Pennsylvania Rate Case

SCOPE

This report looks at two concepts, the allocation of certain distribution plant accounts to a customer cost (aka "minimum grid") or demand costs, here after referred to as the Customer Cost Study, and the allocation of certain distribution costs to customers served as primary voltage accounts. NARUC describes the basics of Customer Costs Studies in their publication "Electric Utility Cost Allocation Manual[1]," but the basics of these studies are to serve the purpose of allocating utility costs and/or asset values to different classes of customers.

Customer Cost Study

The Customer Cost Study is designed to separate the asset values into component costs, as follows;

- Customer Related Costs
- Demand Related Costs
- Energy Related Costs

The costs of the distribution system are primarily impacted by demand and the number of customers, so this study serves the purpose of allocating utility costs and/or asset values to those two cost components[2]. The plant accounts considered in this study are:

- FERC Account 364 – POLES, TOWERS, AND FIXTURES
- FERC Account 365 – OVERHEAD CONDUCTORS & DEVICES
- FERC Account 367 – UNDERGROUND C ONDUCTORS & DEVICES
- FERC Account 368 – LINE TRANSFORMERS

Primary/Secondary Customer Cost Study

The primary/secondary customer cost study is aimed at determining the portion of the distribution assets that are used to serve primary voltage customers; for example, the distribution transformer, secondary conductor, and service conductor types of distribution plant are not used to serve these customers. Similarly some accounts have limited assets that are used to provide service to these primary service customers; the Primary/Secondary Customer Cost Study is designed to determine the extent of each of those accounts used by the Primary Voltage Customer[3]. The accounts considered in this study are:

DEFINTIONS AND TERMS

A number of large data bases house the information used in the preparation of this report. The following definitions and terms describe: those systems and applications, from which data was extracted; the software tools used to extract, analyze, and summarize that information; and finally references are provided to any external data sources used.

Company Computer Systems, Data and Processes

The Company has a number of computer systems that house data used for this study. As utilities have grown, so has the size and complexity of these systems leading to the need to use software tools like SQL queries to analyze data sets that can no-longer be effectively analyzed using common desktop tools like Excel.

CCS

The Company's CCS or "Customer Care System" is the customer accounting and billing system. With data contained in this system the Company is able to tell the type of customer; the customer's customer rate code. The GIS and CCS customer records are connected though connection object database keys, which enable the Company to determine where, on the geographically represented system, each customer, and customer type, is connected. The CCS is a sub-system of SAP (see SAP below).

CREWS

CREWS is FirstEnergy's work management system, used by the Operating Companies to perform engineering estimates for construction work.

GIS

The Company's GIS or "Geographical Information System" is the computer system providing a geographically referenced, asset database of the installed distribution plant information, including information on poles, primary conductors, fuses, transformers, and switches, and how those pieces of the electric distribution system are electrically interconnected from the substation to the customer. The GIS is used primarily for mapping and detailing the distribution system aiding engineering design, planning and troubleshooting tasks.

Pennsylvania Rate Case

SAP

SAP[4] offers bundles of applications and services to enable companies to manage their businesses. These applications can include customer care systems (CCS), billing, financial, purchasing, inventory, and human resources functions.

Software Tools

SQL

Structured Query Language (SQL)[5] is a special programming language designed to manage and extract data held in a relational data base management system (RDBS), like Oracle, Sybase, MySQL, or, Microsoft SQL Server. Most of the Company's data bases, used for the preparation of this report, are Oracle RDBSs.

Toad Data Point

Toad Data Point, by Quest Software Inc[6], a cross-platform, self-service, data-integration tool that simplifies data access, preparation and provisioning. FirstEnergy uses Toad Data Point for general SQL execution and Data Cleaning as it pertains to studies on large datasets.

Microsoft Excel

Excel, by Microsoft[7], is a general use spreadsheet application. The software has functions allowing calculations, graphing, and aggregating data through use of pivot tables.

External Data Sources

Handy-Whitman Index

The *Handy-Whitman Index of Public Utility Construction*[8] provides asset price indexes and the capital book value against a benchmark year. Handy-Whitman Index numbers serve as a yardstick to estimate the impact of fluctuations in the value of material and labor costs, allowing assets of a known age to be reflected in other years. Average prices and cost trends are used to develop the Handy-Whitman Index. This Index is commonly used by utilities and regulators in their calculations of rate base for rate cases and in their valuations of property for insurance purposes.

Electric Utility Cost Allocation Manual[9]

The Electric Utility Cost Allocation Manual, by NARUC**,** was written by a team of utility, public utility commission, and FERC representatives and provides frameworks for costs of service studies. Section II of this Manual contains five chapters that explain the dominant method of cost allocation - the embedded cost study, which is based upon historical or known utility costs. Areas covered are production costs, transmission costs, distribution costs and the classification and allocation of customer-related costs and investments.

FERC Account 364 – POLES, TOWERS, AND FIXTURES

This plant distribution account is predominately made up of the various wood distribution poles used to support primary and secondary distribution conductors.

Assumptions and Method

- The Company's GIS was used to determine the number of wood distribution poles, by size and install year. In the analysis, these poles were replaced by the minimum size wood distribution poles that have seen common use within the study territory; 35-foot poles for those supporting primary conductors without joint use underbuild.
    - Poles without an install year were omitted
    - Poles with install years < 1912 were omitted
    - Only poles supporting primary conductor were included (i.e., street-light and secondary only poles were omitted).
    - Only poles where POLE_MAT in (D, L, M, N, P, R, W, Z) were considered … the other materials are fiberglass, steel, concrete, aluminum, etc. materials that are unlikely for "distribution" poles.
    - Only poles where HEIGHT in (25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, & 95) were considered, the other pole heights typically indicate either street-light only poles, i.e., HEIGHT in (12, 15, 16, 17, 20, 27) or may reflect erroneous data.
- The current installed cost for each size pole was obtained from CREWS, and trended by size to build a list of costs by pole length for each size wood pole.
- The install years were used to age the current costs for the actual size and minimum size transformers using Handy-Whitman indices, and extended by the number of poles in service for each year, then summed to develop the customer component for this plant account.
- The percentage of minimum size cost (Customer Cost), of the Total Plant Value was calculated as the portion represented by the cost of the minimum sized units, 35 foot poles, as previously defined. The percentage of the demand costs for the account is the remainder, after the customer cost component was removed.
- This study was repeated for each Operating Company.

FERC Account 365 - OVERHEAD CONDUCTORS AND DEVICES

This plant distribution account is predominately made up of the various overhead distribution line conductors, operating at either primary or secondary voltage. This study considered primary conductors only, the Company's GIS data is not sufficient to perform a similar analysis on the costs of secondary, service, and/or street-light conductors. The Company's GIS data is not sufficient to perform a Handy-Whitman analysis of the install date for primary conductors.

Assumptions and Method

- The Company's GIS was used to determine the wire miles of overhead distribution primary distribution line conductors. The conductors were categorized into two sizes, large and small.
  - Conductors with a blank or unknown conductor type/size were omitted.
  - Conductor segments longer than 700 feet were omitted as likely being in error.
- The current installed cost for each category of primary line conductor was obtained and used to cost out the currently installed system, if rebuilt using one of those two sizes.
- The minimum grid cost was developed using only the cost of the smaller conductor.
- The percentage of minimum size cost (Customer Cost), of the Total Plant Value was calculated as the portion represented by the cost of the system, built with the minimum sized conductor.

FERC Account 368 - LINE TRANSFORMERS

This plant distribution account is predominately made up of the various distribution transformers used to step the distribution voltage down to the service-voltage level delivered to the customer. This account includes both overhead and pad-mounted transformers.

Assumptions and Method

- The Company's GIS system was used to determine the number of overhead and pad-mounted distribution transformers, by size and install year, to be replaced by the minimum size (25 KVA) overhead line transformer that is in common use within the study territory.
- The current installed cost for each size line transformer was obtained from CREWS, and trended by size to build a list of costs by size for each size overhead and pad-mounted distribution transformer.
- The install years were used to age the current costs for the actual size and minimum size transformers using Handy-Whitman indices, and extended by the number of transformers in service for each year, then summed to develop the customer component for this plant account.
- Transformers missing install year, construction type, or kVA were omitted.
- The percentage of minimum size cost, of the calculated current cost was calculated as the portion represented by the cost of the minimum sized units.

Pennsylvania Rate Case

FERC Account 364 – POLES, TOWERS, AND FIXTURES

This plant distribution account is predominately made up of the various wood distribution poles used to support primary and secondary distribution conductors.

Assumptions and Method

Using data from the Company's GIS, the wood pole plant was separated by poles which have both primary and secondary attached facilities, poles with secondary attached facilities, poles with secondary attached facilities and wood poles with street-lighting facilities. To divide up the value of the account, the raw pole counts were calculated as well as a weighting based upon the cost to install a pole in today dollars, 2024.

The Company's pole data allows for the identification of the total wood poles plant, and wood poles with primary facilities attached, but does not allow for the identification of poles with private-outdoor lighting facilities, street-light facilities or secondary facilities. The poles serving primary service customers are allocated to primary rate customers, all other poles will need to be split between all rate classes, except primary service customers.

A list of primary accounts was extracted from the CCS and used as the starting point for traces in the GIS system. From these traces in GIS, for each of the primary accounts and their associated Connection Object were reviewed to determine if multiple primary customers shared primary circuit routes to ensure facilities allocated to primary rate customers were only counted once.

- Only poles supporting primary and secondary conductor were included (i.e., street-light only poles were omitted).
- Only poles where POLE_MAT in (D, L, M, N, P, R, W, Z) were considered … the other materials are fiberglass, steel, concrete, aluminum, etc. materials that are unlikely for "distribution" poles.
- Only poles where HEIGHT in (15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, & 95) were considered, the other pole heights typically indicate either street-light only poles, i.e., HEIGHT in (12, 15, 16, 17, 20, 27) or may reflect erroneous data.

Pennsylvania Rate Case

FERC Account 365 – OVERHEAD CONDUCTORS & DEVICES

This plant distribution account is predominately made up of the various overhead distribution line conductors, operating at either primary or secondary voltage. This study considered primary conductors only, the Company's GIS data is not sufficient to perform a similar analysis on the costs of secondary and/or service conductors.

Assumptions and Method

The primary conductors are allocated to both primary and secondary rates. To simplify the summations the conductors were divided into two sizes: large and small. The unique conductor paths, avoiding the duplicate counting of conductors, were calculated for all the primary customers back to the breaker on each circuit. The primary conductors were separated into small and large size conductors.

The conductor length of unique primary conductor feet is obtained by obtaining the span length of each primary line segment and then, by segment, multiplying by the number of conductors (1-phase vs 3-phase), and summing to obtain the total primary conductor feet used to serve primary customers. The same process is used for determining the total conductor feet for all primary conductors in the system.

A weighting is then used to account for the differences in cost to install a foot of large vs. small conductor. The weighted conductor length for primary conductors feeding primary rate customers is then compared to the weighted total conductor length of all conductors to obtain the percentage of primary conductor used by the primary rate customers.

Pennsylvania Rate Case

FERC Account 366 – UNDERGROUND CONDUIT

Conduit systems are used to supply both the primary rate and secondary rate customers. The majority of the conduit system is used to protect primary cable (which can be used to serve both primary customers, and secondary customers via transformation), and of that majority, the bulk of the primary conduit system is installed to protect large primary cables. Said another way, where majority of the large-sized primary cables are installed in conduit, and the majority of the small-sized primary cables are direct buried. The majority of secondary cables are direct buried.

Assumptions and Method

The circuit length of unique large sized, underground primary conductor feet is obtained by obtaining the span length of each primary line segment, and summing to obtain the total primary circuit feet used to serve primary customers. The same process is used for determining the total circuit feet for all large primary conductors in the system.

- Conductors with a blank or unknown conductor type/size were omitted
- Conductor segments greater than 2,500’ were considered data errors and omitted

The circuit length for large primary conductors, serving primary rate customers, is then compared to the total large primary circuit length to obtain the percentage of conduit systems used by the primary rate customers.

VII. CONCLUSION 19

DIRECT TESTIMONY
OF
MARK A. JONES

I. INTRODUCTION AND PURPOSE

Q. Please state your name and business address.

A. My name is Mark A. Jones. My business address is 76 South Main Street, Akron, Ohio 44308.

Q. By whom are you employed and in what capacity?

A. I am employed by FirstEnergy Service Company as Vice President, Customer Engagement.

Q. What is your professional and educational background?

A. I have been with FirstEnergy Corp. ("FirstEnergy") or its predecessor utilities or subsidiaries for 25 years. The majority of my time has been in customer and leadership positions. I have a Bachelor of Arts in Technology from Kent State University. My background and experience are more fully described in Appendix A.

Q. Have you ever testified before any regulatory bodies?

A. Yes, I have testified before the New Jersey Board of Public Utilities.

Q. On whose behalf are you testifying in this proceeding?

A. I am testifying on behalf of FirstEnergy Pennsylvania Electric Company ("FE PA" or "Company"). FE PA consists of the Met-Ed, Penelec, Penn Power, West Penn, and PSU rate districts (individually a "Rate District" and in any combination the "Rate Districts").[1]

[1] FE PA also has a sixth Rate District, the Waverly Rate District, which is not discussed directly in my testimony as it relates to FE PA's New York jurisdictional rates. The PSU Rate District is encompassed within the West Penn Rate District. To the extent that the testimony does not specifically mention the PSU Rate District, it can be assumed that it is included within the West Penn Rate District.

Q. What is the purpose of your direct testimony?

A. My testimony addresses the customer-focused organizational changes, as well as initiatives that FE PA has implemented over the last 24 to 48 months. Some of these initiatives are part of an ongoing effort to enhance customers' experience. I also testify about FE PA's proposal for a new low-income assistance initiative, its proposal to recover credit card fees, its proposed adjustments to uncollectible expense, and its proposed pilot program for electric vehicles.

Q. Have you prepared any exhibits to accompany your testimony?

A. Yes, I am sponsoring FE PA Exhibit MAJ-1, which provides the components for the uncollectible expense calculations.

II. CUSTOMER EXPERIENCE INITIATIVES

Q. Please discuss the organizational changes that have taken place recently as well as the recent reorganization of FirstEnergy's Customer Experience business.

A. FirstEnergy has undertaken a comprehensive structural and functional redesign of its organizations that provide direct support to its customers and enhanced its overall customer-focused strategy. This redesign allows for a more direct focus on the customers' needs from the customers' perspective gained from real-time insights and surveys.

More specifically, the customer-oriented business units have been reorganized to reflect a more customer-centric model, resulting in the Customer Service group being rebranded around Customer Experience, Customer Engagement, and Customer Care. This organization is led by a Senior Vice President of Customer Experience who reports directly to the Chief Operating Officer. Customer Experience consists of Customer Care and Customer Engagement, both which directly support the customer experience of

FirstEnergy's operating companies, including FE PA. Each of these groups have distinct areas of focus, but also collectively strive to provide each FirstEnergy customer with the best possible experience and service in the most affordable way.

Q. Can you explain the role of the Customer Care organization?

A. The Customer Care organization is a major operations unit under the Senior Vice President of Customer Experience. Within the Customer Care organization, there are functions that focus on Customer Management (Billing, Controls, Supplier Services), Contact Centers (Customer Care Centers), Revenue Operations (Credit and Collections), National Accounts, Customer Support and Customer Analytics. Customer Care's core function is ensuring the environment, tools, technologies, and policies can protect and meet the needs of FirstEnergy's customers. The team executes strategies to enhance the customer experience, while meeting regulatory commitments and operational excellence. Just recently, in 2023, Customer Care replaced the customer-facing core systems to provide a more seamless, robust omni-channel environment that will continue to evolve over time. In addition to improving this new customer experience platform, Customer Care will continue to focus on creating operational efficiencies through automation, collections scheduling, digital collections, and by unlocking best practices to support customers and employees.

Q. Can you explain what the Customer Engagement Team does?

A. Customer Engagement leads efforts with Economic Development & Business Development, Energy Efficiency, and Customer Policy & Solutions. The Economic Development & Business Development organization staff works to attract traded sector companies into FE PA's service territory, and helps existing trade sector customers expand

their operations in the FirstEnergy service territories. This team works closely with state organizations, their partners, as well as regional, local economic development organizations, consultants, local governments, brokers, and developers to assist in enabling a thriving economic growth plan on behalf of the Commonwealth.

The Energy Efficiency team develops and helps to implement a broad range of energy efficiency and peak demand reduction programs for residential, low-income, commercial, governmental, and industrial customers. These efforts are designed to meet or exceed each state's long-term energy and sustainability goals. The team educates customers on their energy usage and recommends ways they can improve their overall energy efficiency and conservation efforts. In conjunction with states' various regulatory programs, the team offers incentives and rebates for customers to upgrade their homes or facilities with more efficient and cost-effective technologies and promotes behaviors that reduce energy consumption. Combined, these efforts help customers save money on their electric bills and minimize carbon footprints.

Lastly, the Customer Policy & Solutions team develops and delivers products and solutions that customers want from regulated utilities, which comply with legislative and regulatory requirements. For example, the team has been educating customers about electric vehicles and developing additional educational information that customers can access in varying engagement channels.

Q. Do the units within the Customer Experience organization engage in cross-functional initiatives?

A. Yes. In addition to each unit's core functions, there is significant cross-department engagement. A customer-focused strategy is the responsibility of all our employees and

their work is expected to align with the goal of enhancing the customer experience. For example, low-income programs and digital innovation are two such areas. Through cross-department initiatives, the group has identified an impactful approach to connecting with low-income eligible program customers. The group identified new means to reach customers in need or at risk through video campaigns, employee ambassadors, and targeted communications. The group utilized third party vendors beginning in 2022 to reach communities via digital channels, such as email. As a result, in 2023, FirstEnergy saw a 29% increase in the number of customers who qualified for low-income programs in Pennsylvania as compared to the same period in 2022. The campaigns were designed to relay the ease of enrollment and make the experience to connect customers with agencies intuitive and targeted.

Similarly, with respect to digital innovation, the Customer Experience team led a cross-department effort that empowered customers and enhanced experiences through items such as mobile-friendly information and visuals, a redesign to outage reporting, and additional education to consumers so that they could harness self-service features and have more information at their fingertips. Over the past several months, agile teams were able to roll out dozens of new digital features for customers across the key customer journeys of Outage, Move In/Move Out, and Payment/Billing.

The digital enhancements produced by the Customer Experience organization have focused on capabilities such as navigation, process improvements, proactive communication, and other key features on the FirstEnergy website. During 2023, the team improved quick link functionality, streamlined processes such as “Move In,” included typeahead searches and address first lookups. In 2024 and beyond, mobile enhancements

will focus on implementing credit checks, allowing for multiple meter move-ins, additional billing timeline awareness so customers are more connected with their specific billing statuses, autosave functionality, and other capabilities that will help multi-meter customers. FirstEnergy is also looking to enhance the total website design through a key project beginning in 2024 that will last approximately two years and align synergies, the flow, and brand across all pages for a more cohesive, fluid, and tailored experience for customers. With all these examples, the goal is to create digital channels for the customer to seamlessly interact with the Company as effortlessly and effectively as possible.

Q. Please explain how the restructured Customer Experience organization will benefit FE PA customers.

A. The restructuring of the Customer Experience organization has helped the Company focus on service satisfaction, brand trust, and product experience. The Customer Experience organization has made strides to modernize the customer facing technologies to provide a more seamless experience. Additionally, a surveying and customer feedback platform was implemented to connect with FE PA's customers and take their feedback through survey results to enhance the customers' experience. FirstEnergy has leveraged additional channels, such as digital platforms, to communicate and educate customers on programs and offerings to make it easier to resolve issues as well as find ways to save on energy usage. To further drive the ability to educate customers on benefits and offerings, such as low-income outreach and electrification programs, FirstEnergy is focusing on new initiatives in Pennsylvania that will increase customer awareness and adoption.

Q. Please explain how FE PA is using customer feedback to improve the Customer Experience provided by its Care Centers.

A. In response to feedback from customers, the Customer Experience is focused on several key areas to improve our overall customer centric experience. We are modernizing our technology such as the interactive voice response system to help improve hold times, transfers, and live agent response. We are also optimizing systems to aid in bill payment, move in and move out and outage reporting.

III. CREDIT CARD FEES

Q. How are credit card fees being handled today?

A. One-time credit card payments are currently assessed a fee by the vendor, which fees are directly passed to the customer making a payment by credit card.

Q. Are there plans to change the collection of fees for credit card payments in the future?

A. Yes. Customers expect to be able to have multiple choices for making payments. This includes increased preference for paying via devices connected to the internet, allowing customers to utilize debit and credit cards to pay their bills through mobile or online applications.

Providing options to customers with reasonable costs is a priority for FE PA. Benchmarking and customer surveys indicate that 45% of customers would pay by credit card with no fee. If these fees were included in regulatory recovery, the customer is no longer using the cost of the transaction to determine their path for payment and will choose based on their convenience preference – providing a higher quality customer experience.

Q. What are the additional benefits for a fee-free electronic payment?

A. Additional benefits include:

- Helping customers avoid disconnect or late payments;
- Eliminating burden of service fee on customers;
- Reducing confusion between third-pay vendor service fees verses utility payment amount tendered; and
- Increasing customer satisfaction by providing multiple no-fee options for payment – including credit, debit, ACH, and app-supported payment such as PayPal, Venmo, ApplePay, and GooglePay; and
- Reducing inconvenience of sending a check via mail.

Recovering service fees across all customers is consistent with other billing and payment utility services provided today, including processing mailed checks and printing/mailing monthly bills where other customers utilize the mobile e-Bill option. All credit, debit, and ACH transactions for residential customers for both one-time and recurring payment will be "fee-free". Instead, these costs will be assessed by the vendor to FE PA, and then will be included for recovery through base distribution rates as part of the Company's cost of service. Steps such as this are geared towards making the payment process as easy as possible for customers to make payments - so as to try to remove barriers to payment and help reduce or control uncollectible levels to the benefit of all of the Company's customers.

Q. What is the annual expense for these credit card service fees and how will the expense be recovered?

A. The estimated annual expense for the credit card fees is $5.2 million for 2025. These costs will be allocated across the residential class only, as these are the customers who will be benefiting from this change. The costs were forecasted at the rate district level based on historical credit card activities by rate district. Monitoring and benchmarking of any proposed fee changes will be completed as they are communicated by the vendor.

IV. LOW-INCOME ASSISTANCE INITIATIVE

Q. Please discuss the new initiative that FE PA is proposing to further assist low-income customers.

A. The Company proposes to create the Energy Assistance Outreach Team, ("EAOT"), whose purpose is to increase awareness of, and participation in, energy assistance programs available to low-income customers throughout FE PA's service territory. The dedicated team would be responsible for creating educational resources, tools, and technology to reduce or eliminate barriers to program participation. The EAOT would engage with local charity-based organizations to gather information on challenges that reduce program participation. The EAOT would use this information to develop strategies to address the challenges and increase participation. Further, the EAOT will create a presence in the community by hosting or participating in local energy assistance fairs. The EAOT would also provide support to social service agencies when they have questions or special situations. The EAOT would complement similar efforts that are underway in our New Jersey and West Virginia territories.

Q. What specific activities will the EAOT assist customers with?

A. On a broad level, the team will educate low-income residential customers on the assistance programs and assist with the application process for assistance programs. More specifically, the team will:

1. Be responsible for education, resources, navigation of tools/technology needed to reduce and/or eliminate customer barriers to program participation;
2. Work with customers, agencies, local charities, churches, and local governments to understand the types of available programs;
3. Help customers by sharing what information is required to participate in the different programs;
4. Participate in energy assistance fairs and organize additional events as necessary; and
5. Be a support system for agencies to assist with special situations or barriers.

Q. Why is FE PA proposing the EAOT?

A. Twenty-four percent of FE PA's residential customers are estimated to be low-income and only one quarter of those low-income customers participate in available low-income programs. The goal is to connect customers in need with resources that are available to them. A centralized, dedicated team to assist customers with information about enrollment in all assistance programs will benefit customers by helping eligible customers receive assistance to pay their electric bills.

Q. What is the annual budget for the EAOT?

A. FE PA's annual budget for this initiative is $762,520.

Q. What are the components of the annual budget and how are they budgeted at the Rate District level?

A. Staffing, program materials and travel expenses are the main budget components. These items are broken down in the chart below.

Staff – 7 dedicated and 1 Shared Resource	$667,520.00
Materials	$70,000.00
Travel	$25,000.00
Total (Annually)	**$762,520.00**

These costs will only be charged to the Residential class and this overall budget will be allocated based upon each Rate Districts' proportion of total residential customers at the FE PA level.

Q. Will FE PA have dedicated team members for its service territory?

A. Yes, there will be seven full-time staff dedicated to the FE PA service territory.

Q. Please describe the Company's plan for outreach to customers lacking English proficiency.

A. The EAOT will utilize all methods currently implemented across the Company's service territory to provide assistance to customers lacking English proficiency. The Company provides application and outreach materials in Spanish. Customers calling Customer Care Centers can ask for a translator to assist with their call through a telephonic interpreting service that can accommodate over 86 different languages.

Q. How does FE PA intend to measure impact?

A. FE PA intends to measure the impact of the EAOT by monitoring the number of customers enrolled in the Company's assistance programs and comparing it to historical numbers.

V. UNCOLLECTIBLE EXPENSE

Q. Are any changes required in this proceeding to update the uncollectible accounts expense?

A. Yes. Most notably, Chapter 14 of the Public Utility Code, which governs utilities' collections procedures for residential customers, is scheduled to sunset in December of 2024. As a result, a number of changes to the collections procedures outlined in Chapter 14 have been proposed by the legislature. Because the test year ending December 31, 2025, will be used to project the Company's uncollectible accounts expense, these proposed changes, if accepted, could have a significant impact on these calculations as more fully described below.

Q. Please explain the calculations of the components which have been updated within the uncollectible accounts expense.

A. The uncollectible accounts expense for each Rate District is as follows, Met-Ed $19.2 million, Penelec $19.7 million, Penn Power $5 million, and West Penn $17.1 million for a total of $61 million, which includes forecasted impacts resulting from increased revenue projections and the potential Chapter 14 collections rule changes.

The first component, revenue impact, is calculated using current rates and the linear increases associated with them resulting in an additional risk of approximately $3.3 million of increased uncollectible account expense. The second component - arrears risk associated with the potential Chapter 14 collections rule changes, if implemented - is also

factored into the overall uncollectible expense. FE PA Exhibit MAJ-1 demonstrates the effects that the potential Chapter 14 revisions would have on uncollectible expenses, which total approximately $15.9 million. Specifically, this exhibit highlights the notable risks to uncollectible account expenses associated with these potential rule changes to include: 1) allowing additional PUC approved installment plans and increasing the length of installment agreements for customers who seek PUC installment agreements; 2) extending the disconnection notice window; 3) expanded medical certificate options, including lengthening medical certificates from 30 days to 60 days and allowing more certifications than are currently allowed in a rolling 12 months; 4) summer moratoriums for low-income customers; and 5) elimination of security deposits. See FE PA Exhibit MAJ-1. To the extent that the General Assembly does not adopt the proposed changes to Chapter 14 of the Public Utility Code which form the basis for these adjustments, the Company will accordingly update its uncollectible expense claim for the FPFTY.

VI. ELECTRIC VEHICLE PILOT

Q. Can you summarize the Company's Proposed Electric Vehicle ("EV") Pilot?

A. Yes, the EV Pilot is intended to educate customers about EVs and encourage them to adopt EVs by providing incentives and expanding access to EV charging in the FE PA territory. In this proceeding, the Company is proposing to implement and recover the costs of the EV Pilot.

Q. Why is the Company proposing the EV Pilot?

A. FE PA recognizes that electrification of vehicles will play a significant role in the future of transportation and is proposing the EV pilot to help educate its customers and improve accessibility to that transition. Beyond benefits to the environment, electric vehicles can

be a significant method for customers to manage their overall energy wallet for the future. Auto manufacturers are already switching production from internal combustion engine vehicles to EVs. The proposed EV pilot will help customers better understand EV technology and how to take advantage of available grants, rebates, and incentives. The charging installation incentives in the EV Pilot will broaden access to EV charging, making EV ownership more feasible for customers. By focusing on education and accessibility, the goal of the EV pilot is to empower customers by equipping them with the resources and support necessary to transition to electric transportation.

Q. What are the main components of FE PA's EV pilot?

A. The EV Pilot contains two programs: (1) an education and awareness program; and (2) an incentive / rebate program.

Q. Could you explain the main components of the education and awareness program?

A. There are several components to the education and awareness program. First, there is an online EV education platform that will allow customers to learn more about EVs, compare various EV models, and see available incentives and rebates that are offered by FE PA and governmental agencies. This service was provided collectively to FE PA's predecessor companies in 2023 for an annual cost of $66,671. The Company is seeking to recover future costs of this service as well as expand it to include resources specific to commercial and municipal fleet electrification.

Second, there is a grant assistance component that will provide financial support to local governmental entities, school boards, transit authorities, and qualifying non-profit organizations for professional grant application services to secure government funding.

Services include grant writing, application submission, post award reporting, and compliance monitoring.

Third, there is a fleet advisory program to aid commercial and municipal fleets with their fleet electrification transition. Services include feasibility studies, business cases, risk mitigation, cost-benefit analyses, road mapping, and procurement planning.

Fourth, there is a dealership toolkit program. This program will fund kiosks located at dealerships within the service territory that will provide remote concierge services to help educate customers prior to, during, and after their EV purchases. This will provide customers with an additional resource for answering questions about their potential or recent EV purchases including general purchasing information, vehicle maintenance, charging information, home charging installation, utility and governmental rebates and incentives, and utility rate programs. The total costs of the online EV education platform, grant assistance, fleet advisory service, and dealership toolkit program are estimated to be $3,480,000 annually.

Q. Could you explain the main components of the incentive/rebate program?

A. There are three incentive/rebate components – a residential component, a non-residential component, and a DC fast charger component.

The residential component will offer a rebate for the installation of level 2 electric vehicle supply equipment by a licensed electrician. The rebates will be $500 per residence. These rebates will help ensure that licensed professionals safely install the charging equipment.

The non-residential component will be available to government agencies, non-profit entities, workplaces, multi-unit dwellings, and commercial publicly available

locations. This program includes two sets of rebates – a customer-side make-ready rebate and a utility-side make-ready rebate. The customer-side make-ready rebate will reimburse qualifying customers for costs associated with the electric vehicle supply equipment as well as any electrical work that needs to be done on the customer side of the meter. The rebate amounts are capped at the lesser of $2,000 per charging port or 75% of the qualifying cost. The cap for customers in environmental justice areas, as defined by the PA Department of Environmental Protection, is the lesser of $3,000 per charging port or 75% of the qualifying costs. The utility-side make-ready rebates will reimburse qualifying customers for utility construction costs associated with EV charging installations, which are currently billed to those customers as contributions in aid of construction. The rebate amounts are capped at $6,000 per charging port with an aggregate cap of $12,000 per site.

The DC fast charger rebate component will be available to government agencies and non-profit entities installing DC fast chargers with a minimum charging capability of 50 kilowatt per port. Customers utilizing this rebate are prohibited from also utilizing the aforementioned rebates for the same installations. Qualifying costs for the rebate include the electric vehicle supply equipment, customer-side make ready expenses, and utility construction costs billed to the customer as contributions in aid of construction. The rebate amounts are capped at $25,000 per port with an aggregate cap of $50,000 per site.

The total program allowance will be $2,000,000 annually for the residential rebate component and $2,000,000 annually for the combined non-residential and DC fast charging rebate components.

Q. How will the Company recover the costs associated with the EV Pilot?

A. Expenses will be tracked by revenue classes and will be charged directly to the revenue classes benefiting from the programs and recovered through base rates. Allocation across rate districts will be based upon each rate district's proportion of total customers by class at the FE PA level.

Q. Why should FE PA customers fund the EV Pilot?

A. Many of the program elements in the EV Pilot are specifically designed to benefit the public by helping to expand public charging infrastructure or assist public serving entities such as local governments and regional transit authorities. This provides benefit to all customers directly through improved public infrastructure and newer, cleaner public transportation as well as indirectly through reduced tailpipe emissions. Additionally, program elements such as the online education platform and dealership toolkits can even directly benefit customers who opt not to purchase EVs by helping them better understand the technology and providing resources to help them understand whether EVs are the right choice for them.

VII. SETTLEMENT COMMITMENTS

Q. In the Joint Petition for Settlement of Rate Investigation ("Settlement Agreement") that the Pennsylvania Public Utility Commission ("Commission") approved in the 2016 base rate proceeding at Docket Nos. R-2016-2537349, *et al.* FE PA's predecessor companies made various commitments for customer service and the universal services programs. Have the Rate Districts remained in compliance with those provisions?

A. Yes, the Rate Districts are in compliance.

Q. Specifically, the Settlement Agreement required the Company to achieve and maintain an annual call answer rate of at least 80% of calls answered within thirty seconds beginning with the twelve-month period ended 12/31/2016. Did the Rate Districts comply with this provision in the settlement agreement?

A. Yes, the Rate Districts have remained in compliance with this performance metric.

Q. The Rate Districts also agreed to establish a Universal Service Advisory Committee ("USAC") that will hold meetings at least twice a year. Are the Rate Districts in compliance with this provision in the Settlement Agreement?

A. Yes. Beginning in 2017, the Rate Districts established a USAC comprising representatives from the Rate Districts, the Pennsylvania Office of Consumer Advocate, the Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania, the Commission's Bureau of Investigation and Enforcement, the Commission's Bureau of Consumer Service and the organizations that administer the Companies' Universal Service and Energy Conservation Plan ("USECP"), which hold meetings at least twice a year[2] with respect to the Companies' USECP programs. The USAC's purpose is to explore opportunities for enhancements to the Companies' USECP programs, as well as opportunities for outreach and education, language access, notification to low-income customers regarding topics of interest, including security deposit waivers and bill clarity.

[2] In 2020, due to the Covid pandemic, the last meeting was held in May 2020. The meetings resumed in 2022.

Q. Was this settlement term continued following the Pennsylvania Consolidation proceeding ("PA Consolidation")?[3]

A. Yes, as part of the PA Consolidation settlement agreement, the Company agreed to increase frequency and hold USAC meetings on a quarterly basis. Additionally, the Company agreed to expand the USAC meetings to include local organizations and agencies. The Company also committed to maintain specific levels of customer service performance as part of the PA Consolidation settlement agreement.

Q. The Settlement Agreement also required the Company to file to increase the maximum credits allowable under its existing customer assistance program by an amount proportionate to 50% of the average increase to residential rates. Did the Rate Districts comply with this provision in the Settlement Agreement?

A. Yes. An amended USECP for years 2015-2018 increasing the maximum bill-subsidy levels was filed on March 28, 2017, at Docket No. M-2014-2407729, *et al*. A further amended plan was filed on June 20, 2017, at Docket No. M-2014-2407729, *et al* and approved by the Commission on June 22, 2017.

VII. CONCLUSION

Q. Does this conclude your testimony?

A. Yes.

[3] *Joint Application of Metropolitan Edison Company, Pennsylvania Electric Company, Pennsylvania Power Company, West Penn Power Company, Keystone Appalachian Transmission Company, Mid-Atlantic Interstate Transmission, LLC, and FirstEnergy Pennsylvania Electric Company*, Docket Nos. A-2023-3038771, et al. (Order entered December 7, 2023).

Resume: Education and Experience of Mark A. Jones

Education:

1994 - Bachelor of Arts in Technology from Kent State University

Experience:

1999 – 2000	Sr. Customer Account Representative, Illuminating Company Service Company
2000 – 2003	National Accounts Representative, FirstEnergy Solutions
2003 - 2006	Consultant, Supply Chain, FirstEnergy Service Company
2006 – 2011	Area Manager, Illuminating Company Service Company
2011-2012	Director, National Accounts, Customer Support & Consumer Products, FirstEnergy Service Company
2012 - 2017	Vice President, External Affairs, Jersey Central Power & Light Utility Service Company
2017-2018	Vice President, Utility Operations, Jersey Central Power & Light Utility Service Company
2018 - 2019	Regional President, Toledo Edison Service Company
2019 -2021	Regional President, Illuminating Company Service Company
9/2021 to Present	Vice President, Customer Engagement, FirstEnergy Service Company

their work is expected to align with the goal of enhancing the customer experience. For example, low-income programs and digital innovation are two such areas. Through cross-department initiatives, the group has identified an impactful approach to connecting with low-income eligible program customers. The group identified new means to reach customers in need or at risk through video campaigns, employee ambassadors, and targeted communications. DIRECT TESTIMONY
OF
DYLAN W. D'ASCENDIS

I. INTRODUCTION AND BACKGROUND

Q. Please state your name and business address.

A. My name is Dylan W. D'Ascendis. My business address is 3000 Atrium Way, Suite 200, Mount Laurel, NJ 08054.

Q. By whom are you employed and in what capacity?

A. I am a Partner at ScottMadden, Inc.

Q. Please summarize your professional experience and educational background.

A. I have offered expert testimony on behalf of investor-owned utilities before over 35 state regulatory commissions in the United States, the Federal Energy Regulatory Commission, the Alberta Utility Commission, the Canadian Energy Regulator, an American Arbitration Association panel, and the Superior Court of Rhode Island on issues including, but not limited to, common equity cost rate, rate of return, valuation, capital structure, class cost of service, and rate design.

On behalf of the American Gas Association ("AGA"), I calculate the AGA Gas Index, which serves as the benchmark against which the performance of the American Gas Index Fund ("AGIF") is measured on a monthly basis. The AGA Gas Index and AGIF are a market capitalization weighted index and mutual fund, respectively, comprised of the common stocks of the publicly traded corporate members of the AGA.

I am a member of the Society of Utility and Regulatory Financial Analysts ("SURFA"). In 2011, I was awarded the professional designation "Certified Rate of Return

Analyst" by SURFA, which is based on education, experience, and the successful completion of a comprehensive written examination.

I am also a member of the National Association of Certified Valuation Analysts ("NACVA") and was awarded the professional designation "Certified Valuation Analyst" by NACVA in 2015.

I am a graduate of the University of Pennsylvania, where I received a Bachelor of Arts degree in Economic History. I have also received a Master of Business Administration with high honors and concentrations in Finance and International Business from Rutgers University.

The details of my educational background and expert witness appearances are shown in Appendix A.

Q. Please describe the purpose of your testimony.

A. The purpose of my testimony is to present evidence on behalf of FirstEnergy Pennsylvania Electric Company ("FE PA" or the "Company") and recommend an allowed rate of return on common equity ("ROE") for its Pennsylvania jurisdictional rate base.

Q. Have you prepared exhibits in support of your recommendation?

A. Yes. I have prepared FE PA Exhibits DWD-1 through DWD-9, which were prepared by me or under my direction.

Q. What is your recommended ROE for FE PA?

A. I recommend that the Pennsylvania Public Utility Commission (the "Commission") authorize FE PA the opportunity to earn an ROE of 11.30% on its jurisdictional rate base. The ratemaking capital structure and cost of long-term debt is sponsored by Company

Witness Wang. The overall rate of return is summarized on page 1 of FE PA Exhibit DWD-1 and in Table 1 below:

Table 1: Summary of Recommended Weighted Average Cost of Capital

Type of Capital	Ratios	Cost Rate	Weighted Cost Rate
Long-Term Debt	46.94%	4.56%	2.14%
Common Equity	53.81%	11.30%	6.08%
Total	100.00%		8.19%

II. SUMMARY

Q. Please summarize your recommended common equity cost rate.

A. My recommended common equity cost rate of 11.30% is summarized on page 2 of FE PA Exhibit DWD-1. I have assessed the market-based common equity cost rates of companies of relatively similar, but not necessarily identical, risk to FE PA. Using companies of relatively comparable risk as proxies is consistent with the principles of fair rate of return established in the *Hope*[1] and *Bluefield*[2] decisions. No proxy group can be identical in risk to any single company. Consequently, there must be an evaluation of relative risk between the company and the proxy group to determine if it is appropriate to adjust the proxy group's indicated rate of return.

My recommendation results from applying several cost of common equity models, specifically the Discounted Cash Flow ("DCF") model, the Risk Premium Model ("RPM"), and the Capital Asset Pricing Model ("CAPM"), to the market data of a proxy group of 13 electric utilities ("Utility Proxy Group") whose selection criteria will be discussed below. In addition, I applied the DCF model, RPM, and CAPM to a proxy group of 45 domestic, non-price regulated companies comparable in total risk to the Utility Proxy

[1] *Federal Power Comm'n v. Hope Natural Gas Co.*, 320 U.S. 591 (1944) ("Hope").
[2] *Bluefield Water Works Improvement Co. v. Public Serv. Comm'n*, 262 U.S. 679 (1922) ("Bluefield").

Group ("Non-Price Regulated Proxy Group").[3] The results derived from each are as follows:

Table 2: Summary of Common Equity Cost Rates

Discounted Cash Flow Model	9.89%
Risk Premium Model	11.47%
Capital Asset Pricing Model	12.48%
Cost of Equity Models Applied to Comparable Risk, Non-Price Regulated Companies	12.95%
Indicated Range of Common Equity Cost Rates Before Adjustments	9.89% - 12.95%
Credit Risk Adjustment	-0.08%
Flotation Cost Adjustment	0.21%
Indicated Cost of Common Equity Cost Rates After Adjustment	10.01% - 13.07%
Recommended Cost of Common Equity	11.30%

The indicated common equity cost rates across these models range from 9.89% to 12.95% before any Company-specific adjustments. My Company-specific indicated range of common equity cost rates, adjusted for credit risk and flotation costs, which will be discussed in detail below, is between 10.01% and 13.07%. From this range, I recommend that the Commission authorize an ROE of 11.30% for the Company.

Q. How is the remainder of your direct testimony organized?

A. The remainder of my direct testimony is organized as follows:

- *Section III* – Provides a summary of financial theory and regulatory principles pertinent to the development of the cost of capital;

[3] The development of the Non-Price Regulated Proxy Group is explained in more detail in Section V, part D.

- *Section IV* – Explains my selection of the Utility Proxy Group used to develop my analytical results;
- *Section V* – Discusses the reasonableness of the Company's requested capital structure;
- *Section VI* – Describes the analyses on which my recommendation is based;
- *Section VII* – Summarizes my common equity cost rate before adjustments to reflect Company-specific factors;
- *Section VIII* – Explains my adjustments to my common equity cost rate to reflect the Company-specific factors; and
- *Section IX*– Presents my conclusions regarding ROE.

III. GENERAL PRINCIPLES

Q. What general principles have you considered in arriving at your recommended common equity cost rate?

A. In unregulated industries, marketplace competition is the principal determinant of the price of products or services. For regulated public utilities, regulation must act as a substitute for marketplace competition. Assuring that the utility can fulfill its obligations to the public, while providing safe and reliable service, requires a level of earnings sufficient to maintain the integrity of presently invested capital. Sufficient earnings also permit the attraction of needed new capital at a reasonable cost, for which the utility must compete with other firms of comparable risk, consistent with the fair rate of return standards established by the U.S. Supreme Court in the previously cited *Hope* and *Bluefield* cases.

The U.S. Supreme Court affirmed the fair rate of return standards in *Hope*, when it stated:

> The rate-making process under the Act, *i.e.,* the fixing of 'just and reasonable' rates, involves a balancing of the investor and the consumer interests. Thus we stated in the Natural Gas Pipeline Co. case that 'regulation does not insure that the business shall produce net revenues.' 315 U.S. at page 590, 62 S.Ct. at page 745. But such considerations aside, the investor interest has a legitimate concern with the financial integrity of the company whose rates are being regulated. From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. Cf. Chicago & Grand Trunk R. Co. v. Wellman, 143 U.S. 339, 345, 346 12 S.Ct. 400,402. By that standard the return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital.[4]

In summary, the U.S. Supreme Court has found that a return should be adequate to attract capital at reasonable terms and enable the utility to provide service while maintaining its financial integrity. As discussed above, and in keeping with established regulatory standards, that return should be commensurate with the returns expected elsewhere for investments of equivalent risk. The Commission's decision in this proceeding, therefore, should provide the Company with the opportunity to earn a return that is: (1) adequate to attract capital at reasonable cost and terms; (2) sufficient to ensure its financial integrity; and (3) commensurate with returns on investments in enterprises having corresponding risks.

Lastly, the required return for a regulated public utility is established on a stand-alone basis, i.e*.,* for the utility operating company at issue in a rate case. Parent entities, like other investors, have capital constraints and must look at the attractiveness of the expected risk-adjusted return of each investment alternative in their capital budgeting process. That is, utility holding companies that own many utility operating companies have

[4] *Hope*, 320 U.S. 591, 603 (1944).

choices as to where they will invest their capital within the holding company family. Therefore, the opportunity cost concept applies regardless of whether the funding source is public or corporate.

When funding is provided by a parent entity, the return still must be sufficient to provide an incentive to allocate equity capital to the subsidiary or business unit rather than other internal or external investment opportunities. That is, the regulated subsidiary must compete for capital with all the parent company's affiliates, and with other similar risk companies, which may include non-utilities. In that regard, investors value corporate entities on a sum-of-the-parts basis and expect each division within the parent company to provide an appropriate risk-adjusted return.

It therefore is important that the authorized ROE for the Company reflects the risks and prospects of its operations and supports its financial integrity from a stand-alone perspective. Consequently, the ROE authorized in this proceeding should be sufficient to support the operational (i.e., business risk) and financing (i.e., financial risk) of the Company's utility operations on a stand-alone basis.

Marketplace data must be relied on in assessing a common equity cost rate appropriate for ratemaking purposes. Just as the use of the market data for the proxy group adds reliability to the informed expert's judgment used in arriving at a recommended common equity cost rate, the use of multiple, generally accepted common equity cost rate models also adds reliability and accuracy when arriving at a recommended common equity cost rate.

Q. Within that broad framework, how is the cost of capital estimated in regulatory proceedings?

A. Regulated utilities primarily use common stock and long-term debt to finance their permanent property, plant, and equipment (i.e., rate base). The fair rate of return for a regulated utility is based on its weighted average cost of capital, in which the costs of the individual sources of capital are weighted by their respective book values.

The cost of capital is the return investors require to make an investment in a firm. Investors will provide funds to a firm only if the return that they *expect* is equal to, or greater than, the return that they *require* to accept the risk of providing funds to the firm.

The cost of capital (that is, the combination of the costs of debt and equity) is based on the economic principle of "opportunity costs." The principle of opportunity costs recognizes that investing in any asset (whether debt or equity securities) represents a forgone opportunity to invest in alternative assets. For any investment to be sensible, its expected return must be at least equal to the return expected on alternative investment opportunities with comparable risks. Because investments with like risks should offer similar returns, the opportunity cost of an investment should equal the return available on an investment of comparable risk.

The cost of debt is contractually defined and can be directly observed as the interest rate or yield on debt securities. However, the cost of equity is not directly observable and must be estimated based on market data and various financial models. Because the cost of equity is premised on opportunity costs, the models used to determine it are typically applied to a group of "comparable" or "proxy" companies.

In the end, the estimated cost of capital should reflect the return that investors require considering the subject company's business and financial risks, and the returns available on comparable investments.

A. Business Risk

Q. Please define business risk and explain why it is important for determining a fair rate of return.

A. The investor-required return on common equity reflects investors' assessment of the total investment risk of the subject firm. Total investment risk is often discussed in the context of business and financial risk.

Business risk reflects the uncertainty associated with owning a company's common stock without the company's use of debt and/or preferred stock financing. One way of considering the distinction between business and financial risk is to view the former as the uncertainty of the expected earned return on common equity, assuming the firm is financed with no debt.

Examples of business risks generally faced by utilities include, but are not limited to, the regulatory environment, mandatory environmental compliance requirements, customer mix and concentration of customers, service territory economic growth, market demand, operations, capital intensity, size, the degree of operating leverage, emerging technologies including distributed energy resources, the vagaries of weather, and the like, all of which have a direct bearing on earnings.

Although analysts, including rating agencies, may categorize business risks individually, as a practical matter, such risks are interrelated and not wholly distinct from one another. When determining an appropriate return on common equity, the relevant issue

is where investors see the subject company in relation to other similarly situated utility companies (i.e., the Utility Proxy Group). To the extent investors view a company as being exposed to higher risk, the required return will increase, and vice versa.

For regulated utilities, business risks are both long-term and near-term in nature. Whereas near-term business risks are reflected in year-to-year variability in earnings and cash flow brought about by economic or regulatory factors, long-term business risks reflect the prospect of an impaired ability of investors to obtain both a fair rate of return on, and return of, their capital. Moreover, because utilities accept the obligation to provide safe, adequate and reliable service (in exchange for a reasonable opportunity to earn a fair return on their investment), they generally do not have the option to delay, defer, or reject capital investments. Because those investments are capital-intensive, utilities generally do not have the option to avoid raising external funds. The obligation to serve and the corresponding need to access capital is even more acute during period of capital market distress.

Because utilities invest in long-lived assets, long-term business risks are of paramount concern to equity investors. That is, the risk of not recovering the return on their investment extends far into the future. The timing and nature of events that may lead to losses, however, also are uncertain and, consequently, those risks and their implications for the required return on equity tend to be difficult to quantify. Regulatory commissions (like investors who commit their capital) must review a variety of quantitative and qualitative data and apply their reasoned judgment to determine how long-term risks weigh in their assessment of the market-required return on common equity.

B. Financial Risk

Q. Please define financial risk and explain why it is important in determining a fair rate of return.

A. Financial risk is the additional risk created by the introduction of debt and preferred stock into the capital structure. The higher the proportion of debt and preferred stock in the capital structure, the higher the financial risk to common equity owners (i.e., failure to receive dividends due to default or other covenants). Therefore, consistent with the basic financial principle of risk and return, common equity investors require higher returns as compensation for bearing higher financial risk.

Q. Are bond and credit ratings a proxy for a firm's combined business and financial risks to equity owners (i.e., investment risk)?

A. Yes, similar bond ratings/issuer credit ratings reflect, and are representative of, similar combined business and financial risks (i.e., total risk) faced by bond investors.[5] Although specific business or financial risks may differ between companies, the same bond/credit rating indicates that the combined risks are roughly similar from a debtholder perspective. The caveat is that these debtholder risk measures do not translate directly to risks for common equity.

IV. FE PA AND THE UTILITY PROXY GROUP

Q. Why is it necessary to develop a proxy group when estimating the ROE for FE PA?

A. Because FE PA is not publicly traded and does not have publicly traded equity securities, it is necessary to develop groups of publicly traded, comparable companies to serve as

[3] Risk distinctions within S&P's bond rating categories are recognized by a plus or minus, e.g., within the A category, an S&P rating can by at A+, A, or A-. Similarly, risk distinction for Moody's ratings are distinguished by numerical rating gradations, e.g., within the A category, a Moody's rating can be A1, A2 and A3.

"proxies" for the Company. In addition to the analytical necessity of doing so, the use of proxy companies is consistent with the *Hope* and *Bluefield* comparable risk standards, as discussed above. I have selected two proxy groups that, in my view, are fundamentally risk-comparable to the Company: a Utility Proxy Group and a Non-Price Regulated Proxy Group, which is comparable in total risk to the Utility Proxy Group.

Even when proxy groups are carefully selected, it is common for analytical results to vary from company to company. Despite the care taken to ensure comparability, because no two companies are identical, market expectations regarding future risks and prospects will vary within the proxy group. It therefore is common for analytical results to reflect a seemingly wide range, even for a group of similarly situated companies. At issue is how to estimate the ROE from within that range. That determination will be best informed by employing a variety of sound analyses and necessarily must consider the sort of quantitative and qualitative information discussed throughout my direct testimony. Additionally, a relative risk analysis between the Company and the Utility Proxy Group must be made to determine whether or not explicit Company-specific adjustments need to be made to the Utility Proxy Group indicated results.

My analyses are based on the Utility Proxy Group, containing U.S. electric utilities. As discussed earlier, utilities must compete for capital with other companies with commensurate risk (including non-utilities) and, to do so, must be provided the opportunity to earn a fair and reasonable return. Consequently, it is appropriate to consider the Utility Proxy Group's market data in determining the Company's ROE.

Q. Are you familiar with FE PA's operations?

A. Yes. FE PA owns and operates an electric distribution system across Pennsylvania.[6] The operations subject to this proceeding are the electric distribution operations in Pennsylvania, which serve approximately 2 million customers over 32,400 square miles. FE PA is not publicly-traded but rather is an operating subsidiary of FirstEnergy Corp. (the "Parent" or "FirstEnergy"), which operates in six states,[7] serves approximately six million customers, and is publicly traded under symbol FE.

Q. Please explain how you chose the companies in the utility proxy group.

A. Because the cost of equity is a comparative exercise, my objective in developing a proxy group was to select companies that are comparable to the Company. Because the Company is a 100% rate-regulated electric distribution utility, I applied the following criteria to select my Utility Proxy Group:

(i) They were included in the Eastern, Central, or Western Electric Utility Group of *Value Line Investment Survey* (Standard Edition)(*"Value Line"*);

(ii) They have 70% or greater of fiscal year 2022 total operating income derived from, and 70% or greater of fiscal year 2022 total assets attributable to, regulated electric operations;

(iii) At the time of preparation of this testimony, they had not publicly announced that they were involved in any major merger or acquisition activity (i.e., one publicly-traded utility merging with or acquiring another) or any other major development;

(iv) They have not cut or omitted their common dividends during the five years ending 2022 or through the time of preparation of this testimony;

[6] FE PA was formed as a consolidated entity consisting of the operations of Metropolitan Edison Company, Pennsylvania Electric Company, Pennsylvania Power Company, and West Penn Power Company.

[7] FirstEnergy Corp., 2022 SEC Form 10-K, at 1. In addition to Pennsylvania, FirstEnergy also serves customers in Maryland, Ohio, West Virginia, New Jersey, and New York.

(v) They have *Value Line* and Bloomberg Professional Services ("Bloomberg") adjusted Beta coefficients ("beta");

(vi) They have positive *Value Line* five-year dividends per share ("DPS") growth rate projections; and

(vii) They have *Value Line*, Zacks, or Yahoo! Finance consensus five-year earnings per share ("EPS") growth rate projections.

The following 14 companies met these criteria:

Table 3: Utility Proxy Group Companies

Company Name	Ticker Symbol
Alliant Energy Corporation	LNT
Ameren Corporation	AEE
American Electric Power Corporation	AEP
Duke Energy Corporation	DUK
Edison International	EIX
Entergy Corporation	ETR
Evergy, Inc.	EVRG
IDACORP, Inc.	IDA
NorthWestern Corporation	NWE
OGE Energy Corporation	OGE
Pinnacle West Capital Corporation	PNW
Portland General Electric Company	POR
Southern Company	SO
Xcel Energy Inc.	XEL

V. CAPITAL STRUCTURE

Q. What is FE PA's requested capital structure?

A. The Company's requested capital structure consists of 46.19% long-term debt and 53.81% common equity, as shown on page 1 of FE PA Exhibit DWD-1. FE PA's requested capital structure is its expected capital structure at December 31, 2025, as testified by Company Witness Wang.

Q. How does FE PA's common equity ratio of 53.81% compare with the common equity ratios maintained by the utility proxy group?

A. FE PA's common equity ratio of 53.81% is reasonable and consistent with the range of common equity ratios maintained by the Utility Proxy Group. As shown on pages 1 and 2 of FE PA Exhibit DWD-2, common equity ratios of the Utility Proxy Group companies range from 30.19% to 56.13% for fiscal year 2022.

In addition to comparing FE PA's actual common equity ratio with common equity ratios currently and expected to be maintained by the Utility Proxy Group, I also compared the Company's actual common equity ratio with the equity ratios maintained by the operating subsidiaries of the Utility Proxy Group companies. As shown on page 3 of FE PA Exhibit DWD-2, common equity ratios of the operating utility subsidiaries of the Utility Proxy Group range from 38.87% to 59.36% for fiscal year 2022.

In my opinion, FE PA's expected capital structure consisting of 46.94% long-term debt and 53.81% common equity is appropriate for ratemaking purposes. It is appropriate because it is generally consistent with the capital structure ratios (based on total permanent capital) maintained by the Utility Proxy Group on whose market data I base my recommended common equity cost rate.

VI. <u>COMMON EQUITY COST RATE MODELS</u>

Q. Is it important that cost of common equity models be market-based?

A. Yes. As discussed previously, regulated public utilities, like the Company, must compete for equity in capital markets along with all other companies with commensurate risk, including non-utilities. The cost of common equity is thus determined based on equity market expectations for the returns of those companies. If an individual investor is

choosing to invest their capital among companies with comparable risk, they will choose the company providing a higher return over a company providing a lower return.

Q. Are the cost of common equity models you use market-based models?

A. Yes. The DCF model is market-based in that market prices are used in developing the dividend yield component of the model. Regarding the RPM, the total market risk premium approach uses bond ratings and expected bond yields that reflect the market's assessment of bond/credit risk, and the Predictive Risk Premium Model ("PRPM") uses monthly market returns in addition to expectations of the risk-free rate. In addition, betas ("β"), which reflect the market/systematic risk component of equity risk premium, are derived from regression analyses of market prices. The CAPM is market based for many of the same reasons that the RPM is market based (i.e., the use of expected bond yields and betas). Selection criteria for the Non-Price Regulated Proxy Group are based on regression analyses of market prices and reflect the market's assessment of total risk.

Q. What analytical approaches did you use to determine the company's ROE?

A. As discussed earlier, I have relied on the DCF model, the RPM, and the CAPM, which I apply to the Utility Proxy Group described above. I also applied these same models to a Non-Price Regulated Proxy Group described later in this section.

I rely on multiple models because reasonable investors use a variety of tools and do not rely exclusively on a single source of information or single model. Moreover, the specific models on which I rely focus on different aspects of return requirements and provide different insights into investors' views of risk and return. The DCF model, for example, estimates the investor-required return assuming a constant expected dividend yield and growth rate in perpetuity, while Risk Premium-based methods (i.e., the RPM and

CAPM approaches) provide the ability to reflect investors' views of risk, future market returns, and the relationship between interest rates and the ROE. Just as the use of market data for the Utility Proxy Group adds the reliability necessary to inform expert judgment in arriving at a recommended common equity cost rate, the use of multiple generally accepted common equity cost rate models also adds reliability and accuracy when arriving at a recommended common equity cost rate.

A. Discounted Cash Flow Model

Q. Please describe the DCF model, generally.

A. The theory underlying the DCF model is that the present value of an expected future stream of net cash flows during the investment holding period can be determined by discounting those cash flows at the cost of capital, or the investors' capitalization rate. DCF theory indicates that an investor buys a stock for an expected total return rate, which is derived from the cash flows received from dividends and market price appreciation. Mathematically, the dividend yield on market price plus a growth rate equals the capitalization rate; i.e., the total common equity return rate expected by investors, as shown in Equation [1] below:

$$K_e = (D_0 (1+g))/P + g$$

where:

K_e = the required Return on Equity;
D_0 = the annualized Dividend Per Share;
P = the current stock price; and
g = the growth rate.

Q. Which version of the DCF model do you use?

A. I used the single-stage constant growth DCF model.

Q. Please describe the dividend yield you used in applying the constant growth DCF model.

A. The unadjusted dividend yields are based on the proxy companies' dividends as of December 29, 2023, divided by the average closing market price for the 60 trading days ended December 29, 2023.[8]

Q. Please explain your adjustment to the dividend yield.

A. Because dividends are paid periodically (e.g., quarterly), as opposed to continuously (daily), an adjustment must be made to the dividend yield. This is often referred to as the discrete, or the Gordon Periodic, version of the DCF model.

DCF theory calls for using the full growth rate, or D_1, in calculating the model's dividend yield component. Since the companies in the Utility Proxy Group increase their quarterly dividends at various times during the year, a reasonable assumption is to reflect one-half the annual dividend growth rate in the dividend yield component, or $D_{1/2}$. Because the dividend should be representative of the next 12-month period, this adjustment is a conservative approach that does not overstate the dividend yield. Therefore, the actual average dividend yields in Column 1, page 1 of FE PA Exhibit DWD-3 have been adjusted upward to reflect one-half the average projected growth rate shown in Column 5.

Q. Please explain the basis for the growth rates you apply to the utility proxy group in your constant growth DCF model.

A. Investors with more limited resources than institutional investors are likely to rely on widely available financial information services, such as *Value Line*, Zacks, and Yahoo!

[8] *See*, Column 1, page 1 of FE PA Exhibit DWD-3.

Finance. Investors realize that analysts have significant insight into the dynamics of the industries and individual companies they analyze, as well as companies' abilities to effectively manage the effects of changing laws and regulations, and ever-changing economic and market conditions. For these reasons, I used analysts' five-year forecasts of EPS growth in my DCF analysis.

Over the long run, there can be no growth in DPS without growth in EPS. Security analysts' earnings expectations have a more significant influence on market prices than dividend expectations. Thus, using earnings growth rates in a DCF analysis provides a better match between investors' market price appreciation expectations and the growth rate component of the DCF.

Q. Please summarize the constant growth DCF model results.

A. As shown on page 1 of Exhibit DWD-3, the application of the Constant Growth DCF model to the Utility Proxy Group result in mean and median indicated ROEs of 9.89%.

B. The Risk Premium Model

Q. Please describe the theoretical basis of the RPM.

A. The RPM is based on the fundamental financial principle of risk and return; namely, that investors require greater returns for bearing greater risk. The RPM recognizes that common equity capital has greater investment risk than debt capital, as common equity shareholders are behind debt holders in any claim on a company's assets and earnings. As a result, investors require higher returns from common stocks than from bonds to compensate them for bearing the additional risk.

While it is possible to directly observe bond returns and yields, investors' required common equity returns cannot be directly determined or observed. According to RPM

theory, one can estimate a common equity risk premium over bonds (either historically or prospectively) and use that premium to derive a cost rate of common equity. The cost of common equity equals the expected cost rate for long-term debt capital, plus a risk premium over that cost rate, to compensate common shareholders for the added risk of being unsecured and last-in-line for any claim on the corporation's assets and earnings upon liquidation.

Q. Please explain the total market approach RPM.

A. The total market approach RPM adds a prospective public utility bond yield to an average of: (1) an equity risk premium that is derived from a beta-adjusted total market equity risk premium, (2) an equity risk premium based on the S&P Utilities Index, and (3) an equity risk premium based on authorized ROEs for electric utilities.

Q. Please explain how you determined the expected bond yield applicable to the utility proxy group.

A. The first step in the total market approach RPM analysis is to determine the expected bond yield. Because both ratemaking and the cost of capital, including the common equity cost rate, are prospective in nature, a prospective yield on similarly-rated long-term debt is essential. Because I am unaware of any publication that provides forecasted public utility bond yields, I relied on a consensus forecast of about 50 economists of the expected yield on Aaa-rated corporate bonds for the six calendar quarters ending with the second calendar quarter of 2025, and *Blue Chip's* long-term projections for 2025 to 2029, and 2030 to 2034. As shown on line 1, page 1 of Exhibit DWD-4, the average expected yield on Moody's Aaa-rated corporate bonds is 4.90%.

Because that 4.90% estimate represents a corporate bond yield and not a utility specific bond yield, I adjusted the expected Aaa-rated corporate bond yield to an equivalent A2-rated public utility bond yield. That resulted in an upward adjustment of 0.73%, which represents a recent spread between Aaa-rated corporate bonds and A2-rated public utility bonds.[9] Adding that recent 0.73% spread to the expected Aaa-rated corporate bond yield of 4.90% results in an expected A2-rated public utility bond yield of 5.63%.

I then reviewed the average credit rating for the Utility Proxy Group from Moody's to determine if an adjustment to the estimated A2-rated public utility bond was necessary. Since the Utility Proxy Group's average Moody's long-term issuer rating is Baa1, another adjustment to the expected A2-rated public utility bond is needed to reflect the difference in bond ratings. An upward adjustment of 0.17%, which represents two-thirds of a recent spread between A2-rated and Baa2-rated public utility bond yields, is necessary to make the A2-rated prospective bond yield applicable to an Baa1-rated public utility bond.[10] Adding the 0.17% to the 5.63% prospective A2-rated public utility bond yield results in a 5.80% expected bond yield applicable to the Utility Proxy Group.

[9] As shown on line 2 and explained in note 2, page 1 of FE PA Exhibit DWD-4.
[10] As shown on line 4 and explained in note 3, page 1 of FE PA Exhibit DWD-4.

Table 4: Summary of the Calculation of the Utility Proxy Group Projected Bond Yield[11]

Prospective Yield on Moody's Aaa-Rated Corporate Bonds (*Blue Chip)*	4.90%
Adjustment to Reflect Yield Spread Between Moody's Aaa-Rated Corporate Bonds and Moody's A2-Rated Utility Bonds	0.73%
Adjustment to Reflect the Utility Proxy Group's Average Moody's Bond Rating of Baa1	0.17%
Prospective Bond Yield Applicable to the Utility Proxy Group	5.80%

To develop the total market approach RPM estimate of the appropriate return on equity, this prospective bond yield is then added to the average of the three different equity risk premiums, which I now discuss, in turn.

a. Beta-Derived Equity Risk Premium

Q. Please explain how the beta-derived equity risk premium is determined.

A. The components of the beta-derived risk premium model are: (1) an expected market equity risk premium over corporate bonds, and (2) the beta. The derivation of the beta-derived equity risk premium that I applied to the Utility Proxy Group is shown on lines 1 through 9, page 6 of Exhibit DWD-4. The total beta-derived equity risk premium I applied is based on an average of three historical market data-based equity risk premiums, two *Value Line*-based equity risk premiums and a Bloomberg-based equity risk premium. Each of these is described below.

[11] As shown on page 1 of FE PA Exhibit DWD-4.

Q. How did you derive a market equity risk premium based on long-term historical data?

A. To derive a historical market equity risk premium, I used the most recent holding period returns for the large company common stocks from the Stocks, Bonds, Bills, and Inflation ("SBBI") Yearbook 2023 ("SBBI - 2023")[12] less the average historical yield on Moody's Aaa/Aa2-rated corporate bonds for the period 1928 to 2022. Using holding period returns over a very long time is appropriate because it is consistent with the long-term investment horizon presumed by investing in a going concern, i.e., a company expected to operate in perpetuity.

SBBI's long-term arithmetic mean monthly total return rate on large company common stocks was 11.78% and the long-term arithmetic mean monthly yield on Moody's Aaa/Aa2-rated corporate bonds was 5.96%.[13] As shown on line 1, page 6 of Exhibit DWD-4, subtracting the mean monthly bond yield from the total return on large company stocks results in a long-term historical equity risk premium of 5.82%.

I used the arithmetic mean monthly total return rates for the large company stocks and yields (income returns) for the Moody's Aaa/Aa2-rated corporate bonds, because they are appropriate for the purpose of estimating the cost of capital as noted in SBBI - 2023.[14] Using the arithmetic mean return rates and yields is appropriate because historical total returns and equity risk premiums provide insight into the variance and standard deviation of returns needed by investors in estimating future risk when making a current investment. If investors relied on the geometric mean of historical equity risk premiums, they would

[12] *See,* SBBI-2023 Appendix A Tables: Kroll Stocks, Bonds, Bills, & Inflation 1926-2022.
[13] As explained in note 1, page 7 of FE PA Exhibit DWD-4.
[14] SBBI - 2023, at page 200-201.

have no insight into the potential variance of future returns, because the geometric mean relates the change over many periods to a constant rate of change, thereby obviating the year-to-year fluctuations, or variance, which is critical to risk analysis.

Q. Please explain the derivation of the regression-based market equity risk premium.

A. To derive the regression-based market equity risk premium of 7.27% shown on line 2, page 6 of Exhibit DWD-4, I used the same monthly annualized total returns on large company common stocks relative to the monthly annualized yields on Moody's Aaa/Aa2-rated corporate bonds as mentioned above. I modeled the relationship between interest rates and the market equity risk premium using the observed monthly market equity risk premium as the dependent variable, and the monthly yield on Moody's Aaa/Aa2-rated corporate bonds as the independent variable. I then used a linear Ordinary Least Squares ("OLS") regression, in which the market equity risk premium is expressed as a function of the Moody's Aaa/Aa2-rated corporate bonds yield:

$$RP = \alpha + \beta\ (R_{Aaa/Aa2})$$

Q. Please explain the derivation of the PRPM equity risk premium.

A. The PRPM, published in the *Journal of Regulatory Economics,*[15] was developed from the work of Robert F. Engle, who shared the Nobel Prize in Economics in 2003 "for methods of analyzing economic time series with time-varying volatility ("ARCH")".[16] Engle found that volatility changes over time and is related from one period to the next, especially in financial markets. Engle discovered that volatility of prices and returns clusters over time

[15] Autoregressive conditional heteroscedasticity. See "A New Approach for Estimating the Equity Risk Premium for Public Utilities", Pauline M. Ahern, Frank J. Hanley and Richard A. Michelfelder, Ph.D. *The Journal of Regulatory Economics* (December 2011), 40:261-278.

[16] www.nobelprize.org.

and is therefore highly predictable and can be used to predict future levels of risk and risk premiums.

The PRPM estimates the risk-return relationship directly, as the predicted equity risk premium is generated by predicting volatility or risk. The PRPM is not based on an estimate of investor behavior, but rather on an evaluation of the results of that behavior (i.e., the variance of historical equity risk premiums).

The inputs to the model are the historical monthly returns on large company common stocks minus the monthly yields on Moody's Aaa/Aa-rated corporate bonds during the period from January 1928 through December 2023.[17] Using a generalized form of ARCH, known as GARCH, I calculated each Utility Proxy Group company's projected equity risk premium using Eviews© statistical software. When the GARCH model is applied to the historical return data, it produces a predicted GARCH variance series and a GARCH coefficient. Multiplying the predicted monthly variance by the GARCH coefficient and then annualizing it[18] produces the predicted annual equity risk premium. The resulting PRPM predicted a market equity risk premium of 9.35%.[19]

Q. Please explain the derivation of a projected equity risk premium based on *Value Line* data for your RPM analysis.

A. As noted above, because both ratemaking and the cost of capital are prospective, a prospective market equity risk premium is needed. The derivation of the forecasted or prospective market equity risk premium can be found in note 4, page 7 of Exhibit DWD-

[17] Data from January 1928 to December 2022 is from SBBI - 2023. Data from January 2023 to September 2023 is from Bloomberg.
[18] Annualized Return = (1 + Monthly Return) ^12 - 1.
[19] Shown on line 3, page 6 of FE PA Exhibit DWD-4.

4. Consistent with my calculation of the dividend yield component in my DCF analysis, this prospective market equity risk premium is derived from an average of the three- to five-year median market price appreciation potential by *Value Line* for the 13 weeks ended December 29, 2023, plus an average of the median estimated dividend yield for the common stocks of the 1,700 firms covered in *Value Line*'s Standard Edition.[20]

The average median expected price appreciation is 62%, which translates to a 12.82% annual appreciation, and, when added to the average of *Value Line's* median expected dividend yields of 2.33%, equates to a forecasted annual total return rate on the market of 15.15%. The forecasted Moody's Aaa-rated corporate bond yield of 4.90% is deducted from the total market return of 15.15%, resulting in an equity risk premium of 10.25%, as shown on line 4, page 6 of Exhibit DWD- 4.

Q. Please explain the derivation of an equity risk premium based on the S&P 500 companies.

A. Using data from *Value Line*, I calculated an expected total return on the S&P 500 companies using expected dividend yields and long-term growth estimates as a proxy for capital appreciation. The expected total return for the S&P 500 is 14.14%. Subtracting the prospective yield on Moody's Aaa-rated corporate bonds of 4.90% results in a 9.24% projected equity risk premium.

Q. Please explain the derivation of an equity risk premium based on Bloomberg data.

A. Using data from Bloomberg, I calculated an expected total return on the S&P 500 using expected dividend yields and long-term growth estimates as a proxy for capital

[20] As explained in detail in note 1, page 2 of FE PA Exhibit DWD-4.

appreciation, identical to the method described above. The expected total return for the S&P 500 is 17.52%. Subtracting the prospective yield on Moody's Aaa-rated corporate bonds of 4.90% results in a 12.62% projected equity risk premium.

Q. What is your conclusion of a beta-derived equity risk premium for use in your RPM analysis?

A. I gave equal weight to all six equity risk premiums based on each source - historical, *Value Line*, and Bloomberg - in arriving at an 9.09% equity risk premium.

Table 5: Summary of the Calculation of the Equity Risk Premium Using Total Market Returns[21]

Historical Spread Between Total Returns of Large Stocks and Aaa and Aa2-Rated Corporate Bond Yields (1928 – 2022)	5.82%
Regression Analysis on Historical Data	7.27%
PRPM Analysis on Historical Data	9.35%
Prospective Equity Risk Premium using Total Market Returns from *Value Line* Summary & Index less Projected Aaa Corporate Bond Yields	10.25%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from *Value Line* for the S&P 500 less Projected Aaa Corporate Bond Yields	9.24%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P 500 less Projected Aaa Corporate Bond Yields	12.62%
Average	9.09%

After calculating the average market equity risk premium of 9.09%, I adjusted it by beta to account for the risk of the Utility Proxy Group. As discussed below, beta is a meaningful measure of prospective relative risk to the market as a whole, and is a logical way to allocate a company's, or proxy group's, share of the market's total equity risk

[21] As shown on page 6 of FE PA Exhibit DWD-4.

premium relative to corporate bond yields. As shown on page 6 of FE PA Exhibit DWD-4, the average of the mean and median beta for the Utility Proxy Group is 0.81. Multiplying the 0.81 average beta by the market equity risk premium of 9.09% results in a beta-adjusted equity risk premium for the Utility Proxy Group of 7.36%.

b. <u>S&P Utility Index Derived Equity Risk Premium</u>

Q. How did you derive the equity risk premium based on the S&P utility index and Moody's A2-rated public utility bonds?

A. I estimated three equity risk premiums based on S&P Utility Index holding period returns, and two equity risk premiums based on the expected returns of the S&P Utilities Index, using *Value Line* and Bloomberg data, respectively. Turning first to the S&P Utility Index holding period returns, I derived a long-term monthly arithmetic mean equity risk premium between the S&P Utility Index total returns of 10.63% and monthly Moody's A2-rated public utility bond yields of 6.44% from 1928 to 2022 to arrive at an equity risk premium of 4.20%.[22] I then used the same historical data to derive an equity risk premium of 5.01% based on a regression of the monthly equity risk premiums. The final S&P Utility Index holding period equity risk premium involved applying the PRPM using the historical monthly equity risk premiums from January 1928 to December 2023 to arrive at a PRPM-derived equity risk premium of 4.80% for the S&P Utility Index.

I then derived expected total returns on the S&P Utilities Index of 10.63% and 10.61% using data from *Value Line* and Bloomberg, respectively, and subtracted the prospective Moody's A2-rated public utility bond yield of 5.63%,[23] which resulted in

[22] As shown on line 1, page 10 of Exhibit DWD-4.
[23] Derived on line 3, page 1 of Exhibit DWD-4.

equity risk premiums of 5.00% and 4.98%, respectively. As with the market equity risk premiums, I averaged each risk premium based on each source (i.e., historical, *Value Line*, and Bloomberg) to arrive at my utility-specific equity risk premium of 4.80%.

Table 6: Summary of the Calculation of the Equity Risk Premium Using S&P Utility Index Holding Returns[24]

Historical Spread Between Total Returns of the S&P Utilities Index and A2-Rated Utility Bond Yields (1928 – 2022)	4.20%
Regression Analysis on Historical Data	5.01%
PRPM Analysis on Historical Data	4.80%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from *Value Line* for the S&P Utilities Index less Projected A2 Utility Bond Yields	5.00%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P Utilities Index less Projected A2 Utility Bond Yields	4.98%
Average	4.80%

c. Authorized Return Derived Equity Risk Premium

Q. How do you derive an equity risk premium of 4.85% based on authorized ROEs for electric utilities?

A. The equity risk premium of 4.85% shown on line 3, page 5 of FE PA Exhibit DWD-4 is the result of a regression analysis based on regulatory awarded ROEs related to the yields on Moody's A2-rated public utility bonds. That analysis is shown on page 9 of FE PA Exhibit DWD-4. Page 9 of FE PA Exhibit DWD-4 contains the graphical results of a regression analysis of 1,232 rate cases for electric utilities which were fully litigated during the period from January 1, 1980 through December 29, 2023. It shows the implicit equity risk premium relative to the yields on A2-rated public utility bonds immediately prior to the issuance of each regulatory decision.

[24] As shown on page 10 of Exhibit DWD-4.

It is readily discernible that there is an inverse relationship between the yield on A2-rated public utility bonds and equity risk premiums. In other words, as interest rates decline, the equity risk premium rises and vice versa, a result consistent with financial literature on the subject.[25] I used the regression results to estimate the equity risk premium applicable to the projected yield on Moody's A2-rated public utility bonds. Given the expected A2-rated utility bond yield of 5.63%, it can be calculated that the indicated equity risk premium applicable to that bond yield is 4.85%, which is shown on line 3, page 5 of FE PA Exhibit DWD-4.

Q. What is your conclusion of an equity risk premium for use in your total market approach RPM analysis?

A. The equity risk premium I apply to the Utility Proxy Group is 5.67%, which is the average of the beta-adjusted equity risk premium for the Utility Proxy Group, the S&P Utilities Index, and the authorized return utility equity risk premiums of 7.36%, 4.80%, and 4.85%, respectively.[26]

Q. What is the indicated RPM common equity cost rate based on the total market approach?

A. As shown on line 7, page 1 of FE PA Exhibit DWD-4 and shown on Table 7, below, I calculated a common equity cost rate of 11.47% for the Utility Proxy Group based on the total market approach RPM.

[25] *See*, *e.g.*, Robert S. Harris and Felicia C. Marston, *The Market Risk Premium: Expectational Estimates Using Analysts' Forecasts*, Journal of Applied Finance, Vol. 11, No. 1, 2001, at pages 11 to 12; Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson, *The Risk Premium Approach to Measuring a Utility's Cost of Equity*, Financial Management, Spring 1985, at pages 33 to 45.

[26] As shown on page 5 of FE PA Exhibit DWD-4.

Table 7: Summary of the Total Market Return Risk Premium Model[27]

Prospective Moody's Baa1-Rated Utility Bond Applicable to the Utility Proxy Group	5.80%
Prospective Equity Risk Premium	5.67%
Indicated Cost of Common Equity	11.47%

C. The Capital Asset Pricing Model

Q. Please explain the theoretical basis of the CAPM.

A. CAPM theory defines risk as the co-variability of a security's returns with the market's returns as measured by beta (β). A beta less than 1.0 indicates lower variability than the market as a whole, while a beta greater than 1.0 indicates greater variability than the market.

The CAPM assumes that all non-market or unsystematic risk can be eliminated through diversification. The risk that cannot be eliminated through diversification is called market, or systematic, risk. In addition, the CAPM presumes that investors only require compensation for systematic risk, which is the result of macroeconomic and other events that affect the returns on all assets. The model is applied by adding a risk-free rate of return to a market risk premium, which is adjusted proportionately to reflect the systematic risk of the individual security relative to the total market as measured by the beta. The traditional CAPM model is expressed as:

$$R_s = R_f + \beta (R_m - R_f)$$

Where: R_s = Return rate on the common stock

R_f = Risk-free rate of return

R_m = Return rate on the market as a whole

[27] As shown on page 1 of FE PA Exhibit DWD-4.

β = Adjusted beta (volatility of the security relative to the market as a whole)

Numerous tests of the CAPM have measured the extent to which security returns and beta are related as predicted by the CAPM, confirming its validity. The empirical CAPM ("ECAPM") reflects the reality that while the results of these tests support the notion that the beta is related to security returns, the empirical Security Market Line ("SML") described by the CAPM formula is not as steeply sloped as the predicted SML.[28] The ECAPM reflects this empirical reality.

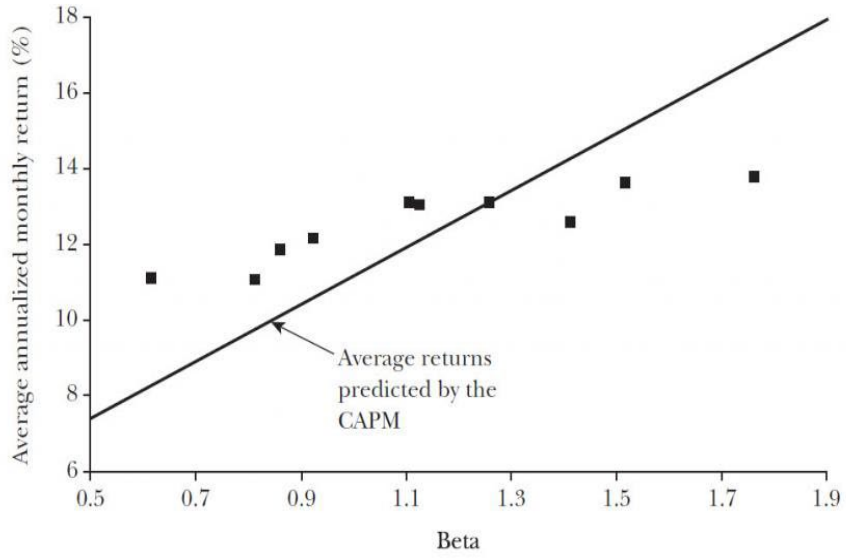
Q. Why is the use of the ECAPM appropriate in determining the ROE for FE PA?

The ECAPM is a well-established model that has been relied on in both academic and regulatory settings. Fama and French clearly state regarding Figure 2, below, that "[t]he returns on the low beta portfolios are too high, and the returns on the high beta portfolios are too low." [29]

[28] Morin, at page 220.
[29] Eugene F. Fama and Kenneth R. French, "The Capital Asset Pricing Model: Theory and Evidence", *Journal of Economic Perspectives*, Vol. 18, No. 3, Summer 2004 at 33 "Fama & French".

Figure 2 http://pubs.aeaweb.org/doi/pdfplus/10.1257/0895330042162430

Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on Prior Beta, 1928–2003



In addition, Morin observes that while the results of these tests support the notion that beta is related to security returns, the empirical SML described by the CAPM formula is not as steeply sloped as the predicted SML. Morin states:

> With few exceptions, the empirical studies agree that … low-beta securities earn returns somewhat higher than the CAPM would predict, and high-beta securities earn less than predicted.[30]
>
> * * *
>
> Therefore, the empirical evidence suggests that the expected return on a security is related to its risk by the following approximation:
>
> $$K = R_F + x\,\beta(R_M - R_F) + (1-x)\,\beta(R_M - R_F)$$
>
> where x is a fraction to be determined empirically. The value of x that best explains the observed relationship [is] Return = 0.0829 + 0.0520 β is between 0.25 and 0.30. If x = 0.25, the equation becomes:
>
> $$K = R_F + 0.25(R_M - R_F) + 0.75\,\beta(R_M - R_F)$$[31]

[30] Morin, at 207.
[31] Morin, at 221.

Fama and French provide similar support for the ECAPM when they state:

> The early tests firmly reject the Sharpe-Lintner version of the CAPM. There is a positive relation between beta and average return, but it is too 'flat.'… The regressions consistently find that the intercept is greater than the average risk-free rate… and the coefficient on beta is less than the average excess market return… This is true in the early tests… as well as in more recent cross-section regressions tests, like Fama and French (1992).[32]

Finally, Fama and French further note:

> Confirming earlier evidence, the relation between beta and average return for the ten portfolios is much flatter than the Sharpe-Linter CAPM predicts. The returns on low beta portfolios are too high, and the returns on the high beta portfolios are too low. For example, the predicted return on the portfolio with the lowest beta is 8.3 percent per year; the actual return as 11.1 percent. The predicted return on the portfolio with the highest beta is 16.8 percent per year; the actual is 13.7 percent.[33]

Research from Dianna R. Harrington also supports the use of the ECAPM. Harrington summarizes studies on the predicted results of the CAPM versus the actual returns in her text Modern Portfolio Theory & the Capital Asset Pricing Model:

> So far we have learned some very interesting things about the CAPM and reality. Some of the earliest work tested realized data (history) against data generated by simulated portfolios. Early studies by Douglas (1969) and Lintner (Douglas [1969]) showed discrepancies between what was expected on the basis of the CAPM and the actual relationships that were apparent in the capital markets. Theoretically, the minimal rate of return from the portfolios (the intercept) and the actual risk-free rate for the period should have been equal. They were not.
>
> * * *
>
> Another study, now more famous than Lintner's was done by Black, Jensen, and Scholes (1972). Lintner had used what is called a cross-sectional method (looking at a number of stock returns during one time period), whereas Black, Jensen, and Scholes used a time-series method (using returns for a number of stocks over several time periods). To make their test, Black, Jensen, and Scholes assumed that what had happened in the past was a good proxy for the investor expectations (a

[32] Fama & French, at 32.
[33] Fama & French, at 33.

frequent assumption in CAPM tests). Using historical data, they generated estimates using what we call the market model:

$$R_{jt} = \alpha_j + \beta_j (R_{mt}) + \varepsilon_j$$

Where:

R = total returns

β = the slope of the line (the incremental return for risk)

α = the intercept or a constant (expected to be 0 over time and across all firms)

ε = an error term (expected to be random, without information)

m = the market proxy

j = the firm or portfolio

t = the time period

Instead of using single stocks, they formed portfolios in an effort to wash out one source of error; because betas of single firms are quite unstable. On the basis of the CAPM, they expected to find

1. That the intercept was equal to the risk-free rate (their proxy was the Treasury bill rate)

2. That the capital market line had a positive slope and that riskier (higher beta) securities provided higher return

Instead they found

1. That the intercept was different from the risk-free rate

2. That high-risk securities earned less and low-risk securities earned more than predicted by the model

3. That the intercept seemed to depend on the beta of any asset: high-beta stocks had a different intercept than low-beta stocks

* * *

Fama and MacBeth (1974) criticized the Black, Jensen, and Scholes study (hereafter called BJS). In a reformation of the study, they supported the first of the BJS findings. They found that the intercept exceeded the risk-free proxy, but did not find the evidence to support the other BJS conclusions.[34]

[34] Dianna R. Harrington, Modern Portfolio Theory & the Capital Asset Pricing Model – A User's Guide, Prentice-Hall, Inc. 1983, at 43-45.

Harrington discusses Black's potential solution to this phenomenon:

> Black's replacement for the risk-free asset was a portfolio that had no covariability with the market portfolio. Because the relevant risk in the CAPM is systematic risk, a risk-free asset would be the one with no volatility relative to the market – that is, a portfolio with a beta of zero. All investor-perceived levels of risk could be obtained from various linear combinations of Black's zero-beta portfolio and the market portfolio… Since R_z (the rate of return of the zero-beta asset) and R_m are uncorrelated (as R_f and R_m were assumed to be in the simple CAPM), the investor can choose from various combinations of R_z and R_m. On segment R_mY, R_z, is sold short and proceeds are invested in R_m. On segment R_zR_m, portions of the zero-beta portfolio are purchased. At R_m, the investor is fully invested in the market portfolio. The equilibrium CAPM was rewritten by Black as follows:
>
> $$E(R_i) = (1 - \beta_i) E(R_z) + \beta_i E(R_m)$$
>
> Where:
>
> E indicates expected,
> $E(R_z)$ is less than $E(R_m)$, and
> R_z holdings over the whole market must be in equilibrium. That is, the number of short sellers and lenders of securities must be equal.
>
> Black's adaptation is intriguing. The result of using this model is a capital market line that has a less steep slope and a higher intercept than those of the simple CAPM. If Black's model is more correct in its description of investor behavior in the marketplace, then the use of the simple model would produce equity return predictions that would be too low for stocks with betas greater than one and too high for stocks with betas of less than one.[35]

Clearly, the justification from Morin, Fama and French, and Harrington, along with their reviews of other academic research on the CAPM, validate the use of the ECAPM. In addition, the New York Public Service Commission has been using this form of the CAPM, with factors of 0.25 and 0.75, since the mid-1990s. As such, the ECAPM is a well-established model that has been relied on in both academic and regulatory settings. I continue to believe it is an appropriate model to estimate FE PA's ROE, and in view of

[35] Dianna R. Harrington, Modern Portfolio Theory & the Capital Asset Pricing Model – A User's Guide, Prentice-Hall, Inc. 1983, at 43-45.

theory and practical research, I have applied both the traditional CAPM and the ECAPM to the companies in the Utility Proxy Group and averaged the results.

Q. What beta coefficients did you use in your CAPM analysis?

A. For the beta in my CAPM analysis, I considered two sources: *Value Line* and Bloomberg Professional Services. While both of those services adjust their calculated (or "raw") betas to reflect the tendency of beta to regress to the market mean of 1.00, *Value Line* calculates beta over a five-year period, while Bloomberg calculates it over a two-year period.

Q. Please describe your selection of a risk-free rate of return.

A. As shown in FE PA Exhibit DWD-5, the risk-free rate adopted for both applications of the CAPM is 4.15%. This risk-free rate is based on the average of the *Blue Chip* consensus forecast of the expected yields on 30-year U.S. Treasury bonds for the six quarters ending with the second calendar quarter of 2025, and long-term projections for the years 2025 to 2029 and 2030 to 2034.

Q. Why do you use the projected 30-year treasury yield in your analyses?

A. The yield on long-term U.S. Treasury bonds is almost risk-free and its term is consistent with the long-term cost of capital to public utilities measured by the yields on Moody's A2-rated public utility bonds; the long-term investment horizon inherent in utilities' common stocks; and the long-term life of the jurisdictional rate base to which the allowed fair rate of return (i.e., cost of capital) will be applied. In contrast, short-term U.S. Treasury yields are more volatile and largely a function of Federal Reserve monetary policy.

Q. Please explain the estimation of the expected risk premium for the market used in your CAPM analyses.

A. The basis of the market risk premium is explained in detail in note 1 on Exhibit DWD-5. As discussed above, the market risk premium is derived from an average of three historical data-based market risk premiums, two *Value Line* data-based market risk premiums, and one Bloomberg data-based market risk premium.

The long-term income return on U.S. Government securities of 5.00% was deducted from the SBBI - 2023 monthly historical total market return of 12.03%, which results in an historical market equity risk premium of 7.03%.[36] I applied a linear OLS regression to the monthly annualized historical returns on the S&P 500 relative to historical yields on long-term U.S. Government securities from SBBI -2023. That regression analysis yielded a market equity risk premium of 8.27%. The PRPM market equity risk premium is 10.44%, and is derived using the PRPM relative to the yields on long-term U.S. Treasury securities from January 1926 through December 2023.

The *Value Line*-derived forecasted total market equity risk premium is derived by deducting the forecasted risk-free rate of 4.15%, discussed above, from the *Value Line* projected total annual market return of 15.15%, resulting in a forecasted total market equity risk premium of 11.00%. The S&P 500 projected market equity risk premium using *Value Line* data is derived by subtracting the projected risk-free rate of 4.15% from the projected total return of the S&P 500 of 14.14%. The resulting market equity risk premium is 9.99%.

The S&P 500 projected market equity risk premium using Bloomberg data is derived by subtracting the projected risk-free rate of 4.15% from the projected total return

[36] SBBI - 2023, at Appendix A-1 (1) through A-1 (3) and Appendix A-7 (19) through A-7 (21).

of the S&P 500 of 17.52%. The resulting market equity risk premium is 13.37%. These six measures, when averaged, result in an average total market equity risk premium of 10.02%.

Table 8: Summary of the Calculation of the Market Risk Premium for Use in the CAPM[37]

Historical Spread Between Total Returns of Large Stocks and Long-Term Government Bond Yields (1926 – 2022)	7.03%
Regression Analysis on Historical Data	8.27%
PRPM Analysis on Historical Data	10.44%
Prospective Equity Risk Premium using Total Market Returns from *Value Line* Summary & Index less Projected 30-Year Treasury Bond Yields	11.00%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from *Value Line* for the S&P 500 less Projected 30-Year Treasury Bond Yields	9.99%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P 500 less Projected 30-Year Treasury Bond Yields	13.37%
Average	10.02%

Q. What are the results of your application of the traditional and empirical CAPM to the utility proxy group?

A. As shown on page 1 of Exhibit DWD-5, the mean result of my CAPM/ECAPM analyses is 12.45%, the median is 12.50%, and the average of the two is 12.48%. Consistent with my reliance on the average of mean and median DCF results discussed above, the indicated common equity cost rate using the CAPM/ECAPM is 12.48%.

[37] As shown on page 2 of Exhibit DWD-5.

D. Common Equity Cost Rates for a Proxy Group of Domestic, Non-Price Regulated Companies Based on the DCF, RPM, and CAPM

Q. Why do you also consider a proxy group of domestic, non-price regulated companies?

A. Although I am not an attorney, my interpretation of the *Hope* and *Bluefield* cases is that they did not specify that comparable risk companies had to be utilities. Since the purpose of rate regulation is to be a substitute for marketplace competition, non-price regulated firms operating in the competitive marketplace make an excellent proxy if they are comparable in total risk to the Utility Proxy Group being used to estimate the cost of common equity. The selection of such domestic, non-price regulated competitive firms theoretically and empirically results in a proxy group which is comparable in total risk to the Utility Proxy Group, since all of these companies compete for capital in the exact same markets.

Q. How did you select non-price regulated companies that are comparable in total risk to the utility proxy group?

A. In order to select a proxy group of domestic, non-price regulated companies similar in total risk to the Utility Proxy Group, I relied on the betas and related statistics derived from *Value Line* regression analyses of weekly market prices over the most recent 260 weeks (i.e., five years). These selection criteria resulted in a proxy group of 45 domestic, non-price regulated firms comparable in total risk to the Utility Proxy Group. Total risk is the sum of non-diversifiable market risk and diversifiable company-specific risks. The criteria used in selecting the domestic, non-price regulated firms was:

(i) They must be covered by *Value Line Investment Survey* (Standard Edition);

(ii) They must be domestic, non-price regulated companies, i.e., not utilities;

(iii) Their betas must lie within plus or minus two standard deviations of the average unadjusted betas of the Utility Proxy Group; and

(iv) The residual standard errors of the *Value Line* regressions which gave rise to the unadjusted betas must lie within plus or minus two standard deviations of the average residual standard error of the Utility Proxy Group.

Betas measure market, or systematic, risk, which is not diversifiable. The residual standard errors of the regressions measure each firm's company-specific, diversifiable risk. Companies that have similar betas and similar residual standard errors resulting from the same regression analyses have similar total investment risk.

Q. Have you prepared an exhibit which shows the data from which you selected the 45 domestic, non-price regulated companies that are comparable in total risk to the utility proxy group?

A. Yes, the basis of my selection and both proxy groups' regression statistics are shown in Exhibit DWD-6.

Q. Did you calculate common equity cost rates using the DCF model, RPM, and CAPM for the non-price regulated proxy group?

A. Yes. Because the DCF model, RPM, and CAPM have been applied in an identical manner as described above, I will not repeat the details of the rationale and application of each model. One exception is in the application of the RPM, where I did not use public utility-specific equity risk premiums.

Page 2 of Exhibit DWD-7 derives the Constant Growth DCF model common equity cost rate. As shown, the indicated common equity cost rate is 10.80%.

Pages 3 through 5 of Exhibit DWD-7 contain the data and calculations that support the 13.76% RPM common equity cost rate. As shown on line 1, page 3 of Exhibit DWD-

7, the consensus prospective yield on Moody's Baa-rated corporate bonds for the six quarters ending in the second quarter of 2025, and for the years 2025 to 2029 and 2030 to 2034, is 5.95%.[38] Since the Non-Price Regulated Proxy Group has an average Moody's long-term issuer rating of A3, a downward adjustment of 0.28% to the projected Baa2-rated corporate bond yield is necessary to reflect a difference in ratings which results in a projected A3-rated corporate bond yield of 5.67% for the Non-Regulated Proxy group.

When the beta-adjusted risk premium of 8.09%[39] relative to the Non-Price Regulated Proxy Group is added to the prospective A3-rated corporate bond yield of 5.67%, the indicated RPM common equity cost rate is 13.76%.

Page 6 of Exhibit DWD-7 contains the inputs and calculations that support my indicated CAPM/ECAPM common equity cost rate of 13.28%.

Q. How is the cost rate of common equity based on the non-price regulated proxy group comparable in total risk to the utility proxy group?

A. As shown on page 1 of Exhibit DWD-7, the results of the common equity models applied to the Non-Price Regulated Proxy Group -- which group is comparable in total risk to the Utility Proxy Group -- are as follows: 10.80% (DCF), 13.76% (RPM), and 13.28% (CAPM). The average of the mean and median of these models is 12.95%, which I used as the indicated common equity cost rates for the Non-Price Regulated Proxy Group.

[38] *Blue Chip Financial Forecasts*, January 1, 2024 at 2 and December 1, 2023 at 14.
[39] Derived on page 5 of Exhibit DWD-7.

VII. CONCLUSION OF COMMON EQUITY COST RATE BEFORE ADJUSTMENTS

Q. What is the indicated common equity cost rate before adjustments?

A. By applying multiple cost of common equity models to the Utility Proxy Group and the Non-Price Regulated Proxy Group, the indicated range of common equity cost rates attributable to the Utility Proxy Group before any relative risk adjustments is between 9.89% and 12.95%. I used multiple cost of common equity models as primary tools in arriving at my recommended common equity cost rate, because each of these models is theoretically sound and available to investors, and because no single model is so inherently precise that it can be relied on to the exclusion of other theoretically sound models. Using multiple models adds reliability to the estimated common equity cost rate, with the prudence of using multiple cost of common equity models supported in both the financial literature and regulatory precedent.

Based on these common equity cost rate results, I conclude that a range of common equity cost rates between 9.89% and 12.95% is reasonable and appropriate before any adjustments for relative risk differences between FE PA and the Utility Proxy Group are made.

VIII. ADJUSTMENTS TO THE COMMON EQUITY COST RATE

A. Size Adjustment

Q. Does a company's size relative to the utility proxy group companies increase its business risk?

A. Yes. A smaller size relative to the Utility Proxy Group companies indicates greater relative business risk for the Company because, all else being equal, size has a material bearing on risk. Size affects business risk because smaller companies generally are less able to cope

with significant events that affect sales, revenues and earnings. For example, smaller companies face more risk exposure to business cycles and economic conditions, both nationally and locally. Additionally, the loss of revenues from a few larger customers would have a greater effect on a small company than on a bigger company with a larger, more diverse, customer base. This is true for utilities, as well as for non-regulated companies.

As further evidence that smaller firms are riskier, investors generally demand greater returns from smaller firms to compensate for less marketability and liquidity of their securities. Kroll's Cost of Capital Navigator: U.S. Cost of Capital Module ("Kroll") discusses the nature of the small-size phenomenon, providing an indication of the magnitude of the size premium based on several measures of size. In discussing "Size as a Predictor of Equity Premiums," Kroll states:

> The size effect is based on the empirical observation that companies of smaller size are associated with greater risk and, therefore, have greater cost of capital [sic]. The "size" of a company is one of the most important risk elements to consider when developing cost of equity capital estimates for use in valuing a business simply because size has been shown to be a *predictor* of equity returns. In other words, there is a significant (negative) relationship between size and historical equity returns - as size *decreases*, returns tend to *increase*, and vice versa. (footnote omitted) (emphasis in original)[40]

Furthermore, in "The Capital Asset Pricing Model: Theory and Evidence," Fama and French note size is indeed a risk factor which must be reflected when estimating the cost of common equity. On page 14, they note:

> . . . the higher average returns on small stocks and high book-to-market stocks reflect unidentified state variables that produce undiversifiable

[40] Kroll, Cost of Capital Navigator: U.S. Cost of Capital Module, Size as a Predictor of Equity Returns, at 1.

> risks (covariances) in returns not captured in the market return and are priced separately from market betas.[41]

Based on this evidence, Fama and French proposed their three-factor model which includes a size variable in recognition of the effect size has on the cost of common equity.

Also, it is a basic financial principle that the use of funds invested, and not the source of funds, is what gives rise to the risk of any investment.[42] Eugene Brigham, a well-known authority, states:

> A number of researchers have observed that portfolios of small-firms (sic) have earned consistently higher average returns than those of large-firm stocks; this is called the "small-firm effect." On the surface, it would seem to be advantageous to the small firms to provide average returns in a stock market that are higher than those of larger firms. In reality, it is bad news for the small firm; **what the small-firm effect means is that the capital market demands higher returns on stocks of small firms than on otherwise similar stocks of the large firms**. (emphasis added)[43]

Consistent with the financial principle of risk and return discussed above, increased relative risk due to small size must be considered in the allowed rate of return on common equity.

Q. Is a relative risk adjustment due to FE PA's small size when compared to the utility proxy group necessary in this proceeding?

A. No. FE PA has similar risk to the average utility in the Utility Proxy Group because FE PA is similar in size to the Utility Proxy Group companies. I measured FE PA's size based on an estimated market capitalization of common for FE PA (whose common stock is not publicly traded).

[41] Fama & French, at 25-43.
[42] Brealey, Richard A. and Myers, Stewart C., Principles of Corporate Finance (McGraw-Hill Book Company, 1996), at 204-205, 229.
[43] Brigham, Eugene F., Fundamentals of Financial Management, Fifth Edition (The Dryden Press, 1989), at 623.

Table 9: Size as Measured by Market Capitalization for FE PA's Electric Operations and the Utility Proxy Group

	Market Capitalization* ($ Millions)	Times Greater than The Company
FE PA	$6,567	
Utility Proxy Group	$15,918	2.4x
*From page 1 of Exhibit DWD-8.		

FE PA's estimated market capitalization was $6.6 billion as of December 29, 2023, compared with the market capitalization of the average company in the Utility Proxy Group of $15.9 billion as of December 29, 2023. The average company in the Utility Proxy Group has a market capitalization 2.4 times the size of FE PA's estimated market capitalization.

As a result, it is necessary to consider if an adjustment to the indicated range of common equity cost rates attributable to the Utility Proxy Group is necessary. The determination is based on the size premiums for portfolios of New York Stock Exchange, American Stock Exchange, and NASDAQ listed companies ranked by deciles for the 1926 to 2022 period.[44] The average size premium for the Utility Proxy Group with a market capitalization of $15.9 billion falls in the 2nd decile, while the Company's estimated market capitalization of $6.6 billion places it in the 3rd decile. The size premium spread between the 2nd decile and the 3rd decile is 0.12%. It is my determination that the size premium spread between the 2nd and 3rd decile of 0.12% is not significant enough to include it in the determination of my recommended range of ROEs at this time.

[44] Source: Kroll, Cost of Capital Navigator.

B. Credit Risk Adjustment

Q. Please discuss your proposed credit risk adjustment.

A. FE PA's long-term issuer ratings are A3 and BBB from Moody's Investors Services and S&P, respectively, which are slightly less risky than the average long-term issuer ratings for the Utility Proxy Group of Baa1 and BBB+, respectively.[45] Hence, an downward credit risk adjustment is necessary to reflect the less risky credit rating, i.e., A3, of FE PA relative to the Baa1 average Moody's bond rating of the Utility Proxy Group.[46]

An indication of the magnitude of the necessary downward adjustment to reflect the lesser credit risk inherent in a A3 bond rating is one-third of a recent three-month average spread between Moody's A2 and Baa2-rated public utility bond yields of 0.25%, shown on page2 of Exhibit DWD-4, or 0.08%.[47]

C. Flotation Cost Adjustment

Q. What are flotation costs?

A. Flotation costs are those costs associated with the sale of new issuances of common stock. They include market pressure and the mandatory unavoidable costs of issuance (e.g., underwriting fees and out-of-pocket costs for printing, legal, registration, etc.). For every dollar raised through debt or equity offerings, the Company receives less than one full dollar in financing.

[45] Source of Information: S&P Global Market Intelligence.
[46] As shown on page 3 of Exhibit DWD-4.
[47] 0.08% = 0.25% * (1/3).

Q. Why is it important to recognize flotation costs in the allowed common equity cost rate?

A. It is important because there is no other mechanism in the ratemaking paradigm through which such costs can be recognized and recovered. Because these costs are real, necessary, and legitimate, recovery of these costs should be permitted. As noted by Morin:

> The costs of issuing these securities are just as real as operating and maintenance expenses or costs incurred to build utility plants, and fair regulatory treatment must permit recovery of these costs….
>
> The simple fact of the matter is that common equity capital is not free….[Flotation costs] must be recovered through a rate of return adjustment.[48]

Q. Should flotation costs be recognized only if there was an issuance during the test year or there is an imminent post-test year issuance of additional common stock?

A. No. As noted above, there is no mechanism to recapture such costs in the ratemaking paradigm other than an adjustment to the allowed common equity cost rate. Flotation costs are charged to capital accounts and are not expensed on a utility's income statement. As such, flotation costs are analogous to capital investments, albeit negative, reflected on the balance sheet. Recovery of capital investments relates to the expected useful lives of the investment. Since common equity has a very long and indefinite life (assumed to be infinity in the standard regulatory DCF model), flotation costs should be recovered through an adjustment to common equity cost rate, even when there has not been an issuance during the test year, or in the absence of an expected imminent issuance of additional shares of common stock.

[48] Morin, at 329.

Historical flotation costs are a permanent loss of investment to the utility and should be accounted for. When any company, including a utility, issues common stock, flotation costs are incurred for legal, accounting, printing fees and the like. For each dollar of issuing market price, a small percentage is expensed and is permanently unavailable for investment in utility rate base. Since these expenses are charged to capital accounts and not expensed on the income statement, the only way to restore the full value of that dollar of issuing price with an assumed investor required return of 10% is for the net investment to earn more than 10% to net back to the investor a fair return on that dollar. In other words, if a company issues stock at $1.00 with 5% in flotation costs, it will net $0.95 in investment. Assuming the investor in that stock requires a 10% return on their invested $1.00 (i.e., a return of $0.10), the company needs to earn approximately 10.5% on its invested $0.95 to receive a $0.10 return.

Q. Do the common equity cost rate models you have used already reflect investors' anticipation of flotation costs?

A. No. All of these models assume no transaction costs. The literature is quite clear that these costs are not reflected in the market prices paid for common stocks. For example, Brigham and Daves confirm this and provide the methodology utilized to calculate the flotation adjustment.[49] In addition, Morin confirms the need for such an adjustment even when no new equity issuance is imminent.[50] Consequently, it is proper to include a flotation cost

[49] Eugene F. Brigham and Phillip R. Daves, Intermediate Financial Management, 9th Edition, Thomson/Southwestern, at p. 342.
[50] Morin, at 342.

adjustment when using cost of common equity models to estimate the common equity cost rate.

Q. How did you calculate the flotation cost allowance?

A. I modified the DCF calculation to provide a dividend yield that would reimburse investors for issuance costs in accordance with the method cited in literature by Brigham and Daves, as well as by Morin. The flotation cost adjustment recognizes the actual costs of issuing equity that were incurred by FirstEnergy. Based on the issuance costs shown on page 1 of Exhibit DWD-9, an adjustment of 0.21% is required to reflect the flotation costs applicable to the Utility Proxy Group.

Q. What is the indicated cost of common equity after your company-specific adjustments?

A. Applying the negative 0.08% credit risk adjustment and the 0.21% flotation cost adjustment to the indicated range of common equity cost rates between 9.89% and 12.95% results in a range of common equity cost rates between 10.01% and 13.07%.

IX. CONCLUSIONS REGARDING RETURN ON COMMON EQUITY

Q. What is your recommended ROE for FE PA?

A. Given the discussion above and the results from the analyses in this testimony, I recommend that an ROE of 11.30%, within a range between 10.01% and 13.07% is appropriate for the Company at this time.

Q. In your opinion, is your proposed ROE of 11.30% just and reasonable to FE PA and its customers?

A. Yes, it is.

Q. Does this conclude your testimony?

A. Yes, it does.

Partner

Summary

Dylan is an experienced consultant and a Certified Rate of Return Analyst (CRRA) and Certified Valuation Analyst (CVA). Dylan joined ScottMadden in 2016 and is a leading expert witness with respect to cost of capital, capital structure, and valuation. He has served as a consultant for investor-owned and municipal utilities and authorities for 15 years. Dylan has testified as an expert witness on over 150 occasions regarding rate of return, cost of service, rate design, and valuation before more than 35 regulatory jurisdictions in the United States and Canada, an American Arbitration Association panel, and the Superior Court of Rhode Island. He also maintains the benchmark index against which the Hennessy Gas Utility Mutual Fund performance is measured. Dylan holds a B.A. in economic history from the University of Pennsylvania and an M.B.A. with concentrations in finance and international business from Rutgers University.

Areas of Specialization

- Expert Witness Testimony
- Rates and Regulation
- Return on Equity
- Valuation
- Utility Regulations
- Rate Case Planning, Management, and Support

Xcel Energy Inc.	3.45	6.00	6.00	6.30	6.10	3.56	9.66
						Average	9.89 %
						Median	9.89 %
						Average of Mean and Median	9.89 %

Notes:

(1) Indicated dividend at 12/29/2023 divided by the average closing price of the last 60 trading days ending 12/29/2023 for each company.

(2) From pages 2 through 15 of this Exhibit

(3) Average of columns 2 through 4 excluding negative growth rates.

(4) This reflects a growth rate component equal to one-half the conclusion of growth rate (from column 5) x column 1 to reflect the periodic payment of dividends (Gordon Model) as opposed to the continuous payment. Thus, for Alliant Energy Corporation, 3.62% x (1+(1/2 x 6.48%)) = 3.74%.

(5) Column 5 + Column 6.

(6) Results were excluded from the final average and median as they were more than two standard deviations from the proxy group's mean.

9.	Forecasted Equity Risk Premium	7.36 %

Notes provided on page 7 of this Exhibit.

FirstEnergy Pennsylvania Electric Companies
Derivation of Equity Risk Premium Based on the Total Market Approach
Using the Beta for the
Utility Proxy Group

Notes:

(1) Based on the arithmetic mean historical monthly returns on large company common stocks from Kroll 2022 SBBI® Yearbook minus the arithmetic mean monthly yield of Moody's average Aaa and Aa corporate bonds from 1928-2022.

(2) This equity risk premium is based on a regression of the monthly equity risk premiums of large company common stocks relative to Moody's average Aaa and Aa rated corporate bond yields from 1928-2022 referenced in note 1 above.

(3) The Predictive Risk Premium Model (PRPM) is discussed in Mr. D'Ascendi's Direct Testimony. The PRPM risk premium is derived by applying the PRPM to the monthly risk premiums between Kroll large company common stock monthly returns and average Aaa and Aa corporate monthly bond yields, from January 1928 through December 2023.

(4) The equity risk premium based on the Value Line Summary and Index is derived by subtracting the average consensus forecast of Aaa corporate bonds of 4.90% (from page 1 of this Exhibit) from the projected 3-5 year total annual market return of 15.15% (described fully in note 1 on page 2 of Exhibit DWD-5).

(5) Using data from Value Line for the S&P 500, an expected total return of 14.14% was derived based upon expected dividend yields and long-term earnings growth estimates as a proxy for capital appreciation. Subtracting the average consensus forecast of Aaa corporate bonds of 4.90% results in an expected equity risk premium of 9.24%.

(6) Using data from Bloomberg for the S&P 500, an expected total return of 17.52% was derived based upon expected dividend yields and long-term earnings growth estimates as a proxy for capital appreciation. Subtracting the average consensus forecast of Aaa corporate bonds of 4.90% results in an expected equity risk premium of 12.62%.

(7) Average of mean and median beta from page 1 of Exhibit DWD-5.

FirstEnergy Pennsylvania Electric Companies
Derivation of Mean Equity Risk Premium Based Studies
Using Holding Period Returns and
Projected Market Appreciation of the S&P Utility Index

Line No.	Equity Risk Premium based on S&P Utility Index Holding Period Returns (1):	Implied Equity Risk Premium
1.	Historical Equity Risk Premium	4.20 %
2.	Regression of Historical Equity Risk Premium (2)	5.01
3.	Forecasted Equity Risk Premium Based on PRPM (3)	4.80
4.	Forecasted Equity Risk Premium based on Projected Total Return on the S&P Utilities Index (Value Line Data) (4)	5.00
5.	Forecasted Equity Risk Premium based on Projected Total Return on the S&P Utilities Index (Bloomberg Data) (5)	4.98
6.	Average Equity Risk Premium (6)	4.80 %

Notes:

(1) Based on S&P Public Utility Index monthly total returns and Moody's Public Utility Bond average monthly yields from 1928-2022. Holding period returns are calculated based upon income received (dividends and interest) plus the relative change in the market value of a security over a one-year holding period.

(2) This equity risk premium is based on a regression of the monthly equity risk premiums of the S&P Utility Index relative to Moody's A2 rated public utility bond yields from 1928 - 2022 referenced in note 1 above.

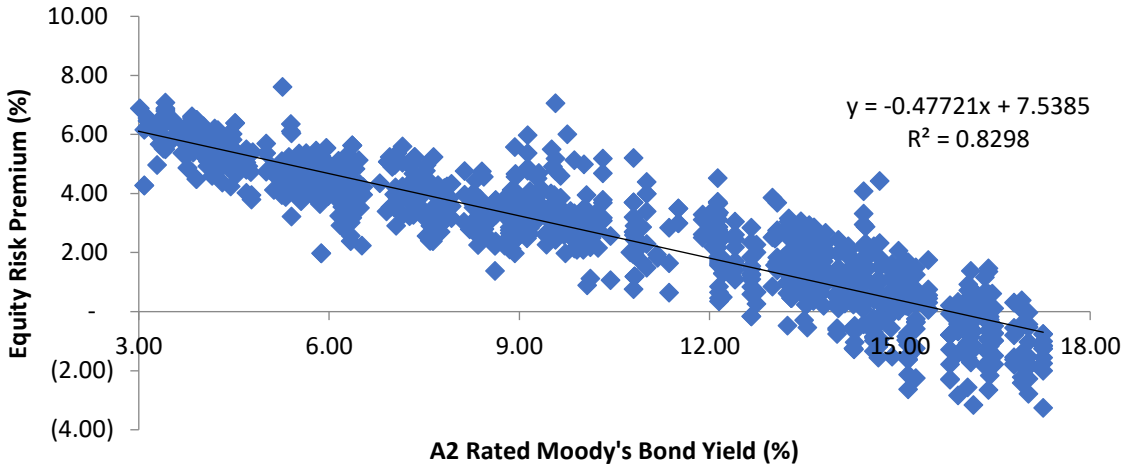
(3) The Predictive Risk Premium Model (PRPM) is applied to the risk premium of the monthly total returns of the S&P Utility Index and the monthly yields on Moody's A2 rated public utility bonds from January 1928 - December 2023.

(4) Using data from Value Line for the S&P Utilities Index, an expected return of 10.63% was derived based on expected dividend yields and long-term growth estimates as a proxy for market appreciation. Subtracting the expected A2 rated public utility bond yield of 5.63%, calculated on line 3 of page 1 of this Exhibit results in an equity risk premium of 5.00%. (10.63% - 5.63% = 5.00%)

(5) Using data from Bloomberg Services for the S&P Utilities Index, an expected return of 10.61% was derived based on expected dividend yields and long-term growth estimates as a proxy for market appreciation. Subtracting the expected A2 rated public utility bond yield of 5.63%, calculated on line 3 of page 1 of this Exhibit results in an equity risk premium of 4.98%. (10.61% - 5.63% = 4.98%)

(6) Average of lines 1 through 5.

FirstEnergy Pennsylvania Electric Companies
Prediction of Equity Risk Premiums Relative to
Moody's A2 Rated Utility Bond Yields - Electric Utilities



Constant	Slope	Prospective A2 Rated Utility Bond (1)	Prospective Equity Risk Premium

Notes on page 2 of this Exhibit.

FirstEnergy Pennsylvania Electric Companies
Notes to Accompany the Application of the CAPM and ECAPM

Notes:

(1) The market risk premium (MRP) is derived by using six different measures from three sources: Kroll, Value Line, and Bloomberg as illustrated below:

Historical Data MRP Estimates:

Measure 1: Kroll Arithmetic Mean MRP (1926-2022)

Arithmetic Mean Monthly Returns for Large Stocks 1926-2022:	12.03 %
Arithmetic Mean Income Returns on Long-Term Government Bonds:	5.00
MRP based on Kroll Historical Data:	7.03 %

Measure 2: Application of a Regression Analysis to Kroll Historical Data
(1926-2022) 8.27 %

Measure 3: Application of the PRPM to Kroll Historical Data:
(January 1926 - December 2023) 10.44 %

Value Line MRP Estimates:

Measure 4: Value Line Projected MRP Thirteen weeks ending December 29, 2023.

Total projected return on the market 3-5 years hence*:	15.15 %
Projected Risk-Free Rate (see note 2):	4.15
MRP based on Value Line Summary & Index:	11.00 %

*Forcasted 3-5 year capital appreciation plus expected dividend yield

Measure 5: Value Line Projected Return on the Market based on the S&P 500

Total return on the Market based on the S&P 500:	14.14 %
Projected Risk-Free Rate (see note 2):	4.15
MRP based on Value Line data	9.99 %

Measure 6: Bloomberg Projected MRP

Total return on the Market based on the S&P 500:	17.52 %
Projected Risk-Free Rate (see note 2):	4.15
MRP based on Bloomberg data	13.37 %

Average of Value Line, Kroll, and Bloomberg MRP: 10.02 %

(2) For reasons explained in the direct testimony, the appropriate risk-free rate for cost of capital purposes is the average forecast of 30 year Treasury Bonds per the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts. (See pages 8 and 9 of Exhibit DWD-4) The projection of the risk-free rate is illustrated below:

First Quarter 2024	4.30 %
Second Quarter 2024	4.30
Third Quarter 2024	4.20
Fourth Quarter 2024	4.10
First Quarter 2025	4.00
Second Quarter 2025	4.00
2025-2029	4.10
2030-2034	4.20
	4.15 %

(3) Average of Column 6 and Column 7.

(4) Results were excluded from the final average and median as they were more than two standard deviations from the proxy group's mean.

FirstEnergy Pennsylvania Electric Companies
Basis of Selection of the Group of Non-Price Regulated Companies
Comparable in Total Risk to the Utility Proxy Group

The criteria for selection of the proxy group of non-price regulated companies comparable in total risk to the Utility Proxy Group was that the non-price regulated companies be domestic and reported in Value Line Investment Survey (Standard Edition).

The proxy group of non-price regulated companies was selected based on the unadjusted beta range of 0.65 - 0.91 and residual standard error of the regression range of 2.6538 - 3.1650 of the proxy group of fourteen electric utilities.

These ranges are based upon plus or minus two standard deviations of the unadjusted beta and standard error of the regression. Plus or minus three standard deviations captures 95.50% of the distribution of unadjusted betas and residual standard errors of the regression.

The standard deviation of the Utility Proxy Group's residual standard error of the regression is 0.1278. The standard deviation of the standard error of the regression is calculated as follows:

$$\text{Standard Deviation of the Std. Err. of the Regr.} = \frac{\text{Standard Error of the Regression}}{\sqrt{2N}}$$

where: N = number of observations. Since Value Line betas are derived from weekly price change observations over a period of five years, N = 259

$$\text{Thus,} \quad 0.1278 = \frac{2.9094}{\sqrt{518}} = \frac{2.9094}{22.7596}$$

						Median	10.64 %
					Average of Mean and Median		10.80 %

Notes:

(1) Average of columns 2 through 4 excluding negative growth rates.

(2) The application of the DCF model to the domestic, non-price regulated comparable risk companies is identical to the application of the DCF to the Utility Proxy Groups. The dividend yield is derived by using the 60 day average price and the spot indicated dividend as of December 29, 2023. The dividend yield is then adjusted by 1/2 the average projected growth rate in EPS, which is calculated by averaging the 5 year projected growth in EPS provided by Value Line, www.zacks.com, and www.yahoo.com (excluding any negative growth rates) and then adding that growth rate to the adjusted dividend yield.

(3) Results were excluded from the final average and median as they were more than two standard deviations from the proxy group's mean.

FirstEnergy Pennsylvania Electric Companies
Indicated Common Equity Cost Rate
Through Use of a Risk Premium Model
Using an Adjusted Total Market Approach

Line No.		Proxy Group of Fourty-Five Non-Price Regulated Companies
1.	Prospective Yield on Baa2 Rated Corporate Bonds (1)	5.95 %
2	Adjustment to Reflect Bond rating Difference of Non-Price Regulated Companies (2)	(0.28)
3	Adjusted Prospective Bond Yield	5.67
4.	Equity Risk Premium (3)	8.09
5.	Risk Premium Derived Common Equity Cost Rate	13.76 %

Notes: (1) Average forecast of Baa corporate bonds based upon the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts dated December 28, 2023 and December 1, 2023 (see pages 8 and 9 of Exhibit DWD-4). The estimates are detailed below.

First Quarter 2024	6.10 %
Second Quarter 2024	6.00
Third Quarter 2024	6.00
Fourth Quarter 2024	5.90
First Quarter 2025	5.80
Second Quarter 2025	5.80
2025-2029	6.00
2030-2034	6.00
Average	5.95 %

(2) The average yield spread of Baa2 rated corporate bonds over A2 corporate bonds for the three months ending December 2023. To reflect the A3 average rating of the Non-Price Regulated Proxy Group, the prosepctive yield on Baa corporate bonds must be adjusted by 2/3 of the spread between A2 and Baa2 corporate bond yields as shown below:

	A2 Corp. Bond Yield	Baa2 Corp. Bond Yield	Spread
Dec-23	5.26 %	5.65 %	0.39 %
Nov-23	5.87	6.29	0.42
Oct-23	6.18	6.63	0.45
		Average yield spread	0.42
		2/3 of spread	0.28

FE PA STATEMENT NO. 11

Weizhong (Bill) Wang

FE PA Statement No. 11

BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION

FIRSTENERGY PENNSYLVANIA ELECTRIC COMPANY

DOCKET NO. R-2024-3047068

Direct Testimony
of
Bill Wang

List of Topics Addressed

Capital Structure
Cost of Long-Term Debt
Weighted Average Cost of Capital

TABLE OF CONTENTS

I. INTRODUCTION AND PURPOSE 1

II. CAPITAL STRUCTURE 3

III. COST OF LONG-TERM DEBT 5

IV. OVERALL COST OF CAPITAL 6

V. CONCLUSION 6

DIRECT TESTIMONY
OF
BILL WANG

I. INTRODUCTION AND PURPOSE

Q. Please state your name and business address.

A. My name is Bill Wang. My business address is 76 South Main Street, Akron, Ohio 44308.

Q. By whom are you employed and in what capacity?

A. I am employed by FirstEnergy Service Company ("FESC") as Assistant Treasurer. I am responsible for managing pension investments of FirstEnergy Corp. ("FirstEnergy") and managing the capital structures for FirstEnergy and its subsidiaries, including FirstEnergy Pennsylvania Electric Company ("FE PA" or the "Company").

Q. Please describe your professional and educational background.

A. I joined Corning Incorporated ("Corning") as a Senior Financial Analyst in May 2001 after I received a Masters Business Administration from the Business School of University of Maryland in College Park. At Corning, I was part of the Treasury team, and participated in its capital structure management including various capital market transactions and banking relationship management. In July 2005, I joined Allegheny Energy, Inc., which merged with FirstEnergy in 2011. I was elected to my current position of Assistant Treasurer in 2016. Prior to that, I served in various Treasury positions including Director, Treasury Integration, and Director, Investment Management, managing FirstEnergy's and its subsidiaries' 's capital structures, $12 billion asset investments related to FirstEnergy's Pension Plan, Savings Plan, and other post-retirements plans. I am also the Treasurer of FirstEnergy's New Jersey subsidiary, Jersey Central Power & Light Company since 2012.

Q. Have you ever testified before the Pennsylvania Public Utility Commission ("Commission")?

A. No, I have never testified before this Commission. I have, however, testified before the Maryland Public Service Commission, New Jersey Board of Public Utilities, and the Public Service Commission of West Virginia.

Q. On whose behalf are you testifying in this proceeding?

A. I am testifying on behalf of FE PA, formerly known as the individual Pennsylvania utility operating companies Metropolitan Edison Company, Pennsylvania Electric Company, Pennsylvania Power Company, and West Penn Power Company (collectively, the "Predecessor Companies").

Q. What is the purpose of your direct testimony?

A. My testimony describes and supports the capital structure, embedded cost of long-term debt, and overall weighted average cost of capital claimed by FE PA.

Q. Have you prepared any exhibits to accompany your testimony?

A. Yes. I am sponsoring the following summary schedules for FE PA, which will be discussed further in this testimony:

- FE PA Exhibit No. BW-1: Capitalization and Capitalization Ratios
- FE PA Exhibit No. BW-2: Schedule of Long-Term Debt Outstanding Projected at December 31, 2025
- FE PA Exhibit No. BW-3: Overall Weighted Average Cost of Capital Projected at December 31, 2025

Additionally, I am responsible for the Commission's base rate filing requirements II-B-5; III-A-1through III-A-2; III-B-1 through III-B-5; III-C-1; III-D-2 through III-D-4; III-E-1 through III-E-2; III-E-4; III-F-2 through III-F-4. Each of these exhibits or filing requirements were prepared by me or under my supervision.

II. CAPITAL STRUCTURE

Q. Please explain the steps FirstEnergy has taken in recent years to improve its balance sheet.

A. Since 2021, FirstEnergy has significantly improved its balance sheet by raising $7 billion dollars in equity capital. This includes a $1 billion common equity transaction in late 2021, a $2.4 billion sale of a 19.9% equity interest in FirstEnergy Transmission, LLC ("FET") in 2022, and an additional $3.5 billion sale of a 30% equity interest in FET in first quarter of 2024. The equity transactions allowed FirstEnergy to reduce long-term debt as a percentage of total debt to 26% at year-end 2023 versus 33% at year-end 2021. Also, FirstEnergy plans to deploy $450 million of the Q1 2024 FET sale proceeds to reduce long-term debt at FE PA in 2024.

Q. What capital structure ratio are you proposing be utilized for purposes of determining overall weighted average cost of capital?

A. I recommend using FE PA's projected capital structure at December 31, 2025, exclusive of short-term debt. That date corresponds to the end of the fully projected future test year in this proceeding and, accordingly, reflects the mix of long-term debt and common equity capital. See FE PA Exhibit No. BW-1 for the proposed capital structure.

Q. Why are you proposing using FE PA's capital structure instead of by rate district?

A. On January 1, 2024, the Predecessor Companies merged into FE PA pursuant to the Commission's Order at Docket Nos. A-2023-3038771, et al ("PA Consolidation"). As part of PA Consolidation, the tariffs of the Predecessor Companies were combined into a single tariff for FE PA, which consists of the Met-Ed, Penelec, Penn Power, West Penn and Pennsylvania State University ("PSU") rate districts (individually a "Rate District" and in any combination the "Rate Districts").[1] Following the consummation of the merger transaction, the existing long-term debt obligations of the Predecessor Companies, both senior unsecured and secured (first mortgage bonds), became obligations of FE PA by operation of law. Going forward, all refinancings of the Predecessor Companies debt and new debt issuances will be done at FE PA.

Q. Does this mean all of the Rate Districts have the same capital structure?

A. Yes, that is correct.

Q. Does FE PA have any preferred stock?

A. No, FE PA does not have any preferred stock outstanding.

Q. How did you derive the anticipated capital structure ratio at December 31, 2025?

A. As set forth in FE PA Exhibit No. BW-1, the starting point was the actual capital structure in place at December 31, 2023 for the Predecessor Companies, which represents the end of the historic test year. Then, based on recent financial forecasts, the respective amounts of long-term debt and common equity were projected forward to December 31, 2024, the end

[1] FE PA also has a sixth Rate District, the Waverly Rate District, which is not discussed directly in my testimony as it relates to FE PA's New York jurisdictional rates.

of the future test year, and to December 31, 2025, the end of the fully projected future test year, to capture: (1) consummated and planned issuances of long-term debt; (2) the pay down of long-term debt; (3) the amortization of long-term debt discount; (4) planned equity infusions; and 5) anticipated changes in retained earnings.

Q. What specific capital structure ratio do you recommend be adopted for rate of return purposes in this case?

A. Since rate setting is prospective, the rate of return should reflect a utility's expected capital structure at the end of the fully projected future test year. Therefore, I recommend the adoption of the projected December 31, 2025, capital structure ratio of 46.2% long-term debt and 53.8% common equity.

III. COST OF LONG-TERM DEBT

Q. What cost rate have you assigned to the long-term debt component of FE PA capital structure?

A. The determination of a utility's weighted average long-term debt cost rate is essentially an arithmetic exercise due to the fact that the utility has contracted for the use of the capital in question for a defined period of time at a specified cost rate. The necessary calculations, which take into account issuance expense, are provided in FE PA Exhibit No. BW-2.

Q. Please describe what is shown in FE PA Exhibit No. BW-2.

A. FE PA Exhibit No. BW-2 itemizes each series of debt, the date of issuance, maturity, original amount issued and projected amount outstanding as of December 31, 2025. The Premium/Discount and Issuance Expenses column represents legal, underwriting and other miscellaneous costs associated with each issuance. The principal amount issued, adjusted

for any premium or discount, less any issuance expenses, equals the Net Proceeds. The effective rate is calculated by taking the Net Proceeds at the time of issuance and calculating the Internal Rate of Return based on the interest rate and the years to maturity. After the effective rate is calculated for each individual series, the rates are weighted by taking the effective rate multiplied by each respective amount outstanding divided by the total amount of long-term debt outstanding.

Q. What long-term debt cost rate do you recommend be utilized in developing FE PA's overall cost of capital?

A. As indicated in FE PA Exhibit No. BW-2, FE PA's projected weighted average long-term debt cost rate is 4.56%.

IV. OVERALL COST OF CAPITAL

Q. How did you calculate FE PA's overall cost of capital?

A. As set forth in FE PA Exhibit No. BW-2, I quantified and then combined FE PA's weighted average cost of long-term debt and common equity by multiplying the projected December 31, 2025 capitalization ratio presented in FE PA Exhibit No. BW-1 by: (1) the average cost of debt developed in FE PA Exhibit No. BW-2; and (2) FE PA's requested return on common equity of 11.30%. The proposed cost of equity is supported by Company witness D'Ascendis in FE PA Statement No. 10. FE PA's overall weighted cost of capital is 8.19%

V. CONCLUSION

Q. Does this conclude your testimony?

A. Yes, it does.

FirstEnergy Pennsylvania Electric Company
Capitalization & Capitalization Ratios
($ in Thousands)

	Actuals at December 31, 2023[1]		Forecast at December 31, 2024		Forecast at December 31, 2025

IV. CONCLUSION 13

DIRECT TESTIMONY
OF
JOHN SPANOS

I. INTRODUCTION AND PURPOSE

Q. Please state your name and business address.

A. My name is John J. Spanos. My business address is 207 Senate Avenue, Camp Hill, Pennsylvania 17011.

Q. By whom are you employed and in what capacity?

A. I am associated with the firm of Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming") as President.

Q. What is your educational background?

A. I have Bachelor of Science degrees in Industrial Management and Mathematics from Carnegie-Mellon University and a Master of Business Administration from York College of Pennsylvania.

Q. Are you a member of any professional societies?

A. Yes. I am a member and past President of the Society of Depreciation Professionals. I am also a member of the joint American Gas Association/Edison Electric Institute Industry Accounting Committee.

Q. Do you hold any special certification as a depreciation expert?

A. Yes. The Society of Depreciation Professionals has established national standards for depreciation professionals. The Society administers an examination to become certified in this field. I passed the certification exam in September 1997 and was recertified in August 2003, February 2008, January 2013, February 2018, and February 2023.

Q. Will you outline your experience in the field of depreciation?

A. I have over 37 years of depreciation experience, which includes giving expert testimony in more than 450 cases before 46 regulatory commissions, including the Pennsylvania Public Utility Commission ("Commission"). My participation in the cases where I appeared as an expert witness has included conducting and analyzing depreciation studies for companies, government-owned utilities, and other service providers in the electric, gas, water, wastewater, and pipeline industries. In addition to the cases in which I submitted testimony, I have supervised over 800 other depreciation or valuation assignments. Please refer to Appendix A for additional information on my qualifications, work history, case experience, and my leadership in the Society of Depreciation Professionals.

Q. Have you ever testified before the Commission?

A. Yes. See Appendix A for a full list of testimony.

Q. On whose behalf are you testifying in this proceeding?

A. I am testifying on behalf of FirstEnergy Pennsylvania Electric Company ("FE PA" or the "Company"). FE PA consists of the Met-Ed, Penelec, Penn Power, West Penn, and PSU rate districts (individually a "Rate District" and in any combination the "Rate Districts").[1]

Q. What is the purpose of your direct testimony?

A. My testimony is in support of the depreciation studies conducted under my direction and supervision for the electric plant of FE PA's jurisdictional Rate Districts.

[1] FE PA also has a sixth Rate District, the Waverly Rate District, which is not discussed directly in my testimony as it relates to FE PA's New York jurisdictional rates. The PSU Rate District is encompassed within the West Penn Rate District. To the extent that the testimony does not specifically mention the PSU Rate District, it can be assumed that it is included within the West Penn Rate District.

Q. Have you prepared any exhibits to accompany your testimony?

A. Yes, I have prepared twelve exhibits, consisting of the following:

- FE PA Exhibit Nos. JJS-1, JJS-4, JJS-7, and JJS-10 present the results of the depreciation studies for each Rate District as of December 31, 2023.
- FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11 present the results of the depreciation studies for each Rate District as of December 31, 2024.
- FE PA Exhibit Nos. JJS-3, JJS-6, JJS-9, and JJS-12 present the results of the depreciation studies for each Rate District as of December 31, 2025.

In addition, I am responsible for the responses to Depreciation Data Filing Requirements FR V-A-2, FR V-B-1, FR V-B-2, FR V-C-1, FR V-D-1, FR V-D-2, and FR V-E-1.

II. DEPRECIATION STUDIES

Q. Please describe FE PA Exhibit Nos. JJS-1 through JJS-12.

A. FE PA Exhibit Nos. JJS-1, JJS-4, JJS-7, and JJS-10, titled "2023 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of December 31, 2023," include the results of the depreciation studies related to the assets of the Rate Districts as of December 31, 2023. The reports also include the detailed depreciation calculations.

FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11, titled "2024 Depreciation Study – Calculated Annual Depreciation Accruals Related to Electric Plant as of December 31, 2024," include the results of the depreciation studies related to the assets of the Rate Districts estimated as of December 31, 2024. The report also includes explanatory text, statistics related to the estimation of service life, and the detailed depreciation calculations.

FE PA Exhibit Nos. JJS-3, JJS-6, JJS-9, and JJS-12, titled "2025 Depreciation Study – Calculated Annual Depreciation Accruals Related to Electric Plant as of December 31, 2025," include the results of the depreciation studies related to the assets of the Rate Districts estimated as of December 31, 2025.

Q. What were the purposes of your depreciation studies?

A. The purposes of the depreciation studies were to estimate the annual depreciation accruals related to electric plant in service for ratemaking purposes and, using Commission-approved procedures, to estimate the Company's book reserve as of December 31, 2023, December 31, 2024, and December 31, 2025.

Q. Is the Company's claim for annual depreciation in the current proceeding based on the same methods of depreciation as were used in its most recent rate proceeding and Annual Depreciation Report?

A. Yes, it is. For most plant accounts, the current claim for annual depreciation is based on the straight line remaining life method of depreciation, which has been used for almost 25 years. However, the depreciation procedure has been changed to the equal life group procedure which is consistent with most other companies in Pennsylvania. For Accounts 391.0, 391.2, 391.25, 391.3, 391.4, 391.5, 393, 394, 395, 397, and 398, the claim is based on the straight line remaining life method of amortization, which is consistent with past practice. These accounts have a large number of units, but small asset values representing less than two percent of the depreciable plant of all the Rate Districts combined. The assets represent items located in office buildings, service centers, garages, and warehouses. Given the difficulty in maintaining accounting records for these numerous assets and high cost for periodic inventories, retirements are recorded when a vintage is fully amortized,

rather than as the units are removed from service. All units are retired when the age of the vintage reaches the amortization period. The annual amortization is based on amortization accounting which distributes the unrecovered cost of fixed capital assets over the remaining amortization period selected for each account.

Q. What group procedure is being used in this proceeding for depreciable accounts?

A. The equal life group procedure is used in the current proceeding for all vintages.

Q. Is the Company's claim for accrued depreciation in the current proceeding made on the same basis as has been used for almost 25 years?

A. Yes. The current claim for accrued depreciation is the book reserve brought forward from the book reserve approved by the Commission in the last proceeding.

Q. How was the book reserve used in the calculation of annual depreciation?

A. The book reserve by account was allocated to vintages to determine original cost less accrued depreciation by vintage. The total annual accrual is the sum of the results of dividing the original costs less accrued depreciation by the vintage composite remaining lives.

Q. How was the book reserve as of December 31, 2024 and December 31, 2025, estimated?

A. The book reserve as of December 31, 2024 and December 31, 2025, by account, was projected by adding estimated accruals, gross salvage, and the amortization of net salvage, and subtracting estimated retirements and cost of removal from the book reserve as of December 31, 2023. Annual accruals were calculated based on average yearly or monthly plant balances. For most accounts, gross salvage and cost of removal were estimated by

(1) expressing actual salvage and cost of removal as a percent of retirements by account, for the most recent five-year period, and (2) applying those percents to the projected retirements by account. For the purpose of calculating the annual accruals, the projected book reserve by account was allocated to vintages based on calculated accrued depreciation as of December 31, 2024 and December 31, 2025.

Q. Has a service life study of the Company's electric utility property been performed?

A. Yes. The most recent service life studies were performed as of December 2023 as part of this rate case. The service life studies are the basis for the service lives I used to calculate annual accruals.

Q. Briefly outline the procedure used in performing the service life studies.

A. The service life studies consisted of assembling and compiling historical data from the records related to the electric utility plant of the Rate Districts; statistically analyzing such data to obtain historical trends of survivor characteristics; conducting site visits of representative assets; obtaining supplementary information from management and operating personnel concerning Company practices and plans as they relate to plant operations; and interpreting the above data to form judgments of service life characteristics.

Iowa type survivor curves were used to describe the estimated survivor characteristics of the mass property groups. Individual service lives were used for major individual units of plant, such as distribution buildings housing offices and shops. The life span concept was recognized by coordinating the lives of associated plant installed in subsequent years with the probable retirement date defined by the life estimated for the major unit.

Q. What statistical data were employed in the historical analyses performed for the purpose of estimating service life characteristics?

A. The data consisted of the entries made to record retirements and other transactions related to the electric plant during the period 1939-2023. The year 1939 is the first-year continuing property records were maintained. These entries were classified by depreciable group, type of transaction, the year in which the transaction took place, and the year in which the plant was installed. Types of transactions included in the data were plant additions, retirements, transfers, and balances. In the presentation of service life statistics, only the significant exposure points that were utilized in determining survivor curves were plotted. This process is utilized to show my judgment in service life determinations.

Q. What was the source of this data?

A. They were assembled from Company records related to its electric plant in service.

Q. Were the methods used in the service life study the same as those used in other depreciation studies for electric utility plant presented before this Commission?

A. Yes. The methods are the same ones that have been presented previously for the Rate Districts and for other electric companies before the Commission and that have been accepted by the Commission in its past orders concerning electric utilities.

Q. What approach did you use to estimate the lives of significant structures such as office buildings and service centers?

A. I used the life span technique to estimate the lives of significant structures. In this technique, the survivor characteristics of the structures are described using interim survivor curves and estimated probable retirement dates. The interim survivor curve describes the

rate of retirement related to the replacement of elements of the structure, such as plumbing, heating, doors, windows, and roofs, that occur during the life of the facility. The probable retirement date provides the rate of final retirement for each year of installation for the structure by truncating the interim survivor curve for each installation year at its attained age at the date of probable retirement. The use of interim survivor curves truncated at the date of probable retirement provides a consistent method for estimating the lives of the several years of installation inasmuch as concurrent retirement of all years of installation will occur when the structure is retired.

Q. Has your firm used this approach in other proceedings before this Commission?

A. Yes, we have used the life span technique on many occasions before the Commission. The life span technique has previously been utilized for each of the Rate Districts in prior proceedings.

Q. What are the bases for the probable retirement years that you have estimated for each structure?

A. The bases for the estimates of probable retirement years are life spans for each structure that are based on judgment and incorporate consideration of the age, use, size, nature of construction, management outlook, and typical life spans experienced and used by other electric utilities for similar structures. Most of the life spans result in probable retirement dates that are many years in the future. As a result, the retirement of these structures is not yet subject to specific management plans. Such plans would be premature. At the appropriate time, studies of the economics of rehabilitation and continued use or retirement of the structure will be analyzed, and the results incorporated in the estimation of the structure's life span.

Q. Are the factors considered in your estimates of service life presented in FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11?

A. Yes. A discussion of the factors considered in the estimation of service lives is presented by account on pages III-2 and III-3 of each exhibit.

Q. Please outline the contents of FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11.

A. Each exhibit is presented in eight parts. Part I, Introduction, sets forth the scope and basis of the study. Part II, Estimation of Survivor Curves, includes a description of the Iowa Curves and the formulation of the retirement rate method. Part III, Service Life Considerations, and Part IV, Calculation of Annual and Accrued Depreciation, include a description of the judgment utilized for life parameters and the explanation of depreciation procedures.

Part V, Results of Study, presents a description of the results and summaries of the depreciation calculations. Part VI, Service Life Statistics, presents the graphs and tables which relate to the service life study. Part VII, Detailed Depreciation Calculations, sets forth the detailed depreciation calculations by account. Part VIII, Experienced and Estimated Net Salvage, presents the cost of removal and gross salvage by account for the years 2020 through 2024.

For example, in Exhibit No. JJS-2, Table 1 on pages V-4 and V-5 presents the estimated survivor curve, the original cost as of December 31, 2024, and the book reserve and calculated annual depreciation for each account or subaccount of Electric Plant. Table 2 on page V-6 presents the bringforward to December 31, 2024, of the book depreciation reserve as of December 31, 2023. Table 3 on page V-7 sets forth the calculation of the

annual accruals used in the bringforward. Table 4 on page V-8 presents the experienced and estimated net salvage during the five-year period, 2020 through 2024.

The section beginning on page VI-2 presents the results of the retirement rate analyses prepared as the historical bases for the service life estimates. The section beginning on page VII-2 presents the cumulative depreciated original cost by year installed. The tabulations beginning on page VII-6 present the calculation of annual depreciation by vintage by account for each depreciable group of utility plant. Each Rate District has exhibits prepared in the same fashion.

Q. Please outline the contents of FE PA Exhibit Nos. JJS-3, JJS-6, JJS-9, and JJS-12.

A. Each exhibit includes a description of the results, summaries of the depreciation calculations, and the detailed depreciation calculations as of December 31, 2025. The descriptions and explanations presented in FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11 are also applicable to the depreciation calculations presented in FE PA Exhibit Nos. JJS-3, JJS-6, JJS-9, and JJS-12. The graphs and tables related to service life presented in FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11 also support the service life estimates used in each fully forecasted test year exhibit inasmuch as the estimates are the same for both test years. The summary tables and detailed depreciation calculations as of December 31, 2025, are organized and presented in the same manner as those as of December 31, 2024.

Q. Please outline the contents of FE PA Exhibit Nos. JJS-1, JJS-4, JJS-7, and JJS-10.

A. Each exhibit includes a description of the results, summaries of the depreciation calculations, and the detailed depreciation calculations as of December 31, 2023. The descriptions and explanations presented in FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and

JJS-11 are also applicable to the depreciation calculations presented in FE PA Exhibit Nos. JJS-1, JJS-4, JJS-7, and JJS-10. The graphs and tables related to service life presented in Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11 also support the service life estimates used in each historic test year, inasmuch as the estimates are the same for both test years. The summary tables and detailed depreciation calculations as of December 31, 2023, are organized and presented in the same manner as those as of December 31, 2024.

Q. Please use an example to illustrate the manner in which the study is presented in FE PA Exhibit Nos. JJS-1 through JJS-12.

A. I will use Account 368.00, Line Transformers, as my example; inasmuch as it is one of the larger depreciable groups and represents 15 percent of the original cost of depreciable utility plant for Met-Ed Rate District as of December 31, 2024.

The retirement rate method was used to analyze the survivor characteristics of this group. The life tables for the 1939-2023 and 1954-2023 experience bands are presented on pages VI-68 through VI-71 of FE PA Exhibit No. JJS-2. The life tables, or original survivor curves, are plotted along with the estimated smooth survivor curve, the 43-R1.5, on page VI-67.

The calculation as of December 31, 2024, is presented on pages VII-42 and VII-43 of FE PA Exhibit No. JJS-2 and is based in part on the bringforward of the book depreciation reserve. The tabulation in FE PA Exhibit No. JJS-2 sets forth the installation year, the original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life, and annual accrual. The totals are brought forward to the table on page V-5 in FE PA Exhibit No. JJS-2.

Q. Do you believe FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11 reflect the appropriate survivor curves for the Rate Districts to be adopted in this proceeding?

A. Yes, I do. The methods and procedures utilized in the development of survivor curves are consistent with past practices for each of the Rate Districts and Pennsylvania ratemaking regulations.

Q. In what manner is net salvage incorporated in the depreciation calculations?

A. As stated on pages I-4 and I-5 of FE PA Exhibit Nos. JJS-2, JJS-5, JJS-8, and JJS-11, no adjustment for net salvage was made to the calculated annual depreciation amounts. The total calculated annual depreciation set forth on page I-4 of FE PA Exhibit No. JJS-1, page V-5 of FE PA Exhibit No. JJS-2, and page I-4 of FE PA Exhibit No. JJS-3 for Met-Ed should include an addition for the amortization of negative net salvage in accordance with the practice of this Commission. The same referenced pages set forth the amortization of negative net salvage for each of the other Rate Districts. The amortization is based on experience during the period 2019 through 2023 for the calculation as of December 31, 2023, and on experience during the period 2020 through December 31, 2023, plus estimates for the twelve months of 2024 for the calculation as of December 31, 2024.

The amortization for the December 31, 2025 calculation is based on experience during the period 2021 through December 31, 2023, plus estimates for the period January 2024 through December 2025. The amounts of the five-year amortizations are calculated in Table 2 on page I-5 of FE PA Exhibit No. JJS-1, in Table 4 on page V-8 of FE PA Exhibit No. JJS-2, and in Table 4 on page I-7 of FE PA Exhibit No. JJS-3 for Met-Ed. The same referenced tables set forth the amortization of negative net salvage for each of the other Rate Districts.

Q. Have you provided a monthly bringforward to December 31, 2025, of the book depreciation reserve as of December 31, 2024?

A. Yes. For each Rate District, a monthly bringforward to December 31, 2025, of the projected book depreciation reserve as of December 31, 2024 has been provided as FE PA Exhibit Nos. JJS-13, JJS-14,JJS-15, and JJS-16. The bringforward of the book depreciation reserve as of December 31, 2024 was performed on an annual basis.

III. DEPRECIATION FOR FUTURE ASSETS

Q. Have you developed depreciation rates for future assets that may be placed in service?

A. Yes. There are plans for new assets in Account 363.00, Electric Storage Battery, that the Company expects it may add in the future. The depreciation rate for battery storage assets for each Rate District is based on a 15-L3 survivor curve. The depreciation rate for this account will be 6.67% for each Rate District. The depreciation rate for each Rate District is set forth in FE PA Exhibit Nos. JJS-2, JJS-3, JJS-5, JJS-6, JJS-8, JJS-9, JJS-11, and JJS-12 on the end of Table 1.

IV. CONCLUSION

Q. Does this conclude your direct testimony?

A. Yes.

METROPOLITAN EDISON COMPANY

Attention Ms. Joanna M. Savage
Director, Rates and Regulatory Affairs – PA

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to electric plant of Metropolitan Edison Company ("MetEd"). The results of our study as of December 31, 2023, are presented in the attached detailed report.

The results of our study as of December 31, 2024, as well as a discussion of the methods and procedures used in the calculations and the support for the service life estimates, are included in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of December 31, 2024." The same methods, procedures and estimates were used in both studies.

The results of our study as of December 31, 2023, are summarized on pages I-3 through I-5 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. RESULTS OF STUDY

METROPOLITAN EDISON COMPANY
DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

The results of the depreciation study are summarized in Table 1, which sets forth the calculated annual depreciation related to Electric Plant in Service as of December 31, 2023. Table 2 presents the experienced gross salvage and cost of removal associated with regular retirements during the five-year period, 2019-2023 and the annual amortization of net salvage.

DETAILED TABULATIONS OF DEPRECIATION CALCULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on II-7. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2019 through 2023, beginning on beginning on III-2 through III-6.

Reading, PA 19605-2469

Attention Ms. Joanna M. Savage
Director, Rates and Regulatory Affairs – PA

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to electric plant in service. The results of our study as of December 31, 2024 are presented in the attached report. The results of our study as of December 31, 2023 are presented in our report titled "2023 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of December 31, 2023". The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves and the calculated annual depreciation rates as of December 31, 2024.

Respectfully submitted,

GANNETT FLEMING VALUATION

METROPOLITAN EDISON COMPANY
DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study conducted for Metropolitan Edison Company ("MetEd") to determine the annual depreciation accrual rates and amounts for ratemaking purposes applicable to the original cost of electric plant as of December 31, 2024.

The depreciation accrual rates and amounts presented herein are based on estimated survivor curves and on methods and procedures set forth in previous orders approved by the Pennsylvania Public Utility Commission. The estimated survivor curves presented herein were based on the results of a service life study incorporating statistical analyses of data through 2023.

BASIS OF STUDY

Depreciation and Amortization

Depreciation, as defined in the Uniform System of Accounts, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of electric plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs over a period of time by allocating annual amounts to expense. Each annual

amount of such depreciation expense is part of that year's total cost of providing utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

The calculation of annual and accrued depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. These subjects are discussed in the sections which follow.

For most plant accounts, depreciation accruals and accrued depreciation were calculated using the straight line method, the remaining life basis, and the equal life group (ELG) procedure for all vintages. The calculations were based on the attained ages and estimated service life characteristics for each depreciable group of electric property. For certain general plant accounts, the amortization amounts, annual and accrued, were based on the age of the vintage and the selected amortization period.

Survivor curves were used to reflect the expected dispersion of retirements, thus providing a consistent method of estimating service lives and depreciation for mass property. Iowa type curves were used to depict the estimated survivor curves. For life span groups, the estimate of life characteristics is consistent because the calculated lives of the units within a group are obtained by employing a single probable retirement date for the entire group.

Service Life Estimates

The method of estimating service life consisted of compiling the service life history of the plant accounts, subaccounts or depreciable groups, reducing this history to trends through the use of acceptable actuarial techniques, and forecasting the trend of survivors for each depreciable group on the basis of interpretations of past trends and consideration of Company plans for the future. The combination of the historical trend and the estimated future trend yielded a complete pattern of life characteristics from which the average service life was derived.

The Company's service life estimates used in the depreciation calculation incorporated historical data compiled through 2023 from the property records of the Company. Such data included plant additions, retirements, transfers and other activity. Generally, retirement data for the years 1939 through 2023 were used in the actuarial life table computations which were the primary statistical support of the service life estimates.

A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirement was obtained through field trips conducted during the course of the service life study. Discussions with operating and management personnel also provided information regarding plans for the future which was incorporated in the interpretation and extrapolation of the statistical analyses.

AMORTIZATION OF NET SALVAGE

Inasmuch as this report relates primarily to Pennsylvania rate regulation practices, under which experienced costs of negative net salvage are amortized after their occurrence, no adjustments for expected net salvage were made to either the

annual depreciation accrual or the calculated accrued depreciation for the individual accounts. The annual provision for recovering negative net salvage is based on the amortization of net salvage over a five-year period, as established by the Commission.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

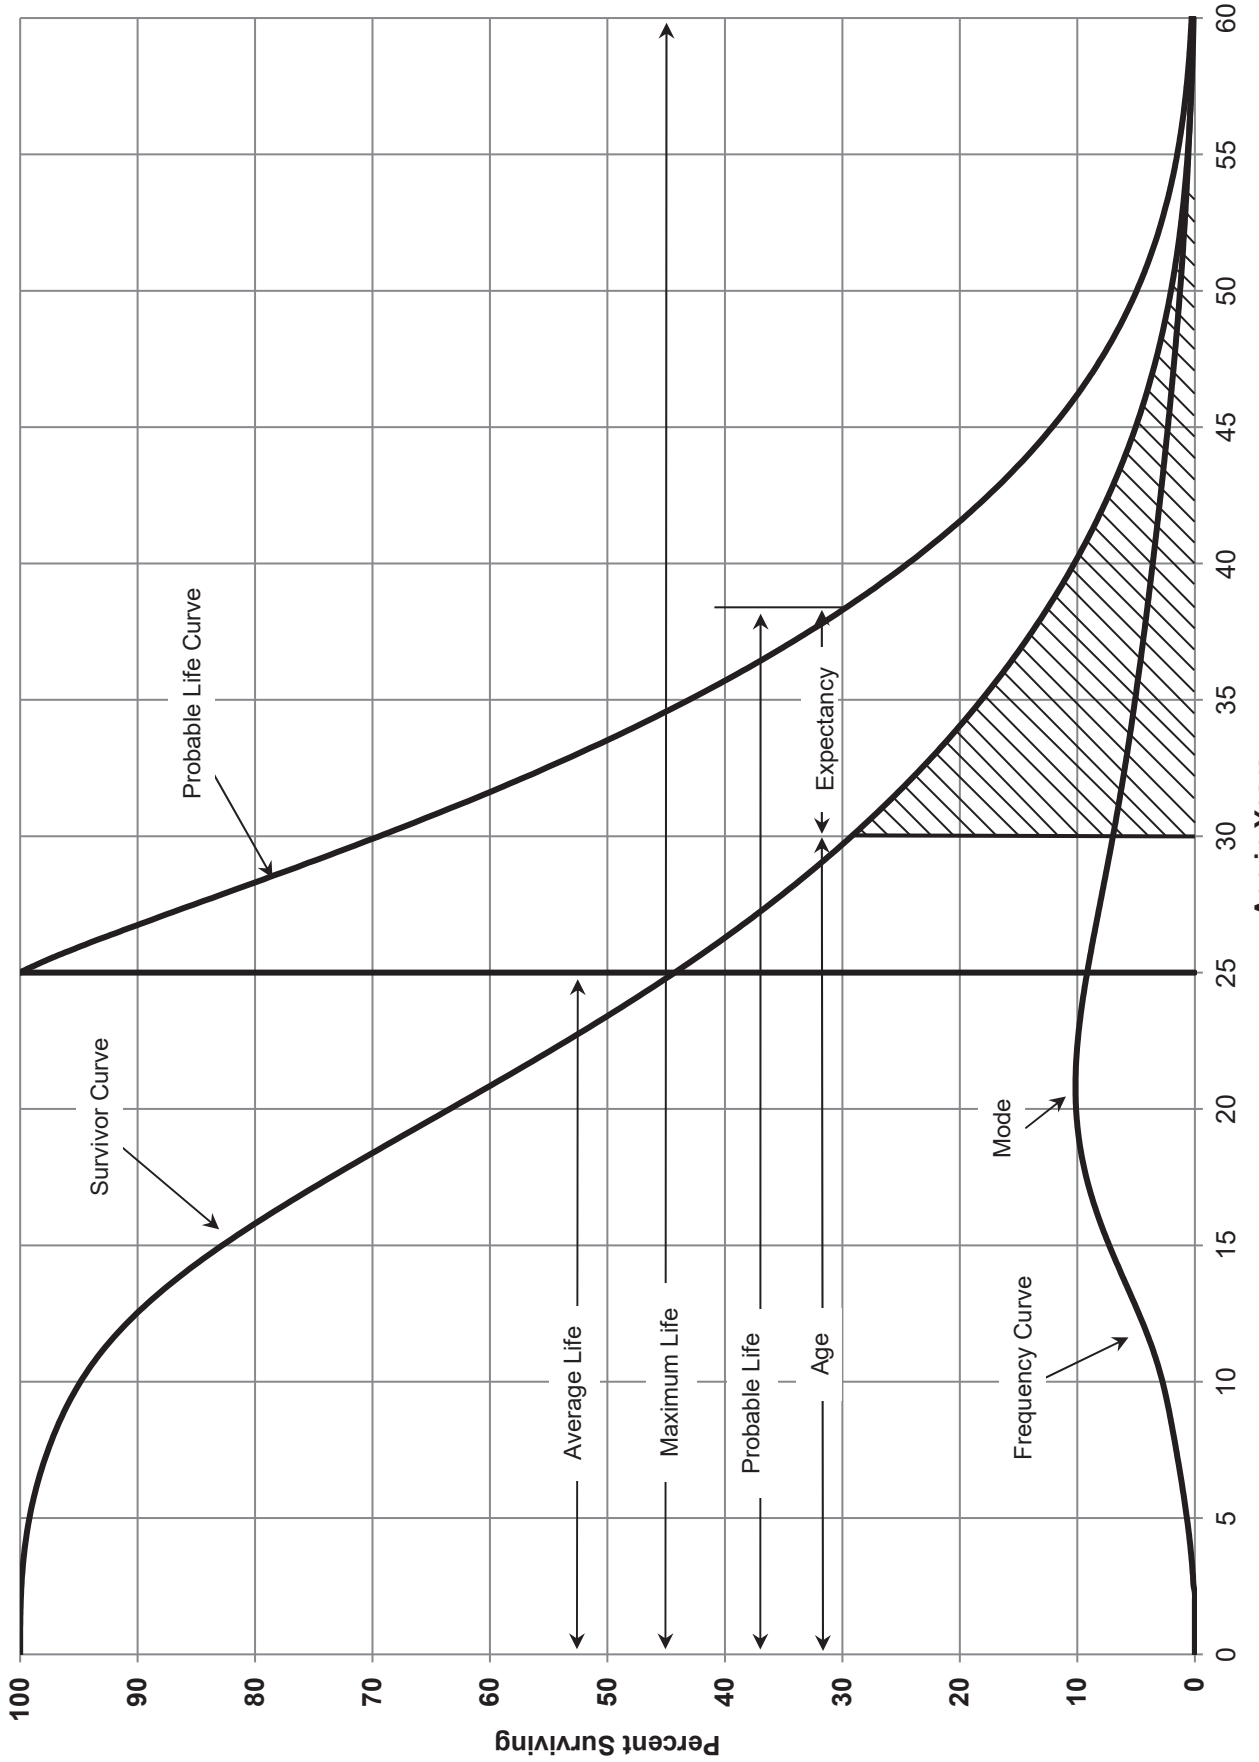

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

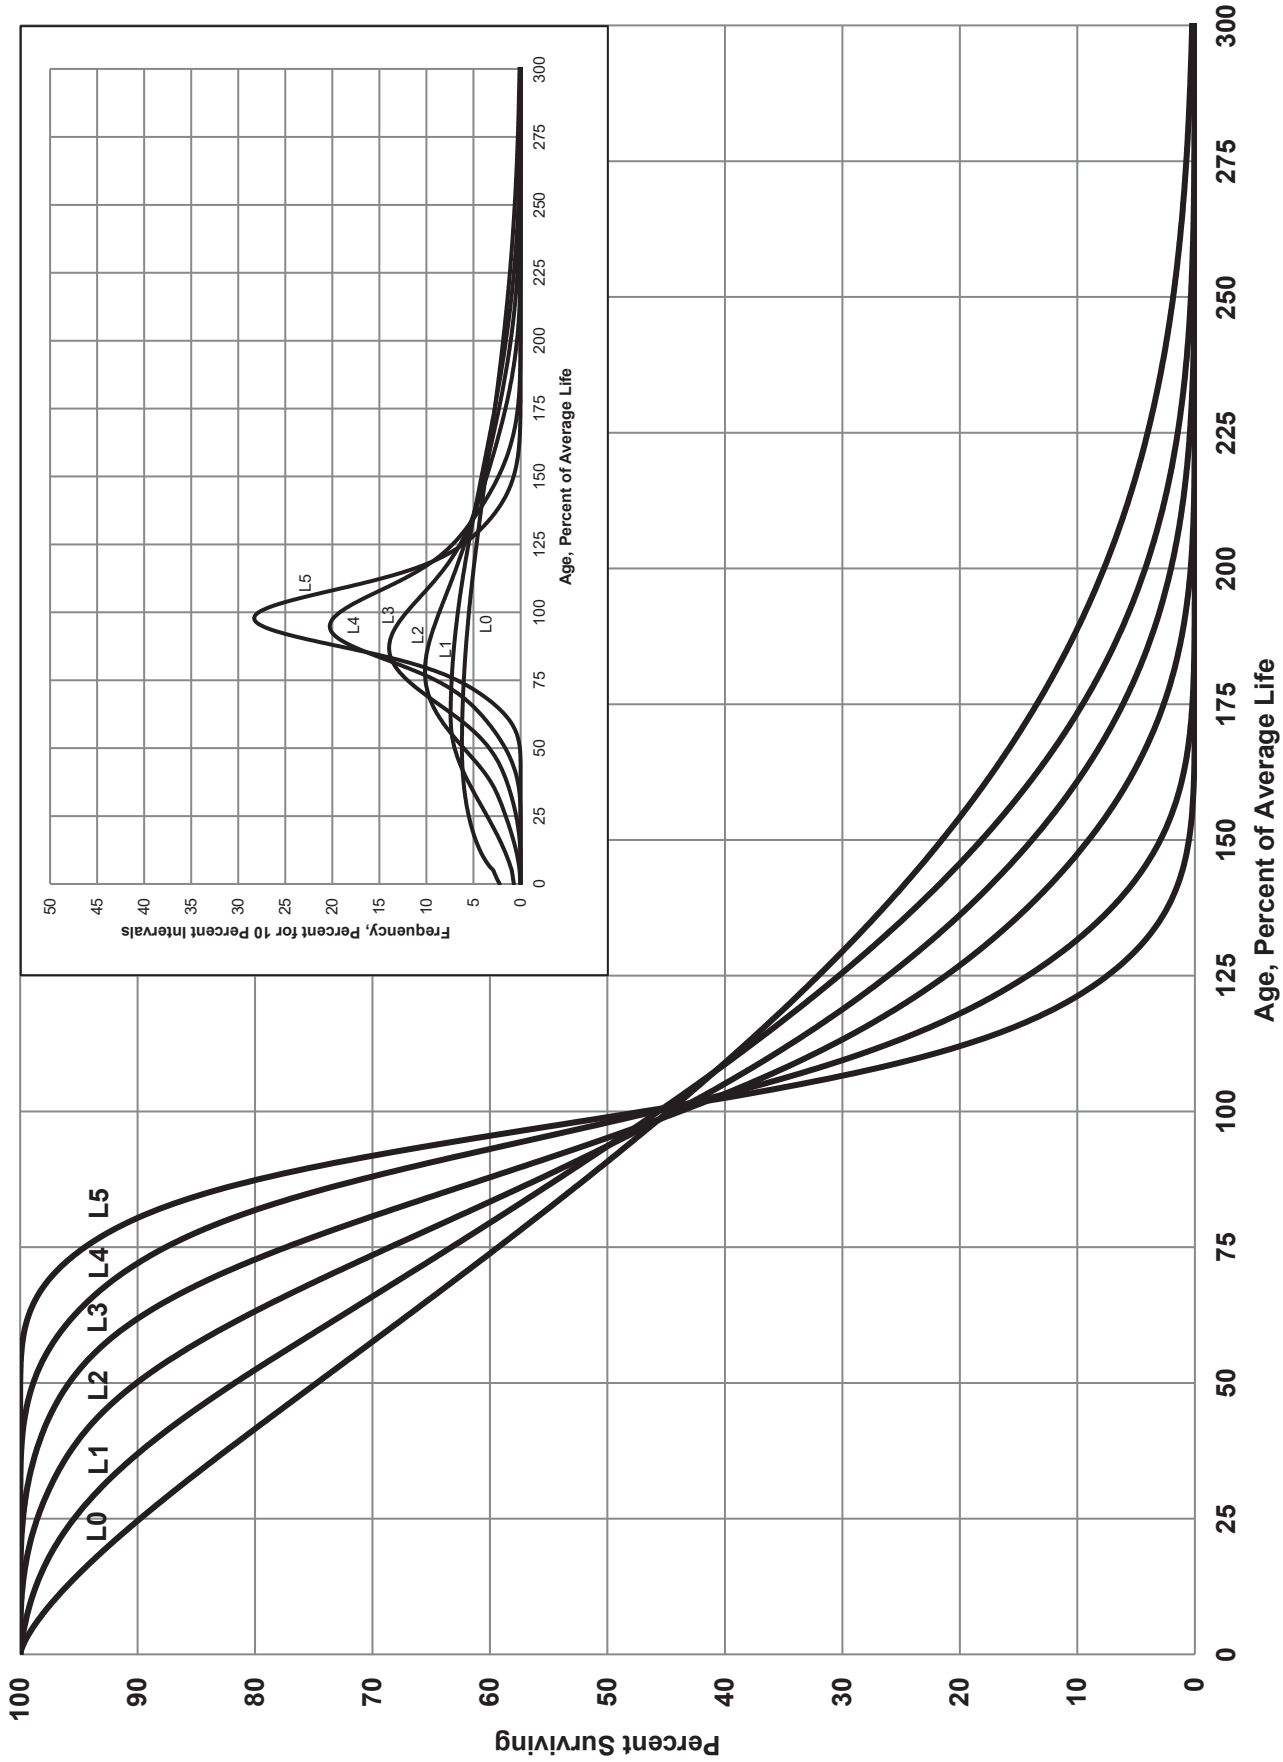

FIGURE 2.. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

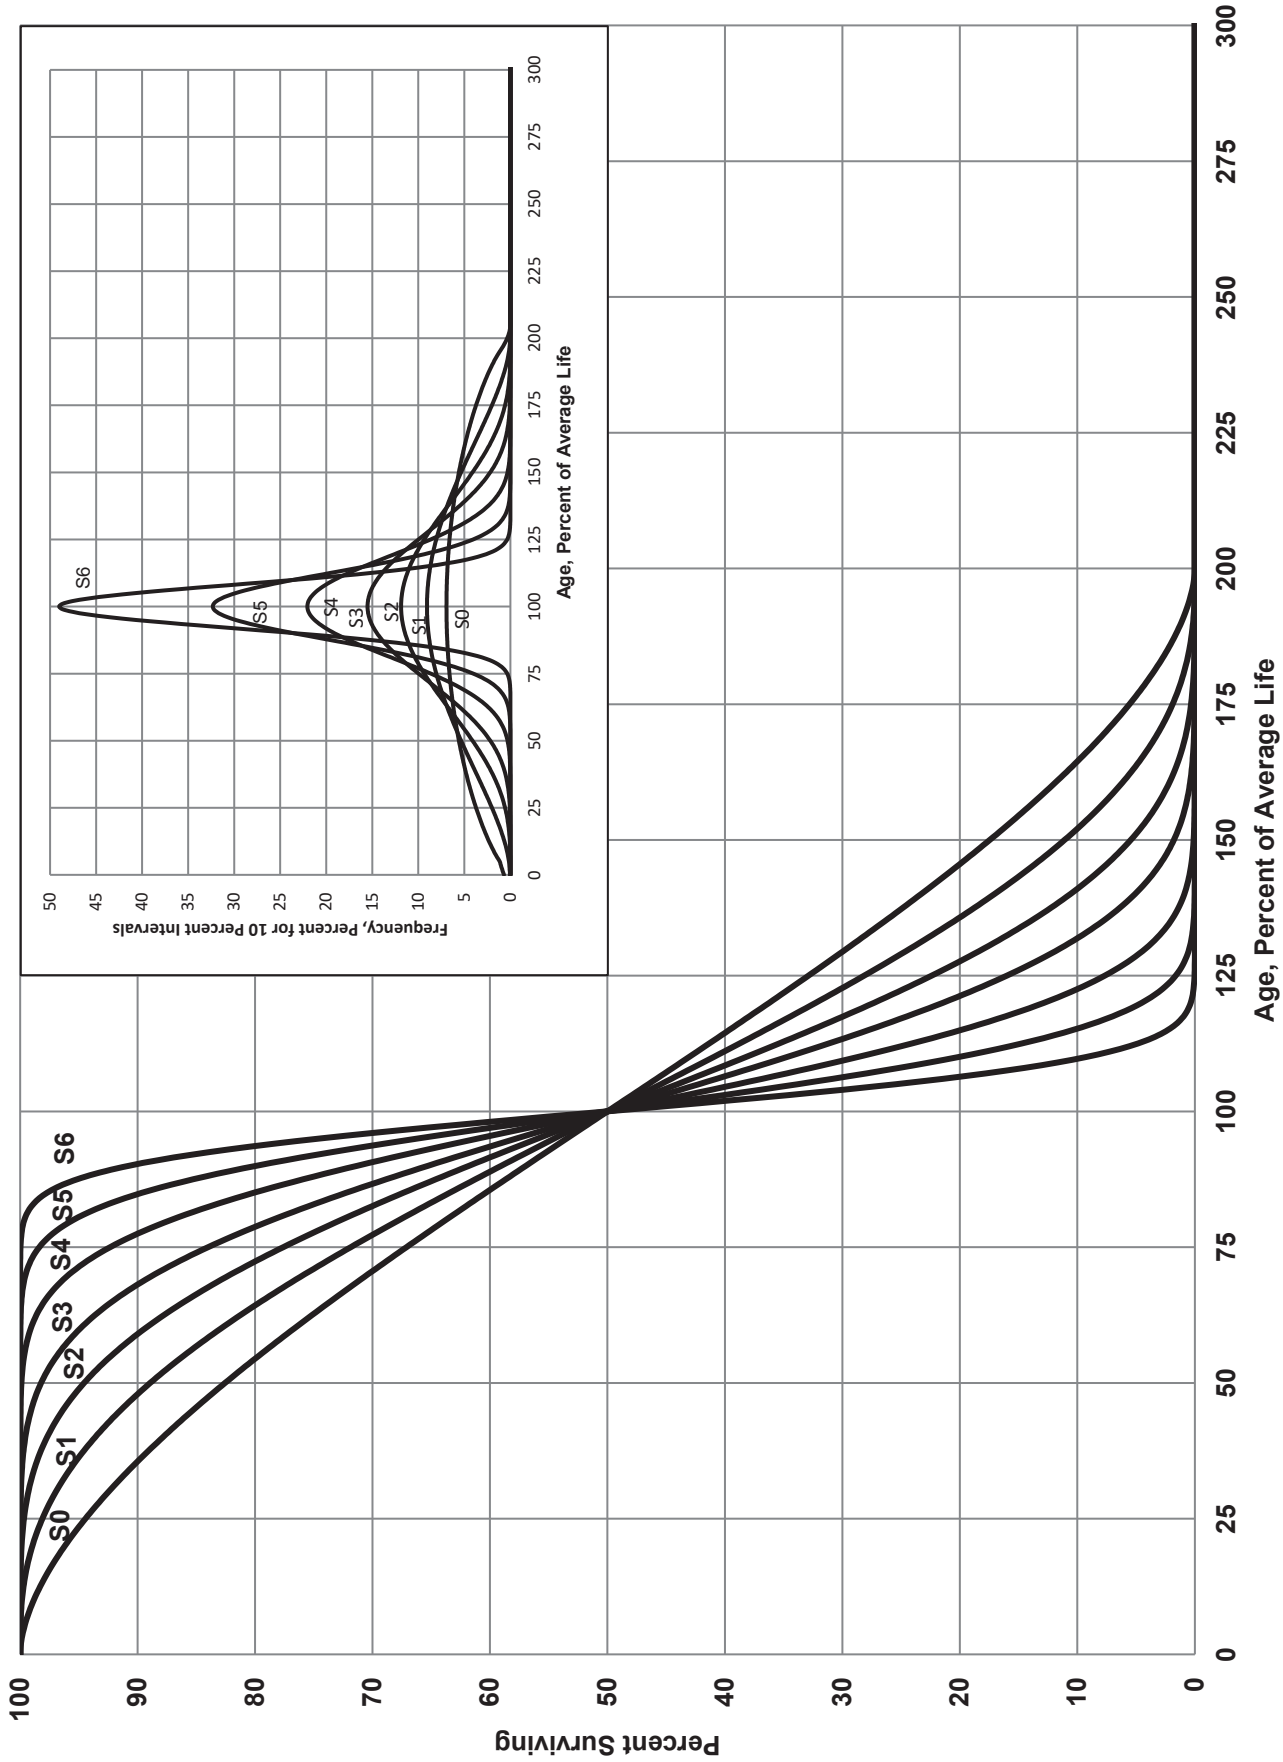

FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

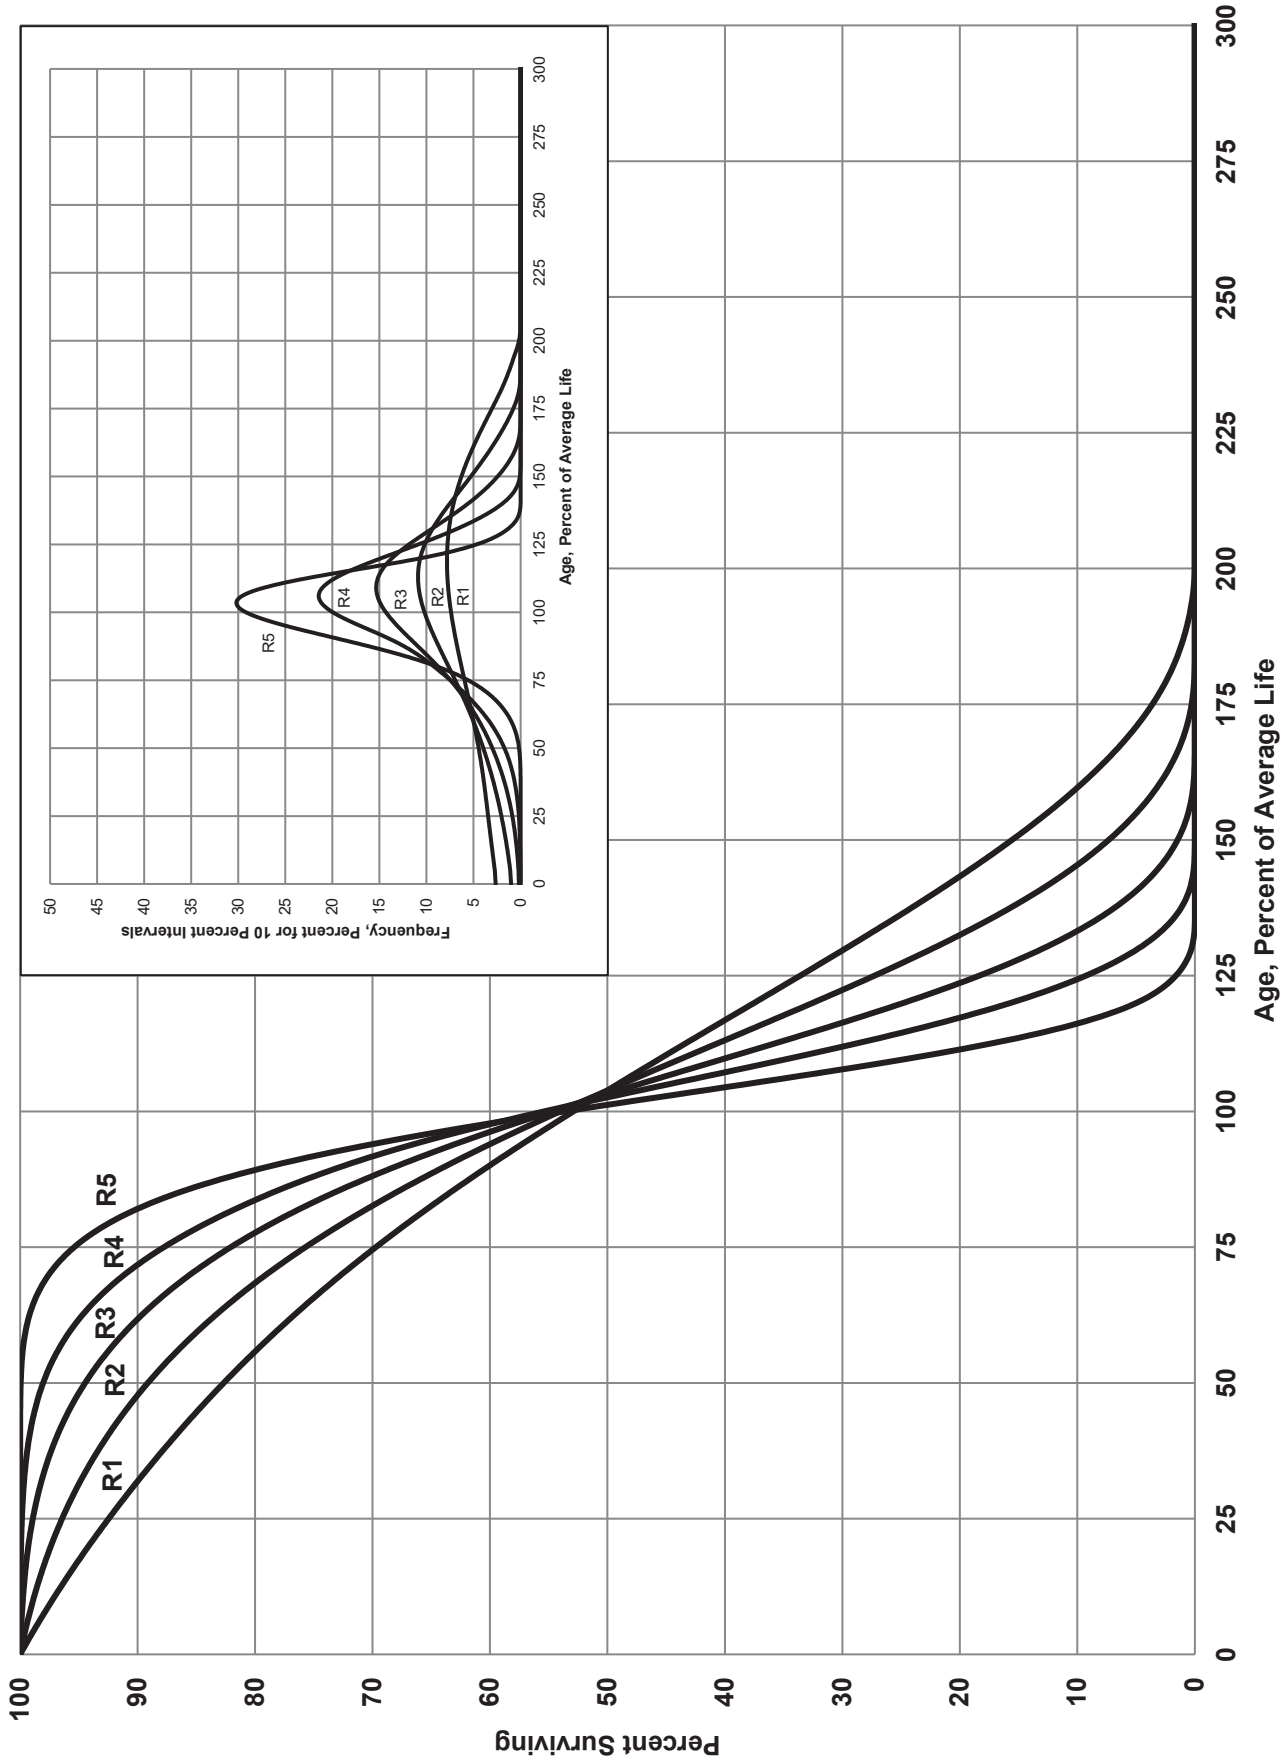

FIGURE 4.. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

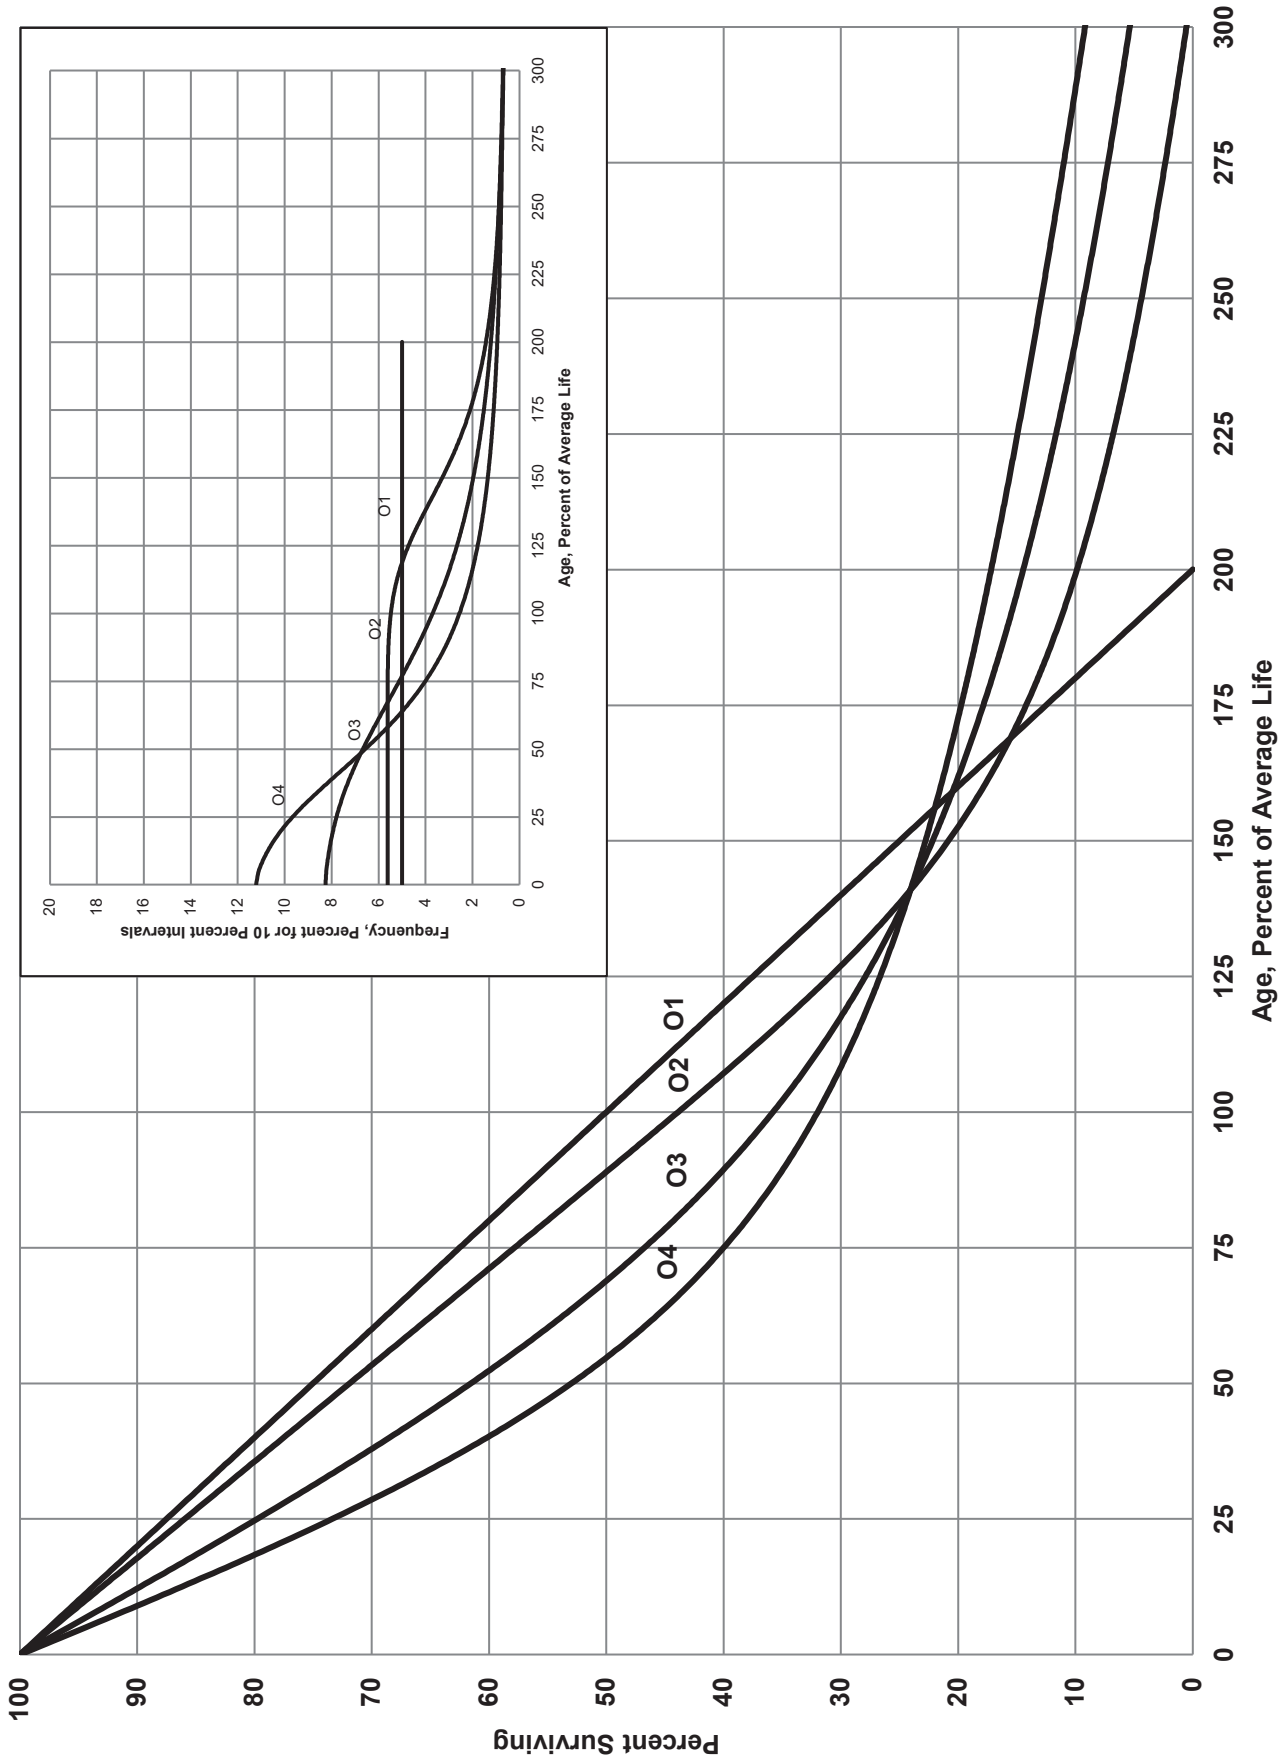

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2014-2023 for which there were placements during the years 2009-2023. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2009 were retired in 2014. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2014 retirements of 2009 installations and ending with the 2023 retirements of the 2018 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

[a] Transfer Affecting Exposures at Beginning of Year
[b] Transfer Affecting Exposures at End of Year
[c] Sale with Continued Use
Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2014 through 2023 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2019 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2014-2023
SUMMARIZED BY AGE INTERVAL

Experience Band 2014-2023

Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2014-2023, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

Field Trips

In order to be familiar with the operation of the Company and observe representative portions of the plant, a field trip was conducted for the study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during the field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

During the period of years our firm has conducted depreciation studies for the Company, the field trips have resulted in numerous reviews of the Company's operating areas. The following is a list of the locations visited during the most recent trip.

December 4, 2023
- Met Ed Corporate Headquarters
- North Temple Substation
- West Reading Substation
- Yorkana Substation
- York Service Center

Judgment

The survivor curve estimates were based on informed judgment which considered a number of factors. The primary factors were retirement rate analyses of historical service life data; current Company policies and outlook as determined during the discussions with management personnel; and the survivor curve estimates from previous depreciation studies for Metropolitan Edison Company and other electric companies.

The statistical analyses resulted in good to excellent indications of the survivor patterns experienced for most of the major accounts. The plant accounts or

subaccounts for which the statistical analyses were significant factors in the judgments of the survivor curves are as follows:

Account Number	Title
Distribution Plant	
362.00	Station Equipment
362.10	Station Equipment – Subtransmission
364.00	Poles, Towers and Fixtures
364.11	Poles, Towers and Fixtures – Subtransmission (Poles and Fixtures)
365.00	Overhead Conductors and Devices
365.01	Overhead Conductors and Devices – Subtransmission
367.00	Underground Conductors and Devices
367.10	Underground Conductors and Devices – Subtransmission
368.00	Line Transformers
369.00	Overhead Services
369.10	Underground Services
371.00	Installations on Customer Premises – Dusk to Dawn Lights
373.00	Street Lighting and Signal Systems
373.30	Street Lighting and Signal Systems – LED
General Plant	
390.10	Structures and Improvements
392.30	Transportation Equipment – Heavy Trucks
392.40	Transportation Equipment – Pole Trailers
396.00	Power Operated Equipment

The combined analysis of Account 365.00, Overhead Conductor and Devices, and Account 365.01, Overhead Conductor and Devices – Subtransmission, is used to illustrate the manner in which the study was conducted for the groups in the preceding list. It is a significant account and serves as a typical illustration. Aged plant accounting data have been compiled for the years 1939 through 2023. These data were coded by type of transaction, year in which the transaction took place, and year in which the plant was placed in service. The data were analyzed by the retirement rate method to obtain an indication of the experienced service life characteristics.

The estimated Iowa 60-O1 survivor curve is based on the experience bands, 1939-2023, 1969-2023 and 2004-2023. The estimated survivor curve is an excellent fit of the observed data, has an average service life that is a little longer than the previous estimate for this account, and is within the typical range of lives used by other electric utilities.

For the combined analysis of Account 364.00, Poles, Towers and Fixtures, and Account 364.11, Poles, Towers and Fixtures – Subtransmission, the estimate of survivor characteristics is based on the 1939-2023 and 1979-2023 experience bands. Most retirements have been due to age and deterioration. Typical service lives for distribution poles and fixtures range from 45 to 60 years. Most of the poles included in this account are wood poles which are subject to decay and rot. The climate and pole treatment are the predominant factors regarding the service life of wood poles. This is the reason for the wide range of lives experienced within the industry. Metropolitan Edison Company has not experienced high levels of replacement of poles over the years and the inclusion of the subtransmission assets has established a longer life than in the past. The Iowa 65-R1.5 survivor curve reflects the outlook of management, is above the upper end of the range of estimates used by other electric utilities and is a reasonable interpretation of a significant portion of the survivor curve through age 80.

The life span technique was used for large office buildings and service centers in Account 390.10, Structures and Improvements. For these large structures in Account 390.10, a life span was estimated for each structure based on its type of construction, use, age, condition and management's plans within the foreseeable future. An interim

survivor curve was estimated for each location, since interim retirements are normal for such structures and, in fact, have been experienced.

Generally, the survivor curve estimates for the remainder of the accounts were based on engineering judgment, considering the nature of the plant and equipment, review of available historical retirement data and a general knowledge of the service lives for similar equipment in other electric companies.

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

Group Depreciation Procedures

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally, the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group.

In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

In the equal life group procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. This procedure eliminates the need to base depreciation on average lives, inasmuch as each group is equivalent to a unit having a single life. The full costs of short-lived units are accrued during their lives, leaving no deferral of accruals required to be added to the annual costs associated with long-lived units. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

Remaining Life Annual Accruals

For the purpose of calculating remaining life accrual rates as of December 31, 2024, the estimated book depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation for the vintages calculated by the equal life group procedure follow. The detailed calculations are set forth in the Results of Study section of the report.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future whole life depreciation accruals if current forecasts of life characteristics are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account, based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life\ Expectancy}{Average\ Service\ Life}.$$

Equal Life Group Procedure

In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\left(\frac{\text{Book Cost}}{\text{Life}} \times \text{Remaining Life}\right)}{\frac{\text{Book Cost}}{\text{Life}}}$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated future survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining LIfe} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost} - \text{Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}.$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$Ratio = \frac{Remaining\ Life}{Average\ Service\ Life}.$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$Ratio = \frac{Age}{Service\ Life}.$$

The table on the following page illustrates the procedure for calculating straight line equal life group accrued depreciation, using an Iowa 12-R4 survivor curve and a December 31, 2024 calculation date.

In the table, each equal life group is defined by the age interval shown in columns 1 and 2, which identify the ages at which the first and last retirement of each group occur. The group's designated life, shown in column 3, is the midpoint of the interval. In the calculation, the equal life groups of each vintage are arranged such that the midpoint of each one-year age interval coincides with the calculation date, e.g., December 31 in this case. This enables the calculation of annual accruals which are centered on, or as of, the same date as the calculation of accrued depreciation.

The retirement during each age interval, shown in column 4, is the size of each equal life group. It is derived from the Iowa 12-R4 survivor curve and is the difference between the percents surviving (not shown) at the beginning and end of the age interval.

TOTAL			100.00000						

Each equal life group's whole life annual accrual, shown in column 5, equals the group's size (column 4) divided by its life (column 3), except that for the first age interval, the annual accrual is set equal to the group's size.

Columns 6 through 10 show the derivation of the whole life annual factor and accrued factor for each vintage based on the data developed in the first five columns. The year installed is shown in column 6. For all vintages other than the first year (2024), the summation of annual accruals for each year installed, shown in column 7, is calculated by adding one-half of the group annual accrual (column 5) for that vintage's current age interval plus the group annual accruals for all succeeding age intervals. For example, the figure 8.84171078118 for 2023 equals one-half of 0.02058000000 plus all of the succeeding figures in column 5. Only one half of the annual accrual for the vintage's current age interval group is included in the summation because the equal life group for that interval expires at the midpoint of the current year.

The summation of annual accruals (column 7) for installations during 2024 is calculated on the basis of an in-service date at the midpoint of the year, i.e., June 30. Inasmuch as the overall calculation is centered on December 31, 2024, the first figure in column 7, for vintage 2024, equals the group annual accrual for 2024 plus one-half of the group annual accruals for each of the subsequent years.

The average percent surviving, derived from the Iowa 12-R4 survivor curve, is shown in column 8 for each age interval. The annual factor, shown in column 9, is the result of dividing the summation of annual accruals (column 7) by the average percent surviving (column 8).

The accrued depreciation factor, shown in column 10, equals the annual factor multiplied by the age of the group as of December 31, 2024.

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization, as defined in the Uniform System of Accounts, is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization periods and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is appropriate for certain General Plant accounts that represent numerous units of property, but a very small portion of depreciable electric plant in service. The accounts and their amortization periods are as follows:

Account		Amortization Period, Years
391.00	Office Furniture and Equipment - Furniture	20
391.30	Personal Computers	5
391.50	Data Processing Smart Meters	5
393.00	Stores Equipment	25
394.00	Tools, Shop and Garage Equipment	25
395.00	Laboratory Equipment	20
397.00	Communication Equipment	25
398.00	Miscellaneous Equipment	20

For the purpose of calculating annual amortization amounts as of December 31, 2024, the book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The book reserve assigned to vintages with an age greater than the amortization period is equal to the vintage's original cost. The remaining book reserve is allocated among vintages with an age less than the amortization period in proportion to the calculated accrued amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the future amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

AMORTIZATION OF NET SALVAGE

Experienced and estimated net salvage is incorporated in the results of the study, as it was reported on the Company's books and records for the period January 1, 2020 through December 31, 2024. Results of the calculations are shown in Table 4.

Net salvage experienced during the five-year period is presented in this manner to determine the amount of negative net salvage to be amortized for book purposes. In developing the amount to be amortized, the data for the accounts which experienced positive net salvage have been netted with those for accounts which experienced negative net salvage.

In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual accruals and accrued depreciation calculated for each individual account. There were no exclusions from the 2020 through 2024 net salvage accrual.

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 4 presented on pages V-4 through V-8 summarize the results of the depreciation study as of December 31, 2024. Table 1 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of December 31, 2024, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 2 presents the bringforward of the book depreciation reserve to December 31, 2024. Table 3 sets forth the calculation of the depreciation accruals for the twelve months ended December 31, 2024. Table 4 presents the annual amortization of experienced and estimated net salvage based on the period 2020 through 2024.

DESCRIPTION OF DETAILED TABULATIONS

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2020-2024 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table(s) plotted on the chart. A cumulative summary, by year installed, for electric plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3. The tabulations of experienced and estimated net salvage by

year by account for the five-year period, 2020-2024, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to original cost are presented in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, future book accruals, remaining life expectancy and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal and gross salvage amounts, by plant account for each year, are presented beginning on page VIII-2. The total gross salvage and removal costs, by year, were used to calculate the five-year net salvage amortization presented in Table 4 on page V-8.

METROPOLITAN EDISON COMPANY

Metropolitan Edison Company
2800 Pottsville Pike
Reading, PA 19605-2459

Attention Ms. Joanna M. Savage
Director, Rates and Regulatory Affairs - PA

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to the electric plant of Metropolitan Edison Company ("MetEd"). The results of our study as of December 31, 2025, are presented in the attached detailed report.

The results of our study as of December 31, 2024, as well as a discussion of the methods and procedures used in the calculations and the support for the service life estimates, are included in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of December 31, 2024." The same methods, procedures and estimates were used in both studies.

The results of our study as of December 31, 2025, are summarized on pages I-3 through I-7 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

JOHN J. SPANOS

PART I. RESULTS OF STUDY

METROPOLITAN EDISON COMPANY
DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 4 presented on pages I-3 through I-7 summarize the results of the depreciation study as of December 31, 2025. Table 1 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of December 31, 2025, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 2 presents the bringforward of the book depreciation reserve to December 31, 2025. Table 3 sets forth the calculations of the depreciation accruals for the twelve months ended December 31, 2025. Table 4 presents the annual amortization of experienced and estimated net salvage based on the period 2021 through 2025.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-7. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2021 through 2025, beginning on pages III-2 through III-6.

METROPOLITAN EDISON COMPANY

Reading, PA 19605-2459

Attention Ms. Joanna M. Savage
Director, Rates and Regulatory Affairs – PA

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to electric plant of Pennsylvania Electric Company ("Penelec"). The results of our study as of December 31, 2023, are presented in the attached detailed report.

The results of our study as of December 31, 2024, as well as a discussion of the methods and procedures used in the calculations and the support for the service life estimates, are included in our report titled "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of December 31, 2024." The same methods, procedures and estimates were used in both studies.

The results of our study as of December 31, 2023, are summarized on pages I-3 through I-5 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

PART I. RESULTS OF STUDY

PENNSYLVANIA ELECTRIC COMPANY
DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

The results of the depreciation study are summarized in Table 1, which sets forth the calculated annual depreciation related to Electric Plant in Service as of December 31, 2023. Table 2 presents the experienced gross salvage and cost of removal associated with regular retirements during the five-year period, 2019-2023 and the annual amortization of net salvage.

DETAILED TABULATIONS OF DEPRECIATION CALCULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on II-7. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2019 through 2023, beginning on beginning on III-2 through III-4.
