenue requirement allocated to the**  
18 **Company's Water Operations?**

19 A. As shown in column 3 of Schedule A of Exhibit No. 12-A, the wastewater cost of  
20 service allocated to the cost of service for PAWC's Water Operations totals  
21 \$71,087,394.

22 **Q. How are the Wastewater Operations revenue requirements allocated to the**  
23 **customer classes in Exhibit No. 12-A?**

1 A. The wastewater operations revenue requirements are allocated to the customer  
2 classes in Exhibit No. 12-A in the manner described in the direct testimony of  
3 Company Witness Charles Rea.

4 **Q. Have you summarized the results of your cost allocation study in Exhibit No.**  
5 **12-A?**

6 A. Yes. In Exhibit No. 12-A, the results for the combined water and wastewater  
7 operations are summarized in columns 2, 3 and 4 of Schedule A. Column 5 presents  
8 each customer classification's cost responsibility as a percent of the total cost.

9 **Q. Have you compared these cost responsibilities with the proportionate revenue**  
10 **under existing rates for each customer classification in Exhibit 12-A?**

11 A. Yes. Allocated cost responsibilities can be compared to the percentage revenue  
12 under present rates, as shown on Schedule A. The percentage cost responsibilities  
13 (relative cost of service) can be compared to the percentage of pro forma revenues  
14 (relative revenues) under proposed rates, as shown on Schedule A in Exhibit  
15 No. 12-A.

16 **COST OF SERVICE ALLOCATION – WASTEWATER SSS OPERATIONS**

17 **Q. Please describe the overall cost of service allocation studies for the Company's**  
18 **Wastewater SSS Operations.**

19 A. The cost of service allocation study for the Company's Wastewater SSS General  
20 Operations includes the combined wastewater revenue requirements for PAWC's  
21 Wastewater Rate Zones 1, 2, 5, 7, 8 and 9. As previously noted, I performed  
22 separate cost of service allocation studies for the Company's WW SSS Butler Area  
23 Operations and WW SSS Brentwood Operations.

1           The purpose of each of those studies was to allocate the total cost of service,  
2           which is the total revenue requirement, to the several customer classifications. In the  
3           studies, the total costs were allocated to the residential, non-residential, large  
4           industrial, and bulk use customer classifications in accordance with generally  
5           accepted cost of service principles and procedures.

6           For the purposes of cost allocation in the Wastewater SSS General  
7           Operations study presented in Exhibit No. 12-B, small industrial customers are  
8           included in the non-residential class, which also includes commercial and public  
9           customers. In Exhibit No. 12-B, two large industrial customers are included in the  
10          large industrial class. The bulk user class also includes the Veterans Administration  
11          Hospital, which is served from the Coatesville system. Finally, in accordance with  
12          Paragraph 41 of the 2022 Rate Case Settlement, Exhibit 12-B includes a separate  
13          class for municipal and utility wastewater systems (“York Bulk Customers”)<sup>1</sup> that  
14          have entered into Wastewater Treatment and Conveyance Agreements (“Bulk  
15          Agreements”) to treat their wastewater flows at the York treatment plant.

16          In Exhibits No. 12-D and 12-E costs were allocated to the residential and  
17          non-residential classes.

18      **Q. In its 2022 rate case, did PAWC include the cost of providing service to the**  
19      **York Bulk Customers in the cost-of-service study for its York WW SSS**  
20      **operations?**

---

<sup>1</sup> The York Bulk Customers consist of The York Water Company, which is the owner of the former West York Borough Collection System; Springettsbury Township; North York Borough; York Township; Manchester Township; West Manchester Township; and Spring Garden Township.

1 A. No. Only retail customers that receive wastewater collection, conveyance and  
2 treatment service were identified as separate classes (residential and non-residential)  
3 for purposes of allocating the total system cost of service among customer classes.  
4 The York Bulk Customers have competitive alternatives to service from PAWC that  
5 were discussed in detail by PAWC witness Bernard D. Grundusky in Statement No.  
6 7-R submitted on August 19, 2022 at Docket Nos. R-2022-3031672 and R-2022-  
7 3031673. Therefore, prices above those negotiated extensively and at arm's length  
8 in the Bulk Agreements would result in the loss of the York Bulk Customers as a  
9 revenue source. Accordingly, in the Company's last rate case, compensation  
10 received under the Bulk Agreements was treated as incremental revenue and, as  
11 such, was used to reduce the cost of service of the retail customers that were  
12 reflected as separate classes in the cost-of-service study.

13 **Q. Is the cost of furnishing service to the York Bulk Customers shown in Exhibit**  
14 **12-B subsidized by other wastewater customers?**

15 A. No. As explained by Company witness Bruce W. Aiton in PAWC Statement No. 3,  
16 the York Bulk Customers continue to have competitive options for bulk treatment  
17 and the negotiated contract rate is necessary to maintain the York Bulk Customers  
18 on the York wastewater system. Retail customers benefit from the contribution that  
19 bulk service revenues provide to offset the fixed costs that otherwise would be borne  
20 entirely by retail customers. In that regard, as shown in Table 1 below, the total  
21 variable cost to furnish wastewater service in the WW SSS General Operations is  
22 \$7,710,415 or \$0.157 per 100 gallons.

1

**Table 1**

<b>VARIABLE COSTS</b>	<u>Total Costs</u>
615.3 Purchased Power	\$ 3,234,166
618.3 Chemicals	\$ 1,810,725
675.4 Misc. Operating Expense - Waste Disposal	\$ 2,572,562
615.5 Purchased Power	\$ 92,962
<b>TOTAL VARIABLE COSTS</b>	<b>\$ 7,710,415</b>
Total Flow (100 gallons)*	49,167,101
Total Variable Cost per 100 gallon usage	\$ 0.157

2

\* Source: Exhibit 10-B.

3

By comparison, the Bulk Agreements impose rates of s \$0.2737 per 100 gallons for

4

Springettsbury Township and \$0.4123 per 100 gallons for the other five York Bulk

5

Customers during the FPFTY. As such, the revenues from the York Bulk Customers,

6

or Bulk User – Contract customers, cover the variable costs of bulk treatment service

7

and provide a meaningful contribution to the total fixed costs incurred to furnish

8

wastewater service to retail customers in the Company’s WW SSS General

9

Operations.

10

**Q. Have you prepared exhibits presenting the results of your studies?**

11

A. Yes. The results of my allocations of the pro forma cost of service as of June 30,

12

2025 are presented in Exhibit Nos. 12-B (Wastewater SSS General Operations),

13

12-D (WW SSS Brentwood Operations), and 12-E (WW SSS Butler Area

14

Operations).

15

**Q. Please describe the method of cost allocation that was used in your studies**

16

**presented in Exhibit Nos. 12-B, 12-D and 12-E.**

1 A. I used the functional cost allocation methodology described in “Financing and  
2 Charges for Wastewater Systems”, Manual of Practice No. 27, published by the  
3 Water Environment Federation (“Manual of Practice No. 27”). This method  
4 allocates the cost of providing wastewater service to customer classifications in  
5 proportion to each classification’s use of the service provider’s facilities and  
6 services. Costs are assigned to cost components using predominant operational  
7 purposes as cost-causative factors. The functional cost method is generally accepted  
8 as a sound method for allocating the cost of wastewater service.

9 **Q. What procedures did you use to apply the cost allocation methodology for**  
10 **wastewater operations?**

11 A. Each element of the cost of service is allocated to customer classifications according  
12 to the functional categories of flow, I&I, customer facilities and customer  
13 accounting. Except for certain depreciation and rate base items that are directly  
14 assigned to the Bulk User/VA Hospital class in Exhibit No. 12-B, the functional  
15 costs are allocated to customer classifications based on the amount of flow  
16 contributed to the system, the amount of I&I allocated to each class, and the number  
17 and relative size of customers.

18 **Q. What costs have you directly assigned to the Bulk User/VA Hospital class for**  
19 **the Company’s Wastewater SSS General Operations in Exhibit No. 12-B?**

20 A. I have directly assigned certain components of rate base and annual depreciation  
21 expense related to wastewater treatment, gravity mains, and manholes based on the  
22 result of the allocation in the 2010 Coatesville cost of service study in Docket R-  
23 2010-2166212 (“Prior Cost of Service Study”). This study allocated Coatesville

1 Wastewater System capital costs to their bulk users in accordance with the design-  
2 basis methodology described in Manual of Practice No. 27 and the I&I study  
3 submitted in compliance with the terms of the settlement at Docket No. R-2008-  
4 2032689. Pursuant to the terms of that settlement, the Company conducted a  
5 comprehensive study to determine the current and future flow volumes for each  
6 classification and the volume of I&I in the system as it relates to direct and bulk  
7 customers. The study was submitted with the Company's wastewater base rate filing  
8 at Docket No. R-2010-2166212 and was used in determining the cost of service for  
9 the bulk user class in that case. In this case, it is appropriate to continue to allocate  
10 certain capital costs related to treatment and mains to the remaining bulk users in the  
11 Coatesville area in Exhibit No. 12-B based on the Prior Cost of Service Study and  
12 I&I study.

13 **Q. What is the basis for the volumes used to allocate costs to customer**  
14 **classifications in Factor 1?**

15 A. Factor 1 is used to allocate costs related to wastewater treatment. In Factor 1, for the  
16 residential and non-residential classes, the flows were based on pro forma water  
17 usage billing determinants multiplied by a factor of 88%, consistent with the  
18 Coatesville I&I study, which determined that 88% of water use is returned to the  
19 sewer system. I then added average daily I&I in column 3 of Schedule E. In Exhibit  
20 No. 12-B, using the Company's flow records, it was determined that 32.9% of the  
21 average daily flow was from I&I. Using the Company's flow and certain  
22 assumptions, it was determined that 62.5% and 32.9% of the average daily flow was  
23 from I&I for WW SSS Butler Area Operations and WW SSS Brentwood Operations,

1 respectively. Except for the bulk user classes for WW SSS General Operations, 1/3  
2 of I&I was allocated to the customer classes based on average daily flow and 2/3  
3 was allocated based on service equivalents. The I&I allocated to the bulk user/VA  
4 Hospital class and the Bulk Users – Contract classes in Exhibit No. 12-B was based  
5 on 25% of the ratio of I&I to customer flow of 32.9%, as the flows from bulk users  
6 already contain I&I from their own collection systems.

7 **Q. Please give a similar description of Factor 2 for Exhibit Nos. 12-B, 12-C, and**  
8 **12-D.**

9 A. Factor 2 is used to allocate costs related to collection. This factor was calculated in a  
10 similar manner as Factor 1. However, based on Company records, maximum day  
11 volumes were found to be 3.0 times total average flow for PAWC's WW SSS  
12 General Operations and this ratio was used for all areas. Except for the bulk use  
13 classes for PAWC's WW SSS General Operations, 1/3 of I&I was allocated to the  
14 customer classes based on average daily flow and 2/3 was allocated based on service  
15 equivalents. The I&I allocated to the Bulk User/VA Hospital class in Exhibit No. 12-  
16 B was based on 25% of the ratio of I&I to customer flow. The Bulk User – Contract  
17 class was not allocated any costs related to the collection system.

18 **Q. Please explain the factors used to allocate capital costs.**

19 A. Factors 3 and 3A are similar to Factors 1 and 2 except that Factors 3 and 3A exclude  
20 the Bulk User/VA Hospital class in Exhibit No. 12-B because assets for these  
21 customers have been directly assigned. Factors 3 and 3A are not used in Exhibit  
22 Nos. 12-C and 12-D as these areas do not have bulk customers who have specific  
23 allocations related to a wastewater treatment plant.

1 **Q. Please explain the remaining cost allocation factors.**

2 A. Factors 4 and 5 were used to allocate customer facilities and customer accounting  
3 costs. These factors were based on the number and relative size of the customers.

4 Factor 6 is a composite factor used to allocate employee pension and benefit  
5 expenses and payroll taxes. Factor 6 is based on the allocation of direct labor  
6 expense.

7 Factors 7 and 8 are based on the allocation of plant in service and rate base,  
8 respectively. Factor 7 allocates other rate base elements and Factor 8 is used to  
9 allocate return and taxes.

10 Factor 9 is based on the total cost of service and is used to allocate regulatory  
11 commission expense and other revenues.

12 Factor 10 is used to allocate administrative and general expenses and is based  
13 on the allocation of all other operating expenses exclusive of power, chemicals and  
14 waste disposal. Factor 11 allocates cash working capital and is based on the  
15 allocation of all operating expenses.

16 **Q. Please explain the procedure for allocating costs to the several customer  
17 classifications.**

18 A. The items of cost, which include operation and maintenance expenses, depreciation  
19 expense, taxes and income available for return, are identified in column 1 of  
20 Schedule D in Exhibit Nos. 12-B, 12-D and 12-E. The cost of each item, shown in  
21 column 3, is allocated to the several customer classifications based on allocation  
22 factors referenced in column 2. The development of the allocation factors is  
23 presented in Schedule E of each exhibit.

1 **Q. What was the source of the total cost of service data set forth in column 3 of**  
2 **Schedule D of Exhibit Nos. 12-B, 12-C and 12-D?**

3 A. The pro forma costs of service were furnished by the Company and are the same as  
4 those set forth in Exhibit No. 3-A. The pro forma cost of service in Exhibit Nos.  
5 12-B, 12-C and 12-D was reduced by the \$31,962,411, \$1,565,232 and \$21,552,699  
6 in revenue requirement, respectively, that is proposed to be recovered in water rates.

7 **Q. Have you summarized the results of your cost allocation studies for the**  
8 **Company's SSS Wastewater Operations?**

9 A. Yes. The results are summarized in columns 1, 2 and 3 of Schedule A of Exhibit  
10 Nos. 12-B, 12-D and 12-E. Column 2 sets forth the total allocated pro forma cost of  
11 service as of June 30, 2025, for each customer classification identified in column 1.  
12 Column 3 presents each customer classification's cost responsibility as a percent of  
13 the total cost.

14 **Q. Have you compared these cost responsibilities with the proportionate revenue**  
15 **under existing rates for each customer classification?**

16 A. Yes. A comparison of the allocated cost responsibilities and the percentage revenue  
17 under existing rates can be made by comparing columns 3 and 5 of Schedule A of  
18 Exhibit Nos. 12-B, 12-D and 12-E. A similar comparison of the percentage cost  
19 responsibilities (relative cost of service) and the percentage of pro forma revenues  
20 (relative revenues) under proposed rates can be made by comparing columns 3 and 7  
21 of Schedule A of each exhibit. The rate of return by customer classification under  
22 present and proposed rates is set forth on Schedules B and C, respectively.

1            **COST OF SERVICE ALLOCATION – WASTEWATER CSS OPERATIONS**

2            **Q.     Please describe the cost of service allocation for the Company’s Wastewater**  
3            **CSS Operations.**

4            A.     The cost of service allocation study is based on the revenue requirements developed  
5            by the Company in Exhibit 3-A for its Wastewater CSS Operations. The study  
6            allocated the combined cost of service of the Scranton, McKeesport and Kane  
7            operations to residential, non-residential, industrial, bulk, and stormwater  
8            classifications.

9            **Q.     Have you prepared an exhibit presenting the results of your study?**

10          A.     Yes. The results of my allocation of the pro forma cost of service as of June 30,  
11          2025 is shown in Exhibit No. 12-C.

12          **Q.     Please describe the method of cost allocation that was used in your study.**

13          A.     For this study, I also used the functional cost allocation methodology described in  
14          Manual of Practice No. 27. I modified the allocation method to determine the  
15          incremental cost related to handling stormwater for a CSS and combined sewer  
16          overflows (“CSO”).

17          **Q.     What procedures did you use to apply the cost allocation methodology for**  
18          **Wastewater CSS Operations?**

19          A.     Each element of the cost of service is allocated to customer classifications according  
20          to the functional categories of sanitary flow (including normal I&I), stormwater  
21          introduced from surface sources, customer facilities and customer accounting.  
22          Except for certain operating costs, depreciation, and rate base items that are directly  
23          assigned to either the sanitary system or to the stormwater function, the functional

1 costs are allocated to customer classifications based on the amount of flow  
2 contributed to the system, the amount of I&I allocated to each class, the volume of  
3 stormwater, and the number and relative size of customers.

4 **Q. What costs have you directly assigned to the sanitary sewer classifications?**

5 A. I directly assigned rate base items and annual depreciation expense associated with  
6 pumping stations, wastewater treatment structures and equipment, gravity mains, and  
7 manholes to the sanitary sewer classes (residential, non-residential and large  
8 industrial). The wastewater collection systems in the Scranton operating district are  
9 not entirely a combined system. Approximately 63% of the collection system is  
10 combined sewers and the remaining 37% comprises sanitary sewers only.

11 Therefore, for gravity mains, after assigning specific stormwater assets to the  
12 stormwater class described below, I allocated 37% of the remaining costs of gravity  
13 mains to the sanitary classes, and I allocated 63% on a combined system basis. The  
14 cost of manholes in Account 361.2 were allocated in the same manner. For the  
15 McKeesport operating district, the collection system is a combined system except for  
16 the Port Vue area where approximately 25% is combined sewers and 75% is sanitary  
17 only. For the Kane operating district, the collection system inside the Borough is a  
18 combined system and the collection system outside the Borough is sanitary only.  
19 The collection system assets allocated to sanitary only, allocated on a combined  
20 system basis and directly assigned to stormwater for each CSS operating district  
21 were aggregated and used to allocate the combined investment to customer  
22 classifications.

1 For pumping system assets, the Froude Avenue pumping station in the  
2 Scranton operating district serves only sanitary sewers and, therefore, its cost was  
3 assigned solely to the sanitary classifications. The remaining pumping stations were  
4 allocated on a combined system basis.

5 For the wastewater treatment plants, a detailed analysis of the structures  
6 account and the equipment account was performed to identify the portions of the  
7 plants specifically related to secondary sanitary treatment. The portions of the plants  
8 thus identified were allocated to the sanitary classifications.

9 The remaining portions of the wastewater treatment structures and equipment  
10 accounts in the Scranton operating district, sized to handle 60 mgd of flow, were  
11 assigned 41.67% (25 mgd) to the sanitary classes and 58.33% (35 mgd) to  
12 stormwater. For the McKeesport operating district, the wastewater treatment plant  
13 costs were assigned based on the capacity of the McKeesport wastewater treatment  
14 plant (the largest treatment plant). This plant is sized to handle 56 mgd of combined  
15 flow, and 35.71% (20 mgd) was assigned to the sanitary classes and 64.29%  
16 (36 mgd) to stormwater. The Kinzua and Pine Street wastewater treatment plants in  
17 the Kane operating district are each sized for 1.5 mgd or a total of 3.0 mgd of  
18 combined flow. This capacity was assigned 66.67% (2 mgd) to the sanitary classes  
19 and 33.33% (1 mgd) to stormwater.

20 **Q. What costs have you directly assigned to the stormwater classification?**

21 A. I directly assigned approximately 10.9% of collection operating labor to stormwater  
22 for seven collection system employees who are specifically tasked with operating  
23 and maintaining the CSO assets within the collection systems. In addition to the

1 pumping stations and portions of the treatment plant related to stormwater that I  
2 previously discussed, I also identified rate base items and associated annual  
3 depreciation expense for specific CSO assets within Account 361.10, Gravity Mains.  
4 These assets include catch basins, CSO outfalls, regulator chambers, diversion  
5 manholes, culverts, detention basins, and biofiltration catch basin systems. The  
6 costs of these assets were directly assigned to the stormwater classification.

7 **Q. What other costs were directly assigned to the stormwater function?**

8 A. For Account 391, Transportation Equipment, the cost of one vactor truck and the  
9 cost of a street sweeper in Scranton, as well as vactor truck assets in McKeesport and  
10 Kane were allocated directly to stormwater.

11 **Q. What is the basis for the volumes used to allocate costs to customer  
12 classifications for operating and maintenance expenses?**

13 A. Factors 1 and 2 are used to allocate operation and maintenance costs related to  
14 wastewater collection and treatment. For Factor 1, for the residential, non-  
15 residential, industrial, and bulk classes, the flows were based on pro forma water  
16 usage billing determinants multiplied by a factor of 88%, consistent with the  
17 Coatesville I&I study. I then added average daily I&I in column 3 of Schedule E.  
18 Using Company flow records for Wastewater SSS, it was determined that 32.9% of  
19 the average daily flow was from I&I. One-third of the I&I was allocated to the  
20 customer classes based on average daily flow and 2/3 was allocated based on service  
21 equivalents using Factor 1A.

22 Factor 2 is based on average daily sanitary flows from Factor 1 plus average  
23 daily stormwater flow. The total wastewater flow (sanitary and stormwater for

1 Scranton, McKeesport and Kane combined) is based on the experienced average  
2 daily total flow for 2022 of 25.4 mgd.

3 **Q. Please explain the factors used to allocate the capital costs.**

4 A. Factors 3 and 4 are similar to Factors 1 and 2 except that Factors 3 and 4 include  
5 peak flows. For Factor 3, the total peak sanitary flow is based on 47 mgd, (sum of  
6 Scranton at 25 mgd, McKeesport at 20 mgd and Kane at 2 mgd) which reflects  
7 additional I&I under peak conditions. For Factor 4, the total peak wastewater flow  
8 capacity is based on 1,190 mgd, with the addition of 72 mgd of peak stormwater  
9 flow, (sum of Scranton at 35 mgd, McKeesport at 36 mgd and Kane at 1 mgd).

10 **Q. Please explain the remaining cost allocation factors.**

11 A. Factors 5 and 6 were used to allocate customer facilities and customer accounting  
12 costs. These factors were based on the number and relative size of the customers.

13 Factor 7 is a composite factor used to allocate employee pension and benefit  
14 expenses and payroll taxes. Factor 7 is based on the allocation of direct labor  
15 expense.

16 Factors 8 and 9 are based on the allocation of plant in service and rate base,  
17 respectively. Factor 8 allocates other rate base elements, and Factor 9 is used to  
18 allocate return and taxes.

19 Factor 10 is based on the total cost of service and is used to allocate  
20 regulatory commission expense and other revenues. Factor 10A is based on the total  
21 cost of service with stormwater costs reallocated to the sanitary classes and is used to  
22 allocate the portion of the CSS wastewater cost of service to be recovered through  
23 water rates.

1 Factor 11 is used to allocate administrative and general expenses and is based  
2 on the allocation of all other operating expenses exclusive of power, chemicals and  
3 waste disposal. Factor 12 allocates cash working capital and is based on the  
4 allocation of all operating expenses.

5 **Q. Please explain the procedure for allocating costs to the several customer**  
6 **classifications.**

7 A. The items of cost, which include operation and maintenance expenses, depreciation  
8 expense, taxes and income available for return, are identified in column 1 of  
9 Schedule D. The cost of each item, shown in column 3, is allocated to the several  
10 customer classifications based on allocation factors referenced in column 2. The  
11 development of the allocation factors is presented in Schedule E of the exhibit.

12 **Q. What was the source of the total cost of service data set forth in column 3 of**  
13 **Schedule D of Exhibit No. 12-C?**

14 A. The pro forma cost of service was furnished by the Company and are the same as  
15 those set forth in Exhibit No. 3-A. This pro forma cost of service was reduced by  
16 \$16,007,052, which is the amount the Company proposes to recover in water rates.  
17 The revenues under proposed rates for the WW CSS Operations are sufficient to  
18 recover the remaining revenue requirement.

19 **Q. Have you summarized the results of your cost allocation studies for the**  
20 **Company's Wastewater CSS Operations?**

21 A. Yes. The results are summarized in columns 1, 2 and 3 of Schedule A of Exhibit  
22 No. 12-C. Column 2 sets forth the total allocated pro forma cost of service as of  
23 June 30, 2025 for each customer classification identified in column 1. Column 3

1 presents each customer classification's cost responsibility as a percent of the total  
2 cost. The total cost of service associated with stormwater for the combined systems  
3 is \$41,027,181, as shown in column 7 of Schedule D. This cost was reallocated to  
4 the sanitary classes based on Factor 1A.

5 **Q. Have you compared these cost responsibilities with the proportionate revenue**  
6 **under existing rates for each customer classification?**

7 A. Yes. A comparison of the allocated cost responsibilities and the percentage revenue  
8 under existing rates can be made by comparing columns 3 and 5 of Schedule A of  
9 Exhibit No. 12-C. A similar comparison of the percentage cost responsibilities  
10 (relative cost of service) and the percentage of pro forma revenues (relative  
11 revenues) under proposed rates can be made by comparing columns 3 and 7 of  
12 Schedule A of Exhibit No. 12-C. The rate of return by customer classification under  
13 present and proposed rates is set forth on Schedules B and C.

14 **CONCLUSION**

15 **Q. Does this complete your direct testimony at this time?**

16 A. Yes, it does.

CONSTANCE E. HEPPENSTALL – LIST OF CASES TESTIFIED

VERIFICATION

I, **Constance E. Heppenstall**, hereby state that the facts set forth in the pre-marked Statement No. 12 and accompanying exhibits, if any, are true and correct to the best of my knowledge, information, and belief. I understand that this verification is made subject to the provisions and penalties of 18 Pa.C.S. § 4904 (relating to unsworn falsification to authorities).

Date: November 8, 2023

  
Constance E. Heppenstall

Attention: Ashely E. Everette  
Senior Director, Rates & Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have conducted a cost of service allocation study based on pro forma revenue requirements estimated for the test year ended June 30, 2025.

The attached report presents the results of the allocation study, as well as supporting schedules which set forth the detailed cost allocation calculations. Schedule A presents a comparison of the cost of service by customer classification with the pro forma revenues produced by each classification under present and proposed rates.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

PENNSYLVANIA AMERICAN WATER COMPANY  
WATER COST OF SERVICE ALLOCATION STUDY  
AS OF JUNE 30, 2025

PART I. INTRODUCTION

PLAN OF REPORT

The report sets forth the results of the cost of service allocation study for the water operations based on pro forma costs as of June 30, 2025, or the fully forecasted future test year (FFTY), for Pennsylvania American Water Company. Part I, Introduction, contains statements with respect to the basis of the study, the procedures employed, and a summary of the results of the study. Schedule A summarizes the cost allocation for the water and wastewater operations and total revenues under present and proposed rates. Part II, Cost of Service by Customer Classification - Water Operations, presents detailed schedules of the allocation of costs to customer classifications, as well as the basis for the allocations for the FFTY. Schedule A in Part II summarizes the water cost allocation and the revenues produced under present and proposed rates.

BASIS OF STUDY

The purpose of the cost allocation study was to determine the relative cost of service responsibilities of the several customer classifications based on considerations of quantity of water consumed, variability of rate of consumption, and costs associated with customer metering, billing and accounting. The allocation study incorporated generally- accepted principles and procedures for allocating the several categories of

cost to customer classifications in proportion to each classification's use of facilities, commodities and services required in providing water service.

## ALLOCATION PROCEDURES

The allocation study was based on the Base-Extra Capacity Method for allocating costs to customer classifications. The method is described in the 2017 and prior editions of the Water Rates Manual published by the American Water Works Association. The four basic categories of cost responsibility are base, extra capacity, customer, and fire protection costs. The following discussion presents a brief description of these costs and the manner in which they were allocated.

Base Costs are costs that tend to vary with the quantity of water used, plus costs associated with supplying, treating, pumping, and distributing water to customers under average load conditions, without the elements necessary to meet peak demands. Base costs were allocated to customer classifications on the basis of average daily usage.

Extra Capacity Costs are costs associated with meeting usage requirements in excess of the average. They include operating and capital costs for additional plant and system capacity beyond that required for average use. The extra capacity costs in this study are subdivided into costs necessary to meet maximum day extra demand and costs to meet maximum hour extra demand. The extra capacity costs were allocated to customer classifications on the bases of each classification's maximum day and hour usage in excess of average usage.

Customer Costs are costs associated with serving customers regardless of their usage or demand characteristics. Customer costs include the operating and capital costs related to meters and services, meter reading costs, and billing and collecting costs. The

customer costs were allocated on the bases of the capital cost of meters and services, the man-hours required to read meters and the number of customers.

Fire Protection Costs are costs associated with providing the facilities to meet the potential peak demand of fire protection service. Fire Protection costs are subdivided into costs to meet Public Fire Protection and Private Fire Protection demands. The extra capacity costs assigned to fire protection service were allocated to Public and Private Fire Protection and Commercial General Service on the basis of the total relative demands of the hydrants, fire service lines, and commercial service lines sized to provide fire protection, as well as general service.

## RESULTS OF STUDY

The results for the cost of service allocation study is set forth on the following pages. The data summarized in Schedule A, Comparison of Pro Forma Cost of Service with Revenues Under Present and Proposed Rates for the Twelve Months Ended June 30, 2025, constitute the principal results of the cost allocation studies and subsequent rate design.

The water operations cost of service by customer classification is shown in column 2 of Schedule A and are developed in Schedule D, Allocation of Cost of Service to Customer Classifications water operations. The allocation of the total cost of service to the several customer classifications was performed by applying the allocation factors referenced in column 2 of Schedule D to the cost of service set forth in column 3. The bases for the allocation factors are presented in Schedule E. The other cost of service shown in column 3 includes wastewater cost of service not recovered by wastewater rates.

Schedule F presents the calculation of the firm standby service and interruptible standby service commodity-demand rates based on the unit costs of service by function for the water operation.

Schedule G sets forth the average day, maximum day system sendout, and maximum day ratios.

PART II. COST OF SERVICE BY CUSTOMER CLASSIFICATION

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS  
COMPARISON OF PRO FORMA COST OF SERVICE WITH REVENUES UNDER PRESENT AND PROPOSED RATES  
FOR THE TWELVE MONTHS ENDED JUNE 30, 2025

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1. ALLOCATION OF COSTS WHICH VARY WITH THE AMOUNT OF WATER CONSUMED.

Factors are based on the pro forma future test year average daily consumption for each customer classification.

Customer Classification <u>(1)</u>	Average Daily Consumption, 100 Gallons <u>(2)</u>	Allocation Factor <u>(3)</u>
Residential	670,557	0.5685
Commercial	348,119	0.2951
Industrial	99,890	0.0847
Public	50,772	0.0430
Other Water Utilities A	20	0.0000
Other Water Utilities B	361	0.0003
Private Fire Protection	1,643	0.0014
Public Fire Protection	<u>8,159</u>	<u>0.0069</u>
 Total	 <u><u>1,179,521</u></u>	 <u><u>1.0000</u></u>

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE AND MAXIMUM DAY EXTRA CAPACITY FUNCTIONS.

(Factor 1) and the factors derived from maximum day extra capacity demand for each customer classification, as follows:

Customer Classification (1)	Average Daily Consumption		Maximum Day Extra Capacity		Allocation Factor (6)=(3)+(5)
	Allocation Factor 1 (2)	Weighted Factor (3)=(2)x 0.7143	Allocation Factor (4)	Weighted Factor (5)=(4)x 0.2857	
Residential	0.5685	0.4061	0.5950	0.1700	0.5761
Commercial	0.2951	0.2108	0.3398	0.0971	0.3079
Industrial	0.0847	0.0605	0.0443	0.0127	0.0732
Public	0.0430	0.0307	0.0180	0.0051	0.0359
Other Water Utilities A	0.0000	0.0000	0.0000	0.0000	0.0000
Other Water Utilities B	0.0003	0.0002	0.0029	0.0008	0.0010
Private Fire Protection	0.0014	0.0010			0.0010
Public Fire Protection	0.0069	0.0049			0.0049
<b>Total</b>	<b>1.0000</b>	<b>0.7143</b>	<b>1.0000</b>	<b>0.2857</b>	<b>1.0000</b>

The derivation of the maximum day extra capacity factors in column 4 and the basis for the column 3 and column 5 weightings are presented on the following page.  
::

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE AND  
MAXIMUM DAY EXTRA CAPACITY FUNCTIONS, cont.

Customer Classification	Average Daily Consumption, 100 Gallons	Maximum Day Extra Capacity		
		Factor*	Rate of Flow, 100 Gallons Per Day	Allocation Factor
(1)	(2)	(3)	(4)	(5)
Residential	670,557	1.0	670,557	0.5950
Commercial	348,119	1.1	382,931	0.3398
Industrial	99,890	0.5	49,945	0.0443
Public	50,772	0.4	20,309	0.0180
Other Water Utilities A	20	0.4	8	0.0000
Other Water Utilities B	361	9.0	3,249	0.0029
Total	<u>1,169,719</u>		<u>1,126,999</u>	<u>1.0000</u>

The weighting of the factors is based on the maximum day ratio of 1.4,  
based on a review of maximum day ratios experienced by the company. (See Schedule G)

	Maximum Day Ratio	Weight
Average Day	1.0	0.7143
Maximum Day Extra Capacity	<u>0.4</u>	<u>0.2857</u>
Total	<u>1.4</u>	<u>1.0000</u>

\* Ratio of maximum day to average day minus 1.0.

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 3. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE, MAXIMUM DAY EXTRA CAPACITY AND FIRE PROTECTION FUNCTIONS.

Factors are based on the weighting of the average daily consumption, the maximum day extra capacity demand, and the fire protection demand for each customer classification.

Customer Classification	Average Daily Consumption		Maximum Day Extra Capacity		Fire Protection		Allocation Factor	
	(1)	(2)	(3)=(2) X	(4)	(5)=(4) X	(6)		(7)=(6) X
Residential	0.5685	0.3891	0.6844	0.5950	0.1629	0.0224	0.0009	0.5519

Public	0.0430	0.0295	0.6844	0.0180	0.0049			0.0344
Other Water Utilities A	0.0000	0.0000	0.6844	0.0000	0.0000			0.0000
Other Water Utilities B	0.0003	0.0002	0.6844	0.0029	0.0008			0.0010
Private Fire Protection	0.0014	0.0010	0.6844			0.1453	0.0061	0.0070
Public Fire Protection	0.0069	0.0047	0.6844			0.8323	0.0349	0.0396
<b>Total</b>	<b>1.0000</b>	<b>0.6844</b>	<b>0.6844</b>	<b>1.0000</b>	<b>0.2737</b>	<b>1.0000</b>	<b>0.0419</b>	<b>1.0000</b>

The basis for the column 3, column 5 and column 7 weightings are presented on the following page.

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 3. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE, MAXIMUM DAY EXTRA CAPACITY AND FIRE PROTECTION FUNCTIONS, cont.

The weighting of the factors is based on the potential demand of general and fire protection service. The bases for the potential demand of general service are the maximum day ratio of 1.4 and the average pumpage for the year ended 12/31/2022. The system demand for fire protection is 20,000 gpm, for 10 hours.

	<u>Ratio</u>	<u>Rate of Flow, (GPD)</u>	<u>Weight</u>
Average Day	1.0	196,045,066	0.6844
Maximum Day Extra Capacity	<u>0.4</u>	<u>78,418,026</u>	<u>0.2737</u>
Subtotal	1.4	274,463,092	0.9581
Fire Protection		<u>12,000,000</u>	<u>0.0419</u>
Total		<u><u>286,463,092</u></u>	<u><u>1.0000</u></u>

The allocation factors in column 6 on the preceding page are based on the relative potential fire demands of General Service and Public and Private Fire Protection Service.

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 4. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE AND MAXIMUM HOUR EXTRA CAPACITY FUNCTIONS.

Factors are based on the weighting of the average hourly consumption, the maximum hour extra capacity demand, and fire protection demand for each customer classification.

Customer Classification	Average Hourly Consumption			Maximum Hour Extra Capacity			Fire Protection			Allocation Factor (9)=(4)+(6)+(8)
	100 Gals. (2)	Allocation Factor (3)	Weighted Factor (4)=(3) X 0.4451	Allocation Factor (5)	Weighted Factor (6)=(5) X 0.4896	Allocation Factor (7)	Weighted Factor (8)=(7) X 0.0654	Allocation Factor (9)=(4)+(6)+(8)

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 6. ALLOCATION OF WATER TREATMENT OPERATION EXPENSES.

Factors are based on the allocation of water treatment operation salaries and wages, as follows:

Customer Classification (1)	Water Treatment Operation Salaries and Wages (2)	Allocation Factor (3)
Residential	\$ 7,736,608	0.5744
Commercial	4,125,979	0.3063
Industrial	998,014	0.0741
Public	437,917	0.0325
Other Water Utilities A	173	0.0000
Other Water Utilities B	12,716	0.0009
Private Fire Protection	25,029	0.0019
Public Fire Protection	133,471	0.0099
Total	<u>\$ 13,469,907</u>	<u>1.0000</u>

FACTOR 7. ALLOCATION OF WATER TREATMENT MAINTENANCE EXPENSES.

Factors are based on the allocation of water treatment maintenance salaries and wages, as follows:

Customer Classification (1)	Water Treatment Maintenance Salaries and Wages (2)	Allocation Factor (3)
Residential	\$ 1,693,794	0.5728
Commercial	901,546	0.3049
Industrial	221,551	0.0749
Public	87,217	0.0295
Other Water Utilities A	34	0.0000
Other Water Utilities B	2,533	0.0009
Private Fire Protection	7,767	0.0026
Public Fire Protection	42,382	0.0143
Total	<u>\$ 2,956,823</u>	<u>1.0000</u>

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 8. ALLOCATION OF COSTS ASSOCIATED WITH MAINS.

Factors are based on the weighting of the maximum daily consumption, Factor 3, and the maximum hour consumption, Factor 4, for each customer classification, as follows:

Customer Classification	10-inch and Larger		Under 10-inch		Allocation Factor (6)=(3)+(5)
	Allocation Factor 3 (2)	Weighted Factor (3)=(2)x 0.2795	Allocation Factor 4 (4)	Weighted Factor (5)=(4)x 0.7205	
Residential	0.5519	0.1543	0.5746	0.4140	0.5683
Commercial	0.2959	0.0827	0.2831	0.2040	0.2867
Industrial	0.0701	0.0196	0.0461	0.0332	0.0528
Public	0.0344	0.0096	0.0277	0.0199	0.0296
Other Water Utilities A	0.0000	0.0000	0.0000	0.0000	0.0000
Other Water Utilities B	0.0010	0.0003	0.0010	0.0007	0.0010
Private Fire Protection	0.0070	0.0020	0.0101	0.0073	0.0093
Public Fire Protection	0.0396	0.0111	0.0575	0.0414	0.0525
<b>Total</b>	<b>1.0000</b>	<b>0.2795</b>	<b>1.0000</b>	<b>0.7205</b>	<b>1.0000</b>

The weighting of the factors is based on the length of transmission mains and distribution mains, as follows:

	Length of Mains (Feet)	Weight
10-inch and Larger	15,222,531	0.2795
Under 10-inch	39,245,693	0.7205
<b>Total</b>	<b>54,468,224</b>	<b>1.0000</b>

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 9. ALLOCATION OF COSTS ASSOCIATED WITH FIRE HYDRANTS.

These costs are assigned directly to Public Fire Protection.

Customer Classification	Allocation Factor
(1)	(2)
Public Fire Protection	1.0000

FACTOR 10. ALLOCATION OF COSTS ASSOCIATED WITH METERS.

Factors are based on the relative cost of meters by size and customer classification, as developed on the following page and summarized below.

Customer Classification	5/8" Dollar Equivalents	Allocation Factor
(1)	(2)	(3)
Residential	724,799	0.70039
Commercial	166,162	0.16057
Industrial	6,580	0.00636
Public	131,109	0.12669
Other Water Utilities A	80	0.00008
Other Water Utilities B	96	0.00009
Private Fire Protection	6,030	0.00583
Total	1,034,856	1.00000

FACTOR 11. ALLOCATION OF COSTS ASSOCIATED WITH SERVICES.

Factors are based on the relative cost of services by size and customer classification, as developed on the second of the following pages, and summarized below.

Customer Classification	3/4" Dollar Equivalents	Allocation Factor
(1)	(2)	(3)
Residential	686,494	0.88575
Commercial	61,191	0.07895

APPENDIX A

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- a. A description of the allocation methods used. A comparison of the allocated cost of service by class with the present and proposed revenues. A cost of service schedule showing the Rate of Return produced by present and proposed rates by class of service.

RESPONSE

A description of the methods used for the cost of service study is provided on Exhibit 12-A and in PAWC Statement No. 12. A comparison of the allocated cost of service by class with the present and proposed revenues is provided on Schedule A of Exhibit 12-A. Schedules B and C showing the rate of return produced by present and proposed rates by customer classification are provided in Exhibit 12-A.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- b. Indicate if the method used for establishing the allocation factors in the Cost of Service Study deviates from the previous study submitted in the last rate case. If yes, indicate which allocation factors were changed and discuss the reason for the changes.

RESPONSE

The methods used for establishing the allocation factors in the cost of service study have not deviated from the previous study submitted in the last case.

PENNSYLVANIA AMERICAN WATER COMPANY  
 RESPONSES TO RATE STRUCTURE  
 AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- c. Supply the average day, the maximum day and the maximum hour deliveries to the system adjusted for storage for the test year and two prior years. Also provide workpapers, analyses, comparative data or other documentation supporting the estimated maximum day and peak hour demands by customer class reflected in the Company's cost of service study.

## RESPONSE

Refer to Schedule G of Exhibit 12-A for the average day and maximum day system deliveries for the years 1987 through 2021. Support for the system maximum hour ratio is provided below and on the attached schedules.

The peak hour consumption analysis in support of the 2.1 system peak hour ratio is attached and summarized below.

Analyses were made to determine hourly water consumption during 1988 peak periods of sendout for PAWC's three largest operating districts, as follows:

Pittsburgh	July 5, 6 and 7, 1988
Riverton	July 6 and 7, 1988
Norristown	July 6, 7 and 8, 1988

These dates had the greatest sendouts experienced in recent years.

PENNSYLVANIA AMERICAN WATER COMPANY  
 RESPONSES TO RATE STRUCTURE  
 AND COST OF SERVICE FILING REQUIREMENTS

RS1c., cont.

Recording charts or other hourly logs of total production were read to derive total hourly delivery to each of the districts. Recording charts for storage reservoirs were read to derive hourly draw or fill from each reservoir. The total hourly delivery plus hourly draw less hourly fill equals hourly consumption.

District	Average M.G.D.	Max Hour M.G.D.	Max Hour Ratio
Pittsburgh	69.28	140.88	2.03
Riverton	10.16	26.17	2.58
Norristown	12.68	22.53	1.78
Total	92.12	189.58	2.06

The attachments set forth the hourly deliveries, storage draws and fills and hourly consumption for the several days and districts which support the above amounts.

Support for the customer class demand factors is provided on the attached pages, Customer Class Demand Study, which was included in the Company's 2017 Rate Case that was filed on April 28, 2017 (Docket No. R-2017-2595853).

CUSTOMER CLASS DEMAND STUDY

GANNETT FLEMING VALUATION AND RATE CONSULTANTS, LLC  
Harrisburg, Pennsylvania

*Excellence Delivered **As Promised***

February 27, 2017

Pennsylvania American Water Company  
800 West Hersheypark Drive  
Hershey, PA 17033-2400

Attention John Cox  
Manager of Rates and Regulations

Gentlemen:

Pursuant to your request, we have prepared a customer class demand study. The study was conducted to provide a basis for the selection of class maximum day and hour demand ratios for use in the cost of service allocation study.

The attached report presents a description of the methods and procedures used, the usage data for each monitored customer, and the detailed calculations of maximum day and hour ratios by classification. The results of the study are presented on page I-9 of the report.

Respectfully submitted,

GANNETT FLEMING VALUATION  
AND RATE CONSULTANTS, LLC

**PART I. INTRODUCTION**

## **PLAN OF REPORT**

The report sets forth the results of the customer class demand study conducted during the period of January 2013 through October 2015 for Pennsylvania American Water Company (Company). The study is organized into three parts. Part I, Introduction, contains statements with respect to the basis and purpose of the study, a description of the methods and procedures used, and a summary of the study results. Part II, Maximum Day and Hour Ratios, describes the calculations of the maximum day and maximum hour ratios for each customer class using the observed demand data. Part III, Daily and Hourly Usage Data, provides the daily usage for each monitored location and the hourly usage for selected days during the study period. Unless noted otherwise, all residential usage units are gallons and non-residential units are hundred gallons.

## **BASIS OF STUDY**

Pursuant to the Joint Petition for Settlement at Docket No. R-2011-2232243, approved by the Commission's Final Order entered November 10, 2011, the Joint Petitioners agreed that the Company would prepare and submit a study on the feasibility and costs of conducting a customer class demand study including the timetable required to complete such a study. In February 2012, the Company submitted the required Feasibility Study to the Joint Petitioners for their review and comment. The Feasibility Study outlined the scope of the proposed demand study, the facilities and equipment that would be required, and an estimate of the total costs. Subsequent to a meeting of the Joint Petitioners to discuss the Feasibility Study, the parties decided to move forward with the Demand Study.

## **PURPOSE OF STUDY**

In the Base Extra-Capacity method of cost allocation, as described in AWWA Manual M1 - Principles of Water Rates, Fees, and Charges, the extra capacity portion of the water system is allocated to customer classifications based on the non-coincident demands of each classification. The non-coincident demand is the sum of the peaks for each class regardless of the day or hour such peaks may occur. The purpose of a customer class demand study is to establish a basis for selecting maximum day and maximum hour ratios for each customer classification. The ratios will be used for allocating maximum day and hour extra capacity costs in the cost of service allocation study prepared for the Company's rate filing. The results of the cost of service allocation study are used as a guide for designing the proposed rate structure.

## METHOD AND PROCEDURES

### Overview

The customers were selected for the study with the objective of obtaining a representative sample of customers in each class. Originally, customer usage was to be monitored for one year, with an extension possible if the weather was deemed insufficiently dry to capture typical peak water use behaviors. In order to determine whether to extend the study in subsequent years, the Palmer Drought Severity Index (PDSI) was used. The National Oceanic and Atmospheric Administration publishes the PDSI, among other measures of drought conditions. The PDSI is a long term measure that is used in determining the severity of droughts. The decision criterion for applying the PDSI to the demand study was that, if there was not at least one summer month (June-August) in which the PDSI was less than 1.0, the study would continue. As shown by the presence of green shading in Table 1-1 below, this threshold was met in the first study year for all but two climate divisions and had been met by August 2014 for all climate divisions. Since neither 2013 nor 2014 had remarkably dry summers, it was deemed worthwhile to continue monitoring through a third summer.

**Table 1-1**  
**Palmer (Long Term) Drought Severity Index for Summer 2013, 2014 , and 2015**

Climate Division	2013			2014			2015		
	June	July	August	June	July	August	June	July	August
1 Poconos	1.29	1.11	1.17	-0.30	-0.18	-0.25	-0.93	-0.94	-1.13

#### Legend

	Greater than Threshold
	Within threshold for acceptability of usage data (less than 1)

Table 1-2 below displays the values for a short-term soil moisture index, the Palmer Moisture Anomaly or “Z” index. This index better reflects the immediate term weather conditions that influence water use for lawn and garden watering. The blue shading indicates relatively moist months and the light orange shading relatively dry months. The table displays that the driest months in general were experienced in late summer of 2015.

**Table 1-2**  
**Palmer (Short Term) Moisture Anomaly Index for Summer 2013, 2014 , and 2015**

Cimate Division	2013			2014			2015		
	June	July	August	June	July	August	June	July	August
1 Poconos	3.87	-0.15	0.52	-0.41	0.25	-0.36	3.71	-0.32	-0.88

Legend

	Moderately to extremely moist (greater than 1.00)
	Near normal (between 1 and negative 1.24)
	Moderately to very dry (negative 1.25 and lower)

Residential Sample

The source of the usage data for the residential sample is the Company’s SCADA information system. The SCADA information system continuously monitors flows through a pump or valve and relays the information to a central location. Some of these monitored pumps or valves serve a closed loop of customers, allowing the data to be used to measure daily and hourly flows for the *group* of residential customers consuming water that passes through that pump or valve.

In order to make the results of the customer demand study representative, residential customers are categorized by housing density to insure that each type of residential user is included. Residential peak demands are primarily influenced by income, lawn size and the amount of precipitation and evapotranspiration. Housing density is used to categorize monitoring points because it represents a measure of both income level and lawn size. The residential monitoring points are located throughout the Company's service area, as indicated in the locator map in Attachment A. The residential class sample consists of approximately 2,500 customers from the following ten SCADA monitoring points that serve a closed loop of exclusively or predominantly residential customers.

System	Housing Density	Residential Customers
Shire Oaks	Low	306
Linnwood	Low	93
Sandy Ridge	Low	31
Sutton Hills	Low	76
Thornburgh and Rosslyn	Medium	649
Winter Road	Medium	212
Ridge Road	Medium	62
Silver	Medium	347
North Strabane	High	106
Millview	High	660
Total		2,542

### Commercial Sample

Because the Company serves a large and diverse set of commercial customers, statistical stratified sampling techniques were applied to the design of the commercial sample. The sample design for this report was based on the recommendations of Dr. Berwood Yost, Director of the Floyd Institute's Center for Opinion and Research at Franklin and Marshall College. The sampling used consumption records available for the most recent twelve month period prior to sample design. The customer consumption records were stratified by consumption level into nine strata, using generally accepted statistical techniques for determining strata boundaries. Strata numbers six through nine encompass customers that consume less than 37,000 gallons per year (3,075 gallons per month). The total 2011 consumption by these customers accounted for approximately two percent of total commercial consumption. Because the consumption within these strata is too small to have an impact on the ratio estimates, the customers in these strata were not included in the sampling.

For the five study strata, simple random sampling was used to draw a sample within each stratum. The sampling approach and sample sizes are designed such that each stratum sample yields a reasonable estimate of the consumption for the population of customers within the stratum. This approach of stratification by size, which is common in large populations with skewed distributions, achieves desired precision levels with smaller sample sizes than can be achieved with simple random sampling from the entire population. The total number of customers and the minimum required and actual sample sizes for each stratum are shown in Table 1-3 below. The stratum boundaries and number of customers monitored in each stratum are for the time period when the sample was drawn. The proportion of all commercial customers in each stratum is fixed for the study period by the stratification design; the stratum boundaries vary slightly from year to year as the consumption totals for each customer change. The monitored customers are placed in the stratum for each year based on how their consumption for the year compares to the stratum boundaries for the year. For this reason the number of monitoring points in each stratum varies slightly from year to year.

The commercial customer sample includes monitoring points in each of the Company's six service regions and a broad variety of types including but not limited to apartments, mobile home parks, nursing homes, hotels, office buildings, golf courses, medical facilities, health clubs, stores, restaurants, and private schools.

**Table 1-3  
Commercial Sample Design**

Stratum	Stratum Lower Boundary (1,000 gallons / year)	Number of Customers	Recommended Sample Size	Customers Monitored
1	13,587	94	13	17
2	3,101	597	18	21
3	708	2,790	19	25
4	162	8,163	19	22
5	37	16,053	17	21
Total		27,697	86	106

Monitoring data results support the accuracy of the sample design and selection. The total commercial consumption estimated from the sample varied from the actual total billed consumption for the class by no more than seven percent. This performance exceeds the target used to determine the minimum sample size, which was set in order to produce a 95% likelihood of being within twenty percent of the actual population amount.

#### Industrial and Public Samples

Both the industrial and public customer classes are characterized by the concentration of consumption among a small number of very large customers. This concentration allows for the production of reasonably reliable estimates with relatively modest sample sizes. The industrial sample included 29 monitoring points representing 25 customer accounts. The consumption at these monitoring points constituted 42% to 44% of total industrial class consumption in the three study years. The public sample included 32 customers, which accounted for 50% to 57% of total public class consumption in the three study years.

#### Sales for Resale Sample

The study included all six sales for resale customers and a total of nine monitoring points, with one customer having four different meter locations.

### Data Collection and Processing Procedures

SCADA monitoring data for residential customers was processed by Company staff on a monthly basis. Hourly flows were estimated by averaging the flows reported for fifteen minute intervals. For systems which included a storage tank, the change in tank level was used to calculate flows into and out of the tank and used in determining net flows to customers for each hour. Because the tank level change and average hourly flow data do not line up precisely, sometimes the net flow calculated after the tank adjustment can appear to indicate a negative flow or an extreme high hour. Another adjustment was made for Thornburgh and Rosslyn, a residential system with two significant non-residential customers. The usage of the large customers was monitored with data logging devices and deducted from the flows for the SCADA monitoring point to yield a net flow for the remaining customers.

Radio read data logging devices were installed on the non-residential sample customers. The device attaches to a customer's meter head and records hourly usage for a fixed period of time, which is then periodically read by a mobile device. The majority of the data logging devices were the "Hot Rod" sold by Mueller/Hersey. The Mueller Hot Rod can store approximately five months of data. Most of the remaining devices were "e-coders" by Neptune, which store data for approximately three months. Several non-residential customers had been fitted with Sensus r900i meters, which have built-in data logging capability, but only keep approximately 31 days of data. Regardless of the device used, Company personnel were on a monthly schedule to download the monitoring data. The accuracy of the data was verified by comparing the logged data to consumption recorded by meter reading for billing purposes.

The hourly and daily monitoring data for each location and customer are summarized in spreadsheet format for each customer class, where each sampled customer's data is in a column, with each day (hour) on a different row. Part III of this report contains the spreadsheets with the daily monitoring data along with hourly data for the day on which the maximum hour occurs. For each day (hour), a consumption per sampled customer is calculated. This amount per average customer is the sum of each customer's consumption divided by the number of customers reporting that day. The *average* customer is calculated because technical difficulties with the data logging equipment or anomalous events at the customer locations can result in the absence of data on any given day for one or several customers. Having a missing data point would result in the simple sum of usage representing an underestimate of the total for that day. As a result, a potential maximum day might be missed.

For sales for resale customers, a total consumption is calculated, because all of the customers are monitored. Use of a total rather than average is advised in this case because the high variance in customer size means that occasional missing datapoints can significantly alter the calculated average and produce false peaks.

#### Identifying Peaks and Calculating Maximum Day and Hour Ratios

The maximum day (hour) is the highest day (hour) of consumption in the class or stratum as a whole for the year. It is the peak that occurs in the calculated average usage per customer in the stratum or class. The maximum day ratios were calculated for each customer and for the class by dividing the peak day consumption by the annual average consumption per day. Maximum hour ratios were calculated similarly, using hourly peaks and annual hourly averages. For the residential monitoring stations, the annual average usages were calculated from the SCADA monitoring station data. For the non-residential customers, the annual average usages were determined from the billing records over a twelve-month period.

## RESULTS OF STUDY

A description and results of the calculations of the maximum day and hour ratios for each customer classification are provided in Part II of the report. Part III contains the detailed tables of monitoring data for each customer and residential SCADA monitoring area. A summary of the resulting calculated ratios for the samples is shown in the Table I-4 below and Figure I-1 on the following page. The selected ratios for use in the Company's future cost of service allocation study are summarized in Table 1-5 below.

**Table I-4**  
**Ratio Results from Study Samples**

	Maximum Day Ratios			Maximum Hour Ratios		
	2013	2014	2015	2013	2014	2015
Residential	1.79	1.72	1.98	5.68	5.29	6.17
Commercial	2.12	1.96	1.63	4.61	4.02	3.95
Industrial	1.46	1.27	1.23	1.72	1.56	1.64
Public	1.32	1.33	1.36	1.82	1.88	2.41
Sales for Resale	1.36	1.19	1.38	3.42	5.06	2.68

**Table I-5**  
**Summary of Maximum Day and Hour Ratios**

Customer Classification	Maximum Day Ratio	Maximum Hour Ratio
Residential	2.0	5.0
Commercial	2.1	4.6
Industrial	1.5	1.7
Public	1.4	2.4
Sales for Resale	1.4	3.2

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- d. Explain thoroughly the methodology employed if the Company distinguishes between transmission and distribution mains in its allocation of costs.

## RESPONSE

For cost allocation purposes, mains that are 10-inch and larger are considered to be transmission mains and are allocated using Factor 3, which is based on average and maximum day extra capacity demands plus the daily requirement for fire demand. Mains sized under 10-inch are considered distribution mains and are allocated using Factor 4, which is based on average and maximum hour extra capacity demands plus the hourly requirement for fire demands.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- e. Provide a detailed explanation of how storage is utilized to meet base, maximum day and maximum hour demands.

#### RESPONSE

Storage facilities have been considered to be adequate if the effective volume of the facility, or groups of facilities acting together, provided sufficient volume during peak hour demands and to meet equalization needs on the maximum day and provide a fire protection reserve. The effective volume of storage is that quantity, which can be used from the tank while maintaining adequate system pressures under the domestic, and fire flow conditions for distribution mains. The equalization volume is that quantity of water needed to allow production plant or booster station output rates to be constant and equal to the daily demand on the maximum day of the year. The use of equalization storage enables a reasonably constant rate of treatment plant operation and thereby promotes overall system efficiency and economy. Existing storage capacity has also been analyzed on a case-by-case basis to determine its contribution to overall system reliability. Where appropriate recommendations are made if additional storage will significantly improve a system's reliability (e.g., its ability to maintain service to its customers during an emergency, such as a spill or power outage.)

PENNSYLVANIA AMERICAN WATER COMPANY  
 RESPONSES TO RATE STRUCTURE  
 AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- f. Provide workpapers, calculations and supporting documentation which develop the equivalent meters and equivalent service weights reflected in the Company's cost of service study.

RESPONSE

The 5/8-inch dollar equivalent was developed using actual installation costs by meter size, provided by the Company for the years 2011-2022, as follows:

<u>Meter Size</u>	Actual Installation Cost <u>2011-2022</u>	5/8-Inch Dollar <u>Equivalent</u>
5/8"	\$ 190.27	1.0
3/4"	289.45	1.5
1"	372.56	2.0
1-1/2"	420.36	2.2
2"	567.97	3.0
3"	1,556.79	8.2
4"	3,864.30	20.3
6"	5,633.17	29.6
8"	6,282.93	33.0
10"	9,745.75	51.2

PENNSYLVANIA AMERICAN WATER COMPANY  
 RESPONSES TO RATE STRUCTURE  
 AND COST OF SERVICE FILING REQUIREMENTS

RS1f., cont.

The 3/4-inch dollar equivalent was developed using the actual installation costs by size, for the years 2011-2022, provided by the Company, as follows:

<u>Service Size</u>	Actual Installation Cost <u>2011-2022</u>	1-Inch <u>Equivalent</u>
3/4" & 1"	\$2,186.38	1.00
1-1/2"	3,135.14	1.43
2"	5,589.98	2.56
4"	4,343.38	1.99
6"	6,119.45	2.80

10"	14,235.83	6.51
12"	27,619.60	12.63

## PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- g. Provide all workpapers and supporting documentation for the fire flow requirement and duration utilized in the cost of service study.

## RESPONSE

The source for the estimated fire protection demand of 20,000 gpm is published fire flow criteria for the population served. The 20,000 gpm estimate is the maximum fire flow requirement generally accepted by published authorities, regardless of population size. This maximum has been established by the National Board of Fire Underwriters (now the American Insurance Association).

General fire-fighting requirements, based on population established by the National Board of Fire Underwriters, are as follows:

- a) For populations of 200,00 or less,  $Q = 1020 \sqrt{P} (1 - 0.01\sqrt{P})$ , where Q is the fire draft in gpm and P is the population in thousands.
- b) For populations in excess of 200,00, Q = 12,000 gpm plus 2,000 to 8,000 gpm for a potential second fire.

Inasmuch as PAWC serves a population in excess of 1.5 million, the maximum fire flow of 12,000 gpm would apply. Also, in consideration of the population being well over 200,000, the maximum of the additional allowance to provide for a second fire was selected for a maximum fire flow of 20,000 gpm.

The foregoing requirements were published in Volume I, "Water and Wastewater Engineering," by Fair, Geyer & Okon, published in 1966 by John Wiley & Sons, Inc.

The required fire flow duration is ten hours.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- h. Provide a breakdown of the number and size of private fire services according to the general water service class of customer.

RESPONSE

Please refer to Filing Requirement Section II, Question OR-10a.

PENNSYLVANIA AMERICAN WATER COMPANY  
 RESPONSES TO RATE STRUCTURE  
 AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- i. Provide a calculation of the Company's base cost of water per unit of consumption.

RESPONSE

The calculation of the base cost of water per hundred gallons is as follows:

Base Cost of Water (See attached Functional Allocation)	\$435,187,477
Pro Forma Water Consumption (Hundred Gallons)	426,947,484
Base Cost per Hundred Gallons	\$1.0193

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- j. Provide a detailed cost analysis that supports the Company's customer charges, by meter size, showing all direct and indirect costs included.

RESPONSE

Please refer to the attached schedules for the year ended June 30, 2025.

Attention Ashley E. Everette  
Senior Director, Rates & Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have conducted a cost of service allocation study based on pro forma revenue requirements estimated for the test year ended June 30, 2025.

The attached report presents the results of the allocation study, as well as supporting schedules which set forth the detailed cost allocation calculations. Schedule A presents a comparison of the cost of service by customer classification with the pro forma revenues produced by each classification under present and proposed rates.

Respectfully submitted,

PART I. INTRODUCTION

PENNSYLVANIA AMERICAN WATER COMPANY

WASTEWATER SANITARY SEWER SYSTEM  
GENERAL OPERATIONS

COST OF SERVICE ALLOCATION STUDY AS OF  
JUNE 30, 2025

PART I. INTRODUCTION

PLAN OF REPORT

The report sets forth the results of the cost of service allocation study for the Wastewater Sanitary Sewer System General Operations (WW SSS Operations) based on pro forma costs as of June 30, 2025, for Pennsylvania-American Water Company. Part I, Introduction, contains statements with respect to the basis of the study, the procedures employed, and a summary of the results of the study. Schedule A summarizes the cost allocation for the WW SSS Operations and total revenues under present and proposed rates. Part II, Cost of Service by Customer Classification, presents detailed schedules of the allocation of costs to customer classifications, as well as the basis for the allocations.

BASIS OF STUDY

The method used for the allocation of wastewater cost of service incorporates the functional cost allocation methodology described in the text "Financing and Charges for Wastewater Systems," Manual of Practice No. 27, published by the Water Environment Federation. This method is recognized for allocating the cost of providing wastewater service to customer classifications in proportion to the classifications' use of the commodity, facilities, and services. It is generally accepted as a sound method for allocating the cost of wastewater service. Under the functional cost method, costs are assigned to cost components using

predominant operational purposes as cost-causative factors.

Each element of the cost of service is allocated to customer classifications according to the functional categories. The cost functions are flow, infiltration and inflow (I&I), customer facilities and customer accounting. The functional costs are allocated to customer classifications based on the amount of flow contributed to the system, the amount of I&I allocated to each class, and the number and relative size of customers.

The results for the allocation of WW SSS Operations cost of service are summarized on Schedule A, column 2. The cost allocation results can be compared with revenues under present and proposed rates in columns 4 and 6 of Schedule A. The proposed increase and percentage increase in revenues are shown in columns 8 and 9.

The cost of service by customer classification is developed in Schedule D. The allocation factors referenced in column 2 are applied to the costs by account in column 3. The allocation factors are set forth in Schedule E.

PART II. COST OF SERVICE BY CUSTOMER CLASSIFICATION

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS  
COMPARISON OF COST OF SERVICE WITH REVENUES UNDER PRESENT AND PROPOSED RATES

WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

**FACTOR 1. ALLOCATION OF COSTS ASSOCIATED WITH WASTEWATER TREATMENT**

Factors are based on the pro forma test year average daily consumption for each customer classification with adjustments. The detail regarding calculation of adjusted flows can be found on the following page.

Classification (1)	Total Adjusted Average Daily Customer Flow 100 gallons (a) (2)	I&I Gallons Per Day 100 gallons (b) (3)	Total I&I		Allocation Factor (7)
			And Average Flow (4)=(2)+(3)	Factor (6)	
Residential	51,566	27,607	79,173	0.4718	0.6651
Non-Residential	23,467	9,573	33,040	0.1969	0.2775
Large Industrial	1,730	306	2,036	0.0121	0.0171
Bulk Users/VA Hospital	4,432	365 (c)	4,797	0.0286	0.0403
Bulk Users - Contract	45,048	3,708 (c)	48,756	0.2906	
<b>Total</b>	<b>126,243</b>	<b>41,559</b>	<b>167,802</b>	<b>1.0000</b>	

(a) Customer Flow.

(b) Allocation based on Factor 1A for Residential, Non-Residential and Large Industrial.

(c) Equal to 25% of total I&I portion.

**FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.**

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification (1)	Total Adjusted Average Daily Flow 100 gallons (2)	Average Daily Flow Factor (3)	Average Daily Flow Weight (4)=(3) x 0.3333	Number of Service Equivalents (5)	Number of Customers Factor (6)	Number of Customers Weight (7)=(6) x 0.6667	Allocation Factor (8)=(4)+(7)
Non-Residential	23,467	0.3057	0.1019	11,123	0.2302	0.1535	0.2554
Large Industrial	1,730	0.0225	0.0075	49	0.0010	0.0007	0.0082

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH THE COLLECTION SYSTEM

Factors are based on peak daily flow for each customer classification.

Customer Classification (1)	Ave. Flow Consumption, 100 gpd (2)	Peak I&I Flow 100 gallons (a) (3)	Total Peak I&I And Average (4)=(2)+(3)	Allocation Factor (5)
Residential	51,566	276,938	328,504	0.7167
Non-Residential	23,467	96,035	119,502	0.2607
Large Industrial	1,730	3,071	4,801	0.0105
Bulk Users/VA Hospital	4,432	1,094 (b)	5,526	0.0121
Bulk Users - Contract	0	0	-	0.0000
<b>Total</b>	<b>81,195</b>	<b>377,138</b>	<b>458,333</b>	<b>1.0000</b>

(a) Allocation based on Factor 1A.

(b) Equal to 25% of total I&I percentage.

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 3. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PROJECTED AVERAGE DAILY FLOW INCLUDING INFILTRATION AND INFLOW EXCLUDING COATESVILLE BULK USERS

Factors are based on the projected average daily consumption for each customer classification.

Classification (1)	Total Average Daily Flow 100 gallons (2)	Direct I&I Gallons Per Day 100 gallons (a) (3)	Total Direct I&I And Average (4)=(2)+(3)	Allocation Factor (7)
	Residential	51,566	27,607	79,173

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 4. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

Customer Classification (1)	Number of Customers (2)	Service Equiv. Ratio (a) (3)	Service Equivalents (2)X(3)=(4)	Allocation Factor (5)
Residential	37,137	1.0	37,137	0.7605
Non-Residential	4,449	2.5	11,123	0.2278
Large Industrial	2	25.0	49	0.0010
Bulk Customers/VA	14	25.0	350	0.0072
Bulk Users - Contract	7	25.0	175	0.0036
Total	<u>41,609</u>		<u>48,834</u>	<u>1.0000</u>

(a) Based on ratio by class for Coatesville service area.

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

Customer Classification (1)	Number of Customers (2)	Allocation Factor (3)
Residential	37,137	0.89251
Non-Residential	4,449	0.10693
Large Industrial	2	0.00005
Bulk Customers/VA	14	0.00035
Bulk Users - Contract	7	0.00017
Total	<u>41,609</u>	<u>1.00000</u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 6. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

Customer Classification	Direct Labor Expense	Allocation Factor
(1)	(2)	(3)
Residential	\$ 2,568,395	0.5224
Non-Residential	995,601	0.2025
Large Industrial	56,246	0.0114
Bulk Users/VA Hospital	123,778	0.0252
Bulk Users - Contract	<u>1,172,306</u>	<u>0.2385</u>
Total	<u>\$ 4,916,327</u>	<u>1.0000</u>

FACTOR 7. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS,  
MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	\$ 411,965,527	0.5853
Non-Residential	157,827,596	0.2242
Large Industrial	7,755,838	0.0110
Bulk Users/VA Hospital	11,063,728	0.0157
Bulk Users - Contract	<u>115,211,790</u>	<u>0.1637</u>
Total	<u>\$ 703,824,480</u>	<u>1.0000</u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 8. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

Factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below.

Customer Classification	Original Cost Measure of Value	Allocation Factor
(1)	(2)	(3)
Residential	\$ 379,974,179	0.5852
Non-Residential	145,532,755	0.2241
Large Industrial	7,154,195	0.0110
Bulk Users/VA Hospital	10,225,164	0.0157
Bulk Users - Contract	<u>106,444,329</u>	<u>0.1639</u>
Total	<u>\$ 649,330,621</u>	<u>1.0000</u>

FACTOR 9. ALLOCATION OF REGULATORY COMMISSION EXPENSES, ASSESSMENTS AND OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor
(1)	(2)	(3)
Residential	\$ 71,385,100	0.5746
Non-Residential	26,860,162	0.2162
Large Industrial	1,349,670	0.0109
Bulk Users/VA Hospital	2,174,695	0.0175
Bulk Users - Contract	<u>22,465,674</u>	<u>0.1808</u>
Total	<u>\$ 124,235,301</u>	<u>1.0000</u>

APPENDIX A

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- a. A description of the allocation methods used. A comparison of the allocated cost of service by class with the present and proposed revenues. A cost of service schedule showing the Rate of Return produced by present and proposed rates by class of service.

RESPONSE

A description of the methods used for the cost of service study is provided in Exhibit 12-B and in PAWC Statement No. 12. A comparison of the allocated cost of service by class with the present and proposed revenues is provided on Schedule A of Exhibit 12-B.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- b. Indicate if the method used for establishing the allocation factors in the Cost of Service Study deviates from the previous study submitted in the last rate case. If yes, indicate which allocation factors were changed and discuss the reason for the changes.

RESPONSE

The methods used for establishing the allocation factors in the cost of service study have not deviated from the previous study submitted in the last case.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- c. Supply the average day, the maximum day and the maximum hour deliveries to the system adjusted for storage for the test year and two prior years. Also provide workpapers, analyses, comparative data or other documentation supporting the estimated maximum day and peak hour demands by customer class reflected in the Company's cost of service study.

RESPONSE

Not applicable.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- d. Explain thoroughly the methodology employed if the Company distinguishes between transmission and distribution mains in its allocation of costs.

RESPONSE

Not applicable.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- e. Provide a detailed explanation of how storage is utilized to meet base, maximum day and maximum hour demands.

RESPONSE

There is no storage for this system.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- f. Provide workpapers, calculations and supporting documentation which develop the equivalent meters and equivalent service weights reflected in the Company's cost of service study.

RESPONSE

There are no meter or service equivalents calculated for this study.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- g. Provide all workpapers and supporting documentation for the fire flow requirement and duration utilized in the cost of service study.

RESPONSE

Because this is a wastewater operation, there is no fire flow requirements.

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

- RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:
- h. Provide a breakdown of the number and size of private fire services according to the general water service class of customer.

RESPONSE

Not applicable.

PENNSYLVANIA AMERICAN WATER COMPANY  
 RESPONSES TO RATE STRUCTURE  
 AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- i Provide a calculation of the Company's base cost of water per unit of consumption.

RESPONSE

The calculation of the average flow cost per hundred gallons is as follows:

Total Flow Cost	\$59,529,129
Pro Forma Usage (Hundred Gallons) (Includes Estimated Unmetered)	46,078,695
Flow Cost per Hundred Gallons	\$1.2919

PENNSYLVANIA AMERICAN WATER COMPANY  
RESPONSES TO RATE STRUCTURE  
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

- j. Provide a detailed cost analysis that supports the Company's customer charges, by meter size, showing all direct and indirect costs included.

RESPONSE

Please refer to the attached schedules.

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTORS 1 and 2. ALLOCATION OF COSTS ASSOCIATED WITH AVERAGE DAILY FLOWS.

Factors are based on the pro forma test year average daily consumption for each customer classification.

Classification (1)	Total		I&I Average Day 100 gallons (b) (3)	Total		Allocation Factor 1 (5)	Total		Allocation Factor 2 (8)
	Average Daily Customer Flow 100 gallons (a) (2)	Average Daily Sanitary Flow (4)=(2)+(3)		Average Day CSO 100 gallons (6)	Average Day Wastewater Flow (7)=(4)+(6)				
Residential	38,324	59,854	21,530	59,854	0.5190	59,854	0.2353		
Non-Residential	24,610	36,667	12,057	36,667	0.3179	36,667	0.1441		
Industrial	3,060	4,995	1,935	4,995	0.0433	4,995	0.0196		
Bulk	11,391	13,812	2,421	13,812	0.1198	13,812	0.0543		
Stormwater CSO	-	-	-	-	-	139,047	0.5466		
<b>Total</b>	<b>77,385</b>	<b>115,328</b>	<b>37,943</b>	<b>115,328</b>	<b>1.0000</b>	<b>254,375</b>	<b>1.0000</b>		

(a) Customer water usage from bill analysis, adjusted to reflect 88% returned to sewer system. See below.

(b) Allocation based on Factor 1A for Residential, Non-Residential and Industrial.

Classification (1)	Annual Usage 100 gallons (2)		Average Day 100 gallons (3)=(2)/365		Percent to Sewer System (6)		Adjusted Average Day 100 gallons (7)	
	Residential	15,895,672	43,550	88.0%	38,324			
Non-Residential	10,207,424	27,966	88.0%	24,610				
Industrial	1,269,373	3,478	88.0%	3,060				
Bulk	4,724,512	12,944	88.0%	11,391				
<b>Total</b>	<b>32,096,981</b>	<b>87,937</b>		<b>77,385</b>				

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification (1)	Total Average Daily Flow 100 gallons (2)	Average Daily Flow		Service Equivalents (Factor 5)		Allocation Factor 1A (8)=(4)+(7)
		Factor (3)	Weight (4)=(3) x 0.3333	Number (5)	Factor (6)	
Residential	38,324	0.4952	0.1651	31,124	0.6035	0.5674
Non-Residential	24,610	0.3180	0.1060	16,380	0.3176	0.3178
Industrial	3,060	0.0395	0.0132	2,925	0.0567	0.0510
Bulk	11,391	0.1472	0.0491	1,141	0.0221	0.0638
<b>Total</b>	<b>77,385</b>	<b>1.0000</b>	<b>0.3333</b>	<b>51,570</b>	<b>1.0000</b>	<b>1.0000</b>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTORS 3 and 4. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PEAK DAILY FLOW.

Factors are based on the peak daily flow for each customer classification.

Classification (1)	Total		I&I Peak Day 100 gallons (b) (3)	Total		Peak Day CSO 100 gallons (6)	Total	
	Average Daily Customer Flow 100 gallons (a) (2)	Sanitary Peak Flow (4)=(2)+(3)		Sanitary Peak Flow (4)=(2)+(3)	Allocation Factor 3 (5)		Peak Day Wastewater Flow (7)=(4)+(6)	Allocation Factor 4 (8)
Residential	38,324	261,109	222,785	261,109	0.5556	261,109	0.2194	
Non-Residential	24,610	149,367	124,757	149,367	0.3178	149,367	0.1255	
Industrial	3,060	23,081	20,021	23,081	0.0491	23,081	0.0194	
Bulk	11,391	36,443	25,052	36,443	0.0775	36,443	0.0306	
Stormwater CSO	-	-	-	-	-	720,000	0.6050	
<b>Total</b>	<b>77,385</b>	<b>470,000</b>	<b>392,615</b>	<b>470,000</b>	<b>1.0000</b>	<b>1,190,000</b>	<b>1.0000</b>	

(a) See Factor 1.

(b) Allocated based on Factor 1A

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

Customer Classification (1)	Number of Customers (2)	Service Equiv. Ratio (3)	Service Equivalents (2)X(3)=(4)	Allocation Factor (5)
Residential	31,124	1.0	31,124	0.6035
Non-Residential	6,552	2.5	16,380	0.3176
Industrial	117	25.0	2,925	0.0567
Bulk	563	*	1,141 *	0.0221
Stormwater CSO	-	-	-	-
Total	<u>38,356</u>		<u>51,570</u>	<u>1.0000</u>

\* Based on 514 aggregated residential customers and 49 Bulk customers at 25.0 service equivalent ratio.

FACTOR 6. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

Customer Classification (1)	Number of Customers (2)	Allocation Factor (3)
Residential	31,124	0.8115
Non-Residential	6,552	0.1708
Industrial	117	0.0031
Bulk	563	0.0147
Stormwater CSO	-	-
Total	<u>38,356</u>	<u>1.0000</u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 7. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

<u>Customer Classification</u> (1)	<u>Direct Labor Expense</u> (2)	<u>Allocation Factor</u> (3)
Residential	\$ 1,640,640	0.2437
Non-Residential	947,331	0.1407
Industrial	125,473	0.0186
Bulk	348,059	0.0517
Stormwater CSO	<u>3,671,452</u>	<u>0.5453</u>
Total	<u>\$ 6,732,956</u>	<u>1.0000</u>

FACTOR 8. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS,  
MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

<u>Customer Classification</u> (1)	<u>Original Cost Less Depreciation</u> (2)	<u>Allocation Factor</u> (3)
Residential	\$ 169,478,961	0.3037
Non-Residential	96,029,295	0.1721
Industrial	14,793,737	0.0265
Bulk	23,194,565	0.0416
Stormwater CSO	<u>254,479,640</u>	<u>0.4561</u>
Total	<u>\$ 557,976,198</u>	<u>1.0000</u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 9. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

Factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below.

Customer Classification <u>(1)</u>	Original Cost Measure of Value <u>(2)</u>	Allocation Factor <u>(3)</u>
Residential	\$ 148,614,323	0.3038
Non-Residential	84,190,398	0.1721
Industrial	12,964,909	0.0265
Bulk	20,353,116	0.0416
Stormwater CSO	<u>223,061,535</u>	<u>0.4560</u>
Total	<u><u>\$ 489,184,281</u></u>	<u><u>1.0000</u></u>

FACTOR 10 and 10A. ALLOCATION OF REGULATORY COMMISSION EXPENSES,  
ASSESSMENTS, OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification <u>(1)</u>	Total Cost of Service <u>(2)</u>	Allocation Factor 10 <u>(3)</u>	Total Cost of Service with Stormwater Reallocated <u>(4)</u>	Allocation Factor 10A <u>(5)</u>
Residential	\$ 29,570,875	0.3155	\$ 52,876,847	0.5641
Non-Residential	16,348,485	0.1744	29,396,208	0.3136
Industrial	2,403,121	0.0256	4,497,238	0.0480
Bulk	4,355,487	0.0465	6,972,683	0.0744
Stormwater CSO	<u>41,041,425</u>	<u>0.4379</u>	<u>-</u>	<u>-</u>
Total	<u><u>\$ 93,719,394</u></u>	<u><u>1.0000</u></u>	<u><u>\$ 93,742,976</u></u>	<u><u>1.0000</u></u>

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 11. ALLOCATION OF ADMINISTRATIVE AND GENERAL EXPENSES

Factors are based on the allocation of all other operation and maintenance expenses excluding purchased water, power, chemicals and waste disposal.

Customer Classification	Operation & Maintenance Expenses	Allocation Factor
(1)	(2)	(3)
Residential	\$ 2,939,228	0.3124
Non-Residential	1,367,012	0.1453
Industrial	159,353	0.0169
Bulk	448,935	0.0477
Stormwater CSO	4,494,014	0.4777
Total	<u>\$ 9,408,543</u>	<u>1.0000</u>

FACTOR 12. ALLOCATION OF CASH WORKING CAPITAL

Factors are based on the allocation of operation and maintenance expenses including purchased water, power, chemicals and waste disposal.

Customer Classification	Operation & Maintenance Expenses	Allocation Factor
(1)	(2)	(3)
Residential	\$ 7,228,536	0.3343
Commercial	3,730,083	0.1725
Industrial	465,170	0.0215
Bulk	1,297,177	0.0600
Stormwater CSO	8,903,134	0.4117
Total	<u>\$ 21,624,101</u>	<u>1.0000</u>

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

**FACTOR 1. ALLOCATION OF COSTS ASSOCIATED WITH WASTEWATER TREATMENT**

Factors are based on the pro forma test year average daily consumption for each customer classification with adjustments. The detail regarding calculation of adjusted flows can be found on the following page.

Classification (1)	Total Adjusted Average Daily Customer Flow 100 gallons (a) (2)	I&I		Allocation Factor (7)
		Gallons Per Day 100 gallons (b) (3)	Total I&I And Average Flow (4)=(2)+(3)	
Residential	3,592	5,032	8,625	0.7918
Non-Residential	1,123	1,144	2,268	0.2082
<b>Total</b>	<b>4,716</b>	<b>6,177</b>	<b>10,892</b>	<b>1.0000</b>

(a) Customer Flow.

(b) Allocation based on Factor 1A for Residential, Non-Residential and Large Industrial.

**FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.**

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification (1)	Total Adjusted Average Daily Flow 100 gallons (2)	Average Daily Flow		Number of Customers		Allocation Factor (8)=(4)+(7)
		Factor (3)	Weight (4)=(3) x 0.3333	Factor (6)	Weight (7)=(6) x 0.6667	
Residential	3,592	0.7618	0.2539	0.8412	0.5608	0.8147
Non-Residential	1,123	0.2382	0.0794	0.1588	0.1059	0.1853
<b>Total</b>	<b>4,716</b>	<b>1.0000</b>	<b>0.3333</b>	<b>1.0000</b>	<b>0.6667</b>	<b>1.0000</b>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BRENTWOOD OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

**FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH THE COLLECTION SYSTEM**

Factors are based on peak daily flow for each customer classification.

Customer Classification (1)	Ave. Flow Consumption, 100 gpd (2)	Peak I&I Flow 100 gallons (a) (3)	Total Peak I&I And Average (4)=(2)+(3)	Allocation Factor (5)
Residential	3,592	11,526	15,119	0.8015
Non-Residential	1,123	2,621	3,744	0.1985
<b>Total</b>	<b>4,716</b>	<b>14,147</b>	<b>18,863</b>	<b>1.0000</b>

(a) Allocation based on Factor 1A.

**FACTOR 3. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PROJECTED AVERAGE DAILY FLOW INCLUDING INFILTRATION AND INFLOW**

Factors are based on the projected average daily consumption for each customer classification.

Classification (1)	Total Average Daily Flow 100 gallons (2)	Direct I&I Gallons Per Day 100 gallons (a) (3)	Total Direct I&I And Average (4)=(2)+(3)	Allocation Factor (7)
Residential	3,592	5,032	8,625	0.7918
Non-Residential	1,123	1,144	2,268	0.2082
<b>Total</b>	<b>4,716</b>	<b>6,177</b>	<b>10,892</b>	<b>1.0000</b>

(a) Allocation based on Factor 1A.

FACTOR 3A. NOT USED IN THIS ALLOCATION

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BRENTWOOD OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 4. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

<u>Customer Classification</u> (1)	<u>Number of Customers</u> (2)	<u>Service Equiv. Ratio (a)</u> (3)	<u>Service Equivalents</u> (2)X(3)=(4)	<u>Allocation Factor</u> (5)
Residential	44,340	1.0	44,340	0.8412
Non-Residential	3,348	2.5	8,370	0.1588
	<hr/>		<hr/>	
Total	<u><u>47,688</u></u>		<u><u>52,710</u></u>	<u><u>1.0000</u></u>

(a) Based on ratio by class for Coatesville service area.

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

<u>Customer Classification</u> (1)	<u>Number of Customers</u> (2)	<u>Allocation Factor</u> (3)
Residential	44,340	0.9298
Non-Residential	3,348	0.0702
	<hr/>	
Total	<u><u>47,688</u></u>	<u><u>1.0000</u></u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BRENTWOOD OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 6. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

Customer Classification	Direct Labor Expense	Allocation Factor
(1)	(2)	(3)
Residential	\$ 60,873	0.7918
Non-Residential	16,004	0.2082
	<hr/>	<hr/>
Total	<u>\$ 76,876</u>	<u>1.0000</u>

FACTOR 7. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS,  
MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	\$ 17,739,721	0.7951
Non-Residential	4,572,039	0.2049
	<hr/>	<hr/>
Total	<u>\$ 22,311,759</u>	<u>1.0000</u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BRENTWOOD OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 8. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

Factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below.

Customer Classification	Original Cost Measure of Value	Allocation Factor
(1)	(2)	(3)
Residential	\$ 17,536,432	0.7952
Non-Residential	4,517,514	0.2048
	<hr/>	<hr/>
Total	<u>\$ 22,053,946</u>	<u>1.0000</u>

FACTOR 9. ALLOCATION OF REGULATORY COMMISSION EXPENSES, ASSESSMENTS AND OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor
(1)	(2)	(3)
Residential	\$ 2,914,581	0.8042
Non-Residential	709,584	0.1958
	<hr/>	<hr/>
Total	<u>\$ 3,624,165</u>	<u>1.0000</u>

WASTEWATER SEWER SANITARY SYSTEM BUTLER AREA OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1. ALLOCATION OF COSTS ASSOCIATED WITH WASTEWATER TREATMENT

Factors are based on the pro forma test year average daily consumption for each customer classification with adjustments. The detail regarding calculation of adjusted flows can be found on the following page.

Classification (1)	Total Adjusted Average Daily Customer Flow 100 gallons (a) (2)	I&I Gallons Per Day 100 gallons (b) (3)	Total I&I And Average Flow (4)=(2)+(3)	Allocation Factor (7)
Residential	14,112	34,875	48,987	0.7785
Non-Residential	7,295	6,643	13,937	0.2215
Total	21,407	41,518	62,924	1.0000

(a) Customer Flow.

(b) Allocation based on Factor 1A for Residential, Non-Residential and Large Industrial.

FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification (1)	Total Adjusted Average Daily Flow 100 gallons (2)	Average Daily Flow Factor (3)	Weight (4)=(3) x 0.3333	Number of Service Equivalents (5)	Number of Customers Factor (6)	Weight (7)=(6) x 0.6667	Allocation Factor (8)=(4)+(7)
Residential	14,112	0.6592	0.2197	171,216	0.9304	0.6203	0.8400
Non-Residential	7,295	0.3408	0.1136	12,816	0.0696	0.0464	0.1600
Total	21,407	1.0000	0.3333	184,032	1.0000	0.6667	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BUTLER AREA OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

**FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH THE COLLECTION SYSTEM**

Factors are based on peak daily flow for each customer classification.

Customer Classification (1)	Ave. Flow Consumption, 100 gpd (2)	Peak I&I Flow 100 gallons (a) (3)	Total Peak I&I And Average (4)=(2)+(3)	Allocation Factor (5)
Residential	14,112	79,097	93,209	0.8065
Non-Residential	7,295	15,067	22,361	0.1935
<b>Total</b>	<b>21,407</b>	<b>94,163</b>	<b>115,570</b>	<b>1.0000</b>

(a) Allocation based on Factor 1A.

**FACTOR 3. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PROJECTED AVERAGE DAILY FLOW INCLUDING INFILTRATION AND INFLOW**

Factors are based on the projected average daily consumption for each customer classification.

Customer Classification (1)	Total Average Daily Flow 100 gallons (2)	I&I Gallons Per Day 100 gallons (a) (3)	Total Direct I&I And Average (4)=(2)+(3)	Allocation Factor (7)
Residential	14,112	34,875	48,987	0.7785
Non-Residential	7,295	6,643	13,937	0.2215
<b>Total</b>	<b>21,407</b>	<b>41,518</b>	<b>62,924</b>	<b>1.0000</b>

(a) Allocation based on Factor 1A.

FACTOR 3A. NOT USED IN THIS ALLOCATION

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BUTLER AREA OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 4. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

Customer Classification <u>(1)</u>	Number of Customers <u>(2)</u>	Service Equiv. Ratio (a) <u>(3)</u>	Service Equivalents <u>(2)X(3)=(4)</u>	Allocation Factor <u>(5)</u>
Residential	171,072	1.0	171,072	0.9303
Non-Residential	12,816	1.0	12,816	0.0697
	<hr/>		<hr/>	
Total	<u><u>183,888</u></u>		<u><u>183,888</u></u>	<u><u>1.0000</u></u>

(a) Based on ratio by class for Coatesville service area.

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

Customer Classification <u>(1)</u>	Number of Customers <u>(2)</u>	Allocation Factor <u>(3)</u>
Residential	171,072	0.9303
Non-Residential	12,816	0.0697
	<hr/>	<hr/>
Total	<u><u>183,888</u></u>	<u><u>1.0000</u></u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BUTLER AREA OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 6. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

Customer Classification	Direct Labor Expense	Allocation Factor
(1)	(2)	(3)
Residential	\$ 1,874,225	0.7785
Non-Residential	533,246	0.2215
	<hr/>	<hr/>
Total	<u>\$ 2,407,470</u>	<u>1.0000</u>

FACTOR 7. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS,  
MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	\$ 185,670,939	0.7935
Non-Residential	48,323,487	0.2065
	<hr/>	<hr/>
Total	<u>\$ 233,994,426</u>	<u>1.0000</u>

PENNSYLVANIA AMERICAN WATER COMPANY  
WASTEWATER SEWER SANITARY SYSTEM BUTLER AREA OPERATIONS  
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 8. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

Factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below.

Customer Classification	Original Cost Measure of Value	Allocation Factor
(1)	(2)	(3)
Residential	\$ 183,730,629	0.7935
Non-Residential	47,806,288	0.2065
	<hr/>	<hr/>
Total	<u><u>\$ 231,536,917</u></u>	<u><u>1.0000</u></u>

FACTOR 9. ALLOCATION OF REGULATORY COMMISSION EXPENSES, ASSESSMENTS AND OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor
(1)	(2)	(3)
Residential	\$ 29,585,086	0.7961
Non-Residential	7,579,123	0.2039
	<hr/>	<hr/>
Total	<u><u>\$ 37,164,209</u></u>	<u><u>1.0000</u></u>

1                    **II.     PURPOSE AND OVERVIEW OF DIRECT TESTIMONY**

2   **Q.     Please describe the purpose of your Direct Testimony.**

3   A.     The purpose of my Direct Testimony is to present evidence and provide a recommendation  
4        regarding the appropriate return on equity (“ROE”) for the Company and to provide an  
5        assessment of the reasonableness of PAWC’s proposed capital structure for ratemaking  
6        purposes.

7   **Q.     Are you sponsoring any exhibits in support of your direct testimony?**

8   A.     Yes. My analysis and recommendations are supported by the data presented in Exhibit No.  
9        13-A Schedule 1 through Schedule 14, which were prepared by me or under my direction.

10   **Q.     Please provide a brief overview of the analyses that led to your ROE recommendation.**

11   A.     As discussed in more detail below, it is important to consider the results of several  
12        analytical approaches in determining a reasonable recommendation for the Company’s  
13        ROE. To develop my ROE recommendation, I first developed a proxy group of utility  
14        companies. I did not limit the proxy group to water utilities, but included a broader group  
15        of utilities that face risk similar to PAWC because a proxy group composed only of water  
16        utilities would result in a small group of companies for which data is limited. To that proxy  
17        group, I applied the Constant Growth Form of the Discounted Cash Flow (“DCF”) model,  
18        the Capital Asset Pricing Model (“CAPM”), and the Empirical Capital Asset Pricing Model  
19        (“ECAPM”). My recommendation also takes into consideration the following factors:

- 20            1. PAWC’s capital expenditure program relative to the proxy group companies;
- 21            2. Flotation costs associated with AWK’s recent equity issuance;

- 1           3. the risks related to environmental and water quality regulation;
- 2           4. the regulatory risk of PAWC relative to the proxy group; and
- 3           5. PAWC’s proposed capital structure as compared to the capital structures of the
- 4           proxy group companies.<sup>1</sup>

5           While I did not make specific adjustments to my recommended ROE for these factors, I

6           did consider them in the aggregate when determining where my recommended ROE falls

7           within the range of the analytical results.

8   **Q.    How is the remainder of your Direct Testimony organized?**

9    A.    The remainder of my direct testimony is organized as follows:

- 10           • Section III provides a summary of my analyses and conclusions.
- 11           • Section IV reviews the regulatory guidelines pertinent to the development of the
- 12           cost of capital.
- 13           • Section V discusses current and projected capital market conditions and the effect
- 14           of those conditions on PAWC’s cost of equity.
- 15           • Section VI explains my selection of the proxy group for PAWC.
- 16           • Section VII describes my analyses and the analytical basis for my recommendation
- 17           of the appropriate ROE for PAWC.
- 18           • Section VIII provides a discussion of specific regulatory, business, and financial
- 19           risks that have a direct bearing on the ROE to be authorized for PAWC in this case.
- 20           • Section IX provides an assessment of the reasonableness of PAWC’s proposed
- 21           capital structure relative to the proxy group.
- 22           • Section X presents my conclusions and recommendations.

---

<sup>1</sup> The selection and purpose of developing a group of comparable companies will be discussed in detail in Section VI of my Direct Testimony.

1 range of results. My conclusion as to the appropriate ROE for PAWC within that range of  
2 results is based on Company's business and financial risk relative to the proxy group and  
3 my assessment of market conditions. As noted above, although the companies in my proxy  
4 group are generally comparable to PAWC, each company is unique. Accordingly, I  
5 considered the Company's business, financial and regulatory risk in aggregate relative to  
6 that of the proxy group companies when determining where the Company's ROE should  
7 fall within the reasonable range of analytical results to appropriately account for any  
8 residual differences in risk.

9 **Q. What are the results of the models that you have used to estimate the cost of equity**  
10 **for PAWC?**

11 A. Figure 1 (and Exhibit No. 13-A, Schedule 1) summarizes the range of results produced by  
12 the Constant Growth DCF, CAPM, and ECAPM analyses.

1

**Figure 1: Summary of Cost of Equity Analytical Results<sup>3</sup>**

2

3

4

5

6

7

8

As shown in Figure 1 (and Exhibit No. 13-A, Schedule 1), the range of results produced by the models used to estimate the COE is wide. For example, the low end of the DCF results are below any ROE that has been authorized by a regulatory commission for a water utility whereas the range set by the higher end of the DCF model overlap the results of the other risk premium-based methodologies. While it is common to consider multiple models to estimate the cost of equity, it is particularly important when the range of results varies

<sup>3</sup> DCF results exclude the result for Middlesex Water Company because the low and mean results are lower than the current yield on the Moody's Baa rated utility bond index, which is illogical and the high end DCF result does not provide a reasonable equity risk premium over the current yield on the Moody's Baa rated utility bond index of 6.48 percent on a 30-day average basis ending October 31, 2023.

1 considerably across methodologies. My ROE recommendation also considers PAWC's  
2 company-specific risk factors and current and prospective capital market conditions.

3 **Q. Are prospective capital market conditions expected to affect the results of the cost of**  
4 **equity for PAWC during the period in which the rates established in this proceeding**  
5 **will be in effect?**

6 A. Yes. Capital market conditions are expected to affect the results of the cost of equity  
7 estimation models. Specifically:

- 8 • Inflation is expected to persist over the near-term, which increases the retail revenue  
9 requirement due to increases in operating costs. Inflation increases the risk that the  
10 revenue requirement that is set in a rate proceeding will not recover the operating  
11 costs of the business going forward, which increases the operating risk of the utility  
12 during the period in which rates will be in effect.
- 13 • Long-term interest rates have increased substantially in the past year in response to  
14 inflation.
- 15 • Equity analysts have noted the increased risk for the utility sector as a result of  
16 rising interest rates and expect the sector to underperform over the near-term.
- 17 • Since utility dividend yields are now less attractive than the risk-free rates of  
18 government bonds, and interest rates are expected to remain elevated, it is likely  
19 that utility share prices will decline.
- 20 • A decline in utility stock prices will increase the dividend yields and thus, all else  
21 equal, the cost of equity estimates produced by the DCF model.
- 22 • Consequently, the results of the DCF model using current utility share prices may  
23 understate the cost of equity during the period that the Company's rates will be in  
24 effect.
- 25 • Furthermore, expected market conditions warrant consideration of forward-looking  
26 cost of equity estimation models such as the CAPM and ECAPM, which rely on  
27 interest rates as a direct input into the models and thus may better reflect the market  
28 expected during the period that the Company's rates will be in effect.

- 1           • Rating agencies have cited increased risk in the utility sector due to increased  
2           interest rates, inflation and elevated capital expenditures.

3           It is appropriate to consider all of these factors when estimating a reasonable range of the  
4           investor-required cost of equity and the recommended ROE for PAWC.

5   **Q.    What is your conclusion regarding the appropriate authorized ROE for PAWC in**  
6   **this proceeding?**

7   A.    Considering the analytical results presented in Figure 1, current and prospective capital  
8           market conditions, as well as the level of regulatory, business, and financial risk faced by  
9           PAWC’s water and wastewater operations in Pennsylvania relative to the proxy group, I  
10          believe a range from 10.00 percent to 11.25 percent is reasonable. Taking into  
11          consideration the results of the analytical models, current market conditions, the  
12          Company’s relative risk, and superior management performance, an ROE in the higher end  
13          of that range of 10.95 percent is reasonable and appropriate.

14 **Q.    Is PAWC’s requested capital structure reasonable and appropriate?**

15 A.    Yes. Comparing the Company’s proposed equity ratio of 55.00 percent to the equity ratios  
16          of the operating companies owned by the proxy group companies demonstrates that the  
17          Company’s requested equity ratio is well within the range of equity ratios for the proxy  
18          group. Further, the Company’s proposed equity ratio is reasonable considering credit  
19          rating agencies’ continued concern with the negative effect on the cash flows and credit  
20          metrics associated with increasing interest rates, inflation and capital expenditures.

1 IV. REGULATORY GUIDELINES

2 **Q. Please describe the guiding principles to be used in establishing the cost of capital for**  
3 **a regulated utility.**

4 A. The U.S. Supreme Court’s precedent-setting *Hope* and *Bluefield* cases established the  
5 standards for determining the fairness and reasonableness of a utility’s authorized ROE.  
6 Among the standards established by the Court in those cases are: (1) consistency with other  
7 businesses having similar or comparable risks; (2) adequacy of the return to support credit  
8 quality and access to capital; and (3) the principle that the specific means of arriving at a  
9 fair return does not need to be determined, only that the end result leads to just and  
10 reasonable rates.<sup>4</sup>

11 **Q. Is fixing a proper rate of return just about protecting the utility’s interests?**

12 A. No. As the Court noted in *Bluefield*, a proper rate of return not only assures “confidence  
13 in the financial soundness of the utility and should be adequate, under efficient and  
14 economical management, to maintain and support its credit [but also] enable[s the utility]  
15 to raise the money necessary for the proper discharge of its public duties.”<sup>5</sup> As the Court  
16 went on to explain in *Hope*, “[t]he rate-making process ... involves balancing of the  
17 investor and consumer interests.”<sup>6</sup>

---

<sup>4</sup> *Bluefield*, 262 U.S. at 692-93; *Hope*, 320 U.S. at 603.

<sup>5</sup> *Bluefield*, 262 U.S. at 693.

<sup>6</sup> *Hope*, 320 U.S. at 603.

1 **Q. Has the Pennsylvania Public Utility Commission (“Commission”) provided similar**  
2 **guidance in establishing the appropriate return on common equity?**

3 A. Yes. The Commission follows the precedents of the Hope and Bluefield cases and  
4 acknowledges that utility investors are entitled to a fair and reasonable return. This position  
5 was set forth by the Commission as follows:

6 In determining a fair rate of return, the Commission must adhere to the  
7 constitutional standards established by the United States Supreme Court in  
8 the seminal cases *Bluefield Water Works and Improvement Co. v. Public*  
9 *Service Comm’n of West Virginia*, 262 U.S. 679, 692-93 (1923) (*Bluefield*)  
10 and *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591,  
11 603 (1944) (*Hope Natural Gas*). In *Bluefield*, the Supreme Court stated:

12 A public utility is entitled to such rates as will permit it to earn a return on  
13 the value of the property which it employs for the convenience of the public  
14 equal to that generally being made at the same time and in the same general  
15 part of the country on investments in other business undertakings which are  
16 attended by corresponding risks and uncertainties; but it has no  
17 constitutional right to profits such as are realized or anticipated in highly  
18 profitable enterprises or speculative ventures. The return should be  
19 reasonably sufficient to assure confidence in the financial soundness of the  
20 utility and should be adequate, under efficient and economical management,  
21 to maintain and support its credit and enable it to raise the money necessary  
22 for the proper discharge of its public duties. A rate of return may be too high  
23 or too low by changes affecting opportunities for investment, the money  
24 market and business conditions generally.

25 Twenty years later in *Hope Natural Gas*, the Supreme Court reiterated:

26 From the investor or company point of view it is important that there be  
27 enough revenue not only for operating expenses but also for the capital costs  
28 of the business. These include service on the debt and dividends on the  
29 stock. By that standard the return to equity owner should be commensurate  
30 with returns on investments in other enterprises having corresponding risks.  
31 That return, moreover, should be sufficient to assure confidence in the

1 financial integrity of the enterprise, so as to maintain its credit and to attract  
2 capital.<sup>7</sup>

3 **Q. Why is it important for a utility to be allowed the opportunity to earn a return that is**  
4 **adequate to attract capital at reasonable terms?**

5 A. A return that is adequate to attract capital at reasonable terms enables PAWC to continue  
6 to provide safe, reliable water and wastewater service efficiently while maintaining its  
7 financial integrity. That return should be commensurate with returns expected elsewhere  
8 in the market for investments of equivalent risk. If it is not, debt and equity investors will  
9 seek alternative investment opportunities for which the expected return reflects the  
10 perceived risks, thereby inhibiting PAWC's ability to attract capital at reasonable cost.  
11 When the Company is afforded a reasonable opportunity to earn its market-based cost of  
12 capital, a fair and reasonable balance will be achieved between customers' and  
13 shareholders' interests.

14 **Q. Is a utility's ability to attract capital also affected by the ROEs authorized for other**  
15 **utilities?**

16 A. Yes. Utilities compete directly for capital with other investments of similar risk, which  
17 include other water, natural gas, and electric utilities. Therefore, the ROE authorized for a  
18 utility sends an important signal to investors regarding whether there is regulatory support  
19 for financial integrity, dividends, growth, and fair compensation for business and financial  
20 risk. The cost of capital represents an opportunity cost to investors. If higher returns are  
21 available elsewhere for other investments of comparable risk over the same time period,

---

<sup>7</sup> Pennsylvania Public Utility Commission, Opinion and Order, PECO Energy Company – Gas Division, Docket No. R-2020-3018929, June 17, 2021 at 8.

1 investors have an incentive to direct their capital to those alternative investments. Thus,  
2 an authorized ROE significantly below authorized ROEs for other water, natural gas, and  
3 electric utilities can inhibit the utility's ability to attract capital for investment.

4 **Q. Is the regulatory framework and the authorized ROE and equity ratio important to**  
5 **the financial community?**

6 A. Yes. The regulatory framework is one of the most important factors in debt and equity  
7 investors' assessments of risk. Specifically regarding debt investors, credit rating agencies  
8 consider the authorized ROE and equity ratio for regulated utilities to be very important  
9 for two reasons: (1) they help determine the cash flows and credit metrics of the regulated  
10 utility; and (2) they provide an indication of the degree of regulatory support for credit  
11 quality in the jurisdiction. To the extent that the authorized returns in a jurisdiction are  
12 lower than the returns that have been authorized more broadly, credit rating agencies will  
13 consider this in the overall risk assessment of the regulatory jurisdiction in which the  
14 company operates. Not only do credit ratings affect the overall cost of borrowing, they  
15 also act as a signal to equity investors about the risk of investing in the equity of a company.

16 **Q. What is the standard for setting the ROE in any jurisdiction?**

17 A. The stand-alone ratemaking principle is the foundation of jurisdictional ratemaking. This  
18 principle requires that the rates that are charged in any operating jurisdiction be for the  
19 costs incurred in that jurisdiction. The stand-alone ratemaking principle ensures that  
20 customers in each jurisdiction only pay for the costs of the service provided in that  
21 jurisdiction, which is not influenced by the business operations in other operating  
22 companies. In order to maintain this principle, the cost of equity analysis is performed for

1 an individual operating company as a stand-alone entity. As such, I have evaluated the  
2 investor-required return for PAWC's water and wastewater operations in Pennsylvania.

3 **Q. What are your conclusions regarding regulatory guidelines?**

4 A. The ratemaking process is premised on the principle that, in order for investors and  
5 companies to commit the capital needed to provide safe and reliable utility services, a  
6 utility must have a reasonable opportunity to recover the return of, and the market-required  
7 return on, its invested capital. Accordingly, the Commission's order in this proceeding  
8 should establish rates that provide the Company with a reasonable opportunity to earn a  
9 ROE that is: (1) adequate to attract capital at reasonable terms; (2) sufficient to ensure its  
10 financial integrity; and (3) commensurate with returns on investments in enterprises with  
11 similar risk. It is important for the ROE authorized in this proceeding to take into  
12 consideration current and projected capital market conditions, as well as investors'  
13 expectations and requirements for both risks and returns. Because utility operations are  
14 capital-intensive, regulatory decisions should enable the utility to attract capital at  
15 reasonable terms under a variety of economic and financial market conditions. Providing  
16 the opportunity to earn a market-based cost of capital supports the financial integrity of the  
17 Company, which is in the interest of both customers and shareholders.

18 **V. CAPITAL MARKET CONDITIONS**

19 **Q. Why is it important to analyze capital market conditions?**

20 A. The models used to estimate the cost of equity rely on market data that are specific either  
21 to the proxy group, in the case of the DCF model, or to the expectations of market risk, in

1 the case of the CAPM. The results of the cost of equity estimation models can be affected  
2 by prevailing market conditions at the time the analysis is performed. While the ROE  
3 established in a rate proceeding is intended to be forward-looking, the analyst uses both  
4 current and projected market data, specifically stock prices, dividends, growth rates, and  
5 interest rates, in the cost of equity estimation models to estimate the investor-required  
6 return for the subject company.

7 Regulatory commissions and analysts recognize that current market conditions affect the  
8 results of the cost of equity estimation models. As a result, it is important to consider the  
9 effect of the market conditions on these models when determining an appropriate range for  
10 the ROE and the recommended ROE for ratemaking purposes for a future period. If  
11 investors do not expect current market conditions to be sustained in the future, it is possible  
12 that the cost of equity estimation models will not provide an accurate estimate of investors'  
13 required return during that rate period. Therefore, it is very important to consider projected  
14 market data to estimate the return for that forward-looking period.

15 **Q. What factors are affecting the cost of equity for regulated utilities in the current and**  
16 **prospective capital markets?**

17 A. The cost of equity for regulated utility companies is being affected by several factors in the  
18 current and prospective capital markets, including: (1) changes in monetary policy; (2)  
19 relatively high inflation; and (3) increased interest rates that also are expected to remain  
20 relatively high over the next few years. These factors affect the assumptions used in the  
21 cost of equity estimation models.

1 **Q. What effect do current and prospective market conditions have on the cost of equity**  
2 **for the Company?**

3 A. As is discussed in more detail in the remainder of this section, the combination of inflation  
4 persistently higher than the Federal Reserve’s target level and the Federal Reserve’s  
5 changes in monetary policy contribute to an expectation of increased market risk and an  
6 increase in the cost of the investor-required return. It is important that these factors be  
7 considered in setting a forward-looking ROE. Inflation has recently been at some of the  
8 highest levels seen in approximately 40 years, and while inflation has declined from these  
9 recent peaks, it remains relatively high. Interest rates, which have increased significantly,  
10 are expected to continue to remain relatively high in direct response to the Federal  
11 Reserve’s use of monetary policy to combat inflation. There is a strong historical inverse  
12 correlation between interest rates (i.e., yields on long-term government bonds) and the  
13 share prices of utility stocks (i.e., as utility share prices decline, utility dividend yields  
14 increase). Since the yields on long-term government bonds currently exceed the dividend  
15 yields of utilities, and historically long-term government bond yields have been lower than  
16 the dividend yields of utilities, it is reasonable to expect that utility investors’ cost of equity  
17 is increasing. Because the cost of equity in this proceeding is being estimated for the future  
18 period that the Company’s rates will be in effect, and because the cost of equity is expected  
19 to increase over the near term for utilities, cost of equity estimates based in whole or in part  
20 on historical or current market conditions, as opposed to projected market conditions, will  
21 likely understate the cost of equity during the future period that the Company’s rates will  
22 be in effect.

1           **A.   Inflationary Expectations in Current and Projected Capital Market**  
2           **Conditions**

3   **Q.    Has inflation increased significantly in recent years?**

4   A.    Yes. As shown in Figure 2, core inflation increased steadily beginning in early 2021, rising  
5        from 1.41 percent in January 2021 to a high of 6.64 percent in September 2022, which was  
6        the largest 12-month increase since 1982.<sup>8</sup> Since that time, while core inflation has  
7        declined in response to the Federal Reserve’s monetary policy, core inflation continues to  
8        remain significantly above the Federal Reserve’s target level of 2.0 percent.

9        Finally, Figure 2 also considers the ratio of unemployed persons per job opening, which is  
10        currently 0.7 and has been consistently below 1.0 since mid- 2021 despite the Federal  
11        Reserve’s accelerated policy normalization. This metric indicates sustained strength in the  
12        labor market. Given the Federal Reserve’s dual mandate of maximum employment and  
13        price stability, the continued increased levels of core inflation coupled with the strength in  
14        the labor market has resulted in the Federal Reserve’s sustained focus on the priority of  
15        reducing inflation.

---

<sup>8</sup> Figure 2, presents the year-over-year (“YOY”) change in core inflation as measured by the Consumer Price Index (“CPI”) excluding food and energy prices as published by the Bureau of Labor Statistics. I considered core inflation because it is the preferred inflation indicator of the Federal Reserve for determining the direction of monetary policy. Core inflation is preferred by the Federal Reserve since it removes the effect of food and energy prices, which can be highly volatile.

1 **Figure 2: Core Inflation and Unemployed Persons-to-Job Openings, January 2019**  
 2 **to October 2023<sup>9</sup>**

3

4 **Q. What are the expectations for inflation over the near term?**

5 A. Despite the declines from 40-year highs, the Federal Reserve has indicated that it expects  
 6 inflation will remain above its target level over at least the next year and that monetary  
 7 policy will remain restrictive in order to reduce inflation. For example, Federal Reserve  
 8 Chair Powell observed at the Federal Open Market Committee (FOMC) meeting in  
 9 September 2023 that while inflation is down from its recent highs, it remains significantly  
 10 above the Federal Reserve’s long-term target:

<sup>9</sup> Bureau of Labor Statistics.

1 Inflation remains well above our longer-run goal of 2 percent. Based on the  
2 Consumer Price Index and other data, we estimate that total PCE [personal  
3 consumption expenditures] prices rose 3.4 percent over the 12 months  
4 ending in August; and that, excluding the volatile food and energy  
5 categories, core PCE prices rose 3.9 percent. Inflation has moderated  
6 somewhat since the middle of last year, and longer-term inflation  
7 expectations appear to remain well anchored, as reflected in a broad range  
8 of surveys of households, businesses, and forecasters, as well as measures  
9 from financial markets. Nevertheless, the process of getting inflation  
10 sustainably down to 2 percent has a long way to go. The median projection  
11 in the SEP for total PCE inflation is 3.3 percent this year, falls to 2.5 percent  
12 next year, and reaches 2 percent in 2026.<sup>10</sup>

13 After the September 2023 and the November 2023 meetings Chair Powell kept open the  
14 possibility of additional rate increases, considering even December this year, or thereafter  
15 if it is appropriate to do so. He also stated that interest rates would likely remain positive  
16 for some time:

17 First of all, interest rates – real interest rates are, are positive now. They’re  
18 meaningfully positive, and that’s a good thing. We need policy to be  
19 restrictive so that we can get inflation down to target. Okay. And we need -  
20 we’re going to need that to remain to be the case for some time. So I think,  
21 you know – remember that the – of course, the SEP [Summary of Economic  
22 Projections] is not a plan that is negotiated or discussed, really, as a plan.  
23 It's accumulation, really, and what you see are the medians. It's  
24 accumulation of individual forecasts from 19 people, and then what you're  
25 seeing are the medians. So I wouldn't want to, you know, bestow upon it the  
26 idea that, that it's really a plan. But what it reflects, though, is that economic  
27 activity’s been stronger than we expected – stronger than I think everyone  
28 expected. And, so what you're – what you’re seeing is, this is what people  
29 believe, as of now, will be appropriate to achieve what we're looking to  
30 achieve, which is progress toward our – toward our inflation goal, as you  
31 see in the SEP.<sup>11</sup>

32 The fact is the committee is not thinking about rate cuts right now at all.  
33 We’re not talking about rate cuts. We’re still very focused on the first  
34 question, which is ‘have we achieved a stance of monetary policy that’s

---

<sup>10</sup> Federal Reserve, Transcript of Chair Powell’s Press Conference, September 20, 2023, p 2.

<sup>11</sup> *Id.*, Transcript of Chair Powell Press Conference, September 20, 2023 at 6.

1 sufficiently restrictive to bring inflation down to 2% over time,  
2 sustainably?’ That is the question we’re focusing on.<sup>12</sup>

3 **B. The Use of Monetary Policy to Address Inflation**

4 **Q. What policy actions has the Federal Reserve enacted to respond to increased**  
5 **inflation?**

6 A. The dramatic increase in inflation has prompted the Federal Reserve to pursue an  
7 aggressive normalization of monetary policy, removing the accommodative policy  
8 programs used to mitigate the economic effects of COVID-19. Since the March 2022  
9 FOMC meeting, the Federal Reserve increased the target federal funds rate through a series  
10 of increases from a range of 0.00 – 0.25 percent to a range of 5.25 percent to 5.50 percent.<sup>13</sup>  
11 Further, as noted above, while the Federal Reserve acknowledges that inflation has  
12 declined from its peak, it still is well above the Federal Reserve’s target of 2 percent.  
13 Therefore, the Federal Reserve anticipates the continued need to maintain the federal funds  
14 rate at a restrictive level in order to achieve its goal of 2 percent inflation over the long run.

15 **C. The Effect of Inflation and Monetary Policy on Interest Rates and the**  
16 **Investor-Required Return**

---

<sup>12</sup> CNBC “Full recap: Fed leaves rates unchanged, Powell discusses December decision”, November 1, 2023.

<sup>13</sup> Federal Reserve, Press Releases, March 16, 2022, May 4, 2022, June 15, 2022, September 22, 2022, November 2, 2022, February 1, 2023, March 22, 2023, May 3, 2023, July 26, 2023, September 20, 2023, November 1, 2023.  
[Federal Reserve Board - Press Releases](#)

1 **Q. Have the yields on long-term government bonds increased in response to inflation and**  
2 **the Federal Reserve’s normalization of monetary policy?**

3 A. Yes. As the Federal Reserve has substantially increased the federal funds rate in response  
4 to increased levels of inflation that have persisted for longer than originally projected,  
5 longer term interest rates have also increased. As shown in Figure 3, since the Federal  
6 Reserve’s December 2021 meeting, the yield on 10-year Treasury bond has more than  
7 doubled, increasing from 1.47 percent on December 15, 2021 to 4.88 percent at the end of  
8 October 2023.

9 **Figure 3: 10-Year Treasury Bond Yield, January 2021 through October 2023<sup>14</sup>**

10

<sup>14</sup> S&P Capital IQ Pro.

1 **Q. What have equity analysts said about long-term government bond yields?**

2 A. Leading equity analysts have noted that they expect the yields on long-term government  
3 bonds to remain elevated. According to the most recent *Blue Chip Financial Forecasts*  
4 report, the consensus estimate of the average yield on the 10-year Treasury Bond is  
5 approximately 3.80 percent through the first quarter of 2025.<sup>15</sup> It is reasonable to expect  
6 that if government bond yields remain elevated, the cost of equity will be increasing above  
7 the levels experienced in the 2020 and 2021 lower interest rate environment.

8 **Q. How have interest rates and inflation changed since the Company’s last rate case?**

9 A. As shown in Figure 4, at the time that the Commission approved the Company’s settlement  
10 in its last rate proceeding, interest rates (as measured by the 30-year Treasury bond yield)  
11 were 3.91 percent and inflation was 5.70 percent. Since the Company’s last rate  
12 proceeding, long-term interest rates have increased approximately 93 basis points as the  
13 Federal Reserve has increased the federal funds rate to combat inflation. While inflation  
14 has moderated since the Company’s last case, it remains above the Federal Reserve’s  
15 target.

1 **D. Expected Performance of Utility Stocks and the Investor-Required Return on**  
2 **Utility Investments**

3 **Q. Are utility share prices correlated to changes in the yields on long-term government**  
4 **bonds?**

5 A. Yes. Interest rates and utility share prices are inversely correlated, which means that  
6 increases in interest rates result in declines in the share prices of utilities and vice versa.  
7 For example, Goldman Sachs and Deutsche Bank examined the sensitivity of share prices  
8 of different industries to changes in interest rates over the past five years. Both Goldman  
9 Sachs and Deutsche Bank found that utilities had one of the strongest negative relationships  
10 with bond yields (*i.e.*, increases in bond yields resulted in the decline of utility share  
11 prices).<sup>17</sup>

12 **Q. How do equity analysts expect the utilities sector to perform in an increasing interest**  
13 **rate environment?**

14 A. Equity analysts project that utilities will underperform the broader market given high  
15 inflation and the recent increases in interest rates. Fidelity classifies the utility sector as  
16 underweight,<sup>18</sup> and Bank of America recently noted that it is “not so constructive on

1 [u]tilities” given that the dividend yields for utilities are below the yields available on both  
2 long- and short-term government bonds.<sup>19</sup>

### 3 **E. Conclusion**

4 **Q. What are your conclusions regarding the effect of current market conditions on the**  
5 **cost of equity for the Company?**

6 A. Investors expect long-term interest rates to remain relatively high in response to continued  
7 elevated levels of inflation and the Federal Reserve’s normalization of monetary policy.  
8 Because the share prices of utilities are inversely correlated to interest rates, and  
9 government bond yields have increased significantly since the lows of 2020, the share  
10 prices of utilities are likely to continue to decline, which is the reason a number of equity  
11 analysts have classified the sector as either underperform or underweight. The expected  
12 underperformance of utilities means that DCF models using recent historical data likely  
13 underestimate investors’ required return over the period that rates will be in effect.  
14 Therefore, this expected change in market conditions supports consideration of the higher  
15 end of the range of cost of equity results produced by the DCF models. Moreover,  
16 prospective market conditions warrant consideration of, and placing more weight on,  
17 forward-looking cost of equity estimation models such as the CAPM and ECAPM, which  
18 better reflect expected market conditions.

1 **VI. PROXY GROUP SELECTION**

2 **Q. Why have you used a group of proxy companies to estimate the cost of equity for**  
3 **PAWC?**

4 A. In this proceeding, I am estimating the cost of equity for PAWC, which is a rate regulated  
5 subsidiary of AWK. Because the ROE is a market-based concept, and given the fact that  
6 PAWC's operations do not make up the entirety of a publicly-traded entity, it is necessary  
7 to establish a group of companies that is both publicly-traded and comparable to the  
8 Company in certain fundamental business and financial respects to serve as its "proxy" for  
9 purposes of the ROE estimation process. The proxy companies used in my analyses all  
10 possess a set of operating and financial risk characteristics that are substantially  
11 comparable to PAWC, and, therefore, provide a reasonable basis for deriving the  
12 appropriate ROE.

13 **Q. Please provide a brief profile of PAWC.**

14 A. PAWC, a wholly-owned subsidiary of AWK, provides water distribution service to  
15 approximately 679,000 customers and wastewater services to approximately 97,000  
16 customers in Pennsylvania.<sup>20</sup> The Company can access debt markets through American  
17 Water Capital Corp. ("AWCC") or independently. The current credit ratings for AWCC

---

<sup>20</sup> American Water Works Company, Inc., 2022 SEC Form 10-K, at 4.

1 and AWK are as follows: (1) S&P - A (Outlook: Stable)<sup>21</sup>; and (2) Moody's - Baa1  
2 (Outlook: Stable).<sup>22</sup>

3 **Q. How did you select the companies in your proxy group?**

4 A. I began with the group of U.S. utilities that Value Line classifies as "Water Utilities" and  
5 "Natural Gas Distribution Companies". That combined group includes 16 domestic U.S.  
6 utilities. I simultaneously applied the following screening criteria to select companies that:

- 7 • pay consistent quarterly cash dividends because companies that do not cannot be  
8 analyzed using the Constant Growth DCF model;
- 9 • have investment grade long-term issuer ratings from S&P and/or Moody's;
- 10 • are covered by at least two utility industry analysts;
- 11 • have positive long-term earnings growth forecasts from at least two utility industry  
12 equity analysts;
- 13 • derive more than 70.00 percent of their total operating income from regulated  
14 operations; and
- 15 • were not parties to a merger or transformative transaction during the analytical  
16 periods relied on.

17  
18 **Q. Did you consider any additional companies for inclusion in your proxy group?**

19 A. Yes. I also considered the group of 36 companies that Value Line classifies as "Electric  
20 Utilities". In determining which electric utilities would qualify for inclusion in my proxy  
21 group, I started by relying on the criteria used to screen the water and natural gas utilities.

---

<sup>21</sup> S&P Global Ratings, American Water Works Co. Inc., June 26, 2023.

<sup>22</sup> Moody's Investors Service, accessed June 30, 2023. Moody's last rating change for American Water Works Company, Inc was as of April 1, 2019. ([https://www.moodys.com/research/Moodys-downgrades-American-Water-and-American-Water-Capital-Corp-to--PR\\_397640](https://www.moodys.com/research/Moodys-downgrades-American-Water-and-American-Water-Capital-Corp-to--PR_397640))

1 I then applied two additional screening criteria to only include electric utilities that would  
2 be considered risk comparable to PAWC:

- 3 • have owned generation comprising less than 10 percent of the Company’s MWh  
4 sales to ultimate customers to ensure that the electric utilities included did not own  
5 a substantial amount of generation and therefore had operations that were primarily  
6 transmission and distribution; and
- 7 • own water operations.

8 **Q. Did you include AWK in your proxy group?**

9 A. No. Consistent with my general practice of excluding the subject company, or its parent  
10 holding company, from the proxy group, I have excluded AWK from my proxy group for  
11 PAWC.

12 **Q. What is the composition of your proxy group?**

13 A. The screening criteria discussed above resulted in a proxy group consisting of the  
14 companies in Figure 5 (see also Exhibit No. 13-A, Schedule 2).

15 **Figure 5: Proxy Group**

<b>Company</b>	<b>Ticker</b>
American States Water Company	AWR
Atmos Energy Corporation	ATO
California Water Service Group	CWT
Essential Utilities, Inc.	WTRG
Eversource Energy	ES
Middlesex Water Company	MSEX
NiSource Inc.	NI
Northwest Natural Gas Company	NWN
ONE Gas, Inc.	OGS
SJW Group	SJW
Spire, Inc.	SR

1 **Q. Why did you include electric utilities and natural gas distribution companies in the**  
2 **proxy group?**

3 A. Value Line currently classifies only seven companies as water utilities. Therefore, the  
4 universe of water utilities is already small before a set of screening criteria are applied.  
5 Additionally, there has been a recent trend towards consolidation in the utility industry,  
6 which reduces the number of available proxy companies. Because there are a small number  
7 of companies that are available for inclusion in the proxy group, I also considered electric  
8 utilities and natural gas distribution companies that meet the screening criteria.

9 **Q. Are electric utilities and natural gas distribution companies reasonably comparable**  
10 **to water utilities to be included in a proxy group used to estimate the cost of equity**  
11 **for a water utility?**

12 A. Yes, I believe that it is reasonable to rely on a combined proxy group. As noted above, due  
13 to consolidation in the water utility industry, there is only a small group of water companies  
14 that can be included in the proxy group. In addition, the screening criteria relied on for my  
15 proxy group require that a company derive more than 70 percent of their operating income  
16 from regulated operations. Therefore, the electric utilities and natural gas distribution  
17 companies included in my proxy group generate a large portion of their operating income  
18 from regulated operations similar to PAWC and the water utilities that will be included in  
19 the proxy group. As a result, I believe that it is appropriate to include electric utilities and  
20 natural gas distribution companies in my proxy group.

1 **VII. COST OF EQUITY ESTIMATION**

2 **Q. Please briefly discuss the ROE in the context of the regulated rate of return.**

3 A. The ROE is the cost of common equity capital in the utility’s capital structure for  
4 ratemaking purposes. The overall rate of return for a regulated utility is the weighted  
5 average cost of capital, in which the cost rates of the individual sources of capital are  
6 weighted by their respective book values. While the costs of debt and preferred stock can  
7 be directly observed, the cost of equity is market-based and, therefore, must be estimated  
8 based on observable market data.

9 **Q. How is the required cost of equity determined?**

10 A. The required cost of equity is estimated by using analytical techniques that rely on market-  
11 based data to quantify investor expectations regarding equity returns, adjusted for certain  
12 incremental costs and risks. Informed judgment is then applied to determine where the  
13 given company’s cost of equity falls within the range of results produced by multiple  
14 analytical techniques. The key consideration in determining the cost of equity is to ensure  
15 that the methodologies employed reasonably reflect investors’ views of the financial  
16 markets in general, as well as the subject company (in the context of the proxy group), in  
17 particular.

18 **Q. What methods did you use to estimate PAWC’s cost of equity?**

19 A. I considered the results of the Constant Growth DCF model, the CAPM, and the ECAPM.  
20 As discussed in more detail below, a reasonable ROE estimate considers alternative

1 methodologies, observable market data, and the reasonableness of their individual and  
2 collective results.

3 **A. Importance of Multiple Analytical Approaches**

4 **Q. Is it important to use more than one analytical approach?**

5 A. Yes. Because the cost of equity is not directly observable, it must be estimated based on  
6 both quantitative and qualitative information. When faced with the task of estimating the  
7 cost of equity, analysts and investors are inclined to gather and evaluate as much relevant  
8 data as reasonably can be analyzed. Several models have been developed to estimate the  
9 cost of equity, and I use multiple approaches to estimate the cost of equity. As a practical  
10 matter, however, all of the models available for estimating the cost of equity are subject to  
11 limiting assumptions or other methodological constraints. Consequently, many well-  
12 regarded finance texts recommend using multiple approaches when estimating the cost of  
13 equity. For example, Copeland, Koller, and Murrin<sup>23</sup> suggest using the CAPM and  
14 Arbitrage Pricing Theory model, while Brigham and Gapenski<sup>24</sup> recommend the CAPM,  
15 DCF, and Bond Yield Plus Risk Premium approaches.

---

<sup>23</sup> Tom Copeland, Tim Koller and Jack Murrin, *Valuation: Measuring and Managing the Value of Companies*, 3rd Ed. (New York: McKinsey & Company, Inc., 2000), at 214.

<sup>24</sup> Eugene Brigham, Louis Gapenski, *Financial Management: Theory and Practice*, 7th Ed. (Orlando: Dryden Press, 1994), at 341.

1 **Q. Do current market conditions support the reliance on more than one analytical**  
2 **approach?**

3 A. Yes. As I discussed above, interest rates have increased substantially over the past year  
4 and are expected to remain elevated from the lows seen during the COVID-19 pandemic.  
5 The benefit of using multiple models is that each model relies on different assumptions,  
6 certain of which may better reflect current and projected market conditions at different  
7 times. As discussed previously, the CAPM, and the ECAPM analyses offer some balance  
8 through the use of projected interest rates since the effect of changes in interest rates,  
9 particularly the recent increase in interest rates, may not be captured as well in the DCF  
10 model at this time. Therefore, it is important to use multiple analytical approaches to  
11 ensure that the cost of equity results reflect market conditions that are expected during the  
12 period that the Company's rates will be in effect.

13 **Q. Has the Commission made similar findings regarding the reliance on multiple**  
14 **models?**

15 A. Yes, it has. In a 2012 decision for PPL Electric Utilities, while noting that the Commission  
16 has traditionally relied primarily on the DCF method to estimate the cost of equity for  
17 regulated utilities, the Commission recognized that market conditions were causing the  
18 DCF model to produce results that were much lower than other models such as the CAPM  
19 and Risk Premium. The Commission's Order explained:

20 Sole reliance on one methodology without checking the validity of the  
21 results of that methodology with other cost of equity analyses does not  
22 always lend itself to responsible ratemaking. We conclude that

1 methodologies other than the DCF can be used as a check upon the  
2 reasonableness of the DCF derived equity return calculation.<sup>25</sup>

3 The Commission ultimately concluded:

4 As such, where evidence based on the CAPM and RP methods suggest that  
5 the DCF-only results may understate the utility's current cost of equity  
6 capital, we will give consideration to those other methods, to some degree,  
7 in determining the appropriate range of reasonableness for our equity return  
8 determination.<sup>26</sup>

9 **Q. Are you aware of any regulatory commissions that have recognized the importance  
10 of considering the results of multiple models?**

11 A. Yes, several regulatory commissions consider the results of multiple COE estimation  
12 methodologies such as the DCF, CAPM, and ECAPM in determining the authorized ROE,  
13 including the Minnesota Public Utilities Commission (“Minnesota PUC”)<sup>27</sup>, the Michigan  
14 Public Service Commission (“Michigan PSC”)<sup>28</sup>, the Iowa Utilities Board (“IUB”)<sup>29</sup>, the  
15 Washington Utilities and Transportation Commission (“Washington UTC”)<sup>30</sup> and the New  
16 Jersey Board of Public Utilities (“NJBPU”)<sup>31</sup>. For example, the Washington UTC has  
17 repeatedly emphasized that it “places value on each of the methodologies used to calculate  
18 the cost of equity and does not find it appropriate to select a single method as being the

1 most accurate or instructive.”<sup>32</sup> The Washington UTC has also explained that “[f]inancial  
2 circumstances are constantly shifting and changing, and we welcome a robust and diverse  
3 record of evidence based on a variety of analytics and cost of capital methodologies.”<sup>33</sup>

4 Additionally, in its recent order for DTE Gas Company (“DTE Gas”) in Case No. U-18999,  
5 the Michigan PSC considered the results of each of the models presented by the ROE  
6 witnesses, which included the DCF, CAPM, and ECAPM in the determination of the  
7 authorized ROE.<sup>34</sup> The Commission also considered authorized ROEs in other states,  
8 increased volatility in capital markets and the company-specific business risks of DTE Gas.

#### 9 **B. Constant Growth DCF Model**

##### 10 **Q. Please describe the DCF approach.**

11 A. The DCF approach is based on the theory that a stock’s current price represents the present  
12 value of all expected future cash flows. In its most general form, the DCF model is  
13 expressed as follows:

$$14 \quad P_0 = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \dots + \frac{D_\infty}{(1+k)^\infty} \quad [1]$$

15 Where  $P_0$  represents the current stock price,  $D_1 \dots D_\infty$  are all expected future dividends,  
16 and  $k$  is the discount rate, or required ROE. Equation [1] is a standard present value  
17 calculation that can be simplified and rearranged into the following form:

---

<sup>32</sup> Wash. Utils. & Transp. Comm’n v. PacifiCorp, Docket UE-130043, Order 05, n. 89 (Dec. 4, 2013).

<sup>33</sup> Wash. Utils. & Transp. Comm’n v. PacifiCorp, Docket UE-100749, Order 06, ¶ 91 (March 25, 2011).

<sup>34</sup> Michigan Public Service Commission Order, DTE Gas Company, Case No. U-18999, September 13, 2018, at 45-47.

1 
$$k = \frac{D_0(1+g)}{P_0} + g \quad [2]$$

2 Equation [2] is often referred to as the Constant Growth DCF model in which the first term  
3 is the expected dividend yield and the second term is the expected long-term growth rate.

4 **Q. What assumptions are required for the Constant Growth DCF model?**

5 A. The Constant Growth DCF model requires the following four assumptions: (1) a constant  
6 growth rate for earnings and dividends; (2) a stable dividend payout ratio; (3) a constant  
7 price-to-earnings ratio; and (4) a discount rate greater than the expected growth rate. To  
8 the extent that any of these assumptions are not objectively valid, considered judgment  
9 and/or specific adjustments should be applied to the results.

10 **Q. What market data do you use to calculate the dividend yield in your Constant Growth**  
11 **DCF model?**

12 A. The dividend yield in my Constant Growth DCF model is based on the proxy group  
13 companies' current annualized dividend and average closing stock prices over the 30-,  
14 90-, and 180-trading days ended October 31, 2023.

15 **Q. Why do you use 30-, 90-, and 180-day averaging periods?**

16 A. I use an average of recent trading days to calculate the term  $P_0$  in the DCF model to reflect  
17 current market data while also ensuring that the result of the model is not skewed by  
18 anomalous events that may affect stock prices on any given trading day.

1 **Q. Did you make any adjustments to the dividend yield to account for periodic growth**  
2 **in dividends?**

3 A. Yes, I did. Because utility companies tend to increase their quarterly dividends at different  
4 times throughout the year, it is reasonable to assume that dividend increases will be evenly  
5 distributed over calendar quarters. Given that assumption, it is reasonable to apply one-  
6 half of the expected annual dividend growth rate for purposes of calculating the expected  
7 dividend yield component of the DCF model. This adjustment ensures that the expected  
8 first-year dividend yield is, on average, representative of the coming twelve-month period,  
9 and does not overstate the aggregated dividends to be paid during that time.

10 **Q. Why is it important to select appropriate measures of long-term growth in applying**  
11 **the DCF model?**

12 A. In its Constant Growth form, the DCF model (*i.e.*, Equation [2]) assumes a single growth  
13 estimate in perpetuity. To reduce the long-term growth rate to a single measure, one must  
14 assume that the payout ratio remains constant and that earnings per share, dividends per  
15 share and book value per share all grow at the same constant rate. Over the long run,  
16 however, dividend growth can only be sustained by earnings growth. Therefore, it is  
17 important to consider a variety of sources in arriving at a singular long-term earnings  
18 growth rate for the Constant Growth DCF model.

19 **Q. Which sources of long-term earnings growth rates did you use?**

20 A. My Constant Growth DCF model incorporates three sources of long-term earnings growth  
21 rates: (1) Zacks Investment Research; (2) Thompson as reported by Yahoo! Finance; and  
22 (3) *Value Line Investment Survey* (“*Value Line*”).

1 **Q. Why are EPS growth rates the appropriate growth rates to be relied on in the DCF**  
2 **model?**

3 A. Earnings are the fundamental driver of a company's ability to pay dividends; therefore,  
4 projected EPS growth is the appropriate measure of a company's long-term growth. In  
5 contrast, changes in a company's dividend payments are based on management decisions  
6 related to cash management and other factors. For example, a company may decide to  
7 retain earnings rather than pay out a portion of those earnings to shareholders through  
8 dividends. Therefore, dividend growth rates are less likely than earnings growth rates to  
9 reflect accurately investor perceptions of a company's growth prospects.

10 **Q. How did you calculate the range of results for the Constant Growth DCF Model?**

11 A. I calculated a low end result for my DCF model using the minimum growth rate of the  
12 three sources (*i.e.*, the lowest of the Zacks, Yahoo Finance, and *Value Line* projected  
13 earnings growth rates) for each of the proxy group companies. I used a similar approach  
14 to calculate a high end result, using the maximum growth rate of the three sources for each  
15 proxy group company. The mean results were calculated using the average growth rate  
16 from all three sources for each proxy group company.

17 **Q. What were the results of your DCF analyses?**

18 A. Figure 6 summarizes the results of my DCF analyses. As shown in Figure 6, the mean and  
19 median DCF results using the average growth rates range from 9.28 percent to 10.00  
20 percent, and the mean and median results using the maximum growth rates range from  
21 10.63 percent to 11.34 percent. While I also summarize the DCF results using the  
22 minimum growth rates, given the expected underperformance of utility stocks going

1 forward and thus the likelihood that the DCF model is understating the cost of equity, I do  
 2 not believe it is appropriate to consider these understated DCF results at this time. It is  
 3 important to note that there have been no relevant regulatory decisions where a commission  
 4 has determined that the appropriate ROE for a water utility should be set in the range  
 5 resulting from the use of the minimum growth rates in the DCF model.

6 **Figure 6: Summary of Constant Growth DCF Results**

	Mean Low	Mean	Mean High
<b>Constant Growth DCF<sup>35</sup></b>			
<b>Mean Results:</b>			
30-Day Average	8.90%	10.00%	11.31%
90-Day Average	8.66%	9.77%	11.08%
180-Day Average	8.50%	9.60%	10.91%
Average	8.69%	9.79%	11.10%
<b>Median Results:</b>			
30-Day Average	8.91%	9.98%	11.34%
90-Day Average	8.65%	9.54%	10.90%
180-Day Average	8.52%	9.28%	10.63%
Average	8.69%	9.60%	10.96%

7 **Q. Has the Commission acknowledged that the DCF model might understate the cost of**  
 8 **equity given the current capital market conditions of high inflation and elevated**  
 9 **interest rates?**

10 **A. Yes.** For example, in its May 2022 decision establishing the cost of equity for Aqua  
 11 Pennsylvania, Inc., the Pennsylvania Public Utility Commission concluded that the current

---

<sup>35</sup> DCF results exclude the result for Middlesex Water Company because the low and mean results are lower than the current yield on the Moody's Baa rated utility bond index, which is illogical and the high end DCF result does not provide a reasonable equity risk premium over the current yield on the Moody's Baa rated utility bond index of 6.48 percent on a 30-day average basis ending October 31, 2023.

1 capital market conditions of high inflation and increased interest rates has resulted in the  
2 DCF model understating the utility cost of equity, and that weight should be placed on risk  
3 premium models, such as the CAPM, in the determination of the ROE.

4 To help control rising inflation, the Federal Open Market Committee has  
5 signaled that it is ending its policies designed to maintain low interest rates.  
6 Aqua Exc. at 9. Because the DCF model does not directly account for  
7 interest rates, consequently, it is slow to respond to interest rate changes.  
8 However, I&E's CAPM model uses forecasted yields on ten-year Treasury  
9 bonds, and accordingly, its methodology captures forward looking changes  
10 in interest rates.

11 Therefore, our methodology for determining Aqua's ROE shall utilize both  
12 I&E's DCF and CAPM methodologies. As noted above, the Commission  
13 recognizes the importance of informed judgment and information provided  
14 by other ROE models. In the 2012 PPL Order, the Commission considered  
15 PPL's CAPM and RP methods, tempered by informed judgment, instead of  
16 DCF-only results. We conclude that methodologies other than the DCF can  
17 be used as a check upon the reasonableness of the DCF derived ROE  
18 calculation. Historically, we have relied primarily upon the DCF  
19 methodology in arriving at ROE determinations and have utilized the results  
20 of the CAPM as a check upon the reasonableness of the DCF derived equity  
21 return. As such, where evidence based on other methods suggests that the  
22 DCF-only results may understate the utility's ROE, we will consider those  
23 other methods, to some degree, in determining the appropriate range of  
24 reasonableness for our equity return determination. In light of the above, we  
25 shall determine an appropriate ROE for Aqua using informed judgement  
26 based on I&E's DCF and CAPM methodologies.<sup>36</sup>

27 .....

28 We have previously determined, above, that we shall utilize I&E's DCF and  
29 CAPM methodologies. I&E's DCF and CAPM produce a range of  
30 reasonableness for the ROE in this proceeding from 8.90% [DCF] to 9.89%  
31 [CAPM]. Based upon our informed judgment, which includes  
32 consideration of a variety of factors, including increasing inflation leading  
33 to increases in interest rates and capital costs since the rate filing, we

---

<sup>36</sup> Pennsylvania Public Utility Commission, Docket Nos. R-2021-3027385 and R-2021-3027386, Opinion and Order, May 12, 2022, pp. 154–155.

1 determine that a base ROE of 9.75% is reasonable and appropriate for  
2 Aqua.<sup>37</sup>

3 Also, in a recent decision, the Massachusetts Department of Public Utilities recognized that  
4 long-term interest rates had increased and found greater certainty in that proceeding (as  
5 compared with prior decisions) that the DCF results understate the Company's cost of  
6 equity. As such, the Department considered this finding in establishing the range of  
7 reasonable results from within the analytical results presented.<sup>38</sup>

8 **Q. What are your conclusions about the results of the DCF models?**

9 A. As discussed previously, one primary assumption of the DCF models is a constant price-  
10 to-earnings ratio. That assumption is heavily influenced by the market price of utility  
11 stocks. Because utility stocks are expected to underperform the broader market over the  
12 near-term as interest rates remain elevated and yields on long-term government bonds  
13 exceed utility dividend yields, it is important to consider the results of the DCF models  
14 with caution. Therefore, although I have given weight to the results of the Constant Growth  
15 DCF model, my recommendation also gives weight to the results of other cost of equity  
16 estimation models that take into greater consideration current and expected market  
17 conditions.

---

<sup>37</sup> *Id.*, pp. 177–178.

<sup>38</sup> D.P.U. 22-22 at 386.

1 investors should only be concerned with systematic or non-diversifiable risk. Non-  
2 diversifiable risk is measured by beta, which is defined as:

$$\beta = \frac{\text{Covariance}(r_e, r_m)}{\text{Variance}(r_m)} \quad [4]$$

3 The variance of the market return (*i.e.*, Variance ( $r_m$ )) is a measure of the uncertainty of the  
4 general market, and the Covariance between the return on a specific security and the  
5 general market (*i.e.*, Covariance ( $r_e, r_m$ )) reflects the extent to which the return on that  
6 security will respond to a given change in the general market return. Thus, beta represents  
7 the risk of the security relative to the general market.

8 **Q. What risk-free rate did you use in your CAPM analysis?**

9 A. I relied on three sources for my estimate of the risk-free rate: (1) the current 30-day average  
10 yield on 30-year U.S. Treasury bonds, which is 4.84 percent;<sup>39</sup> (2) the average projected  
11 30-year U.S. Treasury bond yield for the fourth quarter of 2023 through the fourth quarter  
12 of 2024, which is 4.44 percent;<sup>40</sup> and (3) the average projected 30-year U.S. Treasury bond  
13 yield for 2025 through 2029, which is 3.80 percent.<sup>41</sup>

14 **Q. What Beta coefficients did you use in your CAPM analyses?**

15 A. As shown in Exhibit No. 13-A, Schedule 5, I used the average Beta coefficients for the  
16 proxy group companies as reported by Bloomberg and *Value Line*. The beta coefficients  
17 reported by Bloomberg are calculated using ten years of weekly returns relative to the S&P

---

<sup>39</sup> Bloomberg Professional as of October 31, 2023.

<sup>40</sup> Blue Chip Financial Forecasts, Vol. 42, No. 11, November 1, 2023, at 2.

<sup>41</sup> Blue Chip Financial Forecasts, Vol. 42, No. 6, June 1, 2023, at 14.

1 500 Index. Value Line’s calculation of the beta coefficients is based on five years of weekly  
2 returns relative to the New York Stock Exchange Composite Index (“NYSE”).  
3 Additionally, as shown on Exhibit No. 13-A, Schedule 5 and Exhibit No. 13-A, Schedule 6,  
4 I also considered an additional CAPM analysis that relies on the long-term average utility  
5 beta coefficient for the companies in my proxy group, which is calculated as an average of  
6 the *Value Line* beta coefficients for the companies in my proxy group from 2013 through  
7 2022.

8 **Q. How did you estimate the Market Risk Premium in the CAPM?**

9 A. I estimated the market risk premium as the difference between the implied expected equity  
10 market return and the risk-free rate. As shown in Exhibit No. 13-A, Schedule 7, the  
11 expected market return is calculated using the Constant Growth DCF model discussed  
12 earlier in my testimony for the companies in the S&P 500 Index. Based on an estimated  
13 market capitalization-weighted dividend yield of 1.88 percent and a weighted long-term  
14 earnings growth rate of 10.51 percent, the estimated required market return for the S&P  
15 500 Index as of October 31, 2023 is 12.49 percent. Based on the three risk-free rates  
16 considered, the implied market risk premia ranges from 7.64 percent to 8.69 percent.

17 **Q. How does the current expected market return compare to observed historical market**  
18 **returns?**

19 A. As shown in Figure 7, given the range of annual equity returns that have been observed  
20 over the past century, a current expected market return of 12.49 percent is not unreasonable.  
21 As shown, in 50 out of the past 97 years (or roughly 52 percent of observations), the  
22 realized equity market return was at least 12.49 percent or greater.

1

**Figure 7: Realized U.S. Equity Market Returns (1926-2022)<sup>42</sup>**

2

3 **Q. Did you consider another form of the CAPM in your analysis?**

4 A. Yes. I have also considered the results of an ECAPM in estimating the cost of equity for  
5 PAWC.<sup>43</sup> The ECAPM calculates the product of the adjusted beta coefficient and the  
6 market risk premium and applies a weight of 75.00 percent to that result. The model then  
7 applies a 25.00 percent weight to the market risk premium without any effect from the beta  
8 coefficient. The results of the two calculations are summed, along with the risk-free rate,  
9 to produce the ECAPM result, as noted in Equation [5] below:

10

$$k_e = r_f + 0.75\beta(r_m - r_f) + 0.25(r_m - r_f) \quad [5]$$

<sup>42</sup> Depicts total annual returns on large company stocks, as reported in the 2023 Kroll SBBI Yearbook.

<sup>43</sup> See, e.g., Roger A. Morin, *New Regulatory Finance*, Public Utilities Reports, Inc., 2006, at 189.

1           Where:

2                      $k_e$  = the required market ROE

3                      $\beta$  = Adjusted Beta coefficient of an individual security

4                      $r_f$  = the risk-free rate of return

5                      $r_m$  = the required return on the market as a whole

6           In essence, the empirical form of the CAPM addresses the tendency of the “traditional”  
7           CAPM to underestimate the cost of equity for companies with low beta coefficients such  
8           as regulated utilities. In that regard, the ECAPM is not redundant to the use of adjusted  
9           betas in the traditional CAPM; rather, it recognizes the results of academic research  
10          indicating that the risk-return relationship is different (in essence, flatter) than estimated  
11          by the CAPM, and that the CAPM underestimates the “alpha,” or the constant return  
12          term.<sup>44</sup>

13          As with the CAPM, my application of the ECAPM uses the forward-looking market risk  
14          premium estimates, the three yields on 30-year Treasury securities noted earlier as the risk-  
15          free rate, and the current Bloomberg and *Value Line* and long-term *Value Line* beta  
16          coefficients.

---

<sup>44</sup> *Id.*, at 191.

1 **Q. What are the results of your CAPM analyses?**

2 A. As shown in Figure 8 (*see* also Exhibit No. 13-A, Schedule 5), my traditional CAPM analyses  
3 produce a range of returns from 10.15 percent to 11.17 percent. The ECAPM analysis  
4 results range from 10.73 percent to 11.50 percent.

1

**Figure 8: CAPM Results**

	Current 30-day Average 30-Year Treasury Bond Yield	Near-Term Projected 30- Year Treasury Yield	Longer-Term Projected 30- Year Treasury Yield
<b>CAPM:</b>			
Current Value Line Beta	11.17%	11.10%	10.99%
Current Bloomberg Beta	10.66%	10.56%	10.41%
Long-term Avg. Beta	10.43%	10.32%	10.15%
<b>ECAPM:</b>			
Current Value Line Beta	11.50%	11.44%	11.36%
Current Bloomberg Beta	11.12%	11.04%	10.93%
Long-term Avg. Beta	10.94%	10.86%	10.73%

2

3

**VIII. BUSINESS RISKS AND MANAGEMENT PERFORMANCE**

4

**Q. Taken alone, do the results from the cost of equity estimation models for the proxy group provide an appropriate estimate of the cost of equity for the Company?**

5

6

**A.** No. These results provide only a range for the appropriate estimate of the Company’s cost of equity. There are several additional factors that must be taken into consideration when determining where the Company’s cost of equity falls within the range of results. These factors, which are discussed below, should be considered with respect to their overall effect on the Company’s risk profile.

7

8

9

10

1           **A.    Flotation Costs**

2   **Q.    What are flotation costs?**

3   A.    Flotation costs are the costs associated with the sale of new issues of common stock. These  
4       costs include out-of-pocket expenditures for preparation, filing, underwriting, and other  
5       issuance costs.

6   **Q.    Why is it important to consider flotation costs in the allowed ROE?**

7   A.    A regulated utility must have the opportunity to earn an ROE that is both competitive and  
8       compensatory to attract and retain new investors. To the extent that a company is denied  
9       the opportunity to recover prudently incurred flotation costs, actual returns will fall short  
10      of expected (or required) returns, thereby diluting equity share value.

11 **Q.    Are flotation costs part of the utility’s invested costs or part of the utility’s expenses?**

12 A.    Flotation costs are part of the invested costs of the utility, which are properly reflected on  
13       the balance sheet under “paid in capital.” They are not current expenses, and, therefore,  
14       are not reflected on the income statement. Rather, like investments in rate base or the  
15       issuance costs of long-term debt, flotation costs are incurred over time. As a result, the  
16       great majority of a utility’s flotation cost is incurred prior to the test year but remains part  
17       of the cost structure that exists during the test year and beyond, and as such, should be  
18       recognized for ratemaking purposes. Therefore, it is irrelevant whether an issuance occurs  
19       during the test year or is planned for the test year because failure to allow recovery of past  
20       flotation costs may deny PAWC the opportunity to earn its required rate of return in the  
21       future.

1 **Q. Please provide an example of why a flotation cost adjustment is necessary to**  
2 **compensate investors for the capital they have invested?**

3 A. As shown in Exhibit No. 13-A, Schedule 4, in AWK's most recent stock issuance, the  
4 offering price was \$135.5 per share of common stock. After paying flotation costs  
5 associated with the equity issuance, which include fees paid to underwriters and attorneys,  
6 among others, AWK's net proceeds are only \$133.41 per share invested. AWK invests  
7 that \$133.41 per share in plant used to serve its customers, which becomes part of rate base.  
8 Absent a flotation cost adjustment, the investor will thereafter earn a return on only the  
9 \$133.41 per share invested in rate base, even though the contribution was \$135.50. Making  
10 a small flotation cost adjustment gives the investor a reasonable opportunity to earn the  
11 authorized return, rather than the lower return that results when the authorized return is  
12 applied to an amount less than what the investor contributed.

13 **Q. Is the need to consider flotation costs eliminated because PAWC is a wholly-owned**  
14 **subsidiary of AWK?**

15 A. No. Although PAWC is a wholly-owned subsidiary of AWK, it is appropriate to consider  
16 flotation costs because wholly-owned subsidiaries receive equity capital from their parent  
17 and provide returns on the capital that roll up to the parent, which is designated to attract  
18 and raise capital based upon the returns of those subsidiaries. To deny recovery of issuance  
19 costs associated with the capital that is invested in the subsidiaries ultimately penalizes the  
20 investors that fund the utility operations and could inhibit the utility's ability to obtain new  
21 equity capital at a reasonable cost. This is important for PAWC because, as I will discuss

1 in more detail below, the Company is planning significant capital expenditures in the near  
2 term.

3 **Q. Is the need to consider flotation costs recognized by the academic and financial**  
4 **communities?**

5 A. Yes. The need to reimburse shareholders for the lost returns associated with equity  
6 issuance costs is recognized by the academic and financial communities in the same spirit  
7 that investors are reimbursed for the costs of issuing debt. This treatment is consistent with  
8 the philosophy of a fair rate of return. According to Dr. Shannon Pratt:

9 Flotation costs occur when new issues of stock or debt are sold to the public.  
10 The firm usually incurs several kinds of flotation or transaction costs, which  
11 reduce the actual proceeds received by the firm. Some of these are direct  
12 out-of-pocket outlays, such as fees paid to underwriters, legal expenses, and  
13 prospectus preparation costs. Because of this reduction in proceeds, the  
14 firm's required returns on these proceeds equate to a higher return to  
15 compensate for the additional costs. Flotation costs can be accounted for  
16 either by amortizing the cost, thus reducing the cash flow to discount, or by  
17 incorporating the cost into the cost of capital. Because flotation costs are  
18 not typically applied to operating cash flow, one must incorporate them into  
19 the cost of capital.<sup>45</sup>

20 **Q. How did you calculate the flotation costs for PAWC?**

21 A. My flotation cost calculation is based on the costs incurred by AWK in its most recent  
22 equity offering as of March 3, 2023. That flotation cost percentage is then applied to the  
23 DCF analysis to estimate impact on ROE. As shown in Exhibit No. 13-A, Schedule 4,  
24 based on the flotation costs incurred in the most recent AWK issuance, the impact on the

---

<sup>45</sup> Shannon P. Pratt, Cost of Capital Estimation and Applications, Second Edition, at 220-221.

1 proxy group's cost of equity amounts to 6 basis points (i.e., 0.6 percent) based on the  
2 median and 6 basis points (i.e., 0.6 percent) based on the mean.

3 **Q. Do your final results include an adjustment for flotation cost recovery?**

4 A. No. While the final ROE results do not incorporate an explicit adjustment for flotation  
5 costs, the estimated effect of flotation cost on ROE is considered in identifying a  
6 recommended ROE within the range of ROE estimates from the various models.

7 **B. Risks Associated with Capital Expenditure Program**

8 **Q. How is PAWC's risk profile affected by its substantial capital expenditure program?**

9 A. PAWC projects that the Company will make over \$1 billion in capital investments for the  
10 period through June 30, 2025, including significant investment to replace aging  
11 infrastructure to meet the needs of its customers and to comply with various regulations  
12 and recent acquisitions of water utility systems.<sup>46</sup> These investments are summarized in  
13 PAWC Statement No. 03 in the testimony of Mr. Aiton.

14 From a credit perspective, the additional pressure on cash flows associated with high levels  
15 of capital expenditures exerts corresponding pressure on credit metrics and, therefore,  
16 credit ratings. An S&P report explains:

17 [T]here is little doubt that the U.S. electric industry needs to make record  
18 capital expenditures to comply with the proposed carbon pollution rules  
19 over the next several years, while maintaining safety standards and grid  
20 stability. We believe the higher capital spending and subsequent rise in debt  
21 levels could strain these companies' financial measures, resulting in an  
22 almost consistent negative discretionary cash flow throughout this higher

---

<sup>46</sup> Data provided by PAWC.

1 construction period. To meet the higher capital spending requirements,  
2 companies will require ongoing and steady access to the capital markets,  
3 necessitating that the industry maintains its high credit quality. We expect  
4 that utilities will continue to effectively manage their regulatory risk by  
5 using various creative means to recover their costs and to finance their  
6 necessary higher spending.<sup>47</sup>

7 Although this S&P report refers to electric utilities, the same applies to water utilities. In  
8 an August 2016 report, S&P explained the importance of regulatory support for large  
9 capital projects:

10 When applicable, a jurisdiction's willingness to support large capital  
11 projects with cash during construction is an important aspect of our analysis.  
12 This is especially true when the project represents a major addition to rate  
13 base and entails long lead times and technological risks that make it  
14 susceptible to construction delays. Broad support for all capital spending is  
15 the most credit-sustaining. Support for only specific types of capital  
16 spending, such as specific environmental projects or system integrity plans,  
17 is less so, but still favorable for creditors. Allowance of a cash return on  
18 construction work-in-progress or similar ratemaking methods historically  
19 were extraordinary measures for use in unusual circumstances, but when  
20 construction costs are rising, cash flow support could be crucial to maintain  
21 credit quality through the spending program. Even more favorable are those  
22 jurisdictions that present an opportunity for a higher return on capital  
23 projects as an incentive to investors.<sup>48</sup>

24 **Q. Does PAWC have a capital tracking mechanism to recover some of the costs**  
25 **associated with its capital expenditures plan between rate cases?**

26 A. Yes. PAWC has a Water and Wastewater Distribution System Improvement Charge  
27 ("DSIC") which allows PAWC to recover the costs associated with replacing and repairing  
28 aging water and wastewater infrastructure. In addition, the Company is proposing an  
29 Environmental Compliance Investment Charge recovery mechanism, which will allow for

---

<sup>47</sup> S&P, Ratings Direct, "U.S. Regulated Electric Utilities' Annual Capital Spending is Poised to Eclipse \$100 Billion," July 2014.

<sup>48</sup> S&P Global Ratings, "Assessing U.S. Investor-Owned Utility Regulatory Environments," August 10, 2016, at 7.

1 the recovery of the fixed costs associated with certain non-revenue producing, non DSIC  
2 eligible projects between rate cases that are related to environmental requirements. The  
3 presence of these clauses is certainly a positive aspect of Pennsylvania regulation but they  
4 have become quite commonplace in utility regulation. In fact, each of the proxy group  
5 companies has infrastructure and capital recovery mechanisms that address significant  
6 capital expenditure requirements. As shown in Exhibit AEB-10, the companies in the  
7 proxy group have infrastructure replacement recovery mechanisms in approximately 78.57  
8 percent of their operating jurisdictions. Consequently, the presence of the DSIC, and the  
9 Company's proposed Environmental Compliance Investment Charge recovery mechanism,  
10 while positive regulatory mechanisms, do not reduce the Company's risk vis-à-vis that of  
11 the proxy group.

12 **Q. Why is it important that PAWC's capital tracking mechanisms recover these costs?**

13 A. Over the next few years, PAWC is proposing to invest \$3.28 billion in infrastructure  
14 improvements. On an annual basis, PAWC's capital investment program is greater than its  
15 allowance for depreciation which results in negative Free Cash Flow. Therefore, the  
16 Company will need to seek financing for its capital investments beyond any internally  
17 generated cash flow. Similar to the credit rating agencies, discussed previously, investors  
18 consider the stability and supportiveness of the regulatory environment in the assessment  
19 of overall risk of investment. The use of tracking mechanisms for the recovery of capital

1 investments has become a key component of the strategy to address regulatory lag that  
2 results from significant investments in supportive regulatory jurisdictions.<sup>49</sup>

3 **Q. Has Pennsylvania been viewed as a supportive regulatory jurisdiction?**

4 A. Yes. S&P conducts a ranking of regulatory jurisdictions, using a scale of 9 steps ranging  
5 from a low of Below Average to Above Average, with each ranking having three notches  
6 (“3” being the low end of the ranking and “1” being the high end of the ranking). These  
7 rankings are assigned from an investor perspective and are intended to indicate the relative  
8 regulatory risk associated with the ownership of securities issued by the utilities in the  
9 jurisdiction. The evaluation is intended to assess the level and quality of earnings realized  
10 by the state utilities as a result of regulatory, legislative and court actions. Pennsylvania  
11 has been ranked Above Average 2 since 2019. S&P indicates that this ranking is based on  
12 a constructive regulatory climate, relying on forward test years, year -end rate base and  
13 reduction in regulatory lag.

14 **Q. What is your conclusion regarding the regulatory environment in Pennsylvania as it  
15 relates to PAWC’s capital investment plan?**

16 A. The Company’s capital plan demonstrates a need to access external capital for financing.  
17 Therefore, it is important that the constructive regulatory environment that has been  
18 established by the Commission be maintained to ensure that the Company continues to be  
19 able to secure capital on favorable terms.

---

<sup>49</sup> S&P Global Market Intelligence, RRA Regulatory Focus: Adjustment Mechanisms, July 22, 2022, pp. 6-15.

1           **C.    Rate Decoupling Mechanism**

2   **Q.    Are you aware that the Company is proposing to implement a Rate Decoupling**  
3   **Mechanism (“RDM”)?**

4   A.    Yes. As discussed in PAWC Statement No. 10, the Direct Testimony of Company witness  
5   Mr. Charles Rea, the Company’s current rate design recovers approximately 81 percent of  
6   water and wastewater service revenues under volumetric rates whereas approximately 95  
7   percent of the Company’s costs are fixed costs, which do not vary with usage. Further, Mr.  
8   Rea’s analysis demonstrates that there are two primary factors that cause revenue volatility,  
9   seasonal weather conditions and continuing trends in declining use per customer in the  
10   residential, commercial and municipal customer classes. As Mr. Rea notes, seasonal  
11   weather conditions can cause water sales to increase or decrease from expected going-  
12   forward levels, which creates volatility in revenues. Further, if water usage going forward  
13   is less than the levels set in this rate proceeding, the Company’s revenues will be less than  
14   what is authorized as a result of this case, making it difficult to earn the authorized ROE.

15   **Q.    Does the implementation of an RDM affect your recommended ROE?**

16   A.    No. The recommended ROE in this proceeding has been estimated using market data for a  
17   proxy group of companies. In order to determine the appropriate ROE from within the  
18   range of results, it is necessary to consider PAWC’s overall risks as compared with the  
19   operating companies of the proxy group companies. That evaluation demonstrates whether  
20   or not the Company has greater or less risk and informs the decision regarding the estimated  
21   investor-required return on equity. Therefore, it is necessary to review the proposed

1 mechanism as compared with proxy group to determine if the Company's overall risk is  
2 greater or less than the proxy group companies.

3 **Q. Have you conducted an analysis of the proxy group companies and whether or not**  
4 **they have implemented recovery mechanisms?**

5 A. Yes. I have reviewed each of the operating companies of the proxy group to determine  
6 whether or not they have implemented a mechanism similar to the RDM proposed by  
7 PAWC. As shown on Exhibit No. 13-A, Schedule 9, approximately 59 percent of the proxy  
8 group companies have implemented some form of revenue decoupling mechanism.

9 **Q. What are your conclusions regarding the Company's proposed RDM?**

10 A. Since a significant amount of the operating companies of the proxy group companies have  
11 implemented some form of RDM, the Company's proposed RDM makes PAWC more like  
12 the proxy group. Therefore, comparing PAWC to the proxy group, the Company would be  
13 more comparable to the proxy group with the RDM. If the RDM were not authorized,  
14 PAWC would have greater risk than the proxy group.

15 **D. Risks Associated with Environmental and Water Quality Regulation**

16 **Q. Please provide an overview of the risks associated with water quantity, water quality**  
17 **and other environmental regulations applicable to PAWC's water supply facilities**  
18 **and operations.**

19 A. Water supply utilities are subject to a complex array of regulations at the federal, state and  
20 river basin commission levels with respect to water quantity, water quality and other  
21 environmental aspects of their facilities and operations.

1 In addition to the requirement to make significant investments to extend facilities to  
2 accommodate applicants for service, there are multiple levels of authorization and  
3 regulation that apply to a public water system that wants to add a new source of supply or  
4 increase its withdrawals from existing sources. These factors add to the costs and lead-  
5 time for obtaining new, or increasing existing, water sources to meet new demands that  
6 may arise in portions of the Company's system. These are additional risk factors that can  
7 directly affect PAWC's ability to continue to furnish safe, adequate and reliable service,  
8 and increase the costs PAWC incurs to provide that service.

9 As discussed in the direct testimony of Company witness Mr. Jim Runzer, there are  
10 significant regulations that require the monitoring and treatment of water supplies to ensure  
11 the safety of and reliability of drinking water service. Further, there is increased research  
12 and awareness of contaminants on an ongoing basis that, once identified, require  
13 investment to meet more stringent regulatory standards related to new contaminants.

14 While the Company intends to comply with all state and federal regulatory standards for  
15 safe and reliable drinking water service, the upstream releases of chemicals that are then  
16 found in the Company's water supplies and must be remediated present an ongoing  
17 business risk.

18 **Q. Provide an overview of the risks associated with environmental regulation with**  
19 **respect to PAWC's wastewater system operations.**

20 A. As is the case with regard to drinking water system operations, the operation of wastewater  
21 collection and treatment systems face a range of environmental regulatory risks.

1 Wastewater operations are also regulated at both the federal and state levels pursuant to  
2 numerous statutes and regulations. At the federal level, wastewater systems are regulated  
3 pursuant to the Clean Water Act and numerous regulations adopted by the Environmental  
4 Protection Agency (“EPA”) under that law. At the state level, the Pennsylvania Clean  
5 Streams Law, Sewage Facilities Act, Solid Waste Management Act, Storage Tank and Spill  
6 Prevention Act and other laws administered by the DEP, coupled with the regulations  
7 adopted under those statutes, set standards and requirements for virtually every aspect of  
8 wastewater system operations. Similar to water regulation meeting regulatory compliance  
9 requirements, including evolving permitting requirements, and more stringent limits can  
10 be challenging and can result in significant increases in operating costs. Furthermore,  
11 wastewater systems face significant regulatory and environmental liability risks  
12 enforceable by governmental agencies through penalties and through citizen lawsuits.

13 Finally, combined sewer systems present additional risks, particularly during storms when  
14 water flows can exceed the treatment system capacity and result in excess untreated water  
15 discharging through combined sewer outfalls. These systems can present increased risk, as  
16 they often cannot be separated, and the EPA seeks to reduce the number of these systems  
17 that operate.

18 **Q. What is your conclusion with respect to the effect of the risk associated with**  
19 **environmental regulations and water quality regulations on PAWC’s cost of equity?**

20 A. PAWC has significant risk and uncertainty associated with environmental and water  
21 quality regulations, and the recovery of costs to comply with those regulations. It is clear  
22 that the financial community recognizes the additional risks to credit quality associated

1 with the capital investment required to meet environmental and water quality regulations.  
2 As discussed in Section VI of my testimony, in order to establish a proxy group of sufficient  
3 size, the group is composed of water utilities, electric utilities and natural gas utilities,  
4 which all face significant and increasing environmental requirements. The environmental  
5 risk factors faced by PAWC, and the magnitude of the capital program that the Company  
6 has planned to maintain compliance, support an ROE above the proxy group mean and  
7 median.

8 **E. Management Performance and Recognition**

9 **Q. Please summarize the Public Utility Code as it pertains to consideration of**  
10 **performance factors in the utility's revenue requirement.**

11 A. Section 523 of the Pennsylvania Public Utility Code states that the Commission shall  
12 consider "the efficiency, effectiveness and adequacy of service of each utility when  
13 determining just and reasonable rates under this title". Additionally, the Commission's  
14 Policy Statement on Small Nonviable Water and Wastewater Systems at 52 Pa. Code §  
15 69.711 states that the Commission will consider acquisition incentives including "rate of  
16 return premiums", "acquisition adjustments", "deferral of acquisition improvement costs"  
17 and "plant improvement surcharges" to encourage the acquisition of troubled water and  
18 wastewater systems by viable utilities.

1 **Q. What are the specific performance factors that are to be considered by the**  
2 **Commission?**

3 A. Sections 523 (a) and (b) address the factors considered in evaluating the performance of  
4 water and wastewater utilities. These provisions include 1) the efficiency, effectiveness  
5 and adequacy of service, 2) management effectiveness and operating efficiency, 3) action  
6 or inaction to encourage cost-effective conservation by customers of water, and 4) other  
7 relevant evidence that relates to efficiency, effectiveness and adequacy of service.

8 **Q. How has PAWC demonstrated excellence in these categories?**

9 A. The testimony of Company witness Ashley Everette discusses several areas where PAWC  
10 has demonstrated exemplary management performance. Among these areas, the  
11 performance highlighted by Ms. Everette includes:

- 12 • The Company's H2O program ranks at the top of the Pennsylvania water  
13 utility customer assistance programs for the types of benefits provided  
14 under the program. Further, the Company is expanding this program to  
15 add a fourth tier of eligibility to its bill discount program to customers  
16 whose household incomes are between 151% and 200% of FPL as well as  
17 to offer arrearage forgiveness for certain qualifying customers.
- 18 • PAWC's treatment plants are nationally recognized for optimization and  
19 performance above the regulatory standards.
- 20 • The Company is committed to continuing improvement in water quality  
21 and monitoring for pollutants where there is no obligation to monitor.
- 22 • PAWC's demonstrated commitment to operational and water efficiency  
23 for the benefit of customers.
- 24 • The Company has acted as a receiver for and acquired troubled water and  
25 wastewater systems for over 25 years, acquiring sixteen companies in the  
26 last 10 years.

1 **Q. How have you considered the management performance of PAWC in your**  
2 **recommendation?**

3 A. Yes. As discussed above, a reasonable range of ROE estimates for PAWC is from 10  
4 percent to 11.25 percent. I recommend an ROE of 10.95 percent for PAWC, which is at  
5 the high end of the reasonable range. This recommendation considers the effects of current  
6 market conditions as well as the Company's excellent management performance.

7 **IX. CAPITAL STRUCTURE**

8 **Q. Please explain how the water services capital structure was calculated for PAWC.**

9 A. Because there is specific debt that has been identified for wastewater services, the capital  
10 structures for water and wastewater services were calculated separately. The capital  
11 structure for the total company was calculated first, including all debt issuances and all  
12 sources of capital. As shown in Exhibit No. 13-A, Schedule 11, the total company  
13 projected permanent capital structure includes 44.70 percent long-term debt, 0.00 percent  
14 preferred stock and 55.30 percent common equity for the fully projected future test year  
15 ending June 30, 2025. The total company capital structure includes three issuances that can  
16 be specifically assigned to the wastewater services: Pennvest Clarion; Pennvest Scranton;  
17 and \$47 million of a PEDFA tax-exempt debt issuance for Coatsville. These issuances are  
18 shown on Exhibit No. 13-A, Schedule 14. The capital structure for water service was  
19 calculated by removing the wastewater specific debt instruments from the total long-term  
20 debt of the company and recalculating the ratios of the remaining capital stock. As shown  
21 in Exhibit No. 13-A, Schedule 12 the permanent ratemaking capital structure for the water  
22 service after removing the wastewater specific debt issuances from the total company

1 capital structure is 44.01 percent long-term debt, 0.00 percent preferred stock and 55.99  
2 percent common equity for the fully projected future test year ending June 30, 2025.

3 **Q. How was the wastewater services capital structure calculated?**

4 A. The wastewater specific capital structure was calculated by applying the total company  
5 debt ratio to the wastewater rate base, excluding the specific wastewater debt issuances.  
6 Preferred stock is also calculated by applying the total company percentage of preferred  
7 stock to the rate base less the wastewater specific debt issuances. The equity component  
8 of the capital structure is the rate base less long-term debt, wastewater specific debt  
9 issuances and preferred stock. As shown in Exhibit No. 13-A, Schedule 13, the wastewater  
10 specific capital structure includes 42.73 percent long-term debt, wastewater specific  
11 financing of 4.40 percent, for a total long-term debt of 47.13 percent, 0.00 percent preferred  
12 stock and 52.87 percent common equity for fully projected future test year ending June 30,  
13 2025.

1 **Figure 13: Ratemaking Capital Structures for the Fully Projected Future Test**  
 2 **Year ending June 30, 2025**

Total Company <sup>50</sup>	
Common Equity	55.30%
Preferred Stock	0.00%
Long-Term Debt	44.70%
Water Services <sup>51</sup>	
Common Equity	55.99%
Preferred Stock	0.00%
Long-Term Debt	44.01%
Wastewater Services <sup>52</sup>	
Common Equity	52.87%
Preferred Stock	0.00%
Long-Term Debt	42.73%
WW Specific Debt	4.40%

3 **Q. Why does the ratemaking capital structure exclude short-term debt?**

4 A. The ratemaking capital structure is intended to reflect the permanent financing of rate base  
 5 assets. PAWC has relied on short-term debt as temporary financing; to finance  
 6 Construction Work in Progress (CWIP), and the acquisitions of other water systems. As  
 7 those assets are brought into rate base, the Company secures permanent financing including  
 8 equity and long-term debt.

9 **Q. Did you conduct any analysis to determine if the requested equity ratio was**  
 10 **reasonable?**

11 A. Yes, I did. I reviewed the Company’s proposed capital structure and the capital structures  
 12 of the utility operating subsidiaries of the proxy companies.

---

<sup>50</sup> See Exhibit 13-A, Schedule 11.

<sup>51</sup> *Ibid.*, at Schedule 12.

<sup>52</sup> *Ibid.*, at Schedule 13.

1 **Q. Why is it appropriate to consider the equity ratio for the proxy companies?**

2 A. The determination of the ROE is based on the expected return for a proxy group of  
3 companies that are comparable in risk to PAWC. The equity ratio is a measure of the  
4 financial risk of the company, and the authorized ROE is the return to compensate investors  
5 for that risk. If the Commission is going to rely on the ROE estimates for the proxy  
6 companies to establish the authorized ROE for PAWC, it is important that the financial  
7 risk of PAWC be similar to the financial risk of the proxy group. This is accomplished  
8 when the equity ratio of the subject company (in this case PAWC) is within the range  
9 established by the proxy group.

10 **Q. How did you conduct your analysis of the proxy group capital structures?**

11 A. Specifically, I calculated the mean proportions of common equity, long-term debt and  
12 short-term debt over the past three years for each of companies in the proxy group at the  
13 operating subsidiary level. Exhibit No. 13-A, Schedule 10 summarizes the actual capital  
14 structures of the operating subsidiaries. As shown, the average equity ratios for the  
15 operating subsidiaries of the proxy group range from 49.41 percent to 59.88 percent, with  
16 a mean of 55.88 percent. PAWC's proposed equity ratio of 55.30 percent is well within the  
17 equity ratio range established by the utility operating subsidiaries of the proxy group.

18 **Q. Are there other factors to be considered in setting the Company's capital structure?**

19 A. Yes, there are other factors that should be considered in setting the Companies' capital  
20 structures, namely the challenges that the credit rating agencies have highlighted as placing  
21 pressure on the outlook for utilities in 2023.

1 For example, Moody’s recently revised its 2023 outlook for the regulated gas and electric  
2 utilities sector to “negative” based on ongoing challenges of inflation, increasing interest  
3 rates and higher natural gas prices. Moody’s noted that these challenges increase the  
4 pressure on customer affordability, and thus face heightened public scrutiny and the ability  
5 of utilities to promptly recover their costs. Moody’s concluded that regulated utilities’  
6 financial metrics are already under pressure with little cushion, and that sustained capital  
7 spending is likely as utilities continue progress towards emissions reductions and net-zero  
8 goals. Moody’s noted that the outlook could return to stable if regulatory support remains  
9 intact, natural gas prices are at a level where utilities are able to recover their fuel and  
10 purchased power costs without delay beyond 12 months, overall inflation moderates,  
11 interest rates stabilize and/or utilities’ aggregate funds from operations-to-debt ratio  
12 remains between 14% and 15%.<sup>53</sup>

13 Fitch Ratings (“Fitch”) also highlights similar factors identified by Moody’s as challenging  
14 utilities’ outlook for 2023, stating that the sector faces mounting cost pressures due to  
15 “elevated commodity prices, inflationary headwinds and rising interest costs,” and that  
16 some offset in managing these headwinds include “higher authorized ROEs and the use of  
17 tools such as securitization of under-recovered fuel balances.”<sup>54</sup>

18 Likewise, S&P also continues to maintain a negative outlook for the utility industry, noting  
19 that downgrades have outpaced upgrades for the third consecutive year in 2022 with a

---

<sup>53</sup> Moody’s Investors Service, Outlook. “2023 outlook negative due to higher natural gas prices, inflation and rising interest rates.” November 10, 2022; Moody’s Investors Service. Outlook, Sector In-Depth. “Inflation, high natural gas prices complicate prospects for supportive rate increases.” November 11, 2022.

<sup>54</sup> Fitch Ratings. “North American Utilities, Power & Gas Outlook 2023.” December 7, 2022, at 1-2.

1 median investor-owned utility credit rating of “BBB+”.<sup>55</sup> Further, S&P expects the  
2 industry to have negative discretionary cash flow as a result of significant capital spending  
3 and consistent dividends.<sup>56</sup> Therefore, the utility industry will need ongoing access to  
4 capital markets to fund the capital expenditures. However, S&P notes that inflation, rising  
5 interest rates and decreasing equity prices may “hamper” consistent access to capital  
6 markets and result in additional pressure on cash flows.<sup>57</sup> Moreover, S&P indicates that if  
7 inflation risks persist over the near-term and customer bills increase, regulatory credit  
8 support could decrease resulting in weaker financial metrics for the industry:

9 Over the past decade the industry’s financial measures have weakened from  
10 a combination of rising capital spending, regulatory lag, and lower  
11 authorized return on equity (ROE). The industry’s return on capital was  
12 about 6% a decade ago and today is closer to 4%. More recently, we have  
13 seen instances where not only is the authorized ROE lowered but also the  
14 equity ratio is lowered. These results have weakened the industry’s financial  
15 measures, pressuring credit quality. Under our base case of moderating  
16 inflationary risks during 2023, we expect the industry's credit measures to  
17 generally remain flat. However, if inflationary risks persist, it may further  
18 pressure the customer bill, potentially decreasing the level of regulatory  
19 credit support, weakening the industry's financial performance.<sup>58</sup>

20 The credit ratings agencies’ continued concerns over the negative effects of inflation and  
21 increased capital expenditures underscore the importance of maintaining adequate cash  
22 flow metrics for the industry as a whole, and PAWC in particular in the context of this  
23 proceeding.

1 **Q. What is your conclusion with regard to PAWC's proposed capital structure?**

2 A. Considering the actual capital structures of the proxy group operating companies, I believe  
3 that PAWC's proposed common equity ratio of 55.30 percent is reasonable. The proposed  
4 equity ratio is well within the range and slightly below the mean established by the capital  
5 structures of the utility operating subsidiaries of the proxy companies.

6 **X. CONCLUSION AND RECOMMENDATIONS**

7 **Q. What is your conclusion regarding a fair ROE for PAWC?**

8 A. Figure 9 summarizes the results of my cost of equity analyses. Based on the various  
9 quantitative analyses summarized in Figure 1 above and the qualitative analyses presented  
10 in my Direct Testimony, a reasonable range of ROE results for PAWC is from 10.00  
11 percent to 11.25 percent. Within that range, I believe that an ROE of 10.95 percent is  
12 reasonable and appropriate. A return at the high end of the range of results would recognize  
13 the Company's superior performance and service quality, as discussed in the testimony of  
14 Ms. Ashley Everette at PAWC Statement No. 1. In addition, the recommended ROE takes  
15 into consideration the current conditions in capital markets including the high interest rates,  
16 and elevated inflationary pressures, both of which increase the cost of capital as well as the  
17 need to recover flotation costs and the relative business and financial risk of PAWC as  
18 compared to the proxy group. This ROE would enable the company to attract capital at  
19 reasonable terms under a variety of economic and financial market conditions, while  
20 continuing to provide safe, reliable and affordable water service to customers in  
21 Pennsylvania.

1

- 2 **Q. What is your conclusion regarding PAWC’s proposed capital structure?**
- 3 A. My conclusion is that PAWC’s proposed rate-making capital structure consisting of 55.30
- 4 percent common equity, 44.70 percent long-term debt is reasonable as compared to the
- 5 proxy group companies and should be used for setting rates in this case.

<sup>59</sup> DCF results exclude the result for Middlesex Water Company because the low and mean results are lower than the current yield on the Moody’s Baa rated utility bond index, which is illogical and the high end DCF result does not provide a reasonable equity risk premium over the current yield on the Moody’s Baa rated utility bond index of 6.48 percent on a 30-day average basis ending October 31, 2023.

1 Q. Does this conclude you direct testimony?

2 A. Yes, it does.

FLOTATION COST ADJUSTMENT

			[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]	[9]
Company	Ticker	Date [i]	Shares Issued (000)	Offering Price	Under-writing Discount [ii]	Offering Expense (\$000)	Net Proceeds Per Share	Total Flotation Costs (\$000)	Gross Equity Issue Before Costs (\$000)	Net Proceeds (\$000)	Flotation Cost Percentage
American Water Works Company	AWK	2/28/2023	12,650	135.50	2.033	700	133.41	26,411	1,714,075	1,687,664	1.54% [iii]

[i] Offering Completion Date

[ii] Underwriting discount is calculated as the market price minus the offering price when not explicitly given in the prospectus.

[iii] American Water Works Company: AWK Prospectus 424B7 02.28.2023

The flotation cost adjustment is derived by dividing the dividend yield by 1 - F (where F = flotation costs expressed in percentage terms), or by 0.9846, and adding that result to the constant growth rate to determine the cost of equity. Using the formulas shown previously in my testimony, the Constant Growth DCF calculation is modified as follows to accommodate an adjustment for flotation costs:

$$k = \frac{D \times (1 + 0.5g)}{P \times (1 - F)} + g$$

**Notes to Debt Schedule**

- (1) Re-issuance 12/21/12 from Parent at a coupon rate of 4.30% for 30 years
- (2) New unsecured borrowing at a coupon rate of 4.30% for 30 years
- (3) Issuances costs included make whole premium of \$10M
- (4) Issuances costs included make whole premium of \$7.2M
- (5) Refinanced June 2019 at a lower rate for the remaining term of the bond
- (6) Refinanced Dec 2019 at a lower rate for the remaining term of the bond
- (7) Farmington Twp., Interest rate 1.387% for first 70 months and 2.774% (07/2009) for remainder
- (8) Sandy Ridge, Interest rate 1.000% for first 60 months and 1.156% (07/2010) for remainder
- (9) Sligo/Shippenville, Interest rate 1.385% for first 86 months and 2.763% (06/2013) for remainder
- (10) Ellwood/Butler Interconnect, Interest rate 1.387% for first 74 months and 2.774% (08/2009) for remainder
- (11) Mahoning & Union Twp, Interest rate 1.305% for first 82 months and 2.432% (10/2009) for remainder
- (12) Hanover & Collier 1.274% first 2009 - 2014 and 2.547% starting Oct 2014
- (13) Mount Pleasant Water System Extension 1.559% first 2011 - 2016 and 2.69% starting March 2016
- (14) Rock Run WTP 2.414% first 2011 - 2016 and 3.117% starting Dec 2017
- (15) Silver Spring Clearwell 2.376% first 2012 - 2016 and 3.098% starting Jan 2017
- (16) Wallaceeton Municipal Authority 1.00% for 30 years starting March 2012
- (17) Pittsburgh Meter Improvements 1.799% first 2012 - 2017 and 2.81% starting April 2017
- (18) Pittsburgh Meter Improvement Project Phase II 1.559% first 60 months and 2.69% starting May 2016
- (19) Southwest PA Pipeline Exts Phase II - Interest 1.591% first 5 years - 2.196% starting April 2018
- (20) Clarion WW Act 537 Implementation Project - Interest rate is 1.0% for the life of the loan
- (21) Paint Twp #1 - Interest rate is 1% for the remaining life of the Bond
- (22) Paint Twp #2 - Interest rate is 1% for the remaining life of the Bond
- (23) Fairview Water Main Extension - Interest rate is 1.356% for the first 5 years, 1.985% June 2022 for remaining 5 years
- (24) Debt assumed as part of Scranton Sewer acquisition
- (25) Washington County Main Extension Project - Interest rate is 1.439% until Oct 2021 - 2.027% for the remaining term
- (26) Unsecured borrowing at a coupon rate of 2.80% for 10 years
- (27) Unsecured borrowing at a coupon rate of 3.45% for 30 years
- (28) Issuance costs include make whole premium of \$1.2M
- (29) New unsecured borrowing at a coupon rate of 3.25% for 30 years
- (30) New projected unsecured borrowing at a coupon rate of 4.45% for 10 years
- (31) New unsecured borrowing at a coupon rate of 4.20% for 26 years
- (32) New unsecured borrowing at a coupon rate of 5.05% for 15 years
- (33) New unsecured borrowing at a coupon rate of 5.06% for 15 years
- (34) New unsecured borrowing at a coupon rate of 4.20% for 15 years
- (35) New unsecured borrowing at a coupon rate of 5.06% for 15 years
- (36) New unsecured borrowing at a coupon rate of 4.75% for 15 years
- (37) New unsecured borrowing at a coupon rate of 5.14% for 17 years

**Notes to Debt Schedule**

- (1) Re-issuance 12/21/12 from Parent at a coupon rate of 4.30% for 30 years
- (2) New unsecured borrowing at a coupon rate of 4.30% for 30 years
- (3) Issuances costs included make whole premium of \$10M
- (4) Issuances costs included make whole premium of \$7.2M
- (5) Refinanced June 2019 at a lower rate for the remaining term of the bond
- (6) Refinanced Dec 2019 at a lower rate for the remaining term of the bond
- (7) Farmington Twp., Interest rate 1.387% for first 70 months and 2.774% (07/2009) for remainder
- (8) Sandy Ridge, Interest rate 1.000% for first 60 months and 1.156% (07/2010) for remainder
- (9) Sligo/Shippenville, Interest rate 1.385% for first 86 months and 2.763% (06/2013) for remainder
- (10) Ellwood/Butler Interconnect, Interest rate 1.387% for first 74 months and 2.774% (08/2009) for remainder
- (11) Mahoning & Union Twp, Interest rate 1.305% for first 82 months and 2.432% (10/2009) for remainder
- (12) Hanover & Collier 1.274% first 2009 - 2014 and 2.547% starting Oct 2014
- (13) Mount Pleasant Water System Extension 1.559% first 2011 - 2016 and 2.69% starting March 2016
- (14) Rock Run WTP 2.414% first 2011 - 2016 and 3.117% starting Dec 2017
- (15) Silver Spring Clearwell 2.376% first 2012 - 2016 and 3.098% starting Jan 2017
- (16) Wallaceton Municipal Authority 1.00% for 30 years starting March 2012
- (17) Pittsburgh Meter Improvements 1.799% first 2012 - 2017 and 2.81% starting April 2017
- (18) Pittsburgh Meter Improvement Project Phase II 1.559% first 60 months and 2.69% starting May 2016
- (19) Southwest PA Pipeline Exts Phase II - Interest 1.591% first 5 years - 2.196% starting April 2018
- (20) Clarion WW Act 537 Implementation Project - Interest rate is 1.0% for the life of the loan
- (21) Paint Twp #1 - Interest rate is 1% for the remaining life of the Bond
- (22) Paint Twp #2 - Interest rate is 1% for the remaining life of the Bond
- (23) Fairview Water Main Extension - Interest rate is 1.356% for the first 5 years, 1.985% June 2022 for remaining 5 years
- (24) Debt assumed as part of Scranton Sewer acquisition
- (25) Washington County Main Extension Project - Interest rate is 1.439% until Oct 2021 - 2.027% for the remaining term
- (26) Unsecured borrowing at a coupon rate of 2.80% for 10 years
- (27) Unsecured borrowing at a coupon rate of 3.45% for 30 years
- (28) Issuance costs include make whole premium of \$1.2M
- (29) New unsecured borrowing at a coupon rate of 3.25% for 30 years
- (30) New projected unsecured borrowing at a coupon rate of 4.45% for 10 years
- (31) New unsecured borrowing at a coupon rate of 4.20% for 26 years
- (32) New unsecured borrowing at a coupon rate of 5.05% for 15 years
- (33) New unsecured borrowing at a coupon rate of 5.06% for 15 years
- (34) New unsecured borrowing at a coupon rate of 4.20% for 15 years
- (35) New unsecured borrowing at a coupon rate of 5.06% for 15 years
- (36) New unsecured borrowing at a coupon rate of 4.75% for 15 years
- (37) New unsecured borrowing at a coupon rate of 5.14% for 17 years
- (38) New unsecured borrowing at a coupon rate of 3.625% for 3 years
- (39) New unsecured borrowing at a coupon rate of 5.247% for 10 years
- (40) New unsecured borrowing at a coupon rate of 5.646% for 30 years

Notes:

- (1) Determined by taking into account the effect of the annual sinking fund requirements which are met by the retirement of stock which reduce the term of each issue.
- (2) The effective cost for each issue is the yield to maturity using as inputs the average term of issue, stated dividend rate, and net proceeds ratio.
- (3) Series without sinking fund requirements are outstanding in perpetuity. For those series, the effective cost rate is the stated dividend rate divided by the net proceeds ratio.
