I do not support the construction of large data centers in Pennsylvania. These facilities place enormous strain on our land, water, and power systems, creating a real risk of lasting environmental damage, all while offering minimal benefit to local communities.

If they are allowed at all, they must **produce more than they consume-at least 150% before construction-**so they reduce, rather than increase, our costs. There should be a per-gallon tax on all water used and a binding requirement to employ local labor. If local labor is not utilized, these companies should be required to fund training programs for future workers at their own expense.
