In regards to the use of electricity by data centers I am opposed to those entities paying the same rate as residential consumers. My husband and I have made a significant investment this year in adding a solar grid to our property for two reasons, the first being to help reduce our electric bill which has been climbing significantly over the past few years. The second being our belief in green energy to help reduce climate change. At the very least commercial customers should pay a higher rate than residential customers and not suck energy at the cost of those who cannot afford it.
