The views and opinions of authors expressed herein do not necessarily state or reflect those of the U.S. Government or any agency thereof.

This update is a plan that was prepared in response to the Pennsylvania Climate Change Act (Act 70 of 2008), which requires the Department of Environmental Protection (DEP) to prepare a climate action plan regularly. The Pennsylvania Climate Change Advisory Committee provided input and feedback to the DEP and ICF for the preparation of this assessment. The Climate Change Advisory Committee has 18 members plus 3 ex officio members. The 2021 Climate Action Plan is the fifth iteration of the Pennsylvania Climate Action Plan and builds on the previous action plans. This plan and the analyses contained in it were prepared by the Pennsylvania DEP with support from ICF, Penn State University and Hamel Environmental Consulting.

PENNSYLVANIA CLIMATE ACTION PLAN 2021

Strategies for government, business, agriculture, and community leaders—and all Pennsylvanians

September 2021

MESSAGE FROM GOVERNOR WOLF

The Climate Imperative

As I've seen firsthand in communities statewide, Pennsylvania is undergoing more extreme weather events, from flooding and tornadoes this month in Philadelphia and across southeast and southcentral counties, to record water levels in Lake Erie in 2019, to flooding that led to U.S. Department of Agriculture disaster declarations in 33 counties in 2018.

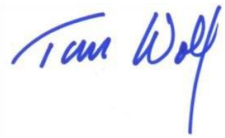
Increasingly frequent, these events are buffeting Pennsylvania with deep recurring socioeconomic costs: public health stresses; evacuations and closings; flooded, buckled, and washed-out roads and bridges; downed trees and power outages; large-scale cleanups; and destroyed homes, businesses, and harvests.

We must move now out of reactive mode on climate change. Leadership across sectors requires knowledge, tools, and proactive approaches to climate change to protect Pennsylvanians' health and safety, economy, infrastructure, farms, businesses, recreation, and environmental resources. In addition to preparing for and adapting to the level of impacts we're already experiencing, we must significantly lower greenhouse gas emissions to prevent worsening impacts.

In 2019, I set the first ever statewide goals to reduce greenhouse gas emissions: 26 percent lower by 2025 and 80 percent lower by 2050, compared to 2005, which is the standard baseline. I've charted a course for Pennsylvania to join 10 Northeast states in the Regional Greenhouse Gas Initiative, the cap-and-invest program that reduces carbon dioxide emissions from electric power plants. Revenue from carbon allowance auctions will be targeted to traditional energy-based communities and Environmental Justice areas across Pennsylvania and to further reduce carbon emissions statewide.

I also mandated that state agencies lead by example, increasing sustainability while saving taxpayers money and creating jobs in Pennsylvania's clean energy economy. In addition to aggressively stepping up energy efficiency measures, we launched an initiative in 2021 to get nearly 50 percent of state agencies' electricity from seven new solar energy arrays to be built around the state by January 2023.

I urge leaders across government, business, agriculture, academia, and community organizations—and all Pennsylvanians—to join in making climate change a top priority. It is only with your commitment, collaboration, and action, large scale or small, that Pennsylvania will meet the climate imperative. Throughout history, Pennsylvania has led the nation in every era of energy innovation. We can and must lead now. Pennsylvania Climate Action Plan 2021 tells us how.



September 22, 2021

MESSAGE FROM SECRETARY PATRICK MCDONNELL

Tools to Lead on Climate Action

Slowing down future climate change and adapting to changes that are already happening present a challenge on a scale that can seem overwhelming. Where to start?

Pennsylvania Climate Action Plan 2021 is where to start. Here you'll find statewide data on and trends in greenhouse gas emissions from every sector: electricity generation, transportation, industry, agriculture, residential and commercial buildings, and more.

A suite of 18 strategies is recommended that—if started now—will meet our statewide greenhouse gas emissions goals for 2025 and 2050. For each strategy, the emission reductions, costs, and benefits in jobs and economic growth are quantified, and health and social benefits are analyzed. Supplemental strategies are also recommended to bolster efforts toward greenhouse gas reductions.

In addition, Pennsylvania Climate Action Plan 2021 identifies priority areas to focus our preparation and adaptation: public health, overburdened and vulnerable populations, agriculture, recreation and tourism, infrastructure, and forests, ecosystems, and wildlife.

Pathways to adaptation are mapped out that will enable us to lessen negative impacts and capitalize on any potential opportunities created by climate change.

After getting an overview from this booklet, head to www.dep.pa.gov/climate. There you can review the complete Pennsylvania Climate Action Plan 2021 in depth to inform your policy, planning, and program decision making. You'll also find helpful related resources, including Pennsylvania Climate Impacts Assessment 2021, the Local Climate Action Program, statewide data on greenhouse gas emissions, as well as on job growth and workforce development needs in clean energy industries, and many more tools to lead on climate action in Pennsylvania.

EXECUTIVE SUMMARY

Introduction

Pennsylvania established its first statewide policy on climate change in the Pennsylvania Climate Change Act of 2008 (Act 70). The Act requires the Department of Environmental Protection (DEP) to compile an annual greenhouse gas (GHG) inventory, develop a voluntary GHG registry, and develop a climate action plan (CAP) and impacts assessment and update them every three years. Act 70 also establishes the Climate Change Advisory Committee (CCAC) to advise DEP during CAP and Impacts Assessment development. Working with the committee, DEP has issued several climate action plans and impacts assessments in the intervening years.

Act 70 Requirements

- Compile annual GHG inventory
- Develop a voluntary registry of GHG emissions
- Develop a Climate Action Plan and Impact Assessment
- Establish a Climate Change Advisory Committee

Executive Order 2019-01

- Recognized the risks of climate change for Pennsylvanians
- Set net GHG reduction targets of 26% by 2025 and 80% by 2050 (from 2005 levels)
- Reestablished the GreenGov Council

Governor Tom Wolf issued an executive order in 2019 that established a Pennsylvania climate goal of a 26% reduction in net GHG emissions statewide by 2025 and an 80% reduction by 2050, from 2005 levels. It also reestablished the GreenGov Council to assist state agencies in incorporating environmentally sustainable practices into policy and planning decisions.

This 2021 Climate Action Plan presents GHG reduction strategies that could realize the executive order's emission reduction goals. It also maps out strategies for adapting to the impacts of climate change, based on the 2021 Pennsylvania Climate Impacts Assessment[1].

Within the last two decades, the Commonwealth has created energy policy and program actions that have complemented and supported Act 70's overall goals. For example, the Alternative Energy Portfolio Standard (AEPS) that increased electric utilities' purchases of renewable power, and Act 129 that continue to require electric utilities to meet customer energy savings targets, were in place when the first CAP was published. Given the many efforts which can be undertaken across state government, local governments, and in the private sector and other organizations, the CAP process allows DEP to identify, coordinate, integrate, and leverage a

[1] PA Department of Environmental Protection (2021). Pennsylvania Climate Impacts Assessment 2021. www.depgreenport.state.pa.us/elibrary/GetDocument?docId=3667348&DocName=PENNSYLVANIA CLIMATE IMPACTS ASSESSMENT 2021.PDF <span style%3D"color:green%3b"> <span style%3D"color:blue%3b">%28NEW%29 4/30/2023

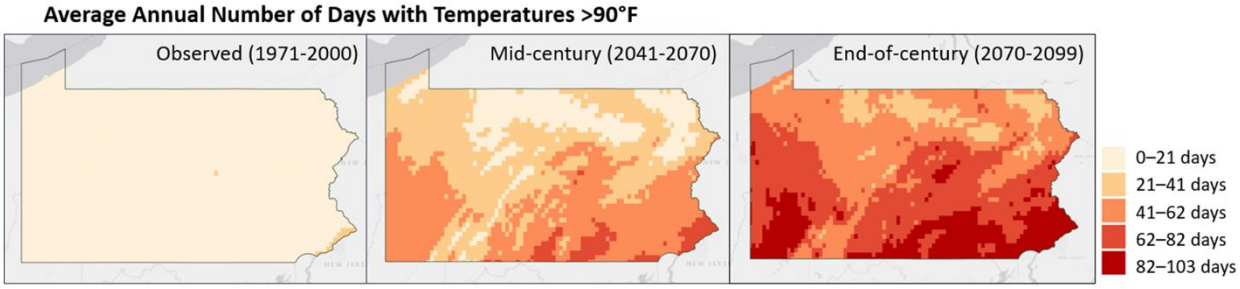
range of strategies that could be employed meet the Commonwealth's GHG reduction goals, while also increasing resilience and adapting to the risks from climate impacts.

This 2021 plan is the CAP's fifth iteration. Building on previous plans and the latest science on the impacts of climate change, it lays out strategies to help Pennsylvania meet the Governor's 2025 and 2050 emission reduction goals, while also helping to prepare for future climate change impacts, and giving added consideration to the plan's effects on public health and equity.

Climate change is already impacting Pennsylvania; worsening heat waves, increased flooding, and other impacts are affecting the state economy and public health. The 2021 Impacts Assessment, published in May 2021, summarizes expected impacts and risks over the next 30 years and beyond, such as:

- The average annual temperature statewide is expected to increase by about 6 degrees Fahrenheit. Extreme heat events will also increase: 90+-degree temperatures are expected to occur approximately 37 days per year, up from 5 days historically; such impacts will, for example, alter the growing season, increase cooling energy use, and decrease heating energy use (Figure ES-1).
- Total average rainfall will increase, coming in less frequent but heavier rain events, but drought conditions are also expected to occur more frequently.
- Tidally influenced flooding is expected to increase in the Delaware Estuary coastal zone. Lake Erie is expected to see lower water levels, increased coastal erosion, and higher water temperatures.

Figure ES-1. Observed and projected annual days with temperatures above 90°F



Rising temperatures and heavy precipitation with inland flooding are identified in the Impacts Assessment as the two highest-risk hazards by mid-century. Increasing temperatures will have major consequences for human health and environmental justice and equity, especially in urban areas. Heavy precipitation and flooding could severely affect human health, agriculture, and built infrastructure, with those in or near floodplains at greatest risk.

Pennsylvania Greenhouse Gas Inventory, Forecast, and Reduction Efforts

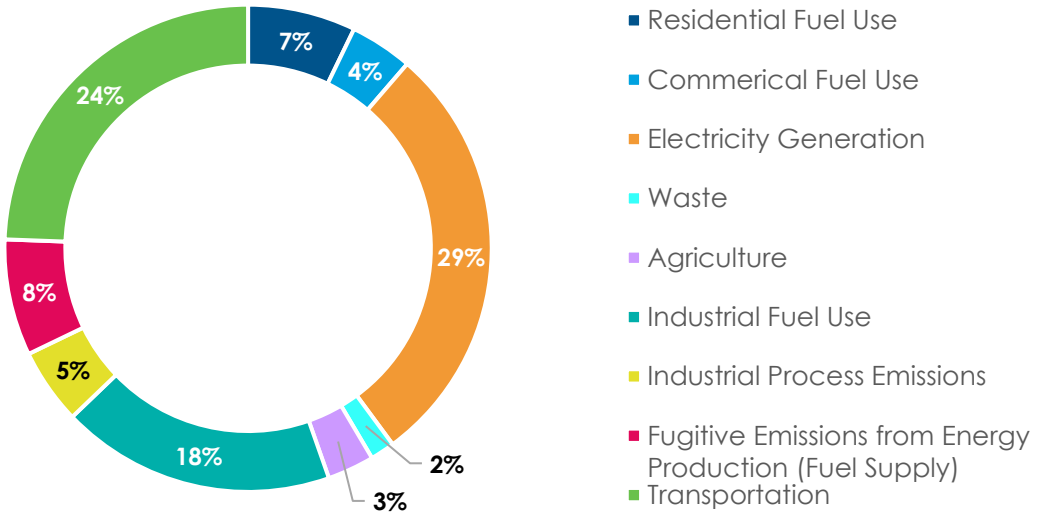
Pennsylvania's latest greenhouse gas inventory reports historical GHG emissions in the Commonwealth from 2000 to 2017. This inventory provides a baseline for tracking progress in reducing GHG emissions over time; it also forms the basis of the business as usual (BAU) emissions forecast through 2050, which is the projected emission levels without any new policy or program changes after 2020. 2017 is the most recent year for Pennsylvania's GHG inventory due to the lag in data availability from the U.S. Environmental Protection Agency (EPA). Pennsylvania is currently working on the 2018 GHG Inventory, but it was not available in time for analysis in the 2021 Impacts Assessment or CAP.

Figure ES-2 below sums up Pennsylvania's 2017 GHG emissions by major sector, totaling 263.2 million metric tons of carbon dioxide or its equivalent ($MMTCO_2e$). More than 10% of that amount is captured each year in soils or vegetation, or "sequestered," resulting in "net" emissions of 233.7 $MMTCO_2e$. 2017 net emissions are almost 20% lower than 2005 levels (289.1 $MMTCO_2e$), which puts Pennsylvania about three-quarters of the way to its 26% reduction goal by 2025.

Emissions have declined since 2005 in most sectors, with the exception of industrial and agricultural emissions. In 2017, the following sectors were the three largest sources of emissions:

- Electricity generation (29%)
- Transportation (24%)
- Industrial fuel use (18%)

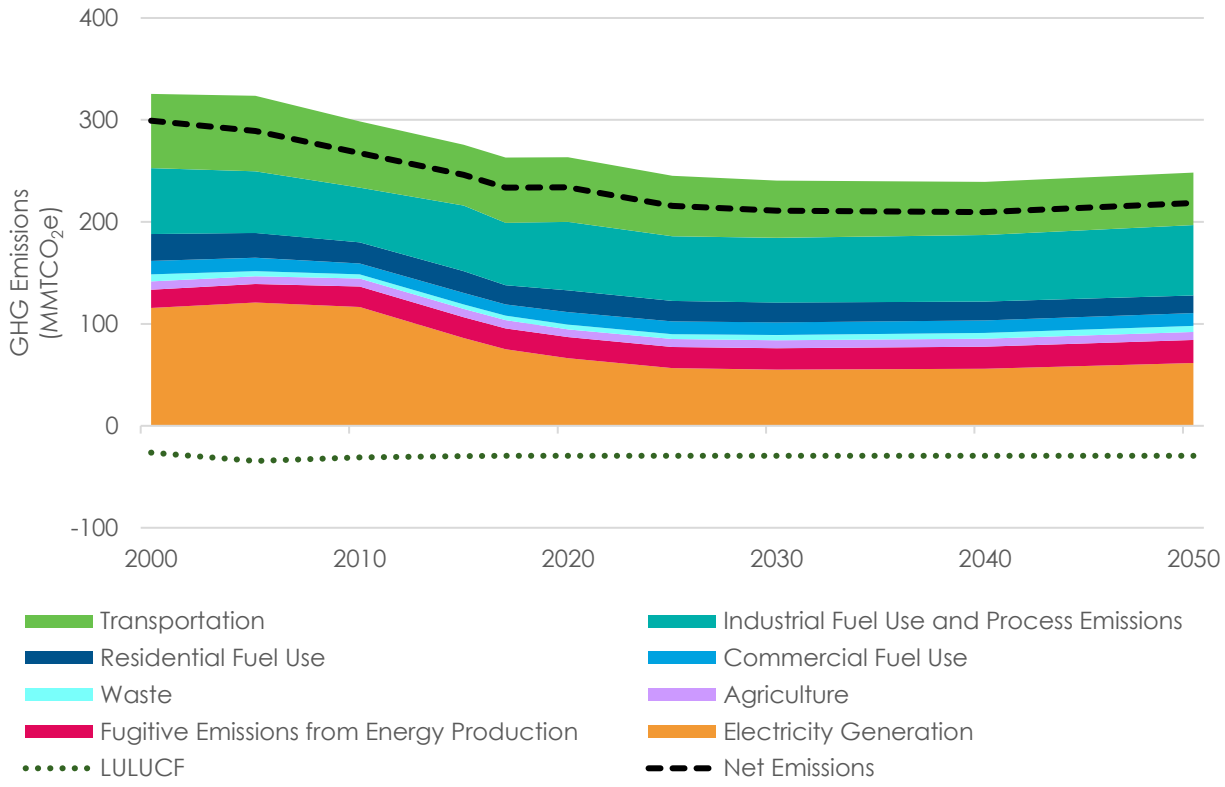
Figure ES-2. Pennsylvania 2017 GHG emissions by sector



Looking forward, Pennsylvania's BAU scenario projects a baseline of GHG emissions through 2050, assuming that current policies and programs, or those significantly underway in

development, are implemented, and thus serving as a benchmark for projecting the impacts of potential GHG reduction strategies. The graphic below shows BAU emissions through 2050: it projects net emissions falling by 24% from 2005 levels. This means that while current policies and actions are expected to almost hit the state goal of reducing GHG emissions 26% by 2025, they fall far short of the 80% emission reductions by 2050 goal. The rest of the required 2050 reductions can be achieved through implementing the CAP's strategies.

Figure ES-3. Business as usual net emissions by sector 2000-2050 ($MMTCO_2e$)



It is important in the context of the BAU assessment to recognize Pennsylvania's energy policies and programs, and key features of its energy economy, that shape both today's energy and environmental agenda and tomorrow's policy and program solutions. Pennsylvania is a leading energy producer and supplier, which has historically and significantly contributed to local economies and wealth. Pennsylvania's energy profile has become increasingly dynamic in recent decades, as both fossil fuel and clean energy generation have grown. These changes, however, have resulted in both challenges and opportunities for reducing GHG emissions. Additional opportunities remain for both improving resilience in Pennsylvania's energy infrastructure and deploying new and diverse energy resources to result in assured energy supply and to mitigate the impacts of climate change. The Commonwealth is the nation's second leading natural gas producer (after Texas) and the largest electricity generator in its

region.[2] In 2019, there were more than 269,000 total energy and motor vehicle sector jobs in Pennsylvania; of those, more than 97,000 were clean energy jobs. [3]

Falling costs for renewable energy, and policies such as the AEPS, have boosted the role of renewable power in the energy mix. However, zero emission energy generation in Pennsylvania is heavily reliant on nuclear power; the Commonwealth is the nation's second largest nuclear power producer. To further reduce power plant emissions, DEP is currently undertaking a rulemaking process to enable Pennsylvania to join the Regional Greenhouse Gas Initiative (RGGI), an 11-state power sector carbon dioxide cap-and-trade program. Participation in RGGI, in addition to driving down emissions, could also create funding to be used in supporting further reductions in GHG emissions.

Energy efficiency has also become a significant source of emissions reductions through more than 10 years of Act 129 implementation, in which the seven largest electric companies meet savings targets by reducing customers' electricity consumption. Act 129 does not cover fuel oil or natural gas use, and fuel oil use is relatively high in rural areas. Cleaner fuels like ethanol and biofuels are mostly used in the transportation sector. To further address transportation fuel emissions, Pennsylvania has been participating in discussions which have helped to develop the Transportation Climate Initiative (TCI), which aims to reduce emissions from the transportation sector. While PA has not committed at this time to joining the TCI Program (TCI-P), which would require fuel suppliers to purchase "allowances" for the GHG emissions resulting from the combustion of fuels sold in participating jurisdictions using cap-and-trade mechanisms, TCI-P is designed such that Pennsylvania may consider participation in the future.

PA Policies Informing the BAU Scenario

- **Act 129.** Act 129 requires PA's seven largest electric distribution companies (EDCs) to reduce customer energy use.
- **Alternative Energy Portfolio Standard.** AEPS sets targets for renewable electricity supplied by PA's EDCs. AEPS 2020 rules are projected to remain constant through 2050.
- **Regional Greenhouse Gas Initiative.** By joining RGGI, Pennsylvania would commit to reducing powerplant emissions along with 11 other states. RGGI 2020 rules are projected to remain in place through 2050. RGGI will not take effect in Pennsylvania until 2022.
- **Hydrofluorocarbon (HFC) Phaseout.** HFC chemicals are found in air conditioning refrigerants. PA will phase out HFCs in accordance with the Federal AIM Act.

[2] U.S. Energy Information Administration (2020). Pennsylvania State Energy Profile. https://www.eia.gov/state/print.php?sid=PA

Pennsylvania has undertaken numerous energy and environmental programs and policies since the early 1990s. Some of the most notable and ongoing examples include:

- Act 213: Alternative Energy Portfolio Standards (AEPS) (2004),
- Act 70: Pennsylvania Climate Change Act (2008),
- Act 129: Energy Efficiency and Conservation Program (2008),
- Act 30: Commercial Property Assessed Clean Energy Program (C-PACE) (2017),
- Act 40: Solar Renewable Energy Credits (2017),
- The Medium- and Heavy-Duty Zero Emission Vehicle MOU,
- Governor's Executive Order 2019-01, which set GHG reduction goals for Pennsylvania and sustainability goals for Commonwealth agencies (2019), and
- Governor's Executive Order 2019-07, which enabled Pennsylvania to join RGGI (2019).

These and other efforts have evolved to support a broader transition to a cleaner and more resilient energy future, encompassing a wide range of organizational, regulatory, and program initiatives. Examples include:

- Regulating volatile organic compounds (VOCs), which reduces co-pollutants like methane emissions from natural gas,
- Planning for climate adaptation,
- Incentives for clean vehicles, and
- Clean energy financing.

The list of efforts underway in state and local governments and the private sector grows ever longer. For more information on these and other ongoing efforts, visit DEP's website: https://www.dep.pa.gov.

Opportunities to Significantly Reduce GHG Emissions in Pennsylvania

DEP worked with the CCAC and other agencies, in addition to gathering public input via a public survey and best-practice information from around the country, to identify, prioritize, and model the impacts of a wide range of strategies for reducing GHG emissions across Pennsylvania's buildings, industry, transportation, power, fuels, agricultural, other land use, and waste sectors. These are summarized in Table ES-1. Considerable deliberation went into identifying, prioritizing, describing, and modeling these strategies; the methods and process for those efforts are described in the body of the plan. Strategies with quantified GHG reductions, costs, and benefits are assigned A-R for ease of reference throughout this plan.

Table ES-1. Summary of GHG reduction strategies by sector

Sector	GHG Reduction Strategy	Expected Implementation Timeframe	Quantified GHG Reductions, Costs and Benefits
Residential and Commercial (R&C) Buildings	A. Support energy efficiency through building codes	Near-term	Yes
	B. Improve residential and commercial energy efficiency (electricity)	Near term	Yes
	C. Improve residential and commercial energy efficiency (gas)	Near term	Yes
	D. Incentivize building electrification	Midterm	Yes
	Introduce state appliance efficiency standards	Midterm	No
	E. Increase distributed on-site solar	Near term	Yes
	Take actions to promote and advance C-PACE financing and other tools for Net Zero Buildings and high-performance buildings	Near term	No
Transportation	F. Increase fuel efficiency of all light duty vehicles and reduce vehicle miles traveled for single occupancy vehicles	Midterm	Yes
	G. Implement the multi-state medium-and heavy-duty zero-emission vehicle memorandum of understanding	Long term	Yes
	H. Increase adoption of light-duty electric vehicles	Midterm	Yes
	I. Implement a Low Carbon Fuel Standard	Midterm	Yes
Industry	J. Increase industrial energy efficiency and fuel switching	Near term	Yes
Fuel Supply	K. Increase production and use of biogas/renewable gas	Midterm	Yes
	L. Incentivize and increase use of distributed Combined Heat and Power	Near term	Yes
	M. Reduce methane emissions across oil and natural gas systems	Midterm	Yes
Electricity Generation	N. Maintain nuclear generation at current levels	Near term	Yes
	O. Create a carbon emissions free grid	Long term	Yes
Agriculture	P. Use programs, tools, and incentives to increase energy efficiency for agriculture	Near term	Yes
	Q. Provide trainings and tools to implement agricultural best practices	Midterm	Yes
LULUCF	R. Increase land and forest management for natural sequestration	Midterm	Yes
Waste	Reduce food waste	Near term	No
	Reduce waste generated by citizens and businesses and expand beneficial use of waste	Near term	No

Highlights of Key Results

The following are highlights of key results of modeled GHG reduction strategies, which include GHG emission reductions and different measures of cost-effectiveness (i.e., costs, jobs, economic growth). Health and social benefits were also analyzed outside of modeling efforts, and are discussed in the body of the plan.

Pennsylvania will likely exceed the 26% GHG emission reduction target by 2025, if all the modeled strategies are implemented and expected impacts are realized. The success of strategies in the fuel supply and industrial sectors will be especially important from now to 2025.

Reaching the 80% reduction target by 2050 will require successful implementation of all recommended strategies. Electricity generation strategies show the greatest potential for reductions through 2050, followed by the transportation, industrial, and buildings sectors. The electricity sector sheds its GHG emissions by producing almost all of its power from nuclear and renewable sources, which is one potential scenario for a future clean grid.

The strategies outlined in the CAP create jobs through cost-effective strategies while sustaining economic growth. Insights from the modeling results show that the CAP strategies:

- **Create over one million job-years[4] by 2050**, with an annual average close to 42,000 supported jobs per year, an increase of about 0.5% per year on average.
- **Result in little effect on economic growth while promoting a more environmentally sustainable future for Pennsylvania**. The average annual gross state product (GSP) decreases marginally by 0.01% overall, but rises in later years with an equivalent GSP increase of about 0.1% annually by 2050. Thus, the Pennsylvania economy continues to grow robustly with CAP strategies in place and the changes in GSP being on the margin, without affecting the overall growth path of the state economy. Similar patterns are expected for personal income changes as well, with slight annual decreases in early years, followed by slight annual increases in later years. The Commonwealth economy continues to grow with these strategies in place, but at a slightly slower rate than without any action to reduce emissions to mitigate the impacts of climate change.
- **Are cost-effective.** Taken together, the CAP strategies cost less per ton of GHG emissions reduced than the cost of inaction**.** Most strategies also create co-benefits such as improved air and water quality, improved health outcomes, increased energy security, and improved equity and environmental justice outcomes.

It is also important to note that these emission reduction strategies will likely reduce need for adaptation investments, and those benefits are not calculated in the CAP modeling process. In

[4] A job-year is defined as one year of work for one person. For example, a new construction job that lasts five years is five job-years.

addition, some of the CAP's emission reduction strategies provide adaptation co-benefits, and vice versa; while not modeled quantitatively, the body of the plan identifies these synergies.

GHG Reduction Modeling Results Highlights

The CAP modeling process showed that Pennsylvania's 2025 and 2050 GHG reduction targets can be met by implementing strategies across all sectors. The "wedge graph" (Figure ES-4) below illustrates a possible pathway to 80% reductions by 2050. The 2025 reduction target could be exceeded through successful implementation of the modeled strategies; beyond that point, sustained impacts are needed from all strategies for the next 25 years. **Figure ES-5** shows annual reductions by sector compared to the BAU for select years.

Figure ES-4. GHG reductions by strategy, through 2050 ($MMTCO_2e$)

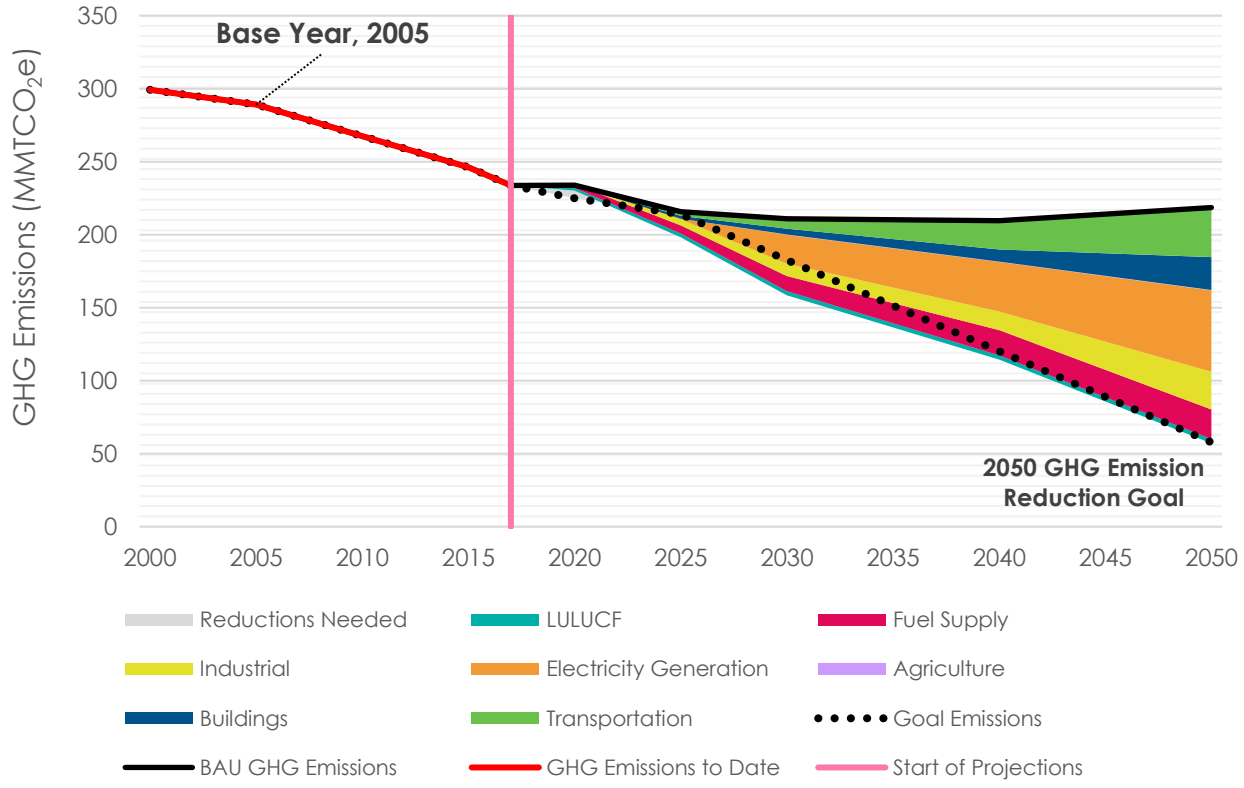

Figure ES-5. GHG reductions by sector for select years, compared to business as usual

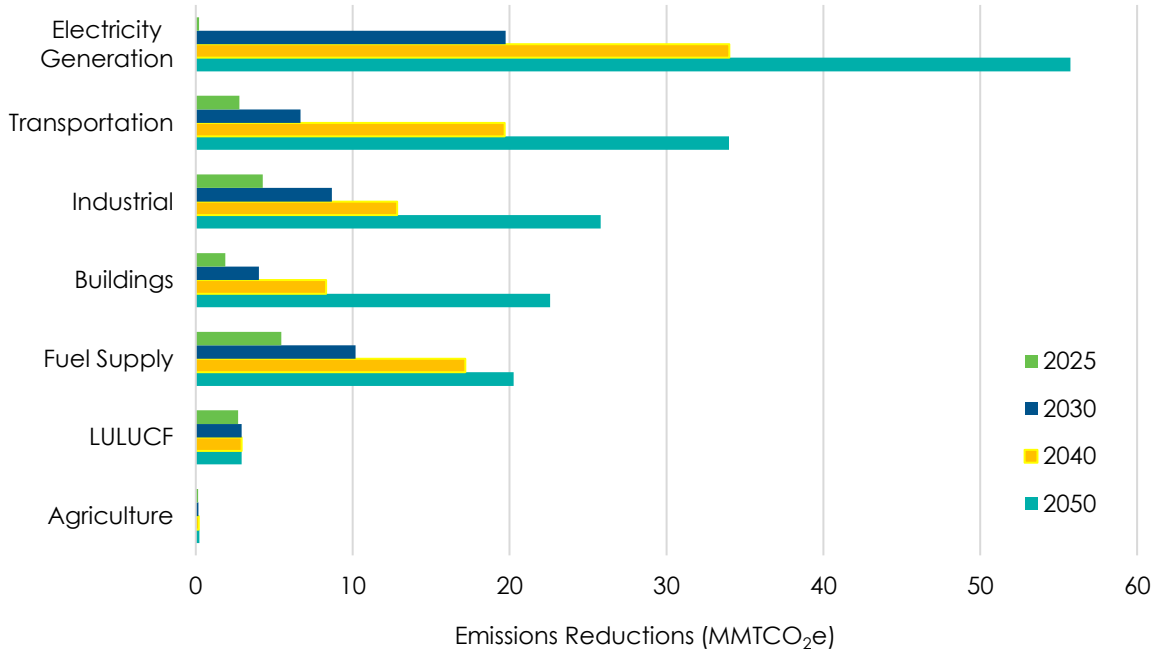


The CAP provides extensive additional details on the modeling process, the strategies that were modeled, the modeling results, as well as detailed descriptions of each strategy. It also explores implementation considerations for these strategies, such as cost, political, and environmental justice considerations, and examines enabling technologies that will likely be needed to facilitate full realization of strategy impacts.

Opportunities to Adapt to the Impacts of Climate Change

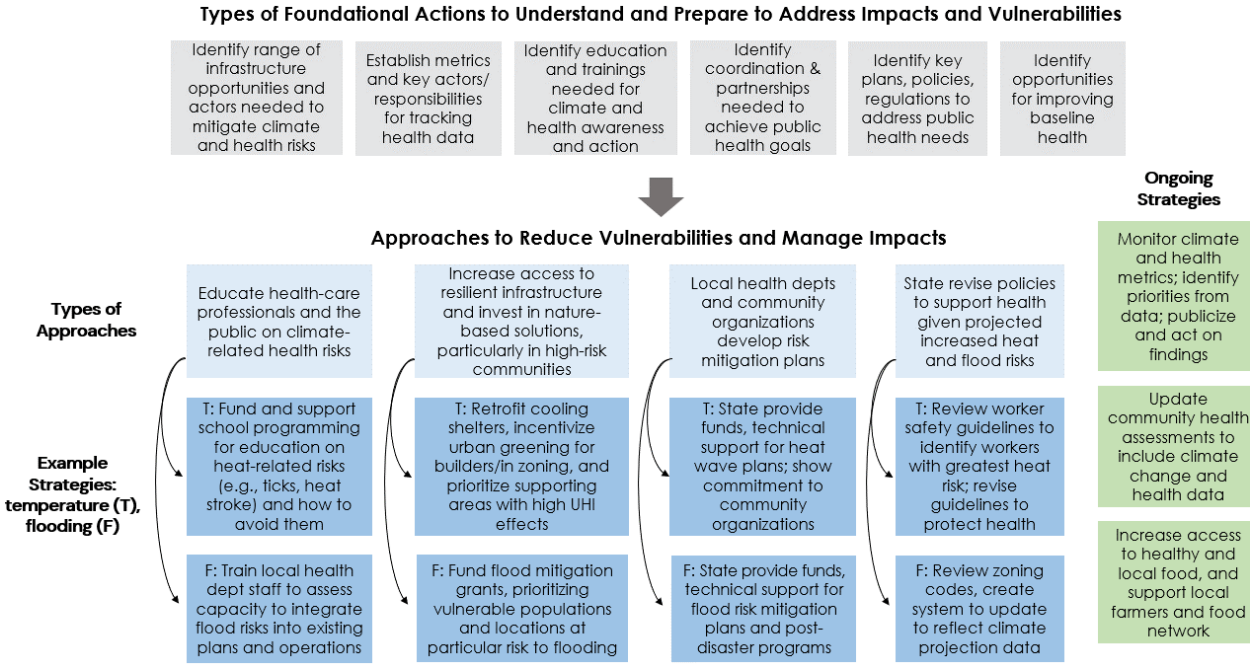
Climate risks and related impacts in Pennsylvania could be severe, potentially causing increased infrastructure disruptions, higher risks to public health, economic impacts, and other changes, unless actions are taken by the Commonwealth to avoid and reduce the consequences of climate change. Taking adaptation action also presents an opportunity for Pennsylvania to strengthen its economy, reduce inequities, and build resilience.

As a result of the 2021 Impacts Assessment, seven priority areas were identified for climate adaptation:

- Increasing heat and flooding on health
- Increasing heat and flooding on overburdened and vulnerable populations
- Increasing average temperatures on forests, ecosystems, and wildlife
- Warmer and wetter climate on agriculture
- Increasing average temperatures on recreation and tourism
- Flooding on built infrastructure
- Landslides on built infrastructure.

The CAP describes a wide range of strategies to help Pennsylvanians adapt to these priority unavoidable impacts of climate change, even as the GHG reduction strategies work to reduce these impacts. Figure ES-6 below illustrates the CAP's approach to adaptation for reducing impacts of heat and flooding on health (one of the seven priority areas); Section 4 provides greater detail across a wide range of impacts and adaptation strategies.

Figure ES-6. Adaptation strategy pathway to reduce public health impacts from heat and flooding



This diagram provides illustrative examples of the primary types of strategies but does not capture the full universe of possible strategies that could be deployed.

Pennsylvania can use a combination of strategies to manage climate risks and can plan and implement strategies over time as conditions and information change. This approach is referred to as "adaptive management" (see Section 4). The Commonwealth can draw on strategies in this CAP as well as other resources.

Below are two examples (Figure ES-7, Figure ES-8) that visualize how adaptive management could be used to manage flood and heat risks in Pennsylvania. They show how new information about future climate risks (e.g., the 2021 Impacts Assessment) and the occurrence of events that will become more frequent (e.g., severe flooding) can guide the Commonwealth in selecting and implementing adaptation strategies. In particular, they illustrate how extreme events—such as a flood that causes devastating infrastructure damage, or a heat wave with a heightened death toll—harm people and places and thereby motivate society to both reconsider what risks are acceptable and take action to reduce risks by implementing additional adaptation strategies.

Figure ES-7. Example adaptive management approaches to flood risk

1 INTRODUCTION

How to Use This Climate Action Plan

This 2021 Climate Action Plan was developed primarily to serve as a guide for leaders and decision makers to set priorities, develop policies and programs, and take data-informed action to reduce GHG emissions and adapt to a changing climate. This plan is not an exhaustive list of all strategies that can be implemented to mitigate climate change, but presents a suite of GHG reduction strategies selected by DEP with advisement by the Climate Change Advisory Committee to meet Pennsylvania's GHG reduction goals. This plan also provides strategies for all Pennsylvanians for adapting to a changing climate.

Legislative and Executive Foundations of the Climate Action Plan

The Pennsylvania Climate Change Act of 2008 (Act 70) requires the Department of Environmental Protection (DEP) to compile an annual greenhouse gas (GHG) inventory for Pennsylvania's GHG emissions, to develop a voluntary GHG registry, and to develop a climate action plan (CAP) and impacts assessment and update them every three years. Act 70 also established the Climate Change Advisory Committee (CCAC) to advise DEP during the development of the Impacts Assessment and CAP. Working with the CCAC, DEP has prepared a series of climate action plans and GHG mitigation strategies since Act 70's creation in 2008.

Act 70 Requirements

- Compile annual GHG inventory
- Develop a voluntary registry of GHG emissions
- Develop a Climate Action Plan and Impacts Assessment
- Establish a Climate Change Advisory Committee

Executive Order 2019-01

- Recognized the risks of climate change for Pennsylvanians
- Set net GHG reduction targets of 26% by 2025 and 80% by 2050 (from 2005 levels)
- Reestablished the GreenGov Council

In 2019, before the release of the fourth Pennsylvania Climate Action Plan, Governor Tom Wolf issued Executive Order 2019-01 (EO 2019-01, Commonwealth Leadership in Addressing Climate Change and Promoting Energy Conservation and Sustainable Governance). This EO establishes a climate goal for Pennsylvania and includes a "Lead by Example" provision for the state government that reestablished the GreenGov Council to encourage the state to incorporate environmentally sustainable practices into the Commonwealth's policy and planning decisions. The third paragraph of the EO also states:

> *Climate change impacts in Pennsylvania are real and continue to put Pennsylvanians at risk: in recent years, extreme weather and natural disasters have become more frequent and more intense. Like many areas of the United States, Pennsylvania is expected to*

> *experience higher temperatures, changes in precipitation, and more frequent extreme weather events and flooding because of climate change in the coming decade.*

EO 2019-01 specifically states that the "Commonwealth shall strive to achieve a 26 percent reduction of net greenhouse gas emissions statewide by 2025 from 2005 levels, and an 80 percent reduction of net greenhouse gas emissions by 2050 from 2005 levels." Net emissions are equal to total (i.e., "gross") emissions minus emissions captured or sequestered (e.g., by forestry and land use). These goals are in line with the goals of the Paris Agreement.[5]

This 2021 Climate Action Plan includes a prioritized set of GHG reduction strategies that, if implemented successfully, could reduce future GHG emissions to levels that actualize the GHG reductions goals of the EO. This 2021 plan also recognizes and maps out flexible strategies and pathways for adapting to the impacts of climate change in Pennsylvania, building directly on the 2021 Pennsylvania Climate Impacts Assessment.

Pennsylvania's Evolving Energy and Climate Efforts

Since the initial CAP and Impacts Assessment were developed and published in 2009, Pennsylvania's approach to addressing climate change has evolved as science and technology continue to mature and the Commonwealth's context and needs change. While some key energy policies that have climate benefits, such as the Alternative Energy Portfolio Standard (AEPS) and Act 129 were in place when the first CAP was published (see Figure 1), the CAP process is important because it allows DEP to map out how climate-relevant policies and programs can continue to evolve, and to determine how potential new policies and programs can lead to further GHG reductions, increased resiliency, and reduced risk from climate impacts, to the benefit of all Pennsylvanians. Previous CAPs have helped lay the foundation for new programs that are being developed now, most notably Pennsylvania participating in the Regional Greenhouse Gas Initiative (RGGI) and developing the Pennsylvania Commercial Property Assessed Clean Energy (C-PACE) Program[6] and ongoing industrial energy assessments.[7]

This 2021 Pennsylvania Climate Action Plan is the fifth iteration of the CAP. It builds on previous plans and includes the latest science on the impacts of climate change, the near- and long-term emission reduction goals for the Commonwealth, new and expanded strategies to

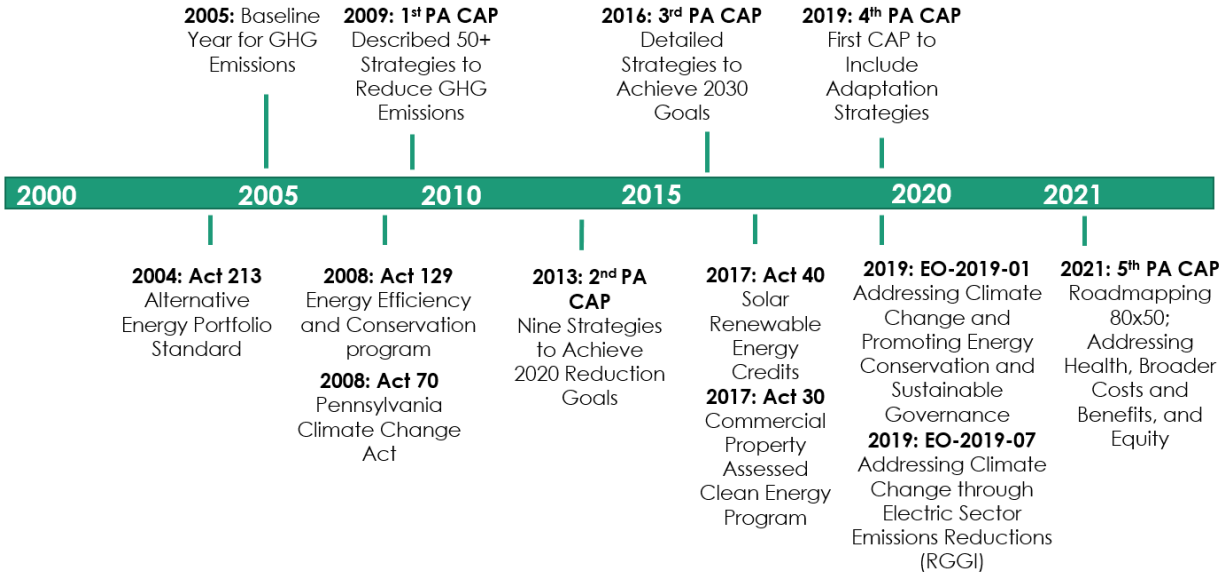
reduce GHG emissions and prepare for the impacts of climate changes, and the consideration of how the strategies outlined in this plan effect public health and equity.

Figure 1. Pennsylvania's evolving energy and climate planning and implementation efforts



Impacts of Climate Change in Pennsylvania

Climate change is already affecting Pennsylvania. From severe heat waves to significant flooding, climate change influences weather events that have economic, health, and other impacts across the Commonwealth. These events can affect some Pennsylvanians more than others.

The 2021 Pennsylvania Climate Impacts Assessment, published in May 2021, summarizes the latest expected impacts and risks from climate change in the Commonwealth. By midcentury, the following climatic changes (compared to a 1971–2000 baseline) are expected:

- The average annual temperature statewide is rising and is expected to increase by 5.9°F (3.3°C).
- There will be more frequent and intense extreme heat events. For example, temperatures are expected to reach at least 90°F on 37 days per year, up from the 5 days during the baseline period (see Figure 2). Days reaching temperatures above 95°F and 100°F will become more frequent as well.
- Increasing temperatures will continue to alter the growing season and increase the number of days that people need to cool their homes and workspaces but will also decrease the number of days that people will need to use heating.
- Pennsylvania could experience more total average rainfall, occurring in less frequent but heavier rain events. Extreme rainfall events are projected to increase in magnitude,

frequency, and intensity (see Figure 3) and drought conditions are also expected to occur more frequently.

- Tidally influenced flooding is expected to increase in the Delaware Estuary coastal zone.
- Lake Erie is expected to undergo significant changes in water level, coastal erosion, and water temperature.

Figure 2. Observed and projected annual days with temperatures above 90°F

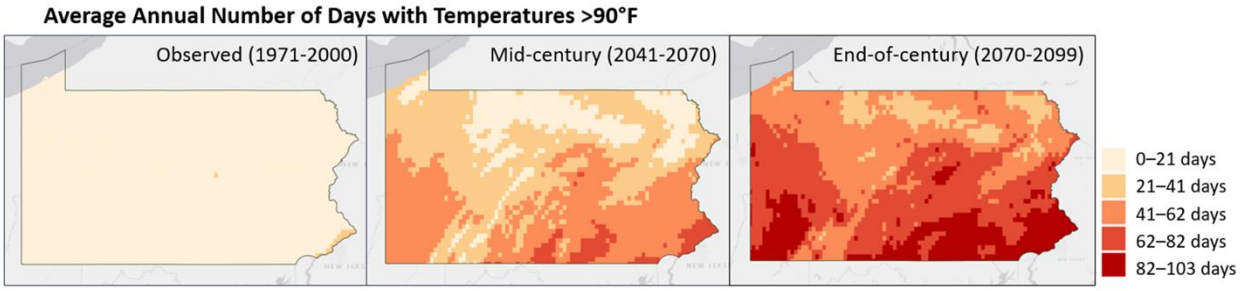


Figure 3. Observed and projected annual days with "very heavy" precipitation

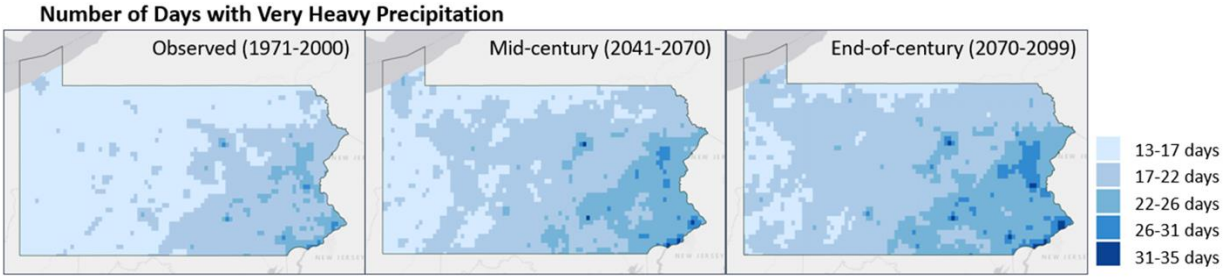

These and other existing and future climate changes are described in further detail in Section 4.

As Pennsylvania works to reduce its climate risks, adapt to climate change, and increase its resilience, it must address any inequitable impacts and ensure that adaptation efforts do not inadvertently exacerbate inequities. Instead, adaptation actions should reduce impacts on vulnerable populations. The 2021 Impacts Assessment identified the following top priorities for adaptation action:

- Reduce extreme heat risks to human health, particularly for vulnerable populations.
- Support the agriculture, recreation, and tourism sectors, as well as forests, ecosystems, and wildlife in the transition to a warmer climate.
- Reduce flood risks to infrastructure and communities.

- Help low-income households cope with an increased energy burden.[8]
- Enhance tropical storm and landslide risk mitigation.

Climate risks and related impacts in Pennsylvania could be severe, potentially causing increased infrastructure disruptions, higher risks to public health, economic impacts, and other changes, unless actions are taken by the Commonwealth to avoid and reduce the consequences of climate change.

The Impacts Assessment found that increasing average temperatures and heavy precipitation and inland flooding are the two highest-risk hazards by midcentury. Both hazards could affect the entire state and all sectors (Figures 2 and 3). Increasing temperatures have the highest consequences for human health and environmental justice and equity, especially in urban areas. Heavy precipitation and flooding could also have severe consequences for human health, agriculture, and built infrastructure, with populations, farms, and infrastructure located in or near floodplains at particular risk.

Adaptation vs. Resilience

Adapting to climate change and increasing resilience to climate risks often go hand in hand. However, the terms have different central meanings, and their definitions may vary by context and the actor using them. The CAP has adapted definitions from the National Climate Assessment (NCA), an industry standard for climate risk assessment and adaptation planning in the U.S.

Adaptation is the process of adjusting to new or changing climate conditions to reduce or avoid negative impacts to valued assets and take advantage of emerging opportunities.

Resilience is the capacity of a community, business, or natural environment to prevent, withstand, respond to, and recover from disturbances, while retaining the basic functions of the system.

For example, Pennsylvania may *adapt* to changing climate conditions by tracking metrics for climate and health and using them alongside climate projections (e.g., future temperature data) to inform public health planning, which will in turn increase the *resilience* of Pennsylvanians to future extreme heat events.

Effects of COVID-19

The COVID-19 pandemic emerged in late 2019 and shut down vast swathes of Pennsylvania, the United States, and the world, off and on throughout 2020 and into 2021. It created extreme conditions that affected all aspects of society, the economy, and the environment from which we are beginning to recover as of the date of this plan. The pandemic caused businesses to shut down (temporarily and permanently), cost people their lives and livelihoods, restricted travel and cultural events, and burdened the healthcare system. For example, from March 21, 2020, to January 2, 2021, 2.57 million Pennsylvanians filed unemployment insurance claims (39.2% of the pre-pandemic labor force). For the 2020 fiscal year that ended in June 2020, Pennsylvania's tax revenue was

[8] This includes energy efficiency, ratemaking that reduces or does not impose rate increases on low income customers, and electrification schemes that do not shift multifamily energy bills from landlords to tenants, for example.

nearly $3.2 billion less than expected, a budget gap of about 9%.[9] For clean energy jobs specifically, by December 2020, industry jobs had declined 12% from the previous year, and only 30% of the jobs lost in the early months were recovered. Experts estimate that it may take years for the sector to fully recover.[10] The impacts to healthcare were particularly egregious as COVID patients strained hospital resources and priorities. Hospitals initially lacked resources such as personal protective equipment and respirators and faced budget shortfalls, threatening the long-term viability of some hospitals.[11] As of June 2021, there were over 1.2 million total cases and over 27,000 deaths attributed to COVID-19 in Pennsylvania.[12]

Although these and other effects of COVID-19 are severe and ongoing, the CAP, particularly the GHG modeling, does not account for the effects of COVID-19. This is because with just a year of data available, analysis of the short-and long-term effects of COVID-19 on energy use and emission related trends is highly uncertain, especially as more people are vaccinated and society returns to normal. The 2021 dataset from the Energy Information Administration's Annual Energy Outlook (AEO), released after the emissions projections were completed for the 2021 CAP, projects that the effects of COVID-19 will be felt mainly in the short term.[13] Following a sharp decline in energy consumption and associated emissions, a recovery to pre-pandemic levels is expected in the next four to five years. The long-term energy trends are quite similar between the 2020[14] and 2021 AEO projections, indicating that the energy sector will not experience significant long-term impacts of COVID-19. Because this CAP focuses mainly on emissions reductions in the long-term (i.e., through 2050), the short-term impacts of COVID-19 are not included in the modeling. Additionally, the full impacts of the pandemic and recovery efforts will take years to fully materialize in available data. Therefore, the effects of COVID-19 will be incorporated into the 2024 CAP when the resultant data are more certain and robust.

CAP Development Process

The development of this CAP was informed by the current and anticipated climate risks Pennsylvania faces and builds on the historical and current climate work of DEP and others. DEP led the development of the Impacts Assessment and this CAP—two related climate assessment and planning efforts that were developed concurrently. The ICF team, including its

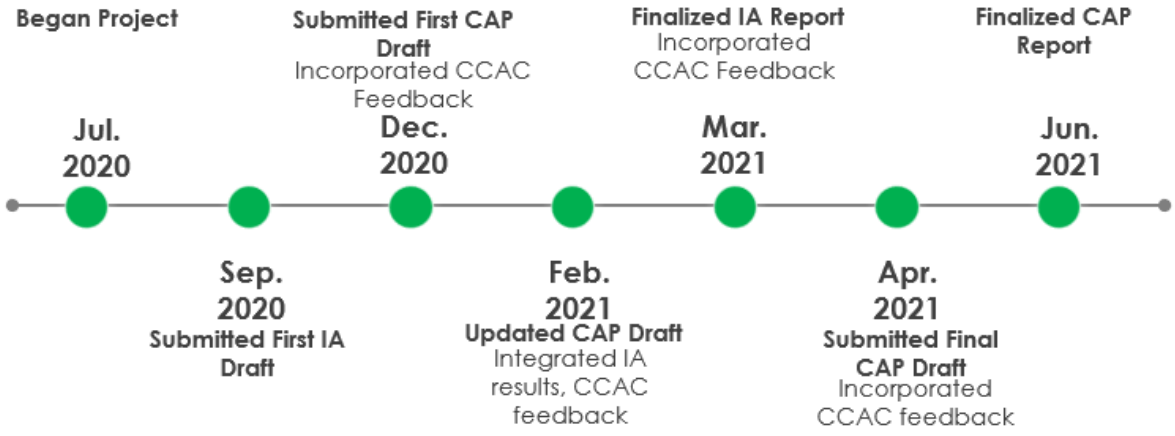
partners at Pennsylvania State University (Penn State) and Hamel Environmental Consulting, was responsible for modeling the BAU, GHG reduction strategies, and adaptation strategies, provided technical expertise throughout the process, and contributed to the writing of this plan. Additionally, DEP's Energy Programs Office engaged other DEP offices and state agencies throughout the planning process, including the DEP Office of Environmental Justice, the DEP Bureau of Air Quality, and the Department of Conservation and Natural Resources. DEP also engaged in public outreach through surveys, open to all Pennsylvanians, to gather information and feedback for this plan. Finally, throughout the process, DEP shared updates with and sought feedback from the CCAC, as mandated in Act 70, to improve the final CAP. This inclusive and iterative process ensured that diverse opinions and information sources were integrated into the Impacts Assessment and the CAP.

Work on the Climate Action Plan began in July 2020 and initially focused on assessing climate impacts through the development of the Impacts Assessment. The Impacts Assessment uses a risk-based approach to assess the impacts of climate change, which feeds into the adaptation strategies identified in this CAP. Figure 4 provides an overview of the Impacts Assessment and CAP development process timeline.

Figure 4. CAP process timeline



What this Plan Provides

The purpose of this plan is to describe DEP's plan to reduce Pennsylvania's contribution to climate change and adapt to the current and future impacts of climate change. Below is a brief outline of the contents.

- Section 2 describes Pennsylvania's current GHG emissions profile, the results of the business-as-usual projection, and the ongoing climate efforts.
- Section 3 outlines the approach used to identify and select GHG reduction strategies and provides a detailed description of each selected strategy and select enabling technologies.
- Section 4 summarizes the priority climate risks and impacts, as well as opportunities to adapt to those impacts.
- Section 5 details challenges and opportunities of climate action, implementation principles, and key steps and stakeholders necessary to implement the CAP.

- Appendix A provides a glossary of key terms and a list of acronyms.
- Appendix B describes the methodology used to develop the analyses in this plan.
- Appendix C provides examples of adaptation strategies in addition those described in Section 4.
- Appendix D contains letters submitted by CCAC appointees identifying "areas of agreement and disagreement" to fulfill the requirement of Act 70.

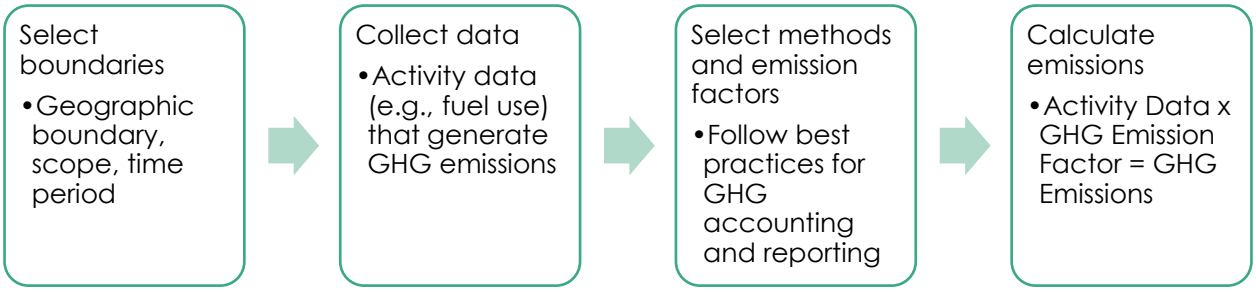
2 PENNSYLVANIA'S GREENHOUSE GAS INVENTORY, FORECAST, AND REDUCTION EFFORTS

Pennsylvania's latest GHG inventory provides a snapshot of GHG emissions in the Commonwealth from 2000 to 2017. The inventory is used to track progress in reducing GHGs and forms the basis of the business as usual (BAU) emissions scenario. The BAU scenario projects emissions in Pennsylvania through 2050 if only the existing (as of December 2020) GHG reduction policies and programs continue.

Current GHG Emissions

The GHG inventory process, summarized in Figure 5, is consistent over time so that inventories can be compared as new inventories are developed. In 2020, DEP developed Pennsylvania's most recent GHG inventory for 2017 emissions by using the EPA's State Inventory Tool (SIT), which follows a standard process for generating state-level emission estimates. The SIT was used to calculate GHG emission estimates for intervals from 2000 through 2017. 2017 is the most recent year for Pennsylvania's GHG Inventory due to the lag in data availability from the EPA. Pennsylvania is currently working on the 2018 GHG Inventory, but it was not available in time for analysis in the 2021 Impacts Assessment or CAP.

Figure 5. The inventory development process



Emissions from the following sectors are included in the inventory:

- Residential fuel use
- Commercial fuel use
- Industrial fuel use and process emissions
- Fugitive emissions from energy production
- Transportation
- Electricity generation
- Agriculture

- Waste management
- Forestry and land use (natural carbon sink).

Figure 6 shows a breakdown of 2017 GHG emissions in Pennsylvania by sector. Figure 7 provides a summary of historical gross and net GHG emissions in Pennsyvlania by sector. GHG emissions are measured in million metric tons of carbon dioxide equivalent ($MMTCO_2e$). The Pennsylvania GHG Inventory[15] and the Inventory of U.S. Greenhouse Gas Emissions and Sinks annual report[16] provide more granular emissions data disaggregated by each type of emission.

Gross vs. Net Emissions

"Gross emissions" includes only source categories with positive emissions, while "net emissions" include source categories with both positive and negative emissions. For Pennsylvania, net emissions are equal to gross emissions plus negative emissions from forestry and land use.

Total statewide gross GHG emissions in 2017 were 263.2 $MMTCO_2e$. Gross emissions do not include carbon sequestered by the land use, land-use change, and forestry (LULUCF) sector, which sequestered 29.5 MMT CO_2e in 2017. The additional carbon sequestration from LULUCF resulted in net GHG emissions of 233.7 $MMTCO_2e$, which was 19.2% lower than 2005 levels (289.1 $MMTCO_2e$). These emissions are about three-quarters of the way to meeting Pennsylania's 2025 goal of reducing GHG emissions 26% from 2005 levels.

Emissions have declined since 2005 in most sectors, except for industrial (fuel use and process emissions) and agricultural emissions. As of 2017, the following sectors were the three largest sources of emissions, presented in order from largest to smallest:

- Electricity generation (29%)
- Transportation (24%)
- Industrial fuel use (18%).

[15] https://www.dep.pa.gov/citizens/climate/Pages/GHG-Inventory.aspx
[16] https://www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks

Figure 6. Pennsylvania 2017 GHG emissions by sector

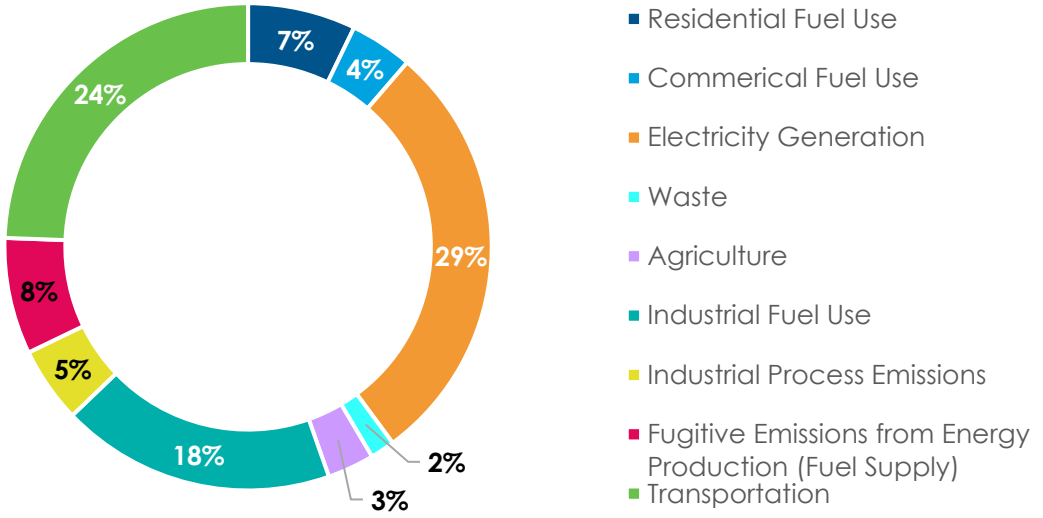


Figure 7. Pennsylvania historical net GHG emissions by sector ($MMTCO_2e$)

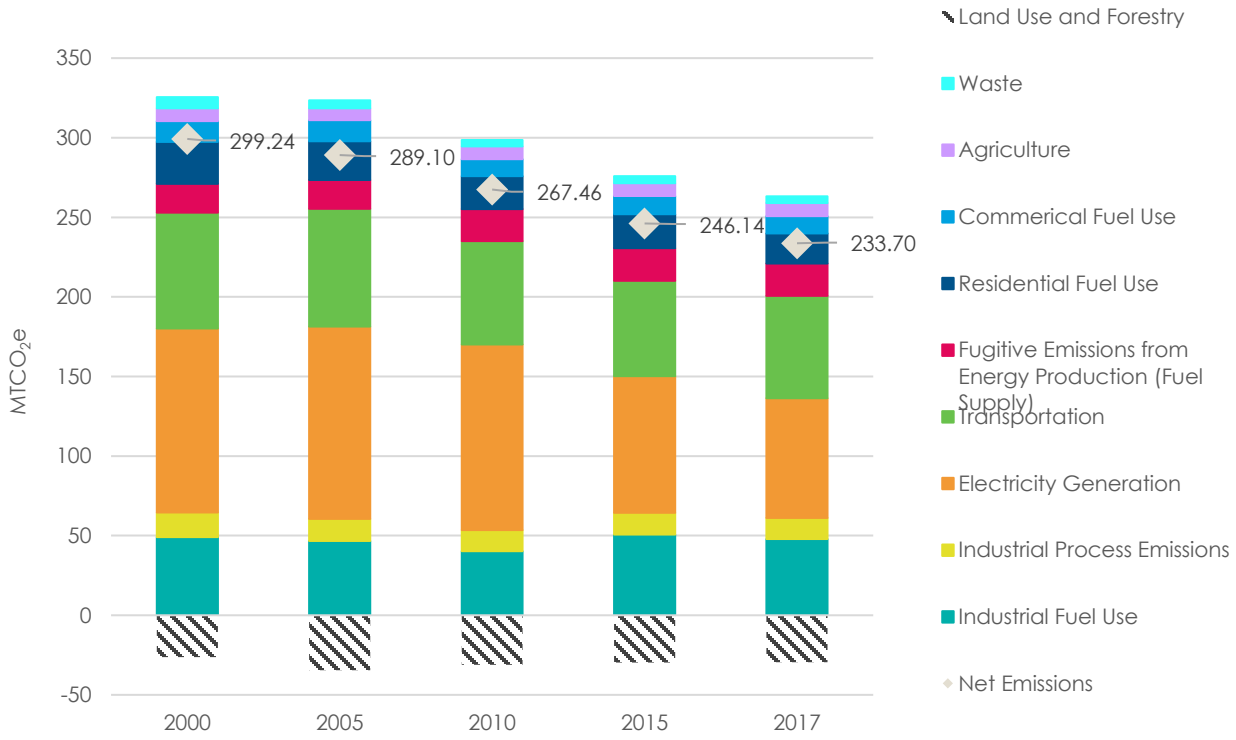
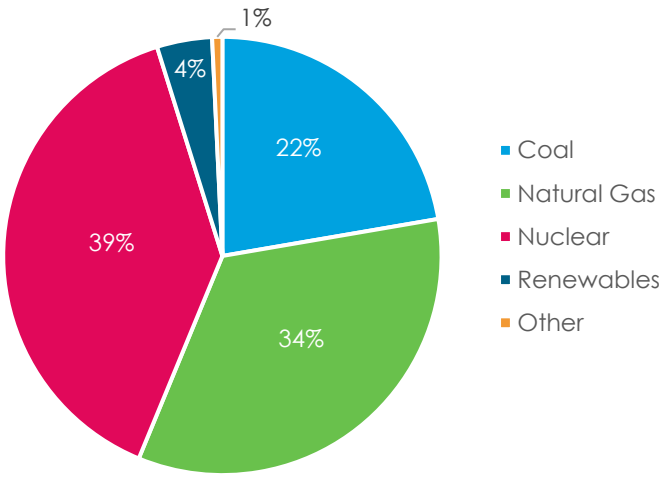


This CAP breaks out industrial emissions and fugitive emissions from energy production to translate the GHG inventory sectors to emission reduction strategies in Section 3. However, for GHG inventory purposes, both of these sources are included in the industrial sector. Electricity generation, transportation, industrial fuel use and process emissions, and fugitive energy production emissions combined account for 95% of total GHG emissions in Pennsylvania. Recent trends in these sectors are briefly discussed below.

Electricity Generation: Emissions from electricity generation decreased 7% from 2016 to 2017, and 38% from 2005 to 2017. This is mainly a result of decreased electricity generation from coal being offset by increases in natural gas generation, energy efficiency improvements as a result of Act 129, and increased electricity generation from alternative and renewable energy sources. Coal-based electricity generation decreased from generating 56% of Pennsylvania's total electricity in 2005 to 22% in 2017. In 2017, nuclear power was the largest source of electricity generated in Pennsylvania, providing 39% of all electricity. Figure 8 shows a breakdown of electricity generated in Pennsylvania in 2017 by fuel type. The Commonwealth's electricity generation mix has changed from year to year and will continue to change, as discussed below. As of 2020, natural gas is the largest electricity-generating source in Pennsylvania. In Figure 8, and throughout this plan, electricity generation from waste coal and traditional coal-fired generation is included in the fuel type "Coal"; the "Other" fuel type includes electricity generation from waste-to-energy and landfill gas facilities.

Figure 8. Electricity generation by fuel type, 2017



Transportation: In 2017, the transportation sector emitted 64.3 $MMTCO_2e$. The majority of transportation emissions were from gasoline-powered personal vehicles. Since 2005, transportation emissions have decreased 11%, mainly because of increased fuel efficiency standards.

Industrial: Industrial emissions made up 23% of Pennsylvania's emissions in 2017 and have increased 1% above 2005 levels to 61.2 $MMTCO_2e$. The majority of industrial emissions (48.0 $MMTCO_2e$) result from the combustion of fossil fuels. Other major sources of emissions include cement manufacturing (1.8 $MMTCO_2e$), iron and steel production (3.8 $MMTCO_2e$), and the use of ozone-depleting substance (ODS) substitutes (6.0 $MMTCO_2e$), as estimated using the SIT. The industrial sector estimates from the SIT also include emissions from sources such as lime manufacturing, soda ash production, and electric power transmission and distribution systems.

Fugitive emissions from energy production. Fugitive emissions in the industrial sector contributed 20.3 $MMTCO_2e$ in 2017, of which 10.7 $MMTCO_2e$ was emitted by coal mining, and 9.7 $MMTCO_2e$ was emitted by natural gas and oil systems. Natural gas and oil systems includes fugitive emissions from production, transmission, and storage of natural gas and petroleum products. Fugitive energy emissions increased 13% since 2005 (18 $MMTCO_2e$ to 20.6 $MMTCO_2e$). At the same time, emissions from coal mining decreased and emissions from oil and gas systems increased, to the point where each accounts for about half of fugitive emissions in 2017.

Residential and commercial fuel use: Residential and commercial emissions from fuel use (i.e., not including electricity consumption, but including on-site fuel combustion) come from the direct use of fuels in homes, businesses, institutional facilities (e.g., schools), and other large buildings. Emissions from the residential and commercial sectors have decreased 20% since 2005, a likely result of the following factors:

- Fuel switching to lower emitting fuels for heating.
- Energy efficiency improvements as a result of Act 129 (which requires efficiency improvements that also impact fuel consumption, in addition to the required reductions in electricity use).
- Technology improvements over time (e.g., ENERGY STAR certified products) that have led to increased energy efficiency.

Business-as-Usual Forecast Overview

Pennsylvania's BAU scenario uses the most recent Pennsylvania GHG inventory (2017) as a starting point, and projects GHG emissions through 2050 under current GHG reduction policies and programs.[17] The BAU is a benchmark for Pennsylvania's GHG reduction planning, providing emissions estimates that can be compared against emissions estimates for selected GHG reduction strategies. Figure 9 shows BAU emissions estimates by sector from 2000 through 2050 (actual emissions for 2000–2017, projected for 2018–2050). In the BAU scenario, Pennsylvania's net emissions are projected to be 218.68 $MMTCO_2e$ in 2050, a 24% decrease from 2005 levels (289.10 $MMTCO_2e$), including carbon sinks. Consistent with the GHG accounting approaches used in the GHG inventory, decreases in emissions from the electric power sector are included in the "electricity generation" category, not with the associated end use (i.e., the residential, commercial, industrial, and transportation sectors include emissions from the use of fuels on site).

Under the BAU scenario, Pennsylvania will nearly achieve its 2025 reduction goal but will not come close to achieving its 2050 reduction goal of 80% from 2005 levels. Net emissions for 2025 are projected to be 215.6 $MMTCO_2e$, a 25.4% decrease from 2005 emissions (289.1 $MMTCO_2e$), which is less than 1% short of the target set in EO 2019-01. Beyond 2025, however, BAU emissions are projected to increase slightly. Net emissions in 2050, with no additional action, are

[17] For a full list of the policies and programs included in the BAU, see Appendix B.

projected to be 218.7 MMTCO2e, a 24% decrease from 2005 levels. Between 2025 and 2050, net emissions are estimated to increase by 1.4%. The increase in net emissions between 2025 and 2050 is due largely to increased emissions from electricity generation and industrial fuel use emissions. Table 1 provides a summary of GHG emissions by sector, with percentage change from 2005 to 2050.

Figure 9. Business-as-usual net emissions by sector, 2000-2050 (MMTCO2e)

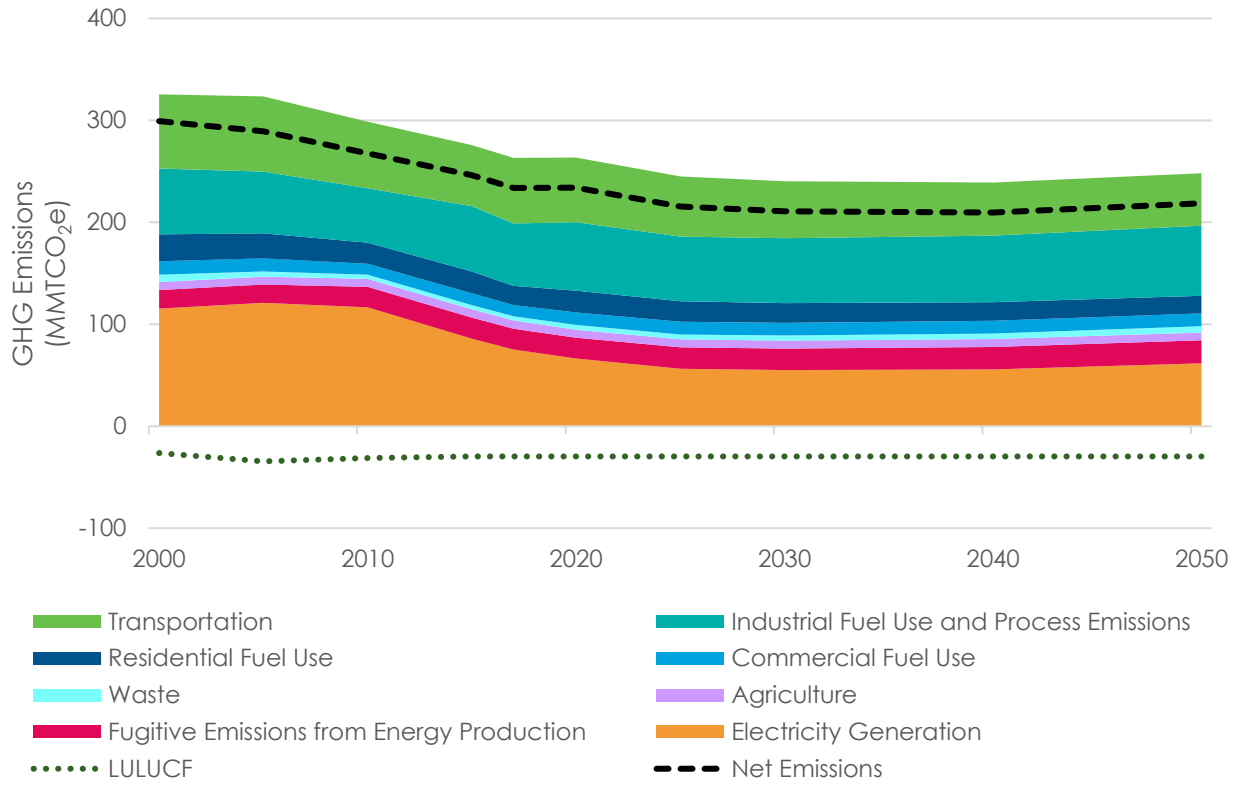


Table 1. Pennsylvania emissions by sector, business-as-usual scenario (MMTCO2e)

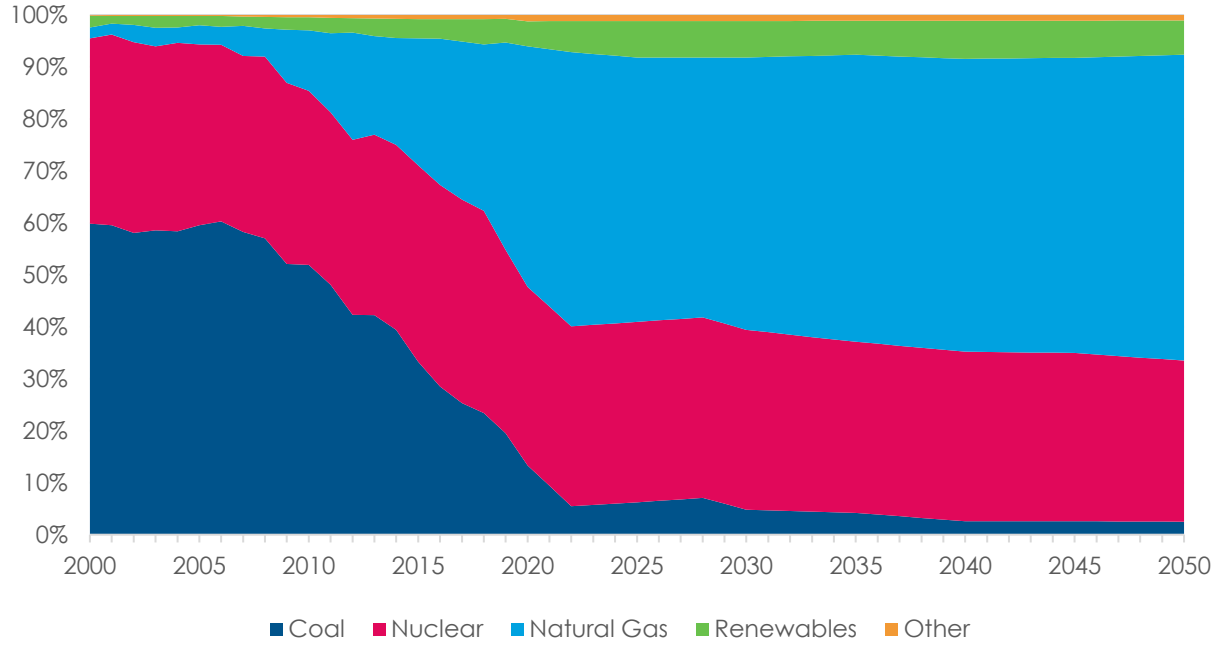
Sector	2005	2017	2025	2030	2050	% Change 2005-2050
Electricity generation	121.0	75.2	56.4	55.1	61.6	-49.1%
Residential fuel use	24.4	18.9	20.2	19.4	17.3	-29.0%
Commercial fuel use	13.1	11.0	12.4	12.4	12.5	-4.6%
Industrial (process and fuel use)	60.5	61.2	63.4	63.6	68.9	14.0%
Transportation	73.9	64.3	59.2	56.0	51.4	-30.5%
Fugitive emissions from energy production	18.1	20.3	20.9	21.0	22.7	25.4%
Agriculture	7.6	8.2	7.7	7.7	7.7	2.3%
Waste	5.1	4.3	4.9	5.2	6.1	19.7%
Gross emissions	**323.6**	**263.2**	**245.2**	**240.4**	**248.2**	**-23.3%**
LULUCF	(34.5)	(29.5)	(29.5)	(29.5)	(29.5)	-14.4%
Net emissions	**289.1**	**233.7**	**215.6**	**210.9**	**218.7**	**-24.4%**

Emissions from electricity generation are projected to be 61.6 $MMTCO_2e$ in 2050, a 49% decrease from 121.0 $MMTCO_2e$ in 2005. The projected decrease in statewide emissions by 2050 from 2005 levels is driven primarily by the decrease in emissions from electricity generation, which decreases sharply, by 64%, between 2005 and 2030 as a result of switching from coal to gas generation due to economic and market factors (see Figure 10). Additional changes in generation from higher-emitting to lower-emitting sources before 2030 are driven partly by the AEPS and RGGI. Total electricity generation associated with in-state consumption is projected to increase from 221,670 GWh in 2020 to 245,260 GWh in 2050 as a result of modest increases in electricity use from the commercial, industrial, and transportation sectors, despite efficiency improvements from Act 129.

As of 2020, natural gas has overtaken nuclear as the largest fuel source for electricity generation in Pennsylvania and continues to replace coal generation. The coal generation that remains after in the BAU in future years is a result of waste coal supported by the AEPS Tier II requirement. Under the BAU scenario, natural gas is expected to continue growing as the primary fuel source for electricity generation; by 2050, it will produce over 58% of Pennsylvania's electricity. Nuclear generation remains steady through 2050, making up roughy one-third of the state's electricity generation. In the BAU modeling nuclear capacity is indirectly supported by RGGI, whose carbon allowance prices provide uplift to nuclear facilities. Figure 10 shows the historical and projected fuel mix for electricity generated in Pennsylvania from 2000 through 2050 (BAU scenario). In Figure 10, electricity generation from waste coal is included in the fuel type "Coal" and remains in place in 2050; the "Other" fuel type category includes electricity generation from waste-to-energy and landfill gas facilities.

Figure 10. Business-as-usual electricity generation mix over time

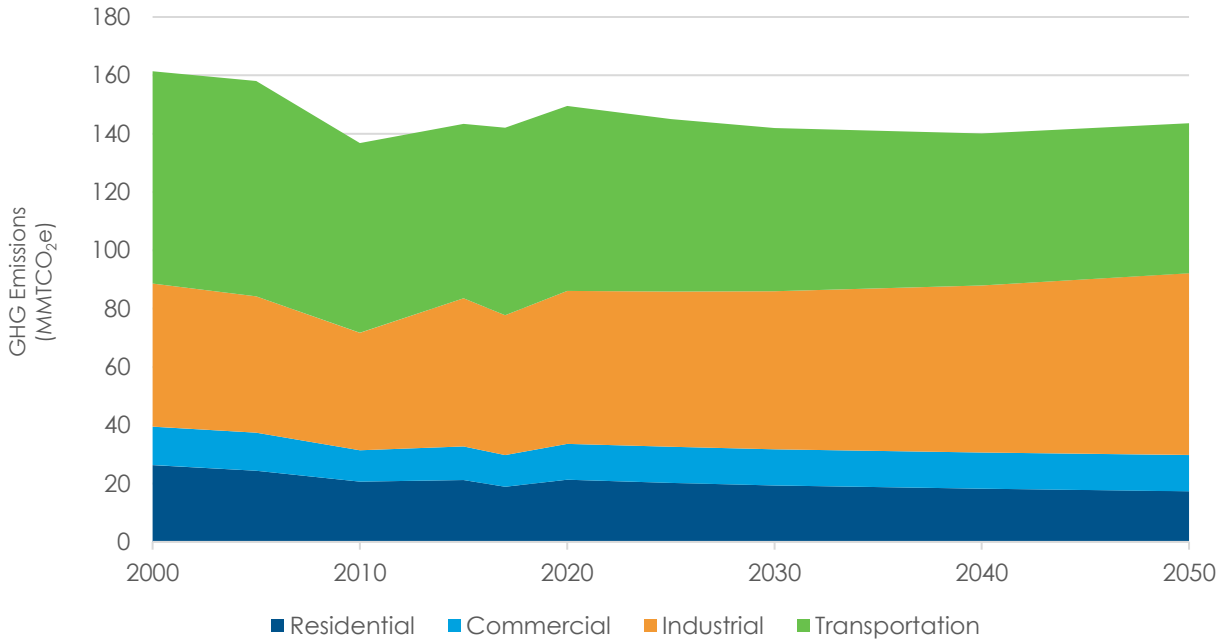


Emissions from direct fuel consumption for residential, commercial, industrial, and transportation uses, which together make up the majority of emissions in Pennsylvania (57% in 2020), are projected to decrease by 9%, from 158.1 $MMTCO_2e$ in 2005 to 143.6 $MMTCO_2e$ in 2050.

Emissions from fuel consumption for transportation and residential uses each decrease by about 30% through 2050. These reductions are likely a result of improved energy efficiency through implementation of Act 129, federal standards for electric appliances in the National Appliance Energy Conservation Act (NAECA), and advances in building energy codes; and improved efficiency of transportation fuels (e.g., motor gasoline), which will result in less fuel used to meet demand.

Industrial emissions from direct fuel consumption are projected to increase from 46.7 $MMTCO_2e$ in 2005 to 62.3 $MMTCO_2e$ in 2050. The increase is driven mainly by economic growth indicators in the Annual Energy Outlook (AEO) Reference Case (2020). Figure 11 shows projected emissions from direct fuel consumption (non-electricity) by sector through 2050. In line with the GHG accounting approach in the state inventory, emissions from electricity consumption are not included in the BAU totals, because that would result in double-counting the emissions from electricity production included.

Figure 11. Emissions from direct fuel consumption (non-electricity) by sector, 2000–2050



Fugitive emissions from energy production, which includes methane emissions from coal mining and natural gas and oil systems, are projected to increase from 20.6 $MMTCO_2e$ in 2020 to 22.7 $MMTCO_2e$ in 2050, driven mainly by continued growth in natural gas production. Despite decreases in coal production (driven by market preferences), the concurrent increase in natural gas production will lead to a net increase in fugitive emissions from these fuel sources (see Figure 9). Non-fuel use emissions from industrial processes (e.g., iron and steel production, cement manufacturing, and the use of ODS substitutes) are projected to decline 52% from 2005 levels by 2050. This decline is driven largely by a decrease in emissions from high global warming potential gases resulting from the expected phaseout of HFCs.[18] Industrial emissions of these gases, including HFCs, PFCs, and SF_6, are projected to fall from a peak of 8.4 $MMTCO_2e$ in 2019 to 0.96 $MMTCO_2e$ in 2050. Emissions from other industrial processes are projected to decrease less dramatically, from 9.1 $MMTCO_2e$ in 2005 to 5.6 $MMTCO_2e$ in 2050. Agricultural emissions increase very little, from 7.6 $MMTCO_2e$ in 2005 to 7.7 $MMTCO_2e$ in 2050. Waste emissions remain fairly constant, decreasing slightly from 5.1 $MMTCO_2e$ in 2005 to 4.6 $MMTCO_2e$ in 2020 before increasing to 6.1 $MMTCO_2e$ in 2050 because of increases in municipal solid waste and wastewater emissions.

Methodology

The BAU estimates for GHG emissions do not include additional GHG reduction strategies beyond the policies and programs already in place or for which significant developments are

[18] As required in the AIM Act of 2020.

underway, as of December 2020. The BAU scenario was modeled using the following data sources:

- **EPA's SIT:** The SIT is used for non-energy projections, including agriculture and waste. SIT provides a combination of population-based forecasts with other state-specific data.
- **State Energy Data System (SEDS)**: Datasets from SEDS were used to provide activity data at the state level that can be disaggregated by sector. SIT incorporates SEDS data to estimate historical energy consumption and production data.
- **Energy Information Administration (EIA)**: Data from EIA's Annual Energy Outlook (AEO) are used for projections of future emissions. AEO estimates are forecasted at the regional level; these estimates are applied to the state-specific datasets to project energy production and consumption trends.
- **State-specific data**: Specific resources developed or collected in the Commonwealth and by DEP include:
  - MOVES (on-road transportation modeling)
  - Act 129 reports
  - Alternative Energy Portfolio Standard (AEPS) compliance reports
  - Distributed solar data
  - Oil and gas production and systems information
  - Biofuel production data
  - Vehicle registration data
  - U.S. Department of Energy's CHP Installation Database that ICF maintains (on combined head and power [CHP] systems, loads, and more)

In addition to these datasets, the BAU also relies on data from ICF's Integrated Planning Model (IPM) to model the electricity sector through 2050.[19]

See Appendix B for additional information about the methodology used to develop the BAU.

[19] ICF's Integrated Planning Model (IPM®) provides integration of wholesale power, system reliability, environmental constraints, fuel choice, transmission, capacity expansion, and key operational elements of generators on the power grid in a linear optimization framework. For more information see https://www.icf.com/technology/ipm.

Pennsylvania's Energy Profile and Policies

The Commonwealth of Pennsylvania is a leading energy producer and supplier, which has historically contributed significantly to local economies. Pennsylvania's energy profile has become increasingly dynamic in recent decades, as both fossil fuel and clean energy generation have grown. These changes, however, have resulted in both challenges and opportunities for reducing GHG emissions. Additional opportunities remain for improving resilience in Pennsylvania's energy infrastructure and deploying new and diverse energy resources to result in assured energy supply and to mitigate the impacts of climate change. The Commonwealth is one of the nation's leading natural gas producers (second only to Texas), producing nearly seven trillion cubic feet of natural gas in 2019.[20] It also is a net energy exporter and the largest electricity generator in the PJM service region.[21] In 2019, there were more than 269,000 total traditional energy, energy efficiency, and motor vehicle jobs in Pennsylvania, accounting for 4.5% of the total workforce. Of those, more than 97,000 were clean energy jobs, mostly in the energy efficiency sector. Although clean energy jobs are growing faster than the statewide average, employers report difficulty finding enough candidates with the appropriate experience, training, and skills.[22]

PA Policies Informing the BAU Scenario

- **Act 129.** Act 129 requires PA's seven largest electric distribution companies (EDCs) to reduce energy use in their service territory.
- **Alternative Energy Portfolio Standard.** AEPS sets targets for the amount of electricity supplied by PA's EDCs that must come from renewable sources. Policies in place as of December 2020 (2022 requirements) are projected to remain consistent through 2050.
- **Regional Greenhouse Gas Initiative.** By joining RGGI, Pennsylvania commits to reducing its GHG emissions in coordination with other member states. Policies in place as of December 2020 (2030 requirements) are projected to remain consistent through 2050, as RGGI will not take effect in Pennsylvania until 2022.
- **HFC Phaseout.** PA will phase out HFCs in accordance with the Federal AIM Act.

Falling costs for renewable energy and policies such as the AEPS, and recent requirements such as in-state solar generation to meet AEPS thresholds, have boosted the share of renewables in the energy mix. Zero-emission energy generation in Pennsylvania relies heavily on nuclear power, and the Commonwealth is the nation's second-largest generator of electricity from nuclear power.[23] Additionally, DEP is undertaking a rulemaking process to enable Pennsylvania to join RGGI. Participation in RGGI could lead to a significant increase in clean energy program

[23] EIA. 2021. "Pennsylvania State Profile and Energy Estimates." https://www.eia.gov/state/?sid=PA#tabs-3.

funding, beginning in 2022.[24] Oil and coal are still produced and used, despite reductions in the past decade, and the Commonwealth is still the third-largest coal-producing state.[25]

Energy efficiency has also become a significant source of emission reductions through state policies such as Act 129 of 2008, requiring the seven largest electric distribution companies to develop energy efficiency and conservation plans and other methods of reducing residential and commercial customers' electricity consumption. One in six households in Pennsylvania uses fuel oil as a heating source—most of these households are in rural areas.[26] The industrial sector in Pennsylvania has a large footprint—with natural gas and oil extraction and mining, metals and machinery manufacturing; chemical products, and agriculture and food processing—and its electricity and fuel consumption continues to grow. Because of its expansive geography and large rural and urban areas at opposite ends of the state, fuel use for consumers in Pennsylvania is relatively high, but because of the state renewable fuels mandate, production and use of ethanol and biofuels are prevalent. To promote a clean energy transition in the transportation sector, DEP is also engaged in the development, outreach, and monitoring of the Transportation and Climate Initiative.

Federal policies may influence Pennsylvania's energy and climate strategies

- The Biden Administration's American Jobs Plan, if enacted, would create funding that could support a number of Pennsylvania's energy and climate strategies.
- A successor EPA rulemaking to the 2015 Clean Power Plan, if promulgated, could require states to develop powerplant GHG reduction plans.
- Congressional Clean Energy Standard legislation, if enacted, could set power sector targets for renewable power.
- A new federal Corporate Average Fuel Economy standards regulation, if promulgated, could accelerate vehicle electrification strategies.

Pennsylvania's Energy and Climate Efforts and Commitments

Past and ongoing efforts in Pennsylvania to use energy more efficiently and promote the use of clean energy have decreased emissions and will help ensure that the 2025 goal of reducing net GHG emissions by 26% from 2005 levels is met.

Pennsylvania has implemented or committed to the following notable energy and environmental programs and policies since the early 1990s:

- Act 213—Alternative Energy Portfolio Standards (AEPS) (2004)
- Act 70—Pennsylvania Climate Change Act (2008)

---

[24] For more information on Pennsylvania's energy profile and policies, see DEP's Clean Energy Program Plan. https://www.dep.pa.gov/Business/Energy/OfficeofPollutionPrevention/Pages/default.aspx#:~:text=The%20Clean%20Energy%20Program%20(CEP,and%20mitigate%20disruptions%20to%20ensure.

[25] EIA. 2021. "Pennsylvania State Profile and Energy Estimates." https://www.eia.gov/state/?sid=PA#tabs-3.

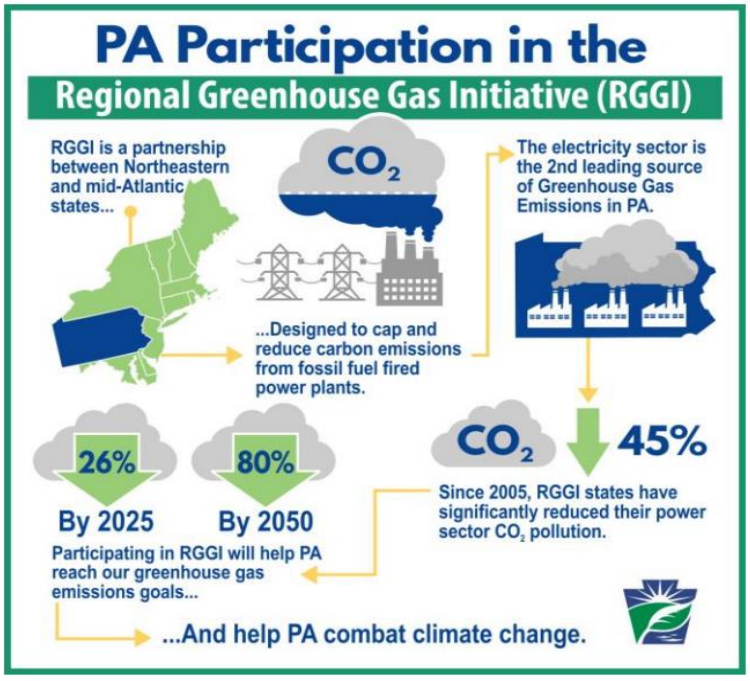
[26] EIA. 2021. "Pennsylvania State Profile and Energy Estimates." https://www.eia.gov/state/data.php?sid=PA#ConsumptionExpenditures

- Act 129—Energy Efficiency and Conservation Program (2008)
- Act 30—Commercial Property Assessed Clean Energy Program (C-PACE) (2017)
- Act 40—Solar Renewable Energy Credits (2017)
- Medium- and Heavy-Duty Zero Emission Vehicle MOU
- Governor's Executive Order 2019-01, which set GHG reduction goals for Pennsylvania and sustainability goals for Commonwealth agencies (2019), and
- Governor's Executive Order 2019-07, which enabled Pennsylvania to join RGGI (2019).

While few of these efforts were solely climate policies or programs, these all have had an impact on GHG emissions and are assisting with a transition to cleaner and renewable sources of energy. Listed below are a number of other ongoing efforts which contribute to reducing GHG emissions and improving resilience in Pennsylvania:

- **GreenGov Council**—helps incorporate environmentally sustainable practices into the Commonwealth's policy, planning, operations, procurement, and regulatory functions. It promotes best practices and energy efficiency, including solar power purchases for state buildings.
- **Control of Emissions from Oil and Gas Operations rulemaking**—requires the reduction of VOC emissions from natural gas well sites, compressor stations and along pipelines, which reduces methane emissions as a co-benefit. This not only contributes to climate change mitigation, but also helps businesses reduce the waste of a valuable product.
- **Act 129 Phase IV**—expands on Phase III, as electric distribution companies incorporate energy efficiency and conservation programs into their operations.
- **DCNR's adaptation plan**—outlines more than 100 steps to strengthen resiliency to climate change impacts.
- **PennDOT's vulnerability study**—helps anticipate the impacts of extreme weather events so that transportation funding and resiliency may be prioritized.
- **RGGI**—reduces GHG emissions from the power sector while also generating economic growth. It sets a regional cap on emissions from electric power plants (see Figure 12).

Figure 12. Summary of Pennsylvania's participation in RGGI



- **Zero Emission Vehicle (ZEV) Program**—adopts parts of the California Air Resource Board's standards to control smog-causing pollutants and GHG emissions of light-duty vehicles as part of the Advanced Clean Cars package. The draft proposed rulemaking to adopt these standards is still under development by DEP.
- **Medium- and Heavy-Duty Zero-Emission Vehicles MOU**—advances and accelerates the market for medium- and heavy-duty electric vehicles.
- **Electric Vehicle (EV) Pennsylvania Roadmap**—expands the EV knowledge base, documents baseline EV data, and identifies near-, mid-, and long-term strategies to incentivize and remove barriers to EV adoption.
- **Drive Electric PA (DEPA) Coalition**—promotes collaboration between DEP and stakeholders statewide to increase the acceptance and adoption of EVs.
- **Driving PA Forward**—creates grants and rebate programs aimed at improving air quality in Pennsylvania by spurring the transition from older, polluting diesel engines to clean engine technologies powered by electricity, compressed natural gas, propane, or clean diesel. This initiative is a product of the Volkswagen Mitigation Trust Fund, a one-time penalty settlement that provided funds to establish grants and the rebate program.
- **Alternative Fuels Incentive Grant (AFIG)**—promotes the use of alternative fuels in Pennsylvania through four incentive programs: Alternative Fuel Vehicle Rebate for consumers, AFIG Program, Fixing America's Surface Transportation (FAST) Act Infrastructure Program, and Alternative Fuels Technical Assistance Program.
- **PEDA COVID-19 Restart Grant**—awarded $1.7 million in funding to restart 11 clean energy projects disrupted by the COVID pandemic in urban and rural areas, especially environmental justice neighborhoods. The projects were intended to rehire workers and hire additional workers to complete projects quickly, make immediate equipment payments to restart the supply chain, and overcome lost revenue caused by market stagnation. It also supported clean energy projects: four solar projects, three energy efficiency projects, one solar and energy-efficiency project, one EV charger project, and two high-performance building projects.
- **C-PACE expansion**—provides business property owners with low-interest, long-term loans for clean energy and clean water projects that are repaid as property tax to benefit the community.
- **Green Bank (in development)**—a facility that can translate and coordinate financing efforts and provide a communications bridge between contractors and finance providers to help finance clean energy projects. For example, it could provide product enhancements for small commercial and agriculture enterprises such as interest rate buy-down, loan loss reserve, and other credit enhancements to make financing more accessible. A Green Bank could also develop new mechanisms such as a specific finance product or market facilitation to connect Green Bank Partnership investments to private capital.
- **DEP's Local Climate Action Program** —allows local governments and college students to work together to develop GHG inventories and climate action plans.

- **Shared Energy Manager Program**—supported five jurisdictions that participated in DEP's Local Climate Action Program. The Shared Energy Manager supported those local governments in implementing energy-related strategies from their programs, such as energy benchmarking, energy audits, solar PV feasibility assessments, development of energy management plans, and alternative fuel evaluations for fleet vehicles.
- **PA Climate Leadership Academy**—strengthens the capacity of state and local government agencies, infrastructure organizations, and businesses to develop and implement sound climate change initiatives through comprehensive training programs.

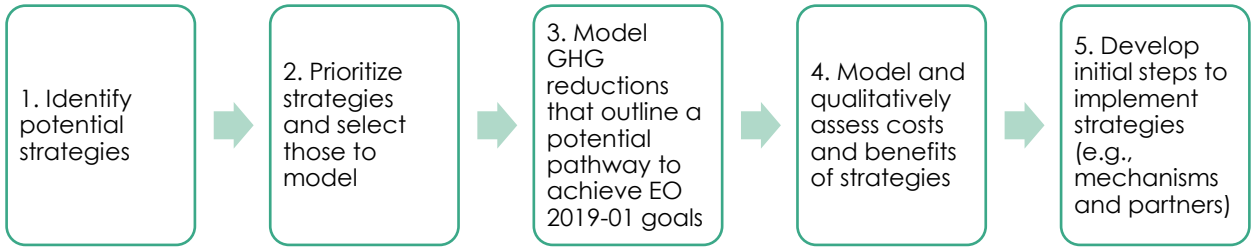
For more information about climate initiatives, visit DEP's website: https://www.dep.pa.gov. The next section describes additional opportunities for reducing GHG emissions in Pennsylvania.

3 OPPORTUNITIES TO SIGNIFICANTLY REDUCE GHG EMISSIONS IN PENNSYLVANIA

GHG Reduction Strategy Analysis

The GHG strategy reductions analysis presented in this section was developed using the process outlined in Figure 13.

Figure 13. GHG reduction analysis approach



Potential Strategies

To start the GHG reduction strategy analysis, the ICF analysis team worked with DEP and CCAC in an iterative process to develop a comprehensive list of potential GHG reduction strategies. The completed list of potential GHG reduction strategies was based on six main sources:

- DEP's knowledge of trending and common strategies used across the state
- Feedback from the Climate Change Advisory Committee (CCAC)
- A review of the 2018 Climate Action Plan, including letters from the CCAC
- A review of the 2021 DEP Clean Energy Program Plan
- A review of public survey data from DEP on the 2018 Climate Action Plan
- The ICF team's knowledge of trending and common strategies used across the country.

Prioritizied Strategies

After listing potential GHG reduction strategies, the analysis team worked with DEP and the CCAC to prioritize which strategies to model and evaluate. DEP developed the criteria for evaluating and prioritizing strategies with input from the CCAC and the ICF analysis team. These criteria are as follows:

- **GHG reduction magnitude**—considers the magnitude of potential GHG reductions from implementing the strategy.

- **Ease of implementation (legal, institutional)**—considers the potential barriers to implementation; whether significant time and resources would be needed to overcome legal or institutional obstacles; and whether existing programs, policies, or institutions could lay the groundwork for implementing the strategy.
- **Initial investment required**—considers the magnitude of up-front costs and capital investment required to implement the strategy.
- **Cost-effectiveness**—considers the cost of implementation compared to the magnitude of potential benefits.
- **Air quality and public health benefits**—considers potential air quality improvement and other potential health-related co-benefits.
- **Resilience benefits**—considers the potential to improve climate resilience.
- **Environmental justice and equitable implementation opportunity benefits**—considers the potential for improving environmental justice and designing implementation strategies that result in more equitable outcomes.

Defining Environmental Justice and Equitable Implementation

Environmental justice embodies the principle that communities and populations should not be disproportionally exposed to adverse environmental impacts. Historically, minority and low-income Pennsylvanians have been forced to bear a disproportionate share of adverse environmental impacts. Addressing environmental justice means ensuring that all Pennsylvanians, especially those that have typically been disenfranchised, are meaningfully involved in the decisions that affect their environment and that no communities are unjustly and/or disproportionally burdened with adverse environmental impacts. Simply put, environmental justice ensures that everyone has an equal seat at the table.

Equitable implementation embodies the principle and commitment to promote fairness and justice in the formation of public policy that results in all residents—regardless of age, race, color, sex, sexual orientation, gender identity, religion, national origin, marital status, disability, socio-economic status, neighborhood of residence, or other characteristics—having opportunity to fully participate in and benefit from program or policy opportunities.

Criteria were weighted according to DEP's priorities: GHG reduction magnitude and cost-effectiveness were assigned the highest weight, followed closely by environmental justice and equitable implementation opportunity benefits and air quality and public health benefits. DEP then evaluated the potential strategies using these criteria and gave each strategy a cumulative weighted score.

After scoring the strategies, DEP selected the subset that aligned best with the Commonwealth's goals, needs, and interests. DEP then worked with ICF to determine which strategies to model for GHG reductions, costs, and benefits. Table 2 summarizes the selected strategies, implementation timeframe, and whether the strategy is quantified. Strategies are described in greater detail in the following sections. Modeled strategies are labeled A through R for ease of reference throughout this plan. Timeframes of potential implementation are defined as near term (1 to 5 years), midterm (5 to 10 years), or long term (10+ years).

Table 2. Selected GHG reduction strategies by sector

Sector	GHG Reduction Strategy	Expected Implementation Timeframe	Quantified GHG Reductions, Costs and Benefits
Residential and commercial (R&C) buildings	A. Support energy efficiency through building codes	Near term	Yes
R&C buildings	B. Improve residential and commercial energy efficiency (electricity)	Near term	Yes
R&C buildings	C. Improve residential and commercial energy efficiency (gas)	Near term	Yes
R&C buildings	D. Incentivize building electrification	Midterm	Yes
R&C buildings	Introduce state appliance efficiency standards	Midterm	No
R&C buildings	E. Increase distributed on-site solar	Near term	Yes
R&C buildings	Take actions to promote and advance C-PACE financing and other tools for net-zero buildings and high-performance buildings	Near term	No
Transportation	F. Increase fuel efficiency of all light duty vehicles and reduce vehicle miles traveled for single occupancy vehicles	Midterm	Yes
Transportation	G. Implement the multi-state medium-and heavy-duty zero-emission vehicle memorandum of understanding	Long term	Yes
Transportation	H. Increase adoption of light-duty electric vehicles	Midterm	Yes
Transportation	I. Implement a Low Carbon Fuel Standard	Midterm	Yes
Industrial	J. Increase industrial energy efficiency and fuel switching	Near term	Yes
Fuel supply	K. Increase production and use of biogas/renewable gas	Midterm	Yes
Fuel supply	L. Incentivize and increase use of distributed Combined Heat and Power	Near term	Yes
Fuel supply	M. Reduce methane emissions across oil and natural gas systems	Midterm	Yes
Electricity generation	N. Maintain nuclear generation at current levels	Near term	Yes
Electricity generation	O. Create a carbon emissions free grid	Long term	Yes
Agriculture	P. Use programs, tools, and incentives to increase energy efficiency for agriculture	Near term	Yes
Agriculture	Q. Provide trainings and tools to implement agricultural best practices	Midterm	Yes
LULUCF	R. Increase land and forest management for natural sequestration	Midterm	Yes
Waste	Reduce food waste	Near term	No
Waste	Reduce waste generated by citizens and businesses and expand beneficial use of waste	Near term	No

Modeling and Analysis Approach

GHG Reduction Accounting Approach

The accounting approach used to model GHG reductions for this plan is aligned with the approach used in the GHG inventory and BAU projections and accounts for the interactions between strategies to ensure accuracy. Key aspects of this accounting approach include:

- Reductions in GHG emissions resulting from reductions in direct fuel use for energy other than electricity are represented in the end-use sector (i.e., residential, commercial, industrial, or transportation).
- Reductions in GHG emissions resulting from changes in end-use electricity consumption are not included in totals to avoid double counting GHG reductions from different sectors and actions.
- Reductions in GHG emissions resulting from changes in electricity consumption and the generation mix are accounted for in the electricity generation sector. This is aligned with the GHG accounting approach used in the GHG inventory. GHG emissions from electricity generation are modeled in a two-step process:
  - Estimate changes in electric load resulting from strategies that affect load (e.g., energy efficiency, electrification).
  - Feed load changes over time into the Integrated Planning Model© with future assumptions to estimate generation mixes over time.

The GHG modeling layers the impacts of certain strategies to avoid overestimating reductions. Strategies are layered in order of potential implementation to account for interactions between them (e.g., a strategy that targets improving fuel efficiency standards may reduce overall fuel consumption; a second strategy that targets electric vehicle adoption incorporates the impacts of more fuel-efficient vehicles on the road at the outset to assess the impact of the second strategy on GHG emissions).

Economic Benefits and Costs

Large-scale transformational change, such as the change required to achieve large reductions in GHG emissions, will require investment and have associated costs. However, such changes, particularly reducing GHG emissions, can have economic benefits and improve air quality, and therefore reduce healthcare and health-related costs. For example, while there is a significant initial capital cost to install EV infrastructure, in the long term, the infrastructure will incentivize the transition to EVs, which can ultimately create savings from decreased fuel use and reduced environmental impacts. As is the case with most investments, a higher portion of costs are incurred at the outset, while the benefits grow and accumulate over time.

Analyzing the net costs and benefits of a strategy determines the cost-effectiveness of the strategy. A strategy does not have to have greater benefits than costs to be cost-effective, rather the costs have to be worth the benefits gained—some benefits are worth paying for.

To assess the cost-effectiveness of the strategies presented in this plan (a requirement of Act 70), multiple factors were considered: net present value (NPV), cost per $MTCO_2e$, number of jobs, gross state product, and personal income.

Net present value (NPV): Many of the GHG reduction strategies were analyzed to determine the economic benefits and costs. Potential capital costs, maintenance and repair costs, and the fuel and energy costs associated with implementation of each strategy were calculated. If the GHG reduction strategy results in net savings, i.e., the benefits are greater than the costs, then the NPV is displayed as a positive value. A negative NPV does not indicate that a strategy is not cost-effective, only that the monetized costs are greater than the monetized benefits.

Social cost of carbon

The social cost of carbon (SCC) is a monetized "value of the net harm to society associated with adding a small amount of that GHG to the atmosphere in a given year. In principle, it includes the value of all climate change impacts, including (but not limited to) changes in net agricultural productivity, human health effects, property damage from increased flood risk natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services."

The SCC benchmark for 2020 is $116/ $MTCO_2e$.

Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990; Interagency Working Group on Social Cost of Greenhouse Gases, United States Government; 2021.

Cost per $MTCO_2e$: For each GHG reduction strategy, the cost to implement it (in present value dollars) is divided by the total $MTCO_2e$ reduced through 2050 by implementing the strategy. The result of the calculation is the average cost to reduce 1 $MTCO_2e$. This metric can be used to help determine the cost-effectiveness of a strategy by comparing it to the social cost of carbon as a benchmark. If the cost per $MTCO_2e$ of the strategy is less than the benchmark, it could be considered cost-effective.

Employment (number of jobs), gross state product, and personal income: To better understand the macroeconomic impacts of GHG reduction strategies in greater detail, the REMI[27] model was used to estimate the impacts on employment and state economic output, as measured by the gross state product (GSP), and disposable personal income (DPI) for Commonwealth residents. The costs and savings estimated in NPV calculations (capital costs, maintenance and repair costs, fuel and energy costs) are modeled within REMI to determine the aggregate economic impacts. Costs and benefits are aligned with different sectors (e.g., residential, commercial, industrial, and transportation) and different industries (e.g., construction, manufacturing, trade, and services) to capture impacts accurately. REMI links

[27] REMI is a popular macroeconometric forecasting and policy analysis model that combines aspects of input-output modeling with computable general equilibrium techniques to create a hybrid economic modeling framework. The model has been used extensively in these types of macroeconomic modeling and forecasting studies in jurisdictions across the country. The model is dynamic, meaning it can be used to evaluate changes over time and allow changes driven by inputs from one year to carry through multiple years. Its dynamic nature enables robust forecasting techniques and estimation of distributional impacts on sectors and regions. Key outputs include employment, economic output or gross state product, and disposable personal income.

industries together so that interactions between individual industries can be captured both upstream and downstream. The links are contained in an economywide input-output matrix based on historical data that is forecasted for each year of the scenarios.

Given the transformational changes inherent in the strategies being modeled, relationships between economic and industrial sectors in the Commonwealth are likely to adapt and evolve to the changing economy. Although the REMI model does attempt to *predict* some changes in its forecasted relationships, uncertainties in the modeling results will remain. If a strategy has positive impacts on employment, GSP, and disposable income, these are represented by positive values in the strategy results, and if a strategy has negative impacts in some years (i.e., fewer jobs, lower GSP), these are represented by negative values.

These modeled cost-effectiveness measures do not consider potential co-benefits and costs such as improvements to environmental quality or public health, nor do they consider equity or environmental justice.

All dollars presented in the plan are representative of 2019 dollars.

Co-Benefits and Costs

GHG reduction strategies can result in positive economic, environmental, and social impacts—known as co-benefits. Co-benefits include improved air quality, health outcomes, safety, equity, and more. Co-benefits can be direct, such as energy efficiency measures that reduce energy consumption, or indirect, such as the reduced energy consumption from energy efficiency measures leading to a reduced reliance on imported energy and therefore increased energy security.

Many GHG reduction strategies could result in co-benefits, and these were considered in the evaluation and prioritization process. Some GHG reduction strategies had moderate climate benefits, but when all additional co-benefits were considered, may result in greater overall benefits than some strategies with greater climate benefits. Considering and quantifying co-benefits helps to make more informed decisions. Co-benefits may also create additional economic benefits that may not be captured elsewhere. For example, increased resilience to extreme weather events will reduce costs associated with inaction, or costs that may have otherwise been incurred as a result of events such as prolonged blackouts due to extreme heat (e.g., resulting businesses not being able to fully function, or manufacturing needing to slow). Finally, it encourages decisionmakers to consider and avoid or mitigate undesired impacts of GHG reduction strategies.

In addition, all GHG reduction strategies reduce the need for adaptation in the long term and thus provide long-term adaptation and economic benefits. In addition, several strategies focused on GHG reduction will have immediate adaptation co-benefits, and vice versa; these relationships are highlighted throughout the CAP.

Environmental Justice and Equity

In the context of this CAP, the term equity refers to the commitment to promote fairness and justice in the formation of public policy that results in all residents having the opportunity to fully participate in and benefit from program or policy opportunities**.** GHG reduction strategies have the potential to advance equity by improving air quality in disproportionately impacted communities, reducing energy costs for low-income households through building weatherization and strategic electrification, increasing transit options in areas with low accessibility, and more.

In general, any given GHG reduction strategy's capacity to benefit or detract from equity depends in part on how the strategy is designed and implemented. Strategies focused on increasing electric vehicle adoption provide a good example of the complexities of determining equity in GHG reduction strategies. There are equity benefits inherent to the strategy, as reduced tailpipe emissions lead to lower air pollution near roadways, thus helping to mitigate disparities in exposure to air pollutants from vehicles.[28] A counterargument to the tailpipe emission reduction benefit is that increased adoption of electric vehicles also leads to increased electricity generation, so potential disparities in exposure to stationary-source air pollution from power plants must be considered as well. However, as the electricity generation sector is decarbonizing, it results in the elimination of criteria pollutants at a much faster rate; this, combined with the greater efficiency of electric vehicles, makes vehicle electrification a preferable strategy to lower net emission impacts from transportation.

Finally, a strategy can be made more equitable by providing a set of clean energy options to consumers. Using the example of electric vehicles, incentives that rely on tax credits largely benefit population segments whose income allows for large tax breaks. That is why point-of-sale vouchers or special low-income loan programs are increasingly being implemented to benefit those who cannot afford high up-front costs and do not have the credit requirements for a loan. Car-sharing programs that incorporate electric vehicles are also becoming popular for providing access to clean mobility without requiring private vehicle purchases. These solutions are becoming popular in low-income and other disadvantaged communities, and they are well received by the public because they offer the co-benefits of reducing road and parking congestion and advancing sustainable land use.

Equity was considered and integrated into the evaluation and prioritization of the GHG reduction strategies. Strategy-specific considerations related to equity are included in the implementation recommendations below.

[28] "Populations on the lower end of the socio-economic spectrum and minorities are disproportionately exposed to traffic and air pollution and at higher risk for adverse health outcomes." See Pratt, et al. 2015. Page 5368. *Traffic, Air Pollution, Minority and Socio-Economic Status: Addressing Inequities in Exposure and Risk*.

Pennsylvania's Pathway to 2050

Key Insights

The following are highlights of key results of the modeled GHG reduction strategies, which include GHG emission reductions and different measures of cost-effectiveness (i.e., costs, jobs, economic growth). Health and social benefits were also analyzed outside of quantitative modeling efforts.

By implementing all modeled strategies, Pennsylvania will likely exceed the 2025 target of reducing GHG emissions 26% below 2005 levels. Strategies to reduce GHG emissions from fuel supply and industrial sources will play a key role.

Reaching Pennsylvania's 2050 target of reducing GHG emissions 80% below 2005 levels will require the implementation of all modeled strategies in all sectors. Strategies to reduce GHG emissions from electricity generation offer the greatest potential for reductions through 2050, followed by strategies to reduce emissions from transportation, industrial sources, and buildings. Nuclear and renewable sources will need to produce nearly all the electricity generated in Pennsylvania by 2050.

If the strategies described in this CAP are implemented, they would:

- **Generate over one million cumulative job-years[29] in the Commonwealth by 2050**, with an annual average of roughly 42,000 jobs per year, an increase of about 0.51% in average annual terms.
- **Result in little effect on economic growth while promoting a more environmentally sustainable future for Pennsylvania**. The average annual GSP decreases from BAU marginally by 0.01% overall, but rises in later years with an equivalent GSP increase of about 0.1% annually by 2050. Thus, the Pennsylvania economy continues to grow robustly with CAP strategies in place and the changes in GSP being on the margin, without affecting the overall growth path of the state economy. Similar patterns are expected for personal income changes as well, with slight annual decreases in early years, followed by slight annual increases in later years. The Commonwealth economy continues to grow with these strategies in place, but at a slightly slower rate than without any action to reduce emissions to mitigate the impacts of climate change.
- **Be cost-effective on a cost per $MTCO_2e$ reduced basis when considered together as a cohesive approach to reducing GHG emissions in the Commonwealth.** Additionally, most strategies result in co-benefits such as improved air and water quality, improved health outcomes, increased energy security, and improved equity and environmental justice outcomes.

[29] A job-year is defined as one year of work for one person. For example, a new construction job that lasts five years is five job-years.

Modeling Results

Pennsylvania's 2025 and 2050 GHG reduction targets can be met by implementing strategies in all sectors. Figure 14 demonstrates a potential pathway to an 80% reduction from 2005 levels by 2050, with a total reduction of 161.6 $MMTCO_2e$ beyond BAU levels. These results show that the 2050 reduction target could be met—but barely (reaching less than 1 $MMTCO_2e$ above target reductions). The 2025 reduction target could be exceeded by nearly 16.0 $MMTCO_2e$ with full implementation of the modeled strategies. Figure 15 shows the cumulative reductions by sector through 2050.

Figure 14. GHG reductions by strategy, through 2050 ($MMTCO_2e$)

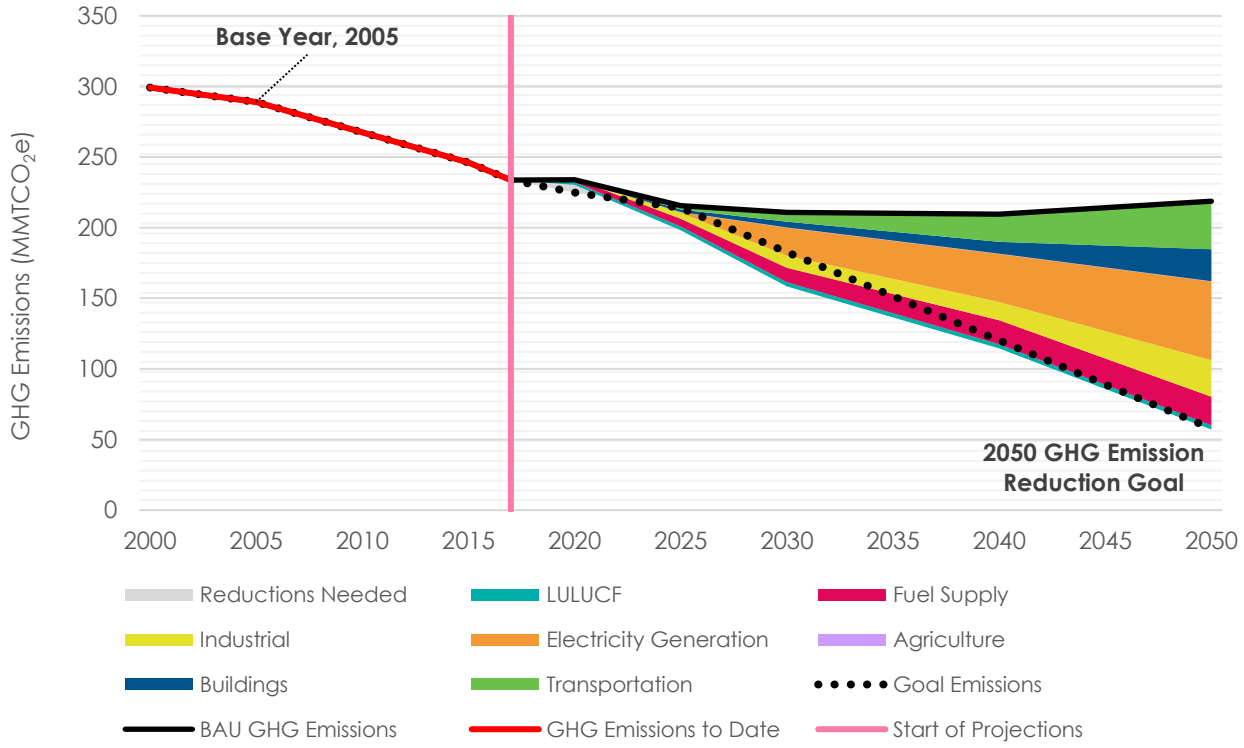


Figure 15. Cumulative GHG reductions by sector, 2005-2050 ($MMTCO_2e$)

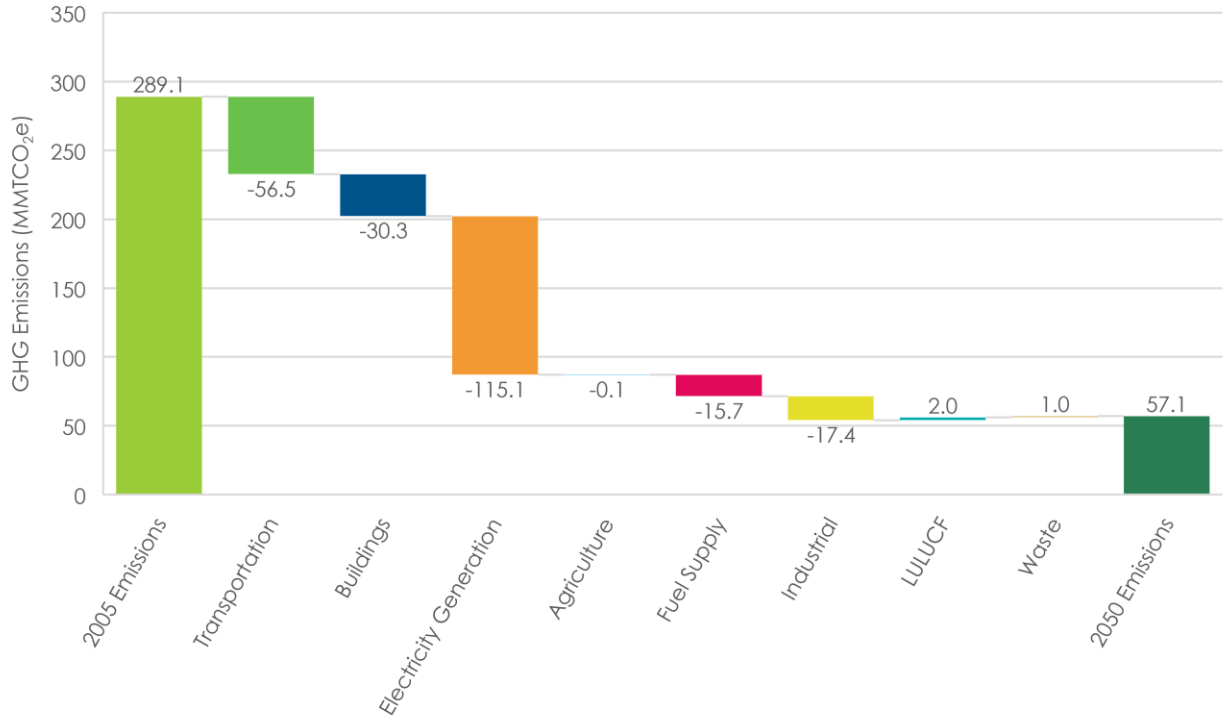

Fuel supply and industrial GHG reduction strategies will play a major role in the near term, respectively contributing 32% and 25% of GHG reductions in 2025 (Figure 16). Electricity generation reductions are not included in Figure 16 because those emissions are projected to be higher in 2025 than in the BAU scenario for this sector. The initial increase in GHG emissions from electricity generation will eventually be reversed, and by 2050, strategies to reduce emissions from electricity generation, if fully implemented, will account for the most significant GHG reductions (Figure 17).

Figure 16. Sector share of total GHG reductions achieved through strategy implementation in 2025 ($MMTCO_2e$)

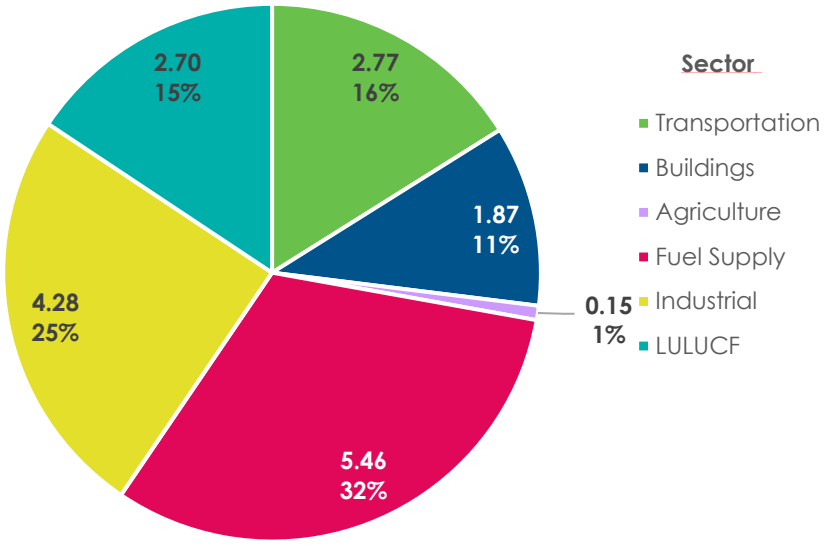

Figure 17. Sector share of total GHG reductions achieved through strategy implementation in 2050 ($MMTCO_2e$)

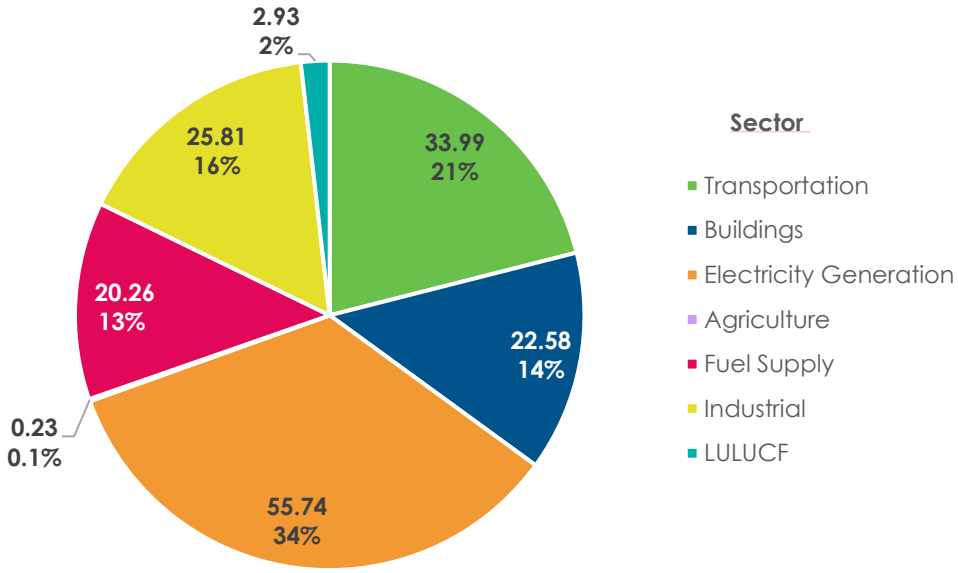
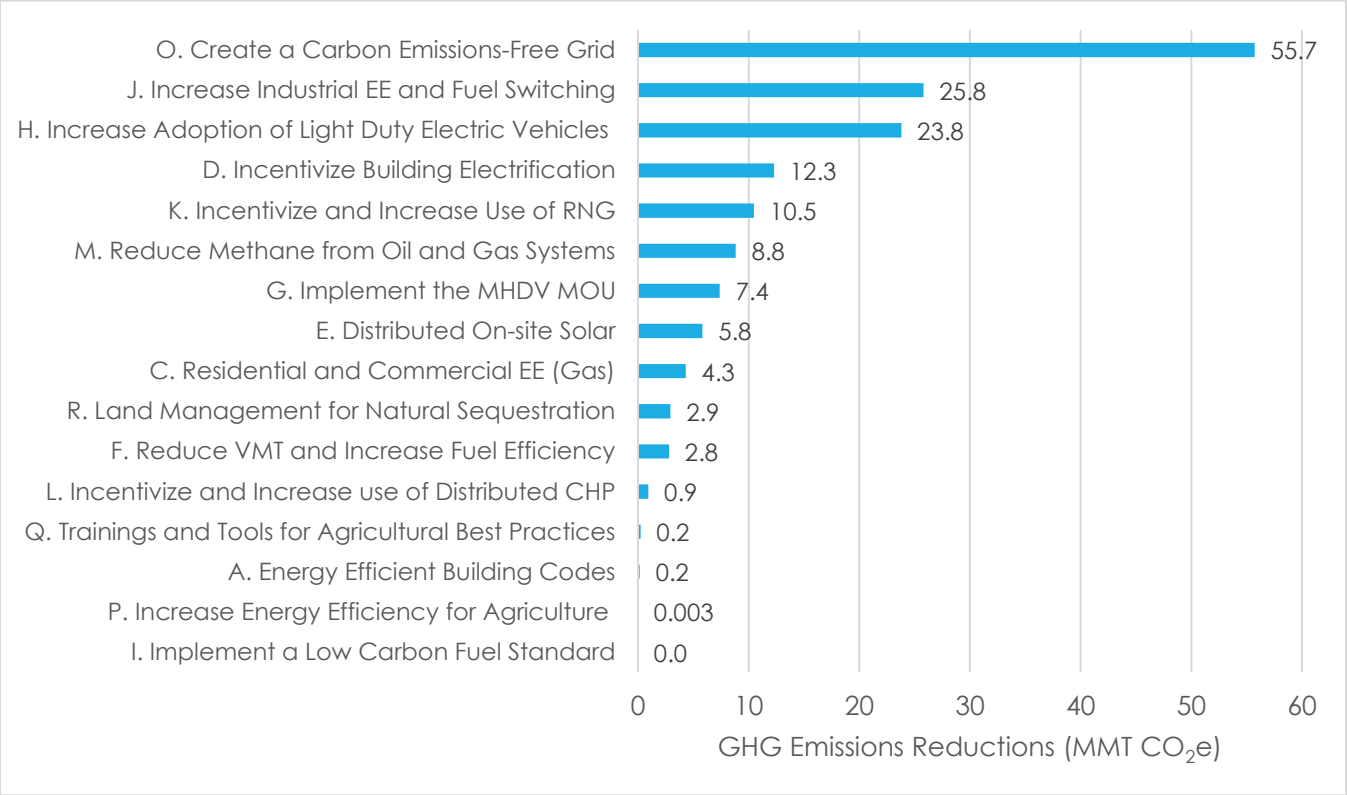


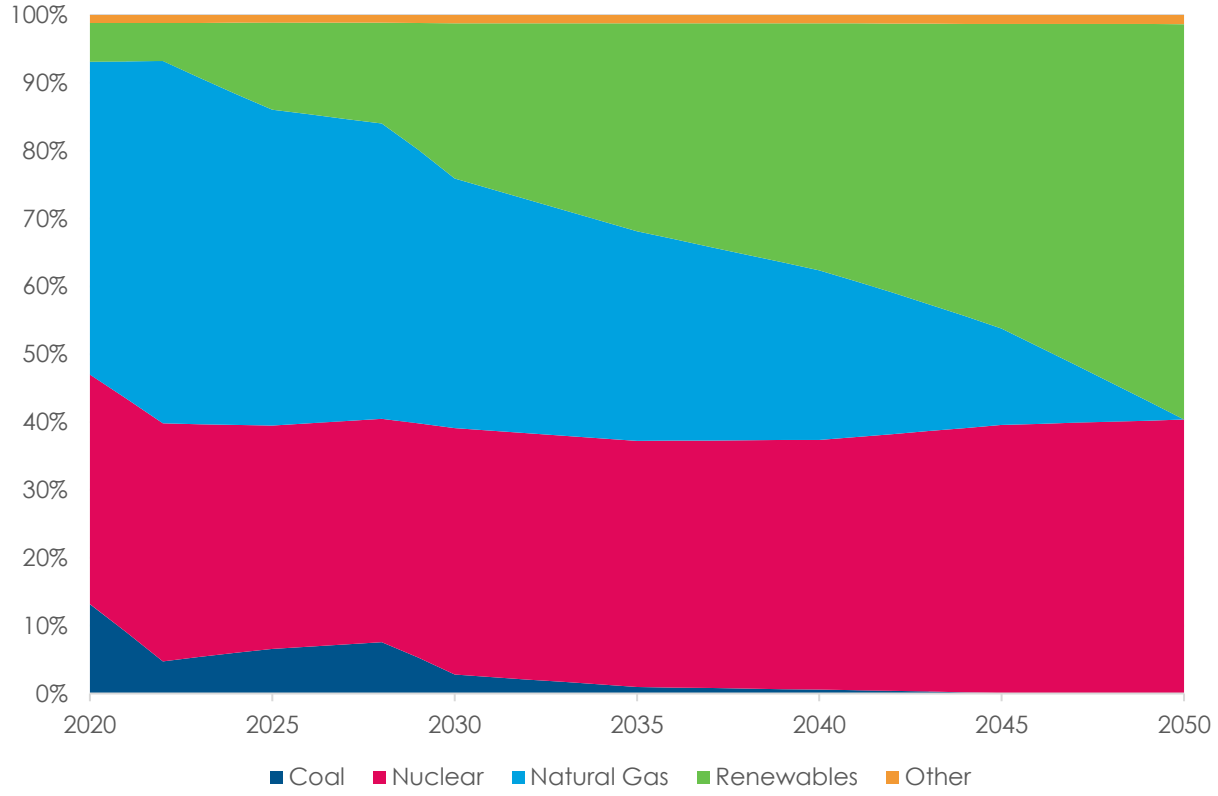
Although reductions in all sectors will be essential to reach Pennsylvania's GHG reduction targets, reductions from electricity generation, transportation, and building strategies will be responsible for the greatest cumulative reductions through 2050. GHG reduction from creating a carbon-free grid will have a gradual trajectory, but in 2050 it could reduce GHG emissions by 55.7 $MMTCO_2e$ compared to the BAU (Figure 18).

Figure 18. GHG reductions from strategies in 2050, compared to business as usual ($MMTCO_2e$)



If the prioritized strategies are fully implemented, the transition to a carbon-free grid would significantly reduce Pennsylvania's GHG emissions by 2050. This would be driven largely by a transition to clean renewable energy generation (e.g., solar), which will replace fossil-based generation such as coal and natural gas. Figure 19 shows a breakdown of electricity generation by source over time, from 2020 to 2050. In Figure 19 electricity generation from waste coal is included in the fuel type "Coal," and the "Other" fuel type includes electricity generation from waste-to-energy and landfill gas facilities. Nuclear generation is projected to remain at its current level, while renewables are expected to grow from roughly 6% of total generation in 2020 to 58% in 2050. Replacing GHG-intensive sources with carbon-free alternatives will contribute significantly to achieving Pennsylvania's GHG reduction targets. Pennsylvania is expected to be an electricity exporter in 2050, exporting approximately 4,000 GWh in 2050. This is much less than in 2020, when it exported about 72,000 GWh. To help balance the added intermittent renewable generation and to backfill the retiring fossil capacity, nearly 47 GW of four-hour battery storage capacity is added by 2050. New, enabling technologies (outlined later in this section) could also play a role in decarbonization of the electricity grid.

Figure 19. Electricity generation mix under a carbon-free grid scenario



Alternative electricity generation mixes

The electric grid strategies modeled in this plan provide one potential pathway toward a carbon free grid by 2050, however different market conditions or new enabling technologies have the potential to provide similar outcomes through a different grid mix. Alternatives could include enhanced roles for carbon capture use and sequestration technologies, hydrogen used for power generation, or additional distributed energy resources. The 80x50 model's grid mix presented provides geographic diversity and certain advantages, however other pathways might increase the diversity of generation types, while still providing reliable electricity.

In addition to reducing GHGs, strategies are projected to result in changes in energy use across sectors. Overall, natural gas, distillate fuel oil, and residual fuel oil consumption is anticipated to decrease, while consumption of electricity and renewable fuels such as biogas and biodiesel are anticipated to increase. Strategies in the buildings and transportation sectors are major drivers of the shift toward increased electricity consumption.

Many of the strategies also have the potential to provide co-benefits such as improved air quality, health, equity, and economic opportunities. The most economically beneficial strategies are those that reduce the cost of energy consumption. The building, fuel, and transportation sectors make up the bulk of the economic benefits, with job increases in most of their strategies.

Taken in isolation, the grid strategy appears to result in the largest decrease in economic activity, though many of the benefits of electrification that the grid strategy provides are

captured in other strategies, so the attribution of strategy costs and benefits are somewhat subjective. The industrial and agriculture sector strategies also have small decreases in economic activity. The strategies offering positive economic impacts, however, more than offset these strategies. The annual number of jobs varies by year (e.g., in 2050, the total jobs supported by these strategies is about 80,000), with an annual average increase of about 42,000 jobs. Combined, the strategies would result in over one million cumulative job-years by 2050. To put these results in context, the macroeconomic impacts estimated here are relatively small compared to the size of Pennsylvania's economy. Annual employment impacts are estimated to range from roughly 0.1% increase to slightly less than 1.0% (in 2050) increase, which averages out to about a 0.51% increase annually for the entire modeling period. Figure 20 and Figure 21 summarize the cumulative employment impacts of all the strategies modeled in REMI.

Figure 20. Job trends—summary employment impacts under the 80x50 scenario

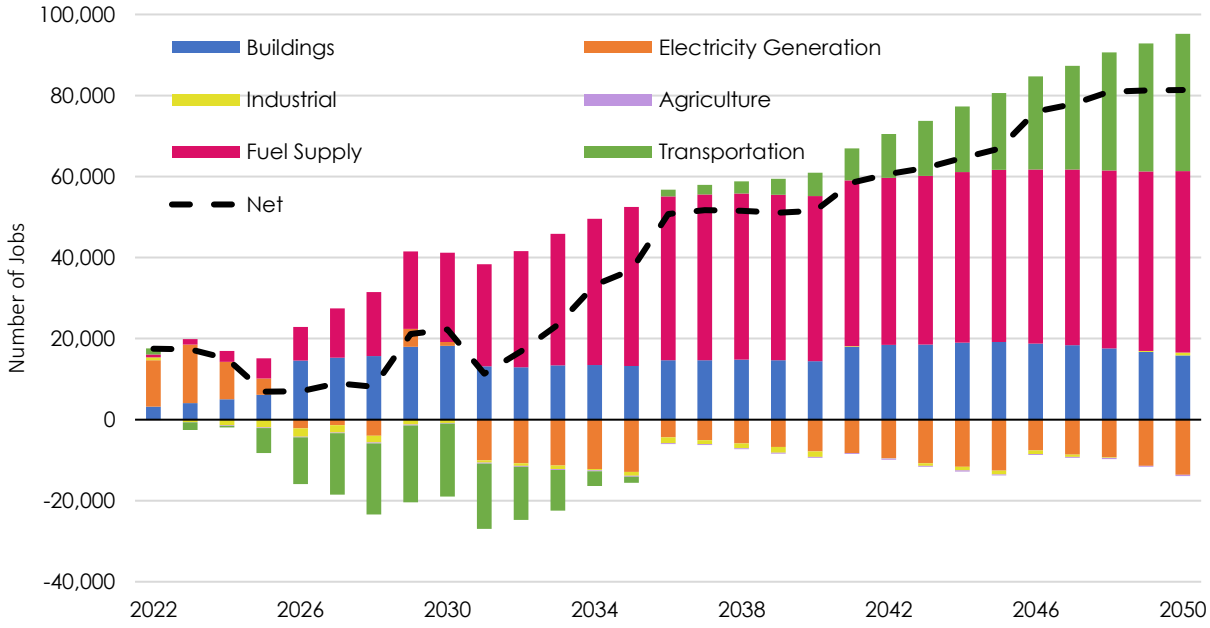


Figure 21. Employment levels under the business-as-usual and 80x50 scenarios

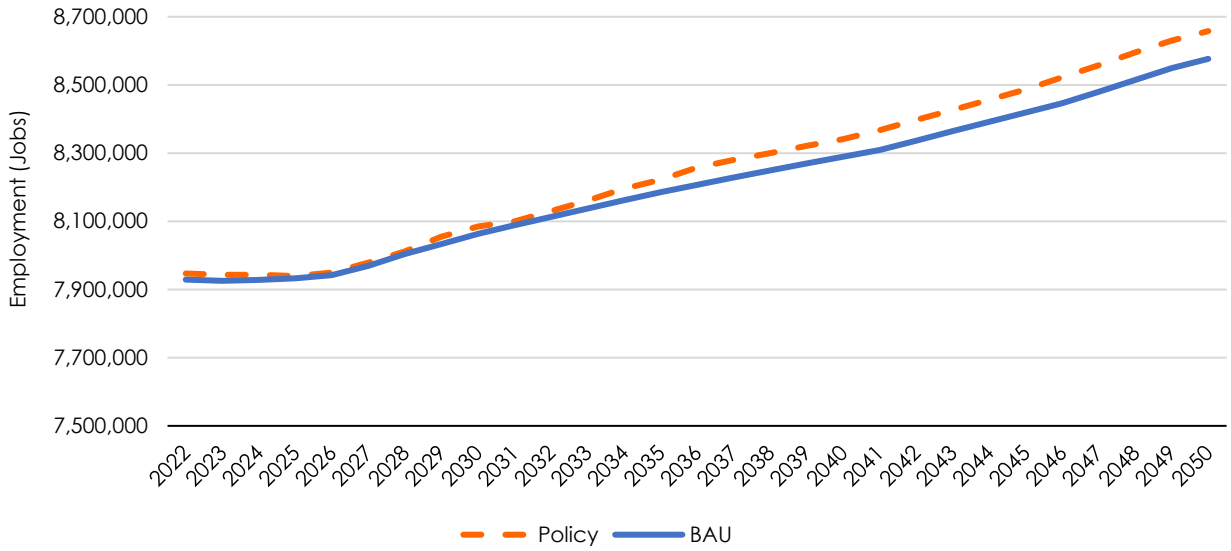
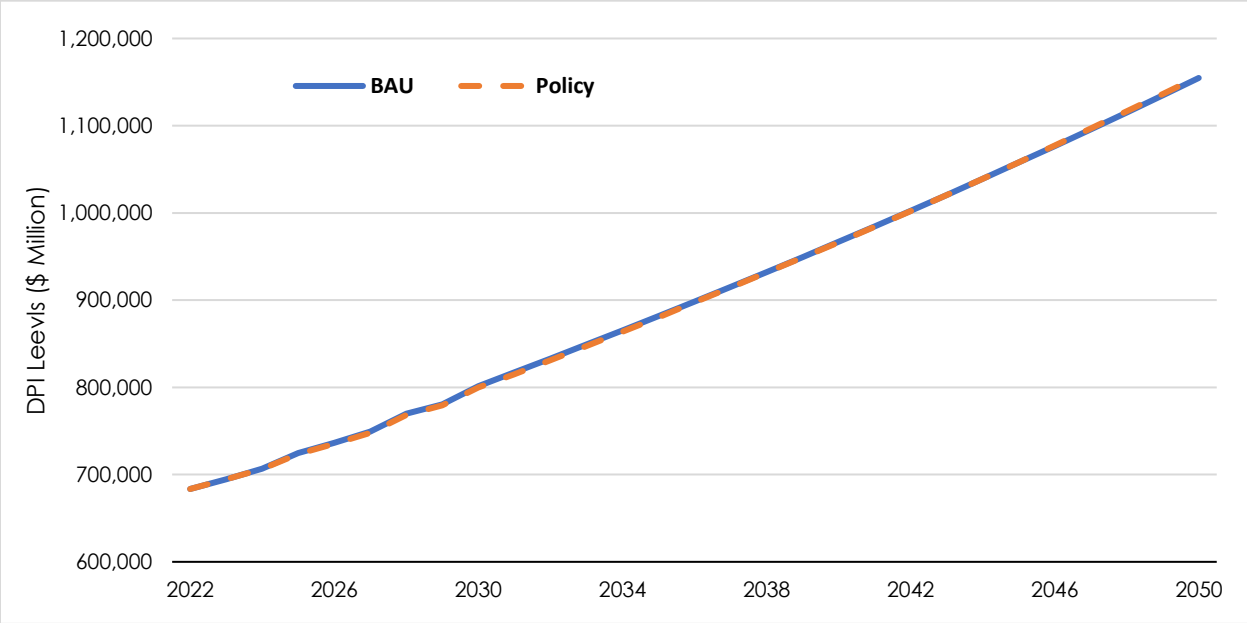


Employment data are from REMI. The BAU employment levels in REMI do not include the effects of COVID-19 on the Commonwealth economy and employment levels.

For GSP and disposable personal income (DPI), slight decreases from the BAU baseline are likely, with GSP decreases of about 0.01% and decreases in DPI of 0.06% in annual average terms. Although the annual average decrease in DPI appears more significant, at -0.06% per year, the Pennsylvania economy continues to grow robustly under the 80x50 scenario, and income levels continue to rise at rates very similar to the BAU baseline. As Figure 22 shows, the rates of growth in disposable income under the BAU and 80x50 scenarios are virtually indistinguishable.

Figure 22. Disposable income levels under the business-as-usual and 80x50 scenarios



Several measures are used to determine the cost-effectiveness of a strategy, one of which is the cost per $MTCO_2e$ reduced. Using this measure, if the cost per $MTCO_2e$ of the strategy is less than the SCC benchmark ($116 per $MTCO_2e$ in 2020[30] or $113.20 per $MTCO_2e$ in 2019[31]), the strategy could be considered cost-effective. Figure 23 presents the cost per $MTCO_2e$ for each strategy, and Figure 24 presents these same results aggregated by sector. Most of the modeled strategies are cost-effective compared to the benchmark, and three of the strategies even result in cost savings (i.e., have a negative cost). Cost-effectiveness is not so black and white, however, and other measures of cost-effectiveness like NPV and macroeconomic effects like jobs and GSP should also be considered. In addition, unquantified effects such as increased equity and co-benefits should be qualitatively assessed to inform a more holistic evaluation of cost-effectiveness.

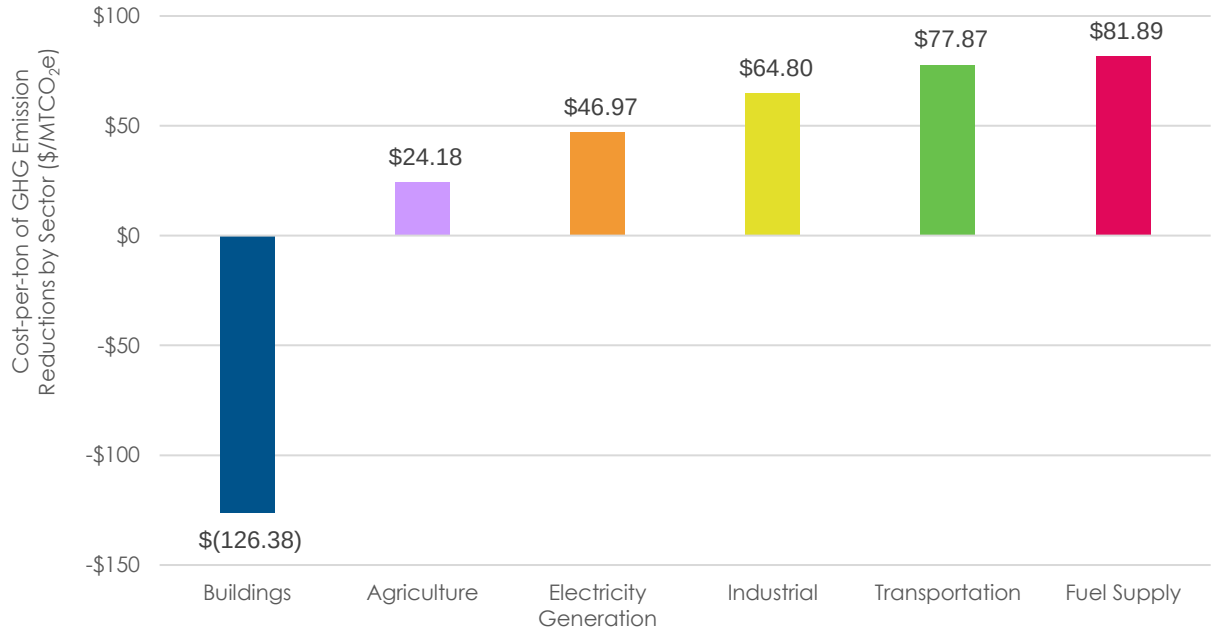
Notes: Costs per $MTCO_2e$ reduced for land use-related reductions are not estimated. Costs for distributed solar (Strategy E) and nuclear electricity (Strategy N) are included in the costs for the carbon-free grid (Strategy O).

Figure 24. Cost per $MTCO_2e$ reduced ($/$MTCO_2e$) for all sectors



Residential and Commercial Buildings

The diversity in building types, vintages, and sizes of Pennsylvania's building stock presents a unique set of challenges to energy efficiency and GHG reductions in the buildings sector. The residential and commercial buildings sector includes homes, apartment complexes, businesses, institutional facilities (e.g., schools, hospitals), and other large buildings. These buildings typically burn fuel on site, primarily for space- and water-heating needs. Note that electricity use is not included in the building sector; it is included in the electricity generation sector. Emissions from the residential and commercial sectors have decreased 20% since 2005, mostly because of the transition to lower-emitting fuels, energy efficiency improvements that reduce the need for fuel consumption, and technological improvements. Strategies to improve building codes and energy efficiency, as well as increased electrification of heating, can help to reduce fuel burning and associated emissions.

There are just over 5 million residential buildings in Pennsylvania. The majority of Pennsylvanians live in detached single-family homes (66%), followed by attached single-family buildings (17%), multifamily buildings (14%), and manufactured or mobile homes (3%). On average, multifamily homes consume the least electricity per person, while detached single-family homes consume the most. The average home in Pennsylvania is 65 years old, about 1,900 square feet, and about 61% less efficient than a home built to 2009 IECC code.[32]

[32] Pennsylvania Public Utility Commission (PUC). 2019. 2018 Pennsylvania Statewide Act 129 Residential Baseline Study. https://www.puc.pa.gov/Electric/pdf/Act129/SWE-Phase3_Res_Baseline_Study_Rpt021219.pdf.

There are approximately 50,000 commercial buildings in Pennsylvania. Commercial buildings include office buildings, restaurants, grocery stores, retail shops, lodging, schools, hospitals, and warehouses. Most commercial buildings rely on natural gas for on-site energy supply used to heat spaces, heat water, and cook food.[33]

The strategies proposed to address building emissions reflect existing technological and policy trends that aim to improve energy efficiency, incentivize electrification, and add clean on-site energy production. Five strategies are modeled:

- Support energy efficiency through building codes
- Improve residential and commercial energy efficiency (electricity)
- Improve residential and commercial energy efficiency (gas)
- Incentivize building electrification
- Increase distributed on-site solar

Together, the modeling results indicate that these strategies will reduce emissions compared to the BAU in 2025 and 2050 (Figure 25), and in 2050 will reduce emissions in the buildings sector by 22,582,992 $MTCO_2e$ (Table 3).

For each strategy, the environmental, economic, and social benefits are reported along with the costs (or savings) associated with the implementation of the strategy. The environmental benefits and costs (or savings) are expressed in terms of GHG emission reductions and changes in energy and fuel use. The economic impacts are expressed in terms of changes in job numbers, DPI, and GSP. The social benefits and costs are expressed in terms of impacts on air quality (e.g., changes in the criteria pollutants like SO_2, NO_x, and $PM_{2.5}$) and associated public health and social impacts such as equity and resilience.

Figure 25. Building sector GHG emissions with reduction strategies compared to business-as-usual

Table 3. Building sector GHG reduction strategies and associated reductions ($MTCO_2e$)

GHG Reduction Strategy	2025	2050
A. Support energy efficiency through building codes	24,444	164,278
B. Improve residential and commercial energy efficiency (electricity)	N/A*	N/A*
C. Improve residential and commercial energy efficiency (gas)	1,365,613	4,311,296
D. Incentivize building electrification	483,807	12,288,250
E. Increase distributed on-site solar	296	5,819,168
Total GHG reduction	**1,874,160**	**22,582,992**

**The GHG reductions from this strategy are captured in the electricity generation sector.*

A. Support energy efficiency through building codes

This strategy includes adopting the most current building codes and training code officials and inspectors on how to enforce existing codes, as well as creating a single stretch code for PA Department of Labor and Industry approval to allow uniform adoption across the Commonwealth. This strategy could create codes based on existing "stretch codes" such as International Green Construction Code (IgCC), Zero Code, NetZero Codes, or allow the adoption of and promote the use of a Pennsylvania-specific stretch code.

Environmental benefits and costs

By reducing the amount of electricity and gas consumed through the adoption of more recent codes, this strategy reduces emissions of CO_2 and other GHG associated with electricity generation and fuel combustion, such as CH_4 and N_2O. This strategy also reduces gaseous and particulate emissions associated with electricity generation and combustion, including criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and volatile organic compounds (VOC) that are ground-level ozone precursors. Finally, energy savings can be expected from the adoption of newer codes.

Economic benefits and costs

The adoption and enforcement of the most current building codes will result in disparate economic impacts. Investments by the residential and commercial sectors and corresponding reductions in energy consumption will result in positive economic impacts. In paying for these investments, however, the residential and commercial sectors will see reductions in other expenditures (opportunity costs of their investments). The net impacts are positive, with an NPV of $13.97 billion. Average annual GSP and DPI impacts are negative, estimated at -$32.82 million and -$79.58 million annually, respectively. The average annual employment impact is expected to be -120 jobs.

$(32.82 million)

Average annual disposable personal income

$(70.58 million)

Average annual employment

-120 jobs

[a] Reductions are compared to the BAU estimates from the respective year.

Social benefits and costs

Adopting progressive energy codes improves air quality by reducing emissions from the combustion of natural gas and the generation of electricity. This strategy also provides a benefit to public health by directly reducing emissions that affect health. Homes built to a more efficient energy code may result in higher initial costs, but code updates typically provide lifetime savings for owners.

Implementation Considerations

Pennsylvania's building energy codes for commercial and residential construction are updated triennially under current law. The Commonwealth has a defined process for residential and commercial energy codes adoption. Pennsylvania can build on its recent progress by continuing to update building codes and allowing or incentivizing local "stretch" code adoption and high-performance or net-zero buildings.

Energy Code Adoption in Pennsylvania

Residential. The Department of Labor and Industry (DLI) would use its authority to promulgate and upgrade the Pennsylvania Uniform Construction Code (UCC), through modifications subject to public hearings and approval by the DLI Review and Advisory Council (RAC). Residential energy code provisions are based on the International Code Council (ICC)'s triennial International Energy Conservation Code (IECC) and International Residential Code (IRC)

Commercial. DLI would update the commercial energy code provisions through the same overall process, but would draw on the IECC's commercial provisions, as well as those of ASHRAE Standard 90.1. In addition, 2017 state legislation enabled the City of Philadelphia to adopt a more stringent code for commercial buildings.

Resilience Considerations

Changes that improve energy efficiency—whether through building codes or electrification, or residential or commercial energy-saving strategies—increase populations' resilience by decreasing costs. Energy efficiency also reduces building energy use, which can in turn reduce stress on the grid during heat waves (and the associated costs and risks of outages), and improve air quality—both important to mitigating health and economic risks in warmer temperatures.

In low-income households, where a higher proportion of income is spent on energy than in high-income households, cost-saving benefits may be particularly significant. For example, for communities that disproportionately lack access to methods of adapting to heat hazards (e.g., if the cost of air conditioning is a barrier), cutting energy costs—or preventing them from rising under warmer temperatures—through energy efficiency may increase those communities' resilience to a wide range of hazards.

New York and Massachusetts allow local jurisdictions to adopt "stretch" codes that exceed state minimum stringency. Creating a single stretch code for Pennsylvania would allow uniform adoption across the Commonwealth, which has many benefits. Consistency enables builders, developers, and code officials to implement energy-saving measures in construction practices. Local governments exercising their own development policy powers, such as granting bonus incentives and expedited permits for greater density, would encourage higher-efficiency new construction.

Energy codes such as IECC are governed by the International Code Council and are considered the national model code. Cost impacts associated with code updates are evaluated, and changes to the code typically provide a cost-effective balance of benefits to home and building owners. Cost-effectiveness tests for building codes are critical to ensure that cost and social equity considerations

are accounted for. Code adoption has received generally positive political support in the past, with mixed opposition when codes are perceived to increase costs.

B. Improve residential and commercial energy efficiency (electricity)

This strategy includes several actions to improve residential and commercial energy efficiency by requiring energy-efficiency improvements aimed at reducing kWh used, either in the existing or in a modified framework of Act 129 and other programs (e.g., increasing savings targets and removing spending caps).

For Act 129, this may include increasing the low- to moderate-income (LMI) share of spending and reforming cost-effectiveness tests to support more LMI focus, in coordination with the Low-Income Usage Reduction Program (LIURP). Act 129 could also be enhanced by specifying a monetary value for avoided GHG emissions (as demonstrated by New York State's Value of Carbon guidance)[34] or by adding climate mitigation and resilience benefits to cost-effectiveness tests. To enhance Act 129 effectiveness and increase savings, incentives and education should also leverage programs such as the federally funded Low-Income Home Energy Assistance Program (LIHEAP) and Weatherization Assistance Program (WAP).

This strategy also calls for creation of a statewide commercial building energy performance program to reduce electricity use in large commercial buildings. Such a program could begin with the energy benchmarking of large facilities and grow to include retro-commissioning or energy efficiency requirements.

$1,058.56 million

Average annual employment
12,765 jobs

[a] GHG emissions associated with decreased electricity consumption from this strategy are not included in totals; generation-based GHG accounting is used in line with the state inventory.

Environmental benefits and costs

By reducing the amount of electricity consumed by expanding energy efficiency, this strategy reduces emissions of CO_2, CH_4, and N_2O. This strategy also reduces gaseous and particulate emissions associated with electricity generation, including criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs. Finally, energy cost savings can be expected from the implementation of electrical energy efficiency.

Economic benefits and costs

Investments in electric energy efficiency result in positive economic impacts resulting from manufacturing and construction (installation) jobs, as well as from increasing residential disposable income and commercial expenditures directly resulting from

[34] New York State. Establishing a Value of Carbon Guidelines for Use by State Agencies. https://www.dec.ny.gov/docs/administration_pdf/vocfguid.pdf. Accessed April 4, 2021.

bill savings. Some negative impacts will result from the lost opportunity costs of investment and impacts to power generators from lost revenues. The NPV of this strategy is positive, at $24.05 billion. The cumulative economic impacts are positive because of increasing bill savings over time. Average annual GSP and DPI impacts are estimated at about $1.2 billion and $1.1 billion, respectively. The average annual employment impact is expected to be about 12,765 jobs.

Social benefits and costs

The implementation of energy efficiency measures improves air quality by reducing emissions from the generation of electricity. This strategy also provides a benefit to public health by directly reducing emissions that affect health.

Implementation Considerations

Improving residential and commercial electrical energy efficiency through incentive and retrofit programs is well established both in Pennsylvania and nationally. This strategy consists of two main programs, the expansion of Act 129 and the establishment and growth of a Commercial Building Energy Performance Program. Changes recommended by this strategy can be implemented immediately and can grow over time.

Reducing electricity usage in buildings can be accomplished through conservation and efficiency measures that result in a variety of environmental, social, and economic benefits. Energy conservation includes behavioral and operational measures and programs, such as changing temperature settings, turning off unused lights and energy-consuming devices, and reducing the operation hours for space conditioning and other systems. Through energy conservation, electricity users can achieve instant, albeit small, reductions through changes in how they use systems and buildings. Energy efficiency includes improving the operating performance of buildings through retrofitting and interventions such as the following:

- Building envelope improvements (e.g., better windows, insulation, and air sealing)
- New and more efficient appliances and equipment
- Lighting retrofits (e.g., LED and other advanced technologies)
- Changes to heating and cooling systems (e.g., ground-source heat pumps, variable refrigerant flow, and ductless systems).

Pennsylvania already implements Act 129, which sets electricity reduction targets for electric distribution companies to meet, but the state legislature would also have to increase annual energy savings targets, remove cost caps, and make other programmatic changes. Increasing the impact of Act 129 programs would also require complementary state legislative or regulatory action to reform rate-making and resource-acquisition policies, to provide incentives for investing in energy efficiency.

A commercial building energy performance program would be modeled on programs in other cities and states, including those in Philadelphia, Pittsburgh, Washington State, and New

Jersey.[35] Large buildings (over 50,000 square feet) would be subject to the program and would be required to benchmark their energy use in the initial years of the program. Over time, more energy performance measures would be added to ensure that large buildings use energy efficiently. To implement this program, the state legislature would have to pass legislation creating the program and would have to assign a regulatory agency to administer it.

Program rules for implementation should ensure equitable implementation and include the continuation of specialized low- and moderate-income programs for Act 129 to ensure that low-income individuals are not financially harmed. If the program included multifamily residential buildings in its design, environmental justice or low-income communities could be financially benefited by this strategy, but careful implementation would be required to avoid increasing financial burdens and disparities.

Energy efficiency programs have generally received broad support from policymakers and program stakeholders, provided that the programs continue to be cost-effective for participating parties. Expanding Act 129 is feasible given the many expected benefits of doing so, including job growth and cost savings.

[35] IMT. Map: U.S. City, County, and State Policies for Existing Buildings: Benchmarking, Transparency and Beyond. Accessed April 5, 2021. https://www.imt.org/resources/map-u-s-building-benchmarking-policies/.

C. Improve residential and commercial energy efficiency (gas)

This strategy includes creating a new energy efficiency program focused on reducing gas consumption that is similar to the voluntary gas demand-side management (DSM) programs already in place with some Pennsylvania gas utilities. This strategy specifically includes a statewide commercial building energy performance program targeting the reduction of natural gas use in large commercial buildings. This type of program begins with energy benchmarking of large facilities and grows to include retro-commissioning or imposing energy efficiency requirements. It also includes an allocation of a certain portion of funds for LMI individuals and the updating of cost-effectiveness tests, such as by adding climate mitigation and resilience benefits to the tests. Act 129 could also be enhanced by including a monetary value for the avoided GHG emissions (as demonstrated by New York State's Value of Carbon guidance).[36]

Annual GHG emissions reduced in 2025
1,365,613 $MTCO_2e$

Annual GHG emissions reduced in 2050
4,311,296 $MTCO_2e$

Annual energy reduced in 2050
80,973 Bbtu of gas

Cost or (benefit) per ton of GHG reduced
$(92.90)/$MTCO_2e$

Net present value
$7.35 billion

Average annual gross state product
$(55.79 million)

Average annual disposable personal income
$143.77 million

Average annual employment
1,396 jobs

Environmental benefits and costs

By reducing the amount of gas consumed through the implementation of gas efficiency measures, this strategy reduces emissions of CO_2 and other GHGs associated with gas combustion such as CH_4 and N_2O. This strategy also reduces gaseous and particulate emissions associated with gas combustion, including small amounts of criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs that are ground-level ozone precursors. Energy savings can also be expected from the implementation of gas efficiency measures.

Economic benefits and costs

As with electric energy, investment in gas energy efficiency results in positive economic impacts because of the creation of manufacturing and installation jobs. Further positive benefits result from increased household and commercial sector spending that is due to realizing savings on the gas bill. Negative impacts will result from the lost opportunity costs of investment and the impacts to power generators from lost revenue. Pennsylvania's large natural gas sector will experience negative economic impacts as a result of lower natural gas consumption, but the negative impacts are offset by the positive impacts. The NPV of this strategy is $7.35 billion. Average annual GSP is estimated at -$55.79 million, largely because of fossil fuel impacts. Annual average DPI impact is estimated at $143.77 million resulting from bill savings associated with energy efficiency. The average annual employment impact is expected to be 1,396 jobs.

[36] New York State. Establishing a Value of Carbon Guidelines for use by State Agencies. Accessed April 4, 2021. https://www.dec.ny.gov/docs/administration_pdf/vocfguid.pdf.

Social benefits and costs

The implementation of gas energy efficiency improves air quality by reducing emissions from the combustion of natural gas. This strategy also provides a benefit to public health by directly reducing air pollutants that affect health.

Implementation Considerations

Improving residential and commercial gas efficiency through incentive and retrofitting programs is well established in Pennsylvania and nationally. Changes recommended by this strategy can be implemented immediately and will grow over time. This strategy consists of two main programs:

- Create a program similar to Act 129 to require gas utilities to operate gas energy efficiency programs.
- Establish a commercial building energy performance program, as discussed in the previous strategy.

Reducing gas use in buildings can be accomplished through conservation and efficiency measures that result in a variety of environmental, social, and economic benefits. Energy conservation includes behavioral and operational measures and programs, such as changing temperature settings and energy consuming devices, and reducing the operation hours for space conditioning and other systems. Through energy conservation, gas users can achieve instant, albeit small, reductions through changes in how they use systems and buildings. Energy efficiency, which this strategy focuses on, includes improving the operating performance of buildings through a variety of retrofits and interventions such as:

- Building-envelope improvements (e.g., better windows, insulation, and air sealing)
- New and more efficient appliance and equipment
- Changes to heating and cooling systems (e.g., enhanced building controls, high-efficiency boilers, and high-efficiency hot water heaters).

Act 129 does not require natural gas utilities to reduce direct natural gas consumption, but it does ask utilities to voluntarily establish energy efficiency programs. To increase savings, the state legislature would need to require utilities to reduce direct natural gas consumption, establish annual savings targets, and create a program that allows for beneficial energy efficiency to be expanded. Models for statewide natural gas legislation and programming are available in neighboring states, including New York and New Jersey.

As described in Strategy B, a commercial building energy performance program would also have a significant impact on natural gas use, because gas is a primary fuel source of many large commercial buildings. Program measures and their associated natural gas reductions are a significant benefit of such a program.

Rules for program implementation should ensure equitable implementation and include the continuation of specialized low- and moderate-income programs, like those already in place for

Act 129's electricity programs, to ensure that low-income individuals are not financially harmed. Environmental justice or low-income communities would not benefit financially from implementation of this strategy, and careful implementation would be required to avoid increasing financial burdens and disparities on these communities.

Energy efficiency programs have received broad support by policy makers and program stakeholders provided that the programs continue to be cost effective to participating parties. Creating a gas efficiency program similar to the one called for in Act 129 is feasible given the many benefits of doing so, including job growth and cost savings.

D. Incentivize building electrification

This strategy includes incentivizing building electrification (e.g., heating and hot water) for the residential and commercial sectors. It also includes a new program focused on beneficial electrification, possibly modeled on the New York Clean Heat program. This includes incentives for converting fuel oil and natural gas use to electricity use in existing buildings and electrification of new buildings when there are large natural gas infrastructure costs or when fuel oil is the alternative.

Annual GHG emissions reduced in 2025

483,807 $MTCO_2e$

Annual GHG emissions reduced in 2050

12,288,250 $MTCO_2e$

Annual energy reduced in 2050

-38,178 GWH of electricity (increase)

222,699 Bbtu of gas

Cost or (benefit) per ton of GHG reduced

$501.76/$MTCO_2e$

Net present value

$(12.19 billion)

Average annual gross state product

$(761.45 million)

Average annual disposable personal income

$(504.13 million)

Average annual employment

-5,155 jobs

Environmental benefits and costs

Electrification of buildings will reduce the amount of gas and fuel oil consumed, and as a result this strategy will reduce emissions of CO_2 and other GHG associated with fossil fuel combustion such as CH_4 and N_2O. This strategy also reduces gaseous and particulate emissions associated with fossil fuel combustion, including small amounts of criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs that are ground-level ozone precursors. In the early years of implementation, any reduction in carbon, gaseous, or particulate emissions will be partially offset by emissions from the generation of electricity, but as the grid switches to cleaner sources, emissions savings will be more pronounced. Energy savings are not expected from this measure because natural gas and fuel oil reduction will be offset by an increase in electricity use.

Economic benefits and costs

The electrification of residential and commercial sectors is expected to have negative economic impacts. While positive impacts are expected in manufacturing and construction (installation) sectors, costs of electrification are high. Paying for electrification will lower disposable income and expenditures in other consumption categories, resulting in net negative economic impacts. The NPV of this strategy is -$12.19 billion. Average annual GSP and DPI impacts are estimated at -$761.45 million and -$504.13 million, respectively. The average annual employment impact is expected to be -5,155 jobs.

Social benefits and costs

The implementation of electrification measures improves air quality by reducing emissions from the combustion of natural gas and fuel oil. This strategy also provides a benefit to public health by directly reducing emissions that affect health. In the early years of implementation, any reduction in carbon, gaseous or particulate emissions will be partially offset by emissions from the generation of electricity, but as the grid switches to cleaner sources, emissions savings will be more pronounced.

Resilience Considerations

Scaling up electrification may provide a variety of climate resilience benefits and opportunities, such as reduced air pollution and associated public health benefits, which can help combat potential declines in air quality and health associated with higher temperatures. It may also reduce sensitivity to price fluctuation of specific fuels, providing financial benefits. However, given projected increased risk of extreme weather events that may cause power outages, ensuring electricity reliability will be increasingly critical.

Considering opportunities to build redundancy and resilience into the electric grid, such as pairing distributed renewable generation with backup battery storage, developing microgrids or demand side management options, using smart technology to efficiently pinpoint outage locations, and working alongside other public and private actors to ensure the grid is resilient to projected climate conditions will be critical in safely electrifying the Commonwealth.

Implementation Considerations

Electrification incentive programs are growing in popularity in the United States but would be new for Pennsylvania. Program design and incentives could be modeled on those in New York's Clean Heat programs, which aim to implement solar hot water heating and air/ground source heat pumps. Program implementation would require support from a variety of educational programs. Broad electrification is still challenged by its lack of cost-effectiveness and limited customer awareness and confidence in the technologies. Supply chains for heat pump technologies will need to grow, and installation contractors will need to offer a broader set of solutions.

To support market growth, government could pilot the use of heat pump solutions in government buildings, with the goal of growing the market and demonstrating the technologies' use and effectiveness. Cost reductions and gains in technology efficiency are critical to the adoption of electrification. Cold climate air source heat pump technology has advanced significantly in recent years, but costs remain high.[37] A rebate program offered opportunities for implementing electrification solutions in Maine. Heat pumps as a secondary heating source (adjacent to fuel oil, propane, and other fuels) and as a source for air conditioning in the summer have been installed and incentivized.[38] A similar offering could be successful in Pennsylvania buildings without air conditioning and where heat pumps could gain part of the heating market share.

[37] NYSERDA, 2019 New Efficiency: New York Analysis of Residential Heat Pump Potential and Economics. https://www.nyserda.ny.gov/-/media/Files/Publications/PPSER/NYSERDA/18-44-HeatPump.pdf

[38] Efficiency Maine, Accessed March 19, 2021. https://www.efficiencymaine.com/heat-pumps/

Eventually, the state legislature could require utilities to implement beneficial electrification solutions, in alignment with the natural gas–reducing strategies outlined in Strategy C. Legislation could establish annual savings targets or create a program that allows for beneficial electrification to be expanded. This work would need to align with Pennsylvania's Act 129, because many of the measures would increase electricity use. Models for statewide legislation and programming are available in neighboring states, including New York.

Equity considerations of beneficial electrification would need to be integrated into the design of a new program. Careful attention to ensuring that low- and moderate-income customers are given opportunities to participate is needed. Electrification measure implementation should also consider resiliency issues because heat pumps and most electrification requires grid electricity to provide heat.

Embodied Carbon Emissions

Embodied carbon emissions consist of the GHGs associated with materials and construction processes throughout the whole lifecycle of the built environment. This document focuses on the mitigation of carbon emissions associated with operational activity happening within the Commonwealth, but the Commonwealth's infrastructure and building construction contain embodied emissions, which should also be considered in decision making. Green building practices typically seek to reduce the footprint of construction by focusing on local and materials with lower lifecycle emissions. In Pennsylvania, green building practices are extremely popular, and programs exist in both Philadelphia and Pittsburgh to support green buildings. Additionally, the PA Department of General Services Bureau of Capital Projects is currently working to require embodied carbon considerations in Commonwealth-owned new construction and major renovation projects. Some regional and sub-national government entities have pursued consumption-based inventories to understand their global carbon impact associated with manufactured goods consumed within the boundaries.

E. Increase distributed on-site solar

Annual GHG emissions reduced in 2025
296 $MTCO_2e$

Annual GHG emissions reduced in 2050
5,819,168 $MTCO_2e$

Annual energy reduced in 2050

Cost/(benefit) per ton of GHG reduced
Included in Strategy O

Net present value
Included in Strategy O

Average annual gross state product
$494.93 million

Average annual disposable personal income
$425.40 million

Average annual employment
5,603 jobs

This strategy includes the installation of on-site distributed solar in both the residential and commercial sectors. On-site, distributed solar photovoltaics play an important part in the decarbonization of the electrical grid. On-site solar implementation will align with the grid decarbonization strategies outlined in Strategies N and O. To maximize the benefits of this strategy, use of solar must expand across the Commonwealth, legislation enabling development of a robust solar industry at the distributed level must be passed, and strategies that increase the value of solar renewable energy credits (SRECs) must be implemented.

Environmental benefits and costs

By generating renewable electricity, this strategy reduces emissions of CO_2 and other GHG associated with grid electricity sources such as CH_4 and N_2O. This strategy also reduces gaseous and particulate emissions associated with electricity generation, including criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs.

Economic benefits and costs

The installation of on-site distributed solar is expected to have positive economic impacts. Some positive impacts result from growth in manufacturing and installation jobs, as a result of photovoltaic investments, but most of the positive impacts result from bill savings. While there is some initial investment, significant bill savings will accrue over time, resulting in additional cost savings potential in later years. Average annual GSP and DPI impacts are estimated at $494.92 million and $425.40 million, respectively. The average annual employment impact is expected to be 5,603 jobs.

Social benefits and costs

The implementation of distributed on-site solar improves air quality by reducing emissions from grid electricity generation sources. This strategy also provides a benefit to public health by directly reducing emissions that affect health. Distributed on-site solar has the potential to improve the resiliency of infrastructure, because solar paired with battery technology can be used to supply power to buildings in case of emergency power shutoffs or blackouts.

Implementation Considerations

Pennsylvania has already supported a variety of distributed on-site solar installations through a combination of programs and policies that provide financial support, rules, and incentives. Programs such as the PA Sunshine Solar Rebate program have provided a direct rebate to users who installed solar projects, while Pennsylvania's net metering rules have allowed on-site solar projects to be more competitive. And as the installed cost of solar PV projects has declined, the

state's Alternative Energy Portfolio Standard (AEPS) has continued to provide financial support to solar projects.

A robust AEPS (as described in Strategy O) will support additional utility and distributed on-site solar projects through a market-based program. Implementation of new distributed solar has been discussed extensively in Pennsylvania's Solar Future Plan,[39] which includes a full set of technology support options, including financing, workforce development, and potential incentives.

Distributed solar projects have several benefits that support the equitable implementation of this strategy. Job creation from distributed solar projects is significant, and solar installers are expected to be a large job-growth area in the coming decade. With its benefits, solar has generally received robust support from the public and policy makers. Implementation of distributed solar also presents an opportunity to enhance resiliency of energy systems when paired with battery or microgrid technologies. As the costs of batteries continue to fall and the deployment of battery technology grows, the possibility for the broad adoption of solar-battery installations has the potential to support the grid. Siting solar projects in underutilized settings such as abandoned fields, brownfields, and warehouses, will help balance carbon sequestration and GHG emission reduction opportunities.

Pennsylvania's Solar Future Plan

In late 2018, DEP published Pennsylvania's Solar Future Plan, a stakeholder-led document that established a target of producing 10% of the Commonwealth's electricity from in-state solar by 2030. The 2021 CAP is aligned with this plan, which saw the following benefits:

- **Jobs:** 60,000 to 100,000+ jobs, depending on the ratio of smaller systems to larger systems. From installers to system designers, these solar jobs have median wages of $20–$38 per hour, and will be available in rural, urban, and suburban areas.
- **Economic development opportunities:** There are opportunities to site solar development in ways that complement the working landscape and rural economy, such as using solar on buffer zones, disturbed lands, and in conjunction with grazing or pollinator friendly perennials.
- **Net benefit of free fuel and cost savings:** The combination of fuel savings (free sunlight) and anticipated cost savings (avoided public health and environmental damages) could result in a net benefit of over $1.60 billion annually from 2018 to 2030.

Resilience Considerations

Increased distributed renewable energy generation may have climate resilience co-benefits. For example, it may reduce the risk of widespread power outages associated with impacts to infrastructure susceptible to damage in extreme weather (e.g., transmission lines, distribution poles) and support demand flexibility, and lower long-term energy costs. Extreme events are projected to occur with increasing frequency and intensity under climate change, and peak power demand may increase as peak summer temperatures get warmer. Without increased resilience and redundancy in the power grid, higher peak demand increases the risk of impacts like higher energy costs for consumers and power outages.

[39] Pennsylvania DEP. Pennsylvania's Solar Future Plan. Accessed April 5, 2021. https://www.dep.pa.gov/Business/Energy/OfficeofPollutionPrevention/SolarFuture/Pages/Pennsylvania's-Solar-Future-Plan.aspx.

Transportation

The transportation sector encompasses all activities that facilitate the transportation of people and goods, while providing a wide range of services. The transportation sector is the second-largest source of GHG emissions in the Commonwealth, and most of these emissions are generated by burning fuel to power internal combustion engines for light-duty passenger cars and trucks. Transportation-related GHG emissions have decreased over the past two decades, however, even as the number of cars on the road and trips taken has increased. This trend is due primarily to higher fuel-economy standards, and is expected to continue as hybrid and zero-emissions vehicles become a significant fraction of vehicles on the road.

Transportation and Climate Initiative

- The Transportation and Climate Initiative (TCI) is a regional collaboration of 13 Northeast and Mid-Atlantic states and the District of Columbia that seeks to improve transportation, develop the clean energy economy and reduce carbon emissions from the transportation sector.
- TCI-P is a cap and invest program. It builds on and can work with other options for reducing emissions from the transportation sector.
- DEP supports the development, outreach, and engagement of the program. Pennsylvania is not currently participating in TCI-P.

In 2018, more than 102 million vehicle miles were traveled in Pennsylvania.[40] Transportation is vital to Pennsylvania's economy, contributing in 2015 an estimated $1.3 billion to the local economy and employing more than 182,000 people. There are more than 120,000 miles of roads, 22,000 bridges, 5,127 miles of railroad tracks, and more than 400 airports in Pennsylvania.[41]

Transportation activities and related emissions are projected to increase in the next decades according to the BAU scenario that reflects the current trends of a growing population in and around urban centers, and more miles driven per capita.

The strategies proposed to address transportation emissions reflect current technological and policy trends of lower fuel consumption and lower carbon intensity of the fuel consumed. Taken together, these two approaches can significantly lower GHG emissions and other air pollutants originating from tailpipes. Four strategies are modeled:

- Increase fuel efficiency of all light duty vehicles and reduce vehicle miles traveled for single occupancy vehicles.
- Implement the multistate medium- and heavy-duty zero-emission vehicle memorandum of understanding (MHD ZEV MOU), of which the Commonwealth is a signatory.
- Increase adoption of light-duty electric vehicles.

---

[40] EIA, 2021. "Pennsylvania State Profile and Energy Estimates." https://www.eia.gov/state/data.php?sid=PA.

[41] American Road and Transportation Builders Association. N.d. "Pennsylvania Transportation Facts—Economic Impacts. https://www.artba.org/wp-content/uploads/2016/08/econ_profile_2015_Pennsylvania.pdf.

- Implement a low carbon fuels standard (LCFS).

The modeling results indicate that these strategies will reduce emissions compared to the BAU scenarios in 2025 and 2050 (Figure 26), and in 2050 will reduce emissions in the transportation sector by 33,989,502 $MTCO_2e$ (Table 4).

For each strategy, the environmental, economic, and social benefits are reported, along with the costs (or savings) associated with the implementation of the strategy. The environmental benefits and costs (or savings) are expressed in terms of GHG emission reductions and changes in energy and fuel use. For the strategies that rely on switching from conventional engines to electric vehicles, the costs associated with electricity consumption for vehicle charging are included; GHG emissions that come from the additional electricity generation for vehicle charging, however, are not included here, but in electricity generation.

The economic impacts are expressed in terms of change in job numbers, disposable income, and GSP. The social benefits and costs (or savings) are expressed in terms of impact on air quality (e.g., change in criteria pollutants) and associated public health and social impacts such as equity and resilience.

Figure 26. Transportation GHG emissions with reduction strategies compared to business as usual

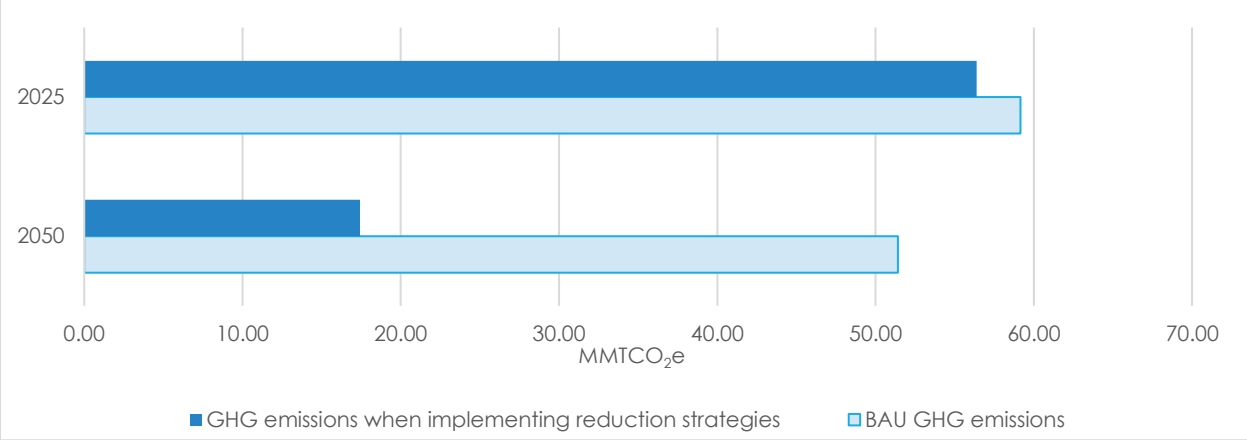

Table 4. Transportation sector GHG reduction strategies and associated reductions ($MTCO_2e$)

GHG Reduction Strategy	2025	2050
F. Increase fuel efficiency of all light-duty vehicles and reduce vehicle miles traveled for single occupancy vehicles	571,524	2,805,452
G. Implement the multi-state medium-and heavy-duty zero-emission vehicle memorandum of understanding	291,395	7,384,410
H. Increase adoption of light-duty electric vehicles	1,225,113	23,799,640
I. Implement a Low Carbon Fuel Standard	683,365	0*
Total GHG Reductions	**2,771,397**	**33,989,502**

**The carbon intensity goal is achieved by 2050 (due to electrification from other transportation strategies) so there is no additional reduction expected in 2050.*

F. Increase fuel efficiency of all light-duty vehicles and reduced vehicle miles traveled for single-occupancy vehicles

This strategy models a reduction of vehicle miles traveled (VMT) for single-occupancy vehicles by implementing travel-demand solutions such as shifting travel mode choice, making travel more efficient, and increasing telecommuting. VMT reduction efforts are paired with land-use and development policies that promote and incentivize sustainable transportation modes (e.g., walking, biking, transit) in densely populated urban areas and assume the expansion of options for sustainable mobility to and from urban centers (bus rapid transit, carpool) in the medium and long terms.

The analysis uses VMT reduction targets of 3.4% by 2030 and 7.5% by 2050 compared to BAU. This estimate is based on the Pennsylvania Energy Assessment Report of 2018,[42] as well as Pennsylvania-specific runs of the EPA's Motor Vehicle Emission Simulator (MOVES), U.S. Energy Information Administration's (EIA) Annual Energy Outlook 2018, and Federal Highway Administration VMT projections.[43] It also incorporates projected gains in fuel economy for light-duty vehicles, assuming a 20% fuel efficiency increase between 2026 and 2050.

Annual GHG emissions reduced in 2025
571,524 $MTCO_2e$

Annual GHG emissions reduced in 2050
2,805,452 $MTCO_2e$

Annual energy reduced in 2050
39,280 BBtu of fuel

Cost or (benefit) per ton of GHG reduced
$(448.43)/$MTCO_2e$

Net present value
$20.03 billion

Average annual gross state product
$116.51 million

Average annual disposable personal income
$86.38 million

Average annual employment
823 jobs

Environmental benefits and costs

This strategy reduces the amount of fuel consumption by 39,280 BBtu in 2050 (with 98.5% of the fuel being gasoline). The associated GHG emission reductions amount to 571,524 $MTCO_2e$ in 2025 and to 2,805,452 $MTCO_2e$ in 2050. The economic benefits include monetary savings of $448.43 per $MTCO_2$ eliminated, with an NPV of $20.03 billion.

VMT reduction and higher fuel economy reduce additional gaseous and particulate emissions from tailpipes, including criteria pollutants such as NO_x (980 MT of NOx reduction in 2050), SO_x (20 MT of SO_x reduction in 2050), and $PM_{2.5}$, as well as VOCs that are ground-level ozone precursors.

Economic benefits and costs

Reducing vehicle pollution generates immediate improvement in air quality and leads to a healthier environment over time. These changes bring economic benefits directly stemming

[42] DEP 2018. Energy Assessment Report for the Commonwealth of Pennsylvania.

[43] FHWA. 2018. Forecasts of Vehicle Miles Traveled, Spring 2018. Accessed July 3, 2018. https://www.fhwa.dot.gov/policyinformation/tables/vmt/vmt_forecast_sum.pdf.

from improvements in public health, such as reduced expenses related to asthma and other respiratory and cardiovascular diseases linked to exhaust from vehicles.

Additional economic benefits of reduced private vehicle use are expected from lower fuel and vehicle maintenance costs, which over time result in higher disposable income for consumers. The strategy is projected to generate $878 million of savings in fuel costs and $1.27 billion of savings in vehicle maintenance in 2050, with a public expenditure of $267 million.

Net economic impacts are expected to be positive. The positive impacts are driven largely by fuel savings associated with less travel, which positively impacts consumer budgets (less money spent on gasoline means more money for other purchases). With less vehicle travel, however, comes less spending on gasoline and vehicle repairs and maintenance. Gasoline stations, rest stops, and repair shops are expected to see negative economic impacts. Increasing fuel efficiency for light-duty vehicles and reducing VMT are expected to have positive impacts on average annual GSP and DPI, expected at $116.51 million and $86.38 million, respectively. The average annual employment impact is expected to be 823 jobs.

Social benefits and costs

Reducing single-occupancy vehicle travel while opting for more sustainable transportation modes reduces road congestion, leading to safer streets and a more pleasant environment for all travel modes. It also improves equity by directly reducing vehicle emissions that disproportionately affect communities living near major roads and highways. Shifting to biking and walking, in particular, creates additional positive health outcomes by increasing exercise opportunities and reducing the stress related to traffic congestion.

Resilience Considerations

Increased fuel efficiency leads to cost savings. Depending on a household's financial situation, these cost savings could be significant, particularly if day-to-day costs may be rising due to impacts of other climate hazards (e.g., higher energy costs of more air conditioning due to warmer temperatures).

Implementation Considerations

A significant VMT reduction can occur only if cost-effective, viable, and convenient transportation alternatives to driving are offered. Because personal mobility needs vary greatly, depending on geographic location, occupation, and demographics, solutions must be tailored to meet different needs. In general, increasing public transit options and the frequency of service encourages travel mode switch. In urban areas, dedicated bus or shared bus/bike lanes are usually effective solutions and are well received by the public because they improve transit service and offer a safer biking environment. Offering micro-mobility options (e.g., bike share) to fill last-mile gaps is also critical to providing access to public transit. Another critical action for the success of this strategy is to build capacity to move people along major commuting routes, either through public transit or private options (e.g., commuter shuttle or vanpool services offered by private companies and large employers).

The actions require coordinated planning and investment, and in some cases, additional infrastructure, therefore the implementation timeframes are considered long. Quick gains, can be achieved, however, especially in urban areas where bus routes and networks can be optimized and redesigned in a few months to a year's time. Similarly, pedestrian and biking experiences can be improved relatively quickly and cost-effectively in urban areas through the creation of bike lanes and the installation of bike-sharing stations. Interventions such as the full implementation of bus rapid transit corridors can take longer.

Depending on the type and scale of the intervention, required funding, and entity overseeing the right-of-way, a VMT strategy might involve different levels of government, from municipality to regional metropolitan planning organizations (MPO), to the state. Small projects such as the separation of bike lanes or the creation of bike share stations can often be planned and resolved at the municipal level; dedicated bus lanes and route adjustments require collaboration between municipalities, transit agencies, and the state DOT. Challenges to implementing these strategies can vary as well and include funding availability (especially for larger interventions), policy acceptance, and consumer behavior. Given the personal nature of transportation, strategies that address VMT reduction also require education, outreach, and community involvement to ensure that all stakeholder voices are heard. The risk of VMT reduction policies stalling is high if they are not accompanied by a robust engagement process and a clear plan. Equity aspects need to be evaluated as well: for example, improving public transit options often directly benefits LMI individuals, who are statistically more likely to use transit or to work jobs that have rigid schedules and are more affected by peak hour congestion.

As more states look at reducing VMT as a win-win strategy for reducing both vehicle emissions and road congestion, policy solutions and enabling technologies will also become more readily available. Those include the targeted use of autonomous electric vehicles, congestion fees, and zero-emission or pedestrian-only zones, especially in densely populated urban centers.

G. Implement the multistate medium-and heavy-duty zero-emission vehicle memorandum of understanding

This strategy models the implementation of the multistate medium- and heavy-duty zero-emission vehicle memorandum of understanding (MHD ZEV MOU), of which the Commonwealth is a signatory.[44] The goal of the MOU is to reach net-zero emissions from new MHDVs by 2050. The strategy assumes that 30% of new MHDV sales will be ZEV by 2030. By 2050, all new MHDV sales are assumed to be ZEV.

Annual GHG emissions reduced in 2025

291,395 $MTCO_2e$

Annual GHG emissions reduced in 2050

7,384,410 $MTCO_2e$

Annual energy reduction or increase in 2050

91,888 BBtu of fuel reduction

6,132 GWh of electricity increase

Cost or (benefit) per ton of GHG reduced

$180.27/$MTCO_2e$

Net present value

$(14.12 billion)

Average annual gross state product

$(248.61 million)

Average annual disposable personal income

$(459.56 million)

Average annual employment

-830 jobs

Environmental benefits and costs

The MOU implementation reduces the amount of fuel oil consumption by almost 92,000 BBtu in 2050 (where 99% of the fuel is distillate oil). The associated GHG emission reductions amount to 291,395 $MTCO_2e$ in 2025 and to 7,384,410 $MTCO_2e$ in 2050. However, the need to charge battery electric vehicles increases electricity consumption over time to 6,132 GWh in 2050. The strategy leads to savings of $13.06 per MT of CO_2 eliminated, with a lifetime NPV of -$14.12 billion.

The modeling indicates that converting conventional MHDV to ZEV eliminates 18,250 MT of NO_x in 2050 and 78 MT of SO_x in 2050, in addition to other criteria pollutants and VOCs that are ground-level ozone precursors.

Economic benefits and costs

The transition from combustion to electric heavy-duty vehicles leads to a healthier environment and immediate public health improvements in areas that are affected by heavy-duty vehicle traffic. At the same time, the additional electricity generation required for vehicle charging could lead to negative health and environmental outcomes for communities located near power plants (the net impacts will depend on how quickly electricity generation switches from fossil to clean sources).

The MHD ZEV MOU is projected to generate fuel savings of $1.06 billion and vehicle maintenance savings of $2 billion in 2050, while the expected capital expenditure from the strategy implementation is $234 million (assuming that MHD ZEV prices decrease 30% by 2030 and 50% by 2050[45]). These results, however, are based on the limited cost data currently available, given the early stage of MHD ZEV deployment. However, examples of new clean

[44] Multi-state Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding. https://ww2.arb.ca.gov/sites/default/files/2020-07/Multistate-Truck-ZEV-Governors-MOU-20200714.pdf.

[45] Comparison of Medium- and Heavy-Duty Technologies in California. ICF-Truck-Report_Final_December-2019.pdf (caletc.com)

technology deployment (e.g., solar PV, wind energy) have demonstrated that manufacturing and implementation costs tend to fall much faster than typically predicted. In addition, the current trajectory of light-duty EV prices suggests that the cost of MHD ZEVs might decrease quicker than predicted as adoption becomes more mainstream and manufacturing at scale makes the strategy progressively more cost-effective.

Finally, new local employment opportunities are expected due to the need for installing, operating, and maintaining the necessary ZEV charging infrastructure. The switch to ZEV will, however, cause a reduction of conventional vehicle maintenance jobs and will require retraining of the workforce to maintain overall job numbers.

The macroeconomic impacts of the transition from combustion to electric heavy-duty vehicles are expected to be negative. Investments in vehicles and charging infrastructure will generate employment in both the manufacturing and installation sectors, and the switch from fossil fuels to electricity is also expected to result in bill savings. Expenditures on EVs, losses to the maintenance and repair sectors, and disinvestment in fossil fuels, however, will result in negative economic impacts. In aggregate, the negative economic impacts outweigh the positive ones. Average annual GSP and DPI impacts are expected to be -$248.61 and -$459.56, respectively. Average annual employment impact is expected to be -830 jobs.

Social benefits and costs

This strategy is expected to yield overall improvement in human health due to the direct elimination of tailpipe emissions from conventional MHD vehicles that typically burn diesel fuel, a known source of black carbon and toxic gases. It will also improve equity by directly reducing diesel vehicle emissions that disproportionately affect disadvantaged communities living near highways and commercial and industrial areas. Another significant effect will be the reduction of waste associated with the maintenance of conventional vehicles such as engine oil and other fluids.

Implementation Considerations

This target would be achieved through a mix of fuel-switching to electric and other zero-emission vehicles such as fuel cell electric vehicles. Several MHDV types can be targeted by this strategy, including buses (both transit and school buses), commercial vans, and short- and long-haul trucks. Zero-emission applications in the transit sector are already well underway, with almost 2,800 electric transit buses on the road or on order nationwide at the end of 2020.[46] The electric school bus market is also growing quickly, with a few hundred units already deployed nationwide and potentially thousands being delivered by 2030.[47] In other sectors, such as

[46] CALSTART, Zeroing in on the ZEBs. https://calstart.org/wp-content/uploads/2021/01/Zeroing_In_on_ZEBs_FINALREPORT_1262021.pdf

[47] Sustainable Bus. 2020. "Electric school buses in the US: 27,000 units to be built in ten years," Interact Analysis forecasts. https://www.sustainable-bus.com/news/electric-school-buses-us-27000-units-to-be-built-in-ten-years/.

commercial deliveries, ZEV applications are still at the pilot stage but are increasing. Potential actions, as stated in the MOU, may include:

- Financial vehicle and infrastructure incentives
- Nonfinancial vehicle and infrastructure incentives
- Actions to encourage public transit and public fleets to deploy zero-emission MHDVs
- Effective infrastructure deployment strategies
- Funding sources and innovative financing models to support incentives and other market-enabling programs
- Leveraging environmental and air quality benefits associated with the adoption of the California Advanced Clean Trucks rule under Section 177 of the Clean Air Act
- Coordinated outreach and education to public and private MHDV fleet managers
- Utility actions to promote zero emission MHDVs, such as electric distribution system planning, beneficial rate design and investment in "make-ready" charging infrastructure
- Measures to foster electric truck use in densely populated areas
- Addressing vehicle weight restrictions that are barriers to zero emission MHDV deployment
- Uniform standards and data collection requirements

The timeframe for implementing this strategy spans several years, and the speed at which the strategy can be implemented depends on how fast the actions listed above can occur. Market forces will also be critical as manufacturers will have to provide vehicles that can satisfy the MHD ZEV MOU requirements. Collaboration among local and state agencies (DEP, DOT, public transit agencies) and local utilities will also be crucial for the MOU implementation.

The early stages of implementation will rely heavily on planning and securing funding for vehicles and charging infrastructure. Identifying cases for pilot studies by partnering with early adopters may be possible. Taking cues from other states that have initiated this process (e.g., California), pilot projects with companies that operate heavy-duty vehicles in port areas appear ideal for trying new MHD ZEV technology because of their relatively low daily mileage and fixed routes. Similarly, urban delivery applications could be targeted for strategic early deployment of MHD ZEV that are already commercially available.

There are strong public health and equity implications from the implementation of the ZEV MOU. Targeting heavy-duty diesel vehicles that operate in disproportionately polluted areas such as ports or delivery hubs can significantly improve the quality of life for frontline communities, which are often low-income and/or minority communities. Likewise, deploying zero-emission delivery options in dense residential neighborhoods, or rolling out electric school buses at scale, can have a significant positive impact on the quality of life of communities across the state.

H. Increase adoption of light-duty electric vehicles

This strategy includes increasing the adoption of light-duty electric passenger vehicles, including private and municipal fleet vehicles. Assuming a moderate EV adoption scenario from the Pennsylvania Electric Vehicle Roadmap,[48] the modeling assumes that electric vehicles will represent 20% of the light-duty market share by 2030, rising to 70% by 2050.

Annual GHG emissions reduced in 2025

1,225,113 $MTCO_2e$

Annual GHG emissions reduced in 2050

23,799,640 $MTCO_2e$

Annual Energy Reduction or Increase in 2050

331,996 BBtu of fuel reduction

33,178 GWh of electricity increase

Cost or (benefit) per ton of GHG reduced

$107.15/$MTCO_2e$

Net present value

$(27.35 billion)

Average annual gross state product

$960.00 million

Average annual disposable personal income

$357.13 million

Average annual employment

5,797 jobs

Environmental benefits and costs

The fuel consumption associated with the strategy decreases by almost 332,000 BBtu in 2050 (98.5% of this value is represented by gasoline fuel). The associated GHG emission reductions amount to 1,225,113 $MTCO_2e$ in 2025 and to 23,799,640 $MTCO_2e$ in 2050. However, electricity consumption required for vehicle charging increases to 33,178 GWh in 2050.

The estimated implementation costs are $107 per MT of CO_2 eliminated, with a negative NPV of approximately -$27.3 billion. However, as the price of batteries decreases and more manufacturers bring EVs to market in the next two to three years, the costs of implementing this strategy will likely be lower than predicted today. Gasoline phase-out targets, like those adopted by California and Massachusetts, to end the sale of gasoline vehicles by 2035 could accelerate the market and reduce overall costs even further.

Finally, the modeling indicates that converting conventional light-duty vehicles to ZEV eliminates 8,293 MT of NO_x in 2050, 180 MT of SO_x in 2050, and other criteria pollutants and VOCs that are ground-level ozone precursors.

Economic benefits and costs

By reducing vehicle pollution, this strategy can generate immediate improvement in air quality and lead to a healthier environment. However, regions that are affected by power plant pollution might see a slightly negative impact from air pollutants associated with the additional electricity generation required for vehicle charging. The resulting net emissions will depend on how fast the power sector displaces fossil fuels, underscoring the interconnectedness of GHG reduction strategies, and the importance of grid decarbonization.

[48] DEP. 2019. *Pennsylvania Electric Vehicle Roadmap*. https://cadmusgroup.com/wp-content/uploads/2019/02/PAEVRoadmap.pdf?hsCtaTracking=5ecd2a08-e3bb-4c32-830f-a73eeb43268c%7C734499cd-191d-4114-94b9-e146eca840ad.

Overall, the projected fuel savings are estimated to be $2.743 billion in 2050 (for a light-duty vehicle, consumer-reported fuel cost savings range from $800 to $1,000 per year[49]) while vehicle maintenance and repair savings are estimated to reach $1.27 billion in 2050. The expected capital expenditure from the strategy implementation is $4.8 billion.

As with the implementation of the MHD ZEV MOU, converting the light-duty vehicle pool to electric will create new employment opportunities at the local level, especially for charging infrastructure installation and maintenance, but will reduce conventional vehicle maintenance and repair jobs; retraining a portion of the workforce will be necessary to avoid net job loss.

Health Benefits of Electric Vehicles

A recent study conducted by the American Lung Association analyzes health benefits associated with the widespread transition to zero-emission transportation technologies. This study projects that within Pennsylvania, widespread adoption of zero-emissions vehicles could result in 2050:

- Premature deaths avoided: 200
- Asthma attacks avoided: 2,400
- Work loss days avoided: 10,800
- Avoided health impact costs: $2.37 billion

Source: American Lung Association. 2020. The Road to Clean Air: Benefits of a Nationwide Transition to Electric Vehicles. Available at: https://www.lung.org/getmedia/99cc945c-47f2-4ba9-ba59-14c311ca332a/electric-vehicle-report.pdf.

The macroeconomic effects of the adoption of light-duty EVs are expected to be positive. Investments in vehicles and charging infrastructure will drive jobs in the manufacturing and installation sectors, while significant bill savings (resulting from gasoline and repair and maintenance savings) will result in more money in consumers' pockets for other expenditures. Although there will be job losses in the fossil fuel industry (resulting from lower gasoline sales) and the vehicle repair and maintenance industry (because EVs require less maintenance than internal combustion engine vehicles), the negative economic impacts are outweighed by the positive ones. Average annual GSP and DPI impacts are expected to be $960.00 million and $357.13 million, respectively. The average annual employment impact is expected to be 5,797 jobs.

Social benefits and costs

Vehicle electrification is expected to yield an immediate improvement in public health from the elimination of tailpipe emissions and long-term benefits from GHG reduction. It also improves equity by directly reducing vehicle emissions that disproportionately affect disadvantaged communities living near highways. Waste is also reduced because less maintenance is required for electric vehicles, which have fewer mechanical parts and engine and transmission fluids to be disposed of.

[49] Consumer Reports. 2020. Electric Vehicle Ownership Costs: Today's Electric Vehicles Offer Big Savings for Consumers. https://advocacy.consumerreports.org/wp-content/uploads/2020/10/EV-Ownership-Cost-Final-Report-1.pdf

Electric vehicles also increase overall social resilience because they can be used to supply power to buildings in case of emergency power shutoffs or blackouts. Although vehicle-to-home (V2H) and vehicle-to-building (V2B) applications are not widespread yet, they are being piloted to determine the best business models and are expected to increase. In fact, most of the light-duty EVs coming to market before 2025 (including pickup trucks) will have two-way charging capabilities, and grid interconnection regulations are being considered by public utility commissions and departments of public utility.[50]

Implementation Considerations

Light-duty electric vehicle technology is well established, and the market is accelerating as manufacturing and battery costs go down. But electric vehicle adoption has not reached mainstream yet, and the implementation of this strategy will require intervention in several policy areas as well as technical and financial support. The 2019 Pennsylvania Electric Vehicle Roadmap offers a viable starting point, as it identifies a series of strategies that can be implemented in the short, medium, and long terms. Further, the state is evaluating a rulemaking to become a ZEV state by joining the Advanced Clean Car program.[51] The biggest advantage of the ZEV Program is the possibility to develop a more robust EV market by providing a stable policy and business environment to vehicle manufacturers and car dealerships, which in turn can encourage utilities and other stakeholders to promote and accelerate EV adoption. Monetary incentives and other price-based policies that can be unlocked under the ZEV program will also be key for the success of this strategy. Point-of-sale vouchers, consumer rebates for charging infrastructure, increased public charging availability, and favorable electricity time-of-use rates can have a significant impact on increasing consumer confidence and acceptance of EVs. Nonmonetary incentives such as access to high occupancy vehicle (HOV) lanes or to priority or free parking spaces can also have a beneficial impact.

Resilience Considerations

As described in Strategy D. Incentivize building electrification, scaling up electrification—whether in buildings or vehicles—may provide a variety of climate resilience benefits, such as public health benefits or reduced sensitivity to price fluctuation of specific fuels. At the same time, with the increased risk of extreme weather events projected, which may cause power outages, ensuring electricity reliability will be increasingly important, especially if it coincides with a need to move large numbers of people (e.g., evacuations). Considering opportunities to build redundancy and resilience into the electric grid will be key to safely electrifying the Commonwealth.

To implement this strategy at scale and equitably, DEP could leverage the AFIG Alternative Fuel Vehicle (AFV) Rebate and the Driving PA Forward programs to expand the scope of or create new ad hoc initiatives targeting rural and low-income communities, multifamily building units, workplaces, and private businesses. Initiatives can be designed to also increase access to

[50] California Energy Commission. Vehicle to Grid Integration Roadmap. https://www.energy.ca.gov/programs-and-topics/programs/california-vehicle-grid-integration-roadmap-update

[51] California Air Resources Board, Advanced Clean Cars Program. https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program

EVs and other clean mobility options through, for example, the creation of carshare and bikeshare programs that use EVs. Carsharing is a cost-effective way to implement EVs in disadvantaged communities that often struggle with good mobility options, cannot afford private EVs, and perceive EV charging options as a gateway to gentrification and displacement. In these cases, working with community-based organizations that are trusted by residents can help find equitable solutions that fit mobility needs.

Possible challenges to implementing the strategy include lack of political will in passing legislation to encourage or incentivize ZEV adoption, economic challenges to secure funding for incentives, and regulatory delays that can slow down the deployment of charging infrastructure. To overcome regulatory delays, a growing number of cities are implementing local EV readiness ordinances through zoning and land use codes, while streamlining the permitting and compliance processes to reduce delays and unexpected costs.

Finally, consumer education and outreach are critical to addressing the anxiety that some consumers have about EV range and performance. Marketing campaigns and outreach strategies that rely on peer-to-peer learning and sharing of personal experiences have demonstrated to be effective.

I. Implement a low carbon fuel standard

The Low Carbon Fuel Standard (LCFS) is a market-based, fuel-neutral program designed to reduce the carbon intensity of traditional transportation fuels through a system of credits that can then be sold to regulated entities (such as importers, producers, and refiners of petroleum fuels that are required to reduce the carbon intensity of the transportation fuels they sell in-state). Users and producers of low carbon transportation fuels earn LCFS credits through the emission reductions generated by operating zero- or low-emission vehicles. In Pennsylvania, an LCFS-like strategy could expand on the ethanol and biodiesel requirements already in place and include zero-emission vehicles. While the LCFS is fuel neutral, ZEVs generate the highest LCFS credits by achieving the greatest carbon reduction compared to conventional and alternative fuels.

Annual GHG emissions reduced in 2025
683,365 $MTCO_2e$

Annual GHG emissions reduced in 2050[a]
0 $MTCO_2e$

Cost or (benefit) per ton of GHG reduced
\$389.57/$MTCO_2e$

Net present value
\$(10.02 billion)

Average annual gross state product
\$(483.60 million)

Average annual disposable personal income
\$(135.33 million)

Average annual employment
-2,514 jobs

[a] The carbon intensity goal is achieved by 2050 due to electrification; therefore there are no additional reductions from this strategy in 2050.

The modeling assumes 12% carbon intensity reduction by 2030, and 22% reduction by 2040. After 2040, no additional GHG reductions through LCFS are modeled, as the carbon intensity goal is achieved by 2050 due to electrification from other transportation strategies. This measure assumes that supporting policies will be implemented to encourage fuel switching and increased electric vehicle adoption required to meet the 2050 carbon intensity targets.

Environmental benefits and costs

The implementation of an LCFS strategy yields GHG emission reductions of 683,365 $MTCO_2e$ in 2025 (in 2040, annual emissions reduced through the LCFS are projected to be 1,584,462 $MTCO_2e$ through the elimination of 26,051 BBtu of distillate fuel oil). Overall, the strategy eliminates 585 MT of NO_x and 16 MT of SO_x in 2040, in addition to $PM_{2.5}$, and VOCs that are ground-level ozone precursors. The LCFS costs \$389.57 per $MTCO_2e$ eliminated, with a negative NPV of approximately -\$10.02 billion. Compliance costs are estimated to be \$511 million.

Although alternative fuels coming from renewable and biological sources reduce GHGs when compared to conventional fossil fuels, concerns remain about the environmental impact of renewable fuel and biofuel in terms of lifecycle GHG emissions from land use. Likewise, although alternative fuels generally reduce gaseous and particulate emissions, biofuels tend to have slightly higher NO_x emissions than diesel or gasoline.

Economic benefits and costs

Alternative fuels are generally associated with improved air quality when compared to gasoline and diesel. Renewable and biofuels are associated with lower energy costs and increased employment opportunities, if produced locally, but costs and other economic benefits vary

widely depending on the type of fuel and where and how it is produced. Fuels that can be produced locally reduce reliance on foreign fossil fuels and increase overall energy resilience.

The macroeconomic impacts of an LCFS are expected to be negative. Fossil fuel producers and consumers are expected to see increased costs under an LCFS. Although renewable-fuel producers will see an increase in revenue through the sale of credits, these positive impacts are outweighed by the passing on of these costs to the fossil fuel industry and ultimately the consumer. Average annual GSP and DPI impacts are expected to be -$483.60 million and -$135.33 million, respectively. The LCFS strategy is expected to result in an average annual employment impact of -2,514 jobs.

Social benefits and costs

This strategy is expected to yield an immediate improvement in public health because of the direct elimination of tailpipe emissions and long-term benefits from GHG reduction. This strategy also improves equity by directly reducing vehicle emissions that disproportionately affect disadvantaged communities living near highways.

Implementation Considerations

The implementation of an LCFS requires a multistep process, including policy design, approval, and implementation. The timeframe to implement an LCFS policy can be lengthy, depending on both policy complexity and acceptance of a carbon trading scheme.

An opportunity for creating an LCFS policy in Pennsylvania is the upcoming rollout of the Transportation and Climate Initiative Program (TCI-P), the regional cap-and-invest program to curb transportation emissions. In that context, an LCFS scheme could complement policy to strengthen the TCI-P. From a technical standpoint, Pennsylvania can take cues from California, Oregon, and other states that are considering this policy (most recently Washington State) in creating an effective LCFS that can bring environmental benefits while generating revenue to finance clean transportation programs.

Policy acceptance can be increased by making sure that the LCFS benefits are understood by the public and legislators alike, and that elements of equity are incorporated into the programs that would be financed by LCFS credits. To increase policy acceptance, Pennsylvania can leverage its participation in RGGI, a similar market-based mechanism relying on carbon credits to ratchet down emissions from power generation while creating revenue for the state.

Industry

The industrial sector includes GHG emissions associated with industry activities such as physical and chemical material processing and manufacturing. The majority of industrial emissions result from the combustion of fossil fuels to power processes. Other major sources include cement manufacturing, iron and steel production, and the use of ozone-depleting substance (ODS) substitutes. Industrial emissions made up nearly a quarter of Pennsylvania's emissions in 2017, and emissions have remained relatively stable since 2005.

Manufacturing and industry services have historically been the backbone of Pennsylvania's economy, though that role has diminished since the industrial heyday. Key industries in the Commonwealth include metals manufacturing, chemical products, and food processing.[52] Emissions from some of these industrial processes will be difficult to reduce, especially processes such as cement and concrete production that involve chemical reactions that produce emissions that cannot be avoided. Industries with these types of unavoidable emissions could be coupled with CCUS technologies that capture CO_2 emissions and either utilize or sequester the CO_2 to reduce industrial emissions. The phaseout of HFCs is expected to reduce industrial emissions in the future, as are fuel switching and energy efficiency measures.

The strategy proposed to address industrial emissions reflects technological and policy trends that aim to improve energy efficiency and encourage fuel switching. One strategy is modeled: Increase industrial energy efficiency and fuel switching. The modeling results indicate that this strategy will reduce emissions compared to the BAU in 2025 and 2050 (Figure 27), and in 2050 will reduce emissions in the industrial sector by 25,813,870 $MTCO_2e$ (see Table 5).

The environmental, economic, and social benefits of the strategy are reported along with the costs (or savings) associated with the implementation of the strategy. The environmental benefits and costs (or savings) are expressed in terms of GHG emission reductions and changes in energy and fuel use. The economic impacts are expressed in terms of changes in job numbers, disposable income, and GSP. The social benefits and costs are expressed in terms of impacts on air quality (e.g., changes in the criteria pollutants like SO_2, NO_x, and $PM_{2.5}$) and associated public health and social impacts such as equity and resilience.

Figure 27. Industrial GHG emissions when implementing reduction strategies compared to business as usual

Total GHG Reductions	**4,277,761**	**25,813,870**

J. Increase industrial energy efficiency and fuel switching

This strategy includes leveraging DEP programs (e.g., the Energy Efficiency, Environment, and Economics [E4] Initiative) and implementing the types of actions outlined in the Clean Energy Program Plan, which was developed by DEP's Energy Programs Office. This strategy would rely on tools such as virtual training and expanded partnerships to reach smaller and hard-to-reach industries. In addition to energy efficiency measures, industrial opportunities that switch from fuel oil to natural gas and measures to switch from natural gas to electricity are included in this strategy.

\$(21.53 billion)

Average annual gross state product

\$(870.15 million)

Average annual disposable personal income

\$(519.69 million)

Average annual employment

-804 jobs

Environmental benefits and costs

Energy efficiency and electrification of industrial processes will reduce the amount of electricity, natural gas, and fuel oil consumed, resulting in reduced emissions of CO_2, and other GHG associated with grid sources and combustion such as CH_4 and N_2O. This strategy also reduces gaseous and particulate emissions associated with gas and fuel oil combustion, including criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs that are ground-level ozone precursors. For electrification measures, in the early years of implementation, any reduction in carbon, gaseous or particulate emissions will be partially offset by emissions from the generation of electricity, but as the grid switches to cleaner sources, emissions savings will be more pronounced. Even with significant electrification and fuel switching, this strategy is projecting to provide energy savings from electricity, natural gas, and fuel oil.

Economic benefits and costs

This strategy is expected to have negative economic impacts. Although energy efficiency often results in positive economic impacts (generally resulting from energy bill savings), the process of electrification is expensive and may not result in net bill savings. Because of the size of the natural gas industry in PA and the associated fuel costs, using fossil fuel as an energy and heating source is comparatively cheap. The switch from natural gas to electricity does not result in bill savings for electrification, and the bill impacts outweigh the impacts from energy efficiency. Average annual GSP and DPI impacts are expected to be -\$870.15 million and -\$519.69 million, respectively. The average annual employment impact is expected to be -804 jobs.

Social benefits and costs

This strategy would improve equity by directly reducing emissions that disproportionately affect disadvantaged communities living near point source industrial processes. Poor air quality affects the health of nearly all residents of the Commonwealth, but is more significant for environmental justice communities near industrial plants.

Implementation Considerations

Lowering emissions by improving industrial energy efficiency and pursuing fuel switching has great potential but is one of the more challenging strategies to implement in Pennsylvania and nationally. This strategy consists of technology shifts that prioritize process changes that increase energy efficiency and prioritize a switch to less carbon-intensive fuels. Process and technology changes can be included in the expansion of Act 129 programs discussed in strategies B, C, and D.

Reducing electricity and natural gas in industry can be accomplished through efficiency measures that result in environmental, social, and economic benefits. Energy efficiency, which this strategy focuses on, includes not only improving the overall and operating performance of industrial processes, but also retrofits the buildings that house industrial processes:

- New and more efficient processing equipment
- Lighting retrofits (e.g., LED and other advanced technologies)
- Changes to heating and cooling buildings systems, and process systems (e.g., enhanced controls, high-efficiency boilers, and high-efficiency hot water heaters).

Fuel-switching opportunities can be accomplished through equipment upgrades or infrastructure modifications (such as new gas services) that enable the switch to lower-carbon fuels. Processes that use fuel oils four and six should be targeted for the switch to gas, and low-heat processes and building HVAC processes that use gas should be targeted for the switch to electricity. These switches should be aligned with beneficial electrification processes outlined in Strategy D.

In addition to energy efficiency, energy management techniques and programs can provide energy reduction benefits. The U. S. Department of Energy runs the Better Plants Program,[53] which provides recommendations on operational changes and investment strategies to support more efficient industrial sites. Industrial plants can also seek independent certifications such as ISO 50001 to build and implement an energy management systems approach.[54]

[53] U.S. Department of Energy, Better Plants Program. Accessed April 8, 2021. https://betterbuildingssolutioncenter.energy.gov/better-plants/program-information

[54] International Organization for Standardization. Accessed April 8, 2021. https://www.iso.org/iso-50001-energy-management.html

Advances in technology are crucial to achieving carbon reductions in the industrial sector. New equipment and changes to processes have the potential to greatly improve efficiency and reduce carbon. Technology changes vary widely depending on the process, and Pennsylvania's diverse industrial footprint requires innovations across a variety of industrial subsectors. While not specifically modeled, technologies such as hydrogen and other renewable energy generated power-to-gas technologies have outsized potential to reduce emissions. A broad set of stakeholders will need to engage with changing technologies and policy aimed at lowering emissions. Education of stakeholders will be crucial as new lower-carbon technologies demonstrate their proficiency. Financing and access to capital will help deploy solutions more rapidly, as many sites require extensive retrofits to decarbonize their industrial processes.

Fuel Supply

The fuel supply sector includes all upstream activities that deliver fuels to non-electricity-generation end-use points, including production, transportation, and storage activities and fugitive emissions. Pennsylvania has extensive fossil resources, primarily coal and natural gas. Most of Pennsylvania's fuel supply for electricity generation is natural gas (45.2% of net electricity generation in 2020),[55] but the supply of biogas and RNG is growing because coal mines and agriculture, two important sources of biogas and RNG, are abundant in Pennsylvania.

Pennsylvania produced 7 trillion cubic feet of natural gas in 2019, 11 times that produced in 2010. This accounted for approximately 20% of total U.S. natural gas production—only Texas produced more natural gas that year. Pennsylvania exports natural gas to other states in the region, and as internal and external distribution has grown, so has the distribution network. Pennsylvania has 55 underground natural gas storage facilities, more than any other state, and production and distribution are on track to increase further.[56]

The strategies proposed to address fuel supply emissions reflect current technological and policy trends that aim to increase the use of biogas and renewable gas and combined heat and power and to reduce methane emissions. Three strategies are modeled:

- Increase production and use of biogas and renewable gas
- Incentivize and increase use of distributed Combined Heat and Power
- Reduce methane emissions across oil and natural gas systems

The modeling results indicate that these strategies will reduce emissions compared to BAU in 2025 and 2050 (see Figure 28), and in 2050 will reduce emissions in the fuel supply sector by 20,262,763 $MTCO_2e$ (see Table 6).

[55] EIA, 2021. "Pennsylvania State Profile and Energy Estimates." Available at: https://www.eia.gov/state/data.php?sid=PA.

[56] DEP. 2021. Internal data.

For each strategy, the environmental, economic, and social benefits are reported along with the costs (or savings) associated with the implementation of the strategy. The environmental benefits and costs (or savings) are expressed in terms of GHG emission reductions and changes in energy and fuel use. The economic impacts are expressed in terms of changes in job numbers, disposable income, and GSP. The social benefits and costs are expressed in terms of impacts on air quality (e.g., changes in the criteria pollutants like SO_2, NO_x, and $PM_{2.5}$) and associated public health and social impacts such as equity and resilience.

Figure 28. Fuel supply GHG emissions when implementing reduction strategies compared to business as usual

Average annual employment
29,880 jobs

This strategy involves increasing the production and use of biogas/renewable gas from sources including animal manure, food waste, landfill gas, water resources recovery facilities, agricultural residue, energy crops, forestry residue, and municipal solid waste. This strategy considers the potential for renewable gas and specific applications in Pennsylvania and regionally for a number of feedstocks identified in the 2019 American Gas Foundation RNG report, Penn State University's RNG analysis, and ICF's Pennsylvania RNG database. Some feedstocks for RNG will be used in direct combined heat and power (CHP) applications, although most of the RNG supply will be injected into the pipeline to decarbonize the gas supply in Pennsylvania. The RNG supply increases to 75% of total feedstock by 2050.

Environmental benefits and costs

Although RNG is chemically similar to natural gas, when combusted, it produces biogenic carbon dioxide, which has a modified impact on emissions because of its biological nature. Thus, the expanded use of RNG will reduce CO_2, CH_4, and N_2O emissions by lowering the amount of natural gas combustion. This strategy replaces 197,326 BBtu of natural gas with RNG in 2050.

Economic benefits and costs

Increasing production and use of RNG is expected to have positive economic impacts. Investments in the RNG sector are expected to spur job growth in the economy. Disinvestment in the fossil fuel sector, however, is expected to drive some negative economic impacts. Overall, net economic impacts are expected to be positive. Average annual GSP and DPI impacts are expected to be $173.74 million and $163.11 million, respectively. This strategy is expected to foster employment for the construction of pipeline interconnections to feed the RNG supply to the natural gas distribution system, resulting in average annual employment of 29,880 jobs. This strategy has a net cost of $151.40 per $MTCO_2e$. Fossil natural gas is cheaper than RNG at present, and as a result this strategy will increase energy costs.

Social benefits and costs

RNG production offers an opportunity to reduce waste by using waste products (e.g., agricultural residue, municipal solid waste) as feedstocks for RNG production. Using waste products as feedstock diverts waste from landfills and produces energy for other uses. This strategy will result in resilience for Pennsylvania's energy supply and infrastructure by decentralizing the supply sources of gas. By increasing the supply from various RNG feedstocks, Pennsylvania will have alternative sources of gas production when fossil natural gas production is disrupted.

Although combusting RNG reduces net GHG emissions and has improved climate benefits compared to burning fossil natural gas, synthetic and biogenic RNG combustion does create local air pollution—emission of VOCs, PM, and CO—similar to that created by fossil natural gas combustion. New policies are needed to decarbonize the gas sector and should also address social costs such as local air quality and health impacts.

Biogenic and Fossil Emissions

When fossil fuels are combusted, carbon that has been stored for millions of years is released and adds to the carbon in our atmosphere. But when RNG is combusted, biogenic carbon is released. Biogenic carbon operates within the natural carbon system and returns to the atmosphere the carbon that was absorbed as plants grew.

Implementation Considerations

This strategy's implementation would begin immediately through use in state of feedstocks that have potential uses for RNG. The technical resource potential of these feedstocks will increase over time, and in 2050, 75% of the collective technical resource potential could be achieved.

Implementation partners include organizations and companies running feedstock operations (e.g., farms), natural gas distribution companies, and regulatory authorities for public utilities, (i.e., Pennsylvania's Public Utility Commission [PUC]). The PUC would be responsible for implementing the strategy, and may consider an RNG portfolio standard to support implementation. A renewable gas portfolio standard would set targets for the use of RNG by Pennsylvania's natural gas utilities and would direct the PUC to establish mechanisms by which the utilities could recover their investments in RNG projects.

There are economic, technical, and social challenges to increasing the RNG supply. First, the capital and operating costs of capturing and cleaning biogas are high, particularly when compared to the low cost of fossil natural gas. Second, maintaining a continuous stream of a feedstock can be a technical challenge to successful CHP operations. There are technical concerns about the varying requirements of gas systems for injection of RNG into a pipeline that can prohibit RNG interconnection, so there is also the cost of developing infrastructure to deliver RNG to customers, although advances in technology can lower these costs. Finally, public perception of RNG includes misconceptions that RNG is less clean or of lower quality than fossil natural gas.

Despite these challenges to increasing the RNG supply, there are solutions that can be explored. A policy solution to advance RNG project development is to establish interconnection incentives and flexible, transparent biogas quality guidelines for pipeline injection.[57]

RNG is produced in a series of steps: collection of a feedstock, delivery to a processing facility for biomass-to-gas conversion, gas conditioning, compression, and interconnection and injection into the pipeline. The most common way to produce RNG today is through anaerobic digestion. For RNG production, anaerobic digestion takes place in a controlled environment

[57] EPA. 2021. An Overview of Renewable Natural Gas from Biogas. https://www.epa.gov/sites/production/files/2021-02/documents/lmop_rng_document.pdf.

called a digester or reactor. In the digester, microorganisms break down organic material over time (a matter of days). The gaseous products of that "digestion" contain a large fraction of methane and carbon dioxide, sometimes referred to as biogas. The biogas is subsequently upgraded and conditioned to yield biomethane, which is injected into the common carrier pipeline.[58]

The thermal gasification of biomass also produces RNG. Thermal gasification includes a broad range of processes whereby a carbon-containing feedstock is converted into a mixture of gases referred to as synthetic gas or syngas, including hydrogen, carbon monoxide, steam, carbon dioxide, methane, and trace amounts of other gases. Thermal gasification generally occurs at high temperatures, which vary depending on the gasification system and the feedstock. RNG can also be produced using renewable electricity as a feedstock to generate hydrogen by way of electrolysis, which is methanated for subsequent injection into the distribution pipeline. This process is referred to as power-to-gas (P2G).

[58] American Gas Foundation. 2019. Renewable Sources of Natural Gas. https://gasfoundation.org/wp-content/uploads/2019/12/AGF-2019-RNG-Study-Full-Report-FINAL-12-18-19.pdf.

L. Incentivize and increase use of distributed combined heat and power

This strategy includes incentivizing and increasing the use of distributed CHP with microgrids, particularly for high-value applications such as critical facilities (e.g., hospitals) and industrial facilities. High-value applications are those with critical power requirements that can operate CHP systems continuously and are able to utilize all the available electricity and thermal energy. This maximizes the operational efficiency, emission reductions, and resiliency benefits associated with the CHP installations. Critical infrastructure and industrial facilities meet these criteria, making them suitable locations for CHP operations. This analysis considers only traditional topping-cycle CHP applications. Other potential CHP applications, such as waste heat-to-power, require a granular, site-by-site analysis and are not considered in this strategy.

Annual GHG emissions reduced in 2025
31,279 $MTCO_2e$

Annual GHG emissions reduced in 2050
936,843 $MTCO_2e$

Annual energy reduced in 2050
8,764 GWH of electricity
-48,906 Bbtu of gas (increase)

Cost or (benefit) per ton of GHG reduced
$177.93/$MTCO_2e$

Net present value
$(1.22 billion)

Average annual gross state product
$78.42 million

Average annual disposable personal income
$115.89 million

Average annual employment
552 jobs

Environmental benefits and costs

Distributed CHP with microgrids will reduce the amount of electricity consumed and offset some portion of natural gas that is used. This will result in reduced emissions of CO_2 and other GHG associated with grid sources and combustion such as CH_4 and N_2O. Reductions from this strategy also reduce gaseous and particulate emissions associated with combustion, including criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs that are ground-level ozone precursors in early years of implementation. As grid electricity gets cleaner, carbon, gaseous and particulate emissions from this measure will increase relative to the zero-carbon grid.

Economic benefits and costs

CHP systems can be configured to operate during grid outages, thus providing energy resilience for host facilities. When properly sized, CHP is roughly 50% more efficient than separate heat and grid power. As a result, CHP produces fewer carbon emissions compared to marginal grid generators. CHP systems can also be an economic investment, producing energy at a lower levelized cost of energy than grid electricity, depending on local electric and gas rates.

The macroeconomic impacts of the increased use of CHP systems are expected to be positive. Positive impacts are driven primarily by investment impacts to the manufacturing and installation sectors, and by energy savings. Average annual GSP and DPI impacts are expected to be $78.42 million and $115.89 million, respectively. The increase in CHP use is expected to result in 552 annual jobs.

Social benefits and costs

This strategy will also result in resilience for Pennsylvania's energy systems, allowing for the continued operation of critical facilities, including public services, hospitals, and industrial plants, to remain independent of the power grid in an electricity interruption. Facilities could also provide services to a region when recovering from weather events or outages and provide grid services during normal operations.

Implementation Considerations

Government intervention will be required to foster widespread deployment of resilient CHP-based microgrids at industrial facilities and critical infrastructure (e.g., hospitals, fire stations, police stations, neighborhood centers, and schools). This will come from a combination of incentives for CHP and microgrid installations and direct funding of projects at government facilities and critical community facilities. In addition to the cost test required for CHP to qualify under Act 129, the Pennsylvania PUC could establish further parameters for CHP, such as emissions reductions. Additionally, state and local governments can fund projects to install resilient CHP microgrids at public buildings, ensuring continued operation and offering community refuges during extended utility outages.

The PUC will ensure equitable distribution of funding for utility incentives, although incentives will naturally be limited to facility owners capable of installing CHP systems. Public sector CHP microgrid installations, however, would make resilient community centers in low-income areas the top priority.

There is a great opportunity for CHP installations to contribute to three areas: (1) improving the energy resiliency of critical facilities, (2) improving energy efficiency, and (3) reducing emissions compared to separate heat and grid power. One of the challenges in implementing this strategy is ensuring that natural gas CHP installations are recognized for their emission reduction contributions and their ability to incorporate RNG and/or hydrogen over time for net-zero emissions as the Pennsylvania grid becomes greener. As the supply of RNG and hydrogen increases, new CHP installations can be required to incorporate these fuels.

M. Reduce methane emissions across oil and natural gas systems

This strategy includes the implementation of practices to reduce methane emissions from upstream and midstream oil and gas operations. This strategy reflects reductions in methane emissions as a co-benefit of the ongoing rulemaking to curb VOC emissions from oil and gas operations.[59] It also includes voluntary mitigation technologies that would be implemented across operations to further reduce methane emissions beyond regulatory requirements. Methane mitigation actions vary in cost, complexity, and reduction effectiveness. Common technologies include the installation of vapor recovery units, routing blowdown gas to flare, replacement of reciprocating rod-packing systems, and implementing leak detection and repair programs.

Annual GHG emissions reduced in 2025
4,320,850 $MTCO_2e$

Annual GHG emissions reduced in 2050
8,841,539 $MTCO_2e$

Annual energy reduced in 2050
Not calculated

Cost or (benefit) per ton of GHG reduced
$5.02/$MTCO_2e$

Net present value
$(949.84 million)

Average annual gross state product
$(22.30 million)

Average annual disposable personal income
$(17.39 million)

Average annual employment
-78 jobs

Environmental benefits and costs

Methane can be emitted from a variety of sources in oil and gas systems. Fugitive leaks can occur as equipment ages and deteriorates. Some methane is also intentionally vented into the atmosphere for maintenance or safety requirements. Implementing methane mitigation actions will reduce the volume of CH_4 emitted into the atmosphere, improving air quality and supporting public health. This strategy reduces CH_4 by 8,841,539 $MTCO_2e$ in 2050 and results in costs of $5 per $MTCO_2e$.

Economic benefits and costs

The costs and benefits of methane reduction actions depend on the types of technologies implemented. Although all actions require an initial capital investment, certain methane reduction actions, such as the installation of vapor recovery units, allow for the capture of methane gas that would otherwise be emitted into the atmosphere. These technologies result in an additional benefit to operators who can otherwise use or sell the gas and pay for the cost of the technologies over time. Other actions, such as routing blowdown gas to flare, incur additional costs with no economic incentive.

This strategy represents voluntary actions taken to reduce methane emissions, regardless of economic viability to a particular operator. Therefore, the overall cost impact is a function of the

[59] This rulemaking establishes requirements for storage vessels, natural gas driven pneumatic controllers, natural gas-driven diaphragm pumps, reciprocating and centrifugal compressors, and fugitive emissions components. For more information see: https://www.dep.pa.gov/Business/Air/pages/methane-reduction-strategy.aspx.

technologies utilized, the amount of gas captured, and the time required to recoup those investments through the sale of additional captured gas.

The reduction in methane emissions in oil and gas systems is expected to have some small negative economic impacts. Many methane mitigation techniques require up-front investment or cost to implement and require some ongoing incremental upkeep cost. These additional costs result in negative economic impacts. The average annual GSP and DPI impacts are expected to be -$22.30 million and -$17.39 million, respectively. The average annual employment impact is expected to be -78 jobs.

Social benefits and costs

Methane reduction strategies improve air quality by reducing and capturing GHG pollutants before being released to atmosphere. In addition to climate benefits, these mitigative actions promote safety at operating facilities by reducing leakage of the hazardous gas, which is extremely flammable and can cause explosions if leaked into confined spaces. Proper monitoring and better emissions controls help avoid the creation of unsafe conditions.

Implementation Considerations

Implementation of methane reduction technologies at oil and gas facilities is a function of several factors, including regulatory requirements, economic considerations, and technical feasibility.

Pennsylvania has recently shown interest in reducing oil and gas emissions with its Methane Reduction Strategy.[60] New regulations through programs such as this one will reduce emissions by requiring certain sources to be addressed. These requirements can have a direct impact because they generally shorten the time an operator has to decide to implement mitigative actions. Regulatory requirements can also be effective for implementing mitigative actions for certain sources that may not otherwise be cost-effective.

The economic viability of an action can influence an oil and gas operator's interest in implementing voluntary mitigative technologies. Although some actions enable the capture of sales gas that would otherwise be lost to the atmosphere (and thus provide a return on capture-technology investment), other reduction actions, such as increased flaring, impose additional capital and maintenance costs with no return on investment for operators. Facility configuration can also affect the economics of implementing reduction options, as larger facilities may allow for more volume to be captured with marginal impact on overall capital and maintenance costs. This economy of scale decreases the time required to recoup investment, making reduction actions more viable for certain facilities.

---

[60] Pennsylvania Department of Environmental Protection. 2016. *A Pennsylvania Framework of Actions for Methane Reductions from the Oil and Gas Sector.* Available at: https://files.dep.state.pa.us/Air/AirQuality/AQPortalFiles/Methane/DEP%20Methane%20Strategy%201-19-2016%20PDF.pdf

Mitigation actions also depend on the specific on-site operations at each individual facility. The layout and configuration of the equipment can allow or disallow certain actions. Issues such as the spacing or size requirements for reduction equipment sometimes do not allow operators to implement certain actions easily, particularly actions requiring large supporting equipment (i.e., vapor recovery systems).

Electricity Generation

Electricity generation is the greatest source of GHG emissions in the Commonwealth, accounting for nearly 30% of total emissions. GHG emissions from this sector are emitted primarily by burning fossil fuels such as coal and natural gas. Pennsylvania is the third-largest energy producing state in the U.S., after Texas and Florida. Pennsylvania is the third-largest coal-producing state in the nation and second-largest natural gas producer.[61] Pennsylvania is also second in electricity generation from nuclear power.[62] Until recently, coal and nuclear were the predominant fuels for generating electricity in Pennsylvania. However, significant growth in natural gas production, due to technological advances and lower prices, has largely displaced coal-fired electricity generation. As of 2020, natural gas has overtaken nuclear as the largest fuel source for electricity generation in Pennsylvania, and it is expected to provide an increasing share of electricity in future years.

The transition from coal to natural gas, and to a lesser degree, the gradual increase in clean renewable energy sources, has reduced overall emissions from the sector significantly. Decreasing costs of renewable energy technology and enabling policies such as the AEPS have helped drive recent increases in renewable power generation, which in 2020 provided just over 4% of total electricity generation.[63]

The strategies proposed to address electricity generation emissions reflect current technological and policy trends that aim to decarbonize the electricity grid. Two strategies are modeled:

- Maintain nuclear generation at current levels
- Create a carbon emissions-free grid

The modeling results indicate that together these strategies will reduce emissions compared to the BAU in 2025 and 2050 (Figure 29) and in 2050 will reduce emissions in the electricity generation sector by 55,741,567 $MTCO_2e$ (see Table 7).

For each strategy, the environmental, economic, and social benefits are reported along with the costs (or savings) associated with the implementation of the strategy. The environmental benefits and costs (or savings) are expressed in terms of GHG emission reductions and changes in energy and fuel use. The economic impacts are expressed in terms of changes in job numbers,

[61] EIA, 2021. "Pennsylvania State Profile and Energy Estimates." Available at: https://www.eia.gov/state/data.php?sid=PA.

[62] EIA, 2021. "Pennsylvania State Profile and Energy Estimates."

[63] EIA, 2021. "Pennsylvania State Profile and Energy Estimates."

disposable income, and GSP. The social benefits and costs are expressed in terms of impacts on air quality (e.g., changes in criteria pollutants like SO_2, NO_x, and $PM_{2.5}$) and associated public health and social impacts such as equity and resilience. Note that costs and savings associated with maintenance, expansion or reconfiguring of either the distribution or transmission grids to manage distributed energy resources and new utility scale renewable projects were not estimated as part of these strategies. Investments for grid modernization will be needed with or without the implementation of reduction strategies.

Figure 29. Electricity generation GHG emissions when implementing reduction strategies compared to business as usual

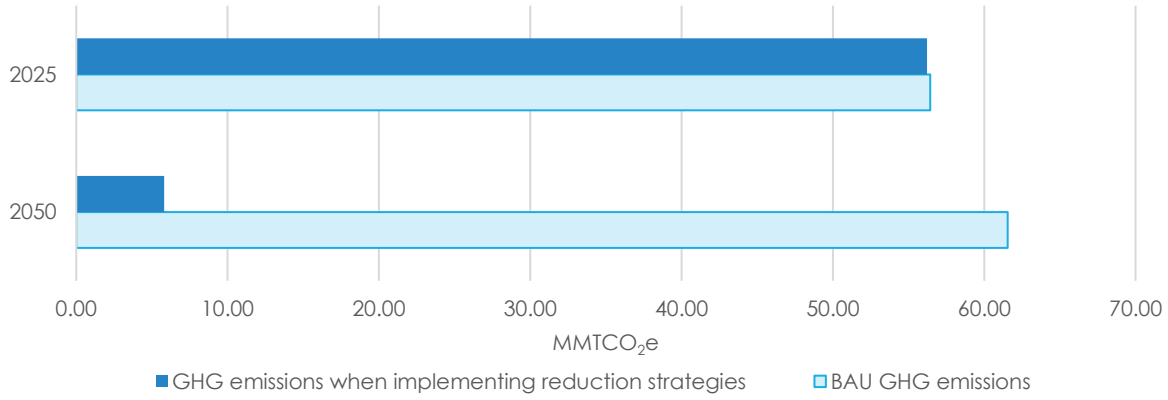

Table 7. Electricity generation sector GHG reduction strategies and associated reductions ($MTCO_2e$)

GHG Reduction Strategy	2025	2050
N. Maintain nuclear generation at current levels	N/A*	N/A*
O. Create a carbon emissions free grid	206,712	55,741,567
Total GHG Reductions	**206,712**	**55,741,567**

**GHG reductions from Strategy N, Maintain nuclear generation at current levels, are included under the carbon-free grid strategy and thus are not reported separately.*

N. Maintain nuclear generation at current levels

This involves implementing a strategy to maintain nuclear generation at current levels. The BAU and 80x50 scenarios assume an 80-year lifetime for all U.S. nuclear units, which would mean that all plants currently in operation will stay online through at least 2050. This strategy assumes that, if needed, Pennsylvania would intervene to keep nuclear units online for their full lifetime, preventing any early retirements. This lifetime assumption is incorporated into the carbon emissions-free grid strategy, Strategy O, and therefore the costs and benefits associated with this strategy are incorporated in the carbon-free grid strategy.

Included in Strategy O

Nuclear facilities can obtain two 20-year operating license extensions from the Nuclear Regulatory Commission; increasing their lifetime to 60 and 80 years. Two facilities have been granted a second extension, known as a subsequent license renewal (SLR): Peach Bottom Units 2 and 3 and Turkey Point Units 3 and 4. These SLRs extend their lifetime to 80 years. There are five SLR applications representing 11 nuclear units (Point Beach Units 1 and 2, North Anna Units 1 and 2, Surry Units 1 and 2, Oconee Nuclear Station Units 1, 2, and 3, and St. Lucie Plant Units 1 and 2) that are pending with the NRC. Only two units in Pennsylvania currently have an 80-year operating license—Peach Bottom 2 and 3. The other six units currently operating in Pennsylvania will have to apply for one or two 20-year renewals to operate for 80 years.

Table 8 lists the current operating nuclear units in Pennsylvania, their current operating license lifetime, and what their retirement year would be, assuming they all receive an SLR extension.

Table 8. Pennsylvania nuclear plants and their lifetimes

Nuclear Plant	Online Year	Operating License Expiration Year	80-yr Lifetime
Beaver Valley Unit 1	1976	2036	2056
Beaver Valley Unit 2	1987	2047	2067
Limerick Unit 1	1985	2024	2065
Limerick Unit 2	1989	2029	2069
Peach Bottom Unit 2	1973	2053	2053
Peach Bottom Unit 3	1974	2054	2054
Susquehanna Unit 1	1982	2042	2062
Susquehanna Unit 2	1984	2044	2064

Environmental benefits and costs

By maintaining current levels of carbon-free electricity and preventing the units from retiring before their 80-year lifetime, this strategy reduces emissions of CO_2 and other GHG associated with fossil electricity sources such as CH_4 and N_2O. This strategy also reduces gaseous and particulate emissions associated with fossil electricity sources, including criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs.

Economic benefits and costs

The macroeconomic impacts of maintaining nuclear generation at current levels are combined with the impacts of a carbon emissions-free grid (Strategy O). Macroeconomic impacts resulting directly from this strategy are expected to be negligible.

Social benefits and costs

Maintaining the current nuclear fleet improves air quality by reducing emissions from the grid that would otherwise replace production from nuclear generation if any units retire early—i.e., before the grid is decarbonized. This strategy also provides a benefit to public health by directly reducing emissions that affect health.

Implementation Considerations

Maintaining the current nuclear capacity may require the state to subsidize facilities if they face unfavorable economic conditions. In the electricity strategies, the 100% AEPS and associated solar carve-out put downward pressure on energy prices because of the significant increase in variable renewable energy generation. Assuming status quo energy and capacity market structures, nuclear facilities may face economic pressure and require Commonwealth intervention to ensure that the facilities do not retire early because of lower wholesale market revenues. One intervention the Commonwealth legislature could make is to pass legislation designating a Commonwealth agency to create and administer a Zero Emission Credit (ZEC) program to subsidize at-risk nuclear plants, as states such as New Jersey, New York, and Illinois have done.

Possible challenges to implementing the strategy include lack of political will to secure funding for ZEC incentives and economic challenges. To mitigate economic challenges, the Commonwealth could limit subsidy eligibility to units that can prove that their unfavorable economic conditions are likely to result in the retirement of the unit. This will also benefit ratepayers by limiting the cost of this strategy. Maintaining the Commonwealth's nuclear capacity also provides long-term economic benefits by ensuring that the communities in which they are located continue to receive tax payments and the facilities continue to provide jobs.

After 2050 the nuclear capacity will begin to reach its lifetime of 80 years, and nuclear maintenance programs will be phased out as the units retire. The ability of this strategy to provide consistent and reliable carbon-free power for at least the next 30 years contributes significantly to Pennsylvania's ability to decarbonize its electricity generation. By 2050, replacing the retiring nuclear units with other clean energy resources will be more cost-effective than if the nuclear capacity were to retire early.

O. Create a carbon emissions-free grid

Annual GHG emissions reduced in 2025
206,712 $MTCO_2e$

Annual GHG emissions reduced in 2050
55,741,567 $MTCO_2e$

Annual energy reduced in 2050
Not calculated

Cost or (benefit) per ton of GHG reduced
$46.97/$MTCO_2e$

Net present value
$(50.54 million)

Average annual gross state product
$(658.98 million)

Average annual disposable personal income
$(1.13 billion)

Average annual employment
-5,285 jobs

This strategy includes amending and increasing the Alternative Energy Portfolio Standard (AEPS) to an in-state requirement of 100% by 2050 to achieve a carbon-free electricity grid. The electricity grid is the network that generates and delivers electricity to consumers and includes generating stations, electrical substations, and transmission and distribution power lines. Tier 1 targets and the solar carve-out would be increased. The solar carve-out can be supplied by in-state grid-scale and distributed solar resources. Nuclear and fossil energy with carbon capture and sequestration, as well as energy storage, would be added to the definition of eligible energy sources for Tier 1, or a new tier could be created in the portfolio of options to meet the 100% target. The Tier 2 requirement is maintained at the current level of 10% through 2050.

To implement this strategy successfully, additional efforts will be needed, such as strategies to expand the development of solar and wind projects and legislation to help develop a robust solar industry. Increasing the solar carve-out to 10% by 2030 would help increase the value of solar renewable energy credits (SRECs). This aligns with the DEP's Pennsylvania Solar Future Plan, as discussed in Strategy E.

Environmental benefits and costs

Decarbonizing electricity generation reduces emissions of CO_2 and other GHG associated with fossil electricity sources such as CH_4 and N_2O. As the grid becomes cleaner and less reliant on fossil-based sources of electricity, annual emissions are reduced, and by 2050, emissions are reduced by 55,741,567 $MTCO_2e$—the greatest emissions reduction from any strategy in this CAP.

Economic benefits and costs

The creation of a carbon-free grid will result in both positive and negative economic impacts. Construction of new power generation and storage facilities, particularly utility-scale solar and paired storage, will create many construction jobs in Pennsylvania. Some manufacturing and utility jobs will also result from the construction and will be maintained over the long term for operation and maintenance. The switch to a carbon-free grid, however, will negatively impact the fossil fuel industry in Pennsylvania. Shifting away from coal and natural gas to renewable sources of power will result in job losses. This strategy is expected to result in average annual

GSP and DPI impacts of -$658.98 million and -$1.13 billion, respectively. Additionally, this strategy is expected to result in an average annual employment impact of -5,285 jobs. The macroeconomic impacts of the carbon-free grid strategy reflect the demand changes called for in the energy efficiency and electrification strategies. The costs modeled in this strategy represent the changes in utility scale generation, but not all costs associated with the implementation of distributed energy resources in the distribution grid are included. Many utilities already perform upgrades to distribution grids for storm hardening and resiliency, and costs associated with the integration of distributed energy resources could be included in those investments.

Social benefits and costs

Decarbonizing the power sector improves air quality by reducing emissions from sources of electricity that would otherwise backfill the nuclear generation if any units retire. This strategy also provides a benefit to public health because it reduces gaseous and particulate emissions associated with fossil electricity sources, including criteria pollutants such as NO_x, SO_x, $PM_{2.5}$, and VOCs.

Implementation Considerations

Creating a carbon-free grid will require legislative action to revise the current AEPS. The target of the AEPS will have to be changed to 100% by 2050, with interim targets established. In addition, the solar carve-out will need to be increased, following Pennsylvania's Solar Future Plan, to require 10% by 2030. This could increase over time to maintain SREC pricing. The AEPS eligibility definitions will also need to expand to include nuclear, storage, CCUS, and any future carbon-free technologies that are developed. Implementing AEPS changes would occur through government

Revitalizing Decommissioned Coal Power Plants

Over the last 10 years, coal-fired power has been steadily losing its competitive edge to lower-emitting power generation resources, and Pennsylvania has witnessed the retirement and decommissioning of most of its coal-fired power plants. Although moving away from coal power has helped the Commonwealth reduce its GHG emissions, the local economic impacts to communities that have lost jobs associated with coal can be difficult to deal with. The Pennsylvania DCED has developed "Economic Repositioning Playbooks for Decommissioned Coal-Fired Power Plants" to begin bringing otherwise valuable brownfield properties back into productive reuse for the community. Although they are no longer in use, they offer opportunities to usher in a new generation of development because typically they are near river, road, rail, and energy transmission infrastructure. The contents of each "playbook" are tailored to the unique attributes of a site that need to be evaluated to help spur redevelopment interest. A typical playbook report includes:

- An assessment of potential or existing environmental impacts
- Cost estimates for demolition and abatement of the plant and associated structures
- Identification of existing permits that may be available for a new end user
- An assessment of existing infrastructure that includes transportation (e.g., rail access) and energy-related assets (e.g., power transmission)
- Local and regional economic analysis.

All this information is used to create at least three viable reuse strategy alternatives—"plays"—that would bring new activity to the site and investment and employment benefits to the community.

The goal of DCED's work is to entice transformational redevelopment of legacy industrial properties. By characterizing the site and recommending various paths forward, the playbooks represent the Commonwealth initiative to provide critical information to visionary community leaders and investors to recognize and act upon the opportunities such sites offer.

legislation. The timeframe for implementing this strategy spans decades, and the speed at which the strategy can be implemented influences how fast clean energy sources can be developed. In addition to policy targets, market forces will be critical in determining the mix of resources. The combination of resources used to meet the requirements will be decided on a least-cost basis. Least cost will determine whether emerging technologies such as carbon capture and sequestration are used to meet the requirements—whether they become commercially viable and cost-competitive with other carbon-free grid technologies and fuels, such as solar.

To build a carbon-free grid, strategies are needed to facilitate the siting and development of solar and wind projects, including transmission planning. Collaboration between utilities and local governments will be crucial to develop siting and interconnection standards to ensure that the clean energy targets are met. Neither the Commonwealth nor DEP has jurisdiction on land use for renewable energy projects, however through collaboration, best practices for land use should be encouraged. Solar photovoltaics should be recommended for land uses that have already been impacted such as brownfields, warehouses, and abandoned mines and fields. Soil and land carbon management practices should be encouraged throughout for all photovoltaic projects to maximize carbon reductions.

Potential for low carbon microgrids:

Most residents and businesses received their electricity through their local utilities, which are supplied by large electricity generators and transmission lines. Another option that is becoming increasingly available is microgrids. Microgrids are relatively small, independently controlled power systems that can be operated in concert with, or apart from, the local distribution and transmission system. At the Philadelphia Navy Yard, their microgrid is powered by a variety of sources including an on-site solar project. In a changing electricity grid, microgrids may play an increased role to provide reliable and low-carbon electricity for critical infrastructure such as hospitals, schools, or shelters.

Possible challenges to implementing the strategy include lack of political will in passing grid decarbonization legislation and regulatory and siting delays for the deployment of new clean energy assets. To overcome the latter, new regulations to streamline permitting of the generating facilities may be needed. The state will also need to ensure that equity concerns are addressed during the siting process and that the economic benefits of the increased renewable energy development benefit affected and environmental justice communities.

Additional economic challenges include stranded fossil assets and sector-specific job losses at those facilities. There are potential opportunities for gas infrastructure to be used in a carbon-free future, and the state can work with the industry to study options such as using gas

Alternative electricity generation mixes

The electric grid strategies modeled in this plan provide one potential pathway toward a carbon free grid by 2050, however different market conditions or new enabling technologies have the potential to provide similar outcomes through a different grid mix. Alternatives could include enhanced roles for carbon capture use and sequestration technologies, hydrogen used for power generation, or additional distributed energy resources. The 80x50 model's grid mix presented provides geographic diversity and certain advantages, however other pathways might increase the diversity of generation types, while still providing reliable electricity.

infrastructure for RNG. The legislature can also consider creating retraining programs to help workers in the fossil fuel industry find jobs in the state. Finally, reliability will need to be monitored as the grid shifts to lower-carbon resources. With greater reliance on electricity for transportation, resiliency will become even more critical for state residents. Resource and transmission planning at both the grid and distributed levels will be critical to ensure a reliable and resilient grid to supply energy to an increasingly electrified state.

Agriculture

Emissions from the agricultural sector are primarily produced by enteric fermentation, manure management, agricultural soil management, and fuel combustion from tractors and other machinery. Energy efficiency and alternative farming methods such as no-till farming and integrated farm management can help reduce agricultural emissions.

The Commonwealth has a rich history as a major agricultural producer, and agriculture contributes significantly to Pennsylvania's economy today, producing a market value of $7.76 billion in 2017, and employing over 90,000 people. Based on economic value, key crops and livestock include hay, corn, soybeans, nursery plants and flowers, poultry, dairy products, cattle, and pigs.[64] In 2019, there were approximately 52,700 farms and ranches spread across 7.3 million acres.[65] Lancaster, Bradford, Franklin, York, and Berks counties have the most acres of farmland in Pennsylvania.[66]

The strategies proposed to address agriculture emissions reflect existing technological and policy trends that aim to increase energy efficiency and implement agricultural best practices. Two strategies are modeled:

- Use programs, tools, and incentives to increase energy efficiency for agriculture
- Provide trainings and tools to implement agricultural best practices

Together, the modeling results indicate that these strategies will reduce emissions compared to the BAU in 2025 and 2050 (Figure 30) and in 2050 will reduce emissions in the agriculture sector by 232,562 $MTCO_2e$ (see Table 9).

For each strategy, the environmental, economic, and social benefits are reported along with the costs (or savings) associated with the implementation of the strategy. The environmental benefits and costs (or savings) are expressed in terms of GHG emission reductions and changes

[64] USDA. N.d. 2017 Census of Agriculture State Profile: Pennsylvania. https://www.nass.usda.gov/Publications/AgCensus/2017/Online_Resources/County_Profiles/Pennsylvania/cp99042.pdf.

[65] USDA. 2021. 2020 State Agriculture Overview: Pennsylvania. https://www.nass.usda.gov/Quick_Stats/Ag_Overview/stateOverview.php?state=PENNSYLVANIA.

in energy and fuel use. The economic impacts are expressed in terms of changes in job numbers, disposable income, and GSP. The social benefits and costs are expressed in terms of impacts on air quality (e.g., changes in the criteria pollutants like SO_2, NO_x, and $PM_{2.5}$) and associated public health and social impacts such as equity and resilience.

Figure 30. Agriculture GHG emissions with reduction strategies compared to business as usual

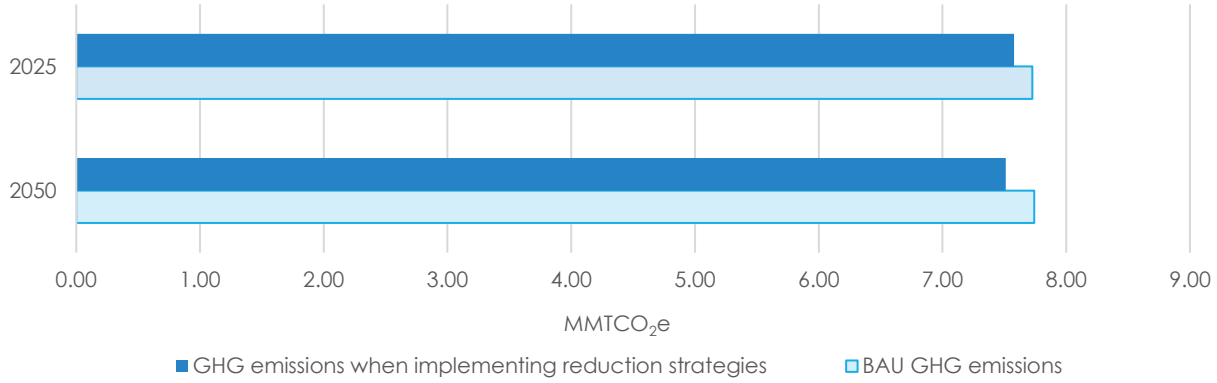

Table 9. Agriculture sector GHG reduction strategies and associated reductions ($MTCO_2e$)

GHG Reduction Strategy	2025	2050
P. Use programs, tools, and incentives to increase energy efficiency for agriculture	2,069	2,965
Q. Provide trainings and tools to implement agricultural best practices	145,799	229,597
Total GHG Reductions	**147,868**	**232,562**

P. Use programs, tools, and incentives to increase energy efficiency for agriculture

This strategy includes programs, tools, and incentives to increase energy efficiency for agricultural end uses such as refrigeration, ventilation, and lighting. For this strategy, energy efficiency improvements are based on a report prepared for DEP by EnSave Inc., titled "Energy Use, Energy Savings, and Energy Efficiency Policy Recommendations for Pennsylvania Agriculture."[67] This report analyzes the potential savings in electricity and fuel consumption that would result from adopting certain efficiency measures.

This strategy estimates potential energy savings for agricultural operations using the commercial energy efficiency savings modeled in the building strategies on energy efficiency (B and C). These savings estimates, based on Act 129, were applied to the technical energy efficiency potential from the EnSave report. The decreases in electricity and fuel consumption were then converted to associated GHG emissions reductions. For this strategy, the measure lifetime was assumed to be 10 years.

Annual GHG emissions reduced in 2025
2,069 $MTCO_2e$

Annual GHG emissions reduced in 2050
2,965 $MTCO_2e$

Annual energy reduced in 2050
14 GWh of electricity
76 BBtu of fuel

Cost or (benefit) per ton of GHG reduced
$43.28/$MTCO_2e$

Net present value
$(3.96 million)

Average annual gross state product
$(0.29 million)

Average annual disposable personal income
$(0.01 million)

Average annual employment
5 jobs

Environmental benefits and costs

By reducing the amount of electricity and fuel consumed through energy efficiency improvements such as equipment and lighting upgrades, this strategy reduces emissions of CO_2 and other GHGs associated with electricity generation and fuel combustion, such as CH_4 and N_2O. This strategy also reduces gaseous and particulate emissions associated with electricity generation and combustion, including criteria pollutants such as NO_x, SO_2, and Hg. Finally, energy savings can be expected from the adoption of more energy efficient measures.

Economic benefits and costs

The macroeconomic impacts of incentivizing energy efficiency for agriculture are small with disparate impacts. Small scale investments are not expected to drive job growth or result in meaningful bill savings, however, they will result in some tightening of budgets and less consumption of other goods and services. Average annual GSP and DPI impacts are expected to

[67] PA DEP. 2020. "Energy Use, Energy Savings, and Energy Efficiency Policy Recommendations for Pennsylvania Agriculture" https://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/Pollution%20prevention%20and%20Energy%20assiatance/Energy%20Use,%20Energy%20Savings,%20and%20Energy%20Efficiency%20Policy%20Recommendations%20for%20Pennsylvania%20Agriculture-2020.pdf.

be -$0.29 million and -$0.01 million, respectively. The average annual employment impacts are expected to be 5 jobs.

Social benefits and costs

Improving energy efficiency of on-farm equipment and infrastructure will increase the resilience of a farm's operations. Farmers that have reliable and up-to-date equipment such as refrigeration, ventilation, and lighting systems will be better equipped to handle market changes such as increased fuel prices. Reducing the amount of fuel consumed on farms will also improve the local air quality by reducing the emissions of criteria air pollutants. Lower criteria air pollutant emissions can lead to a better quality of life for farmers and other individuals that live in the area.

Implementation Considerations

Encouraging adoption of energy efficiency measures for agricultural operations will require a coordinated effort between multiple entities including DEP, the federal government, utilities, and institutions of higher education. The involvement of these parties will give farmers a variety of options and programs to choose from, ensuring the most successful outcome. The report prepared by EnSave recommends a series of complementary program offerings for farmers, including promotion of energy audits and incentive funds, a low-interest revolving loan fund, and competitive grants for energy efficiency projects. EnSave also recommends that these programs focus primarily on dairy and poultry operations because they offer the most significant opportunities for energy savings. However, the programs should be offered to all farms regardless of energy savings potential to ensure equitable implementation.

The most significant barriers to implementation of these programs are the relative costs of certain measures and the volatile business environment in which farms operate. For farms where energy costs make up a significant percentage of total operating costs (e.g., poultry), these measures may be a more cost-effective option than on farms where energy costs are not as substantial. Additionally, the precarious financial situation of many farming operations can make the adoption of energy-efficient measures less attractive. However, the potential to reduce energy consumption and improve farmers' bottom lines are valuable opportunities that should be pursued further.

Q. Provide trainings and tools to implement agricultural best practices

This strategy includes trainings and tools to implement agricultural best practices, such as those focused on no-till farming practices and integrated farm management to reduce the amount of GHGs emitted by farmlands. Practices could include rotational grazing, silvopasture, and organic and regenerative agricultural methods. The modeling of this strategy assumes that agricultural practices are implemented with the intention of reducing tillage intensity and thereby lowering GHG emissions.

Annual GHG emissions reduced in 2025
145,799 $MTCO_2e$

Annual GHG emissions reduced in 2050
229,597 $MTCO_2e$

Annual energy reduced in 2050
326 BBtu of fuel

Cost or (benefit) per ton of GHG reduced
$23.84/$MTCO_2e$

Net present value
$(122.66 million)

Average annual gross state product
$(12.01 million)

Average annual disposable personal income
$(12.12 million)

Average annual employment
-219 jobs

The modeling for this strategy follows a similar methodology to the 2018 CAP. Tillage practices by crop are based on a survey of Pennsylvania farmers conducted by USDA for 2013 and 2014.[68] The modeling team assumed that the proportion of fields with no-till acreage will increase at a constant rate of 5.9% annually until it reaches 98% of all acres, the maximum potential of no-till adoption. GHG reductions are calculated for both the annual increases in carbon sequestration and the decreases in fuel consumption required for tilling.

Environmental benefits and costs

By reducing the intensity of tillage on agricultural lands, GHG reductions will result from both decreased fuel consumption and increased carbon sequestration on croplands. Reducing tillage intensity decreases the amount of fuel consumed while tilling fields, leading to energy savings and lower GHG emissions (CO_2, CH_4, and N_2O) from the fuel consumption itself. Reduced-till and no-till fields also provide a net environmental benefit by sequestering additional carbon directly from the air. This strategy also reduces gaseous and particulate emissions associated with fuel combustion, including criteria pollutants such as NOx and SO_2. Note that these emissions reduction benefits are in addition to water quality benefits from no-till such as reduced nitrogen and sediment loads to waterways.

Economic benefits and costs

The implementation of agricultural best practices is expected to have some negative economic impacts. While there are some expected positive impacts of bill savings resulting from decreased fuel consumption, there are also cost associated with machinery related to no-till or air seeding practices. On the net, the economic impacts are expected to be negative. Average

[68] USDA. 2015. "Tillage Practices with Updated Alfalfa Seedings and Final Acreages." Available at: https://www.nass.usda.gov/Statistics_by_State/Pennsylvania/Publications/Survey_Results/tillage%202014%20jan%2020125.pdf.

annual GSP and DPI are expected to be -$12.01 million and -$12.12 million, respectively. The average annual employment impacts are expected to be -219 jobs.

Social benefits and costs

Reducing the number of acres tilled annually will lower the amount of fuel consumed to operate tillage machinery. Reduced fuel consumption on farms will improve the local air quality by reducing the emissions of criteria air pollutants. Lower criteria air pollutant emissions can lead to a better quality of life for farmers and others who live in the area.

Implementation Considerations

Reducing tillage intensity is an important practice that can benefit the broader environment by increasing carbon sequestration as well as the local environment by reducing runoff and soil erosion. No-till operations, which typically involve the use of a cover crop, are becoming a common practice for farmers who want to maintain soil health and improve their crop's productivity. Implementation of no-till and other soil management practices can be facilitated through education and outreach from DEP and other state actors. Coordination with the Penn State Extension System, farmers' co-ops, and other educational or community programs will be necessary to educate farmers about the environmental benefits (e.g., GHG reductions, improved soil health) of reducing tillage beyond cost savings and decreased fuel consumption.

Resilience Considerations

Implementation of best management practices (BMPs) in agriculture such as reduced tillage may also reduce flood risk (e.g., by allowing soils to hold more water), thereby increasing farms' resilience to projected increased flood risks under climate change.[69] BMPs may also improve the sustainability of agricultural practices to cope under changing climate conditions, reduce erosion, and improve soil health.

In addition, Pennsylvania has the opportunity through this strategy to simultaneously provide training and tools that can help farmers adapt to climate change impacts (see Section 4 on Addressing the Impacts of a Warmer and Wetter Climate on Agriculture).

The technology required to adopt no-till practices already exists, so the most important step is conducting outreach to farmers and helping them apply these technologies to their farms. While convincing farmers to change their behavior or adopt new techniques can be a challenge, the benefits of improving soil health and reducing runoff provide significant incentives to act. Reducing tillage intensity is a promising area of interest for the agriculture sector in Pennsylvania. The opportunities to improve soil health and increase carbon sequestration make it an attractive option for DEP and other ag interest groups to promote statewide.

Making the Case for Cover Crops as Extreme Weather Risk Management." National Wildlife Federation (NWF). Available at: https://www.nwf.org/~/media/PDFs/Water/2015/Drought-and-Flood-Report-Final.pdf

Land Use, Land-Use Change, and Forestry

The land use, land use change, and forestry (LULUCF) sector includes all land that is not developed for agricultural, industrial, or residential uses, and activities on those lands that either capture (i.e., sequester) CO_2 or release GHG emissions. In addition to manmade technologies, CO_2 can also be captured and stored through natural land-based carbon removal approaches that capture CO_2 in soils, biomass, and oceans. Soils, biomass, and oceans are known as carbon sinks because they extract CO_2 from the atmosphere rather than emit it. Strategies to increase the sequestration of CO_2 by using these sinks include reforestation and afforestation, enhanced soil carbon uptake, and biochar.

Pennsylvania enjoys diverse and widespread forests that cover 16.9 million acres of land, or about 58% of all land in the Commonwealth.[70] Common tree species include oak, maple, hickory, birch, and beech, which provide many economic and environmental benefits such as lumber, food, wildlife habitat, and clean air and water. Forests also offer a range of recreation activities such as camping, hiking, fishing, and hunting.

Other land types that are less prevalent than forests but equally important are wetlands and coastal areas, such as along the Delaware Bay and the shore of Lake Erie. Wetlands are typically found near floodplains along rivers and streams, in swamps or marshes, and around lakes. Wetlands are vital breeding and spawning grounds for many animals, including amphibians, birds, and fish. Some of Pennsylvania's threatened and endangered species, like the American bittern, are only found in wetlands.

The strategy proposed to address LULUCF emissions reflects technology and policies that aim to sequester more GHG emissions by increasing forest cover. One strategy is modeled: land and forest management for natural sequestration and increased urban green space. The modeling results indicate that this strategy will reduce emissions compared to the BAU in 2025 and 2050 (Figure 31), and in 2050 will reduce emissions in the LULUCF sector by 2,930,193 $MTCO_2e$ by 2050 (see Table 10).

For each strategy, the environmental, economic, and social benefits are reported along with the costs (or savings) associated with the implementation of the strategy. The environmental benefits and costs (or savings) are expressed in terms of GHG emission reductions and changes in energy and fuel use. The economic impacts are expressed in terms of changes in job numbers, disposable income, and GSP. The social benefits and costs are expressed in terms of impacts on air quality (e.g., changes in the criteria pollutants like SO_2, NO_x and $PM_{2.5}$) and associated public health and social impacts such as equity and resilience.

Figure 31. LULUCF GHG emissions with reduction strategies compared to business as usual

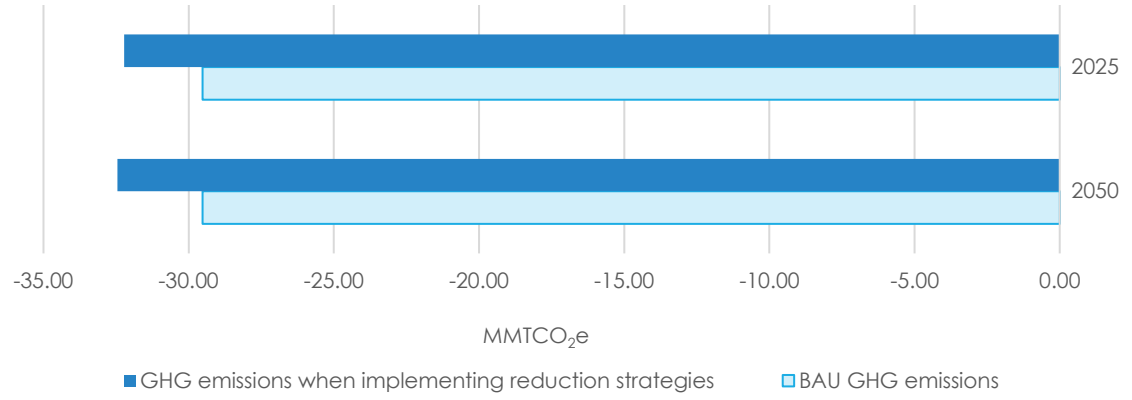

Table 10. LULUCF sector GHG reduction strategies and associated reductions ($MTCO_2e$)

GHG Reduction Strategy	2025	2050
R. Increase land and forest management for natural sequestration	2,698,407	2,930,193
Total GHG Reductions	**2,698,407**	**2,930,193**

R. Increase land and forest management for natural sequestration

Annual GHG emissions reduced in 2025
2,698,407 $MTCO_2e$

Annual GHG emissions reduced in 2050
2,930,193 $MTCO_2e$

Pennsylvania's 6.9 million hectares (17 million acres) of forest land are estimated to sequester about 34 million $MTCO_2e$ annually. Of several natural strategies evaluated for their potential to increase the carbon sequestration of forestland in Pennsylvania, extending harvest cycles and reforestation showed the highest potential.[71,72,73] Afforestation of abandoned/legacy mine lands and marginalized croplands (cropland uncultivated due to challenging soil conditions) offer additional opportunities through expansion on land with no competing uses.

The potential for increased carbon sequestration was evaluated for a series of land management strategies, including:

- **Reforestation** of forest and urban open spaces, suitable shrub and grass areas, pasture, and marginal crop land
- **Afforestation** (establishment of new forest) on abandoned mine lands

[71] Cook-Patton, S. C., Gopalakrishna, T., Daigneault, A., Leavitt, S. M., Platt, J., Scull, S. M., Fargione, J. E. (2020). Lower cost and more feasible options to restore forest cover in the contiguous United States for climate mitigation. One Earth, 3(6), 739-752. doi:10.1016/j.oneear.2020.11.013.

[73] Dugan, A., Steele, A., Hollinger, D., Birdsey, R., & Lichstein, J. (2018). Assessment of Forest Sector Carbon Stocks and Mitigation Potential for the State Forests of Pennsylvania. doi:10.32747/2018.6893743.ch.

- **Extend harvest cycles**, where feasible (on state, private, and other lands) coupled with a 5% increase in long-lived wood products.

The total area of opportunity for strategies based on expanding forest area was estimated for 906,652 hectares, assuming that a combination of land types would be utilized including abandoned mine lands, marginal croplands, pasture, and urban open spaces.[71] A five-year implementation period was assumed for these strategies except for pasturelands, which were projected to be reforested at a rate of 5% per year (based on the total area of opportunity). Estimates used oak-hickory due to their dominance in the state's forests, high-value to the timber industry, and superior food provision for wildlife.

Pennsylvania's forestlands may reduce atmospheric CO_2 levels either directly (through reforestation/afforestation that increases CO_2 uptake) or indirectly through the increased use of wood products from Pennsylvania's forests in place of other materials in buildings and consumer products. Materials substitution as a strategy would maintain forest management jobs while creating additional opportunities in processing and manufacturing.

There are many variables in forest management including historic practices, forest age and type, and quality and type of soils. Considering these variables, the most effective practice for sequestering carbon and reducing emissions is to keep forests as forests, and encourage healthy, diverse forests representing a variety of age classes across the state. State forests should maintain extended harvest rotations in suitable areas such as steep slopes, riparian buffers, and wild and natural areas, where tree age can extend to 130 years and beyond. Harvest rotations on private and other forest ownership types should be extended, where practicable based on forest type and location. It is important for forests to be well-managed for pests, disease and intentionally managing for carbon as well as other values.

Environmental benefits and costs

This strategy will result in GHG reductions from the additional carbon sequestered by new forest land. Abandoned mine lands and marginalized croplands have little to no carbon sequestration potential, so any new forest land that replaces these land types will lead to net reductions in GHG emissions. Increased biodiversity, improved water quality, erosion prevention, and reduced urban heat effect are some additional environmental co-benefits that can be expected from improved forests. Most of the sequestration potential occurs beyond 2025 due to the time required for implementation, i.e., for trees to grow. Promoting practices that diversify and enhance long-term forest health and therefore increase carbon sequestration and storage are key practices that currently yield environmental benefits.

Economic benefits and costs

Sustainable timber supply, diversification of farm income from added hardwood, and improved livestock performance are some expected economic development benefits that this strategy can provide. Expanding forestlands involves establishment costs if active planting is used, and also involves opportunity costs in foregone revenues from cropland, pastureland, or delaying timber harvests. Natural regeneration and extending harvest cycles involve minimal

establishment costs. Estimated annualized planting costs with active planting are $171/hectare-year.[71] Including opportunity costs from these lands would require a carbon price of $40/ton$CO_2e$ to incentivize landowners to engage in forestland expansion. Abandoned mine lands require extensive site preparation costing $6,175/hectare to $8,645/hectare depending on tree type and spacing. Legacy mine lands will incur additional costs due to required site preparation such as deep tilling of heavily compacted soil and control of existing vegetation. Compacted topsoil on legacy mine lands often requires deep tillage and removal of any invasive vegetation before a productive forest can be established.[74]

Indirect pathways for utilizing forest products to reduce atmospheric CO_2 concentrations through substituting wood for materials like cement and steel have received less direct attention in terms of costs, benefits, and relative GHG concentration reductions. Lippke, et al. (2010)[75] and Oliver et al. (2014)[76] estimate that the use of wood as a building material could reduce the GHG footprint of a building by almost 50% compared to concrete and steel, but this analysis is limited to materials substitution and does not consider forest management strategies. The performance of a strategy focused on forest product substitution in buildings and consumer product manufacturing versus extension of harvest cycles has been raised as an important policy consideration in forest management[77,78] but has not been extensively studied and represents a gap relevant to Pennsylvania forest management decisions.

Social benefits and costs

Increasing the amount of forest land will help to improve air and water quality, as forests act as a natural filter for pollutants in the air and water sources. Increased tree cover can also mitigate the effects of urban heat islands, reducing the level of heat stress placed on individuals that live near forests. Forests are an important public resource that provide a source of recreation and enjoyment. Marginal croplands or abandoned mine lands that are converted into forests could be repurposed into public parks and recreational areas.

Resilience Considerations

Depending on where reforestation, afforestation and harvest cycle extension practices occur, there may be an opportunity for them to provide additional resilience benefits, such as reducing urban heat island effects, or improving ecosystem connectivity or reducing runoff or flood risks (see Section 4 on Addressing the Impacts of Increasing Average Temperatures on Forests, Ecosystems, and Wildlife).

[77] Malmsheimer, Robert W., et al. "Managing forests because carbon matters: integrating energy, products, and land management policy." *Journal of Forestry. 109 (7S): S7-S50* 109.7S (2011): S7-S50.

[78] Miner, Reid A., et al. "Forest carbon accounting considerations in US bioenergy policy." *Journal of Forestry* 112.6 (2014): 591-606.

Implementation Considerations

Necessary actions to implement the strategies will include identifying areas needing active or limited management versus where natural regeneration can occur. Additional considerations will include identification of funding sources and appropriate incentives (for private owners), creating public awareness, identification of sufficient planting stock, and establishment of monitoring and maintenance regimes.[71] Private and public land managers will need to be equipped with the appropriate tools, information, and the flexibility to incorporate climate change in management planning and implementation.

Private land ownership greatly influences management and implementation actions. The PA DCNR is mandated with managing the state's forest land. It also provides information and technical advice to private forest landowners and establishes community conservation partnerships. Federal land managers include the National Park Service, U.S. Forest Service, and Fish and Wildlife Service, which oversee 80%, 10% and 10% of federally owned land, respectively. Multi-state partnerships work in collaboration with federal agencies to provide technical guidance. The Appalachian Regional Reforestation Initiative, for example, guides the restoration of high-quality hardwood forests on reclaimed coal mines.

Given the linkages of ecological, economic, and social systems, to ensure that local and non-local needs are met, management decisions and policies should be guided by expert science as well as local and indigenous knowledge through community participation.

Waste

The waste sector includes all activities related to the collection, transportation, processing, and disposal of waste. Unwanted or discarded materials are considered waste. Categories of waste sources include industrial, municipal, residual, and hazardous waste. The following are the primary sources of GHG emissions from the waste sector:

- Landfills (primarily in the form of landfill gas, a natural byproduct of decomposed organic materials)
- Waste-to-energy facilities (primarily from the combustion of solid waste)
- Wastewater treatment plants (from the digestion of biosolids)

Waste transportation and related activities produce additional emissions. Currently in Pennsylvania, there are 43 municipal waste landfills, four construction and demolition waste landfills, and six waste-to-energy facilities.[79] The municipal waste industry in Pennsylvania collected, hauled, and disposed of 8.7 million tons of municipal solid waste in 2016, or about

[79] DEP. 2021. "Municipal Waste Landfills and Resource Recovery Facilities." Available at: https://www.dep.pa.gov/Business/Land/Waste/SolidWaste/MunicipalWaste/MunicipalWastePermitting/Pages/MW-Landfills-and-Resource-Recovery-Facilities.aspx.

1,360 pounds per person. The most common landfilled materials were food waste, non-recyclable paper, corrugated cardboard, newspaper, and mixed paper.[80]

Recycling and reusing materials are methods to reduce the amount of waste generated. In 2017, more than 6.36 million tons of materials were collected and recycled, mitigating approximately 8.78 $MMTCO_2$.[81] Unfortunately, recycling rates are falling across the Commonwealth and country due to the elimination of a significant portion of worldwide recycling processing capacity. Many local governments in Pennsylvania are scaling back or eliminating their recycling programs due to the increased cost and the shrinking market for recyclable materials.[82]

While the waste sector is an important emissions source and there are strategies to reduce waste sector emissions, these strategies were not modeled for the CAP.

Enabling Technologies

The strategies outlined above will rely on existing and future technologies. Leveraging technologies will allow the Commonwealth to more effectively implement the proposed GHG reduction strategies, typically by optimizing performance, reducing overall implementation costs, and/or by reducing GHG emissions at a greater level than possible through alternative technologies or in the absence of technology. Many of these technologies will also be key elements of increasing the resilience and reliability of Pennsylvania's energy systems. Seven key enabling technologies were identified, including:

- Incentivizing grid-level battery storage;
- Power-to-gas and blue and green hydrogen;
- Carbon capture, utilization, and storage (CCUS);
- Direct Air Capture (DAC);
- Peak energy load and balancing strategies;
- Carbon offsets; and
- Disruptive digital technologies.

A description of each is provided below, as well as short explanation of how the technology is relevant to Pennsylvania in particular.

Encourage and incentivize battery storage at the grid level

Battery technology costs have dropped significantly in recent years, and battery energy storage systems will continue to gain traction as new technologies facilitate aggregation and grid

[80] PWIA. 2021. "Waste Facts." Available at: http://pawasteindustries.org/waste-industry/waste-facts/#:~:text=As%20of%202016%2C%20Pennsylvanians%20generate,pounds%20per%20person%20every%20year!.

[81] DEP. 2021. "Statewide Recycling Data." Available at: https://www.dep.pa.gov/Business/Land/Waste/Recycling/Pages/Recycling-Reports-and-Studies.aspx.

[82] Waste Dive. 2019. "How Recycling Has Changed in all 50 States." Available at: https://www.wastedive.com/news/what-chinese-import-policies-mean-for-all-50-states/510751/.

optimization in wholesale markets. Batteries can be paired with other forms of renewable energy, including solar, wind and other variable energy resources as well with as electric vehicle deployments, to enhance the value of specific projects. They can also serve as standalone projects in the grid to provide added peak capacity can potentially serve as an alternative to new or upgraded transmission lines.

Grid-scale storage is still relatively new in the U.S. In addition to providing capacity to the grid, it also serves a role in other grid services such as frequency regulation. Costs for battery storage have dropped in recent years and are expected to continue to drop an additional 40-80% by 2050.[83] See Figure 32 for recent battery price information.[84] Lithium-ion technologies are the leading energy storage solution; however, several other technologies are under investigation for grid-scale applications including vehicle-to-grid technologies, lead-acid, redox flow, and molten salt.[85] While battery storage is currently the leading technology, fly wheels and fuel cell storage using hydrolysis are emerging technologies that have the ability to offer similar storage services to the grid.

Why it matters for Pennsylvania: Pennsylvania's electricity markets are operated by PJM, the independent service operator for the Mid-Atlantic region, and PJM's market rules govern capacity and frequency regulation markets. Battery technology may also be relevant for Electric Distribution Companies (EDC), who may play a role in battery ownership in the distribution grid. The PUC has issued a letter soliciting comments regarding EDC battery ownership as they look to inform future regulatory policies related to battery technologies.[86]

As the Pennsylvania grid mix continues to change, battery storage will play an important role in providing capacity for peak load days. Even without the addition of solar and wind, battery storage can be used to meet 6-8% of PJM's annual peak.[87] With large additions of solar and wind electricity generation sources, a larger percentage can be anticipated. This enabling technology can be paired with the AEPS.

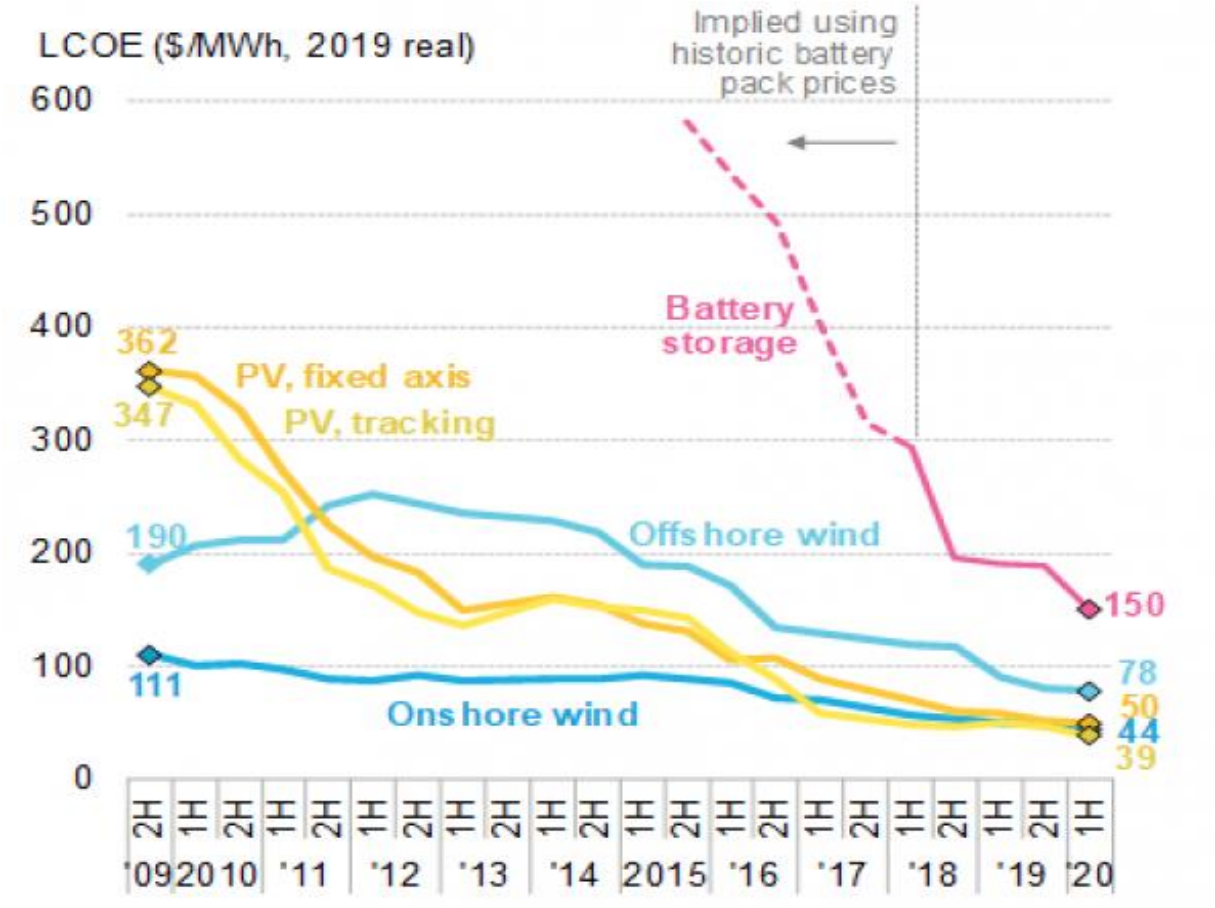
Figure 32. Global levelized cost of energy of battery storage technology relative to renewable energy generation technologies



Some states, such as California, Virginia, and Massachusetts, have gone a step further and promoted battery storage technologies through direct incentives or portfolio standard type policies. These policies have been set to require a certain capacity of storage by a target year and are often passed in combination with renewable energy targets and portfolio standards. As Pennsylvania's AEPS is set to plateau in 2021, battery storage policy solutions may be helpful to explore as a way of reducing costs and carbon emissions in the state.

The Path Forward for Increasing Energy Storage Statewide

Current context

- There are about 1.5 gigawatts (GW) of energy storage capacity in Pennsylvania. This represents 22 operational or announced energy-storage projects, including pumped hydro storage (1.07 GW), lithium-ion batteries (18 megawatts [MW]), lead carbon batteries (12.5 MW), ice and chilled water thermal storage (6 MW), and other technologies providing smaller amounts.
- As of February 2021, there were 64 solar-plus-storage projects, reaching 2.3 GW, in the Pennsylvania portion of the planning queue of PJM, the wholesale electric regional transmission organization serving 14 states. Although these projects are still in early stages and not yet announced, the trend reflects growing recognition of the value of solar-plus-storage.
- Workers and companies are developing energy storage equipment in Pennsylvania today. For example, Arkema, in King of Prussia, was awarded $5 million from the U.S. Department of Energy to develop lithium-ion energy storage manufacturing processes. East Penn Manufacturing, in Lyon Station, recycles 30,000 batteries a day. Eos Energy Storage, in partnership with Holtec International, is producing aqueous zinc batteries for industrial-scale energy storage in Pittsburgh.
- Several entities are doing research and development, including Penn State University Battery and Energy Storage Technology Center and the University of Pittsburgh Energy GRID Institute.

Moving ahead

The 2021 report *Pennsylvania Energy Storage Assessment: Status, Barriers, and Opportunities* recommends:

- Pairing grid-scale solar arrays with battery storage to reduce carbon emissions and increase grid resilience, and catalyzing the action by setting an energy storage capacity target, as seven other states have done.
- The Energy Storage Assessment recommends 14 other measures to foster energy storage investment and integration, including convening a statewide storage issues forum, designating public funding to accelerate storage deployment, establishing incentive programs for storage projects, and accelerating microgrid deployment at critical facilities.
- The assessment report recommends supporting research and development by institutions and businesses in state to innovate energy storage technologies that can incorporate common elements and environmentally friendly design and be made in Pennsylvania.

Source: DEP and Strategen Consulting. 2021. Pennsylvania Energy Storage Assessment: Status, Barriers, and Opportunities. https://files.dep.state.pa.us/Energy/Office of Energy and Technology/OETDPortalFiles/EnergyAssurance/Strategen_PA_Energy_Storage_Assessment_April_2021.pdf.

Analyze the potential role of power-to-gas and blue and green hydrogen in meeting Pennsylvania's goals

Alternatives or supplements to natural gas have the potential to provide lower carbon thermal energy for a variety of different uses including in transport, buildings, and electricity generation. Power-to-gas (P2G), blue hydrogen, and green hydrogen are emerging technologies that are already being used throughout the world and have the potential to continue to grow in the coming decades. Hydrogen as a fuel is not found in nature, but can be derived through various processes, some of which can reduce GHG emissions. Once created, hydrogen can be stored, transferred to other locations by truck or pipeline, or used for various purposes. The demand for hydrogen has tripled since 1975, and production costs have decreased as research advances. The International Energy Agency (IEA) recommends investing in and scaling up hydrogen production as the costs continue to decline and the world seeks to reduce CO_2 emissions.[88] Hydrogen, when used in a fuel cell, emits zero emissions, and when combusted, results in NO_x emissions. Hydrogen can be produced from a variety of resources, including natural gas and biomass or via electrolysis using electricity (i.e., P2G).

Hydrogen Terminology

Power-to-gas is a process that uses electrical power and electrolysis to split water into oxygen and hydrogen so the hydrogen can be used as a gaseous fuel. Power-to-gas may also refer to synthetic gas which is derived from hydrogen using subsequent processes.

Blue Hydrogen is derived from fossil sources such as natural gas but uses carbon capture and sequestration technology to reduce the CO_2 emissions produced to create hydrogen.

Green Hydrogen is hydrogen created from renewable energy sources such as solar, wind, hydropower, biomass, biogas, or municipal waste.

Why it matters for Pennsylvania: The boom in natural gas extraction in the past 15 years in Pennsylvania has provided wide access to a low-cost fuel used for electricity generation, industrial uses, and building heat for Pennsylvania businesses and homes. As the Commonwealth looks to a low-carbon emissions future, continued investment in alternative fuels are expected as they are anticipated to grow in their cost effectiveness and versatility. Both hydrogen and P2G are promising fuels that can be created using electricity, and both fuels have the potential to partially transition from natural gas to lower carbon fuels, thus altering the gaseous fuels marketplace. Hydrogen can provide a future carbon-free option that would potentially reduce the risk of stranded assets (e.g., energy distribution systems).

The potential to create, store, and distribute hydrogen in Pennsylvania using excess electricity generated from nuclear, in-state solar, and planned offshore wind projects could be a unique and important opportunity. These alternative fuels can be especially effective in difficult to decarbonize industrial sectors that require high temperature processes (e.g., steel refining or food production), or as fuels for heavy-duty or off-road vehicles.

[88] International Energy Association (IEA). 2019. *The Future of Hydrogen*. Available at: https://www.iea.org/reports/the-future-of-hydrogen.

Hydrogen may require new or retrofitted equipment so that it can be used as a fuel. Equipment, infrastructure, and vehicle incremental costs will need to be understood by users as they will differ significantly from existing fuels and may require significant investments. Hydrogen may serve as a lower cost fuel option for low-emission vehicles for large fleets of heavy-duty vehicles as the infrastructure and vehicle costs together are considerably lower when compared to heavy duty electric vehicles.

Analyze the potential role of carbon capture, utilization, and sequestration in meeting Pennsylvania's goals

Carbon capture utilization and sequestration (CCUS) is a broad category of technologies that generally capture CO_2 emissions from fossil fuel combustion source points (e.g., coal-fired power plants, industrial flue stacks) to prevent CO_2 emissions from the electrical, industrial, and other sectors from entering the atmosphere. Capturing emissions at source points is the most efficient means of capture as that is where there is the greatest concentration of CO_2—more than 90% of emissions can be captured this way.[89] There are a variety of technologies for capturing CO_2, including absorption, adsorption, membranes, and others. Once captured, CO_2 is typically transported via pipeline to be permanently sequestered in geologic rock formations, used to enhance petroleum hydrocarbon production, or repurposed in industrial and manufacturing processes.

While the technology is effective and proven, there are not many commercial-scale CCUS projects. However, as the technology continues to develop, costs decline, and demand grows, CCUS is poised to grow significantly over the coming years. Federal incentives such as the 45Q tax credit are making CCUS technologies more financially feasible, spurring commercial growth in the sector. While CCUS can help capture CO_2 emissions at source points, it is not a substitute for strategies that prevent or reduce emissions. CCUS can play a significant role in reducing CO_2 emissions from multiple sectors and must be part of a larger multi-disciplinary strategy to achieve carbon neutrality. Land-based sequestration strategies must be considered in concert with geologic storage opportunities to manage competing uses of Pennsylvania's natural and geologic resources.

Why it matters for Pennsylvania: The Commonwealth has a potential geologic sequestration capacity of 88.5 gigatons, enough to store hundreds of years of CO_2 emissions, primarily due to the deep saline formations underground.[90] Additionally, as a major oil and gas producer, it has notable potential to use CCUS technologies for enhanced recovery of petroleum hydrocarbons, and in October 2020, Pennsylvania joined a multi-state commitment to establish a regional CO_2 transport infrastructure, signaling its intent to commit to scaling up CCUS (see text box for

[89] C2ES. N.d. "Carbon Capture." Accessed December 3, 2020. Available at: https://www.c2es.org/content/carbon-capture/.

[90] C2ES. 2020. "Carbon capture offers dual economic and climate opportunities in Pennsylvania." Accessed December 3, 2020. Available at: https://www.c2es.org/2020/06/carbon-capture-offers-dual-economic-and-climate-opportunities-in-pennsylvania/.

details).[91] Together, these factors indicate that the Commonwealth is well positioned to implement CCUS technologies and policies that not only offer significant climate benefits but also bolster the economy by supporting existing and new innovative industries in a carbon-constrained world. Furthermore, by implementing CCUS technologies, Pennsylvania's electricity generators, fossil fuel producers and processors, and high-emitting industries will be poised not only to survive the transition to a decarbonized future but also thrive in a zero-carbon economy. CCUS is expected to play a critical role in achieving GHG reduction goals, but to date, CCUS technologies have had low market penetration due to high costs, lack of policy support, and perceived risks. Realizing that CCUS is both an environmental imperative and an economic opportunity, the Commonwealth launched a CCUS Inter-Agency Work Group in 2019 to identify collaborative opportunities to expedite CCUS in Pennsylvania.[92]

Multistate Initiative to Develop CO_2 Transport Infrastructure

Pennsylvania, Kansas, Louisiana, Maryland, Montana, Oklahoma, and Wyoming signed a memorandum of understanding in 2020 to commit to establishing and implementing a CO_2 transport infrastructure in an effort to ensure energy security, create and preserve jobs, and reduce net carbon emissions. The initiative plans to release its action plan in October 2021 and will identify barriers to regional CCUS and recommendations to overcome them.

Pennsylvania's opportunities for climate change mitigation are best served by providing a comprehensive approach to natural resource management that considers competing land uses and coordinates access to terrestrial and geologic resources.

Provide resources and education on direct air capture

One solution to climate change is to supplement GHG mitigation efforts by directly removing already existing atmospheric CO_2. Direct Air Capture (DAC) systems capture CO_2 from the ambient air through a variety of different techniques. DAC systems differ from other carbon capture techniques because CO_2 in the atmosphere is only present at low concentrations. DAC systems force air through a highly volatile chemical solution or filter that removes the CO_2 from the air. The resulting capture solution or sorbent is processed to isolate the CO_2 and then reestablished through a variety of different chemical and energy intensive processes. Captured CO_2 can be either permanently sequestered or utilized for products such as carbonated beverages or biofuels. Recent estimates indicate the current technology costs range from $300–

Available at: https://dced.pa.gov/newsroom/pennsylvania-joins-6-states-in-commitment-to-plan-for-co2-transport-infrastructure/.

[92] Pennsylvania Geological Survey. 2020. "Supporting Responsible Natural Resource Management, CO_2 Transport Infrastructure, and Economic Development in Pennsylvania." Presented by Kristin Carter. Available at: http://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/Climate%20Change%20Advisory%20Committee/2020/12-22-20/DEP_CCAC_CCUS_Carter_12-22-2020.pdf.

600/tCO_2.[93] DAC is considered to be among the most expensive carbon capture technologies—as much as three times more expensive than carbon capture at point sources.

Though some forms of DAC can be traced back to the 1930s, the technology has not yet reached commercial scale. This is due to several factors, but primarily to high energy demand and high production and operating costs. (A few pilot projects claim to achieve commercial scale, though there is not a clear definition of what constitutes commercial scale for DAC.[94]) However, in the past 10 years, several businesses and research institutions have made significant advances to reduce the costs and improve the efficiency of DAC technologies. DAC has gained attention as a tool against climate change as it is becoming clear that meeting midcentury emissions and global warming goals will probably require the world to remove existing atmospheric CO_2 in addition to mitigating future emissions. As technology advances, costs fall, and the demand to capture CO_2 increases in the coming decades, DAC is likely to play a larger role. Providing resources and education to energy providers and regulators, businesses, academic and research institutions, and other stakeholders now may enable the adoption of better DAC technology.

Why it matters for Pennsylvania: Some emissions sources, like transportation and cement production, are especially hard to decarbonize and will continue to create significant emissions, potentially for decades. When commercially viable, DAC systems can be installed in the Commonwealth to help offset the emissions from those sources until they are decarbonized. DAC can also be integrated into the Commonwealth's larger strategy for CCUS and infrastructure, notably the recent multistate CO_2 transportation project. DAC requires significant energy inputs, though this may not prevent a major energy producer like the Commonwealth from adopting DAC technology.

Implement peak load and balancing strategies

Peak load management is a series of technologies and markets that are implemented to reduce strain on the electricity grid. Electricity is very versatile, but to keep the grid in balance, electricity must be used at the same time and in the same quantity as it is generated. Flexible grids and load management techniques such as demand-and-response and peak load management programs help solve this challenge as they are capable of reducing electricity demand, which helps to keep the grid in balance and reduces large load peaks. Large load peaks, if not abated, can result in increased costs and potential grid disruptions. Managing peak loads and balancing the grids reduces costs for customers by allowing the system to be more efficient. In the future, managing peak loads may play a bigger role as more renewable electricity comes online and contributes to variability. Distributed energy resources (DER) and small-scale battery storage projects may also play a role in balancing the grid by generating

[93] Innovation for Cool Earth Forum. (2018). *Direct Air Capture of Carbon Dioxide.* https://www.globalccsinstitute.com/wp-content/uploads/2020/06/JF_ICEF_DAC_Roadmap-20181207-1.pdf.

[94] Julio Friedmann. N.d. "Senate Environment & Public Works Committee: The USE IT Act and CCUS Deployment." Written testimony. https://www.globalccsinstitute.com/wp-content/uploads/2020/06/JF_Senate_EPW_USE-ITAct-CCUSDeployment-2018-1.pdf.

power at times of peak demand. The Federal Energy Regulatory Commission (FERC) recently allowed distributed energy resources to participate in wholesale markets as aggregated sources and contribute to load management and grid balancing.[95]

Presently, grid interruptions occur when sudden power plant shutdowns, transmission line outages, or distribution system failures occur; however, larger grid reliability issues may occur in the future. Load management and other load flexibility technologies and programs can help mitigate these challenges. For example, wider application of time-of-use rates provides economic incentives for customers to use electricity in ways that reduce peak loads. Dual fuel heat pumps use natural gas to support electric heat pumps and reduce electricity peaks that could occur in winter months. Direct load control, typically applied to HVAC and hot water systems, is an established load management approach. Battery storage is emerging as a peak load management and grid reliability technology, deployed at grid scale, at the building level, or in electric vehicle-to-grid integration schemes.[96]

Why it matters for Pennsylvania: Many Pennsylvania businesses already participate in peak load and balancing strategies, through either PJM markets or their local utility. These programs reduce the costs of operating the grid and can provide revenue to participants. As Pennsylvania's electricity grid changes and variable sources such as wind and solar are incorporated, load management of grid peaks will be needed for a resilient energy system. As load management programs grow in sophistication, regulators and legislators may also need to address rate structures to ensure that load balancing does not hurt small businesses or low-income residents.

Analyze the potential role of carbon offsets in meeting Pennsylvania's goals

Carbon offsets include a range of emission-reduction measures not directly covered in a defined emission-reduction policy framework but that can be used to offset emissions that are deemed difficult or costly to reduce under the policy scheme. Offsets are typically included in a policy framework as certificates that represents a one $MTCO_2$ or equivalent reduction. Offsets are most commonly administered through voluntary projects designed specifically for the purpose of reducing GHG emissions. To be deemed sufficiently robust, a carbon offset typically must be shown to be in addition to any reduction in emissions that would have been achieved through regulatory compliance. An offset project must pass strict verification to be certified as genuine.[97] The system can be thought of in an accounting framework in which an organization emits carbon through its actions that results in a carbon credit, which it balances out by purchasing a carbon offset, or carbon debit. Offset programs are used for both compliance (run by

[95] FERC Order 2222 enables DER aggregators to compete in regional organized wholesale electric markets, but the rules for implementation are still under consideration by states, grid operators, and FERC.

[96] Two examples of pilots in the U.S. by Fermata Energy include: Vehicle-to-building Pilot Installed by Fermata Energy at North Boulder Recreation Center — Fermata Energy, and Vehicle-to-Building (V2B) Technology Coming to Downtown Denver — Fermata Energy.

[97] Stockholm Environment Institute and Greenhouse Gas Management Institute (SEI and GHGMI). N.d. Available at: https://www.offsetguide.org/understanding-carbon-offsets/.

governmental bodies) and voluntary carbon offsetting (typically run by nongovernmental organizations).

Offsets are provided by a program or an entity that takes some action—planting trees, installing renewable energy infrastructure, or a similar action—that will mitigate or sequester CO_2 (or other GHG) emissions. An organization may pursue carbon offsets when the cost of the offset is lower than directly reducing its own carbon footprint. Individuals can also purchase offsets. For example, many people purchase carbon offsets for the emissions that result from their airplane travel. Offset prices range from less than $1 per $MTCO_2e$ to more than $50 per $MTCO_2e$, though prices vary by project type and offset program, and few offsets exceed $15 per $MTCO_2e$.[98] Carbon offsets must meet the following requirements:

- Be verified as legitimate (i.e., a trusted third-party verifies that the offset action will truly reduce emissions)
- Be "additional" (i.e., the activity would not have taken place without the purchase of the offset)
- Be real and permanent (i.e., an acre of trees was actually planted and will not be cut down right after the offset is issued)[99]

Carbon offsets have long been criticized for not fully meeting these criteria, and their long-term efficacy remains unconfirmed. Further criticisms point to concerns about equity and that emissions are not prevented.

Why it matters for Pennsylvania: There are two carbon offset markets applicable to Pennsylvania: the formal carbon offset market under RGGI, and the smaller, voluntary market. As RGGI evolves and grows, the carbon offset market will likely expand in kind, and as a RGGI member, the Commonwealth could benefit by buying or selling offsets, depending on which is more beneficial. As a state with a relatively large population and land area and large forested areas, Pennsylvania is better positioned to provide carbon offsets than many of its neighbors.

Provide resources and education on disruptive digital technologies

Digital technologies, enabled through the "internet of things" and high-speed networks such as 5G (fifth-generation cellular technology standards), are disrupting traditional business models and standard industry processes. The internet of things allows everyday devices to connect to the internet and transmit data (e.g., smart thermostats); widespread application of the internet of things relies on a high-speed 5G network to exchange data, implement updates, and track performance, and 5G is being rolled out nationwide. Artificial intelligence and advanced algorithms are increasingly built into digital technologies, a trend that is expected to continue to grow in the coming years. The potential costs, barriers to implementation, and impacts of

[98] Forest Trends. 2017. Unlocking Potential: State of the Voluntary Carbon Markets 2017. Available at: https://www.forest-trends.org/wp-content/uploads/2017/07/doc_5591.pdf.

[99] Or if not permanent, then vintaged with expiration dates.

digital technologies vary greatly based on the scale and scope of application, yet they will undoubtedly reshape the energy sector in the next 10 years.

The energy sector has historically been an early adopter of digital solutions and has already seen digital technologies penetrate and disrupt energy system supply and demand, from smart metering to distributed grid optimization. Energy end-use sectors such as transport systems, buildings, and industrial plants have already adopted some disruptive digital technologies, including autonomous cars, smart home systems, and 3-D printing. Energy companies and utilities are expected to increasingly invest in disruptive technologies to revolutionize remote automation capabilities, real-time automation, and hazard- and maintenance-sensing ability. Drivers for technology change include education and changes in regulations or rules that affect market conditions and that can also stimulate the installation or economic viability of certain technologies. These technologies have applications in all sectors.

Why it matters for Pennsylvania: Disruptive digital technologies have the potential to strengthen Pennsylvania's energy sector by improving efficiency and optimization. Integrating 5G and the internet of things into energy generation and transmission can potentially reduce operation costs and energy bills, lessen negative environmental impacts, and mitigate GHG emissions. Energy demand will also shift with increased connectivity, and the Commonwealth must improve its capability to respond and adapt to the changing demand.

4 OPPORTUNITIES TO ADAPT TO THE IMPACTS OF CLIMATE CHANGE

Overview of Impacts of Climate Change Already Happening in Pennsylvania

As a result of projected climate changes, the Commonwealth will be impacted in a variety of ways. The 2021 Impacts Assessment analyzed how the six climate change hazards studied might affect different sectors in Pennsylvania. Key findings from the assessment are described below.

Risks from Specific Hazards

Flooding is currently the highest risk hazard, and flood risks are projected to increase. Flooding from heavy rain events affects built infrastructure, human health, and agriculture and has ripple effects throughout the economy.

Increasing average temperatures and heat waves create risks that could reach risk levels as high as flooding is today by midcentury.

In the 2021 Pennsylvania Climate Impacts Assessment, **Impacts** refer to the effects of a climate hazard (e.g., potential impacts of warmer temperatures include health risks on hot days). In the Impacts Assessment, the likelihood and consequences (i.e., severity of impacts) of hazards were weighed together to assess relative risks of climate hazards on each sector and to identify priority areas of focus for adaptation.

Increasing average temperatures could affect nearly every aspect of life in the Commonwealth, including infrastructure design, energy costs, recreational opportunities, agricultural practices, and the natural environment.

Heat waves will become increasingly common and will create particular health and economic risks for vulnerable populations, including low-income populations, the elderly, pregnant people, people with certain mental illnesses, outdoor workers, and those with cardiovascular conditions. These risks will be particularly acute in areas subject to the urban heat island effect.

Landslides and sea level rise pose relatively low risks statewide but can cause severe impacts in the locations where they occur. For example, sea level rise in the Delaware Estuary could drastically change the makeup of the estuary's ecology and also threaten the built infrastructure near the tidal zone. Landslides can have severe consequences if they cut off critical transportation routes, particularly in rural areas.

Severe tropical storms, flooding, and landslides already pose risks, and these could become more likely or severe in the future. Pennsylvania has an opportunity to build on its existing hazard mitigation practices for these risks.

Overall Risks

Climate risks and related impacts in Pennsylvania could be severe, potentially causing increased infrastructure disruptions, higher risks to public health, economic impacts, and other changes, unless actions are taken by the Commonwealth to avoid and reduce the consequences of climate change. Taking adaptation action also presents an opportunity for Pennsylvania to strengthen its economy, reduce inequities, and build resilience.

As a result of the 2021 Impacts Assessment, seven priority areas were identified for climate adaptation:

- Increasing heat and flooding on health
- Increasing heat and flooding on overburdened and vulnerable populations
- Increasing average temperatures on forests, ecosystems, and wildlife
- Warmer and wetter climate on agriculture
- Increasing average temperatures on recreation and tourism
- Flooding on built infrastructure
- Landslides on built infrastructure

All hazards—especially heat waves, increasing temperatures, and flooding—could affect public health negatively. For example, higher temperatures mean more days with hazardous heat conditions or reduced air quality, and increased risk of heat-related illness. Flooding increases the risks of direct injury from flood waters and of illness caused by contaminated water.

Climate change will not affect all Pennsylvanians equally. Some may be more at risk because of their location, income, housing, health, or other factors.

As Pennsylvania works to reduce its climate risks, it must address these inequitable impacts and ensure that adaptation efforts do not inadvertently exacerbate inequities. Instead, adaptation actions should reduce impacts on vulnerable populations. The 2021 Impacts Assessment identified the following top priorities for adaptation action:

- Reduce extreme heat risks to human health, particularly for vulnerable populations
- Support the agriculture, recreation, and tourism sectors, as well as forests, ecosystems, and wildlife in the transition to a warmer climate
- Reduce flood risks to infrastructure and communities
- Help low-income households cope with an increased energy burden
- Enhance tropical storm and landslide risk mitigation
- Support the agriculture, recreation, and tourism sectors, as well as forests, ecosystems, and wildlife in the transition to a warmer climate

The remainder of this chapter describes opportunities for the Commonwealth to adapt to those impacts—that is, to take action to prepare for, reduce, or avoid negative impacts and capitalize on potential opportunities created by climate change, and in a way that equitably serves all Pennsylvanians.

These adaptation opportunities are complementary to ongoing hazard mitigation activities, with a particular emphasis on how the Commonwealth can mitigate risks associated with changes in climate (and associated changes in hazard likelihood or severity).

Adaptation Pathways

For each priority adaptation area, the CAP outlines an adaptation strategy pathway to manage the risk over time. Adaptation pathways outline the steps, options, and decision points involved over time. Each pathway includes:

- **Foundational strategies** that serve as mechanisms for the Commonwealth to improve its understanding of impacts. These strategies typically involve identifying and prioritizing impacts through mapping, data collection, research, community engagement, and monitoring. Gaining a clear picture of impacts early on enables adaptive management (see box at right) moving forward.
- **Strategy categories** that generalize approaches for tackling impacts in each priority area; for example, funding support, technical assistance, construction projects, and education and outreach. Specific strategies fall within these approach categories. These approaches aim to reduce existing challenges and stressors related to climate impacts and to minimize future challenges.
- **Example strategies** for each strategy category provide illustrations of actions that can be taken or mechanisms that can be implemented for a given approach. Appendix C highlights resources to explore more adaptation strategies.

Adaptive management is an iterative risk management approach. As conditions change, adaptive management suggests using adaptation actions that address current risks and preparing for variable future changes. This approach provides flexibility to assess continuously changing risks and undertake appropriate actions to mitigate those risks.

The adaptation strategy pathways developed in the CAP are intended to provide ways the Commonwealth can adaptively manage impacts over time.

Adapted from Lempert, R., J. Arnold, R. Pulwarty, K. Gordon, K. Greig, C. Hawkins Hoffman, D. Sands, and C. Werrell. 2018. "Reducing Risks Through Adaptation Actions." In Impacts, Risks, and Adaptation in the United States: Fourth National Climate Assessment, Volume II [Reidmiller, D.R., C.W. Avery, D.R. Easterling, K.E. Kunkel, K.L.M. Lewis, T.K. Maycock, and B.C. Stewart (eds.)]. U.S. Global Change Research Program, Washington, DC, USA, pp. 1309–1345. doi: 10.7930/NCA4.2018.CH28

Pathways also specify:

- K**ey actors** in Pennsylvania who could engage in adaptation efforts in the priority area.
- **An example progression** of four strategies that illustrates a potential route for adaptation in the priority area. These sets of strategies note the timing of strategies, the relevant actors, the foundational strategies, and the applicable strategy category.
- **An overview of costs and benefits** of adaptation. The qualitative discussion frames the level of resources needed to pursue adaptation efforts and the co-benefits of adaptation.
- **A case study** that exemplifies adaptation in the priority area. The case study dives into the adaptation strategies being pursued and highlights the outcomes of the efforts.

To develop each adaptation pathway, the analysis team first compiled adaptation strategies for each priority adaptation area, based on:

- Feedback from the Climate Change Advisory Committee (CCAC) and various Commonwealth agencies
- A review of the 2018 Climate Action Plan, including addendum letters from the CCAC
- A review of public survey data from DEP on the 2018 Climate Action Plan
- ICF's knowledge of relevant and common strategies used throughout the country

The analysis team then reviewed and refined the compilation of strategies to align with the most significant impacts identified in each priority area in the 2021 Impacts Assessment. The analysis team then categorized the strategies into types of approaches for stakeholders to consider.

The analysis team summarized strategy categories by considering their character and timing. Foundational strategies are characterized as actions that document and improve the understanding of impacts. Strategy categories include strategies focused on direct adaptation efforts or indirect actions that would enable adaptation. With this framework, the analysis team developed each adaptation strategy pathway.

These pathways are intentionally broad and flexible. Each pathway provides possible directions for pursuing adaptation over time. Actions may be adopted as resources and/or more information becomes available. The pathways serve as an illustrative guide for the Commonwealth to reduce pressing impacts and to seize on the opportunities available in each priority area.

The sections below outline pathways for Pennsylvania to adapt to the impacts of climate change in the priority areas designated in the Impacts Assessment.

- Addressing the impacts of increasing heat and flooding on health
- Addressing the impacts of increasing heat and flooding on overburdened and vulnerable populations
- Addressing the impacts of increasing average temperatures on forests, ecosystems, and wildlife
- Addressing the impacts of a warmer and wetter climate on agriculture
- Addressing the impacts of increasing average temperatures on recreation and tourism
- Addressing the impacts of landslides on built infrastructure

Addressing the Impacts of Increasing Heat and Flooding on Health

Impacts

Increasing average temperatures and more frequent and intense heat waves, flooding, and storm events can cause significant human health risks. The following heat-related health risks were identified in the 2021 Impacts Assessment:

- Increased heat-related morbidity (e.g., heat exhaustion or stroke) and mortality
- Hazardous outdoor work, recreation, or exercise, particularly in urban areas
- Reduced outdoor air quality (e.g., due to higher ground-level ozone and allergen levels)
- Increased prevalence of vector-borne diseases (e.g., Lyme disease)
- Increased health risks related to harmful algal blooms on bodies of water
- Increased mental health impacts, including aggression, hostility, violence, and suicide
- Compromised birth outcomes
- Reduced ability to work productively
- Power outages or brownouts due to increased energy demand for cooling and associated risks.

Key Actors

- **State agencies (e.g., Department of Health, PEMA):** Can provide funding, support collaboration and coordination, and elevate key voices (e.g., researchers, local departments of health, community leaders) to support public health with climate hazards in mind.
- **State legislature:** Guided by experts, the Commonwealth's legislature can increase funding and revise policies, planning, and leadership mechanisms to advance climate-related public health priorities.
- **Municipalities:** Local health departments can implement and/or pilot Department of Health programs (e.g., training) in coordination with community organizations and other municipal agencies.
- **Researchers:** Can monitor public health metrics associated with climate hazards, in coordination with community organizations and departments of health.
- **Community-based organizations:** Organizations that advocate for public health or facilitate community networking and communication may support needs such as outreach and information gathering.

Populations with underlying physical or mental health conditions, populations in areas with significant urban heat island effects, and many marginalized, aging, and low-income populations may be more vulnerable to these impacts.

Intense precipitation and inland flooding can also cause significant human health risks, particularly related to flash-flood events and water pollution. The following flood-related health risks identified in the 2021 Impacts Assessment include:

- Physical safety risks from flood waters or limited access to critical services
- Road accidents due to reduced visibility and hazardous driving conditions
- Reduced water quality and associated impacts (e.g., illness from drinking contaminated water)
- Compromised birthing outcomes
- Loss of power and associated risks
- Mental health impacts.

Health and safety impacts of flooding will vary according to the type of land flooded. For example, flooding on poorly protected toxic waste sites or agricultural lands could lead to higher chances of hazardous materials escaping into the environment. Low-income populations tend to live near these areas and may be more vulnerable to these impacts than the general population.

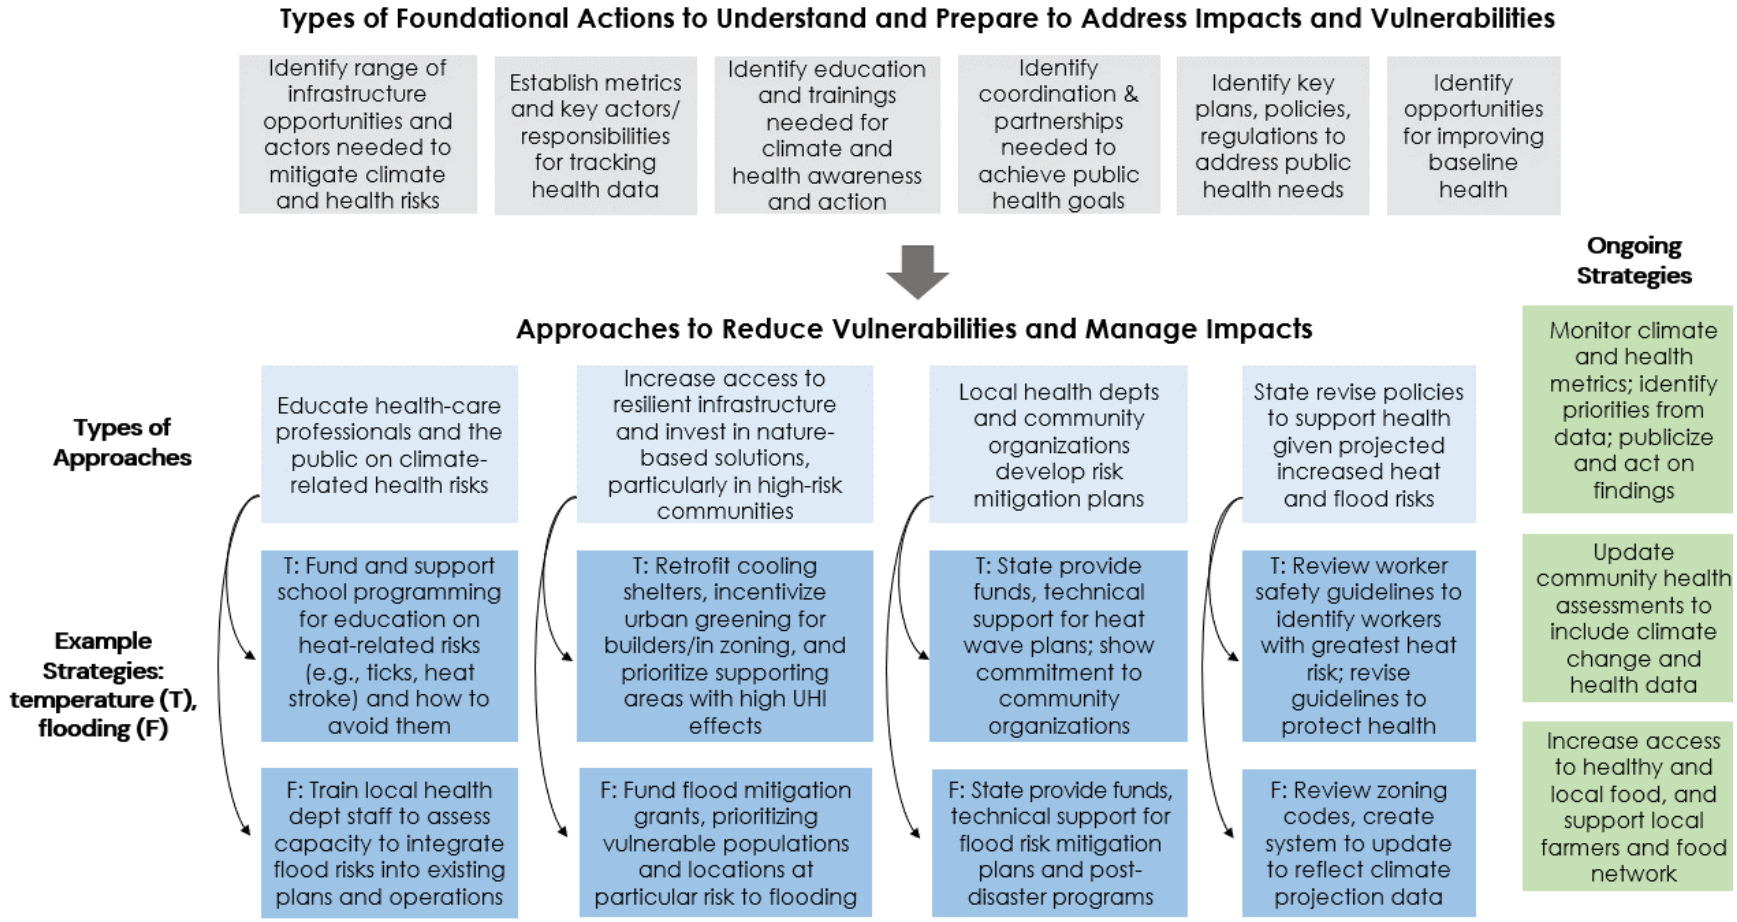
Adaptation Strategy Pathway

Adaptation strategies can be used to target the underlying causes of vulnerability and the resulting impacts. The Commonwealth must first establish climate change-related public health metrics; specify education and training, coordination, and policy/planning needs; and create baseline health improvement opportunities to support public health in a changing climate.

After these first steps, Pennsylvania can pursue various strategies to manage the impacts of increased temperatures and flood events, reduce health stressors, and enable communities, government and business systems, and infrastructure to adapt to the changing climate.

Figure 33 outlines the types of strategies that can be implemented to identify, manage, and address the impacts of heat and flooding on human health in the Commonwealth. Pennsylvania could also pursue other early strategies that may be straightforward and easily accomplished. Many public health strategies will help the Commonwealth adapt to both heat and flooding risks; these dual-purpose strategies are indicated in blue. Strategies specific to addressing heat or flood hazards begin with a T: or F:, respectively

Figure 33. Adaptation strategy pathway to reduce public health impacts from heat and flooding



This diagram provides illustrative examples of the primary types of strategies but does not capture the full universe of possible strategies that could be deployed. Strategies specific to addressing heat or flood hazards begin with a T: or F:, respectively.

How strategies are sequenced—which are implemented first and second, and where the thresholds are that indicate the need for more aggressive actions—depends on state actors' understanding of impacts, the availability of decision-support tools, resources, and capacity.

For example, after identifying education and training needed for climate and health awareness and action, the Department of Health may be able to begin outreach to professionals who can develop the training immediately. But State and local departments of health, healthcare professionals, and climate science experts will have to work together to develop a foundation for trainings and then tailor versions for different audiences (such as healthcare providers, teachers and educators, and homeless shelter staff), which may be more time- and labor-intensive. Increased State funding or operational or programmatic revisions may also be needed. As a result, State action will depend on the availability and willingness of a variety of stakeholders to spend time on climate-hazard education.

State actors can build action plans from the suite of strategies available. Coordination among State leadership, the research community, and community-based organizations is critical to implementing action plans. Acting according to a shared vision will allow the State legislature, State agencies, and local governments to enable and build on one another's efforts.

Figure 34 outlines an example sequence of foundational actions and three strategies led or facilitated by State agencies that could be pursued to support public health work that integrates risks of climate change. Appendix C provides more strategies related to this area.

The Pennsylvania Department of Health (DOH) and county and municipal health departments already support a range of programs and resource centers focused on community health needs. For example, the DOH Community-Based Health Care Program[100] and School Health Program[101] provide health resources, and the Community-Based program provides grants for development, expansion, or improvement of community-based healthcare clinics. Additionally, state health centers[102] and county and municipal health departments[103] support public health through programs such as health education and community health leadership. These programs and departments can play key roles in developing and scaling up climate and health work focused on equity and community leadership.

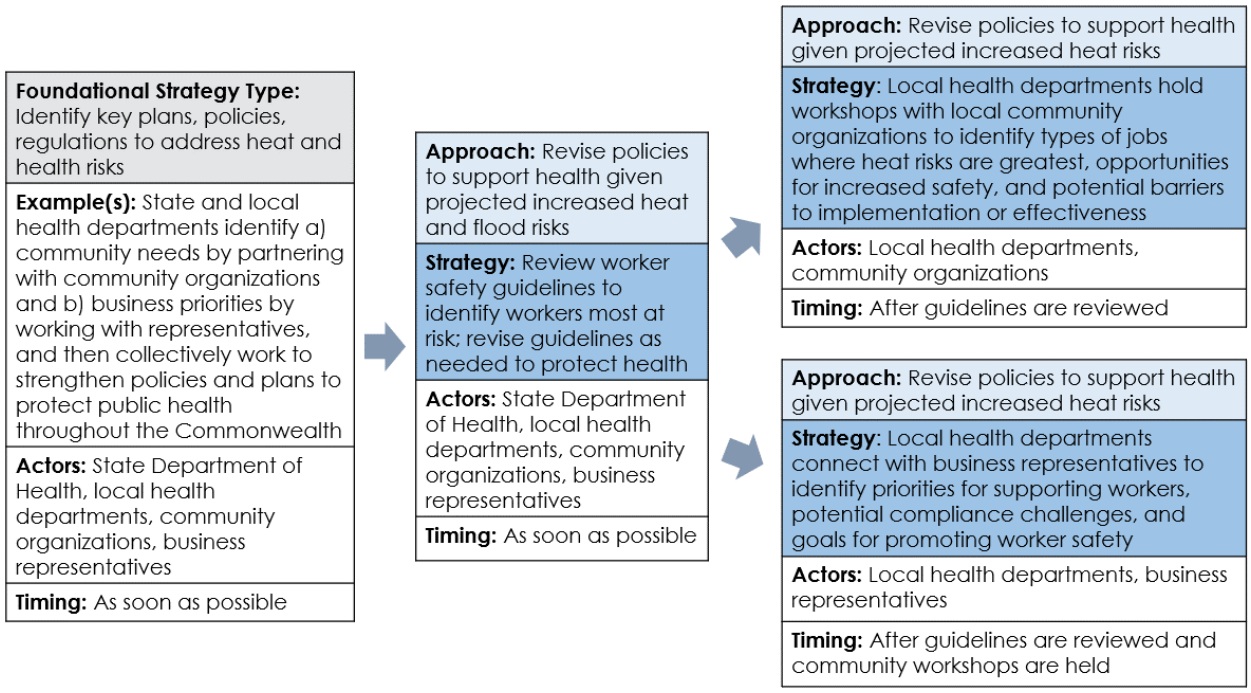
Figure 34. Example set of strategies to be pursued to support public health impacts of increased average temperatures and heat waves



Costs and Benefits

In supporting the health of the Commonwealth's population, these strategies could have co-benefits ranging from saving lives to reducing healthcare costs. Many strategies may also have other economic benefits, such as reduced energy costs and improved livability and desirability of certain neighborhoods (and the associated increase in property values and tax base). For example, strategies to reduce the urban heat island (UHI) may have up-front costs but significant return on investment. One study on the costs and benefits of tree planting and maintenance in five cities found that "on a per tree basis, cities accrued benefits ranging from roughly $1.50 to $3.00 for every dollar invested," with cities spending $15 to $65 per tree each year and accruing $30 to $90 in benefits per tree each year (e.g., increased property values, improved stormwater control, improved air quality).[104]

These co-benefits will be particularly beneficial given the chance of increased operational costs to support health and safety needs under future conditions. "Growing Stronger: Toward a Climate-Ready Philadelphia" found a higher "everyday cost of doing business" projected for city government, businesses, and residents from hotter temperatures and increased

[104] U.S. Environmental Protection Agency (EPA). 2008. "Trees and Vegetation." In: *Reducing Urban Heat Islands: Compendium of Strategies. Draft.* Available at: https://www.epa.gov/heat-islands/heat-island-compendium.

precipitation. For example, climate change could double or almost triple the annual cost (now about $20,000) of running the Heatline, a helpline the city provides during heat emergencies.[105]

CASE STUDY

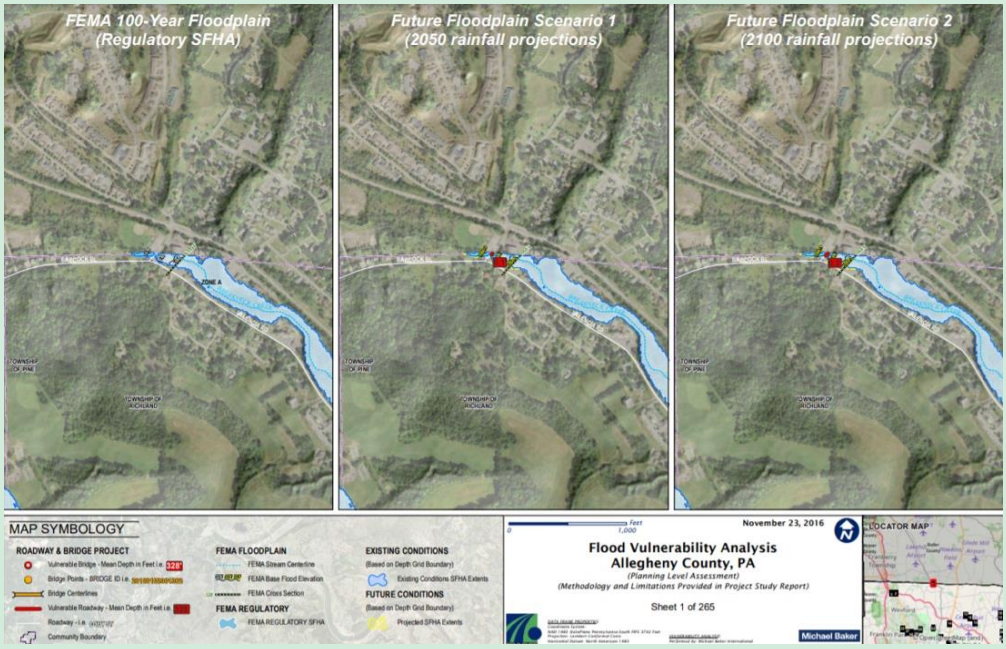
Implementing Strategies at PennDOT to Manage Flood Risks, with Health and Safety Benefits

Two health risks associated with extreme flooding involve transportation: physical safety risks from floodwaters or limited access to critical services, and road accidents due to reduced visibility and hazardous driving conditions. Maintaining and designing flood-resilient transportation systems is foundational to mitigating physical safety and health risks related to reduced transit access or road accidents from flood events.

The Pennsylvania Department of Transportation (PennDOT) Phase 1 Extreme Weather Vulnerability Study,[106] which PennDOT developed in 2017, provides an example of how climate data can be used to assess future flood hazard risks to transportation infrastructure and develop resilience strategies, many of which support safer roads and thereby reduce health risks related to flooding.

To evaluate future climate impacts on flooding, PennDOT studied global climate model projections and developed flood forecast zones that integrated future climate data to study how stream depths might change and affect transportation infrastructure in three counties (Allegheny, Delaware, and Lycoming) (see Figure 35).[107]

Figure 35. Future flood forecast maps. Taken from PennDOT, 2017a.



[105] Philadelphia Mayor's Office of Sustainability and ICF International. 2015. "Growing Stronger: Toward a Climate-Ready Philadelphia." https://www.phila.gov/media/20160504162056/Growing-Stronger-Toward-a-Climate-Ready-Philadelphia.pdf.

[106] Pennsylvania Department of Transportation (PennDOT). 2017. "Phase 1: PennDOT Extreme Weather Vulnerability Study – Study Report." http://s3.amazonaws.com/tmp-map/climate/doc/StudyReport-PaVulnerabilityStudy-ver040317.pdf.

[107] PennDOT, Phase 1: PennDOT Extreme Weather Vulnerability Study.

PennDOT identified resilience strategies in five categories: (1) planning, coordination and training; (2) data analysis and information sharing; (3) maintenance and inspections; (4) design; and (5) equipment, materials and technology.[108]

Example strategies include:

- Maintenance and Inspections:
  - Improve maintenance procedures and armoring of stream banks to prepare for potential increased flooding events in the future
  - Continue to expand and improve methods and procedures for pre- and post-flood inspections of roadways, bridges, and streams
  - Plan for increasing redundancy at roadway locations that may be impacted by storms (ensure secondary roads are maintained and available for use)
- Conduct stormwater management studies using a watershed approach including municipalities, PennDOT, and DEP.
- Design:
  - Identify updates to PennDOT design manuals based on national research and other university studies
- Program projects to improve stormwater capacity, reduce impermeability and ensure adequate maintenance of infrastructure
- Work with municipalities to identify the impacts of development on stormwater management
- Identify facilities requiring design upgrade in advance of funding requests.[109]

Additional information can be found on the Extreme Weather Vulnerability Study site.[110]

The Philadelphia Beat the Heat program is an example of addressing the health impacts of increasing heat. This program is highlighted as a case study in the next section.

Addressing the Impacts of Increasing Heat and Flooding on Overburdened and Vulnerable Populations

Impacts

Warmer temperatures and increased flood risk are expected to disproportionately impact overburdened and vulnerable populations. These populations may both be more at risk to impacts from these hazards and face greater challenges in managing those risks.

The following factors may increase vulnerability to heat and flood risk:

- Demographics (e.g., older age, minority race or ethnicity)

[108] PennDOT, 2017a.

[109] PennDOT, 2017.

[110] PennDOT. 2019. Extreme Weather Vulnerability Study. https://pennshare.maps.arcgis.com/apps/MapSeries/index.html?appid=29bf9f06045f47feb9888193674f8a95

- Limited English proficiency
- Low income or wealth
- Physical or mental disability (e.g., requiring support to walk or communicate needs)
- Food insecurity
- Limited mobility (e.g., limited access to vehicles and/or public transportation)
- Type of employment (e.g., outdoor labor job)
- Distrust of government and media information sources.

Due to the hazards' different impacts, certain populations may also be at greater risk for each hazard.

Key Terms

Exposed areas—Geographic areas projected to be affected by climate change based on climate change projections.

Vulnerable populations—Populations more likely to experience adverse impacts from being exposed to climate hazards, due to factors such as demographics (e.g., race, gender), socio-economic status, and life- or livelihood-sustaining needs (e.g., dependence on electricity for critical medical care).

EJ areas—Shorthand for "Environmental Justice census tracts," where 20% or more individuals live in poverty, and/or 30% or more of the population is minority.

Overburdened populations—"Minority, low-income, tribal, or indigenous populations or geographic locations … that potentially experience disproportionate environmental harms and risks." EJ areas are used in this assessment as a proxy for locations where populations are already overburdened by hazards and other structural disadvantages.

Populations most at risk to high heat include those that are particularly susceptible to heat illness (e.g., older adults or people with cardiovascular disease) and those that disproportionately lack access to ways of adapting to heat, hazards, such as using air conditioning indoors (cost may be a barrier), staying in the shade outdoors (outdoor work and financial constraints may be a barrier), or drawing on support networks (seniors living alone may be especially vulnerable).

Populations most at risk to flood hazards are those that may be disproportionately exposed to the hazards and/or have greater barriers to managing them. For example, unhoused people, low-income people (e.g., those living in a home located in a floodplain or near toxic sites or hazardous facilities; those who cannot afford flood insurance), people who work outside (e.g., in the agricultural or construction sector), and communities of color that face historical disinvestment (e.g., aging and degraded infrastructure) may be more at risk to impacts.

Pennsylvania DEP has identified Environmental Justice (EJ) areas as census tracts where at least 20% of the population is living at or below the poverty line and/or at least 30% of the population identifies as a non-white minority.[111] The 2021 Impacts Assessment evaluated the spatial overlap between EJ areas and areas exposed to climate hazards and found EJ areas were more exposed to extreme heat and flooding risks compared to the state overall. Specifically, EJ

[111] Pennsylvania Office of Environmental Justice. N.d. "PA Environmental Justice Areas." https://www.dep.pa.gov/PublicParticipation/OfficeofEnvironmentalJustice/Pages/PA-Environmental-Justice-Areas.aspx

areas are 1.8 times as exposed to high numbers of high-heat days and are slightly over-represented in high-risk flood zones, compared to the state overall.

Adaptation Strategy Pathway

Various adaptation strategies can be deployed to target these drivers of vulnerability. Any such strategy will require many actors (see box)—including the Office of Environmental Justice (OEJ), the legislature, municipalities, community-based organizations, and researchers—to collaborate with community-based organizations to assist in strengthening communities.

Early foundational strategies to enable adaptation include identifying community-based organizations to partner with and working with the community-based organization on establishing metrics to track vulnerability and progress. With this foundation, various strategies can be pursued to manage potential inequitable impacts of climate change.

State agencies and the legislature will likely primarily provide support and resources (e.g., coordination, facilitation, technical assistance, funding) to advance environmental justice in the context of climate hazards.

Key Actors

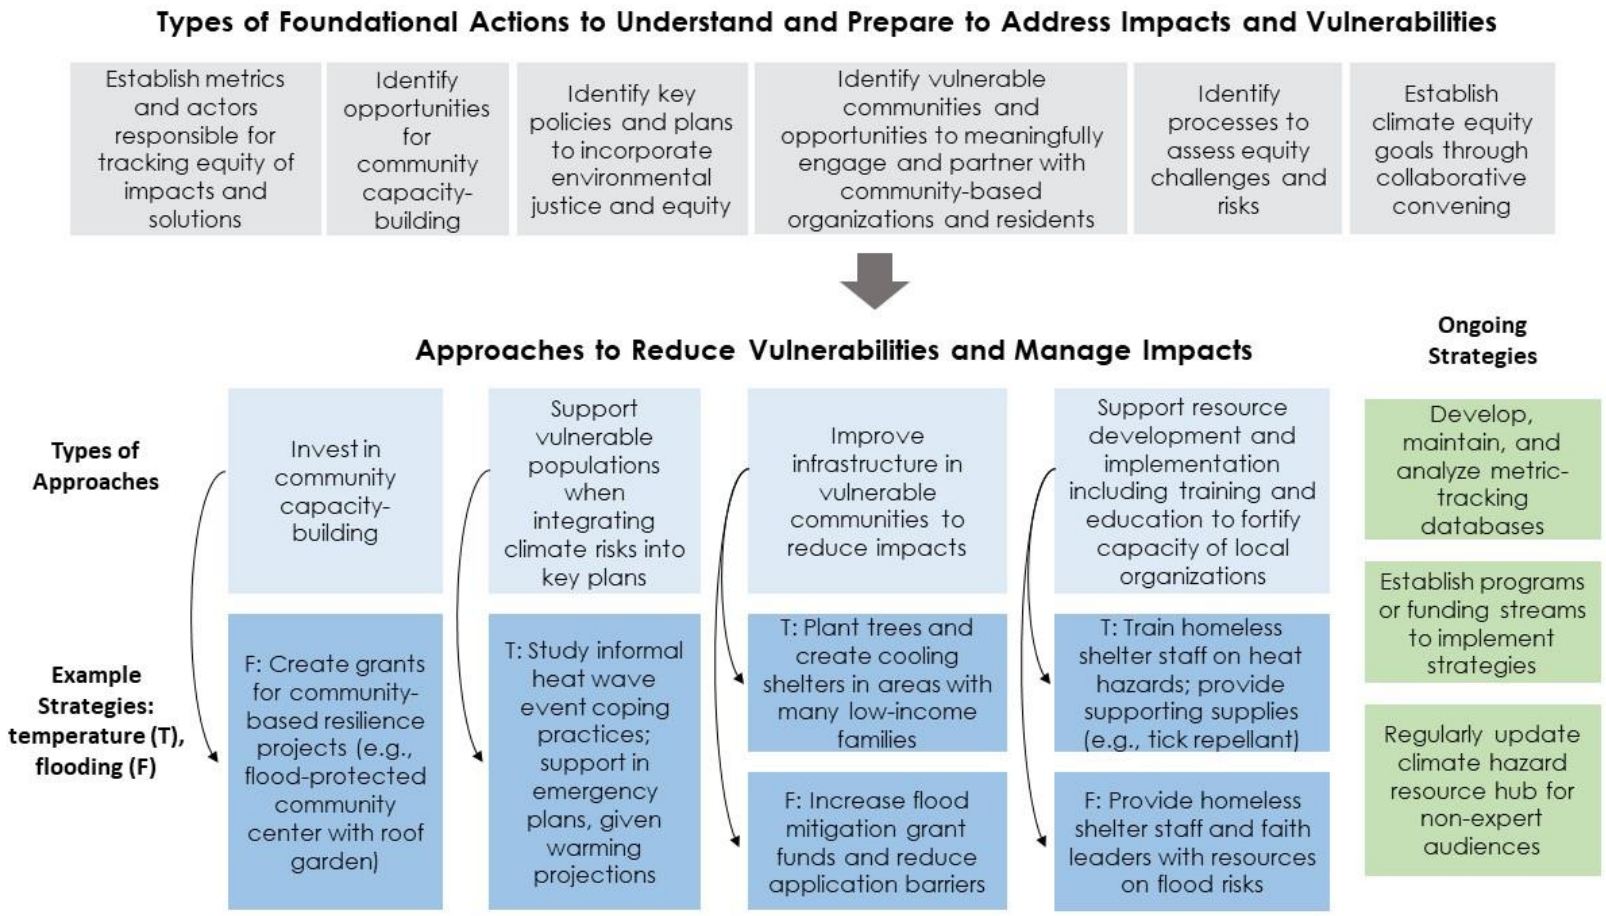
- **State agencies, specifically OEJ:** This Office works to ensure that Pennsylvanians most at risk from pollution and other environmental impacts have a voice in the decision-making process, and live in sustainable communities by minimizing adverse environmental impacts, supporting community empowerment, and fostering economic opportunities.
- **State legislature:** The Commonwealth's legislature can increase funding and support, and revise policies, planning, and leadership mechanisms, to advance climate justice priorities.
- **Municipalities:** Local governments can connect community-based organizations and leaders with officials managing climate planning processes.
- **Community-based organizations:** Organizations that represent communities in EJ areas and vulnerable populations may lead, advise on, and advocate for certain changes.
- **Researchers:** Academia (e.g., colleges and universities) and the broader research community can provide research, tools, and critical subject area expertise around climate issues to aid communities and government in advancing climate planning for vulnerable populations.

Community-based organizations and residents' input, climate science, and expertise from researchers and OEJ can inform data collection, operations, and processes that can either mitigate or exacerbate the impacts of climate hazards on vulnerable populations and in EJ areas. From there, the State, municipalities, researchers, and the science and business communities can work with community stakeholders to assess how they might alter their practices in the near, mid-, and long terms.

Figure 36 outlines some foundational actions and types of strategies that can be deployed over time to identify, manage, and address potential equity impacts from climate hazards.

The sequencing of strategies depends on state actors' understanding of impacts, the availability of decision-support tools, resource availability, and capacity.

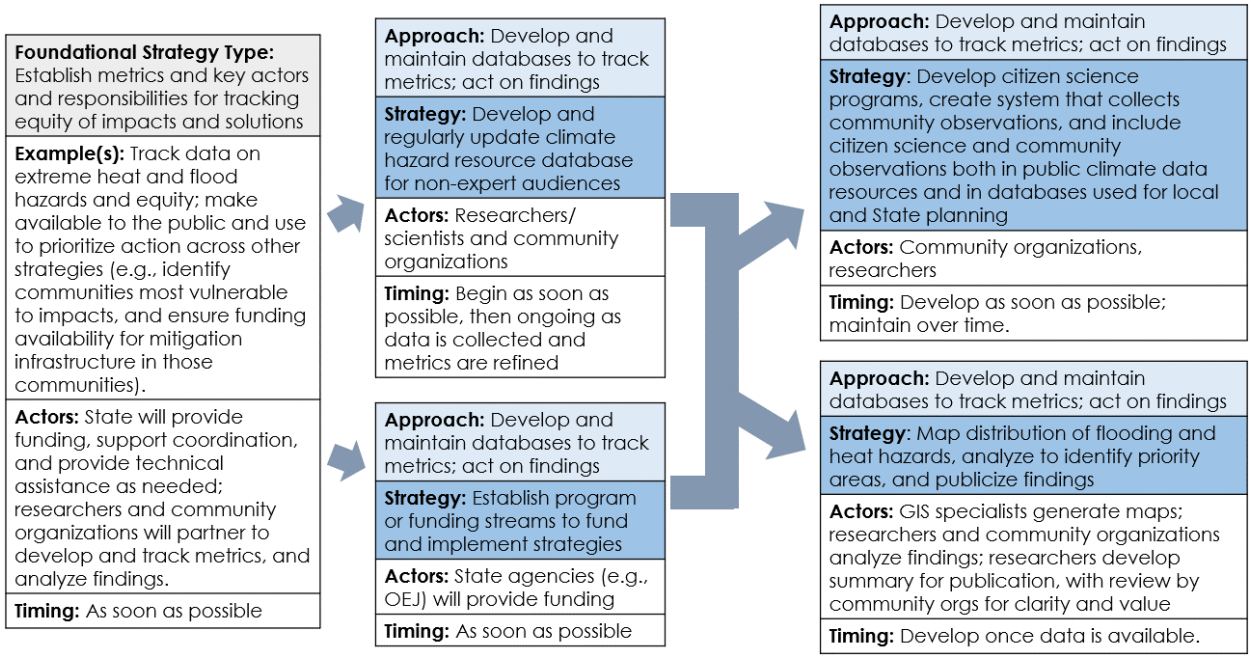
Figure 36. Adaptation strategy pathway to reduce increased hazard impacts of high temperatures and flood on overburdened and vulnerable populations



This diagram shows the primary types of strategies but does not capture the full universe of possible strategies that could be deployed. Strategies specific to addressing heat or flood hazards begin with a T: or F:, respectively.

Figure 37 outlines an example sequence of foundational actions and three strategies initiated or co-facilitated by state agencies that could be pursued to support environmental justice work in the Commonwealth. Appendix C provides more strategies related to this priority area.

Figure 37. Example set of strategies to be pursued to support climate justice and counteract equity challenges resulting from increased average temperatures (top) and flooding (bottom)



For example, after establishing metrics and determining the key actors responsible for tracking the equity of climate hazard impacts and adaptation solutions, the DEP can work with a range of stakeholders, including community partners, and immediately begin to develop databases with information pertinent to designing and prioritizing adaptation measures (e.g., data on which populations and areas may be experiencing disproportionate impacts of hazards). Increased State funding and other additional implementation resources will probably be needed, however, for implementation of citizen science programs and development of a community-observation data collection system. DEP actions will therefore depend on resource availability and establishing relationships with community-based leaders to spend time on building this collective climate hazard work.

A collective process is key to building climate equity action plans from the range of strategies available; community-based organizations, researchers, OEJ, the State legislature, and municipal governments will all be critical in plan design and implementation. Acting according to a shared vision will allow all actors to enable and build on one another's efforts.

Costs and Benefits

Strategies in this priority area will promote equity and they often will have cross-cutting co-benefits. For example, developing relationships to facilitate community engagement and

education for purposes of emergency planning may lead to a better understanding of and support for local needs at a government level. Increasing the availability of funds for community resilience grants—for example, for development of an elevated park, with permeable surfaces to manage nuisance flooding, in a predominantly low-income neighborhood—could lead to new or improved amenities (e.g., the park) that beautify and revitalize neighborhoods, and may increase social cohesion.

The benefits of strategies in this section should be evaluated in terms of the "triple bottom line," where economic, social, and environmental costs and benefits are all considered. Costs of inaction or uninformed adaptation may lead to severe social and environmental costs; the immense human and natural benefits of adaptation must be included in the equation.

Notably, infrastructure strategies may require significant up-front costs, while strategies for education and community development may require lower costs over a longer timeline. Some costs may be shouldered primarily by a single actor, while others, especially those resulting in multiple benefits or that support the goals of multiple funders, may be shared among those stakeholders. For example, education on weatherizing homes to manage heat could be funded by departments of health, energy stakeholders, and property management actors.

CASE STUDY

A Community-Driven Approach to Tackling Heat in Philadelphia

In 2018, the Philadelphia Office of Sustainability (OOS) focused on integrating explicit considerations of equity in the implementation of Greenworks, Philadelphia's sustainability plan, and launched the Beat the Heat initiative as a step in this direction.

The updated Greenworks vision takes a community-driven approach to address impacts of heat, including:

- Acknowledging that environmental inequalities, like exposure to heat, often exist in majority low-income neighborhoods and neighborhoods of color in Philadelphia
- Working to understand how the City's systems, policies, and procedures might create barriers that maintain these inequalities
- Redirecting City resources towards dismantling these barriers.[112]

OOS also promised to implement two key strategies to reduce environmental justice issues around heat risks: (1) to intentionally "use its data to identify disparities" around heat risks, and (2) to "directly engage with communities" not experiencing the benefits of existing sustainability initiatives.[113]

For example, the Philadelphia OOS and Department of Public Health developed the Philadelphia Heat Vulnerability Index,[114] which integrates average surface temperature data with census data and demonstrates a "pattern of unequal exposure," with residents of color and low-income residents disproportionately exposed to hotter temperatures. The Beat the Heat initiative draws on the data

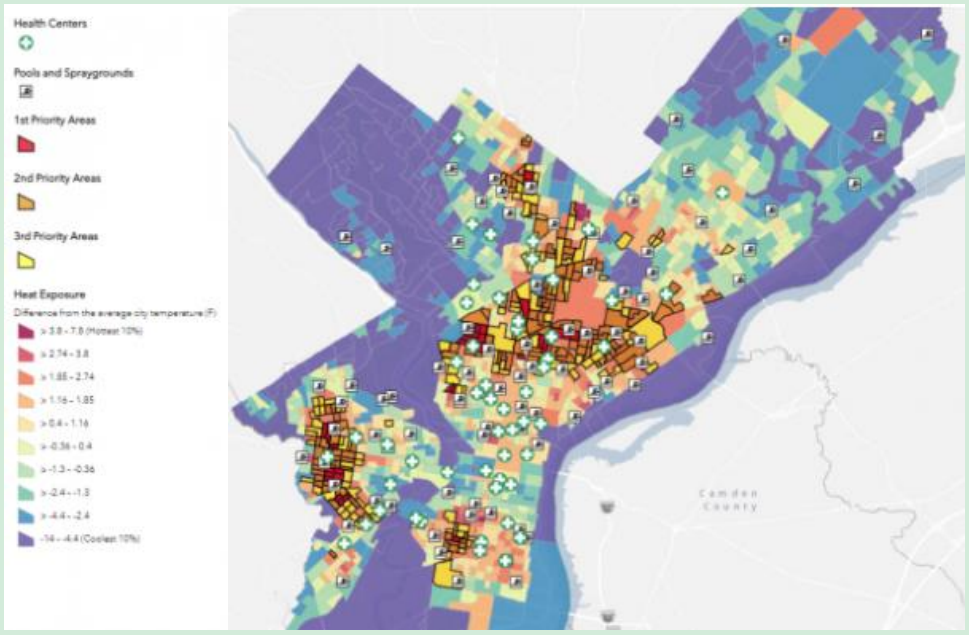
[112] Philadelphia Office of Sustainability (OOS). 2019. "Beat the Heat Hunting Park: A Community Heat Relief Plan." https://www.phila.gov/media/20190719092954/HP_R8print-1.pdf.

[113] OOS, 2019. "Beat the Heat Hunting Park."

[114] Kellner, Hans. July 16, 2019. "Heat Vulnerability Index highlights City hot spots." https://www.phila.gov/2019-07-16-heat-vulnerability-index-highlights-city-hot-spots/

from this Index to support the communities identified as disproportionately exposed and vulnerable to environmental stressors like extreme heat.

Figure 38. Philadelphia Heat Vulnerability Index map



Source: Hans Kellner. July 16, 2019. Heat Vulnerability Index highlights City hot spots.

For the Initiative's pilot, the city convened the interdisciplinary Heat Team to work with community leaders and residents in Hunting Park, one of Philadelphia's "hottest and most heat vulnerable" neighborhoods, to identify root causes of heat disparities in Hunting Park and support "community-driven decision-making about how to reduce these inequities."

Community engagement included workshops, participation in community events, direct work with community leaders, and a neighborhood heat survey.

The following strategies emerged from this community engagement:

- Continue to implement projects that support cooling in Hunting Park, including additional tree plantings and the installation of green stormwater infrastructure.
- Review city policies related to land use, green infrastructure, transportation, and outreach to consider how they might address heat.
- Launch a Hunting Park Heat Relief Network in the summer of 2019.
- Share the Beat the Heat Toolkit with other heat-vulnerable communities.
- Develop a citywide climate adaptation plan to understand how climate change will impact different areas of the city and to begin planning how to mitigate those impacts.
- Identify better ways to communicate about heat and cooling resources, including establishing a city heat website to make it easier for residents to find cooling resources.[115]

This initiative shows what equity-focused heat initiatives could look like and the importance of having community voices take a leading role in equitable climate change adaptation planning.

[115] OO., 2019. "Beat the Heat Hunting Park."

Additional information can be found in Beat the Heat Hunting Park: A Community Heat Relief Plan.

Addressing the Impacts of Increasing Average Temperatures on Forests, Ecosystems, and Wildlife

Impacts

Higher average temperatures are expected to impact forests, ecosystems, and wildlife by altering habitats, changing species' development patterns, and increasing stresses on species and ecosystems. The following drivers and vulnerabilities that will particularly harm forests, ecosystems, and wildlife were identified in the 2021 Impacts Assessment:

- Decreases in suitable species habitat area
- Habitat fragmentation
- Increased prevalence of invasive and pest species
- Changes in migration, dormancy, leaf development, and blooming cycles
- Reductions in fish populations, especially in the Delaware estuary
- Increases in algal blooms.

Adaptation Strategy Pathway

Various adaptation strategies can be deployed to target these drivers and vulnerability areas. First, the Commonwealth must identify and prioritize species and ecosystems to protect and support as temperatures warm. Pennsylvania could also pursue other early strategies that may be straightforward and easily accomplished.

After this evaluation and selection, Pennsylvania can pursue strategies to manage the impacts of increased average temperatures, reduce stressors on species and ecosystems, and enable species and ecosystems to adapt to the changing climate. Figure 40 outlines the types of strategies that can be deployed in sequence to identify, manage, and address the impacts of increased average temperatures on the Commonwealth's forests, ecosystems, and wildlife.

The sequence of strategies depends on state actors' understanding of impacts, the availability of decision-support tools, and resource and capacity availability. For example, after identifying and selecting an especially vulnerable forest, DCNR may be able to immediately expand efforts to control pests that harm critical tree species. But DCNR may need to wait for funding or capacity to work on ecosystem restoration or forest connectivity. As a result, DCNR action might depend on the state legislature's pursuit of new policies or increasing funding.

Key Actors

State agencies: These agencies are responsible for promoting environmental and ecosystem health in the Commonwealth. Relevant natural resource agencies include DEP, DCNR, PA Game Commission, and PA Fish and Boat Commission.

State legislature: The Commonwealth's legislature can increase funding and supports to enhance the resilience of the State's natural resources.

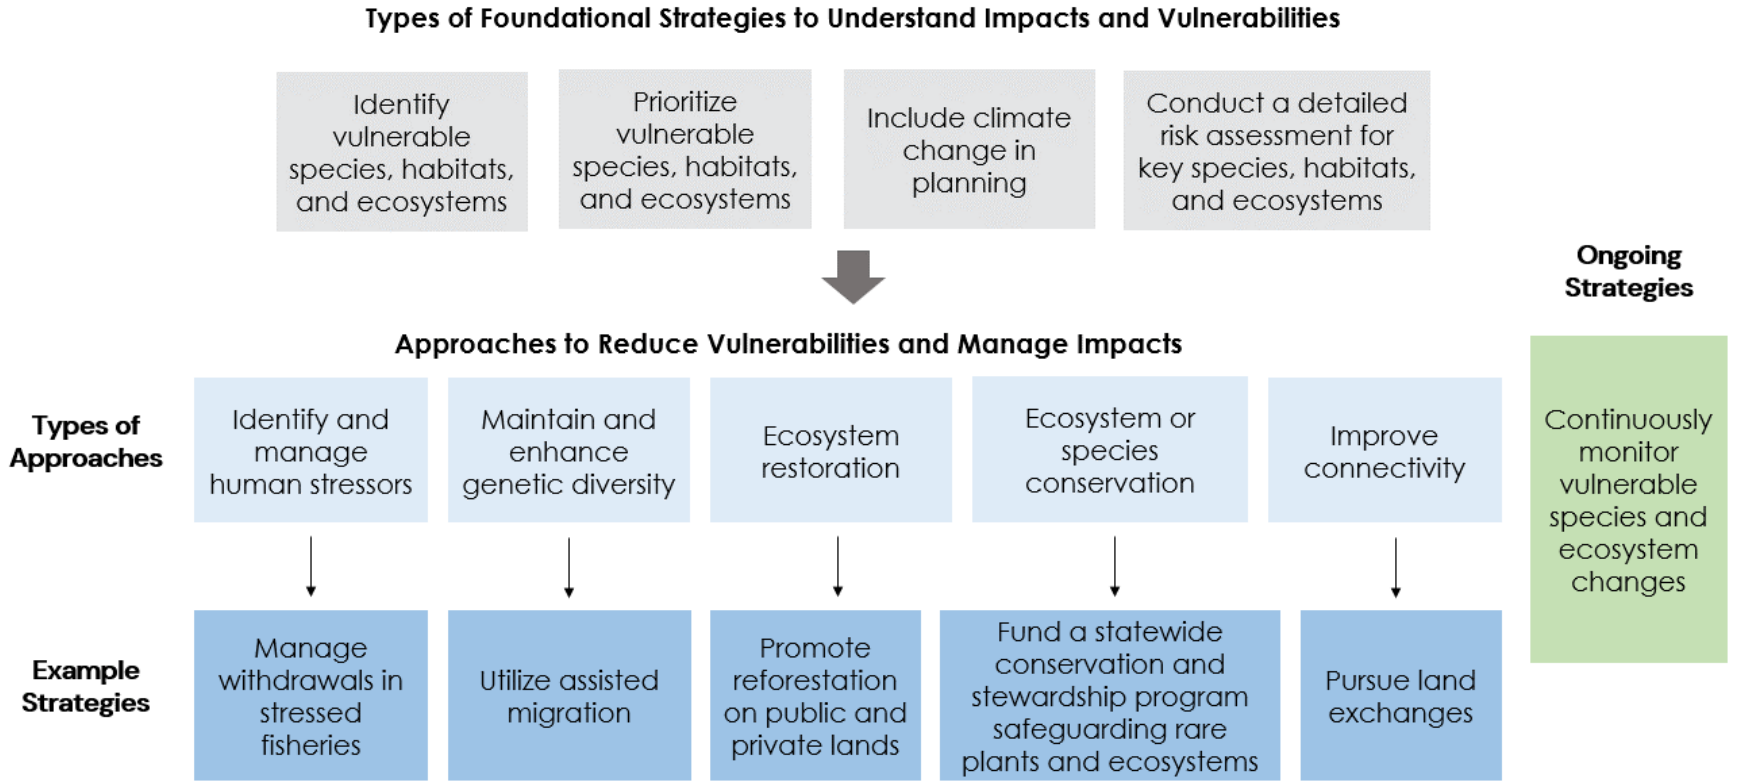
Municipalities: Local governments may operate nature preserves and/or areas with protected natural resources.

Conservation organizations: These groups lead many restoration and conservation efforts in the Commonwealth.

Federal agencies: Several agencies (e.g., National Park Service, Environmental Protection Agency) hold lands in Pennsylvania and/or are generally responsible for preserving the U.S.'s ecosystem health and natural resources.

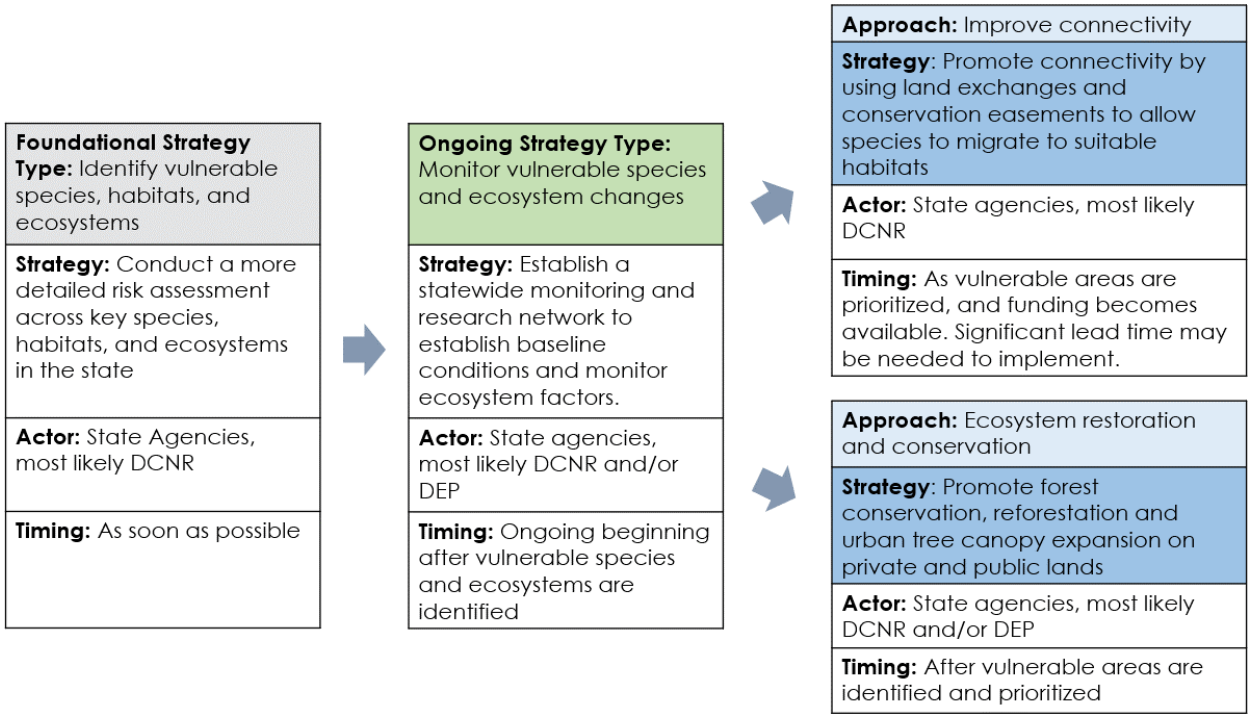
As action plans are developed, state actors can build action plans from the range of strategies available. Coordination between the state's leadership is crucial to implementing action plans. Acting according to a shared vision will allow the state legislature, state agencies, and local governments to enable and build upon one another's efforts. Figure 41 outlines a sequence of four strategies led by state agencies that could be pursued to support vulnerable forests in the state. Appendix C. provides more strategies for this area.

Figure 40. Adaptation strategy pathway to reduce increased average temperatures impact on forests, ecosystems, and wildlife



This diagram provides an illustrative example of the primary types of strategies but does not capture the full universe of possible strategies that could be deployed.

Figure 41. Example set of strategies to support forests vulnerable to increasing average temperatures.



Costs and Benefits

Generally, the costs of strategies related to this priority area may range widely. Low-cost actions may build on existing programs, focus on education and outreach, or manage withdrawals. Higher-cost strategies may focus on developing areas for nature preserves or establishing reforestation programs. Strategies in this priority area will promote overall environmental health and may also benefit recreation and tourism. By bolstering ecosystem health and preserving species, more opportunities for engaging in recreation and tourism in the Commonwealth may become available as forests and ecosystems are preserved.[116] Providing funding for a low-cost action for plant conservation and ecosystem restoration would allow conservation of critical habitat for both plants and animals.

[116] Sources: https://waterlandlife.org/wildlife-pnhp/changing-landscapes/climate-change/ and https://waterlandlife.org/conservancy-protects-90-acres-laurel-highlands-along-great-allegheny-passage-casselman-river/.

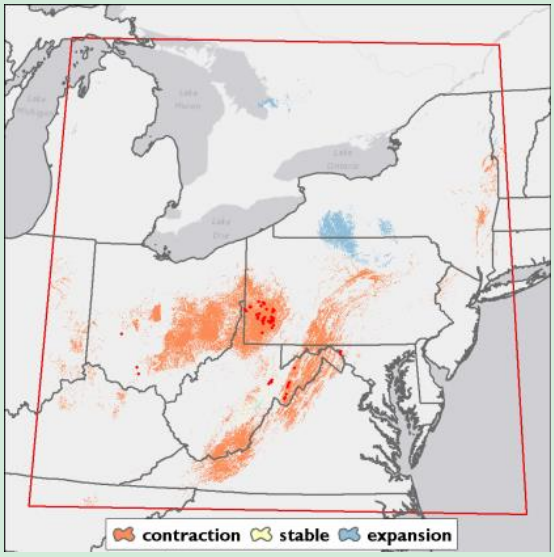
CASE STUDY

Identifying Species Vulnerable to Climate Change to Inform Adaptive Planning

In the Pennsylvania Natural Heritage Program (PNHP), DCNR works with the Western Pennsylvania Conservancy to collect and provide information on important ecological resources (e.g., wildlife, forest communities), including those affected by climate change. As part of this partnership, PNHP collects data on the State's ecological resources to help ensure the conservation of biological diversity across the Commonwealth.

PNHP uses a variety of tools to support conservation. For example, PNHP uses NatureServe's climate change vulnerability index (CCVI) to understand which species are most vulnerable to climate change. Using the CCVI, WPC found that the most vulnerable species are often those with a limited range and/or unique habitat needs.

Figure 42. Map of projected changes in the snow trillium flower species in 2060

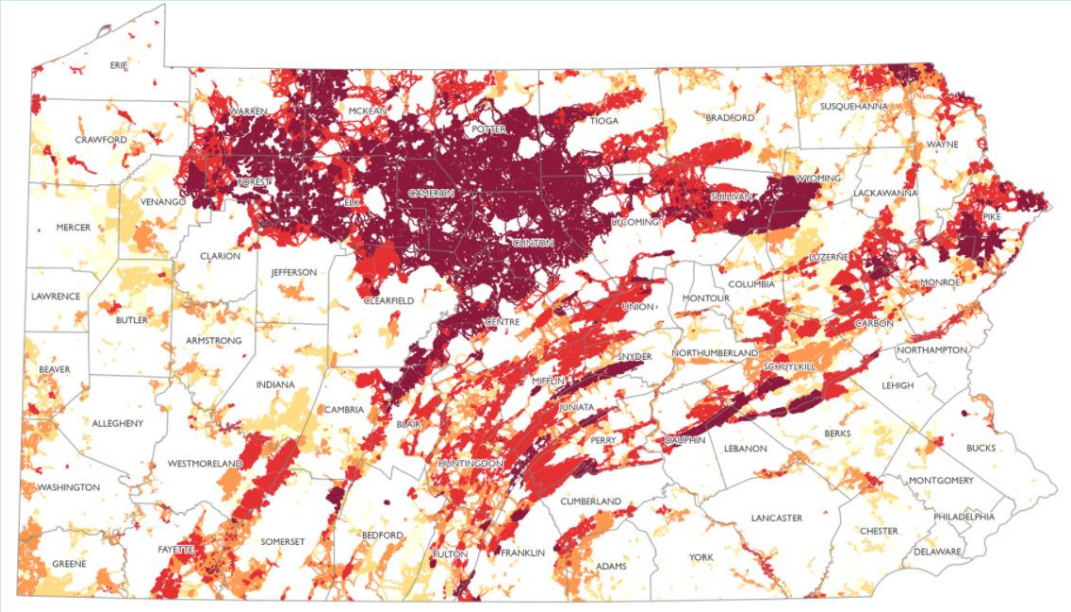


The map highlights that most of the flower species' suitable habitat will be lost by midcentury. Areas that will contract are in orange, those that will be stable are in yellow, and those that will expand are in blue.

As part of its broader effort to understand and monitor climate impacts on at-risk species and habitats, PNHP has also completed monitoring and modeling projects. For example, it used climate envelope modeling to understand how predicted climate change could affect the future distribution of a species. Figure 42 shows results from one modeling project that mapped the shifting habitat of the snow trillium flower. Through field-based monitoring, PNHP is also tracking potential climate change impacts in Pennsylvania's boreal wetlands—bogs and fens—where rare plants, birds, and invertebrates may be more sensitive to climate change.

PNHP's data gathering efforts are increasingly supporting DCNR's planning efforts. To make better informed planning decisions, DCNR recently enlisted PNHP to conduct a statewide analysis of corridor connectivity. The study prioritized locations for climate change connectivity conservation to help DCNR select sites for landscape-scale conservation. The results of the analysis provide insights for DCNR's strategic planning moving forward and serve as a powerful tool for conservation planning in the Commonwealth. Figure 43 highlights the mapped results of the analysis. More information on the study and its results can be found on its online story map.

Figure 43. Climate Change Connectivity Priority Scores identified in the PNHP study.



This map shows areas that are cores and connectors. Dark red represents those that are very high priority, bright red those that are high priority, dark orange those that are medium priority, light orange those that are priority, and light yellow those that are very low priority.

PNHP's climate change work has also pushed WPC to reshape its conservation planning process accordingly. WPC has taken a more informed and targeted approach in its planning process thanks to its improving understanding of climate change impacts on ecological resources. To incorporate climate change in its strategy for conservation and land protection and management, WPC has:

- Identified new guiding principles
- Revisited its conservation actions
- Detailed how climate change informed planning will change its work.

Ultimately, WPC aims to leverage this strategic vision and plan to protect Pennsylvania's critical future habitats and conserve the Commonwealth's ecological diversity as our climate changes. As part of this work, WPC has already started improving ecosystem resilience and connectivity in its land conservation efforts. The recent protection of 90 acres of land in the Laurel Highlands of Southwestern Pennsylvania serves as one example. WPC added the area to continue building a corridor of protected lands that could serve as contiguous and connected habitat for wildlife and plants. As it continues to expand this effort, WPC will aim to provide more suitable areas for species to adapt to the changing climate.

Addressing the Impacts of a Warmer and Wetter Climate on Agriculture

Impacts

Increased annual average rainfall, extreme precipitation, and average and extreme temperatures will alter many facets of agricultural management. For example, with climate change, crop yields are anticipated to shift, and nutrient leaching is likely to increase. The following potential vulnerabilities that will impact agriculture in the Commonwealth were identified in the 2021 Impact Assessment:

- Decreased crop yields
- Changes in crop planting and harvesting
- Altered growing seasons
- Increased runoff and erosion
- Augmented nutrient leaching
- Greater losses or damage to crops, equipment, and livestock
- Increased heat stress on livestock
- Increased volatility of local prices after extreme precipitation events
- Challenges to crop and nutrient management practices
- Reduced efficacy of pollution, nutrient, and sediment control strategies.

Adaptation Strategy Pathway

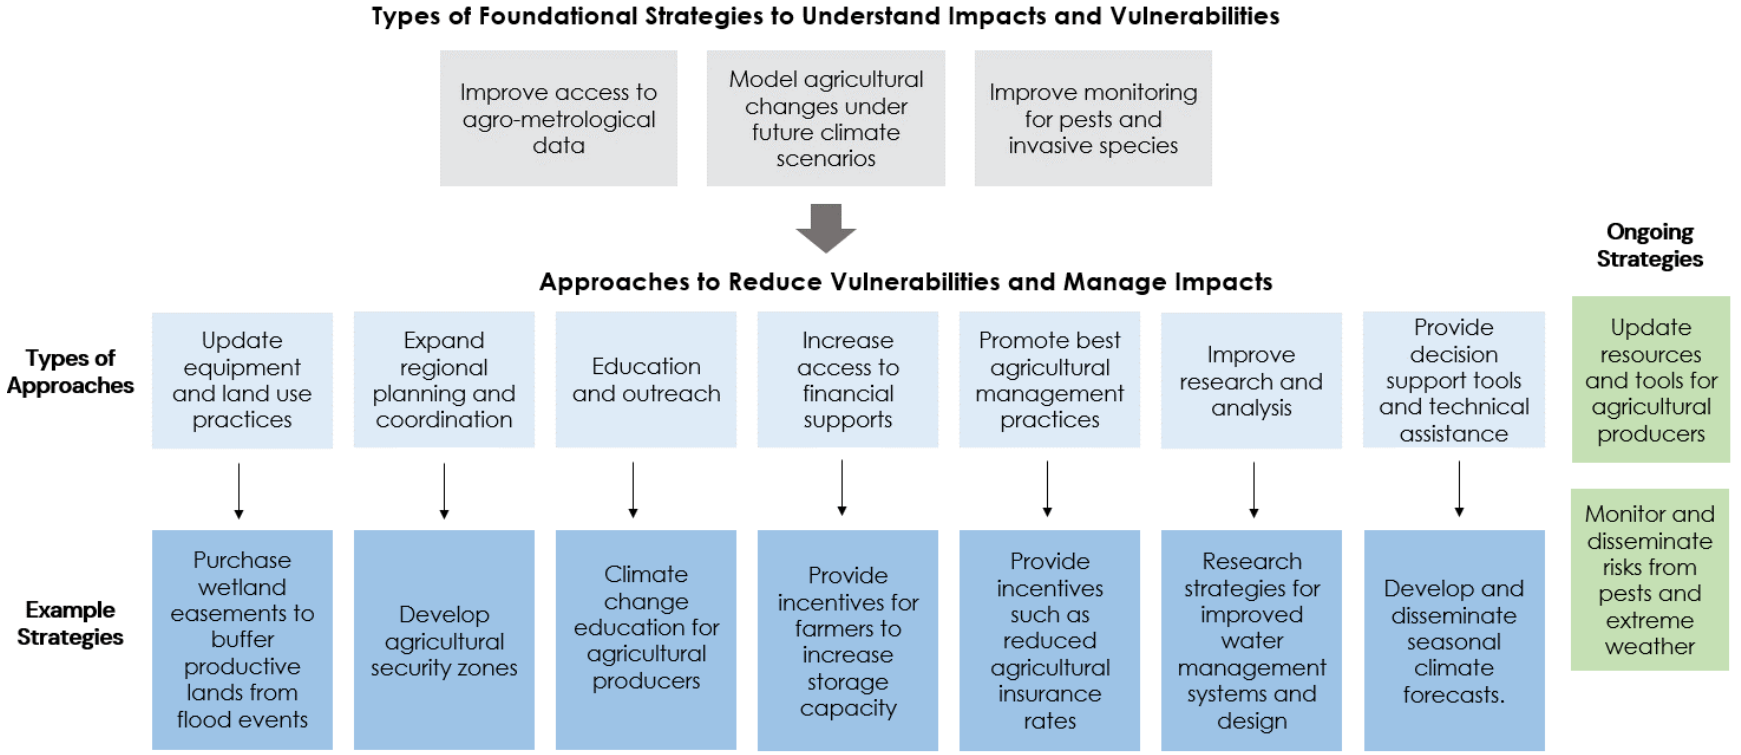
The Commonwealth's agricultural sector is already adapting to the changing climate. For example, no-till management and soil conservation practices implemented in recent years have reduced runoff rates in Pennsylvania. Continuing to adopt adaptive management practices will increase resilience and mitigate the impacts of a warmer and wetter climate.

Although individual farmers or agricultural producers will take most adaptation actions, government and universities can support the transition. First, these groups can work together to increase access to data on changing conditions. With this information, on-the-ground producers can improve their decision making and modify their practices as necessary. These actors can also provide useful resources, tools, and research to assist and encourage adaptation.

Figure 44 outlines the types of strategies that can be pursued to understand and adapt to the impacts of a warmer and wetter climate in agriculture. Many highlighted strategies target actors adjacent to the agricultural sector (e.g., universities, PDA). As the climate changes, updating information on risks, expanding available resources and tools, and reconsidering management practices will be necessary.

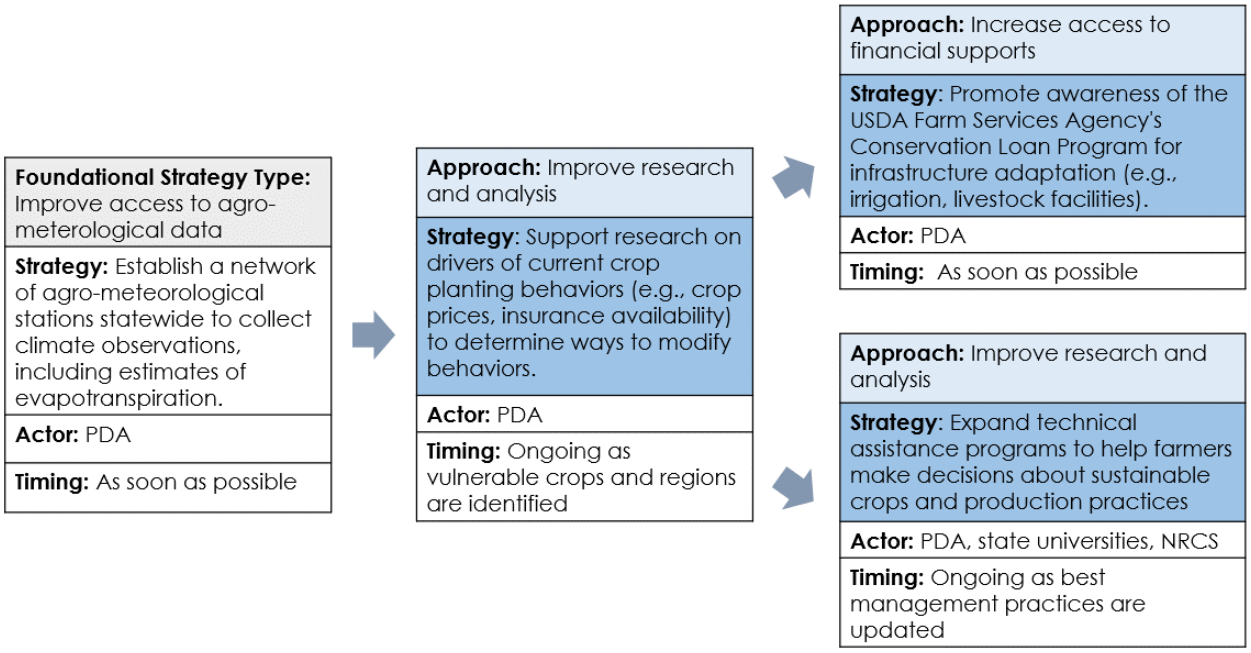
A wide range of support exists to advance adaptation in Pennsylvania's agricultural sector. Financial support, technical assistance, and research on changing conditions will be helpful in disseminating and encouraging best practices. Engaging and coordinating with stakeholders will help producers gain access to the resources they need to modify their practices. Figure 45 outlines a sequence of four strategies led by PDA, USDA, and state universities that could be pursued to support farmers. Appendix C provides more strategies related to this priority area.

Figure 44. Adaptation strategy pathway to reduce the impacts of a warmer and wetter climate on agriculture



This diagram provides an illustrative example of the primary types of strategies, but does not capture the full universe of possible strategies that could be deployed.

Figure 45. Example set of strategies to be pursued to support farmers vulnerable to a warmer and wetter climate



Costs and Benefits

Adaptation strategies in this sector will be time and potentially resource intensive. Updating funding and technical assistance programs will require significant human resources, but strategies in this pathway will be generally less costly than capital-intensive strategies like infrastructure improvements.

Although labor intensive, building resilience in this bedrock sector of the Commonwealth's economy will reap substantial benefits. Producers and farmers may be able to seize new opportunities as new crops become viable in the changed Pennsylvania climate. Modifying management practices to minimize pollution and runoff will also increase ecosystem and environmental health. Furthermore, mitigating climate impacts will bolster individual producers' prosperity and Pennsylvania's overall economic health and support rural communities.

CASE STUDY

USDA Northeast Climate Hubs

The USDA's climate hubs provide a wide array of information and resources on climate impacts to agriculture and on adaptation opportunities. The Northeast Hub aims to fill gaps and supply the needed resources for agricultural producers, including farmers and other stakeholders in Pennsylvania. The Northeast Hub collaborates with a range of organizations, including government agencies (e.g., U.S. Agricultural Research Service, U.S. Forest Service, Natural Resources Conservation Service (NRCS)) and land grant universities (e.g., Penn State). The hub highlights opportunities from partner agencies and research findings and tools from universities that can benefit producers as they adapt to a warmer and wetter climate.

For example, NRCS expanded the Environmental Quality Incentives Program to support adaptation and mitigation of the impacts of increasing weather volatility[117] and now offers funding for a wider scope of soil management practices (e.g., soil health conservation planning, soil testing, nutrient management, tillage management). The NRCS hopes to encourage efforts to improve soil health, which is "a key component for farm resiliency to long term changes in weather such as increased temperatures and increased rainfall."[118]

Similarly, the Northeast Hub spotlights initiatives and findings from partner universities like Penn State. Penn State researchers are investigating cropping practices that can be used on dairy farms to determine the best strategies for reducing erosion and minimizing the need for fertilizers and pesticides.[119] By highlighting resources from the university, the Northeast Hub connects producers to the latest findings on the best sustainable farming practices.

Through coordination and collaboration, the Northeast Hub has become a clearinghouse of climate adaptation information for agricultural stakeholders. The hub compiles tools, support mechanisms, and knowledge to help producers mitigate the impacts of climate change. The hub will continue to increase its offerings and leverage its partnerships to meet the changing needs of farmers.

Addressing the Impacts of Increasing Average Temperatures on Recreation and Tourism

Impacts

Higher average temperatures are expected to impact recreation and tourism in the Commonwealth by driving changes in seasonal recreation activities and eliminating or reducing the feasibility of certain activities. Additionally, higher average temperatures could create hazardous conditions. The following drivers and vulnerabilities that will harm recreation and tourism were identified in the 2021 Impacts Assessment:

- Reduction in viability of snow- and ice-based recreation
- Seasonal shifts in recreational activities, such as extending summer outdoor activities into the spring and fall, or shifting activities away from summer months with very high temperatures (e.g., biking, golfing)
- Decreases in cold-water fishing opportunities
- Growth of water-based recreation in the summer
- Increases in algal blooms.

Adaptation Strategy Pathway

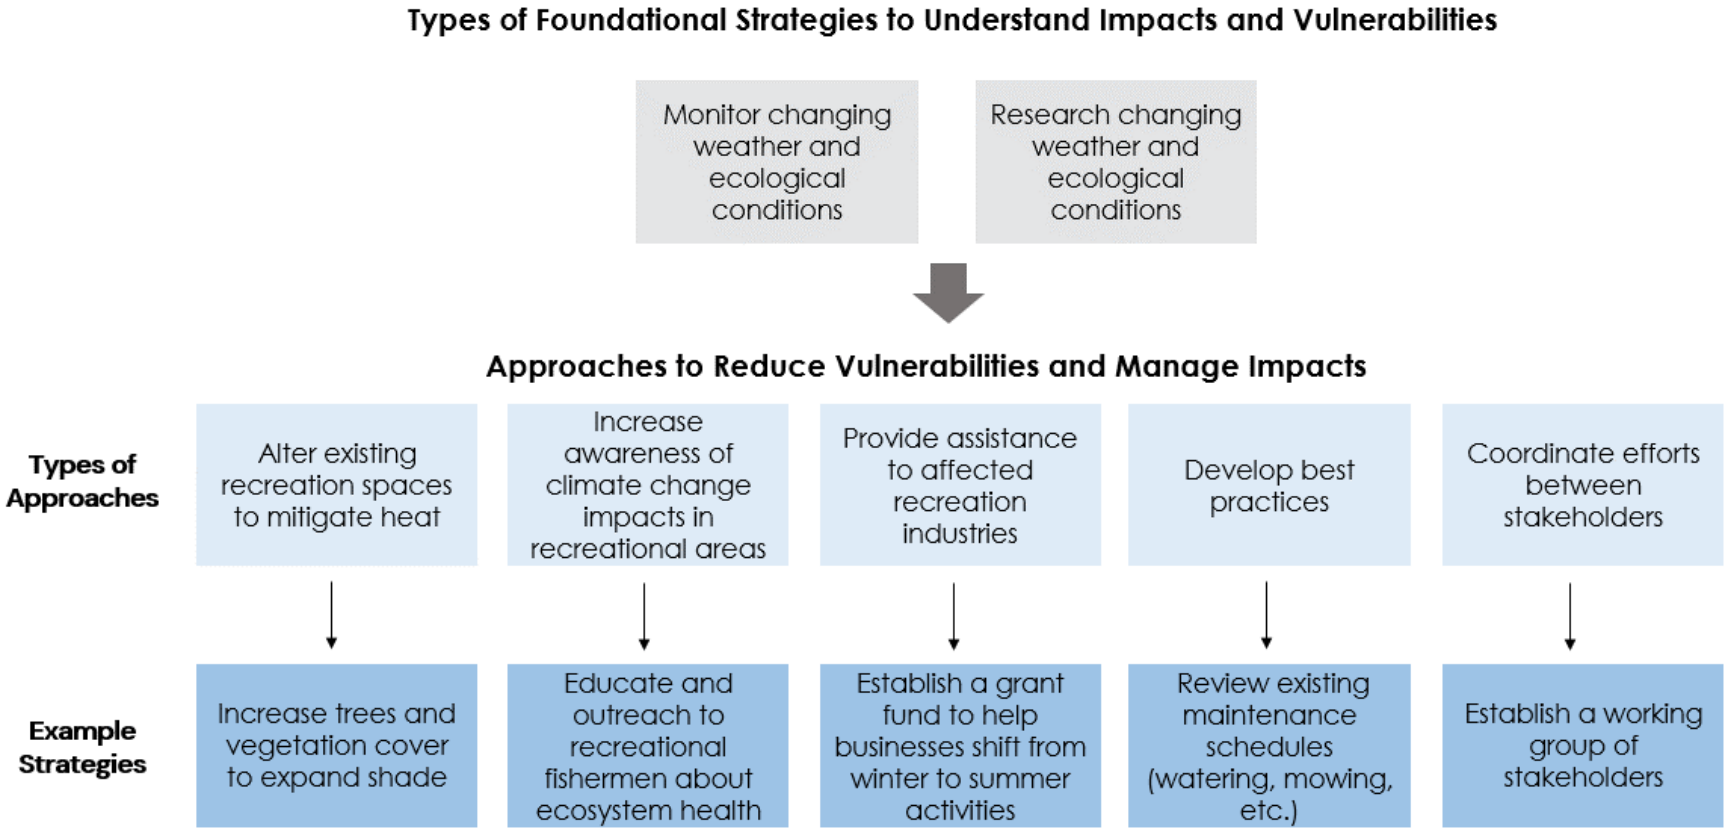
The Commonwealth must improve its understanding of how different industries in the tourism and recreation sector will be affected by higher temperatures. Researching and monitoring how weather and ecological conditions will affect recreation and tourism is a critical first step. Data gathering will help stakeholders (e.g., winter ski resort operators, DCNR) understand the rate at which changes will affect their services, operations, and facilities. With this information, stakeholders can plan for how quickly they must adapt to warming temperatures and pursue steps to manage impacts.

Opportunity for Cross Sector Coordination: Climate monitoring for weather, pests, and other ecological conditions can be pursued across sectors. For example, the agriculture, natural resources, and recreation and tourism sectors will all be interested in water quality monitoring.

Adaptation may take the form of improving recreational areas, encouraging industries to change their practices, and adapting recreational practices to be viable in the long term. Many strategies will not only mitigate consequences, but also capitalize on opportunities to expand offerings in Pennsylvania's recreation and tourism sector.

Figure 47 outlines the types of strategies that can be deployed in sequence to identify and adapt to the impacts of increased average temperatures on the Commonwealth's recreation and tourism sector. The order in which strategies are deployed is dependent on actors' understanding of impacts, the availability of decision support tools, and funding.

Figure 47. Adaptation strategy pathway to reduce increased average temperatures impact on recreation and tourism



This diagram provides an illustrative example of the primary types of strategies but does not capture the full universe of possible strategies that could be deployed.

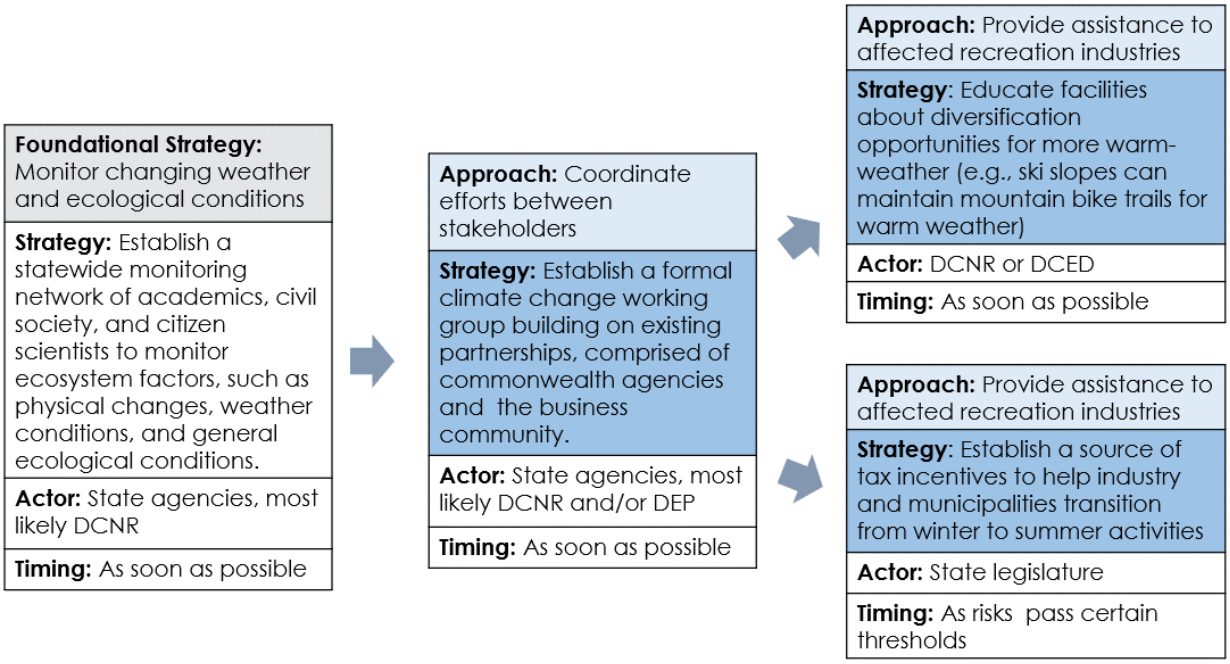
A variety of stakeholders will be impacted by changing recreational opportunities. Organizations that operate recreational facilities (e.g., DCNR, municipalities, businesses), will need to recognize how their revenue stream, operations, services, and/or facilities will change. With this information, stakeholders can then consider how to alter their management practices in the near, mid-, and long terms.

To support adaptation efforts, the state government, including DCNR, DCED, and the legislature, can provide support and resources (e.g., technical assistance, grants, loan programs) to facility operators and businesses. And with better understanding of impacts, including economic impacts such as lost revenue or jobs in winter recreation, municipalities and state leaders might target support to the groups most impacted. Figure 48 outlines a sequence of strategies that could be pursued by state agencies (DCNR, DCED) to support winter recreation businesses. Appendix C provides more strategies related to this priority area.

Key Actors

- **State agencies DCNR and DCED:** These agencies are responsible for promoting the recreation and tourism sector. DCNR also operates many recreational facilities.
- **State legislature:** The legislature can increase funding or make legislative changes to ease the adaptation process.
- **Municipalities:** Local governments can support businesses affected by increasing temperatures. Municipalities may also operate recreational facilities. Towns and cities may also experience changes in tax revenue if they depend on certain recreation centers such as winter ski resorts.
- **Business groups:** Industry groups that represent specific industries such as winter recreation sites and hotels may advocate for certain changes.
- **Individual businesses:** Some businesses may need to alter their services, operations, and/or facilities to remain viable or capitalize on new opportunities.
- **Recreation-based organizations**: Organizations and associations such as Trout Unlimited and the PA Cross Country Skiers Association can explore and advocate for adaptation solutions and support relevant industries in their adaptation efforts.

Figure 48. Example set of strategies to be pursued to support winter recreation businesses vulnerable to increased average temperatures



Costs and Benefits

Generally, strategies for this priority area could be costly but are investments in strengthening resilience. Other strategies, especially those that are foundational or non-intensive, will be less costly. For example, monitoring would be relatively inexpensive, while land acquisition, where needed, has high up-front costs. Investing resources in helping the sector adapt will help mitigate the economic consequences of increasing temperatures in the recreation and tourism industries.

Most significant adaptation techniques will require programs to improve recreation areas to better cope with warmer temperatures. These steps could include introducing new services, improving outdoor areas, retrofitting buildings, or updating equipment, or expanding existing offerings. State actions that support transformational actions may also be costly (e.g., technical assistance, grant programs), but should ultimately pay for themselves as they strengthen the economy's resilience. Some initial steps will require less resources (e.g., improving monitoring, education and outreach programs).

Overall, strategies in this priority area have the potential to have many co-benefits for the Commonwealth. Strategies may bolster economic resilience, promote overall environmental health (e.g., reducing overfishing in endangered fisheries), and support public health (e.g., increasing outdoor exercise opportunities). By creating more spaces that can be used for recreation throughout the year as temperatures warm, the Commonwealth can improve residents' quality of life and sustain Pennsylvania's economic health (i.e., increased jobs, rise in spending on recreation in warmer months).

CASE STUDY

Transforming Winter Ski Resorts

Pennsylvania has over 30 ski areas and thousands of acres of other land dedicated to winter recreation (i.e., ice fishing, cross-country skiing, snowmobiling). These areas are frequented by visitors from in-state and out-of-state.[121] But as winter temperatures warm, ski resorts will face a future filled with less and less snow or snowmaking conditions. The Commonwealth already experiences about a 12% reduction in visitors in lower-snowfall seasons compared to high-snowfall seasons.[122]

While ski areas will be severely impacted by warming temperatures, many opportunities exist to shift areas' uses and take advantage of the vast lands available for recreation. Many winter recreation areas have already updated spaces to provide multi-season attractions. With increasing temperatures, the Commonwealth can support the winter recreation industry in developing these areas for more multi-functional use.

Deploying Snowmaking and Snow Storage Techniques

Ski resorts are taking steps to prepare. Many have invested in snowmaking technologies to manage seasonal fluctuations in snow as winters have warmed.[123] In the short term, these investments can help mitigate reduced snowfall. Innovative techniques to increase access to snow in winter months could also be explored. Craftsbury Outdoor Center, which a cross country ski center in northern Vermont that provides open space for cross-country skiing, is trying snow storage. In 2019 in partnership with the University of Vermont,[124] to provide snow in November when there is insufficient natural snowfall, Craftsbury Outdoor Center produced 9,000 cubic meters of snow at the end of February and packed it densely and insulated it over the spring and summer. By November, 65% of the snow remained, which was enough to cover 2-3 km of trails. As natural snowfall becomes less common and the ski season shortens, the Commonwealth's ski industry and recreation centers with ski offerings can consider such new techniques.

Repurposing for Summer Recreation

Ski resorts have also invested in year-round recreation. By offering recreation opportunities in the spring, summer, and fall, the industry can boost visitors and maintain revenues. For example, Montage Mountain Ski Resort developed a zip line and outdoor water park to mitigate reduction in winter activity.[125] Seven Springs Mountain Resort and Blue Mountain Resort offer dozens of mountain biking trails to use their spaces in summer months.[126,127] Resorts in the Northeast have explored similar additions so that they can provide year-round offerings, such as mountain biking, all-terrain vehicle

Addressing the Impacts of a Changing Climate on Built Infrastructure

Impacts

Built infrastructure will be significantly impacted by flooding related to sea level rise, tropical and extra-tropical cyclones, and other heavy precipitation events. Impacts will be intense but localized. Individually and acting as concurrent forces (i.e., storm surges) these events could cause severe damage to infrastructure and result in substantial cascading impacts. Vulnerabilities identified in the 2021 Impacts Assessment that could harm built infrastructure include:

- Increased disruption and damage, especially from direct flooding in the Southwestern region, to:
  - Local electricity infrastructure
  - Homes, buildings, and facilities in flood zones
  - Fuel delivery systems (e.g., pipelines including those underground)
  - Transportation infrastructure (e.g., bridges, roads, railways, culverts)
  - Urban stormwater and wastewater management systems

[130] U.S. Forest Service Office of Communication. 2014. "U.S. Forest Service Finalizes Policy to Promote Year-Round Recreation on Ski Areas." https://www.usda.gov/media/press-releases/2014/04/15/us-forest-service-finalizes-policy-promote-year-round-recreation

[131] Laurel Highlands Bicycling Club. Blue Knob State Park. https://lhorba.org/blue-knob-state-park/.

- Higher risks of cascading impacts from infrastructure service disruptions, including:
  - Temporary halt or reduction in delivery of fuel products (e.g., natural gas, petroleum)
  - Overflow of stormwater and water systems which could be detrimental to water quality, and could cause severe roadway flooding and water infiltration into buildings
  - Extended blackouts
- Increased flood risk to infrastructure in Southeastern Pennsylvania from flooding related to sea level rise and coastal storms with especially significant impacts to:
  - Homes in certain parts of the Philadelphia region
  - Philadelphia International Airport

Key Actors

- **Department of Transportation (PennDOT):** PennDOT could evaluate flooding risks along state roads and work to improve at risk assets and corridors.
- **Pennsylvania Emergency Management Agency**: PEMA could help in coordinating and planning for extreme event responses.
- **DCED**: DCED could help incentivize flood-proof development through its funding, housing and development, and local government programs.
- **PENNVEST:** PENNVEST could include flooding risks considerations in its investments.
- **Public Utility Commission**: The PUC should evaluate flooding risks to infrastructure networks and take appropriate steps to ensure the resilience of networks.
- **State legislature:** The Commonwealth's legislature can increase funding for infrastructure projects aimed at reducing flooding.
- **Municipalities:** Local governments can take action to reduce flood risks through land use policies. Public works departments can specifically focus on updating stormwater and wastewater management systems.
- **Energy utilities and companies:** Utilities and companies should evaluate how flooding could impact their assets, adopt plans to adapt their systems, and ultimately reduce or eliminate risks to vulnerable assets.

Adaptation Strategy Pathway

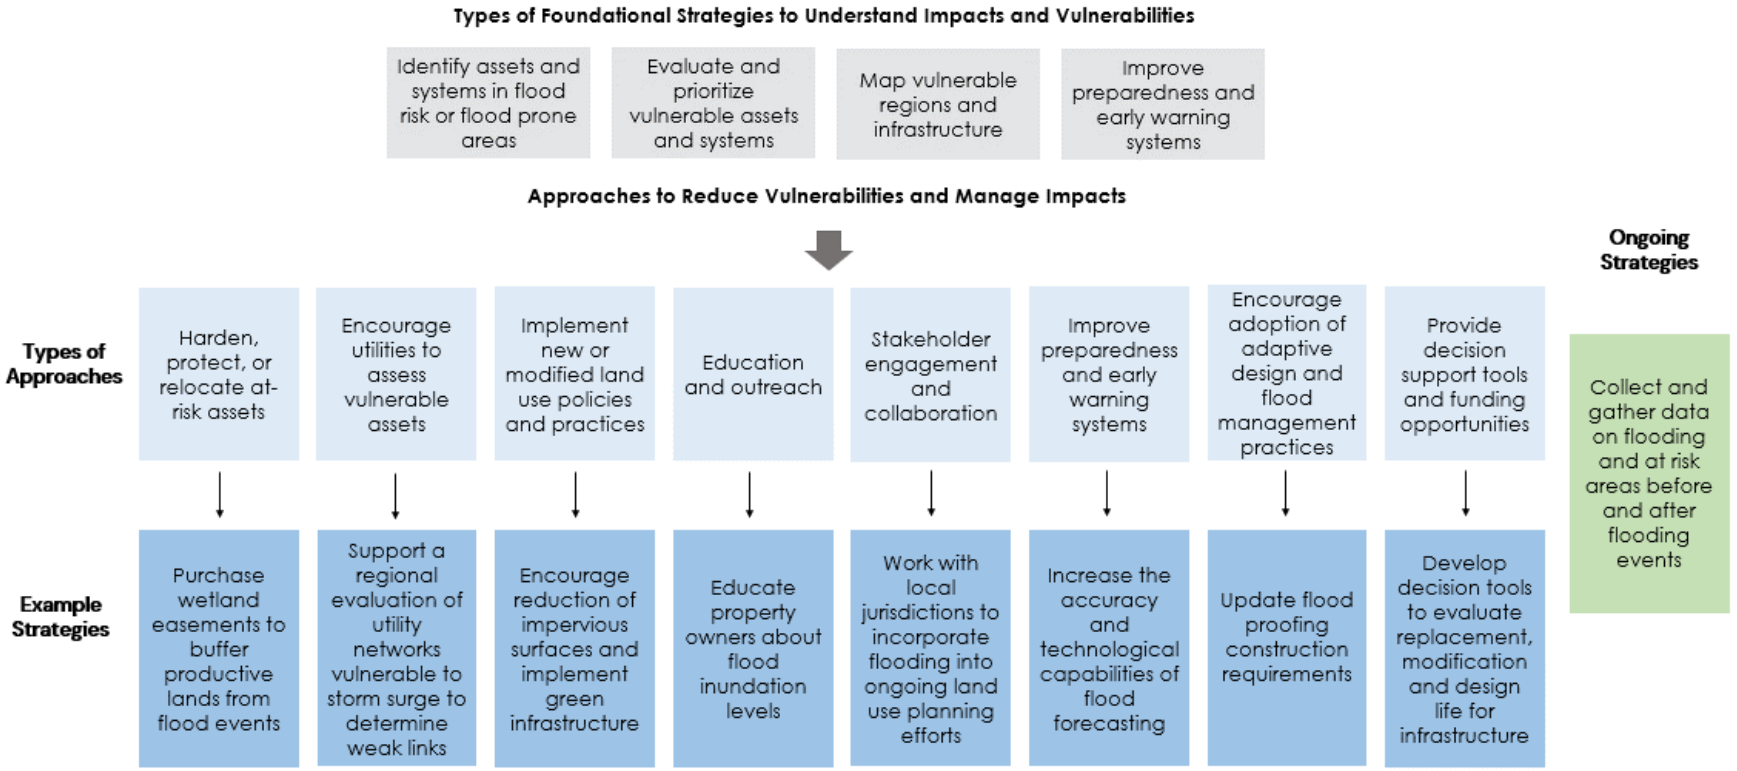
To adapt infrastructure to the impacts of flooding in a changing climate, the Commonwealth must begin by elucidating the highest risk assets and systems. With this information, stakeholders can take steps to update infrastructure assets and build resilience into infrastructure systems.

To address impacts, the Commonwealth can pursue a variety of strategies that engage a wide breadth of stakeholders. These actions range from improving land use policies, developing tools for private sector actors, changing design and engineering practices, and conducting large scale infrastructure improvement projects. Figure 50 outlines the types of strategies that can be deployed to adapt infrastructure assets and systems to the impacts of flooding in a changing climate.

Reducing and adapting to the impacts of flooding in a changing climate will require a multi-sectoral approach throughout the Commonwealth. State agencies (e.g., PennDOT, PEMA), local jurisdictions, utilities, and the construction, design, and engineering sectors will be involved in adaptation. While PennDOT and utilities might focus on building the resilience of their own infrastructure system network, local jurisdictions may use their zoning powers to reduce infrastructure at-risk of being flooded. Each actor has many opportunities to support the Commonwealth's infrastructure adaptation.

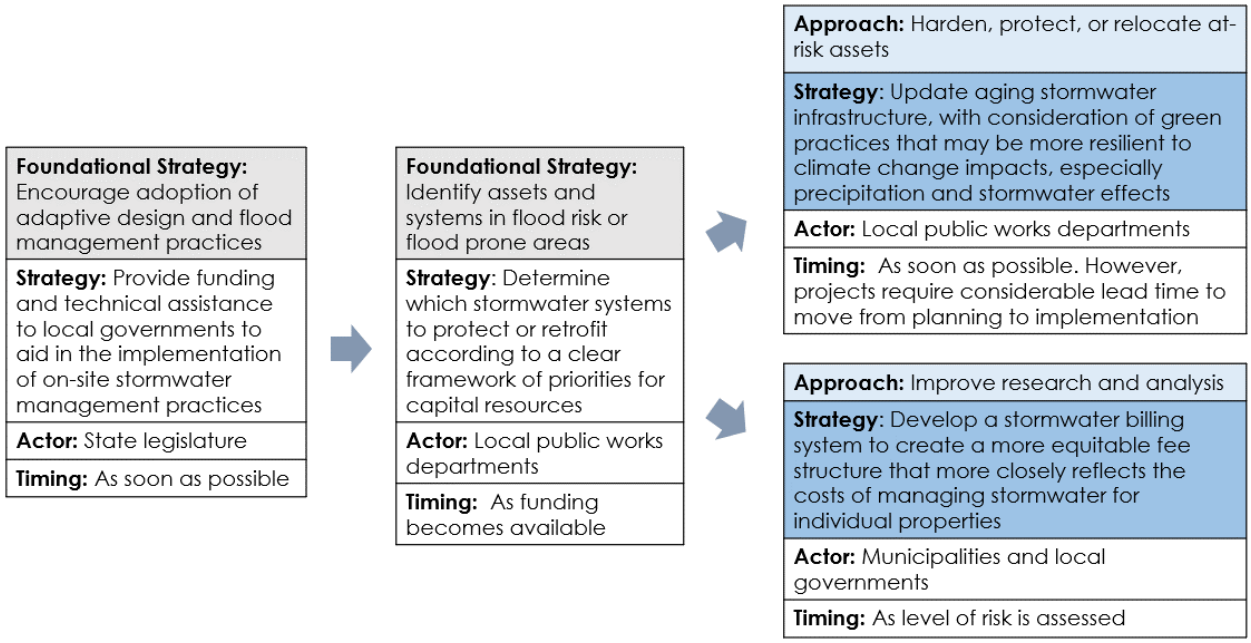
Coordination and engagement are critical as stakeholders work to increase infrastructure's resilience to flooding. Many of these strategies can be taken in conjunction to create a unified approach and increase efforts across the state. Figure 51 outlines an example sequence of four strategies led by state agencies, the legislature, and municipal public works departments to address flooding impacts to stormwater management systems.

Figure 50. Adaptation strategy pathway to reduce impacts of flooding on built infrastructure



This diagram shows the primary types of strategies but does not capture the full universe of possible strategies that could be deployed.

Figure 51. Example set of strategies to be pursued to reduce stormwater infrastructure's vulnerabilities to flooding in a changing climate in the Commonwealth



Some state actors have already begun to pursue actions described in this section. Already, Pennsylvania has many strategic and coordinated efforts to address flooding including the State Planning Board flood hazard mitigation work and PennDOT's climate adaptation efforts.[132,133]

State agencies are also working to provide funding and build capacity at the local level. For example, PEMA administers the Federal Emergency Management Agency's Building Resilient Infrastructure and Communities (BRIC) grant program, which provides funding for local governments to build resilient infrastructure.[135] At the local level, cities, public works departments, and utilities are also acting. For example, the Wyoming Valley Sanitary Authority

In December 2020, the Governor directed the State Planning Board to create recommendations and highlight best practices for addressing flooding.[134] The State Planning Board will focus these efforts on opportunities related to land use, planning, zoning, and storm water management. These recommendations and best practices guidelines will be aimed at helping communities reduce the incidence and impact of flash flooding.

introduced a stormwater impact fee that funds the Authority's Regional Stormwater Management Program to reduce runoff and pollutants.[136]

Appendix C provides more strategies related to this priority area.

Costs and Benefits

Infrastructure upgrades and improvements typically carry high up-front costs, but some strategies, such as identifying and evaluating assets and infrastructure networks, do not. Generally, strategies in this area are labor intensive because they require research, planning, and implementation.

Although adaptation strategies may have high up-front costs, the Commonwealth will achieve significant economic and health benefits long term by improving the resilience of its infrastructure. Construction and infrastructure improvements will create jobs. Increasing resilience to flooding will also reduce downstream economic effects during storms and flooding events (e.g., road delays that disrupt shipping and travel, blackouts that cause business closures). Mitigation investments are also highly effective in reducing future costs. For example, for every $1 invested by the public sector in disaster mitigation, $6 is saved in recovery costs.[137]

Adapting infrastructure to increased flooding will also reap health benefits. Mitigating damages and disruptions to infrastructure networks will reduce accidents. Updating stormwater and wastewater management systems will also hinder any dangers to water quality. Finally, improving building designs to be flood-proof or flood-ready will lower the likelihood that mold develops in buildings and homes after a flooding event. Overall, improving infrastructure to reduce the impacts of a changing climate will result in important benefits for the Commonwealth.

CASE STUDY

Reducing Flood Hazards in New York City

Flood risks related to climate change and associated infrastructure impacts differ from location to location. But techniques, challenges, and opportunities learned from plans to reduce a variety of flood risks for cities can be cross-applicable. The Hurricane Sandy Rebuilding Task Force (Task Force) and U.S. Department of Housing (HUD) "Rebuild by Design" competition is one such example.

The Task Force and HUD launched this competition in 2013 to crowd-source innovative design solutions to promote resilience in the areas impacted by Hurricane Sandy.[138] Submissions to the competition were expected to differ widely in scope and scale from building retrofits to large green

[136] Wyoming Valley Sanitary Authority. 2021. Stormwater Fee. https://www.wvsa.org/stormwater-management/pages/stormwater-fee

[137] National Institute of Building Sciences. 2019. "Mitigation Saves: Federal Grants Provide a $6 Benefit for Each $1 Invested." https://cdn.ymaws.com/www.nibs.org/resource/resmgr/reports/mitigation_saves_2019/ms_v3_federalgrants.pdf

[138] U.S. Department of Housing. "Hurricane Sandy Rebuilding Task Force: Rebuild by Design. https://www.hud.gov/sandyrebuilding/rebuildbydesign.

infrastructure projects.[139] Nearly 150 teams of engineers, scientists, planners, and designers submitted ideas. Six winning designs were selected based on factors including quality of design and resilience benefits, and local community engagement. One winning project, "The Big U," was awarded $335 million.[140]

"The Big U" proposed building "10 continuous miles of protection" along the impacted coast in New York City. It envisioned segmenting the coast into sections, with each area identifying specific infrastructure and social community planning goals and implementation plans through a series of meetings between community stakeholders and local government officials, informed by engineering and design experts.[141] One of those sections, the East Coast Resiliency Project (ESCR), is currently underway.

Figure 52. "The Big U" vision [142]

The ESCR City Team is led by the departments of Design and Construction and Parks and Recreation, with the Mayor's Office of Resiliency; partners include the Departments of Transportation, Environmental Protection, City Planning, and NYC Economic Development Corporation. They are supported by Design & Environmental teams and a Construction Team.

An "integrated flood protection system" is planned to reduce flood risk, including floodwalls and flood gates, a raised bulkhead and underground seepage barrier, and elevated parks along the East River. Measures to reduce flood impacts (e.g., elevated planting beds to reduce risk of saltwater intrusion) are also incorporated. Other project components include upgraded pedestrian bridges and park entries, and a new amphitheater along the water, all designed with accessibility in mind.[143]

[139] U.S. Department of Housing. "Hurricane Sandy: Rebuilding by Design."

[140] Cho, R. 2015. "Rebuilding After Hurricane Sandy." Columbia University Earth Institute. https://blogs.ei.columbia.edu/2015/01/21/rebuilding-after-hurricane-sandy/

[142] Cho, R. 2015. "Rebuilding After Hurricane Sandy." Columbia University Earth Institute. https://blogs.ei.columbia.edu/2015/01/21/rebuilding-after-hurricane-sandy/

[143] City of New York. 2021. East Side Coastal Resiliency Project. https://www1.nyc.gov/site/escr/about/about.page

These natural elements both boost infrastructure resilience and introduce protections for cities. For example, introducing natural infrastructure could also potentially reduce the risk of power outages and the associated economic and health consequences.

Addressing the Impacts of Landslides on Built Infrastructure

Impacts

Landslides may significantly impact the Commonwealth's built infrastructure by causing delays and damage to transportation and energy infrastructure. Landslides could damage roads and cause severe downstream impacts for industries and communities dependent on vulnerable transportation and energy infrastructure networks. The following vulnerabilities of the built infrastructure were identified in the 2021 Impacts Assessment:

- Closures of state and local roads for long periods of time
- Short-term losses of emergency routes
- Disruption of energy transport infrastructure (e.g., natural gas pipelines, electric transmission lines, electric substations)
- Downstream impacts to dependent industries from disruptions to roadway, shipping, and energy delivery networks
- Short-term closures or disruptions to railroads.

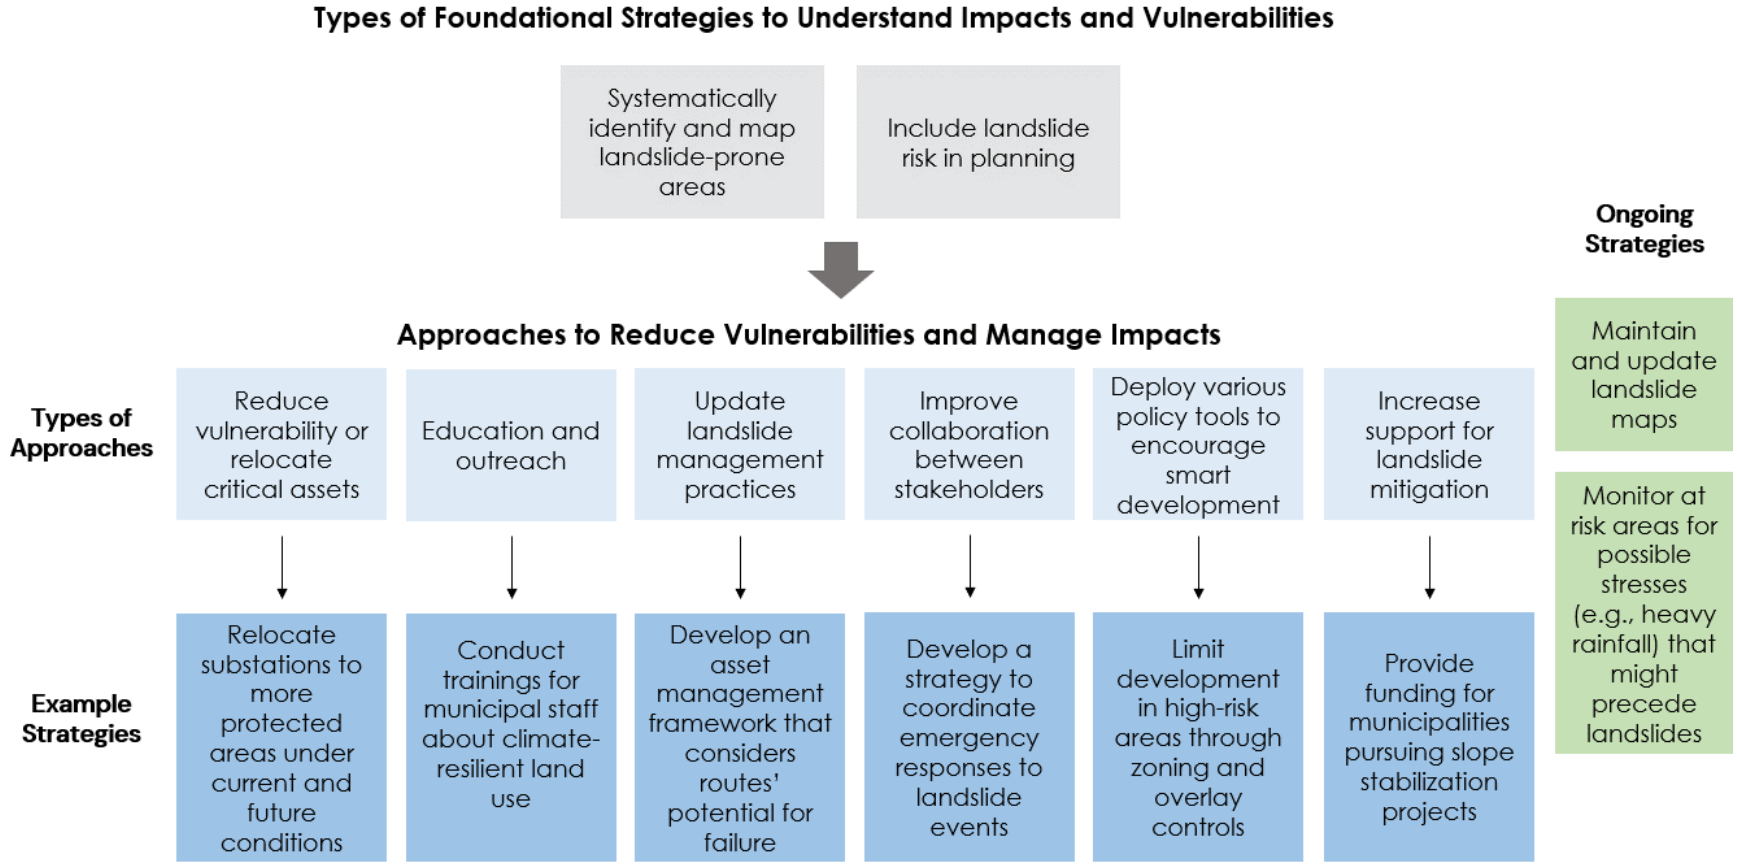
Adaptation Strategy Pathway

Mitigating the impacts of landslides will require understanding the specific locations exposed and making informed investments to stabilize slopes or otherwise prepare for landslides. DCNR has taken the critical first step of inventorying landslide hazard maps created by the U.S. Geological Survey.[144] Updating maps to reflect current landslide risks and providing them to stakeholders is an important early action. Understanding the level of landslide risk in areas at a high resolution and at specific sites will allow planning and development efforts to better mitigate landslides' potential effects.

To reduce and manage impacts, the Commonwealth can take steps to target critical assets, improve planning and development to be climate change informed, incentivize smart growth and landslide mitigation projects, and improve management practices. These strategies will reduce downstream impacts and improve the resilience of infrastructure networks (i.e., energy and transportation) throughout Pennsylvania.

[144] DCNR. USGS Landslide Map Inventory. elibrary.dcnr.pa.gov/GetDocument?docId=1751966&DocName=Hyperlinks_USGSLandslideInventoryMaps_Pa

Figure 53. Adaptation strategy pathway to reduce landslides impact on built infrastructure



This diagram provides an illustrative example of the primary types of strategies but does not capture the full universe of possible strategies.

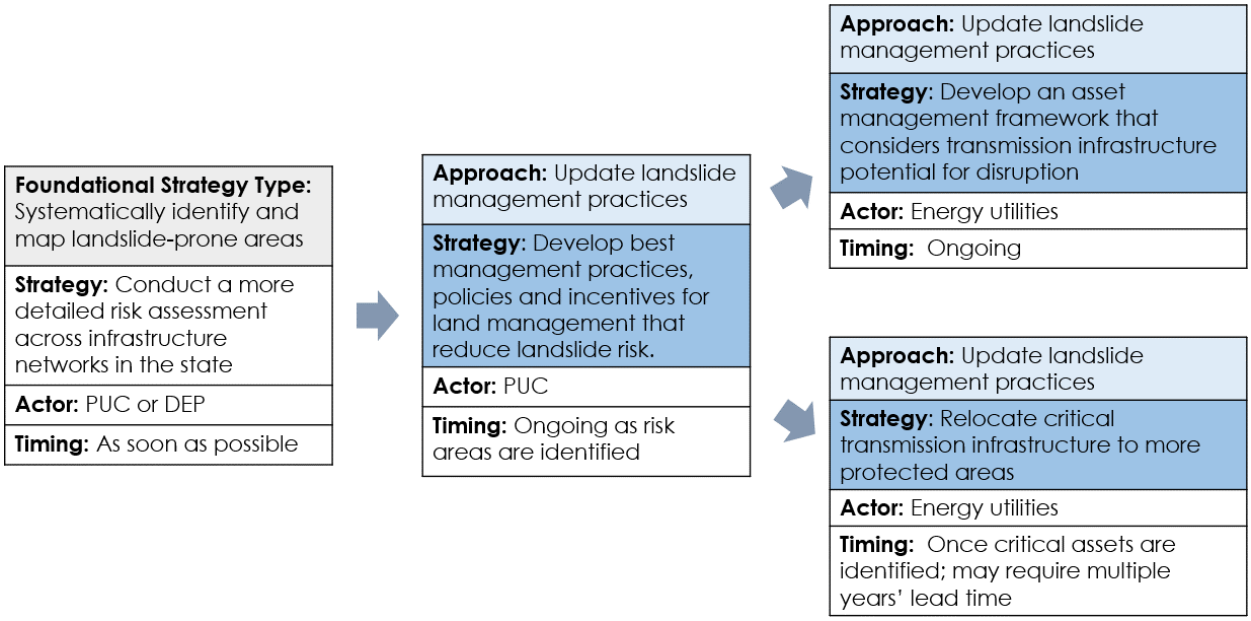
Many stakeholders can contribute to landslide risk mitigation. PennDOT is responsible primarily for reducing impacts to transportation infrastructure networks. Local governments will also play a key role in conducting projects to mitigate landslides in their jurisdictions. Utilities can also work internally to mitigate landslide risks to their assets. Other actors (e.g., legislature, other agencies, universities) can play more peripheral roles by providing support and tools to adapt vulnerable assets and ensure development is climate change- and landslide-risk informed.

Stakeholders must understand the magnitude of impacts that Pennsylvania's infrastructure assets face to be able to prioritize critical assets and vulnerable areas. Figure 54 outlines a sequence of four strategies that could be pursued by state agencies (DEP and PUC) to reduce risks to energy utilities. Appendix C provides more strategies related to this priority area.

Key Actors

- **PennDOT:** PennDOT could evaluate landslide risks along state roads and act to reduce dependencies on at-risk routes.
- **DCNR:** DCNR could support landslide mapping efforts.
- **DCED:** DCED could incentivize development outside landslide hazard zones.
- **Infrastructure Investment Authority (PENNVEST):** PENNVEST could include landslide risk considerations in its investments.
- **Public Utility Commission:** PUC should evaluate risks to energy infrastructure networks and take appropriate steps to ensure the resilience of networks.
- **Pennsylvania Emergency Management Agency:** PEMA could help in coordinating and planning landslide event responses.
- **State legislature:** The Commonwealth's legislature can increase funding for landslide risk mitigation.
- **Municipalities:** Local jurisdictions will be responsible for implementing many actual infrastructure protection projects.
- **Energy utilities and companies:** Utilities and companies should evaluate how landslides could impact their assets and take adequate steps to mitigate those risks.

Figure 54. Example set of strategies to be pursued to reduce energy infrastructure's vulnerabilities to landslides in the Commonwealth.



Costs and Benefits

Adaptation strategies in this priority area that directly address infrastructure risks generally have high up-front costs. For example, infrastructure improvement and slope stabilization projects are expensive. In the case of small landslides affecting only a couple of properties, slope stabilization and repair projects can be prohibitively expensive, with costs exceeding the net value of the properties.[145]

Other strategies, especially those that are foundational, will be less costly. Antecedent steps like mapping, monitoring, and planning will likely be less extensive but require substantial data and expertise. Other less-costly strategies include outreach, updates to management practices, and improvement of collaboration between stakeholders.

Although many actions have high up-front capital costs, the steps can reap massive benefits. Improving the resilience of infrastructure systems to landslides will reduce the potential for infrastructure network disruptions and failures. These disruptions and failures can cause severe downstream impacts that have ripple effects through the Commonwealth's communities and economy. By improving infrastructure resilience to landslides, the Commonwealth can also help mitigate future repair and maintenance costs. For example, one study found that surface-water drainage measures reduced the probability of landslides and the benefits of these measures exceed the costs by a ratio of nearly 3:1.[146] Limiting landslide impacts in landslide-

[145] DCNR. "Landslides." https://www.dcnr.pa.gov/Geology/GeologicHazards/Landslides/Pages/default.aspx

[146] Holcombe, E.A., Smith, S., Wright, E., Anderson, M.G. 2012. An integrated approach for evaluating the effectiveness of landslide hazard reduction in vulnerable communities in the Caribbean. *Natural Hazards*, 61(2): 351-385.

prone areas will likely mean that municipalities and state agencies do not have to spend significant portions of their budget repairing damages. Additionally, challenges with long-term road closures from landslides will be reduced. Adapting to landslide impacts will boost the reliability of critical infrastructure in the Commonwealth, and mitigating landslide impacts will boost economic resilience and limit safety challenges (e.g., injuries in car accidents) associated with landslides.

CASE STUDY

Predicting and Mapping Landslides in Allegheny County

In 2018, Allegheny County experienced landslides that caused an estimated $40 million in damage.[147] The landslides also damaged over 130 properties. Extreme rainfall in February 2018 created the conditions that drove the large-scale landslides seen in the county that year.[148] Landslides disrupted infrastructure, and damaged utility pipes and electricity infrastructure.

To address the landslide challenge, the county created a Landslide Task Force. The Task Force aims to provide the necessary resources to help municipalities in the county adapt to landslide hazards. The task force coordinates with county departments (e.g., Emergency Services, Public Works, Budget) and external stakeholders (e.g., Carnegie Mellon, PEMA, National Weather Service, PennDOT, DEP, utilities).[149] Unifying the expertise and resources of these stakeholders, the Task Force works to:

- Create education and communications for municipalities on landslides.
- Provide up-to-date landslide information,
- Understand opportunities related to landslide mitigation grants to help municipalities take advantage of these programs. [150]

The county developed a Landslide map tool that not only identifies sites with recent or historic landslides, but also highlights areas with landslide risks.[151] Areas included in the map might have slope stability challenges that are problematic for infrastructure development. The map aims to provide an initial screen of areas that should be examined in depth with a technical analysis.

The county is also partnering with researchers at Carnegie Mellon University. The interdisciplinary university research team is developing a deep learning model to predict where landslides might occur. The team uses photographs of infrastructure in the county and historical and geological data.[152] If successful, this tool would help to anticipate future landslide threats so that landslide events can be prevented. Additionally, the researchers hope that this the tool can provide data-based indicators that inform local county and municipal policy and budgets.[153]

5 IMPLEMENTING CLIMATE ACTION IN PENNSYLVANIA

A plan is only effective if it used to shape and drive implementation. This section outlines the primary challenges and opportunities to implement the strategies and approaches outlined in the CAP, the principles that will guide implementation efforts, and how implementation practices can ensure outcomes will be beneficial and equitable for all. The section concludes by describing some of the key stakeholders and steps to implement the CAP.

Implementation Challenges and Opportunities

Implementation of broad GHG reduction and climate adaptation measures will undoubtably encounter challenges and create opportunities for the Commonwealth. Although each strategy and pathway has its own unique set of obstacles, several challenges are common to all sectors.

Potential Grant Opportunity: FEMA Building Resilient Infrastructure in Communities

The Building Resilient Infrastructure and Communities (BRIC) program aims to categorically shift the federal focus away from reactive disaster spending and toward proactive, research-supported investment in community resilience. BRIC is designed to fund ambitious pre-disaster hazard mitigation projects, allowing grantees to safeguard their communities from the destruction and disruption of hurricanes and other natural disasters.

The cost-share for FEMA BRIC generally is 75% federal and 25% state and local. BRIC funding presents opportunities to build resilience to hazards or extreme events.

Challenge: Costs

Actions to mitigate the effects of climate change, whether those discussed here or other investments in building a resilient Pennsylvania, may require significant outlays of vital resources. Upfront costs and lack of funding can slow progress and create a significant challenge to implementation. To overcome this challenge, stakeholders and policymakers need to take a full and holistic accounting of costs and benefits throughout the policy or program, including the cost of inaction and future cost savings as a result of proactive climate action. This should include health and equity impacts, storm recovery costs, and all manner of impacts articulated in this plan.

To mitigate costs and impacts on different groups in Pennsylvania, Pennsylvania could effectively invest revenue generated from putting a price on carbon, or apply funds obtained through COVID-19 recovery stimulus or other federal funding. Potential stimulus revenues or new funding sources could help pay for critical programs and actions. Such revenues can be strategically invested in a number of ways, including in clean energy and energy efficiency programs, GHG abatement and jobs, and supporting vulnerable communities and environmental justice communities. Additionally, the costs of solar and wind technologies have declined rapidly in the last decade, and other clean energy technologies like EVs and battery storage may do the same, thereby reducing the financial burden of implementing GHG reduction strategies. Improving the efficiency or reducing the costs of these technologies is also a potential business opportunity for local manufacturers.

Challenge: Political will and resistance to change

Implementing climate change mitigation and adaptation strategies will create changes to the ways that Pennsylvanians live, work, and get around. Resistance to change can manifest itself as lack of political will, causing delays to new legislation and hesitancy in rolling out new policies and programs. Education and outreach are key to helping Pennsylvanians understand the planned changes and program goals. Efforts should aim to both explain climate change and outline the many co-benefits of taking action, including job creation, improved air and water quality, and the many health benefits that can be enjoyed with improved environmental quality. Careful program design can help alleviate concerns, focus efforts on specific priorities, use funding effectively and efficiently, and create equitable and fair policies to achieve greater buy-in from diverse stakeholders.

Opportunity: Increase jobs and expand businesses

As new technologies and policies are implemented, new opportunities for business and job growth will emerge. Clean energy technologies have already shown their potential to create new jobs and businesses as wind turbine service technicians and solar photovoltaic installers are two of the top three fastest growing jobs over the past 10 years.[154] Future climate mitigation and adaptation technologies could offer similar job and business growth potential. Pennsylvania already supports the state's work in energy employment transitions through DEP's workforce development programs[155] and can continue to grow its commitment to workers through the implementation of RGGI dollars.

Opportunity: Build resiliency

As the Commonwealth prepares to build new infrastructure like bridges, buildings, and roads, it can leverage new technology, design, and planning to ensure its infrastructure and communities are more resilient to climate change. Industries and local governments can adopt plans to adapt their systems and infrastructure to ultimately reduce or eliminate risks to their vulnerable assets. This will be particularly important in the energy sector, as trends toward electrification, distributed energy resources, and renewable energy increase the imperative and complexity associated with electric grid reliability. Program implementation can broaden resiliency by incorporating and emphasizing risks and hazards and incorporating adaptative measures. This work can be supported by a variety of funding sources such as the FEMA BRIC program that aim to make both communities and infrastructure more resilient.

Opportunity: Increase equity

Often those that are most affected by climate change live in communities with the least capacity to adapt to and prepare for climate impacts because of compounding inequities. Additionally,

---

[154] Bureau of Labor and Statistics. 2021. "Fastest Growing Occupation." Accessed April 5, 2021. https://www.bls.gov/ooh/fastest-growing.htm.

[155] Pennsylvania DEP. 2021. Workforce Development. Accessed April 12, 2021. https://www.dep.pa.gov/Business/Energy/OfficeofPollutionPrevention/EnergyEfficiency_Environment_and_EconomicsInitiative/Pages/Workforce-Development.aspx

cost burdens associated with energy-inefficient housing or access to affordable transportation impact low-income Pennsylvanians. Through the implementation of this plan, extra attention should be given to design future projects and programs to address these inequities. Improving equity can overlap with job growth opportunities. Job training and advancement programs should be focused on low-income and marginalized individuals so that they can participate in the clean energy economy.

Opportunity: Increase environmental and health benefits

With the reduced combustion of fossil fuels, the Commonwealth would see a sharp decrease in air and water pollutants, improving the health of Pennsylvanians. Improved air quality will reduce air pollutants such as SO_x, NO_x, mercury, PM, and ozone, which are major causes to a variety of harmful health impacts including asthma, heart attacks, cancer, and shortened lives. Air pollutants present a higher risk to children, older adults, and people with lower incomes.[156] Pennsylvanians should also see cleaner water through implementation, through reduced acid mine drainage, decreased thermal pollution near major power plants, and fewer instances of coal ash water contamination.

Opportunity: Optimize land use

The strategies outlined in this CAP provide opportunities to optimize land uses (e.g., suitable locations for solar, public transit-oriented development). Optimal land use also presents a prime opportunity to implement both GHG reduction and climate adaptation strategies in concert. Successfully integrated strategy implementation may result in maximizing co-benefits.

Implementation Principles

To effectively implement the CAP and the strategies proposed in it, strategy implementation will be guided by the following principles:

- Consider the needs of vulnerable communities and the effects of actions on equity, access, and inclusion.
- Enhance collaboration between government and stakeholders.
- Conduct monitoring and evaluation (M&E) assessments of strategies.

These principles and methods to integrate them into implementation are described below.

Equitable and Beneficial Implementation

In addition to following the implementation principles described above, DEP favors an implementation approach that is designed to equitably improve the lives of Pennsylvanians. Both the benefits and costs of implementing the CAP should be equitably distributed to maximally improve the lives of everyone, and to avoid unfairly burdening certain communities

[156] American Lung Association. Lung Health Policy Brief. Accessed April 12, 2021. https://www.lung.org/getmedia/e310efd8-b189-4411-b3a3-7db31dc54baa/clean-energy-policy-brief_.pdf.

or populations or disproportionately favoring others. To begin considering potential equity effects, DEP applied an equity criterion to the processes of evaluating the potential GHG reduction strategies and adaptation strategies. The modeling of the selected strategies included developing outputs for the potential social and economic effects, such as improved air quality and public safety, job creation, and increased income. But to maximize those benefits and minimize those costs in an equitable manner, the implementation of the selected strategies must be carefully designed.

Climate change will not affect all Pennsylvanians equally. Some may be more vulnerable to impacts due to their location, income, housing, or other factors. For example, certain populations may have greater physical exposure to risks (e.g., construction workers may be more exposed to heat waves) or limitations to their ability to manage consequences if they occur (e.g., income or wealth may impact ability to pay for air conditioning).

Disproportionate impacts are often not random. Consequences of historical discriminatory practices, such as redlining and disinvestment, may also manifest as inequities today. For example, individuals living in deteriorating housing may be more exposed to heat stress.[157] As Pennsylvania works to reduce its climate risks, care needs to be taken that these inequitable impacts are addressed, and that adaptation efforts do not inadvertently exacerbate existing inequities.

Some of the primary ways to design for equitable and beneficial outcomes are to develop equity indicators, identify areas or communities with low equity outcomes, assess the causes of inequity and the needs of different communities, and then develop implementation methods that reduce the causes of inequity and match beneficial outcomes with communities that lack those benefits the most. To do this requires careful analysis, public engagement, and careful M&E to make corrections as needed. Additional funding sources, too, can help ensure that implementing the strategies outlined in the CAP address the needs of different communities. Designing implementation methods in this way helps to protect and improve public health, safety, and welfare; mitigates adverse impacts on traditionally marginalized communities; helps to address the legacy impacts of past discrimination, racism, and environmental injustice; and ensures that all Pennsylvanians benefit from a cleaner, greener environment.

Creating jobs and economic opportunity

From 2017 to 2019, clean energy jobs grew by 8.7%, which was more than four times the average job growth rate. In 2019, there were over 97,000 clean energy jobs statewide. Most job growth occurred in the solar and wind energy industries and in construction, but the majority of clean energy jobs are in the energy efficiency industry. All clean energy generation technologies

[157] K. Maxwell, S. Julius, A. Grambsch, A. Kosmal, L. Larson, and N. Sonti. 2018. "Built Environment, Urban Systems, and Cities." In Impacts, Risks, and Adaptation in the United States: Fourth National Climate Assessment, Volume II [Reidmiller, D.R., C.W. Avery, D.R. Easterling, K.E. Kunkel, K.L.M. Lewis, T.K. Maycock, and B.C. Stewart (eds.)]. U.S. Global Change Research Program, Washington, DC, pp. 438–478. doi: 10.7930/NCA4.2018.CH11.

experienced growth from 2017 to 2019 with the exception of nuclear power.[158] Though some clean energy jobs have been lost since the pandemic arrived, the industry is expected to continue to grow as the economy recovers.

Clean energy jobs pay more on average compared to the occupation's statewide median wage. About two-thirds of clean energy jobs paid a premium compared to the statewide median across energy technology sectors and experience levels, and nearly 87% of entry-level jobs paid more than the median wage. Additionally, the clean energy industry employs a diverse labor force. Hispanic/Latinx, American Indians, Asian Americans, African Americans, and veterans were all employed at greater rates than statewide demographic averages.[159]

Taken together, these factors—high job growth, above average pay, more diverse labor demographics—all indicate that the transition to a clean energy economy can help improve equitable and beneficial outcomes in Pennsylvania. Looking to the future, A 2021 study estimates that Pennsylvania can create 243,000 net jobs annually from 2021-2030 through clean energy investments. 162,000 jobs would be clean energy jobs, and 81,000 jobs would be in supporting industries such as in public infrastructure, manufacturing, land restoration, and agriculture. To achieve these numbers, the study estimates that an average annual investment of $31 billion would be needed (about 3% of the Commonwealth's GSP). Some of that investment would also come from the federal government, which has recently pledged to invest $2 trillion in clean energy efforts.[160]

This job growth could assist the "just transition"—a shift from a fossil-based economy to a clean energy economy. To do so, it will be important for the industry and the State to educate and train workers to prepare them for clean energy careers, because a lack of training or experience was the main reason that clean energy employers found finding qualified applicants difficult.[161] Retraining workers in natural gas, coal, and similar industries for clean energy careers would ease their burden and may help overcome a fear of change or a lack of political will. Targeted and adequate funding, too, will be necessary to ensure economic and employment opportunities are maximized.

Addressing health and equity

Human health is influenced by the local climate and environment. Pollutants such as such as SO_x, NO_x, mercury, and others are emitted when burning fossil fuels and can cause negative health effects such as asthma, cardiac arrest, cancer, and premature death. Reducing GHG emissions reduces emissions of these pollutants and helps to improve the quality of air and water, thereby reducing the associated health hazards and improving public health. Because the risk of experiencing negative health effects caused by pollution are higher for children, older adults, and people with lower incomes, reducing pollution and improving health outcomes increases equitable outcomes.

Historically, not all people or communities have benefited equally from the development of public, industrial, and commercial infrastructure, goods, and services. In fact, low-income and minority communities have often been negatively affected and experience a disproportionately large amount of reduced environmental quality and increased health hazards, and a disproportionately small amount of economic, environmental, and social benefits. Such disproportionate outcomes may not be intentional in some cases, but because these communities lack resources and representation, and because equity has not been integrated into past planning and implementation efforts, inequitable outcomes do occur. However, planners and implementers have increasingly become aware of this issue and are designing policies and programs—such as this CAP—that strive to achieve more equitable outcomes for all.

GHG reduction strategies have the potential to advance health and equity by improving air quality in disproportionately impacted communities, reducing energy bills in low-income households through building weatherization and strategic electrification, increasing transit options in areas with low accessibility, and much more. Similarly, adaptation pathways can improve equity by providing vulnerable communities with shelter from extreme temperatures and reducing the risk of health hazards from extreme weather events and vector-borne diseases.

Key Stakeholders and Collaboration

A broad range of stakeholders, including government actors, industry and business leaders, nonprofit organizations, and Pennsylvania citizens must work together on climate and energy policies and programs that support the economy, public health, and the environment, leading to a low-carbon and more resilient Commonwealth.

Collaboration with other agencies and organizations allows for the pooling of resources and information to achieve more than agencies or organizations could accomplish individually. To succeed in implementing climate mitigation and resiliency measures, stakeholders with overlapping work will need to work together despite varying areas of expertise and differing views on certain subjects. Coordination among stakeholders should begin at the very start of the planning stages of any new policy or program.

Pennsylvania citizens: Citizens of the Commonwealth need to be part of the conversation on climate and program and policy makers should seek many methods to gather feedback,

including open houses and topic specific forums on proposals. Impacts on Pennsylvanians will be significant, and they can provide feedback on a variety of issues, but their perspective on how changes impact their communities, homes and work are especially crucial. Specific outreach to underrepresented populations, and marginalized communities needs to be considered to ensure that changes help reduce social and racial inequities. Work in underrepresented populations can be enabled through community leaders and grassroots organizations that are experienced and rooted in these communities.

Business and industry: Business and industry leaders offer a critical perspective on progress on climate. Mitigating and adapting to climate change will create many opportunities for businesses, including the possibility for new jobs and growth industries. Change may be difficult for some, and new opportunities may not be in the same industry or may require businesses to make significant changes or investments. Policies and program designers should work with businesses to ease transitions and listen to them on a variety of issues. For example, business leaders have experience with how to develop supply chains and understand methods for effective job training.

State government agencies: Collaborations between state agencies should be strongly encouraged to ensure programs and policies are effectively designed and implemented. Perspectives on implementation that differ from the lead agency's approach should be encouraged such that new policies and programs have broad acceptance and are coordinated between many agencies.

Pennsylvania Public Utilities Commission: As new laws are made by Pennsylvania's legislature, the PA PUC will be charged with implementing them fairly and ensuring that utility company operations (water, energy, telecommunications, and transportation) run smoothly. The PA PUC oversight is critical to ensuring that utilities incorporate climate resiliency into their infrastructure planning and operations.

Utilities: In addition to their significant impact on energy, utility companies play an outsized role in the infrastructure, resiliency, and connectivity of the communities they serve. Electric and gas utilities will serve as program implementer for a variety of energy efficiency and resiliency measures and provide connectivity to new technologies and solutions. Telecommunications and water utilities have critical roles in recovery from storms and other hazards. Partnership, cooperation and cocreation of programs will be critical to successful implementation.

Local government: Many local governments are already working to plan and implement climate mitigation and adaptation strategies for their communities and are supported by state programs, partnerships, and resources. Continued partnership and program expansions will help ensure that local perspectives are incorporated into state work and that local implementers have sources of support in the state.

State legislature: The Commonwealth's legislature can greatly influence how climate mitigation and resiliency strategies are implemented. They can pass legislation requiring reduced GHG emissions from various sectors, incorporating new policies and laws and changing funding for state-run programs.

Federal government: Although the Commonwealth can implement many programs and policies, the Federal government through its programs, funding, rules, and laws has outsized influence over all national emissions sectors. Federal funding and legislation can reduce emissions rapidly and expand climate resilience strategies.

Strategy Monitoring and Evaluation

Monitoring and Evaluation (M&E) is a framework for and a core aspect of effective implementation. M&E is used to track and assess the performance of strategies with the goal of improving current and future performance. Monitoring entails periodically or continuously tracking the outcomes or impacts of a program. Consistent monitoring over the course of strategy implementation (rather than only at the end) allows implementing actors to identify and correct inefficiencies, errors, and other unwanted impacts as they arise. Monitoring can be qualitative (e.g., surveys, interviews) and quantitative (e.g., tracking metrics like the amount of emissions reduced annually). Sometimes, monitoring can identify obvious errors that can be corrected immediately, but sometimes, data must be evaluated for a full understanding of the results.

Evaluation entails an objective and thorough analysis of the monitoring results to determine the effectiveness and efficiency of the strategy in achieving intended results. Evaluation experts determine what is working well and what is not working, so that underperforming aspects can be corrected and performing aspects can be maximized, thereby improving the overall impact of the strategy over time. Evaluation exercises are conducted by experts who often apply a framework or performance criteria to assess the monitoring data. The framework or criteria must be developed before implementation and should reflect the priorities and goals of the strategies.

Although M&E requires additional resources, the potential cost savings and long-term improvements in performance typically offset resource costs. Evaluation findings can be used to promote projects or policies, raise awareness, attract investment, and provide accountability and transparency. The lessons learned in strategy evaluations can be applied to similar and future efforts to maximize their effect.

APPENDIX A. KEY TERMS

Glossary

Adaptation—The process of adjusting to new or changing climate conditions to reduce or avoid negative impacts to valued assets and take advantage of emerging opportunities.

Adaptation strategy pathways—Example categories and sequencing of adaptation strategies intended to provide ways the Commonwealth can adaptively manage climate change impacts over time.

Adaptive management—An iterative risk management approach. As conditions change, adaptive management suggests using adaptation actions that address current risks and preparing for variable future changes. This approach provides flexibility to assess continuously changing risks and undertake appropriate actions to mitigate those risks.

Cost per ton of CO_2 reduced—Represents the net present value of the action used to reduce CO_2 divided by the total cumulative CO_2 reduced over the study period. This metric represents the per-unit cost of reducing CO_2. Negative cost-per-ton represents net cost savings.

Disposable personal income—Represents the total after-tax income, of individuals, available for spending or saving in 2019 dollars.

EJ areas—Environmental justice census tracts, where 20% or more individuals live in poverty, and/or 30% or more of the population is minority.[162]

Energy consumed—End-use consumption of energy fuels and electricity in Pennsylvania's residential, commercial, industrial, and transport sectors.

Energy generated—Grid-connected electricity generating units located in Pennsylvania or other energy generation sources located in Pennsylvania facilities.

Exposed areas—Geographic areas projected to be affected by climate change based on climate change projections.

Gross state product (GSP)—Measure of a state's output in 2019 dollars. This metric represents the sum of value added for all industries in the state and is the counterpart of the Nation's gross domestic product (GDP).

Greenhouse gases (GHG)—Gases that trap heat in the atmosphere, contributing to global warming and climate change. Common GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_20), and fluorinated gases.

GHG reductions—Reducing the emissions of heat-trapping greenhouse gases into the atmosphere.

[162] Pennsylvania Office of Environmental Justice (OEJ). N.d. "PA Environmental Justice Areas."

Impacts—refers to the effects of a climate hazard, e.g., potential impacts of warmer temperatures include health risks on hot days.

Job-year—One year of work for one person. For example, a new construction job that lasts five years is five job-years.

Net present value (NPV)—The difference between expenditures (cash outflows or costs) and savings (cash inflows or benefits). These expenditures and savings are discounted to present values to represent the time value of money (the precept that money available now is worth more than an identical sum in the future). NPV is only one metric used to assess the economic effects of an action. It does not include externality costs, such as those of GHGs or other emissions. A positive NPV indicates that cash inflows are greater than costs, whereas a negative NPV indicates the opposite. A negative NPV does not necessarily indicate that a strategy or action is not cost-effective, as there are other metrics that should be used to evaluate cost-effectiveness of an action (e.g., cost per ton of CO_2 reduced, or macroeconomic benefits). A discount rate of 1.75% was used in this analysis, as representative of a societal policy perspective.

Overburdened populations—"Minority, low-income, tribal, or indigenous populations or geographic locations … that potentially experience disproportionate environmental harms and risks."[163] Environmental justice areas are used in this assessment as a proxy for locations where populations are already overburdened by hazards and other structural disadvantages.

Resilience—The capacity of a community, business, or natural environment to prevent, withstand, respond to, and recover from disturbances, while retaining the basic functions of the system.

Risk—The chance a climate hazard with cause harm. Risk is a function of the likelihood of an adverse climate impact occurring and the severity of its consequences (e.g., Risk = Likelihood x Consequence).

Vulnerable populations—Populations more likely to experience adverse impacts from exposure to climate hazards because of demographics factors (e.g., race, gender), socio-economic status, and life- or livelihood-sustaining needs (e.g., dependence on electricity for critical medical care).

APPENDIX B. METHODOLOGY DETAILS

BAU Methodology

The BAU was developed through a series of steps that mostly align with the BAU approach ICF used for the 2018 Pennsylvania CAP and the Energy Assessment Report. The exceptions to this methodology and data sources are noted below. The primary methodological steps undertaken were as follows:

- Compiled and integrated historical energy and emissions data, primarily from the Energy Information Administration (EIA) State Energy Data System (SEDS), the Environmental Protection Agency State Inventory Tool (SIT), and state-specific data sources. Section 2 provides an overview of these data sources in more detail.
- Projected future activity primarily using the EIA Annual Energy Outlook (AEO) Reference Case and made adjustments to align AEO and SEDS geographies. While SEDS data are provided at the state level, AEO data are forecasted at the regional level. To account for this geographical discrepancy, DEP and ICF applied the AEO regional growth rate for a particular energy resource to the historical SEDS data to project Pennsylvania Commonwealth-level energy resource data. Other projection methods, such as those based on regulations on oil and gas emission controls and the Aim Act HFC phaseout, were incorporated as described below.
- Adjusted historical and future activity data to ensure consistency, to capture available Pennsylvania-specific data, to address existing data gaps, and to incorporate the analysis team's expert input using resources such as ICF's Integrated Planning Model (IPM).
- Applied emission factors when available to estimate GHG and criteria air pollutant emissions.

GHG Accounting Methods

The BAU assessment followed the GHG accounting methods used for the existing state GHG inventory. Notably, the BAU estimates and incorporates emissions from electricity generation in total emissions estimates for the Commonwealth. Emissions from electricity consumption (e.g., from the residential and commercial sectors) are reported for informational purposes. This is consistent with the request from the CCAC and will make accounting for policies such as RGGI more transparent and consistent. It will also allow for consistent future goal tracking using the SIT. Data for the SIT and other resources were adjusted and aligned with state-specific data, where available and feasible.

Base and Projection Years

The BAU scenario incorporated activity and emissions data through 2050. DEP and ICF modeled the BAU starting in 2005, as this is the baseline year for Pennsylvania's 2050 GHG

reduction goal. Historical data for 2000 – 2005 are also shown to provide a consistent timeseries. Historical data from the SIT were used up through 2017, which was chosen to match the latest available SIT data in DEP's most recent GHG inventory. Projections that relied on SIT data were developed annually, starting in 2018, for each year through 2050. Emission categories that used other datasets, such as the AEO, were projected beginning in the most recent year of available data (in most cases this was 2019). Policy Assumptions

The BAU scenario projects what emissions in Pennsylvania would be through 2050 if only the existing (as of December 2020) GHG reduction policies and programs continue. This includes policies that are in place today or are well underway in the proposal process. Many of these policies have targets that come before 2050 (e.g., AEPS in 2022 and RGGI in 2030). For these policies, the BAU relies on the assumption that these targets stay constant through 2050 (e.g., the 2030 RGGI cap is the same cap applied in the modeling in 2050).

The policies included in the BAU are:

- **Act 129.** Act 129 requires Pennsylvania's seven largest electric distribution companies (EDCs) to reduce energy use in their service territory.
- **Alternative Energy Portfolio Standard.** AEPS sets targets for the amount of electricity supplied by PA's EDCs that must come from renewable and alternative sources.
- **Regional Greenhouse Gas Initiative.** By joining RGGI, Pennsylvania is obligated to reduce their GHG emissions in coordination with other member states.
- **HFC Phaseout.** Pennsylvania will phase out HFCs in accordance with the American Innovation and Manufacturing (AIM) Act.
- Policies included in the **AEO Reference Case**, as identified in https://www.eia.gov/outlooks/aeo/assumptions/pdf/summary.pdf.

Sector Approach and Data Sources

The following sections outline the approaches and accompanying data sources used in to develop historic BAU estimates and projections.

Transportation

DEP and ICF used transportation fuel use data from SEDS and emission factors from the SIT to analyze historical transportation emissions. Transportation fuel use growth rates from AEO were used to project fuel use and then emissions (applying appropriate emission factors) through 2050. This data was supplemented with state-specific data and assumptions for required production and use levels for biodiesel. Emissions associated with electricity use were not included in total emissions but reported separately for informational purposes.

Residential and Commercial Buildings

Historical building energy consumption data were pulled from SEDS, along with emission factors from the SIT, to calculate past GHG emissions. The analysis team used AEO data and

trends, along with historical data, to project residential and commercial building energy use through 2050. Emissions associated with electricity use were not included in total emissions but reported separately for informational purposes.

Industrial

Similar to the residential and commercial sectors, industrial sector energy use and emissions were taken from SEDS and the SIT. To project activity and emissions, AEO growth trends and related emission factors were applied. Emissions associated with electricity use were not included in total emissions but reported separately for informational purposes.

HFC emissions were extrapolated based on the Kigali Amendment phaseout (which provides a schedule of HFC phaseout that could align with the recently passed AIM Act that is yet to be written into regulations) that requires GHG emissions reductions of 26% below 2005 levels by 2025 and 80% below 2005 levels by 2050. These targets align with the statewide emission reduction goals established by Governor Tom Wolf in EO 2019-01.

Fugitive Emissions from Energy Production from Oil and Gas Systems

Fugitive GHG emissions estimates from oil and natural gas production were based on estimates from the SIT, which uses production data from EIA and the Office of Pipeline Safety (OPS). The historical emissions data from SIT were then projected to 2050 using natural gas and crude oil production and consumption estimates from AEO (Reference Case). Production estimates were used to project natural gas and oil production, while consumption estimates were used for transmission and distribution. The BAU scenario does not account for any reductions from a proposed DEP rule that would reduce the amount of methane emitted through control measures aimed at limiting emissions from volatile organic compounds (VOCs).[164] These reductions are captured in the associated strategy, Reduce Methane Emissions Across Oil and Natural Gas Systems. Fugitive emissions from coal mines were also based on estimates from SIT, which use a combination of EPA data (primarily from the U.S. GHG Inventory) and EIA.

Renewable and Alternative Energy (Non-Electricity)

Biogas (including agricultural waste, wastewater, and landfill gas) estimates are only available for the industrial sector in the EIA data sources. DEP and ICF therefore relied on biogas supply/consumption information from a mix of sources, including EPA's Landfill Methane Outreach Program (LMOP) and AgSTAR project databases, and a listing of wastewater sites in Pennsylvania,[165] and a database of CHP projects maintained by ICF. This information is readily available and was compiled by ICF through its work with the American Gas Foundation to

[164] This rulemaking establishes requirements for storage vessels, natural gas driven pneumatic controllers, natural gas-driven diaphragm pumps, reciprocating and centrifugal compressors, and fugitive emissions components. For more information see: https://www.dep.pa.gov/Business/Air/pages/methane-reduction-strategy.aspx

[165] See: http://www.resourcerecoverydata.org/biogasdata.php.

assess renewable gas supply in the United States. Projections for these sources were based on outputs from the IPM.

Electricity Generation

Historical electricity generation was pulled from SEDS, along with emission factors. Future annual electricity load projections (aggregated for all sectors) were then fed into IPM, which projected future generation mixes and emissions through 2050. The analysis team worked to align historical SEDS data and future IPM projections to ensure consistency. The emission caps from RGGI will continue to decrease through 2030; however, our model currently holds the 2030 cap in place for the remainder of the time series. Data regarding the stringency of the cap beyond 2030 was not available at the time the IPM modeling was performed.

Waste and Wastewater

Both waste and wastewater emissions reflect non-energy sources in the BAU, as the SIT does not allocate emissions from electricity consumption in these sectors. The BAU model does not include CO_2 from landfills in waste emissions estimates, as this is considered biogenic.

For wastewater, similar to waste, the BAU model does not include biogenic CO_2 from treatment plants. The BAU projects wastewater emissions from increased flows due to population growth and landfill waste emissions from the historic activity data and projected waste disposal totals.

Agriculture

Agriculture emissions were estimated using the SIT Agriculture module. Projections for the agricultural sector include CH_4, N_2O, and CO_2 emissions using data from the SIT.

Land Use, Land-Use Change, and Forestry (LULUCF)

ICF estimated net carbon sequestration/emissions from LULUCF using data from the SIT, this is based on data from the US Forest Service. Projections for LULUCF were held constant to latest year of available data for the BAU. Additional changes on forest cover and natural sequestration may be addressed through the GHG reduction analysis.

GHG Reduction Strategy Methodology

The GHG accounting approach used in modeling GHG reductions for this plan is aligned with the GHG accounting approach used in the GHG inventory and BAU projections, and accounts for the interactions between various strategies to ensure accurate accounting. The analysis team used methods and tools similar to what were used to conduct the 2018 CAP analysis with a few exceptions. The analysis was primarily conducted using Excel-based tools, the exception being the use of the IPM model for the electricity sector analysis. ICF also made a few changes to the GHG accounting approach, including accounting for electricity sector generation emissions (pulling out any electricity-related emissions from end use sectors) and applying marginal emission factors (i.e., using emission factors more specific to the fuel/technology to better characterize the change of emissions) where appropriate to estimate reductions. As part of the

GHG reduction analysis, where feasible, ICF also estimated changes in air quality emissions (e.g., NO_x and SO_x) at the state level. Key aspects of this accounting approach include:

- Reductions in GHG emissions as a result of reductions in direct fuel use for all energy other than electricity is represented in the end use sector (i.e., residential, commercial, industrial, and transportation).
- Note: Reductions in GHG emissions as a result of changes in end use electricity consumption are not included in totals to avoiding overlapping GHG reductions from different sectors and actions (i.e., "double counting"). See also below on GHG emissions for electricity generation.
- Reductions in GHG emissions as a result of changes in both electricity consumption and the generation mix are accounted for in the electricity generation sectors. GHG emissions from electricity generation are modeled in a two-step process:
  - Estimate changes in electric load as a result of all strategies that impact load (e.g., energy efficiency, electrification).
  - Feed the load changes over time into the Integrated Planning Model© with policy assumptions to estimate generation mixes over time.
- Layering the impacts of certain strategies to avoid over-estimating reductions. Layering the impacts of strategies indicates the assumed order of implementation in which strategies occur to account for the interactions between them (e.g., a strategy that targets improving fuel efficiency standards may reduce overall fuel consumption, and a second strategy that targets electric vehicle adoption should incorporate the impacts of more fuel-efficient vehicles on the road at the outset to appropriately assess the impact on GHG emissions).

Buildings Sector

A. Support energy efficiency through building codes

Description

This strategy includes adopting the most current building codes, enforcing existing codes, encouraging local adoption of stretch codes, and educating and training code officials and inspectors on code enforcement. To ensure effective compliance with building codes, this strategy also includes steps to educate municipalities on their ability to implement, encourage or require codes beyond the State Code, including "stretch codes" such as International Green Construction Code (IgCC), Zero Code, and NetZero Codes.

Method, Data and Key Assumptions

Residential Energy Savings: Using ICF's Energy Code Calculator,[166] the analysis team assumed an International Energy Conservation Code (IECC) 2015 base code and then implemented

[166] The Energy Codes calculator is a proprietary tool that estimates changes in energy use based on assumed updates to building codes for new construction.

projected future IECC code versions every six years through 2050. The analysis team also reviewed the 2021 IECC code and considered what aspects to integrate in the analysis. This implementation timeframe was based on the actual time it took to adopt the 2015 codes in Pennsylvania.[167] The team assumed 90% code compliance for all new construction homes with a 30-year measure life, based on requirements set in 2009 SEP grants.[168] New home projections were provided by Pacific Northwest National Laboratory.[169] This approach delivers both electricity and natural gas savings.

Commercial Energy Savings: Again, using ICF's Code Calculator, the team assumed an American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) 2007 base code and implement projected future ASHRAE code versions every six years through 2050. The team assumes 90% code compliance for all new construction, renovations, and additions with a 30-year measure life. New commercial square foot projections were provided by Pacific Northwest National Laboratory. This approach delivers both electricity and natural gas savings.

Strategy Layering: This strategy should be applied before any other building energy strategy.

Emissions Accounting: Emissions savings as a result of building electrification appear in two places—emissions related to electricity consumption are accounted for in the electricity generation sector and emissions related to displaced gas or fossil use appear in the buildings sector. Emissions from electricity consumed by residential and commercial buildings are reported for informational purposes only and are not included in emissions totals.

Applicable Emission Factors

GHG: GHG emission factors for electricity come from IPM. ICF calculated a blended gas supply emission factor over time based on the available supply of renewable natural gas (see Fuel Supply 1 measure) and overall gas demand across the state. Other fuel emission factors come from the U.S. Inventory and 2006 IPCC Guidelines for National Greenhouse Gas Inventories (consistent with the State Inventory Tool).

Air Quality: Air Quality emissions factors for electricity come from IPM. Emissions factors for natural gas, coal, fuel oil and other fuels come from EPA AP-42 Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources; and Emission Factor

---

[167] In May 2018 Pennsylvania moved ahead with adopting the 2015 model International Energy Conservation Code for commercial and residential energy codes, while incorporating some select improvements from the 2018 model code. These changes went into effect in October 2018. https://www.dli.pa.gov/ucc/Documents/rac/UCC-RAC2015-Code-Review-Report.pdf.

[168] During the 2009-12 Recovery act period, SEP grants came with a condition that all states set plans to achieve 90% code compliance. A DOE field study for PA shows close to 90% compliance: https://www.energycodes.gov/sites/default/files/documents/Pennsylvania_Residential_Field_Study.pdf.

[169] Pacific Northwest National Laboratory (PNNL). 2014. Utility Savings Estimator. Accessed on July 13, 2018. https://www.energycodes.gov/resource-center/utility-savings-estimator.

Supporting Documentation for the Final Mercury and Air Toxics Standards. Mercury Air Toxic Standards (MATS).

Costs and Benefits Analysis

Components: Costs associated with residential and commercial energy efficiency was taken from PNNL's Cost-Effectiveness of ASHRAE Standard 90.1-2013 for the State of Pennsylvania[170] and PNNL's Cost-Effectiveness Analysis of the Residential Provisions of the 2015 IECC for Pennsylvania.[171]

Assumptions and data: For Residential: The Total Housing Units for the State of Pennsylvania and throughout the US was take from US Census data.[172] Data on Pennsylvania homeownership was taken from St. Louis FED.[173] A value for U.S. home owners reporting retrofit projects was taken from Harvard's work on Improving America's Homes.[174] A value for the total retrofits in Pennsylvania's housing sector was calculated by using a ratio of the total retrofits vs the total us housing stock and multiplying it by Pennsylvania's total housing units. Energy savings from retrofits was taken from PNNL's cost effectiveness studies. An average square footage of PA's homes and cost per square foot of retrofit was taken from PNNL's studies and applied to the portion of PA's total housing units undergoing a retrofit to determine costs.

For Commercial: BAU growth square footage was applied to base energy codes and subtracted from an advanced energy code from ICF's energy code tool based on code updates every six years to determine energy savings. PNNL's costs per square foot was applied to determine capital costs.

B. Improve residential and commercial energy efficiency (electricity)

Description

This strategy includes several actions to improve residential and commercial energy efficiency by requiring increased residential and commercial energy efficiency improvements targeted at kWh savings, either in the existing framework of or a modified framework of Act 129 and other program (e.g., increasing savings targets and removing spending caps).

For Act 129, this may include increasing the low- to moderate-income (LMI) share of spending and reforming cost-effectiveness tests to support more LMI focus, in coordination with the Low Income Usage Reduction Program (LIURP), and adding climate mitigation and resilience

---

[172] United States Census. https://www.census.gov/data/tables/time-series/demo/popest/2010s-total-housing-units.html

[173] St. Louis FED. https://fred.stlouisfed.org/series/PAHOWN

[174] Joint Center for Housing Studies of Harvard University. Improving America's Housing 2019. https://www.jchs.harvard.edu/sites/default/files/Harvard_JCHS_Improving_Americas_Housing_2019.pdf

benefits to cost effectiveness tests. To enhance Act 129 effectiveness and increase savings, incentives and education should also leverage programs like the federally-funded Low Income Home Energy Assistance Program (LIHEAP) and Weatherization Assistance Program (WAP).

Beyond Act 129, this strategy includes statewide programs targeted at reducing electricity use in large commercial buildings through a gradually expanding Commercial Building Energy Performance Program. Such a program could begin with energy benchmarking of large facilities, and grow to include retro-commissioning or energy efficiency requirements.

Method, Data, and Key Assumptions

Residential Electricity Savings: Based on the Pennsylvania Statewide Evaluator's (SWE) Energy Efficiency Potential Study for Pennsylvania, the analysis team applied the calculated maximum achievable potential energy savings from 2021-2040 (1.5%) and 2041-2050 (2%). Maximum achievable takes into account market barriers, and program savings realization rates. Historical evidence suggests this potential estimate can be achieved. The analysis team assumed a measure lifetime of 10 years.

Commercial Electricity Savings: Again, using the SWE's study, the analysis team applied the maximum achievable potential from 2021-2025 (0.8%) followed by 1.0% annual incremental savings for years 2026-2040 and 1.5% for years 2041-2050. The team assumed a measure lifetime of 10 years. For large commercial building over 50,000 square feet, a series of building performance programs will accelerate energy efficiency. The model assumes a benchmarking program is in place from 2021-2026, followed by a building retuning program from 2027-2032, and then a building retro-commissioning or energy efficiency program starting in 2033. Assumed savings from these programs are 7%, 12%, and 25% respectively across all forms of energy. Program savings are modeled based on city-level programs in Philadelphia[175], and PNNL analysis[176] of building performance potential.

Strategy Layering: SWE's study will serve as the base source for modeling savings in the residential and commercial sector. Accelerated progress for a subset of buildings will be layered on top of the base strategies. This strategy is expected to impact any portion of energy use (representative of buildings) not already impacted by Strategy A.

Emissions Accounting: Emissions savings as a result of energy efficiency improvements that affect electricity consumption are accounted for in the electricity generation sector (reduced generation = reduced emissions).

[176] Pacific Northwest National Laboratories. Improving Commercial Building Operations through Building Re-tuning™: Meta-Analysis. Accessed April 8, 2021. https://buildingretuning.pnnl.gov/documents/PNNL-SA-156277_Re-tuningMeta-Analysis_2020-09-05.pdf

Applicable Emission Factors

GHG: GHG emission factors and emissions come from ICF's Integrated Planning Model (IPM).

Air Quality: Air quality emission factors come from IPM (NO_x and SO_x).

Costs and Benefits Analysis

Components: Costs were derived from previous Pennsylvania Act 129 program costs. Total residential and non-residential costs were taken from the SWE EE Potential study and broken out to determine admin costs, participant costs and total incentives based on the total verified impacts. Costs were then allocated to future years based on $/MWh saved from the various sectors. No program costs were estimated for the building performance program, participant costs were based on $/square foot provided by PNNL and DOE for the implementation of retuning and retro-commissioning programs.

Assumptions and data: Data from Philadelphia's Benchmarking Program was used to estimate emissions reductions from the initial building performance policy.[177]

C. Improve residential and commercial energy efficiency (gas)

Description

This strategy includes creating a new energy efficiency program focused on reducing gas consumption that is similar to the voluntary gas demand side management (DSM) programs already in place with some Pennsylvania gas utilities. This strategy specifically includes statewide programs targeted at reducing natural gas use in large commercial buildings through a gradually expanding Commercial Building Energy Performance Program. This type of program includes energy benchmarking of large facilities, and grow to include retro-commissioning or energy efficiency requirements. It also includes an allocation of a certain portion of funds for LMI individuals, and reform cost-effectiveness tests, e.g., by adding climate mitigation and resilience benefits to the tests.

Method, Data, and Key Assumptions

Residential Gas Savings: Using an American Council for an Energy-Efficient Economy (ACEEE) Energy Efficiency Resource Standard (EERS) policy,[178] the analysis team applied the Massachusetts EERS target of 1.1% annual incremental natural gas savings from 2020-2025 followed by 1.5% annual incremental savings from 2026-2050. The team assumed a measure lifetime of 10 years.

---

[177] City of Philadelphia, Philadelphia Building Energy Benchmarking 2019 Report https://www.phila.gov/media/20191210091804/2019-Municipal-Energy-Benchmarking-Report.pdf

[178] ACEEE. 2020. "Energy Efficiency Resource Standard." Accessed December 15, 2020. https://www.aceee.org/toolkit/2020/02/energy-efficiency-resource-standard.

Commercial Gas Savings: The analysis team used the same approach used for residential gas savings, with savings percentages mirroring electricity.

Strategy Layering: Accelerated progress for a subset of buildings will be layered on top of the base strategies. This strategy is expected to impact any portion of energy use (representative of buildings) not already impacted by Strategy A.

Emissions Accounting: Emissions savings as a result of energy efficiency improvements that affect energy consumption are accounted for in the buildings sector.

Applicable Emission Factors

GHG: The analysis team calculated a blended gas supply emission factor over time based on the available supply of renewable natural gas (see Fuel Supply 1) and overall gas demand across the state.

Air Quality: Air quality emissions factors for gas combustion are from the EPA AP-42 Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources; and Emission Factor Supporting Documentation for the Final Mercury and Air Toxics Standards. Mercury Air Toxic Standards (MATS).

Costs and Benefits Analysis

Components: Costs were derived from previous Pennsylvania Act 129 program costs and through a conversion from MWh to BBTU. Total residential and non-residential costs were taken from the SW EE Potential study and broken out to determine admin costs, participant costs and total incentives based on the total verified impacts.

Assumptions and data: Data from Philadelphia's Benchmarking Program was used to estimate emissions reductions from the initial building performance policy.

D. Incentivize building electrification

Description

This strategy includes incentivizing building electrification (e.g., heating and hot water) for the residential and commercial sectors. It also includes a new program focused on beneficial electrification, possibly modeled on the New York Clean Heat program. This includes incentives for converting fuel oil and natural gas to electricity in existing buildings and electrification of new buildings where there are large natural gas infrastructure costs or where fuel oil is the alternative.

Method, Data and Key Assumptions

Method: The analysis team applied an average annual energy savings potential for residential and commercial buildings to evaluate energy consumption (natural gas, and fuel oil) reductions from electrification of existing buildings. For new buildings, the team evaluated the amount of displaced energy consumption. The team assumed that a set share of residential and

commercial buildings will be retrofitted with electric heating and appliances by 2050, and that a set share of new residential and commercial buildings will be all-electric by 2050. Modeled existing and new building electrification shares by 2050 information can be found in Table 11 below.

Table 11. Buildings composition by type

Type	Existing Buildings	New Buildings
Residential Single Family	75%	90%
Residential Multi-Family	60%	80%
Commercial	50%	75%

Strategy Layering: This strategy is applied after Strategies A, B, and C.

Emissions Accounting: Emissions savings or increases as a result of building electrification appear in two places—emissions related to kWh are accounted for in the electricity generation sector and emissions related to displaced fossil energy use appear in the buildings sector.

Applicable Emission Factors

GHG: GHG emission factors for electricity come from IPM. The analysis team calculated a blended gas supply emission factor over time based on the available supply of renewable natural gas (see Measure A) and overall gas demand across the state. Other fuel emission factors are from the U.S. GHG Inventory and 2006 IPCC Guidelines for National Greenhouse Gas Inventories (consistent with the State Inventory Tool).

Air Quality: Air Quality emissions factors for electricity come from IPM. Emissions factors for natural gas, coal, fuel oil and other fuels are from EPA AP-42 Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources; and Emission Factor Supporting Documentation for the Final Mercury and Air Toxics Standards. Mercury Air Toxic Standards (MATS).

Costs and Benefits Analysis

Components: Program costs were derived from previous Pennsylvania Act 129 program costs and allocated to an electrification program. Program costs were allocated as a cost per unit of energy changed (from natural gas to electricity), as opposed to cost per unit of energy saved. Analysis includes costs of the program and energy cost changes (savings from natural gas and fuel oil, increases from electricity).

Assumptions and data: Electrification conversion factors assumed a HSPF (Heating Seasonal Performance Factor) for residential single family and multifamily of 8.2. Electrification of commercial sector included a 18% efficiency electrification factor taken from ACEEE's

"Electrifying Space Heating in Existing Commercial Buildings" study.[179] Since electrification and cold climate heat pumps are still early technology, a 1% annual improvement curve for capital costs and associated incentives was included in alignment with air source heat pump projections from NREL's "Electrification Future's Study"[180].

E. Increase distributed on-site solar

Description

This strategy includes the installation of on-site distributed solar in both the residential and commercial sectors. On-site, distributed solar photovoltaics plays an important part in the decarbonization of the electrical grid. On-site solar implementation will be aligned with the grid decarbonization strategies outlined in Strategies N and O (found below in this section). To maximize the benefits of this strategy successfully, additional efforts will be needed, such as strategies to expand the development of solar across the Commonwealth, legislation to help develop a robust solar industry at the distributive level, and strategies that increase the value of solar renewable energy credits (SRECs).

Method, Data, and Key Assumptions

Method: The team used IPM to determine the distributed solar generation through 2050, in alignment with Strategies N and O (outlined below). The modeling resulted in a clean grid (100% AEPS requirement by 2050), based on the following constraint: The solar carve out is assumed to be in line with the Finding Pennsylvania's Solar Future Plan initially, and then will go beyond it in 2030 through 2050. This included a carveout to allow for at least 20% of the total solar to come from distributed solar resources.

Strategy Layering: This action is applied after Strategy N. This action interacts with other CAP actions that impact electricity use (e.g., buildings, transportation, and CHP), as the electricity consumption emission factor will change from grid changes in the Commonwealth.

Emissions Accounting: GHG emission accounting for this strategy used IPM Reference Case emissions as a baseline and projected GHG reductions in Pennsylvania from transitioning to a clean grid.

Applicable Emission Factors

GHGs: GHG emissions come from IPM.

Air Quality: Emissions for NO_x and SO_2 come from IPM.

Costs and Benefits Analysis

Costs associated with this measure are aligned with Strategies N and O (outlined below) as they are incorporated to the overall power sector.

Transportation Sector

F. Increase fuel efficiency of all light-duty vehicles and reduce vehicle miles traveled for single occupancy vehicles

Description

This strategy models a reduction of vehicle miles traveled (VMT) for single-occupancy vehicles by implementing travel demand strategies such as shifting travel mode choice, making travel more efficient, and increasing the frequency of telecommuting. It also incorporates projected increases in fuel economy for light duty vehicles assuming a 20% improvement between 2026 and 2050. The VMT reduction efforts are paired with land-use and development policies that incentivize and promote sustainable transportation modes (e.g., walking, biking, transit) in existing densely populated urban areas, and assume the expansion of more sustainable mobility options (bus rapid transit, carpool) to and from urban centers in the medium and long term.

The analysis uses a VMT reduction target of 3.4% by 2030 and 7.5% by 2050 compared to BAU. This estimate is based on the Pennsylvania Energy Assessment Report of 2018,[181] as well as Pennsylvania-specific runs of the EPA's Motor Vehicle Emission Simulator (MOVES), U.S. Energy Information Administration's (EIA) Annual Energy Outlook 2018, and Federal Highway Administration VMT projections.[182]

Method, Data, and Key Assumptions

VMT Reduction: The analysis team used an overall VMT reduction target of 3.4% by 2030 and 7.5% of total VMT from BAU by 2050. This estimate is based on the draft Pennsylvania Energy Assessment Report prepared in 2018,[183] as well as Pennsylvania-specific runs of the EPA's Motor Vehicle Emission Simulator (MOVES), U.S. Energy Information Administration's (EIA) Annual Energy Outlook 2018, and Federal Highway Administration VMT projections.[184] The

[184] Federal Highway Administration (FHWA). 2018. FHWA Forecasts of Vehicle Miles Traveled (VMT): Spring 2018. Accessed July 3, 2018. https://www.fhwa.dot.gov/policyinformation/tables/vmt/vmt_forecast_sum.pdf.

analysis team also captured VMT reductions from fuel efficiency improvements. Fuel efficiency improvements included are a 20% improvement for light-duty vehicles between 2026 and 2050 beyond the existing Corporate Average Fuel Economy (CAFE) standards in place in 2020.

Strategy Layering: The reductions from this strategy were accounted for before Transportation Strategies G and H.

Emissions Accounting: Changes in electricity consumption are accounted for in the electricity generation sector and then reported out for informational purposes here (similar to buildings). Other fuel reduction and related emission reductions are represented in this strategy.

Applicable Emission Factors

GHG: GHG emission factors are from the State Inventory Tool Mobile CO2FFC Module. Electricity emission factors are from ICF's IPM.

Air Quality: Air quality emission factors are ICF-developed factors based on MOVES runs provided by DEP.

Costs and Benefits Analysis

Components: The cost analysis includes savings from reduced fuel consumption and costs of VMT reduction program implementation.

Assumptions and data: Assumed a $0.03/mile cost for program implementation. Fuel costs were taken from AFLEET, AAA, and EIA.

G. Implement the multi-state medium-and heavy-duty zero-emission vehicle memorandum of understanding

Description

This strategy models the implementation of the multi-state medium- and heavy-duty zero-emission vehicle memorandum of understanding (MHD ZEV MOU), of which the State of Pennsylvania is a co-signatory.[185] The goal of the MOU is to reach net zero emissions from MHDVs by 2050. The strategy assumes that 30% of new MHD sales will be ZEV by 2030. By 2050, all new MHDV sales are assumed to be ZEV. Potential actions (as stated in the MOU) may include:

- Financial vehicle and infrastructure incentives.
- Non-financial vehicle and infrastructure incentives.
- Actions to encourage public transit and public fleets to deploy zero emission MHDVs.
- Effective infrastructure deployment strategies.

[185] Multi-state Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding. https://ww2.arb.ca.gov/sites/default/files/2020-07/Multistate-Truck-ZEV-Governors-MOU-20200714.pdf.

- Funding sources and innovative financing models to support incentives and other market-enabling programs.
- Leveraging environmental and air quality benefits associated with the adoption of the California Advanced Clean Trucks rule under Section 177 of the Clean Air Act.
- Coordinated outreach and education to public and private MHDV fleet managers.
- Utility actions to promote zero emission MHDVs, such as electric distribution system planning, beneficial rate design and investment in "make-ready" charging infrastructure.
- Measures to foster electric truck use in densely populated areas.
- Addressing vehicle weight restrictions that are barriers to zero emission MHDV deployment.
- Uniform standards and data collection requirements.
- This strategy also models fuel efficiency improvements in MHDVs, leading to reductions in fuel consumption.

Method, Data, and Key Assumptions

- **Method:** 30% of medium- and heavy-duty vehicles will be ZEVs by 2030, and 100% will be by 2050, aligning with Pennsylvania's commitment in the MHDV MOU. MOVES data was used to determine the breakdown of vehicle type and to calculate displaced fuel consumption due to changes in vehicle type. Fuel efficiency improvements included are a 15% improvement for medium- and heavy-duty vehicles between 2026 and 2050.
- **Strategy Layering:** This measure used Strategy F as a baseline to avoid double-counting emissions reductions.
- **Emissions Accounting:** Changes in electricity consumption are accounted for in the electricity generation sector and then reported out for informational purposes here (similar to the buildings strategies). Other fuel reductions and related emission reductions are represented in this strategy.

Applicable Emission Factors

- **GHG:** GHG emission factors are from the State Inventory Tool Mobile CO2FFC Module. Electricity emission factors come from ICF's IPM.
- **Air Quality:** Air quality emission factors are ICF-developed emission factors based on MOVES runs provided by DEP.

Costs and Benefits Analysis

Components: The analysis includes capital costs of vehicles and charging infrastructure, installation costs, maintenance and repair costs, cost of electricity consumed, and savings from reduced fuel consumption.

Assumptions and data: A vehicle lifetime of 12 years is assumed in this analysis. EVSE capital costs and installation costs are based on subject matter expert assumptions and DOE AFDC data. Vehicle capital costs and maintenance and repair costs are based on data from AFLEET.

H. Increase adoption of light-duty electric vehicles

Description

This strategy includes increasing the adoption of light-duty (LD) electric passenger vehicles including private and municipal fleet vehicles. Assuming a moderate EV adoption scenario adopted from the Pennsylvania Electric Vehicle Roadmap,[186] the strategy assumes that electric vehicles will represent 20% of the light-duty market share by 2030, rising to 70% by 2050.

Method, Data and Key Assumptions

EV Market Penetration: EVs will represent 20% of the light-duty market share by 2030, rising to 70% by 2050. The target is based on the Pennsylvania DEP Pennsylvania Electric Vehicle Roadmap report, with consideration for the current market share.

Strategy Layering: This measure will use Strategy F as a baseline to avoid double-counting emissions reductions.

Emissions Accounting: Changes in electricity consumption are accounted for in the electricity generation sector and then reported out for informational purposes here (similar to the buildings sector). Other fuel reductions and related emission reductions are represented in this strategy. Emissions focus on tailpipe emissions from vehicles.

Applicable Emission Factors

GHG: GHG emission factors are from the State Inventory Tool Mobile CO2FFC Module. Electricity emission factors come from ICF's IPM.

Air Quality: Air quality emission factors are ICF-developed factors based on MOVES runs provided by DEP.

Costs and Benefits Analysis

Components: The analysis includes capital costs of vehicles and charging infrastructure, installation costs, maintenance and repair costs, cost of electricity consumed, and savings from reduced fuel consumption.

Assumptions and data: A vehicle lifetime of 12 years is assumed in this analysis. EVSE capital costs and installation costs are based on subject matter expert assumptions and DOE AFDC data. Vehicle capital costs and maintenance and repair costs are based on data from AFLEET.

---

[186] DEP. 2019. *Pennsylvania Electric Vehicle Roadmap*. https://cadmusgroup.com/wp-content/uploads/2019/02/PAEVRoadmap.pdf?hsCtaTracking=5ecd2a08-e3bb-4c32-830f-a73eeb43268c%7C734499cd-191d-4114-94b9-e146eca840ad.

I. Implement a low carbon fuel standard

Description

The Low Carbon Fuel Standard (LCFS) is a market-based, fuel-neutral program designed to reduce the carbon intensity of traditional transportation fuels through a system of credits which can then be sold to regulated entities, such as importers, producers, and refiners of petroleum fuels, that are required to reduce the carbon intensity of the transportation fuels they sell in-state. Users and producers of low carbon transportation fuels earn LCFS credits through the emission reductions generated by operating their cleaner vehicle. In Pennsylvania, a LCFS-like policy would expand on the ethanol and biodiesel requirements already in place and also include zero-emission vehicles (ZEVs). While the LCFS is fuel neutral, ZEVs generate the highest LCFS credits by achieving the highest carbon reduction compared to conventional and alternative fuels.

The modeling assumes 12% carbon intensity reduction by 2030, and 22% by 2040. After 2040, no additional GHG reductions through LCFS are modeled as the carbon intensity goal is achieved by 2050 due to electrification from other transportation strategies. This measure assumes that supporting policies will be implemented to encourage fuel switching and increased electric vehicle adoption required to meet the 2050 carbon intensity targets.

Method Data and Key Assumptions

Energy Savings: As part of this strategy, changes in fuel consumption and associated emissions from fuel switching to (1) renewable diesel, (2) natural gas (i.e., compressed natural gas), and (3) electricity from gasoline and diesel are estimated. Annual changes in fuel consumption were estimated by linearly interpolating reductions in carbon intensity of the fuel mix in accordance with the 8% and 20% carbon intensity reduction targets by 2030 and 2040, respectively. The analysis team assumed total fuel consumption to be equivalent to BAU fuel consumption.

Strategy Layering: This is the final measure to be implemented, and reductions from other transportation strategies are layered into baseline fuel consumption used to model the LCFS.

Emissions Accounting: Changes in electricity consumption are accounted for in the electricity generation sector and then reported out for informational purposes here (similar to the buildings sector). Other fuel reduction and related emission reductions are represented in this strategy.

Applicable Emission Factors

GHG: GHG emission factors are from the State Inventory Tool Mobile CO2FFC Module. Electricity emission factors come from ICF's IPM.

Air Quality: Air quality emission factors are taken from ICF-developed factors based on MOVES runs provided by DEP.

Costs and Benefits Analysis

Components: This analysis includes the compliance cost based on low carbon fuel programs in California and Oregon, and determining the aggregate cost based on the amount of gasoline and diesel fuel use.

Assumptions and data: Historical cost data from California and Oregon will be used to inform cost ranges.

Industry

J. Increase industrial energy efficiency and fuel switching

Description

This strategy includes leveraging existing DEP programs (e.g., the Energy Efficiency, Environment, and Economics [E4] Initiative) and implementing the types of actions outlined in the Clean Energy Program Plan developed by DEP's Energy Programs Office. This strategy will rely on broader tools such as virtual trainings and expanded partnerships to reach smaller and hard to access industries. In addition to energy efficiency measures, industrial opportunities that fuel switch from fuel oil to natural gas and measures to switch natural gas to electricity are included in this strategy.

Method, Data and Key Assumptions

Energy (Electricity and Natural Gas Savings: An internal ICF sector-based industrial carbon reduction study was used to evaluate energy efficiency potential of the various industrial sectors. The various energy efficiencies were allocated to the total industrial sector proportional to the GHG contribution from various sectors, as determined by EPA's 2018 Facility Level Information on GreenHouse Gases Tool (FLIGHT), part of the EPA's GHG Reporting Program. Industrial GHG emissions from underground coal mines were eliminated entirely by 2050. For the proportion of sector-based emissions not covered by the sector study a factor of 25% energy efficiency potential by 2050 was used. Total energy efficiency potential was ramped up to 2050 measures. Strategies were phased in using an assumed lifecycle of 10 years.

Fuel Switching and Electrification: Fuel oil industrial emission were transitioned to natural gas for 80% of the total fuel oil use by 2050. Electrification of industrial natural gas use was applied for 20% of total natural gas use using the same methodology as Strategy D, for the portion of industrial activity and using an 18% efficiency factor.

Strategy Layering: Reductions from this strategy were applied before Strategy L (increased CHP).

Emissions Accounting: Emissions savings as a result of energy efficiency improvements are accounted for in the industrial sector.

Applicable Emission Factors

GHG: GHG emission factors for electricity come from IPM and other relevant sources or were calculated using assumptions from on-site generation projects. The analysis team also accounted for reduced electricity emissions that result from combined heat and power (CHP) generation and updated the emissions factor for CHP as more projects come online. The team calculated a blended gas supply emission factor over time based on the available supply of renewable natural gas (see Strategy K) and overall gas demand across the state. Other fuel emission factors come from the U.S. Inventory and 2006 IPCC Guidelines for National Greenhouse Gas Inventories (consistent with the State Inventory Tool).

Air Quality: Air Quality emissions factors for electricity come from IPM. Emissions factors for natural gas, coal, fuel oil, and other fuels come from EPA AP-42 Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources; and Emission Factor Supporting Documentation for the Final Mercury and Air Toxics Standards. Mercury Air Toxic Standards (MATS).

Costs and Benefits Analysis

Components: Energy Efficiency Potential was estimated from an internal ICF industrial sector-based energy efficiency study. Factors specific to the following sub-sectors were applied. Pulp and Paper, Iron and Steel, Bulk Chemical, Cement and Lime, Petroleum Refining, and Aluminum and Glass subsector energy efficiency values were used. Emissions from coal mines were eliminated by 2050 and a 25% energy efficiency factor was applied to the remaining emissions from the industrial sector. Program costs for electricity and natural gas reductions were estimated using the same methodologies as applied to the Strategies B and C. Since electrification and cold climate heat pumps are still early technology, a 1% annual improvement curve for capital costs and associated incentives was included in alignment with air source heat pump projections from NREL's "Electrification Future's Study."[187]

Fuel Supply

K. Increase production and use of biogas/renewable gas

Description

This strategy includes increases the production and use of biogas/renewable gas from sources including animal manure, food waste, landfill gas, water resources recovery facilities, agricultural residue, energy crops, forestry residue, and municipal solid waste. This strategy considers the potential for renewable gas and specific applications in Pennsylvania and regionally across a number of feedstocks, as identified in the 2019 American Gas Foundation renewable natural gas (RNG) report, Penn State University's RNG analysis, and ICF's

[187] National Renewable Energy Laboratory 2017. "Electrification Futures Study: End-Use Electric Technology Cost and Performance Projections through 2050", p. 43. Available at: https://www.nrel.gov/docs/fy18osti/70485.pdf .

Pennsylvania RNG database. Some feedstocks for RNG will be used in direct CHP applications, although the majority of available RNG supply will be injected into the pipeline to decarbonize the gas supply in Pennsylvania. The RNG supply increases to 75% of total feedstock by 2050.

Method, Data, and Key Assumptions

Potential for RNG: The analysis team's evaluation for the American Gas Foundation in 2019 found various feedstock options for considering biogas and renewable gas in Pennsylvania. These options and their potential are listed below. The potentials are maximum, and the analysis team applied criteria to reduce the amount of supply available by 2050 and phase in availability over the 2020 to 2050 time period. In particular, thermal gasification feedstocks are not available in the analysis team's modeling until 2030.

Table 12. Feedstock options for biogas and renewable gas

Total (Bcf)	PA Total
Animal Manure	56.4
Food Waste	3.8
Landfill Gas	60.9
WRRFs	4.0
Anaerobic Digestion sub-total	125.2
Agriculture Residue	14.4
Energy Crops	74.5
Forestry Residue	7.5
MSW	33.3
Thermal gasification sub-total	129.7
Total	254.8

Uses of RNG: The analysis team assumed that some feedstocks for RNG will be used in direct CHP applications, but that the majority of available RNG supply will be injected into the pipeline to decarbonize the gas supply in Pennsylvania. As a first step, the analysis team considered RNG use for CHP; landfill gas will not be used for CHP and some portion of anaerobic digester gas will be used for CHP (most likely at water resource recovery facilities (WRRFS) and large farms). The remainder of available RNG is distributed proportionally across the end use sectors of residential and commercial buildings, industrial, and transportation based on total gas need.

Strategy Layering: This action interacts with Strategy L (carbon-free grid), Strategy O (CHP), and all strategies that result in continued natural gas use (i.e., the industrial, residential, commercial, and transportation sectors).

Emissions Accounting: GHG emissions reductions for this strategy are reflected in end use sectors and the power sector, as well as for Strategy M, which focuses on reduction of methane emissions from distribution systems for gas.

Applicable Emission Factors

GHGs: The analysis team assumed that RNG is carbon neutral.

Air Quality: The team used the Argonne National Laboratory's GREET Model to determine air quality emission factors for biogas/renewable natural gas.

Costs and Benefits Analysis

Components: This cost analysis includes capital expenditures and operational costs for RNG production from various feedstock and technology pairings described in the American Gas Foundation report.

Assumptions and data: The analysis includes the costs of bringing RNG supply from various feedstocks on to the pipeline system. ICF evaluated the potential costs associated with the deployment of each feedstock and technology pairing. The cost of deployment includes a series of assumptions regarding the production facility sizes, gas upgrading and conditioning and facility upgrading costs, compression, and interconnect for pipeline injection. The costs used in this analysis are dependent on a variety of assumptions, including feedstock costs, the revenue that might be generated via byproducts or other avoided costs, and the expected rate of return on capital investments. ICF finds that there is potential for cost reductions as the RNG for pipeline injection market matures, production volumes increase, and the underlying structure of the market evolves.

L. Incentivize and increase use of distributed combined heat and power

Description

This strategy includes incentivizing and increasing the use of distributed CHP with microgrids, particularly for high-value applications such as critical facilities (e.g., hospitals) and industrial facilities. High-value applications are those with critical power requirements that can operate CHP systems continuously and are able to utilize all the available electricity and thermal energy. This maximizes the operational efficiency, emission reductions, and resiliency benefits associated with the CHP installations. Critical infrastructure and industrial facilities meet these criteria, making them suitable locations for CHP operations. This analysis only considers traditional topping cycle CHP applications. Other potential CHP applications, such as waste heat-to-power, require a granular site-by-site analysis, and are not considered in this strategy.

Method, Data and Key Assumptions

Energy: While most CHP systems use natural gas, they are substantially more efficient than separate heat and utility-delivered electricity. Instead of relying on two separate sources for electricity and thermal energy, CHP systems generate electricity and capture the heat that would otherwise be wasted. With the improved efficiency, there is a net reduction in fossil fuel consumption when CHP is implemented, provided that marginal grid generators are using fossil fuels. In the BAU case, current and planned CHP installations from ICF's CHP Installation

Database[188] are maintained through 2050. Other cases evaluate CHP potential and expected adoption according to economic factors, utility incentives, and technical potential for new CHP installations in Pennsylvania, referenced from ICF's CHP Technical Potential Database.

Strategy Layering: This strategy will be applied after Strategy K.

Emissions Accounting: Emissions savings appear in two places—emissions related to kWh are accounted for in the electricity generation sector, and emissions related to displaced gas or fossil use appear in the buildings sector.

Applicable Emission Factors

GHG: GHG emission factors for electricity will come from IPM. The analysis team calculated a blended gas supply emission factor over time based on the available supply of renewable natural gas (see Fuel Supply 1 measure) and overall gas demand across the state. Other fuel emission factors come from the U.S. Inventory and 2006 IPCC Guidelines for National Greenhouse Gas Inventories (consistent with the State Inventory Tool).

Air Quality: Air Quality emissions factors for electricity come from IPM. Emissions factors for natural gas, coal, fuel oil and other fuels come from EPA AP-42 Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources; and Emission Factor Supporting Documentation for the Final Mercury and Air Toxics Standards. Mercury Air Toxic Standards (MATS). Applicable biogas air quality factors will also be considered (see Fuel Supply 1).

Costs and Benefits Analysis

Components: The cost analysis includes energy costs, including electricity and natural gas.

Assumptions and data: Costs for high load factor CHP applications are based on state average electricity and natural gas prices for the commercial sector to estimate energy costs. Electricity and gas escalation rates for the commercial sector in the AEO Middle Atlantic reference case were used to estimate energy costs through 2050. For CHP installations 1–20 MW in size, 2019 state average industrial sector electricity and gas prices were used, and for potential installations over 20 MW, gas prices were reduced to the state average city-gate price, plus $2 per MMBtu for pipeline transportation. For all potential installations over 1 MW in size, electricity, and gas escalation rates for the industrial sector in the AEO Middle Atlantic reference case were used to estimate energy costs through 2050.

[188] ICF tracks upcoming CHP installations and maintains the DOE CHP Installation Database, hosted online at https://doe.icfwebservices.com/chp.

M. Reduce methane emissions across oil and natural gas systems

Description

This strategy includes the implementation of practices to reduce methane emissions from upstream and midstream oil and gas operations. This strategy reflects reductions of methane emissions as a co-benefit of the ongoing rulemaking to curb VOC emissions from oil and gas operations.[189] It also includes voluntary mitigation technologies that would be implemented across operations to further reduce methane emissions beyond regulatory requirements.

Method, Data and Key Assumptions

Emissions Reductions: This action focuses on determining achievable voluntary reductions from upstream and midstream oil and gas operations. To establish an initial emissions source level baseline and consider the impacts from recently proposed oil and gas regulations,[190] the analysis team leveraged a DEP analysis which quantified these estimates using 2017 as the base year. DEP's analysis utilized oil and gas company data from DEP's Air Emissions Report[191] and assumptions which determine expected reduction impacts from the implementation of the proposed regulations on individual emission sources. For this analysis, ICF first considered emissions from DEP's baseline 2017 data for various emission sources. Expected regulatory reduction impacts were then applied (also per DEP analysis) to arrive at a baseline, net emissions estimate after regulatory control. ICF then considered the implementation of mitigative actions for certain sources to determine additional, achievable voluntary reductions beyond regulatory control. These voluntary reductions were calculated by utilizing an assumed applicability (e.g., technical limitations may exist at certain sites), reduction effectiveness, and the ability for a given operator to achieve the mitigation action in the base year. Each of the above assumptions are based on ICF input. Because DEP estimates are provided for unconventional sources only, conventional estimates were assumed to match that of unconventional sources, similar to the 2018 CAP. All results generated in this analysis were then scaled to match upstream SIT estimates to give appropriate segment proportions and to match BAU case estimates.

Annualization and Projection of Emission and Reduction Results: AEO 2020 reference case oil and natural gas production values were used to project 2017 baseline estimates to 2050. Certain source emissions were derived using forecasted natural gas production, while others were derived using a combination of oil/natural gas production (combined BTU). AEO estimates utilized in this analysis represent the Middle Atlantic and East supply regions, respectively. Forecasted natural gas prices used when determining recovered revenue discussed below also

---

[189] This rulemaking establishes requirements for storage vessels, natural gas driven pneumatic controllers, natural gas-driven diaphragm pumps, reciprocating and centrifugal compressors, and fugitive emissions components. For more information see: https://www.dep.pa.gov/Business/Air/pages/methane-reduction-strategy.aspx

[190] Pennsylvania DEP; https://www.dep.pa.gov/Business/Air/pages/methane-reduction-strategy.aspx.

[191] Pennsylvania DEP Air Emissions Report; http://cedatareporting.pa.gov/reports/powerbi/Public/DEP/AQ/PBI/Air_Emissions_Report.

represent the East supply region in the 2020 AEO. Reductions in future years were determined by first removing achieved reductions in the prior year, then applying applicable reduction percentages to the projected source level net emission estimate in the following year. The analysis team assumed all operators would have the ability to implement voluntary mitigative action by 2050.

Costs and Benefits Analysis

Associated Costs: Capital and operating costs were determined by applying voluntary reduction volumes as determined above to an associated reduction amount per activity. This determines the number of required actions (and associated capital and operating costs) based on the appropriate volume of voluntary reductions for each source. Recovered revenue is calculated using voluntary reduction volumes from activities where capture is possible.

Electricity Generation

N. Maintain nuclear generation at current levels

Description

This strategy includes implementing a policy to maintain nuclear generation at current levels. This would assume an 80-year lifetime extension for plants currently in operation; all plants currently in operation would stay online through 2050 at least with this extension. This lifetime assumption is incorporated into the carbon emissions free grid strategy below and therefore the costs and benefits associated with this strategy are incorporated in the carbon free grid strategy. Nuclear facilities can obtain two 20-year operating license extensions (known as subsequent license renewal), from the Nuclear Regulatory Commission. Two facilities have been granted second extensions, which extends their lifetime to 80 years: Peach Bottom Units 2 and 3 and Turkey Point Units 3 and 4. Four subsequent license renewal applications representing nine nuclear units are pending with the NRC, comprising nine nuclear units.

Method, Data and Key Assumptions

Energy: Current (as of 2020) nuclear generation levels are held constant after these plants are closed. To model a policy action that restores these units to service for the study period, their capacity and generation are added back to the PJM fleet. To balance the overall electricity generation totals over the years (i.e., to not create new generation on top of the business-as-usual scenario), the team assumed that nuclear electricity generation displaces coal and natural gas electricity generation in future years.

Strategy Layering: This action is applied before Strategy O.

GHG Accounting: GHG emission accounting for this strategy used IPM Reference Case output as a baseline, and projected GHG reductions from maintaining nuclear as a source of electricity generation at current levels.

Applicable Emission Factors

GHGs: GHG emission factors come from IPM.

Air Quality: Air quality emission factors come from IPM.

Costs and Benefits Analysis

The cost analysis for this strategy is included in the cost analysis Strategy O.

O. Create a carbon emissions-free grid

Description

This strategy includes increasing the Alternative Energy Portfolio Standard (AEPS) to an in-state requirement of 100% by 2050 to achieve a carbon free electricity grid. The electric grid is the network that generates and delivers electricity to consumers and includes generating stations, electrical substations, and transmission and distribution power lines. Tier 1 targets and the solar carve out would be increased. The solar carve-out can be supplied by in-state grid-scale and distributed solar resources. Nuclear, storage, and fossil with carbon capture and sequestration would be added to the definition of eligible energy sources for Tier 1 as part of the portfolio of options to meet the 100% target. The Tier 2 requirement is maintained at the current level of 10% through 2050. Waste coal begins to retire as renewable and storage capacity comes online and there is no waste coal in 2050 due to the carbon free emissions limit.

To implement this successfully, additional efforts will need to be employed, such as strategies to expand the development of solar and wind projects across the Commonwealth and legislation to help develop a robust solar industry. Increasing the solar carve-out to 10% by 2030 would help increase the value of solar renewable energy credits (SRECs). This is also aligned with the DEP's Pennsylvania Solar Future Plan as discussed in the Distributed On-site Solar Strategy outlined in Strategy E. Additional consideration and efforts will be needed to ensure solar farm siting does not remove forested areas. It is important to conserve forests for carbon sequestration and storage.

Method, Data, and Key Assumptions

Method: The team used IPM to determine the generation through 2050 that will result in a clean grid (100% AEPS requirement by 2050), based on several constraints:

- The solar carve out is assumed to be in line with the Finding Pennsylvania's Solar Future Plan initially, and then will go beyond it in 2030 through 2050.
- Generation for other eligible renewables from 2020 through 2050 were developed using IPM.
- All Alternative Energy Credits (AECs) for the solar carveout and for Tier 2 resources are assumed to come from in-state generation, as required through legislation.

Strategy Layering: This strategy is applied after Strategy N. This strategy interacts with other CAP strategies that impact electricity use (e.g., buildings, transportation, and CHP), as the electricity consumption emission factor will change from grid changes in the Commonwealth.

GHG Accounting: GHG emission accounting for this strategy used IPM Reference Case emissions as a baseline and projected GHG reductions in Pennsylvania from transitioning to a clean grid.

Applicable Emission Factors

GHGs: GHG emissions come from IPM.

Air Quality: Emissions for NO_x and SO_2 come from IPM.

Costs and Benefits Analysis

Refer to EPA's Power Sector Modeling Platform 2020 Reference Case Incremental Documentation for information on the cost analysis associated with this strategy. Costs and savings associated with reconfiguring both the distribution and transmission grids to handle larger amounts of distributed energy resources and new utility scale renewable projects were not estimated as part of this Strategy.

Agriculture

P. Use programs, tools, and incentives to increase energy efficiency for agriculture

Description

This strategy includes programs, tools, and incentives to increase energy efficiency for agricultural end uses such as refrigeration, ventilation, and lighting.[192] For this strategy, energy efficiency improvements are based on a report prepared for DEP by EnSave, titled "Energy Use, Energy Savings, and Energy Efficiency Policy Recommendations for Pennsylvania Agriculture."[193] This report analyzes the potential savings in electricity and fuel consumption that would result from adopting certain efficiency measures.

This strategy estimates potential energy savings for agricultural operations using the commercial energy efficiency savings modeled in the building strategies on energy efficiency (B and C). These savings estimates, based on Act 129, were applied to the technical energy efficiency potential from the EnSave report. The decreases in electricity and fuel consumption

[192] In addition to GHG reductions from energy efficiency measures, installation of manure digesters can also significantly reduce on-farm emissions. These reductions are estimated under the renewable natural gas strategy, "Increase Production and Use of Biogas/Renewable Gas."

[193] See https://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/Pollution%20prevention%20and%20Energy%20assiatance/Energy%20Use,%20Energy%20Savings,%20and%20Energy%20Efficiency%20Policy%20Recommendations%20for%20Pennsylvania%20Agriculture-2020.pdf.

were then converted to associated GHG emissions reductions. For this strategy, the measure lifetime was assumed to be 10 years.

Method, Data and Key Assumptions

Baseline Farm Energy Use: Annual baseline farm energy consumption data is based on a report by EnSave titled "Energy Use, Energy Savings, and Energy Efficiency Policy Recommendations for Pennsylvania Agriculture."[194] The report provides estimates for annual electricity and fuel usage for dairy, beef, poultry, swine, orchard, greenhouse, and crop farming. These estimates are based on EnSave's Farm Energy Audit Tool (FEAT) database. This baseline was disaggregated from the EIA BAU data to ensure alignment and to prevent double counting.

Energy Efficiency Measures: EnSave's report provides a list of recommended energy efficiency strategies that offer farmers the most energy savings potential and reduced fuel consumption. Examples of potential strategies include implementing LED lighting and lighting controls, high-efficiency circulation fans, high-efficiency scroll compressors, wall insulation, and compressor heat recovery systems. The analysis team assumed that the achievable savings would be 10% of the total technical annual savings potential. The strategies were modeled to have a measure lifetime of 10 years, and the associated energy savings are also modeled to run out after 10 years.

GHG Accounting: Emissions savings as a result of energy efficiency improvements that affect electricity consumption are accounted for in the electricity generation sector (reduced generation = reduced emissions). Emissions from electricity consumed by farms were reported for informational purposes only and are not included in total emissions reductions. Thus, total emissions reductions for this strategy only include the reductions associated with decreased fuel consumption.

Strategy Layering: This strategy uses BAU energy consumption estimates from the industrial sector. Emission reductions from this strategy are assumed to be unique and do not overlap with the reductions modeled in the industrial energy efficiency measure.

Applicable Emission Factors

GHG: GHG emission factors for electricity come from IPM, which accounts for reduced electricity emissions that result from CHP generation and other generation-based changes. Other fuel emission factors come from the U.S. Inventory and *2006 IPCC Guidelines for National Greenhouse Gas Inventories* (consistent with the State Inventory Tool).

Air Quality: Air Quality emissions factors for electricity come from eGRID data. Emissions factors for natural gas, coal, fuel oil, and other fuels come from EPA AP-42 Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources;

---

[194] EnSave report "Energy Use, Energy Savings, and Energy Efficiency Policy Recommendations for Pennsylvania Agriculture."

and Emission Factor Supporting Documentation for the Final Mercury and Air Toxics Standards. Mercury Air Toxic Standards (MATS).

Q. Provide trainings and tools to implement agricultural best practices

Description

This strategy includes trainings and tools to implement agricultural best practices, such as those focused on no-till farming practices and integrated farm management to reduce the amount of GHGs emitted by farmlands. Practices could include rotational grazing, silvopasture, and organic and regenerative agricultural methods. The modeling of this strategy assumes that agricultural practices are implemented with the intention of reducing tillage intensity and thereby lowering GHG emissions.

The modeling for this strategy follows a similar methodology to the 2018 CAP. Tillage practices by crop are based on a survey of Pennsylvania farmers conducted by USDA for 2013 and 2014.[195] The modeling team assumed that the proportion of fields with no-till acreage will increase at a constant rate of 5.9% annually until it reaches 98% of all acres, the maximum potential of no-till adoption. GHG reductions are calculated for both the annual increases in carbon sequestration and the decreases in fuel consumption required for tilling.

Method, Data and Key Assumptions

Total Acres Planted: The analysis team assumed the total agricultural acres planted in Pennsylvania will increase by approximately 2% annually based on the U.S. Department of Agriculture (USDA) Pennsylvania Tillage Survey statistics for 2013 and 2014.

Acres Planted by Crop: The team assumed that the percentage of acres planted by crop is consistent with the average percentage of acres planted by crop from 2011 to 2019, as obtained from the USDA National Agricultural Statistics Service QuickStats database.[196]

Tillage Adoption: The team assumed conventional tillage acres will transition to reduced tillage acres, and reduced tillage acres will transition to no-tillage acres.[197]

No-Till Adoption: According to USDA's Pennsylvania Tillage Survey statistics, no-till acres increased by approximately 8.5% from 2013 to 2014. The analysis team conservatively assumed no-till acres in Pennsylvania will increase by approximately 6% annually based on the slower,

---

[195] USDA. 2015. "Tillage Practices with Updated Alfalfa Seedings and Final Acreages." https://www.nass.usda.gov/Statistics_by_State/Pennsylvania/Publications/Survey_Results/tillage%202014%20jan%2020125.pdf.

[196] See: https://quickstats.nass.usda.gov/. Accessed July 4, 2018.

[197] In 2013, farmland comprised 16.6% conventional till acres, 21.5% reduced till acres, and 61.9% no till acres comprised. USDA. 2015. Tillage Practices with Updated Alfalfa Seedings and Final Acreages. Accessed July 3, 2018/. https://www.nass.usda.gov/Statistics_by_State/Pennsylvania/Publications/Survey_Results/tillage%202014%20jan%2020125.pdf.

historical trend of no-till adoption. The team also assumed that no-till adoption will reach a maximum of 98% of acres planted by 2024.

Reduced Till Adoption: According to USDA Pennsylvania Tillage Survey statistics, reduced till acres decreased by approximately 16% from 2013 to 2014. For this analysis, the team assumed this trend will continue through 2020. After 2020, reduced till acres will decrease by approximately 30,000 acres annually until no-till adoption reaches 98% of total acres planted in 2024. After 2024, the share of reduced till acres will remain constant at approximately 1% of total acres planted.

Conventional Till: Conventional till acres were assumed to equal the difference between total acres planted, no-till acres, and reduced till acres.

Carbon Sequestration: Emission reductions by crop/tillage practice for USDA's Northeast region come from the USDA's "Greenhouse Gas Mitigation Options and Costs for Agricultural Land and Animal Production within the United States" report. Emission reductions by crop/tillage practice are based on Pennsylvania's average share of acres planted by crop from 2011 to 2019.

Changes in Yield: Changes in yield by crop/tillage practice for USDA's Northeast region come from USDA's "Greenhouse Gas Mitigation Options and Costs for Agricultural Land and Animal Production within the United States" report. Changes in yield by crop/tillage practice are based on Pennsylvania's average share of acres planted by crop from 2011 to 2019.

Changes in Production and Revenue: The analysis team multiplied estimates of reduced yield by the projected estimates of conventional, reduced, and no-till acres in Pennsylvania to obtain reduced production estimates. The team multiplied production by weighted revenue (dollars per short ton of production).

Strategy Layering: This strategy does not require any layering.

Applicable Emission Factors

Carbon sequestration factors for various crop types are based on estimates from USDA's "Greenhouse Gas Mitigation Options and Costs for Agricultural Land and Animal Production within the United States." Fuel emission factors come from the U.S. Inventory and *2006 IPCC Guidelines for National Greenhouse Gas Inventories* (consistent with the State Inventory Tool).

Air quality emission factors for electricity come from eGRID data. Emissions factors for natural gas, fuel oil, LPG, and other fuels come from EPA AP-42 Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources; and Emission Factor Supporting Documentation for the Final Mercury and Air Toxics Standards. Mercury Air Toxic Standards (MATS).

Costs and Benefits Analysis

Components: This strategy includes estimates of savings from reduced fuel consumption as well as costs incurred from capital expenditures on a per acre basis, as well as operation and maintenance costs by crop, fertilizer usage, and tillage practice.

Assumptions and data: The team estimated fuel savings by applying USDA regional estimates of fuel consumption ($/acre) for various tillage practices to the projected estimates of conventional, reduced, and no-till acres in Pennsylvania. The analysis team assumed diesel, natural gas, liquefied petroleum gas (LPG), motor gasoline, and kerosene represented 73, 23, 2, 3, and <1% of consumption on a BTU basis, respectively, based on consumption data for the Agriculture economic sector from U.S. EPA's 1990-2016 Inventory of U.S. Greenhouse Gas Emissions and Sinks.

The analysis team relies on estimates of capital costs per acre from University of Illinois' 2017 Machinery Cost Estimates. The team then applies per acre capital costs to the projected estimates of conventional, reduced, and no-till acres in Pennsylvania.

The analysis team weights USDA Pennsylvania O&M plowing, planting, drilling, and spraying costs by crop, fertilizer usage, and tillage practice. The team then applies the weighted O&M costs per acre to the projected estimates of conventional, reduced, and no-till acres in Pennsylvania.

Land Use, Land-Use Change, and Forestry

R. Increase land and forest management for natural sequestration

Description

This strategy includes managing and increasing forest cover, particularly of oak-hickory forest, through a reduction of forest removal from 130-yr rotation, and additional conversion of abandoned mined lands or marginalized croplands to forests. This strategy compares the business-as-usual carbon sequestration from forested lands to the addition of natural vegetation on previously barren or marginal lands. DEP's Bureau of Abandoned Mine Land Reclamation received an award for their efforts in removing harmful coal refuse piles and restoring natural vegetation to previously functional mining lands. Since 2016, $105 million in grants have been supplied to Pennsylvania's economy for 53 projects of this nature.[198] While reforestation is not always an option (e.g., on lands that are seriously degraded), replanting native vegetation of many varieties can sequester more carbon than bare mine lands.

There are many options for increasing sequestration on natural lands beyond what is quantified in this strategy. Every year, forests and harvested wood products uptake the equivalent of over 14% of economy-wide CO_2 emissions nationwide. There is a potential to increase carbon

[198] DEP. 2020. "Pennsylvania Receives National Reclamation Award." Available at: https://www.dep.pa.gov/OurCommonWealth/Pages/Article.aspx?post=62.

sequestration capacity by ~20% per year by fully stocking all understocked productive forestland.[199] Additional considerations should be made for strategies to increase forest coverage and improving the timber stock on existing forest land in Pennsylvania.

The Bureau of Forestry of Pennsylvania Department of Natural Resources and Conservation (PA DCNR) identifies no-net-loss of forest cover and increasing forest acreage as major strategies in its climate change mitigation and adaptation plan.[200] Of the individual actions analyzed in this strategy, extending forest rotation and increasing the percentage of long-lived products provides the highest cumulative sequestration potential with 81% of the cumulative carbon sequestered through 2050. Of the actions that increased forestland acreage, urban open spaces offered the single highest potential with 9.2% of the total carbon sequestered. Afforestation of urban open spaces can improve urban air quality while at the same time reducing atmospheric CO_2.[201,202] Afforestation of abandoned mine lands and marginal cropland together represented 5% of the total sequestration potential. Incorporating forests on pastureland represented just 1% of the total sequestration potential due to the assumed low implementation rate.

Challenges and opportunities: A survey of forestry officials cited low funding and a lack of value attributed to forestry as challenges. It recommended increasing steady long-term funding and improving visibility and accessibility of programs. The Forest Stewardship, Forest Land Enhancement, and Forest Legacy Programs were highly rated by forestry officials.[71]

Other considerations: Pasture usually shifts to forest by reclassification when growing trees gain at least 10% canopy. Given the potential pastureland offers, silvopasture might be worth further examination. Opportunity costs and potential leakages from reduced timber harvests will also attribute to ecosystem services, and lack of public awareness as major impediments. Suggestions for improvement need to be examined. Advancements in high-resolution forest carbon measurement will improve accounting, monitoring, and management of the state's carbon stocks.

Oak-hickory (*Quercus*/*Carya*) is the most prevalent forest type in Pennsylvania covering 54% (3,682,640 ha) of the state's area.[73,203] An assessment of habitat suitability, colonization potential,

After 25 years, what does the Pennsylvania Regeneration Study tell us about oak/hickory forests under stress? In: J. M. Kabrick, D. C. Dey, B.O. Knapp, D.R. Larsen, S.R. Shifley, H.E. Stelzer, eds.

and adaptation traits showed that the oaks and hickories have moderate to high adaptability in the state under high and low emissions scenarios for the year 2100.[204] Under a changing climate scenario, white oak (*Quercus alba*), black oak (*Quercus velutina*), and chestnut oak (*Quercus prinus*) were shown to have high coping capabilities in their habitats in the state. Shagbark hickory (*Carya ovata*), pignut hickory (*Carya glabra*), and mockernut hickory (*Carya alba*) were capable of coping under these conditions as well.[204] More than 60% of oak/hickory forests will need management and policy guidelines to prevent intense browsing from deer, which could be a major challenge as seen with the Pennsylvania Oak Forest Regeneration project.[203]

Method, Data and Key Assumptions

Additional sequestration strategies

In addition to the business-as-usual scenario, eight sequestration strategies were considered and three were assessed for their sequestration potential, described below.

1. Harvest extension and increase in long-lived wood products

The U.S. Department of Agriculture Forest Service PA DCNR evaluated 10 management scenarios for the state's forests. Their methods for quantifying forest sector carbon trends, mitigation potential, and substitution benefits as described in Dugan (2018) involved a systems-based approach in a carbon modeling framework. This included:

- An ecosystem model based on growth and yield (the Carbon Budget Model for the Canadian Forest Sector (CBM-CFS3 configured for Pennsylvanian Forest types),
- A lifecycle harvested wood products model (the Carbon Budget Modeling Framework of Harvested Wood Products, CBMF-HWP), and
- published displacement factors for substituting wood fiber for fossil fuel-based energy or products.
- Site-specific input data of forest characteristics and harvesting was obtained from the DCNR forest inventory, the Forest Service's Forest Inventory and Analysis (FIA) database, and remotely sensed disturbance and land-use change data.

Among the scenarios, the highest climate mitigation was projected from extending harvest rotations, reducing harvests, and increasing the proportion of long-lived wood products (including saw logs and panels by 5% at the cost of pulp and paper). This strategy is based on the cited work, Dugan, A., et al. (2018). *Assessment of Forest Sector Carbon Stocks and Mitigation Potential for the State Forests of Pennsylvania* presents modeling scenarios crafted to identify

---

Proceedings of the 20th Central Hardwood Forest Conference; 2016 March 28-April 1; Columbia, MO. General Technical Report NRS-P-167. Newtown Square, PA: U.S. Department of Agriculture, Forest Service, Northern Research Station: 280-290.

[204] Iverson, L. R., Prasad, A. M., Peters, M. P., & Matthews, S. N. (2019). Facilitating Adaptive Forest Management under Climate Change: A Spatially Specific Synthesis of 125 Species for Habitat Changes and Assisted Migration over the Eastern United States. Forests, 10(11), 989. doi:10.3390/f10110989.

strategies that may lead to gains in atmospheric carbon sequestration and carbon storage on forest lands. Scenarios such as very short rotation lengths, which may be practical if PA develops robust bioenergy markets and extending minimum rotation ages of PA forests beyond the typical 80 years were presented. Results from this work suggest that extending rotations to 130 years or more is one of the best strategies for increasing forest carbon. This conclusion is based on data inputs provided to the models and the modeling parameters used. These inputs and parameters did not include robust environmental, social, or economic data to evaluate the trade-offs associated with the scenarios. For example, the current age class distribution of PA's forests is heavily skewed to the mature forest age classes. What this means is young forest is under-represented in PA to the detriment of many wildlife species that depend on these forests for habitat. Extending the rotation of PA forests, which in effect delays the creation of young forest, will likely lead to even less young forest and this trade-off was not evaluated. Additionally, the impact on the PA timber industry that could result from a decreased availability of harvestable timber was not considered in these models either. Although extending the minimum rotation of PA forests appears to be a viable strategy for increasing forest carbon, a thorough evaluation of the associated trade-offs is necessary to ensure there are not any unintended negative impacts.

This scenario is expected to result in a decrease in annual harvest removals because the extension of harvest rotations results in fewer trees being cut each year. About half of this benefit was attributed to the 5% increase in long-lived wood products; increasing the proportion of harvested wood going to such uses further could be a significant driver for greater carbon mitigation from forest management and use. This scenario was projected to have the greatest cumulative mitigation benefit from 2020 through 2050, and therefore was selected for this RGGI strategy. This strategy reduced emissions statewide compared to the BAU scenario by an estimated 6%. This percentage was applied to the business-as-usual scenario for each year to obtain the additional sequestration potential.

2. Afforestation of abandoned mine land

It was assumed that 75% of the total 101,174 ha (250,000 acres) abandoned or legacy mine land in Pennsylvania was available for afforestation. A 5-year implementation period (2022 to 2027) was assumed. Over the project period (2022 – 2050), the average of non-soil forest carbon stocks (live tree, standing dead tree, understory, dead down wood, and forest floor) was estimated based on timber volume and carbon stocks in Oak-Hickory stands in the Northeast reported by Smith et al. (2006). The estimated carbon sink was further reduced by 50% to account for growth rates and carbon pools on abandoned mine lands being lower than natural forests. The annual sequestration rate of 0.65 tonnes CO_{2e}/yr over 35 years, was obtained from the average carbon stocks. Oak-hickory stands were chosen due to their dominance in the state's forests, high-value to the timber industry, and being the most important source of mast for wildlife.

The annual carbon storage was calculated as the sum of annual carbon sequestration on the cumulative planted area.

Costs of site preparation were estimated between $6,175/hectare to $8,645/hectare (pers. comm., Michael Jacobson, Penn State). Costs depended on the extent of land preparation needed, particularly, the depth of ripping required for legacy mine lands with compacted topsoil and the number of trees to be planted.

3. Sequestration from Reforestation – Forests Open Space, Marginal Croplands, Grasslands, Pasture, Shrubs, and Urban Open Space.

Definitions of the land use types followed the National Land Cover Database and the area of opportunity for each strategy was obtained from Cook-Patton et al. (2020).[71]

Carbon stocks, annual sequestration rate, and cumulative annual sequestration followed methods described above for the afforestation of mined lands with a few exceptions:

- No allowance was made for slow growth as done for abandoned mine lands. An annual sequestration rate of 1.31 $MTCO_2e$/year over 35 years was used.
- The implementation area was 40% of pastureland with a maximum of 5% per year.

Applicable Emission Factors

Carbon sequestration factors for reclaimed forest land are based on the study "Early Tree Growth in Reclaimed Mine Soils in Appalachia USA."[205]

Costs and Benefits Analysis

Economic metrics were not estimated for this strategy due to the complexity of quantifying costs and benefits associated with natural lands.

Zero opportunity cost was assumed for abandoned mine lands as they are considered to be underutilized.

Macroeconomic Modeling Methodology

The analysis team used a method to estimate the macroeconomic impacts similar to that used in the 2018 CAP analysis. The macroeconomic modeling (e.g., changes in jobs) was conducted using the REMI PI+ model. This is a structural economic forecasting and policy analysis model that integrates several analytic techniques including input-output, computable general equilibrium (CGE), econometric, and economic geography methodologies. REMI is a dynamic model with forecasts and simulations to include behavioral responses to wage, price, and other economic factors. It can be used for estimating national-, regional-, and state-level impacts of any policy changes. The dynamic modeling framework supports the option to forecast how changes in the economy, and adjustments to those changes, will occur on an annual basis.

[205] Dallaire, K., & Skousen, J. (2019). Early Tree Growth in Reclaimed Mine Soils in Appalachia USA. Forests, 10(7), 549. https://www.mdpi.com/1999-4907/10/7/549.

REMI functions by forecasting two states of the world. The first is the state of the regional economy under some standard assumptions of employment and population changes. This first forecast is referred to as the control forecast. The second forecast, in which the model user incorporates the desired policy changes, is referred to as the alternative forecast or the simulation. The difference between the two forecasts is the estimated effect of the policy, and only these incremental costs are modeled in REMI. Policy changes that were input into REMI were modeled by the analysis team as described above.

Macroeconomic factors are available from REMI, which capture multiple benefit and cost effects, including employment, gross state product, and personal income. To better understand the macroeconomic impacts of the CAP, DEP and the analysis team examined the strategies in greater detail by estimating the impacts on employment, gross state product (GSP), and disposable personal income for Commonwealth residents.

REMI provides a detailed set of macroeconomic results, including industry-specific changes to employment, output, and income. REMI also provides context into commodity price and population changes, as well as economic leakage (e.g., how competitive Pennsylvania is compared to surrounding states, and how many jobs may move into Pennsylvania or may move to other regions). For this analysis, the key metrics of interest are employment, gross state product, and disposable personal income.

- **Employment:** Employment comprises estimates of the number of jobs, full-time plus part-time, by place of work for all industries.
- **Gross state product:** The market value of goods and services produced by labor and property in Pennsylvania.
- **Disposable personal income:** Total after-tax income received by persons, i.e., the income available to persons for spending or saving.

The analysis team used the REMI model and individual action-level inputs to model the CAP strategies and estimate the macroeconomic impacts. These inputs vary by sector.

Building sector: Revised building codes and energy efficiency incentives for the residential and commercial sectors, resulting in modeling capital expenditures and electricity savings for consumers and businesses. Electrification strategies tend to result in increasing energy costs for consumers because of fuel shifts from natural gas to electricity. Distributed solar generation investments result in changing energy savings as consumers can use their self-generated power.

Transportation sector: Investments in light-, medium-, and heavy-duty electric vehicles (a negative impact on consumer budgets) result in increases in electricity bills, but also gasoline and diesel savings and lower maintenance costs. Investments in electric charging infrastructure generates local construction and manufacturing jobs. VMT reduction strategies lower consumer costs, but also result in less revenue for gas and service stations. Implementation of a low carbon fuel standard would result in changing revenue for the fossil fuel industry.

Industrial sector: Capital expenditures for efficient appliances and electrification of the manufacturing process results in changes to electricity use (e.g., an increase for electrification but a decrease for energy efficient appliances) and bill savings from reduced fuel usage (e.g., from reduced natural gas consumption as a result of electrification).

Fuel supply sector: Impacts from an increase in waste digester usage to create energy for sectors such as agriculture, wastewater, landfills, and coal mines. These technologies require capital investment but drive energy savings through the creation of renewable natural gas.

Electricity generation sector: Investments in renewable energy (e.g., wind and solar) and shifts away from fossil fuels (e.g., coal and natural gas) result in economic impacts. This analysis uses the Jobs and Economic Development Impact models from National Renewable Energy Laboratory to identify industry-specific impacts for modeling in REMI. The analysis uses IPM to estimate ratepayer impacts from changing generation mix, credit costs, and carbon price impacts.

Agricultural sector: Savings on diesel and gas expenditures from encouraging best agricultural practices result in some capital expenditures and some savings associated with changing fuel consumption.

Environmental Justice and Equity Analysis

Environmental justice and equity were analyzed and integrated at multiple points in the climate action planning process related to both GHG reductions and adaptation. At the beginning of the process, DEP engaged with the Office of Environmental Justice, and DEP continued to seek feedback and input from this Office throughout the development of the CAP to ensure alignment with Pennsylvania-wide environmental justice principles and polices.

GHG Reductions

To identify and prioritize GHG reduction strategies, DEP first worked with ICF and the CCAC to develop an initial potential list. This list was refined and then prioritized based on a set of criteria, one of which was Environmental Justice and Equitable Implementation Opportunity Benefits. This criterion considered the potential to improve environmental justice, and to design implementation strategies that may result in more equitable outcomes.

Additionally, during the early phases of the CAP development, DEP worked with ICF to evaluate different existing and potential programs around the country that focused on providing equitable benefits. This screening helped support the prioritization analysis and informed the development of strategies to specifically consider equitable access to program benefits and implementation. Strategy-specific considerations related to equity are included in each of the recommended implementation considerations.

GHG reduction strategies have the potential to advance equity by improving air quality in disproportionately impacted communities, reducing energy bills in low-income households through building weatherization and strategic electrification, increasing transit options in areas with low accessibility, and more.

Defining Environmental Justice and Equitable Implementation

Environmental justice embodies the principles that communities and populations should not be disproportionally exposed to adverse environmental impacts. Historically, minority and low-income Pennsylvanians have been forced to bear a disproportionate share of adverse environmental impacts. Addressing environmental justice means that ensuring that all Pennsylvanians, especially those that have typically been disenfranchised, are meaningfully involved in the decisions that affect their environment and that all communities are not unjustly and/or disproportionally burden with adverse environmental impacts.

Equitable implementation embodies the principle and commitment to promote fairness and justice in the formation of public policy that results in all residents—regardless of age, race, color, sex, sexual orientation, gender identity, religion, national origin, marital status, disability, socio-economic status or neighborhood of residence or other characteristics—having opportunity to fully participate in and benefit from program or policy opportunities.

In general, any given GHG reduction strategy's capacity to benefit or detract from equity depends in part on how the strategy is designed and implemented. Strategies focused on increasing electric vehicle adoption provide a good example of the complexities of determining equity in GHG reduction strategies. There are equity benefits inherent to the strategy, as reduced tailpipe emissions lead to lower air pollution near roadways, thus helping to mitigate disparities in exposure to air pollutants from vehicles.[206] A counterargument to the tailpipe emission reduction benefit is that increased adoption of electric vehicles also leads to increased electricity generation, so potential disparities in exposure to stationary-source air pollution from power plants must be considered as well. However, the electricity generation sector is decarbonizing and eliminating criteria pollutants at a much faster rate than the transportation sector; this, combined with the greater efficiency of electric vehicles in total energy usage versus internal combustion engine vehicles, makes vehicle electrification a preferable strategy to lower net emission impacts from transportation.

[206] Literature shows that that "populations on the lower end of the socio-economic spectrum and minorities are disproportionately exposed to traffic and air pollution and at higher risk for adverse health outcomes." See Pratt, et al. 2015. *Traffic, Air Pollution, Minority and Socio-Economic Status: Addressing Inequities in Exposure and Risk*.

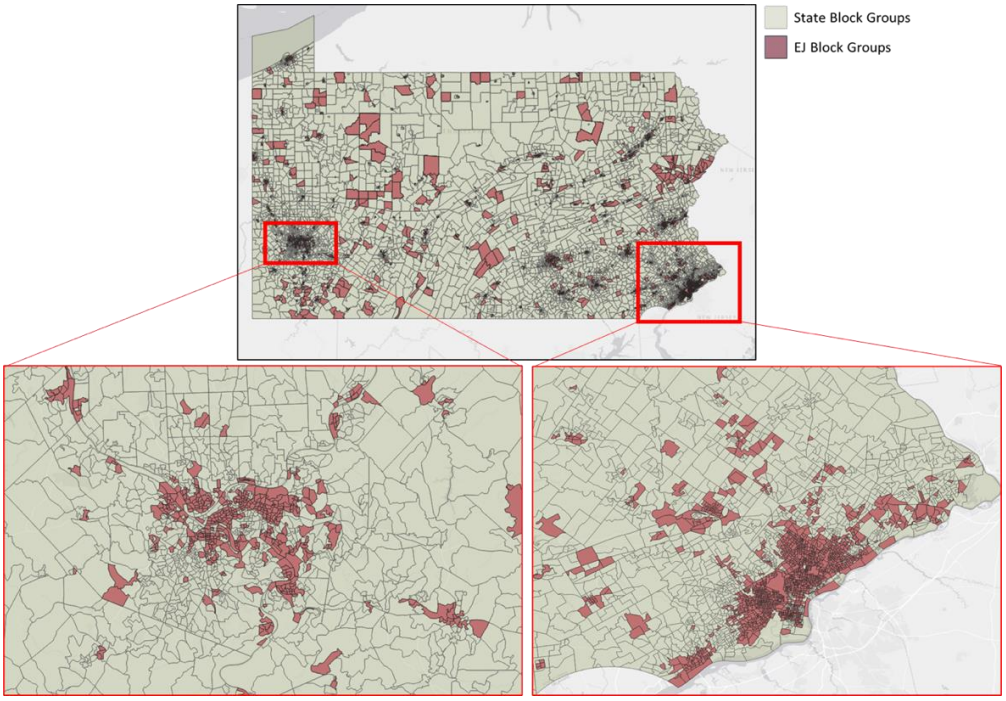
Finally, a strategy can be made more equitable by providing a suite of clean energy options to consumers. Using once again the example of electric vehicles, current incentives that rely on tax credits largely benefit population segments whose income allows for large tax breaks. That is why point-of-sale vouchers or special low-income loan programs are increasingly being implemented to benefit those who cannot afford high up-front costs and do not have the credit requirements for a loan. Car-sharing programs that incorporate electric vehicles are also becoming a popular strategy to provide access to clean mobility without requiring private vehicle purchases. These solutions are becoming popular in low-income and other disadvantaged communities, and they are well received by the public as they have additional co-benefits in reducing road and parking congestion and advancing sustainable land-use.

Adaptation

The adaptation strategies presented in this CAP are based on analyses conducted for the 2021 Climate Impacts Assessment. To evaluate potential environmental justice and equity consequences in the Impacts Assessment, Pennsylvania Environmental Justice Areas are used to represent already disadvantaged populations. An EJ area is any census tract or block group where 20% or more of individuals live in poverty, and/or 30% or more of the population is minority. EJ areas serve as a proxy for already overburdened areas. This indicator does not capture all impacts on overburdened populations (for example, it does not capture impacts on overburdened populations not located in EJ areas). Nonetheless, it is valuable to begin study of structural disadvantages, and this assessment also draws on other information to supplement it where possible given its limitations.

Figure 55 shows where EJ areas (at the block group level) are located across the Commonwealth, with a zoomed-in focus on Philadelphia and Pittsburgh where higher population density makes block group shading less legible in the state map.

Figure 55. Environmental Justice census block groups in Pennsylvania



This analysis is not a comprehensive bottom-up assessment. While based solidly on evidence from past IAs, recent literature, and updated climate projections, the decision-centered approach recognizes uncertainty and emphasizes practicality. Rather than aiming for a perfect characterization of risk, this approach focuses on gathering information at a sufficient level of detail to facilitate prioritization of adaptation actions that can be taken to reduce risks. Further, it provides the foundation for DEP to easily revisit the results of the assessment as needed as priorities or circumstances change.

Using information from the Impacts Assessment it was determined that warmer temperatures and increased flood risk are expected to disproportionately impact overburdened and vulnerable populations. These populations may both be more at risk to impacts from these hazards and face greater challenges to managing those risks. Therefore, the CAP focuses one specific adaptation pathway and set of strategies on reducing these risks in Environmental Justice communities. This approach helps ensure that strategies in place to adapt to climate change are providing benefits and reducing risks equitably for Pennsylvanians.

APPENDIX C. CLIMATE ADAPTATION STRATEGIES

Each adaptation strategy pathway presents examples of adaptation strategies that could be used to address priority risks in each focus area. This appendix contains additional example strategies, as well as outside resources, that the State and other actors could draw on for inspiration or guidance when moving toward implementation.

Additional resources that DEP may consider for ideas of strategies and implementation timing or frameworks include:

- 2018 Pennsylvania Climate Action Plan[207] (available here)
- Growing Stronger: Toward a Climate-Ready Philadelphia[208] (available here)
- North Carolina Climate Risk Assessment and Resilience Plan[209] (available here)
- The City of Providence's Climate Justice Plan[210] (available here)
- State of Oregon Climate Equity Blueprint[211] (available here)
- USAID Fast Track Implementation of Climate Adaptation[212] (available here)
- Preparing for the Regional Health Impacts of Climate Change in the United States[213] (available here)

Addressing the Impacts of Increasing Heat and Flooding on Health

Table 13 provides a list of adaptation strategies for this focus area, some taken from the 2018 Pennsylvania Climate Adaptation Plan and others adapted from outside sources.

Table 13. Adaptation strategies for addressing the impacts of increasing heat and flooding on health

Strategy	Actor
Establish metrics and key actors and responsibilities for tracking health data	State agencies, municipalities, researchers, community-based organizations
Identify coordination and partnerships needed to achieve public health goals	State agencies, municipalities

Strategy	Actor
Identify education and trainings needed for climate and health awareness and action	State agencies, municipalities, researchers, community-based organizations, sector representatives
Identify range of infrastructure opportunities and actors needed to mitigate climate and health risks	State agencies, municipalities, researchers, community-based organizations
Identify key plans, policies, regulations to address public health needs	State agencies, municipalities
Identify opportunities for improving baseline health	State agencies, municipalities, community-based organizations
Provide funding and personnel for monitoring needs	State legislature
Monitor climate and health metrics (e.g., track disease and water quality concerns relevant to health; monitor for new pathogens likely to expand their ranges)	Researchers, municipalities
Identify priorities from climate and health monitoring data	Researchers, state agencies, community-based organizations
Publicize findings from climate and health monitoring, in formats accessible to both expert and non-expert audiences; increase data quality and availability and develop new surveillance databases (e.g., monitoring climate-sensitive morbidity)	Researchers, Department of Health, municipalities, community-based organizations
Develop plan to act on findings from climate and health monitoring data (e.g., identify priority health risks and education needs, incorporate infrastructure needs into Capital Improvement Plan or Program [CIP] or other planning, map data to prioritize community heat studies, etc.)	State agencies, municipalities, community-based organizations
Update community health assessments to include climate change and health data	State agencies, municipalities, researchers, community-based organizations
Map locations of vulnerable populations to target community outreach and support in extreme events	State agencies, municipalities
Increase access to healthy and local food, and support local farmers and food network	Municipalities
Educate health-care professionals and the public on climate-related health risks	State agencies, municipalities, health sector
Fund and support school programming for education on heat-related risks (e.g., ticks, heat stroke) and how to avoid them	State agencies, County and Municipal Health Departments, State Health Centers, municipalities
Train local health department staff to assess capacity to integrate flood risks into existing plans and operations	State agencies (e.g., OEJ), County and Municipal Health Departments
Increase access to resilient infrastructure and invest in nature-based solutions, particularly in communities at high risk to infrastructure-related health risks (e.g., flood risks from poorly protected infrastructure at low elevation)	State agencies, municipalities
Retrofit cooling shelters, incentivize urban greening for builders that in-zone, and prioritize support for areas with strong urban-heat-island effects	State agencies, municipalities
Fund flood mitigation grants, prioritizing vulnerable populations and locations at particular risk to flooding	State legislature

Strategy	Actor
Develop local, community-informed risk mitigation plans	Municipalities, community-based organizations
State provide funds and technical support for heat wave plans and flood risk mitigation and post-disaster programs; show commitment to community organizations	State legislature, state agencies
State revise policies to support health given projected increased heat and flood risks	State legislature
Review worker safety guidelines to identify workers with greatest heat risk; revise guidelines to protect health	State agencies, municipalities
Review zoning codes, create system to update to reflect climate projection data	State agencies, municipalities, researchers
Strengthen climate change public health messaging and outreach (methods, content, and target groups and events)	State agencies, County and Municipal Health Departments, municipalities, community-based organizations
Engage vulnerable groups through existing community networks to conduct outreach and education on climate and health risks, understand concerns, and solicit potential solutions	Municipalities, County and Municipal Health Departments, State Health Centers, community-based organizations
Coordinate on health and emergency efforts across sectors	State agencies, municipalities
Require that emergency preparedness plans include coordination and communication among critical stakeholders. These stakeholders may include community organizations, local businesses, local health departments, hospitals and other health-care delivery facilities, utilities, and local government	State legislature, state agencies, municipalities
Review local occupational health and safety standards to identify occupations at risk due to climate change, and revise as necessary	State agencies, researchers, municipalities
Develop a web-based resource hub to provide information and technical resources on public health and climate change preparedness	State agencies, researchers, community-based organizations
Develop strategies and goals for government to support communities where there has historically been a strained relationship, to be able to effectively support public health needs in those communities	State agencies, municipalities, community-based organizations
Integrate citizens' knowledge of public health needs and opportunities into research, risk assessments, and planning	Municipalities, researchers, community-based organizations

Addressing the Impacts of Increasing Heat and Flooding on Overburdened and Vulnerable Populations

Table 14 provides a list of adaptation strategies for this focus area, some taken from the 2018 Pennsylvania Climate Adaptation Plan and others adapted from outside sources.

Table 14. Adaptation strategies for addressing the impacts of increasing heat and flooding on overburdened and vulnerable populations

Strategy	Actor
Establish metrics and key actors and responsibilities for tracking equity of impacts and solutions	State agencies, municipalities, researchers, community-based organizations
Identify opportunities for community capacity-building	Municipalities, community-based organizations
Identify key policies, regulations, and plans to incorporate environmental justice	State legislature
Identify vulnerable communities, and community organizations to partner with	State agencies (e.g., OEJ), municipalities, community-based organizations
Identify needed education and trainings on equity risks of extreme heat and flooding	Municipalities, community-based organizations
Identify coordination needs to bring together key actors around justice goals	State agencies
Incentivize and facilitate further interdisciplinary collaboration (e.g., between public health providers, scientific researchers, and community-based organizations) to develop a better understanding of the relationship between climate change, diseases, and which populations are most vulnerable and/or most impacted	State agencies (e.g., OEJ)
Invest in community capacity-building and seek out local knowledge	Municipalities, community-based organizations
Create and fund program to provide grants for community-based resilience projects (e.g., flood-protected community center with a roof garden)	State legislature
Fund a statewide forest conservation easement program	State legislature
Support vulnerable populations when integrating climate risks into key plans	Municipalities, community-based organizations
Identify and study communities' informal heat wave event coping practices; support and strengthen in emergency plans, given increased risk of heat waves going forward	Municipalities, community-based organizations
Improve infrastructure in most vulnerable communities to reduce impacts	Municipalities
Plant trees and create designated cooling shelters in areas with many low-income families	Municipalities
Increase flood mitigation grant funds (e.g., for businesses, public parks); reduce barriers to application	State legislature, state agencies, municipalities
Develop and implement trainings and education; act on findings (e.g., provide funds and support to local organizations)	State agencies, municipalities

Strategy	Actor
Train homeless shelter staff on heat hazards; provide tools to address related risks (e.g., tick repellant)	Municipalities, community-based organizations
Provide homeless shelter staff and faith leaders with resources for the community about on increased risks of extreme floods	Municipalities, community-based organizations
Establish program or funding streams to fund and implement strategies	State legislature, state agencies
Develop and maintain databases to track metrics; act on findings	State agencies, municipalities, researchers
Regularly update climate hazard resource hub for non-expert audiences	Municipalities, researchers, community-based organizations
Mandate that emergency plans must be developed and tested with input from community stakeholders, including stakeholders or representatives (e.g., advocacy group leaders) from overburdened populations	State legislature
Ensure that post-shock-event recovery work strengthens the capacity of overburdened and vulnerable populations to adapt to future events	Municipalities, community-based organizations
Evaluate overburdened and vulnerable populations' current flood insurance coverage and access to insurance that protects against climate hazards; develop actionable goals to improve accessibility and awareness of insurance for those populations; work to implement	State legislature, state agencies, municipalities, community-based organizations
Partner with HR department to improve diversity, equity and inclusion (DEI) at all levels of staffing and contracting; review and strengthen workplace supports for staff with a wide range of backgrounds, lived experiences, and identities	State legislature, state agencies, municipalities
Evaluate efficacy of existing communications, alert and early warning systems, and response plans for emergency response (to heat hazards and flooding) in addressing needs of overburdened and vulnerable populations, informed by suggestions and needs identified by community-based organizations; strengthen based on those suggestions	State agencies, municipalities, community-based organizations

Addressing the Impacts of Increasing Average Temperatures on Forests, Ecosystems, and Wildlife

Table 15 provides a list of adaptation strategies for this focus area, some taken from the 2018 Pennsylvania Climate Adaptation Plan and others adapted from outside sources.

Table 15. Adaptation strategies for addressing the impacts of increasing temperatures and flooding on forests, ecosystems, and wildlife

Strategy	Actor
Support initiatives to reduce recreational and commercial fishing in already stressed fisheries; lightly fished stocks are likely to be more resilient to climate change impacts than those heavily fished.	State agencies, conservation organizations
Increase monitoring of species and habitats, particularly those that are vulnerable, against an established baseline over the long term.	State agencies, conservation organizations
Develop and use ecological flow thresholds to manage fish withdrawals so they do not increase thermal stress on sensitive species and habitats.	State agencies, conservation organizations
Conserve and enhance areas representing the full range of wildlife and fish habitats and promote connectivity (e.g., using land exchanges, conservation easements, leases; by removing barriers) to allow species to migrate to suitable habitats	State agencies, conservation organizations
Promote forest conservation, reforestation, and urban tree canopy expansion on private and public lands through various means, including funding a statewide forest conservation easement program.	State legislature, state agencies, municipalities
Develop a central database to store relevant ecosystem data.	State agencies, universities, conservation organizations
Establish a statewide monitoring and research network of academics, civil society, and citizen scientists to establish baseline conditions and monitor ecosystem factors	State agencies, universities, conservation organizations
Review legal, regulatory and policy frameworks that govern protection and restoration of wildlife and fisheries habitats and identify opportunities to improve their ability to address climate change impacts.	State agencies, conservation organizations
Adopt regulations that provide streamflow levels necessary to ensure the resilience and ecological integrity of both warm-water and cold-water streams	State agencies, municipalities
Manage fish populations to increase resilience to interdecadal environmental variability by determining the minimum number of age classes needed for resilience and then managing age structure accordingly.	State agencies
Increase monitoring of stocks and maintain basic fish sampling.	State agencies, conservation organizations
Conduct climate change risk assessments for native fisheries to identify species and populations that are at risk and include potential economic losses and the costs of adaptation measures.	State agencies, conservation organizations

Strategy	Actor
Where appropriate, restore or enhance stream channels to create cold-water refuges	State agencies, municipalities, conservation organizations
To improve overall landscape resilience, create nature preserves as large as possible and maintain habitat connectivity across landscape	State agencies, municipalities, conservation organizations
Increase funding for land conservation	State legislature, state agencies
Establish a carbon banking and trading system that pays landowners to plant and manage working forests on both private and public land	State legislature, state agencies, conservation organizations
Educate recreational land users about the importance of climate change impacts on ecosystems and the dangers of illegal hunting and fishing, pollution, and development	State agencies, municipalities, conservation organizations
Promote sustainable land use planning and development. Intelligent land use planning promotes practices that provide the critical elements for quality of life for residents as well as protects and restores naturally functioning ecosystems and agriculturally productive lands.	State agencies, municipalities

Addressing the Impacts of a Warmer and Wetter Climate on Agriculture

Table 16 lists adaptation strategies for this focus area, some taken from the 2018 Pennsylvania Climate Adaptation Plan and others adapted from outside sources.

Table 16. Adaptation strategies for addressing the impacts of a warmer and wetter climate on agriculture

Strategy	Actor
Reestablish/establish a network of agro-meteorological stations statewide to collect climate observations, including estimates of evapotranspiration, to support research and development of agricultural practices.	State agencies, municipalities
Increase climate change education and outreach to agricultural producers and enable delivery of applied research and decision-making tools	State agencies, municipalities
Create or enhance existing networks to facilitate the rapid transfer and adoption of new knowledge and technologies to help farmers adapt to a changing climate	State agencies, USDA, universities
Expand regional planning initiatives, especially in agricultural areas, focusing on agricultural security zones and local food security.	State agencies, USDA, agricultural groups
Promote awareness of low- or no-cost land available from the USDA Farm Services Agency's Conservation Loan Program for infrastructure adaptation (e.g., irrigation, livestock facilities).	State agencies, agricultural groups, USDA
Improve understanding of how climate change will affect the intensity and distribution of weeds, insects and diseases	State agencies, USDA

Strategy	Actor
Integrate potential climate change impacts (e.g., changes in weeds, diseases, pests) into current detection, monitoring and integrated pest management efforts	State agencies, USDA
Provide information to the agricultural community to enable farmers and growers to modify agricultural practices and to adapt to new pests and diseases.	State agencies, researchers, community-based organizations
Provide financial incentives and support for agriculture best practices including sales or property tax exemptions, rebates, reduced agricultural insurance rates, and, pricing systems that reward conservation (i.e., seasonal pricing).	State legislature, insurance industry
Introduce agricultural insurance requirements to factor climate risk reduction benefits of management best practices	State legislature, insurance industry, USDA
Support economic and cooperative structures that transfer risk from farm and bank like Community Supported Agriculture (CSA)	USDA, state agencies, agricultural groups
Analyze drivers of current crop planting behaviors (e.g., crop prices, insurance availability) to determine ways to modify behaviors	Universities, state agencies, USDA
Develop and disseminate seasonal climate forecasts	Universities, state agencies, USDA
Support research and development of more crop rotations and crop mixtures.	Universities, state agencies, USDA
Learn about management strategies for invasive species (including pests/pathogens) from states where they are already established.	Universities, state agencies, USDA
Increase adoption of techniques that replicate natural systems' mechanisms for pest control, windbreaks, and disease management.	State agencies, USDA, agricultural groups
Expand technical assistance programs to help farmers make decisions about sustainable crops and production practices (e.g., Penn State Ag. Extension, NRCS, county conservation districts, county extension agents).	State agencies, USDA, agricultural groups universities
Promote sustainable land use planning and development. Intelligent land use planning promotes practices that provide the critical elements for quality of life for residents as well as protects and restores naturally functioning ecosystems and agriculturally productive lands.	State agencies, municipalities
Develop and enhance emergency response plans to manage significant pest outbreaks that harm human health, the environment and the economic viability of the agriculture sector	State agencies, USDA
Expand integrated farm management and conservation planning	State agencies, USDA, agricultural groups
Research the benefits of periodic fallowing for active floodplain acres to maximize floodplain storage, nutrient processing, and sediment capture (or to prevent major scour damage).	USDA, state agencies, agricultural groups, universities
Use improved LIDAR elevation data and information to guide farmers considering relocation of vulnerable farming operations.	USDA, state agencies, universities
Promote agriculture that is compatible with periodic flooding	USDA, state agencies, agricultural groups

Strategy	Actor
Provide incentives for farmers to increase storage capacity by using farm ponds/large cisterns to capture runoff for irrigation needs, animal wash water, and cooling water.	State agencies, USDA
Purchase wetland easements on marginal and flood-prone agricultural lands to diversify grower income, buffer productive lands from flood events, and improve the environmental services provided by these lands.	Agricultural groups, USDA, state agencies, agricultural producers
Support research on practices (e.g., cover cropping, conservation tillage, soil fertility) to enhance soil's water- holding capacity and GHG reductions.	USDA, state agencies, universities
Establish an information clearinghouse for growers on water conservation technology.	USDA, state agencies, universities
Develop decision support tools to assist farmers in determining the optimal timing and magnitude of investments to cope with climate change.	USDA, state agencies, universities

Addressing the Impacts of Increasing Average Temperatures on Recreation and Tourism

Table 17 provides a list of adaptation strategies for this focus area, some taken from the 2018 Pennsylvania Climate Adaptation Plan and others adapted from outside sources.

Table 17. Adaptation strategies for addressing the impacts of increasing temperatures on recreation and tourism

Strategy	Actor
Increase tree and vegetation in areas with outdoor activity to provide shade. Also consider building other shade structure and other areas to cool off (e.g., incorporate misters)	State agencies, municipalities, outdoor recreation businesses
Create a business ombudsman or technical assistance center for affected recreational industries and establish a source of grant funding or tax incentives to help industry and municipalities transition from winter to summer activities	State legislature, state agencies
Educate facilities about diversification opportunities for more warm-weather or cold weather activities (e.g., ski slopes can maintain mountain bike trails for warm weather) with consideration of environmental impacts	State legislature, state agencies
Invest in green infrastructure at recreation sites such as constructions with heat-resistant materials; heat-resistant materials for paved assets; energy efficiency improvements.	Recreation site operators including municipalities and state agencies (DCNR)
Establish a statewide monitoring/research network to monitor ecosystem factors, such as physical changes, species distribution, weather conditions, and general ecological conditions	State agencies, universities
Ensure that newly planted vegetation can handle increased temperatures and heavy rainfall events; review maintenance schedules to adjust watering, mowing, and other practices.	Recreation site operators including municipalities and state agencies (DCNR)

Strategy	Actor
Assign more medical staff at places where people congregate and recreate in hot weather and may suffer heat stress	Recreation site operators including municipalities and state agencies (DCNR)
Establish a formal climate change working group building on existing partnerships	State agencies
Develop safer places to jog at night or early morning and add more water fountains and shade along routes.	Municipalities

Addressing the Impacts of Flooding on Built Infrastructure

Table 18 provides a list of adaptation strategies for this focus area, some taken from the 2018 Pennsylvania Climate Adaptation Plan and others adapted from outside sources.

Table 18. Adaptation strategies for addressing the impacts of flooding on built infrastructure

Strategy	Actor
Improve the accuracy and technological capabilities of flood forecasting, early-warning and emergency-preparedness systems.	State agencies, universities
Collaborate with trade associations and the insurance industry to develop specification improvements that ensure building and infrastructure designs are more resilient to flooding.	State agencies, municipalities
Update flood insurance rate maps and other regulatory tools that rely on FEMA maps to reflect evolving risks from climate change.	State agencies, municipalities
Adopt insurance mechanisms and other financial instruments, such as catastrophe bonds, to protect against financial losses associated with infrastructure losses.	State agencies, municipalities, utility industry
Work with local jurisdictions to incorporate consideration of climate change into ongoing land use planning efforts (e.g., growth management, development planning).	State agencies
Implement new or modified policies (e.g., zoning regulations, tax incentives, rolling easements) that encourage appropriate land use and reduce repetitive losses.	Municipalities
Determine critical public buildings that will be impacted by coastal and inland flooding and recommend appropriate adaptation strategies that will not adversely impact natural resources.	Municipalities, state agencies
Upgrade or implement design improvements for flood-control structures (e.g., levees, flood walls) that protect existing critical infrastructure.	Municipalities, state agencies
Encourage owners and operators of critical energy infrastructure to evaluate vulnerability to the impacts of climate change, including the risk of damage and the potential for disruptions and outages from flooding	State agencies
Evaluate ability and need to harden or relocate transfer stations and related solid waste infrastructure located in areas likely to be affected by sea level rise or inland flooding.	Municipalities

Strategy	Actor
Enhance the preparedness of transportation, utilities, and emergency service providers to respond to weather-related emergencies through increases in funding and emergency training.	State legislature, state agencies
Determine vulnerable transportation routes and transportation infrastructure that may adversely impact natural resources and human mobility under future climate change scenarios.	Municipalities, state agencies
Require maps of areas vulnerable to future flooding in applications for new development	State agencies, municipalities
Provide individual landowners with better information about their ecologically based flood-proofing options and the rapidly changing location of floodplains as shifts in land use and climate affect erosion and flooding.	State agencies, municipalities
Work with the Budget Office and Planning Commission to integrate climate change into capital programming and budgeting, and to determine appropriate free board and flood proofing construction requirements.	State agencies
Collect post-event cost data for events that are both above and below the national hazard declaration threshold.	State agencies
Develop decision tools to evaluate replacement, modification, and design life for infrastructure.	State agencies, universities
Preserve open space in flood hazard areas and channel migration zones.	Municipalities, state agencies
Reduce impervious surface and implement green infrastructure to promote infiltration, evapotranspiration, and reuse.	Municipalities
Encourage development of structures and infrastructure in areas that are unlikely to be eroded or flooded by more intense and frequent storms, instead of in vulnerable areas.	Municipalities
Enhance natural flood management capacity by developing regulations and incentives to encourage development projects to restore or create flood storage.	Municipalities
Consider new mortgage products similar to PACE loans to incorporate the costs of adaptation into private property transactions.	Municipalities, state agencies
Undertake long-term managed relocation or elevation of existing structures in vulnerable areas.	Municipalities
Design buildings to maximize resilience by placing on higher floors those assets and services most likely to be impacted by flooding or those most expensive to replace	Municipalities
Develop a stormwater billing system to create a more equitable fee structure that more closely reflects the costs of managing stormwater for individual properties.	Municipalities
Use green infrastructure practices (no regrets strategies) such as broad adoption of rain barrels and rain gardens, wetland development, green roofs, bio retention and green streetscapes to retain runoff and filter pollutants cost effectively.	Municipalities
Provide tax credits for green infrastructure implementation, reduced stormwater fees to reward greater site permeability and rebates for downspout disconnection.	Municipalities, state agencies

Strategy	Actor
Prioritize the retrofit of transportation infrastructure while undergoing maintenance and repair.	Municipalities, state agencies
Support a regional evaluation of transportation and utility networks that are vulnerable to flooding to determine hot spots or weak links that would cause significant disruption to the regional economy and quality of life.	State agencies

Addressing the Impacts of Landslides on Built Infrastructure

Table 19 provides a list of adaptation strategies for this focus area, some taken from the 2018 Pennsylvania Climate Adaptation Plan and others adapted from outside sources.

Table 19. Adaptation strategies for addressing the impacts of landslides on built infrastructure

Strategy	Actor
Systematically identify and map landslide-prone areas statewide.	State agencies
Develop public education and outreach on landslide risks and how to adapt to them.	State agencies
Develop best management practices, policies and incentives for land management that reduces landslide risk.	State agencies
Adjust routine operations, maintenance and inspection, and capital budget expenses to prepare for more landslides.	State agencies
Develop an asset management framework with a rating system that considers the impact of route failure and impacts of disruptions.	State agencies
Improve collaboration on anticipating and communicating landslide risks.	State agencies, municipalities
Coordinate emergency responses to landslide events.	State agencies, municipalities
Incentivize development in safe locations and discourage development in vulnerable locations.	Municipalities
Improve and develop landslide mitigation funding mechanisms	State agencies, municipalities
Map landslide risk along transmission line rights-of-way.	State agencies, municipalities
Relocate public buildings and critical infrastructure systems such as power plants, water lines, or telephone sub-stations to less vulnerable areas.	State agencies, municipalities, utilities
Fund the maintenance landslide maps.	State agencies
Increase the coverage of landslide maps.	State agencies, municipalities, utilities
Improve routine maintenance of roads and consider operational changes.	State agencies, municipalities
Conduct trainings for municipal staff about climate-resilient land use.	State agencies

APPENDIX D. COMMENTS FROM THE CLIMATE CHANGE ADVISORY COMMITTEE

The Pennsylvania Climate Change Act (Act 70 of 2008) requires that the Climate Action Plan "identifies areas of agreement and disagreement among committee members about the Climate Change Action Plan." Letters documenting members' areas of "agreement and disagreement" have been solicited from CCAC appointees, and are included in this appendix. The views presented in these letters do not necessarily represent those of the DEP.

Re: CCAC 2021 Climate Action Plan

Dear DEP and Energy Office,

This is the fourth edition of the PA Climate Action Plan (CAP) that I have been involved with. On behalf of the PA Climate Change Advisory Committee (CCAC), I would like to thank DEP for listening to us and for having the CCAC engaged in the development and review of the CAP. Our request to have more opportunities to review the CAP than the prior 2018 edition was much appreciated. The approach to each edition of the CAP has intentionally been different to address issues as they change over time. This edition provides a road map to achieve the Greenhouse Gas (GHG) reduction targets in Executive Order 2019-01, as well as resiliency and adaptation strategies.

The goals are to reduce GHG by 26% by 2025, and 80% by 2050 (from 2005 levels). There are 18 primary GHG reduction strategy categories discussed and modeled in the 2021 CAP to demonstrate how the Commonwealth can potentially achieve these significant changes. Ten (10) of these GHG reduction strategies are near term. To prepare for the future, the potential benefits, concerns, and costs were analyzed, as well as opportunities to adapt to the changing climate. The report provides advice and many examples on how policy can help maintain prosperity, growth, and provide a sound approach to climate change.

In the building sector, I support the adoption of the latest building codes for not only energy efficiency, but for reasons of resiliency, health, and safety. I hope that we communicate to Pennsylvania communities that they have the option to use stretch codes if they wish to incentivize people to go beyond the basic code and get more value, density, and environmental benefit as a result. The CAP models clearly show there is an economic benefit to energy efficiency, as well as making Pennsylvania businesses more valuable and competitive.

A couple of the most important items we need more of in the future are a real commitment to *net-zero buildings* and *alternative fuel*

Krug Architects

Principal, Architect

vehicles. In order to achieve the goals set out in the CAP and Executive Order 2019-01, the Commonwealth will have to be designing and building many more net-zero buildings and more alternative fuel infrastructure for electric vehicles (EVs). C-PACE financing and other helpful tools will encourage and promote the implementation of healthy high-performance net-zero buildings and EV infrastructure.

The 2021 Climate Action Plan (CAP) maps out a challenging approach to reducing the use of fossil fuels over the next 30 years in Pennsylvania. There are many new opportunities for people to get involved and continue to position Pennsylvania as a leader in the energy sector, albeit there are some exciting/scary transitions required. Hydrogen technology and renewable natural gas are two areas that policy makers should investigate further, because these technologies provide use of Pennsylvania's strong liquid and gas infrastructure and machines. Additionally, the oil and gas industry can show the world their advanced drilling technologies in geothermal and blended fuels for CHP opportunities, just to name a few of the opportunities for businesses and industry to adapt.

2020 was a challenging year and I want to thank the members of the Climate Change Advisory Committee for sharing their valuable knowledge and time. I want to thank DEP and the ICF team for listening to the CCAC advise and for all their hard work. Also, I want to thank AIA Pennsylvania and Krug Architects for their support of my involvement in the CCAC. The CCAC has made some impact over the years, as we have seen several legislative and executive actions. We still have a long way to go.

For example, one of the results of the 2018 CAP, which raised the issue of cap and trade, has been the possibility that Pennsylvania may join RGGI, the Regional Greenhouse Gas Initiative. The Pennsylvania RGGI proceeds could help transition communities, business, and industry to the next level.

Finally, I am looking forward to future discussions about *low embodied carbon procurement policies* and the economic benefits that Pennsylvania can show businesses how to shift our use of energy to new technologies and lead the way as we adapt to a changing climate. Strong building renovation incentives will help lead the charge by reusing existing buildings.

Sincerely,

2021 Pennsylvania Climate Action Plan Comments

Dear Ms. Byron and the Entire DEP,

Thank you for the opportunity to provide comment to the 2021 Pennsylvania Climate Action Plan. I would like to thank PA State Senator Jay Costa (D - Forest Hills) for my appointment to this important Committee, (CCAC) and to acknowledge Stevens Krug for his steady leadership as Chair of the CCAC, my reliable Alternate Joe Morinville, and the rest of my colleagues on the CCAC. I appreciate the opportunity and confidence placed in me for my participation in the Climate Action Plan process over the last six years, and to the CCAC for their trust in elevating me to the role of Vice Chair. I would also like to thank my firm **evolveEA**, where I serve as Managing Principal, and **AIA Pennsylvania**, where I serve several Board roles, for their support of my service.

The Pennsylvania Climate Action Plan carries weight as an objective evaluation and as an instrumental document. The 2021 Climate Action Plan includes an exhaustive tally of the sources of carbon in the Commonwealth, addresses adaptability measures to address climactic forces already in progress and now addresses the human health impacts of climate change. The Plan is unique in its scope, in the intensity of its evaluation, in the productive back and forth among the selected stakeholders, and its specificity to the uniqueness of our Commonwealth of Pennsylvania, both with regards to our own annual Impact Assessment and to our economic and demographic forces.

We are pleased with the results of this collaboration leading to the 2021 Pennsylvania Climate Action Plan and would like to use our perspective to provide the following comments for constructive consideration.

The Regional Greenhouse Gas Initiative is essential to Pennsylvania's Climate Action. Just as Executive Order 2019-01 in 2019 established Pennsylvania carbon goals that, in essence, gave purpose to the 2018 Climate Action Plan, the Regional Greenhouse Gas Initiative (RGGI) will provide a similar underpinning to the 2021 Climate Action Plan. Implemented by gubernatorial executive order, 2019-07, RGGI will provide a price on carbon other than simply first cost, which is an essential component to driving down fossil fuel use. Another essential benefit to the implementation of RGGI is the expected proceeds of hundreds of millions of dollars per year, which will be used for coalfield justice, renewables programs, energy efficiency programs, education, and other priorities currently being established by the DEP.

A price on carbon must be established and maintained. RGGI will establish a price on carbon emissions from electric generating units. Currently we can all emit for free, paying money for the fuel, but not for the sink. Carbon emissions have a cost that must be acknowledged in order for emissions to be valued. Using the market forces that drive our economy, those who economize emissions should be rewarded, while the actions of the profligate should be reflected by a more comprehensive financial cost.

Health and Triple Bottom Line are baked into this Plan. The 2021 Climate Action Plan looks to public health impacts related to climate change to a much greater extent than in previous plans. While drought and growing season impacts have led to less robust, predictable or quality crop yields - which impact public health - this Plan takes urban heat island impacts of climate change into account. The stressors of longer Summer stretches of hot humid days in urban areas prone to urban heat island effects has a magnified impact upon denser and aged populations on fixed incomes. The Triple Bottom Line accounting intended in this Plan accounts for health benefits. Less carbon emissions typically means cleaner air, more physical activity and less illness, all of which have great, measurable social returns and create more well-being for the citizens of the Commonwealth.

Photovoltaics play a more prominent role in this Plan. The application of solar photovoltaics creates energy, offsets air pollution, creates local jobs and decreases demand charges. Monocrystalline panels, the most common, consist of durable, solid state construction with no moving parts and only a 20% degradation over their 25-year lives. Rooftop mounted solar panels increase the asset value of the buildings and land upon which they are installed. Solar panels also contribute to resiliency, able to assist decentralized power generation and storage for use in grid emergencies, which helps increase resiliency.

Fugitive Emissions are not addressed in this Plan. The legacy of Pennsylvania having been an energy juggernaut for centuries is that of abandoned wells across our rich energy landscape. According to the DEP, there are over 200,000 orphaned and abandoned wells that emit gases, largely methane. Methane is a far more potent greenhouse gas than carbon dioxide, and so is not addressed in this Plan. These wells are typically not tracked or documented and have been overgrown, making them difficult to identify, locate or monitor. The DEP has a budget for finding and capping these wells, but all will admit that this budget is laughably inadequate.

Fracking has been a carbon reduction silver bullet, but all costs are not fully accounted. The advent of hydraulic fracturing over the last two decades, notably in the Marcellus Shale formation, has yielded a gas extraction revolution, creating immense output, jobs and wealth. This has had the positive effect of lessening overall emissions due to the direct displacement of coal production. However, the immediate

and long term ground-level and water-table impacts of fracking are not mentioned in this report due to the scope of the Climate Action Plan, a lack of consensus and the need for long term study.

Nuclear power has long been a bane of environmentalists who may now look the other way. The Climate Action Plan calls for nuclear production levels to remain constant over the next decades in spite of the recent decommissioning of Three Mile Island and projected decommissioning of the Beaver Valley nuclear power plant, removing a third of our current nuclear generation. Like coal, nuclear power is effectively being displaced by inexpensive and abundant natural gas. The net effect will be that a no-carbon emission generation method will be replaced by one that does create emissions. Nuclear power has always been unpopular among environmentalists, but in light of the increased importance of meaningful carbon reduction goals, particularly those specific to the scope of this Plan, this potent carbon-free electrical generation is more appealing than in recent decades. This Plan makes assumptions about the continuous production of nuclear power, but, as stated in the Plan, will not be possible without legislative assistance.

Buildings and built form influence carbon in many ways. Commercial and residential buildings account for approximately 40 percent of emissions nationally, but read as about 18 percent in this Plan due to being lumped in as part of consumption. However, building efficiency due to improved building codes (Act 36 of 2017), improved construction technology, increased adoption of building performance rating systems such as LEED, and reduced costs for building-mounted photovoltaics allow buildings to be more energy-efficient while also improving occupant health. Building energy efficiency, healthy interiors and on-site energy generation make buildings high-performing investments. Settlement patterns are also very important, as the transportation associated with access to buildings is markedly less for denser patterns of development, with mass transit and walkability providing carbon reduction and health benefits.

Lastly, but perhaps most importantly, **there is urgency in the application of the strategies of this Plan**. The 2021 Impact Assessment for Pennsylvania authored by ICF with input from Penn State University for the Pennsylvania Department of Environmental Protection states that Pennsylvania temperatures will rise on average by 5.9 degrees Fahrenheit by 2050, in just over a generation! This astonishing number is over 3 degrees Celsius at a time when there is agreement that a 2 degree Celsius rise will cause irreparable harm to our entire planet's biotic systems. This very rapid rate of change will have enormous and cascading impacts on every single aspect of our lives in Pennsylvania – food production, pest migration, air quality, hydrology, human health, air conditioning demand, infrastructure and livability, to name a few - making the adaptability measures of the Plan all the more relevant and timely.

Thank you again for your attention and for the good and important work that the DEP is performing.

Sincerely,

July 22, 2021

Dear Mr. Campbell,

It is my pleasure to share these comments regarding the 2021 update to the Pennsylvania State Climate Action Plan. As an initial matter, I wish to note that I was appointed to the Pennsylvania Climate Change Advisory Committee (CCAC) by Governor Wolf as an individual, not as a representative of a specific organization or industry. Thus, my comments reflect my personal opinion and are not necessarily reflective of the views or opinions of my employer or any other organization with which I am affiliated.

My comments are as follows:

Emissions Reduction Target

This document maintains the greenhouse gas (GHG) emissions reduction target established in the 2019 plan of a 25% reduction in GHG emissions by 2025 and an 80% reduction by 2050, below 2005 levels. Prior to 2019, the state's earlier climate action plans included a list of recommended actions, but no target. I strongly support inclusion of a reduction target. The Climate Action Plan can be thought of as a roadmap; the target sets the end point to which the map is leading.

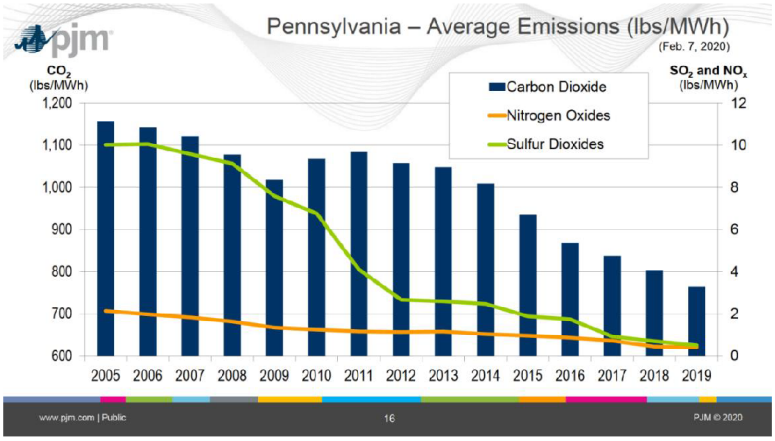
Since the time that Governor Wolf set Pennsylvania's aspirational targets in his 2019 Executive Order, other states, countries, and businesses have set more aggressive goals. For example, President Biden in April 2021 established a national GHG reduction goal of 50-52% below 2005 levels by 2030, approximately double Pennsylvania's goal. I support the Department of Environmental Protection's (DEP's) inclusion of a goal and encourage the Department to continually evaluate and increase this target in future iterations of the plan.

Inclusion of Actions that Potentially Increase Fossil Fuel Use

I am hesitant to endorse a plan that includes recommendations that increase the use of fossil fuels. Specifically, page 76 recommends that the state "Incentivize and Increase Use of Distributed Combined Heat and Power." The plan qualifies that expanded use of combined heat and power (CHP) should occur "particularly for high-value applications such as critical facilities (e.g., hospitals) and industrial facilities. High-value applications are those with critical power requirements that can operate CHP systems continuously and are able to utilize all the available electricity and thermal energy."

The annual increase in natural gas usage associated with this recommendation is estimated at ~48,906 Bbtu in 2050. As shown in Figure 18 on page 34, the emissions reductions associated with this measure are quite modest compared to other actions in the plan.

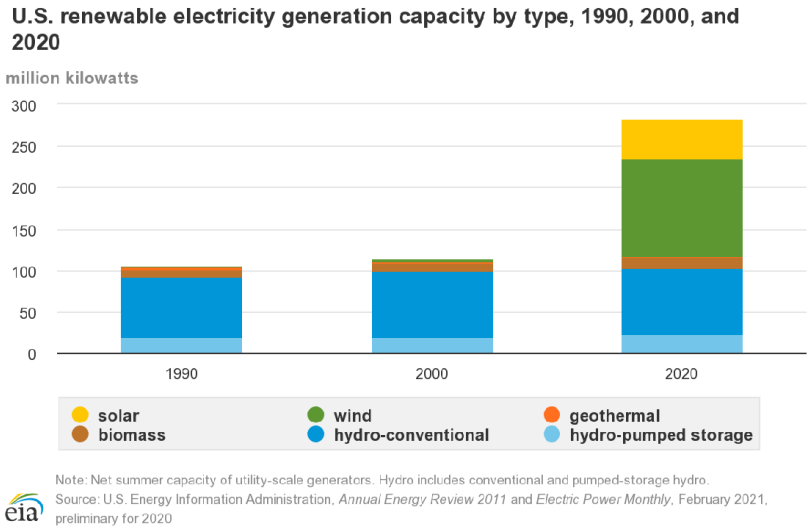
As grid electricity continues to decarbonize, additional thought should be given to whether the state should incentivize distributed fossil fuel based infrastructure. For example, the figure below shows the decrease in emissions per megawatt hour of electricity for Pennsylvania between 2005-2019.[1]



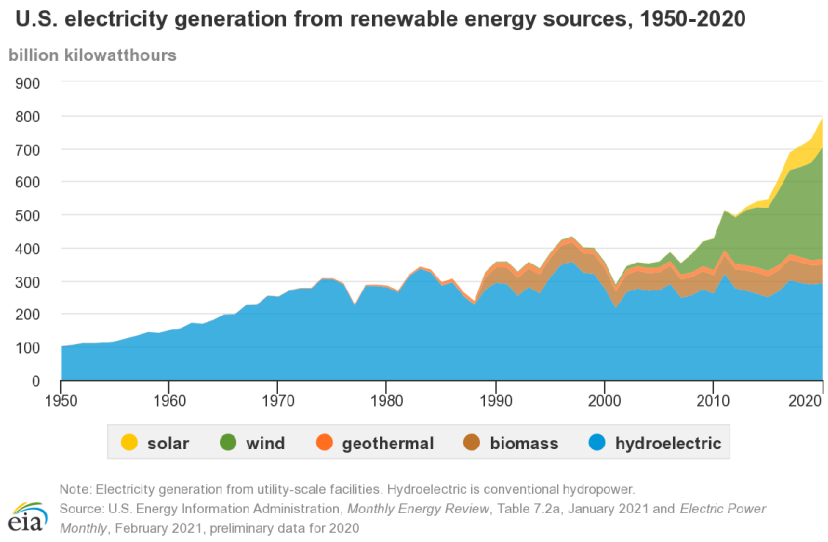
While fuel switching from coal to natural gas played a large part in achieving these emissions reductions, natural gas is not emissions free. The grid continues to decarbonize through the addition of zero-emissions sources, primarily the additional capacity of renewable energy sources. For example, see the below graphic from the Energy Information Administration showing the rapidly increasing capacity of wind and solar.[2]

[1] See Page 16.
https://files.dep.state.pa.us/Air/AirQuality/AQPortalFiles/Advisory%20Committees/Air%20Quality%20Technical%20Advisory%20Committee/2020/10-15-20/20201015%20PJM%20Presentation%20to%20PA%20DEP%20AQTAC%20on%20Generation%20Dispatch.pdf

[22] www.eia.gov/energyexplained/electricity/electricity-in-the-us-generation-capacity-and-sales.php



Additionally, the proportion of energy generated by renewable resources is growing rapidly in recent years.[3]



[3] https://www.eia.gov/energyexplained/electricity/electricity-in-the-us-generation-capacity-and-sales.php

Natural gas will likely be a part of the power generation profile in the U.S. for many years due to its availability and dispatchable attributes. At least in the near term, it will be an important energy source for balancing variable sources of energy, like solar and wind.

Using natural gas in an efficient, centralized power plant has the potential to be equipped with carbon capture technology in the future. In contrast, distributed CHP applications that use natural gas are not emissions-free. CHP will make sense for some customers from an economic or reliability standpoint, based on their unique circumstances. However, as I have noted in Committee meetings in the past, I question whether the state should be incentivizing projects that lock in the use of fossil fuels well into the future, as part of a climate action plan.

Accessibility to the Public

Finally, I encourage the Department to consider how to make this and future plans more accessible to the general public. The current plan, at a length of 200+ pages is overwhelming in scope and is hardly accessible to the average Pennsylvanian. It is my understanding that DEP intends to produce a companion document that is shorter, more concise, uses more common language, and is intended to be easy to understand to a resident or business owner. I strongly support this intention and offer my assistance in my role as a CCAC member.

In closing, I would like to thank the staff of the DEP for the time and effort that has gone into this plan and for the opportunity to participate in the process. I look forward to continuing to support the implementation of this plan, along with the drafting of future plan updates as a member of the Climate Change Advisory Committee.

Sincerely,

Lindsay A. Baxter
Appointed Member
Pennsylvania Climate Change Advisory Committee

Comments Regarding the 2021 Climate Action Plan and Related Documents

Terry R. Bossert

Introduction:

I appreciate the opportunity to comment on the Department's 2021 Climate Action Plan (CAP) and to have my comments appended to the CAP. I also appreciate the time and effort devoted by Department personnel to keep the Climate Advisory Committee informed on the progress of the Department's development of the CAP as well as the Climate Impacts Assessment (IA). Since there was no similar opportunity to append comments to the IA, I also include, herein, some brief comments regarding that report. There are several recommendations in the CAP with which I agree, at least in concept, and I discuss them more fully below. However, in many instances I believe the CAP does not present a full or balanced picture. Having worked at the Department twice in my career it pains me to say so, but in some areas, I believe the plan to be disingenuous. These comments represent my personal views and opinion and should not be attributed to any past, present or future clients, employers, or any other person or entity.

The Faulty Foundation:

Unfortunately, the CAP builds on a faulty foundation. That faulty foundation is the IA. As I previously noted when asked to comment on the IA, the IA fails to comply with the statutory requirements of Act 70. Act 70 requires that the IA assess the "impacts" of climate change. Impact is a neutral word and can mean something positive or something negative. However, the IA unlawfully defines "impact" only as an "environmental hazard." Accordingly, the IA only looks at the potential negative results of climate change and essentially ignores any positives. Moreover, the IA fails to meet the statutory requirement that a "diversity of views" be reflected in the report. Many scientists who are not "deniers" nonetheless question the severity of the predicted impacts suggested by some of the models. Those views are not represented.

A few examples will illustrate the one-sidedness of the IA. We are told that the average annual temperature will increase by 3.3 degrees C. by 2050. However, we are not told that there are currently places where the temperature has historically been at those levels and humans have survived quite nicely. The IA decries the alleged demise of the ski industry without anything more than passing reference to outdoor recreation or water sports. I lived in Georgia and enjoyed waterskiing in October. The IA states that the growing season will be "altered", apparently not wanting to say that it will increase, without discussing what new crops may become possible and what economic benefit may follow. The IA assumes that Pennsylvania now has the perfect climate and that any change is bad.

Lastly, the IA is an insult to the citizens of Pennsylvania. It assumes that citizens will care about climate change only if dire personal consequences are alleged. Most of the "consensus" studies recognize that even the most extreme predictions assume less impact in the temperate zones.

If climate change will cause catastrophic harm elsewhere in the world, that should be sufficient reason for the world to act.

What Does the CAP Accomplish?

Notwithstanding all the hard work that went into preparing the CAP it is hard to see what it will accomplish. Frankly, the CAP seems untethered to world reality. President Biden and John Kerry have both said that implementing the entire climate agenda of the Biden administration will not solve their expressed climate concerns. Without other major countries, such as China and India, making the same scale of reductions the *national* climate plan will have no positive global impact. Therefore, what impact could Pennsylvania's plan have on global climate concerns? Moreover, there is nothing in the plan that suggests that its implementation will produce any climate benefit for Pennsylvanians. The CAP makes bold statements about "shielding" Pennsylvania from the worst impact of climate change but fails to show how any or all of the strategies will accomplish that. One often hears that we should "do our part" notwithstanding the inaction of many others. I agree we should do our part – at the right time. If one were a pitcher on a baseball team and the outfielders were not playing, but were standing around watching you, would you continue to pitch ("do your part") while the score mounted? Of course not. Why should Pennsylvanians endure the disruptions to the economy and lifestyle when no benefit will be realized? When there is a reasonable basis to believe that "doing our part" will make a difference, that is the time to act.

It is apparent that the strategies suggested by the CAP will cause economic and lifestyle disruptions, and in many cases are not cost effective, in the normal sense of that term. The fact that the CAP needs to redefine "cost effective" speaks volumes. The CAP states: "A strategy does not have to have greater benefits than costs to be cost-effective, rather the costs have to be worth the benefits gained—some benefits are worth paying for." (CAP p. 25) Thus making cost effectiveness a subjective determination. Clearly, the CAP is not about cost effective strategies, but rather, is about strategies the someone thinks "are worth paying for" notwithstanding the cost.

Where I Agree – Sort of:

I support many of the energy efficiency recommendations not because of climate concerns alone but also because they prevent waste and excess cost. Having been raised by parents who came of age during the Great Depression, I believe that measures that increase efficiency and minimize the waste of energy or other resources are meritorious even without consideration of any climate change benefits. However, I do not believe that the CAP adequately evaluated the recommendation that building electrification be "incentivized" – which I assume means subsidized in some form. First, the CAP shows that this strategy will have a cost of more than $500.00 per million tons of CO2e reduction, as well as other negative economic consequences. Additionally, there is no evaluation of the relative heating efficiency of gas heating versus

electric heating, nor any consideration of the threat to home energy resiliency caused by relying on one power source.

Likewise, actions that derive energy from waste materials are inherently worthwhile. Renewable natural gas produced from waste materials is worthy of consideration, if for no reason other than it makes productive use of waste material. However, the CAP suggests that somehow the CO2 produced from the combustion of RNG will behave differently in the atmosphere. The CAP states that combusting biomass produces "biogenic carbon dioxide" that "has a modified impact on emissions because of its biological nature." (CAP p. 74). IEA Bioenergy suggests that the C02 emitted from burning biomass is no different and does not have a different impact, it is merely from a different source.[1] It is from a biogenic source, but it is still plain old CO2. Moreover, the IEA assessment is based on combustion of biomass from vegetation, not gas from landfills where some of the decomposing materials were not part of the so-called natural carbon cycle. Despite the "spin" in this section, the use of RNG is a worthy strategy.

I support the transition to electric vehicles, primarily because that transition will result in the reduction of criteria pollutants, especially in urban areas. However, the transition must be done in a carefully planned and paced manner. Recently, California asked its residents to refrain from charging their electric vehicles, demonstrating the dangers of rushing headlong into "feel good" strategies without adequate planning and resources. In addition, the recently revealed problems with Philadelphia's electric busses provide a cautionary note that overly eager moves may backfire and become costly to taxpayers. Nonetheless, a carefully paced transition to electric vehicles is a reasonable goal.

Unfortunately, the CAP does not analyze the benefits to be obtained from the waste-related strategies. Reducing waste, increasing recycling, and expanding beneficial reuse of waste are worthwhile goals. However, many of the Department's existing regulations and policies create barriers to reaching those goals. DEP should examine its existing programs to identify regulations or policy positions that inhibit the beneficial use/recycling of waste as part of the next CAP.

There is no doubt that nuclear energy should be part of the Commonwealth's energy portfolio. However, the CAP suggests merely maintaining nuclear generation at current levels – perhaps to support a specific political agenda item. It seems odd to me that a plan that proposes to de-carbonize the grid does not recommend an increase in the levels of nuclear generation and propose a strategy to do so with some of the emerging technologies around smaller nuclear facilities. It is hard for me to believe that a climate plan is serious about reducing CO2 emission,

[1] "burning fossil fuels releases carbon that has been locked up in the ground for millions of years, while burning biomass emits carbon that is part of the biogenic carbon cycle." https://www.ieabioenergy.com/iea-publications/faq/woodybiomass/biogenic-co2/.

as opposed to funneling taxpayer money to friends and allies, if it fails to support additional nuclear generation.

Carbon Emission-free Grid:

By far the largest GHG reductions would come from the creation of a carbon emission-free electric grid. The projected reductions are more than double the reductions projected from the next highest category. However, this strategy carries significant economic costs, and the CAP fails to adequately evaluate the impediments to implementation. In short it is unrealistic. This strategy relies heavily on significant but uncalculated subsidies to "renewable" power generation sources. Interestingly while suggesting significant command and control legislation and subsidies, as well as favorable permitting schemes for renewable facilities, the CAP then suggests that carbon capture and sequestration will have to compete with these subsidized facilities on a least cost basis, again tilting the playing field in favor of the Department's preferred sources. Pennsylvania is a major electricity exporting state. Whether it will remain so is if this strategy is implemented is not discussed. While advocating the wholesale conversion to wind and solar facilities, the CAP fails to determine the number of wind and solar facilities that will be necessary to meet the goal; how much land area they will require; and where they will be located. Nor is there any discussion regarding the CO2e emissions that will result for the mining of necessary minerals or from the manufacture of the components of renewable facilities. One often hears suggestions regarding cumulative impacts or lifecycle CO2 analysis for fossil fuel facilities. The same should be done for a strategy that proposes a radical transformation of the electric generation grid. Given the growing opposition to some "renewable" facilities, whether from environmentalists, municipal governments, or local citizens, it is difficult to take this strategy seriously.

Additional Issues:

The following are some specific additional concerns I have regarding the CAP:

1. Jobs. On page 29 the CAP references one million "cumulative job-years." The footnote makes clear that one person holding a job for 5 years yields 5 job-years. In other words one new job was created. However, throughout the CAP the term used is simply "jobs". One cannot tell whether the alleged job gains are actual new jobs or job-years.
2. Electric vehicles. Although I support the gradual transition to electronic vehicles, the CAP fails to discuss a major revenue loss that transition will produce. As purchases of gasoline and diesel fuel decline so will the revenue from the taxes imposed on these fuels. Even though these fuel taxes are the primary source of highway maintenance funds, the CAP fails to address this lost revenue as a cost.
3. Vehicle miles traveled. Once again, the CAP offers VMT reduction as a viable strategy without any meaningful way to achieve the goal. All of the implementation recommendations assume an urban setting. The history of other efforts to reduce VMT

should tell us that the public is not yet ready to accept constraints on their movements. This strategy should be dropped as unrealistic.

4. Electrification strategies. The CAP contains aggressive electrification recommendations for both transportation and buildings. GHG reductions are projected to be 21% and 14% respectively. Obviously, these electrification efforts with increase the demand for electricity. While projecting a combined 35% reduction in GHG, due in large measure to electrification strategies, the CAP also projects that electric generation GHG emission will decline by 34%. This seems to be an unrealistic expectation.

Conclusion:

It is obvious that much hard work went into the production of the CAP and some of the recommended strategies have inherent merit. However, its fatal flaw, in my opinion, is its failure to show how implementing these strategies, some of which will require radical changes, will benefit the global climate, or produce any benefit for Pennsylvanians without similar efforts by other states and countries.

COMMENTS ON THE 2021 PENNSYLVANIA CLIMATE ACTION PLAN

Luke Brubaker, Member

Pennsylvania Climate Change Advisory Committee

July 22, 2021

I appreciate the opportunity to offer the following comments regarding the final version of the 2021 Climate Action Plan (2021 CAP) for Pennsylvania.

As background, I currently serve as State Director for Pennsylvania Farm Bureau (PFB) in District 8, representing membership in Dauphin, Lancaster, Lebanon and York Counties. PFB is a statewide general farm organization with local county Farm Bureau affiliates that are active in 64 of Pennsylvania's 67 counties. PFB provides political advocacy, information and educational services, and professional assistance to farm and rural families throughout the Commonwealth. Each year, PFB engages in an extensive grassroots process for development and adoption of the organization's public policy positions. I hope that my comments on the 2021 CAP will generally reflect the views expressed in the adopted policy positions of the organization's members. PFB is the state affiliate of the American Farm Bureau Federation.

Assuming that projections of climate-based impacts to weather, land conditions, and other natural conditions offered by ICF in its 2021 Climate Impacts Assessment are accurate, I would first note my belief that the 2021 CAP's projections of future consequences and challenges to be incurred from these conditions by farming operations in the Commonwealth are reasonably accurate and should be a significant concern to Pennsylvania farmers. Sales of Pennsylvania's farm products directly provide some $7.8 billion annually to the Commonwealth's economy. Along wiith supporting processing enterprises, direct economic output from Pennsylvania's agriculture industry totals $81.5 billion annually.

Exposure of Pennsylvania farms to recurrent episodes of excessive rainfall and flooding or to excessive and prolonged periods of drought would have potentially devastating economic consequences for both producers who directly market fresh commodities and field crops to consumers and producers who market livestock and poultry products wholesale to commercial purchasers and food processors. Any single episode of extreme rainfall or drought can destroy meaningful yield of field-based commodities on a farm in a production year. For producers of fresh fruits and vegetables and producers of marketed grain and field crops, the harsh economic impacts from loss of an entire year's product yield should be obvious.

Destruction of field crops through natural disasters can have similar and harsh economic impacts on animal agricultural operations as well. Animal agricultural operations, especially dairy operations, rely heavily on their own ability to produce field crops or tap a reliable supply of locally grown crops to supply feed for their animals in order to effectively manage their cost of production. Destruction or serious reduction in crop yield from flood or drought in a growing year sharply increases the cost these farmers will need to incur to replace the feed supplies lost for that year. Not only do farmers lose money from the cost they incurred in their failed attempt to produce feed crops. They will also incur high out-of-pocket costs in securing the quantity and type of feed they need for their animals from a more distant source.

For producers of fresh fruits and vegetables, availability and employment of a dependable and productive workforce is also key to their continued success and viability. Continuous and prolonged periods of excessive heat temperatures can seriously discourage potential employees from seeking work in farm fields and can adversely affect their willingness to remain employed in field work. Failure to secure a competent and willing workforce can be especially devastating to producers during critical production periods, such as harvesting time when products to be timely harvested to avoid serious financial loss from deterioration in product quality.

Recognition of these potentially adverse impacts and consequences to Pennsylvania's agriculture industry in the 2021 CAP is important and should be kept consciously in mind by the Commonwealth in engagement of future actions to be pursued under the Plan.

Secondly, I want to express my general support for the 2021 CAP's recommended response for greenhouse gas management by Pennsylvania's agriculture sector. The CAP essentially directs Pennsylvania's farmers to continue to implement and improve those conservation measures that farmers commonly recognize are environmentally effective and can feasibly be implemented or planned for implementation on their farms. While not expressly stated, the 2021 CAP recognizes that many conservation measures currently pursued by farmers provide multiple environmental benefits. More specifically, many conservation practices that improve water quality will also have meaningful and positive impacts in managing greenhouse gases.

The 2021 CAP's recommended approach for agriculture also seems to acknowledge the difficulty faced by Pennsylvania's farm families to sustain viability for their farms in today's agricultural economy and the high degree of failure that would likely occur under approaches recommending more stringent and regulatory measures on Pennsylvania farms in managing climate change effects. I and fellow Pennsylvania farmers must commonly compete with farmers outside of Pennsylvania for product sales in regional, national and even global markets. Too often we have little, if any, control over the price we receive and must accept the prices offered under the raw economic forces of supply

and demand. Essentially, farmers are economically unable to pass on the additional costs to result from increased regulation to their purchasers.

Recent studies of farming operations in the Chesapeake Bay Watershed by Penn State University have shown that, despite economic challenges, many Pennsylvania farmers are willing and making an earnest effort to implement and self-finance effective conservation measures on their farms without governmental financial assistance. And we would like to do more if the economics of our farm operations would provide greater opportunity. The balanced approach recommended under the 2021 CAP provides both a realistic prospect and positive encouragement for additional engagement by farmers to reduce greenhouse gas emissions and ultimate achievement of sustained greenhouse gas reductions from Pennsylvania's agriculture sector.

And without going into detail, the 2021 CAP's approach for agriculture is very much in line with the policy objectives of climate change for agriculture outlined so far by the Biden Administration, which mainly calls for financially incentivizing farmers to reduce greenhouse gas emissions through more market-based initiatives.

I would also express my support for the recommendation offered in the 2021 CAP for implementation of a state program to provide financial assistance to farmers for replacement of lighting, refrigeration, ventilation and other fixtures in farm buildings and structures with those that are more energy efficient. I believe such a program would greatly lower energy consumption on farms (and need for generation of additional energy to meet consumption demand) with relatively modest commitment of public funds.

I do have significant concerns with the potential for governmental actions to be pursued by the Commonwealth under the 2021 CAP to impose serious economic and cost disadvantages upon Pennsylvania's agricultural producers, relative to producers outside Pennsylvania. While the 2021 CAP outlines the greenhouse gas reduction goals to be attained and generally identifies those sectors from which there will be higher expectation of greenhouse gas reduction, the CAP provides far less detail on how the reductions will be achieved by each sector.

Three of the sectors mainly targeted for greenhouse gas reductions in the 2021 CAP – electricity generation, transportation and fuel production – are sectors whose products are heavily used and consumed in farming operations. To viably operate their farms, farmers need to consume significant amounts of electricity and motor and heating fuel. And whether they are performing the task themselves or contracting others, farmers must engage in high level of transportation activities in the production and harvesting of field commodities and in the movement of agricultural supplies to and agricultural products from their farms. The concentrated levels of energy consumption and transportation tasks are major cost items for farming operations.

Extreme governmental actions that impose upon energy and transportation sectors arbitrary and unreasonable mandates for greenhouse gas reductions have a likely potential to result in huge cost increases for those sectors to remain in business. And those who rely on the energy products and transportation services provided by these sectors, such as farmers, will likely bear huge cost increases from price increases imposed by these sectors to offset their additional costs. As I mentioned earlier, agricultural producers have little meaningful ability to affect the price they receive for their products or to pass onto purchasers the additional production costs they incur.

Especially when considering the smaller size and scale of production of Pennsylvania's farms and challenges that Pennsylvania's farmers face in production efficiency (i.e. shorter growing seasons, proportionately less farmland area with optimum soils, and proportionately greater area of significantly sloped farmland) relative to farms in other regions of the county, the ability of Pennsylvania's farmers to manage their cost of production will become even more critical in future decades. Unless serious consideration is given to the economic impacts of governmental actions to energy suppliers and transportation service providers, Pennsylvania's pursuit of greenhouse gas reduction goals prescribed in the 2021 CAP could readily lead to serious increases in price of energy supplies and performance of transportation services. Because of the high degree that energy and transportation costs contribute to farmers' overall cost of production, spikes in purchase price of energy supplies and transportation services would place Pennsylvania farms in serious economic vulnerability.

The 2021 CAP also seems to encourage more aggressive pursuit of development of infrastructure for solar energy generation throughout the Commonwealth. There is potential for Pennsylvania and Pennsylvania's farmers to be benefited from solar energy development. But there is also a real risk for solar energy development to seriously conflict with productive farm management without careful consideration and assessment of impacts of size and location of proposed development projects on affected and neighboring farms. Because of relatively more beneficial land conditions, many of Pennsylvania's farms are being targeted as prime spots for solar energy development. Solar energy development must not be augmented at the sacrifice of compromising the integrity of the agricultural productivity of individual farms or the local agricultural economy. Commonwealth officials must keep in mind that once productive farmland is converted to another land use– even one can potentially provide public benefit – it is extremely difficult, if not wholly unfeasible, for that land be reconverted for farm use.

I also have concern with the degree of real benefit that Pennsylvania's pursuit and attainment of the 2021 CAP goals will provide in environmental quality relative to the additional costs and economic disadvantages the CAP would potentially impose on Pennsylvanians. Essentially Pennsylvania would be acting unilaterally to attain the 2021 CAP's prescribed goals, without assurance that other states would be working in similar fashion to attain similar goals in their states. Without this assurance, Pennsylvanians

could receive little or no meaningful improvement to effects of climate change for the additional personal and economic costs incurred because of failure by other states to act in similar fashion. And Pennsylvania farmers could become subject to serious economic and cost disadvantages in competing with farmers of other states in the marketing of their farm products, as I mentioned earlier.

As with many "plans," the success or failure of the 2021 CAP will depend on whether it can be achieved through means that minimize to the highest degree feasible imposition of onerous burdens on individuals and businesses within Pennsylvania. To ensure that does not happen, there needs to be thorough and continued evaluation of each governmental program and action to be performed pursuant to the CAP, with continued opportunity for transparency and comment by those parties who will potentially be adversely affected by that program or action.

Thank you again for the opportunity to offer comment.

Sincerely,

Luke Brubaker

Comments on 2021 Climate Action Plan

As a member of the Climate Change Advisory Committee (CCAC), I appreciate the opportunity to participate in the committee meetings and provide feedback to the Pennsylvania Department of Environmental Protection (Department) on the 2021 Pennsylvania Climate Action Plan (CAP). The CAP was prepared by the Department with support from ICF and is a product of the Department -- not the CCAC. The Report is prepared to update the original Climate Change Action Plan issued in 2009. This is the fourth iteration of the CAP under the Pennsylvania Climate Change Act (Act 270 of 2008). The CAP is quite expansive and addresses a multitude of issues identified by the Department to which ICF has researched and responded. While the CCAC was regularly updated on the CAP at regularly scheduled CCAC meetings and given the opportunity to provide input and comments on the CAP, the CCAC did not directly draft nor conduct any vote on or endorsement of the final CAP.

Overreliance on energy generation sector

The CAP continues to place most of the reductions of CO2 either directly or indirectly on the existing electric generation fleet. However, the report fails to recognize the contributions that Pennsylvania electric generating units (EGUs) have already made to significantly reduce the industry's greenhouse gas (GHG) footprint. This is a critical point in what Pennsylvania has already accomplished to date in terms of GHG emissions.

Pennsylvania had 78 coal-fired and coal refuse generating units at 40 locations in 2005, with 20,475 megawatts (MW) of capacity – representing 41.5% of the state's total electric generating capacity. Today, Pennsylvania coal-fired generation has dropped to six plants. Of those plants, one is scheduled to retire by 2022 and two are switching from coal to gas over the next decade, leaving only three operating coal-fired plants. One can assume the bulk of the CO2 reductions in Pennsylvania, since 2005, have come primarily from coal-fired power plants being shut down.

There were 15 coal refuse fired plants – 6 bituminous and 9 anthracite. Of these, five facilities have been permanently retired. Several others have been operating seasonally and were at risk of closure prior to recent legislative and regulatory changes. With the loss of each coal refuse to energy plant comes an attendant loss of remediation of hundreds of thousands of tons of coal refuse each year.

From an electric generation standpoint, the CAP is proposing "amending and increasing the Alternative Energy Portfolio Standard (AEPS) to an in-state requirement of 100% by 2050 to achieve a carbon-free electricity grid." This would be accomplished by increasing Tier 1 targets and the solar carve-out, as well as including nuclear, fossil energy with carbon capture and sequestration, energy storage as eligible Tier 1 energy sources, or creating a new tier in the portfolio of options to meet the 100% target. I am please the CAP proposes to maintain the Tier 2 requirement at the current level of 10% through 2050.

What is playing out with these initiatives is a "de-facto" reregulation of Pennsylvania's electric industry. These types of out of market payments impact the PJM energy market and how generators bid and price capacity in the electric generating market. If these suggested changes are made to the AEPS, nearly all of generating capacity in Pennsylvania will be receiving subsidies from the state by 2050. This does not account for federal subsidies for wind and solar generation and any future federal subsidy for other types of generation. From a competitive electric generating market perspective, the impact of these policies create a double hit for coal and natural gas EGUs when competing with solar, wind, and nuclear generation. First, these generation sources would obtain significant subsidies from both the AEPS and federal tax credits for solar and wind. Whereas, coal and gas EGUs would be further burdened as a result of the cap and trade system charging for carbon emissions.

The CAP also fails to take into account the cost of managing both low- and high-level radioactive waste from nuclear power plants. Further, as these plants age, the cost of maintenance increases, which include the management or replacement of equipment. The solar industry has its own issues forthcoming dealing with the management of solar panels as they come to their end-of-life performance or even when there are panels being replaced in the interim for poor performance.

Overlooks the benefits of coal refuse energy and reclamation

Coal refuse-fired EGUs represent a major force in the reclamation of abandon mine land. The CAP appears to support these facilities by maintaining the AEPS Tier 2 requirement at the current level of 10% through 2050. Tier 2 resources are limited to waste coal, distributed generation systems, demand-side management, large-scale hydropower, municipal solid waste, integrated combined coal gasification technology, and generation of electricity utilizing by-products of the pulping process and wood manufacturing. The majority of Tier 2 energy comes from coal refuse energy generation. However, by including a 100% carbon free grid strategy and subsidies for competing generation sources, the result could be the loss of nearly all of this environmentally beneficial power generation from coal refuse-fired EGUs.

The CAP fails to take into account the reduction of GHG emissions from coal refuse reclamation when calculating the impact of coal refuse generation. Similar to biomass energy generation, coal refuse should be considered a "low carbon" or "carbon neutral" fuel, meaning that carbon emitted by burning the fuel does not contribute additional GHG to climate change. There are annual air and GHG emissions due to the very existence of abandoned coal refuse piles in Pennsylvania. Absent the coal refuse reclamation to energy industry, air pollutants and GHG emissions from coal refuse piles will continue to hinder progress toward improvements in air quality and climate change for hundreds of years. Openly smoldering or burning coal refuse in stationary piles and ongoing "low temperature oxidation" of exposed coal piles create uncontrolled air emissions, including GHG emissions. Additionally, by providing the Commonwealth with land remediation and water quality improvements by reclaiming these previously polluted and barren sites, they begin to act as carbon sinks through establishing vegetation and wildlife habitats.

In the recently adopted CO2 Budget Trading Program (RGGI), the Department set aside 12.8 million CO2 allowances annually for this industry to recognize "waste coal-fired units provide an environmental benefit of reducing the amount of waste coal piles in this Commonwealth. Reducing waste coal piles is a significant environmental issue in this Commonwealth, because waste coal piles cause air and water pollution, as well as safety concerns." Additionally, by precluding and extinguishing abandoned coal refuse pile fires created by spontaneous combustion or human interface, these facilities prevent uncontrolled emissions which contain significantly higher GHG and other emissions.

The strategy to "Increase Land and Forest Management for Natural Sequestration" includes additional conversion of abandoned mined lands but fails to recognize the benefits of the coal refuse reclamation to energy industry in this strategy. According to a 2019 study by Econsult Solutions, the industry can reclaim up to 240 acres of abandoned mine lands at its peak operations by removing harmful coal refuse piles and restoring natural vegetation to historic mining lands. While it is true "reforestation is not always an option, replanting native vegetation of many varieties can sequester more carbon than bare mine lands." A lack of funding for was cited as a challenge to this strategy, but the coal refuse reclamation to energy industry invests significant private funds annually to replanting and reforestation efforts on abandoned mine lands.

It also needs to be recognized that unreclaimed coal refuse sites are major source of water pollution from sediment laden runoff and mine drainage. In the 2013 Pennsylvania Climate Assessment Update, Penn State

University was projecting wetter periods with increased runoff. From a climate change perspective, if, as projected, there are increased in more intense precipitation events, that will mean more silt and water pollution will come from these sites. For the unreclaimed abandoned coal refuse sites, this would mean higher sediment laden runoff and increase in mine drainage from these sites. Yet, while the Department discusses in overview form the need for stormwater management, it ignores the benefits of coal refuse reclamation to energy, thereby moving to a future without the tools available to reclaim and ameliorate water quality from abandoned mine lands polluted by coal refuse.

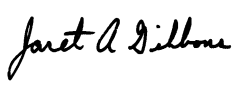
Coal refuse should be modeled and reported as a separate fuel type for energy generation

The CAP breaks out emissions from the electricity generation sector by fuel type, including coal, natural gas, nuclear, renewables, and other. I appreciate the Department clarifying that throughout the CAP the fuel type "Coal" includes "electricity generation from waste coal"; however, I believe that this is not the appropriate fuel type classification. Ideally, waste coal energy generation should be modeled as its own separate fuel type. Alternatively, it would more appropriately be included in the "Other" fuel type, which "includes electricity generation from waste-to-energy and landfill gas facilities" as coal refuse is a waste energy fuel that is more akin to municipal waste than coal.

Coal refuse energy generation has significant differences from traditional coal energy generation, both in terms of the design and operation of the generation technologies utilized at the facilities, as well as the fuel itself. Coal refuse energy facilities utilize a relatively newer and evolving technology where coal refuse is used as fuel in circulating fluidized bed (CFB) boilers that combust it with limestone injection to control air emissions and generate electricity as a viable and environmentally acceptable means to remove polluting coal refuse piles. The resulting highly alkaline ash differs from traditional coal ash and is beneficially used for reclaiming historic mine land sites. These facilities are some of the lowest emitters of air pollutants, including mercury and filterable particulate matter.

Coal refuse is not "Coal" but rather a waste product of the mining process that often contains a variety of substances including rock, clay and other organic and inorganic material. In Pennsylvania, our waste coal is primarily anthracite culm and bituminous gob. The U.S. Energy Information Administration (EIA) defines coal as, "readily combustible black or brownish-black rock whose composition, including inherent moisture, consists of more than 50 percent by weight and more than 70 percent by volume of carbonaceous material." Coal refuse does not meet this definition, but is separately defined as, "a byproduct of previous coal processing operations… composed of mixed coal, soil, and rock (mine waste)." It frequently has high ash or sulfur content making it unable to meet quality and heating characteristics of the boiler design at a coal power plant. The fact that it does not meet the technical characteristic of coal for use in energy production is why it is discarded as waste, thereby making its fuel type classification as "Coal" both unreasonable and inaccurate.

Respectfully submitted,



Jaret A. Gibbons
CCAC Member

COMMENTS ON 2021 CLIMATE CHANGE ACTION PLAN
PREPARED BY PA DEPARTMENT OF ENVIRONMENTAL PROTECTION
PURSUANT TO ACT 70 OF 2008

SUBMITTED BY PATRICK HENDERSON
Member – Climate Change Advisory Committee

July 2021

Too often, those positioned to implement sensible emission-reduction strategies are instead more fixated on compelling others to acknowledge the urgency and nobility of their cause.

Climate change is the McCarthyism of our time.

INTRODUCTION

As a member of the Climate Change Advisory Committee (CCAC), I appreciate the opportunity to share these comments and response to the final 2021 Climate Change Action Plan (Action Plan or CAP) of the Department of Environmental Protection (Department or PA DEP).

The Department's program staff are to be commended for their diligence in assisting the CCAC in reviewing prior drafts of this Action Plan, along with associated documents such as the Climate Impacts Assessment and Greenhouse Gas Inventory, and the facilitation of additional information to the CCAC during its development.

Despite the significant and commendable effort which went into preparing the Action Plan, there are several important areas where I diverge with the Action Plan's conclusions and recommendations. The following reflect my personal comments as a member of the CCAC; they do not reflect, nor have they been reviewed and approved, by my employer or anyone else.

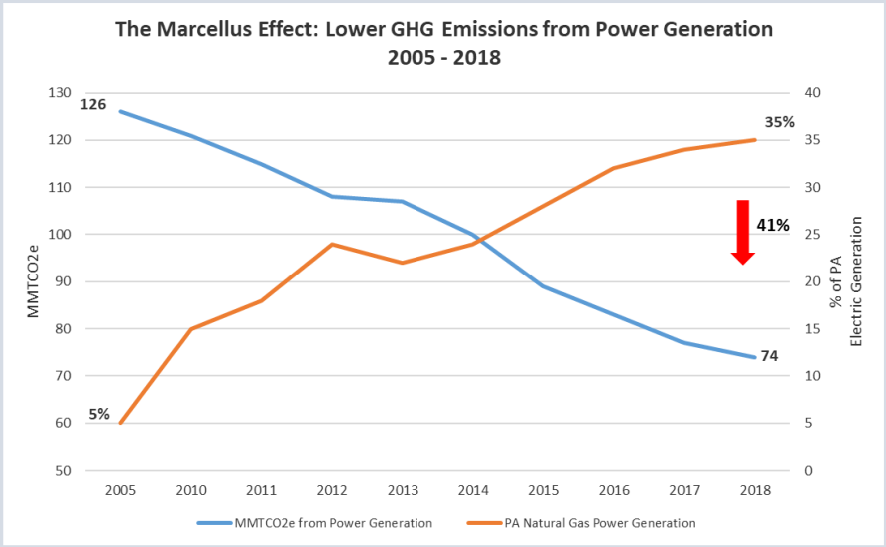
PENNSYLVANIA'S CURRENT GREENHOUSE GAS EMISSION PROGRESS

Notably lacking from the CAP is a discussion on the progress that Pennsylvania has made over the past decade plus in reducing its emissions related to climate change. The CAP serves as the primary forward-facing document for the Department's efforts related to climate change, and it befuddles me that the Department knowingly shies away from informing readers that Pennsylvania has made tremendous progress in reducing emissions to date. I urged the Department to do so in the last iteration of the CAP, but this recommendation is again – mostly – ignored.[1]

[1] Scant attention is paid to historical reductions of GHG emissions in PA on pages 10 – 11 of the report. However, a reader of this report would never know, for example, that Pennsylvania has reduced its carbon dioxide emissions from power generation by perhaps more than any other state in the nation and serves as the second-largest exporter of electricity in the nation, with significant electricity exported to power New England and Mid-Atlantic states that jettisoned their own power generation in response to the RGGI.

Recognizing the progress made to date does not equate to dismissing the need for additional progress. Rather, it informs readers and policymakers that will evaluate the recommendations of the CAP and allows for proper gauging of government-mandated steps compared to market-induced progress. It is notable that the vast majority of the progress realized is market-driven through the citing of new natural gas electric generation facilities. It is also worth recognizing that state policies that help create a competitive electric market, and which shifted the risk of capital investment for power generation from ratepayers to the private market without micromanaging the Commonwealth's electricity portfolio, are significant contributors to this progress.

In Pennsylvania (and as noted in passing in the CAP), the power generation sector has seen a significant increase in the use of natural gas for electricity. There is a direct correlation between the use of natural gas, spurred by the development of the Marcellus Shale and other unconventional natural gas resources, and the decline in carbon dioxide emissions from the sector, as illustrated in this chart below[2]:



LACK OF CLEARLY UNDERSTOOD BENEFITS FOR PENNSYLVANIANS

While the Action Plan includes sweeping new recommendations, including transformation of Pennsylvania's competitive electric generation markets to a command-and-control, centrally-administered portfolio mandate and the discontinuation of coal and natural gas electric generation, there are no clearly defined benefits to be achieved and delivered to the citizens of Pennsylvania if these recommendations are implemented.

[2] Source: U.S. Energy Information Administration

To the extent that the Action Plan includes benefits, it is in the context of specific recommendations that, if implemented, may lead to a quantifiable emission reduction. However, despite ominous warnings that climate change will lead to draconian outcomes if unchecked,[3] the Action Plan fails to include tangible and specific benefits that Pennsylvanians will see should these recommendations be implemented, such as:

- Less-than-projected average temperature increases
- Less saltwater encroachment up the Delaware River estuary
- Maintained or increased water levels in Lake Erie
- Less frequent heavy rain events
- Less severe and fewer flooding events
- Less severe heat waves
- Lower health care costs, including averted premature deaths
- Lower-than-projected rising sea levels
- Fewer-than-projected invasive species

Pennsylvanians are expected to accept that 'less is better' and therefore worthy of the economic costs, sacrifices and impositions to be borne should these recommendations be implemented. While the Action Plan goes to extensive lengths to quantify the costs of climate change to date, as well as future impacts under a business-as-usual scenario, the lack of tangible and specific benefits for Pennsylvanians under this plan is conspicuous and undermines the merits of pursuing many of the suggested policies.

Moreover, to the extent that the overriding benefit of this suite of recommendations is to keep global temperature increases to below the two degree Celsius threshold asserted as necessary to avoid the most dire of consequences from a changing climate, it is imperative for the public and policymakers to understand the following: even proponents acknowledge that this benefit can only be achieved if *"All states achieved similar greenhouse gas reduction targets, and other nations met comparable goals."*[4]

THE FATAL FLAW

The Department and its consultant have evaluated a variety of recommended policies to gauge their cost effectiveness in reducing greenhouse gas emissions within the Commonwealth. The Department has acknowledged that none of these policies have been evaluated to gauge their impact on displacing, or leading to increased, greenhouse gas emissions in other states.

Given that climate change is a global challenge, and that greenhouse gases such as carbon dioxide and methane do not present or pose specific local air quality or respiratory issues, it

[3] Page viii of the CAP warns of higher average temperatures, increased heat waves, saltwater encroachment up the Delaware River estuary, increased droughts, heavier, more severe rain events and other impacts
[4] Page 14 of 2019 Climate Change Action Plan

only makes sense to understand whether a particular policy will lead to a net reduction of greenhouse gas emissions.

The Department's failure to do so renders the recommendations contained in the CAP untested in this regard, and therefore not worthy of implementation because there is no assurance that they will actually achieve a net reduction of greenhouse gas emissions.

SOMETIMES IT RAINS; SOMETIMES IT DOESN'T

While this heading is offered somewhat tongue in cheek – recognition of the impact human activity can have on our environment is important and impacts ought to always be minimized when feasible – it is not an exaggeration to suggest that, in some quarters, nearly every severe or extreme weather event, including the *lack of* an event (such as a drought), seems attributable to climate change. It is akin to proving a negative: demonstrate that some adverse event is *not* the result of climate change. This presents a conundrum which proponents of radical policies have cleverly mastered, too often abetted by public policymakers who ought to know better: blame floods, wildfires, extreme heat, extreme cold and other weather-related events that will cause countless, avoidable deaths on climate change.

"And we're, like, the world is gonna end in twelve years if we don't address climate change…and your biggest issue is how are we gonna pay for it?"

~ U.S. Rep. Alexandria Ocasio-Cortez (D-NY), Lead Architect of Congressional Climate Change Policy - #MLKNow 2019 Event – Jan. 21, 2019

UDATE: The world will now end in ten years.

Without discounting the need to continue to improve upon the success to date, PA DEP should acknowledge that the human race has made significant progress to minimize weather-related deaths. According to the Reason Foundation,[5] aggregate mortality attributable to extreme weather events has declined by 90% since 1920. Additional analysis concludes:

- Deaths and death rates from droughts, which were responsible for approximately 60% of cumulative deaths due to extreme weather events from 1900–2010, are more than 99.9% lower than in the 1920s;
- Deaths and death rates for floods, responsible for over 30% of cumulative extreme weather deaths, have declined by over 98% since the 1930s;
- Deaths and death rates for storms (i.e. hurricanes, cyclones, tornados, typhoons), responsible for around 7% of extreme weather deaths from 1900–2008, declined by more than 55% since the 1970s.

Under any circumstance, people are significantly better protected today from the impacts of extreme weather events than at any time in recorded history. Much of this protection is rooted

[5] Wealth and Safety: The Amazing Decline in Deaths from Extreme Weather in an Era of Global Warming, 1900–2010: Indur Goklany – The Reason Foundation – September 2011

in progress attributable to affordable, domestic and abundant energy resources – energy resources which are now targeted for elimination under this CAP's recommended policies.

PA DEP's ROLE IS TO PROTECT THE ENVIRONMENT – NOT DICTATE ENERGY CHOICES

The role of any environmental regulatory agency is to protect the environment and by extension public health in accordance with the statutes and regulations which lay out their specific obligations. However, too often agencies and those who run them have veered from this charge and instead used the tools at their disposal to advance their vision of the world. Nowhere is this more apparent than in a regulatory agency using its vast reach to dictate energy portfolios or to advocate for or against a specific energy resource.

PA DEP has in recent years sought to oppose the extraction, development and use of fossil fuels, while using its public platform to champion its preferred sources of energy such as wind, solar and other alternative energy resources. The CAP plan provides numerous examples of this, where the Department is focused less on environmental outcomes and more on dictating how to get there. Proposals to mandate that Pennsylvania expand its Tier 1 electric generation portfolio to 100%, leaving no room for traditional sources such as coal or natural gas, is but one example.

PA DEP is even more direct in articulating its opposition to fossil fuel development. For example, in materials prepared for the CCAC outlining the Impacts Assessment and CAP at its December 2020 meeting, the Department touted efforts to "*potentially displace hydraulically fractured or conventional gas*". Why?

This is highly inappropriate. To be clear, the Department's role should be to ensure that any energy resources which are developed are done in a manner that protects public health and the environment; not to dictate which resources are actually developed. Publicly cheerleading[6] for the success of certain preferred energy sources calls into question the objectivity and fairness in the treatment of other energy sources.

"CLEAN" ENERGY

The CAP uses the term "clean energy" nearly 60 times throughout its narrative, with references to "clean energy" jobs,[7] electric generation sources, and taxpayer funding. This term is a

[6] Since 2015, the Department has devoted significant time, energy and financial resources to advocating for solar energy, including contracting with a Harrisburg anti-fossil fuel lobbying organization funded in part by a Pittsburgh-based anti-immigrant foundation to launch a solar deployment initiative. From 2015 to present, the Department has issued over 50 press releases touting the benefits of solar energy, and zero press releases touting the benefits of natural gas or coal.

[7] The definition of "clean energy" jobs is, to put it mildly, overly generous. The Department's own report categorizes 50% of clean energy jobs as coming from the traditional and high-efficiency HVAC sector: 2020 PA Clean Energy Employment Report –

misnomer, unfairly and inaccurately implying that anything which does not meet this narrow definition is "dirty" energy.

This designation ostensibly refers to the fact that some electric generation sources have no or minimal direct emissions at the point of generation. This narrow definition conveniently ignores the significant fossil fuel energy needed to construct or transport the "clean energy" generation components, including extracting through mining processes the rare earth minerals needed for many of these alternative energy sources. It also ignores that nearly all "clean energy" generation sources must be sufficiently backed up by traditional electric generation sources, typically coal, natural gas or nuclear.

Toxic rare earth mineral sludge lake, Inner Mongolia. *Credit: Liam Young/Unknown Fields. Published www.bbc.com April 2, 2015*

Ironically, during a time when anti-fossil fuel advocates insist that fossil fuels be critiqued for impacts throughout their life cycle (extraction to disposal), they reject the application of this very principle to those energy sources they seek to assert are "clean".

TRANSPARENCY OF CONSULTING CONTRACT

While claims of transparency from PA DEP and the Administration have been a consistent theme over the years, the Department's handling of its consulting contract to prepare this report does not comport with the spirit of these public assurances. Like prior CAP reports, the Department commissioned ICF Incorporated from Fairfax, Virginia to help prepare this latest CAP update. Despite legal requirements that all contracts also be posted and available on the Pennsylvania Treasury Department's website, the contract[8] awarded to ICF Incorporated is not available to the public. Rather, the Department executed a "Purchase Order" (# 4300664666) for ICF Incorporated's services related to CAP under a generic contract (# 4400007410) awarded to ICF Incorporated in 2012 by the state's Department of General Services. This generic contract, available online purportedly to comply with the law, lists no specific tasks or services to be performed by ICF Incorporated, nor does it reflect any expenditure of Pennsylvania

https://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/2020EnergyReport/2020_PACEIR_FINAL_1.1.pdf

[8] The agency may argue that, legally, it issued a Purchase Order, not a contract to ICF, and therefore is exempt from the public disclosure requirement. Any such assertion would be widely regarded by the public as mere semantics.

taxpayer money. It generally reflects that ICF Incorporated is a recognized contractor to be called upon in the future for the delivery of specific tasks and services – to be delineated in future "purchase orders". Again, these purchase orders are not publicly available.

To wit, any member of the public which sought to utilize the Pennsylvania Treasury Department's contracts e-Library would never have a clue that ICF Incorporated was receiving $399,990 to perform services related to the preparation of the CAP Update. Going forward, the Department should pledge to submit for public disclosure to the State Treasurer all Purchase Orders it enters into for services. It should also commit to posting these contracts and purchase orders – along with a clear explanation in layman's terms as to what they encompass – on its own publicly available website.[9]

This may be viewed as some by 'inside baseball' and by others as gratuitous commentary irrelevant to the topic at hand. Yet absent raising these concerns here, I don't know of a forum or venue in which to illustrate them. In addition, the associated costs are worthy of public disclosure because doing so is necessary for the public and policymakers to evaluate whether the expenditure of these funds is appropriate and proportionate to the services rendered.

REPEAL ACT 70

Act 70 should be repealed by the General Assembly because developing a CAP is an expensive, time-consuming process that has, to date, resulted in no meaningful – if any – cumulative greenhouse gas emission reductions for Pennsylvania.

DEP seems more fixated on initiating the *next* CAP as soon as one is done, rather than seeking to implement the recommended policies and initiatives of the prior plan. While this may be fortuitous in my own personal view, because I view many of the recommendations as detrimental to our Commonwealth, it nonetheless calls into question: what is the purpose of the plan? If any steps are taken, they are often efforts which would have transpired regardless of the existence or recommendation of the CAP – but are then credited in part to the CAP to demonstrate its value or contribution to the effort. Often, at least in this advisory committee member's view, the CAP and accompanying recommendations are used as political cover to advance tangentially related policies, such as taxpayer subsidization of renewable energy or opposition to fossil fuel development and use, under the guise of addressing climate change.

---

[9] Worth noting: PA DEP issued another Purchase Order (# 4300636995) in the amount of $375,000 to ICF Incorporated to perform an analysis of a proposed rulemaking petition pertaining to greenhouse gas cap and trade, under Contract # 4400011024. Neither the Purchase Order nor a description of services to be provided – nor a later amendment to expand the scope and amount of said Purchase Order to include modeling of Governor Wolf's proposed Regional Greenhouse Gas Initiative (RGGI) regulation – is publicly disclosed or available. An additional contract valued at up to $10 Million awarded by PA DEP to the Delta Institute to advise the Department on how to spend RGGI tax revenue, while publicly available on DGS's website, fails to disclose any scope of services or contracted deliverables, other than the amount and the timeframe of the nearly 8,000 year contract through December 31, 9999 (Contract # 4400023719)

This recommendation – which admittedly is not politically feasible – is not meant to suggest that meaningful dialogue on climate change is unwarranted. It is meant to suggest that the current approach simply is not an effective way of doing so.

I also question the value with which some in the Department hold the viewpoint and input of the CCAC. To be clear, the committee is ably run and has been for years by outstanding committee chairs and vice chairs. And the program staff of the Department which interacts with the CCAC has, as always, comported itself with professionalism while providing timely, informed and knowledgeable assistance to the CCAC. The citizens of Pennsylvania are fortunate to have them working on our behalf.

The members of the committee devote significant personal time from their daily jobs and personal obligations to attend and participate in the meetings, and countless hours of deliberation and input is provided outside of the regular meeting schedule. We knew this was the bargain when we signed up to volunteer for these positions.

Yet, I would be remiss, and perhaps derelict in my duties, to not observe that senior management of the Department does not make the same investment. Any input to senior management from the CCAC seems limited to second-hand relaying of discussions by department program staff or reading of letters such as this. To illustrate this frustration, neither the Secretary nor a member of the DEP Executive office has attended a meeting of the CCAC over the past six years.[10] Despite multiple and repeated protestations that climate change is the single most important threat posed by our nation and environment today, they have never seen fit to receive first-hand input or reaction from those citizen-volunteers who serve on the CCAC.

Conclusion

These thoughts, comments, observations and recommendations are mine and mine alone. I appreciate the time anyone has taken to read them.

[10] I note for the record that the DEP Policy Office is regularly engaged with the CCAC. That engagement is noted and appreciated.

Re: Comments
Pennsylvania Climate Action Plan of 2021
June 2021

Dear David and Lindsay:

The Pennsylvania Climate Action Plan of 2021 ("Climate Action Plan") fails to consider all factors and needs to more fully vetted with the analysis being performed controlled by the Pennsylvania Department of Environmental Protection ("Department") and its Consultant ("ICF").

The Climate Action Plan promotes the benefits of certain industries without considering the negative economic impacts on those industries and related industries. In addition, the economic impacts should also consider impacts on the local tax base, education, and health care. Further, the Climate Action Plan only discusses the perceived negatives of the Department and ICF's unfavored industries and fails to discuss the benefits of their unfavored industries. As a result, the Climate Action Plan reads as a promotional advertisement for their favored industries such as solar energy. Rather than questioning specific areas or topics, the intent is to highlight areas where additional analysis and reviews are deemed to be needed. These areas are:

Net Zero Decarbonization:

The Climate Action Plan fails to clearly define "net zero decarbonization". Is this term solely for the Electric Grid or does it include the non-EGU Industrial Manufacturing Sectors?

The term "net-zero" implies that there will be a need for carbon offsets; however, the Climate Action Plan fails to adequately address. Will there be offsets? How do you track and/or certify any offsets and/or carbon credits? The Climate Action Plan fails to mention or include the self-remediating efforts of various industries.

Further, the Climate Action Plan looks at certain industries in a vacuum rather than looking at the entirety of the industry. For example, the waste coal to energy industry is part of the reclamation process in Pennsylvania and therefore, the overall long-term benefits are substantial when considering that these facilities are reclaiming legacy coal mining areas while producing reliable energy. Further, this industry has substantial environmental benefits which have long been recognized in the Commonwealth.

Electrification of the Grid:

The Climate Action Plan argues for a greater electrification of the grid including but not limited to, electric cars and other vehicles, through the use of electrical furnaces and boilers by the non-EGU Industrial Sector and pushing for the electrification of the homes. However, the Climate Action Plan fails to address and/or provide projections for the increase electric consumption together with how the Commonwealth will meet this increase demand.

The Climate Action Plan should address how the Commonwealth intends to meet future energy demands especially when the Climate Action Plan pursues objectives that would eliminate reliable sources of energy such as the coal industry and the current state of the nuclear energy when considering general market factors. The Climate Action Plan should address how the Commonwealth intends to provide sufficient electric to meet the rising demand in electricity while at the same time, the Commonwealth is pursuing regulatory actions together with market factors that is resulting in a decrease in the supply of reliable electricity. Pennsylvania has a great resource with a diverse portfolio of energy sources, which it should harness rather than play favorites. The potential economic and social costs to the ratepayers, taxpayers, and communities should be included in the Climate Action Plan.

Paris Accords:

With regards to the various signatories to the Paris Accords as it relates to Climate Change, has any determination been made that the required solar, wind and battery storage facilities can be produced and installed within the agreed to time frames? While one projects that the cost of solar, wind and battery storage will decrease; however, if demand increases in order to meet the requirements of the Paris Accords, it seems that price and costs will increase, potentially significantly. As with any commodity and/or good, when demand increases, typically the price and costs increase as demand exceeds supply.

Role of Rare Earth

The push for renewable energy (especially solar and wind) and the "economics" in the push towards decarbonization of the grid is completely ignorant and fails to consider the potential demand of rare earth minerals. Further, the Climate Action Plan overlooks, albeit intentionally, the social and environmental costs to mine and produce rare earth minerals.

To meet greenhouse gas emission reduction targets under the Paris Accords, it will require an accelerated ramping up of renewable energy production. This "accelerated ramping" requires the global production of rare earth minerals (especially neodymium, terbium, indium, dysprosium, and praseodymium) will need to grow by a 12-fold factor by 2050. (This does not include the need for these same rare earths for other purposes.)

This, today, the current global supply of critical rare earth metals is insufficient to meet the demand resulting from the transition to renewable energy systems!

The critical demands for these metals will have a significant impact on electronics, on the auto industry, and more importantly on our defense industry and on our national defense raises serious concerns about the overall strategy to use renewable energy even in the manufacturing industry.

While recognizing the above, what is not considered is the supply chain GHG emissions tied to the mining, processing, and production of these metals. Further, this does not include the environmental impacts of the production. China represents 80% of the production and 95% of the refining.

By pushing and not considering this, the impact strengthens China economic engine while reducing our ability to compete and creating concerns regarding our national defense. It also creates other social, economic, and environmental issues and/or harms that significantly outweigh the perceived harms of carbon producing sources of energy.

Tax Incentives:

The solar industry is being driven by the various incentives such as tax credits and other subsidies. What is intriguing is the effort placed on providing tax credit incentives coupled with renewable energy credits creating an uneven playing field. The claims that renewable energy can compete with fossil fuel generation is misleading. Without these two elements, solar power loses its momentum.

Without the Federal Tax Credit subsidy and renewable energy credits, the ability to compete is limited by the cost per MW generated.

The Climate Action Plan fails to address the societal and economic harm to ratepayers and taxpayers in Pennsylvania as a result of the various Federal incentives. Instead, the Climate Action Plan assumes that Pennsylvania taxpayers and ratepayers will be willing to absorb the heavy burden of promoting certain renewable energy sources when view in light of jobs losses and unemployment; reduction in tax base revenues to local communities and the local school districts (both in property taxes and wages taxes.

Biofuels:

The push to use biofuels as an energy source leads to a slippery slope. As biofuel projects develop (even if sustainable), the impact of converting these agricultural lands to producing biofuel crops place a greater impact on agricultural production to provide basic food production. This is especially important when some farms are leasing their property to solar farms, which results in less crops. With the population continually growing, we will need to produce more food to meet the demand of the population. However, with the incentives set forth above, farmers are now converting their farmland into biofuel projects and/or solar farms. This could result in food shortages and other social, economic and/or environmental harms that the Climate Action Plan fails to even acknowledge.

Solar and Wind Projects:

The Climate Action Plan promotes the expansion of solar and wind projects. Instead of having these projects being developed on forested lands and agricultural lands (as we are doing now), the Commonwealth should actively seek and promote these types of projects on brownfields and grayfields (especially on mine lands). The demand for biofuels and converting other agricultural lands to solar may have the unwanted reaction of declining food productions.

Further, the Commonwealth should be proactive in enacting legislation that prohibits local municipalities from placing restrictions on these types of projects. Unfortunately, and for example, developers of wind projects are constantly facing challenges at the local level and projects are unable to proceed as a result of being unable to obtain permits and/or objections from the municipality.

The Climate Action Plan suggests that these types of projects will be developed without any resistance from local governments. However, developers face resistance on many levels which make these types of projects costly and undesirable for developers. By focusing on brownfields and grayfields, the Commonwealth could enact legislation that these projects are permitted in those areas; thus, removing the risks for developers associated with the permitting process with local governments.

Wind Turbine and Solar Waste:

There is an obvious rush to expand solar and wind power generation without considering the harms of this industry. This rush to expand is short-sighted. What are the long-term impacts of managing these projects when these projects pass their useful life? What is the plan to dispose of solar panels, wind turbines, and/or electric cars? The Climate Action Plan fails to address how the waste produced from these projects will be addressed and thus, it fails to consider the adverse environment, social and economic harm associated with the waste and disposal of these projects after their useful life as ceased.

Additionally, the Climate Action Plan promotes solar and wind energy which does not create the same amount of energy as other sources. As a result, higher producing facilities are going off-line and/or decommissioning and being replaced with lower producing facilities such solar and wind facilities. For example, Three Mile Island nuclear power plant is being decommission. Solar and wind is unable to fill the void created by the decommissioning of Three Mile Island. Further, even assuming that solar and wind could make up for the loss of energy produced by such a nuclear facility, 1000s of acres of forest,

farm land and other viable land would have to be converted from viable agricultural and/or forest land to solar and wind farms. This would result in significant costs to society.

Recycling:

The area of recycling, especially of plastics needs to be more closely examine and incentives provided! This is an area where Europe and some Asian Countries are leading the way with the technology being developed. There are several German Companies deeply involved in recycling of plastics and other wastes.

Waste Coal Facilities:

The Climate Action Plan improperly lumps waste coal facilities in with coal generating facilities. Further, the Climate Action Plan assumes that these facilities will no longer be operating in 2050; especially the waste coal plants. The waste coal plants may last longer pending the availability of coal refuse within an economic haul distance. The Commonwealth, several environmental associations, and river basin commissions have recognized the importance of this industry in reclaiming waste coal, culm and/or gob from the lands of the Commonwealth and returning these lands to a productive use and improving water quality. Pennsylvania's $15+ Billion Dollar AML problem will need help to reclaim these lands as the coal mining industry continues its consolidation and shrinkage due to the elimination of the steam and thermal coal markets.

Fossil Fuel:

Rather than eliminating fossil fuels (coal, gas, and oil) we need to go back to the development phase and look to pyrolysis to capture the carbon for manufacturing and to carbon sequestration purposes, while producing ammonia and hydrogen as the energy source.

Pennsylvania should embrace its diverse energy portfolio and its ability to be a net exporter of electricity. Pennsylvania has great resources. Communities depend on industries especially in the coal region. In addition to government regulation on the coal industry, certain banking and insurance companies have adopted policies not to loan and/or insure coal companies. In addition, a certain steel company recently announced plans to be net-zero carbon by 2050. Unfortunately, these policies and government regulation will have a substantial and devastating impact on certain, already distressed communities which rely upon the coal industry for jobs, tax revenue, and other daily functions. The Commonwealth should develop mechanisms for these industries to continue to prosper rather than trying to eliminate fossil fuels for other Department favored industries.

I would hope that future Pennsylvania Climate Action Plans look at all factors rather than limiting the factors being presented to justify the Department's Plan. Even with perceived favored industries such as solar and wind, there are negative social, economic, and environmental effects that at a minimum should be presented. These negatives factors should be part of the analyzed rather than simply excluded.

The Department has acknowledged in conversation and discussions some of these negative factors but should address them as part of future climate action plans!

Market Failures and Job Creation:

The Climate Action Plan fails to consider market factors and projections, which results in grossly inaccurate analysis. For example, the Climate Action Plan discusses the use of nuclear energy as a future source of energy. However, as we have seen with Three Mile Island and other facilities, these facilities are unable to compete with the low electric prices and the abundance of natural gas in Pennsylvania. In order to maintain the levels as set forth in the Climate Action Plan, this industry would require subsidies and/or other governmental assistance. The same can be said of the coal generation industry, where various facilities have been decommissioned and/or converted to natural gas facilities. The coal generation industry facing stricter and costly government regulations are unable to compete with natural gas and those government propped up industries like the solar and wind turbine industries.

Further, the Climate Action Plan discusses the anticipated increase of jobs as a result of the creation of solar farms and wind turbines. There may be short term jobs created; however, the Climate Action Plan fails to set forth the total impact of this transition to renewable sources of energy. For example, we are replacing large facilities with roughly 50 employees with a solar farm that has very few, if any, working on a daily basis. Also, the Climate Action Plans fails to address the loss of significant jobs in supporting industries that will also be adversely impacted. Recognizing that Environmental Justices Communities are defined by economic conditions, the impact of the proposal does not adequately assess the impact on local communities and potentially taking areas where the economic conditions presently are not considered Environmental Justice Areas to making them Environmental Justice Areas

Summary

While the Climate Change Action Plan provides the Administration directions to address the GHG Issue, it needs to provide a path forward for the following areas:

- The economic impacts related to the mining industry both in terms of employment and lost income to sustain the AML Reclamation Program; to provide similar good paying jobs that are being lost (not just job training) but jobs!
- The economic impacts of a specific industry (power generation) should not be limited to it but should include an economic analysis of the impacts on all the related industries and support industries.
- The economic impact on the local area, in terms of tax base, education, and health care.
- Programs related to waste management and recycling
- Programs to plug abandoned oil and gas wells
- Programs to support the environmental clean up of the abandon coal mine lands programs.
- Programs supporting Carbon Capture, Utilization, and Sequestration
- Insuring that new Environmental Justices Areas are not created!

We also support the recognition provided to the waste coal industry that while it has CO2 emissions, its reclamation and remediation efforts are important providing environmental improvements and ultimately creating carbons sinks.

Thank you for the opportunity to provide comments and observations regarding the 2021 Climate Action Plan.

Sincerely,

Gary L Merritt

Disclaimer and Acknowledgements

The Pennsylvania Department of Environmental Protection (DEP) developed the Commonwealth of Pennsylvania's Priority Climate Action Plan (PCAP) to meet the requirements of the US Environmental Protection Agency's (EPA) Climate Pollution Reduction Grant (CPRG) program. The CPRG program provides funding to states, local governments, tribes, and territories to develop and implement plans for reducing greenhouse gas (GHG) emissions and other harmful air pollution.

The Pennsylvania PCAP includes GHG reduction measures that reflect the Commonwealth's priorities as they relate to implementation funding opportunities through the CPRG program, many of which are in line with existing state climate, energy and transportation goals, plans, actions, and programs. Specifics of each measure provided in the PCAP (e.g., key implementers, implementation activities and milestones) are meant to be informative but are not exhaustive of all specifics of or opportunities to implement a given measure.

Pennsylvania's PCAP was coordinated by staff from the Pennsylvania DEP and informed by interested parties across the state.

DEP would like to thank the technical experts, state agency staff, local government staff, and other interested parties who provided their ideas and time to support this PCAP. DEP would also like to acknowledge the contributions of ICF and Rocky Mountain Institute (RMI).

This project has been funded wholly or in part by the EPA under grant agreement 95315901 to Pennsylvania DEP. The contents of this document do not necessarily reflect the views and policies of the EPA, nor does the EPA endorse trade names or recommend the use of commercial products mentioned in this document.

1 Introduction

The Pennsylvania Department of Environmental Protection (DEP) developed this Priority Climate Action Plan (PCAP) to meet the requirements of the US Environmental Protection Agency's (EPA) Climate Pollution Reduction Grant (CPRG) program. The CPRG program provides funding to states, local governments, tribes, and territories to develop and implement plans for reducing greenhouse gas (GHG) emissions and other harmful air pollution.

As the lead organization for CPRG planning deliverables, DEP was awarded a CPRG planning grant in June 2023 and partially used those funds to develop this PCAP. The funds will also be used to develop a Comprehensive Climate Action Plan (CCAP) by mid-2025, which will serve as a comprehensive update to this PCAP.

The Allentown-Bethlehem-Easton, PA-NJ Metropolitan Statistical Area (MSA), the Philadelphia-Camden-Wilmington, PA-NJ-DE-MD MSA, and the Pittsburgh, PA MSA also received CPRG planning grants. DEP coordinated closely with the Lehigh Valley Planning Commission (LVPC), Delaware Valley Regional Planning Commission (DVRPC), and the Southwest Pennsylvania Commission (SPC) as the lead organizations responsible for the MSAs' CPRG plans, to align priorities within the state to jointly engage with interested parties across Pennsylvania.

PCAP Definitions

- **Greenhouse Gas (GHG):** The air pollutants carbon dioxide, hydrofluorocarbons, methane, nitrous oxide, perfluorocarbons, and sulfur hexafluoride.
- **GHG Inventory:** A list of emission sources and sinks and the associated emissions quantified using standard methods.
- **GHG Reduction Measure:** Policies, programs, actions, or projects that reduce GHG emissions or enhance carbon removal. Measures that enhance "carbon removal" are those that increase the removal of carbon dioxide from the atmosphere through, for example, the uptake of carbon and storage in soils, vegetation, and forests.
- **Co-Benefits:** Positive effects beyond the stated goal of a GHG reduction measure (e.g., improved public health outcomes, economic benefits, increased climate resilience).
- **Low Income Disadvantaged Community (LIDACs):** Communities with residents that have low incomes, limited access to resources, and disproportionate exposure to environmental or climate burdens.

1.1 CPRG Program Overview

The Inflation Reduction Act (IRA), signed into law on August 16, 2022, directs federal funding to reduce carbon emissions, lower healthcare costs, fund the Internal Revenue Service (IRS), and improve taxpayer compliance. The IRA contains provisions that directly or indirectly address issues related to climate change, including reduction of GHG emissions and promotion of adaptation and resilience to climate change impacts.[1]

The CPRG program, authorized under Section 60114 of the IRA, provides $5 billion in grants to states, local governments, tribes, and territories to develop and implement plans for reducing GHG emissions and other harmful air pollution. The program consists of two phases: planning and implementation. The planning phase provides $250 million in noncompetitive planning grants for state and local agencies to develop PCAPs and CCAPs aimed at reducing GHG emissions and providing other benefits to communities. The implementation phase provides $4.6 billion for competitive implementation grants to eligible applicants to implement GHG reduction measures identified in a PCAP developed under a CPRG planning grant.[2]

1.2 PCAP Purpose, Scope, and Overview

Pennsylvania's PCAP identifies cost-effective, ready-to-implement GHG reduction measures that will significantly lower GHG and provide other benefits to the Commonwealth, especially in low-wealth communities, minoritized communities, and communities impacted by environmental justice concerns (also referred to as low-income and disadvantaged communities, or LIDACs in this document in alignment with EPA's CPRG guidelines). Table 1 summarizes the required information for a PCAP, per CPRG guidance, and the location of that information in Pennsylvania's PCAP.[3]

A measure being included within a PCAP is a pre-requisite for agencies and organizations within an MSA or state to compete for implementation grant funding in the second phase of the CPRG program. Accordingly, the measures identified in this PCAP are designed to be broad enough to encompass regional and local priorities for addressing climate pollution. The PCAP also serves as a starting point for the CCAP.

Table 1: PCAP Requirements and Documentation

PCAP Requirement	Requirement Notes and Document Location
GHG Inventory	• Section 2.1
GHG Reduction Targets	• Section 2.2.1
Priority Quantified GHG Reduction Measures	• Priority GHG reduction measures, including the following measures - Section 4 – an estimate of the quantifiable GHG emissions reductions – key implementing agency or agencies – implementation schedule and milestones – expected geographic location if applicable – identification of relevant funding sources – metrics for tracking progress – a review of the statutory or regulatory authority to implement the measure (and a schedule and milestones for key entities to obtain it if not existing). • Details of GHG reduction quantification methods are in Appendix B.
Benefits Analysis	• Qualitative discussion of the expected co-benefits associated with PCAP GHG reduction measures - Section 4.1 • For information by measure in combination with LIDAC Benefits - Section 4.5
Review of Authority to Implement	• Section 4.5
Low Income Disadvantaged Communities Benefits Analysis	• Specific climate impacts or risks to which LIDACs are vulnerable – Section 3.2 • LIDACs that will be affected by the GHG reduction measures in the PCAP – Section 3 and Appendix A • Census block group IDs for affected LIDACs and PCAP measures – Section 3 and Appendix A

	• Qualitative discussion of the expected benefits to LIDACs associated with PCAP GHG reduction measures – Section 4.5 for information by measure • Overview of planned and/or ongoing engagement with representatives and residents of LIDACs to inform PCAP and CCAP development and implementation – Section 1.3.1
Workforce Planning Analysis	• Overview of workforce development activities that are needed to implement the priority measures in the PCAP – Section 4.4 and summarized within industrial measures in Section 4.5

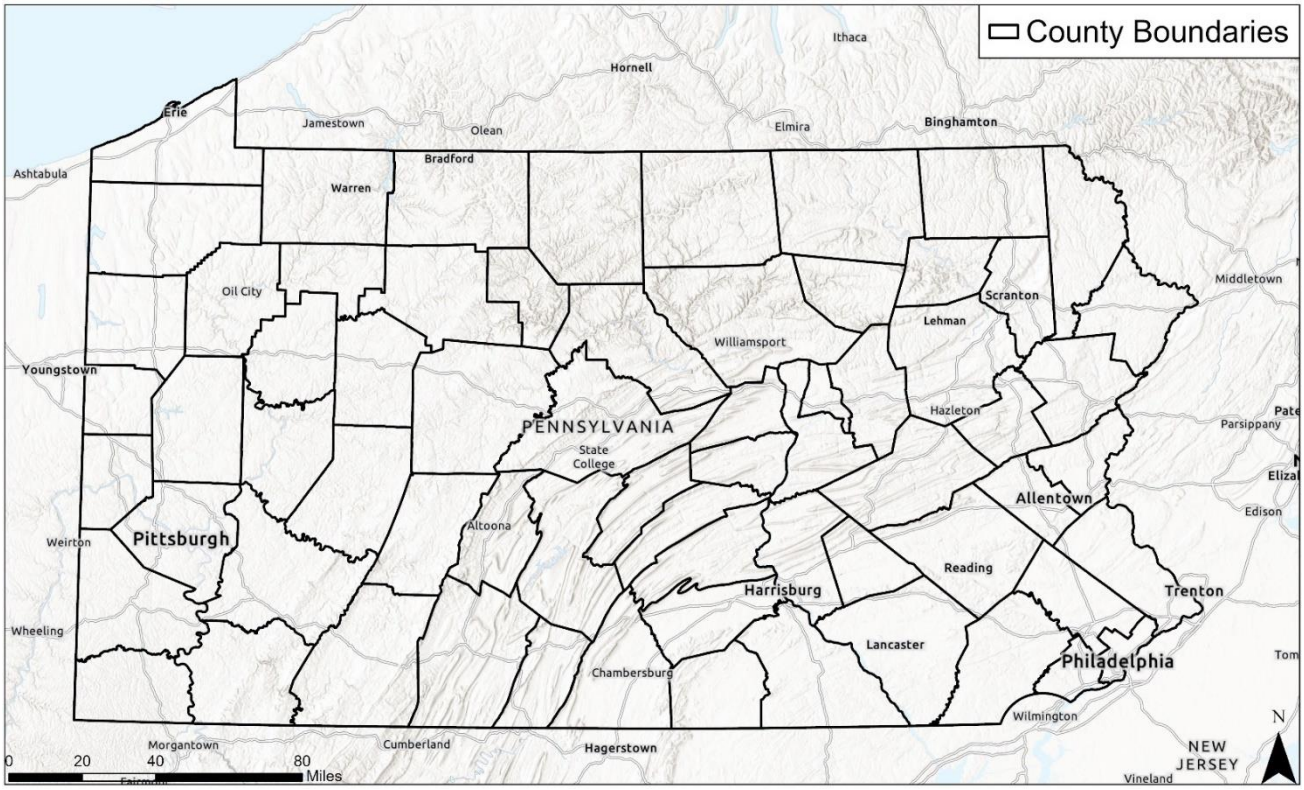
1.2.1 Relationship to Pennsylvania Climate Action Plan Update

As mandated by the Pennsylvania Climate Change Act (Act 70 0f 2008), DEP is required to produce a Climate Action Plan (CAP) every three years that identifies GHG emissions and sequestration trends; evaluates cost-effective strategies for reducing or offsetting GHG emissions from various sectors in the Commonwealth; identifies costs, benefits and co-benefits of those strategies; and makes recommendations to the General Assembly of legislative changes necessary to implement the plan. To meet these requirements, the 2024 CAP is currently being developed in coordination with this PCAP. Pennsylvania's PCAP draws upon the Act 70-required CAP for much of the required analysis, and outlines Commonwealth priorities for the deployment of funds that may be received from the IRA-funded CPRG implementation grant.

1.2.2 Geographic Scope

This PCAP covers the entirety of the Commonwealth of Pennsylvania (Figure 1, including the Allentown-Bethlehem-Easton, PA-NJ MSA, the Philadelphia-Camden-Wilmington, PA-NJ-DE-MD MSA, and the Pittsburgh, PA MSA).

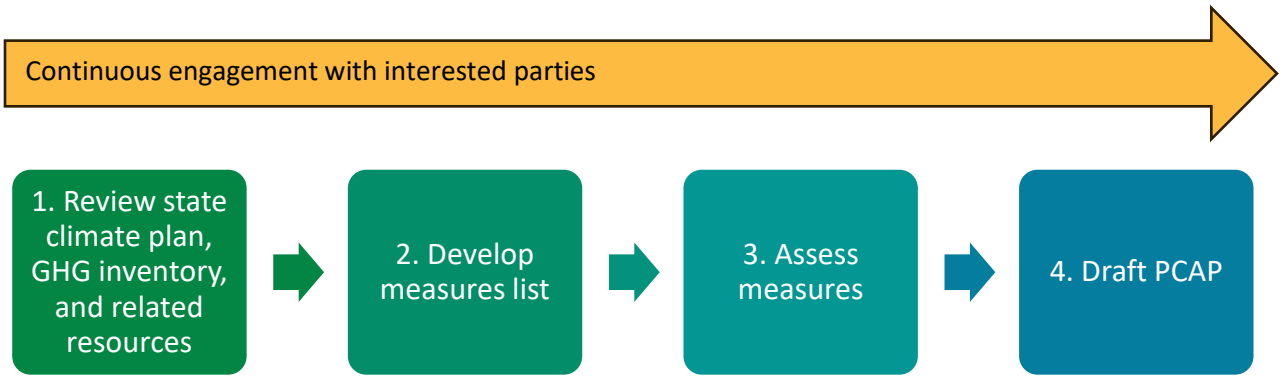
Figure 1: State of Pennsylvania with County Boundaries



1.3 Approach to PCAP Development

To develop the PCAP, DEP followed the approach outlined below.

Figure 2: PCAP Development Process



Step 1. DEP reviewed the 2021 CAP,[4] draft 2024 CAP, the Department of Conservation and Natural Resources' (DCNR) Climate Adaptation and Mitigation Plan,[5] and other existing plans, reports, and resources (e.g., EPA Quantified Climate Actions Measure Directory[6]). DEP also finalized the annual Pennsylvania Greenhouse Gas Emissions Report in December 2023. This inventory (see Section 2.1) was also reviewed to identify PCAP measures by targeting the largest sources of Pennsylvania's GHG emissions.

Steps 2 and 3. DEP compiled a list of measures based upon Step 1 and engagements with interested parties. DEP first sorted concepts by sector. Each measure was assessed in line with PCAP requirements, such as primary actor, authority to implement, quantified GHG reductions, and other information. After review, measures were developed by consolidating similar and related concepts into groups to form the broader reduction measures identified in this PCAP. To prioritize measures, each draft measure was briefly assessed for implementation readiness, GHG reductions, and benefits (particularly for LIDACs). The measure list was also cross checked with priorities as outlined in the Pennsylvania 2021 CAP and draft 2024 CAP updates.

Step 4. DEP prepared this PCAP using information from existing plans and reports, new analysis where information did not exist, and input from interested parties. Along with measure-specific information, DEP assessed other required information for the PCAP in this step, such as identifying LIDACs using EPA's EJScreen and the Pennsylvania Environmental Justice Mapping and Screening tool (PennEnviroScreen)[7]. The PCAP appendices provide information on the GHG quantification methods and LIDAC identification.

Continuous Engagement. Throughout the development of the PCAP, DEP conducted outreach activities for interested parties to educate participants, solicit input, and synthesize priority project and action ideas into the PCAP. These activities built on the extensive outreach DEP already has been conducting related to climate change, energy, and environmental justice. The PCAP engagement activities occurred across multiple modalities to enable maximum participation (i.e., virtual, in-person, via written feedback), and included additional elements to increase accessibility and inclusion for individuals living in communities impacted by environmental justice concerns such as:

- Developed website content for PCAP meeting materials and process updates;
- Provided meeting materials in multiple languages, where appropriate;
- Ensured Americans with Disabilities Act accessibility and accommodations for meetings;

[4] DEP. "2021 Climate Action Plan." 2021. https://www.dep.pa.gov/Citizens/climate/Pages/PA-Climate-Action-Plan.aspx

[6] EPA. "Quantified Climate Action Measures Directory." 2023. https://www.epa.gov/statelocalenergy/quantified-climate-action-measures-directory

[7] PennEnviroScreen (pa.gov)

- Partnered with "ambassador" organizations, such as municipal governments, local non-profits, and community action groups, to site and promote meetings; and
- Solicited community input to inform meeting agendas.

Further information on key participating entities and the engagement process is in Section 1.3.1.

1.3.1 Engagement with Interested Parties

DEP engaged interested parties from state government, local and regional governments, industry, the public, and LIDAC related and representative groups through virtual workshops, working group meetings, and surveys to solicit feedback on PCAP measure development. Through these engagements, interested parties provided useful feedback to help shape priority measures for inclusion in the PCAP. DEP intends to continue these engagements throughout the CPRG process.

Intergovernmental and Intragovernmental

DEP coordinated CPRG at the state-level through a cross-agency working group with representatives from over 25 agencies and departments across the state. This cross-agency working group met on September 5, 2023 to discuss the cross-government intersection of climate change impacts, mitigation, and resilience. The working group convened again on October 31, 2023 to discuss priority GHG reduction measures and program design considerations for an industrial decarbonization program.

DEP participated in regular working group and advisory sessions with the three MSAs who received planning grants within the state (LVPC, DVRPC, and SPC). DEP continually coordinated with these MSAs as their PCAPs and the Commonwealth's PCAP were developed. Additionally, these efforts encouraged interested parties within these communities to reach out to the leading entities to collaborate on regional projects.

To reach local governments, DEP leveraged its existing Local Climate Action Program (LCAP)[8] as well as connections with local government associations such as Pennsylvania Association of Boroughs, Pennsylvania State Association of Township Supervisors, and the County Commissioners Association of Pennsylvania. DEP hosted a virtual session on December 11, 2023 with 51 local and Pennsylvania regional government partners to provide an overview of the CPRG program and solicit feedback on priorities for inclusion in the PCAP. After the meeting, DEP continued outreach with local governments through DEP's existing networks to ensure local governments' priorities are captured within the statewide PCAP measures. DEP is continuing follow-up discussions with local government representatives regarding their CPRG priorities, and potential Implementation Grant applications. Examples of local governments that participated in these outreach meetings and provided priority GHG reduction project ideas include: Catawissa Township, Chambersburg, Lewis Township, Lewisburg Borough, Lower Merion Township, Mansfield, Millvale, Philadelphia, Scranton, SEDA Council of Governments, Tioga County, Shamokin, and many others. DEP held a second virtual meeting with local government representatives on February 15, 2024 to discuss priority climate measures and analyses included in this PCAP.

DEP also participated in monthly working groups led by New Jersey to coordinate efforts with other Mid-Atlantic states and coordinated with Maryland and West Virginia to learn about their approach to PCAP development and their potential priority measures.

Industrial Sector and Other Interested Parties

To engage with industry, DEP hosted a virtual session on November 28, 2023 with 53 industry, manufacturing, and utility sector representatives to provide an overview of the CPRG program and solicit feedback on priorities for inclusion in the PCAP. DEP subsequently released a Request for Information (RFI) on December 30, 2023 to continue to gather feedback on potential program design for an Industrial Decarbonization program that DEP hopes to fund with a CPRG Implementation Grant. The RFI closed on January 29, 2024 and received a total of 39 responses from 24 businesses

[8] DEP. "Local Climate Action Program." https://www.dep.pa.gov/Citizens/climate/LocalClimateAction/Pages/Local-Climate-Action.aspx

and organizations and 15 individuals. Respondents included academic and research organizations, business advocacy groups, civic organizations, the United State Climate Alliance (US Climate Alliance), environmental advocacy groups, trade associations, natural gas utilities, and industrial and technology companies. Respondents expressed interest in ensuring that benefits of the program were prioritized to low-wealth, disadvantaged, and energy-burdened communities. They also encouraged flexibility in program design and structure and supporting peer-learning and technical assistance around the application process to increase accessibility to the program. Respondents also expressed interest in ensuring that the program adequately addresses the needs of small businesses.

Community Engagement

DEP created its Climate Action for Environmental Justice Communities (CAEJC) Program to identify and support strategic actions to help Pennsylvania's communities impacted by environmental justice concerns adapt to climate change while striving to lower GHG emissions, with measures that reduce risk and capitalize on potential opportunities to strengthen local economies. In spring 2023, DEP engaged with Pennsylvanians in seven communities across the Commonwealth including Meadville, Pittsburgh, Scranton, Reading, Harrisburg, Norristown, and Philadelphia. This engagement took the form of in-person open discussions with community members, where participants shared their experiences with climate change and other environmental issues, and insights on climate mitigation and adaptation actions that could be directly beneficial to their communities. A public survey was also developed as part of the CAEJC Program to solicit feedback on statewide climate priorities. Results of this engagement effort were published in a June 2023 report.[9]

DEP expanded on the community engagement of the CAEJC Program to conduct specific outreach to guide the development of this PCAP. There is significant overlap in the areas that DEP identifies as environmental justice areas in Pennsylvania and the areas identified by EPA as LIDACs through its EJScreen tool. In December 2023, DEP held four workshops across the Commonwealth (Clairton – December 4, Williamsport – December 6, Hazelton – December 7, and Wysox – December 12), and one virtual session (December 14) to solicit community feedback on priorities for the PCAP. Workshop locations were selected to build on existing learnings from and expand the reach of DEP's successful CAEJC program. DEP targeted outreach in areas that were identified in EJScreen and PennEnviroScreen as LIDACs or EJ areas, and in communities which have been impacted by industrial activities. Through these sessions, 177 individuals were reached (73 in-person attendees and 104 virtual attendees) and DEP identified community priorities around weatherization, public and active transportation, and air pollution from industrial sites.

2 Pennsylvania Climate Work and Context

2.1 GHG Inventory

Pennsylvania's GHG inventory provides data on GHG emissions in the state from 2005 to 2020 and tracks progress toward the GHG emission-reduction targets.[10] In 2020, gross GHG emissions were 238.74 million metric tons of carbon dioxide equivalent ($MMTCO_2e$), and net GHG emissions in 2020 were 213.94 $MMTCO_2e$. Pennsylvania is on track to meet the 2025 GHG emissions reduction goal of 26% as required in Executive Order 2019-01. Pennsylvania has already reduced net emissions by 25.9% from the 2005 baseline. However, this achievement is likely fleeting and not durable, as the temporary impacts from the COVID-19 pandemic on the economy, rather than new policy implementation, appear to be a main driver of the decrease of GHG emissions in data year 2020.

2.1.1 Methodology

Pennsylvania's GHG inventory reflects CO_2-equivalent GHG emission totals using 100-year Global Warming Potential (GWP) values from the Intergovernmental Panel on Climate Change Fifth Assessment Report (AR5).[11] The inventory was developed using data from US EPA's State Inventory Tool (SIT) and US EPA's Inventory of US Greenhouse Gas Emissions and Sinks by State report, which disaggregates the national inventory emissions to the state level. The GHG inventory methodology is consistent over time so that past and present inventories can be compared.

EPA's SIT consists of sector-specific estimation modules to calculate GHG emissions, using reputable data gathered by federal agencies and other sources. Pennsylvania's GHG inventory was primarily produced using the default activity data included in each SIT module, with supplemental data included for categories that can be estimated in SIT but do not have default data. To supplement the SIT, additional data for several emissions sources were obtained from the US EPA's Inventory of US Greenhouse Gas Emissions and Sinks by State report.

Pennsylvania used data from EPA's state level disaggregates for the following sectors: natural gas and oil sector (abandoned oil and gas wells), forestry and land uses (carbon stocks from Land Converted to Settlements, Wetlands Remaining Wetlands, Land Converted to Wetlands), industrial processes (ferroalloy production, zinc production, carbon dioxide consumption, N_2O from product uses, glass production, lead production, carbide production and consumption), and solid waste (composting and anaerobic digestion at biogas facilities). Because the emissions source categories obtained from the US Inventory by state disaggregation are not estimated within SIT, there is no double-counting, and these additional categories can be directly added to emissions results estimated by the SIT. Note that uncertainty is inherent in all emissions estimates due to incomplete data, proxied or scaled data, and the use of average emissions factors. Certain sectors carry greater uncertainty than other sectors because of these challenges.

2.1.2 Results

The latest GHG inventory results for 2020 include GHG emissions from the electric power, transportation, industrial, residential and commercial buildings, agriculture, waste management, and land-use, land-use change, and forestry (LULUCF) sectors.

Pennsylvania's gross GHG emissions[12] were 238.74 $MMTCO_2e$ and net GHG emissions were 213.94 $MMTCO_2e$ in 2020. Figure 3 shows the breakdown of Pennsylvania's GHG emissions in millions of metric tons of carbon dioxide equivalent ($MMTCO_2e$) in 2020 by economic sector.

---

[10] The latest GHG inventory for Pennsylvania is available online here: https://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/ClimateChange/FINAL_2023_GHG_Inventory_Report_12.13.23.pdf

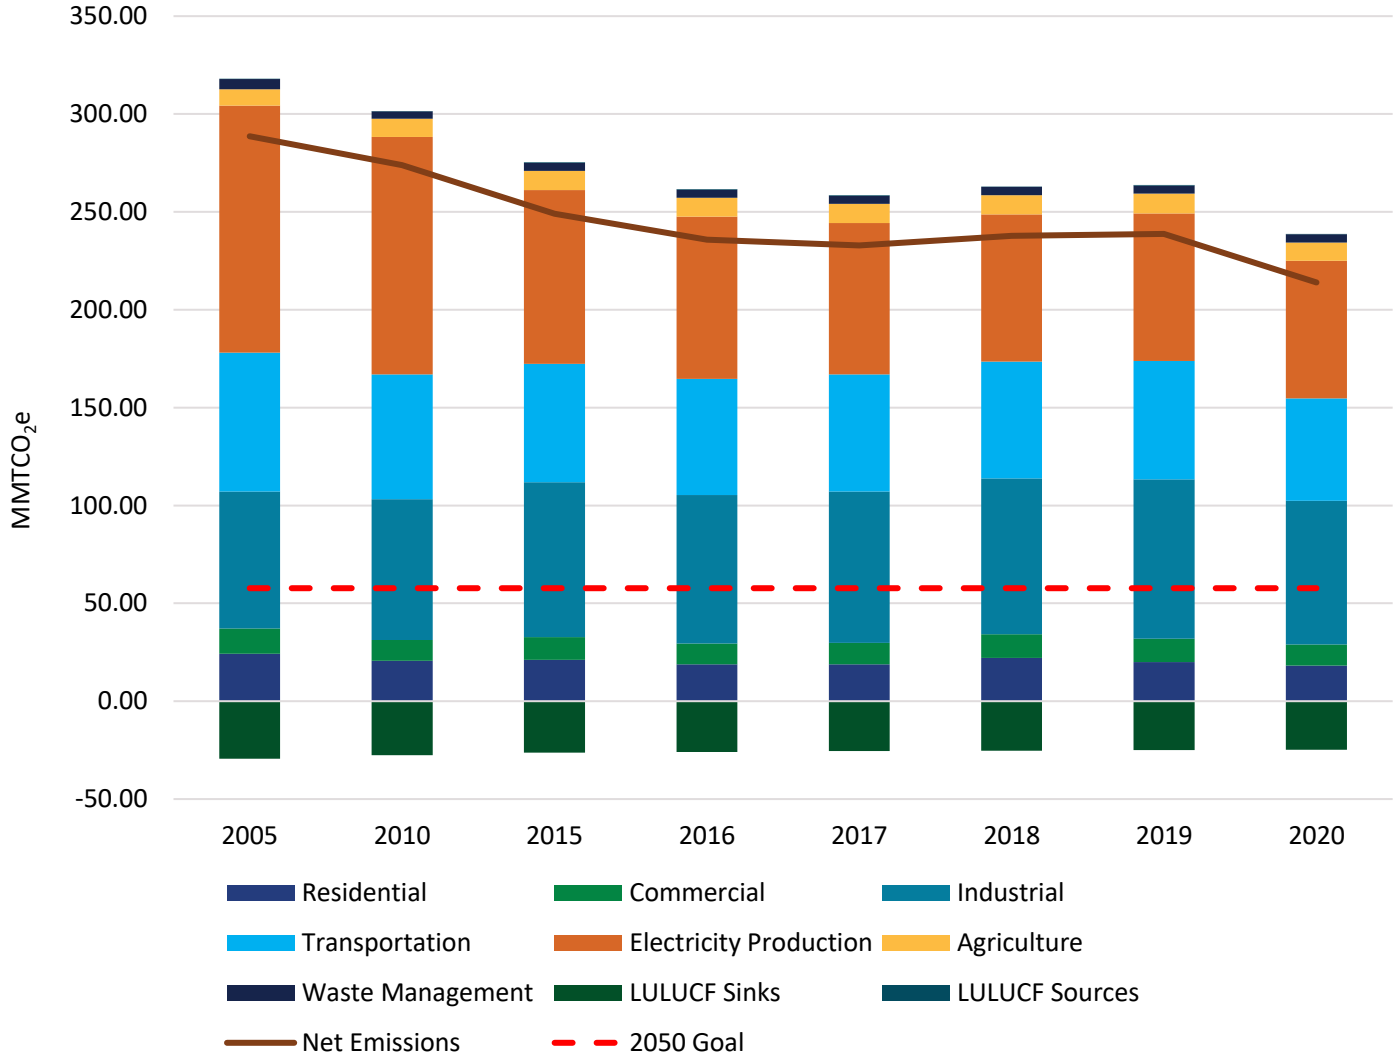
[12] Gross GHG emissions are the sum of all GHG emitting sectors. This sum does not include carbon sinks, such as the Land Use, Land Change, and Forestry Sector.

Figure 3: GHG Emissions by Sector ($MMTCO_2e$)



The largest source of GHG emissions in Pennsylvania in 2020 was emissions from the industrial sector, which emitted 73.56 $MMTCO_2e$, or 31 percent, of gross GHG emissions. Electricity generation was the second largest contributor of GHG emissions, accounting for 70.22 $MMTCO_2e$, or 29 percent of gross emissions. GHG emissions from transportation in Pennsylvania represent the third largest contributor of GHG emissions, accounting for 52.25 $MMTCO_2e$, or 22 percent of gross emissions. Residential buildings produced 18.14 $MMTCO_2e$ (8 percent) and commercial buildings produced 10.76 $MMTCO_2e$ (5 percent). The agriculture sector produced 9.37 $MMTCO_2e$ (4 percent), and waste management produced 4.25 $MMTCO_2e$ (2 percent). Pennsylvania's forestry and land use sector was a net carbon sink, absorbing 24.79 $MMTCO_2e$ in 2020. Table 2 and Table 3 show emissions by subsector and emissions by gas.

Table 2: GHG Emissions by Sector ($MMTCO_2e$)

Sector / Emission Sources ($MMTCO_2e$)	2005	2010	2015	2016	2017	2018	2019	2020

* Emissions from Electricity Consumption are not included in totals in order to avoid double counting with Fossil Fuel Combustion estimates.

Note: Totals shown here are slightly different than totals shown in Table 2 due to differences in accounting and rounding.

Table 4 shows changes in emissions from 2005 to 2020 and 2019 to 2020. Overall, emissions decreased by 24.95 MMTCO2e or 10.4 percent from 2019 levels. Between 2005 and 2020, electricity production emissions decreased by 44.4 percent. This is mainly a result of coal being replaced by increased natural gas generation (and to a smaller extent renewables such as wind and solar) and energy efficiency improvements, due in part to Act 129.[13] Coal-based electricity generation decreased from 60 percent of Pennsylvania's total electricity in 2005 to 10 percent in 2020. In 2020, natural gas-based electricity generation was the largest source of electricity in Pennsylvania, providing 52.5 percent of all electricity. Gas-based electricity generation surpassed nuclear-based electricity generation in 2019.

Although industrial sector emissions decreased by 9.7 percent from 2019 to 2020, this likely resulted from COVID-19 related disruptions. Overall, industrial emissions have increased 5.1 percent since 2005, and are likely to return to pre-COVID levels in upcoming years. This increase in emissions coincides with an increase in manufacturing Gross State Product of 49 percent from 2007 to 2022.[14] Pennsylvania's economy largely consists of industrial activity compared to other states. Industries in Pennsylvania with high levels of emissions include cement manufacturing, iron and steel production, process heating using fossil fuels, and various industrial processes requiring the utilization of ozone-depleting substances (ODS) substitutes.

Transportation emissions decreased by 26 percent since 2005, mainly due to increased fuel efficiency and a growing proportion of alternative fuel vehicles. Emissions from residential and commercial buildings have decreased by 25.2 and 17.1 percent respectively since 2005. This decrease is likely a result of switching to lower emitting fuels for heating, and energy efficiency improvements resulting from the greater availability and cost effectiveness of energy efficiency technologies.

Like the industrial sector, the agriculture sector emissions decreased from 2019 to 2020, despite a 13.8 percent increase in emissions from 2005 to 2020. Net carbon sequestration from forestry and land use decreased 15.6 percent since 2005, and emissions from waste management decreased 20.5 percent since 2005.

[14] NEPIRC 2023. Pennsylvania Manufacturing Industry Report 2023.

Table 4: Summary of Key Emissions Trends

	2020 Emissions		% Change from 2019		% Change from 2005
Residential	18.14	↓	-8.9%	↓	-25.2%
Commercial	10.76	↓	-10.1%	↓	-17.1%
Industrial	73.56	↓	-9.7%	↑	5.1%
Transportation	52.25	↓	-13.7%	↓	-26.2%
Electricity Production	70.22	↓	-6.8%	↓	-44.4%
Agricultural	9.37	↓	-6.9%	↑	13.8%
Waste Management	4.25	↑	0.6%	↓	-20.5%
Forestry and Land Use Non-CO_2 Emissions	0.19	↓	-0.1%	↑	110.6%
Total Gross Emissions	**238.74**	↓	**-9.5%**	↓	**-24.9%**
Forestry and Land Use Net Carbon Flux	-24.79	↓	-0.5%	↓	-15.6%
Total Net Emissions	**213.94**	↓	**-10.4%**	↓	**-25.9%**

Table Key: ↓ = Decrease in emissions; ↑ = Increase in emissions

2.1.3 COVID-19 Pandemic Impacts

Pennsylvania has almost met its 2025 goal of a 26 percent reduction in GHG emissions from 2005 levels. However, the impact of the COVID-19 pandemic on emissions data, particularly in the transportation sector, may have contributed to a portion of this decrease. Recent energy generation, use, and emissions indicators point to potential increases in emissions in 2021 to 2023 compared to values reported in the 2020 inventory as the economy has rebounded from the pandemic. Pennsylvania's CCAP, due in summer of 2025, will include an updated GHG inventory showing data years 2005 through 2021.

2.2 Existing State Goals, Plans, Policies, and Programs

2.2.1 Pennsylvania Climate Change Act and Emissions Reductions Goals

The Pennsylvania Climate Change Act of 2008 requires DEP to compile an annual GHG inventory for Pennsylvania's GHG emissions, to develop a voluntary GHG registry, and to develop a CAP and impacts assessment and update them every three years.

Executive Order 2019-01 established a Pennsylvania climate goal of a 26% reduction in net GHG emissions statewide by 2025 and an 80% reduction by 2050, from 2005 levels. It also reestablished the GreenGov Council to assist state agencies in incorporating environmentally sustainable practices into policy and planning decisions.

In 2019, Pennsylvania joined the US Climate Alliance [15], a bipartisan coalition of governors aiming to advance high-impact climate action. Emissions reductions goals of the US Climate Alliance include:

- Reducing collective net GHG emissions at least 26-28% by 2025 and 50-52% by 2030, both below 2005 levels.
- Collectively achieving overall net-zero GHG emissions as soon as practicable, and no later than 2050.

[15] United States Climate Alliance

2.2.2 Pennsylvania Act 70 Climate Action Plan and Climate Impacts Assessment

As required by the Climate Change Act of 2008, DEP and the Climate Change Advisory Committee produce and submit to the governor a CAP that:

- Identifies GHG emissions and sequestration trends.
- Evaluates cost-effective strategies to reduce or offset GHG emissions.
- Evaluates the costs, benefits, and co-benefits of the recommended reduction strategies.
- Recommends legislative changes necessary to implement the CAP.

This plan is updated every three years with the most recent publication in 2021. The 2021 plan outlines a pathway to reducing GHG emissions by 26 percent in 2025 and 80 percent in 2050 through 18 strategies across economic sectors supported by quantitative modeling to verify the emission reduction estimates. Developed in parallel with the CAP is the climate impacts assessment which identifies current climate hazards impacting Pennsylvania and projects how those impacts will change under several climate change scenarios.

Both the CAP and IA are currently being updated for a 2024 release and have been used to help inform the measures included in this PCAP.

2.2.3 Local Climate Action Program (LCAP)

DEP launched LCAP to help local governments lead by example on critical climate change mitigation actions. LCAP provides free technical and personnel assistance to local governments for planning efforts to reduce GHG emissions and address climate change. As of 2023, LCAP has trained 64 cities, townships, boroughs, counties, and regional organizations, representing approximately 440 municipalities across the Commonwealth. LCAPs have helped Pennsylvania municipalities take mitigation actions and plan for more, with many planned actions included in this PCAP where municipalities are ready to implement. The LCAP has been a crucial program for connecting state-level climate planning and goals with local leaders and jurisdictions to catalyze climate action.

2.2.4 Other Commonwealth Climate Efforts

DCNR's Climate Change Adaptation and Mitigation Plan[16]

DCNR aims to utilize the Department's 2.2 million acres of state forests, 121 state parks, and 15 million acres of private forest land to mitigate atmospheric carbon as well as ensure that the Commonwealth's public lands remain resilient and able to adapt to climate change. DCNR seeks to be a leader in climate-smart land management and green infrastructure development. The plan provides a look at current and projects climate change impacts, and the actions taken by DCNR to address these vulnerabilities.

Pennsylvania Fish and Boat Commission (PFBC) Climate Action Plan[17]

This plan identifies climate change issues anticipated to impact PFBC's trust species (i.e., fish, amphibians, reptiles, freshwater mussels, crayfishes, other aquatic invertebrates), their habitats, the angling and boating public, and other assets. From these issues, the plan provides goals, strategies, and actions to build resilience and support adaptative actions. In the development process, the PFBC CAP Team broadly considered "fish" as all PFBC's trust species (see Legal Authority below). Thus, goals, strategies, and action items are made in this context.

[16] elibrary.dcnr.pa.gov/GetDocument?docId=1743769&DocName=Climate_Change_Adaptation_Plan_Final_Aug2018.pdf

[17] PFBC (Pennsylvania Fish and Boat Commission). 2022. Pennsylvania Fish and Boat Commission Climate Action Plan: Strategies for Enhancing Climate Adaptation and Resilience to Protect, Conserve, and Enhance Pennsylvania's Aquatic Resources and Support Anglers and Boaters, Version 2022-1.0. Harrisburg, Pennsylvania.

Pennsylvania Department of Transportation's (PennDOT) Extreme Weather Vulnerability Study[18]

To help prepare for future extreme weather, PennDOT conducted an Extreme Weather Vulnerability Study, which analyzed past PennDOT flooding-related data, traffic volumes, federal and national weather and flooding resources, and more. It also identified roadways susceptible to flooding based on that data.

The study also projected potential future flooding vulnerabilities in Allegheny, Delaware, and Lycoming counties. The completed study was shared with planning partners, PEMA, federal highway officials, and department staff for reference in maintenance and project work, and to complement the data PennDOT already uses in planning future projects. The next phase of the study will identify potential mitigation strategies to use on projects in Allegheny and Delaware counties, made possible with state and federal matching funds.

Pennsylvania Department of Health (PA DOH) Efforts

PA DOH is working to protect Pennsylvanians from the health impacts of a changing climate.

PA DOH considers work around a changing climate, Environmental Justice (EJ), and health equity to all be intertwined. Some groups have been disproportionately affected by environmental conditions, and PA DOH work must commit to assisting these communities. These groups include those living in EJ areas, as defined by DEP, but also those living in rural areas, and those who do not have the same access to basic needs, such as shelter, healthy food, clean water, schooling, employment.

PA DOH has an internal workgroup comprised of individuals from across various program areas and offices within the department, that meets monthly to discuss the latest information on a changing climate, sustainability, and environmental health topics. This group will help facilitate climate and health prioritization and planning across the department and identify additional external partners for collaborative work.

The latest version of the State Health Improvement Plan[19] includes an environmental health goal, with objectives related to improving air quality, decreasing heat-related hospitalizations, and testing more children for lead. These objectives will be met by various capacity-building, surveillance, and outreach strategies to improve environmental health in Pennsylvania.

PA DOH also has an Environmental Justice Strategic Plan, which lays out internal and external strategies on how the department intends to commit to those living in EJ areas and improve their health and representation in the department's work. Staff from the Division of Environmental Health Epidemiology, Bureau of Emergency Preparedness and Response, Office of Health Equity, and the Policy Office are leading these efforts, including implementing an equity-informed climate work plan which addresses how a changing climate is affecting health. PA DOH has published a document[20] detailing how different changing climate threats are impacting public health. This document also provides information on departmental programs that are working to address these issues and identifies disproportionately affected populations. Part of the work plan includes strengthening their coalition of partners working in the climate space.

[20] Public Health Impacts of Climate Change Threats in Pennsylvania.pdf

3 LIDACs and Pennsylvania Environmental Justice Areas

LIDACs are defined by EPA as communities with low incomes, limited access to resources, and disproportionate exposure to environmental or climate burdens. To identify these communities, CPRG planning guidance references federal tools, including the EPA's EJScreen, which uses a series of environmental and socioeconomic indices like income, air quality, and race. Figure 4 displays LIDACs in Pennsylvania based on EPA's EJScreen.

Through a robust public engagement process[21], Pennsylvania revised its own definition for environmental justice areas, and in 2023 published its updated dataset, PennEnviroScreen, displayed in Figure 5. The PennEnviroScreen tool is updated annually and utilizes Pollution Burden and Population Characteristics data to identify Environmental Justice Areas. By presenting PennEnviroScreen Composite Score percentiles, pinpointing EJ Areas (block groups at the 80th percentile or higher), and detailing individual indicators, the framework aims to enhance public engagement in the permitting process for proposed facilities, promoting a more equitable environmental landscape.[22] This tool provides unique insight into the state of Pennsylvania as it considers indicators specific to the state, like proximity to coal mines and abandoned oil and gas wells, that have significant impacts on local communities but are not considered by EJScreen. Nevertheless, there is a significant overlap between these two data sets.

According to EJScreen, 32% of the state population is designated as residing in an environmental justice area. Philadelphia County has a population of 77% in environmental justice areas, and Allegheny and Lancaster County have an environmental justice population of 34%. Montgomery and Bucks County each have an environmental justice population of 10%. A full list of the Census Block IDs that are identified as environmental justice areas in the Commonwealth is included in Appendix A. Figure 5 shows EJ areas designated by PennEnviroScreen in the state. Like EJScreen, PennEnviroScreen's data indicates that Philadelphia has the highest number of people residing in EJ areas in the Commonwealth.

Throughout the remainder of this report, the terms LIDAC and environmental justice areas, DEP's preferred terminology, are used interchangeably.

Figure 4: EJScreen LIDACs in Pennsylvania

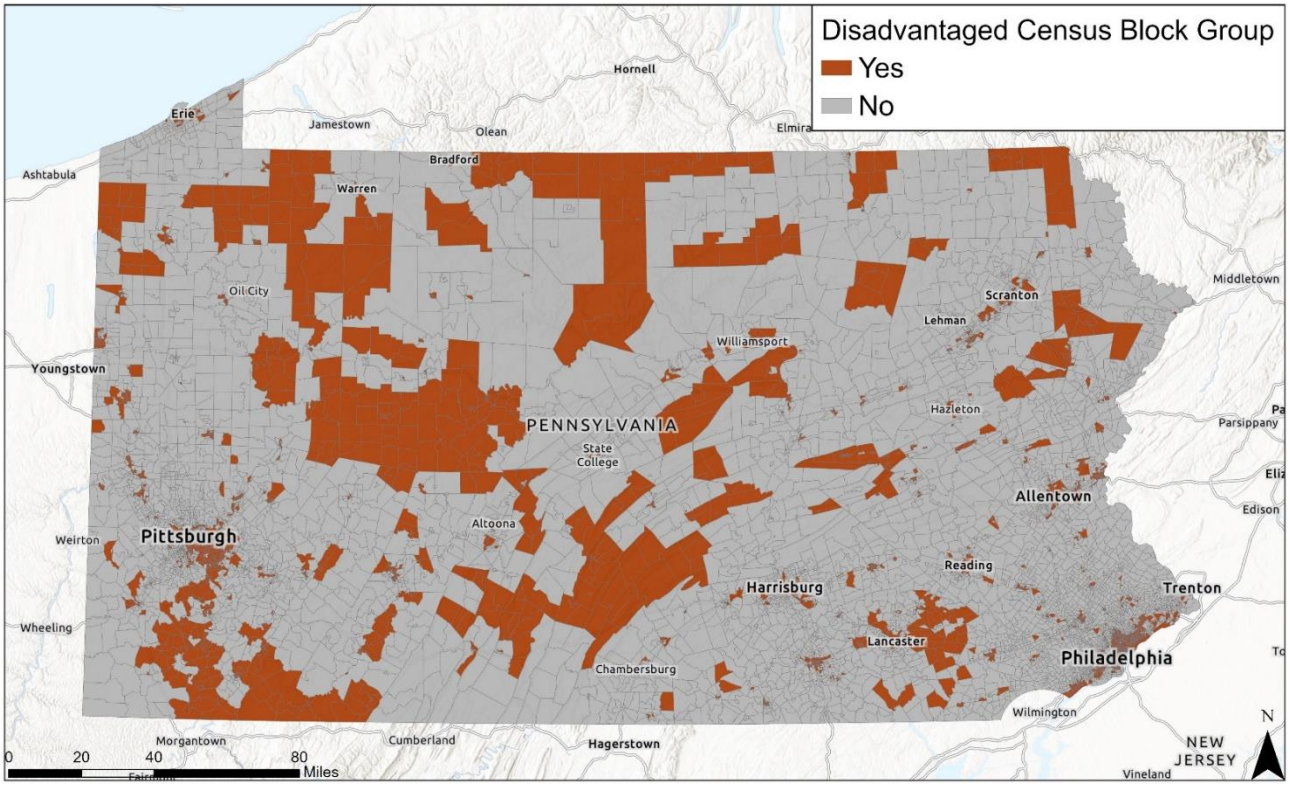

Figure 5: PennEnviroScreen EJ Areas in Pennsylvania

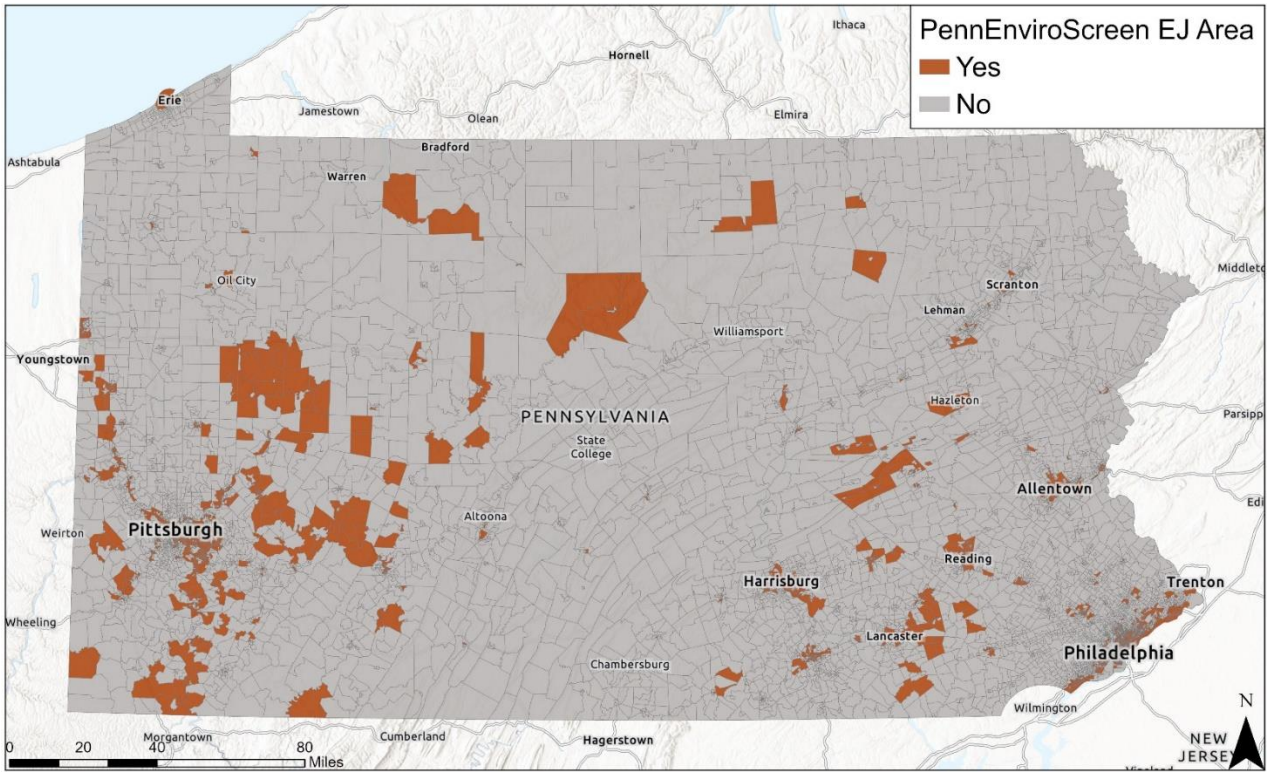

3.2 Climate Risks to Pennsylvania's LIDACs

Climate change will not affect all Pennsylvanians equally. Low-wealth and minoritized communities are expected to experience the most severe impacts of climate change, but they are also the least able to prepare for and respond to these impacts due to a lack of resources and socio-political power.

Within Pennsylvania, the most prevalent climate hazards are extreme precipitation events, extreme heat, landslides, sea level rise, severe tropical and extra-tropical cyclones, and drought, all of which will disproportionately burden LIDAC communities.

Extreme Heat

Between the years 1971 and 2000, Pennsylvania experienced an average annual daily temperature of about 48.3°F. By 2050, this is projected to rise by at least 6.7°F, and up to 10.4°F, by 2100. Additionally, heat waves will increase in frequency and severity. The baseline length for Pennsylvania is 2.3 days; this could rise to 8.8 days by 2050 and 19.3 days by 2100.[23] Exposure to extreme heat can cause heat exhaustion, heat stroke, and can contribute to deaths from a range of cardiovascular diseases such as heart attacks and strokes. Older adults, young children, people of color, outdoor workers, those with poorer health, and low-income individuals are more at risk of heat-related death. Additionally, higher temperatures will lead to increased energy demand and higher energy costs.[9] Individuals belonging to LIDACs will be less able to afford these increased costs, thus exacerbating heat-related health risks.[24]

Pennsylvania's designated EJ areas[25] are expected to be almost twice as exposed to extreme heat as the general Pennsylvania population (see Figure 6). Despite EJ populations constituting less than a third of Pennsylvania's population, more than half of those exposed are in EJ areas. Additionally, heat projections may be underestimated in cities, where urban heat island effects enhance temperatures. In fact, average surface temperatures are up to 22°F hotter in certain neighborhoods than others; these neighborhoods have higher minority and low-income residents. LIDAC populations may lack access to air conditioning, shaded outside areas, cooling centers, and healthcare.[26]

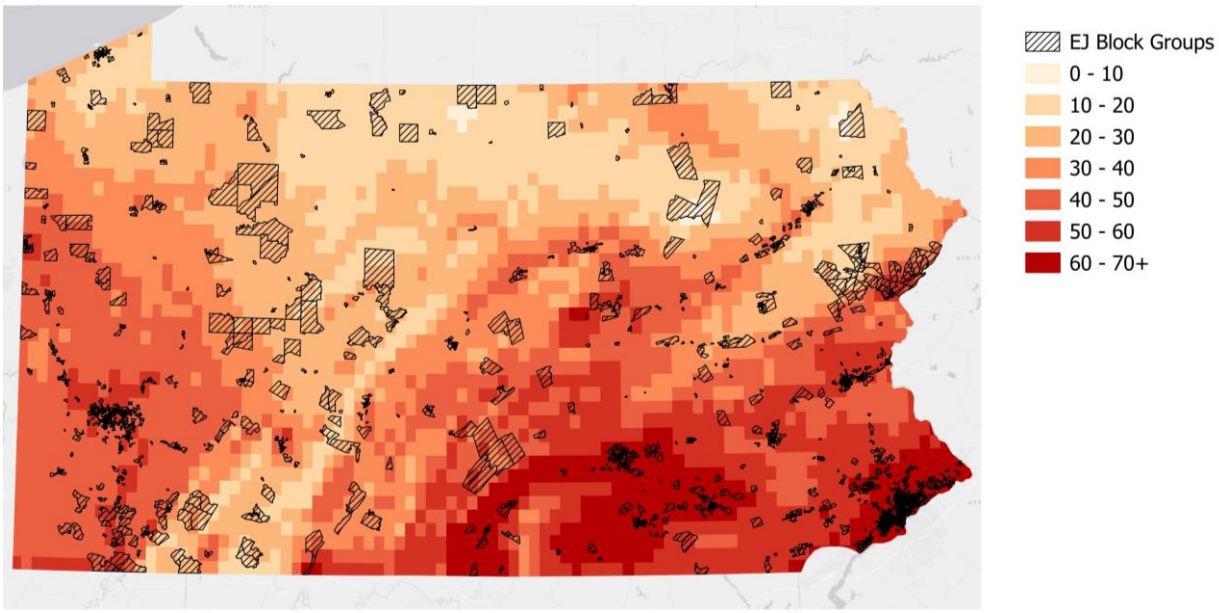
Figure 6. Projected annual number of days with temperatures over 90°F in 2050, with EJ block groups



Extreme Precipitation and Inland Flooding

Extreme precipitation events are projected to increase in Pennsylvania due to climate change, as are annual precipitation levels. The frequency and severity of precipitation events will likely increase throughout the century.[27] This will cause more intense flooding, harming primarily households without homeowners or renters insurance or that cannot afford the necessary infrastructure repairs. In addition to flooding, heavy precipitation can cause landslides, which can further damage infrastructure.[28] Flooding can also impact human health by increasing mold production and exposure to waterborne diseases, particularly affecting those in poor living conditions and lacking access to safe and reliable drinking water.[29]

EJ populations are also disproportionately located in high-risk flood zones compared to Pennsylvania overall. About 5.5% of Pennsylvania land is located in FEMA 100-year floodplains and 5.8% in 500-year floodplains, while 6.5% of EJ areas are located in 100-year floodplains and 7.1% in 500-year floodplains. A history of development practices has placed low-income and minority communities in these higher flood-risk areas. The poorest populations often have less flood protection infrastructure, investment in stormwater management, insurance, and adaptation options available to them.[30]

Landslides

Extreme precipitation events can also increase the risk of landslides, which disproportionately impact EJ areas. EJ areas experience landslides at 1.17 times the risk of the statewide average. Furthermore, they are less able to deal with the

[29] EPA. 2021. Climate Change and Social Vulnerability in the United States: A Focus on Six Impacts. U.S. Environmental Protection Agency, EPA 430-R-21-003. www.epa.gov/cira/social-vulnerability-report
[30] Pennsylvania Department of Environmental Protection. 2021. Pennsylvania Climate Impacts Assessment 2021. https://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/Climate%20Change%20Advisory%20Committee/2021/2-23-21/2021_Impacts_Assessment_Final_2-09-21_clean.pdf

devastating effects of these events. EJ communities often lack homeowners' insurance coverage for landslide damage, cannot afford the cost of repairs, and are located in areas less targeted for infrastructure repairs.[31]

Sea Level Rise

Pennsylvania has a small 56-mile coastline along the Delaware estuary, concentrated in the Philadelphia area. While Philadelphia saw approximately eight days of tidal flooding in a year early this decade, it is likely to see 74 days of tidal flooding by mid-century.[32] Higher sea-level exposes more of Pennsylvania's population to flooding. Coastal EJ areas in Pennsylvania are not disproportionately exposed to sea level rise-driven flooding. However, certain populations may be disproportionately vulnerable to or impacted by this hazard. For example, many flooding inequities prevalent in urban areas often place low-income people and communities of color at higher risk.[33] Those who live in economically distressed communities or in sub-standard housing may have a greater sensitivity to flooding. Affordable housing units have been found to face much higher risk from Sea Level Rise than standard housing in Pennsylvania.[34] They may experience greater impacts from Sea Level Rise related flooding and be less able to recover as a result of limited access to resources.

Severe Tropical and Extra-Tropical Cyclones

Many of the same impacts described under Heavy Precipitation and Inland Flooding apply to cyclone events. Cyclones will threaten those in low-lying areas, as these extreme storm events exacerbate flooding. EJ areas are slightly over-represented in FEMA 500-year floodplains compared to the state average (1.2 times as exposed). Affordable housing is also expected to see a 792% increase in exposure to coastal flood. This is the largest predicted increase in affordable housing exposure for any coastal state.[35]

Beyond being slightly over-represented in terms of exposure, communities with a high percentage of low-income individuals are more at-risk of facing serious consequences after an extreme storm. Low-income households are more likely to lack the resources to recover quickly from an extreme cyclone, and to reside in substandard housing, which increases the risk of mold, mildew, poor indoor air quality, and damage after intense rain and wind during storms.[36,37] Similarly, areas with a high percentage of low-income individuals are more likely to have less climate-resilient infrastructure.[38]

Drought

Despite higher annual rainfall totals, the increasing number of extreme precipitation events will also be punctuated by an increasing number of consecutive dry days, leading to drought.[39] Drought can contribute to water scarcity and cause major food insecurity or threaten farming livelihoods. Food insecurity leads to hikes in food prices and potentially civil unrest and mass migration. All these impacts will be felt most strongly by minority and low-income communities.[40]

4 Priority Climate Action Measures

DEP's priority GHG reduction measures target the industrial, buildings, transportation, power, LULUCF, agricultural, and waste sectors. These measures are designed not only to directly reduce GHG emissions and improve air quality, but provide other benefits to improve public health, create safer and more reliable infrastructure, provide workforce development opportunities, and reduce costs for Pennsylvanians, particularly for people living in areas impacted by environmental justice issues. A list of PCAP Measures is outlined initially in Table 5.

Table 5: PCAP Measures List

Measure	Sector(s)
1. Industrial Electrification, Efficiency, and Process Emissions	Industrial
2. Low Carbon Fuels	Industrial
3. On-Site Renewable Energy	Industrial/Buildings
4. Carbon Capture Utilization and Storage	Industrial/LULUCF
5. Fugitive Emissions Reduction	Industrial/Agricultural/Waste
6. Net-Zero Electricity Grid	Power
7. Building Electrification and Efficiency	Buildings
8. Electric and Alternative Fuel Vehicles	Transportation
9. Public and Active Transportation	Transportation

4.1 Benefits and Co-Benefits Analysis

The initiatives outlined in the PCAP will contribute to achieving local, state, and national climate objectives while reducing co-pollutants, such as criteria air pollutants and hazardous air pollutants, that adversely affect Pennsylvania and its environment. Decreasing fossil fuel (i.e., coal, natural gas, petroleum, propane) use in buildings, vehicles, and electric power generation, in addition to more clean and efficient industrial practices, will lower emissions and generate environmental, public health, and socioeconomic advantages. In the short term, the reduction of co-pollutants will enhance both indoor and outdoor air quality, diminishing hazardous air pollutants, toxins, and other harmful substances. The immediate alleviation of these pollutants can positively impact the physical and economic well-being of communities. In the long run, the reduction of GHGs will mitigate the impacts of climate change. The pollutants reduced by the following PCAP measures are outlined in Table 6.

Table 6: Air Pollutants and GHGs Reduced by PCAP Measures

Type of Pollutant	Categories of Related Measures
Carbon Monoxide (CO)	Industry, Buildings, Transportation, Grid
Methane	Industry, Buildings, Transportation, Grid, Waste
Sulfur dioxide	Industry, Buildings, Transportation, Grid
Nitrogen Oxides	Industry, Buildings, Transportation, Grid
Carbon Dioxide	Industry, Buildings, Transportation, Grid, Waste
Volatile Organic Compounds	Industry, Transportation
Sulfur Hexafluoride	Industry, Buildings, Grid
Particulate Matter (e.g., PM2.5)	Industry, Buildings, Transportation, Grid
Heavy Metals	Industry, Buildings, Transportation, Grid
Nitrous Oxide	Industry, Transportation, Grid
Hydrocarbons	Industry, Transportation
Other hazardous air pollutants and air toxics	Industry, Transportation, Grid

These co-pollutants are also described throughout the PCAP Measures section. The co-benefits, detailed below, impact all communities where programs and projects related to the PCAP measures may be implemented.

4.1.1 Public Health Benefits

Reducing GHG and co-pollutant emissions has and will continue to have profound implications for public health of Pennsylvanians. The combustion of fossil fuels contributes to outdoor and indoor air pollution which, in turn, poses significant health risks. In the United States, roughly 87% of people's lives are spent indoors, so indoor exposure to combustion pollutants, such as natural gas for cooktops or heating, has the potential for substantial health effects.[41] In instances of long-term exposure, these health effects can include premature mortality, adverse birth outcomes, cognitive decline, and gastrointestinal inflammatory disease. Short term exposure can lead to asthma and respiratory symptoms.[42]

Furthermore, the adverse health impacts extend to climate impacts such as extreme heat events. Nearly two-thirds of the US population resides in areas susceptible to health risks related to extreme heat, including heat-related illnesses and cardiovascular conditions. See Section 3.2 for more information on climate-related risks, particularly for LIDACs.

4.1.2 Socioeconomic Benefits

The implementation of the priority GHG reduction measures in Pennsylvania's PCAP can bring significant socioeconomic advantages to Pennsylvanians, especially among people living in communities impacted by environmental justice issues. One major shift will be increased high-quality energy related jobs to the state as it builds renewable energy infrastructure and expands on energy efficiency efforts. The development of clean energy technologies, such as solar installations and electric vehicle (EV) charging infrastructure, necessitates skilled individuals proficient in installing and maintaining such hardware. The 2023 Pennsylvania Energy Efficiency Workforce Needs report[43] projects that demand for energy efficiency

[41] U.S. EPA. 1989. Report to Congress on indoor air quality: Volume 2. EPA/400/1-89/001C. Washington, DC.

[42] Health Effects Institute. 2020. *Health Effects Institute Annual Report 2020: Valuing Science Informing Decisions.* https://www.healtheffects.org/system/files/hei-annual-report-2020.pdf

[43] PA DEP. 2023. Pennsylvania Energy Efficiency Workforce Needs https://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/2023_Energy_Report/PA%20EE%20Workforce%20Needs%20Report%20Final.pdf

and building electrification workers including heating, air conditioning, and refrigeration mechanics and construction and building inspectors will see a significant increase over the next decade. Offering clean energy job training, especially within environmental justice areas, both supports resilient and clean infrastructure and generates economic opportunities.

Clean energy can be developed to improve grid resilience (e.g., through battery storage), reducing the risk of blackouts and promoting energy independence.[44] Consequently, these investments mitigate the economic and physical impact of extreme weather events.

GHG emissions contribute to more frequent and severe extreme weather events, resulting in substantial financial costs and economic impacts. Long-term reduction of GHG emissions can mitigate these events, such as extreme precipitation and storms, while preventing associated costs like increased insurance premiums, expenses for repairing structural damage, and losses in crops and natural resources. The reduction of extreme weather events also alleviates costs related to medical bills and premature deaths. In 2022 alone, the US faced 18 extreme weather and climate events costing over $1 billion, making the reduction of these costs crucial for individual, community, and overall economic well-being.[45]

Electrifying and decarbonizing energy end-use sectors and enhancing efficiency through properly designed measure implementation can offer financial relief to individuals and businesses, especially for low-wealth and minoritized residents. Energy efficiency retrofits will reduce overall household energy use, therefore lowering energy bills. This reduction in energy cost burden eases financial stress for households and businesses, allowing resources to be redirected to better individual economic situations and stimulate the economy.

Additionally, the PCAP measures promote and require public education, community engagement, and social inclusion. Implementing measures such as enhanced multimodal and public transit options fosters social capital, encourages community engagement, and contributes to the overall socioeconomic well-being of the Commonwealth.

4.2 LIDAC Benefits

The PCAP measures provide a range of benefits to LIDAC communities including:

- **Reduced Indoor Air Pollution:** Reductions in co-pollutants (e.g., GHGs, particulate matter, hazardous air pollutants) result in enhanced public health outcomes, including declines in illnesses and premature mortality associated with indoor air pollution.[46]
- **Reduced Outside Air Pollution:** Enhanced public health outcomes stemming from reductions in co-pollutants (e.g., GHGs, particulate matter, hazardous air pollutants) result in enhanced public health outcomes, including declines in illnesses and premature mortality associated with outdoor air pollution.[47]
- **Increased Resilience to Climate Change:** Strengthened resilience to climate change events from measures that reduce GHGs and offer climate adaptation co-benefits. GHG emissions are linked to global warming and climate change, so reducing emissions lowers the likelihood of climate events (e.g., extreme heat) and associated risks (e.g., heat-related illness).[48]
- **Increased Employment Opportunities and Workforce Development:** Establishment of high-quality employment opportunities and workforce development initiatives in LIDAC communities, prioritizing access to the clean workforce and economy for LIDAC workers and small businesses, in accordance with Justice40 guidance.

- **Increased Energy Security:** Bolstered energy security through enhancements in energy efficiency and the adoption of more resilient energy generation technologies.
- **Enhanced Quality of Space:** Increased comfort and quality of space, such as a safer, healthier home or workplace due to reduced indoor air pollution.
- **Improved Access to Climate Change Resources:** Provide easier access to climate change-related resources, education, job trainings, and services.
- **Increased Accessibility to Transit and Active Transportation:** Expanded access to public transit and alternative transportation methods (e.g., increased frequency in transit routes, improved sidewalks or bike lanes).
- **Less Noise Disturbance:** Less noise pollution (e.g., from vehicle traffic) due to a decrease in single-occupancy vehicles on the road.
- **Increased Climate Change Awareness:** More purposeful community engagement and enhanced public awareness of climate-related projects and their outcomes.
- **Expanded Community Networks:** Greater social capital that arises when communities can enjoy public spaces safely (i.e., without air pollution), have greater access to public resources (e.g., information, transportation), and overall live healthier lives with improved socioeconomic wellbeing.
- **Energy Efficiency Cost Savings:** Cost savings from energy efficiency as a smaller portion of income is allocated to electricity and heating bills.[49]
- **Electric Vehicle Cost Savings:** Cost savings associated with the transition from ICE vehicles to EVs due to lower vehicle fuel and maintenance cost.[50]

Table 7 shows the associated LIDAC benefits for each measure. Details of LIDAC benefits for each measure are described in Section 4.5.

4.3 Implementation Schedule

Table 8 depicts a proposed timeline for implementation of the PCAP measures.

Table 8: Proposed Timeline

Milestone	Timeframe
2024	
Deliver final PCAP to EPA, which includes interested party input on measures	March 1, 2024
Identify key actions to take under each measure	Throughout 2024
2025	
Coordinate resources across jurisdictions and take initial actions across the PCAP measures	Early 2025
Estimate GHG emissions reductions measure actions	Early 2025
Estimate LIDAC benefits from measure actions	Early 2025
Deliver final CCAP to EPA	Mid 2025
2026	
Continue implementing measure actions	Early 2026
Implement pilot programs and short-term strategies for GHG reductions	Mid 2026
Secure approval and budget for ongoing GHG reductions	Mid-late 2026
2027	
Deliver Status Report to EPA	Mid 2027
Continue to implement measures and reduce GHGs; Track progress across the state	2027 onward

4.4 Workforce Planning Analysis

4.4.1 Labor Demand and Priority Occupations

The CPRG calls for grantees to reduce climate pollution while building the clean energy economy in a way that benefits all Americans, provides new workforce training opportunities, and effectively addresses environmental injustices in low-wealth and minoritized communities. This PCAP includes a preliminary analysis of workforce development activities needed to implement the plan's priority measures, with emphasis on industrial measures. To analyze the local workforce in preparation for these priority industrial measures, it is vital to take multiple factors into account, including examining the structure of the current workforce and the workforce required to implement the measures, anticipated supply of labor appropriate to the measures, inventory of workforce education and training resources to shape and meet the demand for labor and skills gaps, and how workforce measures can benefit the communities that need the most help.

There are approximately ten priority occupations that will be in-demand as a result of the implementation of the industrial measures, and these occupations are likely to see some of the greatest increase in demand. Due to the nature of these occupations' specialized skills, the shortage of these workers would hinder the successful implementation of the plan's priority measures. The priority occupations with descriptions of their primary roles are listed below.

- **Electricians** install, maintain, and repair electrical wiring, equipment, and fixtures.
- **Heating, Air Conditioning, and Refrigeration (HVAC/R) Mechanics and Installers** install or repair heating, central air conditioning, HVAC, or refrigeration systems, including oil burners, hot-air furnaces, and heating stoves.
- **Pipelayers, Plumbers, Pipefitters, and Steamfitters** assemble, install, alter, and repair pipelines or pipe systems that carry water, steam, air, or other liquids or gases.
- **Construction Laborers** perform tasks involving physical labor at construction sites.
- **Carpenters** construct, erect, install, or repair structures and fixtures made of wood and comparable materials, such as concrete forms; building frameworks, including partitions, joists, studding, and rafters; and wood stairways, window and door frames, and hardwood floors.
- **Boilermakers** construct, assemble, maintain, and repair stationary steam boilers and boiler house auxiliaries.

- **Construction Equipment Operators** operate one or several types of power construction equipment, such as motor graders, bulldozers, scrapers, compressors, pumps, derricks, shovels, tractors, or front-end loaders to excavate, move, and grade earth, erect structures, or pour concrete or other hard surface pavement.
- **Insulation Workers** apply insulating materials to pipes, ductwork, or other mechanical systems in order to help control and maintain temperature.
- **Industrial Machinery Installation, Repair, and Maintenance Workers** repair, install, adjust, or maintain industrial production and processing machinery or refinery and pipeline distribution systems.
- **Welding, Soldering, and Brazing Workers** use hand-welding, flame-cutting, hand-soldering, or brazing equipment to weld or join metal components or to fill holes, indentations, or seams of fabricated metal products.

Based on the typical attributes of these jobs including wages, benefits, training needed, unionization rates, and access to training pathways, the increase in demand for these occupations provides a significant opportunity to create and maintain good jobs throughout Pennsylvania as the industrial sector decarbonizes. By focusing workforce development investments and programs in support of these occupations, Pennsylvania and its residents can maximize the funding resources available and streamline engagement with critical stakeholders.

More than 210,000 workers are employed within the ten priority occupations in Pennsylvania. Construction Laborers (51,300 jobs) and Carpenters (35,500) make up the largest share of priority occupation workers, while Insulation Workers and Boilermakers account for fewer than 1,500 jobs each across the state. Six of the ten priority occupations (carpenters; electricians; plumbers, pipefitters, and steamfitters; construction laborers; boilermakers; and insulation workers) have location quotients—or concentration of those jobs—lower than the national average. That means that although these occupations are crucial to supporting the implementation of the priority measures, many of them are found in lower concentrations in Pennsylvania than the broader United States, which could worsen shortages as the demand for these workers increases.

4.4.2 Considerations for Meeting Demand

Hiring Difficulty

With unemployment near all-time lows, stories of hiring difficulty across industries have become more commonplace. In fact, the 2023 US Energy and Employment Report found that 59% of non-union construction firms in clean energy reported it was very difficult to find new workers, while only 31% of union signatory or Project Labor Agreement firms reported the same level of difficulty.[51] The energy sector in Pennsylvania is no different; two-thirds of non-labor signatory firms reported it was 'very difficult' to find workers compared to 28% of labor signatory firms. In fact, 44% of labor signatories reported no challenges finding talent at all.

Key Skills

The ten priority occupations overwhelmingly do not require workers with a four year degree. In fact, between 85% and 95% of workers in each of the priority occupations do not have a four year degree, compared to 58% of all workers throughout the Pennsylvania economy. This data makes it clear that these occupations do not have extensive educational requirements or barriers. The priority occupations also have many shared top knowledge attributes, skills, and abilities. For example, nine out of ten priority occupations require 'Mechanical' knowledge, and eight out of ten priority occupations have 'Critical Thinking' as a top skill. The similarities in knowledge attributes, skills, and abilities means that pre-apprenticeship and other career entry programs can support many of these occupations simultaneously without the need to specialize curriculum.

Economic Opportunity for LIDACs

Residents within LIDAC communities have far fewer economic opportunities than their non-disadvantaged neighbors; the unemployment rate is nearly twice as high, the labor force participation rate is five percentage-points lower, and

[51] https://www.energy.gov/sites/default/files/2023-06/2023%20USEER%20REPORT-v2.pdf

household income is nearly half as high (Table 9). The severity of the discrepancy highlights the historic lack of investment and opportunity flowing into these communities and reflects both a need and an opportunity for these communities. Greater effort and resources are needed to attract and access the greater share of potential job seekers that live within disadvantaged communities. Offering wraparound support services to job seekers can increase retention and completion rates of training programs and help individuals segue into their new careers.

Table 9. Economic Opportunity for Disadvantaged Communities in Pennsylvania

	Unemployment Rate	Labor Force Participation Rate	Household Income
Non-Disadvantaged Communities	4.4%	64.2%	$108,245
Disadvantaged Communities	9.0%	59.4%	$58,200

4.5 Priority GHG Reduction Measures

The Pennsylvania PCAP incorporates GHG reduction measures aligned with the Commonwealth's priorities to pursue funding opportunities under the CPRG program. Pennsylvania's PCAP GHG reduction measures encompass a broad range of project, program, and idea submissions from the state government, local authorities, regional planning agencies, individuals living in communities impacted by environmental justice issues, and other interested parties received by the Pennsylvania CPRG team. The details of each measure, such as key implementers, implementation activities, and milestones, are intended to be informative but are not exhaustive of all opportunities to implement a given measure.

Notably, Pennsylvania acknowledges the potential far-reaching impact of leveraging the IRA tax incentives. While the clean technology adoption and utilization decisions are decentralized across the Commonwealth's many residents and businesses, Pennsylvania can play a role in informing and engaging the public of the available opportunities, easing access to those opportunities with streamlined and simplified application requirements and technical support, and developing data-driven, targeted complementary policies to increase uptake economywide. The Commonwealth is exploring the potential of a centralized resource to coordinate and facilitate this streamlining and engagement, versus embedding these functions directly in their relevant measures and programs.

The measures in this document highlight the Commonwealth's priorities, with a specific focus on opportunities within the industrial sector, where emissions have been growing and where there has been a smaller emphasis on programs, policies, and projects to reduce emissions. Six of the nine PCAP measures have potential to reduce emissions in the industrial sector (Industrial Electrification, Efficiency, and Process Emissions; Low Carbon Fuels; On-Site Renewable Energy; Carbon Capture, Use and Storage; Fugitive Emissions Reduction; and Net-Zero Electricity Grid.)

4.5.1 Industrial Electrification, Efficiency, and Process Emissions

GHG Measure Description

Pennsylvania is home to a range of industrial operations for processing raw materials and finished products with significant diversity. While industrial processes vary significantly across types of industry (including iron and steel, bulk chemical processes, pulp and paper and other industrial work), nearly all industrial processes have opportunities to enhance their thermal or electrical efficiency. With opportunities from the IRA, some industrial operations can be cost-effectively decarbonized through electrification tools from heat pumps for low to medium temperature ranges to thermal storage for high temperature processes, and by changing industrial processes that generate GHG emissions. Electrification's suitability might differ by use case, and such efforts are well complemented by further changes to chemical processes, production techniques to reduce process emissions, and/or carbon capture, utilization, and storage (CCUS). This measure complements the advancement of CCUS and hydrogen/hub infrastructure (more details in the *CCUS* and *Low Carbon Fuels* measures) which includes exploring the expansion of the current offtake profiles of hydrogen hubs to include heavy industry, particularly steel, chemicals and fertilizer/ammonia production, and establishing regulations.

This measure will be supported by national and DEP programs to enhance energy efficiency, deploy electrification, and reduce process emissions in industrial facilities throughout the Commonwealth. Additionally, pilots of new technologies to reduce emissions from hard-to-decarbonize industrial processes is a key activity of this measure. Finally, studies to identify phase-down and phase-out pathways for fossil-reliant industries that cannot be defossilized, as well as exploring

regulatory standards or financial disincentives that can complement public investments and encourage private investments into technology and equipment changes, would effectively leverage the strategies proposed in this measure to reduce industrial emissions in Pennsylvania.

Deploying industrial electrification, efficiency and reducing process emissions can take many forms including:

- Supporting education on industrial decarbonization opportunities (electrification, efficiency and process emissions reduction).
- Funding industrial decarbonization.
- Using financing tools to expand industrial decarbonization.
- Encouraging and providing incentives for industrial decarbonization.
- Conducting comprehensive planning efforts in deploying hydrogen and/or biomethane projects (both production and use) in industrial applications, with a goal to support the project development and implementation of projects.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory Sector: Industrial
- Cumulative Reductions from 2025-2030: 20.1 MMT CO_2e
- Cumulative Reductions from 2025-2050: 265.4 MMT CO_2e

Summary of GHG reduction calculations approach

Industrial emissions reductions from thermal efficiency gains were modeled using EPA's Flight Facility-level GHG Emissions Data, Greenhouse Gas Reporting Program[52] and the US Department of Energy (DOE) Industrial Decarbonization Roadmap[53] data to identify thermal efficiency potentials for each industry type and the resulting emissions compared to the business as usual (BAU) case.

Industrial process emissions reductions were estimated using the Energy Policy Simulator (EPS) for Pennsylvania, a model maintained by Energy Innovation and RMI. Strategies estimated using the EPS include methane destruction and capture, fluorinated gas equipment retrofits, cement clinker substitution, N2O abatement, and material efficiency. The rate of implementation of these strategies is commensurate with meeting 2030 and 2050 targets, and technological readiness.

More detail on the methodology for thermal efficiency emissions reductions, how the EPS works and the inputs can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

- **Pennsylvania Energy Development Authority (PEDA):** PEDA is Pennsylvania's State Energy Financing Institution (SEFI) under Title 17, and as the PA Energy Accelerator Program/Pennsylvania's Green Bank. PEDA assists in the deployment of low-carbon solutions for the industrial sector through financial mechanisms , and has applied for the EPA Solar for All funding opportunity.
- **Pennsylvania Department of Community and Economic Development (DCED) and Commonwealth Financing Authority (CFA):** Provides financing opportunities for various energy projects including solar, geothermal, and wind energy.
- **Pennsylvania Department of Labor and Industry (L&I):** Partners in the development of a clean energy workforce.
- **State and Federal Government:** Can support new technologies, update regulations, and incentivize investments. They can enable pilot projects by updating regulations or through permitting. This can enable the use of technologies for which a clear regulatory process does not yet exist.

[52] https://ghgdata.epa.gov/ghgp/main.do?site_preference=normal

[53] DOE. "Industrial Decarbonization Roadmap." 2022. https://www.energy.gov/industrial-technologies/doe-industrial-decarbonization-roadmap

- **Industry and trade groups:** Industry and trade groups may implement electricity and gas efficiency, electrification, or process improvement projects, share best practices, and build and disseminate resources for companies and other industrial bodies to become more efficient and decarbonized. Partnering with industry and trade groups enables efficiency and decarbonization planning that is tailored to subsectors with unique needs.
- **Utilities:** Gas and electric utilities provide crucial support for efficiency programs and provide energy to support industrial operations.
- **C-PACE Administrators:** Regional or local partners that have provided assistance to industry in implementing efficiency measures and have strong connections to decision-makers in the industrial space.

Progress to Date and Future Activities and Milestones

Progress in industrial decarbonization has mainly been targeted at industrial efficiency through participation in DOE's Better Plants Challenge and DEP's Energy Efficiency, Environment, and Economics (E4) Initiative. Actions outlined in the Pennsylvania Clean Energy Program Plan (CEPP)[54] have been taken to decarbonize the industrial sector including:

- Clean energy financing through Green Energy Loan Fund (GELF).
- Deployment of assistance for clean and resilient microgrids for industrial entities.
- Development of a training incentive program with L&I to train new clean energy workers.
- Dedication of DOE State Energy Program Funds provided to Pennsylvania for over 10 years to conduct industrial energy assessments. This program is currently expanding with Bipartisan Infrastructure Law funding.

Future activities that will support this measure include, but are not limited to:

- Funding and providing technical assistance to industrial partners through the in-development Reducing Industrial Sector Emissions in Pennsylvania (RISE PA) grant program.
- Building best practices, and legal frameworks to facilitate and structure the growing CCUS and hydrogen infrastructure adjacent to industrial decarbonization proposed within this measure.
- Clean energy workforce analysis (building off the PA DEP 2022 energy and clean energy employment reports[55]), training, and development.
    - Train workers to employ energy management systems, conduct scoping audits, and prepare industry to utilize technology to manage and reduce emissions.
    - Partner with state universities and post-secondary institutions to provide training, apprenticeship, and educational programs to support the growing hydrogen and carbon capture infrastructure.
    - Support coal and coke communities that may suffer employment loss as demand for thermal and metallurgical coal decreases.
- Accelerate the deployment of energy efficiency solutions in existing facilities.
    - Energy efficiency actions can include heat exchange efficiency, novel and existing efficient technologies, combined heat and power, and waste heat recovery. Analysis of emissions reduction potential for each industry and facility would be beneficial to ensure significant capital is not spent on efficiency improvements with limited emissions reductions, as large investments in existing fossil-based facilities with limited emissions reductions will create carbon lock-in.
    - Provide incentives for energy management or demand response actions.
- Electrify industrial processes and equipment for low- and mid-temperature processes. Decarbonization of the electric grid (see the *Net-Zero Electricity Grid measure*) will increase the impact of electrified industrial processes and equipment.
    - Heat electrification methods can include: heat pumps for low-medium temperature ranges (<200C), thermal storage for high-temperature ranges (>200C) that apply for most heavy industrial processes from

[54] DEP. "Clean Energy Program Plan: Priorities in Renewable Energy and Energy Efficiency, Security, and Workforce Development." 2022. https://greenport.pa.gov/elibrary//GetDocument?docId=4852828&DocName=CLEAN%20ENERGY%20PROGRAM%20PLAN%202023-2025.PDF%20%3cspan%20style%3D%22color:green%3b%22%3e%3c/span%3e%20%3cspan%20style%3D%22color:blue%3b%22%3e%28NEW%29%3c/span%3e

[55] https://files.dep.state.pa.us/Energy/Office%20of%20Energy%20and%20Technology/OETDPortalFiles/2022_Energy_Report/2022_PA_CEER_3.4vw.pdf

steel, cement, chemicals and refining, as well as novel electrochemical based methods (e.g. electrified chemical separation processes).
    - Create analysis to assess rate and tariff design in partnership with the Pennsylvania Public Utility Commission to establish, if necessary, affordable industrial user rates that properly values flexible loads while ensuring equitable outcomes (including avoiding cost shifts) for Pennsylvania residents.
    - Leverage federal funding opportunities such as the Energy Infrastructure Reinvestment (EIR) funds to fund coal conversion projects that combine thermal storage's ability to integrate renewables and on-site thermal equipment (such as steam turbines), with heat as an output for industrial off-takers.
- Invest in large scale industrial decarbonization projects.
    - Support first of its kind industrial projects through grants, offtake agreements, and other incentives (including demand-side incentives).
    - Streamline permitting processes for industrial decarbonization projects while maintaining proper safety considerations and requiring community consent or engagement as a key part of project approval processes.
    - Increase funding to leverage PEDA's status as Pennsylvania's State Energy Financing Institution (SEFI) under Title 17 and leverage DOE Loan Program Office funds to act as a credit backstop for industrial decarbonization projects, similar to the US Department of Agriculture's (USDA) Empowering Rural America (New ERA) program, to ensure projects are able to attract private financing.
    - Transition existing steel assets away from coal-based production and towards cleaner technologies (electrolysis, direct reduction paired with carbon capture, hydrogen or electric arc furnaces).
    - Create a long-term phase down and phase out of petroleum and natural gas production, refining, processing and end-use industrial activities in conjunction with labor and community representatives.
- Reduce embodied carbon from alternative material use, sustainable regional supply chain hubs, and industrial clusters. Lower-carbon materials can be used in the development of lower-carbon industrial markets.
    - Material efficiency can be achieved in the industrial sector by "lightweighting" products, designing products for longer use, utilizing more sustainable materials, and increasing reuse and recycling.
    - Support increased usage of low carbon supplementary cementitious materials such as calcined clays, fly ash, slag, natural pozzolans, and others.
    - Explore and pilot ordinary Portland cement alternatives through relevant subsidies and pilot projects.
    - Support state level buy-clean initiatives to help grow demand for low-carbon construction materials (steel and cement).
    - Adopt product-specific, third-party verified environmental products declarations to identify and prioritize lower-carbon petrochemical materials such as insulation and carpeting material in state public procurement initiatives, while incentivizing bio-based materials as a long-term transition goal for procurement.
- Perform an analysis, cost estimation, and provide general technical support of the industrial sector, targeted subsectors, or specific project sites to identify what technologies, financing approaches, and projects should be a focus of industrial decarbonization programs and what it would cost to implement them.
- Implement an industrial emissions standard to ensure alignment and industry compliance with state decarbonization goals. Investments in monitoring equipment (GHG emissions and other air pollution) within facility fence lines would aid in emission transparency, as well as meet long-standing community concerns about toxic industrial emissions.

The actions that will be most effective in decarbonizing one industrial sector may vary greatly from another. Under this measure, actions to decarbonize the industrial sector must be flexible to allow for the most impactful actions to be deployed for each industry.

Authority to Implement

The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the Air Pollution Control Act (APCA) or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs. Alternatively, industrial partners have the authority to

implement energy efficiency, electrification, and process emission reduction projects. DEP has the authority to administer programs that provide funding to incentivize industrial decarbonization efforts. If industrial decarbonization mandates are pursued, there is precedent in Act 129, but any new legislation would have to go through the same process.

Geographic Coverage

This measure is applicable to the entire state of Pennsylvania.

Funding Sources

- 48C Federal Tax Credit
- US Department of Energy (US DOE) - State Energy Program
- US DOE - Energy Efficiency Revolving Loan Fund Capitalization Grant Program
- US DOE - Energy Efficiency and Conservation Block Grant
- Federal Highway Administration - Carbon Reduction Program
- US Department of Housing and Urban Development - Green and Resilient Retrofit Program
- US EPA - Greenhouse Gas Reduction Fund (GGRF)
- PA DEP – GELF, PEDA
- PA DEP - Alternative Fuels Incentive Grants and Rebates

LIDAC Benefits and Co-Benefits

Benefits to LIDACs in Pennsylvania may include improved air quality, especially in fence line communities where localized air pollution can be reduced. This can lead to improved public health outcomes in highly industrialized communities. For example, a recent American Council for an Energy-Efficient Economy (ACEEE) study notes that children living near industrial sites have a much higher likelihood of being diagnosed with asthma.[56] Through implementing this measure, this likelihood and other risks will be reduced for fence line communities. This was a priority identified in CAEJC outreach in EJ areas. Reducing the amount of fossil fuels used in industry can also result in improved safety and working conditions for industrial employees.

The equity considerations and associated LIDAC vary depending on the technologies and specific strategies involved in facilitating industrial decarbonization.

Iron and steelmaking, in addition to upstream coke production and coal preparation, are sources of considerable local environmental pollutants (NOx, SOx, PM2.5, PM10, hazardous air pollutants). Removing coal from production methods and transitioning to direct reduced iron and electric arc furnace steelmaking (DRI-EAF) can help to reduce these pollutants in addition to GHG emissions.

Workforce Planning Analysis

Industrial decarbonization and improved efficiency offers a strong path forward for both high-quality employment and climate goals. Heavy industry is a heavily unionized sector that requires well-trained and skilled workers to complete complex jobs safely, and decarbonizing industry will require many such workers. The implementation of this priority measure is expected to increase the creation of jobs within the following occupations:

- Carpenters
- Heating, Air Conditioning, and Refrigeration Mechanics and Installers
- Electricians
- Plumbers, Pipefitters, and Steamfitters
- Construction Laborers
- Boilermakers
- Construction Equipment Operators

[56] ACEEE. “Funded Strategically, Industrial Decarbonization Can Cut Pollution in Disadvantaged Communities. December 2023. https://www.aceee.org/blog-post/2023/12/funded-strategically-industrial-decarbonization-can-cut-pollution-disadvantaged.

- Insulation Workers
- Industrial Machinery Installation, Repair, and Maintenance Workers
- Welding, Soldering, and Brazing Workers

Metrics

Potential metrics to track progress for this measure include:

- Number of and types of industrial decarbonization projects completed.
- Energy savings from projects (kWh for electricity, kBTU for gas).
- GHG and other harmful pollutants' emissions reductions ($MMTCO_2e$ or by gas for some process emissions).
- Number of quality jobs created.
- Mitigation of environmental justice impacts, which can be measured by recognized DOE or EPA tools such as Climate & Economic Justice Screening Tool (CEJST), Environmental Justice Screening and Mapping Tool (EJScreen), and/or PennEnviroScreen.

4.5.2 Low Carbon Fuels

GHG Measure Description

Incentivizing and increasing the production and use of low-carbon fuels will be imperative to reduce the Commonwealth's industrial sector emissions.

Through this measure, Pennsylvania will further explore the production and deployment of clean fuels used in heavy industries, particularly in cases where electrification poses a significant challenge. The industrial sector is uniquely positioned to use alternative gaseous fuels such as hydrogen and biomethane as a substitute for fossil gas. This measure aims to increase the production and use of both fuel types as a way of reducing net emissions. Further incentivizing market development of low carbon fuels will be key to decarbonizing the fuel supply of heavy industry.

The dedicated use of hydrogen could take place in hubs of industrial operations or other use cases where the fuel is either burned or run through a fuel cell to generate needed power. Hydrogen production is expected to increase in Pennsylvania, particularly through the Appalachian Regional Clean Hydrogen Hub (ARCH2) and the Mid-Atlantic Clean Hydrogen Hub (MACH2) efforts, two projects that were awarded funding by the DOE, that will provide a total of almost $1.7 billion to expand production and use of hydrogen throughout Pennsylvania and other participating hub states.[57] When produced using carbon-free energy sources, like wind or solar power, hydrogen is a zero-carbon fuel that can reduce emissions when replacing fossil fuels. Where renewable energy is not available, hydrogen can be produced with natural gas and paired with CCUS technologies to reduce the net emissions resulting from production.

Biomethane from sources including animal manure, food waste, landfill gas, water resources recovery facilities, agricultural residue, energy crops, forestry residue, and municipal solid waste, helps to capture GHGs that would be emitted into the atmosphere as part of the natural carbon cycle. Biomethane development from animal waste also has the dual benefit of increased nutrient management and can lead to positive impacts on odor and can improve nutrient efficiencies.

Deploying low carbon fuels in Pennsylvania can take many forms including:

- Supporting education on hydrogen and biomethane, how it is generated and its uses.
- Developing and scaling feedstocks of biomethane production throughout the Commonwealth.
- Developing low carbon fuels standard whereby a certain amount of gas used by facilities would need to come from low-carbon sources.
- Using clean energy financing tools to expand fuel use and production facilities.
- Encouraging and providing incentives for the use of hydrogen and biomethane in industrial operations.
- Revising or supporting local governments to amend rules that might limit the production or use of hydrogen and biomethane.
- Conducting comprehensive planning efforts in deploying hydrogen and/or biomethane projects (both production and use) in industrial applications, with a goal to support the project development and implementation of projects.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory Sector: Industrial
- Cumulative Reductions from 2025-2030: 20.0 $MMTCO_2e$
- Cumulative Reductions from 2025-2050: 284.1 $MMTCO_2e$

Summary of GHG reduction calculations approach

GHG reduction associated with the use of hydrogen fuels was modeled through switching natural gas fuel to hydrogen fuel in the built environment, transportation, and power generation sectors. EPA Motor Vehicle Emissions Simulator

[57] DOE. "Regional Clean Hydrogen Hubs Selections for Award Negotiations." https://www.energy.gov/oced/regional-clean-hydrogen-hubs-selections-award-negotiations

(MOVES3) was used to model transportation section transitions while a proprietary market model was used to project the growth of hydrogen in the building sector. Integrated Planning Model (IPM) was used for hydrogen consumption in the power sector. Emissions associated with hydrogen consumption was calculated based on the projected percentage of blue, green, and pink hydrogen based upon assumed changes in the Pennsylvania energy generation mix.

GHG reduction associated with the use of biomethane was based on the 2019 American Gas Foundation evaluation for feedstock options for biomethane in Pennsylvania to determine the potential for replacing natural gas usage with biomethane usage where biomethane is a carbon neutral fuel.

Additional detail on these methodologies can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

- **Industrial energy consumers:** Most end users in the hydrogen economy will be in hard-to-electrify sectors like industrial and power sectors, but there may be additional transport uses from heavy-duty trucking, public transport buses, garbage trucks, and other heavy-duty maintenance vehicles. Transportation uses of low-carbon fuels are outlined in the *Electric and Alternative Fuel Vehicles* measure.
- **Industry (fuel producers and transporters):** Industry will manufacture new technologies to enable the use of hydrogen fuels such as fuel cells, electrolyzer producers, refueling stations for hydrogen-powered vehicles, pipelines, and more. Industry will also develop hydrogen delivery infrastructure such as pipelines, liquefaction plants, liquid tankers, dispensers, and more.
- **Inspectors and regulators:** Inspectors and regulators will play a role in reviewing new low-carbon fuel infrastructure, detecting leaks, and more.
- **Companies and farms running feedstock operations:** Suppliers of biomethane feedstocks, including farms, waste management facilities and land management entities would need to work to develop projects to store and transport feedstocks.

Progress to Date and Future Activities and Milestones

To support further production and deployment of clean fuels for heavy industries, Pennsylvania has passed a Hydrogen and Natural Gas Tax Credit for the purchase of hydrogen or natural gas from a Regional Clean Hydrogen Hub in Pennsylvania. Pennsylvania is poised to be an early leader in hydrogen production through the ARCH2 and MACH2 hydrogen hub awards, to expand production and use of hydrogen throughout Pennsylvania and other participating hub states. Other complementary policies that may be explored for this measure include:

- A production tax credit for sustainable aviation and or maritime fuels that aligns with federal requirements for incentive-qualifying fuels.
- Incentivization for the offtake of hydrogen into priority sectors, which includes heavy transportation vehicles including aircraft, ocean-going vessels, hydrogen powered forklifts, and other offroad vehicles, as well as industries that cannot or should not be electrified for a variety of reasons like cement production, steel and aluminum smelting, and chemical refining.
- Permit streamlining and standardization for clean fuel production facilities and offtake infrastructure like pipelines and fueling stations.

Authority to Implement

DEP recognizes that electric utilities and hydrogen fueling network partners will be key players in incentivizing the market adoption of these technologies. The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the APCA or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs.

Any new policies would need to be passed as legislation through Pennsylvania's legislature and signed by the Governor. Passage of a low carbon fuel standard (LCFS), incentives for low carbon fuels, streamlined permitting, or other supportive

concepts would empower DEP and other relevant agencies to work together to design and implement the specifics of the LCFS program.

Geographic Coverage

This measure is applicable to the entire state of Pennsylvania.

Funding Sources

- US DOE - Industrial Efficiency and Decarbonization Funding Opportunity Announcement
- US DOE - Hydrogen Hubs

LIDAC Benefits and Co-Benefits

The development of hydrogen technology may result in the creation of jobs. Pennsylvania can work with the ARCH2 and MACH2 clean energy hubs to facilitate the equitable distribution of these jobs.[58] Additionally, when evaluating which sectors or uses of hydrogen are most viable, costs should be considered, to emphasize uses that are most cost effective and do not place undue financial or tax burden on communities impacted by environmental justice issues. New biomethane projects may result in the creation of job opportunities as well as new revenue streams, which can benefit small businesses, farms, and local communities.

To maximize emissions reductions, hydrogen must be produced with the lowest carbon intensities possible, through either electrolysis using zero-carbon electricity or through adding CCUS technologies to other production processes, such as steam methane reforming of natural gas. Zero emission sources such as solar, wind or nuclear energy are used to produce hydrogen will reduce emissions from CO_2 and other GHGs associated with unabated fossil fuel-fired electricity generating sources. In addition to GHGs, reducing the volume of natural gas combustion also reduces criteria pollutant emissions such as NOx, SOx, $PM_{2.5}$, and VOCs that are ground-level ozone precursors.

While hydrogen fuels can reduce net GHG emissions and the emissions of other air pollutants such as VOCs, the combustion of hydrogen fuel, when done in the presence of air, can still lead to the generation of nitrous oxides, which can contribute to community air pollution and negative health impacts. When used in fuel cells, hydrogen does not generate these nitrous oxides, leading to air quality benefits.

Workforce Planning Analysis

When deploying novel technologies like hydrogen hubs, it can be difficult to know if a workforce is ready. Fortunately, in Pennsylvania, there is a significant workforce that is already prepared to meet the technical specifications for these new technologies. The transition to low carbon fuels offers a strong path forward for both high-quality employment and climate goals. The implementation of this priority measure is expected to increase the creation of jobs within the following occupations:

- Carpenters
- Heating, Air Conditioning, and Refrigeration Mechanics and Installers
- Electricians
- Plumbers, Pipefitters, and Steamfitters
- Construction Laborers
- Boilermakers
- Construction Equipment Operators
- Insulation Workers
- Industrial Machinery Installation, Repair, and Maintenance Workers
- Welding, Soldering, and Brazing Workers

[58] Governor Josh Shapiro: Pennsylvania the Only State to Secure Two Regional Clean Hydrogen Hub Projects - PA Department of Community & Economic Development

Metrics

Potential metrics to track progress for this measure include:

- GHG and other harmful pollutants' emissions reductions.
- Number of quality jobs created.
- Mitigation of environmental justice impacts, which can be measured by EJScreen and/or PennEnviroScreen.
- Number of hydrogen fuel stations, hydrogen production facilities or biomethane facilities
- Amount of hydrogen and biomethane produced and used in Pennsylvania.

4.5.3 On-Site Renewable Energy

GHG Measure Description

Developing on-site renewable energy and energy storage systems for residential, commercial, and industrial properties will be critical to bolstering clean electricity sources across the Commonwealth. The most common source of on-site renewable energy will be solar photovoltaics, which can be developed on all types of buildings, from single-family homes and shopping centers to school and local government buildings. However, on-site renewable energy development can also include small wind turbines (especially in more rural or industrial areas), micro-hydropower, or geothermal technologies. On-site renewables and energy storage play an important part in the decarbonizing of the electrical grid because they expand the magnitude of renewable energy sources while contributing to a more decentralized, and thus less vulnerable, energy grid system. Developing on-site renewable energy can also lower energy costs for property owners and their tenants.

Deploying renewable energy in Pennsylvania can take many forms including:

- Installing distributed generation on properties, such as rooftop solar systems, and battery storage systems.
- Using renewable energy certificates or other clean energy financing tools to expand onsite clean energy such as solar and storage.
- Encouraging and providing incentives for the use of solar panels and energy storage systems on existing buildings and in the construction of new buildings.
- Providing incentives to homeowners and home builders on completing electrification-ready upgrades when doing other work (e.g., panel upgrades to be prepared for a future heat pump or electric appliance) and steps to make buildings ready for charging infrastructure.
- Revising or supporting local governments to amend rules such as local zoning or permitting to encourage better adoption of solar and energy storage projects.
- Conducting comprehensive planning efforts in deploying solar and storage projects in buildings, with a goal to support the project development and implementation of projects.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory Sector: Residential, Commercial, and Industrial, Electricity Consumption
- Cumulative Reductions from 2025-2030: 1.7 $MMTCO_2e$
- Cumulative Reductions from 2025-2050: 15.4 $MMTCO_2e$

Summary of GHG reduction calculations approach

Emissions reductions from renewable energy were projected through the forecasted adoption of rooftop solar systems in Pennsylvania. Total technical potential for rooftop solar was aggregated from city and county level data and the most aggressive 2050 adoption scenario from National Renewable Energy Laboratory's (NREL) storage futures study was applied to this potential. PJM's 2023 load forecast was used to determine existing capacity. NREL's annual technology baseline was used to determine avoided emissions due to solar. More detail on this methodology including full assumptions and data sources can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

- **Pennsylvania Public Utility Commission, Utilities, and Energy Suppliers:** Participation and approval by these groups and their regulators is critical for renewable energy implementors. They manage interconnection rules (for both energy generation and storage) and have the ability to streamline renewable energy development.
- **Local Governments:** Local governments and their supporting agencies can streamline the permitting and development of energy generation and storage projects. Local zoning laws (especially those prohibiting structures above certain heights, therefore wind turbines), can be major barriers to renewable energy development in the residential and commercial sector.
- **Energy generation and storage installers**: There will continue to be a growing demand for a skilled energy generation and storage installation workforce.
- **Private sector and building owners:** Property owners and tenants must participate in developing small-scale renewable energy operations to reap the financial and environmental benefits of their investments.

Progress to Date and Future Activities and Milestones

Pennsylvania has a long history of supporting renewable energy, and specifically on-site renewable energy through a range of programs. In the past, the following actions have been taken:

- The Pennsylvania DEP developed Finding Pennsylvania's Solar Future[59], a comprehensive solar deployment plan, through a statewide partnership of experts who have collaborated to identify strategies, including grid-scale solar and smaller, distributed systems (such as rooftop installations), that can increase solar-powered electricity development.
- Pennsylvania's Alternative Energy Portfolio Standard (AEPS), originally passed in 2004 requires that electric distribution companies and electric generation suppliers include a specific percentage of electricity from alternative resources, including onsite solar, in the generation that they sell to Pennsylvania customers. This program provides additional incentives for renewable energy sources.

More recently, the Commonwealth has pursued funding for EPA's Solar for All program as part of the GGRF and has pursued projects and sought to lead by example in renewable energy adoption by prioritizing installing on-site renewable energy projects on public buildings and land.

In the future, the Commonwealth and local government partners can continue to support on-site renewable energy by bolstering a range of programs that educate consumers, connect them with programs and incentives for renewable energy development, or through direct funding of projects. Financing programs can connect developers with local, state, and federal incentives for renewable energy development and seek to develop replicable models for deployment. Pennsylvania can also use funding to subsidize the installation and interconnection of renewable energy projects on residential, commercial, and industrial properties.

Finally, Pennsylvania could pursue a range of legislative updates:

- Reforming the existing tier 1 and solar credits established by Pennsylvania's Alternative Energy Portfolio Standards Act (2005) to require 30% of electricity to come from renewable energy sources by 2030 and further support renewable energy to align with the strategy to achieve a carbon-free grid by 2050. The recommendation could also include a carveout for on-site renewable energy projects.
- Authorizing community solar in the Commonwealth to allow households within a geographic area to subscribe to and share electricity from a project in exchange for a credit on their electricity bill from the power produced by the project. Community solar is a well-suited option for Pennsylvania households who do not have access to solar because they rent, live in multi-tenant buildings or have physical restrictions on their rooftops that make them unable to host a system.

[59] Pennsylvania's Solar Future Plan (pa.gov)

- Encouraging or incentivizing localities across the state to reconsider zoning laws that prevent renewable energy development in residential, commercial, and industrial areas.

Authority to Implement

The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the APCA or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs. The Commonwealth can support the development of renewable energy under its authority to streamline permitting and siting processes, and collaborate with utility regulatory agencies to make improvements to the interconnection process. The Commonwealth can also support investments in transmission and distribution grids to ensure sufficient capacity to meet demand from an increasing number of energy providers. Pennsylvania will need to work in partnership with utilities and local governments to approve, design, and interconnect these projects.

Geographic Coverage

This measure is relevant to the entire state of Pennsylvania.

Funding Sources

- US DOE - Energy Efficiency and Conservation Block Grant
- EPA - GGRF, Solar for All
- Production Tax Credit for Electricity Renewables
- Energy Credit for Solar & Wind Facilities Placed in Service in Connection with Low-Income Communities
- Clean Electricity Production/Investment Tax Credits

LIDAC Benefits and Co-Benefits

On-site renewable energy development is a property improvement that can support both renter and owner-occupied properties. Community-scale solar can be supported at community centers or rental properties, given legislative updates. The range of different ways to install solar (purchase, financed, power purchase agreements, leases) provide varied opportunities to enable solar development without placing undue burden on individuals living or working in environmental justice areas. Ensuring that savings realized by renewable energy installations on rental properties can be passed on to tenants, especially in energy burdened renting communities, is vitally important. Renewable energy generation and storage development can also create job opportunities for communities in need. Additionally, program administrators can prioritize a local workforce and create partnerships with high schools in EJ areas or training programs. In addition to these benefits, reducing overall emissions from fossil fuel combustion will reduce air pollution and improve environmental justice outcomes for low-wealth and minoritized communities.

Workforce Planning Analysis

When installing renewable energy and energy storage technologies, the primary workforce will be electricians and construction laborers for onsite systems. Pennsylvania already has a significant workforce that is prepared to install these technologies. However, significant growth will be needed, especially for electricians. The transition to onsite renewable energy offers a strong path forward for both high-quality employment and climate goals. The implementation of this priority measure is expected to increase the creation of jobs within the following occupations:

- Electricians
- Construction Laborers

Metrics

Potential metrics to track progress for this measure include:

- Number of on-site renewable energy installations, across Pennsylvania and in LIDACs
- Capacity of on-site renewable energy installations, across Pennsylvania and in LIDACs

Number of quality jobs created.

4.5.4 Carbon Capture Utilization and Storage

GHG Measure Description

This measure aims to reduce GHG emissions through point source CCUS and natural-land based storage and sequestration efforts.

CCUS can be used in both the industrial and the power sectors to decarbonize in hard-to-abate sectors. In the industrial sector, CCUS is helpful where electrification, low carbon fuels, and efficiency are insufficient to achieve deep decarbonization, and in the power sector, where CCUS can provide reliability for a net zero grid by helping fossil fuel-powered generating plants continue operating. Power sector CCUS is included in the *Net-Zero Electricity Grid* measure elsewhere in this document.

Point source capture of CO_2 from industrial sector emissions for utilization or storage provides a key opportunity to reduce GHG emissions. Efforts should be focused on heavy industry applications that currently lack viable low-carbon alternatives including cement and chemicals manufacturing (4.9 MT CO_2 annually[29]). Additionally, capture and storage of non-fossil CO_2 is one of the most mature and scalable non-nature-based carbon dioxide removal technologies, and utilization of this CO_2 is required as a critical feedstock for some harder to electrify applications (chemicals/plastics) or synfuels (e.g. aviation). Between its waste, pulp & paper, and ethanol facilities, the Commonwealth has approximately 3.1 MT CO_2 per year of biogenic CO_2 available for utilization/storage. According to the Great Plains Institute's report on implementing Carbon Capture and Storage[60] in the state:

- Pennsylvania has the estimated capacity to store roughly 2.4 billion metric tons of CO_2 through geologic storage.[61]
- The 47 facilities in Pennsylvania that qualify for the IRA's 45Q tax credit are responsible for ~85% of the state's industrial and power sector emissions.
- There are 22 facilities that have been identified as potentially economically feasible candidates for near-term CCUS.

Improving agricultural and land-based management practices are imperative in the Commonwealth's decarbonization efforts. Carbon dioxide can be captured and stored through carbon sinks such as trees, soils, biomass, and oceans. Strategies to increase the sequestration of CO_2 by using these sinks include reforestation and afforestation, enhanced soil carbon uptake and increased soil health, biochar or compost application to soils, and more. Pennsylvania has significant potential for these opportunities because it is estimated that forests cover 16.6 million acres of land[62], and agriculture covers 7.3 million acres in the Commonwealth as of 2022.[63]

Actions under this measure will prioritize funding, policies, and programs that support the deployment of point source capture and geological storage of carbon as well as support for forest, agriculture, and other land-based management strategies. Deploying CCUS in Pennsylvania can take many forms including:

- Installing point source capture on existing or new industrial facilities.
- Developing new geological storage facilities.
- Using clean energy financing tools to expand point source capture, geological storage, or natural land-management strategies.
- Encouraging and providing incentives for point source capture, geological storage, or natural land-management strategies.

---

[60] Implementing Carbon Capture and Storage Technology (Great Plains Institute, 2021) https://carboncaptureready.betterenergy.org/wp-content/uploads/2021/06/PA_5_25_2021.pdf

[61] Ibid.

[62] "Forests of Pennsylvania, 2019" (USDA, 2020), https://www.fs.usda.gov/nrs/pubs/ru/ru_fs251.pdf.

[63] USDA. 2023. 2020 State Agriculture Overview: Pennsylvania. https://www.nass.usda.gov/Quick_Stats/Ag_Overview/stateOverview.php?state=PENNSYLVANIA.

- Revising or supporting local governments to amend rules such as local zoning or permitting to encourage better adoption of CCUS facilities.
- Conducting comprehensive planning efforts in deploying point source and land management CCUS strategies.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory Sector: Industrial, LULUCF
- Cumulative Reductions from 2025-2030: 0.03 $MMTCO_2e$
- Cumulative Reductions from 2025-2050: 28.2 $MMTCO_2e$

Summary of GHG reduction calculations approach

CCUS technology is assumed to be available to some facilities by 2030, ramping up in deployment and availability by 2050. Excluding facilities with annual stationary combustion emissions less than 100,000 MT per year, roughly 85% of stationary combustion emissions are modeled to remain available for the emission reduction potential of CCUS. A trajectory was developed using industry expectations and expert opinion to model CCUS deployment as a percent of total CCUS potential. Emissions reductions are calculated against a BAU that models no implementation of CCUS and holds industry emissions flat through 2050. More detail on this methodology can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

- **Industry:** Members of various industrial sectors such as iron and steel, chemical and petrochemical, cement, and others will play a role by participating in retrofits to their facilities.
- **Federal government agencies (energy, research, and environment related):** Can support the development of new technologies, update regulations, and incentivize investments. The federal government can enable pilot projects by updating regulations, or through permitting once research demonstrates the feasibility of applications of CCUS technologies.
- **Local governments:** Offers oversight and funding opportunities, and disseminates resources for carbon sequestration and capture within their respective jurisdictions.
- **Private landowners:** Private landowners will be partners in reforestation and restoration programs.
- **State Agencies:** Coordination between Pennsylvania agencies can centralize knowledge and processes relevant to deploying agencies that can offer oversight, funding opportunities, and disseminate resources for carbon sequestration and capture.
- **Federal Land Use and Forestry Agencies:** The National Park Service, US Forest Service, and Fish and Wildlife Service, which oversee 80%, 10%, and 10% of federally owned land, respectively may provide resources, oversight, and technical assistance to forestry and restoration projects.
- **Non-governmental and Non-profit Organizations:** NGOs and local non-profits with expertise in conservation and restoration (e.g., Northeast-Midwest State Foresters Alliance) can provide marketing, outreach, and education to Pennsylvania residents. They can also increase awareness of the importance of afforestation and grassland restoration, creating social momentum.
- **Farmers Association and Agricultural Groups**: Engages with farm coalitions and agricultural groups to understand obstacles and opportunities in manure management, fertigation, and no-till practices. Sustainability-oriented groups like Pasa Sustainable Agriculture offer trainings, technical assistance, and other resources throughout Pennsylvania's farming community.
- **Insurance Companies:** The introduction of agricultural insurance requirements that consider climate risk could encourage adoption of emissions reducing agricultural practices.

- **Universities and Research Institutions:** These bodies may investigate and develop further opportunities and best practices for CCUS.

Progress to Date and Future Activities and Milestones

The Commonwealth has several opportunities to support carbon sequestration use and sequestration as a point source capture including:

- Ensuring enabling policy and regulation is in place to accelerate infrastructure deployment to facilitate point source CCUS, such as establishing:
    - Policy for creation of carbon utilization and sequestration hubs. Hubs are instrumental to streamline infrastructure deployment and reduce CO_2 transport costs.
    - Regulation & permitting, including pore space rights, long-term liability, class VI primacy, and permitting for CO_2 pipelines.
    - Supply incentives, such as federal funding/cost-share support, grants, and tax incentives.
    - Demand side-policy, such as state procurement and incentives to spur private sector offtake.
    - Workforce education/training.
- Partnership with local organizations for two-way communication, engagement, and education on carbon management and CO_2 infrastructure.
- Governor's CCUS Inter-Agency Work Group (2019 – Present): DCNR, DEP, and DCED collaboration on technical, regulatory, and economic policy pillars.

The Commonwealth has several existing programs that support carbon sequestration and capture in rural and urban communities.

- DNCR's Urban and Community Forestry Program, formerly TreeVitalize, is a public-private partnership that supports communities with tree planting design and maintenance throughout the Commonwealth. The group also offers educational opportunities about the benefits of trees.
- Clean and Green is a tax assessment program that encourages protection of farmland, forestland, and open spaces. Landowners can save money and preserve land for carbon sequestration. Currently, more than 9.3 million acres are enrolled statewide.

Future actions to support this measure could include:

- Provide education and resource opportunities to landowners and farmers
    - Equip private and public landowners with the proper tools, information, and flexibility to incorporate climate change in management planning and implementation.
    - Incentivize conservation of privately owned forest land, riparian forest buffers – tax relief for ecosystem services provided, funding for management projects.
    - Conduct outreach and education to agricultural networks on the societal and environmental benefits of methane-reducing feed additives, which may otherwise present little to no advantage to farmers.
    - Inform farmers on how and where to implement no-till technologies, which are already available on the market.
    - Support research and development of agricultural practices that will sequester Carbon on-farm.
- Establish incentives and economic development opportunities
    - Incentivize adoption of nitrification inhibitors and feed additives via subsidies.
    - Provide incentives for shopping malls, office buildings, apartment buildings and other major urban centers in cities to establish and maintain greenspaces such as gardens, courtyards, and rooftop greenspaces.
    - Purchase wetland easements on marginal and flood-prone agricultural lands to diversify grower income, buffer productive lands from flood events, and improve the environmental services provided by these lands.
- Update agricultural infrastructure and processes
    - Reduce GHG emissions through feed additives, enhanced efficiency fertilizers, fertigation, and improved manure management.

Authority to Implement

The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the APCA or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs. Pennsylvania's state agencies such as the Department of Agriculture and DCNR have the authority to support policy and programming aimed at reducing carbon through sequestration and other capture efforts.

Geographic Coverage

This measure is applicable to the entire state of Pennsylvania.

Funding Sources

Examples of potential funding sources include, but are not limited to:

- US Forest Service - Urban and Community Forestry Grants
- USDA Natural Resources Conservation Service - Agricultural Conservation Easement Program (AECP)
- 45Q Federal Tax Credit
- PA Department of Agriculture - Agricultural Conservation Assistance Program (ACAP)

LIDAC Benefits and Co-Benefits

There is potential for job creation and retention due to the expansion of CCUS technology in new and existing facilities. Building, operating, and maintaining the infrastructure needed to deploy the technology will require qualified staff. To prioritize equitable implementation, Pennsylvania can prioritize hiring a local workforce. Because CCUS does not capture harmful air co-pollutants along with CO_2, the deployment of CCUS technologies in fence line communities is unlikely to see benefits realized from many of the other decarbonization strategies such as improved localized air quality.

Working with people living or working in environmental justice areas to determine opportunities for beneficial implementation of natural land-based CO_2 sequestration can result in GHG reductions as well as increased resilience in vulnerable communities. Depending on where reforestation, afforestation and harvest cycle extension practices occur, there may be an opportunity for these practices to provide benefits, such as reducing urban heat island effects, or improving ecosystem connectivity or reducing runoff or flood risks. By prioritizing equity, Pennsylvania can target these benefits to communities that disproportionately experience these effects of climate change.

Implementing afforestation practices on abandoned coal mines may have a positive impact on previously highly industrialized communities. This could include public health benefits in communities that previously experienced a high volume of criteria pollutant emissions. Afforestation efforts and the associated public health benefits also align directly with CAEJC-identified actions related to ecosystem conservation and pollution mitigation.

Implementation of best management practices (BMPs) in agriculture such as reduced tillage may also reduce flood risk (e.g., by allowing soils to hold more water), thereby increasing farms' resilience to projected increased flood risks under climate change. BMPs may also improve the sustainability of agricultural practices to cope under changing climate conditions, reduce erosion, and improve soil health. Prioritizing equitable implementation of this strategy will allow these benefits of increased resilience to be realized in LIDACs.

Workforce Planning Analysis

When dealing with novel technologies and pilot projects like CCUS, it can be difficult to know if a workforce is ready. Fortunately, in Pennsylvania there is a significant workforce that is already prepared to meet the technical specifications for these new technologies. The increase in CCUS offers a strong path forward for both high-quality employment and climate goals. The implementation of this priority measure is expected to increase the creation of jobs within the following occupations:

- Carpenters
- Heating, Air Conditioning, and Refrigeration Mechanics and Installers

- Electricians
- Plumbers, Pipefitters, and Steamfitters
- Construction Laborers
- Boilermakers
- Construction Equipment Operators
- Insulation Workers
- Industrial Machinery Installation, Repair, and Maintenance Workers
- Welding, Soldering, and Brazing Workers

Metrics

Potential metrics to track progress for this measure include:

- Tons of CO_2e captured (e.g., as reported through the EPA Greenhouse Gas Reporting Program) and sequestered through different mechanisms
- Number of facilities with carbon capture installed
- Acreage of planned implemented BMPs
- Number of trees planted
- Percent of green space and/or tree canopy in urban environments

4.5.5 Fugitive Emissions Reductions

GHG Measure Description

Methane can be emitted from a variety of sources in the energy, agriculture, and waste sectors. Fugitive leaks can occur in gas and oil systems as equipment ages and deteriorates. Methane is also released from coal mining activities and abandoned mines. Fugitive emissions from energy production contributed 27.82 $MMTCO_2e$ in 2021. Most of these emissions (16.20 $MMTCO_2e$) were from natural gas and oil systems and 11.62 $MMTCO_2e$ were from coal mining.[64] Nearly half of Pennsylvania's methane emissions from oil and gas operations stem from marginal wells that account for less than 1% of statewide oil and gas production.[65,66] Landfills generate methane as the organic waste decomposes without oxygen. While some landfills have gas capture systems in place, significant amounts of methane still escape into the atmosphere, due to insufficient collection system coverage, cover integrity issues, and equipment malfunction.

With a higher GWP than CO_2, methane is a potent GHG, and reducing its emissions yields significant environmental benefits, helping to limit near-term climate change. Reducing fugitive methane emissions can also reduce emissions of harmful co-pollutants, benefiting local air quality, health, and quality of life.

Actions under this measure will prioritize funding, policies, and programs that support infrastructure improvements and policies aimed at plugging inactive and marginal wells and reducing methane emissions from oil and gas infrastructure, coal mine methane, and landfills, through increased implementation of monitoring and capture technologies. Actions could also include:

- Using financing tools to expand deployment of infrastructure improvements to reduce methane leaks at energy, agriculture, and waste facilities.
- Encouraging and providing incentives for infrastructure improvements to reduce methane leaks at energy, agriculture, and waste facilities.

---

[64] Pennsylvania DEP. 2023. Pennsylvania Greenhouse Gas Inventory.

[65] "Methane Emissions from Conventional and Unconventional Natural Gas Production Sites in the Marcellus Shale Basin | Environmental Science & Technology," accessed October 31, 2023, https://pubs.acs.org/doi/full/10.1021/acs.est.5b05503.

[66] Mark Omara et al., "Methane Emissions from US Low Production Oil and Natural Gas Well Sites," Nature Communications 13, no. 1 (April 19, 2022): 2085, https://doi.org/10.1038/s41467-022-29709-3.

- Conducting comprehensive planning efforts to more effectively make infrastructure improvements to reduce methane leaks at energy, agriculture, and waste facilities.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory Sector: Industrial, Waste
- Cumulative Reductions from 2025-2030: 18.2 $MMTCO_2e$
- Cumulative Reductions from 2025-2050: 87.8 $MMTCO_2e$

Summary of GHG reduction calculations approach

Reduction of emissions from oil and gas production processes (which accounts for roughly 50% of total production emissions) can be focused on the 10% of wells considered highest emitters. Monitoring and repair efforts can reduce overall oil and gas production emissions by 80% over a 10 year ramp up.

The emissions reductions associated with the plugging of marginal and abandoned wells assumes that 25% of abandoned wells will be plugged by 2050.

Additional industrial fugitive emissions reduction from coal, water and waste activities were estimated using the EPS for Pennsylvania, a model maintained by Energy Innovation and RMI. Strategies estimated using the EPS include methane destruction and capture from coal. The rate of implementation of these strategies is commensurate with meeting 2030 and 2050 targets, and technological readiness.

More detail on the methodology for the fugitive emissions measure, and how the EPS works and the inputs can be found in Appendix B. Quantified GHG Reductions Methodology (note that discussion of EPS and inputs are discussed in the methodology for the Industrial electrification, efficiency, and process emissions measure).

Key Implementing Agency(ies) and Partners

- **Oil and Gas Producers:** The producers would be required to implement and operate leak detection and repair technologies.
- **Coal Mine Operators and Owners.** Operators and owners can implement technologies to capture coal mine methane during the entire mining process.
- **Landfill Operators:** Operators and owners can implement technologies and practices to monitor and capture fugitive methane emissions.
- **Methane Monitoring & Control Technology Companies:** Substantial research and innovation is currently underway to produce more effective and efficient leak detection technologies, across sectors. These technologies, as they are developed and enter the marketplace, will ideally reduce the cost and improve the effectiveness of methane leak detection and repair efforts.
- **State regulators**: The state oversees the implementation of new leak detection and repair requirements, and coal mine methane capture technologies. The state would also be asked to review and approve technologies as they are brought to the marketplace. Pennsylvania can also update the air regulations for municipal solid waste landfills, following leading states like Oregon, Maryland, and California, to incorporate recent advances in methane monitoring and capture and expand adoption of best practices to reduce emissions at landfills across the state.
- **Scientists and engineers**: Research is required to determine the causes of large leaks in oil and gas production operations. This research, largely funded by the federal government and including the participation of the oil and gas industry, is underway.

Progress to Date and Future Activities and Milestones

DEP worked with Carbon Mapper and the US Climate Alliance to conduct overflights with airborne methane detection technology, gathering data on methane emission sources and rates. Flights occurred nine times over a 3-week period in May 2021. 153 total plumes were detected from 91 individual sources across oil & gas operations, coal mines, and landfills. Operators were notified of observed plumes and in some cases achieved voluntary reductions in observed methane emissions from landfills and oil and gas infrastructure.

Control of volatile organic compounds (VOC) Emissions from Oil and Natural Gas Sources, 25 Pa. Code Chapters 121 and 129 established Reasonably Available Control Technology requirements for VOC emissions including fugitive emission components. It requires that fugitive emission sources located between the wellhead and the natural gas transmission and storage segment are inspected monthly. This ensures the reduction of methane emissions from inactive or marginal gas and oil wells.

Implementation of the EPA's recent (December 2023) final New Source Performance Standards which address methane[67] and the proposed EPA rule to reduce methane as initiated through IRA[68] would further reduce methane emissions through increased controls and detection of leaks. EPA's proposed rule would require all producers in the Commonwealth to enhance leak detection and repair with the following regulations:

- Higher frequency leak detection for high-producing and complex production sites;
- Flexibility in leak detection technology including higher detection thresholds for potentially large emitters; and
- Annual leak detection and repair requirements for all producing sites.[69]

The intent of more frequent leak detection and repair for high-producing and complex production sites is to capture large leaks more rapidly. Enabling flexibility in the technology will enable more cost effective, higher-frequency leak detection technology to be deployed, capable of detecting the large leaks responsible for a majority of methane emissions but potentially costing less to implement and moving toward continuous leak detection methods. Annual leak detection and repair for all producing sites is intended to remove the long-tail of relatively large emissions that can occur even with marginal wells.

Beyond the oil and gas sector, there are also resources like the US Coal Mine Methane Current Projects and Opportunities Mapping Tool that can be used to identify mines in the Commonwealth that have or need methane capture technology.

Future actions to reduce fugitive methane emissions could include:

- Expanding state-wide "super-emitter response" programs across methane sources:
    - Pennsylvania can build on the success of its Carbon Mapper collaboration to quickly alert operators of large methane emission events and inform mitigation. New data will soon be publicly available from methane-detecting satellites, and the Commonwealth can play a role in ensuring operators are acting on this information in a timely manner. EPA's super-emitter program under the new oil and gas Sec. 111 rules will formalize this alert-response process for covered oil and gas sources. Pennsylvania can play a role in ensuring observations of other detected sources, such as landfills, coal mines, and oil & gas infrastructure not covered by EPA's rule (e.g., transmission, distribution), result in timely mitigation.
- Updating state air regulations for municipal solid waste landfills to better control landfill methane emissions.
    - Modernizing air emissions regulations for landfills can promote expanded gas collection, more comprehensive monitoring (e.g., leveraging remote sensing and near-ground approaches), better cover practices, and other common-sense improvements to limit the release of methane to the atmosphere at landfills across the state and protect communities from other harmful co-pollutants. Pennsylvania could consider emulating three states that have taken action to better control their landfill methane emissions by setting stronger standards than EPA's. State rules make several improvements to landfill design, operational, and monitoring requirements to increase methane capture and reduce the risk of large leaks. For example, the Maryland Department of Environment estimates a 25-50% reduction in landfill emissions once the rule is in full effect.

[68] https://www.epa.gov/newsreleases/biden-harris-administration-announces-proposed-rule-reduce-wasteful-methane-emissions

[69] EPA. 2023. 40 CFR Part 60. https://www.epa.gov/system/files/documents/2023-12/eo12866_oil-and-gas-nsps-eg-climate-review-2060-av16-final-rule-20231130.pdf

- Expanding voluntary adoption of methane monitoring and control technologies at facilities, beyond minimum federal standards.
    - Provide funding (e.g., leveraging GGRF, Methane Emissions Reduction Program, and other federal programs) and incentives to expand the adoption of advanced methane monitoring and control technologies across sectors.
    - State and local governments can work with operators to set quantitative targets to increase gas capture rates and reduce fugitive emissions.
    - In the oil and gas sector, encourage implementing strong Leak Detection and Repair programs in line with voluntary gas certification program best practices.
    - Provide funding and incentives to replace high or low bleed equipment with zero bleed alternatives in oil and natural gas supply chains to reduce methane intensity.
    - Make all data on fugitive methane emissions and reductions publicly available to promote transparency and accountability.
- Plugging inactive and marginal wells.
    - Leverage federal funding (e.g., Orphaned Well Funds from the Bipartisan Infrastructure Law (BIL), Methane Emissions Reduction Program) to accelerate plugging of inactive and marginal wells.
    - Use methane monitoring data to verify successful plugging.

Authority to Implement

The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the APCA or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs. The Pennsylvania DEP also has authority to update air emission regulations for landfills to incorporate the latest best practices in methane monitoring and control. State agencies also have authority to design programs and grant funds to support voluntary methane monitoring and reductions, beyond minimum federal standards. Oil and gas producers, coal mine owners, landfill operators, and local governments have the authority to implement technologies and best practices that monitor and either reduce or capture fugitive emissions.

Geographic Coverage

This measure is applicable to the entire state of Pennsylvania.

Funding Sources

- BIL's Orphaned Oil and Gas Wells Funding
- IRA's Methane Emissions Reduction Program
- IRA's GGRF
- IRA's Community Change Grants
- BIL's Energy Efficiency and Conservation Block Grants (EECBG)
- IRA's Methane Monitoring Funds

LIDAC Benefits and Co-Benefits

Increasing compliance requirements to reduce uncaptured methane emissions was a priority action identified by the CAEJC outreach that directly aligns with this PCAP measure. To help ensure equitable implementation of this measure, the costs of emission reductions should be borne by those who benefit the most from the production and consumption of oil and gas, and not distributed across society in a way that is unrelated to the consumption and production of oil and gas.

Health impacts of leakage of VOCs and other possible air toxics from oil and gas production operations have the greatest impact on people living near production facilities. These populations suffer environmental damages that are inequitable as they often do not benefit in any direct way from oil and gas production close to their homes or businesses. Minimizing leakage of methane from these facilities will also minimize the leakage of VOCs that are a portion of natural gas. Thus, reduced methane leakage from oil and gas production improves environmental equity by minimizing health damages to

people living close to production facilities. As a result, this strategy supports air pollution reduction which was also identified as a priority area by CAEJC outreach.

In addition to cutting planet-heating methane, addressing methane emissions from landfills creates local benefits. Improving methane capture also better controls for emissions of hazardous air pollutants, smog-forming compounds, and odors, while reducing explosion hazards. This improves air quality, safety, public health, and quality of life for communities near landfills. Expanding landfill methane monitoring and implementing BMPs can also create local jobs in methane mitigation, as well as economic benefits through the productive use of captured methane, which can in some cases displace more expensive fossil fuels.

Workforce Planning Analysis

Implementing strategies that reduce fugitive emissions offers a strong path forward for both high-quality employment and climate goals, building on Pennsylvania's existing fossil gas workforce. The implementation of this priority measure is expected to increase the creation of jobs within the following occupations:

- Plumbers, Pipefitters, and Steamfitters
- Construction Laborers
- Construction Equipment Operators
- Industrial Machinery Installation, Repair, and Maintenance Workers
- Welding, Soldering, and Brazing Workers

Metrics

Potential metrics to track progress for this measure include:

- Methane emission reductions
- Number of inactive and marginal wells plugged

4.5.6 Net-Zero Electricity Grid

GHG Measure Description

This measure leverages clean and renewable resources in the region to achieve a net zero electricity generating sector while ensuring grid reliability by implementing a comprehensive framework of incentives and assistance programs. To support the realization of a net zero grid, the state will need to consider policy changes to regulate carbon emissions in the state or require an increasing share of electricity sales to come from clean energy resources within the state and surrounding region. This measure assumes the realization of a net zero electricity grid by 2050, which could be met through a combination of resources including existing nuclear, new small modular reactor nuclear, solar, wind, hydroelectric power, biomass, coal- or gas-fired power plants with carbon capture technology, or gas-fired power plants utilizing low carbon fuels such as biomethane or hydrogen. For these technologies to be deployed at the pace and scale needed, the state will need to consider permitting reform to ensure new clean energy projects can be sited and developed within the state in a timely manner.

In addition, the measure also aims to transition to a clean energy grid while ensuring grid reliability and resilience. To support that, this PCAP measure prioritizes electrification paired with investments in energy efficiency and distributed resources to help mitigate strain on the grid from electrified buildings and vehicles. Electricity producers can help ensure a reliable power supply by balancing intermittent resources with battery storage or other clean baseload sources, such as gas-fired turbines with carbon capture or through the use of low carbon fuels. At the same time, the transmission and distribution grid infrastructure will also require significant investment to be able to handle the influx of new grid-scale and distributed projects developed. Investment will be needed in both core grid infrastructure, such as lines and substations, as well as in software systems to control distributed resources and enhance grid flexibility. There will also be a need for grid modernization investments such as switches, sensors, and controls to improve grid operator's visibility and grid flexibility.

Actions under this measure will prioritize funding, policies, and programs that support the deployment of clean electricity sources and ensuring grid reliability and resiliency. Deploying clean electricity in Pennsylvania can take many forms including:

- Building new clean energy facilities, retrofitting existing facilities with point source capture equipment, and installing new transmission or distribution infrastructure.
- Using clean energy financing tools to build new clean energy facilities, retrofit existing facilities with point source capture equipment, and install new transmission or distribution infrastructure.
- Encouraging and providing incentives to build new clean energy facilities, retrofit existing facilities with point source capture equipment, or install new transmission or distribution infrastructure.
- Revising or supporting local governments to revise permitting, zoning and other reforms to build new clean energy facilities, retrofit existing facilities with point source capture equipment, and install new transmission or distribution infrastructure.
- Conducting comprehensive planning efforts to build new clean energy facilities, retrofit existing facilities with point source capture equipment, and install new transmission or distribution infrastructure.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory sector: Power
- Cumulative Reductions from 2025-2030: 2.6 $MMTCO_2e$
- Cumulative Reductions from 2025-2050: 534.0 $MMTCO_2e$

Summary of GHG reduction calculations approach

This measure modeled the resulting GHG emissions reductions from the achievement of a net zero grid for Pennsylvania by 2050. The IPM, which is used by EPA to analyze the projected impact of environmental policies on the electric power sector. IPM was also used to determine grid emission factors. Additional detail on the constraints and emission factors used can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

- **Electric Utilities and PA PUC:** Close coordination with utilities and the PA PUC will be crucial to transitioning the current grid to lower-emission alternatives while providing reliable power coverage, responsibly managing brownfields and retired infrastructure, and establishing new clean energy infrastructure.
- **Regional organizations including the Federal Energy Regulatory Commission (FERC) and PJM**: FERC is responsible for approving or denying new transmission infrastructure projects and works with the Regional Transmission Organizations (e.g., PJM) to regulate wholesale electricity markets. PJM is the regional transmission organization that oversees the electricity wholesale marketplace in Pennsylvania and the neighboring region. The state will need to coordinate with FERC and PJM to facilitate interconnection queue reforms to reduce delays and to coordinate transmission investments in the region.
- **Independent Power Producers (IPP):** As a third-party owner of generating resources, IPPs will need to be included in coordination on efforts to decarbonize the power grid on similar actions as mentioned for electric utilities and PA PUC.
- **Local participating entities and advocacy groups:** Establishing a working relationship with local participants and advocacy groups will help with permitting, zoning and other local issues associated with the deployment of net zero emissions electricity facilities.
- **Community and Technical colleges:** Workforce development will require partnerships with educational institutions to ensure that Pennsylvania has an adequate workforce to deploy clean energy technologies efficiently and effectively.

Progress to Date and Future Activities and Milestones

Pennsylvania has already seen significant reductions in emissions from electricity generation, with carbon dioxide emissions declining 38% from 1990 to 2021, largely due to a shift from coal-fired to natural gas-fired electricity generation.

Pennsylvania has an AEPS that has helped drive recent increases in renewable power generation. Since 2010, grid-scale wind and solar capacity in the state has doubled to over 1,600 MW, providing about 2% of total electricity generation in 2022.

While grid-scale renewable capacity has also increased in recent years, the Commonwealth has a long way to go to reach a reliable and clean electricity generating portfolio.

To accomplish its goal of a net-zero electricity grid, Pennsylvania will seek to:

- Maintain existing nuclear facilities and develop new small modular reactor nuclear power.
- Support the development of solar, wind, and hydroelectric power by connecting energy developers with financial incentives, facilitating interconnection agreements, and streamlining permitting processes.
- Pursue point source carbon capture technologies to reduce emissions from existing coal and natural gas plants.
- Expand battery storage to improve reliability and availability of renewable energy.
- Establish educational and work training programs to bolster the state's clean energy workforce to support the installation and maintenance of clean energy technologies.
- Promote federal and state funding opportunities for localities, households, and businesses transitioning to clean energy sources.
- Facilitate the responsible closure of high-emission coal fired power plants as supplemented by the installation of new clean energy sources.

Authority to Implement

The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the APCA or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs. In addition, the Commonwealth can support the development of renewable energy under its authority to streamline permitting and siting processes, and collaborate with utility regulatory agencies to make improvements to the interconnection process. Under its own authority, Pennsylvania can conduct outreach to connect developers with the financial incentives to invest in new technologies like carbon capture and build out renewable energy infrastructure. The Commonwealth will need to work in partnership with utilities and local governments to approve, design, and interconnect renewable energy projects. It will also need to work closely with local communities to facilitate the siting and permitting of new projects, as well as implement workforce training programs to support these new energy systems.

Geographic Coverage

This measure impacts the entire state of Pennsylvania.

Funding Sources

- IRA's GGRF
- BIL's Energy Efficiency and Conservation Block Grants (EECBG)
- BIL's Building a Better Grid Grants
- BIL's Grid Innovation Program
- BIL's Grid Resilience Grants
- BIL's Smart Grid Grants
- Production Tax Credit for Electricity Renewables
- Zero Emission Nuclear Power Production Credit
- Energy Credit for Solar & Wind Facilities Placed in Service in Connection with Low-Income Communities
- Clean Electricity Production/Investment Tax Credits

LIDAC Benefits and Co-Benefits

Low-wealth and minoritized communities have been historically disadvantaged by the siting of energy projects that produce environmental hazards and significant public and environmental health impacts. Pennsylvania will ensure that equity concerns are addressed during the siting process and that the economic benefits of the increased renewable energy development benefit affected communities.

Decarbonizing electricity generation will reduce emissions from CO_2 and other GHGs associated with unabated fossil fuel-fired electricity generating sources. In addition to GHGs, reducing the volume of natural gas combustion also reduces criteria pollutant emissions such as NO_x, SO_x, $PM_{2.5}$, and VOCs that are ground-level ozone precursors. As a result, public health outcomes related to air pollution and air quality will improve. This measure also will have significant economic impacts, including the creation of new jobs in construction, operation, and maintenance of these clean energy facilities. Decarbonizing the power grid will improve air quality and reduce the strain on public health from fossil fuel electricity sources.

Precedent exists for developing solar projects on the brownfield sites that remain in the place of closed coal plants. Doing so can increase nearby home property values and maintain the tax base of the area. Repurposing plants can also streamline the permitting process for siting solar, which increases the administrative feasibility of adding clean energy projects to the power mix.

Decarbonizing power generation provides opportunities for job creation. The Commonwealth can prioritize local and historically disadvantaged communities as the beneficiaries of employment opportunities in clean energy industries. Several counties in Pennsylvania were awarded funding to support displaced workers from the coal industry. In addition, there is a need for workers in the power sector to enable updates to transmission and distribution. To prioritize equitable

implementation, Pennsylvania could prioritize local communities for employment in jobs on transmission and distribution projects in the Commonwealth.

Grid reliability will need to be monitored as the grid shifts to lower-carbon resources. With greater reliance on electricity, it will be critical to ensure that renewable energy sources with inconsistent power (e.g., solar and wind are connected to substantial networks of power storage and potential backups in the case of outages or periods of low power provision (e.g., sun or wind exposure).

Metrics

Potential metrics to track progress for this measure include:

- GHG emissions reductions from the electric power sector in Pennsylvania
- Carbon intensity of the electricity mix
- Number, capacity and generation potential of renewable energy projects permitted and/or in operation
- Number, capacity and generation potential of coal and natural gas plants retrofitted with CCUS
- Number, capacity and generation potential of nuclear and small modular reactor facilities

4.5.7 Building Electrification, and Efficiency

GHG Measure Description

Decarbonizing buildings through energy efficiency, fuel switching, adaptive reuse, and other actions are a high priority for the Commonwealth. Emissions from buildings (i.e., residential, commercial, and industrial fuel use, as well as industrial processes) accounted for approximately 31% of GHG emissions in Pennsylvania in 2020. This measure focuses on increasing opportunities for owners and users of all building types to access and install technologies to decrease overall energy consumption, increase energy efficiency, and reduce GHG emissions from the built environment. It covers both market rate and low/moderate income customers, as well as, private and public buildings.

This measure will reduce emissions from this sector through a range of energy efficiency and electrification investments. Types of actions in this measure include the implementation of energy efficiency improvements to reduce gas and electricity usage, maintaining and promoting building codes and green building practices for new buildings, and through electrification of fossil fuel energy use within Pennsylvania's commercial and residential buildings. This measure can be implemented by a range of actors throughout the Commonwealth and is supported by foundational work already in place.

In Pennsylvania, Act 129 established Energy Efficiency & Conservation (EE&C) programs for electricity, which can be expanded on in a range of different ways.

- By increasing targets and removing spending caps while focusing on providing benefits in LIDACs.
- By mandating participation of gas utilities to expand gas efficiency, thus moving beyond voluntary demand-side management programs, and establishing programs to reduce gas usage from residential and commercial buildings.
- By expanding to include beneficial electrification of equipment that can displace use of natural gas and oil by replacing fossil fuel equipment with electric equipment, and as the grid becomes cleaner, emission reductions can be enhanced if equipment has been converted to electric.

Additionally, continued renewal of Pennsylvania's building codes, the adoption of stretch codes and integration of green infrastructure and nature-based solutions will reduce emissions from new construction and major renovations.

Pennsylvania has a range of clean energy financing tools available and under development that are offered through organizations like PEDA, the Philadelphia Energy Authority, and a range of Community Development Financial Institutions (CDFIs) and community lenders.

Actions under this measure will prioritize funding, policies, and programs that support the deployment of building energy efficiency and electrification. Deploying efficiency and electrification can take many forms including:

- Supporting construction, retrofit or redevelopment of new highly efficiency and electrified buildings.
- Using clean energy financing tools to support construction, retrofit or redevelopment of new highly efficiency and electrified buildings.
- Encouraging and providing incentives to support construction, retrofit or redevelopment of new highly efficiency and electrified buildings.
- Revising or supporting local governments to revise permitting, zoning and other reforms to support construction, retrofit or redevelopment of new highly efficiency and electrified buildings.
- Conducting comprehensive planning efforts to support construction, retrofit or redevelopment of new highly efficiency and electrified buildings.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory Sector: Buildings
- Cumulative Reductions from 2025-2030: 12.7 $MMTCO_2e$
- Cumulative Reductions from 2025-2050: 147.2 $MMTCO_2e$

Summary of GHG reduction calculations approach

Emissions reduction for this measure were modeled utilizing the CO2Sight tool, incorporating the Distributed Energy Resources Planner (DER Planner), a bottom-up model used to calculate technical, economic, and achievable potential

estimates for energy change and resulting emission reductions. Building stock is scaled to cover Pennsylvania through the ResStock and ComStock building models. A detailed description of the CO2Sight and DER Planner methodologies can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

State Agencies: State agencies that can support this measure include the PA PUC and PA Department of L&I.

Utilities: Utilities are among the providers of existing energy efficiency and building decarbonization for Pennsylvania rate-payers.

Property Owners, Developers, and Renters: End users of energy can improve efficiency both through changes to the property (i.e., equipment or fuel choice) and through behavioral changes that reduce energy consumption.

Builders, Contractors and Equipment Service Providers: Providers of the services and equipment to decarbonize buildings. This group may expand over the course of measure implementation, especially due to workforce development and expansion.

Inspectors and Regulators: Inspectors and regulators are key implementers of building codes, responsible for assessing compliance of new and existing building supply with standards of the code. Support for inspectors and regulators can include training for increased understanding of how to review buildings for compliance.

Local Energy/Climate Non-profits: Energy non-profits, such as local chapters of the US Green Building Council, can participate in marketing, outreach, and education with Pennsylvania residents to increase awareness of the benefits of new building codes and EE&C programs, as well as demand for programs run by electricity utilities.

Progress to Date and Future Activities and Milestones

Actions that can be taken to support this measure include:

Changes to Act 129, which has already established programs to increase energy efficiency through the utilities and provide programs to allow building decision-makers to increase efficiency.

- Expanding Act 129 and the current programs that support EE&C to provide participants with expanded incentives to undertake energy efficiency measures.
- Implementing a program similar to Act 129 that mandates natural gas utilities to reduce direct natural gas consumption through EE&C programs and establishing annual savings targets.
- Implement electrification after energy efficiency measures. This increases the effectiveness of electrification by reducing the amount of electricity wasted by inefficient appliances and leaks in building envelopes.

Establishing and growing existing programs, such as clean energy financing, commercial building energy performance programs or other incentives and mandates to spur action from large commercial energy consumers to invest in upgrades equipment, appliances, and building envelopes.

- Including carbon as a target of Building Energy Performance Standard (BEPS) programs (instead of the typical overall energy usage target) to incentivize electrification.
- Create or expand voluntary and/or mandatory benchmarking programs for large commercial buildings.

Strengthening of energy codes and green building policies. Implementing strengthened codes, including “stretch codes,” can encourage lower carbon buildings during both construction and operations.

- Facilitate net zero building development. Prioritizing low-emissions practices across the lifecycle (in construction, maintenance, and end of life) of new buildings and retrofits to existing buildings can yield more integrated emissions savings.

Expand or create new programs and incentives for clean energy retrofits and upgrades.

- Single, multifamily homes and small commercial retrofits (e.g., building efficiency retrofits including window replacements, insulation, more efficient and/or electric appliances, hybrid or all-electric heat pumps or more efficient gas heat pumps).

- Implement energy efficiency and fuel switching in large commercial buildings and other large energy users (e.g., hospitals), including implementing solutions to reduce the use of back up diesel generators and transitioning to cleaner alternatives.
- Expand and/or create new programs and incentives for retrofits and upgrades to municipal and government buildings, including public schools, government buildings, and operations (e.g., building efficiency and electrification retrofits, street lighting and stadium lighting retrofits, microgrids).
- Support for energy audits and site assessments. By conducting these assessments, implementers can collect information on which areas of the building inventory, if any, need additional support in achieving improved energy efficiency and decarbonization, and have the highest potential to result in energy savings.
- Planning for electric panel upgrades in properties to better support future electrification.

Authority to Implement

The authority to establish programs that mandate utilities provide energy efficiency programs is well established in Act 129. Expansions on this act or a similar act designed for gas utilities will need to go through the same legislative process as Act 129. The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the APCA or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs.

Energy code implementation across the region is governed by state law, which with some variations limits local governments' ability to implement codes different from those adopted at the state level. All other activities mentioned above can be implemented or are being implemented through existing voluntary or regulatory programs.

Geographic Coverage

This measure is intended to reduce emissions across Pennsylvania.

Funding Sources

Examples of potential funding sources include, but are not limited to:

- US DOE Energy Efficiency and Conservation Block Grants
- DOE Home Efficiency Rebates and Home Electrification and Appliance Rebates
- DOE State Energy Program
- US Department of Housing and Urban Development Green and Resilient Retrofit Program
- DOE and State Weatherization Assistance Programs

LIDAC Benefits and Co-Benefits

Energy efficiency upgrades lead to a decrease in energy costs. Homes in low-wealth areas and communities impacted by environmental justice issues historically bear disproportionately high energy burdens and can be impacted by changes. A reduction in energy burden for homeowners and renters will occur for a majority of energy efficiency and electrification investments, however, actions need to be taken to ensure that the cost of upgrading to more efficient equipment or to electrify buildings does not create either debt or higher energy costs from electricity.

Reductions in fuel use through efficiency upgrades or fuel switching will lead to a reduction in both outdoor and indoor air pollution. Air pollution impacts have been concentrated in LIDACs where community members may have reduced access to medical resources and care. The resulting reductions in air pollution will lead to better health outcomes and economic impact from reduced healthcare costs.

Metrics

Potential metrics to track progress for this measure include:

- Number of units/square footage retrofitted, disaggregated by type of building
- Number of units/square footage of efficient and electrified new buildings

- Dollar amount of energy savings
- Reductions in the use of fossil fuels in buildings (natural gas, fuel oil)
- Number of new construction units constructed as net zero, high efficiency, or certified sustainable (through USGBC, ISO, or other organizations)

4.5.8 Electric and Alternative Fuel Vehicles

GHG Measure Description

This measure aims to transition light-duty conventional internal combustion engine vehicles (ICEs) to electric vehicles (EVs) and accelerate the adoption of zero-carbon medium- and heavy-duty vehicles (MHDVs) including battery electric, hydrogen fuel cell, and plug-in hybrid electric vehicles. Sales of light-duty EVs have already increased over recent years due to reduced costs, increased financial incentives, and improved charging infrastructure. Even though an increase in EVs will result in increased electricity consumption, mile for mile, the additional electricity generated will result in lower GHG emissions than burning gasoline or diesel to drive. This reduction is even greater if the electricity is generated from renewable sources.

For light- and medium-duty vehicles, as well as for some shorter distance heavy-duty vehicles, electrification would be the most impactful decarbonization method, but for long-distance heavy-duty vehicles, hydrogen may play a larger role in decarbonization. This is in line with the joint memorandum of understanding (MOU) with 14 other states and the District of Columbia committing to the adoption of zero-carbon MHDVs that Pennsylvania has committed to.

To further reduce emissions from light-duty vehicles, Pennsylvania will continue to publicize federal tax credits that encourage the manufacture and purchase of electric passenger vehicles. Pennsylvania will also encourage the adoption of zero-emission MHDVs by reducing manufacturing, capital, and infrastructure installation costs This could include tax credits or rebates for vehicle purchases, leveraging federal incentives for clean hydrogen production, and incentivizing networked MHDV charging. To support hydrogen fuel adoption, Pennsylvania will plan, construct, and establish management for hydrogen infrastructure and supply. Hydrogen supply, ideally of the cleanest and lowest emissions variety, must be readily available across refueling stations for effective deployment of hydrogen fuel cell electric vehicles (FCEVs) and resulting emissions reduction.

Actions under this measure will prioritize funding, policies, and programs that support the deployment of electric light-duty vehicles, battery electric, hydrogen fuel cell, and plug-in hybrid electric MHDVs and their associated charging and fueling infrastructure. Deploying electric and alternative fuel vehicles can take many forms including:

- Supporting purchase of new electric and alternative fuel vehicles and associated charging and fueling infrastructure.
- Using clean energy financing tools to purchase new electric and alternative fuel vehicles and their associated charging and fueling infrastructure.
- Encouraging and providing incentives to purchase new electric and alternative fuel vehicles and their associated charging and fueling infrastructure.
- Revising or supporting local governments to revise permitting, zoning and other reforms to purchase new electric and alternative fuel vehicles and their associated charging and fueling infrastructure.
- Conducting comprehensive planning efforts to purchase new electric and alternative fuel vehicles and their associated charging and fueling infrastructure.

Quantified GHG Reductions ($MMTCO_2e$)

- Sector: Transportation
- Emissions Reductions by 2030: 19.6 $MMTCO_2e$
- Emissions Reductions by 2050: 616.1 $MMTCO_2e$

Summary of GHG reduction calculations approach

This measure models the resulting GHG emissions reduced if Pennsylvania meets the zero-emission vehicle (ZEV) sales targets outlined by California's Advanced Clean Cars II (ACCII) rule for light-duty vehicles (LDVs) and Advanced Clean Fleets (ACF) rule for medium and heavy-duty vehicles. The model uses outputs from the EPA Motor Vehicle Emissions Simulator (MOVES3) to project baseline vehicle miles traveled (VMT), vehicle population, energy consumption, and Scope 1 emissions for on-road transportation in the state by fuel type (gasoline, diesel, ethanol (E-85), and compressed natural gas), vehicle source type, and model year. Additional detail for the methodology of this measure can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

- **PA DEP and PennDOT**: Encourage and facilitate the transition to clean fuels.
- **Automakers**: Car manufacturers must be able to meet the demand for both light-duty EVs and MHDVs to fully utilize the increased commercial interest supported by increased grant funding.
- **Electric Utilities**: Supply and handle the charging load requisite for the large influx of EVs. Consider networked EV charging to reduce overall loads where possible.
- **Hydrogen Fueling Network Partners**: Build out the hydrogen fueling infrastructure within PA to allow for any significant transition to hydrogen vehicles.

Progress to Date and Future Activities and Milestones

Pennsylvania has completed a range of work to support electric and alternative vehicle adoption throughout the Commonwealth including:

- PennDOT's Electric Vehicle Mobility Plan and management of the National Electric Vehicle Infrastructure (NEVI) Formula Program for Pennsylvania
- Pennsylvania DEP's Electric Vehicle Roadmap
- Signing on to the joint MOU with 14 other states and the District of Columbia committing to the adoption of zero carbon MHDVs. The MOU committing to accelerating the adoption of zero carbon MHDVs has goals of 30% of MHDV sales being zero carbon by 2030, increasing to 100% by 2050.
- DEP's Alternative Fuel Vehicle (AFV) Rebate and Alternative Fuels Incentive Grant (AFIG) Program.

Actions that could be taken to support this measure include:

- Establishing fast public charging (L2/DC) for EVs, and ensuring that it is frequent, easy to locate, and easily accessible along highways. A reasonable availability goal is to have chargers ("charging corridors") every 50 miles, each less than five miles from the highway. Increased presence of public charging can help reduce range anxiety and increase perception of EV ownership as convenient and worry-free.
- Seeking out landowners, federal properties, and business owners who are close to highways that may be interested in hosting charging stations.
- Reducing capital costs through increased funding for the statewide rebate program or implementing a tax credit program complementing federal incentives for both EVs themselves and home chargers. Home chargers also include upfront costs for purchase, installation, and "make-ready," or the need to upgrade wiring and other technical specs of the vehicle; reducing such costs may ease deployment.
- Increasing public familiarity and knowledge of EVs, such as existing model varieties, charging station locations, and incentives and available rebates for both LDVs and MHDVs.
- Establishing statewide EV LDV sales goals, and publicly report on progress.
- Increase incentives for businesses, government entities, and other landowners to install public charging stations.
- Encouraging companies and agencies with vehicle fleets to apply for Heavy-Duty Emission Reduction Grants (via the IRA) to electrify their fleets and train workers.
- Collaborating with utilities to ensure the grid can handle loads from charging. Managed network charging could help reduce peak loading. Utilities can also consider electric distribution system planning, beneficial rate design and investment in "make-ready" charging infrastructure.
- Implementing Pennsylvania DEP's EV roadmap.
- Planning, constructing, and establishing management for Hydrogen infrastructure and supply, for effective deployment of Hydrogen FCEVs and resulting emissions reduction. Hydrogen supply and its various varieties (green, blue, pink, and more, each with their own emissions profiles) must be readily available across refueling stations.
- Conduct outreach and education, particularly to small and/or minority-owned businesses to communicate the available tax credits, rebates, and other financial incentives and opportunities related to fleet electrification.

Authority to Implement

The Pennsylvania Department of Transportation has the authority to issue recommendations for individuals and businesses to switch to zero carbon fuels. However, it will need to work in partnership with other agencies to leverage financial incentives to build charging infrastructure on state and federal land. For state or local jurisdictions, the purchase of vehicles for the fleet is within the authority of those entities. Purchasing or procurement policies may need to be adjusted to prioritize electric and AFVs. Private and personal purchasing of low and no emissions vehicles does not have any statutory limitations. Local zoning or code changes may need to be made for charging and fueling infrastructure. The state will be able to utilize the funds received from federal sources to support this measure.

Geographic Coverage

This measure is intended to reduce emissions across all of Pennsylvania.

Funding Sources

Examples of potential funding sources include, but are not limited to:

- IRA – Clean Vehicle Tax Credit
- IRA – Previously Owned Vehicle Tax Credit
- IRA – Clean Commercial Vehicle Tax Credit
- IRA – Alternative Fuel Vehicle Refueling Property Tax Credit
- Clean Heavy-Duty Vehicle Program
- FHWA – NEVI Formula Program
- FHWA – Charging and Fueling Infrastructure Grants
- EPA – Clean School Bus Program
- EPA Diesel Emissions Reduction Program
- EPA Clean Heavy-Duty Vehicle Program
- PA DEP – Alternative Fuels Incentive Grants and Rebates

LIDAC Benefits and Co-Benefits

As identified from Climate Action for Environmental Justice Communities[70] outreach, reducing air pollution from the transition from ICE to electric and alternative fuel vehicles, and particularly medium and heavy-duty vehicles, has the co-benefit of improving public health outcomes for individuals living or working in environmental justice areas and the community overall.

Incentives that reduce the gap in purchasing price between ICE compared to electric and alternative fuel vehicles, as well as electric micro-mobility options with lower costs/barriers to entry (e.g., electric bikes) will lead to reductions in ongoing fuel and operations and maintenance costs for EVs. This has an outsized impact in communities impacted by environmental justice issues as those costs are a more significant part of total expenses, increasing the impact of the EV transition in low-wealth areas. At the same time, care must be taken to ensure that EV infrastructure does not displace important resources or supersede the needs of the community where it is installed.

The EV transition, along with the installation of infrastructure to support it will also support the expansion of the clean energy workforce. In accordance with the Justice40 priorities, steps will be taken to ensure that these benefits are seen in LIDACs.

In addition, smaller businesses, including family and minority-owned businesses, may face greater strains in electrifying their fleets. Smaller vehicle fleets may purchase MHD EVs from secondary markets, excluding them from incentives for the purchases of new vehicles. Smaller businesses transitioning to clean fleets may also be more strained for workforce development and personnel training on EV operation and maintenance, so it is important that state-wide incentives,

[70] Climate Action for Environmental Justice Communities (pa.gov)

rebates, or grant funding addresses the transition process after purchasing. Municipalities or PennDOT may also consider offering technical assistance to smaller fleets.

Metrics

Potential metrics to track progress for this measure include:

- Number of EVs and alternative fuel vehicles registered and/or purchased.
- VMT by vehicle type and fuel.
- Number of publicly accessible charging stations (tracking total, Level 2, and DC fast chargers).
- Charging station uptime hours.
- Number of maintenance and repair workers trained.

4.5.9 Public and Active Transportation

GHG Measure Description

This strategy aims to reduce emissions from the transportation sector by reducing VMT for passenger vehicles in Pennsylvania. It aims to provide other robust modes of transportation that are not only used alongside passenger vehicles, but ultimately become the default option instead of passenger vehicles.

There is no "one-size-fits-all" solution to reduce VMT. Modes of transportation other than personal vehicles are highly dependent on population density, local topography, existing infrastructure, demographics, and even weather. As such, solutions must be tailored at the local level to meet the specific needs of each community. Paired with land-use and development policies, efforts to incentivize sustainable transportation modes (e.g., walking, biking, transit) in urban areas, to expand multimodal options outside urban areas (e.g., bus rapid transit, carpool), and to optimize when travel does occur (e.g., through telecommuting, trip consolidation) will reduce VMT.

Pennsylvania can take advantage of BIL grant programs, like the Congestions Mitigation and Air Quality Improvement Program or the Transportation Alternatives Set-Aside from the Surface Transportation Block Grant Program, which provide funding for a variety of projects from public transit charging equipment to shared micro-mobility (e.g., bike sharing) to constructing bike and pedestrian infrastructure.

Actions under this measure will prioritize funding, policies, and programs that support public and active transportation throughout the Commonwealth. Supporting public and active transportation can take many forms including:

- Supporting the development of new facilities, infrastructure, vehicles and associated supporting work for public and active transportation.
- Using clean energy financing tools to support the development of new facilities, infrastructure, vehicles and associated supporting work for public and active transportation.
- Encouraging and providing incentives to support the development of new facilities, infrastructure, vehicles and associated supporting work for public and active transportation.
- Revising or supporting local governments to revise permitting, zoning and other reforms to support the development of new facilities, infrastructure, vehicles and associated supporting work for public and active transportation.
- Conducting comprehensive planning efforts to support the development of new facilities, infrastructure, vehicles and associated supporting work for public and active transportation.

Quantified GHG Reductions ($MMTCO_2e$)

- Inventory Sector: Transportation
- Cumulative Reductions from 2025-2030: 7.5 $MMTCO_2e$
- Cumulative Reductions from 2025-2050: 45.3 $MMTCO_2e$

Summary of GHG reduction calculations approach

This measure models the resulting GHG emissions reductions if Pennsylvania implements a variety of strategies to reduce VMT. These strategies included land use changes, transit fare reductions, travel demand strategies, transit enhancements, and bicycle/pedestrian/micro-mobility enhancements. VMT reduction impacts are assumed to be only applicable to urban areas since the impacts of VMT policies and strategies is expected to be minimal in rural areas. More detail on the methodology for this measure can be found in Appendix B. Quantified GHG Reductions Methodology.

Key Implementing Agency(ies) and Partners

- **Regional and Local Transportation Agencies:** Agencies such as PennDOT can initiate and implement transit expansion, transit-oriented design, and multimodal transportation options.
- **Metropolitan and Rural Planning Organizations (MPOs and RPOs)**: MPOs and RPOs can evaluate regional transportation system performance, assess resources required for improvements, and liaise with PennDOT for intrastate projects.

- **Local governments.** Responsible for land use planning and comprehensive planning; transportation planning, development and operations, including local transit; program development and administration (e.g., travel demand management programs), and local policies.
- **Private sector partners.** Private sector partners, such as land-owners, developers, and businesses play a key role in development decisions and design that affect the viability of using alternatives to driving. Businesses can also implement telecommuting policies and other policies that help manage travel demand.

Progress to Date and Future Activities and Milestones

Pennsylvania has many existing resources, programs, and planning to shift public use of ICEVs to public transit and active transportation methods. For example:

- PennDOT's Bicycle Routes Map identifies trails, paths, and roads to bike within the Commonwealth. The map is available on PennDOT's website for access.
- PennDOT's 2045 Long Range Transportation Plan (LRTP) aligns with this measure, with expressed priorities in safety, equity and accessibility, and climate resilience.

Future actions the state can take as part of this measure include:

- Increase the number and/or frequency of public transit stops.
- Increase the efficiency and reliability of public transit by ensuring that buses and trains arrive on time. For accountability, easy reporting of issues, and consumer trust, establish a PennDOT-wide transit app for users to find nearest routes and timetables.
- Designate bus lanes in high-traffic areas or during high-traffic times of day, so that bus travelers may avoid traffic congestion.
- Improve and/or establish protected bike lanes where possible, to ensure that biking remains safe, easy, and unintimidating. Improve signage and traffic lights to keep bicyclists safe.
- Subsidize bikeshares, especially electric bikeshare programs, which are already well-established in urban areas of the state.
- Improve the safety and desirability of micromobility via adequate, smooth, and regularly maintained sidewalk space for pedestrians, and protected bike lanes where possible.
- Improve safety, cleanliness, and security for public transportation, including transit stops, platforms, and trains or buses themselves.
- Communicate and promote each of these implementation strategies. Conduct outreach, education, and community involvement so that transit expansion is tailored to the needs and interests of communities.

Authority to Implement

The Conservation and Natural Resources Act of Jun 28, 1995, P.L. 89, No. 18 (1995 Act 18, Section 504) and the APCA or 35 P.S. §4001-4015 grants the authority to the DEP to establish programs related to the control, prevention, abatement and reduction of air pollution and air contamination, which would include new clean energy financing, incentive, or other associated programs. Regional and local transportation agencies like PennDOT have the authority to implement this measure through policies and programming within their respective jurisdictions.

Geographic Coverage

This measure is applicable to the entire state of Pennsylvania.

Funding Sources

- Federal Transit Administration (FTA) Urbanized Area Formula Program
- FTA Bus and Bus Facility Grants
- FTA Capital Investment Grants
- FTA Low or No Emission Grant Program
- Federal Highway Administration (FHWA) Carbon Reduction Program
- FHWA Congestion Mitigation and Air Quality Improvements (CMAQ) Program

- FHWA Surface Transportation Block Grant (STBG) Program
- FHWA Active Transportation Infrastructure Investment Program (ATIIP)
- EPA Clean Heavy-Duty Vehicle Program
- Department of Transportation (DOT) Reconnecting Communities and Neighborhoods Grant Program
- National Park Service (NPS) Rivers, Trails, and Conservation Assistance program (RTCA)
- PA DEP – Alternative Fuels Incentive Grants and Rebates

LIDAC Benefits and Co-Benefits

Investment in public transit and transit options often directly benefits people living or working in environmental justice areas, who are statistically more likely to use transit or to work jobs that have rigid schedules and are more affected by peak hour congestion. Such investments were identified as areas of interest for people living in environmental justice areas, during outreach conducted by the CAEJC program. LIDAC communities and individuals may be neglected by public transit systems with high costs to ride, or distance from work or residential centers. Increasing public transit opportunities should address these existing barriers and improve the physical accessibility and affordability of transit. Safety of multimodal areas should also be considered. Equitable transit-oriented design should consider locating public housing or otherwise affordable housing near transit hubs.

Efforts to reduce VMT through transit and active transportation investment will result in more mobility options for those who are unable to own or operate a vehicle. Additionally, it will reduce the criteria air pollutants that result from gasoline and diesel combustion, which will improve air quality and reduce the burden of health issues associated with these air pollutants. This will be especially true for communities near highways or major roadways that are disproportionately impacted by vehicle air pollution.

In addition, reducing VMT reduces congestion and ultimately leads to a safer and more pleasant experience for all who use the road. Shifting to active transportation modes like biking and walking will also have a positive impact on public health by increasing exercise. When paired with nature-based land management solutions, utilizing active transportation modes can improve wellness through access to nature and cleaner air. Expanded public transportation options can also result in better social cohesion and community access to resources and services.

Metrics

Potential metrics to track progress for this measure include:

- Transit ridership
- Frequency and number of public transit stops
- Miles of expanded pedestrian and bicycle trails
- Creation or expansion of an e-bike program

5 Moving Forward

5.1 CPRG Implementation Grants

DEP, other executive branch-level agencies, offices, and departments in Pennsylvania are eligible to participate in the general competition for CPRG implementation grants, competing against other similar entities for up to $4.3 billion in funding through individual grants ranging from $2 million to $500 million each.[71] Implementation grant applications are due April 1, 2024, with awards anticipated by the end of 2024. Pennsylvania submitted a Notice of Intent to Apply to EPA on January 19, 2024, and intends to apply to fund a statewide Industrial Decarbonization Incentive Program. For more information about the implementation grant applications and competition see: https://www.epa.gov/inflation-reduction-act/about-cprg-implementation-grants.

5.2 Other CPRG Planning Grant Deliverables

As the lead organization for CPRG planning deliverables, along with this PCAP DEP is responsible for developing a CCAP, which will serve as a comprehensive update to this PCAP, and a Status Report on CCAP progress. Through the CCAP process, DEP will continue to meaningfully engage with interested parties, including other state agencies, industry, community organizations, local governments, the public and more.

Per the CPRG guidance, the CCAP will include the following:

- An updated GHG inventory for the Commonwealth
- BAU GHG emissions projections and an economy-wide GHG emissions reduction scenario
- GHG reduction targets for Pennsylvania (short- and long-term)
- A comprehensive list of GHG reduction measures that address economy-wide emissions. Building on the PCAP, this will include the following for each measure:
    - Quantified estimates of GHG reduction and costs
    - Key implementing agency or agencies
    - Implementation schedule and milestones
    - Expected geographic location if applicable
    - Quantified estimates of co-pollutant reductions (e.g., $PM_{2.5}$, NO_x, SO2, VOCs, air toxics)
    - A more robust or quantified analysis of benefits for LIDACs
    - A review of the statutory or regulatory authority to implement the measure (and a schedule and milestones for key entities to obtain it if not existing).
    - Identification of funding sources that have been secured for implementation.
    - Metrics for tracking progress.
- A workforce planning analysis

In 2027 DEP will develop and share a CPRG Status Report that will include:

- The implementation status of the quantified GHG reduction measures from the CCAP.
- Relevant updated analyses or projections supporting CCAP implementation.
- Next steps and future budget or staffing needs to continue CCAP implementation.

B. Quantified GHG Reductions Methodology

The following is a summary of methods used for calculating emissions reductions in the Pennsylvania PCAP. In developing these values, modelers sought to determine reasonable GHG emissions reductions from the deployment of specific measures. In some cases, there may be areas of overlap between emissions reduction values between measures. For example, modelers used electricity emissions factors associated with a progressively cleaner grid to determine emissions reduction potential for a range of measures (such as efficiency and electrification). This might result in double counting when comparing it to the Net Zero Electricity Grid measure, which also accounts for emissions reductions from cleaner electricity. Any conflicts and double counting between measures will be resolved in the modeling for the CCAP phase of this plan.

Industrial Electrification, Efficiency, and Process Emissions

This measure models the resulting GHG emission reductions from thermal efficiency gains and is applied to stationary combustion emissions from direct emitters in the industrial sector, fuel switching and electrification of industrial facilities, and process emissions reductions.

Thermal Efficiency Improvements

To estimate the emissions reductions that could be achieved through the adoptions of more efficient thermal processes in industrial applications, total emissions from stationary industrial sources are quantified by industry type. Using the latest DOE resource for industry sector decarbonization, efficiency potentials were identified for each industry type using thermal efficiency potentials when available and combined (thermal and electric) potentials otherwise. Summing up the products of the efficiency potentials and the stationary combustion emissions yielded a total thermal efficiency potential of 22.3%. Assuming this thermal efficiency potential is achieved through linear, incremental growth from 2020 to 2050, emissions reductions were calculated against the BAU energy use case, which had no assumed efficiency gains.

Data used was from EPA Flight Facility-level GHG Emissions Data, Greenhouse Gas Reporting Program[72] and the DOE Industrial Decarbonization Roadmap.[73]

Industrial Electrification and Fuel Switching

Two different calculations were made to estimate emission reduction that could be achieved from fuel switching (oil to gas) and through the electrification of gas industrial processes. An assumption that 80% of fuel oil application could transition to gas and 22.5% of gas uses could be electrified (from DOE's Industrial Decarbonization Roadmap[74]) was implemented through 2050, along with assumptions on existing and new equipment. Assumptions of change were made against a BAU projection of industrial energy use. It was assumed that existing fuel oil boilers would have an average efficiency between 80-85% between 2022 and 2050 and new gas boilers would have an average efficiency between 85-90% over the same time period. For electrification of industrial processes, it was assumed that components of industrial would have an efficiency change in efficiency to commercial buildings use and a factor of 18% was used in alignment with ACEEE's Commercial Electrification Study[75]. A straight-line implementation curve was assumed to transition from fuel oil to gas and gas to electricity, which resulted in approximately 3% of fuel oil use changing to gas every year and 0.8% of gas use changing to electricity. Emissions factors for fuel oil, gas and electricity were applied to determine the emissions reductions.

Process Emissions Reductions

Industrial process and industrial fugitive emissions reductions were estimated using the Energy Policy Simulator (EPS) for Pennsylvania, a model maintained by Energy Innovation and RMI. Strategies estimated using the EPS include methane destruction and capture, fluorinated gas equipment retrofits, cement clinker substitution, N2O abatement, and material efficiency. The rate of implementation of these strategies is commensurate with meeting 2030 and 2050 targets, and technological readiness.

The Energy Policy Simulator (EPS) is a free-to-use, publicly available, open-source model for estimating the environmental, economic, and human health impacts of climate and energy policies.

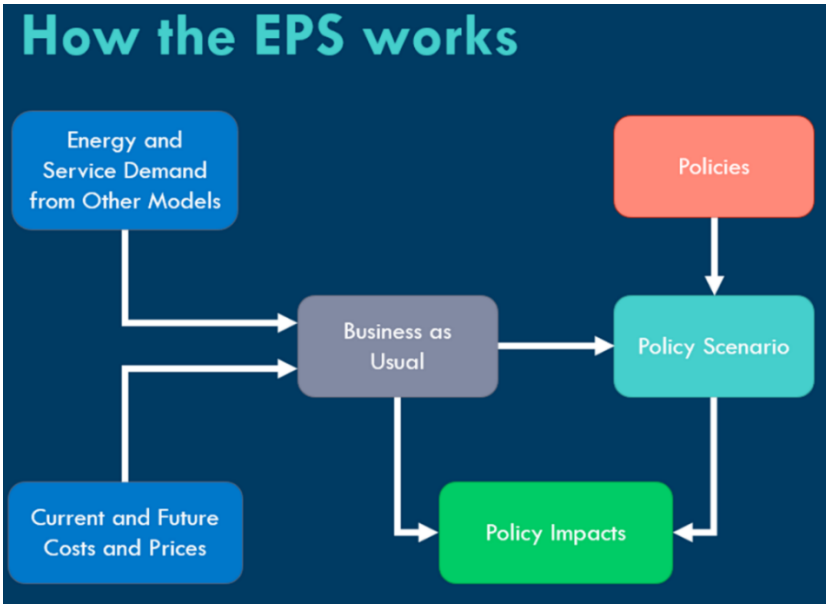
RMI and Energy Innovation have developed state-level EPS models for all lower 48 states. The models use official data from the EPA, DOE, NREL, and other federal and state sources.

Sector	Subsectors	Source
Electricity	In-state capacity and generation; out of state imports	Energy Information Administration (EIA) State Electricity Data
Building Energy Use	All energy use, all building components, residential and commercial buildings	EIA's State Energy Data Systems from 2020 NREL 2017 Electrification Futures Study - Reference Scenario
Industrial Energy Use	All fuel use for industrial sector	EIA's Annual Energy Outlook tables on Industrial Energy Use EIA's State Energy Data Systems
Industrial Process Emissions	Agriculture and industrial process emissions	EPA's US State-level Non-CO2 GHG Mitigation Report
Land Use	Natural carbon sinks and sources (LULUCF)	EPA's State GHG Emissions and Removals 2020 Inventory Report
Transportation	All energy use, vehicle miles	EIA's State Energy Data Systems from 2020 EIA's Annual Energy Outlook tables on Industrial Energy Use NREL Electrification Futures Study - Reference Scenario

The EPS allows the user to control a large variety of policies that affect energy use and emissions in every major sector of the economy including transportation, electricity, buildings, industry, agriculture, and land use. It also includes various smaller components, such as hydrogen supply, district heat, waste management, and geoengineering. The model reports outputs at annual intervals and provides outputs such as GHG emissions, energy usage, cash flow, and others.

The EPS works by drawing upon outputs from other energy and service models, plus current and future costs and prices, to form a BAU scenario. That scenario is then acted upon by policy strategies set by the user to become a policy scenario. The EPS then calculates policy impacts from both the BAU and Policy Scenario.[76]

[76] Detailed documentation of the EPS is available can be found on Energy Innovation's website.



For the Pennsylvania PCAP, the EPS was only used for estimating certain industrial and waste sector emissions and energy usage. 12 strategies within the EPS were utilized:

EPS Subsector	EPS Strategy	Implementation Amount and Timeline
Water and Waste*	Methane Destruction	100%, beginning in 2025 and reaching 100% in 2030
Water and Waste*	Methane Capture	100%, beginning in 2025 and reaching 100% in 2030
Other Metals	F-Gas Eqpt. Maintenance & Retrofits	100%, beginning in 2025 and reaching 100% in 2050
Chemicals	F-Gas Eqpt. Maintenance & Retrofits	100%, beginning in 2025 and reaching 100% in 2050
Coal Mining*	Methane Destruction	100%, beginning in 2025 and reaching 100% in 2030
Coal Mining*	Methane Capture	100%, beginning in 2025 and reaching 100% in 2030
[Applied to entire industry sector]	F-Gas Substitution	100%, beginning in 2025 and reaching 100% in 2050
Energy Pipelines and Gas Processing*	Methane Destruction	100%, beginning in 2025 and reaching 100% in 2030
Cement and Other Nonmetallic Minerals	Cement Clinker Substitution	100%, beginning in 2025 and reaching 100% in 2050
Cement and Other Nonmetallic Minerals	Material Efficiency, Longevity, & Re-Use	10% demand reduction, beginning in 2025 and ramping to 2050
Iron and Steel	Material Efficiency, Longevity, & Re-Use	15% demand reduction, beginning in 2025 and ramping to 2050
Chemicals	N2O Abatement	100%, beginning in 2025 and reaching 100% in 2050
*** Included in fugitive emissions quantification**		

The implementation amount and timeline were based set commensurate with meeting 2030 and 2050 targets, and technological readiness. Although the level of implementation of a strategy may reach 100% that does not mean that source of emissions has reached zero. For example, there is a technical limitation to how much substitute material can be used in cement clinker.

Outputs from the EPS were post-processed to be in alignment with estimates from ICF modeling.

Low Carbon Fuels

Hydrogen Fuels

This measure modeled the approximate emissions reductions of switching from natural gas fuel to hydrogen fuel in the built environment, transportation, and power generation sectors. Projected hydrogen use in transportation was calculated for each model year, using outputs of EPA Motor Vehicle Emissions Simulator (MOVES3), taking the fraction of VMT outputted by the model that was designated as fuel type "electricity" or "hydrogen" based on the sales curve. The resulting energy consumption was found using the following equation:

$$Energy\ Consumption = VMT\ \times Energy\ Efficiency,$$

where energy efficiency was in units of kJ/mi for battery EVs (BEVs) and FCEVs. FCEV energy efficiencies were sourced from the California ACF rule making and the Alternative Fuels Data Center.

For projecting hydrogen consumption for the building sector ICF used proprietary market modeling of projected hydrogen market growth in the United States. Hydrogen consumption was assumed to replace an increasing proportion of natural gas demand. These assumptions are summarized in the table below.

	2030	2040	2050
% of Natural Gas Demand Replaced by Hydrogen Consumption	1%	7%	19%

Hydrogen consumption for the power sector was generated by IPM (see Net-Zero Electricity Grid measure for details on IPM and power sector modeling).

Total hydrogen consumption was then divided into assumed percentages of blue, green, and pink hydrogen based upon assumed changes in the Pennsylvania energy generation mix. Based upon currently available IRS guidance on 45V tax credit application, pink hydrogen was assumed to be generated only from new steam methane reformer construction. Percentages of blue hydrogen were assumed to be higher in initial years with green and pink percentages increasing over time.

To model GHG emissions reductions in the measure, for each model year emissions from hydrogen consumption were first calculated based on the identified consumption per hydrogen color, using the following emissions factors:

	MTCO2e per BBTU
Blue Hydrogen Carbon Intensity	8.16
Green/Pink Hydrogen Carbon Intensity	0.00

Reductions were then determined based on subtracting the hydrogen production emissions from the assumed natural gas emissions based on baseline usage in the BAU.

Ten percent of the natural gas used in blue hydrogen production was assumed to be from biomethane.

Biomethane

This measure modeled the approximate emissions reductions of switching from natural gas fuel to biomethane in the built environment, transportation, and power generation sectors. It was based on an evaluation for the American Gas Foundation (AGF)[77] in 2019 found various feedstock options for considering biogas and renewable gas in the Mid-Atlantic region and allocated a proportional amount of gas us in Pennsylvania. The modeling team assumed a high availability of biomethane from anaerobic digestion feedstock and a low amount of thermal gasification feedstocks through 2050 in

[77] Renewable Sources of Natural Gas: Supply and Emissions Reduction Assessment, AGF, 2019. https://gasfoundation.org/wp-content/uploads/2019/12/AGF-2019-RNG-Study-Full-Report-FINAL-12-18-19.pdf

alignment with AGF's study and compared Mid-Atlantic regional feedstocks to 2021 Annual Energy Outlook (AEO) Reference Case gas use for all sectors through 2050.

It was assumed that the available renewable natural gas (RNG) supply will be injected into the pipeline to decarbonize the gas supply in Pennsylvania. For emissions accounting purposes, RNG is assumed to be carbon neutral.

On-Site Renewable Energy

Emissions reductions from renewable energy were projected through the forecasted adoption of rooftop solar systems in Pennsylvania. The total technical potential for rooftop solar was aggregated from Project Sunroof's estimates of the technical potential in each of the counties and cities in Pennsylvania.[78] To determine an adoption rate, the most aggressive 2050 adoption scenario from NREL's Storage Futures Study was applied to the total technical potential.[79] Existing rooftop solar capacity assumptions for Pennsylvania were sourced from PJM's 2023 Load Forecast for all utilities within Pennsylvania and then grown to meet the assumed 2050 level.

To calculate the kWh of solar output, the analysis used the capacity factor for residential solar from NREL's annual technology baseline corresponding to the geography of Pennsylvania. The incremental growth in solar output from current levels, multiplied by grid emissions factors, resulted in the potential avoided emissions from rooftop solar.

Assumptions

- Constant technical potential per building over time
- Constant ratio of commercial to residential rooftop solar capacity
- No incremental rooftop photovoltaic (PV) installation beyond existing in BAU case
- Linear growth of PV installations between 2023 and 2050 in Policy Case
- BAU emissions factors (2020 eGRID held flat)
- PCAP Policy emission factors (2020 eGRID grown based on 2023 AEO Reference Case)

Carbon Capture Utilization and Storage

CCUS technology is assumed to be available to some facilities in the industrial and power sectors by 2030, ramping up in deployment and availability by 2050.

Industrial sector potential modeling is based on EPA Flight Emissions data and excludes facilities with annual stationary combustion emissions less than 100,000 MT per year. After removing smaller facilities, roughly 85% of stationary combustion emissions are modeled to remain available for the emission reduction potential of CCUS. A trajectory was developed using industry expectations and expert opinion to model CCUS deployment as a percent of total CCUS potential as follows: 1% in 2030, 10% in 2035, 40% in 2040, 60% in 2045, and 80% in 2050. Assuming a capture rate of 87.5%, consistent with assumptions from the Congressional Budget Office in 2023, emissions reductions in the policy case are calculated against a BAU projection of industrial emissions that models no implementation of CCUS and holds industry emissions flat through 2050. Data used was from EPA Flight Facility-level GHG Emissions Data, Greenhouse Gas Reporting

[78] Google. "Project Sunroof". Accessed Feb 13, 2024. https://sunroof.withgoogle.com/
[79] NREL. "Storage Futures Study." https://www.nrel.gov/analysis/storage-futures.html

Program[80] the DOE Industrial Decarbonization Roadmap[81], and the Congressional Budget Office Carbon Capture and Storage in the United States.[82]

For the power sector, the Net Zero Grid measure includes the use of carbon capture technology on some natural gas-fired generators where cost-effective to help the state achieve a net zero carbon supply of electricity while maintaining grid reliability. The cost-effectiveness of the technology in the power sector modeling is largely driven by the available federal tax credit.

Fugitive Emissions Reduction

The aim of this measure is to reduce emissions from oil and gas production. It is known that roughly 50% of emissions of oil and gas production process comes from the production process rather than midstream/downstream processing. Around 10% of the wells are considered to be the highest emitters, monitoring and repairing these wells can reduce overall oil and gas production emissions by 80%[83]. This strategy models the emission reduction from repairing all of these high emitter wells. A ramp up speed of 10-year is assumed.

Fugitive emissions are also expected to be reduced through the plugging of all the marginal and abandoned wells. These wells have an estimated emission rate of one kilogram of methane gas per hour[8485]. Modeling assumed that 25% of the abandoned wells will be plugged by 2050 and action to plug the wells will begin in 2030.

Additional fugitive emissions related to the industrial sector (including methane capture and destruction from waste, water, and coal sectors) were modeled using the EPS, the methodology of which is described in the methodology section for industrial electrification, efficiency, and process emissions (found above).

Net Zero Electricity Grid

This measure models the resulting GHG emissions reductions from achievement of a 100% net zero electric grid for the state by 2050. The IPM was used to model changes in the electric generating mix over time in Pennsylvania in line with clean grid goal. IPM is the same model used by EPA to analyze the projected impact of environmental policies on the electric power sector. Detailed documentation of the model is available here.

The grid emissions factor used was the output of electric power sector modeling conducted using IPM. IPM is a multi-regional, dynamic, and deterministic linear programming model of the North American electric power sector. The model provides forecasts of least cost capacity expansion, electricity dispatch, and emission control strategies, while meeting energy demand, environmental, transmission, dispatch, and reliability constraints.

Key assumptions for Pennsylvania include:

- Load: 2023 PJM load forecast
- Cost: 2023 NREL ATB capital cost and performance assumptions for new clean energy resources, with the additional inclusion of IRA tax credits for existing nuclear resources as well as new clean energy resources.
- Policy: Assumed to meet a net zero power sector for the state of Pennsylvania. Pennsylvania is assumed to be a participant in the Regional Greenhouse Gas Initiative (RGGI)[86].

[86] Pennsylvania's participation in and implementation of RGGI is on hold pending active litigation.

Emissions from the clean grid policy scenario were compared to a BAU scenario to determine emission reductions. The BAU scenario modeled the same assumptions except that the net zero grid goal for 2050 was not included.

Applicable Emission Factors

GHGs

The CO_2 emissions factors from IPM were combined with CH_4 and N_2O eGRID emission factor data from the RFCE region to estimate a CO_2 emission factor for the state.

Building Electrification and Efficiency

Methods, Data, and Key Assumptions

This measure calculated emissions reductions from electrification and energy efficiency in the building sector. Building energy use and building emission projections are based on energy consumption from electricity, natural gas, fuel oil, and propane in existing residential (single-family, multifamily, and mobile homes) and commercial buildings (office, food service, school, hotel, healthcare, retail, and warehouse). The base year and projections for energy consumption in existing buildings are built from the 2022 AEO, which represented projected energy user prior to the passage of the IRA, from the US EIA. AEO data is scaled to cover Pennsylvania by scaling AEO census level data with the ResStock and ComStock building models of North American building stock with county-level resolution. The tool first calibrates ComStock and ResStock energy consumption to AEO energy consumption on a census division level. It then proportionally adjusts county-level energy consumption to the scaled census division level. Energy use values have been integrated with emissions factors for primary fuels (electricity, gas, propane and fuel oil) to provide total emissions. Results are provided every five years from 2020 to 2050 and interpolated for years in between.

For Pennsylvania, modeling assumed an accelerated electrification scenarios for HVAC as well as Water Heating and Cooking, and a High scenario for building envelope implementation in alignment with sources outlined below.

Calculating Energy Change

CO_2Sight utilizes ICF's DER Planner model for modeling existing buildings. DER Planner is a bottom-up model that is built upon the best practice principles for potential modeling outlined by the National Action Plan for Energy Efficiency in their Guide for Conducting Energy Efficiency Potential Studies.[87] The model can be used to calculate technical, economic, and achievable potential estimates. Together, the CO_2Sight platform and DER Planner estimate energy and emissions changes from a range of decarbonization strategies, including electrification retrofits and energy efficiency.

Building characteristics and energy use data for modeling buildings are derived from ResStock[88] and ComStock[89] datasets provided by NREL. These datasets integrate large public and private data sources statistical sampling, detailed sub-hourly building simulations, and high-performance computing. By synthesizing multiple sources into a single resource, these data allow for a granular understanding of the housing and commercial stock and the impacts of building technologies in different communities and businesses. These data are comprehensive and widely used across similar analyses and modeling efforts, and thus allow for development of comparable results. The ResStock and ComStock energy use data are calibrated to match the EIA's AEO dataset.

Distributed Energy Resource Planner Model is ICF's leading edge potential study model built on more than a decade's worth of ICF's experience performing potential studies. It offers a simple Excel-based front end and employs an open-source R script plug-in for all computationally intensive calculations.

DER Planner, informed by stock CO_2Sight measures data, has the capabilities to model various energy efficiency, electrification, and building envelope measures in selected building types. This tool allows the analysis of over

[87] National Action Plan for Energy Efficiency (2007). *Guideline for Conducting Energy Efficiency Potential Studies*. https://www.epa.gov/sites/production/files/2015-08/documents/potential_guide_0.pdf
[88] https://www.nrel.gov/buildings/resstock.html
[89] https://comstock.nrel.gov/

80 residential and commercial measures in selected regions applied to the Pennsylvania building characteristics. The model uses key inputs such as equipment stock, participation rate curves, and energy change per measure and estimates potential savings from applying efficient measures available for each building type and end-use. Given the efficient technologies available, this quantifies how much energy could be reduced. To compute total savings potential, the model runs all permutations combining savings per energy efficiency measure unit, expected measure penetration, and total number of measure units (or total eligible stock) by all adoption types (ROB and RET).[90]

By integrating DER-Planner and comprehensive datasets such as ResStock and ComStock, CO2Sight aggregates energy and emissions changes to estimate changes in energy use. ICF's program experience and available national data sources inform these measures' impacts on energy use.

Applicable Emission Factors

Electricity Emission Factors

CO_2Sight uses ICF's IPM tool to generate a trajectory of grid emissions factors associated with the electricity grid. Emissions factors for this measure were derived from the Net-Zero Electricity Grid measure.

Natural Gas and Propane Emission Factors

Values from EPA's Center for Corporate Climate Leadership GHG Emission Factors Hub were used for natural gas and propane reductions.[91]

Fuel	Emission Factors (kg CO2e/MMBTU)
Natural Gas	53.06
Propane	62.39

Measure Intensities and Participation Curves

As an input into DER Planner, each measure has participation (or technology adoption curves) connected to them. A range of factors can impact whether new electric or efficiency technologies are adopted. This approach builds from NREL's Electrification Future Study[92], from which many of the adoption curves are provided. It accounts for costs, supporting infrastructure, ownership and availability, health and sustainability (including policies) and other factors that could influence technology change. Adoption curves are also provided from the implementation energy efficiency programs and informed by ICF expertise. For ease of use, users can select prepopulated groupings of participation curves to match the types of energy change they want to model. The groupings are outlined below:

HVAC, Water Heating, and Cooking Pathways

- **Business-as-Usual:** Small amount of energy efficiency, no specific electrification strategy or fuel switching
- **Gas Efficiency:** Significant amount of energy efficiency, no electrification, specific emphasis on efficiency for gas equipment. Gas heat pumps in future years.
- **Beneficial Electrification:** Significant amount of energy efficiency, small amount of electrification for those projects that are presently cost-effective.
- **End of Life Electrification:** Significant amount of energy efficiency, large amount of electrification when equipment reaches the end of its useful life.

[90] Measures' adoption type definitions: **Replace on Burnout (ROB)** is Replace On Burnout and implies that the technology will be adopted when the previous technology needs to be replaced**. Retrofit (RET)** implies that the technology is adopted before the previous technology needs to be replaced.
[91] https://www.epa.gov/climateleadership/ghg-emission-factors-hub
[92] https://www.nrel.gov/analysis/electrification-futures.html

- **Accelerated Electrification:** Signification amount of energy efficiency, large amount of electrification prior to equipment reaching the end of its useful life.

Water Heating and Cooking Pathways

- **Business as Usual:** Small amount of energy efficiency, no specific electrification strategy or fuel switching.
- **Gas Efficiency:** Significant amount of energy efficiency, no electrification, specific emphasis on efficiency for gas equipment. Gas heat pumps in future years.
- **Beneficial Electrification:** Significant amount of energy efficiency, small amount of electrification for those projects that are presently cost-effective.
- **End of Life Electrification:** Significant amount of energy efficiency, large amount of electrification when equipment reaches the end of its useful life.
- **Accelerated Electrification:** Signification amount of energy efficiency, large amount of electrification prior to equipment reaching the end of its useful life.

Building Envelope Pathways

- **Business as Usual:** Small amount of energy efficiency on building envelope.
- **Low:** Moderate building envelope work, some deep energy retrofits.
- **High:** Significant building envelope work, Significant deep energy retrofits.

In addition to HVAC; Water Heating and Cooking Pathway selection is being chosen, there are opportunities to influence core energy efficiency work occurring in each pathway including:

- Full lighting retrofits and lighting controls
- Smart Thermostats and Building Automation Systems
- New energy efficient appliances
- New energy efficient HVAC equipment

Electric and Alternative Fuel Vehicles

This measure models the resulting GHG emissions reduced if Pennsylvania meets the ZEV sales targets outlined by California's Advanced Clean Cars II (ACCII) rule for LDVs and ACF rule for medium and heavy-duty vehicles. This results in the following range of ZEV sales fractions:

	2030	2040	2050
Light-Duty Vehicles (T3)	52%	100%	100%
Medium and Heavy Duty Vehicles (T4)	29%-74%	100%	100%
Transit Buses (T4)	100%	100%	100%

Sales curves by vehicle type within each category varied. The fractions shown in the above table represent total ZEV sales, and were further broken down by technology (e.g., BEV, FCEV, and plug-in-hybrid-electric vehicles (PHEV)) to sum to the total ZEV sales.

The model uses outputs from the EPA Motor Vehicle Emissions Simulator (MOVES3) to project baseline VMT, vehicle population, energy consumption, and Scope 1 emissions for on-road transportation in the state by fuel type (gasoline, diesel, ethanol (E-85), and compressed natural gas), vehicle source type, and model year. Default input values were used.

To model GHG emissions reductions in the policy scenario, for each model year, a fraction of VMT was designated as fuel type "electricity" or "hydrogen" based on the sales curve. The resulting energy consumption was found using the following equation:

$$Energy\ Consumption = VMT\ \times Energy\ Efficiency,$$

where energy efficiency was in units of kJ/mi for battery EVs (BEVs) and FCEVs. BEV energy efficiencies were sourced from the Alternative Fuel Life-Cycle Environmental and Economic Transportation tools and FCEV energy efficiencies were sourced from the California ACF rule making and the Alternative Fuels Data Center. Scope 1 emissions were found by reducing baseline

internal combustion engine vehicle (ICEV) emissions by the ZEV sales fraction. Scope 2 emissions were found using the following equation:

$$Scope\ 2\ Emissions = Electricity\ Consumption\ \times\ Electricity\ Emission\ Factor$$

Electricity emissions factor projections were sourced from the result of the net-zero electricity grid measure.

The following additional key assumptions were made throughout the analysis:

- ZEVs exist in the vehicle fleet for the same length of time as ICEVs.
- ZEV activity/use is identical to an ICEV.
- The annual ZEV sales fraction applies to every fuel type.

Public and Active Transportation

This measure models the resulting GHG emissions reductions if Pennsylvania implements a variety of strategies to reduce VMT. These strategies included land use changes, transit fare reductions, travel demand strategies, transit enhancements, and bicycle/pedestrian/micro-mobility enhancements.

This measure assessed three different mode shift and travel behavior scenarios, and the VMT reduction targets for Pennsylvania for this measure are based off the low VMT reduction scenario for that study. To extrapolate these results to account for rural areas in Pennsylvania, it was assumed that these VMT reductions are only applicable to urban areas since the impacts of VMT policy and strategies is expected to be minimal in rural areas.

According to FHWA Highway Statistics, in 2020, on average nationally 70% of Pennsylvania VMT was associated with urban travel, while rural travels accounted for the remaining 30%. The targets of 7% passenger VMT reduction from baseline by 2030 and 9% passenger VMT reduction from baseline by 2050, with linear growth in interim years starting in 2025, were derived using this proportion of urban versus rural VMT. The same baseline VMT, vehicle population, energy consumption, and emissions by fuel type and vehicle source type from EPA MOVES3 used for electric and alternative fuel vehicles was used for this measure.

Letter from the Mayor

Greetings Friends,

Climate change is one of the most pressing issues of our time. Every day we see new evidence that climate change is real and that it is hurting our residents—particularly people of color and poor and working-class residents. If left unaddressed, the hotter and wetter climate will multiply existing risks like poverty, poor health, and economic inequity. But Philadelphia has never backed away from a challenge. We know that taking transformative action to address climate change now will ensure that Philadelphians can thrive today and for generations to come.

When the Trump Administration decided to withdraw from the Paris Climate Agreement, we committed Philadelphia to staying the course. We committed to reducing our carbon pollution and moving towards 100 percent renewable energy. This year, I committed us to going even farther to achieve carbon neutrality by 2050—a goal we know we must meet to prevent the worst impacts of climate change.

The City has made great progress in reducing emissions within City government and beyond. We're increasing energy efficiency in buildings to save money and create jobs through initiatives like Commercial Property Assessed Clean Energy and the Building Energy Performance Policy. This policy is projected to create 500 jobs while cutting carbon emissions by 200,000 metric tons, the equivalent of taking 40,000 cars off the road. We're ramping up the use of clean energy in homes and businesses through Solarize Philly. At the City, we'll purchase 22 percent of our municipal electricity from a new 70-megawatt solar facility built right here in Pennsylvania. We continue to promote low- and no-carbon transportation options by installing and protecting high quality bike lanes, expanding our equitable Indego bike share program and re-envisioning our transit system. And we're addressing the harms created by generating waste by exploring new opportunities, such as an urban mining pilot and a Community Composting Network.

We know that even while we continue to reduce Philadelphia's carbon pollution, we must deepen efforts to protect our residents, communities and infrastructure from a hotter, wetter future. We know that not all residents benefit from a healthy, climate resilient environment. That's why, with City Council's leadership, we're launching the City's first Environmental Justice Advisory Commission. Working to "Beat the Heat" in Hunting Park, we're lifting up community-led ideas to help neighborhoods cool off. Our innovative Green City, Clean Waters program is using green infrastructure to manage stormwater runoff and localized flooding. But seeing the Eastwick community devastated by flooding yet again shows that we have much more work to do in protecting our city from natural disasters.

For these reasons, I'm proud to share with you Philadelphia's Climate Action Playbook, a comprehensive overview of all the projects, policies, and plans our City has put forward to achieve climate justice. The information here is not new, but by bringing these efforts together we aim to clearly show what our commitments are, which agencies are leading them, what the time frames are for completion, what the co-benefits are, and where there is room for improvement. We hope this playbook will be used by those who want to learn more about what the City is doing and how we are working to create a thriving, resilient and just Philadelphia today and in the future.

Sincerely,

James F. Kenney

Jim Kenney
MAYOR

Christine M Knapp

Christine Knapp
DIRECTOR

Introduction

In 2015, the world's nations came together in Paris to acknowledge the reality of climate change. People were already feeling the impact: hotter summers, increased precipitation, and stronger storms. 196 countries committed to reducing greenhouse gas (GHG) emissions to limit these impacts. These commitments are known as the Paris Climate Agreement (Paris Agreement).

The City of Philadelphia (the City) is committed to meeting the goals of the Paris Agreement. This document outlines actions the City is taking to meet these goals. It also outlines actions the City is taking to respond to the impacts that already have and will occur. Continuing to emit carbon as usual will have devastating impacts on our planet and our city. It will take commitment and collaboration from many stakeholders to meet our climate goals. But, together, we can work to build a more climate resilient Philadelphia.

What the Playbook IS:

The Philadelphia Climate Action Playbook (the Playbook) outlines the actions Philadelphia is taking to respond to climate change through 2050. It brings together actions from existing plans across City departments. This provides a more comprehensive view of how we are working to achieve our climate goals. **The Playbook also outlines how climate change will impact Philadelphia and where we need to go further to achieve our goals.**

The Playbook outlines climate actions in three areas:

1

Reducing our Contribution to Climate Change

Actions to reduce carbon pollution.*

2

Utilizing Nature as a Solution to Climate Pollution

Actions to remove carbon pollution from the atmosphere.

3

Adapting to a Changing Climate

Actions to prepare Philadelphia for a hotter, wetter future.

**These come from three main sources: Buildings and Industry, Transportation, and Waste.*

What the Playbook IS NOT:

The Playbook is NOT a new plan. The Playbook pulls together proposed actions from existing City plans. There are no new actions provided in the Playbook as of October 15th, 2020.

How the Playbook Should Be Used:

The Playbook is a one-stop resource for anyone interested in learning more about climate action in Philadelphia. It is a living document which will be updated as new plans and resources become available.

Philadelphia and Climate Change

PHILADELPHIA CONTEXTUAL SUMMARY

The City of Philadelphia is the urban center of the "Greater Philadelphia" region. This is a region made up of 12 counties across four states: Pennsylvania, New Jersey, Delaware, and Maryland as defined by the U.S. Census Bureau[1]. The city straddles two rivers, the Schuylkill River and the Delaware River. Philadelphia also benefits from Fairmount Park, which at roughly 9,200 acres, is the nation's largest urban park.

Philadelphia is in a humid continental climate zone. This means we experience four distinct seasons, including hot summers and cold winters. Historically, winters have an average temperature of 41.9°F, and summers have an average temperature of 84.5°F (for the years 1961 to 2000). Precipitation is consistent throughout the year, with the greatest amounts occurring during the spring and summer. For more information visit Useful Climate Science for Philadelphia.

Population Characteristics of Philadelphia, 2018[2]

	PHILADELPHIA	PENNSYLVANIA	UNITED STATES
POPULATION			
Total Population (estimates, July 1, 2019)	1,584,064	12,801,989	328,239,523
Population growth – April 1, 2010 to July 1, 2019	3.8%	0.8%	6.3%
Households, 2014-2018 (count)	594,778	5,025,132	119,730,128
CHARACTERISTICS			
Persons under 18 years	21.6%	20.6%	22.3%
Persons 65 years and over	14%	18.7%	16.5%
Female persons	52.7%	51%	50.8%
Foreign born persons, 2014-2018	13.9%	6.8%	13.5%
With a disability, under age 65 years, 2014-2018	12.4%	9.8%	8.6%
Persons without health insurance, under age 65 years	8.7%	6.7%	10%
RACE			
Black	43.6%	12%	13.4%
White	34.3%	75.5%	60.1%
Hispanic or Latino	15.2%	7.8%	18.5%
Asian	7.8%	3.8%	5.9%
American Indian and Alaska Native	0.9%	0.4%	1.3%
Native Hawaiian and Other Pacific Islander	0.2%	0.1%	0.2%

Population per square mile, 2010	11,379.50	283.9	87.4
Land area in square miles, 2010	134.1	44,742.70	3,531,905.43
Mean travel time to work, workers age 16 years+, 2014-2018 (minutes)	33.4	26.9	26.6

Disclaimer: The following statistics are not reflective of the impact of Covid-19, and may have changed.

POPULATION–Philadelphia reached a low of 1,488,710 residents in 2006. Philadelphia began to recover, and as of 2019 there were 1,584,064 residents. This trend of population growth is expected to continue to 1,696,133 residents by 2045. Philadelphia is racially and ethnically diverse–40 percent non-Hispanic Black, 34 percent non-Hispanic white, 15 percent Hispanic, and 7 percent Asian. Philadelphia remains fairly segregated with one race or ethnic group representing the majority in 84 percent of the city's 381 census tracts.

JOB GROWTH–Over the last three years, Philadelphia has outperformed the national average in job growth rate. The city had approximately 724,000 jobs in 2018, an increase from the 657,000 it had in 2010. However, this recent growth is not the norm for Philadelphia. Before 2016, Philadelphia was behind the national average, and its 10-year average for job growth lags behind as well.

POVERTY—Philadelphia has a high poverty rate – the second highest rate among the 20 largest U.S. cities. But, the poverty rate has begun to decline. According to the American Community Survey, in Philadelphia the poverty rate in 2019 was 23.3 percent. This is an improvement from 25.7 percent in 2016. The poverty rate for non-white Philadelphians is much higher than the rate for white Philadelphians. This disparity has been consistent since 2012.

LABOR FORCE AND UNEMPLOYMENT—The unemployment rate peaked in July 2012 at 12 percent as the recession took its toll. Today, that rate has been cut in half. The number of Philadelphians in the labor force has increased since 2010, rising from 668,000 to 707,000 in 2018[3].

HEALTH—Life expectancy varies by neighborhood in Philadelphia. Disparities of up to 20 years exist between neighborhoods which are just a mile apart. Areas with lowest health outcomes are those experiencing a multitude of factors, including high rates of asthma, obesity, cardiovascular disease, and substance abuse[4].

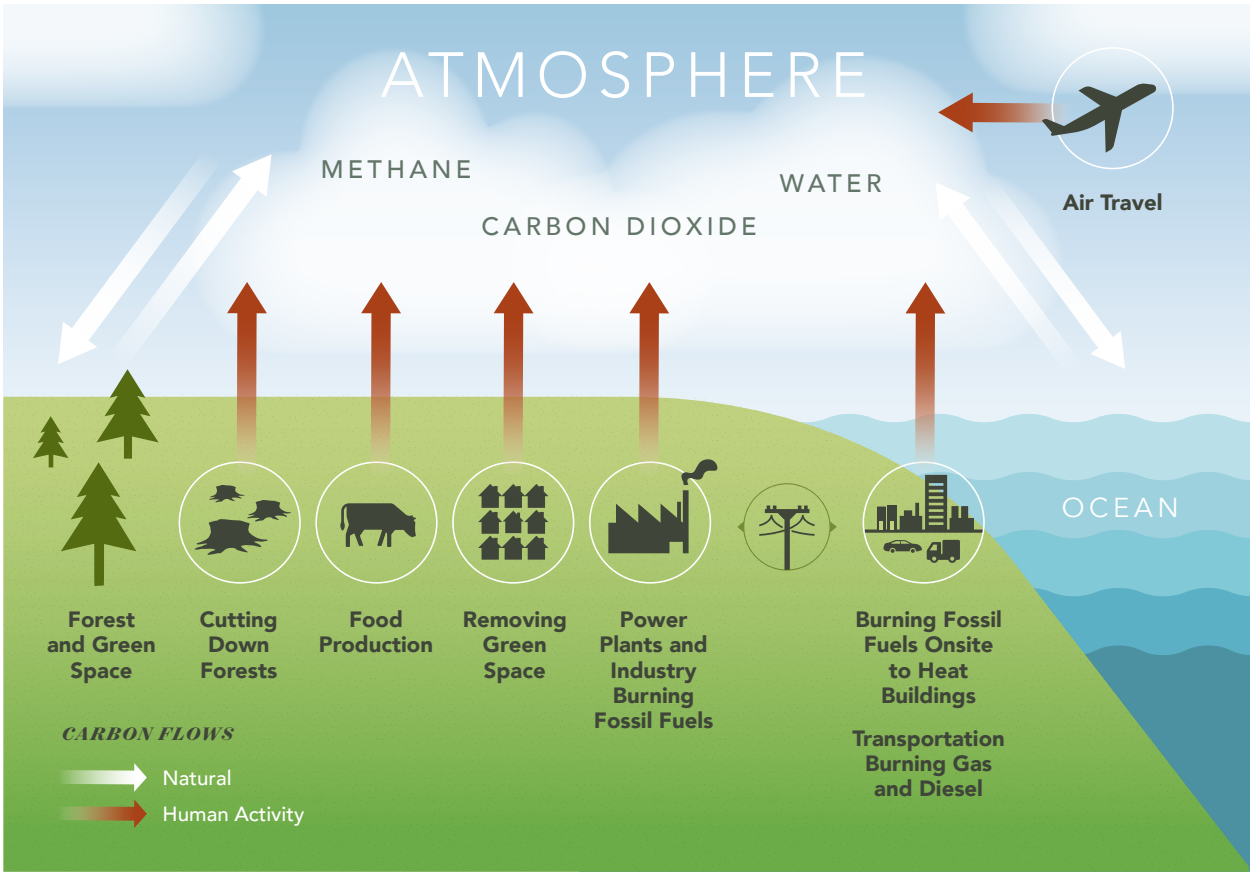
CLIMATE CHANGE IN PHILADELPHIA

What is Climate Change?

In the past, the natural carbon cycle kept our planet at a steady temperature. Since the Industrial Revolution, humans have changed this cycle by burning fossil fuels at a rapid rate. Fossil fuels include things like coal, oil, natural gas, and gasoline that we burn for energy and heat. Burning these fuels release gases such as carbon dioxide and methane. These gases and others are called greenhouse gases (GHGs) and trap heat in the atmosphere. The rise in GHGs has had major impacts including higher temperatures and more extreme weather patterns.

THE CAUSES OF CLIMATE CHANGE



Human activity in Philadelphia and worldwide have altered the natural carbon cycle while warming the planet.

WHAT PHILADELPHIANS THINK ABOUT CLIMATE CHANGE:

The Philadelphia Office of Sustainability (OOS) conducted a survey to understand how Philadelphians respond to climate change in their homes and communities.

Equity Impacts

In Philadelphia, environmental harms still threaten too many communities. Longstanding challenges of systemic racism have led to differences between neighborhoods. Pollution and industrial areas are most likely to be in Black, Brown and low-income neighborhoods. The same areas are less likely to have green land cover like parks and gardens. These differences contribute to inequality in health and wellbeing.

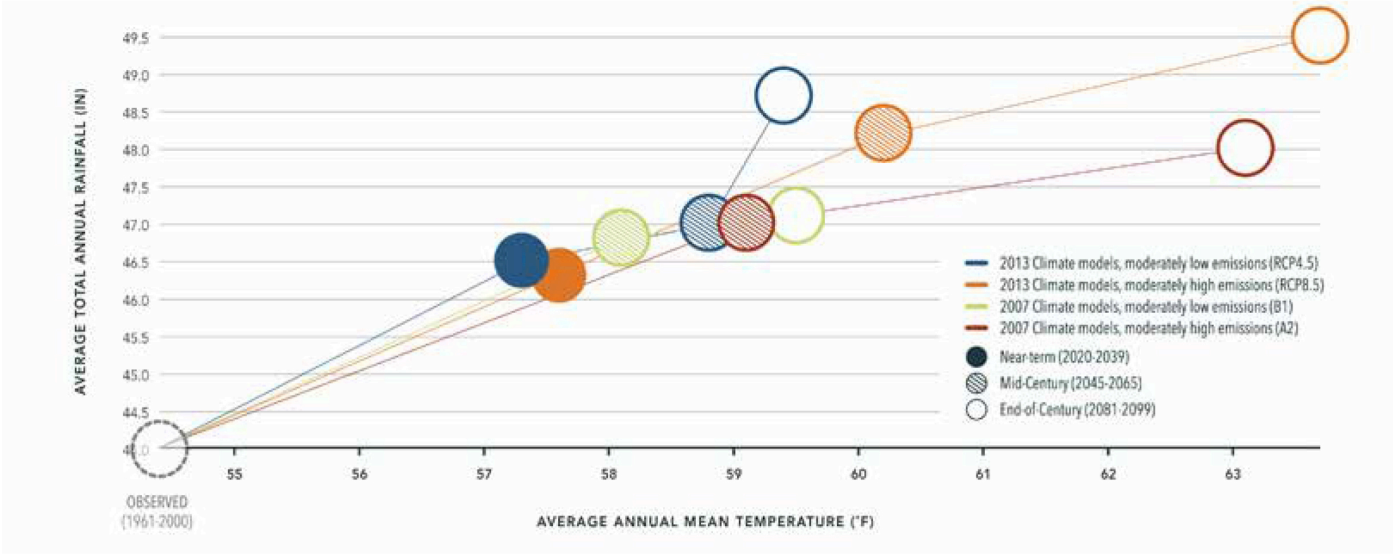
The impacts of climate change will be felt by these frontline communities first and worst. The actions outlined in this document contribute to building climate resilience. They can also build a more just Philadelphia, one where every resident thrives regardless of their zip code.

Environmental Impacts

In Philadelphia, climate change will have two major impacts: hotter temperatures and more precipitation. Already, residents in the city have noticed our summers getting hotter. In the 1900's we had an average of four days above 95°F annually. By 2100, that number could reach up to 52 days . In 2015, OOS and the Philadelphia Department of Public Health (PDPH) collected data to create the Philadelphia Heat Vulnerability Index. This showed that some neighborhoods can be up to 22°F hotter than others. These hotter neighborhoods are more likely to be low-income communities and communities of color.

Along with the increase in temperature will be an increase in precipitation. There will be more rain in the warmer months, and increased snowfall during winter. The depth and extent of flooding will increase along the Schuylkill and Delaware Rivers. This will worsen flooding near the Philadelphia International Airport, in Eastwick, in Manayunk, and in other areas. It will also introduce flooding to new parts of the city. We can also expect more powerful storms like Hurricanes Sandy and Irene, and these storms cost the City hundreds of thousands of dollars to recover from and are a danger to human health.

PROJECTED CHANGES IN AVERAGE ANNUAL TEMPERATURE AND TOTAL ANNUAL PRECIPITATION IN PHILADELPHIA, UNDER FOUR CARBON EMISSIONS SCENARIOS



Scenarios RCP4.5 and B1 assume relatively low emissions, while RCP8.5 and A2 assume moderately high emissions.[4]

Images (clockwise, from top left) of the Schuylkill River in its current state, an actual photo during Hurricane Irene, a simulation of four feet of sea level rise, which is the expected sea level rise in 2100 under a scenario of moderate greenhouse gas emissions, and a simulation of four feet of sea level rise plus a Category 1 storm, which is the expected sea level rise in 2100 plus the most severe hurricane the region has ever experienced. (The sea level rise and hurricane scenario does not include overland flooding, only coastal water storm surge traveling up the river. Actual flooding will likely be higher due to additional flooding from upriver rainfall.)

Health Impacts

The PDPH conducted an analysis of the public health impacts of climate change in our city. They found that hotter temperatures will increase the occurrences of:

- Heat related illness, including dehydration and heat stroke
- Heat-related mortality
- Respiratory disease exacerbation

More storms and precipitation will increase the occurrences of:

- Injuries
- Displacement and mental stress
- Respiratory disease exacerbation
- Vector and water borne diseases

These impacts will hit vulnerable residents such as the elderly, children, and people of low socioeconomic status the hardest. More information about these impacts can be found in PDPH's Climate and Health Adaptation Plan, which is in progress.

Economic Impacts

Climate change will cost our city. Increases in severe weather will bring the most noticeable economic burden. Hurricanes and severe weather events are estimated to cost the City anywhere from $200,000 - $2,000,000 to recover from. Climate-change induced health impacts are projected to cost the city $20,000,000 by 2050. The increase in average temperature is projected to raise annual air conditioning costs in the city by $1,000,000 annually.

Further, these costs will not be incurred equally. The electricity costs associated with more cooling needs will burden low-income residents who spend a higher percentage of their income on energy bills. Residents in areas of frequent flooding will incur property damage and associated costs.

How Can We Become More Climate-Resilient?

While the impacts are daunting, climate change is also an opportunity to rethink our systems and infrastructure. It will take action and cooperation on every level, from the grassroots to large institutions, to achieve our climate goals. Many are already doing the work to build a more climate-resilient Philadelphia. They are:

- Young people marching for climate justice
- Residents growing fresh food in their community
- Neighbors checking on neighbors during heat waves and extreme cold
- Organizers advocating for a clean energy grid and green economy
- Businesses reducing their waste and committing to a living wage
- Building owners making plans to increase their energy efficiency
- Artists, educators, and faith leaders building climate resiliency in communities

The strategies included in this Playbook can also build toward a more resilient, thriving future.

- More green land cover such as parks and gardens provides shading and cooling during extreme heat.
- An urban agriculture network provides fresh food to more households and lowers our food related emissions and waste.
- Retrofitting homes for energy efficiency lowers costs to keep households cool and dry.
- The Green Economy offers opportunities for stable living wage jobs.
- An efficient public transit network helps improve air quality and decrease commute times.

More Information

More information on the impacts of climate change in our region can be found in:

- Useful Climate Information for Philadelphia: Past and Future – Climate change projections for our region, specifically around flooding, storms, and extreme heat (2014)
- Growing Stronger: Toward a Climate-Ready Philadelphia – Philadelphia's Municipal climate change adaptation plan (2015)

PHILADELPHIA'S CARBON FOOTPRINT

Sources of Emissions

OOS measures and tracks Philadelphia's carbon footprint. According to the most recent inventory, Philadelphia's emissions come from three major sources: Buildings and Industry, Transportation, and Waste.

Buildings and Industry, and the energy that supplies them, account for 75 percent of total GHG emissions in Philadelphia. Most buildings are powered by our regional electricity grid. This electricity is produced by a mix of methods, including burning fossil fuels. As an older city, much of our building stock is aging and needs investment to become more energy efficient and resilient.

Transportation is the second largest source of GHG emissions in Philadelphia at 22 percent. When vehicles burn diesel or gasoline to power their engines, they release GHGs into the atmosphere. Philadelphia's transportation emissions are low in comparison to other major cities. This is thanks to Philadelphia's walkability and public transit infrastructure. Still, transportation by single-occupancy vehicle, the most carbon intensive transit option, has increased in the past several years.

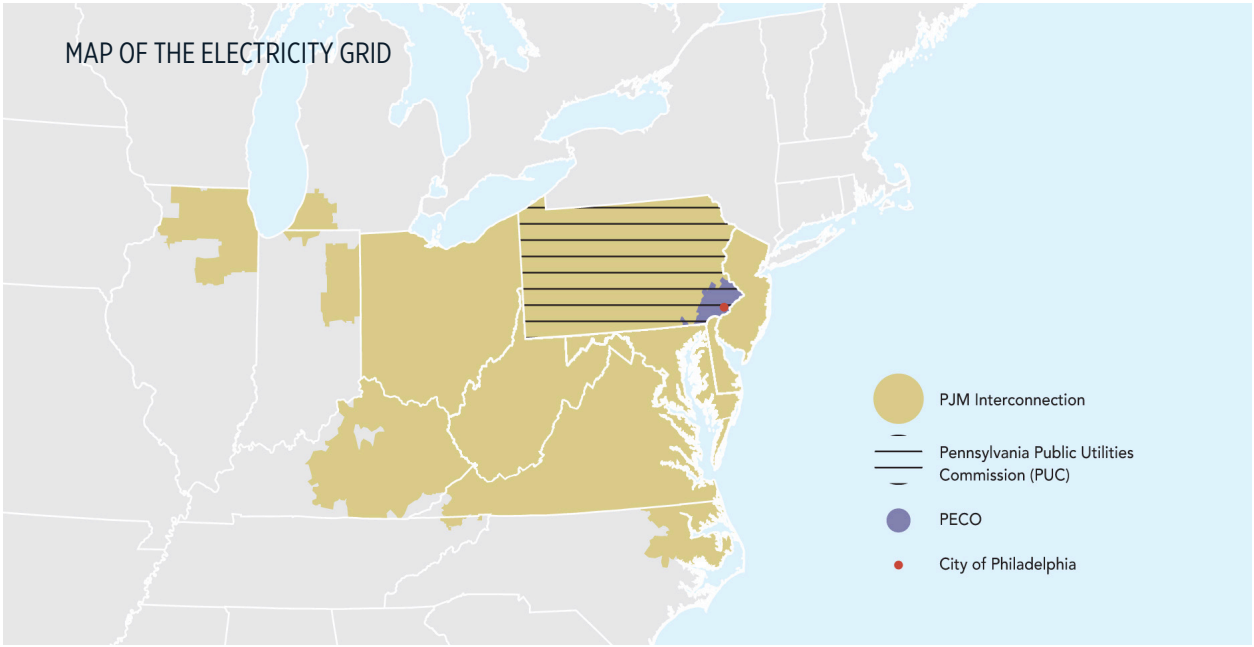
Waste accounts for 3 percent of GHG emissions. Philadelphia disposes of close to 1.5 million tons of waste per year. Most of this is sent to landfills, incinerators, or recycling facilities. Processing this waste is energy intensive and releases GHGs.

How Emissions are Calculated

OOS follows the Global Protocol for Community-Scale Greenhouse Gas Emission Inventories (GPC) to calculate emissions. These are international standards defined by the World Resources Institute (WRI), C40, and ICLEI - Local Governments for Sustainability. Cities can account for three different groups of emissions. These groups are called 'Scopes'. For all three scopes, a significant amount of data gathering is needed to produce accurate models. This requires collaboration between OOS and many major institutions in the city.

Scope 1 emissions are those which come from primary sources located within the city boundary. These can include emissions related to industry, transportation, and other emissions generated within city limits. If there is any in-city energy production this would be accounted for in Scope 1. Philadelphia Gas Works (PGW), the country's largest municipally owned utility, is included in Scope 1 for emissions for natural gas.

Scope 2 emissions come from the use of energy produced regionally but used within the city boundary. This is often energy that comes from the regional electricity grid that is used by buildings and street lighting. OOS tracks energy use in large buildings through the Energy Benchmarking Program.



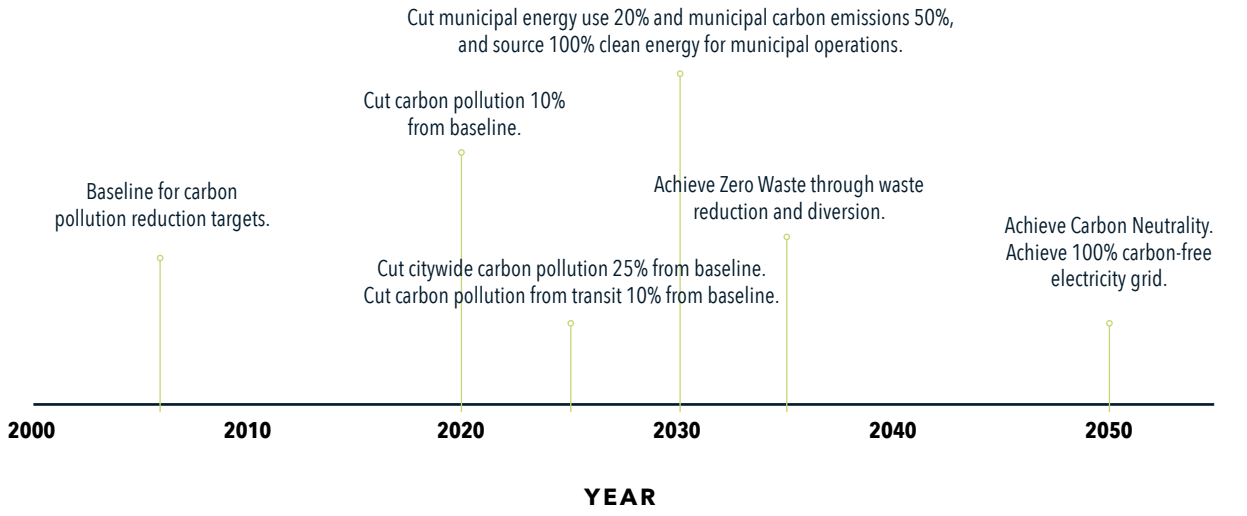
The electricity we use in Philadelphia is generated across the regional electricity grid, and several entities are collectively responsible for providing our electricity:

- *PJM Interconnection: PJM operates the wholesale electricity marketplace across 13 states and the District of Columbia.*
- *Pennsylvania Public Utilities Commission (PUC): Electricity is regulated at the state level by the PA PUC. The PUC sets rates and manages programs to improve energy efficiency and promote renewable electricity.*
- *PECO: PECO is the distribution company in Philadelphia.*
- *City of Philadelphia: The City has a strong working relationship with PECO and regularly files comments on relevant proceedings with the PUC.*

Scope 3 emissions are those which occur outside the city boundary because of activities taking place within the city. This means waste and transport that originates in the city but whose destination is outside of the city. For Philadelphia and many other cities across the globe, Scope 3 emissions are not calculated as they involve a larger amount of guesswork than Scope 1 and Scope 2 emissions.

Carbon Reduction Goals

TIMELINE OF GHG REDUCTION GOALS



In 2021, Mayor Kenney announced the City of Philadelphia's commitment to achieving carbon neutrality by 2050. A carbon neutral city generates net-zero greenhouse gas emissions in the buildings, energy, transportation, and waste sectors. Previously, he also signed the Mayors for Clean Energy pledge to transition Philadelphia to 100 percent clean energy.

Philadelphia also joined C40 Cities; Deadline 2020 Initiative. This is a commitment from some of the world's largest cities to deliver on the Paris Climate Agreement. By 2020, each city will produce a plan or guide like the Playbook, which outlines climate actions to prevent the worst impacts of climate change while strengthening community resilience. We know now that meeting the 80x50 goal is not enough to prevent the worst impacts of climate change, and are examining opportunities to go further.

History of Climate Planning in Philadelphia:

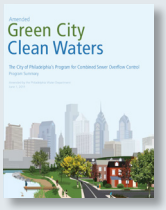
2007

A group of City agencies come together to create a ***Local Action Plan for Climate Change.***

2008

The Mayor's Office of Sustainability (MOS) is established under the administration of Mayor Michael Nutter.

2009



City publishes ***Greenworks Philadelphia***, a plan to create a more sustainable Philadelphia.

PWD releases ***Green City, Clean Waters*** the City's program to control Combined Sewer Overflows using green stormwater infrastructure (GSI).

2011

The **Food Policy Advisory Council** (FPAC) is established to address the city's food challenges and provide policy recommendations to the Mayor.

2014

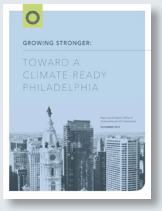
The **Office of Sustainability** (OOS) is made a permanent office within City government by City charter amendment.

OOS issues ***Useful Climate Information for Philadelphia: Past and Future*** to better understand how climate change will impact the city.

PWD establishes the **Climate Change Adaptation Program** (CCAP).

2015

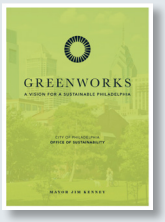
The City of Philadelphia convened the **Flood Risk Management Task Force** to coordinate an interagency response to address the circumstances of flooding in Philadelphia neighborhoods.



OOS produces ***Growing Stronger: Towards a Climate Ready Philadelphia*** to begin the process of preparing City infrastructure for a changing climate.

OOS issues ***Options for Achieving Deep Reductions in Carbon Emissions in Philadelphia by 2050***, prepared by Drexel University.

2016

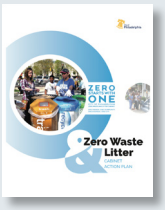


OOS issues ***Greenworks: A Vision for a Sustainable Philadelphia***, updating the City's sustainable framework around eight key vision areas

Mayor Kenney signs Executive Order 13-16, creating the **Zero Waste and Litter Cabinet**

The Philadelphia Energy Authority establishes the ***Philadelphia Energy Campaign***

2017



The Zero Waste and Litter Action Plan is released, moving the city forward to achieve a 90 percent waste reduction by 2035.

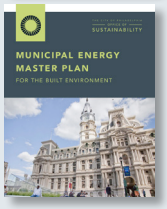
The Philadelphia Water Department (PWD) issues ***The Utility Wide Strategic Energy Plan*** outlining the utility's commitment to the 80x50 goal, as well as their own clean energy projects.

2018

The Office of Transportation, Infrastructure, and Sustainability (OTIS) issues ***Connect: Philadelphia's Strategic Transportation Plan***. The plan outlines efforts to reduce carbon emissions from transportation 10 percent by 2025.

PHL Airport builds upon their ReNEW Sustainability program with ***RePHL***, an energy plan which aligns Airport planning and operations with the City's deep GHG reductions targets.

OOS releases ***Powering Our Future: A Clean Energy Vision*** for Philadelphia laying out ongoing and proposed efforts to slash carbon emissions from Philadelphia buildings and infrastructure.



EO releases the ***Municipal Energy Master Plan***, laying a path to reduce carbon emissions from the municipal built environment by 50 percent and to move to 100 percent clean electricity by 2030.

The Streets Department issues the ***Organics Diversion Feasibility Study*** to examine how to eliminate organics from the waste stream.

OTIS releases the ***Electric Vehicle Policy Task Force Recommendations***.

2018 continued

The City appoints its first **Floodplain Manager** to oversee flood preparedness and damage reduction, public information, mapping, and regulations.

2019

OOS releases the ***Beat the Heat Hunting Park: A Community Heat Resilience Plan***—a resource for communities to build heat resilience in their neighborhoods and adapt to the warming climate.

PDPH completes two sections of the ***Climate and Health Adaptation Plan***: Extreme Heat and Coastal Storms and Flooding

2020 and beyond

OOS established the position of **Chief Resilience Officer (CRO)** to begin the process of a citywide climate change adaptation plan.

PDPH is preparing subsequent sections of its ***Climate and Health Adaptation Plan***.

OOS is establishing the City's first **Environmental Justice Advisory Commission**, which will provide recommendations to address disparate environmental harm throughout Philadelphia.

Parks and Recreation is developing an ***Urban Agriculture Strategic Plan*** and an ***Urban Forest Strategic Plan***.

OTIS is developing a ***Public Transit Strategic Plan***.

OOS is working with the Office of Fleet Management to create a ***Municipal Clean Fleet Plan***.

OOS is developing a **business diversification** study for Philadelphia Gas Works (PGW).

PWD is developing **Planning & Design Guidance** with climate change considerations.

Departments not included in this timeline are also working towards a thriving city. They develop programs to reduce violence, increase economic opportunity, and provide a quality education for all. In the development of the Climate Action Playbook, the OOS reviewed plans from across the City to assess how climate action can help support these goals. The results are the Co-Benefits Matrix. The matrix assesses each climate action across four action areas: Equity, Health, Environment, and Economy.

The efforts of these plans in action have resulted in several accomplishments, many of which are tracked through the OOS Greenworks Dashboard. OOS also publishes stories of Philadelphia's sustainability accomplishments through the Greenworks Review Magazines. Find examples of key successes highlighted throughout the Playbook.

Climate Action Areas

This playbook comprises a portfolio of climate actions Philadelphia will pursue in 2020 and beyond. The playbook is divided into three areas:

1

Reducing our Contribution to Climate Change

Actions to reduce carbon pollution.*

2

Utilizing Nature as a Solution to Climate Pollution

Actions to remove carbon pollution from the atmosphere.

3

Adapting to a Changing Climate

Actions to prepare Philadelphia for a hotter, wetter future.

Explore renewable energy projects in key utilities and infrastructure such as PWD and PHL.	EO, OOS	■	◧	□	■	■	□	□	◧	□	■	◧	◧	◧	◧	n/a

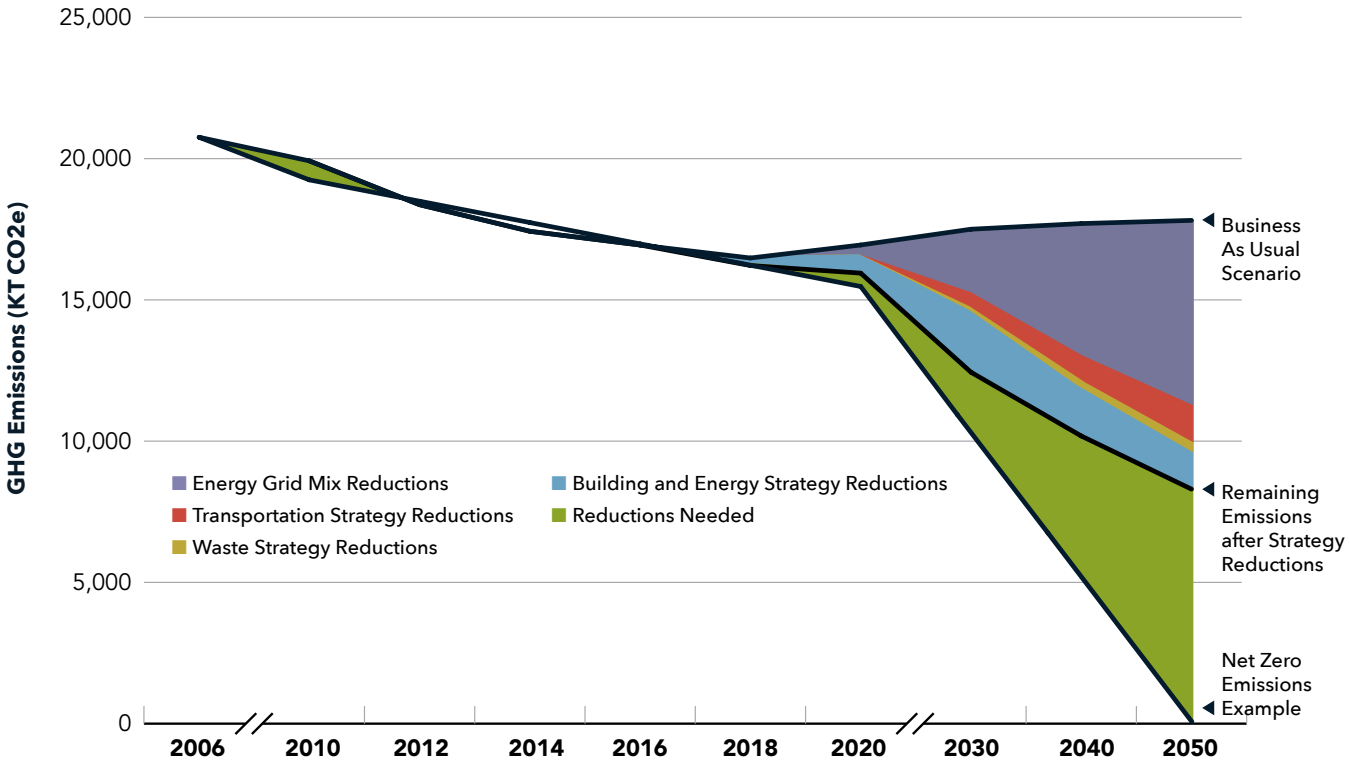
Each chapter contains a matrix of climate actions. For each climate action, the lead and supporting partners are listed. An analysis of each action's equity, health, environmental, and economic impacts was conducted and the results are shown in the co-benefits matrix to demonstrate how climate actions support the priorities and address the challenges unique to Philadelphia. Below the matrix, further descriptions around co-benefits are included, as well as measurable goals and metrics and what plans they come from. We also outline state and federal actions that can help support or enable Philadelphia's climate action goals.

Refer to the "Key Documents" sections throughout for clickable links to relevant reports.

Monitoring the Playbook: OOS conducts a citywide GHG inventory every two years at which time staff will assess the progress of actions included in the Playbook and incorporate new actions that the City is taking to address climate change. These assessments will be published publicly as bi-annual updates.

REDUCING OUR CONTRIBUTION TO CLIMATE CHANGE

The following pages outline actions to reduce our contribution to climate change by eliminating our carbon emissions from three sectors: Buildings and Industry, Transportation, and Waste.



The chart above illustrates the carbon reduction potential from the actions proposed across these sectors. It also shows where the City needs to go further to achieve our goals. Included in each sub-sector heading is an analysis that shows the GHG reduction potential of distinct actions. Assumptions included in this analysis are included in appendix 2.

Buildings and Industry

Buildings and industry account for 75 percent of Philadelphia's carbon emissions.

						EQUITY			HEALTH				ENVIRONMENT			ECONOMY

Co-Benefits

EQUITY – Energy efficiency and home repair can lower energy costs for low-income residents. There are opportunities to lower the costs and barriers to residential solar installation for low-income households.

HEALTH – Investment in clean energy can help reduce pollution from fossil fuel energy production. This can improve air quality for more breathable air. Energy efficiency upgrades can improve indoor air quality and make cooling more affordable.

					EQUITY			HEALTH				ENVIRONMENT			ECONOMY				
SECTOR	CODE	CLIMATE ACTION	DESCRIPTION	DEPTARTMENT	Mobility	Community capacity	Poverty Reduction	Wellbeing	Public Safety	Heat Preparedness	Flood Preparedness	Green space	Waste Reduction	Carbon Pollution reduction	Jobs	Cost Savings	Competitiveness	Lead by example	GHG REDUCTION BY 2050 FROM 2006 BASELINE
REDUCING OUR CONTRIBUTION TO CLIMATE CHANGE BUILDINGS AND INDUSTRY	3	Low Carbon Thermal Energy	Low-carbon thermal energy - Explore and invest in low-carbon alternative energy sources by tracking technological developments, evaluating implementation opportunities, promoting geothermal heating and cooling systems and solar heat systems. Continued on next page.

ENVIRONMENT – Fossil fuels are a major contributor to climate change. Reducing fossil fuel use helps prevent the worst impacts of climate change. Further, a move away from fossil fuel extraction and fracking will help prevent environmental degradation, including impacts on air and water quality. Fossil fuels are a major contributor to climate change. Reducing fossil fuel use helps prevent the worst impacts of climate change.

ECONOMY – Jobs in clean energy infrastructure, building retrofits and energy efficient new construction will help support a growing construction job market in the years to come. It will also save building owners and tenants capital in operating costs.

Highlight: Building Energy Performance Policy

At the end of 2018, Philadelphia was selected as one of 25 participants in the Bloomberg American Cities Climate Challenge. This is an initiative designed to help cities meet their commitment to reduce carbon pollution. Thanks to support from Climate Challenge partners at the Natural Resources Defense Council and Institute for Market Transformation, City Council passed and Mayor Kenney signed a new Building Energy Performance Policy into law in December 2019.

The Building Energy Performance Policy mandates all non-residential buildings 50,000 square feet and larger to either:

1. Submit a certification of high-energy performance to OOS or
2. Conduct a tune-up to bring existing building energy systems up to a state of good repair.

Tune-ups are small tweaks to existing systems that save money for building owners and increase comfort for tenants. OOS has estimated that the policy will create as many as 600 new local jobs in Philadelphia. Once fully implemented, it will cut carbon pollution in Philadelphia by nearly 200,000 metric tons. This is the equal to taking 40,000 automobiles off our roads.

Key Goals and Metrics

- Reduce carbon pollution from the City-owned buildings and street lights 50 percent by 2030. (Municipal Energy Master Plan)
- Reduce City operations' energy use 20 percent by 2030. (Municipal Energy Master Plan)
- Generate or purchase 100 percent of all electricity for City operations from renewable resources by 2030. (Municipal Energy Master Plan)
- Provide critical long-term home repair in 25,000 low and moderate income single and multi-family homes by 2026. (PEA)
- Provide energy and building improvements for 2,500 small food and grocery businesses by 2026. (PEA)
- Reduce School District energy use by 30 percent by 2026. (PEA)
- Create 10,000 jobs in energy efficiency and clean energy projects by 2026. (PEA)
- Achieve a clean electricity grid by 2050. (POF)

State, Regional, and Federal Actions

State actions which could support Philadelphia buildings and industry climate actions:

- Strengthen Pennsylvania's Alternative Energy Portfolio Standard (AEPS) to dictate the requirements of 'alternative' energy to mean carbon-free, and increase the percentage of electricity required from these sources above 18 percent of total demand.
- Enter the Regional Greenhouse Gas Initiative (RGGI) to capitalize on greenhouse gas reductions.
- Re-establish the PA Sunshine Program, an incentive established in 2009 under Governor Rendell which provided $100 million in rebates for solar panels on homes and small businesses but has since been unfunded.
- Explore shared and community solar configurations which are currently not allowed in PA. Community solar participants benefit by owning or leasing a part of a solar array, or by purchasing a part of the renewable electricity generation.
- Continue and increase requirements of Act 129 allowing the Public Utilities Commission to impose requirements on electric distribution companies (EDCs), with the goal of reducing energy consumption and demand.

Regional actions which could support Philadelphia buildings and industry climate actions:

- As part of the PJM Cities and Communities Coalition, work to preserve PJM regional grid policies that open markets to low carbon energy resources and solutions, and support PJM governance reforms allowing cities and other end users to weigh in on key decisions affecting their constituencies.

Federal actions which could support Philadelphia buildings and industry climate actions:

- Enact the Clean Power Plan (CPP) or similar program to limit carbon pollution from power plants during the transition to a 100 percent clean grid.
- Renew or replace the 30 percent Solar Investment Tax Credit (ITC) which began to ramp down in 2019.

Timeline and Cost

The Municipal Energy Master Plan (MEMP) outlines strategies with the goal of reducing emissions from the City's built environment 50 percent by 2030. Powering Our Future outlines long-term citywide actions through 2050, and the Clean Energy Vision playbook provides short-term steps to achieve our goals through 2020.

The MEMP also outlines the cost of the actions needed to reach our goal. It estimates that the costs of the actions included will maintain or decrease energy costs for the City. In February 2016, PEA launched its first major initiative, the Philadelphia Energy Campaign, aiming to leverage $1 billion toward energy efficiency and clean energy in the city over the next ten years.

Key Documents

- Philadelphia Energy Campaign, PEA (2016)
- Municipal Energy Master Plan, EO (2017)
- Utility Wide Strategic Energy Master Plan, PWD (2017)
- Powering Our Future: A Clean Energy Vision for Philadelphia, OOS (2018)
    - Clean Energy Vision Action Plan, OOS (2018)
- Philadelphia Gas Works Diversification Study, PGW (ETD 2020)

Transportation

Transportation accounts for 22 percent of Philadelphia's carbon footprint.

						EQUITY			HEALTH				ENVIRONMENT			ECONOMY				
	SECTOR	CODE	CLIMATE ACTION	DESCRIPTION	DEPTARTMENT	Mobility	Community capacity	Poverty Reduction	Wellbeing	Public Safety	Heat Preparedness	Flood Preparedness	Green space	Waste Reduction	Carbon Pollution reduction	Jobs	Cost Savings	Competitiveness	Lead by example	GHG REDUCTION BY 2050 FROM 2006 BASELINE

Continued on next page.

Co-Benefits

EQUITY – For many in Philadelphia, public transit is their primary mode to get where they need to go. An equitable public transit system is an affordable network that connects all neighborhoods, demographics, and income levels to jobs and opportunities without increasing the harms of congestion and traffic-related pollution.

HEALTH – Philadelphia has one of the highest rates of traffic deaths per capita in the country. Enhancing public transit helps prevent road-related deaths. Active transit options such as biking and walking provide many health benefits.

ENVIRONMENT – Investments in public transit encourages compact development. Compact development and less pavement cover benefits land, preservation, and air quality. Reduced emissions from private vehicles helps prevent severe climate change.

ECONOMY – Public transit networks help reduce commute times and connect people to jobs and opportunities.

						EQUITY			HEALTH				ENVIRONMENT			ECONOMY				
	SECTOR	CODE	CLIMATE ACTION	DESCRIPTION	DEPTARTMENT	Mobility	Community capacity	Poverty Reduction	Wellbeing	Public Safety	Heat Preparedness	Flood Preparedness	Green space	Waste Reduction	Carbon Pollution reduction	Jobs	Cost Savings	Competitiveness	Lead by example	GHG REDUCTION BY 2050 FROM 2006 BASELINE
REDUCING OUR CONTRIBUTION TO CLIMATE CHANGE	TRANSPORTATION	6	A Clean Fleet	Continue to transition the municipal fleet to clean and electric vehicles through commitments such as the Climate Mayors Electric Vehicle Purchasing Collaborative and the Clean Fleet Plan. Explore opportunities to reduce idling in the municipal fleet.	OTIS, OFM	◻	◻	◻	◻	◻	◻	◻	◻	◻	◧	◧	◧	◧	■	1113800
		7	Reduced Emissions from Private Vehicles	Continue to implement recommendations from the Electric Vehicle (EV) Policy Task Force report such as EV charging station installation throughout Philadelphia, including at PHL. Support the safety, accessibility, and reliability of alternative modes of transit to promote a mode shift from vehicles to transit more broadly.	OTIS	◧	⊘	⊘	■	◻	◧	◻	◻	◻	◧	◧	◧	◻	◧	■	11200

Highlight: Indego

Indego Bike Network is Philadelphia's bike share program. It launched in 2015 as the city's newest form of public transportation with 60 stations and 600 bikes. It has now expanded to over 130 stations and 1,400 bikes. The program is an initiative of the City of Philadelphia and sponsored by Independence Blue Cross. Indego is part of the Better Bike Share Partnership (BBSP), which seeks to develop bike share equitably across the country. Indego has one of the highest rates of participation among communities of color and low-income households of all bike share programs in the U.S.

In 2019 Indego expanded by adding new stations and providing electric-assisted bicycles as an option for riders. These stations will make Indego more reliable for people who count on the program for their daily transportation. Since its launch riders have taken more than 2.6 million trips, proving bicycle transit is a popular option to get around in Philadelphia.

Key Goals and Metrics

- Increase the number of residents living within 0.25 miles of frequent transit by 10 percent. (Connect)
- Increase bike share trips by 100 percent and those taken by minority or low-income populations by 120 percent. (Connect)
- Reach goal of zero traffic-related deaths by 2030. (Connect)
- Increase transit ridership in Philadelphia by 10 percent vs. the national trend. (Connect)
- Develop a Municipal Clean Fleet Plan. (Connect)

State and Federal Action

State actions which could support Philadelphia transportation climate actions:

- Work with partners such as the Pennsylvania Department of Transportation (PennDOT), Delaware Valley Regional Planning Commission (DVRPC), and SEPTA to secure greater funding for public transit and to coordinate decisions to control congestion and transit demand while keeping our roadways operating efficiently for commuters.
- Follow California's lead and pass a bill requiring zero emissions private vehicles by 2035 to transition cars into the carbon-free future.

Timeline and Cost

Connect is Philadelphia's strategic transportation plan that carries through to 2025. OTIS is developing a plan to identify opportunities to expand and support public transit alongside partners in the region.

Key Documents

- Vision Zero Action Plan, OTIS (2017)
- Connect: Philadelphia's Strategic Transportation Plan, OTIS (2018)
- Energy Action Plan, SEPTA (2018)
- Philadelphia Trail Plan PCPC (2018)
- Municipal Clean Fleet Plan, OOS (Forthcoming)
- Public Transit Plan, OTIS (Forthcoming)

Waste

Waste accounts for only 3 percent of Philadelphia's carbon footprint, yet it is one of the most visible manifestations of carbon consumption and emissions.

						EQUITY			HEALTH				ENVIRONMENT			ECONOMY				
	SECTOR	CODE	CLIMATE ACTION	DESCRIPTION	DEPTARTMENT	Mobility	Community capacity	Poverty Reduction	Wellbeing	Public Safety	Heat Preparedness	Flood Preparedness	Green space	Waste Reduction	Carbon Pollution reduction	Jobs	Cost Savings	Competitiveness	Lead by example	GHG REDUCTION BY 2050 FROM 2006 BASELINE
REDUCING OUR CONTRIBUTION TO CLIMATE CHANGE	WASTE	8	Reduced Municipal Waste	Identify sustainable procurement opportunities to reduce waste in City government. Monitor and support departmental waste reduction efforts through the Municipal Building Waste Audit Program. Pilot strategies for reducing municipal food waste through the NRDC Food Matters Regional Initiative. Continue to divert organic waste to compost and donation using tools such as the Food Connect app. Work with PADEP and PPR to pilot an urban composting site. 		10	Reduced Industrial and Utilities Waste	Continue operating the biosolids recycling center through PWD, diverting Aircraft Deicing Fluid from PHL to be used in fertilizer creation. Support PHL in airport composting. Explore further opportunities to reduce waste in key utilities and infrastructure.	PHL, PWD	□	□	□	◧	◧	□	□	□	■	■	■	■	■	■	1800

Co-Benefits

EQUITY – Minimizing waste and illegal dumping, and expanding recycling and composting will help ensure that each Philadelphia neighborhood is clean and cared for.

HEALTH – Landfills and incinerators produce air and water pollution that impact nearby communities. Waste, litter, and illegal dumping attract insects, pests, and rodents that spread disease. Minimizing waste helps protect the health of these communities.

ENVIRONMENT – Landfills and incinerators produce methane, a GHG four times as potent as carbon dioxide. Diesel-powered trash trucks used to haul waste impact air quality. Reducing waste in the city keeps our public spaces and waterways clean of trash, our air clean, and helps prevent climate change.

ECONOMY – Eliminating waste and illegal dumping helps save taxpayer dollars. Incentives such as the Zero Waste Partnership Program and sustainable business tax credit support businesses through marketing, assistance, and financial support.

Highlight: Food Waste

Over the next two years, the City will pursue several projects to tackle food waste. Philadelphia will receive technical assistance from the Natural Resources Defense Council (NRDC) as part of its Food Matters Project. Through this project, Philadelphia will collaborate with four other cities to pilot innovative strategies to tackle food waste locally.

The City is also the recipient of a grant issued by the United States Department of Agriculture. This grant will support PPR's Community Composting Network. It will also support a Food Service Business Challenge by providing technical assistance to 10-15 businesses to implement food waste reduction strategies.

In autumn 2020, PPR will launch the state's first-ever urban composting permit pilot. The site will collect compost from recreation centers citywide free of charge in exchange for rent and utilities.

Key Goals and Metrics:

- Continue to implement the Zero Waste and Litter Action Plan, addressing 100 percent of its recommendations.
- Achieve a citywide waste diversion rate of 90 percent, with the remaining 10 percent of waste being processed through waste-to-energy, by 2035.
- Achieve 100 percent compliance in the Municipal Building Waste Audit Program.
- Eliminate food and organic waste from the landfill and waste-to-energy streams.

State and Federal Actions

State and federal actions which could support waste-related climate action in Philadelphia:

- Support State-level bans of plastic bags and other littered single-use packaging items.
- State-level policy that incentivizes recycling of packaging materials (such as bottle returns and other container deposits), or other source-separated recycling programs. These programs support materials recovery and reduce opportunities for contamination to the recycling stream and therefore may reduce fees that municipalities must pay for single-stream recycling, and incentivize household recycling.
- State-level organic waste bans/food recycling laws and other legislation aimed at minimizing wasted food.
- Support extended producer responsibility (EPR) legislation for goods and packaging at the state and federal levels.

Highlight: Curb Your Waste

The Streets department has developed several tools to help residents manage their waste and the city to reduce emissions. Curb Your Waste provides an array of tips for residential waste management, beginning with waste reduction.

Additionally, a new tool called StreetSmartPHL provides direct access to the Streets Department's core services. PickupPHL monitors trucks in near real time using GPS tracking. It helps facilitate route optimization to reduce fuel consumption and emissions. A grant from The Recycling Partnership, funded by the Closed Loop Partners, will investigate a variety of strategies to support residents to reduce recycling contamination. This will help ensure all recyclables are being processed correctly.

Timeline and Cost

The City pays an average of $66 per ton for trash disposal and $90-110 per ton for recycling. Fluctuations in the price of processing waste and recyclables inform the cost of actions related to GHG emissions reductions from this sector.

The Zero Waste and Litter Action Plan, the City's waste reduction and diversion vision document, outlines the City's Zero Waste strategies and sets the goal of having Philadelphia reach a 90 percent waste diversion rate by 2035, with the remaining 10 percent of waste being processed through waste-to-energy. As this work continues to move forward, new targets that account for current conditions will be set. The City is currently working with the C40 Thriving Cities Initiative to plan for and pilot anti-consumption initiatives and with several other groups to expand circular economy efforts in Philadelphia.

Key Documents

- The Zero Waste and Litter Action Plan, ZWLC (2017)
- Utility Wide Strategic Energy Master Plan, PWD (2017)
- Municipal Waste Management Plan, Streets (2018)
- Litter Index Report, ZWLC (2019)
- Municipal Building Waste Audit Report, ZWLC (2019)

UTILIZING NATURE AS A SOLUTION TO CLIMATE POLLUTION

Land cover like trees and parks helps remove carbon pollution from the atmosphere. Only 20 percent of Philadelphia is tree canopy, while 49 percent of the city could be modified to include more.

					EQUITY			HEALTH				ENVIRONMENT			ECONOMY				
	CODE	CLIMATE ACTION	DESCRIPTION	DEPTARTMENT	Mobility	Community capacity	Poverty Reduction	Wellbeing	Public Safety	Heat Preparedness	Flood Preparedness	Green space	Waste Reduction	Carbon Pollution reduction	Jobs	Cost Savings	Competitiveness	Lead by example	GHG REDUCTION BY 2050 FROM 2006 BASELINE
UTILIZING NATURE AS A SOLUTION TO CLIMATE POLLUTION	11	Cleaner Public Spaces	Track litter across all neighborhoods through the Litter Index survey and use data to inform waste interventions. Continue to expand the Community Cans public-private partnership program to improve trash can coverage on commercial corridors. Expand residential access to lidded recycling bins, and implement and enforce new regulatory requirements including requirements for Construction and Demolition Waste Plans on all L&I construction, demolition, and alterations permits.	Streets, PWD, OOS, L&I	☐	■	◧	■	■	◧	◧	■	■	☐	◧	◧	◧	■	n/a
	12	Increased and Preserved Green Space	Continue to increase citywide tree coverage through programs such as TreePhilly and Green City, Clean Waters. Finalize the development of an Urban Forest Strategic Plan to identify opportunities to further incorporate vegetation and tree coverage equitably throughout the city.	OTIS, OOS, PWD, PPR	☐	■	■	■	■	■	◧	■	☐	■	■	■	■	■	n/a

Continued on next page.

Co-Benefits

EQUITY – Low-income neighborhoods and communities of color tend to have the fewest street trees and other green spaces in Philadelphia. This impacts neighborhood-level heat and flood resilience. Increasing tree coverage and green spaces in these communities can support resilience to heat and flooding.

HEALTH – Green coverage such as trees, gardens, and parks help manage heat and stormwater runoff, and clean pollutants from the air. Further, proximity to greenery can decrease stress levels and improve general quality of life for residents.

					EQUITY			HEALTH				ENVIRONMENT			ECONOMY				
	CODE	CLIMATE ACTION	DESCRIPTION	DEPTARTMENT	Mobility	Community capacity	Poverty Reduction	Wellbeing	Public Safety	Heat Preparedness	Flood Preparedness	Green space	Waste Reduction	Carbon Pollution reduction	Jobs	Cost Savings	Competitiveness	Lead by example	GHG REDUCTION BY 2050 FROM 2006 BASELINE
UTILIZING NATURE AS A SOLUTION TO CLIMATE POLLUTION	13	City Wide Composting	Continue to explore the feasibility of citywide compost collection. Launch Community Composting Network to expand residents' access to composting, and work with PADEP and PPR to test urban composting site, with potential to create the first urban composting permit for the state of Pennsylvania. Support PHL airport in implementing a composting program. Continue to divert organic waste from PPR facilities to composting. Demonstrate opportunities for food waste diversion to commercial and industrial sectors.	OOS, PHL, PPR	☐	■	◧	◧	☐	☐	☐	◧	■	◧	■	☐	■	■	n/a
	14	Carbon Sink Network	Explore the feasibility of further carbon sink options as new technologies and strategies emerge. Advocate for the preservation of current carbon sinks in the region and globally.	OOS	⊘	⊘	⊘	⊘	⊘	⊘	◧	⊘	◧	⊘	⊘	⊘	⊘	⊘	n/a

*Continued on next page.

ENVIRONMENT – Forests absorb CO2, a GHG, from the atmosphere and use it in the photosynthesis process. At the end of this cycle, they then produce oxygen and the air we breathe. Trees and other green infrastructure also help improve local air and water quality.

ECONOMY – According to a study produced by the Sustainable Business Network of Greater Philadelphia, investments in green stormwater infrastructure through PWD's Green City, Clean Waters has supported about 1,000 jobs in the region.

Highlight: TreePhilly

Since 2011 PPR's TreePhilly program has been bringing the urban forest to the yards of Philadelphians. TreePhilly has helped give away more than 22,000 free trees for city residents. These trees can be planted in front yards, back yards, and private community spaces. Although the entire city benefits from tree planting, not every neighborhood has access to adequate green space. Areas with fewer trees need greater investment. To meet the City's goals, TreePhilly is distributing trees through partnerships with community-based organizations around the city. In 2019 TreePhilly received funding from TD Bank to support planting

Key Goals and Metrics

- Develop an Urban Forest Strategic Plan.
- Continue to implement Green City, Clean Waters through 2036.

State and Federal Actions

State actions which could support Philadelphia carbon sequestration related climate actions:

- Consider a State-level requirement such as New York's which requires that some communities expand their composting capacity and infrastructure to introduce a citywide composting program later.
- Protect and preserve state parks and forests.

Federal actions which could support Philadelphia carbon sequestration related climate actions:

- Extend the USDA Farm Bill allotment to test programs for composting in more states.
- Continue to fund the U.S. Department of Energy research into carbon capture, utilization, and storage.
- Protect and preserve national parks and forests.

Timeline and Cost

Green City, Clean Waters is Philadelphia's program to control Combined Sewer Overflow (CSO) primarily using green stormwater infrastructure. The program commitment is more than 1 billion dollars for addressing water quality goals as set by both Pennsylvania and national CSO control policies. These projects will be implemented over a 25-year period, with metrics and milestones developed to measure progress along the way.

Key Documents

- Green City Clean Waters, PWD (2011)
- Urban Forest Strategic Plan (Forthcoming)
- Urban Agriculture Master Plan (Forthcoming)
- Compost Feasibility Study (Forthcoming)

ADAPTING TO A CHANGING CLIMATE

Philadelphia can expect hotter, wetter weather due to climate change, an impact we are already beginning to see. The actions below consider how we will address these changes.

					EQUITY			HEALTH				ENVIRONMENT			ECONOMY				
	CODE	CLIMATE ACTION	DESCRIPTION	DEPTARTMENT	Mobility	Community capacity	Poverty Reduction	Wellbeing	Public Safety	Heat Preparedness	Flood Preparedness	Green space	Waste Reduction	Carbon Pollution reduction	Jobs	Cost Savings	Competitiveness	Lead by example	GHG REDUCTION BY 2050 FROM 2006 BASELINE
ADAPTING TO A CHANGING CLIMATE	15	Climate Informed Planning	Create a citywide adaptation roadmap which integrates climate change impacts into future planning. Build upon the municipal adaptation plans in Growing Stronger and PDPH Climate Change and Public Health Plan.	OOS, PCPC, L&I	◧	■	◧	■	■	■	■	■	□	⊘	◧	■	◧	■	n/a
	16	Climate Prepared Communi-ties	Implement recommendations from the PDPH Climate Change and Health Plan to prepare for public health risks induced by climate change. Explore opportunities to build community resilience to these risks through neighborhood level interventions such as Beat the Heat Hunting Park. Continue to convene the interagency Flood Risk Management Task Force.	OOS, PPR, PDPH	■	■	◧	■	■	■	■	■	□	◧	□	■	◧	■	n/a

Continued on next page.

Co-Benefits

EQUITY – Climate change impacts will not be felt the same by every neighborhood. Adaptation planning throughout the city will need to address these differentiated impacts. We must also work to reduce the social inequalities which make some populations more vulnerable to these impacts.

HEALTH – Proactive efforts to adapt and prepare for these climate impacts can help prevent future health emergencies. For example, a local food network can buffer against food system disruptions due to a changing climate. Supporting climate resiliency can improve quality of life and well being for all communities.

					EQUITY			HEALTH				ENVIRONMENT			ECONOMY

ENVIRONMENT – Adaptive management can help Philadelphia's parks and gardens flourish in a new climate. Investment in green landcover can help neighborhoods manage flooding and extreme heat.

ECONOMY – Proactive measures to prepare for climate changes can lead to great long-term cost savings. Investments in a climate resilient infrastructure support job creation and protect city assets.

Highlight: Beat the Heat Hunting Park

Hunting Park is a heat vulnerable neighborhood in North Philadelphia with an active environmental advocacy community. OOS teamed up with these advocates and neighborhood organizations, including Esperanza, Hunting Park Neighborhood Advisory Committee, Hunting Park United, Lenfest Center, and North10 Philadelphia to address heat issues.

By working together, the group engaged over 600 residents in an eight-month community engagement process. The core team attended community events, received 530 survey responses and the insights of over 40 residents who participated in a community design workshop. This process led to Philadelphia's first ever neighborhood heat plan. The plan was released in July 2019 to inform residents about what causes extreme heat and to advocate

Key Goals and Metrics

- Develop Citywide Climate Resiliency Strategy (Forthcoming)
- Complete the Urban Agriculture Strategic Plan (Forthcoming)
- Update the Office of Emergency Management's (OEM) Hazard Mitigation Plan (Forthcoming)

State and Federal Actions

State actions which could support Philadelphia adaptation related climate actions:

- Update PA's Climate Change Act (2009) to include more extensive adaptation commitments.

Federal actions which could support Philadelphia adaptation related climate actions:

- Support policies such as the Green New Deal and The Breathe Act which address mitigation and adaptation to climate change and racial equity at the federal level.
- Continue to allow funds from the Disaster Relief Appropriations Act (2013) to be used to install adaptive measures during storm recovery processes.
- Update the Federal Emergency Management Agency's (FEMA) floodplain maps to include the impacts of climate change and Community Identified flood hazard areas.
- Coordinate State/federal permitting activities with local permitting to garner stronger environmental compliance – using state/federal/local regulations to enforce.

Timeline and Cost

The City has begun its Climate Adaptation planning process in 2020 and this work will establish further deadlines. Certain adaptation measures are already underway and will continue such as OOS's heat resilience work. The City is currently exploring adaptation pathways and determining the costs of planning and actions related to these pathways.

PDPH - Philadelphia Department of Public Health

PEA - Philadelphia Energy Authority

PGW - Philadelphia Gas Works

PHL - Philadelphia International Airport

PJM - PJM Interconnection

Port - Port of Philadelphia

PPR - Philadelphia Parks and Recreation

PWD - Philadelphia Water Department

SDP- School District of Philadelphia

SEPTA - Southeastern Pennsylvania Transportation Authority

Streets - Philadelphia Streets Department

II. ASSUMPTIONS IN GHG REDUCTIONS MODELING

The Climate Action Playbook includes GHG reductions projections based on research and modeling completed by the Office of Sustainability (OOS). Listed below are some of the key assumptions that were made to create the analysis shown throughout this report.

GENERAL MODEL ASSUMPTIONS

The Climate Action Playbook uses population projections from Delaware Valley Regional Planning Commission (DVRPC) and assumes current construction rates continue to estimate increase in electricity and natural gas demand through 2050. Current emissions from Philadelphia's built environment are derived from citywide PECO and PGW data along with supplementary information on individual buildings from the City's energy benchmarking program. The modeling in this report assumes a zero-carbon grid is technically feasible, but does not make any assumptions about the technologies or costs required to achieve it.

CLEAN ELECTRICITY SUPPLY

Powering Our Future considers two electricity supply scenarios and assumes carbon intensity (CO2e/MWh) pathways for each scenario. The business-as-usual scenario assumes the carbon intensity of the grid follows the Energy Information Agency's generation fuel mix projections. The clean electricity supply grid scenario assumes the regional electricity grid follows a linear reduction trend to zero carbon emissions in 2050. This scenario does not make assumptions about which technologies or generation sources will be used in the zero-emissions grid.

CITYWIDE SOLAR

Powering Our Future projections for solar generation within the city are based on existing solar panel technology. A study by Penn State University found that nearly half of Philadelphia rooftops are suitable for solar generation, and *Powering Our Future* assumed that 80 percent of these rooftops were producing electricity from solar by 2050. The resulting electricity generation is treated as a portion of the clean electricity supply.

ENERGY-EFFICIENT HOMES AND BUSINESSES

Data from PECO, PGW, and the energy benchmarking program were used as a baseline for modeling programs in the Energy-Efficiency Playbook.

Key assumptions for specific programs include:

- Commercial and Residential Energy Codes: Philadelphia adopts new building codes with each triennial International Code Council update through 2030 and 75 percent of new construction and major renovations completed through 2050 comply with code.
- Residential Energy Code Enforcement for Renovations and Additions: Building codes continue to become more energy efficient through 2030, and all renovations completed through 2050 meet code.
- Third-Party Energy Code Compliance: Compliance rates increase from an estimated 75 percent to 95 percent for residential properties.
- 2030 District: 70 percent of existing buildings in Center City and University City meet the 2030 District targets.
- Permit Streamlining: Streamlining leads to 75 percent of expected new construction meeting LEED or ENERGY STAR standards.
- Density Bonus: 30 new properties take advantage of bonus annually.
- Property Tax Incentives for High-Performing New Buildings: 50 percent of new office space in Center City and University City take advantage of incentives.
- Utility-Funded Efficiency Opportunities: Act 129 savings targets extend to 2050 with an annual savings rate of 1.1 percent.
- Expanded Energy Benchmarking Program: Benchmarking threshold is reduced to 25,000 square feet. 90 percent of buildings comply, and they reduce energy use 2 percent annually.
- Building Energy Performance Program: Program applies to buildings 25,000 square feet and larger, and 75 percent of eligible buildings comply, achieving 10 percent one-time savings.
- City Government Leading by Example: For more on this analysis, see the recently released Municipal Energy Master Plan, available at www.phila.gov/green.

LOW-CARBON THERMAL ENERGY

The Low-Carbon Thermal Energy section assumes that natural gas and fuel oil use for heating, hot water, and cooking will be partially displaced by new no- and low-carbon technologies. The model assumes that 70 percent of residences and 30 percent of commercial buildings will use these new technologies by 2050. The model does not make any assumptions about which technologies will be used.

LOW-CARBON ECONOMY

The city's GHG inventory includes emissions from Philadelphia's local industry. The inventory includes large point source emissions from the EPA's Greenhouse Gas Reporting Program tool and Philadelphia's share of additional industrial emissions from the Pennsylvania Department of Environmental Protection greenhouse gas inventory. The Low-Carbon Economy section assumes that the carbon dioxide-equivalent output of industry is 80 percent lower by 2050.

TRANSPORTATION

The Transportation section utilizes data and modeling from the Drexel 80x50 Report, "Options for Achieving Deep Reductions in Carbon Emissions in Philadelphia by 2050". The model assumes that in a business as usual scenario, passenger vehicle transport will take up 91.5 percent of GHG emissions with the remaining 8.5 percent taken up by transit by 2050. Further, the model assumes that actions taken result in a 10 percent reduction in Vehicle Miles Traveled (VMT) from Business As Usual by 2050, and a consumer EV market share of 88 percent by 2050.

WASTE

The Waste section assumes a 70 percent reduction in municipal, residential, commercial and industrial waste by 2050 from various baselines. Baseline numbers come from the Municipal Waste Management Plan from the Philadelphia Streets Department (Table 1-1, Waste Characterization Data) and the Municipal Building Waste Audit conducted by the Zero Waste and Litter Cabinet. Residential waste characterization percentages are applied to commercial waste totals.

III. CO-BENEFITS DEFINITIONS AND METHODOLOGY

The co-benefits analysis included in the Playbook uses a methodology adapted from New York City's benefits analysis included in the NYC 1.5 Degree Climate Action Plan and outlined in their Action Prioritization Methodology Case Study produced in conjunction with C40.

The four categories of benefits are organized by the co-benefits categories included in Philadelphia's sustainability plan, Greenworks: Equity, Health, Environment, and Economy. Also included is an analysis of the leadership role the City provides for each action. The questions following each co-benefit were used to guide those who completed the assessment as to how each action did or did not support that benefit. Internal OOS staff completed the assessment collaboratively, and then leadership from relevant departments and external partners with expertise in climate relevant areas were asked to review the assessment and provide any recommendations for changes.

Scorers ranked each action under each co-benefit from 0-2. 0 meant there was no benefit, 1 a partial benefit, and 2 a full benefit. The scorer could also place an X if there was not enough information to place an informed assessment. While this methodology is subjective, it provides a framework through which to assess what climate actions can support other goals within Philadelphia and invites deeper analysis.

EQUITY

Mobility – Does this decrease trip duration? Could this increase access to essential services such as hospitals and jobs? Could this improve safety during commutes?

Community Capacity – Could this address health or environmental justice disparities? Could this strengthen social cohesion and emergency preparedness in communities? Could this increase community (lead or co-creation) in planning? Could this limit displacement of residents and small businesses when surrounding property values rise?

Poverty Reduction – Could this reduce or stabilize the energy cost for energy-burdened households? Could this provide job opportunities and training for disadvantaged communities? Could this decrease unemployment?

HEALTH

Wellbeing – Could this increase the comfort and mental health of residents? Could this lead to improvements in the quality and ventilation of indoor spaces (e.g. pest management, or mold)? Could this improve outdoor air quality and reduce incidences of asthma, respiratory, and cardiac problems? Does this promote active modes of transport? Could this increase access to quality food?

Public Safety – Could this minimize disruptions to energy or mobility services during emergencies or natural disasters? Could this improve flood and fire safety? Could this increase access to essential services such as hospitals? Could this reduce violence or crime?

Extreme Heat Preparedness – Could this improve indoor temperature control? Could this mitigate the urban heat island effect? Could this reduce heat risks for vulnerable populations?

Flood mitigation – Could this increase the amount of permeable surface cover? Could this increase flood resilience by preserving and restoring land, protecting waterways, or preventing sewage discharges? Could this help vulnerable households in the FEMA and sea level rise projections prepare for flooding?

ENVIRONMENT

Green Spaces – Could this improve access to green and healthy spaces for community members? Does this prioritize access to green spaces to communities that historically have not had access to them? Could this contribute to the preservation of green space, wildlife habitats, or sensitive ecosystems? Could this expand the benefits of existing green space?

Waste Reduction – Does this limit the primary creation of waste? Does this limit the amount of waste reaching landfills and incinerators? Does this decrease litter in public spaces? Does this allow for an increase in waste diversion?

Carbon Pollution Reduction – Could this reduce peak electricity demand? Does this sequester GHGs? Does this reduce GHG emissions?

ECONOMY

Jobs – Could this generate new, quality jobs? Could this lead to sustained long-term jobs? Could this support growth in key industries for Philadelphia?

Long-term Cost Savings – Could this benefit health outcomes and productivity, leading to reduced citywide healthcare costs? Could this mitigate the risk of property damage to city infrastructure? Could this lead to long-term utility bills or transportation cost savings for households?

Economic Competitiveness – Could this improve workers' skills? Could this increase the number of individuals receiving City-sponsored, industry-focused training? Could this unlock private sector capital, technology adoption, and/or innovation?

LEADERSHIP

Lead by example – Is City government reducing emissions or preparing for climate change? Could this influence actions led by another city, state, or federal entity? Could this increase public awareness of climate change issues?

IV. 2016 GPC COMPLIANT GHG INVENTORY SNAPSHOT

GPC REF. NO.	GHG EMISSIONS SOURCE (BY SECTOR AND SUB-SECTOR)	TOTAL GHGS (METRIC TONNES CO2E)

Physicians for Social Responsibility, *This Is What Energy Democracy Looks Like* (2024)

toryehrn · 10 minutes ago · 10 min read

This is What Energy Democracy Looks Like

When you sign up for electricity from PECO, how much of that energy is coming from renewable sources like solar? Although almost 80% of approximately PECO's 1.6 million customers are on this default plan, a very tiny percent of those people probably know what the makeup of that energy plan is, that is, what percent of power for their home is coming from coal, gas, nuclear, solar or other sources. But while the number of people advocating for more renewable power in PECO's default plan has skyrocketed over the last two times PECO has submitted its plan for approval, the committed proportion for solar energy in that plan has remained...a very tiny percent. **Specifically half of one percent.**

Approximately every four years, PECO has to get the plan for how it procures its default service approved by the Pennsylvania Utility Commission. Four years ago, the mix of energy PECO had in its default service procurement was only shown to be .5% from solar power. Despite outcry from customers at the public hearing that the PUC hosted in 2020 - the first time ever that the PUC had hosted a public hearing on PECO's default service where customers were able to speak - the PUC approved that procurement plan. Now PECO has submitted its plan for the 2025-2029 period, and it has the same proportion of energy coming from solar.

Doubling the opportunity for input from the single hearing four years previous, last week the PUC hosted two public hearings - one telephonic and one in person - to solicit PECO customer input. These hearings generated a lot of passion, lasting over 3 hours each, with 35 people testifying on the phone and 46 in person. This is ever twice the number of people who testified in 2020 (35). For a look into this process, you can read coverage in the Philly Voice or watch the entirety of the FOUR HOUR in person hearing on PSR PA's instagram. However, since not every customer who is concerned about the lack of renewable energy in PECO's default service is able to join a telephonic or in person hearing, others prepared written comments to be shared publicly. You can scroll down or click here to see those comments, which reflect the overwhelming message of those who shared last week: that PECO's proposed default service plan is harmful for our climate, and as we see the cost of solar decline, PECO is leaving (ratepayer) money on the table as well.

Officials also weighed in, with 29 Pennsylvania senators, representatives, and municipal officials signing a letter to PECO's CEO that urged "dramatically increasing the portion of PECO's energy supply that is procured from renewable energy." You can read that letter here.

PSR PA is one of six organizations legally intervening in the process by which the Pennsylvania Utility Commission approves PECO's default service energy procurement, alongside allies POWER Interfaith, Sierra Club, Vote Solar, Clean Air Council, and PennEnvironment, together represented by Earthjustice.

Paul Leonard, Maple Glenn
Retired Township Manager and Perkasie Borough Public Electricity Manager

I would like to see the amount of clean renewable power in PECO's electricity mix increase from the current 6% to the maximum amount practically possible by 2030. This is achievable if the full spectrum of existing technology is used, including solar, wind, battery, virtual power plants and reconductoring. It is the responsible thing to do and it is also economically efficient.
As a previous borough manager of a public electricity distribution system in Bucks County PA, I became aware of the large amount of money that an electricity distribution system could create. As a non-profit public entity, our electric distribution rates were below those of PECO and PPL AND we had excess funds that could be used for the operations of the government AND we could lower taxes. For a city manager, this was an extremely fortunate situation. We were able to provide more reliable electric service with fewer and shorter outages. We also could fund excellent roads, parks, swimming pools and libraries because our residents owned the electric lines. They could pay their bill in person, talk to a live person on the phone when there was a problem, get an accurate estimate of the outage time and vote out the councilmembers if they were unsatisfied with the electric system's management.

When a private corporation provides the electricity, you are sacrificing a lot of service and money. It seems time for the for-profit electric corporations to remember that they are granted monopoly status to better serve the genuine needs of the public, not to further their investors. I feel that serving the public means listening to their requests for quality electric service, and in 2024, this means electricity powered by lots of clean modern renewable energy.

Cathy Leonard, Maple Glen

We need our electricity to be supplied with as much nonpolluting renewable electricity as possible, and as soon as possible. I am very disheartening at the extremely low rate of 6% renewable energy currently offered by PECO as the default electricity selection. I would like to see the amounts of renewable electricity in PECO's electricity mix increase by 6% each year. This rate of emission reductions would be in line with the Intergovernmental Panel on Climate Change recommendations and the US government's commitment of a Nationally Determined Contribution of greenhouse gas reductions of 45% by 2030. Because I am concerned that global warming is a serious threat to us all, I have educated myself on the causes and solutions. I have come to the conclusion that our electricity system is both a serous contributor to the problem but also a source of solutions.

I am surely not alone is expecting that a public monopoly should fulfill the wishes of the public. In the December 13, 2023 survey of the general public in Pennsylvania and the Philadelphia metropolitan area by the Yale Center for Climate Communication we find:
80% of residents think that corporations should do more to address global warming
74% think that fossil fuel companies should be required to pay a carbon tax
61% think that local officials should do more to address global warming.
Source: Yale Climate Opinion Maps 2023. Search by state and zip code in Tools and Interactives at https://climatecommunication.yale.edu/visualizations-data/ycom-us/

The amount of carbon dioxide, natural/methane gas and other pollutants that are being released by PECO is contributing to the brown haze that hangs over our city and enters our lungs, sickening us. These pollutants have been found to cause heart disease, stroke, asthma and dementia. In the summer, I need to check the ozone and particulate matter concentrations to see if it is safe for me to exercise outdoors. If PECO stopped polluting our air by employing near 100% clean electricity, I might be able to go outside with confidence that I was not harming my health. With the increase of electric vehicles in our area, it seems only fair that PECO would match these personal investments in clean air by investing in clean electric power for these cars.

As a customer of PECO, an investor owned public utility, I feel that the high electricity prices are not justified by the antiquated and polluting electricity generation, transmission and distribution that we receive. PECO is receiving outstanding guaranteed profit for that subpar planning, clean electricity investment and social responsibility to customers and the economy of the Philadelphia region. We should not wait until a Texas type disaster strikes Philadelphia in a prolonged heat wave and kills dozens to start reinvesting in our aging infrastructure by building renewable energy, updated transmission lines and modern operations.

As regular people like myself become more informed about the negative impacts of fossil fuel electricity, they are finding ways to reduce electricity use. This is not a good business model for a corporation selling electricity. It is does not encourage people to electrify their homes when they realize that the electricity is dirty.

I have numerous customer and operational needs that I would like PECO, PJM and the PUC to address in an urgent timeline to bring our outdated electricity generation, transmission and distribution system up to the exponentially increasing load demands. Because renewable electricity generation is less expensive than other type of generation, this is the most economical and responsible path forward. Planning should begin immediately for retiring polluting and expensive fossil fuel plants and replaced them with more economical solar and wind generation. Utility scale battery storage could be employed to balance increasing renewable electricity resources. The currently installed, but underutilized, smart meters in the PECO area could assist in shaving the peak load to enable the retirement of fossil fuel plants. Virtual power plants could be employed extremely quickly. Reconductoring of congested transmission lines could reduce prices to the PECO area.

The failure of PECO to plan for increased renewable electricity is preventing the city and state from attracting the growing number of clean energy businesses that are planting their roots this year in other states, leaving Philadelphia and Pennsylvania behind. This may be especially critical to the operation of the upcoming clean hydrogen hubs. We may have already missed the boat on establishing a new clean industry in PA, but we could still try to get on board this year. It really seems like it's now or never.

Victoria Alfred-Lewow, Philadelphia
I stand with thousands of PA consumers in encouraging PECO to build solar and wind energy into its default service plan. Everyone in the state has to pay utility bills every month, and every resident has to live on this planet every day. Bills won't change, but how we pay them - in the dollars and cents way and the long-term environmental cost way - MUST change.

Pastor Jonny Rashid, West Philadelphia Mennonite Fellowship
PECO's new DSP for the next 4 years is dangerous. The majority of PECO's power is fossil fuel generated and PECO will continue to emit millions of tons of CO2, pollute our air, aggravate our asthma, and cause our electricity prices to fluctuate, unless they are forced to change.
In a recent interview, PECO's response to generating less power from fossil fuels was "PECO will work to ensure the electricity is purchased a the lowest price possible and in a way that will guard against price volatility for our customers" thus implying that the price of renewable power is neither cheap nor stable. This is not true.

Do a quick search of "price of solar power vs natural gas" and any article less than 2 or 3 years old states solar generated power is unquestionably less expensive than fossil fuel generated power. In fact, the first article that appeared for me was an article in Bloomberg News stating "Solar Is Now 33% Cheaper Than Gas Power in the US. Natural gas's dominance as power-plant fuel in the US is fading fast as the cost of electricity generated by wind farms and solar projects tumbles." 33% cheaper!

What about price volatility? The sun is going to shine uninterrupted for the next 5 billion years, give or take a few. And as long as the sun shines, the wind also will blow, same 5 billion years. Build a solar farm or a wind farm and it will generate power day after day after day, same cost, regardless of labor strike, political turmoil, natural disaster, war, fuel tax, carbon taxes, you name it. The price of sun and wind is the same. Always. Zero. Where's the price volatility in this? This sounds to me like a good candidate for predictable, long-term, stable power prices. Can the same argument be made about natural gas prices, that they aren't going to spike in 6 months when a supply or production or political event throws the energy markets into turmoil? Of course not. That is why power generators using fossil fuels won't sell long term contracts. They don't know what their costs are going to be tomorrow, never mind 6 months or a year from now. If anybody wants an example of a commodity with a volatile price profile, fossil fuels are the poster child example!

PECO, is signing long-term power contracts for power with a stable, predictable cost profile, arguably 33% less expensive than short term contracts, really going to cause higher, unstable prices? I fail to see the logic of your argument.

Eve Gutman, Philadelphia

My name is Eve Gutman, I live in Southwest Philadelphia, and I'm a PECO customer. The energy that PECO uses in its default service is important to me because I cannot afford to buy my electricity from an alternative provider. I do not want my public utility to be purchasing energy that is poisoning and killing people, like coal, oil, and methane gas are, on my behalf. I'm asking the PUC to ensure that PECO dramatically increases the percentage of energy it procures from renewable sources like wind and solar and that it negotiates longer-term contracts, thus unlocking more affordable wind and solar energy.

I'm familiar with the many-years-long grassroots campaign calling on PECO to increase its procurement of local solar energy. So many concerned citizens have gotten involved in those efforts and the work has been sustained for so long because this is such an important issue for many PECO customers. We want PECO to have a procurement plan in place that is truly in our best interest -- for our health and safety now and in the future. Those of us who have spoken up at recent hearings or submitted written testimony are just the tip of the iceberg; many more want affordable renewable energy than those who were able to show up to hearings or those who knew about submitting written testimony.

For all of us, all of them, and all PECO customers, PECO must do much better with increasing the amount of renewable energy it procures in its default service.

Barbara Atkinson

On this Earth Day, I'm reflecting on the many years since the first Earth Day in 1970. I attended Temple University in the late 1970s, became fascinated with solar and renewable energy through an undergraduate class, and majored in Engineering Technology to follow this interest. I worked in the fields of solar and energy-efficiency for the rest of my career and obtained a Master's degree in Energy and Resources from UC Berkeley along the way. I've also served on several volunteer committees and boards for low-income energy programs, environmental justice, and green electricity.

I attended the PUC hearing on PECO's Default Service Plan on April 18th. I support the Energy Advocates' position that PECO incorporate a substantially higher portion of solar and wind in its energy supply portfolio. And I advocate the use of long-term contracts to procure the most economical energy sources for its customers, which economists have shown would favor renewable energy.

We've known for all these decades since the "Energy Crisis" of the 1970s that our society needed to needed to move toward meeting our energy demand – including electricity - by more efficient technologies and practices and supplying the rest with renewable energy. Here is an example from that Temple class on energy fundamentals over 40 years ago. Among the range of energy sources, fracked gas was seen as one of the most unrealistic and highly wasteful methods to squeeze the last drops of fossil fuel from the earth. Developing more sustainable energy sources would have avoided having to resort to this unfortunate technology. And in the larger picture, the multiple examples of human-caused climate change would not be so heavily upon us. It's way past time for regulators and utilities to step up to turn this crisis. I urge the PUC to make the right decision to fix our energy mix now!

Open Letter of Elected Officials

Michael Innocenzo
Dave Velazquez
PECO
2301 Market St.
Phila PA 19103

April 24, 2024

RE: Advancing Clean Energy through PECO's Default Service Plan

Dear Michael A. Innocenzo, Dave Velazquez and PECO Senior Leadership**,**

We, the undersigned elected officials – representing constituents across PECO's service territory urge you to dramatically increase the portion of PECO's energy supply that is procured from renewable energy.

As elected officials, we are resolutely committed to protecting the health and safety of our constituents. Calling on you to dramatically reduce our region's reliance on fossil fuels is in alignment with that imperative.

The urgency of transitioning to a clean energy future has never been more clear. Our communities are already experiencing the devastating impacts of extreme weather, worsening air quality, and energy insecurity. We must accelerate the deployment of clean energy in order to avert the worst impacts of global warming; in doing so, we will also create life-sustaining local jobs, decrease the volatility of utility bills, and facilitate resilience in the face of a changing climate. As Pennsylvanians, our state gives us the right to clean air, pure water, and to the preservation of our natural resources under Article 1, Section 127 of Pennsylvania's Constitution. We are asking PECO to adhere to the same rights for its constituents.

Since most of our region's residents are served by PECO's Default Service Plan, increasing the share of solar energy within that procurement is the most direct route to a cleaner grid for all. In 2020 many of our colleagues testified regarding PECO's present Default Service Plan, and now PECO has another chance to

lead towards a renewable energy future that works for all. By procuring solar through long-term contracts, PECO can provide cost certainty, lower overall wholesale costs, and help drive the market for more solar to come online. This will especially benefit low-income households, who are disproportionately burdened by the volatile costs and health impacts of fossil fuels.

As public servants, we were elected to safeguard the best interests of our constituents. By increasing the renewable energy in its default service plan, PECO can similarly demonstrate its commitment to safeguarding the social, environmental, and economic well-being of the communities it serves.

We look forward to collaborating with you to preserve a brighter, more sustainable future for our constituents and future generations.

Sincerely,

State Senators

Amanda M. Cappelletti, District 17 (D)
Art Haywood, District 4 (D)
Katie Muth, District 44 (D)
Nikil Saval, District 1 (D)

State Representatives

Acknowledgments and Disclaimers

This brief was written by Jasmine McAdams and is based on work supported by the U.S. Department of Energy under Award Number DE-OE0000925. The author thanks the following individuals for their contributions, comments, and insights, which helped to improve the paper:

- **Natasha Campbell**, NASEO
- **Cara Dougherty**, NGA
- **Kelsey Jones**, NASEO
- **Maddie Koewler**, NASEO
- **William McCurry**, NARUC
- **Tanya Paslawski**, NARUC
- **Jessica Rackley**, NGA
- **Danielle Sass Byrnett**, NARUC
- **Kirsten Verclas**, NASEO
- All roundtable participants including federal and state decision-makers, members of community-based organizations, and subject-matter experts

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

Background

The National Association of Regulatory Utility Commissioners (NARUC), National Association of State Energy Officials (NASEO), and National Governors Association (NGA) hosted a State Energy Justice Roundtable (Roundtable) in April 2022. Participants included federal and state decision-makers, members of community-based organizations, and subject-matter experts. The Roundtable members explored current state efforts to articulate and incorporate energy justice concerns into energy-related decision-making. Participants established connections with one another to better understand the current landscape of existing resources, learn about emerging efforts, and identify ongoing support opportunities for advancing energy justice.

This paper is one of five authored by the host organizations on topics that were the focus of the Roundtable. Each paper summarizes key themes, emerging efforts, and group takeaways that were discussed at the Roundtable and should assist state members in developing and meeting their own state goals around energy justice. The papers all include the same discussions of background, introduction, and reading list so they can be read separately. Each paper is written from the perspective of one association and includes options for its members to take actions that could support more equitable state energy policies and programs. The five papers cover:

- Participation in decision making (NARUC)
- Customer affordability and arrearages (NARUC)
- Energy justice metrics (NARUC)
- Equity in clean energy research and development (NASEO)
- Equitable distributed energy resource (DER) access (NGA)

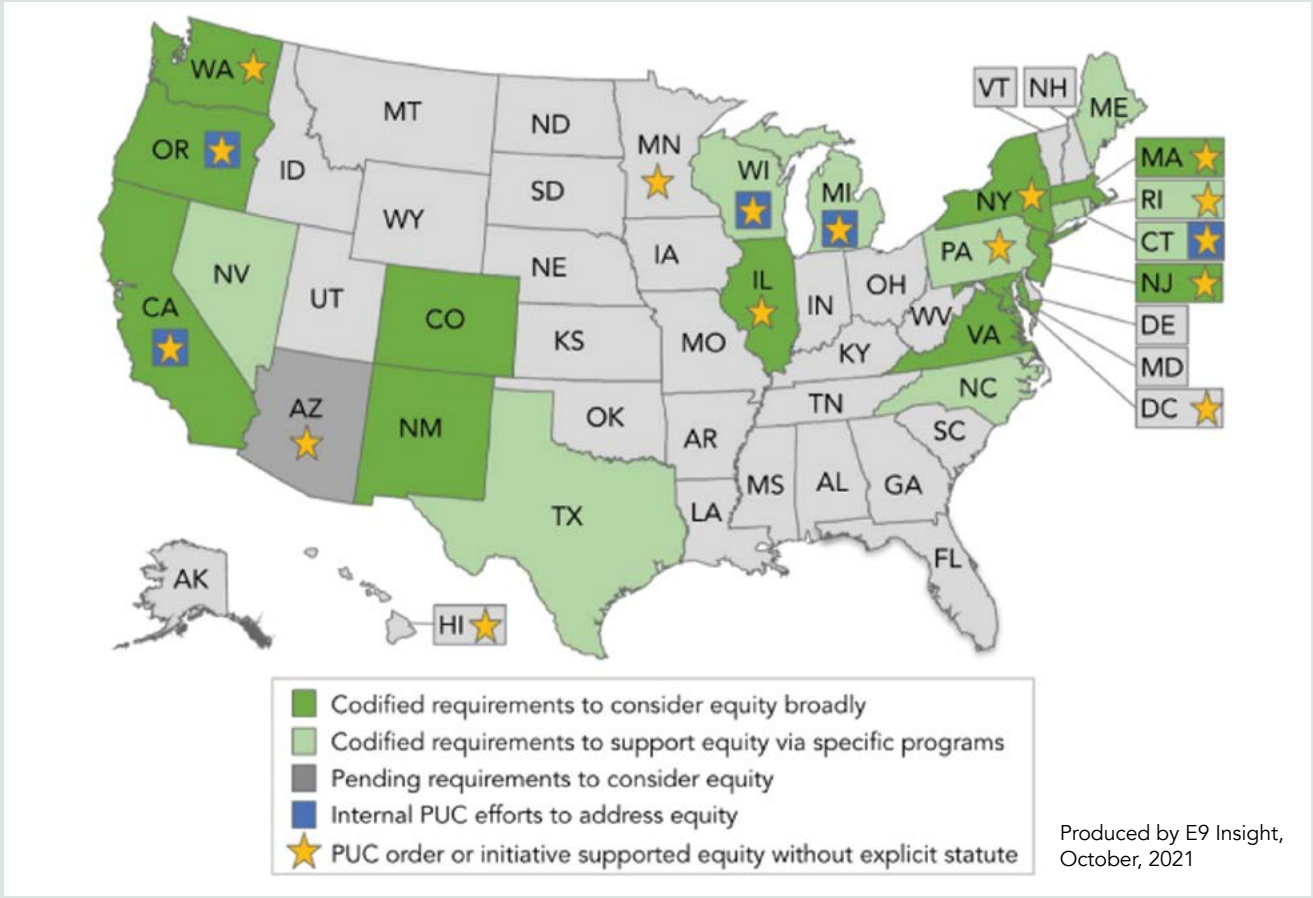
The resources and recommendations listed in these papers are not meant to be exhaustive, as this field of study continues to evolve. Although this brief is focused on electricity, energy justice considerations extend to all energy needs and services, including the impact of energy extraction, processing, and distribution functions.

Introduction

The Growing Priority of Energy Justice in Energy Policy

The impetus for the Roundtable was the emergence of energy justice as a priority for state and federal decision-makers in recent years. The energy sector transition from fossil fuels to low-carbon energy resources has highlighted the disparate social, economic, and health impacts of the current energy system. The recent focus on energy justice has been driven by state legislative mandates, state programs and policies, focused federal investments, and societal recognition of inequities. Examples of recent state legislation on energy justice include California's SB 350, 2021, Colorado's HB21-1266, 2021, Illinois' SB 2408, 2021, Maine's HP 1251, 2021, Massachusetts' S.9, 2021, and Oregon's HB 2475, 2021.[1] Further, **Figure 1** illustrates actions by state public utility commissions (PUCs) across the country.

Figure 1. Equity Activities and Requirements at U.S. Public Utility Commissions



Produced by E9 Insight, October, 2021

Significant federal action has also occurred recently. In early 2021, President Biden issued Executive Order 14008, directing 40 percent of the overall benefits from federal climate and clean energy investments toward disadvantaged communities in an initiative known as Justice40. In July 2021, the Office of Management and Budget released Interim Guidance for the Justice40 Initiative that outlined requirements for federal agencies that manage covered programs, established an interim definition of disadvantaged communities, and defined actions required of state agencies, such as State Energy Offices, that manage Justice40 programs. Subsequently, on July 25, 2022, the U.S. Department of Energy (DOE) released

1 C. Farley et al., *Advancing Equity in Utility Regulation*, Lawrence Berkeley National Laboratory, 2021, https://emp.lbl.gov/publications/advancing-equity-utilityregulation

General Guidance for Justice40 Implementation that provided program and funding guidance, policy priorities and benefits, and case studies for demonstration and educational purposes.[2]

In addition, on February 18, 2022, the White House Council on Environmental Quality released the beta version of its Climate and Economic Justice Screening Tool (CEJST) to help federal agencies identify disadvantaged communities that are marginalized, underserved, and overburdened by pollution.[3] On the same day, the U.S. Environmental Protection Agency released an update to its EJSCREEN tool, an environmental justice mapping and screening tool that may complement CEJST. Additional guidance from the federal government on the Justice40 initiative is expected.

Defining Energy Justice

Although the concept of energy justice and injustice varies among organizations and stakeholders, it generally includes evaluation of:

- **Energy burden** – the proportion of energy expenditures relative to overall household income
- **Energy insecurity** – the hardships households face when meeting basic household energy needs
- **Energy poverty** – the lack of access to reliable and affordable energy
- **Energy democracy** – whether communities have agency in shaping their energy future[4]

The host organizations of the Roundtable proposed the following working definition of energy justice, adapted from the Initiative for Energy Justice:

> **The goal of achieving equity in both the social and economic participation in the energy system, while also remediating social, economic, and health burdens on those historically harmed by the energy system. Energy justice explicitly centers the concerns of marginalized communities and aims to make energy more accessible, affordable, clean, reliable, resilient, and democratically managed by and for all communities.**[5]

What's The Difference between Energy Justice, Environmental Justice, and Climate Justice?

Justice, by definition, implies fairness and impartiality. Energy justice, environmental justice, and climate justice are inherently connected and together represent a more just future for individuals and communities who have suffered historic injustices. **Environmental justice** specifically involves the 'recognition and remediation of the disproportionately high and adverse human health or environmental effects on communities of color and low-income communities' as well as fair treatment and meaningful involvement in the development, application, and administration of environmental laws, regulations, and polices. **Climate justice** focuses on the 'remediation of the impacts of climate change on poor people and people of color, and compensation for harms suffered by such communities due to climate change.' Collectively with **energy justice** (defined above) these frameworks can help create a comprehensive vision for a just transition. The principle of a just transition supports the co-existence of a healthy economy and clean environment, and the process and practice of achieving this vision is one that is fair and does not cost workers or community residents their health, environment, jobs, or economic assets.

5 Ibid.

The energy industry is embarking on fundamental changes to the way energy is produced and delivered that will result in cleaner, and possibly more localized, options. This transformation offers an opportunity to recognize disparities in who has received the benefits and who has carried the burdens of the existing system by intentionally investing in historically disadvantaged communities.

A four-pillar framework has emerged in energy justice literature that helps conceptualize how energy justice is achieved. Although the exact terminology varies slightly among groups, the following language was used to frame the Roundtable discussions:

- **Distributional justice** – an inherently spatial concept[6] that concerns both the distribution of costs, hazards, or externalities, and the distribution of benefits and access to modern energy systems and services, throughout society.[7]
- **Procedural justice** – relates to the accessible and meaningful participation of individuals in the energy decision-making processes.
- **Recognition justice** – seeks to acknowledge the various needs, rights, and experiences of different groups in relation to the energy system.[8]
- **Restorative justice** – aims to repair the harm done to people (and/or society/nature) and can pinpoint where prevention needs to occur.[9]

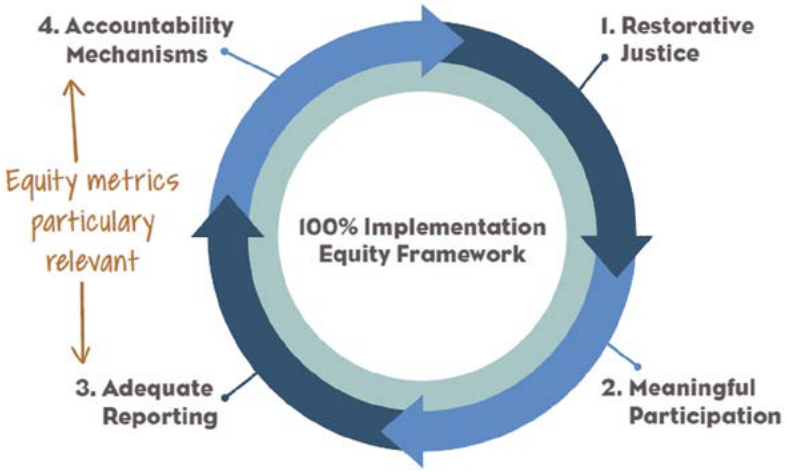
Metrics Context within the Broader Energy Justice Framework

The collection and analysis of data are essential to energy justice efforts. They can be used to develop programs, evaluate outcomes, and compare them to the intended goals and are an important resource for accountability. A framework, similar to what was provided in the previous section, was developed by the Initiative for Energy Justice and Front and Centered specifically to guide and evaluate implementation of renewable energy requirements,[10] which also provides a roadmap that can be applied to other policies (see **Figure 2**).

Figure 2. Framework to Guide Clean Energy Program Implementation



1. **Restorative Justice** ensures that past and current energy injustices guide implementation and underline all aspects of policymaking and program implementation processes, particularly to frame, ground, and clarify definitions and parameters.
2. **Meaningful Participation** is key throughout the development, evaluation, iteration, and enforcement of implementation plans.
3. **Adequate Reporting** is necessary for state decision-makers and the public to meaningfully evaluate and respond to actions undertaken during the implementation period of a policy or program.
4. **Accountability Mechanisms** are structures that hold the utility, state, or other parties accountable to the goals and actions outlined in an implementation plan. Here, the process restarts with a commitment to restorative justice and active engagement of the public to respond to progress and address remaining inequities.[11]

The Roundtable discussion reiterated how the concepts in this framework can enable the just development and implementation of metrics. In addition to the four-part approach described previously, participants cited the need for:

- Transparency in how metrics are selected and operationalized
- Meaningful stakeholder participation through an iterative data and metrics selection process
- Adequate resources to empower community members and community-based organizations to access and use relevant metrics
- The creation of a "Data Bill of Rights" to encourage practices that protect consumer interests and the ethical collection and use of data
- Integration of energy justice metrics within system planning process and with consideration of other system interdependencies (i.e., water)

Types of Metrics

During the Roundtable, and in a literature review conducted by the Pacific Northwest National Laboratory,[12] four types of metrics emerged as pertinent to energy justice initiatives: target population identification, investment decision making, program impact assessment , and accountability metrics.

Target Population Identification

Target population identification metrics identify criteria that can be used to direct policies and programs to intended populations. Being intentional and comprehensive in the selection of these metrics can provide a more thorough understanding of those with energy-related needs. Demographic information is a common source of data to help policymakers target programs and efforts to those they are intended to serve.

Potential questions to guide identification of population metrics are:

- Who is eligible for support programs?
- Who has not received support?
- Which communities are included/excluded in the federal and/or state definitions of disadvantaged communities?
- Where are energy prices higher or more burdensome?
- Who is able to make their monthly utility bill payments?
- Where have energy efficiency measures been put into place?
- Which households limit their energy expenditures to meet other necessities?

Roundtable participants noted that these metrics are crucial for ensuring that policies and programs do not exclude individuals or communities who may have limited access to electricity, such as some Indigenous communities, or those that may be not clearly fall under certain thresholds, such as the Federal poverty levels or energy burden definitions.

State Snapshot: New York

New York's Climate Leadership and Community Protection Act (Climate Act), signed into law in 2019, requires state agencies, authorities, and entities to direct 40 percent of the benefits from clean energy and energy efficiency program investments to disadvantaged communities. The Act also directed the Climate Justice Working Group to establish criteria for defining disadvantaged communities.

Over the last couple of years, the working group has been developing a mapping tool that aggregates data at the census tract level. While the Climate Act provided broad categories for consideration of disadvantaged communities, such as areas burdened by pollution and areas most vulnerable to climate change, the working group identified 45 unique indicators such as income, race, home ownership, and prevalence of asthma to come up with an aggregate score for each census tract. Using this proposed method, the census tracts that score in the top 27 percent statewide, and those that score in the top 27 percent in New York City, would be designated as disadvantaged communities.

The state opened a 120-day public comment period from March 9, 2022, to July 7, 2022, on the proposed criteria and methods.

12 B. Tarekegne, G. Pennell, D. Preziuso, &R. O'Neil, Review of Energy Equity Metrics. Pacific Northwest National Laboratory, 2021, https://www.osti.gov/servlets/purl/1830804.

In November 2022, the White House Council on Environmental Quality (CEQ) launched version 1.0 of the Climate and Economic Justice Screening Tool (CEJST).[13] Communities are considered disadvantaged if they are in a census tract that meets the threshold for at least one of the tool's categories of burden and corresponding economic indicator, or are on the lands of a Federally Recognized Tribe. Version 1.0 of the CEJST identifies 27,251 communities as disadvantaged or partially disadvantaged. The CEJST uses an open-source platform that provides transparency on the methodology and datasets used. The CEJST will continue to be updated based on recommendations from a National Academies of Sciences, Engineering, and Medicine committee[14] and public feedback. Version 1.0 of the Climate and Economic Justice Screening Tool and frequently asked questions can be found at https://screeningtool.geoplatform.gov.

Investment Decision Making Metrics

Assessing the distributional impact of potential investments can be used to direct programs toward communities that meet designated eligibility criteria. For example, community-based organizations attending the Roundtable noted the importance of maximizing opportunities for the economic benefits of the energy transition to stay within frontline communities. Decision-makers can evaluate the potential impacts of a decision by using metrics such as wealth creation, and the number of potential quality clean energy jobs or business contracts in these communities. These priorities were also reflected in Presidential Executive Order (EO) 14008: Tackling the Climate Crisis at Home and Abroad. EO 14008 introduced the Justice40 (J40) initiative to direct 40 percent of the benefits to disadvantaged communities (DACs) from climate and clean energy investments.[15] Guidance on J40, released by DOE in July 2022, provided several example metrics to capture these benefits, such as:

- Dollars spent [$] and/or number of participants from DACs in job training programs, apprenticeship programs, STEM education, tuition, scholarships, and recruitment
- Number of hires from DACs resulting from DOE job trainings
- Number of and/or dollar [$] value of partnerships, contracts, or training with minority serving institutions
- Number of contracts and/or dollar value [$] awarded to businesses that are principally owned by wom en, minorities, disabled veterans, and/or LGBT persons.[16]

Potential questions to utilize investment metrics in decision-making are:

- In which communities does a proposed policy/goal/investment lead to the greatest number of new quality jobs?
- What are the health and environmental impacts of a proposed policy/goal/investment in a community?
- What is the degree of community acceptance and support for a proposed policy/goal/ investment?
- To what extent does a proposed policy/goal/investment improve energy security in a community?

Information on customer behavior may also influence investment decisions. For example, a recent study by researchers at Carnegie Mellon University revealed that the income-based metric of energy burden does not sufficiently capture the extent of a household's energy poverty and insecurity, as the data overlook how they

13 The White House, *Biden-Harris Administration Launches Version 1.0 of Climate and Economic Justice Screening Tool, Key Step in Implementing President Biden's Justice40 Initiative*, November 22, 2022, https://www.whitehouse.gov/ceq/news-updates/2022/11/22/biden-harris-administration-launches-version-1-0-of-climate-and-economic-justice-screening-tool-key-step-in-implementing-president-bidens-justice40-initiative/

may limit their energy consumption to lower costs at the expense of their health and comfort. The researchers suggested a new energy poverty metric to complement energy burden – the energy equity gap.

> *The energy equity gap is the difference in the inflection temperatures, or the outdoor temperatures at which a household starts using a cooling system, between low- and high-income groups.*

The energy burden and energy equity gap metrics can be used together "to identify households experiencing multiple forms of energy poverty: those who experience financial strain while satisfying their energy needs [energy burden] and those who forgo energy consumption to reduce financial strain and satisfy other necessities [energy equity gap]."[17]

State Snapshot: Connecticut

To achieve their goal of weatherizing 80 percent of all homes in the state by 2030, the Connecticut Department of Energy and Environmental Protection and the Connecticut Green Bank set their focus on attracting private investment to scale up low-income energy efficiency efforts and ensure equitable access to solar. The metrics strategy used by Connecticut was to use a variety of data sources to define the low-income residential sector for energy efficiency and solar deployment in low- and moderate-income communities, and track their progress in a statewide energy efficiency dashboard. Connecticut also utilized the U.S. Department of Energy's Low-Income Energy Affordability Data (LEAD) tool to target programs to single-family, owner-occupied homes and large multifamily buildings.

For energy efficiency programs, the Green Bank conducted analysis at the census tract level on households that may be eligible for utility-administered programs, which provided insight on whether equitable participation was being achieved. For solar photovoltaic (PV) deployment, they visualized the data at the census tract level for the number of projects and the kW installed to calculate the kW installed per capita at different income levels. The Green Bank also leveraged analysis on customer behavior and bias to better tailor customer communication. Census-tract level maps were also used to target new low-income customers for these programs.

These measures, along with others, helped support the launch of the Solar for All program, bringing solar and energy efficiency to underserved communities.

Program Impact Assessment Metrics

Metrics that show how well a support program has helped a targeted community can be employed after implementation to understand the impact. Although they are often tied to target population identification and investment decision-making metrics, these metrics are focused on tracking outcomes and progress by measuring the benefits that directly reach people.

Potential questions to guide identification of impact metrics are:

- Are communities enrolling in and satisfied with the program?
- Has the program generated wealth for targeted communities?
- Has the program generated savings in energy or energy costs?
- Has the program improved communities' quality of life?[18]

Accountability Metrics

Roundtable participants elevated accountability metrics as fundamental for both utilities and agencies engaged in this work. Accountability not only helps to advance positive program outcomes but plays an important role in building community trust and continued engagement. Participants suggested metrics that captured elements such as transparency in processes, diverse and inclusive demographic representation within utilities and agencies, and meaningful stakeholder engagement processes.

Potential questions to guide the identification of accountability metrics are:

- Has stakeholder engagement around the policy/goal/investment engaged a diverse group representative of those who will be/are being impacted?
- To what extent is the representation of agency/utility staff representative of ratepayers/residents?
- During which parts of the process are stakeholders engaged?
- Have stakeholders had the opportunity to provide meaningful feedback after implementation?

Outstanding Needs and Limitations

Throughout the Roundtable, participants discussed the outstanding needs for and limitations of energy justice metrics. Feedback generally coalesced around the issues of:

- Standardization
- Missing, incomplete, or outdated data
- Concerns about misuse of data
- Staff capacity and expertise
- Bureaucratic inefficiencies

Participants noted that the lack of standardization in how data are collected and which metrics are used contributed to a hesitancy to implement metrics, difficulty comparing progress between locations, and added hurdles for inter-agency coordination. These challenges also add strain to organizational resources, which are often already limited by finite funding, staffing, and technical expertise. Participants suggested that these resource limitations could be addressed through means such as having access to a national database or pool of technical experts and through increased funding for technical assistance.

Gaps in current data are also seen as a significant limitation to the quality and applicability of energy justice metrics. Participants listed the following data gaps as current challenges:

- Unreliability of data, particularly for Indigenous or rural communities, due to the lack of granular data or distrust in how data is collected
- Lack of data related to procedural justice
- Limited access to utility data
- Lack of grid reliability and resilience data overlapping with other equity metrics
- Challenges identifying critical assets and vulnerabilities
- Lack of comprehensive analysis on the status of data infrastructure
- Need for increased third-party validation to ensure quality control of data

Bureaucratic inefficiencies and IT infrastructure were also mentioned as a limitation for agencies and organizations regarding data sharing. However, state staff shared promising practices that could be applied in other regions of the country.

- The Vermont Climate Council has a subcommittee on Science and Data to oversee the incorporation of high-quality and updated data for inclusion in the state's climate action plan and is working to identify where current data gaps exist.[19]
- In California, the development of CalEnviroScreen,20 which identifies and maps DACs in California, compiles data from agencies throughout the state for a comprehensive suite of demographic, health, and environmental metrics.

Participants also discussed the value of data sharing among agencies such as state departments of emergency management and economic development agencies.

Although the Roundtable discussion largely focused on the importance of allocating resources to improve the development of metrics, participants also cautioned that this effort should not come at the expense of equity considerations that may not be explicitly quantifiable or disregard analyses where data may not be 100 percent complete.

The group also raised the following overarching questions about metrics that warrant further inquiry:

1. How can these topics be considered for cooperative and municipal utilities that are not regulated?
2. Is there a baseline standard for how much funding and effort should agencies allocate for this work?
3. How are these metrics implemented absent authorizing legislation?
4. What is the appropriate balance between improving data collection and access with protecting individual privacy?

Relevant Resources

One of the challenges of identifying appropriate metrics is that stakeholders have different interpretations of justice and equity. Multiple organizations have recognized the need to address this issue and have convened diverse stakeholders to define and characterize energy justice metrics for use by state, local, and federal agencies, utilities, and other entities. A few ongoing initiatives are highlighted as follows:

- Launched in early 2021, the American Council for an Energy Efficiency Economy's (ACEEE) Leading with Equity Initiative is convening community-based organizations, advocates, and utilities to jointly define success for equitable decarbonization, and use this definition to develop metrics for ACEEE's city, state, and transportation electrification scorecards that capture progress towards equity-centered clean energy policies and program outcomes.

- The Energy Equity Project (EEP) is an initiative housed out of the Urban Energy Justice Lab at the University of Michigan's School for Environment & Sustainability working to create a framework for measuring energy efficiency and clean energy programs among utilities, state regulatory agencies, and other practitioners. EEP is centering Black, Indigenous and People of Color (BIPOC) and frontline communities in the metrics development process to support the equitable distribution of benefits of climate and clean energy programs. A beta version of the equity measurement framework is set to launch in 2022.

20 California Office of Environmental Health Hazard Assessment, CalEnviroScreen 4.0, https://oehha.ca.gov/calenviroscreen.

- The Initiative for Energy Justice developed the *Justice in 100 Metrics Report* by reviewing existing literature and compiling equity metrics for the implementation of 100% renewable energy policy. The framework is composed of equity indicators and utility actions across the categories of energy access and affordability, procedural justice and democracy, community ownership and economic participation, and health and environmental impacts.

Actions for Public Utility Commissions

Participants in the Roundtable would like to see Commissions move forward with energy justice metrics by adopting promising practices identified in this brief and also:

- Coordinate with other state agencies and utilities to share data
- Include a diverse set of stakeholders, particularly those from frontline communities, in a transparent and iterative process for metric development, whether led by the Commission or utilities under its jurisdiction
- When overseeing utilities incorporating energy justice metrics, consider adopting a standardized set of metrics and data practices
- When selecting metrics for target population identification, consider metrics that capture a comprehensive scope of burden beyond just income and energy burden

Resource List

The following list of publications, data and tools, and organizations conducting work on energy justice issues is included to assist state members seeking more detailed information and support for their efforts. Content was compiled from Roundtable participants and staff conducting research for these briefs. Inclusion in this list is not an endorsement of any individual resource or organization's content by NARUC, NASEO, or NGA members, or staff.

Initiative for Energy Justice | iejusa.org

initiative for energy justice

The Initiative for Energy Justice provides law and policy resources to advocates and policymakers to advance local and state shifts to equitable clean energy.

Our team formed the Initiative to address the persistent gap between grassroots communities at the frontlines of the climate justice fight and those sitting at relevant policymaking tables. We connect grassroots-led solutions with the best-available data, evidence, and scholarship. Through concrete technical policy tools and project models, we support frontline communities, justice-based organizations, and policymakers to foreground equity in a just transition to renewable energy.

Executive Summary

The Case for an Energy Justice Workbook and an Energy Justice Scorecard

In recent years, advocates, academics, and policymakers have begun to navigate the transition away from fossil fuels to clean and renewable energy sources. As policies emerge within this transition, stakeholders have debated whether, and how, such policies can (or even should) include issues of equity and social justice. Marginalized communities, which include communities at the frontline of pollution and climate change ("frontline communities"), and those historically and presently disenfranchised by racial, economic, and social inequity, have emphasized the need for equity and justice in the creation of new energy policies. Similarly, some policymakers have expressed interest in equity-centered policy but lack detailed guidance on how to do so.

Despite a growing desire for equity-centered energy policy, a lack of consistent terminology concerning energy equity and energy justice hinders the ability of stakeholders to advance clear policy. This Workbook addresses this gap. The Workbook builds a bridge between theories and practices of energy justice, and develops an Energy Justice Scorecard that provides guideposts to advance equity-centered energy policy. The key audiences for this Workbook include community advocates and policymakers. The Workbook should serve as a guide for activists and advocates on the ground working for energy justice at the state level, and to assist policymakers seeking to understand how to incorporate energy justice into their emerging energy policy frameworks.

What is Energy Justice?

Energy justice cannot be separated from environmental justice and climate justice. The complex lived experiences of marginalized communities reveal an interconnectedness among environmental, climate, and energy justice that would seem to require that energy policy acknowledge the unique ways that environmental harms and climate-related harms affect frontline communities. As such, building on the environmental justice and climate change movements, legal and social science scholars have introduced the concept of "energy justice," which encompasses tenets of procedural, distributive, and recognition justice sought by advocates, academics, and policymakers.

Energy justice refers to the goal of achieving equity in both the social and economic participation in the energy system, while also remediating social, economic, and health burdens on marginalized communities. Energy justice explicitly centers the concerns of frontline communities and aims to make energy more accessible, affordable, clean, and democratically managed for all communities. Those involved in the movement for the transition away from fossil fuels to renewable energy often frame energy justice, energy equity, and energy democracy as a part of a broader "just transition" to a low-carbon regenerative economy that will remedy the injustices of the fossil-fuel energy system and extractive economy across multiple sectors. This Workbook uses the term "energy justice" because it synthesizes and lift ups the traditions of justice-based scholarship, and draws on recent activist practice around energy equity and energy democracy.

Workbook Organization

The Workbook is broken up into three sections. Section 1 provides an overview and synthesis of energy justice, as discussed by frontline advocates, social scientists, and legal scholars. This section begins by defining and summarizing fundamental energy justice principles and terms in order to create understanding and

commonality among key players working to advance principles of energy justice. Section 1 goes on to analyze the principles and terms unique to practitioners, scholars, and policymakers independently.

The authors note that advocates tend to center the voices of frontline communities and attempt to remedy past harms faced by these communities due to the current energy system. Conversely, academic and legal scholars tend to focus on procedural and distributive justice. While the research shows commonality in their emphasis on procedural and distributive justice, the analytical frames differ in two regards: (1) the scope of energy justice and its connection to related "justice" concepts; and (2) the centering of traditionally excluded voices in energy policy. The Workbook combines these separate approaches to energy justice within a unified framework that draws on the practitioners' unique perspectives as well as the theoretical approaches of social scientists and legal scholars.

Section 2 introduces an Energy Justice Scorecard created by the Initiative for Energy Justice. The Scorecard is intended to help those engaging with the energy transition to determine if a policy incorporates energy justice principles, specifically procedural and distributive justice. The Scorecard offers five energy justice indicators: 1) **Process:** Have marginalized communities participated meaningfully in the policymaking process with sufficient support?; 2) **Restoration:** Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?; 3) **Decision-making:** Does the policy center the decision-making of marginalized communities?; 4) **Benefits:** Does the policy center economic, social, or health benefits for marginalized communities?; and 5) **Access:** Does the policy make energy more accessible and affordable to marginalized communities? The scorer then sums the value of each indicator (1 to 5 based on congruence to the principle) to determine the effectiveness of the policy as it relates to energy justice.

Applying the Energy Justice Scorecard: California and New York Case Studies

In order to demonstrate the applicability of the Scorecard to various policy initiatives, Section 3 uses the Scorecard to evaluate emerging community energy policies in both California and New York. Community energy (or community solar) refers to offsite structures that generate power shared by multiple electricity customers. Community energy policies that achieve energy justice strive to supply local communities with renewable energy in an integrated and equitable way, for example through community generated, owned, or managed energy systems.

The California Case Study

Section 3 begins with a focus on two community energy programs in California, the Enhanced Community Renewables (ECR) program and the Community Solar Green Tariff (CSGT). Both of these policies were projected to benefit customers otherwise excluded from other renewable energy programs. More specifically, ECR was intended to provide communities with the benefits of access to nearby offsite renewable energy, while CSGT was intended to provide alternatives to net energy metering and ensure the growth of distributed renewable energy among frontline communities.

ECR allows customers to contract directly with a developer and subscribe to a specific project for all or a portion of their energy needs. Customers receive a credit from the investor-owned utility (IOU) based on their subscription to project developed by a third-party. Unfortunately, ECR did not lead to any realized projects and receives only 7 out of 25 when applied to the Scorecard. The ECR program failed for three main reasons: (1) the conversation around the ECR was continually delayed, (2) the pricing structure was flawed, and (3) there were barriers in the process and mechanisms of participation leading to a lack of procedural and distributive justice. In the end, ECR failed to accomplish the goal of expanding access to renewable energy for Californians unable to benefit from onsite solar.

CSGT is projected to be fully implemented in 2020. CSGT will allow individuals to subscribe to solar energy associated with new installations within five miles of their community and will provide residential customers on the CSGT 100% renewable energy at a 20% discount. This encourages communities to find new methods for maximizing the use of rooftop space and other areas for solar production. The CSGT receives a 14 out of 25 when applied to the Scorecard.

The CSGT will allow for more energy access to low-income communities, but still scores low in benefits to frontline communities and access to decision-making by these communities.

Despite the relatively low scores of both the ECR and CSGT programs, the Scorecard gives future community solar policymakers the ability to foresee potential barriers and inequities, and create new solutions to avoid these barriers.

The New York Case Study

The authors also use the Energy Justice Scorecard to score New York's Community Distributed Generation (CDG) program, which ultimately receives a score of 14 out of 25. CDG was created as a part of Reforming the Energy Vision (REV), a regulatory reform platform that was created in response to Superstorm Sandy, an unprecedented storm that led to widespread power outages and revealed vulnerabilities in New York's energy system.

CDG is one of the many dockets created under REV. Like the ECR and CGST policies developed in California, CDG allows electricity customers to participate in an offsite energy generation project. While CDG provided an avenue for participation from frontline communities in the policymaking process, ultimate policy decisions about CDG design failed to reflect that participation. In particular, CDG failed to center economic, social, and health benefits for traditionally excluded populations.

Key Takeaways from Case Studies

The California and New York case studies share similarities in demonstrating three key takeaways of what is necessary for community energy policies that achieve energy justice: (1) community participation in policy development, (2) sound energy pricing and valuation structures, and (3) sustainable business models that balance both targeting priority customers and consumer protection. The case studies also point to three objectives required for equitable community solar: (1) project feasibility, (2) equitable participation, and (3) community control.

The use of the Scorecard in each case study helps to validate the root causes for the successes and failures of a given policy. This tool gives actors the ability to evaluate existing energy policies as well as inform their approach to proposed energy policy. This Workbook hopes to not only bridge the gaps among activists, academics, and policymakers, but also to provide an accessible tool to facilitate thoughtful conversations, creations, and applications of energy policies that encompass the field of study and practice of energy justice.

Introduction

Around the country, states have begun to act in the absence of clear federal guidance on climate. We are witnessing a sea change through a suite of policy actions, from ambitious renewable energy targets, to rooftop solar programs, community energy legislation, and market innovations such as community choice aggregation. In the face of this rapidly-evolving landscape, those disproportionately harmed by the fossil-fuel based energy system ("frontline communities") and more broadly, marginalized communities (including, but not limited to, environmental justice communities, indigenous communities, low-income and working-class communities, and communities of color)—seek to place equity and distributive justice at the heart of new policies addressing the transition away from fossil fuels to clean and renewable energy sources. As noted by industry observers and community activists alike, this energy transition offers an opportunity to reshape the socio-economic relationships created by energy policy choices. It creates an opening to center the concerns of frontline communities in the creation of energy policy. For example, the energy transition offers an opportunity for communities to own and control clean energy resources while reducing localized environmental and health impacts associated with the burning of fossil fuels.

Energy justice has emerged as both a field of study and practice to guide the energy transition, but the inconsistency surrounding definitions and use threatens the coherency of the field and the ability to advance clear policy guidance actually rooted in energy justice. Scholars in both social science and law have begun to grapple with the theoretical aspects of energy justice as well as its practical applications. In parallel, advocates have also begun to engage in a diversity of activities connected to energy justice and its corollaries, energy equity and energy democracy. Although scholars and practitioners frequently rely on energy justice and energy equity to animate parallel strands of study and practice, these two constituencies are not in active conversation and these parallel strands rarely, if ever, intersect. In light of the varied landscape, we choose to use the term, "energy justice" because we find it to be the most unifying terminology for this overarching concept that can synthesize and lift up both the traditions of justice-based scholarship, and recent activist practice around energy equity and energy democracy.

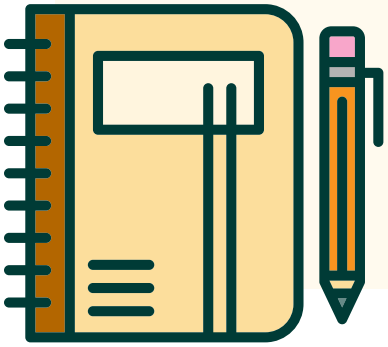
Taking advantage of the opportunity for structural transformation in our energy system requires that equity be placed at the center of emerging policy frameworks; however, community participants in policy debates concerning the energy transition often lack concrete details for energy policies that actually do place equity at the center. Similarly, policymakers lack theoretical grounding and practical frameworks to create and implement equity-centered energy policy. This Workbook addresses these gaps, and builds a bridge between theories and practices of energy justice to facilitate operationalizing energy justice through energy policy. The key audiences for this Workbook include community advocates and policy makers. The Workbook should serve as a guide for activists and advocates on the ground working for energy justice at the state level, and to assist policymakers seeking to understand how to incorporate energy justice into their emerging energy policy frameworks.

How to use this Workbook

The pages that follow provide a broad overview of "energy justice," synthesizing energy justice (and similar terms) as framed by practitioners in the field, as well as by scholars explicitly writing about energy justice.

The Workbook proceeds in four sections. Section 1 provides an overview and synthesis of energy justice, as discussed by frontline advocates, social scientists, and legal scholars. The section ends with a summary of the key energy justice principles that should animate transitional energy policy. Section 2 lays out an energy justice scorecard that may be used by advocates and policymakers to evaluate and design transitional energy policy. Section 3 uses the scorecard developed in Section 2 to evaluate emerging community energy policy in California and New York. We have also included a Glossary and Appendix for easy access to commonly used terms and the data we've relied on in our analysis.

The energy policy landscape is dynamic, and energy justice is context specific. However, basic principles of justice endure. We designed this Workbook to be highlighted, dog-eared, and referenced as the policy landscape evolves. The framework provided herein should be used to provide key benchmarks to guide energy policy discussions. We also designed this Workbook to address the question that frequently arises in the context of equity and energy policy: **What is energy justice?**



Section 1

Defining Energy Justice:
Connections to Environmental Justice, Climate Justice, and the Just Transition

Summary: **Energy justice** refers to the goal of achieving **equity** in both the **social** and **economic** participation in the energy system, while also **remediating** social, economic, and health **burdens** on those historically harmed by the energy system ("frontline communities"). Energy justice explicitly centers the concerns of marginalized communities and aims to make energy more accessible, affordable, clean, and democratically managed for all communities. The practitioner and academic approaches to energy justice emphasize these process-related and distributive justice concerns.

Energy justice connects to, and builds upon, the deep scholarly and grassroots traditions of the environmental justice and climate change movements.[1] Those involved in the movement for the transition away from fossil fuels to renewable energy often frame energy justice, energy equity, and energy democracy as a part of a broader "**just transition**" to a low-carbon regenerative economy that will remedy the injustices of the fossil-fuel energy system and extractive economy across multiple sectors.[2] Advocates engaged in just transition work, through the leadership of the Climate Justice Alliance and the support of Movement Generation, have adopted the following model to reflect their efforts.

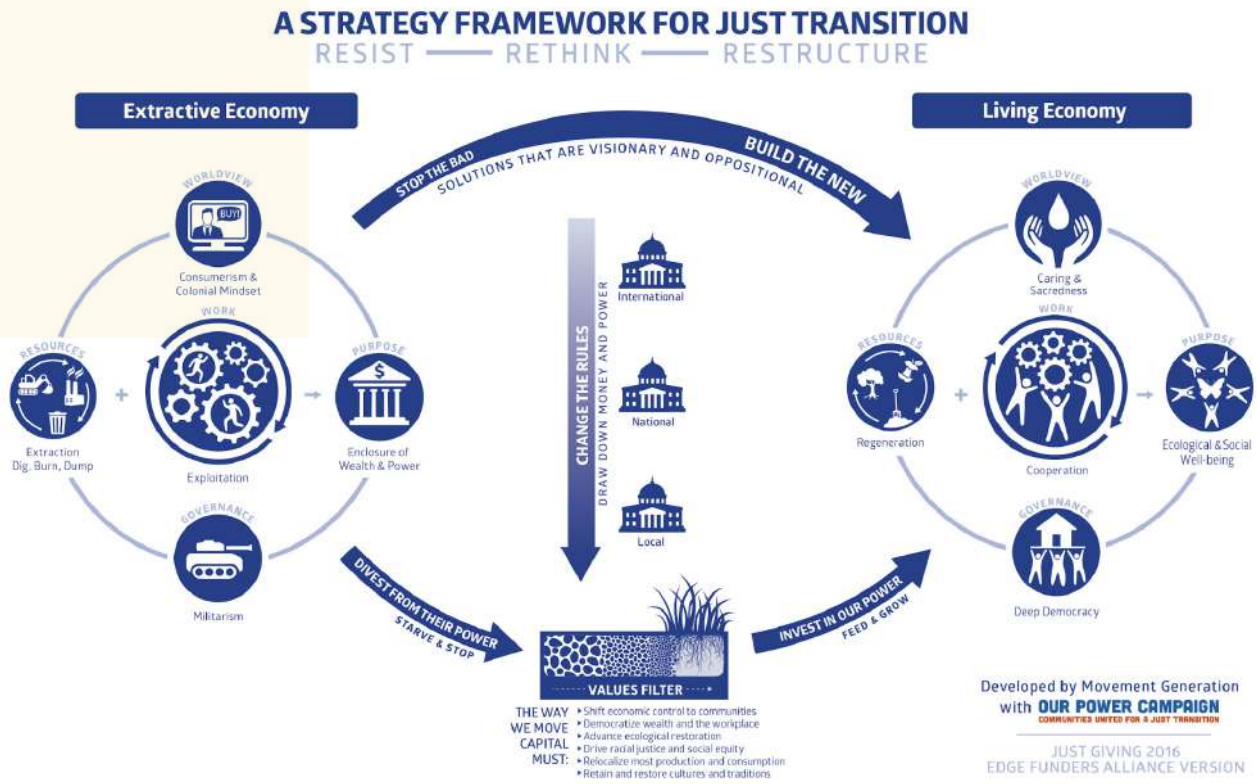


Diagram 1: Movement Generation Just Transition Framework [3]

Energy justice (also referred to as "energy equity") is integral to the just transition, as it addresses fairness and equity concerns within the current, extractive energy system, and incorporates aspects of "deep democracy," cooperation, and regeneration that feature in the just transition frame. Energy justice has several dimensions, itncluding:

- **energy burden**, which refers to the expense of energy expenditures relative to overall household income;[4]
- **energy insecurity**, which refers to the hardships households face when meeting basic household needs;
- **energy poverty**, which refers to a lack of access to energy itself;[5] and
- **energy democracy**, the notion that communities should have a say and agency in shaping their energy future.[6]

Issues of racial, economic, and social justice are not new aspects of political discourse in the United States; however, their nexus with issues of energy and the environment is a relatively recent phenomenon. Furthermore, the focus on "equity" within the energy justice frame indicates that policy approaches should work to level the playing field for those long disadvantaged under the existing energy system, rather than simply provide for "equal" opportunities for all under the new system.

Diagram 2 illustrates the framing of energy justice within the broader movement for a just transition, as well as how the component parts of energy justice fit together.

What is the origin of energy justice?

Energy justice closely connects to terms familiar to both practitioners and scholars in the field: **environmental justice** and **climate justice**. Environmental justice emerged in the early 1980's as both an activist practice and field of scholarship in the wake of damning evidence that communities of color often faced disproportionate environmental burdens, and that the suite of recently passed environmental laws did little to protect such communities from environmental harm.[7] Eventually, in response to a mounting body of evidence produced by activists[8] and academics alike,[9] in 1994, President Bill Clinton issued Executive Order 12898 directing federal agencies, to "the greatest extent practicable and permitted by law . . . make achieving environmental

justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States. . . ."[10] Although some scholars have questioned the efficacy of the environmental justice movement, as well as its utility as a policy tool,[11] others have noted the importance of relying on the environmental justice movement to inform the current transition away from fossil fuels.[12] In any case, environmental justice spawned the climate justice movement, which addresses the acute climate change issues facing communities of color and working class communities.

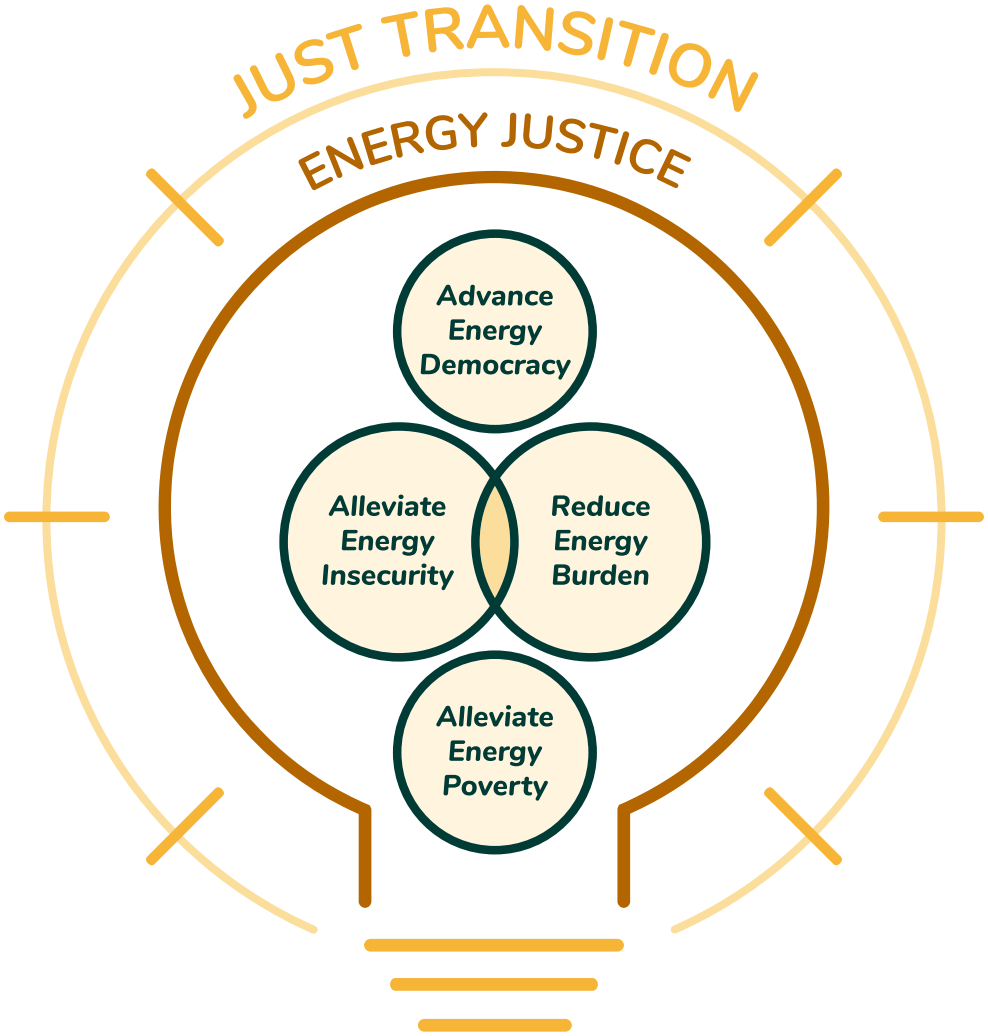

Diagram 2: The Goals of Energy Justice

While environmental justice might be seen as more of a domestic, United States-centric, movement focused on local concerns,[13] climate justice is decidedly global in scope. The movement emerged in the late 1990's and 2000's in light of the recognition that climate change would disproportionately affect those in the Global South, who did very little to contribute to creating the problem of climate change in the first instance.[14] Around the world, those with the least ability to respond to the impacts of climate change—the poor and people of color, including island nations and indigenous peoples—would bear the brunt of its effects. In the United States, climate justice advocates broadly recognize that the poor and people of color in this country will suffer the deepest impacts of climate change, given legacies of legalized segregation, redlining, and disinvestment that have left communities of color and the poor on land and in economic circumstances that make them the most vulnerable to climate change impacts. Moreover, such communities lack the economic resources to easily "bounce back" from climate change related events.[15]

High water marks of the climate justice movement include:

- **2010:** The creation of the People's Agreement in Cochabamba, Bolivia in 2010, where participants called for the creation of an International and Climate Environmental Justice Tribunal with the legal capacity to "prevent, judge, and penalize States, industries and people that by commission or omission contaminate and provoke climate change."[16] The People's Agreement was the product of the People's Conference on Climate Change and the Rights of Mother Earth after the disastrous 2009 United Nations meeting in Copenhagen to address climate change;

- **2014:** The People's Climate March organized by activist groups, where 400,000 people gathered in New York City to center "the leadership of Indigenous communities, communities of color, and working-class white communities" in the climate movement;[17] and

- **2019:** In the summer of 2019, a coalition of environmental justice organizations and national organizations aligned to create an "Equitable and Just National Climate Platform" which set forth a "bold national climate policy agenda" to advance "economic, racial, climate, and environmental justice."[18] The Platform calls for a commitment to limit global warming to 1.5 degrees Celsius through the mobilization of community, government, science and research, and industry resources "toward the development of just, equitable, and sustainable long-term comprehensive solutions" that "acknowledge and repair the legacy of environmental harms on communities inflicted by fossil fuel and other industrial pollution."[19] The Platform further argues for new leadership to "advance solutions in ways that meaningfully involve and value the voices and positions of [environmental justice communities]."[20]

Both environmental justice and climate justice weave together the requirements of procedural and substantive (or distributive) justice. In the case of environmental justice, key principles of the movement include fair distribution of the burdens of development, and involvement in all aspects of "the development, implementation and enforcement of environmental laws, regulations and policies."[21] Climate justice proponents, on the other hand, argue for policies that address the disproportionate burdens that will be borne by vulnerable communities due to climate change, even going so far as to argue for distributive justice in the form of reparations.[22] Further, as noted by the Climate Justice Alliance, *actual* climate justice requires that voices of communities of color, indigenous peoples, and the working-class be placed at the forefront of discussions concerning climate.[23]

Energy justice emerges from this rich history. As Eleanor Stein elegantly summarizes, the general view of scholars is that an energy just world involves equitable sharing of benefits and burdens involved in the production and consumption of energy services.[24] It is also one that is fair in how it treats people and communities in energy decision-making.[25] Further, key concerns of the field are:

- issues of access,
- distribution of harms,
- fairness of energy decision-making to ensure that decisions do not infringe on human rights and civil liberties, and
- informed participation.[26]

Sections 1.1 and 1.2 provide an in-depth review of the conceptual underpinnings of energy justice theory and practice. **Diagram 3** illustrates the environmental justice, climate justice, and energy justice movements, as well as the primary claims within each. As the diagram reflects, the movements and analytical frameworks are rooted in similar ideologies and goals. Moreover, they run on parallel and overlapping paths.

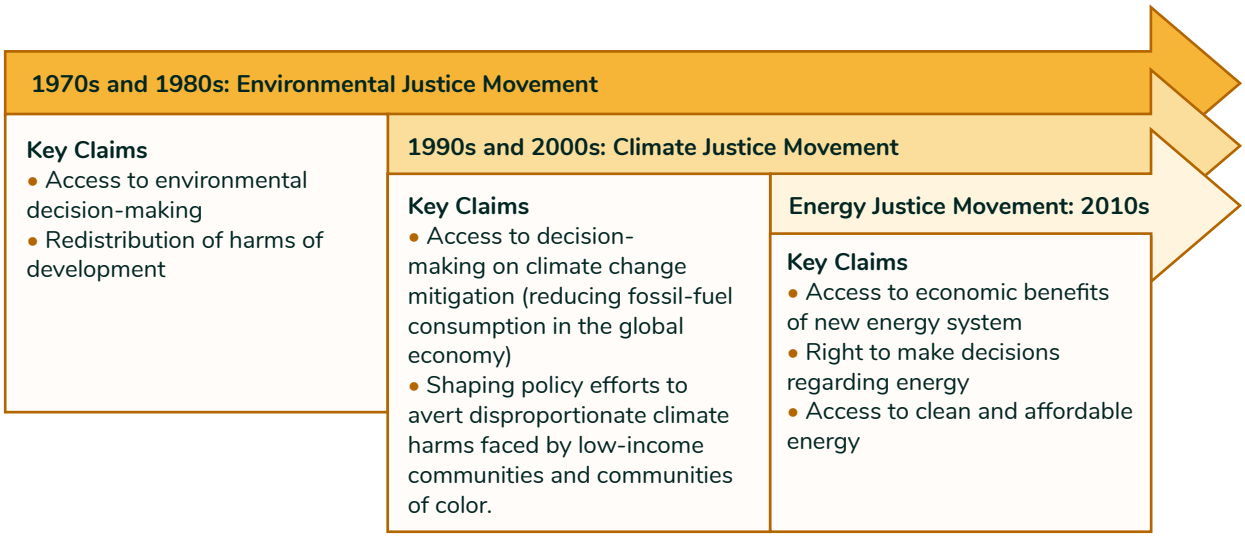

Diagram 3: Movements for Environmental Justice, Climate Justice, and Energy Justice

The following Section discusses how "energy justice" and the range of terms associated with it are used in practice as well as in academic circles (mainly social scientists and legal scholars). Before that discussion, however, we offer a synopsis of terms used in this section and the sections that follow:

Frequently Used Terms	Definition
Climate Justice	Remediation of the impacts of climate change on poor people and people of color, and compensation for harms suffered by such communities due to climate change.[27]
Energy Burden	Amount of overall household income spent to cover energy costs.[28]
Energy Democracy	The notion that communities should have a say and agency in shaping and participating in their energy future.[29]

Frequently Used Terms	Definition
Energy Insecurity	"The inability to meet basic household energy needs"[30] due to the high cost of energy.
Energy Justice (and Energy Equity)	The goal of achieving equity in both the social and economic participation in the energy system, while also remediating social, economic, and health burdens on those historically harmed by the energy system.
Energy Poverty	A lack of access to basic, life-sustaining energy.
Environmental Justice	Recognition and remediation of the disproportionately high and adverse human health or environmental effects on communities of color and low-income communities.[31]
Just Transition	A transition away from the fossil-fuel economy to a new economy that provides "dignified, productive, and ecologically sustainable livelihoods; democratic governance; and ecological resilience."[32]

Section 1.1 - Energy Justice In Practice

In *Framing Energy Justice: Perspectives from Activism and Advocacy*, Sara Fuller and Darren McCauley interrogate energy justice in the context of activist and advocacy movements, seeking to illuminate for the scholarly community the ways that energy justice is defined by those on the ground and the communities that experience the direct impacts of the energy system from "cradle to grave." The authors observed "energy justice on the ground," and found no consistent, "single energy justice frame." Instead, they found "the existence of multiple and diverse mobilizations around energy justice[,]" and localized expressions of justice. Rather than attempt to explain practitioner and advocate approaches to energy justice using tools designed by scholars, this Workbook acknowledges the unique perspectives and understandings of energy justice as defined by those engaged in the work on the ground. This expertise, grounded in the lived experiences of advocates, provides an invaluable perspective to inform equity-centered energy policy.

Our Approach

Summary: We reviewed the public-facing statements of practitioners and advocates engaged in advocacy work around energy policy. We also met with frontline leaders and organizations engaged in energy policy efforts. With a few notable exceptions,[33] practitioners and advocates tend to rely less on "**energy justice**" and more on terms like "**energy equity**" and "**energy democracy**" in their work. Although the terminology differs, the usage commonly focuses on frontline-led approaches to energy policy that center the economic, social, and health concerns of marginalized communities.

Our Survey of the Field

Energy justice mirrors the distributive and procedural justice demands of the environmental justice and climate justice movements, and encompasses several goals including:

- Transitioning the power and control over the means of energy production into the hands of the community,
- Ensuring fair and equitable distribution of the benefits and burdens of energy production activities, and
- Centering the concerns of marginalized communities.

To gain an understanding of existing community-based approaches to and understandings of energy justice, we relied mainly on a review of advocacy statements concerning "energy justice." Our own experiences working with frontline organizations around the country also informed our understandings of energy justice practice. Our approach to understanding what was happening in the field began with a simple, internet-based search to cast a wide net for activist groups using the terms "energy justice," "energy democracy," or "energy equity" in their mission statements. The search was then narrowed to groups that specifically defined these terms in a way that creates a framework for their mission. Additional sources were found by looking at sources cited in academic papers about community activism and energy justice frameworks. Another key search method was working from a list of known organizations based on past association with the authors of this Workbook, which helped to fill in gaps in regional representation.

Originally, our search included only those organizations that specifically used the term "energy justice" in their work. However, many advocacy groups favor the phrase "energy democracy" when talking about issues pertaining to developing energy transition frameworks with a social and environmental justice focus. We then expanded the search to include this terminology, as well as the phrase "just transition," which is also used to describe the transition away from an extractive economy to a regenerative one. The use of these terms – energy justice, energy democracy, and just transition – provides much the same frame for advocacy groups as the phrase "energy justice" provides for academic investigations. The resulting list, further discussed in Appendix B, represents a nation-wide survey of U.S. organizations.

Our own experience in the field mirrors what we found in the written material. As a whole, practitioners and advocates at nonprofit organizations we work with don't use the term "energy justice" in common practice, but show general receptivity toward it. This includes individuals we know in different regions around the country, including the South, Northeast, Midwest, and West. Some advocates occasionally use the term energy justice themselves, and others are part of alliances that have member organizations within their alliance that use the term. Some colleagues use the term "energy justice" interchangeably with a "just energy system," while others use "just energy" but not "energy justice."

Many of our partners use the term "energy equity" in a way that is either entirely or substantially interchangeable with how we define energy justice in this Workbook. Some practitioners use the term equity when talking about energy, though not necessarily "energy equity" as a phrase. For example, some use specific phrases such as "equitable deep decarbonization" and "equitable energy system."

Despite the work of organizations clearly falling under the umbrella of "energy justice," this term is almost never used in their mission statements or writing. Generally, the word "justice" is used only to incorporate a social, racial, or environmental justice approach to the energy transition framework, rather than to aid in the development of a new framework specifically for the just energy transition. Therefore, while activist groups are clearly contributing to the dialogue on what achieving energy justice looks like, they are currently not working with the vocabulary utilized within the academic community. This disconnect threatens the efficacy of scholarship to reach practitioners, and could lead to broader confusion concerning the meaning of energy justice among policymakers.

> *"The disconnect between practice and academia could lead to broader confusion concerning the meaning of energy justice among policymakers."*

Prevalence of "Energy Democracy"

With respect to our analysis of practitioner approaches, the term most often used to describe the missions of organizations engaged in equity-based energy policy work is "energy democracy." Based on our research, it seems that "energy democracy" is especially favored among groups in the U.S. advocating for a community-empowerment component to energy transition activities. The use of the term "democracy" within the U.S. context could serve two strategic purposes within the movement.

First, energy democracy might portray the importance that involvement from the community plays in these groups' vision for just energy systems. It is clear that these organizations feel that justice in energy generation, distribution, and transition activities will be achieved only if the decision-making power and control over the systems lies in the hands of the community affected by that system.[34] A way of accomplishing that goal is by putting that system under democratic control and allowing for social and economic participation in that system. Further, as emphasized by Denise Fairchild and Al Weinrub in *Energy Democracy*, "deep democracy," meaning, centering the engagement of poor people, people of color, and groups traditionally marginalized within energy transition policy discussions, goes further than mere economic and social participation in the energy system.[35] Under the Fairchild and Weinrub analysis, energy democracy requires not only basic participation in the design of the new energy system, but a deeper structural transformation of the social and economic structures underpinning the energy system.[36]

The second purpose of using "energy democracy" could relate to the long, and frequently problematic, history of the term "democracy" in the American context. Democracy is a core value in American political and social systems, and linking this concept, which evokes feelings of patriotism and equity, to the energy transition movement is likely to yield more positive outcomes than linking the movement to "social justice" or "racial justice", which can evoke a more negative, or polarized, response. The use of patriotic phrasing could therefore be strategically important in policy advocacy efforts, where public and political support is crucial.[37]

Groups using the term "energy democracy" tend to include the following concepts of community empowerment in their work.

- **Community Ownership:** the community owning and controlling the sources of energy production;
- **Community Decision-making:** community having a democratic say in the means of energy production and distribution; and
- **Power Decentralization:** Empowerment of those closest to the means of production, geographically, socially and economically.

These concepts indicate a desire to redistribute economic and political power away from centralized energy producers to smaller subsections of society. Advocates press for meaningful community involvement to eradicate many of the inequalities and injustices that currently plague the energy system, such as the disproportionate ecological, economic, and social harms that currently affect low-income communities and communities of color.[38]

A significant number of nonprofit professionals we work with also use the term energy democracy. Most appear to view energy democracy as meaning something at least slightly distinct from energy justice or energy equity. Some view energy democracy as a component within a larger frame of energy equity. More specifically, some view energy democracy as focusing on ownership of distributed generation, while energy equity considers the entire energy system, including utility-scale generation and transportation energy. Others consider energy democracy as describing the tangible objectives within the broader, intersectional vision of energy equity.

While energy democracy appears to be the most commonly used term among those working at the intersection of equity and energy, many use energy equity to mean something slightly broader in scope than energy democracy: using energy policy to actually center the concerns of those harmed by the existing energy system. Some advocates either use or resonate with energy justice as perhaps a more holistic and compelling frame.

In the advocacy sphere, advocates place less emphasis on a uniformity of terminology describing the work than scholars of energy justice and, appropriately, more emphasis on the outcomes associated with the work. What is echoed among all of the groups we reviewed is a desire for upheaval in the current energy system, a shift towards more democratically controlled systems, and a new emphasis on social inclusiveness and equity.

"What is echoed among all of the groups we reviewed is a desire for upheaval in the current energy system, a shift towards more democratically controlled systems, and a new emphasis on social inclusiveness and equity."

Advocates are also concerned about the impacts of the energy system and focus on the following key concepts:

- **Equitable Distribution of Benefits and Harms:** Equitable distribution of both the benefits and harms of the energy system, which again relates to alleviating the pressure that currently disproportionately affects low-income communities and communities of color;
- **Economic Benefits:** Some groups believe allowing frontline communities to economically benefit from the new energy system could remedy many of the social issues currently being experienced by such communities[39] and lead to social and political empowerment through job creation and local control of economic resources. Moreover, improving energy efficiency can lower the overall cost of living.
- **Decreasing Pollution:** Other distributive concerns include limiting pollution to decrease negative health impacts.
- **Centering Frontline Voices and Control:** Another method of ensuring this equity is by putting the power in the hands of the people most affected by the decisions.[40] The idea is that these groups will be most motivated to responsibly manage the benefits and risks of energy production and distribution.

These distributive and procedural justice frames are echoed throughout the social science and legal literature as well.

Section 1.2 - Usage of Energy Justice in Social Science and Law

In general, practitioner and advocate approaches to energy justice make explicit references to centering the voices of low-income communities and communities of color, as well as recognizing the important role of equity to remediate prior harms experienced by communities within the existing energy system. Academics approaching energy justice have tended to take a more measured approach. In general, scholars of energy justice have hewed more closely to procedural and distributive justice concerns; until recently, the predominant discussions of energy justice have not included an analysis of the historical harms faced by certain communities.

As with the practitioner approaches to energy justice, within both the social science and legal literatures, a range of terms have emerged under the broader umbrella of energy justice:

- energy justice,
- energy democracy,
- energy poverty.
- clean energy justice,
- energy insecurity,
- energy equity,
- energy burden, and

Social scientists favor energy justice, energy democracy, and energy insecurity. Legal scholars have a much less well-defined approach to the energy justice, and have used a range of terms including all of the foregoing terms as well as clean energy equity, energy poverty, and energy burden.

On the whole, policymakers and advocates seeking key takeaways for an “applied” policy approach to energy justice rooted in robust scholarship will find the literature rather thin and somewhat unhelpful. Much of the literature of the past several years has focused on questions of definitions, rather than application within a policy context. The legal literature provides a bit of an exception to this, as legal scholars tend to focus on key policy areas such as net energy metering, community solar, and regimes designed to meet state renewable portfolio standards; however, the legal literature lacks a consistent framework or analytical approach to apply energy justice across the various areas of energy policymaking. This Workbook aims to close these gaps by synthesizing the literature and various theoretical approaches to energy justice. The Workbook then combines

these approaches to fit within a workable frame that draws on the practitioner framework, social science framework, and legal frameworks available at the time of publication. This section provides a synthesis of the three approaches to energy justice: practitioner, social science scholars, and legal scholars. We provide a comprehensive overview of the social science and legal literature in Appendix A.

The following chart summarizes the terminology and usages across areas of practice and research.

Term	Practitioner	Social Sciences	Law
Energy Justice	Infrequently used	Used	Infrequently used
Energy Equity	Used	Not used	Infrequently used
Clean Energy Justice	Not used	Not used	Infrequently used
Energy Democracy	Used	Used	Used
Energy Burden	Used	Used	Infrequently used
Energy Insecurity	Infrequently used	Infrequently used	Used
Energy Poverty	Infrequently used	Not used	Infrequently used
Energy Deep Decarbonization	Infrequently used	Not used	Not used
Equitable Energy System	Infrequently used	Not used	Not used

Our research reveals that there are substantial overlaps among the three analytical frames: advocacy, social science, and law. Despite some overlap in terminology, however, the more complex question is how the diverse usages of these terms are used by each group, and whether these usages are contradictory. The following discussion addresses this question.

Section 1.3 - Unpacking the Approaches to Energy Justice: A Synthesis

Each analytical frame—advocacy, social science, and law—emphasizes **procedural justice** and **distributive justice**:

- **Procedural justice** concerns who is at the decision-making table, and whether, once at the table, everyone's voice is heard.
- **Distributive justice** is outcome focused, and speaks to whether all equally share in the benefits and burdens of the energy system.

Despite these similarities and shared understandings, the analytical frames differ in two key ways: (1) the scope of energy justice and its connection to related "justice" concepts and (2) the centering of traditionally excluded voices in energy policy. Each difference is addressed below.

What is the scope of energy justice and how does energy justice connect to related "justice" concepts?

Each analytical frame raises questions regarding the scope of the energy justice umbrella. For example, given the focus on the **procedural** and **distributive** justice dimensions among energy justice, environmental justice, and climate justice, how do the terms and approaches connect? Does energy justice simply build on environmental justice and climate justice principles, and therefore stand apart as a distinct approach to designing energy policy? Or, does an energy justice approach to energy policy explicitly incorporate the principles of each framework? Further, regarding the scope of energy justice, how do the concepts of energy poverty, energy democracy, and energy insecurity factor into an energy justice policy framework? And finally, is "just transition" a broader conceptual frame that incorporates energy justice, or does it stand alone as an analytical frame?

Synthesis:

Energy justice cannot be separated from environmental justice and climate justice. The complex lived experiences of marginalized communities reveal an interconnectedness among environmental, climate, and energy justice that would seem to require that energy policy acknowledge the unique ways that environmental harms and climate-related harms affect frontline communities. For example, the Environmental Protection Agency has identified low-income communities of color residing in the L.A. basin as among the most impacted environmental justice communities in the country; they house hazardous waste clean-up sites (Superfund sites) in disproportionate numbers.[41] Such communities also face disproportionate risks to climate-related events, given that, for a number of reasons, community members lack the mobility in the face of climate-related weather events. Further, in addition to the well documented energy burden faced by such communities, power outages uniquely burden such communities given that they are unable to "bounce back" as quickly from events that damage food and medicine supplies. Energy justice requires an exploration of these multiple layers of burden faced by frontline communities in the approach to energy policy design.

Frontline communities rely on the "just transition" framework to illustrate how to transition away from the current, fossil fuel driven economy to a new, regenerative one that honors workers, "redresses past harms, and creat[es] new relationships of power for the future through reparations."[42] Further, as the Climate Justice Alliance notes, this broader framing ties directly to the unique histories of the environmental justice and climate justice movements.[43] Just transition "represent[s] a host of strategies to transition whole communities to build thriving economies that provide dignified, productive and ecologically sustainable livelihoods; democratic governance and ecological resilience."[44] From a policymaking standpoint, therefore, energy justice, as a mechanism to help facilitate the transition away from fossil fuels, must be considered within a broader holistic frame that acknowledges, at the very least, the rights of workers to access jobs in the new energy economy.[45] **Diagram 4** below illustrates the interconnectedness among these "justice-related" concepts within a synthesized frame.

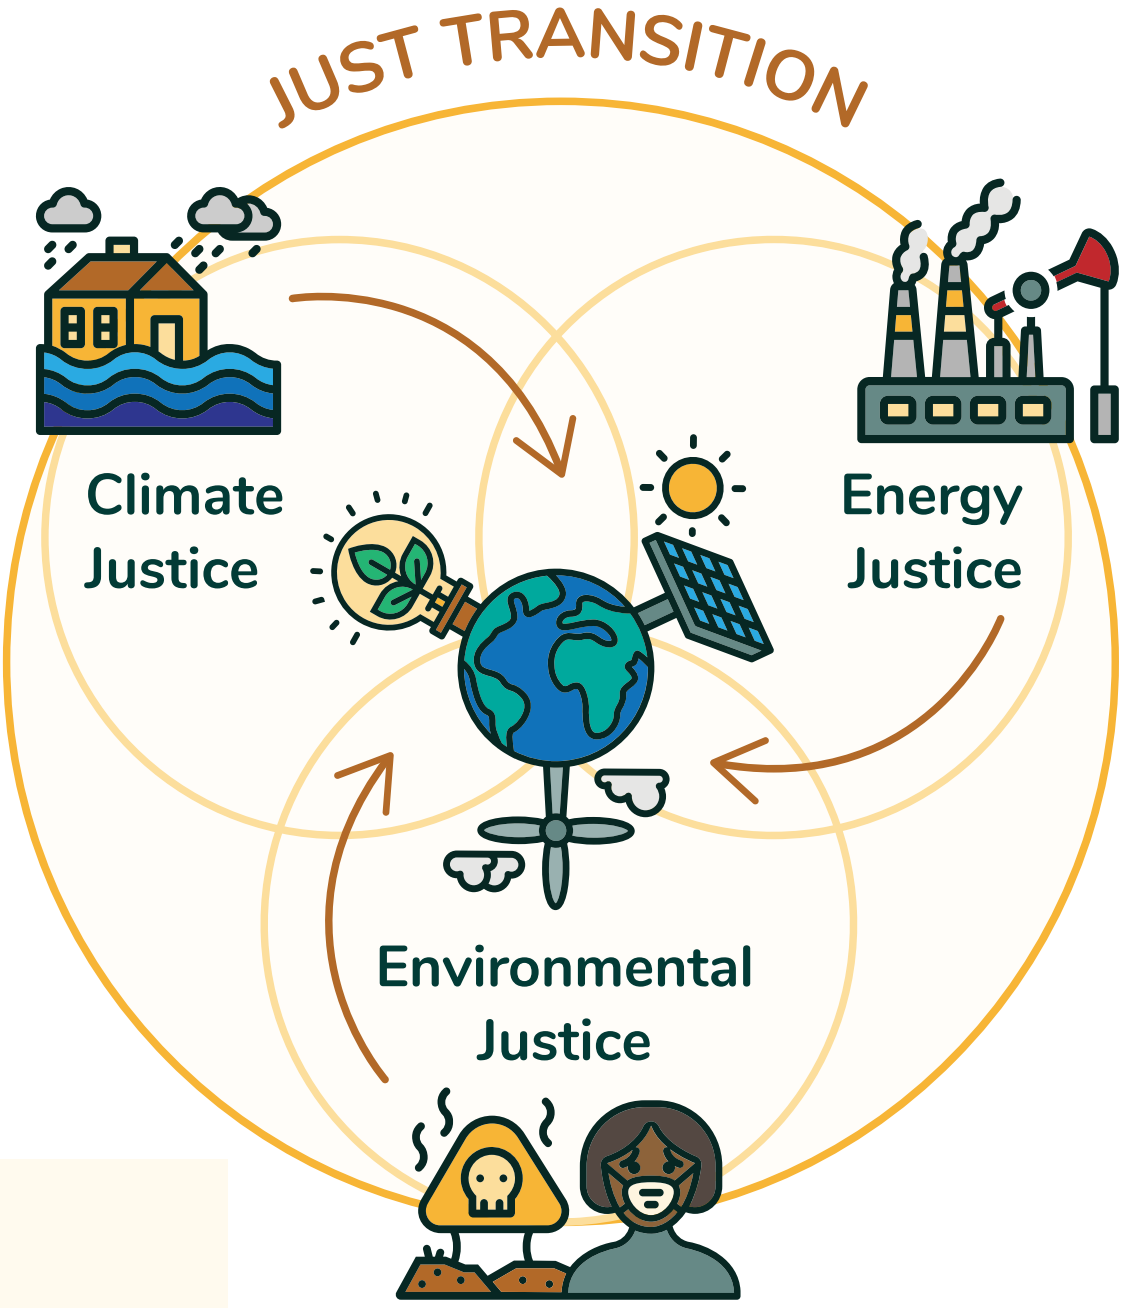

Diagram 4: Connections among Environmental Justice, Climate Justice, and Energy Justice

Whose voices should be centered in an energy justice approach to energy policy?

The second key difference among the analytical frames is the emphasis on whose voices are centered in approaches to energy justice. The social science literature has evolved to include the idea of restorative justice within its analytical frame, which would seem to suggest that an energy justice-based approach to energy policy would require the acknowledgement of prior harms to low-income communities and communities of color. Legal scholars have generally avoided the deeper equity analysis, and focus instead on equitable access (for the energy poor), energy burdens, and fairness (as an approach to distributed energy generation). The practitioner framing of energy justice unequivocally centers the voices of those who have been the most harmed by the current energy system, and also takes an equity-driven approach.

Synthesis:

A synthesized perspective of energy justice requires not only that traditionally excluded voices become a central part of the energy policy conversation, but that they are first in line to receive the benefits of policies adopted to facilitate the energy transition. This approach draws heavily on the activist orientation to energy justice and also incorporates both the "recognition" and "restorative" justice angles of the social science literature. It is also consistent with a "fairness" based approach to law and policy.

Section 1.4 - Approaching Energy Policymaking

As the foregoing discussion illustrates, the procedural justice and distributive justice principles that animate both the energy justice literature and field of practice draw heavily on movement-centered approaches to environmental justice and climate justice, as well as the epistemic traditions of environmental and climate justice scholarship. Further, the movement and principles associated with energy justice are situated squarely within a broader "just transition" frame. Finally, the voices and concerns of traditionally burdened groups are centered in thinking through policymaking approaches.

This synthesis gives rise to additional questions for stakeholders engaging in energy justice policymaking: **How should stakeholders approach energy justice, and what types of outcomes should energy justice produce?**

Procedural justice requires that traditionally excluded groups, frontline communities, and those otherwise marginalized due to the energy system work with policymakers to co-create and co-design a fair process for inclusion in energy decision-making. This requires an analysis of the process *used* to create new energy policy as well as the procedural justice dimensions *reflected in* the policy.

The distributive justice dimensions are much more difficult to discern, and ultimately require stakeholders to evaluate policy efficacy along racial and socio-economic dimensions. Energy policies should therefore be empirically evaluated regularly for efficacy along such equity dimensions.

In sum, when evaluating policies through an energy justice lens, policymakers, communities, and academics should ask:

(1) Process: *Have marginalized communities participated meaningfully in the policymaking process with sufficient support?* Factors for consideration include, but are not limited to, the following:

- Convenience of the meeting for frontline attendees, including location (e.g., proximity to public transportation) and time (e.g., outside of customary work hours, with multiple opportunities to participate);
- Communication of meeting time and location to frontline leaders and community groups;
- Provision of relevant and clear information to sufficiently evaluate the proposed policy and program;
- Financial support to frontline advocates to defray the cost of participation in process (e.g., payment to assist with intervention in a regulatory proceeding); and
- Childcare support during meeting.

(2) Restoration: *Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?*

(3) Decision-making: *Does the policy center the decision-making of marginalized communities?*

- A key consideration here includes an evaluation of whether the policy allows for ownership and control of energy assets by communities at the frontline of pollution and climate change, working class people, indigenous communities, and those historically disenfranchised by racial and social inequity.

(4) Benefits: *Does the policy center economic, social, or health benefits for marginalized communities?*

- A factor to consider is whether the policy considers benefits and harms in other non-energy areas (e.g., gentrification and displacement), including for future generations.

(5) Access: *Does the policy make energy more accessible and affordable to marginalized communities?*

The Energy Justice Scorecard provided in the next Section operationalizes this energy justice framework into a tool that can be used to evaluate existing energy policies as well as inform the approach to a proposed energy policy. The Scorecard presented reflects a number of qualitative indicators; however, advocates can further develop the indicators to reflect more context-specific qualitative and quantitative metrics.

Section 2

Energy Justice Scorecard

How to use the Energy Justice Scorecard

You can use this Scorecard to evaluate existing or proposed energy policy. The Question in the left column should be used to evaluate how the policy scores on an energy justice indicator. The Score will range from 1 to 5 and should be indicated in the second column.

- A score of 1 means that the policy does not meet the requirements laid out in the question.
- A score of 2 means that the policy only partially meets the requirements laid out in the question.
- A score of 3 on the indicator means the policy somewhat meets the requirement.
- A score of 4 means that the policy mostly meets the requirement.
- A score of 5 means that the policy fully meets the requirement of the energy justice indicator.

The Explanation in the third column should be used to discuss why you scored the Question the way you did. This column will help to refine the tool for your own use and the use of other advocates and policymakers.

The Reference column should be the reference to the particular policy, process, conversation, web site or other source that provided the basis for the Score.

At the end, add up the Score. The Score out of 25 will give you, policymakers, and advocates a general sense for how the policy scores in comparison to a "perfect," energy just policy. The Score is meant to catalyze action toward deeper considerations of justice within a particular policy area. As with many scales, this one is imperfect; however, it should provide a workable basis for advancing energy justice in the realm of energy policy. Further, it should offer an opening for discussion on how to advance energy justice in a particular policy area.

Energy Justice Scorecard

Scoring Key: 1 (No), 2 (A little bit), 3 (Somewhat), 4 (Mostly), 5 (Yes)

Question	Score	Explanation	Reference
(1) Process: Have marginalized communities participated meaningfully in the policymaking process with sufficient support?	5 4 3 2 1		
(2) Restoration: Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?	5 4 3 2 1		
(3) Decision-making: Does the policy center the decision-making of marginalized communities?	5 4 3 2 1		
(4) Benefits: Does the policy center economic, social, or health benefits for marginalized communities?	5 4 3 2 1		
(5) Access: Does the policy make energy more accessible and affordable to marginalized communities?	5 4 3 2 1		
Total Score	___ / 25		

Section 3

Case Studies of California and New York Community Energy Programs

Transitioning local and state jurisdictions to renewable energy generation requires considering and developing a range of strategies, such as renewable portfolio standards to drive utility scale renewables and net energy metering programs to promote rooftop solar. To apply the energy justice framework and Scorecard presented above in this vast field, it's helpful to narrow in and start by analyzing one strategy for accelerating the deployment of renewables. Below we first assess an area within energy policy ripe for centering equity: community renewable energy, that is, cooperatively generating renewable energy such as solar. In particular, we look at community energy programs adopted in California and New York, where two of the Workbook's authors worked. Evaluating these policies through an energy justice lens offers insight into both the framework of analysis (the Scorecard), the policies themselves, and how other energy policies may similarly be analyzed under this approach.

Each case study:

(1) Describes the background for each state's community energy policies,
(2) Analyzes the procedural aspects – the process of how the policies came to be,
(3) Presents the final outcome of policies and program design, and
(4) Evaluates the policies based on the Energy Justice Scorecard.

What is Community Energy?

This Workbook uses the terms community renewable energy, community energy, and community solar somewhat interchangeably. Community energy and community solar have become umbrella terms applicable to many different versions of cooperatively generating renewable energy.

Community energy is short for community renewable energy and refers to the same general concept as community solar but applies to all forms of renewable energy. Other than specific aspects related to the underlying technology, the policy issues discussed here apply to both community solar and community energy. Community energy and community solar have become umbrella terms applicable to many different versions of cooperatively generating renewable energy. Typically they refer to structures of **offsite, but nearby, generation of electricity** that multiple electricity customers share.[46] However, community energy and community solar can also apply to onsite shared generation (such as solar on multifamily buildings like apartment complexes) or generation that has a community element of some sort, even if the electricity is not shared by multiple electricity customers (for example, multiple people collectively owning solar t generation on a third party's property, even if that third party is the only one consuming the electricity).[47]

The terms **shared renewables** or **shared solar** typically mean only those structures where the electricity is shared by multiple customers, and thus sometimes has a more specific meaning than community energy or community solar. Social justice and economic justice advocates define **community energy** as being **community-owned** or **community-controlled**.

The community energy case studies highlight three themes that are similar in both the California and New York context. Effectively designing community energy policies such that they achieve energy justice requires close attention in particular to

(1) Community participation in policy development and program design;
(2) Energy pricing and valuation structures that make projects viable and attractive to customers and developers; and
(3) Sustainable business models that enable community decision-making and control over customer-generated energy resources while balancing the need to target priority customers and provide consumer protection.

Section 3.1 - Case Study of Community Energy Programs in California

As in other states taking the climate crisis seriously, energy policymaking in California is robust, with a myriad of laws and regulations in different areas such as efficiency, generation, building codes, transportation, and more. To begin to understand and analyze whether California's efforts are achieving energy justice, it's useful to first explore community renewable energy policies, given their intention to benefit customers otherwise left out by other renewable energy programs. This section analyzes two community energy programs in California: the Enhanced Community Renewables (ECR) program and the Community Solar Green Tariff (CSGT). The section explores each program in depth and then examines them using the Energy Justice Scorecard.

The Enhanced Community Renewables program is California's general community solar program available to anyone in the state. It has failed to result in any constructed projects after opening for participation in 2016. The Community Solar Green Tariff program is a small targeted program meant to serve low-income and other disadvantaged communities. It was created in 2018 and is set to open for participation sometime in 2020. Using the Energy Justice Scorecard, we give the ECR program a score of 7 out of 25 points and the CSGT 14 out of 25. While the Enhanced Community Renewables program has failed to result in any projects, its regulatory history is important to understand so that similar mistakes are not replicated in other states. Therefore, it is discussed below in less detail and more for the sake of context. The Community Solar Green Tariff illuminates some solutions and advances in the realm of equitable community solar, but also demonstrates policy gaps that persist and limit the achievement of energy justice.

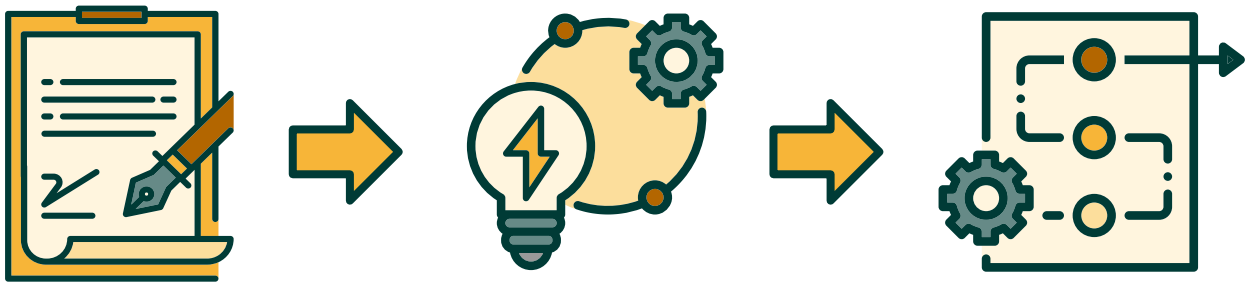
Background: Community Energy Programs In California

In 2013, California Governor Jerry Brown signed into law Senate Bill (SB) 43, creating the Green Tariff Shared Renewables (GTSR) program. This broader initiative included California's first attempt at providing all California communities with access to offsite shared renewable energy: the Enhanced Community Renewables program.[48] That same year, when reauthorizing the state's net energy metering (NEM) program for home and business owners with rooftop solar panels in Assembly Bill (AB) 327, the Legislature also directed the California Public Utilities Commission (CPUC), the state electricity regulatory authority, to develop specific alternatives to the standard net metering tariff to ensure the growth of renewable distributed generation "among residential customers in disadvantaged communities."[49] In response, the CPUC developed the Community Solar Green Tariff.

Community Energy Programs in California:

Program Name	Authorizing Statute (Year)	Purpose	Specific Statutory Language
1) Enhanced Community Renewables (ECR) Program – *a component of the Green Tariff Shared Renewables Program (GTSR)*	SB 43 (2013)	To provide communities with the benefits of access to nearby offsite renewable energy.	"A participating utility shall provide support for enhanced community renewables programs to facilitate development of eligible renewable energy resource projects located close to the source of demand."[50]
2) Community Solar Green Tariff – *a component of the reauthorized Net Energy Meeting (NEM) Program (or NEM 2.0)*	AB 327 (2013)	To provide alternatives to net energy metering and ensure the growth of distributed renewable energy among "disadvantaged communities."[51]	"ensures that customer-sited renewable distributed generation continues to grow sustainably and include specific alternatives designed for growth among residential customers in disadvantaged communities."[52]

As the diagram below illustrates, the community solar law, GTSR (SB 43), and the reauthorized NEM law, NEM 2.0 (AB 327), which were both passed in 2013, set in motion two CPUC proceedings to develop and implement the related programs and tariffs.



Step 1: State Legislature passes laws GTSR (SB 43) and NEM 2.0 (AB 327).

Step 2: California Public Utilities Commission opens policymaking proceedings to implement law.

Step 3: Utilities issue implementation letters and tariffs. Programs become operational.

Diagram 5: Policymaking Process for Community Energy Programs in California

One of this Workbook's authors, Subin DeVar, participated in both CPUC proceedings over the course of three years, from 2015 to 2018, on behalf of the Sustainable Economies Law Center, a nonprofit organization based in Oakland. In the first proceeding (to implement SB 43), the Law Center primarily filed its own initial comments on particular issues related to enabling equitable

community-based projects and then subsequently collaborated to submit joint comments with other organizations, including the California Environmental Justice Alliance (CEJA), Clean Coalition, and Greenlining Institute.[53] In the second proceeding (to implement AB 327), the Law Center was only involved in the portion of the proceeding that related to developing alternatives for disadvantaged communities and filed all comments during that stage jointly with CEJA, with a focus on proposing an equitable Virtual Net Energy Metering program.[54]

Statutes and regulatory proceedings such as these provide a rich source of insight into how well the state is achieving energy justice when actually implementing programs and creating the rules that determine who actually benefits from state programs. This section briefly describes both community solar policies and then analyzes them using the Energy Justice Scorecard. As the following discussion illustrates, even laws *designed* with equity issues in mind may face difficulty fully realizing the equity dimensions of the law once the law is implemented.

Section 3.1.1 - SB 43 Enhanced Community Renewables Program: A Flawed Start

Background

The Green Tariff Shared Renewables program established by SB 43 aims to "expand access" to the benefits of renewable energy in "a manner that facilitates a large, sustainable market for *offsite* electrical generation."[55] The legislature designed the GTSR program to expand access to the benefits of renewable energy to customers who cannot access the benefits of *onsite* generation, such as residential rooftop solar generation.[56] According to the law, the GTSR program is critical to expanding access to renewable energy benefits by allowing renters, homeowners with shaded rooftops, and individuals who cannot afford a solar system for their residence or business, to receive the "financial, health, environmental, and workforce benefits" of shared renewable energy facilities.[57]

SB 43 directed the state's three largest investor-owned utilities (IOUs), Pacific Gas & Electric (PG&E), San Diego Gas & Electric (SDG&E), and Southern California Edison (SCE) to "file with the … [CPUC] an application requesting approval of a green tariff shared renewables program to implement a program that the utility determines is consistent with the legislative findings and statements of intent of Section 2831," the purposes summarized above.[58] The GTSR program permits "customers within the service territory of the utility to purchase electricity pursuant to the tariff approved by the commission"[59] from "renewable energy resources with a nameplate rated generating capacity not exceeding 20 megawatts."[60] In total, the state capped the program at 600 megawatts (MW) and a set a few specific reservations of program capacity for particular purposes.[61] The law requires that 100 MW of the statewide limitation be reserved for facilities (no larger than 1 MW) located in areas previously identified by the California Environmental Protection Agency as "the most impacted and disadvantaged communities".[62] Other specific targeting provisions include a requirement that, "[t]o the extent possible, a participating utility shall actively market the utility's green tariff shared renewables program to low-income and minority communities and customers."[63]

While SB 43 describes the GTSR program generally throughout its text, one provision prescribes:

> A participating utility shall provide support for enhanced community renewables programs to facilitate development of eligible renewable energy resource projects located close to the source of demand.[64]

This line is the only provision in SB 43 that specifies anything in particular for the Enhanced Community Renewables program. However, earlier on in the text the statute states: "To the extent possible, a participating utility shall seek to procure eligible renewable energy resources that are located in reasonable proximity to enrolled participants."[65] The latter statement seems to imply either that all participants of the GTSR program are enrolling to receive power from specific resources, or that perhaps they should have the ability to, given the requirement for the utilities to consider proximity to a certain extent. Given the direction to "provide support for enhanced

community renewables programs to facilitate … projects located close to the source of demand" it is logical to conclude that the Legislature envisioned that ECR programs would be the avenue where people could access electricity from specific community-based renewable energy projects located offsite but nearby.

Although the GTSR program generally purported to "expand access" to the benefits of renewable energy in one way – through access to the energy itself – the ECR program appeared aimed to expand access to both renewable energy and the full co-benefits of local, community-based clean energy development. The legislative findings and intent reflect this transformative vision for low- and moderate-income Californians to finally access these benefits.[66]

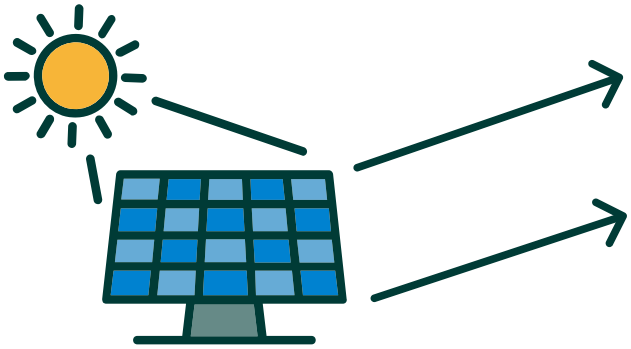


Diagram 6: Intended Purpose of California Senate Bill 43

Regulatory Policymaking Process

In implementing SB 43, the CPUC interpreted the law as prescribing two programs, a Green Tariff (GT) program that met the general provisions of the statute, and an Enhanced Community Renewables program, that met certain remaining provisions. Therefore, the CPUC split the GTSR implementation proceeding into different phases. The first CPUC decision implemented the Green Tariff program, outlined some major features for the ECR program, and scoped out remaining issues.[67] The second decision largely completed implementation of the ECR program.[68]

On January 29, 2015, the CPUC began implementation of SB 43 by issuing Decision 15-01-051 ("GTSR Decision I"), which established the Green Tariff portion of the GTSR program.[69] The Green Tariff option allows customers to sign up for a higher-cost "green" rate and meet 50% or 100% of their energy needs from a pool of renewable projects procured by their IOU. The pool of projects is comprised of new renewable energy facilities of between 500 kilowatts (kW) and 20 MW in capacity. Essentially the Green Tariff is a "green option" for customers to select to get renewable energy directly from the utility, rather than from the utility's default portfolio of energy resources. However, the Green Tariff program does not allow the customer to select the specific energy generating facility their power is coming from. That option would be covered by the ECR program, to be implemented in a later phase of the proceeding.

The CPUC finalized the rules of the ECR program in 2016 ("GTSR Decision II"),[70] and the three IOUs subject to the program held the first auctions to procure ECR projects in August of that year.

Program Design of Enhanced Community Renewables

The ECR program allows customers to contract directly with a developer and subscribe to a specific project for all or a portion of the customer's energy needs. The ECR program is a hybrid of traditional rooftop solar programs, where the customer receives a bill credit from the IOU based on their subscription to an ECR project developed by a third-party developer. Projects must be developed with community involvement,[71] but by default, communities do not own or control the energy produced by the developer. The program does not technically prevent communities from

self-organizing and creating a community-based development entity in order to collectively own the ECR project. However, as described further below, in reality, the rules of the program make it both administratively difficult and expensive to self organize.

ECR projects involve three parties: 1) developers, 2) customers, and 3) utilities.

(1) **Developers** contract with utilities to be allowed to participate in the ECR program and to have the utility buy excess power from a project that isn't fully subscribed.
(2) **Customers** contract directly with a developer for a portion of a project's output. Customers pay developers directly for their subscription.
(3) **Utilities** credit customers based on their subscription to the project.

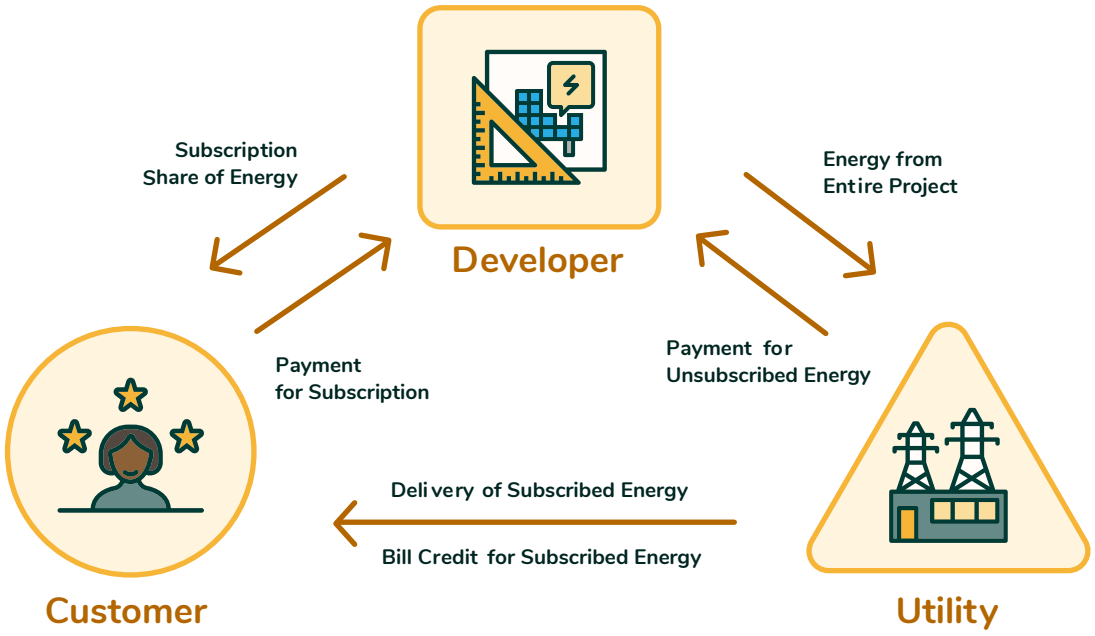

Diagram 7: California's Enhanced Community Renewables Program Design

According to GTSR Decision II, the IOUs set rates at which a customer will be credited for their enrollment in an ECR program, and then a customer and developer separately determine what rate the customer will pay the developer for the subscription. The rate that the IOUs credit customers is a key factor in whether ECR projects will make financial sense for developers and customers. Developers must obtain financing for the project and pay down the cost of the project through the subscription fees it charges customers. The amount of the credit customers receive from the utility will determine how much the customers are willing to pay developers.

Analysis

Pricing Mechanism

For traditional rooftop solar, the utility credits a customer for solar they generate at approximately the same rate as they would otherwise pay the utility – their "retail" rate. In California, the average price the utility charges a customer to deliver electricity, the "**retail**" rate, is approximately **19¢/kWh**.[72] Therefore, when customers generate solar energy, they are credited on their bill about 19¢/kWh. If the customer did not pay upfront for the full cost of installing the system to own it outright, they are likely paying the third-party installer of the system monthly payments for the solar energy being generated by the panels. Say, for example, that the customer is paying the developer 9¢/kWh; they would still save money overall, because the net of the +19¢/kWh credit on their bill, and -9¢/kWh paid to the developer, means they are paying 10¢/kWh less than they would otherwise pay to the utility if they did not have solar.

In the case of the ECR credit, however, GTSR Decision II set the rate a customer would get credited at around the "**wholesale**" rate for renewable electricity (e.g., the price that the utility would pay for electricity from renewable sources on the open market). Under PG&E's rates for its ECR program, the ECR credit for customers is roughly **6¢/kWh**.[73] In this scenario, if the customer is paying the ECR developer 9¢/kWh; they would be spending more money overall, because the net of the +6¢/kWh credit on their bill, and the -9¢/kWh paid to the developer means they are paying 3¢/kWh more in total than they would otherwise pay to the utility if they did not subscribe to the ECR solar project.

Since a developer is not likely to be able to cover its costs of development if it charges the customer less than 6¢/kWh, the developer would be forced to charge the ECR customer a **premium** to cover its costs. Not many customers are interested in paying more for their power, even if it is cleaner. In contrast, California's residential rooftop solar program (net energy metering) incentivizes participation on the part of developers and customers because the parties understand they are guaranteed a one-for-one cost exchange for energy produced and the energy used by the customer. However, the ECR program creates a disincentive for participation.

Indeed, the three years that have gone by since the program officially opened prove that result. No utility's ECR program has secured any customers. Only two of the three utilities have even made conditional commitments to procure projects – 2.4 MW by SDG&E and 1.66 MW by PG&E.[74] Those figures are a drop in the bucket of the 600MW allocated to the GTSR program overall.

Considerations of Equity

The implementation of the ECR program raises important equity concerns. First, the discussion of the ECR program was continually delayed — a common theme for equity-oriented deliberations at the CPUC. Second, the fundamental pricing structure of the ECR program was flawed, in spite of adequate evidence and warning that such an approach would lead to failure. Third, the commission created shockingly discriminatory barriers for all but the wealthiest individuals and corporations to participate, including a requirement for project developers to get a legal opinion from one of the richest 100 law firms declaring that the ECR project design does not violate state or federal securities laws.[75] After finally getting the process going, these latter two factors were nevertheless the two main reasons for the program's ineffectiveness.

Where and when did things go wrong? The pricing structure flaw began with a particularly problematic provision in the authorizing legislation regarding program costs. The statute included a "nonparticipant ratepayer indifference" requirement that costs of the GTSR program not impact customers who weren't participating.[76] Basically, the program was not supposed to cost ratepayers more money if they weren't signed up for it. This statutory language stems from an argument made frequently by investor-owned utilities; namely, that distributed solar energy harms non-participating utility customers by shifting grid maintenance costs not paid by solar customers to non-participants. The "non-impact" language inserted into SB 43 responded directly to this argument, and added an additional barrier to implementation of the law.

The CPUC could potentially have approached this legislative directive in such a way that still enabled projects to be built, but instead it took the most conservative position as advocated by the IOUs. For example, to ensure with absolute certainty that no costs were shifted from non-participating customers to participating customers, the CPUC priced the credit for solar generation near the cost of purchasing wholesale renewable energy. This narrow analysis of cost did not add any other "value" to the tariff, such as lack of reliance on the transmission grid by ECR projects. The CPUC also failed to identify any other possible sources of funding to add to the credit rate offered to customers, such as Cap-and-Trade Auction Proceeds.

Beyond the pricing structure, the CPUC further acquiesced to utility demands regarding implementation, creating numerous barriers in the process and mechanisms of participation. Two issues in particular stand out. First, as noted above, in one of the most shocking outcomes of the proceeding, the CPUC proposed requiring potential project developers to first get a legal opinion certifying that there were no risks of violating securities laws from one of the 100 top-grossing law firms in the country. The list of firms had nothing to do with securities law expertise, but instead was simply based on an annual magazine listing of the wealthiest firms.[77] This requirement added

significant costs to potential developers and erected a significant barrier to project development. Eventually, with advocacy led by the Sustainable Economies Law Center, this requirement was modestly eased, although the Sustainable Economies Law Center pressed for removing it entirely. Second, rather than create a program that anyone in the public could easily access if they wanted to build a project, the CPUC limited approval of new projects to an opaque biannual auction, rather than a transparent and rolling application.

In the end, the Enhanced Community Renewables program falls far short of its goals to provide all Californians – including renters, low- to moderate-income communities, and environmental justice communities – with access to the benefits of offsite renewable energy generation. The failure of the ECR program reflects a policy choice by California to not design a functional program to expand the benefits of solar ownership and self-generation to the renters, low-income homeowners, and others who were left out of the state's massive transition to distributed renewable energy.

Application of Energy Justice Scorecard Metrics to CA ECR Policy

As presented above, those evaluating policies through an energy justice lens can apply the Energy Justice Scorecard to crystalize and summarize the many considerations of energy equity. By reviewing whether policies are advancing energy justice, and using the Scorecard as a tool for dissecting where policies have succeeded and where they have failed, advocates and policymakers can more effectively direct future efforts. Below we use the framework of five guiding questions to evaluate California's Enhanced Community Renewables program adopted pursuant to SB 43. This application provides both an example of how the Scorecard can be used, as well as additional considerations for advocates and policymakers working on community solar programs. Many states may approach community solar similarly to how California did with the ECR program, so even though the program failed in California, it may succeed in serving as a guide of what not to do for others.

(1) Process: *Have marginalized communities participated meaningfully in the policymaking process with sufficient support?*

Score 2 - A little bit; more indirectly through a statewide advocacy group than directly. The California Environmental Justice Alliance (CEJA) participated in the policymaking proceeding at the CPUC. (Note: we have not analyzed who was involved in the original legislation, and so the focus on this analysis is the regulatory implementation.) CEJA is a statewide alliance. One representative of CEJA directly participated in the proceeding, and our understanding is that the representative received direction and feedback from a steering committee representing all of the member EJ organizations who are a part of CEJA. In turn, those EJ organizations themselves are member-based, rooted in low-income communities of color, and have channels for community input and feedback. It's uncertain, but seems unlikely that many, if any, community members directly engaged with the policymaking process.

There are also general strengths and weaknesses about the policymaking process at the CPUC that are worth noting. First, the CPUC offers Intervenor compensation for anyone's time spent engaged in the proceeding, if they demonstrate financial need. This is crucial for allowing EJ groups to participate meaningfully. Second, the CPUC doesn't take a very proactive role in publicizing its proceedings, and there are very specific rules of practice and procedure one has to follow. This means most community members likely would not know that the policymaking was even happening, and even if they did, might have difficulty navigating the process of filing comments, which isn't very user-friendly.

(2) Restoration: *Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?*

Score: 1 - A little bit theoretically, but not at all in practice. Key remedies in the realm of community solar sought by marginalized communities disproportionality burdened by pollution include: (1) financial access and benefits, (2) ease of participation, and (3) alleviation of health issues from sources of pollution.

Financial access and benefits: the ECR program offers no bill savings or discount to make participation financially accessible and presents no clear route for wealth-building or job benefits.

Ease of participation: it is hard to apply for projects due to biannual auctions rather than rolling applications and the costly barrier of the securities legal opinion requirement.

Health: there is no prioritization or value-adding incentive for projects that might offset load from natural gas peaking plants or mechanisms to drive local air quality co-benefits. Projects are not financially viable, so none have been constructed, and thus none of these concerns are being addressed.

(3) Decision-making: *Does the policy center the decision-making of marginalized communities?*

Score: 2 - Mostly no/a little bit. Participation barriers discussed above make it hard for traditionally excluded populations to be in the driver's seat of building grassroots-led projects through the ECR program. Furthermore, there is no incentive for community ownership and control. However, the policy does require applicants to demonstrate that there is a certain level of community interest in a project before it is approved. This could help prevent a project from moving forward if there isn't community buy-in. Still, that requirement represents a more passive approach to ensure a bare minimum of community interest. The policy does not proactively encourage any involvement (nevertheless decision-making) from community members of traditionally excluded population by any specific means.

(4) Benefits: *Does the policy center economic, social, or health benefits for marginalized communities?*

Score: 1 - No. The ECR policy in practice does not focus on economic, social, or health benefits for traditionally marginalized populations. The program's focus is only on energy access and even then it fails to achieve any expansion of access to renewable energy because the programs cost more than existing services. Legislatively, the authorizing statute did envision broader benefits, and theoretically, the ECR component could have gone beyond expanding access to energy alone by allowing communities to build projects that promote other economic, social, or health benefits. However, the implemented program does not explicitly focus on achieving any such benefits, nor does it promote them in practice.

(5) Access: *Does the policy make energy more accessible and affordable to marginalized communities?*

Score: 1 - No. The ECR program is both hard to navigate and costs more than standard electricity rates. Therefore, it fails to make energy more accessible or affordable.

Energy Justice Scorecard: California Enhanced Community Renewables Program

Scoring Key: 1 (No), 2 (A little bit), 3 (Somewhat), 4 (Mostly), 5 (Yes)

Question	Score	Explanation	Reference
(1) Process: Have marginalized communities participated meaningfully in the policymaking process with sufficient support?	5 4 3 (2) 1	A little bit; more indirectly through a statewide advocacy group than directly.	A record of all party comments can be found online. [78]
(2) Restoration: Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?	5 4 3 2 (1)	A little bit theoretically, but not at all in practice. The policy was supposed to create projects in environmental justice communities, but implementation failed.	
(3) Decision-making: Does the policy center the decision-making of marginalized communities?	5 4 3 (2) 1	Mostly not/a little bit. There is no incentive for community governance, but there are community interest requirements.	
(4) Benefits: Does the policy center economic, social, or health benefits for marginalized communities?	5 4 3 2 (1)	No. The policy does not focus on economic, social, or health benefits for traditionally marginalized populations.	
(5) Access: Does the policy make energy more accessible and affordable to marginalized communities?	5 4 3 2 (1)	No. The ECR program is both hard to navigate and costs more than standard electricity rates. Therefore it fails to make energy more accessible or affordable.	
Total Score	7 / 25		

Section 3.1.2 - AB 327 Community Solar Green Tariff: An Uncertain Step Forward

Background

In 2013, the California legislature reauthorized the state's net energy metering (NEM) program for rooftop solar by passing Assembly Bill (AB) 327. The law directed the California Public Utilities Commission (CPUC) to develop specific alternatives to the standard net metering tariff to ensure the growth of renewable distributed generation "among residential customers in disadvantaged communities."[79] The Community Solar Green Tariff (CSGT) was one of a suite of programs created by this statutory requirement.

Regulatory Policymaking Process

In 2017-2018, during the second half of the AB 327 implementation proceeding, the CPUC had another opportunity to revisit the issue of equity in its distributed generation policies. In addition to a different statutory directive, a few other things had also changed at the Commission since the implementation of SB 43. First, leadership had shifted, and a Commissioner much more concerned with energy equity, Commissioner Martha Guzman-Aceves, played a much more direct role in ensuring a more successful outcome in the AB 327 proceeding than the SB 43 proceeding. Second, by this point, the failure of the ECR program was already apparent, as well as the stark divergence between the ECR program and net metering-based programs – including Virtual Net Energy Metering (VNEM) programs – which were widely successful due to a strong pricing structure based on crediting customers for energy production at the same rate that they purchase energy. Third, the CPUC's Energy Division staff were much more engaged with proactively offering policy solutions (rather than simply being reactive to party proposals) and were also much more engaged in reviewing comments from all parties with a critical lens, not just accepting feedback at face value. In particular, as opposed to the SB 43 proceeding, the CPUC did not simply rubber stamp many of the arguments of the IOUs.

At the same time, a few other contextual differences were at play between the AB 327 and SB 43 proceedings. First, while AB 327 encouraged cost containment, the law didn't explicitly specify that the programs couldn't lead to rate increases for non-participants.[80] Second, the CPUC considered separate funding sources for the disadvantaged community programs, an effective solution for avoiding arguments of supposed "cost-shifting." Nevertheless, even though the stage was set for a better – more equitable – outcome in the AB 327 proceeding, as time went by, hopes for a robust and fair virtual net metering based community solar program for disadvantaged communities dwindled.[81] This resulted in part from parties advocating for divergent positions and in part from the Commission's decision-making process.

Proposals by Different Players in the Process

The CPUC requested proposals from parties to the proceeding for alternatives to net energy metering for disadvantaged communities and most of the proposals offered fell roughly into three approaches. First, green tariff-based proposals outlined programs that would give customers access to renewable energy, but no element of net energy metering or potential for community ownership of local resources. In addition, some parties recommended the expansion or extension of the Single-family Affordable Solar Housing "SASH" program, which provided incentives for net metering-based solar installations on single family affordable housing. Finally, there were two proposals for creating a virtual net energy metering (VNEM) based program to enable offsite community solar.

The first of two VNEM-based proposals was submitted by Vote Solar/Solar Energy Industries Association ("Solar Parties"). Their "DAC VNEM" proposal recommended expanding the existing VNEM program under the same retail rate compensation rules to allow any resident of a designated "Disadvantaged Community" or "DAC" census tract to subscribe to energy from any community solar project located in any other DAC census tract.[82]

Second, the California Environmental Justice Alliance/Sustainable Economies Law Center proposal for an "Equity VNEM" program aimed to promote smaller, local, community-owned renewable energy projects. The Equity VNEM proposal was offered as an add-on to the Solar Parties VNEM program, to address a few shortcomings of that model. Primarily, the industry proposal didn't encourage community-based projects (participants of a project could be from all over the IOU's service territory), projects didn't have a size limit, and there were no incentives for community ownership and control. These three issues were all tackled by the CEJA/SELC proposed add-on layer of Equity VNEM to prioritize projects that were close to customers, smaller, and collectively controlled.[83]

VNEM-based proposals ultimately led to the creation of the Community Solar Green Tariff. Proponents of VNEM argued that it was a necessary alternative to the standard NEM tariff, because NEM is fundamentally about self-generation, the economic benefit of bill credits tied to actual solar generation, and customer-based participation and demand. These characteristics of NEM could not be achieved simply by green tariff-based or SASH-based programs alone, the parties insisted. While the CPUC did not ultimately create a VNEM-based program as part of this proceeding, it created the CSGT program in an attempt to address some of the issues and goals raised.

CPUC Deliberations

Initially, it appeared that the Commission would implement some form of VNEM, with modifications to make it more community-based, though not incentivizing community ownership. While the Administrative Law Judges assigned to the proceeding did not include any form of a VNEM program in their Proposed Decision, one of the five Commissioners who heads the CPUC, Commissioner Martha Guzman-Aceves, simultaneously issued an Alternate Proposed Decision (APD) on the same day that included a VNEM-based Community Solar program. However, the Solar Parties argued that the APD's Community Solar proposal would not work and requested modifications to the program. The IOUs also attacked the APD's VNEM proposal, but had no interest in the program being improved at all; they advocated that the CPUC pull the proposal entirely. Rather than fixing the issues raised against the VNEM Community Solar proposal, even this door that was slightly cracked open was subsequently shut.

Ultimately, the CPUC walked back the VNEM-based program and proposed a more modest tariff-based community solar program: the Community Solar Green Tariff. The Community Solar Green Tariff (CSGT) allows people to subscribe to solar energy associated with a new installation nearby them – within 5 miles. And it allows communities to find new methods for maximizing the use of rooftop space and other areas for solar production. It wasn't exactly what parties had asked for, but the equity-aligned parties still saw it as something better than nothing, and supported its adoption while arguing for improvements as well.

Program Design of Community Solar Green Tariff

The CSGT program aims "to allow primarily low-income customers in certain disadvantaged communities to benefit from the development of solar generation projects located in their own or nearby disadvantaged communities" to "provide benefits to the participating customers, benefits to their communities, and benefits to the environment."[84] CSGT is meant to fill a gap in clean energy programs, specifically to serve renters and low-income communities who do not reside in multi-family buildings, and provide them a way "to access green benefits from a local source at an affordable cost."[85] Furthermore, it strives to allow indirect community ownership and leverage unique community solar funding sources.[86]

CSGT is a community solar program based on a "green program" or "green tariff" model rather than virtual net energy metering.[87] Subscribing residential customers on the CSGT get 100% renewable energy at a 20% discount as compared to their otherwise applicable rate.[88] The program requires community involvement; CSGT projects must have a nonprofit or government "Local Sponsor." The Local Sponsor is eligible to receive the 20% bill discount.[89]

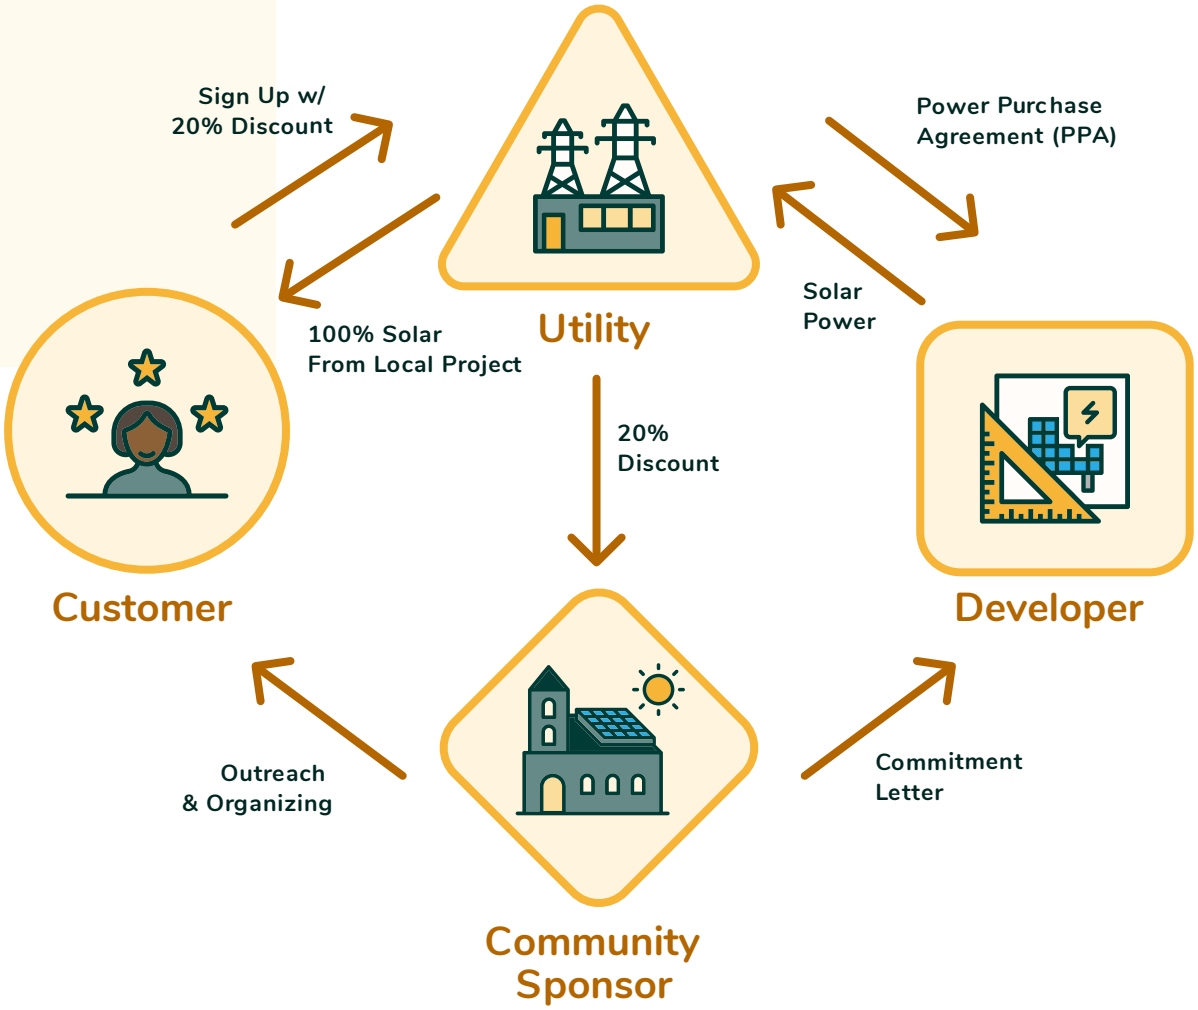

Diagram 8: California's Community Solar Green Tariff Program Design

Key Elements of Community Solar Green Tariff Program

- **Program Capacity:** The CSGT program is limited to 41 MW in total across all IOUs and community choice aggregators (another type of energy provider in California).[90] This represents an estimated 6,700 households.

- **Project Size:** The upper limit on project size is 3MW or 30% of the total capacity in that IOU's Community Solar Green Tariff program, whichever is larger.[91] The program explicitly does not set a lower limit on project size. (Unlike the 500kW minimum in the GTSR program.)

- **Definition of Disadvantaged Community ("DAC"):** One of the top 25 most vulnerable census tracts statewide as identified by CalEnviroScreen 3.0, as well as the "22 census tracts in the highest 5 percent of CalEnviroScreen's Pollution Burden, but that do not have an overall CalEnviroScreen score because of unreliable socioeconomic or health data."[92]

- **Location of Projects & Customers:** CSGT projects must be sited in a DAC and subscribers to a project must be in the same census tract where the project is located or in a DAC within 5 miles of the subscriber's DAC.[93]

- **Ownership:** CSGT is meant to allow a "sense" of indirect community ownership in projects as well as community involvement. The program does not incentive financial ownership, but indirect ownership is still technically feasible because there can be third party ownership, and participants can be part of an entity that owns the project.[94]

- **Low-Income Requirement:** 50% of customers must be low-income customers. For this program, the CPUC defines low-income customers as CARE-eligible and FERA-eligible customers.[95]

- **Bill Credit:** The CSGT program provides a flat guaranteed 20% discount on a customer's total bill – based on their "otherwise applicable residential tariff" before signing up for the CSGT program.[96]

- **Community Sponsorship:**
    - **Requirement:** In order to demonstrate community involvement, CSGT projects must have a "non-profit community-based organization or local government 'sponsoring' a project on behalf of residents." Sponsorship requires a letter of commitment from the organization, which must include elements such as a demonstration of community interest, estimates of size and subscriptions, a preliminary outreach plan, and community siting preferences.[97] Sponsors should also include job training and workforce development efforts.[98]
    - **Incentive:** The Local Sponsor is eligible to receive bill credits based on the CSGT (i.e., 20% discount) for up to 25% of the project's capacity, but not more than the Sponsor's energy needs.[99] This discount lasts for the life of the project.[100]

- **Procurement Process:** Projects are accepted through an auction-based process, in which the project is selected after a competitive solicitation. Once accepted, the IOU executes a Power Purchase Agreement (PPA) with the applicant solar project developer. The CSGT program does not require any direct relationship between the subscriber and the project developer.[101] IOUs must issue at least two RFOs per year for CSGT projects and prioritize four types of projects in particular, listed below.[102]
    - **Prioritizations:**
        - Projects located in top 5% most vulnerable communities (about 500 census tracts)[103]
        - Projects located in San Joaquin Valley pilot communities[104]
        - Projects that leverage other government funding or projects "that provide evidence of support or endorsements" from local or state climate programs or initiatives[105]
        - Projects that include job training and workforce development factors - "As part of their RFO process, utilities should prioritize job training and workforce development factors. Further, sponsors should ensure that their efforts include job training and workforce development efforts to benefit the local communities which would benefit from the projects"[106]
    - **Cost Containment:** "We will establish a cost cap similar to that in the Enhanced Community Renewables Environmental Justice program, which has a cap of 200% of the historical RAM clearing price." But for CSGT: "utilities should limit contract awards to Community Solar Green Tariff program projects whose bid price is at or below the higher of 200 percent of the maximum executed contract price in either the Renewable Auction Mechanism's as-available peaking category or the Green Tariff program."[107]

The following hypothetical example helps to demonstrate how a CSGT project might work. In this example, the Local Sponsor is a church. The Local Sponsor church will also be the host of the solar system, which will have a capacity size of 100kW and be located on the church's roof. The church will sign a commitment letter with a solar developer outlining efforts that will be conducted by the church, including outreach and community organizing. The solar developer will install or manage installation of the system and enter an agreement with the utility for the utility to purchase the power from the system. The utility will directly handle billing and customer service for enrolled customers. Those enrolled customers will get a 20% discount on their overall bill each month with no upfront costs.

Hypothetical Example of a Community Solar Green Tariff Project:

- **System size: 100kW capacity system**
  - The Local Sponsor is a church with a roof that can support a system with 100 kW capacity.
- **Sponsor subscription: 25kW capacity**
  - The church's historical/estimated usage (i.e., past 12 month kWh usage + any variation likely for future) equals an estimated need of a 25kW sized system at that location (based on solar radiation/system performance calculators).
  - So, the Sponsor subscribes to 25% of project capacity (25kW/100kW).
  - The church gets the 20% discount CSGT rate for usage up to 25% of the system's output. Any additional usage will be billed at the church's otherwise applicable rate.
- **Customer subscriptions: 75kW capacity in total**
  - The remaining 75 kW of capacity is apportioned to customers based on their actual historical/estimated usage (i.e., past 12 month kWh + any likely change)
  - Let's say the average for 25 residents is 3kW capacity need each, for a total of 75kW.
  - The customers get a 20% discount on every monthly bill, regardless of actual monthly usage.

Analysis

Pricing Mechanism

Because CSGT is not a VNEM-based program, the economics of developing projects is a bit more obscure, and ultimately it is not clear if projects will be constructed under this program. To build a project, a solar project developer must first secure a power purchase agreement (PPA) from the utility, which will then allow the developer to finance the project. To secure a PPA, the developer must submit a bid in a competitive, auction-based, solicitation. The bid is an offer to sell power from a proposed CSGT project at a specified price. As noted above, the utilities may not accept bids higher than a certain level, that is, bids more than twice the cost of the highest bid accepted in another renewable energy auction. By design, auction bids are confidential, so it is not known what exact price will win in a CSGT procurement auction, and thus how much a developer will get paid for power from a CSGT project. However, wholesale renewable energy contracts (for utility scale solar or wind) are typically in the range of 4 to 6 cents/kWh, so the CSGT bid cap might be around 8 to 12 cents/kWh. Even at that range, it's not clear if such revenue will be enough to cover construction, customer acquisition, and other costs to build a project. While it's a price range that has enabled community-scale solar installations, solar industry representatives have expressed concern that some CSGT program requirements, such as the geographic limitations and customer income qualification limitations, will make projects too costly to pencil out.

On the other hand, the economics of participation from a customer's standpoint is in some ways more clear for CSGT than a net metering-based program. With net metering programs, a customer receives credits on their electricity bill and pays the utility less per month, however

they either have to pay upfront to install their system or pay a solar company monthly payments in addition to their utility bill. Therefore, it can be a bit more challenging to calculate how much a customer might save overall.

Considerations of Equity

If projects can get built, CSGT will represent a significant step forward for equitable community solar in California. Even though the program is limited in its overall size to only be up to 41 MW, it would allow the development of local solar projects that customers could choose to receive their power from at a clear discount and with no upfront costs. It would allow customers in communities overburdened from pollution to access these benefits and would not only be limited to low-income customers. Nevertheless, it is a major issue of fairness and equity that the program size is so small, that customers do not have access to bill credits as valuable as net metering-based credits, and that the procurement pricing limitations leave so much doubt as to whether projects can get built at all.

Application of Energy Justice Scorecard Metrics to CA CSGT Policy

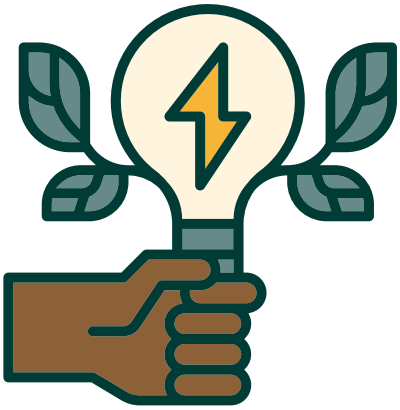
Below we evaluate the Community Solar Green Tariff adopted under AB 327 by applying the Energy Justice Scorecard. While we assessed the ECR program as having a score of 7, we give CSGT a 14 using the scorecard. The higher score and accompanying analysis demonstrates the progress that was made and that which is still needed. In particular, the CSGT program has made meaningful progress to ensure marginalized communities receive energy and non-energy benefits from the program, and slightly increases the economic feasibility of project development. CSGT has not yet been fully implemented, however, and questions will remain until it goes online and can be more thoroughly evaluated.

(1) Process: *Have marginalized communities participated meaningfully in the policymaking process with sufficient support?*

Score: 3 - Somewhat. The answer here for CSGT is mostly the same as for the ECR program, although there was slightly more community participation. Primarily, that participation came in the form of CEJA being a party to the proceeding and being actively involved. In addition, one of its member groups, APEN was also directly involved, so that increased the amount of participation. CEJA also received support from a legal clinic and partnered with the Sustainable Economies Law Center on some comments, which expanded its capacity to participate in the policymaking process. There were also more organizations that represent low-income communities involved in this proceeding, outside of CEJA member groups, including the Brightline Defense Project, which works to create sustainable environments and empower low-income communities, including the San Francisco's Bayview-Hunters Point community.

(2) Restoration: *Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the fossil-fuel based energy system?*

Score: 3 - Somewhat. CSGT was specifically designed to target barriers faced by disadvantaged communities in accessing the benefits of distributed renewable generation. The Commission was responsive in aiming to design a program that promoted local solar generation on community buildings in pollution-burdened communities. However, it does not go far enough to robustly address the concerns raised to significantly counter prior harms. *Financial access and benefits:* the program includes a flat 20% discount and potentially opens the door for community-based developers who could use the program as a means for wealth-building and job creation. But that's very tentative, and also the size of the program isn't very large, so it's not likely to drive a lot of projects, wealth, or jobs. *Ease of participation:* the program unfortunately still relies on a biannual auction, but doesn't have a securities legal opinion requirement. *Health:* CSGT doesn't explicitly target replacing emissions from local fossil fuel power plants but is focused on siting solar projects in pollution-burdened census tracts.



(3) Decision-making: *Does the policy center the decision-making of marginalized communities?*

Score: 2 - A little bit. The policy includes a requirement that projects have a community sponsor, who can also access the 20% bill savings, so that is an avenue to get more community participation and involve a community anchor institution. However, CSGT does not otherwise require, incentivize, or do anything proactively to encourage decision-making by the community. The commission declined to specifically promote community-ownership or control, but collective ownership is technically still possible because the program allows third party ownership of solar projects.

(4) Benefits: *Does the policy center economic, social, or health benefits for marginalized communities?*

Score: 2 - A little bit. As noted above, the program does include bill savings, potentially a route for local wealth-building and good jobs, and perhaps health benefits from local siting. However, the likelihood for benefits beyond the bill savings is quite tenuous. CSGT does not include any specific mechanisms or evaluation methods to ensure or reflect on the attainment of such benefits.

(5) Access: *Does the policy make energy more accessible and affordable to marginalized communities?*

Score: 4 - Yes, probably. Participants receive a 20% bill savings discount and that discount applies on top of other discounts from low-income assistance programs such as California Alternate Rates for Energy (CARE) and Family Electric Rate Assistance Program (FERA). CSGT also requires that at least 50% of the capacity of each project is allocated to low-income residential customers. On the one hand, this may drive accessibility and affordability for working class families because they must be included, but on the other hand it may make it challenging to build projects and sign up enough customers. So there remains a major question of whether projects can and will be built, and if they cannot, then of course no one will see such benefits. Other factors that have also raised concerns from analysts about the economic viability of constructing projects include the geographic limit to the customer base for projects[108] and the utility procurement pricing method employed.[109]

Energy Justice Scorecard: California Community Solar Green Tariff Program

Scoring Key: 1 (No), 2 (A little bit), 3 (Somewhat), 4 (Mostly), 5 (Yes)

Question	Score	Explanation	Reference
(1) Process: Have marginalized communities participated meaningfully in the policymaking process with sufficient support?	5 4 (3) 2 1	*Somewhat. Primarily, in the form of an alliance being a party to the proceeding and being actively involved, along with a few more orgs.*	*A record of all party comments can be found online.* [110]
(2) Restoration: Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?	5 4 (3) 2 1	*Somewhat. CSGT was specifically designed to target barriers faced by disadvantaged communities in accessing the benefits of distributed renewable generation.*	
(3) Decision-making: Does the policy center the decision-making of marginalized communities?	5 4 3 (2) 1	*A little bit. Does not incentivize community control, but requires a local sponsor to assist in community outreach.*	
(4) Benefits: Does the policy center economic, social, or health benefits for marginalized communities?	5 4 3 (2) 1	*A little bit. The program includes 20% electric bill savings, but benefits beyond that are uncertain.*	
(5) Access: Does the policy make energy more accessible and affordable to marginalized communities?	5 (4) 3 2 1	*Yes, probably. In addition to the bill discount there is a requirement that 50% of the capacity of each project is allocated to low-income residential customers.*	
Total Score	*14* / 25		

Section 3.2 - Case Study of Community Distributed Generation Program in New York

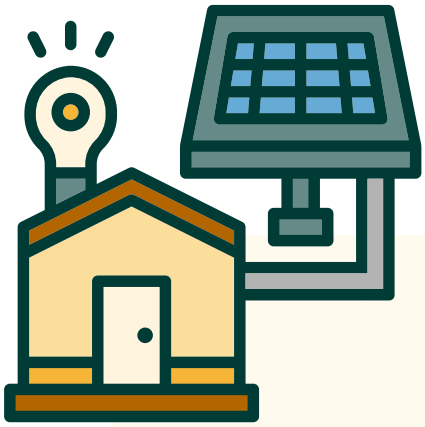
This section reviews New York's Community Distributed Generation ("CDG") program, which came out of Reforming the Energy Vision ("REV") – a broad overhaul of the electricity generation and distribution system in New York State. The CDG program allows multiple electricity customers to access energy and benefits from a single energy generation project. Using the Energy Justice Scorecard, we give the CDG program a score of 14 out of 25 points. While New York's CDG policy seeks to address energy-related burdens for low-income and environmental justice communities, it does not include environmental justice components in the value of solar or public health, economic, and other social benefits of a solar project.

Background

Key guiding principles for REV are (1) transitioning from centralized to distributed energy generation, (2) improving the reliability of transmission and distribution infrastructure, (3) phasing out of fossil fuel-based generation and expansion of renewable energy resources, (4) developing more resilient grid infrastructure and energy generation in the face of extreme weather and climate change impacts on weather patterns, (5) facilitating increased agency and individual choice on the part of the electricity consumer, and (6) improving and sustaining deep affordability of energy for consumers.[111]

REV grew out of both the acute shock of Superstorm Sandy as well as a recognition of more chronic and longstanding stresses on the energy system, energy generators, and energy consumers. Superstorm Sandy put in sharp relief the need for more resilient electricity infrastructure in the face of sweeping blackouts and power outages that lasted for weeks in some communities. The disparate impacts of extreme weather events like Superstorm Sandy on lower-income New Yorkers, the elderly and infirm, and public housing residents were also apparent as the communities that suffered the worst outcomes were those with limited access to the resources necessary to weather the storm and recover in its aftermath. Public housing developments in lower lying areas of New York City faced significant flooding and prolonged blackouts, coastal communities saw entire blocks ravaged, and critical infrastructure throughout New York City, including the transit system and a Con Edison facility, were seriously damaged. The failure of the electricity grid alone resulted in life threatening and in some cases fatal conditions. The Sandy post-mortem was replete with stories of residents requiring elevators for accessibility purposes stranded in their homes, those with serious health conditions unable to use critical medical equipment, lack of access to fresh food, cooking, medicines, and inability to climate control homes resulting in serious health concerns for families, young children, and the elderly. The calls for meaningful change that would result in better preparedness and resiliency, particularly for the most vulnerable populations, grew in large part out of these deeply troubling stories and the desire for communities to build power and agency to withstand the next storm. The widespread power outages and energy system vulnerabilities revealed by Superstorm Sandy spurred New York regulators to action, and in 2015, the state's energy regulators opened the Reforming the Energy Vision regulatory docket to advance the state's transition toward a cleaner, more nimble energy system.

Prior to Superstorm Sandy, New York's electricity generation system was far from optimized. Lack of access to affordable, reliable energy posed an ongoing and significant challenge for New York City's low-income residents. New York's electricity rates were 59 percent higher than the national average, and some low-income residents were paying up to 20 percent of their income towards utility costs, while higher-income residents often paid less than 5 percent. Low-income households were also more likely to experience power termination due to lack of bill payment, and additional penalties that only compounded their inability to pay. Due to increasing energy prices and volatility, New York utilities issued a record



number of shut-off notices to customers in 2015. These challenges were not merely academic but very real lived experiences: without utilities, residents cannot properly heat or cool their homes, which can be fatal for vulnerable populations such as the elderly and those living with chronic health challenges. In addition, routine daily activities, such as getting ready for work, completing schoolwork, preparing food, or even simple mobility through an apartment building can be nearly impossible without working utilities.

Regulatory Process

At its inception, REV had themes of inclusivity, access, and equity. New Yorkers would be able to access clean energy "regardless of their income or zip code," Richard Kauffman, the State's appointed leader on energy policy, stated in 2015. Affordability was also front and center, with the goal of alleviating utility burdens across the state a key driver of the proposed infrastructure improvements and need for more robust clean energy development. The recognition that the energy affordability crisis hit lower-income New Yorkers in much more profound ways than higher-income New Yorkers fueled the search for policies that would not only encourage more renewable energy throughout the state but also make it accessible to residents who traditionally could not tap into a renewable energy source due to economics or renter status.

The principles of access and affordability dovetailed with the other REV concept of customer choice, that electricity customers should have more agency to choose where their energy came from and how it was generated. This idea, coupled with REV's other core goal of increased renewable energy development, opened up new policy avenues that would allow for innovative models of energy generation and ownership. Advocates and policymakers recognized the more transformational possibility stemming out of this potential policy platform – that communities could directly participate in local, community-owned distributed clean energy generation. The possibility of customers moving beyond a status as "ratepayers," those that simply receive and pay a bill from a corporate utility, to energy generators and consumers (or "prosumers") would allow individuals and communities to create real value out of clean energy development and most importantly, keep that value and the accompanying benefits, within their own communities and households.

This vision ended up codified in New York's community distributed generation policy and its accompanying Public Service Commission proceedings and orders.[112] Community distributed generation ("CDG"), in the New York energy policy context, can refer to a wide range of energy generation systems in terms of scale, energy source, and technologies. However, the unifying principle underlying all CDG systems in New York state is that multiple individuals, households, and ratepayers may jointly participate in an energy generation project either as owners or subscribers and collectively partake of the benefits flowing from that project, whether it be the energy itself and/or the economic value from resale to the grid.

Relevant Proceedings within REV with Energy Justice Impacts

REV is an umbrella regulatory reform platform that ultimately contained within it a number of dockets at New York's Public Service Commission ("PSC") that facilitated the actual regulatory proceedings necessary to realize the articulated goals of REV as a policy. The proceedings within REV most relevant to energy justice considerations and impacts include:

- Community Distributed Generation/Shared Renewables/Community Solar
- Value of Distributed Energy Resources
- Uniform Business Practices for Distributed Energy Resources Providers
- Energy Storage
- Energy Efficiency
- Microgrids

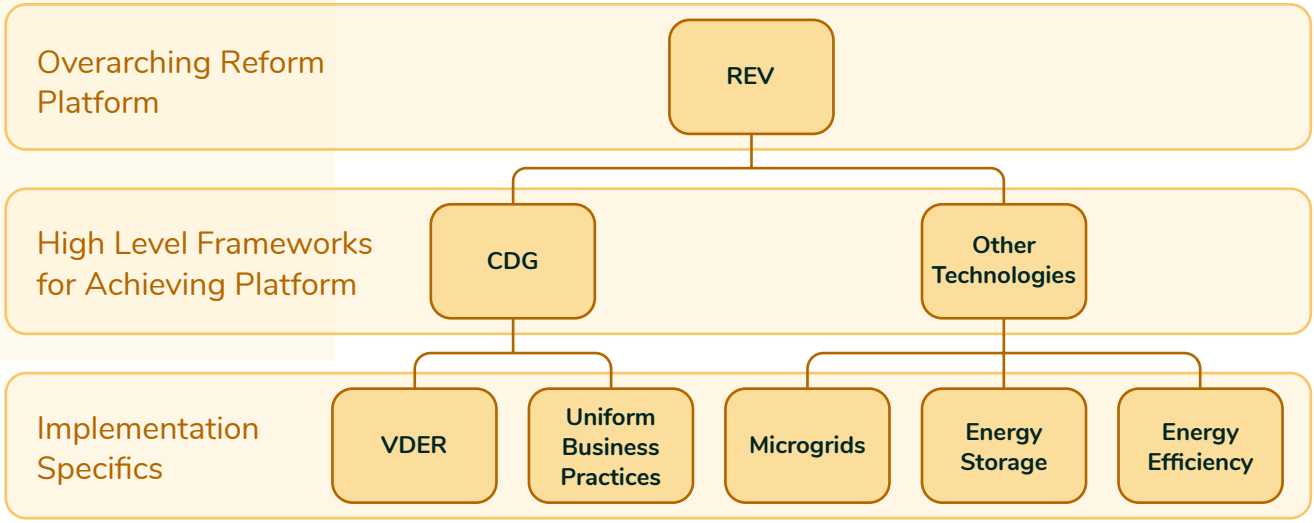


Diagram 9: Key Proceedings within Restoring the Energy Vision (REV)

Each of these proceedings were commenced at different times during multiple phases of REV starting in 2014 and continuing to date. A proceeding would typically involve some sort of kick-off that included preliminary information gathering and a stakeholder process where staff at the Department of Public Service ("DPS"), the agency that supports the PSC, would hold meetings and allow for filings on the docket to effectively scope the problem to be tackled in the particular proceeding. From there, each proceeding tended to take different forms depending on the nature of the types of stakeholder and expert input required and the timeline needed given the depth of a particular topic area. Often an iterative process, DPS would take preliminary input gathered through meetings, filings responsive to specific questions put forth by DPS, and other avenues of expert input, and issue a Staff Report that would detail recommendations as to how to proceed, typically including specific frameworks for a potential PSC order (the form that PSC official regulatory policy takes) addressing the matter at hand. Stakeholders would then have an opportunity to comment on the Staff Report, and these responses would be included in the record and accounted for in the PSC's ultimate decision on the form a policy should take in its final order on the topic.

Participants in the proceeding included the following categories of groups and representatives (not intended to be an exhaustive list):

- Utilities from across New York State
- Representatives of solar industry trade associations and individual renewable energy developers
- Environmental conservation-oriented NGOs
- Representatives from environmental justice organizations and coalitions
- Academic institutions and affiliates working in the energy and environmental field
- Policy think tanks working in the energy and environmental field
- Representatives from local, municipal, and county government
- Representatives from organizations advocating for low-income customers and communities
- Consumer advocates

Program Design of Community Distributed Generation

While REV included many regulatory proceedings, as described above, the PSC's Community Distributed Generation ("CDG") Order and its progeny formed the fundamental (and in many ways seismic) shift underpinning New York's policy reform to allow for increased access, equity, and justice in the energy space. New York's CDG policy, the regulatory framework that provides the basis for the more commonly referred to "community solar," allows for a separation between a project developer (or "sponsor" under the CDG Order), the owner of the property on which the project is located, and those that own the energy produced.

Under a typical net metering scheme, in contrast to CDG, these three roles are typically held by the same entity. For example, an individual may elect to install solar panels on a roof they own and subsequently use that generated solar energy to power their own home or sell it back to the utility grid to make profit. CDG allows for those that cannot generate or use renewable energy on property they own, or directly finance such a project, to nonetheless participate in a project that facilitates expanded renewable resources and earn economic value from those resources. For example, a CDG project sponsor may find a site, such as a parking lot or institutional roof, that could host a large photovoltaic system. The sponsor enters into a lease agreement with the owner of the site that allows the sponsor to conduct the necessary feasibility studies to build, access, and maintain the infrastructure. The sponsor can then enter into separate agreements with potential "subscribers" to the project – a subscriber may purchase an ownership interest in a set of panels that are part of the bigger project or may purchase a share in the legal entity that owns the project or may purchase a subscription to buy a certain amount of produced energy. By separating out these three roles, conceptually, CDG should dramatically expand access to renewable energy generation and its co-benefits.

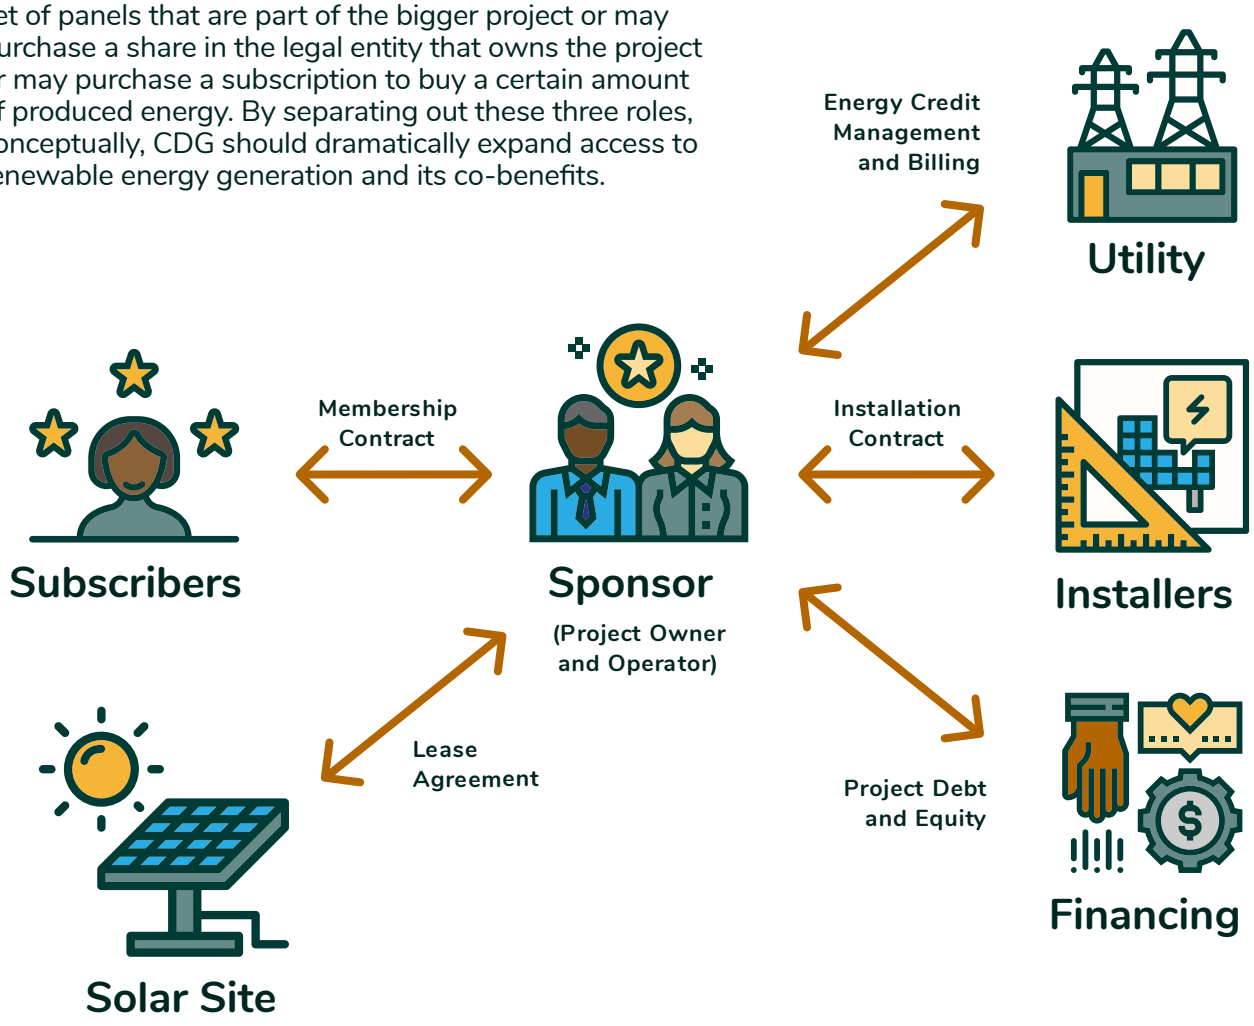

Diagram 10: New York's Community Distributed Generation Program Design

Given this expansion under the new CDG Order, utilities became concerned with the potential burdens on the grid due to an increased volume of distributed solar projects coming online. Grid interconnection queues under the new CDG Order ballooned as project sponsors sought to take advantage of the new opportunity afforded by the CDG model.[113] From a technical standpoint, utilities carefully monitor and control the interconnection of distributed energy generation (most commonly prior to the CDG Order, rooftop solar) to ensure that the grid can handle the input from such systems when energy is fed back into the grid and maintain reliability. Additionally, utilities must compensate individuals for any energy fed back onto the grid from their projects. Up until recently, the amount of compensation was calculated pursuant to Net Energy Metering ("NEM") – the retail value that a customer would pay for a kilowatt-hour of energy is the same value that customer would receive for feeding a kilowatt-hour of energy back into the grid.

Utilities in New York began to call for a shift from NEM to some other compensation scheme that would account for the cost burdens on the system due to a project's interconnection to the grid.[114] Essentially the utilities argued that NEM overestimated the total value of a unit of energy sold back to the utility and was too coarse of a metric to properly capture the value a utility should be paying for a unit of distributed energy from a project.[115] This call for reform to NEM is not being made only by utilities in New York State, but rather is part of a national trend by utilities seeking to change the compensation scheme for energy fed back onto the grid. Utilities argue generally that such reform is needed because the penetration of renewables onto the grid is increasing, thereby making compensation at NEM levels unrealistic as renewables continue to scale. Specifically, utilities cite to potential impacts to the costs other ratepayers using energy off the grid are paying if compensation for distributed energy to those generating it is too high. Debate on this issue rests in part on the threshold level of penetration of renewables on the grid (usually described as the percentage of total energy on the grid that is coming from distributed renewables) that would call for a change to NEM compensation. For example, research conducted by Berkeley Lab found that impacts on rates would remain at 5% or less if NEM compensation was used for distributed generation penetration levels that were less than 10%. Arguably then, a "NEM 2.0" would not be necessary until penetration levels reached 10%. For comparison, the national average as of that study was 0.4%.[116] While this is a national average, by definition some jurisdictions examined as part of the study had penetration levels higher than this.

In response to the call for NEM reform in New York State, the PSC opened the Value of Distributed Energy Resources ("VDER") proceeding, an effort to figure out what a replacement for NEM would look like.[117] This proceeding sought to establish a more refined calculation of the true costs and benefits of a unit of energy, in a particular location on the grid, at a particular time, being sold to the grid to determine how utilities should compensate generators for that particular unit of energy. Given the complexity of this calculation, the core element of the VDER scheme is a "value stack" which includes a number of layers of different types of value (e.g., a time of day factor, a locational factor, a wholesale price factor). As detailed below, the components of the value stack and the calculation of the amount of the costs and benefits became ground zero for how equity and justice considerations are accounted for within the REV framework as a whole.

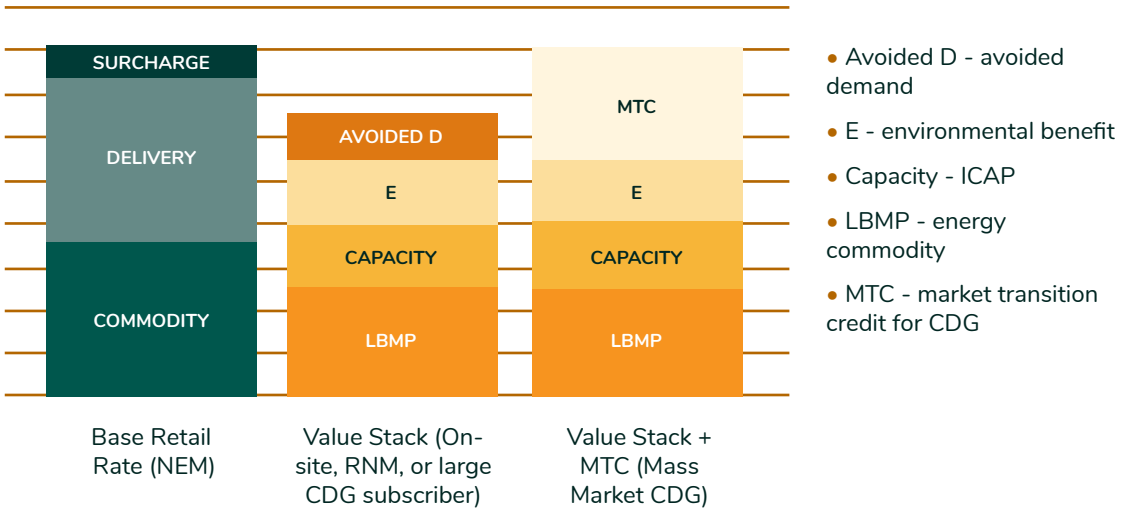

Diagram 11: Original VDER Value Stack Components -- Source: NYSERDA

The Value Stack includes components that vary with project characteristics including location on the grid (i.e., LBMP or location-based marginal pricing), which capture in part the relieved burdens on the grid due to the distributed resource, and the environmental characteristics of the project (i.e., "E" – the component available to CDG projects that utilize a renewable source of energy including solar, fuel cell, hydro, wind, tidal, and somewhat controversially in the environmental justice community, biomass). The Market Transition Credit (MTC) was designed purely as a market incentive mechanism to bolster the initial Value Stack level to an amount closer to what projects would get under NEM. It was intended to soften the blow of the transition from NEM to VDER and to be phased out over time as, theoretically, the CDG market took off and no longer required it.

Analysis

Considerations of Equity

New York has sought to address equity and access to clean energy for low-income New Yorkers in a number of dockets within REV, principally: (1) the CDG proceeding, (2) the VDER proceeding, and (3) the Low Income Affordability proceeding. At times, these three proceedings dovetailed and at times they ran in parallel, arguably addressing different aspects of securing clean and affordable energy for low-income New Yorkers but ultimately requiring reference back to one another given the interrelated nature of the issues each addressed.

When the Commission first issued the Community Distributed Generation (CDG) order in July 2015, it included a carve out for an initial phase that would prioritize the development of CDG projects that had at least 20% low- to moderate-income (LMI) subscribers in the Phase 1 of the CDG policy roll-out.[118] While this was a heartening indication of the possibility of prioritizing low-income inclusion in CDG at the outset, the lack of subsequent project support and guidance on workable low-income CDG models resulted in no CDG projects being built during this preliminary phase. The PSC, in its first CDG Order, was trying to balance project feasibility in a brand-new and largely unknown CDG market with prioritizing the REV goal of access and affordability for low-income customers. Unfortunately, the initial 20% carveout policy didn't ultimately strike the right balance.

In the hopes of addressing low-income participation in CDG with a more long-term strategy than the 20% carve out approach in the first phase of CDG implementation, DPS Staff commenced a Low-Income Collaborative process that brought stakeholders to the table to brainstorm and develop solutions to address low-income participation in the clean energy sector and CDG in particular.[119] The Collaborative culminated in the release of a report in August 2016 that reflected deep work and consensus-building by stakeholders.[120] DPS Staff elected to not take up any of the recommendations from that lengthy report and declared that there was effectively a market failure in the low-income sector requiring alternative utility ownership interventions. This conclusion was in many ways circular, as the Collaborative had been tasked to develop solutions precisely because the LMI sector wasn't properly addressed by current policies.

Pricing Mechanism

The VDER proceeding provides arguably the most robust example of the role of procedural justice in addressing low income and environmental justice issues. Stakeholders provided detailed and emphatic feedback to DPS through the various early stakeholder processes, technical conferences, and formal comment periods as to the likely impacts of VDER on low-income access to CDG and how those impacts could be mitigated. Additionally, many stakeholders articulated the need for CDG policy to properly account for environmental justice and that such considerations should be included in the VDER value stack mechanism itself. Specifically, advocates and experts called for the full valuation of all the benefits to communities and customers of expansion of DERs, not just costs to the grid as articulated by the utilities. A broad spectrum of benefits from renewable energy and CDG specifically were raised including project participation for underserved market segments, reduced energy burden on low-income utility customers, avoided social and public health costs, added grid resiliency, offsetting of current pollution, displacing the need for current and future polluting facilities, clean energy job creation, and meeting state and local climate targets.

When the final VDER order came out in March 2017, it included a directive to DPS staff to explore and address low-income participation in CDG. Low-income issues, and environmental justice considerations concurrently, were thus rolled into the VDER proceeding. However, the Phase 1 implementation of VDER did not include any mechanisms to support the participation of low-income customers in a CDG project. After a push on the part of advocates, DPS staff took up the issue during Phase 2 of VDER implementation. To that end, the VDER Phase 2 proceeding was broken up into three working groups to develop recommendations for staff around Value Stack, Rate Design, and Low to Moderate Income issues, respectively. Many advocates and stakeholders that had been calling for thoughtful process and substantive policies around low-income inclusion and environmental justice joined the LMI Working Group with the understanding that this was the appropriate venue to reiterate actionable recommendations and see meaningful movement.

On the contrary, it was clear from the outset of the LMI Working Group that the basic underlying assumption driving Staff's facilitation of this work was that CDG would not work for low-income customers in its current iteration and that environmental justice concerns were outside the scope of their work. Despite the formation of a broad ad hoc coalition of sixteen groups participating in the LMI Working Group—the "Aligned Parties"[121]—and the development of robust written recommendations in a proposal shared with key DPS Staff as well as filed on the docket that would fix CDG policies so that they could work for low-income households, DPS Staff indicated such issues were outside the scope of the proceeding.

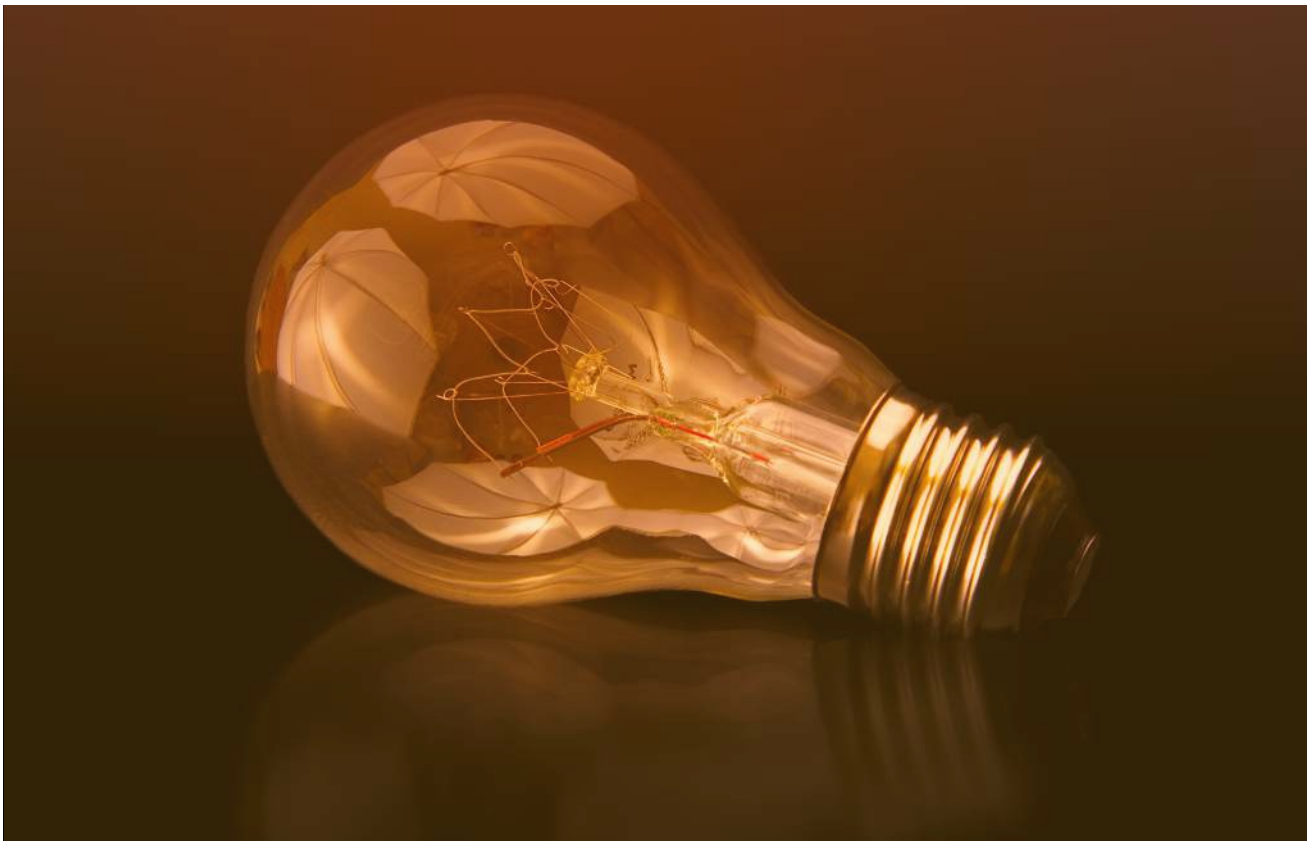
The LMI Working Group functioned for approximately six months between June and December 2017 and culminated in a Staff Report on Low-Income CDG that put forth policy and programmatic recommendations that had largely not been discussed within the Working Group collaborative process.[122] The Staff Report further declined, for the most part, to make recommendations around the policy proposals that had been put forth by consensus by a majority of the participating parties. The opportunity to discuss programming related to low income customer participation in CDG seemed to be closed at this point, and the LMI Working Group was dismantled with no clear commitments to specifically take up any of the recommendations by the Aligned Parties or in the Low Income CDG Staff Report to once and for all meaningfully remedy a serious lack of access by low-income households to CDG projects.

With respect to environmental justice issues, the Low Income CDG Staff Report suggested that the VDER Phase 2 Value Stack Working Group take up the topic as it likely required a quantitative analysis of environmental justice values to be included in the VDER value stack calculation.[123] However, there was a great deal of confusion as to exactly what steps the Value Stack Working Group needed to take and whether EJ values would even be discussed at all in that venue. At the urging of stakeholders at a Value Stack Working Group meeting, Staff allowed the formation of a "subgroup" to further examine environmental justice considerations in VDER and CDG. However, this subgroup was not afforded necessary resources to properly undertake this work and was largely self-organized and facilitated by advocates and academic experts. Through the generosity of pro bono support from economists at NYU's Institute for Public Integrity, the group made some headway in what a valuation of avoided social and economic costs due to mitigated air pollution might look like within the VDER mechanism. Unfortunately, as this work was underway, participants in the subgroup were informed by Staff that there were no hard commitments on DPS' part to gather input on these issues and incorporate them into a recommendation and approach, despite the time and resources being put into the effort by advocates and experts. This also spurred further confusion as to what exactly the mandate had been by the PSC in its initial CDG order to meaningfully explore issues related to low-income customers in accessing the benefits of the CDG framework.

The subgroup presented findings to Staff at a July 11, 2018, Value Stack Working Group meeting. Subsequently, Staff issued some limited fixes and recommendations for adjustments of the VDER mechanism through an order that boosted the value stack for certain projects in certain areas, though this was not with an emphasis on environmental justice considerations, rather was intended to address the viability of the CDG market on the whole, particularly in challenging utility service territories.[124] While very necessary and welcome, these particular fixes did not get at the heart of incorporating the full scope of values from the transition to renewable energy resources for the state, low-income customers, and for environmental justice communities.

Separately from the CDG Order and VDER proceedings, the PSC also sought to study the broader dynamics of how low-income customers were served by utility programs, and commenced the Low-Income Affordability proceeding on a parallel track.[125] This docket, and resulting PSC order, primarily addressed bill assistance programs for low-income customers and did not touch substantially upon the larger structural issues regarding energy affordability facing low-income customers, including expansion of access to energy efficiency and clean energy options. The proceeding resulted in a Commission Order issued in May 2016 calling for a goal of reducing the energy burden for all low-income New Yorkers to 6% or below and articulated the need for future coordination between agencies and programs to achieve this goal.[126] The order also explicitly describes the potential for distributed energy resources (DER) to help bridge the affordability gap, which indicated that eliminating barriers to access to CDG projects and other DERs for low-income customers could and would be prioritized in Commission policy and state programming moving forward.[127]

Another related proceeding that ran in parallel to the CDG and VDER proceedings that addressed particularized concerns for low- and moderate-income customers was the Uniform Business Practices for DER proceeding. This proceeding essentially sought to establish the consumer protection measures in place for customers purchasing energy from DER projects (including as subscribers to CDG projects). Given that the CDG Order would now allow for the sale of new kinds of energy products to consumers, the PSC wanted to ensure that the market would not become plagued by predatory practices that had occurred in the past with new fangled energy services being offered to low-income customers.[128] The preliminary order that resulted from this proceeding laid out a number of requirements for DER/CDG providers including registration, mandatory customer agreement contract provisions, billing and payment processing, and customer information.



Takeaways from CDG/VDER Proceedings for Energy Justice Objectives

Procedural Considerations

- Policymakers should articulate clear avenues for influence and input by stakeholders and how that input will concretely be considered and incorporated. This allows those participating in the regulatory proceeding to formulate strategies to be most effective in informing, educating, and advocating for policies that address their concerns.

- Process for process' sake is not meaningful for stakeholders, particularly those newly at the table and most impacted by potential outcomes. Advocates and experts do not want to waste their time on a symbolic public process as they typically have to make difficult decisions as to allocation of staff and organizational time and resources.

- Participants in a regulatory proceeding may consider requesting more detailed information from policymakers regarding process and timeline for a particular issue and how input will be considered. This could serve two purposes: one, it may encourage policymakers to think through that question when they haven't previously considered it (and staff proceedings accordingly) and two, it may allow participants to pick and choose where they put time and resources.

Substantive Policy Considerations

- Policy and value judgments as to what gets "counted" in the value stack for the purposes of determining the value of distributed renewable energy generation need to be discussed honestly and openly. These values-based conversations are a reflection of deeper beliefs about priorities and problems in the energy sector that have to be addressed prior to technical research, analysis, and economic modeling.

- New York, and other states considering similar reforms, needs to better grapple with the idea of the "prosumer" and the move from a utility model that bifurcates generators and consumers to one where they may (and in some cases should) be the same entity. Recognize that this necessarily requires a change in the fundamental business model of investor-owned utility energy distribution, that there is a natural tension given the economic interests of investor-owned utilities and the desire of consumers to become prosumers, and address what new models may look like that address these potentially divergent interests.

- It is important to balance innovation in new models for distributed energy generation development and their accompanying increased access for new customers/generators with consumer protection considerations. Those seeking to access clean energy generation, whether through rooftop solar on their own homes or through a community solar subscription, deserve robust protections against predatory practices. Such consumer protection policies should be well tailored to address potential problems without creating conditions that effectively render such projects infeasible. This is a real challenge and an area where much more attention and nuance should be afforded by policymakers.

- Decisionmakers should regularly check back in with the guiding principles behind the opening of a particular proceeding and make sure that the proposed solutions map onto those goals at every step. It is easy to get lost in the weeds and end up with "solutions" to entirely different or non-existent problems.

- Participants in a regulatory proceeding should be prepared to not only provide input and recommendations related to the communities they seek to represent but also to counter anticipated arguments that may come up in opposition to such recommendations. Often, policymakers and more traditional participants have certain preconceived notions going into a proceeding on a particular issue – a more productive process may result if those assumptions can be addressed up front before development of new ideas and solutions.

Application of Energy Justice Scorecard Metrics to New York REV Case Study

Having provided a detailed background of the context in which REV came about as well as certain substantive policy mechanisms included within it that speak particularly well to energy justice principles, below we provide an application of the Energy Justice Scorecard to New York's CDG policy. The goal is to provide an illustrative example of the use of the Scorecard that may facilitate its use in other policy contexts in service of energy justice and energy democracy movements in other states.

(1) Process: *Have marginalized communities participated meaningfully in the policymaking process with sufficient support?*

Score: 4 - Mostly yes. In terms of process, frontline communities were able to participate in the CDG and VDER dockets at the Public Service Commission. This included participation in various stakeholder and working group meetings with the PSC, submission of written testimony to the docket, and more targeted meetings with relevant policymakers to discuss matters of concern to frontline communities in particular. Whether such participation would be considered meaningful by the representatives of frontline communities in the PSC proceeding is likely where the debate would lie. To the extent that meaningful participation connotes consideration of the input by relevant policymakers, participants representing frontline communities likely felt that certain recommendations were not given the same consideration by policymakers as those of more traditional participants in energy regulatory proceedings (i.e., utilities, large NGOs). That being said, some informal avenues, in addition to the more formalized input in the regulatory context that

tended to be dominated by traditional participants, were created for stakeholders to work with policymakers to develop strategies and solutions addressing issues in the energy justice realm.

(2) **Restoration:** *Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?*

Score: 3 - Somewhat. New York's CDG policy, in its current form, appears to be largely forward looking by seeking to address energy-related burdens for low-income and environmental justice communities in the future through CDG and other forms of renewable energy development in those communities and for those marginalized customers. Attempts at including an "environmental justice" component in the value stack as part of VDER that would allow for additional incentives for project development that serves communities that have been harmed in the past by the fossil fuel industry did not have much traction with policymakers, due to cited concerns related to implementation in a fair and effective manner.

(3) **Decision-making:** *Does the policy center the decision-making of marginalized communities?*

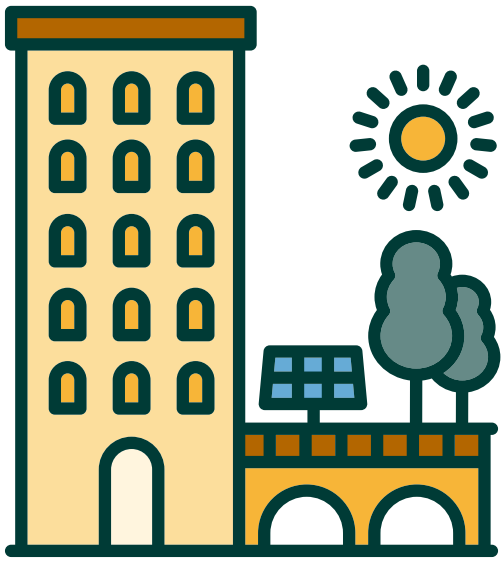
Score: 2 - A little bit. The concept of providing not just affordable, clean energy to traditionally excluded populations but also providing avenues for agency and meaningful decision-making related to the production of that energy did not have much traction with policymakers. Some attempts were made to develop a program that would allow for low-income subscribers to a project an avenue to eventually buy an ownership interest and thereby have some agency and decision-making power. This particular proposal did not end up being further developed and the program remained one that would facilitate low-income subscribers to a community solar project but did not provide ownership opportunities for those subscribers or facilitate capacity-building for more localized organizations to play a developer or sponsor role.

(4) **Benefits:** *Does the policy center economic, social, or health benefits for marginalized communities?*

Score: 2 - A little bit. Not currently, but may in the future. Despite rigorous attempts on the part of advocates and academics to quantify and include such a component in the value stack for VDER that would capture public health, economic, and other social benefits of the deployment of clean, affordable energy through a community solar project, the value stack currently does not include such a targeted component.

(5) **Access:** *Does the policy make energy more accessible and affordable to marginalized communities?*

Score: 3 - Somewhat. Theoretically yes, but unclear if so in practice. New York's CDG policy framework, in its current iteration, should allow for expanded access to renewable energy for those unable to install and benefit from renewable energy generation on property they own, as it allows for a bifurcation between owner/developer and recipient of the energy generation benefits. However, the most substantial barriers to access and affordability under the policy are (1) the lack of adequate monetary incentives that allow projects that serve low-income subscribers to pencil out and (2) lack of capacity building oriented programs and funding such that local organizations or organized groups of local residents may be able to play a sponsorship role in a project thereby increasing the benefits they receive as a result of the project (the economic benefits of asset ownership as compared to the more limited economic benefits of purchasing units of energy).



Energy Justice Scorecard: New York Community Distributed Generation Program

Scoring Key: 1 (No), 2 (A little bit), 3 (Somewhat), 4 (Mostly), 5 (Yes)

Question	Score	Explanation	Reference
(1) Process: Have marginalized communities participated meaningfully in the policymaking process with sufficient support?	5 (4) 3 2 1	*Mostly yes. Frontline communities were able to participate in dockets at the NY PSC, but it is questionable if they were meaningfully heard.*	*Party comments can be found online.*[129]
(2) Restoration: Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the energy system?	5 4 (3) 2 1	*Somewhat. New York's CDG policy seeks to address energy-related burdens for low-income and environmental justice communities, however does not include environmental justice components in the value of solar.*	
(3) Decision-making: Does the policy center the decision-making of marginalized communities?	5 4 3 (2) 1	*A little bit. The concept of providing avenues for agency and meaningful decision-making related to the production of energy did not have much traction with policymakers.*	
(4) Benefits: Does the policy center economic, social, or health benefits for marginalized communities?	5 4 3 (2) 1	*Not currently, but may in the future. Despite advocacy to quantify and include public health, economic, and other social benefits of a solar project, the value stack currently does not include such components.*	
(5) Access: Does the policy make energy more accessible and affordable to marginalized communities?	5 4 (3) 2 1	*Somewhat. Theoretically yes, but unclear if so in practice. The policy should allow for expanded access but benefits may go to developers and there are various barriers to access and affordability.*	
Total Score	*14* / 25		

Section 3.3 - Lessons from Community Energy Case Studies

The case studies offer three key lessons for community energy policies consistent with energy justice:

(1) community participation in policy development and program design;
(2) energy pricing and valuation structures that make projects viable and attractive to customers and developers; and
(3) sustainable business models that enable community decision-making and control over customer-generated energy resources while balancing the need to target priority customers and provide consumer protection.

Lesson 1: Community Participation

In both the California and New York contexts, community participation was a crucial element. Adequate community participation requires that voices are engaged, heard, and genuinely responded to. For example, while stakeholders in New York felt as though the final outcome did not tie back to overarching goals and community input, to some degree California's CSGT program represents progress in soliciting comments from community representatives on overarching goals and referencing those goals later on during the process.

Lesson 2: Pricing and Valuation

Both the California and New York programs struggle with pricing solar in their community energy policies. First, at a basic level, the pricing structure is a threshold issue that will determine if any projects are economically viable under the policy. The outcome in New York appears to have provided more certainty that at least some projects can get built, while that is a matter still to be determined in California. Second, the valuation of energy from certain types of projects is also a potential driver for equitable non-energy benefits such as public health, community wealth, and other social benefits. However, both California and New York have yet to include value adders or incentives for those projects that drive more community benefits than other projects.

Lesson 3: New Business Models

The case studies present lessons on developing and transitioning to sustainable business models for community self-generation of renewable energy. First, these experiences highlight the need to adapt the conventional utility model of centralized energy production sold as a commodity to customers to one where individuals and communities have agency, governance, and decision-making around their own production of clean energy. Second, considering equity means both ensuring that programs include and provide benefits to specific target customer groups such as low-income households, while ensuring protection from deceptive business practices.

Reflection on Using the Energy Justice Scorecard for Community Energy Policy

Applying the Energy Justice Scorecard to this arena highlights a key balancing issue in the community energy realm: How can community energy policy prioritize robust benefits for traditionally marginalized utility customers while also making community energy projects feasible for development? Questions 1-4 help to analyze the inclusivity of process and benefits, while question 5 demonstrates the importance of project feasibility. If projects cannot get built, no one will see purported benefits. But without meaningful community participation and evaluating disparate historical harms and present burdens, projects could get built in ways that further exacerbate inequities.

The Scorecard questions help to identify underlying elements that should be considered in designing an equitable community solar policy:

(1) Process: *Have marginalized communities participated meaningfully in the policymaking process with sufficient support?*

- In the community energy context, this could be analyzed in regards to legislative policymaking, but is more likely to have more applicability in terms of regulatory policymaking in a state-level public service/utility commission proceeding. However, this could also occur at the municipal level or through a utility's own internal process in some cases.
- Key considerations include whether accessibility, income, language, or other barriers are addressed to ensure community members can participate; whether there is financial compensation for time spent contributing to the policymaking; and whether the ultimate policy decision-makers have an obligation to respond to public comments and state why they have or have not been addressed.
- Public understanding of the terms and concepts being used in a policymaking forum is critical for meaningful engagement, so key concepts should be explained via print, online, and/or in-person meetings, including virtual net energy meeting, tariffs, power purchase agreements, and procurement mechanisms.

(2) Restoration: *Does the policy aim to remedy prior and present harms faced by communities negatively impacted by the fossil-fuel based energy system?*

- A key mechanism for ensuring such harms are considered is a mapping tool based in large part on disparate pollution burdens, such as the CalEnviroScreen tool developed by the California EPA. The US EPA has a similar tool, and various states are also developing their own. Such a tool can allow for geographic targeting of participation, benefits, and incentives.
- A robust community solar policy would consider mechanisms for prioritizing projects that reduce pollution in these neighborhoods (such as by reducing demand for nearby fossil-fuel plants) in addition to other community benefits from renewable projects.

(3) Decision-making: *Does the policy center the decision-making of marginalized communities?*

- The policy should promote community self-determination, governance, and agency through cooperative ownership or control of renewable energy assets. Moreover, it should support the efforts of community-based organizations that serve marginalized populations to advance energy democracy for their communities.
- Policy mechanisms such as application prioritization, financial adders, and other incentives can promote equitable community-based projects.

(4) Benefits: *Does the policy center economic, social, or health benefits for marginalized communities?*

- The above questions build upon each other and lead to this focus on robust benefits to marginalized community beyond just renewable energy itself, in addition to prioritizing fossil-fuel harmed communities and community decision-making.
- Equitable community solar policies can advance deep impacts with requirements and designs that advance meaningful bill savings; family-sustaining jobs training; community wealth-building and investment opportunities; cleaner air from avoided fossil fuel extraction and generation; reduced fires, costs, and power shutoffs from less reliance on transmission lines; and resilience from power outages through pairing solar with storage.

(5) Access: *Does the policy make energy more accessible and affordable to marginalized communities?*

- As mentioned above, a fundamental issue here is ensuring that pricing and valuation structures making projects feasible and attractive both for developers (ideally community-based ones) and customers. In addition to compensation methods based on retail rates, programs could guarantee a certain amount of savings for customers, or payments to developers.

- Many other mechanisms could be considered. Minimum participation requirements can ensure projects must include a certain percentage of low-income customers but should be balanced with economic incentives to make sure projects can still be financed and constructed. Various groups have developed new methods of evaluating the likelihood a customer pays bills, and more equitable approaches should be utilized as opposed to conventional credit checks. Allowing the limited participation of anchor commercial customers (such as schools, nonprofit organizations, or municipal customers) in a community solar project might make participation more accessible or affordable to residential customers.

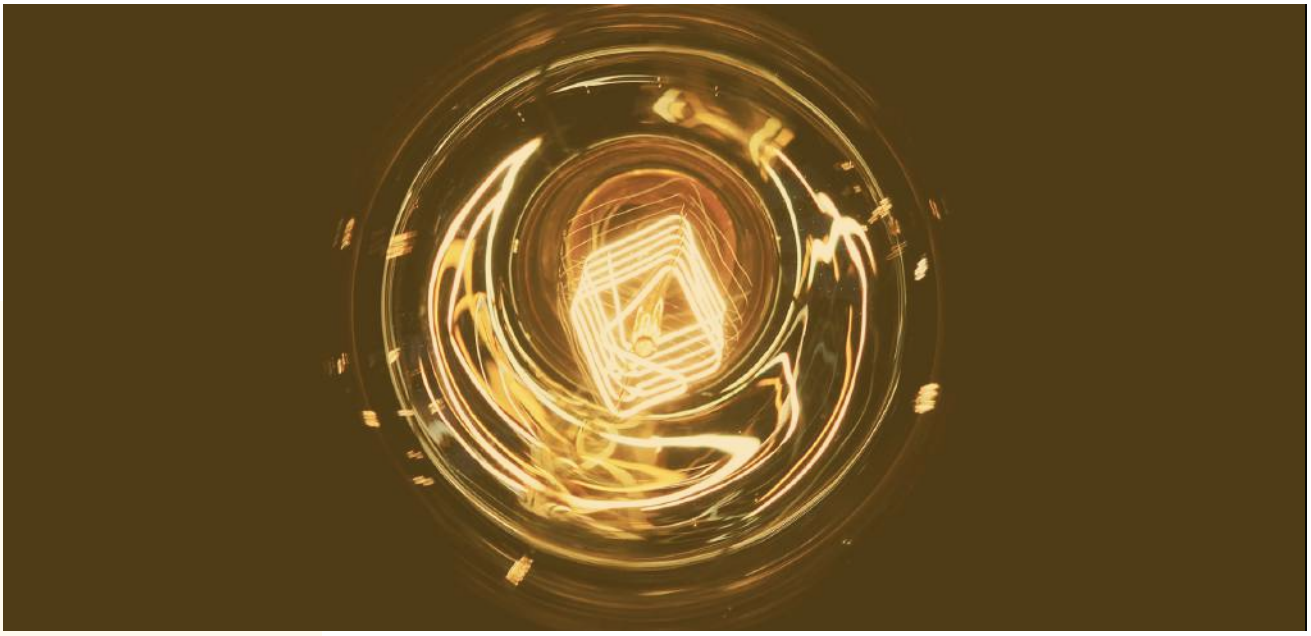
Equitable Community Solar Framework

In light of the case study lessons and Scorecard-based analysis of community solar programs, the elements of good community solar policy becomes more clear. First, instead of simply defining community solar, we can propose a definition of what equitable community solar looks like. Equitable community solar (1) allocates energy and benefits from one solar system to multiple customers via viable economic incentives, (2) intentionally engages and centers participation of marginalized populations, and (3) prioritizes local community self-generation and ownership of energy resources.

The overall goal of an equitable community solar policy is the achievement of robust, justice-oriented impacts, as determined by an equitable process. In sum, from the advocacy, writings, and participation of environmental, economic, and social justice communities, such a process will likely identify, at a minimum, potential outcomes such as equitable economic, health, grid, resilience, and environmental benefits. As emphasized previously, local communities, advocates, and policymakers must go through as process of identifying goals, and then design a program to achieve them.

The definition of equitable community solar laid out above helps illuminate key program objectives for an equitable community solar policy that will ultimately lead to the overall goal of robust, justice-oriented impacts. And the high-level objectives give structure, direction, and purpose for underlying mechanisms in the policy design. Each element of the definition can be summarized generally into three objectives:

(1) Project Feasibility - allocates energy and benefits from one solar system to multiple customers via viable economic incentives
(2) Equitable Participation - intentionally engages and centers participation of marginalized populations
(3) Community Control - prioritizes local community self-generation and ownership of energy resources



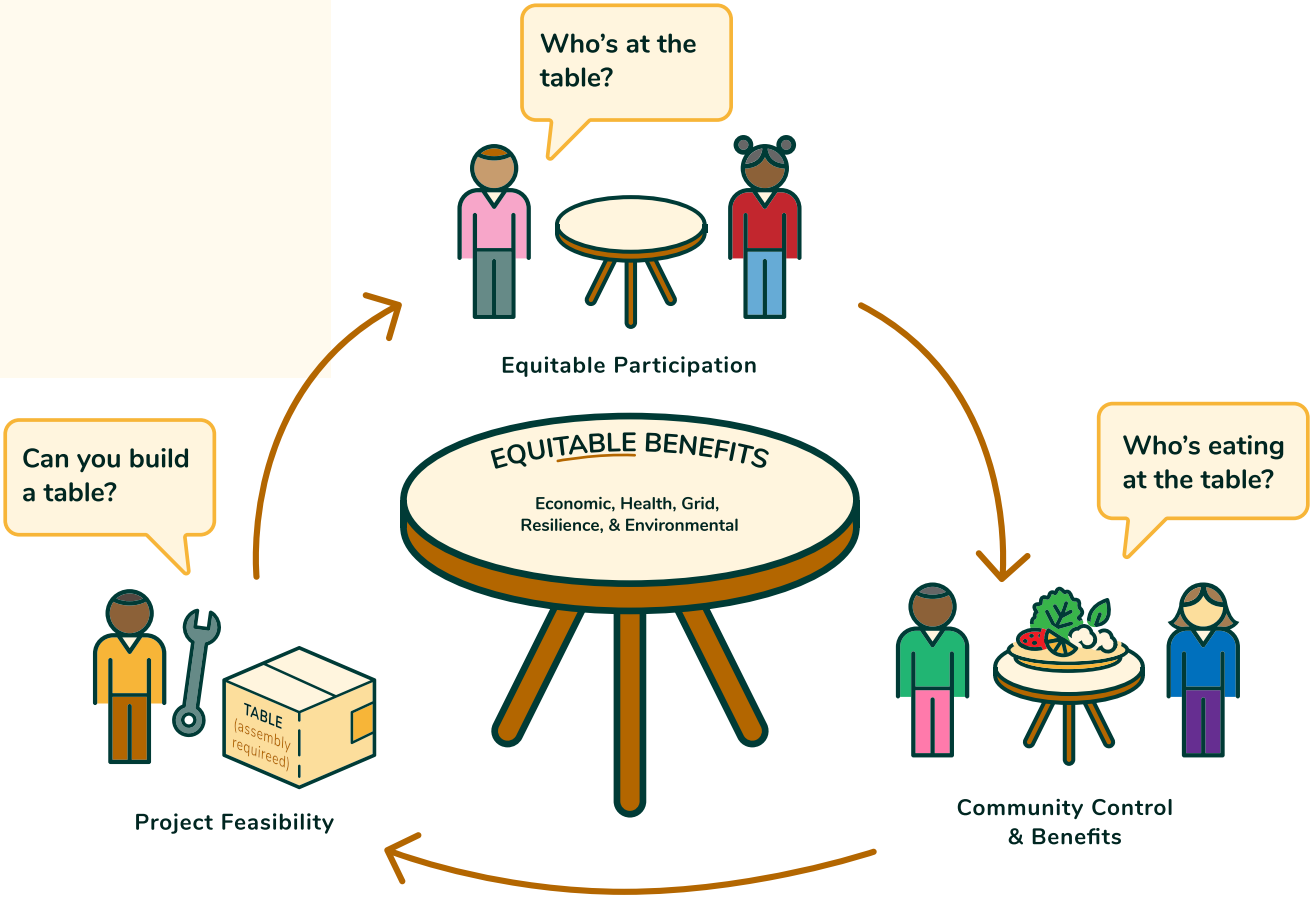


Diagram 12: Equitable Community Solar Framework

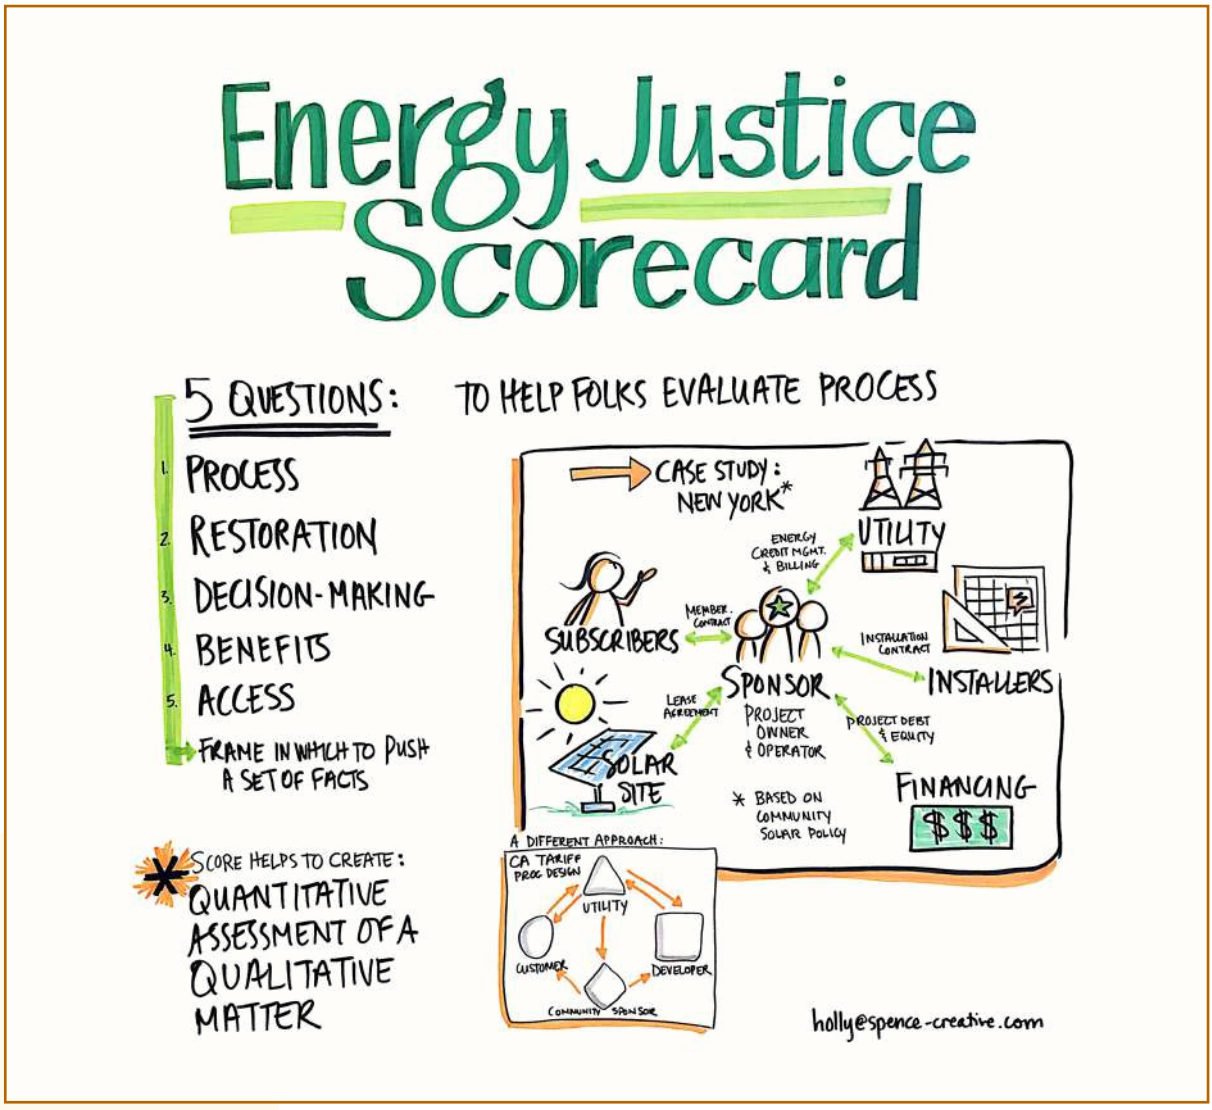
The three program objectives can also be framed as: 1) can projects get built?, 2) are they designed to include marginalized communities?, and 3) are they designed to deliver robust economic, health, and social benefits by allowing communities to own and control energy resources? Or in other words: 1) can you build a table?, 2) who's at the table?, and 3) who's eating at the table?

By delving into the questions that the Energy Justice Scorecard asks, not only does it become evident that we can approach policies in such a way that advances both an equitable and rapid transition to renewables – we *must*. It is our moral imperative.

Conclusion

As the long history of the grassroots struggle for social justice and decolonization intersects with the disparate harms posed by the climate crisis, the concept and urgency of energy justice begins to crystalize. Yet beyond the potential for disaster lies the opportunity of a just transition to a regenerative clean energy economy – along with the dignified work, wellbeing, and shared wealth that it offers. Whatever our planet's outcome – from catastrophe to justice or somewhere in between – it is not inevitable. The generation alive today will determine not just the temperature of the planet that future generations will inherit, but the level of justice or injustice that they will experience.

We hope this Workbook contributes to this social and political discourse for advocates and policymakers by demystifying what energy justice is and how we can achieve it through policymaking. Our effort to propose a definition for energy justice, and a tool to operationalize it through the Energy Justice Scorecard, is just one part of a vast and ongoing movement and dialogue to achieve energy justice, environmental justice, climate justice, energy democracy, and more. It is our hope that this Workbook serves as a vehicle for brainstorming policy campaigns and positions, a practice guide for engaging in policymaking, or simply food for thought and conversation. The more we can visualize responding to our interconnected crises of inequity and climate change in a transformative manner, and the more we can paint a picture of how we get there, the more we convert hope to reality.



Notes, Glossary, and Appendix

Glossary of Terms

Climate Justice: Climate justice is the remediation of the impacts of climate change on poor people and people of color, and compensation for harms suffered by such communities due to climate change.[130]

Community Energy/Solar: Community energy is short for community renewable energy and refers to cooperatively generating renewable energy such as solar.

Distributed Generation: "Distributed generation, also called on-site generation or decentralized generation, is the term for generation of electricity from sources that are near the point of consumption, as opposed to centralized generation sources such as large utility-owned power plants.... Distributed generation systems, which can include on-site renewable energy systems and combined heat and power (CHP), reduce the amount of energy lost in transmitting electricity because the electricity is generated near the point of consumption, often even in the same building or facility."[131]

Distributive/Substantive Justice: Distributive or substantive justice is outcome focused, and speaks to whether all equally share in the benefits and burdens of the energy system.

Energy Democracy: Energy democracy is the notion that communities should have a say and agency in shaping and participating in their energy future.[132]

Energy Justice/Equity: The goal of energy justice or energy equity is to achieve equity in both the social and economic participation in the energy system, while also remediating social, economic, and health burdens on those historically harmed by the energy system.

Environmental Justice: Environmental justice is the recognition and remediation of the disproportionately high and adverse human health or environmental effects on communities of color and low-income communities.[133] The key principles of the movement include fair distribution of the burdens of development, and involvement in all aspects of "the development, implementation and enforcement of environmental laws, regulations and policies."[134]

Environmental Justice Communities: Environmental justice communities "are commonly identified as those where residents are predominantly minorities or low-income; where residents have been excluded from the environmental policy setting or decision-making process; where they are subject to a disproportionate impact from one or more environmental hazards; and where residents experience disparate implementation of environmental regulations, requirements, practices and activities in their communities. Environmental justice efforts attempt to address the inequities of environmental protection in these communities."[135] Some state and local governments define environmental justice communities by specific metrics including, the percentage of the population below the poverty line,[136] the rate of toxic cancer among the community,[137] and the makeup of the community by race and ethnicity.[138]

Equity/Justice: Equity or justice "refers to achieved results where advantage and disadvantage are not distributed on the basis of"[139] social identities. "Strategies that produce equity must be targeted to address the unequal needs, conditions, and positions of people and communities that are created by institutional and structural barriers."[140]

Frontline Communities: Frontline communities are the communities experiencing the first and worst of climate change consequences, specifically those most impacted by the energy system and the resulting pollution. Frontline communities include, but are not limited to communities of color, low-income communities, indigenous communities, and communities surrounded by extractive energy production.

Just Transition: The just transition refers to a transition away from the fossil-fuel economy to a new economy that provides "dignified, productive, and ecologically sustainable livelihoods; democratic governance; and ecological resilience."[141]

Marginalized Communities/Populations/Peoples: Marginalized communities are communities denied involvement in mainstream economic, political, cultural and social activities. Marginalization or social exclusion deprives a group from access to basic rights and participation in decision making. Marginalized communities include, but are not limited to, frontline communities, low-income and/or working class communities, and those historically disenfranchised by racial and social inequity (e.g., minority identities based on race, ethnicity, sex, gender, sexual orientation, and ability status).

Net Energy Metering: Net Energy Metering refers to an on-site renewable energy system's accounting "for the value of the electricity produced when production is greater than demand. Net metering allows customers to bank this excess electric generation on the grid, usually in the form of kilowatt-hour (kWh) credits during a given period. Whenever the customer's system is producing more energy than the customer is consuming, the excess energy flows to the grid and the customer's meter 'runs backwards.' This results in the customer purchasing fewer kilowatt-hours from the utility, so the electricity produced from the renewable energy system can be valued at the retail price of power."[142]

Power Purchase Agreement: A Power Purchase Agreement "is an agreement between a wholesale energy producer and a utility under which the utility agrees to purchase power. The [Power Purchase Agreement] includes details such as the rates paid for electricity and the time period during which it will be purchased."[143]

Procedural Justice: Procedural justice concerns who is at the decision-making table, and whether, once at the table, everyone's voice is heard.

Virtual Net Energy Metering: "[V]irtual net metering allows net metering credits generated by a single renewable system to offset load at multiple retail electric accounts within a utility's service territory. As with traditional net metering, credits appear on each individual customer's bill."[144]

Appendix A: An Overview of Energy Justice in Academic Literature

How do Social Scientists Conceptualize Energy Justice?

Key Terms:
- Energy Justice
- Energy Democracy
- Energy Insecurity
- Energy Burden

Northern European scholars currently dominate the energy justice academic landscape, producing over one hundred articles on the topic since 2014. In particular, four scholars have made the biggest impact on the field: Benjamin Sovacool, Darren McCauley, Raphael Heffron,[145] and Kirsten Jenkins. Over the past seven years, these authors have come to define energy justice as "a global energy system that fairly disseminates both the benefits and costs of energy services, and one that has representative and impartial energy decision-making."[146] Energy justice is also comprised of a triumvirate of tenets that include distributional justice, procedural justice, recognition justice[147] and, more recently, restorative justice. All of the tenets should apply across the life cycle of the energy system.[148] Sovacool has also advanced the concept of "eight core principles" of energy justice: availability, affordability, due process, transparency and accountability, sustainability, intra-generational equity, inter-generational equity, and responsibility.[149]

As Heffron and McCauley note, these "defined concepts of energy justice compete with each other and at the same time complement each other."[150] Further, a "major limitation of the approaches outlined above—the triumvirate of tenets, energy life-cycle (systems) approach, and the principle-based approach—is that there is little reflection of how these transfer into practice and are 'enforced' in practice, i.e. energy justice becomes a delivered outcome through policy."[151] Despite these shortcomings, it is useful to review the key aspects of the foregoing frameworks.

In McCauley et al.'s assessment, distributional justice is concerned with the spatial dimensions of energy, in particular, the "physically unequal allocation of environmental benefits and ills and the uneven distribution of their associated responsibilities."[152] Procedural justice "manifests as a call for equitable procedures that engage all stakeholders in a non-discriminatory way."[153] Recognition justice relates to procedural justice, but contains additional elements. According to McCauley et al., recognition justice is "more than tolerance, and states that individuals must be fairly represented, that they must be free from physical threats and that they must be offered complete and equal political rights."[154] Further, recognition justice "includes calls to recognise the divergent perspectives rooted in social, cultural, ethnic, racial and gender differences[.]"[155] Restorative justice "aims to repair the harm done to people (and/or society/nature)."[156] The concept applies when "applying energy justice decision-making forces decision-makers to engage with justice concerns and consider the full range of issues, as any injustice caused by an energy activity would have to be rectified."[157]

Applying these complex conceptual frameworks within policy-making and real-world scenarios poses a challenge. Heffron and McCauley suggest that, in "looking at the energy justice conceptual framework, one begins with looking at the core tenets of the energy justice [framework] to see if they are present before then broadening their scope to see where the issues fits within the energy life-cycle (or energy system) in the context of having a world-view, i.e. a cosmopolitan perspective. They then look at how to apply energy justice in practice and look for how the problem, issue, and/or challenge they are researching can be addressed (or not) by the [eight] principles."[158] **Diagram 13**, below, reflects this analytical approach.

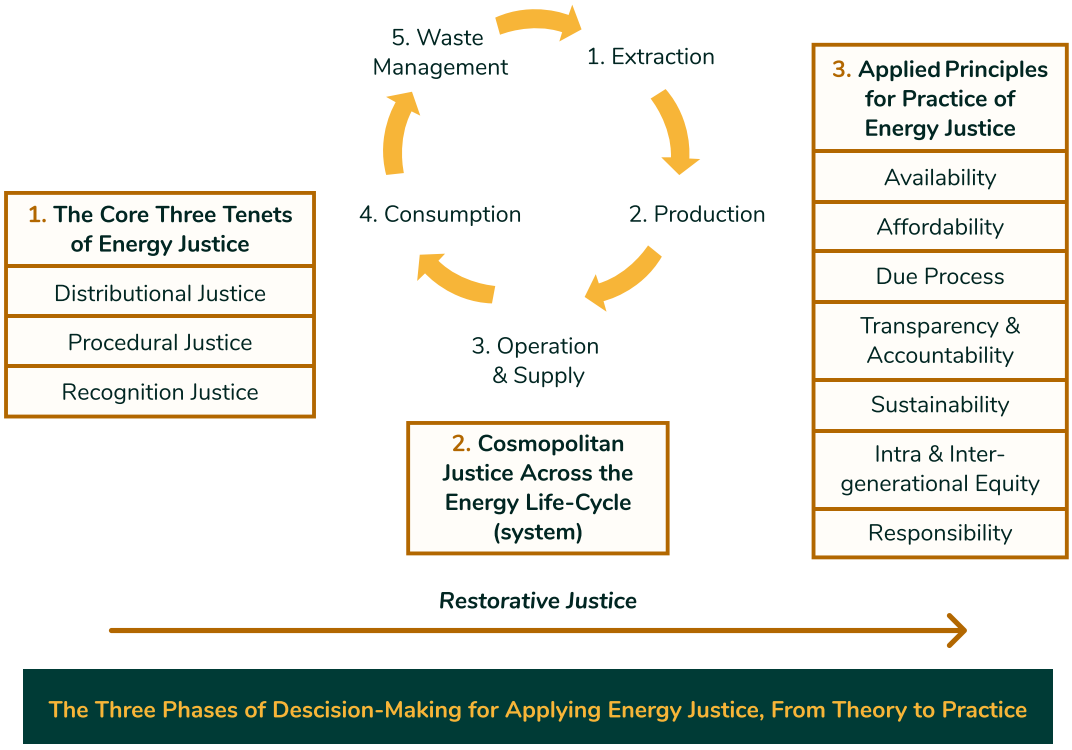


Diagram 13: Heffron and McCauley (2017).

Before moving into the legal literature, three related concepts, energy democracy, energy insecurity, and energy burden, deserve discussion, as they also fit under the broad umbrella of energy justice.

Energy Democracy

As with environmental justice and climate justice, energy democracy exists both as an organizing principle for activists as well as an area of increasing scholarly engagement.[159] Energy democracy, the movement, "seeks to create opportunities for destabilizing power relations, reversing histories of dispossession, marginalization and social and environmental injustices, and

replacing monopolized fossil fuel energy systems with democratic and renewable structures."[160] Borrowing from the Trade Unions for Energy Democracy approach to energy democracy, scholars Matthew Burke and Jennie Stephens note that the energy democracy goals include: (1) **resisting** the dominant fossil fuel agenda in order to shift to 100% renewable energy resources; (2) **reclaiming** public control of the energy sector; and (3) **restructuring** the energy sector to "better support democratic processes, social justice and inclusion, and environmental sustainability."[161]

For some, energy democracy does not always incorporate equity-based principles or a historical analysis,[162] and the use of the term, "democracy" can actually mask inequality. Under this approach, energy democracy could simply mean democratizing the energy system to allow for participation in energy production and ownership. Such participation may, by design, privilege those with access to financial resources and other types of capital that flow from an unequal society. This ahistorical, equity-blind approach to energy democracy threatens to replicate the injustices in the existing energy system by "democratizing" the grid and opportunities for self-generation of electricity only for those who can afford it, rather than emphasizing broader grid access for those whose voices have traditionally been excluded from energy decisions affecting their communities.[163] Policymakers and advocates should thus use caution and be clear when using this term to reflect more meaningful opportunities to participate in the energy system.

> "An ahistorical, equity-blind approach to energy democracy threatens to replicate the injustices in the existing energy system by '**democratizing**' the grid and opportunities for self-generation of electricity only for those who can afford it, rather than emphasizing broader grid access for those whose voices have traditionally been excluded from energy decisions affecting their communities."

Energy Insecurity and Energy Burden

Diana Hernández's work has explored the concept of "energy insecurity," which "reflects hardships with the cost and quality of household energy" and is "defined as 'the inability to meet basic household energy needs.'"[164] Energy insecurity also "describes the interplay between physical conditions of housing, household energy expenditures and energy-related coping strategies."[165] Energy insecurity frequently appears alongside "energy burden," a term that reflects the amount of overall household income spent to cover energy costs. The concerns of low- to moderate-income communities fit under both conceptual frameworks, as studies indicate that such communities consistently find themselves making difficult choices that balance energy expenditures against other household expenses, and simply pay a greater portion of their overall income to cover energy costs. An energy justice approach to energy policy would aim to remediate such burdens by making access to clean energy affordable to those most burdened under the existing energy system.

> "An energy justice approach to energy policy would aim to remediate the financial burdens of energy by making clean energy affordable and accessible to those most burdened under the existing energy system."

In sum, social scientists have attempted to create a conceptual framework for energy justice that includes procedural, distributive, and recognition justice, as well as restorative justice, across the life cycle of the energy system. The framework also includes a consideration of certain principles of energy justice: availability, affordability, due process, transparency and accountability, sustainability, intra-generational equity, and inter-generational equity. Participation (energy democracy), burden of energy costs relative to other household expenditures and income (energy burden), and ability to meet energy needs (energy insecurity), also form a part of the broad picture of energy justice as conceptualized by social scientists in the field.

As noted above, this mix of terms and definitions create challenges for practitioners and policymakers seeking deeper understanding of a coherent framework for energy justice. The Workbook addresses this difficulty in Section 1.3, where the different approaches to energy justice and related concepts are synthesized into a coherent frame. Further, although social scientists have developed a robust energy justice literature, it is largely separate from the legal academics discussing energy justice and related terms. This disconnect also illustrates the need for a synthesized approach to energy justice within the policy arena. Below we provide an overview of the discussion by legal scholars around concerns of equity and fairness within the energy system.

How is the Concept of Energy Justice used in Legal Literature?

Key Terms:
- Energy Justice
- Clean Energy Justice
- Clean Energy Equity
- Energy Democracy
- Energy Poverty
- Energy Insecurity

Although the first mention of energy justice in scholarship appears in a 2010 article, *Energy Justice and Sustainable Development*, by legal scholar, Lakshman Guruswamy,[166] with few exceptions,[167] legal scholars have done little to advance a concrete understanding of the field of energy justice. In fact, at least one scholar suggests that there is no need for a "uniform definition of what energy justice means or what it seeks to achieve."[168] Such a dearth of "energy justice" scholarship is ironic in a field like law, which is committed to justice and equity, but rather than make explicit mention of "energy justice" through a series of self-referential debates (as we see in the social science literature), in legal scholarship, discussions of energy justice have generally evolved to include scattered discussions of "energy poverty,"[169] "energy democracy,"[170] "clean energy justice,"[171] "clean energy equity,"[172] and "fairness."[173] Moreover, legal scholars go a bit further than social scientists by, in some cases, attempting to discuss equity across a range of policy areas, such as distributed energy generation policy.

While the term, "energy justice" is used rarely and is often not fully fleshed out, there is at least some consensus in legal scholarship that energy justice closely relates to environmental justice and should, at the very least, build upon its key principles of distributive and procedural justice.[174] Unlike practitioners, however, legal scholars do not center the concerns or voices of frontline communities or advocates. The following discussion provides an overview of the varying viewpoints of legal scholars. Our overview illustrates that there is no singular vocabulary concerning energy justice, but the concepts elaborated by scholars tend to align along the axes of procedural and distributive justice.

Energy Poverty

Lakshman Guruswamy is credited with introducing the concept of energy justice to the academic community. His 2010 law review article concerns itself with the "energy oppressed poor, defined as people "devoid of life sustainable energy." In the article, he brings together two terms, energy and justice, to suggest that, as a single term, "[e]nergy justice seeks to apply basic principles of justice as fairness to the injustice evident among" the energy oppressed poor" and that energy justice "is an integral and inseparable dimension of the universally accepted foundational principle, or groundnorm, of international law and policy."[175] Guruswamy's later work evolves: "energy oppressed poor" becomes the "energy poor" and "energy justice," converts to "energy poverty."[176]

Most legal scholars have diverged from this narrow focus on energy poverty to discuss the range of energy issues that face the most vulnerable populations. For example, in her article discussing energy justice, Joroff connects energy poverty concepts to the domestic U.S. sphere, referencing the "energy burdens" that force low-income families that face "disproportionately high energy costs relative to income" to make dangerous tradeoffs that "can jeopardize health, safety,

and housing stability," rendering children and the elderly particularly vulnerable.[177] Others have tended to blend the conceptual approaches taken by leading social scientists to flesh out the term.

Energy Justice

Unlike Guruswamy, Shalanda Baker's (a co-author of this Workbook) work on energy justice takes perhaps the broadest view of energy justice. In a 2012 article exploring energy justice within the context of Mexico's transition away from fossil fuels to cleaner energy, *Mexican Energy Reform, Climate Change, and Energy Justice in Indigenous Communities*, Baker argues that energy justice incorporates climate justice, environmental justice, and energy democracy.[178] Energy justice, she argues, "requires that development activities bear in mind the need to reduce vulnerability to climate change and enhance resiliency when possible."[179] Further, certain communities should not be disproportionately burdened by development in the transition to renewable energy. Finally, referencing the indigenous right to free, prior, and informed consent in matters that affect them, Baker states that "[d]evelopment rooted in energy democracy thus allows for broader community participation."[180]

In another departure from the social science literature, legal scholars exploring energy justice concepts and theories beyond energy poverty have tended to examine justice (or fairness) across a range of policy debates concerning the participatory grid (e.g., individual and community participation in electricity generation), including, for example, net energy metering, community solar, and community choice aggregation. Although fully-fleshed out discussions of energy justice are rare in the legal literature, Welton distinguishes "energy justice" from "clean energy justice," by noting that, in each case, the focus is on distributive justice with respect to the energy system, whether that be a system powered by clean energy and smart technology, or one organized around fossil fuels.[181] Further, Welton notes, electricity law has a "long-standing equity commitment," which can help to guide the suite of justice-based challenges that have emerged with the clean energy transition.[182]

Energy Democracy

Defining energy democracy has proven more difficult. As Welton argues in *Grasping for Energy Democracy*, several competing definitions present a "troubling hurdle to the project of democratizing the field, as different conceptions of the term counsel for divergent legal reforms."[183] In the article, Welton outlines three concepts of energy democracy that have emerged in discussions of energy reform:

- **consumer choice**, which suggests that "[e]nergy governance regimes should be redesigned to give consumers more choices in their energy purchasing decisions, including more control over their level of energy demand and the opportunity to generate, store, and sell their own electricity";
- **local control**, which decentralizes energy decision making to local communities "claiming ownership and control of energy resources and control over energy decision making";
- **access to process**, which urges regulators to "embrace procedural reforms that enable more citizens to participate in governmental decision making processes about energy policy across all levels of government."[184]

Here, Welton makes a compelling argument for convergence of definitions and coherence within scholarship to adequately inform policymakers. She states that "[n]umerous other scholars are writing around the concept of energy democracy without labeling it as such: those embracing localism as a climate change strategy; those considering the evolving mandate and powers of public utility commissions; those exploring the relationship between federal energy markets and state policy objectives; and those focused on the opportunities and challenges posed by new, small-scale energy technologies."[185] Further, she notes that energy democracy itself remains incoherent in scholarship, flying "under other reform banners, including those of consumer empowerment, consumer participation, local energy, and energy justice."[186]

Additional discussions of justice-related concerns within the legal literature concerning energy policy argue for less "polarizing" and politically fraught approaches to transitional policy, arguing for equity-based approaches rooted in the familiar cost-benefit analysis framework.[187] Although cost-benefit analysis in policy has done little to advance the aims of deep justice in poor and low-income communities of color, Felix Mormann argues that equity, framed in cost-benefit terms, "offers a reliable metric of socio-economic impact."[188] That said, however, Mormann ultimately calls for deeper participation in the formation of clean energy policies (feed-in tariffs, tender regimes, net energy metering, tax credits, and renewable portfolio standards), in order to avoid unintended negative distributional problems.

In sum, although the current legal approach to energy justice is somewhat scattered and even internally inconsistent, the legal field contributes to the overall understanding of energy justice by hewing closely to the principles of distributive and procedural justice. Operationalizing these concepts across a suite of policies, however, poses a key challenge. Section 1.3 of the Workbook synthesizes the practitioner and academic approaches to energy justice with the goal of providing a condensed framework to guide energy policymaking.

Appendix B: Library of Advocate Terminology

We developed this Library of Advocate Terminology to get a general sense of the use of the terms "energy justice," "energy democracy," and "energy equity" in the advocacy sphere, specifically relating to how the groups themselves define them and characterize their work using the terms. The analysis revealed that for most groups, energy democracy includes a component of community empowerment through transitioning control of energy generation and distribution to the public. Energy democracy also includes equitably distributing both the benefits and harms of energy infrastructure across all communities and stakeholders, which will remedy the current disproportionate harm being done to low-income and minority groups. The analysis also showed that while few groups use the term "energy justice," many include a justice component in their work, which is often framed in terms of social, racial or environmental justice.

Organization	Location	Key Word	Definition of Energy Justice/ Democracy/Equity
Center for Social Inclusion / Race Forward	New York, NY	energy democracy	"Energy democracy means that community residents are innovators, planners, and decision-makers on how to use and create energy that is local and renewable. By making our energy solutions more democratic, we can make places environmentally healthier, reduce mounting energy costs so that families can take better care of their needs, and help stem the tide of climate change." [189] "Energy democracy means ensuring that local communities are innovators, planners, and decision-makers on how to use and create energy that is local and renewable and moves us closer to racial justice." [190]
Institute for Local Self-Reliance	MN, ME, DC	energy democracy	"Energy democracy means both the sources and ownership of energy generation are distributed widely. Energy democracy means that the management of the energy system be governed by democratic principles that allows ordinary citizens to have a say. This means that communities that wish greater control over their energy system should have minimal barriers to doing so. Energy democracy means that the wide distribution of power generation and ownership, and access to governance of the energy system be equitable by race and socioeconomic status." [191]
Trade Unions for Energy Democracy	New York, NY	energy democracy	"Energy democracy must include a decisive shift in power over energy transition activities towards workers, communities and the public. A transfer of resources, capital and infrastructure from private hands to a democratically controlled public sector will need to occur in order to ensure that a truly sustainable energy system is developed in the decades ahead." [192]
Energy Justice Network	Philadelphia, PA	energy democracy	"We seek to ensure that all members of our global society share the same rights to protect and democratically determine the sustainable use of our air, land, food, water and energy resources, so that future generations may thrive." [193]
New York Energy Democracy Alliance	New York	energy democracy	"Our work to promote energy democracy is designed to move the state toward a better system, one in which residents have the right and the authority to determine their own energy future, to protect our most vulnerable populations, and to prevent the wholesale destruction of our precious ecosystems. Putting ownership and control over the means of sustainable energy production into the hands of everyday people, into the hands of municipalities, and into the hands of local businesses." [194]
Soulardarity	Highland Park, MI	energy democracy	"Energy Democracy is the idea that the people most impacted by energy decisions should have the greatest say in shaping them." [195]

Organization	Location	Key Word	Definition of Energy Justice/ Democracy/Equity
Partnership for Southern Equity	Georgia	energy equity	"Against the backdrop of global climate change, 'energy equity' translates into the fair distribution of benefits and burdens from energy production and consumption." [196]
Kentuckians for the Commonwealth	Kentucky	just transition	"The term Just Transition describes an all-in, inclusive, and place-based process to build economic and political power to shift from an extractive economy to a regenerative one. A Just Transition requires solutions that ensure the well-being of workers and communities; address racial, economic and gender injustice; protect our health, environment and climate; and create meaningful, good jobs and a thriving and sustainable economy." [197]
Climate Justice Alliance	National	energy democracy	"Energy Democracy represents a shift from the corporate, centralized fossil fuel economy to one that is governed by communities, is designed on the principle of no harm to the environment, supports local economies, and contributes to the health and well-being for all peoples." [198]
Centre for Sustainable Energy	UK	energy justice	"Achieving a degree of 'fairness' or 'justice' in climate policy may therefore be key to initiating public action on climate change. It is also a core component of sustainability. We've been exploring this subject – which we call 'energy justice' – to establish a clearer picture of how to achieve a socially just climate policy within the UK." [199]
California Environmental Justice Alliance	California	environmental justice	"CEJA is working to build democratic, equitable solutions to pollution, poverty and racism that do not reproduce ecologically and socially harmful systems."[200]
Local Clean Energy Alliance	California	energy democracy	"Energy Democracy: maximizing community ownership and control of energy resources, with shared leadership and decision-making authority that involves all stakeholder communities." [201]

[37] It is interesting to note that the U.K.-based organization represented in the sample, Centre for Sustainable Energy (CSE), does not feel the same pressure to avoid using the word "justice" to describe its work. However, "justice" in their context takes on a different meaning from that usually found in social and racial justice movements. CSE uses justice to mean fairness in the distribution of the burden of climate action, specifically that every person must feel like his or her required contribution is fair in relation to the contributions of those around them. This definition lacks the restorative and moralistic angles of justice movements in the United States.

[73] *Electric Schedule E-ECR: Enhanced Community Renewables Program*, Pacific Gas & Electric Company 3 (Oct. 1, 2019), https://www.pge.com/tariffs/assets/pdf/tariffbook/ELEC_SCHEDS_E-ECR.pdf.
[74] See A.12-01-008 SDG&E Monthly GTSR Report for May 2019 (June 24, 2019); A.12-01-008 PG&E Monthly GTSR Progress Report for May 2019 (June 25, 2019); A.12-01-008 SCE Monthly GTSR Program Progress Report for May (June 25, 2019).
[75] The CPUC first required developers to submit a legal opinion from an "Am Law 100" law firm, that is, a law firm listed on the American Lawyer magazine's list of the 100 law firms with the highest gross revenue. Decision 15-01-051 at 71; Decision 16-05-006 at 34. This requirement was later modified to be based on factors such as an attorney's experience and the amount of liability insurance coverage held by the firm. *Decision Modifying the AmLaw 100 Securities Opinion Requirement for Enhanced Community Renewables Projects Under the Green Tariff Shared Renewables Program in D.15-01-051*, Decision 17-07-007, No. 12-01-008, No. 12-04-020, No. 14-01-007 (Cal. Pub. Util. Commission July 13, 2017).
[76] See Cal. Pub. Util. Code § 2833(p) ("The commission shall ensure that charges and credits associated with a participating utility's green tariff shared renewables program are set in a manner that ensures nonparticipant ratepayer indifference for the remaining bundled service, direct access, and community choice aggregation customers and ensures that no costs are shifted from participating customers to nonparticipating ratepayers.")
[77] The "Am Law 100" is an annual list published by The American Lawyer.
[78] *Proceeding Details A1201008*, Cal. Pub. Util. Comm'n (Jan. 17, 2012), https://apps.cpuc.ca.gov/apex/f?p=401:56:0::NO:RP,57,RIR:P5_PROCEEDING_SELECT:A1201008.
[79] Assemb. B. 327, 2013 Leg., Reg. Sess. (Cal. 2013).
[80] See Cal. Pub. Util. Code §2827.3(a) (requiring the CPUC to study costs and benefits associated with a net metering tariff); §2827.1(b)(3) ("Ensure that the standard contract or tariff made available to eligible customer-generators is based on the costs and benefits of the renewable electrical generation facility.").
[81] Under existing policy, California allows for multifamily buildings and adjacent properties to enroll in VNEM. The state's VNEM rules for those properties were renewed in the first phase of the AB 327 proceeding when the standard NEM tariff was reauthorized. Both the NEM and VNEM tariffs were slightly modified from their first generation versions, but

fundamentally retained the basic concept of on-bill retail rate compensation for rooftop solar generation.
[82] See *Vote Solar, SEIA, & CalSEIA Opening Proposal*, R.14-07-002 (Apr. 24, 2017).
[83] See *CEJA SELC Opening Proposal*, R.14-07-002, 2, 11 (Apr. 24, 2017). The main incentives along the lines of location, size, and ownership proposed in Equity VNEM were providing a slightly higher bill credit for (about 2 cents/kWh compared to DAC VNEM) to "community-based projects" defined as (1) "located within the same or an adjacent DAC census tract as all customers," (2) having a generating capacity which does not exceed 1 megawatt, and (3) being majority owned or controlled by the residents of disadvantaged communities or a nonprofit or government entity.
[84] *Alternate Decision Adopting Alternatives to Promote Solar Distributed Generation in Disadvantaged Communities*, Decision 18-06-027, No. 14-07-002 at 56 (Cal. Pub. Util. Commission June 21, 2018).

[108] Participants must be located within 5 miles for most projects, and within 40 miles for some select pilot projects in the San Joaquin Valley. Some commentators worry this limit may pose a challenge in finding enough customer or raise the cost of finding customers beyond what is economically viable for a profitable project.
[109] Utilities will enter power purchase agreements for all of the energy produced by the CSGT projects if they select a project's bid within biannual auctions. However, the price the utilities may pay for that energy is capped at 200% of the highest executed contract price in previous California renewable auctions for its Green Tariff program. It remains to be seen if the auction ceiling is high enough to allow projects to be built given the additional limitations and costs for such projects beyond other wholesale renewable projects.

[112] The first iteration of the CDG policy was codified in the Order Establishing a Community Distributed Generation Program and Making Other Findings, Proceeding on Motion of the Commission as to the Policies, Requirements and Conditions for Implementing a Community Net Metering Program, Case 15-E-0082 (July 17, 2015) [hereinafter "CDG Order"].
[113] The CDG Order included certain limitations on membership to a CDG project but explicitly kept it quite flexible to encourage project development in the nascent CDG market. For example, projects required a minimum of ten subscribers, each of whom could offtake up to 25kW of energy, and any large offtaker (or "anchor") that had an energy demand exceeding 25kW could only offtake up to 40% of the total energy generated by the project.

[127] Affordability Order at 7.
[128] Specifically, low-income households were the target of such practices after the regulation of the energy market in New York which resulted in the formation of many energy service companies (ESCOs). The ESCOs would engage in door to door sales, pitching potential customers on the opportunity to reduce their energy costs if they signed a contract with the company. Many of these contracts contained provisions that not only did not lower costs, but in fact in many cases resulted in sky rocketing utility costs for the customer. Significant litigation and regulatory reform resulted from the ESCO fiasco.

I. Witness Identification and Qualifications

Q. Please provide your name, employer, and business address.

A. My name is Ben Kujala. I am employed by 6893449 CANADA INC (doing business as Dunsky Energy + Climate Advisors), and my business address is 50 Saint-Catherine St W, Montreal, Quebec H2X 3V4.

Q. Please summarize your academic experience.

A. I earned a Master of Science in Statistics from Portland State University in 2009 and taught mathematics and statistics at Portland State University. I've given seven invited academic presentations as an expert on power planning, including presenting at the University of Washington, Portland State University, Boise State University, and Western Washington University. I presented for Continuing Education Credits as an energy system expert for Law Seminars International.

Q. Please summarize your experience and expertise in the utility industry.

A. I have worked in the energy and utility industries for over 15 years. I joined Dunsky Energy + Climate Advisors (Dunsky) in 2022 and lead Dunsky's Power Planning practice. Dunsky was founded in 2004 and supports leading governments, utilities, corporations, and others across North America in their efforts to accelerate the clean energy transition effectively and responsibly.

As the lead for Dunsky's Power Planning practice, I have consulted with utilities, governments, and NGOs in Canada and the United States. I have provided confidential

analyses of PPA pricing for renewable developers and corporations. I led Dunsky's analysis of the cost of renewables for planning purposes prepared for Clean Energy Canada. Clients have retained me to review the treatment of renewable resources in utility Integrated Resource Plans in Manitoba and New Brunswick. I supported Transition Accelerator as an expert on modeling decarbonization in the power system for their meta-analysis on the pan-Canadian decarbonization studies.

Before joining Dunsky, I served as the Director of Power Planning for the Northwest Power and Conservation Council. The Northwest Power and Conservation Council is an interstate compact of the Northwest states of Idaho, Montana, Oregon, and Washington formed as a result of the 1980 Northwest Power Act passed by the United States Congress. The Council is known for its history of pioneering smart power planning focused on minimizing economic and environmental costs and risks. It is responsible for developing a regional power plan and fish and wildlife program to balance the Northwest's environment and energy needs. The Council publishes a power plan every five years. As the Director of Power Planning, I led the 2021 Northwest Power Plan, published in the Federal Register and submitted to Congress. The power plan directly examined the cost of renewable resources and established a plan for an adequate, efficient, economical, and reliable power supply for the Northwest. I was also the Manager of System analysis for the 7th Northwest Power Plan published in 2016 by the Council. I was responsible for overseeing all the power system modeling in the plan. I developed the approach to regional portfolio modeling, including assessing the cost and potential for developing renewable resources for the Northwest region.

During my tenure as a Council staff member, I was a member of the Idaho Power IRP Advisory Committee from 2018 to 2021. I also represented the Council on the Idaho Power Variable Energy Resource Integration and Technical Review Committee in 2018. I was an expert reviewer of the United States Environment Protection Agency's Energy and Environment Guide to Action. I was an expert panelist on Power System Flexibility for the Electric Power Research Institute. I've been a panelist presenting at over 20 industry conferences. I was a guest expert for a local news weekend program on KGW Portland. I was quoted in the regional and national media over 20 times, including being interviewed by NPR and quoted by the Associated Press.

Before the Council, I worked at the Bonneville Power Administration, a federal agency operating in the Northwest. Bonneville is one of four regional Federal power marketing agencies within the United States Department of Energy. I started in 2008 and left in 2013 when I joined the Council staff. At Bonneville, I was responsible for examining the long-term contribution of wind generation to system reliability. I contributed to Bonneville's study of wind integration and the associated rate filing. I reviewed the preliminary release of the first phase of the United States Department of Energy National Renewable Energy Lab's Western Wind and Solar Integration Study for the Bonneville system. I was also an expert witness for the BP-12 rate case on the Market Price and Risk study. I represented Bonneville as a power system modeling expert in their review of the potential for an Energy Imbalance Market in the Northwest, working with Battelle's Pacific Northwest National Lab run on behalf of the United States Department of Energy. A detailed resume is attached as Exhibit BK-1.

Q. Have you ever testified before the Pennsylvania Public Utility Commission or other regulatory agencies?

A. As Director of Power Planning for the Northwest Power and Conservation Council, I have presented in proceedings before the Idaho, Montana, Oregon, and Washington utility commissions. During my tenure, I provided the context of the Northwest regional power system and an introduction to the Northwest Power and Conservation Council for all new regulators in the four states. I represented the Council on the Committee for Regional Electric Power Cooperation, a joint committee of the Western Interstate Energy Board and the Western Conference of Public Service Commissioners. I co-chaired the Demand Response Project for the Northwest Power and Conservation Council with the Regulatory Assistance Project. I presented to a joint session of the California Energy Commission, California Public Utility Commission, and the California Independent System Operator in July 2021. I was a panelist for the 2018 Western Conference of Public Service Commissioners meeting. I presented to the Pacific Cost Inter-Staff Collaboration Summit 2017 with 35 California, Nevada, Oregon, and Washington Utility Commission staff members. I also commented on the Council's behalf to the State of Oregon Residential and Manufactured Structures board in a proceeding regarding construction codes for Additional Dwelling Units.

As an Operations Research Analyst for Bonneville Power Administration, I testified on the Power Risk and Market Price Study for the BP-12 rate case proceeding.

II. Purpose and Scope

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to present Dunsky's findings on different procurement strategies that could be used to serve the default service load within PECO Energy Company's Default Service Plan (DSP). The study consisted of two sets of analyses.

The first analysis, the Historical Analysis, evaluates the overall impact on default service costs if PECO had procured long-term Solar PPA contracts under the current DSP V, which began in June 2021.

The second analysis, the Future Analysis, estimates the impact on default service costs if PECO procures long-term solar PPA contracts under the upcoming DSP VI. My testimony presents a quantitative analysis of the potential impact on overall costs for serving default service customers by integrating zero emission renewable PPAs into the DSP.

Q. Why was a Solar PPA chosen for the analysis?

A. Solar PPAs were chosen as a representative zero emission renewable resource available to interconnect in PJM.[1] Our analyses use solar costs and characteristics to illustrate the potential value of this category of resources. Our selection of this technology as illustrative should not be taken as a representation that other zero emission renewable

[1] In 2022, PJM had over 2600 MW of installed solar capacity: https://www.pjm.com/-/media/markets-ops/ops-analysis/capacity-by-fuel-type-2022.ashx.

technologies are undesirable or prohibitively expensive. Instead, we focus on solar generation as an illustrative potential approach to meet residential demand with a PPA or PPAs from zero emission renewable generation.

Q. How is your testimony organized?

A. The balance of my testimony is laid out in the following manner:

- Section III, titled "Summary of Findings," summarizes the Historical and Future Analyses. We provide a brief overview of the study, covering the approach, findings, and results.
- Section IV, titled "Historical Model," provides a detailed overview of the methodology and approach used in historical modeling. We identify the key sensitivities, scenarios, data sources, and assumptions made in the analysis.
- Section V, titled "Future Model," provides a detailed overview of the methodology and approach used in future modeling and identifies the key sensitivities, scenarios, data sources, and assumptions made in the analysis.

III. Summary of Findings

Q. How is your analysis organized?

A. The study's objective is to assess the impact on the overall cost of the default service residential portfolio by integrating long-term solar power purchase agreements (PPAs) into PECO's default service plans. We have conducted two sets of analyses. The first analysis (Historical Model) evaluates the overall impact on residential default service costs if PECO had procured long-term Solar PPA contracts under the current DSP V,

which began in June 2021 and until December 2023.[2] The second analysis (Future Model) estimates the impact on residential default service costs if PECO procures long-term solar PPA contracts under the upcoming DSP VI period (June 2025 to May 2029). In each analysis, we evaluated a solar portfolio serving up to 7 percent of default residential load.

Throughout the testimony and analysis, all costs and savings are presented in 2024$.[3]

A. Historical Model

Q. Please briefly discuss the approach used in the Historical Model.

A. The following approach was adopted to evaluate the historical impact of long-term solar PPA contracts on residential default service costs, and a detailed description of data sources and analytical methodology can be found in Section IV:

1. **Develop Scenario Portfolios:** We first developed a Reference Portfolio that represents the existing procurement plan under the current DSP V for the default residential customer class. Then, an Alternate Portfolio where 7 percent of the annual default residential load is met by solar PPAs was developed along with three different PPA price assumptions.

[2]Since the historical analysis relies on published historical data, December 2023 was the latest month of publicly available residential load data available at the time this analysis was conducted.

[3] This calculation is conducted by relying upon Consumer Price Index ("CPI") data from the Bureau of Labor Statistics. U.S. Dep't of Labor, *BLS Data Viewer,* BLS Data Labs (2024), https://beta.bls.gov/dataViewer/view/timeseries/CUUR0000SA0;jsessionid=864EF2569B7C58A0FE0F72D15C46CFEE.

2. **Establish the Historical Long-Term Solar PPA:** We leveraged multiple data sources to establish a price range for long-term solar PPAs, including energy and renewable energy credits. The historical PPA prices vary from $32.42/MWh (Low) to $48/MWh (High) and broadly represent the range of PPA costs that PECO could have expected to pay for long-term solar contracts during the DSP V period.

3. **Estimate the Cost of Additional Supporting Services:** To estimate the additional costs of supporting services that would have been incurred for integrating the solar PPA into the residential supply portfolio, we applied a "Rest-of-Stack" adder to estimate the cost of support services, including the cost for capacity and ancillary services. This adder is described in more detail in Section IV.

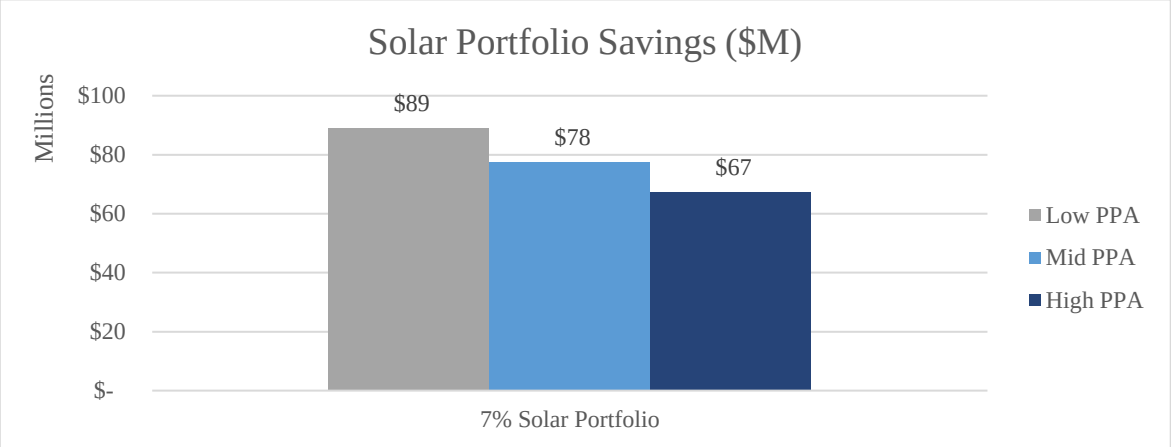
4. **Determine Overall Costs of the Portfolios:** We then calculated the overall costs of the Reference and Alternate solar portfolios. The overall cost for the Reference Portfolio was calculated by adding the costs from fixed-price full requirements (FPFR) contracts, spot market purchases, and hydropower costs. The costs for the Alternate Portfolio were estimated by summing the costs from long-term solar PPAs, the additional supporting services, FPFR contracts, spot market purchases, hydropower costs, and backing out the Alternate Energy Credits (AECs) as appropriate.

5. **Determine the overall impact of long-term solar PPAs on costs:** The difference in total costs between the Reference and Alternate Portfolio was estimated to evaluate the overall impact of integrating long-term solar PPAs on residential default service costs.

Q. Please summarize the findings from the Historical Model

A. The historical analysis evaluates the impact on default service costs for the residential customer class if PECO had procured long-term Solar PPA contracts under the current DSP V period, which began in June 2021. Figure BK-*1* below outlines the savings that the alternate solar could have achieved under three levels of PPA Pricing: Low ($32.44), Medium ($38.00) and High ($43.00).

Figure BK-1: Total Savings of a 7 percent Solar Portfolio ($M) based on different PPAs and historical default supply costs from June 1st, 2021, to December 31st, 2023, in 2024$



According to the analysis, procuring long-term solar PPA to meet 7 percent of the residential load from the start of DSP V to December 31st, 2023, could have resulted in savings ranging from $67M to $89M, depending on the PPA price secured.

B. Future Model

Q. Please briefly discuss the approach used in the Future Model.

A. The following approach was adopted to evaluate the impact of long-term solar PPA contracts on residential default service costs, and a detailed description of data sources and analytical methodology can be found in Section V:

1. **Develop Scenario Portfolios:** We first developed a Reference Portfolio representing the existing procurement plan under DSP VI for the residential customer class. An Alternate Portfolio was created to provide 7 percent of the annual residential load through solar energy. This would be achieved via three separate capacity installations: 150 MW by June 2026, another 175 MW by June 2027, and finally, 200 MW by June 2028, for a total of 525 MW before the end of the DSP VI period. This portfolio was developed alongside three distinct PPA price assumptions.

2. **Forecast Future FPFR Contract and Spot Market Prices**: To develop the FPFR Contract Price Forecast, we evaluated the existing FPFR contracts that extend from DSP V into DSP VI (June 1, 2021, to May 31, 2029), which include all related costs such as capacity and ancillary services. We used a recent forward

curve[4] to establish expected future market prices. Then, we added the "Rest-of-Stack" adder established in our Historical Model to estimate the cost of future FPFR contracts. We weighted the expected future market prices based on default residential load profiles for the Spot Price Forecast. Given the uncertainty in future spot market prices, a plus/minus 25 percent scalar was used to create the High and Low price sensitivities to assess a range of market conditions for FPFR prices. This scalar was added prior to the "Rest-of-Stack" adder.

3. **Establish a Long-Term Solar PPA Price Range:** We leveraged multiple data sources to establish a price range for long-term solar Power Purchase Agreements (PPAs) that include energy and renewable energy credits. The PPA price varies from $32.42/MWh (Low) to $71.46/MWh (High) and broadly represents the range of PPA costs that PECO could expect to pay for long-term solar contracts in the DSP VI period. To estimate the additional costs of supporting services such as capacity and ancillary services that would be incurred for integrating the solar PPA into the residential supply portfolio, we applied the "Rest-of-Stack" adder.

4. **Estimate the Reference and Alternate Portfolio Costs:** We then calculated the estimated costs of the Reference and Alternate solar portfolios on a monthly basis

[4] CME Group, *PJM PECO Zone 5 MW Peak Calendar-Month Day-Ahead LMP* (2024), https://www.cmegroup.com/markets/energy/electricity/pjm-peco-zone-5-mw-peak-calendar-month-day-ahead-lmp-swap-futures.html#venue=globex; CME Group, *PJM PECO Zone 5 MW Off-Peak Calendar-Month Day-Ahead LMP* (2024), https://www.cmegroup.com/markets/energy/electricity/pjm-peco-zone-5-mw-off-peak-calendar-month-day-ahead-lmp-swap-futures.html#venue=globex.

for the DSPI VI period. The cost for the Reference Portfolio was estimated by adding the expected costs from forecasted FPFR contracts, forecasted spot market purchases, and hydropower costs. The costs for the Alternate Portfolio were estimated by summing the expected costs from long-term solar PPAs, FPFR contracts, spot market purchases, hydropower costs, and backing out the AECs attributed to solar generation.

5. **Estimate the Impact of Long-Term Solar PPAs on Residential Default Service Costs:** We estimate the impact of integrating long-term solar PPAs on the residential default service costs by calculating the difference between the cost estimates for the Reference and Alternate Portfolios under three PPA price assumptions and three FPFR price scenarios.

Q. Please summarize the findings from the Future Model

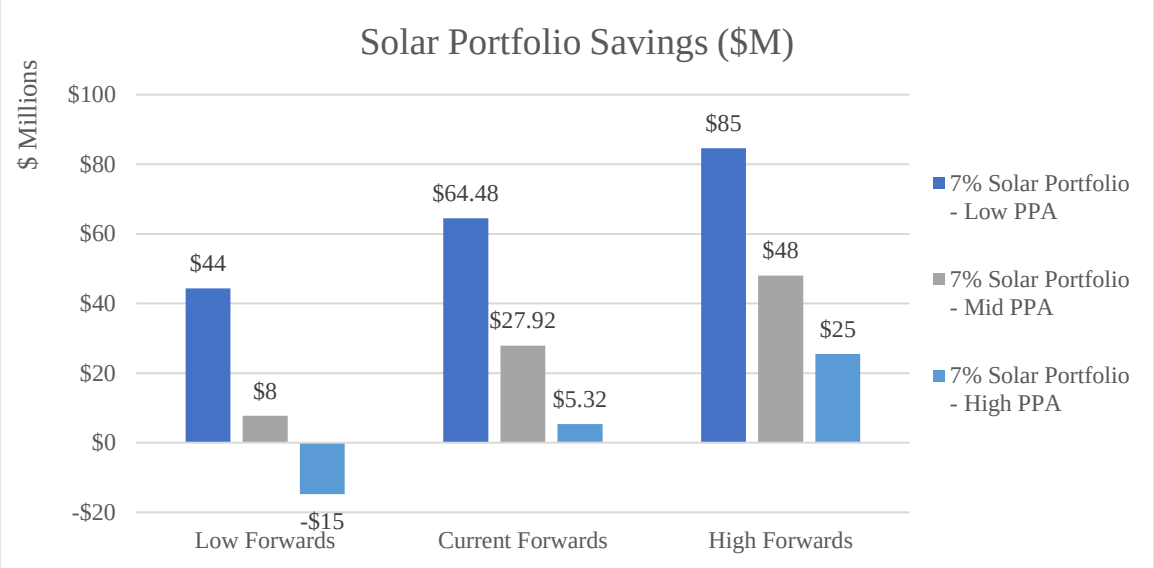
A. The Future Analysis estimates the impact on default service costs for the residential customer class if PECO procures long-term solar PPA contracts under the upcoming DSP VI period.

<u>Estimated Impact on DSP VI Costs</u>:

The total Reference Portfolio costs under the Low, Current, and High Forwards scenarios were calculated to be $2.849 Billion, $3.399 Billion, and $3.949 Billion, respectively. Figure BK-2 below outlines the expected savings that the Alternate Portfolio would achieve under each Forward scenario and for the three levels of PPA pricing: Low

($32.44), Medium ($56.47), and High ($71.46). The portfolio references recent (April 18th, 2024) futures pricing for PECO.

Figure BK-2: Total Savings of a 7 percent Solar Portfolio ($M) based on different PPA pricing levels and forward market assumptions throughout DSP VI in 2024$.



Procuring long-term solar PPAs in DSP VI would produce savings in eight of the nine pricing scenarios presented above, with savings ranging from -$15M to $85M, depending on the assumed Forwards and PPA price.

While we don't quantify the likelihood of each pricing scenario in this modeling exercise, generally, we would expect that lower prevailing market prices would put competitive pressures on renewable developers. Thus, the chances of having persistently low market prices and high PPA pricing should be considered much less likely than our scenarios

with more balance between the market and PPA pricing. Similarly, persistently high market prices and low PPA pricing should also be considered less likely.

IV. Detailed Discussion of Historical Model

Q. Please provide a detailed overview of the methodology used in the Historical Model.

A. This analysis (Historical Analysis) estimates the overall impact on default service costs if PECO had procured long-term Solar PPA contracts under the current DSP V, which began in June 2021. The analysis brings all costs into 2024$[5] to ensure an apples-to-apples comparison as costs are added together across the years of DSP V. The following steps outline Dunsky's approach to this analysis.

Step 1 - Develop Scenario Portfolios: First, Dunsky developed a reference for comparison in our analysis, compiling the cost of default service under the procurement plan approved as part of DSP V for the residential customer class. Next, we developed a hypothetical historical portfolio that is used to estimate the costs where up to 7 percent of the portfolio is served by long-term solar PPAs and up to 93 percent of the portfolio is supplied at an equivalent cost to the FPFR and spot market (FPFR/Spot) contract mixture from our reference. In both the reference and hypothetical portfolios, we assume that the first 0.2 percent of the residential default service load is served by the existing hydropower allocation approved by the Commission.

[5] This calculation is conducted by relying upon Consumer Price Index ("CPI") data from the Bureau of Labor Statistics. U.S. Dep't of Labor, *BLS Data Viewer,* BLS Data Labs (2024), https://beta.bls.gov/dataViewer/view/timeseries/CUUR0000SA0;jsessionid=864EF2569B7C58A0FE0F72D15C46CFEE.

Step 2 – Establish the Historical Long-Term Solar PPA Price Range and "Rest-of-Stack" Adder: The amount of electricity projected to have been purchased through the long-term solar Power Purchase Agreements (PPA) was established based on 7 percent of the portfolio's default residential load.[6] The estimated hourly production profile approximates a general solar installation in Pennsylvania/PJM.[7]

We did not establish a single price for the historical analysis of Solar PPA. Instead, we consulted multiple sources to determine a potential range of prices that PECO could have paid throughout the DSP V period. A range of factors, including solar insolation, grid interconnection, interest rates, and market supply chain disruption, can affect solar PPA prices, and thus, future prices are expected to be subject to notable variation. Based on the 2020 PPA data in PJM from Lawrence Berkeley National Lab, we established a Low Solar PPA price of $32.43/MWh (2024$).[8] Based on the average of 2021 and 2022 PPA data in PJM from LevelTen Energy, we established a High Solar PPA price of

[6] Residential load data was downloaded directly from PECO at PECO, *Procurement for Default Supply* (2024), https://pecoprocurement.com/index.cfm?s=dataRoom&p=monthly and was additionally supplied in Exh. BK-2, PECO Interrogatory Responses, Attachment EJA-IV-1(a). The column representing "Default Energy (MWh)" was used.

[7] The production profile was generated using the National Renewable Energy Laboratory ("NREL") System Advisor Model ("SAM") PVWatts calculator. NREL, *PVWattts Calculator* (2024), https://pvwatts.nrel.gov/pvwatts.php. The location modeled was Lancaster County, Pennsylvania. Lat, Lng: 40.05, -76.3 for a 1-Axis Tracking array of 1 kW.

[8] Lawrence Berkeley National Lab, Energy Markets & Policy, *CapEx, LCOE, and PPA Prices by Region* (2024), https://emp.lbl.gov/capex-lcoe-and-ppa-prices-region where the 2020 PJM price is $29.57 (in 2022$). Adjusted for inflation, this represents $32.43 in 2024$.

$43.00/MWh (2024$).[9] As a third case, we assumed a Mid Solar PPA Price of $38.00/MWh (2024$), a rounded average of the Low and High prices.

Since the FPFR contracts are full requirements contracts, they provide services beyond delivered energy (i.e., they include capacity and ancillary services, and other components). To estimate the cost of replacing a portion of the FPFR/Spot contracts, we estimated the additional cost of services to integrate the solar PPA energy into the PECO portfolio, also called the "Rest-of-Stack" adder. These costs were estimated by analyzing the historical PJM PECO on-peak power forward curves[10] for the contract period and calculating the delta between the full requirements contracts for the residential customer class and the average forward curve price. From June 1, 2021, to December 31, 2023, the average cost of residential full contract requirements less energy costs (which includes capacity, ancillary services, and residual compensation, amongst other cost components) was $24.48/MWh (2024$). This cost was added to the cost of the PPA to estimate the additional cost of services that PECO would have needed to procure to incorporate the long-term PPA contract. This "Rest-of-Stack" adder is comparable to the sum of Capacity, Ancillary Services, Load Shaping, and AEPS costs throughout DSP V as

[9] Exh. BK-3, Mark Bolinger et al., Utility-Scale Solar, 2023 Edition: Empirical Trends in Deployment, Technology, Cost, Performance, PPA Pricing, and Value in the United States, Lawrence Berkeley National Lab., at 34 (Oct. 2023), https://liveetabiblio.pantheonsite.io/sites/default/files/utility_scale_solar_2023_edition_slides.pdf Prices were extracted from the figures in 2021 ($33.65) and 2022 ($45.01) and converted into 2024$ to produce an average of $43 (2024$). Underlying data are available for download at https://live-etabiblio.pantheonsite.io/sites/default/files/2023_utility-scale_solar_data_update.xlsx, Exhibit BK-4.

[10] S&P Global Platform, *S&P Capital IQ Financials*, *NYMEX Power PECO*, https://www.marketplace.spglobal.com/en/datasets/s-p-capital-iq-financials-(10). Data are only available for qualified users. Forward prices were downloaded for the duration of DSP V.

provided by PECO.[11] While there is potential that these costs could vary under differing market conditions, we do not expect the PPA price would directly influence the cost of services and thus use the same expected cost for all examined PPA prices.

Step 3—Determine Overall Costs of Each Portfolio: Each portfolio was analyzed on a monthly basis from June 1, 2021, the beginning of the DSP V period, to December 31, 2023, the end of the historical load data currently available from PECO.[12] Dunsky calculated the reference cost and estimated the cost under the Alternate Portfolio previously described.

Calculate the Reference Cost: The reference cost is the cost consistent with energy procured through FPFR contracts spot market purchases, and hydro allocation purchases, described in Equation 1.

Equation 1:

$$\text{Total Costs (\$)}_{\text{Reference Portfolio}} = \text{Total Costs (\$)}_{\text{FPFR Contract}} + \text{Total Costs (\$)}_{\text{Spot Market}} + \text{Total Costs (\$)}_{\text{Hydro}}$$

FPFR Contract Costs: We calculated the total costs of the FPFR contract by multiplying their monthly contracted volume in MWh with the average monthly price. To determine

[11] *See* Exh. BK-5, PECO Interrogatory Responses, Attachment EJA-I-7(a.2) "PECO Residential.xlsx" in the "Summary" tab, columns H, I, J, and K representing Load Shaping, Capacity, Ancillary Services, and AEPS costs, respectively.

[12] At the time this analysis was conducted.

the average monthly contract price for the FPFR contracts, we developed a weighted average FPFR price based on each contract's tranche size. We collected the contract prices and tranche data from the Results of DSP V Solicitation, which were published on PECO's website.[13] The average FPFR contract prices range from $60.70/MWh to $85.78/MWh (2024$). We assumed that default service providers would serve up to 99 percent of the residential customer class load to calculate the total contract volume served by the default service contracts. Up to 1 percent was met through purchases in the spot market and 0.2 percent was met through a hydro contract.[14] The equation below summarizes the calculation approach to estimating the costs under FPFR contracts.

Equation 2:

$$\text{Total Costs (\$)}_{\text{FPFR Contract}} = \text{Average Price (\$/MWh)}_{\text{FPFR Contract}} \times \text{Contract Volume (MWh)}_{\text{FPFR Contract}}$$

Costs Incurred from Spot Market Purchases: To estimate the total costs incurred from spot market purchases, we multiplied the monthly volumes purchased on the spot market by the average monthly spot market price. As mentioned earlier, we assumed that only 1 percent of the overall residential load was purchased on the spot market, constituting the contracted volume for spot market purchases. To calculate the average monthly spot

[13] Average contract prices and tranche sizes were downloaded directly from PECO. PECO, *PECO Procurement for Default Supply* (2024), https://pecoprocurement.com/index.cfm?s=background&p=previousResults. These contract prices were additionally supplied by PECO in Exh. BK-5, PECO Interrogatory Responses, Attachment EJA-I-7(a.2) "PECO Residential.xlsx" in the "R Winning Bids" tab.

[14] Petition of PECO Energy Company for Approval of its Default Service Program for the Period from June 1, 2025 Through May 31, 2029, at 8 (Feb. 2, 2024).

market price, we took an average of the hourly spot market costs and weighted them by the hourly residential load.[15] The equation below summarizes the calculation approach to estimating the overall costs under spot market purchases.

Equation 3:

Total Costs ($) $_{\text{Spot Market}}$ = Weighted Average Price ($/MWh) $_{\text{Spot Market}}$ x Volume (MWh) $_{\text{Spot Market}}$

Costs from the Hydro Allocation: To estimate the total costs incurred from hydro allocation purchases, we multiplied the monthly volumes procured by the contracted price. The analysis assumes that 0.2 percent[16] of the default residential load is served by hydro at a contract price of $4.92/MWh.[17]

Calculate the Alternate Portfolio Costs*:* The estimated total cost under the Alternate Portfolio is the overall cost incurred through long-term solar PPA contracts and supporting services less the Alternative Energy Portfolio Standard (AEPS) costs avoided by solar's contribution, plus the costs of FPFR contracts, hydro contract, andspot market

[15] As noted above, hourly residential load data was downloaded directly from PECO at PECO, *PECO Procurement for Default Supply* (2024), https://pecoprocurement.com/index.cfm?s=dataRoom&p=monthly. Historic spot market prices for the the PECO pricing node were downloaded at PJM Data Miner 2, *Pricing Nodes* (2024), https://dataminer2.pjm.com/feed/pnode.

[16] Petition of PECO Energy Company for Approval of its Default Service Program for the Period from June 1, 2025 Through May 31, 2029, at 8 (Feb. 2, 2024).

[17] Exh. BK-6, PECO Interrogatory Responses, Response to EJA-V-6.

purchases. The overall costs for the Alternate Portfolio can be summed up in the equation below:

Equation 4:

$$\text{Total Costs (\$)}_{\text{Alt Portfolio}} = (\text{Total Costs (\$)}_{\text{Solar PPA and Support}} - \text{AEPS Avoided Costs (\$)}_{\text{Tier I Non-Solar}}) + \text{Total Costs (\$)}_{\text{FPFR Products}} + \text{Total Costs (\$)}_{\text{Hydro}} + \text{Total Costs (\$)}_{\text{Spot Market}}$$

Long-Term Solar PPA Costs: We estimate potential costs under long-term solar PPAs by multiplying their monthly contracted volume in MWh with the High, Mid, and Low average monthly PPA prices plus the "Rest-of-Stack" adder price. We then established the total volume (MWh) of energy procured under the long-term solar contracts for the Alternate Portfolio to be equivalent to 7 percent of the average annual default residential load from June 1st, 2021, to December 31st, 2023.

Equation 5:

$$\text{Total Costs (\$)}_{\text{Solar PPA and Services}} = \text{Average Price (\$/MWh)}_{\text{Solar PPA and Services}} \text{ x Expected Generation Volume (MWh)}_{\text{Solar PPA}}$$

FPFR Contract Costs: As previously described in Equation 2, we calculate the FPFR contract costs under the Alternate Portfolio by multiplying the monthly contracted volume in MWh with the average monthly contract price. In our modeling, we assume that FPFR contracts serve up to 99 percent of the remaining residential default service load, net of the portion served by long-term solar PPAs and the portion service by the

hydro allocation. The remaining one percent of the net residential default service load is assumed to be served through purchases from the spot market. As previously described, we established the average monthly contract price for the FPFR contracts by developing a weighted average of contracts based on each contract's tranche size. The monthly average contract price for the FPFR contracts is assumed to be unchanged in the Reference and Alternate Portfolios.[18]

Costs Incurred from Spot Market Purchases: As previously described, to estimate the total costs incurred from spot market purchases, we multiplied the monthly volumes purchased on the spot market by the average monthly spot market price. As mentioned earlier, we assumed that only one percent of the net default residential load was purchased on the spot market, constituting the contracted volume for spot market purchases. We calculated the average monthly spot market price by weighting the hourly residential load with the hourly spot market costs. Since PECO's Residential customer class energy consumption only constitutes 1.5 percent[19] of the PJM market,[20] the monthly average spot market price is assumed to be unchanged in the Reference and Alternate Portfolios.

[18] This assumption likely underestimates savings because having a long-term contract in place would allow PECO to select the most price-competitive FPFR contracts, lowering the average price of these contracts overall.

[19] PJM RTO Total (GWh) energy in 2022 was 792,832 GWh whereas PECO's default residential class consumed 11,897 GWh in 2022, or 1.5% of PJM's total energy. With 5% of solar integration into the PECO residential load, solar generation for PECO's default residential customer class would make up 0.08% of PJM's annual energy.

[20] PJM Load Forecast Report – January 2024, at PDF 87 (2024), https://www.pjm.com/-/media/library/reports-notices/load-forecast/2024-load-report.ashx.

Costs from the Hydro Allocation: To estimate the total costs incurred from hydro allocation purchases, we multiplied the monthly volumes procured by the contracted price. The analysis assumes that 0.2 percent[21] of the default residential load is served by hydro at a contract price of $4.92/MWh.[22]

Alternative Energy Portfolio Standard (AEPS) Avoided Costs: Default Suppliers are responsible for providing AECs during the term of the Uniform SMA for PECO to comply with the AEPS Act, as well as other Orders, regulations and rules. Starting from 2020, the minimum Tier I compliance requirement was 7.5 percent. PECO can meet this requirement by obtaining Alternative Energy Credits (AECs) from qualifying solar PPAs.

The "Rest-of-Stack" adder is calculated as the difference between the full requirements contract and the average forward curve price and thus implicitly includes the price for AECs. Therefore, we subtracted the AEC costs from the adder for the Alternate Portfolio for the amount of solar generation that would have been procured. The average prices for Tier I Non-Solar AECs were provided by PECO and the average price used in the Historic Analysis is $24.06 (2024$).[23] Accounting for this benefit reduces the overall

[21] Petition of PECO Energy Company for Approval of its Default Service Program for the Period from June 1, 2025 Through May 31, 2029, at 8 (Feb. 2, 2024).

[22] Exh. BK-6, PECO Interrogatory Responses, Response to EJA-V-6.

[23] These Tier I Non-Solar AEC prices were supplied by PECO in Exh. BK-7, PECO Interrogatory Responses, Attachment EJA-I-7(a.2) "PA AEPS for PECO Solicitations.xlsx" in the "AEC Prices" tab.

contract prices for FPFR and supporting services for solar PPAs. The equation for the AEPS Avoided Costs can be summarized as follows:

Equation 6

AEPS Avoided Costs ($)$_{\text{Tier I Non-Solar}}$ =

Average AEC Price ($/MWh) $_{\text{Tier I Non-Solar}}$ X Expected Annual Solar Generation (MWh)[24]

Step 4—Determine Overall Impact on Costs from Long-Term Solar PPAs: In previous steps, we calculated the total costs of serving default residential load under the Reference and Alternate Portfolio. We then calculated the difference in overall portfolio costs between the Reference and Alternate Portfolio to determine the impact of long-term solar PPAs on default service costs for PECO's residential customers.

Q. What data sources and key assumptions were used in the Historical Model?

A. The data and sources used in the historical model are summarized in the table below.

Table 1: Data Sources for the Historical Model

Data	Source
Long-Term Solar PPA (Contract) Prices	Berkeley Lab's "Utility-Scale Solar, 2023 Edition". Source contains Berkeley Lab & LevelTen sourced PPA prices.[25]

[24] Note this assumes the PPA generation is less than the AECs required for residential load.

[25] Exh. Key Modeling Assumptions:

1. Solar PPA contracts include AECs: Solar PPAs are generally bilateral contracts, and our model assumes that the solar developer would incorporate the cost of AECs

[26] The production profile was generated using the NREL SAM PVWatts calculator. NREL, *PVWattts Calculator* (2024), https://pvwatts.nrel.gov/pvwatts.php. The location modeled was Lancaster County, Pennsylvania. Lat, Lng: 40.05, -76.3 for a 1-Axis Tracking array of 1 kW.

[27] The production profile was generated using the NREL SAM PVWatts calculator. NREL, *PVWattts Calculator* (2024), https://pvwatts.nrel.gov/pvwatts.php. The location modeled was Lancaster County, Pennsylvania. Lat, Lng: 40.05, -76.3 for a 1-Axis Tracking array of 1 kW.

[28] Average contract prices and tranche sizes were downloaded directly from PECO. PECO, *PECO Procurement for Default Supply* (2024), https://pecoprocurement.com/index.cfm?s=background&p=previousResults. These contract prices were additionally supplied by PECO in Exh. BK-5, PECO Interrogatory Responses, Attachment EJA-I-7(a.2) "PECO Residential.xlsx" in the "R Winning Bids" tab.

[29] Residential load data was downloaded directly from PECO at PECO, *Procurement for Default Supply* (2024), https://pecoprocurement.com/index.cfm?s=dataRoom&p=monthly and was additionally supplied in Exh. BK-2, PECO Interrogatory Responses, Attachment EJA-IV-1(a). The column representing "Default Energy (MWh)" was used.

[30] Historic spot market prices for the PECO pricing node were downloaded at PJM Data Miner 2, *Pricing Nodes* (2024), https://dataminer2.pjm.com/feed/pnode.

[31] S&P Global Platform, *S&P Capital IQ Financials*, *NYMEX Power PECO*, https://www.marketplace.spglobal.com/en/datasets/s-p-capital-iq-financials-(10) Data are only available for qualified users. Forward prices were downloaded for the duration of DSP V.

within their PPA.[32] Thus, PECO would retain all the rights to hold, retire, sell, trade, etc., the AECs from the long-term solar contracts.

2. Capacity Credit from Solar: Our analysis assumes that PECO would need to purchase services from the market to support incremental capacity needs beyond the capacity associated with the long-term Solar PPA, and this cost is included in the "Rest-of-Stack" Adder. This implies a conservative assumption that solar generation would provide a similar value of capacity to what is provided by a load-weighted purchase of peak and off-peak blocks of electricity.[33]

Q. Please detail the findings from the Historical Model.

A. The total cost of both portfolios was analyzed, and the relative cost savings from including a solar PPA were developed.

[32] Exh. BK-3, Mark Bolinger et al., Utility-Scale Solar, 2023 Edition: Empirical Trends in Deployment, Technology, Cost, Performance, PPA Pricing, and Value in the United States, Lawrence Berkeley Nat'l Lab., at PDF p. 29 (Oct. 2023).

[33] Our expected average generation from solar single-axis tracking over a year is 17.3 percent of the installed capacity. Thus, the energy generated per installed MW of solar power would be 8760 hours for a non-leap year multiplied by 17.3 percent or around 1515 MWh. In PJM, the current default capacity contribution for solar resources is 42 percent of the nameplate capacity for fixed tilt and 60 percent for single-axis tracking. So, the capacity contribution of solar single-axis tracking would be 0.6 MW per MW of installed solar. On the other hand, a peak contract for 5 MW will cover 16 hours times 5 days per week times 52 weeks per year or 4160 hours (without adjusting for holidays). Thus, it would provide 4160 MWh per contracted MW. If the contract can be counted toward capacity requirements, it would provide 1 MW of capacity contribution per contracted MW. In this case, the ratio of capacity to energy in the solar PPA is over 160 percent of the same ratio for a peak contract.

Figure BK-3: Total Savings of a 7 percent Solar Portfolio ($M) based on different PPAs and historical default supply costs from June 1st 2021 to December 31st 2023, in 2024$.

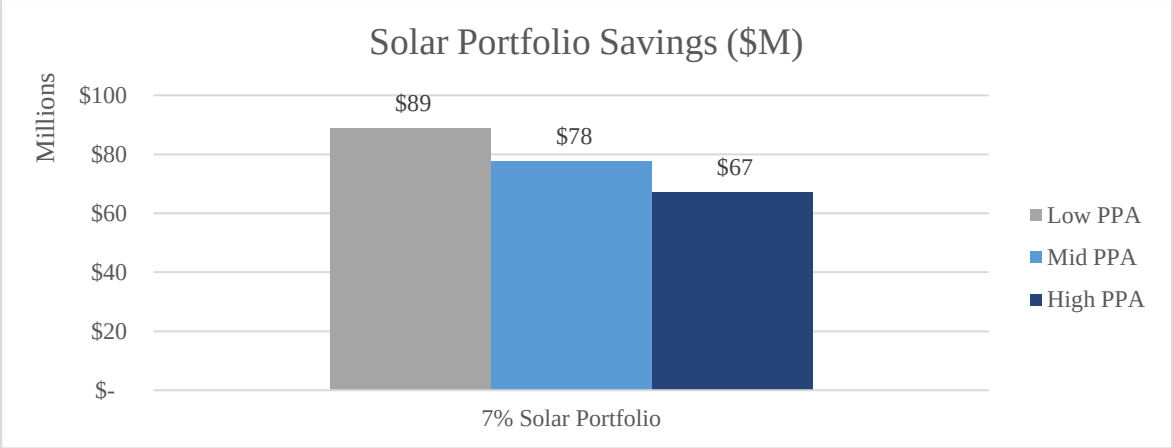

Table 2: Total Cost and Relative Savings of Each Portfolio in 2024$.

Scenario	Total Cost (June 1, 2021, to December 31st, 2023)	Cost Savings Compared to Reference Portfolio (June 1, 2021, to December 31st, 2023)		
		Low Solar PPA ($32.44/MWh)	Mid Solar PPA ($38/MWh)	High Solar PPA ($43/MWh)
Reference	$2,219 M	-	-	-
7 percent Solar Portfolio	$2,130 - $2,152 M	$89.0 M	$77.5 M	$67.2 M

Reference Portfolio: The estimated total cost associated with the Reference Portfolio, which is meant to approximate the cost of default service under DSP V from June 2021 to December 2023, was $2.22 billion.

Alternate Portfolio: The total costs of the Alternate Portfolio, which consists of up to 93 percent FPFR/Spot and hydro contracts and 7 percent solar PPA contracts, ranges between $2.13 billion to $2.15 Billion. By adding 7 percent long-term solar PPA contracts to the mix and depending upon the Solar PPA price, residential default service

customers could have saved between $67 million to $89 million compared to the reference scenario.

V. Detailed Discussion of Future Model

Q. Please provide a detailed overview of the methodology used in the Future Model.

A. The future analysis estimates the impact on default service costs if PECO procures long-term Solar PPA contracts under DSP VI, beginning in June 2025. The analysis brings all costs into 2024$[34] to ensure an apples-to-apples comparison as costs are added together across the years of DSP V. The following steps outline Dunsky's approach to this analysis.

Step 1 - Develop Scenario Portfolios: First, Dunsky developed a Reference Portfolio for comparison in our analysis, which forecasts the cost of default service under DSP VI for the residential customer class. The DSP VI FPFR contracts would be executed in a similar manner to those executed as part of DSP V.

Next, we developed a hypothetical Alternate Portfolio to estimate the cost of solar generation for the DSP VI period. As part of the analysis, solar generation would be procured from 3 separate capacity installments: 150 MW by June 2026, 175 MW by June 2027, and 200 MW by June 2028. This total installment of 525 MW results in

[34] This calculation is conducted by relying upon CPI data from the Bureau of Labor Statistics. U.S. Dep't of Labor, BLS Data Labs, *BLS Data Viewer* (2024), https://beta.bls.gov/dataViewer/view/timeseries/CUUR0000SA0;jsessionid=864EF2569B7C58A0FE0F72D15C46CFEE. The long-term discount rate to convert future nominal costs into 2024$ is 2.5%.

approximately 7 percent of the default residential load being met by solar generation (17.3 percent average capacity factor).[35]

We estimate the projected cost of a portfolio with a long-term PPA equivalent to the energy required to serve up to 7 percent of the default residential load by the end of DSP-VI. Up to 93 percent of the portfolio energy is supplied at an equivalent cost to the FPFR contract mixture from our Reference Portfolio.

Step 2—Develop FPFR Contract and Spot Price Forecasts:

FPFR Contract Price Forecast: As the first step, we list the existing FPFR contracts that were approved as part of DSP V (June 1st, 2021, to May 31st, 2025) that extend into DSP VI (June 1st, 2025, to May 31st, 2029). Then, we estimated the cost of future FPRF contracts using the future prices from the NYMEX exchange for PECO (5 MW Off-Peak & Peak Calendar Month Day-Ahead LMP Futures) and a "Rest-of-Stack" adder to represent the additional services (e.g., additional capacity and ancillary services) included in the FPFR contracts. The "Rest-of-Stack" adder costs were estimated by analyzing the historical PJM PECO on-peak power forward curve[36] for the contract period and

[35] Assumed average default service residential load of approximately 11.3 million MWh (2023 total residential default load was 11,179,240 MWh) throughout DSP VI period, where 7 percent of this is 790,000 MWh or approximately 525 MW * 17.3 percent * 8760 hours in a year.

[36] S&P Global Platform, *S&P Capital IQ Financials*, *NYMEX Power PECO* (2024), https://www.marketplace.spglobal.com/en/datasets/s-p-capital-iq-financials-(10) Data are only available for qualified users. Future contract prices were downloaded for the duration of DSP V. The "forward curve" is industry terminology for the collected current prices of all futures contracts that provide the same commodity at different maturities. Future contracts for electricity are also broken down by peak and off-peak delivery.

calculating the delta between the average cost of the full requirements contracts and the average price of the futures contracts covering the same period.[37] This "Rest-of-Stack" adder ranged from $11.45/MWh to $31.17/MWh for contracts that were approved as part of DSP V. The average value of $24.48/MWh (adjusted to inflation) was used as the "Rest-of-Stack" adder to adjust the futures pricing to reflect the estimated cost of future FPFR contracts.

Energy cost forecasts were developed based on a recent forward curve (NYMEX LMP Futures for PECO) collected from the S&P Commodity Price Aggregator,[38] while the "Rest-of-Stack" adder costs were forecasted based on inflation. From June 1, 2025, to May 31st, 2029, the average cost of default residential full contract requirements is forecasted to be $75.94/MWh (2024$) under the Current Forwards scenario. Given the uncertainty in future spot market prices, a plus/minus 25 percent scalar was used to create the High and Low price sensitivities to assess a range of market conditions. The Current Forwards scenario prices are characterized by the current, as of April 18th, 2024, forward curve obtained from the NYMEX exchange.

[37] Average contract prices and tranche sizes were downloaded directly from PECO. PECO, *PECO Procurement for Default Supply* (2024), https://pecoprocurement.com/index.cfm?s=background&p=previousResults. These contract prices were additionally supplied by PECO in Exh. BK-5, PECO Interrogatory Responses, Attachment EJA-I-7(a.2) "PECO Residential.xlsx" in the "R Winning Bids" tab.

[38] CME Group, *PJM PECO Zone 5 MW Peak Calendar-Month Day-Ahead LMP* (2024), https://www.cmegroup.com/markets/energy/electricity/pjm-peco-zone-5-mw-peak-calendar-month-day-ahead-lmp-swap-futures.html#venue=globex; CME Group, *PJM PECO Zone 5 MW Off-Peak Calendar-Month Day-Ahead LMP* (2024), https://www.cmegroup.com/markets/energy/electricity/pjm-peco-zone-5-mw-off-peak-calendar-month-day-ahead-lmp-swap-futures.html#venue=globex.

Spot Price Forecast: To develop a forecast for the spot prices, we used the on-peak and off-peak futures contract prices (NYMEX LMP Futures for PECO) collected from the S&P Commodity Price Aggregator.[39] We used the 10-year U.S. Treasury bill (T-bill) rate of 4.64 percent as of April 18th, 2024, to represent the investors' risk-free rate. This rate then discounted the future contracts to derive the market's expected future spot market prices. Our model uses these derived spot market prices as an electricity price forecast.

We applied gross-up factors to the derived on-peak and off-peak expected prices based on the residential load profiles[40] to develop monthly residential-specific average costs. Finally, we applied the on-peak and off-peak load allocation factors to develop a monthly weighted average residential price forecast.

Step 3 - Establish a Long-Term Solar PPA Price Range: Next, we determine the amount of electricity purchased through long-term solar PPAs based on 7 percent of the portfolio's default residential load by the end of the DSP-VI period. The 7 percent load procurement is split into three capacity tranches in the second (150 MW), third (175

[39] CME Group, *PJM PECO Zone 5 MW Peak Calendar-Month Day-Ahead LMP* (2024), https://www.cmegroup.com/markets/energy/electricity/pjm-peco-zone-5-mw-peak-calendar-month-day-ahead-lmp-swap-futures.html#venue=globex; CME Group, *PJM PECO Zone 5 MW Off-Peak Calendar-Month Day-Ahead LMP* (2024), https://www.cmegroup.com/markets/energy/electricity/pjm-peco-zone-5-mw-off-peak-calendar-month-day-ahead-lmp-swap-futures.html#venue=globex.

[40] Exh. BK-8, PECO Interrogatory Responses, Attachment EJA-III-16(a-d) "PECO Forecast 10-31-23.xlsx" in the "Loads" tab.

MW), and fourth (200 MW) year of the DSP-VI period. The hourly production profile[41] approximates a general solar installation in Southern Pennsylvania within PJM. Thus, the amount of installed solar capacity would vary based on solar's average annual capacity factor and location.

We did not establish a single price for the future analysis of Solar PPA. Instead, we consulted multiple sources to determine a potential range of prices that PECO may pay throughout the DSP VI period. Various factors, such as solar insolation, grid interconnection, interest rates, market supply chain disruption, etc., can affect solar PPA prices.

Based on the 2020 PPA data in PJM from Lawrence Berkeley National Lab, we established a Low Solar PPA price of $32.43 (2024$).[42] Based on the average Q1 2023 and Q1 2024 PPA data in PJM from LevelTen, we established a High Solar PPA price of $71.46 (2024$). As a reference case, we assumed a Mid/Medium Solar PPA Price of $56.47 (2024$) based on the National Renewable Energy Laboratory (NREL) Utility-Scale PV Levelized Cost of Energy forecast for solar. The Mid Solar PPA price was based on NREL's Annual Technology Baseline moderate scenario, the technical life cost

[41] The production profile was generated using the NREL SAM PVWatts calculator. NREL, *PVWattts Calculator* (2024), https://pvwatts.nrel.gov/pvwatts.php. The location modeled was Lancaster County, Pennsylvania. Lat, Lng: 40.05, -76.3 for a 1-Axis Tracking array of 1 kW.

[42] Lawrence Berkeley National Lab, Energy Markets & Policy, *CapEx, LCOE, and PPA Prices by Region* (2024), https://emp.lbl.gov/capex-lcoe-and-ppa-prices-region where the 2020 PJM price is $29.57 (in 2022$). Adjusted for inflation, this represents $32.43 in 2024$.

recovery period, and the class 10 technology filter.[43] From these criteria, The Mid-PPA cost was then calculated based on the weighted average levelized cost of energy based on the expected solar procurement schedule for the DSP VI period from 2026 to 2028 (150, 175, 200 MW). The data was inflation-adjusted to 2024$.

Since the FPFR contracts are full requirements contracts, they provide services beyond delivered energy (i.e., they include capacity and ancillary services, among other services). To estimate the cost of replacing a portion of the FPFR contracts, the "Rest-of-Stack" adder we estimated in Step 2 is expected to be the additional cost of services to integrate the solar PPA energy into the PECO portfolio. This cost was added to the cost of the PPA to estimate the additional cost of services that PECO would need to procure to incorporate the long-term PPA contract.

Step 4—Determine the Overall Costs of Portfolio: Each portfolio was analyzed on a monthly basis from June 1, 2025, the beginning of the DSP VI period, to May 31st, 2029, the end of the DSP VI period. Dunsky calculated the reference cost and estimated the cost under the Alternate Portfolio of the three tranches previously described.

[43] *See* National Renewable *Energy Laboratory, Annual Technology Baseline* (2023), https://atb.nrel.gov/electricity/2023/utility-scale_pv, where we took the LCOE ($/MWh) for the moderate scenario for Class 10 Utility PV for each of the 3 years (2026, 2027, 2028) where solar is due to be procured. A weighted average LCOE was calculated based on the amount of incremental solar procured within each year. Costs were then converted to 2024$ since they are presented in 2021$, which results in a mid price of $56.47/MWh.

Calculate the Reference Cost: The reference cost is the costs consistent with energy procured through FPFR contracts, spot market purchases, and hydro allocation purchases, described in Equation 1.

Equation 1:

$$\text{Total Costs (\$)}_{\text{Reference Portfolio}} = \text{Total Costs (\$)}_{\text{FPFR Contract}} + \text{Total Costs (\$)}_{\text{Spot Market}} + \text{Total Costs (\$)}_{\text{Hydro}}$$

FPFR Contract Costs: We calculated the total costs of the FPFR contract by multiplying their monthly contracted volume in MWh with the average forecasted monthly price, which includes the "Rest-of-Stack" adder. The 25 percent plus /minus scalar was only applied directly to the portion of the energy encompassed within the FPFR contracts and not the "Rest-of-Stack" adder. This is because the scalar is applied to the futures curves and is meant to reflect its price uncertainty.

To calculate the total contract volume served by default service contracts, net of the 0.2 percent hydro generation, we assumed that default service providers would serve up to 99 percent of the residential customer class load.[44] The remaining 1 percent was met through purchases in the spot market. The equation below summarizes the calculation approach to estimating the costs under FPFR contracts.

[44] Exh. BK-8, PECO Interrogatory Responses, Attachment EJA-III-16(a-d) "PECO Forecast 10-31-23.xlsx" in the "Loads" tab, Column H "PECO Forecasted Retained Load at Meter (MWh)."

Equation 2:

Total Costs ($) $_{\text{FPFR Contract}}$ = Average Price ($/MWh) $_{\text{FPFR Contract}}$ x Contract Volume (MWh) $_{\text{FPFR Contract}}$

Costs Incurred from Spot Market Purchases: To estimate the total costs incurred from spot market purchases, we multiplied the monthly volumes purchased on the spot market by the forecasted average monthly spot market price. As mentioned earlier, we assumed that only 1 percent of the overall default residential load,[45] net the hydro allocation, was purchased on the spot market, constituting the contracted volume for spot market purchases. The equation below summarizes the calculation approach to estimating the overall costs under spot market purchases.

Equation 3:

Total Costs ($) $_{\text{Spot Market}}$ = Weighted Average Price ($/MWh) $_{\text{Spot Market}}$ x Volume (MWh) $_{\text{Spot Market}}$

Costs from the Hydro Allocation: To estimate the total costs incurred from hydro allocation purchases, we multiplied the monthly volumes procured by the contracted

[45] Exh. BK-8, PECO Interrogatory Responses, Attachment EJA-III-16(a-d) "PECO Forecast 10-31-23.xlsx" in the "Loads" tab, Column H "PECO Forecasted Retained Load at Meter (MWh)."

price. The analysis assumes that 0.2 percent[46] of the default residential load is served by hydro at a contract price of $4.92/MWh.[47]

***Calculate the Alternate Portfolio Costs**:* The estimated total cost under the Alternate Portfolio is the overall costs incurred through long-term solar PPA contracts and supporting services less the AEPS costs avoided by solar's contribution, plus the costs of FPFR and hydro contracts, and spot market purchases. The overall costs for the Alternate Portfolio can be summed up in the equation below:

Equation 4:

$$\text{Total Costs (\$)}_{\text{Alt Portfolio}} = (\text{Total Costs (\$)}_{\text{Solar PPA and Support}} - \text{AEPS Avoided Costs (\$)}_{\text{Tier I Non-Solar}}) + \text{Total Costs (\$)}_{\text{FPFR Products}} + \text{Total Costs (\$)}_{\text{Hydro}} + \text{Total Costs (\$)}_{\text{Spot Market}}$$

Long-Term Solar PPA Costs: We estimate potential costs under long-term solar PPAs by multiplying their monthly expected generation volume in MWh with the High, Mid, and Low average monthly PPA prices. We then added the estimated cost to procure supporting capacity and ancillary services to the PPA cost (quantified by the "Rest-of-Stack" adder). We then established the eventual total volume (MWh) of energy procured under the long-term solar contracts to be equivalent to approximately 7 percent of the

[46] Petition of PECO Energy Company for Approval of its Default Service Program for the Period from June 1, 2025 Through May 31, 2029, at 8 (Feb. 2, 2024).

[47] Exh. BK-6, PECO Interrogatory Responses, Response to EJA-V-6.

average annual residential load[48] split into three capacity tranches in the second (150 MW), third (175 MW), and fourth (200 MW) year of the DSP-VI period.

Equation 5:

Total Costs ($) $_{\text{Solar PPA}}$ = Average Price ($/MWh) $_{\text{Solar PPA and Services}}$ x Expected Generation Volume (MWh) $_{\text{Solar PPA}}$

FPFR Contract Costs: As previously described in Equation 2, we calculate the FPFR contract costs under the Alternate Portfolio by multiplying the monthly contracted volume in MWh with the average forecasted monthly contract price, which includes the "Rest-of-Stack" Adder. The monthly average contract price for the FPFR contracts is assumed to be unchanged in the Reference and Alternate Portfolio. The 25 percent plus/minus scalar was again only applied directly to the portion of the energy encompassed within the FPFR contracts and not the "Rest-of-Stack" adder.

Our modeling assumes that FPFR contracts serve up to 99 percent of the remaining residential default service load, net of the portion served by long-term solar PPAs and hydropower. The remaining 1 percent of the net residential default service load is assumed to be served through purchases from the spot market.

[48] Exh. BK-8, PECO Interrogatory Responses, Attachment EJA-III-16(a-d) "PECO Forecast 10-31-23.xlsx" in the "Loads" tab, Column H "PECO Forecasted Retained Load at Meter (MWh)."

Costs Incurred from Spot Market Purchases: As previously described, to estimate the total costs incurred from spot market purchases, we multiplied the monthly volumes purchased on the spot market by the average monthly spot market price. We assumed that only 1 percent of the net residential load was purchased on the spot market, constituting the contracted volume for spot market purchases. The monthly average spot market price is assumed to be unchanged in the Reference and Alternate Portfolios.

Costs from the Hydro Allocation: To estimate the total costs incurred from hydro allocation purchases, we multiplied the monthly volumes procured by the contracted price. The analysis assumes that 0.2 percent[49] of the default residential load is served by hydro at a contract price of $4.92/MWh.[50]

Alternative Energy Portfolio Standard (AEPS) Avoided Costs: PECO can meet its Tier 1 Non-Solar Requirements and comply with the AEPS by obtaining AECs from Solar PPAs. The "Rest-of-Stack" adder implicitly includes the price for RECs. Therefore, we calculated the AEC costs separately and subtracted them from the total Alternate Portfolio costs for the Alternate Portfolio. Correspondingly, this reduces the overall contract prices for FPFR and supporting services for solar PPAs. The prices for Tier I Non-Solar AECs

[49] Petition of PECO Energy Company for Approval of its Default Service Program for the Period from June 1, 2025 Through May 31, 2029, at 8 (Feb. 2, 2024).

[50] Exh. BK-6, PECO Interrogatory Responses, Response to EJA-V-6.

were provided by PECO. These ranged from $26.84/MWh in June 2025 to $20.65/MWh in May 2029 (2024$).[51]

The equation for the AEPS Benefits can be summarized as follows:

Equation 6

AEPS Avoided Costs ($)$_{\text{Tier I Non-Solar}}$ =

Average AEC Price ($/MWh) $_{\text{Tier I Non-Solar}}$ X Expected Annual Solar Generation (MWh)[52]

Step 5—Determine Overall Impact on Costs from Long-Term Solar PPAs: In the previous steps, we calculated the total costs of serving the default residential load under the Reference and Alternate Portfolios. We then calculated the cost difference between the Reference and Alternate Portfolios to determine the long-term solar PPAs' impact on default service costs for PECO's residential customers.

Q. What data and sources of data were used in the Future Model?

A. The data and sources used in the future model are summarized in the table below.

Table 3: Data Sources for the Future Model

Data	Source
Long-Term Solar PPA (Contract) Prices	Low: Berkeley Lab 2020 Solar PPA for PJM[53]

[51] Exh. BK-8, PECO Interrogatory Responses, Attachment EJA-III-16(a-d) "PECO Forecast 10-31-23.xlsx" in the "AEPS" tab, Column G "Non-Solar Req Part of Tier I."

[52] Note this assumes the PPA generation is less than the AECs required for residential load.

[53] Lawrence Berkeley National Lab, Energy Markets & Policy, *CapEx, LCOE, and PPA Prices by Region* (2024), https://emp.lbl.gov/capex-lcoe-and-ppa-prices-region where the 2020 PJM price is $29.57 (in 2022$). Adjusted for inflation, this represents $32.43 in 2024$.

	Medium: NREL Utility-Scale PV 2026 LCOE (conservative scenario, Technical Life, Utility PV – Class 10)[54] High: Average of LevelTen Q1 2023 and Q1 2024 PPA prices for PJM
Hourly Solar Profile	NREL PVWatts Calculator[55]
Yearly Solar Capacity Factor	NREL PVWatts Calculator[56]
PECO Contract Solicitation Pricing (Portion of pricing up to May 2026)	PECO Procurement[57]
PECO Residential Load Forecast (PECO Retained Derated Load at Meter)	PECO Forecast 10-31-23[58]

[54] *See* National Renewable *Energy Laboratory, Annual Technology Baseline* (2023), https://atb.nrel.gov/electricity/2023/utility-scale_pv where we took the LCOE ($/MWh) for the moderate scenario for Class 10 Utility PV for each of the 3 years (2026, 2027, 2028) where solar is due to be procured. A weighted average LCOE was calculated based on the amount of incremental solar procured within each year. Costs were then converted to 2024$ since they are presented in 2021$, which results in a mid price of $56.47/MWh for the future model.

[55] The production profile was generated using the NREL SAM PVWatts calculator. NREL, *PVWattts Calculator* (2024), https://pvwatts.nrel.gov/pvwatts.php. The location modeled was Lancaster County, Pennsylvania. Lat, Lng: 40.05, -76.3 for a 1-Axis Tracking array of 1 kW.

[56] The production profile was generated using the NREL SAM PVWatts calculator. NREL, *PVWattts Calculator* (2024), https://pvwatts.nrel.gov/pvwatts.php. The location modeled was Lancaster County, Pennsylvania. Lat, Lng: 40.05, -76.3 for a 1-Axis Tracking array of 1 kW.

[57] Average contract prices and tranche sizes were downloaded directly from PECO at PECO, *PECO Procurement for Default Supply* (2024), https://pecoprocurement.com/index.cfm?s=background&p=previousResults. These contract prices were additionally supplied by PECO Exh. BK-5, PECO Interrogatory Responses, Attachment EJA-I-7(a.2) "PECO Residential.xlsx" in the "R Winning Bids" tab.

[65] Exh. BK-8 PECO Interrogatory Responses, Attachment EJA-III-16(a–d) "PECO Forecast 10-31-23.xlsx" in the "AEPS" tab, Column G "Non-Solar Req Part of Tier I."

Key Modeling Assumptions:

1. Solar PPA contracts include AECs: Solar PPAs are generally bilateral contracts. Our model assumes that the solar developer would incorporate the cost of AECs within their PPA. Thus, PECO would retain all the rights to hold, retire, sell, and trade the AECs from the long-term solar contracts.
2. Capacity Credit from Solar: Our analysis assumes that PECO would need to purchase services from the market to support incremental capacity needs beyond the capacity associated with the long-term Solar PPA, and this cost is included in the "Rest-of-Stack" Adder. This implies a conservative assumption that solar generation would provide a similar value of capacity to what is provided by a load-weighted purchase of peak and off-peak blocks of electricity.[66]

Q. Please detail the findings from the Future Model.

A. The total cost of both portfolios was analyzed, and the relative cost savings from including a solar PPA were developed.

Impact of Long-Term Solar PPA on DSP VI Costs

[66] Our expected average generation from solar single-axis tracking over a year is 17.3 percent of the installed capacity. Thus, the energy generated per installed MW of solar power would be 8760 hours for a non-leap year multiplied by 17.3 percent or around 1515 MWh. In PJM, the current default capacity contribution for solar resources is 42 percent of the nameplate capacity for fixed tilt and 60 percent for single-axis tracking. So, the capacity contribution of solar single-axis tracking would be 0.6 MW per installed solar MW. On the other hand, a peak contract for 5 MW will cover 16 hours times 5 days per week times 52 weeks per year or 4160 hours (without adjusting for holidays). Thus, it would provide 4160 MWh per contracted MW. If the contract can be counted toward capacity requirements, it would provide 1 MW of capacity contribution per contracted MW. In this case, the ratio of capacity to energy in the solar PPA is over 160 percent of the same ratio for a peak contract.

Figure BK-4: Total Savings of a 7 percent Solar Portfolio ($M) based on different PPAs and forward market assumptions throughout DSP VI in 2024$.

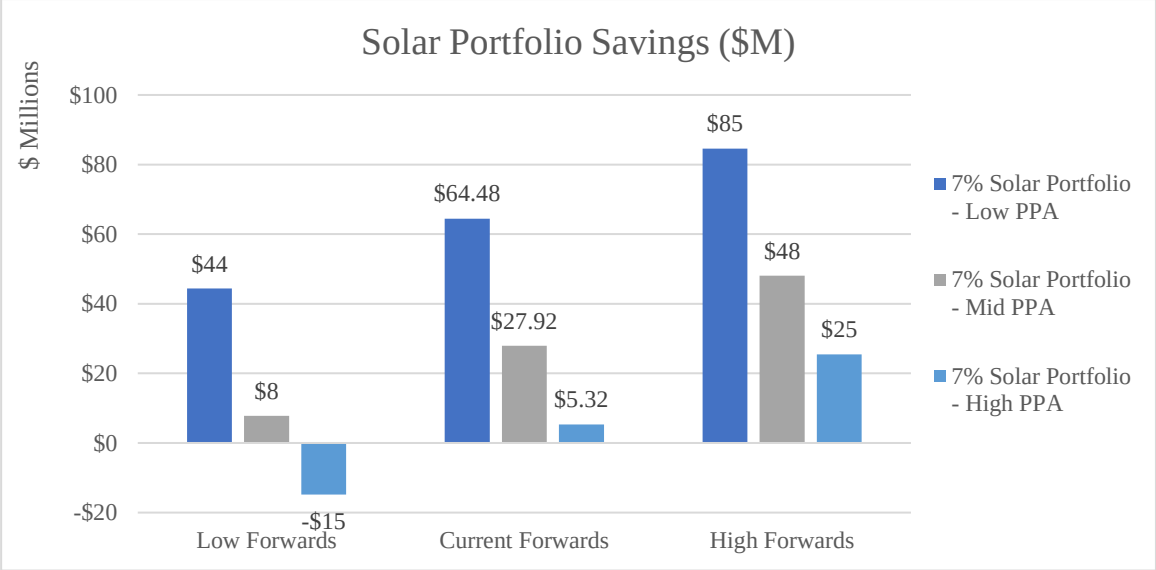

Table 4: Total Cost and Relative Savings of 7 percent Solar Portfolio based on different PPA's and forward market assumptions throughout DSP VI, in 2024$ Million.

Reference & PPA Price Scenarios	Total Costs - DSP VI Period			Savings Compared to Reference Portfolio - DSP VI Period[67]		
	Low Forwards	*Mid Forwards*	*High Forwards*	*Low Forwards*	*Mid Forwards*	*High Forwards*
Reference	$2,849	$3,399	$3,949	-	-	-
7 percent Solar – Low PPA	$2,804	$3,334	$3,864	$44	$64	$85
7 percent Solar – Mid PPA	$2,841	$3,371	$3,900	$8	$28	$48
7 percent Solar – High PPA	$2,863	$3,393	$3,923	-$15	$5	$25

[67] Total costs and savings differences may not exactly match due to rounding.

Reference Scenario: The estimated total cost associated with the Reference Portfolio under the Current Forwards (current as of April 18th, 2024) scenario is $3.40 billion. This represents the cost of default service under DSP VI (June 2025 to May 2029) based on current market conditions.

The following sections present the total costs and relative savings for each PPA price scenario portfolio compared to the Reference Portfolio for the Current Forwards scenario (current as of April 18th, 2024).

1) 7 percent Solar – Low PPA – Current Forwards: The total cost of this portfolio, which consists of up to 7 percent solar generation by the end of the DSP VI period, is $3.334 billion. This assumes solar generation is procured from 3 separate capacity installments: 150 MW by June 2026, 175 MW by June 2027, and 200 MW by June 2028. By adding up to 7 percent long-term solar PPA contracts to the mix at a $32.44/MWh Solar PPA price, residential default service customers are expected to save $64.48 million compared to the Reference Portfolio.

2) 7 percent Solar – Mid PPA - Current Forwards: The total cost of this portfolio, which consists of up to 7 percent solar generation by the end of the DSP VI period, is $3.371 billion. This assumes solar generation is procured from 3 separate capacity installments: 150 MW by June 2026, 175 MW by June 2027, and 200 MW by June 2028. By adding up to 7 percent long-term solar PPA contracts to the mix at a $56.47/MWh

Solar PPA price, residential default service customers are expected to save $27.92 million compared to the Reference Portfolio.

3) 7 percent Solar – High PPA - Current Forwards: The total cost of this portfolio, which consists of up to 7 percent solar generation by the end of the DSP VI period, is $3.393 billion. This assumes solar generation is procured from 3 separate capacity installments: 150 MW by June 2026, 175 MW by June 2027 and 200 MW by June 2028. By adding up to 7 percent long-term solar PPA contracts to the mix at a $71.46 /MWh Solar PPA price, residential default service customers are expected to save $5.32 million compared to the Reference Portfolio.

Q. Under current market forecasts (Current Forward pricing), what is the threshold in your modeling where solar PPA prices would increase costs for residential consumers?

A. The PPA price at which the 7 percent solar portfolio (procured in 3 separate tranches: 150 MW by June 2026, 175 MW by June 2027 and 200 MW by June 2028) would not produce economic savings relative to the Reference Portfolio ($3.40 billion) is $75.56/MWh.

Q. What is the probability of the scenarios?

A. While we don't quantify the likelihood of the scenarios, generally, we would expect that lower prevailing market prices would put competitive pressures on renewable developers. Thus, the chances of having both low market prices and persistently high PPA pricing

should be considered much less likely than our scenarios with more balance between the market and PPA pricing. Similarly, very high market prices and persistently low PPA pricing should also be considered less likely.

VI. Conclusion

Q. Does this conclude your testimony?

A. Yes.

VERIFICATION

I hereby verify that the facts contained in the foregoing testimony are true and accurate to the best of my knowledge and that I am duly authorized to make this verification, and that I expect to be able to prove the same at any hearing held in this matter. I understand that the statements herein are made subject to penalties of 18 Pa. C.S. § 4904 (relating to unsworn falsification to authorities).

Dated: April 25, 2024

Ben Kujala

Exhibit BK-1
Ben Kujala Resume

BEN KUJALA

SENIOR RESEARCH LEAD

Ben Kujala brings 15 years of experience in the energy sector and leads Dunsky's Power Planning practice. Before joining Dunsky, Ben served as Director of Power Planning for the Northwest Power and Conservation Council – the body responsible for the long-term planning of the regional power grid serving the Pacific Northwest states of Oregon, Washington, Montana and Idaho. He was notably responsible for leading the region's 2021 Power Plan, adopted by all four states. The NWPCC is known for its history of pioneering smart power planning focused on minimizing economic and environmental costs and risks. Before that, Ben was with the Bonneville Power Administration (BPA), where he addressed key issues, including the long-term system adequacy implications of wind power, electricity market price forecasting, the region's hydropower options, and evaluation of the benefits of a Northwest Power Pool Energy Imbalance Market. Since joining Dunsky in early June 2022, he has supported an array of utility, government and third-party clients.

PROFESSIONAL EXPERIENCE

2022- DUNSKY ENERGY + CLIMATE ADVISORS

Senior Research Lead (2022 – Present)

Resource Planning

- Provided expert review of NB Power's econometric load forecasting approach and analyzed electrification potential in their service territory, including space heating, transportation, and industrial electrification. Provided review of econometric forecasting, statistical approaches to disaggregating regional forecasts to feeder-level forecasts, and high-electrification-driven load impacts on demand-side measures integrated with Time-Of-Use rates for EPCOR, FortisAB, and Platt River Power Authority.
- Led a study forecasting power purchase agreement pricing for wind generation considering residual value upon contract expiration for a confidential Canadian client. Led a study forecasting the cost of wind, solar, batteries, and natural gas resources in Alberta and Ontario for Clean Energy Canada. Supported a study forecasting the cost of green hydrogen using wind generation as the primary source of electricity for a confidential client.
- Developed a cost/benefit analytical approach for assessing battery storage projects for the Government of Nova Scotia.

Reliability and Grid Integration

- Reviewed and proposed climate-change-based adaptations to weather normalization for peak load forecasting for distribution feeders for EPCOR.
- Analyzed the economics of partial capacity provision from clean energy generation for a confidential Canadian client.
- Provided expert guidance on strategies for adapting Energy System Optimization (Times/MARKAL) for high-penetration renewable scenarios, including adaptation of Planning Reserve Margins and capacity contribution of wind generation paired with batteries.
- Assessed the integration of renewable generation with diesel-based grids in remote communities for a confidential Canadian client.

Hydrogen and Clean Fuels

- Provided analysis on the potential for using electrolyzers to produce green hydrogen to replace the current industrial use of grey hydrogen in New Brunswick.
- Analyzed the cost of producing green hydrogen from wind generation in Canada for a confidential client.

Energy Policy and Regulatory Analysis

- Led and supported several confidential assessments supporting regulatory considerations regarding jurisdictions in North America.
- Led a study for Electricity Canada on barriers to building electricity infrastructure faster.
- Provided expert support for a policy panel and workgroups formed by National Resources Canada to advise the minister on decarbonization in the electric sector.

Modelling

- Reviewed production cost model setup and results and recommended adaptations for external market impacts and capacity expansion modelling.
- Supported Transition Accelerators Meta-Analysis of pan-Canadian decarbonization studies, including reviewing results from production cost models in NREL and EPRI reports and Energy System Optimization models.

Transmission

- Studied Non-Wires Alternatives (NWA) in California and Colorado as an alternative to distribution infrastructure for the Connecticut Public Utilities Regulatory Authority.

2013-22 NORTHWEST POWER AND CONSERVATION COUNCIL (NWPCC)

Director of Power Planning (2016-2022); Manager of System Analysis (2014-2016); Senior Analyst (2013-2014)

Resource Planning

- Directed a team of 13 analytical experts tasked with studying and planning for the transition of the electric grid to a more renewable-based power system and communicating the resulting complex considerations to a governor-appointed council tasked with developing a strategic plan for the regional electric grid.
- Member of the Idaho Power Integrated Resource Plan (IRP) Advisory Committee for two Idaho Power IRPs. Represented the NWPCC in the Bonneville Resource Program proceeding.

Reliability and Grid Integration

- Led a team that developed a correlated capacity contribution surface approach for valuing combined technology builds of generation and storage as a capacity expansion module for a resource adequacy model based on the PSR SDDP production cost model.
- Led detailed studies on the interaction between hydroelectric generation with high and low water conditions and high wind and solar generation penetrations in the Northwest US region and neighbouring markets.
- Developed a statistical approach for linking Planning Reserve Margins (PRMs) in a portfolio model to resource adequacy metrics from a resource adequacy model.
- Member of the EPRI Power System Flexibility Expert Panel and advisor on the Western Interconnection Flexibility Assessment prepared by NREL and E3.
- Technical Advisory to Idaho Power on their wind integration rate study.

Energy Policy and Regulatory Analysis

- Expert Reviewer for the US Environmental Protection Agency's (US EPA) Energy and Environment Guide to Action.
- Represented the Council by speaking with state regulators and regulatory staff, interfacing with Northwest delegation congressional staff, engaging with utility executives and planners, responding to press requests, and presenting at technical and policy-based conferences.
- Provided technical information and introductory sessions for all Idaho, Montana, Oregon, and Washington regulators.
- Represented the NWPCC on the Western Governors' Committee on Regional Electric Power Cooperation (CREPC) and the Western Interstate Energy Board (WIEB).
- Spearheaded the inclusion of a pathways to decarbonization study in the 2021 Northwest Power Plan.

- Expert guidance on integrating policy-driven constraints into power system models for the 2021 Northwest Power Plan and the 7th Power Plan.

Modelling

- Integrated statistical risk modelling for electricity use, commodity market pricing, and hydroelectric generation into regional portfolio modelling.
- Led a complex regional analysis of the US Northwest power system using the Energy2020 end-use load model, the AURORAxmp production cost model from EnergyExemplar, the GENESYS reliability model based on the SDDP production cost model from PSR, and multiple in-house models, tools and analyses to setup and interconnect the models evaluating the least cost manner to expand the regional power system with an emphasis on demand-side measures and regional clean energy policies.
- Led the development of a portfolio model developed in Analytica and was the primary statistical expert on risk and convolution of distribution approach to approximating resource dispatch.
- Redeveloped a legacy Fortran waterflow model to estimate the maximum capacity of the regional hydroelectric generation.

Transmission

- Member of the Transmission Expansion Planning Policy Committee of the Western Electricity Coordinating Council (WECC). Contributed substantially to a WECC-wide production cost model database in PROMOD and GridView production cost models, including expert review and feedback on model outputs for the Northwest US region. Worked on a team coordinating extraction of hourly dispatch from the production cost model into the PowerWorld power flow simulator for detailed transmission simulation and study.
- One of five members of the South of Allston Reinforcement Project Review Panel for ColumbiaGrid reviewing a proposed Bonneville transmission upgrade in the I-5 corridor.

2008-13 BONNEVILLE POWER ADMINISTRATION

Operations Research Analyst (2009-2013); Public Utility Assistant (2008-2009)

Resource Planning

- Collaborated on creating a Black-Scholes-based natural gas future price risk model used for risk evaluation of the Bonneville market position. Primary analyst for a uranium pricing risk model evaluating the risk of different purchase strategies for nuclear generation fuel.
- Author of a statistical risk model for long-term evaluation of wind generation risk that was used in an in-house review of the contribution of wind to resource adequacy in a predominantly hydro-based system.

Reliability and Grid Integration

- Technical advisor on the long-term risk profile of wind generation in the Bonneville Balancing Authority (BA) for the Variable Energy Resource Balancing Service (VERBS) rate.
- Pre-release reviewer for Bonneville of the NERL Western Wind and Solar Integration Study, including reviewing the relationship between Mesoscale meteorological data on wind speed compared to generation from existing interconnected wind generation in the Bonneville BA.

Modelling

- Primary analyst for Bonneville on the Northwest Power Pool (NWPP) Energy Imbalance Market study implementing a multi-stage 5-minute redispatch in the Plexos production cost model simulating a market-based redispatch approach that reflected the NERC CPS Reliability Standards in the constraints and limited deviation from transmission scheduled flows.
- Estimated day-ahead marketing inventory for the Bonneville trading floor using the ColumbiaVista waterflow model developed by Hatch and created ad-hoc and automated data visualizations to guide decisions on marketing electric power in the California ISO (CAISO) market pulling ICE and CAISO OASIS data.

- Primary analysts for the electricity market price study for the Bonneville BP-12 rate case using the AURORAxmp production cost model. Authored an R package to build standardized LaTeX reports extracting data from the AURORAxmp database on SQL Server.

Transmission

- Created a transmission Available Transfer Capability (ATC) risk model for near-term and mid-term electricity price forecasting in production cost modelling.
- Provided statistical support and generation expertise for developing a conditional firm transmission product for Bonneville.

PRESENTATIONS AND MEDIA COVERAGE

INVITED ACADEMIC TALKS

- **"Challenges of Planning for the Future Northwest Electric Power Grid"** for EE500 Series at the University of Washington, Seattle, WA, November 18, 2021

NON-ACADEMIC SPEAKING ENGAGEMENTS

- Presentation on the 2021 Northwest Power Plan to the Energy Northwest Board of Directors, December 16, 2021
- Presentation on the 2021 Northwest Power Plan to the Oregon Municipal Electric Utilities Fall Meeting, Sisters, Oregon, October 29, 2021

- Guest on KGW Straight Talk, a local news weekend program, Aired March 13, 2021 https://www.kgw.com/video/entertainment/television/programs/straight-talk/straight-talk-looking-back-on-the-february-ice-storm/283-3b59ce8a-9e82-436d-aded-4ab492022994
- Guest on Energi.Media Podcast, "Pacific Northwest electricity going carbon-free without natural gas?" December 31, 2020 https://energi.media/energy-climate-student-resources/pacific-northwest-electricity-going-carbon-free-without-natural-gas/
- Presentation on Topics Related to Natural Gas in the 2021 Northwest Power Plan, Northwest Gas Association Board Meeting, March 12, 2020
- Presentation on Resource Adequacy in the Northwest to the Northwest Power Pool Resource Adequacy Forum, October 2, 2019
- Presentation on the Midterm Assessment to Law Seminars International's Electric Power in the West Conference, Seattle, WA, January 25, 2019 https://www.lawseminars.com/seminars/2019/19BSEWA.php
- Presentation on Regional Conservation Progress Report to the Pacific Northwest Utility Conference Committee Board of Directors, Portland, OR, September 7, 2018 http://www.pnucc.org/meetings/board-directors-meetings/september-7-2018
- Presentation on "Western Markets: Current Landscapes and Future Horizons," EnergyNorthwest Board of Directors, Seattle, WA, September 27, 2017
- Presentation on "Regional Adequacy," Idaho Power IRP, Boise, ID, March 9, 2017
