Pennsylvania ratepayers are already subsidizing Big Tech's grid build-out across the region. Rates for water and electricity have increased significantly over the past year. Now, the Pennsylvania Public Utility Commission is considering decisions that could lock in even more cost-shifting onto everyday households and small businesses. This is unacceptable! Residential customers and small businesses should be strongly protected from the costs of data centers by requiring the owners to fully pay for any grid/transmission upgrades and by paying a higher rate for electricity and water so that residential rates do not increase as a result of the greatly increased energy and water needs of these data centers. Residents and small businesses do not share in the private profits of large load consuming corporations, so accordingly, the costs associated with grid updates and increased competition for energy and water should never be paid by residents and small businesses. Additionally, residential power and water needs should always be priority over any data center needs in times of high usage or times where energy and water needs exceed capacity. Residents should never bear any cost financially or in energy or water availability for the data centers which will also cause noise and air pollution decreasing quality of life. Water and energy needs of residents and small businesses should always be prioritized over A.I. needs.
