Re: Docket No. M-2025-3054271

I am very concerned that the state of Pennsylvania is ignoring facts of physics and economics when it supports the rapid expansion of data centers fueled by gas. Burning gas to make electricity is more expensive than using solar & wind sources of electricity and burning gas is much less efficient. I don't want to be paying to clean up wasted assets.

I support the following statement from the Better Path Coalition and No False Climate Solutions PA. “The problems being addressed in PUC’s tentative order are largely manufactured ones resulting from the state’s rush to get into the data center business before the boom goes bust. As is too often the case, the public is only engaged after the big decisions are made. Our first opportunity to comment comes when the only things left to decide are how to deal with the new project/business/industry. At that point, advancement of the thing under consideration is taken to be an inevitability when it really isn’t. Therefore, we feel it is important to state up front that we oppose the approval of hyperscale data centers in Pennsylvania based on many well-documented concerns about their environmental, health, safety, climate, quality of life, economic, and ethical impacts that scattershot regulations across agencies, in this case tariffs, cannot address. Our regulatory agencies should be our advocates, using their expertise to stop the state from creating preventable problems rather than resigning themselves to managing them.”

I do not want my taxes to pay for AI development or for cryptomining. Both of these technologic developments are of very limited benefit considering the costs they bring by enslaving us to decades more fracking with all its harms. Exporting gas as LNG is extremely wasteful and leads to increased cost of gas generated electricity in the US.

Electricity generation is not regulated in Pennsylvania, so the tariff only pertains to distribution costs. If approved, the tariff would not protect the public from generation costs which account for roughly 45% of consumer energy bills. Carnegie Mellon and its research partners projected that electricity generation costs will increase by as much as 25% by 2030.

Carnegie Mellon and its research partners say that already “Virginia's data center growth drives increased fossil fuel use in nearby states like Ohio, Pennsylvania, and West Virginia, potentially undermining state and regional climate goals.”, According to Carnegie Mellon and its research partners, “Power sector emissions could increase 30% compared to scenarios without data center growth, reaching 275 million metric tonnes of CO2 annually by 2030. That matches the entire annual carbon output of France.”, Natural gas would be used to power data centers. Methane leaks occurring at every step of natural gas

production, transmission, and distribution exacerbate climate change. Hundreds of thousands of legacy wells leaking methane unchecked further add to the state's contribution to the climate crisis. Continued and even increased natural gas production to power data centers is unacceptable.

Throughout the discussion of the tentative order, the PUC's disposition fell short of imposing the most stringent requirements on large load customers. Therefore, the tentative order is weak and inadequate., The reporting requirements are out of step with the state's efforts to fast-track data center approvals. The tentative order states that compliance reports must be filed on an annual basis by the end of the first quarter of the following year. Compliance data should be available on a real-time basis so that pertinent information is accessible as future data centers are fast-tracked.

Be aware that air temperature has increased every year, because of the continued burning of fossil fuels. More people die of heat related illness every year. The decisions of PUC that drive irresponsible growth with further increases in burning gas to make electricity will cause great damage to residents of Pennsylvania.
