

I am submitting public comment to oppose any decision that allows AI-driven hyperscale data centers to shift grid expansion and transmission costs onto residential customers and small businesses.

These facilities are uniquely energy-intensive and are driving the need for new infrastructure. Ratepayers should not be forced to subsidize corporate operations that generate enormous private profit while increasing public cost and grid risk.

Please prioritize consumer protection, grid reliability, and fairness by requiring these companies to pay the full cost of the infrastructure they necessitate.
