Because the Company timely elected in 1972 the special rule for ratable flow-through of Federal investment tax credits under former Section 46(f)(2) (at that time Section 46(e)(2)) of the Internal Revenue Code, the only reduction that may be made to the Company's cost of service, with respect to Federal investment tax credits generated in calendar year 1972 and thereafter, is to amortize the Federal investment tax credits ratably over the life of the property. Under the special rule for ratable flow-through, the rate base of the utility cannot be reduced by any portion of deferred Federal investment tax credits.

Q. Explain Exhibit No. FIV-17-2.

A. Exhibit No. FIV-17-2 is an adjustment to reflect projected current Federal income tax and projected current Pennsylvania corporate net income tax based on projected taxable income for the twelve months ending December 31, 2025, under existing rates at the

currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.99%.

Total projected operating income before income taxes and excluding depreciation under existing rates for the twelve months ending December 31, 2025, in the amount of $36,636,117 is determined by subtracting projected operating expenses under existing rates in the amount of $28,987,478 (Refer to Exhibit No. FIII-2, Page 2 of 22, Column 4) and projected operating taxes other than income taxes under existing rates in the amount of $1,758,014 (Refer to Exhibit No. FIV-15, Page 2 of 4, Column 4) from projected operating revenues under existing rates in the amount of $67,381,609 (Refer to Exhibit No. FII-2, Page 2 of 9, Column 3) ($67,381,609 - $28,987,478 - $1,758,014 = $36,636,117). To arrive at taxable income at present rates, amounts are added for expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $16,770 and amounts are then deducted for tax repair expense in the amount of $17,241,159, cost of removal in the amount of $3,018,880, tank painting in the amount of $480,000, deferred rate case expense in the amount of $944,750, state tax depreciation in the amount of $11,976,051, and pro forma interest expense deduction for ratemaking purposes in the amount of $8,523,195.

Expenses of the Company's Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $16,770 are not allowed as a deduction for income tax purposes. Since these amounts are included in operating expenses and deducted in arriving at the figure of $36,636,117, they must be added back in arriving at taxable income. Tax repair expense in the amount of $17,241,159 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $3,018,880 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Tank painting in the amount of $480,000 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Deferred rate case expense in the amount of $944,7500 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Tax depreciation in the amount of $11,976,051 is detailed on Exhibit No. HIV-17-3, and Exhibit No. HIV-17-3 (a). I note that the Federal tax depreciation is less than state tax depreciation due to the provisions of Act 89 of 2002, which I will explain later with respect to Exhibit No. HIV-17-3 (a). Pro forma interest expense deduction for ratemaking purposes in the amount of $8,523,195 is determined by reflecting the interest

charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $413,332,385 x Weighted Debt Cost Rate of 2.06%).

Projected taxable income under existing rates in the amount of $(5,140,393) is determined by adding the expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $16,770 and amounts are then deducted for tax repair expense in the amount of $17,241,159, cost of removal in the amount of $3,018,880, tank painting in the amount of $480,000, deferred rate case expense in the amount of $944,750, state tax depreciation in the amount of $11,976,051, and pro forma interest expense deduction for ratemaking purposes in the amount of $8,523,195 from projected net operating income in the amount of $36,636,117 [$36,636,117 + $4,800 + $7,762 + $1,740 + $1,052 + $236,188 + $(23,331) + $145,298 + $3,081 + $5,138 + $672 + $8,357 + $16,770 - $17,241,159 - $3,018,880 - $480,000 - $944,750 - $11,976,051 - $8,523,195 = $(5,140,393)].

Projected State income tax under existing rates in the amount of $(410,717) is determined by applying the Pennsylvania corporate net income tax rate of 7.99% to projected taxable income in the amount of $(5,140,393) [$(5,140,393) x 0.0799 = $(410,717)]. Projected Federal taxable income under existing rates in the amount of $(4,127,474) is determined

by subtracting projected State income tax under existing rates in the amount of $(410,717) and adding back additional allowed State depreciation on bonus property of $602,201 to projected taxable income in the amount of $(5,140,393) [$(5,140,393) - $(410,717) + $602,201 = $(4,127,474)]. Projected Federal income tax under existing rates in the amount of $(866,769) is determined by applying the presently effective Federal income tax rate of 21% to the projected Federal taxable income under existing rates in the amount of $(4,127,474) [$(4,127,474 x 0.21 = $(866,769)]. Total projected current income taxes under existing rates in the amount of $(1,277,487) is determined by adding projected state income tax under existing rates in the amount of $(410,717) and projected Federal income tax under existing rates in the amount of $(866,769) [$(410,717) + $(866,769) = $(1,277,487)]. The adjustment to income taxes in the amount of $(1,278,121) is determined by subtracting total pro forma current income taxes under existing rates during the twelve months ended December 31, 2024, in the amount of $634 (Refer to Exhibit No. FIV-17) from total projected current income taxes under existing rates in the amount of $(1,277,487) [$(1,277,487) - $634 = $(1,278,121)]. The adjustment to income taxes at present rates in the amount of $(1,278,121) has been carried forward to Exhibit No. FIV-17, Page 2, Column 3.

Q. Explain Exhibit No. FIV-17-3.

A. Exhibit No. FIV-17-3 provides information concerning income tax depreciation used to calculate current and deferred Federal Income Taxes for ratemaking purposes. In order to explain Exhibit No. FIV-17-3, a general explanation of the tax depreciation methods used by York Water for various vintages of property is required.

For property placed in service during calendar year 1970 and prior years, the Company's method of tax depreciation is the straight-line method. No provision has been made in the rate case exhibits for normalization of tax depreciation for property placed in service in 1970 and prior years.

For property placed in service during calendar years 1971 through 1978, the Company's method of tax depreciation is the double declining balance method. As explained later, normalization of the income tax deferrals resulting from use of an accelerated tax depreciation method for property placed in service during calendar years 1971 through 1978 is required by Internal Revenue Code Section 167(1)(2)(B) because the Company's "applicable 1968 method" was straight line. The Company also filed, as a precaution, a timely election with the Internal Revenue Service electing normalization of accelerated depreciation.

For property placed in service during calendar years 1979 and 1980, the Company's method of tax depreciation is the double declining balance method under the Internal Revenue Service's Asset Depreciation Range System. Normalization of the income tax deferrals resulting from use of an accelerated depreciation method for property placed in service during the calendar years 1979 and 1980 also is required by Internal Revenue Code Section 167(1)(2)(B).

Normalization of the income tax deferrals resulting from the use of an accelerated tax depreciation method for property placed in service during calendar years 1971 through 1980 is required because the Company's "applicable 1968 method", for purposes of

Section 167 of the Internal Revenue Code, was the straight-line method. Under Section 167(1)(2)(B) of the Internal Revenue Code, because the Company's "applicable 1968 method" was straight line, the Company may not deduct accelerated depreciation for property placed in service during calendar years 1971 through 1980 for income tax purposes unless there is normalization for ratemaking purposes.

For property placed in service beginning with calendar year 1981 and continuing through 2025, the Company employs various methods of tax depreciation as permitted by law. Normalization of the tax deferrals resulting from the use of these accelerated depreciation methods is required by the Internal Revenue Code.

I note that for qualified property placed in service after September 10, 2001, and before January 1, 2005, the Company's method of tax depreciation includes either the Internal Revenue Code's Special 30 Percent Depreciation Allowance or the Internal Revenue Code's Special 50 Percent Depreciation Allowance.

I note that for qualified property placed in service after January 1, 2008, and before January 1, 2018, the Company's method of tax depreciation includes either the Internal Revenue Code's 50 Percent First Year Bonus Depreciation or the Internal Revenue Code's 100 Percent First Year Bonus Depreciation.

If the Company is not permitted to recover revenues necessary to provide for normalization of the income tax effects of accelerated depreciation, the Company will not be permitted to deduct accelerated depreciation for Federal income tax purposes.

Tax depreciation by vintage year in the amount of $14,676,498 for property included in the measure of value is shown on Exhibit FIV-17-2, Column 3.

Deferred taxes must be provided with the normalization requirements of Internal Revenue Code Sections 167 and 168. The amount of $14,676,498 is reduced by $12,885,523, which is the amount included for ratemaking purposes as depreciation in order to determine the difference of $1,790,975 to be used for calculating the deferred Federal income tax ($14,676,498 - $12,885,523 = $1,790,975). The Federal income tax rate of 21% is applied to the difference of $1,790,975 to determine deferred Federal income tax in the amount of $376,105 ($1,790,975 x 0.21). The adjustment to deferred Federal income tax in the amount of $21,983 is determined by subtracting deferred Federal income tax recorded on the corporate books during the twelve months ended December 31, 2024, in the amount of $354,122 from the calculated deferred Federal income tax in the amount of $376,105 ($376,105 - $354,122 = $21,983). The adjustment to deferred Federal income tax in the amount of $21,983 has been carried forward to Exhibit No. FIV-17, Column 3.

Q. Explain Exhibit No. FIV-17-3 (a).

A. Exhibit No. FIV-17-3 (a) is the calculation of the state tax decoupling from the Federal Special 30-Percent and 50-Percent Depreciation Allowance in accordance with Pennsylvania Act 89 of 2002 signed into law June 29, 2002 and the Economic Growth and Tax Relief Reconciliation Act of 2001, the Job Creation and Worker Assistance Act of 2002, the Jobs and Growth Tax Relief Reconciliation Act of 2003, the Economic

Stimulus Act of 2008, and the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010. These acts require corporate taxpayers who elect the Federal Special 30-Percent and Special 50-Percent Depreciation Allowance to make adjustments, which eliminate the effect of the Federal Special 30-Percent and Special 50-Percent Depreciation Allowance in arriving at Pennsylvania taxable income. Because Act 89 of 2002 eliminated the effect of the first-year Federal bonus depreciation, additional State depreciation deductions are allowed in subsequent years.

The basis of property qualified for the additional first year depreciation allowance is reflected in Column 2 of Exhibit No. FIV-17-3 (a). Total Federal tax depreciation is shown in Column 3 of Exhibit No. FIV-17-3 (a). The adjustment for additional allowed state depreciation in lieu of the Federal Special 30-Percent and 50 Percent depreciation is reflected in Column 6 and is determined by multiplying Federal depreciation shown in Column 5 by 0.42857 (3/7). The factor of 0.42857 (3/7) is reflected in the Bureau of Corporation Taxes Adjustment for Bonus Depreciation (Form REV-784).

The recovery of a portion of the bonus depreciation of $602,201 is carried forward to Exhibit No. FIV-17-2 and FIV-17-5 as an adjustment to State tax depreciation.

Q. Explain Exhibit No. FIV-17-4.

A. Exhibit No. FIV-17-4 calculates the reversal of excess deferred Federal income taxes related to accelerated depreciation on property. Upon passage of the Tax Cuts and Jobs Act of 2017, the Company adjusted the balance of its deferred Federal income taxes related to accelerated depreciation on property to the newly enacted statutory Federal

income tax rate of 21%. The difference between the existing balance of deferred Federal income taxes related to accelerated depreciation on property and the adjusted balance of deferred Federal income taxes related to accelerated depreciation on property was recorded as a regulatory liability for the excess deferred Federal income taxes related to accelerated depreciation on property.

A reversal is recorded for the excess deferred Federal income taxes whose normalized depreciation exceeds tax depreciation, that is, the tax life of the property has reached what is commonly referred to as the "turnaround point." The vintage years that have reached the turnaround point are 1971 through 1973, 1979 through 1999, 2011, and 2015 through 2017. Tax depreciation for these vintage years subject to normalization requirements of Internal Revenue Code Section 167 and 168 is $596,214. The amount of tax depreciation of $596,214 is less than $1,917,477, which is the amount included for ratemaking purposes as depreciation on property placed in service during these vintage years. The difference of $(1,321,263) is to be used for calculating the return of excess previously deferred Federal income tax to be reversed [$596,214 - $1,917,477 = $(1,321,263)]. Tax depreciation, and thus excess deferred Federal income taxes recovered from customers, was computed to the turnaround point for all of these properties at a rate of 21%, 34%, 46%, or 48%. The excess of 2% between 48% and 46% has been amortized as a reduction to the cost of service in prior rate proceedings. However, the Tax Reform Act of 1986 and the Tax Cuts and Jobs Act of 2017 prohibits flow back of the excess between the prior rates and the current rate any faster than ratably over the tax life of the property following the property attaining the turnaround point. This ratable flow back is to be achieved by using a weighted average tax rate, representing the weighted average rate for

each vintage for all years prior to the turnaround year. The weighted average rate for each vintage year, which has reached the turnaround point, is shown in Column 6. The weighted average tax rate is applied to the tax depreciation subject to deferral shown in Column 4 to determine the reversal of deferred Federal income taxes in the amount of $(448,968). This was compared to the value of the deferred Federal income taxes at the newly enacted rate of $277,465 determined by multiplying the total tax depreciation subject to deferral of $(1,321,263) by the newly enacted rate of 21% [$(1,321,263) x 0.21 = $(277,465)]. The difference between the deferred Federal income taxes at prior rates of $(448,968) and those at the newly enacted rate of $277,465 is the reversal of the excess deferred Federal income taxes of $(171,502) [$(448,968) - $277,465 = $(171,502)]. An adjustment of the excess deferred Federal income taxes in the amount of $6,354 is determined by subtracting the reversal of pro forma excess deferred Federal income taxes during the twelve months ended December 31, 2024, in the amount of $(177,856), from the calculated pro forma reversal of excess deferred Federal income taxes in the amount of $(171,502) [$(171,502) - $(177,856) = $6,354]. The adjustment of the reversal of deferred Federal income taxes in the amount of $6,354 has been carried forward to Exhibit HIV-17, Column 3.

Q. Explain Exhibit No. FIV-17-5.

A. Exhibit No. FIV-17-5 is an adjustment to reflect pro forma current Federal income tax and pro forma current Pennsylvania corporate net income tax based on pro forma taxable income for the twelve months ending December 31, 2025, under existing rates at the currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.99%.

Total pro forma operating income before income taxes and excluding depreciation under existing rates for the twelve months ending December 31, 2025, in the amount of $36,052,837 is determined by subtracting pro forma operating expenses under existing rates in the amount of $29,932,527 (Refer to Exhibit No. FIII-2, Page 9 of 9, Column 1) and pro forma operating taxes other than income taxes under existing rates in the amount of $1,833,113 (Refer to Exhibit No. FIV-15, Page 2 of 4, Column 7) from pro forma operating revenues under existing rates in the amount of $67,818,476 (Refer to Exhibit No. FII-2, Page 4 of 9, Column 3) ($67,818,476 - $29,932,527 - $1,833,113 = $36,052,837). To arrive at taxable income at present rates, amounts are added for the expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $16,770 and amounts are then deducted for tax repair expense in the amount of $17,241,159, cost of removal in the amount of $3,018,880, tank painting in the amount of $480,000, deferred rate case expense in the amount of $944,750, state tax depreciation in the amount of $11,976,051, and pro forma interest expense deduction for ratemaking purposes in the amount of $8,523,195.

Expenses of the Company’s Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740,

Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $16,770 are not allowed as a deduction for income tax purposes. Since these amounts are included in operating expenses and deducted in arriving at the figure of $36,052,837, they must be added back in arriving at taxable income. Tax repair expense in the amount of $17,241,159 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $3,018,880 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Tank painting in the amount of $480,000 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Deferred rate case expense in the amount of $944,750 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Tax depreciation in the amount of $11,976,051 is detailed on Exhibit No. FIV-17-3 and Exhibit No. FIV-17-3 (a). I note that the Federal tax depreciation is less than state tax depreciation due to the provisions of Act 89 of 2002, which I previously explained with respect to Exhibit No. FIV-17-3 (a). Pro forma interest expense deduction for ratemaking purposes in the amount of $8,523,195 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $413,332,385 x Weighted Debt Cost Rate of 2.06%).

Pro forma taxable income under existing rates in the amount of $(5,723,673) is determined by adding the expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $16,770 and amounts are then deducted for tax repair expense in the amount of $17,241,159, cost of removal in the amount of $3,018,880, tank painting in the amount of $480,000, deferred rate case expense in the amount of $944,750, state tax depreciation in the amount of $11,976,051, and pro forma interest expense deduction for ratemaking purposes in the amount of $8,523,195 from projected net operating income in the amount of $36,052,837 [$36,052,837 + $4,800 + $7,762 + $1,740 + $1,052 + $236,188 + $(23,331) + $145,298 + $3,081 + $5,138 + $672 + $8,357 + $16,770 - $17,241,159 - $3,018,880 - $480,000 - $944,750 - $11,976,051 - $8,523,195 = $(5,723,673)].

Pro forma State income tax under existing rates in the amount of $(457,321) is determined by applying the Pennsylvania corporate net income tax rate of 7.99% to pro forma taxable income in the amount of $(5,723,673) [$(5,723,673) x 0.0799 = $(457,321)]. Pro forma Federal taxable income under existing rates in the amount of $(4,664,150) is determined by subtracting pro forma State income tax under existing rates in the amount of $(457,321) and adding back additional allowed State depreciation on bonus property of $602,201 to pro forma taxable income in the amount of $(5,723,673)

[$(5,723,673) - $(457,321) + $602,201 = $(4,664,150)]. Pro forma Federal income tax under existing rates in the amount of $(979,471) is determined by applying the presently effective Federal income tax rate of 21% to the pro forma Federal taxable income under existing rates in the amount of $(4,664,150) [$(4,664,150) x 0.21 = $(979,471)]. Total pro forma current income taxes under existing rates in the amount of $(1,436,793) is determined by adding pro forma state income tax under existing rates in the amount of $(457,321) and pro forma Federal income tax under existing rates in the amount of $(979,471) [$(457,321) + $(979,471) = $(1,436,793)]. The adjustment to income taxes in the amount of $(159,306) is determined by subtracting total projected current income taxes under existing rates during the twelve months ending December 31, 2025, in the amount of $(1,277,487) (Refer to Exhibit No. FIV-17-2) from total pro forma current income taxes under existing rates in the amount of $(1,436,793) [$(1,436,793) - $(1,277,487) = $(159,306)]. The adjustment to income taxes at present rates in the amount of $(159,306) has been carried forward to Exhibit No. FIV-17, Page 2, Column 6.

Q. Explain Exhibit No. FIV-17-6.

A. Exhibit No. FIV-17-6 is an annualized amortization of Federal investment tax credits for the twelve months ended February 28, 2027. The Tax Reform Act of 1986 repealed the investment tax credit provisions effective December 31, 1985. The investment tax credits for 1986 through February 28, 2027, are claimed under the transitional property provisions of TRA-86.

Federal investment tax credits as of February 28, 2027, generated during the period 1972 through February 28, 2027, are shown on Column 2 of Exhibit No. FIV-17-9. The

Company adopted a fifty-year amortization period for Federal investment tax credits to meet the requirements of former Section 46(f)(2) of the Internal Revenue Code. The pro forma annual amortization of Federal investment tax credits in the amount of $(39,126) shown in Column 4 of Exhibit No. FIV-17-6 is determined by dividing the Federal investment tax credits generated, shown in Column 2, by the fifty-year amortization period shown in Column 3.

In 1972, the Company timely elected the special rule for ratable flow-through of investment tax credits under former Section 46(f)(2) (at that time Section 46(e)(2)) of the Internal Revenue Code which requires that Federal investment tax credits be flowed through the ratepayers as a reduction to Federal income taxes ratably over the depreciable life of the property. An adjustment of the annual amortization of Federal investment tax credits in the amount of $1,185 is determined by subtracting the pro forma amortization of Federal investment tax credits for the period ended December 31, 2025, of $(38,374) (see Exhibit No. FIV-17-1) from the calculated pro forma annual amortization of Federal investment tax credits in the amount of $(37,190), shown in Column 4 [$(37,190) - $(38,374) = $1,185]. The adjustment of the annual amortization of Federal investment tax credits in the amount of $1,185 has been carried forward to Exhibit FIV-17, Page 3, Column 3.

Because the Company timely elected in 1972 the special rule for ratable flow-through of Federal investment tax credits under former Section 46(f)(2) (at that time Section 46(e)(2)) of the Internal Revenue Code, the only reduction that may be made to the Company's cost of service, with respect to Federal investment tax credits generated in

calendar year 1972 and thereafter, is to amortize the Federal investment tax credits ratably over the life of the property. Under the special rule for ratable flow-through, the rate base of the utility cannot be reduced by any portion of deferred Federal investment tax credits.

Q. Explain Exhibit No. FIV-17-7.

A. Exhibit No. FIV-17-7 is an adjustment to reflect projected current Federal income tax and projected current Pennsylvania corporate net income tax based on projected taxable income for the twelve months ending February 28, 2027, under existing rates at the currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.49%.

Total projected operating income before income taxes and excluding depreciation under existing rates for the twelve months ending February 28, 2027, in the amount of $34,988,046 is determined by subtracting projected operating expenses under existing rates in the amount of $31,154,718 (Refer to Exhibit No. FIII-2, Page 16 of 22, Column 1) and projected operating taxes other than income taxes under existing rates in the amount of $1,844,441 (Refer to Exhibit No. FIV-15, Page 3 of 4, Column 4) from projected operating revenues under existing rates in the amount of $67,987,204 (Refer to Exhibit No. FII-2, Page 6 of 9, Column 3) ($67,987,204 - $31,154,718 - $1,844,441 = $34,988,046). To arrive at taxable income at present rates, amounts are added for expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188,

Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $9,379 and amounts are then deducted for tax repair expense in the amount of $16,533,188, cost of removal in the amount of $2,220,538, state tax depreciation in the amount of $14,287,107, and pro forma interest expense deduction for ratemaking purposes in the amount of $9,167,897.

Expenses of the Company's Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $9,379 are not allowed as a deduction for income tax purposes. Since these amounts are included in operating expenses and deducted in arriving at the figure of $34,988,046, they must be added back in arriving at taxable income. Tax repair expense in the amount of $16,533,188 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $2,220,538 is capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. State tax depreciation in the amount of $14,287,107 is detailed on Exhibit No. FIV-17-8 and Exhibit No. FIV-17-8 (a). I note that the state tax depreciation is greater than Federal tax depreciation, which I will

explain later with respect to Exhibit No. FIV-17-8 (a). Projected interest expense deduction for ratemaking purposes in the amount of $9,167,897 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $444,597,217 x Weighted Debt Cost Rate of 2.06%).

Projected taxable income under existing rates in the amount of $(6,820,550) is determined by adding the expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $9,379 and amounts are then deducted for tax repair expense in the amount of $16,533,188, cost of removal in the amount of $2,220,538, state tax depreciation in the amount of $14,287,107, and pro forma interest expense deduction for ratemaking purposes in the amount of $9,167,897.from projected net operating income in the amount of $34,988,046 ($34,988,046 + $4,800 + $7,762 + $1,740 + $1,052 + $236,188 + $(23,331) + $145,298 + $3,081 + $5,138 + $672 + $8,357 + $9,379 - $16,533,188 - $2,220,538 - $14,287,107 - $9,167,897 = $(6,820,550)].

Projected State income tax under existing rates in the amount of $(510,859) is determined by applying the Pennsylvania corporate net income tax rate of 7.49% to projected taxable income in the amount of $(6,820,550) [$(6,820,550 x 0.0749 = $(510,859)]. Projected

Federal taxable income under existing rates in the amount of $(5,719,564) is determined by subtracting projected State income tax under existing rates in the amount of $(510,859) and adding back additional allowed state depreciation on bonus property of $590,127 to projected taxable income in the amount of $(6,820,550) [$(6,820,550) - $(510,859) + $590,127 = $(5,719,564)]. Projected Federal income tax under existing rates in the amount of $(1,201,108) is determined by applying the presently effective Federal income tax rate of 21% to the projected Federal taxable income under existing rates in the amount of $(5,719,564) [$(5,719,564) x 0.21 = $(1,201,108)]. Total projected current income taxes under existing rates in the amount of $(1,711,968) is determined by adding projected state income tax under existing rates in the amount of $(510,859) and projected Federal income tax under existing rates in the amount of $(1,201,108) [$(510,859) + $(1,201,108) = $(1,711,968)]. The adjustment to income taxes in the amount of $(275,175) is determined by subtracting total pro forma current income taxes under existing rates during the twelve months ended December 31, 2025, in the amount of $(1,436,793) (Refer to Exhibit No. FIV-17-5) from total projected current income taxes under existing rates in the amount of $(1,711,968) [$(1,711,968) - $(1,436,793) = $(275,175)]. The adjustment to income taxes at present rates in the amount of $(275,175) has been carried forward to Exhibit No. FIV-17, Page 3, Column 3.

Q. Explain Exhibit FIV-17-8.

A. Exhibit No. FIV-17-8 provides information concerning income tax depreciation used to calculate current and deferred Federal Income Taxes for ratemaking purposes for the fully projected future test year. A general explanation of the tax depreciation methods used by York Water for various vintages of property is required in order to fully understand

Exhibit No. FIV-17-8. That explanation was previously provided with respect to Exhibit No. FIV-17-3.

Tax depreciation by vintage year in the amount of $15,721,287 for property included in the measure of value is shown on Exhibit FIV-17-8, Column 3.

Deferred taxes must be provided with the normalization requirements of Internal Revenue Code Sections 167 and 168. The amount of $15,721,287 is reduced by $13,688,761, which is the amount included for ratemaking purposes as depreciation in order to determine the difference of $2,032,526 to be used for calculating the deferred Federal income tax ($15,721,287 - $13,688,761 = $2,032,526). The Federal income tax rate of 21% is applied to the difference of $2,032,526 to determine deferred Federal income tax in the amount of $426,830 ($2,032,526 x 0.21). The adjustment to deferred Federal income tax in the amount of $50,726 is determined by subtracting deferred pro forma Federal income tax during the twelve months ended December 31, 2025, in the amount of $376,105 from the calculated deferred Federal income tax in the amount of $426,830 ($426,830 - $376,105 = $50,726). The adjustment to deferred Federal income tax in the amount of $50,726 has been carried forward to Exhibit No. FIV-17, Column 3.

Q. Explain Exhibit No. FIV-17-8 (a).

A. Exhibit No. FIV-17-8 (a) presents the calculation of the state tax decoupling from the Federal Special 30-Percent and 50 Percent Depreciation Allowance for the fully projected future test year in accordance with Act 89 of 2002 signed into law June 29, 2002 and the Economic Growth and Tax Relief Reconciliation Act of 2001, the Job Creation and

Worker Assistance Act of 2002, the Jobs and Growth Tax Relief Reconciliation Act of 2003, the Economic Stimulus Act of 2008, and the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010. These acts require corporate taxpayers who elect the Federal Special 30-Percent and 50 Percent Depreciation Allowance to make adjustments, which eliminate the effect of the Federal Special 30-Percent and 50 Percent Depreciation Allowance in arriving at Pennsylvania taxable income. Because Act 89 of 2002 eliminated the effect of the first-year Federal bonus depreciation, additional State depreciation deductions are allowed in subsequent years.

The basis of property qualified for the additional first-year depreciation allowance is reflected in Column 2 of Exhibit No. FIV-17-8 (a). Total Federal tax depreciation is shown in Column 3 of Exhibit No. HIV-17-3 (a). The adjustment for additional allowed state depreciation in lieu of the Federal Special 30-Percent and 50 Percent depreciation is reflected in Column 6 and is determined by multiplying Federal depreciation shown in Column 5 by 0.42857 (3/7). The factor of 0.42857 (3/7) is reflected in the Bureau of Corporation Taxes Adjustment for Bonus Depreciation (Form REV-784).

The increase in depreciation of $590,127 is carried forward to Exhibit No. FIV-17-7 and FIV-17-10 as an adjustment to State tax depreciation.

Q. Explain Exhibit No. FIV-17-9.

A. Exhibit No. FIV-17-9 calculates the reversal of excess deferred Federal income taxes related to accelerated depreciation on property for the fully projected future test year. Upon passage of the Tax Cuts and Jobs Act of 2017, the Company adjusted the balance

of its deferred Federal income taxes related to accelerated depreciation on property to the newly enacted statutory Federal income tax rate of 21%. The difference between the existing balance of deferred Federal income taxes related to accelerated depreciation on property and the adjusted balance of deferred Federal income taxes related to accelerated depreciation on property was recorded as a regulatory liability for the excess deferred Federal income taxes related to accelerated depreciation on property.

A reversal is recorded for the excess deferred Federal income taxes whose normalized depreciation exceeds tax depreciation, that is, the tax life of the property has reached what is commonly referred to as the "turnaround point." The vintage years that have reached the turnaround point are 1971 through 1974, 1979 through 2001, 2011, and 2015 through 2017. Tax depreciation for these vintage years subject to normalization requirements of Internal Revenue Code Section 167 and 168 is $692,599. The amount of tax depreciation of $692,599 is less than $1,861,126, which is the amount included for ratemaking purposes as depreciation on property placed in service during these vintage years. The difference of $(1,168,527) is to be used for calculating the return of excess previously deferred Federal income tax to be reversed [$692,599 - $1,861,126 = $(1,168,527)]. Tax depreciation, and thus excess deferred Federal income taxes recovered from customers, was computed to the turnaround point for all of these properties at a rate of 21%, 34%, 46%, or 48%. The excess of 2% between 48% and 46% has been amortized as a reduction to the cost of service in prior rate proceedings. However, the Tax Reform Act of 1986 and the Tax Cuts and Jobs Act of 2017 prohibits flow back of the excess between the prior rates and the current rate any faster than ratably over the tax life of the property following the property attaining the turnaround point. This ratable flow back is to be

achieved by using a weighted average tax rate, representing the weighted average rate for each vintage for all years prior to the turnaround year. The weighted average rate for each vintage year, which has reached the turnaround point, is shown in Column 6. The weighted average tax rate is applied to the tax depreciation subject to deferral shown in Column 4 to determine the reversal of deferred Federal income taxes in the amount of $(392,624). This was compared to the value of the deferred Federal income taxes at the newly enacted rate of $245,391 determined by multiplying the total tax depreciation subject to deferral of $(1,168,527) by the newly enacted rate of 21% [$(1,168,527) x 0.21 = $(245,391)]. The difference between the deferred Federal income taxes at prior rates of $(392,624) and those at the newly enacted rate of $245,391 is the reversal of the excess deferred Federal income taxes of $(147,233) [$(392,624) - $245,391 = $(147,233)]. An adjustment of the excess deferred Federal income taxes in the amount of $24,2669 is determined by subtracting the reversal of pro forma excess deferred Federal income taxes during the twelve months ended December 31, 2025, in the amount of $(171,502), from the calculated pro forma reversal of excess deferred Federal income taxes in the amount of $(147,233) [$(147,233) - $(171,502) = $24,269]. The adjustment of the reversal of deferred Federal income taxes in the amount of $24,269 has been carried forward to Exhibit HIV-17, Column 3.

Q. Explain Exhibit No. FIV-17-10.

A. Exhibit No. FIV-17-10 is an adjustment to reflect pro forma current Federal income tax and pro forma current Pennsylvania corporate net income tax based on pro forma taxable income for the twelve months ending February 28, 2027, under existing rates at the

currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.49%.

Total pro forma operating income before income taxes and excluding depreciation under existing rates for the twelve months ending February 28, 2027, in the amount of $34,607,573 is determined by subtracting pro forma operating expenses under existing rates in the amount of $31,832,762 (Refer to Exhibit No. FIII-2, Page 16 of 16, Column 4) and pro forma operating taxes other than income taxes under existing rates in the amount of $1,864,974 (Refer to Exhibit No. FIV-15, Page 3 of 4, Column 7) from pro forma operating revenues under existing rates in the amount of $68,305,310 (Refer to Exhibit No. FII-2, Page 9 of 9, Column 3) ($68,305,310 - $31,832,762 - $1,864,974 = $34,607,573). To arrive at taxable income at present rates, amounts are added for the expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $9,379 and amounts are then deducted for tax repair expense in the amount of $16,533,188, cost of removal in the amount of $2,220,538, state tax depreciation in the amount of $14,287,107, and pro forma interest expense deduction for ratemaking purposes in the amount of $9,167,897.

Expenses of the Company's Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $9,379 are not allowed as a deduction for income tax purposes. Since these amounts are included in operating expenses and deducted in arriving at the figure of $34,988,046, they must be added back in arriving at taxable income. Tax repair expense in the amount of $16,533,188 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $2,220,538 is capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. State tax depreciation in the amount of $14,287,107 is detailed on Exhibit No. FIV-17-8 and Exhibit No. FIV-17-8 (a). I note that the state tax depreciation is greater than Federal tax depreciation, which I will explained previously with respect to Exhibit No. FIV-17-8 (a). Projected interest expense deduction for ratemaking purposes in the amount of $9,167,897 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $444,597,217 x Weighted Debt Cost Rate of 2.06%).

Pro forma taxable income under existing rates in the amount of $(7,201,022) is determined by adding the expenses of the Customer Survey of $4,800, Dividend Reinvestment and Direct Stock Purchase and Sale Plan of $7,762, Long-term Incentive

Plan of $1,740, Employee Stock Purchase Plan of $1,052, Normalization of Rate Case Expenses of $236,188, Amortization of Acquisition Adjustments of $(23,331), Amortization of Lead Service Line Replacements of $145,298, Filter Plant Yard Piping Survey of $3,081, Service Life Study of $5,138, Long-term Infrastructure Improvement Plan of $672, Nondeductible Parking of $8,357, and Nondeductible Meals of $9,379 and amounts are then deducted for tax repair expense in the amount of $16,533,188, cost of removal in the amount of $2,220,538, state tax depreciation in the amount of $14,287,107, and pro forma interest expense deduction for ratemaking purposes in the amount of $9,167,897.from projected net operating income in the amount of $34,988,046 ($34,607,573 + $4,800 + $7,762 + $1,740 + $1,052 + $236,188 + $(23,331) + $145,298 + $3,081 + $5,138 + $672 + $8,357 + $9,379 - $16,533,188 - $2,220,538 - $14,287,107 - $9,167,897 = $(7,201,022)].

Pro forma State income tax under existing rates in the amount of $(539,357) is determined by applying the Pennsylvania corporate net income tax rate of 7.49% to pro forma taxable income in the amount of $(7,201,022) [$(7,201,022 x 0.0749 = $(539,357)]. Pro forma Federal taxable income under existing rates in the amount of $(6,071,539) is determined by subtracting pro forma State income tax under existing rates in the amount of $(539,357) and adding back additional allowed state depreciation on bonus property of $590,127 to pro forma taxable income in the amount of $(7,201,022) [$(7,201,022) - $(539,357) + $590,127 = $(6,071,539)]. Pro forma Federal income tax under existing rates in the amount of $(1,275,023) is determined by applying the presently effective Federal income tax rate of 21% to the pro forma Federal taxable income under existing rates in the amount of $(6,071,539) [$(6,071,539) x 0.21 =

$(1,275,023)]. Total pro forma current income taxes under existing rates in the amount of $(1,814,380) is determined by adding pro forma state income tax under existing rates in the amount of $(539,357) and pro forma Federal income tax under existing rates in the amount of $(1,275,023) [$(539,357) + $(1,275,023) = $(1,814,380)]. The adjustment to income taxes in the amount of $(102,412) is determined by subtracting total projected current income taxes under existing rates during the twelve months ending February 28, 2027, in the amount of $(1,711,968) (Refer to Exhibit No. FIV-17-7) from total pro forma current income taxes under existing rates in the amount of $(1,814,380) [$(1,814,380) - $(1,711,968) = $(102,412)]. The adjustment to income taxes at present rates in the amount of $(102,412) has been carried forward to Exhibit No. FIV-17, Page 4, Column 3.

Q. Please explain Exhibit No. FIV-17-11.

A. Exhibit No. FIV-17-11 is an adjustment to reflect increased Federal income tax and Pennsylvania corporate net income tax based on the proposed revenue increase resulting from proposed rates.

The total proposed increase in sales of water in the amount of $20,266,144 (Refer to Exhibit No. FII-2, page 9, Column 8) is increased by the increase in late charges of $45,834 (Refer to Exhibit No. FII-2-44) and reduced by the increase in pro forma expense for the Commission's general assessment, the Consumer Advocate's assessment, the Small Business Advocate's assessment, and the Damage Prevention Control Assessment under proposed rates in the amount of $137,029 (Refer to Exhibit No. FIV-15-12) and the increase in pro forma uncollectible accounts expense under proposed rates of $133,785 (Refer to Exhibit No. FIII-2-55) to arrive at the net increase in taxable income subject to

Pennsylvania corporate net income tax in the amount of $20,041,163 ($20,266,144 + $45,834 - $137,029 - $133,785 = $20,041,163). The Pennsylvania corporate net income tax rate of 7.49% is applied to the net increase in taxable income subject to state income tax in the amount of $20,041,163 to determine the increase of $1,501,083 in the state income tax as a result of the proposed revenue increase ($20,041,163 x 0.0749). The increase in the amount of $1,501,083 in the state income tax has been carried forward to Exhibit No. FIV-17, Page 4, Column 6.

The proposed revenue increase subject to state income tax of $20,041,163 is reduced further by the increase of $1,501,083 in the state income tax to determine the proposed revenue increase in the amount of $18,540,080 subject to Federal income tax ($20,041,163 - $1,501,083 = $18,540,080). The presently effective Federal income tax rate of 21% is applied to the net increase in taxable income subject to Federal income tax to determine the increase in the amount of $3,893,417 in the Federal income tax that results from the proposed revenue increase ($18,540,080 x 0.21), and this amount has been carried forward to Exhibit No. FIV-17, Page 4, Column 6.

Q. Explain Exhibit No. FIV-18.

A. Exhibit No. FIV-18 provides an explanation of the debt interest expense utilized for the income tax calculation on projected income for the twelve months ending December 31, 2025, and an explanation and the calculation of debt interest expense utilized for the income tax calculation on pro forma income for the twelve months ending December 31, 2025.

Debt interest expense utilized for the income tax calculation on projected and pro forma income for the twelve months ending December 31, 2025, is determined by reflecting the interest charges to ratepayers in the cost of capital determination (interest synchronization).

The original cost measure of value as of December 31, 2025 (Refer to Exhibit No. FV-1, page 2) of $431,332,385 times the weighted debt cost rate of 2.06% equals the interest expense utilized for income tax calculation on projected and pro forma income for the twelve months ending December 31, 2025, of $8,523,195.

Debt interest expense on projected and pro forma income for the twelve months ending December 31, 2025, in the amount of $8,523,195 has been carried forward to Exhibit Nos. FIV-17-2 and FIV-17-5, which I explained previously.

Exhibit No. FIV-18 also provides an explanation of the debt interest expense utilized for the income tax calculation on projected income for the twelve months ending February 28, 2027, and an explanation and the calculation of debt interest expense utilized for the income tax calculation on pro forma income for the twelve months ending February 28, 2027.

Debt interest expense utilized for the income tax calculation on projected and pro forma income for the twelve months ending February 28, 2027, is determined by reflecting the interest charges to ratepayers in the cost of capital determination (interest synchronization).

The original cost measure of value as of February 28, 2027 (Refer to Exhibit No. FV-1, page 3) of $444,597,217 times the weighted debt cost rate of 2.06% equals the interest expense utilized for income tax calculation on projected and pro forma income for the twelve months ending February 28, 2027, of $9,167,897.

Debt interest expense on projected and pro forma income for the twelve months ending February 28, 2027, in the amount of $9,167,897 has been carried forward to Exhibit Nos. FIV-17-7 and FIV-17-10, which I explained previously.

Q. Are you sponsoring any other exhibits regarding the Company's operating income taxes?

A. Yes, I am also sponsoring Exhibit Nos. FIV-1, FIV-3, FIV-4, FIV-6, FIV-7, FIV-8, FIV-9, FIV-10, FIV-11, FIV-13, FIV-14, and FIV-16.

Q. Explain Exhibit No. FV-1-1.

A. Exhibit No. FV-1-1 is a summary, by year, of the projected unamortized balance of deferred income taxes related to accelerated depreciation and the unamortized balances of excess deferred income taxes related to accelerated depreciation that are deducted from the measure of value.

Deferred Federal Income Tax Related to Accelerated Depreciation on Property Constructed with Customers' Advances for Construction and Contributions in Aid of Construction have been eliminated from this schedule.

By Order entered April 28, 1988, at Docket Nos. R-870769 and P-870225, the Commission approved the Company's proposal to account for income taxes on Customers' Advances for Construction ("Advances") and Contributions in Aid of Construction ("Contributions") pursuant to what is known as "Method 5" treatment. Under Method 5 treatment, the Company excluded, for ratemaking purposes, all income taxes paid by the Company as a result of receipt of Contributions or Advances and excluded, from the calculation of income taxes, the portion of tax depreciation that related to property constructed with Contributions or Advances. Under this procedure, customers did not bear the increased income taxes resulting from the receipt of Contributions or Advances, and the Company recovered, over the tax life of the property, reductions in income taxes in an amount equal to the increased income taxes resulting from receipt of contributions and advances. Under Method 5, it is necessary for the Company to retain the benefits resulting from depreciation on property constructed with a Contribution or Advance, in order to be compensated for the additional income taxes paid as a result of the TRA-86 requirement that a Contribution or Advance be recognized as taxable income in the year received.

The projected unamortized balance of deferred income taxes as of December 31, 2025, in the amount of $25,787,845 has been carried forward to Exhibit FV-1, page 2 and has been deducted from the original cost measure of value.

Page 2 of Exhibit No. FV-1-1 is a summary, by year, of the projected unamortized balance in the amount of $26,229,748, as of February 28, 2027, of deferred income taxes related to accelerated depreciation that are deducted from the measure of value. Column

2 lists, by year, deferred federal income taxes resulting from accelerated depreciation from 1971 through February 28, 2027. The balance in Column 2 is $26,229,748.

The projected unamortized balance of deferred income taxes as of February 28, 2027, in the amount of $26,229,748 has been carried forward to Exhibit FV-1, page 3 and has been deducted from the original cost measure of value.

Page 3 of Exhibit No. FV-1-1 is a calculation of the adjustment to the deferred income taxes related to accelerated depreciation as required under Treasury Regulation 1.167(l)-1 of the Internal Revenue Code. Under the regulation, if a future period is used in determining the maximum amount of the reserve to be excluded from the rate base, the amount of the reserve is the amount of the reserve at the beginning of the period and a pro rata portion of the projected increase to the account during the period. The increase in deferred income taxes from February 28, 2026, to February 28, 2027, is $378,774, or a monthly increase of $31,565 as presented in Column 3. The regulation requires the pro rata portion of the increase to be determined by multiplying the increase by a fraction of which the numerator is the number of days remaining in the period and the denominator is the total number of days in the period. Those fractions are presented in Column 4 and the pro rata portion of the increase is presented in Column 5. The deferred income taxes under this regulation are presented in Column 6 as the pro rata portion of the increase added to the deferred income taxes at the beginning of the period. The difference between the deferred income taxes per the corporate books and the deferred income taxes per this regulation is presented in Column 7. The difference as of February 28, 2027, in the amount of $(205,213) has been carried forward to Exhibit FV-1, page 3 and has offset

the projected unamortized balance of deferred income taxes as of February 28, 2027, in the amount of $26,229,748 presented on Page 2 of Exhibit No. FV-1-1.

Page 4 of Exhibit No. FV-1-1 is a summary, by year, of the projected unamortized balance in the amount of $12,918,425, as of December 31, 2025, of excess deferred income taxes related to accelerated depreciation that are deducted from the measure of value. Column 2 lists, by year, deferred federal income taxes resulting from accelerated depreciation from 1971 through 2017. The balance in Column 2 is $12,918,425.

The projected unamortized balance of excess deferred income taxes as of December 31, 2025, in the amount of $12,918,425 has been carried forward to Exhibit FV-1, page 2 and has been deducted from the original cost measure of value.

Page 5 of Exhibit No. FV-1-1 is a summary, by year, of the projected unamortized balance in the amount of $12,771,192, as of February 28, 2027, of excess deferred income taxes related to accelerated depreciation that are deducted from the measure of value. Column 2 lists, by year, deferred federal income taxes resulting from accelerated depreciation from 1971 through 2017. The balance in Column 2 is $12,771,192.

The projected unamortized balance of excess deferred income taxes as of February 28, 2027, in the amount of $12,771,192 has been carried forward to Exhibit FV-1, page 2 and has been deducted from the original cost measure of value.

Page 6 of Exhibit No. FV-1-1 is a calculation of the adjustment to the excess deferred income taxes related to accelerated depreciation as required under Treasury Regulation 1.167(l)-1 of the Internal Revenue Code. Under the regulation, if a future period is used in determining the maximum amount of the reserve to be excluded from the rate base, the amount of the reserve is the amount of the reserve at the beginning of the period and a pro rata portion of the projected decrease to the account during the period. The decrease in excess deferred income taxes from February 28, 2026, to February 28, 2027, is $126,200, or a monthly decrease of $10,517 as presented in Column 3. The regulation requires the pro rata portion of the decrease to be determined by multiplying the decrease by a fraction of which the numerator is the number of days remaining in the period and the denominator is the total number of days in the period. Those fractions are presented in Column 4 and the pro rata portion of the decrease is presented in Column 5. The excess deferred income taxes under this regulation are presented in Column 6 as the pro rata portion of the decrease subtracted from the excess deferred income taxes at the beginning of the period. The difference between the excess deferred income taxes per the corporate books and the excess deferred income taxes per this regulation is presented in Column 7. The difference as of February 28, 2027, in the amount of $68,373 has been carried forward to Exhibit FV-1, page 3 and has been added to the projected unamortized balance of excess deferred income taxes as of February 28, 2027, in the amount of $12,771,192 presented on Page 5 of Exhibit No. FV-1-1.

Q. Explain Exhibit No. FV-1-10.

A. Exhibit No. FV-1-10 provides the calculation of the unamortized taxes on deposits for construction and customer advances as of December 31, 2025, in the amount of

$1,104,327 and as of February 28, 2027, in the amount of $1,042,833, that are added to the original cost measure of value.

Under the Tax Cuts and Jobs Act of 2017, the definition of tax contributions in aid of construction was modified under Section 118(b) and the exclusion from gross income under Section 118(c) was repealed. The modification to the definition of taxable contribution in aid of construction includes contributions from customers as well as any payment received from a governmental or civic entity. Under the Company's approved tariff, the Company paid income taxes on any deposit, Customer Advance, Contribution in Aid of Construction, or other like amounts received from an applicant which would constitute taxable income as defined by the Internal Revenue Service. Such income taxes would be segregated in a deferred account for inclusion in rate base in a future rate case proceeding. Such income taxes associated with a deposit or advance would not be charged to the specific depositor of capital. This provision was rescinded under the Infrastructure Investment and Jobs Act of 2021.

The Company paid taxes on deposits for construction and customer advances received during the period under which the deposits for construction and customer advances was taxable of $1,157,922 as of December 31, 2024.

The total income taxes on deposits for construction and customer advances as of December 31, 2024, of $1,157,922 is offset by the reduction of income taxes from the depreciation on the projects paid for with the deposits for construction and customer advances. The depreciation on the projects paid for with the deposits for construction

and customer advances of $196,231 for the period ending December 31, 2025, is determined by applying the depreciation rate of 4% to the deposits for construction and customer advances. State income tax deduction in the amount of $15,679 is determined by applying the Pennsylvania corporate net income tax rate of 7.99% to the depreciation on the projects paid for with deposits for construction and customer advances of $196,231 ($196,231 x 0.0799 = $15,679). Federal income tax deduction in the amount of $37,916 is determined by subtracting State income tax deduction in the amount of $15,679 from the depreciation on the projects paid for with deposits for construction and customer advances of $196,231 and applying the presently effective Federal income tax rate of 21% [($196,231 - $15,679) x 0.21 = $37,916]. Total income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending December 31, 2025, in the amount of $53,595 is determined by adding state income taxes in the amount of $15,679 and Federal income taxes in the amount of $37,916 ($15,679 + $37,916 = $53,595). The net taxes on deposits for construction and customer advance as of December 31, 2025, of $1,104,327 is determined by subtracting the income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending December 31, 2025, in the amount of $53,595 from the income taxes on deposits for construction and customer advances as of December 31, 2024, in the amount of $1,157,922 ($1,157,922 - $53,595 = $1,104,327). The net taxes on deposits for construction and customer advance as of December 31, 2025, of $1,104,327 has been carried forward to Exhibit No. FV-1, Page 2.

The total income taxes on deposits for construction and customer advances as of December 31, 2025, of $1,104,327 is offset by the reduction of income taxes from the depreciation on the projects paid for with the deposits for construction and customer advances. The depreciation on the projects paid for with the deposits for construction and customer advances of $228,937 for the period ending February 28, 2027, is determined by applying the depreciation rate of 4% to the deposits for construction and customer advances. State income tax deduction in the amount of $16,984 is determined by applying the weighted average Pennsylvania corporate net income tax rate of 7.42% to the depreciation on the projects paid for with deposits for construction and customer advances of $16,984 ($228,937 x 0.0742 = $16,984). Federal income tax deduction in the amount of $44,510 is determined by subtracting State income tax deduction in the amount of $16,984 from the depreciation on the projects paid for with deposits for construction and customer advances of $228,937 and applying the presently effective Federal income tax rate of 21% [($228,937 - $16,984) x 0.21 = $44,510]. Total income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending February 28, 2027, in the amount of $61,494 is determined by adding state income taxes in the amount of $16,984 and Federal income taxes in the amount of $44,510 ($16,987 + $44,510 = $61,494). The net taxes on deposits for construction and customer advance as of February 28, 2027, of $1,042,833 is determined by subtracting the income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending February 28, 2027, in the amount of $61,494 from the income taxes on deposits for construction and customer advances as of December 31, 2025, in the amount of $1,104,327 ($1,104,327 - $61,494 = $1,042,833). The net taxes on deposits for construction and

customer advance as of February 28, 2027, of $1,042,833 has been carried forward to Exhibit No. FV-1, Page 3.

Q. Explain Exhibit No. FV-8-1 (g).

A. Exhibit No. FV-8-1 (g) is the calculation by customer classification of the average lag days from the provision of service to receipt of operating revenues. Calculations of the lag days in receipt of operating revenues of 61.4 for metered repumped customers and lag days of 60.5 for metered gravity customers are shown in Columns 2 and 3, respectively. The components of the operating revenue lag day calculation, shown in Column 1, include the lag from the midpoints of the service periods (service period lag), the lag from the mid-point of the meter reading to billing (billing lag) and the lag from billing to collection ("collection lag"). "Billing" for purposes of determining the billing lag and the collection lag is the date that bills are entered into the Company's accounts receivable for that billing cycle. The calculation of the billing lag from metered repumped customers and metered gravity customers are presented on Exhibit No. FV-8-1 (g) 1, which I will explain later. The calculation of the collection period lag is presented in Exhibit No. FV-8-1 (g) 2, which I will explain later. The total lag days have been carried forward to Column 3 of Exhibit No. FV-8-1.

Q. Explain Exhibit No. FV-8-1 (g) 1.

A. Exhibit No. FV-8-1 (g) 1 provides the calculation of average lag days to read meters, enter data, validate and process data, and enter amounts into accounts receivable. The calculation of average lag days for repumped customers during the twelve months ended December 31, 2021, of 5.5 is shown on page 1 of Exhibit No. FV-8-1 (g) 1, and the

calculation of average lag days for gravity customers during the twelve months ended December 31, 2017, of 4.6 is shown on page 2 of Exhibit No. FV-8-1 (g) 1.

For each customer classification, the date of the mid-point of the meter reading for each billing cycle is shown in Column 2, and the date amounts were entered into the Company's accounts receivable for each billing cycle is shown in Column 3. The number of days lag between the date mid-point of the of the meter reading and the date amounts were entered into the Company's accounts receivable is calculated and shown in Column 4. The twelve-month average of lag days per billing cycle is determined by adding the lag days for each billing cycle shown in Column 4 and dividing by the number of billing cycles. The average billing lag days of 5.5 and 4.6 for metered repumped and metered gravity billing cycles, respectively, have been carried forward to Exhibit No. FV-8-1 (g).

Under the Company's validation procedure, if a customer's meter reading meets certain criteria of either high or low consumption based on historical averages, the reading is listed on a report for review by the billing control coordinator. If the billing control coordinator is unable to determine the reason for the unusual consumption, a reread order is generated and a meter reader is dispatched to the customer's premises to investigate the situation. The meter reader will reread the meter and, assuming the reading confirms the initial reading, check for leaks, check meter operation, and notify the customer of the results of the investigation. Only after this process is completed is the meter reading considered to be validated.

I note that internal auditing controls set up within the Company's accounting system require that validation for all bills be completed before all bills for each cycle are booked to accounts receivable.

Page 3 of Exhibit No. FV-8-1 (g) 1 is a summary of the Company's billing lag calculated during the period 1991 to 2024. The billing lag calculations demonstrate a significant improvement (reduction) in the billing lag during this period. As reflected on this exhibit, the billing lag for repumped and gravity customers has been reduced by 64.7% and 62.3%, respectively, since 1991.

Q. Explain Exhibit No. FV-8-1 (g) 2.

A. Exhibit No. FV-8-1 (g) 2 is the calculation of the weighted average operating revenue collection lag. This is the average lag between billing customers and receipt of revenues.

The weighted average operating revenue collection lag of 40.7 days is determined by dividing the number of days in the test year by the calculated turnover ratio of 9.0 times (365 ÷ 9.0 = 40.7). The calculated turnover ratio of 9.0 times is determined by dividing test year sales and penalties in the amount of $66,473,760 by the annual average of outstanding monthly accounts receivable balances per books in the amount of $7,408,701 ($66,473,760 ÷ $7,408,701 = 9.0).

Q. Are you sponsoring any other exhibits regarding the original cost measure of value?

A. Yes, I am also sponsoring Exhibit No. FV-10.

Q. Explain Exhibit No. FVII-5.

A. Exhibit No. FVII-5 provides financial data of the Company for the last five years.

Q. Explain Exhibit No. FVII-6.

A. Exhibit No. FVII-6 provides information concerning the rate used for the Company's allowance for funds used during construction ("AFUDC"). The AFUDC rate used by the Company as of December 31, 2024, was 10.04%. The AFUDC rate is set by the Company based upon the sum of the weighted cost of debt and the weighted cost of common equity as determined in the Company's most recent fully-litigated rate proceeding before the Commission. The AFUDC rate used by the Company has not changed since December 31, 1992. I note that under FAS62, the capitalization rate to be applied to projects financed with tax-free debt is the rate of that specific borrowing.

Q. Explain Exhibit No. FVII-7.

A. Exhibit No. FVII-7 describes the Company's indenture requirements and dividend restrictions.

Q. Explain Exhibit No. FVII-9.

A. Exhibit No. FVII-9 describes long-term debt reacquisition by the Company. There have been no long-term debt re-acquisitions by the Company since 1969.

Q. Explain Exhibit No. FVII-11.

A. Exhibit No. FVII-11 provides information concerning the Company's lines of credit. The Company anticipates having a balance of $15,87,585 of short-term loans as of February

28, 2027, and an average daily balance of ST loans outstanding for the twelve months ended February 28, 2027, of $10,086,510.

Q. Are you sponsoring any other exhibits relating to rate of return?

A. Yes, I am also sponsoring Exhibits FVII-1, FV11-2, FVII-3, FV11-4, FVII-8, FVII-10, FVII-12, FVII-13, FVII-14, FVII-15, FVII-16, FVII-17, FVII-18, FVII-19, FVII-20, FVII-21, FVII-22, FVII-23, FVII-24, FVII-25, FVII-26, FVII-27, FVII-28, FVII-29, FVII-30, FVII-31, and FVII-32.

Q. Explain Exhibit FX-1.

A. Exhibit FX-1 is the Company's comparative balance sheet, per books, as of February 28, 2027, and December 31, 2024. Page 2 of Exhibit FX-1 reflects the projected assets of the Company net of depreciation reserve and reserve for uncollectible accounts in the amount of $678,475,253 as of February 28, 2027, and actual assets of the Company net of depreciation reserve and reserve for uncollectible accounts in the amount of $610,295,603 as of December 31, 2024. Page 3 of Exhibit FX-1 reflects the projected liabilities and total capitalization of the Company in the amount of $678,475,253 as of February 28, 2027, and actual liabilities and total capitalization of the Company in the amount of $610,295,603 as of December 31, 2024.

Q. Explain Exhibit FX-2.

A. Exhibit FX-2 sets forth the major items of Other Physical Property, Investment in Affiliated Companies, and Other Investments as of February 28, 2027. The Exhibit reflects the projected Other Physical Property of the Company as of February 28, 2027, in

the amount of $2,070,079. York Water projects to have no investments in affiliated companies as of February 28, 2027. Other investments include Columbia Water Company common stock owned by the Company in the amount of $59,724.

Q. Explain Exhibit FX-3.

A. Exhibit FX-3 sets forth the amount and a description of Special Cash Deposits held by the Company as of February 28, 2027. As of February 28, 2027, the Company has projected to deposit in an interest-bearing statement savings account funds of its employees in the amount of $45,748. These funds of the Company's employees in the amount of $45,748 are offset by a credit amount, reflected in Account 231.27, Employee Benefits Withheld-ESPP and can be used only for purchase of the Company's common stock on behalf of employees in accordance with the Company's Employee Stock Purchase Plan.

As of February 28, 2027, the Company projects to have deposited $500 with York Township to be used to indemnify the Township against any loss or damage caused by the Company while working in the Township's streets.

Q. Explain Exhibit FX-4.

A. Exhibit FX-4 details and describes Notes Receivable, Accounts Receivable from Associated Companies, and Other Accounts Receivable as of February 28, 2027. Page 1 of Exhibit FX-4 details projected Notes Receivable as of February 28, 2027, in the amount of $255,481, which consists of notes receivable from water districts. A general

description of the water district procedure can be found in the Commission's Order in York Water's 1992 rate case (77 Pa. P.U.C. 367).

York Water projects no accounts receivable from associated companies as of February 28, 2027. There is no other company projected to be an "associated company" of York Water.

York Water classifies other significant receivables, other than customer accounts, in Account 142, Other Accounts Receivable. A detail of Other Accounts Receivable projected as of February 28, 2027, in the amount of $193,896 is shown on page 2 of Exhibit FX-4.

Q. Explain Exhibit FX-5.

A. York Water uses the reserve method of recording uncollectible accounts for book purposes. Exhibit FX-5 provides the amount of accumulated reserve for uncollectible accounts as of February 28, 2027, and December 31, 2025 and 2024. Exhibit FX-5 also provides the annual accruals, amounts of accounts written off and recoveries of amounts previously written off for the twelve months ended February 28, 2027, and December 31, 2025 and 2024.

Q. Explain Exhibit FX-6.

A. Exhibit FX-6 provides a list of projected prepayments as of February 28, 2027. York Water projected no special prepayments as of February 28, 2027.

Q. Explain Exhibit FX-8.

A. Exhibit FX-8 details and describes projected Other Deferred Assets as of February 28, 2027. As of February 28, 2027, the Company projects to reflect on its balance sheet Unamortized Debt Expense in the amount of $2,261,025. This account includes the unamortized portion of debt expense as of February 28, 2027, associated with the issuance of long-term debt. The balance as of February 28, 2027, includes continued amortization of historic amounts and the new issuance costs. The debt expense is amortized over the respective terms of long-term debt by crediting this account and debiting Account 428, Amortization of Debt Expense.

As of February 28, 2027, the Company projects to reflect on its balance sheet Deferred 2025 Rate Case Expenses in the amount of $708,563. The Company anticipates that Deferred 2025 Rate Case Expenses will be normalized over 48 months on the corporate books. The normalization of 2022 Rate Case Expenses will be credited to this account and charged to Account No. 66680000, Rate Case Expense. (See Exhibit No. HIII-2-1 for the normalization of 2025 rate case expense.)

As of February 28, 2027, the Company projects to reflect on its balance sheet Cash Value of Supplemental Retirement Plan in the amount of $5,617,226. The Company has a supplemental retirement plan for five key employees of the Company, consisting of the President and Chief Executive Officer, Chief Financial Officer, Chief Administrative Officer and General Counsel, Vice-President-Operations, and Vice President-Engineering, and seven retired former key employees. The plan is funded through life insurance policies. The Company has a deferred savings plan for fifteen of its

management and supervisory employees and ten retired former management employees. The plan is also funded through life insurance policies. The deferred debit related to both plans' benefits represents the current cash surrender value of the life insurance policies that have been purchased to reimburse the Company for the costs of the plans. The Company also reflects on its books of account as a deferred credit the current accrued amount of the Company's future liability with respect to the deferred compensation benefits.

The expenses and income associated with the Company's supplemental retirement and deferred savings plans have been eliminated from this rate case in accordance with the Settlement Agreement approved by the Commission at Docket No. R-00016236 with the exception of expenses from the deferred savings plan for employees not in the defined benefit pension plan.

York Water does not have deferred asset accounts for temporary facilities, research and development, and property losses, and therefore, there is no amortization with regard to such items, which would affect operating results.

As of February 28, 2027, the Company projects to reflect on its balance sheet deferred preliminary survey costs in the amount of $7,056. This account includes expenditures for preliminary surveys, plans and investigations made for the purpose of determining the feasibility of projects under consideration. These expenditures are not included in the Company's rate base or in the cost of service in this case.

Q. Explain Exhibit FX-10.

A. Exhibit FX-10 details and describes Other Deferred Credits as of February 28, 2027. As of February 28, 2027, the Company projects to reflect on its corporate books deferred interest rate swap in the amount of $196,654. The Company utilizes an interest rate swap agreement to convert its variable rate debt to a fixed rate (a cash flow hedge). As of February 28, 2027, the Company recorded an unrealized loss on the interest rate swap. The interest rate swap agreement will expire on October 1, 2029.

Q. Explain Exhibit FX-12.

A. Page 2 of Exhibit FX-12 provides an analysis of Retained Earnings as of February 28, 2027, and December 31, 2025, 2024, and 2023. The analysis includes activity for the fourteen months ended February 28, 2027, and for the twelve months ended December 31, 2025, 2024, and 2023.

Q. Are you sponsoring any other exhibits regarding the Company's balance sheet?

A. Yes, I am also sponsoring Exhibit Nos. F (c)-2, FX-7, FX-9, FX-11, and FX-13.

Q. Are you sponsoring any other exhibits?

A. Yes, I am also sponsoring Exhibit Nos. F (a)-1, F (a)-6, F (a)-9, F (a)-10, F (a)-11, FVIII-2, FXI-1, FXI-2, FXI-3, and FXI-4.

Q. Does this conclude your future test year and fully projected future test year direct testimony at this time?

A. Yes.

YORK WATER STATEMENT NO. 104

BEFORE THE

PENNSYLVANIA PUBLIC UTILITY COMMISSION

THE YORK WATER COMPANY

DIRECT TESTIMONY OF DANIEL E. COPPERSMITH JR.

Q. State your name and business address.

A. Daniel E. Coppersmith Jr. My business address is: 130 East Market Street, York, Pennsylvania.

Q. By whom are you employed?

A. I am employed by The York Water Company (the “Company”).

Q. State your present position with the Company and explain your duties and responsibilities.

A. I am the Finance Manager for the Company. My duties and responsibilities include preparing the operating budget, managing the Property Records Department, and filing data requirements with the Pennsylvania Public Utility Commission (the "Commission").

Q. How long have you been employed by the Company?

A. I have been employed by the Company since June 19, 2007.

Q. What is your educational background?

A. I have a Bachelor's of Science Degree in Accounting from Central Penn College.

Q. Have you previously testified before a regulatory commission?

A. Yes, I have presented testimony to the Pennsylvania Public Utility Commission ("Commission") in the Company's last two rate cases.

Q. Will you list the exhibits you are sponsoring in this proceeding?

A. I am sponsoring the following exhibits prepared by me or under my direction and supervision:

Exhibit No. F(c)-3 relating to utility plant;

Exhibit Nos. FI-2-1 and FI-2-2 relating to depreciation expense included in the statement of operations for the water division; and

Exhibit Nos. F(c)-1, FV-1, FV-1-2, FV-1-3, FV-1-6, FV-1-7, FV-1-8, FV-1-9, FV-2, FV-3, FV-4, FV-5, FV-6, FV-7, FV-8, FV-8-1, FV-8-1(a), FV-8-1(b), FV-8-1(c), FV-8-1(d), FV-8-1(e), FV-8-2, FV-8-3, FV-8-4, FV-9, FV-11, FV-13, FV-14, FV-15, FV-16, FV-16-1, FV-16-2, FV-16-3, and FV-16-4 relating to the original cost measure of value for the water division.

Q. Explain Exhibit No. F(c)-3.

A. Exhibit No. F(c)-3 provides a projected summary, by detailed plant account, of the book value of utility property as of February 28, 2027.

Q. Explain Exhibit No. FI-2-1.

A. Exhibit No. FI-2-1 adjusts the depreciation accrual from the level determined in the depreciation study identified as Exhibit No. HVI for the twelve months ended December 31, 2024, to the pro forma level determined in the depreciation study identified as Exhibit No. FVI-A for the twelve months ending December 31, 2025. The adjustment in the amount of $1,007,694 is determined by subtracting the pro forma depreciation accrual for the twelve months ended December 31, 2024, in the amount of $13,389,453 from the pro forma annual depreciation accrual in the amount of $14,397,147. The adjustment in the amount of $1,007,694 has been carried forward to Exhibit No. FI-2, page 2, Column 3.

Q. Explain Exhibit No. FI-2-2.

A. Exhibit No. FI-2-2 adjusts the depreciation accrual from the level determined in the depreciation study identified as Exhibit No. FVI-A for the twelve months ended December 31, 2025, to the projected level determined in the depreciation study identified as Exhibit No. FVI-B for the twelve months ending February 28, 2027. The adjustment in the amount of $1,036,228 is determined by subtracting the pro forma depreciation accrual for the twelve months ended December 31, 2025, in the amount of $14,397,147 from the projected annual depreciation accrual in the amount of $15,433,375. The adjustment in the amount of $1,036,228 has been carried forward to Exhibit No. FI-2, page 6, Column 3.

Q. Who will testify with respect to the pro forma depreciation expense for the twelve-month periods ended December 31, 2025, and February 28, 2027?

A. John J. Spanos, Vice President, Depreciation and Valuation Studies, Gannett Fleming Valuation and Rate Consultants, Inc. will testify with respect to the annual depreciation accrual (York Water Statement No. 106).

Q. Are you sponsoring any other exhibits regarding the Company's statement of operations?

A. No.

Q. Explain Exhibit No. FV-1.

A. Exhibit No. FV-1 provides a summary of the components of the original cost measure of value in the amount of $413,332,385 as of December 31, 2025, and $444,597,217 as of February 28, 2027, pro forma net operating income available and rate of return under existing rates for the twelve months ended December 31, 2024, projected net operating income and rate of return under existing rates for the twelve months ending December 31, 2025, and February 28, 2027, net operating income and rate of return under existing rates after adjustments for ratemaking purposes ("pro forma") for the twelve months ending December 31, 2025, and February 28, 2027, and net operating income and rate of return under proposed rates for the twelve months ending February 28, 2027.

A summary of the components of the original cost measure of value in the amount of $413,332,385 as of December 31, 2025, is shown on page 2 of Exhibit No. FV-1.

One component is the projected utility plant in service less projected book accrued depreciation as of December 31, 2025. The projected original cost of utility plant in service as of December 31, 2025, is $612,265,731, and the projected accrued depreciation as of December 31, 2025, is $122,659,508. The projected depreciated original cost of utility plant in service as of December 31, 2025, is $489,606,223 ($612,265,731 - $122,659,508 = $489,606,223). The details of projected original cost of utility plant in service and projected accrued depreciation by account, sub account and vintage are set forth in Exhibit No. FVI-A.

Q. Who will testify with respect to projected accrued depreciation in the amount of $122,659,508 as of December 31, 2025, related to utility plant in service?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Will you continue with your explanation of page 2 of Exhibit No. FV-1?

A. The projected unamortized balance as of December 31, 2025, of deferred Federal income taxes related to accelerated depreciation in the amount of $25,787,845 is deducted from the original cost measure of value, and this amount is set forth in Exhibit No. FV-1-1, page 1, which Mr. Poff addresses in his testimony (see York Water Statement No. 103).

The projected unamortized balance, as of December 31, 2025, of excess deferred Federal income taxes related to accelerated depreciation in the amount of $12,918,425 is deducted from the original cost measure of value, and this amount is set forth in Exhibit No. FV-1-

1, page 4, which Mr. Poff addresses in his testimony (see York Water Statement No. 103).

An amount of $34,219,871 representing projected contributions in aid of construction less accrued depreciation as of December 31, 2025, is deducted from the original cost measure of value. This amount is comprised of the projected original cost of contributions in aid of construction as of December 31, 2025, in the amount of $43,574,326 less projected accrued depreciation as of December 31, 2025, in the amount of $9,354,455 ($43,574,326 - $9,354,455 = $34,219,871). The details are shown by account, sub account, and vintage in Exhibit No. FVI-A.

An amount of $10,524,801 for customers' advances for construction less projected accrued depreciation as of December 31, 2025, is deducted from the original cost measure of value. This component is comprised of the projected original cost of customers' advances for construction as of December 31, 2025, in the amount of $14,982,041 less projected accrued depreciation as of December 31, 2025, in the amount of $4,457,240 ($14,982,041 - $4,457,240 = $10,524,801). The details are shown by account, sub account, and vintage in Exhibit No. FVI-A.

Q. Who will testify with respect to the projected accrued depreciation related to contributions and advances?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Do the amounts set forth in Exhibit No. FV-1 for Contributions and Advances as of December 31, 2025, reflect any amounts related to income tax liabilities that the Company has incurred between January 1, 1987, and June 12, 1996, as a result of the TRA-86 requirement that Contributions and Advances be taxed or has incurred between January 1, 2018, and December 31, 2020, as a result of the Tax Cuts and Jobs Act of 2017 requirement that Contributions and Advances be taxed?

A. No. Consistent with the Company's ratemaking and accounting procedure in effect at the time with regard to the income taxes on Contributions and Advances, the Company has made no adjustment to amounts recorded between January 1, 1987, and June 12, 1996, or between January 1, 2018, and December 31, 2020, for Contributions or Advances to reflect additional income taxes that were required to be paid with respect to receipt of such Contributions or Advances as a result of Section 824 of TRA-86 or the Tax Cuts and Jobs Act of 2017. Contributions and Advances received between January 1, 1987, and June 12, 1996, or between January 1, 2018, and December 31, 2020, are reflected in the utility plant accounts and in the accounts for Contributions and Advances, as shown in Exhibit No. FVI-A at the original cost of the facilities constructed with the Contribution or Advance, without consideration of the associated income tax liability incurred by the Company. Under federal tax law provisions in effect at the time, Contributions and Advances received subsequent to June 12, 1996, through December 31, 2017, were not taxed. Under federal tax law provisions currently in effect, Contributions and Advances received subsequent to December 31, 2020, are not taxed.

Q. Will you continue with your explanation of page 2 of Exhibit No. FV-1?

A. Projected funds supplied through Customer Advances not expended as of December 31, 2025, in the amount of $1,696,554 is deducted from the original cost measure of value, and this amount is set forth in Exhibit No. FV-1-2, which I will explain later.

Projected materials and supplies in the amount of $3,830,308 are included in the original cost measure of value, and the details are set forth in Exhibit No. FV-11, which I will explain later.

An allowance for projected cash working capital in the amount of $3,997,420 is included in the original cost measure of value. The details are shown in Exhibit Nos. FV-8, FV-8-1, FV-8-1 (a), FV-8-1 (b), FV-8-1 (c), FV-8-1 (d), FV-8-1 (e), FV-8-1 (g), FV-8-1 (g) 1, FV-8-1 (g) 2, FV-8-2, FV-8-3, and FV-8-4, which I will explain later and Mr. Poff addresses in his testimony (see York Water Statement No. 103).

Unamortized utility plant adjustments for Margaretta Mobile Home Park, Westwood Mobile Home Park, Lincoln Estates Mobile Home Park, The Meadows, and Scott Water Company in the amount of ($58,398) which is [$17,578 + $(23,900) + $(24,442) + $(50,292) + $22,659 = ($58,398)] are included in the original cost measure of value. The details are set forth in Exhibit Nos. FV-1-3, FV-1-6, FV-1-7, FV-1-8, and FV-1-9, which I will explain later. I note that Exhibit No. FV-1-4 and Exhibit No. FV-1-5 were not used in this case.

Taxes on deposits for construction and customer advances in the amount of $1,104,327 are included in the original cost measure of value. The details are shown in Exhibit No. FV-1-10, which Mr. Poff addresses in his testimony (see York Water Statement No. 103).

A summary of the components of the original cost measure of value in the amount of $444,597,217 as of February 28, 2027, is shown on page 3 of Exhibit No. FV-1.

One component is the projected utility plant in service less projected book accrued depreciation as of February 28, 2027. The projected original cost of utility plant in service as of February 28, 2027, is $643,098,076, and the projected accrued depreciation as of February 28, 2027, is $122,414,932. The projected depreciated original cost of utility plant in service as of February 28, 2027, is $520,683,144 ($643,098,076 - $122,414,932 = $529,683,144). The details of projected original cost of utility plant in service and projected accrued depreciation by account, sub account, and vintage are set forth in Exhibit No. FVI-B.

Q. Who will testify with respect to projected accrued depreciation in the amount of $122,414,932 as of February 28, 2027, related to utility plant in service?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Will you continue with your explanation of page 3 of Exhibit No. FV-1?

A. The projected unamortized balance as of February 28, 2027, of deferred Federal income taxes related to accelerated depreciation in the amount of $26,024,536 is deducted from

the original cost measure of value, and this net amount is set forth in Exhibit No. FV-1-1, pages 2 and 3, which Mr. Poff addresses in his testimony (see York Water Statement No. 103).

The projected unamortized balance as of February 28, 2027, of excess deferred Federal income taxes related to accelerated depreciation in the amount of $12,839,564 is deducted from the original cost measure of value, and this net amount is set forth in Exhibit No. FV-1-1, pages 5 and 6, which Mr. Poff addresses in his testimony (see York Water Statement No. 103).

An amount of $35,498,692 representing projected contributions in aid of construction less accrued depreciation as of February 28, 2027, is deducted from the original cost measure of value. This amount is comprised of the projected original cost of contributions in aid of construction as of February 28, 2027, in the amount of $45,425,964 less projected accrued depreciation as of February 28, 2027, in the amount of $9,927,272 ($45,425,964 - $9,927,272 = $35,498,692). The details are shown by account, sub account, and vintage in Exhibit No. FVI-B.

An amount of $9,294,036 for customers' advances for construction less projected accrued depreciation as of February 28, 2027, is deducted from the original cost measure of value. This component consists of the projected original cost of customers' advances for construction as of February 28, 2027, in the amount of $13,880,403 less projected accrued depreciation as of February 28, 2027, in the amount of $4,586,367 ($13,880,403 -

$4,586,367 = $9,294,036). The details are shown by account, sub account, and vintage in Exhibit No. FVI-B.

Q. Who will testify with respect to the projected accrued depreciation related to contributions and advances?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Do the amounts set forth in Exhibit No. FV-1 for Contributions and Advances as of February 28, 2027, reflect any amounts related to income tax liabilities that the Company has incurred between January 1, 1987, and June 12, 1996, as a result of the TRA-86 requirement that Contributions and Advances be taxed or has incurred between January 1, 2018, and December 31, 2020, as a result of the Tax Cuts and Jobs Act of 2017 requirement that Contributions and Advances be taxed?

A. No.

Q. Will you continue with your explanation of page 3 of Exhibit No. FV-1?

A. Projected funds supplied through Customer Advances not expended as of February 28, 2027, in the amount of $1,696,554 are deducted from the original cost measure of value, and this amount is set forth in Exhibit No. FV-1-2, which I will explain later.

Projected materials and supplies in the amount of $4,100,231 are included in the original cost measure of value, and the details are set forth in Exhibit No. FV-11, which I will explain later.

An allowance for projected cash working capital in the amount of $4,155,568 is included in the original cost measure of value. The details are shown in Exhibit Nos. FV-8, FV-8-1, FV-8-1 (a), FV-8-1 (b), FV-8-1 (c), FV-8-1 (d), FV-8-1 (e), FV-8-1 (g), FV-8-1 (g) 1, FV-8-1 (g) 2, FV-8-2, FV-8-3, and FV-8-4, which I will explain later and Mr. Poff addresses in his testimony (see York Water Statement No. 103).

Unamortized utility plant adjustments for Margaretta Mobile Home Park, Westwood Mobile Home Park, Lincoln Estates Mobile Home Park, The Meadows, and Scott Water Company in the amount of ($31,178) which is [$11,102 + $(15,095) + $(15,437) + $(31,764) +$20,015 = ($31,178)] are included in the original cost measure of value. The details are set forth in Exhibit Nos. FV-1-3, FV-1-6, FV-1-7, FV-1-8, and FV-1-9, which I will explain later. I note that Exhibit No. FV-1-4 and Exhibit No. FV-1-5 were not used in this case.

Taxes on deposits for construction and customer advances in the amount of $1,042,833 are included in the original cost measure of value. The details are shown in Exhibit No. FV-1-10, which Mr. Poff addresses in his testimony (see York Water Statement No. 103).

Column 1 of page 4 of Exhibit No. FV-1 shows pro forma net operating income available for return under existing rates for the twelve months ended December 31, 2024, in the amount of $24,230,709 and the rate of return on the original cost measure of value as of February 28, 2027, of 5.45%. Column 3 of page 4 of Exhibit No. FV-1 shows the adjustments to determine projected net operating income for the twelve months ending

December 31, 2025, in the amount of ($621,330). These adjustments have been detailed in other exhibits, which Mr. Poff address in his testimony (see York Water Statement No. 103). Projected net operating income available for return under existing rates for twelve months ending December 31, 2025, in the amount of $23,609,379 and the rate of return on the original cost measure of value as of February 28, 2027, of 5.31% are shown in Column 4 of page 4 of Exhibit No. FV-1. Column 6 of page 4 of Exhibit No. FV-1 shows the adjustments to determine pro forma net operating income for the twelve months ending December 31, 2025, in the amount of ($423,974). These adjustments have been detailed in other exhibits, which Mr. Poff addresses in his testimony (see York Water Statement No. 103). Pro Forma net operating income available for return under existing rates for twelve months ending December 31, 2025, in the amount of $23,185,405 and the rate of return on the original cost measure of value as of February 28, 2027, of 5.21% are shown in Column 7 of page 4 of Exhibit No. FV-1 and are carried forward to Column 1, page 5 of Exhibit No. FV-1.

Column 3 of page 5 of Exhibit No. FV-1 shows the adjustments to determine pro forma net operating income for the twelve months ending February 28, 2027, in the amount of ($1,902,024). These adjustments have been detailed in other exhibits, which Mr. Poff addresses in his testimony (York Water Statement No. 103). Projected net operating income available for return under existing rates for twelve months ending February 28, 2027, in the amount of $21,283,381 and the rate of return on the original cost measure of value as of February 28, 2027, of 4.79% are shown in Column 4 of page 5 of Exhibit No. FV-1. Pro forma adjustments to net operating income available for return in the amount of ($278,060) are shown in Column 6, page 5 of Exhibit No. FV-1. These adjustments

have been detailed in other exhibits, which Mr. Poff addresses in his testimony (York Water Statement No. 103). Column 7, page 5 of Exhibit No. FV-1 shows pro forma net operating income available for return for the twelve months ending February 28, 2027, under existing rates of $21,005,321 and the rate of return on the original cost measure of value as of February 28, 2027, of 4.72%. The Column 7 figures are carried forward to Column 1, page 6 of Exhibit No. FV-1.

Adjustments to pro forma net operating income available for return for the twelve months ending February 28, 2027, related to the effect of proposed rates in the amount of $14,646,663 are shown in column 3 of page 6 of Exhibit No. FV-1. These adjustments have been detailed in other exhibits which Mr. Poff addresses in his testimony (York Water Statement No. 103). Column 4 of page 6 of Exhibit No. FV-1 shows pro forma net operating income available for return for the twelve months ending February 28, 2027, in the amount of $35,651,984 and the rate of return on the original cost measure of value as of February 28, 2027, of 8.01%.

Q. Explain Exhibit No. FV-1-2.

A. Exhibit No. FV-1-2 provides projected thirteen-month average of customers' advances received from developers that, as of December 31, 2025, and February 28, 2027, will not have been spent on construction projects. The Company's normal procedure with respect to revenue-producing projects is to estimate the cost of the project and to require the developer to deposit the estimated cost prior to construction. Construction generally is completed within a period of several months, after which any advance in excess of construction costs is refunded. If construction costs exceed the original estimate, the

developer must advance additional costs to make up the difference. The projected thirteen-month average of customer advances received from developers with respect to revenue-producing projects remaining under construction as of December 31, 2025, and February 28, 2027, in the amount of $4,906,198 is shown in Column 2 of Exhibit No. FV-1-2. The projected thirteen-month average of related construction expenditures as of December 31, 2025, and February 28, 2027, in the amount of $3,209,644 are shown in Column 3 of Exhibit No. FV-1-2. The thirteen-month average of customers' advances in excess of related construction expenditures remaining under construction as of December 31, 2025, and February 28, 2027, in the amount of $1,696,554 ($4,906,198 - $3,209,644) is shown in Column 4 of Exhibit No. FV-1-2. The thirteen-month average of customers' advances in excess of related construction expenditures as of December 31, 2025, and February 28, 2027, in the amount of $1,696,554 has been carried forward to Exhibit No. FV-1, page 2 and has been deducted from the original cost measure of value. The projected thirteen-month average of customer advances from developers remaining under construction, the thirteen-month average of related construction expenditures, and the projected thirteen-month average of advances in excess of construction expenditures remaining under construction for December 31, 2025, and February 28, 2027, are equal to the historic test year actual (Refer to HV-1-2 for detail of thirteen-month average).

Q. Explain Exhibit No. FV-1-3.

A. Exhibit No. FV-1-3 provides the calculation of the unamortized utility plant acquisition adjustment relative to the acquisition of Margaretta Mobile Home Park as of December 31, 2025, in the amount of $17,578 and as of February 28, 2027, in the amount of $11,102 included in the original cost measure of value.

Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code. This amortization was specifically approved by the Commission in accordance with the Settlement Agreement at Docket No. R-2018-3000019. The amortization period began March 1, 2019 (the effective date of rates under the Order issued in the Company's 2018 base rate proceeding (Docket No. R-2018-3000019)) and ends February 28, 2029.

The acquisition adjustment subject to amortization of $55,509 is determined by subtracting the depreciated original cost of waterworks property acquired from Margaretta Mobile Home Park in the amount of $46,159 from the Margaretta Mobile Home Park acquisition costs of $101,667 ($101,667 - $46,159 = $55,509). The unamortized Margaretta Mobile Home Park acquisition adjustment as of December 31, 2025, in the amount of $17,578 is determined by subtracting the amortization during the period March 1, 2019, the effective date of rates under the Order issued in the Company's 2018 base rate proceeding (Docket No. R-2018-3000019), through December 31, 2025, of $37,931 from the acquisition adjustment subject to amortization of $55,509 ($55,509 - $37,931 = $17,578). Unamortized utility plant acquisition adjustment as of December 31, 2025, in the amount of $17,758 has been carried forward to Exhibit FV-1, page 2 and has been added to the original cost measure of value.

The unamortized acquisition adjustment for the period ending February 28, 2027, of $11,102 is determined by taking the unamortized acquisition adjustment as of December

31, 2025, of $17,578 and deducting the monthly amortization in the amount of $463 ($55,509 / 10 years / 12 months) for the fourteen months from January 2026 through February 28, 2027, of $6,476 ($463 x 14) ($17,578 - $6,476 = $11,102). The unamortized utility plant acquisition adjustment as of February 28, 2027, in the amount of $11,102 has been carried forward to Exhibit FV-1, page 3 and has been added to the original cost measure of value.

Q. Explain Exhibit No. FV-1-6.

A. Exhibit No. FV-1-6 provides the calculation of the unamortized utility plant acquisition adjustment relative to the acquisition of Westwood Mobile Home Park as of December 31, 2025, in the amount of $(23,900) and as of February 28, 2027, in the amount of $(15,095) included in the original cost measure of value.

This amortization was specifically approved by the Commission in accordance with the Settlement Agreement at Docket No. R-2018-3000019. The amortization period began March 1, 2019 (the effective date of rates under Order No. R-2018-3000019) and ends February 28, 2029.

The negative acquisition adjustment subject to amortization of $(75,474) is determined by subtracting the depreciated original cost of waterworks property acquired from Westwood Mobile Home Park in the amount of $96,795 from the Westwood Mobile Home Park acquisition costs of $21,321 [$21,321 - $96,795 = ($75,474)]. The unamortized Westwood Mobile Home Park negative acquisition adjustment as of December 31, 2025, in the amount of $(23,900) is determined by subtracting the amortization during the

period March 1, 2019, the effective date of rates under the Order issued in the Company's 2018 base rate proceeding (Docket No. R-2018-3000019), through December 31, 2025, of $(51,574) from the negative acquisition adjustment subject to amortization of $(75,474) [$(75,474) – $(51,574) = $(23,900)]. Unamortized utility plant negative acquisition adjustment as of December 31, 2025, in the amount of $(23,900) has been carried forward to Exhibit FV-1, page 2 and has been added to the original cost measure of value.

The negative unamortized acquisition adjustment for the period ending February 28, 2027, of $(15,095) is determined by taking the unamortized negative acquisition adjustment as of December 31, 2025, of $(23,900) and deducting the monthly amortization in the amount of $(629) [$(75,474) / 10 years / 12 months] for the fourteen months from January 1, 2026 through February 28, 2027, of $(8,805) [$(629) x 14] [$(23,900) – $(8,805) = $(15,095)]. The unamortized negative utility plant acquisition adjustment as of February 28, 2027, in the amount of $(15,095) has been carried forward to Exhibit FV-1, page 3 and has been added to the original cost measure of value.

Q. Explain Exhibit No. FV-1-7.

A. Exhibit No. FV-1-7 provides the calculation of the unamortized utility plant negative acquisition adjustment relative to the acquisition of Lincoln Estates Mobile Home Park as of December 31, 2025, in the amount of $(24,442) and as of February 28, 2027, in the amount of $(15,437) included in the original cost measure of value.

This amortization was specifically approved by the Commission in accordance with the Settlement Agreement at Docket No. R-2018-3000019. The amortization period began March 1, 2019 (the effective date of rates under Order No. R-2018-3000019) and ends February 28, 2029.

The negative acquisition adjustment subject to amortization of $(77,185) is determined by subtracting the depreciated original cost of waterworks property acquired from Lincoln Estates Mobile Home Park in the amount of $146,957 from the Lincoln Estates Mobile Home Park acquisition costs of $69,772 [$69,772 - $146,957 = ($77,185)]. The unamortized Lincoln Estates Mobile Home Park negative acquisition adjustment as of December 31, 2025, in the amount of $(24,442) is determined by subtracting the amortization during the period March 1, 2019, the effective date of rates under the Order issued in the Company's 2018 base rate proceeding (Docket No. R-2018-3000019), through December 31, 2025, of $(52,743) from the negative acquisition adjustment subject to amortization of $(77,185) [$(77,185) – $(52,743) = $(24,442)]. Unamortized negative utility plant acquisition adjustment as of December 31, 2025, in the amount of $(24,442) has been carried forward to Exhibit FV-1, page 2 and has been added to the original cost measure of value.

The unamortized negative acquisition adjustment for the period ending February 28, 2027, of $(15,437) is determined by taking the unamortized negative acquisition adjustment as of December 31, 2025, of $(24,442) and deducting the monthly amortization in the amount of $(643) [$(77,185) / 10 years / 12 months] for the fourteen months from January 1, 2026, through February 28, 2027, of $(9,004) [$(643) x 14]

[$(24,442) – $(9,004) = $(15,437)]. The unamortized negative utility plant acquisition adjustment as of February 28, 2027, in the amount of $(15,437) has been carried forward to Exhibit FV-1, page 3 and has been added to the original cost measure of value.

Q. Explain Exhibit No. FV-1-8.

A. Exhibit No. FV-1-8 provides the calculation of the unamortized utility plant negative acquisition adjustment relative to the acquisition of The Meadows as of December 31, 2025, in the amount of $(50,292) and as of February 28, 2027, in the amount of $(31,764) included in the original cost measure of value.

This amortization was specifically approved by the Commission in accordance with the Settlement Agreement at Docket No. R-2018-3000019. The amortization period began March 1, 2019 (the effective date of rates under Order No. R-2018-3000019) and ends February 28, 2029.

The negative acquisition adjustment subject to amortization of $(158,818) is determined by subtracting the depreciated original cost of waterworks property acquired from The Meadows in the amount of $221,778 from The Meadows acquisition costs of $62,960 [$62,960 - $221,778 = $(158,818)]. The unamortized The Meadows negative acquisition adjustment as of December 31, 2025, in the amount of $(50,292) is determined by subtracting the amortization during the period March 1, 2019, the effective date of rates under the Order issued in the Company's 2018 base rate proceeding (Docket No. R-2018-3000019), through December 31, 2025, of $(108,536) from the negative acquisition adjustment subject to amortization of ($158,818) [$(158,818) – $(108,526) = $(50,292)].

Unamortized negative utility plant acquisition adjustment as of December 31, 2025, in the amount of $(50,292) has been carried forward to Exhibit FV-1, page 2 and has been added to the original cost measure of value.

The unamortized negative acquisition adjustment for the period ending February 28, 2027, of $(31,764) is determined by taking the unamortized negative acquisition adjustment as of December 31, 2025, of $(50,292) and deducting the monthly amortization in the amount of $(1,323) [$(158,818) / 10 years / 12 months] for the fourteen months from January 1, 2026, through February 28, 2027, of $(18,529) [$(1,323) x 14] [$(50,292) – $(18,529) = $(31,764)]. The unamortized utility plant negative acquisition adjustment as of February 28, 2027, in the amount of $(31,764) has been carried forward to Exhibit FV-1, page 3 and has been added to the original cost measure of value.

Q. Explain Exhibit No. FV-1-9.

A. Exhibit No. FV-1-9 provides the calculation of the unamortized utility plant acquisition adjustment relative to the acquisition of Scott Water Company as of December 31, 2025, in the amount of $22,659 and as of February 28, 2027, in the amount of $20,015 included in the original cost measure of value.

Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code. The Company is seeking approval to amortize the reasonable acquisition costs greater than the depreciated original cost of waterworks property and

rights. Please see the testimony of Mr. Hand for details on this acquisition (see York Water Statement No. 1).

The acquisition adjustment subject to amortization of $22,659 is determined by subtracting the depreciated original cost of waterworks property acquired Scott Water Company in the amount of $9,144 from Scott Water Company acquisition costs of $31,803 ($31,803 - $9,144 = $22,659).

The unamortized acquisition adjustment for the period ending February 28, 2027, of $20,015 is determined by taking the acquisition adjustment as of December 31, 2025, of $22,659 and deducting the monthly amortization in the amount of $189 ($22,659 / 10 years / 12 months) for the fourteen months from January 1, 2026, through February 28, 2027, of $2,644 ($189 x 14) ($22,659 - $2,644 = $20,015). The unamortized utility plant acquisition adjustment as of February 28, 2027, in the amount of $20,015 has been carried forward to Exhibit FV-1, page 3 and has been added to the original cost measure of value.

Q. Explain Exhibit No. FV-8.

A. Exhibit No. FV-8 is the calculation of the projected cash working capital requirement for the periods ending December 31, 2025, and February 28, 2027, in the amounts of $3,997,420 and $4,155,568, respectively, to be included in the original cost measure of value. The projected cash working capital requirement for December 31, 2025, consists of various amounts that are listed on page 1 of Exhibit No. FV-8. The first amount on page 1 of Exhibit No. FV-8 is $4,615,982 that is the cash working capital allowance

calculated using the lead-lag methodology. The total of pro forma operating expenses including taxes, less uncollectible accounts and amortized expenses, in the amount of $31,346,674 is divided by the number of days in the pro forma test year, 365 ($31,346,675 ÷ 365) to derive the average daily operating expense, including taxes, in the amount of $85,881, and this amount is then multiplied by the net lag relationship between the receipt of operating revenues and the payment of operating expenses and taxes of 53.7 days to arrive at the projected cash working capital requirement in the amount of $4,615,982 ($85,881 x 53.7). The calculation of the net lag of 53.7 days is shown on Exhibit No. FV-8-1, which I will explain later.

The second amount shown on page 1 of Exhibit No. FV-8 is $220,289 and is for projected prepayment of the Commission, Office of Consumer Advocate ("OCA"), Office of Small Business Advocate ("OSBA"), and Damage Prevention Committee ("DPC") assessments. This represents a thirteen-month average of projected monthly prepayment balances of the Commission, OCA, OSBA, and DPC assessments reflected on the Company's balance sheet for the twelve months ending December 31, 2025. Prepaid Commission, OCA, OSBA, and DPC assessments have been excluded from the Company's lead-lag study. The calculation of the projected thirteen-month average prepayment balance is presented on Exhibit No. FV-8-4, which I will explain later.

The third amount shown on page 1 of Exhibit No. FV-8 is $(409,315) that is a deduction with respect to projected water revenues paid by customers in advance. This represents a thirteen-month average of projected water revenues paid in advance. The calculation of the thirteen-month average is shown on Exhibit No. FV-8-2, which I will explain later.

The fourth amount is $(429,536) that is a deduction with respect to projected interest payments. The calculation of the deduction with respect to projected interest payments is shown on Exhibit No. FV-8-3, which I will explain later.

The total projected cash working capital requirement for the period ending December 31, 2025, in the amount of $3,997,420 [4,615,982 + $220,289 + ($409,315) + ($429,536)] is carried forward to Exhibit No. FV-1 page 2 and is included in the Company's original cost measure of value.

Page 2 of Exhibit No. FV-8 is the calculation of the projected cash working capital requirement for the period ending February 28, 2027, in the amount of $4,155,568 to be included in the original cost measure of value. The projected cash working capital requirement consists of various amounts that are listed on page 2 of Exhibit No. FV-8. The first amount on page 2 of Exhibit No. FV-8 is $4,884,375 that is the cash working capital allowance calculated using the lead-lag methodology. The total of pro forma operating expenses including taxes, less uncollectible accounts and amortized expenses, in the amount of $33,275,610 is divided by the number of days in the pro forma test year, 365 ($33,275,610 ÷ 365) to derive the average daily operating expense, including taxes, in the amount of $91,166, and this amount is then multiplied by the net lag relationship between the receipt of operating revenues and the payment of operating expenses and taxes of 53.6 days to arrive at the projected cash working capital requirement in the amount of $4,884,375 ($91,166 x 53.6). The calculation of the net lag of 53.6 days is shown on Exhibit No. FV-8-1, which I will explain later.

The second amount shown on page 2 of Exhibit No. FV-8 is $219,788 and is for projected prepayment of the Commission, OCA, OSBA, and DPC assessments. This represents a thirteen-month average of projected monthly prepayment balances of the Commission, OCA, OSBA, and DPC assessments reflected on the Company's balance sheet for the twelve months ending February 28, 2027. Prepaid Commission, OCA, OSBA, and DPC assessments have been excluded from the Company's lead-lag study. The calculation of the projected thirteen-month average prepayment balance is presented on Exhibit No. FV-8-4, which I will explain later.

The third amount shown on page 2 of Exhibit No. FV-8 is $(409,315) that is a deduction with respect to projected water revenues paid by customers in advance. This represents a thirteen-month average of projected water revenues paid in advance. The calculation of the thirteen-month average is shown on Exhibit No. FV-8-2, which I will explain later.

The fourth amount is $(539,280) that is a deduction with respect to projected interest payments. The calculation of the deduction with respect to projected interest payments is shown on Exhibit No. FV-8-3, which I will explain later.

The total projected cash working capital requirement for the period ending February 28, 2027, in the amount of $4,155,568 [$4,884,375 + $219,788 + ($409,315) + ($539,280)] is carried forward to Exhibit No. FV-1 page 3 and is included in the Company's original cost measure of value.

Q. Explain Exhibit No. FV-8-1.

A. Exhibit No. FV-8-1 is the calculation of the net lag relationship between the receipt of operating revenues and the payment of operating expenses, including taxes, for the periods ending December 31, 2025, and February 28, 2027, of 53.7 days and 53.6 days, respectively. The 53.7-day net lag relationship for the period ending December 31, 2025, shown in Column 5 of page 2, is determined by reducing the weighted average lag days in receipt of revenues of 61.2 days by the weighted average lag days in payment of expenses and taxes of 7.4 days (61.2 – 7.4 = 53.7). The weighted average lag days in receipt of operating revenues of 61.2 days is determined by multiplying pro forma sales of water under existing rates by class, shown in Column 2, by the estimated number of lag days by class, shown in Column 3, to arrive at dollar days of 4,097,910,046, shown in Column 4. The estimated number of lag days by class is calculated in Exhibit No. FV-8-1 (g), which Mr. Poff addresses in his testimony (York Water Statement No. 103). The dollar-day amount of 4,097,910,046, shown in Column 4, is divided by total pro forma revenues for the sales of water at existing rates of $66,999,722 shown in Column 2 to produce 61.2 days (4,097,910,046 ÷ $66,999,722 = 61.2).

The weighted average lag days in payment of operating expenses and taxes of 7.4 days is determined by multiplying pro forma operating expenses including taxes, excluding uncollectible accounts and amortized expenses, shown in Column 2, in the amount of $31,346,674 by the estimated number of lag days in payment of expenses and taxes by class of expense and tax, shown in Column 3, to arrive at dollar days of 232,425,921, shown in Column 4. The dollar-day amount of 232,425,921, shown in Column 4, is divided by total pro forma operating expenses including taxes, excluding uncollectible

accounts and amortized expenses, in the amount of $31,346,674 to produce 7.4 days (232,425,921 ÷ $31,346,674 = 7.4). The calculation of lag days for payroll expense and payroll taxes is presented in footnote (a) of Exhibit No. FV-8-1. The calculation of lag days for power purchased, insurance, and other goods and services and taxes is based on an analysis of invoices paid during twelve months ended December 31, 2024, and is shown on Exhibit Nos. FV-8-1 (a), FV-8-1 (b), and FV-8-1 (c), FV-8-1 (d), and FV-8-1 (e), which I will explain later. The net lag relationship of 53.7 days between the receipt of operating revenues and the payment of operating expenses has been carried forward to Exhibit No. FV-8.

The 53.6-day net lag relationship for the period ending February 28, 2027, shown in Column 5 of page 4, is determined by reducing the weighted average lag days in receipt of revenues of 61.2 days by the weighted average lag days in payment of expenses and taxes of 7.6 days (61.2 – 7.6 = 53.6). The estimated number of lag days by class has been previously explained. The weighted average lag days in receipt of operating revenues of 61.2 days is calculated as follows. The dollar-day amount of 4,128,416,108, shown in Column 4, is divided by total pro forma revenues from sales of water at existing rates of $67,478,569 shown in Column 2 to produce 61.2 days (4,127,416,108 ÷ $67,478,569 = 61.2).

The weighted average lag days in payment of operating expenses and taxes of 7.6 days is determined by multiplying pro forma operating expenses including taxes, excluding uncollectible accounts and amortized expenses, shown in Column 2, in the amount of $33,275,610 by the estimated number of lag days in payment of expenses and taxes by

class of expense and tax, shown in Column 3, to arrive at dollar days of 252,549,749, shown in Column 4. The dollar-day amount of 252,549,749, shown in Column 4, is divided by total pro forma operating expenses including taxes, excluding uncollectible accounts and amortized expenses, in the amount of $33,275,610 to produce 7.6 days (252,549,749 ÷ $33,275,610 = 7.6). The calculation of lag days for payroll expense and payroll taxes is presented in footnote (a) of Exhibit No. FV-8-1. The calculation of lag days for power purchased, insurance and other goods and services and taxes is based on an analysis of invoices paid during twelve months ended December 31, 2024, and is shown on Exhibit No. FV-8-1 (a), FV-8-1 (b) and FV-8-1 (c), FV-8-1 (d), and FV-8-1 (e), which I will explain later.

The net lag relationship of 53.6 days between the receipt of operating revenues and the payment of operating expenses has been carried forward to Exhibit No. FV-8 page 2.

Q. Explain Exhibit No. FV-8-1(a).

A. Exhibit No. FV-8-1(a) reflects the calculation of the average days lag in payment of purchased power of 25.7 days. The average days lag in payment of purchased power of 25.7 is determined by dividing total dollar days lag in the amount of 27,134,073 by total charges for the accounts included in the Company's sample of purchased power locations incurred during the twelve months ended December 31, 2024, of $1,054,515 (27,134,073 ÷ $1,054,515 = 25.7). The average days lag in payment of purchased power of 25.7 has been carried forward to Exhibit No. FV-8-1 page 1 and FV-8-1 page 3.

Q. Explain Exhibit No. FV-8-1 (b).

A. Exhibit No. FV-8-1 (b) page 1 reflects the calculation of the average days lag in payment of insurance expense of (60.8) days. The average days lag in payment of insurance expense of (60.8) days is determined by dividing total dollar days lag in the amount of (212,091,716) by total invoice amount of $3,489,599 included in insurance expense during the twelve months ended December 31, 2024 [(212,091,716) ÷ $3,489,599 = (60.8)]. The Company's sample of insurance payments includes all insurance payments made during the twelve months ended December 31, 2024. Negative average lag days for insurance expense are determined because insurance payments precede the midpoints of service provided as a result of such payment. The average days lag in payment of insurance expense of (60.8) has been carried forward to Exhibit No. FV-8-1 page 1 and FV-8-1 page 3.

Q. Explain Exhibit No. FV-8-1 (c).

A. Exhibit No. FV-8-1 (c) reflects the calculation of the average days lag in payment of other goods and services of 33.1 days. The average days lag in payment of other goods and services of 33.1 days is determined by dividing total dollar days lag in the amount of 25,180,421 by total invoice amount included in the Company's sample of other goods and services invoices of $760,473 (25,180,421 ÷ $760,473 = 33.1). The Company performed a random sampling of other goods and services payments by selecting approximately every 20th payment made during the twelve months ended December 31, 2024. The average days lag in payment of other goods and services of 33.1 has been carried forward to Exhibit No. FV-8-1 page 1 and FV-8-1 page 3.

Q. Explain Exhibit FV-8-1 (d).

A. Exhibit No. FV-8-1 (d) reflects the calculation of the average days lag in payment of public utility realty and local property taxes of (79.2) days. The average days lag in payment of public utility realty and local property taxes of (79.2) days is determined by dividing total dollar days in the amount of 34,505,087 by total amount included in the Company's sample of public utility realty and local property tax payments of $435,534 [(34,505,087) ÷ $435,534 = (79.2) days]. The Company's sample of public utility realty and local property tax payments includes all public utility realty and local property tax payments made during the twelve months ended December 31, 2024. Negative average lag days for the payment of public utility realty and local property taxes are determined because most public utility realty and local property tax payments precede the midpoints of service provided as a result of such payment.

The average days lag in payment of public utility realty and local property taxes of (79.2) has been carried forward to Exhibit No. FV-8-1, page 1 and FV-8-1, page 3.

Q. Explain Exhibit No. FV-8-1 (e).

A. Exhibit No. FV-8-1 (e) reflects the calculation of the average days lag in payment of state and federal income taxes of 31.3 days. The average days lag in payment of state and federal income taxes of 31.3 days is determined by dividing total dollar days in the amount of 29,540,500 by total amount included in the Company's sample of other tax payments of $943,000 [29,540,500 ÷ $943,000 = 31.3 days]. The Company's sample of state and federal income tax payments includes all state and federal income tax payments made during the twelve months ended December 31, 2024. The average days lag in

payment of state and federal income taxes of 31.3 has been carried forward to Exhibit No. FV-8-1, page 1 and FV-8-1, page 3.

Q. Explain Exhibit No. FV-8-2.

A. Exhibit No. FV-8-2 shows the calculation of the thirteen-month average of projected builders' deposits and water revenues paid in advance in the amount of $409,315 based upon the actual month-end balances of builders' deposits and water revenues paid in advance for the thirteen months ended December 31, 2024. The thirteen-month average of projected builders' deposits and water revenues in advance of $409,315 has been carried forward to Exhibit No. FV-8 page 1 and FV-8 page 2.

Q. Explain Exhibit No. FV-8-3.

A. Exhibit FV-8-3 presents the calculation of the projected payment lag for interest payments for the years ending December 31, 2025, and February 28, 2027, in the amounts of $429,536 and $539,280, respectively. The amount of $429,536 on page 1 of Exhibit No. FV-8-3 is calculated by multiplying the projected average daily interest expense of $26,931 by the net interest payment lag of 15.9 days ($26,931 x 15.9). The average projected daily interest expense in the amount of $26,931 is calculated by dividing the projected interest payments in the amount of $9,829,636 by the number of days in the future test year of 365 ($9,829,636 ÷ 365 = $26,921). The net interest payment lag of 15.9 days is determined by subtracting the weighted average lag days in receipt of operating revenues of 61.2 days from the weighted average lag days for interest payments of 77.1 days (77.1 days – 61.2 days = 15.9 days). The weighted average lag days for interest payments of 77.1 days is determined by dividing weighted projected

interest payments of 757,991,589, shown in Column 3, by projected interest payment in the amount of $9,829,636, shown in Column 1 (757,991,589 ÷ $9,829,636 = 77.1). The amount of $429,536 has been carried forward to Exhibit No. FV-8, page 1.

The amount of $539,280 on page 2 of Exhibit No. FV-8-3 is calculated by multiplying the projected average daily interest expense of $24,522 by the net interest payment lag of 22.0 days ($24,522 x 22.0). The average projected daily interest expense in the amount of $24,522 is calculated by dividing the projected interest payments in the amount of $8,950,427 by the number of days in the fully projected future test year of 365 ($8,950,427 ÷ 365 = $24,522). The net interest payment lag of 22.0 days is determined by subtracting the weighted average lag days in receipt of operating revenues of 61.2 days from the weighted average lag days for interest payments of 83.2 days (83.2 days – 61.2 days = 22.0 days). The weighted average lag days for interest payments of 83.2 days is determined by dividing weighted projected interest payments of 744,301,854, shown in Column 3, by projected interest payment in the amount of $8,950,427, shown in Column 1 (744,301,854÷ $8,950,427 = 83.2). The amount of $539,280 has been carried forward to Exhibit No. FV-8, page 2.

Q. Explain Exhibit No. FV-8-4.

A. Exhibit No. FV-8-4 shows the calculation of the thirteen-month average of projected prepaid Commission, OCA, OSBA, and DPC assessments of $220,289 and $219,788 based upon the projected month-end balances of prepaid Commission, OCA, OSBA, and DPC assessments for the thirteen months ending December 31, 2025, and for the thirteen months ending February 28, 2027, respectively. Prepaid Commission, OCA, OSBA, and

DPC assessments have been excluded from the Company's lead-lag study. The thirteen-month average of projected prepaid Commission, OCA, OSBA, and DPCA assessments of $220,289 for December 31, 2025, has been carried forward to Exhibit FV-8, page 1, and the thirteen-month average of $219,788 for February 28, 2027, has been carried forward to Exhibit No. FV-8, page 2.

Q. Explain Exhibit No. FV-9.

A. Exhibit No. FV-9 shows that amortized expenses and bad debt expense have been removed from total expenses for the cash working capital calculations for the period ending December 31, 2025, and the period ending February 28, 2027.

Q. Explain Exhibit No. FV-11.

A. Exhibit No. FV-11 shows the calculation of the thirteen-month average, in the amounts of $3,830,308 and $4,100,231, of projected materials and supplies based upon projected month-end balances for the thirteen months ending December 31, 2025, and February 28, 2027, respectively. The 2025-month end balances were projected by applying the 2024 (13-month average) ratio of materials and supplies to utility plant in service, to projected 2025 monthly plant in service balances. I note that under the Company's accounting procedure, amounts are included in the materials and supplies balance upon receipt of the materials and supplies. The total for the thirteen-month period is $49,794,006, and this amount is divided by 13 to arrive at the thirteen-month average of the materials and supplies balance in the amount of $3,830,308 for the period ending December 31, 2025. The thirteen-month average in the amount of $3,830,308 has been carried forward to Exhibit No. FV-1, page 2 and has been added to the original cost measure of value.

The February 28, 2027 month end balances were projected by applying the 2024 (13-month average) ratio of materials and supplies to utility plant in service, to projected 2026 monthly plant in service balances. The total for the thirteen-month period is $53,303,007, and this amount is divided by 13 to arrive at the thirteen-month average of the materials and supplies balance in the amount of $4,100,231 for the period ending February 28, 2027. The thirteen-month average in the amount of $4,100,231 has been carried forward to Exhibit No. FV-1, page 3 and has been added to the original cost measure of value.

Q. Are you sponsoring any other exhibits regarding the original cost measure of value?

A. Yes, I am also sponsoring Exhibit Nos. F(c)-1, FV-2, FV-3, FV-4, FV-5, FV-6, FV-7, FV-13, FV-14, FV-15, FV-16, FV-16-1, FV-16-2, FV-16-3, and FV-16-4.

Q. Are you sponsoring any other exhibits?

A. No.

Q. Does this conclude your future test year and fully projected future test year direct testimony at this time?

A. Yes.

I. INTRODUCTION

A. WITNESS IDENTIFICATION

Q. Please state your name and business address.

A. My name is Dylan W. D'Ascendis. My business address is 1820 Chapel Avenue W, Suite 300, Cherry Hill, NJ 08003.

Q. By whom are you employed and in what capacity?

A. I am a Partner at ScottMadden, Inc.

B. BACKGROUND AND QUALIFICATIONS

Q. Please summarize your professional experience and educational background.

A. I have offered expert testimony on behalf of investor-owned utilities before over 40 state regulatory commissions in the United States, the Federal Energy Regulatory Commission, the National Energy Regulator in Canada, the Alberta Utility Commission, an American Arbitration Association panel, and the Superior Court of Rhode Island on issues including, but not limited to, common equity cost rate, rate of return, valuation, capital structure, class cost of service, and rate design.

On behalf of the American Gas Association ("AGA"), I calculate the AGA Gas Index, which serves as the benchmark against which the performance of the American Gas Index Fund ("AGIF") is measured on a monthly basis. The AGA Gas Index and AGIF are a market capitalization-weighted index and mutual fund, respectively, comprised of the common stocks of the publicly traded corporate members of the AGA.

I am a member of the Society of Utility and Regulatory Financial Analysts ("SURFA"). In 2011, I was awarded the professional designation "Certified Rate of Return Analyst" by SURFA, which is based on education, experience, and the successful completion of a comprehensive written examination.

I am also a member of the National Association of Certified Valuation Analysts ("NACVA") and was awarded the professional designation "Certified Valuation Analyst" by the NACVA in 2015.

I am a graduate of the University of Pennsylvania, where I received a Bachelor of Arts degree in Economic History. I have also received a Master of Business Administration with high honors and concentrations in Finance and International Business from Rutgers University. The details of my educational background and expert witness appearances are included in Appendix A

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your Direct Testimony in this proceeding?

A. The purpose of my Direct Testimony is to present evidence on behalf of The York Water Company ("York Water" or the "Company") about the appropriate capital structure and corresponding cost rates the Company should be given the opportunity to earn on its jurisdictional rate base.

Q. Have you prepared any Schedules in support of your recommendation?

A. Yes. I have prepared Schedules DWD-1 through DWD-9, which have been prepared by me or under my direct supervision.

Q. What is your recommended cost of capital for York Water?

A. I recommend the Pennsylvania Public Utility Commission ("PA PUC" or the "Commission") authorize the Company the opportunity to earn an overall rate of return of 8.01% based on the Company's actual capital structure, which consists of 45.42% long-term debt at a weighted average cost rate of 4.54%, and 54.58% common equity at my recommended return on common equity ("ROE") of 10.90%. The overall rate of return is summarized on page 1 of Schedule DWD-1 and in Table 1 below:

Table 1: Summary of Overall Rate of Return

Type of Capital	Ratios	Cost Rate	Weighted Cost Rate
Long-Term Debt	45.42%	4.54%	2.06%
Common Equity	54.58%	10.90%	5.95%
Total	100.00%		8.01%

III. SUMMARY

Q. Please summarize your recommended common equity cost rate.

A. My recommended common equity cost rate of 10.90% is summarized on page 2 of Schedule DWD-1. I have assessed the market-based common equity cost rates of companies of relatively similar, but not necessarily identical, risk to York Water. Using companies of relatively comparable risk as proxies is consistent with the principles of fair rate of return established in the *Hope*[1] and *Bluefield*[2] Supreme Court cases. No proxy group can be identical in risk to any single company, so there must be an evaluation of relative risk between the Company and the proxy group to see if it is appropriate to make adjustments to the proxy group's indicated rate of return.

My recommendation results from the application of several cost of common equity models, specifically the Discounted Cash Flow ("DCF") model, the Risk Premium Model ("RPM"), and the Capital Asset Pricing Model ("CAPM"), to the market data of a proxy group of six water companies ("Utility Proxy Group") whose selection criteria will be discussed below. In addition, I also applied the DCF, RPM, and CAPM to a proxy group of domestic, non-price regulated companies comparable in total risk to the Utility Proxy Group ("Non-Price Regulated Proxy Group").

---

1 *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591 (1944). *("Hope")*

2 *Bluefield Water Works Improvement Co. v. Public Serv. Comm'n*, 262 U.S. 679 (1922). ("*Bluefield*")

The results derived from each are as follows:

Table 2: Summary of Common Equity Cost Rate

Discounted Cash Flow Model	9.82%
Risk Premium Model	10.70%
Capital Asset Pricing Model	10.74%
Market Models Applied to Comparable Risk, Non-Price Regulated Companies	11.51%
Indicated Range of Common Equity Cost Rates Before Adjustments for Company-Specific Risk	9.82%- 11.51%
Business Risk Adjustment	0.15%
Flotation Cost Adjustment	0.12%
Performance Factor Adjustment	0.25%
Indicated Range of Common Equity Cost Rates after Adjustment	10.34% – 12.03%
Recommended Cost of Common Equity	10.90%

After analyzing the indicated common equity cost rates derived through these models, the indicated range of common equity cost rates applicable to the Utility Proxy Group is between 9.82% and 11.51%.

The indicated range of common equity cost rates applicable to the Utility Proxy Group was then adjusted upward by 0.15% to reflect York Water's greater business risk due to its substantially smaller size relative to the Utility Proxy Group. I then adjusted the indicated common equity cost rate upward by 0.12% to account for flotation costs. I also adjusted the Company's' indicated range of common equity cost rates upward by 0.25% to reflect a performance factor adjustment, based on guidance from Section 523 of the Pennsylvania Public Utility Code, 66 Pa.C.S. § 523. These adjustments result in a Company-specific range of common equity cost rates between 10.34% and 12.03%. From

this range of results, I recommend the Commission consider a common equity cost rate of 10.90% for use in setting rates for the Company.

IV. GENERAL PRINCIPLES

Q. What general principles have you considered in arriving at your recommended common equity cost rate of 10.90%?

A. In unregulated industries, the competition of the marketplace is the principal determinant of the price of products or services. For regulated public utilities, regulation must act as a substitute for marketplace competition. Assuring that the utility can provide safe and reliable service at all times to their customers requires a level of earnings sufficient to maintain the integrity of presently invested capital. Sufficient earnings also permit the attraction of needed new capital at a reasonable cost, for which the utility must compete with other firms of comparable risk, consistent with the fair rate of return standards established by the U.S. Supreme Court in the previously cited *Hope* and *Bluefield* decisions. The U.S. Supreme Court affirmed the fair rate of return standards in *Hope*, when it stated:

> The rate-making process under the Act, i.e., the fixing of 'just and reasonable' rates, involves a balancing of the investor and the consumer interests. Thus we stated in the Natural Gas Pipeline Co. case that 'regulation does not insure [sic] that the business shall produce net revenues.' 315 U.S. at page 590, 62 S.Ct. at page 745. But such considerations aside, the investor interest has a legitimate concern with the financial integrity of the company whose rates are being regulated. From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. Cf. Chicago & Grand Trunk R. Co. v. Wellman, 143 U.S. 339, 345, 346 12 S.Ct. 400, 402. By that standard the return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure

> confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. [3]

In summary, the U.S. Supreme Court has found a return that is adequate to attract capital at reasonable terms enables the utility to provide service while maintaining its financial integrity. As discussed above, and in keeping with established regulatory standards, that return should be commensurate with the returns expected elsewhere for investments of corresponding risk. The Commission's decision in this proceeding, therefore, should provide the Company with the opportunity to earn a return that is: 1) adequate to attract capital at reasonable cost and terms; 2) sufficient to ensure its financial integrity; and 3) commensurate with returns on investments in enterprises having corresponding risks.

In addition, the required return for a regulated public utility is established on a stand-alone basis, i.e., for the utility operating company at issue in a rate case. Parent entities, like other investors, have capital constraints and must look at the attractiveness of the expected risk-adjusted return of each investment alternative in their capital budgeting process. That is, utility holding companies that own many utility operating companies have choices as to where they will invest their limited capital within the holding company family. Therefore, the opportunity cost concept applies regardless of whether the funding source is public or corporate.

When funding is provided by a parent entity, the return still must be sufficient to provide an incentive to allocate equity capital to the subsidiary or business unit rather than other internal or external investment opportunities. That is, the regulated subsidiary must compete for capital with all the parent company's affiliates, and with other similar risk

[3] *Hope*, 320 U.S. 591 (1944), at 603.

companies, which may include non-utilities. In that regard, investors value corporate entities on a sum-of-the-parts basis and expect each division within the parent company to provide an appropriate risk-adjusted return.

It, therefore, is important that the authorized ROE for the Company reflects the risks and prospects of its operations and supports its financial integrity from a stand-alone perspective.

Q. Within that broad framework, how is the cost of capital estimated in regulatory proceedings?

A. Regulated utilities primarily use common stock and long-term debt to finance their permanent property, plant, and equipment (i.e., rate base). The fair rate of return for a regulated utility is based on its weighted average cost of capital, in which, as noted earlier, the costs of the individual sources of capital are weighted by their respective book values.

The cost of capital is the return investors require to make an investment in a firm. Investors will provide funds to a firm only if the return that they *expect* is equal to, or greater than, the return that they *require* to accept the risk of providing funds to the firm.

The cost of capital (that is, the combination of the costs of debt and equity) is based on the economic principle of "opportunity costs." The principle of opportunity costs recognizes that investing in any asset (whether debt or equity securities) represents a forgone opportunity to invest in alternative assets. For any investment to be sensible, its expected return must be at least equal to the return expected on alternative investment opportunities with comparable risks. Because investments with like risks should offer similar returns, the opportunity cost of an investment should equal the return available on an investment of comparable risk.

The cost of debt is contractually defined and can be directly observed as the interest rate or yield on debt securities. However, the cost of equity must be estimated based on market data and various financial models. Because the cost of equity is premised on opportunity costs, the models used to determine it are typically applied to a group of "comparable" or "proxy" companies.

In the end, the estimated cost of capital should reflect the return that investors require in light of the subject company's business and financial risks, and the returns available on comparable investments.

A. BUSINESS RISK

Q. Please define business risk and explain why it is important to the determination of a fair rate of return.

A. Business risk is the riskiness of a company's common stock without the use of debt and/or preferred capital. Examples of such general business risks faced by all utilities (i.e., electric, natural gas distribution, and water) include size, the quality of management, the regulatory environment in which utilities operate, customer mix and concentration of customers, service territory growth, and capital intensity. All of these have a direct bearing on earnings.

Consistent with the basic financial principle of risk and return, business risk is important to the determination of a fair rate of return, because the higher the level of risk, the higher the rate of return investors demand.

Q. What business risks do the water and wastewater industries face in general?

A. Water and wastewater utilities have an ever-increasing responsibility to be stewards of the environment from which water supplies are drawn in order to preserve and protect essential natural resources of the United States. Water utilities also produce the only utility

commodity that is ingested. Because of this, water utilities are subject to continuous monitoring by the Environmental Protection Agency and state and local governments for potential contaminants. Furthermore, emergence of new contaminants exposes water utilities to litigation.

In addition, water utilities have significant capital needs due to their aging infrastructure, exacerbating the pressure on free cash flows arising from increased capital expenditures for infrastructure repair and replacement. The significant amount of capital investment is another major risk factor for the water and wastewater utility industry.

Value Line Investment Survey ("*Value Line*") observes the following about the water utility industry:

> Water utilities have been playing catch up for more than a decade. The industry had deferred capital spending for years, partially to keep customers' bills artificially low. As a result, the condition of the nation's water infrastructure has deteriorated significantly. In many parts of the country, the average age of pipelines can vary from 40 to 75 years. In addition to leaky pipes, many valves are broken. This causes a portion of the water being transported to never make it to its destination. The companies here have increased their capital budgets aggressively and have been hard at work upgrading their systems. Nevertheless, there is so much work ahead that the construction cycle should continue for the foreseeable future.[4]

The water and wastewater industry also experiences low depreciation rates. Depreciation rates are one of the principal sources of internal cash flows for all utilities (through a utility's depreciation expense) and are vital for a company to fund ongoing replacements and repairs of water and wastewater systems. Water/wastewater utility assets have long lives and therefore have long capital recovery periods. As such, they face greater risk due to inflation, which results in a higher replacement cost per dollar of net plant.

[4] *Value Line Investment Survey*, April 4, 2025.

Simply, capital that is retiring today will need to be replaced with capital which is significantly more expensive.

Substantial capital expenditures, as noted by *Value Line*, require significant financing. The three sources of financing typically used are debt, equity (common and preferred), and cash flow. All three are intricately linked to the opportunity to earn a sufficient rate of return as well as the ability to achieve that return. Consistent with *Hope* and *Bluefield*, the return must be sufficient to maintain credit quality as well as enable the attraction of necessary new capital, be it debt or equity capital. If unable to raise debt or equity capital, the utility must turn to either retained earnings or free cash flow,[5] both of which are directly linked to earning a sufficient rate of return. The level of free cash flow represents a utility's ability to meet the needs of its debt and equity holders. If either retained earnings or free cash flow is inadequate, it will be nearly impossible for the utility to attract the needed capital for new infrastructure investment necessary to ensure quality service to its customers. An insufficient rate of return can be financially devastating for utilities as well as a public safety issue for their customers.

The water and wastewater utility industry's high degree of capital intensity and low depreciation rates, coupled with the need for substantial infrastructure capital spending and growing exposure to legal risks from emerging contaminants and public health concerns, require regulatory support in the form of adequate and timely rate relief, and in particular, a sufficient authorized return on common equity, so that the industry can successfully meet the challenges it faces.

[5] Free Cash Flow = Operating Cash Flow (Funds From Operations) minus Capital Expenditures.

B. FINANCIAL RISK

Q. Please define financial risk and explain why it is important to the determination of a fair rate of return.

A. Financial risk is the additional risk created by the introduction of debt and preferred stock into the capital structure. The higher the proportion of debt and preferred stock in the capital structure, the higher the financial risk (i.e., likelihood of default). Therefore, consistent with the basic financial principle of risk and return, investors demand a higher common equity return as compensation for bearing higher default risk.

Q. Can bond and credit ratings be a proxy for the combined business and financial risk (i.e., investment risk of an enterprise)?

A. Yes, similar bond ratings/issuer credit ratings reflect, and are representative of, similar combined business and financial risks (i.e., total risk) faced by bond investors.[6] Although specific business or financial risks may differ between companies, the same bond/credit rating indicates that the combined risks are roughly similar, albeit not necessarily equal, as the purpose of the bond/credit rating process is to assess credit quality or credit risk (i.e., the risk of the company not paying its outstanding debt), and not common equity risk (i.e., the risk of the company not paying its outstanding debt, nor compensating its equity investors).

[6] Risk distinctions within S&P's bond rating categories are recognized by a plus or minus, i.e., within the A category, an S&P rating can be at A+, A, or A-. Similarly, risk distinctions for Moody's ratings are distinguished by numerical rating gradations, i.e., within the A category, a Moody's rating can be A1, A2 and A3.

Q. That being said, do rating agencies reflect company size in their bond ratings?

A. No. Neither Standard & Poor's ("S&P") nor Moody's Ratings ("Moody's") have minimum company size requirements for any given rating level. This means, all else equal, a relative size analysis needs to be conducted for companies with similar bond ratings.

V. YORK WATER AND THE UTILITY PROXY GROUP

Q. Are you familiar with the operations of York Water?

A. Yes. York Water provides water and wastewater services to approximately 212,000 people across 57 municipalities in York, Adams, Franklin, and Lancaster counties in south-central Pennsylvania. As of December 31, 2024, the Company served 73,089 water customers and 6,682 wastewater customers within its franchised service territory. Water service is supplied through the Company's own distribution system, drawing primarily from the south and east branches of the Codorus Creek and the Susquehanna River. The Company's common stock is publicly traded on the NASDAQ under the ticker symbol "YORW".

Q. Why is it necessary to develop a proxy group when estimating the ROE for the Company?

A. Even though the Company is publicly traded, it is still necessary to develop groups of publicly traded, comparable companies to serve as "proxies" for the Company. In addition to the analytical necessity of doing so, the use of proxy companies is consistent with the *Hope* and *Bluefield* comparable risk standards, as discussed above. I have selected a proxy group that, in my view, is fundamentally risk-comparable to the Company.

Even when proxy groups are carefully selected, it is common for analytical results to vary from company to company. Despite the care taken to ensure comparability, because no two companies are identical, market expectations regarding future risks and prospects will vary within the proxy group. It therefore is common for analytical results to reflect a

seemingly wide range, even for a group of similarly situated companies. At issue is how to estimate the ROE for the target company from within that range. That determination will be best informed by employing a variety of sound analyses and necessarily must consider the sort of quantitative and qualitative information discussed throughout my Direct Testimony. Additionally, a relative risk analysis between the Company and the Utility Proxy Group must be made to determine whether explicit Company-specific adjustments need to be made to the Utility Proxy Group's indicated results.

My analyses are based on the Utility Proxy Group containing U.S. water utilities. As discussed earlier, utilities must compete for capital with other companies with commensurate risk (including non-utilities) and, to do so, must be provided the opportunity to earn a comparable return to these companies having a commensurate risk. Consequently, it is appropriate to consider the Utility Proxy Group's market data in determining the Company's ROE.

Q. Please explain how you chose your Utility Proxy Group.

A. The basis of selection for the Utility Proxy Group was to select those companies which meet the following criteria:

(i) They are included in the Water Utility Group of *Value Line's Standard Edition* (April 4, 2025);

(ii) They have 60% or greater of 2024 total operating income or 60% or greater of 2024 total assets attributable to regulated water operations;

(iii) At the time of preparation of this testimony, they had not publicly announced that they were involved in any major merger or acquisition activity (i.e., one publicly traded utility merging with or acquiring another);

(iv) They have not cut or omitted their common dividends during the five years ending 2024 or through the time of the preparation of this testimony;

(v) They have *Value Line* and Bloomberg Professional Services ("Bloomberg") adjusted Beta coefficients ("beta");

(vi) They have a positive *Value Line* five-year dividends per share ("DPS") growth rate projection; and

(vii) They have *Value Line*, Zacks or S&P Capital IQ five-year earnings per share ("EPS") growth rate projections.

The following six companies met these criteria: American States Water Company, American Water Works Company, Inc., California Water Service Group, Essential Utilities Inc., Middlesex Water Company, and SJW Group.

Q. Why did you exclude YORW from your proxy group in this proceeding?

A. YORW is not in the *Value Line Standard Edition*, nor does it have projected EPS growth rates from *Value Line*, Zacks or S&P Capital IQ needed to calculate an indicated DCF cost rate.

Q. Please describe Schedule DWD-2, page 1.

A. Page 1 of Schedule DWD-2 contains comparative capitalization and financial statistics for the Utility Proxy Group identified above for the years 2020 to 2024. During the five-year period ending 2024, the historically-achieved earnings rate on book common equity for the group averaged 10.16%. The average common equity ratio based on total permanent capital (excluding short-term debt) was 50.06%, and the average dividend payout ratio was 55.95%.

Total debt to earnings before interest, taxes, depreciation, and amortization for the years 2020 to 2024 ranges between 4.84x and 5.61x, with an average of 5.30x. Funds from operations to total debt range from 11.18% to 13.26%, with an average of 12.02%.

VI. CAPITAL STRUCTURE AND COST OF LONG-TERM DEBT

Q. What capital structure ratio do you recommend be employed in developing an overall fair rate of return appropriate for the Company in this proceeding?

A. I recommend the Commission authorize a ratemaking capital structure based on the Company's capital structure at December 31, 2024, consisting of 45.42% long-term debt and 54.58% common equity.

Q. What are the typical sources of capital commonly considered in establishing a utility's capital structure?

A. Common equity and long-term debt are commonly considered in establishing a utility's capital structure because they are the typical sources of capital financing a utility's rate base.

Q. Please explain.

A. Long-lived assets are typically financed with long-lived securities, so that the overall term structure of the utility's long-term liabilities (both debt and equity) closely match the life of the assets being financed. As stated by Brigham and Houston:

> In practice, firms don't finance each specific asset with a type of capital that has a maturity equal to the asset's life. However, academic studies do show that most firms tend to finance short-term assets from short-term sources and long-term assets from long-term sources.[7]

[7] Eugene F. Brigham and Joel F. Houston, Fundamentals of Financial Management, Concise 4th Ed., Thomson South-Western, 2004, at 574.

Whereas short-term debt has a maturity of one year or less, long-term debt may have maturities of 30 years or longer. Although there are practical financing constraints, such as the need to "stagger" long-term debt maturities, the general objective is to extend the average life of long-term debt. Still, long-term debt has a finite life, which is likely to be less than the life of the assets included in rate base. Common equity, on the other hand, is outstanding into perpetuity. Thus, common equity more accurately matches the life of the going concern of the utility, which is also assumed to operate in perpetuity. Consequently, it is both typical and important for utilities to have significant proportions of common equity in their capital structures.

Q. How does York Water's common equity ratio of 54.58% compare with the total equity ratios maintained by the Utility Proxy Group?

A. The Company's common equity ratio of 54.58% for York Water is reasonable and consistent with the range of common equity ratios maintained by the Utility Proxy Group on which I base my recommended common equity cost rate. As shown on Schedule DWD-2, page 2, the range of common equity ratios maintained by the Utility Proxy Group is between 43.99% and 58.95%. Regarding expected equity ratios, as shown on pages 2 through 7 on Schedule DWD-3, *Value Line* projects a range of equity ratios between 43.50% and 66.00%. for the years 2028-2030. The company's actual common equity ratio of 54.58% falls within this range.

Q. What embedded cost of long-term debt do you recommend for York Water in this proceeding?

A. I recommend York Water's actual embedded cost of long-term debt as of December 31, 2024 of 4.54% in this proceeding.

VII. COMMON EQUITY COST RATE MODELS

Q. Is it important that cost of common equity models be market-based?

A. Yes. A public utility must compete for equity in capital markets along with all other companies of comparable risk, which includes non-utilities. The cost of common equity is thus determined based on equity market expectations for the returns of those comparable risk companies. If individual investors are choosing to invest their capital among companies of comparable risk, they will choose a company providing a higher return over a company providing a lower return.

Q. Are your cost of common equity models market-based models?

A. Yes. The DCF model is market-based because market prices are used in developing the dividend yield component of the model. The RPM is market-based because the bond ratings and expected bond yields used in the application of the RPM reflect the market's assessment of bond/credit risk. In addition, the use of beta (β) to determine the equity risk premium reflects the market's assessment of market/systematic risk, since betas are derived from regression analyses of market prices. The Predictive Risk Premium Model ("PRPM") uses monthly market returns in addition to expectations of the risk-free rate. The CAPM is market-based for many of the same reasons that the RPM is market-based (i.e., the use of expected bond yields and beta). Selection of the comparable risk non-price regulated companies is market-based because it is based on statistics which result from regression analyses of market prices and reflect the market's assessment of total risk.

Q. What analytical approaches did you use to determine the Company's ROE?

A. As discussed earlier, I have relied on the DCF model, the RPM, and the CAPM, which I applied to the Utility Proxy Group described above. I also applied these same models to a Non-Price Regulated Proxy Group described later in this section.

I rely on multiple models because reasonable investors use a variety of tools and do not rely exclusively on a single source of information or single model. Moreover, the specific models on which I rely focus on different aspects of return requirements, and provide different insights to investors' views of risk and return. The DCF model, for example, estimates the investor-required return assuming a constant expected dividend yield and growth rate in perpetuity, while Risk Premium-based methods (i.e., the RPM and CAPM approaches) provide the ability to reflect investors' views of risk, future market returns, and the relationship between interest rates and the ROE. Just as the use of market data for the Utility Proxy Group adds the reliability necessary to inform expert judgment in arriving at a recommended common equity cost rate, the use of multiple generally accepted common equity cost rate models also adds reliability and accuracy when arriving at a recommended common equity cost rate.

A. DISCOUNTED CASH FLOW MODEL

Q. What is the theoretical basis of the DCF model?

A. The DCF model is based on the theory that the present value of an expected future stream of net cash flows during the investment holding period can be determined by discounting those cash flows at the cost of capital, or the investors' capitalization rate. Mathematically this is shown as:

$$P_0 = \frac{D_1}{(1+ke)} + \frac{D_2}{(1+ke)^2} + \ldots + \frac{D_t}{(1+ke)^t}$$

where:

k = the required Return on Common Equity;

$D_{1...}D_t$ = the future expected dividends; and

P_0 = the current stock price.

The above equation can be rearranged to form the single-stage constant growth DCF model as such:

$$K_e = (D_0 (1+g))/P + g$$

where:

K_e = the required Return on Common Equity;

D_0 = the annualized Dividend Per Share;

P = the current stock price; and

g = the growth rate.

In this form, the required ROE is equal to the expected dividend yield plus an expected long-term growth rate. The constant growth DCF formula is derived from the present value DCF formula.

Under the model's strict assumptions, the growth rate equals the rate of capital appreciation (that is, the growth in the stock price). Given that assumption, it does not matter whether the investor holds the stock in perpetuity, or whether they hold the stock for some period of time, collect the dividends, then sell at the prevailing market price.

Q. Which version of the DCF model did you use?

A. I used the single-stage constant growth DCF model.

Q. Please describe the dividend yield you used in your application of the DCF model.

A. The unadjusted dividend yields are based on the proxy companies' dividends as of April 1, 2025, divided by the average of closing market prices for the 60 trading days ending April 1, 2025.[8]

[8] *See*, Schedule DWD-3, page 1, Column 1.

Q. Please explain your adjustment to the dividend yield.

A. Because dividends are paid periodically (quarterly), as opposed to continuously (daily), an adjustment must be made to the dividend yield. This is often referred to as the discrete, or the Gordon Periodic, version of the DCF model.

DCF theory calls for the use of the full growth rate, or D_1, in calculating the dividend yield component of the model. Since the various companies in the Utility Proxy Group increase their quarterly dividend at various times during the year, a reasonable assumption is to reflect one-half the annual dividend growth rate in the dividend yield component, or $D_{1/2}$. Because the dividend should be representative of the next 12-month period, my adjustment is a conservative approach that does not overstate the dividend yield. Therefore, the actual average dividend yields in Column 1 on page 1 of Schedule DWD-3 have been adjusted upward to reflect one-half the average projected growth rate shown in Column 5.

Q. Please explain the basis of the growth rates you applied to the Utility Proxy Group in your DCF model.

A. Investors with more limited resources than institutional investors are likely to rely on widely available financial information services, such as *Value Line*, Zacks, and S&P Capital IQ. Investors realize that analysts have significant insight into the dynamics of the industries and individual companies they analyze, as well as companies' abilities to effectively manage the effects of changing laws and regulations, and ever-changing economic and market conditions. For these reasons, I used analysts' five-year forecasts of EPS growth in my DCF analysis.

Over the long run, there can be no growth in DPS without growth in EPS. Security analysts' earnings expectations have a more significant influence on market prices than

dividend expectations. Thus, the use of earnings growth rates in a DCF analysis provides a better match between investors' market price appreciation expectations and the growth rate component of the DCF.

Q. Please summarize the DCF model results.

A. As shown on page 1 of Schedule DWD-3, the application of the constant growth DCF model to the Utility Proxy Group results in a wide range of indicated ROEs from 6.03% to 14.46%. The mean of those results is 10.07%, the median result is 9.57%, and the average of the two is 9.82%.

B. THE RISK PREMIUM MODEL

Q. Please describe the theoretical basis of the RPM.

A. The RPM is based on the fundamental financial principle of risk and return, namely, that investors require greater returns for bearing greater risk. The RPM recognizes that common equity capital has greater investment risk than debt capital, as common equity shareholders are behind debt holders in any claim on a company's assets and earnings. As a result, investors require higher returns from common stocks than from investment in bonds, to compensate them for bearing the additional risk.

While it is possible to directly observe bond returns and yields, investors' required common equity return cannot be directly determined or observed. According to RPM theory, one can estimate a common equity risk premium over bonds (either historically or prospectively) and use that premium to derive a cost rate of common equity. The cost of common equity equals the expected cost rate for long-term debt capital, plus a risk premium over that cost rate, to compensate common shareholders for the added risk of being unsecured and last-in-line for any claim on the corporation's assets and earnings in the event of a liquidation.

Q. Please explain the total market approach RPM.

A. The total market approach RPM adds a prospective public utility bond yield to an average of: 1) an equity risk premium that is derived from a beta-adjusted total market equity risk premium; and 2) an equity risk premium based on the S&P Utilities Index.

Q. Please explain the basis of the expected bond yield of 5.69% applicable to the Utility Proxy Group.

A. The first step in the total market approach RPM analysis is to determine the expected bond yield. Because both ratemaking and the cost of capital, including common equity cost rate, are prospective in nature, a prospective yield on similarly-rated long-term debt is essential. I rely on a consensus forecast of about 50 economists of the expected yield on Aaa rated corporate bonds for the six calendar quarters ending with the third calendar quarter of 2026, and the long-term projections for 2026 to 2030, and 2031 to 2035 from *Blue Chip Financial Forecasts ("Blue Chip")*. As shown on line 1 of page 1 of Schedule DWD-4, the average expected yield on Moody's Aaa rated corporate bonds is 5.23%. In order to derive an expected yield on A2 rated public utility bonds, I make an upward adjustment of 0.39%, which represents a recent spread between Aaa rated corporate bonds and A2 rated public utility bonds, in order to adjust the expected Aaa rated corporate bond yield to an equivalent Moody's A2 rated public utility bond.[9] Adding that recent 0.39% spread to the expected Aaa rated corporate bond yield of 5.23% results in an expected A2 rated public utility bond of 5.62%.

Since the Utility Proxy Group's average Moody's long-term issuer rating is A3, another adjustment to the expected A2 rated public utility bond yield is needed to reflect the difference in bond ratings. An upward adjustment of 0.07%, which represents one-

[9] As shown on line 2 and explained in note 2 of page 1 of Schedule DWD-4.

third of a recent spread between A2 and Baa2 rated public utility bond yields, is necessary to make the A2 rated prospective bond yield applicable to an A3 rated public utility bond.[10] Adding the 0.07% to the 5.62% prospective A2 rated public utility bond yield results in a 5.69% expected bond yield for the Utility Proxy Group.

Table 3: Summary of the Calculation of the Utility Proxy Group Projected Bond Yield[11]

Prospective Yield on Moody's Aaa Rated Corporate Bonds (*Blue Chip)*	5.23%
Adjustment to Reflect Yield Spread Between Moody's Aaa Rated Corporate Bonds and Moody's A2 Rated Utility Bonds	0.39%
Adjustment to Reflect the Utility Proxy Group's Average Moody's Bond Rating of A3	0.07%
Prospective Bond Yield Applicable to the Utility Proxy Group	5.69%

To develop the indicated ROE using the total market approach RPM, this prospective bond yield is then added to the average of the three different equity risk premiums described below.

Q. Please explain how the beta-derived equity risk premium is determined.

A. The components of the beta-derived risk premium model are: 1) an expected market equity risk premium over corporate bonds, and 2) beta. The derivation of the beta-derived equity risk premium that I applied to the Utility Proxy Group is shown on lines 1 through 8 of page 6 of Schedule DWD-4. The total beta-derived equity risk premium I applied was based on an average of three historical market data-based equity risk premiums, a *Value*

[10] As shown on line 4 and explained in note 3, page 1 of Schedule DWD-4. Moody's does not provide public utility bond yields for A3 rated bonds. As such, it was necessary to estimate the difference between A2 rated and A3 rated public utility bonds. Because there are three steps between Baa2 and A2 (Baa2 to Baa1, Baa1 to A3, and A3 to A2) I assumed an adjustment of one-third of the difference between the A2 rated and Baa2 rated public utility bond yield was appropriate.

[11] As shown on page 1 of Schedule DWD-4.

Line-based equity risk premium, and combined *Value Line*, Bloomberg, and S&P Capital IQ-based equity risk premium. Each of these is described in turn.

Q. How did you derive a market equity risk premium based on long-term historical data?

A. To derive a historical market equity risk premium, I used the most recent holding period returns for the large company common stocks less the average historical yield on Moody's Aaa/Aa rated corporate bonds for the period 1928 to 2024. The use of holding period returns over a very long period of time is appropriate because it is consistent with the long-term investment horizon presumed by investing in a going concern, i.e., a company expected to operate in perpetuity.

The long-term arithmetic mean monthly total return rate on large company common stocks was 12.05% and the long-term arithmetic mean monthly yield on Moody's Aaa/Aa rated corporate bonds was 5.95% from 1928 to 2024. As shown on line 1 of page 6 of Schedule DWD-4, subtracting the mean monthly bond yield from the total return on large company stocks results in a long-term historical equity risk premium of 6.10%.

I used the arithmetic mean monthly total return rates for the large company stocks and yields (income returns) for the Moody's Aaa/Aa rated corporate bonds, because they are appropriate for the purpose of estimating the cost of capital as noted in Kroll's Stocks, Bonds, Bills, and Inflation ("SBBI") Yearbook 2023 ("SBBI - 2023"). The use of the arithmetic mean return rates and yields is appropriate because historical total returns and equity risk premiums provide insight into the variance and standard deviation of returns needed by investors in estimating future risk when making a current investment. If investors relied on the geometric mean of historical equity risk premiums, they would have no insight into the potential variance of future returns because the geometric mean relates

to the change over many periods to a constant rate of change, thereby obviating the year-to-year fluctuations, or variance, which is critical to risk analysis.

Q. Please explain the derivation of the regression-based market equity risk premium.

A. To derive the regression analysis-derived market equity risk premium of 6.97%, shown on line 2 of page 6 of Schedule DWD-4, I used the same monthly annualized total returns on large company common stocks relative to the monthly annualized yields on Moody's Aaa/Aa rated corporate bonds as mentioned above. The relationship between interest rates and the market equity risk premium was modeled using the observed monthly market equity risk premium as the dependent variable, and the monthly yield on Moody's Aaa/Aa rated corporate bonds as the independent variable. I used a linear Ordinary Least Squares ("OLS") regression, in which the market equity risk premium is expressed as a function of the Moody's Aaa/Aa rated corporate bond yield:

$$RP = \alpha + \beta\ (R_{Aaa/Aa})$$

where:

RP = the market equity risk premium;

α = the regression intercept coefficient;

β = the regression slope coefficient; and

RAaa/Aa = the Moody's Aaa/Aa rated corporate bond yield.

Using the equation generated by the regression, an expected equity risk premium of 6.97% is calculated using the average forecast of Aaa rated corporate bond yield of 5.23%, as discussed above.

Q. Please explain the derivation of a PRPM equity risk premium.

A. The PRPM, published in the *Journal of Regulatory Economics,*[12] was developed from the work of Robert F. Engle, who shared the Nobel Prize in Economics in 2003 "for methods of analyzing economic time series with time-varying volatility ("ARCH")".[13] Engle found that volatility changes over time and is related from one period to the next, especially in financial markets. Engle discovered that volatility of prices and returns clusters over time and is therefore highly predictable and can be used to predict future levels of risk and risk premiums.

The PRPM estimates the risk-return relationship directly, as the predicted equity risk premium is generated by predicting volatility or risk. The PRPM is not based on an estimate of investor behavior, but rather on an evaluation of the results of that behavior (i.e., the variance of historical equity risk premiums). The inputs to the model are the historical monthly returns on large company common stocks minus the monthly yields on Moody's Aaa/Aa rated corporate bonds during the period from January 1928 through March 2025.[14] Using a generalized form of ARCH, known as GARCH, I calculated each Proxy Groups' company's projected equity risk premium using Eviews© statistical software. When the GARCH model is applied to the historical return data, it produces a predicted GARCH variance series and a GARCH coefficient. Multiplying the predicted monthly variance by the GARCH coefficient and then annualizing it[15] produces the

15 Annualized Return = (1 + Monthly Return) ^12 - 1.

predicted annual equity risk premium. The resulting PRPM predicted a market equity risk premium of 7.15%.[16]

Q. Please explain the derivation of a projected equity risk premium based on *Value Line Summary and Index* data for your RPM analysis.

A. As noted previously, because both ratemaking and the cost of capital are prospective, a prospective market equity risk premium is needed. The derivation of the forecasted or prospective market equity risk premium can be found in note 4 on page 6 of Schedule DWD-4. Consistent with the premise that total returns are the sum of capital appreciation and income returns, this prospective market return is derived from an average of the three- to five-year median market price appreciation potential by *Value Line Summary and Index* for the 13 weeks ending April 4, 2025, plus an average of the median estimated dividend yield for the common stocks of the 1,700 firms covered in *Value Line*'s Standard Edition.[17]

The average median expected price appreciation is 48.00%, which translates to a 10.30% annual appreciation, and when added to the average of *Value Line's* median expected dividend yields of 2.12%, equates to a forecasted annual total return rate on the market of 12.42%. The forecasted Aaa rated bond yield of 5.23% is deducted from the total market return of 12.42%, resulting in an equity risk premium of 7.19% shown on page 6, line 4 of Schedule DWD-4.

Q. Please explain the derivation of an equity risk premium based on the S&P 500 companies.

A. Using data from *Value Line*, Bloomberg, and S&P Capital IQ, I calculated an expected total return on the S&P 500 using expected dividend yields as a proxy for income returns

[16] Shown on line 3, page 6 of Schedule DWD-4.
[17] As explained in detail in page 2, note 1 of Schedule DWD-5.

and long-term growth estimates as a proxy for capital appreciation. The expected total return for the S&P 500 is 15.20%. Subtracting the prospective yield on Aaa-rated corporate bonds of 5.23% results in a 9.97% projected equity risk premium as shown on page 6, line 5 of Schedule DWD-4.

Q. What is your conclusion of a beta-derived equity risk premium for use in your RPM analysis?

A. I gave equal weight to the five equity risk premiums in arriving at my conclusion of 7.48%.[18]

Table 4: Summary of the Calculation of the Equity Risk Premium Using Total Market Returns[19]

Historical Spread Between Total Returns of Large Stocks and Aaa and Aa2 Rated Corporate Bond Yields (1928 – 2024)	6.10%
Regression Analysis on Historical Data	6.97%
PRPM Analysis on Historical Data	7.15%
Prospective Equity Risk Premium using Total Market Returns from *Value Line* Summary & Index less Projected Aaa Corporate Bond Yields	7.19%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns for the S&P 500 less Projected Aaa Corporate Bond Yields	9.97%
Average	7.48%

After calculating the average market equity risk premium of 7.48%, I adjusted it by beta to account for the risk of the Utility Proxy Group. As discussed below, the beta is a meaningful measure of prospective relative risk to the market as a whole and is a logical means by which to allocate a Company's, or proxy group's, share of the market's total equity risk premium relative to corporate bond yields. As shown on page 1 of Schedule DWD-5, the average of the mean and median beta for the Utility Proxy Group is 0.71.

[18] *See*, line 6 on page 6 of Schedule DWD-4.
[19] As shown on page 6 of Schedule DWD-4.

Multiplying the beta of the Utility Proxy Group of 0.71 by the market equity risk premium of 7.48% resulted in a beta-adjusted equity risk premium of 5.31% for the Utility Proxy Group.

Q. How did you derive the equity risk premium based on the S&P Utility Index and Moody's A-rated public utility bonds?

A. I estimated three equity risk premiums based on S&P Utility Index holding returns, and one equity risk premium based on the expected returns of the S&P Utilities Index, using data from *Value Line*, Bloomberg, and S&P Capital IQ. Turning first to the S&P Utility Index holding period returns, I derived a long-term monthly arithmetic mean equity risk premium between the S&P Utility Index total returns of 10.59% and monthly A rated public utility bond yields of 6.42% from 1928 to 2024, to arrive at an equity risk premium of 4.16%.[20] I then used the same historical data to derive an equity risk premium of 4.89% based on a regression of the monthly equity risk premiums. The final S&P Utility Index holding period equity risk premium involved applying the PRPM using the historical monthly equity risk premiums from January 1928 to March 2025 to arrive at a PRPM-derived equity risk premium of 4.83% for the S&P Utility Index.

I then derived expected total returns on the S&P Utilities Index of 10.54% using data from *Value Line*, Bloomberg, and S&P Capital IQ and subtracted the prospective A2 rated public utility bond yield (5.62%),[21] which resulted in a risk premium of 4.92%. As with the market equity risk premiums, I averaged each risk premium to arrive at my utility-specific equity risk premium of 4.70%.

[20] As shown on line 1 on page 9 of Schedule DWD-4.
[21] Derived on line 3 of page 1 of Schedule DWD-4.

Table 5: Summary of the Calculation of the Equity Risk Premium Using S&P Utility Index Holding Returns[22]

Historical Spread Between Total Returns of the S&P Utilities Index and A2 Rated Utility Bond Yields (1928 – 2024)	4.16%
Regression Analysis on Historical Data	4.89%
PRPM Analysis on Historical Data	4.83%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns for the S&P Utilities Index less Projected A2 Utility Bond Yields	4.92%
Average	4.70%

Q. What is your conclusion of an equity risk premium for use in your total market approach RPM analysis?

A. The equity risk premium I applied to the Utility Proxy Group is 5.01%, which is the average of the beta-derived and the S&P utility equity risk premiums of 5.31% and 4.70%, respectively.[23]

Q. What is the indicated RPM common equity cost rate based on the total market approach?

A. As shown on line 7 of Schedule DWD-4, page 1, I calculated a common equity cost rate of 10.70% for the Utility Proxy Group based on the total market approach of the RPM.

Table 6: Summary of the Total Market Return Risk Premium Model[24]

Prospective Moody's A3 Rated Utility Bond Applicable to the Utility Proxy Group	5.69%
Prospective Equity Risk Premium	5.01%
Indicated Cost of Common Equity	10.70%

[22] As shown on page 9 of Schedule DWD-4.
[23] As shown on page 5 of Schedule DWD-4.
[24] As shown on page 1 of Schedule DWD-4.

C. THE CAPITAL ASSET PRICING MODEL

Q. Please explain the theoretical basis of the CAPM.

A. CAPM theory defines risk as the co-variability of a security's returns with the market's returns as measured by beta (β). A beta of less than 1.0 indicates lower variability than the market as a whole, while a beta greater than 1.0 indicates greater variability than the market.

The CAPM assumes that all other risk (i.e., all non-market or unsystematic risk) can be eliminated through diversification. The risk that cannot be eliminated through diversification is called market, or systematic, risk. In addition, the CAPM presumes that investors require compensation only for systematic risk, which is the result of macroeconomic and other events that affect the returns on all assets. The model is applied by adding a risk-free rate of return to a market risk premium, which is adjusted proportionately to reflect the systematic risk of the individual security relative to the total market, as measured by beta. The traditional CAPM model is expressed as:

$$R_s = R_f + \beta(R_m - R_f)$$

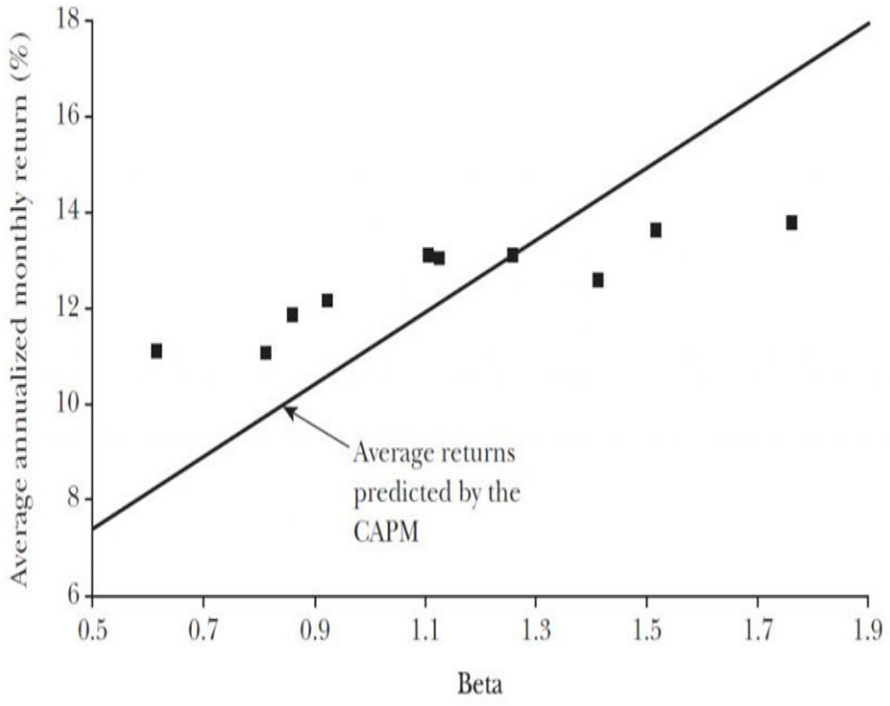
Where:
- R_s = Return rate on the common stock;
- R_f = Risk-free rate of return;
- R_m = Return rate on the market as a whole; and
- β = Adjusted beta (volatility of the security relative to the market as a whole).

Numerous tests of the CAPM have measured the extent to which security returns and beta are related as predicted by the CAPM, confirming its validity. The empirical CAPM ("ECAPM") reflects the reality that while the results of these tests support the notion that beta is related to security returns, the empirical Security Market Line ("SML")

described by the CAPM formula is not as steeply sloped as the predicted SML.[25] The ECAPM reflects this empirical reality. Fama and French clearly state regarding Figure 2, below, that "[t]he returns on the low beta portfolios are too high, and the returns on the high beta portfolios are too low." [26]

Figure 2 http://pubs.aeaweb.org/doi/pdfplus/10.1257/0895330042162430

Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on Prior Beta, 1928–2003



In addition, Morin observes that while the results of these tests support the notion that beta is related to security returns, the empirical SML described by the CAPM formula is not as steeply sloped as the predicted SML. Morin states:

[25] Roger A. Morin, Modern Regulatory Finance, (PUR Books, 2021) at 221. ("Morin")

[26] Eugene F. Fama and Kenneth R. French, "The Capital Asset Pricing Model: Theory and Evidence", *Journal of Economic Perspectives*, Vol. 18, No. 3, Summer 2004 at 33 ("Fama & French"). http://pubs.aeaweb.org/doi/pdfplus/10.1257/0895330042162430.

> With few exceptions, the empirical studies agree that … low-beta securities earn returns somewhat higher than the CAPM would predict, and high-beta securities earn less than predicted.[27]

* * *

> Therefore, the empirical evidence suggests that the expected return on a security is related to its risk by the following approximation:

$$K = R_F + x\,\beta(R_M - R_F) + (1-x)\,\beta(R_M - R_F)$$

> where x is a fraction to be determined empirically. The value of x that best explains the observed relationship [is] Return = 0.0829 + 0.0520 β is between 0.25 and 0.30. If x = 0.25, the equation becomes:

$$K = R_F + 0.25(R_M - R_F) + 0.75\,\beta(R_M - R_F)$$[28]

> Fama and French provide similar support for the ECAPM when they state:

> The early tests firmly reject the Sharpe-Lintner version of the CAPM. There is a positive relation between beta and average return, but it is too 'flat.'… The regressions consistently find that the intercept is greater than the average risk-free rate… and the coefficient on beta is less than the average excess market return… This is true in the early tests… as well as in more recent cross-section regressions tests, like Fama and French (1992).[29]

> Finally, Fama and French further note:

> Confirming earlier evidence, the relation between beta and average return for the ten portfolios is much flatter than the Sharpe-Linter CAPM predicts. The returns on low beta portfolios are too high, and the returns on the high beta portfolios are too low. For example, the predicted return on the portfolio with the lowest beta is 8.3 percent per year; the actual return as 11.1 percent. The predicted return on the portfolio with the highest beta is 16.8 percent per year; the actual is 13.7 percent.[30]

Clearly, the justification from Morin, Fama, and French along with their reviews of other academic research on the CAPM, validate the use of the ECAPM. In view of theory and practical research, I have applied both the traditional CAPM and the ECAPM to the companies in the Utility Proxy Group and averaged the results.

---

27 Morin, at 207.
28 Morin, at 221.
29 Fama & French, at 32.
30 Fama & French, at 33.

Q. What beta did you use in your CAPM analysis?

A. With respect to beta, I considered two methods of calculation: 1) the average beta of the Utility Proxy Group companies reported by Bloomberg; and 2) the average beta of the Utility Proxy Group companies as reported by *Value Line*. While both of those services adjust their calculated (or "raw") betas to reflect the tendency of beta to regress to the market mean of 1.00, *Value Line* calculates beta over a five-year period, while Bloomberg's calculation is based on two years of data.

Q. Please describe your selection of a risk-free rate of return.

A. As shown in column 5 on page 1 of Schedule DWD-5, the risk-free rate adopted for both applications of the CAPM is 4.46%. This risk-free rate is based on the average of the *Blue Chip* consensus forecast of the expected yields on 30-year U.S. Treasury bonds for the six quarters ending with the third calendar quarter of 2026, and long-term projections for the years 2026 to 2030 and 2031 to 2035.

Q. Why is the yield on long-term U.S. Treasury bonds appropriate for use as the risk-free rate?

A. The yield on long-term U.S. Treasury Bonds is almost risk-free, and its term is consistent with the long-term cost of capital to public utilities measured by the yields on A2 rated public utility bonds, the long-term investment horizon inherent in utilities' common stocks, and the long-term life of the jurisdictional rate base to which the allowed fair rate of return (i.e., cost of capital) will be applied. In contrast, short-term U.S. Treasury yields are more volatile and largely a function of Federal Reserve monetary policy.

Q. Please explain the estimation of the expected risk premium for the market used in your CAPM analysis.

A. The basis of the market risk premium is explained in detail in note 1 on page 2 of Schedule DWD-5. As discussed previously, the market risk premium is derived from an average of two historical data-based market risk premiums, one *Value Line* data-based market risk premium and one Bloomberg, *Value Line*, and S&P Capital IQ data-based market risk premium.

The long-term income return on U.S. Government Securities of 4.99% was deducted from the monthly historical total market return of 12.29%, which results in an historical market equity risk premium of 7.31%.[31] I applied a linear OLS regression to the monthly annualized historical returns on the S&P 500 relative to historical yields on long-term U.S. Government Securities. That regression analysis yielded a market equity risk premium of 8.03%. The PRPM market equity risk premium is 8.01% and is derived using the PRPM relative to the yields on long-term U.S. Treasury securities from January 1926 through March 2025.

The *Value Line*-derived forecasted total market equity risk premium is derived by deducting the forecasted risk-free rate of 4.46%, discussed above, from the *Value Line* Summary and Index projected total annual market return of 12.42%, resulting in a forecasted total market equity risk premium of 7.96%.

The S&P 500 projected market equity risk premium using *Value Line*, Bloomberg, and S&P Capital IQ data is derived by subtracting the projected risk-free rate of 4.46%

[31] SBBI - 2023, at Appendix A-1 (1) through A-1 (3) and Appendix A-7 (19) through A-7 (21); Bloomberg Professional.

from the projected total return of the S&P 500 of 15.20%. The resulting market equity risk premium is 10.74%.

These five market risk premiums, when averaged, resulted in an average total market equity risk premium of 8.41%.

Table 7: Summary of the Calculation of the Market Risk Premium for Use in the CAPM[32]

Historical Spread Between Total Returns of Large Stocks and Long-Term Government Bond Yields (1926 – 2024)	7.31%
Regression Analysis on Historical Data	8.03%
PRPM Analysis on Historical Data	8.01%
Prospective Equity Risk Premium using Total Market Returns from *Value Line* Summary & Index less Projected 30-Year Treasury Bond Yields	7.96%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns for the S&P 500 less Projected 30-Year Treasury Bond Yields	10.74%
Average	8.41%

Q. What are the results of your application of the traditional and empirical CAPM to the Utility Proxy Group?

A. As shown on page 1 of Schedule DWD-5, the mean result of my CAPM/ECAPM analysis is 10.74%, the median is 10.74%, and the average of the two is 10.74%. Consistent with my reliance on the average of mean and median DCF results discussed above, the indicated common equity cost rate using the CAPM/ECAPM is 10.74%.

[32] As shown on page 2 of Schedule DWD-5.

D. COMMON EQUITY COST RATES FOR A PROXY GROUP OF DOMESTIC, NON-PRICE REGULATED COMPANIES BASED ON THE DCF, RPM, AND CAPM

Q. Why did you also consider a proxy group of domestic, non-price regulated companies?

A. In the *Hope* and *Bluefield* cases, the U.S. Supreme Court did not specify that comparable risk companies had to be utilities. Since the purpose of rate regulation is to be a substitute for the competition of the marketplace, non-price regulated firms operating in the competitive marketplace make an excellent proxy if they are comparable in total risk to the Utility Proxy Group being used to estimate the cost of common equity. The selection of such domestic, non-price regulated competitive firms theoretically and empirically results in a proxy group which is comparable in total risk to the Utility Proxy Group.

Q. How did you select non-price regulated companies that are comparable in total risk to the Utility Proxy Group?

A. In order to select a proxy group of domestic, non-price regulated companies similar in total risk to the Utility Proxy Group, I relied on beta and related statistics derived from *Value Line* regression analyses of weekly market prices over the most recent 260 weeks (i.e., five years). Using these selection criteria resulted in a proxy group of 36 domestic, non-price regulated firms comparable in total risk to the Utility Proxy Group. Total risk is the sum of non-diversifiable market risk and diversifiable company-specific risks. The following criteria were used in the selection of the domestic, non-price regulated firms:

(i) They must be covered by *Value Line* (Standard Edition);

(ii) They must be domestic, non-price regulated companies, i.e., non-utilities;

(iii) Their beta must lie within plus or minus two standard deviations of the average unadjusted beta of the Utility Proxy Group; and

(iv) The residual standard errors of the *Value Line* regressions which gave rise to the unadjusted betas must lie within plus or minus two standard deviations of the average residual standard error of the Utility Proxy Group.

Betas are a measure of market or systematic risk, which is not diversifiable. The residual standard errors of the regressions were used to measure each firm's company-specific, diversifiable risk. Companies that have similar betas and similar residual standard errors resulting from the same regression analyses have similar total investment risk.

Q. Have you prepared a schedule which shows the data from which you selected the 36 domestic, non-price regulated companies that are comparable in total risk to the Utility Proxy Group?

A. Yes, the basis of my selection, and both proxy groups' regression statistics, are shown in Schedule DWD-6.

Q. Did you calculate common equity cost rates using the DCF, RPM, and CAPM for the Non-Price Regulated Proxy Group?

A. Yes. Because the DCF, RPM, and CAPM have been applied in an identical manner as described above, I will not repeat the details of the rationale and application of each model. One exception is in the application of the RPM, where I did not use public utility-specific equity risk premiums.

Page 2 of Schedule DWD-7 contains the derivation of the DCF cost rates. As shown, the indicated common equity cost rate using the DCF for the Non-Price Regulated Proxy Group comparable in total risk to the Utility Proxy Group, is 11.53%.

Pages 3 through 5 of DWD-7 contain the data and calculations that support the 11.68% RPM cost rate. As shown on line 1 of page 3 of Schedule DWD-7, the consensus prospective yield on Moody's Baa2-rated corporate bonds for the six quarters ending in

the third quarter of 2026, and for the years 2026 to 2030 and 2031 to 2035, is 6.03%.[33] Since the Non-Price Regulated Proxy Group has an average Moody's long-term issuer rating of A3, a 0.18% downward adjustment of the prospective Baa2 rated corporate bond yield is necessary to reflect a difference in ratings which results in a projected A3-rated corporate bond yield of 5.85% for the non-price regulated proxy group.[34]

When the beta-adjusted risk premium of 5.83%[35] relative to the Non-Price Regulated Proxy Group is added to the adjusted prospective A3 rated corporate bond yield of 5.85%, the indicated RPM cost rate is 11.68%.

Page 6 contains the inputs and calculations that support my indicated CAPM/ECAPM cost rate of 11.23%.

Q. What is the cost rate of common equity based on the Non-Price Regulated Proxy Group comparable in total risk to the Utility Proxy Group?

A. As shown on page 1 of Schedule DWD-7, the results of the DCF, RPM, and CAPM applied to the Non-Price Regulated Proxy Group comparable in total risk to the Utility Proxy Group are 11.53%, 11.68%, and 11.23%, respectively. The average of the mean and median of these models is 11.51%, which I used as the indicated common equity cost rate for the Non-Price Regulated Proxy Group.

---

33 *Blue Chip Financial Forecasts*, April 1, 2025, at p. 2, and November 27, 2024, at p. 14.

34 The 0.18% downward adjustment is equal to two-thirds of the spread between A2 and Baa2 corporate bond yields, as illustrated in note 2 on page 3 of Schedule DWD-7.

35 Derived on page 5 of Schedule DWD-7.

VIII. CONCLUSION OF COMMON EQUITY COST RATE BEFORE ADJUSTMENT

Q. What is the indicated range of common equity cost rates before adjustments?

A. Based on the results of the application of multiple cost of common equity models to the Utility Proxy Group, my recommended range of ROEs attributable to the Utility Proxy Group is between 9.82% and 11.51%.

I used multiple cost of common equity models as primary tools in arriving at my recommended common equity cost rate, because no single model is so inherently precise that it can be relied on solely to the exclusion of other theoretically sound models. The use of multiple models adds reliability to the estimation of the common equity cost rate, and the prudence of using multiple cost of common equity models is supported in both the financial literature and regulatory precedent.

Based on these common equity cost rate results, I conclude that a range of common equity cost rates between 9.82% and 11.51% is reasonable and appropriate before any adjustments for relative risk differences between the Company and the Proxy Group are made.

IX. ADJUSTMENTS TO THE COMMON EQUITY COST RATE

A. BUSINESS RISK ADJUSTMENT

Q. Does York Water's smaller size relative to the Utility Proxy Group companies increase its business risk?

A. Yes. York Water's smaller size relative to the Utility Proxy Group companies indicates greater relative business risk for the Company because, all else being equal, size has a material bearing on risk.

Size affects business risk because smaller companies generally are less able to cope with significant events that affect sales, revenues, and earnings. For example, smaller

companies face more risk exposure to business cycles and economic conditions, both nationally and locally. Additionally, the loss of revenues from a few larger customers would have a greater effect on a small company than on a bigger company with a larger, more diverse, customer base.

As further evidence illustrates that smaller firms are riskier, investors generally demand greater returns from smaller firms to compensate for less marketability and liquidity of their securities. Kroll's Cost of Capital Navigator: U.S. Cost of Capital Module ("Kroll") discusses the nature of the small-size phenomenon, providing an indication of the magnitude of the size premium based on several measures of size. In discussing "Size as a Predictor of Equity Premiums," Kroll states:

> The size effect is based on the empirical observation that companies of smaller size are associated with greater risk and, therefore, have greater cost of capital [sic]. The "size" of a company is one of the most important risk elements to consider when developing cost of equity capital estimates for use in valuing a business simply because size has been shown to be a *predictor* of equity returns. In other words, there is a significant (negative) relationship between size and historical equity returns - as size *decreases*, returns tend to *increase*, and vice versa. (footnote omitted) (emphasis in original)[36]

Furthermore, in "The Capital Asset Pricing Model: Theory and Evidence," Fama and French note size is indeed a risk factor which must be reflected when estimating the cost of common equity. On page 38, they note:

> . . . the higher average returns on small stocks and high book-to-market stocks reflect unidentified state variables that produce undiversifiable risks (covariances) in returns not captured in the market return and are priced separately from market betas.[37]

Based on this evidence, Fama and French proposed their three-factor model which includes a size variable in recognition of the effect size has on the cost of common equity.

---

[36] Kroll: Cost of Capital Navigator: U.S. Cost of Capital Module, "Size as a Predictor of Equity Returns," at 1.

[37] Fama & French, at 25-43.

Also, it is a basic financial principle that the use of funds invested, and not the source of funds, is what gives rise to the risk of any investment.[38] Eugene Brigham, a well-known authority, states:

> A number of researchers have observed that portfolios of small-firms (sic) have earned consistently higher average returns than those of large-firm stocks; this is called the "small-firm effect." On the surface, it would seem to be advantageous to the small firms to provide average returns in a stock market that are higher than those of larger firms. In reality, it is bad news for the small firm; **what the small-firm effect means is that the capital market demands higher returns on stocks of small firms than on otherwise similar stocks of the large firms.** (emphasis added)[39]

Consistent with the financial principle of risk and return discussed above, increased relative risk due to small size must be considered in the allowed rate of return on common equity. Therefore, the Commission's authorization of a cost rate of common equity in this proceeding must appropriately reflect the unique risks of York Water, including its small size, which is justified and supported above by evidence in the financial literature.

Q. Is there a way to quantify a relative risk adjustment due to York Water's greater business risk relative to the Utility Proxy Group?

A. Yes. In the absence of other empirical methods, I compared York Water's and the Utility Proxy Group's relative size, as measured by market capitalization on April 1, 2025.

[38] Richard A. Brealey and Stewart C. Myers, Principles of Corporate Finance (McGraw-Hill Book Company, 1996), at 204-205, 229.

[39] Eugene F. Brigham, Fundamentals of Financial Management, Fifth Edition (The Dryden Press, 1989), at 623.

Table 8: Size as Measured by Market Capitalization for the Company and the Utility Proxy Group

	Market Capitalization* ($ Millions)	Times Greater Than the Company
York Water	$500.753	
Utility Proxy Group Median	$ 2,951.447	5.9x
*From page 1 of Schedule DWD-8.		

The Company's market capitalization was at $500.753 million as of April 1, 2025, compared with the median market capitalization of the Utility Proxy Group of $2.95 billion as of April 1, 2025. The Utility Proxy Group's market capitalization is 5.9 times the size of York Water's market capitalization.

As a result, it is necessary to upwardly adjust the indicated range of common equity cost rates to reflect York Water's greater risk due to its smaller relative size. The determination is based on the size premiums for portfolios of New York Stock Exchange, American Stock Exchange, and NASDAQ listed companies ranked by deciles for the 1926 to 2024 period. The average size premium for the Utility Proxy Group with a market capitalization of $2.95 billion falls in the 6th decile, while York Water's market capitalization of $500.753 million places the Company in the 9th decile. The size premium spread between the 6th decile and the 9th decile is 0.73%. Even though a 0.73% upward size adjustment is indicated, I conservatively applied a size premium of 0.15% to York Water's indicated range of common equity cost rates.

Q. Does this Commission consider size in determining the authorized ROE?

A. Yes. In Docket No. R-2019-3008212, the Commission stated:

> Based on the evidence of record, we agree with the recommendation of the ALJs that the Company be awarded a DCF cost of common equity which is one standard deviation about the average of the mean and median proxy group ROE from the Company's DCF analysis. In so doing, we recognize

> that the Company's size is a factor in assessing its ability to attract capital. Accordingly, we shall reject Citizens' Exception No. 10, I&E's Exception No. 4, and the OCA's Exception No. 7, consistent with the following discussion.
>
> We are not convinced by the arguments of I&E and the OCA that the ALJs erred in awarding a size adjustment to Citizens'. Rather, we are of the same position as the ALJs that the Company's witness Mr. D'Ascendis offered persuasive record evidence that there is a general inverse relationship between size and risk, such that smaller utilities like Citizens' face greater risk.[40]

Q. What would be the ROE result using the Commission's method in this case?

A. The average of the mean and median DCF model result is 9.82%, as shown on page 1 of Schedule DWD-3. The standard deviation of those results is 2.69%. Adding the standard deviation to the average of the mean and median DCF result would indicate an ROE of 12.51% for York Water, which is higher than my ultimate recommendation in this case. In view of this, my size adjustment should be considered conservative.

B. FLOTATION COST ADJUSTMENT

Q. What are flotation costs?

A. Flotation costs are those costs associated with the sale of new issuances of common stock. They include market pressure and the mandatory unavoidable costs of issuance (e.g., underwriting fees and out-of-pocket costs for printing, legal, registration, etc.). For every dollar raised through debt or equity offerings, the Company receives less than one full dollar in financing.

[40] Pennsylvania Public Utility Commission, Docket No. R-2019-3008212, Opinion and Order, at 103.

Q. Why is it important to recognize flotation costs in the allowed common equity cost rate?

A. It is important because there is no other mechanism in the ratemaking paradigm through which such costs can be recognized and recovered. Because these costs are real, necessary, and legitimate, recovery of these costs should be permitted. As noted by Morin:

> The costs of issuing these securities are just as real as operating and maintenance expenses or costs incurred to build utility plants, and fair regulatory treatment must permit the recovery of these costs….
>
> The simple fact of the matter is that common equity capital is not free…[Flotation costs] must be recovered through a rate of return adjustment.[41]

Q. Should flotation costs be recognized only if there was an issuance during the test year or there is an imminent post-test year issuance of additional common stock?

A. No. As noted above, there is no mechanism to recapture such costs in the ratemaking paradigm other than an adjustment to the allowed common equity cost rate. Flotation costs are charged to capital accounts and are not expensed on a utility's income statement. As such, flotation costs are analogous to capital investments, albeit negative, reflected on the balance sheet. Recovery of capital investments relates to the expected useful lives of the investment. Since common equity has a very long and indefinite life (assumed to be infinity in the standard regulatory DCF model), flotation costs should be recovered through an adjustment to common equity cost rate, even when there has not been an issuance during the test year, or in the absence of an expected imminent issuance of additional shares of common stock.

Historical flotation costs are a permanent loss of investment to the utility and should be taken into account. When any company, including a utility, issues common stock,

[41] Morin, at 329.

flotation costs are incurred for legal, accounting, printing fees, and the like. For each dollar of issuing market price, a small percentage is expensed and is permanently unavailable for investment in utility rate base. Since these expenses are charged to capital accounts and not expensed on the income statement, the only way to restore the full value of that dollar of issuing price with an assumed investor required return of 10% is for the net investment, $0.95, to earn more than 10% to net back to the investor a fair return on that dollar. In other words, if a company issues stock at $1.00 with 5% in flotation costs, it will net $0.95 in investment. Assuming the investor in that stock requires a 10% return on their invested $1.00 (i.e., a return of $0.10), the company needs to earn approximately 10.5% on its invested $0.95 to receive a $0.10 return.

Q. Do the common equity cost rate models you have used already reflect investors' anticipation of flotation costs?

A. No. All of these models assume no transaction costs. The literature is quite clear that these costs are not reflected in the market prices paid for common stocks. For example, Brigham and Daves confirm this and provide the methodology utilized to calculate the flotation adjustment.[42] In addition, Morin confirms the need for such an adjustment even when no new equity issuance is imminent.[43] Consequently, it is proper to include a flotation cost adjustment when using cost of common equity models to estimate the common equity cost rate.

Q. How did you calculate the flotation cost allowance?

A. I modified the DCF calculation to provide a dividend yield that would reimburse investors for issuance costs in accordance with the method cited in literature by Brigham and Daves,

---

[42] Eugene F. Brigham and Phillip R. Daves, Intermediate Financial Management, 9th Edition, Thomson/Southwestern, at p. 342.

[43] Morin, at 3thir-339.

as well as by Morin. The flotation cost adjustment recognizes the actual costs of issuing equity that were incurred by York Water. Based on the issuance costs shown on page 1 of Schedule DWD-9, an adjustment of 0.12% is required to reflect the flotation costs applicable to the Utility Proxy Group.

C. PERFORMANCE FACTOR ADJUSTMENT

Q. Have you reflected the Company's requested rate of return premium based on Code 66 Pa.C.S. § 523 regarding performance factor?

A. Yes. The adjustment is shown on line 8 of page 2 of Schedule DWD-1. The testimony supporting the performance factor adjustment in the ROE for the Company is sponsored by York Water Witness J.T. Hand. The rate of return premium associated with the performance factor is 0.25%.

Q. What is the indicated cost of common equity after your Company-specific adjustments?

A. Applying the 0.15% business risk adjustment, the 0.12% flotation cost adjustment, and the 0.25% performance factor adjustment to the indicated range of common equity cost rates between 9.82% and 11.51% results in a range of common equity cost rates between 10.34% and 12.03%.

X. CONCLUSION

Q. Given the above, what is your recommended ROE for the Company?

A. Given the discussion above and the results of my analytical models, I recommend an ROE of 10.90% to be used in setting rates for the Company at this time.

Q. In your opinion, are the Company's capital structure and long-term debt cost rate reasonable?

A. Yes, they are.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

scottmadden
MANAGEMENT CONSULTANTS

Appendix A - Resume and Testimony Listing of:
Dylan W. D'Ascendis, CRRA, CVA
Partner

Summary

Dylan is an experienced consultant and a Certified Rate of Return Analyst (CRRA) and Certified Valuation Analyst (CVA). Dylan joined ScottMadden in 2016 and is a leading expert witness with respect to cost of capital, capital structure, and valuation. He has served as a consultant for investor-owned and municipal utilities and authorities for 16 years. Dylan has testified as an expert witness on over 150 occasions regarding rate of return, cost of service, rate design, and valuation before more than 40 regulatory jurisdictions in the United States and Canada, an American Arbitration Association panel, and the Superior Court of Rhode Island. He also maintains the benchmark index against which the Hennessy Gas Utility Mutual Fund performance is measured. Dylan holds a B.A. in economic history from the University of Pennsylvania and an M.B.A. with concentrations in finance and international business from Rutgers University.

Areas of Specialization

- Expert Witness Testimony
- Rates and Regulation
- Return on Equity
- Valuation
- Utility Regulations
- Rate Case Planning, Management, and Support
- Utility Benchmarking

Notes:
(1) All capitalization and financial statistics for the group are the arithmetic average of the achieved results for each individual company in the group, and are based upon financial statements as originally reported in each year.
(2) Computed by relating actual total debt interest or preferred stock dividends booked to average of beginning and ending total debt or preferred stock reported to be outstanding.
(3) Total debt relative to EBITDA (Earnings before Interest, Income Taxes, Depreciation and Amortization).
(4) Funds from operations (sum of net income, depreciation, amortization, net deferred income tax and investment tax credits, less total AFUDC) plus interest charges as a percentage of total debt.

						Average	10.07 %
						Median	9.57 %
						Average of Mean and Median	9.82 %

NA= Not Available
NMF=Not Meaningful Figure

Notes:

(1) Indicated dividend at 4/1/2025 divided by the average closing price of the last 60 trading days ending 4/1/2025 for each company.
(2) From pages 2 through 7 of this Schedule.
(3) Average of columns 2 through 4 excluding negative growth rates and extreme positive values.
(4) This reflects a growth rate component equal to one-half the conclusion of growth rate (from column 5) x column 1 to reflect the periodic payment of dividends (Gordon Model) as opposed to the continuous payment. Thus, for American States Water Company, 2.47% x (1+(1/2 x 3.52%)) = 2.51%.
(5) Column 5 + Column 6.

BUSINESS: American States Water Co. operates as a holding company. Through its principal subsidiary, Golden State Water Co., it supplies water to 264,557 customers in 10 California counties. Service areas include the metropolitan areas of Los Angeles and Orange Counties. The company also provides electricity to 24,857 customers in Big Bear Lake and San Bernardino Cnty. Provides water & wastewater services to U.S. military bases through its ASUS subsidiary. Sold Chaparral City Wtr. of AZ. (6/11). Employs 846. BlackRock, Inc. owns 18.2% of out. shares; Vanguard, 12.4%; off. & dir., 0.8% (4/24 Proxy). Chair.: Anne M. Holloway. Pres. & CEO: Robert Sprowls. Inc: CA. Address: 630 East Foothill Blvd., San Dimas, CA 91773. Tel.: 909-394-3600. Int.: www.aswater.com.

Shares of American States Water ought to appeal to an assortment of investors. For starters, the equity is ranked to outperform the market averages in the year ahead. Moreover, AWR has a solid 2.6% yield and good distribution growth prospects. Over the pull to 2028-2030, the stock offers attractive potential on a risk-adjusted basis. Indeed, even though its projected total returns are just modestly above the *Value Line* median, this is favorable because American States carries a 1 (Highest) ranking for Safety. It also scores a 95 (out of 100) for Price Stability and has a Beta coefficient of only 0.75, compared with the 1.0 average.

Meanwhile, state regulators have settled a long-delayed rate case. The company's water utility, Golden State Water (GSW), originally filed for rate relief for the 2025 to 2027 period in August, 2023. On January 30th, 2025, the California Public Utility Commission (CPUC) finally made its decision. And, while some of GSW's requests were denied, the ruling wasn't meaningfully different from what the utility and the Public Advocates Office agreed to much earlier.

The company's earnings will be better than they appear in 2025 and 2026. Due to delays in regulatory rulings, sometimes the utility will have to absorb costs for several or more quarters and then be allowed to recoup them retroactively. This can distort year-over-year comparisons, as was the case in 2023 and 2024. With higher rates in effect since February 1st, we expect the company's share earnings to rise 4% to $3.30 this year, and move 5% higher in 2026, to $3.45.

Nonutility operations could make our estimates look conservative. American States has a nonregulated business called ASUS that aids in privatizing the United States military's water operations. Bids are being sought to transform military facilities on a base-by-base basis. The contract terms are typically for 50 years. ASUS has been successful in the past and currently oversees 11 military bases. Though the bidding process is competitive, we expect ASUS to continue to be awarded more work. Since the CPUC has no jurisdiction, ASUS's returns are not capped here, as is the case for GSW.

James A. Flood *April 4, 2025*

(A) Primary earnings. Excludes nonrecurring gains/(losses):; '10, (23¢); '11, 10¢. Next earnings report due mid-May.

BUSINESS: American Water Works Company, Inc. is the largest investor-owned water and wastewater utility in the U.S., providing services to approximately 14 million people in 24 states. Nonregulated business assists municipalities and military bases with the maintenance and upkeep as well. Regulated operations made up 92% of 2024 revenues. Pennslyvania (23%); New Jersey (21%); Missouri (14%); and Illinois (11%) are its largest markets. Has 6,700 employees. Vanguard owns 12.3% of outstanding shares; BlackRock, 9.5%; State St., 5.7%; officers & directors, less than 1.0% (3/24 Proxy). President & Chief Executive Officer: M. Susan Hardwick. . Address: 1 Water Street, Camden, NJ 08102. Telephone: 856-346-8200. Internet: www.amwater.com.

American Water Works has bright prospects. In 2024, the water utility had a strong bottom-line showing, as its share earnings rose 10%, to $5.39. We estimate that the company's profit growth can increase by 6% and 8%, in 2025 and 2026, respectively. This is within leadership's 7%-10% annual five-year target projections. A larger rate base and rate relief, along with its acquisition strategy ought to support this level of growth.

The fragmentation of the United States' water utility industry provides American Water with significant opportunities. Excluding the smallest ones, there are an estimated 50,000 different water utilities in this country. Almost all are municipally run, inefficient, poorly capitalized, and in need of capital investment to replace aging pipelines. The company has been steadily purchasing some of these districts and increasing operating margins meaningfully (about $417 million was spent in 2024). Moreover, it plans on investing $1.5 billion to $2.0 billion over the next five years on additional acquisitions. We would not be surprised if this range was exceeded by $500 million to $1 billion, as many districts do not have the wherewithal to modernize their pipelines. American Water also has a good historical track record of using these purchases to boost earnings.

Capital expenditures will remain burdensome for the foreseeable future. Leadership recently released a projected spending budget for upgrading its existing pipeline and wastewater assets. Over the period from 2025 to 2029, expenditures are estimated at $15.5 billion to $16.0 billion. We think it will be near the higher end of the range and average $3.3 billion a year. What's more, this is not cyclical. The company's infrastructure (like all of its peers) is in such poor condition that these outlays will probably continue for decades.

These shares do not stand out for either short- or long-term performance. The equity's Timeliness rank is only a 3 (Average) while its 18-month prospects are subpar. Furthermore, though American Water has healthy share earnings and dividend growth prospects, the stock's 12% rise in 2025 seems to have factored in the good news.

James A. Flood *April 4, 2025*

(A) Diluted earnings. Excludes nonrecur. losses: '08, $4.62; '09, $2.63; '11, $0.07. Disc. oper.: '06, ($0.04); '11, $0.03; '12, ($0.10); '13,($0.01). GAAP used as of 2014. Includes $2.70 sh. gain from sale of HOS sub.in Q4,'21. Next earnings report due mid-May.

California Water Service Group posted mixed financial results to close out 2024. Fourth-quarter revenues of $222 million rose slightly versus the previous-year tally, as higher customer rates during the period offset relatively lower water usage. Meanwhile, operating expenses, namely water production costs and higher wholesale rates, pressured profits. A lower income tax benefit during the period also weighed on the bottom line, resulting in a 37% year-over-year earnings contraction, to $0.33 per share. But despite the tepid December period, California Water's financial performance in 2024 was largely solid.

We look for modest revenue growth and decent earnings this year. The top line ought to be supported by ongoing rate approval activity, specifically in regard to the in-process 2024 general rate case, as well as increased customer water usage and an expanding customer base. On the earnings front, production costs are likely to remain somewhat elevated in the near term. Thus, our model calls for share net to take a slight step back this year, to $3.00.

The company's track record of annual dividend increases has not wavered. The board of directors recently raised the quarterly payout 7%, to $0.30 per share. At present, the yield is slightly above that of the *Value Line* median, making these shares a good selection for income-seeking accounts.

Capital investment is poised to remain solid over the pull to late decade. In tandem with general rate case filings and capital spending budgets to state regulators, management intends to invest more than $1.5 billion over the next several years. The majority of funds will likely be earmarked for infrastructure upgrades on treatment plants and water delivery systems.

Untimely California Water shares may pique the interest of investors with a long-term horizon. At recent levels, the stock offers attractive total return potential over the 2028-2030 time frame. Moreover, the equity is ranked 2 (Above Average) for Safety and is significantly less volatile than the broader market, which adds to the stock's appeal.

BUSINESS: Essential Utilities, Inc. became the new name for Aqua America on Feb. 3, 2020, to reflect the acquisition of Peoples, a natural gas utility, which occurred in 3/20. In 2024, Aqua Amer. provided water and wastewater services in the states of PA, OH, TX, IL, NC, NJ, IN, VA, NS, WS. Acquired AquaSource, 7/13; N. Maine Util., 7/15; and others. Water respn. for 59% of revenues in 2024; residential, 32%; commercial, 9%; industrial, wastewater & other, 18%. Gas 40%; other, 1%. Employs 3,291. Off. & dir. own less than 1% of the common stock; BlackRock, 11.3%; Vanguard, 10.2%; Can. Pen. Plan 7.9% (3/24 proxy). Pres. & CEO: Christopher Franklin. Inc.: PA Addr.: 762 W Lancaster Ave., Bryn Mawr, PA 19010. Tel.: 610-525-1400. Int.: www.essential.co.

Essential Utilities delivered mixed results to close out 2024. The diversified utility provider reported December-period revenues of $604 million and earnings of $0.67 per share. The former came in shy of our call, but improved notably year over year, while the latter bested our mark, and jumped 14% versus the previous-year tally. Toward the end of 2024, the company had some wind at its back, including rising water and natural gas volumes, as well as higher rates. These trends likely carried over into 2025, suggesting the company is poised for a strong start to the year.

Modest top- and bottom-line growth is on tap for 2025 and 2026. Based on our model, we look for annual revenue and earnings expansion of 14% and 4%, respectively, for this year. The recently completed acquisition of Greenville Wastewater and the approved Pennsylvania rate case ought to support the advance. For 2026, our introductory estimates suggest that revenues may well improve 6%, to $2.52 billion, while earnings jump roughly 9%, to $2.45 per share.

Capital investments are expected to accelerate in the years ahead. In particular, Essential Utilities will likely be focused on replacing aging water systems and pipelines, removing harmful chemicals such as PFAS contamination, as well as upgrading the safety of its natural gas operations. This will probably prompt the company to seek additional rate hike approvals from regulators going forward, as some of these costs can be recouped via rate increases.

We like these shares predominately for investors with a 3- to 5-year holding period. The stock is just an Average (Timeliness: 3) selection for relative year-ahead price performance, while upside over the 18-month window is also unexciting at recent levels. On the other hand, total return potential over the 2028-2030 time frame is well above the *Value Line Investment Survey* median. This is supported partly by a healthy dividend yield. Finally, the equity's defensive characteristics, including a favorable rank for Safety (2) and a good Financial Strength mark (A), further sweeten the pot for conservative accounts.

BUSINESS: Middlesex Water Company engages in the ownership and operation of regulated water utility systems in New Jersey, Delaware, and Pennsylvania. It also operates water and wastewater systems under contract on behalf of municipal and private clients in NJ and DE. Its Middlesex System provides water services to 61,000 retail customers, primarily in Middlesex County, New Jersey. In 2024, the Middlesex System accounted for 67% of operating revenues. At 12/31/24, the company had 360 employees. Incorporated: NJ. President, CEO, and Chairman: Dennis W. Doll. Officers & directors own 1.8% of the com. stock; BlackRock Inst. Trust Co., 14.6% (4/24 proxy). Add.: 485 C Route 1 South, Suite 400, Iselin, NJ 08830. Tele.: 732-634-1500. Int.: www.middlesexwater.com.

Middlesex Water's stock price has rebounded a bit since our last review in early January. Shares of the regulated water utility are up more than 10% in value over the past three months subsequent to a sharp dip in price in late 2024. Investor enthusiasm likely stemmed from a combination of solid fourth-quarter financial results and a shift in general investor sentiment toward more-conservative securities amidst recent broader market turbulence. The stock remains a middling selection (3) for Timeliness at this juncture.

Revenues and earnings are poised to remain in growth mode, in our view. Indeed, Middlesex delivered strong year-over-year top- and bottom-line expansion for 2024, supported largely by base rate increases associated with New Jersey state regulator's rate case approval last March, as well as resilient customer water demand. We think the company is in good shape for this year. On top of higher water rates, an expanding customer base, particularly in the Delaware System, holds promise. To that end, the company recently announced the purchase of water utility assets from Ocean View for $4.6 million. The acquisition, which will add more than 900 customers to the roster, is slated for completion in April.

Long-term business prospects are bright. In our view, secular growth drivers include a healthier economic backdrop and increased consumer water consumption, along with periodic rate hikes related to the company's future base rate applications with regulators. Meanwhile, capital investment across the company's aging infrastructure is apt to continue over the pull to late decade. Specifically, management plans to invest nearly $400 million on treatment plants and water delivery system upgrades through 2027.

Subscribers with a holding period of one year or longer may find these shares appealing. At recent levels, total return potential over both the 18-month and 3- to 5-year horizons is attractive. Moreover, the stock's defensive characteristics (good Financial Strength mark and high scores for Price Stability and Earnings Predictability) ought to catch the eye of conservative-leaning investors.

Nicholas Patrikis *April 4, 2025*

2025					

BUSINESS: SJW Group engages in the production, purchase, storage, purification, distribution, and retail sale of water. It provides water service to approximately 232,000 connections with a total population of roughly one million people in the San Jose area and 16,000 connections that reach about 88,000 residents in the region between San Antonio and Austin, Texas. The company merged with Connecticut Water (10/19) which provides service to approx. 142,000 connections with a total population of 463,000 people. Has 808 employees. Officers and directors own less than 1.0% of outstanding shares (3/24 proxy). Chairman & CEO: Eric Thornburg. Incorporated: California. Address: 110 West Taylor Street, San Jose, CA 95110. Telephone: (408) 279-7800. Internet: www.sjwater.com.

SJW Group recently announced some upper-level management changes. Effective June 30, 2025, current Chief Executive Officer and President Eric W. Thornburg is set to retire, and will be succeeded by Andrew F. Walters (current CFO). In addition, Bruce A. Hauk will be promoted to President in addition to his COO role. Lastly, Mr. Thornburg will remain on as non-executive Chair of the Board.

The company reported decent results for the full-year 2024. The top line advanced 11% year over year, to $749 million, while the bottom line rose by 7%, to $2.85 per share. Driving the performance was a combination of rate increases (+$62 million), higher customer water usage (+$15 million), and customer expansion (+$2.5 million). This more than offset a modest decline in revenues from regulatory adjustments. Elsewhere, rising water production costs and higher administrative fees kept somewhat of a lid on earnings growth during the year. For 2025, our model suggests that revenues may well edge higher 3%, to $775 million, while profits are poised to jump 12%, to $3.20 per share.

Long-term capital spending initiatives are ramping up from previously announced levels. Subsequent to investing more than $350 million on infrastructure and water supply upgrades last year, management has raised its five-year spending plan by 25%, to approximately $2.0 billion. These increased funds will be utilized primarily to support water and wastewater systems, as well as bolster the treatment of harmful chemicals. Indeed, we think these actions ought to prompt increased rate approval activity in the years ahead, as the company seeks to raise customer rates to recoup a good portion of these investments.

These shares are a worthwhile selection for investors with an eye to late decade. The stock, which is now neutrally ranked (3) for Timeliness, offers solid total return potential over the pull to 2028-2030. This is supported partly by a healthy dividend yield. What's more, a Safety rank of 2 (Above Average) and a high score for Price Stability (90 out of 100) should pique the interest of conservative accounts.

Nicholas Patrikis *April 4, 2025*

The York Water Company
Judgment of Equity Risk Premium for the
Proxy Group of Six Water Companies

Line No.		Proxy Group of Six Water Companies
1.	Calculated equity risk premium based on the total market using the beta approach (1)	5.31 %
2.	Mean equity risk premium based on a study using the holding period returns of public utilities with A2 rated bonds (2)	4.70
3.	Average equity risk premium	5.01 %

Notes: (1) From page 6 of this Schedule.
(2) From page 9 of this Schedule.

The York Water Company
Derivation of Equity Risk Premium Based on the Total Market Approach
Using the Beta for the
Proxy Group of Six Water Companies

Line No.	Equity Risk Premium Measure	Proxy Group of Six Water Companies
1.	Kroll Equity Risk Premium (1)	6.10 %
2.	Regression on Kroll Risk Premium Data (2)	6.97
3.	Kroll Equity Risk Premium based on PRPM (3)	7.15
4	Equity Risk Premium Based on Value Line Summary and Index (4)	7.19
5.	Equity Risk Premium Based on Bloomberg, Value Line, and S&P Global Market Intelligence S&P 500 Companies (5)	9.97
6.	Conclusion of Equity Risk Premium	7.48 %
7.	Adjusted Beta (6)	0.71
8.	Forecasted Equity Risk Premium	5.31 %

Notes:

(1) Based on the arithmetic mean historical monthly returns on large company common stocks from Kroll Cost of Capital Navigator and Bloomberg Professional Services minus the arithmetic mean monthly yield of Moody's average Aaa and Aa2 corporate bonds from 1928-2024.

(2) This equity risk premium is based on a regression of the monthly equity risk premiums of large company common stocks relative to Moody's average Aaa and Aa2 rated corporate bond yields from 1928-2024 referenced in Note 1 above. Using the equation generated from the regression, an expected equity risk premium is calculated using the average consensus forecast of Aaa corporate bonds of 5.23% (from page 1 of this Schedule).

(3) The Predictive Risk Premium Model (PRPM) is discussed in the accompanying direct testimony. The Ibbotson equity risk premium based on the PRPM is derived by applying the PRPM to the monthly risk premiums between Ibbotson large company common stock monthly returns and average Aaa and Aa corporate monthly bond yields, from January 1928 through March 2025.

(4) The equity risk premium based on the Value Line Summary and Index is derived by subtracting the average consensus forecast of Aaa corporate bonds of 5.23% (from page 1 of this Schedule) from the projected 3-5 year total annual market return of 12.42% (described fully in note 1 on page 2 of Schedule DWD-5).

(5) Using data from the Bloomberg Professional Services, Value Line, and S&P Capital IQ for the S&P 500, an expected total return of 15.20% was derived based upon expected dividend yields as a proxy for income returns and long-term earnings growth estimates as a proxy for capital appreciation. Subtracting the average consensus forecast of Aaa corporate bonds of 5.23% results in an expected equity risk premium of 9.97%.

(6) Average of mean and median beta from page 1 of Schedule DWD-5.

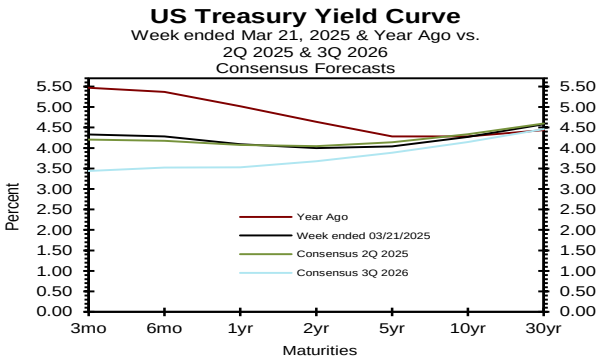
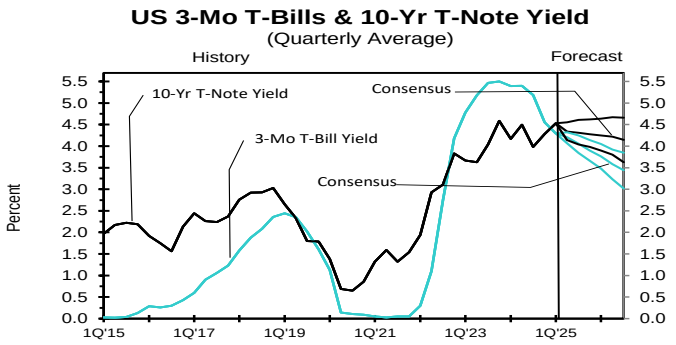
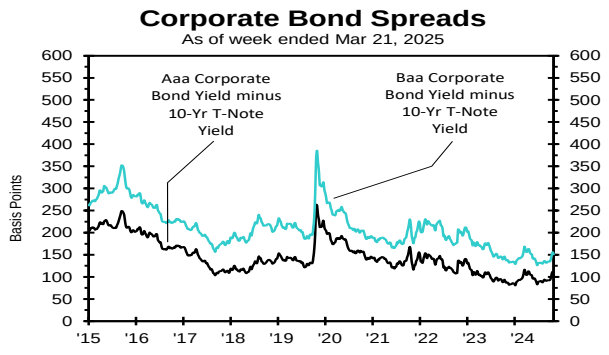
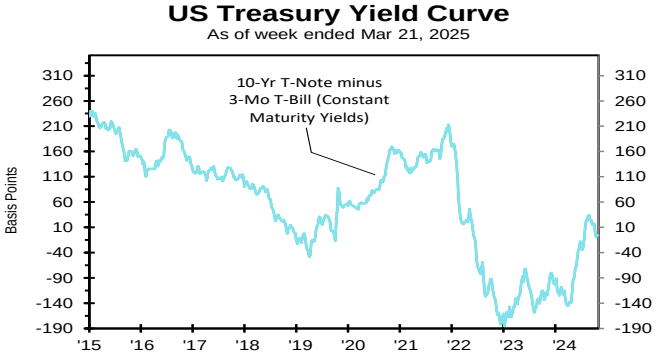
Forecasts for interest rates and the Federal Reserve's Advanced Foreign Economies Index represent averages for the quarter. Forecasts for Real GDP, GDP Price Index, CPI and PCE Price Index are seasonally adjusted annual rates of change (saar). Individual panel members' forecasts are on pages 4 through 9. Historical data: Treasury rates from the Federal Reserve Board's H.15; AAA-AA and A-BBB corporate bond yields from Bank of America-Merrill Lynch and are 15+ years, yield to maturity; State and local bond yields from Bank of America-Merrill Lynch, A-rated, yield to maturity; Mortgage rates from Freddie Mac, 30-year, fixed; SOFR from the New York Fed. *Interest rate data for 1Q 2025 based on historical data through the week ended March 21. **Data for 1Q 2025 for the Fed's AFE $ Index based on data through the week ended March 21. Figures for 1Q 2025 Real GDP, GDP Chained Price Index, Consumer Price Index, and PCE Price Index are consensus forecasts from the March 2025 survey.









Long-Range Survey:

The table below contains the results of our twice-annual long-range CONSENSUS survey. There are also Top 10 and Bottom 10 averages for each variable. Shown are consensus estimates for the years 2026 through 2030 and averages for the five-year periods 2026-2030 and 2031-2035. Apply these projections cautiously. Few if any economic, demographic and political forces can be evaluated accurately over such long time spans.

Projected Market Appreciation of the S&P Utility Index
Derivation of Mean Equity Risk Premium Based Studies
Using Holding Period Returns and
Projected Market Appreciation of the S&P Utility Index

Line No.		Implied Equity Risk Premium
1.	Historical Equity Risk Premium (1)	4.16 %
2.	Regression of Historical Equity Risk Premium (2)	4.89
3	Forecasted Equity Risk Premium Based on PRPM (3)	4.83
4.	Forecasted Equity Risk Premium based on Projected Total Return on the S&P Utilities Index (Bloomberg, Value Line, and S&P Capital IQ Data) (4)	4.92
5.	Average Equity Risk Premium (5)	4.70 %

Notes: (1) Based on S&P Public Utility Index monthly total returns and Moody's Public Utility Bond average monthly yields from 1928-2024. Holding period returns are calculated based upon income received (dividends and interest) plus the relative change in the market value of a security over a one-year holding period.

(2) This equity risk premium is based on a regression of the monthly equity risk premiums of the S&P Utility Index relative to Moody's A2 rated public utility bond yields from 1928 - 2024 referenced in note 1 above. Using the equation generated from the regression, an expected equity risk premium is calculated using the prospective A2 rated public utility bond yield of 5.62% (from line 3, page 1 of this Schedule).

(3) The Predictive Risk Premium Model (PRPM) is applied to the risk premium of the monthly total returns of the S&P Utility Index and the monthly yields on Moody's A2 rated public utility bonds from January 1928 - March 2025.

(4) Using data from Bloomberg, Value Line, and S&P Capital IQ for the S&P Utilities Index, an expected return of 10.54% was derived based on expected dividend yields as a proxy for income returns and long-term growth estimates as a proxy for market appreciation. Subtracting the expected A2 rated public utility bond yield of 5.62%, calculated on line 3 of page 1 of this Schedule results in an equity risk premium of 4.92% (10.54% - 5.62% = 4.92%).

(5) Average of lines 1 through 4.

Notes on page 2 of this Schedule.

The York Water Company
Notes to Accompany the Application of the CAPM and ECAPM

Notes:

(1) The market risk premium (MRP) is derived by using five different measures from four sources: Kroll, Value Line, Bloomberg, and S&P Capital IQ as illustrated below:

Measure 1: Kroll Arithmetic Mean MRP (1926-2024)

Arithmetic Mean Monthly Returns for Large Stocks 1926-2024:	12.29	%
Arithmetic Mean Income Returns on Long-Term Government Bonds:	4.99	
MRP based on Kroll Historical Data:	7.31	%

Measure 2: Application of a Regression Analysis to Kroll Historical Data

(1926-2024)	8.03	%

Measure 3: Application of the PRPM to Kroll Historical Data

(January 1926 - March 2025)	8.01	%

Measure 4: Value Line Projected MRP (Thirteen weeks ending April 4, 2025)

Total projected return on the market 3-5 years hence*:	12.42	%
Risk-Free Rate (see note 2):	4.46	
MRP based on Value Line Summary & Index:	7.96	%

*Forecasted 3-5 year capital appreciation plus expected dividend yield

Measure 5: Bloomberg, Value Line, and S&P Capital IQ Projected Return on the Market based on the S&P 500

Total return on the Market based on the S&P 500:	15.20	%
Risk-Free Rate (see note 2):	4.46	
MRP based on Bloomberg, Value Line, and S&P Capital IQ data	10.74	%

Average of all MRP Measures:	8.41	%

(2) For reasons explained in the Direct Testimony, the appropriate risk-free rate for cost of capital purposes is the average forecast of 30 year Treasury Bonds per the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts. (See pages 7 and 8 of this Schedule.) The projection of the risk-free rate is illustrated below:

Second Quarter 2025	4.60	%
Third Quarter 2025	4.60	
Fourth Quarter 2025	4.50	
First Quarter 2026	4.50	
Second Quarter 2026	4.50	
Third Quarter 2026	4.50	
2026-2030	4.30	
2031-2035	4.20	
	4.46	%

(3) Average of Column 6 and Column 7.

The York Water Company
Basis of Selection of the Group of Non-Price Regulated Companies
Comparable in Total Risk to the Proxy Group of Six Water Companies

The criteria for selection of the proxy group of non-price regulated companies comparable in total risk to the proxy group of six water companies was that the non-price regulated companies be domestic and reported in Value Line Investment Survey (Standard Edition).

The proxy group of non-price regulated companies was selected based on the unadjusted beta range of 0.53 - 0.87 and residual standard error of the regression range of 2.7417 - 3.2701 of the proxy group of six water companies.

These ranges are based upon plus or minus two standard deviations of the unadjusted beta and standard error of the regression. Plus or minus three standard deviations captures 95.50% of the distribution of unadjusted betas and residual standard errors of the regression.

The standard deviation of the Utility Proxy Group's residual standard error of the regression is 0.1321. The standard deviation of the standard error of the regression is calculated as follows:

$$\text{Standard Deviation of the Std. Err. of the Regr.} = \frac{\text{Standard Error of the Regression}}{\sqrt{2N}}$$

where: N = number of observations. Since Value Line betas are derived from weekly price change observations over a period of five years, N = 259

$$\text{Thus,} \quad 0.1321 = \frac{3.0059}{\sqrt{518}} = \frac{3.0059}{22.7596}$$

NA= Not Available
NMF=Not Meaningful Figure

Notes:

(1) Average of columns 2 through 4 excluding negative growth rates and extreme positive values.

(2) The application of the DCF model to the domestic, non-price regulated comparable risk companies is identical to the application of the DCF to the Utility Proxy Group. The dividend yield is derived by using the 60 day average price and the spot indicated dividend as of 4/01/2025. The dividend yield is then adjusted by 1/2 the average projected growth rate in EPS, which is calculated by averaging the 5 year projected growth in EPS provided by Value Line, www.zacks.com, and S&P Capital IQ (excluding any negative growth rates) and then adding that growth rate to the adjusted dividend yield.

(3) Results were excluded from the final average and median as they were more than two standard deviations from the proxy group's mean.

The York Water Company
Indicated Common Equity Cost Rate
Through Use of a Risk Premium Model
Using an Adjusted Total Market Approach

Line No.		Proxy Group of Thirty-Six Non-Price Regulated Companies
1.	Prospective Yield on Baa2 Rated Corporate Bonds (1)	6.03 %
2.	Adjustment to Reflect Bond rating Difference of Non-Price Regulated Companies (2)	(0.18)
3.	Adjusted Bond Yield	5.85
4.	Equity Risk Premium (3)	5.83
5.	Risk Premium Derived Common Equity Cost Rate	11.68 %

Notes: (1) Average forecast of Baa corporate bonds based upon the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts dated November 27, 2024 and April 1, 2025 (see pages 7 and 8 of Schedule DWD-4). The estimates are detailed below.

Second Quarter 2025	6.00 %
Third Quarter 2025	6.00
Fourth Quarter 2025	6.00
First Quarter 2026	6.10
Second Quarter 2026	6.10
Third Quarter 2026	6.10
2026-2030	6.00
2031-2035	5.90
Average	6.03 %

(2) The average yield spread of Baa2 rated corporate bonds over A2 corporate bonds for the three months ending March 2025. To reflect the A3 average rating of the Non-Price Regulated Proxy Group comparable in total risk to the Proxy Group, the yield on Baa corporate bonds must be adjusted by 2/3 of the spread between A2 and Baa2 corporate bond yields as shown below:

	A2 Corp. Bond Yield	Baa2 Corp. Bond Yield	Spread
Mar-25	5.65 %	5.93 %	0.28 %
Feb-25	5.66	5.92	0.26
Jan-25	5.80	6.08	0.28
		Average yield spread	0.27
		2/3 of spread	0.18

YORK WATER STATEMENT NO. 3W

BEFORE THE

PENNSYLVANIA PUBLIC UTILITY COMMISSION

THE YORK WATER COMPANY

DIRECT TESTIMONY OF MATTHEW E. POFF

Q. State your name and business address.

A. Matthew E. Poff. My business address is: 130 East Market Street, York, Pennsylvania.

Q. By whom are you employed?

A. I am employed by The York Water Company ("York Water" or the "Company").

Q. State your present position with the Company and explain your duties and responsibilities.

A. I am Chief Financial Officer and Treasurer for the Company. My duties and responsibilities include managing the day-to-day financial transactions of the Company.

Q. How long have you been employed by the Company?

A. I have been employed by the Company since June 15, 2009.

Q. What is your educational background?

A. I have a Bachelor's Degree from the Pennsylvania State University, University Park, Pennsylvania and a Master's Degree in Business Administration from York College of Pennsylvania, York, Pennsylvania.

Q. Are you a certified public accountant?

A. Yes, I am a certified public accountant licensed by the Commonwealth of Pennsylvania.

Q. What has been your other business experience?

A. From September 2006 through June 2009, I was employed by I. B. Abel, Inc. in York, Pennsylvania as the Chief Financial Officer. In this capacity, I managed the day-to-day accounting and financial transactions of the Company.

From July 1995 through September 2006, I was employed by Beard Miller Company LLP (now Baker Tilly US, LLP) as a certified public accountant. In this capacity, I oversaw the audits and reviews and preparation of financial statements and tax returns for various business entities, both private and public companies of various sizes.

Q. Have you previously testified before a regulatory commission?

A. Yes, I have presented testimony to the Pennsylvania Public Utility Commission ("Commission") in the Company's last three rate cases.

Q. Will you list the exhibits you are sponsoring in this proceeding?

A. In addition to the exhibits identified in York Water Statement No. 3, I am sponsoring the following exhibits prepared by me or under my direction and supervision:

Exhibit Nos. HI-1W and HI-2W relating to the statement of operations for the wastewater division;

Exhibit Nos. H (b)-3W, HII-1W, HII-2W, HII-2-2W, HII-2-3W, HII-2-4W, HII-2-5W, HII-2-6W, HII-2-7W, HII-2-8W, HII-3W, HII-4W, HII-5W, HII-7W, HII-8W and HII-9W relating to operating revenues for the wastewater division;

Exhibit Nos. HIII-1W, HIII-2W, HIII-2-1W, HIII-2-2W, HIII-2-3W, HIII-2-4W, and HIII-2-9W relating to operating expenses for the wastewater division;

Exhibit Nos. HIV-15W, HIV-15-1W, and HIV-15-2W relating to taxes other than income taxes for the wastewater division; and

Exhibit Nos. HIV-6W, HIV-17W, HIV-17-2W, HIV-17-3W, HIV-17-3(a)W, HIV-17-5W, and HIV-18W relating to operating income taxes for the wastewater division.

Exhibit No. HV-1-1W and HV-1-4W relating to the original cost measure of value for the wastewater division; and

Exhibit No. HVII-28W relating to rate of return.

Q. Explain Exhibit No. HI-1W.

A. Exhibit No. HI-1W provides a detailed comparative operating statement for the wastewater operations for the twelve months ended December 31, 2024, and December 31, 2023. Column 1 of pages 2 through 3 of Exhibit No. HI-1W reflects the Company's

detailed operating statement per books for the twelve months ended December 31, 2024, showing operating income of $543,390. Column 2 of pages 2 through 3 of Exhibit No. HI-1W reflects the Company's detailed operating statement per books for the twelve months ended December 31, 2023, showing operating income of $833,072. Column 3 of pages 2 through 3 of Exhibit No. HI-1W reflects the increases and decreases by account between the operating statement for the twelve months ended December 31, 2024, and the operating statement for the twelve months ended December 31, 2023. Major wastewater account variances (>$40,000) between the detailed operating statement for the twelve months ended December 31, 2024, and the detailed operating statement for the twelve months ended December 31, 2023, are identified in Column 4 of pages 2 through 3 of Exhibit No. HI-1W. Detailed explanations of the causes of the major account variances between the operating statement for the twelve months ended December 31, 2024, and the operating statement for the twelve months ended December 31, 2023, are provided beginning on page 4 of Exhibit No. HI-1W.

Q. Explain Exhibit No. HI-2W.

A. Exhibit No. HI-2W summarizes ratemaking adjustments under existing rates to per book statement of income for the twelve months ended December 31, 2024, and the anticipated statement of income when proposed rates become effective. The income per books for the twelve months ended December 31, 2024, as shown in Column 1 of Exhibit No. HI-2W is $979,845. I note that this amount reflects non-operating income and other income deductions not included in the calculation of net operating income for ratemaking purposes. Net operating income, for ratemaking purposes, was $543,390 for the twelve months ended December 31, 2024, as shown in column 1, page 1 of Exhibit No. HI-2W. Column 4 of Exhibit No. HI-2W shows adjusted net operating income of $744,958. The

adjustments to net operating income in the amount of $201,568 are shown in Column 3 of Exhibit No. HI-2W. These adjustments are detailed in other exhibits, which will be explained later in my testimony or others' testimony. Column 7 of Exhibit No. HI-2W shows net operating income of $3,565,707 after reflecting adjustments related to the effects of proposed rates. The adjustments to net operating income in the amount of $2,820,750 are shown in Column 6 of Exhibit No. HI-2W, and these adjustments are detailed in other exhibits, which will be explained later in my testimony or others' testimony.

Q. Explain Exhibit No. H(b)-3W.

A. Exhibit No. H(b)-3W provides the number of wastewater customers whose monthly bills will increase under proposed rates based on pro forma historic test year volumes.

Q. Explain Exhibit No. HII-1W.

A. Exhibit No. HII-1W is a comparative statement of volumes received and operating revenues per books by class for the twelve months ended December 31, 2024, and December 31, 2023, and the number of customers by class as of December 31, 2024, and December 31, 2023. Volumes received is based upon metered water usage for those customers who are metered wastewater service customers of York Water. Volumes received are not tracked for customers who are billed at flat rates.

Q. Explain Exhibit No. HII-2W.

A. Exhibit No. HII-2W summarizes adjustments to per book operating revenues for the twelve months ended December 31, 2024, that are required for ratemaking purposes. As I will explain later, such adjustments reflect elimination of net accrued operating revenues

recorded on the corporate books during the twelve months ended December 31, 2024. The adjustments also annualize the effects of changes in number of customers and the acquisition of the York Haven Borough wastewater collection and treatment system, which occurred during the twelve months ended December 31, 2024.

The operating revenues per books, for the twelve months ended December 31, 2024, as shown in Column 1 of Exhibit No. HII-2W, were $7,417,557. Adjustments under existing rates to increase historic test year operating revenues in the amount of $418,263 are summarized on page 2 of 2 of Exhibit No. HII-2W and are shown in Column 2, page 1 of 2 of Exhibit No. HII-2W. These adjustments are explained later in Exhibit Nos. HII-2-2W through HII-2-8W. Pro forma operating revenues under existing rates, after adjustment, for twelve months ended December 31, 2024, of $7,835,820 are shown in Column 3 of Exhibit No. HII-2W. The proposed increase in historic test year operating revenues in the amount of $3,928,397 is shown in Column 5 of Exhibit No. HII-2W. The corresponding percentage increase in operating revenues is shown in Column 6.

For historic test year purposes, the increase of $3,928,397 shown on Exhibit No. HII-2W was not produced by the application of proposed rates to historic test year volumes. Since the Company's claim in this case is based upon data for a fully forecasted future test year ending February 28, 2027, annualized and normalized for ratemaking purposes, the increase of $3,928,397, or 50.13%, is the increase calculated based upon pro forma historic test year revenues, expenses, and rate base.

Q. Explain Exhibit No. HII-2-2W.

A. Exhibit No. HII-2-2W eliminates net accrued operating revenues recorded on the corporate books during the twelve months ended December 31, 2024. In response to the enactment of the Tax Reform Act of 1986, the Company estimates for income tax and financial reporting purposes the amount of income attributable to utility services provided during each accounting period, but after the final meter reading which falls within that accounting period.

Since unbilled revenues from the end of one accounting period are included in the first meter reading for the next accounting period, unbilled revenues from one accounting period are offset by unbilled revenues in the succeeding accounting period, with the result that the Company will record for accounting purposes, as either a debit or credit, the negative or positive difference in accrued revenues between the two accounting periods. This difference represents net accrued revenues recorded for the latter accounting period.

Operating revenues are presented for ratemaking purposes on an "as billed basis" for the historic and future test years, to eliminate the uncertainties inherent in estimated "unbilled revenues." Therefore, for ratemaking purposes, net accrued operating revenues are eliminated.

Q. Explain Exhibit No. HII-2-3W.

A. Exhibit No. HII-2-3W annualizes operating revenues for metered residential, commercial, and industrial customers and unmetered residential and commercial/industrial customers by applying base rates effective March 1, 2023, to test year units and consumption. By Order entered in the Company's 2022 base rate case at Docket No. R-2022-3031340, the Commission authorized increased base rates for the Company. These rates along with the

rates approved by the Commission as part of the Company's acquisitions since the 2022 base rate case are the currently effective base rates of the Company. Annualization of revenues by customer class at present base rates effective March 1, 2023, in the amount of $5,095,548 for metered customers and $2,319,580 for unmetered customers are shown in Column 2 on Exhibit No. HII-2-3W. Application of present base rates to the customer units and consumption analysis for the twelve months ended December 31, 2024, is shown on Exhibit No. HII-4W, which I will explain later. Metered operating revenues by customer class billed and recorded on the corporate books during the twelve months ended December 31, 2024, in the amount of $5,030,191 are shown in Column 1 of Exhibit No. HII-2-3W and are subtracted from annualized revenues at metered base rates effective March 1, 2023, to determine the adjustment by customer class to operating revenues shown in Column 3 of Exhibit No. HII-2-3 [$5,095,548 - $5,030,191 = $65,357]. Unmetered operating revenues by customer class billed and recorded on the corporate books during the twelve months ended December 31, 2024, in the amount of $2,376,715 are shown in Column 1 of Exhibit No. HII-2-3W and are subtracted from annualized revenues at unmetered base rates effective March 1, 2023, to determine the adjustment by customer class to operating revenues shown in Column 3 of Exhibit No. HII-2-3 [$2,319,580 - $2,376,715 = ($57,135)]. The adjustment by customer class of operating revenues in the amount of $8,221 [$65,357 + ($57,135)] is carried forward to Exhibit No. HII-2, page 3.

Q. Explain Exhibit No. HII-2-4W.

A. Exhibit No. HII-2-4W annualizes operating revenues for metered residential wastewater customers connected and disconnected during the twelve months ended December 31, 2024. For metered residential customers, the net gain in number of metered residential

customers during the twelve months ended December 31, 2024, was 326 (4,153 metered residential wastewater customers as of December 31, 2024, less 3,827 metered residential wastewater customers as of December 31, 2023). Since 326 metered residential wastewater customers were gained throughout the test year, it is assumed the historic test year average number of metered residential wastewater customers is equal to the average of metered residential wastewater customers at the beginning and end of the historic test year, or 3,990 ([4,153 + 3,827] ÷ 2). The increase in metered residential customers is concentrated in the West Manheim and Amblebrook service territories. Based on that, the average annual revenue per average metered residential customer for the West Manheim and Amblebrook service territories was calculated to be $1,054.58. The adjustment to annualize revenues for the net gain in metered residential wastewater customers during the twelve months ended December 31, 2024, is determined by multiplying the net gain of 326 metered residential wastewater customers by the average annual revenue per average metered residential West Manheim and Amblebrook wastewater customer in the amount of $1,054.88, and by dividing the product of this calculation by two (326 x $1,054.88 ÷ 2 = $171,945). The product is divided by two since it is reasonable to assume that customers were gained evenly through the historic test year and that annualized revenues already reflect the gain of one-half of one year's revenue, on average, for the 326 customers. The result of the calculations described above is the amount of $171,945, which is carried forward to Exhibit No. HII-2W, page 2.

Q. Explain Exhibit No. HII-2-5W.

A. Exhibit No. HII-2-5W annualizes operating revenues for metered commercial wastewater customers connected and disconnected during the twelve months ended December 31,

2024. For metered commercial customers, the net gain in number of metered commercial customers during the twelve months ended December 31, 2024, was 12 (197 metered commercial wastewater customers as of December 31, 2024, less 185 metered commercial wastewater customers as of December 31, 2023). Since 12 metered commercial wastewater customers were gained throughout the test year, it is assumed the historic test year average number of metered commercial wastewater customers is equal to the average of metered commercial wastewater customers at the beginning and end of the historic test year, or 191 ([197 + 185] ÷ 2). Annualized revenues for metered commercial wastewater customers of $658,339 (refer to Exhibit No. HII-4W) are divided by the historic test year average number of metered commercial wastewater customers of 191 to calculate the average annual revenue per average metered commercial wastewater customer in the amount of $3,446.80 ($658,339 ÷ 191 = $3,446.80). The adjustment to annualize revenues for the net gain in metered commercial wastewater customers during the twelve months ended December 31, 2024, is determined by multiplying the net gain of 12 metered commercial wastewater customers by the average annual revenue per average metered commercial wastewater customer in the amount of $3,446.80, and by dividing the product of this calculation by two (12 x $3,446.80 ÷ 2 = $20,681). The product is divided by two since it is reasonable to assume that customers were gained evenly through the historic test year and that annualized revenues already reflect the gain of one-half of one year's revenue, on average, for the 12 customers. The result of the calculations described above is the amount of $20,681, which is carried forward to Exhibit No. HII-2W, page 2.

Q. Explain Exhibit No. HII-2-6W.

A. Exhibit No. HII-2-6W annualizes operating revenues for metered MESCO residential wastewater customers acquired by the Company during the twelve months ended December 31, 2024. The addition of MESCO metered residential customers for the twelve months ended December 31, 2024, occurred on January 31, 2024. There are not twelve months of revenue included in the historic test year. January 2025 actual residential revenue of $7,956 was used to annualize metered MESCO residential revenue. The adjustment of $7,956 is carried forward to Exhibit No. HII-2W, page 2.

Q. Explain Exhibit No. HII-2-7W.

A. Exhibit No. HII-2-7W annualizes operating revenues for metered York Haven Borough residential wastewater customers acquired by the Company during the twelve months ended December 31, 2024. The addition of York Haven Borough metered residential customers for the twelve months ended December 31, 2024, occurred on December 5, 2024. No revenue was recognized from this acquisition in 2024 so there are twelve months of revenue not included in the historic test year. The 299 acquired residential wastewater customers are billed at a monthly base rate of $50.00. Total monthly revenue from the residential wastewater customers is $14,950 (299 x $50.00). Annual revenue from the residential wastewater customers is $179,400 ($14,950 x 12). The adjustment of $179,400 is carried forward to Exhibit No. HII-2W, page 2.

Q. Explain Exhibit No. HII-2-8W.

A. Exhibit No. HII-2-8W annualizes operating revenues for metered York Haven Borough commercial wastewater customers acquired by the Company during the twelve months ended December 31, 2024. The addition of York Haven Borough metered commercial customers for the twelve months ended December 31, 2024, occurred on December 5,

2024. No revenue was recognized from this acquisition in 2024 so there are twelve months of revenue not included in the historic test year. The 6 acquired commercial wastewater customers are billed at a monthly base rate of $102.67 and a consumption rate of $9.75 per thousand gallons. Total base rate monthly revenue from the commercial wastewater customers is $616 (6 x $102.67). Total consumption based monthly revenue from the commercial wastewater customers is $835 based on estimated consumption of 85,633 gallons (85,633 / 1,000 x $9.75). Total monthly revenue from the commercial wastewater customers is $1,451 ($616 + $835). Annual revenue from the commercial wastewater customers is $17,411 ($1,451 x 12). The adjustment of $1,451 is carried forward to Exhibit No. HII-2W, page 2.

Q. Explain Exhibit No. HII-4W.

A. Exhibit No. HII-4W provides a detailed customer consumption analysis by customer classification for metered wastewater customers and a detailed customer revenue analysis by customer classification for unmetered wastewater customers.

Pages 2 through 4 of Exhibit No. HII-4W provide the application of present-metered and unmetered base rates to the customer analysis for the twelve months ended December 31, 2024. The application of present-metered and unmetered base rates to the customer analysis for the twelve months ended December 31, 2024, results in annualized revenues at present-metered and unmetered base rates on pages 2 through 4 of Exhibit No. HII-4W of $7,415,127 ($6,215,672 + $1,096,710 + $102,745).

Q. Explain Exhibit No. HII-5W.

A. Exhibit No. HII-5W provides a detailed explanation of the accounting procedures and methods used to determine accrued revenues and detailed computations of accrued revenues as of December 31, 2024, and December 31, 2023.

In response to the enactment of the Tax Reform Act of 1986, the Company estimates for income tax and financial reporting purposes the amount of income attributable to utility services provided during each accounting period, but after the final meter reading which falls within that accounting period. Since unbilled revenues from the end of one accounting period are included in the first meter reading for the next accounting period, unbilled revenues from one accounting period are offset by unbilled revenues in the succeeding accounting period, with the result that the Company will record for accounting purposes, as either a debit or credit, the negative or positive difference in accrued revenues between the two accounting periods. This difference represents net accrued revenues recorded for the latter accounting period. Operating revenues are presented for ratemaking purposes on an "as billed basis" for the historic and future test years, to eliminate the uncertainties inherent in estimated "unbilled revenues." Refer to Exhibit No. HII-2-2W, which I explained previously, for an operating revenue adjustment, which eliminates net accrued revenues recorded during the test year from the cost of service.

Page 2 of Exhibit No. HII-5W provides a detailed computation of accrued utility revenues as of December 31, 2024.

Page 3 of Exhibit No. HII-5W provides a detailed computation of accrued utility revenues as of December 31, 2023.

Page 4 of Exhibit No. HII-5W provides a summary of entries recorded during the twelve months ended December 31, 2024, accounting for accrued revenues.

Q. Explain Exhibit No. HII-7W.

A. Exhibit No. HII-7W provides the number of customers and the number of customers added or lost by customer classification for the year ended December 31, 2024, and the year-to-date period ended February 28, 2025.

Q. Are you sponsoring any other exhibits regarding the Company's operating revenues?

A. Yes, I am also sponsoring Exhibit Nos. HII-3W, HII-8W, and HII-9W.

Q. Explain Exhibit No. HIII-1W.

A. Exhibit No. HIII-1W is a comparative statement of wastewater operating expenses per books for the twelve months ended December 31, 2024, December 31, 2023, and December 31, 2022.

Q. Explain Exhibit No. HIII-2W.

A. Exhibit No. HIII-2W summarizes adjustments to operating expenses for the twelve months ended December 31, 2024, to annualize and normalize the effect of changes occurring during the twelve months ended December 31, 2024.

Operating expenses per books for the twelve months ended December 31, 2024, in the amount of $5,409,092 are shown in Column 1 of Exhibit No. HIII-2W. Adjustments to operating expenses in the amount of $294,734, to annualize and normalize the effect of

changes occurring during the twelve months ended December 31, 2024, are shown in Column 3 of Exhibit No. HIII-2W and are detailed in Exhibit Nos. HIII-2-4 of the water portion of the case, and HIII-2-1W through HIII-2-4W, and HIII-2-9W of the wastewater portion of the case. The Company has made no adjustments to operating expenses due to the increase in operating revenues resulting from the proposed increase in rates.

Q. Explain Exhibit No. HIII-2-1W.

A. Exhibit No. HIII-2-1W amortizes over ten years the acquisition costs of the wastewater property and rights of Felton Borough in excess of the original cost of the property when first devoted to public service less the applicable accrued depreciation. Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code. The acquisition adjustment of $294,808 is determined by subtracting the depreciated original cost of wastewater property and rights of $618,871 from acquisition costs of $913,679 ($913,679 - $618,871 = $294,808). The acquisition adjustment of $294,808 is divided by ten years to determine the annual amortization of $29,481 ($294,808 ÷ 10). The approved amount was one-half of the annual amortization of the acquisition costs in the amount of $14,741 ($29,481 x 0.50). The annual amortization of the acquisition costs of $14,741 has been carried forward to Exhibit No. HIII-2W, Column 3. This amortization was specifically approved by the Commission as part of the settlement in the Company's 2022 base rate case at Docket No. R-2022-3031340. The amortization period began March 1, 2023 (the effective date of rates under Docket No. R-2022-3031340) and ends February 28, 2033.

Q. Explain Exhibit No. HIII-2-2W.

A. Exhibit No. HIII-2-2W annualizes operating costs for the York Haven Borough wastewater collection and treatment system acquired on December 5, 2024.

The annualized amount of sludge removal from the treatment plant was budgeted at $36,000 and from the pumping stations was budgeted at $3,000. The annualized amount of purchased power for the treatment plant of $16,400 and from the pumping stations of $2,200 was based on a review of the first three invoices received. The annualized amount of chemicals for the treatment plant was budgeted at $15,000 based on historical usage of similar treatment plants. The annualized amount of maintenance for the treatment plant was budgeted at $45,000 and for the pumping stations was budgeted at $3,000 based on their initial inspections, age, and operating characteristics. The annualized amount of testing expense was budgeted at $6,000 based on historical amounts at similar wastewater systems. The annualized amount of communications expense to remotely monitor the pumping stations was budgeted at $1,500 based on historical amounts at similar wastewater systems. The adjustments of $36,000, $3,000, $16,400, $2,200, $15,000, $45,000, $3,000, $6,000, and $1,500 have been carried forward to Exhibit No. HIII-2W, Column 3.

Q. Explain Exhibit No. HIII-2-3W.

A. Exhibit No. HIII-2-3W adjusts the purchased treatment from Pennsylvania American Water Company. Pennsylvania American Water Company provides the treatment for the Company's customers in the West York Borough service territory. The Pennsylvania American Water Company's agreement with Company allows it to increase the current rate by a Consumer Price Index factor. The current consumptive rate per 100 gallons is

$0.375. Based on the current data, the Consumer Price Index factor will be 1.0466, increasing the consumption rate to $0.392 ($0.375 x 1.0466). The volume sent in the historic test year was 2,505,245 hundred gallons. The adjusted purchased treatment amount will be $983,246 (2,505,245 x 0.392). The adjustment of $48,911 was determined by comparing the actual purchased treatment amount during the twelve months ended December 31, 2024, of $934,246 to the estimated amount of $983,246 ($983,246 - $934,335 = $48,911). The adjustment of $48,911 has been carried forward to Exhibit No. HIII-2W, Column 3.

Q. Explain Exhibit No. HIII-2-4W.

A. Exhibit No. HIII-2-4W amortizes over ten years the acquisition costs of the wastewater property and rights of York Haven Borough in excess of the original cost of the property when first devoted to public service less the applicable accrued depreciation. Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code. The acquisition adjustment of $127,481 is determined by subtracting the depreciated original cost of wastewater property and rights of $281,095 from acquisition costs of $408,576 ($408,576 - $281,095 = $127,481). The acquisition adjustment of $127,481 is divided by ten years to determine the annual amortization of $12,748 ($127,481 ÷ 10). The annual amortization of the acquisition costs of $12,748 has been carried forward to Exhibit No. HIII-2W, Column 3.

Refer to the testimony of Mr. Hand (York Water Statement No. 1) for a further explanation of this acquisition and why the acquisition costs above depreciated original cost should be reflected in accordance with Section 1327.

Q. Explain Exhibit No. HIII-2-9W.

A. Exhibit No. HIII-2-9W adjusts purchased power expense for the twelve months ended December 31, 2024, to reflect generation, transmission, and distribution rates effective or contracted to in 2025 from the Company's electric service providers. Purchased power expense charged to Account Nos. 71530000 and 71550000 during the twelve months ended December 31, 2024, of $45,234 and $176,095, respectively, are subtracted from pro forma purchased power expense of $50,333 and $217,096, respectively, to determine the adjustment to purchased power expense of $5,099 and $41,008, respectively. The adjustments to purchased power expense of $5,099 and $41,088 has been carried forward to Exhibit No. HIII-2W, Column 3.

Q. Explain Exhibit No. HIV-6W.

A. Exhibit No. HIV-6W provides a schedule of the adjustments to wastewater taxable net income per books for the twelve months ended December 31, 2024. Adjustments to taxable net income per books for the twelve months ended December 31, 2024, are classified as Expenses Recorded on Books Not Deducted on Return and Deductions Not Charged against Booked Income. Tax adjustments classified as expenses recorded on books not deducted on return include nondeductible vacation pay of ($823) (for ratemaking purposes, the Company does not include accrued vacation pay in the cost of service), amortization of acquisition adjustments of $(27,311) which is not deductible for income taxes (acquisition adjustments are reflected on the Company's income statement as "below the line"), nondeductible penalties of $12,225 which is not deductible for income taxes (penalties are reflected on the Company's income statement as "below the line"), and nondeductible business meals of $99 (only 50% of otherwise allowable meal

expenses are deductible). Tax adjustments classified as deductions not charged against book income include tax depreciation in excess of depreciation recorded on books in the amount of $280,286 (the normalization of accelerated tax depreciation expense for ratemaking purposes is explained later in this testimony), tax repair expense in the amount of $44,940 (the Company deducts eligible repair items for tax purposes, but capitalizes repair items for book purposes), and cost of removal deducted currently in the amount of $3,000 (the Company deducts cost of removal for tax purposes, but capitalizes cost of removal for book purposes).

Adjustments to pro forma taxable net income for ratemaking purposes for the twelve months ended December 31, 2024, are shown on Exhibit No. HIV-17-2W, which I will explain later.

Q. Explain Exhibit No. HIV-15W.

A. Exhibit No. HIV-15W summarizes adjustments to operating taxes other than income taxes for the twelve months ended December 31, 2024, for ratemaking purposes and to reflect additional operating taxes other than income taxes resulting from the proposed increase in operating revenues. Operating taxes other than income taxes per books for the twelve months ended December 31, 2024, in the amount of $92,906 are shown in Column 1 of Exhibit No. HIV-15W. Adjustments to operating taxes other than income taxes of $16,885 are made to reflect the calculation of the pro forma level of taxes other than income taxes under existing rates for the twelve months ended December 31, 2024. Such adjustments are shown in Column 3 of Exhibit No. HIV-15W and are detailed in Exhibit No. HIV-15-1W, which I will explain later. Adjustments to operating taxes other than income taxes amounting to $26,562 are made to reflect the increased operating taxes

other than income taxes that result from the increase in operating revenues under proposed rates. These adjustments are shown in Column 6 of Exhibit No. HIV-15W and are detailed in Exhibit No. HIV-15-2W, which I will explain later.

Q. Explain Exhibit No. HIV-15-1W.

A. Exhibit No. HIV-15-1W is an adjustment to reflect the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and Damage Prevention Committee Assessment based on pro forma operating revenues under existing rates for twelve months ended December 31, 2024, and the 2024-2025 assessment factors. The currently-effective combined 2024-2025 assessment rate of 0.676148% for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and Damage Prevention Committee Assessment is applied to pro forma operating revenues at existing rates for twelve months ended December 31, 2024, in the amount of $7,812,521 (See Exhibit No. HII-2W, Column 3) to determine the pro forma combined assessment under existing rates for twelve months ended December 31, 2024, in the amount of $52,824 ($7,812,521x 0.00676148). The adjustment in the amount of $16,885 is determined by subtracting the test year assessments of $35,939 from the calculated pro forma amount of $52,824 ($52,824 - $35,939 = $16,885). The adjustment in the amount of $16,885 has been carried forward to Exhibit No. HIV-15W, Column 3.

Q. Explain Exhibit No. HIV-15-2W.

A. Exhibit No. HIV-15-2W presents an adjustment to reflect the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and Damage Prevention Committee Assessment based on pro forma

operating revenues under proposed rates for twelve months ended December 31, 2024, and the 2024-2025 assessment factors. The currently-effective combined 2024-2025 assessment rate of 0.676148% for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Committee Assessment General is applied to pro forma operating revenues at proposed rates for twelve months ended December 31, 2024, in the amount of $11,740,918 (See Exhibit No. HII-2W, Column 6) to determine the pro forma combined assessment under proposed rates for twelve months ended December 31, 2024, in the amount of $79,386 ($11,740,918 x 0.00676148). The adjustment in the amount of $26,562 is determined by subtracting the pro forma assessment under existing rates for the twelve months ended December 31, 2024, of $52,824 from the calculated pro forma amount of $79,386 ($79,386 – $52,824 = $26,562). The adjustment in the amount of $26,562 has been carried forward to Exhibit No. HIV-15W, Column 6.

Q. Explain Exhibit No. HIV-17W.

A. Exhibit No. HIV-17W summarizes adjustments to operating income taxes for the twelve months ended December 31, 2024, for ratemaking purposes and to reflect additional operating income taxes resulting from the proposed increase in operating revenues.

Operating income taxes per books for the twelve months ended December 31, 2024, in the amount of $341,618 are shown in Column 1 of Exhibit No. HIV-17W. Pro forma adjustments to operating income taxes of $(415,489) are shown in Column 3 of Exhibit No. HIV-17W and are detailed on Exhibit Nos. HIV-17-2W through HIV-17-3W. Adjustments to operating income taxes amounting to $1,081,085 are made to reflect the increased operating income taxes that result from the increase in operating revenues

under proposed rates, and these adjustments are shown in Column 6 of Exhibit No. HIV-17W and are detailed in Exhibit No. HIV-17-5W.

Q. Explain Exhibit No. HIV-17-2W.

A. Exhibit No. HIV-17-2W shows an adjustment to reflect current Federal income tax and current Pennsylvania corporate net income tax based on pro forma taxable income under existing rates at the currently effective Federal income tax rate of 21% and at the currently effective Pennsylvania corporate net income tax rate of 8.49%.

Total pro forma operating income before income taxes and excluding depreciation under existing rates in the amount of $2,022,203 is determined by subtracting pro forma operating expenses under existing rates in the amount of $5,703,826 (Refer to Exhibit No. HIII-2W, Column 4) and pro forma operating taxes other than income taxes under existing rates in the amount of $109,791 (Refer to Exhibit No. HIV-15W, Column 4) from pro forma operating revenues under existing rates in the amount of $7,835,820 (Refer to Exhibit No. HII-2W, Column 3) [$7,835,820 - $5,703,826 - $109,791 = $2,022,203]. To arrive at taxable income at present rates, amounts are added for Amortization of Acquisition Adjustments of $27,489 and nondeductible meals of $99, and amounts are then deducted for tax repair expense in the amount of $44,940, cost of removal in the amount of $3,000, state tax depreciation in the amount of $1,381,744 and pro forma interest expense deduction for ratemaking purposes in the amount of $917,796. Expenses of the Company's Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 are not allowed as a deduction for income tax purposes. Since these amounts are included in operating expenses and deducted in arriving at the figure of $2,022,203, they must be added back in arriving at taxable income. Tax repair

expense in the amount of $44,940 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $3,000 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Tax depreciation in the amount of $1,381,744 is detailed on Exhibit No. HIV-17-3W and Exhibit No. HIV-17-3 (a)W. I note that the state tax depreciation is greater than Federal tax depreciation due to the provisions of Act 89 of 2002, which I will explain later with respect to Exhibit No. HIV-17-3 (a)W. Pro forma interest expense deduction for ratemaking purposes in the amount of $917,796 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $44,508,541 x Weighted Debt Cost Rate of 2.06%).

Pro forma taxable income under existing rates in the amount of $(297,690) is determined by adding the expenses of the Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 and deducting tax repair expense in the amount of $44,940, cost of removal in the amount of $3,000, tax depreciation in the amount of $1,381,744, and pro forma interest expense in the amount of $917,796 from pro forma net operating income in the amount of $2,034,951 [$2,022,203 + $27,489 + 99 - $44,940 - $3,000 - $1,381,744 - $917,796 = $(297,690)].

Pro forma State income tax under existing rates in the amount of $(25,274) is determined by applying the Pennsylvania corporate net income tax rate of 8.49% to pro forma taxable income in the amount of $(297,690) [$(297,690) x 0.0849 = $(25,274)]. Pro forma Federal taxable income under existing rates in the amount of $(263,078) is determined by subtracting pro forma State income tax under existing rates in the amount

of $(25,274) and adding back state depreciation in excess of Federal depreciation of $9,339 [Refer to Exhibit No. HIV-17-3 (a)W] from pro forma taxable income in the amount of $(297,690) [$(297,690) – $(25,274) + 9,339 = $(263,078)]. Pro forma Federal income tax under existing rates in the amount of $(55,246) is determined by applying the presently effective Federal income tax rate of 21% to the pro forma Federal taxable income under existing rates in the amount of $(263,078) [$(263,078) x 0.21 = $(55,246)]. Total pro forma current income taxes under existing rates in the amount of $(80,520) is determined by adding pro forma state income tax under existing rates in the amount of $(25,274) and pro forma Federal income tax under existing rates in the amount of $(55,246) [$(25,274) + $(55,246) = $(80,520)]. The adjustment to income taxes in the amount of $(355,790) is determined by subtracting current income taxes recorded on the corporate books during the twelve months ended December 31, 2024, in the amount of $275,270 from total pro forma current income taxes under existing rates in the amount of $(80,520) [$(80,520) – $275,270 = $(355,790)]. The adjustment to income taxes at present rates in the amount of $(355,790) has been carried forward to Exhibit No. HIV-17W, Column 3.

Q. Explain Exhibit No. HIV-17-3W.

A. Exhibit No. HIV-17-3W provides provide information concerning income tax depreciation used to calculate current and deferred Federal Income Taxes for ratemaking purposes. To explain Exhibit HIV-17-3W, a general explanation of the tax depreciation methods used by York Water for various vintages of property is required.

For property placed in service beginning with calendar year 2012, the Company employs various methods of tax depreciation as permitted by law. Normalization of the tax

deferrals resulting from the use of these accelerated depreciation methods is required by the Internal Revenue Code.

If the Company is not permitted to recover revenues necessary to provide for normalization of the income tax effects of accelerated depreciation, the Company will not be permitted to deduct accelerated depreciation for Federal income tax purposes.

Tax depreciation by vintage year in the amount of $1,375,406 for property included in the measure of value is shown on Exhibit No. HIV-17-3W, Column 3.

Deferred taxes must be provided with the normalization requirements of Internal Revenue Code Sections 167 and 168. The amount of $1,375,406 is reduced by $1,328,583, which is the amount included for ratemaking purposes as depreciation to determine the difference of $46,823 to be used for calculating the deferred Federal income tax ($1,375,406 – $1,328,583 = $46,823). The Federal income tax rate of 21% is applied to the $46,823 to determine the deferred Federal income tax amount of $9,833 ($46,823 x 0.21). The adjustment to deferred Federal income tax expense in the amount of $(59,699) is determined by subtracting deferred Federal income tax recorded on the corporate books during the twelve months ended December 31, 2024, in the amount of $69,532 from the calculated deferred Federal income tax amount of $9,833 [$9,833 - $69,532 = $(59,699]. The adjustment to deferred Federal income tax in the amount of $(59,699) has been carried forward to Exhibit No. HIV-17W, Column 3.

Q. Explain Exhibit No. HIV-17-3(a)W.

A. Exhibit No. HIV-17-3(a)W is the calculation of the state tax decoupling from the Federal Special 30-Percent and 50 Percent Depreciation Allowance in accordance with Act 89 of 2002 signed into law June 29, 2002, and the Economic Growth and Tax Relief Reconciliation Act of 2001, the Job Creation and Worker Assistance Act of 2002, the Jobs and Growth Tax Relief Reconciliation Act of 2003, the Economic Stimulus Act of 2008, and the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010. These acts require corporate taxpayers who elected the Federal Special 30-Percent and 50 Percent Depreciation Allowance to make adjustments that eliminate the effect of the Federal Special 30-Percent and 50 Percent Depreciation Allowance in arriving at Pennsylvania taxable income. Because Act 89 of 2002 eliminated the effect of the first-year Federal bonus depreciation, additional State depreciation deductions are allowed in subsequent years.

The recovery of a portion of the bonus depreciation of $9,339 is carried forward to Exhibit No. HIV-17-2 as an adjustment to State Tax Depreciation.

The basis of property qualified for the additional first year depreciation allowance is reflected in Column 2 of Exhibit No. HIV-17-3 (a). Total Federal tax depreciation is shown in Column 3 of Exhibit No. HIV-17-3 (a). The adjustment for additional allowed state depreciation in lieu of the Federal special 30-percent and 50 percent depreciation is reflected in Column 6 and is determined by multiplying Federal depreciation (net of current year bonus depreciation) shown in Column 5 by 0.42857 (3/7). The factor of 0.42857 (3/7) is reflected in the Bureau of Corporation Taxes Adjustment for Bonus Depreciation (Form REV-784).

Q. Please explain Exhibit No. HIV-17-5W.

A. Exhibit No. HIV-17-5W is an adjustment to reflect increased Federal income tax and state income tax based on the calculated revenue increase using historic test year data.

The total calculated operating revenue increase using historic test year data in the amount of $3,928,397 (Refer to Exhibit No. HII-2W, Column 6) is reduced by the increase in pro forma expense for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Committee Assessment under calculated rates in the amount of $26,562 (Refer to Exhibit No. HIV-15-2W) to arrive at the net increase in taxable income subject to state income tax in the amount of $3,901,835 ($3,928,397 - $26,562 = $3,901,835). The state income tax rate of 8.49% is applied to the net increase in taxable income subject to state income tax in the amount of $3,901,835 to determine the increase of $331,266 in the state income tax as a result of the proposed revenue increase ($3,901,835 x 0.0849 = $331,266). The increase in the amount of $331,266 in the state income tax has been carried forward to Exhibit No. HIV-17W, Column 6.

The proposed revenue increase subject to state income tax of $3,901,835 is reduced further by the increase of $331,266 in state income tax to determine the proposed revenue increase in the amount of $3,570,569 subject to Federal income tax ($3,901,835 - $331,266 = $3,570,569). The presently effective Federal income tax rate of 21% is applied to determine the increase in the amount of $749,820 in the Federal income tax that results from the proposed revenue increase ($3,570,569 x 0.21), and this amount has been carried forward to Exhibit No. HIV-17W, Column 6.

Q. Explain Exhibit No. HIV-18W.

A. Exhibit No. HIV-18W provides an explanation of the debt interest expense utilized for the income tax calculation reflected on the Company's corporate books, as well as an explanation and the calculation of debt interest expense utilized for the income tax calculation on pro forma income for the twelve months ended December 31, 2024.

Debt interest expense utilized for the income tax calculation reflected on the Company's corporate books for the twelve months ended December 31, 2024, is actual debt expense incurred during that period for the combined water and wastewater company. Debt interest expense utilized for the income tax calculation on pro forma income for the twelve months ended December 31, 2024, is determined by reflecting the interest charges to ratepayers in the cost of capital determination (interest synchronization). Wastewater does not have its own capital structure, but rather that of the Company as a whole.

The original cost measure of value as of December 31, 2024 (Refer to Exhibit No. HV-1W, page 2) of $44,508,541 times the weighted debt cost rate of 2.06% equals the interest expense utilized for income tax calculation on pro forma income for the twelve months ended December 31, 2024, of $917,796 ($44,508,541 x 2.06% = $917,796).

Debt interest expense on pro forma income for the twelve months ended December 31, 2024, in the amount of $917,796 has been carried forward to Exhibit No. HIV-17-2W, which I explained previously.

Q. Explain Exhibit No. HV-1-1W.

A. Exhibit No. HV-1-1W is a summary, by year, of the unamortized balances of deferred income taxes related to wastewater accelerated depreciation and the unamortized balances of excess deferred income taxes related to wastewater accelerated depreciation that are deducted from the measure of value.

Page 1 of Exhibit No. HV-1-1W is a summary, by year, of the unamortized balance in the amount of $287,364, as of December 31, 2024, of deferred income taxes related to accelerated depreciation, that are deducted from the measure of value. Column 2 lists deferred federal income taxes resulting from accelerated depreciation from 2012 through 2024. The balance in Column 2 is $287,364.

The unamortized balance of deferred income taxes as of December 31, 2024, in the amount of $287,364 has been carried forward to Exhibit No. HV-1W, page 2 and has been deducted from the original cost measure of value.

Page 2 of Exhibit No. HV-1-1 is a summary, by year, of the unamortized balance in the amount of $0, as of December 31, 2024, of excess deferred income taxes related to accelerated depreciation, that are deducted from the measure of value. Column 2 lists, by year, excess deferred federal income taxes resulting from accelerated depreciation from 2012 through 2017. As of December 31, 2024, all excess deferred Federal income taxes had been reversed. The balance in Column 2 is $0.

The unamortized balance of excess deferred income taxes as of December 31, 2024, in the amount of $0 has been carried forward to Exhibit No. HV-1, page 2 and has been deducted from the original cost measure of value.

Q. Explain Exhibit No. HV-1-4W.

A. Exhibit No. HV-1-4W is a summary, by year, of the unamortized balance in the amount of $18,479, as of December 31, 2024, of taxes on deposits for construction and customer advances, that are added to the original measure of value. Column 2 lists, by year, taxes on deposits for construction and customer advances from 2018 through 2020. The balance in Column 2 is $18,479.

Under the Tax Cuts and Jobs Act of 2017, the definition of tax contributions in aid of construction was modified under Section 118(b) and the exclusion from gross income under Section 118(c) was repealed. The modification to the definition of taxable contribution in aid of construction includes contributions from customers as well as any payment received from a governmental or civic entity. Under the Company's approved tariff, the Company will pay income taxes on any deposit, Customer Advance, Contribution in Aid of Construction or other like amounts received from an applicant which shall constitute taxable income as defined by the Internal Revenue Service. Such income taxes shall be segregated in a deferred account for inclusion in rate base in a future rate case proceeding. Such income taxes associated with a deposit or advance will not be charged to the specific depositor of capital. This provision was rescinded under the Infrastructure Investment and Jobs Act of 2024.

The unamortized balance of taxes on deposits for construction and customer advances as of December 31, 2024, in the amount of $18,479 has been carried forward to Exhibit No. HV-1W, page 2 and has been included in the original cost measure of value.

Q. Explain Exhibit No. HVII-28W.

A. Exhibit No. HVII-28W shows the Company's short-term debt balance, the construction work in progress balance, and the balance of construction work in progress, which is eligible for Allowance for Funds Used During Construction ("AFUDC") for the most recent twenty-four months for combined water and wastewater.

Q. Does this conclude your historic test year direct testimony at this time?

A. Yes.

YORK WATER STATEMENT NO. 4W

BEFORE THE

PENNSYLVANIA PUBLIC UTILITY COMMISSION

THE YORK WATER COMPANY

DIRECT TESTIMONY OF DANIEL E. COPPERSMITH JR.

Q. State your name and business address.

A. Daniel E. Coppersmith Jr. My business address is: 130 East Market Street, York, Pennsylvania.

Q. By whom are you employed?

A. I am employed by The York Water Company ("York Water" or the "Company").

Q. State your present position with the Company and explain your duties and responsibilities.

A. I am the Finance Manager for the Company. My duties and responsibilities include preparing the operating budget, managing the Property Records Department, and filing data requirements with the Pennsylvania Public Utility Commission ("Commission").

Q. How long have you been employed by the Company?

A. I have been employed by the Company since June 19, 2007.

Q. What is your educational background?

A. I have a Bachelor's of Science Degree in Accounting from Central Penn College.

Q. Have you previously testified before a regulatory commission?

A. Yes, I have presented testimony to the Commission in the Company's last two rate cases.

Q. Will you list the exhibits you are sponsoring in this proceeding?

A. In addition to the exhibits identified in York Water Statement No. 4, I am sponsoring the following exhibits prepared by me or under my direction and supervision:

Exhibit No. HI-2-1W relating to depreciation expense included in the statement of operations for the wastewater division;

Exhibit Nos. HV-1W, HV-1-2W, and HV-1-3W relating to the original cost measure of value for the wastewater division; and

Exhibit Nos. HV-16W, HV-16-1W, and HV-16-2W relating to the original cost measure of value for the wastewater division.

Q. Explain Exhibit No. HI-2-1W.

A. Exhibit No. HI-2-1W adjusts the wastewater depreciation accrual from the historic test year level for the twelve months ended December 31, 2024, to the level determined in the depreciation study identified as Exhibit No. HVI-W. The adjustment in the amount of

$320,566 is determined by subtracting the booked depreciation accrual for the twelve months ended December 31, 2024, in the amount of $1,030,551 from the pro forma annual depreciation accrual in the amount of $1,351,117. The adjustment in the amount of $320,566 has been carried forward to Exhibit No. HI-2W, Column 3.

Q. Who will testify regarding the determination of the pro forma annual wastewater depreciation accrual for the twelve months ending December 31, 2024?

A. John J. Spanos, President, Depreciation and Valuation Studies, Gannett Fleming Valuation and Rate Consultants, Inc. will testify with respect to the pro forma depreciation accrual (see York Water Statement No. 106).

Q. Are you sponsoring any other exhibits regarding the Company's wastewater statement of operations?

A. No.

Q. Explain Exhibit No. HV-1W.

A. Exhibit No. HV-1W provides the wastewater original cost measure of value in the amount of $44,508,541 as of December 31, 2024, net operating income available and rate of return under existing rates for the twelve months ended December 31, 2024, net operating income and rate of return under existing rates after adjustments for ratemaking purposes ("pro forma") for the twelve months ended December 31, 2024, and net operating income and rate of return under proposed rates for the twelve months ended December 31, 2024. The original cost measure of value in the amount of $44,508,541 as of December 31, 2024, is shown on page 2 of Exhibit No. HV-1W.

The original cost of utility plant in service per books as of December 31, 2024, is $62,544,668, and the accrued depreciation as of December 31, 2024, is $13,836,432. The depreciated original cost of utility plant in service as of December 31, 2024, is $48,708,236 ($62,544,668 - $13,836,432 = $48,708,236). The details of original cost of utility plant in service and accrued depreciation by account, sub account and vintage are set forth in Exhibit No. HVI-W.

Q. Who will testify with respect to accrued depreciation in the amount of $13,836,432 as of December 31, 2024, related to wastewater utility plant in service?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Continue with your explanation of Exhibit No. HV-1W.

A. The unamortized balance, as of December 31, 2024, of deferred Federal income taxes related to accelerated depreciation in the amount of $287,364 is deducted from the original cost measure of value, and this amount is set forth in Exhibit No. HV-1-1W, which is explained in Mr. Poff's testimony (see York Water Statement No. 3W).

The unamortized balance, as of December 31, 2024, of excess deferred Federal income taxes related to accelerated depreciation in the amount of $0 is deducted from the original cost measure of value, and this amount is set forth in Exhibit No. HV-1-1W, which is explained in Mr. Poff's testimony (see York Water Statement No. 3W).

An amount of $4,103,008 representing contributions in aid of construction less accrued depreciation as of December 31, 2024, is deducted from the original cost measure of value. This amount consists of the original cost of contributions in aid of construction per books as of December 31, 2024, in the amount of $5,323,041 less accrued depreciation as of December 31, 2024, in the amount of $1,220,033 ($5,323,041 - $1,220,033 = $4,103,008). The details are shown by account, sub account and vintage in Exhibit No. HVI-W.

An amount of $75,663 for customers' advances for construction less projected accrued depreciation as of December 31, 2024, is deducted from the original cost measure of value. This component is comprised of the projected original cost of customers' advances for construction as of December 31, 2024, in the amount of $77,235 less projected accrued depreciation as of December 31, 2025, in the amount of $1,572 ($77,235 - $1,572 = $75,663). The details are shown by account, sub account, and vintage in Exhibit No. HVI-W.

Q. Who will testify with respect to the accrued depreciation related to contributions and advances?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Do the amounts set forth in Exhibit No. HV-1W for Contributions reflect any amounts related to income tax liabilities that the Company has incurred between January 1, 1987, and June 12, 1996, as a result of the TRA-86 requirement that Contributions and

Advances be taxed or has incurred between January 1, 2018, and December 31, 2020, as a result of the Tax Cuts and Jobs Act of 2017 requirement that Contributions and Advances be taxed?

A. No. Consistent with the Company's ratemaking and accounting procedure in effect at the time with regard to the income taxes on Contributions, the Company has made no adjustment to amounts recorded between January 1, 1987, and June 12, 1996, or between January 1, 2018, and December 31, 2023, for Contributions to reflect additional income taxes that were required to be paid with respect to receipt of such Contributions as a result of Section 824 of TRA-86 or the Tax Cuts and Jobs Act of 2017. Contributions received between January 1, 1987, and June 12, 1996, and between January 1, 2018, and December 31, 2023, are reflected in the utility plant accounts and in the accounts for Contributions, as shown in Exhibit No. HVI-W at the original cost of the facilities constructed with the Contribution or Advance, without consideration of the associated income tax liability incurred by the Company. Under federal tax law provisions in effect at the time, Contributions received subsequent to June 12, 1996, through December 31, 2017, were not taxed. Under federal tax law provisions currently in effect, Contributions received subsequent to December 31, 2020, are not taxed.

Q. Continue with your explanation of Exhibit No. HV-1W.

A. Unamortized utility plant adjustment for the Felton Borough and York Haven Borough wastewater acquisitions in the amount of $247,861 ($120,380 + $127,481) is included in the original cost measure of value. The details are set forth in Exhibits No. HV-1-2W and HV-1-3W, which I will explain later.

Taxes on deposits for construction and customer advances in the amount of $18,479 are included in the original cost measure of value. The details are set forth in Exhibit No. HV-1-4W, which is explained in Mr. Poff's testimony (see York Water Statement No. 3W).

There are no other components of the measure of value for the wastewater portion of the business. The wastewater portion of the business did not have its own materials and supplies inventory, nor did it have its own cash working capital calculation as of December 31, 2024.

Column 1 of page 3 of Exhibit No. HV-1W shows net operating income available for return under existing rates for the twelve months ended December 31, 2024, in the amount of $543,390 and the rate of return on the original cost measure of value as of December 31, 2024, of 1.22%. Column 3 of page 3 of Exhibit No. HV-1W shows the adjustments to net operating income in the amount of $201,568. These adjustments have been detailed in other exhibits that Mr. Poff addresses in his testimony (see York Water Statement Nos. 3W). Column 4 of page 3 of Exhibit No. HV-1W shows pro forma net operating income available for return under existing rates for the twelve months ended December 31, 2024, in the amount of $744,958 and the rate of return on the original cost of measure of value as of December 31, 2024, of 1.67%. Adjustments to pro forma net operating income for the twelve months ended December 31, 2024, related to the effect of proposed rates in the amount of $2,820,750 are shown in Column 6 of page 3 of Exhibit No. HV-1W. These adjustments have been detailed in other exhibits that Mr. Poff addresses in his testimony (see York Water Statement Nos. 3W). Column 7 of page 3 of

Exhibit No. HV-1W shows pro forma net operating income available for return for the twelve months ended December 31, 2024, in the amount of $3,565,707 and the rate of return on the original cost measure of value as of December 31, 2024, of 8.01%. The rate of return used for the wastewater portion of the business is identical to that used for the water portion of the business.

Q. Explain Exhibit No. HV-1-2W.

A. Exhibit No. HV-1-2W provides the calculation of the unamortized utility plant acquisition adjustment relative to the acquisition of Felton Borough wastewater assets as of December 31, 2024, in the amount of $120,380 included in the original cost measure of value.

Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code.

The unamortized acquisition adjustment of $120,380 is determined by subtracting one-half of the depreciated original cost of wastewater property acquired from Felton Borough of in the amount of $618,871 and the amortization from March 1, 2023, the effective date of rats under the Order issued in the Company's 2022 base rate proceeding (Docket No. R-2022-3031340), to December 31 2024 in the amount of $27,024 from one-half of Felton Borough acquisition costs of $913,679 [(($913,679 - $618,871) / 2) - $27,024 = $120,380].

Q. Explain Exhibit No. HV-1-3W.

A. Exhibit No. HV-1-3W provides the calculation of the acquisition adjustment subject to amortization relative to the acquisition of the York Haven Borough as of December 31, 2024, in the amount of $127,481 included in the original cost measure of value.

Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code. Please see the testimony of Mr. Hand (York Water Statement No. 1) for details on this acquisition.

The acquisition adjustment subject to amortization of $127,481 is determined by subtracting the depreciated original cost of waterworks property acquired from the York Haven Borough in the amount of $281,095 from the York Haven Borough acquisition costs of $408,576 ($408,576 - $281,095 = $127,481).

The Company is proposing amortization over a ten-year period in Exhibit No. HIII-2-4W.

Q. Are you sponsoring any other exhibits regarding the original cost measure of value?

A. No.

Q. Does this conclude your historic test year direct testimony at this time?

A. Yes.

YORK WATER STATEMENT NO. 103W

BEFORE THE

PENNSYLVANIA PUBLIC UTILITY COMMISSION

THE YORK WATER COMPANY

DIRECT TESTIMONY OF MATTHEW E. POFF

Q. State your name and business address.

A. Matthew E. Poff. My business address is: 130 East Market Street, York, Pennsylvania.

Q. By whom are you employed?

A. I am employed by The York Water Company ("York Water" or the "Company").

Q. State your present position with the Company and explain your duties and responsibilities.

A. I am Chief Financial Officer and Treasurer for the Company. My duties and responsibilities include managing the day-to-day financial transactions of the Company.

Q. How long have you been employed by the Company?

A. I have been employed by the Company since June 15, 2009.

Q. What is your educational background?

A. I have a Bachelor's Degree from the Pennsylvania State University, University Park, Pennsylvania and a Master's Degree in Business Administration from York College of Pennsylvania, York, Pennsylvania.

Q. Are you a certified public accountant?

A. Yes, I am a certified public accountant licensed by the Commonwealth of Pennsylvania.

Q. What has been your other business experience?

A. From September 2006 through June 2009, I was employed by I. B. Abel, Inc. in York, Pennsylvania as the Chief Financial Officer. In this capacity, I managed the day-to-day accounting and financial transactions of the Company.

From July 1995 through September 2006, I was employed by Beard Miller Company LLP (now Baker Tilly US, LLP) as a certified public accountant. In this capacity, I oversaw the audits and reviews and preparation of financial statements and tax returns for various business entities, both private and public companies of various sizes.

Q. Have you previously testified before a regulatory commission?

A. Yes, I have presented testimony to the Pennsylvania Public Utility Commission ("Commission") in the Company's last three rate cases.

Q. Will you list the exhibits you are sponsoring in this proceeding?

A. In addition to the exhibits identified in York Water Statement No. 103, I am sponsoring the following exhibits prepared by me or under my direction and supervision:

Exhibit Nos. FI-2W relating to the statement of operations for the wastewater division;

Exhibit Nos. F(a)-4W, FII-2W, FII-2-1W, FII-2-2W, FII-2-3W, FII-2-4W, FII-2-5W, FII-2-6W, FII-2-7W, FII-2-8W, FII-2-9W, FII-2-10W, FII-3W, FII-4W, FII-5W, FII-7W, FII-8W, and FII-9W relating to operating revenues for the wastewater division;

Exhibit Nos. FIII-2W, FIII-2-6W, FIII-2-13W, FIII-2-20W, and FIII-2-30W relating to operating expenses for the wastewater division;

Exhibit Nos. FIV-15W, FIV-15-1W, FIV-15-2W, FIV-15-3W, FIV-15-4W, and FIV-15-5W relating to taxes other than income taxes for the wastewater division;

Exhibit Nos. FIV-17W, FIV-17-2W, FIV-17-3W, FIV-17-3(a)W, FIV-17-4, FIV-17-5W, FIV-17-7W, FIV-17-8W, FIV-17-8(a)W, FIV-17-10W, FIV-17-11W, and FIV-18W relating to operating income taxes for the wastewater division;

Exhibit No. FV-1-1W and FV-1-4W relating to the original cost measure of value for the wastewater division; and

Exhibit Nos. F(b)-1W.

Q. Explain Exhibit No. FI-2W.

A. Exhibit No. FI-2W summarizes projections of income for the twelve months ending December 31, 2025 and February 28, 2027, and summarizes adjustments to such projected income to: (1) annualize and normalize the effect of changes occurring during the twelve months ending December 31, 2025, and February 28, 2027, and (2) reflect changes in operating revenues, Public Utility Commission, Consumer Advocate, Small Business Advocate, and Damage Prevention Control assessments, and income taxes due to the increase in operating revenues resulting from the proposed increase in rates.

Projected net income for the twelve months ending December 31, 2025, in the amount of $2,016,124 is shown in Column 4 of Exhibit No. FI-2W, page 2. I note that this amount reflects non-operating income and other income deductions not included in the calculation of net operating income for ratemaking purposes. In deriving the projected net operating income, I began with the pro forma net operating income at present rates for the twelve months ended December 31, 2024, in the amount of $744,958, which is shown in Column 1 of Exhibit No. FI-2W, page 2, and which is taken from Exhibit No. HI-2W. The net of all adjustments to revenues and expenses results in projected future test year level of income adjustments of $834,712 at present rates as shown in Column 3 of Exhibit No. FI-2W, page 2. These adjustments are detailed in other exhibits, which will be explained later. The net operating income of $1,579,669 represents net operating income for the projected future test year. It is necessary to adjust such net operating income to reflect and annualize various changes during the future test year to determine operating

income at the level of operations at the end of the test year at present rates to be used for ratemaking purposes.

Column 6 of Exhibit No. FI-2W, page 2 summarizes the pro forma adjustments to the projected future test year net operating income. Projected net operating income for the twelve months ending December 31, 2025, in the amount of $1,579,669 is shown in Column 4 of Exhibit No. FI-2W, page 2. Adjustments to operating income in the net amount of $64,058 to annualize and normalize the effect of changes during the twelve months ending December 31, 2025, are shown in Column 6 of Exhibit No. FI-2W, page 2. These adjustments are detailed in other exhibits, which will be explained by various witnesses. The net operating income of $1,643,727 represents net operating income for the pro forma future test year. The figures in Column 7 of page 2 of Exhibit No. FI-2W have been carried over to Column 1 of page 3 of Exhibit No. FI-2W.

In deriving the projected net operating income for the fully projected future test year, I began with the pro forma net operating income at present rates for the twelve months ended December 31, 2025, in the amount of $1,643,727, which is shown in Column 1 of Exhibit No. FI-2W, page 3. The net of all adjustments to revenues and expenses results in fully projected future test year income adjustments of $(176,630) at present rates as shown in Column 3 of Exhibit No. FI-2W, page 3. These adjustments are detailed in other exhibits, which will be explained by various witnesses. The net operating income of $1,467,097 represents net operating income for the fully projected future test year ending February 28, 2027. It is necessary to adjust such net operating income to reflect

and annualize various changes during the fully projected future test year to determine operating income at the level of operations at the end of the test year at present rates to be used for ratemaking purposes.

Column 6 of Exhibit No. FI-2W, page 3 summarizes the pro forma adjustments to the fully projected future test year net operating income. Projected net operating income for the twelve months ending February 28, 2027, in the amount of 1,467,097 is shown in Column 4 of Exhibit No. FI-2W, page 3. Adjustments to operating income in the net amount of $113,790, to annualize and normalize the effect of changes during the twelve months ending February 28, 2027, are shown in Column 6 of Exhibit No. FI-2W, page 3. These adjustments are detailed in other exhibits, which will be explained by various witnesses. The net operating income of $1,580,887 represents pro forma net operating income for the fully projected future test year. Column 7 figures have been carried over to Column 1 of Exhibit FI-2W, page 4.

Column 3 of Exhibit No. FI-2W page 4 provides a summary of the increases to net operating income under proposed base rates at the fully projected future test year level of operations. The net increase to net operating income at proposed rates would be $2,800,116 after reflecting increases in operating revenues, and related increase in Public Utility Commission, Consumer Advocate, Small Business Advocate, and Damage Prevention Control assessments and income taxes. These adjustments are shown in Column 3 of Exhibit No. FI-2W, page 4 and are detailed in other exhibits, which various witnesses will explain later. Pro forma net operating income for the twelve months

ending February 28, 2027, in the amount of $4,817,458 is shown in Column 4 of Exhibit No. FI-2W, page 4.

Q. Explain Exhibit No. FII-2W.

A. Exhibit No. FII-2W is to summarize projections of operating revenues under existing rates for the twelve months ending December 31, 2025, and February 28, 2027, and to summarize adjustments to such projected operating revenues to: (1) annualize the effect of changes occurring during the twelve months ending December 31, 2025, and February 28, 2027, under existing rates; (2) reflect the increase in operating revenues resulting from the proposed increase in rates; and (3) summarize the revenue requirement for wastewater after allocating a portion to water customers.

Projected operating revenues under existing rates for the twelve months ending December 31, 2025, in the amount of $8,028,446 are shown in Column 3 of Exhibit No. FII-2W, page 2. In deriving the projected operating revenues under existing rates, I began with the pro forma operating revenues at present rates for the twelve months ended December 31, 2024, in the amount of $7,835,820, which are shown in Column 1 of Exhibit No. FII-2W, page 2, and which are taken from Exhibit No. HII-2W. Adjustments to the pro forma historic test year operating revenues to project the future test year operating revenues under existing rates in the amount of $192,626 are shown in Column 2 of Exhibit No. FII-2W, page 2. These adjustments are detailed in Exhibit Nos. FII-2-1W through FII-2-2W, which I will explain later and are summarized in Exhibit No. FII-2W, page 3.

Exhibit No. FII-2, page 4 summarizes the pro forma adjustments to the projected future test year operating revenues. Projected operating revenues under existing rates for the twelve months ending December 31, 2025, in the amount of $8,028,446 are shown in Column 1 of Exhibit No. FII-2W, page 4. Adjustments to operating revenues under existing rates in the amount of $192,626 to annualize the effect of changes during the twelve months ending December 31, 2025, are shown in Column 2 of Exhibit No. FII-2W, page 4. These adjustments are detailed in Exhibit Nos. FII-2-3W through FII-2-4W, which I will explain later, and are summarized in Exhibit No. FII-2, page 5. Column 3 of Exhibit No. FII-2W, page 4 shows the pro forma operating revenues under existing rates of $8,221,073 for the twelve months ending December 31, 2025.

Projected operating revenues under existing rates for the twelve months ending February 28, 2027, in the amount of $8,477,908 are shown in Column 3 of Exhibit No. FII-2W, page 6. In deriving the projected operating revenues under existing rates, I began with the pro forma operating revenues at present rates for the twelve months ended December 31, 2025, in the amount of $8,221,073, which are shown in Column 1 of Exhibit No. FII-2W, page 6. Adjustments to the pro forma future test year operating revenues to project the fully projected future test year operating revenues under existing rates in the amount of $256,835 are shown in Column 2 of Exhibit No. FII-2W, page 6. These adjustments are detailed in Exhibit Nos. FII-2-5W through FII-2-8W, which I will explain later, and are summarized in Exhibit No. FII-2W, page 7.

Exhibit No. FII-2W, page 9 summarizes the pro forma adjustments to the fully projected future test year operating revenues. Projected operating revenues under existing rates for the twelve months ending February 28, 2027, in the amount of $8,477,908 are shown in Column 1 of Exhibit No. FII-2W, page 9. Adjustments to operating revenues under existing rates in the amount of $192,625 to annualize the effect of changes during the twelve months ending February 28, 2027, are shown in Column 2 of Exhibit No. FII-2W, page 9. These adjustments are detailed in Exhibit Nos. FII-2-9W through FII-2-10W, which I will explain later, and are summarized in Exhibit No. FII-2W, page 8.

Adjustments to operating revenues in the amount of $3,857,507, or 44.5% reflect the increase in operating revenues due to the application of proposed base rates set forth in Supplement No. 26 to Tariff Wastewater-Pa. P.U.C. No. 1 are shown on Column 6 of Exhibit No. FII-2W, page 9. Pro forma operating revenues under proposed rates for the twelve months ending February 28, 2027, in the amount of $12,528,041 are shown on Column 7 of Exhibit No. FII-2W, page 9.

Q. Explain Exhibit No. FII-2-1W.

A. Exhibit No. FII-2-1W projects operating revenues under existing rates for estimated metered residential wastewater customers connected and disconnected during the twelve months ending December 31, 2025. The projected net gain in number of metered residential wastewater customers during the twelve months ending December 31, 2025, is 326. This projection is based on the average net gain in metered residential wastewater customers for the year ended December 31, 2024. The projected net gain of metered

residential wastewater customers during the twelve months ending December 31, 2025, of 326 is multiplied by the annual average revenue per average metered residential wastewater customer during the historic test year ended December 31, 2024, of $1,054.88 to derive the annualized revenue adjustment of $343,891 (326 x $1,054.88).

In order to present the projected future test year metered sales to residential wastewater customers, it is necessary to determine the portion of the annualized revenue adjustment in the amount of $343,891 that will occur during the twelve months ending December 31, 2025. The projected net gain of metered residential wastewater customers for the twelve months ending December 31, 2025, is presumed to occur evenly throughout the future test year. Accordingly, one half (0.50) of the annualized revenue adjustment determined in this Exhibit is projected to occur during the twelve months ending December 31, 2025. The portion of the annualized revenue adjustment included in the twelve months ending December 31, 2025, or $171,945 ($343,891 x 0.50) has been carried forward to Exhibit No. FII-2W, page 3. The remainder of the annualized revenue adjustment is reflected on Exhibit No. FII-2-3W, which I will explain later.

Q. Explain Exhibit No. FII-2-2W.

A. Exhibit No. FII-2-2W projects operating revenues under existing rates for estimated metered commercial wastewater customers connected and disconnected during the twelve months ending December 31, 2025. The projected net gain in number of metered commercial wastewater customers during the twelve months ending December 31, 2025, is 12. This projection is based on the average net gain in metered commercial wastewater

customers for the year ended December 31, 2024. The projected net gain of metered commercial wastewater customers during the twelve months ending December 31, 2025, of 12 is multiplied by the annual average revenue per average metered commercial wastewater customer during the historic test year ended December 31, 2024, of $3,446.80 to derive the annualized revenue adjustment of $41,362 (12 x $3,446,80).

In order to present the projected future test year metered sales to commercial wastewater customers, it is necessary to determine the portion of the annualized revenue adjustment in the amount of $41,362 that will occur during the twelve months ending December 31, 2025. The projected net gain of metered commercial wastewater customers for the twelve months ending December 31, 2025, is presumed to occur evenly throughout the future test year. Accordingly, one half (0.50) of the annualized revenue adjustment determined in this Exhibit is projected to occur during the twelve months ending December 31, 2025. The portion of the annualized revenue adjustment included in the twelve months ending December 31, 2025, or $20,681 ($41,362 x 0.50) has been carried forward to Exhibit No. FII-2W, page 3. The remainder of the annualized revenue adjustment is reflected on Exhibit No. FII-2-4W, which I will explain later.

Q. Explain Exhibit No. FII-2-3W.

A. Exhibit No. FII-2-3W annualizes operating revenues for estimated metered residential wastewater customers connected and disconnected during the twelve months ending December 31, 2025. As explained previously, the Company projects a net gain of 326 in the number of metered residential wastewater customers during the twelve months ending

December 31, 2025. The projected net gain of metered residential wastewater customers during the twelve months ending December 31, 2025, of 326 is multiplied by the annual average revenue per average metered residential wastewater customer during the historic test year ended December 31, 2024, of $1,054.88 to derive the annualized revenue adjustment of $343,891 (326 x $1,054.88).

As explained previously with respect to Exhibit No. FII-2-1W, I have already reflected in projected future test year revenues that portion of the increased revenues from these 326 customers that are projected to be gained during the future test year ending December 31, 2025. That projected amount is $171,945, or one half of the annualized revenue adjustment of $343,891. The remaining half of the annualized revenue adjustment is reflected on Exhibit No. FII-2-3W as an annualization adjustment to the future test year projection. The remaining half of the annualized revenue adjustment of $171,945 has been carried forward to Exhibit No. FII-2W, page 5.

Q. Explain Exhibit No. FII-2-4W.

A. Exhibit No. FII-2-4W annualizes operating revenues for estimated metered commercial wastewater customers connected and disconnected during the twelve months ending December 31, 2025. As explained previously, the Company projects a net gain of 12 in the number of metered commercial wastewater customers during the twelve months ending December 31, 2025. The projected net gain of metered commercial wastewater customers during the twelve months ending December 31, 2025, of 12 is multiplied by the annual average revenue per average metered commercial wastewater customer during

the historic test year ended December 31, 2024, of $3,446.80 to derive the annualized revenue adjustment of $41,362 (7 x $3,446.80).

As explained previously with respect to Exhibit No. FII-2-2W, I have already reflected in projected future test year revenues that portion of the increased revenues from these 12 customers that are projected to be gained during the future test year ending December 31, 2025. That projected amount is $20,681, or one half of the annualized revenue adjustment of $41,362. The remaining half of the annualized revenue adjustment is reflected on Exhibit No. FII-2-4W as an annualization adjustment to the future test year projection. The remaining half of the annualized revenue adjustment of $20,681 has been carried forward to Exhibit No. FII-2W, page 5.

Q. Explain Exhibit No. FII-2-5W.

A. Exhibit No. FII-2-5W projects operating revenues for the estimated metered residential wastewater customers connected and disconnected during January and February 2026. Although these customers are projected to be added prior to the fully projected future test year, the revenues from these customers will be included in the revenues earned for the twelve months ending February 28, 2027, so it is appropriate to include these revenues.

As was the case for the twelve months ending December 31, 2025, the Company projects a net gain of 326 in the number of metered residential wastewater customers during the twelve months ending December 31, 2026. The projected net gain of metered residential wastewater customers during the twelve months ending December 31, 2026 of 326 is

divided by twelve and multiplied by two to yield the number of customers expected to be gained during the two-month period ending February 28, 2026, which is 54 (326 / 12 x 2). Next, the number of customers gained during the two-month period is multiplied by the annual average revenue per average metered residential wastewater customer during the future test year ended December 31, 2025, of $1,054.88 to derive the annualized revenue adjustment for residential wastewater customers of $57,315 (12 x $1,054.88).

The adjustment for the estimated residential wastewater customers to be added during January and February 2026, of $57,315 has been carried forward to Exhibit No. FII-2W, page 7.

Q. Explain Exhibit No. FII-2-6W.

A. Exhibit No. FII-2-6W projects operating revenues for the estimated metered commercial wastewater customers connected and disconnected during January and February 2026. Although these customers are projected to be added prior to the fully projected future test year, the revenues from these customers will be included in the revenues earned for the twelve months ending February 28, 2027, so it is appropriate to include these revenues.

As was the case for the twelve months ending December 31, 2025, the Company projects a net gain of 12 in the number of metered commercial wastewater customers during the twelve months ending December 31, 2026. The projected net gain of metered commercial wastewater customers during the twelve months ending December 31, 2026 of 12 is divided by twelve and multiplied by two to yield the number of customers

expected to be gained during the two-month period ending February 28, 2026, which is 2 (12/ 12 x 2). Next, the number of customers gained during the two-month period is multiplied by the annual average revenue per average metered commercial wastewater customer during the future test year ended December 31, 2025, of $3,446.80 to derive the annualized revenue adjustment for commercial wastewater customers of $6,894 (1 x $3,446.80).

The adjustment for the estimated commercial wastewater customers to be added during January and February 2026, of $6,894 has been carried forward to Exhibit No. FII-2W, page 7.

Q. Explain Exhibit No. FII-2-7W.

A. Exhibit No. FII-2-7W projects operating revenues under existing rates for estimated metered residential wastewater customers connected and disconnected during the twelve months ending February 28, 2027. The projected net gain in number of metered residential wastewater customers during the twelve months ending February 28, 2027, is 326. This projection is based on the average net gain in metered residential wastewater customers for the year ended December 31, 2024. The projected net gain of metered residential wastewater customers during the twelve months ending February 28, 2027, of 326 is multiplied by the annual average revenue per average metered residential wastewater customer during the historic test year ended December 31, 2024, of $1,054.88 to derive the annualized revenue adjustment of $343,891 (326 x $1,054.88).

In order to present the projected future test year metered sales to residential wastewater customers, it is necessary to determine the portion of the annualized revenue adjustment in the amount of $343,891 that will occur during the twelve months ending February 28, 2027. The projected net gain of metered residential wastewater customers for the twelve months ending February 28, 2027, is presumed to occur evenly throughout the future test year. Accordingly, one half (0.50) of the annualized revenue adjustment determined in this Exhibit is projected to occur during the twelve months ending February 28, 2027. The portion of the annualized revenue adjustment included in the twelve months ending February 28, 2027, or $171,945 ($343,891 x 0.50) has been carried forward to Exhibit No. FII-2W, page 7. The remainder of the annualized revenue adjustment is reflected on Exhibit No. FII-2-9W, which I will explain later.

Q. Explain Exhibit No. FII-2-8W.

A. Exhibit No. FII-2-8W projects operating revenues under existing rates for estimated metered commercial wastewater customers connected and disconnected during the twelve months ending February 28, 2027. The projected net gain in number of metered commercial wastewater customers during the twelve months ending February 28, 2027, is 12. This projection is based on the average net gain in metered commercial wastewater customers for the year ended December 31, 2024. The projected net gain of metered commercial wastewater customers during the twelve months ending February 28, 2027, of 12 is multiplied by the annual average revenue per average metered commercial wastewater customer during the historic test year ended December 31, 2024, of $3,446.80 to derive the annualized revenue adjustment of $41,362 (12 x $3,446.80).

In order to present the projected future test year metered sales to commercial wastewater customers, it is necessary to determine the portion of the annualized revenue adjustment in the amount of $41,362 that will occur during the twelve months ending February 28, 2027. The projected net gain of metered commercial wastewater customers for the twelve months ending February 28, 2027, is presumed to occur evenly throughout the future test year. Accordingly, one half (0.50) of the annualized revenue adjustment determined in this Exhibit is projected to occur during the twelve months ending February 28, 2027. The portion of the annualized revenue adjustment included in the twelve months ending February 28, 2027, or $20,681 ($41,362 x 0.50) has been carried forward to Exhibit No. FII-2W, page 7. The remainder of the annualized revenue adjustment is reflected on Exhibit No. FII-2-10W, which I will explain later.

Q. Explain Exhibit No. FII-2-9W.

A. Exhibit No. FII-2-9W annualizes operating revenues for estimated metered residential wastewater customers connected and disconnected during the twelve months ending February 28, 2027. As explained previously, the Company projects a net gain of 326 in the number of metered residential wastewater customers during the twelve months ending February 28, 2027. The projected net gain of metered residential wastewater customers during the twelve months ending February 28, 2027, of 326 is multiplied by the annual average revenue per average metered residential wastewater customer during the historic test year ended December 31, 2024, of $1,054.88 to derive the annualized revenue adjustment of $343,891 (326 x $1,054.88).

As explained previously with respect to Exhibit No. FII-2-7W, I have already reflected in projected future test year revenues that portion of the increased revenues from these 71 customers that are projected to be gained during the fully projected future test year ending February 28, 2027. That projected amount is $171,945, or one half of the annualized revenue adjustment of $343,891. The remaining half of the annualized revenue adjustment is reflected on Exhibit No. FII-2-3W as an annualization adjustment to the future test year projection. The remaining half of the annualized revenue adjustment of $171,945 has been carried forward to Exhibit No. FII-2W, page 8.

Q. Explain Exhibit No. FII-2-10W.

A. Exhibit No. FII-2-10W annualizes operating revenues for estimated metered commercial wastewater customers connected and disconnected during the twelve months ending February 28, 2027. As explained previously, the Company projects a net gain of 12 in the number of metered commercial wastewater customers during the twelve months ending February 28, 2027. The projected net gain of metered commercial wastewater customers during the twelve months ending February 28, 2027, of 12 is multiplied by the annual average revenue per average metered commercial wastewater customer during the historic test year ended December 31, 2024, of $3,446.80 to derive the annualized revenue adjustment of $41,362 (12 x $3,446.80).

As explained previously with respect to Exhibit No. FII-2-8W, I have already reflected in projected future test year revenues that portion of the increased revenues from these 7

customers that are projected to be gained during the fully projected future test year ending February 28, 2027. That projected amount is $20,681, or one half of the annualized revenue adjustment of $41,362. The remaining half of the annualized revenue adjustment is reflected on Exhibit No. FII-2-4W as an annualization adjustment to the future test year projection. The remaining half of the annualized revenue adjustment of $20,681 has been carried forward to Exhibit No. FII-2W, page 8.

Q. Explain Exhibit No. FII-3W.

A. Exhibit No. FII-3W provides a comparison of present and proposed base rates. The present base rates are those set forth in Supplement No. 20 to Wastewater-Pa P.U.C. No. 1 approved by the Commission March 1, 2023. The proposed base rates are set forth in Supplement No. 26 to Wastewater-Pa. P.U.C. No. 1. A copy of the Company's proposed tariff supplement is attached to Exhibit No. FII-3W.

Q. Explain Exhibit No. FII-4W.

A. Exhibit No. FII-4W provides a detailed customer analysis by customer classification. Pages 2 through 3 of Exhibit No. FII-4W provides the application of present metered base rates, which became effective March 1, 2023, to the pro forma customer analysis for the twelve months ending February 28, 2027.

Q. Explain Exhibit No. FII-9W.

A. Exhibit No. FII-9W, page 2 provides the number of customers by class as of December 31, 2022, 2023, and 2024 and the projected number of customers by class as of December

31, 2025, and as of February 28, 2027, February 29, 2028, and February 28, 2029. Page 3 of Exhibit No. FII-9W provides consumption by customer class for the twelve months ended December 31, 2022, 2023, and 2024 and the projected consumption by customer class for the twelve months ending December 31, 2025, and as of February 28, 2027, February 29, 2028, and February 28, 2029.

Q. Are you sponsoring any other exhibits relative to operating revenues?

A. Yes, I am also sponsoring Exhibit Nos. F(a)-4W, FII-5, FII-7 and FII-8.

Q. Explain Exhibit No. FIII-2W.

A. Exhibit No. FIII-2W summarizes adjustments to operating expenses for the twelve months ending December 31, 2025, annualizes and normalizes the effect of changes occurring during the twelve months ending December 31, 2025, summarizes adjustments to operating expenses for the twelve months ending February 28, 2027, and annualizes and normalizes the effect of changes occurring during the twelve months ending February 28, 2027, due to the increase in operating revenues resulting from the proposed increase in rates.

Pro forma operating expenses for the twelve months ended December 31, 2024, in the amount of $5,703,826 are shown in Column 1 of Exhibit FIII-2W page 3. Adjustments required to project operating expenses for the twelve months ending December 31, 2025 in the amount of $22,132 are shown in Column 3 of Exhibit FIII-2W, page 3, and are detailed in Exhibit Nos. FIII-2-1, FIII-2-12, and FIII-2-6W. Projected operating expenses

for the twelve months ending December 31, 2025, in the amount of $5,725,958 are shown in Column 4 of Exhibit FIII-2W, page 3.

Adjustments to operating expenses in the amount of $103,196 to annualize and normalize the effect of changes projected to occur during the twelve months ending December 31, 2025, are shown in Column 6 of Exhibit FIII-2W, page 3, and are detailed in Exhibit No. FIII-2-15 and FIII-2-13W. Pro forma operating expenses for the twelve months ending December 31, 2025, in the amount of $5,829,154 are shown in Column 7 of Exhibit FIII-2W, page 3 and are carried over to Column 1 of Exhibit No. FIII-2W, page 4.

Adjustments required to project operating expenses for the twelve months ending February 28, 2027, in the amount of $100,569 are shown in Column 3 of Exhibit FIII-2W, page 5, and are detailed in Exhibit Nos. FIII-2-25, FIII-2-37, and FIII-2-20W. Projected operating expenses for the twelve months ending February 28, 2027, in the amount of $5,929,723 are shown in Column 4 of Exhibit FIII-2W, page 5 and are carried over to Column 1 of Exhibit No. FIII-2W, page 6.

Adjustments to operating expenses in the amount of $35,624 to annualize and normalize the effect of changes projected to occur during the twelve months ending February 28, 2027, are shown in Column 3 of Exhibit FIII-2W, page 7, and are detailed in Exhibit No. FIII-2-40 and FIII-2-30W. Pro forma operating expenses for the twelve months ending February 28, 2027, in the amount of $5,965,347 are shown in Column 4 of Exhibit FIII-2W, page 7.

There are no projected adjustments to operating expenses due to the increase in operating revenues resulting from the proposed increase. Pro forma operating expenses for the twelve months ending February 28, 2027, in the amount of $5,965,347 are shown in Column 7 of Exhibit FIII-2W, page 7.

Q. Explain Exhibit No. FIII-2-6W.

A. Exhibit No. FIII-2-6W projects the allocations from water operations for the twelve months month ending December 31, 2025, based on the Company's current allocation methodology and projected expense adjustments to the accounts that are allocated. Various expenses that are for both the water and wastewater portions of the business are recorded on the water side of the business. At the end of each accounting period, a portion of those allocable expenses are recorded as a reduction to expense on the water side of the business and an addition to expense on the wastewater side of the business.

The allocable portion of indirect labor, indirect fringe benefits and operating expense to wastewater based on the projected balances of the accounts to be allocated for the twelve months ending December 31, 2025, is calculated to be $531,732. The payroll taxes and fringe benefits on the direct labor recorded on the wastewater side of the business is calculated to be $243,044. The adjustment of $(7,941) is determined by subtracting the allocation to wastewater for the twelve months ended December 31, 2024, of $782,717 by the calculated allocable portion of indirect labor, indirect fringe benefits and operating expense of $531,732 and calculated payroll taxes and fringe benefits on the direct labor of

$243,044 [$531,732 + $243,044 - $782,717 = $(7,941)]. The adjustment of allocations to wastewater for the twelve months ending December 31, 2025, of $(7,941) as an adjustment to Account No. 77580005 has been carried forward to Exhibit No. FIII-2W, Page 3, Column 3.

Q. Explain Exhibit No. FIII-2-13W.

A. Exhibit No. FIII-2-13W annualizes the allocations from water operations for the twelve months month ending December 31, 2025, based on the Company's current allocation methodology and pro forma expense adjustments to the accounts that are allocated. Various expenses that are for both the water and wastewater portions of the business are recorded on the water side of the business. At the end of each accounting period, a portion of those allocable expenses are recorded as a reduction to expense on the water side of the business and an addition to expense on the wastewater side of the business.

The allocable portion of indirect labor, indirect fringe benefits and operating expense to wastewater based on the pro forma balances of the accounts to be allocated for the twelve months ending December 31, 2025, is calculated to be $537,773. The payroll taxes and fringe benefits on the direct labor recorded on the wastewater side of the business is calculated to be $265,979. The adjustment of $28,975 is determined by subtracting the projected allocation to wastewater for the twelve months ended December 31, 2025, of $774,776 (see Exhibit No. FIII-2-6W) by the calculated allocable portion of indirect labor, indirect fringe benefits and operating expense of $537,773 and calculated payroll taxes and fringe benefits on the direct labor of $265,979 [$537,773 + $265,979 -

$774,776 = $28,975]. The adjustment of allocations to wastewater for the twelve months ending December 31, 2025, of $28,975 as an adjustment to Account No. 77580005 has been carried forward to Exhibit No. FIII-2W, Page 3, Column 6.

Q. Explain Exhibit No. FIII-2-20W.

A. Exhibit No. FIII-2-20W projects the allocations from water operations for the twelve months ending February 28, 2027, based on the Company's current allocation methodology and projected expense adjustments to the accounts that are allocated. Various expenses that are for both the water and wastewater portions of the business are recorded on the water side of the business. At the end of each accounting period, a portion of those allocable expenses are recorded as a reduction to expense on the water side of the business and an addition to expense on the wastewater side of the business.

The allocable portion of indirect labor, indirect fringe benefits, and operating expense to wastewater based on the projected balances of the accounts to be allocated for the twelve months ending February 28, 2027, is calculated to be $592,647. The payroll taxes and fringe benefits on the direct labor recorded on the wastewater side of the business is calculated to be $269,494. The adjustment of $58,390 is determined by subtracting the allocation to wastewater for the future test year ended December 31, 2025, of $803,751 (see Exhibit No. FIII-2-13W) by the calculated allocable portion of indirect labor, indirect fringe benefits, and operating expense of $592,647 and calculated payroll taxes and fringe benefits on the direct labor of $269,494 [$592,647 + $269,494 - $803,751 = $58,390]. The adjustment of allocations to wastewater for the twelve months ending February 28,

2027, of $58,390 as an adjustment to Account No. 77580005 has been carried forward to Exhibit No. FIII-2W, Page 5, Column 3.

Q. Explain Exhibit No. FIII-2-30W.

A. Exhibit No. FIII-2-30W annualizes the allocations from water operations for the twelve months month ending February 28, 2027, based on the Company's current allocation methodology and pro forma expense adjustments to the accounts that are allocated. Various expenses that are for both the water and wastewater portions of the business are recorded on the water side of the business. At the end of each accounting period, a portion of those allocable expenses is recorded as a reduction to expense on the water side of the business and an addition to expense on the wastewater side of the business.

The allocable portion of indirect labor, indirect fringe benefits, and operating expense to wastewater based on the pro forma balances of the accounts to be allocated for the twelve months ending February 28, 2027, is calculated to be $599,197. The payroll taxes and fringe benefits on the direct labor recorded on the wastewater side of the business is calculated to be $276,358. The adjustment of $13,413 is determined by subtracting the projected allocation to wastewater for the twelve months ended February 28, 2027, of $862,142 (see Exhibit No. FIII-2-20W) by the calculated allocable portion of indirect labor, indirect fringe benefits and operating expense of $599,197 and calculated payroll taxes and fringe benefits on the direct labor of $276,358 [$599,197 + $276,358 - $862,142 = $13,413]. The adjustment of allocations to wastewater for the twelve months

ending February 28, 2027, of $13,413 as an adjustment to Account No. 77580005 has been carried forward to Exhibit No. FIII-2, Page 7, Column 3.

Q. Explain Exhibit No. FIV-15W.

A. Exhibit No. FIV-15W summarizes projected and pro forma adjustments to operating taxes other than income taxes for the twelve months ending December 31, 2025, and February 28, 2027, for ratemaking purposes and to reflect additional operating taxes other than income taxes resulting from the proposed increase in operating revenues.

Pro forma operating taxes other than income taxes for the twelve months ended December 31, 2024, in the amount of $109,791 are shown in Column 1, Page 2 of Exhibit FIV-15W. Adjustments to operating taxes other than income taxes of $1,302 reflect the calculation of the projected level of taxes other than income taxes under existing rates for the twelve months ending December 31, 2025. Such adjustments are shown in Column 3, Page 2 of Exhibit No. FIV-15W and are detailed in Exhibit No. FIV-15-1W. Projected operating taxes other than income taxes for the twelve months ended December 31, 2025, in the amount of $111,094 are shown in Column 4, Page 2 of Exhibit FIV-15.

Adjustments to operating taxes other than income taxes of $1,302 reflect the calculation of the Pro Forma level of taxes other than income taxes under existing rates for the twelve months ending December 31, 2025. Such adjustments are shown in Column 6, Page 2 of Exhibit No. FIV-15W and are detailed in Exhibit Nos. FIV-15-2W. Pro Forma operating taxes other than income taxes for the twelve months ending December 31, 2025, in the

amount of $112,396 are shown in Column 7, Page 2 of Exhibit No. FIV-15W and are carried forward to Column 1 of Page 3 of Exhibit No. FIV-15W.

Projected adjustments to operating taxes other than income taxes of $1,737 are shown in Column 3, Page 3 of Exhibit No. FIV-15W and are detailed in Exhibit Nos. FIV-15-3W. Projected operating taxes other than income taxes for the twelve months ended February 28, 2027, in the amount of $114,133 are shown in Column 4, Page 3 of Exhibit FIV-15.

Adjustments to operating taxes other than income taxes of $1,302 reflect the calculation of the Pro Forma level of taxes other than income taxes under existing rates for the twelve months ending February 28, 2027. Such adjustments are shown in Column 6, Page 3 of Exhibit No. FIV-15W and are detailed in Exhibit Nos. FIV-15-4W. Pro forma operating taxes other than income taxes for the twelve months ending February 28, 2027, of $115,435 are shown in Column 7, Page 3 of Exhibit No. FIV-15W and are carried forward to Column 1 of Page 4 of Exhibit No. FIV-15W.

Adjustments to operating taxes other than income taxes amounting to $26,082 are made to reflect the increased operating taxes other than income taxes that result from the increase in operating revenues under proposed rates. These adjustments are shown in Column 3, Page 4 of Exhibit No. FIV-15W and are detailed in Exhibit No. FIV-15-5W. Pro Forma operating taxes other than income taxes under proposed rates for the twelve months ended February 28, 2027, in the amount of $141,518 are shown in Column 4, Page 4 of Exhibit FIV-15W.

Q. Explain Exhibit No. FIV-15-1W.

A. Exhibit No. FIV-15-1W is an adjustment to reflect the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment based on projected operating revenues under existing rates for twelve months ending December 31, 2025, and the 2024-2025 assessment factors. The currently-effective combined 2024-2025 assessment rate of 0.676148% for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment is applied to projected operating revenues at existing rates for twelve months ending December 31, 2025, in the amount of $8,005,147 (Refer to Exhibit No. FII-2W) to determine the projected combined assessment under existing rates for twelve months ended December 31, 2025, in the amount of $54,127 ($8,005,147 x 0.00676148). The adjustment in the amount of $1,302 is determined by subtracting the pro forma assessments for the twelve months ended December 31, 2024, of $52,842 (Refer to Exhibit No. HIV-15-1W) from the calculated projected amount of $54,127 [$54,127 - $52,824 = $1,302]. The adjustment in the amount of $1,302 has been carried forward to Exhibit No. FIV-15W, Page 2, Column 3.

Q. Explain Exhibit No. FIV-15-2W.

A. Exhibit No. FIV-15-2W is an adjustment to reflect the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment based on Pro Forma

operating revenues under existing rates for twelve months ending December 31, 2025, and the 2024-2025 assessment factors. The currently-effective combined 2024-2025 assessment rate of 0.676148% for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment is applied to Pro Forma operating revenues at existing rates for twelve months ending December 31, 2025, in the amount of $8,197,774 (Refer to Exhibit No. FII-2W) to determine the pro forma combined assessment under existing rates for twelve months ended December 31, 2025, in the amount of $55,429 ($8,197,774 x 0.00676148). The adjustment in the amount of $1,302 is determined by subtracting the projected year assessments for the twelve months ended December 31, 2025, of $54,127 (Refer to Exhibit No. FIV-15-1W) from the calculated pro forma amount of $55,429 ($55,429 - $54,127 = $1,302). The adjustment in the amount of $1,302 has been carried forward to Exhibit No. FIV-15W, Page 2, Column 6.

Q. Explain Exhibit No. FIV-15-3W.

A. Exhibit No. FIV-15-3W is an adjustment to reflect the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment based on projected operating revenues under existing rates for twelve months ending February 28, 2027, and the 2024-2025 assessment factors. The currently-effective combined 2024-2025 assessment rate of 0.676148% for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment is applied to projected operating revenues at existing rates

for twelve months ending February 28, 2027, in the amount of $8,454,609 (Refer to Exhibit No. FII-2W) to determine the projected combined assessment under existing rates for twelve months ended February 28, 2027, in the amount of $57,166 ($8,454,609 x 0.00676148). The adjustment in the amount of $1,737 is determined by subtracting the Pro Forma year assessments for the twelve months ending December 31, 2025, of $55,429 (Refer to Exhibit No. FIV-15-2W) from the calculated projected amount of $57,166 [$57,166 - $55,429 = $1,737]. The adjustment in the amount of $1,737 has been carried forward to Exhibit No. FIV-15W, Page 3, Column 3.

Q. Explain Exhibit No. FIV-15-4W.

A. Exhibit No. FIV-15-4W is an adjustment to reflect the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment based on Pro Forma operating revenues under existing rates for twelve months ending February 28, 2027, and the 2024-2025 assessment factors. The currently-effective combined 2024-2025 assessment rate of 0.676148% for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment is applied to Pro Forma operating revenues at existing rates for twelve months ending February 28, 2027, in the amount of $8,647,235 (Refer to Exhibit No. FII-2W) to determine the pro forma combined assessment under existing rates for twelve months ended February 28, 2027, in the amount of $58,468 ($8,647,235 x 0.00676148). The adjustment in the amount of $1,302 is determined by subtracting the projected year assessments for the twelve months ending February 28, 2027, of $57,166

(Refer to Exhibit No. FIV-15-3W) from the calculated Pro Forma amount of $58,468 ($58,468 - $57,166 = $1,302). The adjustment in the amount of $1,302 has been carried forward to Exhibit No. FIV-15, Page 3, Column 6.

Q. Explain Exhibit No. FIV-15-5W.

A. Exhibit No. FIV-15-5W is an adjustment to reflect the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment based on Pro Forma operating revenues under proposed rates for twelve months ending February 28, 2027, and the 2024-2025 assessment factors. The currently-effective combined 2024-2025 assessment rate of 0.676148% for the Commission's General Assessment, the Consumer Advocate's Assessment, the Small Business Advocate's Assessment, and the Damage Prevention Control Assessment is applied to Pro Forma operating revenues under proposed rates for twelve months ending February 28, 2027, in the amount of $12,504,742 (Refer to Exhibit No. FII-2W) to determine the Pro Forma combined assessment under proposed rates for twelve months ending February 28, 2027, in the amount of $84,551 ($12,504,742 x 0.00676148). The adjustment in the amount of $26,082 is determined by subtracting the Pro Forma year assessments under existing rates for the twelve months ending February 28, 2027, of $58,468 (Refer to Exhibit No. FIV-15-4W) from the calculated Pro Forma amount under proposed rates of $84,551 ($84,551 - $58,468 = $26,082). The adjustment in the amount of $26,082 has been carried forward to Exhibit No. FIV-15W, Page 4, Column 3.

Q. Explain Exhibit No. FIV-17W.

A. Exhibit No. FIV-17W is to summarize adjustments to operating income taxes for the twelve months ending December 31, 2025, and February 28, 2027, for ratemaking purposes and to reflect additional operating income taxes resulting from the proposed increase in operating revenues.

Pro forma operating income taxes for the twelve months ended December 31, 2024, in the amount of $(73,871) are shown in Column 1 of Page 1 of Exhibit FIV-17W. Projected adjustments to operating income taxes of $(891,713) are shown in Column 3 of Page 1 of Exhibit No. FIV-17W and are detailed in Exhibit Nos. FIV-17-2W through FIV-17-4W, which I will explain later. Pro forma adjustments to operating income taxes of $24,069 are shown in Column 6 of Page 1 of Exhibit No. FIV-17W and are detailed in Exhibit No. FIV-17-5W, which I will explain later. Pro forma operating income taxes for the twelve months ending December 31, 2025, in the amount of $(941,515) are shown in Column 7 of Page 1 of Exhibit No. FIV-17W and are carried forward to Column 1 of Page 2 of Exhibit No. FIV-17W. Projected adjustments to operating income taxes of $172,330 are shown in Column 3 of Page 2 of Exhibit No. FIV-17W and are detailed in Exhibit Nos. FIV-17-7W through FIV-17-9W, which I will explain later. Projected operating income taxes for the twelve months ending February 28, 2027, in the amount of $(769,185) are show in Column 4 of Page 2 of Exhibit No. FIV-17W and are carried forward to Column 1 of Page 3 of Exhibit No. FIV-17W. Pro forma adjustments to operating income taxes of $41,910 are shown in Column 3 of Page 3 of Exhibit No. FIV-17W and are detailed in Exhibit No. FIV-17-10W, which I will explain later.

Adjustments to operating income taxes amounting to $1,031,308 are to reflect the increased operating income taxes that will result from the increase in operating revenues under proposed rates, and these adjustments are shown in Column 6 of Page 3 of Exhibit No. FIV-17W and are detailed in Exhibit No. FIV-17-11W, which I will explain later.

Q. Explain Exhibit No. FIV-17-2W.

A. Exhibit No. FIV-17-2W is an adjustment to reflect projected current Federal income tax and projected current Pennsylvania corporate net income tax based on projected taxable income for the twelve months ending December 31, 2025, under existing rates at the currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.99%.

Total projected operating income before income taxes and excluding depreciation under existing rates for the twelve months ending December 31, 2025, in the amount of $2,191,395 is determined by subtracting projected operating expenses under existing rates in the amount of $5,725,958 (Refer to Exhibit No. FIII-2W, Page 3 of 7, Column 4) and projected operating taxes other than income taxes under existing rates in the amount of $111,094 (Refer to Exhibit No. FIV-15W, Page 2 of 4, Column 4) from projected operating revenues under existing rates in the amount of $8,028,446 (Refer to Exhibit No. FII-2W, Page 2 of 10) [$8,028,446 - $5,725,958 - $111,094 = $2,191,395]. To arrive at taxable income at present rates, amounts are added for Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99, and amounts are then deducted for tax repair expense in the amount of $2,926,659, cost of removal in the amount of

$255,075, state tax depreciation in the amount of $1,693,682 and pro forma interest expense deduction for ratemaking purposes in the amount of $1,027,888. Expenses of the Company's Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 are not allowed as a deduction for income tax purposes. Since this amount is included in operating expenses and deducted in arriving at the figure of $2,191,395, it must be added back in arriving at taxable income. Tax repair expense in the amount of $2,926,659 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $255,075 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. State tax depreciation in the amount of $1,693,682 is detailed on Exhibit No. FIV-17-3W and Exhibit No. FIV-17-3 (a)W. I note that the Federal tax depreciation is less than state tax depreciation, which I will explain later with respect to Exhibit No. FIV-17-3 (a)W. The projected interest expense deduction for ratemaking purposes in the amount of $1,027,888 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $49,847,442 x Weighted Debt Cost Rate of 2.06%).

Projected taxable income under existing rates in the amount of $(3,684,322) is determined by adding the expenses of the Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 and deducting tax repair expense in the amount of $2,926,659, cost of removal in the amount of $255,075, state tax depreciation in the amount of $1,693,682, and projected interest expense in the amount of $1,027,888 from

projected net operating income in the amount of $2,204,143 [$2,191,395 + $27,489 + $99 - $2,926,659 - $255,075 - $1,693,682 - $1,027,888 = $(3,684,322)].

Projected State income tax under existing rates in the amount of $(294,377) is determined by applying the Pennsylvania corporate net income tax rate of 7.99% to projected taxable income in the amount of $(3,684,322) [$(3,684,322) x 0.0799 = $(294,377)]. Projected Federal taxable income under existing rates in the amount of $(3,384,363) is determined by subtracting projected State income tax under existing rates in the amount of $(294,377) and adding back additional allowed State depreciation on bonus property of $5,581 from projected taxable income in the amount of $(3,684,322) [$(3,684,322) - $(294,377) + $5,581 = $(3,384,363)]. Projected Federal income tax under existing rates in the amount of $(710,716) is determined by applying the presently effective Federal income tax rate of 21% to the projected Federal taxable income under existing rates in the amount of $(3,384,363) [$(3,384,363) x 0.21 = $(710,716)]. Total projected current income taxes under existing rates in the amount of $(1,005,094) is determined by adding projected state income tax under existing rates in the amount of $(294,377) and projected Federal income tax under existing rates in the amount of $(710,716) [$(294,377) + $(710,716) = $(1,005,094)]. The adjustment to income taxes in the amount of $(924,573) is determined by subtracting total pro forma current income taxes under existing rates during the twelve months ended December 31, 2024, in the amount of $(80,520) (Refer to Exhibit No. FIV-17W) from total projected current income taxes under existing rates in the amount of $(1,005,094) [$(1,005,094) - $(80,520) = $(924,573)]. The adjustment

to income taxes at present rates in the amount of $(924,573) has been carried forward to Exhibit No. FIV-17W, Page 1, Column 3.

Q. Explain Exhibit No. FIV-17-3W.

A. Exhibit No. FIV-17-3W provides information concerning income tax depreciation used to calculate current and deferred Federal Income Taxes for ratemaking purposes for the future test year. In order to explain Exhibit FIV-17-3W, a general explanation of the tax depreciation methods used by York Water for various vintages of property is required.

For property placed in service beginning with calendar year 2012, the Company employs various methods of tax depreciation as permitted by law. Normalization of the tax deferrals resulting from the use of these accelerated depreciation methods is required by the Internal Revenue Code.

If the Company is not permitted to recover revenues necessary to provide for normalization of the income tax effects of accelerated depreciation, the Company will not be permitted to deduct accelerated depreciation for Federal income tax purposes.

Tax depreciation by vintage year in the amount of $1,688,100 for property included in the measure of value is shown on Exhibit No. FIV-17-3W, Column 3.

Deferred taxes must be provided with the normalization requirements of Internal Revenue Code Sections 167 and 168. The amount of $1,688,100 is reduced by

$1,499,962, which is the amount included for ratemaking purposes as depreciation in order to determine the difference of $188,138 to be used for calculating the deferred Federal income tax [$1,688,100 – $1,499,962 = $188,138]. The Federal income tax rate of 21% is applied to the difference of $188,138 to determine deferred Federal income tax in the amount of $39,509 [$188,138 x 0.21]. The adjustment to deferred Federal income tax expense in the amount of $29,676 is determined by subtracting deferred Federal income tax recorded on the corporate books during the twelve months ended December 31, 2024, in the amount of $9,833 from the calculated deferred Federal income tax in the amount of $39,509 [$39,509 - $9,833 = $29,676]. The adjustment to deferred Federal income tax in the amount of $29,676 has been carried forward to Exhibit No. FIV-17W, Column 3.

Q. Explain Exhibit No. FIV-17-3 (a)W.

A. Exhibit No. FIV-17-3 (a)W is the calculation of the state tax decoupling from the Federal Special 30-Percent and 50 Percent Depreciation Allowance for the twelve months ended December 31, 2025, in accordance with Act 89 of 2002 signed into law June 29, 2002, and the Economic Growth and Tax Relief Reconciliation Act of 2001, the Job Creation and Worker Assistance Act of 2002, the Jobs and Growth Tax Relief Reconciliation Act of 2003, the Economic Stimulus Act of 2008, and the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010. These acts require corporate taxpayers who elected the Federal Special 30-Percent and 50 Percent Depreciation Allowance to make adjustments, which eliminate the effect of the Federal Special 30-Percent and 50 Percent Depreciation Allowance in arriving at Pennsylvania taxable

income. Because Act 89 of 2002 eliminated the effect of the first-year Federal bonus depreciation, additional State depreciation deductions are allowed in subsequent years.

The recovery of a portion of the bonus depreciation of $5,581 is carried forward to Exhibit No. FIV-17-2W as an adjustment to State Tax Depreciation.

The basis of property qualified for the additional first year depreciation allowance is reflected in Column 2 of Exhibit No. FIV-17-3 (a)W. Total Federal tax depreciation is shown in Column 3 of Exhibit No. FIV-17-3 (a)W. The adjustment for additional allowed state depreciation in lieu of the Federal Special 30-percent and 50 percent depreciation is reflected in Column 6 and is determined by multiplying Federal depreciation (net of current year bonus depreciation) shown in Column 5 by 0.42857 (3/7). The factor of 0.42857 (3/7) is reflected in the Bureau of Corporation Taxes Adjustment for Bonus Depreciation (Form REV-784).

Q. Explain Exhibit No. FIV-17-4W.

A. Exhibit No. FIV-17-4W calculates the reversal of excess deferred Federal income taxes related to accelerated depreciation on property for the Future Test Year. Upon passage of the Tax Cuts and Jobs Act of 2017, the Company adjusted the balance of its deferred Federal income taxes related to accelerated depreciation on property to the newly enacted statutory Federal income tax rate of 21%. The difference between the existing balance of deferred Federal income taxes related to accelerated depreciation on property and the adjusted balance of deferred Federal income taxes related to accelerated depreciation on

property was recorded as a regulatory liability for the excess deferred Federal income taxes related to accelerated depreciation on property.

A reversal is recorded for the excess deferred Federal income taxes whose normalized depreciation exceeds tax depreciation, that is, the tax life of the property has reached what is commonly referred to as the "turnaround point." As of December 31, 2024, all excess deferred Federal income taxes had been reversed. An adjustment of the excess deferred Federal income taxes in the amount of $3,184 is equal to the excess deferred Federal income taxes recorded on the corporate books during the twelve months ended December 31, 2024, in the amount of $(3,184), from the calculated pro forma reversal of excess deferred Federal income taxes in the amount of $0 [$0 - $(3,184) = $3,184]. The adjustment of the reversal of deferred Federal income taxes in the amount of $3,184 has been carried forward to Exhibit FIV-17, Column 3.

Q. Explain Exhibit No. FIV-17-5W.

A. Exhibit No. FIV-17-5W is an adjustment to reflect pro forma current Federal income tax and pro forma current Pennsylvania corporate net income tax based on pro forma taxable income for the twelve months ending December 31, 2025, under existing rates at the currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.99%.

Total pro forma operating income before income taxes and excluding depreciation under existing rates for the twelve months ending December 31, 2025, in the amount of

$2,279,522 is determined by subtracting pro forma operating expenses under existing rates in the amount of $5,829,154 (Refer to Exhibit No. FIII-2W, Page 3 of 7, Column 7) and pro forma operating taxes other than income taxes under existing rates in the amount of $112,396 (Refer to Exhibit No. FIV-15W, Page 2 of 4, Column 7) from pro forma operating revenues under existing rates in the amount of $8,221,073 (Refer to Exhibit No. FII-2W, Page 2 of 2) [$8,221,073 - $5,829,154- $112,396 = $2,279,522]. To arrive at taxable income at present rates, amounts are added for Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99, and amounts are then deducted for deducted for tax repair expense in the amount of $2,926,659, cost of removal in the amount of $255,075, state tax depreciation in the amount of $1,693,682, and pro forma interest expense deduction for ratemaking purposes in the amount of $1,027,888. Expenses of the Company's Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 are not allowed as a deduction for income tax purposes. Since this amount is included in operating expenses and deducted in arriving at the figure of $2,292,270 it must be added back in arriving at taxable income. Tax repair expense in the amount of $2,926,659 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $255,075 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. State tax depreciation in the amount of $1,693,682 is detailed on Exhibit No. FIV-17-3W and Exhibit No. FIV-17-3 (a)W. I note that the Federal tax depreciation is less than state tax depreciation, as previously explained with respect to Exhibit No. FIV-17-3 (a)W. The projected interest expense deduction for ratemaking purposes in the amount of

$1,027,888 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $49,847,442 x Weighted Debt Cost Rate of 2.06%).

Pro forma taxable income under existing rates in the amount of $(3,596,194) is determined by adding the expenses of the Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 and deducting tax repair expense in the amount of $2,926,659, cost of removal in the amount of $255,075, state tax depreciation in the amount of $1,693,682, and projected interest expense in the amount of $1,027,888 from pro forma net operating income in the amount of $2,279,522 [$2,279,522 + $27,489 - +$99 - $2,926,659 - $255,075 - $1,693,682 - $1,027,888 = $(3,596,194)].

Pro forma State income tax under existing rates in the amount of $(287,336) is determined by applying the Pennsylvania corporate net income tax rate of 7.99% to pro forma taxable income in the amount of $(3,596,194) [$(3,596,194) x 0.0799 = $(287,336)]. Pro forma Federal taxable income under existing rates in the amount of $(3,303,277) is determined by subtracting pro forma State income tax under existing rates in the amount of $(287,336) and adding back additional allowed State depreciation on bonus property of $5,581 from pro forma taxable income in the amount of $(3,596,194) [$(3,596,194) – $(287,336) + $5,581 = $(3,303,277)]. Pro forma Federal income tax under existing rates in the amount of $(693,688) is determined by applying the presently effective Federal income tax rate of 21% to the pro forma Federal taxable income under existing rates in the amount of $(3,303,277) [$(3,303,277) x 0.21 = $(693,688)]. Total

pro forma current income taxes under existing rates in the amount of $(981,024) is determined by adding pro forma state income tax under existing rates in the amount of $(287,336) and pro forma Federal income tax under existing rates in the amount of $(693,688) [$(287,336) + $(693,688) = $(981,024)]. The adjustment to income taxes in the amount of $24,069 is determined by subtracting total projected current income taxes under existing rates during the twelve months ended December 31, 2025, in the amount of $(1,005,094) (Refer to Exhibit No. FIV-17-2W) from total pro forma current income taxes under existing rates in the amount of $(981,024) [$(981,024) – $(1,005,094) = $24,069]. The adjustment to income taxes at present rates in the amount of $24,069 has been carried forward to Exhibit No. FIV-17W, Page 1, Column 6.

Q. Explain Exhibit No. FIV-17-7W.

A. Exhibit No. FIV-17-7W is an adjustment to reflect projected current Federal income tax and projected current Pennsylvania corporate net income tax based on projected taxable income for the twelve months ending February 28, 2027, under existing rates at the currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.49%.

Total projected operating income before income taxes and excluding depreciation under existing rates for the twelve months ending February 28, 2027, in the amount of $2,434,052 is determined by subtracting projected operating expenses under existing rates in the amount of $5,929,723 (Refer to Exhibit No. FIII-2W, Page 5 of 7, Column 4) and projected operating taxes other than income taxes under existing rates in the amount

of $114,133 (Refer to Exhibit No. FIV-15, Page 3 of 4, Column 4) from projected operating revenues under existing rates in the amount of $8,477,908 (Refer to Exhibit No. FII-2W, Page 2 of 2) [$8,477,908 - $5,929,723 - $114,133 = $2,434,052]. To arrive at taxable income at present rates, amounts are added for Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99, and amounts are then deducted for deducted for tax repair expense in the amount of $2,460,000, cost of removal in the amount of $87,000, state tax depreciation in the amount of $1,754,550, and pro forma interest expense deduction for ratemaking purposes in the amount of $1,127,650. Expenses of the Company's Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 are not allowed as a deduction for income tax purposes. Since this amount is included in operating expenses and deducted in arriving at the figure of $2,446,800, it must be added back in arriving at taxable income. Tax repair expense in the amount of $2,460,000 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $87,000 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. State tax depreciation in the amount of $1,754,550 is detailed on Exhibit No. FIV-17-8W and Exhibit No. FIV-17-8 (a)W. I note that the state tax depreciation is greater than Federal tax depreciation, which I will explain later with respect to Exhibit No. FIV-17-8 (a)W. The projected interest expense deduction for ratemaking purposes in the amount of $1,127,650 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $54,685,381 x Weighted Debt Cost Rate of 2.06%).

Projected taxable income under existing rates in the amount of $(2,967,561) is determined by adding the expenses of the Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 and deducting tax repair expense in the amount of $2,460,000, cost of removal in the amount of $87,000, state tax depreciation in the amount of $1,754,550 and projected interest expense in the amount of $1,127,650 from pro forma net operating income in the amount of $2,434,052 [$2,434,052 + $27,489 + 99 - $2,460,000 - $87,000 - $1,754,550 - $1,127,650 = $(2,967,561)].

Projected State income tax under existing rates in the amount of $(222,270) is determined by applying the Pennsylvania corporate net income tax rate of 7.49% to projected taxable income in the amount of $(2,967,561) [$(2,967,561) x 0.0749 = $(222,270)]. Projected Federal taxable income under existing rates in the amount of $(2,739,707) is determined by subtracting projected State income tax under existing rates in the amount of $(222,270) and adding back additional allowed state depreciation on bonus property of $5,583 to projected taxable income in the amount of $(2,967,561) [$(2,967,561) – $(222,270) + $5,583 = $(2,739,707)]. Projected Federal income tax under existing rates in the amount of $(575,339) is determined by applying the presently effective Federal income tax rate of 21% to the projected Federal taxable income under existing rates in the amount of $(2,739,707) [$(2,739,707) x 0.21 = $(575,339)]. Total projected current income taxes under existing rates in the amount of $(797,609) is determined by adding projected state income tax under existing rates in the amount of $(222,270) and projected Federal income tax under existing rates in the amount of $(575,339) [$(222,270) +

$(575,339) = $(797,609)]. The adjustment to income taxes in the amount of $183,415 is determined by subtracting total pro forma current income taxes under existing rates during the twelve months ended December 31, 2025, in the amount of $(981,024) (Refer to Exhibit No. FIV-17-5W) from total projected current income taxes under existing rates in the amount of $(797,609) [$(797,609) – $(981,024) = $183,415]. The adjustment to income taxes at present rates in the amount of $183,415 has been carried forward to Exhibit No. FIV-17, Page 2, Column 3.

Q. Explain Exhibit No. FIV-17-8W.

A. Exhibit No. FIV-17-8W provides information concerning income tax depreciation used to calculate current and deferred Federal Income Taxes for ratemaking purposes for the fully projected future test year. A general explanation of the tax depreciation methods used by York Water for various vintages of property is required in order to fully understand Exhibit No. FIV-17-8W. That explanation was previously provided with respect to Exhibit No. FIV-17-3W.

Tax depreciation by vintage year in the amount of $1,748,967 for property included in the measure of value is shown on Exhibit No. FIV-17-3W, Column 3.

Deferred taxes must be provided with the normalization requirements of Internal Revenue Code Sections 167 and 168. The amount of $1,748,967 is reduced by $1,613,616, which is the amount included for ratemaking purposes as depreciation in order to determine the difference of $135,351 to be used for calculating the deferred

Federal income tax [$1,748,967 – $1,613,616 = $135,351]. The Federal income tax rate of 21% is applied to the difference of $135,351 to determine deferred Federal income tax in the amount of $28,424 [$135,351 x 0.21]. The adjustment to deferred Federal income tax expense in the amount of $(11,085) is determined by subtracting deferred Federal income tax recorded on the corporate books during the twelve months ended December 31, 2025, in the amount of $39,509 from the calculated deferred Federal income tax in the amount of $28,424 [$28,424 - $39,509 = $(11,085)]. The adjustment to deferred Federal income tax in the amount of $(11,085) has been carried forward to Exhibit No. FIV-17W, Column 3.

Q. Explain Exhibit No. FIV-17-8 (a)W.

A. Exhibit No. FIV-17-8 (a)W is the calculation of the state tax decoupling from the Federal Special 30-Percent and 50 Percent Depreciation Allowance for the projected period ending February 28, 2027, in accordance with Act 89 of 2002 signed into law June 29, 2002, and the Economic Growth and Tax Relief Reconciliation Act of 2001, the Job Creation and Worker Assistance Act of 2002, the Jobs and Growth Tax Relief Reconciliation Act of 2003, the Economic Stimulus Act of 2008, and the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010. These acts require corporate taxpayers who elected the Federal Special 30-Percent and 50 Percent Depreciation Allowance to make adjustments, which eliminate the effect of the Federal Special 30-Percent and 50 Percent Depreciation Allowance in arriving at Pennsylvania taxable income. Because Act 89 of 2002 eliminated the effect of the first-year Federal

bonus depreciation, additional State depreciation deductions are allowed in subsequent years.

The recovery of a portion of the bonus depreciation of $5,583 is carried forward to Exhibit No. FIV-17-5W as an adjustment to State Tax Depreciation.

The basis of property qualified for the additional first year depreciation allowance is reflected in Column 2 of Exhibit No. FIV-17-8 (a)W. Total Federal tax depreciation is shown in Column 3 of Exhibit No. FIV-17-8 (a)W. The adjustment for additional allowed state depreciation in lieu of the Federal special 30-percent and 50 percent depreciation is reflected in Column 6 and is determined by multiplying Federal depreciation (net of current year bonus depreciation) shown in Column 5 by 0.42857 (3/7). The factor of 0.42857 (3/7) is reflected in the Bureau of Corporation Taxes Adjustment for Bonus Depreciation (Form REV-784).

Q. Explain Exhibit No. FIV-17-10W.

A. Exhibit No. FIV-17-10W is an adjustment to reflect pro forma current Federal income tax and pro forma current Pennsylvania corporate net income tax based on pro forma taxable income for the twelve months ending February 28, 2027, under existing rates at the currently effective Federal income tax rate of 21% and at the Pennsylvania corporate net income tax rate of 7.49%.

Total pro forma operating income before income taxes and excluding depreciation under existing rates for the twelve months ending February 28, 2027, in the amount of $2,589,752 is determined by subtracting pro forma operating expenses under existing rates in the amount of $5,965,347 (Refer to Exhibit No. FIII-2W, Page 7 of 7, Column 7) and pro forma operating taxes other than income taxes under existing rates in the amount of $115,435 (Refer to Exhibit No. FIV-15W, Page 3 of 4, Column 7) from pro forma operating revenues under existing rates in the amount of $8,670,534 (Refer to Exhibit No. FII-2W, Page 2 of 2) [$8,670,534 - $5,965,347 - $115,435 = $2,589,752]. To arrive at taxable income at present rates, amounts are added for Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99, and amounts are then deducted for deducted for tax repair expense in the amount of $2,460,000, cost of removal in the amount of $87,000, state tax depreciation in the amount of $1,754,550, and pro forma interest expense deduction for ratemaking purposes in the amount of $1,127,650. Expenses of the Company's Amortization of Acquisition Adjustments of $27,489 and Nondeductible Meals of $99 are not allowed as a deduction for income tax purposes. Since this amount is included in operating expenses and deducted in arriving at the figure of $2,602,500, it must be added back in arriving at taxable income. Tax repair expense in the amount of $2,460,000 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. Cost of removal in the amount of $87,000 has been capitalized on the corporate books but is taken as a current deduction on the Company's Federal and State income tax returns. State tax depreciation in the amount of $1,754,550 is detailed on Exhibit No. 17-8W and Exhibit No. FIV-17-8 (a)W. I note that the state tax depreciation is greater than Federal

tax depreciation, which I explained previously with respect to Exhibit No. FIV-17-8 (a)W. The projected interest expense deduction for ratemaking purposes in the amount of $1,127,650 is determined by reflecting the interest charges to ratepayers in the cost of capital determination (Interest Synchronization) (Rate Base of $54,685,381 x Weighted Debt Cost Rate of 2.06%).

Pro forma taxable income under existing rates in the amount of $(2,811,861) is determined by adding the expenses of the Amortization of Acquisition Adjustments of $14,471 and Nondeductible Meals of $99 and deducting tax repair expense in the amount of $2,460,000, cost of removal in the amount of $87,000, state tax depreciation in the amount of $1,754,550, and projected interest expense in the amount of $1,127,650 from pro forma net operating income in the amount of $2,589,752 [$2,589,752 + $27,489 + 99 - $2,460,000 - $87,000 - $1,754,550 - $1,127,650 = $(2,811,861)].

Pro forma State income tax under existing rates in the amount of $(210,608) is determined by applying the Pennsylvania corporate net income tax rate of 7.49% to pro forma taxable income in the amount of $(2,811,861) [$(2,811,861) x 0.0749 = $(210,608)]. Pro forma Federal taxable income under existing rates in the amount of $(2,595,669) is determined by subtracting pro forma State income tax under existing rates in the amount of $(210,608) and adding back additional allowed state depreciation on bonus property of $5,583 to pro forma taxable income in the amount of $(2,811,861) [$(2,811,861) – $(210,608) + $5,583 = $(2,595,669)]. Pro forma Federal income tax under existing rates in the amount of $(545,091) is determined by applying the presently

effective Federal income tax rate of 21% to the pro forma Federal taxable income under existing rates in the amount of $(2,595,669) [$(2,595,669) x 0.21 = $(545,091)]. Total pro forma current income taxes under existing rates in the amount of ($755,699) is determined by adding pro forma state income tax under existing rates in the amount of $(210,608) and pro forma Federal income tax under existing rates in the amount of $(545,091) [$(210,608) + $(545,091) = $(755,699)]. The adjustment to income taxes in the amount of $41,910 is determined by subtracting total projected current income taxes under existing rates during the twelve months ending February 28, 2027, in the amount of $(797,609) (Refer to Exhibit No. FIV-17-7W) from total pro forma current income taxes under existing rates in the amount of $(755,699) [$(755,699) – $(797,609) = $41,910]. The adjustment to income taxes at present rates in the amount of $41,910 has been carried forward to Exhibit No. FIV-17W, Page 3, Column 3.

Q. Please explain Exhibit No. FIV-17-11W.

A. Exhibit No. FIV-17-11W is an adjustment to reflect increased Federal income tax and Pennsylvania corporate net income tax based on the proposed revenue increase resulting from proposed rates.

The total proposed increase in wastewater revenue in the amount of $3,857,507 (Refer to Exhibit No. FII-2W, page 2 of 2) is reduced by the increase in pro forma expense for the Public Utility Commission's general assessment, the Consumer Advocate's assessment, the Small Business Advocate's assessment, and the Damage Prevention Control assessment under proposed rates in the amount of $26,082 (Refer to Exhibit No. FIV-15-

3W) to arrive at the net increase in taxable income subject to Pennsylvania corporate net income tax in the amount of $3,831,425 ($3,857,507 - $26,082 = $3,831,425). The Pennsylvania corporate net income tax rate of 7.49% is applied to the net increase in taxable income subject to state income tax in the amount of $3,831,425 to determine the increase of $286,974 in the state income tax as a result of the proposed revenue increase ($3,831,425 x 0.0749 = $286,974). The increase in the amount of $286,974 in the state income tax has been carried forward to Exhibit No. FIV-17W, Page 3, Column 6.

The proposed revenue increase subject to state income tax of $3,831,425 is reduced further by the increase of $286,974 in the state income tax to determine the proposed revenue increase in the amount of $3,544,451 subject to Federal income tax ($3,544,451 - $286,974 = $3,544,451). The presently effective Federal income tax rate of 21% is applied to the net increase in taxable income subject to Federal income tax to determine the increase in the amount of $744,335 in the Federal income tax that results from the proposed revenue increase ($3,544,451 x 0.21 = $744,335), and this amount has been carried forward to Exhibit No. FIV-17W, Page 3, Column 6.

Q. Explain Exhibit No. FIV-18W.

A. Exhibit No. FIV-18W provides an explanation of the debt interest expense utilized for the income tax calculation on projected income for the twelve months ending December 31, 2025, and an explanation and the calculation of debt interest expense utilized for the income tax calculation on pro forma income for the twelve months ending December 31, 2025.

Debt interest expense utilized for the income tax calculation on projected and pro forma income for the twelve months ending December 31, 2025, is determined by reflecting the interest charges to ratepayers in the cost of capital determination (interest synchronization).

The original cost measure of value as of December 31, 2025 (Refer to Exhibit No. FV-1W, page 2) of $49,847,442 times the weighted debt cost rate of 2.06% (from Exhibit No. FVII) equals the interest expense utilized for income tax calculation on projected and pro forma income for the twelve months ending December 31, 2025, of $1,027,888.

Debt interest expense on projected and pro forma income for the twelve months ending December 31, 2025, in the amount of $1,027,888 has been carried forward to Exhibit Nos. FIV-17-2W and FIV-17-6W, which I explained previously.

Exhibit No. FIV-18W also provides an explanation of the debt interest expense utilized for the income tax calculation on projected income for the twelve months ending February 28, 2027, and an explanation and the calculation of debt interest expense utilized for the income tax calculation on pro forma income for the twelve months ending February 28, 2027.

Debt interest expense utilized for the income tax calculation on projected and pro forma income for the twelve months ending February 28, 2027, is determined by reflecting the

interest charges to ratepayers in the cost of capital determination (interest synchronization).

The original cost measure of value as of February 28, 2027 (Refer to Exhibit No. FV-1W, page 3) of $54,685,381 times the weighted debt cost rate of 2.06% (from Exhibit No. FVII) equals the interest expense utilized for income tax calculation on projected and pro forma income for the twelve months ending February 28, 2027, of $1,127,650.

Debt interest expense on projected and pro forma income for the twelve months ending February 28, 2027, in the amount of $1,127,650 has been carried forward to Exhibit Nos. FIV-17-7W and FIV-17-10W, which I explained previously.

Q. Explain Exhibit No. FV-1-1W.

A. Exhibit No. FV-1-1W is a summary, by year, of the projected unamortized balance of deferred income taxes related to accelerated depreciation and the unamortized balances of excess deferred income taxes related to accelerated depreciation, which is $0 as previously explained, that are deducted from the measure of value.

Page 1 of Exhibit No. FV-1-1W is a summary, by year, of the projected unamortized balance in the amount of $326,873 as of December 31, 2025, of deferred income taxes related to accelerated depreciation that are deducted from the measure of value. Column 2 lists, by year, deferred federal income taxes resulting from accelerated depreciation from 2012 through December 31, 2025. The balance in Column 2 is $326,873.

The projected unamortized balance of deferred income taxes as of December 31, 2025, in the amount of $326,873 has been carried forward to Exhibit FV-1W, page 2 and has been deducted from the original cost measure of value.

Page 2 of Exhibit No. FV-1-1W is a summary, by year, of the projected unamortized balance in the amount of $355,297 as of February 28, 2027, of deferred income taxes related to accelerated depreciation that are deducted from the measure of value. Column 2 lists, by year, deferred federal income taxes resulting from accelerated depreciation from 2012 through February 28, 2027. The balance in Column 2 is $355,297.

The projected unamortized balance of deferred income taxes as of February 28, 2027, in the amount of $355,297 has been carried forward to Exhibit FV-1W, page 3 and has been deducted from the original cost measure of value.

Page 3 of Exhibit No. FV-1-1W is a calculation of the adjustment to the deferred income taxes related to accelerated depreciation as required under Treasury Regulation 1.167(l)-1 of the Internal Revenue Code. Under the regulation, if a future period is used in determining the maximum amount of the reserve to be excluded from the rate base, the amount of the reserve is the amount of the reserve at the beginning of the period and a pro rata portion of the projected increase to the account during the period. The increase in deferred income taxes from February 28, 2026, to February 28, 2027, is $24,363, or a monthly increase of $2,030 as presented in Column 3. The regulation requires the pro

rata portion of the increase to be determined by multiplying the increase by a fraction of which the numerator is the number of days remaining in the period and the denominator is the total number of days in the period. Those fractions are presented in Column 4 and the pro rata portion of the increase is presented in Column 5. The deferred income taxes under this regulation are presented in Column 6 as the pro rata portion of the increase added to the deferred income taxes at the beginning of the period. The difference between the deferred income taxes per the corporate books and the deferred income taxes per this regulation is presented in Column 7. The difference as of February 28, 2027, in the amount of $(13,200) has been carried forward to Exhibit FV-1W, page 3 and has offset the projected unamortized balance of deferred income taxes as of February 28, 2027, in the amount of $355,297 presented on Page 2 of Exhibit No. FV-1-1W.

Q. Explain Exhibit No. FV-1-4W.

A. Exhibit No. FV-1-4W provides the calculation of the unamortized taxes on deposits for construction and customer advances as of December 31, 2025, in the amount of $17,725 and as of February 28, 2027, in the amount of $16,860, that are added to the original cost measure of value.

Under the Tax Cuts and Jobs Act of 2017, the definition of tax contributions in aid of construction was modified under Section 118(b) and the exclusion from gross income under Section 118(c) was repealed. The modification to the definition of taxable contribution in aid of construction includes contributions from customers as well as any payment received from a governmental or civic entity. Under the Company's approved

tariff, the Company paid income taxes on any deposit, Customer Advance, Contribution in Aid of Construction, or other like amounts received from an applicant that shall constitute taxable income as defined by the Internal Revenue Service. Such income taxes shall be segregated in a deferred account for inclusion in rate base in a future rate case proceeding. Such income taxes associated with a deposit or advance will not be charged to the specific depositor of capital. This provision was rescinded under the Infrastructure Investment and Jobs Act of 2024.

The Company paid taxes on deposits for construction and customer advances received during the period under which the deposits for construction and customer advances was taxable of $18,479 as of December 31, 2024.

The total income taxes on deposits for construction and customer advances as of December 31, 2024, of $18,479 is offset by the reduction of income taxes from the depreciation on the projects paid for with the deposits for construction and customer advances. The depreciation on the projects paid for with the deposits for construction and customer advances of $2,761 for the period ending December 31, 2025, is determined by applying the depreciation rate of 4% to the deposits for construction and customer advances. State income tax deduction in the amount of $221 is determined by applying the Pennsylvania corporate net income tax rate of 7.99% to the depreciation on the projects paid for with deposits for construction and customer advances of $2,761 ($2,761 x 0.0799 = $221). Federal income tax deduction in the amount of $533 is determined by subtracting State income tax deduction in the amount of $221 from the

depreciation on the projects paid for with deposits for construction and customer advances of $2,761 and applying the presently effective Federal income tax rate of 21% [($2,761 - $221) x 0.21 = $533]. Total income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending December 31, 2025, in the amount of $754 is determined by adding state income taxes in the amount of $221 and Federal income taxes in the amount of $533 [$221 + $533 = $754]. The net taxes on deposits for construction and customer advance as of December 31, 2025, of $17,725 is determined by subtracting the income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending December 31, 2025, in the amount of $754 from the income taxes on deposits for construction and customer advances as of December 31, 2024, in the amount of $18,479 ($18,479 - $754 = $17,725). The net taxes on deposits for construction and customer advance as of December 31, 2025, of $17,725 has been carried forward to Exhibit No. FV-1W, Page 2.

The total income taxes on deposits for construction and customer advances as of December 31, 2025 of $17,725, is offset by the reduction of income taxes from the depreciation on the projects paid for with the deposits for construction and customer advances. The depreciation on the projects paid for with the deposits for construction and customer advances of $3,221 for the period ending February 28, 2027, is determined by applying the depreciation rate of 4% to the deposits for construction and customer advances. State income tax deduction in the amount of $239 is determined by applying the weighted average Pennsylvania corporate net income tax rate of 7.42% to the

depreciation on the projects paid for with deposits for construction and customer advances of $3,221 ($3,221 x 0.0742 = $239). Federal income tax deduction in the amount of $626 is determined by subtracting State income tax deduction in the amount of $239 from the depreciation on the projects paid for with deposits for construction and customer advances of $3,221 and applying the presently effective Federal income tax rate of 21% [($3,221 - $239) x 0.21 = $626]. Total income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending December 31, 2025, in the amount of $865 is determined by adding state income taxes in the amount of $239 and Federal income taxes in the amount of $626 [$239 + $626 = $865]. The net taxes on deposits for construction and customer advance as of February 28, 2027, of $16,860 is determined by subtracting the income tax deductions on depreciation on the projects paid for with deposits for construction and customer advances for the period ending February 28, 2027, in the amount of $865 from the income taxes on deposits for construction and customer advances as of December 31, 2025, in the amount of $19,145 ($17,725 - $865 = $16,860). The net taxes on deposits for construction and customer advance as of February 28, 2027, of $16,860 has been carried forward to Exhibit No. FV-1W, Page 3.

Q. Are you sponsoring any other exhibits?

A. Yes, I am also sponsoring Exhibit No. F(b)-1W.

Q. Does this conclude your future test year and fully projected future test year direct testimony at this time?

A. Yes.

YORK WATER STATEMENT NO. 104W

BEFORE THE

PENNSYLVANIA PUBLIC UTILITY COMMISSION

THE YORK WATER COMPANY

DIRECT TESTIMONY OF DANIEL E. COPPERSMITH JR.

Q. State your name and business address.

A. Daniel E. Coppersmith Jr. My business address is: 130 East Market Street, York, Pennsylvania.

Q. By whom are you employed?

A. I am employed by The York Water Company (the “Company”).

Q. State your present position with the Company and explain your duties and responsibilities.

A. I am the Finance Manager for the Company. My duties and responsibilities include preparing the operating budget, managing the Property Records Department, and filing data requirements with the Pennsylvania Public Utility Commission (the "Commission").

Q. How long have you been employed by the Company?

A. I have been employed by the Company since June 19, 2007.

Q. What is your educational background?

A. I have a Bachelor's of Science Degree in Accounting from Central Penn College.

Q. Have you previously testified before a regulatory commission?

A. Yes, I have presented testimony to the Pennsylvania Public Utility Commission ("Commission") in the Company's last two rate cases.

Q. Will you list the exhibits you are sponsoring in this proceeding?

A. In addition to the exhibits identified in York Water Statement No. 104, I am sponsoring the following exhibits prepared by me or under my direction and supervision:

Exhibit Nos. FI-2-1W and FI-2-2W relating to depreciation expense included in the statement of operations for the wastewater division; and

Exhibit Nos. FV-1W, FV-1-2W, FV-1-3W, FV-16-1W, FV-16-2W, FIV-16-3W, and FV-16-4W relating to the original cost measure of value for the wastewater division.

Q. Explain Exhibit No. FI-2-1W.

A. Exhibit No. FI-2-1W adjusts the depreciation accrual from the Pro Forma level reflected on the corporate books for the twelve months ended December 31, 2024, to the Pro Forma level determined in the depreciation study identified as Exhibit No. FVI-WA for the twelve-month period ending December 31, 2025. The adjustment in the amount of $226,193 is determined by subtracting the Pro Forma depreciation accrual for the twelve

months ended December 31, 2024, in the amount of $1,351,117 from the projected annual depreciation accrual in the amount of $1,577,310. The adjustment in the amount of $226,193 has been carried forward to Exhibit No. FI-2W page 2, Column 3.

Q. Explain Exhibit No. FI-2-2W.

A. Exhibit No. FI-2-2W adjusts the depreciation accrual from the Pro Forma level reflected for the twelve months ending December 31, 2025, to the Pro Forma level determined in the depreciation study identified as Exhibit No. FVI-WB for the twelve-month period ending February 28, 2027. The adjustment in the amount of $158,830 is determined by subtracting the Pro Forma depreciation accrual for the twelve months ending December 31, 2025, in the amount of $1,577,310 from the projected annual depreciation accrual in the amount of $1,736,140. The adjustment in the amount of $158,830 has been carried forward to Exhibit No. FI-2W, page 3, Column 3.

Q. Who will testify with respect to pro forma annual depreciation expense for the Future Test Year and the Fully Projected Future Test Year?

A. John J. Spanos will testify with respect to annual depreciation expense (see York Water Statement No. 106).

Q. Are you sponsoring any other exhibits regarding the Company's statement of operations?

A. No.

Q. Explain Exhibit No. FV-1W.

A. Exhibit No. FV-1W provides a summary of the components of the original cost measure of value in the amount of $49,847,442 as of December 31, 2025, and $54,685,381 as of February 28, 2027, pro forma net operating income available and rate of return under existing rates for the twelve months ended December 31, 2024, projected net operating income and rate of return under existing rates for the twelve months ending December 31, 2025, and February 28, 2027, net operating income and rate of return under existing rates after adjustments for ratemaking purposes ("pro forma") for the twelve months ending December 31, 2025, and February 28, 2027, and net operating income and rate of return under proposed rates for the twelve months ending February 28, 2027.

A summary of the components of the original cost measure of value in the amount of $49,847,442 as of December 31, 2025, is shown on page 2 of Exhibit No. FV-1W.

One component is the projected utility plant in service less projected book accrued depreciation as of December 31, 2025. The projected original cost of utility plant in service as of December 31, 2025, is $69,086,670, and the projected accrued depreciation as of December 31, 2025, is $15,110,041. The projected depreciated original cost of utility plant in service as of December 31, 2025, is $53,976,630 ($69,086,670-$15,110,041 = $53,976,630). The details of projected original cost of utility plant in service and projected accrued depreciation by account, sub account, and vintage are set forth in Exhibit No. FVI-WA.

Q. Who will testify with respect to projected accrued depreciation in the amount of $15,110,041 as of December 31, 2025, related to utility plant in service?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Will you continue with your explanation of page 2 of Exhibit No. FV-1W?

A. The projected unamortized balance as of December 31, 2025, of deferred Federal income taxes related to accelerated depreciation in the amount of $326,873 is deducted from the original cost measure of value, and this amount is set forth in Exhibit No. FV-1-1W, page 1, which Mr. Poff addresses in his testimony (see York Water Statement No. 103W).

An amount of $3,979,080 representing contributions in aid of construction less accrued depreciation as of December 31, 2025, is deducted from the original cost measure of value. This amount consists of the original cost of contributions in aid of construction per books as of December 31, 2025, in the amount of $5,323,041 less accrued depreciation as of December 31, 2025, in the amount of $1,343,961 ($5,323,041 - $1,343,961 = $3,979,080). The details are shown by account, sub account, and vintage in Exhibit No. FVI-WA.

An amount of $74,080 for customers' advances for construction less projected accrued depreciation as of December 31, 2025, is deducted from the original cost measure of value. This component is comprised of the projected original cost of customers' advances for construction as of December 31, 2025, in the amount of $77,235 less projected accrued depreciation as of December 31, 2025, in the amount of $3,155 ($77,235 - $3,155 = $74,080). The details are shown by account, sub account, and vintage in Exhibit No. FVI-A.

Q. Who will testify with respect to the accrued depreciation related to contributions and advances?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Do the amounts set forth in Exhibit No. FV-1W for Contributions as of December 31, 2025, reflect any amounts related to income tax liabilities that the Company has incurred between January 1, 1987, and June 12, 1996, as a result of the TRA-86 requirement that Contributions and Advances be taxed or has incurred between January 1, 2018, and December 31, 2020, as a result of the Tax Cuts and Jobs Act of 2017 requirement that Contributions and Advances be taxed?

A. No. Consistent with the Company's ratemaking and accounting procedure in effect at the time with regard to the income taxes on Contributions and Advances, the Company has made no adjustment to amounts recorded between January 1, 1987, and June 12, 1996, or between January 1, 2018, and December 31, 2020, for Contributions to reflect additional income taxes that were required to be paid with respect to receipt of such Contributions as a result of Section 824 of TRA-86 or the Tax Cuts and Jobs Act of 2017. Contributions received between January 1, 1987, and June 12, 1996, or between January 1, 2018, and December 31, 2020, are reflected in the utility plant accounts and in the accounts for Contributions, as shown in Exhibit No. FVI-WA at the original cost of the facilities constructed with the Contribution, without consideration of the associated income tax liability incurred by the Company. Under federal tax law provisions in effect at the time, Contributions and Advances received subsequent to June 12, 1996, through December 31,

2017, were not taxed. Under federal tax law provisions currently in effect, Contributions and Advances received subsequent to December 31, 2020, are not taxed.

Q. Continue with your explanation of Exhibit No. FV-1W.

A. Unamortized utility plant adjustment for the Felton Borough and York Haven Borough wastewater acquisitions in the amount of $233,121 ($105,640 + $127,481) is included in the original cost measure of value. The details are set forth in Exhibits No. FV-1-2W and FV-1-3W, which I will explain later.

Taxes on deposits for construction and customer Advances in the amount of $17,725 are included in the original cost measure of value. The details are set forth in Exhibit No. FV-1-4W, which Mr. Poff addresses in his testimony (see York Water Statement No. 103W).

A summary of the components of the original cost measure of value in the amount of $54,685,381 as of February 28, 2027, is shown on page 3 of Exhibit No. FV-1W.

One component is the projected utility plant in service less projected book accrued depreciation as of February 28, 2027. The projected original cost of utility plant in service as of February 28, 2027, is $75,477,763, and the projected accrued depreciation as of February 28, 2027, is $16,740,738. The projected depreciated original cost of utility plant in service as of February 28, 2027, is $58,737,025 ($75,477,763 - $16,740,738 = $58,737,025). The details of projected original cost of utility plant in service and

projected accrued depreciation by account, sub account, and vintage are set forth in Exhibit No. FVI-WB.

Q. Who will testify with respect to projected accrued depreciation in the amount of $16,740,738 as of February 28, 2027, related to utility plant in service?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Will you continue with your explanation of page 3 of Exhibit No. FV-1W?

A. The projected unamortized balance as of February 28, 2027, of deferred Federal income taxes related to accelerated depreciation in the amount of $342,097 is deducted from the original cost measure of value, and this net amount is set forth in Exhibit No. FV-1-1W, pages 2 and 3, which Mr. Poff addresses in his testimony (see York Water Statement No. 103W).

An amount of $3,854,883 representing projected contributions in aid of construction less accrued depreciation as of February 28, 2027, is deducted from the original cost measure of value. This amount consists of the projected original cost of contributions in aid of construction as of February 28, 2027, in the amount of $5,232,041 less projected accrued depreciation as of February 28, 2027, in the amount of $1,468,158 ($5,343,041 - $1,468,158 = $3,854,883). The details are shown by account, sub account, and vintage in Exhibit No. FVI-WB.

An amount of $72,574 for customers' advances for construction less projected accrued depreciation as of February 28, 2027, is deducted from the original cost measure of value. This component is comprised of the projected original cost of customers' advances for construction as of February 28, 2027, in the amount of $77,235 less projected accrued depreciation as of February 28, 2027, in the amount of $4,661 ($77,235 - $4,661 = $72,574). The details are shown by account, sub account, and vintage in Exhibit No. FVI-A.

Q. Who will testify with respect to the projected accrued depreciation related to contributions and advances?

A. John J. Spanos will testify with respect to accrued depreciation (see York Water Statement No. 106).

Q. Do the amounts set forth in Exhibit No. FV-1W for Contributions as of February 28, 2027, reflect any amounts related to income tax liabilities that the Company has incurred between January 1, 1987, and June 12, 1996, as a result of the TRA-86 requirement that Contributions and Advances be taxed or has incurred between January 1, 2018, and December 31, 2020, as a result of the Tax Cuts and Jobs Act of 2017 requirement that Contributions and Advances be taxed?

A. No.

Q. Will you continue with your explanation of page 3 of Exhibit No. FV-1W?

A. Unamortized utility plant adjustment for the Felton Borough and York Haven Borough wastewater acquisitions in the amount of $201,051 ($88,442 + $112,608) is included in

the original cost measure of value. The details are set forth in Exhibits No. FV-1-2W and FV-1-3W, which I will explain later.

Taxes on deposits for construction and customer advances in the amount of $16,860 are included in the original cost measure of value. The details are set forth in Exhibit No. FV-1-3W, which Mr. Poff addresses in his testimony (see York Water Statement No. 103W).

Column 1 of page 4 of Exhibit No. FV-1W shows pro forma net operating income available for return under existing rates for the twelve months ended December 31, 2024, in the amount of $744,958 and the rate of return on the original cost measure of value as of February 28, 2027, of 1.36%. Column 3 of page 4 of Exhibit No. FV-1W shows the adjustments to determine projected net operating income for the twelve months ending December 31, 2025, in the amount of $834,712. These adjustments have been detailed in other exhibits that Mr. Poff addresses in his testimony (see York Water Statement No. 103W). Projected net operating income available for return under existing rates for twelve months ending December 31, 2025, in the amount of $1,579,669 and the rate of return on the original cost measure of value as of February 28, 2027, of 2.89% are shown in Column 4 of page 4 of Exhibit No. FV-1W. Column 6 of page 4 of Exhibit No. FV-1W shows the adjustments to determine pro forma net operating income for the twelve months ending December 31, 2025, in the amount of $64,058. These adjustments have been detailed in other exhibits that Mr. Poff addresses in his testimony (see York Water Statement No. 103W). Pro forma net operating income available for return under existing rates for twelve months ending December 31, 2025, in the amount of $1,643,727 and the

rate of return on the original cost measure of value as of February 28, 2027, of 3.01% are shown in Column 7 of page 4 of Exhibit No. FV-1W and are carried forward to Column 1, page 5 of Exhibit No. FV-1W.

Column 3 of page 5 of Exhibit No. FV-1W shows the adjustments to determine projected net operating income for the twelve months ending February 28, 2027, in the amount of $(176,630). These adjustments have been detailed in other exhibits that Mr. Poff addresses in his testimony (see York Water Statement No. 103W). Projected net operating income available for return under existing rates for twelve months ending February 28, 2027, in the amount of $1,467,097 and the rate of return on the original cost measure of value as of February 28, 2027, of 2.68% are shown in Column 4 of page 5 of Exhibit No. FV-1W. Pro forma adjustments to net operating income available for return in the amount of $113,790 are shown in Column 6, page 5 of Exhibit No. FV-1W. These adjustments have been detailed in other exhibits that Mr. Poff addresses in his testimony (see York Water Statement No. 103W). Column 7, page 5 of Exhibit No. FV-1W shows pro forma net operating income available for return for the twelve months ending February 28, 2027, under existing rates of $1,580,887 and the rate of return on the original cost measure of value as of February 28, 2027, of 2.89%. The Column 7 figures are carried forward to Column 1, page 6 of Exhibit No. FV-1W.

Adjustments to pro forma net operating income available for return for the twelve months ending February 28, 2027, related to the effect of proposed rates in the amount of $2,800,116 are shown in column 3 of page 6 of Exhibit No. FV-1W. These adjustments have been detailed in other exhibits which Mr. Poff addresses in his testimony (see York

Water Statement No. 103W). Column 4 of page 6 of Exhibit No. FV-1W shows pro forma net operating income available for return for the twelve months ending February 28, 2027, in the amount of $4,381,003 and the rate of return on the original cost measure of value as of February 28, 2027, of 8.01%. The rate of return used for the wastewater portion of the business is identical to that used for the water portion of the business.

Q. Explain Exhibit No. FV-1-2W.

A. Exhibit No. FV-1-2W provides the calculation of the unamortized utility plant acquisition adjustment relative to the acquisition of Felton Borough as of December 31, 2025, in the amount of $105,640 and as of February 28, 2027, in the amount of $88,442 included in the original cost measure of value.

Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code. This amortization was specifically approved by the Commission in accordance with the Settlement Agreement at Docket No. R-2022-3031340. The amortization period began March 1, 2023 (the effective date of rates under Order No. R-2022-3031340) and ends February 28, 2033.

The acquisition adjustment subject to amortization of $147,404 is determined by subtracting one-half of the depreciated original cost of wastewater property acquired from Felton Borough of in the amount of $618,871from one-half of Felton Borough acquisition costs of $913,679 [(($913,679 - $618,871) / 2) = $147,404]. The unamortized Felton Borough acquisition adjustment as of December 31, 2025, in the amount of $105,640 is

determined by subtracting the amortization during the period March 1, 2023, the effective date of rates under the Order issued in the Company's 2022 base rate proceeding (Docket No. R-2022-3031340), through December 31, 2025, of $41,764 from the acquisition adjustment subject to amortization of $147,404 ($147,404 - $41,764 = $105,640). Unamortized utility plant acquisition adjustment as of December 31, 2025, in the amount of $105,640 has been carried forward to Exhibit FV-1, page 2 and has been added to the original cost measure of value.

The unamortized acquisition adjustment for the period ending February 28, 2027, of $88,442 is determined by taking the unamortized acquisition adjustment as of December 31, 2025, of $105,640 and deducting the monthly amortization in the amount of $1,228 ($147,404 / 10 years / 12 months) for the fourteen months from January 2026 through February 28, 2027, of $17,198 ($1,228 x 14) ($105,640 - $17,198 = $88,442). The unamortized utility plant acquisition adjustment as of February 28, 2027, in the amount of $88,442 has been carried forward to Exhibit FV-1W, page 3 and has been added to the original cost measure of value.

Q. Explain Exhibit No. FV-1-3W.

A. Exhibit No. FV-1-3W provides the calculation of the unamortized utility plant acquisition adjustment relative to the acquisition of the York Haven Borough as of December 31, 2025, in the amount of $127,481 and as of February 28, 2027, in the amount of $112,608 included in the original cost measure of value.

Reasonable acquisition costs greater than depreciated original cost are permitted to be included in rate base and amortized over ten years in accordance with Section 1327 of the Public Utility Code. The Company is seeking approval to amortize the reasonable acquisition costs greater than the depreciated original cost of waterworks property and rights. Please see the testimony of Mr. Hand for details on this acquisition (see York Water Statement No. 1).

The acquisition adjustment subject to amortization of $127,481 is determined by subtracting the depreciated original cost of waterworks property acquired from the York Haven Borough in the amount of $281,095 from the York Haven Borough acquisition costs of $408,576 ($408,576 - $281,095 = $127,481).

The unamortized acquisition adjustment for the period ending February 28, 2027, of $112,608 is determined by taking the acquisition adjustment as of December 31, 2025, of $127,4816 and deducting the monthly amortization in the amount of $1,062 ($127,481 / 10 years / 12 months) for the fourteen months from January 1, 2026, through February 28, 2027, of $14,873 ($1,062 x 14) ($127,481 - $14,873 = $112,608). The unamortized utility plant acquisition adjustment as of February 28, 2027, in the amount of $112,608 has been carried forward to Exhibit FV-1W, page 3 and has been added to the original cost measure of value.

Q. Are you sponsoring any other exhibits regarding the original cost measure of value?

A. Yes, I am also sponsoring Exhibit Nos. FV-16-1W, FV-16-2W, FV-16-3W, and FV-16-4W.

Q. Does this conclude your future test year and fully projected future test year direct testimony at this time?

A. Yes.

York, PA 17405

Attention Mr. Matthew E. Poff
Chief Financial Officer

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant. The results of our study as of December 31, 2025, are presented in the attached report. The results of our study as of December 31, 2024, are presented in our report, "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of December 31, 2024." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of December 31, 2025.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

THE YORK WATER COMPANY

DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report presents the results of the depreciation study prepared for The York Water Company (the Company) as applied to water plant in service as of December 31, 2025. The study results include annual depreciation rates and amounts for regulatory reporting. The regulatory rates and amounts are based on the straight line remaining life method of depreciation. The report also describes the concepts, methods and basic judgments which underlie recommended annual depreciation accrual rates and amounts related to current water plant in service.

PLAN OF REPORT

Part I, Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and the methods used in the service life and net salvage studies. Part III, Service Life Considerations, presents the factors and judgment utilized in the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents a summary by depreciable group of annual depreciation accrual rates and amounts. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates; Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation; and Part VIII, Experienced and Estimated Net Salvage, presents the cost of removal and gross salvage recorded for the period 2018-2022.

BASIS OF THE STUDY

Depreciation

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

For most accounts, the annual depreciation was calculated by the straight line remaining life method using the equal life group procedure. For certain General Plant accounts, the annual depreciation is based on amortization accounting. Both types of calculations were based on original cost, attained ages of plant in service and the estimated service life characteristics of each depreciable group.

Service Life Estimates

The service life estimates used in the depreciation and amortization calculations were based on informed judgment which incorporated a review of management's plans,

policies and outlook, a general knowledge of the water utility industry, and comparisons of the service life estimates from our studies of other water utilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for water plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and estimates of future experience yielded estimated survivor curves from which the average service lives were derived.

The Company's service life estimates used in the depreciation calculation incorporated historical data compiled through December 2021 from the property records of the Company. Such data included plant additions, retirements, transfers and other activity. Generally, retirement data for the years through 2021 were used in the actuarial life table computations which were the primary statistical support of the service life estimates.

A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirement was obtained through discussions with operating and management personnel conducted during the course of the service life study. Information regarding plans for the future was incorporated in the interpretation and extrapolation of the statistical analyses.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

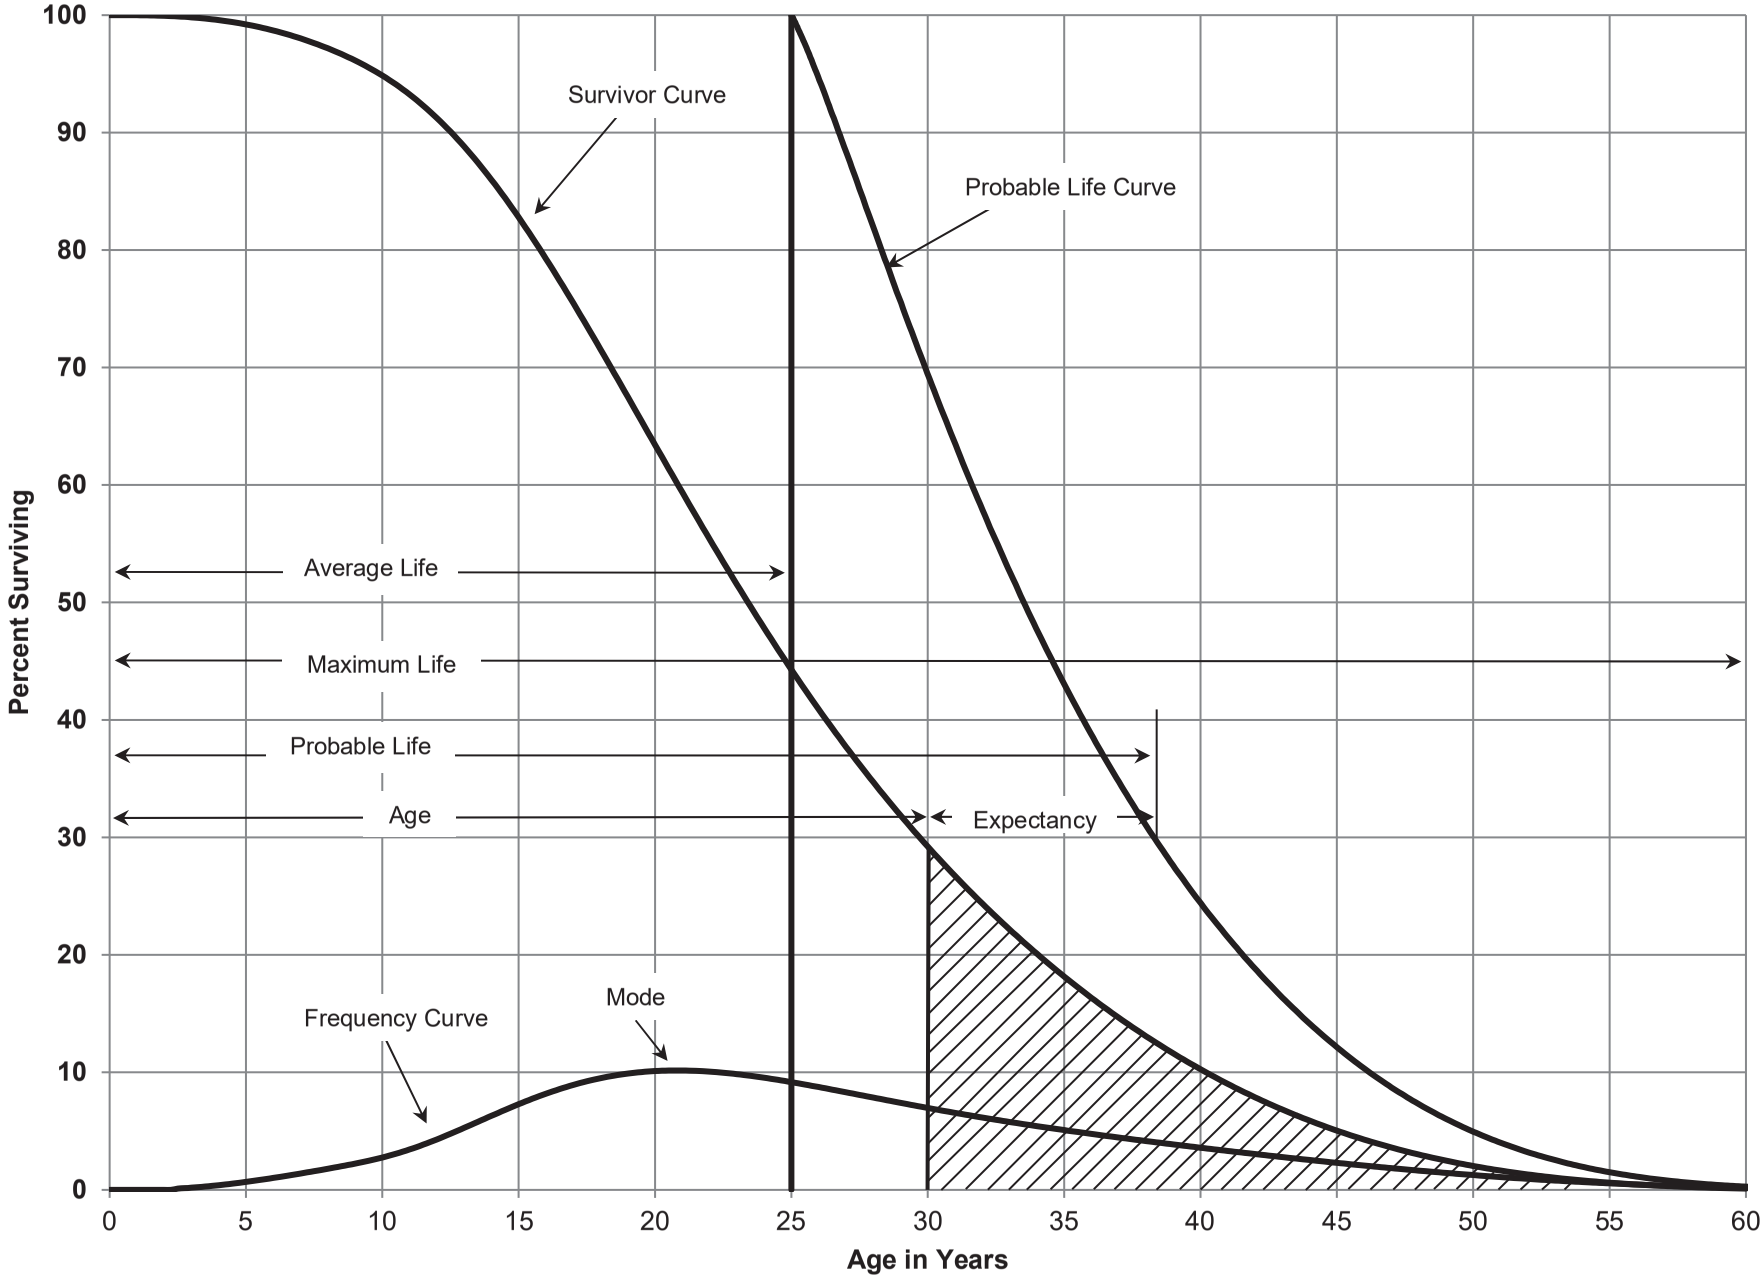

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

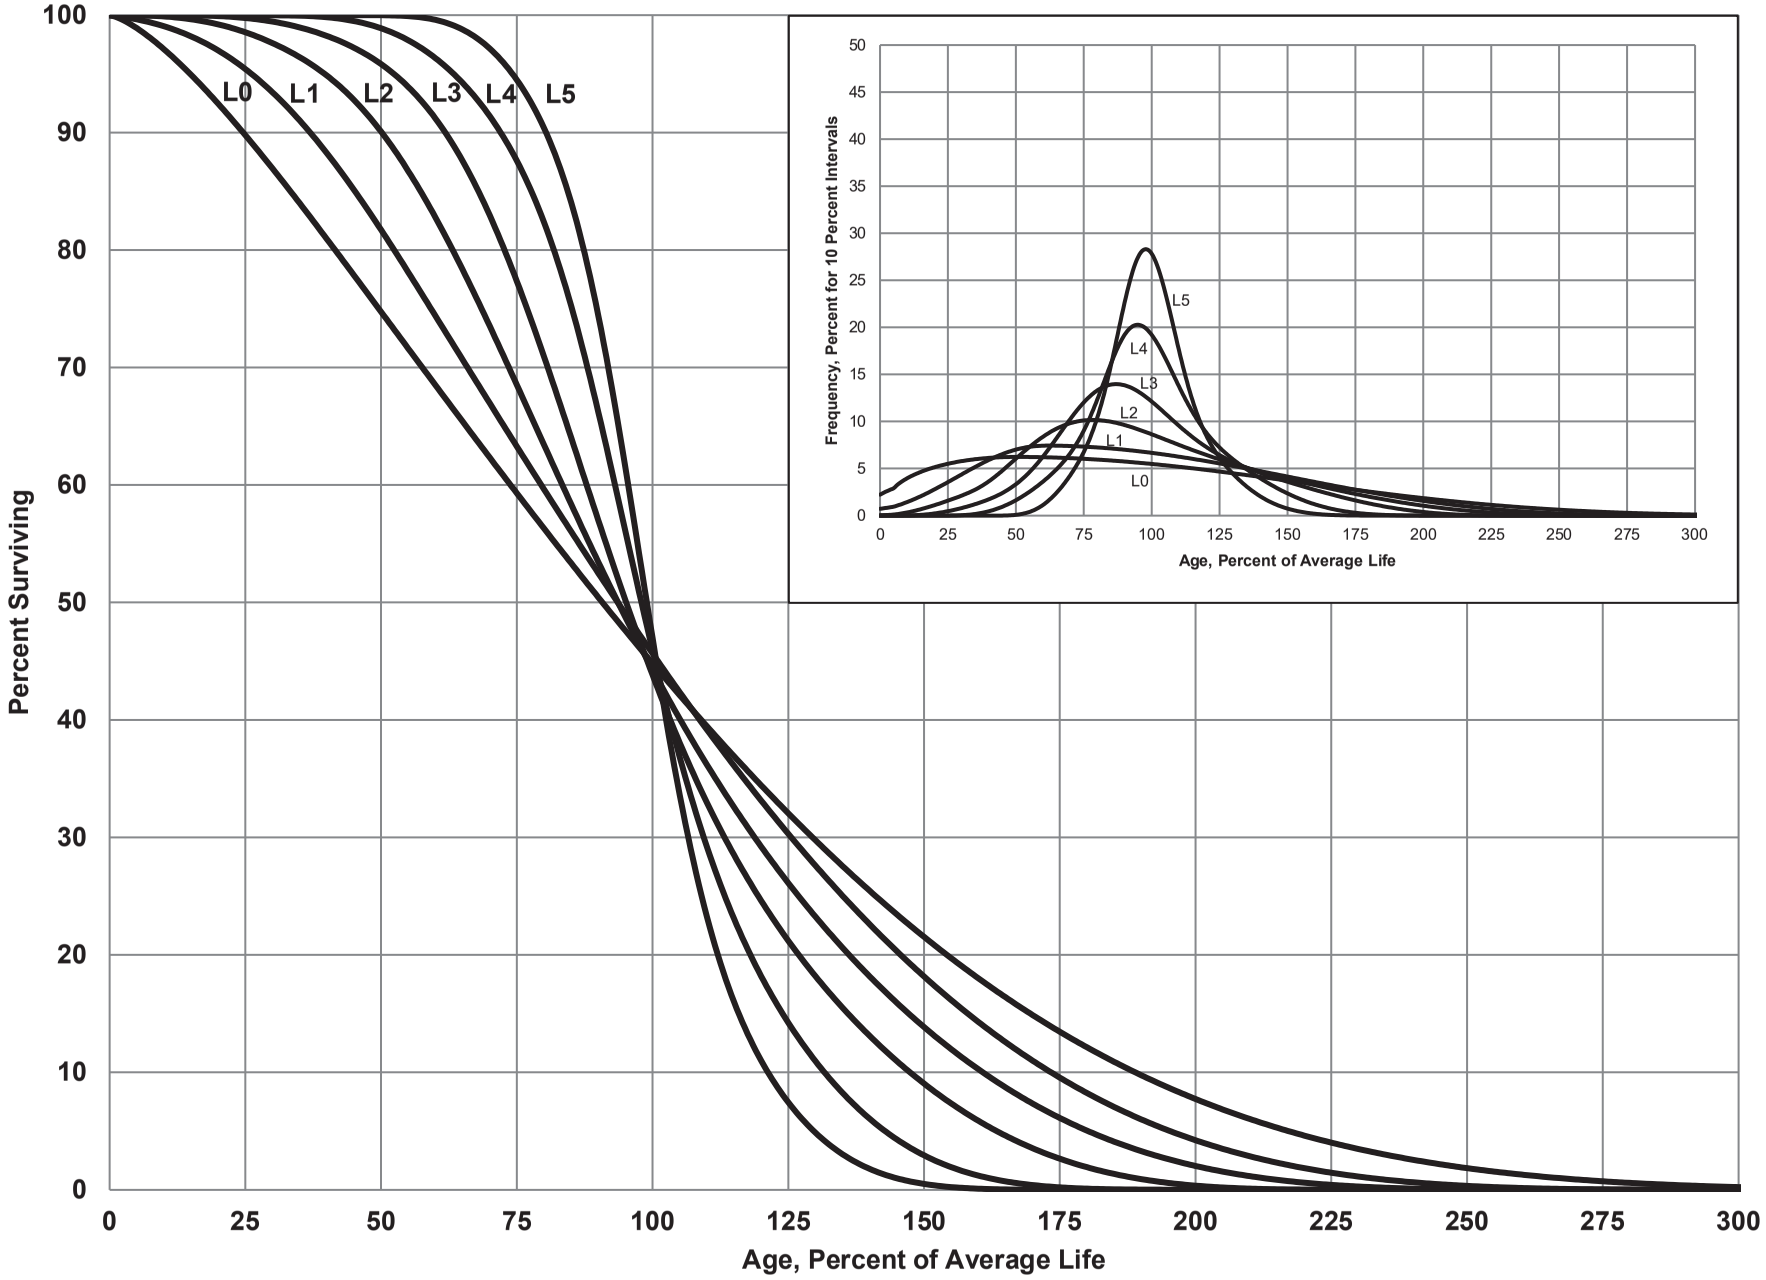

FIGURE 2. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

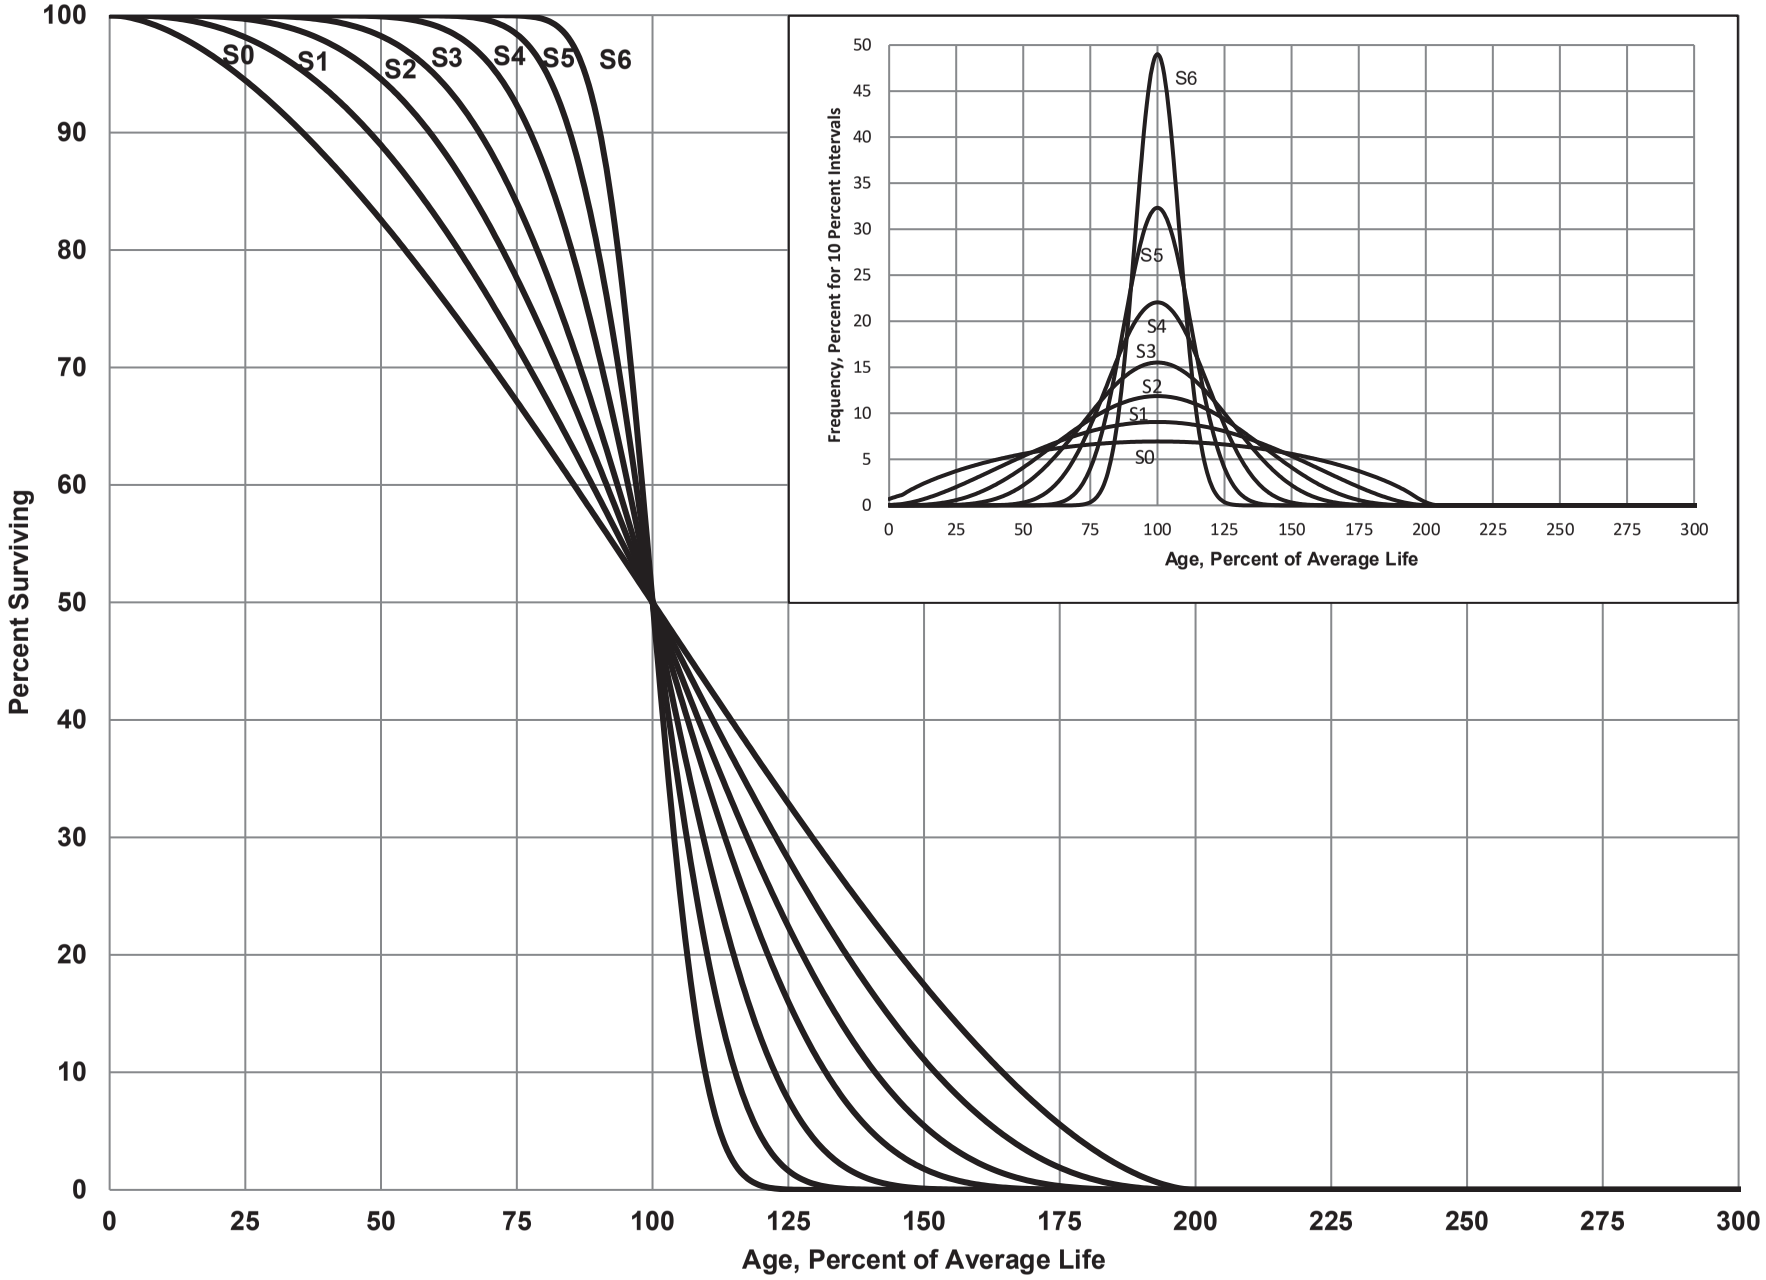

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

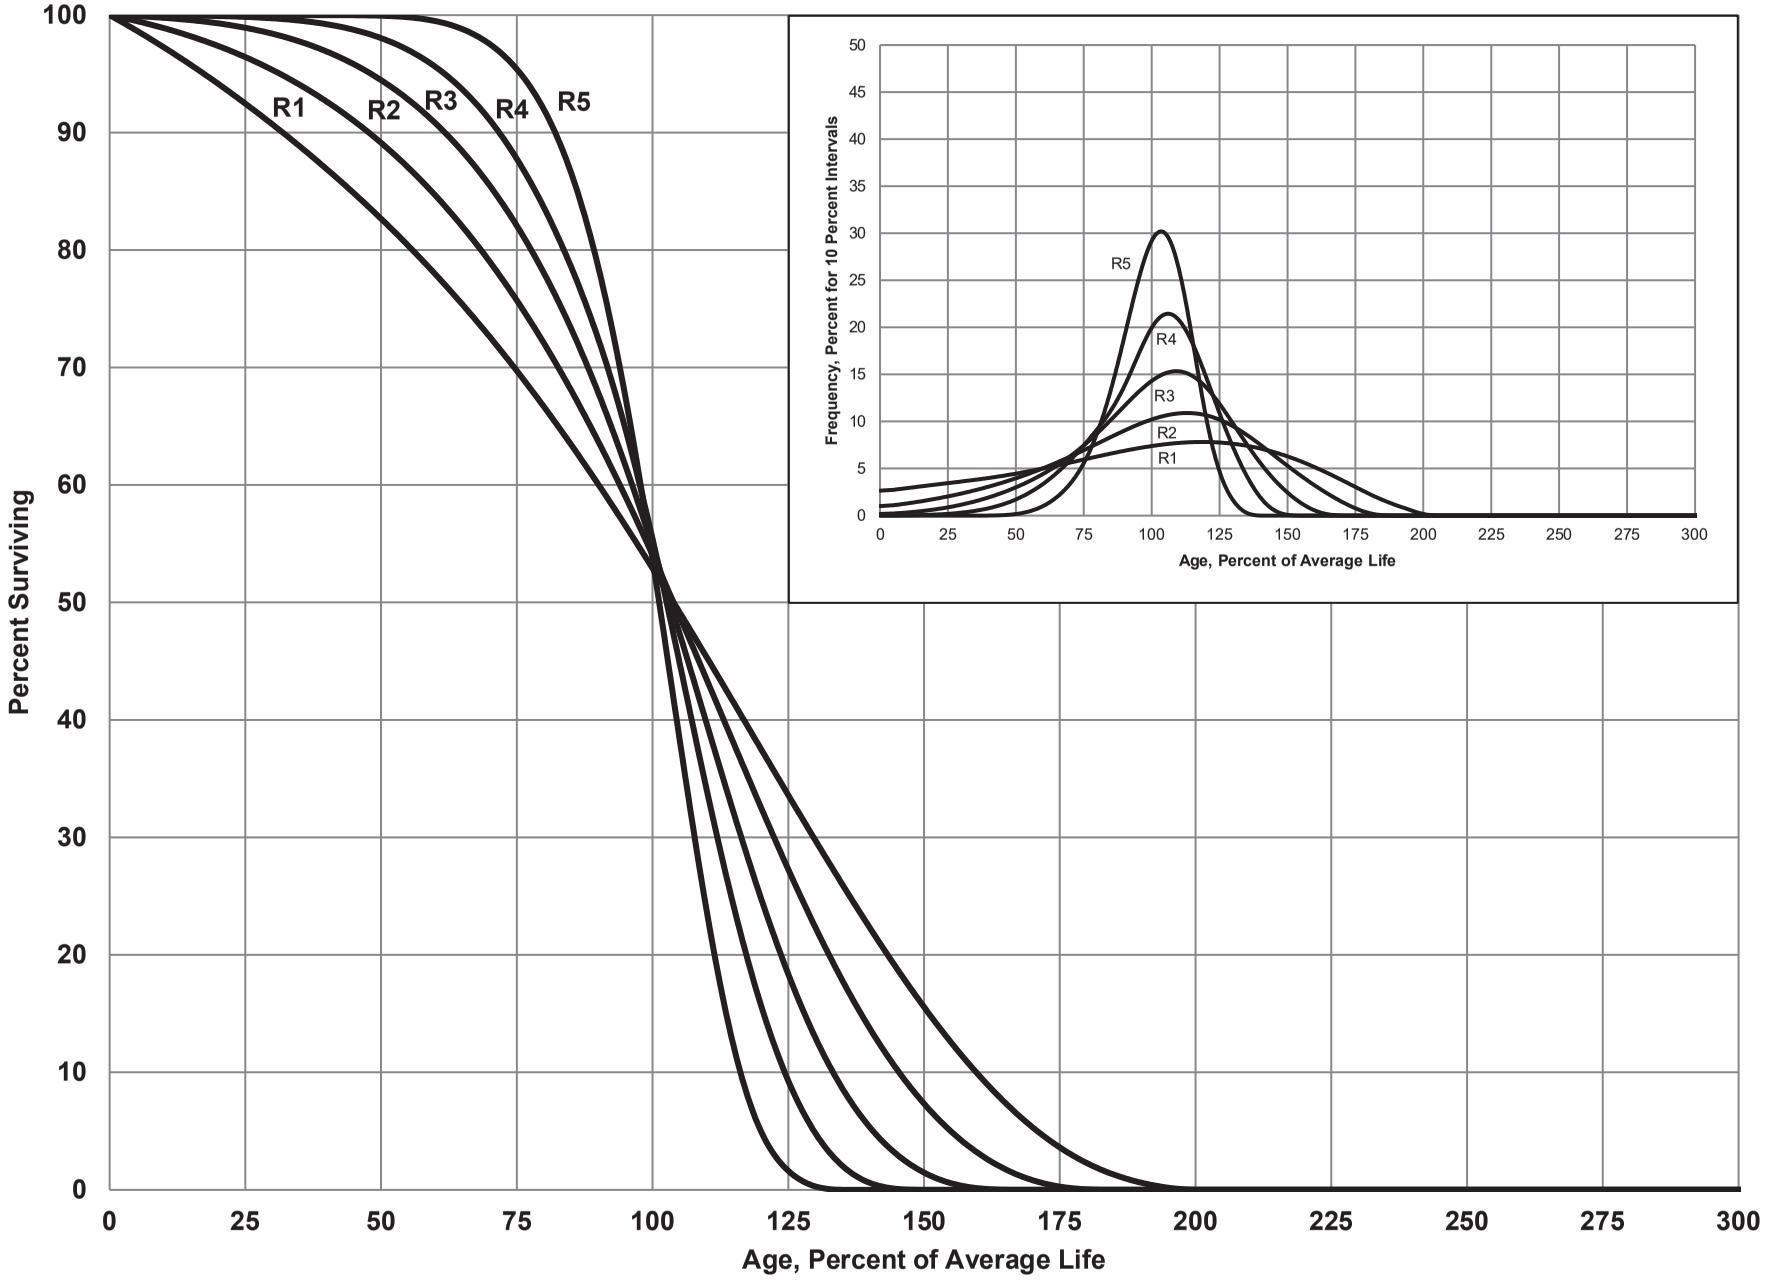

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

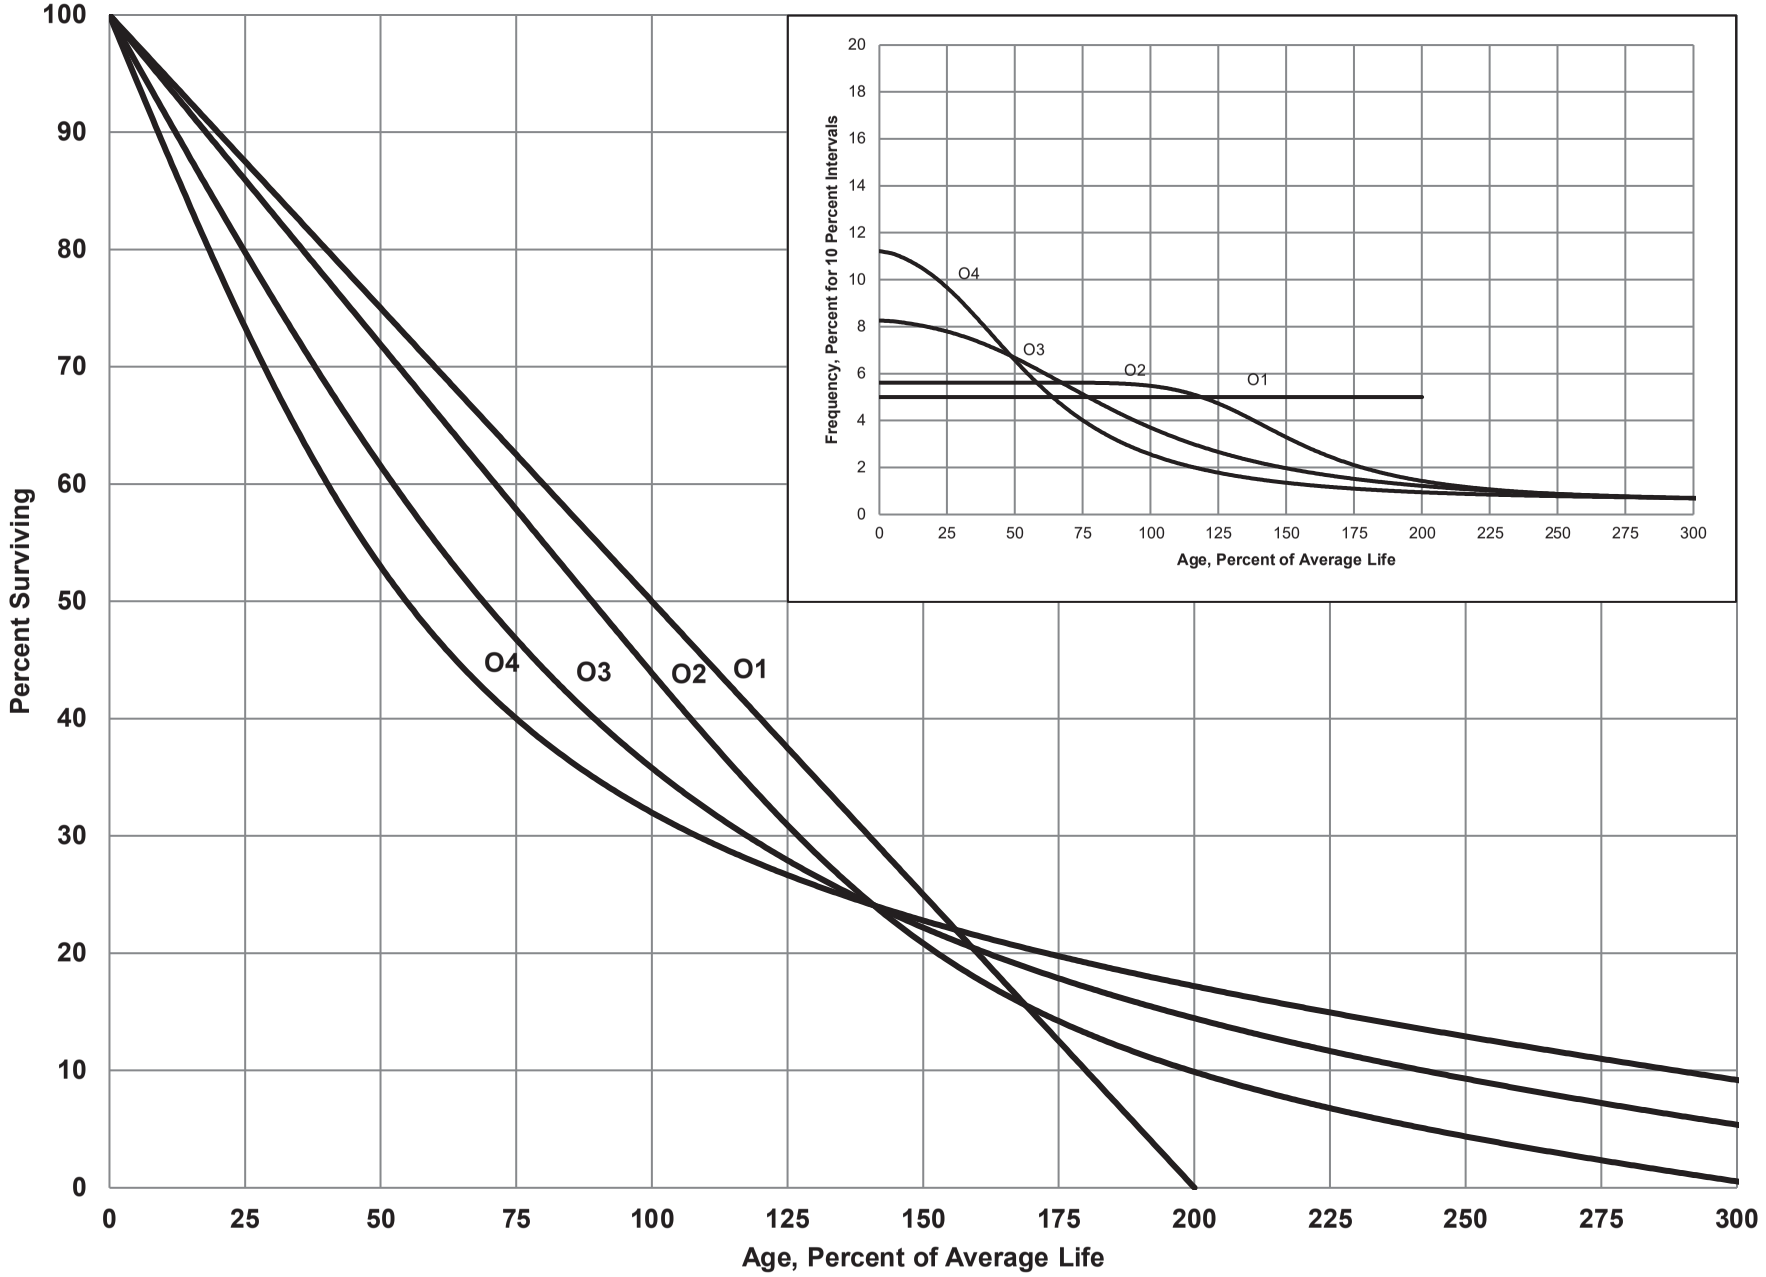

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024

[a] Transfer Affecting Exposures at Beginning of Year
[b] Transfer Affecting Exposures at End of Year
[c] Sale with Continued Use
Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024

Placement Band 2010-2024

Year Placed	Exposures, Thousands of Dollars — Annual Survivors at the Beginning of the Year										Total at Beginning of Age Interval	Age Interval
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
2010	255	245	234	222	209	195	239	216	192	167	167	13½-14½
2011	279	268	256	243	228	212	194	174	153	131	323	12½-13½
2012	307	296	284	271	257	241	224	205	184	162	531	11½-12½
2013	338	330	321	311	300	289	276	262	242	226	823	10½-11½
2014	376	367	357	346	334	321	307	297	280	261	1,097	9½-10½
2015	420[a]	416	407	397	386	374	361	347	332	316	1,503	8½-9½
2016		460[a]	455	444	432	419	405	390	374	356	1,952	7½-8½
2017			510[a]	504	492	479	464	448	431	412	2,463	6½-7½
2018				580[a]	574	561	546	530	501	482	3,057	5½-6½
2019					660[a]	653	639	623	628	609	3,789	4½-5½
2020						750[a]	742	724	685	663	4,332	3½-4½
2021							850[a]	841	821	799	4,955	2½-3½
2022								960[a]	949	926	5,719	1½-2½
2023									1,080[a]	1,069	6,579	½-1½
2024										1,220[a]	7,490	0-½
Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024 Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93

2.5	4,955	150	0.0303	0.9697	94.07
3.5	4,332	146	0.0337	0.9663	91.22
4.5	3,789	143	0.0377	0.9623	88.15
5.5	3,057	131	0.0429	0.9571	84.83
6.5	2,463	124	0.0503	0.9497	81.19
7.5	1,952	113	0.0579	0.9421	77.11
8.5	1,503	105	0.0699	0.9301	72.65
9.5	1,097	93	0.0848	0.9152	67.57
10.5	823	83	0.1009	0.8991	61.84
11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips are conducted for each service life study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The plant facilities visited in 1982, 1985, 1988, 1991, 1996, 2001, 2003, 2012, 2017, 2022 and 2023 are set forth in the following list by date visited.

December 7, 2023
- Conewago Water and Wastewater Plant

December 13, 2022
- Letterkenny Water Treatment Plant

April 7, 2022
- Wrightsville Standpipe
- Loganville Standpipe
- Lake Redman Pump Station
- Brillhart Pump Station
- Shunk's Hill Tank

Judgments. The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during field trips and other discussions with management, and survivor curve estimates from previous studies of the Company, as well as other water companies. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group. The judgments for a life span group were made by estimating the life of the major facility in the group and assigning lives to the related items of property which terminate at the probable retirement date of the major facility.

The life span estimates for structures and equipment in Accounts 304.00, 305.00, 306.00, 310.00, 320.00 and 330.00 were based on the type of construction, attained age, observed features and conditions at the time of field visits, and specific plans of management. The following tabulation sets forth, for each life span group, the major location, type of construction and the estimated life span.

Life Span Group	Type of Construction	Life Span
Account 304.15, Other Water Source Structures		
Lake Redman Outfall	Piping	50
Carroll Valley	Concrete Block	55
Account 304.20, Power and Pumping Structures		
Berlin Road	Concrete	60,19
Pump Station Structures	Brick, Concrete Block	55,50
North York	Concrete	107,50
Southern Repump	Concrete	63,40
Hallam	Wood Frame, Concrete Block	65,50
Susquehanna River	Masonry	60
Brillhart/Codorus Creek	Brick, Stone, Concrete Block	160,101,35
Amblebrook		50
Lake Redman		60

Life Span Group	Type of Construction	Life Span
	Wood Frame Concrete and Steel Frame	
Account 304.30, Purification Buildings		
Filter Plant	Brick, Concrete, Concrete Block	120
Sedimentation and Residuals Handling	Pre-Fabricated Steel, Concrete	40
Amblebrook	Wood Frame	50
Account 304.61, Office Buildings		
Main Office - 130 E. Market St.	Stone, Brick, Concrete	122
Office - 124 E. Market St.	Stone, Brick, Concrete	55
Account 304.62, Stores, Shop and Garage Buildings		
Codorus Creek Shop Building	Brick and Stone	70
Codorus Creek Garage	Brick	87,33
Reservoir Tract Service Building	Brick	137,65
Impounding Basin Shop Building and Roadway	Pre-Fabricated Steel	40
Mt. Rose Ave. Distribution Center	Brick, Concrete, Concrete Block	60,47
Codorus Creek Shed	Steel	30
Susquehanna River Garage	Concrete, Steel	40
Account 304.63, Miscellaneous Structures and Improvements		
Structure at Lake Redman	Brick	65
Longstown	Concrete	40
Shrewsbury Monochlor	Concrete	40
Account 305.00, Collecting and Impounding Reservoirs		
Lake Williams Reservoir	Concrete, Earth-Masonry	150,80
Lake Williams Bascule Gates and Other Equipment	Hydraulic, Mechanical	85,80
Lake Redman Reservoir	Concrete, Earth-Masonry	150
Lake Redman Equipment	Electrical-Mechanical	35
SCADA Equipment	Electronic	10
Account 306.00, Lake River and Other Intakes		
Rock Filled Timber Crib-Dam	Timber, Concrete-Masonry	139
Traveling Screen and Equipment	Electrical-Mechanical	74,35
Bypass, Meter and Vault	Concrete, Pipe, Electrical	67
Concrete Weir Beam	Concrete	40
East Branch Gauge	Concrete, Concrete Block	40

Life Span Group	Type of Construction	Life Span
Water Conservation Measure and Release Control	Steel, Electrical-Mechanical	30
East Branch Measurement Weir	Steel	40
Susquehanna River Pump Station Intake	Masonry	60
SCADA Equipment	Electronic	10
Brillhart Intake	Concrete, Steel	40
Account 310.70, Oil Engine Pumping Equipment		
Diesel Engines	Mechanical	40
Account 320.00, Purification System		
Filters and Associated Structures	Concrete, Brick, Steel	150,80,37
Sedimentation Basins and Flocculators	Concrete, Mechanical	94,73,42
Sedimentation and Residual Handling	Concrete, Steel	40
Account 330.00, Distribution Reservoirs and Standpipes		
Basins and Covers at Filter Plant	Concrete	170,75
Shunk's Hill	Concrete, Earth	89,60
Standpipes	Steel	55,60,70
Standpipe Painting	Painting	10
SCADA Equipment	Electronic	10

Further discussion of several of the estimates set forth above follows. Account 305 consists of the construction costs of the dams and related facilities associated with the two impounding reservoirs, Lake Williams and Lake Redman, located on the Codorus Creek. Life spans of 150 years were used for depreciation purposes, inasmuch as each is a major dam expected to serve its present purpose for an extended period of time. The 150-year period is reasonable for purposes of recovering the original cost and has been used consistently for reservoirs of this nature for ratemaking purposes. The intake dam in Account 306 was assigned a life span with termination coinciding with the estimated

life span of the associated pump station. This resulted in a life span of 139 years for the dam, which is a reasonable life estimate for such facilities.

The life span estimate for the Brillhart (Codorus Creek) pumping station is 160 years from the initial 1896 portions of the plant and results in a 101-year life span for the major 1955 addition of the plant and a 35-year life span for the major addition in 2021. The life span for North York is 50 years from the 1987 addition and results in a 107-year life span for the initial portions built in 1930. The life span of the Southern Repump booster station is based on a similar probable retirement year of the filter plant.

The life span of the Reservoir Tract Service Building is based on the probable retirement year of the Filter Plant. The life span of the Mt. Rose Avenue Distribution Center is based on a 60-year life span from 1971, which was the original year of construction, and a 47-year life span for the major addition in 1984.

The life span of the filters and associated structures in Account 320.00 is based on the probable retirement year of the Filter Plant. A study of historical retirement experience for the 1956-2021 experience band indicated that the use of an interim survivor curve is appropriate for this group, the Brillhart (Codorus Creek) pumping station and the Filter Plant building. The Iowa 80-S0.5 interim survivor curve was used in conjunction with the life spans, based on the combined statistical analysis.

The basins and covers in Account 330.00 are located adjacent to the filter plant. The basins were initially constructed in 1898 and were covered in 1993 and 1996. The covers are concrete structures. A 75-year service life was estimated for the covers and results in a 170-year life span for the basins. Each standpipe and pressure tank included in the account also was assigned a life span typical for the type of structure. Generally,

55 to 70-year life spans were assigned to the standpipes, inasmuch as, on the average, a 55-70-year life is typical of steel storage reservoirs and standpipes.

The average survivor curves estimated for depreciable groups with numerous similar items were based on statistical analyses, Company policies, and previous estimates made for this and other companies. For nineteen plant accounts and subaccounts for which survivor curves were estimated, the statistical analysis resulted in good indications of the survivor patterns experienced. Generally, the statistical analyses were the primary bases for the estimates for the following accounts, although information external to the statistics contributed to the specific interpretations of these statistics in several cases.

	Property Group	Survivor Curve
304.20	Structures and Improvements – Power and Pumping	80-S0.5
304.30	Structures and Improvements – Purification	80-S0.5
304.61	Office Buildings	75-R0.5
304.63	Miscellaneous Structures and Improvements	45-R1.5
311.00	Electrical Pumping Equipment	50-R1.5
320.00	Purification System:	
	Filters, Basins and Piping	80-S0.5
	Chemical Treatment Equipment	38-S0
	Electronic Control Equipment	25-S0.5
	Mains and Accessories	
330.00	Distribution Reservoirs and Standpipes	65-R2
331.00	Cast Iron - 6-Inch and 8-Inch	95-S2
331.00	Vaults	95-R2.5
331.00	Venturi Tubes	45-L1
331.00	Transite	70-R2
331.00	Valves and Valve Boxes	100-R2.5
331.00	Copper, Plastic and Galvanized	70-R2
333.00	Services	78-R1.5
334.00	Meters	28-L2

335.00	Fire Hydrants	70-R2
344.00	Laboratory Equipment	25-S0

The average survivor curves for eight of the fourteen property groups in Account 331.00, Mains and Accessories, were based on judgment incorporating the statistical analyses, the size and nature of the property, and previous studies for this and other companies. The average survivor curves for these property groups are as follows:

Mains and Accessories:	
Cast Iron - 4-Inch and Under	85-S0.5
Cast Iron - 10-Inch and Over	115-R3
Concrete	100-R4
Steel	70-S4
Emergency Bypass Piping	45-S3
Metering Equipment	26-O1
Automatic Flushers	25-R3
Cleaning and Lining	60-L4

The results of the statistical analyses for these groups were inconclusive because the average service lives are relatively long and the average ages of surviving property has not reached the average. That is, historical indications of complete survivor characteristics have not yet materialized. However, moderately high mode curves with long service lives were indicated for most subaccounts. The survivor curve estimates are typical of those used in other water utilities and are generally similar estimates to those previously used for this company.

Generally, the service life estimates for the remainder of the accounts, which comprise a minor portion of the total depreciable original cost, were based on judgments which considered the nature of the plant and equipment, reviews of available historical

data and a general knowledge of the service lives for similar equipment in other water companies.

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

BOOK RESERVE

The book reserve as of December 31, 2025, is the result of a bringforward of the book reserve as of September 30, 1985, as adjusted in accordance with the Order of the Pennsylvania Public Utility Commission in Docket No. R-850268. The book reserve activity subsequent to September 30, 1985, consists of accruals, retirements, cost of removal, gross salvage and other debits and credits recorded to the book reserve through December 31, 2024. The projected book reserve as of December 31, 2025, is a bringforward of the December 31, 2024 book reserve based on projected accruals, retirements, cost of removal, gross salvage and other credits.

CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

The annual depreciation accruals as of December 31, 2025, are based on the straight line remaining life method using the equal life group procedure. For the purpose of calculating the remaining life accruals as of December 31, 2025, the book reserve is allocated among vintages in proportion to the calculated accrued depreciation as of December 31, 2025.

Group Depreciation Procedure. A group procedure for depreciation is appropriate when considering more than a single item of property. Normally, the items within a group do not have identical service lives, but have lives that are dispersed over a range of time.

In the equal life group procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which

experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. This procedure eliminates the need to base depreciation on average lives, inasmuch as each group is equivalent to a unit having a single life. The full costs of short-lived units are accrued during their lives, leaving no deferral of accruals required to be added to the annual costs associated with long-lived units. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

Remaining Life Annual Accruals. For the purpose of calculating remaining life accrual rates as of December 31, 2025, the estimated book depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations are set forth in the Results of Study section of the report.

In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$Composite\ Remaining\ Life = \frac{\sum(\frac{Book\ Cost}{Life}\ x\ Remaining\ Life)}{\sum\frac{Book\ Cost}{Life}}.$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$Composite\ Remaining\ Life = \frac{\sum Whole\ Life\ Future\ Accruals}{\sum Whole\ Life\ Annual\ Accruals}$$

or

$$Composite\ Remaining\ Life = \frac{\sum Book\ Cost - Calc.\ Reserve}{\sum Whole\ Life\ Annual\ Accrual}.$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level, and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$Ratio = 1 - \frac{Remaining\ Life}{Service\ Life}.$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$Ratio = 1 - \frac{Age}{Service\ Life}.$$

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization, as defined in the Uniform System of Accounts, is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization periods and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is used for certain General Plant accounts that represent numerous units of property, but a very small portion of depreciable plant in service. The accounts and their amortization periods are as follows:

Account		Amortization Period, Curve
340.00	Office Furniture and Equipment	
	Furniture	30
	Mechanical Equipment	10
	Mail Machine	10
	Computer	5
	Enterprise Software	10
342.00	Stores Equipment - Other	30
343.10	Shop Equipment	30
343.20	Tools and Work Equipment	25
343.30	Tractor and Equipment	20
346.00	Communication Equipment	15
347.00	Miscellaneous Equipment	15

For the purpose of calculating annual amortization amounts as of December 31, 2025, the estimated book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The book reserve assigned to vintages with an age greater than the amortization period is equal to the vintage's original cost. The remaining book reserve is allocated among vintages with an age less than the amortization period in proportion to the calculated accrued amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the future amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

NET SALVAGE

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2021 through December 31, 2024 and estimated for the period January 1, 2025 through December 31, 2025. Retirements classified as sales or reimbursements were excluded to the extent to which the salvage receipt represents the recovery of original cost. The gross salvage and cost of removal amounts for Account 341.00, Transportation Equipment - Cars and Trucks; Account 342.00, Stores Equipment - Tow Motor; and Account 345.00, Power Operated Equipment, also were excluded. No provision for net salvage or annual accrual is made in the depreciation calculations for these accounts since annual expense is charged to clearing accounts. The calculation of the amortization is shown in Table 4 on page V-13. The amounts of gross salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and net salvage and for the change of the composition of property in service. The annual accrual rates were calculated in accordance with the straight line remaining life method of depreciation, using the equal life group procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

The annual depreciation accrual rates are applicable specifically to the water plant in service as of December 31, 2025. For most plant accounts, the application of such rates to future balances that reflect additions subsequent to December 31, 2025, is reasonable for a period of three to five years.

DESCRIPTION OF DETAILED TABULATIONS

The results of the depreciation study are summarized in Table 1 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book depreciation reserve related to net original cost and the annual amortization of net salvage. Table 2 presents the bringforward to December 31, 2025 of the book reserve as of December 31, 2024. Table 3 sets forth the calculation of estimated depreciation accruals for the twelve months ended December 31, 2025.

Table 4 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2021-2025. The total amortization amount is incorporated in the total annual accrual in Table 1.

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021-2025 are presented in Part VI, VII and VIII.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for water utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-2. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2021-2025, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to

develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 4, which presents the five-year amortization of net salvage.

York, PA 17405

Attention Mr. Matthew E. Poff
Chief Financial Officer

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant as of February 28, 2027. The results of our study as of December 31, 2025 are presented in our report titled "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of December 31, 2025". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 4, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

DEPRECIATION STUDY

RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 4 presented on pages I-3 through I-11 summarize the results of the depreciation study as of February 28, 2027. Table 1 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of February 28, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 2 presents the bringforward of the book reserve to February 28, 2027. Table 3 sets forth the calculation of the depreciation accruals for the fourteen months ended February 28, 2027. Table 4 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026, beginning on pages III-2 through III-5.

The York Water Company
130 East Market Street
York, PA 17405

Attention Mr. Matthew E. Poff
Chief Financial Officer

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant as of December 31, 2024. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 and 2, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of December 31, 2024".

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. RESULTS OF STUDY

THE YORK WATER COMPANY

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

SUMMARY OF RESULTS

The results of the depreciation study are summarized in Table 1, which sets forth the book reserve and the calculated annual depreciation related to original cost as of December 31, 2024, and the annual amortization of net negative salvage. Table 2 presents the calculation of the amortization of experienced net salvage, by account, based on the five-year period, 2020-2024.

DETAILED TABULATIONS OF DEPRECIATION CALCULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book depreciation reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2020 through 2024, on pages III-2 through III-6.

York, PA 17405

Attention Mr. Matthew E. Poff
Chief Financial Officer

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of December 31, 2025, are presented in the attached report. The results of our study as of December 31, 2024, are presented in our report, "2024 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of December 31, 2024." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of December 31, 2025

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

THE YORK WATER COMPANY

DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for The York Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of December 31, 2025. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of December 31, 2025.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics presents the statistical analysis of service life estimates, Part VII, Detailed Depreciation Calculations presents the detailed tabulations of annual depreciation and Part VIII, Experienced and Estimated Net Salvage presents the cost of removal and gross salvage recorded for the period 2021-2025.

BASIS OF THE STUDY

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of December 31, 2025. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all wastewater systems; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of Iowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

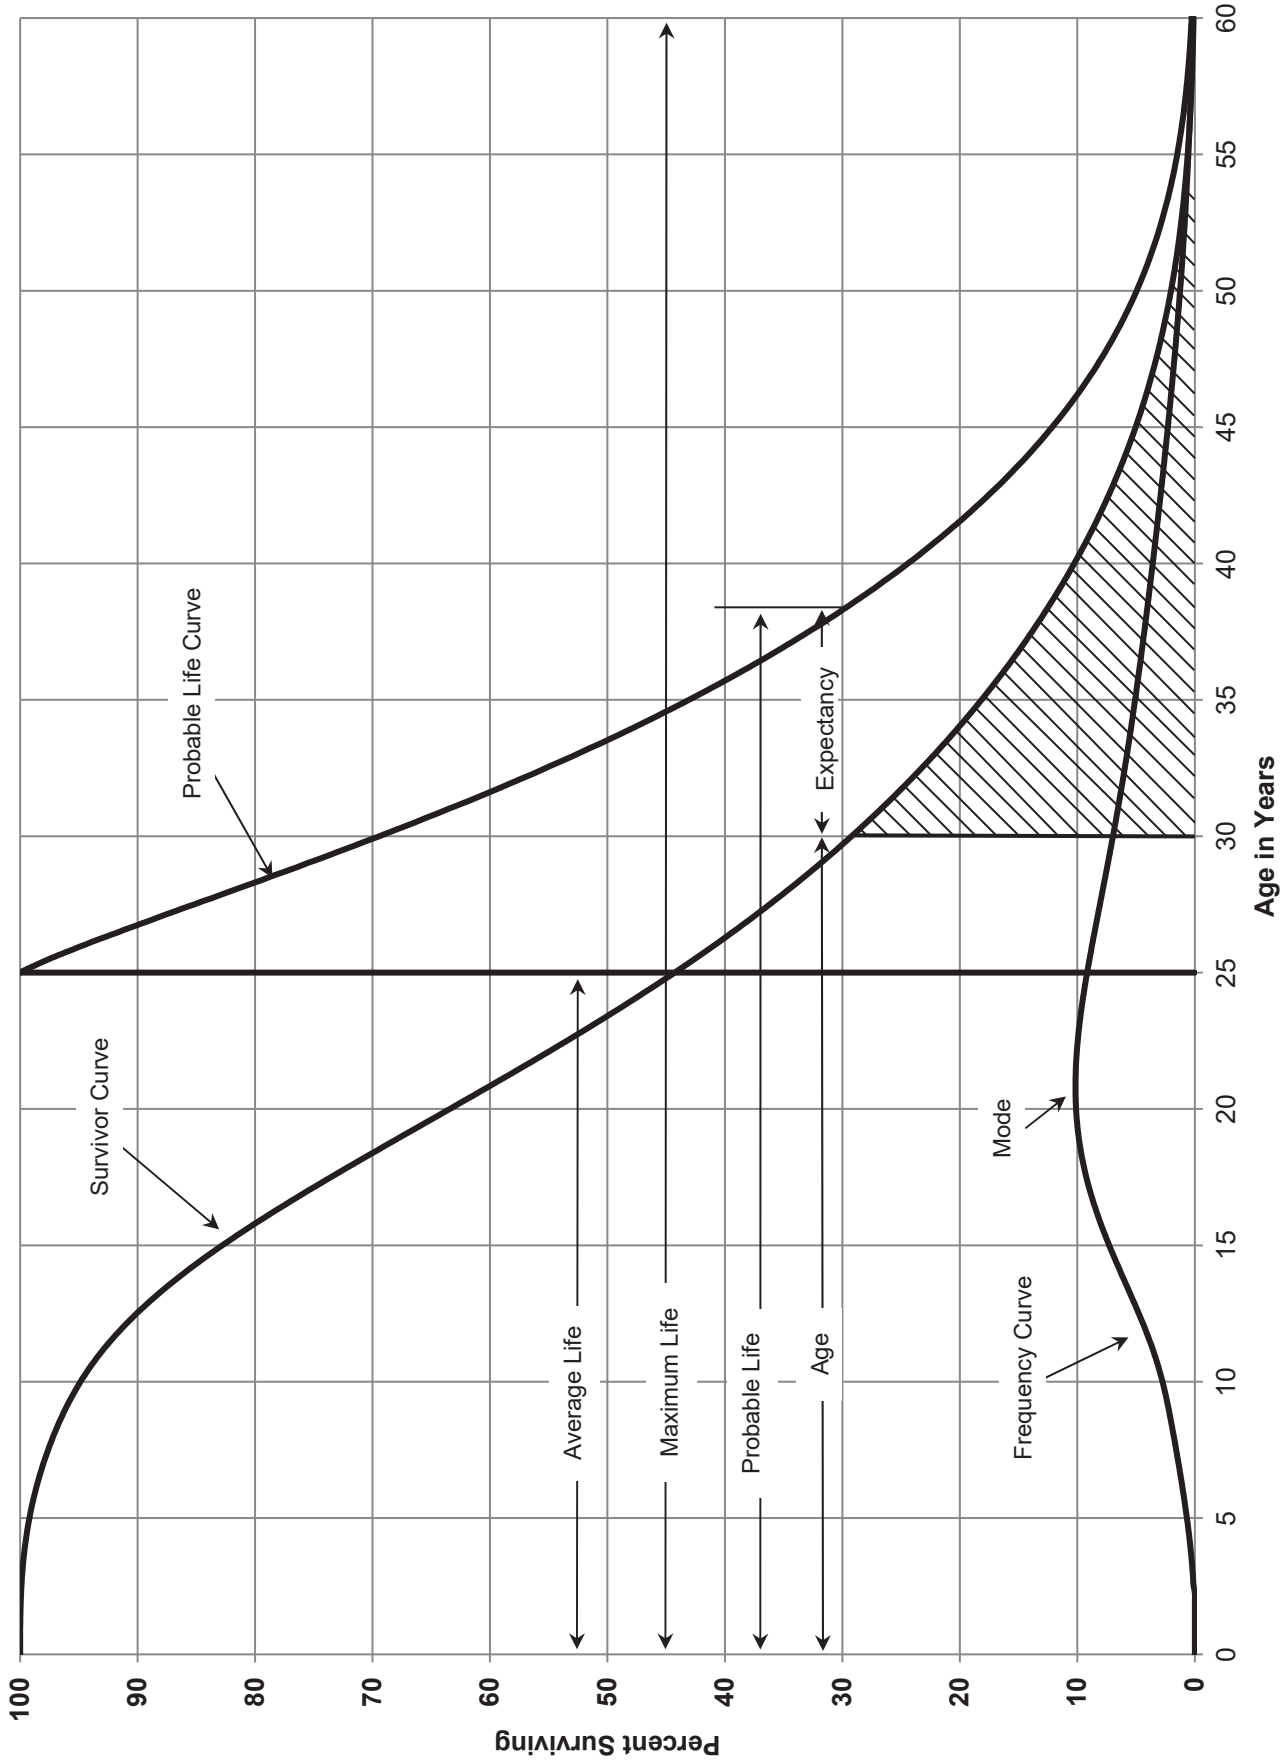

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

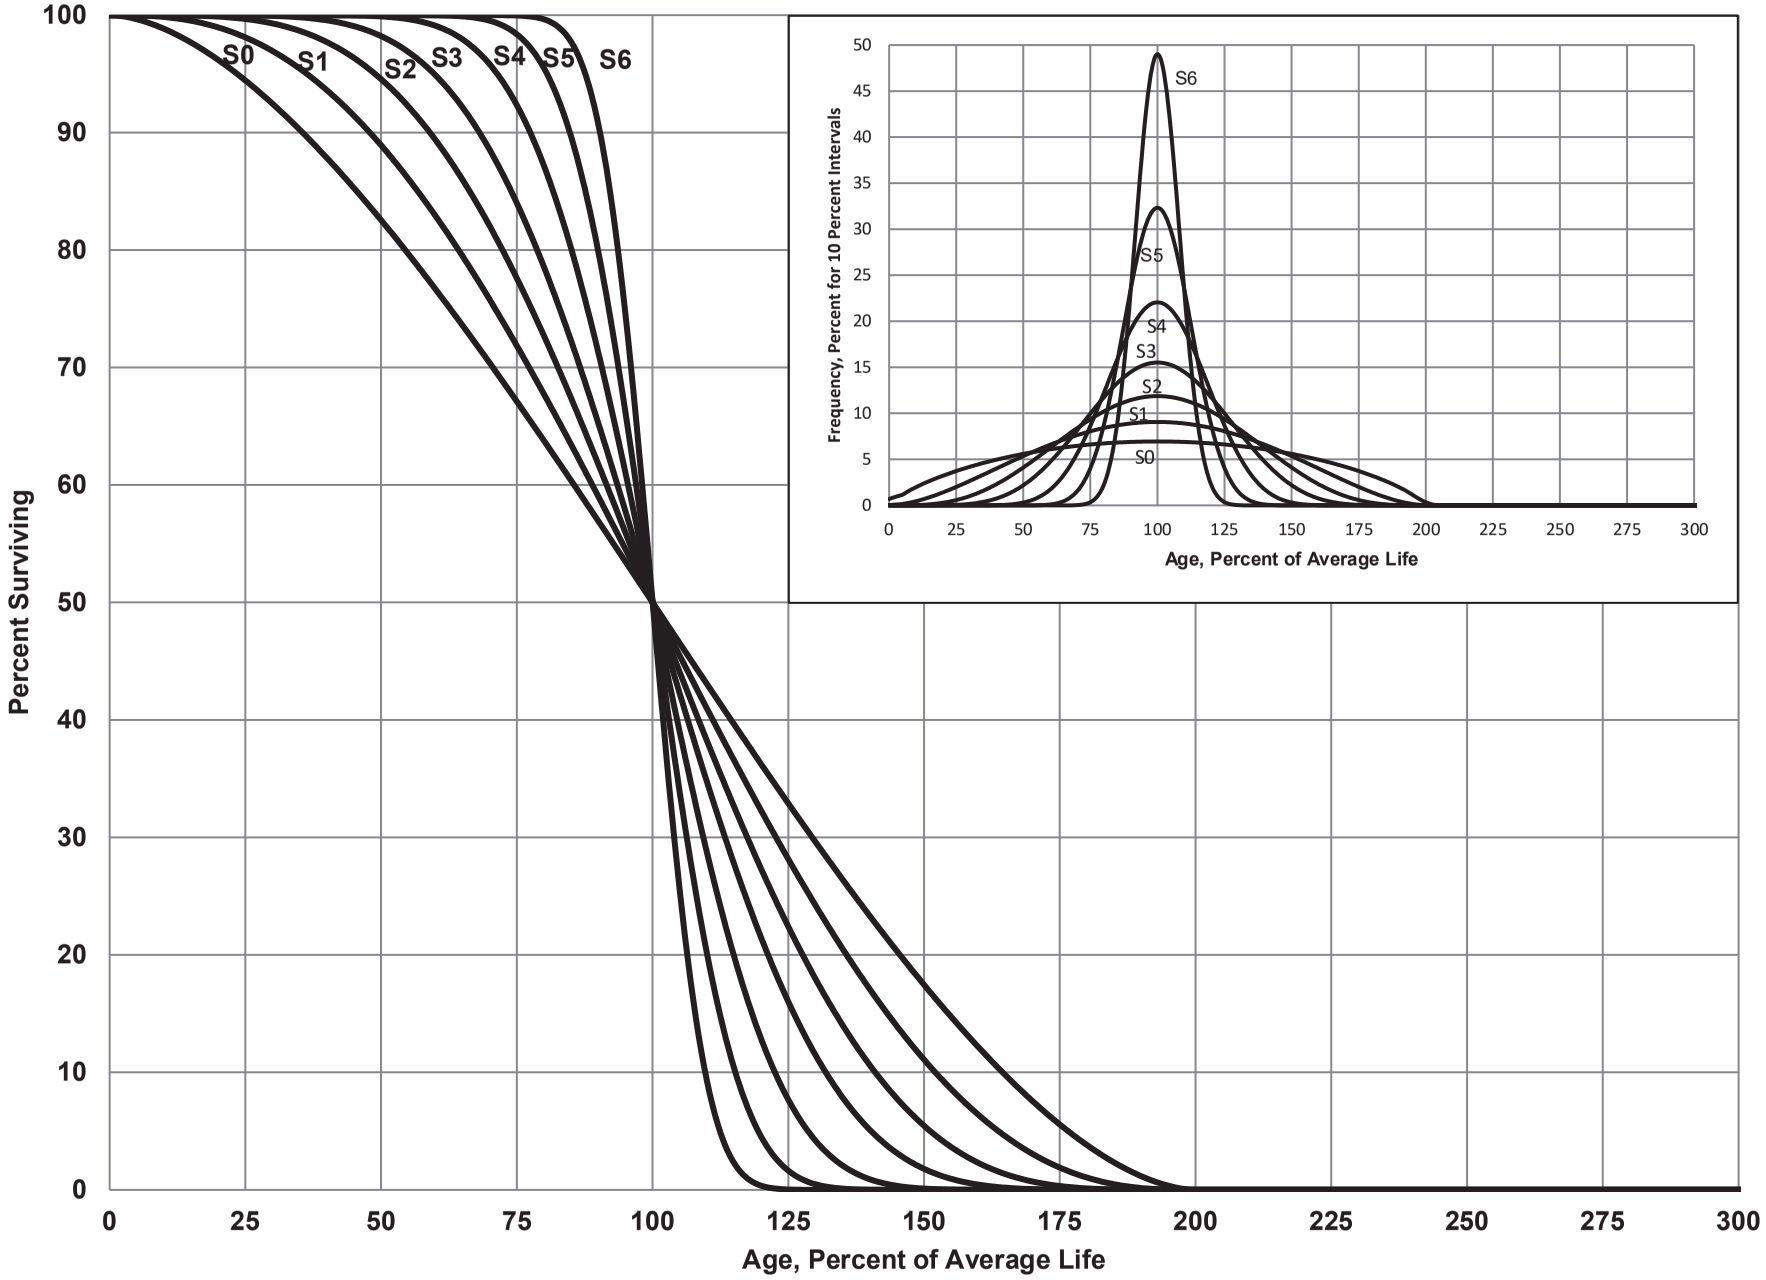

FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

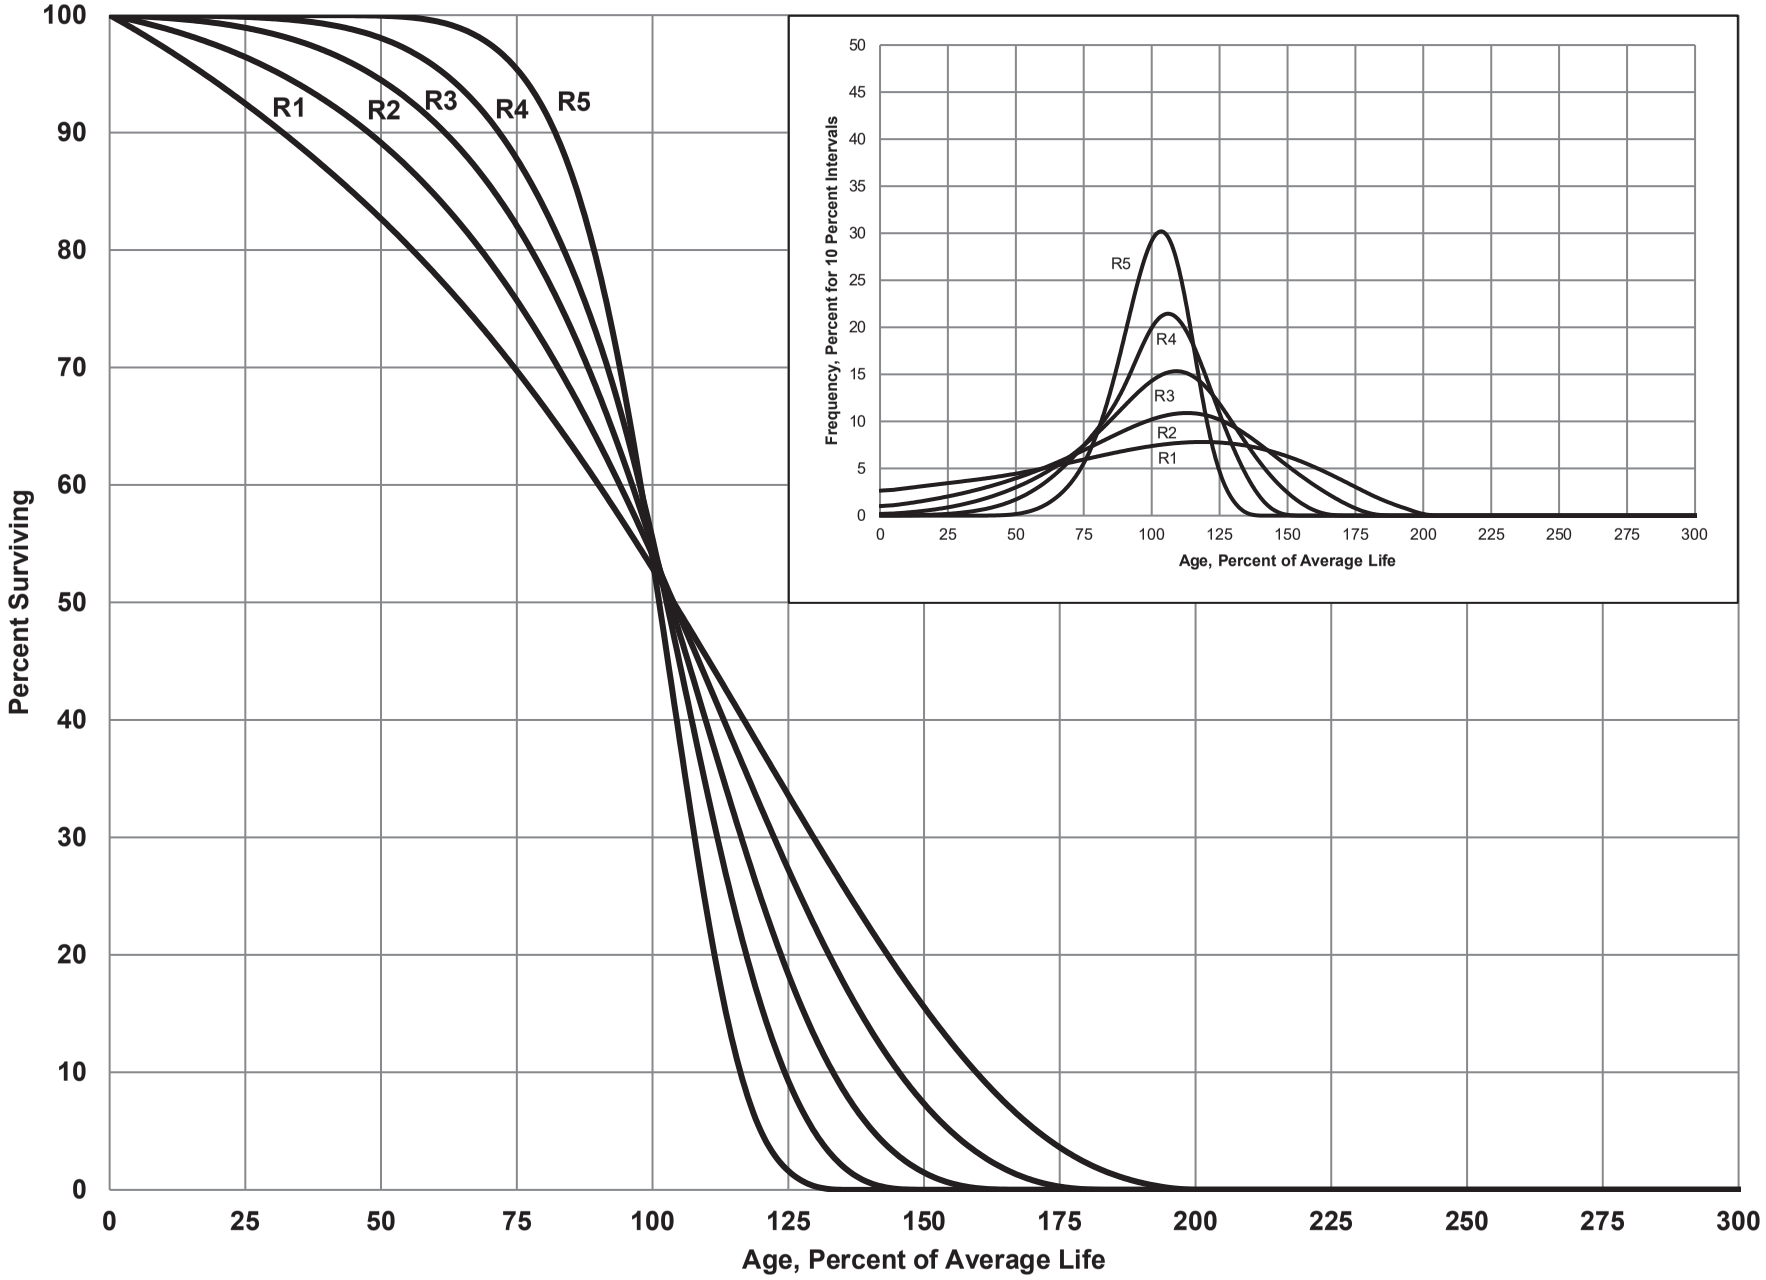

FIGURE 4.. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

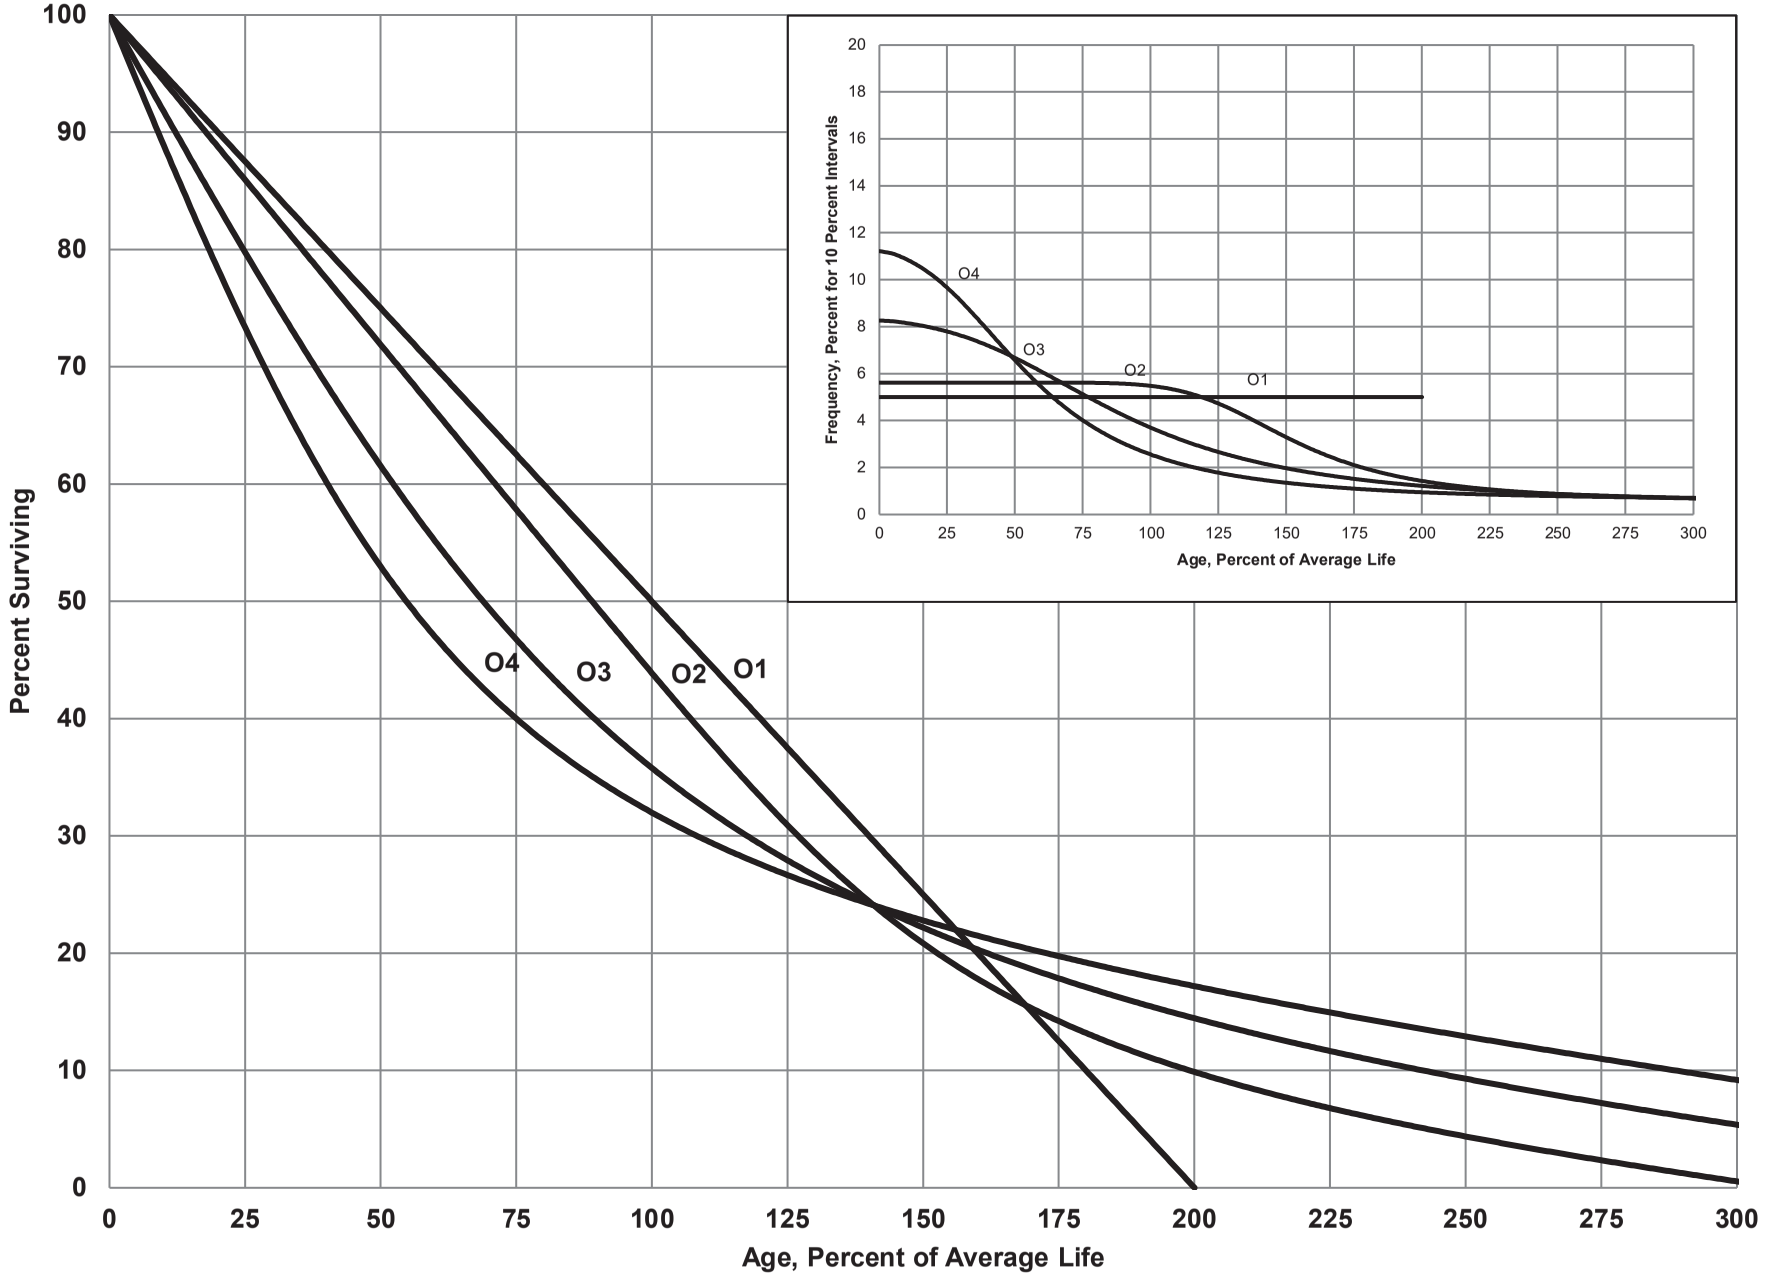

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

Year Placed	Retirements, Thousands of Dollars During Year										Total During Age Interval	Age Interval
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
2010	10	11	12	13	14	16	23	24	25	26	26	13½-14½
2011	11	12	13	15	16	18	20	21	22	19	44	12½-13½
2012	11	12	13	14	16	17	19	21	22	18	64	11½-12½
2013	8	9	10	11	11	13	14	15	16	17	83	10½-11½
2014	9	10	11	12	13	14	16	17	19	20	93	9½-10½
2015	4	9	10	11	12	13	14	15	16	20	105	8½-9½
2016		5	11	12	13	14	15	16	18	20	113	7½-8½
2017			6	12	13	15	16	17	19	19	124	6½-7½
2018				6	13	15	16	17	19	19	131	5½-6½
2019					7	14	16	17	19	20	143	4½-5½
2020						8	18	20	22	23	146	3½-4½
2021							9	20	22	25	150	2½-3½
2022								11	23	25	151	1½-2½
2023									11	24	153	½-1½
2024										13	80	0-½
Total	53	68	86	106	128	157	196	231	273	308	1,606	

SCHEDULE 2. OTHER TRANSACTIONS FOR EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

Year Placed	Acquisitions, Transfers and Sales, Thousands of Dollars During Year										Total During Age Interval	Age Interval

[a] Transfer Affecting Exposures at Beginning of Year
[b] Transfer Affecting Exposures at End of Year
[c] Sale with Continued Use
Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

Year Placed	Exposures, Thousands of Dollars — Annual Survivors at the Beginning of the Year										Total at Beginning of Age Interval	Age Interval
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
2010	255	245	234	222	209	195	239	216	192	167	167	13½-14½
2011	279	268	256	243	228	212	194	174	153	131	323	12½-13½
2012	307	296	284	271	257	241	224	205	184	162	531	11½-12½
2013	338	330	321	311	300	289	276	262	242	226	823	10½-11½
2014	376	367	357	346	334	321	307	297	280	261	1,097	9½-10½
2015	420[a]	416	407	397	386	374	361	347	332	316	1,503	8½-9½
2016		460[a]	455	444	432	419	405	390	374	356	1,952	7½-8½
2017			510[a]	504	492	479	464	448	431	412	2,463	6½-7½
2018				580[a]	574	561	546	530	501	482	3,057	5½-6½
2019					660[a]	653	639	623	628	609	3,789	4½-5½
2020						750[a]	742	724	685	663	4,332	3½-4½
2021							850[a]	841	821	799	4,955	2½-3½
2022								960[a]	949	926	5,719	1½-2½
2023									1,080[a]	1,069	6,579	½-1½
2024										1,220[a]	7,490	0-½
Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024 Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93
1.5	5,719	151	0.0264	0.9736	96.62
2.5	4,955	150	0.0303	0.9697	94.07
3.5	4,332	146	0.0337	0.9663	91.22
4.5	3,789	143	0.0377	0.9623	88.15
5.5	3,057	131	0.0429	0.9571	84.83
6.5	2,463	124	0.0503	0.9497	81.19
7.5	1,952	113	0.0579	0.9421	77.11
8.5	1,503	105	0.0699	0.9301	72.65
9.5	1,097	93	0.0848	0.9152	67.57
10.5	823	83	0.1009	0.8991	61.84
11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips are periodically conducted for studies. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the most recent field trips.

December 9, 2024
- York Haven Wastewater Plant

December 7, 2023
- Conewago Industrial Park Wastewater Plant

June 7, 2023
- SYC Treatment Plant

December 13, 2022
- Letterkenny Wastewater Plant
- Lift Station #49
- Lift Station #133

April 7, 2022
- East Prospect Wastewater Treatment Plant

September 8, 2021
- Martz Road Pump Station
- DGM Pump Station
- South Pointe Pump Station
- Beck's Mill Pump Station

June 7, 2012
- Asbury Pointe Wastewater Plant

Judgments. The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of the predecessor wastewater systems, as well as other wastewater companies. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

Account 361.20, Collection Sewer - Gravity, is used to illustrate the manner in which the study was conducted. Aged plant accounting data have been compiled for the years through 2021. These data have been coded according to account or property group, type of transaction, year in which the transaction took place, and year in which the utility plant was placed in service. The retirements, other plant transactions and plant additions were analyzed by the retirement rate method.

The survivor curve estimate for this account is the 65-R2.5 and is presented with the statistics for the period 2012-2021. The 65-R2.5 is set forth on page VI-13, is consistent with management outlook, and is at the upper end of the typical service life range of 55 to 65 years for collection sewers.

The amortization periods selected for general plant Accounts 390.00, 393.00, 396.00 and 397.00 are discussed in the section, “Amortization of General Plant Accounts.”

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

BOOK RESERVE

The book reserve as of December 31, 2024, is the result of a bringforward of the book reserves established for all wastewater assets at time of acquisition. The projected book reserve as of December 31, 2025, is a bringforward of the December 31, 2024 book reserve based on projected accruals, retirements, cost of removal, salvage and other credits.

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000 \left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

The annual depreciation accruals as of December 31, 2025, are based on the straight line remaining life method using the equal life group procedure. For the purpose of calculating remaining life accruals as of December 31, 2025, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of December 31, 2025, are set forth in the Results of Study section of the report.

The remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of the vintage. The composite remaining life is derived by weighting the individual equal life group remaining lives in accordance with the following equation:

$$Composite\ Remaining\ Life = \frac{\sum(\frac{Book\ Cost}{Life}\ x\ Remaining\ Life)}{\sum\frac{Book\ Cost}{Life}}$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

The composite remaining life for the account is calculated by dividing the sum of the future book accruals by the sum of the remaining life annual accruals.

AMORTIZATION OF GENERAL PLANT ACCOUNTS

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390, 393, 396 and 397; amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts is that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

Account Number	Description	Amortization Period, Years
Office Furniture and Equipment		
390.00	Furniture	20
390.40	Computers and Software	5
390.50	Office Enterprise Software	10
393.00	Tools, Shop and Garage Equipment	25
396.00	Communication Equipment - SCADA	10
397.00	Miscellaneous Equipment	15

NET SALVAGE

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2021 through December 31, 2024, and estimated for the period January 1, 2025 through December 31, 2025. The calculation of the amortization is shown in Table 4 on page V-9. The amounts of salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

The results of the depreciation study are summarized in Table 1 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book depreciation reserve related to net original cost and the annual amortization of net salvage. Table 2 presents the bringforward to December 31, 2025 of the book reserve as of December 31, 2024. Table 3 sets forth the calculation of estimated depreciation accruals for the twelve months ended December 31, 2025. Table 4 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2021-2025. The total amortization amount is incorporated in the total annual accrual in Table 1.

DESCRIPTION OF DETAILED TABULATIONS

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021-2025 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-2. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2021-2025, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation.

The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 4, which presents the five-year amortization of net salvage.

Attention Mr. Matthew E. Poff
Chief Financial Officer

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of February 28, 2027. The results of our study as of December 31, 2025 are presented in our report titled "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of December 31, 2025". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 4, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

THE YORK WATER COMPANY

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

SUMMARY OF RESULTS

Tables 1 through 4 presented on pages I-3 through I-8 summarize the results of the depreciation study as of February 28, 2027. Table 1 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of February 28, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 2 presents the bringforward of the book depreciation reserve to February 28, 2027. Table 3 sets forth the calculation of the depreciation accruals for the fourteen months ended February 28, 2027. Table 4 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026, on page III-2.

Attention Mr. Matthew E. Poff
Chief Financial Officer

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of December 31, 2024. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 and 2, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of December 31, 2025".

Respectfully submitted,

PART I. RESULTS OF STUDY

THE YORK WATER COMPANY

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

SUMMARY OF RESULTS

The results of the depreciation study are summarized in Table 1, which sets forth the book depreciation reserve and the calculated annual depreciation related to wastewater plant in service as of December 31, 2024, and the annual amortization of net negative salvage. Table 2 presents the calculation of the amortization of experienced net salvage, by account, based on the five-year period, 2020-2024.

DETAILED TABULATIONS OF DEPRECIATION CALCULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2020 through 2024, on page III-2.

BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION

RE: THE YORK WATER COMPANY
DOCKET NO. R-2025-___

DIRECT TESTIMONY OF JOHN J. SPANOS

Q. Please state your name and address.

A. John J. Spanos. My business address is 300 Sterling Parkway, Mechanicsburg, Pennsylvania (formerly 207 Senate Avenue, Camp Hill, Pennsylvania).

Q. With what firm are you associated?

A. I am associated with Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming").

Q. How long have you been associated with Gannett Fleming?

A. I have been associated with the firm since June 1986.

Q. What is your position in the firm?

A. I am President.

Q. What is your educational background?

A. I have Bachelor of Science degrees in Industrial Management and Mathematics from Carnegie-Mellon University and a Master of Business Administration from York College of Pennsylvania.

Q. Are you a member of any professional societies?

A. Yes. I am a member and past President of the Society of Depreciation Professionals. I am also a member of the American Gas Association/Edison Electric Institute Industry Accounting Committee.

Q. Have you taken the certification exam for depreciation professionals?

A. Yes, I passed the certification exam of the Society of Depreciation Professionals sponsored by the Society in September 1997, and was recertified in August 2003, February 2008, January 2013, February 2018 and February 2023.

Q. Please outline your experience in the field of depreciation?

A. I have over 38 years of depreciation experience which includes giving expert testimony in more than 490 cases before 47 regulatory commissions, including the Pennsylvania Public Utility Commission ("Commission"). These cases have included depreciation studies in the electric, gas, water, wastewater and pipeline industries. In addition to the cases that I have submitted testimony, I have supervised in over 900 other depreciation or valuation assignments. Please refer to Appendix A for my qualifications statement, which includes further information with respect to my work history, case experience, and leadership in the Society of Depreciation Professionals

Q. What is the purpose of your testimony in this proceeding?

A. My testimony in this proceeding supports the depreciation studies conducted under my direction and supervision for The York Water Company ("York Water" or the "Company") for water and wastewater assets with regards to plant in service as of December 31, 2024, December 31, 2025, and February 28, 2027.

Q. Have you prepared exhibits presenting the results of your studies?

A. Yes. Exhibit Nos. HVI, HVI-W, FVI-A, FVI-WA, FVI-B, and FVI-WB present the results of the depreciation studies. Exhibit No. HVI presents the results of the study as of December 31, 2024, for the water assets. Exhibit No. FVI-A presents a description of the methods used and the results of the study as of

December 31, 2025, for water assets, and Exhibit No. FVI-B presents the results of the study as of February 28, 2027, for water assets. Exhibit No. HVI-W presents the results of the wastewater study as of December 31, 2024. Exhibit No. FVI-WA presents a description of the methods used and the results of the wastewater study as of December 31, 2025, and Exhibit No. FVI-WB presents the results of the wastewater study as of February 28, 2027.

Q. Please summarize the contents of Exhibit Nos. HVI and HVI-W.

A. The contents of Exhibit Nos. HVI and HVI-W include summary tables and detailed tabulations of the results of the depreciation calculations related to water and wastewater plant in service as of December 31, 2024. Exhibit No. HVI, Table 1, pages I-3 through I-6, present a summary of the results of the depreciation calculations by depreciable group related to the original cost of Water Plant in Service, Customers' Advances for Construction, and Contributions in Aid of Construction. The table shows the estimated survivor curve, original cost, book depreciation reserve, future book accruals, composite remaining life, and the calculated annual accrual rate and amount. Exhibit No. HVI-W, Table 1, pages I-3 and I-4 sets forth the same information for wastewater plant in service.

Table 2 on page I-7 of Exhibit No. HVI presents a summary of the cost of removal and gross salvage data for the five-year period, 2020-2024. Table 2 on page I-5 of Exhibit No. HVI-W sets forth the same information for wastewater cost of removal and gross salvage.

For Exhibit No. HVI, the detailed depreciation calculations by account are presented in the section beginning on page II-7. Cost of removal and gross

salvage data by account are set forth on pages III-2 through III-6. For Exhibit No. HVI-W, the detailed depreciation calculations by account are set forth in the section beginning on page II-6. Cost of removal and gross salvage data by account are set forth on page III-2..

Q. Please describe Exhibit Nos. FVI-A, FVI-WA, FVI-B, and FVI-WB.

A. Exhibit No. FVI-A titled, “2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of December 31, 2025,” and Exhibit No. FVI-WA titled, “2025 Depreciation Study- Calculated Annual Depreciation Accruals Related to Wastewater Plant as of December 31, 2025,” include the results of the water and wastewater depreciation studies as related to the estimated original cost as of December 31, 2025. Each report also includes explanatory text and detailed tabulations of the annual depreciation accruals. Exhibit No. FVI-B titled “2027 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of February 28, 2027” includes the results of the depreciation study related to the estimated water assets as of February 28, 2027. Exhibit No. FVI-WB is the same as Exhibit No. FVI-B, however, for wastewater assets.

Q. What was the purpose of your depreciation studies?

A. The purpose of the depreciation studies was to estimate the book depreciation reserve and the annual depreciation accruals related to water and wastewater plant as of December 31, 2025, and February 28, 2027, for ratemaking purposes.

Q. Is York Water's claim for annual and accrued depreciation in the current proceeding made on the same basis as the prior rate cases at Docket Nos. R-

850268, R-870769, R-901813, R-922168, R-943053, R-963619, R-994605, R-016236, R-027975, R-049165, R-061322, R-2008-2023067, R-2010-2157140, R-2012-2336379, R-2018-3000019 and R-2022-3031340?

A. Yes. The current claim for annual depreciation accruals is based on the straight line equal life group remaining life method of depreciation as approved by the Commission in prior rate proceedings. The current claim for accrued depreciation is the book reserve brought forward from the book reserve approved by the Commission at Docket No. R-850268. The current claim for accrued depreciation for wastewater plant is the book reserve brought forward from the book reserve established at time of acquisition for each system and approved in the prior rate proceeding or recent original cost study.

Q. How was the book reserve used in the calculation of annual depreciation?

A. The book reserve by account was allocated to vintages to determine the remaining undepreciated original cost by vintage. The total annual accrual is the sum of the results of dividing the remaining undepreciated original costs by the vintage composite remaining lives.

Q. How was the book reserve as of December 31, 2025 estimated?

A. The book reserve as of December 31, 2025, by account, was projected by adding estimated accruals, gross salvage, and amortization of net salvage and subtracting estimated retirements and cost of removal from the book reserve as of December 31, 2024. Annual accruals were estimated using annual accruals calculated as of December 31, 2024. Gross salvage and cost of removal were estimated by applying average gross salvage and cost of removal percents for the most recent five-year period to projected retirements. The projected book

reserve by account was allocated to vintages for the purpose of the annual accrual calculation based on calculated accrued depreciation as of December 31, 2025.

Q. Briefly outline the procedure used in performing the service life study.

A. The service life study, which incorporates plant accounting data through 2024, consisted of assembling and compiling historical data from the records related to the water and wastewater utility plant of York Water; statistically analyzing such data to obtain historical trends of survivor characteristics; obtaining supplementary information from management and operating personnel concerning Company practices and plans as they relate to plant operations; observing the features of the visible plant in the field; and interpreting the above data to form judgments of service life characteristics.

Iowa type survivor curves were used to describe the estimated survivor characteristics of the mass property groups. Individual service lives were used for major individual units of plant, such as reservoirs and buildings housing the treatment plant, pump stations, offices, and shops. The life span concept was recognized by coordinating the lives of associated plant installed in subsequent years with the probable retirement date defined by the life estimated for the major unit.

Q. Have you physically observed the Company's plant and equipment in the field?

A. Yes, field reviews have been conducted many times and listed on pages III-2 through III-5 of Exhibit No. FVI-A. Field review for the wastewater facilities were initially conducted in conjunction with the original cost study in June 2012, and then subsequent site visits have been conducted since 2021.

Q. What statistical data were employed in the historical analyses performed for the purpose of estimating service life characteristics?

A. The data consisted of the entries made to record retirements and other transactions related to the water plant during the period 1956-2021. These entries were classified by depreciable group, type of transaction, the year in which the transaction took place, and the year in which the plant was installed. Types of transactions included in the data were plant additions, retirements and transfers. The year-end surviving age distribution are the remaining entries within the historical data. The same information was prepared for the wastewater assets for the period 2012-2021.

Q. What was the source of these data?

A. They were assembled from Company records related to its water and wastewater utility plant in service.

Q. Were the methods used in the service life study the same as those used in other depreciation studies for water and wastewater utility plant presented before this Commission?

A. Yes. The most recent service life study was performed as of December 2021 as service life studies are required in Pennsylvania every five years. The methods are the same ones that have been presented previously by our firm for York Water and for other water and wastewater companies before the Commission and that have been accepted by the Commission in its past orders concerning water and wastewater utilities.

Q. Are the factors considered in your estimates of service life presented in Exhibit Nos. FVI-A and FVI-WA?

A. Yes. A discussion of the factors considered in the estimation of service lives is presented on pages III-2 through III-12 of Exhibit No. FVI-A and on pages III-2 and III-3 of Exhibit No. FVI-WA. I would emphasize that consistent with prior Commission directives, my estimates of service life consider, but are not exclusively based on, historical experience.

Q. Please outline the contents of Exhibit Nos. FVI-A and FVI-WA.

A. Exhibit No. FVI-A is presented in eight parts. Part I, Introduction, sets forth the scope and basis of the study. Part II, Estimation of Survivor Curves, includes a description of the Iowa Curves and the formulation of the retirement rate method. Part III, Service Life Considerations, and Part IV, Calculation of Annual and Accrued Depreciation, include a description of the judgment utilized for life parameters and the explanation of depreciation procedures. Part V, Results of Study, presents a description of the results, summaries of the depreciation calculations, graphs, and tables that relate to the service life study and the detailed depreciation calculations.

Table 1, pages V-5 through V-8, presents the estimated survivor curve, the original cost as of December 31, 2025, and the book depreciation reserve and calculated annual depreciation for each account or subaccount of Water Plant in Service, Customers' Advances for Construction, and Contributions in Aid of Construction. Table 2, pages V-9 and V-10, presents the bringforward to December 31, 2025, of the book depreciation reserve as of December 31, 2024.

Table 3, pages V-11 and V-12, presents the bringforward to December 31, 2025, of the book depreciation reserve as of December 31, 2024. Table 4,

page V-13, presents the experienced and estimated net salvage during the five-year period, 2021 through 2025, and the amount of the amortization of net salvage to be included in the cost of service.

The section beginning on page VI-2 presents the results of the retirement rate analyses prepared as the historical bases for the service life estimates.

The section beginning on page VII-2 presents the depreciation calculations related to original cost. The tabulation on pages VII-3 through VII-5 presents the cumulative depreciated original cost by year installed. The tabulations on pages VII-7 through VII-255 present the calculation of annual depreciation by vintage by account for each classification of water plant. The tabulation on pages VIII-2 through VIII-6 presents the retirements, gross salvage, and cost of removal by account for each year during the period 2021 through 2025. Exhibit No. FVI-WA is set forth in the same manner as Exhibit No. FVI-A.

Q. Please use an example to illustrate the manner in which the studies are presented in Exhibit Nos. FVI-A and FVI-WA.

A. I will use Account 334, Meters, in Exhibit No. FVI-A as my example, inasmuch as it is a significant water account. The retirement rate method was used to analyze the survivor characteristics of this group. The life tables for the 1956-2021, 1987-2021 and 2005-2021 experience bands are presented on pages VI-139 through VI-147 of Exhibit No. FVI-A. The life table, or original survivor curve, is plotted along with the estimated smooth survivor curve, the 28-L2, on page VI-138. The 1987 through 2021 experience along with the overall 1956

through 2021 period for meters was selected as the basis for the survivor curve estimate, inasmuch as the retirement levels during this period are anticipated to continue in the future. The 2005 through 2021 experience band for meters was selected as the basis for understanding recent practices for replacing meters going forward. Management anticipates that most meters will be in service for one to two cycles or 20 to 40 years and the encoders will be in service for 10 to 20 years. Thus, lives of 10 to 40 years are expected for the several elements of this account and the 28-L2 based on the 1956-2021, 1987-2021 and 2005-2021 experience is consistent with this outlook.

The calculation of the annual depreciation related to the original cost as of December 31, 2025, of water plant in service is presented on pages VII-228 and VII-229 of Exhibit No. FVI-A. The calculation is based on the 28-L2 survivor curve, the attained age and the allocated book reserve. The tabulation sets forth the installation year, the original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life, and annual accrual. The totals are brought forward to Table 1 on page V-6 of Exhibit No. FVI-A. The depreciation calculations for Contributions in Aid of Construction are presented in detail on page VII-227 and summarized in Table 1 on page V-8 of Exhibit No. FVI-A.

Q. Were the methods and procedures used in the depreciation calculations as of December 31, 2024, the same as those used in the depreciation calculations as of December 31, 2025, and February 28, 2027?

A. Yes, they were.

Q. Were the estimated survivor curves used in the depreciation calculations as of December 31, 2024, the same as those used in the depreciation calculations as of December 31, 2025, and February 28, 2027?

A. Yes, they were.

Q. In what manner is net salvage incorporated in the depreciation calculations?

A. As stated on page IV-7 of Exhibit No. FVI-A, no adjustment for net salvage was made to the calculated annual depreciation amounts. The total calculated annual depreciation amounts set forth on page V-8 of Exhibit No. FVI-A, page I-6 of Exhibit No. HVI and page I-6 of Exhibit No. FVI-B reflect an addition for the amortization of negative net salvage in accordance with the practice of this Commission. The amortization as of December 31, 2025, is based on experience during the period January 2021 through December 2024 and estimated for the time period January 2025 through December 2025. The amortization as of February 28, 2027, is based on experience during the period January 2022 through December 2024 and estimated for the time period January 2025 through December 31, 2026. The detail by plant account of regular retirements, gross salvage, and cost of removal for each year is presented on pages VIII-2 through VIII-6 of Exhibit No. FVI-A and on pages III-2 through III-5 of Exhibit No. FVI-B. The totals are brought forward to Table 4 on page V-13 of Exhibit No. FVI-A and Table 4 on page I-11 of Exhibit No. FVI-B in which the amount of the five-year amortization is calculated. The amortization as of December 31, 2024, is based on the 2020 through 2024 experience as detailed on pages III-2 through III-6 of Exhibit No. HVI. The amortization

amount as of December 31, 2024, is developed in Table 2 on page I-7 of Exhibit No. HVI.

Q. Does this conclude your direct testimony?

A. Yes, it does.

Appendix A

JOHN SPANOS

DEPRECIATION EXPERIENCE

Q. Please state your name.

A. My name is John J. Spanos.

Q. What is your educational background?

A. I have Bachelor of Science degrees in Industrial Management and Mathematics from Carnegie-Mellon University and a Master of Business Administration from York College.

Q. Do you belong to any professional societies?

A. Yes. I am a member and past President of the Society of Depreciation Professionals and a member of the American Gas Association/Edison Electric Institute Industry Accounting Committee.

Q. Do you hold any special certification as a depreciation expert?

A. Yes. The Society of Depreciation Professionals has established national standards for depreciation professionals. The Society administers an examination to become certified in this field. I passed the certification exam in September 1997 and was recertified in August 2003, February 2008, January 2013, February 2018 and February 2023.

Q. Please outline your experience in the field of depreciation.

A. In June 1986, I was employed by Gannett Fleming Valuation and Rate Consultants, Inc. as a Depreciation Analyst. During the period from June 1986 through December 1995, I helped prepare numerous depreciation and original cost studies for utility companies in various industries. I helped perform depreciation studies for the following telephone companies: United Telephone of Pennsylvania, United Telephone of New Jersey, and Anchorage Telephone Utility. I helped perform depreciation studies for the following companies in

the railroad industry: Union Pacific Railroad, Burlington Northern Railroad, and Wisconsin Central Transportation Corporation.

I helped perform depreciation studies for the following organizations in the electric utility industry: Chugach Electric Association, The Cincinnati Gas and Electric Company (CG&E), The Union Light, Heat and Power Company (ULH&P), Northwest Territories Power Corporation, and the City of Calgary - Electric System.

I helped perform depreciation studies for the following pipeline companies: TransCanada Pipelines Limited, Trans Mountain Pipe Line Company Ltd., Interprovincial Pipe Line Inc., Nova Gas Transmission Limited and Lakehead Pipeline Company.

I helped perform depreciation studies for the following gas utility companies: Columbia Gas of Pennsylvania, Columbia Gas of Maryland, The Peoples Natural Gas Company, T. W. Phillips Gas & Oil Company, CG&E, ULH&P, Lawrenceburg Gas Company and Penn Fuel Gas, Inc.

I helped perform depreciation studies for the following water utility companies: Indiana-American Water Company, Consumers Pennsylvania Water Company and The York Water Company; and depreciation and original cost studies for Philadelphia Suburban Water Company and Pennsylvania-American Water Company.

In each of the above studies, I assembled and analyzed historical and simulated data, performed field reviews, developed preliminary estimates of service life and net salvage, calculated annual depreciation, and prepared reports for submission to state public utility commissions or federal regulatory agencies. I performed these studies under the general direction of William M. Stout, P.E.

In January 1996, I was assigned to the position of Supervisor of Depreciation Studies. In July 1999, I was promoted to the position of Manager, Depreciation and

Valuation Studies. In December 2000, I was promoted to the position as Vice-President of Gannett Fleming Valuation and Rate Consultants, Inc., in April 2012, I was promoted to the position as Senior Vice President of the Valuation and Rate Division of Gannett Fleming Inc. (now doing business as Gannett Fleming Valuation and Rate Consultants, LLC) and in January of 2019, I was promoted to my present position of President of Gannett Fleming Valuation and Rate Consultants, LLC. In my current position I am responsible for conducting all depreciation, valuation and original cost studies, including the preparation of final exhibits and responses to data requests for submission to the appropriate regulatory bodies.

Since January 1996, I have conducted depreciation studies similar to those previously listed including assignments for Pennsylvania-American Water Company; Aqua Pennsylvania; Kentucky-American Water Company; Virginia-American Water Company; Indiana-American Water Company; Iowa-American Water Company; New Jersey-American Water Company; Hampton Water Works Company; Omaha Public Power District; Enbridge Pipe Line Company; Inc.; Columbia Gas of Virginia, Inc.; Virginia Natural Gas Company National Fuel Gas Distribution Corporation - New York and Pennsylvania Divisions; The City of Bethlehem - Bureau of Water; The City of Coatesville Authority; The City of Lancaster - Bureau of Water; Peoples Energy Corporation; The York Water Company; Public Service Company of Colorado; Enbridge Pipelines; Enbridge Gas Distribution, Inc.; Reliant Energy-HLP; Massachusetts-American Water Company; St. Louis County Water Company; Missouri-American Water Company; Chugach Electric Association; Alliant Energy; Oklahoma Gas & Electric Company; Nevada Power Company; Dominion Virginia Power; NUI-Virginia Gas Companies; Pacific Gas & Electric Company; PSI Energy; NUI - Elizabethtown Gas Company; Cinergy Corporation – CG&E; Cinergy

Corporation – ULH&P; Columbia Gas of Kentucky; South Carolina Electric & Gas Company; Idaho Power Company; El Paso Electric Company; Aqua North Carolina; Aqua Ohio; Aqua Texas, Inc.; Aqua Illinois, Inc.; Ameren Missouri; Central Hudson Gas & Electric; Centennial Pipeline Company; CenterPoint Energy-Arkansas; CenterPoint Energy – Oklahoma; CenterPoint Energy – Entex; CenterPoint Energy - Louisiana; NSTAR – Boston Edison Company; Westar Energy, Inc.; United Water Pennsylvania; PPL Electric Utilities; PPL Gas Utilities; Wisconsin Power & Light Company; TransAlaska Pipeline; Avista Corporation; Northwest Natural Gas; Allegheny Energy Supply, Inc.; Public Service Company of North Carolina; South Jersey Gas Company; Duquesne Light Company; MidAmerican Energy Company; Laclede Gas; Duke Energy Company; E.ON U.S. Services Inc.; Elkton Gas Services; Anchorage Water and Wastewater Utility; Kansas City Power and Light; Duke Energy North Carolina; Duke Energy South Carolina; Monongahela Power Company; Potomac Edison Company; Duke Energy Ohio Gas; Duke Energy Kentucky; Duke Energy Indiana; Duke Energy Progress; Northern Indiana Public Service Company; Tennessee- American Water Company; Columbia Gas of Maryland; Maryland-American Water Company; Bonneville Power Administration; NSTAR Electric and Gas Company; EPCOR Distribution, Inc.; B. C. Gas Utility, Ltd; Entergy Arkansas; Entergy Texas; Entergy Mississippi; Entergy Louisiana; Entergy Gulf States Louisiana; the Borough of Hanover; Louisville Gas and Electric Company; Kentucky Utilities Company; Madison Gas and Electric; Central Maine Power; PEPCO; PacifiCorp; Minnesota Energy Resource Group; Jersey Central Power & Light Company; Cheyenne Light, Fuel and Power Company; United Water Arkansas; Central Vermont Public Service Corporation; Green Mountain Power; Portland General Electric Company; Atlantic City Electric; Nicor Gas Company; Black Hills Power; Black Hills Colorado Gas; Black Hills Energy Arkansas, Inc.; Black Hills Kansas

Gas; Black Hills Service Company; Black Hills Utility Holdings; Public Service Company of Oklahoma; City of Dubois; Peoples Gas Light and Coke Company; North Shore Gas Company; Connecticut Light and Power; New York State Electric and Gas Corporation; Rochester Gas and Electric Corporation; Greater Missouri Operations; Tennessee Valley Authority; Omaha Public Power District; Indianapolis Power & Light Company; Vermont Gas Systems, Inc.; Metropolitan Edison; Pennsylvania Electric; West Penn Power; Pennsylvania Power; PHI Service Company - Delmarva Power and Light; Atmos Energy Corporation; Citizens Energy Group; PSE&G Company; Berkshire Gas Company; Alabama Gas Corporation; Mid-Atlantic Interstate Transmission, LLC; SUEZ Water; WEC Energy Group; Rocky Mountain Natural Gas, LLC; Illinois-American Water Company; Northern Illinois Gas Company; Public Service of New Hampshire; FirstEnergy Service Corporation; Northeast Ohio Natural Gas Corporation; Blue Granite Water Company; Spire Missouri, Inc.; Dominion Energy South Carolina, Inc.; South FirstEnergy Operating Companies; Dayton Power and Light Company; Liberty Utilities; East Kentucky Power Cooperative; Bangor Natural Gas; Hanover Borough Municipal Water Works; West Virginia American Water Company; Evergy Metro; Evergy Missouri West; Granite State Electric; Bluegrass Water; The Borough of Ambler; Newtown Artesian Water Company and Connecticut Water Company.

My additional duties include determining final life and salvage estimates, conducting field reviews, presenting recommended depreciation rates to management for its consideration and supporting such rates before regulatory bodies.

Q. Have you submitted testimony to any state utility commission on the subject of utility plant depreciation?

A. Yes. I have submitted testimony to the Pennsylvania Public Utility Commission; the

Commonwealth of Kentucky Public Service Commission; the Public Utilities Commission of Ohio; the Nevada Public Utility Commission; the Public Utilities Board of New Jersey; the Missouri Public Service Commission; the Massachusetts Department of Telecommunications and Energy; the Alberta Energy & Utility Board; the Idaho Public Utility Commission; the Louisiana Public Service Commission; the State Corporation Commission of Kansas; the Oklahoma Corporate Commission; the Public Service Commission of South Carolina; Railroad Commission of Texas – Gas Services Division; the New York Public Service Commission; Illinois Commerce Commission; the Indiana Utility Regulatory Commission; the California Public Utilities Commission; the Federal Energy Regulatory Commission ("FERC"); the Arkansas Public Service Commission; the Public Utility Commission of Texas; Maryland Public Service Commission; Washington Utilities and Transportation Commission; The Tennessee Regulatory Commission; the Regulatory Commission of Alaska; Minnesota Public Utility Commission; Utah Public Service Commission; District of Columbia Public Service Commission; the Mississippi Public Service Commission; Delaware Public Service Commission; Virginia State Corporation Commission; Colorado Public Utility Commission; Oregon Public Utility Commission; South Dakota Public Utilities Commission; Wisconsin Public Service Commission; Wyoming Public Service Commission; the Public Service Commission of West Virginia; Maine Public Utility Commission; Iowa Utility Board; Connecticut Public Utilities Regulatory Authority; New Mexico Public Regulation Commission; Commonwealth of Massachusetts Department of Public Utilities; Rhode Island Public Utilities Commission and the North Carolina Utilities Commission.

Q. Have you had any additional education relating to utility plant depreciation?

A. Yes. I have completed the following courses conducted by Depreciation Programs, Inc.:

"Techniques of Life Analysis," "Techniques of Salvage and Depreciation Analysis," "Forecasting Life and Salvage," "Modeling and Life Analysis Using Simulation," and "Managing a Depreciation Study." I have also completed the "Introduction to Public Utility Accounting" program conducted by the American Gas Association.

Q. Does this conclude your qualification statement?

A. Yes.

The York Water Company
130 East Market Street
York, PA 17405

Attention Mr. Matthew E. Poff
Chief Financial Officer

Pursuant to your request, we have conducted a cost of service allocation study based on proforma revenue requirements estimated for the test year ended February 28, 2027, and have prepared proposed rate schedules designed to produce the pro forma revenue requirements.

The attached report presents the results of the study, as well as supporting schedules which set forth the detailed cost allocation calculations. Schedule A presents a comparison of the cost of service by customer classification with the pro forma revenues produced by each classification under present and proposed rates.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

THE YORK WATER COMPANY

COST OF SERVICE ALLOCATION STUDY
AS OF FEBRUARY 28, 2027
AND PROPOSED CUSTOMER RATES

PART I. INTRODUCTION

PLAN OF REPORT

The report sets forth the results of the cost of service allocation study as of February 28, 2027, prepared for The York Water Company. Part I, Introduction, contains statements with respect to the basis of the study, the procedures employed, and a summary of the results of the study. Part II, Cost of Service by Customer Classification, presents detailed schedules of the allocation of costs to customer classifications, as well as the bases for the allocations. Part III, Proposed Customer Rates, sets forth the proposed rate structure, the application of present and proposed rates to the consumption analysis and comparisons of customers' bills under present and proposed rates.

BASIS OF THE STUDY

The purpose of the study was to allocate costs to several customer classifications within the gravity and repumped service areas based on considerations of quantity of water consumed, variability of rate of flow, and costs associated with metering, billing and accounting. The allocation study was based on recognized procedures for allocating the several categories of costs to customer classifications in proportion to each classification's use of the facilities, commodities and services which entail the total cost of providing water service.

ALLOCATION PROCEDURES

The allocation study was based on the Base-Extra Capacity Method for allocating costs to customer classifications. The method is described in the 2017 and prior editions of the Water Rates Manual, published by the American Water Works Association. The four basic categories of cost responsibility are base, extra capacity, customer and fire protection costs. The following discussions present a brief description of these costs and the manner in which they were allocated.

Base Costs are costs that tend to vary with the quantity of water used, plus costs associated with supplying, treating, pumping and distributing water to customers under average load conditions, without the elements necessary to meet peak demands. Base costs were allocated to customer classifications on the basis of average daily usage.

Extra Capacity Costs are costs associated with meeting usage requirements in excess of the average. They include operating and capital costs for additional plant and system capacity beyond that required for average use. The extra capacity costs in this study are subdivided into costs necessary to meet maximum day extra demand and costs to meet maximum hour extra demand. The extra capacity costs were allocated to customer classifications on the bases of each classification's maximum day and hour usage in excess of average usage. (Extra capacity costs related to fire protection are allocated directly to the fire protection classifications.)

Customer Costs are costs associated with serving customers regardless of their usage or demand characteristics. Customer costs include the operating and capital costs related to meters and services, meter reading costs, and billing and collecting costs. The customer costs were allocated on the bases of the relative cost of meters and services, the number of meter readings and the number of bills.

Fire Protection Costs are costs associated with providing the facilities to meet the potential peak demand of fire protection service. Fire protection costs are subdivided into costs to meet Public Fire Protection and Private Fire Protection demands. Operating and capital costs for hydrants were allocated to Public Fire Protection for the gravity and repumped service areas on the basis of the number of hydrants. The extra capacity costs assigned to fire protection service were allocated to Public and Private Fire Protection on the basis of the total relative demands of the hydrants and fire service lines.

Public fire costs exceeding 25% of the public fire cost of service were reallocated to the other classifications within the gravity and repumped service areas. Such costs cannot be recovered from public hydrant rates, in accordance with Section 1328 of the Public Utility Code, and therefore have become the permanent responsibility of the remaining classes.

RESULTS OF STUDY

The data summarized in Schedule A, "Comparison of Pro Forma Cost of Service with Revenues Under Present and Proposed Rates for the Twelve Months Ended February 28, 2027," constitute the principal results of the allocation study.

The cost of service by customer classification, shown in column 2 of Schedule A, is developed in Schedule D, "Cost of Service as of February 28, 2027, at Proposed Revenue Level Allocated to Residential, Commercial, Industrial and Fire Protection Customer Classifications". The allocation of the total cost of service to the several customer classifications was performed by applying the allocation factors referenced in column 2 to the cost of service by account in column 3. The bases of the allocation factors are presented in Schedule E.

Schedule F, "Summary of Average Daily Send-Out and Maximum Daily and Hourly Usage for the Years 2000-2024," presents the experienced maximum day and hour ratios for the overall system. Schedule G, "Basis for Allocation of Demand-Related Costs of Fire Service to Private and Public Fire Protection," presents the calculation of the total relative demand of fire hydrants and fire service lines.

DESIGN OF PROPOSED RATES

The results of the cost of service allocation study were discussed with Company management in order that it be afforded the opportunity of performing its role in the design of proposed rates. The rate design guidelines developed during the discussion were (1) increase the existing public fire hydrant rates so that such rates are sufficient to recover 25% of the cost of service in accordance with Section 1328 of the Public Utility Code; and (2) increase all other rates by varying percentages to achieve the total revenue requirement and to move revenues by class toward the indicated cost of service for each classification.

The proposed rate structure, as presented in Part III, Proposed Customer Rates, Schedule I, consists of customer charges by meter size and consumption charges by class and service area. The revenues resulting from the proposed rate structure are shown in columns 6 and 7 of Schedule A, and reflect the movement toward cost of service with each classification's increase indicated in column 9.

Pursuant to Section 1328 of the Public Utility Code, public fire hydrant rates were increased so that existing rates are sufficient to recover 25% of the cost of service.

The application of the present and proposed base rates to the pro forma consumption analysis is set forth in Schedule J. Comparisons of bills under present and proposed base rates are shown in Schedule K.
