Re: Petition of PPL Electric Utilities Corporation for Approval of its Second Distributed Energy Resources Management Plan
Docket No. P-2024

Dear Secretary Chiavetta:

Enclosed for filing is the Petition of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") for Approval of its Second Distributed Energy Resources ("DER") Management Plan. PPL Electric is filing its Petition pursuant to Paragraph 62 of the Joint Petition for Settlement of All Issues approved by the Pennsylvania Public Utility Commission's ("Commission") at Docket No. P-2019-3010128. If approved, the Company's Second DER Management Plan would become effective on March 22, 2025, the day after PPL Electric's First DER Management Plan's Pilot Program is set to end.

PPL Electric notes that Proprietary and Non-Proprietary copies of the filing are being submitted. The Proprietary version contains **HIGHLY CONFIDENTIAL** PPL Electric Exhibits CD-5 through CD-7, CD-9 through CD-12, and KM-2 through KM-5. These exhibits contain proprietary and sensitive information about PPL Electric's distribution system and operations. Accordingly, PPL Electric respectfully requests that the Proprietary version of the filing be afforded proprietary treatment and placed in a non-public folder.

Due to file size restrictions, the Non-Proprietary and Proprietary versions are being uploaded separately to the Commission's ShareFile for large filings.

Additionally, under separate cover, PPL Electric is sending the Commission a CD containing PDF copies of the Proprietary and Non-Proprietary versions of the filing.

The Company's filing consists of the following documents:

1. Petition for Approval of PPL Electric's Second DER Management Plan;
2. PPL Electric St. No. 1 – Direct Testimony of Salim Salet, including PPL Electric Exhibits SS-1 and SS-2;
3. PPL Electric St. No. 2 – Direct Testimony of Aliesha Dombrowski-Diamond, including PPL Electric Exhibits AD-1 through AD-7;
4. PPL Electric St. No. 3 – Direct Testimony of Cody M. Davis, including PPL Electric Exhibits CD-1 through CD-4 and CD-8 and **HIGHLY CONFIDENTIAL** PPL Electric Exhibits CD-5 through CD-7 and CD-9 through CD-12;
5. PPL Electric St. No. 4 – Direct Testimony of Reigh A. Walling, including PPL Electric Exhibit RW-1;
6. PPL Electric St. No. 5 – Direct Testimony of Jay Johnson, including PPL Electric Exhibit JJ-1;
7. PPL Electric St. No. 6 – Direct Testimony of Dr. Elizabeth Cook, including PPL Electric Exhibit EC-1;
8. PPL Electric St. No. 7 – Direct Testimony of Lee Krevat, including PPL Electric Exhibits LK-1 through LK-11;
9. PPL Electric St. No. 8 – Direct Testimony of Dr. Karen Miu, including PPL Electric Exhibit KM-1 and **HIGHLY CONFIDENTIAL** PPL Electric Exhibits KM-2 through KM-5; and
10. PPL Electric St. No. 9 – Direct Testimony of Kevin Underwood.

As shown on the attached Certificate of Service, PPL Electric has served the Non-Proprietary copy of the filing on the Office of Consumer Advocate, Office of Small Business Advocate, the

Commission's Bureau of Investigation and Enforcement, and all parties from the First DER Management Plan proceeding. The Company is also serving the Non-Proprietary copy of the filing on Tesla, Inc. ("Tesla"), Sun Directed, American Home Contractors ("AHC"), Sunrun, Inc. ("Sunrun"), and the Solar Energy Industries Association ("SEIA") (collectively, the "Joint Solar Parties"), as evidenced by the Certificate of Service.

The Company also requests that the Commission publish notice of this filing in the *Pennsylvania Bulletin* and that a reasonable deadline for intervention be set as part of that notice.

PPL Electric believes that these various communications initiatives will provide all interested parties with full notice of the Company's proposed Second DER Management Plan and an opportunity to participate in any Commission proceeding about this Petition. However, if the Commission concludes that additional notice would be appropriate, the Company will provide such additional notice as the Commission may direct.

Lastly, as set forth in the Petition, PPL Electric respectfully requests Commission approval of the Second DER Management Plan no later than its February 20, 2025 public meeting, so that the Company has sufficient time to implement the Second DER Management Plan before the Pilot Program ends on March 21, 2025.

Respectfully submitted,

Devin Ryan

V. REQUEST FOR COMMISSION APPROVAL IN SUFFICIENT TIME BEFORE PILOT PROGRAM EXPIRES 34

VI. CONCLUSION 35

Appendix A – PPL Electric Utilities Corporation's Direct Testimony and Exhibits

Pursuant to 52 Pa. Code §§ 5.41, 53.3, 53.31, and 75.13(k) and Paragraph 62 of the Joint Petition for Settlement of All Issues approved at Docket No. P-2019-3010128, PPL Electric Utilities Corporation ("PPL Electric" or the "Company") hereby petitions the Pennsylvania Public Utility Commission ("Commission") for approval of tariff modifications and other authorizations that are needed to implement PPL Electric's Second Distributed Energy Resources ("DER") Management Plan ("Second DER Management Plan" or the "Plan") as set forth in this Petition and the Company's direct testimony and exhibits. The Second DER Management Plan expands on the Company's First DER Management Plan, the First DER Management Plan's Pilot Program ("Pilot Program"), and Rule 12 of its tariff, which were approved at Docket No. P-2019-3010128 and govern the interconnection and operation of new DERs deployed in the Company's service territory.

As explained herein, the electric transmission and distribution systems in Pennsylvania and the United States continue to undergo significant changes. In particular, the increasing deployment and use of DERs, such as solar panels and batteries, have upended the traditional electric grid[1] model of large-scale generation located at significant distances from customers. By allowing customers to both consume and produce electricity at what were traditionally points of delivery (*i.e.*, at the distribution system's "edge"), DERs force the electric distribution system to perform in a way for which it was not originally designed and, as a result, place an increasing stress on the grid. Critically, while the deployment of DERs in Pennsylvania continues to increase, the Company still must provide reasonable, safe, and reliable electric service to all of its customers, including those who have not installed DERs.

[1] The terms "grid," "electric grid," or "power grid," as used in this Petition, mean an interconnected network for delivering electricity from producers to consumers. The network includes both the transmission system and distribution system.

In 2019, the Company took a proactive step requesting Commission approval to implement its First DER Management Plan, which was designed to produce cost-effective benefits for customers with and without DERs, the DER market, and the Commonwealth as a whole. Under that proposal, customers applying to interconnect new DERs with PPL Electric's distribution system would be required to: (1) use Company-approved smart inverters that are compliant with IEEE 1547-2018 and then-forthcoming revisions to UL Standard 1741; and (2) install DER Management devices that enable PPL Electric to monitor and actively manage DERs. These proposals would enable PPL Electric to:

1. Facilitate and encourage the increased deployment of DERs in its service territory by reducing interconnection costs for customers installing DERs and increasing hosting capacity on distribution circuits[2];

2. Improve the safety, reliability, adequacy, and resiliency of its distribution service by gaining visibility into the DERs' impacts on the distribution system and actively leveraging the grid support functions of the DERs' smart inverters;

3. Improve distribution system operation and planning by eliminating "hidden load"[3] at DER points of interconnection; and

4. Reduce the Company's capital costs and operation and maintenance expenses that are passed onto ratepayers by, among other things, remotely managing the DERs' voltage support functions to mitigate voltage violations on distribution circuits, which decreases system upgrades as well as costs to manually address voltage violations (*e.g.*, reduction in the number of truck rolls).

Ultimately, the Commission approved a settlement reached by all the active parties in that proceeding, which, among other things, outlined that: (1) new DERs interconnecting with the

[2] "Hosting capacity is the amount of [distributed photovoltaic systems ('DPV')] that can be added to distribution system before control changes or system upgrades are required to safely and reliably integrate additional DPV." Advanced Hosting Capacity Analysis, NREL, *available at* https://www.nrel.gov/solar/market-research-analysis/advanced-hosting-capacity-analysis.html.

[3] "Hidden load" is the amount of load that is present on a circuit but not measured at telemetry points (e.g., the feeder circuit breaker) because the energy is being provided by local downstream DERs. The amount of load measured by distribution equipment is often referred to as the "net" load, and the total amount of load operating on the feeder (including the amount offset by DER production) is the "native" load, with "hidden" load in a given interval as the difference between the two.

Company's distribution system on or after January 1, 2021, would be required to have smart inverters meeting the applicable standards set forth in Rule 12 of the Company's tariff; and (2) PPL Electric would undertake a Pilot Program to test and evaluate (a) the costs and benefits to distribution system operation and design of monitoring DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means (e.g., automated meter reading equipment, advanced distribution management systems ("ADMS"), modeling) and (b) the costs and benefits to distribution system operation of active management of DERs as compared to the benefits available through the use of inverter autonomous grid support functions. Paragraph 62 of the Settlement further provided that within 60 days after the end of Program Year 2 of the Pilot Program, which concluded on March 21, 2024, PPL Electric can file a Petition to: (a) extend the program and make such other changes to the program as the Company may request; (b) continue installing the DER Management devices on new DERs in its service territory; and/or (c) authorize the Company to remotely and actively manage (i) the DERs that were in the Pilot Program's control groups, (ii) the DERs that have enrolled and will enroll in the program, and (iii) any new DERs that will interconnect with the Company's distribution system after the program concludes.

PPL Electric commends the Commission on having the foresight to approve the Settlement, so that the benefits of monitoring and actively managing DERs could be realized. The Pilot Program has improved the reliability and performance of the distribution system, increased DER hosting capacity, reduced interconnection costs for interconnection applicants, and facilitated the

interconnection of more DERs, all without materially affecting the generation of participating DERs.[4]

Also, PPL Electric has seen significant, cost-effective benefits from monitoring and actively managing DERs. Based on the data gathered through Program Year 2, PPL Electric's Pilot Program has reduced the Company's operation and maintenance expenses by approximately $15.33 million and the Company's capital expenditures by approximately $6.60 million.[5] When compared to the $128,000 of operation and maintenance expenses and the $6.38 million of capital costs that the Pilot Program has cost as of the end of Program Year 2, the Pilot Program has produced substantial benefits compared to its costs. Furthermore, PPL Electric's continued learning and adaptations have resulted in additional program efficiencies related to the overall cost of the DER Management device installation and provisioning.

To continue and expand on these achievements, PPL Electric hereby submits this Petition for approval of its Second DER Management Plan. As set forth in this Petition and the Company's testimony and exhibits, PPL Electric proposes to expand on its Pilot Program by receiving approval to: (1) actively monitor and manage the smart inverter settings on customer DERs in the Pilot Program's control groups; (2) utilize the Volt/Watt functionality, with customer consent, when the interconnecting DER could create a localized high voltage issue on the distribution system at the time of interconnection, which would not be resolved by the Volt/VAR or Constant Power Factor grid support functions; and (3) make the Pilot Program permanent. Moreover, the Company

[4] As explained in the direct testimony of Cody M. Davis (PPL Electric Statement No. 3), PPL Electric uses monitored real and reactive power data to calculate the amount of customer energy generation lost as a result of the operation of Volt/VAR curves for each customer in the Pilot Program. The average annual energy losses are generally less than 10 kWh.

[5] Further, the Pilot Program has increased hosting capacity by an estimated 29 MW. If that additional 29 MW were fully utilized as of March 21, 2024, it would have produced additional generation and reduced distribution and transmission losses valued at approximately $4.57 million.

proposes to install DER Management devices on: (1) solar photovoltaic systems interconnected before the Pilot Program started on January 1, 2021; and (2) inverter-based DERs interconnected after the Pilot Program started without DER Management devices installed on them.[6] Collectively, the Second DER Management Plan will produce additional, substantial, cost-effective benefits for customers with and without DERs.

By approving this Petition, the Commission would further support and enable Pennsylvania's vision of renewable energy growth to address climate and sustainability objectives by reducing greenhouse gas emissions. The Second DER Management Plan will facilitate the greatest penetration of DERs at the least cost while maintaining service reliability and safety. Additionally, PPL Electric's monitoring and active management of DERs has helped the DER market by facilitating the safe, reliable, efficient, and affordable deployment of DERs in the Company's service territory, which has seen significant increases in the number of DER interconnection applications since the start of the Pilot Program. Since the start of the Pilot Program, the Company has received 19,464 interconnection applications. Of those 19,464 applications, 7,418 have been included in the Pilot Program and have a DER Management device installed. Also, as of May 17, 2024, PPL Electric has worked with 392 solar developers through the life of the Pilot Program to interconnect their systems to the distribution systems. The Company has also reviewed and approved 272 inverters from 15 different manufacturers.

For these reasons, and as explained in more detail below, PPL Electric respectfully requests that the Commission approve the proposed revisions to PPL Electric's tariff, grant the

[6] As proposed in PPL Electric Exhibit SS-2, customer-generators with these systems must submit a new interconnection application when they upgrade their system, install a new inverter on their system, or by March 22, 2040, whichever is earlier. The DER Management devices will be installed on those systems after their new interconnection applications are approved as compliant with the Company's current requirements for DERs and inverters and after their systems are installed and inspected.

authorization to require the installation of the DER Management devices pursuant to 52 Pa. Code § 75.13(k), and grant any other Commission approvals that are needed to implement the Company's Second DER Management Plan.[7] Further, as set forth in Section V, *infra*, PPL Electric respectfully requests Commission approval of the Second DER Management Plan no later than its February 20, 2025 public meeting, so that the Company has sufficient time to implement the Second DER Management Plan before the Pilot Program ends on March 21, 2025.

I. INTRODUCTION

1. PPL Electric is a corporation organized and existing under the laws of the Commonwealth of Pennsylvania. PPL Electric is a wholly-owned direct subsidiary of PPL Corporation.

2. PPL Electric furnishes electric distribution, transmission and default supply services to approximately 1.5 million customers throughout its certificated service territory, which includes all or portions of 29 counties and encompasses approximately 10,000 square miles in eastern and central Pennsylvania.

3. PPL Electric is a "public utility," an "electric distribution company" and a "default service provider" as defined in Sections 102 and 2803 of the Public Utility Code, 66 Pa. C.S. §§ 102, 2803.

4. The complete name and address of PPL Electric is as follows:

[7] Unlike with the First DER Management Plan, the Company no longer requires the waivers of the Commission's regulations that it received in the First DER Management Plan proceeding because the updated IEEE and UL standards that the Company proactively implemented have since been automatically incorporated into the Commission's regulations by reference. *See* 52 Pa. Code § 75.22 (defining "Certified" as "(i) IEEE Standard 1547, 'Standard for Interconnecting Distributed Resources with Electric Power Systems,' as amended and supplemented" and "(ii) UL Standard 1741, 'Inverters, Converters and Controllers for use in Independent Power Systems' (January 2001), as amended and supplemented") (emphasis added).

PPL Electric's attorneys are authorized to receive all notices and communications regarding this Petition.

II. LEGAL STANDARDS

6. Section 5.41 of the Commission's regulations states, in part, that "[p]etitions for relief under the act or other statute that the Commission administers, must be in writing, state clearly and concisely the interest of the petitioner in the subject matter, the facts and law relied upon, and the relief sought." 52 Pa. Code § 5.41(a).

7. Copies of any petition under Section 5.41 must be served on the statutory parties and "on all persons directly affected and on other parties whom petitioner believes will be affected by the petition," as well as further directed by the Commission. 52 Pa. Code §§ 5.41(b)-(c).

8. "Unless the Commission otherwise orders, a public utility . . . may not change an existing and duly established tariff, except after notice of 60 days to the public." 52 Pa. Code § 53.31.

9. Electric distribution companies ("EDCs") are required to "file a tariff with the Commission that provides for net metering consistent with" Chapter 75 of the Commission's regulations. 52 Pa. Code § 75.13(c).

10. In addition, an EDC and default service provider ("DSP") "may not require additional equipment or insurance or impose any other requirement" on a net metering customer-generator "unless the additional equipment, insurance or other requirement is specifically authorized under this chapter or by order of the Commission." 52 Pa. Code § 75.13(k).

III. THE COMMISSION SHOULD APPROVE THE SECOND DER MANAGEMENT PLAN, RELATED AUTHORIZATIONS AND TARIFF MODIFICATIONS REQUESTED BY PPL ELECTRIC

A. SECOND DER MANAGEMENT PLAN'S REQUIREMENTS AND BENEFITS

11. PPL Electric's Second DER Management Plan will enable the Company to continue to integrate, monitor, and manage DER resources throughout PPL Electric's service territory.

12. As proposed, PPL Electric's Second DER Management Plan will require that all customer-owned and third party-owned, inverter-based DER system installations be equipped with DER Management devices so that the Company can monitor and manage the DERs.

13. Complete details of the Second DER Management Plan's requirements are set forth in the Second DER Management Plan (see PPL Electric Exhibit SS-1) and the Company's proposed modifications to Tariff Rule 12 (see PPL Electric Exhibit SS-2).

14. As demonstrated by the Pilot Program, the Company can leverage the smart inverters' grid support functions to improve safety, reliability and resiliency, reduce interconnection costs for DER interconnection applicants (*e.g.*, avoidance of paying for distribution system upgrades), mitigate the impact of DERs on the distribution system, and increase the distribution circuits' hosting capacity by monitoring and managing DERs in the service territory.

15. Indeed, as explained in Section III.B, *infra*, the Company's proposal will facilitate DER adoption and provide a wide range of benefits, while also supporting the statewide initiatives to reduce greenhouse gas emissions.

16. Moreover, the Second DER Management Plan's benefits align with PPL Electric's statutory duty to provide safe, reliable, adequate, affordable, and reasonable service to all of its customers. *See* 66 Pa. C.S. § 1501.

17. As the owner and operator of the distribution system with a statutory duty to provide safe and reliable service, PPL Electric should have visibility and management of the generation interconnected with its distribution system, similar to how Regional Transmission Operators ("RTOs") and Independent System Operators ("ISOs") that are responsible for the transmission systems have visibility and management of the generation assets interconnected with the transmission systems.

18. The following sections generally outline the required equipment, technical standards, and benefits of implementing the changes for PPL Electric and its customers.

1. Smart Inverters

19. Inverters are devices that convert the direct current ("DC") power produced by solar panels into the alternating current ("AC") power transported on the electric distribution system for use in homes and businesses.

20. Smart inverters[8] provide additional functionality to standard inverters. For example, smart inverters are equipped with many grid support functions, including: (1) Constant Power Factor, Volt/VAR, Volt/Watt, and Reactive Power; (2) Frequency/Watt; (3) Voltage and Frequency Ride-through; and (4) Remote ON/OFF capability. This functionality allows the DERs that utilize smart inverters to operate in "sync" with the distribution system, thereby reducing power quality issues and maximizing potential DER output and operability. Smart inverters are also used in battery (energy storage) systems, electric vehicle chargers, and any other technologies that use DC power.

21. Under the Second DER Management Plan, PPL Electric will continue to test and approve smart inverters for use in the Company's territory.

22. PPL Electric's DER Lab completes a series of tests to confirm the inverter is compliant with IEEE 1547-2018 and UL 1741 SB. These tests verify that the applicable communication protocol registers are built into the inverter and also that the proper registers are read/write capable. The Company's DER Lab sample Test Plan for Inverters is attached hereto as PPL Electric Exhibit AD-7. For inverters that are not compliant, the DER Lab works with the inverter manufacturer to build said registers that allow the device to be compliant with IEEE 1547-2018 and UL 1741 SB.

23. Inverters that are certified to IEEE 1547-2018 and UL Standard 1741 Supplement B ("UL 1741 SB") can be compatible with the Company's DER Management devices and approved for use in the Company's service territory under Rule 12 of PPL Electric's tariff.

[8] As used in this Petition, "smart inverter" means an "inverter that performs functions that, when activated, can autonomously contribute to grid support during excursions from normal operating voltage and frequency system conditions by providing: dynamic reactive/real power support, voltage and frequency ride-through, ramp rate controls, communication systems with ability to accept external commands and other functions." PG&E Rule 21 Interconnection Tariff, *available at* http://www.cpuc.ca.gov/General.aspx?id=5071.

24. The Company also tests the inverters to ensure that they are compatible with PPL Electric's DER Management devices and can be safely and reliably utilized in the field together.

25. The Company reviews and approves inverters quickly, typically within two weeks. If an inverter does not have the proper firmware or functionality, the review process can take longer.

26. PPL Electric's approved inverter list includes inverters from the vast majority of inverter manufacturers. Inverters such as SolarEdge Technologies, Inc. ("SolarEdge"), Delta Electronics, Inc. ("Delta"), SMA Solar Technology AG, Tigo Energy, Solis (Ginlong Technologies), and Sol-Ark, LLC ("Sol-Ark") in varying sizes can be found on this list.

27. As of May 17, 2024, PPL Electric's approved inverter list includes 272 inverters from 15 different manufacturers, with more inverters from 6 additional inverters manufacturers in the pipeline, that cover the vast majority of inverter manufacturers and inverters that are certified to IEEE 1547-2018 and UL 1741 SB.

2. DER Management Devices

28. A DER Management device is the communication medium between the DER inverters and the EDC.

29. Under the Second DER Management Plan, DER Management devices must be installed and connected to the local communication interface of the DER system, so that the Company can monitor and manage the DERs and take advantage of the DERs' grid support functions.

30. PPL Electric's DER Management devices feature an advanced radio or cellular modem and connect to the DER's local communication interface to enable the monitoring and management of the DER through the Radio Frequency ("RF") Mesh network or a cellular network.

The device allows PPL Electric to remotely monitor the attributes and performance of the DER and manage its grid support settings as needed.

31. PPL Electric currently relies on three different DER Management devices: (1) the Smart Collar and Dongle device; (2) the Bridge device; and (3) the Cellular Gateway device.

32. The Smart Collar and Dongle was the first-generation DER Management device and has since been replaced by the Bridge. Both the Bridge and Smart Collar and Dongle devices use the existing advanced metering infrastructure ("AMI") network (*i.e.*, RF) Mesh network) to communicate back to the Company's head-end system.

33. The Cellular Gateway solution is used for IEEE 2030.5 inverters and communicates back to the Company's servers.

34. All three of these solutions communicate back to the Company's ADMS through either AMI or Cellular.

35. The Company is experienced with managing cybersecurity concerns associated with these communication devices. Robust practices and protocols are used to manage and mitigate cyber threats. These practices and protocols are equal to or exceed industry standards and will be enhanced as necessary to address evolving threats.

3. DER Monitoring and Management

36. IEEE 1547-2018 and UL 1741 SB focus on the need for smart inverters' grid support functionality and communication with EDCs' operational systems.

37. As the deployment of DERs continues to increase, it remains critically important for the Company to monitor and manage the DERs interconnected with its electric distribution system.

38. Solar and other intermittent resources can negatively affect the voltage on the electric distribution system, resulting in delayed interconnection or the need for potentially costly distribution system reinforcements before additional DERs can be installed.

39. Without the ability to directly communicate with and manage customer DERs to leverage grid support functionality, the amount of intermittent generation that can be interconnected on the distribution circuits must be limited to maintain system stability and reliability.

40. Therefore, PPL Electric respectfully requests that it continue to have the ability to monitor and manage DERs through the DER management devices by engaging their smart inverter grid support capabilities.

41. Specifically, as set forth in the Second DER Management Plan, PPL Electric proposes that it be permitted to monitor and actively manage the following grid support functions in the smart inverters: (1) Volt/VAR; (2) Constant Power Factor; (3) Remote On/Off; (4) Voltage Ride-through; (5) Frequency Ride-through; and (6) with customer consent, Volt/Watt.

42. Volt/VAR shall be the default voltage management mode for all actively managed inverters.

43. Volt/Watt will only be enabled and managed with the consent of the interconnecting customer when the interconnecting DER could create a localized high voltage issue on the distribution system at the time of interconnection, which would not be resolved by the Volt/VAR or Constant Power Factor grid support functions.

4. Expansion of the First DER Management Plan

44. Through the Second DER Management Plan, PPL Electric proposes to expand on its First DER Management Plan's Pilot Program by receiving approval to: (1) actively monitor and

manage the smart inverter settings on all DERs that are in the Pilot Program's control groups; (2) utilize the Volt/Watt functionality, with customer consent, when the interconnecting DER could create a localized high voltage issue on the distribution system at the time of interconnection, which would not be resolved by the Volt/VAR or Constant Power Factor grid support functions[9]; and (3) make the Pilot Program permanent.

45. As such, provisions in the Settlement that limit the scope of the Pilot Program's requirements, such as the annual cap of 3,000 DER Management devices, would be eliminated.

46. Moreover, the Company proposes to install DER Management devices on: (1) solar photovoltaic systems interconnected before the Pilot Program started on January 1, 2021; and (2) inverter-based DERs interconnected after the Pilot Program started without DER Management devices installed on them.[10]

5. Customer Communications

47. The implementation of new equipment and DER management protocols and standards requires clear communication with any prospective customer-generators.

48. Customers who are pursuing or are interested in learning more about installing DERs on the PPL Electric distribution system can find detailed information and instructions about the interconnection process on PPL Electric's external website, which has been updated to appropriately reflect the changes to its DER standards.

[9] Such customer consent will be required because the Volt/Watt functionality will affect the generating facility's production.

[10] As proposed in PPL Electric Exhibit SS-2, customer-generators with these systems must submit a new interconnection application when they upgrade their system, install a new inverter on their system, or by March 22, 2040, whichever is earlier. The DER Management devices will be installed on those systems after their new interconnection applications are approved as compliant with the Company's current requirements for DERs and inverters and after their systems are installed and inspected.

49. For example, the Frequently Asked Questions section on the website has been updated to include additional information regarding customer impacts and equipment requirements for the DER management device.

50. Further, the Company's Renewable Energy Connection portal has been updated to include a section on the DER Management device and steps required before receiving approval from PPL Electric to interconnect with the distribution system.

51. In addition, the Company's Rules for Electric Metering and Service Installation ("REMSI") website includes the requirements for interconnecting DERs, required equipment specifications, and installation rules for the DER Management device.

52. PPL Electric's customer service department is also equipped with documentation allowing them to address customers' questions regarding the smart inverters and DER Management devices.

B. BENEFITS OF THE SECOND DER MANAGEMENT PLAN

1. The Second DER Management Plan Builds Upon Initiatives To Address And Encourage Interconnection Of Alternative Energy Sources

a. State, Federal, and Company Initiatives

53. As noted previously, PPL Electric's First DER Management Plan was designed to help facilitate and encourage the deployment of customer-owned DERs in its service territory, and the Pilot Program's results have shown that the First DER Management Plan has been incredibly successful in achieving that goal.

54. Since the start of the Pilot Program, the Company has received 19,464 interconnection applications. Of those 19,464 applications, 7,418 have been included in the Pilot Program and have a DER Management device installed. As of May 17, 2024, PPL Electric has worked with 392 solar developers through the life of the Pilot Program to interconnect their

systems to the distribution systems. The Company has also reviewed and approved 272 inverters from 15 different manufacturers.

55. Meanwhile, PPL Electric continues to project increases in the deployment of customer-owned DERs in its service territory due to several state and federal initiatives to bolster the deployment of alternative energy sources.

56. In Pennsylvania, customer-owned DERs are governed by the Alternative Energy Portfolio Standards ("AEPS") Act of 2004, 73 P.S. §§ 1648.1-1648.8, which became effective in February 2005, and has since been revised by Act 35 of 2007 (effective July 2007) and Act 129 of 2008 (effective November 2008). The AEPS Act enables customer-generators to interconnect their generating facilities with the distribution systems of EDCs, like PPL Electric. *See* 73 P.S. § 1648.5.

57. The AEPS Act directed the Commission to "develop the technical and net metering interconnection rules for customer-generators to operate renewable onsite generators in parallel with the electric utility grid." *See id.* Pursuant to this directive, the Commission promulgated regulations that govern the interconnection and net metering of customer-generators' facilities. *See* 52 Pa. Code, Ch. 75.

58. Since the Commission's AEPS Act regulations became effective on December 16, 2006, the Company has connected over 26,243 customer-owned and third party-owned DERs to its electric distribution system. Of these, approximately 26,078 are solar photovoltaic ("PV") facilities, with the remaining systems primarily consisting of combined heat and power, wind, and biomass.

59. Back when PPL Electric filed its Petition for approval of its First DER Management Plan in 2019, those figures were 8,000 and 7,900, respectively, which demonstrates the significant increase seen in the Company's service territory in approximately five years.

60. Further, since January 1, 2021, PPL Electric has received an average of 5,839 DER interconnection applications per year, with the overwhelming majority of applications for solar PV systems.

61. Again, back when PPL Electric filed its Petition for approval of its First DER Management Plan in 2019, the Company received on average between 1,000 and 1,500 DER interconnection applications per year, which shows the substantial rise of DER interconnection applications over approximately the last five years.

62. Based upon historic interconnection of renewables throughout Pennsylvania,[11] the Company expects DER interconnection applications to rise as DER technologies become increasingly affordable and efficient.

63. Moreover, DER development has been and continues to be encouraged by financial incentives, legislative changes, and policy initiatives.

64. For example, in November 2018, the Pennsylvania Department of Environmental Protection ("DEP") released its Pennsylvania's Solar Future Plan ("PSFP").[12] The PSFP considers various opportunities for Pennsylvania residents and businesses to capitalize on the technical and

[11] See, e.g., page 32 of the Commission's "Alternative Energy Portfolio Standards Act of 2004 – Compliance for Reporting Year 2021-2022 (available at https://www.puc.pa.gov/media/2332/aeps-2022-report-final-032223-_dm.pdf), which shows an increase in total Tier I and Solar PV from 2012 to 2022.

[12] Pennsylvania's Solar Future Plan, Pennsylvania Department of Environmental Protection (Nov. 2018), *available at* http://www.depgreenport.state.pa.us/elibrary/GetDocument?docId=1413595&DocName=PENNSYLVANIA%26%2339%3bS%20SOLAR%20FUTURE%20PLAN.PDF%20%20%3cspan%20style%3D%22color:blue%3b%22%3e%28NEW%29%3c/span%3e.

economic potential of solar electric generation from distributed generation systems and utility-scale solar PV farms. One key proposal of the PSFP is to "[a]ccelerate use of smart inverters to manage over-voltage concerns on low voltage distribution lines and avoid unnecessarily adding costs on small solar distributed generation projects."[13] Additionally, the PSFP modeled various scenarios that investigated the viability of increasing the state's solar obligation from 0.5% in 2021 to 10% by 2030 – amounting to an estimated 11 gigawatts of new solar generation.[14]

65. Additionally, in October of 2017, Governor Wolf signed Act 40[15] into law, which effectively closed Pennsylvania's borders to solar renewable energy credits ("SRECs") generated from solar facilities outside of the Commonwealth. This has supported the development of solar facilities within the Commonwealth because EDCs and electric generation suppliers ("EGSs") must now fulfill their AEPS Act solar obligations from the generation of solar energy within the Commonwealth.

66. The projected increased installation of DERs is further supported by the Commission's "*Electric Power Outlook for Pennsylvania 2022-2027*,"[16] which states on pages 9-10 that the following changes to the "generation resource mix continues to change and have potential impacts for reliability" of electric service:

- Reliable Interconnection of Inverter-Based Resources: <u>Reliably integrating inverter-based resources (IBR), which include most solar and wind generation, onto the grid is paramount</u>. Over 70% of the new

> generation in development for connecting to the [Bulk Power System ("BPS")] over the next 10 years is solar, wind, and hybrid (a generating source combined with a battery). Note that the regional transmission operator (RTO) that serves Pennsylvania, PJM Interconnection, LLC (PJM), has developed a white paper outlining some risks with high penetration of IBR if proper planning and study are not undertaken.
>
> - Accommodating Large Amounts of Distributed Energy Resources (DER): Preparing the grid to operate with increasing levels of distribution resources must also be a priority in many areas. Solar photovoltaic (PV) DERs are projected to reach over 80 GW by the end of the [Long-Term Reliability Assessment ("LTRA")] 10-year assessment, a 25% increase in projection since [North American Electric Reliability Corporation's ("NERC")] 2021 LTRA. A total of 12 assessment areas project to double the amount of DERs in their areas by 2032.[17]

67. PPL Electric has been proactively preparing for increasing DER interconnections. The Company actively engaged in assessing and understanding the impact of DER development through its Keystone Solar Future Project ("KSFP") and received a grant of over $3 million for this program from the U.S. Department of Energy's ("DOE") Office of Energy Efficiency and Renewable Energy through its Sunshot Initiative in August 2017. The objective of the project was to gain greater insights into operational and technical impacts on the distribution system as increasing amounts of customer-owned and third party-owned solar generation are integrated into the existing distribution system. As a part of the KSFP, the Company developed and implemented a Distributed Generation ("DG") Portal, a web-based tool for rapid review of customer-owned DG applications.

68. Further, in July 2019, PPL Electric upgraded its Distribution Management System ("DMS") to an ADMS and developed a Distribution Energy Resource Management System

[17] *Id.* at 9-10 (emphasis added) (footnote omitted).

("DERMS") to gather DER data, provide DER system forecast capabilities, and provide DER management capabilities.

69. Additionally, the Company requested Commission approval of its First DER Management Plan on May 24, 2019, and received such approval on December 17, 2020. Since that time, PPL Electric has seen substantial increases in DER deployments in its service territory and fostered innovation and development of the DER market.

70. In addition, on September 17, 2020, the Federal Energy Regulatory Commission ("FERC") issued Order No. 2222 at Docket No. RM18-9-000, which "remove[d] barriers to the participation of distributed energy resource aggregations in the Regional Transmission (RTO) and Independent System Operator (ISO) markets (RTO/ISO markets)."[18] The ability for aggregated DERs on the distribution system to participate in the wholesale markets may bolster interconnections in the Company's service territory.[19]

71. In light of these financial incentives, legislative changes, policy initiatives, and Company efforts, PPL Electric continues to project a substantial rise in the number of DER interconnection applications in the future based upon historic trends of renewable interconnections throughout Pennsylvania, projected incentives to encourage installations to reduce carbon emissions, and the increasing affordability and efficiency of DER technology. As explained previously, there are several activities – some promulgated by the market, some by government

[18] *See Participation of Distributed Energy Res. Aggregations in Markets Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, 172 FERC ¶ 61,247 (Sept. 17, 2020) ("FERC Order No. 2222"), *on reh'g*, *Participation of Distributed Energy Res. Aggregations in Markets Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, 2021 FERC LEXIS 360 (Mar. 18, 2021) ("FERC Order No. 2222-A"), *on reh'g*, *Participation of Distributed Energy Res. Aggregations in Markets Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, 2021 FERC LEXIS 887 (June 17, 2021) ("FERC Order No. 2222-B").

[19] FERC Order No. 2222 also authorizes electric distribution utilities, such as PPL Electric, to "override RTO/ISO dispatch of a distributed energy resource aggregation in circumstances where such override is needed to maintain the reliable and safe operation of the distribution system." FERC Order No. 2222, 172 FERC ¶ 61,247, P310.

entities, and others by PPL Electric itself – to enhance and prepare for the future development of DERs within Pennsylvania. Efforts such as these demonstrate opportunities to increase DER installations within the Commonwealth.

72. The increased solar generation and other types of DERs on distribution systems will require careful and thoughtful planning by all EDCs.

73. Through the instant Petition, PPL Electric seeks to continue its proactive steps to integrate, monitor, and manage DERs on its distribution system for the benefit of its customers, the DER market, and the Commonwealth as a whole.

b. IEEE Standard 1547 and UL Standard 1741

74. The Second DER Management Plan, like the First DER Management Plan, builds upon the requirements and purposes of IEEE 1547-2018 and UL 1741 SB.

75. IEEE Standard 1547 is formally identified as "IEEE Standard for Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces." This standard outlines technical requirements concerning the interconnection and interoperability performance of DERs, including operation and testing, safety, maintenance, and security requirements. The standard also specifies that a DER must be equipped with additional grid support functions.

76. The original IEEE 1547-2003 established very basic DER interconnection requirements, which included:

- Prohibition of energization of an otherwise de-energized distribution circuit.
- Disconnection of the DER from the utility system for distribution system faults and other voltage and frequency deviations.
- Prohibition on causation of voltages on the distribution system outside of accepted bounds.

- Limitation of harmonic current distortion.

- Detection and cessation of energization of a disconnected distribution feeder (island detection).

77. The significantly revised IEEE 1547-2018 retained these basic requirements with some changes, but introduced many additional requirements including:

- Minimum reactive power injection and absorption capability. The intent is that this reactive power capability can be deployed to help regulate the distribution system voltage, particularly to mitigate voltage impacts caused by the DER. The prohibition by the original IEEE 1547-2003 of DER regulation of voltage was interpreted by many that a DER should only operate at unity power factor (no reactive power). Consequently, many inverter-based DERs were previously not designed to have any reactive power capability.

- Capability to control the reactive power according to several different defined functions including the "volt-var" function where reactive power is varied as a function of the measured local voltage. This is effectively a voltage regulation function. The original IEEE 1547-2003 strictly prohibited DERs from performing any voltage regulation.

- Ability to ride through (i.e., not trip offline) for voltage and frequency disturbances of specified severities for specified durations. These ride-through characteristics were coordinated with the expected severity and durations of bulk transmission faults and frequency disturbances, such that DER do not trip offline as a result of bulk transmission disturbances. Consequential tripping of DER for such disturbances poses the distinct possibility of substantially aggravating the severity of large-scale system disturbances, posing a threat to power grid security and reliability. IEEE 1547-2018 retains the requirement for DER to trip offline, similar to previous requirements in IEEE 1547-2003, but with adjustment of parameters to better coordinate with bulk system security needs.

- Limitations on the allowable power quality impact of DERs, specifically regarding lamp flicker (repetitive voltage variations) and rapid voltage change (isolated abrupt changes in voltage). Limitations on harmonic distortion in IEEE 1547-2018 are similar to the previous requirements with some adjustments of parameters.

- Automatic variation of active (real, or kW) power with grid frequency. This is the functionality of the speed governor of a rotating generator DER and is applied to all DERs, including inverter-based DERs. The intent is to provide support to grid frequency regulation by increasing

DER power output when the frequency of the grid drops below the 60 Hz nominal value, and decreasing power output when the frequency rises above nominal. With the growth of inverter-based generation, at both the distribution and transmission levels, and the concurrent retirement of conventional generating plants, the mechanical inertia of the power grid will decrease. As a result, grid frequency will tend to vary more quickly as a result of changes in the balance between load demand and generation. This new requirement of IEEE 1547-2018 ensures that DERs provide commensurate contribution to grid frequency regulation and helps avoid excessive frequency variations that can lead to grid collapse and blackout.

- Capability for interoperability and information exchange with external entities, typically the interconnected utility, using a unified information model and standard communication protocols. This interoperability includes real-time measurements of DER parameters, such as active and reactive power output, terminal voltage, ability for the external entity to disable and enable DER operation and set power output limits, and change DER parameters (e.g., voltage regulation setpoints), in real time. This requirement for interoperable capability applies to all DERs, regardless of whether the host utility or any other entity provides the communication medium to the DER point of connection at the time of original DER installation. The intent of this requirement is to allow DER operation to be properly coordinated with the operation and security of the distribution system and power system at large in the future, if not immediately, as the complexity of the DER-penetrated grid increases.

78. Other changes made in the 2018 version that are not specifically new capability requirements include:

- Interconnection and performance of microgrids when connected to the distribution system is defined.

- Large utility-scale DER facilities (e.g., solar farms connected to distribution systems) are distinguished from smaller behind-the-meter DER installations with regard to the point where requirements are applied.

- Test and conformance evaluation requirements are made dependent on where the standard requires the performance requirements to apply and whether the DER unit is a pre-tested device or a bespoke assemblage of components.

79. The above requirements comprise substantial, if not revolutionary, changes to DER capabilities that have been deemed necessary to accommodate the rapid increase of DER penetration, coordinate with modern digitized power grids, and leverage the capabilities of advancing technology to provide necessary grid-supporting services.

80. In addition to the IEEE 1547-2018 standard, which governs the technical requirements for DERs, UL Standard 1741 also applies to DERs and governs the physical testing procedures that manufacturers must perform to certify that a DER inverter meets IEEE 1547-2018.

81. The underlying vision put forth in IEEE 1547-2018 is that DERs provide grid support and minimize their own adverse power system impacts in coordination with utility distribution system controls.

82. PPL Electric's Second DER Management Plan is a prudent step toward fulfillment of this vision by utilizing the advanced grid support features required of DERs by this standard in a flexible manner and with integration with distribution system controls to meet objectives of providing quality and reliable service to all electric consumers on the relevant circuits. Most significantly, the Plan integrates DERs into a cohesive and coordinated system management architecture by utilizing real-time management of DER grid-support function parameters and visibility of DER operations using the data interoperability requirements of the standard.

83. While IEEE 1547-2018 provides functions that can be applied with fixed parameters and thus perform autonomously, this is very sub-optimal in a modern automated distribution system that can be topologically reconfigured to address loading and reliability constraints and requires significant performance compromises.

84. A distribution circuit with substantial DERs connected will have a wide variety of operational situations over days and over seasons for which fixed DER parameters provide compromised performance.

85. Also, modern distribution systems are designed to be self-healing by performing reconfiguration of the distribution system topology in response to faults and outages. DER management parameters that are appropriate for the normal system configuration can be counterproductive in an alternate system configuration. Dynamic adjustment of parameters, as will be made possible by the Second DER Management Plan, allows more complete implementation of the potential benefits afforded by the Standard's DER functionality requirements.

86. As for UL 1741 SB, the first edition of UL 1741 was published in May 1999. Prior to November 2005, the title of UL 1741 was "Standard for Inverters, Converters, and Controllers for Use in Independent Power Systems."

87. The Second Edition of UL 1741 was published in January 2010 and the most recent, Third Edition, was published on September 28, 2021. UL Standards & Engagement ("ULSE") encourages comments and proposals for revisions at any time to be submitted via the Collaborative Standards Development System ("CSDS"). Based on these proposals, changes were made to the Third Edition on October 19, 2022, and April 12, 2023.

88. The requirements for UL 1741 Supplement SB, "Grid Support Utility-Interactive Inverters and Converters Based upon IEEE 1547-2018 and IEEE 1547.1-2020," directly reference IEEE 1547-2018, "IEEE Standard for Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces," and the associated conformance standard, IEEE 1547.1-2020, "IEEE Standard Conformance Test Procedures for Equipment

Interconnecting Distributed Energy Resources with Electric Power Systems and Associated Interfaces," as Source Requirement Documents ("SRDs") for UL 1741 SB certification testing.[20]

89. The development and revision of UL 1741, like all UL safety standards, is performed in accordance with the American National Standards Institute ("ANSI") Essential Requirements,[21] approved in "ULSE ANSI Accredited Procedures"[22]. UL 1741 was updated after the publication of IEEE 1547.1-2020 to include Supplement SB using a consensus-based process within a Standards Technical Panel ("STP")[23] composed of a diverse set of technical experts representing different interests. Voting members of the STP came from a balanced collection of individuals representing the following interest categories: Producer, Testing and Standards Organizations, Supply Chain, AHJ/Regulator, Government, Consumer, General Interest, and Commercial/Industrial Users.

90. The purpose of UL 1741 is to clearly define the purpose, process, requirements, and criteria to certify inverters, converters, controllers, and Interconnection System Equipment ("ISE") to consensus-based safety, functional, and interconnection requirements from multiple SRDs. To this end, the purpose of UL 1741 SB is to provide a certification standard for the conformance test procedures in IEEE 1547.1-2020, so products can be listed to the requirements in IEEE 1547-2018. This creates an essential, traceable link between the widely adopted IEEE 1547-2018 interconnection standard and products that can be interconnected in that jurisdiction.

[20] UL 1741 SB1.1.

[21] American National Standards Institute (ANSI), ANSI Essential Requirements, Jan 2024, *available at* https://www.ansi.org/american-national-standards/ans-introduction/essential-requirements.

[22] ULSE ANSI Accredited Procedures - Approved by ANSI on March 15, 2023, *available at* https://ulse.org/data-insights/ulse-ansi-accredited-procedures.

[23] As of 2022, UL STPs are now called Technical Committees ("TCs").

Only products that have been listed to UL 1741 SB by a Nationally Recognized Testing Laboratory ("NRTL") should be considered compliant with IEEE 1547-2018.

91. UL 1741 SB requires that all listed DER equipment include grid support interactive electrical modes and a local communication interface. Depending on the categorization of the equipment, UL 1741 SB will require dozens of tests to validate compliance to the conformance standard. Example tests include validation of Voltage Trip and Voltage Ride-Through, Voltage Disturbances in Continuous Region, Frequency Trip and Frequency Ride-Through, Voltage Phase-Angle Change Ride-Through, Enter Service, Limit Active Power, Constant Power Factor Mode, Voltage-Reactive Power Mode, Active Power-Reactive Power Mode, Constant Reactive Power Mode, Voltage-Active Power Mode, and Frequency-Droop Capability. Additionally, a standardized local communication interface is required which uses the SunSpec Modbus, IEEE 1815, or IEEE 2030.5 protocol. These interfaces are validated using four types of tests: Nameplate Data Test, Configuration Information Test, Monitoring Information Test, and Management Information Test. The three standardized communication protocols are further defined in the associated information models provided by the SunSpec Alliance and IEEE.

92. PPL Electric started requiring UL 1741 SB listings for all newly installed DER equipment on January 1, 2023. After that time, PPL Electric could then rely on the equipment having standardized communication interfaces and incorporate their mandatory grid support interactive functionality defined in IEEE 1547-2018 into its First DER Management Plan. This provided PPL Electric the ability to remotely adjust voltage regulation modes, active power capabilities, and adjustable protection functions to minimize voltage violations, improve system restoration, better visualize power flows, and defer capital costs associated with system upgrades.

93. Going forward, the Second DER Management Plan will similarly capitalize on these capabilities made possible by IEEE 1547-2018 and UL 1741 SB.

2. The Second DER Management Plan Will Produce Significant, Cost-Effective Benefits

94. The Second DER Management Plan will provide several substantial benefits to customers, the Company, and the Commonwealth by improving the safety, quality, efficiency, stability, and reliability of the Company's operations and service while facilitating the increased deployment of DERs through the Company's service territory.

95. As noted previously and in the Company's direct testimony and exhibits, the Second DER Management Plan will:

a. Facilitate and encourage the increased deployment of DERs in its service territory by reducing interconnection costs for customers installing DERs and increasing hosting capacity on distribution circuits;

b. Improve the safety, reliability, adequacy, and resiliency of its distribution service by gaining visibility into the DERs' impacts on distribution system and actively leveraging the grid support functions of the DERs' smart inverters;

c. Improve distribution system operation and planning by eliminating "hidden load" at DER points of interconnection; and

d. Reduce the Company's capital costs and operation and maintenance expenses that are passed onto ratepayers by, among other things, remotely managing the DERs' voltage support functions to mitigate voltage violations on distribution circuits, which decreases the number of truck rolls that would otherwise be needed to address voltage violations manually.

96. Indeed, through the Pilot Program, PPL Electric has seen significant, cost-effective benefits from monitoring and actively managing DERs. Based on the data gathered through Program Year 2, PPL Electric's Pilot Program has reduced the Company's operation and

maintenance expenses by approximately $15.33 million and the Company's capital expenditures by approximately $6.60 million.[24]

97. When compared to the $128,000 of operation and maintenance expenses and $6.38 million of capital costs that the Pilot Program has cost as of the end of Program Year 2, the Pilot Program has produced substantial benefits compared to its costs.

98. Therefore, the Pilot Program has improved the reliability, resiliency, safety, and performance of the distribution system, increased DER hosting capacity, mitigated the impact of DERs on the distribution system, and facilitated the interconnection of more DERs, all the while reducing the Company's capital costs and expenses that would be passed on to customers and without materially affecting the generation of participating DERs.[25]

99. In addition, by increasing the hosting capacity of the distribution circuits, enabling the safe and reliable interconnection of more DERs, and reducing the number of truck rolls needed to resolve voltage violations, PPL Electric's Second DER Management Plan will help to combat climate change by enabling renewable energy and reducing greenhouse gas emissions.

100. Furthermore, PPL Electric's continued learning and adaptations have allowed additional program savings related to the overall cost of the DER Management device installation and provisioning.

101. Thus, as shown above, the Second DER Management Plan will build upon the Pilot Program's successes and is designed to produce several substantial benefits for customers, the DER market, the Company, and the Commonwealth.

---

[24] The DER Pilot has increased hosting capacity by an estimated 29 MW. If that additional 29 MW were fully utilized as of March 21, 2024, it would have produced additional generation and reduced distribution and transmission losses valued at approximately $4.57 million.

[25] *See* note 4, *supra*.

3. Denial of the Instant Petition Would Adversely Affect PPL Electric, the Company's Distribution System, PPL Electric's Customers, and the Commonwealth

102. As noted previously, the Second DER Management Plan will produce substantial, cost-effective benefits for customers, the Company, and the Commonwealth.

103. Conversely, the Commission's denial of this Petition will adversely affect PPL Electric, the Company's distribution system, PPL Electric's customers, and the Commonwealth.

104. By denying the instant Petition, all of the benefits produced by the First DER Management Plan, including reduced capital costs and operation and maintenance expenses, increased hosting capacity for DERs on distribution circuits, and reduced interconnection costs for DER applicants, would be lost.

105. Those lost benefits would put upward pressure on PPL Electric's distribution rates and increase the costs for DER applicants to interconnect their DERs with the distribution system. Therefore, such an outcome would harm customers with and without DERs in the Company's service territory and potentially discourage DER development.

106. In addition, denial of the Petition would negatively impact PPL Electric's distribution system and, by extension, its ability to provide safe, reliable, adequate, affordable, and reasonable service as required by Section 1501 of the Public Utility Code.

107. As set forth in the Company's direct testimony, PPL Electric currently experiences voltage issues and two-way power flows on its distribution system due to the current level of DER interconnections.

108. Such interconnections are only projected to increase, which will compound those issues.

109. PPL Electric's First DER Management Plan has been successful in limiting the impact and resolving many of those issues.

110. However, the Commission's denial of this Petition will exacerbate those issues and prevent the Company and its customers from fully realizing the benefits of DERs on the grid. For example, PPL Electric would lose the ability to use the actively managed DERs to help mitigate the duration and frequency of voltage violations on its distribution system, which would negatively affect the adequacy of the Company's service (*e.g.*, voltage) and increase the Company's operation and maintenance expenses to manually respond to voltage violations by rolling trucks to the violations' locations. The Company also would not be able to increase distribution circuits' hosting capacity, thereby leading to interconnection applicants having to pay for distribution system upgrades and potentially discouraging DER development.

111. In addition, PPL Electric would lose the capability to use smart inverters' Remote On/Off function to shut off DERs that fail to shut off on their own when there is an emergency, potentially placing Company personnel, first responders, and the public at risk.

112. Lastly, as explained in PPL Electric's direct testimony, distribution utilities need to get ahead of the challenges presented by DERs on their distribution systems before too many DERs without monitoring and management capabilities are deployed. If the Commission were to deny PPL Electric's Petition, the Company would be prevented from proactively tackling the issues presented by DERs and, instead, forced to invest in costly distribution system upgrades to resolve those issues.

C. THE COMPANY'S PROPOSED TARIFF MODIFICATIONS AND COMMISSION AUTHORIZATIONS ARE REASONABLE AND IN THE PUBLIC INTEREST AND SHOULD BE APPROVED

1. Proposed Tariff Modifications

113. Attached to Mr. Salim Salet's direct testimony as PPL Electric Exhibit SS-2 is the Company's *pro forma* tariff supplement modifying Rule 12 of the Company's tariff, which sets forth rules and requirements related to the Second DER Management Plan.

114. The modified Rule 12 provides customer application details and technical DER equipment standards under the Second DER Management Plan.

115. Specifically, these tariff pages provide details about the device requirements, including smart inverters, DER Management devices, and DER monitoring and management.

116. PPL Electric respectfully requests Commission approval of the tariff modifications set forth in the *pro forma* tariff supplement attached to Mr. Salim Salet's direct testimony as PPL Electric Exhibit SS-2 to become effective on one day's notice of a Commission order approving such tariff modifications.

117. As noted previously, these tariff modifications are necessary to implement the Second DER Management Plan.

118. Given the substantial benefits of the DER Management Plan,[26] the proposed tariff modifications are in the public interest and should be approved.

2. Proposed Authorization Under Section 75.13(k) Of The Commission's Regulations

119. Section 75.13(k) states, in pertinent part, that "[t]he EDC and DSP may not require additional equipment or insurance or impose any other requirement unless the additional equipment, insurance or other requirement is specifically authorized under this chapter or by order of the Commission." 52 Pa. Code § 75.13(k).

120. Here, Company will require customer-generators to install additional equipment (*i.e.*, the DER management device) and impose additional requirements (*e.g.*, that the customer-generator allow PPL Electric to monitor and manage the DER and that the DER utilize a

[26] *See* Section III.B, *supra*.

standardized, non-proprietary communications protocol specified by the utility) that are not specifically authorized under Chapter 75 or a Commission order.

121. Therefore, PPL Electric is requesting Commission authorization pursuant to Section 75.13(k), which is necessary to implement the DER Management Plan.

122. Finally, the Company respectfully requests that the Commission grant any additional approvals or authorizations it deems are necessary to implement the Second DER Management Plan.

IV. NOTICE

123. PPL Electric has served copies of the filing on the Office of Consumer Advocate, Office of Small Business Advocate, the Commission's Bureau of Investigation and Enforcement, and all parties and commenters from the First DER Management Plan proceeding, as evidenced by the Certificate of Service.

124. Also, the Company confirms that it is serving a copy of the filing on Tesla, Inc. ("Tesla"), Sun Directed, American Home Contractors ("AHC"), Sunrun, Inc. ("Sunrun"), and the Solar Energy Industries Association ("SEIA") (collectively, the "Joint Solar Parties"), as evidenced by the Certificate of Service.

125. This filing also will be posted on PPL Electric's website at www.pplelectric.com.

126. The Company also requests that the Commission publish notice of this filing in the *Pennsylvania Bulletin* and that a reasonable deadline for intervention be set as part of that notice.

127. PPL Electric believes that these various communications initiatives will provide all interested parties with full notice of the Company's proposed Second DER Management Plan and an opportunity to participate in any Commission proceeding about this Petition.

128. However, if the Commission concludes that additional notice would be appropriate, the Company will provide such additional notice as the Commission may direct.

V. REQUEST FOR COMMISSION APPROVAL IN SUFFICIENT TIME BEFORE PILOT PROGRAM EXPIRES

129. Under the Settlement in the First DER Management Plan proceeding, PPL Electric's current Pilot Program is set to terminate on March 21, 2025.

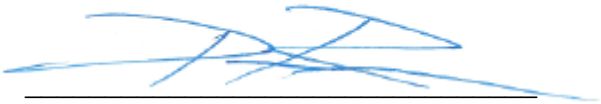
130. As such, PPL Electric respectfully requests that a litigation schedule be established that facilitates Commission review and approval of this Petition in sufficient time before that date, so that the Company can implement the Second DER Management Plan.

131. Thus, PPL Electric submits that the Commission should render its Final Order on this Petition no later than its public meeting scheduled for February 20, 2025.

VI. CONCLUSION

WHEREFORE, PPL Electric Utilities Corporation respectfully requests that the Pennsylvania Public Utility Commission approve the Company's Second DER Management Plan, the Company's proposed tariff modifications, and related authorizations and grant any other approvals or authorizations that are necessary to implement PPL Electric's Second DER Management Plan.

Respectfully submitted,



Kimberly A. Klock (ID # 89716)
Michael J. Shafer (ID # 205681)

Attorneys for PPL Electric Utilities Corporation

VERIFICATION

I, SALIM SALET, being the Vice President of Transmission, Distribution & Substation Engineering & Construction at PPL Services Corporation, hereby state that the facts above set forth are true and correct to the best of my knowledge, information and belief and that I expect PPL Electric Utilities Corporation to be able to prove the same at a hearing held in this matter. I understand that the statements herein are made subject to the penalties of 18 Pa.C.S. § 4904 relating to unsworn falsification to authorities.

Date: 05/20/2024

Petition of PPL Electric Utilities Corporation	:	
for Approval of its Second Distributed Energy	:	Docket No. P-2024-_____
Resources Management Plan	:	

DIRECT TESTIMONY OF
SALIM SALET

PPL Electric Statement No. 1

May 20, 2024

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Salim Salet, and my business address is 827 Hausman Rd. Allentown, PA 18104.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by PPL Services Corporation as Vice President – TD&S Engineering & Construction.

Q. WHAT ARE YOUR DUTIES AS VICE PRESIDENT – TD&S ENGINEERING & CONSTRUCTION?

A. As the Vice President of Transmission, Distribution, & Substation Engineering & Construction, I oversee the enterprise-wide organization responsible for completing the engineering and construction of all transmission, distribution, and substation projects, creating and maintaining design and construction standards, and identifying emerging technologies that will help PPL Corporation's operating utility subsidiaries, including PPL Electric Utilities Corporation ("PPL Electric" or the "Company"), improve the services provided to customers.

Q. WOULD YOU PLEASE DESCRIBE PPL ELECTRIC?

A. PPL Electric is a corporation organized and existing under the laws of the Commonwealth of Pennsylvania. PPL Electric is a wholly-owned direct subsidiary of PPL Corporation. I have been advised by counsel that PPL Electric is a "public utility," an "electric distribution

company" and a "default service provider" as defined in Sections 102 and 2803 of the Public Utility Code, 66 Pa. C.S. §§ 102, 2803.

Q. WHAT IS YOUR EDUCATIONAL BACKGROUND?

A. I received a B.S. degree in Electrical Engineering from Pennsylvania State University in May 2006, and master's degree in business administration from the University of Saint Leo in December 2017. I am also a licensed Professional Engineer in the Commonwealth of Pennsylvania since October 2010.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.

A. I have been employed by PPL Electric since I graduated from Penn State in May of 2006. During my 13-year career in the energy industry, I have held multiple positions and gained valuable experience in various functions of the industry. Below is the list of these positions:

- May 2006 – December 2009 – Substations Engineer – I was responsible for developing scope, schedule, cost estimates, physical electrical design, and relay and control protections design for various grid upgrade and enhancement projects on the distribution and transmission grid.
- December 2009 – April 2012 – Support Engineer – I was responsible for designing and programming control systems for PPL Electric's smart grid automation system.
- April 2012 – June 2014 – Supervising Engineer – I led a group of engineers and technicians responsible for designing and maintaining PPL Electric's distribution and transmission substation control systems.

- June 2014 – July 2015 and May 2016 – April 2017 – Manager, Relay Engineering – I led a group of 45 engineers and technicians on multiple distribution and transmission grid upgrade projects. The projects included upgrades to PPL Electric's distribution and transmission management system.
- July 2015 – May 2016 – Manager, Distribution Engineering – I led a group of 30 engineers and technicians on multiple distribution design, standards, and protection projects. The group was responsible for developing and maintaining distribution standards, designing large distribution system upgrade projects, designing underground systems upgrades, and designing protection schemes for all distribution projects.
- April 2017 – March 2019 – Director, Distribution Engineering – I led a group of 125 engineers and technicians with the responsibility to develop short and long-term strategy for PPL Electric's distribution system. Some of the group's responsibilities included: (1) prioritizing investments in the distribution grid to overcome current and future challenges with a total annual budget of approximately $300 million; and (2) leveraging new technologies to improve the operation and quality of the services provided by PPL Electric.
- March 2019 – April 2021 – Director of Operations – I led a group of about 120 operators, linemen, and engineers. The group was responsible for overseeing the 24/7 operation of the distribution grid in Pennsylvania, which included storms and emergent work. My duties included building a Distributed Energy Resources ("DER") strategy that supports the rapid changes of the grid.

- April 2021 – March 2024 – Vice President of Distribution Operations – I led an organization of over 1,000 employees responsible for the operation of the distribution grid in Pennsylvania. This group's responsibilities included the day-to-day operations, future planning of the grid, maintenance strategy, storm management, budget management, and asset management.
- March 2024 – present – Vice President of Transmission, Distribution, & Substation Engineering & Construction – My job responsibilities are listed above.

Q. HAVE YOU PREVIOUSLY TESTIFIED AS A WITNESS BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION ("COMMISSION")?

A. Yes, I testified in support of PPL Electric's DER Management Plan at Docket No. P-2019-3010128.

Q. WOULD YOU PLEASE DESCRIBE THE SUBJECT MATTER OF YOUR TESTIMONY?

A. My testimony will: (1) provide an overview of other witnesses' direct testimony; (2) provide an overview and history of the Company's First DER Management Plan, which governs the interconnection and operation of new DERs deployed in the Company's service territory; (3) provide an overview of the Company's proposal to implement its Second DER Management Plan; (4) describe the Company's requested tariff modifications; (5) outline the Commission approvals that the Company is requesting; and (6) explain how the Second DER Management Plan will leverage the Company's investments, existing technologies, and innovation.

Q. ARE YOU SPONSORING ANY EXHIBITS WITH YOUR TESTIMONY?

A. Yes, I am sponsoring the following exhibit:

- PPL Electric Exhibit SS-1 – PPL Electric's Second DER Management Plan; and
- PPL Electric Exhibit SS-2 – PPL Electric's *pro forma* tariff supplement modifying PPL Electric's "Rule 12 – Distributed Energy Resource (DER) Interconnection Service."

A. OVERVIEW OF OTHER WITNESSES' DIRECT TESTIMONY

Q. WOULD YOU PLEASE PROVIDE AN OVERVIEW OF THE OTHER WITNESSES WHO ARE SUBMITTING DIRECT TESTIMONY ON BEHALF OF PPL ELECTRIC IN THIS PROCEEDING?

A. Below is a list of the other witnesses and the subject matters of their direct testimony:

- PPL Electric Statement No. 2, Direct Testimony of Aliesha Dombrowski-Diamond. In her testimony, Ms. Dombrowski-Diamond: (1) provides an overview of the technologies that facilitate PPL Electric's management of DERs; (2) provides an overview of the Company's DER management devices; (3) describes the Company's field operations and experiences installing DER management devices; (4) outlines the smart inverter testing and certification process; and (5) addresses the Company's capability to adapt to future changes in DER systems and inverter technology.
- PPL Electric Statement No. 3, Direct Testimony of Cody M. Davis. Mr. Davis provides: (1) an overview of the DER Management pilot program ("Pilot Program"); (2) details about the use cases listed in the Second Revised Pilot Implementation Plan

that have been analyzed during the course of the Pilot Program; and (3) details about other use cases that the Company has analyzed during the Pilot Program.

- PPL Electric Statement No. 4, Direct Testimony of Reigh A. Walling. In his direct testimony, Mr. Walling addresses: (1) the development of the 2018 revisions to the Institute of Electrical and Electronics Engineers ("IEEE") Standard 1547, "Standard for Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces" ("IEEE 1547-2018"), along with the standard's purpose and requirements; (2) the operational challenges created by DER on an electric distribution system; (3) the operational benefits of utility monitoring and management of DERs; and (4) the potential future consequences of integration of DERs without adequate utility visibility and management.
- PPL Electric Statement No. 5, Direct Testimony of Jay Johnson. Mr. Johnson addresses the development of Supplement B to Underwriters Laboratories ("UL") Standard 1741, "Inverters, Converters and Controllers for use in Independent Power Systems" ("UL 1741 SB") and how the Second DER Management Plan builds upon the standard's purpose and requirements for smart inverters.
- PPL Electric Statement No. 6, Direct Testimony of Dr. Elizabeth Cook. In her direct testimony, Dr. Cook provides an overview of the status of solar development in Pennsylvania, electric utilities' experiences with DERs in Pennsylvania and other states, and electric utilities' pursuit of grid modernization.
- PPL Electric Statement No. 7, Direct Testimony of Lee Krevat. Mr. Krevat addresses: (1) how utility monitoring and management of DERs can help encourage and facilitate renewable energy development and combat climate change; and (2) the opportune

timing of PPL Electric's First DER Management Plan and its Second DER Management Plan, which will help (a) get ahead of the issues that DERs without utility monitoring and management can cause on the distribution system, such as those seen in other states, where DERs without utility monitoring and management have caused problems on the distribution system that can only be remedied through costly system upgrades, and (b) leverage the opportunities presented by monitored and managed DERs, thereby providing additional benefits to customer-generators and non-customer-generators alike.

- PPL Electric Statement No. 8, Direct Testimony of Dr. Karen Miu. In her direct testimony, Dr. Miu addresses the need for the Company to continue monitoring and managing DERs under its Second DER Management Plan, including: (1) the issues PPL Electric previously experienced on its distribution system from the deployment of DERs due to the Company's inability to monitor and manage those systems; and (2) the distribution system's more recent performance now that the Company does monitor and manage DERs on its system.
- PPL Electric Statement No. 9, Direct Testimony of Kevin Underwood. Mr. Underwood addresses the cybersecurity architecture related to the Company's proposal under its Second DER Management Plan.

B. OVERVIEW AND HISTORY OF THE FIRST DER MANAGEMENT PLAN

Q. COULD YOU PLEASE PROVIDE SOME BACKGROUND ON THE COMPANY'S FIRST DER MANAGEMENT PLAN?

A. Yes. On May 24, 2019, PPL Electric filed a Petition seeking Commission approval of tariff modifications and waivers of regulations necessary to implement its First DER Management Plan. The Plan would govern the interconnection and operation of new DERs deployed in the Company's service territory. Under the First DER Management Plan, PPL Electric would be able to monitor and manage the DERs interconnected with its distribution system.

Specifically, through the Petition, PPL Electric requested to proactively implement IEEE 1547-2018 and the then-forthcoming revisions to UL 1741. Under the Company's proposal, customers applying to interconnect new DERs with PPL Electric's distribution system would be required to: (1) use Company-approved smart inverters that are compliant with IEEE 1547-2018 and the then-forthcoming UL 1741 revisions (or until that standard is finalized, UL 1741 Supplement A ("UL 1741 SA"); and (2) install DER Management devices that enable PPL Electric to monitor and proactively manage DERs.

Q. WHY DID THE COMPANY FILE THE PETITION TO IMPLEMENT ITS FIRST DER MANAGEMENT PLAN?

A. The electric transmission and distribution systems in Pennsylvania and the United States continue to undergo significant changes. In particular, the increasing deployment and use

of DERs, such as solar panels and batteries, have upended the traditional electric grid[1] model of large-scale generation located at significant distances from customers. By allowing customers to both consume and produce electricity at what were traditionally points of delivery (*i.e.*, at the distribution system's "edge"), DERs force the electric distribution system to perform in a way for which it was not originally designed and, as a result, place an increasing stress on the grid. Critically, while the deployment of DERs in Pennsylvania continues to increase, the Company still must provide reasonable, safe, and reliable electric service to all of its customers, including those who have not installed DERs.

Transmission operators, such as PJM Interconnection LLC ("PJM"), manage the transmission grid by maintaining a balance between demand and generation through monitoring and managing generation assets near instantaneously. Traditionally, distribution operators did not have to worry about balancing demand and generation because the distribution grid had very little generation connected to it. However, as the penetration level of DERs increased, the classic model of distribution systems was not well-equipped to handle the simultaneous balancing of demand and generation on the distribution system. Therefore, as distribution systems have become increasingly similar to transmission, *i.e.*, a mix of demand and generation, the need to balance generation and demand becomes vitally important. Such balancing cannot be accomplished without the ability to monitor and manage generation assets on the grid.

[1] The terms "grid," "electric grid," or "power grid," as used in this Petition, mean an interconnected network for delivering electricity from producers to consumers. The network includes both the transmission system and distribution system.

At the time PPL Electric filed its Petition on May 24, 2019, the Company lacked the ability to readily monitor and manage the DERs interconnected with its distribution system. As more DERs continued to be interconnected with the Company's distribution system, PPL Electric concluded it would have to balance demand and generation simultaneously, as mentioned above, and would increasingly experience issues on its distribution system without any way to monitor and manage those resources.

Indeed, solar and other intermittent resources can negatively affect the voltage on the electric distribution system, resulting in delayed interconnection or the need for potentially costly distribution system reinforcements before additional DERs can be installed. Without the ability to directly communicate with and manage customer DERs to leverage grid support functionality, the amount of intermittent generation that can be interconnected on the distribution circuits must be limited to maintain system stability and reliability. Moreover, without such ability to monitor and manage the DERs, the reliability, safety, and efficiency of electric service would be placed at increased risk with each new DER that is interconnected to the distribution system. Thus, PPL Electric filed its First DER Management Petition to address the changing dynamics within the electric utility industry and to better integrate and manage the increased deployment of DERs in its service territory.

Q. DID PPL ELECTRIC SERVE COPIES OF ITS PETITION FOR APPROVAL OF THE FIRST DER MANAGEMENT PLAN ON OTHER PARTIES?

A. Yes. The Company initially served the First DER Management Petition on the Commission's Bureau of Investigation and Enforcement, the Office of Consumer

Advocate ("OCA"), and the Office of Small Business Advocate. Notice of the First DER Management Petition also was published in the *Pennsylvania Bulletin* on July 20, 2019, and established a deadline for protests and comments of July 30, 2019. PPL Electric also served several solar entities, as directed by the Commission's July 10, 2019 Secretarial Letter.

Q. DID ANY PARTIES PARTICIPATE IN THE FIRST DER MANAGEMENT PETITION PROCEEDING?

A. Yes. Comments were filed by Trinity Solar, the Sustainable Energy Fund ("SEF"), GridLab, the Solar Unified Network of Western Pennsylvania ("SUNWPA"), Energy Independent Solutions, LLC ("EIS"), the Interstate Renewable Energy Council, Inc. ("IREC"), the Pennsylvania Solar Energy Industries Association ("PASEIA"), and Exact Solar. In addition, Natural Resources Defense Council ("NRDC"), Sunrun, Inc. ("Sunrun"), and SEF intervened in the proceeding. The OCA also actively participated in the case.

Q. WAS THE FIRST DER MANAGEMENT PETITION APPROVED BY THE COMMISSION?

A. Yes. On December 17, 2020, the Commission entered an Order approving the First DER Management Petition, as modified by the terms and conditions of the Joint Petition for Settlement of All Issues ("DER Settlement" or "Settlement") that was filed by PPL Electric, OCA, NRDC, and SEF. I note that the remaining party, Sunrun, stated that it would not file an objection to the Settlement.

Q. COULD YOU PLEASE PROVIDE AN OVERVIEW OF THE DER SETTLEMENT?

A. The DER Settlement set forth, among other things: (1) requirements for the use of smart inverters in PPL Electric's service territory effective January 1, 2021; (2) the terms and conditions for PPL Electric's Pilot Program, including the submission of a detailed Pilot Implementation Plan; (3) a provision addressing cost recovery of PPL Electric's DER Management devices; (4) a provision concerning the Company's agreement to participate in any statewide proceeding initiated by the Commission that focuses on smart inverters, DER management devices, IEEE 1547-2018, IEEE 1547.1, and/or UL 1741; (5) several reporting requirements, including annual reports to the Commission and to customers participating in the Pilot Program; (6) the Company's compliance tariff supplement; (7) an exemption for electric vehicles ("EVs") from the Pilot Program; and (8) a provision addressing certain data on program performance to be sent to SEF.

Q. PLEASE EXPLAIN THE REQUIREMENTS FOR THE USE OF SMART INVERTERS IN PPL ELECTRIC'S SERVICE TERRITORY UNDER THE DER SETTLEMENT.

A. Effective January 1, 2021, new DERs interconnecting with the Company's distribution system were required to have smart inverters installed that meet: (1) UL 1741 SA; and (2) the Company's testing for the communications requirements under IEEE 1547-2018. These requirements are known as the "Interim Requirements." The Interim Requirements were used by PPL Electric until January 1, 2023, at which point, the Company transitioned

to requiring new DERs to have smart inverters installed that meet IEEE 1547-2018 and have been certified with IEEE 1547.1 / UL 1741 SB.

Q. PLEASE DESCRIBE THE PILOT PROGRAM'S REQUIREMENTS UNDER THE DER SETTLEMENT.

A. The Pilot Program was designed to test and evaluate: (1) the costs and benefits to distribution system operation and design of monitoring DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means (e.g., automated meter reading equipment, ADMS systems, modeling); and (2) the costs and benefits to distribution system operation of active management of DERs as compared to the benefits available through the use of inverter autonomous grid support functions. The Pilot Program began on January 1, 2021, and will end three years after the second control group is established (*i.e.*, by March 21, 2025). The three years after the second control group is established are referred to as Program Year 1, Program Year 2, and Program Year 3.

During the Pilot Program, the Company is authorized to purchase and install DER Management devices on all new DERs with inverters up to an annual limit of 3,000 DER Management devices. DERs installed above the annual limit are not part of the Pilot Program. All DER Management devices are owned, operated, and maintained by the Company at no direct cost to interconnecting customers. Moreover, the annual cap on the number of DER Management devices is not an annual cap on the number of new DERs that can be interconnected with the Company's distribution system.

In addition, under the Pilot Program, two control groups have been established. The first group consists of any DERs connected during the Pilot Program to the first 75 circuits for which interconnection applications were received by the Company on or after January 1, 2021. The second group consists of the first 1,000 new DERs installed in the Company's service territory on or after January 1, 2021. DERs connected during the Pilot Program in the first group were counted toward 1,000 DERs in the second group. Even after the second group comprised 1,000 DERs, DERs interconnected to the first 75 circuits were added to the first group. For both control groups, DER inverters operate under autonomous settings only. While the Company may monitor DER operations in the control group by collecting data through the DER Management devices, the Company cannot make operational decisions regarding the distribution system, such as distribution system planning, based on that information. For DERs that are not part of the control groups, the Company is permitted to actively manage the grid support functions of DER inverters using the DER Management devices and the Company's DERMS and can make operational decisions based on DER operational information obtained through the DER Management devices.

As for the smart inverters' functionalities, Volt/VAR is used as the default voltage management mode for all inverters for all new DERs interconnected with the Company's distribution system after January 1, 2021. The Company established default Volt/VAR settings and default settings for voltage ride-through and frequency ride-through functions consistent with PJM Interconnection LLC's ("PJM") standards. Alternative voltage management modes and settings can be used to reduce or eliminate distribution system upgrade costs to interconnect customers with the customer's agreement. For DERs in the Actively Managed Group, the Company can only manage the following grid support

functions of the smart inverters: (1) Volt/VAR; (2) Constant Power Factor; (3) Remote On/Off; (4) Voltage Ride-through; (5) Frequency Ride-through; and (6) Volt/Watt. Volt/VAR shall be the default voltage management mode for all actively controlled inverters. Volt-Watt can only be enabled and managed with the consent of the interconnecting customer. Settings for voltage ride-through and frequency ride-through are maintained in accordance with PJM's standards. Also, PPL Electric will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or "islanded" from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage.

Furthermore, monitoring and/or management of DER inverters by the Company during the Pilot Program cannot be used to enable the Company to offer services in PJM wholesale markets. Monitoring and/or management of DER inverters by the Company during the Pilot Program to support distribution grid services beyond system safety and reliability (e.g., conservation voltage reduction) is only permitted after separate application by the Company and approval by the Commission. Monitoring and/or management of inverters by DER customers or third parties during the Pilot Program to offer services in PJM wholesale markets, or to offer distribution grid services that may be established during the Pilot Program, is permitted subject to any limitations caused by the Company's management of the inverters to manage distribution system safety and reliability as part of the Pilot Program.

Q. DID THE COMPANY SUBMIT AN IMPLEMENTATION PLAN FOR THE PILOT PROGRAM?

A. Yes. Under Paragraph 61 of the Settlement, the Company was required to submit a Pilot Implementation Plan, which set forth how the Company will implement and conduct the Pilot Program, including the goals of the Pilot Program, the use cases the Company plans to test and evaluate, the specific methods and approaches for testing each use case, the methods by which PPL Electric will communicate the Pilot Program's requirements to customers and DER installers, and any additional information PPL Electric believes is necessary to include in the annual reports that will be submitted to the Commission and customers participating in the Pilot Program. PPL Electric filed its initial Pilot Implementation Plan on January 19, 2021, its Revised Pilot Implementation Plan on March 1, 2021 (which incorporated feedback from parties' comments on the Pilot Implementation Plan), and its Second Revised Pilot Implementation Plan on February 28, 2023.

Q. PLEASE EXPLAIN THE SETTLEMENT'S PROVISION GOVERNING THE COST RECOVERY OF THE DER MANAGEMENT DEVICES.

A. Under Paragraph 64 of the Settlement, PPL Electric is authorized to make a claim in its next base rate case to recover the capital costs and expenses associated with the DER Management devices that the Company purchases, owns, installs, and maintains pursuant to the Settlement. In said base rate case, the other signatories to the Settlement can challenge the amount of the Company's claim, the prudency and reasonableness of the costs and expenses, and the manner in which those costs and expenses are recovered; provided, however, that those signatories will not argue that the Pilot Program for remote

monitoring and active management itself was imprudent or unreasonable, except to the extent that the Company retains discretion over the Pilot Implementation Plan.

Q. PLEASE DESCRIBE THE DER SETTLEMENT'S PROVISION ABOUT THE COMPANY'S AGREEMENT TO PARTICIPATE IN A STATEWIDE PROCEEDING.

A. The Company agreed to participate in any statewide proceeding initiated by the Commission that focuses on smart inverters, DER Management devices, IEEE 1547-2018, IEEE 1547.1, and/or UL 1741, and the Company would give due consideration to revise its default voltage management and ride-through modes and settings, as well as other DER management protocols, to help achieve greater statewide consistency.

Q. PLEASE EXPLAIN THE REPORTING REQUIREMENTS SET FORTH IN THE DER SETTLEMENT.

A. There are two sets of annual reports that are submitted under the Settlement. First, the Company submits annual reports to the Commission at Docket No. P-2019-3010128, The providing detail quantitative information germane to evaluation the results of the Pilot Program. The reports are publicly available and do not contain any identifying customer information. The annual reports are filed within 30 days following the end of each program year and include, but are not limited to, the following information: (1) the number of times and the locations at which the Company actively managed each grid support function and the average duration that the function was actively managed; (2) the grid benefits achieved in each instance of active management, including, but not limited to, real-time grid

constraint mitigation; (3) the amounts of net generation lost due to the Company's active management of grid support functions in each instance; (4) distribution system upgrades avoided due to increased hosting capacity attributed to monitoring; (5) distribution system upgrades avoided due to increased hosting capacity attributed to autonomous functioning; (6) distribution system upgrades avoided due to increased hosting capacity attributed to active management; (7) system operation comparisons of circuits under autonomous inverter operation versus active management; (8) operational descriptions of how active management was executed and implemented (e.g., day-ahead and real-time remote setting alterations [i.e., remotely dispatch autonomous Fixed Power Factor, Active Power Limit, Volt/Watt and Volt/VAR settings to multiple DERs]); and (9) performance measures related to active management, and where applicable monitoring, including, but not limited to, communication reliability (e.g., communication uptime) and data quality. Reports include data in electronic formats that support analysis (i.e., Excel or other machine-readable data where appropriate). Additionally, the annual report sets forth the number of DERs installed, the number of DER Management devices installed, and the capital costs and expenses associated with the purchase, installation, ownership, and maintenance of the DER Management devices.

Second, the Company sends individualized annual reports to each new DER customer whose smart inverter's grid support functions were used by the Company during the annual reporting period. The customer's annual report provides the following information for the annual reporting period: (a) the amount of the DER's net generation loss due to the use of the automated grid support functions; (b) the aggregate amount of the DER's net generation loss due to the Company's active management of the grid support

functions; (c) the method and technique used to calculate the DER's net generation loss; (d) the number of times each grid support function was used on an automated basis and the average duration of that function's automated use; and (e) the number of times that PPL Electric actively managed each grid support function and the average duration that the function was actively managed. Also, for the events where a Constant Power Factor was temporarily used to override an existing Volt/VAR curve, the customer's annual report shows the existing Volt/VAR curve, the Power Factor that was temporarily used, and the duration of the event. For the events where a new Volt/VAR curve was issued, the new curve is included in the report. The customer's annual report is sent to the customer within 30 days following the cash-out of the customer's banked excess generation, which typically occurs at the end of each PJM Planning Year.

Q. PLEASE DESCRIBE THE COMPLIANCE TARIFF SUPPLEMENT APPROVED AS PART OF THE DER SETTLEMENT.

A. Following the Commission's approval of the Settlement, PPL Electric was required to submit a compliance tariff supplement consistent with the *pro forma* tariff supplement attached to the Settlement as Appendix A. PPL Electric filed this compliance tariff supplement, which set forth Rule 12 of PPL Electric's Tariff, on December 23, 2020, and it became effective on January 1, 2021.

Q. PLEASE ADDRESS THE DER SETTLEMENT'S EXEMPTION FOR EVS.

A. Under Paragraph 71 of the Settlement, electric vehicles ("EVs") are exempt from the requirements of the Pilot Program.

Q. PLEASE EXPLAIN THE DER SETTLEMENT'S PROVISION ABOUT THE DATA ON PROGRAM PERFORMANCE TO BE PROVIDED TO SEF.

A. PPL Electric must provide SEF with anonymized data within 30 days after the completion of each program year. This data includes raw meter readings, such as delivered kWh, received kWh, and RMS voltage, recorded at 15-minute intervals. Additionally, the Company provides anonymized participant DER management data, encompassing 15-minute inverter statistics, like kW and voltage.

Q. WHEN DID THE COMPANY'S PILOT PROGRAM START?

A. The Pilot Program began on January 1, 2021, and all applications since have been broken into five different groups: (1) Control Group 1 ("CG1"); (2) Control Group 2 ("CG2"); (3) Control Group 1 and 2 ("CG12"); (4) Actively Managed ("AM"); and Grandfathered Group ("GF"). Control Group 1 is filled with customers on the 75 select feeders. To date, customers who apply on any of these 75 feeders are still added to CG1. Control Group 2 consists of the first 1,000 installed DERs after the Pilot Program began. The Company hit 1,000 new DERs on March 21, 2022. Some customers fall into both CG1 and CG2 because they were a part of the 1,000 new DERs but were installed on the 75 select feeders included in CG1. For tracking purposes, PPL Electric includes those customers in CG12. Program Year 1 began on March 22, 2022, and all DER interconnection applicants since that date have been included in the AM Group if they have received a DER Management device.

Q. WHEN IS THE COMPANY'S PILOT PROGRAM SET TO CONCLUDE?

A. As noted previously, the Pilot Program is set to end on March 21, 2025.

Q. HAS THE COMPANY SEEN BENEFITS FROM PROACTIVELY IMPLEMENTING THE SMART INVERTER REQUIREMENTS AND WITH DEPLOYING ITS PILOT PROGRAM?

A. Absolutely. During the life of the Pilot Program, PPL Electric has documented multiple benefits to customers as a result of monitoring and actively managing DERs. Monitoring DER outputs such as real power has proven beneficial to improving planning model accuracy, which increases hosting capacity and reduces costs of interconnections for customers. Monitoring real power output is also critical for real time operation of the grid. Visibility to DER output in real time enables operators to make better decisions during switching events and avoid longer outages, as explained by Cody M. Davis in his direct testimony (PPL Electric Statement No. 3). Active management of DERs has also proven to be beneficial to improving power quality, increasing hosting capacity, and reducing costs to customers. For example, as detailed in Mr. Davis's testimony (PPL Electric Statement No. 3), actively managing power factor settings enables PPL Electric to better manage voltage levels, provide better power quality to customers, defer system investments (thereby reducing costs to customers), and increase hosting capacity.

Q. BASED ON THOSE SUCCESSES, IS THE COMPANY PROPOSING TO CONTINUE INSTALLING DER MANAGEMENT DEVICES AND MONITORING AND MANAGING DERS?

A. Yes. Under the Company's Second DER Management Plan, the Company is proposing to continue installing DER Management devices and actively monitoring and managing DERs. Further, as set forth in the following section of my testimony, PPL Electric is making some proposals to expand and build on the Pilot Program's successes.

C. OVERVIEW OF THE SECOND DER MANAGEMENT PLAN

Q. WOULD YOU PLEASE PROVIDE DETAILS ON THE COMPANY'S SECOND DER MANAGEMENT PLAN?

A. PPL Electric's Second DER Management Plan will enable the Company to continue to integrate, monitor, and manage DER resources throughout PPL Electric's service territory. As proposed, PPL Electric's Second DER Management Plan will require that all customer-owned and third party-owned, inverter-based DER system installations be equipped with DER Management devices so that the Company can monitor and manage the DERs. Complete details of the Second DER Management Plan's requirements are set forth in the Second DER Management Plan (see PPL Electric Exhibit SS-1) and the Company's proposed modifications to Tariff Rule 12 (see PPL Electric Exhibit SS-2), both of which are attached to my direct testimony. The Second DER Management Plan would become effective on March 22, 2025, *i.e.*, the day after the Pilot Program ends on March 21, 2025.

In addition, the Second DER Management Plan would expand on the Pilot Program by authorizing PPL Electric to: (1) actively monitor and manage the smart inverter settings

on all DERs that are in the Pilot Program's control groups; (2) utilize the Volt/Watt functionality, with customer consent, when the interconnecting DER could create a localized high voltage issue on the distribution system at the time of interconnection, which would not be resolved by the Volt/VAR or Constant Power Factor grid support functions[2]; and (3) make the Pilot Program permanent. As such, provisions in the Settlement that limit the scope of the Pilot Program's requirements, such as the annual cap of 3,000 DER Management devices, would be eliminated. Moreover, the Company proposes to install DER Management devices on: (1) solar photovoltaic systems interconnected before the Pilot Program started on January 1, 2021; and (2) inverter-based DERs interconnected after the Pilot Program started without DER Management devices installed on them.[3]

These proposals are necessary and appropriate because they will help PPL Electric fully realize the benefits of actively monitoring and managing DERs. As demonstrated by the Pilot Program, the Company can leverage the smart inverters' grid support functions to improve safety, reliability and resiliency, reduce interconnection costs for DER interconnection applicants (*e.g.*, avoidance of paying for distribution system upgrades), mitigate the impact of DERs on the distribution system, and increase the distribution circuits' hosting capacity by monitoring and managing DERs in the service territory.

Also, I am advised by counsel that the Company no longer requires the waivers of the Commission's regulations that PPL Electric received in the First DER Management

[2] Such customer consent will be required because the Volt/Watt functionality will affect the generating facility's production.

[3] As proposed in PPL Electric Exhibit SS-2, customer-generators with these systems must submit a new interconnection application when they upgrade their system, install a new inverter on their system, or by March 22, 2040, whichever is earlier. The DER Management devices will be installed on those systems after their new interconnection applications are approved as compliant with the Company's current requirements for DERs and inverters and after their systems are installed and inspected.

Plan proceeding because the IEEE and UL standards that the Company proactively implemented have since been automatically incorporated into the Commission's regulations by reference. Counsel advises me, however, that the Company still needs Commission approval under 52 Pa. Code § 75.13(k) to require the installation of the DER Management devices for interconnecting customer-generators.

Q. WHAT ARE SMART INVERTERS?

A. Inverters are devices that convert the direct current ("DC") power produced by solar panels into the alternating current ("AC") power transported on the electric distribution system for use in homes and businesses. Smart inverters[4] provide additional functionality to standard inverters.

Q. WHAT CAPABILITIES DO THESE SMART INVERTERS POSSESS?

A. Smart inverters are equipped with many grid support functions, including: (1) Constant Power Factor, Volt/VAR, Volt/Watt, and Reactive Power; (2) Frequency/Watt; (3) Voltage and Frequency Ride-through; and (4) Remote ON/OFF capability. This functionality allows the DERs that utilize smart inverters to operate in "sync" with the distribution system, thereby reducing power quality issues and maximizing potential DER output and operability. Smart inverters are also used in battery (energy storage) systems, electric vehicle chargers, and any other technologies that use DC power.

[4] The term "smart inverter" means an "inverter that performs functions that, when activated, can autonomously contribute to grid support during excursions from normal operating voltage and frequency system conditions by providing: dynamic reactive/real power support, voltage and frequency ride-through, ramp rate controls, communication systems with ability to accept external commands and other functions." PG&E Rule 21 Interconnection Tariff, *available at* http://www.cpuc.ca.gov/General.aspx?id=5071.

Q. WHAT DER MANAGEMENT DEVICES DOES THE COMPANY PLAN TO UTILIZE UNDER ITS SECOND DER MANAGEMENT PLAN?

A. PPL Electric currently relies on three different DER Management devices: (1) the Smart Collar and Dongle device; (2) the Bridge device; and (3) the Cellular Gateway device. The Company would continue to use those DER Management devices. However, as discussed in Ms. Dombrowski-Diamond's direct testimony (PPL Electric Statement No. 2), the Company continues to address new technologies (including new inverters), address particular types of DER setups and configurations, improve on the existing devices, and improve overall customer experience. Therefore, although PPL Electric has multiple DER Management devices that can be used, PPL Electric needs the flexibility to develop and deploy new types of DER Management devices under its Second DER Management Plan, so that the Company can properly respond to developments in the DER market.

Q. HOW MANY DERS ARE CURRENTLY INTERCONNECTED WITH PPL ELECTRIC'S DISTRIBUTION SYSTEM?

A. There are 26,243 DERs currently interconnected with PPL Electric's distribution system as of April 30, 2024. Since the Pilot Program started, PPL Electric has received 19,464 interconnection applications, of which 7,418 have been included in the Pilot Program and have a DER Management device installed.

Q. HOW MANY DER INTERCONNECTION APPLICATIONS DOES PPL ELECTRIC RECEIVE EACH YEAR?

A. Since January 1, 2021, PPL Electric has received an average of 5,839 applications per year. By comparison, back when PPL Electric filed its Petition for approval of its First DER Management Plan in 2019, the Company received on average between 1,000 and 1,500 DER interconnection applications per year, which shows the substantial rise of DER interconnection applications over approximately the last five years.

Q. DOES THE COMPANY EXPECT THE NUMBER OF DERS INTERCONNECTED WITH ITS DISTRIBUTION SYSTEM TO INCREASE IN THE FUTURE?

A. Yes.

Q. PLEASE EXPLAIN.

A. PPL Electric continues to project a substantial increase in DER interconnection applications in the future based upon historic trends of renewable interconnections throughout Pennsylvania, projected incentives to encourage installations to reduce carbon emissions and combat climate change, and the increasing affordability and efficiency of DERs. In fact, there are financial incentives, legislative changes, political efforts, and PPL Electric initiatives all supporting that conclusion.

Q. CAN YOU PROVIDE SOME EXAMPLES?

A. Yes. In November 2018, the Pennsylvania Department of Environmental Protection ("DEP") released its Pennsylvania's Solar Future Plan ("PSFP").[5] The PSFP considers various opportunities for Pennsylvania residents and businesses to capitalize on the technical and economic potential of solar electric generation from distributed generation systems and utility-scale solar PV farms. One key proposal of the PSFP is to "[a]ccelerate use of smart inverters to manage over-voltage concerns on low voltage distribution lines and avoid unnecessarily adding costs on small solar distributed generation projects."[6] Additionally, the PSFP modeled various scenarios that investigated the viability of increasing the state's solar obligation from 0.5% in 2021 to 10% by 2030 – amounting to an estimated 11 gigawatts of new solar generation.[7]

Additionally, in October of 2017, Governor Wolf signed Act 40[8] into law, which effectively closed Pennsylvania's borders to solar renewable energy credits ("SRECs") generated from solar facilities outside of the Commonwealth. This has supported the development of solar facilities within the Commonwealth because EDCs and electric

[5] Pennsylvania's Solar Future Plan, Pennsylvania Department of Environmental Protection (Nov. 2018), *available at* http://www.depgreenport.state.pa.us/elibrary/GetDocument?docId=1413595&DocName=PENNSYLVANIA%26%2339%3bS%20SOLAR%20FUTURE%20PLAN.PDF%20%20%3cspan%20style%3D%22color:blue%3b%22%3e%28NEW%29%3c/span%3e.

[6] PSFP at xiv.

[7] PSFP at xvi.

[8] Act 40 of 2017, H.B. 118, 2017 Pa. Laws 40; *see also Implementation of Act 40 of 2017*, Docket No. M-2017-2631527 (Order entered May 3, 2018), *reconsideration granted in part and denied in part*, Docket No. M-2017-2631527, 2018 Pa. PUC LEXIS 276 (Order entered Aug. 2, 2018).

generation suppliers ("EGSs") must now fulfill their AEPS Act solar obligations from the generation of solar energy within the Commonwealth.

The projected increased installation of DERs is further supported by the Commission's "*Electric Power Outlook for Pennsylvania 2022-2027*,"[9] which states on pages 9-10 that the following changes to the "generation resource mix continues to change and have potential impacts for reliability" of electric service:

- Reliable Interconnection of Inverter-Based Resources: Reliably integrating inverter-based resources (IBR), which include most solar and wind generation, onto the grid is paramount. Over 70% of the new generation in development for connecting to the [Bulk Power System ("BPS")] over the next 10 years is solar, wind, and hybrid (a generating source combined with a battery). Note that the regional transmission operator (RTO) that serves Pennsylvania, PJM Interconnection, LLC (PJM), has developed a white paper outlining some risks with high penetration of IBR if proper planning and study are not undertaken.

- Accommodating Large Amounts of Distributed Energy Resources (DER): Preparing the grid to operate with increasing levels of distribution resources must also be a priority in many areas. Solar photovoltaic (PV) DERs are projected to reach over 80 GW by the end of the [Long-Term Reliability Assessment ("LTRA")] 10-year assessment, a 25% increase in projection since [North American Electric Reliability Corporation's ("NERC")] 2021 LTRA. A total of 12 assessment areas project to double the amount of DERs in their areas by 2032.[10]

PPL Electric also has been proactively preparing for increasing DER interconnections. The Company actively engaged in assessing and understanding the impact of DER development through its Keystone Solar Future Project ("KSFP") and

[9] Pennsylvania Public Utility Commission, "*Electric Power Outlook for Pennsylvania 2022-2027*" (August 2023), *available at* https://www.puc.pa.gov/media/2527/electric-power-outlook-for-pennsylvania-2022-2027-8-29-2023-final-draft-with-covers.pdf.

[10] *Id.* at 9-10 (emphasis added) (footnote omitted).

received a grant of over $3 million for this program from the U.S. Department of Energy's ("DOE") Office of Energy Efficiency and Renewable Energy through its Sunshot Initiative in August 2017. The objective of the project was to gain greater insights into operational and technical impacts on the distribution system as increasing amounts of customer-owned and third party-owned solar generation are integrated into the existing distribution system. As a part of the KSFP, the Company developed and implemented a Distributed Generation ("DG") Portal, a web-based tool for rapid review of customer-owned DG applications.

Further, in July 2019, PPL Electric upgraded its Distribution Management System ("DMS") to an ADMS and developed a Distribution Energy Resource Management System ("DERMS") to gather DER data, provide DER system forecast capabilities, and provide DER management capabilities.

Additionally, the Company requested Commission approval of its First DER Management Plan on May 24, 2019, and received such approval on December 17, 2020. Since that time, PPL Electric has seen substantial increases in DER deployments in its service territory and fostered innovation and development of the DER market.

In addition, on September 17, 2020, the Federal Energy Regulatory Commission ("FERC") issued Order No. 2222 at Docket No. RM18-9-000, which "remove[d] barriers to the participation of distributed energy resource aggregations in the Regional Transmission (RTO) and Independent System Operator (ISO) markets (RTO/ISO

markets)."[11] The ability for aggregated DERs on the distribution system to participate in the wholesale markets may bolster interconnections in the Company's service territory.[12]

In light of these financial incentives, legislative changes, policy initiatives, and Company efforts, PPL Electric continues to project a substantial rise in the number of DER interconnection applications in the future based upon historic trends of renewable interconnections throughout Pennsylvania, projected incentives to encourage installations to reduce carbon emissions, and the increasing affordability and efficiency of DER technology. As explained previously, there are several activities – some promulgated by the market, some by government entities, and others by PPL Electric itself – to enhance and prepare for the future development of DERs within Pennsylvania. Efforts such as these demonstrate opportunities to increase DER installations within the Commonwealth.

Q. WHY IS THE COMPANY PROPOSING ITS SECOND DER MANAGEMENT PLAN?

A. PPL Electric is proposing its Second DER Management Plan because it will provide significant benefits to the Company, its customers, and the Commonwealth of Pennsylvania. Indeed, the Second DER Management Plan will enable PPL Electric to:

[11] *See Participation of Distributed Energy Res. Aggregations in Markets Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, 172 FERC ¶ 61,247 (Sept. 17, 2020) ("FERC Order No. 2222"), *on reh'g*, *Participation of Distributed Energy Res. Aggregations in Markets Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, 2021 FERC LEXIS 360 (Mar. 18, 2021) ("FERC Order No. 2222-A"), *on reh'g*, *Participation of Distributed Energy Res. Aggregations in Markets Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, 2021 FERC LEXIS 887 (June 17, 2021) ("FERC Order No. 2222-B").

[12] FERC Order No. 2222 also authorizes electric distribution utilities, such as PPL Electric, to "override RTO/ISO dispatch of a distributed energy resource aggregation in circumstances where such override is needed to maintain the reliable and safe operation of the distribution system." FERC Order No. 2222, 172 FERC ¶ 61,247, P310.

1. Facilitate and encourage the increased deployment of DERs in its service territory by reducing interconnection costs for customers installing DERs and increasing hosting capacity on distribution circuits[13];

2. Improve the safety, reliability, adequacy, and resiliency of its distribution service by gaining visibility into the DERs' impacts on the distribution system and actively leveraging the grid support functions of the DERs' smart inverters;

3. Improve distribution system operation and planning by eliminating "hidden load"[14] at DER points of interconnection; and

4. Reduce the Company's capital costs and operation and maintenance expenses that are passed onto ratepayers by, among other things, remotely managing the DERs' voltage support functions to mitigate voltage violations on distribution circuits, which decreases system upgrades as well as costs to manually address voltage violations (*e.g.*, reduction in the number of truck rolls).

The Pilot Program has improved the reliability and performance of the distribution system, increased DER hosting capacity, reduced interconnection costs for interconnection applicants, and facilitated the interconnection of more DERs, all without materially affecting the generation of participating DERs.[15]

In addition, PPL Electric has seen significant, cost-effective benefits from monitoring and actively managing DERs. Based on the data gathered through Program Year 2, PPL Electric's Pilot Program has reduced the Company's operation and

[13] "Hosting capacity is the amount of [distributed photovoltaic systems ('DPV')] that can be added to distribution system before control changes or system upgrades are required to safely and reliably integrate additional DPV." Advanced Hosting Capacity Analysis, NREL, *available at* https://www.nrel.gov/solar/market-research-analysis/advanced-hosting-capacity-analysis.html.

[14] As explained in Cody M. Davis's direct testimony (PPL Electric Statement No. 3), "hidden load" is the amount of load that is present on a circuit but not measured at telemetry points (e.g., the feeder circuit breaker) because the energy is being provided by local downstream DERs. The amount of load measured by distribution equipment is often referred to as the "net" load, and the total amount of load operating on the feeder (including the amount offset by DER production) is the "native" load, with "hidden" load in a given interval as the difference between the two.

[15] As explained in the direct testimony of Cody M. Davis (PPL Electric Statement No. 3), PPL Electric uses monitored real and reactive power data to calculate the amount of customer energy generation lost as a result of the operation of Volt/VAR curves for each customer in the Pilot Program. The average annual energy losses are generally less than 10 kWh.

maintenance expenses by approximately $15.33 million and the Company's capital expenditures by approximately $6.60 million.[16] When compared to the $128,000 of operation and maintenance expenses and $6.38 million of capital costs that the Pilot Program has cost as of the end of Program Year 2, the Pilot Program has produced substantial benefits compared to its costs. Furthermore, PPL Electric's continued learning and adaptations have resulted in additional program efficiencies related to the overall cost of the DER Management device installation and provisioning. PPL Electric has submitted its Second DER Management Plan to continue and expand on these achievements.

Q. WHAT ARE THE CONSEQUENCES IF THE COMMISSION WERE TO NOT APPROVE THE COMPANY'S SECOND DER MANAGEMENT PLAN?

A. The Commission's denial of this Petition will adversely affect PPL Electric, the Company's distribution system, PPL Electric's customers, and the Commonwealth. By denying the instant Petition, all of the benefits produced by the First DER Management Plan, including reduced capital costs and operation and maintenance expenses, increased hosting capacity for DERs on distribution circuits, and reduced interconnection costs for DER applicants, would be lost. Those lost benefits would put upward pressure on PPL Electric's distribution rates and increase the costs for DER applicants to interconnect their DERs with the distribution system. Therefore, such an outcome would harm customers with and

[16] Further, the Pilot Program has increased hosting capacity by an estimated 29 MW. If that additional 29 MW were fully utilized as of March 21, 2024, it would have produced additional generation and reduced distribution and transmission losses valued at approximately $4.57 million.

without DERs in the Company's service territory and potentially discourage DER development.

In addition, denial of the Petition would negatively impact PPL Electric's distribution system and, by extension, its ability to provide safe, reliable, adequate, affordable, and reasonable service as required by Section 1501 of the Public Utility Code. As set forth in Dr. Karen Miu's direct testimony (see PPL Electric Statement No. 8), PPL Electric currently experiences voltage issues and two-way power flows on its distribution system due to the current level of DER interconnections. Meanwhile, Dr. Elizabeth Cook explains in her direct testimony that such interconnections are only projected to increase (see PPL Electric Statement No. 6), which will compound those issues.

Although PPL Electric's First DER Management Plan has been successful in limiting the impact and resolving many of those issues (see PPL Electric Statement No. 3, the Direct Testimony of Cody M. Davis), the Commission's denial of this Petition will exacerbate those issues and prevent the Company and its customers from fully realizing the benefits of DERs on the grid. For example, PPL Electric would lose the ability to use the actively managed DERs to help mitigate the duration and frequency of voltage violations on its distribution system, which would negatively affect the adequacy of the Company's service (*e.g.*, voltage) and increase the Company's operation and maintenance expenses to manually respond to voltage violations by rolling trucks to the violations' locations. The Company also would not be able to increase distribution circuits' hosting capacity, thereby leading to interconnection applicants having to pay for distribution system upgrades and potentially discouraging DER development.

In addition, PPL Electric would lose the capability to use smart inverters' Remote On/Off function to shut off DERs that fail to shut off on their own when there is an emergency, potentially placing Company personnel, first responders, and the public at risk.

Lastly, as explained in the Direct Testimony of Reigh A. Walling, Dr. Elizabeth Cook, Lee Krevat, and Dr. Karen Miu (PPL Electric Statement Nos. 4, 6, 7, and 8, respectively) distribution utilities need to get ahead of the challenges presented by DERs on their distribution systems before too many DERs without monitoring and management capabilities are deployed. If the Commission were to deny PPL Electric's Petition, the Company would be prevented from proactively tackling the issues presented by DERs and, instead, forced to invest in costly distribution system upgrades to resolve those issues.

D. THE COMPANY'S PROPOSED TARIFF MODIFICATIONS

Q. PLEASE DESCRIBE THE TARIFF MODIFICATIONS THAT PPL ELECTRIC IS PROPOSING IN THIS PROCEEDING.

A. As noted previously, attached to my direct testimony as PPL Electric Exhibit SS-2 is a *pro forma* tariff supplement setting forth the Company's proposed modifications to Tariff Rule 12, which would apply, subject to Commission approval, beginning March 22, 2025 (*i.e.*, after the end of the Pilot Program). These modifications are consistent with and incorporate the provisions set forth in the Company's Second DER Management Plan (see PPL Electric Exhibit SS-1). The proposed tariff modifications should be approved so that the Company can implement the Second DER Management Plan, which, as explained previously, is designed to produce several benefits and enable the Company to facilitate and encourage

the deployment of DERs while continuing to provide safe, reliable, adequate, and reasonable service.

E. SUMMARY OF COMMISSION APPROVALS REQUESTED BY PPL ELECTRIC

Q. PLEASE DESCRIBE THE COMMISSION APPROVALS THAT THE COMPANY IS REQUESTING IN THIS PROCEEDING.

A. To implement the Company's Second DER Management Plan, the Company is requesting approval to require the installation of DER Management devices for all new DERs that apply to interconnect to its distribution system. Specifically, Section 75.13(k) states, in pertinent part, that "[t]he EDC and DSP may not require additional equipment or insurance or impose any other requirement unless the additional equipment, insurance or other requirement is specifically authorized under this chapter or by order of the Commission." 52 Pa. Code § 75.13(k). Here, the Company will continue to require new customer-generators to install additional equipment (*i.e.*, the DER management device) and impose additional requirements (*e.g.*, that the customer-generator allow PPL Electric to monitor and manage the DER and that the DER utilize a standardized, non-proprietary communications protocol specified by the utility) that are not specifically authorized under Chapter 75 or a Commission order. Therefore, I have been advised by counsel that PPL Electric has requested approval pursuant to Section 75.13(k), which is necessary to implement the Second DER Management Plan.

In addition, as noted in the previous section, PPL Electric is requesting Commission approval of modifications to Rule 12 of its Tariff.

Q. IS THE COMPANY PROPOSING ANY WAIVERS OF REGULATIONS IN THIS PROCEEDING?

A. No. I have been advised by counsel that unlike with the First DER Management Plan, the Company no longer requires the waivers of the Commission's regulations that it received in the First DER Management Plan proceeding because the updated IEEE and UL standards that the Company proactively implemented have since been automatically incorporated into the Commission's regulations by reference. *See* 52 Pa. Code § 75.22 (defining "Certified" as "(i) IEEE Standard 1547, 'Standard for Interconnecting Distributed Resources with Electric Power Systems,' as amended and supplemented" and "(ii) UL Standard 1741, 'Inverters, Converters and Controllers for use in Independent Power Systems' (January 2001), as amended and supplemented") (emphasis added). However, to the extent there are additional approvals or authorizations that the Commission deems are necessary to implement the Second DER Management Plan, PPL Electric is requesting such approvals and authorizations.

F. THE SECOND DER MANAGEMENT PLAN'S ABILITY TO LEVERAGE THE COMPANY'S PRIOR INVESTMENTS, EXISTING TECHNOLOGIES, AND INNOVATION

Q. COULD YOU PLEASE EXPLAIN HOW THE SECOND DER MANAGEMENT PETITION WILL LEVERAGE THE COMPANY'S PREVIOUS INVESTMENTS AND EXISTING TECHNOLOGIES?

A. PPL Electric is uniquely positioned to implement this Second DER Management Plan due to its ability to take advantage of prior investments and existing technologies implemented by the Company. To successfully facilitate increased levels of DER deployments, PPL

Electric needs the ability to monitor and manage the DER assets, which requires a communications link with a distribution management system ("DMS"). Here, PPL Electric has already deployed an industry leading DMS that is prepared to be utilized as a link with customers' DERs. Further, enabling DERs to interconnect and integrate seamlessly with the grid requires implementing a DERMS, which is a grid control optimization system. The DERMS platform incorporates DERs and offers functionality such as Volt/VAR optimization (VVO), power quality management, and DER coordination to support operational needs. PPL Electric developed a DERMS that became operational in October 2019. Because the DERMS provides grid operators with the capability to monitor and manage DER assets, PPL Electric was prepared to implement and execute the First DER Management Plan and is prepared to implement and execute the Second DER Management Plan.

In addition, as explained previously, PPL Electric plans to use its existing RF Mesh network as part of its Second DER Management Plan. The RF Mesh network was deployed in accordance with the Company's Commission-approved Smart Meter Plan, Act 129 of 2008, and the Commission's related orders. By taking advantage of the existing RF Mesh network, the Company has expanded the benefits of the investments in its network that have been paid for by ratepayers. Leveraging investments already made by PPL Electric, such as DERMS and the RF Mesh network, places PPL Electric in a prime position to monitor and manage DERs and implement the Second DER Management Plan.

PPL Electric also integrated DERMS with its Advanced Distribution Management System ("ADMS"). ADMS includes a common graphical user interface that combines distribution management system functions for control room operations, outage

management, SCADA, distributed energy resource management, and Volt/VAR optimization. DERMS and ADMS leverage the same network model and power flow to validate DER dispatch schedules, which enables PPL Electric to better manage the grid complexity that come from increased levels of DER deployments.

Thus, PPL Electric is appropriately and uniquely prepared to successfully execute the Second DER Management Plan.

Q. ARE THERE OTHER REASONS WHY PPL ELECTRIC IS WELL-POSITIONED TO IMPLEMENT THE SECOND DER MANAGEMENT PLAN?

A. Yes. Foremost, PPL Electric's successes under the Pilot Program will enable the Company to implement the Second DER Management Plan. In addition, PPL Electric has a proven track record of being a successful innovator in the utility industry, particularly in the areas of DERs, distribution system automation, and grid modernization. For example, the Smart Electric Power Alliance ("SEPA") named PPL Electric as the Investor-Owned Utility of the Year for 2019 due to the Company's development of the DERMS. Furthermore, in 2022, PPL Electric won the SEE Awards 2022 Environmental Champion Utility by Escalent and the POWER Magazine Award for smart grid. In 2023, the Company wont the *Public Utilities Fortnightly* 2023 Charles Steinmetz Top Innovator Award in Grid Operations for distribution operations grid automation. Therefore, PPL Electric is well-positioned to build upon its past successes and implement the DER Management proposal.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY AT THIS TIME?

A. Yes, although I reserve the right to supplement my direct testimony.

I. INTRODUCTION

This document describes PPL Electric Utilities Corporation's ("PPL Electric" or the "Company") Second Distributed Energy Resource ("DER") Management Plan ("Plan") that is set to commence on March 22, 2025, and explains how the Company will implement and conduct the Plan, including the goals of the Plan, the Plan's requirements, including requirements set forth in Rule 12 of the Company's tariff, the methods by which PPL Electric will communicate the Plan's requirements to customers and DER installers, and any additional information PPL Electric believes is necessary to be included to facilitate the implementation of the Plan.

By way of background, many utilities have experienced operations and planning challenges as DER penetration becomes increasingly significant. These challenges include, but are not limited to, voltage swings, masked or hidden load, limited hosting capacity, planning uncertainties, and protection/operational challenges with two-way power flow. As a response to these challenges, the Institute of Electrical and Electronics Engineers ("IEEE") made revisions to Standard 1547 in 2018 ("IEEE 1547-2018"), which set forth requirements for smart inverters that can help support the distribution system. When these smart inverters are coupled with DER Management devices, electric utilities can monitor and manage DERs interconnected with their distribution systems.

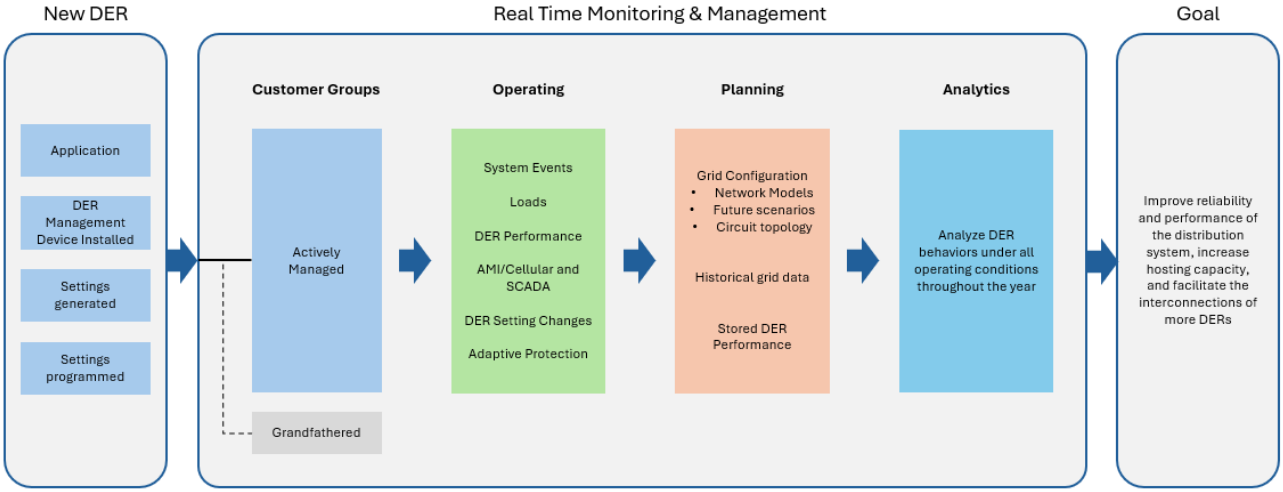
On May 24, 2019, PPL Electric filed a Petition with the Commission for permission to require smart inverters that meet the new IEEE and Underwriters Laboratories ("UL") standards, to install DER Management devices on new DERs interconnected with its distribution system, and to monitor and manage those new DERs. Ultimately, the parties filed a Joint Petition for Settlement of All Issues ("Settlement") approved by the Pennsylvania Public Utility Commission ("Commission") on December 17, 2020, at Docket No. P-2019-3010128, which permitted the Company to conduct a DER Management Pilot Program ("Pilot Program") to test and evaluate the costs and benefits of monitoring and managing DERs. The Pilot Program commenced on January

1, 2021, and is set to continue through March 21, 2025. Also, Paragraph 62 of the Settlement provided that within 60 days after the end of Program Year 2 of the Pilot Program, which concluded on March 21, 2024, PPL Electric can file a Petition to: (a) extend the program and make such other changes to the program as the Company may request; (b) continue installing the DER Management devices on new DERs in its service territory; and/or (c) authorize the Company to remotely and actively manage (i) the DERs that were in the Pilot Program's control groups, (ii) the DERs that have enrolled and will enroll in the program, and (iii) any new DERs that will interconnect with the Company's distribution system after the program concludes. This Plan is being submitted as part of such Petition and outlines the requirements under its Second DER Management Plan and how those requirements will be implemented.

II. SECOND DER MANAGEMENT PLAN

PPL Electric's Second DER Management Plan will require that all customer-owned and third party-owned, inverter-based DER system installations be equipped with DER Management devices so that the Company can monitor and manage the DERs. Figure 1 is a graphic overview of the Plan, beginning with a PPL Electric customer filing an application to interconnect a DER with the Company's distribution system. Approved DER interconnection applications will receive a DER Management device.

Figure 1- Plan Overview



A. DER CUSTOMER GROUPS

For purposes of the Pilot Program, PPL Electric identified four different DER customer groups: (1) Grandfathered Group, (2) Control Group 1, (3) Control Group 2, and (4) Actively Managed Group. DER customers who were in the Grandfathered Group were not required to comply with the new interconnection requirements in the operations and maintenance of their DER installation. As such, PPL Electric collected information continuously on the distribution system, including the circuits that hosted these DER customers, but there was no direct monitoring or active management of DER installations in this group. DER customers in Control Groups 1 and 2 received DER Management devices but were interconnected in monitoring mode and were operated with autonomous grid support functions only. DER customers in the Actively Managed Group received DER Management devices, and the Company was permitted to actively manage the grid support functions of the DER inverters in this group using the DER Management devices and the Company's Distributed Energy Resources Management System ("DERMS").

As of the effective date of this Plan, all DER customers in Control Groups 1 and 2 will be converted to the Actively Managed Group. Moreover, the Company will install DER Management devices on: (1) solar photovoltaic systems interconnected before the Pilot Program started on

January 1, 2021; and (2) inverter-based DERs interconnected after the Pilot Program started without DER Management devices installed on them. Customer-generators with these systems must submit a new interconnection application when they upgrade their system, install a new inverter on their system, or by March 22, 2040, whichever is earlier. The DER Management devices will be installed on those systems after their new interconnection applications are approved as compliant with the Company's current requirements for DERs and inverters and after their systems are installed and inspected. These DERs will be a part of the Actively Managed Group.

B. COMPONENTS AND ARCHITECTURE

Several components will be used as part of the Plan to process the DER interconnections and monitor and manage the DERs under the Plan. The Company's DER Management Advanced Metering Infrastructure ("AMI") Architecture and DER Management Cellular Architecture are set forth in Figures 2a and 2b below, respectively, and outline how the Company will interconnect the DERs to the system, communicate to DER Management devices, receive and integrate operational feedback from DERs for system analysis, calculate dynamic operation settings for DERs, and manage settings changes as needed.

Figure 2a - DER Management AMI Architecture

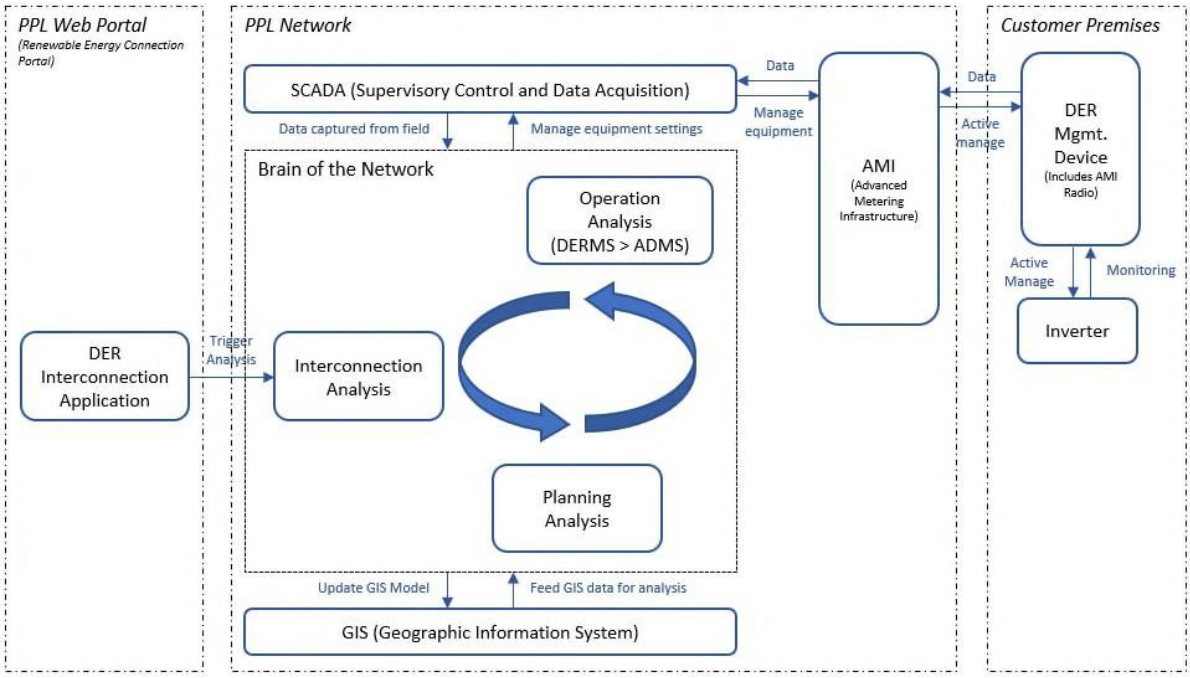


Figure 2b – DER Management Cellular Architecture

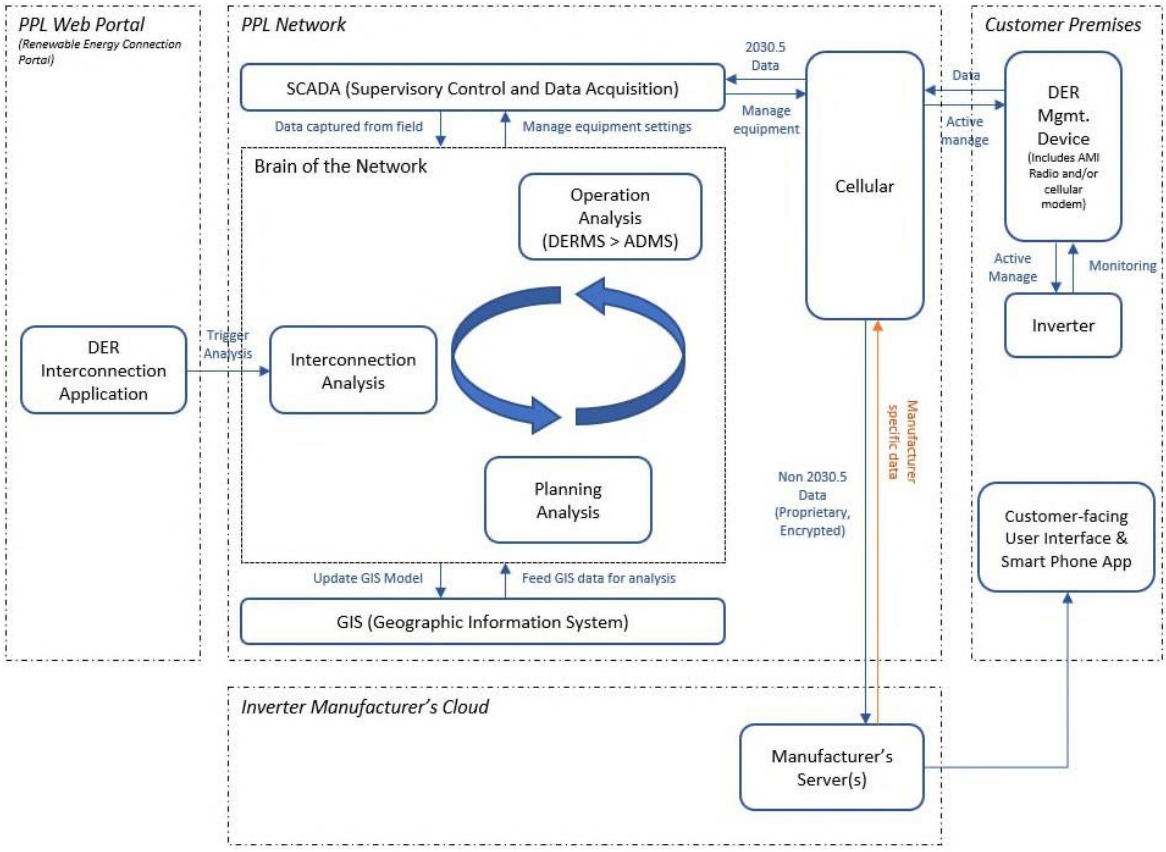

The components in the architecture are:

- DER Interconnection Application: Interconnection applications are submitted through a customer facing portal on PPL Electric's website. The portal allows for work orders to be generated and for customer and inverter data to pass automatically to the Company's Geographic Information System ("GIS").
- Interconnection Analysis: The technical analysis process by which PPL Electric reviews the proposed interconnection against its requirements, determines if upgrades are required to the PPL Electric system, and, when satisfied, provides approval for installation.
- Planning Analysis: The routine technical analysis PPL Electric uses to determine whether additional system upgrades are required to address capacity, voltage, or reliability needs on the distribution system. The planning process uses data from the Supervisory Control and Data Acquisition ("SCADA") system and GIS, among other systems.
- Distributed Energy Resource Management System ("DERMS"): A centralized system responsible for DER management; DERMS is a suite of programs, including Load and Volt/VAR Management ("LVM"), within Advanced Distribution Management System ("ADMS"). ADMS will be used for DER monitoring and management during the Plan.
- Geographic Information System: A database providing the equipment, asset data, and locations of the equipment on the distribution system.
- Supervisory Control and Data Acquisition: In addition to the data that is already collected by PPL Electric's SCADA system, this system captures the data from the inverters through the AMI mesh network or a cellular connection and provides it to DERMS, and then subsequently into ADMS. Additionally, SCADA data is stored and

available historically.

- AMI Mesh Network: The communication pathway that was originally created for the Company's AMI meters that is now being used for DER communication as well. It facilitates data exchange with SCADA via the AMI head-end system and with the individual DERs via the AMI radios located within the DER Management devices.
- Cellular Network: The communication pathway that facilitates data exchange with SCADA via PPL Electric's cellular head-end servers and with the individual DERs via the cellular modem located within the DER Management devices.
- DER Management Device: Featuring an AMI radio or cellular modem, this device connects to the DER's local communication interface, enabling monitoring and management of the DER through the existing AMI mesh network or cellular connection. This device allows PPL Electric to remotely monitor the attributes and performance of the DER and manage its grid support settings as needed. In situations where DER systems require additional communication equipment to support the Company's renewable energy connection requirements/interconnection requirements, the DER Management device setup may include additional hardware. An example of this type of hardware is the SMA Data Manager.

C. DER INVERTERS

1. Inverter Requirements

DERs interconnecting with the Company's distribution system shall comply with IEEE 1547-2018 and be certified to UL 1741 Supplement B ("UL 1741 SB"). PPL Electric will continue to test and approve smart inverters for use in the Company's territory. The Company will also test the inverters to ensure that they are compatible with PPL Electric's DER Management devices and can be safely and reliably utilized in the field together. The Company will strive to perform its

inverter testing expeditiously so that DER interconnections are not unreasonably delayed. Equipment (e.g., DER inverters) must undergo PPL Electric's review process to be eligible for Plan participation.

If the Company does not have a DER Management device that is available or compatible with the proposed DER inverter set forth in an interconnection application, the Company may, in its sole discretion, approve the interconnection application, provided that the interconnection application and proposed DER meet all of the other requirements under the Commission's regulations and Rule 12 of PPL Electric's tariff. The Company will then install a DER Management device on such DERs once a compatible DER Management device becomes available.

2. Approved List of Smart Inverters

The Approved List of Smart Inverters that meet the Company's applicable requirements are publicly available and will be regularly updated on the Company's website.[1] If a customer or installer would like to use an inverter not on the approved inverter list, they must follow PPL Electric's inverter review process.

3. Inverter Testing and Review Process

PPL Electric follows a streamlined process for testing new inverters requesting approval.

First, the inverter manufacturer must provide proof that the inverter is UL 1741 SB certified and has a dedicated local communication interface available for testing. The inverter manufacturer also must provide technical information on its inverter model, including, but not limited to, the inverter's communication protocol, data models, and configuration profiles. The Company will also obtain a test model of the inverter for PPL Electric's testing lab or will work with the DER

[1] https://www.pplelectric.com/-/media/PPLElectric/At-Your-Service/Docs/REMSI/Metering-Equipment-Tables/PPL-EU-Smart-Inverter-List.ashx.

manufacturer to reserve testing facilities for remote testing if limited by physical size of the inverter-based systems.

Second, after the Company receives all of the requested information and has set up a test model in the lab (or via a remote lab environment in some cases), the inverter testing proceeds in the following sequence:

a. DER Communication Protocol Testing

PPL Electric validates that one of the three approved protocols (IEEE 2030.5, IEEE 1815(DNP3) or SunSpec Modbus) is supported as a local communication interface.

b. Profile Configuration including Data Point Mapping

PPL Electric develops and loads the proper server profile configuration to allow data points to flow correctly between the server and client.

c. Read Points Testing

PPL Electric tests and validates the capability to receive the following via the inverters' local communication interface. In accordance with IEEE 1547-2018 § 10.3, required monitoring functionality includes:

i. Real Power;
ii. Reactive Power; and
iii. Voltage (Phase A-to-neutral, B-to-neutral, C-to-neutral).

d. Write Points Testing

PPL Electric reviews the equipment's capability to monitor and manage grid support functions of the inverters via their local communication interface. In accordance with IEEE 1547-2018, required management functionality includes:

i. Constant power factor mode (required per IEEE 1547-2018 § 10.6.2);

ii. Voltage-reactive power mode (also known as Volt-VAR mode, required per IEEE 1547-2018 § 10.6.3);

iii. Constant reactive power mode (also known as fixed VAR mode or reactive

power setpoint mode; required per IEEE 1547-2018 § 10.6.5);

iv. Voltage-active power mode (also known as Volt-Watt mode, required per IEEE 1547-2018 § 10.6.6);

v. Voltage trip (also known as Low Voltage Ride Through, LVRT, and High Voltage Ride Through, HVRT; required per IEEE 1547-2018 § 10.6.7);

vi. Frequency trip (also known as Low Frequency Ride Through, LFRT, and High Frequency Ride Through, HFRT; required per IEEE 1547-2018 § 10.6.8);

vii. Enter service and cease to energize and trip (also known as remote on/off, energize/deenergize, connect/disconnect, or operate/standby; required per IEEE 1547-2018 § 10.6.10 and 10.6.11); and

viii. Limit maximum active power (also known as maximum real power output setpoint; required per IEEE 1547-2018 § 10.6.12).

e. DER Management Device Testing

PPL Electric tests and validates end-to-end testing between the DER and the Company's DERMS via the DER Management device.[1]

Smart inverters that satisfy the Company's requirements are added to PPL Electric's Approved List of Smart Inverters.

4. Customer Enrollment

The DER interconnection application process will utilize the Company's Renewable Energy Connection web portal for the approval and the creation of interconnection work orders. The portal also is used to obtain the Certificate of Completion ("COC") for the DER interconnection.

Under the Plan, the Company will purchase and install DER Management devices for all customer-owned and third party-owned, inverter-based DER system installations. All DER Management devices shall be owned, operated, and maintained by the Company at no direct cost to interconnecting customers. All DERs subject to Plan must have an open and available communication port dedicated for use by PPL Electric. When a complete DER interconnection

application is received, a unique and internal DER management identification category will be assigned to the application based on the order it was received relative to other applications.

5. DER Settings

Volt/VAR will be used as the default reactive power management mode for all inverters. The Company will establish and maintain Volt/VAR settings based on the location and impact of each DER, as well as Voltage Ride-through and Frequency Ride-through functions which meet or exceed PJM Interconnection LLC's ("PJM") guidelines. Where appropriate, modifications to the Volt/VAR curve and Ride-through curves may be made in order to improve system voltage management, reduce customer lost generation, comply with changes in transmission standards, or due to other factors.

The developed Volt/VAR curve will be used until field conditions deem a change in the DER reactive power is necessary to address current or expected system conditions. At such times, the Company may override the Volt/VAR curve by assigning a temporary fixed power factor or a temporary reactive power setpoint value to the DER. Following such an event, Volt/VAR curve on the DER will be re-enabled. The Company may manage the real power output capability of DER through the application of a Volt/Watt curve or through the modification of the maximum real power output setpoint, with customer consent, when the interconnecting DER could create a localized voltage issue on the distribution system. Such system conditions may include emergency response, planned switching for maintenance, unplanned switching to facilitate power restoration during outage conditions, or other conditions under which the DER could otherwise be subjected to disconnection as described within the Interconnection Agreement.

The Company will only use the Remote On/Off function during situations where a DER is operating within a portion of the system that is intended to be de-energized. This may include emergency response scenarios such as gas leak response or a reported fire. The Remote On/Off

command may also be utilized for DER that have not safely isolated or "islanded" themselves from the de-energized distribution system during a power outage.

D. CUSTOMER AND INSTALLER INFORMATION

Customers and installers who are pursuing or are interested in learning more about installing DERs on PPL Electric's distribution system can find information and instructions about the updated interconnection process on PPL Electric's external Rules for Electric Meter and Service Installations ("REMSI") website and also on the PPL Electric's Renewable Energy Connection Portal. The frequently asked questions ("FAQs") section on the REMSI website has been updated to include impacts and details for the Plan and appropriate PPL Electric contact information.

PPL Electric's webpage specifically dedicated to DER Management acts as the main "hub" with easily located information or hyperlinks to pertinent information on DER Management, including, but not limited to, material pertaining to DER Management as a whole, Volt/VAR and Ride-through setting guidelines, approved installation sketches, frequently asked questions, and the Approved List of Smart Inverters.

THIS TARIFF MAKES CHANGES **(C)** IN EXISTING RATES. SEE PAGE TWO.

PPL Electric Utilities Corporation

LIST OF CHANGES MADE BY THIS SUPPLEMENT

CHANGES:

Rule 12 - Distributed Energy Resource Interconnection Service	Rule 12 is amended to incorporate the proposals set forth in the Second DER Management Plan filed on May 20, 2024, at Docket No. P-2024-_____

PPL Electric Utilities Corporation

RULES FOR ELECTRIC SERVICE
RULE 12 - DISTRIBUTED ENERGY RESOURCE (DER) INTERCONNECTION SERVICE

A. PURPOSE (C)

The Distributed Energy Resource Interconnection Service (DERIS) shall be applied to all new DER interconnections with the distribution system effective March 22, 2025, and as further provided in this Rule. DERs shall include inverter-based alternative energy sources and systems, as defined in the Alternative Energy Portfolio Standards Act of 2004 (73 P.S. §§ 1648.1 - 1648.8), and storage resources (batteries).

B. APPLICATION (C)

(1) This Rule shall apply to all inverter-based DERs, whose interconnection applications are received on or after March 22, 2025.

(2) This Rule shall apply to all customers who receive Basic Utility Supply Service under Rate Schedules RS, GS-1, GS-3, and LP-4.

C. DEVICE REQUIREMENTS

(1) Renewable Energy Connection –

The online portal allows customers to apply to interconnect the DER Management Devices with the distribution system. Refer to the REMSI Renewable Energy Connection under PPL Electric's Electric Rates and Rules for additional information. https://www.pplelectric.com/utility/about-us/electric-rates-and-rules.aspx

(2) Smart Inverters — (C)

Inverters connecting to the distribution system must comply with IEEE 1547-2018 and must be certified to UL 1741 Supplement B, or current utility certification requirements. The list of smart inverters that meet these requirements will be made publicly available and regularly updated on the Company's REMSI website.

(3) DER Management Device – (C)

All DERs whether Customer-Owned or Third Party-Owned that are applying to interconnect with PPL Electric's distribution system must install smart inverters as defined in Rule 12(C)(2). Additionally, a DER Management Device owned, installed, and maintained by the Company will be connected to the data port of the smart

(Continued)

RULE 12 - DISTRIBUTED ENERGY RESOURCE (DER) INTERCONNECTION SERVICE (Continued)

C. DEVICE REQUIREMENTS (Continued)

(3) DER Management Device – (Continued)

inverter for any new DER installation. The DER Management Device is a sealed utility enclosure governed by REMSI Rule 1 and may use the Meter Network radios to connect wirelessly to PPL Electric's RF mesh network. These devices shall be installed and maintained in accordance with the Company's "Rules for Electric Meter and Service Installations (REMSI)". Refer to the REMSI DER Management Device section for additional information.

The Company also will install DER Management devices on: (1) solar photovoltaic systems interconnected before the First DER Management Plan's Pilot Program (Pilot Program) started on January 1, 2021; and (2) inverter-based DERs interconnected after the Pilot Program started without DER Management devices installed on them. Customer-generators with these systems must submit a new interconnection application when they upgrade their system, install a new inverter on their system, or by March 22, 2040, whichever is earlier. The DER Management devices will be installed on those systems after their new interconnection applications are approved as compliant with the Company's current requirements for DERs and inverters and after their systems are installed and inspected.

If the Company does not have a DER Management device that is available or compatible with the proposed DER inverter set forth in an interconnection application, the Company may, in its sole discretion, approve the interconnection application, provided that the interconnection application and proposed DER meet all of the other requirements under the Commission's regulations and this tariff. The Company reserves the right to install a DER Management device on such DERs once a compatible DER Management device becomes available.

D. DER MANAGEMENT (C)

Effective March 22, 2025, the Company shall be permitted to actively monitor and manage the grid support functions of DER inverters using the DER Management Devices and the Company's Distributed Energy Resources Management System (DERMS), as set forth in the Second DER Management Plan, and may make operational decisions based on DER operational information obtained through the DER Management devices.

RULE 12 - DISTRIBUTED ENERGY RESOURCE (DER) INTERCONNECTION SERVICE (Continued)

(THIS PAGE INTENTIONALLY LEFT BLANK)

BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION

Petition of PPL Electric Utilities Corporation	:	
for Approval of its Second Distributed Energy	:	Docket No. P-2024-_____
Resources Management Plan	:	

DIRECT TESTIMONY OF ALIESHA M. DOMBROWSKI-DIAMOND

PPL Electric Statement No. 2

May 20, 2024

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Aliesha M. Dombrowski-Diamond, and my business address is 1639 Church Road, Allentown, PA 18104.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by PPL Electric Utilities Corporation ("PPL Electric" or the "Company") as Supervisor – Distribution Operations Engineering & Energy Resource Management.

Q. WHAT ARE YOUR DUTIES IN YOUR CURRENT POSITION?

A. I am primarily responsible for the Company's Distributed Energy Resource ("DER") Lab, DER Automation Team, and DER Communications team. The DER Lab reviews new inverters for the approved inverter list as well as builds the device control word ("DCW") and installation directions for inverters based on manufacturer's direction. The DER Automation team programs all inverters for DERs that are enrolled in the First DER Management Plan's Pilot Program ("Pilot Program"). The DER Communications team monitors the inverters to maintain communication and verifies issues as they arise. After the DER Communications team verifies there is an issue with an inverter, the DER field team investigates and corrects the issue.

Q. WHAT IS YOUR EDUCATIONAL BACKGROUND?

A. I have a B.S. in Mathematics from Lock Haven University.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.

A. I have been employed by PPL Electric as Supervisor – Distribution Operations Engineering & Energy Resource Management since April 2023. From September 2022 until April 2023, I was employed by Pinnacle Group and hired to work at PPL Electric as an engineer in the DER Lab. From January 2019 until August 2022, I was employed by Landis & Gyr as Field Services Coordinator/RF Lead and was assigned as the Network Manager for PPL Electric's Advanced Metering Infrastructure ("AMI") network. From August 2017 until December 2018, I was employed by Itron, Inc. as a network engineer and was assigned to the AMI network implementation projects for FirstEnergy Corp. and Duquesne Light Company. From May 2015 to August 2017, I was employed by Orchard Pump and Supply Inc. as Operations Manager.

Q. HAVE YOU PREVIOUSLY TESTIFIED AS A WITNESS BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION ("COMMISSION")?

A. No.

Q. WOULD YOU PLEASE DESCRIBE THE SUBJECT MATTER OF YOUR TESTIMONY?

A. My testimony will: (1) provide an overview of the technologies that facilitate PPL Electric's management of DERs; (2) provide an overview of the Company's DER management devices; (3) describe the Company's field operations and experiences installing DER management devices; (4) outline the smart inverter testing and certification

process; and (5) address the Company's capability to adapt to future changes in DER systems and inverter technology.

Q. ARE YOU SPONSORING ANY EXHIBITS WITH YOUR TESTIMONY?

A. Yes, I am sponsoring the following exhibit:

- PPL Electric Exhibit AD-1 – PPL Electric's approved list of smart inverters as of May 17, 2024.
- PPL Electric Exhibit AD-2 – PPL Electric's DER Lab Sample Test Plan of DER Management devices as of May 17, 2024.
- PPL Electric Exhibit AD-3 – PPL Electric's Simple/Smart Collar Testing Procedures Internal and External.
- PPL Electric Exhibit AD-4 – PPL Electric's Bridge and Cellular Gateway Testing Procedures External.
- PPL Electric Exhibit AD-5 – PPL Electric's Net-Metered Distributed Energy brochure.
- PPL Electric Exhibit AD-6 – PPL Electric's Distribution Department Instructions (DDI) M-365K Single Phase SolarEdge Inverter.
- PPL Electric Exhibit AD-7 – PPL Electric's DER Lab Sample Test Plan for Inverters as of May 17, 2024.

A. OVERVIEW OF THE TECHNOLOGIES THAT FACILITATE THE DER MANAGEMENT PLAN

Q. PLEASE PROVIDE AN OVERVIEW OF PPL ELECTRIC'S EXISTING TECHNOLOGIES THAT FACILITATE THE COMPANY'S DER MANAGEMENT PLAN.

A. The DER Management Plan relies on three different DER Management devices: (1) the Smart Collar and Dongle device; (2) the Bridge device; and (3) the Cellular Gateway device. The Smart Collar and Dongle device was the first-generation DER Management device and has since been replaced by the Bridge device. Both the Bridge and Smart Collar and Dongle devices use the existing AMI network (*i.e.*, the Radio Frequency ("RF") Mesh network) to communicate back to the Company's head-end system.[1] The Cellular Gateway solution is used for IEEE 2030.5 inverters and communicates back to the Company's servers. All three of these solutions communicate back to the Company's Advanced Distribution Management System ("ADMS") through either AMI or Cellular.

Q. HOW DO THESE TECHNOLOGIES INTEGRATE WITH THE DER MANAGEMENT PLAN?

A. The following figures from the Company's Second Revised Pilot Implementation Plan, which was filed in the initial DER Management Plan proceeding at Docket No. P-2019-3010128, provide details of how the technologies integrate with the DER Management Plan. In general, however, the DER Management device relays communications to and

[1] A head-end system is the hardware and software that receives the stream of meter data brought back to PPL Electric through the AMI network.

from the inverters. Those communications flow both ways, meaning that the Company sends commands through the communications networks to the inverters, such as changes to the smart inverters' grid support functions, and that data is sent from the inverters through the communications networks back to PPL Electric.

Figure 1 - DER Management AMI Architecture

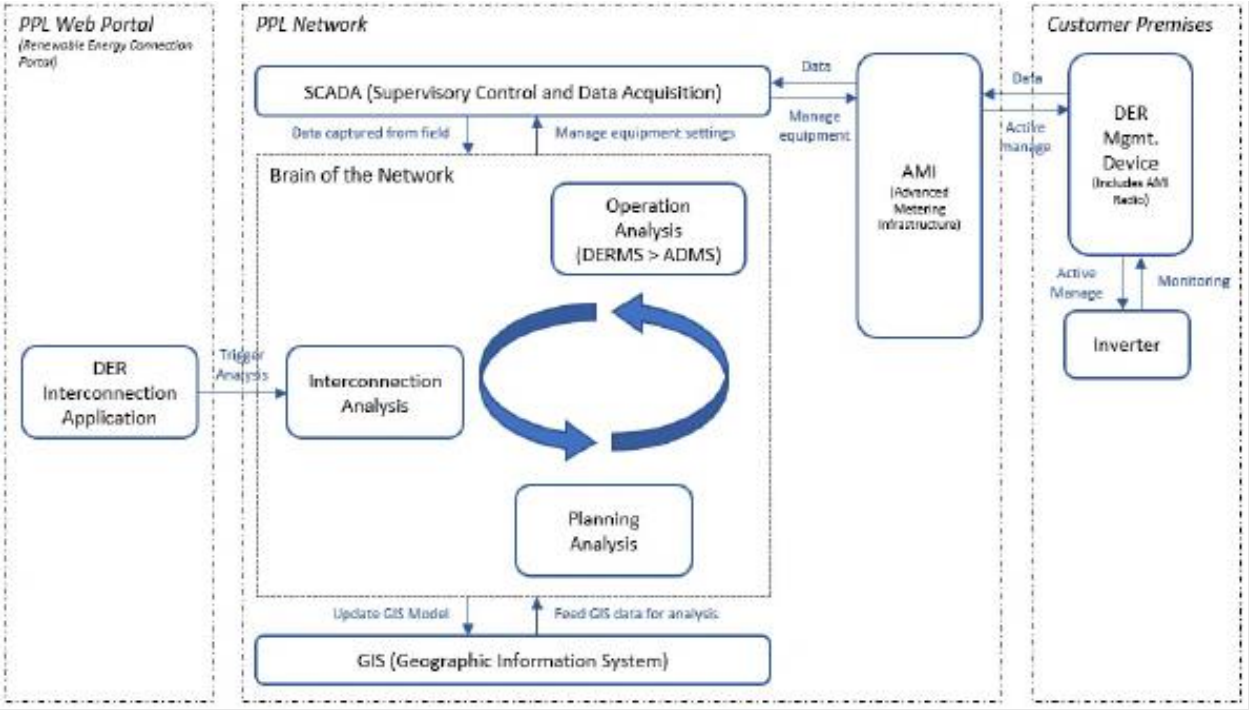

Figure 2 - DER Management Cellular Architecture

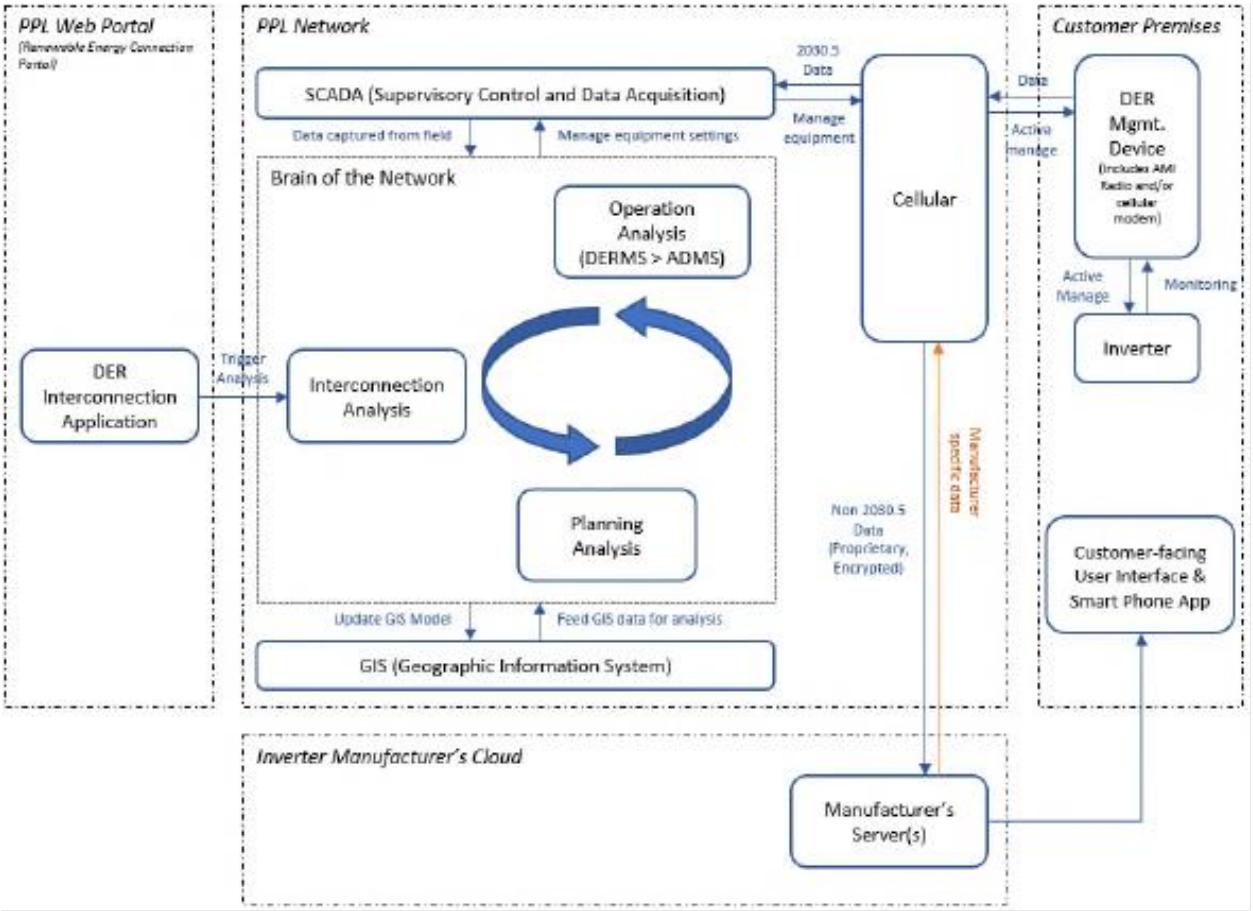


Q. PLEASE DESCRIBE THE DISTRIBUTION MANAGEMENT SYSTEM ("DMS") AND ADMS THAT ARE USED BY PPL ELECTRIC.

A. The original DMS that went live in July 2014 included maps and visuals, Supervisory Control and Data Acquisition ("SCADA") for non-DER devices, and the Distribution Power Flow ("DPF") and Fault Isolation and Service Restoration ("FISR") applications. Originally, these functions did not incorporate DERs. The Company's Advanced Distribution Management System ("ADMS") went live in July 2019 and fully

incorporates DERs and DER measurements into its network model, SCADA, and advanced applications.

Q. WHAT ROLE DOES THE ADMS PLAY IN THE DEPLOYMENT OF DERS AND THE COMPANY'S DER MANAGEMENT PLAN?

A. The ADMS enables the Company to have visibility into DER location, size, and output. The ADMS also supports DERs with its distribution power flow model and can optimize DER management through its Volt/VAR optimization function, Load Volt/VAR Management ("LVM"). Specifically, the ADMS provides the following functionalities:

1. Allows operators and analysts to locate and view DERs and see their basic nominal information, such as location, size, and output;
2. Includes DERs' generation contributions in the DPF function, the results of which are used to manage and optimize the distribution system;
3. Incorporates telemetered inverters' measurements, which allows near real time (approximately 5-minute interval) data to be viewed by operators in ADMS;
4. Uses the Actively Managed ("AM") Group's[2] inverter measurements with DPF and other advanced functions, such as FISR and LVM;
5. Can send commands to AM Group's inverters in the same way as other telemetered devices; and

[2] As explained in Mr. Cody M. Davis's direct testimony (PPL Electric Statement No. 3), the Pilot Program has multiple customer groups: (1) Control Group 1 ("CG1"); (2) Control Group 2 ("CG2"); (3) Control Group 12 ("CG12"); and (4) the AM Group.

6. Can optimize, through its LVM, DERs' power factor setpoints based on DPF solutions at regular intervals, providing an automated method to set DERs to the optimized power factors regularly.

Q. PLEASE DESCRIBE THE COMPANY'S AMI NETWORK.

A. As noted previously, the Company's AMI network is an RF Mesh network made up of multiple network devices, including, but not limited to, meters, routers, collectors, gateways, Integrated WanGate Radios ("IWRs"), and Single Board Radios ("SBRs"). These network devices work together to send meter and network data to PPL Electric's head-end system (*i.e.*, command center).

Q. COULD YOU PROVIDE MORE DETAIL ON HOW THE AMI NETWORK WORKS WITH THE COMPANY'S DER MANAGEMENT DEVICES?

A. PPL Electric's Bridge and Smart Collar and Dongle solutions communicate through the previously discussed RF Mesh network. The inverters are connected to the Company's DER Management devices, allowing PPL Electric to collect the data from the inverters and pass it through the RF Mesh network to the head-end system. Once the data arrives at the head-end system, a "transparent passthrough command"[3] is created to send this data to PPL Electric's servers. These servers feed into the Company's ADMS. Collectively, these technologies allow PPL Electric to monitor the inverters and send commands as necessary.

[3] This command allows the inverter's DNP3 data to pass through to the Company's ADMS.

Q. COULD YOU PROVIDE MORE DETAIL ON HOW THE CELLULAR NETWORK WORKS WITH THE COMPANY'S DER MANAGEMENT DEVICES?

A. The Company's Cellular Gateway solution communicates through a public-facing internet protocol ("IP") to the Company's servers. The Company's servers then communicate to PPL Electric's ADMS, thereby allowing the Company to monitor and send commands as needed. Also, the public-facing IP allows IEEE 2030.5 data traffic to pass to both inverter manufacturers and PPL Electric, meaning that both entities can retrieve data from the inverters.

B. DER MANAGEMENT DEVICES

Q. WHAT IS A DER MANAGEMENT DEVICE?

A. As previously explained, PPL Electric's DER Management devices feature an AMI radio or cellular modem, connect to the DER's local communication interface, and enable the monitoring and management of the DER through the RF Mesh network or a cellular network. The DER Management device allows PPL Electric to remotely monitor the attributes and performance of the DER and manage its grid support settings as needed.

Q. PLEASE DESCRIBE THE INVERTERS THAT ARE CURRENTLY COMPATIBLE WITH THE COMPANY'S DER MANAGEMENT DEVICES.

A. Currently, inverters that are certified to IEEE 1547-2018 and UL 1741 Supplement SB ("UL 1741 SB") can be compatible with the Company's DER Management devices and approved for use in the Company's service territory under Rule 12 of PPL Electric's tariff.

The Company also tests the inverters to ensure that they are compatible with PPL Electric's DER Management devices and can be safely and reliability utilized in the field together.

As of May 17, 2024, PPL Electric's approved inverter list includes 272 approved inverters from 15 different manufacturers, with more inverters from 6 additional inverters manufacturers going through verification and testing at this moment. This list covers the vast majority of inverter manufacturers and inverters that are certified to IEEE 1547-2018 and UL 1741 SB. These inverters are listed in PPL Electric Exhibit AD-1.

PPL Electric also reviews and approves inverters expeditiously; within approximately two weeks. If a customer would like an to use an inverter that is not on the Company's approved list, the customer can send PPL Electric the inverter to review in its DER Lab. Once the Company obtains all the needed documentation from the inverter manufacturer and the inverter passes the Company's review process, the inverter will be added to the approved inverter list. Therefore, as new inverters come to market, PPL Electric can review and approve them for use so long as they meet the applicable requirements. For those inverters that do not initially pass the Company's review process, the DER Lab team will work with the inverter manufacturer on any and all updates that are necessary to pass the review process.

Q. HOW DOES PPL ELECTRIC DESIGN AND TEST ITS DER MANAGEMENT DEVICES FOR CONNECTION TO DER SYSTEMS?

A. Once an inverter has undergone testing, the DER Lab team performs a series of steps to confirm the DER Management device properly connects and communicates with the DER

system. During the review process, the DER Lab works closely with the DER system manufacturer. These steps are laid out in PPL Electric Exhibit AD-2.

Q. DOES THE COMPANY TEST DER MANAGEMENT DEVICES TO ENSURE THAT THEY ARE SAFE?

A. Yes. The Company's DER Management devices undergo a series of internal and manufacturer tests to confirm they are safe for use. Some of these tests include tampering, voltage checks, amperage checks, and weatherproof checks. All of PPL Electric's DER Management devices have passed these tests. These testing procedures and steps are described in PPL Electric Exhibit AD-3 and AD-4.

Q. SINCE THE INCEPTION OF THE PILOT PROGRAM, HOW MANY DER MANAGEMENT DEVICES HAS THE COMPANY INSTALLED?

A. As of May 16, 2024, there are 7,418 DER Management devices installed.

Q. HOW MANY DERS WERE INSTALLED ON PPL ELECTRIC'S DISTRIBUTION SYSTEM DURING THAT SAME TIME PERIOD?

A. As of May 16, 2024, a total of 11,841 DER systems have been installed during the Pilot Program. Of those 11,841 DERs, 7,418 have DER Management devices installed. The remaining 4,423 DERs are grandfathered systems, meaning that they did not have DER Management devices installed because: (1) PPL Electric hit the annual cap of 3,000 DER Management devices; or (2) there were no DER Management devices available that were compatible with those DERs at that time.

C. FIELD OPERATIONS AND EXPERIENCES INSTALLING DER MANAGEMENT DEVICES

Q. AT WHAT STAGE OF THE INTERCONNECTION PROCESS IS THE DER MANAGEMENT DEVICE INSTALLED?

A. The current interconnection process is as follows:

A customer applies for interconnection on the Company's Distributed Generation ("DG") Web Portal[4] choosing one of the approved inverters, or, as stated above, if the customer would like a different inverter, they can contact PPL Electric and request a review of said different inverter. Once the customer applies for interconnection and the applicable interconnection fees are paid, a work order is created. At that point, the interconnection application follows one of two paths, either: (1) the "fast track," which means the applicant's interconnection size is 10 kW or less and, therefore, can proceed with a Level 1 interconnection review process[5] that is quicker than the other interconnection review processes under Chapter 75 of the Commission's regulations; or (2) the work order heads to the Company's Engineering and Design teams so they can start correctly planning for the new DER's load. PPL Electric's interconnection process is further described in PPL Electric Exhibit AD-5. All work orders reach the Company's Planning team for an individually calculated Volt/VAR curve. Once all holds are released from a work order (e.g., Engineering, Design, Planning, Customer Service), the work order is ready for a DER Management device to be installed at the service address by one of the Company's meter

[4]Available at https://www.pplelectric.com/utility/about-us/electric-rates-and-rules/customer-owned-generation/application-process.aspx.

[5] *See* 52 Pa. Code § 75.34(1)(i).

technicians. Once installed, the device will communicate with the Company's servers, so that the PPL Electric DER Automation team can successfully program the individually-calculated Volt/VAR curve onto the inverter.

Q. HOW DOES THE COMPANY INSTALL DER MANAGEMENT DEVICES IN THE FIELD?

A. As noted above, the DER Management devices are installed by PPL Electric meter technicians. When installing a DER Management device, the technicians first verify that they are installing the correct device at the correct location. Once the verification is complete, then the technicians follow a Distribution Device Instruction ("DDI"), which gives step by step instructions to install the DER Management device based on the type of inverter. Ultimately, the DER Management device is connected to the inverter using a RS485 connection[6] or RJ45 connection.[7] PPL Electric Exhibit AD-6 is an example of an inverter manufacturer DDI.

Q. DO THE TECHNICIANS INSTALLING THE DEVICES UNDERGO ANY TYPE OF TRAINING?

A. Yes. The technicians undergo an extensive two-week training on installing DER Management devices, which includes practicing installations in the Company's DER Lab

[6] An RS485 connection refers to a serial connection. *See* https://www.cuidevices.com/blog/rs-485-serial-interface-explained#:~:text=motion%20control%20equipment.-,What%20is%20RS%2D485%3F,devices%20on%20the%20same%20bus.

[7] An RJ45 connection refers to an ethernet cable connection. *See* https://www.cuidevices.com/blog/the-ultimate-guide-to-rj45-connectors.

as well as demonstrating successful side-by-side installations in the field with the trainer. Also, during this training, all technicians are required to pass a written and physical test before they can install DER Management devices alone.

Q. WHAT HAS THE COMPANY LEARNED FROM ITS EXPERIENCES INSTALLING DER MANAGEMENT DEVICES?

A. The Company has many lessons learned from its experience installing DER Management devices. For example, the Company determined how to properly wire SolarEdge Technologies, Inc. ("SolarEdge") backup interface ("BUI") setups with multiple inverters, which allowed PPL Electric to help solar installers in the Company's service territory install these types of DER systems. The Company has also helped solar installers learn about inverter defects causing capacitors to blow due to a hardware failure. Further, PPL Electric has discovered quirks with certain inverters and passed along those findings to solar installers. Some examples of these quirks include when Delta Electronics, Inc. ("Delta") inverters need to be daisy chained, these inverters need a specific RS485 pin out selected,[8] or how touch screen SolarEdge inverters can only use RS485 Port 1 or TCP ports because the inverter will revert to either of these settings if RS485 Port 2 is chosen.

[8] A pin out refers to the serial connection pin-out provided to PPL Electric by the inverter manufacturer to read/write to the device. *See* https://knowledge.ni.com/KnowledgeArticleDetails?id=kA00Z0000019M21SAE.

Q. HAVE CUSTOMERS BENEFITTED FROM THE INSTALLATION OF THE DER MANAGEMENT DEVICES ON DER SYSTEMS?

A. Absolutely. On numerous occasions, the Company has alerted customers that their systems were either turned off or not generating. When on site, the Company also has supported customers by informing them that their backup battery was not connected properly and instructed them to reach out to their installers to have the situation fixed. In other instances, the Company has alerted customers that their inverters were faulty and needed replacement due to hardware issues.

D. SMART INVERTER TESTING AND CERTIFICATION PROCESS

Q. HOW DOES THE COMPANY TEST NEW SMART INVERTERS FOR COMPATIBILITY WITH ITS DER MANAGEMENT DEVICES?

A. PPL Electric's DER Lab completes a series of tests to confirm the inverter is compliant with IEEE 1547-2018 and UL 1741 SB. These tests verify that the applicable communication protocol registers are built into the inverter and also that the proper registers are read/write capable. The Company's DER Lab sample Test Plan for Inverters is attached hereto as PPL Electric Exhibit AD-7. For inverters that are not compliant, the DER Lab works with the inverter manufacturer to build said registers that allow the device to be compliant with IEEE 1547-2018 and UL 1741 SB.

Q. HOW LONG DOES IT TAKE FOR A NEW INVERTER TO BE APPROVED?

A. As explained earlier in my testimony, the Company reviews and approves inverters quickly, typically within two weeks. If an inverter does not have the proper firmware or functionality, it can make the review process take longer.

Q. PLEASE PROVIDE AN OVERVIEW OF THE TYPES OF INVERTERS INCLUDED ON THE COMPANY'S APPROVED LIST OF SMART INVERTERS.

A. PPL Electric's approved inverter list includes inverters from the vast majority of inverter manufacturers. Inverters such as SolarEdge, Delta, SMA Solar Technology AG, Tigo Energy, Solis (Ginlong Technologies), and Sol-Ark, LLC ("Sol-Ark"), in varying sizes, can be found on this list. The prices of these inverters vary, with some being as low as $1,000.

Q. HOW MANY SMART INVERTERS HAS THE COMPANY APPROVED THROUGH THIS TESTING PROCESS?

A. As I noted previously, as of May 17, 2024, PPL Electric's approved inverter list includes 272 inverters from 15 different manufacturers, with more inverters from 6 additional inverters manufacturers going through verification and testing at this moment.

E. FUTURE TECHNOLOGY

Q. IS THE COMPANY'S SECOND DER MANAGEMENT PLAN POSITIONED TO RESPOND TO DEVELOPMENTS IN FUTURE TECHNOLOGY?

A. Yes. The Company actively works to add new inverters to the approved list as they come to market. PPL Electric continuously evaluates the current DER Management devices to verify that they communicate with all technologies attempting to connect to the distribution grid. As new technologies and standards come to the market, the Company will actively work to develop a DER Management device solution.

Q. CAN THE COMPANY'S DER MANAGEMENT DEVICES ACCOMMODATE SOLAR PLUS BATTERY STORAGE SYSTEMS?

A. Yes. The Company's DER Management devices have been connected to multiple solar plus battery storage systems to date. These systems include setups with inverters such as SolarEdge or Sol-Ark. Even with the battery installed, the Company can communicate with the inverter and receive the necessary data. Customers can also access the same data while PPL Electric's DER Management device is installed.

Q. CAN THE COMPANY'S DER MANAGEMENT DEVICES ACCOMMODATE COMBINED HEAT AND POWER ("CHP") SYSTEMS?

A. Yes. One inverter-based CHP system that is IEEE 1547-Supplement A ("IEEE 1547-SA") certified has been interconnected with the distribution system and has had a DER Management device installed. This system needed to be reviewed offsite due to the heat portion of the system, but through working with the manufacturer, the Company has

successfully reviewed a Capstone Turbine CHP system. This type of system has an open and available port similar to solar inverters.

Q. ARE THERE OTHER EMERGING TECHNOLOGIES THAT THE COMPANY IS PREPARING TO INTEGRATE INTO ITS DER MANAGEMENT PROGRAM?

A. Many inverter manufacturers are working on moving to cloud communications instead of serial connections. PPL Electric is prepared for inverters that use cloud communications, as the Company's Cellular Gateway is compatible with them. This technology is also compatible with inverters that use cloud communications.

Q. IF A CUSTOMER PROPOSES TO INTERCONNECT A SYSTEM THAT IS NOT COMPATIBLE WITH THE COMPANY'S DER MANAGEMENT DEVICES, CAN THE SYSTEM STILL BE APPROVED TO INTERCONNECT?

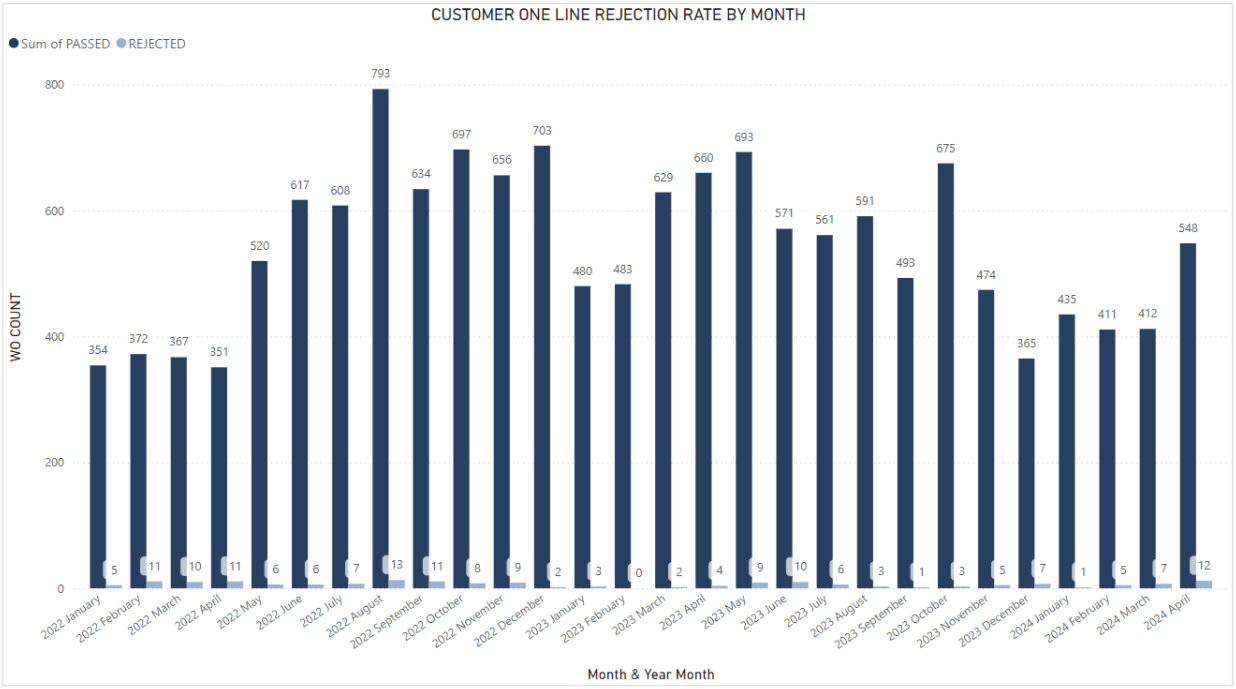
A. Yes. Under the Pilot Program, PPL Electric allows customer-generators to interconnect their DERs if the Company does not have a DER Management device available. Going forward, the Company proposes some modifications to Tariff Rule 12 to clarify and improve on this process for the Second DER Management Plan. As set forth in the proposed *pro forma* tariff supplement (PPL Electric Exhibit SS-2), if the Company does not have a DER Management device that is available or compatible with the proposed DER inverter set forth in an interconnection application, the Company may, in its sole discretion, approve the interconnection application, provided that the interconnection application and proposed DER meet all of the other requirements under the Commission's regulations and

Rule 12 of PPL Electric's tariff. The Company will then install a DER Management device on such DERs once a compatible DER Management device becomes available.

Q. HOW OFTEN DOES THE COMPANY DENY INTERCONNECTION APPLICATIONS?

A. PPL Electric is a strong supporter of DER development and promoting alternative energy sources. Notably, PPL Electric's average interconnection rejection rate is very low (*i.e.*, 1.17% of all applications). Figure 3, below, shows the Company's interconnection rejection rate between January 2022 and April 2024.

Figure 3 - DER Management Reject Rate per Month



Applications that have issues such as incorrect one-line diagrams or incorrect inverters are returned to customers with a detailed explanation of why the application was rejected and how to address the issues found. Once a customer addresses the deficiencies in the

application, it is reviewed again and will be approved if all identified issues were satisfactorily addressed. Therefore, PPL Electric's interconnection team actively works with both the installers and applicants to correct any issues with the application and system design so the interconnection application can be approved.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY AT THIS TIME?

A. Yes, although I reserve the right to supplement my direct testimony.

PPL Electric Exhibit AD-1

PPL Test Plan for DER Management devices

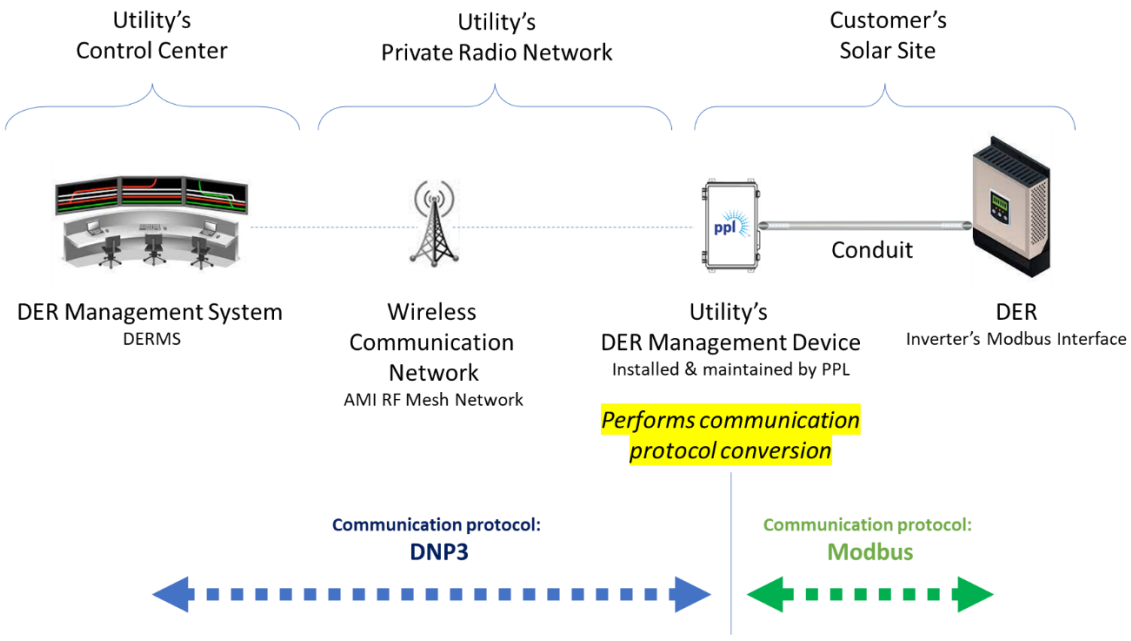
As of 05/17/2024

Contents

Purpose: Test DER Management Device.....1
Setup 2
Verify Communication from Data Center to Radio 2
Verify End-to-End Communication 2

Purpose: Test DER Management Device

- The intention of this test plan is to verify that a DER Management Device functions as intended.



Setup

Typical setup for performing this test:

- Install into the DER Management Device a Landis+Gyr (L+G) radio that is configured to connect to the AMI test network
- Connect DER Management Device's data interface to an inverter (DER)
- Connect power to DER Management Device
    - Verify DER Management Device has expected voltage at its power terminals using a multimeter.
    - Verify DER Management Device's power indicator lights are lit as expected
- Verify L+G radio is properly seated
    - Verify L+G radio LED is lit (indicating power) and network indicator light is "slow" blinking (indicating connection to network)

Verify End-to-End Communication

- Using Command Center, connect to the L+G radio to verify it has connected to the AMI test network
- Using RadioShop:
    - Connect to the L+G radio
    - Deploy DCW associated with the inverter used in the test setup
    - Verify Modbus communication from L+G radio to inverter using Send Generic Command: 00,01,10,10
    - Observe Modbus polling requests and poll responses
    - After confirmation, disable Communication Monitor using Send Generic Command: 00,01,11,11
- Using SUBNET SubSTATION Server ("Subnet"):
    - Configure Subnet to connect to L+G radio and load the data template associated with the inverter used in the test setup
    - Open Subnet Communication Monitor feature to observe outgoing DNP poll requests and incoming poll responses
    - Observe inverter data in Subnet interface

ConnectDER

Meter Socket Adapters

What are they and what do they do?
How are they tested?
What is the industry best practice?

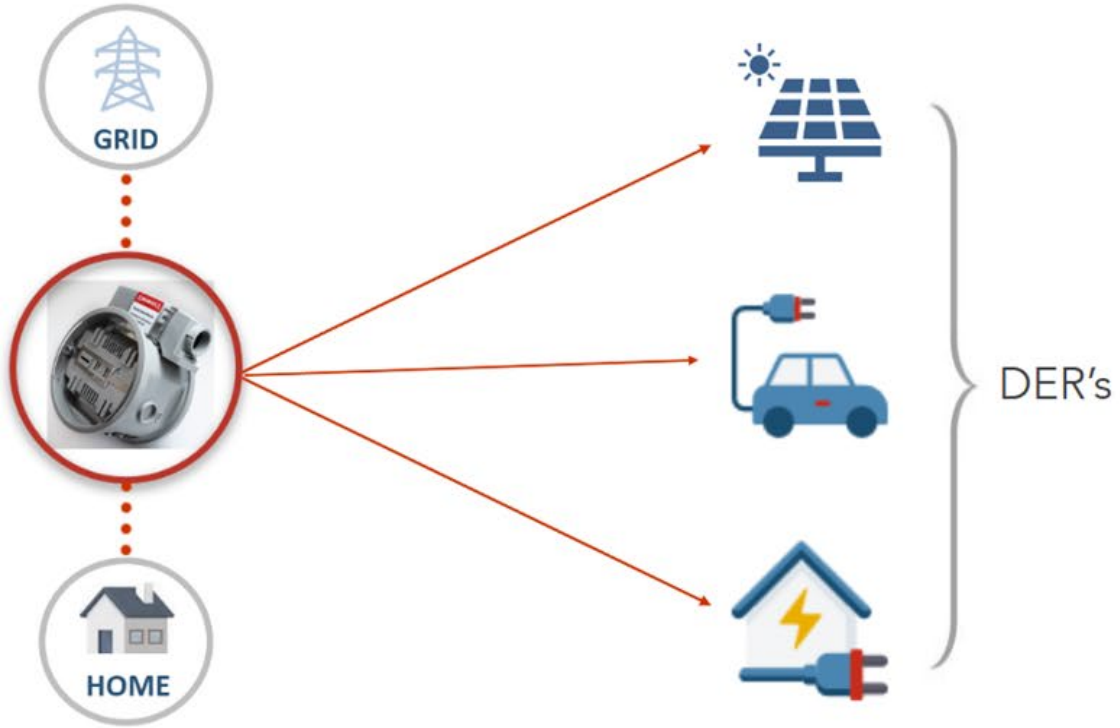
PPL 4/25/24

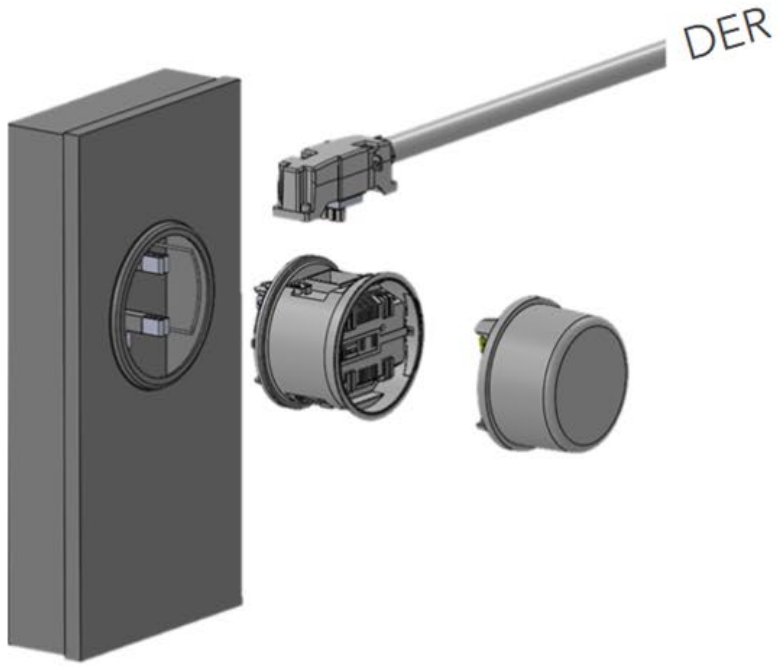
Dan Falcone VP Product dfalcone@connectder.com
Jon Knauer VP Policy jknauer@connectder.com
Colin Mattox Director EV cmattox@connectder.com
Martin Vilarino Product Manager mvilarino@connectder.com

What is a Meter Socket Adapter (MSA)?

- An MSA is a unique hardware interface/gateway physically installed between a meter socket and a utility billing meter to accommodate streamlined interconnection of Distributed Energy Resources (DER's)

- An MSA works on most homes and eliminates the need for service upgrades, modification to existing service equipment, or main panel upgrades (MPU)





Meter Socket Adapter (MSA)

→ What is an MSA? How is it Tested / Certified?

- "*A meter socket adapter is an enclosed construction with blades and jaws intended for installation between a meter socket and the utility meter…The typical meter socket adapter is a circular 'collar' type device…utilized in many different applications, such as meter conversions, transfer of meter position, distributed energy connections, surge protection, metering and communication…*"
- Physical / electrical aspects are covered by:
  - ANSI/NEMA C12.7, Requirement for watthour meter sockets
  - C12.10, Electromechanical watthour meters
  - UL 414, Meter Sockets

National Electrical Manufacturers Association

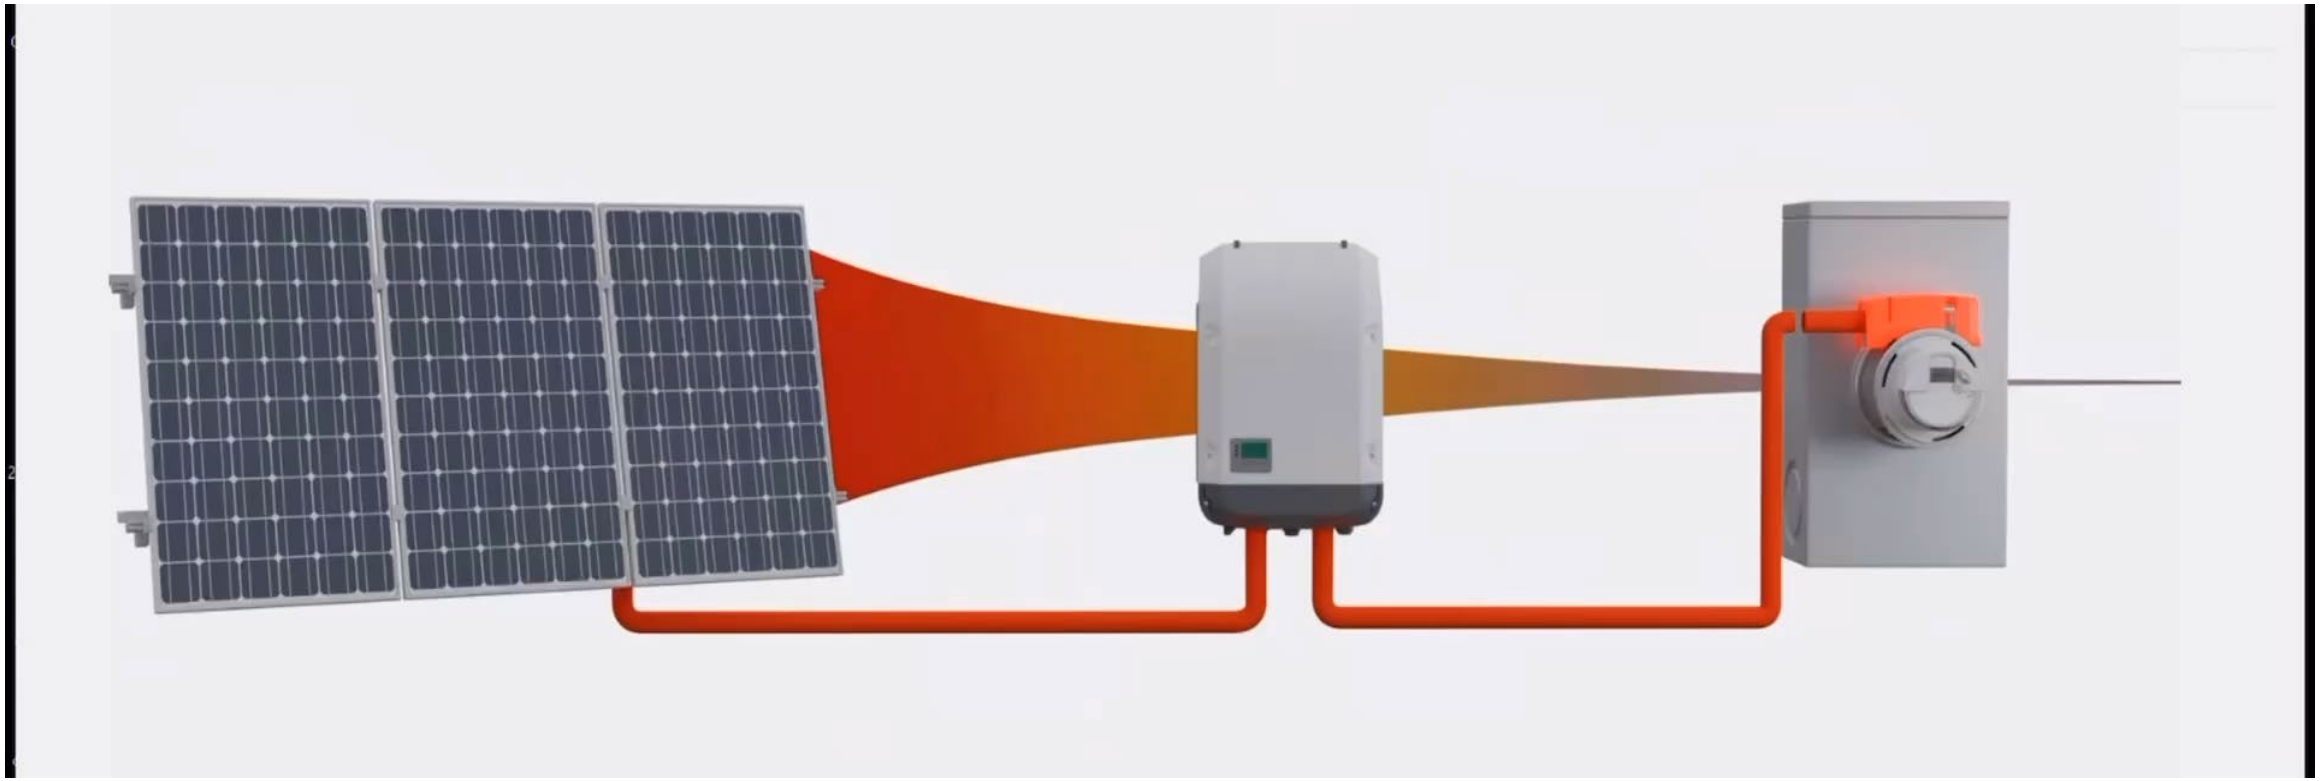
Interconnection Simplified

Connecting Solar PV



We know that the *UTILITY* has ambitious goals and the energy industry is moving to electrification

Support DERs

With pending climate goals, upcoming electrification, and increasing load forecasts, increased enablement of DERs is key for success.

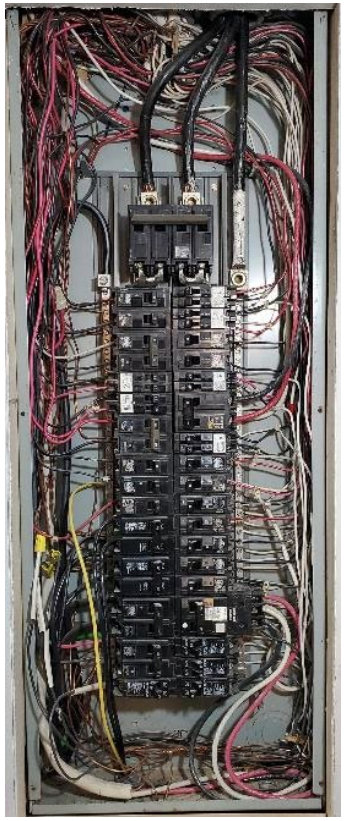
Improve Customer Satisfaction

Utilities are being evaluated for customer facing programs and support in addition to providing safe and reliable power.

Improve equitable and affordable options

Electrification is more challenging for lower and middle income customers. Adoption of technology can allow more flexibility and options for electrification.

The challenge: Service panels limit how quickly and effectively customers and the Utility can reach these goals



- **Low-tech**: Most panels do not allow for integration of new technology and resources
- **Undersized**: Panels cannot accommodate increasing need for DERs like rooftop solar PV and EVSEs
- **Hard to reach**: Panels may be inconveniently located, requiring structural changes to accommodate additional appliances and end-uses
- **Expensive to replace**: Main panel upgrades can cost $2-$5,000 or more

Additional Challenges

- **Lack of Standardized Interconnection Methods**: Other ‘supply-side’ interconnection methods vary noticeably in quality, safety, consistency and local approval

- **Complicated/Dangerous Site Inspections**: Pre-sales/installation site visits to investigate interconnection options can be complex, dangerous and requires special training

- **Meter-Main Combo Panels**: Combination panels with meter and service panel in same enclosure, typically found in Western/Southern U.S. can be difficult or impossible for DER’s to interconnect within

- **Indoor Work & Disruption**: Routing DER circuits through/across internal walls, floors, attics and basements is laborious and invasive to homeowners

- **Cost**: Standardizing around a single interconnection method that is outdoor MSA-based can save upwards of $2-5,000 per DER installation

Electrification for the Consumer will be costly!

- For residential buildings and the end consumer, electrification may involve:

  - ASHP – Air Source Heat Pump in place of gas / oil heat
  - Electric hot water – on demand, tank, via heat pump
  - EVSE – Electric Vehicle Supply Equipment – EV Chargers
  - BESS - Battery Energy Storage Systems
  - PV Solar – residential PV solar systems

- Many of these technologies have added cost for home wiring, service panel upgrades, and challenges with physical location of assets.

- The global market in the US exceeds $100 billion!

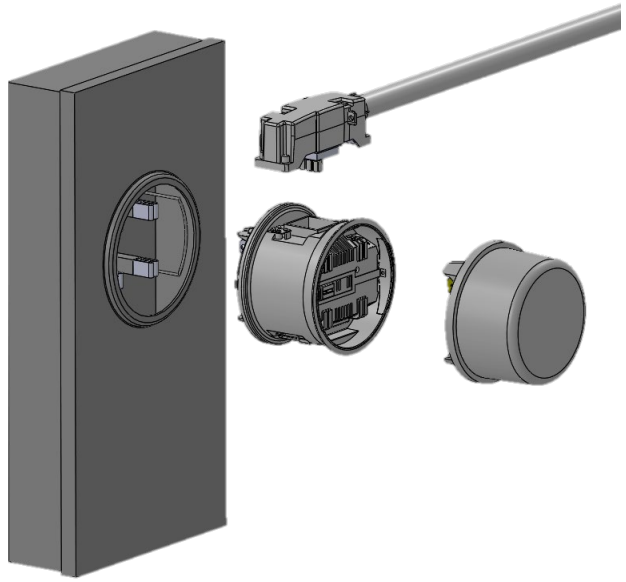
- MSAs can enable significant cost savings as we move to electrification by reducing labor costs and standardizing installations!

Reference: Pecan Street & Juniper Research

ConnectDER MSAs connect solar, EVSE, and more without costly upgrades

Overview

- Extension of meter socket – fits between customer's meter socket and utility meter
- 200 Amp continuous rating – same as the meter and socket
- Installed by qualified personnel in under 15 minutes
- UL Listed (414 - Meter Sockets)



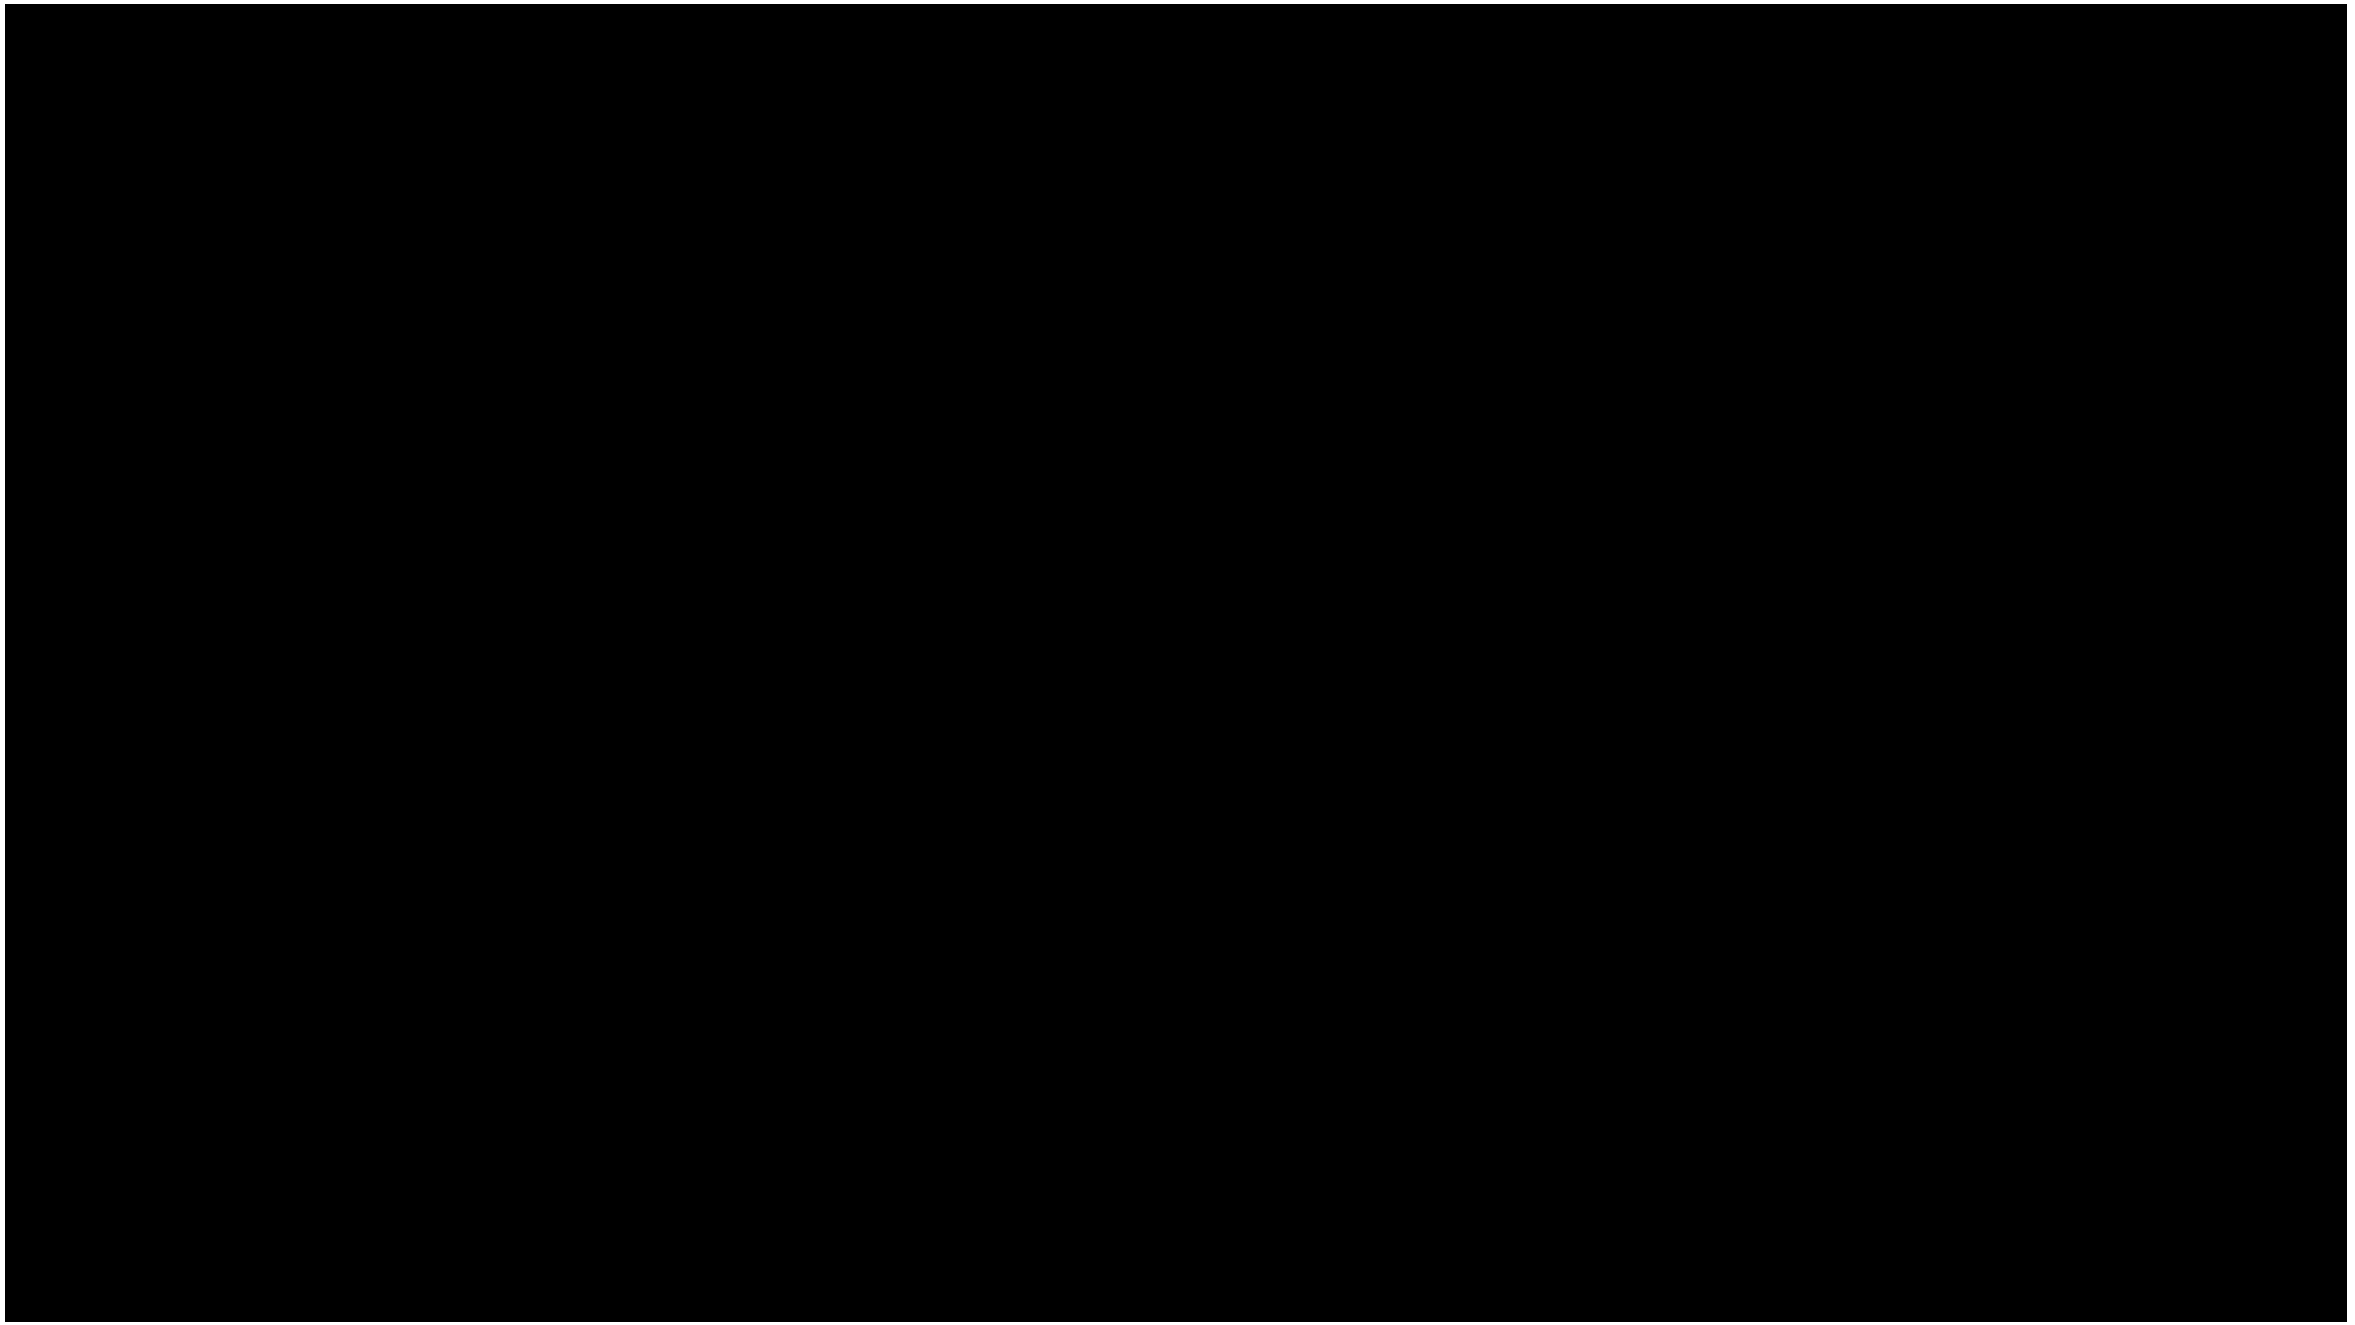
Plug-in adapter uses meter socket instead of the service panel

Ease of Installation

Plug & Play Design

- Design improvements based on utility feedback for ease of removal of MSA without special tooling
- Can be disassembled and removed with leather protectors over secondary gloves
- Uses industry standard meter seals for securing
- *ConnectDER has a patent on the specific design

MSA Install



UL Testing

- UL Solutions evaluates product for safety in several ways
- UL Solutions has tested certified and listed the ConnectDER MSA against UL 414, SA & SB
- UL File #E361188

Hazard	Purpose	Tests
Installation Safety	• Safe installation for trained installer • Fit for purpose for installation in Meter Socket and with a Meter • Resistant to environmental factors	• Construction Review • Markings Review • Installation Manual Review, • Insertion and Withdrawal Force for Meter Jaws • Strength Test of Insulating Base and Support • Rain Test • Ball Impact • Crushing Resistance
Thermal Safety	• Resistance to fire • No risk of fire from internal sources • Controlled heat for adjacent structures and equipment	• Construction Review • Flammability • Heat Rise • Short Circuit • Dielectric Voltage Withstand
Electrical Safety	• No risk of electrocution from exposed live parts • Proper grounding • Internal insulation and clearances to prevent short circuits	• Construction Review • Mold Stress Relief Distortion • Dielectric Voltage Withstand • Bonding Continuity • Short Circuit • Ball Impact • Crushing Resistance • Rain Test

Test	Test Criteria	Applicable Standard (Clause)	Result
Construction Review	• Ensure all components and materials are UL LISTED and/or meet corresponding UL® standards. • Measure that creepage and clearances for all electrical conductors meet or exceed minimum requirements. • Confirm that insulation thickness and bend radius of all wire conductors meet or exceed the minimum requirement. • Verify that dimensions are compatible with Meters and Meter Sockets.	UL 414 (3-12) UL 414A (SA2) UL 414B (SB5-SB7)	☑ PASS
Flammability	• Ensure material does not sustain flame or produce flaming debris. • Ensure exposure to flame does not result in opening that could expose live parts.	UL 746C (52)	☑ PASS
Crushing Resistance	• Ensure exposed surface of the product resists to crushing force of at least 100 lbs.	UL 746C (55)	☑ PASS
Resistance to Impact	• Ensure exposed surface of the product resists to impact of at least 5 ft-lbs (3 different locations).	UL 746C (56)	☑ PASS
Mold Stress Relief Distortion	• Ensure that the product does not shrink or distort in a way that reduces clearances, expose live parts to contact, or cause interference with the operation of the product, following heating at 10C above maximum operating temperature.	UL 746C (61)	☑ PASS
Rain Test	• Ensure no water from simulated rain enters the enclosure above the lowest live part or terminal. • Ensure no water comes in contact with live parts or insulating material.	UL 414 (17)	☑ PASS
Insertion and Withdrawal Force for Meter Jaws	• Ensure no operation (insertion or removal) requires force greater than 100lbs. • Ensure no damage (e.g. cracking) occurs during insertion or removal.	UL 414 (19)	☑ PASS
Dielectric Voltage Withstand	• Ensure that product can withstand 1480V between live parts or opposite polarity, and live parts to enclosure.	UL 414 (20.1)	☑ PASS

Test	Test Criteria	Applicable Standard (Clause)	Result
Bonding Continuity	• Ensure continuity between the grounding straps on the top of the MSA and the tabs on the base.	UL 414 (22)	☑ PASS
Strength Test of Insulating Base and Support	• Ensure the insulating base of the Junction Box is not damaged when applying 110% of the torque marked on the unit to the field wiring terminals.	UL 414 (24)	☑ PASS
Heat Rise	• Ensure that temperature rise observed in the product does not exceed 65C for jaws (*) and bus bars, 60C on factory wiring terminals, and 55C for field wiring terminals under the maximum rated current. (*) Meter Socket Jaw Heat Rise values are corrected based on measurements with a simulated meter only, as ConnectDER Solar MSAs are not intended for use in a specific meter socket (SB12.2).	UL 414B (SB12)	☑ PASS
Short Circuit	• Ensure the product can withstand a short circuit of 22kA on the DER branch circuit without: o damage to the enclose that would expose live parts o excess current to ground o Arcing between live parts of opposite polarity o Failure of a dielectric voltage-withstand test	UL 414B (SB13)	☑ PASS
Markings	• Ensure all required marking, such as voltage, continuous current, and short circuit current ratings, are included.	UL 414B (SB14)	☑ PASS
Installation Manual	• Ensure the installation manual includes required instruction, such as proper installation of the field wiring, grounding conductors, safe installation into a meter socket.	UL 414B (SB15)	☑ PASS

The regulatory landscape has shifted aggressively to electrification

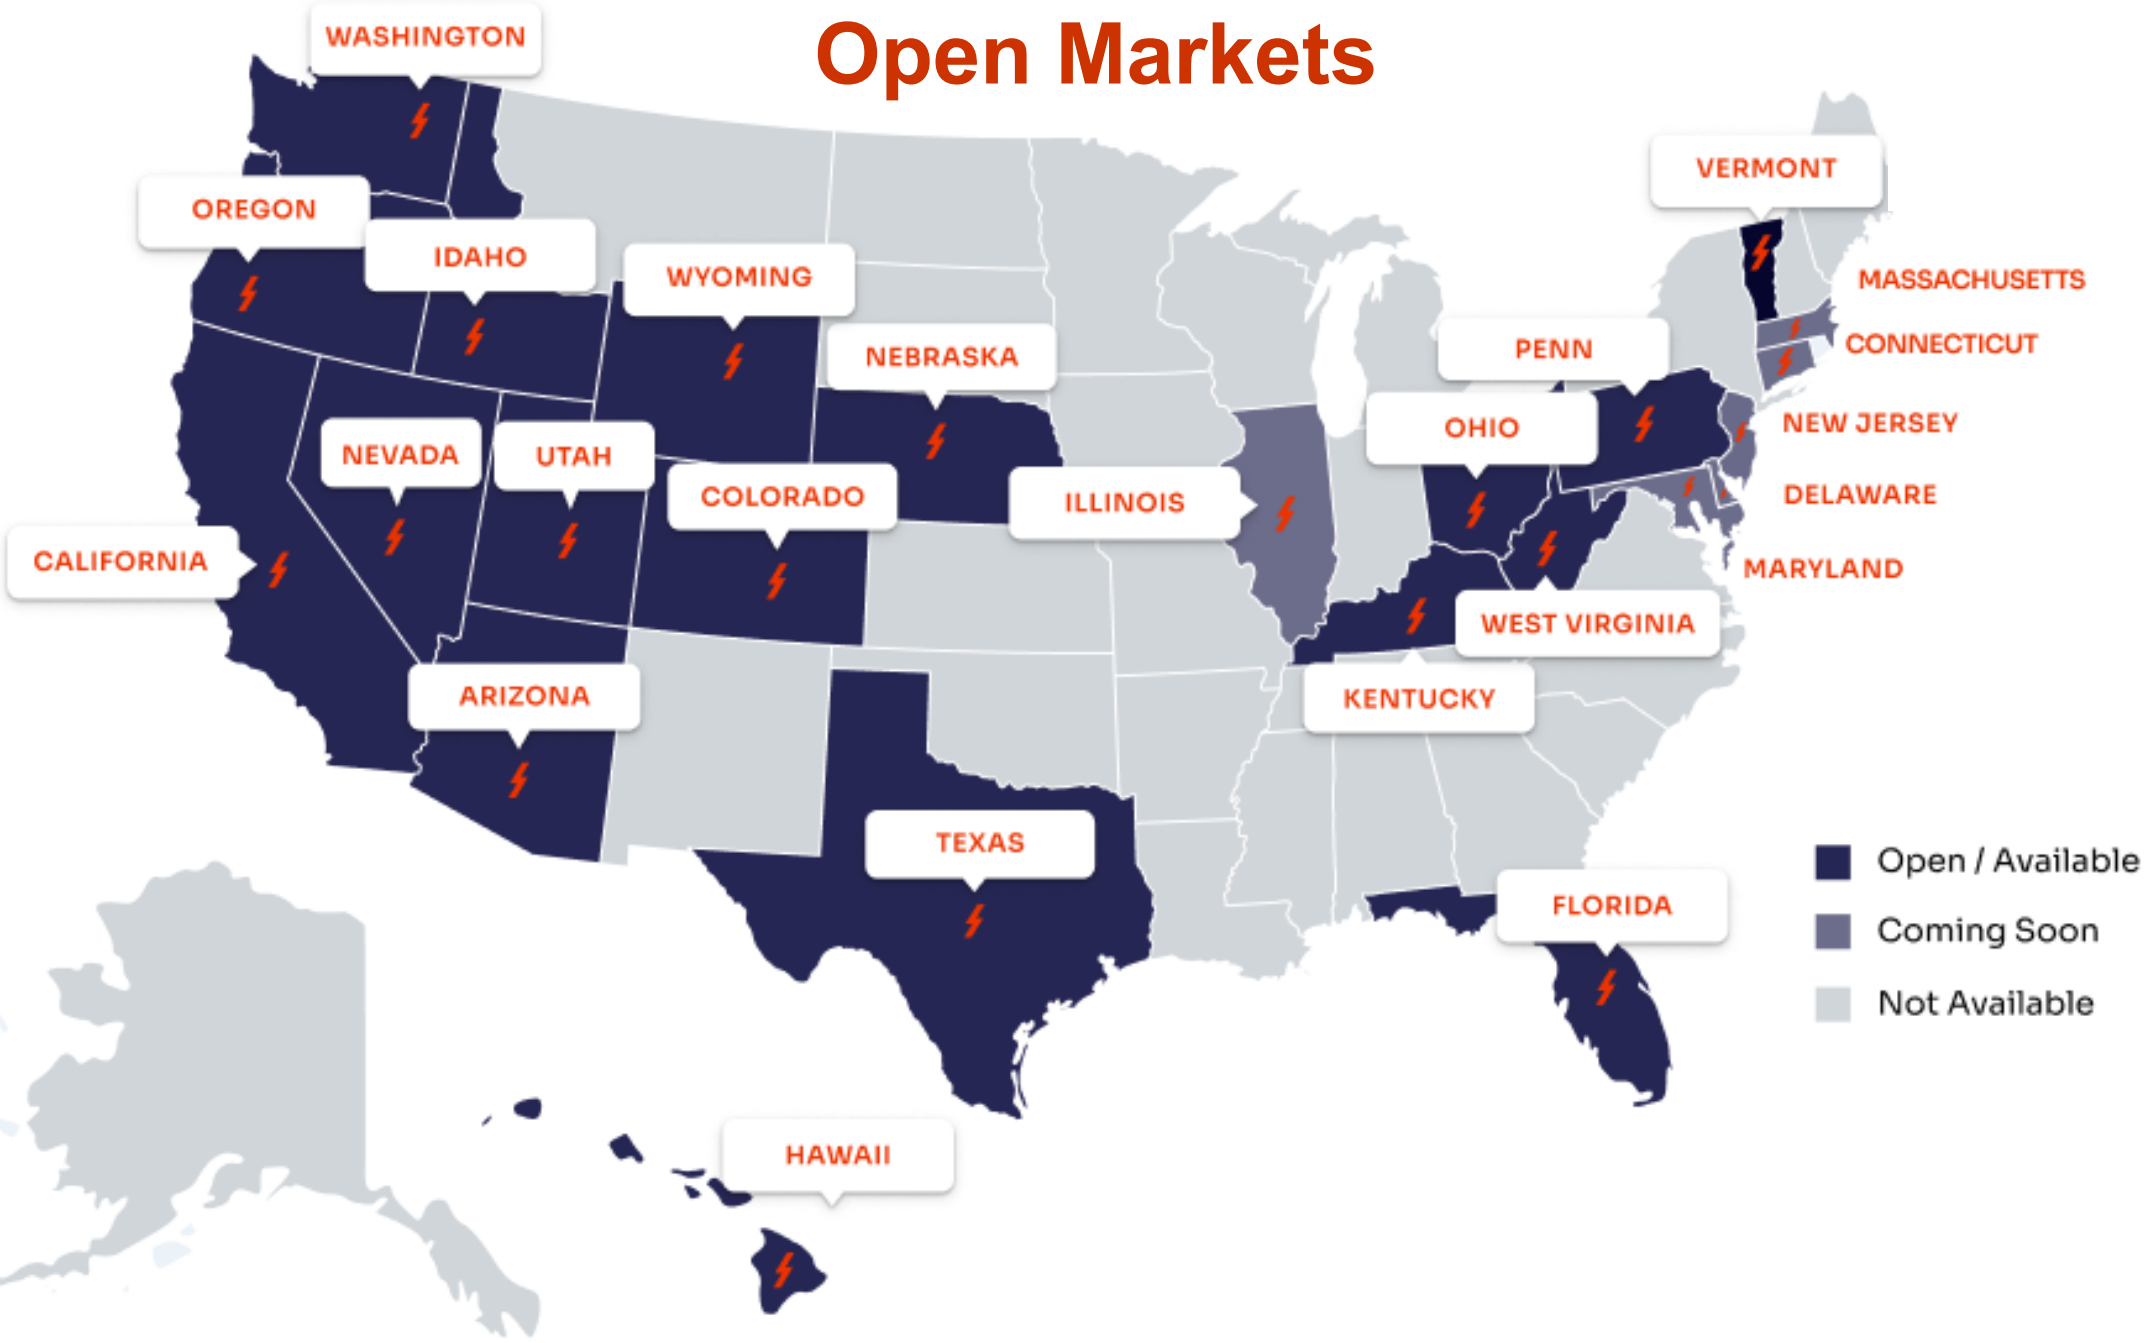
- Legislation and Regulatory proceedings in 10+ states
- Markets in Texas, New England, and the Northwest are in scope for 2024
- Examples of current political environment with regards to adoption of technologies for affordable, sociable, and equitable electrification:

Existing
- Colorado
- Arizona
- California
- New Jersey
- New York

Ongoing
- Illinois
- Maryland
- Connecticut
- Massachusetts

Initiated
- DC
- Delaware
- Texas
- New Hampshire
- Michigan

Open Markets



MSA Best Practices

Test & Evaluate

- Test sample units
- Review NRTL / Standards Listing Reports
- Review Manufacturer Documentation
- Intracompany review
- Regulatory response (if applicable)

Approve

- Add to utility handbook / approved list with model numbers
- Update training documentation for meter install / exchange / removal
- Add an option for MSA selection within DER interconnection applications
- Inform field crews of new customer owned device

Open Market

- Manufacturer begins sales in the approved service territory
- Interconnection applications are processed with an MSA
- Customer Installs begin
- Products are promoted to support clean energy goals, electrification, and LMI programs / initiatives

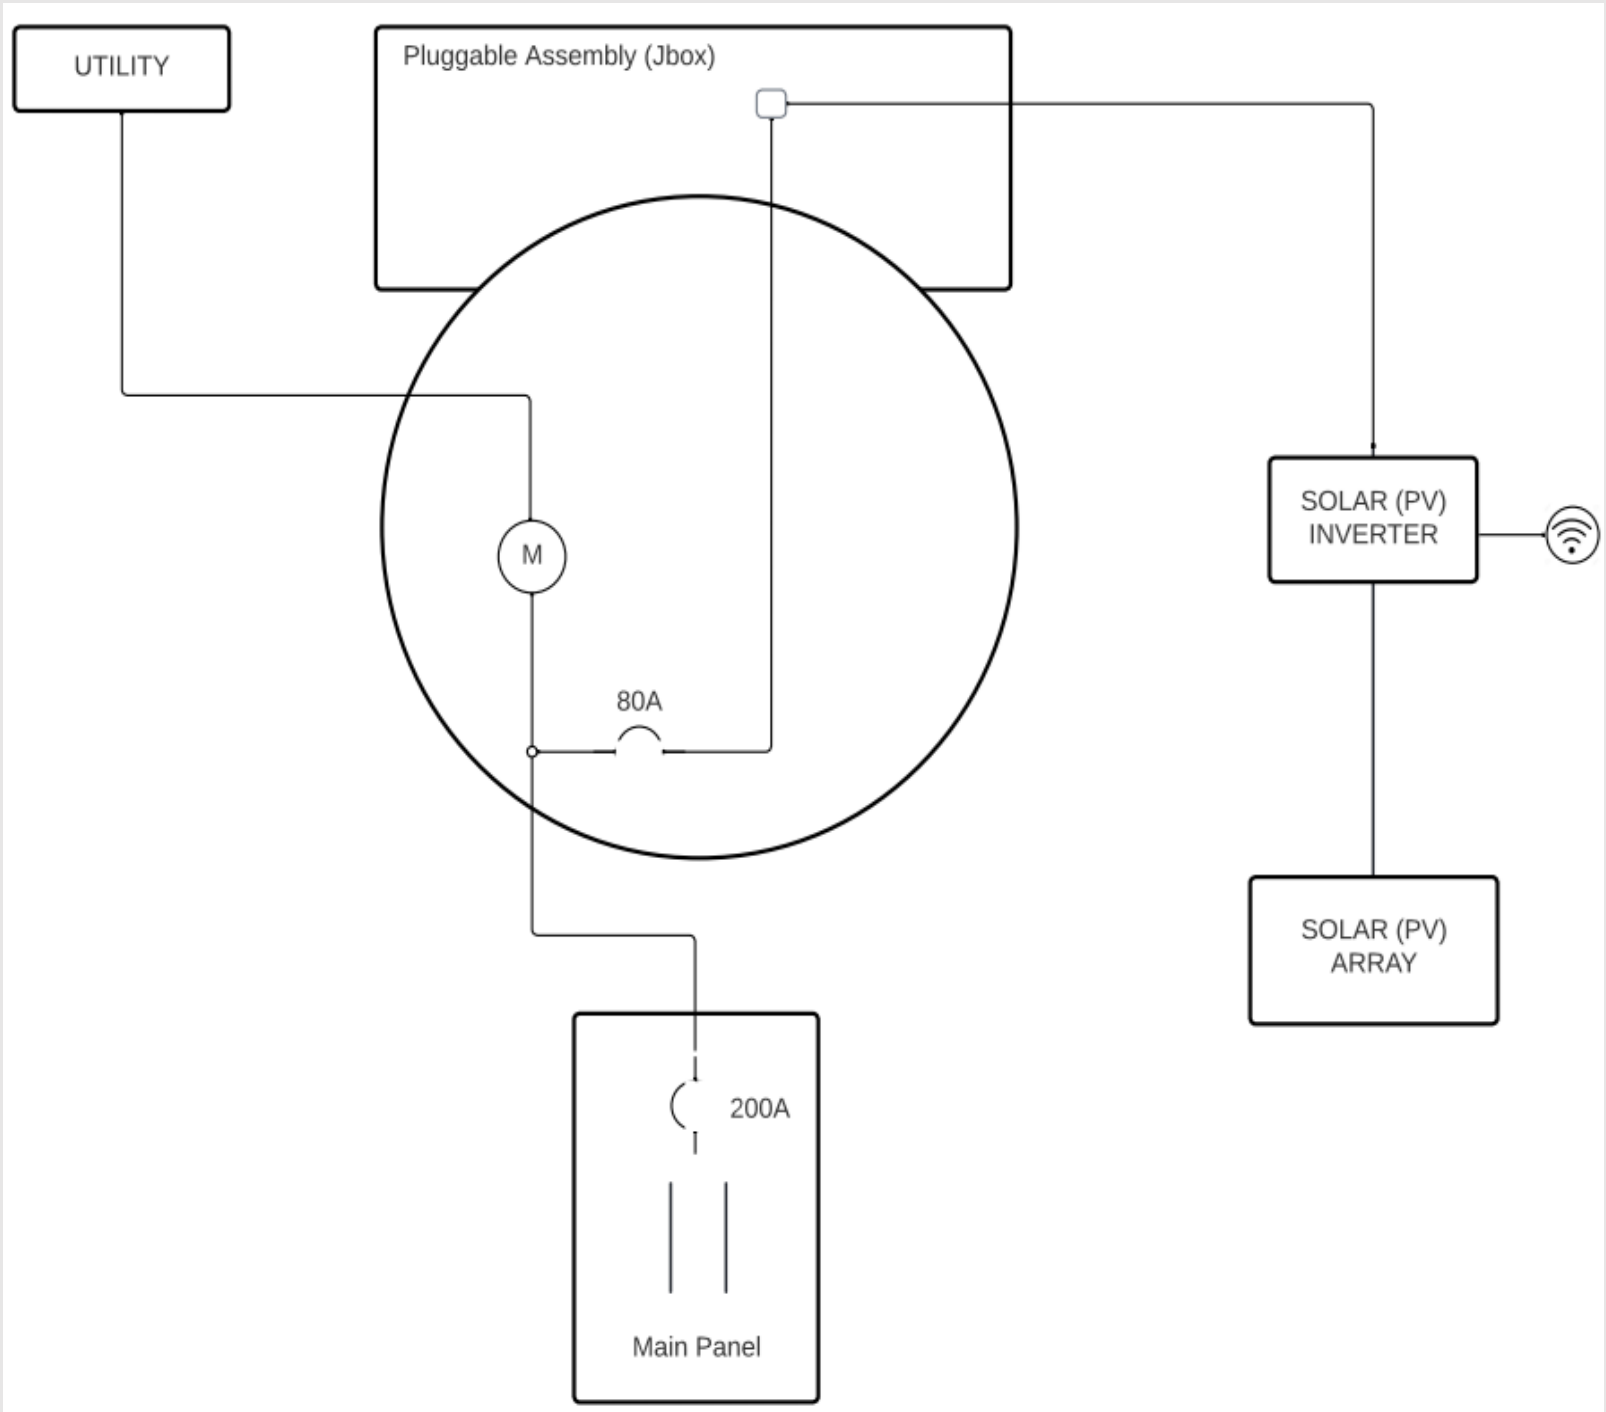
Solar MSA V5.2

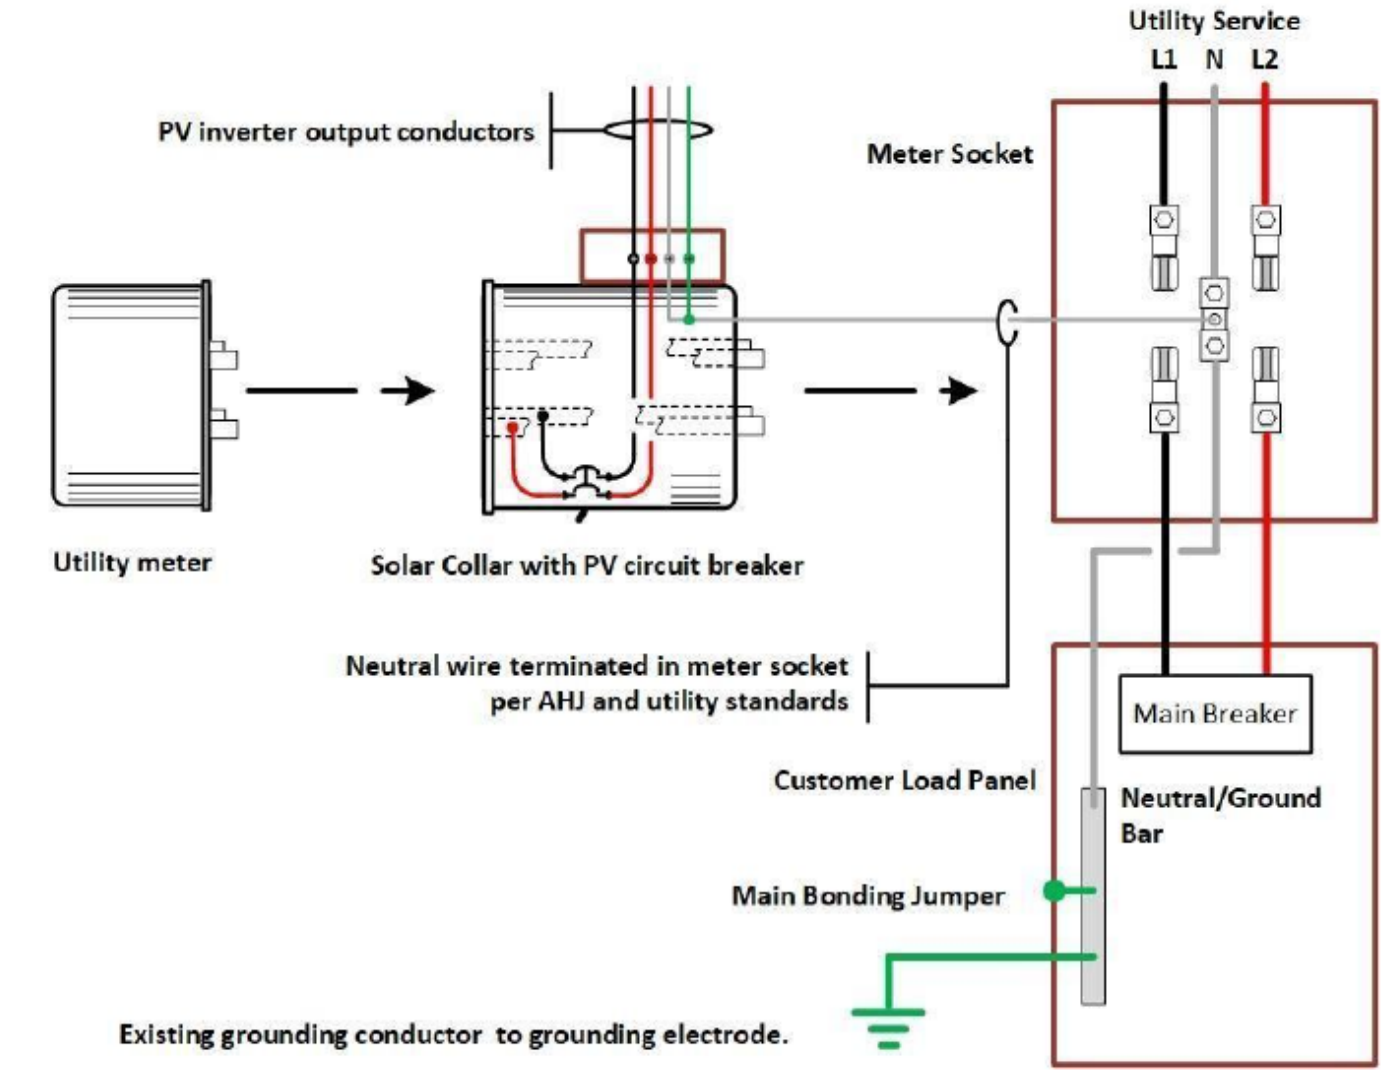
Key Features

- Rated for use in up to 200 Amp services
- 15-80 Amp circuit breaker options
- Up to 15.36 kW PV Solar
- 22k AIC / AIR rating
- 2S and 12S meter forms



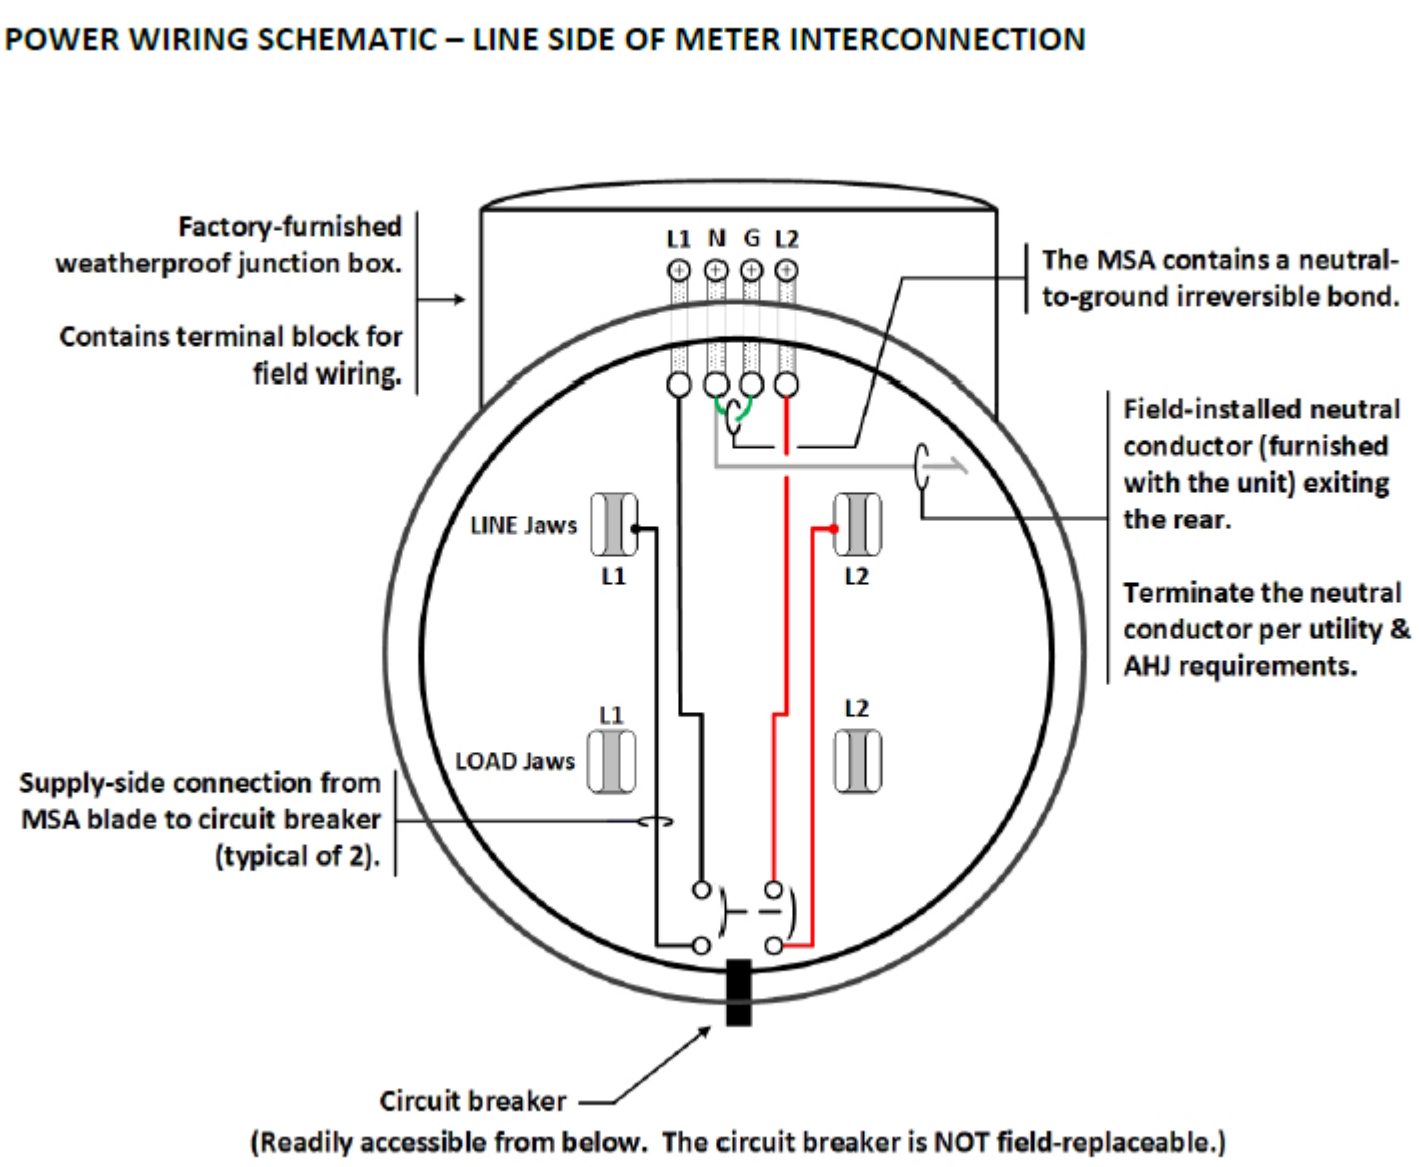
Wiring Diagram

SOLAR PV INTERCONNECTION WIRING EXAMPLE – LOAD SIDE MSA

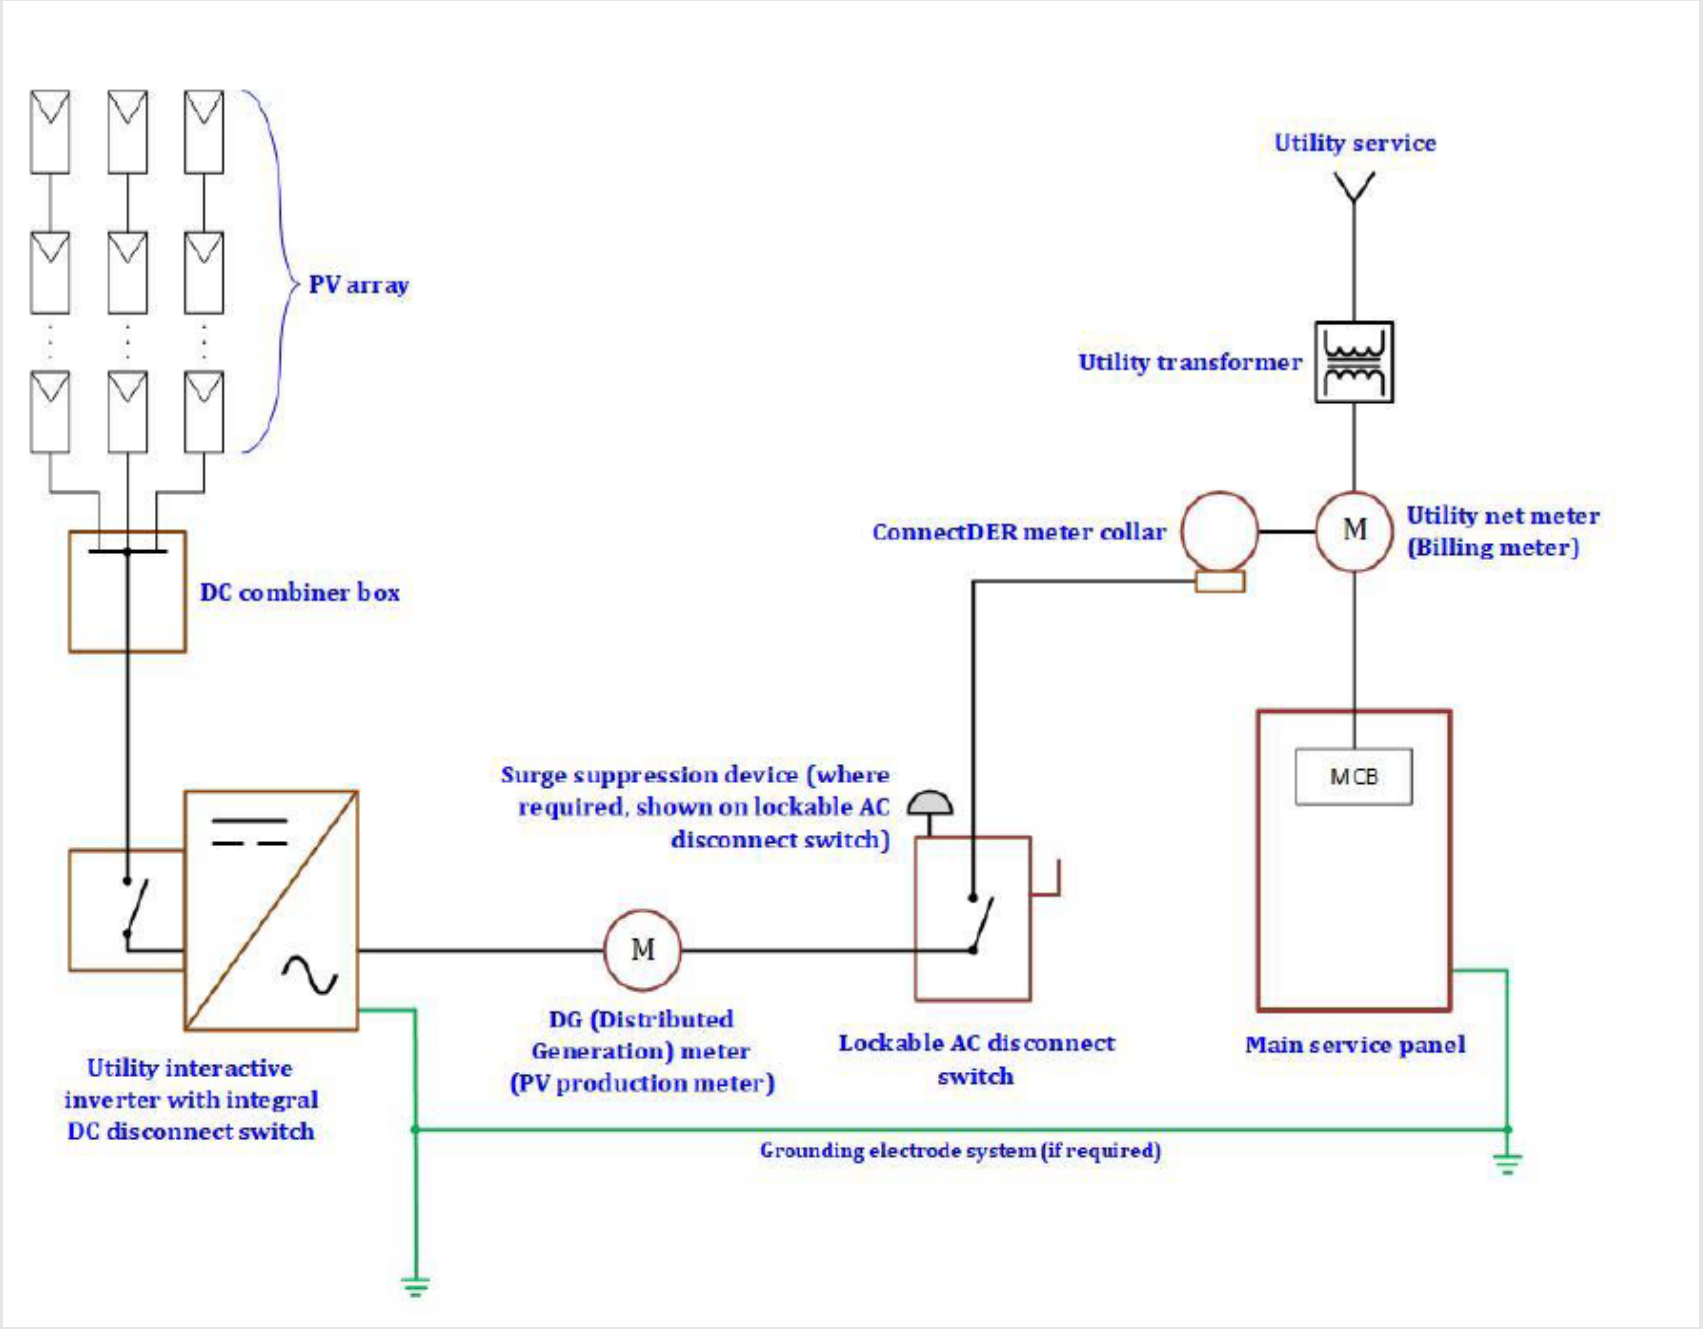


NOTE – The MSA creates a supply-side PV/DER interconnection on the load side of the meter. The MSA contains a factory-installed neutral-to-ground bond.

Wiring Diagram



Single Line
Solar PV & MSA



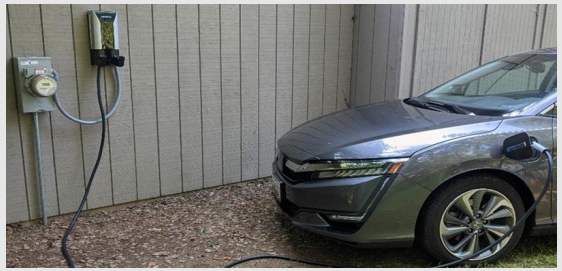
Current and Future Product Lines

Solar MSA

- Simple interconnection of solar PV to the home
- Addresses common problems, typical of solar installations - connecting to problematic / difficult to access service panels and expensive service upgrades due to overfull / undersized service panels
- Future data-out feature enables solar + storage for advanced grid functions, devalued net-metering (NEM 3.0) and partial-home backup

EV MSA

- Simple connection of level 2 EV charging equipment (EVSE) to the home
- Mitigates the most common obstacle to adoption - undersized service panels that require costly replacement
- Enables bidirectional EVSE for charging and vehicle-to-grid (V2G) configurations
- Data-out version enables multi-DER applications, i.e. solar + stationary storage



IslandDER MSA

- Simple connection of multi-DER configurations
  - ✓ Solar PV
  - ✓ EV charging equipment (EVSE)
  - ✓ Energy Storage Systems (ESS)
- Avoids problematic service panels and costly service upgrades
- Enables bidirectional EVSE for charging and V2H V2G, V2X applications
- Streamlined, more cost effective whole - house disconnect during grid outages for microgrid operation

- Meters were tested with and without a MSA installed
- Meters were tested under higher amperage – 50 then 100 then 100Amps
- All tests were performed with a recently calibrated TESCO 3050
- There was NO impact to meter function / accuracy under any scenario

Mechanical Testing

- Various mechanical tests were run on the MSA
- Some tests are being proposed as additions to UL 414 standard
- Some tests were implemented based on industry feedback from utility partners
- The ConnectDER MSA exceeded all test criteria in each scenario

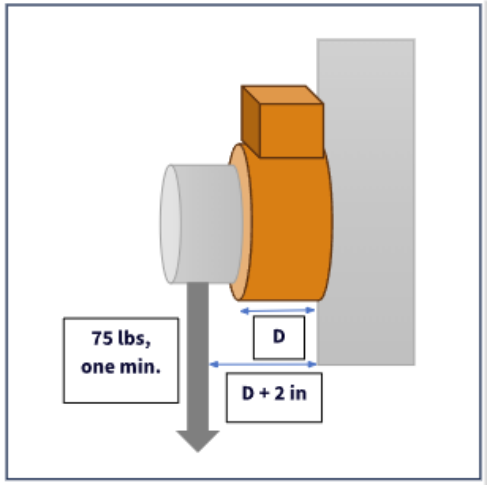
Test	Test Criteria	Result
Junction Box Withdrawal	• Junction Box remains connected to the MSA Upper housing. • MSA remains properly connected to Meter Socket.	PASS
Rapid Withdrawal of Junction Box Under Load	• No catastrophic fault of the system • MSA remains properly connected to Meter Socket.	PASS
NEMA C12.7 6.11 – downward force	• Maintain 75-lbs weight for 60s • No separation greater than 1/8" inch • No deformation to MSA, meter socket, or flanges • MSA remains properly connected to Meter Socket.	PASS
NEMA C12.7 6.11 – upward force	• Maintain 75-lbs weight for 60s • No separation greater than 1/8" inch • No deformation to MSA, meter socket, or flanges • MSA remains properly connected to Meter Socket.	PASS
Pull down on Drip Loop – right angle	• Maintains **150-lbs** weight for 60s • MSA Junction Box remains fully attached. • No gap or opening exposing live conductors in MSA	PASS
Pull down on Drip Loop – straight	• Maintains **100-lbs** weight for 60s • MSA Junction Box remains fully attached. • No gap or opening exposing live conductors in MSA	PASS

Mechanical Testing

- Various mechanical tests were run on the MSA
- Some tests were implemented based on industry feedback from utility partners
- Environmental tests were run to support our product service life
- The ConnectDER MSA exceeded all test criteria in each scenario

Test	Test Criteria	Result
Pull up on Drip Loop - straight	• Maintains **100-lbs** weight for 60s • MSA Junction Box remained fully attached. • No gap or opening exposing live conductors in MSA	PASS
Accelerated Environmental Life Test	• Six (6) years simulated UV and Humidity weathering • MSA remains in acceptable functional condition. • All elements, including upper, lower housing, junction boxes and hinge elements remains intact and functional. • MSA remains properly interfaced with the meter socket connection.	PASS
Weather Simulation Test	• No corrosion noted. • No deleterious discoloration. • Covers and hinged elements are readily removable.	PASS
Salt Spray Test	• No corrosion noted. • Covers and hinged elements are readily removable. • Small amount of salt fog ingress acceptable	PASS
Freeze/Thaw Test	• No signs of damage or degradation • No cracking or deformation • All gaskets and seals remain intact and in good condition • No excess leakage current in Hi Pot test. • No separation of labels	PASS
Rain Test	• No water entry above the lowest live part • No water found on live parts and insulating material	PASS

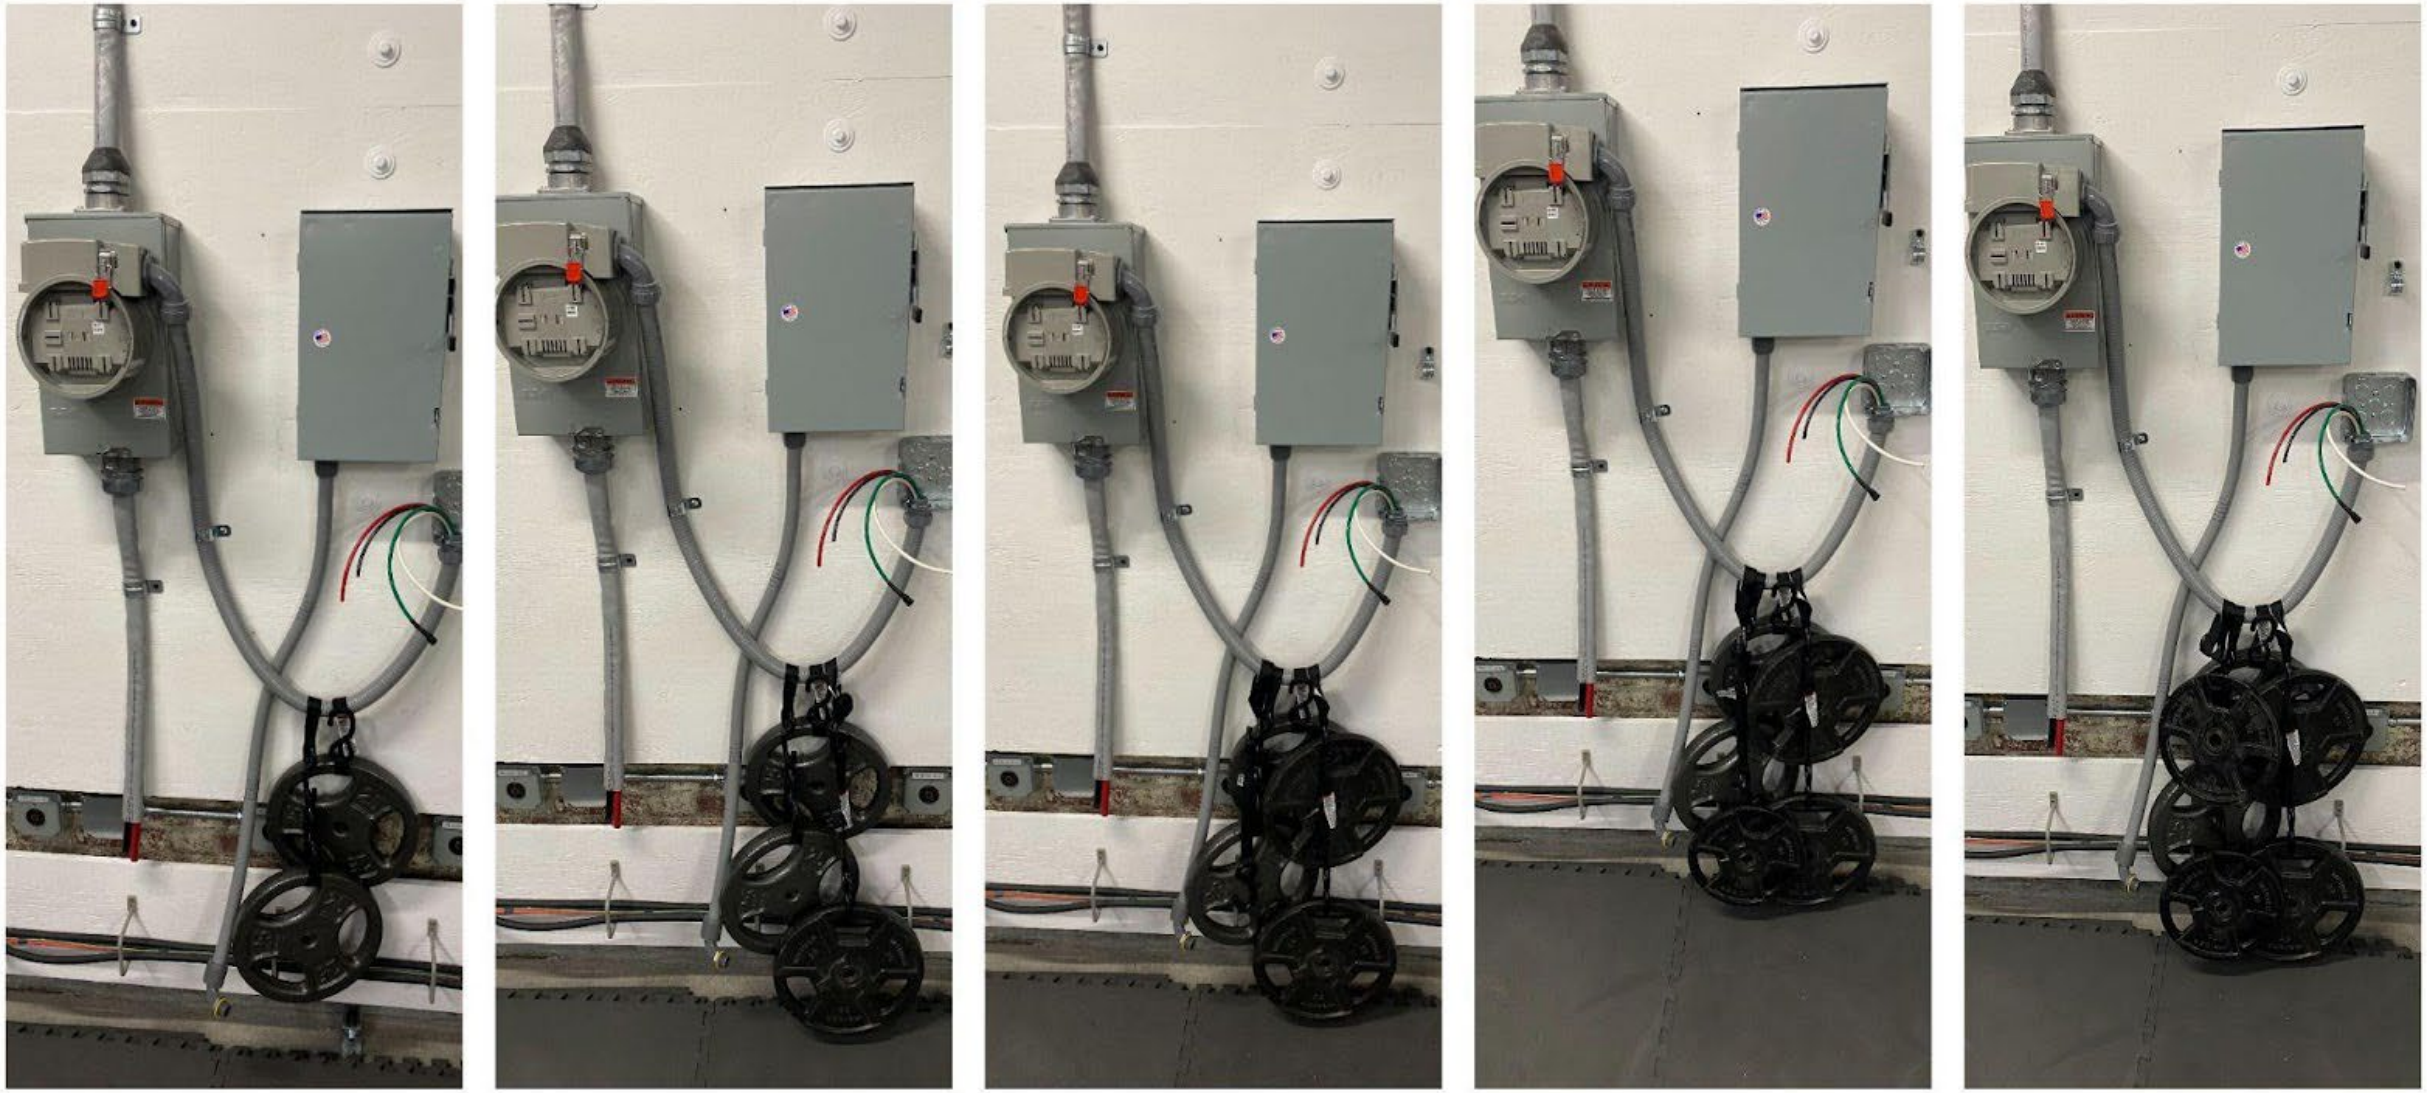
Mechanical Testing



- This is a new proposed test for UL 414
- The criteria was pulled from ANSI / NEMA C12.7 (Downward Force)
- Weights were hung from a simulated meter attached to the MSA
- The ConnectDER MSA exceeded
- the 75# limit and ran past 150#

Mechanical Testing

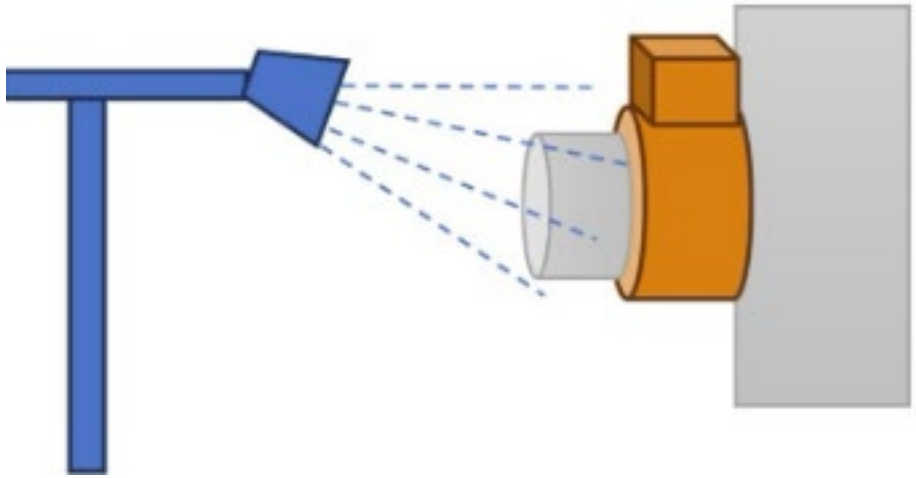
- Weights were hung from a right-angle conduit connection to the MSA
- Test was run based on utility feedback over torsional force via the conduit
- The ConnectDER MSA exceeded 150# of sustained force



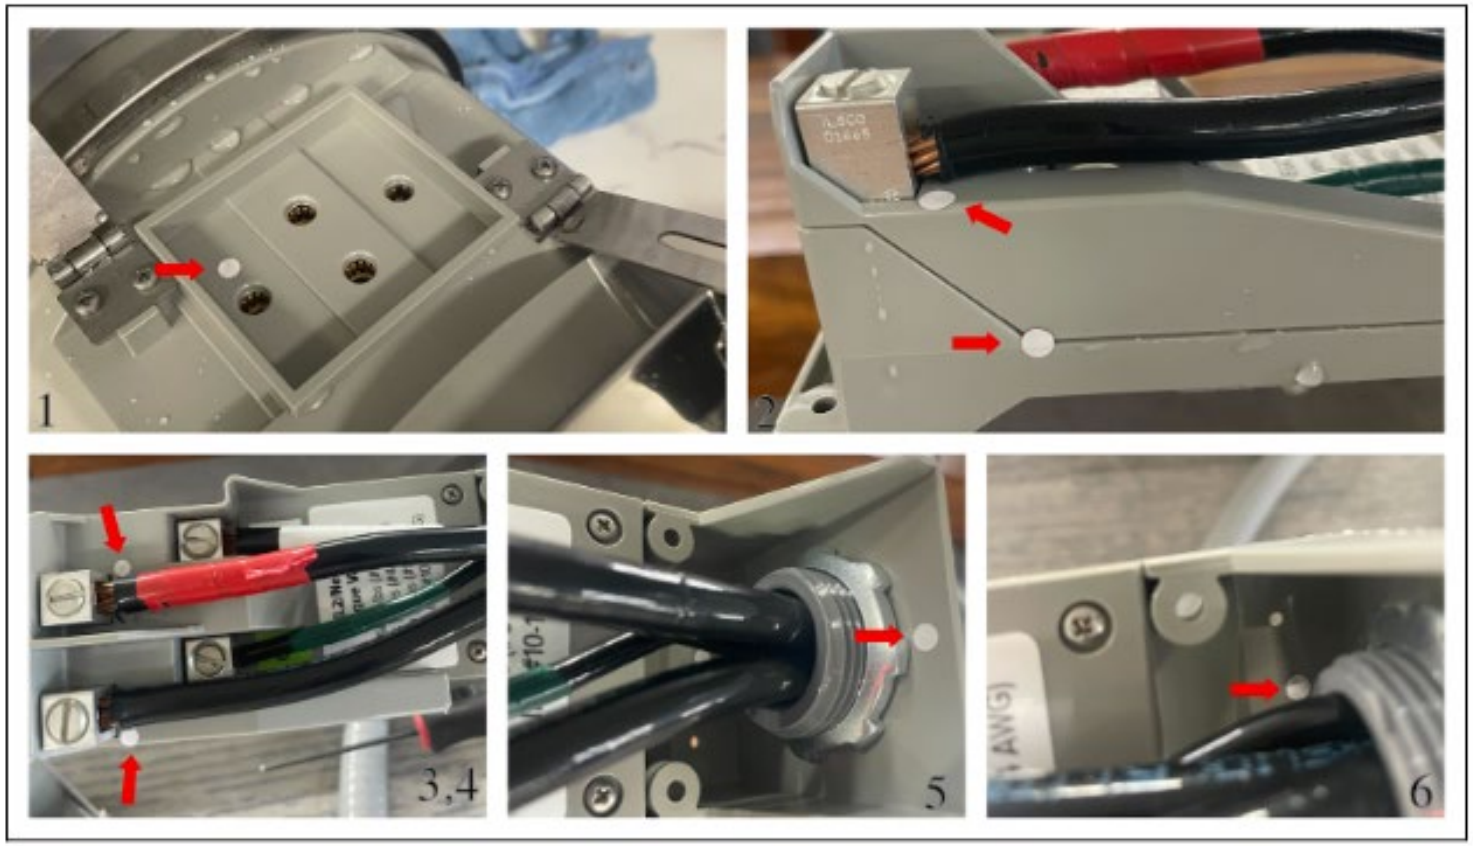
Mechanical Testing

- Weights were hung from a straight conduit connection to the MSA
- Test was run based on utility feedback over torsional force via the conduit
- The ConnectDER MSA exceeded 100# of sustained force

Mechanical Testing – Environmental



- The MSA was ran through a rain test, UV test, freeze thaw test, salt spray test, and other environmental conditions
- Moisture was looked for in 6 different places and not found
- Corrosion was also investigated
- The ConnectDER MSA exceeded all test criteria



Temperature Testing

- Heat Rise is also formally conducted by UL for certification and listing

Test	Test Criteria	Result
Heat Rise	• Ensure that temperature rise observed in the product does not exceed 65C for jaws (*) and bus bars, 60C on factory wiring terminals, and 55C for field wiring terminals under the maximum rated current. (*) Meter Socket Jaw Heat Rise values are corrected based on measurements with a simulated meter only, as ConnectDER Solar MSAs are not intended for use in a specific meter socket (SB12.2).	PASS

Temperature Testing – Heat Rise

No	Location of Thermocouples	Heat Rise Limit
1	Meter Socket Jaw – Line Side – L1	65°C (*)
2	Meter Socket Jaw – Line Side – L2	65°C (*)

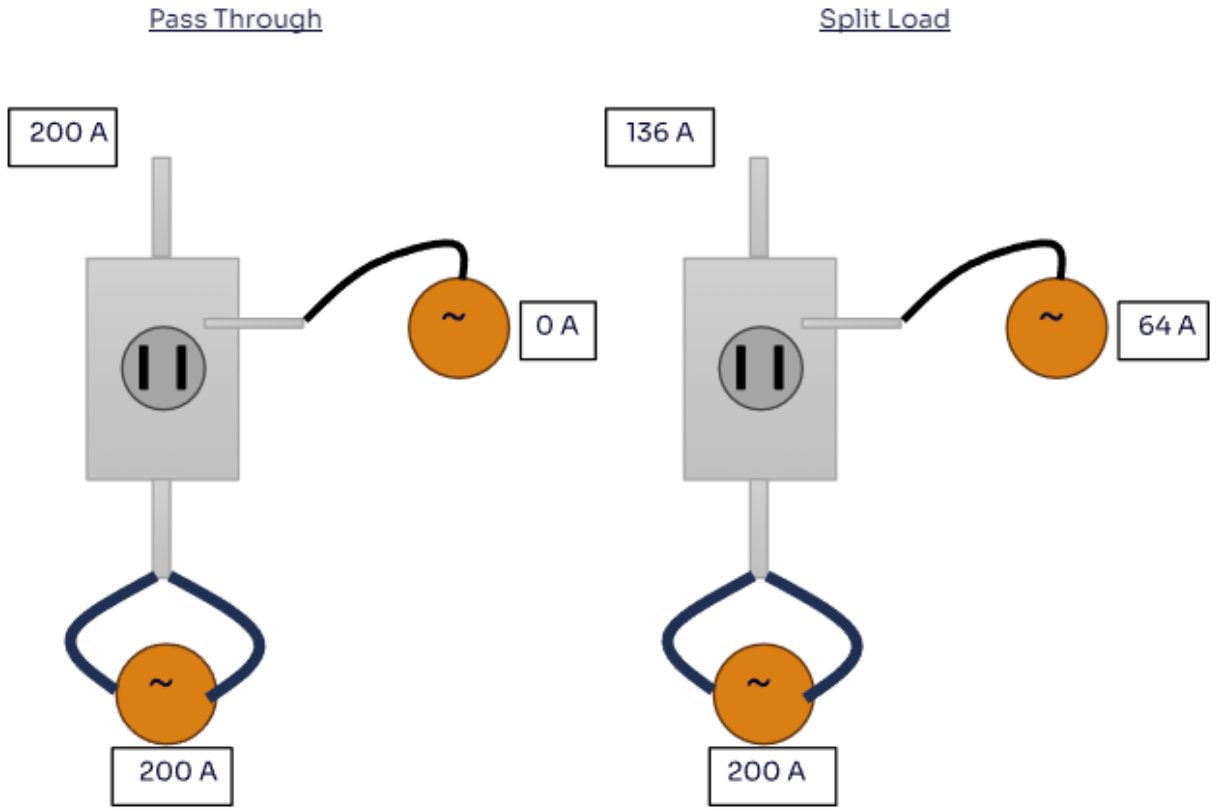
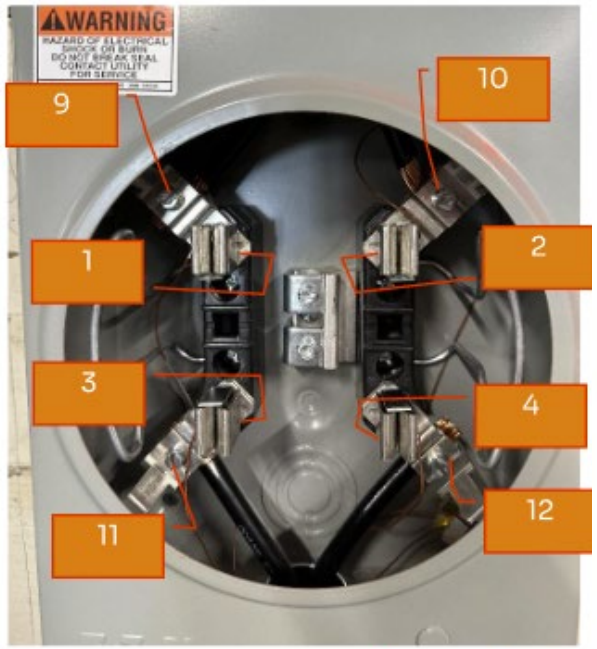
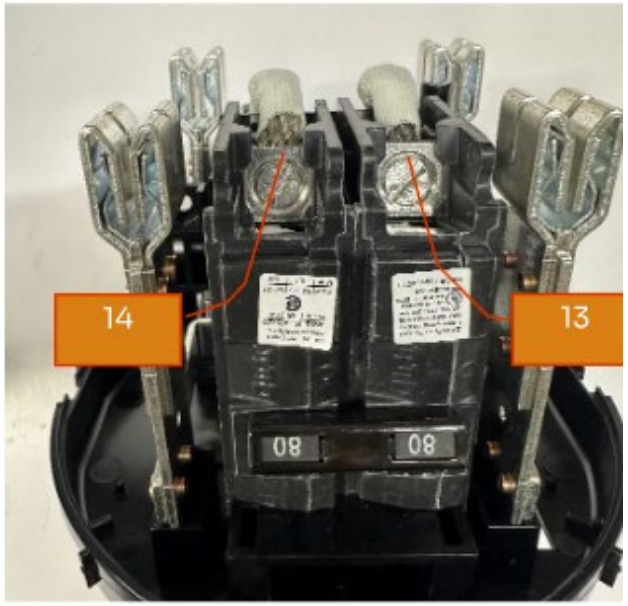
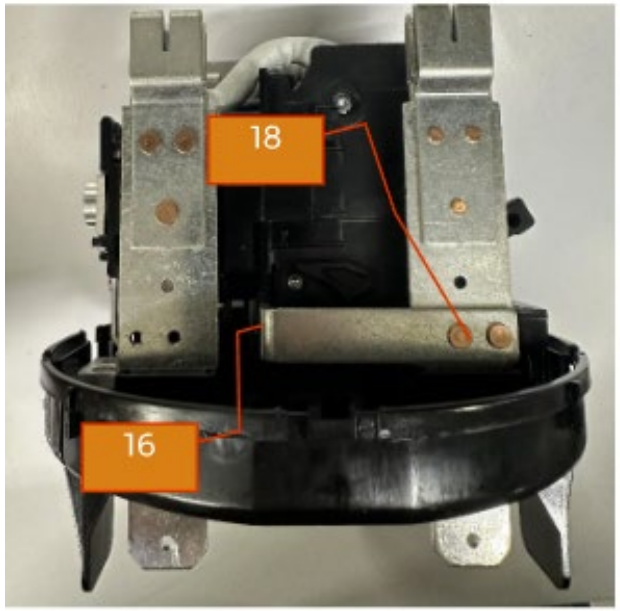
15	MSA Junction Box Connector – L2	65°C
16	MSA Junction Box Connector – L1	65°C

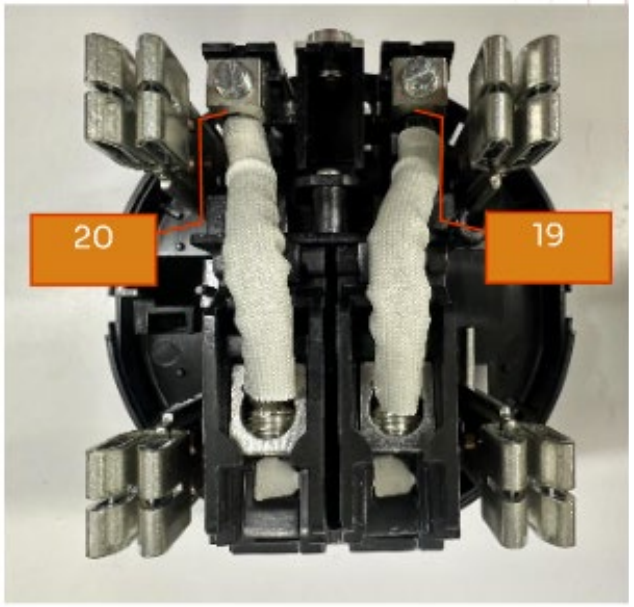


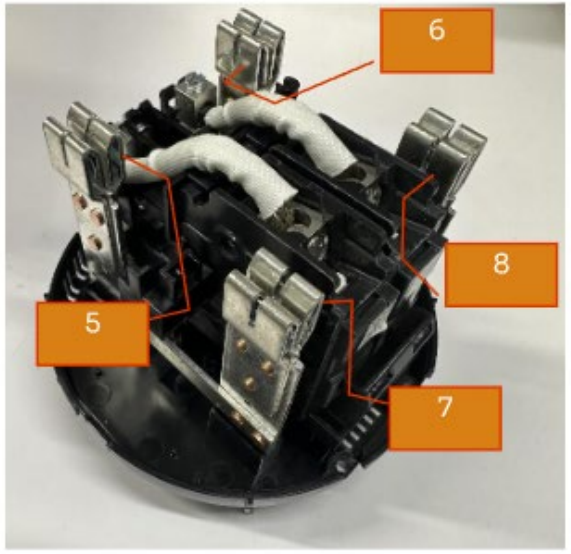
Temperature Testing – Heat Rise

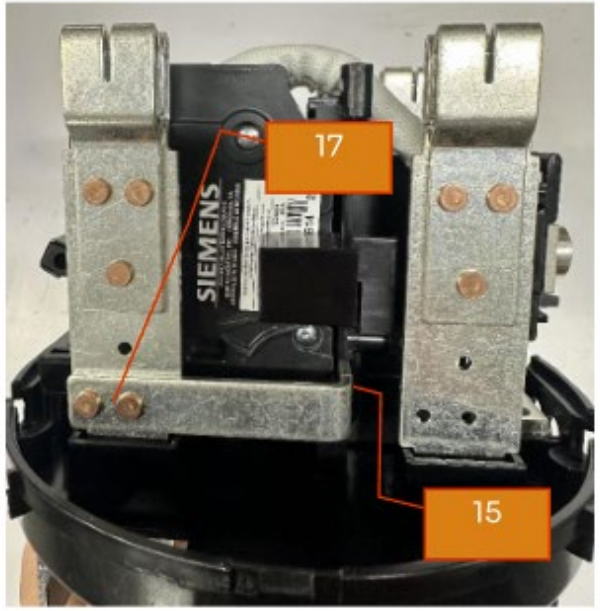


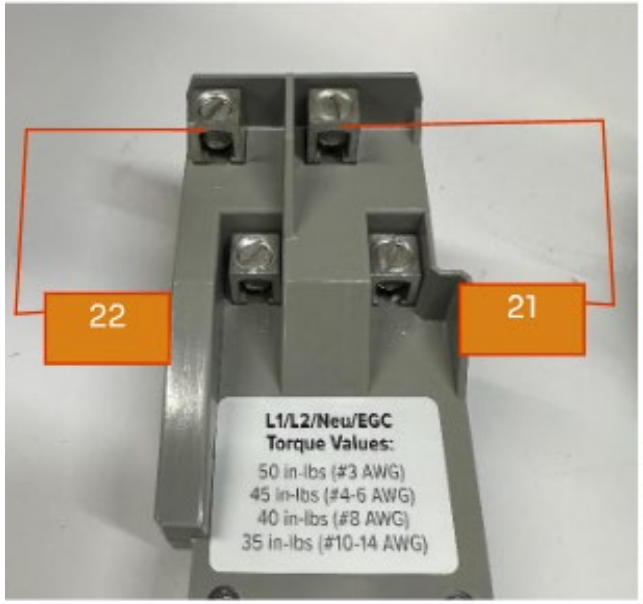


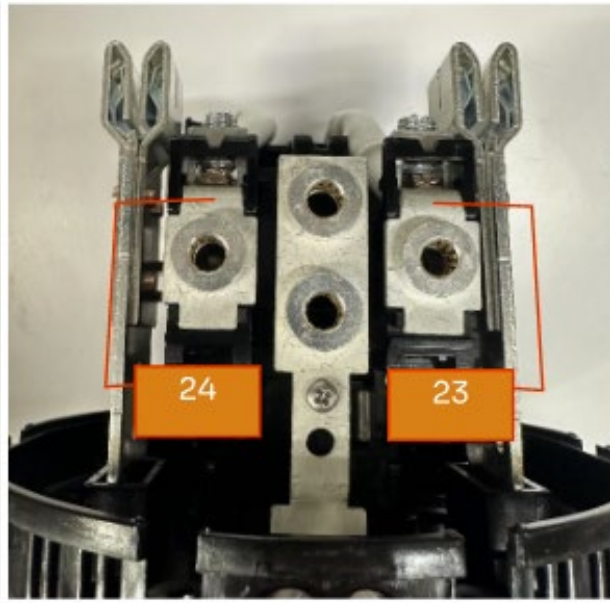












Temperature Testing Heat Rise

- Heat Rise is conducted with full 200 amps through meter & MSA
- Heat Rise is conducted with combined 200 amps through the meter and MSA (energy split via DER circuit max ampacity)
- Max Allowable rise is 65C with temperature correction factor applied – all locations passed

Temperature Testing – Heat Rise

- ConnectDER runs internal heat rise tests on all prototypes, samples, and manufactured units
- UL also runs their own heat rise tests as part of standards compliance and UL listing (UL 414 SB)
- UL data aligns to internal testing and shows compliance at 200-amp rating
- *Reproduced with UL Solutions Permission*

Note Rise: = Measured Temperature – Ambient

UL Testing

- UL Solutions evaluates product for safety in several ways
- UL Solutions has tested certified and listed the ConnectDER MSA against UL 414, SA & SB
- UL File #E361188

Hazard	Purpose	Tests
Installation Safety	• Safe installation for trained installer • Fit for purpose for installation in Meter Socket and with a Meter • Resistant to environmental factors	• Construction Review • Markings Review • Installation Manual Review, • Insertion and Withdrawal Force for Meter Jaws • Strength Test of Insulating Base and Support • Rain Test • Ball Impact • Crushing Resistance
Thermal Safety	• Resistance to fire • No risk of fire from internal sources • Controlled heat for adjacent structures and equipment	• Construction Review • Flammability • Heat Rise • Short Circuit • Dielectric Voltage Withstand
Electrical Safety	• No risk of electrocution from exposed live parts • Proper grounding • Internal insulation and clearances to prevent short circuits	• Construction Review • Mold Stress Relief Distortion • Dielectric Voltage Withstand • Bonding Continuity • Short Circuit • Ball Impact • Crushing Resistance • Rain Test

Test	Test Criteria	Applicable Standard (Clause)	Result
Construction Review	• Ensure all components and materials are UL LISTED and/or meet corresponding UL® standards. • Measure that creepage and clearances for all electrical conductors meet or exceed minimum requirements. • Confirm that insulation thickness and bend radius of all wire conductors meet or exceed the minimum requirement. • Verify that dimensions are compatible with Meters and Meter Sockets.	UL 414 (3-12) UL 414A (SA2) UL 414B (SB5-SB7)	☑ PASS
Flammability	• Ensure material does not sustain flame or produce flaming debris. • Ensure exposure to flame does not result in opening that could expose live parts.	UL 746C (52)	☑ PASS
Crushing Resistance	• Ensure exposed surface of the product resists to crushing force of at least 100 lbs.	UL 746C (55)	☑ PASS
Resistance to Impact	• Ensure exposed surface of the product resists to impact of at least 5 ft-lbs (3 different locations).	UL 746C (56)	☑ PASS
Mold Stress Relief Distortion	• Ensure that the product does not shrink or distort in a way that reduces clearances, expose live parts to contact, or cause interference with the operation of the product, following heating at 10C above maximum operating temperature.	UL 746C (61)	☑ PASS
Rain Test	• Ensure no water from simulated rain enters the enclosure above the lowest live part or terminal. • Ensure no water comes in contact with live parts or insulating material.	UL 414 (17)	☑ PASS
Insertion and Withdrawal Force for Meter Jaws	• Ensure no operation (insertion or removal) requires force greater than 100lbs. • Ensure no damage (e.g. cracking) occurs during insertion or removal.	UL 414 (19)	☑ PASS
Dielectric Voltage Withstand	• Ensure that product can withstand 1480V between live parts or opposite polarity, and live parts to enclosure.	UL 414 (20.1)	☑ PASS

Test	Test Criteria	Applicable Standard (Clause)	Result
Bonding Continuity	• Ensure continuity between the grounding straps on the top of the MSA and the tabs on the base.	UL 414 (22)	☑ PASS
Strength Test of Insulating Base and Support	• Ensure the insulating base of the Junction Box is not damaged when applying 110% of the torque marked on the unit to the field wiring terminals.	UL 414 (24)	☑ PASS
Heat Rise	• Ensure that temperature rise observed in the product does not exceed 65C for jaws (*) and bus bars, 60C on factory wiring terminals, and 55C for field wiring terminals under the maximum rated current. (*) Meter Socket Jaw Heat Rise values are corrected based on measurements with a simulated meter only, as ConnectDER Solar MSAs are not intended for use in a specific meter socket (SB12.2).	UL 414B (SB12)	☑ PASS
Short Circuit	• Ensure the product can withstand a short circuit of 22kA on the DER branch circuit without: o damage to the enclose that would expose live parts o excess current to ground o Arcing between live parts of opposite polarity o Failure of a dielectric voltage-withstand test	UL 414B (SB13)	☑ PASS
Markings	• Ensure all required marking, such as voltage, continuous current, and short circuit current ratings, are included.	UL 414B (SB14)	☑ PASS
Installation Manual	• Ensure the installation manual includes required instruction, such as proper installation of the field wiring, grounding conductors, safe installation into a meter socket.	UL 414B (SB15)	☑ PASS

UL Testing - Flammability

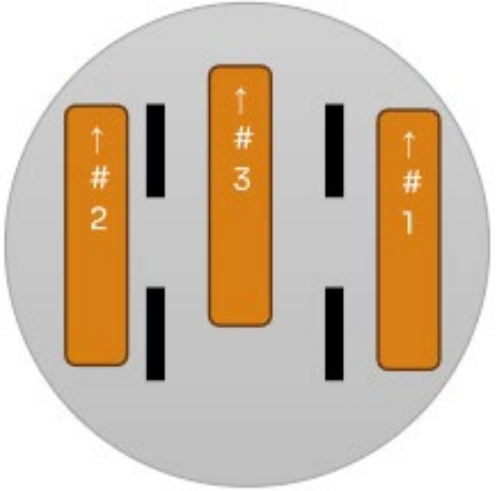

Figure 1: Location of the 3 flame applications for the Flammability Test

- A measured flame is applied for several intervals of 5S of direct contact with the MSA interior
- The MSA must not ignite, allow the flame to penetrate externally or allow any drippings 12 inches below on flammable cotton
- The ConnectDER MSA did not ignite, have any external openings exposed or have any drippings

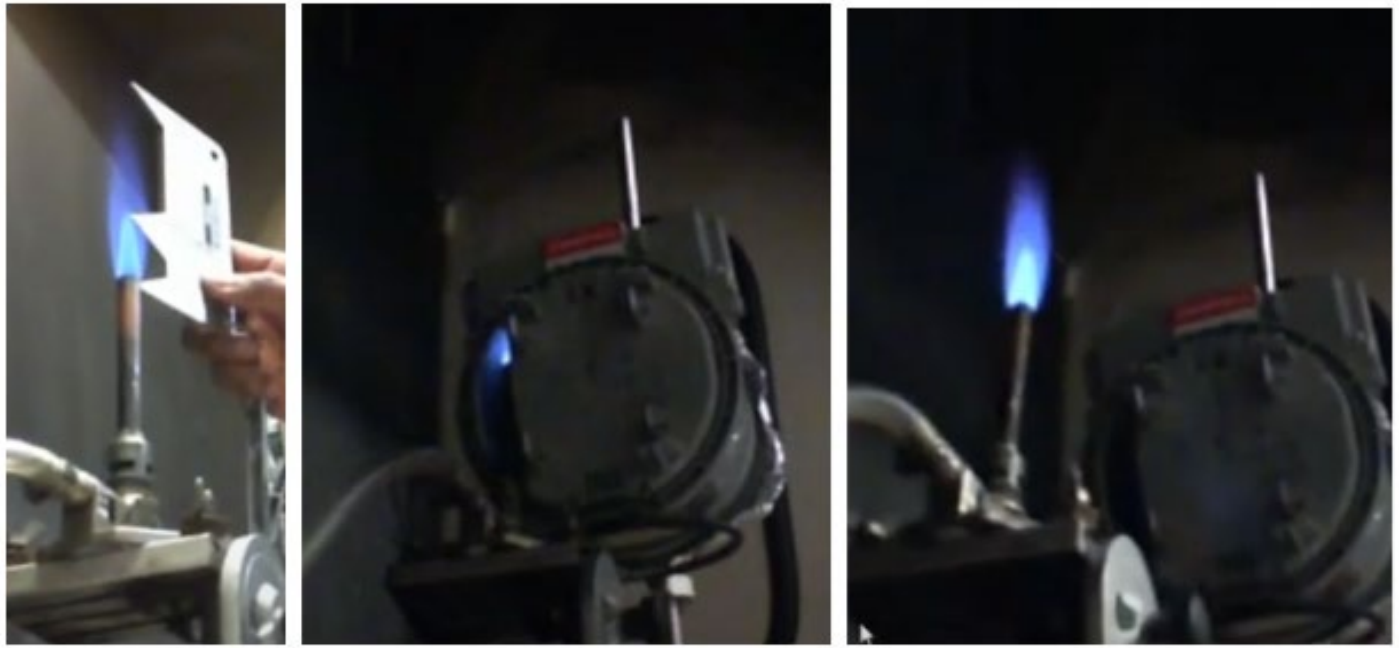

Figure 2: Flame Calibration, Flame inside the test sample (5 sec) and Flame outside the sample (5 sec)

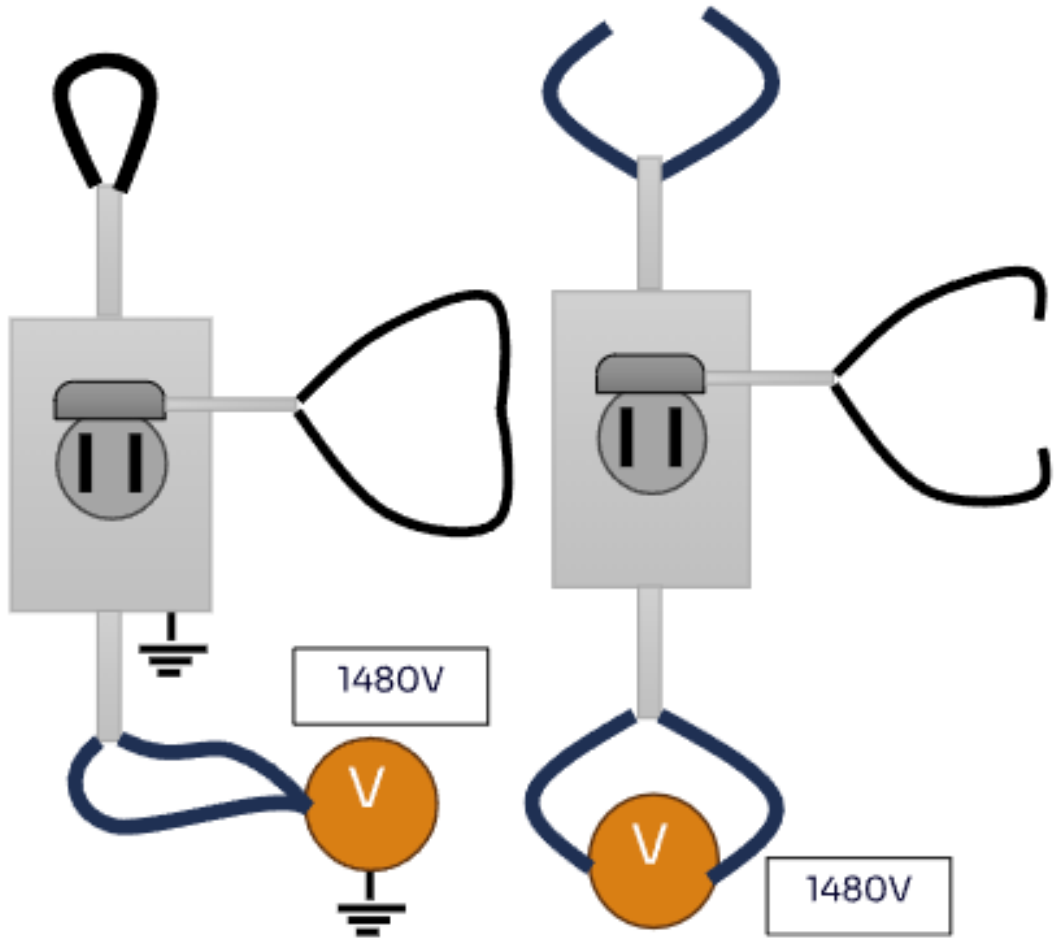
UL Testing – Crush Test

- 100# of force is applied to 6 locations on the MSA
- The force is sustained for 60s
- There must be no cracks, breaks, dents, change to function, exposure to live parts, mechanical changes, etc

UL Testing – Dielectric Voltage

- 1480V is applied to a ConnectDER MSA between live parts and ground and between L1 and L2 for 60s
- There must be no current flow
- The ConnectDER MSA exceeded the test criteria



UL Testing – Short Circuit

- A current is applied corresponding to the 22k AIC / AIR breaker rating into a short between L1 and L2 on the DER branch circuit
- A 30A fuse is connected between the ground of the enclosure and neutral to minor ground leakage
- The test is performed at a random closing angle achieved by closing the breaker into a short with a remote-controlled actuator

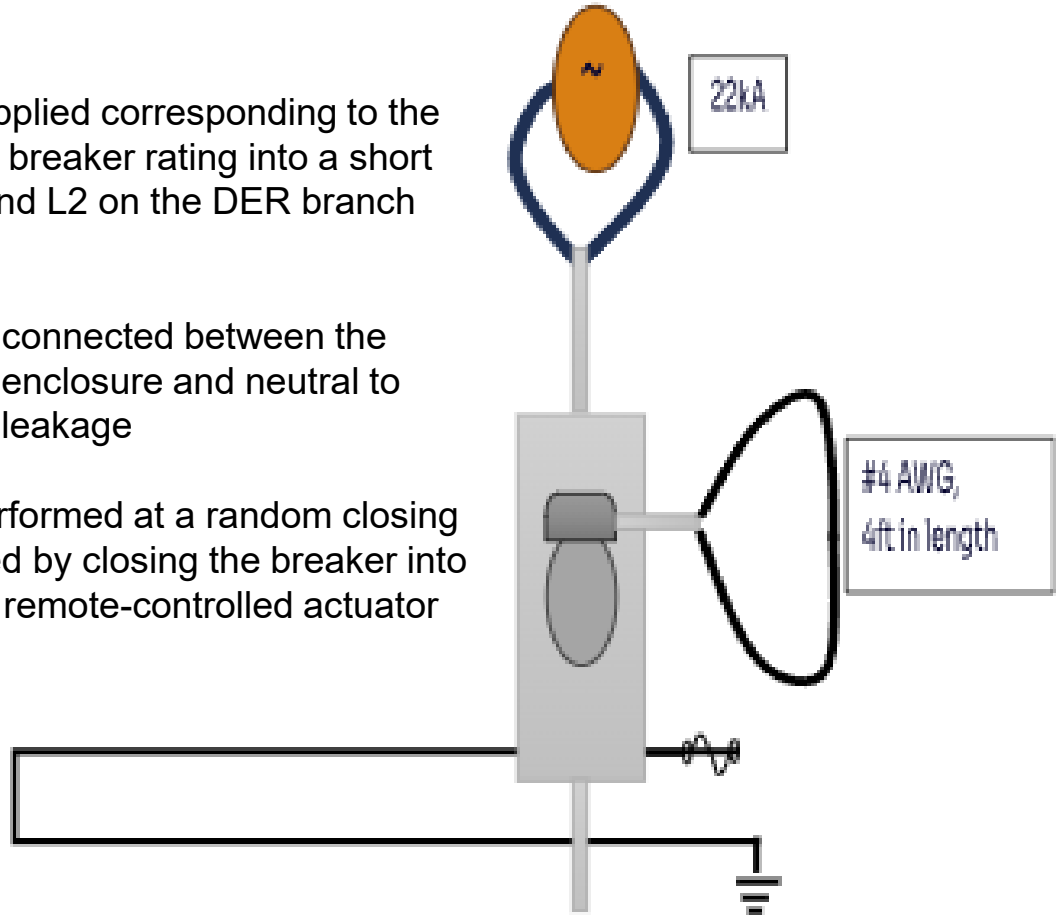


Figure 15: Picture of the test setup for the Short Circuit Test

Thank You

Difference in Results between Line Side and Load Side Test

The Line Side and Load Hot Socket Results differ significantly in both time to reach and steady-state temperature. A difference between Line and Load side results is expected, as the MSA is not symmetrical. Specifically, the Load Side is connected to the DER Circuit Breaker and Junction Box, resulting in significantly higher heat mass on the load side compared to the Line side, which just has straight blades. However, the simple assumption would be for the Line Side, with its lower heat mass, to reach higher temperature faster; that is not what was observed. Below are some possible reasons for the difference in Hot Socket results between Line Side and Load Side.

Thermal Transfer Theory

At its core, the Hot Socket test is a heat transfer test: how effectively we can transfer heat from the heaters to the AMI meter through the MSA. Differences in contact between the heaters and the blades of the MSA, or between the jaws of the MSA and the blades of the AMI meter, would affect how much heat reaches the AMI meter, and therefore the peak temperature that can be achieved.

Total System Energy Theory

Because the Line Side blades have less heat mass, fewer Joules of energy are needed for the heaters to reach the setpoint of 425°C. Therefore, the less total energy is introduced in the system for the Line Side test vs the Load Side configuration. Less energy in the system could translate into a lower temperature and a slower ramp.

Heat Mass Loading Theory

This is another way to interpret the Total System Energy Theory. In the Line Side configuration, the heat mass of the DER Circuit is effectively pulling heat away through the meter load side blades. The resulting temperature achieved inside the meter is less than if the heat were to be applied to the load side blades.

Appendix Sheets

How is the Short Circuit Test conducted?

The short circuit test is performed by applying a current corresponding to the Ampere Interrupting Capacity (AIC) of the highest circuit breaker rating of 22k AIC (*) inside the **ConnectDER Solar MSA** into a short circuit between L1 and L2 on the DER branch circuit. The short circuit is implemented by connecting a #4 AWG conductor 4ft in length on the field terminals of the Junction Box. A 30A fuse is attached between the ground of the enclosure and neutral of the current source to monitor ground leakage currents. The test was performed at a random closing angle, which is achieved by closing the circuit breaker into the short circuit using a remotely controlled actuator.

You are receiving this report as a Manufacturing Factory for the above-referenced Applicant.

This report covers the Safety evaluation of the referenced model(s) according to the standard(s) specified above.

This report includes portions of the full Applicant report and is designed to support any Follow-Up inspections at the Manufacture's facility.

Please refer to any Supplements to this document for a detailed manufacturer report, which includes information for the Follow-Up Inspection as specified below:

- **Appendix C**: Follow-Up Service Documentation
- **Appendix A**: Enclosures

Report Modifications Summary

The following changes were made to this report. If none listed in the below table, this report is the originally issued report.

NOTE: Some of the changes listed below were made in the full report and may not reflect the changes in this associated Factory Report, which just includes the Appendices listed above from the main report.

Date Modified *(Year-Month-Day)*	Modifications Made (include Report Reference Number)	Modified By
2022-10-17	Technical Amendment to report E527070-D1000 to include the alternate enclosure option noted below as well as a correction to the Fuse Holder model. The alternate enclosure is identical to the existing option and therefore, required no additional testing or evaluation to be included. The fuse holder model was corrected from the 155 series to the 150 series to match the intended component. Alternate Enclosures: Models WQ-50 and WQ-57, manufactured by ECP CORP, DBA POLYCASE.	Jeff Werner
2023-08-24	Amendment to E527070-D1000-1/A1/C0 - Updated critical components table to add new terminal block. Added interchangeable option for power input terminal block. No testing considered necessary due to alternate component being suitably rated for the application. The part 2 standard requirements were not affected by this update.	Derek Spain / Jeff Werner

4)	Make sure Circuit Breaker covers are re-installed.	JL
5)	Make sure Distribution Block covers are re-installed.	NA
6)	Make sure any plexiglass is re-installed.	NA
7)	Place Job labels on the Panel with applicable UL/NEC info.	NA
8)	Place fuse replacement label on applicable panel.	NA
9)	Place "***Build Label***" on the panel ensuring each area has been initialed.	JL
10)	Place "***Danger High Voltage***" stickers on all panel doors for panels over 42V RMS where applicable.	NA
11)	Place sticker(s) for supply voltage above the main disconnect, circuit breaker, or on the panel door.	JL
12)	Place a "***Caution Multiple Power Sources***" tag on the outside of the main door for panels with multiple sources of power.	NA
13)	Place equipment ground labels next to all grounding points for UL panels.	NA
14)	Place the grounding symbol label next to all grounding points.	NA
15)	Verify that any other UL markings are on all listed panels or prints. See table 52.1 in UL508A for markings location.	NA
16)	Verify that any Caution/Warning Labels per NEC and UL are on the panel.	JL
17)	Place UL label on applicable panels.	NA
18)	Make sure that all drawing mark-ups are in Red Ink, Dated, and Initialed.	JL
19)	Check the BOM on drawing to see if there is any loose component to be shipped.	JL
20)	Make sure all component documentation, extra hardware, accessories, and any loose parts are clearly identified, bagged up and attached to the inside of the panel to be shipped.	JL
21)	If CCS is responsible for the drawings get the "***AS MANUFACTURED***" drawings from the design group to ship with the panel.	JL
22)	If CCS is NOT responsible for the drawings make a color copy of the redlined drawings to ship with the panel.	JL
23)	Vacuum the panel and remove any debris.	JL
24)	Move the job to the Shipping Department in I-PReP.	JL
25)	Place the "***Tested***" sticker on the panel and move it to the Shipping Department.	JL
26)	Notify Shipping Personal and the Shop Supervisor that the panel is complete and has been moved to the Shipping Department.	JL
27)	End Activity in Epicor.	JL

Standard Panel Testing Checklist

Customer: Industria Networking Job Number: 530629-1-1 Date: 7/24/23

Layout by: CV Wired by: A.B Tested by: John L

Pre-Power Check

Tasks	Initials
1) Start Production Activity in Epicor.	JL
2) Verify that Layout and Wiring Checklists have been filled in and signed off completely before moving on to number 3 on the checklist.	JL
3) Verify job has been moved to Test in I-PReP.	JL
4) Verify panel layout matches the drawings.	JL
5) Verify that device tags are clean, straight, and that they match the drawings.	JL
6) Verify that all devices are level.	JL
7) Verify that all door interlocks and disconnects are functioning properly.	JL
8) Verify that the enclosure paint color matches the drawings.	JL
9) Make sure spiral wrap is installed as needed.	NA
10) Make sure any enclosure openings are smooth to the touch or have a protective cover installed.	JL
11) Check Circuit Breakers for covers.	NA
12) Conduct a pull test on all wiring connections.	JL
13) Check all connections for wire frays.	JL
14) Check all connections for crimped insulation.	JL
15) Check to make sure all wire labels are straight, facing the correct direction, and heat shrunk.	JL
16) Verify that wire colors and gauges match the prints.	JL
17) Check Power wire lug/bolts are torqued to Mfg. or UL specs if Mfg. does not supply data.	NA
18) Make sure wiring duct and covers are straight.	NA
19) Verify any components with dip switches have been set properly.	NA
20) Verify that fuses are installed per the prints.	NA
21) Verify motor overloads ranges match prints.	NA
22) Verify that Circuit Breakers match the prints.	JL
23) Make sure all grounds and bonds are installed as required.	JL
24) Verify PLC I/O configuration matches the prints.	NA
25) Verify proper voltage for all connections and devices. VFDs, Transformers, Power Supplies, etc.	JL
26) Conduct a visual inspection and a continuity check for polarities and power connections.	JL
27) Make sure all wire labels are heat shrunk.	JL
28) Ensure any wiring changes that are needed have been made.	JL

PPL Electric Exhibit AD-5

Net-Metered Distributed Energy

Requirements, timeline and checklists to connect to the PPL Electric Utilities power grid

When you're installing solar panels, CHP, biomass, or another type of distributed energy resource (DER), PPL Electric Utilities is here to help you connect to the power grid. We recommend applying at least six (6) months before interconnection service is needed.

For installations under 25 kW (nameplate), you'll hear from us within 3-4 weeks of submitting a completed application. For all other systems, additional reviews and field visits may be required. In addition, for systems 500 kw or larger, we must submit our recommendation to the Public Utility Commission. The project must be under scheduling or under construction within one year of application.

APPLICATION

Applications with existing service should be submitted at pplelectric.com/renewable. When applying, you'll need your one-line diagram, site plan and equipment data sheet. For systems less than 25 kW, email EUSolarPower@pplweb.com. For systems 25 kW or greater, email businessaccounts@pplweb.com. For DER applications without existing electric service, please contact DERapplications@pplweb.com.

DESIGN

If our facilities need to be modified, your designer will create your plan and contact you with any estimated fees. A right-of-way agreement is required before new electric facilities can be placed on any propert.

SCHEDULING

If PPL Electric needs to do work, we will schedule that 6-8 weeks after design completion and all customer requirements have been met: customer payment, signed right-of-way agreement, customer contract agreement and customer tree work. Trench/conduit for underground secondary/services installation must be completed two weeks before construction.

We schedule jobs to be completed by the week. The exact day will vary based on weather and other circumstances.

If PPL Electric Utilities equipment changes are needed, all customer responsibilities including customer payment and signed right-of-way agreement, if needed, must be met before your job can be scheduled.

All checks must be made out to PPL Electric Utilities. Please print the applicable distributed generation number (renewable work order) or invoice quote number on your check to ensure proper processing.

Payments must be made by check and mailed to:
PPL Electric Utilities
P.O. Box 419054
St Louis, MO 63141-9054

Overnight payments must be made out to "PPL Electric Utilities" and sent to:
Firstech
Attn: Lockbox PFC
12300 Olive Blvd
Creve Coeur, MO 63141

CONSTRUCTION

Be sure to prepare your site for our crews to complete the construction work. Remember to call 811 at least three business days before you dig. After your system is installed and before it is activated, please email us the Certificate of Completion.

Be sure to double-check your application for accuracy.

Once submitted, technical details cannot be modified or altered by PPL Electric. Should you require a change in system sizing, equipment used, etc., you will need to cancel your existing application, submit a new application, and pay any associated fees.

EXPECTED REVIEW TIMES

PPL Electric Utilities

pplelectric.com/renewable

Customer Service: 1-800-342-5775 or eusolarpower@pplweb.com.
Business Services: 1-888-220-9991 (say "Renewable" at the prompt) or businessaccounts@pplweb.com.

Checklist for Distributed Energy Resources

pplelectric.com/renewable

APPLICATION

- ☐ Review the interconnection requirements for electric service at pplelectric.com/remsi.
- ☐ Choose an inverter approved by UL-1741 SB and IEEE 1547. Only approved inverters may be used. For more information, see pplelectric.com/inverters.
- ☐ Submit any energy storage installations for approval.
- ☐ Submit your application, one-line diagram, site plan, equipment data sheet. Also:
  - Call us if the customer does not have a social security number or tax ID on file.
  - Pay the application and any other fees related to your installation.
  - Check your customer rate; only residential (RS), small business (GS1 and GS3) and large power (LP4) rates qualify.
  - Be aware that systems over 50 kW require customers to be on a non-residential rate.
  - If you change your equipment, resubmit your interconnection application.
- ☐ Electronically sign your Interconnection Agreement via the email link from Adobe/Ecosign once you receive it.

DESIGN

- ☐ Place the A/C disconnect switch directly next to and in sight of the PPL Electric Utilities meter. See pplelectric.com/remsi for more details.
- ☐ Use approved termination and metering compartments listed at pplelectric.com/remsi. Transformer cabinets may not be used as junction points or termination cabinets.
- ☐ Pay any up-front costs to upgrade PPL Electric Utilities equipment such as transformers and upgrading lines.
- ☐ Payments must be made before the job can be scheduled.

CONSTRUCTION

- ☐ Call 811 at least three business days before you dig.
- ☐ Clear all obstructions at the service connection locations.
- ☐ Ensure all switchgear/meter base are installed and inspected.

PPL Electric Exhibit AD-6

Install Single Phase SolarEdge Inverter

Using Modbus RTU (RS485 serial port)

Using Modbus over TCP (Ethernet port)

Using Modbus RTU (RS485 serial port)

1. Use SolarEdge Set App to scan inverter QR code
    1.1. Pull red switch for 2 seconds, then release
    1.2. Choose “Join”
    1.3. Choose “Start commissioning”
    1.4. Select “Site Communications”
    1.5. Select “Modbus RS-485-2 port”
    1.6. Verify settings (change if needed)

        Protocol: Sunspec

        ID: 1*

        Baud Rate: 9600

PPL Electric Utilities

***Note**: If multiple inverters, connect to next inverter and increase ID by 1

1.7. Return to **Set App Home** screen

2. Switch inverter **power** switch to OFF (CRITICAL STEP – **PPE Required**) – blue, green & red lights will flash

Wait for capacitors to discharge before turning off! (CRITICAL STEP)

Inverter display reads "Voltage is below 50V and is safe to turn off" OR

SetApp notifies you it is safe to turn off OR

Red light stops flashing OR

When in doubt, wait 5 minutes

3. Turn DC Safety switch OFF

4. Isolate inverter AC side at all customer-owned service disconnect locations (CRITICAL STEP – **PPE Required**)

PPL Electric Utilities

4.1. Turn AC disconnect switches OFF

4.2. Lock out AC disconnect and document

5. Test AC/DC power termination points to verify de-energized (CRITICAL STEP – **PPE Required**)

6. Take a photo

7. Install DER Management Device (see M-365C)

   Note: If line-to-ground voltage is >150V, power and COM cables **must** use separate conduits

8. Strip **communications** wire in inverter and terminate into RS485 port (see DDI M-366 for pinout)

9. Terminate **power** wires in inverter

   9.1. Strip **power** wires in inverter

   9.2. Terminate **ground** connection in inverter ground bar

9.3. Crimp fork terminal onto #16 **neutral** from DER Management Device to inverter **neutral**

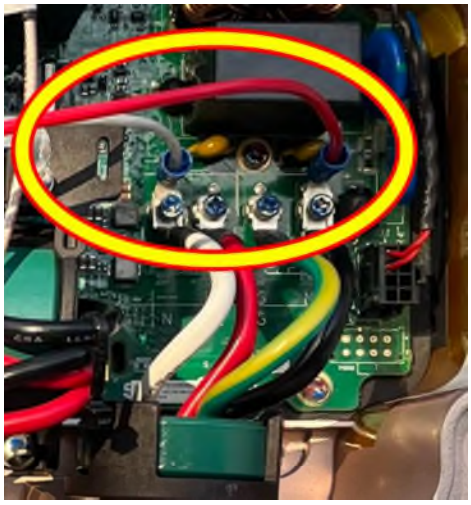

Figure 1 - Power Wires

9.4. Connect **neutral** from DER Management Devie to inverter's **neutral** terminal (CRITICAL STEP – **PPE Required**)

9.5. Connect #16 **power** cable from DER Management Device to one side **of in-line fuse**

9.6. Crimp fork terminal onto other end of **in-line fuse**

9.7. Connect fork terminal from **in-line fuse** to inverter's **hot**

PPL Electric Utilities

line terminal (far right) (CRITICAL STEP – **PPE Required**)

10. Continuity test all **power** & **communication** connections (CRITICAL STEP – **PPE Required**)

11. Take a photo of the inverter, radio, overall system and inverter(s) serial number(s)

12. Close inverter

13. Turn DC power ON (CRITICAL STEP - **PPE required**)

14. Remove lock, return all customer-owned disconnects on inverter AC side to ON and document

15. Turn DC Safety switch ON

16. Turn inverter power switch ON

17. Verify DER Management Device Connection:

    5B (blue) & 3.3V (orange) LEDs lit

    Note: Tx & Rx LEDs blink when communicating with inverter (if SW2 set to "TCP" position)

    Red & green LEDs blinking

    Note: If green light stays off, toggle SW1 (SBR) to opposite position

18. Close DER Management Device, add applicable stickers and seal enclosure

Using Modbus Over TCP (Ethernet Port)

STOP! Verify Lantronix Device Installer on computer. If not - install before arriving!

1. Use SolarEdge Set App to scan invert QR code (See this link if no QR code)

    1.1. Pull red switch for 2 seconds, then release

1.2. Select “Join”

1.3. Select “Start commissioning”

1.4. Select “Site Communications”

1.5. Select “Modbus TCP port”

1.6. Select “Modbus TCP”

1.7. Select “Enable”

1.8. Set Port for “502”

1.9. Select “Ethernet”

1.10. Select “Yes” when prompted

1.11. Change to “Static IP”

IP Address: 169.254.12.3

Subnet Mask: 255.255.0.0 (or Wi-Fi subnet mask)

Default Gateway: 169.254.1.1 (or Wi-Fi Gateway IP address)

DNS: 8.8.8.8

1.12. Return to **Set App home** screen

2. Move inverter power switch to OFF (CRITICAL STEP - **PPE required**) – blue, green & red lights will flash

Wait for capacitors to discharge before turning off! (CRITICAL STEP)

Inverter display reads "Voltage is below 50V and is safe to turn off" OR

SetApp notifies you it is safe to turn off OR

Red light stops flashing OR

When in doubt, wait 5 minutes

3. Turn DC Safety switch OFF

4. Isolate inverter AC side at all customer-owned service disconnect locations (Critical Step – **PPE required**)

   4.1. Turn DC and AC disconnect switches OFF

   4.2. Lock out AC disconnect and document

5. Open inverter & test AC/DC power termination points to confirm system de-energized Critical Step – **PPE required**)

6. Take a photo

7. Install DER Management Device using Ethernet option (DDI M-365A)

   Note: If line-to-ground voltage is >150V, power and COM cables **must** use separate conduits

8. Terminate **Ethernet** cable to inverter

9. Terminate **power** wires in inverter

   9.1. Strip **power** wires in inverter

9.2. Terminate **ground** connection in inverter's **ground** bar

9.3. Crimp fork terminal onto #16 **neutral** from DER Management Device to inverter **neutral**

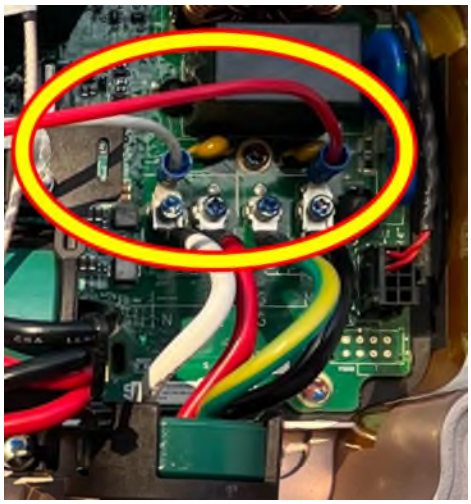

Figure 2 - Power Wires

9.4. Connect **neutral** from DER Management Devie to inverter's **neutral** terminal (CRITICAL STEP – **PPE Required**)

9.5. Connect #16 **power** cable from DER Management Device to one side **of in-line fuse**

9.6. Crimp fork terminal onto other end of **in-line fuse**

PPL Electric Utilities

9.7. Connect fork terminal from **in-line fuse** to inverter's **hot line terminal** (far right) (CRITICAL STEP – **PPE Required**)

10. Continuity test all power & communication connections CRITICAL STEP - **PPE required**)

11. Take photo of inverter, radio, overall system, and inverter(s) serial number(s)

12. Close inverter

13. Turn ON:

    AC power supplies

    DC safety switch

    Inverter power switch

14. See M-365D for details on programming XPort connection on Bridge

15. Connect Ethernet cable from inverter to XPort

16. Verify DER Management Device Connection:

    5B (blue) & 3.3V (orange) LEDs lit

    Tx and Rx LEDs blink when communicating with inverter (if SW2 set to “TCP” position”)

    Red & green LEDs blinking

    Note: If green light stays off, toggle SW1 (SBR) to opposite position

17. Close DER Management Device, add applicable stickers and seal enclosure

See DDI M-365 for full details and instructions.

Toggle between Volt-VAR mode and Constant Power Factor mode 10

Test ability to use "ride-through" curve functionality (i.e., voltage & frequency limits) 11

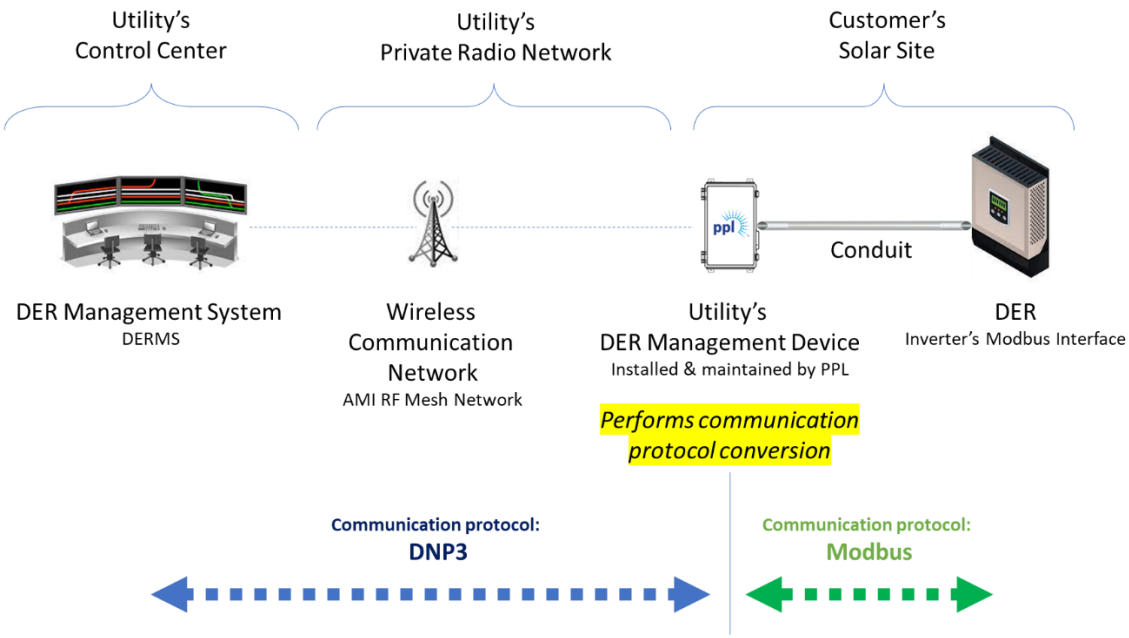
Relevant registers 11

Set curves (Change Values as Necessary with Unit and Scale Changes) 11

Purpose: Test inverter's grid support functionality via its Modbus interface

- The intention of this test plan is to verify that we understand, step-by-step, precisely how to manage the inverter's grid support functions.

- This information will be used to develop a communications protocol conversion program to facilitate communications (interoperability) between PPL's DERMS and the DER.



PPL's DERMS communicates directly with DERs via the utility's radio network.

DERMS regularly polls the inverter for updated system performance information and manages the inverter's grid support functionality, adjusting settings as needed.

- It's critical to, throughout the test, observe and record details that could be relevant to the protocol translation program.

  This includes data types (e.g., 16-bit register vs. 32-bit register, signed integer vs. unsigned integer), scaling (e.g., a value of 1.00 is represented as 1000), sign (positive values vs. negative values), etc.

- The protocol translation program also initiates command sequences. For example, if DERMS sends a Constant Power Factor (cos phi) value of "-0.90", the protocol conversion program (residing in the DER Management Device, which is physically connected to the DER's Modbus interface) will initiate a command sequence, setting all the registers necessary to operate the function.

  Accordingly, throughout this test, it's critical to note all relevant registers and commands that must be sent to achieve the desired settings change.

Test Setup

Typical setup for performing this test:

- Connect a laptop to the Modbus interface of the inverter
- On the laptop, use a Modbus master app (such as Modbus Poll) to interact with the inverter's Modbus interface
- PPL performs the tests detailed in the remainder of this document
    - We typically use the Zoom Record feature to easily capture every step of the process
    - Throughout the testing process, we also take notes and screenshots that we can use for quick reference

Set inverter to deenergize

- Register [Register Number], [Register Name]
    - Set to **[Value to Deenergize]**, *Stop*
- Observe register [Register Number] and the read-only registers (listed in the first test)
    - Record before-and-after values
    - Verify that the inverter performed the action as expected

Set inverter to reenergize

- Register [Register Number], [Register Name]
    - Set to **[Value to Reenergize]**, *Start*
- Observe register [Register Number] and the read-only registers (listed in the first test)
    - Record before-and-after values
    - Verify that the inverter performed the action as expected

Test ability to use constant power factor (cos phi) functionality

Relevant registers

[INSERT IMAGES FROM MODBUS MAP]

Set inverter PF to -0.90 (absorbing)

- Register [Register Number to Enable PF Mode], [Register Name]
    - Set to [Register Number], [Register Name]
- Register [Register Number to Set PF Value], [Register Name]
        - Set to -**9000** (Edit for Scale Factor if Needed)
- Register [Register Number to Change Leading/Lagging, if necessary], [Register Name]
    - Set to **[Value to Underexcite],** *UnderExcited*
- Observe Registers [Registers Numbers Above] and the read-only registers (listed in the first test)
    - Record before-and-after values
        - Pay attention to sign (+ or -) on the reactive power and power factor registers
    - Verify that the inverter performed the action as expected

Set inverter PF to +0.90 (injecting)

- Register [Register Number to Enable PF Mode], [Register Name]
    - Set to [Register Number], [Register Name]
- Register [Register Number to Set PF Value], [Register Name]
        - Set to **9000** (Edit for Scale Factor if Needed)
- Register [Register Number to Change Leading/Lagging, if necessary], [Register Name]
    - Set to **[Value to Overexcite],** *OverExcited*
- Observe Registers [Registers Numbers Above] and the read-only registers (listed in the first test)
    - Record before-and-after values
        - Pay attention to sign (+ or -) on the reactive power and power factor registers
    - Verify that the inverter performed the action as expected

Set inverter PF back to 1.00 (unity)

- Register [Register Number to Enable PF Mode], [Register Name]
    - Set to [Register Number], [Register Name]
- Register [Register Number to Set PF Value], [Register Name]
        - Set to **10000** (Edit for Scale Factor if Needed)
- Observe Registers [Registers Numbers Above] and the read-only registers (listed in the first test)
    - Record before-and-after values
        - Pay attention to sign (+ or -) on the reactive power and power factor registers
    - Verify that the inverter performed the action as expected

Test ability to use volt-VAR curve functionality

Background

- PPL configures every DER site with a unique Volt-VAR curve.
    - PPL's planning engineers calculate an optimal Volt-VAR curve for every DER site, based on the voltage profile of the circuit, the DER's location on that circuit, and time-of-day and seasonal variations in that location's voltage profile.
    - Here is how PPL structures a Volt-VAR curve:
    - 
        - where Voltage is measured in *per unit of nominal (pu)*
        - and Reactive Power Output is measured in *percentage of nameplate power output (%)*

Relevant registers

Set curves (Change Values as Necessary with Unit and Scale Changes)

- OV1 = 1.10 p.u. @ 2.10 sec
    - Register [Register Number], [Register Name] unit: pu scale: 1000
        - To set 1.10 pu (264.0V), write a value of **1100**
    - Register [Register Number], [Register Name], unit: s, scaling = 1
        - To set 2.10 sec, write a value of **2100**
- OV2 = 1.20 p.u. @ 0.20 sec
    - Register [Register Number], [Register Name]
        - To set 1.20 pu (288.0V), write a value of **1200**
    - Register [Register Number], [Register Name]
        - To set 0.20 sec, write a value of **160**
- UV1 = 0.88 p.u. @ 2.10 sec
    - Register [Register Number], [Register Name]
        - To set 0.88 pu (211.2V), write a value of **880**
    - Register [Register Number], [Register Name]
        - To set 2.10 sec, write a value of **2100**
- UV2 = 0.50 p.u. @ 0.60 sec
    - Register [Register Number], [Register Name]
        - To set 0.50 pu (120.0V), write a value of **500**
    - Register [Register Number], [Register Name]
        - To set 0.60 sec, write a value of **600**
- OF1 = 61.2 Hz @ 301.00 sec
    - Register [Register Number], [Register Name], unit: Hz, scaling = 100
        - To set 61.2 Hz, write a value of **6,120**
    - Register [Register Number], [Register Name], unit: Hz scaling: 1000
        - To set 301.00 sec, write a value of **301,000**
- OF2 = 62.0 Hz @ 0.20 sec
    - Register [Register Number], [Register Name]
        - To set 62.0 Hz, write a value of **6,200**
    - Register [Register Number], [Register Name]
        - To set 0.20 sec, write a value of **200**
- UF1 = 58.5 Hz @ 301.00 sec
    - Register [Register Number], [Register Name]
        - To set 58.5 Hz, write a value of **5,850**
    - Register [Register Number], [Register Name]
        - To set 301.00 sec, write a value of **301,000**

- UF2 = 56.5 Hz @ 0.20 sec
    - Register [Register Number], [Register Name]
        - To set 56.5 Hz, write a value of **5,650**
    - Register [Register Number], [Register Name]
        - To set 0.20 sec, write a value of **200**

- Observe these registers
    - Record before-and-after values
    - Verify that the inverter received the curve settings as expected

Test Broadcast Functionality:

Use ID 0 to send a command to select registers; Observe is Changes were Reflected.

Test Writing Function Code Functionality:

Send a command to select registers using Function Code 6, Observe if Changes were Reflected.

Send a command to select registers using Function Code 16, Observe if Changes were Reflected.

Test Multi-Inverter Configuration:

Create a Poll group using Inverter IDs 2, 3, etc.

Confirm you can read/write to select registers from Modbus Poll using all available Inverter IDs

BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION

Petition of PPL Electric Utilities Corporation	:	
for Approval of its Second Distributed Energy	:	Docket No. P-2024-_____
Resources Management Plan	:	

DIRECT TESTIMONY OF CODY M. DAVIS

PPL Electric Statement No. 3

May 20, 2024

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Cody M. Davis, and my business address is 1904 S First St, Champaign, IL 61820.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by Electric Power Engineers, LLC as a Senior Manager of Distribution and Grid Modernization.

Q. WHAT ARE YOUR DUTIES IN YOUR CURRENT POSITION?

A. I am primarily responsible for leading a team of power systems engineers in providing consultation services to a variety of clients with different roles related to power distribution systems. My team supports utilities clients, regulatory bodies, non-profit organizations, generation developers, and commercial and industrial business by providing expertise in matters related to the distribution system. These matters include distribution system planning and load forecasting as well as the integration of emerging technologies like solar, battery energy storage, distributed energy resources ("DERs"), advanced metering infrastructure ("AMI"), advanced distribution management systems ("ADMS"), and DER management systems ("DERMS"), among others. I am responsible for providing expert consulting services as well as overseeing and ensuring the quality of information, deliverables, and services provided by my team. Currently, I am supporting PPL Electric in Pennsylvania with its implementation and evaluation of the current DER Management Plan and with its proposed Second DER Management Plan.

Q. WHAT IS YOUR EDUCATIONAL BACKGROUND?

A. I received a Bachelor of Science degree in Electrical and Computer Engineering from Southern Illinois University Edwardsville in 2014.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.

A. I have over 9 years of experience working within a distribution utility and as a consultant on projects in a variety of power distribution subject matter areas including distribution design, distribution planning, DER interconnection, and distribution system operations. Prior to joining Electric Power Engineers, LLC in 2020, I was a Career Engineer at Ameren Illinois Company ("Ameren Illinois") working on DER integration and strategy. During my time in this role, I performed DER interconnection and system impact studies for larger solar installations and lead internal interconnection policy and criteria development. I also led several initiatives and pilot analyses in hosting capacity, non-wires alternatives, the value of DERs to the distribution system, and the impact of smart inverter functions on Ameren Illinois's voltage optimization program. My full resume is attached as PPL Electric Exhibit CD-1.

Q. HAVE YOU PREVIOUSLY TESTIFIED AS AN EXPERT WITNESS BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION ("COMMISSION")?

A. No, I have not.

Q. HAVE YOU PREVIOUSLY TESTIFIED AS AN EXPERT WITNESS BEFORE OTHER REGULATORY AGENCIES ON PUBLIC UTILITY ISSUES?

A. Yes. On behalf of Ameren Illinois, I provided testimony before the Illinois Commerce Commission at Docket No. 20-0389. On behalf of the Just Solar Coalition, I provided testimony before the Minnesota Public Utilities Commission at Docket No. E002/GR-21-630. On behalf of the Environmental Intervenors, I provided testimony before the Iowa Utilities Board at Docket No. RPU-2023-0002.

Q. WHAT IS YOUR ROLE IN PPL ELECTRIC'S IMPLEMENTATION OF THE DER MANAGEMENT PILOT PROGRAM ("PILOT PROGRAM")?

A. In my role with PPL Electric, I have supported many different aspects of the Pilot Program, including change management, process improvement, technology assessment, operational management implementation, use case development, data analytics, and reporting. With my background in distribution planning and DER interconnection, one of my primary focus areas is the development and assessment of use cases for the additional functionality provided by the Pilot Program.

Q. WOULD YOU PLEASE DESCRIBE THE SUBJECT MATTER OF YOUR TESTIMONY?

A. My testimony will provide: (1) an overview of the Pilot Program; (2) details about the use cases listed in the Second Revised Pilot Implementation Plan that have been analyzed during the course of the Pilot Program; and (3) details about other use cases that the Company has analyzed during the Pilot Program.

Q. ARE YOU SPONSORING ANY EXHIBITS WITH YOUR TESTIMONY?

A. Yes, I am sponsoring the following exhibits:

- PPL Electric Exhibit CD-1 – Resume of Cody M. Davis;
- PPL Electric Exhibit CD-2 – Second Revised Pilot Implementation Plan ("Pilot Implementation Plan");
- PPL Electric Exhibit CD-3 – List of 75 Distribution Circuits for Control Group 1;
- PPL Electric Exhibit CD-4 – Program Year 2 Annual Report;
- PPL Electric Exhibit CD-5 (HIGHLY CONFIDENTIAL) – Hidden Load Impact on Load Forecasting;
- PPL Electric Exhibit CD-6 (HIGHLY CONFIDENTIAL) – Hosting Capacity Year 2 Observations;
- PPL Electric Exhibit CD-7 (HIGHLY CONFIDENTIAL) – Hidden Load Impact on System Restoration;
- PPL Electric Exhibit CD-8 – Identification of a Non-Producing System;
- PPL Electric Exhibit CD-9 (HIGHLY CONFIDENTIAL) – Avoided Reinforcement During Switching #1;
- PPL Electric Exhibit CD-10 (HIGHLY CONFIDENTIAL) – Avoided Reinforcement During Switching #2;
- PPL Electric Exhibit CD-11 (HIGHLY CONFIDENTIAL) – Real Power Management Case Study; and
- PPL Electric Exhibit CD-12 (HIGHLY CONFIDENTIAL) – Real Power Management During Transfer Case Study.

I. OVERVIEW OF THE PILOT PROGRAM

Q. PLEASE DESCRIBE THE PURPOSE OF THE PILOT PROGRAM.

A. The goal of the Pilot Program is to understand, demonstrate, and quantify the benefits of active management, their associated costs, and the overall impact on distribution system and customers' DER system performance. PPL Electric's Pilot Program is the first of its kind in North America on this scale, communicating with and managing DERs down to the individual residential installation level for the purposes of improving power quality, safety, and hosting capacity, expanding operational awareness, and avoiding otherwise necessary capital investments and operational and maintenance expenses. The Commission's authorization of this program has already yielded significant benefits and will continue to enable the growth of clean energy in Pennsylvania while maintaining system reliability, power quality, and affordability.

In fact, the number of DERs has significantly grown in PPL Electric's service territory since the First DER Management Plan began on January 1, 2021. PPL Electric has seen increases of approximately 350% in DER applications, with a total of 11,841 DERs interconnected between the start of the First DER Management Plan on January 1, 2021, and May 16, 2024.

A full description of the Pilot Program is contained in the Second Revised Pilot Implementation Plan, which was submitted in the Company's First DER Management Plan proceeding at Docket No. P-2019-3010128. A copy of the Second Revised Pilot Implementation Plan is attached as PPL Electric Exhibit CD-2.

Q. PLEASE DESCRIBE THE TIMELINE OF THE PILOT PROGRAM.

A. The Pilot Program's test period began on March 22, 2022, after Control Group 2, described below, was fully established. The time leading up to the test period's commencement, from January 1, 2021, to March 21, 2022, was Program Year 0. Program Year 1 ran from March 22, 2022, through March 21, 2023. Program Year 2 began on March 22, 2023, and ended March 21, 2024, and Program Year 3 began on March 22, 2024, and will end on March 21, 2025.

Q. PLEASE DESCRIBE THE DER CUSTOMER GROUPS INCLUDED IN THE PILOT PROGRAM.

A. For purposes of the Pilot Program, PPL Electric identified four different DER customer groups. The groups are defined below, including their relationship to the Pilot Program. These definitions are critical to understanding the comparisons that the use cases make across the different customer groups, to establishing reporting requirements, and to calculating the costs and benefits attributed to monitoring and management of the DERs. Control Groups 1 and 2 and the Actively Managed Group were created and defined as part of the Pilot Program. Conversely, information from the Grandfathered Group is used as a basis for comparison. Some DER customers cannot participate in the Pilot Program because they are grandfathered or because PPL Electric exhausted the cap of 3,000 DER Management devices installed in the calendar year that they interconnected the DERs. The four defined DER customer groups are:

(1) **Grandfathered Group:** DER customers who applied for interconnection on or before December 31, 2020, and have completed their installation, are

"grandfathered" and, therefore, are not required to comply with the new interconnection requirements in the operations and maintenance of their DER installation. The Grandfathered Group also includes any customers who have applied for and completed their interconnection on or after January 1, 2021, but did not receive a DER Management device as part of their interconnection. One example of this group is customers who installed an inverter which communicates using IEEE 2030.5 prior to the availability of PPL Electric's IEEE 2030.5 communications solution. PPL Electric collects information continuously on the distribution system, including the circuits that host these DER customers, but there is no direct monitoring or active management of DER installations in this group.

(2) **Control Group 1:** This group contains all DER customers, who apply on or after January 1, 2021, and are located on 75 specific circuits, which are identified in PPL Electric Exhibit CD-3. These circuits were selected based on the circuits which serve the first 75 DER customers who applied to interconnect and are served by unique circuits. After those circuits were identified, all new DER customers who are served by one of these 75 circuits were interconnected in monitoring mode and operate with autonomous grid support functions only. The DERs on these 75 circuits are in "monitor-only" mode for the duration of the Pilot, meaning that they cannot be actively managed by PPL Electric and that the data collected from Control Group DERs is not used to make operational decisions. DER customers in Control Group 1 receive DER Management devices. Pursuant to the Settlement approved by the Commission in the First DER Management Plan proceeding,

Control Group 1 does not include any of the excluded circuits set forth in Attachment A to PPL Electric Exhibit CD-2.

(3) **Control Group 2:** This group contains the first DER customers to complete their installation, up to 1,000 participants, who also applied to interconnect on or after January 1, 2021, regardless of where they are located on the system. These customers are interconnected in monitoring mode and operate with autonomous grid support functions only. DER customers in Control Group 2 receive DER Management devices. DER customers in Control Group 1 count toward the 1,000 DERs in Control Group 2, with some customers being members of both Control Group 1 and Control Group 2.

(4) **Actively Managed Group.** All DER customers who submit applications and interconnect with the distribution system on or after January 1, 2021, excluding the customers outlined in Control Groups 1 and 2, as well as any customers who are members of the grandfathered group as a result of being interconnected after the cap of 3,000 DER management devices installed in the calendar year has been reached or due to other factors. The Company actively manages the grid support functions of the DER inverters in this Actively Managed Group using the DER Management devices and the Company's DERMS. The following grid support functions can be utilized in the smart inverters: (1) Volt/VAR; (2) Constant Power Factor; (3) Remote On/Off; (4) Voltage Ride-through; (5) Frequency Ride-through; and (6) Volt/Watt. Volt/Watt may only be enabled and managed with the consent of the interconnecting customer. PPL Electric only uses the Remote On/Off function on battery storage or solar systems that have not safely isolated or

"islanded" from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during restoration efforts following a power outage.

Control Group 1, Control Group 2, and the Actively Managed Group are included in the Pilot Program's scope and reporting. The Pilot Program's use cases, discussed in Section II, below, compare these groups to each other and to the Grandfathered Group to understand the costs and benefits of monitoring and actively managing DERs.

Q. HOW IS DATA COLLECTED AND VERIFIED FOR THE PILOT PROGRAM?

A. DER information, such as grid number, premise number, user group, circuit ID, nameplate generation size (kW), and distance from substation, is captured from the Geographic Information System ("GIS") and Customer Service System ("CSS") databases for all DER customer groups. Voltage data is taken across PPL Electric's network at all the available measuring points, such as the Supervisory Control and Data Acquisition ("SCADA") system and AMI meters, to monitor the network voltage level. System load data is captured at Company-owned devices at all the available measuring points in the network, such as circuit breakers, recloser devices, smart switching devices, and AMI meters. Voltage and load data is captured at all DER inverters within Control Groups 1 and 2 and the Actively Managed Group. Inverter baseline data that is collected and archived includes amps, voltage, watts, VARs, Power Factor, Power Factor setpoint value, Power Factor setpoint enabled, Volt/VAR enabled, and system status (On/Off). This data is captured for all DER customer groups and used for comparative analysis.

With DER monitoring and management, PPL Electric has seen a significant increase in data to help manage and plan the distribution system, with sources from the grid (before the meter) as well as AMI meter data and DER inverter data (behind the meter). Collecting data both before and behind the meter brings critical information to understand the full impact of two-way power flow on the safe and reliable operation of the distribution system. Using this data, PPL Electric is able to conduct comparisons among the four DER customer groups, show use cases, track multiple metrics, and analyze the differences in performance and grid-supporting behaviors of DERs with active management, monitoring, and without visibility on the distribution system.

Q. HOW ARE THE PILOT PROGRAM'S FINDINGS ANALYZED BY THE COMPANY?

A. PPL Electric gathers and stores data from participating DERs in three of the customer groups: Control Group 1, Control Group 2, and the Actively Managed Group. The data is used in comparison among the four customer groups (*i.e.,* Control Group 1, Control Group 2, Actively Managed Group, and Grandfathered Group) to determine the impact and benefits of DER monitoring and active management. Analysis of the collected data occurs in both an operating (real-time) environment and in planning (long-term) scenarios.

Operational analysis is done in near real-time so that operators and the Company's DERMS and ADMS can identify the impact of each DER on voltage and load on the circuit. The Company does not make operational decisions regarding the distribution system based on the information gathered from Control Group 1 and Control Group 2. DERMS/ADMS will determine if adjustments need to be made to traditional voltage

management devices, the settings on inverters in the Actively Managed Group, or both to mitigate violations and make work conditions safer. The operators can then change the inverter settings and determine if the potential violation is ameliorated. The information from all these events, for both monitored and actively managed customers, will be tracked and made available for further analysis.

Planning analysis includes post-event analysis of voltage and load information from the circuits with Grandfathered Group DERs (no monitoring) compared to circuits with monitored DERs and those with actively managed DERs. These comparisons determine whether monitoring and/or actively managing the DERs results in fewer voltage violations, fewer capital expenditures, or other system challenges being avoided.

II. OVERVIEW OF CAPABILITIES AND USE CASES INCLUDED IN THE PILOT PROGRAM

Q. PLEASE EXPLAIN THE ROLE OF USE CASES IN THE PILOT PROGRAM.

A. The use cases are intended to capture the benefits realized through the use of the new capabilities enabled by the Pilot Program. Identifying, tracking, and analyzing use case opportunities is an important aspect of evaluating the efficacy and efficiency of the Pilot Program and ensuring that the overall value is maximized.

Q. PLEASE PROVIDE AN OVERVIEW OF THE USE CASES INCLUDED IN THE SECOND REVISED PILOT IMPLEMENTATION PLAN.

A. The Second Revised Pilot Implementation Plan included eight use cases: (1) voltage violation at DER Point of Interconnection ("POC"); (2) voltage violation mitigated by DERs on the circuit; (3) voltage violation during planned switching; (4) system restoration;

(5) hidden load impact on load forecasting; (6) DER management impact on voltage management; (7) DER active management impact on hosting capacity increase and deferral of capital upgrade; and (8) DER operation in emergency conditions and in active work zones. I will address each of those use cases in the following sections.

Q. YOU MENTION NEW CAPABILITIES ENABLED BY THE PILOT PROGRAM. WHAT NEW CAPABILITIES ENABLED BY THE PILOT PROGRAM ARE YOU REFERENCING?

A. The Pilot Program has enabled PPL Electric to monitor and control several facets of inverter-based DER, as detailed within the Second Revised Pilot Implementation Plan. These capabilities include:

- Monitoring the real power production of the DER;
- Monitoring the reactive power production of the DER;
- Monitoring the voltage at the DER location;
- Modifying settings for the Volt/VAR curve autonomous grid support function;
- Modifying the settings for the ride-through autonomous grid support functions; and
- Adjusting the power factor in response to distribution system conditions.

Q. HOW ARE THESE CAPABILITIES INTERRELATED WITH THE USE CASES IN THE PILOT PROGRAM?

A. The use cases are, fundamentally, the identification of the ways in which these new capabilities result in improvements in distribution outcomes for customers. In this section of my testimony, I will identify the use cases, both those that were included in the Second

Revised Pilot Implementation Plan and those identified separately by PPL Electric, according to the specific capability used to achieve the benefits.

III. BENEFITS OF MONITORING CAPABILITIES ENABLED BY THE PILOT PROGRAM

Q. PLEASE DESCRIBE THE MONITORING CAPABILITIES ENABLED BY THE PILOT PROGRAM.

A. PPL Electric's DER Management device enables the Company to remotely communicate with inverters and collect near real-time data related to performance, device settings, and operating status. For the purposes of the use cases, the ability to monitor real power, reactive power, and voltage are the most impactful of the monitoring capabilities. PPL Electric also monitors status points and settings points, such as the Volt/VAR management mode, power factor management mode, and Volt/VAR curve setting points, among others. These status and settings points are necessary for ensuring ongoing system performance and to assess communication health but are not primary drivers of value for the use cases.

A. MONITORING REAL POWER

Q. WHAT USE CASES RESULT FROM PPL ELECTRIC'S ABILITY TO MONITOR REAL POWER PRODUCTION FOR INVERTER-BASED DER?

A. The communications capabilities and the data subsequently collected through monitoring real power production data has significant value for both system planning and operations. From the planning perspective, real power monitoring increases the accuracy of planning models and calculations. This results in increases in the available system load capacity by enabling the detection of hidden load (Use Case #5, Hidden Load Impact on Load Forecasting) as well as increases in DER hosting capacity (Use Case #7, DER Active

Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade). From an operational perspective, monitoring real power improves operational models, enables the detection of hidden load in order to facilitate safe switching and restoration (Use Case #4, System Restoration), and enables the identification of DER still operating within areas intended to be de-energized due to system outages or maintenance (Use Case #8, DER Operation in Emergency Conditions and Active Work Zones). In addition to these use cases from the Second Revised Pilot Implementation Plan, monitoring real power enables PPL Electric to identify systems that are not operational and notify customers of this condition.

Q. WHAT DO YOU MEAN BY "PLANNING MODELS"?

A. "Planning model" generally refers to the circuit models developed by PPL Electric (and peer utilities) to study various aspects of power flows on distribution circuits as well as identify the impacts of potential or expected changes in circuit conditions. PPL Electric uses power flow modeling software to develop power flow models for this purpose for distribution circuits.

Q. HOW DOES REAL POWER MONITORING IMPROVE THE ACCURACY OF PLANNING MODELS?

A. PPL Electric includes interconnected DER within its distribution system model. In the absence of historical real power production data, planning engineers must make assumptions about the relative output of the DER in the scenario(s) being studied. Generally speaking, planning studies are conducted to identify and evaluate constraints or determine whether violations of planning criteria will occur that would negatively impact

customers or damage infrastructure. Consequently, assumptions within these studies tend to be based on worst case scenarios in order to ensure that these constraints and planning criteria are not violated. The availability of historical DER real power production data, obtained as a result of real power monitoring of DER through the Pilot Program, eliminates the need for such assumptions by allowing the actual production values to be used instead. Because the DER real power production changes the power flow results within the model, the end result is a more accurate model of distribution system conditions.

Q. WHAT BENEFITS RESULT FROM IMPROVING THE ACCURACY OF PLANNING MODELS?

A. Improving the accuracy of planning models also improves the accuracy of the studies that utilize those models, including load interconnection studies and DER interconnection studies. Because the assumptions replaced by the monitored data are generally more risk-averse, the improved accuracy generally results in fewer system modifications needed to accommodate new load and generation and, subsequently, less interconnection cost for customers.

Q. YOU MENTIONED THAT REAL POWER MONITORING ALSO ENABLES THE DETECTION OF HIDDEN LOAD. WHAT IS HIDDEN LOAD?

A. Hidden load is the amount of load that is present on a circuit but not measured at telemetry points (e.g., the circuit breaker) because the energy is being provided by local downstream DERs. The amount of load measured by distribution equipment is often referred to as the "net" load, and the total amount of load operating on the circuit (including the amount

offset by DER production) is the “native” load, with “hidden” load in a given interval as the difference between the two.

Q. HOW DOES HIDDEN LOAD IMPACT DISTRIBUTION SYSTEM CAPACITY PLANNING WHEN DERS’ REAL POWER PRODUCTION IS NOT MONITORED?

A. Similar to the planning model impact I discussed previously, a lack of historical data for DER real power means that assumptions must be utilized instead in order to estimate net load and native load for planning purposes. If production is assumed to be too high, this can place infrastructure at risk of unintended overloads. Consequently, in the absence of actual performance data, it is common to assume full nameplate real power production in order to minimize the risk of equipment overloads. In practice, because all DER are unlikely to be operating at full nameplate output during the local distribution peak, this assumption artificially increases the estimated loading and reduces the estimated amount of capacity available on the system. In addition, since the present year data is used to develop future year load forecasts, often by using percentage annual growth factors, using an artificially high peak load value can result in increasing amounts of capacity-reducing error in future years of the forecast.

Q. HOW DOES THE MONITORING OF DER REAL POWER PRODUCTION IMPROVE THE HIDDEN LOAD AND CAPACITY DETERMINATION PROCESSES?

A. The benefits of using monitored DER real power production data within this process are identified within Use Case #5 (Hidden Load Impact on Load Forecasting) of the Second Revised Pilot Implementation Plan. The data gathered of a result of real power monitoring improves the accuracy of load and capacity calculations, resulting in more timely investments in capacity where it is needed. Absent this data, such investments would be more likely to occur sooner than necessary.

Q. HAS PPL ELECTRIC IDENTIFIED ANY SPECIFIC CAPACITY INCREASES OR INVESTMENT DEFERRALS AS A RESULT OF THE DATA COLLECTED FROM MONITORING DER REAL POWER?

A. Yes. HIGHLY CONFIDENTIAL PPL Electric Exhibit CD-5, Hidden Load Impact on Load Forecasting, evaluates eight circuits with relatively high penetrations of DER that were forecasted to experience load growth and subsequent capacity constraints. Of these eight, seven showed potential to defer upgrades within the next 10 years as a result of using monitored data in place of the nameplate DER output.

Circuit	Planning Nominal Rating (kVA)	Load Growth	Gen Growth	Circuit Upgrade Required By (w/o DER monitoring)	Circuit Upgrade Required By (w DER monitoring)	Circuit Upgrade Deferred by	Circuit Upgrade Cost
A	10,000	3%	8%	2023	2030	7 yrs	$410 K
B	10,000	2%	8%	2023	2024	1 yr	$1,099 K
C	8,000	3%	10%	2031	2032	1 yr	$383 K
D	10,000	5%	8%	2026	2033+	7+ yrs	$148 K
E	11,000	3%	10%	-	-	-	-
F	10,000	3%	8%	2023	2027	4 yrs	$1,520 K
G	10,000	3%	8%	2023	2028	5 yrs	$ 66 K
H	11,000	3%	8%	2023	2027	4 yrs	N/A

Q. YOU ALSO MENTIONED USE CASE #7, WHICH DEALS WITH HOSTING CAPACITY. WHAT IS HOSTING CAPACITY ANALYSIS, AND HOW IS IT RELATED TO SYSTEM UPGRADES?

A. Hosting capacity analysis is a type of distribution study which uses planning models to estimate the amount of DER that can be added at different locations within the distribution system before load or voltage violations begin to occur. When a potential DER interconnection is larger than the available hosting capacity, system upgrades are required in order to accommodate that DER. Consequently, increasing hosting capacity increases the amount of generation that can be installed at a given location, reducing the need for system upgrades and the resulting costs. Increasing hosting capacity by using the real power monitoring and power factor control capabilities is identified within the Second Revised Pilot Implementation Plan as Use Case #7 (DER Active Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade).

Q. HOW DOES REAL POWER MONITORING IMPROVE HOSTING CAPACITY AND POTENTIALLY DEFER CAPITAL UPGRADES?

A. Since hosting capacity analysis is based on the results from planning models, the model accuracy benefits of real power monitoring, which I discussed previously, and result in generally higher hosting capacity values.

Q. HAS PPL ELECTRIC IDENTIFIED ANY HOSTING CAPACITY IMPROVEMENTS AS A RESULT OF ITS PILOT PROGRAM?

A. Yes. As explained in the Program Year 2 Annual Report (PPL Electric Exhibit CD-4), the use of data from real power monitoring increased the system-wide hosting capacity by approximately 18 MW when compared to using the DER nameplate data instead. PPL Electric also examined the individual node-level data at the system and circuit level to capture the impacts more granularly, the results of which are provided as HIGHLY CONFIDENTIAL PPL Electric Exhibit CD-6: Hosting Capacity Year 2 Observations. Averaged across the entire distribution system, monitoring real power increased the hosting capacity at the average system node by 1.0% in the analysis performed for Program Year 2 (March 2023 – March 2024). On specific circuits, the results are significantly more impactful, with many circuits seeing increases of more than 50% when compared to the nameplate assumption results.

Q. HOW WILL ADDING MORE DER WITH MONITORING CAPABILITIES IMPACT THE RESULT OF THE HOSTING CAPACITY ANALYSIS?

A. I believe that as more DERs with monitoring capabilities are added, the increases resulting from the scenario using monitored data, compared with the nameplate scenario, will continue to grow. Effectively, each new DER with monitoring capability that is added increases the gap between results because the nameplate alternative is a much more conservative assumption that underestimates the true hosting capacity available. This will help accommodate DER growth in a cost-effective manner.

Q. YOU ALSO MENTIONED THAT REAL POWER MONITORING IMPROVES THE ACCURACY OF OPERATIONAL MODELS. WHAT DO YOU MEAN BY "OPERATIONAL MODELS"?

A. As PPL Electric Witness Aliesha Dombrowski-Diamond discusses within her direct testimony (PPL Electric Statement No. 2), PPL Electric utilizes an Advanced Distribution Management System (ADMS) that is capable of performing power flow calculations based on the system configuration, incorporating status and measurement points from telemetered devices. For simplicity, I will refer to the ADMS, the monitored status and measurement points, and the results of power flow calculations and estimated thermal loading, voltage, and other values as "operational models."

Q. HOW DOES REAL POWER MONITORING IMPROVE THE ACCURACY OF OPERATIONAL MODELS?

A. Similar to the planning models, incorporating real power measurements allows for the replacement of performance assumptions with real data, which increases the accuracy of power flow calculations and improves the load and voltage estimates within the operational

model. It also allows for the ADMS and system operators to quantify the amount of load being hidden by DER that would need to be supported by the distribution system if the DER were no longer producing.

Q. WHAT BENEFITS RESULT FROM IMPROVING THE ACCURACY OF OPERATIONAL MODELS?

A. Increasing the accuracy of voltage calculations helps PPL Electric more effectively identify and respond to voltage violations through both traditional means (e.g., using capacitor banks) and using the DER power factor control capabilities established by the Pilot Program. Improved model quality also improves the operation of Fault Isolation and Service Restoration ("FISR") schemes by providing more accurate estimates for load and voltages under potential switching configurations to restore service automatically following an outage.

In addition, being aware of the hidden load helps ensure that switching operations (especially those that occur automatically through FISR) do not result in equipment overloads or any potential equipment damage. This is captured in Use Case #4 (System Restoration) from the Second Revised Pilot Implementation Plan. Following an outage, a DER must remain de-energized for at least five minutes, during which time the distribution system must carry both the load it had previously been carrying as well as any hidden load that was previously supported by the DER. Being aware of the magnitude of the hidden load enables operators and the ADMS to make informed decisions to avoid overload conditions during restoration efforts.

Q. HAS PPL ELECTRIC IDENTIFIED ANY SPECIFIC INSTANCES OF THESE BENEFITS ON THE DISTRIBUTION SYSTEM?

A. Yes. PPL Electric performed an analysis to better understand the impacts of DERs and hidden load in operations during system restoration events, which has been provided as HIGHLY CONFIDENTIAL PPL Electric Exhibit CD-7: Hidden Load Impact on System Restoration. This analysis was performed on eight circuits with high DER penetration and relatively high load and compared the estimated overload risk with and without the use of DER real power monitoring data. Of the eight circuits studied, seven had potential overload risk based on estimated loading within a 10-year forecast period. For all seven circuits, the risk was mitigated for at least one additional year because of improved accuracy from DER real power monitoring.

Q. YOU REFER TO USING MONITORING TO IDENTIFY DERS STILL OPERATING IN AREAS INTENDED TO BE DE-ENERGIZED. CAN YOU EXPLAIN HOW MONITORING COULD BE USED IN SUCH SCENARIOS?

A. This application of monitoring is captured within Use Case #8 (DER Operations in Emergency Conditions and Active Work Zones) from the Second Revised Pilot Implementation Plan. For safety reasons and to avoid equipment damage, DERs are not permitted to remain operating in parallel with the distribution system during planned maintenance outages or unplanned outages. Monitoring DERs' real power can help operators identify DERs that are still producing in areas intended to be de-energized and take action to avoid injury to line crews and the public.

Locations on the distribution system may also be de-energized for public safety during emergency events such as house fires and gas leaks. Monitoring DERs' real power can identify whether DERs at such locations are still energized, which can improve information and safety for first responders. For example, if a customer has a back-up power system, PPL Electric's actions to de-energize the location (for example, by utilizing the AMI meter disconnection capability) will not be able fully de-energize the site. If the back-up power scheme incorporates the customers monitored solar system, PPL Electric can identify that the location is still energized and inform first responders on-site to improve their safety and response capabilities.

Q. YOU MENTIONED THAT REAL POWER MONITORING CAN HELP PPL ELECTRIC IDENTIFY SYSTEMS THAT ARE NOT OPERATIONAL. WHAT DO YOU MEAN BY "NOT OPERATIONAL"?

A. Systems that are not operational are those that are not able to produce real power when expected. This could be a result of a number of different causes related to a customer's equipment, including having a disconnect switch open, a blown fuse, or other causes.

Q. HOW IS REAL POWER MONITORING USED TO IDENTIFY SYSTEMS THAT ARE NOT OPERATIONAL?

A. Because PPL Electric has a communication path to the DERs and can monitor the real power production, it is possible to identify systems that have lost communication or where the real power production during daylight hours is zero.

Q. WHAT BENEFITS RESULT FROM PPL ELECTRIC'S ABILITY TO IDENTIFY SUCH SYSTEMS?

A. Where such systems are identified, PPL Electric can notify customers that their system is not producing energy, which can improve customer awareness and result in customer maintenance actions to restore the system to functionality.

Q. HAS PPL ELECTRIC NOTIFIED ANY CUSTOMERS THAT THEIR SYSTEMS WERE NOT PRODUCING?

A. Yes. As identified within the Program Year 2 Annual Report, PPL Electric has contacted 22 customers to notify them that their DER is not producing real power. An example of one such case is provided as PPL Electric Exhibit CD-8: Identification of a Non-Producing System. In this case, PPL Electric observed a loss of communication to the DER Management device and, upon investigation, identified that the customer's fused disconnect had blown, de-energizing the DER system. After PPL Electric notified the customer of this condition, it was corrected by the customer and their installer in order to restore the energy production of the system.

Q. WHAT DO YOU CONCLUDE ABOUT PPL ELECTRIC'S ABILITY TO MONITOR DER REAL POWER AS ENABLED BY THE PILOT PROGRAM?

A. I conclude that the ability to monitor DERs' real power through the Pilot Program has resulted in significant benefits to PPL Electric customers and significant improvements in planning and operational outcomes and subsequently avoided or deferred capital investments.

B. MONITORING REACTIVE POWER AND VOLTAGE

Q. WHAT USE CASES RESULT FROM PPL ELECTRIC'S ABILITY TO MONITOR THE REACTIVE POWER CONTRIBUTION OF INVERTER-BASED DER?

A. PPL Electric's ability to monitor reactive power for DERs within the Pilot Program improves the accuracy of operational models and enables the calculation of lost generation that results from reactive power support functions, including Volt/VAR curves and power factor setpoint management.

Q. HOW DOES MONITORING REACTIVE POWER IMPROVE OPERATIONAL MODEL ACCURACY?

A. Similar to monitoring real power, monitoring DERs' reactive power also improves operational models and power flow calculations of thermal loading and voltage by replacing the performance assumed by the model with actual data points. This yields calculation results that more closely match actual circuit values in the field, which enhances the operation of applications such as FISR and voltage management.

Q. YOU MENTION "LOST GENERATION" AS THE RESULT OF VOLT/VAR CURVES AND ACTIVE MANAGEMENT. PLEASE EXPLAIN WHAT THIS "LOST GENERATION" IS AND WHAT OCCURS.

A. Inverters have a maximum apparent power rating (in units of kVA) above which they cannot operate, which varies by inverter model. Real and reactive power capabilities both contribute to the overall apparent power of the inverter in the classic power triangle

relationship, where the square of the real power plus the square of the reactive power equals the square of the apparent power. In the absence of any reactive power support requirements, the inverter can produce real power (in units of kW) up to the inverter's rated apparent power rating because the entire apparent power consists of real power. If an inverter is operating at the maximum real power and reactive support is required, the real power value must be reduced in order to allow for reactive power support to be provided while also not exceeding the inverter's maximum apparent power rating. This occurs with the use of Volt/VAR curves with reactive power priority (which is the mode utilized by many utilities, including PPL Electric) as well as the use of power factor management commands. For simplicity, I will use the term "lost generation" to refer to the difference between the amount of real power generated over time (in units of kWh) with reactive support requirements considered when compared to the amount that would've been generated in the absence of reactive power support requirements.

Q. HOW IS MONITORING REACTIVE POWER RELATED TO LOST GENERATION?

A. Monitoring the reactive power of the inverter (either directly or indirectly through the monitoring of other values than enable the calculation of reactive power) is necessary in order to calculate the lost generation for a given inverter. This calculation cannot be performed using just the real power data.

Q. DOES PPL ELECTRIC CALCULATE LOST GENERATION FOR DERS WITHIN THE PILOT PROGRAM?

A. Yes. As identified within the Second Revised Pilot Implementation Plan, PPL Electric must provide a report to each customer within the Pilot Program that identifies the amount of generation lost or gained as a result of the use of autonomous grid support functions and as a result of the Company's active management of grid support functions.

Q. HOW DOES PPL ELECTRIC CALCULATE LOST GENERATION FOR THOSE CUSTOMERS?

A. Net generation lost is calculated by totaling the energy lost during all time intervals where inverter grid support functions were utilized, assuming sufficient generation was available to reach the maximum inverter apparent power rating if not limited by the reactive power support requirements.

Lost generation from reactive power support functions (i.e., Volt/VAR and Constant Power Factor) can only occur when the inverter's real power generation is between 90% and 100% of the apparent power rating and when the inverters measured/calculated apparent power and maximum rated apparent power are the same magnitude. When it is producing real power at 100% of the apparent power rating, there is no lost generation because no reactive support is being provided. When it is producing real power below 90% of the apparent power rating, real power does not need to be reduced in order to provide reactive support, because reactive power support up to the maximum required level of 44% of the inverter's maximum apparent power rating results in the total apparent power remaining below the inverter's maximum nameplate rated apparent power.

To calculate a customer's lost generation resulting from reactive power support functions, PPL Electric identifies each time interval from the monitored real power data where real power production is between 90% and 100% of the nameplate apparent power rating. Within each such interval, the monitored reactive power is used to calculate whether the total apparent power of the inverter is operating at the maximum rated value. If the actual apparent power is lower than the nameplate apparent power rating, no generation is lost in that interval. If the actual apparent power is equal to the maximum rated apparent power of the inverter, then the lost generation in that time interval is calculated as the difference between the nameplate apparent power rating and the measured real power value during the same interval. This difference is effectively the amount of additional real power that would have been produced if not for reactive power requirements. Once each interval is identified, the time duration of the interval is applied in order to convert to an energy value (in units of kWh), and then all such intervals are summed to determine the overall lost generation for the customer.

Q. HOW DOES CALCULATING THE LOST GENERATION RESULT IN BENEFITS FOR CUSTOMERS?

A. PPL Electric's ability to calculate lost generation as a result of Volt/VAR curves allows for uniquely effective and low-cost tracking of the overall performance of Volt/VAR curves and their impact on customer generation. For utilities without monitoring capabilities, there is limited visibility into the lost generation resulting from the use of Volt/VAR curves. Lost generation information is also provided directly to customers so that they can understand how the Volt/VAR curve impacts their energy generation and potentially pursue

modifications to increase their energy generation capabilities. Similarly, for power factor management commands, PPL Electric is able to calculate the total amount of lost generation for each customer and collectively as a result of the active management of DER power factor setpoints. Within the Program Year 2 Annual Report, a total of 4,859.52 kWh of lost generation was identified across 221,394 control events for an average of 0.02195 kWh per event. Tracking this aspect of performance is important to continuous improvement efforts to manage voltage effectively while minimizing any potential negative impacts to customers.

Q. WHAT USE CASES RESULT FROM PPL ELECTRIC'S ABILITY TO MONITOR DER VOLTAGE?

A. The ability to monitor DERs' voltage improves system operator information and awareness (which is a component of Use Case #1, Voltage Violation at the DER Point of Interconnection) and improves PPL Electric's ability to respond to customer voltage issues.

Q. HOW DOES MONITORING DERS' VOLTAGE IMPROVE OPERATOR INFORMATION AND AWARENESS?

A. Historically, voltage measurements for operations have been limited to a relatively small number of locations where distribution devices have communications capabilities. This includes equipment such as substation busbars and circuit breakers, communications-enabled reclosers, and capacitor banks, all with varying degrees of measurement accuracy. The ability to observe voltage at more points within the network through DER voltage monitoring further improves the ability of operators to understand system voltages and

compare the measured values against the voltage values estimated by the operational model to verify model accuracy.

DER voltage monitoring also enables the ADMS and system operators to identify voltage violation conditions at the DER location and take appropriate action. The detection of these conditions and the subsequent actions make up Use Case #1 (Voltage Violation at the DER Point of Interconnection) from the Second Revised Pilot Implementation Program.

Q. YOU STATED THAT MONITORING VOLTAGE IMPROVES CUSTOMER VOLTAGE ISSUE TROUBLESHOOTING. PLEASE EXPLAIN HOW DER VOLTAGE INFORMATION CAN BE UTILIZED FOR THIS PURPOSE.

A. PPL Electric receives and responds to customer inquiries related to voltage issues. These issues can be caused by a myriad of conditions including loose connections, lack of customer grounding equipment, system-level voltage issues, customer equipment malfunction, or a host of other potential causes. Therefore, it is often useful to gather data at the customer's location in order to narrow down possible root causes. Traditionally, this includes using historical AMI voltage measurement data along and may include setting power quality monitoring equipment temporarily to gather high-resolution data. With the addition of DER voltage monitoring, power quality investigations have an additional source of voltage data at DER customer locations that can be useful in determining the root cause of the voltage issue.

Q. WHAT DO YOU CONCLUDE ABOUT PPL ELECTRIC'S ABILITY TO MONITOR DER REACTIVE POWER AND VOLTAGE AS ENABLED BY THE PILOT PROGRAM?

A. I conclude that PPL Electric's ability to monitor DER reactive power and voltage improves the information and capabilities of system operators and enables important information gathering to support efficient voltage management and inform customers about the operation of their DER.

IV. BENEFITS OF MANAGING AUTONOMOUS GRID SUPPORT FUNCTIONS ENABLED BY THE PILOT PROGRAM

Q. PLEASE DESCRIBE THE AUTONOMOUS GRID SUPPORT FUNCTION MANAGEMENT CAPABILITIES ENABLED BY THE PILOT PROGRAM.

A. The Pilot Program enables PPL Electric to modify the Volt/VAR curve setpoints for DERs within the Actively Managed Group. It also allows PPL Electric to modify the Overvoltage, Undervoltage, Overfrequency, and Underfrequency Ride-Through setpoints (collectively referred to as "ride-through curves").

Q. WHAT USE CASES RESULT FROM PPL ELECTRIC'S ABILITY TO MANAGE THE AUTONOMOUS GRID SUPPORT FUNCTIONS?

A. The use cases resulting from the management of autonomous grid support functions were not explicitly identified within Attachment C of the Second Revised Pilot Implementation Plan but are impactful and help improve the integration and performance of DERs. PPL Electric utilizes the management of the autonomous grid support functions to program initial values into customer inverters, which helps streamline the interconnection process.

PPL Electric can manage the Volt/VAR curves to respond to changing system conditions or increase the amount of energy generated by the customer's DER. PPL Electric also has the capability to update the ride-through curves efficiently in bulk if any changes become necessary in the future.

Q. PLEASE EXPLAIN HOW INVERTERS ARE PROGRAMMED WITH VOLT/VAR CURVE AND RIDE-THROUGH CURVE SETTINGS UNDER PPL ELECTRIC'S PILOT PROGRAM.

A. Once a customer has completed the installation of their inverter and after PPL Electric has installed the DER Management device, PPL Electric programs the Volt/VAR curve and ride-through curves on the customers inverter(s) remotely. Neither the customer nor their DER installer needs to be involved in programming inverter settings.

Q. IN YOUR EXPERIENCE, HOW ARE INVERTERS PROGRAMMED WITH VOLT/VAR CURVES AND RIDE-THROUGH CURVES IN OTHER UTILITY JURISDICTIONS?

A. In my experience, in other utility jurisdictions, Volt/VAR curves and ride-through curves are set by the customer or their installer as part of the commissioning process. When a utility has standard Volt/VAR and ride-through curves for all DER interconnections, inverter grid profiles may be used to set the inverter curve points for each curve to the appropriate standard for the utility territory. If the utility does not have standard curves available within a manufacturer grid profile, the customer or their installer will need to modify the settings individually. In some cases, utilities may require assurance or evidence

that the appropriate curves have been programmed, or they may verify the curve points during the utility witness test process prior to authorizing the operation of the DERs.

Q. HOW DOES PPL ELECTRIC'S CURVE PROGRAMMING CAPABILITY, ENABLED BY THE PILOT PROGRAM, IMPROVE UPON PRACTICES FROM OTHER JURISDICTIONS?

A. Because PPL Electric can program and validate the Volt/VAR and ride-through curves remotely, customers and installers do not have to establish the settings locally or provide any validation of the settings. This removes the settings modification responsibilities from customers and installers and eliminates the need for separate settings verification steps within the interconnection process.

Q. YOU IDENTIFIED UPDATING VOLT/VAR CURVES IN RESPONSE TO CHANGES IN DISTRIBUTION SYSTEM CONDITIONS AS A USE CASE FOR THE PILOT PROGRAM. WHAT TYPES OF CHANGES IN SYSTEM CONDITIONS ARE YOU REFERRING TO, AND HOW DO THEY IMPACT CUSTOMERS?

A. The distribution system changes over time as new loads, new generators, and new infrastructure are built and connected. This is particularly true with the expected levels of electrification and DER adoption anticipated in the next several years. Such changes will result in changes to distribution system connectivity and customer voltage profiles, both of which are impactful to Volt/VAR curve performance.

From a system planning perspective, distribution system connectivity is based on the "normal" system configuration, which is the state the system is intended to be operated in whenever feasible. Permanent modifications to the "normal" system configuration occur regularly as part of the planning process in order to provide additional capacity, resolve voltage issues, or improve reliability. As an example, when PPL Electric constructs a new distribution substation, customers previously served by other substations will be transferred over to the new substation and circuits as their new "normal" source. These types of changes in configuration can result in significant changes to customer voltage profiles. For example, a customer who was previously located several miles away from the closest substation may now be much closer and, subsequently, experience voltages on the higher end of the allowable range. Such changes can impact the relative effectiveness and amount of lost generation experienced as a result of the Volt/VAR curve. In addition to configuration changes, anticipated increases in the amounts of DER and electrification loads connected to the distribution system will have a significant impact on customer voltage profiles and, subsequently, the performance of the Volt/VAR curve.

Q. HOW DOES UPDATING VOLT/VAR CURVES IN RESPONSE TO SUCH CONDITIONS RESULT IN BENEFITS?

A. PPL Electric determines customized Volt/VAR curves for each interconnecting DER and bases the calculation of this curve on the location, electrical system equipment characteristics, and historical voltage profile at that location. This results in more optimized Volt/VAR curve performance when compared to less targeted, system-wide curves but can create challenges if the circuit voltage profile changes or the customer is transferred to a

different circuit. The ability to update Volt/VAR curves in response to changes in system conditions enables PPL Electric to use a location-specific Volt/VAR curve approach to improve voltage management on the distribution system. In the absence of these capabilities, PPL Electric would have to consider using more generic Volt/VAR curves that would reduce the voltage management performance of the curves.

Q. HAS PPL ELECTRIC MODIFIED ANY CUSTOMER VOLT/VAR CURVES IN RESPONSE TO CHANGING SYSTEM CONDITIONS?

A. Yes. In 2023, PPL Electric completed construction of the new University substation, which began serving customers previously served by other nearby substations. Of the customers transferred, six had actively managed DERs that required new Volt/VAR curves. PPL Electric calculated new Volt/VAR curves for these six customers based on the expected conditions on the circuits supplied by the new substation. These curve modifications were identified within the Program Year 2 Annual Report and were executed remotely without any disruption to the affected customers.

Q. ARE THERE OTHER REASONS PPL ELECTRIC WOULD ASSIGN A NEW VOLT/VAR CURVE?

A. Yes. As I discussed earlier in my testimony, PPL Electric uses monitored real and reactive power data to calculate the amount of customer energy generation lost as a result of the operation of Volt/VAR curves for each customer in the Pilot Program. While the average energy losses are generally less than 10 kWh (based on the results of PPL Electric's Customer Reports from Program Year 1), some customers experience significantly more

lost generation than others. This result, with some high loss outlier customers, has also occurred at other utilities using Volt/VAR curves, such as Hawaiian Electric Company[1]. In these outlier cases, PPL Electric can perform analysis using the measured historical DER real power, reactive power, and voltage information, along with AMI voltage and other circuit parameters, to evaluate whether modifications to the Volt/VAR curve can reduce the amount of energy losses experienced by the customer.

Q. HAS PPL ELECTRIC UPDATED ANY CUSTOMER VOLT/VAR CURVES TO INCREASE THE AMOUNT OF ENERGY GENERATED BY DERS?

A. Yes. PPL Electric has modified the Volt/VAR curves of six DERs (in addition to the six on University substation) to increase the amount of energy produced by the customers' DERs. PPL Electric also identified two customers within the control groups that could have had their energy generation increased through PPL Electric's update of their Volt/VAR curve. While PPL Electric is currently prohibited from making such modifications, it was estimated that these two customers could see annual increases of 106.7 kWh and 52 kWh respectively[2]. If PPL Electric were allowed to modify the Volt/VAR curves for customers within the control groups, as proposed within PPL Electric Witness Salim Salet's direct testimony (PPL Electric Statement No. 1), these increases could be realized.

[1] Smart Inverter Utility Experience in Hawaii: nrel.gov/docs/fy19osti/74091.pdf.

[2] PPL Electric Exhibit CD-4, p. 31.

Q. BEYOND THE VOLT/VAR CURVE UPDATES, ARE THERE BENEFITS TO BEING ABLE TO UPDATE RIDE-THROUGH CURVES REMOTELY AS WELL?

A. Yes. PPL Electric's standard ride-through curves are based on the settings recommended by PJM Interconnection LLC ("PJM") to support the stability of the bulk power system. PPL Electric's ability to remotely modify ride-through settings for DERs within the Pilot Program makes it possible to adjust settings on large numbers of interconnected DERs in the future at minimal cost of deemed necessary in the future by PJM.

Q. WHAT DO YOU CONCLUDE ABOUT PPL ELECTRIC'S ABILITY TO MODIFY VOLT/VAR AND RIDE-THROUGH SETTINGS AS ENABLED BY THE PILOT PROGRAM?

A. I conclude that PPL Electric's ability to modify Volt/VAR and ride-through settings has resulted in beneficial outcomes for customers and would continue to do so in the future.

V. BENEFITS OF REACTIVE POWER MANAGEMENT CAPABILITIES ENABLED BY THE PILOT PROGRAM

Q. PLEASE DESCRIBE THE REACTIVE POWER MANAGEMENT CAPABILITIES ENABLED BY THE PILOT PROGRAM.

A. As described within the Second Revised Pilot Implementation Plan, PPL Electric has the ability to issue a new power factor setpoint to DERs within the Active Management Group, temporarily overriding the pre-set Volt/VAR curve or a previously issued power factor setpoint. PPL Electric executes these override commands automatically using its ADMS/DERMS in response to voltage violation conditions on the distribution system.

These commands are configured such that the reactive power remains within the capability ranges established within the IEEE 1547-2018 standard based on the amount of real power produced by the inverter. The power factor setpoints issued by PPL Electric currently range from 0.9 absorbing to 0.9 injecting in order to ensure that inverters are not directed to produce more than 44% of their nameplate as reactive power, which is also established within IEEE 1547-2018.

Q. WHAT USE CASES RESULT FROM PPL ELECTRIC'S ABILITY TO MANAGE THE POWER FACTOR SETPOINT OF DERS?

A. From the Second Revised Pilot Implementation Plan, the following use cases are derived from power factor management capabilities:

- Use Case #1: Voltage Violation at DER Point of Interconnection
- Use Case #2: Voltage Violation Mitigated by DERs on the Circuit
- Use Case #3: Voltage Violation During Planned Switching
- Use Case #6: DER Management Impact on Voltage Management
- Use Case #7: DER Active Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade

Collectively, these use cases explore different impacts and consequences of PPL Electric's improved ability to address voltage violations on the system by utilizing DER reactive power capabilities in an orchestrated, centrally optimized manner.

Q. HOW DOES PPL ELECTRIC DEFINE A VOLTAGE VIOLATION?

A. PPL Electric must maintain system voltages within certain allowable ranges, which vary by service type. A voltage violation occurs when a customer's service voltage is outside of the allowable range for greater than one minute.[3] For most customers, PPL Electric generally aims to maintain service voltages between 95% and 105% (0.95 to 1.05 in per unit values) of the nominal service voltage.

Q. PLEASE EXPLAIN WHY THE SEGMENTATION OF THE VOLTAGE-DRIVEN USE CASES INTO FIVE USE CASES IS BENEFICIAL IN UNDERSTANDING THE IMPACTS OF DER POWER FACTOR MANAGEMENT.

A. Each of the five voltage management use cases, while dealing with the same core challenge, address voltage violations in different ways and using different strategies. As a result, the benefits of active management of the power factor setpoint manifest in different forms. At the point of interconnection, the role of the Volt/VAR curve is central to evaluating opportunities for enhancement through power factor control. On the system more broadly, voltage violation mitigation is part of system operations, system reliability, and distribution planning. The goals and methods of each group vary, as do the benefits achieved through the use of active management of the power factor setpoint. I will explain the specific roles of these functions and teams, as well as how they relate to the use cases.

[3] 52 Pa. Code § 57.14(b)-(c).

Q. WHAT IS THE ROLE OF VOLT/VAR CURVES IN MANAGING VOLTAGE AND ADDRESSING VOLTAGE VIOLATIONS?

A. Fundamentally, Volt/VAR curves measure the voltage at the DER terminals and modify the reactive power setpoint based on that locally measured voltage. PPL Electric's Volt/VAR curve calculation process fully utilizes DER reactive power capabilities during voltage violations, requiring 44% of nameplate power as reactive power support when voltages are below 0.95 or above 1.05 per unit. As a result, Volt/VAR curves are highly effective at responding to voltage violations at the DER point of interconnection. In some cases, the Volt/VAR curve is active as a result of the voltage rise from interconnecting the DER itself, and the curve helps to avoid voltage violations that would otherwise be caused by the DER. In other cases, when the DER is located in an area experiencing a high or low voltage condition, it can respond to those conditions (because it measures and responds to local voltage) and help mitigate voltage violations for both the DER customer and other customers in the area. If the DER is not within the area experiencing a voltage violation, it provides much more limited support capabilities. PPL Electric's custom Volt/VAR curve approach helps to maximize the value of the Volt/VAR curve in such scenarios by developing setpoints that facilitate both local and system-level support, but there are limitations to such capabilities.

Q. WHAT IS THE ROLE OF DER POWER FACTOR SETPOINT ADJUSTMENTS IN MANAGING SYSTEM VOLTAGE AND ADDRESSING VOLTAGE VIOLATIONS?

A. Power factor setpoint adjustments are primarily intended to complement the voltage support functionality of the Volt/VAR curve and enable DER reactive power to help resolve voltage violations where the Volt/VAR curve has not fully utilized the DER's available reactive support capability. This applies for voltage violations at both the DER point of interconnection as well as elsewhere on the distribution system.

Q. WHAT IS THE ROLE OF PPL ELECTRIC SYSTEM OPERATORS AND THE ADMS/DERMS IN MANAGING VOLTAGE AND ADDRESSING VOLTAGE VIOLATIONS?

A. Within the operational time horizon, the role of system operators and the ADMS/DERMS in voltage management is to take actions using the available resources to minimize the occurrence, magnitude, and duration of voltage violations. Historically, this has been accomplished by opening or closing capacitor banks to provide reactive power support and adjust the power factor to address undervoltage or overvoltage events. This has also included interfacing with the transmission system operators if incoming distribution bus voltages are outside the acceptable ranges. With the addition of DER power factor adjustment capabilities, system operators and the ADMS/DERMS now have an additional set of resources to adjust reactive power to address voltage issues on the operational time horizon. These operational capabilities are primarily addressed within Use Case #1 (Voltage Violation at DER Point of Interconnection), Use Case #2 (Voltage Violation

Mitigated by DERs on the Circuit), and Use Case #3 (Voltage Violation During Planned Switching).

Q. PLEASE EXPLAIN HOW USING DER POWER FACTOR SETPOINT ADJUSTMENTS CAN ADDRESS VOLTAGE ISSUES AT THE DER POINT OF INTERCONNECTION, AS IDENTIFIED WITHIN USE CASE #1.

A. As I explained previously, the Volt/VAR curve is the primary means by which voltage violations at the DER point of interconnection are addressed, and PPL Electric's Volt/VAR curves fully utilize the available reactive power support during local voltage violations. With that said, there are cases where active management of the power factor setpoint can improve local customer voltage. For three-phase inverters, the Volt/VAR curve may not fully utilize the full reactive power capabilities on the same phase on which a voltage violation is occurring. In addition, voltage rise on the customer's system between the DER and the meter may impact the measured voltage and, subsequently, may result in not fully utilizing the available reactive support.

Volt/VAR curves for three-phase inverters set the reactive power contribution for each phase equally based on the average of the three measured phase voltages, as required by IEEE 1547-2018. Because PPL Electric operates a system capable of connecting single phase loads and DERs, voltage violations may occur on one or more of the three phases. Since the Volt/VAR curve responds based on the average, rather than the minimum, it may not fully engage with its maximum reactive power support capability on the phase(s) requiring voltage support.

Likewise, connecting DERs that inject real power results in a voltage increase between the DERs and PPL Electric's AMI meter. If the customer's AMI meter is measuring a low voltage condition below the 0.95 per unit threshold, the DER may still be measuring a voltage above 0.95 per unit and may not fully engage its reactive power support capabilities. While both of these conditions can occur, their overall impact is relatively small.

Q. HAS PPL ELECTRIC UTILIZED ACTIVE MANAGEMENT OF THE POWER FACTOR SETPOINT TO ADDRESS VOLTAGE VIOLATIONS AT THE DER POINT OF INTERCONNECTION?

A. Not to my knowledge. While PPL Electric has established and benefited from the DER voltage monitoring capabilities identified in Use Case #1 and described earlier in my testimony, I am not aware of any power factor management events on DERs intended to resolve voltage violations at the DER location being managed. Active management of the setpoint power factor has been primarily successful at mitigating voltage violations in other locations on the distribution system, which is captured in Use Case #2 (DER Voltage Violation Mitigated by DERs on the Circuit) within the operational time horizon.

Q. PLEASE EXPLAIN HOW THE USE OF DER POWER FACTOR SETPOINT ADJUSTMENTS HAS IMPACTED VOLTAGE ISSUES ON DISTRIBUTION CIRCUITS.

A. PPL Electric has utilized the active management of DER power factor setpoints extensively to improve distribution system voltages and address voltage violation events in an efficient

manner, as described within Use Case #2 (Voltage Violation Mitigated by DERs on the Circuit) from the Second Revised Pilot Implementation Plan. These events have resulted in decreases in the frequency, duration, and severity of voltage violations on circuits with actively managed DER when compared to the outcomes expected if active management of power factor setpoints were not available. The Program Year 2 Annual Report contains several relevant analyses and data points that support this conclusion.

- Through the end of Program Year 2 in March of 2024, PPL Electric had performed 221,394 power factor management events.

- Prior to the first active management event in 2022, customers on circuits that now have active management DERs experienced significantly longer and more frequent voltage violations (Program Year 2 Annual Report, page 15) when compared to circuits that now have control group 1 DER. Since the first active management event in 2022, the difference in voltage violation frequency and duration between the two groups has narrowed significantly, indicating that active management has been effective at reducing voltage violation frequency and duration.

- In 2022, customers on circuits with actively managed DERs experienced a relatively lower incidence of the most severe levels of voltage violations when compared to their peers in Control Group 1 (Program Year 2 Annual Report, page 18). By the end of 2023, this gap had widened even further as a result of the significant increase in the number of active management events and their effectiveness at reducing voltage violation severity.

- Active management of power factor setpoints resulted in highly net positive outcomes in resisting voltage violation occurrence and degradation, improving voltage violation conditions by reducing the magnitude, and resolving voltage violation conditions (Program Year 2 Annual Report, pages 21 and 22).

Q. YOU ALSO MENTIONED VOLTAGE VIOLATIONS DURING PLANNED SWITCHING. WHAT IS PLANNED SWITCHING?

A. Planned switching occurs when circuits are reconfigured in order to support known, planned maintenance work or other events. For instance, if a circuit breaker inside a substation requires maintenance, the customers normally served by that circuit may instead be transferred temporarily to a different circuit so that the circuit breaker can be de-energized and safely maintained without causing customer outages. In contrast, "unplanned" switching generally occurs as a result of a fault that causes customer service interruptions. A parallel example of unplanned switching would be if a circuit breaker in a substation failed, causing an outage to customers on that circuit. Those customers would be switched to a different circuit temporarily in order to restore service, but the switching is in response to system events rather than planned ahead of time.

Q. WHAT IS THE ROLE OF SYSTEM OPERATORS AND THE ADMS/DERMS DURING PLANNED SWITCHING?

A. To facilitate a requested maintenance or other need, system operators will identify a switching plan to meet the maintenance need safely while maintaining service to customers and will create switching orders to implement that plan. If there are concerns about

switching, particularly related to potential equipment loading or customer voltages, distribution planning will study the proposed configuration and identify any potential negative equipment or customer impacts, which can result in modifying the switching plan or, if necessary, cancelling the planned switching if a suitable configuration cannot be identified.

Once the planned switching has been executed, system operators and the ADMS/DERMS are responsible for monitoring the system for reliability, loading, and voltage issues for the duration of the planned switching and responding to any issues that arise. Once the underlying maintenance work or other event driver has been completed, the system operators facilitate the restoration of the system to its normal configuration.

Q. HOW IS ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS BENEFICIAL DURING PLANNED SWITCHING?

A. Active management of DER power factor setpoints is useful both during distribution planning's switching study process (which I will discuss in more detail later in my testimony) and to system operators for the duration of planned switching events. These benefits are captured within Use Case #3 (Voltage Violation During Planned Switching). When loads are transferred to circuits other than their normal source, voltage issues are a significant concern. Historically, the focus has primarily been on low voltage issues due to increased load and generally increasing distances when customers are fed from a different circuit. With the increasing amounts of interconnected DERs on the distribution system, high voltage issues are an increasingly relevant concern during switching events. If a large DER or a collection of smaller DERs are transferred to an alternate source during

conditions of relatively light load and are far from the substation source, this can result in high voltage conditions. In either case, active management of DER power factor setpoints can be used as a tool to mitigate unexpected high or low voltage issues that may arise while the system is abnormally configured.

Q. IS DER POWER FACTOR SETPOINT MANAGEMENT USEFUL DURING UNPLANNED SWITCHING AS WELL?

A. Yes. While the driver for the switching event may be different, the potential for voltage issues as a result of unplanned system reconfiguration is still present and may actually be more likely to benefit DER power factor support for voltage. Planned switching to support maintenance is generally more common during periods of relatively light loading (e.g., during spring) because circuits are less prone to overloading and low voltage during such periods. Outage events, in contrast, can occur at any time, so switching to restore customers may be more likely to result in voltage issues. Active management of DER power factor setpoints provides another resource to help mitigate these issues and restore service to customers.

Q. WHAT IS THE ROLE OF PPL ELECTRIC'S RELIABILITY ENGINEERING TEAM IN ADDRESSING VOLTAGE VIOLATIONS?

A. The reliability engineering team reviews voltage violation events detected by AMI and responds to customer inquiries related to voltage issues. Where needed, they investigate voltage issues and identify any corrective actions or system modifications to address the issues identified and prevent the recurrence of such issues in the future. This can include

developing projects for new equipment such as capacitor banks and voltage regulators, which would also be coordinated with the planning team.

Q. HOW DOES ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS IMPACT THESE EFFORTS BY THE RELIABILITY ENGINEERING TEAM?

A. DER power factor setpoint adjustments performed by system operators and the ADMS/DERMS (which I discussed previously) can reduce the number, frequency, and duration of voltage violations. This reduces the number of customers who contact PPL Electric about voltage violations and, subsequently, reduces the number of investigations performed by the reliability engineering team and the number of visits to customer locations by PPL Electric (commonly referred to as "truck rolls"). Within the Program Year 2 Annual Report, PPL Electric identified 23,272 customers that had a voltage violation resolved during the same time interval as a DER power factor control event through the end of Program Year 2 in March 2024 and could have resulted in a truck roll. If each such customer had contacted PPL Electric about their voltage issue, it would have resulted in approximately $13,666,306 of operation and maintenance expense for truck rolls. Reducing the frequency, duration, and severity of voltage violations can also help reduce the need to make system modifications or investments in voltage support equipment, which is captured within Use Case #6 (DER Management Impact on Voltage Management).

Q. HAS PPL ELECTRIC IDENTIFIED ANY SPECIFIC AVOIDED SYSTEM INVESTMENTS IN VOLTAGE SUPPORT EQUIPMENT AS A RESULT OF THE ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS?

A. Not yet. While there have been significant impacts to reducing the frequency, duration, and severity of voltage violations, no specific avoided investments have been identified. There are a few factors that impact this result. First, active management of DER power factor setpoints for solar resources is only impactful during daylight hours. As such, DERs may address voltage issues during the day, but if the event extends into the evening or re-occurs at night, additional resolution measures may still be needed. Second, while the population of active management DERs has increased significantly, they still make up a relatively small percentage of PPL Electric's distribution system. Even on the circuits with the highest penetrations of active management DERs, the total collective reactive power support capabilities are less than the 600 kVAR provided by a typical distribution capacitor bank on PPL Electric's system. Still, despite these limitations, there have been significant positive impacts to system voltages on circuits with active management DERs, which shows that there is significant potential to prevent future needs for voltage support equipment, especially as active management DER penetration continues to increase.

Q. WHAT IS THE ROLE OF PPL ELECTRIC'S DISTRIBUTION PLANNING TEAM IN ADDRESSING VOLTAGE RELATED ISSUES?

A. The distribution planning team is responsible for studying historical and forecast system load and voltage conditions and identifying any voltage-driven capital investments, device settings changes, or other system modifications to prevent or resolve voltage violations.

This includes the use of distribution planning models to study the impact of load changes or other circuit changes on system voltage levels. In addition, the distribution planning team performs interconnection studies for new large loads and large DERs. This includes the calculation of hosting capacity at various locations on the distribution system. The distribution planning team also performs studies to support planned operational switching, studying the load and voltages expected to result from temporary circuit reconfiguration and load transfers to ensure that planned maintenance switching can be performed without creating load or voltage issues.

Q. HOW DOES ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS IMPACT THESE EFFORTS BY THE DISTRIBUTION PLANNING TEAM?

A. The ability to adjust the power factor setpoint for DERs provides the planning team with additional tools to resolve voltage issues in the studied scenarios, potentially preventing the need for system modifications, capital investments, and customer interconnection costs that would otherwise be necessary. These benefits are primarily captured within Use Case #3 (Voltage Violation During Planned Switching), Use Case #6 (DER Management Impact on Voltage Management), and Use Case #7 (DER Active Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade).

Q. WHAT BENEFITS DOES ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS PROVIDE DURING PLANNED SWITCHING STUDIES?

A. As I discussed earlier, planned switching can result in voltage issues. PPL Electric's distribution planning team studies proposed planned switching in order to determine

whether the plan will result in equipment overloads or voltage issues. Based on the study results, the planning team coordinates with the operations team to determine the appropriate path forward, which may include modifying the date, time, or duration of the planned switching, installing additional equipment to mitigate potential issues, or cancelling the planned switching if no viable solution is available. The ability to actively manage DER power factor setpoints, when incorporated into planned switching studies, provide an additional resource to address voltage violations, which can enable planned switching events at dates and times that would otherwise not be viable and may avoid system upgrades that would otherwise be needed to support switching events. These benefits are identified within Use Case #3 (Voltage Violation During Planned Switching) from the Second Revised Pilot Implementation Plan.

Q. HAS PPL ELECTRIC IDENTIFIED ANY SPECIFIC INSTANCES WHERE THE ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS WOULD BENEFIT PLANNED SWITCHING OUTCOMES?

A. Yes. Within the Program Year 2 Annual Report, PPL Electric identified two studies related to planned switching that indicate that active management of DER power factor setpoints would have been able to avoid $38,000 of investment in capacitor banks to support planned switching. The analyses for these two cases, demonstrating these benefits of active management and the inability of Volt/VAR curves to provide the same level of benefits, are provided as HIGHLY CONFIDENTIAL PPL Electric Exhibits CD-9 and Exhibit CD-10.

Q. WHAT BENEFITS DOES ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS PROVIDE WITH RESPECT TO THE DISTRIBUTION PLANNING TEAM'S STUDIES TO MAINTAIN SYSTEM VOLTAGES?

A. Active management of DERs' power factor setpoints provides an additional tool to address voltage constraints within planning studies for both present and future conditions. This can help drive down the potential need for voltage related system upgrades to respond to changes in voltages as a result of load and DER growth over time. This is captured within Use Case #6 (DER Management Impact on Voltage Management) within the Second Revised Pilot Implementation Plan, which I also discussed previously in my testimony when I identified the impacts to PPL Electric's reliability engineering team. The underlying value driver is the same, with reliability engineering focused on present-day identified issues and distribution planning focused on future forecast changes and different scenarios.

Q. YOU ALSO MENTIONED ADDITIONAL HOSTING CAPACITY. HOW DOES THE ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS RESULT IN ADDITIONAL HOSTING CAPACITY?

A. One of the conditions that limits hosting capacity on the distribution system is the occurrence of voltage violations, especially voltages above the allowable range, as a result of the addition of new DERs to the system. Within PPL Electric's hosting capacity analysis (the results of which are provided as Appendix E of the Program Year 2 Annual Report), the hosting capacity at many nodes on the distribution system is limited by this constraint. PPL Electric's ability to actively manage the power factor setpoint provides an additional resource to address these limitations, which results in an increase in system hosting

capacity. This is captured within Use Case #7 (DER Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade) of the Second Revised Pilot Implementation Plan.

Q. HAS PPL ELECTRIC IDENTIFIED SPECIFIC HOSTING CAPACITY INCREASES AS A RESULT OF THE ACTIVE MANAGEMENT OF DER POWER FACTOR SETPOINTS?

A. Yes. From the Program Year 2 Annual Report (PPL Electric Exhibit CD-4), the use of active management of the DER power factor setpoint increased the system-wide hosting capacity by approximately 5 MW when compared to using the autonomous only Volt/VAR curve scenario. With monitoring, Volt/VAR, and active management capabilities included, system hosting capacity was estimated to be 29 MW higher than in the nameplate scenario. PPL Electric also examined the individual node-level data at the system and circuit level to capture the impacts more granularly, the results of which are provided as HIGHLY CONFIDENTIAL PPL Electric Exhibit CD-6: Hosting Capacity Year 2 Observations. Averaged across the entire distribution system, the monitoring, Volt/VAR, and active management capabilities together increased the hosting capacity at the average system node by 2.0% in the analysis performed for Program Year 2 (March 2023 – March 2024). As a more specific example, hosting capacity on one circuit was limited by high voltage impacts. On this circuit, active management of the DER power factor setpoint increased the average nodal hosting capacity from 736.58 to 802.79, an increase of approximately 9% when compared to the autonomous Volt/VAR curve scenario.

Q. HOW DOES INCREASING HOSTING CAPACITY IMPACT DER INTERCONNECTION COSTS?

A. Increasing hosting capacity enables the distribution system to accommodate more DERs before system conditions begin to require modifications or the addition of new voltage management equipment. Consequently, using active management to increase hosting capacity reduces overall interconnection costs for new DER.

Q. WHAT DO YOU CONCLUDE ABOUT PPL ELECTRIC'S ABILITY TO MANAGE THE POWER FACTOR OF DERS AS ENABLED BY THE PILOT PROGRAM?

A. I conclude that PPL Electric's ability to manage DER power factors has resulted in significant reductions in the frequency, duration, and severity of customer voltage violations. It has also shown positive impacts on PPL Electric's ability to perform planned switching and has increased the hosting capacity of the distribution system.

VI. BENEFITS OF REMOTE ON/OFF CONTROL CAPABILITIES ENABLED BY THE PILOT PROGRAM

Q. PLEASE DESCRIBE THE REMOTE ON/OFF CONTROL CAPABILITIES ENABLED BY THE PILOT PROGRAM.

A. Through the DER Management device, PPL Electric can modify the On/Off status of an inverter-based DER remotely. Use of this function allows an inverter to be effectively disabled (and later re-enabled) and prevented from injecting power into the distribution system. As identified within the Second Revised Pilot Implementation Plan, PPL Electric can only use this functionality "on battery storage systems or solar systems that have not

safely isolated or 'islanded' from the distribution system; (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage."

Q. WHAT USE CASES RESULT FROM PPL ELECTRIC'S ABILITY TO MANAGE THE ON/OFF STATUS OF DERS?

A. From the Second Revised Pilot Implementation Plan Attachment C, Use Case #8 (DER Operation in Emergency Conditions and in Active Work Zones) is primarily driven by the management of the DER On/Off status. Within this use case, PPL Electric can monitor DER status (as discussed earlier in my testimony) and remotely disable DER during emergency situations such as a fire or gas leak. This can provide an additional layer of safety for first responders by removing a potential source of energy at a location intended to be de-energized.

PPL Electric can also monitor DER status during outages and can remotely disable any active management DERs that are still operating within areas that should be de-energized for public or crew safety due to fault conditions, downed conductors, or during repairs.

Q. HAS PPL ELECTRIC UTILIZED THE REMOTE ON/OFF CONTROL CAPABILITY TO ACHIEVE THESE BENEFITS?

A. Not yet. Within the Program Year 2 Annual Report, PPL Electric identified 1,022 outage events that impacted actively managed DERs but did not observe any which caused an unintentional islanding event. The report also identifies one instance of public safety

disconnection at an actively managed DER location, but the Remote On/Off capability was not utilized because the incident occurred at night.

Q. WILL IT BECOME MORE LIKELY THAT THESE CAPABILITIES ARE USED IN THE FUTURE?

A. Yes. As more actively managed DERs are added and more emergency response events occur over time, it will become more likely that the two will coincide and the remote disconnection capabilities can be used to improve first responder safety. With regard to outages and unintentional islanding, increasing DER penetration and deployments of different types of inverters can increase the likelihood of unintentional islands.[4]

VII. BENEFITS OF NEW CAPABILITIES PROPOSED BY PPL ELECTRIC

Q. IN ADDITION TO CAPABILITIES ESTABLISHED BY THE PILOT PROGRAM, IS PPL ELECTRIC REQUESTING ANY ADDITIONAL CAPABILITIES IN THIS DOCKET?

A. Yes. As identified in PPL Electric Witness Salet's direct testimony (PPL Electric Statement No. 1), PPL Electric is requesting the ability to directly set the reactive power value on inverters, rather than relying solely on the present power factor control capability. PPL Electric is also seeking approval to manage the maximum real power output value on the inverter.

[4] National Renewable Energy Laboratory, A Primer on Unintentional Islanding Protection Requirement IEEE Std 1547-2018, pp. 22-23.

Q. WHAT USE CASES ARE IMPACTED BY THE CAPABILITY TO DIRECTLY MANAGE THE REACTIVE POWER SETPOINT ON DERS?

A. Direct management of the reactive power setpoint is an improved method to achieve the same use cases and benefits as the power factor management capabilities I discussed earlier in my testimony. This primarily includes Use Cases #1, #2, #3, #6, and #7.

Q. HOW DOES DIRECT MANAGEMENT OF THE REACTIVE POWER SETPOINT IMPROVE OUTCOMES FOR THESE USE CASES?

A. One of the challenges with using power factor setpoints to manage reactive power is that changes in real power output over time (due to, for example, changes in irradiance on solar systems) will result in unintended changes in reactive power that can reduce the effectiveness of active management at mitigating voltage violations. Using the direct management method allows PPL Electric to decouple the reactive power setpoint from the real power output. This decoupling allows for reactive power to be set in a manner that does not change with the real power output, so long as the real power remains in the range where reactive support capability is required by IEEE 1547-2018. The end result is more efficient and consistent management of reactive power for voltage support use cases when compared to the use of power factor management for the same purposes.

Q. WHAT DO YOU CONCLUDE ABOUT PPL ELECTRIC'S PROPOSED CAPABILITIES FOR DIRECTLY MANAGING THE REACTIVE POWER SETPOINT FOR DER?

A. I conclude that management of the reactive power setpoint could improve voltage management outcomes when compared to power factor control.

Q. YOU ALSO IDENTIFIED THAT PPL ELECTRIC IS REQUESTING THE ABILITY TO MANAGE THE MAXIMUM REAL POWER OUTPUT FOR DERS. WHAT USE CASES DOES THIS RESULT IN THAT BENEFIT PPL ELECTRIC'S CUSTOMERS?

A. The ability to manage the maximum real power output function will allow PPL Electric to interconnect a higher volume of DERs more quickly and at a lower cost compared to the current capabilities established by the Pilot Program. The real power management capability can also improve outcomes during planned or unplanned switching for customers with and without DERs.

Q. IS PPL ELECTRIC THE ONLY UTILITY PURSUING THIS CAPABILITY?

A. No. This concept, often referred to as Flexible Interconnection, is being explored by many stakeholders within the industry. The Electric Power Research Institute ("EPRI") has developed materials explaining the concept in more detail[5] and the U.S. Department of Energy ("DOE") is providing and facilitating information sharing and technical assistance

[5] EPRI – Understanding Flexible Interconnection: https://www.epri.com/research/products/000000003002014475.

through their Interconnection Innovation e-Xchange ("I2X")[6]. Several utilities are pursuing or have deployed pilot projects, including Avangrid through New York State Electric and Gas ("NYSEG") and Rochester Gas and Electric ("RG&E") in New York[7] and National Grid in Massachusetts[8]. The topic has also been discussed in Illinois as part Multi-Year Integrated Grid Plans dockets, with both Ameren Illinois[9] and Commonwealth Edison Company ("Commonwealth Edison")[10] planning to develop written plans for Flexible Interconnection. Beyond just utilities, other industry advocates are also highlighting the benefits of flexible interconnection, especially in support of the integration of clean energy. In Illinois, the Joint Non-Governmental Organizations ("Joint NGOs"), consisting of Environmental Law and Policy Center, Natural Resources Defense Council, Vote Solar, and Union of Concerned Scientists, stated in their reply brief[11] that "Flexible Interconnection is one of the most important things Ameren can do to accelerate DER interconnection and optimize the hosting capacity of the grid." In New York, the Clean Energy Parties (a coalition of clean energy trade associations and member companies)

provided comments within the Coordinated Grid Planning Process in support of Flexible Interconnection as a way to meet the state's aggressive clean energy goals, stating their belief that "it is reasonable and appropriate for flexible interconnection to be evaluated as an alternative to local T&D upgrades in a manner consistent with its expected operational capabilities."[12] While different stakeholders may disagree on some aspects of the implementation, there is recognition from a variety of stakeholders in the industry that Flexible Interconnection can provide useful new capabilities in interconnecting DERs to the distribution system in a timely and cost-effective manner.

Q. HOW COULD THE MANAGEMENT OF THE REAL POWER LIMIT FUNCTION RESULT IN LOWER INTERCONNECTION COSTS?

A. Traditionally, planning and DER interconnection studies without real power control capabilities are performed at the "boundary" conditions, which are the scenarios where system constraints are most likely to appear (e.g., peak and minimum load) under normal operating conditions. Therefore, system reinforcements may be identified that are only necessary during times when the system is near the "boundary" conditions and when the DER is at its full output capability. Rather than pursuing costly system upgrades that may only be needed a handful of hours per year, customers could elect to have PPL Electric manage the maximum real power output parameter of the DER during such conditions to prevent the constraint condition from occurring in the first place. This enables the DER to interconnect and operate at its full nameplate capabilities whenever possible without

[12] Clean Energy Party Comments in New York's Coordinated Grid Plan Process: https://www.nyseia.org/_files/ugd/a89dc9_4ddd1df72e7b4446a3d22cf2a5b276ec.pdf.

requiring extensive system upgrades by applying real power limits during constrained time periods.

Q. HAS PPL ELECTRIC IDENTIFIED ANY SUCH OPPORTUNITIES FOR LOWER INTERCONNECTION COSTS ON ITS DISTRIBUTION SYSTEM?

A. Yes. In an illustrative case study (see HIGHLY CONFIDENTIAL PPL Electric Exhibit CD-11: Real Power Management Case Study), the management of the real power limit function would enable a proposed 10 MW solar facility to avoid approximately $1.48 million in system upgrades that would otherwise be necessary as a result of a conductor overload. Within the study, it was estimated that the applicant solar facility could produce approximately 96% of the total annual energy generation capabilities. PPL Electric's ability to manage the real power limit function would enable this applicant to choose whether to pursue a system upgrade to achieve their full energy generation or to avoid the upgrade by allowing PPL Electric to manage the system during constrained time periods. This added flexibility empowers the interconnector and helps enable cost-effective integration of DER within the distribution system.

Q. HOW DOES THE MANAGEMENT OF THE REAL POWER LIMIT FUNCTION RESULT IN FASTER INTERCONNECTION TIMELINES?

A. Because managing the real power limit function enables resources to interconnect without requiring system upgrades, the time needed to design and construct those system upgrades is also avoided. In cases where the timeline for constructing the system upgrades avoided (including procurement of any long lead-time equipment) would have been longer than the

timeline to construct the DER facilities, then the interconnection timeline for DERs will be reduced. If the customer does pursue a system upgrade as part of their DER interconnection, managing the real power limit could be used while upgrades are being constructed to allow the DER to operate in a more limited capacity, rather than having to wait for construction to be completed.

Q. HOW COULD MANAGEMENT OF THE REAL POWER LIMIT FUNCTION BE USED TO IMPROVE OUTCOMES DURING PLANNED AND UNPLANNED SWITCHING EVENTS?

A. As I explained earlier when discussing Use Case #3 (Voltage Violation During Planned Switching) and Use Case #4 (System Restoration), planned and unplanned switching are often performed on the distribution system in order to restore service following an outage or to enable maintenance and repairs. Because of how many potential configurations could exist and the different load and system conditions at those times, interconnecting DERs are typically only studied in their normal configuration. This means that, during switching scenarios, DERs can create thermal, voltage, or other issues that were not identified during the interconnection study. In such cases, these DERs may be required to disconnect from the distribution system until the normal configuration can be restored, preventing the facility from generating for the duration of the event.

Through the management of the real power maximum function, rather than disconnecting the affected DERs, PPL Electric could instead limit the DER to a maximum production amount that does not result in system constraints. This increases the amount of energy that could be generated by the DER. Keeping the DER online during such scenarios

can also benefit the distribution system and other customers. The potential for equipment overloads and low voltage during switching can limit switching capabilities or require system upgrades to accommodate. By keeping the DER online, the voltage improvements from the real power generation and reactive power support may enable switching that would not be possible or would require system upgrades. This can increase the number of customers for whom service can be restored during an outage or allow for system maintenance that would otherwise be more costly.

Q. HAS PPL ELECTRIC IDENTIFIED ANY CASES WHERE THESE OUTCOMES COULD BE ACHIEVED?

A. Yes. In one case study (HIGHLY CONFIDENTIAL PPL Electric Exhibit CD-12: Real Power Management During Transfer Case Study), PPL Electric studied a contingency switching scenario and incorporated the potential impact of a 10 MW applicant solar facility. Without the 10 MW DER, the reconfiguration would result in an undervoltage to 918 customers, necessitating a 3-phase voltage regulator installation to enable the switching to occur. With the 10 MW system included in the model with no real power management, the 10 MW system must remain de-energized for the duration of the switching (in this case, one week) and the voltage regulator would still be necessary. Enabling real power management, in contrast, results in significant improvements for both the DER and for PPL customers. Under this management scenario, the 10 MW DER was permitted to remain connected and produce at up to 45% of its nameplate (4.5 MW), resulting in an estimated 30,150 additional kWh of energy generated. With the DER remaining connected and producing at this level, the undervoltage identified in the base

case was also resolved as a result of the DER. This illustrates how the management of the real power maximum function can result in benefits for customers with and without DER.

Q. IS THIS ONLY APPLICABLE TO LARGE DER INTERCONNECTIONS?

A. No. While it is easier to illustrate the concept with large DERs, the same concepts apply to collections of smaller DERs. In fact, because it is logistically much more difficult to disconnect many small DERs as opposed to one large DER, PPL Electric has fewer good options in addressing any issues that arise from switching groups of small DERs to other circuits. Real power management provides a viable pathway to mitigate any such issues that is practical to implement and fully leverages DER capabilities.

Q. WHAT DO YOU CONCLUDE ABOUT PPL ELECTRIC'S PROPOSED CAPABILITIES FOR MANAGING THE MAXIMUM REAL POWER LIMIT FUNCTION OF DER?

A. I conclude that the management of the maximum real power limit function could reduce DER interconnection costs, reduce DER interconnection timelines, and improve outcomes for both DER and other customers during planned and unplanned switching scenarios.

VIII. CONCLUSION

Q. WHAT DO YOU CONCLUDE ABOUT THE COMPANY'S MONITORING AND MANAGEMENT OF DERS?

A. I conclude that:

- The ability to monitor DER real power through the Pilot Program has resulted in significant benefits to PPL Electric customers and significant improvements in planning and operational outcomes and subsequently avoided or deferred capital investments.
- PPL Electric's ability to monitor DER reactive power and voltage improves the information and capabilities of system operators and enables important information gathering to support efficient voltage management and inform customers about the operation of their DERs.
- PPL Electric's ability to modify Volt/VAR and ride-through settings has resulted in beneficial outcomes for customers and would continue to do so in the future.
- PPL Electric's ability to manage DER power factors has resulted in significant reductions in the frequency, duration, and severity of customer voltage violations. It has also shown positive impacts on PPL Electric's ability to perform planned switching and has increased the hosting capacity of the distribution system.
- Management of the reactive power setpoint could improve voltage management outcomes when compared to power factor control.
- The management of the maximum real power limit function could reduce DER interconnection costs, reduce DER interconnection timelines, and improve outcomes for both DER and other customers during planned and unplanned switching scenarios.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY AT THIS TIME?

A. Yes, although I reserve the right to supplement my direct testimony.

PPL Electric Exhibit CD-1

Curriculum Vitae

CODY DAVIS

Senior Engineering Manager

Cody Davis is a power systems engineer with 9 years of experience with a focus on distribution system planning and the interconnection and integration of Distributed Energy Resources (DER) on the distribution system. His expertise includes traditional capacity and voltage planning, static and time-series circuit analysis, Non-Wires Alternatives techno-economic analysis, DER interconnection study processes and criteria, Smart Inverter utilization and system impact studies, and Hosting Capacity. Cody also has experience working directly with utilities as a project manager with a focus on change management, process optimization, and regulatory compliance. He also has experience working with a wide variety of utility and public stakeholders on a range of emerging, complex, and high-profile regulatory issues and has authored reports and testimony publicly filed in Illinois, Maine, and Minnesota the Modernization of Distribution Planning and Operations. He has also filed testimony with the Illinois Commerce Commission discussing the value of distributed generation to the distribution system.

EDUCATION AND TRAINING

- B.S. in Electrical Engineering, Southern Illinois University – Edwardsville, Edwardsville, IL – 2014

PROFESSIONAL EXPERIENCE

2022 – Present	Electric Power Engineers, LLC, Champaign, IL Senior Engineering Manager
2020 – 2022	Electric Power Engineers, LLC, Austin, TX Engineering Manager
2019 – 2020	Ameren Illinois, Peoria, IL Career Engineer, DER Integration and Strategies
2015 – 2018	Ameren Illinois, Peoria, IL Region Engineer, North Region

TECHNICAL PROFICIENCY

Senior Engineering Manager, EPE, Champaign, IL, USA, Aug. 2022 – Present
Engineering Manager, EPE, Austin, TX, USA, Oct. 2020 – Aug. 2022

- Perform and oversee static and time-series distribution system modeling studies related to system planning, protection, optimization, and DER integration.
- Perform and oversee DER Interconnection studies on clients' distribution systems, including the modeling and recommendation of Smart Inverter Settings and DERMS control capabilities.
- Provide support or expert testimony in regulatory proceedings related to distribution planning, Non-Wires Alternatives, DER value, DER interconnection and Smart Inverter utilization.
- Manage projects and process improvements and provide technical and regulatory guidance related distribution system operations with active DER management capabilities.
- Perform and oversee Non-Wires Alternative siting, sizing, dispatch, and financial analysis.
- Work with clients to improve DER interconnection and planning study process flows, technical requirements, and reference materials.
- Develop Hosting Capacity methods and strategies based on clients' available data and tools.

Career Engineer, DER Integration and Strategies, Ameren Illinois, Belleville, IL, USA, Jan. 2019 – Oct. 2020

- Collaborated with Electric Power Research Institute (EPRI) to develop a technical report on the Effects of Smart Inverters on Voltage Optimization for the Illinois Commerce Commission under Docket 18-0753 by utilizing 8760 time-series analysis, Smart Inverter functions, and DER penetration modeling tools in a variety of system configuration and DER penetration scenarios.
- Developed a Value of Distributed Generation framework to generate node-specific rebate values from time series load data for 2500+ distribution feeders and prepared testimony and exhibits filed with the Illinois Commerce Commission under Docket 20-0389.
- Developed DERMS use cases, system models, investment justification, and technical criteria for RFP evaluation.
- Developed technical standards, reference materials, and training presentations for DER interconnection studies, distribution system modeling with DER, DER system planning impacts, smart inverter settings, and DER witness testing.
- Developed and implemented a Hosting Capacity procedure to generate nodal values for Hosting Capacity for 2500+ distribution feeders.
- Identified and performed technical and financial analysis on prospective Non-Wires Alternatives (NWA) projects and benchmarked NWA solutions' capital cost, revenue requirement impact, and overall efficacy against traditional solutions.

Region Engineer, North Region, Ameren Illinois, Belleville, IL, USA, Jan. 2015 – Dec. 2018

- Developed five-year Work Plans for planning areas ranging from 15-50 distribution substations, including business case development for proposed capacity and reliability projects.
- Performed 60+ solar interconnection studies for large solar plants on 4kV-15k systems.
- Designed and managed construction of overhead and underground distribution and sub-transmission facilities for projects identified within five-year Work Plans.
- Performed various distribution system modeling studies, including load flows, power factor correction, distribution protection coordination, motor start, and phase balancing studies.
- Responded to residential, commercial, and industrial customer reliability, voltage, and power quality issues.

Re: Petition of PPL Electric Utilities Corporation for Approval of Tariff Modifications and Waivers of Regulations Necessary to Implement its Distributed Energy Resources Management Plan
Docket No. P-2019-3010128

Dear Secretary Chiavetta:

PPL Electric Utilities Corporation ("PPL Electric" or the "Company") hereby files the enclosed Second Revised Distributed Energy Resources ("DER") Management Pilot Implementation Plan with the Pennsylvania Public Utility Commission ("Commission").

As noted in the Company's First Revised Pilot Implementation Plan, PPL Electric has been developing a DER Management device that is compatible with Institute of Electrical and Electronics Engineers ("IEEE") 2030.5 smart inverters.

PPL Electric has since developed such a solution and is prepared to begin utilizing it for any new DERs proposing to use IEEE 2030.5 smart inverters, subject to the terms and conditions of the Commission-approved settlement in the above-referenced proceeding. In contrast to the existing devices, the IEEE 2030.5 solution uses cellular networks instead of the Radio Frequency ("RF") Mesh network. The Commission-approved settlement does not specify the type of DER Management device or the communications method that must be used. Therefore, the Company maintains that the settlement does not need to be modified to account for the IEEE 2030.5 solution. However, the Revised Pilot Implementation Plan contains some language that needs to be updated to reflect the use of the new IEEE 2030.5 solution.

As such, PPL Electric hereby submits a Second Revised Pilot Implementation Plan that has been updated to reflect the use of the IEEE 2030.5 solution.

In advance of filing, PPL Electric consulted with the other parties in this proceeding about the IEEE 2030.5 solution. PPL Electric incorporated their feedback in the final version of the Second Revised Pilot Implementation Plan, and the Company is unaware of any outstanding concerns.

Clean and compare versions of the Second Revised DER Management Pilot Implementation Plan are enclosed. The compare version shows, in redline, the changes made to the Revised DER Management Pilot Implementation Plan filed on March 1, 2021.

Copies of this filing are being provided as indicated on the Certificated of Service.

Respectfully submitted,

Devin Ryan

I. INTRODUCTION

This Implementation Plan describes PPL Electric Utilities Corporation's ("PPL Electric" or the "Company") Distributed Energy Resource ("DER") Management Pilot ("Pilot") that commenced on January 1, 2021. This Implementation Plan has been prepared and submitted pursuant to the Joint Petition for Settlement of All Issues ("Settlement") approved by the Pennsylvania Public Utility Commission ("Commission") at Docket No. P-2019-3010128. As required, this Implementation Plan explains how the Company will implement and conduct the Pilot, including the goals of the Pilot, the use cases the Company plans to test and evaluate, the specific methods and approaches for testing each use case, the methods by which PPL Electric will communicate the Pilot's requirements to customers and DER installers, and any additional information PPL Electric believes is necessary to be included in the annual reports submitted pursuant to the Settlement.

By way of background, many utilities have experienced operations and planning challenges as DER penetration becomes increasingly significant. These challenges include, but are not limited to, voltage swings, masked or hidden load, limited hosting capacity, planning uncertainties, and protection/operational challenges with two-way power flow. As a response to these challenges, the Institute of Electrical and Electronics Engineers ("IEEE") made revisions to Standard 1547 in 2018 ("IEEE 1547-2018"), which set forth requirements for smart inverters that can help support the distribution system. When these smart inverters are coupled with DER management devices, electric utilities can monitor and manage DERs interconnected with their distribution systems.

On May 24, 2019, PPL Electric filed a Petition with the Commission for permission to require smart inverters that meet the new IEEE and Underwriters Laboratories ("UL") standards, to install DER management devices on new DERs interconnected with its distribution system, and

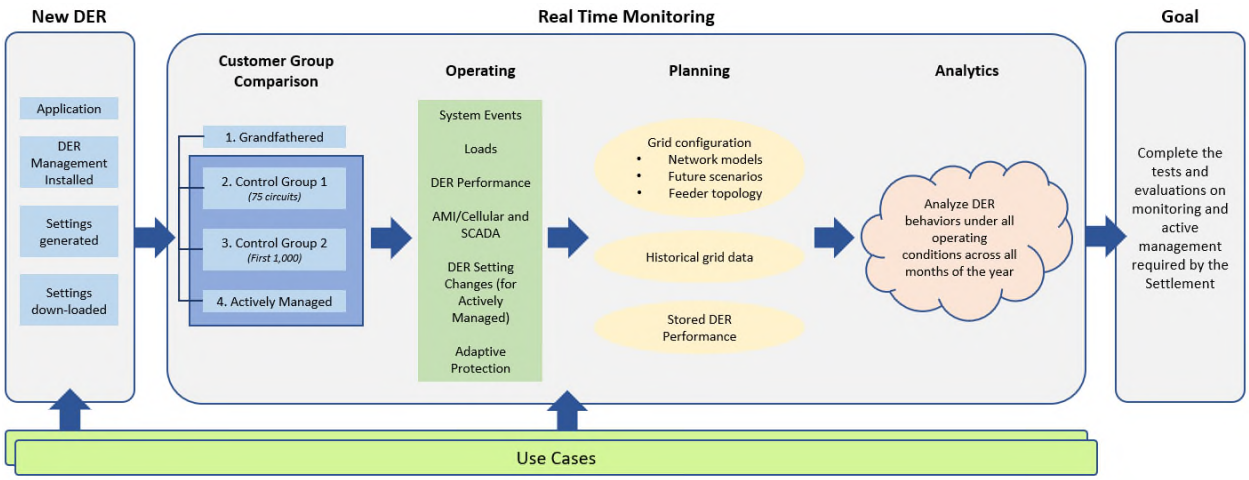
to monitor and manage those new DERs. Ultimately, the parties agreed to the Settlement, which, as approved by the Commission, permits the Company to conduct a Pilot to test and evaluate the costs and benefits of monitoring and managing DERs.

II. DER MANAGEMENT PILOT

A. OBJECTIVES

Under the Settlement, the Pilot is designed to test and evaluate: (1) the costs and benefits to distribution system operation and design of monitoring DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means; and (2) the costs and benefits to distribution system operation of active management of DERs as compared to the benefits available through the use of inverter autonomous grid support functions. Figure 1 is a graphic overview of the Pilot, beginning with a PPL Electric customer filing an application to interconnect a DER to the Company's distribution system. Approved DER interconnection applications will receive a DER management device and be assigned to a customer group pursuant to the Settlement.

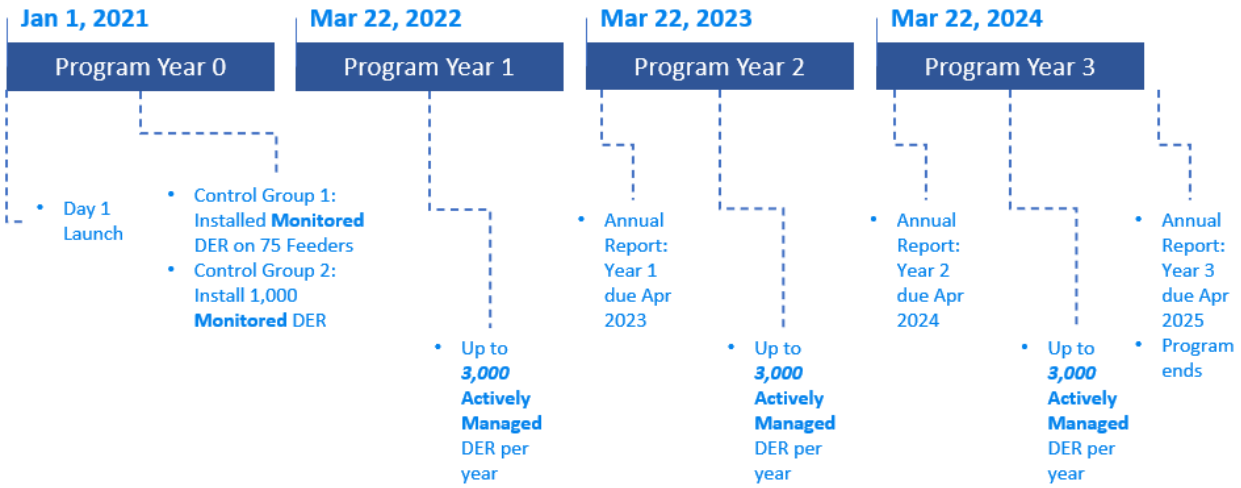
Figure 1- Pilot Overview



B. TIMELINE AND MILESTONES

The three-year Pilot timeline will commence after Control Groups 1 and 2, described below in Section C, have been fully established. The time leading up to the Pilot commencement will be referred to as Program Year 0. After the end of Program Year 0, the subsequent three years of the Pilot will be referenced as Program Year 1, Program Year 2, and Program Year 3, respectively. Pilot milestones are described below in Figure 2. A more detailed list is provided in Attachment B.

Figure 2- Pilot Implementation Milestones



C. DER CUSTOMER GROUPS

As of December 31, 2020, PPL Electric has 11,614 DERs interconnected with its electric distribution system. Some of these DERs are participating in the Company's Keystone Solar Future Project, which are interconnected with 12 specific distribution circuits on PPL Electric's system.

For purposes of this Pilot, PPL Electric has identified four different DER customer groups. The groups are defined below, including their relationship to this Pilot. These definitions are critical to understanding the comparisons that will be made across the different customer groups,

to establishing reporting requirements, and to calculating the costs and benefits attributed to monitoring and management of the DERs. Control Groups 1 and 2 and the Actively Managed Group are created and defined as part of the Pilot. Conversely, information from the Grandfathered Group will be used in the final analysis of the Pilot Program as a basis for comparison. Pursuant to the Commission-approved Settlement, some DER customers will not be able to participate in the Pilot because they are grandfathered or because PPL Electric exhausted the cap of 3,000 DER management devices installed in the calendar year that they interconnected the DERs.

1) **Grandfathered Group**. DER customers who applied for interconnection on or before December 31, 2020, are "grandfathered" and, therefore, are not required to comply with the new interconnection requirements in the operations and maintenance of their DER installation. PPL Electric collects information continuously on the distribution system, including the circuits that host these DER customers, but there is no direct monitoring or active management of DER installations in this group.

2) **Control Group 1.** This group will contain all DER customers, who apply on or after January 1, 2021 and are located on 75 specific circuits. These circuits will be selected based on the circuits which serve the first 75 DER customers who apply to interconnect and are served by unique circuits. Once those circuits are identified, all new DER customers who are served by one of these 75 circuits will be interconnected in monitoring mode and will operate with autonomous grid support functions only. The DERs on these 75 circuits will remain in "monitor-only" mode for the duration of the Pilot. DER customers in Control Group 1 will receive DER management devices. Pursuant to the Settlement, Control Group 1 will not include any of the excluded circuits set forth in Attachment A. This Control Group was fully established on February 10, 2021.

3) **Control Group 2.** This group will contain the first DER customers to complete their installation, up to 1,000 participants, who also applied to interconnect on or after January 1, 2021, regardless of where they are located on the system. These customers will be interconnected in monitoring mode and will operate with autonomous grid support functions only. DER customers in Control Group 2 will receive DER management devices. DER customers in Control Group 1 will count toward the 1,000 DERs in Control Group 2. This Control Group was fully established on March 22, 2022.

4) **Actively Managed Group.** All DER customers who submit applications and interconnect with the distribution system on or after January 1, 2021, excluding the customers outlined in Control Groups 1 and 2 as well as any customers interconnecting

after the cap of 3,000 DER management devices installed in the calendar year has been reached. The Company can actively manage the grid support functions of the DER inverters in this Actively Managed Group using the DER management devices and the Company's Distributed Energy Resources Management System ("DERMS"). The following grid support functions can be utilized in the smart inverters: (1) Volt/VAR; (2) Constant Power Factor; (3) Remote On/Off; (4) Voltage Ride-through; (5) Frequency Ride-through; and (6) Volt/Watt. Volt/Watt may only be enabled and managed with the consent of the interconnecting customer. PPL Electric will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or "islanded" from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during restoration efforts following a power outage.

Control Group 1, Control Group 2, and the Actively Managed Group are included in the Pilot scope and reporting. The analysis will compare these groups to each other and to the Grandfathered Group to understand the costs and benefits of monitoring and actively managing DERs.

D. COMPONENTS AND ARCHITECTURE

Several components will be used as part of the Pilot to process the DER interconnections and monitor and manage the DERs under the Pilot. The Company's DER Management Architecture is set forth in Figures 3a and 3b below and outlines how the Company will interconnect the DER to the system, communicate to DER management devices, receive and integrate operational feedback from DERs for system analysis, calculate dynamic operation settings for DERs, and manage settings changes as needed.

Figure 3a - DER Management AMI Architecture

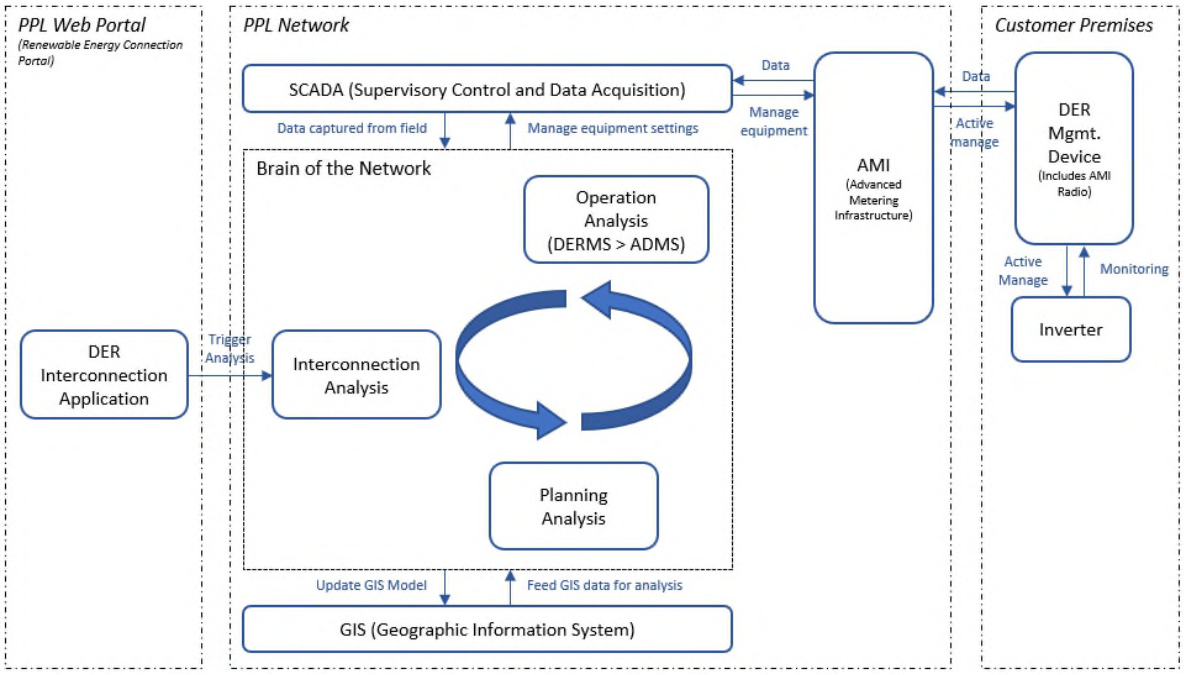


Figure 3b – DER Management Cellular Architecture

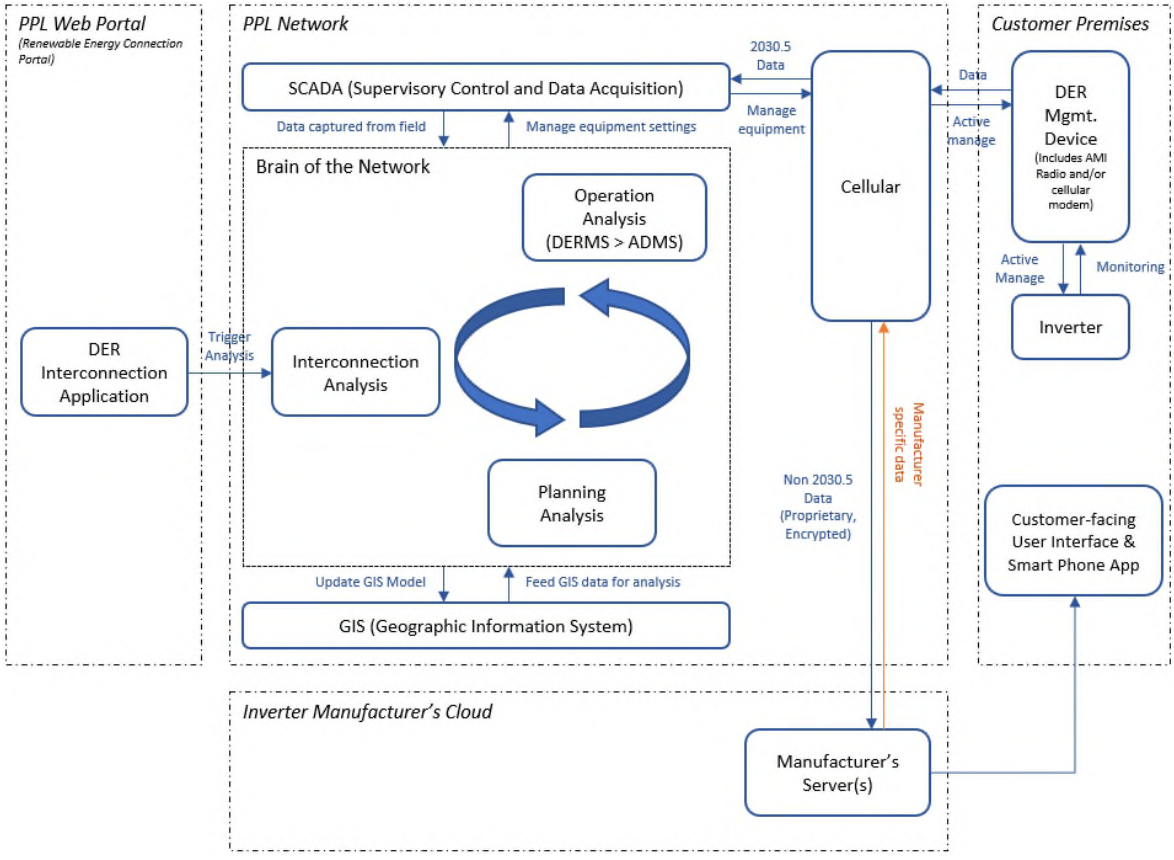

The components in the architecture are:

- DER Interconnection Application: Interconnection applications are submitted through a customer facing portal on PPL Electric's website. The portal allows for work orders to be generated and for customer and inverter data to pass automatically to the Company's Geographic Information System ("GIS").
- Interconnection Analysis: The technical analysis process by which PPL Electric reviews the proposed interconnection against its requirements, determines if upgrades are required to the PPL Electric system, and, when satisfied, provides approval for installation.
- Planning Analysis: The routine technical analysis PPL Electric uses to determine whether additional system upgrades are required to address capacity, voltage, or reliability needs on the distribution system. The planning process uses data from the Supervisory Control and Data Acquisition ("SCADA") system and GIS, among other systems.
- Distributed Energy Resource Management System ("DERMS"): A centralized system responsible for DER management; DERMS is being migrated to an Advanced Distribution Management System ("ADMS") in the first quarter of 2021. First DERMS, then ADMS, will be used for DER monitoring and management during the Pilot.
- Geographic Information System: A database providing the equipment, asset data, and locations of the equipment on the distribution system.
- Supervisory Control and Data Acquisition: In addition to the data that is already collected by PPL Electric's SCADA system, this system captures the data from the

inverters through the advanced metering infrastructure ("AMI") mesh network or a cellular connection and provides it to DERMS. Additionally, SCADA data is stored and available historically.

- AMI Mesh Network: The communication pathway that was originally created for the Company's AMI meters that is now being used for DER communication as well. It facilitates data exchange with SCADA via the AMI Headend and with the individual DERs via the AMI radios located within the DER management devices.
- Cellular Network: The communication pathway that facilitates data exchange with SCADA via PPL Electric's cellular headend servers and with the individual DERs via the cellular modem located within the DER management devices.

DER Management Device: Featuring an AMI radio or cellular modem, this device connects to the DER's local communication interface, enabling monitoring and management of the DER through the existing AMI Mesh Network or cellular connection. This device allows PPL Electric to remotely monitor the attributes and performance of the DER and manage its grid support settings as needed.

E. DER INVERTERS

1. Inverter Requirements

From January 1, 2021, through December 31, 2021, new DERs interconnecting with the Company's distribution system were required to feature smart inverters that met: (1) UL Standard 1741 Supplement A ("UL 1741 SA"); and (2) the Company's testing for the communications requirements under IEEE 1547-2018. These requirements were known as the "Interim Requirements." Beginning January 1, 2022, PPL Electric transitioned to requiring new inverters that connect to the distribution system to comply with IEEE 1547-2018 and to be certified to UL 1741 Supplement B ("UL 1741-SB"). During the transition period of January 1, 2022, through

December 31, 2022, each new inverter connecting to PPL Electric's distribution system must either: (1) meet UL 1741-SA (as amended or supplemented) and the communication requirements under IEEE 1547-2018 (as tested by or on behalf of the Company); or (2) comply with IEEE 1547-2018 and be certified to UL 1741-SB. Beginning January 1, 2023, new inverters connecting to the distribution system must comply with IEEE 1547-2018 and must be certified to UL 1741-SB. The Company shall perform its testing expeditiously so DER interconnections are not delayed. Inverter manufacturers will be required to follow PPL Electric's certification process to be eligible for Pilot participation.

If a customer installs a new inverter on an existing DER installation or upgrades an existing DER installation after January 1, 2021, the customer may install a replacement inverter of similar make and model as the existing inverter; provided, however, that any such inverter must meet the Commission's applicable standards and requirements set forth in its regulations. These inverter requirements also do not apply to DER installations whose interconnection applications are submitted to PPL Electric before January 1, 2021.

2. Approved List of Smart Inverters

The list of smart inverters that meet the Company's applicable requirements are publicly available and will be regularly updated on the Company's website. An initial list was published on December 1, 2020. On January 1, 2021, the Company's Renewable Energy Connection web portal was updated to reflect the list of smart inverters that have been certified to meet the Company's applicable requirements. If a customer or installer would like to use an inverter not on the approved inverter list, they must follow PPL Electric's certification process.

3. Inverter Testing and Certification Process

PPL Electric follows a streamlined process for testing new inverters requesting approval. The steps are laid out as follows:

First, the inverter manufacturer needs to provide proof that the inverter is UL 1741-SB certified and has a dedicated local communication interface available for testing, which are both pre-requisites for being able to be certified under the Interim Requirements. (Note that UL 1741-SA certification was accepted until January 1, 2023; UL 1741-SB certification has been required since that date.) The inverter manufacturer also must provide technical information on its inverter model, including, but not limited to, the inverter's communication protocol, data models, and configuration profiles. The Company also works with the inverter manufacturer to obtain a test model for PPL Electric's testing lab.

Second, after the Company receives all of the requested information and has set up a test model in the lab, the inverter testing proceeds in the following sequence:

1. DER Communication Protocol Testing

   PPL Electric validates that one of the three approved protocols (IEEE 2030.5, IEEE 1815(DNP3) or SunSpec Modbus) is supported as a local communication interface.

2. Profile Configuration including Data Point Mapping

   PPL Electric develops and loads the proper server profile configuration to allow data points to flow correctly between the server and client.

3. Read Points Testing

   PPL Electric tests and validates the capability to receive the following via the inverters' local communication interface.

   - Real Power
   - Apparent Power
   - Reactive Power
   - Power Factor
   - Current (Total, Phase A, Phase B, and Phase C)
   - Voltage (Phase A-to-neutral, B-to-neutral, C-to-neutral)

4. Write Points Testing

PPL Electric tests and validates the capability to monitor and manage grid support functions of the inverters via their local communication interface.

5. DER Management Device Testing

   PPL Electric tests and validates end-to-end testing between the DER and the Company's DERMS/ADMS via the DER Management device.[1]

Smart inverters that pass the Company's testing requirements are added to PPL Electric's Approved List of Smart Inverters.

4. Customer Enrollment

The DER interconnection application process will utilize the Company's Renewable Energy Connection web portal for the approval and the creation of interconnection work orders. The portal also is used to obtain the Certificate of Completion ("COC") for the DER interconnection.

During the Pilot, the Company will purchase and install DER management devices on all new DERs with inverters installed for DER customers in Control Groups 1 and 2 and DER customers in the Actively Managed Group, up to an annual limit of 3,000 DER management devices. DERs installed above the annual limit shall not be part of the Pilot. All DER management devices shall be owned, operated, and maintained by the Company at no direct cost to interconnecting customers. The smart inverters that are installed as part of the Pilot must have one of their communications ports dedicated to use by PPL Electric. In the event that the customer's

[1] The Company's AMI Mesh Network DER Management device is not compatible with IEEE 2030.5 inverters. PPL Electric actively worked on a solution that would resolve the incompatibility issue. Ultimately, PPL Electric developed a Cellular Network DER Management device that is compatible with IEEE 2030.5. Therefore, when that IEEE 2030.5-compatible device becomes available, applications for new DERs utilizing IEEE 2030.5 inverters that pass the Company's other testing requirements to interconnect will be subject to the pilot program. Applications for new DERs using IEEE 2030.5-compatible inverters that are submitted before that IEEE 2030.5-compatible device becomes available shall remain not a part of the pilot program.

DER requires two communications ports to operate (such as in a solar plus battery storage set-up), PPL Electric will provide a three-communications port solution at no direct cost to that customer.

When a complete DER interconnection application is received, a unique and internal DER management identification category is assigned to the application based on: (1) the order it was received relative to other applications; and (2) the customer group to which that specific application was assigned, as shown in Table 1 below.

Table 1: DER Management Designation

DER Management Designation	Description
Designation Category 0	This DER management designation will include interconnections that belong to the Grandfathered Group that are not required to comply with the new interconnection requirements in the operations and maintenance of their installation.
Designation Category 1	This DER management designation will be assigned to those DER customers in Control Group 1, those on the first 75 circuits for which DERs are installed.
Designation Category 2	This DER management designation will include the first 1,000 DERs which apply and complete their interconnection on or after January 1, 2021 and may include DER customers who are also assigned to Control Group 1 (Designation Category 1).*
Designation Category 3	A DER system that is enrolled in the Actively Managed Group will be assigned this DER management designation.

* Customers included in the first 1,000 DERs interconnected and are on one of the first 75 circuits will have a designation noting inclusion in both control groups.

5. DER Settings

Volt/VAR will be used as the default voltage management mode for all inverters. The Company will establish and maintain default Volt/VAR settings based on the location and impact of each DER, as well as voltage ride-through and frequency ride-through functions which meet or exceed PJM Interconnection LLC's ("PJM") guidelines. Alternative voltage management modes and settings may be used to reduce or eliminate distribution system upgrade costs to interconnecting customers with their agreement.

Prior to the customer completing the DER installation and submitting the COC, a Volt/VAR curve will be calculated and stored in a database to be sent to the inverter following its installation. Each Volt/VAR curve will be calculated using the DER's location on the distribution system, kW nameplate, calculated voltage rise, and other pertinent data.

DERs in Control Group 1 and Control Group 2 will be monitored using DERMS/ADMS and the AMI Mesh Network to understand the actual state of the distribution system and the DERs' performance. The Company shall not make operational decisions regarding the distribution system based on that information. Control Group inverters will exclusively use autonomous grid support functions, which will dictate the inverter's operational behaviors, using the local conditions as input. Each Control Group inverter will be tagged in DERMS/ADMS to prevent any active management by either DERMS/ADMS or PPL Electric's operations personnel.

In the Actively Managed Group, the developed Volt/VAR curve will be used until field conditions deem a power factor override or a change of power factor is necessary to maintain acceptable system conditions. In operating scenarios where the distribution system is configured abnormally due to maintenance or an outage, DERMS/ADMS may manage these inverter settings by "overriding" the autonomous Volt/VAR curve and using a specific Constant Power Factor until system conditions return to acceptable levels. PPL Electric will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or "islanded" from the distribution system. The Company will only use Volt/Watt when mutually agreed upon by the DER customer and the Company. Aside from Volt/VAR curves, default Voltage Ride-through and Frequency Ride-through will also be provided and programmed by the Company at interconnection. PPL Electric will track and report yearly on each instance when active management is used.

F. PILOT PROGRAM ANALYSIS

During the Pilot, PPL Electric will gather and store data from participating DERs in three of the customer groups: Control Group 1, Control Group 2, and the Actively Managed Group. The data will be used in comparison among the four customer groups (*i.e.*, Control Group 1, Control Group 2, Actively Managed Group, and Grandfathered Group) to determine the impact and benefits of DER monitoring and active management. The analysis will occur in both an operating (real-time) environment and in planning (long-term) scenarios.

Operational analysis will be done in near real-time so that operators and DERMS/ADMS can identify the impact of each DER on voltage and load on the circuit. The Company shall not make operational decisions regarding the distribution system based on the information gathered from Control Group 1 and Control Group 2. DERMS/ADMS will determine if adjustments need to be made to traditional voltage management devices, the settings on inverters in the Actively Managed Group, or both to mitigate violations and make work conditions safer. The operators can then change the inverter settings and determine if the potential violation is ameliorated. The information from all these events, for both monitored and actively managed customers, will be tracked and made available for further analysis.

Planning analysis will include post-event analysis of voltage and load information from the circuits with Grandfathered Group DERs (no monitoring) compared to circuits with monitored DERs and those with actively managed DERs. Comparisons will determine whether monitoring and/or actively managing the DERs results in fewer voltage violations, fewer capital expenditures, or other system challenges being avoided.

1. Anticipated Benefits

The anticipated benefits are expected to provide a value proposition for Reliability, Power Quality, and Safety as shown in Table 2, below.

Table 2- Value Proposition and Anticipated Benefits

Reliability	a. Enhance operational flexibility
	b. Improved excursion ride-through
	c. Improved hidden load visibility
Power Quality	d. System upgrades deferred / avoided
	e. Increased hosting capacity
	f. Improved long-term forecasting
	g. Improved voltage management
Safety	h. Safer work environment

2. Data Collection and Verification

DER information, such as grid number, premise number, user group, circuit ID, nameplate generation size (kW), and distance from substation, will be captured from the GIS and Customer Service System ("CSS") databases for all DER customer groups. Voltage data will be taken across PPL Electric's network at all the available measuring points, such as SCADA and AMI meters, to monitor the network voltage level. System load data will be captured at Company-owned devices at all the available measuring points in the network, such as circuit breakers, recloser devices, smart switching devices, and AMI meters. Voltage and load data will be captured at all DER inverters within Control Groups 1 and 2 and the Actively Managed Group.

Inverter baseline data to be collected and archived includes amps, voltage, watts, VARs, Power Factor, Power Factor setpoint value, Power Factor setpoint enabled, Volt/VAR enabled, and system status (On/Off). This data will be captured for all DER customer groups and used for comparative analysis. This comparative analysis includes, but is not limited to:

a. Peak load and associated voltage;

b. Minimum load and associated voltage;

c. Minimum daytime load and associated voltage;

d. Number of voltage violations;

e. Standard deviation of voltage violations;

f. Peak load at customer meter for all DER customers on the circuit;

g. Minimum load at customer meter for all DER customers on the circuit;

h. Standard deviation of loads for all DER customers on the circuit;

i. Number of hours without DER production; and

j. 8760 load levels and voltage levels on circuits.

With DER monitoring and management, PPL Electric will have a significant increase in data to help manage and plan the distribution system, with sources from the grid (before the meter) as well as AMI meter data and DER inverter data (behind the meter). Collecting data both before and behind the meter will bring critical information to understand the full impact of two-way power flow on the safe and reliable operation of the distribution system.

Using this, PPL Electric will be able to conduct comparisons among the four DER customer groups, show use cases, track multiple metrics, and analyze the differences in performance and grid-supporting behaviors of DERs with active management, monitoring, and without visibility on the Distribution system.

3. Use Cases

These use cases cover relevant scenarios under which DERs would interact with the electric distribution system. By leveraging the DER management devices' ability to monitor and/or manage the DERs, several beneficial objectives can be achieved in each use case. Throughout the Pilot's implementation, as PPL Electric gains more experience, the Company may revise and refine the details of these use cases, adjust the methodology and approaches, use more advanced tools, and adopt industry best practices. The use cases include:

1. Voltage violation at DER Point of Interconnection ("POC")
2. Voltage violation mitigated by DERs on the circuit
3. Voltage violation during planned switching
4. System restoration
5. Hidden load impact on load forecasting
6. DER management impact on voltage management
7. DER active management impact on hosting capacity increase and deferral of capital upgrade
8. DER operation in emergency conditions and in active work zones

Use cases are further described in Attachment C. The Company will provide its findings and information on these use cases in its annual reports filed with the Commission.

G. PILOT PROGRAM REPORTING

1. Annual Reports Submitted to the Commission

The annual reports will be filed with the Commission at Docket No. P-2019-3010128, providing detailed quantitative information relevant to the evaluation of the results of the Pilot. Annual reports to the Commission will be published at the end of each program year, starting with the end of Program Year 1. The reports will also be made publicly available. Care will be taken to protect customer privacy, so reporting shall not contain any sensitive customer information. The annual reports shall be filed within 30 days following the end of each program year (first report is estimated to be filed in the second quarter of 2022). Reports shall include data in electronic formats that support analysis (i.e., Excel or other machine-readable data where appropriate). Annual reports shall include the information listed below.

(1) The number of DERs installed and the number of each type of DER management device installed

(2) A list of the participating DERs that includes for each DER: (a) a unique customer identifier; (b) the nameplate capacity; (c) the initial settings established for that DER's smart inverter; and (d) the type of DER (e.g., solar, solar plus storage)

(3) Capital costs and expenses associated with the purchase, installation, ownership, and maintenance of the DER management devices

The capital costs will be identified separately for each type of DER management device installed. PPL Electric will begin tracking expenses for each type of DER management device installed effective with the deployment of the IEEE 2030.5 solution in the field. The expenses tracked by the Company for each type of DER management device installed will be reported beginning with the annual report for Program Year 2.

(4) Number of times, locations, and duration for active management

The number of times and the locations at which the Company actively managed each grid support function and the average duration that the function was actively managed.

This would be a summary showing aggregated counts among all customers of:

- Volt/VAR Curve Overrides
- Power Factor Setting Changes
- Ride-through Setting Changes
- Remote On/Off
- Volt/Watt Curve Overrides (where applicable)

(5) Grid benefits achieved for each instance of active management

The grid benefits achieved in each instance of active management, include, but are not limited to, real-time grid constraint mitigation. The Company shall develop the definition and parameters of the grid benefits.

(6) Net generation loss or gain due to active management

The net generation loss or gain due to the Company's active management of grid support functions (defined above) in each instance.

(7) Distribution system upgrades avoided due to increased hosting capacity attributed to monitoring

This report will be a comparison of the computed circuit hosting capacity when all DERs are evaluated at nameplate kW only, versus the hosting capacity of each circuit with actual kW output, gained via monitoring (while keeping Grandfathered DERs at nameplate kW).

(8) Distribution system upgrades avoided due to increased hosting capacity attributed to autonomous grid support functions

This report will be a comparison of the computed circuit hosting capacity of each circuit with actual kW gained via monitoring only versus the scenario where those DERs are equipped with autonomous grid support functions (while keeping Grandfathered DERs at nameplate kW).

(9) Distribution system upgrades avoided due to increased hosting capacity attributed to active management

This report will be a comparison of the computed circuit hosting capacity when all DERs are evaluated at nameplate kW only, the scenario without any monitoring or active management, versus the hosting capacity of each circuit with actual kW output gained via active management (while keeping Grandfathered DER at nameplate kW).

(10) System operation comparisons of circuits under autonomous inverter grid support functions versus active management

The comparison will involve DERs on the 75 circuits in Control Group 1, circuits with DERs in Control Group 2, and the circuits with actively managed DERs. This report will be in the form of a voltage metric depicting the performance characteristics between the two groups. Depending on the mix of Grandfathered Group, Control Group, and Actively Managed Group DERs on the remaining circuits, those circuits may need to be segmented

to provide an accurate statistical comparison. This reporting will be tracked and maintained manually.

(11) Operational descriptions of how active management was executed and implemented

This report will use data captured in DERMS/ADMS, which identifies any operational issues faced, what kind of active management action was taken, and the resulting system impact(s) and benefit(s) of the action. Additional manually noted information will be provided in this report, as available (e.g., day-ahead and real-time remote setting alterations to DERs).

(12) Performance measures related to active management

This report will address all performance measures related to active management and, where applicable, monitoring, including, but not limited to, communication reliability (e.g., communication uptime) and data quality.

(13) Findings and information on the Company's use cases

This report will provide findings and information on the pilot program's use cases to date, in addition to the data being presented in the annual report.

2. Annual Reports to Individual DER Customers

Within 30 days following the cash-out of the customers' banked excess generation, which typically occurs at the end of each PJM Planning Year, each DER customer whose smart inverter's grid support functions are used by the Company during the annual reporting period will be sent an individualized annual report. The annual report will provide:

(1) The amount of the DER's net generation loss or gain due to the use of the autonomous grid support functions:

- Default Volt/VAR Settings
- Default Voltage Ride-through Settings

- Default Frequency Ride-through Settings

(2) The aggregate amount of all DERs' net generation loss or gain due to the Company's active management of the grid support functions outlined below:

- Volt/VAR Curve Overrides
- Power Factor Setting Changes
- Ride-through Setting Changes
- Remote On/Off
- Volt/Watt Curve Overrides (where applicable)

(3) The method and technique used to calculate the DER's net generation loss or gain

The Company will provide a description of the method and technique used to calculate the net generation loss or gain for customer reporting.

(4) The number of times each grid support function was used on an automated basis, and the average duration of that function's automated use

(5) The number of times that PPL Electric actively managed each grid support function, and the average duration that the function was actively managed

(6) Volt/VAR Curve Override Table

For the events where a Constant Power Factor is temporarily used to override an existing Volt/VAR curve, the customer's annual report will show the existing Volt/VAR curve, the Power Factor that was temporarily used, and the duration of the event. For the events where a new Volt/VAR curve is issued, the new curve will be included in the report.

3. Data on Program Performance

Within 30 days after the end of each program year, PPL Electric will provide the following data on an anonymous basis to the Sustainable Energy Fund ("SEF"):

(1) Raw DER Data – 15-minute interval data for participants (delivered kWh, received kWh, RMS voltage).

(2) DER Management Data – 15-minute inverter data for participants (kW and voltage).

PPL Electric will use generic but unique identifiers for each customer to anonymize the customers' names and account numbers when providing the data to SEF.

H. CUSTOMER AND INSTALLER INFORMATION

Customers and installers who are pursuing or are interested in learning more about installing DERs on the PPL Electric distribution system are able to find information and instructions about the updated interconnection process on PPL Electric's external Rules for Electric Meter and Service Installations ("REMSI") website and also on the PPL Electric's Renewable Energy Connection Portal. The frequently asked questions ("FAQs") section on the REMSI website has been updated to include impacts and details for the Pilot and appropriate PPL Electric contact information.

On an annual basis during the Pilot, customers whose inverters' settings are actively managed during the Pilot will receive the individualized annual reports outlined in Section II.G.2, *supra*. Customers, or the installers who are installing the DERs, will be notified by the Company, via a phone call, regarding coordination of a PPL Electric representative installing the DER management device.

Also, on May 13, 2021, PPL Electric launched a new webpage specifically for DER Management. This new webpage acts as the main "hub" with easily located information or hyperlinks to pertinent information on DER Management, including, but not limited to, material pertaining to DER management as a whole, Volt/VAR and Ride-through setting guidelines, approved installation sketches, frequently asked questions, the Pilot Implementation Plan, and the approved inverter list.

Attachment A

Excluded Distribution Circuits

To preserve the integrity of the 75 distribution circuit control group, the Pilot will not include any of the following 12 distribution circuits, due to the presence of remotely managed DERs (e.g., participants in PPL Electric's Keystone Solar Future Project) and/or similar Company-owned facilities (e.g., batteries) on these distribution circuits during the term of the Pilot:

(1) Leola No. 3 Distribution Circuit
(2) Leola No. 5 Distribution Circuit
(3) Prince No. 2 Distribution Circuit
(4) South Akron No. 4 Distribution Circuit
(5) Cocalico No. 1 Distribution Circuit
(6) Letort No. 1 Distribution Circuit
(7) Letort No. 2 Distribution Circuit
(8) Buck No. 3 Distribution Circuit
(9) East Petersburg No. 1 Distribution Circuit
(10) Newport No. 1 Distribution Circuit
(11) Crackersport No. 2 Distribution Circuit
(12) Renovo No. 2 Distribution Circuit.

Attachment B

Pilot Milestones with Program Year 1 Commencing March 2022

Key timeline and milestones of the Pilot implementation are provided below based on the March 22, 2022 start date of Program Year 1.

1. December 1, 2020 – Inverter List Published on REMSI
2. December 17, 2020 – Commission Order Approving the Settlement
3. January 1, 2021 – Day 1 of Pilot
4. January 19, 2021 – File the Pilot Implementation Plan
5. January 28, 2021 –Technical Collaborative
6. February 8, 2021 – Other Parties' Comments Due
7. February 10, 2021 – Control Group 1 Established
8. March 22, 2022 – Start date of Program Year 1
9. June 30, 2022 – 30 days after PJM Calendar Year, First Annual Reports to Customers
10. January 1, 2023 – New DERs have inverters certified with IEEE 1547.1 / UL 1741 SB
11. April 21, 2023 – First Annual Report to Commission
12. June 30, 2023 – Second Annual Reports to Customers
13. April 21, 2024 – Second Annual Report to Commission
14. Simultaneously with End of Program Year 2, 2024 – Potential Petition Filing
15. June 30, 2024 – Third Annual Reports to Customers
16. April 21, 2025 – Third Annual Report to Commission

Attachment C

Use Cases

1. Voltage Violation at DER Point of Interconnection

DERs can sometimes exacerbate voltage violations on the network. Currently, there is no real time visibility for the grid operator of the voltage level at the physical location of all DERs. As a result, often the grid operator might not be aware of a voltage violation caused or exacerbated by a DER in a timely fashion, and, if they do notice a voltage violation on the network, there is no way to identify which DER is the cause of the issue. Monitoring capability and an alarm system at a DER location can certainly provide visibility that is needed but missing.

If a violation is identified on a particular DER, currently the only way to act on the issue is to contact the DER operator and request action from them. In some cases, PPL Electric staff will need to be sent on-site, which is time consuming and resource intensive. Active management capability will enable speedy response to the issue and save cost and resources by avoiding sending field personnel to be physically present at the location.

For Monitored DER customers, the Company will be able to identify voltage violations at particular DER locations remotely and will be able to come up with mitigation strategies. For Actively Managed DER customers, the Company will be able to identify the voltage violation and actively manage the DER to attempt to eliminate the voltage violation.

For the Grandfathered Group, the Company will record voltage violations (counts and violation level) using non real-time AMI voltage data. For Control Groups 1 and 2, the Company will record voltage violations using the DER information available from monitoring these customers. For the Actively Managed group, the Company will capture any event where DER settings are adjusted to mitigate voltage issues at the DER point of interconnection.

The Company will analyze the impacts and interaction in voltage management among DERs across the defined customer groups. The Company will also record all field trips needed and those avoided to resolve voltage violations and will calculate the cost savings resulting from fewer trips.

2. Voltage Violation Mitigated by DERs on the Circuit

DER interconnections can exacerbate voltage fluctuations particularly if there are numerous DERs on a single circuit. With additional DERs coming on the system, the voltage violations could be extreme, and, without visibility, PPL Electric's operators and planners will be challenged to manage the system reliably and safely.

For the Actively Managed DER customers, PPL Electric will identify and capture scenarios where DERs may be utilized to alleviate the voltage violations via active management of the DER settings. For the Monitored DER customers, PPL Electric will capture and review events where DERs are using autonomous grid support functions to mitigate voltage issues and will study their overall impact on circuit voltage.

3. Voltage Violation During Planned Switching

During planned switching, when loading and/or network topology changes, DERs can cause network violations. Although some violations can be addressed by changing settings at voltage regulation equipment, sometimes violations would require changes at the customer level, such as requiring DERs to stay offline during the switching. With DER monitoring, the Company has more accurate data to predict the impact of DERs during the switching. With active management, DERMS/ADMS and operators can respond to and mitigate the violation by changing the DERs' settings.

The analysis will be performed prior to execution of the planned switching. The analysis will utilize historically collected data at both the monitored and actively managed DERs on the

circuit(s) to design mitigation strategies if violations would exist during the planned switching period. The Company will decide and document if DERs need to switch from the default Volt/VAR mode to Constant Power Factor during the planned switching, or if a revised default Volt/VAR curve shall be temporarily issued.

During the switching period, the Company will also utilize its Load/Voltage Management program within the DERMS/ADMS to manage the actively managed DERs that are in Constant Power Factor mode.

4. System Restoration

When an outage occurs, all the DERs on the circuit shall automatically switch off to avoid unintentional islanding. When the restoration is complete, the load that will need to be brought back online is larger than the load level under normal operating conditions because the load normally served by the DER will now need to be sourced by the Company's network ("hidden load"). By being aware of the actual amount of hidden load, restoration can be planned to accommodate the total load (apparent + hidden) and dramatically reduce the risk of conductor overload and equipment damage during restoration. Monitoring capability at the DER will provide the critical information on the actual amount of hidden load on the circuit and guide the grid restoration with more visibility. Analysis will be based on the voltage level and circuit loading level recorded in the log after the restoration of circuits with different DER customer groups (Grandfathered Group, Control Groups 1 and 2, and Actively Managed Group). If the information is not clearly portrayed in the log, the Company will perform simulation studies as needed without taking the hidden load into consideration and compare the difference between loading levels with or without the hidden load.

5. Hidden Load Impact on Load Forecasting

Distribution planning reviews the load data for all distribution circuits routinely (during customer load and generation application analysis. During this planning review, the circuit/substation overload risks are evaluated with hidden load considered. Hidden load is the amount of load on a circuit that is masked by distributed generation making the perceived kilovolt-ampere ("kVA") value appear to be lower than it is. System investments are developed based on the outcome of the load forecasting. To compensate for the hidden load, the system may be studied with all DER off-line, as it depicts a scenario where the distribution system must carry the full load without DERs. This makes the analysis less accurate, which may result in unnecessary or less timely system investments. DERs in the Pilot with monitoring and active management capabilities will improve the load model accuracy and decrease circuit/substation overload risk, which could defer the need for system investment.

6. DER Management Impact on Voltage Management

With DER monitoring, the accuracy of voltage profile studies will improve. Having more voltage data points will eliminate assumptions made today and will provide a more accurate voltage profile and allow for timelier and more prudent system upgrades with DER active management through DERMS/ADMS. Also, more voltage support functions will be available, and system investments for upgrading voltage management equipment, such as voltage regulators and capacitor banks, can be avoided. DER management and Volt/VAR curve will also be implemented in the power flow modeling process when applications are reviewed by the Planning team and will directly save the cost of reinforcements to the customer by being able to alleviate voltage violations through the use of smart inverters.

The DER data generated will be utilized by the Planning team to conduct studies and compile a list of voltage violations alleviated through DER monitoring, autonomous grid support

functions, and active management. Planning will use this information and perform power flow and voltage studies to determine reinforcements that would have been required to prevent these voltage violations. A cost-saving estimation will be compiled for each DER management category.

7. DER Active Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade

Hosting Capacity is the amount of Distributed Generation that can be added to the distribution system before load or voltage violations occur or system upgrades are required for safe and reliable DER integration. With DER monitoring enabled, the actual DER generation information will be used to identify the available hosting capacity, rather than using DER kW nameplate ratings. Knowing that DER actual generation is always smaller or equal to its nameplate rating, the hosting capacity of the distribution system will increase if the actual generation information is used.

The impact analysis will consist of conducting two hosting capacity studies (also known as integration capacity studies) on PPL Electric's network in power flow simulation platform using: (1) DERs' nameplate rating (kW, kilovolt-ampere reactive ("kVAR"), kVA); and (2) DERs' actual generation info (kW, kVAR, kVA) obtained from smart inverters. The hosting capacity at node level, circuit level, and system level will be obtained in both studies and compared together to investigate hosting capacity improvement attributed to the following comparison scenarios:

i. Monitored DERs versus Grandfathered DERs

ii. Autonomous DERs versus Grandfathered DERs

iii. Actively Managed DERs versus Grandfathered DERs

In addition, capital upgrades may be required for new DER interconnection applications, due to limited hosting capacity calculated based on existing DERs' nameplate ratings. The hosting

capacity obtained from actual DER generation info of monitored DERs is used to investigate avoided/deferred capital investments attributed to the comparison scenarios mentioned above.

8. DER Operation in Emergency Conditions and in Active Work Zones

When there is a reported fire, gas leak, or down conductor, field personnel may be needed to clear the issue. The network in the affected part of the distribution system will be de-energized for the safety of the Company's employees and the general public. Through monitoring of DERs, the team can identify all DERs in the active work zone and verify their status (on or off), and through active management, the Company can turn off the DERs remotely when they do not safely isolate from the distribution system. As a result, safety risks during field work will be greatly mitigated.

In addition, in a fire situation in which the fire chief requests a house to be de-energized, the house can be disconnected from the grid at the meter point by the Company remotely. If there is a behind-the-meter DER on site, the Company can monitor whether the DER turns off as required. With monitored DERs, the Fire Department can be notified if the DER is still in operation. The actively managed DERs can be turned off remotely if the DER does not safely isolate from the distribution system on its own. This will increase the certainty of de-energizing and as a result, increase the overall safety level.

The Company will record the number of DERs in active work zones and the number of DERs that require remote management, as the data and time permit. The Company will also record the costs and benefits to the safety measurements through monitoring and/or actively managed DERs.

As previously stated, in accordance with Paragraph 59 of the Settlement, PPL Electric will only use the Remote On/Off function on battery storage or solar systems that have not safely

isolated or ‘islanded’ from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage.

Attachment D

Due Consideration of Other Parties' Comments

Under Paragraph 61 of the Settlement, PPL Electric agreed to give due consideration to the Joint Petitioners' written Comments. However, the Company retained the ultimate discretion to accept or reject the Joint Petitioners' feedback in its Pilot Implementation Plan. If any changes were made to the Pilot Implementation Plan based on the Joint Petitioners' feedback, PPL Electric would file a revised Pilot Implementation Plan at this docket within 20 days after the deadline for the Joint Petitioners' Comments.

In compliance with Paragraph 61 of the Settlement, PPL Electric reviewed and gave due consideration to the Joint Petitioners' Comments. Sunrun, who was not a Joint Petitioner, also filed Comments on the Pilot Implementation Plan. Although not obligated to consider Sunrun's Comments under the Settlement, PPL Electric nevertheless reviewed and gave due consideration to those Comments as well.

PPL Electric appreciates the other parties' feedback on the Pilot Implementation Plan. As seen in the first revised Pilot Implementation Plan, and as explained further in this Attachment D, the Company incorporated some of the recommendations proposed by the parties. As a result, PPL Electric determined that it needed to file its first revised Pilot Implementation Plan. In the following sections, PPL Electric summarizes and responds to certain of the parties' Comments.

I. OTHER PARTIES' COMMENTS

A. SEF'S COMMENTS

SEF contends in its Comments that PPL Electric "misrepresents the objective of the DER Management Pilot Program," believing that the purpose is to determine the cost and benefits to ratepayers, not PPL Electric. (SEF Comments, pp. 1-2.)

The Company disagrees with SEF's characterization. The pilot program's objectives are clearly outlined in Paragraph 54 of the Settlement, which states that the pilot program will "test and evaluate: (1) the costs and benefits to distribution system operation and design of *monitoring* DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means (e.g., automated meter reading equipment, ADMS systems, modeling); and (2) the costs and benefits to distribution system operation of *active management* of DERs as compared to the benefits available through the use of inverter autonomous grid support functions." (Settlement ¶ 54.) Nothing in the Pilot Implementation Plan alters those fundamental objectives. Moreover, costs and expenses incurred by PPL Electric are sought for recovery from the Company's ratepayers, and benefits to PPL Electric's electric distribution service are experienced by its ratepayers, who ultimately receive that service. Therefore, PPL Electric views SEF's characterization as a distinction without a difference.

In addition, SEF argues that the pilot should be delayed "until PPL Electric approves more inverters representing a more significant market share." (SEF Comments, p. 3.) SEF states that "[a]s of the recent conference call among the parties in this proceeding, PPL Electric has yet to solve the technical issues in communicating with Enphase inverters." (SEF Comments, p. 2.) As for SolarEdge, according to SEF, "the Solar Edge inverters approved by PPL Electric are incomplete," as the Company "only approved the H-US series of inverters designed for residential systems and the KUS inverters designed for 3-phase systems." (SEF Comments, p. 2.) SEF states that "[f]or residential customers alone, the approval does not include the H-RW, M-RW, and K-RW series inverters." (SEF Comments, p. 2.) SEF raises concerns about the inverters' approved for use in the Company's service territory and the potential impact on solar developments. (SEF Comments, pp. 2-3.)

PPL Electric has resolved the concerns regarding the IEEE 2030.5 inverters, such as the microinverters used by Enphase. With the agreement of the other parties, until the IEEE 2030.5-compatiable DER Management device is available, PPL Electric will permit DERs using Company-tested and validated IEEE 2030.5 inverters to interconnect and not be subject to the pilot program. Subsequently, once the IEEE 2030.5-compatible DER Management device becomes available, any new DER interconnection applications that will use an IEEE 2030.5 inverter would be included in the pilot program. This practice is consistent with Paragraph 56 of the Settlement, which states that "the Company shall not deny or delay the permission to connect and operate a DER due to unavailability of DER management devices" and that "[a]ny DER not equipped with a DER management device for this reason shall not be part of the pilot program." (Settlement ¶ 56.) Nevertheless, effective January 1, 2021, the Settlement requires new DERs interconnecting with the Company's distribution system to have smart inverters installed that meet: (1) UL 1741 SA; and (2) the Company's testing for the communications requirements under IEEE 1547-2018. (Settlement ¶ 48.) Therefore, PPL Electric must still test those inverters and validate that they meet those requirements before they can be installed in the Company's service territory.

SEF's concerns about the inverter approvals have either been addressed or lack merit. PPL Electric completed the testing and validation of Enphase's IEEE 2030.5 inverters on February 25, 2021. Thus, interconnection applications using those inverters can now be submitted on PPL Electric's web portal. As a result, SEF's concerns about the testing of Enphase's IEEE 2030.5 inverters are moot. Moreover, PPL Electric confirmed with SolarEdge that the Company tested and validated all of the inverter models currently offered by SolarEdge. The inverter models listed by SEF in its Comments are not SolarEdge models. Consequently, SEF's allegations about the testing and validation of SolarEdge's inverters lack merit.

SEF also raised concerns about the Remote On/Off function regarding solar plus storage installations. (SEF Comments, p. 3.) SEF believes that modifications to "the use cases for system restoration and DER operation in emergency conditions and in active work zones" should "be reviewed with the parties in this proceeding prior to implementation." (SEF Comments, p. 3.) SEF continues to believe that under the DER Management Plan, "PPL Electric could modify its approach to shut-down inverters appropriately disconnected from the distribution system," which "could endanger the life of ratepayers that utilize energy storage systems to provide uninterrupted service in the event of the failure of PPL Electric's distribution system." (SEF Comments, p. 3.) Although "SEF fully understands PPL Electric's concern for the safety of its workers," SEF asserts that "these workers can still be provided safe access to the distribution circuits without unnecessarily endangering the lives of ratepayers who may be using solar plus storage to power durable medical equipment." (SEF Comments, p. 3.)

To be clear, PPL Electric will adhere to Paragraph 59 of the Settlement, which states that the Company "will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or 'islanded' from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage." (Settlement ¶ 59.) Therefore, SEF's concern that PPL Electric may "shut-down inverters appropriately disconnected from the distribution system" is without merit. Remote On/Off will only be used for systems that "have not safely isolated or 'islanded' from the distribution system" and only in the circumstances set forth in Paragraph 59 of the Settlement. Nonetheless, PPL Electric has added language to the Pilot Implementation Plan's eighth use case to make this well-established point clearer. (*See* Pilot Implementation Plan, Attachment C, pp. 6-7.)

B. OCA'S COMMENTS

In its Comments, the OCA asserted that "[m]itigation or deferral of DER-related system upgrades can be achieved through numerous smart inverter related use cases that require various technological capabilities. Therefore, it is critical that the Company collect sufficient information to further inform these possibilities and potential solutions." (OCA Comments, p. 3.)

PPL Electric agrees and has designed its use cases not only to "further inform these possibilities and potential solutions" but potentially achieve system upgrade deferrals during the pilot program.

The OCA also commented on the data collection of energy storage systems, stating that "it is unclear as to whether, or what, energy storage related data the Company will collect through the Pilot Program." (OCA Comments, p. 3.) The OCA claims that "it is unclear whether the Company will be able to capture the existence of energy storage systems on PPL's system and separately evaluate the characteristics of these devices." (OCA Comments, p. 3.) Further, the OCA notes that "energy storage charging tariffs have been proposed in different districts throughout the country." (OCA Comments, pp. 3-4.) "While it is unclear whether PPL has grid connected storage or whether the Commission would consider a charging tariff reasonable at this time," the OCA believes that "collecting data on energy storage systems for the purpose of understanding cost causation is reasonable." (OCA Comments, p. 4.) Therefore, the OCA recommends that PPL "collect energy storage related data and specify how it will collect and share this information within the Pilot Program" and that, "[a]t a minimum, PPL should track and provide energy storage data as a separate load profile." (p. 4.)

PPL Electric will collect the same data from all DERs that are participating in the pilot program. Energy storage data will not be treated any differently. Therefore, for solar plus storage DERs, PPL Electric will collect the same data that the Company collects from any other DER

participating in the pilot program. As for the OCA's Comments about charging tariffs and developing a separate load profile for storage, PPL Electric views these issues as outside the scope of the pilot program. As stated previously, PPL Electric is committed to test and evaluate: (1) the costs and benefits to distribution system operation and design of *monitoring* DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means (e.g., automated meter reading equipment, ADMS systems, modeling); and (2) the costs and benefits to distribution system operation of *active management* of DERs as compared to the benefits available through the use of inverter autonomous grid support functions. (Settlement ¶ 54.) However, in its annual reports, PPL Electric will be indicating the type of DER installation for each of the participating systems (e.g., solar plus storage). Thus, the OCA will be able to analyze data about solar plus storage systems participating in the pilot program.

Further, the OCA "strongly supports the evaluation of" the active network management ("ANM") use case and "appreciates PPL clearly articulating the use [case] in the Pilot" because it can "be an exceptionally cost-effective approach to increasing hosting capacity and deferring system upgrades related to DERs." (OCA Comments, pp. 4-5.) The OCA recommends that PPL Electric "consider tracking cost causative characteristics of DER export, which will provide interested stakeholders information concerning the qualities of DERs that can cause costs to be incurred by the Company, that may otherwise be avoided through the use of PPL's Distributed Energy Resource Management System (DERMS)." (OCA Comments, p. 5.)

PPL Electric will be reporting the distribution system upgrades that were avoided with DER monitoring and remote active management. Although not intended for evaluation of ANM cases, PPL Electric believes that this reporting will provide a good foundation for the stakeholders to conduct such an evaluation.

The OCA also argues that the "cost-effectiveness of PPL's DER Management Device could be highly dependent on the size of DER that the Company monitors and controls." (OCA Comments, p. 6.) As a result, the OCA recommends that "PPL, to the extent possible, attempt to collect data and conduct analysis to investigate this issue." (OCA Comments, p. 6.)

PPL Electric will collect and report on the nameplate capacities of the DERs participating in the pilot program. In its annual reports, PPL Electric will provide the nameplate capacity of each participating DER. This will enable the stakeholders, including the OCA, to analyze the data based on specific nameplate capacities of the DERs. However, PPL Electric does not believe that a specific use case needs to be developed to analyze the impact of the DER's size on the cost-effectiveness of the DER Management device. The stakeholders will be able to disaggregate and analyze the annual reports' data by system size, thereby enabling them to perform their own evaluation. Nevertheless, PPL Electric's planned use cases are subject to change, and the Company may ultimately analyze the impact of the DER's size on cost-effectiveness, either as a separate use case or within the currently planned use cases.

C. NRDC'S COMMENTS

In NRDC's Comments, NRDC raises a series of concerns about inverter testing and compatibility issues, namely SolarEdge's inverters and the IEEE 2030.5 inverters, such as the microinverters manufactured by Enphase. (NRDC Comments, pp. 2-6.) NRDC agrees with PPL Electric's plan to address the incompatibility of IEEE 2030.5 inverters with the Company's DER Management device, under which: (1) until the IEEE 2030.5-compatiable DER Management device is available, PPL Electric will permit DERs using Company-tested and validated IEEE 2030.5 inverters to interconnect and not be subject to the pilot program; and (2) once the IEEE 2030.5-compatible DER Management device becomes available, any new DER interconnection applications that will use an IEEE 2030.5 inverter would be included in the pilot program. (NRDC

Comments, p. 5.) NRDC states, however, that "the Company should clarify the reasons for the incompatibility between a smart inverter that appears to clearly meet the interim standards and the ConnectDER device, and explain what actions it is taking to ensure that similar issues do not arise with other smart inverters that meet the interim standards." (NRDC Comments, p. 5.) NRDC also suggests providing more detail on whether the delays with the Enphase inverters is manufacturer-specific or a broader issue. (NRDC Comments, p. 5.) Furthermore, NRDC recommends that PPL "undertake efforts to ensure that other inverter manufacturers are aware of the issue of ConnectDER compatibility with IEEE 2030.5 and the temporary exemption to install affected inverters outside the pilot program." (NRDC Comments, pp. 5-6.)

As noted by NRDC, the concerns raised specifically to SolarEdge are moot because the list of approved smart inverters now includes SolarEdge's inverters. (NRDC Comments, p. 3.) Moreover, as explained in Section II.A., *supra*, PPL Electric completed testing and validating Enphase's IEEE 2030.5 inverters on February 25, 2021, and interconnection applications using those inverters can now be submitted. Therefore, the inverter testing issues raised by NRDC have been addressed.

Regarding the IEEE 2030.5 inverters' incompatibility with PPL Electric's DER Management device, PPL Electric clarifies that the incompatibility issue is only limited to inverters that use IEEE 2030.5 as the sole communication protocol. Per IEEE 1547-2018, inverters should be able to support one of the three communication protocols: DNP 3, SunSpec Modbus, or IEEE 2030.5, as specified by the electric distribution company. Before filing the DER Management Petition, PPL Electric surveyed and researched the inverter industry and determined that the majority of the inverter manufacturers use SunSpec Modbus and DNP 3. Thus, PPL Electric's current DER Management device was designed, tested, and implemented to support these two

protocols. IEEE 2030.5 is the newest of the three communications protocols, and PPL Electric is actively working on a DER Management device solution that will resolve the incompatibility issue. Although PPL Electric believes that many of the issues encountered with testing and validating Enphase's IEEE 2030.5 inverters were manufacturer-specific, the incompatibility with the current DER Management device applies to all IEEE 2030.5 inverters. As such, PPL Electric will update its solar inverter and other PPL Electric webpages to help make manufacturers, solar installers, customers, and other stakeholders aware of the incompatibility issue and how customers using tested and validated IEEE 2030.5 inverters will not be a part of the pilot program until PPL Electric has a compatible DER Management device available and ready to be used.

Next, NRDC states that PPL Electric should limit the use of "bespoke inverter settings" in the Control Groups' DER installations. (NRDC Comments, pp. 7-8.) According to NRDC, "the spirit of the pilot would be better served by using utility default inverter settings in as widespread a fashion as practicable." (NRDC Comments, p. 7.) "While it may be the case that locational and other factors may favor departing from default settings in particular circumstances (e.g., larger DER systems)," NRDC believes that "even then the establishment of default settings will provide valuable lessons about the extent of any limitations with a default setting-centered approach." (NRDC Comments, p. 8.)

PPL Electric generally disagrees with NRDC's suggestion. PPL Electric already will be tracking and reporting the initial settings of each DER participating in the pilot. Moreover, PPL Electric developed its Volt/VAR settings in a manner consistent with IEEE standards, i.e., maintaining power factor no lower than +/- 90%. Leveraging Volt/VAR curves which are calculated based on the DER's specific location and size provides the required granularity for distribution system stability. Due to the varied nature of PPL Electric's distribution system, which

goes from very urban, short distribution feeders with a high short circuit duty to very rural, long, distribution feeders with a low short circuit duty, the use of a default curve would result in some DERs absorbing or injecting VARs unnecessarily. DERs close to a substation should expect to see a voltage on the higher side of the acceptable range due to its proximity to the source just as DERs that are far from the substation should expect to see a voltage lower in the acceptable range. Use of strict, uniform default settings would necessitate more active management for DERs not in one of the Control Groups and would potentially lead to voltage issues on feeders within the control groups.

Also, PPL Electric has a statutory duty to all of its customers to provide safe, reliable, and adequate electric distribution service. *See* 66 Pa. C.S. § 1501. PPL Electric will not turn a blind eye and allow a DER to interconnect with suboptimal default settings, which, as described previously, could negatively affect the Company's electric distribution service.

Regarding the annual reports, NRDC recommends that the annual reports include information on PPL Electric's review of use cases, specifically "narrative interim assessments," not just data, and that the Company clarify this point in its Pilot Implementation Plan. (NRDC Comments, pp. 8-9.) NRDC also recommends that the annual reports include: (1) all initial inverter settings, including data allowing for regional comparative analysis; (2) the customer's feeder line; and (3) an actual analysis of DER system size, not only the details of the DERs' nameplate capacities. (NRDC Comments, pp. 9-11.)

As stated on pages 16 and 19 of the revised Pilot Implementation Plan, PPL Electric's annual reports will provide findings and information of these use cases. Moreover, PPL Electric will include each participating DER's initial inverter settings and nameplate capacity. However, PPL Electric will not provide each DER's feeder line in a publicly-available annual report. In the

Company's experience, customers are very concerned about their privacy, especially when it comes to details about their electric usage, generation, and DER systems. If PPL Electric provides the feeder line for each participating DER along with all of the other information being presented in the annual reports, the Company cannot guarantee that the customer's identity will be shielded from public view.

Lastly, NRDC makes a series of recommendations about making program documents available to the public. Specifically, NRDC recommends that "all pilot documentation . . . be made available on a dedicated webpage accessible through the . . . Company's Renewable Energy webpage." (NRDC Comments, p. 11.) NRDC believes that the REMSI website was designed with installers in mind, so it may not be an easily navigable resource for some stakeholders. (NRDC Comments, pp. 12-13.) NRDC also appreciates the Company's willingness to put the default setting ranges from PPL Electric Exhibit SS-1R on its REMSI website. (NRDC Comments, p. 12.) Additionally, NRDC seeks clarification on where the "frequently asked questions" appears on PPL Electric's website. (NRDC Comments, p. 13.)

PPL Electric will be launching a new webpage specifically for DER Management, including the pilot program. This new webpage will go live in March or April 2021 and will serve as the main "hub" with easily located information or hyperlinks to pertinent information on DER Management, including, but not limited to, material pertaining to DER management as a whole, Volt/VAR and Ride-through setting guidelines, approved installation sketches, frequently asked questions, the Pilot Implementation Plan, and the approved inverter list. PPL Electric intends for this new webpage to address many, if not all, of NRDC's recommended changes to the Company's website.

D. SUNRUN'S COMMENTS

In its Comments, Sunrun raises issues concerning the Company's testing of inverters, particularly IEEE 2030.5 inverters, and recommends that either: (1) "interconnection should not be delayed for inverters that meet UL 1741 SA and IEEE 1547-2018 standards but are pending PPL testing; or (2) "Pilot Program implementation as a whole should be delayed until PPL demonstrates that its DER management device is compatible with a larger number of smart inverters, including smart inverters with IEEE 2030.5 communication protocols." (Sunrun Comments, pp. 2-4.)

Sunrun's recommendations are unnecessary. As explained previously, PPL Electric has finished testing and validating SolarEdge's inverters and Enphase's IEEE 2030.5 inverters. Therefore, many inverters have been tested and validated by PPL Electric and are now available to be used in the Company's service territory, including the inverter brands that are the most popular in PPL Electric's service territory. Moreover, after consulting with the other parties, including Sunrun, PPL Electric will allow DER installations using tested and validated IEEE 2030.5 inverters to be used in the Company's service territory. Since the Company currently does not have a DER Management device that is compatible with IEEE 2030.5 inverters, such installations will not be part of the pilot program until such a DER Management device is available. PPL Electric believes this is a reasonable approach that will enable the pilot program to continue, while providing the Company more time to develop a solution that will enable DERs using IEEE 2030.5 inverters to participate in the pilot program.

In addition, Sunrun supports revising the Pilot Implementation Plan to include clarifying language about PPL Electric's use of the Remote On/Off function. (Sunrun Comments, p. 4.) Sunrun also states that PPL Electric "should be able to differentiate DERs which have storage from

those which do not, as to more effectively utilize remote on/off technology only when it should be used per the Settlement." (Sunrun Comments, p. 4.)

As stated previously and in the revised Pilot Implementation Plan, PPL Electric only will use the Remote On/Off function in compliance with Paragraph 59 of the Settlement. That is, the Company "will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or "islanded" from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage." (Settlement ¶ 59.) Language to that effect has been added to the revised Pilot Implementation Plan. (*See* Pilot Implementation Plan, Attachment C, pp. 6-7.)

I. INTRODUCTION

This Implementation Plan describes PPL Electric Utilities Corporation's ("PPL Electric" or the "Company") Distributed Energy Resource ("DER") Management Pilot ("Pilot") that commenced on January 1, 2021. This Implementation Plan has been prepared and submitted pursuant to the Joint Petition for Settlement of All Issues ("Settlement") approved by the Pennsylvania Public Utility Commission ("Commission") at Docket No. P-2019-3010128. As required, this Implementation Plan explains how the Company will implement and conduct the Pilot, including the goals of the Pilot, the use cases the Company plans to test and evaluate, the specific methods and approaches for testing each use case, the methods by which PPL Electric will communicate the Pilot's requirements to customers and DER installers, and any additional information PPL Electric believes is necessary to be included in the annual reports submitted pursuant to the Settlement.

By way of background, many utilities have experienced operations and planning challenges as DER penetration becomes increasingly significant. These challenges include, but are not limited to, voltage swings, masked or hidden load, limited hosting capacity, planning uncertainties, and protection/operational challenges with two-way power flow. As a response to these challenges, the Institute of Electrical and Electronics Engineers ("IEEE") made revisions to Standard 1547 in 2018 ("IEEE 1547-2018"), which set forth requirements for smart inverters that can help support the distribution system. When these smart inverters are coupled with DER management devices, electric utilities can monitor and manage DERs interconnected with their distribution systems.

On May 24, 2019, PPL Electric filed a Petition with the Commission for permission to require smart inverters that meet the new IEEE and Underwriters Laboratories ("UL") standards, to install DER management devices on new DERs interconnected with its distribution system, and

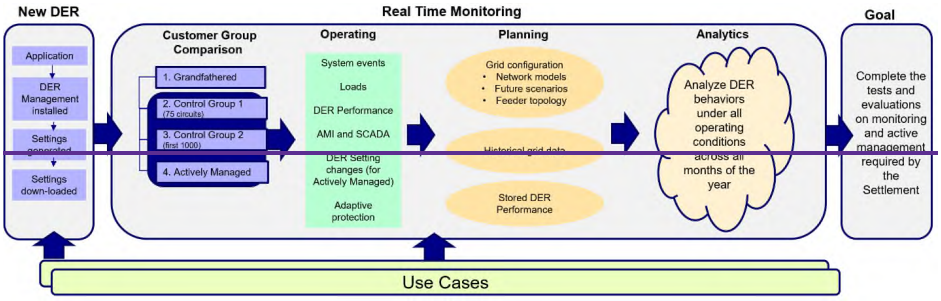
to monitor and manage those new DERs. Ultimately, the parties agreed to the Settlement, which, as approved by the Commission, permits the Company to conduct a Pilot to test and evaluate the costs and benefits of monitoring and managing DERs.

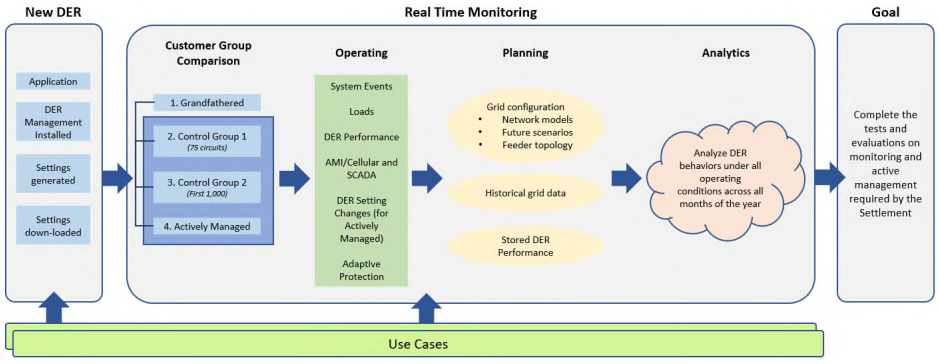
II. DER MANAGEMENT PILOT

A. OBJECTIVES

Under the Settlement, the Pilot is designed to test and evaluate: (1) the costs and benefits to distribution system operation and design of monitoring DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means; and (2) the costs and benefits to distribution system operation of active management of DERs as compared to the benefits available through the use of inverter autonomous grid support functions. Figure 1 is a graphic overview of the Pilot, beginning with a PPL Electric customer filing an application to interconnect a DER to the Company's distribution system. Approved DER interconnection applications will receive a DER management device and be assigned to a customer group pursuant to the Settlement.

Figure 1- Pilot Overview

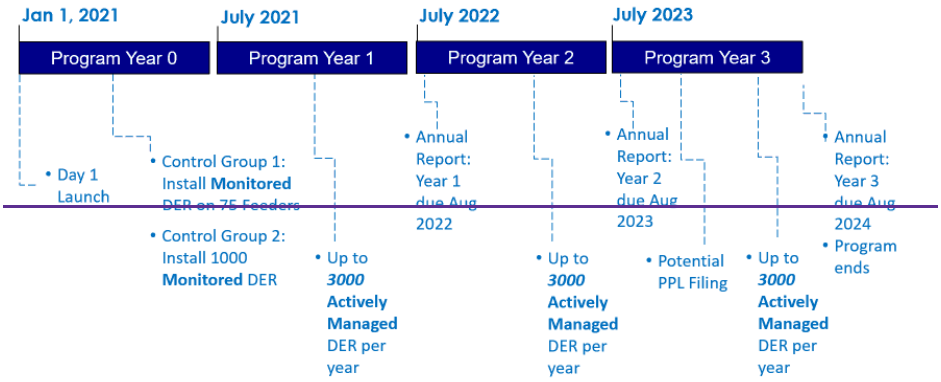


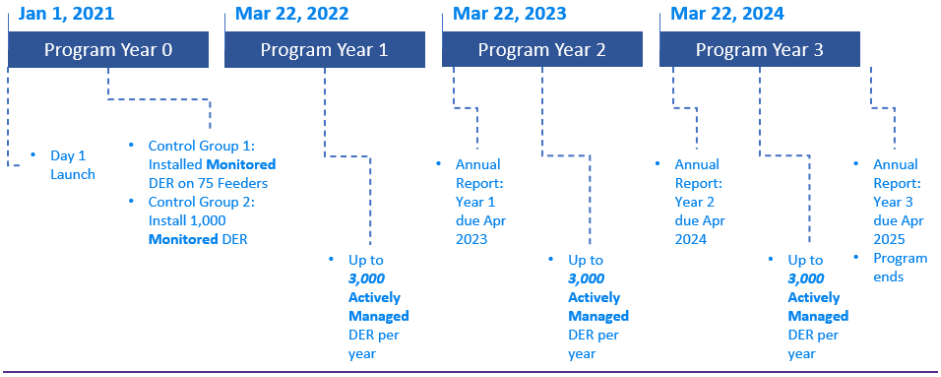


B. TIMELINE AND MILESTONES

The three-year Pilot timeline will commence after Control Groups 1 and 2, described below in Section C, have been fully established. The time leading up to the Pilot commencement will be referred to as Program Year 0. After the end of Program Year 0, the subsequent three years of the Pilot will be referenced as Program Year 1, Program Year 2, and Program Year 3, respectively. ~~Assuming Control Groups 1 and 2 have reached 75 circuits and 1,000 participants by July 2021,~~ Pilot milestones are described below in Figure 2. A more detailed list is provided in Attachment B.

Figure 2- Pilot Implementation Milestones





C. DER CUSTOMER GROUPS

As of December 31, 2020, PPL Electric has 11,614 DERs interconnected with its electric distribution system. Some of these DERs are participating in the Company's Keystone Solar Future Project, which are interconnected with 12 specific distribution circuits on PPL Electric's system.

For purposes of this Pilot, PPL Electric has identified four different DER customer groups. The groups are defined below, including their relationship to this Pilot. These definitions are critical to understanding the comparisons that will be made across the different customer groups,

to establishing reporting requirements, and to calculating the costs and benefits attributed to monitoring and management of the DERs. Control Groups 1 and 2 and the Actively Managed Group are created and defined as part of the Pilot. Conversely, information from the Grandfathered Group will be used in the final analysis of the Pilot Program as a basis for comparison. Pursuant to the Commission-approved Settlement, some DER customers will not be able to participate in the Pilot because they are grandfathered or because PPL Electric exhausted the cap of 3,000 DER management devices installed in the calendar year that they interconnected the DERs.

1) **Grandfathered Group**. DER customers who applied for interconnection on or before December 31, 2020, are "grandfathered" and, therefore, are not required to comply with the new interconnection requirements in the operations and maintenance of their DER installation. PPL Electric collects information continuously on the distribution system, including the circuits that host these DER customers, but there is no direct monitoring or active management of DER installations in this group.

2) **Control Group 1.** This group will contain all DER customers, who apply on or after January 1, 2021 and are located on 75 specific circuits. These circuits will be selected based on the circuits which serve the first 75 DER customers who apply to interconnect and are served by unique circuits. Once those circuits are identified, all new DER customers who are served by one of these 75 circuits will be interconnected in monitoring mode and will operate with autonomous grid support functions only. The DERs on these 75 circuits will remain in "monitor-only" mode for the duration of the Pilot. DER customers in Control Group 1 will receive DER management devices. Pursuant to the Settlement, Control Group 1 will not include any of the excluded circuits set forth in Attachment A. This Control Group was fully established on February 10, 2021.

3) **Control Group 2.** This group will contain the first DER customers to complete their installation, up to 1,000 participants, who also applied to interconnect on or after January 1, 2021, regardless of where they are located on the system. These customers will be interconnected in monitoring mode and will operate with autonomous grid support functions only. DER customers in Control Group 2 will receive DER management devices. DER customers in Control Group 1 will count toward the 1,000 DERs in Control Group 2. This Control Group was fully established on March 22, 2022.

4) **Actively Managed Group.** All DER customers who submit applications and interconnect with the distribution system on or after January 1, 2021, excluding the customers outlined in Control Groups 1 and 2 as well as any customers interconnecting

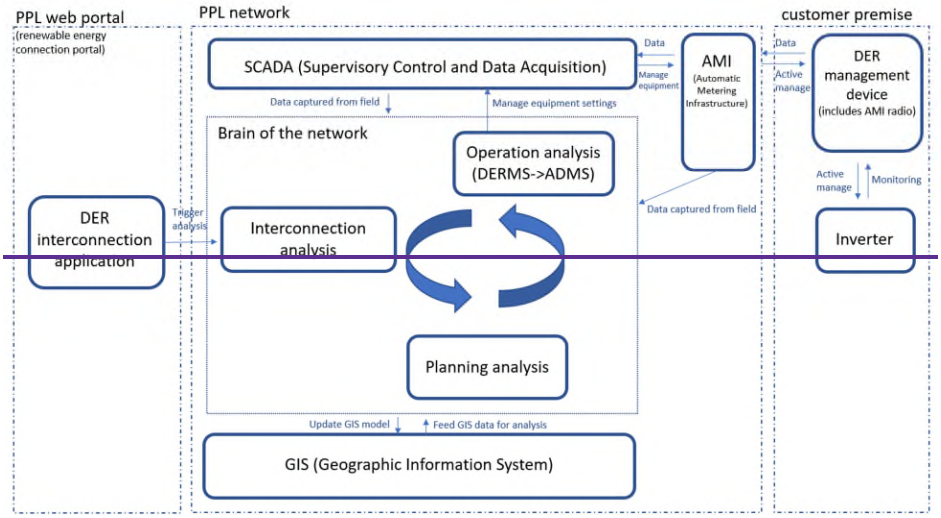
after the cap of 3,000 DER management devices installed in the calendar year has been reached. The Company can actively manage the grid support functions of the DER inverters in this Actively Managed Group using the DER management devices and the Company's Distributed Energy Resources Management System ("DERMS"). The following grid support functions can be utilized in the smart inverters: (1) Volt/VAR; (2) Constant Power Factor; (3) Remote On/Off; (4) Voltage Ride-through; (5) Frequency Ride-through; and (6) Volt/Watt. Volt/Watt may only be enabled and managed with the consent of the interconnecting customer. PPL Electric will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or "islanded" from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during restoration efforts following a power outage.

Control Group 1, Control Group 2, and the Actively Managed Group are included in the Pilot scope and reporting. The analysis will compare these groups to each other and to the Grandfathered Group to understand the costs and benefits of monitoring and actively managing DERs.

D. COMPONENTS AND ARCHITECTURE

Several components will be used as part of the Pilot to process the DER interconnections and monitor and manage the DERs under the Pilot. The Company's DER Management Architecture is set forth in ~~Figure 3~~Figures 3a and 3b below and outlines how the Company will interconnect the DER to the system, communicate to DER management devices, receive and integrate operational feedback from DERs for system analysis, calculate dynamic operation settings for DERs, and manage settings changes as needed.

Figure ~~3~~3a - DER Management AMI Architecture



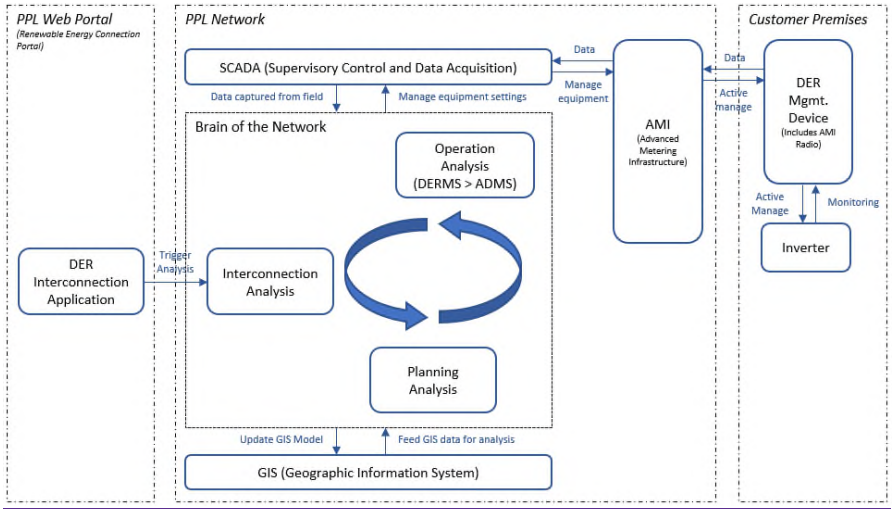


Figure 3b – DER Management Cellular Architecture

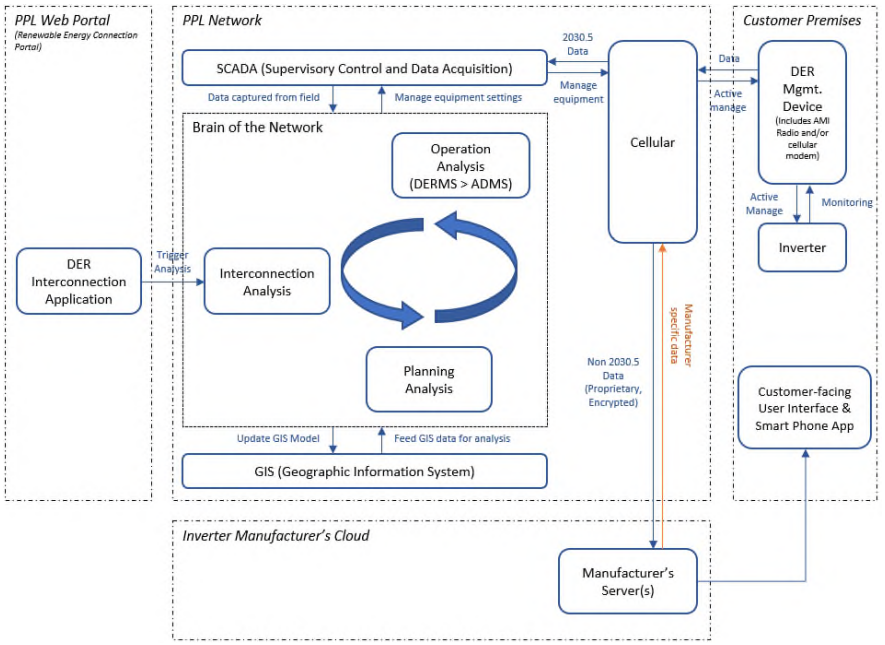

The components in the architecture are:

- DER Interconnection Application: Interconnection applications are submitted through a customer facing portal on PPL Electric's website. The portal allows for work orders to be generated and for customer and inverter data to pass automatically to the Company's Geographic Information System ("GIS").
- Interconnection Analysis: The technical analysis process by which PPL Electric reviews the proposed interconnection against its requirements, determines if upgrades are required to the PPL Electric system, and, when satisfied, provides approval for installation.
- Planning Analysis: The routine technical analysis PPL Electric uses to determine whether additional system upgrades are required to address capacity, voltage, or

reliability needs on the distribution system. The planning process uses data from the Supervisory Control and Data Acquisition ("SCADA") system and GIS, among other systems.

- Distributed Energy Resource Management System ("DERMS"): A centralized system responsible for DER management; DERMS is being migrated to an Advanced Distribution Management System ("ADMS") in the first quarter of 2021. First DERMS, then ADMS, will be used for DER monitoring and management during the Pilot.
- Geographic Information System: A database providing the equipment, asset data, and locations of the equipment on the distribution system.
- Supervisory Control and Data Acquisition: In addition to the data that is already collected by PPL Electric's SCADA system, this system captures the data from the inverters through the ~~automated~~advanced metering infrastructure ("AMI") mesh network or a cellular connection and provides it to DERMS. Additionally, SCADA data is stored and available historically.
- AMI Mesh Network: The communication pathway that was originally created for the Company's AMI meters that is now being used for DER communication as well. It facilitates data exchange with SCADA via the AMI Headend and with the individual DERs via the AMI radios located within the DER management devices.
- Cellular Network: The communication pathway that facilitates data exchange with SCADA via PPL Electric's cellular headend servers and with the individual DERs via the cellular modem located within the DER management devices.

- DER Management Device: Featuring an AMI radio or cellular modem, this device connects to the DER's local communication interface, enabling monitoring and management of the DER through the existing AMI Mesh Network. or cellular connection. This device allows PPL Electric to remotely monitor the attributes and performance of the DER and manage its grid support settings as needed.

Formatted: No bullets or numbering

E. DER INVERTERS

1. Inverter Requirements

Effective From January 1, 2021, through December 31, 2021, new DERs interconnecting with the Company's distribution system must were required to feature smart inverters that meet met: (1) UL Standard 1741 Supplement A ("UL 1741 SA"); and (2) the Company's testing for the communications requirements under IEEE 1547-2018. The Company shall perform its testing expeditiously so DER interconnections are not delayed. These requirements shall be were known as the "Interim Requirements" and will be used until." Beginning January 1, 2022. Thereafter, the Company will transition , PPL Electric transitioned to requiring new DERs to have smart inverters that meet IEEE 1547-2018 and have been certified connect to the distribution system to comply with IEEE 1547.1 /-2018 and to be certified to UL 1741 Supplement B ("UL 1741 –SB"). During the transition period of January 1, 2022, through December 31, 2022, each new inverter connecting to PPL Electric's distribution system must either: (1) meet UL 1741-SA (as amended or supplemented) and the communication requirements under IEEE 1547-2018 (as tested by or on behalf of the Company); or (2) comply with IEEE 1547-2018 and be certified to UL 1741-SB. Beginning January 1, 2023, new inverters connecting to the distribution system must comply with IEEE 1547-2018 and must be certified to UL 1741-SB. The Company shall perform its testing

expeditiously so DER interconnections are not delayed. Inverter manufacturers will be required to follow PPL Electric's certification process to be eligible for Pilot participation.

If a customer installs a new inverter on an existing DER installation or upgrades an existing DER installation after January 1, 2021, the customer may install a replacement inverter of similar make and model as the existing inverter; provided, however, that any such inverter must meet the Commission's applicable standards and requirements set forth in its regulations. These inverter requirements also do not apply to DER installations whose interconnection applications are submitted to PPL Electric before January 1, 2021.

2. Approved List of Smart Inverters

The list of smart inverters that meet the ~~Interim Requirements~~Company's applicable requirements are publicly available and will be regularly updated on the Company's website. An initial list was published on December 1, 2020. On January 1, 2021, the Company's Renewable Energy Connection web portal was updated to reflect the list of smart inverters that have been certified to meet the ~~Interim Requirements.~~Company's applicable requirements. If a customer or installer would like to use an inverter not on the approved inverter list, they must follow PPL Electric's certification process.

3. Inverter Testing and Certification Process

PPL Electric follows a streamlined process for testing new inverters requesting approval. The steps are laid out as follows:

First, the inverter manufacturer needs to provide proof that the inverter is ~~UL 1741-SA certified~~ UL 1741-SB certified and has a dedicated local communication interface available for testing, which are both pre-requisites for being able to be certified under the Interim Requirements. (Note that UL 1741-SA certification was accepted until January 1, 2023; UL 1741-SB certification has been required since that date.) The inverter manufacturer also must provide technical

information on its inverter model, including, but not limited to, the inverter's communication protocol, data models, and configuration profiles. The Company also works with the inverter manufacturer to obtain a test model for PPL Electric's testing lab.

Second, after the Company receives all of the requested information and has set up a test model in the lab, the inverter testing proceeds in the following sequence:

1. DER Communication Protocol Testing

   PPL Electric validates that one of the three approved protocols (IEEE 2030.5, IEEE 1815(DNP3) or SunSpec Modbus) is supported as a local communication interface.

2. Profile Configuration including Data Point Mapping

   PPL Electric develops and loads the proper server profile configuration to allow data points to flow correctly between the server and client.

3. Read Points Testing

   PPL Electric tests and validates the capability to receive the following via the inverters' local communication interface.

   - Real Power
   - Apparent Power
   - Reactive Power
   - Power Factor
   - Current (Total, Phase A, Phase B, and Phase C)
   - Voltage (Phase A-to-neutral, B-to-neutral, C-to-neutral)

4. Write Points Testing

   PPL Electric tests and validates the capability to monitor and manage grid support functions of the inverters via their local communication interface.

5. DER Management Device Testing

PPL Electric tests and validates end-to-end testing between the DER and the Company's DERMS/ADMS via the DER Management ~~devices~~device.[1]

Smart inverters that pass the Company's testing requirements are added to PPL Electric's Approved List of Smart Inverters.

4. Customer Enrollment

The DER interconnection application process will utilize the Company's Renewable Energy Connection web portal for the approval and the creation of interconnection work orders. The portal also is used to obtain the Certificate of Completion ("COC") for the DER interconnection.

During the Pilot, the Company will purchase and install DER management devices on all new DERs with inverters installed for DER customers in Control Groups 1 and 2 and DER customers in the Actively Managed Group, up to an annual limit of 3,000 DER management devices. DERs installed above the annual limit shall not be part of the Pilot. All DER management devices shall be owned, operated, and maintained by the Company at no direct cost to interconnecting customers. The smart inverters that are installed as part of the Pilot must have one of their communications ports dedicated to use by PPL Electric. In the event that the customer's DER requires two communications ports to operate (such as in a solar plus battery storage set-up), PPL Electric will provide a three-communications port solution at no direct cost to that customer.

[1] The Company's ~~current~~AMI Mesh Network DER Management device is not compatible with IEEE 2030.5 inverters. PPL Electric ~~is~~ actively ~~working~~worked on a solution that ~~will~~would resolve the incompatibility issue. ~~However, until~~Ultimately, PPL Electric developed a ~~IEEE 2030.5 compatible~~Cellular Network DER Management device that is compatible with IEEE 2030.5. Therefore, when that IEEE 2030.5-compatible device becomes available, ~~PPL Electric will permit~~applications for new DERs ~~using~~utilizing IEEE 2030.5 inverters that pass the Company's other testing requirements to interconnect ~~and not~~will be subject to the pilot program. ~~Subsequently, once the~~Applications for new DERs using IEEE 2030.5-compatible ~~DER Management~~inverters that are submitted before that IEEE 2030.5-compatible device becomes available~~, any new DER interconnection applications that will use an IEEE 2030.5 inverter would be included in the pilot program. This practice is consistent with Paragraph 56 of the Settlement, which states that "the Company~~ shall ~~not deny or delay the permission to connect and operate a DER due to unavailability of DER management devices" and that "[a]ny DER not equipped with a DER management device for this reason shall not be~~remain not a part of the pilot program.~~" (Settlement ¶ 56.)~~ .

When a complete DER interconnection application is received, a unique and internal DER management identification category is assigned to the application based on: (1) the order it was received relative to other applications; and (2) the customer group to which that specific application was assigned, as shown in Table 1 below.

Table 1: DER Management Designation

DER Management Designation	Description
Designation Category 0	This DER management designation will include interconnections that belong to the Grandfathered Group that are not required to comply with the new interconnection requirements in the operations and maintenance of their installation.
Designation Category 1	This DER management designation will be assigned to those DER customers in Control Group 1, those on the first 75 circuits for which DERs are installed.
Designation Category 2	This DER management designation will include the first 1,000 DERs which apply and complete their interconnection on or after January 1, 2021 and may include DER customers who are also assigned to Control Group 1 (Designation Category 1).*
Designation Category 3	A DER system that is enrolled in the Actively Managed Group will be assigned this DER management designation.

* Customers included in the first 1,000 DERs interconnected and are on one of the first 75 circuits will have a designation noting inclusion in both control groups.

5. DER Settings

Volt/VAR will be used as the default voltage management mode for all inverters. The Company will establish and maintain default Volt/VAR settings based on the location and impact of each DER, as well as voltage ride-through and frequency ride-through functions which meet or exceed PJM Interconnection LLC's ("PJM") guidelines. Alternative voltage management modes and settings may be used to reduce or eliminate distribution system upgrade costs to interconnecting customers with their agreement.

Prior to the customer completing the DER installation and submitting the COC, a Volt/VAR curve will be calculated and stored in a database to be sent to the inverter following its

installation. Each Volt/VAR curve will be calculated using the DER's location on the distribution system, kW nameplate, calculated voltage rise, and other pertinent data.

DERs in Control Group 1 and Control Group 2 will be monitored using DERMS/ADMS and the AMI Mesh Network to understand the actual state of the distribution system and the DERs' performance. The Company shall not make operational decisions regarding the distribution system based on that information. Control Group inverters will exclusively use autonomous grid support functions, which will dictate the inverter's operational behaviors, using the local conditions as input. Each Control Group inverter will be tagged in DERMS/ADMS to prevent any active management by either DERMS/ADMS or PPL Electric's operations personnel.

In the Actively Managed Group, the developed Volt/VAR curve will be used until field conditions deem a power factor override or a change of power factor is necessary to maintain acceptable system conditions. In operating scenarios where the distribution system is configured abnormally due to maintenance or an outage, DERMS/ADMS may manage these inverter settings by "overriding" the autonomous Volt/VAR curve and using a specific Constant Power Factor until system conditions return to acceptable levels. PPL Electric will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or "islanded" from the distribution system. The Company will only use Volt/Watt when mutually agreed upon by the DER customer and the Company. Aside from Volt/VAR curves, default Voltage Ride-through and Frequency Ride-through will also be provided and programmed by the Company at interconnection. PPL Electric will track and report yearly on each instance when active management is used.

F. PILOT PROGRAM ANALYSIS

During the Pilot, PPL Electric will gather and store data from participating DERs in three of the customer groups: Control Group 1, Control Group 2, and the Actively Managed Group.

The data will be used in comparison among the four customer groups (*i.e.*, Control Group 1, Control Group 2, Actively Managed Group, and Grandfathered Group) to determine the impact and benefits of DER monitoring and active management. The analysis will occur in both an operating (real-time) environment and in planning (long-term) scenarios.

Operational analysis will be done in near real-time so that operators and DERMS/ADMS can identify the impact of each DER on voltage and load on the circuit. The Company shall not make operational decisions regarding the distribution system based on the information gathered from Control Group 1 and Control Group 2. DERMS/ADMS will determine if adjustments need to be made to traditional voltage management devices, the settings on inverters in the Actively Managed Group, or both to mitigate violations and make work conditions safer. The operators can then change the inverter settings and determine if the potential violation is ameliorated. The information from all these events, for both monitored and actively managed customers, will be tracked and made available for further analysis.

Planning analysis will include post-event analysis of voltage and load information from the circuits with Grandfathered Group DERs (no monitoring) compared to circuits with monitored DERs and those with actively managed DERs. Comparisons will determine whether monitoring and/or actively managing the DERs results in fewer voltage violations, fewer capital expenditures, or other system challenges being avoided.

1. Anticipated Benefits

The anticipated benefits are expected to provide a value proposition for Reliability, Power Quality, and Safety as shown in Table 2, below.

Table 2- Value Proposition and Anticipated Benefits

a. Enhance operational flexibility

Reliability	b. Improved excursion ride-through
	c. Improved hidden load visibility
Power Quality	d. System upgrades deferred / avoided
	e. Increased hosting capacity
	f. Improved long-term forecasting
	g. Improved voltage management
Safety	h. Safer work environment

2. Data Collection and Verification

DER information, such as grid number, premise number, user group, circuit ID, nameplate generation size (kW), and distance from substation, will be captured from the GIS and Customer Service System ("CSS") databases for all DER customer groups. Voltage data will be taken across PPL Electric's network at all the available measuring points, such as SCADA and AMI meters, to monitor the network voltage level. System load data will be captured at Company-owned devices at all the available measuring points in the network, such as circuit breakers, recloser devices, smart switching devices, and AMI meters. Voltage and load data will be captured at all DER inverters within Control Groups 1 and 2 and the Actively Managed Group.

Inverter baseline data to be collected and archived includes amps, voltage, watts, VARs, Power Factor, Power Factor setpoint value, Power Factor setpoint enabled, Volt/VAR enabled, and system status (On/Off). This data will be captured for all DER customer groups and used for comparative analysis. This comparative analysis includes, but is not limited to:

a. Peak load and associated voltage;

b. Minimum load and associated voltage;

c. Minimum daytime load and associated voltage;

d. Number of voltage violations;

e. Standard deviation of voltage violations;

f. Peak load at customer meter for all DER customers on the circuit;

g. Minimum load at customer meter for all DER customers on the circuit;

h. Standard deviation of loads for all DER customers on the circuit;

i. Number of hours without DER production; and

j. 8760 load levels and voltage levels on circuits.

With DER monitoring and management, PPL Electric will have a significant increase in data to help manage and plan the distribution system, with sources from the grid (before the meter) as well as AMI meter data and DER inverter data (behind the meter). Collecting data both before and behind the meter will bring critical information to understand the full impact of two-way power flow on the safe and reliable operation of the distribution system.

Using this, PPL Electric will be able to conduct comparisons among the four DER customer groups, show use cases, track multiple metrics, and analyze the differences in performance and grid-supporting behaviors of DERs with active management, monitoring, and without visibility on the Distribution system.

3. Use Cases

These use cases cover relevant scenarios under which DERs would interact with the electric distribution system. By leveraging the DER management devices' ability to monitor and/or manage the DERs, several beneficial objectives can be achieved in each use case. Throughout the Pilot's implementation, as PPL Electric gains more experience, the Company may revise and refine the details of these use cases, adjust the methodology and approaches, use more advanced tools, and adopt industry best practices. The use cases include:

1. Voltage violation at DER Point of Interconnection ("POC")
2. Voltage violation mitigated by DERs on the circuit
3. Voltage violation during planned switching

4. System restoration
5. Hidden load impact on load forecasting
6. DER management impact on voltage management
7. DER active management impact on hosting capacity increase and deferral of capital upgrade
8. DER operation in emergency conditions and in active work zones

Use cases are further described in Attachment C. The Company will provide its findings and information on these use cases in its annual reports filed with the Commission.

G. PILOT PROGRAM REPORTING

1. Annual Reports Submitted to the Commission

The annual reports will be filed with the Commission at Docket No. P-2019-3010128, providing detailed quantitative information relevant to the evaluation of the results of the Pilot. Annual reports to the Commission will be published at the end of each program year, starting with the end of Program Year 1. The reports will also be made publicly available. Care will be taken to protect customer privacy, so reporting shall not contain any sensitive customer information. The annual reports shall be filed within 30 days following the end of each program year (first report is estimated to be filed in the second quarter of 2022). Reports shall include data in electronic formats that support analysis (i.e., Excel or other machine-readable data where appropriate). Annual reports shall include the information listed below.

(1) The number of DERs installed and the number of each type of DER management device~~s~~ installed

(2) A list of the participating DERs that includes for each DER: (a) a unique customer identifier; (b) the nameplate capacity; (c) the initial settings established for that DER's smart inverter; and (d) the type of DER (e.g., solar, solar plus storage)

(3) Capital costs and expenses associated with the purchase, installation, ownership, and maintenance of the DER management devices

The capital costs will be identified separately for each type of DER management device installed. PPL Electric will begin tracking expenses for each type of DER management device installed effective with the deployment of the IEEE 2030.5 solution in the field. The expenses tracked by the Company for each type of DER management device installed will be reported beginning with the annual report for Program Year 2.

(4) Number of times, locations, and duration for active management

The number of times and the locations at which the Company actively managed each grid support function and the average duration that the function was actively managed.

This would be a summary showing aggregated counts among all customers of:

- Volt/VAR Curve Overrides
- Power Factor Setting Changes
- Ride-through Setting Changes
- Remote On/Off
- Volt/Watt Curve Overrides (where applicable)

(5) Grid benefits achieved for each instance of active management

The grid benefits achieved in each instance of active management, include, but are not limited to, real-time grid constraint mitigation. The Company shall develop the definition and parameters of the grid benefits.

(6) Net generation loss or gain due to active management

The net generation loss or gain due to the Company's active management of grid support functions (defined above) in each instance.

(7) Distribution system upgrades avoided due to increased hosting capacity attributed to monitoring

This report will be a comparison of the computed circuit hosting capacity when all DERs are evaluated at nameplate kW only, versus the hosting capacity of each circuit with actual kW output, gained via monitoring (while keeping Grandfathered DERs at nameplate kW).

(8) Distribution system upgrades avoided due to increased hosting capacity attributed to autonomous grid support functions

This report will be a comparison of the computed circuit hosting capacity of each circuit with actual kW gained via monitoring only versus the scenario where those DERs are equipped with autonomous grid support functions (while keeping Grandfathered DERs at nameplate kW).

(9) Distribution system upgrades avoided due to increased hosting capacity attributed to active management

This report will be a comparison of the computed circuit hosting capacity when all DERs are evaluated at nameplate kW only, the scenario without any monitoring or active management, versus the hosting capacity of each circuit with actual kW output gained via active management (while keeping Grandfathered DER at nameplate kW).

(10) System operation comparisons of circuits under autonomous inverter grid support functions versus active management

The comparison will involve DERs on the 75 circuits in Control Group 1, circuits with DERs in Control Group 2, and the circuits with actively managed DERs. This report will be in the form of a voltage metric depicting the performance characteristics between the two groups. Depending on the mix of Grandfathered Group, Control Group, and Actively Managed Group DERs on the remaining circuits, those circuits may need to be segmented to provide an accurate statistical comparison. This reporting will be tracked and maintained manually.

(11) Operational descriptions of how active management was executed and implemented

This report will use data captured in DERMS/ADMS, which identifies any operational issues faced, what kind of active management action was taken, and the resulting system impact(s) and benefit(s) of the action. Additional manually noted information will be provided in this report, as available (e.g., day-ahead and real-time remote setting alterations to DERs).

(12) Performance measures related to active management

This report will address all performance measures related to active management and, where applicable, monitoring, including, but not limited to, communication reliability (e.g., communication uptime) and data quality.

(13) Findings and information on the Company's use cases

This report will provide findings and information on the pilot program's use cases to date, in addition to the data being presented in the annual report.

2. Annual Reports to Individual DER Customers

Within 30 days following the cash-out of the customers' banked excess generation, which typically occurs at the end of each PJM Planning Year, each DER customer whose smart inverter's grid support functions are used by the Company during the annual reporting period will be sent an individualized annual report. The annual report will provide:

(1) The amount of the DER's net generation loss or gain due to the use of the autonomous grid support functions:

- Default Volt/VAR Settings
- Default Voltage Ride-through Settings
- Default Frequency Ride-through Settings

(2) The aggregate amount of all DERs' net generation loss or gain due to the Company's active management of the grid support functions outlined below:

Formatted: Space After: 12 pt

- Volt/VAR Curve Overrides
- Power Factor Setting Changes
- Ride-through Setting Changes
- Remote On/Off
- Volt/Watt Curve Overrides (where applicable)

(3) The method and technique used to calculate the DER's net generation loss or gain

The Company will provide a description of the method and technique used to calculate the net generation loss or gain for customer reporting.

(4) The number of times each grid support function was used on an automated basis, and the average duration of that function's automated use

(5) The number of times that PPL Electric actively managed each grid support function, and the average duration that the function was actively managed

(6) Volt/VAR Curve Override Table

For the events where a Constant Power Factor is temporarily used to override an existing Volt/VAR curve, the customer's annual report will show the existing Volt/VAR curve, the Power Factor that was temporarily used, and the duration of the event. For the events where a new Volt/VAR curve is issued, the new curve will be included in the report.

3. Data on Program Performance

Within 30 days after the end of each program year, PPL Electric will provide the following data on an anonymous basis to the Sustainable Energy Fund ("SEF"):

(1) Raw DER Data – 15-minute interval data for participants (delivered kWh, received kWh, RMS voltage).

(2) DER Management Data – 15-minute inverter data for participants (kW and voltage).

PPL Electric will use generic but unique identifiers for each customer to anonymize the customers' names and account numbers when providing the data to SEF.

H. CUSTOMER AND INSTALLER INFORMATION

Customers and installers who are pursuing or are interested in learning more about installing DERs on the PPL Electric distribution system are able to find information and instructions about the updated interconnection process on PPL Electric's external Rules for Electric Meter and Service Installations ("REMSI") website and also on the PPL Electric's Renewable Energy Connection Portal. The frequently asked questions ("FAQs") section on the REMSI website has been updated to include impacts and details for the Pilot and appropriate PPL Electric contact information.

On an annual basis during the Pilot, customers whose inverters' settings are actively managed during the Pilot will receive the individualized annual reports outlined in Section II.G.2, *supra*. Customers, or the installers who are installing the DERs, will be notified by the Company, via a phone call, regarding coordination of a PPL Electric representative installing the DER management device.

Also, ~~in March or April~~on May 13, 2021, PPL Electric ~~will be launching~~launched a new webpage specifically for DER Management. This new webpage ~~will act~~acts as the main "hub" with easily located information or hyperlinks to pertinent information on DER Management, including, but not limited to, material pertaining to DER management as a whole, Volt/VAR and Ride-through setting guidelines, approved installation sketches, frequently asked questions, the Pilot ~~Implantation~~Implementation Plan, and the approved inverter list.

Attachment A

Excluded Distribution Circuits

To preserve the integrity of the 75 distribution circuit control group, the Pilot will not include any of the following 12 distribution circuits, due to the presence of remotely managed DERs (e.g., participants in PPL Electric's Keystone Solar Future Project) and/or similar Company-owned facilities (e.g., batteries) on these distribution circuits during the term of the Pilot:

(1) Leola No. 3 Distribution Circuit
(2) Leola No. 5 Distribution Circuit
(3) Prince No. 2 Distribution Circuit
(4) South Akron No. 4 Distribution Circuit
(5) Cocalico No. 1 Distribution Circuit
(6) Letort No. 1 Distribution Circuit
(7) Letort No. 2 Distribution Circuit
(8) Buck No. 3 Distribution Circuit
(9) East Petersburg No. 1 Distribution Circuit
(10) Newport No. 1 Distribution Circuit
(11) Crackersport No. 2 Distribution Circuit
(12) Renovo No. 2 Distribution Circuit.

Attachment B

Pilot Milestones with Program Year 1 Commencing ~~July 2021~~March 2022

Key timeline and milestones of the Pilot implementation ~~is~~ are provided below based on the March 22, 2022 start date of Program Year 1. ~~This includes an assumption that Program Year 1 will start in the third quarter of 2021. In the event that DER adoption is slower or faster, the three-year schedule will be adjusted accordingly.~~

1. December 1, 2020 – Inverter List Published on REMSI
2. December 17, 2020 – Commission Order Approving the Settlement
3. January 1, 2021 – Day 1 of Pilot
4. January 19, 2021 – File the Pilot Implementation Plan
5. January 28, 2021 –Technical Collaborative
6. February 8, 2021 – Other Parties' Comments Due

~~7. March 1~~February 10, 2021 – ~~File the Revised Pilot Implementation Plan (if necessary)~~

~~8. June 30, 2021 – 30 days after PJM Calendar Year, First Annual Reports to Customers~~

~~9. July 2021 – Estimated start date of Program Year 1~~

~~-~~7. Control Group 1 Established ~~with Circuits 1 to 75~~

~~– Control Group 2 Established with DERs 1 to 1,000 Installed~~

~~10. January 1, 2022 – New DERs have inverters certified with IEEE 1547.1 / UL 1741 SB~~

~~11.~~8. ~~June 30~~March 22, 2022 – ~~Second Annual Reports to Customers~~Start date of Program Year 1

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

9. ~~End of Program Year 1,~~ June 30, 2022 – 30 days after PJM Calendar Year, First Annual Reports to Customers

10. January 1, 2023 – New DERs have inverters certified with IEEE 1547.1 / UL 1741 SB

~~12.~~11. April 21, 2023 – First Annual Report to Commission

~~13.~~ June 30, ~~2023 – Third Annual Reports to Customers~~

12. ~~End of Program Year 2,~~ 2023 – Second Annual Reports to Customers

~~14.~~13. April 21, 2024 – Second Annual Report to Commission

~~15.~~14. Simultaneously with End of Program Year 2, ~~2023~~2024 – Potential Petition Filing

~~16.~~15. June 30, 2024 – ~~Fourth~~Third Annual Reports to Customers

~~17.~~16. ~~End of Program Year 3, 2024~~April 21, 2025 – Third Annual Report to Commission

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Attachment C

Use Cases

1. Voltage Violation at DER Point of Interconnection

DERs can sometimes exacerbate voltage violations on the network. Currently, there is no real time visibility for the grid operator of the voltage level at the physical location of all DERs. As a result, often the grid operator might not be aware of a voltage violation caused or exacerbated by a DER in a timely fashion, and, if they do notice a voltage violation on the network, there is no way to identify which DER is the cause of the issue. Monitoring capability and an alarm system at a DER location can certainly provide visibility that is needed but missing.

If a violation is identified on a particular DER, currently the only way to act on the issue is to contact the DER operator and request action from them. In some cases, PPL Electric staff will need to be sent on-site, which is time consuming and resource intensive. Active management capability will enable speedy response to the issue and save cost and resources by avoiding sending field personnel to be physically present at the location.

For Monitored DER customers, the Company will be able to identify voltage violations at particular DER locations remotely and will be able to come up with mitigation strategies. For Actively Managed DER customers, the Company will be able to identify the voltage violation and actively manage the DER to attempt to eliminate the voltage violation.

For the Grandfathered Group, the Company will record voltage violations (counts and violation level) using non real-time AMI voltage data. For Control Groups 1 and 2, the Company will record voltage violations using the DER information available from monitoring these customers. For the Actively Managed group, the Company will capture any event where DER settings are adjusted to mitigate voltage issues at the DER point of interconnection.

The Company will analyze the impacts and interaction in voltage management among DERs across the defined customer groups. The Company will also record all field trips needed and those avoided to resolve voltage violations and will calculate the cost savings resulting from fewer trips.

2. Voltage Violation Mitigated by DERs on the Circuit

DER interconnections can exacerbate voltage fluctuations particularly if there are numerous DERs on a single circuit. With additional DERs coming on the system, the voltage violations could be extreme, and, without visibility, PPL Electric's operators and planners will be challenged to manage the system reliably and safely.

For the Actively Managed DER customers, PPL Electric will identify and capture scenarios where DERs may be utilized to alleviate the voltage violations via active management of the DER settings. For the Monitored DER customers, PPL Electric will capture and review events where DERs are using autonomous grid support functions to mitigate voltage issues and will study their overall impact on circuit voltage.

3. Voltage Violation During Planned Switching

During planned switching, when loading and/or network topology changes, DERs can cause network violations. Although some violations can be addressed by changing settings at voltage regulation equipment, sometimes violations would require changes at the customer level, such as requiring DERs to stay offline during the switching. With DER monitoring, the Company has more accurate data to predict the impact of DERs during the switching. With active management, DERMS/ADMS and operators can respond to and mitigate the violation by changing the DERs' settings.

The analysis will be performed prior to execution of the planned switching. The analysis will utilize historically collected data at both the monitored and actively managed DERs on the

circuit(s) to design mitigation strategies if violations would exist during the planned switching period. The Company will decide and document if DERs need to switch from the default Volt/VAR mode to Constant Power Factor during the planned switching, or if a revised default Volt/VAR curve shall be temporarily issued.

During the switching period, the Company will also utilize its Load/Voltage Management program within the DERMS/ADMS to manage the actively managed DERs that are in Constant Power Factor mode.

4. System Restoration

When an outage occurs, all the DERs on the circuit shall automatically switch off to avoid unintentional islanding. When the restoration is complete, the load that will need to be brought back online is larger than the load level under normal operating conditions because the load normally served by the DER will now need to be sourced by the Company's network ("hidden load"). By being aware of the actual amount of hidden load, restoration can be planned to accommodate the total load (apparent + hidden) and dramatically reduce the risk of conductor overload and equipment damage during restoration. Monitoring capability at the DER will provide the critical information on the actual amount of hidden load on the circuit and guide the grid restoration with more visibility. Analysis will be based on the voltage level and circuit loading level recorded in the log after the restoration of circuits with different DER customer groups (Grandfathered Group, Control Groups 1 and 2, and Actively Managed Group). If the information is not clearly portrayed in the log, the Company will perform simulation studies as needed without taking the hidden load into consideration and compare the difference between loading levels with or without the hidden load.

5. Hidden Load Impact on Load Forecasting

Distribution planning reviews the load data for all distribution circuits routinely (during customer load and generation application analysis. During this planning review, the circuit/substation overload risks are evaluated with hidden load considered. Hidden load is the amount of load on a circuit that is masked by distributed generation making the perceived kilovolt-ampere ("kVA") value appear to be lower than it is. System investments are developed based on the outcome of the load forecasting. To compensate for the hidden load, the system may be studied with all DER off-line, as it depicts a scenario where the distribution system must carry the full load without DERs. This makes the analysis less accurate, which may result in unnecessary or less timely system investments. DERs in the Pilot with monitoring and active management capabilities will improve the load model accuracy and decrease circuit/substation overload risk, which could defer the need for system investment.

6. DER Management Impact on Voltage Management

With DER monitoring, the accuracy of voltage profile studies will improve. Having more voltage data points will eliminate assumptions made today and will provide a more accurate voltage profile and allow for timelier and more prudent system upgrades with DER active management through DERMS/ADMS. Also, more voltage support functions will be available, and system investments for upgrading voltage management equipment, such as voltage regulators and capacitor banks, can be avoided. DER management and Volt/VAR curve will also be implemented in the power flow modeling process when applications are reviewed by the Planning team and will directly save the cost of reinforcements to the customer by being able to alleviate voltage violations through the use of smart inverters.

The DER data generated will be utilized by the Planning team to conduct studies and compile a list of voltage violations alleviated through DER monitoring, autonomous grid support

functions, and active management. Planning will use this information and perform power flow and voltage studies to determine reinforcements that would have been required to prevent these voltage violations. A cost-saving estimation will be compiled for each DER management category.

7. DER Active Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade

Hosting Capacity is the amount of Distributed Generation that can be added to the distribution system before load or voltage violations occur or system upgrades are required for safe and reliable DER integration. With DER monitoring enabled, the actual DER generation information will be used to identify the available hosting capacity, rather than using DER kW nameplate ratings. Knowing that DER actual generation is always smaller or equal to its nameplate rating, the hosting capacity of the distribution system will increase if the actual generation information is used.

The impact analysis will consist of conducting two hosting capacity studies (also known as integration capacity studies) on PPL Electric's network in power flow simulation platform using: (1) DERs' nameplate rating (kW, kilovolt-ampere reactive ("kVAR"), kVA); and (2) DERs' actual generation info (kW, kVAR, kVA) obtained from smart inverters. The hosting capacity at node level, circuit level, and system level will be obtained in both studies and compared together to investigate hosting capacity improvement attributed to the following comparison scenarios:

i. Monitored DERs versus Grandfathered DERs
ii. Autonomous DERs versus Grandfathered DERs
iii. Actively Managed DERs versus Grandfathered DERs

In addition, capital upgrades may be required for new DER interconnection applications, due to limited hosting capacity calculated based on existing DERs' nameplate ratings. The hosting

capacity obtained from actual DER generation info of monitored DERs is used to investigate avoided/deferred capital investments attributed to the comparison scenarios mentioned above.

8. DER Operation in Emergency Conditions and in Active Work Zones

When there is a reported fire, gas leak, or down conductor, field personnel may be needed to clear the issue. The network in the affected part of the distribution system will be de-energized for the safety of the Company's employees and the general public. Through monitoring of DERs, the team can identify all DERs in the active work zone and verify their status (on or off), and through active management, the Company can turn off the DERs remotely when they do not safely isolate from the distribution system. As a result, safety risks during field work will be greatly mitigated.

In addition, in a fire situation in which the fire chief requests a house to be de-energized, the house can be disconnected from the grid at the meter point by the Company remotely. If there is a behind-the-meter DER on site, the Company can monitor whether the DER turns off as required. With monitored DERs, the Fire Department can be notified if the DER is still in operation. The actively managed DERs can be turned off remotely if the DER does not safely isolate from the distribution system on its own. This will increase the certainty of de-energizing and as a result, increase the overall safety level.

The Company will record the number of DERs in active work zones and the number of DERs that require remote management, as the data and time permit. The Company will also record the costs and benefits to the safety measurements through monitoring and/or actively managed DERs.

As previously stated, in accordance with Paragraph 59 of the Settlement, PPL Electric will only use the Remote On/Off function on battery storage or solar systems that have not safely

isolated or ‘islanded’ from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage.

Attachment D

Due Consideration of Other Parties' Comments

Under Paragraph 61 of the Settlement, PPL Electric agreed to give due consideration to the Joint Petitioners' written Comments. However, the Company retained the ultimate discretion to accept or reject the Joint Petitioners' feedback in its Pilot Implementation Plan. If any changes were made to the Pilot Implementation Plan based on the Joint Petitioners' feedback, PPL Electric would file a revised Pilot Implementation Plan at this docket within 20 days after the deadline for the Joint Petitioners' Comments.

In compliance with Paragraph 61 of the Settlement, PPL Electric reviewed and gave due consideration to the Joint Petitioners' Comments. Sunrun, who was not a Joint Petitioner, also filed Comments on the Pilot Implementation Plan. Although not obligated to consider Sunrun's Comments under the Settlement, PPL Electric nevertheless reviewed and gave due consideration to those Comments as well.

PPL Electric appreciates the other parties' feedback on the Pilot Implementation Plan. As seen in the first revised Pilot Implementation Plan, and as explained further in this Attachment D, the Company incorporated some of the recommendations proposed by the parties. As a result, PPL Electric determined that it needed to file ~~a~~its first revised Pilot Implementation Plan. In the following sections, PPL Electric summarizes and responds to certain of the parties' Comments.

I. OTHER PARTIES' COMMENTS

A. SEF'S COMMENTS

SEF contends in its Comments that PPL Electric "misrepresents the objective of the DER Management Pilot Program," believing that the purpose is to determine the cost and benefits to ratepayers, not PPL Electric. (SEF Comments, pp. 1-2.)

The Company disagrees with SEF's characterization. The pilot program's objectives are clearly outlined in Paragraph 54 of the Settlement, which states that the pilot program will "test and evaluate: (1) the costs and benefits to distribution system operation and design of *monitoring* DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means (e.g., automated meter reading equipment, ADMS systems, modeling); and (2) the costs and benefits to distribution system operation of *active management* of DERs as compared to the benefits available through the use of inverter autonomous grid support functions." (Settlement ¶ 54.) Nothing in the Pilot Implementation Plan alters those fundamental objectives. Moreover, costs and expenses incurred by PPL Electric are sought for recovery from the Company's ratepayers, and benefits to PPL Electric's electric distribution service are experienced by its ratepayers, who ultimately receive that service. Therefore, PPL Electric views SEF's characterization as a distinction without a difference.

In addition, SEF argues that the pilot should be delayed "until PPL Electric approves more inverters representing a more significant market share." (SEF Comments, p. 3.) SEF states that "[a]s of the recent conference call among the parties in this proceeding, PPL Electric has yet to solve the technical issues in communicating with Enphase inverters." (SEF Comments, p. 2.) As for SolarEdge, according to SEF, "the Solar Edge inverters approved by PPL Electric are incomplete," as the Company "only approved the H-US series of inverters designed for residential systems and the KUS inverters designed for 3-phase systems." (SEF Comments, p. 2.) SEF states that "[f]or residential customers alone, the approval does not include the H-RW, M-RW, and K-RW series inverters." (SEF Comments, p. 2.) SEF raises concerns about the inverters' approved for use in the Company's service territory and the potential impact on solar developments. (SEF Comments, pp. 2-3.)

PPL Electric has resolved the concerns regarding the IEEE 2030.5 inverters, such as the microinverters used by Enphase. With the agreement of the other parties, until the IEEE 2030.5-compatiable DER Management device is available, PPL Electric will permit DERs using Company-tested and validated IEEE 2030.5 inverters to interconnect and not be subject to the pilot program. Subsequently, once the IEEE 2030.5-compatible DER Management device becomes available, any new DER interconnection applications that will use an IEEE 2030.5 inverter would be included in the pilot program. This practice is consistent with Paragraph 56 of the Settlement, which states that "the Company shall not deny or delay the permission to connect and operate a DER due to unavailability of DER management devices" and that "[a]ny DER not equipped with a DER management device for this reason shall not be part of the pilot program." (Settlement ¶ 56.) Nevertheless, effective January 1, 2021, the Settlement requires new DERs interconnecting with the Company's distribution system to have smart inverters installed that meet: (1) UL 1741 SA; and (2) the Company's testing for the communications requirements under IEEE 1547-2018. (Settlement ¶ 48.) Therefore, PPL Electric must still test those inverters and validate that they meet those requirements before they can be installed in the Company's service territory.

SEF's concerns about the inverter approvals have either been addressed or lack merit. PPL Electric completed the testing and validation of Enphase's IEEE 2030.5 inverters on February 25, 2021. Thus, interconnection applications using those inverters can now be submitted on PPL Electric's web portal. As a result, SEF's concerns about the testing of Enphase's IEEE 2030.5 inverters are moot. Moreover, PPL Electric confirmed with SolarEdge that the Company tested and validated all of the inverter models currently offered by SolarEdge. The inverter models listed by SEF in its Comments are not SolarEdge models. Consequently, SEF's allegations about the testing and validation of SolarEdge's inverters lack merit.

SEF also raised concerns about the Remote On/Off function regarding solar plus storage installations. (SEF Comments, p. 3.) SEF believes that modifications to "the use cases for system restoration and DER operation in emergency conditions and in active work zones" should "be reviewed with the parties in this proceeding prior to implementation." (SEF Comments, p. 3.) SEF continues to believe that under the DER Management Plan, "PPL Electric could modify its approach to shut-down inverters appropriately disconnected from the distribution system," which "could endanger the life of ratepayers that utilize energy storage systems to provide uninterrupted service in the event of the failure of PPL Electric's distribution system." (SEF Comments, p. 3.) Although "SEF fully understands PPL Electric's concern for the safety of its workers," SEF asserts that "these workers can still be provided safe access to the distribution circuits without unnecessarily endangering the lives of ratepayers who may be using solar plus storage to power durable medical equipment." (SEF Comments, p. 3.)

To be clear, PPL Electric will adhere to Paragraph 59 of the Settlement, which states that the Company "will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or 'islanded' from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage." (Settlement ¶ 59.) Therefore, SEF's concern that PPL Electric may "shut-down inverters appropriately disconnected from the distribution system" is without merit. Remote On/Off will only be used for systems that "have not safely isolated or 'islanded' from the distribution system" and only in the circumstances set forth in Paragraph 59 of the Settlement. Nonetheless, PPL Electric has added language to the Pilot Implementation Plan's eighth use case to make this well-established point clearer. (*See* Pilot Implementation Plan, Attachment C, pp. 6-7.)

B. OCA'S COMMENTS

In its Comments, the OCA asserted that "[m]itigation or deferral of DER-related system upgrades can be achieved through numerous smart inverter related use cases that require various technological capabilities. Therefore, it is critical that the Company collect sufficient information to further inform these possibilities and potential solutions." (OCA Comments, p. 3.)

PPL Electric agrees and has designed its use cases not only to "further inform these possibilities and potential solutions" but potentially achieve system upgrade deferrals during the pilot program.

The OCA also commented on the data collection of energy storage systems, stating that "it is unclear as to whether, or what, energy storage related data the Company will collect through the Pilot Program." (OCA Comments, p. 3.) The OCA claims that "it is unclear whether the Company will be able to capture the existence of energy storage systems on PPL's system and separately evaluate the characteristics of these devices." (OCA Comments, p. 3.) Further, the OCA notes that "energy storage charging tariffs have been proposed in different districts throughout the country." (OCA Comments, pp. 3-4.) "While it is unclear whether PPL has grid connected storage or whether the Commission would consider a charging tariff reasonable at this time," the OCA believes that "collecting data on energy storage systems for the purpose of understanding cost causation is reasonable." (OCA Comments, p. 4.) Therefore, the OCA recommends that PPL "collect energy storage related data and specify how it will collect and share this information within the Pilot Program" and that, "[a]t a minimum, PPL should track and provide energy storage data as a separate load profile." (p. 4.)

PPL Electric will collect the same data from all DERs that are participating in the pilot program. Energy storage data will not be treated any differently. Therefore, for solar plus storage DERs, PPL Electric will collect the same data that the Company collects from any other DER

participating in the pilot program. As for the OCA's Comments about charging tariffs and developing a separate load profile for storage, PPL Electric views these issues as outside the scope of the pilot program. As stated previously, PPL Electric is committed to test and evaluate: (1) the costs and benefits to distribution system operation and design of *monitoring* DERs through devices connected to inverters as compared to maintaining distribution system status visibility through other means (e.g., automated meter reading equipment, ADMS systems, modeling); and (2) the costs and benefits to distribution system operation of *active management* of DERs as compared to the benefits available through the use of inverter autonomous grid support functions. (Settlement ¶ 54.) However, in its annual reports, PPL Electric will be indicating the type of DER installation for each of the participating systems (e.g., solar plus storage). Thus, the OCA will be able to analyze data about solar plus storage systems participating in the pilot program.

Further, the OCA "strongly supports the evaluation of" the active network management ("ANM") use case and "appreciates PPL clearly articulating the use [case] in the Pilot" because it can "be an exceptionally cost-effective approach to increasing hosting capacity and deferring system upgrades related to DERs." (OCA Comments, pp. 4-5.) The OCA recommends that PPL Electric "consider tracking cost causative characteristics of DER export, which will provide interested stakeholders information concerning the qualities of DERs that can cause costs to be incurred by the Company, that may otherwise be avoided through the use of PPL's Distributed Energy Resource Management System (DERMS)." (OCA Comments, p. 5.)

PPL Electric will be reporting the distribution system upgrades that were avoided with DER monitoring and remote active management. Although not intended for evaluation of ANM cases, PPL Electric believes that this reporting will provide a good foundation for the stakeholders to conduct such an evaluation.

The OCA also argues that the "cost-effectiveness of PPL's DER Management Device could be highly dependent on the size of DER that the Company monitors and controls." (OCA Comments, p. 6.) As a result, the OCA recommends that "PPL, to the extent possible, attempt to collect data and conduct analysis to investigate this issue." (OCA Comments, p. 6.)

PPL Electric will collect and report on the nameplate capacities of the DERs participating in the pilot program. In its annual reports, PPL Electric will provide the nameplate capacity of each participating DER. This will enable the stakeholders, including the OCA, to analyze the data based on specific nameplate capacities of the DERs. However, PPL Electric does not believe that a specific use case needs to be developed to analyze the impact of the DER's size on the cost-effectiveness of the DER Management device. The stakeholders will be able to disaggregate and analyze the annual reports' data by system size, thereby enabling them to perform their own evaluation. Nevertheless, PPL Electric's planned use cases are subject to change, and the Company may ultimately analyze the impact of the DER's size on cost-effectiveness, either as a separate use case or within the currently planned use cases.

C. NRDC'S COMMENTS

In NRDC's Comments, NRDC raises a series of concerns about inverter testing and compatibility issues, namely SolarEdge's inverters and the IEEE 2030.5 inverters, such as the microinverters manufactured by Enphase. (NRDC Comments, pp. 2-6.) NRDC agrees with PPL Electric's plan to address the incompatibility of IEEE 2030.5 inverters with the Company's DER Management device, under which: (1) until the IEEE 2030.5-compatiable DER Management device is available, PPL Electric will permit DERs using Company-tested and validated IEEE 2030.5 inverters to interconnect and not be subject to the pilot program; and (2) once the IEEE 2030.5-compatible DER Management device becomes available, any new DER interconnection applications that will use an IEEE 2030.5 inverter would be included in the pilot program. (NRDC

Comments, p. 5.) NRDC states, however, that "the Company should clarify the reasons for the incompatibility between a smart inverter that appears to clearly meet the interim standards and the ConnectDER device, and explain what actions it is taking to ensure that similar issues do not arise with other smart inverters that meet the interim standards." (NRDC Comments, p. 5.) NRDC also suggests providing more detail on whether the delays with the Enphase inverters is manufacturer-specific or a broader issue. (NRDC Comments, p. 5.) Furthermore, NRDC recommends that PPL "undertake efforts to ensure that other inverter manufacturers are aware of the issue of ConnectDER compatibility with IEEE 2030.5 and the temporary exemption to install affected inverters outside the pilot program." (NRDC Comments, pp. 5-6.)

As noted by NRDC, the concerns raised specifically to SolarEdge are moot because the list of approved smart inverters now includes SolarEdge's inverters. (NRDC Comments, p. 3.) Moreover, as explained in Section II.A., *supra*, PPL Electric completed testing and validating Enphase's IEEE 2030.5 inverters on February 25, 2021, and interconnection applications using those inverters can now be submitted. Therefore, the inverter testing issues raised by NRDC have been addressed.

Regarding the IEEE 2030.5 inverters' incompatibility with PPL Electric's DER Management device, PPL Electric clarifies that the incompatibility issue is only limited to inverters that use IEEE 2030.5 as the sole communication protocol. Per IEEE 1547-2018, inverters should be able to support one of the three communication protocols: DNP 3, SunSpec Modbus, or IEEE 2030.5, as specified by the electric distribution company. Before filing the DER Management Petition, PPL Electric surveyed and researched the inverter industry and determined that the majority of the inverter manufacturers use SunSpec Modbus and DNP 3. Thus, PPL Electric's current DER Management device was designed, tested, and implemented to support these two

protocols. IEEE 2030.5 is the newest of the three communications protocols, and PPL Electric is actively working on a DER Management device solution that will resolve the incompatibility issue. Although PPL Electric believes that many of the issues encountered with testing and validating Enphase's IEEE 2030.5 inverters were manufacturer-specific, the incompatibility with the current DER Management device applies to all IEEE 2030.5 inverters. As such, PPL Electric will update its solar inverter and other PPL Electric webpages to help make manufacturers, solar installers, customers, and other stakeholders aware of the incompatibility issue and how customers using tested and validated IEEE 2030.5 inverters will not be a part of the pilot program until PPL Electric has a compatible DER Management device available and ready to be used.

Next, NRDC states that PPL Electric should limit the use of "bespoke inverter settings" in the Control Groups' DER installations. (NRDC Comments, pp. 7-8.) According to NRDC, "the spirit of the pilot would be better served by using utility default inverter settings in as widespread a fashion as practicable." (NRDC Comments, p. 7.) "While it may be the case that locational and other factors may favor departing from default settings in particular circumstances (e.g., larger DER systems)," NRDC believes that "even then the establishment of default settings will provide valuable lessons about the extent of any limitations with a default setting-centered approach." (NRDC Comments, p. 8.)

PPL Electric generally disagrees with NRDC's suggestion. PPL Electric already will be tracking and reporting the initial settings of each DER participating in the pilot. Moreover, PPL Electric developed its Volt/VAR settings in a manner consistent with IEEE standards, i.e., maintaining power factor no lower than +/- 90%. Leveraging Volt/VAR curves which are calculated based on the DER's specific location and size provides the required granularity for distribution system stability. Due to the varied nature of PPL Electric's distribution system, which

goes from very urban, short distribution feeders with a high short circuit duty to very rural, long, distribution feeders with a low short circuit duty, the use of a default curve would result in some DERs absorbing or injecting VARs unnecessarily. DERs close to a substation should expect to see a voltage on the higher side of the acceptable range due to its proximity to the source just as DERs that are far from the substation should expect to see a voltage lower in the acceptable range. Use of strict, uniform default settings would necessitate more active management for DERs not in one of the Control Groups and would potentially lead to voltage issues on feeders within the control groups.

Also, PPL Electric has a statutory duty to all of its customers to provide safe, reliable, and adequate electric distribution service. *See* 66 Pa. C.S. § 1501. PPL Electric will not turn a blind eye and allow a DER to interconnect with suboptimal default settings, which, as described previously, could negatively affect the Company's electric distribution service.

Regarding the annual reports, NRDC recommends that the annual reports include information on PPL Electric's review of use cases, specifically "narrative interim assessments," not just data, and that the Company clarify this point in its Pilot Implementation Plan. (NRDC Comments, pp. 8-9.) NRDC also recommends that the annual reports include: (1) all initial inverter settings, including data allowing for regional comparative analysis; (2) the customer's feeder line; and (3) an actual analysis of DER system size, not only the details of the DERs' nameplate capacities. (NRDC Comments, pp. 9-11.)

As stated on pages 16 and 19 of the revised Pilot Implementation Plan, PPL Electric's annual reports will provide findings and information of these use cases. Moreover, PPL Electric will include each participating DER's initial inverter settings and nameplate capacity. However, PPL Electric will not provide each DER's feeder line in a publicly-available annual report. In the

Company's experience, customers are very concerned about their privacy, especially when it comes to details about their electric usage, generation, and DER systems. If PPL Electric provides the feeder line for each participating DER along with all of the other information being presented in the annual reports, the Company cannot guarantee that the customer's identity will be shielded from public view.

Lastly, NRDC makes a series of recommendations about making program documents available to the public. Specifically, NRDC recommends that "all pilot documentation . . . be made available on a dedicated webpage accessible through the . . . Company's Renewable Energy webpage." (NRDC Comments, p. 11.) NRDC believes that the REMSI website was designed with installers in mind, so it may not be an easily navigable resource for some stakeholders. (NRDC Comments, pp. 12-13.) NRDC also appreciates the Company's willingness to put the default setting ranges from PPL Electric Exhibit SS-1R on its REMSI website. (NRDC Comments, p. 12.) Additionally, NRDC seeks clarification on where the "frequently asked questions" appears on PPL Electric's website. (NRDC Comments, p. 13.)

PPL Electric will be launching a new webpage specifically for DER Management, including the pilot program. This new webpage will go live in March or April 2021 and will serve as the main "hub" with easily located information or hyperlinks to pertinent information on DER Management, including, but not limited to, material pertaining to DER management as a whole, Volt/VAR and Ride-through setting guidelines, approved installation sketches, frequently asked questions, the Pilot Implementation Plan, and the approved inverter list. PPL Electric intends for this new webpage to address many, if not all, of NRDC's recommended changes to the Company's website.

D. SUNRUN'S COMMENTS

In its Comments, Sunrun raises issues concerning the Company's testing of inverters, particularly IEEE 2030.5 inverters, and recommends that either: (1) "interconnection should not be delayed for inverters that meet UL 1741 SA and IEEE 1547-2018 standards but are pending PPL testing; or (2) "Pilot Program implementation as a whole should be delayed until PPL demonstrates that its DER management device is compatible with a larger number of smart inverters, including smart inverters with IEEE 2030.5 communication protocols." (Sunrun Comments, pp. 2-4.)

Sunrun's recommendations are unnecessary. As explained previously, PPL Electric has finished testing and validating SolarEdge's inverters and Enphase's IEEE 2030.5 inverters. Therefore, many inverters have been tested and validated by PPL Electric and are now available to be used in the Company's service territory, including the inverter brands that are the most popular in PPL Electric's service territory. Moreover, after consulting with the other parties, including Sunrun, PPL Electric will allow DER installations using tested and validated IEEE 2030.5 inverters to be used in the Company's service territory. Since the Company currently does not have a DER Management device that is compatible with IEEE 2030.5 inverters, such installations will not be part of the pilot program until such a DER Management device is available. PPL Electric believes this is a reasonable approach that will enable the pilot program to continue, while providing the Company more time to develop a solution that will enable DERs using IEEE 2030.5 inverters to participate in the pilot program.

In addition, Sunrun supports revising the Pilot Implementation Plan to include clarifying language about PPL Electric's use of the Remote On/Off function. (Sunrun Comments, p. 4.) Sunrun also states that PPL Electric "should be able to differentiate DERs which have storage from

those which do not, as to more effectively utilize remote on/off technology only when it should be used per the Settlement." (Sunrun Comments, p. 4.)

As stated previously and in the revised Pilot Implementation Plan, PPL Electric only will use the Remote On/Off function in compliance with Paragraph 59 of the Settlement. That is, the Company "will only use the Remote On/Off function on battery storage or solar systems that have not safely isolated or "islanded" from the distribution system: (1) in emergency situations, such as a gas leak or fire in the vicinity of the DER; or (2) during a power outage." (Settlement ¶ 59.) Language to that effect has been added to the revised Pilot Implementation Plan. (*See* Pilot Implementation Plan, Attachment C, pp. 6-7.)

RE: Petition of PPL Electric Utilities Corporation for Approval of Tariff Modifications and Waivers of Regulations Necessary to Implement its Distributed Energy Resources Management Plan
Docket No. P-2019-3010128

Dear Secretary Chiavetta:

Enclosed for filing on behalf of PPL Electric Utilities Corporation (the "Company") is the 2024 DER Management Report, which is being filed pursuant to the Recommended Decision issued November 17, 2020 in the above-captioned proceeding.

Due to their large size, both the PDF of the 2024 DER Management Report and the Excel files of the data sets referenced within the report are being filed via the Secretary's SharePoint site. For the parties on the Certificate of Service, the Company will serve the report and appendices via a OneDrive site established for file sharing.

Pursuant to 52 Pa. Code § 1.11, the enclosed document is to be deemed filed on April 22, 2024, which is the date it was filed electronically using the Secretary's SharePoint site.

If you have questions, please do not hesitate to contact me.

Respectfully submitted,

Kimberly A. Klock

Enclosure

PPL Electric Utilities Corporation

2024 DER Management Report

to the

Pennsylvania Public Utility Commission

April 22, 2024

PPL Electric Utilities Corporation ("PPL Electric" or the "Company") hereby submits this annual report for Program Year 2 of its Distributed Energy Resource ("DER") Management Pilot Program ("DER Pilot" or "Pilot"). The DER Pilot is the first of its kind in North America, communicating with and managing DERs down to the individual residential installation level for the purposes of improving power quality, safety, and hosting capacity, expanding operational awareness, and avoiding otherwise necessary capital or maintenance expenses. The DER Pilot's goal is to understand, demonstrate, and quantify the benefits of active management, their associated costs, and the overall impact on distribution system and customers' DER system performance. The Pennsylvania Public Utility Commission's ("Commission" or "PUC") authorization of this program has already yielded significant benefits and will continue to enable the growth of clean energy in Pennsylvania while maintaining system reliability, power quality, and affordability.

The DER Pilot's Program Year 2, which spanned from March 22, 2023, to March 21, 2024, achieved significant progress in the integration and management of DERs pursuant to these goals. Program Year 2 highlights continued success in executing DER interconnection and management processes, along with thorough analysis and documentation of the program's benefits. The distribution grid realized a remarkable cumulative growth in DER adoption within PPL Electric's territory, with 12,590 DER totaling 153.82 MW being interconnected since the DER Pilot's inception. The growth of DER in PPL Energy's territory demonstrated benefits in reliability through the monitoring of DER interconnections minimizing potential negative impacts to the distribution grid. The effective management of DERs by PPL Electric has enhanced grid resilience and reliability, as well as highlighted the value of monitoring and managing these resources. Overall, PPL Electric's DER Management Pilot program in its second year showcases a successful model of integrating DERs in a manageable, scalable manner that benefits the Company, its customers, solar developers, and the Commonwealth.

Specifically, based on the data gathered through Program Year 2, PPL Electric's DER Pilot has reduced the Company's capital expenditures by approximately $6.60 million and the Company's operation and maintenance expenses by approximately $15.33 million.[1] When compared to the $6.38 million of capital costs and $128,000 of operation and maintenance expenses that the DER Pilot has cost to date, the DER Pilot has produced substantial benefits compared to its costs. In fact, the DER Pilot has improved the reliability and performance of the distribution system, increased DER hosting capacity, and facilitated the interconnection of more DERs, all the while reducing the Company's capital costs and expenses that would be passed onto customers. Furthermore, PPL Electric's continued learning and adaptations have allowed additional program savings related to the overall cost of the DER Management device installation and provisioning.

As PPL Electric looks forward, the Company is evaluating new ways to produce benefits through DER management, such as using active management to help the electric distribution system adapt to higher levels of DER penetration in the future, which will produce even more benefits. PPL Electric also has worked to expand the number of inverters that are approved for use in its service territory. Specifically, PPL Electric's approved inverter list includes 241 inverters as of April 22, 2024, from 12 different manufacturers, with more inverters from 8 additional inverters manufacturers in the pipeline, that cover

[1] The DER Pilot has increased hosting capacity by an estimated 29 MW. If that additional 29 MW were fully utilized as of March 21, 2024, it would have produced additional generation and reduced distribution and transmission losses valued at approximately $4.57 million.

the vast majority of inverter manufacturers and inverters that are certified to IEEE 1547-2018 and UL 1741-SB. PPL Electric also reviews and approves inverters expeditiously; within approximately two weeks. Therefore, as new inverters come to market, PPL Electric can review and approve them for use so long as they meet the applicable requirements. Additionally in 2023, PPL Electric deployed its first DER Management device capable of managing inverters that utilize the IEEE 2030.5 communication protocol, further increasing the number of inverters that are compatible with the DER Management device and enabling those DERs to be included in the DER Pilot. Taken together, the high volume of installations and continued availability of many inverter models show PPL Electric's continued commitment to facilitating customer DER interconnections.

PPL Electric's DER Pilot also showcases the significant benefits of active management in achieving dynamic grid optimization. Unlike autonomous systems that operate on predefined rules and have limited adaptability, active management of DERs facilitates real-time operational adjustments. This dynamic approach optimizes grid performance in response to changing conditions, enhancing grid reliability, safety, and affordability. Moreover, actively managed DER systems boast scalability and flexibility because they are capable of being adjusted for growth without the need for extensive in-person reprogramming or physical changes required by autonomous systems.

This active management strategy has yielded notable customer benefits within PPL Electric's program. PPL Electric expects these benefits to grow as more DER Management-enabled devices connect to the distribution system. Key to this success is the implementation of power factor management, which has resulted in shorter durations and lower magnitudes of voltage violations on feeders with actively managed DERs. As more actively managed DERs are incorporated, customer outcomes on these feeders improve in tandem, highlighting the effectiveness of PPL Electric's voltage management approach. Contrasting with the limitations of autonomous curves, which only react to local voltage conditions, PPL Electric's active management of the DERs optimizes all available resources. This improves power quality for customers with minimal impact on the ability for such customers to generate real power, underlining the additional benefits of active management in enhancing grid performance.

PPL Electric's DER Pilot has achieved substantial enhancements in both DER hosting capacity and additional load capacity. This annual report's DER hosting capacity analysis reveals that PPL Electric has unlocked a total of 29 MW of new hosting capacity because of the DER Pilot. 18 MW of the new hosting capacity was the result of monitoring DER production. Additionally, the utilization of PPL Electric's uniquely calculated autonomous volt/var curves contributed 6 MW of new hosting capacity, and the active management of power factor added another 5 MW. These figures are anticipated to rise as the number of actively managed DERs increases on the system. Furthermore, PPL Electric's capability to monitor DER real power production has significantly boosted its capacity to support new load growth. In 2023, an additional 16 MW of distribution capacity was identified, stemming from PPL Electric's enhanced ability to detect hidden load through DER monitoring. This development is crucial as the proliferation of DER and electrification technologies continues. The ongoing application of DER monitoring and management not only effectively improves interconnection capacity but also plays a pivotal role in reducing both infrastructure and interconnection costs for customers. This forward-looking approach emphasizes PPL Electric's commitment to innovatively addressing the evolving needs of the energy grid and its users.

1) The number of DERs Installed and the Number of DER Management Devices Installed

Between March 22, 2023, and March 21, 2024, 6,001 Distributed Energy Resources ("DERs") totaling 81.44 MW were installed on PPL Electric's distribution system and 2,921 DER Management devices were installed.

Of the 2,921 DER Management devices installed:

- 1 was the ConnectDER Generation 1 DER Management Device
- 2,687 were the ConnectDER Bridge
- 233 were the Cellular Gateway

Through the end of Program Year 2, a total of 12,590 DERs with a total size of 153.82 MW were installed on PPL Electric's distribution system. Of these 12,590 new DER installations, 6,878 were eligible for the program and received a DER Management device.

Of the 6,878 DER Management devices installed through the end of Program Year 2,

- 1,033 were the ConnectDER Generation 1 DER Management Device
- 5,612 were the ConnectDER Bridge
- 233 were the Cellular Gateway

In September 2023, PPL Electric began utilizing the Cellular Gateway to communicate with IEEE 2030.5 capable inverters. Before PPL Electric implemented the Cellular Gateway communication platform, applications with inverters which exclusively use the IEEE 2030.5 communication protocol were excluded from the program but allowed to interconnect. In September of 2023, PPL Electric ceased installation of DER Management devices for the remainder of 2023 due to the annual 3,000 device cap, with subsequent system interconnections in 2023 grandfathered as required. These two factors were the primary driver of the difference between the number of DER installed and the number of DER Management devices installed.

2) A list of participating DERs that includes for each DER: (a) a unique customer identifier; (b) the nameplate capacity; (c) the initial settings established for that DER's smart inverter; and (d) the type of DER (e.g., solar, solar plus storage)

A full list of participating DERs, along with the applicable DER attributes and the assigned volt/var curves, has been provided in Appendix A.

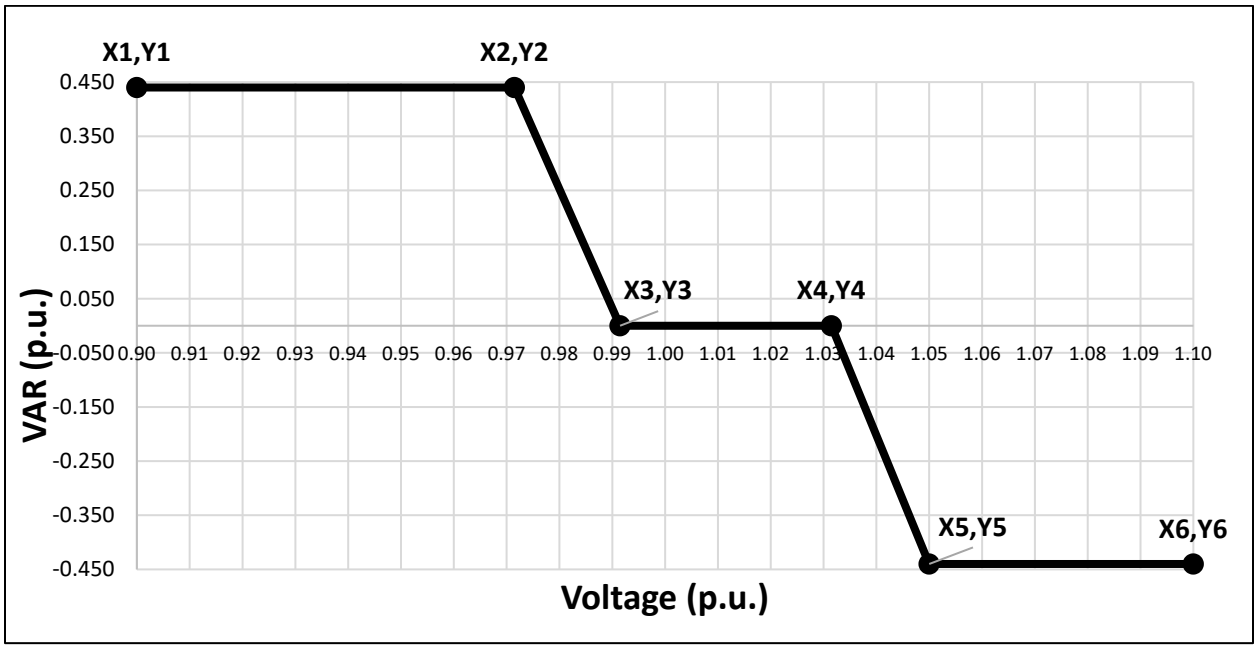
For the Pilot Group field, the following group assignments have been applied:

- Group 1: Control Group 1 (Installations on the 75 Control Group 1 Feeders)
- Group 2: Control Group 2 (The first 1,000 installations within the DER Pilot)
- Group 12: Control Group 1 and Control Group 2
- Group AM: Active Management Group

For the volt/var curve parameters listed in this table, specific attributes will adhere to the following conventions:

- Points X1 - X6 correspond to specific voltage values, progressing from low voltage (X1) to high voltage (X6) that define the transition points of the volt/var curve from one slope to a different slope.
- Points Y1 - Y6 correspond to the specific reactive power output values at which the inverter is required to perform for the corresponding voltage measurement transition points.
- An example curve has been provided below for reference.

Figure 1 Example Volt/Var Curve



In addition, all participating DERs are programmed with standardized voltage and frequency ride-through values identified within the tables below. In 2023, PPL Electric updated its standard ride-through curve points to improve protective performance and account for limitations on some inverter models, consistent with direction by PJM Interconnection LLC. Following this change, existing active management inverters had their ride-through curves modified. All new installations in both the active management group and Control Group 1 were programmed with these updated ride-through curve points. Installations in Control Group 2 and legacy installations in Control Group 1 did not have their ride-through settings modified.

PPL Electric Standard Ride-Through Curve Points

Table 1 Standard Under Voltage Requirements

Under Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
UV1	0.88	2.1
UV2	0.5	0.6

Table 2 Standard Over Voltage Requirements

Over Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
OV1	1.1	2.1
OV2	1.2	0.2

Table 3 Standard Under Frequency Requirements

Shall Trip – Under Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
UF1	58.5	301
UF2	56.5	0.2

Table 4 Standard Over Frequency Requirements

Shall Trip – Over Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
OF1	61.2	301
OF2	62	0.2

Because PPL Electric is not permitted to modify the ride-through settings of existing inverters within Control Groups 1 and 2, there are some systems which still utilize the legacy ride-through settings identified below. All such systems are marked in Appendix A as “Legacy RT”.

PPL Electric Legacy Ride-Through Curve Points

Table 5 Legacy Under Voltage Requirements

Under Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
UV1	0.88	2.0
UV2	0.5	0.5

Table 6 Legacy Over Voltage Requirements

Over Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
OV1	1.1	2.0
OV2	1.2	0.16

Table 7 Legacy Under Frequency Requirements

Shall Trip – Under Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
UF1	58.5	300
UF2	56.5	0.16

Table 8 Legacy Over Frequency Requirements

Shall Trip – Over Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
OF1	61.2	300
OF2	62	0.16

3) Capital costs and expenses associated with the purchase, installation, ownership, and maintenance of DER management devices

As of March 21, 2024, the following capital costs and expenses, shown in Table 9 and Table 10, represent the cost for the purchase, installation, ownership, and maintenance of DER management devices within the DER Pilot.

Table 9 Total Program Year 2 Capital Costs

	Pilot Total
Purchase Costs	
ConnectDER Simple Collar	$93,874.00
ConnectDER Generation 1 DER Management Device	$976,370.00
ConnectDER Bridge Device	$3,262,698.53
Cellular Gateway	*$255,601.00*
Sub Total (Purchase)	***$4,588,543.53***
Installation Costs	
ConnectDER Simple Collar	$5,271.00
ConnectDER Generation 1 DER Management Device	$352,212.00
ConnectDER Bridge Device	$1,372,644.00
Cellular Gateway	$58,716.00
Sub Total (Installation)	***$1,788,843.00***
Total Capital Costs	**$6,377,386.53**

Table 10 Total Program Year 2 Expenses

	Pilot Total
Maintenance Costs	
ConnectDER Simple Collar	$84.00
ConnectDER Generation 1 DER Management Device	$64,209.95
ConnectDER Bridge Device	$63,248.05
Cellular Gateway	$0.00
Sub Total (Maintenance)	***$127,542.00***
Total Expenses	***$127,542.00***

Table 11 Total Spent By Device Type (Materials, Labor, Maintenance)

Device Type	Total Spent Per Device
ConnectDER Generation 1 DER Management Device	$ 1,162.60
ConnectDER Bridge Device	$ 862.76
Cellular Gateway	$ 1,349.00

Tables 9, 10, and 11 above depict the costs associated with each DER Management device type. In some cases, where the initial DER Management device was replaced under warranty, it may have been replaced with a different DER Management device. In such cases, the initial purchase and installation costs have been categorized based on the original device type installed. Any maintenance costs for the location are categorized based on the device type installed when the maintenance is performed. As seen in Table 11, the cost of installation per device has been reduced as new generations of DER Management devices evolve. PPL Electric has saved $1.43 million from installing the ConnectDER Bridge device instead of the ConnectDER Generation 1 DER Management Device.

4) Number of times, locations, and duration for active management

An aggregated summary of the number of times PPL Electric actively managed each grid support function between March 22, 2023, and March 21, 2024, is shown in Table 12.

Table 12 Grid Support Function Total Event Counts

Grid Support Function	Total Number of Events
Volt/VAR Curve Overrides	12
Power Factor Setting Changes	221,394
Ride-through Setting Changes	4,138
Remote On/Off	0
Volt/Watt Curve Overrides (where applicable)	0

A detailed table capturing the total number of times, locations, and average durations of active management events aggregated to the distribution feeder level is provided in Appendix B. When aggregated by feeder (as in Appendix B), each table entry may contain more than one inverter power

factor settings change if multiple inverters on the same feeder have their power factor changed at the same time. As a result, the total number of entries in Appendix B is lower than the total inverter power factor setting change count in Table 12.

The total number of power factor management events in Program Year 2 increased significantly from 768 events in Program Year 1. This is a result of PPL Electric's continued enhancement of its ADMS/DERMS operational systems. In October of 2023, PPL Electric deployed a software patch to its ADMS/DERMS that significantly improved success for power factor management commands. This patch as well as the increase in the number of inverters in the program are the primary drivers of the increase in power factor management events.

In addition, of the total 221,394 events, 80,165 events were the result of PPL Electric's DER Management device instructing the inverter to revert to unity power factor after 10 hours of power factor management. These management events are not intended to provide grid benefits; rather, they act as a failsafe to ensure customers do not experience excessive generation curtailment if the DER Management device were to fail to return the system to volt/var management mode as programmed. A 10-hour reset time was selected to restore the inverter to unity power factor after a full day of daylight operation. A power factor management event occurring as a result of this function does not indicate that the device failed, but rather that PPL Electric's failsafe to protect customers is working as intended.

PPL Electric also performed volt/var curve overrides for the first time in Program Year 2, adjusting volt/var curves for 12 customers. As part of the DER Management Pilot program, PPL Electric monitors the amount of lost generation experienced by each customer as a result of the volt/var curve overrides. Through this monitoring, PPL Electric can identify customers with volt/var curves that experience lost generation significantly above the system average and make adjustments to reduce the amount of lost generation experienced. In addition, PPL Electric's circuit reconfigurations can result in changes to a customer's expected voltage profile and, subsequently, the optimal volt/var curve for the DER. Six of the 12 volt/var curve changes were the result of volt/var curve calculations following a circuit reconfiguration. The new volt/var curves developed from these analyses were then programmed remotely using PPL Electric's DER management capabilities with no disruption to the customer or their equipment.

5) Grid benefits achieved for each instance of active management

PPL Electric has developed the definition and parameters of grid benefits to capture real-time grid constraint mitigation for each instance of active management. Results for Program Year 2 show consistent improvements in system voltage, but do not fully resolve voltage issues in all cases. As the penetration of actively managed DERs continues to increase in future years, it is expected that voltage violations experienced by customers will decline in number and severity as more resources will be available in a wider variety of locations to respond to power quality challenges. Additional analysis on the grid benefits that were achieved, combining AMI voltage measurements and ADMS/DERMS model results, can be found in Section 11 ("Operational descriptions of how active management was executed and implemented") of this report.

PPL Electric defines "grid benefits achieved" for real-time constraint mitigation as the change in the number or severity of voltage violations present on the system in the time intervals before and after the

active management of one or more DERs. The intent is to capture changes which result directly from active management on a per-event basis. One challenge with this approach is that many other factors can influence customer voltage within the same time window of the calculations. Factors such as circuit load changes, local service transformer load changes, capacitor status changes, transmission voltage changes, and other factors can hide or overwhelm the impact of active management of DERs, especially on substations with relatively few DERs that can be managed. The methodology developed to calculate "grid benefits achieved" on a per-event basis calculates voltage changes for each active management event but cannot isolate whether or how much the magnitude of the calculated voltage change is caused by the active management event. PPL Electric has provided additional analysis in Section 11 of this report to better identify the contributions of active management to improving customer voltages by aligning ADMS/DERMS actions with the measured voltage changes.

For this report, the change in voltage violations for each instance of active management is calculated by evaluating the measured Advanced Metering Infrastructure ("AMI") meter voltages for the reporting interval immediately preceding and immediately following the active management for all DERs served by the same substation bus as the active management DERs. Since each event may include one or more DERs on the same bus, the total number of events may be lower than the total power factor setting change counts and the feeder-level event counts identified in other sections of this report. Grid benefits are considered by quantifying the reduction in the number of voltage violations or the reduction in the magnitude of the severity of those violations (e.g., reducing the voltage when a customer was experiencing a high voltage condition).

These measures were selected because they have the highest potential to capture the voltage improvement outcomes expected to result from active management capabilities on a per-instance basis. Using the measured AMI voltages before and after each instance of active management provides a quantitative means of measuring the impact of the active management event to improving customer voltage.

Manual modeling the specific effects of Active Management is impractical on a per-instance basis due to the volume and scale of analysis that would be required. Specific modeling performed for this purpose can be found within the use cases described below for certain scenarios. PPL Electric's ADMS/DERMS also calculates an estimated number of voltage violations resolved as a result of active management for each instance of active management. A description of these calculations and the results can be found in Section 11 of this report.

PPL Electric has identified any switched capacitor banks which were operated within the same time interval and the overall change in feeder reactive power measurements in order to isolate DER-specific benefits to the extent possible at this scale and to provide context for the calculated results.

The complete table of grid benefits achieved for each instance of active management has been compiled as Appendix C.

6) Net generation gain or loss due to active management

PPL Electric has developed a report capturing the net generation loss or gain due to PPL Electric's active management of grid support functions in each instance.[2] The total generation loss identified as a result of active management events represents a very small portion of overall system generation capabilities. This is primarily because the management actions are targeted to specific locations and time intervals where system benefits can be achieved.

On average, active management customers saw approximately 0.02195 kWh of net generation loss per management event as a result of active management, totaling 4859.52 kWh across 221,394 events. A table containing net generation changes for each instance of active management can be found within Appendix D.

7) Distribution system upgrades avoided due to increased hosting capacity attributed to monitoring

PPL Electric is required to develop a report which compares the computed circuit hosting capacity when all DERs are evaluated at nameplate kW only versus the hosting capacity of each circuit with actual kW output, gained via monitoring, while keeping Grandfathered DERs at nameplate kW. Results indicate that the availability and use of actual DER system production data results in a noticeable increase in a circuit's calculated hosting capacity in most cases. Cost-effective increases in hosting capacity are critical to enabling the renewable energy transition by reducing and avoiding costs for future interconnections of renewable resources.

Hosting capacity calculations have been performed for each of PPL Electric's radially fed non-dedicated distribution feeders.[3] The results for the "Nameplate" and "Monitored" calculations for each feeder can be found in Appendix E ("Nameplate – Avg Nodal Hosting Capacity (kW)" and "Monitored – Avg Nodal Hosting Capacity (kW)", respectively). Feeders that have zero calculated hosting capacity have pre-existing criteria violations within the model. Additional details regarding the methodology of the Hosting Capacity calculations can also be found in Appendix E.

In addition to the nodal calculations, the largest installation size that can be accommodated on each feeder has been identified. The maximum system size calculation results for the "Nameplate" and "Monitored" scenarios for each feeder can be found in the table provided in Appendix E ("Nameplate – Max Hosting Capacity (kW)" and "Monitored – Max Hosting Capacity (kW)", respectively).

PPL Electric also computed the estimated total system-wide hosting capacity of the distribution system under the "Nameplate" and "Monitored" scenarios. This calculation was performed by identifying the largest DER that could be accommodated on each substation transformer (each supporting one or more feeders) and summing those values for all substation transformers. Because each substation bus operates relatively independently, this result provides a reasonable estimate of the system-level hosting capacity available (assuming no constraints are experienced on the transmission system).

[2] PPL Electric notes that it has not measured any generation loss or gain as a result of modifications to the ride-through curves.

[3] Feeders fed by PPL Electric's Underground Secondary Network, also referred to as the "Low Tension Network," have been excluded, as have those dedicated to serving a single customer.

As of the end of Program Year 2, PPL Electric's ability to monitor DERs through the DER Pilot has resulted in an estimated increase of 18 MW of hosting capacity across the system when compared to the Nameplate scenario.

8) Distribution system upgrades avoided due to increased hosting capacity attributed to autonomous grid support functions

PPL Electric has developed a report which compares the computed circuit hosting capacity with actual kW gained via monitoring only versus the scenario where those DERs are equipped with autonomous grid support functions, while keeping grandfathered DERs at nameplate kW. Autonomous functions provide additional benefits in the form of improved hosting capacity by allowing DERs to respond to local voltages to help mitigate high or low voltage constraints.

Hosting capacity calculation results on each applicable feeder can be found in the table provided in Appendix E ("Monitored – Avg Nodal Hosting Capacity (kW)" and "Autonomous- Avg Nodal Hosting Capacity (kW)", respectively). Feeders that have zero calculated hosting capacity have pre-existing criteria violations within the model. Additional details regarding the methodology of the Hosting Capacity calculations can also be found in Appendix E.

In addition to the nodal calculations, the largest installation size that can be accommodated on each feeder has been identified. The maximum system size calculation results for the "Monitored" and "Autonomous" scenarios for each feeder can be found in the table provided in Appendix E ("Monitored – Max Hosting Capacity (kW)" and "Autonomous – Max Hosting Capacity (kW)", respectively).

PPL Electric also computed the estimated total system-wide hosting capacity of the distribution system under the "Monitored" and "Autonomous" scenarios. This calculation was performed by identifying the largest DER that could be accommodated on each substation transformer (each supporting one or more feeders) and summing those values for all substation transformers. Because each substation bus operates relatively independently, this result provides a reasonable estimate of the system-level hosting capacity available (assuming no constraints are experienced on the transmission system).

As of the end of Program Year 2, the utilization of PPL Electric calculated volt/var curves through the DER Pilot has resulted in an estimated increase of 6 MW of hosting capacity across the system when compared to the Monitored scenario.

9) Distribution system upgrades avoided due to increased hosting capacity attributed to active management

PPL Electric has developed a report which compares the computed circuit hosting capacity when all DERs are evaluated at the nameplate kW only, without any monitoring or active management, versus the hosting capacity of each circuit with actual kW output gained via active management, while keeping grandfathered DERs at nameplate kW. Active management shows additional improvements in feeder hosting capacity when compared to autonomous only scenarios. This results from the ability of active management to utilize DER to respond to voltage violations holistically, rather than relying on DERs to adjust themselves based on local measurements.

Hosting capacity calculation results on each applicable feeder can be found in the table provided in Appendix E ("Nameplate – Avg Nodal Hosting Capacity (kW)" and "Active Management – Avg Nodal

Hosting Capacity (kW)", respectively). Feeders that have zero calculated hosting capacity have pre-existing criteria violations within the model. Additional details regarding the methodology of the Hosting Capacity calculations can also be found in Appendix E.

In addition to the nodal calculations, the largest installation size that can be accommodated on each feeder has been identified. The maximum system size calculation results for the "Nameplate" and "Active Management" scenarios for each feeder can be found in the table provided in Appendix E ("Nameplate – Max Hosting Capacity (kW)" and "Active Management – Max Hosting Capacity (kW)", respectively).

PPL Electric also computed the estimated total system-wide hosting capacity of the distribution system under the "Nameplate" and "Active Management" scenarios. This calculation was performed by identifying the largest DER that could be accommodated on each substation transformer (each supporting one or more feeders) and summing those values for all substation transformers. Because each substation bus operates relatively independently, this result provides a reasonable estimate of the system-level hosting capacity available (assuming no constraints are experienced on the transmission system).

As of the end of Program Year 2, PPL Electric's DER Pilot has resulted in an estimated increase of 29 MW of hosting capacity across the system when compared to the "Nameplate" scenario, with 5 MW of the 29 MW of hosting capacity attributed to the active management of power factor. This increase of 29 MW can help reduce interconnection costs and enable additional interconnections. If that additional 29 MW were fully utilized as of March 21, 2024, it would have produced additional generation and reduced distribution and transmission losses valued at approximately $4.57 million.

10) System operation comparisons of circuits under autonomous inverter grid support functions versus active management

PPL Electric has developed voltage metrics depicting performance characteristics between the Grandfathered Group ("GF"), Control Group 1 ("CG1"), Control Group 2 ("CG2"), and Active Management Group ("AM"). These metrics have been provided both at the point-of-interconnection level (comparing all DER Pilot groups) and at the feeder level (comparing feeders with active management DER against Control Group 1 feeders).

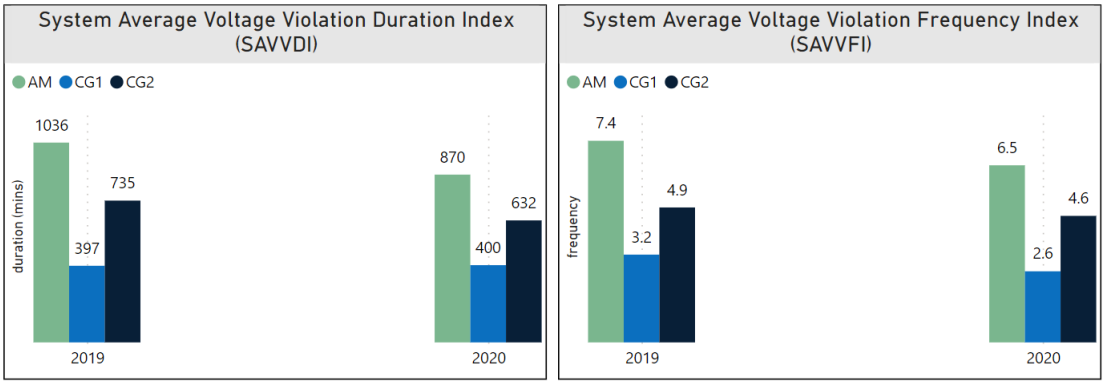
PPL Electric has developed new voltage performance metrics that are designed to improve understanding and mimic established industry practices for quantifying reliability. For outage data, the System Average Interruption Frequency Index ("SAIFI") and System Average Interruption Duration Index ("SAIDI") convey the expected number of, and duration of, outages that the average customer experiences in a given year. For voltage, the System Average Voltage Violation Frequency Index ("SAVVFI") and System Average Voltage Violation Duration Index ("SAVVDI") will provide similar information but for voltage violations. These values are calculated as follows:

> SAVVFI = (Total number of voltage violation events experienced by all customers in a set) / (total number of customers in the set)
> SAVVDI = (Total duration in minutes of voltage violation events experienced by a set of customers) / (total number of customers in the set)

These values have been calculated separately for the Grandfathered, Control Group 1, Control Group 2, and Active Management customer sets. Where customers are in both Control Group 1 and Control Group 2, they will be included within both the CG1 and CG2 data sets. Because the SAVVFI and SAVVDI are inherently normalized by dividing by the number of customers in the set, there is no potential for double counting.

When examining the voltage violation data across the groups, it is important to consider both the data and the underlying factors which can influence the comparative analysis. The voltage violation comparison data from the Program Year 1 Annual Report identified that the initial control group installations are likely located in locations less prone to voltage violations because such installations experienced relatively fewer voltage violations than those installations in the Active Management Group before the DER Pilot. This is further illustrated by the data below, which calculates the SAVVFI and SAVVDI for the customers in each group from 2019 and 2020, *i.e.*, before the interconnection of any DERs within the DER Pilot.

Figure 2 DER Customer Historical SAVVFI & SAVVDI



Voltage violation data for Grandfathered Group, Control Group 1, Control Group 2, and Active Management Group customers is provided in Figure 3 and Figure 4 below through the end of 2023. The data for this analysis starts being collected for each customer location from the date that the DER is connected and (in the case of active management and control group DERs) programmed with a volt/var curve. Due to the relatively small population of DERs in 2021, there is insufficient sample size for CG1, CG2, and AM customer groups to identify specific findings from 2021 data; the same is true with 2022 data for AM group. Because the populations of these groups (except the GF group) change over time, it is difficult to draw conclusions from year-over-year comparisons. Similarly, while 2023 data provides the best group to group comparison yet, the SAVVFI and SAVVDI will continue to regress to the mean as more DERs are added to the groups.

Figure 3 DER Customer SAVVDI Results

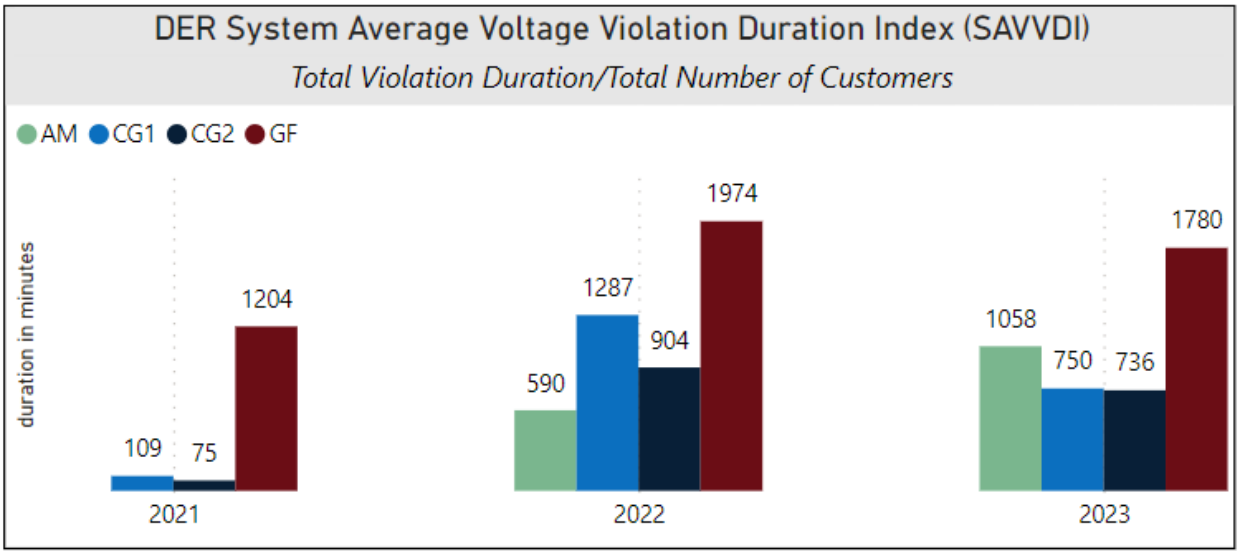


Figure 4 DER Customer SAVVFI Results

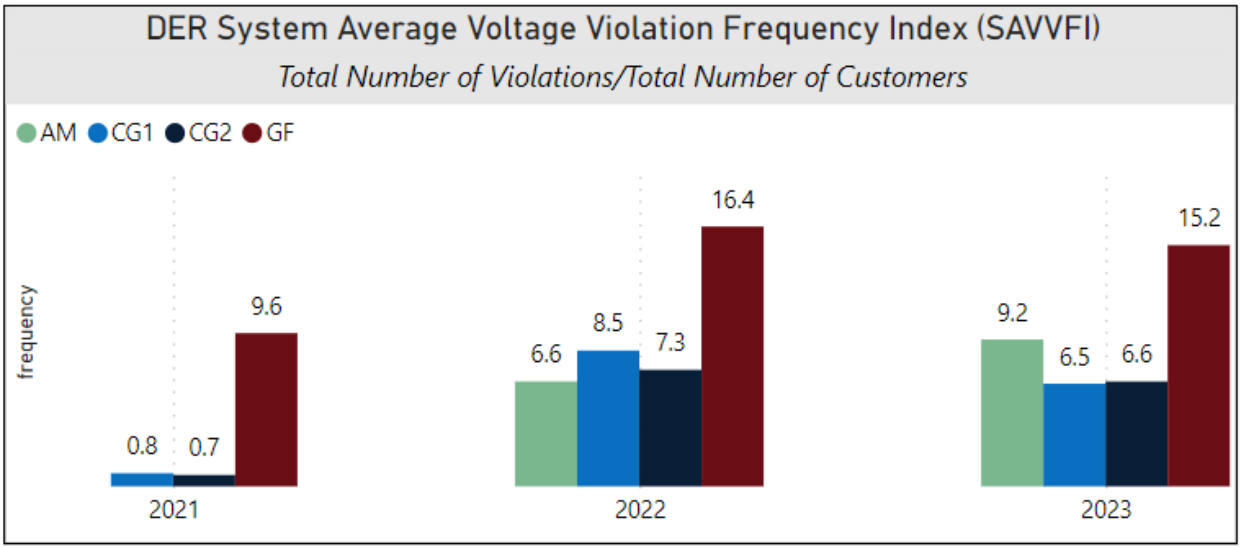

On its own, the voltage data at the DER customer location does not paint a complete picture of the impact of volt/var curves and active management on customer voltages and power quality. To capture the full impact, the voltages at all customer locations, both those with and those without DERs, must be considered. Both PPL Electric's volt/var curve design process and the execution of active management consider both the local DER customer voltage as well as the impacts to voltage elsewhere on the system. The existence of Control Group 1 provides a more direct way of evaluating the impact of active management capabilities on customer voltage violations. In Figure 5 and Figure 6 below, SAVVFI and SAVVDI have been calculated for all customers on Control Group 1 feeders as well as for all customers on feeders with actively managed DERs. Because this data considers each meter on a given set of feeders (Control Group 1 or Active Management), low sample size is not an issue, even for relatively smaller numbers of actively managed DERs because those DERs are spread across many different feeders and, consequently, a high volume of voltage measurement datapoints.

Figure 5 Feeder-Level SAVVDI Comparison Results

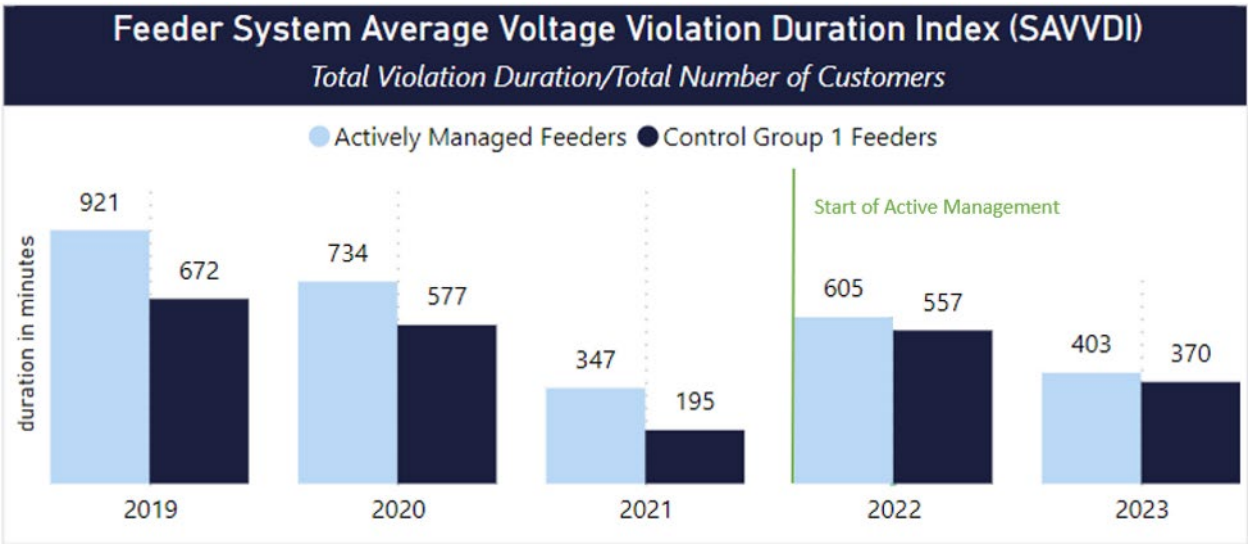

Figure 5 Feeder-Level SAVVFI Comparison Results

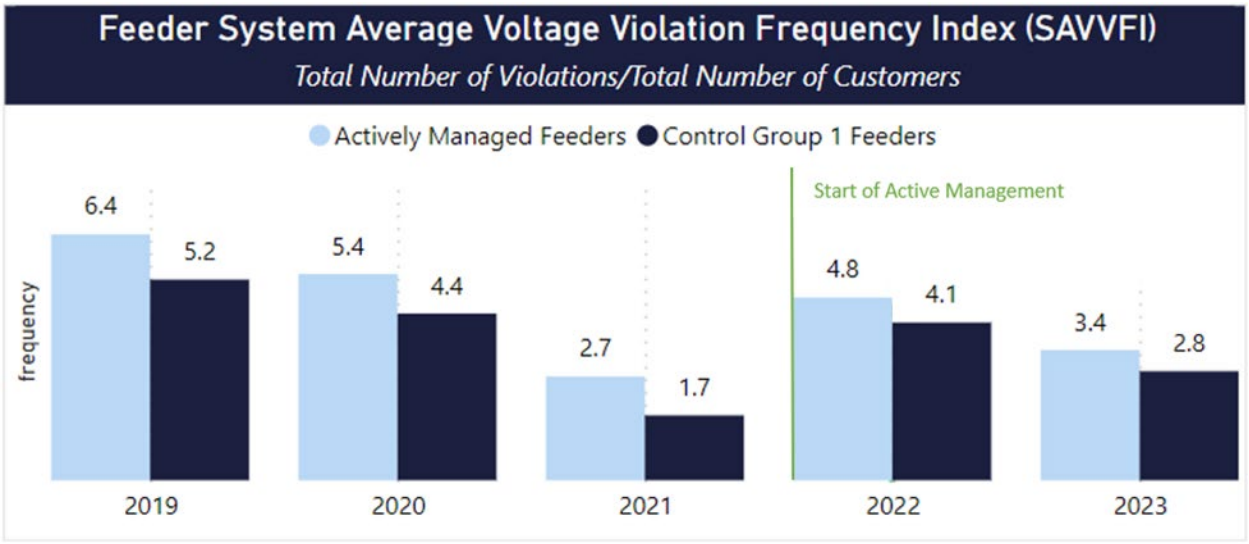

When comparing the data for the actively managed feeders and the Control Group 1 feeders, the impact of active management on the duration and frequency of voltage violations is readily apparent. From 2019-2021, which is before the first power factor management event in 2022, customers on the feeders that have actively managed DERs experienced significantly longer durations of voltage violations than their peers on Control Group 1 feeders. Beginning in 2022, with the start of active management, this gap closed significantly. In 2023, the gap between duration outcomes for customers on Control Group 1 feeders and those on actively managed feeders closed further. This clearly demonstrates the capabilities of active management to reduce the duration of voltage violations.

For the frequency data, both the Active Management feeders and Control Group 1 feeders show general trends of decreasing year-over-year. Similar to the duration data, customers on feeders that now have actively managed DERs have historically experienced a higher frequency of voltage violations than their peers on Control Group 1 feeders. This gap also shows signs of reducing starting in 2022, though not as

strongly. This is not entirely unexpected, as PPL Electric's ADMS/DERMS currently reacts to system conditions to respond to voltage violations, rather than attempting to prevent them. As a result, the frequency impacts are less pronounced and primarily result from preventing the recurrence of a violation within the same day or from management actions intended to address a modeled voltage issue that does not yet exist in the field. In the future, improvements in operational forecasting may enable more capabilities to reduce voltage violation frequency through active management before violations occur, rather than responding after their occurrence.

In addition to frequency and duration, PPL Electric also developed metrics to quantify and understand the relative severity of voltage violations across the DER Pilot groups. In this context, voltage violation severity is the relative difference between the measured voltage and the target voltage range of 0.95 to 1.05 per unit (114 V to 126 V for a 120V base service voltage). For instance, a voltage violation severity of 0.001 indicates a per unit voltage of 1.051 (126.12 V on a 120V base service voltage) or 0.949 (113.88 V on a 120V base service voltage). The results in Figure 7 below depict the relative frequency of voltage violations of varying levels of severity at DER locations, calculated based on the number of time intervals a voltage measurement was within each band as a percentage of the total number of daylight time intervals considered. The relative percentage of time intervals with no voltage violations is also included to provide context for the results.

Figure 6 Voltage Severity Results by Pilot Group

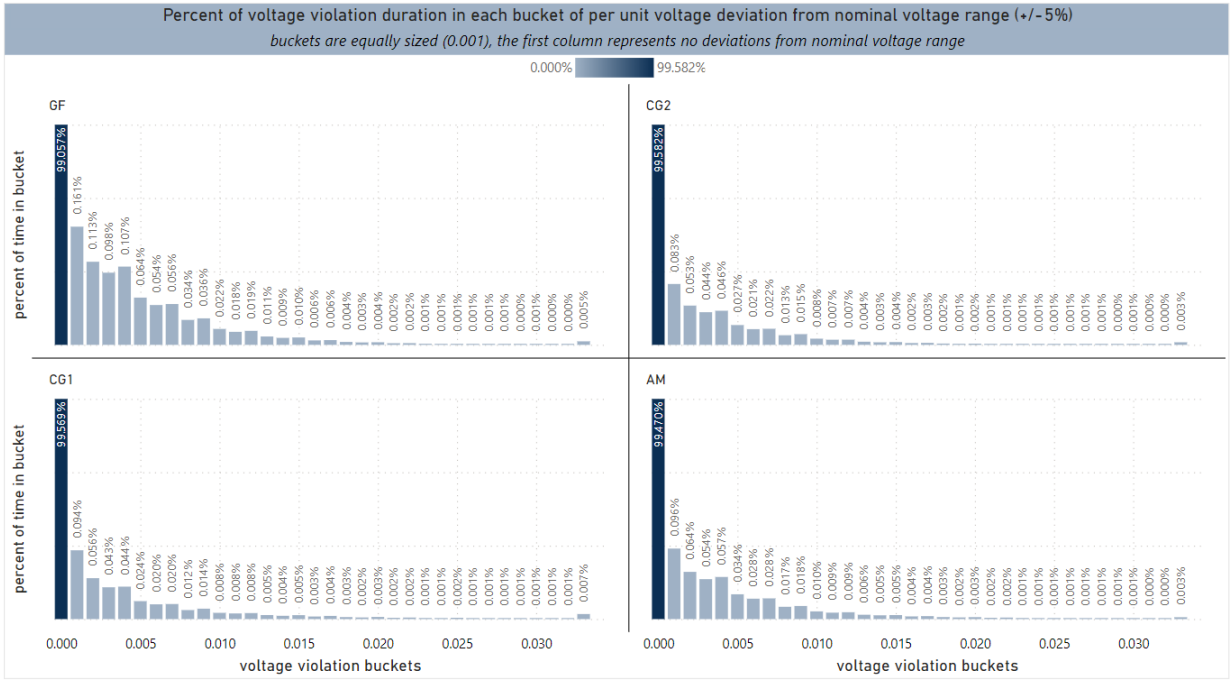

Figure 8 below depicts the same underlying data, but with the intervals with no violations removed, and the remaining data converted to percentages. In this graph, having a higher percentage of low-magnitude violations (e.g., with larger values nearer to the left vertical axis) indicates that, when a voltage violation does occur, it is relatively less severe. Within this data, grandfathered DER locations spend relatively less time in the lower magnitude regions, indicating that they tend to have more severe voltage violations when compared to their control group and active management peers. From the data,

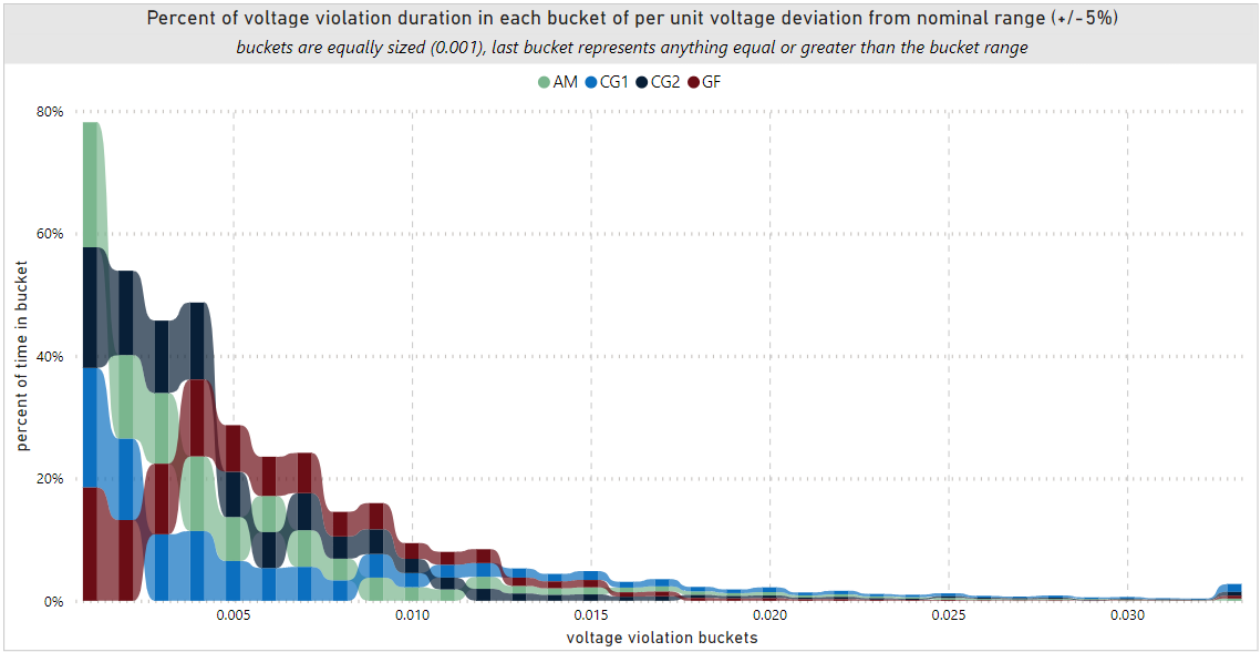
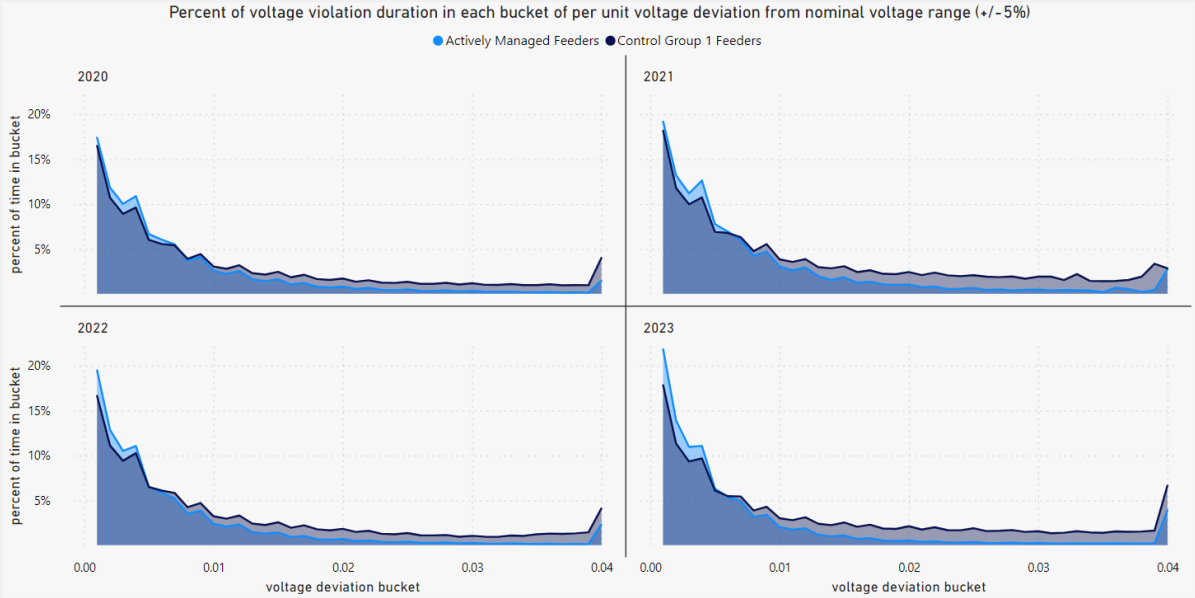
it is clear that the use of volt/var curves reduces the severity of voltage violations at the point of interconnection.

Figure 7 Voltage Severity Comparative Results by Pilot Group, Y-axis is stacked by size from smallest to largest percentage.



As with the frequency and duration data above, the data measured at the DER locations does not tell the whole story, as it does not include the impacts of autonomous and active management on voltage violations experienced by other customers on the same feeder. The results in Figure 9 below depict the same voltage violation severity analysis methodology applied to customers on Control Group 1 feeders and customers on feeders with actively managed DERs. To improve the comparability of the data, time intervals without voltage violations have been excluded, and the data is presented as the percentage of time, when a violation is present, that the various levels of voltage violation occur.

Figure 8 Feeder-Level Voltage Severity Results Comparison



Prior to the start of active management events in 2022, customers on feeders with actively managed DERs experienced a relatively lower incidence of the most severe levels of voltage violation when compared to their peers on Control Group 1 feeders. By the end of 2023, with the number of actively managed DERs and active management events significantly increased, this gap widened even more. When customers on feeders with actively managed DERs experienced a violation in 2023, the violation was more likely to be less severe than for customers on Control Group 1 feeders. The reduction in voltage violation severity as a result of PPL Electric's active management of DERs is a clear demonstration of the impact on customer power quality.

Key takeaways from the comprehensive review of the progression of figures in section 10 and their associated explanations are:

1. **Trend of Shorter and Less Frequent Voltage Violations:** The Grandfathered Group has longer and more frequent voltage violations than Control Group 1, Control Group 2, and the Active Management Group. The trend of shorter and less frequent voltage violations for the latter three groups demonstrates that the DER Pilot is improving grid conditions.

2. **Historical Challenges in Actively Managed Feeders:** Feeders with actively managed DERs historically faced a higher frequency of voltage violations compared to those in Control Group 1. However, the disparity in violation frequency between these groups has started to decrease since 2022, showcasing how actively managing the DERs has gradually improved the feeders' performance.

3. **Response vs. Prevention:** PPL Electric's systems, including ADMS/DERMS, are configured more for responding to existing voltage violations rather than preventing them. This reactive approach results in less pronounced impacts on violation frequency, as interventions are primarily aimed at preventing recurrence within the same day or addressing potential future issues not yet manifest in the field. However, with DER management, the potential exists for

significant enhancements in how voltage violations are managed through advancements in operational forecasting. With better predictive capabilities, it may become feasible to proactively manage and reduce the frequency of voltage violations before they occur, shifting from a reactive to a preventative management style.

4. **Quantifying Severity:** The development of new metrics to understand the severity of voltage violations adds another layer of depth to grid management. These metrics help quantify how far off the voltage measurements are from the target range, providing a clearer picture of the grid's health and the effectiveness of voltage regulation strategies.

5. **Understanding Impact Over Time:** The analysis of severity across different times and conditions (such as daylight time intervals) helps in understanding the dynamic nature of voltage violations and the operational effectiveness of DER management across different scenarios.

In addition, active management's ability to mitigate and resolve voltage violations without needing to roll trucks has reduced the Company's operation and maintenance expenses. To calculate the estimated expense reduction due avoided truck rolls, PPL Electric first multiplied the number of customers with at least one voltage violation resolved within a load and voltage management ("LVM") plan period by 79.3%. The 79.3% represents the completion rate of LVM plans—from initiation to resolution of planned actions, as analyzed up to March 21, 2024—and represents the approximate percentage of voltage violations resolved by active management. Customer count is used rather than violation count to avoid counting multiple resolutions for a single customer as multiple truck rolls, and because not all resolutions are directly attributable to active management.

Subsequently, this figure is multiplied by 75%, which is the frequency that PPL Electric deploys a truck in response to a voltage violation complaint based on the Company's power service problem ("PSP") data. The resulting figure is then multiplied by the cost PPL Electric incurs per truck roll to resolve a voltage violation, providing an estimate of the overall cost-effectiveness of active management in identifying, mitigating, and resolving voltage violations.

Table 93 Total Cost to Respond to Voltage Violations that Were Avoided per Year

Year	Truck Roll Rate	Voltage Violations that Could Have Resulted in Truck Rolls	Total Cost to Respond to Voltage Violations that Were Avoided
2022	$711	796	$565,956.00
2023	$535	13,586	$7,268,510.00
2024	$656	8,890	$5,831,840.00
			$13,666,306.00

11) Operational descriptions of how active management was executed and implemented

PPL Electric has developed a report based on data captured from the ADMS/DERMS system, which identifies the operational issues faced, the active management action taken, and the expected resulting impact of the action for each instance of active management. The resulting data has been compiled within Appendix F. Similar to the "Grid Benefits Achieved" section of the report, data derived from the ADMS/DERMS event logs and provided in Appendix F identifies the number and severity of voltage violations present before and after ADMS/DERMS executes the management plan. In contrast to the approach used in the "Grid Benefits Achieved" section, which uses measured AMI data but does not determine the relative role of DERs, the data provided in this section captures the expected role of DERs in resolving voltage violations but relies upon power flow results calculated within the operational model. These results reflect the best information available at the time the management action was taken, which incorporates some voltage and load measurements received through SCADA but does not include measured AMI voltages. The resulting management plans can include both DERs and capacitor management actions. Capacitor management actions events, as well as the overall change in the area power factor, have been included in order to further isolate DER-specific benefits to the extent possible for the calculated results.

When the ADMS/DERMS is managing system voltage, it identifies voltage violations within the operational model, determines an optimal plan to mitigate voltage violations, and then calculates the hypothetical future state expected to result from that plan. Both the "pre-plan" and "post-plan" calculated values are recorded within the event log files, which are then used to estimate the number of voltage violations resolved by the ADMS/DERMS action.

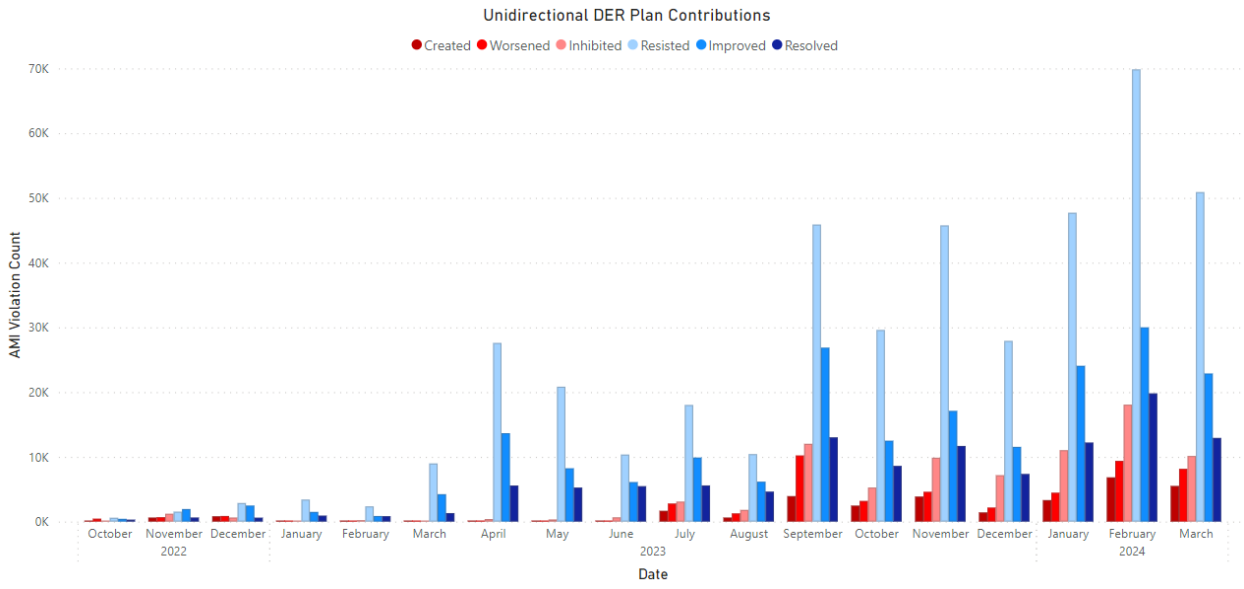
This number of voltage violations resolved, when calculated in this manner from the ADMS/DERMS logs, is higher than the actual number of voltage violations resolved. This is due to a few factors. First, while power flow calculations incorporate real time measurements and are generally accurate, they are imperfect, and slight errors in voltage calculations are to be expected. Since most voltage violations are only slightly outside of voltage limits, voltage violation counts can be extremely sensitive to these slight inaccuracies, resulting in overestimations of the impact of some events and underestimations of the impact for other events. Second, each power flow and optimization cycle (currently occurring approximately every 15 minutes) is largely independent from the previous cycle. As a result, voltage violations for the same set of customers may be counted as resolved multiple times throughout the day. Third, the estimated violation resolutions do not account for failed communication with DERs, which would result in only a partial realization of the expected benefits. Finally, the power flow solution accounts for locally managed devices, including capacitors and voltage regulators, changing position due to DER management. These locally managed devices can change states between the "pre-plan" and "post-plan" results.

ADMS/DERMS also attempts to reduce the severity of voltage violations as part of the voltage management process. While there may not yet be sufficient penetration of actively managed DERs to resolve voltage violations in all areas, ADMS/DERMS still utilizes the available resources to improve system voltage conditions. These values, on a per-event basis, are also provided in Appendix F.

To validate the performance of the ADMS/DERMS in addressing voltage violations, PPL Electric has compared DER management plan logs from ADMS/DERMS to the actual number of customers that had voltage violations impacted during the 15-minute period that the plan was generated in (calculated via AMI voltage data). Because many things can change over a 15-minute period that impact voltage, attributing any specific change in voltage status of customers solely to a DER management action is very difficult at this scale. It is possible, however, to assess whether the ADMS/DERMS plans generally align with and support voltage changes that are needed to improve voltage violation conditions.

Successful DER management utilizes DERs to reduce voltage for high voltage violations and increase voltage to resolve low voltage violations. For this analysis, PPL Electric sorted the ADMS/DERMS log events to identify logs where all DERs are being managed to change voltage in the same direction (relative to unity power factor), then identified the changes in AMI voltages associated with the DER management event for customers on the same nominal feeder and phase as the DERs. For example, if five DERs are being managed and all five are adjusted to increase the amount of injected kVAR, that is a unidirectional change to increase voltage. Likewise, if those five DERs are being adjusted to increase the amount of absorbed kVAR, this is a unidirectional change to reduce voltage. Because of the complexity and local nature of voltage, some management events involve a mix of DER management actions, with some DERs increasing their kVAR absorption and others increasing their kVAR injection within the same plan. These multi-directional events are difficult to analyze at scale and have been excluded from the data in this analysis to provide a clearer understanding of the effectiveness of DER management actions. The results of this analysis can be found in Figure 10 below.

Figure 100 DER Management Plan Contribution Results



Each DER management's contribution to the change of voltage violation was categorized as follows:

- *Created*: A voltage violation existed in the direction of the DER plan voltage contribution at the end of an AMI period that did not exist prior to the management action
    - Ex: DER inject kVAR which would raise voltage, and a customer voltage changes from 1.049 per unit to 1.051 per unit

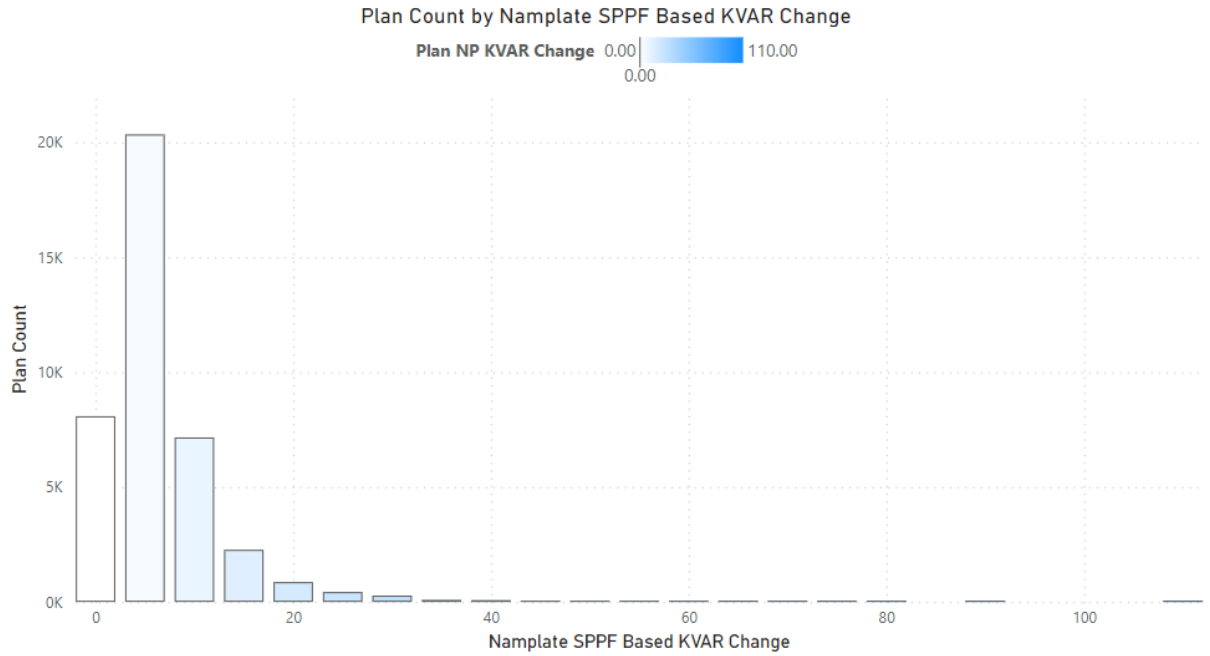
- *Worsened*: A voltage violation was more severe in the direction of the DER plan voltage contribution at the end of an AMI period than prior to the management action
    - Ex: DER inject kVAR which would raise the voltage, and a customer voltage changes from 1.051 to 1.052 per unit
- *Inhibited*: A voltage violation was less severe at the end of an AMI period, but the DER plan voltage contribution was in the opposite direction
    - Ex: DER inject kVAR which would raise the voltage, and a customer voltage changes from 1.052 to 1.051 per unit.
- *Resisted*: A voltage violation was more severe at the end of an AMI period despite the DER plan voltage contribution in the direction opposite the violation
    - Ex: DER absorbs kVAR which would lower the voltage, and a customer voltage changes from 1.051 to 1.052 per unit.
- *Improved*: A voltage violation was less severe at the end of an AMI period in the direction of the DER plan voltage contribution
    - Ex: DER absorbs kVAR which would lower the voltage, and a customer voltage changes from 1.052 to 1.051 per unit.
- *Resolved*: A voltage violation existed at the start of an AMI period that did not exist at the end in the direction of the DER plan voltage contribution
    - Ex: DER absorbs kVAR which would lower the voltage, and a customer voltage changes from 1.051 to 1.049 per unit.

Generally, autonomous settings and active management are intended to *resolve* voltage violations conditions, *improve* voltage violation magnitudes, or *resist* other factors that are making voltage violations occur or become more severe. While *creating*, *worsening*, or *inhibiting* the resolution of voltage violations are not generally desirable, it is important to consider that optimization is complex and can result in trade-offs with net positive results overall. For example, creating one new voltage violation with a relatively small magnitude in order to resolve five voltage violations elsewhere on the system is a significant net positive from the system perspective.

From the data provided in the analysis, it is clear the PPL Electric's active management is providing significant net positive effects on customer voltages. While there are some violations that are created or worsened, there are significantly higher numbers of voltage violations resolved or improved.

The results provided to date are a result of the number and size of DERs connected within the Active Management Group. On many feeders, the total amount of reactive power support that can be provided by actively managed DERs is still relatively small, which is indicated by the high prevalence of events that "resist" voltage degradation but do not fully resolve voltage issues. As more DERs are able to be actively managed, it is expected that more voltage violations can be resolved or improved. As shown in Figure 11 below, the majority of DER plans have resulted in a change of less than 20 kVAR.

Figure 111 Relative Frequency of Total Planned kVAR Change



12) Performance measures related to active management

PPL Electric has developed performance tracking metrics for monitoring and active management installations which capture communication reliability and overall data quality. PPL Electric's communication systems have continued to perform at a high level as the number of communicating DERs has increased through the end of Program Year 2. PPL Electric continues to focus on maintaining and improving the reliability of its AMI network.

For communications reliability, PPL Electric tracks communications between the customer's inverter and the AMI head-end system. This captures the overall reliability and performance of the AMI network layer. Within the AMI communications layer, commands are sent from the AMI head-end system to the endpoint devices, which respond back to the head-end system. One execution of this cycle is a "round trip". Communication reliability and performance for the AMI layer of communications are measured by evaluating the percentage of successful round trips. PPL Electric aims to maintain an overall communications success rate of 95% between the AMI head-end system and DER Management devices.

Figure 122 - Average AMI Communication Success Rate by Month, 2021-2022

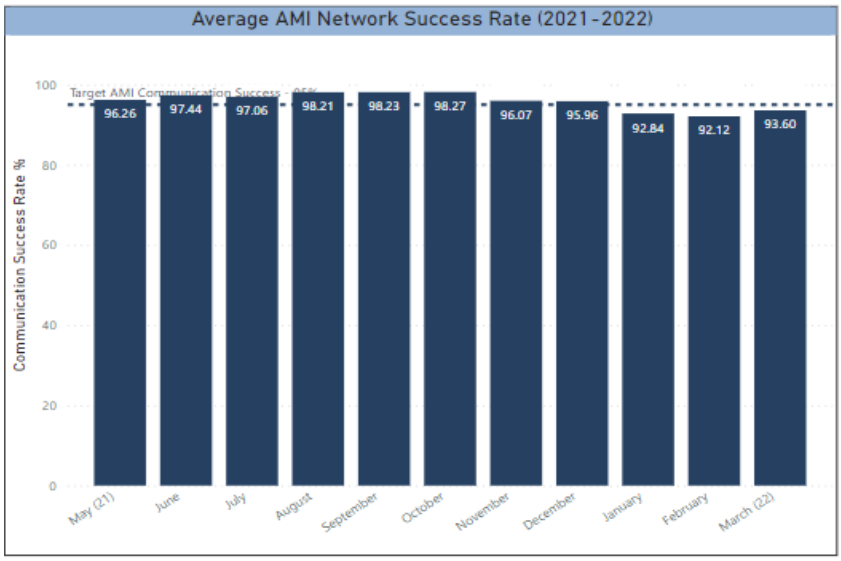


Figure 133 - Average AMI Communication Success Rate by Month, 2022-2023

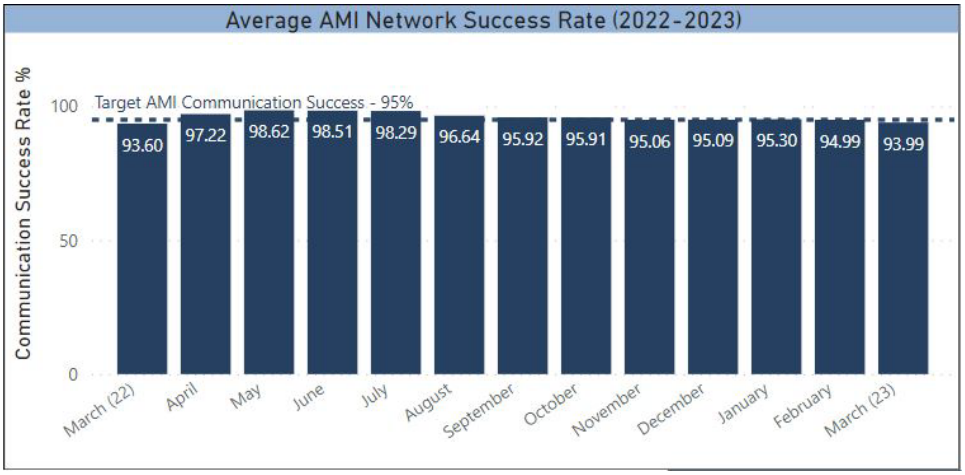

Figure 144 - Average AMI Communication Success Rate by Month, 2023-2024

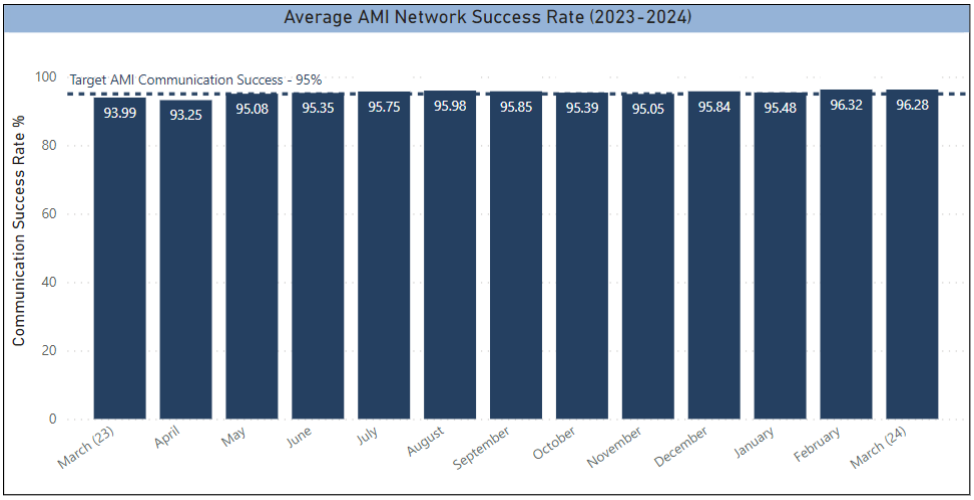

For the AMI communication success data above, locations where AMI communication could not be established have been removed from the averages depicted, as their performance is not indicative of overall network performance. As of March 2024, 147 devices have been removed from this data set. This accounts for 2% of DER installations enrolled in the Pilot. These locations are being investigated by PPL Electric.

Average Round Trip Time, another important element of AMI performance, measures the amount of time it takes for a command to be sent from the head-end system and for the response to be returned by the radio. For the average round trip time, PPL Electric aims to maintain a maximum time of 60 seconds to ensure reliable performance. Based on historical performance data, a 30 second round trip time target was implemented for the 2023-2024 timeframe and beyond to monitor for significant changes in network performance.

Figure 155 – Average AMI Round Trip Time by Month 2021-2022

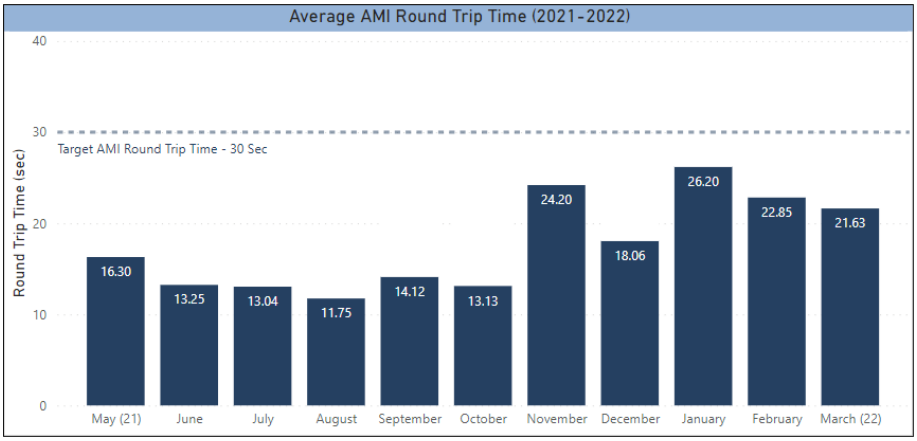

Figure 166 – Average AMI Round Trip Time by Month 2022-2023

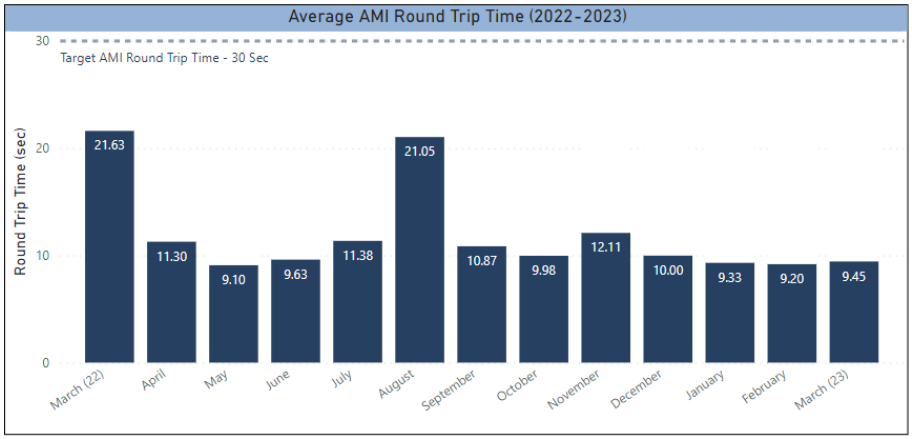

Figure 177 – Average AMI Round Trip Time by Month 2023-2024

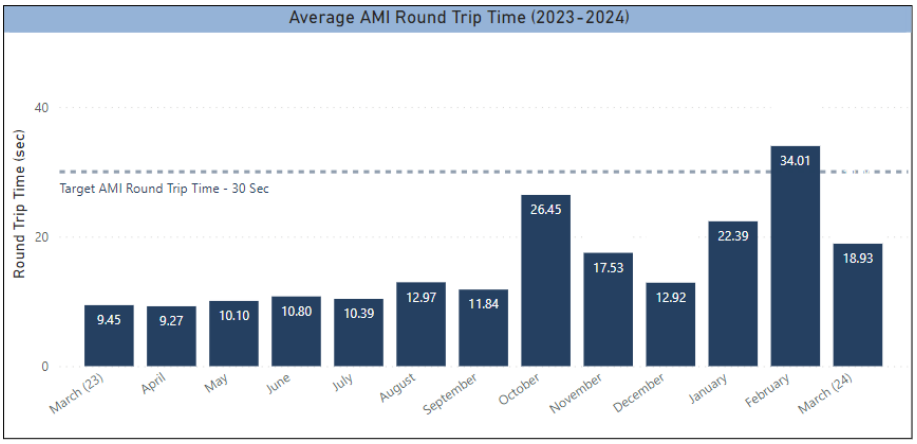

Data quality is an important aspect of overall communications health. A communications interval is determined to be a "quality" interval when at least one reading within a given 15-minute interval during daylight hours (9 AM – 5 PM) is received in which the data is within reasonable limits for key parameters like voltage, volt/var curve points, etc. One challenge within the analysis of historical inverter data is that many inverters reported real power measurements that were above their rated nameplate, at times exceeding the nameplate by more than 10%. This can negatively impact the data quality, as it can cause readings to be identified as invalid despite other parameters being within expected ranges.

Between March 22, 2023 and March 21, 2024, 89.93% of communications intervals resulted in quality data, which was an improvement from the 78.40% seen between January 1, 2021, and March 21, 2023. PPL Electric continually monitors data quality and has identified and implemented many enhancements to improve overall data quality and will continue such efforts in the future.

13) Findings and information on PPL Electric's use cases

PPL Electric has compiled findings and information below related to the eight use cases identified within the Pilot Implementation Plan, as well as some additional use cases not previously identified. These use cases capture both the benefits gained as a result of the Pilot as well as opportunities missed as a result

of the inability to communicate with or manage DERs installed prior to the start of the Pilot. These studies enable PPL Electric to learn and adapt to a system with an increasing penetration of DERS.

Use Case #1 – Voltage Violation at DER Point of Interconnection (POI)

Voltage must be maintained within ANSI C84.1 and PUC requirements at all levels in the distribution system to ensure safety and power quality for customers. DERs can sometimes intensify voltage violations on the network. Monitoring capabilities and alarms in ADMS/DERMS at the DER locations can provide visibility that is needed, allowing a proactive approach to identifying and responding to these violations. By monitoring the voltage levels, PPL Electric will be able to capture the added benefits each group has to mitigate voltage violations further.

Between March 22, 2023, and March 21, 2024, there have been 32,869 voltage violations recorded at autonomous DER locations (including Control Groups 1 and 2 as well as actively managed DERs) on the system.

Use Case #2 – Voltage Violation Mitigated by DERs on the Circuit

DER interconnections can create or intensify voltage issues, particularly if there is a high penetration of them on a single circuit. Without visibility and management capabilities, PPL Electric operators and planners will be faced with a deeper challenge to manage the system safely, reliably, and effectively. For the actively managed DER customers, PPL Electric will capture scenarios where the DERs may be utilized to help alleviate or mitigate voltage violations. Active management provides PPL Electric flexibility in mitigating voltage violations on the circuit. Additionally, captured scenarios allow PPL Electric to learn and adapt to a system with increasing DER penetration.

As of March 21, 2024, there have been 23,272 voltage violations resolved through PPL Electric's active management. These resolved voltage violations resulted in approximately $13.7 million of operational savings, as noted in Table 13, *supra*.

As of March 21, 2024, there have been five (5) cases studied that resulted in mitigated voltage violations for 577 customers through autonomous volt/var curves and an additional 342 customers with active management. Additionally, PPL Electric has performed studies for four (4) DER management events comparing ADMS/DERMS calculated voltage violation mitigation estimates and actual AMI readings during the same interval, showing 16 voltage violations mitigated during the identified ADMS/DERMS calculation time intervals.

1. Case 1: A study was conducted with an initial voltage violation count of 247 customers due to a regulator failure. Through mitigations identified in the study, all violations could have been resolved, with 219 being attributed to Active Management.
2. Case 2: A study was conducted on a Control Group 1 feeder with an initial voltage violation count of 136 customers due to an emergency feeder load transfer. Through mitigations identified in the study, all violations could have been resolved, with 46 being attributed to Active Management.
3. Case 3: A study was conducted with an initial voltage violation count of 117 customers due to a stuck regulator. Through mitigations identified in the study, 59 violations could have been resolved, with 16 being attributed to Active Management.

4. Case 4: A study was conducted with an initial voltage violation count of 111 customers due to switching. Through mitigations identified in the study, 65 violations could have been resolved, with 38 being attributed to Active Management.
5. Case 5: A study was conducted with an initial voltage violation count of 175 customers due to high loading. Through mitigations identified in the study, 70 violations could have been resolved, with 23 being attributed to Active Management.
6. Case 6: A review of ADMS/DERMS calculations indicated that 4 low voltage violations would be resolved through an active management action. AMI voltage readings across customer meters showed that 5 voltage violations were resolved during the same time interval.
7. Case 7: A review of ADMS/DERMS calculations indicated that 4 low voltage violations would be resolved through an active management action. AMI voltage readings across customer meters showed that 4 voltage violations were resolved during the same time interval.
8. Case 8: A review of ADMS/DERMS calculations indicated that 3 low voltage violations would be resolved through an active management action. AMI voltage readings across customer meters showed that 2 voltage violations were resolved during the same time interval.
9. Case 9: A review of ADMS/DERMS calculations indicated that 2 low voltage violations would be resolved through an active management action. AMI voltage readings across customer meters showed that 5 voltage violations were resolved during the same time interval.

Use Case #3 – Voltage Violation During Planned Switching

Planned switching occurs when all or a portion of one circuit is transferred to an alternate source (e.g., a different feeder) for a planned de-energization of a portion of the system, often for maintenance or construction. During planned switching, because the system configuration is abnormal and customers may be served from a source that is further away than normal, there is an increased potential for voltage violations to arise. These events are pro-actively studied by PPL Electric to identify any such loading or voltage issues. Although some issues can be addressed with existing voltage regulating equipment, there may be instances where successful switching needs additional equipment installed, phase balancing, or additional load transfers. If any violations are noticed during a planned switching study, DER management will be taken into consideration to decide if active management can support a successful switching event to minimize the installation of additional voltage regulating equipment or other mitigation actions.

As of March 21, 2024, there have been two (2) studies that have identified voltage violation mitigations with the use of settings changes during planned switching events, resulting in $38,000 (Active Management) in PPL Electric cost savings.

- Case 1: *$18,000* – During a substation transfer for maintenance a capacitor bank can be avoided, and voltage violations mitigated through implementation of active management.
- Case 2: *$20,000* – During a substation transfer for maintenance a capacitor bank can be avoided, and voltage violations mitigated through implementation of active management of DER (including one large DER within the application process).

Use Case #4 – System Restoration

When an outage occurs, all DERs within the outage area automatically shut off to avoid unintentional islanding. Following re-energization, the DERs are delayed from reconnecting for five minutes. During

this window, the load the DERs were carrying will need to be sourced and brought online by PPL Electric's network, thereby creating a larger pick-up load than what was measured prior to the outage. The difference between the load measured passing through feeder equipment and the total load served by both the feeder and the DERs is referred to as hidden load. By being aware of the hidden load needing to be supplied by PPL Electric's equipment, restoration can be planned in a safe and effective manner without equipment damage or unexpected overload trips.

As of March 21, 2023, PPL Electric has identified zero restorations that resulted in overloading due to hidden load being picked up. PPL Electric has performed analysis on several feeders to evaluate the potential future risk of such events.

1. Case 1: Using load and DER growth forecasting, 8 highly penetrated feeders were evaluated to determine when a feeder's normal emergency rating would be met, triggering an upgrade. Each feeder was evaluated with and without using DER monitoring for native loads to compare when an upgrade would be needed under each scenario. For 7 feeders, the study showed reinforcements could be deferred 1-4 years longer when implementing DER monitoring for native load.

Use Case #5 – Hidden Load Impact on Load Forecasting

Each year, PPL Electric reviews circuits' summer and winter peak load values to determine overload risks as well as hidden load. The hidden load caused by DERs without telemetry makes the analysis less accurate, which can result in unnecessary capital projects. By monitoring the DERs, hidden load can be accurately accounted for and improve the load models, which could avoid the need for capital investment.

As of March 21, 2024, PPL Electric identified 17.6 MW of hidden load at the system peak load (July 2023) as a result of monitoring data from 33.6 MW of DER at the time of system peak. Detection of this hidden load resulted in 16 MW of additional peak system capacity. PPL Electric has performed analysis on several feeders to evaluate the potential future impact of hidden load on load forecasting.

1. Case 1: Using load and DER growth forecasting, 8 highly penetrated feeders were evaluated to determine the overload risks with hidden (masked) load considered, triggering an upgrade. Each feeder was evaluated with and without using DER monitoring for native loads to compare when an upgrade would be needed under each scenario. For 7 feeders, the study showed reinforcements could be deferred 1-7 years longer when implementing DER monitoring for native load.

Use Case #6 – DER Management Impact on Voltage Management

With DER monitoring, the accuracy of voltage profile studies will improve. Having more voltage data points will eliminate assumptions made today and will provide a more accurate voltage profile for precise studies. Also, having more voltage data points will allow PPL Electric to identify and prioritize system upgrade needs effectively. DER management and volt/var curves will be implemented in the power flow modeling process when applications are reviewed to show the customer cost savings of avoided reinforcements by being able to alleviate voltage violations using smart inverters and ease integration for new and existing DER. The DER data generated will be utilized by the Planning team to

conduct studies and compile a list of voltage violations alleviated through DER monitoring, autonomous grid support functions, and active management.

As of March 21, 2024, a total of five (5) cases have been identified, and they resulted in projected customer cost savings of $231,500, all attributed to autonomous volt/var curves.

1. Case 1: *$5,000* – Can avoid a phase swap through an autonomous volt/var curve.
2. Case 2: *$105,000* – Can avoid 3-phase voltage regulator through an autonomous volt/var curve.
3. Case 3: *$16,500* – Can avoid capacitor bank conversion through an autonomous volt/var curve.
4. Case 4: *$105,000* – Can avoid 3-phase voltage regulator through an autonomous volt/var curve.
5. Case 5: Can avoid voltage violations for 26 customers through an autonomous volt/var curve. Using active management improves feeder head power factor and minimizes line losses.

Use Case #7 – DER Active Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade

Hosting Capacity is the amount of Distributed Generation that can be added to the distribution system before a load or voltage violation occurs or system reinforcements are required. By monitoring DERs' actual generation, a more accurate study can be conducted for a safe and reliable interconnection of DERs. During interconnection studies, scenarios will be conducted to determine what the cost savings could be for the customer by using measured inverter data and active management functionality. Doing these studies and implementing active management can help ensure cost-effective reinforcements for customers, ease integration, encourage more DER interconnections, and improve hosting capacity.

As of March 21, 2024, PPL Electric has identified three (3) studies which can result in $1,664,000, all attributed to autonomous volt/var curves for customers applying to interconnect to the distribution system.

1. Case 1: *$105k* - Can avoid a 3-phase voltage regulator and mitigate voltage violations for 391 customers through an autonomous volt/var curve.
2. Case 2: *$1,454mil* – Can avoid 2.66 miles of reconductoring 3-phase line through an autonomous volt/var curve.
3. Case 3: *$105k* – Can avoid a 3-phase voltage regulator and mitigate voltage violations for 80 customers through an autonomous volt/var curve.

Use Case #8 – DER Operations in Emergency Conditions and in Active Work Zones

When there is a fire, gas leak, or down conductor reported, PPL Electric's field crews will be sent out to investigate and help resolve the issue. During this response, portions of the distribution system may need to be de-energized for the safety of the public and PPL Electric's workforce. Through DER monitoring, system operators can determine whether there are DERs in the active work zone and the DERs' current status. Through active management, the PPL Electric team can turn off the DERs remotely if they are operating in an area that was intended to be de-energized. As a result, safety risks in operations will be mitigated. During a localized emergency issue behind a single meter, PPL Electric may remotely shut off power at the meter. Having monitoring on the DERs allows PPL Electric to recognize the system is shut off. If the system is still producing when it should be offline, active management will allow the DER system to be shut off allowing for emergency work to safely continue.

As of March 21, 2024, there have been 1,022 outage events that have impacted customers with actively managed DERs and subsequently presented a risk of unintentional islanding. No instances of unintentional islanding were detected. For public safety disconnections, there has been one instance of AMI meter disconnection for public safety that impacted a customer with an actively managed DER. In this case, the DER on/off function was not utilized because the event occurred at night, so the solar DER was not generating at that time.

Additional Use Case #1 – Modifying Volt/Var Curves to Reduce Customer Lost Generation

As a result of PPL Electric's ability to monitor DERs' real and reactive power, PPL Electric can calculate the amount of lost generation experienced by each customer as a result of volt/var curve operations. PPL Electric utilizes this data to identify customers experiencing significantly more lost generation than their peers in order to determine whether modifications to the volt/var curve could increase customer generation capabilities without negatively impacting overall system voltages. To date, PPL Electric has modified 12 customer volt/var curves in order to increase the amount of energy generated by these systems. PPL Electric has also identified two customers within the control groups who would benefit from a modified volt/var curve if PPL Electric were permitted to do so. Case studies for these two customers estimate that they would have experienced additional generation of approximately 106.7 kWh and 52 kWh annually.

Additional Use Case #2 – Identifying Customer System Issues

PPL Electric's ability to monitor DERs' real power allows PPL Electric to detect when customer generation systems have become inoperable. Once this has been detected, PPL Electric can contact customers to ensure they are aware that their system is not producing and take appropriate actions to restore the system to working order. In two example cases, PPL Electric performed a site visit to inspect the DER Management device following a loss of communication and identified that the customer's fuse had blown, preventing their system from producing. PPL Electric notified the customers and their installer to facilitate the restoration of DER production. To date, PPL Electric has contacted 22 customers to notify them of the condition of their DER systems.
