DIRECT TESTIMONY OF BRETT NOLT ON BEHALF OF KELLY ROAD SOLAR, LLC, LANCASTER AVENUE SOLAR, LLC, AND TWILIGHT RENEWABLES, LLC

Solar Projects' Statement No. 1
July 15, 2025

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. I am Brett Nolt, and I reside at 23 Snyder Hill Road, Lititz, PA 17543.

Q. BY WHOM ARE YOU EMPLOYED AND WHAT IS YOUR JOB TITLE?

A. I am CEO and owner of Twilight Renewables.

Q. WHAT IS YOUR RELATIONSHIP TO KELLY ROAD SOLAR AND LANCASTER AVENUE SOLAR?

A. I am the owner of Kelly Road Solar LLC, as well as the EPC contractor for the Lancaster Avenue Solar LLC Project.

Q. CAN YOU PLEASE DESCRIBE WHAT YOUR COMPANY DOES?

A. Twilight Renewables is a solar construction contractor that I own. I also originate and develop solar projects for personal ownership outside of Twilight Renewables.

Q. HOW MANY SOLAR PROJECTS HAVE YOU DEVELOPED IN THE CITIZENS OF LEWISBURG TERRITORY?

A. Twilight has developed 6 rooftop solar projects in Citizens Territory:

- (2) solar projects that are currently in operation (180kWAC, and 360kWAC).
- (2) projects currently under construction (360kW & 360kW).
- (2) projects that are currently in the development process to be constructed late 2025/ early 2026 (480kW & 480kW).

Q. WHEN YOU SAY ROOFTOP, DO YOU MEAN RESIDENTIAL ROOFTOP OR COMMERCIAL ROOFTOP?

A. Commercial rooftops, specifically barns, used for poultry operations.

Q. WHAT IS THE OUTPUT OF THE OPERATING PROJECTS?

A. The 6 projects combined are rated at 2.22MW AC and produce roughly 4,100,500 kWh a year.

Q. WHEN YOU CONSTRUCTED THE OPERATING PROJECTS WAS THERE ANY COMMUNICATION WITH CITIZENS THAT SUGGESTED THAT CITIZENS WOULD BE ALTERING ITS METHODOLOGY FOR CHARGING CUSTOMERS OF YOUR SIZE?

A. No.

Q. WHEN DID YOU FIRST LEARN OF THE PROPOSED CHANGES TO CITIZEN'S TARIFF?

A. I received an email from Patrick Anderson, senior director of engineering and operations, that notified me of this proposed change on Friday 5/16/2025.

Q. WERE YOU IN A POSITION TO ADJUST YOUR PLANS IN RESPONSE TO THE PROPOSED CHANGES?

A. No. The 50% down payment for the $160,000 in grid upgrades to accommodate the (2) projects currently under construction were paid on 3/31/2025 and 4/28/2025. Once the upgrades are paid for, it signals that the customer is at a point where they cannot "turn back", as the construction contract is signed, and the grid upgrade costs are committed to and Citizens has begun construction. The (2) projects that are currently under development

were submitted on 5/5/2025 and 5/7/2025, and the down payment for grid upgrades for (1) of these was paid on 7/11/2025.

Q. CAN YOU EXPLAIN WHAT CITIZENS HAS PROPOSED WITH REGARDS TO CUSTOMER GENERATORS OF YOUR SIZE?

A. First, Citizens has changed the definition of billing demand. I provide two examples of the impact below.

Q. WHAT ARE THE EFFECTS ON NET METERED SOLAR PROJECTS OVER 400KW THAT PRIMARILY PROVIDE POWER FOR OFFSITE USAGE (EITHER VIRTUAL NET METERING FROM A CUSTOMER SITE, TO A DIFFERENT SITE OPERATED BY THAT SAME CUSTOMER DUE TO SITING CONSTRAINTS, OR SIMPLY SELLING POWER TO CITIZENS) IN THE GLP-1 RATE CLASS:

- The tariff will institute a new demand charge for power being sent to the grid and will increase distribution costs for a 480kW (933,000 kWh/yr) generator from $264/year to $26,000/year. This increase is equivalent to 2.787 cents per kWh of cost, which is a >9700% increase in rates that impacts only generators, with no demonstration of increased costs.
- The tariff would immediately re-classify any solar project rated over 400kWAC from GSSR-1 (a retail rate averaging 8.565 cents/ kWh the last 10 years) down to GSSR-2 (a wholesale LMP rate of and average of 3.238 cents per kWh). From an operational perspective, based on data from 5/18/24 - 5/18/25, using a PA solar array overlaid to LMP pricing. The energy revenue will decrease by 62% .

- This combination of decrease in revenue and increase in cost will provide net a revenue for a generator of this size of .451 cents per kWh or $4,207.83/year for the electricity they produce.
- When taking into consideration the fact that a 734kWDC/480kWAC Solar system costs roughly $1,285,200 upfront with $6,600 of annual operating costs (maintenance & insurance), plus 90% financing at 7% interest amortized over 25 years, the yearly payments and operating cost for a 480kWAC System owner are $104,702, compared to $32,207 in income.

Q. WHAT ARE THE EFFECTS ON COMMERCIAL NET METERED SOLAR PROJECTS UNDER 400KW THAT ARE DESIGNED TO OFFSET 95% OF ONSITE USAGE IN GLP-1 RATE CLASS?

A. The tariff will institute a new demand charge for power being sent to the grid that will be approximately 126% higher than the current tariff. The rate impact will vary on a case-by-case basis, depending on the demand charge being paid before solar was installed. (See Exhibit BN-1 (Shelmar Acres)). This Exhibit is a case study on an operational solar array. In this example, an agricultural operation that uses roughly 253,000kWh annually and has an average monthly demand of 58kW. To offset 95% off the usage (240,000kWh), a 204kWDC/146kWAC solar system is required to be installed. So instead of paying distribution charges for 58kW of demand without solar, they now will pay distribution charges for 146kW. Instead of paying $3,120/year for demand charges, this customer now is paying $7,908/year. This represents a 153% increase in cost for the customer if the customer decides to offset their own usage with solar. Equivalent to 1.995 Cents per kWh

of increased cost. Unfortunately, this equation changed after the owner of Lancaster Avenue Solar LLC invested in a solar system.

This increase in cost will net the generator 6.57 cents per kWh (10 year price to compare average of 8.565 cents/kWh – 1.995 Cents of distribution charges) or $15,768/year in revenue for electricity.

A 204kWDC/146.5kWAC Solar system costs roughly $357,000 upfront with $800 of annual operating costs (maintenance & insurance). With 90% financing at 7% interest amortized over 25 years, produces yearly payments and operating cost for a 146kWAC System owner of $29,050. Compared to $22,968 in income. It is generally understood that solar impacts peak demand of commercial customers by 0-10%, meaning that under the existing tariffs, customers are already paying their fair share.

Q. WHAT WILL BE THE IMPACT OF THESE CHANGES?

A. In summary, based on the above financial picture in both examples, this tariff will ensure no solar of this type over 400kW will get built in this territory and will cause immediate and irreparable financial harm to solar arrays of this type placed in service before this tariff change, if not grandfathered. Customers with commercial systems below 400kW that are offsetting usage will be unable to adequately service debt payments as well due to the 153% increase in distribution costs.

Q. HOW ARE DISTRIBUTION CHARGES CALCULATED PRESENTLY?

A. Calculated solely based on what customers use from the grid.

Q. HOW EXACTLY HAS CITIZENS PROPOSED TO CALCULATE DISTRIBUTION CHARGES MOVING FORWARD?

A. Distribution charges will be calculated on either what customer uses from the grid, or what the customer provides to the grid, even at times of extreme demand when distributed generation is helping grid congestion. These charges will be based on demand, kW, not usage, kWh. And since the company is proposing to charge distribution based solely on kW, generation will not offset any distribution charges.

Q. WHAT PROCUREMENT CLASS ARE YOUR PROJECTS SITUATED IN PRESENTLY?

A. Under the current tariff, all projects would be in GSSR-1, because demand (as it is currently defined) for 5 of the 6 projects are essentially 0. Far from the 400kW threshold requiring customers to go to GSSR-2.

Q. EXPLAIN HOW CITIZENS PROPOSES TO CHANGE THE QUALIFICATIONS FOR THOSE PROCUREMENT CLASSES?

A. Rate classes are structured around the amount of demand needed at your site, historically power used at your site. Redefining demand puts a 480kW solar array in the same class as a large 480kW demand, a manufacturing plant for example, even though there are major differences between the two, with the solar array being a lot more flexible with grid support functions, and the ability to go offline immediately.

Q. WHAT WILL THE CONSEQUENCES BE FOR YOUR PROJECT FROM THE PROPOSED CHANGES TO THE GSSR I AND GSSR II PROCUREMENT CLASSES?

A. I will not be able to service the debt on the project and I will suffer irreparable harm.

Q. HOW IS THE RATE THAT CUSTOMERS WILL BE CHARGED FOR ENERGY IN THE GSSR 2 TO BE CALCULATED?

A. Hourly RTP Energy Charge (This is the LMP) will include the following:

- Capacity Charge
- Transmission Charge
- RTEP Charge
- Administrative Charge (this is the costs incurred by the company and its wholesale supplier to manage energy procurement and delivery)
- Gross Receipts Tax

Q. WILL THIS METHODOLOGY BE THE SAME METHODOLOGY APPLIED TO CUSTOMERS WHO GENERATE ENERGY IN EXCESS OF WHAT THAN THEY CONSUME IN A YEAR?

A. No, customer generators will be paid only at the LMP for excess generation.

Q. HOW VOLATILE IS THE PJM LMP PRICE MECHANISM?

A. Extremely volatile.

Q. IS THE LMP RATE A WHOLESALE RATE?

A. Yes.

Q. DOES THE LMP RATE SOMETIMES FALL BELOW 0?

A. Yes.

Q. IS THE RATE THAT WILL BE APPLIED TO EXCESS GENERATION FROM ONE OF YOUR PROJECTS BE THE SAME RATE IN EACH HOUR THAT WILL BE CHARGED TO OTHER GSSR II CUSTOMERS THAT ONLY CONSUME ELECTRICITY?

A. No, because LMP is the only metric being used for reimbursement. GSSR II customers that consume pay for transmission, capacity etc. in addition to LMP.

Q. DOES LMP RATE VARY EVERY HOUR?

A. Yes

Q. HAS CITIZENS PROPOSED TO ALLOW CUSTOMER GENERATORS TO CHOOSE WHETHER TO BE ON THIS VARIABLE RATE?

A. No, if the system is over 400kWAC, you are forced into GSSR-2.

Q. DOES THE LMP RATE CHANGE MORE FREQUENTLY THAN QUARTERLY?

A. Yes.

Q. EXPLAIN HOW DEMAND CHARGES ARE CALCULATED PRESENTLY?

A. Highest electrical usage of any 15-minute period in a billing month (in kW)

Q. EXPLAIN HOW CITIZENS HAS PROPOSED TO CALCULATE DEMAND CHARGES IN THE FUTURE?

A. Calculated to reflect the customer "use of the distribution system", which will be the greater of Gross generator Rating (kW AC) as stated in the generators interconnection application,

or the maximum demand of the customer during any 15-minute period during the current month. This means that for every generator, their demand is based on the nameplate capacity of the system, which will always be greater than actual maximum demand.

Q. HAS CITIZENS PROPOSED TO INCREASE DEMAND CHARGES FOR CUSTOMER GENERATORS OR OTHER COMMERCIAL CUSTOMER RATE CLASSES?

A. GLP-1 is going up from $3.74/KW to $4.52/KW for all traditional customers, representing a 20% increase. Customer Generators are hit with a 153%-9,700% increase depending on the situation.

Q. IS IT TRUE THAT DEMAND CHARGES ARE BASED ON KW'S OR ON DEMAND RATHER THAN KWH'S WHICH ARE BASED ON ENERGY FLOW?

A. Correct.

Q. HAS CITIZENS PRESENTED ANY DATA TO DEMONSTRATE THAT THERE ARE ADDITIONAL COSTS THAT CUSTOMER GENERATORS IMPOSE ON THE DISTRIBUTION SYTEM, LET ALONE COSTS THAT SUPPORT AN INCREASE 50 TIMES THAT OF CONSUMING CUSTOMERS?

A. No. Not a single witness has offered any data to demonstrate any basis for that claim, it is pure conjecture. **(**See Exhibit BN-2; Citizens' Electric of Lewisburg's response to Solar Project's Set I, No. 14). It is clear that there is no hard data to confirm Citizen's allegations of harm.

Q. **DO YOU HAVE ANYTHING FURTHER TO ADD AT THIS TIME**?

A. No, and this concludes my direct testimony.

EXHIBIT BN-2

SP-I-14

With regard to Mr. Johnson's statement at page 8, lines 5-8 of Citizens' Statement No. 4, that the introduction of net metering will cause a 5,000,000 kWh reduction in Citizens' sales revenue, explain in detail the cause and effect that Mr. Johnson anticipates.

a. Provide all documents consulted by Mr. Johnson to form his conclusion.
b. Provide all facts relied upon by Mr. Johnson as a basis for his conclusion.

Response Provided By:
Nathan Johnson, President & CEO, Citizens' Electric Company

Date: June 26, 2025

Response:

The Company's projection that approximately 5,000,000 kWh would be lost from the 2022 Rate Case to FPFTY 2026 does not claim that the entire 5,000,000 kWh loss is directly and solely due to net metering, but rather that net metering and energy efficiency efforts are notable contributors to the loss. See the attachment titled SP-I-14 Attachment A for a calculation of kWh consumption reductions by new net-metered customer-generators from 2022 through 2024. This analysis shows approximately 2,000,000 kWh lost to net-metered generation during this time. At the current rate of development, the Company expects approximately 1,000,000 kWh in additional offset annually, which would result approximately 4,000,000 kWh lost to net-metered generation by FPFTY 2026, as in indicated in Statement No. 4.

SURREBUTTAL TESTIMONY OF BRETT NOLT ON BEHALF OF KELLY ROAD SOLAR, LLC, LANCASTER AVENUE SOLAR, LLC, AND TWILIGHT RENEWABLES, LLC

Solar Projects' Statement No. 1-SR
August 28, 2025

Q. Please state your name and business address.

A. I am Brett Nolt, and I reside at 23 Snyder Hill Road, Lititz, PA 17543, which is my business address as well.

Q. By whom are you employed and what is your job title?

A. I am CEO and owner of Twilight Renewables

Response to Citizens' Witness Nathan Johnson

Q. In his Rebuttal Testimony at Page 15, Line 9 and 10, Mr. Johnson suggests that paying customer generators at the GSSR-1 PTC would constitute an "unreasonable subsidy", how do you respond?

A. Compliance with the Alternative Energy Portfolio Standards Act of 2004 (which requires compensation for electricity from net metered systems be at the full retail value) should not be construed to be an unreasonable subsidy. This legislated mandate has been in place for over 20 years.

Q. On Page 15, Line 15 of his Rebuttal Testimony, Mr. Johnson admits that "some customer generators" will be charged substantially more for distribution demand, how do you respond?

A. A very common goal desired by customers looking into solar, is to offset 100% of their usage. Such a system fully shields them from long-term electric generation/transmission price volatility. Typically, only when space constraints arise do customers settle for less than 100% offset. In my experience, all non-residential customers for whom I have built

systems, (which produce 100% (+/- 10%) of their electrical usage) see more real-time production demand (kW), than usage demand (kW) during midday hours most days out of the year. Therefore, a very common customer goal of a 100% usage-offsetting solar array will almost always trigger increased demand charges under the proposed Citizens Tariff unless the load is perfectly in sync with generation during peak generation hours. That means that even a system designed only to offset usage will still incur substantial rate increases under Citizens' proposed tariff.

Q. In his Rebuttal Testimony at Page 16, Lines 1-3, Mr. Johnson claims that if a customer with demand already exceeding 400 kW were to install solar to offset a portion of their load, they would see little increase in demand charges. How do you respond?

A. In my experience, almost all businesses I deal with that are in a real-time pricing rate class (over 400kW in Citizen's case) lock into fixed price contracts with an electric generation supplier to fix their costs. They don't want to be subject to real time price volatility. However, electric generation suppliers are not required to offer net metering to customers. All suppliers that I have dealt with that do offer net metering include components in addition to LMP's (the capacity, transmission, etc.). I cannot recall a single supplier that reimburses for excess electricity in an energy year. If the customer produces 110% of their usage in a year (due to business decline, energy efficiency upgrades over time etc.) 10% of the production value cannot be monetized. For such customers, there would be a change. However, it is very common for construction of a solar system to void a supply contract, and return the customer to default utility service, where the value of the solar generation is now limited to only LMP as Mr. Johnson stated, and do not include other components

(capacity, transmission, RTEP, e-factor etc.). This could change their rate significantly. In a situation where the customer is only offsetting less than 50% of their usage with a solar generator and has a relatively normal usage profile, there is a good chance that the usage demand number will still be the demand number utilized for billing under the new tariff, resulting in no excess demand charges.

Q. On page 17 of his Rebuttal Mr. Johnson includes a table. Do you have any comments regarding this table?

A. Per my Exhibit: "*BN-1 Excel Form Corrected with Added Detail for Set III"* the real-world agricultural case study suggests a customer offsetting 95% of their usage, that has an average peak demand of 57kW, would be required to install a 146kW generator that operates close to this rating at least once a month in order to meet its consumption. This result aligns best with row 2 of Mr. Johnson's table "50kW Import, 150 kW Gen GLP-1". The resulting change to that customer is a bill going from $2,108/yr to $7074/yr. This is the most common scenario**.**

Q. On page 18, Lines 18-21 of his Rebuttal, Mr. Johnson criticizes your Exhibit BN-1, how do you respond?

A. The method of calculating demand charges is not flawed. Per the table in BN-1, column 4 indicates "Pk KW 3P Usage." Pk meaning peak. I averaged out the peak demand of every month for 4 years to use in my calculations, not the average. Nonetheless, it is not surprising that my "flawed" method of calculation produced the same result as Mr. Johnson's method.

Q. In his Rebuttal at page 18 lines 21-22, and page 19, lines 1-2, Mr. Johnson criticizes your calculation of the generation rate. How do you respond?

A. See Updated *"Citizens Electric Price to Compare Average"* (**Attached as Exhibit BN - 3**). In the exhibit, I weighted the length of time price each price was in effect. The figures are very similar, and they do not change the findings. The average in my testimony was $.08565/kWh. Weighting by length of time produces a result of $.08361/kWh.

Q. In his Rebuttal on Page 19 lines 6-12, Mr. Johnson suggests that your analysis would have a solar project losing money even without the proposed changes. How do you respond?

A. This example was meant to bring to light existing financial pressure with the current tariff, with debt amortized over almost the entire system's useful life, let alone what is being proposed. Financers and wise investors manage their downside risk. We feel that the 10-year average PTC is a good baseline to conservatively model cashflow for the future, while fully realizing there is upside potential in electric rates, as we have seen in the past 2 years. It is true that $.08XX/kWh power for these types of projects is breakeven in a lot of cases. Therefore, a loss of $1,294 in one year cannot be presumed for 25 years. Hence why the new tariff is an existential issue for customers who built projects under the current tariff but are subject to new tariff rules. If rates were to return to an average $.085/kWh for GSSR-1, and a $.03xxx/kWh's worth of distribution charges are introduced, the customer is under water.

Q. On page 20 of Mr. Johnson's Rebuttal at Lines 1-6, he criticizes your singular use of solar projects in your examples, how do you respond?

A. From Discovery it was learned that all (99) customer generators in Citizens Electric territory are fueled by solar. For that reason, for the purposes of my testimony in this case, I have been using "customer generator" and "solar generator" interchangeably. I understand the confusion and understand that a customer generator fueled by a different source will have different peak demand characteristics, but none of those are yet on Citizens' system.

Q. On page 21 of his Rebuttal Testimony at Lines 13-17, Mr. Johnson addresses your suggestion that such radical changes to the Citizen's tariff, which will financially devastate existing customers, should contain a "grandfathering" provision and not apply to existing customers? How do you respond ?

A. A fundamental definition change, and new methodology for billing customers, with some customers being affected by more than 1000% rate increases is completely out of line and needs to be subject to some sort of grandfathering clause. The Company's "phase-in" of some of the charges is not nearly sufficient considering the life of the assets.

Q. On Page 22 of his Rebuttal at lines 13-26, Mr. Johnson proposes the above-mentioned phase-in. Will this be sufficient to address the harm the changes will cause?

A. All of the systems in service are less than 1 year old and have a 30-year service life. Phasing in from 70%-100% in the first 3 years does not come close to fixing fundamental issues at hand.

Q. In his Rebuttal Testimony at page 23, lines 21-22, Mr. Johnson admits that Citizens has relied entirely on the Commission's decision in the UGI case, a case which is currently under appeal. How do you react?

A. I think that it is reckless to base tariff changes of such magnitude on a case where the issues and outcome are disputed and the courts have yet to address the substance of the appeal.?

Q. In Mr. Johnson's Rebuttal at Page 30, lines 15-21, he suggests that you don't know what size transformer is needed for specific loads. What is your response?

A. On all 4 systems in operation, 100% percent of the service costs were covered by the customer, including wiring and transformers, all of which has a lifespan equal to or greater to the solar array lifespan. Mr. Gorman's table on page 17 line 9 of his rebuttal shows the utility charging $22,000/year or $660,000/system life for a 500kVA service that was paid for, in full, by the customer before the system was active.

Q. Mr. Johnson claims that your argument that your distinction between a manufacturing plant load and a customer generator's production is misplaced, and that solar facilities are non-dispatchable on the Citizens' system, how do you respond (Citizens St. 4-R, page 31, lines 15-16)?

A. Other PA utilities have PUC approval to install DER devices that interface with Inverters for power quality/grid reliability reasons. I would assume Citizens has the regulatory ability to utilize settings in customer supplied inverter equipment to strengthen their grid. Citizens chooses not to utilize those benefits, to the detriment and cost of their customers.

Q. Mr. Johnson's Rebuttal at page 31 Lines 22-23, and page 32, at lines 1-3, criticizes your claim that the proposed compensation method for excess generation artificially diminishes the reimbursement, how do you respond?

A. That fact that billing cycle crediting for excess kWh only happens once a month, and kWh's are monetized only once a year does not change the value of the kWh. It is still calculated hourly, and so remains very volatile. Weighted by solar availability, there is on average a $.05/kWh loss in electric value when a customer is moved from GSSR-1 to GSSR-2. Yearly cashflow constraints of being paid only once per year is not the issue that we are concerned about, it's the value of our product being severely reduced.

Q. On page 32 of his Rebuttal, Mr. Johnson claims that the GSSR-2 rate will be a retail rate, do you agree?

A. No, if it were a retail rate, and not just passing through "several" wholesale costs, it would look like GSSR-1. The law requires "full retail value", not a contrived retail "rate" and what Mr. Johnson is proposing does not pass muster.

Q. In Mr. Johnson's Rebuttal at page 32, line 14, he claims that you incorrectly state that a customer generator's "Gross Generator Capacity will always be greater than actual maximum demand." How do you respond?

A. This statement was directed solely looking at the generator independent of any load. A 400kW rated generator will never read 400kW at the utility metering point. The Generators are not 100% efficient, and there will be a small percentage of line loss leading up to the metering point. Metering will typically read somewhere between 392-399kW.

Q. In his rebuttal at page 32, Lines 18-20, Mr. Johnson again attacks your statements regarding Gross Generator Capacity ("GGC"); how do you respond?

A. The Luke Hoover system that Twilight Renewables installed is a good example of the negative impacts specifically Virtually Net Metered Customers. Under current PA net metering laws, a customer can install a Solar system at one site and offset metered accounts within 2 miles under the same utility account name/operation control. Luke Hoover had a brand-new roof (not available at any other location), and easily accessible 3 phase infrastructure at this location. By design, an oversized system was installed to cover the

farm usage at the site on which the solar was located, and the home farm less than 2 miles away, leaving some margin for solar degradation and future load growth.

Utilizing virtual net metering saves the customer from unnecessary construction costs attributed to interconnecting at multiple different service points. Because most of the land area in Citizen's territory is agricultural, it is very common for a farmer to own several farms with electric services within a 2-mile radius of the "home farm". This was the lowest cost solution for Luke Hoover under the existing tariff. This is very common situation solar contractors run into and is not limited just to my "rationale". The new tariff discriminates against a virtual net metering customers, due to the fact that they have to pay distribution charges equating to roughly $.03/kWh to put power into the grid from the solar site, and then pay distribution charges again at the electric service within a 2-mile radius to bring the power "back in" so to speak. I believe this goes against the very intent of Virtual net metering and net metering in general.

Q. In his Rebuttal on page 34 lines 7 & 8, Mr. Johnson suggests that you "could have" known about the UGI decision in February of this year when the decision was rendered, how do you respond?

A. I am not sure what Mr. Johnson is suggesting, but it is irrelevant to my initial point to suggest that I should have some interest in a PUC decision in a territory where I have no projects and could have known about the UGI decision before I did know about it.

Q. In his Rebuttal at page 34, line 10, Mr. Johnson discusses your not having demanded refunds of payments made to Citizens after learning of this case, how do you respond?

A. This is a ridiculous spin on actual events. Transformers were procured by Citizens for these specific projects, and active line construction was happening by Citizens towards the goal of interconnecting the solar generator in good faith prior to the payments being made. To say I could have requested a return of my deposits on May 15th, leaving citizens with unfinished/unneeded 3-phase line infrastructure, with costs being ultimately paid for by existing ratepayers is absurd.

Q. In his Rebuttal at page 34, line 12, Mr. Johnson claims that you proceeded with a project, even knowing about the changes Citizens was proposing. What is your response?

A. Apart from acknowledging that the proposed Citizens' changes are so arduous that it would seem reasonable to him that I withdraw my projects, I did indeed submit the Fairfield Road Solar Project's 50% utility upgrade down payment, in an effort to establish service at the facility and energize the solar array by the end of the year, prior to this case being decided by the PUC, or the Commonwealth Court's decision on the UGI case. The world does not stop under regulatory uncertainty. Several PA senate bills regarding net metering are introduced every year. To say no development should happen during regulatory uncertainty is absurd. We plan to energize new system under AEPS Law, under the current EDC tariff. Luke Hoover, and the Lancaster Avenue Solar Project were turned on last year and were in operation prior to the UGI default service proceeding. Disputing the fact that they will suffer irreparable harm is ridiculous.

Response to Citizens' Witness Gorman

Q. On page 16 lines 21-23 of his rebuttal testimony, Mr. Gorman claims that both your testimony and that of Mr. Lucas "clearly explain that avoiding distribution charges is a part of the incentive for their projects." How do you respond?

A. My testimony claims that non-residential customers that install systems to cover 100% of their electrical usage (+/-10%) will continue to pay usage demand charges as before. I claim that solar generation will affect usage distribution charges by 0-10% under the current tariff. Avoiding distribution charges is not part of the incentive here. Mr. Gorman is incorrect.

Q. On page 17 of his Rebuttal, at lines 6-7, Mr. Gorman suggests that the company needs the same assets to serve 400kw of load as it does 400 kW of generation – is he correct?

A. No. His answer ignores power quality differences. Power quality can be improved by DER as discussed in my testimony.

Q. In his rebuttal testimony at page 19, lines 12-13, Mr. Gorman suggests that generators will at some point use all of their capacity: is he correct?

A No. A 400kW rated generator will never read 400kW at the utility metering point. The Generators are not 100% efficient, and there will be a small percentage of line loss leading up to the metering point. Metering will typically read somewhere between 392-399kW. If a battery was introduced to limit output to of a 400kW solar generator to 200kW during the day, and exported stored power at night, that is a possibility as well to limit demand on the grid below the rated generator capacity.

Q. Does this conclude you Surrebuttal Testimony?

A. Yes.

I. INTRODUCTION AND QUALIFICATIONS

Q1. Please state for the record your name, position, and business address.

A1. My name is Kevin Lucas. I am the Vice President of Policy Analysis at the Solar Energy Industries Association ("SEIA"). My business address is 1425 K St. NW #1000, Washington, DC 20005.

Q2. Please summarize your business and educational background.

A2. I began my employment at SEIA in April 2017 as the Director of Rate Design and since January 2024 have been Vice President of Policy Analysis. SEIA is leading the transformation to a clean energy economy. SEIA works with its 1,200 member companies and other strategic partners to fight for policies that create jobs in every community and shape fair market rules that promote competition and the growth of reliable, low-cost solar power. Founded in 1974, SEIA is a national trade association building a comprehensive vision for the Solar+ Decade through research, education, and advocacy.

During my time at SEIA, I have developed testimony in rate cases on rate design and cost allocation; in integrated resource plans on resource selection and portfolio analysis; worked on net energy metering, virtual power plant, and distributed generation compensation mechanisms; and performed a variety of analyses for internal and external stakeholders.

Before I joined SEIA, I was Vice President of Research for the Alliance to Save Energy ("Alliance") from 2016 to 2017, a DC-based nonprofit focused on promoting technology-neutral, bipartisan policy solutions for energy efficiency in the built environment. In my role at the Alliance, I co-led the Alliance's Rate Design Initiative, a working group that consisted of a broad array of utility companies and energy efficiency products and service providers that sought mutually beneficial rate design solutions. Additionally, I performed general analysis and research related to state and federal policies

that impacted energy efficiency (such as building codes and appliance standards) and domestic and international forecasts of energy productivity.

Prior to my work with the Alliance, I was Division Director of Policy, Planning, and Analysis at the Maryland Energy Administration, the state energy office of Maryland, where I worked between 2010 and 2015. In that role, I oversaw policy development and implementation in areas such as renewable energy, energy efficiency, and greenhouse gas reductions. I developed and presented before the Maryland General Assembly bill analyses and testimony on energy and environmental matters and developed and presented testimony before the Maryland Public Service Commission on numerous regulatory matters.

I received a Master's degree in Business Administration from the Kenan-Flagler Business School at the University of North Carolina, Chapel Hill, with a concentration in Sustainable Enterprise and Entrepreneurship in 2009. I also received a Bachelor of Science in Mechanical Engineering, *cum laude*, from Princeton University in 1998.

Q3. Have you testified previously before the Pennsylvania Public Utility Commission ("Commission")?

A3. No, I have not.

Q4. Have you testified previously before other state utility commissions?

A4. Yes. I have submitted testimony in rate cases, integrated resource plans ("IRP"), utility merger proceedings, and renewable portfolio and energy efficiency resource standards before the Arizona Corporation Commission, the Colorado Public Utilities Commission, the Georgia Public Service Commission, the Illinois Commerce Commission, the Maryland Public Service Commission, the Michigan Public Service Commission, the Public Utility Commission of Nevada, the North Carolina Utilities Commission, the Public

Service Commission of South Carolina, the Public Utility Commission of Texas, and the Virginia State Corporation Commission. My complete CV is attached to my testimony.[1]

Q5. On whose behalf are you submitting testimony?

A5. My testimony is provided on behalf of Kelly Road Solar, LLC, Lancaster Avenue Solar, LLC, and Twilight Renewables, LLC (collectively, the "Solar Projects").

Q6. What is the purpose of your testimony?

A6. I review the application of Citizens' Electric Company of Lewisburg, PA ("Citizens'") in this proceeding. While the focus of my testimony is on this Citizens' proceeding, I also discuss related issues in the now-consolidated application of Wellsboro Electric Company ("Wellsboro") in Docket No. R-2025-3054392. The primary focus of my testimony is the implication of Citizens' and Wellsboro's (collectively, "the Utilities") proposals to change the way small commercial customer-generators would be assigned the GSSR-1 and GSSR-2 rate schedules. I review some of the discovery responses that shed further light on the mechanics of their proposals and the potential impact on their customers.

Q7. Please summarize your findings.

A7. I find the Utilities' proposal to introduce a new concept of Billing Demand based on hypothetical power flows is deeply flawed and recommend that it be rejected. Their proposal to charge customers based not on their actual use of the system but based on hypothetical, idealized use of the system results in unreasonable and unjust rates. Further, the use of Billing Demand could increase the distribution bills of customer-generators more than if they had never installed solar, despite potentially lowering their peak demand during times of higher grid stress. And despite all these negative outcomes, the Utilities propose to apply this definition to all existing and soon-to-be customer-generators, with no legacy customer treatment.

[1] Attachment KL-1, Kevin M. Lucas CV.

I also question the viability of the Utilities' proposal to shift from a kilowatt hour ("kWh")-based net metering rubric to a dollar-based net billing rubric for generation compensation for larger customers. It appears the proposal directly contradicts the underlying Pennsylvania net metering statute both by bifurcating the netting and compensation treatment of generation from distribution and transmission, and by shifting to a net billing construct. While the attorneys in this case will address the legal implications of the Utilities' proposals, I find that the policy implications of this shift are also troubling as they would require medium-sized businesses to take default service under a much more complex tariff that could have significant adverse impacts on their businesses.

Q8. Please summarize your recommendations.

A8. I recommend the Commission reject the Utilities' proposal related to Billing Demand and its use in charging and classifying customers for electricity service. I further recommend the Commission determine whether the proposed shift to a net billing structure for generation compensation comports with Pennsylvania law, but even if it technically does, reject it based on policy reasons.

II. THE UTILITIES' "BILLING DEMAND" PROPOSAL IS HIGHLY UNUSUAL, INAPPROPRIATE, AND FLAWED AND SHOULD BE REJECTED

Q9. What is the purpose of this section of your testimony?

A9. In this section of testimony, I provide an overview of the Utilities' Billing Demand proposal. I discuss several reasons why the definition is flawed and examine its impact on several customer-generators' scenarios. I respond to the Utilities' assertion that the Billing Demand definition is needed to avoid cost shifts to other customers. Finally, I discuss why the expansion of the Billing Demand concept from a different default service docket into distribution ratemaking is inappropriate and why the Utilities' new netting proposal may conflict with Pennsylvania law.

A. Billing Demand Proposal Overview

Q10. Please explain the Billing Demand Proposal advanced by the Utilities.

A10. The Utilities propose to introduce a new Billing Demand definition for use in both distribution rates and for classifying customers into the Default Service Generation Supply Service Rate ("GSSR") schedules. Billing Demand is defined as follows:

> Billing Demand shall reflect the Customer's use of the distribution system, which will be the greater of Gross Generator Rating (kW(AC)) as stated in the generator interconnection application or the maximum demand of the customer during any 15-minute period during the current month.[2]

For customers with distributed generation ("DG"), the Company proposes to use the larger of the net demand (e.g., native load less self-consumed DG energy) and the maximum DG generator rating, even if the latter is not actually attained in a given month. Moreover, the construction of the proposal means that the maximum DG generator rating will act as a permanent, 100% demand ratchet for the customer regardless of how their usage changes over time.

The Utilities also propose to use this new Billing Demand definition to assign non-residential customers to different distribution and Default Service rates. Both Utilities propose to base the non-residential tariff break points on the Billing Demand of a customer, rather than on their actual net usage of the grid. The proposed breakpoints and rates of the two utility's tariffs are shown below in Table 1.[3]

[2] Citizens' Statement No. 4, Direct Testimony and Exhibits of Nathan Johnson at 18. ("Johnson Direct").
[3] Citizens' Tab D, Supplement 172 ("Citizens' Tariff""); Wellsboro Tab D, Supplement 162 ("Wellsboro Tariff").

Table 1 – Non-Residential Customer Tariff Break Points			
	Small	**Medium**	**Large**
Citizens'	**GLP-1**		**GLP-3**
Demand Limits			>= 50 kW
Customer Charge	$21.00		$100.00
$/kW	$4.52		$6.91
$/kWh Flat	$0.01164		
$/kWh per kW			$0.01221 up to 30 kWh/kW
$/kWh additional			$0.00133
Wellsboro	**No. 3**	**No. 4**	**No. 5**
Demand Limits / Voltage	<= 7 kW / Secondary	> 7 kW / Secondary	> 50 kW / Primary
Customer Charge	$16.50	$32.03	$150.00
$/kW		$9.24	$14.00
$/kWh Flat	$0.15758	$0.03357	
$/kWh per kW			$0.02881 up to 130 kWh/kW
$/kWh additional			$0.00182

The Billing Demand will also be used to assign customers into either GSSR-1 or GSSR-2. Customers with a Billing Demand under 400 kilowatt ("kW") will be assigned to the GSSR-1 tariff, while those 400 kW or more will be assigned to the GSSR-2 tariff.[4]

Q11. What arguments are advanced to support this change?

A11. Both Utilities make similar but not identical arguments as to why the proposal is needed. Generally, the Utilities argue:

- Customers should pay for their use of the distribution system, and this use is best measured by either power flow from the utility to the customer or by the maximum amount of power a customer could generate.[5]
- There is not a meaningful difference in planning or utility operations depending on whether a customer imports power from the grid or a customer exports power to the grid.[6]
- The Commission's decision in the recent UGI Utilities, Inc. – Electric Division ("UGI") Default Service Plan proceeding should be extended beyond the power supply context and be used to determine distribution rates.[7]

[4] Citizens' Tariff, GSSR-1 Rider, GSSR-2 Rider.
[5] Johnson Direct at 17, Wellsboro Statement No. 4, Direct Testimony and Exhibits of Byron Farnsworth, Jr. at 23. ("Farnsworth Direct").
[6] Johnson Direct at 17, Farnsworth Direct at 23.
[7] Johnson Direct at 17-18 (discussing *Petition of UGI Utilities, Inc. – Electric Division for Approval of a Default Service Plan for the Period of June 1, 2025 through May 31, 2029, Docket No. P-2004-3049343, et al.)*, Farnsworth Direct at 22.

Q12. Do you agree with the Utilities on these points?

A12. No, I do not. As a primary matter, the Utilities' testimony on these points is very thin, with only a handful of paragraphs dedicated to what would be a seismic shift away from evidence-based cost of service ratemaking principles to impose rate design changes that would have outsized adverse impacts on certain customers. Utilities have the burden of proof in rate cases to show that the rates proposed are just and reasonable,[8] and the lack of detail in the Utilities' filings is very problematic. Taken in total, the proposals advanced by the Utilities are quite radical, and such an extreme proposal would need equivalent levels of support for the Commission to be able to approve it. That has simply not been provided in this case.

Moreover, each point contains a problematic jump in logic that is outside traditional ratemaking practices. The Utilities propose to bill customers not based on their actual demand levels, but on the potential power their generation systems could place on the system even if that value is never attained. It also transfers the Commission's settlement approval regarding power supply rates to its distribution rates, despite the dramatically different regulatory structure that governs these two different areas. I will discuss each of these issues in turn.

B. The Utilities' Proposed Billing Demand Definition is Flawed and Punitive

Q13. What are the issues with the Utilities' Billing Demand definition?

A13. There are three major issues with the proposed definition. First, the Utilities propose to apply the new definition to existing customers with no legacy customer or project treatment (*i.e.*, grandfathering). Second, it is not based on a customer's actual use of the distribution system. Third, it can assign customers to a larger distribution customer class rate or a substantially more complex power supply rate independent of actual usage. The first issue alone is highly problematic, but when coupled with the second and third, it results in a

[8] *See* 66 Pa. C.S. § 315(a).

discriminatory rate that penalizes customers who have or plan to install on-site generating systems to participate in net metering, or behind-the-meter DG ("BTM DG") systems.

Q14. Do the Utilities propose to exempt any customers that currently operate BTM DG systems from the new Billing Demand definition?

A14. No. The Utilities' proposal contains no legacy customer treatment of any kind, meaning that any customer who has already installed is in the process of installing a BTM DG system will immediately be subject to the new definition. This may come with a mandatory change in the customer's distribution rate schedule and default service rate structure. As I will discuss below, there are several major differences between the Utilities' small commercial and large commercial rate schedules that would have sizable bill impacts on customers, independent of the compensation for their exported solar generation.

Q15. In your experience, do changes related to net metering typically occur on a forward-looking basis?

A15. Yes. In almost all cases when policy makers decide to make changes to net metering structures, they do so at a future date and exempt existing customers who have either installed their systems or have reached a certain development milestone such as a signed interconnection agreement. Subjecting a customer who has already made an investment in a BTM DG system to structural financial changes that could not have been reasonably anticipated is, in my view, bad policy. If the Commission decides to approve the Utilities' Billing Demand proposal – which I strongly recommend it does not – it should at a minimum require this change only a prospective basis, starting on a future date certain, while allowing sufficient time for in-development projects to be completed and placed on the current tariff regime.

Q16. Turning to the second issue, how does the proposal ignore a customer's actual use of the system?

A16. The Billing Demand definition is based on the larger of two values: (1) the highest average power usage over any 15-minute period in a month; and (2) the gross generation rating of

a DG system. The former is a conventional method among non-residential customers to determine billing demand, and if the Utilities had based Billing Demand on this value there would be little concern about its appropriateness. However, by taking the gross generation rating of a DG system, which is the maximum amount of power that it could produce independent of load or weather conditions, the Utilities break from convention.

The gross generator rating serves as an upper bound on the energy production from a DG system. It typically only is realized on clear, sunny days during certain months of the year, and then only for a portion of the hours in the middle of the day.[9] In one of the workpapers provided by the Utilities in discovery, a modeled PV rooftop PV system only reached its gross generation rating in 19 hours over the course of a year.[10] In other words, for 99.8% of the year, the system produced less power than its theoretical maximum.

Further, all solar systems degrade slowly over time, meaning that for every year that passes the system will produce slightly less output in similar weather conditions. The Utilities' proposals do not factor this in and, given the gross generation rating is a function of a system's inverter hardware, it will remain fixed for the lifespan of the system even if the system ceases to be able to saturate the power output of its inverters.

Q17. Does the proposed Billing Demand definition reflect the load of a BTM customer-generator?

A17. No, it does not. The Utilities' proposals look at the gross generation rating of the system in isolation. But for a BTM system, the apparent load that a customer-generator places on the grid is a function of both BTM generation and its native load.[11] The Utilities completely ignore this reality, despite providing a workpaper that vividly demonstrated this fact.

Q18. Please describe this workpaper.

[9] Ground-mounted single-axis tracking systems are able to maintain their maximum generation for more hours in day as they can pivot to follow the sun, but the frequency of these maximum generation hours depends on the inverter loading ratio. Fixed-tilt systems common on rooftops do not attain their maximum generation as often.
[10] Ex. KL-2, SP-I-21 Attachment A excerpt. The Utilities modeled a fixed-tilt system with a 1.2 ILR.
[11] The native load is the load that the customer's equipment consumes independent of solar generation.

A18. Citizens' provided a workpaper in discovery that purported to analyze the impact of its proposal on a hypothetical 450 kW_{AC} fixed-tilt photovoltaic ("PV") system on its own, when paired with a roughly 400 kW peak demand customer, and when paired with a roughly 120 kW peak demand customer.[12] That said, the workpaper contained many errors that rendered its results moot and required correction before any reasonable comparison can be made. These errors include:

- **Incorrect modeled system size**. Citizens' discovery response stated they modeled a 450 kW_{AC} system, but the workpaper actually modeled a 412.5 kW_{AC} system due to an improper inverter load ratio ("ILR") assumption.
- **Mismatched solar generation**. The workpaper contained hourly load in Eastern Prevailing Time format, but did not adjust the PVWatts modeled solar generation, which is in Eastern Standard Time.
- **Applies "generic" weather and solar generation to actual metered load**. PVWatts uses a "typical meteorological year" weather to derive solar generation. This approach takes a month's worth of weather from 12 different years and necessarily does not match weather conditions for the actual hourly load data.
- **Hardcoded, incorrect system size in bill calculation**. The workpaper used the incorrect system size in the bill calculation.
- **Incorrect metered demand**. The metered demand for the two customers does not correspond to the hourly load data, the hourly solar generation, or the hourly net load data.[13]
- **Incorrectly copied wrong Customer A metered demand values to Customer B.** The workpaper copied the hardcoded metered demand values from one customer to the other instead of recalculating them from the hourly load information.
- **Customer B is not entirely based on actual data.** Customer B's load from June and July is just a scaled-down version of Customer A. It is unclear whether a customer with a roughly 66% lower load would have the same hourly load pattern as the larger customer during these hot summer months.
- **Incorrectly calculated energy use.** The workpaper references the incorrect value when calculating the kWh per kW energy usage.

[12] Exhibit KL-3, Citizens' response to SP-I-21. The values above are based on the hourly load data as the embedded historic metered demand values do not match the hourly data.

[13] It is possible although unlikely that some of the monthly differences are due to the use of 15-minute peak demand history compared to the hourly integrated load presented in the worksheet. However, the difference for some months is sizable (e.g., the hardcoded value in September is 400 kW compared to a maximum hourly load of 350 kW), and in some months the hardcoded value is smaller than the maximum hourly load (in which case the hardcoded value cannot represent the highest 15-minute billing demand if there is a larger hourly demand in the same month).

- **Incorrectly calculated net energy bank usage.** The workpaper does not correctly net out a month's usage with the banked energy before calculating the energy component of the bill.

Q19. Were you able to correct these issues?

A19. I corrected all of the issues except for the application of the Typical Meteorological Year ("TMY") weather files as 2025 historic weather data is not yet available for the time period the Company analyzed. While this may have a noticeable impact on the overall customer bill if a hot, sunny afternoon where customer load is high is represented by a cool, cloudy afternoon in the TMY data, historic load data during a time when historic weather data was not available at the time submission of this pre-filed testimony.

After correcting these issues, I recomputed annual bills based on two different metrics. The first is based on a conventional definition of billing demand, which is the maximum amount of net power the Utilities deliver to a customer, labeled "Bill on Inflow" below. The second was based on the highest power flow to or from the customer, labeled "Bill on Max Inflow/Outflow" below. This approach is still unconventional and not recommended as it is not reflective of cost-causation principles, but it highlights the difference between billing on actual power flows as opposed to hypothetical ones as the Utilities propose.[14]

Using my counter-analysis, the extreme nature of the Utilities' proposals becomes clear. A customer-generator with significant excess generation would see a massive increase in its bill, going from essentially paying only the fixed customer charge to paying 27 times more under the Utilities' proposal. Customer A, who self-consumes nearly 93% of its solar generation and never had an hour where exported solar exceeded its minimum nighttime load, much less its minimum daytime load, would still see a 25% increase in its distribution bill despite not placing any more demand on the Utilities' systems. And

[14] When applied to shared distribution assets, non-coincident demand charges are not reflective of cost-causation because these assets are designed to share the diversified load of all customers that are being served by them. A customer with a sizable BTM solar generator will likely experience their maximum exported power in the middle of the day in non-summer months, a time when the power grid has spare capacity and the exported power is not causing any marginal cost increases.

Customer B, whose system would be sized to offset 108% of their annual usage, would see more than a 350% increase in their annual distribution bill compared to the current definitions of billing demand.

Table 2 – Bill Comparison

	412.5 kW PV System	Customer A ~400 kW Load	Customer B ~120 kW Load
Citizens' Original Workpaper	$38,514	$42,589	$38,574
Corrected Citizens' Workpaper[15]	$35,405	$39,338	$35,447
Bill on Inflow	$1,200	$31,431	$7,795
% Increase	2,850%	25%	355%
Bill on Max Inflow/Outflow	$32,437	$31,431	$26,920
% Increase	9%	25%	32%

The Bill on Max Inflow/Outflow shows how much the Utilities' proposal to use hypothetical energy flows would impact bills. Given the high degree of self-consumption, Customer A never exports more than 46% of its solar generation to the grid in any given hour. Further, the highest hour of solar export (178 kW) is actually lower than the lowest level of inflow over the entire year (185 kW). In other words, every piece of equipment that is needed to deliver the minimum annual load to this customer – which is about 45% of its peak load – is already able to handle the power flow associated with the maximum export of solar generation. And yet the Utilities' reliance on the gross generator rating would increase this customer's bill by 25%.

Customer B would perform worse on this metric as its solar system is larger relative to its native loads. In this case, billing based on the gross generator rating instead of the maximum power flow to and from the customer would result in a 32% increase in annual distribution bills.

Q20. Please discuss the third reason the Utilities' approach is problematic.

A20. The customers above have peak demands (roughly 400 kW and 120 kW) that are well above the 50 kW threshold of the Utilities' large commercial customer tariffs. But smaller customers who wish to install a BTM PV system that offsets a reasonable fraction of their

[15] As corrected by based on my revisions discussed herein.

annual energy usage could pay outsized demand charges based on power flows that are simply not relevant to cost causation.

Imagine Customer C is a Citizens' customer with a 25-kW peak demand who takes service on the GLP-1 tariff. Under Citizens' proposed rate increase, that customer would face a customer charge of $21 per month and a demand charge of $4.52/kW.[16] If one scaled the peak demand of Customer A to this size, a 50 kW_{AC} PV system would offset about 51% of their annual usage, a reasonably modest amount. Further, the maximum export this customer would have in a year of 36 kW is well below the 50 kW gross generator rating that would establish their Billing Demand.

Q21. What do these changes do to Customer C's distribution bill?

A21. They substantially increase it, even after accounting for the solar generation. Table 3 below shows what Customer C would pay under the GLP-1 tariff with and without solar under the current tariff definitions, and under the GLP-1 tariff with solar under the Utilities' proposal. The Utilities' proposals would increase the total distribution component by 77% compared to what the customer would pay on the GLP-1 tariff under the current definitions, and adding solar would increase the distribution charges by 25% compared to having no solar at all.

Table 3 - 25 kW Load / 50 kW Solar Bill Comparison

	Customer Charge	Demand Charge	Energy Charge	Distribution Total
GLP-1 No Solar	$252	$1,110	$1,680	$3,042
GLP-1 Current	$252	$1,064	$825	$2,141
GLP-1 Proposed	$252	$2,712	$825	$3,789

Q22. The Utilities argue that this is appropriate to avoid any cost shift to other customers. Do you agree?

A22. No. The Utilities' proposals do not just prevent this customer from reducing their distribution bill, it actively increases beyond what they would pay without solar. Their argument is that the loads that Customer C places on the system after installing solar

[16] SEIA takes no position on the revenue requirement and cost allocation proposed by the Company.

somehow increases the cost of providing service to this customer, and if Customer C does not pay more, then other customers will have to make up the difference. But Customer C's peak demand is reduced after installing solar in all non-winter months, with its peak demand falling by as much as 10% in the summer where the grid is under the most strain. Figure 1 below shows the pre- and post-solar peak hourly demands of the customer, showing these persistent demand reductions during the summer months when load on the Company's system is high.[17]

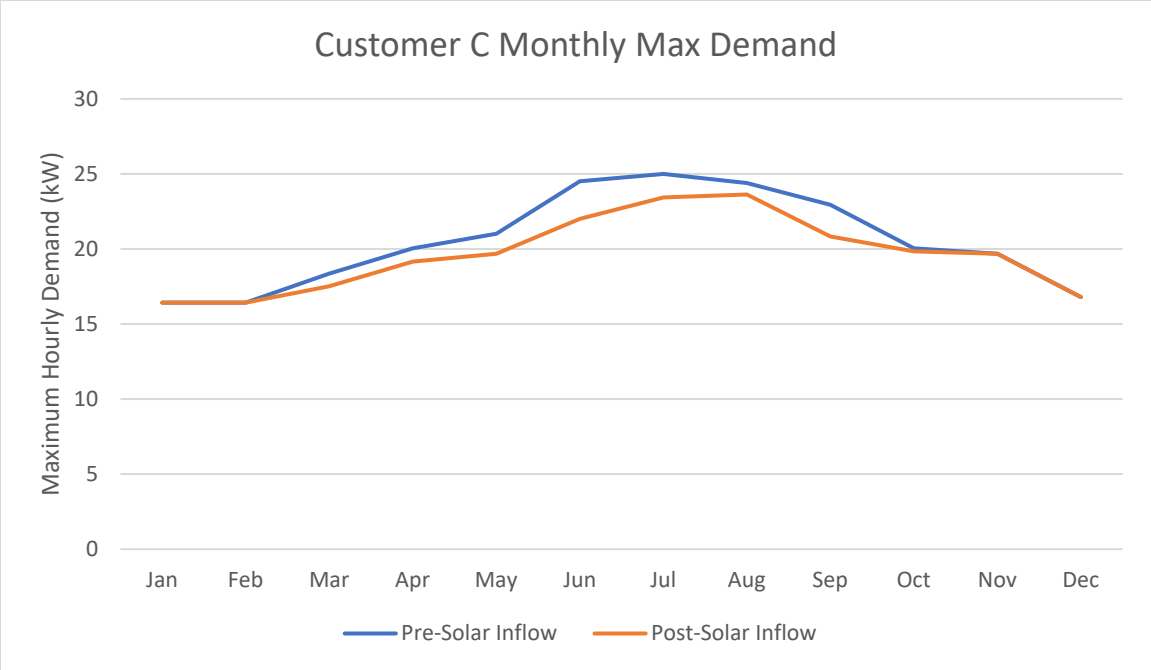

Figure 1 - Customer C Monthly Max Demand

Q23. Does the absolute level of power flow from Customer C to the utility increase after installing solar?

A23. Yes, but only during non-summer months. Figure 2 below adds in the maximum power flow to or from the Utilities' grid. In the early months of the year, there are weekend midday hours when solar generation is high and on-site consumption is low, leading to an

[17] Notably, the summer month with the smallest load reduction is August. In inspecting the TMY weather file used to simulate the solar generation, there was a two-day cloud event that produced very low solar generation. If the weather file and the load files had been date-matched, then this cloud event would likely have also cause a reduction in cooling load, which could have reduced the post-solar peak demand for that month. This temporal mismatching between load and generation is one of the limitations of the Utilities's analysis.

export level of roughly 35 kW that exceeds Customer C's maximum inflow demand during these months. In the summer, Customer C's maximum power flow is set by inflows as the midday solar generation is consumed onsite. In the fall, maximum outflows again surpass maximum inflows as cooling loads fall. And in all cases, the maximum outflow is well below the gross generator rating ("GGR") of 50 kW on which the Utilities propose to base demand charges.

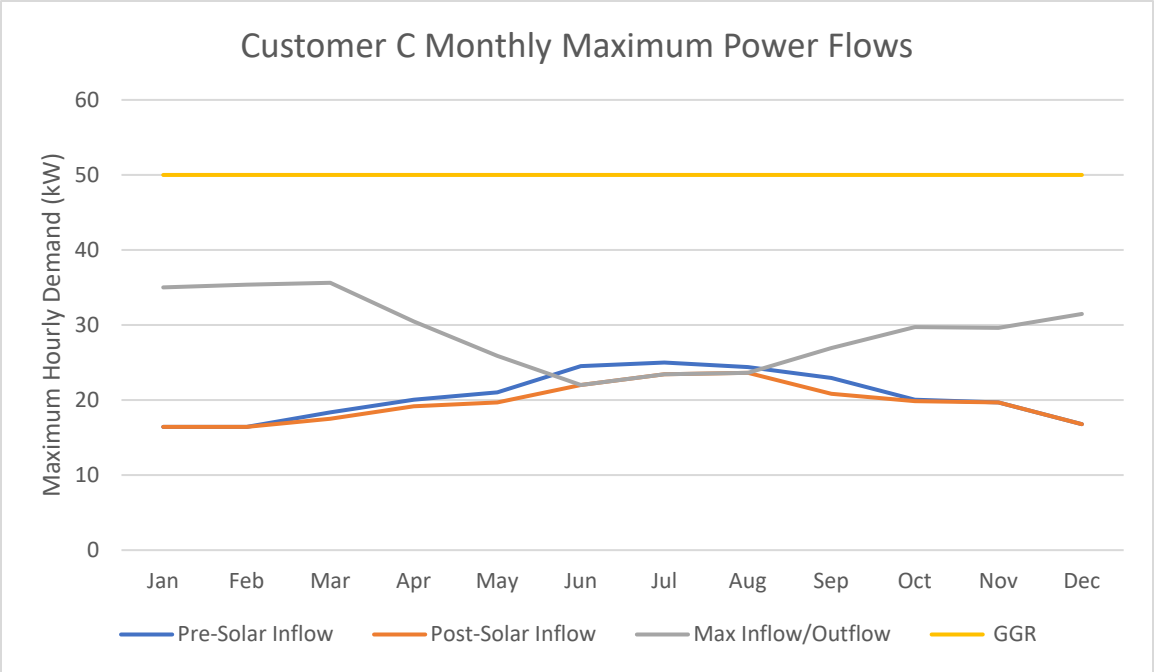

Figure 2 - Customer C Monthly Maximum Power Flows

Q24. Are these increased power flows during the non-summer months problematic for the Utilities?

A24. No. It is important to note that aside from service drops, meters, and line transformers in sparsely-populated areas, very few customers have dedicated distribution equipment that is designed to serve only their load. In fact, the vast majority of the Utilities' distribution rate base is comprised of shared assets such as substations, feeders, and most transformers. These assets are designed to meet the diversified demand of all customers being served by the assets, not the maximum power flows of each individual customer.

Further, the increased outflows in the non-summer months all occur in the middle of the day when the broader distribution grid is experiencing lower loads overall. The maximum outflows occurred between 11 AM and 12 PM three times, between 12 PM and 1 PM five times, and between 1 PM and 2 PM once. By contrast, in non-summer months the Utilities' grids peak in the early morning or late evening, so this marginal increase in midday exported power has no bearing on the aggregate peak load of shared distribution assets.

The one instance in which the increased power flows from Customer C's exported power could be an issue is if Customer C was served by dedicated distribution assets (such as a line transformer or service drop) that cannot handle the new power flows. However, in this instance, Customer C would have been required to pay for an upgrade to these facilities in order to safely interconnect the distributed energy resource ("DER") system in the first place, isolating other distribution customers from the potential cost increase of upsizing these assets.

Q25. Given this, what is the net effect of the Utilities' Billing Demand definition?

A25. The proposal fails on all fronts. It is not fair as it relies on hypothetical power flows that in reality are not realized by customers with BTM solar. It is not based on cost-causation principles as it can, without justification, substantially increase the distribution rates a customer pays even if they do not place loads on the system that increases costs. And it is punitive as it can substantially increase distribution bills for customers who have already installed BTM solar systems.

C. Power Flows from Individual Customers Must Be Analyzed as Part of the Whole

Q26. What is the Utilities' second justification for their proposal?

A26. The second justification is, generally, that the Utilities must plan and operate their grids for maximum power flows whether they are being sent to the customer or being received from the customer.

Q27. Is this assertion technically accurate?

A27. Yes, but it must be taken in the proper context. It is obviously the case that the Utilities must plan for and manage the power flows on the grid, and they have policies and protocols in place that allow them to do so. But the actual impact of most BTM DER systems is limited to a small portion of the power grid that serves the customer-generator and their neighbors.

Citizens' provided a data response showing that of the 87 solar systems that have been installed on Citizens' grid, 72 were for residential customers.[18] For the typically-sized residential systems, power exported to the Utilities' grid will flow to the nearest load, which in almost all cases will simply be the customer-generator's neighbors. The assets that handle the power flow between these very local sections of the grid – including service drops, line transformers, and feeders – are intrinsically able to handle two-way power flows. Further, the relatively small number of DERs on the Utilities' grids suggest that the systems are too few in number to be highly geographically concentrated.[19]

The situation is somewhat different for the larger PV systems. As discussed above, a customer with a relatively high load and large PV system can have periods when exported power is sizable. However, the Utilities' interconnection process screens for these exact situations prior to allowing a customer to install a generator. If these exports would overload equipment or cause power quality issues for other customers, the prospective customer-generator would have to pay for upgrades to resolve the issues before being able to proceed.

Q28. How do the Utilities' frame exported power?

A28. The Utilities discuss exported power as something that a customer-generator delivers to other customers over the grid. This framing not only fails to acknowledge that the Utilities

[18] Exhibit KL-4, Citizens' response to SP-I-2. There is one "residential" customer that has a 137 kW PV system, which is substantially larger than any other residential system.
[19] Citizens' has about 6,000 residential customers, meaning that roughly 1 in 83 have installed solar.

are the ones that deliver the exported power, but also is used to justify the Billing Demand definition:

> As a result, EDCs like Wellsboro must accommodate the interconnection and net metering of customer generators with capacity of up to 3 MW that use very little electricity supplied by the EDC. In addition, we may have a customer that has generation producing power that exceeds their usage at the service location. **In both scenarios, the customer generator uses the Wellsboro distribution system to deliver its output,** which then offsets the energy that must be delivered to the Wellsboro service territory through the PJM (FE MAIT) transmission system. We are obligated to compensate the customer generator first by netting any electricity used by the account against the exported kWh, then by paying them "full retail value" for the remaining kWh at the end of the year that has not been netted against their usage.[20]

Q29. What happens when power is exported from a customer-generator's premises?

A29. Physically, the power flows from the customer-generator's PV system and serves any on-site loads. Any power beyond that instantaneous on-site need flows through the customer's utility meter, on to the service drop, and on to the Company's grid. From there, the power will flow to the nearest source of load.

Q30. Once the power leaves the customer's meter, who owns it?

A30. The Utilities own ("take title to") the exported power as soon as it flows through the utility meter. And because they now own the energy, it is the Utilities who deliver the power over their own grids to the nearest source of load. When the power finds that load, likely at a neighbor, it flows through that neighbor's utility meter and the neighbor is billed for the energy at their full retail rate.

Q31. Do the Utilities use their entire distribution grid to deliver this exported power?

A31. No, they do not. In most cases, the exported power only flows through a tiny fraction of the Utilities' distribution assets. It may not even flow past the low-side of the line transformer if multiple neighbors share a transformer. Despite this, the Utilities charge the neighbor for the energy at the full retail distribution rate, which is designed to recover the costs of the entire distribution grid.

[20] Farnsworth Direct at 21. (emphasis added)

Q32. Why is this distinction important?

A32. It is important because the Utilities claim that it is appropriate to charge a customer-generator for "the use of" the distribution grid "to deliver its output." This is the basis for using the gross generator rating in the determination of Billing Demand: "Using these measures [net power flow from or onto the Utilities's distribution system] provides an accurate reflection of the Customer's use of the distribution system."[21] But it is not the customer-generator that "uses" the distribution grid "to deliver its output" – it is the Utilities who have already taken title to the exported energy and use their own distribution grid to deliver their own product to another one of their own customers. The customer-generator is compensated for the exported power the instant it leaves the utility meter, and at this point, the customer-generator is no longer the responsible party. Charging them based on this rubric is inappropriate.

D. The Utilities Improperly Expand the Scope of the Commission's UGI Settlement Approval

Q33. What is the Utilities' third justification for their proposal?

A33. Generally, the Utilities argue that the Commission's recent decision in the recent UGI default service docket can be expanded to distribution ratemaking.

> Until recently, we assumed that customer generators must be classified for distribution and generation purposes based on amount of peak electricity that the electric distribution company supplied to the customer generator's account. However, a recent decision by the Commission in Petition of UGI Utilities, Inc-Electric Division for Approval of a Default Service Plan for the Period of June 1, 2025 though May 31, 2029¸ Docket No. P-2004-3049343, et al., indicated that customer generators can be classified for generation purposes according to their peak electricity imported from the EDC or exported to the EDC. We are proposing to clarify in our tariff that we will use customer generator's net power flow from or onto the Company's distribution system to establish the distribution charges

[21] Johnson Direct at 17.

> for the account and eligibility for the Generation Supply Service Rate ("GSSR") 1 or GSSR-2.[22]
>
> I am advised by counsel that the logical legal extension of the UGI decision is that distribution service schedule placement and billing can reflect the customer generator's use of the distribution system, whether through its peak import from the system or its peak export to the distribution system. This ensures non-discriminatory treatment between customers that use the distribution system to power their non-residential operations and those who use the distribution system for the delivery of their energy product.[23]

Q34. Did the Commission explicitly approve the Utilities' proposed Billing Demand definition, or something similar, in the UGI case?

A34. No. The Commission approved a settlement between certain parties that contained, among other elements, a definition that would classify customers into either GSSR-1 or GSSR-2 based on the larger of their power consumption from the grid or their power exports to the grid. The Utilities' proposal does not directly mirror the approved change in the UGI case, and I am advised by counsel that the UGI case has been appealed and is currently before the Pennsylvania Commonwealth Court.

Q35. Given the lack of direct Commission approval, do the Utilities provide any meaningful support for this jump in logic?

A35. No. Citizens' couches its proposal as a shift in assumptions that allows it to "clarify" its tariff, underscoring the magnitude of its proposal. Wellsboro's witness notes a vague "advised by counsel" notion but provides no additional legal support for its change. While I am not an attorney and am not offering legal opinions, I understand that the core issue in the UGI case is currently working its way through Pennsylvania's appeals court process, meaning the matter is far from settled. And against this uncertain backdrop, it is doubly improper to expand the scope of the UGI settlement to distribution rate making. I further note that the UGI change was approved in a default service proceeding, not a distribution rate case as is the case here.

[22] Johnson Direct at 17.
[23] Farnsworth Direct at 22.

Q36. From a policy perspective, is there a difference between setting default service rates and distribution rates?

A36. Yes. Pennsylvania has restructured its electric utility industry, meaning that while the Commission is able to approve the structure of default service plans that utilities provide, it does not directly set prices. By contrast, the Commission does have oversight over the actual rates and rate designs of electric distribution companies ("EDCs"), and is obligated to ensure that utilities implement just and reasonable rates.

A component of ensuring that all Commonwealth residents and businesses pay just and reasonable rates is that EDCs have a burden of proof to justify any proposed changes. In their filings, the Utilities provide scant support for their new definition of Billing Demand, relying instead on a handful of pages of testimony, no legal arguments, and no policy impact analysis. Instead, the proposals' support boils down to vague claims regarding the appropriateness to extend the UGI settlement construct to distribution rates and a specious claim that basing rates on hypothetical energy flows is just and reasonable.

Q37. What is one example of how the Utilities' proposal could result in unjust and unreasonable rates?

A37. The Utilities propose to use base demand charges on the larger of the GGR and the highest 15-minute demand in a given month, even if this value is not reflective of the customer-generator's use of the system: "[t]he Company's proposed Tariff revision for billing demand would include the rated output capacity of the net-metered generator system in the calculation. Rated output capacity may differ from the nameplate capacity of a generating facility and/or the actual peak output."[24] This functionally acts as a 100% demand ratchet based on the installed capacity of the customer-generator's DER system, even if this level of power is never attained by the customer as shown in the Customer C example above.

[24] Exhibit KL-5, Citizens' response to SP-I-13.

The Utilities' current demand ratchet, which sets the billing demand floor at 50% of the demand attained by the customer in the prior 12 months, is at least based on actual power usage by the customer. If a customer uses 100 kW in a given month, then it will be required to pay demand charges based on at least 50 kW of demand for the next 12 months, even if its demand fell to no more than 45 kW on a permanent basis. After the 12-month demand ratchet expires, the billing demand would be reset to the lower value, and a new 50% ratchet floor would be established.

By contrast, a customer-generator could install a 100 kW PV system that never actually produces 100 kW, that never results in 100 kW of exported power, and where the customer never consumes 100 kW of power from the grid, and yet they could be charged a demand charge based on 100 kW for decades as long as their DER was operation. While the Utilities' current demand ratchet sends a poor price signal to reduce demand, it is at least based on actual power flows. The Billing Demand proposal, however, is completely independent from actual power flows and is thus, by definition, arbitrary. And arbitrary definitions should not be considered a sufficient basis for just and reasonable rates.

Q38. Aside from the fact that the Utilities have failed to sufficiently support their proposals, do you have other concerns with the Billing Demand definition and implementation?

A38. Yes. While I am not an attorney and am not making legal arguments, I have 15 years of experience drafting and interpreting legislative language, drafting and interpreting regulatory language, and performing policy analysis that requires a very close reading of relevant statutory authorities. In my review of Pennsylvania's net-metering statute and the Utilities' proposed tariff language and discovery responses, I believe there is an irreconcilable divergence in Utilities' netting proposals and the underlying Pennsylvania statute.

Q39. What is the nature of this divergence?

A39. The Utilities propose to shift compensation for generation from a kWh-based net metering construct to a dollar-based net billing construct. These are two fundamentally different rubrics, and the latter appears to be facially inconsistent with the net metering statue.

Q40. Please describe the traditional kWh-based accounting used in net-metering.

A40. In the traditional approach to net-metering, a single meter was used that was capable of measuring energy delivered to a customer (inflow) and delivered from the customer to the grid (outflow). When the customer's energy use was larger than their DER generation, the inflow energy spun the meter "forward," and each kWh increased the meter's accumulated register. When generation exceeded on-site load, outflow energy spun the meter "backward" and decremented the meter's register.

At the end of the billing period month, the utility would measure the register, compare it to the value at the end of the prior billing period, and determine whether there was net inflow or net outflow for the billing period. If there was net inflow, meaning the customer consumed more power than the produced during the billing period, they would be charged for this net usage at the retail rate. If there was net outflow, meaning the total generation exceeded total consumption, the utility would "carry forward" the kWh credit to be applied against the next month's usage. Depending on state or utility rules, the carry-forward kWh credits may be "cashed out" at the end of a year at a designated price.

Q41. Please contrast this approach with the dollar-based net billing structure.

A41. In a net billing structure, rather than measuring and netting generation and load in kWh, generation and net energy are converted from kWh to dollars based on a specified rate at specific times. The netting may occur on a monthly basis. Under this approach, the meter would "spin" back and forth within the month and excess generation converted to a dollar value at the end of the billing period. Alternatively, the netting may occur on an instantaneous basis. Here, a utility would measure and accumulate all inflow power in one meter register, all outflow power in another meter register. At the end of the billing period, the total inflow power would be multiplied by the full retail rate, and the total outflow

power credited at a potentially different outflow rate. The dollar amounts would be netted against each other and charged to the customer.

Q42. Which of these do the Utilities propose?

A42. The Utilities' proposal is in the middle of these two net billing methods. For customers with Billing Demand larger than 400 kW, they propose an hourly netting with the inflow and outflow rate equal to the PJM real-time locational marginal price ("LMP") at the PJM West Hub.[25]

Q43. Is this change obvious from the Utilities' testimony?

A43. No, and in fact, the Utilities' testimony on this matter is in direct conflict with their actual proposal. Citizens' testimony on this point only refers to the LMP being applicable to the annual cash out: "For customers with Billing Demands over 400 kW, the annual cash out will be a weighted average locational marginal price ("LMP")."[26] Wellsboro similarly says

> We are obligated to compensate the customer generator first by netting any electricity used by the account against the exported kWh, then by paying them "full retail value" for the remaining kWh at the end of the year that has not been netted against their usage. For customers with Billing Demands over 400 kW, the annual cash out will be a weighted average locational marginal price ("LMP").[27]

In both cases, the Utilities' testimony make it appear that they will continue to follow the Pennsylvania net metering statute using a kWh-based net metering approach on a month-to-month basis, and only apply the lower LMP to the final annual cash out calculation. But this testimony is directly contradicted by the Utilities' discovery response, which provides more details about the proposed methodology.[28]

Q44. What is their actual netting proposal for customers with larger Billing Demands?

[25] Exhibit KL-6, Citizens' response to SP-I-4.
[26] Johnson Direct at 17.
[27] Farnsworth Direct at 21.
[28] Exhibit KL-6, Citizens' response to SP-I-4.

A44. When asked to "explain how Citizens intends to 'net' the customer-generators production against its consumption on an annual basis for both GSSR-1 and GSSR-2, broken down by rate class", Citizens' replied:

> For GSSR-1 customers, net energy consumption is calculated in the customer-generators utility meter billing read register. Net energy is equal to the total energy consumed through the meter minus the energy exported through the meter from one billing read to the next. Net kWh consumption is the same for both distribution and generation billing calculations.
>
> For GSSR-2 customers, the Company proposes to use the same calculation as for GSSR-1 for calculation of distribution billing charges. For generation billing, the customer-generator will be billed for each hour of net consumption at the PJM West Hub Real-time Locational Marginal Price ("LMP"). Each hour of net export will be credited to the generation portion of the customer-generator's bill at the corresponding LMP. Excess credit will carry over to offset generation costs in future bill periods [sic] any excess balance will be cashed out to the customer-generator annually following the May bill cycle.[29]

Here, the Utilities bifurcate their netting approach both by customer size and by rate component. Customers with Billing Demands under 400 kW would be classified as GSSR-1 customers, and the Utilities plan to follow the traditional kWh-based accounting and annual cash out process as stipulated in the statutory language. Similarly, it appears that GSSR-2 customers will have their distribution costs calculated using the traditional approach.

But the proposal for compensating GSSR-2 customers for their generation is decidedly different. Instead of netting kWh on a monthly basis with kWh carryforwards for excess monthly generation, the Utilities propose to convert kWh to a dollar value on an hourly basis and accrue dollar charges and credits throughout the year.

The proposals are unambiguous on this matter. Customer-generators will be "billed" each hour for inflow energy "at the [LMP]", and "credited" each hour for outflow energy "at the corresponding LMP". The dollar-based "excess credit" will offset

[29] Exhibit KL-6, Citizens' response to SP-I-4.

"generation costs in the future" – not excess generation measured in kWh, but excess generation "credits" that offset future "costs". The kWh-based accounting of traditional NEM is completely missing for the generation component, replaced by an hourly net billing structure.

Q45. How does this compare to the Regulation language regarding net-metering?

A45. It is quite different. The relevant portions of the Pennsylvania code follow:[30]

> (d) An EDC and DSP shall credit a customer-generator at the full retail kilowatt-hour rate, which shall include generation, transmission and distribution charges, for each kilowatt-hour produced by a Tier I or Tier II resource installed on the customer-generator's side of the electric revenue meter, up to the total amount of electricity used by that customer during the billing period. If a customer-generator supplies more electricity to the electric distribution system than the EDC and DSP deliver to the customer-generator in a given billing period, the excess kilowatt hours shall be carried forward and credited against the customer-generator's kilowatt-hour usage in subsequent billing periods at the full retail rate. Any excess kilowatt hours that are not offset by electricity used by the customer in subsequent billing periods shall continue to accumulate until the end of the year. For customer-generators involved in virtual meter aggregation programs, a credit shall be applied first to the meter through which the generating facility supplies electricity to the distribution system, then through the remaining meters for the customer-generator's account equally at each meter's designated rate.
>
> (e) At the end of each year, the DSP shall compensate the customer-generator for any remaining excess kilowatt hours generated by the customer-generator that were not previously credited against the customer-generator's usage in prior billing periods at the DSP's price to compare rate.

Q46. What elements of the Utilities' tariffs do you believe to be inconsistent with the Regulation's language?

A46. A plain reading of the Regulation confirms that the "full retail kilowatt-hour rate" includes "generation, transmission, and distribution charges." It further posits that if a customer-generator sends more energy to the EDC or default service provider than they receive (*i.e.*,

[30] 52 Pa. Code § 75.13.

if there is net outflow) in "a given billing period", the "excess kilowatt hours shall be carried forward." Further, this carryforward must be "credited… against kilowatt-hour usage in subsequent billing periods at the full retail rate," which is explicitly defined to include generation, transmission, and distribution charges. Finally, any excess kWh carryforward that is not extinguished in a billing period "shall continue to accumulate until the end of the year."

There is no wiggle room for the Utilities to bifurcate their proposed netting methodologies for generation and transmission from those used for distribution. The statute is clear that all crediting must be done at the "full retail rate" which explicitly includes all three components. Neither is there space to switch from a month-by-month kWh-based accounting framework to a dollar-based one; kWh carryforwards are required to be credited against kWh usage until the end of the year. Only at the end of the year is the conversion between kWh and dollars permissible, where it is done at the price to compare.

Q47. Does the statute define "billing period"?

A47. Yes. While the NEM statute includes a reference to the defined term "billing month" and not "billing period", the PA code provides a cross-reference definition elsewhere.

- 52 Pa. Code § 75.12
  - "Billing month—The term has the same meaning as set forth in § 56.2 (relating to definitions)."[31]
- 52 Pa. Code § 56.2
  - "Billing month—A period of not less than 26 days and not more than 35 days except in the following circumstances:"[32]
  - "Billing period—In the case of public utilities supplying gas, electric and steam heating service, the billing period must conform to the definition of "billing month."[33]

[31] 52 Pa. Code § 75.12.
[32] 52 Pa. Code § 56.2. The "circumstances" relate to customers starting and stopping service, correcting a billing problem, a change in meter reading route, or a change in electricity supplier.
[33] 52 Pa. Code § 56.2.

Based on these definitions, one cannot construe the "billing period" referenced in the netting section of the NEM statute to be an hourly time period as the Utilities propose, as to conform with the definition of billing month, the billing period must be at least 26 days. But the Utilities' proposals sidestep this requirement when it proposes to net energy over each hourly period and convert each hour's net inflow or net outflow to a dollar credit based on LMP.

Q48. Setting aside the legal question, what is the immediate impact of this change when combined with other elements of the Utilities' proposals?

A48. The Utilities propose to classify customers for generation supply service based on the ill-conceived Billing Demand concept. This means that a BTM customer who has pre-solar loads well below the 400 kW cutoff for GSSR-2, and whose post-solar exports are also well below the 400 kW cutoff for GSSR-2, could be shifted to a dramatically different supply tariff if they install a 400 kW PV generator, even if this PV system only offsets a fraction of their annual load.

This change would impact not only the value of their exported solar generation, but also all power they consume. Instead of being billed on the quasi-fixed GSSR-1 rate that is updated every six months, they would be subject to the real-time price fluctuations of the PJM wholesale market. Further, as the Utilities propose to charge and credit customers for their inflow and outflow energy at a rate that is neither known in advance nor fixed for any meaningful period of time, customers who are placed on the GSSR-2 tariff because of the size of their PV generation will no longer be able to determine what they will pay for generation supply nor what their exports will be valued at. These are massive changes for a medium-sized business to manage, particularly if they were not expecting to be shifted to a much more complex tariff.

Q49. Please summarize your testimony and recommendations

A49. The Commission should reject the Utilities' proposals to introduce a new definition of Billing Demand and to classify and charge customers based on this definition. The

Utilities' attempt to bring a concept from a different type of regulatory docket – *i.e.*, a default service case - into this proceeding and expand a non-traditional approach to ratemaking is not rigorously supported by its testimony. Further, because it relies on hypothetical power flows and not actual power flows, it is not a sound basis to produce just and reasonable rates. The result is a rate design that can lead to substantial increases in distribution bills for customer-generators after installing solar, despite the new power flows from the solar system occurring during times when the grid has spare capacity.

In addition, the Utilities' proposals to shift from a kWh-based net-metering approach to a dollar-based net billing approach for generation compensation appears to be in conflict with Pennsylvania's net metering regulations, though I am not a lawyer and am not making a legal conclusion. But regardless of this legal question, the Utilities have not met their burden to demonstrate the sizable policy shift of pushing medium-sized businesses onto a much more complex supply tariff is in the interests of all ratepayers and, therefore, I recommend that the Commission wholly reject the Utilities' ill-conceived proposals.

Q50. Does this conclude your testimony?

A50. Yes, it does.

EXHIBIT KL-1

KEVIN M. LUCAS

SOLAR ENERGY INDUSTRIES ASSOCIATION

Mr. Lucas is Vice President of Policy Analysis for the Solar Energy Industries Association (SEIA). SEIA is the national trade association for the U.S. solar industry. SEIA is leading the transformation to a clean energy economy. SEIA works with its 1,200 member companies and other strategic partners to fight for policies that create jobs in every community and shape fair market rules that promote competition and the growth of reliable, low-cost solar power.

Since 2010, Mr. Lucas has worked in the energy and environment industry focusing on renewable energy, energy efficiency, and greenhouse gas reduction. In his role at SEIA, Mr. Lucas develops expert witness testimony for rate cases, integrated resource plans, and other regulatory proceedings. He also supports SEIA's State Affairs, Regulatory Affairs, and Congressional Affairs divisions on policy and market design matters. Prior to joining SEIA, Mr. Lucas worked for the Alliance to Save Energy, a Washington DC-based nonprofit focused on reducing energy use in the built environment. Before the Alliance, he worked for the Maryland Energy Administration, the state energy office, on numerous legislative and regulatory issues and developed and presented testimony before the Maryland General Assembly and the Maryland Public Service Commission.

Prior to entering the energy and environment field, Mr. Lucas was a manager at Accenture, a leading consulting firm. Mr. Lucas implemented enterprise resource planning software for Fortune 500 companies in industries such as consumer electronics, oil and gas, and manufacturing.

AREAS OF EXPERTISE

- Renewable Energy Policy Analysis: extensive experience analyzing renewable energy policy issues and communicating results to both expert and general audiences.
- Energy Efficiency Policy Analysis: detailed understanding of energy efficiency policies, including the development of potential studies and utility efficiency program design and implementation.
- Quantitative Analysis: deep expertise in quantitative analysis across a broad range of topics including analyzing financial and operational data sets, constructing models to explore electricity industry data, and incorporating original analysis into expert witness testimony.
- Energy Markets: studies interaction of renewable energy and energy efficiency policies with wholesale market operation and price impacts.
- Legislative Analysis: reviews legislation related to energy issues to discern potential impacts on markets, utilities, and customers.

EDUCATION

Mr. Lucas holds a Masters of Business Administration from the University of North Carolina, Kenan-Flagler Business School (2009) and a Bachelor of Science in Engineering, Mechanical Engineering from Princeton University (1998).

ACADEMIC HONORS

- Beta Gamma Sigma Honor Society
- Paul Fulton Fellowship, Kenan-Flagler Business School
- Graduated *cum laude* from Princeton University

KEVIN M. LUCAS

SOLAR ENERGY INDUSTRIES ASSOCIATION

EXPERT WITNESS TESTIMONY

Arizona Corporation Commission

- Docket No. E-01345A-19-0236 – *In the Matter of the Application of Arizona Public Service Company for a Hearing to Determine the Fair Value of the Utility Property of the Company for Ratemaking Purposes, to Fix a Just and Reasonable Rate of Return Thereon, to Approve Rate Schedules Designed to Develop Such Return.*
    - Analyzing and modifying APS's class cost of service study, arguing for changes to time of use rate design, proposing new rate designs for solar plus storage installations, proposing improvements to non-residential rate designs, advocating for a "bring your own device" program.
- Docket No. E-01933a-22-0107 – *In the Matter of the Application of Tucson Electric Power Company for the Establishment of Just and Reasonable Rates and Charges Designed to Realize a Reasonable Rate of Return on the Fair Value of the Properties of Tucson Electric Power Company Devoted to its Operations Throughout the State of Arizona and for Related Approvals.*
    - Direct and rebuttal testimony advocating for a "bring your own device" program designed to optimize the use of solar plus storage systems, proposed and designed new storage-supporting residential and non-residential tariffs, argued for the removal of an out-of-date fee for distributed solar metering equipment.
- Docket No E-01345A-22-0144 – *In the Matter of the Application of Arizona Public Service Company for a Hearing to Determine the Fair Value of the Utility Property of the Company for Ratemaking Purposes, to Fix a Just and Reasonable Rate of Return Thereon, and to Approve Rate Schedules Designed to Develop Such Return.*
    - Direct and rebuttal testimony advocating for a "bring-your-own-device" program designed to optimize the use of solar plus storage systems, proposed and designed new storage-supporting residential and non-residential tariffs, argued against APS's cost of service study for solar customers.

Public Utilities Commission of the State of Colorado

- Proceeding 17A-0797E – *Public Service Company - Accelerated Depreciation - AD/RR*
    - Advocating for appropriate structure to utilize renewable energy funds to support the early retirement of coal facilities and to continue to support distributed resources.
- Proceeding 19A-0369E – *In the Matter of The Application of Public Service Company of Colorado For Approval of Its 2020-2021 Renewable Energy Compliance Plan*
    - Advocating for changes to better support solar and solar plus storage installations
- Proceeding 19AL-0687E - *In the Matter of Advice No. 1814-Electric of Public Service Company of Colorado to Revise its Colorado P.U.C. No. 8 – Electric Tariff to Reflect a Modified Schedule RE-TOU and Related Tariff Changes to be Effective on Thirty-Days' Notice*
    - Designed and advocated for new data-based default time of use rate.

Public Utilities Commission of the State of Colorado – Cont.

- Proceeding No. 21A-0141E – *In the Matter of the Application of Public Service Company of Colorado for Approval of its 2021 Electric Resource Plan and Clean Energy Plan.*
    - Argued for changes to proposed resource plan to more accurately reflect capabilities of solar and storage, to updated template contracts, and improve procurement process.
- Proceeding No. 21A-0625EG – *Public Service Company - Renewable Energy Compliance Plan.*
    - Advocated for various program modifications and enhancements for the utility's four-year distributed generation and community solar plan.
- Proceeding No. 23AL-0243E – *In the Matter Of Advice Letter No. 1923-Electric Of Public Service Company Of Colorado To Revise Its Colorado P.U.C. No. 8-Electric Tariff To Reset The General Rate Schedule Adjustments, To Place Into Effect Revised Base Rates, And To Implement Other Phase II Tariff Proposals To Become Effective June 15, 2023*
    - Analyzed novel cost allocation methodology proposed by PSCo, proposed modifications to non-residential rate design, critiqued PSCo's meter cost analysis.
- Proceeding No. 24AL-0377E – *In the Matter Of Advice Letter No. 1960 Filed By Public Service Company Of Colorado To Revise Its Colorado P.U.C. No. 8 – Electric Tariff To Modify Time-Of-Use ("Tou") Tariffs For Electric Service, Including Tou Periods And Associated Tou Rates And Charges, To Become Effective October 4, 2024.*
    - Proposed updated TOU schedule based on PSCo's evolving resource mix and decarbonization goals.
- Proceeding No. 24A-0442E – *In The Matter of the Application of Public Service Company of Colorado For Approval Of Its 2024 Just Transition Solicitation*
    - Discussed impacts of solar generation variability, proposed economic analysis of planning reserve margin, analyzed impact of large load customers

Georgia Public Service Commission

- Docket No. 44160 – *In Re: Georgia Power Company's 2022 Integrated Resource Plan* and Docket No. 44161 – *In Re: Georgia Power Company's Application for the Certification, Decertification, and Amended Demand Side Management Plan*
    - Advocated for improvements to proposed procurement plan with an increased focus on solar plus storage projects and distributed energy resources; recommended expansion of monthly netting program for BTM solar projects.
- Docket No. 44280 – *Georgia Power 2022 Rate Case*
    - Analyzed and critiqued Georgia Power's rate case filing, specifically regarding its proposed flat interconnection fee for DG systems, its purported cost shift associated with BTM solar customers, its consistent and sizable excess revenue collection over a decade, and various proposals to modify or eliminate residential tariffs.

Illinois Commerce Commission

- Docket No. 22-0486 – *Commonwealth Edison Company Order Requiring Commonwealth Edison Company To file an Initial Multi-Year Integrated Grid Plan And Initiating Proceeding to Determine Whether The Plan is Reasonable and Complies with the Public Utilities Act.* and 23-0055 – *Verified Petition for Approval of a Multi-Year Rate Plan under Section 16-108.18 of the Public Utilities Act.*
    - Designed and advocated for a virtual power plan program and community solar and storage program to help assist ComEd with its demand reduction goals. Also recommended approval of meter collar adaptors as a way to reduce solar install costs.
- Docket No. 22-0487 & 23-0082 – Ameren Illinois Company d/b/a Ameren Illinois Petition for Approval of a Multi-Year Rate Plan Pursuant to 220 ILCS 5/16-108.18.
    - Designed and advocated for a virtual power plan program and community solar and storage program to help assist Ameren with its demand reduction goals. Also recommended approval of meter collar adaptors as a way to reduce solar install costs.

Maryland Public Service Commission

- Case 9153, 9154, 9155, 9156, 9157, 9362 – *In the Matter of Maryland Utility Efficiency, Conservation and Demand Response Programs Pursuant to the Empower Maryland Energy Efficiency Act of 2008*
    - Multiple filings regarding the design and implementation of Maryland's energy efficiency portfolio standard.
- Case 9271 – *In re the Merger of Exelon Corp. & Constellation Energy Grp., Inc.*
    - Analysis of renewable energy commitments in merger proposal.
- Case 9311 – *In re the Application of Potomac Elec. Power Co. for an Increase in its Retail Rates for the Distrib. of Elec. Energy*
    - Supporting the implementation of a limited cost tracker to accelerate reliability investments after 2012 Derecho.
- Case 9326 – *In re the Application of Balt. Gas & Elec. Co. for Adjustments to its Elec. & Gas Base Rates.*
    - Supporting the implementation of a limited cost tracker to accelerate reliability investments after 2012 Derecho.
- Case 9361 – *In re the Matter of the Merger of Exelon Corporation and Pepco Holdings, Inc.*
    - Policy analysis of merger proposal.

Michigan Public Service Commission

- Case U-18419 – *In the matter of the application of DTE ELECTRIC COMPANY for approval of Certificates of Necessity pursuant to MCL 460.6s, as amended, in connection with the addition of a natural gas combined cycle generating facility to its generation fleet and for related accounting and ratemaking authorizations.*
    - Arguing against DTE Electric's proposal to construct a new natural gas combined cycle generating facility and instead meet its future capacity and energy needs with a distributed portfolio of solar, wind, energy efficiency, and demand response.
- Case U-20162 – *In the matter of the Application of DTE Electric Company for authority to increase its rates, amend its rate schedules and rules governing the distribution and supply of electric energy, and for miscellaneous accounting authority*
    - Arguing against DTE Electric's proposal for a net energy metering successor tariff that improperly undervalued the contribution of distributed solar.
- Case U-20165 – *In the matter of the application of Consumers Energy Company for approval of its integrated resource plan pursuant to MCL 460.6t and for other relief.*
    - Discussing Consumers Energy Company's integrated resource plan, arguing for advancing the deployment of solar to meet its capacity requirements, arguing against Consumers' proposed financial compensation mechanism for third-party PPA contracts, supporting a robust PURPA market, and supporting transparent and equitable competitive procurement guidelines.
- Case U-20471 – *In the matter of the Application of DTE Electric Company for approval of its integrated resource plan pursuant to MCL 460.6t, and for other relief.*
    - Evaluating DTE's integrated resource plan, arguing for the Company to modify its modeling assumptions for solar, analyzing the operation and reliability of DTE's aging peaker fleet, demonstrating that solar and solar plus storage could replace some of DTE's peakers, advocating for robust competition and third-party access to new resources.
- Case U-20836 – *In the matter of the application of DTE Electric Company for authority to increase its rates, amend its rate schedules and rules governing the distribution and supply of electric energy, and for miscellaneous accounting authority.*
    - Critiquing DTE's Stable Bill tariff as poorly designed and not reflective of costs; arguing against the requirement for solar customers to take service on the Stable Bill tariff; calculating a new cost-based outflow tariff for exported solar energy.
- Case U-21193 - In the matter of the application of DTE Electric Company for approval of its Integrated Resource Plan pursuant to MCL 460.6t, and for other relief.
    - Discussing interconnection reforms that would facilitate incremental renewable energy capacity
- Case U-21224 – *In the matter of the application of Consumers Energy Company for authority to increase its rates for the generation and distribution of electricity and for other relief.*
    - Critiquing Consumes Energy's proposed outflow compensation for DG customers, its minimum bill proposal, and supporting changes in its cost-of-service model.

Public Utility Commission of Nevada

- Docket Nos. 17-06003 & 17-06004 Phase III – Rate Design – *Application of Nevada Power Company d/b/a NV Energy for authority to adjust its annual revenue requirement for general rates charged to all classes of electric customers and for relief properly related thereto.*
    - Arguing against Nevada Power Company's proposal to increase fixed customer charge.
- Docket No. 24-02026 – Rate Design - *Application of Sierra Pacific Power Company d/b/a NV Energy and Sierra Pacific Power Company d/b/a NV Energy for Authority to Adjust its Annual Revenue Requirement for General Rates Charged to All Classes of Electric Customers and For Relief Properly Related Thereto.*
    - Arguing against Sierra Pacific Power Company's proposal to increase fixed customer charge and solar cost of service study

North Carolina Utility Commission

- Docket E-100 Sub 165 – *2020 Integrated Resource Plans*
    - Advocating for modifications to Duke Energy's IRP, including assumptions on capital and O&M costs, operational assumptions, and natural gas forecast methodology.

Public Service Commission of South Carolina

- Docket Nos. 2019-224-E and 2019-225-E – *South Carolina Energy Freedom Act (House Bill 3659) Proceeding Related to S.C. Code Ann. Section 58-37-40 and Integrated Resource Plans for Duke Energy Carolinas, LLC and Duke Energy Progress, LLC*
    - Advocating for modifications to Duke Energy's IRP, including assumptions on capital and O&M costs, operational assumptions, and natural gas forecast methodology.

Public Utility Commission of Texas

- Docket 46831 – *Application of El Paso Electric Company to Change Rates*
    - Critiquing El Paso Electric's proposal to implement a three-part rate for residential and small commercial net metered customers.
- Docket 57568 - *Application of El Paso Electric Company for Authority to Change Rates*
    - Critiquing El Paso Electric's proposal to implement a three-part rate for residential and small commercial net metered customers, proposing an alternative time of use rate

Virginia State Corporation Commission

- Case No. PUR-2021-00146 – *For approval of the RPS Development Plan, approval & certification of proposed CE-2 Solar Projects pursuant to § 56-580 D and 56-46.1 of the Code of Virginia, revision of rate adjustment clause, designated Rider CE, under §56-585.1 A 6 of the Code of Virginia, and a prudence determination to enter into power purchase agreements pursuant to § 56-585.1:4 of the Code of Virginia.*
    - Evaluating Dominion Energy's compliance with the RPS requirements of the Virginia Clean Economy Act
- Case No. PUR-2024-00161 - *Petition of Appalachian Power Company for Approval to Revise its Net Metering Program Pursuant to § 56-594 of the Code of Virginia*
    - Analyzing and critiquing Appalachian Power Company's proposal to modify its net metering construct

EXHIBIT KL-3

SP-I-21

Explain the ongoing distribution rate Citizens would receive for a net-metered 450 kWAC system in their territory as compared to that same system connected as a PJM wholesale generator.

Response Provided By:
Nathan Johnson, President & CEO, Citizens' Electric Company

Date: June 26, 2025

Response:

The company cannot provide exact rate implications of a net-metered 450kW$_{AC}$ generation system. A number of parameters including, but not limited to:

- Existing load at service
  - Existing kWh usage behind the meter
  - Magnitude and timing of existing demand peak(s)
  - Load factor of existing load

- Nature of generating system
  - Parasitic load magnitude and characteristics
  - Coincidence of generation with existing load demand peak(s)
  - Type and nature of generation source

- Generation interconnection characteristics
  - Phase
  - Voltage

While no single answer is possible or appropriate for this question, the Company has provided an attachment, titled SP-I-21 Attachment A providing several hypothetical net-metered installations. The scenarios examined in the attachment are described below:

Scenario A:	450kW$_{AC}$ Rack Mounted SPV Array (Parameters provided in spreadsheet) with no co-located load.
Scenario B:	Scenario A SPV system with co-located ~420kW$_{AC}$ 3ph GLP-3 load.
Scenario C:	Scenario A SPV system with co-located 562MWh annual usage 3ph GLP-3 load.

The Company is unable to provide a distribution rate comparison case for the same system connected as a PJM wholesale generator. Distribution rates for a standalone wholesale generator would be negotiated in a site-specific contract, for which the Company has no comparable examples.

EXHIBIT KL-4

SP-I-2

How many customer generators have applied for interconnection, or are already interconnected, in the Citizens' service territory, and what is the kw rating and estimated kWh production of each? Please break down by rate class.

Response Provided By:
Nathan Johnson, President & CEO, Citizens' Electric Company

Date: June 26, 2025

Response:

There are currently 99 known existing or applied-for interconnections on the Company's system. See the attachment titled SP-I-2 Attachment A for the requested detailed listing. Estimated kWh production is provided as listed on the interconnection application unless no production was provided, or the provided number was invalid.

EXHIBIT KL-5

SP-I-13

Does Citizens intend to base demand charges for GSSR-2 customer generators on the nameplate capacity of the generating facility or the actual peak output, if they differ?

Response Provided By:
Nathan Johnson, President & CEO, Citizens' Electric Company

Date: June 26, 2025

Response:

The Company's proposed Tariff revision for billing demand would include the rated output capacity of the net-metered generator system in the calculation. Rated output capacity may differ from the nameplate capacity of a generating facility and/or the actual peak output.

EXHIBIT KL-6

SP-I-4

Explain how Citizens intends to "net" the customer-generators production against its consumption on an annual basis for both GSSR-1 and GSSR-2, broken down by rate class.

Response Provided By:
Nathan Johnson, President & CEO, Citizens' Electric Company

Date: June 26, 2025

Response:

For GSSR-1 customers, net energy consumption is calculated in the customer-generators utility meter billing read register. Net energy is equal to the total energy consumed through the meter minus the energy exported through the meter from one billing read to the next. Net kWh consumption is the same for both distribution and generation billing calculations.

For GSSR-2 customers, the Company proposes to use the same calculation as for GSSR-1 for calculation of distribution billing charges. For generation billing, the customer-generator will be billed for each hour of net consumption at the PJM West Hub Real-time Locational Marginal Price ("LMP"). Each hour of net export will be credited to the generation portion of the customer-generator's bill at the corresponding LMP. Excess credit will carry over to offset generation costs in future bill periods any excess balance will be cashed out to the customer-generator annually following the May bill cycle.

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE FOR THE RECORD YOUR NAME, POSITION, AND BUSINESS ADDRESS.

A1. My name is Kevin Lucas. I am the Vice President of Policy Analysis at the Solar Energy Industries Association ("SEIA"). My business address is 1425 K St. NW #1000, Washington, DC 20005.

Q2. ARE YOU THE SAME KEVIN LUCAS THAT SUBMITTED DIRECT TESTIMONY IN THIS CASE?

A2. Yes, I am.

Q3. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A3. The purpose of my rebuttal testimony is to address several arguments raised by Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "the Company") and by the Pennsylvania Office of Consumer Advocate ("OCA").

Q4. DOES YOUR FAILURE TO ADDRESS A PARTICULAR WITNESS OR ISSUE IMPLY SUPPORT OF THAT WITNESS OR ISSUE?

A4. No, it does not.

Q5. PLEASE SUMMARIZE YOUR FINDINGS AND RECOMMENDATIONS

A5. The arguments advanced in Company's rebuttal testimony do little to bolster support for its Billing Demand proposal. It continues to claim that customer-generators should be billed based on demand they do not place on the system, and its rebuttal offer to "phase in" the results of its punitive proposal do not remedy the inherent flaws in the concept.

Citizens' admits that customer-generator's exported power may not cause incremental costs on its system, but it proposes to substantially increase distribution costs for these customers because of nebulous "new obligations" that they place on the system. However, these "obligations" are completely undefined, unsupported with analysis, and do not correspond to the physical use of the system by customer-generators. Despite this, the Company has doubled down on its flawed proposal, recalculating its rates based on the higher (and seemingly incorrect) inclusion of the new Billing Demand definition.

The results are even higher bills for customer-generators, despite no change in their usage of the system. I continue to recommend the Commission fully reject the proposed Billing Demand proposal.

In response to the Office of Consumer's Advocate ("OCA") discovery requests following the direct testimony filing, the Company expanded on its reasons why large customer-generators should be shifted off of the GSSR-1 tariff. The additional responses, along with a revised version of a prior analysis, provided the opportunity to scrutinize this proposal further. As with the Company's analysis on the impact of the Billing Demand proposal that I discussed in my direct testimony, I found the Company's analysis and reasoning wanting.

The Company has improperly discounted the non-trivial contribution that solar customer-generators make to reducing capacity costs on the Default Service Provider ("DSP") contract, in part due to a flawed analysis. After fixing the Company's errors, I find that not only do solar customer-generators reduce capacity costs, they reduce them in a manner that provides more value than the average cost to serve the DSP load. Put another way, the avoided cost value of solar generation on the DSP contract is higher than the Price to Compare ("PTC") cost of the DSP contract.

This finding renders moot the Company's claim that compensating annual excess energy from customer-generators at the PTC results in a cost shift to non-customer-generator customers. Instead, all customers taking service on the DSP contract benefit from the addition of solar generation on the Company's distribution grid. Additionally, a review of the Company's most recently approved DSP contract does not reveal any price increase due to a higher risk premium than the prior contract, despite concerns raised by OCA. Given this, I recommend the Commission allow customer-generators to take service on whatever DSP rate they prefer.

II. REBUTTAL OF CITIZENS' WITNESSES GORMAN AND JOHNSON

Q6. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A6. In this section of testimony, I discuss the rebuttal testimony of Company witnesses Howard S. Gorman[1] and Nathan Johnson.[2]

Q7. PLEASE SUMMARIZE YOUR FINDINGS.

A7. The Company introduces several new arguments in its rebuttal testimony. It argued that there is precedent under its demand ratchet and minimum billing provisions for billing customers not based on their actual usage, but some other measure. But these measures are fundamentally different in nature than the proposed Billing Demand metric, and raise their own concerns.

Citizens' claims that its proposal will reduce customer confusion. However, it is not distinguishing between the very few customers that would be required to switch to the GSSR-2 rate from the many more customer-generators that would see sizable distribution bill increases due to the same definitional change. Far form reducing customer confusion, the proposal will likely incite frustration among most customer-generators.

The Company introduces a new and inflammatory claim that the GSSR-1 tariff provides the perverse incentive for customer-generators to intentionally act to harm the rest of the ratebase by turning off their systems during peak hours in an effort to manipulate the capacity market to their benefit. This is an extraordinary argument, which not only lacks extraordinary support, but lacks any evidence or analysis whatsoever. The Company's argument is farcical in its face given a small customer-generator has no ability to effectively manipulate the price of the multi-billion dollar, multi-Gigawatt PJM capacity market. The Company's unfortunate testimony on this point can only be seen as an effort to unjustly discredit customer-generators and should be fully disregarded by the Commission.

[1] Citizens Statement No. 1R - Rebuttal Testimony and Exhibit of H. Gorman ("Gorman Rebuttal").
[2] Citizens' Statement No. 4R - Rebuttal Testimony and Exhibits of Nathan Johnson ("Johnson Rebuttal").

In its rebuttal testimony, the Company recalculated its rates based on the proposed Billing Demand definition. The new rates exacerbate the issues identified in my direct testimony, causing an even more punitive rate impact for customer-generators based on demand they do not place on the system and costs they do not impose. The result is an even more stark bill increase that appears to only benefit non-customer-generators.

Finally, I revisit the Company's updated analysis on the capacity contribution of solar generation and its ability to reduce costs on the DSP contract. I find that, contrary to the Company's claims, the avoided cost benefits of the solar generation profile handily exceed the cost of serving the DSP load profile. Quite simply, paying customer-generators for their excess power at the PTC undercompensates these customers for the excess generation. Given this was the main reason why the Company proposes to require larger customer-generators to take service on the GSSR-2 rate, I recommend the Commission reject this proposal and allow customer-generators to take service on whichever rate they prefer.

A. Ratemaking and Demand Ratchet

Q8. MR. GORMAN ARGUES THAT YOUR OBSERVATION THAT THE IMPACT TO THE COMPANY'S SYSTEM IS LIMITED TO THE SMALL SET OF ASSETS THAT SERVE A CUSTOMER-GENERATOR IS NOT RELEVANT FOR RATEMAKING PURPOSES.[3] HOW DO YOU RESPOND?

A8. Mr. Gorman does not disagree with the fact that any impact to the Company's system from customer-generator systems is limited to the assets serving that customer. This is readily observable when the Company experiences a limited outage on its distribution system from downed trees or equipment failures. Customers on distant parts of the Company's grid are not impacted and continue to receive service as they are not directly served by the assets experiencing the outage. Similarly, the physical impact on the

[3] Gorman Rebuttal at 18.

Company's system from a customer-generator is necessarily limited to the assets that serve that customer, and those impacts are attenuated as one moves further upstream from local line transformers to feeders to substations as the usage is blended in with dozens, hundreds, or thousands of other loads.

Instead, Mr. Gorman argues that rates are designed to "recover its costs for the entire distribution system, from all its customers", with an exception for customer-dedicated assets. This statement is accurate, but it not only missed the point of my testimony, it runs counter to the entire basis of the Company's Billing Demand proposal: that customer-generators are imposing differential obligations through their use of the system and must be treated differently than in the past and from other customers.

Q9. WHERE IN THE RATEMAKING PROCESS DOES THIS DECISION GET MADE?

A9. The decision to implement the Billing Demand proposal is "upstream" from cost allocation and rate design components of the ratemaking process. Put another way, the Billing Demand decision is a precursor to the Company's cost of service study and rate design steps. In fact, in the Company's rebuttal testimony, it recalculated its demand rates based on the new definition of Billing Demand and allowed for potential future revisions to cost allocation "which can be eventually based on the actual class data."[4] So while it is true that the mechanical steps of ratemaking is intended to recover costs of the entire system from customers, the specific results are very much a result of which assumptions and methodologies a utility proposes.

Q10. DO YOU CONTINUE TO BELIEVE THAT THE COMPANY MODIFIED ITS RATEMAKING PROCESS BASED ON A FAULTY PREMISE?

A10. Yes. The Company attempts to justify disparate treatment of these customers by billing them not based on their actual usage but their potential usage of the system because it claims they impose burdens on the system that are not captured through the traditional

[4] Gorman Rebuttal at 4.

measures of imported demand. It bases these arguments not on how it must plan and operate its entire system writ large, but instead on how it must serve these individual customer-generators: "From a distribution perspective, we have to plan the same for a customer that is exporting 400 kW to Citizens' as we do for a customer that is receiving 400 kW from Citizens'. In fact, our planning for the export of power to us is more complicated because of potential variability, voltage sags/surges and other issues."[5]

In other words, the Company's justification for the Billing Demand proposal is specific to the usage characteristics of customer-generators, and it is on the robustness of this argument that the proposal must be measured. The Company cannot sidestep this crucial step by claiming that the end result is based on all the costs on the entire grid; it must instead justify its Billing Demand proposal on the facts of said usage. And as I discussed in my direct testimony, I do not believe the Company has met this burden.

Q11. MR. JOHNSON AND MR. GORMAN POINT TO THE USE OF BILLING DEMAND RATCHETS AS A PRECEDENT FOR NOT CHARGING CUSTOMERS BASED ON THEIR ACTUAL USAGE.[6] HOW DO YOU RESPOND?

A11. Mr. Johnson observed that "from July 2024 to May 2025, only 52% of non-residential bills charged for the actual metered demand during the same period" due to the 50% demand ratchet. Mr. Gorman had a slightly different figure, saying that only 49% of customers were billed based on their actual demand.[7] Regardless of whether it is 52% or 49% of customer bills that are caught by the demand ratchet, this is a troubling result. Given that nearly all of the distribution assets that serve customers are shared assets that are planned, sized, and operated to meet the diversified demand of the customers on the assets, it appears the Company is charging customers based on what are likely anomalous

[5] Citizens' Statement No. 4 at 17.
[6] Johnson Rebuttal at 39.
[7] Gorman Rebuttal at 15. Mr. Gorman states "Approximately 51% of all customer bills issued for GLP-1 and GLP-3 during the year are billed using the alternative measure (i.e., 50% of the highest monthly Billing Demand during the prior 11 months) rather than the metered monthly demand usage."

non-coincident peak ("NCP") demand that may have nothing to do with the cost causation of those demands.

The Company's statement means that roughly half of customer bills were for monthly peak demands that were less than half of the single maximum peak demand in the prior year or less than the 5 kW minimum demand on the GLP-1 tariff. For example, this could mean that a customer who had a peak demand of 100 kW in one month had demands of less than 50 kW in all other months would still be charged for 50 kW of usage for up to 11 months even if the 100 kW was an unusual outlier. Unless the Company has definitive evidence that even half of this peak demand of 100 kW was reflective of the cost-causing demand that they actually placed on the system, then it may be charging customers inappropriately based on a demand ratchet that is not tied to costs. I recommend the Commission investigate this issue further and request that the Company demonstrate that its use of the demand ratchet results in appropriate bills for its customers.

Q12. IS THIS DEMAND RATCHET ISSUE EXACERBATED WHEN COMBINED WITH THE PROPOSED BILLING DEMAND DEFINITION?

A12. Yes. There is a key distinction between being billed based on a demand ratchet and being billed based on the Company's proposed Billing Demand methodology. As problematic as the demand ratchet may be, it at least is based on some fraction of actual demand that a customer has placed on the grid in the prior 11 months. By contrast, the Billing Demand methodology is based on a hypothetical demand value that *may never be placed* on the Company's grid and can be substantially larger than any actual measure of demand the customer-generator draws from or places onto the Company's system.

Q13. DO YOU HAVE A ROUGH SENSE OF HOW SIZABLE THIS DIFFERENCE COULD BE?

A13. Yes. In my direct testimony, I corrected the Company's analysis related to how its Billing Demand proposal would impact a hypothetical customer.[8] As part of the modifications of the workpaper, I enabled functionality to quickly modify the customer peak demand and solar system and calculate the resulting power flows and customer Billing Demands under the current and proposed definition. I simulated potential combinations of customer peak demand and PV system size, with the results shown below in Table 1.

Billing Demand / Inflow Ratio				
	Customer Peak Demand			
PV System Size	**25**	**50**	**75**	**100**
25	1.27	1.00	1.00	1.00
50	2.55	1.27	1.00	1.00
75	3.83	1.91	1.27	1.00
100	5.11	2.55	1.69	1.27
125	6.40	3.19	2.12	1.59
150	7.68	3.83	2.55	1.91
175	8.96	4.47	2.98	2.23
200	10.25	5.11	3.41	2.55
225	11.53	5.75	3.83	2.87
250	12.82	6.40	4.26	3.19

Table 1 – Biling Demand / Inflow Demand Ratio

Q14. HOW DO YOU INTERPRET THESE RESULTS?

A14. The values in the table show the ratio of the average monthly customer peak demand under proposed Billing Demand definition and the current peak demand definition. The columns represent customers with different size peak demands (ranging from 25 kW to 100 kW in 25 kW increments), while the rows represent different size PV systems (ranging from 25 kW to 250 kW in 25 kW increments). The intersection of the row and column contains the result of dividing the average Billing Demand value by the average peak demand value. For instance, a customer with a 50 kW peak demand and a 100 kW PV system would see an average monthly Billing Demand that was 2.55 times larger than

[8] Lucas Direct at 9.

the current peak demand measurement, even if they never exported 100 kW to the Company's grid.

Q15. WHAT PERCENTAGE OF THAT CUSTOMER'S ANNUAL USAGE WOULD BE MET BY THAT SIZE SOLAR SYSTEM?

A15. Using the Company's example customer scaled to 50 kW peak demand, a 100 kW solar system would only cover about 51% of their annual load. Despite this relatively modest system size, the Company's proposed Billing Demand definition would result in distribution demand charges that are more than 2.5 times higher than under the current definition. For a customer wishing to offset their entire annual load, the new Billing Demand would be about 5 times higher than the current definition. This stands in stark contrast to the Company's demand ratchets, which are only triggered when peak demand falls below 50% of what a customer has already attained in the prior 11 months.

Q16. IS THERE ANOTHER PROBLEMATIC INTERACTION BETWEEN THE BILLING DEMAND DEFINITION AND THE DEMAND RATCHET?

A16. Yes. Because the demand ratchet would set the minimum demand based on the new Billing Demand definition – which could be based entirely on the gross generator rating ("GGR") of the PV system – a customer who meets more than roughly 20% of their annual usage could never reduce their ratcheted demand without changing the PV system hardware.[9] Using the Company's example customer's load profile, if a customer with a 100 kW peak demand installed an 80 kW PV system, they would offset roughly 20% of their annual usage and see their peak inflow demand fall from 100 kW to 80 kW. But because their Billing Demand could never fall below 80 kW due to the GGR, even if they took actions to further reduce their demand below 80 kW, they would get no relief on their demand charges because the GGR would set the billing demand floor in every month.

[9] Using the Company's example load profile, a customer with a PV system equal to 80% of their peak demand (e.g., a 100 kW customer with an 80 kW PV system) would see their demand switch from their actual usage of the grid to the GGR.

B. Customer Confusion, Alternative Definition of Billing Demand, and Billing Demand Phase In

Q17. THE COMPANY CONTINUES TO ASSERT THAT ITS BILLING DEMAND DEFINITION WILL "REDUCE CUSTOMER CONFUSION."[10] WHAT IS YOUR RESPONSE TO THAT?

A17. I disagree, and in fact, it is difficult to see how customer confusion would not increase under the proposal. The Company proposes to use the Billing Demand definition for two purposes: 1) assigning a customer taking default service to either GSSR-1 or GSSR-2, and 2) billing customers for a portion of their distribution costs. The former decision point would only affect customers with DG system sizes over 400 kW_{AC}, which is a small subset of customer-generators. Of the 87 customer-generators (15 of which are non-residential systems) that are currently taking service with the Company, only one is larger than 400 kW_{AC}.[11] Of the additional 12 projects that are listed as "Indicated" or "Applied / In Progress" (5 of which are non-residential), only two exceed 400 kW_{AC}.[12] In other words, even if all of the projects that exist or that the Company is aware of were all built, only three out of 99 would be impacted by the Company's proposal to assign default supply rates based on the 400 kW_{AC} Billing Demand threshold. This change would result in a sizable, negative impact for these individual customers, but it would not result in widespread customer confusion across the entire non-residential customer base.

On the other hand, all of the non-residential customer-generators would be impacted by a sizable change in their bills due to the use of the proposed Billing Demand definition on their distribution bills. Because all but one of these existing customers have system sizes below 400 kW_{AC}, they would not be impacted by the assignment of supply rates, but would nonetheless see sizable distribution bill increases. Why the Company believes that this would result in "reduced customer confusion" and not confused and frustrated customers who just received a huge bill increase is unclear.

[12] *Id.*

Q18. IS THE COMPANY OPEN TO USING AN ALTERNATIVE DEFINITION OF BILLING DEMAND?

A18. It appears so, but only if ordered by the Commission.[13] The Company acknowledges that "[t]here are other possibilities that could be used, such as the 15 minutes of maximum bi-directional demand during the billing cycle."[14] But it notes that its current meters are not configured for measuring bi-directional demand and would require reprogramming. It also raises a concern that "using the bi-directional demand could result in an account moving between the GSSR-1 and GSSR-2 net-metering credit process on an annual basis."[15]

Q19. DO YOU SEE EITHER OF THESE AS MAJOR ISSUES?

A19. No, although I continue to believe using bi-directional demand for the purposes of billing customers for their usage to be inappropriate for all the reasons discussed in my direct testimony. That said, if the Commission were to approve that definition, I do not believe these two issues are major impediments to using that definition.

First, the number of meters that would need to be reprogrammed is small as the Company currently only has 15 non-residential customer-generators on its system. Any new customer-generator could have a meter preconfigured for bi-directional measurement before installation, obviating any additional work. Second, while the Company did not provide the peak inflow demand of its customer-generators, it is reasonable to assume that the PV system size will be similar or larger in size than the customer's peak demand.[16] Given only one existing non-residential customer-generator exceeds the 400 kW_{AC} threshold (and, at 1.77 MW, by a sizable amount), the only way for other customer-generators to switch between GSSR-1 and GSSR-2 on an annual basis due to their actual peak bi-directional demand would be for their imported power to fluctuate above and below 400 kW.

[13] Johnson Rebuttal at 25.
[14] *Id.*
[15] Johnson Rebuttal at 26.
[16] As discussed above, a customer seeking to offset a reasonable portion of their annual usage will need to install a PV system that exceeds its peak demand.

Q20. DO YOU BELIEVE THIS WOULD HAPPEN OFTEN?

A20. No. Of the 15 non-residential customer-generators in service, 11 have PV systems under 200 kW_{AC}. For these systems to flip the net imported power from above 400 kW to below 400 kW would require a customer to have a sizable daytime load (e.g., 500 kW), which means the systems are offsetting very little of the customer's annual generation. For the 3 systems between 200 kW_{AC} and 400 kW_{AC}, the daytime load of the customer would need to be even larger.

Given the average GLP-1 customer has a billing demand of 12 kW[17] and that nearly all of the existing non-residential customer-generators take service on this tariff, the odds that all of the customer-generators on this tariff are extreme outliers with several hundred kW of demand is low. More likely, these customers have peak demands that are equal to or lower than their PV system sizes (which are already below the 400 kW_{AC} threshold), meaning that they are highly unlikely to switch between the GSSR-1 and GSSR-2 tariff on an annual basis based on actual power flows.

Q21. THE COMPANY PROPOSES TO PHASE IN THE BILLING DEMAND DEFINITION OVER THREE YEARS FOR DISTRIBUTION RATES.[18] WHAT IS YOUR RESPONSE TO THIS?

A21. This is a solution in search of a problem. First, the Company does not propose to phase in the definition to the supply rate, which would be implemented immediately in January 2026. Second, phasing in the Billing Demand definition over three years does not remedy its flaws; it merely tries to cushion the rate shock that would result from the unsupported proposal. The customers that would be the most impacted by this change – those with large systems relative to their on-site load – the economic life of a solar system is measured in decades, not in years. Phasing in a substantial increase in distribution costs over three years will do little to mitigate the lifetime financial impact on the system.

[17] Schedule B6-3 shows Schedule GLP-1 with 13,644 annual bills and 163,587 kW of annual demand. Dividing the latter by the former results in roughly 12 kW of monthly demand.
[18] Johnson Rebuttal at 22.

C. GSSR-1 and GSSR-2 Price Signals and Incentives

Q22. THE COMPANY SUGGESTS THAT CUSTOMER-GENERATORS TAKING SERVICE ON THE GSSR-2 TARIFF HAVE A GREATER INCENTIVE TO MAXIMIZE EXPORTS DURING PEAK HOURS.[19] WHAT IS YOUR RESPONSE TO THIS?

A22. I disagree with the Company's hypothesis. Mr. Johnson argues that a customer-generator placed on the GSSR-2 tariff will have an incentive to export to the grid "during higher-priced hours."[20] He continues:

> Although a solar generator may be relatively inelastic in producing power in response to hourly prices, many qualifying net-metered generation sources are able to respond directly to price signals. In addition, even the customer-generator with a solar array may be able to reduce the host load consumption to increase its exports during these hours.[21]

Q23. WHAT IS WRONG WITH THIS STATEMENT?

A23. As a primary matter, there is no way for a customer-generator to respond to the price signal provided by the GSSR-2 tariff. That tariff charges (or compensates) generation at the "actual real-time PJM West Hub Locational Marginal Price ('LMP') for each hour of the billing month"[22] The real-time LMP price is recalculated every five minutes throughout the day, and the "actual" value for any given hour cannot be calculated until the hour has already passed since it is necessarily the load-weighted average of the 12 five-minute periods of that hour. In other words, by the time a generator could even know what the real-time hourly rate at which they will be charged (or compensated), their usage (or generation) will have already occurred.

Q24. COULD A CUSTOMER-GENERATOR MONITOR THE REAL-TIME 5-MINUTE LMP INTERVALS AND MODIFY THEIR BEHAVIOR IN RESPONSE TO THESE PRICE SIGNALS?

[19] Johnson Rebuttal at 27.
[20] Johnson Rebuttal at 28.
[21] *Id.*
[22] GSSR-2 Rider

A24. No. PJM itself does not display the price of a 5-minute interval until most of the way through the interval.[23] Further, the idea that a business should be expected to moderate its load in response to price signals that could change by hundreds of dollars per MWh in minutes overstates the likely flexibility of the loads. It is one thing to reschedule a production line 24 hours in advance or even to make planned load adjustments several hours in advance based on expected prices, but actively managing a business enterprise based on minute-by-minute price fluctuations in the PJM wholesale market is a bar too high for nearly all businesses.

More problematically, the PJM real-time LMP frequently experiences unpredictable "needle peaks" where the price may jump by considerable amounts in one 5-minute interval only to fall just as rapidly as the generators on the grid are re-dispatched. For example, on August 25th, real-time prices were low in early morning hours and largely consistent with the day-ahead prices. At 8:10 AM, the Western Hub Real-Time LMP was $22.82/MWh. At 8:15 AM, it increased to $79.90/MWh. At 8:20 AM, it fell back to $25.65/MWh and stayed at or near that level for most of the rest of the morning. These needle peaks are not uncommon, as shown in Figure 1 below.[24] Moreover, they are not predictable since they are necessarily the result of very short-term imbalances in supply and demand resulting from issues such as unplanned generator or transmission line outages or sudden, unanticipated spikes in demand. The suggestion that customer-generators should or would monitor and respond to these "price signals" on a continuous basis is not reasonable.

[23] https://dataviewer.pjm.com/dataviewer/pages/public/lmp.jsf. The prices on the publicly accessible pages updated roughly four minutes into a given five-minute period. For example, the price for the period from 2:40 PM to 2:45 PM was updated on the PJM website at 2:44.

[24] Data accessed from https://dataviewer.pjm.com/dataviewer/pages/public/lmp.jsf at 3 PM on August 25, 2025.

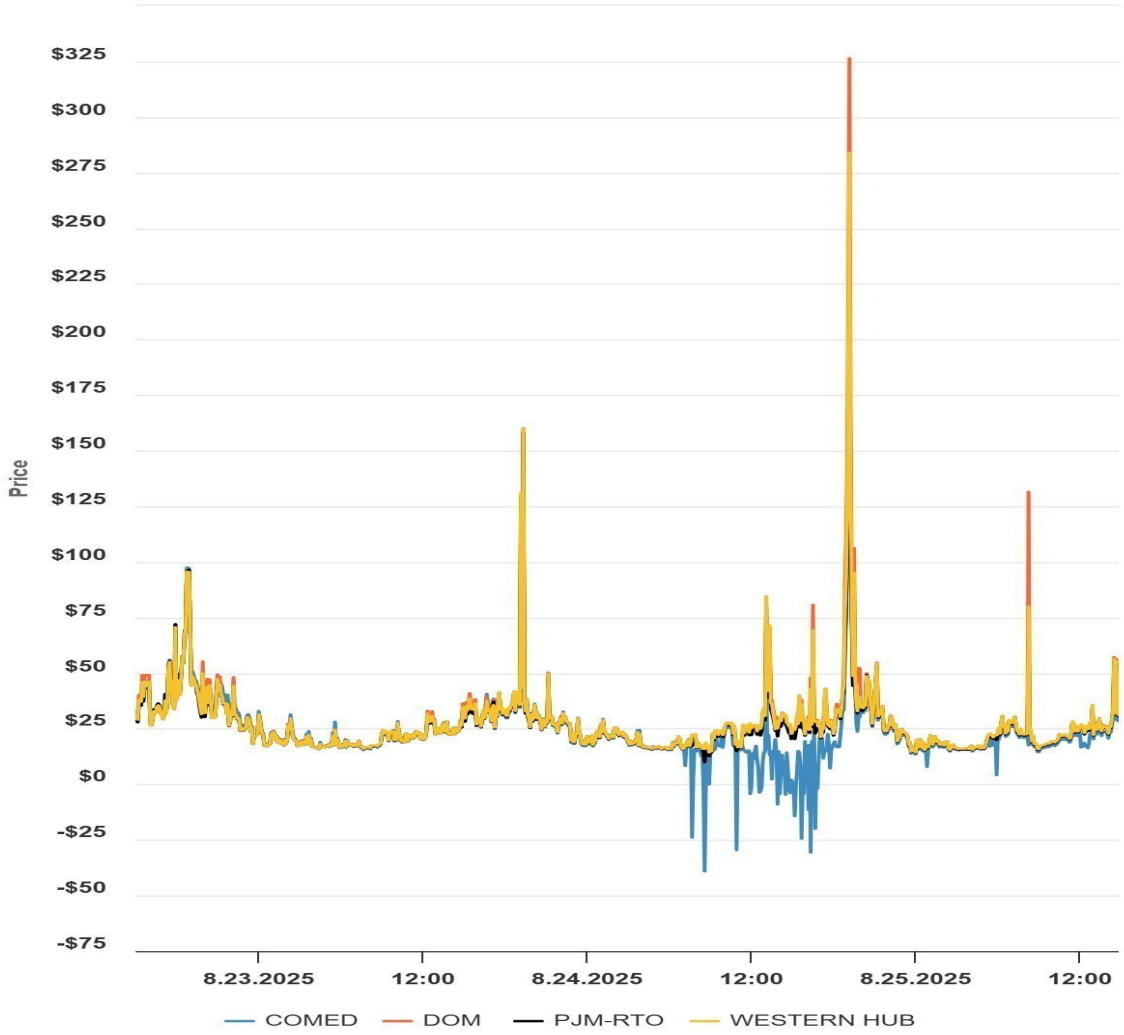

Figure 1 - PJM Real Time Prices August 22, 2025 to August 25, 2025

Q25. DOES THE COMPANY BELIEVE THESE PRICE SIGNALS AND INCENTIVES ALSO EXIST ON THE GSSR-1 RATE?

A25. No. In fact, the Company goes further and suggests that customer-generators have an incentive to withhold generation during peak hours to intentionally increase GSSR-1 rates.

> In fact, the GSSR-1 rate provides an economic disincentive for exporting during high-demand hours. Net exporting customer-generators are paid at the end of the energy-year at the PTC, which includes transmission and capacity costs determined by the Company's contribution to annual PJM peak hours. Exporting during peak hours reduces the Company's costs, thus reducing the value of export credits. Net-metered generation is non-dispatchable and, as Mr. Nolt states in his

> testimony, is able to "go offline immediately" so a customer-generator could reduce or eliminate output during peak hours to maximize the value of future export credits. In short, rather than incentivizing customer-generators to export during peak hours for benefit of all ratepayers in the class, the GSSR-1 rate structure, coupled with net metering code requirements, provide a financial incentive for customer-generators to deny exports during peak hours at the cost of non-exporting ratepayers.[25]

Q26. WHAT IS YOUR PERSPECTIVE ON THIS STATEMENT?

A26. This is a rather staggering accusation. The Company asserts – with no evidence or analysis whatsoever – that customer-generators would engage in market manipulation by intentionally reducing the output of their solar facilities in order to increase the peak demand of customers being served on the GSSR-1 tariff in hopes of inflating the future costs of that rider. It further presupposes that this increased peak demand will necessarily translate into increased costs that must be recovered from GSSR-1 customers, eventually increasing the credit rate at which exported energy is compensated.

Putting aside the unfounded and incredibly cynical basis for the statement, there are three problems with the Company's assertion. First, no customer knows when the five coincident peak hours that will be used in PJM's calculation of generation and transmission capacity cost allocation will occur. These are only announced months after the fact and are by definition retrospective. For a customer-generator to be confident of impacting one of these five hours, they would have to reduce their generation output on many hot afternoons as one simply cannot be determined with any precision when a combination of weather and customer load will trigger one of these system-wide peak hours.

Second, this repeated reduction in generation will have a much larger impact on a generator's compensation than any hypothetical price increase triggered by the intentional withholding of exported power could have. A customer-generator would be taking a sizable risk that forgoing guaranteed revenue by not generating on a given day

[25] Johnson Rebuttal at 28-29.

will result in future price increases that more than offset the lost revenue, particularly given the insignificance of a single distribution-connected DG system on the multi-Gigawatt, multi-billion dollar PJM capacity market.

Third, the DSP contract that the Company has with its wholesale supplier passes through PJM generation capacity and transmission costs directly based on the actual costs apportioned to the Company. The Company then divides these dollars by the kWh sold on the GSSR-1 tariff to determine the GSSR-1 $/kWh rate component for the recovery of generation and transmission costs. If a customer-generator reduced their output, it would result in increased net sales at the Company's PJM settlement point, which means the capacity costs would be divided by a larger quantity of sales. This would tend to reduce, not increase, the $/kWh rate that a customer-generator would be credited for excess generation.

Q27. PUTTING ASIDE THESE ISSUES, IS THERE EVEN A HYPOTHETICAL POSSIBILITY THAT A CUSTOMER-GENERATOR WOULD BENEFIT FROM THE MARKET MANIPULATION SUGGESTED BY THE COMPANY?

A27. No. Suppose a customer on the GSSR-1 tariff had a 100 kW_{AC} PV system that produced 147 MWh per year.[26] For a BTM customer-generator, much of this production will be used on-site and will not result in exported power. But to illustrate a worst-case scenario, suppose that all power was exported and compensated at the GSSR-1 rate.

The GSSR-1 rate used in the Company's workpapers included was $110.77/MWh, $42.27/MWh of which was for generation and transmission capacity.[27] At this rate, the customer-generator would receive $16,284 for excess generation at the end of the year. Suppose that this customer could magically determine exactly which five hours would be used in the PJM cost allocation process and decided to "turn off" their generation during only those five hours. Given that PJM's peak hours tend to occur

[26] This is the expected generation using the Company's PVWatts assumptions.
[27] Company workpaper SP-II-5 Attachment A.

between 4 and 6 PM EPT, the 100 kW generator will not be outputting 100 kW, but something lower.[28] The exact value will depend on the weather, but to continue the "worst case scenario", one can assume they may be outputting an average of 56 kW during these hours.[29] If the customer-generator deactivated the generation for these five hours, it would forgo roughly $31 in compensation.[30] In order for the customer-generator to come out ahead as a result of this behavior, the price of the transmission and capacity components of the GSSR-1 rate would have to increase by at least 0.5% as a direct result of the individual customer-generator's actions.[31]

In reality, a customer-generator would not have the magical ability to only deactivate their system during the 5 CP hours as these hours are not known in advance. Instead, a customer-generator seeking to manipulate the market to its favor would have to turn off their system during many summer afternoons between 4 PM and 6 PM with the hopes that one of those days would end up being a 5 CP hour. If they instead picked 20 days during which to target their peak load increase, the forgone revenue would increase by roughly 5 times, which would in turn require the capacity price impact from the customer-generator's actions to be in the 2-3% range to recoup the losses.

Q28. IS THERE ANY EVIDENCE WHATSOEVER OF A COORDINATED EFFORT AMONG ANY, MUCH LESS ALL, OF THE CUSTOMER-GENERATORS TO INTENTIONALLY DEACTIVATE THEIR SYSTEMS DURING PEAK HOURS TO MANIPULATE THE MARKET PRICE OF CAPACITY AND TRANSMISSION SERVICES?

[28] 18 of the past 20 5CP hours occurred either between 4 PM and 5 PM EPT or between 5 PM and 6 PM EPT. https://www.pjm.com/-/media/DotCom/planning/res-adeq/load-forecast/summer-2024-peaks-and-5cps.pdf

[29] The average of the five highest generation hours between 4 PM and 6 PM EPT from June to September in the Company's workpapers for a 100 kW_{AC} system averaged 56.5 kW. This represents the largest increase to peak demand that the customer-generator might expect to make on the 5CP days by shutting down its PV system.

[30] 56 kW * 5 hours * $110.77/MWh = $31.32 in lost revenue.

[31] Returning to the original revenue would require a total PTC of $110.98/MWh, which is $0.21/MWh higher than the original price. This would require a 0.51% increase in the generation and transmission capacity prices.

A28. Of course not. But even if there was, the ability for an individual customer-generator's behavior today to impact future capacity prices is swamped by so many other factors as to be rendered moot.

Q29. HOW MUCH CUSTOMER-GENERATOR SOLAR CAPACITY IS CURRENTLY OPERATING ON THE COMPANY'S GRID?

A29. The Company indicated it has about 4.1 MW of customer-generators in service on its system across all customer sizes and types.[32] Much of this is serving behind-the-meter loads, meaning only a fraction of this capacity would benefit from the hypothetical market manipulation suggested by the Company.

Q30. HOW MUCH LOAD WAS PRESENT DURING THE 2024 5 CP HOURS IN THE PPL PJM ZONE, WHICH SETS THE CAPACITY PRICE FOR THE COMPANY?

A30. The average of the 2024 5CP hours in PPL's PJM zone was 6,928.2 MW.[33]

Q31. WHAT WAS THE RECENT AMOUNT OF OFFERED AND CLEARED CAPACITY IN THE MOST RECENT PJM CAPACITY AUCTION IN THE PPL ZONE?

A31. The PJM PPL zone had 8,424.6 MW of capacity offered and cleared 8,377.4 MW of capacity.[34]

Q32. PUTTING THESE FIGURES TOGETHER, WHAT WOULD HAVE TO HAPPEN FOR A CUSTOMER-GENERATOR'S DECISION TO DEACTIVATE THEIR SYSTEM DURING PEAK HOURS TO IMPACT CAPACITY PRICES TO A SUFFICIENT DEGREE TO MAKE IT WORTH THEIR WHILE?

A32. First, a customer-generator would have to be served on the GSSR-1 tariff and have annual excess energy. This already eliminates any customer with a system that does not produce more energy over the course of the year than their consumption. Then, the customer will have to decide to attempt to manipulate the PJM capacity market by intentionally shutting their system down for several hours during hot summer afternoons.

[32] Exh. KL-7, Company workpaper SP-I-2 Attachment A.
[33] https://www.pjm.com/-/media/DotCom/planning/res-adeq/load-forecast/summer-2024-peaks-and-5cps.pdf
[34] https://www.pjm.com/-/media/DotCom/markets-ops/rpm/rpm-auction-info/2026-2027/2026-2027-bra-report.pdf

Depending on the system size and configuration, this may require the repeated manual flipping of cutoff switches and accepting any additional wear and tear on components that results.

Following this, the customer will have to sit around and wait to see if the day they selected to shut off their system ends up being one of the 5 CP hours on which PJM capacity cost allocations are based. If they missed by even an hour, they would have forgone guaranteed revenue based on speculation. But even if they were right, they would then have to wait several years for the increase in load attributable to their action to be captured via PJM's load forecast methodology and subsequently increase the load obligation of the PPL zone.[35] Next, generation and other capacity resource owners would have to bid in a manner where the marginal increase in PPL zonal load from the foregone solar generation triggers a price increase in the capacity market that exceeds the lost revenue from shutting down their system. Finally, three to four years hence, the customer-generator would have to wait for the end of the year to receive any added compensation for their annual excess generation that their actions has netted them.

Q33. IS THIS IN ANY WAY A REALISTIC SCENARIO?

A33. No; it is instead an absurd one. Putting aside the notion that the Company's small customer-generators will be flipping disconnect switches on hot summer afternoons in an attempt to manipulate the multi-billion-dollar PJM capacity market, the actions of any individual customer-generator would simply be lost among the many thousands of MW of load and generation that set PJM capacity prices. Even if there was a grand conspiracy and all 4.1 MW of customer-generators (including those that do not have any excess annual generation and thus would be completely unmotivated to lose money) turned off their systems during hot summer hours, this would only represent 0.05% of the cleared capacity in the PPL zone and has essentially zero chance of affecting the clearing price.

[35] PJM capacity prices are typically set three years in advance, although the capacity auction schedule has been compressed in recent years.

Q34. WHAT DO YOU RECOMMEND WITH RESPECT TO THIS "CONCERN" RAISED BY THE COMPANY?

A34. I recommend the Commission completely and wholeheartedly disregard it. It is a specious argument that has no basis in rational action by customer-generators and should be summarily dismissed.

D. The Billing Demand Proposal Discriminates Against Customer-Generators in Favor of Non-Customer Generators

Q35. WHAT CHANGES DID THE COMPANY MAKE TO ITS RATE DESIGN IN ITS REBUTTAL TESTIMONY?

A35. The Company modified the billing determinants that it used to calculate the demand charge in the GLP-1 and GLP-3 tariffs to confirm with its proposed Billing Demand definition.[36] In its original application, the Company used the actual and/or ratcheted demand from the customer to calculate the demand rates. When these were updated based on the proposed definition, the total demand billing determinants on the GLP-1 tariff increased by roughly 25%, going from 163,587 kW to 203,588 kW. The GPL-3 tariff had a much smaller increase given the fewer number of customer-generators and relatively larger customer loads on this tariff, increasing from 131,543 kW to 133,103 kW. The increase in billing determinants has an inverse effect on demand rates as they are still designed to recover the same revenue. The GLP-1 rates fell roughly 20% from $4.44/kW to $3.79/kW, while the GLP-3 rates fell modestly from $6.78/kW to $6.71/kW.

Q36. WHAT IS THE PRACTICAL EFFECT OF THIS CHANGE?

A36. The practical effect is that the 13 customer-generators on the GLP-1 tariff will see a massive increase in distribution costs, while the 1,124 non-customer-generators on the GLP-1 tariff will see a non-trivial distribution bill reduction.[37]

Q37. IS IT POSSIBLE TO CALCULATE THE MAGNITUDE OF THIS CHANGE?

[36] Gorman Rebuttal at 4. All figures in this paragraph are from Table HGS-2.
[37] Table HGS-2 indicates 13,644 annual bills, which is 1,137 customers. Workpaper SP-I-2 Attachment A shows 13 current customer-generators take service on the GLP-1 tariff, with a combined rated capacity of 2,967 kW.

A37. It is possible to get a rough estimate, although the Company's figures and discovery responses conflict with each other. Specifically, the increase in the GLP-1 billing determinants due to the inclusion of the GGR (3,333 kW per month) is larger than the sum of the GGR reported for active customer-generators on the GLP-1 tariff (2,967 kW per month). Given many of these customers are BTM generators, their demand under the current definition should not be zero, widening the disparity in the Company's figures.

The Company does not indicate that any of the "in progress" solar projects will take service on the GLP-1 tariff, nor does it include any new GLP-1 customers in its projected test year.[38] Further, after reviewing a confidential discovery response just before filing this testimony that included details about individual GLP-1 net metered customers, the 40,001 kW annual increase used in the bill determinant recalculation is substantially larger than the sum of the incremental Billing Demand in that workpaper.[39] I recommend the Commission investigate this matter further if it accepts the Company's Billing Demand definition to ensure that rates are being calculated correctly.

In my analysis using publicly available data, I attempted to de-skew the average cost impact due to the one very large (1.77 MW) customer-generator currently taking service on GLP-1 by separately analyzing this customer.[40] Using Excel, I set up a set of equations to calculate the average demand of the 1,124 non-customer generators and the 12 remaining customers-generators under the old and new definitions, setting the resulting total demand equal to the values in Table HGS-2. I then used Excel's Solver to solve the equations.[41] The results are found in Table 2 below.

[38] Exh. KL-7. In SP-I-2 Attachment A, all four projects listed as "Applied / In Progress" are listed on rate GLP-3. In the Company's COSS Study (Schedule B2-1), there are no additional customers forecasted for 2025 or 2026.
[39] Citizens' HIGHLY CONFIDENTIAL SP-II-11 Attachment A. I reviewed the workpaper too late to modify the analysis below. That said, the analysis presented here does not utilize confidential data and can thus be publicly filed and is largely consistent with the customer-specific results in the confidential attachment.
[40] Breaking this customer out made it impossible to solve the equations perfectly, although the resulting answer is within roughly 2.5% of the demand totals listed in the Company's rebuttal testimony.
[41] The equations have multiple results depending on the assumed average demand of non-customer-generators and customer-generators. Absent any additional information, I seeded the Solver algorithm with the assumption that the

	Direct Definition

Table 2 – Billing Demand Definition Impact on Rates and Bills

Q38. HOW DO YOU INTERPRET THESE RESULTS?

A38. Assuming the Company's discovery responses and calculations are correct (although they do conflict with each other), mathematically the only way for the total demand billing determinants to increase by the 40,001 kW per year from 13 customers is for each customer to see a sizable increase in their assigned billing demand. In all likelihood, the one large 1.77 MW customer-generator represents a sizable portion of the increase, which I estimated at just over 40% of the total.[42] Even when I separately account for this, the

two groups of customers had the same average demand under the current definition. Even if customer-generators have larger-than-average demands, the total bill impact of this change remains similar.

[42] I estimated the average peak demand of this customer assuming a 50% load factor and using the 2022 sales from Workpaper SP-1-14 of 1.66 million kWh, resulting in an average peak demand of 380 kW. This customer's 2024 sales were reduced to 0 kW, suggesting that their solar system is fully offsetting their annual usage.

remaining customer-generators see an average billing demand increase of roughly 101 kW per month.

The impact on the customer-generators is sizable. The single large customer-generator would see its bill increase by more than $60,000 per year, a truly punitive amount and equal to a nearly 300% increase in its distribution bill. The remaining customer-generators would on average see bill increases of about $4,500 per year, representing a nearly 400% increase. Meanwhile, the non-customer generators would on average receive an 11% reduction in their demand charges, despite no change in behavior or usage of the system.

Q39. WHAT POSSIBLE JUSTIFICATION FOR THIS RESULT DOES THE COMPANY PROVIDE?

A39. Despite admitting that customer-generator exports do not always cause an increase in costs, and even if they did, that it has not done the requisite studies to determine those costs, the Company essentially claims that it has been billing customers wrong for as long as it has had customer-generators:

> Q. If the new "obligations" above do not result in incremental costs to serve its customers, does the Company believe it is appropriate to charge the customer-generator more after installing the on-stie generation? Please explain in full.
>
> A. Yes, just as obligations from new or increased load that increase peak consumed demand will result in increased charges to customers—regardless of whether specific, measurable incremental cost increases can be directly correlated to the new load—the Company proposes to charge exported 'demand' in a similar manner. The Company cannot reasonably calculate the exact incremental costs incurred by each individual customer on an ongoing basis, which is one of the reasons why tariffed rates are used. Billing demand and usage provide the best reasonable representation of a customer's relative utilization of the distribution system and, as such, are appropriate quantities on which to base customer bills.[43]

In short, the Company claims that customer-generators place new "obligations" on the system, and that even if these obligations do not increase the cost of the system, it is nonetheless appropriate for customer-generators to pay more for their use of the

[43] Exhibit KL-8, SP-VI-5.c.

system. In the example above, "serving" these new "obligations" results in a typical customer-generator seeing their costs increase by thousands of dollars per year.

Q40. HAS THE COMPANY PERFORMED ANY ANALYSES TO SUPPORT THIS DRAMATIC RESULT?

A40. No. The Company admits that adding customer-generators to its systems "do[es] not always result in incremental cost increases to operate and maintain the system."[44] It admits that customer-generators must pay for required studies and systems upgrades to safely interconnect with the Company's system.[45] It admits that adding distributed generation to its system will never increase feeder peak demand.[46] It admits that it has not performed a cost of service study comparing the cost responsibility using actual metered energy flows or its GGR Billing Demand methodology.[47] It admits that it does not perform marginal cost of service studies for its distribution system specifically related to the marginal cost of exports from distributed generation.[48] Finally, it admits that it is not aware of any other unbundled distribution utility that uses its proposed Billing Demand methodology.[49] In short, it has done none of the legwork required to demonstrate its proposal is just and reasonable.

Q41. DID THE COMPANY IDENTIFY WITH ANY SPECIFICITY WHAT THESE NEW "OBLIGATIONS" ARE?

A41. It specifically noted that customer-generators place new obligations on the system "by exporting more energy than it previously imported, and then expecting the return of the 'banked' excess supply on-demand."[50] It continued, "Finally, the Company does not argue that generation, by nature, creates additional costs compared to consumption of a

[49] Exhibit KL-15, SP-V-3.
[50] Johnson Rebuttal at 23.

similar magnitude. Rather, we seek to treat all utilization of the distribution system equally, regardless of the direction in which power flows"[51]

Q42. WHAT IS THE "RETURN OF THE 'BANKED' EXCESS SUPPLY ON-DEMAND" DESCRIBING?

A42. Physically, it is describing nothing other than the Company providing power to the customer-generator. The power grid does not physically separate excess generation, set it aside, and then return it to the customer-generator at a later time; it meets the instantaneous power needs of the customers at all times. The "banking" concept is strictly related to the net metering accounting rules and is the policy of the Commonwealth. Rather, the Company is describing its obligation to provide its customers with power when called upon, which is a core component of its obligation to serve. It does this the same for customer-generators as it does with non-customer-generators; there is nothing special here in terms of the system usage or subsequent cost-causation of customer-generators.

Q43. HAS THE COMPANY IDENTIFIED ANY SCENARIO IN WHICH THESE NEW "OBLIGATIONS" CANNOT BE HANDLED BY THE EXISTING SYSTEM WITHOUT MODIFICATION?

A43. The Company has not identified any specific issues that directly result from customer-generators being connected to its system. It does mention hypothetical concerns related to power fluctuations from passing clouds, but admits that these types of issues are screened for during the interconnection process, must be remedied and paid for by a customer-generator prior to connecting to the system, and there is "little difference" between solar generation and customer load fluctuation of similar size and timescale.[52]

Q44. DO DISTRIBUTION SYSTEM ASSETS GENERALLY CARE WHICH DIRECTION POWER FLOWS THROUGH THEM?

A44. Generally, no. Poles are structural, not electrical, in nature. Wires are unaffected by the direction of power flow and are only limited by the total power they can carry, and

[51] *Id.*
[52] Exhibit KL-16, SP-III-1.

transformers can typically handle reverse power flows with no impact on operations. There may be some larger switching equipment and voltage control equipment that are not designed to manage two-way flow, but these comprise a small portion of the Company's distribution rate base and the Company has not identified any ratebase-funded upgrades needed to accommodate reverse power flows as those would need to be paid for by the customer-generator as a condition of interconnection.

Q45. IS THE COMPANY'S BILLING DEMAND PROPOSAL REALLY BASED ON "ALL UTILIZATION" OF THE SYSTEM BY ITS CUSTOMERS?

A45. No. For a customer-generator, the Billing Demand is the larger of the peak imported power and the GGR, even if the GGR power equivalent is never actually exported to the grid. Further, the Company has already admitted that its current billing practices are heavily influenced by its use of a 50% demand ratchet, with roughly 50% of customers already being billed not on their actual usage but their ratcheted demand.

Q46. WHAT IS YOUR RECOMMENDATION ON THIS MATTER?

A46. The Company's justification for its Billing Demand proposal is inconsistent and selectively punitive towards customer-generators. It claims that it is proper to base demand charges on "all utilization" for customer-generators, even though it does not do so for non-customer-generators. It claims that customer-generators create additional "obligations" on the system and should thus pay more, despite the complete lack of incremental costs associated with these "obligations." Its updated rate design would increase distribution rates for most non-residential customer-generators by roughly 400% while providing a roughly 11% reduction for non-residential, non-customer-generators, despite no individual customer shifting their behavior in a way that impacts costs. I continue to recommend the Commission reject the Company's Billing Demand proposal as unsupported, not cost-based, and discriminatory towards customer-generators.

E. The Company Misrepresents the Interaction between Customer-Generators and its Default Service Provider Contract.

Q47. WHAT IS ONE OF THE CORE ASSERTIONS OF THE COMPANY IN THIS CASE?

A47. The Company asserts that there is a cost shift that occurs when a customer-generator is paid for its annual excess energy at the GSSR-1 PTC rate.[53] The Company's contends its analysis demonstrates "the limited ability of net-metered [solar PV] to mitigate PJM costs."[54] It continues:

> Additionally, while no quantitative analysis has been performed, basic market principles suggest that as the total volume of energy purchased decreases, the price-per-unit will increase. In essence, as more energy is purchased from net-metered exports, less is purchased through the DSP wholesale contract. This lowers the 'buying power' of the DSP while concentrating non-volumetric (Company and supplier admin costs, Capacity, Transmission, and RTEP) costs across a smaller total quantity purchased, increasing the cost per MWh of default supply.
>
> Finally, as purchased net-metered energy creates net under collection of GSSR costs under the existing structure (where the customer generator receives the GSSR-1 price regardless of the generator's size), the resulting reconciliation in future periods through the E-factor inflates the cost of default supply which, in turn, inflates the purchased cost of future-period net-metered energy purchases. In short, net-metered customer-generators directly benefit from the price inflation that they cause in a compounding fashion that increases as more net-metered generation is installed.
>
> The Company concludes from its analysis that 1) net-metered generation exports result in a significant increase to default supply costs and 2) its proposed tariff change will mitigate these increases by shifting large exporters to the GSSR-2 rate and corresponding reimbursement formula.[55]

Q48. PLEASE DISCUSS YOUR UNDERSTANDING OF THE COMPANY'S DSP CONTRACT.

A48. Based on a review of the recent DSP docket and discovery responses from the Company, it is my understanding that the Company has engaged a wholesale electricity supplier in a "Load-Following Full Requirements contract."[56] The contract requires the supplier to

[53] Exhibit KL-17, SP-II-5 Revised.
[54] *Id.*
[55] *Id.*
[56] Joint Default Service Plan for Citizens' Electric Company of Lewisburg, PA and Wellsboro Electric Company For the Period June 1, 2025 through May 31, 2029 at 1, Docket Number P-2024-3049357, May 31, 2024. ("DSP Plan Application")

deliver all necessary energy to the Company's PJM pricing node and allows the supplier to directly pass through many costs, including those for transmission and generation capacity and PJM's Regional Transmission Expansion Plan/Transmission Enhancement Costs ("RTEP/TEC"). It prices energy using a six-month laddered approach, where a 12-month strip of forward prices for the monthly PJM West Hub on-peak price are triggered every six months for half of the anticipated load.[57]

The contract also includes a "Supplier Adder", which includes the following:

> The Supplier Adder covers all other costs to deliver default service power (both fixed and hourly energy) to the wholesale meter at the Citizens' or Wellsboro Aggregate Bus. This includes congestion, marginal losses, Alternative Energy Portfolio Standards ("AEPS") Act compliance, and transmission losses, as well as all risks associated with default service customer usage variability, customer migration (switching to an EGS for supply service or returning to default service as permitted under the Companies' tariffs and Pennsylvania law) and deviations between the forward pricing and actual costs.[58]

The Company elaborated on the purpose of the Supplier Adder:

> On top of the respective energy component charges, Citizens' and Wellsboro will pay a Supplier Adder* to their wholesale supplier, which will be a uniform cents-per-kWh charge fixed for the duration of the 4-year contract. The Supplier Adder will compensate the wholesale suppliers for all costs and risks for delivery to the wholesale meter for the Citizens' or Wellsboro Aggregate Bus, including marginal losses, ancillary services, congestion, transmission charges (other than NITS and RTEP/TEC), AEPS costs, marginal losses, customer load variability, and customer migration. Importantly, the Supplier Adder avoids the need for the Companies to maintain congestion management plans, as wholesale suppliers would continue to assume congestion costs and the associated rights to Auction Revenue Rights "ARR" and Financial Transmission Rights "FTR".
>
> *The Supplier Adder will place the risk of deviations in actual versus forward energy costs, sales, on-peak/off-peak customer usage and on-peak/off-peak wholesale pricing differentials on the wholesale supplier.[59]

Q49. HAS THE COMPANY'S LATEST DSP PLAN BEEN APPROVED?

[57] DSP Plan Application at 12.
[58] *Id.*
[59] *Id.* at 14.

A49. Yes. The Company's DSP Plan was approved by the Commission on January 23, 2025, and will be in effect from June 1, 2025, through May 31, 2029.[60] Unless subsequently modified by agreement of all parties, the pricing methodology and Supplier Adder will be locked in for the next roughly four years.

Q50. GIVEN ALL OF THE COSTS AND RISKS THAT ARE INCLUDED IN THE SUPPLIER ADDER, HOW MUCH DID THE WINNING BIDDER OF THE CONTRACT CHARGE FOR THIS ITEM?

A50. The winning bidder not only did not charge a premium for the Supplier Adder, it offered and won with a Supplier Adder credit of $2.66/MWh.[61] In other words, for every MWh that the supplier bills the Company for default service, it reduces the cost by $2.66/MWh.

Q51. HOW DOES THIS COMPARE TO THE SUPPLIER ADDER IN THE PRIOR DSP PLAN?

A51. The Supplier Adder in the prior DSP period from June 1, 2021, through May 31, 2025, was $1.37/MWh.[62] In this procurement, the winning bidder had a Supplier Adder that was $4.03/MWh lower, a considerable drop from the prior plan.

Q52. DID THE COMPANY MAKE ANY STRUCTURAL CHANGES TO THE CURRENT DSP PLAN THAT MIGHT HAVE IMPACTED THIS FIGURE?

A52. Potentially. The Company requested and was approved a "minor modification" to the energy pricing formula trigger date.[63] Instead of providing notice to the supplier on a day-ahead basis, the Company switched to a same-day trigger process. This reduces the risk that market prices move substantially between when the trigger is executed and when the actual prices are locked in.

Q53. DO YOU BELIEVE THIS MODIFICATION WAS RESPONSIBLE FOR A MEANINGFUL PART OF THE REDUCTION OF THE SUPPLIER ADDER?

---

[63] DSP Plan Application at 13.

A53. It is obviously not possible to determine exactly what thought process the winning bidder used in setting its Supplier Adder, but one can examine the degree to which PJM monthly forward contracts change in price on a day-to-day basis. In reviewing data on CME Group's website, while there were some days which future contract prices changed by several $/MWh on subsequent days, most days saw much smaller changes measured in the cents/MWh.[64] As such, it is unlikely that this change alone resulted in the sizeable drop of the Supply Adder in this procurement.

Q54. WERE THE ISSUES THAT ARE AT PLAY IN THIS DOCKET PRESENT DURING THE TIME WHEN BIDDERS WERE PARTICIPATING IN THE DSP PROCUREMENT PROCESS?

A54. Yes. The Company's DSP Plan was not approved until the end of January 2025. The ability of large customer-generators to produce substantial amounts of excess generation and be compensated on the GSSR-1 tariff was in place at that time. In fact, the Company did not file the application in this docket until April 30, 2025, which was after its compliance filing on April 17, 2025, in the DSP Plan reporting the results of the finalized procurement.

Mr. Johnson testified that the Company "did not provide any party or customer with advanced briefings on the various proposals or content of the rate filing until it was submitted."[65] In other words, the suppliers that bid in the DSP Plan procurement in early 2025 would have had no public knowledge at the time of the Company's plan to modify its default supply classification process.

Q55. DID ANY PARTY DISCUSS THE POSSIBILITY THAT SUPPLIERS WOULD ADD A LARGER "RISK PREMIUM" TO THEIR BIDS BECAUSE OF SOME OF THE RISKS ASSOCIATED WITH CUSTOMER-GENERATORS AND NET METERING?

[64] Several different futures contracts were examined roughly a year before their covered date at https://www.cmegroup.com/markets/energy/electricity/pjm-western-hub-peak-calendar-month-real-time-lmp.quotes.html

[65] Johnson Rebuttal at 34.

A55. Yes. While discussing the UGI Electric Default Service Plan order in his rebuttal testimony, OCA Witness Zach Teti noted that UGI raised three issues related customer-generators and its DSP procurement:

> (1) their output would decrease GSR-1 group load and tranche size; (2) there is substantial question as to the level of output and timing of when these projects will become operational; and (3) these large customer-generators have the ability to leave default service at any time and participate in the wholesale market, thereby creating an attrition risk if projects opt to leave GSR-1 service and shop their output elsewhere.[66]

In his own discussion of this issue, Mr. Teti stated

> While the Company did not show this effect in their analysis, the Company and I share the concern about the risk premiums associated with customer-generator uncertainty described in the above excerpt of the PUC's Opinion and Order. In the above remark, the Company expresses a comparable concern: that a large customer-generator stands to benefit from "price inflation that they cause in a compounding fashion." I take this statement to mean that the large customer-generator (output capacity > 400 kW) stands to benefit from higher prices caused by the risk premiums added to DSP suppliers to address their risks caused by unknown output quantities and attrition risk of large customer-generators.[67]

Q56. BASED ON THE LATEST DSP PROCUREMENT, DOES THIS SEEM TO BE AN ONGOING CONCERN?

A56. No. The most recent DSP procurement for the Company resulted in a substantial decrease in the Supplier Adder, which includes, among other things, all the risks identified in the UGI order above. The winning bidder was clearly sufficiently comfortable, even with those open issues, to undercut the prior Supplier Adder by more than $4.00/MWh. Further, even if suppliers were concerned about these developments, the Company's customers will be served for nearly four years before the issue will come up again. Given the myriad changes to the PJM market, including data center load growth, state and federal policy changes, and market design reforms that are likely to occur over the coming four years, there will be many other issue that will impact future DSP procurements than just those issues being addressed in this case.

[66] Teti Rebuttal at 11, quoting the PUC Decision in Docket P-2024-3049343 at 23.
[67] Teti Rebuttal at 12.

Q57. RETURNING TO THE INTERACTION OF THE DSP CONTRACT AND THE POTENTIAL COST IMPACT OF CUSTOMER-GENERATORS TAKING SERVICE ON THE GSSR-1 TARIFF, WHAT ANALYSIS DID THE COMPANY PRODUCE?

A57. The Company produced an analysis that purported to show that a 400 kW_{AC} rooftop system with no offsetting load could increase DSP costs by roughly $27,000 per year, while a 3 MW_{AC} ground mount single-axis tracking system with no offsetting load could increase DSP costs by $230,000 per year.[68] In calculating these figures, the Company assumed that it pays the full retail PTC to customer-generators for their excess energy, but only offsets the energy portion of the DSP contract when that generation reduces the energy that the wholesale supplier must provide to the Company. In other words, it provides zero value for any offset of generation capacity, transmission capacity, or RTEP/TEC costs, all of which are based on the peak load being provided by the wholesale supplier.

Q58. WHAT JUSTIFICATION DID THE COMPANY PROVIDE FOR THIS APPROACH?

A58. It provided four explanations, summarized below:

- NEM systems are not dispatchable
- GSSR-1 customers benefit from high PTC costs, providing an incentive to increase the costs
- Solar systems have a low demonstrated coincidence with peak demand periods.
- NEM generation is volatile and impacted by weather.[69]

Based on these factors, the Company "does not believe it is appropriate to incorporate any capacity or transmission impact into its analysis, however, because net-metered generation does not guarantee those savings and is economically disincentivized to export during peak demand periods."[70]

Q59. DO ANY OF THESE FACTORS MATTER IN TERMS OF HOW THE DSP CONTRACT IS STRUCTURED?

[68] Exhibit KL-17, SP-II-5 Revision 1.
[69] Exhibit KL-18, OCA-XV-1.
[70] Exhibit KL-19, OCA-XV-2.

A59. No. The fact that NEM systems are not dispatchable is irrelevant. The wholesale supplier is responsible for dispatching the anticipated DSP load on a day-ahead basis through the PJM scheduling process.[71] If the supplier chooses, it can include expected generation from customer-generators in its load assumptions. During the settlement process, any differences between scheduled and actual load are reconciled. All risks associated with any load variability from the DSP customers falls on the supplier and is one of the enumerated components of the Supplier Adder discussed above. This includes any failure to accurately forecast net load and any costs that may be needed to reconcile that load in the real-time market.

The remaining points do not support the Company's conclusion that solar should be afforded zero credit against PJM capacity costs. Because the customer-generators are connected to the distribution grid "downstream" of the PJM settlement point, and because the quantity of net metering capacity is substantially lower than the peak demand of the Company, every kW of power that is produced on the Company's distribution grid is consumed on the Company's distribution grid by another customer. As such, every kW of power that is being generated during one of the five coincident peak ("5CP") hours that determines cost allocation in the PJM market will reduce the amount of capacity that is assigned to the wholesale supplier. Given that the supplier passes these costs directly through to the Company, there is a 1:1 reduction in load obligations based on the generation in those hours.[72]

Q60. DO CUSTOMER-GENERATORS HAVE TO BE PRODUCING AT 100% OF THEIR GGR TO REDUCE PJM COSTS?

A60. No. The Company's argument that solar is intermittent and may not be producing during peak hours has nothing to do with the post hoc analysis that PJM uses to allocate costs. If

[71] Exhibit KL-20, SP-VI-17.

[72] There is a one year delay in when these reductions impact the load obligation, but they will be fully reflected in the PTC for the following energy year.

the system was producing power during a 5CP hour, it will be credited for that power, regardless of the ex ante probability of the generation during that 5CP hour.

Q61. HAVE YOU REVIEWED THE COMPANY'S ANALYSIS SUGGESTING THAT SOLAR IS POORLY CORRELATED WITH PEAK HOURS?

A61. Yes. As with the Company's other analysis that I discussed in my direct testimony, it contains a number of errors and improper methodological choices that artificially depress the result.

The Company was made aware of one such mistake where it improperly accounted for the AC to DC ratio of the system and issued a revised workpaper.[73] However, several other methodological issues remain. First, the Company again failed to adjust its modeled solar generation for Daylight Saving Time. For most of the year, this resulted in using solar generation from an hour later than was appropriate, and given the PJM 5CP hours tend to fall during late summer afternoons, this had a sizable impact on the forecasted generation.

Second, in using PVWatts, the Company utilized a typical meteorological year ("TMY") weather file for its modeled generation. TMY files are comprised of actual weather data from many different years that are specifically selected to represent "typical" weather conditions over the full year. The result of simulated generation using TMY files is more likely to represent the long-term average generation in a given location, but it is inappropriate to use when analyzing generation on a specific day at a specific time.

The PJM systems tends to peak during hot, summer afternoons. Hot summer afternoons are often sunny, meaning that solar production may be above average for that time of year. If the TMY file contained July weather from 2007, then the generation using that weather file on July 27th, 2007 at 5 PM EPT will not match the weather

[73] Exhibit KL-17, SP-II-5 Revision 1.

conditions that led to July 27th, 2023 at 5 PM EPT to be a 5CP hour. A proper analysis must include weather that corresponds to the grid conditions in place at the time.

Finally, the Company's analysis includes 5CP data going back to 2015, but fails to recognize what is a clear trend in the transmission cost allocation hours. Between 2015 and 2019, 18 of the 25 5CP hours for transmission cost allocation occurred during non-summer months. But between 2020 and 2024, only 4 of the 25 hours occurred outside the summer.[74] PPL, the transmission system in which the Company operates, is clearly shifting from winter to summer, and as a result, including data from the winter months from 10 years ago in the performance average is no longer appropriate.

Q62. WERE YOU ABLE TO FIX THE COMPANY'S ANALYSIS?

A62. Yes. I used the National Renewable Energy Laboratory's System Advisor Model ("SAM"), which is a more sophisticated version of its PVWatts tool, to replicate system generation using actual weather files from 2015 through 2024.[75] I fixed the Daylight Saving Time issue and recalculated the average performance during the 5CP hours from the past five years. The results are found below in Table 3.

	400 Kw Fixed Tilt		**3 MW Tracker**	
% of Nameplate during 5CP Hours	PLC Gen. Capacity	NSPL Trans. Capacity	PLC Gen. Capacity	NSPL Trans. Capacity
Original	25.4%	20.9%	39.9%	27.2%
Corrected	41.8%	35.0%	65.2%	50.1%
Change	**164.6%**	**167.4%**	**163.7%**	**184.0%**

Table 3 – Average Solar Contribution during 5CP Hours 2020-2024.

Q63. HOW DO YOU INTERPRET THESE RESULTS?

A63. The corrections increased the Company's original solar capacity contribution values by 64% to 84%. Further, the corrected results demonstrate that solar PV provides meaningful generation during the 5CP hours for both generation and transmission cost

[74] Exh. KL-17, SP-II-5 Attachment B
[75] https://sam.nrel.gov/

allocation purposes, particularly for the 3 MW tracking system. It is correct that these values are lower than the GGR of these systems, but these values are more than sufficient to discredit the Company's position that solar should get no capacity reduction credit for generation and transmission costs.

Q64. HOW DO YOU ANTICIPATE THE COMPANY RESPONDING TO THIS ANALYSIS?

A64. I suspect they will acknowledge the methodological shortfalls of their original analysis, but would still argue that because solar has a relatively low capacity factor and is not perfectly correlated with the 5CP hours, it is still causing a cost shift when paid the full PTC.[76]

Q65. DO YOU HAVE ANY ADDITIONAL INSIGHT INTO THAT ISSUE?

A65. Yes. It is important to consider the implications of the result. In the location simulated by the Company, solar production from a single-axis tracker is on average 18.8% of its GGR over the course of a year, while that of a fixed-tilt system is 16.7% of its GGR over the course of a year.[77] But during the peak hours, generation is 2-2.5 higher for fixed-tilt systems, and 2.7-3.5 times higher for single-axis tracking system. In other words, the solar systems outperform during peak hours compared to the total number of MWh they generate.

This has meaningful implications for the Company's PTC contract. In the Company's DSP Plan Compliance Filing, it broke down its calculation for the PTC.[78] Energy costs are calculated based on monthly forward pricing from PJM Western Hub futures contracts. Generation and Transmission capacity costs are converted from dollars to a $/kWh rate by multiplying the total capacity obligation in MW, the corresponding

[76] The Company may also disagree on the appropriateness of using only the past 5 years to reflect the shift in transmission peaks to the summer months. However, the trend in the data is clear, and given that cost allocation is based on actual and not projected data, I continue to recommend this adjustment.
[77] Exh. KL-17, SP-II-5 Attachment B (REV). The Company modeled zip code 17837. The values above represent the capacity factor of solar in that location.
[78] GSSR-1, GSSR-2 ADJ; SUPP NO 171 TO PA PUC NO 14; EFF: 6/1/25 - CITIZENS' ELECTRIC CO OF LEWISBURG, Docket No. P-2024-3049357. ("DSP Plan Compliance Filing") Available at https://www.puc.pa.gov/pcdocs/1875351.pdf

capacity rate in $/MW-day, and the number of days in a year, and finally divided by the total forecasted sales.

The Company performs these calculations for its projected PTC for June 1, 2025, through November 30, 2025, but also includes sales forecast data through May 30, 2026.[79] As such, it is possible to compare the avoided cost value of the generation profile of a fixed-tilt and single-axis tracking solar system against the cost of serving the load profile of the entire DSP load.

Q66. DID YOU PERFORM THESE CALCULATIONS?

A66. Yes, I did. I used solar generation from the TMY weather file for the avoided energy cost calculations given this analysis is for an unspecified period of time. I also used my updated generation and transmission capacity contribution calculations discussed above to calculate the avoided capacity cost values. The results of this calculation are shown below in Table 4.

	400 kW Fixed Tilt	3 MW Tracker	GSSR-1 Load Forecast
Annual Generation / Load MWh	567.9	5,333.2	114,007.0
Gen Capacity Contribution	41.8%	65.2%	
Gen Capacity MW	0.17	1.96	22.86
Gen Rate $/MW-Day	$270.43	$270.43	$270.43
Gen $	$16,487	$193,182	$2,255,947
Gen Rate $/MWh	**$29.03**	**$36.22**	**$19.23**
Trans Capacity Contribution	35.0%	50.1%	
Trans Capacity MW	0.14	1.50	24.90
Trans Rate $/MW-Day	$297.57	$297.57	$297.57
Trans $	$15,221	$163,290	$2,704,465
Trans Rate $/MWh	**$26.80**	**$30.62**	**$23.05**
Energy Rate $/MWh	**$66.82**	**$66.82**	**$66.82**
Total Rate $/MWh	**$122.66**	**$133.66**	**$109.10**

Table 4 – Solar Avoided Cost vs. DSP Load Profile Cost

Q67. HOW DO YOU INTERPRET THESE RESULTS?

[79] DSP Plan Compliance Filing, Schedules 1-12. The energy price for the second 6-month period will change when the new 12-month future contract is locked in. However, the analysis uses the currently 12-month future strip for the analysis as this is the only value available at this time.

A67. The analysis above duplicates the cost for the wholesale supplier of serving a load profile that is identical to the generation profile of the two solar systems. I followed the same steps to calculate the resulting $/MWh rate using the relative quantities of energy, generation capacity, and transmission capacity.[80] The result shows that the cost of serving the solar generation "load profile" is higher than the cost of serving the DSP load profile. Of course, this means the inverse is true: avoiding energy and capacity due to the solar generation profile is worth more than the average cost to serve the DSP load profile.

For the 400 kW_{AC} fixed-tilt system, I calculated an avoided cost benefit of $122.66/MWh, which is $13.56/MWh or 12% higher than the corresponding PTC components cost of $109.10/MWh. For the 3 MWAC tracking system, the avoided cost benefit was even higher at $133.66/MWh, which is $24.57/MWh or 23% higher than the corresponding PTC components. In short, paying customer-generators the PTC for their solar generation does not cause a cost shift to non-solar customers, it in fact undercompensates the solar system's contribution to reducing costs.

Q68. THE FIGURES ABOVE ARE BASED ON YOUR ADJUSTMENTS TO SOLAR'S CAPACITY CONTRIBUTION. WHAT IF THE COMMISSION DISAGREES WITH SHORTENING THE TIME HORIZON TO FIVE YEARS?

A68. If one only corrects the clear methodological errors of the Company's analysis of failing to adjust for Daylight Saving Time and using actual weather data from each year, but still uses the full 10-year average that the Company used, the result is directionally the same. The avoided cost benefits fall slightly to $116.67/MWh for the fixed-tilt system and $125.62/MWh for the tracking system, but these are still comfortably above the corresponding PTC component rate of $109.10/MWh.

[80] I did not include the RTEP/TEC costs as these are minor ($0.94/MWh) and the DSP Compliance Plan did not describe the calculation methodology. I also did not include the Admin costs, which are also minor ($1.35/MWh) and would be skewed by the relatively small quantity of solar generation. Finally, I did not include any distribution loss adjustment as it was unclear whether the Company's load forecast already included this value or not when calculating the final $66.82/MWh rate.

Q69. BUT IF SOLAR IS NOT PRODUCING AT ITS FULL GGR DURING THE PEAK HOURS, AND HAS A LOWER CAPACITY FACTOR THAN THE COMPANY'S DSP LOAD FACTOR, HOW DO YOU EXPLAIN THE ABOVE RESULT?

A69. Another way to analyze the avoided cost benefits is to look at the relative share of each PTC component on a dollar basis. As shown below in Figure 2, the solar generation profiles are "overweighted" in capacity compared to energy. This reflects solar's higher-than-average generation during the 5CP hours compared to the total quantity of generation over the course of the year when compared to the same peak load / total energy ratio of the DSP load profile. The result of this is that outsized avoided capacity benefits are "concentrated" into a small number of annual generation MWh, resulting in the higher rates above.

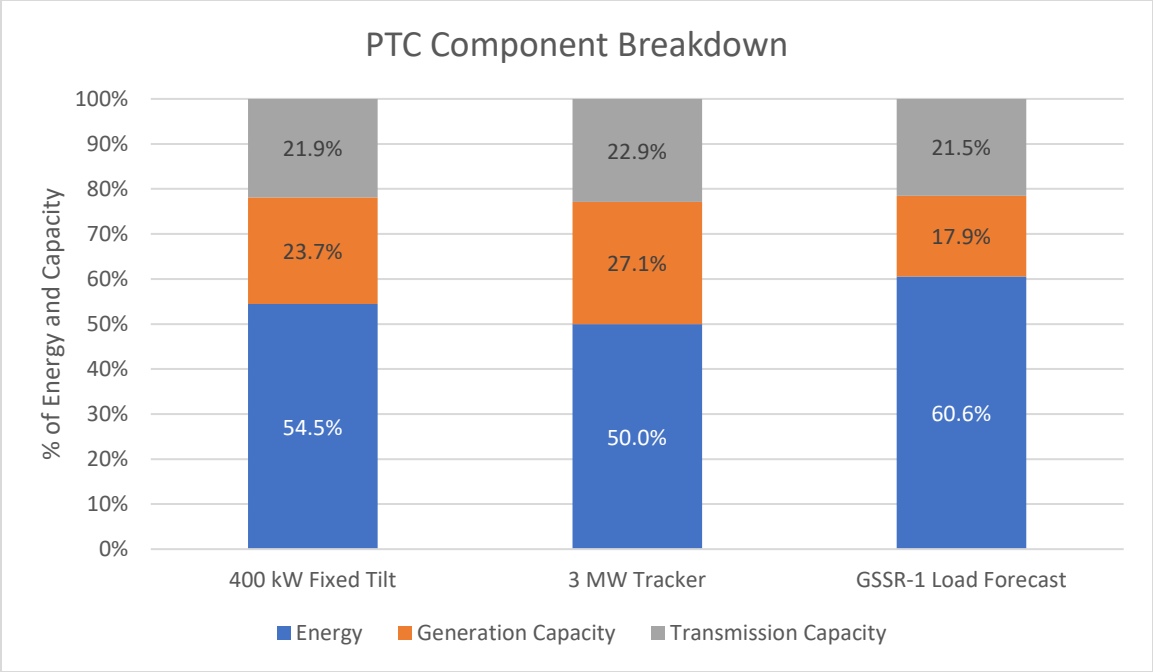

Figure 2 - PTC Component Breakdown

Q70. BUT DOESN'T THE LOWER AMOUNT OF GENERATION FROM A SOLAR SYSTEM IMPROPERLY INFLATE THE SOLAR RATE CALCULATION COMPARED TO THE LOAD PROFILE RATE CALCULATION?

A70. No. Although one might think that dividing the avoided capacity cost benefits by a smaller number of MWh artificially inflates the rates above, there is a simple way to prove this is not true: comparing the cost to serve the DSP load with and without a solar generator.

Because of the capacity cost pass-through and energy cost index structure of the DSP contract, the Company is only obligated to pay for the actual energy and capacity that its DSP customers use. If they use less energy because of distribution-connected solar systems, then the wholesale supplier has to deliver less of this product. If they have lower demand during the 5CP hours because of solar generation, the capacity cost allocation will be proportionately lower. The specific ratio of these decreases will determine whether the overall PTC rate increases or falls as it will be calculated based on the total capacity dollars divided by the total sales.[81]

Q71. WHAT IS THE RESULT OF THIS ANALYSIS?

A71. The results are shown in Table 5 below for the GSSR-1 load net of the fixed-tilt and tracking system. As expected, the rate to serve the GSSR-1 load net of either solar system is lower than the rate to serve the GSSR-1 load by itself, and the rate to serve the load net of the tracker is lower than to serve the load net of the fixed tilt. This is due to the greater reduction in capacity costs than the reduction in total energy in both, but a more pronounced difference in the tracker.

[81] Because of the contract structure, the energy component of the PTC rate remains constant regardless of the number of sales.

	GSSR-1 Load Forecast	Load Less Fixed Tilt	Load Less Tracker
Annual Load MWh	**114,007**	**113,439**	**108,674**
Gen Capacity MW	22.86	22.69	20.90
Gen Rate $/MW-Day	$270.43	$270.43	$270.43
Gen $	$2,255,947	$2,239,460	$2,062,765
Gen Rate $/MWh	**$19.23**	**$19.18**	**$18.42**
Trans Capacity MW	24.90	24.76	23.40
Trans Rate $/MW-Day	$297.57	$270.43	$270.43
Trans $	$2,704,465	$2,443,970	$2,309,406
Trans Rate $/MWh	**$23.05**	**$20.93**	**$20.62**
Energy Rate $/MWh	**$66.82**	**$66.82**	**$66.82**
Total Rate $/MWh	**$109.10**	**$106.93**	**$105.86**

Table 5 – DSP Load Profile Net of Solar Generation

Q72. THE ANALYSIS ABOVE ASSUMES THAT THERE IS NO LOAD TO OFFSET THE PV SYSTEM. DOES THIS ANALYSIS CHANGE IF THESE ARE BTM SYSTEMS THAT ARE INSTEAD OFFSETTING LOAD?

A72. No. The DSP contract is for delivery of all aggregated load at the Company's 69 kV St. Mary's substation.[82] Whether customer-generator uses this energy onsite or exports it to serve its neighbor's load, the net result at the St. Mary's substation is a reduction equal to the solar generation plus distribution line losses.

Q73. THE COMPANY CLAIMS THAT CUSTOMER-GENERATORS WILL BENEFIT "IN A COMPOUNDING FASHION" THROUGH THE INTERACTION OF NETTING ENERGY AND THE GSSR-1 RECONCILIATION FACTOR.[83] DO YOU AGREE WITH THIS STATEMENT?

A73. No, I do not. First, it is important to understand the scale of the DSP contract cost and the potential under-collection due to excess annual energy. The Company reported that customer-generators had accumulated a grand total of 636 MWh of net excess energy at the end of energy year 2025.[84] Even assuming that 100% of these customers are served on the GSSR-1 tariff, at the current PTC of $114.19/MWh, this represents payouts of

[82] DSP Plan, Exhibit NJ-3 at 3.
[83] Exhibit KL-17, SP-II-5 Revision 1.
[84] Exhibit KL-21, SP-IV-13.

approximately $73,000. By contrast, the DSP Plan is projected to collect roughly $13 million in energy year 2026.[85] Even if this excess energy caused a shortfall to be collected in future periods, it would only increase the rate from $114.19/MWh to $114.83/MWh. Given the average commercial customer with excess annual energy only had 58 MWh of banked generation at the end of the year, the reconciliation adjustment discussed above would on average result in an extra $35 or so.[86] This is hardly noticeable compared to the sizable increase these customers would experience under the proposed Billing Demand definition.

More to the point, the Company should be including anticipated generation from customer-generators in the sales forecast used to calculate the GSSR-1 capacity components. If the Company correctly includes these values for its existing and in-progress fleet, then the only potential under-collection due to unplanned excess generation would be from new systems that were conceived and built within the energy year and resulted in excess annual generation for the customer-generator. Given the Company updates its PTC every six months, this is an extremely unlikely scenario.

Finally, even if there were unplanned excess generation that resulted in under-collections in the GSSR-1 account, as shown above, that generation will contribute more to reducing capacity costs than reducing energy sales. When the following year's load obligations are released, they will be lower than they would have been absent the solar generation, which will reduce costs for all customers on the GSSR-1 tariff.

III. REBUTTAL OF OCA WITNESSES ZACH TETI

Q74. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

[85] DSP Plan Compliance Filing, Schedule 3. The Company forecasts 114,007 MWh of GSSR-1 sales at $114.19, which would result in collections of $13,018,459.
[86] Exhibit KL-21, SP-IV-13. There were 10 commercial customers with a total of 577 MWh of excess energy.

A74. In this section of testimony, I discuss the rebuttal testimony of OCA witnesses Zach Teti.[87]

Q75. PLEASE SUMMARIZE THE RELEVANT POSITIONS OF OCA'S REBUTTAL TESTIMONY.

A75. OCA witness Mr. Teti supports the approval of the Company's Billing Demand proposal, indicating his belief that the "overall default service supply portfolio and the specific default service procured on behalf of residential customers would benefit from the Company's proposed Billing Demand methodology."[88]

Q76. DOES MR. TETI PROVIDE ANY INDEPENDENT ANALYSIS OR REASONING TO SUPPORT HIS RECOMMENDATION?

A76. No. Mr. Teti repeats the Company's position, but does not independently discuss or analyze the Billing Demand proposal.[89] In doing so, he adopts the Company's arguments but does not offer any new insight or critiques of those arguments. For instance, he does not discuss the problems with charging customers for demand that they do not place on the system, nor does he question the Company's analysis provided in SP-II-5 Attachment A. In follow up discovery, Mr. Teti admitted that he "did not independently validate the quantitative approach by reconciling/cross-checking monetary values and magnitude of costs."[90] Given the myriad errors identified in the latter analysis in my direct testimony, Mr. Teti's failure to scrutinize the workpapers may have contributed to his acceptance of the problematic results.[91]

Mr. Teti was not able to independently validate the Company's explanation of how demand reductions from customer-generators impact PJM wholesale costs because of some ambiguity in the Company's discovery responses.[92] Mr. Teti did submit

[87] OCA Statement No. 5R - Rebuttal Testimony of Zach Teti on Behalf of the Pennsylvania Office of Consumer Advocate ("Teti Rebuttal").

[92] Teti Rebuttal at 10, footnote 13.

discovery to follow up on this issue, but it was not received before the filing deadline for his rebuttal testimony.

Q77. HAS THE COMPANY SINCE PROVIDED RESPONSES TO MR. TETI'S DISCOVERY?

A77. Yes, they have.[93]

Q78. AND DID THE DISCOVERY CLARIFY THE ISSUE?

A78. No, it did not. Mr. Teti asked the company "Please refer to "Attachment A (Rev)" of Citizens' response to SP-II-5, specifically in the portion that states: 'PJM costs substantially unaffected by net metered sales.' Please explain the effect of net metered sales on PJM costs."[94]

The Company's response did not address the core issue: how do net metered sales, including excess generation from both customer-sited behind-the-meter ("BTM") systems and distribution-connected commercial scale the PJM settlement process and the default service provider's ("DSP") full requirements contract. Instead, the Company reiterated its generic observations about net metered solar; namely, that it is not dispatchable, that solar generation does not peak at the same time as the system peak, and that excess generation is volatile.[95]

Q79. ARE THESE OBSERVATIONS RELEVANT TO THE MECHANICS OF THE PJM SETTLEMENT PROCESS AND THE DSP CONTRACT?

A79. No, they are not. The lack of dispatchability does not matter; these are not capacity resources that must have a specific capacity accreditation in the PJM wholesale market and are held accountable for their output during peak days. The observation that solar generation does not peak during the system peak hours does not mean that solar cannot and does not provide peak demand reductions; it does, albeit at a level that is lower than the GGR of the system. Similarly, the day-to-day volatility of an individual solar generator is smoothed out across a wider geographic area, and system operators

[93] Exhibit KL-18, Citizens' response to OCA-XV-1.
[94] Id.
[95] Id.

understand that solar generation has a diurnal generation profile and can plan the system around this fact.

Q80. WHAT APPEARS TO BE OCA'S MAIN CONCERN RELATED TO THE OPERATING CHARACTERISTICS OF DISTRIBUTION-CONNECTED DG SYSTEMS?

A80. Mr. Teti notes a concern that DSP providers will increase their bids to reflect a "risk premium" associated with the distribution-connected DG systems.[96] He also notes a Company concern about large customer-generators "benefiting from 'price inflation that they cause in a compounding fashion.'"[97] Notably, neither of these concerns has anything to do with the establishment of base distribution rates, which is ostensibly the purpose of this proceeding. They are exclusively related to the issue of DSP procurement, which should be litigated in a DSP proceeding. This proceeding is simply the wrong forum to address DSP-related matters.

Q81. HAS OCA PERFORMED ANY ANALYSIS RELATED TO THE PURPORTED UPWARD PRESSURE ON BIDS CAUSED BY THIS RISK PREMIUM?

A81. No, it has not for the understandable reason that "OCA is not permitted to see bid details following the completion of default service procurement auctions."[98] It is problematic that the office responsible for representing consumers in front of the Commission is not able to investigate one of the more speculative elements supporting a large change to customer-generator compensation.

Q82. ARE THERE OTHER ISSUES THAT MR. TETI RAISES REGARDING THE COMPANY'S TESTIMONY AND TARIFFS?

A82. Yes. Mr. Teti notes several instances of ambiguity and lack of clarity in the Company's testimony, discovery responses, and tariffs regarding how PJM costs are impacted by distribution-connected DG systems.[99] The follow-up discovery that Mr. Teti asked did

[96] Teti Rebuttal at 12.
[97] Teti Rebuttal at 12.
[98] Exhibit KL-22, OCA Response to Solar Projects Set I-3.b
[99] Teti Rebuttal at 16.

not resolve these issues, and it appears the record continues to lack clarity on how exported generation is incorporated into the PJM settlement process and how that impacts DSP costs.

Q83. DO YOU AGREE THERE IS A LACK OF CLARITY?

A83. Yes. I do not believe that the Company has directly answered OCA's questions on this matter, as discussed above. This is yet another reason that issues related to DSP costs should be fully litigated in a DSP proceeding where parties could properly clarify the record on these issues. Making a decision in this rate case docket while key questions related to supply costs for the DSP remain unanswered would be improper.

Q84. DOES THIS CONCLUDE YOUR TESTIMONY?

A84. Yes, it does.

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE FOR THE RECORD YOUR NAME, POSITION, AND BUSINESS ADDRESS.

A1. My name is Kevin Lucas. I am the Vice President of Policy Analysis at the Solar Energy Industries Association ("SEIA"). My business address is 1425 K St. NW #1000, Washington, DC 20005.

Q2. ARE YOU THE SAME KEVIN LUCAS THAT SUBMITTED DIRECT TESTIMONY IN THIS CASE?

A2. Yes, I am.

Q3. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A3. The purpose of my rebuttal testimony is to address several arguments raised by Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "the Company") and by the Pennsylvania Office of Consumer Advocate ("OCA").

Q4. DOES YOUR FAILURE TO ADDRESS A PARTICULAR WITNESS OR ISSUE IMPLY SUPPORT OF THAT WITNESS OR ISSUE?

A4. No, it does not.

Q5. PLEASE SUMMARIZE YOUR FINDINGS AND RECOMMENDATIONS

A5. The arguments advanced in Company's rebuttal testimony do little to bolster support for its Billing Demand proposal. It continues to claim that customer-generators should be billed based on demand they do not place on the system, and its rebuttal offer to "phase in" the results of its punitive proposal do not remedy the inherent flaws in the concept.

Citizens' admits that customer-generator's exported power may not cause incremental costs on its system, but it proposes to substantially increase distribution costs for these customers because of nebulous "new obligations" that they place on the system. However, these "obligations" are completely undefined, unsupported with analysis, and do not correspond to the physical use of the system by customer-generators. Despite this, the Company has doubled down on its flawed proposal, recalculating its rates based on the higher (and seemingly incorrect) inclusion of the new Billing Demand definition.

The results are even higher bills for customer-generators, despite no change in their usage of the system. I continue to recommend the Commission fully reject the proposed Billing Demand proposal.

In response to the Office of Consumer's Advocate ("OCA") discovery requests following the direct testimony filing, the Company expanded on its reasons why large customer-generators should be shifted off of the GSSR-1 tariff. The additional responses, along with a revised version of a prior analysis, provided the opportunity to scrutinize this proposal further. As with the Company's analysis on the impact of the Billing Demand proposal that I discussed in my direct testimony, I found the Company's analysis and reasoning wanting.

The Company has improperly discounted the non-trivial contribution that solar customer-generators make to reducing capacity costs on the Default Service Provider ("DSP") contract, in part due to a flawed analysis. After fixing the Company's errors, I find that not only do solar customer-generators reduce capacity costs, they reduce them in a manner that provides more value than the average cost to serve the DSP load. Put another way, the avoided cost value of solar generation on the DSP contract is higher than the Price to Compare ("PTC") cost of the DSP contract.

This finding renders moot the Company's claim that compensating annual excess energy from customer-generators at the PTC results in a cost shift to non-customer-generator customers. Instead, all customers taking service on the DSP contract benefit from the addition of solar generation on the Company's distribution grid. Additionally, a review of the Company's most recently approved DSP contract does not reveal any price increase due to a higher risk premium than the prior contract, despite concerns raised by OCA. Given this, I recommend the Commission allow customer-generators to take service on whatever DSP rate they prefer.

II. REBUTTAL OF CITIZENS' WITNESSES GORMAN AND JOHNSON

Q6. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A6. In this section of testimony, I discuss the rebuttal testimony of Company witnesses Howard S. Gorman[1] and Nathan Johnson.[2]

Q7. PLEASE SUMMARIZE YOUR FINDINGS.

A7. The Company introduces several new arguments in its rebuttal testimony. It argued that there is precedent under its demand ratchet and minimum billing provisions for billing customers not based on their actual usage, but some other measure. But these measures are fundamentally different in nature than the proposed Billing Demand metric, and raise their own concerns.

Citizens' claims that its proposal will reduce customer confusion. However, it is not distinguishing between the very few customers that would be required to switch to the GSSR-2 rate from the many more customer-generators that would see sizable distribution bill increases due to the same definitional change. Far form reducing customer confusion, the proposal will likely incite frustration among most customer-generators.

The Company introduces a new and inflammatory claim that the GSSR-1 tariff provides the perverse incentive for customer-generators to intentionally act to harm the rest of the ratebase by turning off their systems during peak hours in an effort to manipulate the capacity market to their benefit. This is an extraordinary argument, which not only lacks extraordinary support, but lacks any evidence or analysis whatsoever. The Company's argument is farcical in its face given a small customer-generator has no ability to effectively manipulate the price of the multi-billion dollar, multi-Gigawatt PJM capacity market. The Company's unfortunate testimony on this point can only be seen as an effort to unjustly discredit customer-generators and should be fully disregarded by the Commission.

[1] Citizens Statement No. 1R - Rebuttal Testimony and Exhibit of H. Gorman ("Gorman Rebuttal").
[2] Citizens' Statement No. 4R - Rebuttal Testimony and Exhibits of Nathan Johnson ("Johnson Rebuttal").

In its rebuttal testimony, the Company recalculated its rates based on the proposed Billing Demand definition. The new rates exacerbate the issues identified in my direct testimony, causing an even more punitive rate impact for customer-generators based on demand they do not place on the system and costs they do not impose. The result is an even more stark bill increase that appears to only benefit non-customer-generators.

Finally, I revisit the Company's updated analysis on the capacity contribution of solar generation and its ability to reduce costs on the DSP contract. I find that, contrary to the Company's claims, the avoided cost benefits of the solar generation profile handily exceed the cost of serving the DSP load profile. Quite simply, paying customer-generators for their excess power at the PTC undercompensates these customers for the excess generation. Given this was the main reason why the Company proposes to require larger customer-generators to take service on the GSSR-2 rate, I recommend the Commission reject this proposal and allow customer-generators to take service on whichever rate they prefer.

A. Ratemaking and Demand Ratchet

Q8. MR. GORMAN ARGUES THAT YOUR OBSERVATION THAT THE IMPACT TO THE COMPANY'S SYSTEM IS LIMITED TO THE SMALL SET OF ASSETS THAT SERVE A CUSTOMER-GENERATOR IS NOT RELEVANT FOR RATEMAKING PURPOSES.[3] HOW DO YOU RESPOND?

A8. Mr. Gorman does not disagree with the fact that any impact to the Company's system from customer-generator systems is limited to the assets serving that customer. This is readily observable when the Company experiences a limited outage on its distribution system from downed trees or equipment failures. Customers on distant parts of the Company's grid are not impacted and continue to receive service as they are not directly served by the assets experiencing the outage. Similarly, the physical impact on the

[3] Gorman Rebuttal at 18.

Company's system from a customer-generator is necessarily limited to the assets that serve that customer, and those impacts are attenuated as one moves further upstream from local line transformers to feeders to substations as the usage is blended in with dozens, hundreds, or thousands of other loads.

Instead, Mr. Gorman argues that rates are designed to "recover its costs for the entire distribution system, from all its customers", with an exception for customer-dedicated assets. This statement is accurate, but it not only missed the point of my testimony, it runs counter to the entire basis of the Company's Billing Demand proposal: that customer-generators are imposing differential obligations through their use of the system and must be treated differently than in the past and from other customers.

Q9. WHERE IN THE RATEMAKING PROCESS DOES THIS DECISION GET MADE?

A9. The decision to implement the Billing Demand proposal is "upstream" from cost allocation and rate design components of the ratemaking process. Put another way, the Billing Demand decision is a precursor to the Company's cost of service study and rate design steps. In fact, in the Company's rebuttal testimony, it recalculated its demand rates based on the new definition of Billing Demand and allowed for potential future revisions to cost allocation "which can be eventually based on the actual class data."[4] So while it is true that the mechanical steps of ratemaking is intended to recover costs of the entire system from customers, the specific results are very much a result of which assumptions and methodologies a utility proposes.

Q10. DO YOU CONTINUE TO BELIEVE THAT THE COMPANY MODIFIED ITS RATEMAKING PROCESS BASED ON A FAULTY PREMISE?

A10. Yes. The Company attempts to justify disparate treatment of these customers by billing them not based on their actual usage but their potential usage of the system because it claims they impose burdens on the system that are not captured through the traditional

[4] Gorman Rebuttal at 4.

measures of imported demand. It bases these arguments not on how it must plan and operate its entire system writ large, but instead on how it must serve these individual customer-generators: "From a distribution perspective, we have to plan the same for a customer that is exporting 400 kW to Citizens' as we do for a customer that is receiving 400 kW from Citizens'. In fact, our planning for the export of power to us is more complicated because of potential variability, voltage sags/surges and other issues."[5]

In other words, the Company's justification for the Billing Demand proposal is specific to the usage characteristics of customer-generators, and it is on the robustness of this argument that the proposal must be measured. The Company cannot sidestep this crucial step by claiming that the end result is based on all the costs on the entire grid; it must instead justify its Billing Demand proposal on the facts of said usage. And as I discussed in my direct testimony, I do not believe the Company has met this burden.

Q11. MR. JOHNSON AND MR. GORMAN POINT TO THE USE OF BILLING DEMAND RATCHETS AS A PRECEDENT FOR NOT CHARGING CUSTOMERS BASED ON THEIR ACTUAL USAGE.[6] HOW DO YOU RESPOND?

A11. Mr. Johnson observed that "from July 2024 to May 2025, only 52% of non-residential bills charged for the actual metered demand during the same period" due to the 50% demand ratchet. Mr. Gorman had a slightly different figure, saying that only 49% of customers were billed based on their actual demand.[7] Regardless of whether it is 52% or 49% of customer bills that are caught by the demand ratchet, this is a troubling result. Given that nearly all of the distribution assets that serve customers are shared assets that are planned, sized, and operated to meet the diversified demand of the customers on the assets, it appears the Company is charging customers based on what are likely anomalous

[5] Citizens' Statement No. 4 at 17.
[6] Johnson Rebuttal at 39.
[7] Gorman Rebuttal at 15. Mr. Gorman states "Approximately 51% of all customer bills issued for GLP-1 and GLP-3 during the year are billed using the alternative measure (i.e., 50% of the highest monthly Billing Demand during the prior 11 months) rather than the metered monthly demand usage."

non-coincident peak ("NCP") demand that may have nothing to do with the cost causation of those demands.

The Company's statement means that roughly half of customer bills were for monthly peak demands that were less than half of the single maximum peak demand in the prior year or less than the 5 kW minimum demand on the GLP-1 tariff. For example, this could mean that a customer who had a peak demand of 100 kW in one month had demands of less than 50 kW in all other months would still be charged for 50 kW of usage for up to 11 months even if the 100 kW was an unusual outlier. Unless the Company has definitive evidence that even half of this peak demand of 100 kW was reflective of the cost-causing demand that they actually placed on the system, then it may be charging customers inappropriately based on a demand ratchet that is not tied to costs. I recommend the Commission investigate this issue further and request that the Company demonstrate that its use of the demand ratchet results in appropriate bills for its customers.

Q12. IS THIS DEMAND RATCHET ISSUE EXACERBATED WHEN COMBINED WITH THE PROPOSED BILLING DEMAND DEFINITION?

A12. Yes. There is a key distinction between being billed based on a demand ratchet and being billed based on the Company's proposed Billing Demand methodology. As problematic as the demand ratchet may be, it at least is based on some fraction of actual demand that a customer has placed on the grid in the prior 11 months. By contrast, the Billing Demand methodology is based on a hypothetical demand value that *may never be placed* on the Company's grid and can be substantially larger than any actual measure of demand the customer-generator draws from or places onto the Company's system.

Q13. DO YOU HAVE A ROUGH SENSE OF HOW SIZABLE THIS DIFFERENCE COULD BE?

A13. Yes. In my direct testimony, I corrected the Company's analysis related to how its Billing Demand proposal would impact a hypothetical customer.[8] As part of the modifications of the workpaper, I enabled functionality to quickly modify the customer peak demand and solar system and calculate the resulting power flows and customer Billing Demands under the current and proposed definition. I simulated potential combinations of customer peak demand and PV system size, with the results shown below in Table 1.

Billing Demand / Inflow Ratio				
	Customer Peak Demand			
PV System Size	**25**	**50**	**75**	**100**
25	1.27	1.00	1.00	1.00
50	2.55	1.27	1.00	1.00
75	3.83	1.91	1.27	1.00
100	5.11	2.55	1.69	1.27
125	6.40	3.19	2.12	1.59
150	7.68	3.83	2.55	1.91
175	8.96	4.47	2.98	2.23
200	10.25	5.11	3.41	2.55
225	11.53	5.75	3.83	2.87
250	12.82	6.40	4.26	3.19

Table 1 – Biling Demand / Inflow Demand Ratio

Q14. HOW DO YOU INTERPRET THESE RESULTS?

A14. The values in the table show the ratio of the average monthly customer peak demand under proposed Billing Demand definition and the current peak demand definition. The columns represent customers with different size peak demands (ranging from 25 kW to 100 kW in 25 kW increments), while the rows represent different size PV systems (ranging from 25 kW to 250 kW in 25 kW increments). The intersection of the row and column contains the result of dividing the average Billing Demand value by the average peak demand value. For instance, a customer with a 50 kW peak demand and a 100 kW PV system would see an average monthly Billing Demand that was 2.55 times larger than

[8] Lucas Direct at 9.

the current peak demand measurement, even if they never exported 100 kW to the Company's grid.

Q15. WHAT PERCENTAGE OF THAT CUSTOMER'S ANNUAL USAGE WOULD BE MET BY THAT SIZE SOLAR SYSTEM?

A15. Using the Company's example customer scaled to 50 kW peak demand, a 100 kW solar system would only cover about 51% of their annual load. Despite this relatively modest system size, the Company's proposed Billing Demand definition would result in distribution demand charges that are more than 2.5 times higher than under the current definition. For a customer wishing to offset their entire annual load, the new Billing Demand would be about 5 times higher than the current definition. This stands in stark contrast to the Company's demand ratchets, which are only triggered when peak demand falls below 50% of what a customer has already attained in the prior 11 months.

Q16. IS THERE ANOTHER PROBLEMATIC INTERACTION BETWEEN THE BILLING DEMAND DEFINITION AND THE DEMAND RATCHET?

A16. Yes. Because the demand ratchet would set the minimum demand based on the new Billing Demand definition – which could be based entirely on the gross generator rating ("GGR") of the PV system – a customer who meets more than roughly 20% of their annual usage could never reduce their ratcheted demand without changing the PV system hardware.[9] Using the Company's example customer's load profile, if a customer with a 100 kW peak demand installed an 80 kW PV system, they would offset roughly 20% of their annual usage and see their peak inflow demand fall from 100 kW to 80 kW. But because their Billing Demand could never fall below 80 kW due to the GGR, even if they took actions to further reduce their demand below 80 kW, they would get no relief on their demand charges because the GGR would set the billing demand floor in every month.

[9] Using the Company's example load profile, a customer with a PV system equal to 80% of their peak demand (e.g., a 100 kW customer with an 80 kW PV system) would see their demand switch from their actual usage of the grid to the GGR.

B. Customer Confusion, Alternative Definition of Billing Demand, and Billing Demand Phase In

Q17. THE COMPANY CONTINUES TO ASSERT THAT ITS BILLING DEMAND DEFINITION WILL "REDUCE CUSTOMER CONFUSION."[10] WHAT IS YOUR RESPONSE TO THAT?

A17. I disagree, and in fact, it is difficult to see how customer confusion would not increase under the proposal. The Company proposes to use the Billing Demand definition for two purposes: 1) assigning a customer taking default service to either GSSR-1 or GSSR-2, and 2) billing customers for a portion of their distribution costs. The former decision point would only affect customers with DG system sizes over 400 kW_{AC}, which is a small subset of customer-generators. Of the 87 customer-generators (15 of which are non-residential systems) that are currently taking service with the Company, only one is larger than 400 kW_{AC}.[11] Of the additional 12 projects that are listed as "Indicated" or "Applied / In Progress" (5 of which are non-residential), only two exceed 400 kW_{AC}.[12] In other words, even if all of the projects that exist or that the Company is aware of were all built, only three out of 99 would be impacted by the Company's proposal to assign default supply rates based on the 400 kW_{AC} Billing Demand threshold. This change would result in a sizable, negative impact for these individual customers, but it would not result in widespread customer confusion across the entire non-residential customer base.

On the other hand, all of the non-residential customer-generators would be impacted by a sizable change in their bills due to the use of the proposed Billing Demand definition on their distribution bills. Because all but one of these existing customers have system sizes below 400 kW_{AC}, they would not be impacted by the assignment of supply rates, but would nonetheless see sizable distribution bill increases. Why the Company believes that this would result in "reduced customer confusion" and not confused and frustrated customers who just received a huge bill increase is unclear.

[12] *Id.*

Q18. IS THE COMPANY OPEN TO USING AN ALTERNATIVE DEFINITION OF BILLING DEMAND?

A18. It appears so, but only if ordered by the Commission.[13] The Company acknowledges that "[t]here are other possibilities that could be used, such as the 15 minutes of maximum bi-directional demand during the billing cycle."[14] But it notes that its current meters are not configured for measuring bi-directional demand and would require reprogramming. It also raises a concern that "using the bi-directional demand could result in an account moving between the GSSR-1 and GSSR-2 net-metering credit process on an annual basis."[15]

Q19. DO YOU SEE EITHER OF THESE AS MAJOR ISSUES?

A19. No, although I continue to believe using bi-directional demand for the purposes of billing customers for their usage to be inappropriate for all the reasons discussed in my direct testimony. That said, if the Commission were to approve that definition, I do not believe these two issues are major impediments to using that definition.

First, the number of meters that would need to be reprogrammed is small as the Company currently only has 15 non-residential customer-generators on its system. Any new customer-generator could have a meter preconfigured for bi-directional measurement before installation, obviating any additional work. Second, while the Company did not provide the peak inflow demand of its customer-generators, it is reasonable to assume that the PV system size will be similar or larger in size than the customer's peak demand.[16] Given only one existing non-residential customer-generator exceeds the 400 kW_{AC} threshold (and, at 1.77 MW, by a sizable amount), the only way for other customer-generators to switch between GSSR-1 and GSSR-2 on an annual basis due to their actual peak bi-directional demand would be for their imported power to fluctuate above and below 400 kW.

[13] Johnson Rebuttal at 25.
[14] *Id.*
[15] Johnson Rebuttal at 26.
[16] As discussed above, a customer seeking to offset a reasonable portion of their annual usage will need to install a PV system that exceeds its peak demand.

Q20. DO YOU BELIEVE THIS WOULD HAPPEN OFTEN?

A20. No. Of the 15 non-residential customer-generators in service, 11 have PV systems under 200 kW_{AC}. For these systems to flip the net imported power from above 400 kW to below 400 kW would require a customer to have a sizable daytime load (e.g., 500 kW), which means the systems are offsetting very little of the customer's annual generation. For the 3 systems between 200 kW_{AC} and 400 kW_{AC}, the daytime load of the customer would need to be even larger.

Given the average GLP-1 customer has a billing demand of 12 kW[17] and that nearly all of the existing non-residential customer-generators take service on this tariff, the odds that all of the customer-generators on this tariff are extreme outliers with several hundred kW of demand is low. More likely, these customers have peak demands that are equal to or lower than their PV system sizes (which are already below the 400 kW_{AC} threshold), meaning that they are highly unlikely to switch between the GSSR-1 and GSSR-2 tariff on an annual basis based on actual power flows.

Q21. THE COMPANY PROPOSES TO PHASE IN THE BILLING DEMAND DEFINITION OVER THREE YEARS FOR DISTRIBUTION RATES.[18] WHAT IS YOUR RESPONSE TO THIS?

A21. This is a solution in search of a problem. First, the Company does not propose to phase in the definition to the supply rate, which would be implemented immediately in January 2026. Second, phasing in the Billing Demand definition over three years does not remedy its flaws; it merely tries to cushion the rate shock that would result from the unsupported proposal. The customers that would be the most impacted by this change – those with large systems relative to their on-site load – the economic life of a solar system is measured in decades, not in years. Phasing in a substantial increase in distribution costs over three years will do little to mitigate the lifetime financial impact on the system.

[17] Schedule B6-3 shows Schedule GLP-1 with 13,644 annual bills and 163,587 kW of annual demand. Dividing the latter by the former results in roughly 12 kW of monthly demand.
[18] Johnson Rebuttal at 22.

C. GSSR-1 and GSSR-2 Price Signals and Incentives

Q22. THE COMPANY SUGGESTS THAT CUSTOMER-GENERATORS TAKING SERVICE ON THE GSSR-2 TARIFF HAVE A GREATER INCENTIVE TO MAXIMIZE EXPORTS DURING PEAK HOURS.[19] WHAT IS YOUR RESPONSE TO THIS?

A22. I disagree with the Company's hypothesis. Mr. Johnson argues that a customer-generator placed on the GSSR-2 tariff will have an incentive to export to the grid "during higher-priced hours."[20] He continues:

> Although a solar generator may be relatively inelastic in producing power in response to hourly prices, many qualifying net-metered generation sources are able to respond directly to price signals. In addition, even the customer-generator with a solar array may be able to reduce the host load consumption to increase its exports during these hours.[21]

Q23. WHAT IS WRONG WITH THIS STATEMENT?

A23. As a primary matter, there is no way for a customer-generator to respond to the price signal provided by the GSSR-2 tariff. That tariff charges (or compensates) generation at the "actual real-time PJM West Hub Locational Marginal Price ('LMP') for each hour of the billing month"[22] The real-time LMP price is recalculated every five minutes throughout the day, and the "actual" value for any given hour cannot be calculated until the hour has already passed since it is necessarily the load-weighted average of the 12 five-minute periods of that hour. In other words, by the time a generator could even know what the real-time hourly rate at which they will be charged (or compensated), their usage (or generation) will have already occurred.

Q24. COULD A CUSTOMER-GENERATOR MONITOR THE REAL-TIME 5-MINUTE LMP INTERVALS AND MODIFY THEIR BEHAVIOR IN RESPONSE TO THESE PRICE SIGNALS?

[19] Johnson Rebuttal at 27.
[20] Johnson Rebuttal at 28.
[21] *Id.*
[22] GSSR-2 Rider

A24. No. PJM itself does not display the price of a 5-minute interval until most of the way through the interval.[23] Further, the idea that a business should be expected to moderate its load in response to price signals that could change by hundreds of dollars per MWh in minutes overstates the likely flexibility of the loads. It is one thing to reschedule a production line 24 hours in advance or even to make planned load adjustments several hours in advance based on expected prices, but actively managing a business enterprise based on minute-by-minute price fluctuations in the PJM wholesale market is a bar too high for nearly all businesses.

More problematically, the PJM real-time LMP frequently experiences unpredictable "needle peaks" where the price may jump by considerable amounts in one 5-minute interval only to fall just as rapidly as the generators on the grid are re-dispatched. For example, on August 25th, real-time prices were low in early morning hours and largely consistent with the day-ahead prices. At 8:10 AM, the Western Hub Real-Time LMP was $22.82/MWh. At 8:15 AM, it increased to $79.90/MWh. At 8:20 AM, it fell back to $25.65/MWh and stayed at or near that level for most of the rest of the morning. These needle peaks are not uncommon, as shown in Figure 1 below.[24] Moreover, they are not predictable since they are necessarily the result of very short-term imbalances in supply and demand resulting from issues such as unplanned generator or transmission line outages or sudden, unanticipated spikes in demand. The suggestion that customer-generators should or would monitor and respond to these "price signals" on a continuous basis is not reasonable.

[23] https://dataviewer.pjm.com/dataviewer/pages/public/lmp.jsf. The prices on the publicly accessible pages updated roughly four minutes into a given five-minute period. For example, the price for the period from 2:40 PM to 2:45 PM was updated on the PJM website at 2:44.

[24] Data accessed from https://dataviewer.pjm.com/dataviewer/pages/public/lmp.jsf at 3 PM on August 25, 2025.

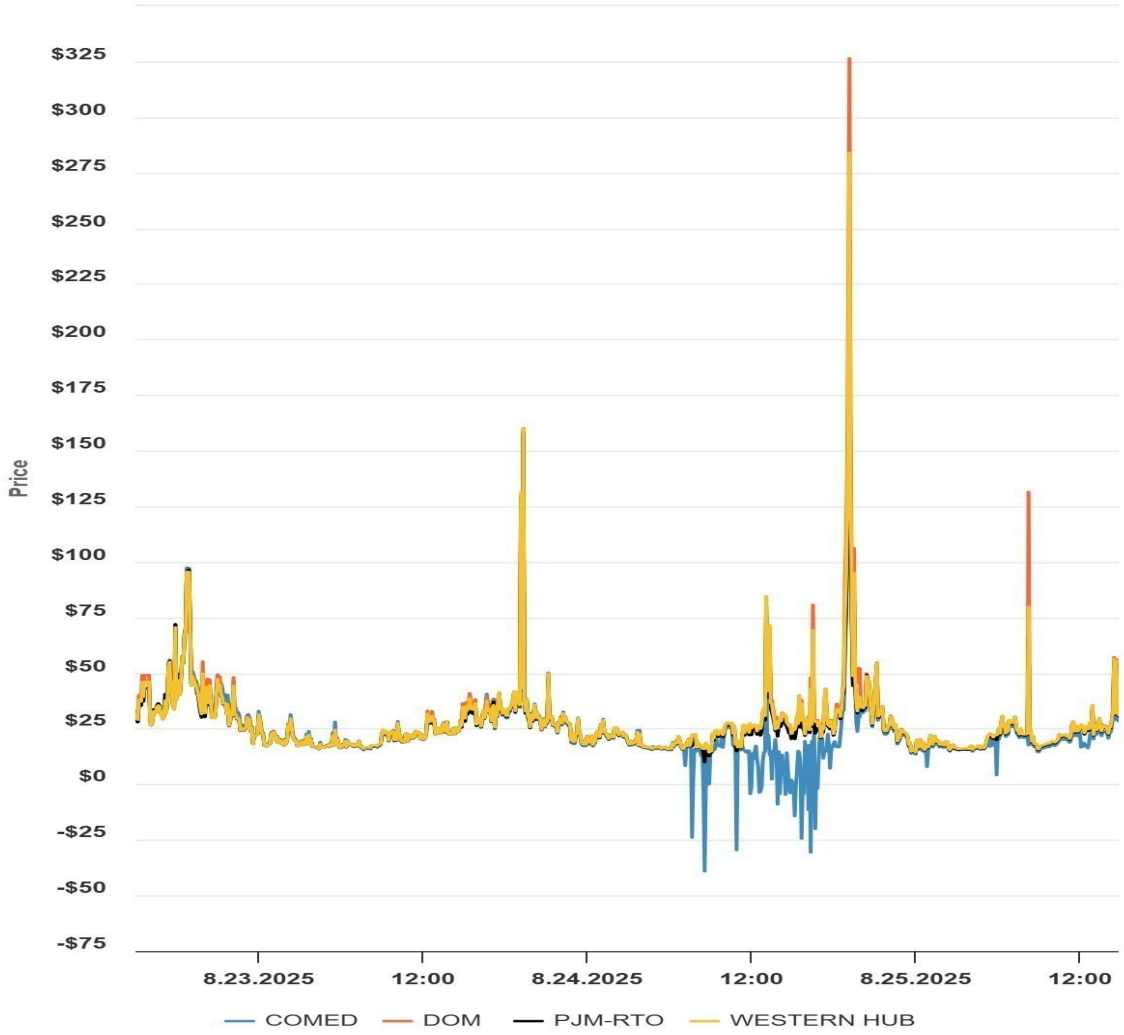

Figure 1 - PJM Real Time Prices August 22, 2025 to August 25, 2025

Q25. DOES THE COMPANY BELIEVE THESE PRICE SIGNALS AND INCENTIVES ALSO EXIST ON THE GSSR-1 RATE?

A25. No. In fact, the Company goes further and suggests that customer-generators have an incentive to withhold generation during peak hours to intentionally increase GSSR-1 rates.

> In fact, the GSSR-1 rate provides an economic disincentive for exporting during high-demand hours. Net exporting customer-generators are paid at the end of the energy-year at the PTC, which includes transmission and capacity costs determined by the Company's contribution to annual PJM peak hours. Exporting during peak hours reduces the Company's costs, thus reducing the value of export credits. Net-metered generation is non-dispatchable and, as Mr. Nolt states in his

> testimony, is able to "go offline immediately" so a customer-generator could reduce or eliminate output during peak hours to maximize the value of future export credits. In short, rather than incentivizing customer-generators to export during peak hours for benefit of all ratepayers in the class, the GSSR-1 rate structure, coupled with net metering code requirements, provide a financial incentive for customer-generators to deny exports during peak hours at the cost of non-exporting ratepayers.[25]

Q26. WHAT IS YOUR PERSPECTIVE ON THIS STATEMENT?

A26. This is a rather staggering accusation. The Company asserts – with no evidence or analysis whatsoever – that customer-generators would engage in market manipulation by intentionally reducing the output of their solar facilities in order to increase the peak demand of customers being served on the GSSR-1 tariff in hopes of inflating the future costs of that rider. It further presupposes that this increased peak demand will necessarily translate into increased costs that must be recovered from GSSR-1 customers, eventually increasing the credit rate at which exported energy is compensated.

Putting aside the unfounded and incredibly cynical basis for the statement, there are three problems with the Company's assertion. First, no customer knows when the five coincident peak hours that will be used in PJM's calculation of generation and transmission capacity cost allocation will occur. These are only announced months after the fact and are by definition retrospective. For a customer-generator to be confident of impacting one of these five hours, they would have to reduce their generation output on many hot afternoons as one simply cannot be determined with any precision when a combination of weather and customer load will trigger one of these system-wide peak hours.

Second, this repeated reduction in generation will have a much larger impact on a generator's compensation than any hypothetical price increase triggered by the intentional withholding of exported power could have. A customer-generator would be taking a sizable risk that forgoing guaranteed revenue by not generating on a given day

[25] Johnson Rebuttal at 28-29.

will result in future price increases that more than offset the lost revenue, particularly given the insignificance of a single distribution-connected DG system on the multi-Gigawatt, multi-billion dollar PJM capacity market.

Third, the DSP contract that the Company has with its wholesale supplier passes through PJM generation capacity and transmission costs directly based on the actual costs apportioned to the Company. The Company then divides these dollars by the kWh sold on the GSSR-1 tariff to determine the GSSR-1 $/kWh rate component for the recovery of generation and transmission costs. If a customer-generator reduced their output, it would result in increased net sales at the Company's PJM settlement point, which means the capacity costs would be divided by a larger quantity of sales. This would tend to reduce, not increase, the $/kWh rate that a customer-generator would be credited for excess generation.

Q27. PUTTING ASIDE THESE ISSUES, IS THERE EVEN A HYPOTHETICAL POSSIBILITY THAT A CUSTOMER-GENERATOR WOULD BENEFIT FROM THE MARKET MANIPULATION SUGGESTED BY THE COMPANY?

A27. No. Suppose a customer on the GSSR-1 tariff had a 100 kW_{AC} PV system that produced 147 MWh per year.[26] For a BTM customer-generator, much of this production will be used on-site and will not result in exported power. But to illustrate a worst-case scenario, suppose that all power was exported and compensated at the GSSR-1 rate.

The GSSR-1 rate used in the Company's workpapers included was $110.77/MWh, $42.27/MWh of which was for generation and transmission capacity.[27] At this rate, the customer-generator would receive $16,284 for excess generation at the end of the year. Suppose that this customer could magically determine exactly which five hours would be used in the PJM cost allocation process and decided to "turn off" their generation during only those five hours. Given that PJM's peak hours tend to occur

[26] This is the expected generation using the Company's PVWatts assumptions.
[27] Company workpaper SP-II-5 Attachment A.

between 4 and 6 PM EPT, the 100 kW generator will not be outputting 100 kW, but something lower.[28] The exact value will depend on the weather, but to continue the "worst case scenario", one can assume they may be outputting an average of 56 kW during these hours.[29] If the customer-generator deactivated the generation for these five hours, it would forgo roughly $31 in compensation.[30] In order for the customer-generator to come out ahead as a result of this behavior, the price of the transmission and capacity components of the GSSR-1 rate would have to increase by at least 0.5% as a direct result of the individual customer-generator's actions.[31]

In reality, a customer-generator would not have the magical ability to only deactivate their system during the 5 CP hours as these hours are not known in advance. Instead, a customer-generator seeking to manipulate the market to its favor would have to turn off their system during many summer afternoons between 4 PM and 6 PM with the hopes that one of those days would end up being a 5 CP hour. If they instead picked 20 days during which to target their peak load increase, the forgone revenue would increase by roughly 5 times, which would in turn require the capacity price impact from the customer-generator's actions to be in the 2-3% range to recoup the losses.

Q28. IS THERE ANY EVIDENCE WHATSOEVER OF A COORDINATED EFFORT AMONG ANY, MUCH LESS ALL, OF THE CUSTOMER-GENERATORS TO INTENTIONALLY DEACTIVATE THEIR SYSTEMS DURING PEAK HOURS TO MANIPULATE THE MARKET PRICE OF CAPACITY AND TRANSMISSION SERVICES?

[28] 18 of the past 20 5CP hours occurred either between 4 PM and 5 PM EPT or between 5 PM and 6 PM EPT. https://www.pjm.com/-/media/DotCom/planning/res-adeq/load-forecast/summer-2024-peaks-and-5cps.pdf

[29] The average of the five highest generation hours between 4 PM and 6 PM EPT from June to September in the Company's workpapers for a 100 kW_{AC} system averaged 56.5 kW. This represents the largest increase to peak demand that the customer-generator might expect to make on the 5CP days by shutting down its PV system.

[30] 56 kW * 5 hours * $110.77/MWh = $31.32 in lost revenue.

[31] Returning to the original revenue would require a total PTC of $110.98/MWh, which is $0.21/MWh higher than the original price. This would require a 0.51% increase in the generation and transmission capacity prices.

A28. Of course not. But even if there was, the ability for an individual customer-generator's behavior today to impact future capacity prices is swamped by so many other factors as to be rendered moot.

Q29. HOW MUCH CUSTOMER-GENERATOR SOLAR CAPACITY IS CURRENTLY OPERATING ON THE COMPANY'S GRID?

A29. The Company indicated it has about 4.1 MW of customer-generators in service on its system across all customer sizes and types.[32] Much of this is serving behind-the-meter loads, meaning only a fraction of this capacity would benefit from the hypothetical market manipulation suggested by the Company.

Q30. HOW MUCH LOAD WAS PRESENT DURING THE 2024 5 CP HOURS IN THE PPL PJM ZONE, WHICH SETS THE CAPACITY PRICE FOR THE COMPANY?

A30. The average of the 2024 5CP hours in PPL's PJM zone was 6,928.2 MW.[33]

Q31. WHAT WAS THE RECENT AMOUNT OF OFFERED AND CLEARED CAPACITY IN THE MOST RECENT PJM CAPACITY AUCTION IN THE PPL ZONE?

A31. The PJM PPL zone had 8,424.6 MW of capacity offered and cleared 8,377.4 MW of capacity.[34]

Q32. PUTTING THESE FIGURES TOGETHER, WHAT WOULD HAVE TO HAPPEN FOR A CUSTOMER-GENERATOR'S DECISION TO DEACTIVATE THEIR SYSTEM DURING PEAK HOURS TO IMPACT CAPACITY PRICES TO A SUFFICIENT DEGREE TO MAKE IT WORTH THEIR WHILE?

A32. First, a customer-generator would have to be served on the GSSR-1 tariff and have annual excess energy. This already eliminates any customer with a system that does not produce more energy over the course of the year than their consumption. Then, the customer will have to decide to attempt to manipulate the PJM capacity market by intentionally shutting their system down for several hours during hot summer afternoons.

[32] Exh. KL-7, Company workpaper SP-I-2 Attachment A.
[33] https://www.pjm.com/-/media/DotCom/planning/res-adeq/load-forecast/summer-2024-peaks-and-5cps.pdf
[34] https://www.pjm.com/-/media/DotCom/markets-ops/rpm/rpm-auction-info/2026-2027/2026-2027-bra-report.pdf

Depending on the system size and configuration, this may require the repeated manual flipping of cutoff switches and accepting any additional wear and tear on components that results.

Following this, the customer will have to sit around and wait to see if the day they selected to shut off their system ends up being one of the 5 CP hours on which PJM capacity cost allocations are based. If they missed by even an hour, they would have forgone guaranteed revenue based on speculation. But even if they were right, they would then have to wait several years for the increase in load attributable to their action to be captured via PJM's load forecast methodology and subsequently increase the load obligation of the PPL zone.[35] Next, generation and other capacity resource owners would have to bid in a manner where the marginal increase in PPL zonal load from the foregone solar generation triggers a price increase in the capacity market that exceeds the lost revenue from shutting down their system. Finally, three to four years hence, the customer-generator would have to wait for the end of the year to receive any added compensation for their annual excess generation that their actions has netted them.

Q33. IS THIS IN ANY WAY A REALISTIC SCENARIO?

A33. No; it is instead an absurd one. Putting aside the notion that the Company's small customer-generators will be flipping disconnect switches on hot summer afternoons in an attempt to manipulate the multi-billion-dollar PJM capacity market, the actions of any individual customer-generator would simply be lost among the many thousands of MW of load and generation that set PJM capacity prices. Even if there was a grand conspiracy and all 4.1 MW of customer-generators (including those that do not have any excess annual generation and thus would be completely unmotivated to lose money) turned off their systems during hot summer hours, this would only represent 0.05% of the cleared capacity in the PPL zone and has essentially zero chance of affecting the clearing price.

[35] PJM capacity prices are typically set three years in advance, although the capacity auction schedule has been compressed in recent years.

Q34. WHAT DO YOU RECOMMEND WITH RESPECT TO THIS "CONCERN" RAISED BY THE COMPANY?

A34. I recommend the Commission completely and wholeheartedly disregard it. It is a specious argument that has no basis in rational action by customer-generators and should be summarily dismissed.

D. The Billing Demand Proposal Discriminates Against Customer-Generators in Favor of Non-Customer Generators

Q35. WHAT CHANGES DID THE COMPANY MAKE TO ITS RATE DESIGN IN ITS REBUTTAL TESTIMONY?

A35. The Company modified the billing determinants that it used to calculate the demand charge in the GLP-1 and GLP-3 tariffs to confirm with its proposed Billing Demand definition.[36] In its original application, the Company used the actual and/or ratcheted demand from the customer to calculate the demand rates. When these were updated based on the proposed definition, the total demand billing determinants on the GLP-1 tariff increased by roughly 25%, going from 163,587 kW to 203,588 kW. The GPL-3 tariff had a much smaller increase given the fewer number of customer-generators and relatively larger customer loads on this tariff, increasing from 131,543 kW to 133,103 kW. The increase in billing determinants has an inverse effect on demand rates as they are still designed to recover the same revenue. The GLP-1 rates fell roughly 20% from $4.44/kW to $3.79/kW, while the GLP-3 rates fell modestly from $6.78/kW to $6.71/kW.

Q36. WHAT IS THE PRACTICAL EFFECT OF THIS CHANGE?

A36. The practical effect is that the 13 customer-generators on the GLP-1 tariff will see a massive increase in distribution costs, while the 1,124 non-customer-generators on the GLP-1 tariff will see a non-trivial distribution bill reduction.[37]

Q37. IS IT POSSIBLE TO CALCULATE THE MAGNITUDE OF THIS CHANGE?

[36] Gorman Rebuttal at 4. All figures in this paragraph are from Table HGS-2.
[37] Table HGS-2 indicates 13,644 annual bills, which is 1,137 customers. Workpaper SP-I-2 Attachment A shows 13 current customer-generators take service on the GLP-1 tariff, with a combined rated capacity of 2,967 kW.

A37. It is possible to get a rough estimate, although the Company's figures and discovery responses conflict with each other. Specifically, the increase in the GLP-1 billing determinants due to the inclusion of the GGR (3,333 kW per month) is larger than the sum of the GGR reported for active customer-generators on the GLP-1 tariff (2,967 kW per month). Given many of these customers are BTM generators, their demand under the current definition should not be zero, widening the disparity in the Company's figures.

The Company does not indicate that any of the "in progress" solar projects will take service on the GLP-1 tariff, nor does it include any new GLP-1 customers in its projected test year.[38] Further, after reviewing a confidential discovery response just before filing this testimony that included details about individual GLP-1 net metered customers, the 40,001 kW annual increase used in the bill determinant recalculation is substantially larger than the sum of the incremental Billing Demand in that workpaper.[39] I recommend the Commission investigate this matter further if it accepts the Company's Billing Demand definition to ensure that rates are being calculated correctly.

In my analysis using publicly available data, I attempted to de-skew the average cost impact due to the one very large (1.77 MW) customer-generator currently taking service on GLP-1 by separately analyzing this customer.[40] Using Excel, I set up a set of equations to calculate the average demand of the 1,124 non-customer generators and the 12 remaining customers-generators under the old and new definitions, setting the resulting total demand equal to the values in Table HGS-2. I then used Excel's Solver to solve the equations.[41] The results are found in Table 2 below.

[38] Exh. KL-7. In SP-I-2 Attachment A, all four projects listed as "Applied / In Progress" are listed on rate GLP-3. In the Company's COSS Study (Schedule B2-1), there are no additional customers forecasted for 2025 or 2026.
[39] Citizens' HIGHLY CONFIDENTIAL SP-II-11 Attachment A. I reviewed the workpaper too late to modify the analysis below. That said, the analysis presented here does not utilize confidential data and can thus be publicly filed and is largely consistent with the customer-specific results in the confidential attachment.
[40] Breaking this customer out made it impossible to solve the equations perfectly, although the resulting answer is within roughly 2.5% of the demand totals listed in the Company's rebuttal testimony.
[41] The equations have multiple results depending on the assumed average demand of non-customer-generators and customer-generators. Absent any additional information, I seeded the Solver algorithm with the assumption that the

	Direct Definition

Table 2 – Billing Demand Definition Impact on Rates and Bills

Q38. HOW DO YOU INTERPRET THESE RESULTS?

A38. Assuming the Company's discovery responses and calculations are correct (although they do conflict with each other), mathematically the only way for the total demand billing determinants to increase by the 40,001 kW per year from 13 customers is for each customer to see a sizable increase in their assigned billing demand. In all likelihood, the one large 1.77 MW customer-generator represents a sizable portion of the increase, which I estimated at just over 40% of the total.[42] Even when I separately account for this, the

two groups of customers had the same average demand under the current definition. Even if customer-generators have larger-than-average demands, the total bill impact of this change remains similar.

[42] I estimated the average peak demand of this customer assuming a 50% load factor and using the 2022 sales from Workpaper SP-1-14 of 1.66 million kWh, resulting in an average peak demand of 380 kW. This customer's 2024 sales were reduced to 0 kW, suggesting that their solar system is fully offsetting their annual usage.

remaining customer-generators see an average billing demand increase of roughly 101 kW per month.

The impact on the customer-generators is sizable. The single large customer-generator would see its bill increase by more than $60,000 per year, a truly punitive amount and equal to a nearly 300% increase in its distribution bill. The remaining customer-generators would on average see bill increases of about $4,500 per year, representing a nearly 400% increase. Meanwhile, the non-customer generators would on average receive an 11% reduction in their demand charges, despite no change in behavior or usage of the system.

Q39. WHAT POSSIBLE JUSTIFICATION FOR THIS RESULT DOES THE COMPANY PROVIDE?

A39. Despite admitting that customer-generator exports do not always cause an increase in costs, and even if they did, that it has not done the requisite studies to determine those costs, the Company essentially claims that it has been billing customers wrong for as long as it has had customer-generators:

> Q. If the new "obligations" above do not result in incremental costs to serve its customers, does the Company believe it is appropriate to charge the customer-generator more after installing the on-stie generation? Please explain in full.
>
> A. Yes, just as obligations from new or increased load that increase peak consumed demand will result in increased charges to customers—regardless of whether specific, measurable incremental cost increases can be directly correlated to the new load—the Company proposes to charge exported 'demand' in a similar manner. The Company cannot reasonably calculate the exact incremental costs incurred by each individual customer on an ongoing basis, which is one of the reasons why tariffed rates are used. Billing demand and usage provide the best reasonable representation of a customer's relative utilization of the distribution system and, as such, are appropriate quantities on which to base customer bills.[43]

In short, the Company claims that customer-generators place new "obligations" on the system, and that even if these obligations do not increase the cost of the system, it is nonetheless appropriate for customer-generators to pay more for their use of the

[43] Exhibit KL-8, SP-VI-5.c.

system. In the example above, "serving" these new "obligations" results in a typical customer-generator seeing their costs increase by thousands of dollars per year.

Q40. HAS THE COMPANY PERFORMED ANY ANALYSES TO SUPPORT THIS DRAMATIC RESULT?

A40. No. The Company admits that adding customer-generators to its systems "do[es] not always result in incremental cost increases to operate and maintain the system."[44] It admits that customer-generators must pay for required studies and systems upgrades to safely interconnect with the Company's system.[45] It admits that adding distributed generation to its system will never increase feeder peak demand.[46] It admits that it has not performed a cost of service study comparing the cost responsibility using actual metered energy flows or its GGR Billing Demand methodology.[47] It admits that it does not perform marginal cost of service studies for its distribution system specifically related to the marginal cost of exports from distributed generation.[48] Finally, it admits that it is not aware of any other unbundled distribution utility that uses its proposed Billing Demand methodology.[49] In short, it has done none of the legwork required to demonstrate its proposal is just and reasonable.

Q41. DID THE COMPANY IDENTIFY WITH ANY SPECIFICITY WHAT THESE NEW "OBLIGATIONS" ARE?

A41. It specifically noted that customer-generators place new obligations on the system "by exporting more energy than it previously imported, and then expecting the return of the 'banked' excess supply on-demand."[50] It continued, "Finally, the Company does not argue that generation, by nature, creates additional costs compared to consumption of a

[49] Exhibit KL-15, SP-V-3.
[50] Johnson Rebuttal at 23.

similar magnitude. Rather, we seek to treat all utilization of the distribution system equally, regardless of the direction in which power flows"[51]

Q42. WHAT IS THE "RETURN OF THE 'BANKED' EXCESS SUPPLY ON-DEMAND" DESCRIBING?

A42. Physically, it is describing nothing other than the Company providing power to the customer-generator. The power grid does not physically separate excess generation, set it aside, and then return it to the customer-generator at a later time; it meets the instantaneous power needs of the customers at all times. The "banking" concept is strictly related to the net metering accounting rules and is the policy of the Commonwealth. Rather, the Company is describing its obligation to provide its customers with power when called upon, which is a core component of its obligation to serve. It does this the same for customer-generators as it does with non-customer-generators; there is nothing special here in terms of the system usage or subsequent cost-causation of customer-generators.

Q43. HAS THE COMPANY IDENTIFIED ANY SCENARIO IN WHICH THESE NEW "OBLIGATIONS" CANNOT BE HANDLED BY THE EXISTING SYSTEM WITHOUT MODIFICATION?

A43. The Company has not identified any specific issues that directly result from customer-generators being connected to its system. It does mention hypothetical concerns related to power fluctuations from passing clouds, but admits that these types of issues are screened for during the interconnection process, must be remedied and paid for by a customer-generator prior to connecting to the system, and there is "little difference" between solar generation and customer load fluctuation of similar size and timescale.[52]

Q44. DO DISTRIBUTION SYSTEM ASSETS GENERALLY CARE WHICH DIRECTION POWER FLOWS THROUGH THEM?

A44. Generally, no. Poles are structural, not electrical, in nature. Wires are unaffected by the direction of power flow and are only limited by the total power they can carry, and

[51] *Id.*
[52] Exhibit KL-16, SP-III-1.

transformers can typically handle reverse power flows with no impact on operations. There may be some larger switching equipment and voltage control equipment that are not designed to manage two-way flow, but these comprise a small portion of the Company's distribution rate base and the Company has not identified any ratebase-funded upgrades needed to accommodate reverse power flows as those would need to be paid for by the customer-generator as a condition of interconnection.

Q45. IS THE COMPANY'S BILLING DEMAND PROPOSAL REALLY BASED ON "ALL UTILIZATION" OF THE SYSTEM BY ITS CUSTOMERS?

A45. No. For a customer-generator, the Billing Demand is the larger of the peak imported power and the GGR, even if the GGR power equivalent is never actually exported to the grid. Further, the Company has already admitted that its current billing practices are heavily influenced by its use of a 50% demand ratchet, with roughly 50% of customers already being billed not on their actual usage but their ratcheted demand.

Q46. WHAT IS YOUR RECOMMENDATION ON THIS MATTER?

A46. The Company's justification for its Billing Demand proposal is inconsistent and selectively punitive towards customer-generators. It claims that it is proper to base demand charges on "all utilization" for customer-generators, even though it does not do so for non-customer-generators. It claims that customer-generators create additional "obligations" on the system and should thus pay more, despite the complete lack of incremental costs associated with these "obligations." Its updated rate design would increase distribution rates for most non-residential customer-generators by roughly 400% while providing a roughly 11% reduction for non-residential, non-customer-generators, despite no individual customer shifting their behavior in a way that impacts costs. I continue to recommend the Commission reject the Company's Billing Demand proposal as unsupported, not cost-based, and discriminatory towards customer-generators.

E. The Company Misrepresents the Interaction between Customer-Generators and its Default Service Provider Contract.

Q47. WHAT IS ONE OF THE CORE ASSERTIONS OF THE COMPANY IN THIS CASE?

A47. The Company asserts that there is a cost shift that occurs when a customer-generator is paid for its annual excess energy at the GSSR-1 PTC rate.[53] The Company's contends its analysis demonstrates "the limited ability of net-metered [solar PV] to mitigate PJM costs."[54] It continues:

> Additionally, while no quantitative analysis has been performed, basic market principles suggest that as the total volume of energy purchased decreases, the price-per-unit will increase. In essence, as more energy is purchased from net-metered exports, less is purchased through the DSP wholesale contract. This lowers the 'buying power' of the DSP while concentrating non-volumetric (Company and supplier admin costs, Capacity, Transmission, and RTEP) costs across a smaller total quantity purchased, increasing the cost per MWh of default supply.
>
> Finally, as purchased net-metered energy creates net under collection of GSSR costs under the existing structure (where the customer generator receives the GSSR-1 price regardless of the generator's size), the resulting reconciliation in future periods through the E-factor inflates the cost of default supply which, in turn, inflates the purchased cost of future-period net-metered energy purchases. In short, net-metered customer-generators directly benefit from the price inflation that they cause in a compounding fashion that increases as more net-metered generation is installed.
>
> The Company concludes from its analysis that 1) net-metered generation exports result in a significant increase to default supply costs and 2) its proposed tariff change will mitigate these increases by shifting large exporters to the GSSR-2 rate and corresponding reimbursement formula.[55]

Q48. PLEASE DISCUSS YOUR UNDERSTANDING OF THE COMPANY'S DSP CONTRACT.

A48. Based on a review of the recent DSP docket and discovery responses from the Company, it is my understanding that the Company has engaged a wholesale electricity supplier in a "Load-Following Full Requirements contract."[56] The contract requires the supplier to

[53] Exhibit KL-17, SP-II-5 Revised.
[54] *Id.*
[55] *Id.*
[56] Joint Default Service Plan for Citizens' Electric Company of Lewisburg, PA and Wellsboro Electric Company For the Period June 1, 2025 through May 31, 2029 at 1, Docket Number P-2024-3049357, May 31, 2024. ("DSP Plan Application")

deliver all necessary energy to the Company's PJM pricing node and allows the supplier to directly pass through many costs, including those for transmission and generation capacity and PJM's Regional Transmission Expansion Plan/Transmission Enhancement Costs ("RTEP/TEC"). It prices energy using a six-month laddered approach, where a 12-month strip of forward prices for the monthly PJM West Hub on-peak price are triggered every six months for half of the anticipated load.[57]

The contract also includes a "Supplier Adder", which includes the following:

> The Supplier Adder covers all other costs to deliver default service power (both fixed and hourly energy) to the wholesale meter at the Citizens' or Wellsboro Aggregate Bus. This includes congestion, marginal losses, Alternative Energy Portfolio Standards ("AEPS") Act compliance, and transmission losses, as well as all risks associated with default service customer usage variability, customer migration (switching to an EGS for supply service or returning to default service as permitted under the Companies' tariffs and Pennsylvania law) and deviations between the forward pricing and actual costs.[58]

The Company elaborated on the purpose of the Supplier Adder:

> On top of the respective energy component charges, Citizens' and Wellsboro will pay a Supplier Adder* to their wholesale supplier, which will be a uniform cents-per-kWh charge fixed for the duration of the 4-year contract. The Supplier Adder will compensate the wholesale suppliers for all costs and risks for delivery to the wholesale meter for the Citizens' or Wellsboro Aggregate Bus, including marginal losses, ancillary services, congestion, transmission charges (other than NITS and RTEP/TEC), AEPS costs, marginal losses, customer load variability, and customer migration. Importantly, the Supplier Adder avoids the need for the Companies to maintain congestion management plans, as wholesale suppliers would continue to assume congestion costs and the associated rights to Auction Revenue Rights "ARR" and Financial Transmission Rights "FTR".
>
> *The Supplier Adder will place the risk of deviations in actual versus forward energy costs, sales, on-peak/off-peak customer usage and on-peak/off-peak wholesale pricing differentials on the wholesale supplier.[59]

Q49. HAS THE COMPANY'S LATEST DSP PLAN BEEN APPROVED?

[57] DSP Plan Application at 12.
[58] *Id.*
[59] *Id.* at 14.

A49. Yes. The Company's DSP Plan was approved by the Commission on January 23, 2025, and will be in effect from June 1, 2025, through May 31, 2029.[60] Unless subsequently modified by agreement of all parties, the pricing methodology and Supplier Adder will be locked in for the next roughly four years.

Q50. GIVEN ALL OF THE COSTS AND RISKS THAT ARE INCLUDED IN THE SUPPLIER ADDER, HOW MUCH DID THE WINNING BIDDER OF THE CONTRACT CHARGE FOR THIS ITEM?

A50. The winning bidder not only did not charge a premium for the Supplier Adder, it offered and won with a Supplier Adder credit of $2.66/MWh.[61] In other words, for every MWh that the supplier bills the Company for default service, it reduces the cost by $2.66/MWh.

Q51. HOW DOES THIS COMPARE TO THE SUPPLIER ADDER IN THE PRIOR DSP PLAN?

A51. The Supplier Adder in the prior DSP period from June 1, 2021, through May 31, 2025, was $1.37/MWh.[62] In this procurement, the winning bidder had a Supplier Adder that was $4.03/MWh lower, a considerable drop from the prior plan.

Q52. DID THE COMPANY MAKE ANY STRUCTURAL CHANGES TO THE CURRENT DSP PLAN THAT MIGHT HAVE IMPACTED THIS FIGURE?

A52. Potentially. The Company requested and was approved a "minor modification" to the energy pricing formula trigger date.[63] Instead of providing notice to the supplier on a day-ahead basis, the Company switched to a same-day trigger process. This reduces the risk that market prices move substantially between when the trigger is executed and when the actual prices are locked in.

Q53. DO YOU BELIEVE THIS MODIFICATION WAS RESPONSIBLE FOR A MEANINGFUL PART OF THE REDUCTION OF THE SUPPLIER ADDER?

---

[63] DSP Plan Application at 13.

A53. It is obviously not possible to determine exactly what thought process the winning bidder used in setting its Supplier Adder, but one can examine the degree to which PJM monthly forward contracts change in price on a day-to-day basis. In reviewing data on CME Group's website, while there were some days which future contract prices changed by several $/MWh on subsequent days, most days saw much smaller changes measured in the cents/MWh.[64] As such, it is unlikely that this change alone resulted in the sizeable drop of the Supply Adder in this procurement.

Q54. WERE THE ISSUES THAT ARE AT PLAY IN THIS DOCKET PRESENT DURING THE TIME WHEN BIDDERS WERE PARTICIPATING IN THE DSP PROCUREMENT PROCESS?

A54. Yes. The Company's DSP Plan was not approved until the end of January 2025. The ability of large customer-generators to produce substantial amounts of excess generation and be compensated on the GSSR-1 tariff was in place at that time. In fact, the Company did not file the application in this docket until April 30, 2025, which was after its compliance filing on April 17, 2025, in the DSP Plan reporting the results of the finalized procurement.

Mr. Johnson testified that the Company "did not provide any party or customer with advanced briefings on the various proposals or content of the rate filing until it was submitted."[65] In other words, the suppliers that bid in the DSP Plan procurement in early 2025 would have had no public knowledge at the time of the Company's plan to modify its default supply classification process.

Q55. DID ANY PARTY DISCUSS THE POSSIBILITY THAT SUPPLIERS WOULD ADD A LARGER "RISK PREMIUM" TO THEIR BIDS BECAUSE OF SOME OF THE RISKS ASSOCIATED WITH CUSTOMER-GENERATORS AND NET METERING?

[64] Several different futures contracts were examined roughly a year before their covered date at https://www.cmegroup.com/markets/energy/electricity/pjm-western-hub-peak-calendar-month-real-time-lmp.quotes.html

[65] Johnson Rebuttal at 34.

A55. Yes. While discussing the UGI Electric Default Service Plan order in his rebuttal testimony, OCA Witness Zach Teti noted that UGI raised three issues related customer-generators and its DSP procurement:

> (1) their output would decrease GSR-1 group load and tranche size; (2) there is substantial question as to the level of output and timing of when these projects will become operational; and (3) these large customer-generators have the ability to leave default service at any time and participate in the wholesale market, thereby creating an attrition risk if projects opt to leave GSR-1 service and shop their output elsewhere.[66]

In his own discussion of this issue, Mr. Teti stated

> While the Company did not show this effect in their analysis, the Company and I share the concern about the risk premiums associated with customer-generator uncertainty described in the above excerpt of the PUC's Opinion and Order. In the above remark, the Company expresses a comparable concern: that a large customer-generator stands to benefit from "price inflation that they cause in a compounding fashion." I take this statement to mean that the large customer-generator (output capacity > 400 kW) stands to benefit from higher prices caused by the risk premiums added to DSP suppliers to address their risks caused by unknown output quantities and attrition risk of large customer-generators.[67]

Q56. BASED ON THE LATEST DSP PROCUREMENT, DOES THIS SEEM TO BE AN ONGOING CONCERN?

A56. No. The most recent DSP procurement for the Company resulted in a substantial decrease in the Supplier Adder, which includes, among other things, all the risks identified in the UGI order above. The winning bidder was clearly sufficiently comfortable, even with those open issues, to undercut the prior Supplier Adder by more than $4.00/MWh. Further, even if suppliers were concerned about these developments, the Company's customers will be served for nearly four years before the issue will come up again. Given the myriad changes to the PJM market, including data center load growth, state and federal policy changes, and market design reforms that are likely to occur over the coming four years, there will be many other issue that will impact future DSP procurements than just those issues being addressed in this case.

[66] Teti Rebuttal at 11, quoting the PUC Decision in Docket P-2024-3049343 at 23.
[67] Teti Rebuttal at 12.

Q57. RETURNING TO THE INTERACTION OF THE DSP CONTRACT AND THE POTENTIAL COST IMPACT OF CUSTOMER-GENERATORS TAKING SERVICE ON THE GSSR-1 TARIFF, WHAT ANALYSIS DID THE COMPANY PRODUCE?

A57. The Company produced an analysis that purported to show that a 400 kW_{AC} rooftop system with no offsetting load could increase DSP costs by roughly $27,000 per year, while a 3 MW_{AC} ground mount single-axis tracking system with no offsetting load could increase DSP costs by $230,000 per year.[68] In calculating these figures, the Company assumed that it pays the full retail PTC to customer-generators for their excess energy, but only offsets the energy portion of the DSP contract when that generation reduces the energy that the wholesale supplier must provide to the Company. In other words, it provides zero value for any offset of generation capacity, transmission capacity, or RTEP/TEC costs, all of which are based on the peak load being provided by the wholesale supplier.

Q58. WHAT JUSTIFICATION DID THE COMPANY PROVIDE FOR THIS APPROACH?

A58. It provided four explanations, summarized below:

- NEM systems are not dispatchable
- GSSR-1 customers benefit from high PTC costs, providing an incentive to increase the costs
- Solar systems have a low demonstrated coincidence with peak demand periods.
- NEM generation is volatile and impacted by weather.[69]

Based on these factors, the Company "does not believe it is appropriate to incorporate any capacity or transmission impact into its analysis, however, because net-metered generation does not guarantee those savings and is economically disincentivized to export during peak demand periods."[70]

Q59. DO ANY OF THESE FACTORS MATTER IN TERMS OF HOW THE DSP CONTRACT IS STRUCTURED?

[68] Exhibit KL-17, SP-II-5 Revision 1.
[69] Exhibit KL-18, OCA-XV-1.
[70] Exhibit KL-19, OCA-XV-2.

A59. No. The fact that NEM systems are not dispatchable is irrelevant. The wholesale supplier is responsible for dispatching the anticipated DSP load on a day-ahead basis through the PJM scheduling process.[71] If the supplier chooses, it can include expected generation from customer-generators in its load assumptions. During the settlement process, any differences between scheduled and actual load are reconciled. All risks associated with any load variability from the DSP customers falls on the supplier and is one of the enumerated components of the Supplier Adder discussed above. This includes any failure to accurately forecast net load and any costs that may be needed to reconcile that load in the real-time market.

The remaining points do not support the Company's conclusion that solar should be afforded zero credit against PJM capacity costs. Because the customer-generators are connected to the distribution grid "downstream" of the PJM settlement point, and because the quantity of net metering capacity is substantially lower than the peak demand of the Company, every kW of power that is produced on the Company's distribution grid is consumed on the Company's distribution grid by another customer. As such, every kW of power that is being generated during one of the five coincident peak ("5CP") hours that determines cost allocation in the PJM market will reduce the amount of capacity that is assigned to the wholesale supplier. Given that the supplier passes these costs directly through to the Company, there is a 1:1 reduction in load obligations based on the generation in those hours.[72]

Q60. DO CUSTOMER-GENERATORS HAVE TO BE PRODUCING AT 100% OF THEIR GGR TO REDUCE PJM COSTS?

A60. No. The Company's argument that solar is intermittent and may not be producing during peak hours has nothing to do with the post hoc analysis that PJM uses to allocate costs. If

[71] Exhibit KL-20, SP-VI-17.

[72] There is a one year delay in when these reductions impact the load obligation, but they will be fully reflected in the PTC for the following energy year.

the system was producing power during a 5CP hour, it will be credited for that power, regardless of the ex ante probability of the generation during that 5CP hour.

Q61. HAVE YOU REVIEWED THE COMPANY'S ANALYSIS SUGGESTING THAT SOLAR IS POORLY CORRELATED WITH PEAK HOURS?

A61. Yes. As with the Company's other analysis that I discussed in my direct testimony, it contains a number of errors and improper methodological choices that artificially depress the result.

The Company was made aware of one such mistake where it improperly accounted for the AC to DC ratio of the system and issued a revised workpaper.[73] However, several other methodological issues remain. First, the Company again failed to adjust its modeled solar generation for Daylight Saving Time. For most of the year, this resulted in using solar generation from an hour later than was appropriate, and given the PJM 5CP hours tend to fall during late summer afternoons, this had a sizable impact on the forecasted generation.

Second, in using PVWatts, the Company utilized a typical meteorological year ("TMY") weather file for its modeled generation. TMY files are comprised of actual weather data from many different years that are specifically selected to represent "typical" weather conditions over the full year. The result of simulated generation using TMY files is more likely to represent the long-term average generation in a given location, but it is inappropriate to use when analyzing generation on a specific day at a specific time.

The PJM systems tends to peak during hot, summer afternoons. Hot summer afternoons are often sunny, meaning that solar production may be above average for that time of year. If the TMY file contained July weather from 2007, then the generation using that weather file on July 27th, 2007 at 5 PM EPT will not match the weather

[73] Exhibit KL-17, SP-II-5 Revision 1.

conditions that led to July 27th, 2023 at 5 PM EPT to be a 5CP hour. A proper analysis must include weather that corresponds to the grid conditions in place at the time.

Finally, the Company's analysis includes 5CP data going back to 2015, but fails to recognize what is a clear trend in the transmission cost allocation hours. Between 2015 and 2019, 18 of the 25 5CP hours for transmission cost allocation occurred during non-summer months. But between 2020 and 2024, only 4 of the 25 hours occurred outside the summer.[74] PPL, the transmission system in which the Company operates, is clearly shifting from winter to summer, and as a result, including data from the winter months from 10 years ago in the performance average is no longer appropriate.

Q62. WERE YOU ABLE TO FIX THE COMPANY'S ANALYSIS?

A62. Yes. I used the National Renewable Energy Laboratory's System Advisor Model ("SAM"), which is a more sophisticated version of its PVWatts tool, to replicate system generation using actual weather files from 2015 through 2024.[75] I fixed the Daylight Saving Time issue and recalculated the average performance during the 5CP hours from the past five years. The results are found below in Table 3.

	400 Kw Fixed Tilt		**3 MW Tracker**	
% of Nameplate during 5CP Hours	PLC Gen. Capacity	NSPL Trans. Capacity	PLC Gen. Capacity	NSPL Trans. Capacity
Original	25.4%	20.9%	39.9%	27.2%
Corrected	41.8%	35.0%	65.2%	50.1%
Change	**164.6%**	**167.4%**	**163.7%**	**184.0%**

Table 3 – Average Solar Contribution during 5CP Hours 2020-2024.

Q63. HOW DO YOU INTERPRET THESE RESULTS?

A63. The corrections increased the Company's original solar capacity contribution values by 64% to 84%. Further, the corrected results demonstrate that solar PV provides meaningful generation during the 5CP hours for both generation and transmission cost

[74] Exh. KL-17, SP-II-5 Attachment B
[75] https://sam.nrel.gov/

allocation purposes, particularly for the 3 MW tracking system. It is correct that these values are lower than the GGR of these systems, but these values are more than sufficient to discredit the Company's position that solar should get no capacity reduction credit for generation and transmission costs.

Q64. HOW DO YOU ANTICIPATE THE COMPANY RESPONDING TO THIS ANALYSIS?

A64. I suspect they will acknowledge the methodological shortfalls of their original analysis, but would still argue that because solar has a relatively low capacity factor and is not perfectly correlated with the 5CP hours, it is still causing a cost shift when paid the full PTC.[76]

Q65. DO YOU HAVE ANY ADDITIONAL INSIGHT INTO THAT ISSUE?

A65. Yes. It is important to consider the implications of the result. In the location simulated by the Company, solar production from a single-axis tracker is on average 18.8% of its GGR over the course of a year, while that of a fixed-tilt system is 16.7% of its GGR over the course of a year.[77] But during the peak hours, generation is 2-2.5 higher for fixed-tilt systems, and 2.7-3.5 times higher for single-axis tracking system. In other words, the solar systems outperform during peak hours compared to the total number of MWh they generate.

This has meaningful implications for the Company's PTC contract. In the Company's DSP Plan Compliance Filing, it broke down its calculation for the PTC.[78] Energy costs are calculated based on monthly forward pricing from PJM Western Hub futures contracts. Generation and Transmission capacity costs are converted from dollars to a $/kWh rate by multiplying the total capacity obligation in MW, the corresponding

[76] The Company may also disagree on the appropriateness of using only the past 5 years to reflect the shift in transmission peaks to the summer months. However, the trend in the data is clear, and given that cost allocation is based on actual and not projected data, I continue to recommend this adjustment.
[77] Exh. KL-17, SP-II-5 Attachment B (REV). The Company modeled zip code 17837. The values above represent the capacity factor of solar in that location.
[78] GSSR-1, GSSR-2 ADJ; SUPP NO 171 TO PA PUC NO 14; EFF: 6/1/25 - CITIZENS' ELECTRIC CO OF LEWISBURG, Docket No. P-2024-3049357. ("DSP Plan Compliance Filing") Available at https://www.puc.pa.gov/pcdocs/1875351.pdf

capacity rate in $/MW-day, and the number of days in a year, and finally divided by the total forecasted sales.

The Company performs these calculations for its projected PTC for June 1, 2025, through November 30, 2025, but also includes sales forecast data through May 30, 2026.[79] As such, it is possible to compare the avoided cost value of the generation profile of a fixed-tilt and single-axis tracking solar system against the cost of serving the load profile of the entire DSP load.

Q66. DID YOU PERFORM THESE CALCULATIONS?

A66. Yes, I did. I used solar generation from the TMY weather file for the avoided energy cost calculations given this analysis is for an unspecified period of time. I also used my updated generation and transmission capacity contribution calculations discussed above to calculate the avoided capacity cost values. The results of this calculation are shown below in Table 4.

	400 kW Fixed Tilt	3 MW Tracker	GSSR-1 Load Forecast
Annual Generation / Load MWh	567.9	5,333.2	114,007.0
Gen Capacity Contribution	41.8%	65.2%	
Gen Capacity MW	0.17	1.96	22.86
Gen Rate $/MW-Day	$270.43	$270.43	$270.43
Gen $	$16,487	$193,182	$2,255,947
Gen Rate $/MWh	**$29.03**	**$36.22**	**$19.23**
Trans Capacity Contribution	35.0%	50.1%	
Trans Capacity MW	0.14	1.50	24.90
Trans Rate $/MW-Day	$297.57	$297.57	$297.57
Trans $	$15,221	$163,290	$2,704,465
Trans Rate $/MWh	**$26.80**	**$30.62**	**$23.05**
Energy Rate $/MWh	**$66.82**	**$66.82**	**$66.82**
Total Rate $/MWh	**$122.66**	**$133.66**	**$109.10**

Table 4 – Solar Avoided Cost vs. DSP Load Profile Cost

Q67. HOW DO YOU INTERPRET THESE RESULTS?

[79] DSP Plan Compliance Filing, Schedules 1-12. The energy price for the second 6-month period will change when the new 12-month future contract is locked in. However, the analysis uses the currently 12-month future strip for the analysis as this is the only value available at this time.

A67. The analysis above duplicates the cost for the wholesale supplier of serving a load profile that is identical to the generation profile of the two solar systems. I followed the same steps to calculate the resulting $/MWh rate using the relative quantities of energy, generation capacity, and transmission capacity.[80] The result shows that the cost of serving the solar generation "load profile" is higher than the cost of serving the DSP load profile. Of course, this means the inverse is true: avoiding energy and capacity due to the solar generation profile is worth more than the average cost to serve the DSP load profile.

For the 400 kW_{AC} fixed-tilt system, I calculated an avoided cost benefit of $122.66/MWh, which is $13.56/MWh or 12% higher than the corresponding PTC components cost of $109.10/MWh. For the 3 MWAC tracking system, the avoided cost benefit was even higher at $133.66/MWh, which is $24.57/MWh or 23% higher than the corresponding PTC components. In short, paying customer-generators the PTC for their solar generation does not cause a cost shift to non-solar customers, it in fact undercompensates the solar system's contribution to reducing costs.

Q68. THE FIGURES ABOVE ARE BASED ON YOUR ADJUSTMENTS TO SOLAR'S CAPACITY CONTRIBUTION. WHAT IF THE COMMISSION DISAGREES WITH SHORTENING THE TIME HORIZON TO FIVE YEARS?

A68. If one only corrects the clear methodological errors of the Company's analysis of failing to adjust for Daylight Saving Time and using actual weather data from each year, but still uses the full 10-year average that the Company used, the result is directionally the same. The avoided cost benefits fall slightly to $116.67/MWh for the fixed-tilt system and $125.62/MWh for the tracking system, but these are still comfortably above the corresponding PTC component rate of $109.10/MWh.

[80] I did not include the RTEP/TEC costs as these are minor ($0.94/MWh) and the DSP Compliance Plan did not describe the calculation methodology. I also did not include the Admin costs, which are also minor ($1.35/MWh) and would be skewed by the relatively small quantity of solar generation. Finally, I did not include any distribution loss adjustment as it was unclear whether the Company's load forecast already included this value or not when calculating the final $66.82/MWh rate.

Q69. BUT IF SOLAR IS NOT PRODUCING AT ITS FULL GGR DURING THE PEAK HOURS, AND HAS A LOWER CAPACITY FACTOR THAN THE COMPANY'S DSP LOAD FACTOR, HOW DO YOU EXPLAIN THE ABOVE RESULT?

A69. Another way to analyze the avoided cost benefits is to look at the relative share of each PTC component on a dollar basis. As shown below in Figure 2, the solar generation profiles are "overweighted" in capacity compared to energy. This reflects solar's higher-than-average generation during the 5CP hours compared to the total quantity of generation over the course of the year when compared to the same peak load / total energy ratio of the DSP load profile. The result of this is that outsized avoided capacity benefits are "concentrated" into a small number of annual generation MWh, resulting in the higher rates above.

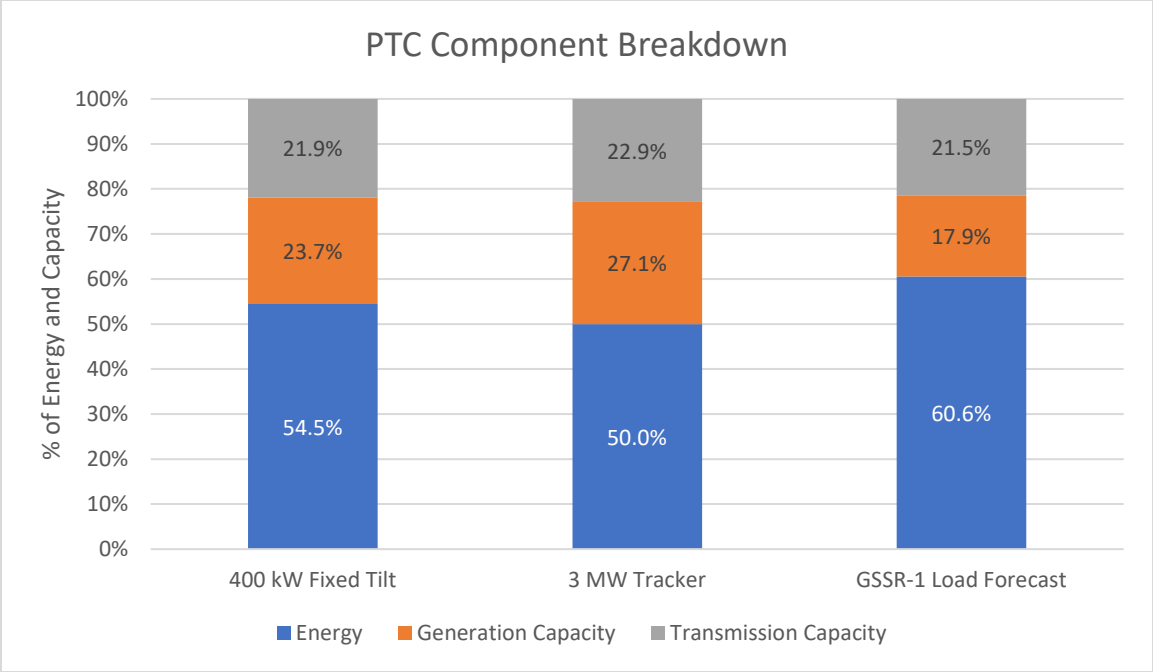

Figure 2 - PTC Component Breakdown

Q70. BUT DOESN'T THE LOWER AMOUNT OF GENERATION FROM A SOLAR SYSTEM IMPROPERLY INFLATE THE SOLAR RATE CALCULATION COMPARED TO THE LOAD PROFILE RATE CALCULATION?

A70. No. Although one might think that dividing the avoided capacity cost benefits by a smaller number of MWh artificially inflates the rates above, there is a simple way to prove this is not true: comparing the cost to serve the DSP load with and without a solar generator.

Because of the capacity cost pass-through and energy cost index structure of the DSP contract, the Company is only obligated to pay for the actual energy and capacity that its DSP customers use. If they use less energy because of distribution-connected solar systems, then the wholesale supplier has to deliver less of this product. If they have lower demand during the 5CP hours because of solar generation, the capacity cost allocation will be proportionately lower. The specific ratio of these decreases will determine whether the overall PTC rate increases or falls as it will be calculated based on the total capacity dollars divided by the total sales.[81]

Q71. WHAT IS THE RESULT OF THIS ANALYSIS?

A71. The results are shown in Table 5 below for the GSSR-1 load net of the fixed-tilt and tracking system. As expected, the rate to serve the GSSR-1 load net of either solar system is lower than the rate to serve the GSSR-1 load by itself, and the rate to serve the load net of the tracker is lower than to serve the load net of the fixed tilt. This is due to the greater reduction in capacity costs than the reduction in total energy in both, but a more pronounced difference in the tracker.

[81] Because of the contract structure, the energy component of the PTC rate remains constant regardless of the number of sales.

	GSSR-1 Load Forecast	Load Less Fixed Tilt	Load Less Tracker
Annual Load MWh	**114,007**	**113,439**	**108,674**
Gen Capacity MW	22.86	22.69	20.90
Gen Rate $/MW-Day	$270.43	$270.43	$270.43
Gen $	$2,255,947	$2,239,460	$2,062,765
Gen Rate $/MWh	**$19.23**	**$19.18**	**$18.42**
Trans Capacity MW	24.90	24.76	23.40
Trans Rate $/MW-Day	$297.57	$270.43	$270.43
Trans $	$2,704,465	$2,443,970	$2,309,406
Trans Rate $/MWh	**$23.05**	**$20.93**	**$20.62**
Energy Rate $/MWh	**$66.82**	**$66.82**	**$66.82**
Total Rate $/MWh	**$109.10**	**$106.93**	**$105.86**

Table 5 – DSP Load Profile Net of Solar Generation

Q72. THE ANALYSIS ABOVE ASSUMES THAT THERE IS NO LOAD TO OFFSET THE PV SYSTEM. DOES THIS ANALYSIS CHANGE IF THESE ARE BTM SYSTEMS THAT ARE INSTEAD OFFSETTING LOAD?

A72. No. The DSP contract is for delivery of all aggregated load at the Company's 69 kV St. Mary's substation.[82] Whether customer-generator uses this energy onsite or exports it to serve its neighbor's load, the net result at the St. Mary's substation is a reduction equal to the solar generation plus distribution line losses.

Q73. THE COMPANY CLAIMS THAT CUSTOMER-GENERATORS WILL BENEFIT "IN A COMPOUNDING FASHION" THROUGH THE INTERACTION OF NETTING ENERGY AND THE GSSR-1 RECONCILIATION FACTOR.[83] DO YOU AGREE WITH THIS STATEMENT?

A73. No, I do not. First, it is important to understand the scale of the DSP contract cost and the potential under-collection due to excess annual energy. The Company reported that customer-generators had accumulated a grand total of 636 MWh of net excess energy at the end of energy year 2025.[84] Even assuming that 100% of these customers are served on the GSSR-1 tariff, at the current PTC of $114.19/MWh, this represents payouts of

[82] DSP Plan, Exhibit NJ-3 at 3.
[83] Exhibit KL-17, SP-II-5 Revision 1.
[84] Exhibit KL-21, SP-IV-13.

approximately $73,000. By contrast, the DSP Plan is projected to collect roughly $13 million in energy year 2026.[85] Even if this excess energy caused a shortfall to be collected in future periods, it would only increase the rate from $114.19/MWh to $114.83/MWh. Given the average commercial customer with excess annual energy only had 58 MWh of banked generation at the end of the year, the reconciliation adjustment discussed above would on average result in an extra $35 or so.[86] This is hardly noticeable compared to the sizable increase these customers would experience under the proposed Billing Demand definition.

More to the point, the Company should be including anticipated generation from customer-generators in the sales forecast used to calculate the GSSR-1 capacity components. If the Company correctly includes these values for its existing and in-progress fleet, then the only potential under-collection due to unplanned excess generation would be from new systems that were conceived and built within the energy year and resulted in excess annual generation for the customer-generator. Given the Company updates its PTC every six months, this is an extremely unlikely scenario.

Finally, even if there were unplanned excess generation that resulted in under-collections in the GSSR-1 account, as shown above, that generation will contribute more to reducing capacity costs than reducing energy sales. When the following year's load obligations are released, they will be lower than they would have been absent the solar generation, which will reduce costs for all customers on the GSSR-1 tariff.

III. REBUTTAL OF OCA WITNESSES ZACH TETI

Q74. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

[85] DSP Plan Compliance Filing, Schedule 3. The Company forecasts 114,007 MWh of GSSR-1 sales at $114.19, which would result in collections of $13,018,459.
[86] Exhibit KL-21, SP-IV-13. There were 10 commercial customers with a total of 577 MWh of excess energy.

A74. In this section of testimony, I discuss the rebuttal testimony of OCA witnesses Zach Teti.[87]

Q75. PLEASE SUMMARIZE THE RELEVANT POSITIONS OF OCA'S REBUTTAL TESTIMONY.

A75. OCA witness Mr. Teti supports the approval of the Company's Billing Demand proposal, indicating his belief that the "overall default service supply portfolio and the specific default service procured on behalf of residential customers would benefit from the Company's proposed Billing Demand methodology."[88]

Q76. DOES MR. TETI PROVIDE ANY INDEPENDENT ANALYSIS OR REASONING TO SUPPORT HIS RECOMMENDATION?

A76. No. Mr. Teti repeats the Company's position, but does not independently discuss or analyze the Billing Demand proposal.[89] In doing so, he adopts the Company's arguments but does not offer any new insight or critiques of those arguments. For instance, he does not discuss the problems with charging customers for demand that they do not place on the system, nor does he question the Company's analysis provided in SP-II-5 Attachment A. In follow up discovery, Mr. Teti admitted that he "did not independently validate the quantitative approach by reconciling/cross-checking monetary values and magnitude of costs."[90] Given the myriad errors identified in the latter analysis in my direct testimony, Mr. Teti's failure to scrutinize the workpapers may have contributed to his acceptance of the problematic results.[91]

Mr. Teti was not able to independently validate the Company's explanation of how demand reductions from customer-generators impact PJM wholesale costs because of some ambiguity in the Company's discovery responses.[92] Mr. Teti did submit

[87] OCA Statement No. 5R - Rebuttal Testimony of Zach Teti on Behalf of the Pennsylvania Office of Consumer Advocate ("Teti Rebuttal").
[88] Teti Rebuttal at 3.
[89] Teti Rebuttal at 6.
[90] Exhibit KL-22, OCA Response to Solar Projects I-2.

[92] Teti Rebuttal at 10, footnote 13.

discovery to follow up on this issue, but it was not received before the filing deadline for his rebuttal testimony.

Q77. HAS THE COMPANY SINCE PROVIDED RESPONSES TO MR. TETI'S DISCOVERY?

A77. Yes, they have.[93]

Q78. AND DID THE DISCOVERY CLARIFY THE ISSUE?

A78. No, it did not. Mr. Teti asked the company "Please refer to "Attachment A (Rev)" of Citizens' response to SP-II-5, specifically in the portion that states: 'PJM costs substantially unaffected by net metered sales.' Please explain the effect of net metered sales on PJM costs."[94]

The Company's response did not address the core issue: how do net metered sales, including excess generation from both customer-sited behind-the-meter ("BTM") systems and distribution-connected commercial scale the PJM settlement process and the default service provider's ("DSP") full requirements contract. Instead, the Company reiterated its generic observations about net metered solar; namely, that it is not dispatchable, that solar generation does not peak at the same time as the system peak, and that excess generation is volatile.[95]

Q79. ARE THESE OBSERVATIONS RELEVANT TO THE MECHANICS OF THE PJM SETTLEMENT PROCESS AND THE DSP CONTRACT?

A79. No, they are not. The lack of dispatchability does not matter; these are not capacity resources that must have a specific capacity accreditation in the PJM wholesale market and are held accountable for their output during peak days. The observation that solar generation does not peak during the system peak hours does not mean that solar cannot and does not provide peak demand reductions; it does, albeit at a level that is lower than the GGR of the system. Similarly, the day-to-day volatility of an individual solar generator is smoothed out across a wider geographic area, and system operators

[93] Exhibit KL-18, Citizens' response to OCA-XV-1.
[94] Id.
[95] Id.

understand that solar generation has a diurnal generation profile and can plan the system around this fact.

Q80. WHAT APPEARS TO BE OCA'S MAIN CONCERN RELATED TO THE OPERATING CHARACTERISTICS OF DISTRIBUTION-CONNECTED DG SYSTEMS?

A80. Mr. Teti notes a concern that DSP providers will increase their bids to reflect a "risk premium" associated with the distribution-connected DG systems.[96] He also notes a Company concern about large customer-generators "benefiting from 'price inflation that they cause in a compounding fashion.'"[97] Notably, neither of these concerns has anything to do with the establishment of base distribution rates, which is ostensibly the purpose of this proceeding. They are exclusively related to the issue of DSP procurement, which should be litigated in a DSP proceeding. This proceeding is simply the wrong forum to address DSP-related matters.

Q81. HAS OCA PERFORMED ANY ANALYSIS RELATED TO THE PURPORTED UPWARD PRESSURE ON BIDS CAUSED BY THIS RISK PREMIUM?

A81. No, it has not for the understandable reason that "OCA is not permitted to see bid details following the completion of default service procurement auctions."[98] It is problematic that the office responsible for representing consumers in front of the Commission is not able to investigate one of the more speculative elements supporting a large change to customer-generator compensation.

Q82. ARE THERE OTHER ISSUES THAT MR. TETI RAISES REGARDING THE COMPANY'S TESTIMONY AND TARIFFS?

A82. Yes. Mr. Teti notes several instances of ambiguity and lack of clarity in the Company's testimony, discovery responses, and tariffs regarding how PJM costs are impacted by distribution-connected DG systems.[99] The follow-up discovery that Mr. Teti asked did

[96] Teti Rebuttal at 12.
[97] Teti Rebuttal at 12.
[98] Exhibit KL-22, OCA Response to Solar Projects Set I-3.b
[99] Teti Rebuttal at 16.

not resolve these issues, and it appears the record continues to lack clarity on how exported generation is incorporated into the PJM settlement process and how that impacts DSP costs.

Q83. DO YOU AGREE THERE IS A LACK OF CLARITY?

A83. Yes. I do not believe that the Company has directly answered OCA's questions on this matter, as discussed above. This is yet another reason that issues related to DSP costs should be fully litigated in a DSP proceeding where parties could properly clarify the record on these issues. Making a decision in this rate case docket while key questions related to supply costs for the DSP remain unanswered would be improper.

Q84. DOES THIS CONCLUDE YOUR TESTIMONY?

A84. Yes, it does.

EXHIBIT KL-8

ORIGINAL

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-VI-5

Please refer to Citizens' Statement No. 4R at 23, which states "Second, I disagree with the implication that a customer who installs on-site generation with capacity that exceeds the historic account generation demand is not changing its use of the distribution system. The customer is placing a new obligation on Citizens' and on the distribution system by exporting more energy than it previously imported, and then expecting the return of the "banked" excess supply on-demand."

a. Confirm that a distribution asset that is able to serve a given level of peak demand can also serve all levels of demand up to that level of peak demand. That is, if a piece of equipment can serve 100 kW of demand, it can also serve demands from 0 to 100 kW. If deny, please explain in detail.

b. Is it the Company's position that the new "obligations" discussed above always result in incremental costs to serve its customers? If so, please provide all analyses that the Company has performed to support that position.

c. If the new "obligations" above do not result in incremental costs to serve its customers, does the Company believe it is appropriate to charge the customer-generator more after installing the on-stie generation? Please explain in full.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

a. Confirmed.

b. No, new obligations, whether from newly installed load or generation, or simply changing load characteristics, do not always result in incremental cost increases to operate and maintain the system; however, the new obligations may support changing the account's proportionate cost responsibility for the shared distribution resources.

c. Yes, just as obligations from new or increased load that increase peak consumed demand will result in increased charges to customers—regardless of whether specific, measurable incremental cost increases can be directly correlated to the new load—the Company proposes to charge exported 'demand' in a similar manner. The Company cannot reasonably calculate the exact incremental costs incurred by each individual customer on an ongoing basis, which is one of the reasons why tariffed rates are used. Billing demand

Please refer to Statement No. 1R at 17, which states "The Company must stand ready to serve both of these loads, at any time, in either direction. Whether the customer is drawing 400 kW from the grid, or injecting 400 kW, the Company needs the same assets to serve the customer's needs."

a. Suppose a customer with a 400 kW peak demand is on a feeder that serves 3 MW of peak demand from all customers connected to that feeder. Further suppose that this customer installs a solar generator that enables it to export 400 kW of power to the grid, and that this generator passed the Company's interconnection screening process without triggering any system upgrade costs.

   i. Please indicate all additional pieces of equipment that the Company must install to serve the 400 kW of exported power that did not already exist to serve the 400 kW of imported power.

   ii. Please identify any incremental cost associated with serving the 400 kW of exported power that are solely the result of the presence of exported power and were not required to serve the 400 kW of imported power.

   iii. Does the Company believe that the 400 kW of exported power will ever increase the peak demand served by the feeder? If yes, please explain the circumstances in which that would occur.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

The Company cannot provide specific answers to subparts (i) and (ii) of this question. What, if any, distribution costs incurred and/or necessary upgrades will result from the addition of generation of new generation, even with a peak output equal to or less than existing load, is unique for each customer-generator based upon their individual load characteristics, coincidence of load and generation, characteristics of surrounding customers loads and generation, and the existing construction of the distribution system supplying them.

iii. No, adding generation will not increase feeder peak demand.

Please refer to Statement No. 1R at 17, which states "Mr. Lucas' opinion that Citizens' proposal is not in accord with the traditional "billing demand" as used in distribution ratemaking (i.e., the amount that the account imports from the utility) is incorrect.

a. Please list all other instances the Company is aware of where a utility uses a measurement of billing demand in its cost of service, cost allocation, or rate design for distribution rates that is consistent with the Company's proposed Billing Demand methodology.

Response Provided By:
Howard S. Gorman, President, HSG Group
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

The Company is unaware of any unbundled distribution rates that use the definition of "Billing Demand" proposed in this case; however, the proposal is consistent with traditional cost of service principles and reflects the evolving bi-directional use of the distribution system.

ORIGINAL

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-V-4

Please refer to Statement No. 1R at 17-18, which states "Having fewer customers paying for the system means that more of the costs would be borne by customers that do not adopt the new technologies. The Company must continue to build, operate and maintain the system to accommodate the technology adopters. The costs to do so will not decrease; however, if the technology-adopters are able to avoid all or some of their cost responsibility, the larger cost burden would be paid by the remaining (non-technology adopting) customers."

a. Suppose that a customer with a 400 kW peak demand performs an energy efficiency upgrade that permanently reduces their peak demand to 300 kW.

    i. Confirm that the revenue collected from this customer will be reduced as a result of their lower peak demand. If deny, please explain.

    ii. Does the Company believe that this revenue reduction causes a cost-shift to other customers who have not performed energy efficiency upgrades?

b. Suppose that a customer with a 400 kW peak demand participates in a demand response program that permanently peak reduces their demand to 300 kW.

    i. Confirm that the revenue collected from this customer will be reduced as a result of their lower peak demand. If deny, please explain.

    ii. Does the Company believe that this revenue reduction causes a cost-shift to other customers who do not participate in demand response programs?

c. Suppose that a customer with a 400 kW peak demand installs a battery storage system that permanently reduces their peak demand to 300 kW.

    i. Confirm that the revenue collected from this customer will be reduced as a result of their lower peak demand. If deny, please explain.

    ii. Does the Company believe that this revenue reduction causes a cost-shift to other customers who do not install battery storage systems?

d. In any of the instances above, does the Company either currently or propose to modify its cost allocation process, its Billing Demand definitions, or its rate design methodology to

address the reduction in peak demand from the actions of these customers? If so, please explain in detail.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

a.i.
Yes, over time; however, the revenue reduction may be delayed due to the operation of the billing demand provisions in GLP-1 and GLP-3.

a.ii.
Yes. The majority of the costs for the distribution system are fixed and do not vary with usage. If all other factors are held constant, then in the next distribution rate case, distribution system costs will be shifted to other customer classes due to the lower GLP-1 or GLP-3 class demand that results from the energy efficiency upgrade. Depending on the length of historic demand and usage used for the cost of service analysis, this may take a series of rate cases. In addition, this will reduce the billing determinants used to calculate the demand and kWh-based distribution charges for GLP-1 or GLP-3, which will increase the rates and shift costs to other customers in the class.

b.i. & ii.
The Company is unaware of a demand response program that permanently reduces demand and therefore cannot answer this question. Demand response programs change the customer's consumption in response to certain conditions, such as PJM emergency conditions.

c.i.
Yes, over time; however, the revenue reduction may be delayed due to the operation of the billing demand provisions in GLP-1 and GLP-3.

c.ii.
Yes. The majority of the costs for the distribution system are fixed and do not vary with usage. If all other factors are held constant, then in the next distribution rate case, distribution system costs will be shifted to other customer classes due to the lower GLP-1 or GLP-3 class demand that results from the energy efficiency upgrade. Depending on the length of historic demand

and usage used for the cost of service analysis, this may take a series of rate cases. In addition, this will reduce the billing determinants used to calculate the demand and kWh-based distribution charges for GLP-1 or GLP-3, which will increase the rates and shift costs to other customers in the class.

d.

As previously mentioned, the billing demand provisions in GLP-1 and GLP-3 would address some of these situations by ensuring that the Billing Demand is not less than 50% of the highest Billing Demand in the last 11 months. If these situations were to occur, it would impact future cost allocations in the cost of service study. The Company is proposing in this case to increase the customer charges for GLP-1 and GLP-3, which makes recovery less dependent on the kW billing determinant. In addition, the Company may make adjustments to rate designs, cost allocations and other tariff definitions, as appropriate, in future proceedings.

ORIGINAL

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-V-5

Please refer to Statement No. 1R at 19, which states "For customers who use the distribution system solely to withdraw power, it is not practical to compute the potential maximum they could withdraw, and likely not meaningful; first, customers can add machines or appliances at any time; and second, it is unlikely that all machines or appliances would be used at once. For generators, though, the maximum potential use of the distribution system is knowable, and it is reasonable to expect the generator will use all its capacity at some time; after all, that is why it is there."

a. Confirm that it is readily possible for the Company to calculate the potential maximum power a customer could draw by multiplying the amperage of their service connection by the voltage they are served on. For instance, a customer who is served on a 100 amp connection at 240 volts could draw a maximum of 24 kW. If deny, please explain.

b. Please indicate any and all instances where consideration of how a customer intends to use electricity and any measures of the "reasonableness" of that usage, and not their actual use of the system, is determinative in cost allocation or rate design.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 5, 2025

Response:

(a) Denied, due to National Electrical Code ("NEC") requirements for commercial services, the size of a customer's service is often substantially larger than any realistic determination of the actual load present behind the service. In practice the company sizes its facilities for consumption-only accounts based on determinations of the maximum possible diversified consumption behind the meter. Customers are required to inform the Company if their maximum possible consumption increases so that the service can be resized (and their bill may increase as well). The NEC does not require customer-generators to overstate their gross generator capacity. In the case of solar, the customer generator sizes their inverters—which determine gross generator capacity—at their discretion. Additionally, they may add additional generation behind the inverters—up to the gross generator capacity—without further notification to the utility, because they have already been approved to interconnect at that level of potential export.

(b) Citizens' current tariff includes a provision that allows volunteer fire departments, non-profit ambulance services, non-profit rescue squads and non-profit senior citizens centers to be billed under the residential rate schedule. GLP-1 and GLP-3 also set a minimum billing demand using 50% of the highest demand during the prior 11 months. Other examples may exist; however, identifying "any and all instances" would require an unreasonable study and excessive burden when the Company can already identify these examples in its tariff.

Please refer to the Company's response to SP-II-3, which states "The most obvious example of instability caused by DER is intermittent cloud cover over solar arrays. A cloud bank passing over a group of large distribution arrays can cause a significant change in power flow over a very short time period, causing a voltage sag. This causes voltage control devices on the system to react to restore voltage, but may then result in a subsequent voltage surge as the clouds pass and SPV output returns to its full potential. Aside from the immediate concern of voltage instability, this increases the duty cycle of voltage control devices, which shortens their expected lifespans. It may also negatively impact nearby consumers."

a. Confirm whether the voltage control devices referred to above are manually adjusted, actively adjusted, or function passively. To the extent there are different types of voltage control devices being referred to in the response, please expand how each type would respond to the event discussed above.
b. On what time frame (sub-second, second, minutes, etc.) do the voltage control devices operate to correct system voltage?
c. Please confirm that the Company's interconnection process screens for the types of voltage instability discussed above. If denied, please explain.
d. If c) above is confirmed, will the Company allow a DER to connect to its grid without requiring customer-generator-funded system upgrades? Please explain the process in detail.
e. Suppose the Company has a commercial customer with a 400 kW load, 200 kW of which can rapidly switch on and off.
    i. Confirm that the customer's rapidly changing load can cause a significant change in power flow on the Company's system over a short time period. If denied, please explain in detail why.
    ii. Confirm that the customer's rapidly changing load can impact voltage on the Company's system. If denied, please explain in detail why.
    iii. Confirm that voltage control systems on the Company's grid will react to restore voltage as this customer's load changes rapidly. If denied, please explain in detail why.
    iv. Please explain all differences in the impact on the grid of a PV system that sees a 200 kW reduction in power output over 10 seconds from a passing cloud and a customer with a large load activating 200 kW of load over 10 seconds.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company

Date: July 14, 2025

Response:

a. The voltage control devices referred to are automated devices that respond to deviations from programmed time-voltage criteria to correct system voltage. The Company uses both automatically controlled capacitor banks and regulators. The Company does utilize 'fixed' and manually energy capacitors, but neither are relevant to the circumstances referred to in this question and response.

b. Typical voltage control devices on the Company's system use two levels of criteria. Under both criteria, devices can react to changes in system voltage within seconds. More importantly, to provide for stability and prevent 'hunting' (a phenomenon where nearby devices react to each other, rather than system-driven changes), devices have a time delay between operations and may also use a longer time delay if more than a pre-determined number of operations occur within a set period. Devices also have 'override' criteria to prevent system voltages from deviating out of a wider, pre-determined bandwidth. Override criteria has fewer limitations on the interval and number of operations.

c. Confirmed, the company screens for the potential incremental system impact of each interconnection.

d. Customers are required to fund system upgrades to mitigate potential disruption or instability caused by their interconnection. The Company's system modelling software allows it to model proposed interconnections and evaluate their effect on system conditions, including voltage. If disruptions can be handled by the Company's existing equipment, then no upgrade funding will be required prior to interconnection. If unacceptable effects are indicated, mitigating upgrades can be modeled and tested for effectiveness to identify the most practical and economical solution. Once a solution is identified, a magnitude estimate for the upgrade is developed and provided to the customer for them to determine if they wish to proceed with the interconnection as planned, discuss potential modifications with engineering to lessen costs, or abandon the application.

e. Regarding a customer with 200kW of rapidly fluctuating load:

   i. Denied, a rapidly shifting 200kW load may cause some 'hyper-local' changes in power flow, but a 200kW shift in load is unlikely to affect power flow on a system scale.

   ii. Denied, similar to subpart (i), a rapidly shifting 200kW load may cause some 'hyper-local' voltage impacts, affecting customers in their immediate area. Once this impact was identified, the customer would be required to make changes to mitigate these effects.

   iii. Confirmed, if a change in customer load causes a voltage disruption of sufficient magnitude to affect system voltage, installed voltage control devices will react to

stabilize voltage. As noted above, the customer may be required to make changes to mitigate ongoing voltage disruptions.

iv. There is little difference in system impact between a rapid change in a 200kW customer load and 200kW of PV generation; both situations may require corrective actions by the account and/or the operation of on-system control devices.

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-III-2

Please refer to workpaper SP-II-5 Attachment A

a. There is a note that the 6/1/25 GSSR Rates are used. How often are these rates updated?
b. What time period does the 6/1/25 GSSR rate represent?
c. Do the PTC components listed in rows 2-8 of the first three tabs represent prices at the generator level, or prices at the meter level?
d. What is the source for the 3.2% loss factor, and what loss factor does this represent?
e. There is a note in row 31 that states "PJM costs substantially unaffected by net metered sales."
    i. What is the basis for this statement?
    ii. Please provide all workpapers that were developed to support this statement in their original format with formulas intact.
    iii. Confirm that in the Company's workpaper, energy purchased through net metered export is provided zero value in reducing PJM costs paid, as indicated by the same values being found in cells C31 as in cells C20. If denied, please explain in detail why.
f. On tab "Ex + Prop >400kW", the value for MWh purchased from Supplier is 1,880 MWh, with a note that says, "Expected annual overproduction of existing & proposed >400kW NM Generation."
    i. What is the basis of this assumed annual overproduction?
    ii. Please provide all workpapers that were used to develop the 1,880 MWh value in their original format with formulas intact.
g. On tab "PVWatts 400kWAC Analysis", it appears the Company used a 440 kW DC size with a 1.2 DC/AC inverter load rating. If the intent was to produce a 400 kW AC system, why were these values used?
h. On tab "PVWatts 3MWAC Analysis",
    i. It appears the Company used a 3,300 kW DC size with a 1.2 DC/AC inverter load rating. If the intent was to produce a 3,000 kW AC system, why were these values used?
    ii. Is it the Company's position that 3 MW single axis tracking systems typically have an inverter load rating of 1.1 or 1.2? If so, please provide the basis for this position.
i. Confirm that if a behind-the-meter DER generates 400 kW in a given hour, that the impact on the Company's aggregate load that must be met by a wholesale supplier in that hour is the same whether the energy is consumed onsite by the customer-generator or exported to the nearest source of load, excluding any losses between the customer-generator and the nearest source of load. If deny, please explain in full.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company

Date: July 14, 2025

Response:

a. GSSR Rates are typically updated on June 1 and December 1 each year. Interim GSSR changes may be filed if changes occur in the projected purchased power costs that would result in a significant over or under collection if the GSSR Rates are not updated.
b. The 6/1/25 GSSR rate is expected to remain in effect from June 1, 2025 through November 30, 2025.
c. The Price-to-Compare (PTC) is a cost published by the Company that represents the current cost of default supply service at the meter, inclusive of gross receipts tax (GRT), State Tax Adjustment Surcharge (STAS), and other governmental or regulatory mandated taxes and fees, and not including Sales Tax.
d. As stated in the Citizens' tariff, the loss factor is adjusted each June 1 to reflect the rolling three calendar year average of distribution losses on the system. It is the difference between metered energy delivered to the substation and aggregated metered energy delivered to customers over the calculation period.
e. Regarding "PJM costs substantially unaffected by net metered sales," the Company is referring to the sum of PJM Capacity, Transmission, and RTEP costs:
    i. As demonstrated in SP-II-5 Attachment A, the Company has analyzed the past ten years of PJM peak hours and found that:
        1. On average, fixed rooftop PV systems are able to provide approximately 21% of their rated output for NSPL hours and 25% of rated output for PLC hours. Ground mounted, tracking systems can be expected to provide 27% and 40% of their rated output for NSPL and PLC hours, respectively.

        2. Both system types show significant volatility in their ability to contribute during peak times, ranging from 0% to 80% of rated output, with little ability to predict or anticipate coincidence in advance. It should be noted that the analysis does not account for additional volatility caused by localized environmental conditions (e.g. cloud cover), customer-generator load and demand response, and generator availability (i.e. is the generator online at all).

    Additionally, the Company cannot dispatch net-metered generation, nor are net-metered customer-generators obligated to produce or export during peak hours.

    ii. The Company's workpapers to support this conclusion are those provided as attachments to the revised response to SP-II-5.

    iii. Confirmed, the Company's calculation does not assume a reduction in PJM costs based on increases in net metered exports, nor does it assign any credit to net metered generation in its calculations based on a single or aggregated customers' performance during the peaks that determine the billing determinants for the PJM costs. As stated in subpart (i), over ten years, an average of only 25% of the rated output of net metered generation is expected to be available during peak hours. There is also high volatility in coincidence between net-metered generation export and PJM peak hours. Additionally, the Company must treat net-metered customer-

generators similar to non-generating customers in the same rate classes. Non-generating GSSR-1 customers are not individually credited for any actions that they take that might mitigate PJM costs. GSSR-2 customers are charged for PJM generation, transmission, and RTEP costs based on their calculated individual contribution to PJM peaks, but are not further credited for any benefit their demand response might provide to other GSSR-2 customers.

f. Regarding the 'Ex + Prop >400kW' tab:

i. The estimated annual overproduction is based on historical actual overproduction by existing net metered customers, plus estimated overproduction by >400kW interconnection applications in the queue with sufficient known data to determine overproduction estimates.

ii. Workpapers were not used to develop the 1,880MWh estimated export of customer-generators with rated outputs exceeding 400kW, as only three active or proposed installations meet this criteria. The table below provides the data used to calculate the estimated export:

SL	Status	Actual Export (2025)	Expected Export (ICA)
18167	Active	112,171 kWh	
	Proposed		835,000 kWh
	Proposed		933,000 kWh
TOTAL:		**1,880,171 kWh**	

g. The 1.2 DC to AC ratio is the PVWatts default assumption, the Company used a 1.1 factor, in error, to set total DC system size. The Company has revised the attachments to SP-II-5 and will resubmit them as a revised to response to SP-II-5.

h. Regarding the 3MWAC PVWatts Analysis:

i. See the Company's response to subpart (g), above.

ii. The Company's analysis utilizes standard PVWatts assumptions in its analysis in order to provide an objective 3rd party source of data without unnecessary modification by the Company. The Company has found that PVWatts analysis of customer interconnection applications tends to closely match estimated production provided in the application, and thus trusts that these values are an accurate representation of actual output. Any debate as the reasonableness of the DC to AC ratio used is, in fact, irrelevant to the Company's analysis, as the Company used the ratio only to provide the necessary DC system size to achieve the rated AC outputs desired for analysis. No DC values are used for the analysis. This is reflective of the Company's handling of actual net-metered interconnections, where

the AC rated output capacity, and AC production and export are used for modeling, analysis, and crediting of net-metered generation.

i. Confirmed if the customer generator is a default service customer. The customer generator has the option to deal with an Electric Generation Supplier for its supply arrangements.

DOCKET NO. R-2025-3054394

SP-III-3

Please refer to workpaper SP-II-5 Attachment B.

a. On tab "Coincidence Analysis", please provide the source for the values date and time values in column B and G for PLC and NSPL, respectively.

b. The formula that calculates the "% Nameplate Production on PLC" and "% Nameplate Production on NSPL" divide the system size by 1.1. Please indicate the purpose of this adjustment.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company

Date: July 14, 2025

Response:

a. Columns B and G are the PJM peak hours provided to the Company annually and used in determining GSSR-1 and individual GSSR-2 customer contributions to peak costs.

b. See the Company's response to SP-III-2 (g), the Company used a 1.1 factor to determine AC rated output in error. The intent of the adjustment was to convert the DC system size in the PVWatts tabs to AC system size for use in the coincidence analysis.

SP-II-5

Please reference Citizens' St. No. 4, p. 17. Has Citizens conducted any studies or analyses of the effects of this tariff change on Citizens' default procurement of electricity based on its Default Service Plan ("DSP")? If yes, please provide all studies or analyses related to the same.

Response Provided By:
Nathan Johnson, President & CEO

Date: June 30, 2025 (original)
July 14, 2025 (revised)

Response:

July 14, 2025 Revisions:
The Company has revised the attachments ("SP-II-5 Attachment A" and "SP-II-5 Attachment B") provided with the original response to SP-II-5, and made revisions to the response below, highlighted in yellow after identifying a data error related to the AC-to-DC ratio of the model PV systems used.

Original Response with July 14, 2025 Revision Incorporated:

Yes, the Company has analyzed the impact of net metered energy on default service costs in two different ways:

1) The direct cost of purchased net-metered energy compared to the cost of purchasing the same volume of energy through the DSP.

2) The potential for net-metered generation to mitigate PJM Capacity, Transmission, and RTEP costs.

The purchase cost analysis can be found in the attachment titled "SP-II-5 Attachment A (REV)." It contains several comparisons, summarized in the table below:

Comparison	Description	Result
400kW	400kW$_{AC}$ Roof Mount SPV w/ no offset load, standard PVWatts® roof-mount parameters	~$27,000 increase in GSSR-1 costs annually.
Ex + Prop >400kW	Expected net-metered export purchases of existing and proposed systems with ≥400kW rated output capacity	~$88,000 increase in GSSR-1 costs annually.

3000kW	3MW$_{AC}$ Rack Mounted Tracking (w/ Backtracking) SPV, premium panels, standard PVWatts® parameters	~$230,000 increase in GSSR-1 costs annually.

The analysis of PJM cost mitigation can be found in the attachment titled "SP-II-5 Attachment B (REV)." It contains a ten year history of PJM Capacity and Transmission peak hours and hourly outputs from the same PVWatts® studies used in Attachment A (REV). For nearly half of the past decade's PJM Capacity and Transmission Peak hours, SPV output from either model was 20% or less of rated capacity, demonstrating the limited ability of net-metered SPV to mitigate PJM costs.

Additionally, while no quantitative analysis has been performed, basic market principles suggest that as the total volume of energy purchased decreases, the price-per-unit will increase. In essence, as more energy is purchased from net-metered exports, less is purchased through the DSP wholesale contract. This lowers the 'buying power' of the DSP while concentrating non-volumetric (Company and supplier admin costs, Capacity, Transmission, and RTEP) costs across a smaller total quantity purchased, increasing the cost per MWh of default supply.

Finally, as purchased net-metered energy creates net under collection of GSSR costs under the existing structure (where the customer generator receives the GSSR-1 price regardless of the generator's size), the resulting reconciliation in future periods through the E-factor inflates the cost of default supply which, in turn, inflates the purchased cost of future-period net-metered energy purchases. In short, net-metered customer-generators directly benefit from the price inflation that they cause in a compounding fashion that increases as more net-metered generation is installed.

The Company concludes from its analysis that 1) net-metered generation exports result in a significant increase to default supply costs and 2) its proposed tariff change will mitigate these increases by shifting large exporters to the GSSR-2 rate and corresponding reimbursement formula.

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

OCA-XV-1

Please refer to "Attachment A (Rev)" of Citizens' response to SP-II-5, specifically in the portion that states: "PJM costs substantially unaffected by net metered sales." Please explain the effect of net metered sales on PJM costs.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 4, 2025

Response:

The net effect of net-metered sales on PJM costs is better explained by SP-II-5 Attachment B which examines the coincidence of the output of two different hypothetical solar arrays with the Company's historical PJM peak hours for the past ten years. This analysis demonstrates both the low coincidence and high volatility of solar output with respect to peak hours. The company discounts potential savings in PJM Capacity and Transmission costs resulting from net-metered generation because:

1) Net-metered generation cannot be dispatched and is not required or incentivized to export during peak demand periods unless the energy crediting mechanism is the real-time locational marginal price (or another time-differentiated rate that accurately reflects real time conditions).

2) Beyond the lack of incentive to export during peak periods, GSSR-1 customer-generators that produce more than they consume on an annual basis actually benefit from high capacity and transmission prices that inflate the PTC rate they are reimbursed at, which disincentivizes participation during peak demand periods.

3) Net-metered generation, solar in particular, has a low demonstrated coincidence with peak demand periods.

4) Net-metered generation output during peak demand periods is highly volatile because of the influence of weather, seasonal availability, and the variation in seasons, days and times at which peaks occur.

DOCKET NO. R-2025-3054394

OCA-XV-2

Please refer to "Attachment B (Rev)" of Citizens' response to SP-II-5, specifically the Average Output on Peak of 25.36%. Does this net metered generation reduce the load obligation driving PJM costs? If yes, how should this load reduction be incorporated in the analysis in response to SP-II-5?

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 4, 2025

Response:

Please see the Company's response to OCA-XV-1. The on Peak Output of net-metered generation may reduce load that determines the PJM obligations determining PJM costs. The Company does not believe it is appropriate to incorporate any capacity or transmission impact into its analysis, however, because net-metered generation does not guarantee those savings and is economically disincentivized to export during peak demand periods. Please note that a customer generator on the GSSR-2 rate would see the benefit of a zero transmission and/or capacity obligation if it successfully offsets its on-site consumption during the relevant PJM peaks.

SP-IV-13

Please provide the annual number of customers currently eligible for net metering, and the total exported kWh credited at retail rates, for each of the past three (3) years.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

The request, as stated, would be burdensome and irrelevant to proposals discussed in rebuttal testimony. The Company, instead, provides a 3-yr analysis of all monthly exports and energy-year-end credits provided to customer-generators.

The Table below provides the requested data for the most recent three available energy-years. Please note that the column titled "Total Monthly Net Exports" is the sum of all months for which a customer in that class *added* kWh to their bank. It does not account for hourly exports later consumed within the same billing period.

Year	Class	# Eligible	# Annual Exporters	Total Monthly Net Exports	EOY Banked kWh

Pa. PUC v. Citizens' Electric Company
Docket Nos. R-2025-3054394
Interrogatories of Kelly Road Solar, LLC, Lancaster Avenue Solar, LLC, and Twilight Renewables, LLC (Solar Projects)
OCA Response to Solar Projects Set I

---

1. Please refer to OCA Statement 5R at 6, which contains a summary of the Company's argument as to why its proposed Billing Demand proposal is reasonable. Does OCA have an independent perspective of whether the Company's Billing Demand proposal is reasonable? If so, please provide OCA's perspective on this proposal.

In the recent UGI Electric Order[1], one of the contested issues involved a proposed methodology for assigning customers to different rates based upon supply peak load impact (SPLI).
In my opinion, the methodology approved by the PUC in the UGI Electric Order is generally similar to Citizens' proposal in this proceeding. In the UGI Electric Order, the Commission accepted UGI's reasoning that the "approach [would] better align larger net-metering customer-generators with larger customers that have similar grid impacts."[2] In my analysis of Citizens' proposal, I found the methodology to be reasonable for a similar reason, as it would ensure that the overall default service construct, including its rates and rate classification, would be designed efficiently. I addressed this in pages 9-10 of my rebuttal testimony.

2. Please refer to OCA Statement 5R at 9, which contains a summary of the Company's analysis performed in SP-II-5 Attachment A. Has OCA independently validated the quantitative approach used by the Company in this analysis? If so, did it find any deficiencies in the analysis or did it reach the same conclusion as the Company?

While I reviewed and evaluated the quantitative approach presented in SP-II-5 Attachment A, I did not independently validate the quantitative approach by reconciling/cross-checking monetary values and magnitude of costs. Based on my evaluation, the quantitative approach appears sensible, and I did not find the analysis to be deficient. Therefore, I found the direction of the conclusion in SP-II-5 Attachment A (cost comparison/deviation driven by "PJM costs [which would be] substantially unaffected by net metered sales") to be sensible.

3. Please refer to OCA Statement 5R at 12, which states "I take this statement to mean that the large customer-generator (output capacity > 400 kW) stands to benefit from higher prices caused by the risk premiums added to DSP suppliers to address their risks caused by unknown output quantities and attrition risk of large customer-generators."

   a. What is the basis for this assumption, and is it supported by any discovery responses

[1] *Petition of UGI Utilities, Inc-Electric Division for Approval of a Default Service Plan for the Period of June 1, 2025 though May 31, 2029*¸ Docket No. P-2024-3049343, et al (*UGI Electric Order*).
[2] UGI Electric Order, p. 4

provided by the Company?

My assumption is based on two documents.

First, see the following description of UGI's argument in the UGI Electric Order, p. 23:

> The Company determined that if large customer-generators were to be included in the GSR-1 group, then: (1) their output would decrease GSR-1 group load and tranche size; (2) there is substantial question as to the level of output and timing of when these projects will become operational; and (3) these large customer-generators have the ability to leave default service at any time and participate in the wholesale market, thereby creating an attrition risk if projects opt to leave GSR-1 service and shop their output elsewhere. UGI argued that each of these factors would substantially increase risk for wholesale suppliers, causing higher bid premiums and likely reducing the number of competitive bidders.[3]

Second, the response from Citizens to SP-II-5 provides:

> Additionally, while no quantitative analysis has been performed, basic market principles suggest that as the total volume of energy purchased decreases, the price-per-unit will increase. In essence, as more energy is purchased from net-metered exports, less is purchased through the DSP wholesale contract. This lowers the 'buying power' of the DSP while concentrating non-volumetric (Company and supplier admin costs, Capacity, Transmission, and RTEP) costs across a smaller total quantity purchased, increasing the cost per MWh of default supply.
>
> Finally, as purchased net-metered energy creates net under collection of GSSR costs under the existing structure (where the customer generator receives the GSSR-1 price regardless of the generator's size), the resulting reconciliation in future periods through the E-factor inflates the cost of default supply which, in turn, inflates the purchased cost of future-period net-metered energy purchases. In short, net-metered customer-generators directly benefit from the price inflation that they cause in a compounding fashion that increases as more net-metered generation is installed.[4]

The above passages informed my assumption. In the Company's response above, the Company concludes their discussion of uncertainty and market principles by noting "price inflation" after a detailed outline of the cause and effect of under-collection driven by purchased net-metered energy. Given this, I found the statement to be generally comparable to the "bid premium" discussion in the UGI Electric Order.

[3] PA PUC Opinion and Order, p. 23
[4] Citizens' Response to SP-II-5, p. 2

b. Has OCA performed any analysis or research on whether suppliers have included an additional risk premium in their bids when participating in the default service procurement auctions? If so, please provide all such analysis or research.

No, for the following reasons: (1) the OCA is not permitted to see bid details such as these following the completion of default service procurement auctions; and (2) given this lack of information, no further analysis on risk premiums was performed. A qualitative evaluation is provided in my testimony.

4. Please refer to OCA Statement 5R at 15, which states "Mr. Nolt may be overstating the impact of the proposed Billing Demand methodology on customer-generator compensation."

a. Is OCA disputing the calculations that Mr. Nolt provided in his testimony, or does this sentence refer to the lack of clarity on how the Company will compensate customer-generators for excess generation? If the former, please provide all analysis that OCA performed disputing Mr. Nolt's calculations.

This sentence refers to the latter: the lack of clarity on how the Company will compensate customer-generators for excess generation.

5. Please refer to OCA Statement 5R at 16, lines 7-11, discussing the proposed Billing Demand methodology's impact on residential customers with DER.

a. Does OCA believe that commercial customers with behind-the-meter DERs could be impacted by the Company's Billing Demand proposal?

Yes, commercial customers with behind-the-meter DERs could be impacted depending on the output capacity of their DER.

b. If the answer to a) is yes, please provide OCA's position on the impact of the Company's proposed Billing Demand methodology on commercial customers with DERs.

I believe that the Company's Billing Demand proposal could be impactful to these commercial customers. Some customers will be deemed GLP-1 based on the buildings on their premises and might be applied the GSSR-2 rate based on their electricity usage or if the output capacity of their associated DER is greater than 400 kW. If this is the case, aligning the management of supply for this block of larger retail customers alongside a block of larger customer generators should be more

DOCKET NO. R-2025-3054394

SP-IV-17

Please produce any PJM or internal system planning guidelines that explicitly require sizing based on GGR rather than measured peak inflow/outflow.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

PJM does not specify planning criteria for distribution level, net-metered generation.

The Company does not maintain a written planning guideline that explicitly requires sizing based on GGR because distribution system planning is done by two employees (i.e., the President & Chief Executive Officer and/or the Senior Director of Engineering & Operations). As such, a written planning guideline is not necessary. The Company has consistently utilized this value in its planning calculations based on internal engineering judgement with support from management.

Exhibit Nos. KL-8 through KL-22

REVISED

EXHIBIT KL-8

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-VI-5

Please refer to Citizens' Statement No. 4R at 23, which states "Second, I disagree with the implication that a customer who installs on-site generation with capacity that exceeds the historic account generation demand is not changing its use of the distribution system. The customer is placing a new obligation on Citizens' and on the distribution system by exporting more energy than it previously imported, and then expecting the return of the "banked" excess supply on-demand."

a. Confirm that a distribution asset that is able to serve a given level of peak demand can also serve all levels of demand up to that level of peak demand. That is, if a piece of equipment can serve 100 kW of demand, it can also serve demands from 0 to 100 kW. If deny, please explain in detail.

b. Is it the Company's position that the new "obligations" discussed above always result in incremental costs to serve its customers? If so, please provide all analyses that the Company has performed to support that position.

c. If the new "obligations" above do not result in incremental costs to serve its customers, does the Company believe it is appropriate to charge the customer-generator more after installing the on-stie generation? Please explain in full.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

a. Confirmed.

b. No, new obligations, whether from newly installed load or generation, or simply changing load characteristics, do not always result in incremental cost increases to operate and maintain the system; however, the new obligations may support changing the account's proportionate cost responsibility for the shared distribution resources.

c. Yes, just as obligations from new or increased load that increase peak consumed demand will result in increased charges to customers—regardless of whether specific, measurable incremental cost increases can be directly correlated to the new load—the Company proposes to charge exported 'demand' in a similar manner. The Company cannot reasonably calculate the exact incremental costs incurred by each individual customer on an ongoing basis, which is one of the reasons why tariffed rates are used. Billing demand

Do customer generators pay for a detailed engineering study to ensure a net metering system will not cause adverse grid conditions as a result of their interconnection?

Response Provided By:
Nathan Johnson, President & CEO, Citizens' Electric Company

Date: June 26, 2025

Response:

Yes, customer-generators are required to pay for detailed engineering, as necessitated by location-specific distribution system characteristics, to ensure safe interconnection.

REVISED

EXHIBIT KL-12

REVISED

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-V-2

Please refer to Statement No. 1R at 17, which states "The Company must stand ready to serve both of these loads, at any time, in either direction. Whether the customer is drawing 400 kW from the grid, or injecting 400 kW, the Company needs the same assets to serve the customer's needs."

a. Suppose a customer with a 400 kW peak demand is on a feeder that serves 3 MW of peak demand from all customers connected to that feeder. Further suppose that this customer installs a solar generator that enables it to export 400 kW of power to the grid, and that this generator passed the Company's interconnection screening process without triggering any system upgrade costs.

   i. Please indicate all additional pieces of equipment that the Company must install to serve the 400 kW of exported power that did not already exist to serve the 400 kW of imported power.

   ii. Please identify any incremental cost associated with serving the 400 kW of exported power that are solely the result of the presence of exported power and were not required to serve the 400 kW of imported power.

   iii. Does the Company believe that the 400 kW of exported power will ever increase the peak demand served by the feeder? If yes, please explain the circumstances in which that would occur.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

The Company cannot provide specific answers to subparts (i) and (ii) of this question. What, if any, distribution costs incurred and/or necessary upgrades will result from the addition of generation of new generation, even with a peak output equal to or less than existing load, is unique for each customer-generator based upon their individual load characteristics, coincidence of load and generation, characteristics of surrounding customers loads and generation, and the existing construction of the distribution system supplying them.

iii. No, adding generation will not increase feeder peak demand.

Please refer to Statement No. 1R at 17, which states "Mr. Lucas' opinion that Citizens' proposal is not in accord with the traditional "billing demand" as used in distribution ratemaking (i.e., the amount that the account imports from the utility) is incorrect.

a. Please list all other instances the Company is aware of where a utility uses a measurement of billing demand in its cost of service, cost allocation, or rate design for distribution rates that is consistent with the Company's proposed Billing Demand methodology.

Response Provided By:
Howard S. Gorman, President, HSG Group
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

The Company is unaware of any unbundled distribution rates that use the definition of "Billing Demand" proposed in this case; however, the proposal is consistent with traditional cost of service principles and reflects the evolving bi-directional use of the distribution system.

REVISED

EXHIBIT KL-16

REVISED

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-III-1

Please refer to the Company's response to SP-II-3, which states "The most obvious example of instability caused by DER is intermittent cloud cover over solar arrays. A cloud bank passing over a group of large distribution arrays can cause a significant change in power flow over a very short time period, causing a voltage sag. This causes voltage control devices on the system to react to restore voltage, but may then result in a subsequent voltage surge as the clouds pass and SPV output returns to its full potential. Aside from the immediate concern of voltage instability, this increases the duty cycle of voltage control devices, which shortens their expected lifespans. It may also negatively impact nearby consumers."

a. Confirm whether the voltage control devices referred to above are manually adjusted, actively adjusted, or function passively. To the extent there are different types of voltage control devices being referred to in the response, please expand how each type would respond to the event discussed above.
b. On what time frame (sub-second, second, minutes, etc.) do the voltage control devices operate to correct system voltage?
c. Please confirm that the Company's interconnection process screens for the types of voltage instability discussed above. If denied, please explain.
d. If c) above is confirmed, will the Company allow a DER to connect to its grid without requiring customer-generator-funded system upgrades? Please explain the process in detail.
e. Suppose the Company has a commercial customer with a 400 kW load, 200 kW of which can rapidly switch on and off.
    i. Confirm that the customer's rapidly changing load can cause a significant change in power flow on the Company's system over a short time period. If denied, please explain in detail why.
    ii. Confirm that the customer's rapidly changing load can impact voltage on the Company's system. If denied, please explain in detail why.
    iii. Confirm that voltage control systems on the Company's grid will react to restore voltage as this customer's load changes rapidly. If denied, please explain in detail why.
    iv. Please explain all differences in the impact on the grid of a PV system that sees a 200 kW reduction in power output over 10 seconds from a passing cloud and a customer with a large load activating 200 kW of load over 10 seconds.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company

Date: July 14, 2025

Response:

a. The voltage control devices referred to are automated devices that respond to deviations from programmed time-voltage criteria to correct system voltage. The Company uses both automatically controlled capacitor banks and regulators. The Company does utilize 'fixed' and manually energy capacitors, but neither are relevant to the circumstances referred to in this question and response.

b. Typical voltage control devices on the Company's system use two levels of criteria. Under both criteria, devices can react to changes in system voltage within seconds. More importantly, to provide for stability and prevent 'hunting' (a phenomenon where nearby devices react to each other, rather than system-driven changes), devices have a time delay between operations and may also use a longer time delay if more than a pre-determined number of operations occur within a set period. Devices also have 'override' criteria to prevent system voltages from deviating out of a wider, pre-determined bandwidth. Override criteria has fewer limitations on the interval and number of operations.

c. Confirmed, the company screens for the potential incremental system impact of each interconnection.

d. Customers are required to fund system upgrades to mitigate potential disruption or instability caused by their interconnection. The Company's system modelling software allows it to model proposed interconnections and evaluate their effect on system conditions, including voltage. If disruptions can be handled by the Company's existing equipment, then no upgrade funding will be required prior to interconnection. If unacceptable effects are indicated, mitigating upgrades can be modeled and tested for effectiveness to identify the most practical and economical solution. Once a solution is identified, a magnitude estimate for the upgrade is developed and provided to the customer for them to determine if they wish to proceed with the interconnection as planned, discuss potential modifications with engineering to lessen costs, or abandon the application.

e. Regarding a customer with 200kW of rapidly fluctuating load:

   i. Denied, a rapidly shifting 200kW load may cause some 'hyper-local' changes in power flow, but a 200kW shift in load is unlikely to affect power flow on a system scale.

   ii. Denied, similar to subpart (i), a rapidly shifting 200kW load may cause some 'hyper-local' voltage impacts, affecting customers in their immediate area. Once this impact was identified, the customer would be required to make changes to mitigate these effects.

   iii. Confirmed, if a change in customer load causes a voltage disruption of sufficient magnitude to affect system voltage, installed voltage control devices will react to

stabilize voltage. As noted above, the customer may be required to make changes to mitigate ongoing voltage disruptions.

iv. There is little difference in system impact between a rapid change in a 200kW customer load and 200kW of PV generation; both situations may require corrective actions by the account and/or the operation of on-system control devices.

SP-II-5

Please reference Citizens' St. No. 4, p. 17. Has Citizens conducted any studies or analyses of the effects of this tariff change on Citizens' default procurement of electricity based on its Default Service Plan ("DSP")? If yes, please provide all studies or analyses related to the same.

Response Provided By:
Nathan Johnson, President & CEO

Date: June 30, 2025 (original)
July 14, 2025 (revised)

Response:

July 14, 2025 Revisions:
The Company has revised the attachments ("SP-II-5 Attachment A" and "SP-II-5 Attachment B") provided with the original response to SP-II-5, and made revisions to the response below, highlighted in yellow after identifying a data error related to the AC-to-DC ratio of the model PV systems used.

Original Response with July 14, 2025 Revision Incorporated:

Yes, the Company has analyzed the impact of net metered energy on default service costs in two different ways:

1) The direct cost of purchased net-metered energy compared to the cost of purchasing the same volume of energy through the DSP.

2) The potential for net-metered generation to mitigate PJM Capacity, Transmission, and RTEP costs.

The purchase cost analysis can be found in the attachment titled "SP-II-5 Attachment A (REV)." It contains several comparisons, summarized in the table below:

Comparison	Description	Result
400kW	400kW$_{AC}$ Roof Mount SPV w/ no offset load, standard PVWatts® roof-mount parameters	~$27,000 increase in GSSR-1 costs annually.
Ex + Prop >400kW	Expected net-metered export purchases of existing and proposed systems with ≥400kW rated output capacity	~$88,000 increase in GSSR-1 costs annually.

3000kW	3MW$_{AC}$ Rack Mounted Tracking (w/ Backtracking) SPV, premium panels, standard PVWatts® parameters	~$230,000 increase in GSSR-1 costs annually.

The analysis of PJM cost mitigation can be found in the attachment titled "SP-II-5 Attachment B (REV)." It contains a ten year history of PJM Capacity and Transmission peak hours and hourly outputs from the same PVWatts® studies used in Attachment A (REV). For nearly half of the past decade's PJM Capacity and Transmission Peak hours, SPV output from either model was 20% or less of rated capacity, demonstrating the limited ability of net-metered SPV to mitigate PJM costs.

Additionally, while no quantitative analysis has been performed, basic market principles suggest that as the total volume of energy purchased decreases, the price-per-unit will increase. In essence, as more energy is purchased from net-metered exports, less is purchased through the DSP wholesale contract. This lowers the 'buying power' of the DSP while concentrating non-volumetric (Company and supplier admin costs, Capacity, Transmission, and RTEP) costs across a smaller total quantity purchased, increasing the cost per MWh of default supply.

Finally, as purchased net-metered energy creates net under collection of GSSR costs under the existing structure (where the customer generator receives the GSSR-1 price regardless of the generator's size), the resulting reconciliation in future periods through the E-factor inflates the cost of default supply which, in turn, inflates the purchased cost of future-period net-metered energy purchases. In short, net-metered customer-generators directly benefit from the price inflation that they cause in a compounding fashion that increases as more net-metered generation is installed.

The Company concludes from its analysis that 1) net-metered generation exports result in a significant increase to default supply costs and 2) its proposed tariff change will mitigate these increases by shifting large exporters to the GSSR-2 rate and corresponding reimbursement formula.

REVISED

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

OCA-XV-1

Please refer to "Attachment A (Rev)" of Citizens' response to SP-II-5, specifically in the portion that states: "PJM costs substantially unaffected by net metered sales." Please explain the effect of net metered sales on PJM costs.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 4, 2025

Response:

The net effect of net-metered sales on PJM costs is better explained by SP-II-5 Attachment B which examines the coincidence of the output of two different hypothetical solar arrays with the Company's historical PJM peak hours for the past ten years. This analysis demonstrates both the low coincidence and high volatility of solar output with respect to peak hours. The company discounts potential savings in PJM Capacity and Transmission costs resulting from net-metered generation because:

1) Net-metered generation cannot be dispatched and is not required or incentivized to export during peak demand periods unless the energy crediting mechanism is the real-time locational marginal price (or another time-differentiated rate that accurately reflects real time conditions).

2) Beyond the lack of incentive to export during peak periods, GSSR-1 customer-generators that produce more than they consume on an annual basis actually benefit from high capacity and transmission prices that inflate the PTC rate they are reimbursed at, which disincentivizes participation during peak demand periods.

3) Net-metered generation, solar in particular, has a low demonstrated coincidence with peak demand periods.

4) Net-metered generation output during peak demand periods is highly volatile because of the influence of weather, seasonal availability, and the variation in seasons, days and times at which peaks occur.

REVISED

EXHIBIT KL-19

REVISED

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

OCA-XV-2

Please refer to "Attachment B (Rev)" of Citizens' response to SP-II-5, specifically the Average Output on Peak of 25.36%. Does this net metered generation reduce the load obligation driving PJM costs? If yes, how should this load reduction be incorporated in the analysis in response to SP-II-5?

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 4, 2025

Response:

Please see the Company's response to OCA-XV-1. The on Peak Output of net-metered generation may reduce load that determines the PJM obligations determining PJM costs. The Company does not believe it is appropriate to incorporate any capacity or transmission impact into its analysis, however, because net-metered generation does not guarantee those savings and is economically disincentivized to export during peak demand periods. Please note that a customer generator on the GSSR-2 rate would see the benefit of a zero transmission and/or capacity obligation if it successfully offsets its on-site consumption during the relevant PJM peaks.

REVISED

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-VI-17

Please explain excess generation exported from a behind-the-meter generator onto the Company's distribution system affects the Default Service Provider's supply obligation and the associated PJM settlement processes. In particular, please explain how excess generation from net metering customers affects the Load-Following Full Requirements contract(s) between the Company and it's Default Service Provider(s). To the extent that the answer varies between the GSSR-1 and GSSR-2 rate schedules, please discuss.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

The Company is the Default Service Provider in its territory. As explained in the Company's response to SP-VI-16, net-metered generation reduces the load delivered by Citizens' wholesale supplier at the delivery point, reducing the total MWh that the wholesale supplier is responsible to procure for the Company. The wholesale supplier schedules anticipated hourly default service load through the PJM scheduling process on a day-ahead basis. This day-ahead schedule is subsequently reconciled against actual volumes for Citizens' default service customers. The reconciliation includes multiple components. First, the total hourly metered values at the Citizens' Aggregate Bus are reduced by the metered volumes (plus distribution losses) for accounts that are served by Electric Generation Suppliers ("EGSs"). Second, Citizens' must account for any hourly energy exports from the Bucknell University Qualifying Facility under the Public Utility Regulatory Policies Act ("PURPA"). Finally, Citizens' uses hourly default service account metered usage to segregate the amounts between the GSSR-1 and GSSR-2 classifications.

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

SP-IV-13

Please provide the annual number of customers currently eligible for net metering, and the total exported kWh credited at retail rates, for each of the past three (3) years.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company of Lewisburg, PA

Date: August 25, 2025

Response:

The request, as stated, would be burdensome and irrelevant to proposals discussed in rebuttal testimony. The Company, instead, provides a 3-yr analysis of all monthly exports and energy-year-end credits provided to customer-generators.

The Table below provides the requested data for the most recent three available energy-years. Please note that the column titled "Total Monthly Net Exports" is the sum of all months for which a customer in that class *added* kWh to their bank. It does not account for hourly exports later consumed within the same billing period.

Year	Class	# Eligible	# Annual Exporters	Total Monthly Net Exports	EOY Banked kWh

EXHIBIT KL-22

REVISED

Pa. PUC v. Citizens' Electric Company
Docket Nos. R-2025-3054394

Interrogatories of Kelly Road Solar, LLC, Lancaster Avenue Solar, LLC, and Twilight Renewables, LLC (Solar Projects)
OCA Response to Solar Projects Set I

---

1. Please refer to OCA Statement 5R at 6, which contains a summary of the Company's argument as to why its proposed Billing Demand proposal is reasonable. Does OCA have an independent perspective of whether the Company's Billing Demand proposal is reasonable? If so, please provide OCA's perspective on this proposal.

In the recent UGI Electric Order[1], one of the contested issues involved a proposed methodology for assigning customers to different rates based upon supply peak load impact (SPLI).
In my opinion, the methodology approved by the PUC in the UGI Electric Order is generally similar to Citizens' proposal in this proceeding. In the UGI Electric Order, the Commission accepted UGI's reasoning that the "approach [would] better align larger net-metering customer-generators with larger customers that have similar grid impacts."[2] In my analysis of Citizens' proposal, I found the methodology to be reasonable for a similar reason, as it would ensure that the overall default service construct, including its rates and rate classification, would be designed efficiently. I addressed this in pages 9-10 of my rebuttal testimony.

2. Please refer to OCA Statement 5R at 9, which contains a summary of the Company's analysis performed in SP-II-5 Attachment A. Has OCA independently validated the quantitative approach used by the Company in this analysis? If so, did it find any deficiencies in the analysis or did it reach the same conclusion as the Company?

While I reviewed and evaluated the quantitative approach presented in SP-II-5 Attachment A, I did not independently validate the quantitative approach by reconciling/cross-checking monetary values and magnitude of costs. Based on my evaluation, the quantitative approach appears sensible, and I did not find the analysis to be deficient. Therefore, I found the direction of the conclusion in SP-II-5 Attachment A (cost comparison/deviation driven by "PJM costs [which would be] substantially unaffected by net metered sales") to be sensible.

3. Please refer to OCA Statement 5R at 12, which states "I take this statement to mean that the large customer-generator (output capacity > 400 kW) stands to benefit from higher prices caused by the risk premiums added to DSP suppliers to address their risks caused by unknown output quantities and attrition risk of large customer-generators."

   a. What is the basis for this assumption, and is it supported by any discovery responses

[1] *Petition of UGI Utilities, Inc-Electric Division for Approval of a Default Service Plan for the Period of June 1, 2025 though May 31, 2029*¸ Docket No. P-2024-3049343, et al (*UGI Electric Order*).
[2] UGI Electric Order, p. 4

provided by the Company?

My assumption is based on two documents.

First, see the following description of UGI's argument in the UGI Electric Order, p. 23:

> The Company determined that if large customer-generators were to be included in the GSR-1 group, then: (1) their output would decrease GSR-1 group load and tranche size; (2) there is substantial question as to the level of output and timing of when these projects will become operational; and (3) these large customer-generators have the ability to leave default service at any time and participate in the wholesale market, thereby creating an attrition risk if projects opt to leave GSR-1 service and shop their output elsewhere. UGI argued that each of these factors would substantially increase risk for wholesale suppliers, causing higher bid premiums and likely reducing the number of competitive bidders.[3]

Second, the response from Citizens to SP-II-5 provides:

> Additionally, while no quantitative analysis has been performed, basic market principles suggest that as the total volume of energy purchased decreases, the price-per-unit will increase. In essence, as more energy is purchased from net-metered exports, less is purchased through the DSP wholesale contract. This lowers the 'buying power' of the DSP while concentrating non-volumetric (Company and supplier admin costs, Capacity, Transmission, and RTEP) costs across a smaller total quantity purchased, increasing the cost per MWh of default supply.
>
> Finally, as purchased net-metered energy creates net under collection of GSSR costs under the existing structure (where the customer generator receives the GSSR-1 price regardless of the generator's size), the resulting reconciliation in future periods through the E-factor inflates the cost of default supply which, in turn, inflates the purchased cost of future-period net-metered energy purchases. In short, net-metered customer-generators directly benefit from the price inflation that they cause in a compounding fashion that increases as more net-metered generation is installed.[4]

The above passages informed my assumption. In the Company's response above, the Company concludes their discussion of uncertainty and market principles by noting "price inflation" after a detailed outline of the cause and effect of under-collection driven by purchased net-metered energy. Given this, I found the statement to be generally comparable to the "bid premium" discussion in the UGI Electric Order.

[3] PA PUC Opinion and Order, p. 23
[4] Citizens' Response to SP-II-5, p. 2

b. Has OCA performed any analysis or research on whether suppliers have included an additional risk premium in their bids when participating in the default service procurement auctions? If so, please provide all such analysis or research.

No, for the following reasons: (1) the OCA is not permitted to see bid details such as these following the completion of default service procurement auctions; and (2) given this lack of information, no further analysis on risk premiums was performed. A qualitative evaluation is provided in my testimony.

4. Please refer to OCA Statement 5R at 15, which states "Mr. Nolt may be overstating the impact of the proposed Billing Demand methodology on customer-generator compensation."

a. Is OCA disputing the calculations that Mr. Nolt provided in his testimony, or does this sentence refer to the lack of clarity on how the Company will compensate customer-generators for excess generation? If the former, please provide all analysis that OCA performed disputing Mr. Nolt's calculations.

This sentence refers to the latter: the lack of clarity on how the Company will compensate customer-generators for excess generation.

5. Please refer to OCA Statement 5R at 16, lines 7-11, discussing the proposed Billing Demand methodology's impact on residential customers with DER.

a. Does OCA believe that commercial customers with behind-the-meter DERs could be impacted by the Company's Billing Demand proposal?

Yes, commercial customers with behind-the-meter DERs could be impacted depending on the output capacity of their DER.

b. If the answer to a) is yes, please provide OCA's position on the impact of the Company's proposed Billing Demand methodology on commercial customers with DERs.

I believe that the Company's Billing Demand proposal could be impactful to these commercial customers. Some customers will be deemed GLP-1 based on the buildings on their premises and might be applied the GSSR-2 rate based on their electricity usage or if the output capacity of their associated DER is greater than 400 kW. If this is the case, aligning the management of supply for this block of larger retail customers alongside a block of larger customer generators should be more

AND EXHIBITS

OF

HOWARD S. GORMAN

ON BEHALF OF

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

APRIL 30, 2025

BEFORE

THE PENNSYLVANIA PUBLIC UTILITY COMMISSION

Pennsylvania Public Utility Commission	**:**	
	:	
v.	**:**	**Docket No. R-2025-_____**
	:	
Citizens' Electric Company of Lewisburg, PA	**:**	

DIRECT TESTIMONY OF HOWARD S. GORMAN
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name, occupation and business address.

A. My name is Howard Gorman. I am the President of HSG Group, Inc., a consulting firm specializing in utility rate and regulatory matters, located in Great Neck, NY.

Q. Please summarize your educational background and professional experience.

A. My educational background, professional experience and summary of testimony are outlined in Attachment A.

Q. Please state on whose behalf you are testifying and describe the purposes of your testimony.

A. I am testifying on behalf of the petitioner, Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company"). The purposes of my testimony are:

- To develop the Fully Projected Future Test Year ("FPFTY") Revenue Requirement and Rate Base, and Future Test Year ("FTY") net income, based on Historic Test Year ("HTY") data and appropriate adjustments;
- To present the allocated class cost of service study that I performed; and

- To present the Company's proposed revenue allocation and the proposed Rates and Charges that produce the overall revenue requirement and the class revenue targets, and the proof of revenue and bill comparisons at the proposed rates.

The rates proposed in this filing are for the FPFTY; the FPFTY Revenue Requirement and Rate Base were determined for distribution only. Revenue and costs related to Citizens' Generation Supply Service Rate ("GSSR") were excluded from the analysis.

References in my testimony are to *Exhibit __ (HSG-1)*; for example, *Schedule C1* refers to *Exhibit __ (HSG-1), Schedule C1*.

In my testimony, dollar amounts (excluding rates and charges) are rounded to the nearest thousand dollars; in computing revenue requirements and rates, whole dollars are used.

Q. What FPFTY, FTY and HTY were used?

A. The HTY is Citizens' actual results for calendar year 2024. The FTY is Citizens' forecast for 2025 and the FPFTY is Citizens' forecast for 2026. Citizens' uses a calendar year for financial reporting.

When will the new rates take effect?

A. If the Commission suspends the filing for the statutory period, then the rates will take effect on January 30, 2026; however, the rate changes could be effective sooner if the Commission doesn't suspend the filing or if the parties reach a settlement that includes an accelerated effective date and that settlement is approved by the Commission.

Q. Is the presented FPFTY consistent with the Commission's revised regulations for rate cases using a FPFTY?

A. Yes. Earlier this year, the Commission adopted revised regulations for Sections 53.51-53.56 that are pending before the Independent Regulatory Review Commission, with final

action expected soon after the Company submits this filing. The revised regulations contain the following definition of FPFTY:

> A 12-consecutive-month period beginning with the first month that the new rates will be in effect after application of the full suspension period permitted under section 1308(d) of the Public Utility Code, 66 Pa.C.S. § 1308 (relating to voluntary changes in rates) and reflecting estimated results of operations of the public utility.

Q. Please summarize the results of your testimony regarding Citizens' revenue requirement.

A. Under its present rates, Citizens' is forecast to have Net operating income of approximately $250,000 in FPFTY 2026, a return on rate base of 1.46%. To produce the return of 8.49% that Company witnesses Mr. D'Ascendis and Mr. Kucan recommend, requires an increase in revenue of $1,795,000, an increase of 29.6% in Distribution revenue. This equals an increase in total revenue (distribution and supply) of 11% of Citizens' 2024 total revenue. The revenue produced by the proposed rates in the FPFTY, $7,849,000 (plus $104,000 Other revenue, for total distribution revenue of $7,953,000) would recover Citizens' forecast costs in the FPFTY, and provide return on rate base of 8.49% (Schedule C1).

Q. Please summarize the purpose and results of the allocated class cost of service study.

A. The purpose of an allocated class cost of service study ("ACOS") is to assign, on a cost-causation basis, the total distribution revenue requirement among the rate classes. The results of Citizens' ACOS are presented on Schedule E-1. This schedule shows, for each rate class, FPFTY net income at present rates (line 7), return on rate base at present rates (line 11), the revenue requirement to produce a return of 8.49% (line 13) and the increase or decrease in revenue to achieve the class revenue requirement (line 28). The Company

used the results of the ACOS to allocate the proposed increase among customer classes to move the classes closer to the cost-to-serve as indicated in the ACOS.

Q. Please summarize the proposed revenue allocation and rate design.

A. The Company's proposed revenue target for each class is presented on Schedule B6-4, line 24, and the proposed increases are on line 36. This schedule also presents other information about the increase, which I discuss later in this testimony.

The Company's proposed rates are presented on Schedule B6-3, lines 12-21, and also on Schedule B7. Schedule B6-3 demonstrates that the proposed rates produce the class revenue targets (compare lines 29 and 30; differences due to rounding).

Q. Please describe the approach used to develop Citizen's revenue requirement and proposed rates.

A. *First*, the FTY and FPFTY forecast of sales and distribution revenue was developed. Information about HTY sales and revenue was obtained from Citizens' financial records. Summary information on sales and revenues is presented in Schedule B. Information for HTY 2024 is on Schedule B1, with computations on Schedule B1-1. Schedule B4 presents a reconciliation of HTY 2024 revenue to Citizens' financial statements. Sales and revenue for FTY 2025 is on Schedule B2, with computations on Schedule B2-1. Sales and revenue for FPFTY 2026 is on Schedule B3, with computations on Schedule B3-1.

Second, costs were obtained for the HTY, and forecasted costs were obtained for the FTY and FPFTY. These costs, detailed by account, are presented on Schedule C1-1.

Third, the Rate Base for the HTY, FTY and FPFTY was developed, using information for the HTY, projected capital expenditures for the FTY and FPFTY and computing annual depreciation expense. In addition, accumulated deferred income taxes, cash working

capital allowance and other rate base components were computed. These computations are shown on Schedule C1-5.

Fourth, the required Net Utility Operating Income was developed using the FPFTY costs and rate base, and the required rate of return developed by Mr. D'Ascendis and Mr. Kucan, 8.49%. FPFTY revenue of $7,953,000 (including Other revenue) is needed to produce the 8.49% rate of return. These results are presented in Schedule C1, which also shows the rate of return for the HTY, FTY and FPFTY at present rates.

Fifth, the ACOS (presented in Schedule E) was performed to develop the share of the total revenue requirement attributable to each rate class.

Finally, proposed rates were developed that produce the required FPFTY revenue. The proposed rates are shown on Schedules B6-3 and B7. The amounts that typical ratepayers can expect to pay under the proposed rates are compared to the amounts they would pay under the present rates on Schedule B8 (including the present GSSR rate), Schedule B8-1 (excluding GSSR) and B8-2 (including the proposed GSSR rate effective June 1, 2025.). Schedule B6-3 demonstrates that the proposed rates produce the required revenue (compare lines 29 and 30).

Q. What are the reasons that Citizens' needs an increase in rates at this time?

A. Schedule C5-1 presents the financial drivers for the requested rate increase by comparing the FPFTY to the final results of Citizens' prior rate case, Docket R-2022-3032692. The increase is driven by increased costs and capital expenditures. The Company's internal witnesses will discuss this in more detail.

Q. What service classifications does Citizens' use to report sales and revenue?

A. Citizens' reports sales and revenue using the following service classifications:

Residential	• Schedule RS- Residential
Commercial and Industrial	• Schedule GLP1 – General Light and Power Service • Schedule GLP3 – General Light and Power Service • Schedule SH – Space Heating
Lighting	• Schedule MBL – Municipal Boulevard Lighting • Schedule OL – Outdoor Lighting

Q. What types of charges are in the current Tariff?

A. *Schedule RS* rates include a fixed monthly charge, a volumetric (kWh-based) distribution charge and the volumetric GSSR charge.

Schedule SH rates include a fixed monthly charge, a volumetric (kWh-based) distribution charge and the volumetric GSSR charge.

Schedule GLP-1 rates include a fixed monthly charge, a volumetric (kWh-based) distribution charge, a demand (kW-based) charge and the GSSR charge, which may be the GSSR-1 (volumetric) or the GSSR-2 (volumetric and demand components). The demand charge is the greater of 1) actual demand for the month based on the highest 15-minute interval and 2) 50% of the maximum billed demand in the previous 11 months.

Schedule GLP-3 rates include a fixed monthly charge, a volumetric distribution (kWh-based) charge, a demand (kW-based) charge and the GSSR charge, which may be the GSSR-1 (volumetric) or the GSSR-2 (volumetric and demand components). The volumetric distribution charge has two blocks, with the first block comprised of 30 kWh times the customer's billed demand for the month. The demand charge is the greater of 1) actual demand for the month based on the highest 15-minute interval and 2) 50% of the maximum billed demand in the previous 11 months. Some GLP-3 customers are also subject to a reservation charges and / or a high voltage discount.

Schedule MBL rates include fixed monthly charges based on the number of meters (installations) and the number of lamp posts, plus the volumetric GSSR charge.

Schedule OL rates are fixed monthly charges per lamp and the volumetric GSSR charge.

All customers are billed monthly.

Q. Is the Company proposing any rate structure changes?

A. No, the Company is not proposing any rate structure changes.

HTY INFORMATION

Q. Please identify and describe the exhibits that show HTY sales and revenue.

A. Schedule B shows total revenue by customer type for HTY 2024, and distribution-only revenue for HTY 2024, FTY 2025 and FPFTY 2026. HTY total revenue is $16,378,000 based on Citizens' financial records. The HTY distribution-only amounts equal the total revenue amounts minus GSSR revenue. The HTY total revenue amounts are from Schedule B1, which is supported by detailed computations on Schedule B1-1, using present rates and HTY billing units. The billing units are sales in kWh, numbers of customer bills and demand in kW.

Q. Please describe the HTY information regarding costs.

A. Schedule C1-1 shows the details of operating expenses for the HTY. This exhibit is described in detail later in my testimony.

Q. Please describe the HTY information regarding rate base and Rate of Return.

A. Schedule C1-5 computes the rate base for the HTY. Schedule C1 shows the return on rate base for the HTY 2024 was 5.27% for distribution-only.

FTY AND FPFTY SALES AND REVENUE

Q. Please identify and describe the exhibits that show FTY 2025 and FPFTY 2026 sales and revenue at present rates.

A. Information on sales and revenue is presented in Schedule B. The computation of revenue on these schedules reflects the rates in effect December 31, 2024. In this testimony, "sales" measures kWh delivered.

Information for HTY 2024 is on Schedule B1, with computations on Schedule B1-1. Sales were approximately 151 million kWh, with approximately 295,000 kW billed demand.

The FTY 2025 and FPFTY 2026 sales forecasts, including number of customers, kWh and kW demand, were developed separately for each rate class.

Schedule RS Residential reflects average kWh per customer over 2020-2024, times average number of customers in 2024, plus expected growth of 25 customers in FTY 2025 and another 25 in FPFTY 2026.

Schedule SH Space Heating reflects the class average kWh per customer over 2020-2024, with no change in number of customers.

Schedule GLP-1 reflect the class average kWh per customer over 2020-2024, with no change in number of customers and no change in billed demand.

Schedule GLP-3 reflects the class average kWh per customer over 2020-2024 for existing customers, plus expected growth of 1 customer in FTY 2025 with associated additions of kWh and billed demand, and no further changes in FPFTY 2026.

Schedules MBL and *OL* reflect the customers and usage in 2024; HPS lamps have been replaced with LED over the years, therefore 2024 usage is more representative of future usage than using the historic average.

Forecast FTY 2025 sales are approximately 161 million kWh (Schedule B2-1, line 51) and distribution revenue at present rates is $6,038,000 (Schedule B2-1, line 29).

Forecast FPFTY 2026 sales are approximately 162 million kWh (Schedule B3-1, line 53), and distribution revenue at present rates is $6,055,000 (Schedule B3-1, line 29).

FTY AND FPFTY COSTS

Q. Please list the types of costs included in FTY and FPFTY costs.

A. FTY and FPFTY costs include Operating and Maintenance costs ("O&M") and Non-operating costs. O&M costs include Purchased Electricity, Distribution expenses, Customer accounting and collection expenses and Administrative & General expenses. Non-operating costs include Depreciation expense, Taxes other than income and Income tax expense.

Q. How did you develop the FTY and FPFTY O&M costs?

A. HTY actual O&M costs, totaling $13,866,000, are summarized on Schedule C1, line 17. Schedule C1-1 shows the detail of O&M costs by account for 2023 and HTY 2024 (actual) and for FTY 2025 and FPFTY 2026 (forecast). The costs are carried forward to Schedule C1. Schedule C1-1, lines 41-46, presents a summary of costs by type (labor, overhead, transportation, materials).

The Labor portion of each O&M account is also shown on Schedule C1-1.

The HTY, FTY and FPFTY costs are summarized and carried forward to Schedule C1.

Q. How was Depreciation expense computed for each year?

A. Schedule C3, page 1, shows the asset values at original cost in PAPUC / FERC account detail as of December 31, 2023, actual additions and retirements in HTY 2024, and planned additions for FTY 2025 and FPFTY 2026.

Schedule C3, page 2, shows the depreciation rate applicable to each account, and depreciation expense for each year. The annual depreciation expense for each asset account was computed by multiplying X) the depreciation rate for the asset account times Y) original cost at prior year end plus one-half of the additions for the year. The total FPFTY depreciation expense, less the amount charged to clearing accounts and recovered in O&M costs, is $1,410,000; this amount is carried forward to Schedule C1.

Schedule C4 shows the Reserve for Depreciation at the ends of the HTY, FTY and FPFTY.

Q. How did you compute Taxes other than income for FTY 2025 and FPFTY 2026?

A. Schedule C1-3 shows the components of Taxes other than income.

The Pennsylvania Use Tax and the PUC Assessment are assumed to be the same in FTY and FPFTY as in HTY. The Public Utility Realty Tax is assumed to change in relation to Net plant. The Pennsylvania Gross Receipts Tax ("GRT") is computed by applying the tax rate of 5.90% to the applicable revenue for each year.[1] The FTY and FPFTY totals are carried forward to Schedule C1.

Q. How did you compute Rate case expense amortization?

A. Rate case expense amortization reflects normalized rate case expense. Expenses for the pending rate case, if fully litigated, are estimated at $327,000 and a three-year normalization period was determined to be reasonable, starting January 1, 2026 (the start of the FPFTY). The computation is shown on Schedule C1-3 and the result is carried forward to Schedule C1-1, Account 928 (line 34), Regulatory Commission Expense.

Q. How did you compute the FTY and FPFTY Income tax expense?

A. Income tax expense for the FTY and FPFTY is computed on Schedule C1-4.

[1] The effective tax rate is calculated using the 59 mills GRT.

Net operating income before income taxes (line 1), is from Schedule C1, line 25.

Synchronized interest expense (lines 3-8) is computed by multiplying rate base (Schedule C1, line 30) by the weighted cost of debt (Schedule C1-2).

Taxable income before depreciation tax adjustments (line 9) is equal to Net operating income before income taxes less Synchronized interest expense.

Regulatory Pennsylvania taxable income and Regulatory Pennsylvania tax expense are computed using the Full flow through method; that is, tax depreciation is used in the computation. The Pennsylvania depreciation adjustment (lines 11-14) reflects the depreciation expense on Citizens' Pennsylvania tax return and is computed using the double declining balance method applied to tax basis and tax life (just as on the tax return). Regulatory Pennsylvania taxable income (line 15) is equal to Taxable income before depreciation tax adjustments as adjusted by the Pennsylvania depreciation adjustment. Regulatory Pennsylvania income tax expense (line 16) is equal to Regulatory Pennsylvania taxable income times the statutory 9.99% rate.

Regulatory Federal taxable income and Regulatory Federal tax expense are computed using a modified Full flow through method; that is, a modified tax depreciation amount is used in the computation. The Federal depreciation adjustment (lines 19-21), reflects straight line depreciation applied to tax basis and tax life. Federal taxable income (line 26) is equal to Taxable income before depreciation tax adjustments as adjusted by the Federal depreciation adjustment and less Regulatory Pennsylvania tax expense. Regulatory Federal income tax (line 27) is equal to Regulatory Federal taxable income times the statutory 21% rate.

Regulatory Total income tax expense (line 29) is equal to Regulatory Pennsylvania income tax expense plus Regulatory Federal income tax expense, and is carried forward to Schedule C1, line 27.

Q. Does the computation of income tax expense included in the revenue requirement comply with Act No. 40 of 2016, which amends the Public Utility Code regarding the treatment of income tax expense for ratemaking purposes?

A. Yes. The computation of income tax expense for ratemaking purposes, presented on Schedule C1-4 (i.e., in the revenue requirement), reflects a tax deduction for each item of expense of investment (i.e., depreciation expense) in the revenue requirement. In addition, there are no items that reduce the income tax expense for ratemaking purposes, or increase the deferred tax liability, other than reflected in the revenue requirement.

Q. Did you compute the Net Utility Operating Income and Return on Rate Base at present rates?

A. Yes. Schedule C1, line 28 and Schedule C5, line 14 show Net Utility Operating Income at Present Rates for the HTY, FTY and FPFTY. Schedule C1, line 31 shows Return on Rate Base for distribution-only at present rates of 5.27% for HTY 2024, 3.48% for FTY 2025 and 1.46% for FPFTY 2026.

RATE BASE FOR THE FTY AND FPFTY

Q. How did you develop the Rate Base?

A. The Rate Base at the end of the HTY, FTY and FPFTY is presented in Schedule C1-5. Schedule C3, page 1, shows the asset values at original cost in PAPUC / FERC account detail at December 31, 2023, actual additions and retirements in HTY 2024, and planned additions for FTY 2025 and FPFTY 2026. Annual depreciation expense is computed as

stated above. Accumulated depreciation at each year-end is computed by adding annual depreciation expense, and subtracting retirements, to the prior year-end balance.

The amounts in Rate Base for Customer Deposits and Materials and Supplies, were taken from the Balance Sheets for the HTY, FTY and FPFTY presented in Schedule C2. The HTY information is from Citizens' financial statements at December 31, 2024. These items were estimated to be the same for the FTY and the FPFTY as for the HTY.

The rate base includes a reduction for Accumulated Deferred Income Taxes ("ADIT"), equal to the difference between Accumulated depreciation based on X) Depreciation used to compute the Federal tax expense borne by ratepayers (i.e., using straight line method discussed above) and Y) Depreciation used to compute Citizens' actual tax Federal tax expense (i.e., based on double declining balance method), times the current Federal income tax rate. The ADIT is computed on Schedule C1-5, lines 27-32 and carried up to line 6.

The rate base includes a reduction for Accrued Pension / OPEB liability, reflecting the excess of amounts charged to expense over amounts paid (Schedule C1-5, lines 42-47, carried up to Schedule C1-5, line 9).

Cash Working Capital was determined by using the widely-accepted formula of 1/8 of non-fuel cash operating costs (Schedule C1-5, lines 15-25, carried up to line 12).

The total Rate Base, Schedule C1-5, line 13, is carried forward to Schedule C1, line 30.

NET UTILITY OPERATING INCOME

Q. What revenue is included in the distribution revenue requirement?

A. The revenue requirement includes:

- Electric operating revenue: Revenue from distribution of electricity, including exchange with other utilities.

- Other Revenue: Other revenue includes Forfeited Discounts (late payment charges), Revenue from rental of electric property and Miscellaneous revenue.

The revenue requirement excludes Unbilled Revenue, because the FPFTY is fully normalized, and GSSR Revenue, because this is a distribution-only rate case.

Q. What is the distribution revenue requirement for the FPFTY?

A. FPFTY forecast revenue at present rates (including Other revenue) is $6,159,000. The FPFTY revenue required to produce Mr. D'Ascendis' and Mr. Kucan's recommended rate of return of 8.49% is $7,953,000. Citizens' is requesting a revenue increase of $1,795,000, to produce total revenue of $7,953,000. See Schedule C1, line 10.

Q. What rate of return on rate base did Mr. D'Ascendis and Mr. Kucan recommend?

A. They recommend a return of 8.49%. The revenue required (including Other income) to produce this return is $7,953,000, and the Company's proposed rates produce this revenue.

ALLOCATED CLASS COST OF SERVICE STUDY

Q. Please briefly describe the purpose of an allocated class cost of service study.

A. The purpose of an allocated class cost of service study ("ACOS") is to assign, on a cost-causation basis, the total distribution revenue requirement of a utility among the rate classes in its Tariff. In performing the ACOS, each of the utility's costs of providing service is analyzed, in order to assign or allocate the costs among the rate classes, so that the utility can establish rates that ensure, subject to assumptions such as delivery volumes and customer counts, that it recovers its costs in full from each class.

Q. What are the guiding principles in performing an ACOS?

A. The essential element in performing an ACOS is the selection of allocators based on causal relationships between customer demands, load profiles and usage characteristics on one hand, and the costs incurred by the Company to meet those requirements on the other hand. The primary goals in selecting allocators are:

1. recognition of **cost causality** as opposed to **value of service**;
2. **stability** of results over time;
3. logical **consistency** and **completeness**; and
4. ease of implementation.

Q. What rate classes are included in Citizens' ACOS?

A. The rate classes included in Citizens' ACOS are Schedule RS- Residential; Schedule GLP1 - General Light and Power Service; Schedule GLP3 - General Light and Power Service; Schedule SH - Space Heating; Schedule MBL - Municipal Boulevard Lighting and Schedule OL – Outdoor Lighting.

Q. Please summarize the approach you followed in preparing Citizens' ACOS.

A. The most critical task in performing an ACOS is establishing relationships between customer demands, load profiles and usage characteristics on one hand, and the costs incurred to meet those requirements on the other hand. This requires an understanding of the utility system design and its relationship to the characteristics of the customers it is designed to serve. Citizens', like most utilities, designs its electric distribution system to meet three primary objectives:

1. To extend distribution services to all customers;

2. To deliver the aggregate peak demand for electricity of all firm delivery customers; and

3. To deliver electricity to customers throughout the year.

The allocation of costs in a class cost of service study must recognize these ***cost-causative*** characteristics of the utility's plant investments and operating expenses. A cost of service study should objectively reflect cost-causation factors and should not be influenced by end-results or other revenue allocation and rate design considerations.

Citizens' ACOS follows the traditional three-step process: 1) *functionalization* of rate base and costs; 2) *classification* of functionalized costs as demand-related, commodity-related or customer-related; and 3) *class allocation* of the functionalized, classified costs among the rate classes.

Q. Are there are changes from the methodology used in Citizens' last rate case, Docket R-2022-3032692?

A. No, the methodology is the same.

Q. What functions are reflected in the ACOS?

A. The Citizens' ACOS includes the following functions:

Primary Distribution - Designed to move power from the transmission system to the Secondary Distribution system; includes substations as well as conductors operating primarily at voltages of over 600V up to and including 12 kV, and related assets.

Secondary Distribution - Designed to move power from the Primary Distribution system to customers' premises; includes services.

Billing - Includes meter as well as assets and activities related to enabling the distribution of electricity to customers, and billing and collecting revenue.

Citizens' does not own any transmission-voltage facilities of over 12 kV.

Q. Please describe the classification step of an ACOS.

A. In the **classification** step, the previously functionalized assets and costs are separated according to the system design or operating characteristics that cause those costs to be incurred in the first instance. Each asset and cost is determined to be incurred to serve **customers**, to deliver the electricity or **commodity** year-round or to meet peak **demand** including coincident and non-coincident peaks ("NCPs").

Customer related costs are the costs incurred to attach a customer to the distribution system, to meter usage and to maintain the customer's account. Customer costs are a function of the number of customers served and continue to be incurred whether or not the particular customer uses any electricity. They include capital costs associated with services and meters, and operating costs such as customer service, field service, billing and accounting expenses.

Commodity related costs are those costs that vary with the quantity of electricity delivered throughput sold to, or transported for, customers. These costs include purchased electricity costs and related costs.

Demand, or **capacity**, related costs are associated with plant that is designed, installed and operated to meet peak usage. Distribution assets are designed to meet the peak loads of the particular customers they serve.

Q. Please describe the class allocation step of an ACOS.

A. In the **class allocation** step, the functionalized, classified costs are allocated among the rate classes, based on causal relationships with the utility's system design and operations, its accounting records and its system and customer usage and load data. Based on the analyses

of cost relationships, each plant and cost item in the rate base and revenue requirement is directly assigned to a rate class, or an allocator is selected to apportion the item.

Q. Please explain the term "direct assignment."

A. The term "direct assignment" means identifying plant investments or costs incurred exclusively to serve a specific customer or group of customers. Direct assignments best reflect the cost-causation of serving individual customers or groups of customers and should be used whenever the data are available.

Q. In a typical ACOS are most costs directly assigned, or are most costs allocated?

A. Most costs must be allocated, because utility operations are characterized by common facilities. In addition, direct assignments require detailed information which may be unavailable or require a great deal of time to prepare. The assets and costs that cannot be directly assigned are distributed among the rate classes using allocation factors.

Q. Please explain how allocators are derived.

A. Two types of allocators are typically used in performing an ACOS: external allocators and internal allocators. *External allocators* are based on special studies derived from the utility's accounting and other records. Examples of external allocators are number of customers and NCPs. Schedule D lists the external allocators used in the ACOS, and Schedules D1 through D6 show the development of the external allocators.

Internal allocators are based on some combination of external allocators, previously directly assigned costs and other internal allocators. For example, the allocator for property insurance costs is based on plant investment amounts assigned to components of the rate base; as a result, it is necessary to compute the rate base before property insurance costs

can be allocated. Both external and internal allocators are used in functionalization, classification and class allocation.

Q. What is the rate base and how is it used in the ACOS?

A. The rate base is the cost, net of accumulated depreciation, of Citizens' investment in plant and other assets used to serve customers. The FPFTY rate base is $17,092,000 (Schedule C1 and Schedule C1-6). Citizens' is requesting an increase of $1,795,000, which will produce a return on rate base of 8.49%, as discussed above. The ACOS allocates the rate base (and return of 8.49%) among rate classes.

Q. What are the major components of Citizens' rate base?

A. The major categories in Citizens' rate base are:

- Distribution plant
- Intangible plant
- General plant
- Depreciation reserve
- Other rate base items

Q. How was distribution plant functionalized, classified and allocated among the rate classes?

A. Distribution plant comprises:

Land and Land Rights and Stations Equipment were functionalized to Primary Distribution, classified as demand and allocated among the rate classes using the NCP-Primary allocator.

Poles, Towers and Fixtures; Overhead Conductors and Devices; Underground Conduit; Underground Conductors & Devices were functionalized between Primary and Secondary based on circuit miles / lines miles (Schedule D1, lines 1-28).

The Primary portion was classified as demand-related and allocated among the rate classes using the NCP- Primary allocator.

The Secondary portion was classified between customer-related and demand-related using a zero-load analysis. The portion of total installation costs that are labor-related (i.e., all costs except material) were classified as customer-related, and the balance as demand-related (Schedule D1, lines 29-34, equal to the averages over the current and four prior rate cases). The zero-load component of the Secondary system represents the cost of extending service to all customers, without regard to peak or average load, and is therefore customer-related. The assets and costs functionally classified to Secondary-customer were allocated among the rate classes based on number of customers served at Secondary voltages. The assets and costs functionally classified to Secondary-demand were allocated using the NCP- Secondary allocator.

Line Transformers were functionalized to Secondary and classified between customer-related and demand-related using a minimum size analysis (Schedule D3). The minimum size was determined to be a 50 kVA transformer serving four customers, or one-fourth of a 50 kVA transformer. The minimum size portion was classified as customer-related and allocated among the rate classes based on number of customers served at Secondary voltages. The balance of costs were classified as demand-related and allocated using the NCP-LTr allocator, which is the NCP-Secondary allocator reduced by the load-carrying capacity of the minimum size transformers (Schedule D2, lines 26-38).

Services connect individual customers to the system, and were functionalized to Secondary, classified as customer-related and allocated based on total replacement cost for each class (Schedule D4). Total replacement cost of Services for a class was computed as X) estimated replacement cost of a typical service for the class times Y) number of customer locations in the class.

Meters were functionalized to Billing, classified as customer-related and allocated based on total replacement cost for each class (Schedule D5). Meter costs include CT (current transformers) and PT (Potential transformers). Total replacement cost of Meters for a class was computed as X) estimated replacement cost of meters for the class times Y) number of customers in the class.

Street Lighting and Signal Systems were functionalized to Secondary Distribution, classified as customer-related and directly assigned to Lighting.

Q. What is the NCP-Primary allocator and how was it developed?

A. The NCP-Primary allocator (or "NCP-Prim") is used in the ACOS to allocate, among the rate classes, the assets and costs that are functionalized to Primary distribution. To compute the NCP-Prim allocator, the NCP was determined for each class, for years 2015 and 2018-2024. In each year, each class' share of the sum of all class NCPs was computed. The NCP-Prim allocator for each class is the average of the class' annual shares.

To compute annual NCP, Citizens' provided hourly data for each class, for 2018-2024, and the NCP's were determined for each year. Information for 2015 is from a prior rate case (Docket R-2016-2531550). For SH and MBL, 2024 shares of NCP were used because 1) SH has had significant changes in number of customers and 2) MBL has had significant changes in kWh due to using energy-efficient LED lights.

NCP-Prim computations are presented on Schedule D2, lines 1-20. In computing the NCP-Prim allocator, metered values were used.

Q. What is the NCP-Secondary allocator and how was it developed?

A. The NCP-Secondary allocator (or "NCP-Sec") is used in the ACOS to allocate, among the rate classes, the assets and costs that are functionalized to Secondary distribution and classified as demand-related, except for Line Transformers (and assets and costs that include Line Transformers).

The NCP-Secondary allocator value for each rate class was computed by removing from the NCP-Prim allocator, customers served at Primary voltages. The computations are shown on Schedule D2, lines 22-24.

Q. What is the NCP-Line-Transformer allocator and how was it developed?

A. The NCP-Line-Transformer allocator (or "NCP-LTr") is used in the ACOS to allocate among the rate classes the cost of Line Transformers that are functionalized to Secondary distribution and classified as demand-related. It represents the demands on the Secondary distribution system in excess of the minimum system and is equal to the NCP-Secondary allocator values, minus the load-carrying capacity of the minimum size transformers (Schedule D2, lines 26-38).

Q. How was General plant functionalized, classified and allocated among rate classes?

A. General plant includes primarily Structures and improvements, Office furniture and equipment, Computers and Communications equipment, as well as other assets. These assets were functionalized, classified and allocated among rate classes based on direct labor content of operating expenses, reflecting the nature of the assets and common cost of service practice.

Q. How was Accumulated Depreciation functionalized, classified and allocated among rate classes?

A. Each component of the Depreciation reserve was functionalized, classified and allocated among rate classes in the same ratio as the related assets.

Q. How were other Rate Base Items functionalized, classified and allocated among rate classes?

A. Other Rate Base Items were functionalized, classified and allocated as follows:

Cash Working Capital represents Citizens' need for cash to keep the business running until revenues are collected to pay costs. This item was functionalized, classified and allocated in proportion to operating expenses.

Materials and Supplies was functionalized, classified and allocated in proportion to operating expenses.

Customer Deposits were directly assigned between Residential and Non-residential, then allocated based on revenues (Schedule D6).

ADIT was functionalized, classified and allocated in proportion to plant in service.

Accrued Pension/OPEB Liability was functionalized, classified and allocated in proportion to labor content of O&M expense accounts.

Q. What are the major categories of Citizens' costs?

A. The major cost categories in Citizens' cost of service are:

- Distribution operating and maintenance expenses
- Customer accounts and service expenses
- Administrative and general expenses
- Depreciation expense

- Tax expense, other than on income
- Income tax expense

Q. In determining how to treat these costs in the ACOS, was any other important category of costs considered?

A. Yes, labor costs affect most of the cost categories because many costs are assigned based on the direct labor content of other costs. For example, Administrative & General Salaries, Account 920, is allocated among rate classes based on the direct labor content of operating expense accounts. To perform these allocations, the direct labor content of each cost account was provided by Citizens', and appropriate allocators were developed.

Q. What costs are included in distribution operating and maintenance costs and how were they functionalized, classified and allocated among the rate classes?

A. Citizens' distribution operating and maintenance costs includes operating and maintenance costs for its distribution system including stations; poles, towers and fixtures; overhead and underground conductors and related equipment; meters; line transformers; lighting; and other assets. Each cost was analyzed to determine which assets it was incurred to operate or maintain, and the cost was functionalized, classified and allocated among rate classes in the same manner as those assets. For example, Miscellaneous distribution expenses, Account 588, relates to the Overhead and Underground assets, and was functionalized, classified and allocated in the same manner as Overheard Conductors and Devices, and Underground Conduits and Conductors.

Q. What costs are included in customer accounts and service expenses and how were they functionalized, classified and allocated among the rate classes?

A. Customer-accounts costs includes primarily meter-reading expenses, customer records and collection expenses and uncollectible-accounts expense. These costs were functionalized to Billing and classified as customer-related.

Meter Reading Expenses were allocated among the rate classes in proportion to Meter costs.

Customer Records and Collection Expenses includes activities for billing, call center, payment processing, recoveries and service initiation / termination, and were allocated based on the number of customers.

Uncollectible Accounts Expense was directly assigned between Residential and Non-residential based on Citizens' historic data, then allocated among the specific rate classes based on revenues (Schedule D6).

Q. How were Administrative and General expenses functionalized, classified and allocated among rate classes?

A. Administrative and General ("A&G") expenses comprises the following:

A&G salaries, Office supplies and expense, and Employee benefits were functionalized, classified and allocated among rate classes based on labor content of the operating and maintenance and customer accounting costs. Most Employee benefits costs are included in the O&M and customer accounting accounts, and not in A&G costs.

Property Insurance, Injuries and Damages and Maintenance of General Property were functionalized, classified and allocated based on plant costs.

Outside Services and Miscellaneous General Expenses were functionalized, classified and allocated based on a 50/50 weighting of labor and plant costs.

Regulatory Commission Expenses were functionalized to Billing, classified as customer-related and allocated among rate classes in proportion to rate base. As discussed above, this account include amortization of rate case expense, and recovery of extraordinary costs associated with the Coronavirus pandemic.

Q. How was depreciation expense functionalized, classified and allocated among rate classes?

A. Depreciation expense was computed for each asset account (Schedule C3); each component was functionalized, classified and allocated among rate classes in proportion to the related assets.

Q. How were taxes other than GRT and income taxes functionalized, classified, and allocated among the rate classes?

A. These taxes are PURTA and PA Use taxes, which were functionalized, classified and allocated among rate classes in proportion to plant, and PUC Assessment which was functionalized, classified and allocated among rate classes in proportion to rate base.

Q. How was GRT functionalized, classified, and allocated among the rate classes?

A. GRT is based on revenue, and GRT at present rates was computed for each function, classification and rate class on that basis. In computing the revenue requirement, the GRT expense for each class was computed based on class revenue requirements.

Q. How was income tax expense functionalized, classified and allocated among rate classes?

A. Income tax expense in the FPFTY was functionalized, classified and allocated in proportion to pretax income. For the FPFTY revenue requirement, Income tax expense for each class equals pretax income, grossed up.

Q. How was revenue at present rates computed for each rate class?

A. Distribution Revenue at Present Rates is shown on Schedule B1. The total was functionalized and classified based on pro forma revenue requirements and was assigned to each rate class based on forecast revenue at present rates for each rate class.

Forfeited Discounts was functionalized to Billing and allocated based on historical experience for write-offs.

Rent for Electric Property represents pole rental revenue and was functionalized, classified and allocated in proportion to Poles, Towers and Fixtures.

Other Electric Revenue was allocated in proportion to Distribution revenue.

Q. How was the revenue requirement for each rate class developed?

A. The revenue requirements for each rate class are computed in the same manner as for the total Company, as shown on Schedule C1. The revenue requirement for each rate class is the sum of allocated operating expenses, depreciation expense, general taxes, return on rate base and income tax expense. Return on rate base was computed by multiplying the class' rate base by the proposed rate of return, 8.49%. Income tax expense for each class was computed by grossing up the required return on rate base for the class at the income tax rate related to the overall revenue requirement. GRT for each class was computed by grossing up the required revenue for the class including income tax. Schedule E-1A, line 179 and Schedule E-1, line

13, show the total rate class revenue requirements based on fully allocated distribution cost of service at the proposed Rate of Return.

Q. Please summarize the results of the ACOS.

A. Schedule E-1, shows Net income at present rates for each rate class (line 7) and Return on rate base at present rates (line 11). It also shows the revenue requirement for each class to produce the proposed system return of 8.49% (line 13) and the increase or decrease this represents over revenue at present rates (line 28).

PROPOSED REVENUE ALLOCATION

Q. What were the considerations in the proposed revenue allocation for each class?

A. The following objectives were established for the proposed revenue allocation:

- To move each class closer to cost of service, computed in the ACOS (Schedule E-1).
- To mitigate extreme rate impacts on rate classes and on customer subgroups.

Q. Have you prepared a schedule that presents the proposed revenue allocation?

A. Yes. Schedule B6-4 presents the proposed revenue allocation and related information. Lines 1-8 present the results of the ACOS, including revenue, net income and return on rate base at present rates. Lines 10-21 present the revenue requirement for each class to provide a return of 8.49%, to produce an increase in revenue of $1,794,000. This information is from Schedule E-1.

Schedule B6-4 shows, for each rate class:

- Proposed revenue target for each class (line 24);
- Proposed increase in dollars (line 36), as a percent of present rate distribution revenue (line 37) and present rate total bill (using the presently effective GSSR rate

of $0.08695 per kWh) (line 38) and distribution increase relative to the average increase of 29.6% (line 40);

- Return on rate base at the proposed revenue allocation (line 32) and relative to the average of 8.49% (line 33) and progress toward unity (line 34) (how much of the gap between x) relative return at present rates and y) relative return at proposed revenue allocation, is closed based on the proposed revenue allocation); and
- Change in subsidy paid (received) (lines 42-45), where the subsidy is the difference between xx) rate of return produced by the rate class and yy) average rate of return, applied to the rate base allocated to the class.

Q. Have you prepared a schedule that presents the proposed rates?

Yes. The Company's proposed rates are presented on Schedule B6-3, lines 12-21, and also on Schedule B7. Schedule B6-3 demonstrates that the proposed rates produce the class revenue targets (compare lines 29 and 30; differences due to rounding).

Q. Why do you believe the proposed revenue allocation presented at Schedule B6-4 is fair and reasonable?

A. The revenue allocation is fair and reasonable because all classes make significant progress toward the system average return (Schedule B6-4, line 34), meeting the goal of moving each class closer to cost of service; and no class receives an increase greater than 75% (Schedule B6-4, line 37), meeting the goal of mitigating extreme impacts. In addition, all classes have reductions in the subsidy paid or received (Schedule B6-4, line 45).

PROPOSED RATES

Q. Please identify exhibits that show FPFTY sales and revenue at proposed rates.

A. Schedule B6 shows the same information as Schedule B, with an additional column showing distribution revenue at "PROPOSED Rates" for FPFTY 2026. The information in this column is from Schedule B6-1, carried forward from Schedule B6-2. Schedule B6-2 summarizes the computations of billing units times proposed rates, on Schedule B6-3.

Q. Did you prepare a schedule that summarizes the present and proposed rates?

A. Yes. Schedule B6-3 presents the proposed rates for each rate class. Schedule B7 presents the present and proposed rates for each rate class in a table.

Q. Did you compare the amounts that typical customers in each rate class would pay under the present and proposed rates?

A. Yes. Schedule B8 compares the amounts customers in each rate class, with a range of usage levels, would pay in the FPFTY, at present rates and proposed rates, on a total bill basis (including the present GSSR rate). Schedule B8-1 compares the amounts distribution-only (excluding GSSR). Schedule B8-2 compares total bills, reflecting the proposed GSSR rate that Citizens' filed in mid-April with a proposed effective date of June 1, 2025 for both 'the 'present rate' and 'proposed rate' calculations.

Q. Did you prepare a schedule showing the number of customers whose bills would increase under the proposed rates?

A. Yes. Schedule B5 presents that information.

Q. What were the goals for rate design?

A. The goals of rate design for each class were to produce the target revenue, to align the rates more closely with costs, to stabilize revenue for the utility and costs for customers and to mitigate extreme impacts on most customers.

Q. How did you compute the proposed rates for Residential?

A. For Residential, the proposed monthly charge is $16.50, less than the customer-related costs typically included based on the ACOS ($17.94, Schedule E1-C, line 27). The balance of the class revenue target is proposed to be recovered in the volumetric kWh charge.

Q. How did you compute the proposed rates for Space Heating?

A. For Space Heating, the proposed monthly charge is $24.00, less than the customer-related costs typically included based on the ACOS ($29.35, Schedule E1-C, line 27). The balance of the class revenue target is proposed to be recovered in the volumetric kWh charge.

Q. How did you compute the proposed rates for GLP-1?

A. For GLP-1, the proposed monthly charge is $21.00, less than the customer-related costs typically included based on the ACOS ($21.47, Schedule E1-C, line 27). The demand charge and the volumetric kWh-based rates were each increased by the same proportion (29.1%) to produce the balance of the class revenue target.

Q. How did you compute the proposed rates for GLP-3?

A. For GLP-3, the proposed monthly charge is $100.00, less than the customer-related costs typically included based on the ACOS ($128.65, Schedule E1-C, line 27). Each other rate component (demand charge, reservation charge, both blocks of the volumetric rate and the voltage discount) was increased by the same proportion (28.7%) to produce the balance of the class revenue target.

Q. How did you compute the proposed rates for MBL?

A. The two components of MBL rates, Meter and Post, were each increased by the same percentage, 75%, to produce the class revenue target.

Q. How did you compute the proposed rates for OL (Public Lighting)?

A. The rates for each lamp OL were changed by the same percentage, 28.8%, to produce the class revenue target.

Q. Do the proposed rates produce the required revenue?

A. Yes. Schedule B6-3, line 29, shows the proposed rates produce FPFTY total distribution revenue of $7,849,000 (excluding Other revenue), equal to Schedule C1, line 6. This revenue is an increase of $1,795,000, and produces a return of 8.49%,

Q. Does this conclude your Direct Testimony?

A. Yes.

EXHIBITS

OF

HOWARD S. GORMAN

ON BEHALF OF

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

APRIL 29, 2022

RESUME OF
HOWARD S. GORMAN

SUMMARY

Mr. Gorman has more than 35 years of experience in the energy industry, including 25 years in rate and regulatory proceedings. His areas of expertise include embedded class cost of service studies, marginal cost studies, revenue allocation, rate design and revenue requirements, for both electric and gas utilities. He has testified as an expert witness before the Massachusetts Department of Public Utilities, New Hampshire Public Utilities Commission, New Jersey Board of Public Utilities, New York State Public Service Commission, Ontario Energy Board, Pennsylvania Public Utility Commission and Rhode Island Public Utilities Commission. Mr. Gorman also has experience in financial modeling, financial analysis and forecasting and treasury and financial management.

PROFESSIONAL EMPLOYMENT

2010 - Present	HSG Group, Inc. • *President*
1997 - 2010	Black & Veatch Corporation (R.J. Rudden Associates, Inc. before 2005) • *Principal Consultant*
1995 - 1997	Independent Consultant
1987 – 1995	Trigen Energy Corporation • 1987-1993- *Corporate Controller; Trigen was formed in 1987* • 1993-1995- *Treasurer; Trigen had IPO with NYSE listing in 1994*
1982 - 1987	Coleco Industries, Inc. • *Director, Treasury*
1976 - 1979	Touche Ross & Co. • *Staff Accountant*

PROFESSIONAL EXPERIENCE

Utility Accounting and Costing

Mr. Gorman has performed numerous class cost of service studies, and has developed and supported revenue requirements, revenue allocation, rate designs and marginal cost studies, in rate cases before regulatory commissions in several jurisdictions, for electric and gas utilities. These assignments included developing test year data and rate year forecasts, establishing cost causality, selecting and developing allocators and analyzing customer impacts and policy considerations

Energy Project Analysis and Financing

Mr. Gorman has negotiated and completed transactions including construction and term loans, tax-exempt bonds, taxable bonds, subordinated debt and asset-backed (receivables and inventory) revolving credit facilities. He has worked successfully with lenders and borrowers to source and structure transactions, and was instrumental in negotiating loan documents and in designing power sale and supply procurement contracts to be financed. Mr. Gorman has performed financial analyses of energy-related assets, including electric and gas distribution companies, power plants and transmission operators. These analyses included development of cash flows and financial statements based on both regulatory and accounting presentations, and included review of assumptions, analysis of data, modeling and forecasting, sensitivity testing and stress testing.

Accounting and Financial Management

As controller of Trigen Energy Corporation, Mr. Gorman built the finance and accounting function; developed reports, procedures and management tools; and managed subsidiary controllers across North America, including an IPO with NYSE listing. He managed the corporate insurance portfolios and the benefit plans for Trigen Energy Corporation and for Coleco Industries, and has managed interest rate and currency forward contracts for the purpose of managing risk.

REBUTTAL TESTIMONY OF HOWARD S. GORMAN
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name, occupation and business address.

A. My name is Howard Gorman. I am the President of HSG Group, Inc., a consulting firm specializing in utility rate and regulatory matters, located in Great Neck, NY.

Q. Are you the same Howard Gorman that provided Direct Testimony on behalf of Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company")?

A. Yes. Terms defined in my Direct Testimony have the same meaning in this rebuttal testimony.

Q. What is the purpose of your testimony today?

A. The purposes of my testimony are to update the Company's filing and to rebut portions of the testimony of the following witnesses:

- Bureau of Investigation and Enforcement ("I&E") Witness Walker (I&E St. No. 1), regarding Pennsylvania Corporate Income Tax rate, Rate Case expense, Unamortized Rate Case expense and Cash Working Capital.
- I&E Witness Cline (I&E St. No. 3), regarding Materials and Supplies and Customer Deposits amounts in Rate Base, Scale Back and Customer charges.
- Office of Consumer Advocate ("OCA") Witness Myer (OCA St. No. 1), regarding Revenue at present rates and Uncollectible accounts expense.

- OCA Witness Deupree (OCA St. No. 3), regarding the Company's Allocated Class Cost of Service Study ("ACOS"), Revenue allocation and Rate design.
- Office of Small Business Advocate ("OSBA") Witness Farr (OSBA St. No. 1), regarding Pennsylvania Corporate Income Tax rate.
- Kelly Road Solar, LLC, Lancaster Avenue Solar, LLC and Twilight Renewables, LLC ("Solar Projects") witnesses Nolt and Lucas regarding proposed tariff changes.

Q. Are you sponsoring any exhibits today?

A. Yes, I am sponsoring Exhibit___(HSG-1R), which includes an index on Schedule A (R). The Company is supporting an increase of $1,641,472 compared to $1,794,525 in its original filing, reflecting the changes shown in Table HSG-1:

Line	Table HSG-1	Revenue Increase
1	Original Filing	1,794,525
2	Update PA Tax rates	(42,586)
3	Remove GCR Costs from Contra Account 921.9 (2023, 2025, 2026)	(111,048)
4	Remove POLR/PJM-from Rate Base	(8,935)
5	Materials & Supplies Customer Deposits Using most recent 13-month	9,516
6		
7		1,641,472

These changes in the revenue requirement are summarized below:

Items Discussed in This Testimony

- PA Corporate Income tax rate - Change to 7.49% in 2026.
- Rate Case Expense - Remove $8,289 generation-related costs which were included in error.
- Materials and Supplies and Customer Deposits - Include most recent 13-month average balances in rate base.
- Cash Working Capital - Adjust the allowance in Rate Base to equal 1/8 times applicable expenses.
- Revenue Allocation and Rate Design - Revenue Allocation and Rate Design are updated for the revenue requirement on Exhibit___(HSG-1R), Schedule C1 (R).

Items Discussed In Rebuttal Testimony of Other Company Witnesses

- Remove GCR Costs from Contra Account 921.9 - Response to I&E-RE-19-D
- Computation of Billing Demand - The Company is proposing to change the way it calculates Billing Demand that will apply to certain customers as discussed in the testimony of Mr. Johnson (Citizens' St. No. 5R). This change is reflected on Exhibit___(HSG-1R), Schedule B6-3 (R).

Q. Have you updated the ACOS, revenue allocation and rates that Citizens' is proposing to recover its revenue requirement?

A. Yes. The results of the ACOS, and the class revenue required to produce a return of 8.49%, are on Schedule B6-4 (R), lines 1-20. There were no changes in methodology in preparing this ACOS from the original filed ACOS.

The proposed revenue allocation, presented on Schedule B6-4 (R), lines 22-45, including metrics, was updated, and the increase for Rate MBL was adjusted to 1.50X the system average to address a concern by the OCA.

The proposed rates, which produce the revenue target for each class as well as the overall revenue target, are developed on Schedule B6-3 (R), with bill impacts on Schedules B8 (R) and 8-1 (R).

Q. Have you made any changes to the ACOS or the billing units in the rate analysis?

A. Yes, the Company evaluated whether the ACOS and/or rate design should be updated due to the proposal to add the nameplate capacity for a customer generator into the Billing Demand definition.

The Company believes that the change in the Billing Demand definition to add the nameplate of the customer generators does not change the calculation of Non-Coincident

Peaks ("NCP") for these classes because the impact is too uncertain at this time. Therefore, I have not adjusted the allocator values in the ACOS, the ACOS results or the revenue allocation. In future Commission proceedings, once the Company incorporates the change to the Billing Demand definition, there may be impacts to the ACOS, which can be evaluated based on the actual class data.

Regarding rate design, however, the revised definition would impact the billing units for GLP-1 and GLP-3. In computing the proposed rates in Exhibit___(HSG-1R), Schedule B6-3 (R), lines 35-44, the Billing Demand units were computed using the Company's proposed method. As a result, Billing Demand units for GLP-1 increased from 163,587 kW to 203,580 kW; and Billing Demand units for GLP-3 increased from 131,543 kW to 133,103 kW. This affected the computation of the kW-based rates and other rates for these classes. Table HSG-2 below compares the distribution rates for GLP-1 and GLP-3 using the Company's revenue allocation, depending on whether the Company's Billing Demand proposal is accepted, or the existing definition is used.

	Table HSG-2	**GLP-1**	**GLP-1**	**GLP-3**	**GLP-3**
		Existing Billing Demand	Proposed Billing Demand	Existing Billing Demand	Proposed Billing Demand
1	Customer Charge per Month	$21.00	$21.00	$100.00	$100.00
2	Energy Charge per kWh- Block 1	$0.01143	$0.00976	$0.01198	$0.01185
3	Energy Charge per kWh- Block 2			$0.00130	$0.00129
4					
5	Demand per kW	$4.44	$3.79	$6.78	$6.71
6					
7	Reservation Charge per kW			$3.17	$3.13
8	Voltage Discount			($0.29595)	($0.29278)
9					
10	Customer Bills	13,644	13,644	504	504
11	kWh	27,208,762	27,208,762	46,600,138	46,600,138
12	Demand Units	163,587	203,588	131,543	133,103
13					
14	Total Distribution Revenue	$1,323,845	$1,323,678	$1,134,595	$1,135,125

I&E Witness Walker

PA Corporate Income Tax Rate

Q. What does Mr. Walker propose regarding the PA Corporate Income Tax rate?

A. Mr. Walker notes that pursuant to Pennsylvania House Bill 1342 and Act 53 of 2022, the PA Corporate Income Tax rate is 8.49% in 2024, 7.99% in 2025 and 7.49% in 2026, with annual reductions of 0.5% until it reaches 4.99% in 2031 (I&E St. No. 1, p 25). Citizens' original filing inadvertently used 9.99% for 2026. Citizens' agrees that the appropriate rate for 2026 is 7.49%. The correct rates as proposed by Mr. Walker are reflected in the Company's Rebuttal filing, Exhibit___(HSG-1R).

Rate Case Expense

Q. What does Mr. Walker propose regarding Rate Case Expense?

A. Mr. Walker proposes removing $8,298 for PJM/POLR from Rate Case expense because this is a generation-related item, and not a distribution-related item (I&E St. No. 1, p. 9). The Company accepts this adjustment and has removed the item from Rate Case expense (Exhibit___(HSG-1R), Schedule C1-3 (R)).

Unamortized Rate Case Expense

Q. What does Mr. Walker propose regarding Unamortized Rate Case Expense?

A. Mr. Walker proposes removing Unamortized Rate Case expense from rate base, on the grounds that Rate Case expense is a normal operating expense for a utility, and the utility should not earn a return on a normal operating expense (I&E St. No. 1, p. 12).

Q. Do you agree?

A. No. The utility has working capital tied up in unrecovered Rate Case expense and is entitled to a return on that working capital. The Company pays the rate case expense on a

real-time basis during the proceeding, then collects the projected amount included in the Rate Case expense claim over the normalization period without carrying charges. As such, allowing the return on the balance is necessary to compensate Citizens' for the delay between paying the expense and receiving the compensation in post-proceeding distribution revenues.

This treatment is analogous to Materials and Supplies, where the Company has laid out or committed working capital and the item has not flowed through expense yet. The cost of unused Materials and Supplies is routinely included in rate base. For the same reason, the unrecovered portion of Rate Case expense should be included as well, and this adjustment should be rejected.

Cash Working Capital

Q. What does Mr. Walker propose regarding Cash Working Capital?

A. Mr. Walker proposes that the Cash Working Capital ("CWC") allowance be computed based on the Commission's determination of expenses in this case (I&E St. No. 1, p. 24). He accepts the Company's use of the 1/8 convention in computing CWC. The Company adjusts its CWC claim in Rebuttal Exhibit__(HSG-1R) using the 1/8 convention and will use this approach for the final revenue requirement. The Company accepts this proposal.

I&E Witness Cline

Materials and Supplies and Customer Deposits

Q. What does Mr. Cline propose regarding Materials and Supplies and Customer Deposits?

A. Mr. Cline proposes to include these two items in Rate Base based on their 13-month averages for the most recent periods available at the time of determination (I&E St. No. 3,

p. 7). The Company accepts this proposal and has reflected it in its Rebuttal filing, Exhibit___(HSG-1R), Schedule C1-5 (R).

Scale Back and Customer Charges

Q. What does Mr. Cline propose regarding Scale Back and Customer Charges?

A. Mr. Cline accepts the customer charges proposed by the Company based on the revenue requirement in its original filing. He proposes that the final rates be based on "the cost of service study ultimately approved by the Commission" (I&E St. No. 3, pp. 8-9). The Company will submit an ACOS based on the revenue requirement approved by the Commission. If the Commission accepts the Company's ACOS but reduces its requested revenue requirement, then the Company proposes to use a proportionate scale back to allocate the increase. Citizens' does not agree, however, that the proposed customer charges should be reduced (unless an updated customer cost analysis indicates otherwise). The proposed customer charges are consistent with the Commission's policy and should be approved as submitted. I will address in more detail below why appropriate rate design should include customer charges at levels that promote revenue stability for the utility and balance other factors.

OCA Witness Meyer

Revenue

Q. What adjustments to Revenue does Mr. Meyer propose?

A. The Company's sales and revenue forecast was based on annual average kWh per customer, by rate class, over the most recent 5 years. Mr. Meyer proposes using the most recent 10 years, which he supports by showing that the 10-year average is close to the 15-year average. (OCA St. No. 1, pp. 6-11).

Q. Does Mr. Meyer's analysis support his proposed adjustment?

A. No, I believe his analysis supports the Company's position. As shown in Table HSG-3 below, the major rate classes have each shown marked declines in annual kWh usage per customer in recent periods. In fact, the 2023 and 2024 actual numbers are well below the 5-year averages that were used in the Company's forecast. Mr. Meyer's adjustment would exacerbate under-collection of revenues, would short-change the Company in the short run, and would accelerate the need for the next rate case. This adjustment should be rejected by the Commission.

	Table HSG-3	Residential	GLP-1	GLP-3
	Average Annual kWh Per Customer			
1	15-year Average	14,644	26,284	1,290,608
2	10-year Average	14,617	25,907	1,301,308
3	5-year Average (bel	14,488	23,930	1,144,553
4	Change 15-year to 1	(0.18%)	(1.43%)	0.83%
5	Change 10-year to 5	(0.89%)	(7.63%)	(12.05%)
6	Change 5-year to 20	(5.41%)	(5.70%)	(4.85%)
7	Annual 2020	14,723	24,544	1,175,513
8	Annual 2021	14,911	25,044	1,263,563
9	Annual 2022	15,193	24,951	1,146,006
10	Annual 2023	13,906	22,546	1,048,651
11	Annual 2024	13,704	22,566	1,089,034

Uncollectibles Expense

Q. What adjustments to Uncollectibles expense does Mr. Meyer propose?

A. Mr. Meyer proposes to compute Uncollectibles expense using the 5-year average of the ratio of write-offs to revenue. (OCA St. No. 1, pp. 12-13).

Q. Do you agree?

A. No. Mr. Meyer's Table GRM-5 shows a rising trend in this ratio, from a range of 0.120%-0.138% in 2020-2022, to a range of 0.153%-0.157% in 2023-2024. The Company's

Uncollectibles expense ratio of 0.167% is a reasonable continuation of this trend. Mr. Meyer's proposed adjustment should be rejected.

OCA Witness Deupree

ACOS

Q. Please summarize Mr. Deupree's views regarding the Company's ACOS.

A. Mr. Deupree appears to accept the Company's ACOS, *except for* the classification of Secondary portions of distribution plant (Accounts 364, 365, 366) and Line Transformers (Account 368). He claims these items have no customer component and are 100% demand-related. He makes the following arguments in support of his claims:

- Theoretical Nature of Zero-Load System- Mr. Deupree notes that the Company's separation of costs into demand-related and customer-related is based on "hypotheticals that do not exist in the real world, including the assumption that somehow there is an electric distribution system out there in the world that could or would be plausibly built to serve customers but not load" (OCA St. 3, p. 17).

  This is an often-used but misleading argument. I acknowledge that the Zero-Load System, and the Minimum Size System, are theoretical constructs, but this is not a valid reason to reject them. They are useful tools to separate costs between demand-related and customer-related, regardless of the fact that no such systems would be built.

  As an aside, Mr. Deupree's argument regarding Line Transformers is incorrect and just falls apart. However, it would be possible to install transformers with ratings of 12.5 kVA (the minimum size is deemed to be 50 kVA X 1/4) for customers where this is sufficient to meet demand, and to install larger capacity transformers only where needed.

- Load Carrying Capacity- Mr. Deupree cites the NARUC Manual's caution that a minimum system would have a certain load-carrying capacity (OCA St. No. 3, p. 18).

  For items other than Line Transformers, the Zero-Load System presented in my ACOS excludes the cost of materials and would have no load-carrying capacity.

  For Line Transformers, the demand component does reflect the capacity of the minimum system (Exhibit___(HSG-1R), Schedule D2 (R), lines 26-30, with the capacity of the minimum system shown on line 29).

- Bonbright - Mr. Deupree cites Professor Bonbright's claim that including the minimum-sized distribution system in customer-related costs is "clearly indefensible" (Bonbright, p. 492, cited at OCA St. No. 3, p. 20).

  Yet, he ignores Bonbright's claim that "its exclusion from the demand-related costs stands on much firmer ground" (Bonbright, p. 492) and goes ahead and classifies all costs including any minimum size component as demand-related. One cannot simultaneously criticize and rely on the same source.

- Relation to Number of Customers - Mr. Deupree analyzes the relationship between the number of customers the Company added (or lost) 2008 through 2024, and net dollar additions to distribution plant. Unsurprisingly, he found no statistical correlation (OCA St. No. 3, pp. 20-21).

  I applaud Mr. Deupree's efforts, but I disagree with his conclusion that because he could not demonstrate statistical correlation, there is no relationship between the number of customers added and distribution system costs. On the face of it, this conclusion does not make sense. Even in years with decreases in the number of customers, the utility must invest in the distribution system. The reasons that Mr. Deupree does not

demonstrate correlation include: the amount of net investment is affected by asset retirements; net dollar additions to distribution plant vary due to factors other than new customers, such as repairs, maintenance and upgrades; the timing of customer additions has not been matched to the timing of investments; and critically, the dollar value of investments may be affected by demand capacity added, which the analysis ignores.

Mr. Deupree's conclusion that because he could not demonstrate statistical correlation, there is therefore no relationship between the number of customers added and distribution system costs, is wrong.

Q. Please summarize the discussion regarding Mr. Deupree's objections to your ACOS.

A. First, the endpoints of the distribution system connect to customers, usually through a transformer; it is a tautology that the investment in distribution system, especially the Secondary system, is directly related to the number of customers. Regarding Transformers, the Company uses the rule of thumb that one 50kVA transformer serves four residential customers (Schedule D3), establishing a direct relationship between this particular component and the number of customers.

Second, each of the several arguments that Mr. Deupree raises are flawed, as discussed above.

Q. Do other intervenors comment on the Company's ACOS?

A. Yes. OSBA Witness Farr concludes that "the cost of service study aligns with the principles of cost causation and that Citizens' proposed revenue allocation falls within the range of reasonableness" (OSBA St. No. 1, p. 3). I&E Witness Cline does not comment on the ACOS but relies on the Company's ACOS to review customer charges (I&E. St. No. 3, p. 8).

Q. Has the Commission provided guidance regarding minimum system studies in allocated cost studies?

A. Yes, many times. The Commission has repeatedly endorsed minimum system studies, including in Citizens' 2019 rate case, in Wellsboro Electric Company's 2019 rate case at Docket No. R-2019-3008208, in UGI Utilities, Inc.—Electric Division's ("UGI") 2018 rate case at Docket No. R-2017-2640058, and in PPL Electric Utilities Corporation's 2019 and 2012 rate cases. The Commission found that Citizens' analysis in the 2019 rate case, which I personally performed, was reasonable and appropriate for the classification and allocation of distribution system costs.

Q. What do you recommend regarding the Company's ACOS?

A. The Commission must reject Mr. Deupree's criticism of the Company's ACOS for the reasons stated above. The Commission should accept the Company's ACOS, Exhibit___(HSG-1R), Schedule E (R). This ACOS is based on the Company's revenue requirement submitted in Rebuttal, and uses the same methodology as the Company's originally filed ACOS Exhibit___(HSG-1), Schedule E.

Revenue Allocation

Q. What does Mr. Deupree recommend regarding revenue allocation?

A. Mr. Deupree prepared his own ACOS, in which he failed to recognize any customer component of the Secondary distribution system. This is a fatal flaw. He relies on his ACOS for revenue allocation. Because Mr. Deupree's ACOS is fatally flawed, the Commission should reject it and should also reject his recommendations as to revenue allocation, as they rely on the flawed ACOS.

Mr. Deupree also recommends that the increase in the Municipal Boulevard Lighting ("MBL") class be limited to 1.25X the system average increase; the Company is willing to accommodate this request and has reduced the relative increase proposed for this class.

Rate Design

Q. What does Mr. Deupree recommend regarding rate design?

A. Mr. Deupree recommends that the Commission reject the Company's proposed increases to customer charges. He cites several reasons, which I address below.

- Computation of customer-related costs - Mr. Deupree claims the Company's ACOS inaccurately reflects customer-related costs and, presumably, should not be relied on to develop the fixed monthly charge. However, the Company's analysis of customer-related costs for inclusion in the fixed monthly charge (Exhibit__(HSG-1R), Schedule E-1C(R) excludes the Secondary portion of the distribution system, which is the portion of the ACOS that Mr. Deupree contested. The analysis does include Transformers, however, the impact of Transformer-related costs is minor in comparison to total costs. Mr. Deupree has not identified a significant flaw in my computation of the customer-related costs.
- Comparison to other regional utilities - Mr. Deupree claims the Company's present and proposed fixed monthly charges for Residential and Space Heating ("SH") customers are higher than the charges of neighboring regional utilities. This is not relevant to our discussion; however, the Company disagrees with the peer group chosen by Mr. Deupree. As Mr. Johnson explains, the Company's proposals are comparable with Citizens' actual neighboring utility, PPL Electric Utilities Corporation.

- Effect on energy conservation and low-usage customers - Mr. Deupree claims that higher customer charges are contrary to the goal of energy conservation. However, the goal of energy conservation should not be considered in a vacuum; rate design must balance this with concerns such as revenue stability for the utility and efficient price signals, as well as affordability. In fact, Commission policy permits only certain costs to be recovered in the customer charge, and these do not include all fixed costs the utility incurs. As proposed, the customer charge recovers only 23% of monthly distribution charges for a typical residential customer using 1,250 kWh per month. The generation rate is also charged on a kWh basis, which provides more incentive for the customer to pursue energy conservation. Inefficient pricing and under-recovery of costs leads to more frequent rate cases and also to cross-subsidies within rate classes, as costs are shifted to higher-usage customers.

Q. Does the Company's proposed customer charge reflect the cost of service?

A. Yes, the Company's proposed customer charge reflects its analysis of customer-related costs for inclusion in the fixed monthly charge, based on its ACOS (Exhibit___(HSG-1R), Schedule E-1C(R)).

Q. Has the Commission provided guidance on proposed customer charges?

A. Yes, in the UGI 2018 Order in Docket No. R-2017-2640058, p. 173, the Commission said, "Thus, we find that UGI's proposal is consistent with *Lloyd,* which held that rate structures should be adjusted to reflect the cost of service to each rate class and to eliminate cross-subsidization."

Q. What do you recommend?

A. The Company's proposed customer charges are supported by its ACOS. And consistent with Commission policy, I recommend that the Commission approve the Company's proposed customer charges.

OSBA Witness Farr

PA Corporate Income Tax Rate

Q. What does Mr. Farr propose regarding PA Corporate Income Tax Rate?

A. Mr. Farr makes the same proposal as Mr. Walker regarding the PA Corporate Income Tax rate (OSBA St. No. 1, pp. 11-13); as discussed above, the correct rates are reflected in the Company's Rebuttal filing, Exhibit___(HSG-1R).

Solar Projects Witnesses Nolt and Lucas

Q. Have you reviewed the testimony provided by Mr. Nolt and Mr. Lucas regarding Citizens' proposed "Billing Demand" definition?

A Yes. I will address the distribution aspects of their respective testimony regarding the Company's proposal.

Q. Please summarize the Company's proposed Billing Demand calculation.

A Presently, Billing Demand is the customer's highest amount of electricity withdrawn from the system during the month, measured in 15-minute periods. Any customer on GLP-1 or GLP-3 is charged using the Billing Demand, which is the higher of the metered 15-minute peak usage during the month or 50% of the highest monthly Billing Demand during the prior 11 months. Approximately 51% of all customer bills issued for GLP-1 and GLP-3 during the year are billed using the alternative measure (i.e., 50% of the highest monthly Billing Demand during the prior 11 months) rather than the metered monthly demand

usage. The Company proposes to reflect customer generators in the Billing Demand definition, which would then set the Billing Demand at the highest of the following during any month, again measured in 15-minute periods:

- Electricity withdrawn from the system during the month; or
- 50% of the maximum electricity withdrawn from the system during the prior 11 months; or
- Nameplate capacity of generation unit.

Q. Why are the Company's proposed changes to Billing Demand appropriate?

A. Mr. Johnson discusses several reasons why these changes are appropriate, including the guidance from the Commission in the recent UGI Default Service Plan proceeding at Docket No. P-2024-3049343 and the changing expectations for the distribution system. In addition, although a small number of existing customer generators may experience a change in distribution costs, it will properly reflect their distribution cost responsibility. Under the Public Utility Code, a utility cannot maintain unreasonable distinctions in service or rates. Mr. Johnson explains in detail how the usage of the distribution system is similar by both a 400 kW manufacturing plant and a generator with a 400 kW solar array. Furthermore, if the installation of on-site customer generation and other distributed energy resources ("DER") strategies increases, the Company's proposed changes will ensure that all customers who use the system pay for the service they receive. If generators who use the system by injecting power are not charged, then only a fraction of customers (i.e., users of electricity) would pay for all the costs of the system. Mr. Nolt and Mr. Lucas' testimony clearly explains that avoiding distribution charges is a part of the incentive for their projects. However, simply not charging generators for their use of the system does not

change the Company's distribution system costs; it merely puts the burden onto other customers.

Q. Why is the usage of the distribution system for a 400 kW manufacturing plant similar to that of a generator with a 400 kW solar array?

A. The Company must stand ready to serve both of these loads, at any time, in either direction. Whether the customer is drawing 400 kW from the grid, or injecting 400 kW, the Company needs the same assets to serve the customer's needs.

Q. Does the presence of DER and other new technologies change the cost allocation methodology?

A. No. The purpose of cost allocation is to assign cost responsibility among the users of the system. Mr. Lucas' opinion that Citizens' proposal is not in accord with the traditional "billing demand" as used in distribution ratemaking (i.e., the amount that the account imports from the utility) is incorrect. The important consideration is not the direction of the power flow; the important consideration is the assets to be built, operated and maintained to meet the customers' needs, regardless of whether they are consumers or providers of power. The generator/exporter is using the system to accept its output and is relying on the system just as a power importer is using the system.

Mr. Lucas' and Mr. Nolt's testimonies raise important considerations regarding how the costs of the distribution system should be allocated between customers who adopt technologies like DER and customers who do not. Although the technology adopters may want to avoid distribution cost responsibility, the system must be designed, maintained and operated to meet their requirements, as well as those of all other customers. Having fewer customers paying for the system means that more of the costs would be borne by customers

that do not adopt the new technologies. The Company must continue to build, operate and maintain the system to accommodate the technology adopters. The costs to do so will not decrease; however, if the technology-adopters are able to avoid all or some of their cost responsibility, the larger cost burden would be paid by the remaining (non-technology adopting) customers. The Commission relies on cost of service and ratemaking considerations to address the important issue of how the users of the distribution system should share in its costs.

Q. On page 17 of his testimony, Mr. Lucas states, "the actual impact of most [behind the meter] DER systems is limited to a small portion of the power grid that serves the customer generator and their neighbors." Is this relevant for ratemaking purposes?

A. No. The entire distribution system, with its multiple paths and redundancies, is designed and operated to provide safe and reliable service to customers whenever it is needed. Citizens' rates are designed to recover its costs for the entire distribution system, from all its customers. The only exception is where a customer uses only dedicated assets and those assets are not used by other customers, and a directly-assigned rate is developed; that is not the case here.

Q. Mr. Nolt and Mr. Lucas assert that there will be large changes to distribution charges under the proposal. Would ratemaking principles support phasing-in the change to Billing Demand?

A. Yes. A consideration in rate design is to mitigate extreme impacts and to make changes gradually. If the impact of this change on generator bills is significant, as Mr. Nolt and Mr. Lucas claim, then phasing in the change over a number of years would be a reasonable

approach. This does not change the fact that customer generators bear cost responsibility for the assets the Company must have in order to fulfill its obligation to serve them.

Q. Would it be reasonable to measure Billing Demand using actual data, instead of nameplate maximum capacity?

A Yes, this would be reasonable too. This would be similar to the approach used for electricity consumers; however, there are distinctions that could support using the generator capacity as Citizens' has proposed. For customers who use the distribution system solely to withdraw power, it is not practical to compute the potential maximum they could withdraw, and likely not meaningful; first, customers can add machines or appliances at any time; and second, it is unlikely that all machines or appliances would be used at once.

For generators, though, the maximum potential use of the distribution system is knowable, and it is reasonable to expect the generator will use all its capacity at some time; after all, that is why it is there. However, a parallel treatment to electricity consumers, measuring Billing Demand based on actual data, could be reasonable subject to other considerations, such as metering capability and the net metering implementation discussed by Mr. Johnson.

Q. Please summarize the discussion of the testimonies of Mr. Nolt and Mr. Lucas.

A. The Company's proposed charge to Billing Demand reflects well-established principles of cost causation. The Company must stand ready to serve both a customer that draws 400 kW from the grid, and a generator that injects 400 kW; the Company uses the same distribution system to serve both. Simply not charging generators for their use of the system does not change the Company's distribution system costs; it merely puts the burden

onto other customers. Therefore, the Company's proposed Billing Demand charge is appropriate.

Q. Does this conclude your rebuttal testimony today?

A. Yes.

Citizens' Electric Company of Lewisburg, PA	**:**	

SURREBUTTAL TESTIMONY OF HOWARD S. GORMAN
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name, occupation and business address.

A. My name is Howard Gorman. I am the President of HSG Group, Inc., a consulting firm specializing in utility rate and regulatory matters, located in Great Neck, NY.

Q. Are you the same Howard Gorman that provided Direct Testimony on behalf of Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company")?

A. Yes. Terms defined in my Direct Testimony or my Rebuttal Testimony have the same meaning in this Surrebuttal Testimony.

Q. What is the purpose of your testimony today?

A. The purpose of my testimony is to respond to the Rebuttal Testimony of the following witnesses:

- Office of Consumer Advocate ("OCA") Witness Myer (OCA St. 1R)
- OCA Witness Deupree (OCA St. 3R)

Q. Are you sponsoring any exhibits today?

A. No.

Q. Are you supporting any changes to the Company's filing, as amended by Exhibit___(HSG-1R)?

A. No.

Q. Please summarize your review of the Rebuttal Testimony of Mr. Meyer (OCA St. 1R) and Mr. Deupree (OCA St. 3R).

A. Except for Mr. Deupree's discussion of the Company's Customer Cost Analysis, which I address immediately below, neither Mr. Meyer nor Mr. Deupree raised any new issues or provided any new arguments for their positions.

Mr. Meyer addresses two adjustments that were suggested in the Direct Testimony by other parties. Citizens' already accepted one of those adjustments (Tax Rate). I addressed the other adjustment (Unamortized Rate Case Expense) in my Rebuttal Testimony. Mr. Meyer has not raised any arguments that I have not fully refuted.

Q. What did Mr. Deupree say regarding the Company's Customer Costs Analysis?

A. Mr. Deupree repeated his objection to any increase in the monthly Customer Charges (OCA ST. 3R, p. 5). I will address the specifics of his testimony below:

- Mr. Deupree opines that the Customer Cost Analysis should be based on the Rate of Return ("ROR") at present rates of 1.46%, because the Commission has not approved its requested ROR or that of any other witness (OCA St. 3R, p. 3). This approach does not make sense. First, Mr. Deupree is implicitly accepting the Company's computation of its revenue requirement, but the Commission has not accepted that either. Second, we are establishing the rates for a Fully Projected Future Test Year assuming that a rate increase will be granted. Using the existing ROR without consideration of the rate relief is inconsistent with this process. Third, the rates and revenues currently charged

by the Company are too low, that is why a rate case was filed, so using the existing ROR only perpetuates the shortfall. What if the Company had been producing a negative ROR; would Mr. Deupree advocate using a negative ROR to set new rates?

- Mr. Deupree compared the Company's current Customer Charges to Customer-Related Costs computed using the ROR proposed by OCA Witness Walters, 7.44%; and computed that for Residential Service ("RS"), Space Heating ("SH") and General Light and Power Service ("GLP-1"), current Customer Charges recover approximately 76%, 74% and 78% of Customer-Related Costs; and therefore, in his view, there is no "pressing need to increase" them (OCA St. 3R, p. 4). For the reasons stated in my prior testimony, it is important that Customer Charges reflect costs, and this view is supported by prior guidance from the Commission, including the UGI 2017 Order, p. 173, where the Commission said, "Thus, we find that UGI's proposal is consistent with *Lloyd,* which held that rate structures should be adjusted to reflect the cost of service to each rate class and to eliminate cross-subsidization." There is no authority or rationale to substitute Mr. Deupree's judgment that the current monthly Customer Charges are "good enough" for ratemaking and economic theory and practice and the long-standing guidance of the Commission regarding the appropriate method to establish customer charges.
- Finally, Mr. D'Ascendis has explained why OCA Witness Walters' ROR recommendation is unreasonably low and not appropriate to establish rates in this proceeding.

I recommend the Commission evaluate the Company's proposed Customer charges based on the information it has filed in this case, Exhibit___(HSG-1R), and the principles which have been established by precedents.

Q. Does this conclude your Surrebuttal Testimony today?

A. Yes.

REJOINDER TESTIMONY OF HOWARD S. GORMAN
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name and business address.

A. My name is Howard Gorman. I am the President of HSG Group, Inc., a consulting firm specializing in utility rate and regulatory matters, located in Great Neck, NY.

Q. Are you the same Howard Gorman who previously submitted Direct Testimony in this proceeding on behalf of Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company")?

A. Yes. Terms defined in my Direct Testimony, Rebuttal Testimony or Surrebuttal Testimony have the same meaning in this Rejoinder Testimony.

Q. What is the purpose of your Rejoinder Testimony?

A. I will respond to various arguments Mr. Kevin Lucas put forth on behalf of the Solar Projects.

Q. Mr. Lucas has argued that because the Company has not shown that its costs have increased in order to serve the Solar Projects, then the Solar Projects should be excused from paying any costs of the distribution system. Please respond.

A. Mr. Lucas' argument is without merit.

First, Pennsylvania does not recognize incremental or marginal costs as the basis for distribution rates; instead, Pennsylvania recognizes embedded costs.

Second, following Mr. Lucas' suggestion, any customer who installs new equipment could say, 'The Company did not immediately add any costs to serve me, so I should not have to pay for my use of the system.' Of course, that would be unfair and unworkable on its face. When the Company adds a new 1 MW customer, it may not incur additional costs either. That does not mean that we do not charge the customer a fair portion of the overall distribution costs, as reflected in the rates.

Similarly, the Commission must reject Mr. Lucas' argument on behalf of the Solar Projects, that it should not pay for distribution costs if it does not immediately cause additional costs to be incurred.

Q. Mr. Lucas also notes that the Company's cost of service study does not include the gross generator capacity or bi-directional demand data. Please explain why those items are not included.

A. The Company's current meters do not measure bi-directional demand. As a result, we did not have data to include in the ACOS.

For the gross generator capacity, this data will be captured in future cost studies, assuming the Company's proposal is approved by the Commission. As set forth in my Rebuttal Testimony, the Company has captured the estimated additional billing kW in the GLP-1 and GLP-3 rate analysis (again, assuming the Company's proposal is approved). We do not have historic data to make a similar adjustment to the billing determinants.

I would like to note that reflecting historical data for bi-directional peaks in the ACOS allocators would either have no effect, or would increase, the portion of costs borne by GLP-1 customers.

Q. If the Company's proposal is reasonable, has Citizens' been treating its customers in an unreasonable manner since net metering started?

A. The Company must treat its customers as required by the terms of its Tariff. However, not charging generators that use the system by exporting power is not reasonable or fair, hence the proposed change.

Q. Citizens' cost of service study does not reflect the nameplate capacity. Please comment.

A. Neither historical export data nor nameplate capacity were used in developing the ACOS allocators. Demand allocators were the average of historical class Non-Coincident Peak ("NCP") ratios. Mr. Johnson informs me that he believes that including demand information from this customer would not change the class NCP significantly in any year, and in any event, the effect on the average would be negligible.

Q. Will Citizens' see incremental revenue from customer-generators?

A. Citizens' rates are designed to produce a target revenue. The target revenue for the class should be paid by all customers who use the system.

Q. Mr. Lucas appears to argue that it is acceptable if the Solar Projects are not charged, because Citizens' would be kept whole. Please comment.

A. Mr. Lucas' argument misses the point. Citizens' rates are designed to recover the target revenue for each class, from customers in the class who use the system. The costs should

be paid by all customers who use the system. The proposal that the Solar Projects should not pay for distribution system costs flies in the face of this overarching principle.

Q. Does this conclude your Rejoinder Testimony?

A. Yes.

DIRECT TESTIMONY OF NATHAN JOHNSON
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name and business address.

A. My name is Nathan (Nate) Johnson. My business address is 1775 Industrial Blvd., Lewisburg, Pennsylvania.

Q. By whom are you employed and what position do you hold with Citizens' Electric Company of Lewisburg, PA?

A. I am employed by C&T Enterprises, Inc., ("C&T"), and assigned to Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company"), as the President and Chief Executive Officer.

Q. What are your duties in that capacity?

A. My duties are to lead and provide general management to Citizens'. I am also responsible for power supply and regulatory issues.

Q. Please describe your educational and professional background.

A. I have a bachelor's degree in electrical engineering from Bucknell University. I joined Citizens' as the Senior Director of Engineering and Operations in 2018. In 2023, I became the President and Chief Executive Officer. Prior to joining Citizens', I held various

technical and supervisory positions in distribution operations with PPL Electric Utilities Corporation. I am also a registered professional engineer in Pennsylvania.

Q. Please describe the purpose of your testimony.

A. My testimony supports the operations, maintenance and capital plan projections that were used by HSG Group, Inc. ("HSG Group") for compilation and preparation of the filing. In discussing this topic, I also address our capital improvement activities, vegetation management, and the proposed changes to Citizens' tariff.

I also provide a general overview of Citizens', its service territory, and its customer base. In addition, I address portions of the historical data, future test year expenses, and capital improvements information provided to Company witness Mr. Gorman for compilation and preparation of the filing. Finally, I will discuss the unique circumstances faced by Citizens' as a small electric utility, and the basis for a performance adjustment to the Company's rate of return.

Q. Please provide a brief overview of Citizens' and its service territory.

A. Citizens' is a small investor-owned Electric Distribution Company ("EDC") under the jurisdiction of the Pennsylvania Public Utility Commission ("PUC" or "Commission") operating in Lewisburg Borough, Buffalo, East Buffalo and Kelly Townships in Union County, Pennsylvania. Citizens' service territory is surrounded by PPL Electric Utilities Corporation ("PPL"). As of December 31, 2024, Citizens' served 5,964 residential customers, 1,164 commercial and industrial customers, and 39 lighting customers – a total of 7,176.

Citizens' was acquired on February 8, 1999, by C&T through the purchase of 99.9% of Citizens' stock with the remaining shares being held by several minority shareholders.

C&T subsequently acquired the remaining outstanding shares, making C&T the sole shareholder of Citizens'. C&T is a holding company and management services firm that is jointly owned by Tri-County Rural Electric Cooperative based in Mansfield, Pennsylvania, and Claverack Rural Electric Cooperative based in Wysox, Pennsylvania. C&T is also the parent corporation of Wellsboro Electric Company ("Wellsboro") and Valley Energy, Inc. ("Valley").

Q. What changes were made to the Company's tariff and operations as a result of the Electricity Generation Customer Choice and Competition Act ("Competition Act")?

A. Citizens' unbundled its generation supply service from its electric distribution service. Electric distribution service remains a service that is regulated by the Commission pursuant to traditional ratemaking processes under Chapter 13 of the Public Utility Code. This filing proposes changes to our unbundled distribution rates in accordance with the Chapter 13 requirements and process.

Citizens' retains the obligation to provide generation supply service to all customers as the Default Service Provider ("DSP") in its service territory in conformance with requirements set forth in the Competition Act. The Commission approves the rules and tariff mechanism to pass through our costs for DSP generation supply service in separate proceedings that address only generation issues. The generation rate is known as our Generation Supply Service Rate ("GSSR" includes GSSR-1 and GSSR-2). We are not proposing to make any changes to the GSSR in this proceeding; however, one change will clarify that we are using a consistent way to measure a customer's billing demand for distribution and generation rate determinations.

Q. Do the proposed distribution rates include any expenses related to generation supply?

A. No. Mr. Gorman's analysis focused solely on our regulated distribution service rates. As a result, both the revenues and expenses related to generation supply services in the historic, future, and fully-projected future test years (HTY, FTY and FPFTY) are removed from our overall revenue and expenses.

In addition, the legal and consulting fees that Citizens' incurs for the generation function are collected through the GSSR and were not included in the distribution rates in this filing. Finally, our cash working capital assumption for the new distribution rates is based only on the portion of the expenses and bills related to distribution service and does not include generation expenses.

Q. When was Citizens' last base rate proceeding?

A. Citizens' last base rate proceeding was in 2022, with the new rates taking effect on January 31, 2023. In that proceeding, we reached a settlement with the parties that resulted in an increase of $930,000 in annual distribution revenues.

Q. What revenue requirement increase is Citizens' requesting in this proceeding?

A. Citizens' is requesting an increase of $1.79 million. On a total bill basis (including generation costs), for the average residential customer using 1,250 kWh per month, this will be a 10.8% increase. A typical small commercial customer on Rate GLP-1 will experience a 5 to 9% increase on a total bill basis. For a larger commercial customer on Rate GLP-3, the increase is 4 to 7%.

Q. Can you explain generally the changes that have occurred since the last rate case?

A. First, although some of the inflation since the COVID period has lessened, we continue to see increases in the costs of materials and equipment, and of labor over that time. To remain competitive in attracting and retaining our employees, we conducted a Wage &

Salary Study in 2024, the results of which are being phased-in over three years (2025 through 2027). The combined impacts of the material cost increases and labor expense increases have increased our Operations and Maintenance ("O&M") expenses by approximately $1.3 million over the expenses reflected in our prior case. In addition, we continue to invest in improvements to our facilities, adding approximately $4.5 million to our net rate base, which to date has not been reflected in our rates. These increases to expenses and rate base have been offset by some increases to our revenues from customers; however, not enough to continue earning a fair return. Mr. Gorman's Exhibit__(HSG-1), Schedule C5-1 calculates how the major elements of our rates have changed since the 2022 settlement.

Without rate relief, we are projected to earn only 1.46% on our rate base in 2026. This clearly is inadequate for any business and will not support our ongoing investments in the system that are needed to continue providing safe and reliable service. Mr. Gorman's Exhibit__(HSG-1), Schedule C1 calculates the rate of return for Citizens' with and without the rate increase requested in this proceeding.

Q. Please discuss the Wage & Salary Study undertaken by Citizens' and C&T 2024.

A. In 2024, Citizens', along with its affiliates in the C&T Enterprises, Inc. family of companies, conducted wage and salary reviews for all non-bargaining positions employed through C&T. This included all positions at Citizens' Electric. A consultant was engaged to facilitate a review of the 105 affected positions by a team comprised of executive management from each affiliated company as well as human resources and legal counsel from C&T Shared Services. The team assessed each position using a quantitative matrix of expertise, leadership, accountability, problem solving, and communication factors to

determine the internal equity of positions and place them in appropriate pay grades. The consultant then brought in external market data from the National Rural Electric Cooperative Association (NRECA), Economic Research Institute (ERI), and American Gas Association (AGA) to align internal salary grades with current labor markets. A final review of grades and associated market salary ranges identified, evaluated, and corrected any outlier positions.

Upon completion of the study, the management team assessed the total magnitude of disparity between current and market wages for all positions to identify a reasonable implementation strategy. The team concluded that an overall 3-year implementation goal was appropriate, with each company given the discretion to manage market adjustments for each employee based on the total disparity to market, performance history, and experience on an individual basis. Citizens' applied the first round of market adjustments effective January 1, 2025. Ms. Stauder's testimony provides an exhibit showing the annual impact on operating expense of the planned implementation.

SMALL UTILITY ISSUES AND COMPANY PERFORMANCE

Q. Do you classify Citizens' as a small utility?

A. Yes. As I mentioned previously, Citizens' serves over 7,200 customers. I further note that in their Direct Testimony, Company witnesses Dylan D'Ascendis and Ryan Kucan of ScottMadden, Inc. conduct a market capitalization analysis showing Citizens' to be a small public utility relative to their comparison group.

Q. As a small, privately-held utility, does Citizens' face any unique financial challenges?

A. Yes. As explained in Mr. D'Ascendis' and Mr. Kucan's testimony, small utilities face increased financial and business risks. A significant risk we face is the reduction of electric load due to business closures or other factors outside of our control that adversely impact our kWh sales (such as weather, net metering, customer on-site generation, etc.). Citizens' capital investment and operating expenses that are necessary to maintain service and reliability remain the same or continue to increase whether we lose customers or distribute less kWh; however, our operating income is decreased. Small utilities also experience greater revenue swings and variation based on weather patterns. Finally, at times, the costs of complying with regulatory requirements can have greater impact on Citizens' than it would on larger EDCs.

Q. Can you discuss the risk of customer loss that Citizens' faces as a small utility?

A. Yes. Approximately one-third of Citizens' load is large commercial and industrial, with 10 of our largest customers representing approximately 23% of our total kWh sales. In the current economic environment, we view a portion of that load as having a high potential risk of closure or relocation. As an unfortunate and actual example, when one customer, Pennsylvania House Furniture ("Pennsylvania House"), ceased operations in Lewisburg at the end of 2004, Citizens' suffered the substantial loss of approximately 5.4% of annual revenues. We had a similar loss in late 2021, when RR Donnelley stopped production in Lewisburg. This reduced our load by 7,104,000 kWh. A portion of the RR Donnelley loss was offset in the last case by adding a new hotel; however, overall, we saw a decrease. Although we are not projecting a loss similar to the RR Donnelley closure in this

proceeding, such events are unpredictable by Citizens' and outside of our control. We face the risk of losing a larger account at any time.

Q. Is Citizens' facing other variables that could reduce anticipated distribution revenues?

A. Yes. We face load variability risks due to solar net metering and energy efficiency efforts. In fact, from 2022 to the current case, we are actually projecting to lose approximately 5,000,000 kWh in sales despite having more customer accounts. *See* Exhibit__(HSG-1), Schedule C5-1.

Q. Can you explain how regulatory requirements can have a magnified impact on smaller utilities?

A. First, let me express our appreciation to the Commission and the General Assembly for recognizing in many instances where smaller utilities should have flexibility in meeting certain regulations and policies. The General Assembly exempted Citizens' and Wellsboro from the mandatory Energy Efficiency and Conservation Plans and from Smart Meter requirements. Similarly, the Commission has allowed us flexibility in designing our DSP plans. In addition, the Commission recently adopted revised regulations for rate case filing requirements that will enable us to request increases of up to $5 million without compiling all of the lengthy requirements set forth in Section 53.53 of the regulations. Because the new regulations have not yet been published in the *Pennsylvania Bulletin*, we used our best efforts in this filing to respond to the old Section 53.53 requirements where we could.

For some items, however, we have the same requirements as the larger EDCs. One requirement is Net Metering. Because of our small size, we have fewer customers to offset

any lost distribution revenues from net metering. The impact of virtual net metering or an oversized net metering project is greater on a smaller EDC than on larger EDCs.

Q. How do you recommend the Commission should address the additional risks faced by small utilities?

A. In my opinion, it is reasonable for the Commission to address this risk through an appropriate overall return on our investment through distribution rates. For the rate of return, the Commission should adopt the recommendation of Mr. D'Ascendis and Mr. Kucan.

Q. Regarding the Company's rate of return, did Mr. D'Ascendis and Mr. Kucan propose any adjustments?

A. Yes, they proposed both a small company adjustment and a performance adjustment.

Q. What are the bases for the small company and performance adjustments proposed by Mr. D'Ascendis and Mr. Kucan?

A. I have already discussed the Company's size, which forms the basis for the proposed small company adjustment. For the performance adjustment, Mr. D'Ascendis' and Mr. Kucan's testimony cites to Section 523 of the Public Utility Code, which provides the Commission's guidelines for performance adjustments. I am advised by counsel that the Public Utility Code identifies several criteria to be considered in assessing the performance of a fixed utility for purposes of a performance factor adjustment, including consideration of any relevant and material evidence of efficiency, effectiveness, and adequacy of service. The Commission should consider Citizens' operations as supportive of the proposed performance adjustment, including the following:

- **Low customer complaints.** For the period 2022-2024, Citizens' received no formal complaints and 22 informal complaints, resolved in an average resolution period of 24 days. Of the 22 informal complaints, 18 were requests for Commission issued payment arrangements. The remaining 4 related to billing disputes, all of which were dismissed by BCS staff. A spreadsheet tracking the formal and informal PUC complaints and resolution timeframes for the period 2022-2024 is attached as Exhibit__(NJ-1).
- **Favorable customer feedback.** We consistently receive very favorable evaluations and comments from our customers, with over 90% of customers providing a 'Very Satisfied' rating on the past three years' Annual Customer Contact survey.
- **High responsiveness: customer support calls.** Records from the Commission's Quality of Service System attached as Exhibit__(NJ-2) show Citizens' has answered, on average, more than 97% of customer phone calls within 30 seconds. Citizens' has been and remains very responsive to customer inquiries.
- **High responsiveness: energizing new service locations.** The spreadsheet attached as Exhibit__(NJ-3) demonstrates that new service locations are energized, on average, within four days of receipt of an approved cut-in card from an electrical inspector.
- **Excellent reliability metrics.** The PUC's *Pennsylvania Electric Reliability Report 2023* (the latest report available), shows that Citizens' has maintained the lowest 3-year average CAIDI, SAIFI and SAIDI of all Pennsylvania EDCs. Exhibit__(NJ-

4) contains *Appendix A – Electric Reliability Metrics* from the PUC's 2023 report, showing Citizens' performance for the 2023 calendar year and 3-year average.

- **Zero reportable injuries.** Citizens' had zero reportable injuries in 2024, as demonstrated by the OSHA Form 300A attached as Exhibit__(NJ-5).
- **Technology adoption: SmartHub use.** A total of 3,210 customers, representing 3,863 accounts (over half of Citizens' total accounts) are now using SmartHub to receive and/or pay their bills electronically, analyze detailed usage reports, report and check on outages, and conduct other business with the Company via a mobile application or the website. SmartHub provides significant customer convenience and is available 24 hours a day.
- **Technology adoption: tablets for line crews.** With tablets provided to line crews, the crews are able to complete inspections, report some types of work completed, view up-to-date system maps, view live analysis of outages, access online material safety information, consult company safety and procedures manuals, complete time sheets, and view live system, customer and right-of-way records. This is a significant asset to the crews and increases their efficiency, safety, and knowledge.
- **Increased pole attachment billing.** Citizens' continues to update its pole attachment fees annually since implementing the FCC cost formulae in 2022. The Company is currently assessing the value of a system-wide one-time or programmatic audit of attachments to capture undocumented attachments and other violations, further shifting costs from ratepayers to the organizations actually incurring attachments-related costs.

- **"Tree Line USA" designation.** The Company has been recognized by the National Arbor Day Foundation as a "Tree Line USA" utility for the 23rd consecutive year. This recognition acknowledges Citizens' commitment to proper tree pruning techniques which result in a more efficient vegetation management program and healthier trees. Exhibit__(NJ-6) contains a recent press release documenting this designation.
- **Significant capital investment.** As discussed below, Citizens' continues to invest approximately $1.9 million annually in system replacements and improvements. Exhibit__(NJ-7) shows three years of capital results. These investments were funded from base rates, without assessing a Distribution System Improvement Charge upon customers.

CITIZENS' CAPITAL PROJECTS

Q. Could you please describe some of the distribution system projects Citizens' has completed since the Company's last rate case?

A. In addition to ongoing maintenance and operations, the Company has invested in capital improvements. These plant investments were in the form of replacing aged poles, increasing conductor size to provide greater operating flexibility and reliability, replacing underground cable, reconductoring to increase capacity and reliability, replacing first-generation smart meters, and relocating lines for reliability improvement. Additionally, Citizens' has completed numerous small line extensions and upgrades.

Q. Please provide some examples of projects that the Company is undertaking in 2025 and 2026.

A. Significant capital projects for our Future Test Year and Fully-Projected Future Test Year include:

- **Neutral Reconductoring along Route 15.** The Company has budgeted $15,000 each in 2025 and 2026 to upgrade the neutral conductor on the main supply circuit to the southeastern extent of the service area. This will allow full utilization of the capacity of the existing three-phase primary conductors in the area.
- **Recloser Replacements.** The Company budgeted $67,000 to replace single-phase reclosers and older-style three-phase reclosers with new electronic vacuum reclosers ("VCR") in 2025 and 2026. The new VCRs will be installed in lieu of preventative maintenance on the Company's existing fleet of single-phase and three-phase hydraulic oil circuit reclosers ("OCR"), which are nearing end-of-life. This will provide both a cost and operational benefit by reducing maintenance needs and increasing reliability.
- **Underground Cable Reconductoring in Weiser Heights Development.** This project upgrades 1970s vintage cable and will ensure continued reliability for customers. The Company has budgeted $65,000 in 2025 for this project and $100,000 in 2026. Recognizing the limited, remaining life expectancy of the 1970-vintage direct buried, underground, high voltage cables, the Company plans to continue a systematic cable replacement program.
- **Three-Phase Relocation along Glover Hill Rd.** The Company has budgeted $150,000 in 2025 to relocate an inaccessible three-phase circuit along Glover Hill Rd. This project will

also address replacing several poles that have failed recent inspections and moving them along the road.

Q. Do you anticipate that the rate of capital improvements will continue?

A. Yes, Citizens' has a 5-year work plan that includes additional improvements. A copy of our 5-year work plan is included in the filing as Citizens Confidential Exhibit 2.

Q. Please discuss Citizens' vegetation management program.

A. Citizens' annually inspects all of its approximately 160 miles of overhead line to assess vegetation management needs. Most of our scheduled vegetation management is accomplished by an outside contractor. We solicit bids for vegetation management and specify to the contractor the total miles to be accomplished. Prior to the contract year, we establish a specific schedule for projects based on a number of factors, including identification of priority trees.

For 2025, we are increasing our vegetation management expenses by approximately 6% over 2024 to address faster than expected regrowth and increased efforts to identify and remove emergent hazard trees. This will be an ongoing increase to our historic performance to reflect both operational realities (i.e., faster regrowth) and the Commission's emphasis on vegetation management efforts to enhance reliability. Additionally, 2025 bids for the tree trimming contract indicate that significant price increases can be expected in future years; Exhibit__(NJ-8) demonstrates this trend. For 2026, we have increased our budget forecast for tree trimming work by 81% in anticipation of these cost increases.

Q. Is Citizens' using technology to assist with vegetation management?

A. Yes. In 2023, we conducted a pilot project with an outside vendor to conduct drone inspections of our system. Beginning in 2025 and for the subsequent years, we are contracting with a vendor to conduct drone inspections of our facilities. This program will assist us in identifying conditions that are not readily apparent from a ground-level inspection. Also, the company is evaluating various digital tools to increase the efficiency and accuracy of conducting and documenting vegetation management inspections.

Q. Does Citizens' O&M and Capital spending vary from quarter to quarter during the year?

A. Yes. Due our small size, Citizens' can only work on a limited number of projects concurrently. Since work on budgeted projects is typically continuous from start to finish, spending tends to reflect any individual major projects under way at the time. For example, when a major line reconductoring project is under construction, it may require 75% or more of the workforce on a typical day. The result is that spending during that time will be predominantly Capital. Upon completion of the project, the workforce may move on to I&M inspections, at which point spending will shift towards O&M. This is also true of contracted work, such as tree trimming or underground cable replacement. In addition to an inherently low volume of concurrent work, weather also drives certain patterns in spending. Major projects tend to be completed in the shoulder months when favorable weather and low demand allow for uninterrupted work and greater flexibility in load transfers. During winter and storm season, smaller projects or I&M inspections provide work that requires little switching and can easily be put on hold during foul weather or outage restorations.

Q. Are Citizens' operations, maintenance and replacement practices resulting in safe, adequate and reliable service to customers?

A. Yes. Citizens' traditionally has among the best SAIDI (System Average Interruption Duration Index – measures average outage duration time for every customer served), SAIFI (System Average Interruption Frequency Index – measures average frequency of interruptions for every customer), and CAIDI (Customer Average Interruption Duration Index – measures average restoration time for every customer who lost power) among Pennsylvania electric utilities.

PROPOSED TARIFF CHANGES

Q. What changes does Citizens' propose to make to its tariff as part of this filing?

A. In preparation for this filing, the Citizens' management and staff reviewed each provision in the tariff to determine where updates or changes may be appropriate.

One important issue that we are clarifying is how customers with smaller on-site generation resources will be placed on distribution rate schedules and billed for service. We also have some clarifications to tariff rules.

Q. Please provide an overview of the changes to address customer-generators.

A. Since the adoption of the Alternative Energy Portfolio Standards ("AEPS") Act in 2014, Pennsylvania has been focused on issues surrounding "customer generators", which are defined as:

> A nonutility owner or operator of a net metered distributed generation system with a nameplate capacity of not greater than 50 kilowatts if installed at a residential service or not larger than 3,000 kilowatts at other customer service locations, except for customers whose systems are above 3 megawatts and up to 5 megawatts who make their systems available to operate in parallel with the electric utility during grid emergencies as defined by the regional transmission organization or where a microgrid is in place for the primary or secondary purpose of maintaining critical infrastructure . . . .

Customer generators are entitled to receive "Net Metering" from the electric distribution company.

Until recently, we assumed that customer generators must be classified for distribution and generation purposes based on amount of peak electricity that the electric distribution company supplied to the customer generator's account. However, a recent decision by the Commission in *Petition of UGI Utilities, Inc-Electric Division for Approval of a Default Service Plan for the Period of June 1, 2025 though May 31, 2029*¸ Docket No. P-2004-3049343, et al., indicated that customer generators can be classified for generation purposes according to their peak electricity imported from the EDC or exported to the EDC.

We are proposing to clarify in our tariff that we will use customer generator's net power flow from or onto the Company's distribution system to establish the distribution charges for the account and eligibility for the Generation Supply Service Rate ("GSSR") 1 or GSSR-2. For customers with Billing Demands over 400 kW, the annual cash out will be a weighted average locational marginal price ("LMP").

.

Q. Why is it appropriate to use the net power flow from or onto the Company's distribution system?

A. Using these measures provides an accurate reflection of the Customer's use of the distribution system. From a distribution perspective, we have to plan the same for a customer that is exporting 400 kW to Citizens' as we do for a customer that is receiving 400 kW from Citizens'. In fact, our planning for the export of power to us is more complicated because of potential variability, voltage sags/surges and other issues. It is

equitable to charge a customer exporting 400 kW to us similar to how we charge a customer that uses 400 kW.

In the recent *UGI Electric* Order, the Commission determined that is appropriate to treat these customers similarly for generation supply services. For Citizens', this will ensure that we apply a uniform definition of "billing demand", which is used in our distribution rate schedules and the GSSR-1 and GSSR-2 Riders.

Q. Please discuss the tariff changes to implement this proposal.

First, we are proposing to add an explanation in Rule 26—Determination of Billing Demand stating:

> (a) **Billing Demand:** Billing Demand shall reflect the Customer's use of the distribution system, which will be the greater of Gross Generator Rating (kW(AC)) as stated in the generator interconnection application or the maximum demand of the customer during any 15-minute period during the current month.

Second, for GLP-1 and GLP-3, we would modify the 'Billing Demand" sections of each as follows:

> "Billing Demand" is <u>defined in Rule 26(a),</u> but not less than 50% of the highest Billing Demand during the preceding eleven months."

Third, in the "Generation Supply Rates" portion of GLP-1 and GLP-3, we propose to capitalize the two occurrences of "Billing Demand". We would make the same capitalization changes in the GSSR-1 and GSSR-2 Riders, where "monthly billing demand" occurs in the first paragraph of each rider.

Q. Do you have any other changes to the tariff to standardize the definition of Billing Demand?

A. Yes. We are proposing to clarify the "Application of Schedule" sections of GLP-1 and GLP-3 to remove the reference to the customer choosing alternative service voltages.

Finally, for GLP-3, we are specifying that the 50 kW minimum demand is based on the Billing Demand.

Q. Does Citizens' have additional tariff changes?

A. Yes. We have clarifications to Rules 5, 12(b), and 17(b), and a modification to how we will treat seasonal service.

Q. Please provide the clarifications.

In Rule 5, we are changing the phrase "is willing to" to "may".

In Rule 12(b), we are adding language that confirms a Customer's ability to request an in-person meter reading for a charge of $35.00.

In Rule 17(b), we are clarifying the premises owner's responsibility to accurately label meters if there are two or more meters installed at a building.

Q. What changes is Citizens' proposing to seasonal service?

A. Citizens' current seasonal service provisions in Rule 30(B)(2) is confusing for customers and cumbersome for Citizens' to administer. We are proposing to streamline the rule by requiring the premises owner or customer to pay the minimum charge under the tariff for each month the seasonal service is disconnected, as well as the cost of disconnection and reconnection.

Q. Does this conclude your Direct Testimony?

A. Yes.

West Penn (FE)	285	179	257	59.3%	11.0%

*Note: **GREEN** = better than benchmark; **RED** = worse than standard; **BLACK** = between benchmark and standard.*

Performance Benchmark. An EDC's performance benchmark is calculated by averaging the EDC's annual, system-wide reliability performance indices over the five-year period directly prior to the implementation of electric restructuring (1994 to 1998). The benchmark is the level of performance that the EDC should strive to achieve and maintain.

2023 Pennsylvania Electric Reliability Report

Performance Standard. An EDC's performance standard is a numerical value that represents the minimal performance allowed for each reliability index for a given EDC. Performance standards are based on a percentage of each EDC's historical performance benchmarks.

OSHA's Form 300A (Rev. 01/2004)

Summary of Work-Related Injuries and Illnesses

Note: You can type input into this form and save it.
Because the forms in this recordkeeping package are "fillable/writable" PDF documents, you can type into the input form fields and then save your inputs using the free Adobe PDF Reader.

Year 20 24

U.S. Department of Labor
Occupational Safety and Health Administration

Form approved OMB no. 1218-0176

All establishments covered by Part 1904 must complete this Summary page, even if no work-related injuries or illnesses occurred during the year. Remember to review the Log to verify that the entries are complete and accurate before completing this summary.

Using the Log, count the individual entries you made for each category. Then write the totals below, making sure you've added the entries from every page of the Log. If you had no cases, write "0."

Employees, former employees, and their representatives have the right to review the OSHA Form 300 in its entirety. They also have limited access to the OSHA Form 301 or its equivalent. See 29 CFR Part 1904.35, in OSHA's recordkeeping rule, for further details on the access provisions for these forms.

Number of Cases

Total number of deaths	Total number of cases with days away from work	Total number of cases with job transfer or restriction	Total number of other recordable cases
0	0	0	0
(G)	(H)	(I)	(J)

Number of Days

Total number of days away from work	Total number of days of job transfer or restriction
0	0
(K)	(L)

Injury and Illness Types

Total number of . . . (M)			
(1) Injuries	0	(4) Poisonings	0
(2) Skin disorders	0	(5) Hearing loss	0
(3) Respiratory conditions	0	(6) All other illnesses	0

Post this Summary page from February 1 to April 30 of the year following the year covered by the form.

Public reporting burden for this collection of information is estimated to average 50 minutes per response, including time to review the instructions, search and gather the data needed, and complete and review the collection of information. Persons are not required to respond to the collection of information unless it displays a currently valid OMB control number. If you have any comments about these estimates or any other aspects of this data collection, contact: US Department of Labor, OSHA Office of Statistical Analysis, Room N-3644, 200 Constitution Avenue, NW, Washington, DC 20210. Do not send the completed forms to this office.

Establishment information

Your establishment name: Citizens' Electric Co

Street: 1775 Industrial Blvd

City: Lewisburg State: PA Zip: 17837

Industry description (*e.g., Manufacture of motor truck trailers*)
Electric Distribution Utility

Standard Industrial Classification (SIC), if known (*e.g., 3715*)

OR

North American Industrial Classification (NAICS), if known (e.g., 336212)
221122

Employment information *(If you don't have these figures, see the Worksheet on the next page to estimate.)*

Annual average number of employees: 19

Total hours worked by all employees last year: 36185

Annual Tree-Pruning Begins This Week

Citizens' Electric's annual tree-pruning program is expected to begin this week in the Lewisburg area.

Citizens' has awarded its right-of-way maintenance contract to Asplundh Tree Expert, LLC (Asplundh) headquartered in Willow Grove, PA.

Asplundh will attempt to contact customers before beginning pruning work on their properties. The company's tree-pruning professionals possess photo identification and all work vehicles are marked with the company logo.

Asplundh brings experienced personnel, specialized equipment, innovative technology, and logistical resources to help execute successful vegetation management programs. All pruning methods used will follow the ideal method of tree care practice for electric utilities, according to the American National Standards Institute (ANSI).

By keeping the lines clear, Citizens' Electric can provide safer and more reliable service and reduce overall system maintenance costs.

For more information about the company's right-of-way program or planting trees near electric lines,
please contact **Ryan James, Engineering Technician for Citizens' Electric, at (570) 524-2231**.

Tree-Planting Tips

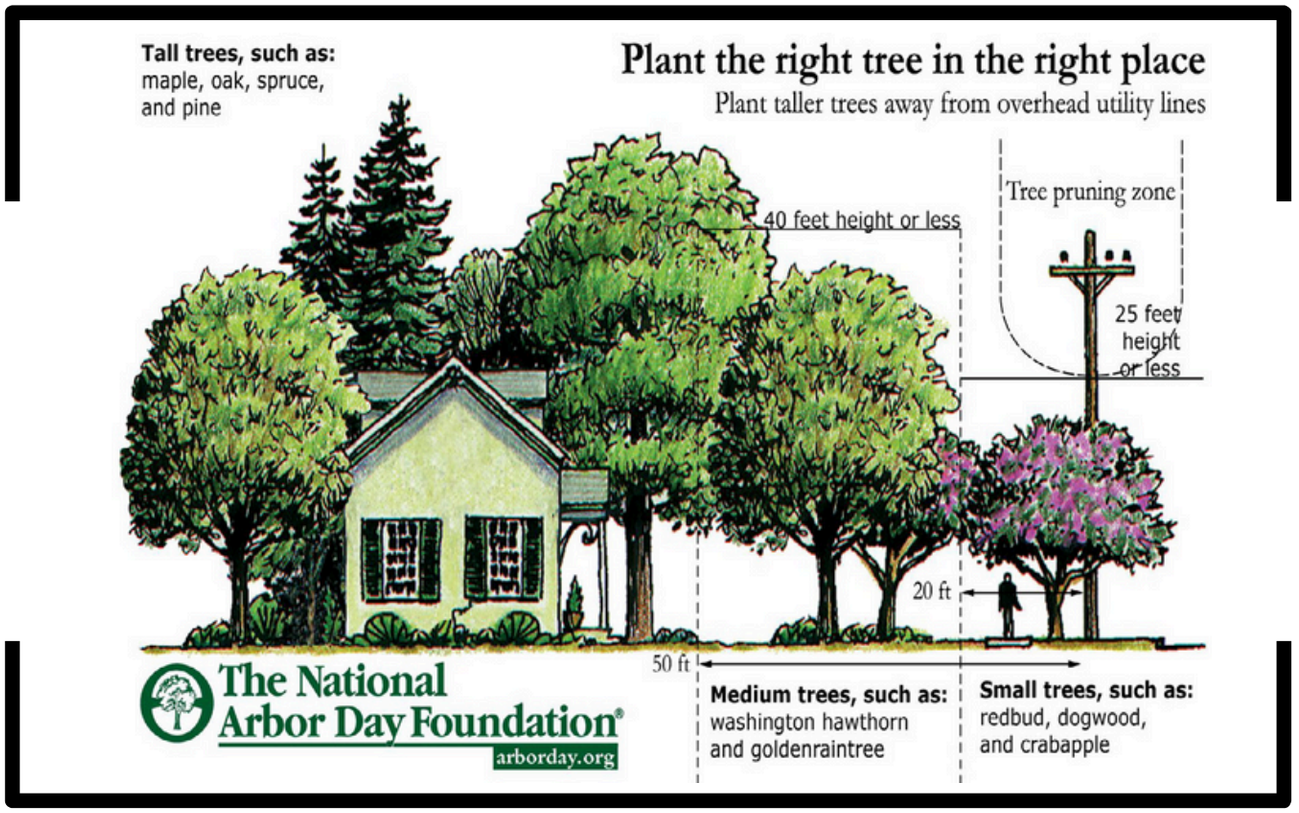
You can help reduce right-of-way maintenance costs by selecting trees appropriate for your yard based on their mature height and proximity to electric lines.

• Plant tall trees far away from overhead lines, and ensure the roots have room to grow and won't interfere with underground lines.

• Plant only smaller trees and shrubs near any electric lines.

• Check to make sure there are no underground power lines where you plan to dig. To do so, call Pennsylvania One Call at 811.

• Trees planted too close to electric lines must be pruned. Your cooperation is appreciated when your trees require pruning. Thank you!



Citizens' Electric Recognized as a Tree Line USA Utility for Over Two Decades

The Arbor Day Foundation's Tree Line USA program helps forward-looking utility providers to be seen as community partners, by outlining best practices in public and private utility arboriculture.

"The Tree Line USA designation reflects our commitment to consistent vegetation-management work using proven techniques," said Citizens' Electric President & CEO Nate Johnson. "Trimming trees adjacent to electric lines is essential to our mission of providing safe, reliable service to our customers. Using methods that promote long-term tree health, minimize property owner impact, and reduce follow-up trimming is the responsible way to accomplish that goal."

NATHAN JOHNSON

ON BEHALF OF

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

AUGUST 13, 2025

BEFORE
THE PENNSYLVANIA PUBLIC UTILITY COMMISSION

Pennsylvania Public Utility Commission	:	
	:	
v.	:	**Docket No. R-2025-3054394**
	:	
Citizens' Electric Company of Lewisburg, PA	:	

REBUTTAL TESTIMONY OF NATHAN JOHNSON
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name and business address.

A. My name is Nathan (Nate) Johnson. My business address is 1775 Industrial Blvd., Lewisburg, Pennsylvania.

Q. Are you the same Nathan Johnson who previously submitted Direct Testimony in this proceeding on behalf of Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company")?

A. Yes. Terms defined in my direct testimony have the same meaning in this Rebuttal Testimony.

Q. What is the purpose of your testimony today?

A. My testimony will respond to the Direct Testimony of the following witnesses:

- Witnesses Keller, Walters, and Farr, representing Bureau of Investigation and Enforcement ("I&E"), Office of Consumer Advocate ("OCA"), and the OSBA"), respectively, regarding their opposition to the Company's proposed Performance and Small Size adjustments used in its return on equity ("ROE") calculations.
- Witnesses Keller, Walters, and Farr, representing I&E, OCA, and OSBA, respectively, regarding their proposed adjustments to the Company's Expense Claims.

- OCA Witness Wise, regarding her recommendations for the Company to implement various changes to its practices related to customer payment arrangements.
- Kelly Road Solar, LLC, Lancaster Avenue Solar, LLC and Twilight Renewables, LLC ("Solar Projects") Witnesses Nolt and Lucas, regarding their opposition to the Company's proposed change to the definition of Billing Demand in its tariff.

PERFORMANCE ADJUSTMENT

Q. Please summarize the parties' positions regarding the Company's proposed performance adjustment. (I&E Statement No. 2 at 48, OCA Statement No. 2 at 78, OSBA Statement No. 1 at 13)

A. Witnesses Walters, Keller, and Farr, representing OCA, I&E, and OSBA, respectively, all recommend that the proposed performance adjustment factor be removed.

Q. How do you respond to this recommendation?

A. Their testimonies, in essence, all imply that the Company is asking for a bonus as a reward for simply meeting its regulatory obligations[1]. This implication ignores the specific examples provided by the Company of performance that *exceeds* regulatory requirements. None of the witnesses dispute any of the examples provided, nor do they comment explicitly on whether the Company's performance exceeds required performance. All three witnesses assert that performance adjustments are not guaranteed, that simply meeting obligations does not warrant a performance obligation, and that they do not believe the Company should be allowed one. The Company agrees that there is no obligation or entitlement to performance adjustments, and that satisfactory performance does not

[1] I&E Statement No. 1 at 51; OCA Statement No. 2 at 79; OSBA Statement No. 1 at 14.

warrant an adjustment. The proposed adjustment, however, is based on *exceptional* performance provided above and beyond regulatory requirements.

Q. Please explain how the basis for the performance adjustment provided in your Direct Testimony represents exceptional performance.

A. The Company's examples of exceptional performance, which were initially presented in my Direct Testimony[2], are further described below:

- Low Customer Complaints

  The Company has not had a single formal or justified informal complaint since its last rate case. Of the informal complaints that were filed, 18 were for payment arrangements and only four were for other issues. This demonstrates the rarity with which customers are dissatisfied with the service that we provide to them, and our record of performance since none of the informal complaints were found by BCS to be justified.

- Favorable Customer Feedback

  Customer satisfaction is not a regulatory requirement, and it is commonly accepted that consumers are more likely to report dissatisfaction than satisfaction. A customer satisfaction rating of over 90% demonstrates that the Company routinely exceeds customer expectations.

- Customer Support Calls

  The Company carefully manages its customer service functions and phone/IVR systems to ensure that customers can always reach an individual when needed. While many companies seek to reduce human interaction in their customer service functions,

[2] Citizens' Statement No. 4 at 9.

the Company recognizes our ratepayers' desire to have an employee available to answer the phone and maintains a system that provides for this service.

- Energizing New Service Locations

  The Company's average time to energize a new service location is less than many other utilities' minimum lead time for scheduling new service energizations. Again, this is based on feedback from our customers and their contractors that they prefer the Company's management of its schedule over other electric distribution companies ("EDC") processes, and the Company working to accommodate our customers and their contractors.

- Reliability

  The Company routinely exceeds the Pennsylvania Public Utility Commission ("PUC") benchmark standards for reliability and, in an absolute comparison with peer EDCs, is consistently one of the most reliable in the state. Service reliability cannot be guaranteed, but the Company is obviously committed to providing exceptional service.

- Zero Reportable Injuries

  Safety of employees, customers and the public go hand-in-hand, so the Company's absence of reportable injuries, not only for 2024, but for the prior decade, indicates an exceptional commitment to safety. This also minimizes costs associated with insurance and damage claims, which can be significant when injuries or accidents occur.

- Technology Adoption

  The Company adopts technology as it identifies opportunities to improve operations or customer service, rather than to fulfill any regulatory requirement. One example of this is the drone inspection program that we are pursuing. Another is providing SmartHub

for our customers. This improves efficiency and keeps customers informed and satisfied.

- Pole Attachments

  The Company has voluntarily undergone an extensive review of its pole attachment fees and annually reviews its attachment licenses, rates and field data to ensure that customers are not burdened by regulatory obligations to share pole space.

- Tree Line Designation

  The Company is one of only 4 designated Tree Line Utilities in Pennsylvania, and the second longest standing. Only 143 utilities nationwide are recognized as Tree Line Utilities. Tree Line designation is indicative of the Company's efforts to pursue best practices that maximize cost efficiency, customer satisfaction, and environmental stewardship.

- Capital Investment

  While capital investment is necessary for all utilities, the Company has continued to fund adequate investment in its system without burdening customers with an additional Distribution System Improvement Charge.

Q. Did the Commission accept a performance adjustment for Citizens' in prior proceedings?

A. Yes, the Commission acknowledged the adjustment in our fully-litigated 2019 proceeding. We urge the Commission to recognize the value of regulatory consistency and certainty by adopting a similar approach in this proceeding.

SIZE ADJUSTMENT

Q. Please summarize the parties' recommendations regarding the Company's proposed size adjustments. (I&E Statement No. 2 at 44, OCA Statement No. 2 at 80, OSBA Statement No. 1 at 14)

A. Witnesses Walters, Keller, and Farr, representing OCA, I&E, and OSBA, respectively, all recommend that the proposed performance adjustment factor be removed. They also contest various other portions of Mr. D'Ascendis' testimony, which I will defer to him to defend in his rebuttal. OSBA Witness Farr also contests the Company's argument for the risk associated with the loss of a large customer.

Q. How do you respond to Witness Farr's assessment of the risk of losing a large customer?

A. Witness Farr acknowledges that the loss of a large customer could reduce the Company's revenues[3]. He goes on to suggest that Company could equally benefit from a new, large customer and that, in general, new customers might offset any losses. Recent history indicates that, in the Company's case, the losses outweigh the gains. The Company has lost several major customers in recent years, and large net metering installations continue to increase in number. In contrast, new load has failed to offset or exceed these losses.

Q. Did the Commission accept a size adjustment for Citizens' in prior proceedings?

A. Yes, the Commission acknowledged the adjustment in our fully-litigated 2019 proceeding. We urge the Commission to recognize the value of regulatory consistency and certainty by adopting a similar approach in this proceeding.

[3] OSBA Statement No. 1 at 21

EXPENSE CLAIMS

Q. Please explain OCA's proposed adjustment to overhead line maintenance. (OCA Statement No. 1 at 16)

A. OCA Witness Meyer opposes the Company's projected increase in costs under FERC account 593[4]. He proposes that historical growth rates be applied, ignoring the Company's explanation for the projected increase.

Q. Do you agree with this recommendation?

A. No, the Company's projected expenses are well supported. Witness Meyer suggests that the Company has offered only a "bald assertion[5]" that costs will increase. To the contrary, the Company explained its reasoning at length, providing three maintenance activities that contribute to the increase and even providing copies of tree trimming bids as evidence. Below, I provide further explanation of each component of the increase:

- Vegetation Management

  Vegetation management represents a substantial maintenance expense for all Pennsylvania EDCs. With trees being, by volume, the most abundant hazard to overhead lines in our service area, it should be no surprise that it is also our largest maintenance expense. Bids for the 2025 trimming contract clearly indicate that prices can be expected to rise dramatically in coming years. To be knowingly under budget for expected tree trimming expenses would be to risk significant consequences to service reliability and employee and public safety.

[4] OCA Statement No. 1, at 16.
[5] OCA Statement No. 1 at 18.

- Drone Inspections

  The Company's drone inspection program is new in 2025 after a 2023 pilot program proved its usefulness. New programs come at a cost, and while it is expected that this program will yield long-term savings, Citizens' will incur expenses in the Future Test Year ("FTY") and Fully Projected Future Test Year ("FPFTY") for the drone program that were not incurred in 2024 (the Historic Test Year ("HTY")).

- Pole Inspections

  The Company's pole inspection program is well established and has been reviewed and approved by the PUC as part of our Biennial Inspection and Maintenance Plan. The Company knows, in advance, how many poles will be inspected and can predict with reasonable accuracy the cost to have them inspected.

  Attached as Exhibit__(NJ-1R) is the annual breakdown of the Account 593 costs.

Q. Mr. Meyer testifies that the Company has not demonstrated that it engages in cost control. Do you have any comments?

A. Yes. In conjunction with his discussion of Account 593, Mr. Meyer comments that he is "struck that there is no discussion of how the Company is exercising cost control.[6]" The Company was asked to provide, in I&E-RE-14-D, an explanation of why costs increased, and the Company did that. Every expense incurred by the Company is also reviewed for cost containment opportunities, from $350,000 tree contracts down to sticky notes in the office. The Company does not describe detailed cost containment activities for its other expense claims, yet Mr. Meyer does not contest these. To demonstrate the Company's

[6] OCA Statement No. 1, at 18.

commitment to cost containment, I will address cost containment activities related to each of the line maintenance expense categories in question:

- Vegetation Management

  Unlike many larger EDCs, which contract vegetation management by circuit or substation and pay per mile, the Company provides a specific layout of desired tree trimming work each year. This allows for a firm-bid contract that is specific to the work performed; bidders do not have to price as much risk into their proposals because they are provided with an explicit work plan. To further increase efficiency, the Company pairs its overhead visual line inspection program with trimming layout, supporting two maintenance goals with one effort.

- Drone Inspections

  The Company piloted its drone inspection plan in 2023 in order to evaluate its effectiveness before committing to a multi-year program. We do expect the program to yield savings, but over a course of several years, not instantly, as Witness Meyer implies it they should. As with Vegetation Management, we also look to gain efficiency with the program in areas outside of its specific purpose. The inspection will provide improved pole location coordinates in remote areas, allow for auditing of pole hardware, and reduce site visits to remote poles via high-resolution imagery . Again, however, these efficiencies will take time to reflect in expenses.

- Pole Inspections

  The Company competitively bids pole inspections and has frequently investigated alternative methods of inspection, and approached vendors about consolidating services such as pole auditing, inspection and drone inspection. Pole inspections have

proven their effectiveness, and the Company's low rate of 'reject' poles shows the benefits they provide to our customers.

WAGE AND SALARY (PAYROLL) EXPENSES

Q. Did OCA propose any adjustment to the Company's Wage & Salary expenses. (OCA Statement No. 1 at 13)

A. OCA Witness Meyer recommends that the Company's payroll expenses be adjusted to reflect an increase of 4%, and that the salaries of the Company's proposed additional hires be removed entirely, resulting in a total reduction in payroll expenses of $116,567.

Q Do you agree with this adjustment?

A No, the proposed adjustment by Witness Meyer ignores the Company's well supported rationale for the increase in payroll expenses and proposes, instead, to replace it with a 4% annual adjustment based on his "…experience that a typical range for annual payroll increases are between 3.5 to 4% per year"[7] without providing any further evidence in support.

Q. Please explain why you believe it is appropriate to include the two additional hires in the Company's revenue requirement.

A. The Company has an obligation to evaluate its workforce and develop a hiring plan to meet the needs of the business and its ratepayers. The two hires in question are replacements for line technicians expected to retire in the years following 2026. Line workers are trained through a rigorous, multi-year apprenticeship which typically requires four to five years to complete. In order to maintain an adequate staff of fully trained line workers, the Company must hire new line workers four years in advance of expected vacancies. The two proposed

[7] OCA Statement No. 1 at 15.

hires are necessary to maintain safe and reliable operation of the Company's distribution system and should thus be included in the revenue requirement for this filing.

Q. Is the 4% annual adjustment of overall payroll expenses by Witness Meyer reasonable?

A. No, the Company has provided extensive support of its Wage and Salary plan, both in its Direct Testimony and responses to various discovery requests by the parties. Based on the study, several of our positions required adjustments to better reflect market conditions, which we are making over two years (the FTY and FPFTY). Our projections also include merit-based increases that we project based on the developmental paths of employees. Finally, we included the impact of an annual base compensation adjustment, which used historic adjustments to project the FPFTY adjustment. Witness Meyer, on the other hand, has provided no support for his adjustment other than his personal experience of 'typical' increases. He rolls all compensation adjustments into his 4% estimate, without examining or disputing our evidence of the separate components that support the FPFTY payroll levels.

PAYMENT PLANS

Q. Does OCA raise concerns with the Company's practices related to customer payment plans? (OCA Statement No. 4 at 10)

A. Yes, OCA Witness Wise expresses concern that the Company does not have metrics in place to track the success of payment arrangements. Witness Wise goes on to state that "[i]n [her] professional opinion, the absence of such oversight may reflect a lack of due

diligence and raise concerns about the company's ability to manage financial risk or make informed decisions regarding customer repayment strategies[8]."

Q. Please respond to these concerns.

A. Ignoring the disparaging tone of Witness Wise's comment, it is also entirely subjective and unsubstantiated. Witness Wise describes her professional background as working with a large telecommunications company. While this is relevant, the practices of a national corporation should not be projected onto a function performed by a single individual at Citizens' Electric, nor is it appropriate to imply that a lack of formalized metrics represents a lack of oversight.

Citizens' actively manages its billing and collection activities, including payment arrangement status. We monitor and follow up on late payments, undertaking outreach to customers who have fallen behind. We work with our payment-troubled customers to connect them with resources to help them. We are financially prudent in our operations.

Q. Does OCA make any recommendations related to payment plans? If so, please explain?

A. Yes, OCA Witness Wise recommends that the Company establish metrics for measuring the success of payment plans, clearly communicate payment options to customers, and goes on to make several specific suggestions about how these changes should be accomplished.

Q. Please provide the Company's position on each of the recommendations made.

A. 1) <u>The Company should establish metrics for measuring success.</u>[9]

The Company's manager of customer service individually assesses, negotiates, and approves each payment arrangement, and is equally personally aware of the success of

[8] OCA Statement No. 4 at 12.
[9] *Id.* at p 12, ln 7.

failure of each arrangement. As provided in the Company's response to OCA-VI-17, there were 82 customers on payment arrangements as of June 9, 2025. Complex metrics are not necessary for a single individual to assess the success of a relatively small number of arrangements. Furthermore, Witness Wise assumes that payment arrangements fail because the customer cannot afford the payment. In my experience, factors other than the inability to pay are often the reasons that the arrangements fail. Finally, contrary to Witness Wise's implication that the Company does document how Federal Poverty Income Guidelines ("FPIG") are used and terms calculated, the Company provided this information to OCA in its response to OCA-VI-16.

2) The Company should make sure payment options are clearly communicated.[10]

The Company does this already, and Witness Wise does not suggest anywhere in her testimony that customers are inadequately informed of their options, so no change is necessary.

3) The Company should maintain internal controls.[11]

The small quantity of customers enrolled in payment plans allows the Company to assess requests individually and use its discretion to "tailor payment obligations in line with a customer's financial means[12]" as acknowledged by Witness Wise. Rather than providing additional benefits to customers, the Company believes that establishing rigid controls would limit the ability of the Company to accommodate customers' needs in a manner mutually beneficial to the individual customer, and other ratepayers in general.

[10] *Id.* at p 12, ln 10.
[11] *Id.* at p 12, ln 13.
[12] *Id.* at 11.

4) The Company should consider separating plans by income levels.[13]

This suggestion would result in breaking payment arrangements into quantities too small for statistically relevant analysis. As of July 22, 2025, there are 63 customers on payment arrangements, broken down into the four FPIG categories used, there would be 15 or less arrangements in some categories, rendering any analysis broken out by income level volatile and ineffective. Based on OCA's line of questioning in its discovery requests, such a breakdown may correspond well to their established means of analyzing payment arrangement programs but would provide little value to the Company or its ratepayers.

5) The Company should routinely evaluate its payment arrangements.[14]

As with (2), above, the Company already does this, and Witness Wise does not suggest otherwise except to imply so with her recommendation. No change is necessary.

Q. Please summarize your responses to Witness Wise.

A. The Company's payment plan process is working well and does not need the "enhancements" suggested by the OCA. Our staff is small and keeps watch over the billing and collection processes, including payment plans. We adhere to the Commission's guidelines. No additional protocols, policies, or reporting are needed.

[13] *Id.* at 12.
[14] *Id.* at p 12, ln 15.

BILLING DEMAND FOR CUSTOMER-GENERATORS

Q. Have you reviewed the Direct Testimony provided by Mr. Nolt and Mr. Lucas on behalf of Kelly Road Solar, LLC, Lancaster Avenue Solar LLC, and Twilight Renewables, LLC?

A. Yes. Like any change in rate application or design, the proposal will impact each customer separately depending on their circumstances. As the utility, we are seeking to treat all customers fairly and to charge our customers an appropriate portion of the distribution costs. We also believe that categorizing customer-generators appropriately for the default service rates is necessary to prevent GSSR-1 customers from paying unreasonable subsidies to sophisticated businesses that install on-site generation.

Q. Is the Company instituting a new demand charge for generators? (SP Statement No. 1 at 12, 13)

A. No, Mr. Nolt's testimony misconstrues the nature of the tariff change. All non-residential customers currently pay a demand charge, including customer-generators. The Company's proposed tariff change will result in increased demand charges for some customer-generators, particularly those generators that are producing substantially more than they consume in real time, or that do not offset any non-generation load at all.

Q. Do you agree that this change will prevent any new net-metered generation of greater than 400 kW[15] Gross Generator Capacity? (SP Statement No. 1 at 5)

A. No, it may be true that this change will dissuade Twilight Renewables from further projects of this size in the Company's service area, but the viability of Mr. Nolt's projects is not representative of all potential customer-generators. For example, if a GLP-3 customer with

[15] For the purposes of this testimony, kW refers to *alternative current kilowatts (*kW(AC)) unless otherwise noted.

demand already exceeding 400 kW were to install a solar array to offset a portion of their load, they would see little, if any, increase in demand charges, no change in energy rates, and may achieve substantial savings. Mr. Nolt's business model appears to focus on one business strategy; however, other strategies exist where a customer-generator takes advantage of net metering.

Q. Please discuss your understanding of Mr. Nolt's projects in the Citizens' territory.

A. In discovery, we asked Mr. Nolt for more information regarding the projects that he has completed or that are under development in our territory. Attached as Exhibit__(NJ-2R) are discovery responses to Citizens-SP II-1 and 8 that describe the projects. One of the completed projects is owned by the host customer at an agricultural site. For the other five, the host customer will provide Mr. Nolt and/or his investors with a roof lease to install and operate the solar array. Mr. Nolt indicates that the size is based primarily on the available roof space.

Q. You previously stated that Twilight Renewables pursues a specific business model. Do other customer-generators use different business strategies?

A. Yes. The customer has the option to install any size of generation for net metering, up to 3 MW. Some customer-generators determine the size of their solar array based on the amount of rooftop area or land that is available or conducive to solar. Other customers may pursue solar generation due to non-monetary motivations such as sustainability accreditations. Other customer-generators pursue the strategy of installing large generation facilities with little or no load at the site.

Moreover, customer-generators are not limited to solar generation. Other fuel options have much higher availability factors.

Q. Can you calculate the distribution cost impact of the proposal for other business strategies?

A. Yes. The table below, supported by Exhibit NJ-3R shows how distribution cost responsibility may be impacted for other strategies. For this example, I am focusing solely on the monthly customer and demand charges, without any kWh distribution charges included. I also am assuming that the customer's onsite usage peak does not occur coincident with operation of the on-site generation. Finally, I have used the demand rates that reflect approval of the Billing Demand definition, as calculated by Mr. Gorman's rebuttal testimony (Citizens' Statement No. 1R at 5).

	Combined Customer & Demand Charges			
Customer-Generator Description	Existing Demand / Present Rates	Existing Demand / Proposed Rates	Proposed Demand / Proposed Rates	Monthly / Annual Difference
50 kW Import 50 kW Gen GLP-1	$ 176 /mo $ 2,108 /yr	$ 183 /mo $ 2,194 /yr	$ 211 /mo $ 2,526 /yr	$ 28 /mo $ 332 /yr
50 kW Import 150 kW Gen GLP-1	$ 176 /mo $ 2,108 /yr	$ 183 /mo $ 2,194 /yr	$ 590 /mo $ 7,074 /yr	$ 407 /mo $ 4,880 /yr
150 kW Import 75 kW Gen GLP-3	$ 741 /mo $ 8,896 /yr	$ 958 /mo $ 11,492 /yr	$ 958 /mo $ 11,492 /yr	$ 0 /mo $ 0 /yr
400 kW Import 500 kW Gen GLP-1	$ 1,182 /mo $ 14,189 /yr	$ 1,203 /mo $ 14,436 /yr	$ 1,916 /mo $ 22,992 /yr	$ 713 /mo $ 8,556 /yr
5 kW Import 480 kW Gen GLP-1	$ 35 /mo $ 416 /yr	$ 40 /mo $ 479 /yr	$ 1,840 /mo $ 22,082 /yr	$ 1,800 /mo $ 21,603 /yr
5 kW Import 1000 kW Gen GLP-1	$ 35 /mo $ 416 /yr	$ 40 /mo $ 479 /yr	$ 3,811 /mo $ 45,732 /yr	$ 3,771 /mo $ 45,253 /yr

As this demonstrates, the impact of the change depends on the customer-generator's configuration. The example that is especially troubling is the distribution cost responsibility for the customer-generator with 1000 kW Gross Generator Capacity and only 5 kW Imported Demand at the current rates. While we do not have customer-generators

like this yet, we are aware of many such projects in other electric distribution company territories. It is prudent to implement the requested change now so we can ensure appropriate distribution charges if a customer-generator chooses to interconnect a project like this in our territory.

Q. Mr. Johnson, have you reviewed Mr. Nolt's "case study" provided with his testimony?

A. Yes, Mr. Nolt's case study does calculate a reasonably accurate increase in demand charges resulting from the proposed change to Billing Demand, albeit through flawed calculations. His conclusion regarding the impact of the Billing Demand change on the finances of example projects is also misleading. I have performed an analysis of Mr. Nolt's Exhibit BN-1, attached as Exhibit NJ-4R, and describe my findings below. The analysis incorporates the updated proposed rates provided in Mr. Gorman's testimony (Citizens Statement No. 1R at 5).

First, regarding the increase in demand charges, Mr. Nolt's testimony claims an increase of $4,788 annually ($7,908 - $3,120)[16], which equates to an average monthly increase of $399. This approximately matches my calculated average increase of $402/month, or $4,891 annually using the originally proposed rates. Using the updated proposed rates, this increase is reduced to $338/month, or $4,054 annually. Although his ultimate conclusion was reasonable, his method of calculating demand charges is inherently flawed. Mr. Nolt uses *average* demand only to determine annual charges, which is not an accurate method of calculating costs that are based on *peak* demand. Similarly, Mr. Nolt determines his generation rate by calculating individual PTC prices from January 2014 through February

[16] SP Statement No. 1 at 4.

2024 without weighting for the length of time each price was in effect or seasonal variation in SPV output.

Second, Mr. Nolt's concluding analysis of the project finances projects an annual loss of $6,082 ($29,050 – $22,968). He asserts that customer-generators "below 400 kW that are offsetting usage will be unable to adequately service debt payments as well due to the 153% increase in distribution costs.[17]" This ignores the fact that even if his calculated annual distribution increases of $4,788 were returned, he would still be operating at an annual loss of $1,294. I find it unlikely that a commercial solar developer would install a project that, at year-one rates, would result in a $68,000 loss over of the life of the project ($1,294 x 25 years plus 10% down payment). Either the example provided neglects to include expected revenues (or savings/credits), or the project is not financially viable regardless of the proposed tariff change.

Q. Does the Gross Generator Capacity of a solar array have to exceed an existing customer's peak demand in order to offset that customer's annual kWh usage?

A. Not necessarily, different customers have different load characteristics. The existing load in Mr. Nolt's exhibit has a 'load factor' (the ratio of the actual kWh consumed or generated against the total potential kWh consumed or generator over a specific period of time—one year, in this case) of approximately 50%. As load factor increases, more kWh consumption occurs for the same peak demand. Customer load factors can vary widely, as can the load factor of different generation sources.

For customer-generators planning to offset their annual usage, the relationship between the output capacity of their generation system and their existing peak load will depend on the

[17] SP Statement No. 1 at 5.

relative load factors of their chosen generation source and their existing load. Mr. Nolt's assertion that customer-generators must install generation with Gross Generator Capacity significantly exceeding existing peak demand is incorrect, it may be true for the generation source (solar) that he provides and the consumption (poultry barns in all cases referenced) he seeks to offset, but should not be assumed to be true for all potential customer-generators.

Q. Please explain the relevance of load factor for generation sources.

A. Solar generation has a relatively 'poor' load factor, meaning that the total kWh output of the generation system is low compared to the potential output if it were able to operate at maximum capacity at all times. This is an inherent characteristic of solar generation, as it can only generate during daylight hours, and even then only approaches its Gross Generator Capacity for a few hours each day. Other generation sources have different load factors, driven by the characteristics of the generator, availability of fuel (or environmental energy source), and the operating needs and preferences of the customer-generator. Reservoir hydropower, for example, could be expected to maintain a much higher load factor. The energy source is large and can be proactively managed, and the generator can run at all times of the day. Also, biomethane or landfill gas generators use animal or landfill waste, which can have higher load factors. Wind power is also eligible for net metering under the Commission's regulations.

Q. Mr. Nolt's Exhibit BN-1 includes two "options" for future projects. Please summarize the options suggested by Mr. Nolt.

A. Mr. Nolt includes the following "options":

Option 1: Reduce the tariff distribution rate by 55% to $2/kW for all net-metered systems (both grid supply and usage customers), to keep costs neutral for customers with/without solar and have everyone "pay their fair share";

Option 2: Change back the billed (sic) demand definition since 100% usage net-metered solar has very little electric demand impact. This option is preferred due to the fact that a customer that only has a demand of 200 kW normally will need a >400 kW Solar Array to offset 100% of their usage, and then their account will get kicked into time of use, which adds a lot of complexity to Net Metering, and are harder to educate customers and banks on. Language will need to be added to encompass systems that produce >200% of usage (grid supply) will need to pay $2/kW.

Q. Do you agree that any modifications made to accommodate Mr. Nolt's concerns should apply only to "future projects"?

A. No. The underlying reasons for the changes that we have proposed do not depend on whether the customer-generator's system was installed before our April 30, 2025 filing or after the April 30, 2025 filing. The Commission should not create a special class of customer-generators based on the filing date or based on the effective date of the tariff change.

Q. Please address Mr. Nolt's Option 1.

A. This option requires us to maintain a separate distribution rate for accounts with customer-generators and is not acceptable. We do not support creating a new distribution customer class and separate rate for the customer-generators. Additionally, the $2/kW rate was apparently chosen in order to neutralize the effect of the proposed billing demand change, without regard for actual cost-of-service principals.

Q. Please discuss Mr. Nolt's Option 2.

A. Option 2 essentially requires Citizens' to abandon our proposal for customer-generators that produce less than 200% of the host account's annual usage. It appears, however, that Mr. Nolt would allow us to implement it for customer-generators that exceed that threshold. We do not see a legal or cost of service basis to make this distinction in the application of the proposal.

Q. Is Citizens' willing to phase-in the proposal over multiple years to mitigate the immediate impact on the distribution costs for non-residential net-metered accounts?

A. Yes. We are willing to modify the tariff definition to indicate that 70% of Gross Generator Capacity will be considered in 2026 (Year 1), 85% of Gross Generator Capacity will be considered in 2027 (Year 2), and 100% of Gross Generator Capacity will be considered in 2028 (Year 3). The modified definition is as follows:

> (a) **Billing Demand:** Billing Demand shall reflect the Customer's use of the distribution system, which will be the greater of Gross Generator Rating (kW(AC)) as stated in the generator interconnection application or the maximum demand of the customer during any 15-minute period during the current month.
>
> *(i) For the purposes of determining the applicability of the GSSR-1 or GSSR-2, the Billing Demand definition shall apply effective January 30, 2026.*
>
> *(ii) For the purposes of calculating distribution charges under Rates GLP-1 and GLP-3, the following provisions shall apply:*
>
> *(i) For calendar year 2026, the Gross Generator Rating shall be reduced by 30% in calculating the Billing Demand.*
>
> *(ii) For calendar year 2027, the Gross Generator Rating shall be reduced by 15% in calculating the Billing Demand.*
>
> *(iii) For calendar year 2028 and beyond, there shall be no reduction to the Gross Generator Rating in calculating the Billing Demand.*

Q. Why is it important to specify the phase-in in the tariff language?

A. Specifying the phase-in in the tariff language will ensure all customer-generators, customers considering a project and project developers understand that the Billing Demand will change in the subsequent years.

Q. Both Mr. Nolt and Mr. Lucas assert that Citizens' has not demonstrated that it faces increased costs from having a customer-generator on its system. Do you have any comments?

A. First, Citizens' is not proposing to create a new distribution rate to reflect solely the distribution costs that are specific to non-residential customer-generators. Rather, we are apportioning a fair share of distribution-related costs to the net-metered accounts based on their use of the distribution system and company facilities. We are treating them like other customers by asking them to pay appropriate portions of distribution O&M costs, joint and common costs like the billing system, and the return on the Company's distribution system facilities. Without their contribution to those costs, more will be required to be paid by the other customers on the system.

Second, I disagree with the implication that a customer who installs on-site generation with capacity that exceeds the historic account generation demand is not changing its use of the distribution system. The customer is placing a new obligation on Citizens' and on the distribution system by exporting more energy than it previously imported, and then expecting the return of the "banked" excess supply on-demand.

Finally, the Company does not argue that generation, by nature, creates additional costs compared to consumption of a similar magnitude. Rather, we seek to treat all utilization of the distribution system equally, regardless of the direction in which power flows.

Q. Why is it important to make the change at this time?

A. First, we are following the Commission's decision in the UGI case currently pending before the Commission. The Commission adopted essentially the same proposal for the net metering crediting and annual cashout of UGI hourly default service customers. Although

the demand threshold is different, it is essentially the same and the precedent should be followed here, especially for administering the net metering billing credit.

Second, new technologies continue to be introduced that are changing the nature of the distribution system. There is an increasing expectation that the distribution utility will accommodate Distributed Energy Resources ("DERs"), electric vehicles and other advancements. In this environment, it is important to evaluate how distribution costs will be collected among ratepayers who adopt those technologies and ratepayers that do not adopt those technologies.

Third, it is especially important at this time to ensure that larger customer-generators over 400 kWAC are being credited and compensated under the GSSR-2 rate. Mr. Nolt's testimony discusses the historic difference between the GSSR-1 price to compare ("PTC") and the average LMP that is relied upon for the GSSR-2. Our GSSR-1 PTC is expected to increase further over the upcoming years due to the rising capacity prices in the PJM markets. Ensuring that the customer-generators with Billing Demands over 400 kW are accounted for as GSSR-2 accounts will ensure that any cashout is reflected in the reconciliation for the GSSR-2 class, rather than the GSSR-1 class. This will reduce costs paid for by the GSSR-1 class, which includes residential customers.

Q. Would a phase-in apply to the generation charges and net metering cash-out?

A. No. Given the impending wholesale generation cost changes that will be impacting the GSSR-1 PTC, it is important to implement the generation portion of the proposal without a phase-in. Generation supply costs are required by statute to be passed through directly to ratepayers. Phasing-in generation charges would intentionally introduce a discrepancy

between supply costs and recovery of those costs by the ratepayers incurring them and is not appropriate.

Q. Why does the Company propose to use the Gross Generator Capacity for the on-site generation as stated in the Interconnection Application for the Billing Demand determination rather than an alternative measure such as the maximum hourly exported demand in each month?

A. First, we used the Gross Generator Capacity because it was what the Commission approved for UGI (under a different term—"Supply Peak Load Impact"). Especially for the generation rate classification, we believed it was preferable to mirror the UGI structure to the extent warranted. Of course, Citizens' has a different demarcation for our hourly default generation service than UGI maintains (i.e., Citizens' uses 400 kWAC and UGI uses 100 kWAC).

Second, we want to use a common definition for "Billing Demand" for both generation and distribution services to minimize customer confusion associated with the changes. This also helps our internal administration of net metering.

Finally, as I will address in more detail below, the Gross Generator Capacity is the demand level that we must plan for our system to be able to accommodate. Thus, it is the most appropriate measure for this purpose.

Q. Could the Commission adopt a different method to calculate the Billing Demand for customer-generators?

A. Yes. There are other possibilities that could be used, such as the 15 minutes of maximum bi-directional demand during the billing cycle. As previously explained, we believe that following the UGI approach is appropriate and best reflective of how we must plan for the

customer-generator. In addition, our meters currently are not programmed to measure bi-directional demand; however, the meters could be reprogrammed to measure bi-directional demand or we could purchase meters with this capability. We have some concerns that using the bi-directional demand could result in an account moving between the GSSR-1 and GSSR-2 net-metering credit process on an annual basis. In addition to changing the billing credit for the customer-generator, it would shift the annual cashout costs between the GSSR-1 and GSSR-2 default service classes, which could result in rate volatility for each of the default service rates. Adopting the Gross Generator Capacity avoids this variation for the customer-generator and for the other default service customers who pay the net cashout.

If the Commission views the bi-directional demand as more appropriate, then the Company could use the bi-directional demand in lieu of Gross Generator Capacity. The phase-in would not be needed.

Q. Mr. Nolt and Mr. Lucas complain about the economic impact of the Company's proposal on certain solar projects. Is the economic viability of a customer-generator the appropriate yardstick against which to measure Citizens' proposed inclusion of the Gross Generator Capacity in the calculation of Billing Demand?

A. No. As the ALJs discussed in the UGI Recommended Decision, the economic impact on certain customer-generators is not the litmus test for assessing the correct default service rate classification. We believe that applies equally to the correct distribution cost evaluation. The Commission must balance the interests of all ratepayers, not just seek to maximize the business economics of a small subset of the users of the distribution system. This becomes even more critical when the generation owner is not a Citizens' ratepayer.

Q. Is generation a regulated business in Pennsylvania?

A. No. The generation of electricity is not a regulated business in Pennsylvania. As such, there is no guarantee of profits for a particular customer-generator.

Q. Does net-metered generation "[help] grid congestion?" (SP Statement No. 1 at 6)

A. Yes, to a limited extent. Net-metered generation, if it is producing during times of high demand, and if it is located with or near to sufficient load, can help to ease local congestion and/or reduce system demand.

Q. Does solar production typically coincide with peak demand hours?

A. Again, to a limited extent. The Company's response to SP-II-5 provides an analysis demonstrating that, on average, approximately 28% of rated solar output is available to the distribution system during PJM peak hours. Mr. Nolt's testimony cites a 0-10% reduction in peak demand[18], similarly demonstrating the limited ability of solar to reduce customer peaks. The coincidence between peak hours and solar production is also highly volatile and can be expected to vary from 0% to 81% availability, with no ability by the utility to dispatch the generation when it is needed most. Network System Peak Load ("NSPL") hours that determine our PJM transmission requirements are particularly unaffected by solar production, with 44% of NSPL hours occurring during times when less than 5% of rated solar capacity is available to the distribution system.

Q. Will net metering larger customer-generators under the GSSR-2 rate increase the incentive to maximize exports during peak hours?

A. Yes. Using the GSSR-2 hourly energy rate in the net metering credit mechanism encourages the customer-generator to export power to the distribution system during

[18] Statement No. 1, Page 5.

higher-priced hours. Although a solar generator may be relatively inelastic in producing power in response to hourly prices, many qualifying net-metered generation sources are able to respond directly to price signals. In addition, even the customer-generator with a solar array may be able to reduce the host load consumption to increase its exports during these hours. The GSSR-2 credit mechanism rewards any customer-generator, regardless of the energy source, for high coincidence between load and generation, and exports during high-demand hours. GSSR-2 customers' transmission and capacity costs are based on their individual contribution to the Company's peaks, so well-aligned load and/or exports during peak hours can reduce or even eliminate transmission and capacity costs for the coming energy year.

Q. Does net metering larger generators under the GSSR-1 rate provide similar incentives?

A. No. In fact, the GSSR-1 rate provides an economic disincentive for exporting during high-demand hours. Net exporting customer-generators are paid at the end of the energy-year at the PTC, which includes transmission and capacity costs determined by the Company's contribution to annual PJM peak hours. Exporting during peak hours reduces the Company's costs, thus reducing the value of export credits. Net-metered generation is non-dispatchable and, as Mr. Nolt states in his testimony, is able to "go offline immediately[19]," so a customer-generator could reduce or eliminate output during peak hours to maximize the value of future export credits. In short, rather than incentivizing customer-generators to export during peak hours for benefit of all ratepayers in the class, the GSSR-1 rate structure, coupled with net metering code requirements, provide a financial incentive for

[19] SP Statement No. 1 at 6.

customer-generators to deny exports during peak hours at the cost of non-exporting ratepayers.

Q. Is it true that the Company will no longer net kWh usage of customer-generators based on the tariff change? (SP Statement No. 1 at 6)

A. No, not at all. The Company has not proposed any change to the manner in which kWh usage is netted or banked on a monthly basis for distribution charges, and will only change credit for or netting of kWh generation charges to the extent that customer-generators with billing demands greater than 400 kW will be billed at the GSSR-2 rate (if they do not choose an Electric Generation Supplier) and credited or reimbursed in a manner appropriate with that rate structure.

Q. Is it appropriate to treat a 480 kW generator similarly to a 480 kW load? (SP Statement No. 1 at 6)

A. Yes. While every customer is unique, it is unrealistic to craft a rate structure tailored to each individual customer. Instead, the Company must structure its tariff to place customers in the rate class that best represents their characteristics. In the case of an account hosting a 480 kW generator, the customer-generator is *more* similar to loads of similar magnitude than to much smaller generators or loads. For non-residential GSSR-1 customers, the average demand is only 18 kW and 93% of GSSR-1 customers have demands of 50 kW or less, so while a 480 kW generator may be different than a 480 kW load, it differs far more from the majority of GSSR-1 customers.

Q. Mr. Nolt responded to a discovery response setting forth his views on why a 400 kW generator is similar to a 100 kW customer. Please respond to Mr. Nolt's arguments.

A. Attached as Exhibit__(NJ-5R) is Mr. Nolt's response to Citizens-SP-II-15. Mr. Nolt bases his claim of similarity that both customers are supplied by similar primary wire sizes, both are served by a transformer, and both are metered and receive bills. I will respond individually to each:

1) (1) High voltage tap into the 12kV system with similar primary wire size.

All of the Company's customers are supplied by primary wire and the Company, in similar fashion to many other utilities, uses only a limited number of primary wire sizes for new construction to increase efficiency and achieve cost savings through higher purchase volumes. The use of primary lines and the size of wire is largely irrelevant to the characteristics of individual customers.

2) (1) Transformer to install.

Again, nearly all of the Company's customers, excepting only a very small number of 'primary' customers are supplied by a transformer. Mr. Nolt's argument ignores the obvious difference in the size and corresponding cost of a transformer required to supply a 480 kW generation load versus a 100 kW demand customer. Assuming a 3-phase, 480V service for both, typical new 100 kW demand would be supplied by a 150 kVA pad-mounted transformer costing between $10,000 and $15,000, while a typical 480 kW demand would be supplied by a 500 kVA pad-mounted transformer costing $25,000 or more.

3) (1) Customer bill to produce, meter to read, etc (administrative side).

With the exception of unmetered street lights, all customers are entitled to a meter, bill, and other basic customer service functions, regardless of size. This function has little to do with a customer's utilization of the distribution system.

Mr. Nolt's response provides only characteristics common to nearly every customer served by Citizens' Electric. His similarity explanation proves nothing.

Q. What are the average demands for Citizens' non-residential customers on Rates GLP-1 and GLP-3?

A. The average demand for GLP customers is 26.2 kW, with over 93% of all GLP customers registering a maximum demand of less than 50 kW. Thus, most of our non-residential customers are not similar to the host sizes before the generation is installed and will be even less similar to the customer-generators after the generation is installed.

Q. Mr. Nolt claims that solar arrays are more flexible "with grid support functions, and the ability to go offline immediately." Please comment.

A. We explained to the Solar Projects in discovery that we do not have the ability to dispatch solar generation on our system or to communicate any need for "grid support". Mr. Nolt's attempt to create a distinction between a manufacturing plant and a solar array is factually incorrect on our distribution system and is a red herring. Additionally, "the ability to go offline immediately" is not a grid support function.

Q. Do you agree with Witness Nolt's assessment of LMP price volatility? (SP Statement No. 1 at 7)

A. No, Mr. Nolt is correct that LMP can vary significantly from one hour to the next. He ignores the fact that customer-generators are reimbursed for excess kWh produced only

once annually and netting credit only once monthly (under the Company's proposed treatment of GSSR-2 customer-generators), so hourly volatility can be addressed in Mr. Nolt's financial projections. An analysis of the past ten "energy years" (June 1 to May 31), comparing a LMP and PTC (weighted by solar availability), shows a maximum variation of 3.3 cents/kWh in LMP and 5.0 cents/kWh in PTC on an energy year basis.

Q. Please confirm that the GSSR-2, which is variable based on the LMP, is a retail rate.

A. Yes. The GSSR-2 is a retail rate charged to retail customers. The GSSR-2 contains a passthrough of several wholesale cost elements, including the LMP, the PJM capacity charge and the PPL transmission charge; however, it is a retail rate that has been approved by the Commission.

Q. Is it true that every customer-generator's demand will be based on the Gross Generator Capacity of their generation system under the proposed tariff change? (SP Statement No. 1 at 9)

A. No, Mr. Nolt incorrectly states that the Gross Generator Capacity of customer-generator's system "will always be greater than actual maximum demand[20]." This is not true for all existing non-residential customer-generators, and there is no requirement that it be the case for future installations. Customers size their system based on a variety of factors. Mr. Nolt's systems, to date, have had Gross Generator Capacities exceeding any existing on-site demand, but it is inappropriate to assume that all customer-generators size their systems using the same rationale as one developer.

[20] SP Statement No. 1 at 9.

Q. Please respond to Witness Nolt's question and answer on Page 9, Ln 10-12 of his testimony. (SP Statement No. 1 at 9)

A. In his testimony, Mr. Nolt responds in the affirmative to the question: "Is it true that demand charges are based on kW's or on Demand rather than kWh's which are based on energy flow?[21]"

It is unclear to me what exactly his question means, or how it is relevant to this discussion. Demand, for billing purposes, is a measurement, in kW, of the average real power flow through a meter over a 15-minute period. Usage is a measurement, in kWh, of the net accumulated energy consumed or exported through a meter during a billing period. Both are already used in non-residential utility billing. "Energy flow" is not an explicitly defined or universally recognized term within the utility industry. Of the two measurements discussed above, however, demand (kW) is the one that specifically measures the rate of 'flow' of energy, while usage (kWh) measures accumulated energy, regardless of the rate at which it 'flows.'

Q. Mr. Nolt comments on the notice that he received from Citizens' regarding the tariff changes. Please discuss.

A. Citizens' became aware of the Commission's decision in the UGI Default Service Proceeding in late February 2025. At that time, we began to analyze the implications for our service territory, including whether it would impact the rate case that we were then preparing. As required by the Commission's regulations, we provided the advanced confidential notice to the Commission on March 28, 2025, stating that we would be requesting rate relief in excess of $1 million. Our rate case was then filed on April 30,

[21] *Id.* at 9.

2025. We did not provide any party or customer with advanced briefings on the various proposals or content of the rate filing until it was submitted.

All customers were mailed our customer notice for the rate case on April 30, 2025. We also issued a press release to alert customers that we had submitted the filing. Shortly after the filing was made, we posted the filing on our website.

Mr. Nolt received personal contact from Citizens' on May 15th. Moreover, like Citizens', Mr. Nolt could have been aware of the Commission's decision in the UGI Default Service proceeding in late February.

Q. Did Mr. Nolt ask for the return of his deposits submitted on March 31 and April 28?

A. No.

Q. Did Mr. Nolt submit additional payments after he knew of the filing?

A. Yes. Despite knowing that the proposal had been submitted, he indicated in his testimony that he chose to go forward with a deposit in July 2025. He submitted the deposits despite the regulatory uncertainty that currently exists regarding the treatment of customer-generators. In an environment where rate designs, classifications and other rules can change, the Commission's actions on the UGI proposal placed all stakeholders on notice. His claims of reliance and "irreparable harm" should be rejected.

Q. Mr. Lucas indicates that the Company has provided "thin" support for its proposal and that it should be rejected on this basis. Do you have any comments?

A. Mr. Lucas misunderstands the rate case process. We provided Direct Testimony to explain the proposal. The Solar Projects had the opportunity to ask discovery questions regarding our testimony if they needed additional detail. During discovery, we responded to three sets of questions from the Solar Projects. They provided their Direct Testimony, to which

we will respond. Our attorneys will address during the briefing stage the "burden of proof" and what level is required to approve our proposals.

Q. Is the Company's proposed billing demand change based on "hypothetical, idealized" use of its distribution system? (SP Statement No. 2 at 3)

A. No, it is based on the realistic and likely potential output of a customer-generator. Mr. Lucas asserts throughout his testimony that customer-generators rarely, if ever, export the Gross Generator Capacity of their generation systems. It is true that solar arrays will output to their Gross Generator Capacity only infrequently, but this ignores the obligation of EDC's to design, build, and maintain a distribution system that can accommodate the Gross Generator Capacity at any time. His testimony assumes that all customer-generators are solar arrays, but the same rate structure must accommodate any qualifying net-metered energy source, many of which can run year-round at all times of the day. It is Mr. Lucas' arguments that are based on hypothetical—in that all customer-generators are solar arrays—and idealized—assuming that a customer will never produce the Gross Generator Capacity of their system—while the Company, instead, plans for realistic, inevitable utilization of the distribution system.

Q. Does the Company's proposal contradict or violate existing statutory or regulatory requirements? (SP Statement No. 2 at 4, 22)

A. No, 52 Pa. Code § 75.13(d) requires that the Company "…credit a customer-generator at the full retail kilowatt-hour rate, which shall include generation, transmission and distribution charges, for each kilowatt-hour produced…" The Company's proposal adheres to this regulation.

First, Mr. Lucas incorrectly asserts that 'bifurcating' distribution and generation for netting purposes is both novel and violates regulations. Distribution and generation are already 'bifurcated' because 1) under the existing rate structure, only portions of distribution costs are netted out through kWh net metering and 2) for shopping customers, the EDC does not provide any net credit for generation usage. Similarly, under the proposed change, the Company will continue to net those portions of distribution charges based on kilowatt-hour rates, and will do the same for generation charges, crediting the customer for any kilowatt-hour-based generation charges incurred at the kilowatt-hour rate value of exports.

Second, Mr. Lucas argues that the Company is shifting to a "net billing construct[22]" in violation of code. Pennsylvania code requires that EDCs *credit* customers at the full kilowatt-hour *rate*. Mr. Lucas asserts that because code states that the rate "shall include generation, transmission and distribution charges," it is a violation not to credit GSSR-2 customer-generators for transmission costs. Kilowatt-hour netting applies to charges that are billed on a kWh basis. For GSSR-2 customers, capacity and transmission are billed based on customers' individual contribution to the Company's peak loads, not on a kWh basis. This is similar to the crediting for distribution charges, where non-residential customers are credited only for the portion of their distribution charges that are billed at kWh rates and receive no credit towards their distribution customer or demand (kW) charges.

Finally, Mr. Lucas argues that converting generation usage to a dollar value violates code. This is incorrect, code does not explicitly require that the credit occur at the unit level, rather that customer-generators are *credited* for kilowatt-hours produces at the full

[22] SP Statement No. 2 at 23.

kilowatt-hour rate. The Company's proposal provides a credit for each kilowatt-hour produced at the rate for which any customer in the same class would pay for that same kilowatt-hour and applies against the customer-generator's kilowatt-hour based charges. Nowhere does this violate the plain language of Pennsylvania Code.

Q. Do the Commission's regulations contemplate that net metering may occur with a time-differentiated rate?

A. Yes. Although the particular portion of the Commission's regulations that Mr. Lucas cites was adopted before Citizens' had hourly default service and before the majority of the other EDCs in Pennsylvania had hourly default service, the regulations acknowledge that a utility can apply "load profiles" to determine hourly usage if it is appropriate to administer the net metering for the particular generation rate. Hourly metering is more precise than a load profile and is possible under our metering system. The GSSR-2 design using the hourly LMP is the most precise version of a time-differentiated retail energy rate.

Q. Is the pending appeal of UGI's Default Service Order a sufficient reason to reject Citizens' proposal?

A. In my opinion, it is not. I am advised that neither the Commission nor the Court has stayed the effectiveness of the decision. We urge the Commission to be consistent in its decisions on this issue by approving our proposal.

Q. Is the GSSR-2 rate inappropriate or unfair to net-metered customer-generators?

A. No. The GSSR-2 rate could be used today for net metering. Both Mr. Lucas and Mr. Nolt imply that the change to billing demand has created an unfair circumstance by placing customer-generators in the GSSR-2 generation rate class, but the Company's existing approved rate structures already make this possible. The likelihood that the proposed

change will place one or more of *Mr. Nolt's* projects in the GSSR-2 rate class is not relevant to the broader matter of determining a fair means of treating customer-generators with demand exceeding 400 kW, regardless of whether that demand is calculated using existing or proposed rate structures.

Q. Do you believe that the GSSR-2 rate is too complex for medium-sized businesses installing net-metered generation? (SP Statement No. 2 at 4)

A. No, the argument that the GSSR-2 rate is too 'complex' for medium-sized businesses is subjective and irrelevant. First, it is already possible under the existing rate structure for 'medium-sized' businesses to be placed in the GSSR-2 rate. Second, to suggest that a business successfully managing the financial and technical complexities of a $1 million or greater[23] generation system cannot understand the GSSR-2 generation rate is paradoxical.

Q. Has the Commission determined that medium-sized businesses can adapt to hourly pricing?

A. Yes. The Commission's default service regulations, policy statements and the *End State Order*, have expanded the hourly default service pricing to more and more customers, with the Commission's preferred threshold for the service being 100 kW. The Commission made clear in the recent UGI decision that the threshold for hourly pricing can apply to the net metering for customer-generators.

Q. Please discuss the level of sophistication for mid and large customer-generators that install generation.

A. The testimony here demonstrates the level of sophistication involved. Mr. Nolt indicates that the customer is installing a particular generation size to offset a large portion of the

[23] SP Statement No. 1 at 4.

annual consumption at the host site. In the process of doing this, the customer is undertaking a capital project to install generation that may cost over $1 million. They are entering into financing arrangements, if necessary. They are negotiating with the developer to construct (and possibly maintain) the project. They also must arrange for the developer or a third-party to market the alternative energy credits ("AECs") of the project. They may also be taking advantage of tax reduction strategies or governmental grants. All of those actions seem quite sophisticated.

Furthermore, for 5 of 6 projects in Citizens' territory, the actual solar array is owned by Mr. Nolt or third-party investors. The Commission is being asked to insulate those investors from the risk that tariff and net metering rules may change over time to reduce the subsidization they receive from Citizens' ratepayers.

Q. Does the Company propose to shift tariff break points to demand rather than "net usage of the grid?" (SP Statement No. 2 at 5)

A. It is unclear what Mr. Lucas means by this statement. The break points he discusses are based on billing demand under both existing and proposed rates, and forward and reverse billing demand are not netted against one another in either case.

Q. Is it unfair to bill a customer based on a demand level that was not reached during the billing period? (SP Statement No. 2 at 7)

A. No, this is already part of existing non-residential rate structures. The demand component of non-residential bills already includes a minimum of 50% of the highest demand during the preceding 11 billing periods, even if that exceeds actual demand measured during the current billing period. In fact, from June 2024 to May 2025, only 52% of all non-residential bills charged for the actual metered demand during the same period.

Q. Will the Company's proposed billing demand change "come with a mandatory change in the customer's rate schedule?[24]" (SP Statement No. 2 at 8)

A. No, Mr. Lucas' interpretation of the Company's tariff is incorrect. The 50 kW threshold for GLP-3 is the minimum demand required for a customer to be eligible for the rate, it does not require that the customer change to the rate. For accounts that are eligible for more than one rate class, namely GLP-1 vs. GLP-3, the Company routinely evaluates their usage and assists the customer in determining the most economical rate. Rather than mandating a change to a new distribution rate, the proposed change to billing demand may open up additional options for large customer-generators.

Q. Does the Company's proposed billing demand change break with historical rate conventions? (SP Statement No. 2 at 9)

A. No, because historic ratemaking conventions are not unchangeable. There were times in history when metering for many customers could not measure demand; however, as metering evolved, the distribution rate designs evolved. Similarly, when distribution rates were unbundled in the 1990s, some historic rate designs included multiple declining block distribution rates. Those designs have evolved. The practice of determining billing demand from forward (consumed) power only traces back to rate design methods that did not contemplate a distribution system in which the average consumer would produce power to be consumed elsewhere within the system. Rates have evolved over time based on the actual needs and use of the distribution system. Relative to historical billing practices, net metering is still a relatively new phenomenon, and the current trend of large customer-generators exporting substantially more power than they produce is even more recent. As

[24] SP Statement No. 2 at 8.

the impact of net-metered customer-generators on the distribution system, utility operations, and ratepayers has become discernable, the Company has evaluated it and developed a reasonable rate structure intended to recover the cost of serving customer-generators. While the specific definition of billing demand may incorporate new language to accommodate the changing nature and uses of the distribution system and, in that sense, "break from convention," the rationale behind the change is consistent with cost-of-service principles.

Q. Is it appropriate to bill customer-generators based on Gross Generator Capacity if their actual capacity might diminish over time? (SP Statement No. 2 at 9)

A. Yes, this is another example of the narrow line of reasoning presented by the Solar Projects. It is true that, using current technology, the output capacity of individual solar panels tends to degrade over time. However, this ignores the broad range of generation technology eligible for net metering, future improvements in solar panel longevity, and possibility that owners of large arrays have the ability to change panels that fail or sufficiently diminish in output without notifying the Company. Additionally, customer-generators are not obligated to report maintenance or upgrades 'behind' their inverters to the Company if the Gross Generator Capacity of the system does not change. A customer with declining output could install additional panels to augment losses without renewing their interconnection application. The company is obligated to build and maintain the system to accommodate the Gross Generator Capacity of the system, regardless of whether it ever produces to that level.

Q. Do you agree that the proposed billing demand definition ignores the on-site load of customer-generators? (SP Statement No. 2 at 9)

A. No, not at all. Metered, forward (consumed) demand remains part of the billing demand calculation. Mr. Lucas correctly notes in his testimony that "the apparent load for that a customer-generator places on the grid is a function of both BTM generation and its native load[25]." He then asserts that the Company's proposed changes "ignore this reality[26]." This is not true, as the customer-generator's native load and, particularly, its coincidence with generation output may have a substantial impact on monthly charges. Instead, it is the current rate structure that ignores the reality of the impact that generation has on the customer-generator's apparent load. The Company's proposed change seeks to rectify this and account for the influence of both generation and load on the distribution system.

Q. How do you respond to Witness Lucas' criticism of the Company's attachment provided with its response to SP-I-21? (SP Statement No. 2 at 10)

A. First, the Company always seeks to provide accurate and relevant information in support of its position and has provided an updated version of the workpaper as Exhibit NJ-6R. Mr. Lucas, in his testimony, devotes substantial effort to pointing out errors in an apparent effort to discredit the workpaper, but the conclusions he draws from his 'corrected' workpaper are not substantially different from the Company's original analysis. Additionally, several of his 'corrections' do not, in fact, correct errors, but instead adjust the analysis to circumstances that he believes are more realistic. He is entitled to his reanalysis, but these were hypothetical examples to begin with and his disagreement with the parameters used does not constitute an error on the Company's part.

[25] SP Statement No. 2 at 9.
[26] *Id.* at 9.

Q. Does the Company claim that customer-generators use "the entire distribution grid" to deliver exported power? (SP Statement No. 2 at 18)

A. No, of course not. No single customer uses the entire distribution system to deliver or receive power. Costs to build, operate, and maintain the distribution system are, to a certain extent, inherently socialized between ratepayers. Effective rate design, however, recovers costs from customers in a manner consistent with their contribution to the aggregated needs served by the Company's distribution system.

Q. Mr. Lucas asserts that the Company "takes title" to the energy that flows onto the Citizens' system. Does Citizens' take title to the energy produced by customer-generators? (SP Statement No. 2 at 18)

A. No. While I am not a lawyer, I have reviewed the net metering statute. It does not say that we are "purchasing" the output; rather, we have a duty to provide a credit to the customer-generator. Essentially, our distribution system acts as a virtual storage bank for the customer-generator, allowing them to over-produce energy and then use it at other times when their on-site generation does not produce enough to satisfy their consumption needs. Excess energy on an annual basis is similarly credited to the customer-generator at a regulated rate to compensate the generator for other customers' consumption of the energy. The statute creates a billing credit mechanism; it does not require us to purchase the power.

Q. Does the statute address title to other products?

A. Yes. It explicitly discusses the ownership ("title") of alternative energy credits related to the customer-generator.

Q. Please summarize Citizens' general responses to the Solar Parties' objections to the proposed change to billing demand.

A. The Solar Projects make numerous arguments opposing the change. I will address what are, based on my interpretation of their testimony, the overarching themes of these arguments.

1) <u>The change will negatively impact the finances of their projects and their future opportunities for development.</u>

I do not contest this argument; the Company's own testimony supports that the change will increase costs to *some* non-residential customer-generators and/or decrease the value of year-end credits they receive. However, these arguments are narrow in their scope. Their testimony seeks to project the negative financial impact on a very few customer-generators onto all non-residential net-metered customer-generators. This is unreasonable, as net metering represents a broad variety of renewable generation assets and customer needs, strategies, and financial circumstances. The Company's intent is to appropriately recover costs from all net-metered services. The fact that a certain few may incur substantial cost increases is not sufficient reason to reject the entire change.

2) <u>Placing a customer-generator on the GSSR-2 rate is unfair and violates PUC regulations.</u>

This argument fails, first and foremost, because rejecting the change to billing demand does not avoid the necessity of determining how to equitably treat GSSR-2 customer-generators. A customer-generator can already qualify as GSSR-2 under existing approved rates, rejecting the proposed change just so that it does not have to be

addressed now, and so that one existing and two proposed generation systems do not have to change class does not benefit the Company's ratepayers in general.

3) <u>There is no additional cost associated with supplying net-metered services, so increases in billing demand charges are unfair and "punitive[27]."</u>

The Company does not suggest that customer-generators incur *additional* costs on the distribution system beyond those incurred by consumed loads of similar magnitude, instead we present the argument that reverse (exported) demand incurs costs *similar* to that of forward (consumed) demand and should thus be charged similarly. Current rate structures provide no ability to recover costs incurred for accommodating net-metered exports when the generator size substantially exceeds the customer's consumed on-site demand, so nearly all of these costs are borne by non-generation ratepayers. The proposed change corrects this unbalance and assigns costs equitably to both generators and consumers. As to the purported 'punitive' nature of the change, accurately recovering costs is not punitive. Instead, customer-generators have unfairly benefited from a gap in historical rate structures that dramatically under-recover the costs they incur and shifts them onto others.

4) <u>The proposed change violates regulations.</u>

The argument that the change violates net metering regulations rests on a biased interpretation of current regulations, rather than an objective reading of the plain language of Pennsylvania Code. The Solar Projects misconstrue Pa. Code § 75 to require that credit be given in *units of kWh* rather than at the full or price-to-compare *rate*, and that transmission costs must be incorporated into a kilowatt-hour rate even

[27] SP Statement No. 2 at 16.

though a clear precedent, not disputed by the parties, already exists for crediting or compensating only those elements of charges that are already charged by the kilowatt-hour.

Q. Does this complete your Rebuttal Testimony?

A. Yes.

DOCKET NO. R-2025-3054394

Citizens'-SP-II-1

Please reference Statement No. 1, page 1. For each rooftop solar project listed at lines 16-19, please provide the following information:

A. Date that the project became operational or is expected to become operational.
B. Expected annual output of the solar project in MWh.
C. The customer's annual and monthly consumption of electricity in the 3 years immediately prior to the installation of the solar project.
D. The customer's peak demand for electricity by month in the 3 years immediately prior to the installation of the solar project.
E. Explain how the installed size of the solar array was finalized, including whether it was based on a desire to offset a percentage of the customer's annual usage, and, if so, the desired percentage that will be offset.
F. Does the customer receive revenue for the Alternative Energy Credits ("AECs") associated with the project?
G. If Mr. Nolt is aware, did the customer receive any tax credits and/or government grants associated with the project?
H. Does Twilight Renewables or Mr. Nolt own any of the equipment at the project? Please specify which equipment.
I. Does Twilight Renewables, Mr. Nolt or any company owned by Mr. Nolt install the solar equipment for the customer? If subcontractors are used, please explain the role of the subcontractors.
J. Does Twilight Renewables, Mr. Nolt or any company owned by Mr. Nolt receive compensation from the customer to maintain or operate the equipment after it is installed? Please explain how this compensation is determined.
K. Provide written, dated documentation (if any exists) confirming that Mr. Nolt is authorized to advocate on behalf of the customer in this proceeding.

KELLY ROAD SOLAR, LLC, LANCASTER AVENUE SOLAR, LLC,
AND TWILIGHT RENEWABLES, LLC
TO INTERROGATORIES AND REQUESTS
FOR PRODUCTION OF DOCUMENTS
TO CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA, SET II

DOCKET NO. R-2025-3054394

RESPONSE:

A. Luke Hoover Project: 10/29/2024
Lancaster Avenue Solar LLC: 12/2/2024
TKK Solar LLC: 7/18/2025
IMP Solar LLC: 9/12/2025
Fairfield Road Solar LLC: 12/31/2025
Kelly Road Solar LLC: 4/30/2025

B. Luke Hoover: 285 MWh
Lancaster Avenue Solar LLC: 688MWh
TKK Solar LLC: 683 MWh
IMP Solar LLC: 654 MWh
Fairfield Road Solar LLC: 835 MWh
Kelly Road Solar LLC: 933 MWh

C. All projects with the exception of Luke Hoover are new services without historical usage/peak demand, and the only load on these services is solar equipment related. The Luke Hoover Solar project located at 7146 Furnace Road, Mifflinburg PA was constructed simultaneously with (3) new poultry barns and are electrically connected. The barns have not reached a full year in production yet. It is estimated that the barns will use 120MWh annually. Luke Hoover also has a farm less than 2 miles away at 7220 Old Turnpike Road, Mifflinburg PA that is virtually net metered and has an annual usage of 80MWh historically.

D. See answer above.

E. Luke Hoover was sized at 140% of usage to account for future farm usage growth over the next 20 years. All other systems were sized based off available roof space.

F. Yes, Current spot market value is at 2.6 Cents/kWh or $26/MWh. This is variable, and the future value is expected to decrease due to the compliance standards (which help drive demand) having remained unchanged since 2021, and because the supply of credits increases annually. Credit spot market prices have dropped from $36/MWh to $26/MWh in the past year alone.

RESPONSES OF
KELLY ROAD SOLAR, LLC, LANCASTER AVENUE SOLAR, LLC,
AND TWILIGHT RENEWABLES, LLC
TO INTERROGATORIES AND REQUESTS
FOR PRODUCTION OF DOCUMENTS
TO CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA, SET II

DOCKET NO. R-2025-3054394

G. No grants were received for any of these projects. For projects already placed in service (Luke Hoover, and Lancaster Avenue Solar LLC), tax credits were minted but are unable to utilize them themselves in the near term due to their specific tax situation.

H. Please specify which equipment. Luke Hoover, Lancaster Ave Solar, TKK Solar, and IMP solar are all 100% owned by parties outside of Twilight Renewables/Mr. Nolt. Brett Nolt is the current owner of Fairfield Road Solar LLC, and Kelly Road Solar LLC.

I. If subcontractors are used, please explain the role of the subcontractors. Twilight Renewables was the EPC Contractor for all of the projects. Supplemental subcontractors were used for excavation, and some electrical labor, with oversight by Twilight Personnel.

J. Twilight offers a 10-year workmanship warranty on the installation. Customers in the first 10 years do not typically sign O&M agreements for the system until after the warranty period expires. That being said, it is encouraged to wash panels every 1-2 years to maintain production levels (a service not performed by Twilight), and to set aside sufficient funds to replace inverters between years 10 and 20 (a $40-$50k expense overall)

K. At this point the agreement was not reduced to writing but is now in process.

Please reference Statement No. 1, page 7, line 4.

A. Which of the six projects listed earlier in Mr. Nolt's testimony is referenced in this response?
B. Please explain in detail the contractual relationship with the customer at the project site(s) that results in Mr. Nolt or his company holding the debt for the project, including, but not limited to, what compensation or benefits the customer is receiving for hosting the solar array.
C. Could the debt reference in this statement be refinanced?
D. What role does the revenue from Alternative Energy Credits ("AECs") serve in the financial profile and Mr. Nolt's ability to service the debt?

RESPONSE:

A. Kelly Road Solar LLC.

B. All projects with the exception of the Luke Hoover Project, are roof leases. There is a third-party investor that owns the solar array, and the site host receives compensation (over 99% upfront) for rooftop access for the life of the solar array. All electrical infrastructure is separate from the host.

C. If the electric rate goes from 8.565 cents per kWh to 3.2 cents per kWh, no bank would be able to underwrite this, regardless of term length due to the project losing money annually.

D. Banking underwriters typically do not account for AEC's in the Debt service coverage ratio calculations due to their high variability.

Citizens'-SP-II-15

Reference Statement No. 1, page 6, lines 17-19.

A. Explain how a 480kW solar array is similar to a non-generation customer of less than 100kW demand.
B. Explain what benefits the flexibility and grid support functions of a solar array provide, and how does the ability to "go offline immediately" benefit the distribution system?

RESPONSE:

A. (1) High Voltage tap into the 12kV System with similar primary wire size. (1) transformer to install. (1) customer bill to produce, meter to read etc. (administrative side).

B. The inverters installed on all 6 projects are UL 1741-SA & SB compliant. PPL provides DER Communication devices that can alter settings of inverters based on grid conditions to provide grid support. Citizens' electric has no such infrastructure to fully utilize the capabilities of the inverters, at no fault of the solar projects.

UL 1741-SA was published in conjunction with California Rule 21 Phase 1 requirements. These safety tests certify the "smart inverter" grid support functionality needed to modernize the grid through widespread DER integration. The testing requirements for UL 1741-SA are as follows:

- Anti-islanding
- Low/high-voltage ride-through (L/HVRT)
- Low/high-frequency ride-through (L/HFRT)
- Specified power factor (SPF)
- Volt/VAR mode
- Volt/watt mode
- Frequency/watt mode
- Ramp rate

UL 1741-SB introduced an interoperability conformance test in accordance with IEEE 1547.1 2020. Conformance can be achieved through either DNP3, IEEE 2030.5, or SunSpec Modbus communications protocols, which are used to store or

---

send information and to control adjustable inverter functions. The testing requirements for UL 1741-SB are more stringent and include the following in addition to the requirements defined above for UL 1741-SA certification:

- Watt/VAR mode
- Voltage magnitude and time trip
- Frequency magnitude and time trip
- EMI
- Surge
- Rate of change of frequency (ROCOF)
- Dynamic voltage support
- Enter service
- Synchronization
- Open phase
- Harmonics
- DC injection
- Ground fault overvoltage (GFOV)
- Load rejection overvoltage (LROV)
- Prioritization of DER responses
- Fault current
- Persistence of DER parameter setting

The solar-only services are not critical loads, that would not require off hour outage response to get placed back in service. The inverters, even if the DER capabilities are not fully utilized by the utility, will not operate if voltage, frequency, etc. is out of acceptable parameters

Citizens' Electric Company of Lewisburg, PA	**:**	

SURREBUTTAL TESTIMONY OF NATHAN JOHNSON
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name and business address.

A. My name is Nathan (Nate) Johnson. My business address is 1775 Industrial Blvd., Lewisburg, Pennsylvania.

Q. Are you the same Nathan Johnson who previously submitted Direct Testimony in this proceeding on behalf of Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company")?

A. Yes. Terms defined in my Direct Testimony or my Rebuttal Testimony have the same meaning in this Surrebuttal Testimony.

Q. What is the purpose of your Surrebuttal Testimony?

A. I will respond to the Rebuttal Testimony submitted by Zach Teti on behalf of the Office of Consumer Advocate ("OCA").

Q. Please summarize Mr. Teti's testimony.

A. Mr. Teti supports the Company's proposal to include a customer-generator’s generating capacity in the determination of Billing Demand but requested additional information regarding how Citizens' Generation Supply Service Rate 2 ("GSSR-2") operates. I am

providing a basic summary of our default service purchasing strategy as background to support the explanation of how the GSSR-2 operates.

Q. Please discuss the Company's default service procurement and retail pricing approach.

A. Under the Company's current Joint Default Service Plan ("DSP") with Wellsboro Electric Company ("Wellsboro"), the Commission authorized Citizens' and Wellsboro (collectively, "Companies") to conduct a joint Request for Proposal ("RFP") to obtain a single wholesale supplier for the default service load in each territory. The supplier provides Load-Following Full Requirements ("FR") service for each respective Company's default service customers under a 4-year contract for this supply (June 1, 2025 through May 31, 2029). The supplier serves as the PJM Load Serving Entity ("LSE") for the default service load. The wholesale service is priced as follows:

- Energy (as measured at the wholesale meter for the Citizens' or Wellsboro Aggregate Bus, less kWh for customers supplied by Electric Generation Suppliers ("EGS"):
  - Residential and Small Commercial and Industrial Default Service: The energy component is layered and periodically based on PJM West Hub on-peak monthly forward pricing on Trigger Dates determined by the Companies; the wholesale rate formula will assume a straight passthrough of the mathematical average of the monthly on-peak per MWh strip pricing for all MWh sold to customers during the twelve-month (12-month) pricing period. This results in a 'laddered approach' to attempt to mitigate against overly sharp pricing swings by relying on a twelve-month (12-month) average. The Companies use the Intercontinental Exchange ("ICE") to set the strip prices. The specific schedule for the layering is attached as Exhibit__(NJ-1SR).
  - Commercial and Industrial Hourly Default Service: The energy component of Hourly Priced Service ("HPS") will be the real-time hourly PJM Locational Marginal Price ("LMP") for the PJM West Hub.
- Capacity (Reliability Pricing Model, Locational Reliability, Capacity Performance): Passthrough of actual monthly costs for the default service load, without markup.

- Network Integrated Transmission Service ("NITS"): Passthrough of actual monthly costs for the default service load, without markup.

- Regional Transmission Expansion Plan/Transmission Enhancement Costs ("RTEP/TEC"): Passthrough of actual monthly costs for the default service load, without markup.

- Supplier Adder: Per-kWh charge applicable to both fixed and hourly energy supply that covers all other costs to deliver default service power to the Citizens' or Wellsboro Aggregate Bus, including congestion, marginal losses, Alternative Energy Portfolio Standards ("AEPS") Act compliance, and transmission losses, as well as all risks associated with default service customer usage variability, customer migration (switching to an EGS for supply service or returning to default service as permitted under the Companies' tariffs and Pennsylvania law) and deviations between the forward pricing and actual costs. The Supplier Adder may be different for each territory but remains fixed for the term of the wholesale contract.

Q. Is the Supplier Adder the same for all customer classes within a service territory?

A. Yes.

Q. How do the Companies choose the wholesale supplier for each territory?

A. The suppliers bid based on the Supplier Adder, with the contract going to the lowest qualified bidder in each territory.

Q. Please explain the pricing components of the Generation Supply Service Rate 1 ("GSSR-1")?

A. The GSSR-1 consists of: (1) projected Purchased Power Costs (the fixed energy rate (adjusted for distribution losses) + the Supplier Adder + (Projected NITS + Projected RTEP/TEC + Projected Capacity) Costs for the GSSR-1 class + Company Administrative Costs); plus or minus (2) the Reconciliation Period E-factor; divided by (3) projected metered sales to GSSR-1 default service customers; times (4) a Gross Receipts Tax ("GRT") gross-up. This rate is adjusted every 6 months, although the Supplier Adder would remain fixed throughout the 4-year DSP period. The fixed energy rate is based on the PJM

West Hub on-peak monthly forward pricing as measured on predetermined Trigger Dates. The GSSR-1 cost components are reflected in the existing Citizens' tariff.

Q. How does the Company project transmission costs?

A. The transmission costs for the GSSR-1 are projected by multiplying the Company's Transmission Obligation for the projected default services load by the Federal Energy Regulatory Commission ("FERC")-approved transmission rate applicable to the PPL Zone. A similar process occurs for RTEP/TEC.

Q. How do the Companies project the costs for capacity charges?

A. We pay for capacity daily, as determined by PJM. Our costs are based on: (1) the Company service territory’s PJM-assigned Capacity Obligation for the default service load; and (2) the Net Load Price for its Locational Deliverability Area as determined in the PJM Reliability Pricing Model ("RPM") auctions. Capacity also includes the Capacity Performance Costs (or credits). To project the costs for each six-month (6-month) pricing period, we multiply the anticipated Capacity Obligation for the Company's default service customers on the GSSR-1, by the Net Load Price (stated on a $/MW-day basis), and then by the number of days in the pricing period.

Q. How does PJM assign the Transmission Obligation and Capacity Obligation?

A. The Transmission Obligation and Capacity Obligation are determined based on the Company service territory's performance during the transmission and capacity peak hours. The Capacity Obligation is assigned based on the Company service territory's performance during the Regional Transmission Organization peak hours from June 1 through September 30. The obligation is provided to Citizens' in late November or December of the year. The

obligation will then apply for the following capacity delivery year, which runs from June 1 through May 31.

The Transmission Obligation is assigned based on the performance during the PPL Zonal peaks. These peaks can occur at any time during the year. In many years, those hours occur during the winter.

Attached as Exhibit__(NJ-2SR) is a compilation of the dates and hours that determined the obligations for Citizens' service territory for the last five years.

Q. How do the pricing components of the GSSR-2 differ from the GSSR-1?

A. The basic cost structure is similar, but the GSSR-2 was designed to recover actual costs rather than projections. First, the GSSR-2 includes a different energy component since commercial and industrial customers with a peak demand above 400 kW take Hourly Price Service ("HPS"), based on the real-time PJM LMP for the PJM West Hub. Also, while the GSSR-1 assigns a fixed per-kWh charge for NITS, Capacity, and RTEP/TEC based on projected kWh load, the GSSR-2 passes through NITS, Capacity, and RTEP/TEC costs on a per-kW basis, reflecting the individual PJM allocations for each customer. Accordingly, the GSSR-2 costs are made up of: (1) the real-time HPS rate as calculated by PJM for the PJM West Hub (adjusted for distribution losses); **plus** (2) the per-kWh Supplier Adder; **plus** (3) the per-kWh Company Administrative Costs; **plus** (4) a per-kW Transmission, RTEP/TEC and Capacity charge based on the applicable PJM rates and each customer's PJM NITS and Capacity obligations; **plus** (5) the GSSR-2 E-factor; **times** (6) a GRT gross-up. The kWh charges will be billed using the customer's metered hourly usage.

Q. How does Citizens' calculate the Transmission and Capacity obligations for each GSSR-2 account?

A. We do this based on the account's performance during the same hours that PJM uses to calculate the service territory Transmission and Capacity Obligations. Each GSSR-2 account is assigned an obligation based on its individual average contribution to system demand for each of the five capacity or transmission peak hours, adjusted for losses and PJM scaling/reconciliation.

Q. Mr. Teti asked how a net-metered customer on the GSSR-2 default service rate will be charged for generation service. Please discuss.

A. Due to the hourly variability of the GSSR-2 rate, the Company must first determine charges for all consumed energy as described below. Credit for net-metered generation exports will be calculated and applied separately, which I will address later in my testimony. GSSR-2 Charges are determined as follows:

- Energy Charge per kWh: The customer will be charged for each hour of net consumption at the real-time LMP for that hour.

- Capacity Charge: The customer will be charged for capacity each month based on their prior-year peak load contribution.

- Transmission Charge: The customer will be charged for transmission each month based on their prior-year Network Service Peak Load ("NSPL") contribution.

- Regional Transmission Expansion Plan/Transmission Enhancement Charge: The customer will be charged for RTEP/TEC each month based on their prior-year NSPL contribution.

- GSSR-2 E-Factor: The GSSR-2 E-Factor is applied to all hours of net consumption by the customer-generator. The E-Factor is per-kWh rate based on under- or over-collected GSSR-2 revenues from the prior reconciliation period, divided across projected kWh consumption by the GSSR-2 rate class for the current reconciliation period.

- GSSR-2 Administrative Charge: The GSSR-2 Administrative Charge is applied to all hours of net consumption by the customer-generator.

Q. For clarity, will a net-metered account on GSSR-2 pay a transmission and/or capacity charge?

A. This answer depends on what the account status is during the peak hours that determine the capacity and transmission obligations. If the average performance during the peaks results in a positive demand being consumed, then the account will have the transmission and/or capacity charge for the subsequent year. If the average performance during the peaks does not result in a positive demand being consumed, then the account will have a zero obligation, and no capacity and/or transmission charges the subsequent year.

Q. Why are the account-level obligations either zero or a positive charge?

A. For retail accounts, PJM recognizes only positive (or zero) obligations. All of our customers have the ability to shop for generation supply. When that happens, we transfer the responsibility for that account at PJM to the EGS. We cannot transfer a negative capacity or transmission obligation to the EGS.

Q. Please respond to Mr. Teti's request for an explanation of how the net metering process will be administered for the GSSR-2 account?

A. The Company proposes to credit the customer-generator for each hour of net export during the billing period at the real-time LMP for that hour. Credit will be applied against the hourly LMP charges on the customer's bill for the current billing period. If the hourly export credit exceeds the hourly consumption charges for a billing period, the excess credit will be 'banked'—carried forward—for credit against future hourly consumption charges. If any credit remains following the last bill of the energy year (May), a credit will be issued to the customer-generator for that amount, and the customer-generator will start the new energy year with a zero balance in their generation "bank."

The customer-generator also receives a credit applied to the kWh-based distribution charges on its bill. That kWh-based distribution credit can carry forward from month-to-month as it currently does with existing GSSR-1 customers.

Q. Do you agree with Mr. Teti's discussion of the "risk premium" associated with keeping medium and larger customer-generators on the GSSR-1 rate?

A. Yes, however, the impact would be more directly reflected in the wholesale costs for the GSSR-1 rate, rather than the wholesale supplier's basis that they bid in the RFP. Compensating the larger customer-generators at the GSSR-1 rate does not incentivize the customer-generator to maximize its exports during the peak hours that determine the capacity and transmission obligations. From an economic standpoint and depending on the wholesale capacity and transmission rates, the customer-generator may benefit more by withholding its generation during those peaks, thus increasing the capacity and transmission obligations for the GSSR-1 class and increasing the GSSR-1 Price to Compare. This risk premium can be avoided by treating customer-generators with Gross Generator Ratings over 400 kW as GSSR-2 customers, where similar energy-consuming customers are placed.

Q. Is Mr. Teti correct in his assertion that 'Residential Customers with DER' will be substantially unaffected by proposed billing demand methodology?

A. I interpret Mr. Teti's statement as confirmation that the proposed billing demand methodology will not adversely affect residential customers, which I agree with. The proposal applies only to non-residential accounts. In addition, as discussed in both Mr. Teti's and my testimony, residential accounts—which are all served under the GSSR-1

rate—pay higher default service rates as a result of net metering refunds for excess generation. The proposed billing demand methodology will remove this burden.

Q. Does this conclude your Surrebuttal Testimony?

A. Yes.

REJOINDER TESTIMONY OF NATHAN JOHNSON
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name and business address.

A. My name is Nathan (Nate) Johnson. My business address is 1775 Industrial Blvd., Lewisburg, Pennsylvania.

Q. Are you the same Nathan Johnson who previously submitted Direct Testimony in this proceeding on behalf of Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company")?

A. Yes. Terms defined in my Direct Testimony, Rebuttal Testimony or Surrebuttal Testimony have the same meaning in this Rejoinder Testimony.

Q. What is the purpose of your Rejoinder Testimony?

A. I will respond to the Surrebuttal Testimony submitted by Brett Nolt and Kevin Lucas on behalf of the Solar Projects.

RESPONSES TO MR. NOLT

Q. In Mr. Nolt's Surrebuttal Testimony, page 6, Mr. Nolt claims that the Company relied entirely on the Commission's decision in the UGI Utilities, Inc. – Electric Division ("UGI") default service proceeding in submitting the proposal. Is this correct?

A. No. The Commission's UGI decision prompted us to look at the default service classification for customer-generators; however, we also relied on our own assessment of how customer-generators should be treated for both default service and distribution service cost recovery.

Q. Is it "reckless" for Citizens' to consider the implications of Commission decisions for other utilities?

A. No. We monitor many Commission decisions and statements issued at Public Meetings to assess how the Commission prefers to address rate and service issues. As a regulated utility, we try to be responsive to Commission trends, preferences and orders.

Q. On page 6, lines 17-19, Mr. Nolt claims that the Company is charging $22,000 per year (or $660,000 over the life of the system) for facilities that were paid in full by the customer before the generation was active. Is this accurate?

A. No. Mr. Nolt assumes a 30-year life for the solar generation. The facilities that are installed Year 1 on the Citizens' system, as well as existing facilities already in place that nonetheless still accommodate the new generation, require ongoing maintenance, including potential replacement if the equipment fails or becomes inoperable. The customer generator does not pay if we have to replace that equipment. The distribution rates charged to the customer-generator and others also cover ongoing maintenance of that specific equipment

as well as the other portions of the distribution system and services that are needed to serve the customer-generation.

Q. On pages 7 and 11, Mr. Nolt discusses that other Pennsylvania utilities operated distributed energy resource programs that look at power quality and grid reliability. Please discuss those programs.

A. The only program that I am aware of is a pilot program being conducted by PPL Electric Utilities Corporation ("PPL"). I reviewed the most recent program evaluation report submitted by PPL, which our counsel has marked as Exhibit__(NJ-1RJ).

Based on this report, the PPL program is very unique and is only a pilot program. Although PPL has claimed reduced capital and O&M expenditures, the upfront implementation costs are very substantial. PPL has over a million customers and 1000s of miles of distribution equipment, while we have only about 7,200 customers and less than 400 miles of line. Even if the PPL program is cost-effective, it is not clear that it will be scalable to our size.

Q. On page 8, Mr. Nolt claims that the GSSR-2 is not a retail rate. Do you agree?

A. No. It is charged to retail customers. It is not a wholesale rate, which is a sale for resale. Retail sales are subject to the PUC's jurisdiction and are subject to certain taxes. The GSSR-2 is such a rate.

Q. On pages 8-9, Mr. Nolt discusses virtual net metering by agricultural customers. Do you have any response?

A. Mr. Nolt discusses another way that a solar customer may be leaning on the distribution system to offset usage at other locations. In this situation, rather than the distribution system operating as a virtual storage bank for the later return of power, the excess is being virtually "wheeled" to other accounts. The aim of our distribution proposal is to apportion

distribution costs among various customers when the distribution system is being put to new uses such as this. We believe it is fair, just and reasonable to charge the customer-generator for its share of the distribution costs.

Q. On page 10, Mr. Nolt suggests that he could not request to get his deposits back. Please respond.

A. Mr. Nolt suggests that the only way his deposit could have been refunded was for Citizens' to return it in its entirety and strand ratepayers with the cost of unused facilities. This is incorrect; had Mr. Nolt requested to stop construction, the Company would have refunded him for any costs not yet incurred. We would also have reviewed the construction already completed and materials already purchased to determine if any construction or materials could be repurposed to provide benefits to other ratepayers, and credited Mr. Nolt accordingly.

RESPONSES TO MR. LUCAS

Q. On page 13 of his surrebuttal, Mr Lucas claims that customer generators cannot respond to price signals provided by the GSSR-2 tariff because it is a "real time" rate. Do you agree?

A. No. Day-ahead hourly pricing is available from PJM Interconnection, L.L.C ("PJM") that provides a good correlation to the actual real-time pricing the following day. PJM also issues maximum generation and load management alerts in advance that assist customers in peak-shaving or other responsive actions. Outside of PJM, electronic services are available that will provide the Locational Marginal Price ("LMP") on a constant basis during the day and project peak hours. It is not simply a price signal that is completely opaque to the customer when it is happening. Monitoring the information that is available

from PJM and third parties can provide the customer-generator with the directional trend for the pricing (up or down) so they can respond.

Q. Do the "needle peaks" in 5-minute LMP create substantial uncertainty for customers?

A. No. Using the integrated hourly LMP smooths the impact of the "needle peaks" cited by Mr. Lucas.

Q. On pages 14-15, Mr. Lucas suggests that a customer-generator could not intentionally act to withhold its generation during the capacity and transmission peaks because the peak hours are not published until after the fact. Do you agree?

A. No. Some larger customers pursue "peak shaving" strategies to reduce usage during the peak hours even though they do not know the precise hours in advance. If larger customers can predict those hours with relative accuracy to peak shave, then the customer-generators or their consultants can develop similar strategies for their operations.

Q. Mr. Lucas asserts that the cost impact of withholding on the customer-generator would not justify this strategy. Please comment.

A. That is highly dependent on the generator size and PJM capacity and transmission prices. The key takeaway, however, is that the GSSR-2 rate structure provides the customer-generator with better signals to be producing at the peaks than the GSSR-1 structure does.

Q. Is Mr. Lucas' explanation of the impact of the operation of the Company's GSSR-1 on page 17 correct?

A. No. Mr. Lucas ignores the impact of the customer-generators and net metering on the sales used to determine the GSSR-1 rates. Just because a customer-generator withholds its

exports during the peaks does not mean that account is importing extra energy from the Company during those times.

Q. On pages 18-20, Mr. Lucas refutes the assertion that customer-generators are manipulating the market price of capacity and transmission services. Did you make this claim in your Rebuttal Testimony?

A. No. Mr. Lucas has attempted to refute an argument that we did not make. It isn't clear why he needed to do so since we did not make that argument.

Q. Mr. Lucas claims that the billing demand proposal discriminates against customer-generators in favor of other customers. Please comment.

A. I would suggest that, without the billing demand proposal, the Commission will be discriminating in favor or the customer-generators at the expense of other GLP-1 and GLP-3 customers. Ultimately, the Commission must decide which side of the argument is accurate.

Q. Mr. Lucas, on page 25 of his Surrebuttal Testimony, claims that the Company has not performed an analysis in support of its proposal. Do you agree?

A. No. We analyzed the planning implications of the customer-generators and how the use is similar to a similarly-sized, use-only customer. In the seven (7) years that I have been employed by Citizens', planning and overseeing the distribution system have been my responsibility.

In addition, Mr. Lucas lists several inaccurate or misleading suggestions regarding analysis for the proposal. Mr. Gorman will address why incremental cost studies and marginal cost studies are not relevant to his case. He also will explain that the absence of a "cost of

service study comparing the cost responsibility using actual metered energy flows or its GGR Billing Demand methodology" is not dispositive.

Mr. Lucas' statement that the customer-generator must pay for a study and may be required to pay for system upgrades to safely interconnect ignores the other ongoing costs, maintenance and equipment replacements that are required over the 30-year life of the generation. In addition, although the peak demand on our feeders has not been increased to date, this does not mean that we admit that a customer-generator could not increase the peak demand on a feeder.

Finally, the fact that other utilities do not use this definition of Billing Demand is not dispositive. Until the Commission approved the UGI settlement, the same could be said for UGI's proposal.

Q. Mr. Lucas disputes that customer-generators would be confused if the Billing Demand for the generation and distribution were calculated using two different definitions. Do you have any comments?

A. Mr. Lucas notes that there are 15 non-residential customer-generators on our distribution system. As I explained in my testimony, once the Commission issued the decision in the UGI case, we believed that following that definition would reduce confusion. We are also willing to use the bi-directional demand for those customers and have agreed with the Office of Consumer Advocate, Bureau of Investigation and Enforcement, and the Office of Small Business Advocate to a non-unanimous settlement in this matter that uses bi-directional demand.

Q. Please explain the difference between the originally proposed use of 'Gross Generator Rating' for billing demand and the Company's revised proposal to use 'bi-directional metered demand.'

A. A customer-generator's 'Gross Generator Rating' is the rated maximum output of the generation system and is essentially fixed (unless the customer-generator changes their output and reapplies for interconnection) for the life of the generator. Bi-directional metered demand—which will require programming changes to the Company's AMI system—measures the actual peak power flows of both imports and exports and provides the single highest peak for the billing calculation. This is a dynamic measurement and will likely change both seasonally and over the life of a generation system.

Q. So, do you agree with Mr. Lucas' Surrebuttal Testimony at page 11 that it is feasible to use the bi-directional demand for both the distribution billing and determining the default service classification?

A. Yes, and under the settlement, we are willing to either reprogram the existing meters to measure the bi-directional demand or procure meters with this additional functionality for the non-residential customer-generators on the system.

Q. On page 30 of Mr. Lucas' Surrebuttal, he indicates that the existence of net metered customer-generators did not impact the most recent default service solicitation, as evidenced by the negative supplier basis that resulted. Do you agree?

A. The bidders were given historic load information for the default service solicitation as of January 2025. That historic load information would not have included four of Mr. Nolt's projects, which are quite sizable. The load information for future solicitations will begin to incorporate Mr. Nolt's data.

Based on our analysis, the negative supplier adder reflects two factors. First, there is generally a negative correlation between the PJM West wholesale pricing that is used in the GSSR-1 and GSSR-2 rate mechanisms and the real time pricing at our Aggregate Bus. In other words, the hourly pricing at the Citizens' location is generally lower than the hourly pricing at PJM West hub.

Second, the wholesale supplier is able to use Financial Transmission Rights ("FTRs") for our default service load. This enables them to make money at PJM that offsets their costs to provide the wholesale supply for our load.

Q. Finally, on page 47 of his Surrebuttal Testimony, Mr. Lucas suggests that the Commission delay its consideration of this proposal until the Company's next default service proceeding. Do you agree?

A. Absolutely not. We filed this proposal on April 30, 2025. Mr. Nolt and Mr. Lucas had ample opportunity to explore the proposal for both the distribution and generation proposals prior to submitting their Direct Testimony. In my Surrebuttal Testimony, I addressed Mr. Teti's concerns raised in the Rebuttal Testimony stage of this proceeding. Waiting an additional three or four years to litigate this issue to a decision is not appropriate and will only magnify the impact of large customer-generators on our system.

Q. Does this conclude your Rejoinder Testimony?

A. Yes.

Introduction

PPL Electric Utilities Corporation ("PPL Electric" or the "Company") hereby submits this annual report for Program Year 3 ("PY3") of its Distributed Energy Resource ("DER") Management Pilot Program ("DER Pilot" or "Pilot"). The DER Pilot is the first of its kind in North America, communicating with and managing DERs down to the individual residential installation level for the purposes of improving power quality, safety, and hosting capacity, expanding operational awareness, and avoiding otherwise necessary capital or maintenance expenses. The DER Pilot's goal has been to understand, demonstrate, and quantify the benefits of active management, their associated costs, and the overall impact on the distribution system and DERs' performance. The Pennsylvania Public Utility Commission's ("Commission" or "PUC") authorization of this program has yielded significant benefits and will continue to enable the growth of clean energy in Pennsylvania while maintaining system reliability, power quality, and affordability.

During the DER Pilot's PY3, which spanned March 22, 2024, to March 21, 2025, the Company achieved significant progress in the integration and management of DERs, pursuant to the goals of the Pilot. PY3 continued the DER Pilot's success in executing DER interconnection and management processes, along with thorough analysis, documentation, and forecasting of the Pilot's benefits. Over PY3, the Company's service territory saw 3,976 new solar DER installations with a total nameplate capacity of 74.1 MW. 2,772 of those solar DERs, which have a combined nameplate capacity of 42.5 MW, became participants in the DER Pilot. From the Pilot's inception through PY3, a total of 9,678 DERs have become Pilot participants while 7,154 other DERs have interconnected but not become participants in the Pilot. Overall, PPL Electric's DER Pilot showcases a successful model of integrating DERs in a manageable, scalable manner that benefits the Company, its customers, solar developers, and the Commonwealth.

Specifically, based on the data gathered through PY3, PPL Electric has calculated that the DER Pilot could reduce planned capital expenditure by approximately $18.7 million and operation and maintenance expenses by approximately $51.4 million.[1] By comparison, the total capital costs and operation and maintenance expenses associated with the DER Management device costs were approximately $12.3 million and $986,000, respectively. When considering the additional start-up costs associated with the DER Pilot, the total capital costs and operation and maintenance expenses were approximately $17 million and $3.7 million, respectively. Therefore, the DER Pilot has produced substantial benefits compared to its costs. The DER Pilot has improved the reliability and performance of the distribution system, increased DER hosting capacity, and facilitated the interconnection of more DERs, all the while reducing the Company's capital costs and expenses that would be passed onto customers. Furthermore, PPL Electric's continued learning and adaptations have allowed additional program savings related to the overall cost of the DER Management device installation and provisioning.

PPL Electric continues to evaluate methods to expand the benefits produced by DER management, particularly to adopt to higher levels of DER penetration in the future. The Company's analyses are detailed within 19 whitepapers and include the use cases set forth in the DER Pilot's Pilot Implementation Plan.[2] The continued analysis of current and potential application of active management and monitoring has been a critical component of the DER Pilot and will help develop and expand on ways to facilitate and encourage DER deployments, while maintaining and improving the safety, reliability, and adequacy of electric service.

For example, DER hosting capacity increases continue to help interconnection a greater number of DERs at a reduced cost to interconnection applicants. At the conclusion of PY3, hosting capacities for monitored, autonomous, and active

[1] The DER Pilot has increased hosting capacity by an estimated 98 MW. If that additional 98 MW were fully utilized as of March 21, 2025, it would have produced additional generation and reduced distribution and transmission losses valued at approximately $11.3 million.
[2] https://www.puc.pa.gov/pcdocs/1694930.pdf.

management were calculated to be 63 MW, 80 MW, and 98 MW respectively, demonstrating one of the key, incremental benefits of active management compared to relying solely on inverters' autonomous functions.

In addition, PPL Electric continues to expand the number of approved inverters that can be safely connected to and used with the Company's DER Management devices. As of March 21, 2025, PPL Electric's Approved Inverter List has 309 inverters from 18 different manufacturers, up from 241 inverters and 12 different manufacturers as of April 22, 2024. Also, inverters from 5 manufacturers are currently undergoing the review and approval processes. PPL Electric reviews and approves inverters expeditiously. Therefore, as new inverters come to market, PPL Electric can review and approve them for use so long as they meet the applicable requirements. Taken together, the high volume of DER installations and continued availability of many inverter models show that the Company is committed to facilitating DER interconnections.

PPL Electric's DER Pilot also showcases the significant benefits of active management in achieving dynamic grid optimization. Unlike autonomous systems that operate on predefined rules and have limited adaptability, active management of DERs facilitates real-time operational adjustments. This dynamic approach optimizes grid performance in response to changing conditions, enhancing grid reliability, safety, and affordability. Moreover, actively managed DERs boast scalability and flexibility because they are capable of being adjusted for growth without the need for extensive in person reprogramming or physical changes required by autonomous systems.

This active management strategy has yielded notable customer benefits within PPL Electric's Pilot. PPL Electric expects these benefits to grow as more actively managed DERs connect to the distribution system. Key to this success is the implementation of power factor management, which has resulted in shorter durations and lower magnitudes of voltage violations on feeders with actively managed DERs. As more actively managed DERs are incorporated, customer outcomes on these feeders improve in tandem, highlighting the effectiveness of PPL Electric's voltage management approach. Contrasting with the limitations of autonomous curves, which only react to local voltage conditions, PPL Electric's active management of the DERs optimizes all available resources. This improves power quality for customers with minimal impact on the ability for such customers to generate real power, underlining the additional benefits of active management in enhancing grid performance.

In sum, active management and monitoring of DERs is crucial as the proliferation of DER and electrification technologies continues. The ongoing application of DER monitoring and management not only effectively improves interconnection capacity but also plays a pivotal role in reducing both infrastructure and interconnection costs for customers. This forward-looking approach emphasizes PPL Electric's commitment to innovatively addressing the evolving needs of the energy grid and its users.

DER and Management Device Installations

Per Implementation Plan Section G.1.1 -The number of DERs Installed and the Number of DER Management Devices Installed

PPL Electric has enrolled 9,678 DER participants from the start of the DER Pilot through PY3. DER adoption continues to increase annually, beyond the limits of the Pilot. Under the Commission-approved Settlement establishing the Pilot, no more than 3,000 DER Management devices can be installed in a calendar year. PPL Electric hit that annual cap in 2023 and 2024. Any DERs placed in-service during the calendar year after the annual cap is hit are not enrolled in the Pilot and do not have DER Management devices installed for them.

- Control Group 1 (CG1)
  - PY3 participants: 342
  - Installed within the first 75 participating feeders
  - Does not include any Pilot DER assigned within the Active Management control group
- Control Group 2 (CG2)
  - PY3 participants: 0
  - Consists of the first 1,000 Pilot participants and includes participants within Control Group 1, until threshold has been achieved
  - In total there are 999 Pilot participants within Control Group 2, with 205 being also assigned within Control Group 1
- Active Management Group (AM)
  - PY3 participants: 2,429
  - All DER Pilot participants that have DER Management devices installed and can have their DERs actively managed
- Non-Pilot Participants or Grandfathered
  - PY3 installations: 1,204
  - No DER Management devices installed

Communications Methodology

At the DER Pilot's inception, PPL Electric utilized ConnectDER devices to monitor and actively manage DERs participating in the Pilot. PPL Electric added its Cellular Gateway devices in September 2023, expanding Pilot participation to include IEEE 2030.5-compliant devices. Before the addition of the Cellular Gateway devices, DERs' inverters that were only compatible with this communications standard were excluded from the Pilot.

A detailed list of Pilot participating DERs and initially programmed Volt-VAR Curves (VVC) is set forth in Appendix A.

DER Management Device Installations

From the DER Pilot's start through PY3, a total of 9,678 DER Management devices have been installed at participating DERs, representing slightly more than 100 MW of nameplate capacity. During PY3, a total of 2,789 DER Management devices were installed, as detailed within Table 1.

Table 1. DER Management Devices Installed per Year

	Year 1	Year 2	Year 3	Total
ConnectDER Generation 1 DER Management Device	1,197*	1	0	**1,198**
ConnectDER Bridge	2,769	2,688	1,936	**7,393**
Cellular Gateway	0	234	853	**1,087**
Total	**3,966**	**2,923**	**2,789**	**9,678**

*The total number of ConnectDER Generation 1 DER Management devices installed within PY1 has been updated to 1,197, as opposed to the 1,219 listed in the PY1 and PY2 Annual Reports. This update was made after the Company reconciled the data in its internal records and its Work Management Systems.

DER Management Pilot Participant Programming

Per Implementation Plan Section G.1.2 - A list of participating DERs that includes for each DER: (a) a unique customer identifier; (b) the nameplate capacity; (c) the initial settings established for that DER's smart inverter; and (d) the type of DER (e.g., solar, solar plus storage)

A full list of participating DERs, along with the applicable DER attributes and the assigned Volt/VAR curves, has been provided in Appendix A.

Autonomous DER Management Parameters

PPL Electric has created unique Volt-VAR Curves ("VVC") for each DER Pilot participant. These curves consider the influence of the transmission system, distance from the substation, and the observed variations in the customer's voltage. From the results of the VVC analysis, unique curve points are assigned, similar to those indicated within the sample curve, Figure 1, *infra*. These unique values correspond to the following:

- Points X1 - X6
    - Each of these values corresponds to specific per unit voltage values, progressing from low voltage (X1) to high voltage (X6).
    - These values represent the calculated transition points of the VVC.
- Points Y1 - Y6
    - Each of these values corresponds to the required reactive power output values of the inverter.
    - Note: the maximum and minimum inverter output is fixed at +/- 44%.

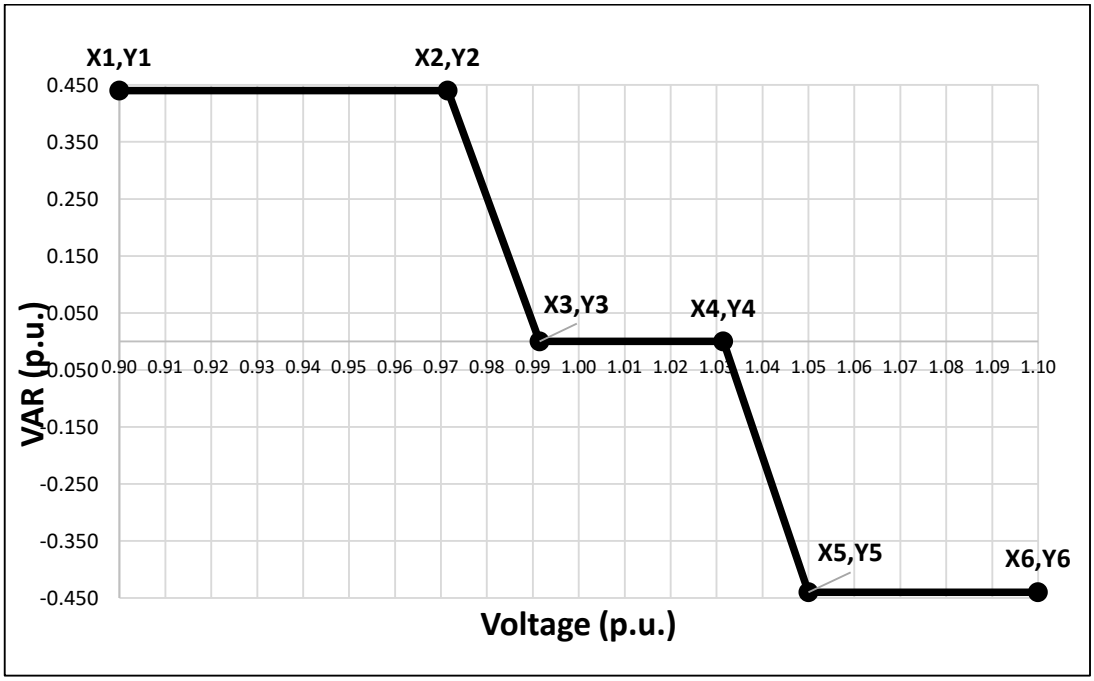

Figure 1. Sample Volt-VAR Curve (VVC)

Ride-Through Curve Parameters

All participating DERs are programmed with the latest approved standardized voltage and frequency ride-through parameters. Revisions to these settings, once initial programming has been completed, are only permitted for actively managed DERs. The latest revision of these parameters was approved in 2023. The actively managed DERs' inverters have had their ride-through curve parameters updated to the latest revision in order to improve their response to voltage and frequency variations.

DER Pilot participants in Control Groups 1 and 2 are only permitted to be programmed with the then-current ride through parameters at the time of initial programming. All non-Pilot participating DERs are not required to utilize PPL Electric-specific ride through settings, but they may be required to follow the minimum guidelines as detailed within PJM Guideline for Ride Through Performance of Distribution-Connected Generators[3] (2019).

Current PPL Electric Standard Ride-Through Curve Points

As noted previously, PPL Electric's current standard ride-through parameters were approved in 2023. The following tables detail those parameters.

Table 2. Current Standard Under Voltage Requirements

Under Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
UV1	0.88	2.1
UV2	0.5	0.6

[3] https://www.pjm.com/-/media/DotCom/planning/plan-standards/pjm-guideline-for-ride-through-performance.ashx

Table 3. Current Standard Over Voltage Requirements

Over Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
OV1	1.1	2.1
OV2	1.2	0.2

Table 4. Current Standard Under Frequency Requirements

Shall Trip – Under Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
UF1	58.5	301
UF2	56.5	0.2

Table 5. Current Standard Over Frequency Requirements

Shall Trip – Over Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
OF1	61.2	301
OF2	62	0.2

Legacy Ride-Through Parameters

As noted previously, because PPL Electric is not permitted to modify the ride-through settings of existing inverters within Control Groups 1 and 2, there are some systems which still utilize the legacy ride-through settings identified below. All such systems are marked accordingly in the "Legacy Ride Through" column in Appendix A.

Table 6. Legacy Under Voltage Requirements

Under Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
UV1	0.88	2.0
UV2	0.5	0.5

Table 7. Legacy Over Voltage Requirements

Over Voltage Requirements *Shall Ride Through* and *Shall Trip* curves are identical (overlapping) and defined in this table.		
Shall Trip Function	Voltage (p.u. of nominal voltage)	Time (sec)
OV1	1.1	2.0
OV2	1.2	0.16

Table 8. Legacy Under Frequency Requirements

Shall Trip – Under Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
UF1	58.5	300
UF2	56.5	0.16

Table 9. Legacy Over Frequency Requirements

Shall Trip – Over Frequency Requirements		
Shall Trip Function	Frequency (Hz)	Clearing Time (sec)
OF1	61.2	300
OF2	62	0.16

Pilot Expenditures

Per Implementation Plan Section G.1.3 - Capital costs and expenses associated with the purchase, installation, ownership, and maintenance of DER management devices

The capital costs and expenses associated with the purchase, installation, ownership, and maintenance of the DER management devices utilized throughout the Pilot are presented in Tables 10 and 11, *infra*. These capital costs and expenses cover the start of the DER Pilot on January 1, 2021, through March 21, 2025.

Table 10. Pilot Total DER Management Device Purchase and Installation Costs

Purchase Costs	Pilot Total
ConnectDER Simple Collar	$ 98,559.60
ConnectDER Generation 1 DER Management Device	$ 856,535.34
ConnectDER Bridge Device	$ 4,842,744.21
Cellular Gateway	$ 1,231,241.75
Sub Total (Purchase)	***$ 7,029,080.90***
Installation Costs	
ConnectDER Simple Collar	$ 76,576.09
ConnectDER Generation 1 DER Management Device	$ 300,598.68
ConnectDER Bridge Device	$ 3,847,150.80
Cellular Gateway	$ 1,065,784.07
Sub Total (Installation)	***$ 5,290,109.64***
Total Capital Costs	**$ 12,319,190.54**

Table 11. Total Maintenance Costs

Maintenance Costs	Pilot Total
ConnectDER Simple Collar	$ 84.00
ConnectDER Generation 1 DER Management Device	$ 195,929.98
ConnectDER Bridge Device	$ 500,122.25
Cellular Gateway	$ 62,903.39
IT	$ 227,001.26
Total Maintenance (Expense)	**$ 986,040.88**

The average per unit cost of each DER Management device has been detailed within Table 12. These costs consider the total material, labor (installation and troubleshooting), and maintenance costs, divided by the total number of the respective devices currently installed, as detailed within Table 1.

Table 12. Average Total Cost per Unit by Device Type (Materials, Labor, Maintenance)

Device Type	Average Total Cost Per Unit
ConnectDER Generation 1 DER Management Device	$ 1,152.88
ConnectDER Bridge Device	$ 1,265.67
Cellular Gateway	$ 2,194.49

PPL Electric notes that the average per unit cost of the ConnectDER Generation 1 device has decreased compared to the PY2 Annual Report, while the average per unit cost of the Bridge and Cellular Gateway has increased. Those increases were driven by higher labor costs for installing the Bridge and Cellular Gateway devices in PY3. PPL Electric is actively investigating potential ways to reduce those labor costs, including a decreased reliance on contractors to install the DER Management devices.

Additionally, the Company is phasing out the current generation of the Bridge and Cellular Gateway devices later in 2025. The new versions of the devices will be significantly cheaper to procure. Specifically, the per-unit procurement cost for the new Bridge device will likely be at least 40% cheaper, while the per-unit procurement cost of the new Cellular Gateway device will likely be at least 60% cheaper. By moving to these new and less expensive versions of the devices, PPL Electric will significantly reduce the procurement costs for the devices.

DER Management Device Intervention

Per Implementation Plan Section G.1.4 - Number of times, locations, and duration for active management

Through the DER Pilot, PPL Electric Pilot participants, within the active management control group, have been able to be centrally managed, via the Advanced Distribution Management System's ("ADMS") Load and Voltage Management ("LVM") module. In addition to being centrally managed, the programmed settings of a subset of these participants have also been able to be updated, as indicated within Table 13.

Table 13. Grid Support Function - Total Event Counts, by Pilot Year

	Year 1 (Jan 21 - Mar 23)	Year 2 (Mar 23 – Mar 24)	Year 3 (Mar 24 – Mar 25)
Volt-VAR Curve Overrides	0	12	0
Power Factor Setting Changes	768	221,394	298,391
Ride-through Setting Changes	0	4,138	0
Remote On/Off	0	0	0
Volt-Watt Curve Overrides (where applicable)	0	0	0

The year-over-year increase in the number of power factor management events can be attributed to: (1) the continued refinement of PPL Electric's ADMS and Distributed Energy Resource Management System ("DERMS"); and (2) an increase in the number of actively managed DERs. Appendix B details the average duration of each power factor adjustment event, by distribution feeder, with the total number of events identified within Table 13 above. Further, each indicated event accounts for all actively managed DERs within an event. This results in potential variances between the total number of events listed within Table 13 and Appendix B.

Currently, in the Pilot's Active Management Group, each participant has a maximum fixed power factor duration, prior to restoring its autonomous functionality. For a large portion of these DERs, the maximum duration has been established at 10 hours. During PY3, 298,391 events occurred, of which 94,670 returned the DERs to unity power factor, restoring

autonomous functionality. The return to unity power factor is not intended to provide grid benefits; rather, it acts as a failsafe to ensure customers do not experience excessive generation curtailment if the DER Management device were to fail to return the system to Volt/VAR management mode as programmed. A-10-hour reset time was selected to restore the inverter to unity power factor after a full day of daylight operation. A power factor management event occurring as a result of this function does not indicate that the device failed, but rather that PPL Electric's failsafe to protect customers is working as intended.

Observed DER Management Benefits

PPL Electric's DER Pilot continues to showcase the significant benefits of the integration of autonomous DER functionality and centralized active management, providing dynamic grid optimization. Throughout the DER Pilot, PPL Electric has increased the total number of DERs that can positively impact distribution system voltage and power factor. This dynamic approach optimizes grid performance in response to changing conditions, cost-effectively enhancing electric reliability, safety, and power adequacy. As a result, the Pilot has yielded notable customer benefits that are anticipated to continue, as more DER Management devices are interconnected with the distribution system. With these additional devices, opportunities to leverage all participating DERs to further address power quality issues will be possible. Continued implementation of power factor management is a key to future DER Management success and will result in a reduction in instances, durations, and severity of voltage violations.

Autonomous Benefits

The use of autonomous VVC has enabled participating DERs to help maintain PPL Electric's distribution system voltage within mandated voltage ranges.[4] As noted previously, within the description of Figure 1, each DER begins to adjust its kVAR output- once the measured voltage extends outside of the deadband range (X3 – X4) according to the programmed VVC. Each inverter's influence on overall distribution system voltage is dependent on the programmed VVC and its ability to restore system voltage within the deadband area. Through these efforts, each DER's programmed VVC is tailored to its location in order to provide the maximum support necessary without sacrificing DER output.

Validating autonomous benefits is more difficult to quantify than those detailed within active management interventions. This is due to the instantaneous influence occurring via the programmed VVCs, versus the centralized commands issued by PPL Electric to actively managed DERs. Near real time autonomous response can occur via the observed voltage at the DER and the anticipated location within each VVC. The impact of each inverter's output can be assessed against the observed feeder voltage violations by utilizing the Company's smart meter data.

Active Management Benefits

Per Implementation Plan Section G.1.5 - Grid benefits achieved for each instance of active management

PPL Electric's DER Pilot continues to showcase the significant benefits of active management in achieving dynamic grid optimization. Unlike autonomous systems, operating on predefined rules, DER active management utilizes a centralized overview of a feeder to facilitate near real-time operational adjustments, of inverter outputs. Active management swiftly responds to larger events, beyond the capabilities of an autonomous DERs, through a centralized overview and

[4] *See* 52 Pa. Code § 57.14.

simulation of potential power factor adjustment iterations before enacting them. As a result, PPL Electric can modify DER power factors to respond to a global requirement, providing a coordinated response to an event.

Through PPL Electric's DER Pilot, the Company has defined the parameters of grid benefits for each instance of active management intervention. As with the results detailed in the PY2 Annual Report, the Company has seen continued improvements in system voltage event resolution. While not all violation events are fully resolved, the use of actively managed DERs continues to help reduce the number, duration, and severity of voltage violations. Continued growth in actively managed DERs will support a greater number of voltage violations being resolved and provide additional support towards resolution of events that were not previously able to be resolved.

The Company defines "grid benefits achieved" for real-time constraint mitigation as the change in the number or severity of voltage violations present on the system in the time intervals before and after the active management of one or more DERs. The intent is to capture observed changes which result directly from the influence of an active management on a per-event basis. Voltage is also influenced by a multitude of factors that can contribute to each customer's observed voltage within an interval. The variability of these factors can mask the attribution of the positive impact of actively managed DER. This is particularly true within feeders and substations whose actively managed DERs are only a small portion of the total DERs present. As noted previously, isolating the portion of observed voltage change attributed to each specific actively managed DER is not currently possible at scale.

Further, the change in customer observed voltage violations, for each active management event, is calculated by evaluating the reported average smart meter voltages for the reporting interval immediately preceding and immediately following the active management event. Each active management event may include one or more DERs supplied from the same distribution bus. Also, the total number of events may differ between the number of DER power factor settings changes and the identified violations indicated elsewhere within this report. Additionally, PPL Electric's ADMS/DERMS estimates the number of voltage violations resolved, due to the active management of each DER. A description of these calculations and the results can be found within the active management operational descriptions section of this report. The complete table of grid benefits achieved for each instance of active management has been compiled as Appendix C.

Manually modeling the specific effects of each active management event is impractical, due to the volume and scale of analysis that would be required. However, several specific events have had comprehensive studies completed. The results of these studies are detailed within the Use Case section of the report below.

Active management has established the ability to incorporate telemetered DER data and leverage each participating DER's output into future control system strategies, yielding notable customer benefits. Through continued DER penetration growth, these benefits are anticipated to continue to grow. This will enable an increase in the opportunity to leverage all participating DERs to contribute to resolving voltage issues, power quality issues, or both on the grid. As noted previously, a key observation to the continued successful implementation of centralized DER output management is a reduction in the number, duration, and severity of voltage violations on feeders with actively managed DERs. As more actively managed DER are incorporated, it is anticipated that these results will continue to improve, highlighting the effectiveness of PPL Electric's centralized voltage management approach.

Contrasting with the limitations of autonomous curves, which only react to local voltage conditions, PPL Electric's active management of DER optimizes all available resources, locally and globally. This improves power quality for customers with minimal impact on their ability to generate real power, underlining the additional benefits of active management in enhancing grid performance.

Net DER Generation Impact Due to Active Management

Per Implementation Plan Section G.1.6 - Net generation gain or loss due to active management

PPL Electric has created a detailed report capturing the net generation loss or gain due to PPL Electric's active management of grid support functions, for each device intervention. That report can be found in Appendix D. The total active power generation reduction identified, as a result of these active management events, continues to represent a very small portion of overall system generation capabilities.

Specifically, on average, actively managed DERs experienced a net generation reduction of 0.099465kWh per event, totaling 29,679 kWh across 298,391 events.

Distribution Capital Investment Avoidance Due to DER Hosting Capacity

Among other benefits, PPL Electric's DER Pilot helps avoid distribution system upgrades by increasing distribution circuits' hosting capacity. Based on the data collected through PY3, the Pilot has increased available DER hosting capacity by 98 MW.

To derive that amount, PPL Electric utilizes a nodal analysis approach, whereby the Company evaluates the maximum amount of DERs that can be added to each feeder node without triggering any violation criterion (i.e., device overload, voltage violation, potential islanding etc.). The results have been compiled within Appendix E.

In addition to the detailed nodal DER hosting capacity, the maximum DERs permitted to interconnect on each substation's 12 kV bus has also been compiled. These indicated values, within this second portion of the analysis, represent the point at which reverse power flow occurs on the 12 kV bus or violates load and voltage criteria. These values are also contained within Appendix E, under Columns F and G (Nameplate – Max Hosting Capacity (kW) and Monitored – Max Hosting Capacity (kW)).

PPL Electric has also calculated an estimated maximum DER hosting capacity for nameplate and monitored scenarios. This total was calculated by identifying the largest amount of DERs that could be accommodated on each substation transformer bus, when supplying more than one feeder, and adding these values for all non-parallelled substation buses. These buses are generally independent of each other, as tie switches, and breakers, are normally open. Thus, the calculated values represent a reasonable approximation of the system-level DER hosting capacity, assuming no constraints are observed within the transmission system.

An overview of the hosting capacity results is provided in Table 14. As seen in that table, active management continues to prove beneficial and reduce or avoid capital investments in the distribution system.

Table 14. DER Hosting Capacity Results, by Reporting Year (in MW)

	Year 1	Year 2	Year 3
Nameplate vs Monitored	6.6	18.1	63
Monitored vs Autonomous	1.4	5.7	17
Autonomous vs Actively Managed	1.0	4.9	18
Monitored vs Actively Managed	9.0	28.8	35

Capital Investment Avoidance Attributed to Increased DER Hosting Capacity - Monitoring

Per Implementation Plan Section G.1.7 - Distribution system upgrades avoided due to increased hosting capacity attributed to monitoring

PPL Electric is required to develop a report which compares the computed circuit hosting capacity when all DERs are evaluated at nameplate kW only versus the hosting capacity of each circuit with actual kW output, gained via monitoring, while keeping Grandfathered DERs at nameplate kW. Results indicate that the availability and use of actual DER system production data results in a noticeable increase in a circuit's calculated hosting capacity in most cases. Cost-effective increases in hosting capacity are critical to enabling the renewable energy transition by reducing and avoiding costs for future interconnections of renewable resources.

As of the end of PY3, PPL Electric's ability to monitor DERs has resulted in an increase of 63 MW of DER hosting capacity.

Capital Investment Avoidance Attributed to DER Hosting Capacity – Autonomous Functions

Per Implementation Plan Section G.1.8 - Distribution system upgrades avoided due to increased hosting capacity attributed to autonomous grid support functions

PPL Electric has developed a report which compares the computed circuit hosting capacity with actual kW gained via monitoring only versus the scenario where those DERs are equipped with autonomous grid support functions, while keeping grandfathered DERs at nameplate kW. Autonomous functions provide additional benefits in the form of improved hosting capacity by allowing DERs to respond to local voltages to help mitigate high or low voltage constraints.

As of the end of PY3, the utilization of PPL Electric-calculated VVCs has resulted in an estimated 17 MW of DER hosting capacity.

Capital Investment Avoidance Attributed to DER Hosting Capacity – Active Management Functions

Per Implementation Plan Section G.1.9 - Distribution system upgrades avoided due to increased hosting capacity attributed to active management

PPL Electric has developed a report which compares the computed circuit hosting capacity when all DERs are evaluated at the nameplate kW only, without any monitoring or active management, versus the hosting capacity of each circuit with actual kW output gained via active management, while keeping grandfathered DERs at nameplate kW. Active management shows additional improvements in feeder hosting capacity when compared to autonomous only scenarios. This results from the ability of active management to utilize DER to respond to voltage violations holistically, rather than relying on DERs to adjust themselves based on local measurements.

As of the end of PY3, PPL Electric's ability to actively manage DERs has increased DER hosting capacity by 18 MW when compared to autonomous functions and by 35 MW when compared to monitored results.

Reliability Improvements

Per Implementation Plan Section G.1.10 - System operation comparisons of circuits under autonomous inverter grid support functions versus active management

PPL Electric has compiled customer meter voltage data and has developed observations pertaining to customer meter voltage performance between DER Pilot participants and non-participants. The non-participants have been identified as grandfathered ("GF"), whereas Pilot participants are classified further as Control Group 1 ("CG1"), Control Group 2 ("CG2"), and Active Management Group ("AM"). Through these initial observations, the Company has developed a comparison of customer voltage between each DER control group at the customer point-of-interconnection. PPL Electric completed a further comparison of all customer meter data between feeders with actively managed DERs versus those with CG1 DERs. Within the feeder comparison, GF DERs may also exist.

PPL Electric's voltage performance metrics have been designed to improve overall understanding of distribution system voltage performance, while closely following industry established reliability practices. In particular, PPL Electric based its voltage metrics on System Average Interruption Frequency Index ("SAIFI") and System Average Interruption Duration Index ("SAIDI"). While SAIFI and SAIDI are outage focused, the Company utilized these standardized metrics to create its own voltage metrics: System Average Voltage Violation Frequency Index ("SAVVFI") and System Average Voltage Violation Duration Index ("SAVVDI"). The calculation of these metrics utilizes the following datapoints:

> SAVVFI = (Total number of voltage violation events experienced by all customers in a set) / (total number of customers in the set)
> SAVVDI = (Total duration in minutes of voltage violation events experienced by a set of customers) / (total number of customers in the set)

In addition to the frequency (SAVVFI) and duration (SAVVDI) metrics previously detailed, PPL Electric also developed additional metrics to quantify the severity of voltage violations observed within each control group, (non) pilot participant. Within this context, a voltage violation's severity is the relative difference between the measured customer meter voltage and the permissible voltage range, per the Commission's regulations (0.95 to 1.05 per unit).[5]

For DER Point of Interconnection ("POI") analysis, SAVVDI, SAVVFI, and voltage severity values have been calculated separately for the GF, CG1, CG2, and AM groups. Pilot participants identified as CG12, who were assigned to both CG1 and CG2 control groups, will be included within CG1 and CG2 analysis. All calculations within this analysis only consider daylight hours.

DER POI SAVVDI and SAVVFI Historical Trends

Prior to completing an examination of the DER POI voltage violation data, the Company reviewed historical voltage violation trends that had been present before and the participating DER had been installed. The data within Figure 3 shows the SAVVDI and SAVVFI trends, at customer metering locations, before any Pilot DERs were interconnected. Pilot participants, as well as grandfathered DERs, interconnected by December 31, 2024, encompass the dataset for the results presented in Figure 2. Within these results, it is evident that a number of voltage violations were present in each

[5] *See* 52 Pa. Code § 57.14.

Pilot group (CG1, CG2, and AM) prior to any DER Management devices being installed. The use of these periods can be utilized as pre-Pilot baselines and used as a measure of comparison going forward.

Similarly, within this analysis, the DERs identified as grandfathered are those that have been installed after the Pilot commenced but are non-Pilot participants. Continued analysis of these DER, in the future, can also consider this data set as a pre-installation baseline, like the aforementioned Pilot participants. The remaining grandfathered DERs, which were installed prior to the Pilot, have been excluded from the remaining analysis detailed below.

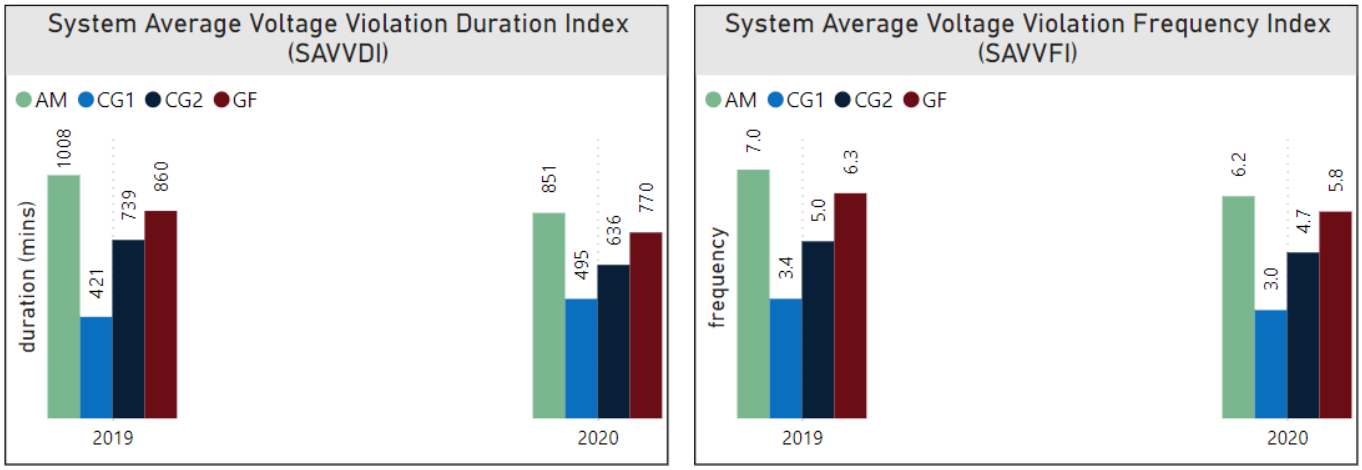

Figure 2. DER Customer Historical SAVVFI & SAVVDI by Calendar Year

Figure 3 and Figure 4 present a continuation of the trends depicted in Figure 2, as the DER Pilot commenced. However, it is important to recognize that voltage violation data for the GF, CG1, CG2, and AM groups starts being collected for each customer location from the date that the DER is connected and (in the case of AM and control group DERs), programmed with a VVC. As a result, the corresponding SAVVDI and SAVVFI results have an upward trend, as additional customer meter data is included within the analysis. The Pilot participating DERs (CG1, CG2, and AM groups) have a smaller impact on the SAVVDI and SAVVFI calculations, while the non-Pilot participating GF DERs have had a significant increase in both SAVVDI and SAVVFI. There continues to be significant increases in the number of Pilot participating DERs within the AM group, with the ability to positively impact voltage violations. DERs assigned within the AM group function autonomously via their uniquely assigned VVCs until ADMS/DERMS intervention.

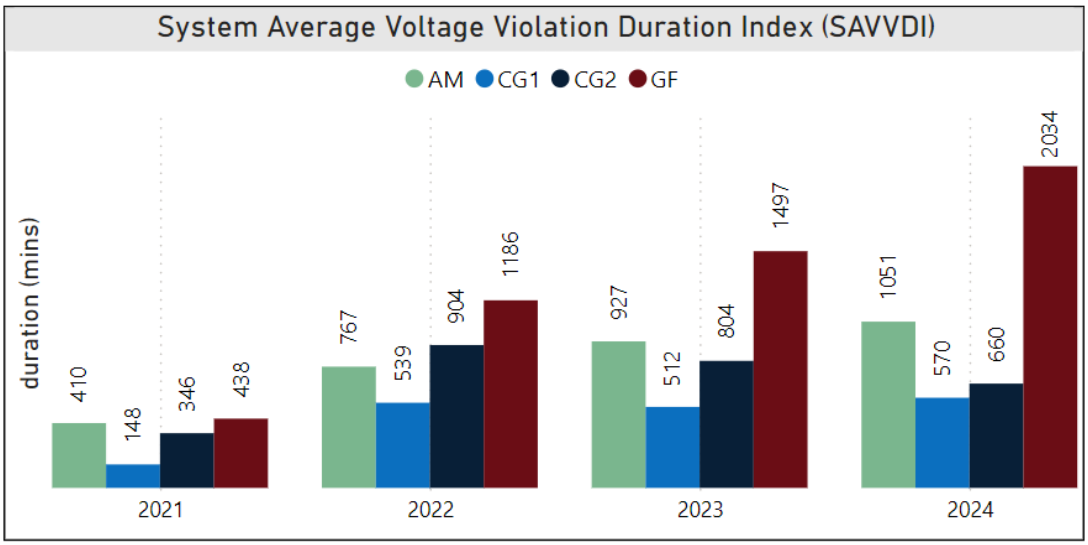

Figure 3. DER Customer SAVVDI with Fixed Customer Set by Calendar Year

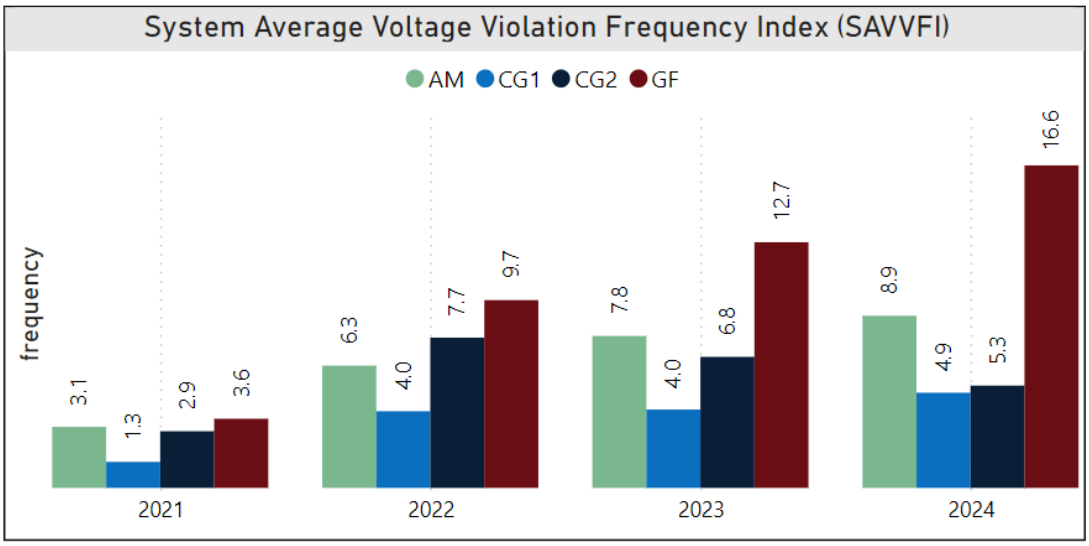

Figure 4. DER Customer SAVVFI with Fixed Customer Set by Calendar Year

On its own, the voltage data at the DER customer location does not paint a complete picture of the impact of VVCs and active management on customer voltages and power quality. To capture the full impact, the voltages at all customer locations, both those with and those without DERs, must be considered. Both PPL Electric's VVC design process and the execution of active management consider both the local DER customer voltage as well as the impacts to voltage elsewhere on the system. The existence of CG1 provides a more direct way of evaluating the impact of active management capabilities on customer voltage violations. In Figures 9 and 10 later in this report, SAVVFI and SAVVDI have been calculated for all customers on CG1 feeders as well as for all customers on feeders with actively managed DERs. Because this data considers each meter on a given set of feeders (CG1 or AM), low sample size is not an issue, even for relatively smaller numbers of actively managed DERs because those DERs are spread across many different feeders and, consequently, a high volume of voltage measurement datapoints.

DER POI SAVVDI and SAVVFI Throughout Pilot

PPL Electric also completed an analysis that directly compares voltage trends and performance of non-Pilot participating DERs installed before the Pilot started (assigned within the grandfathered control group) versus Pilot participating DERs (assigned within CG1, CG2 and AM groups). Similar to the previous analysis, smart meter voltage data, for customers within each dataset, was collected and assessed. An overview of the modifications to the previous analysis includes:

1. Inclusion of pre-Pilot DERs, within the GF group, i.e., placed in-service to the January 1, 2021 start of the Pilot.
2. Inclusion of all Pilot participating DERs (CG1, CG2, and AM groups).

Note: The number of Pilot participants continued to grow throughout this analysis, whereas the number of GF group members was constant.

In the first year of the DER Pilot, the number of Pilot participants was relatively small. Due to the initial small sample set, the 2021 results are significantly lower than subsequent years and may be excluded in the development of any long-term trend analysis. Additionally, no DERs were assigned to the AM group in 2021. After Q2 2022, the AM group's size and ability to influence the distribution system voltage grew significantly, as illustrated within Figure 5 and Figure 6.

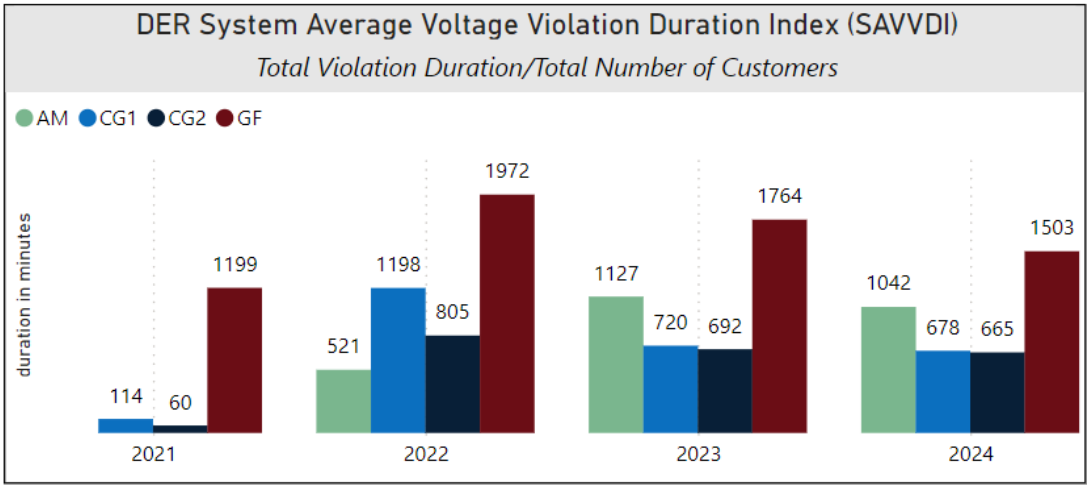

Figure 5. DER Customer SAVVDI Results by Calendar Year

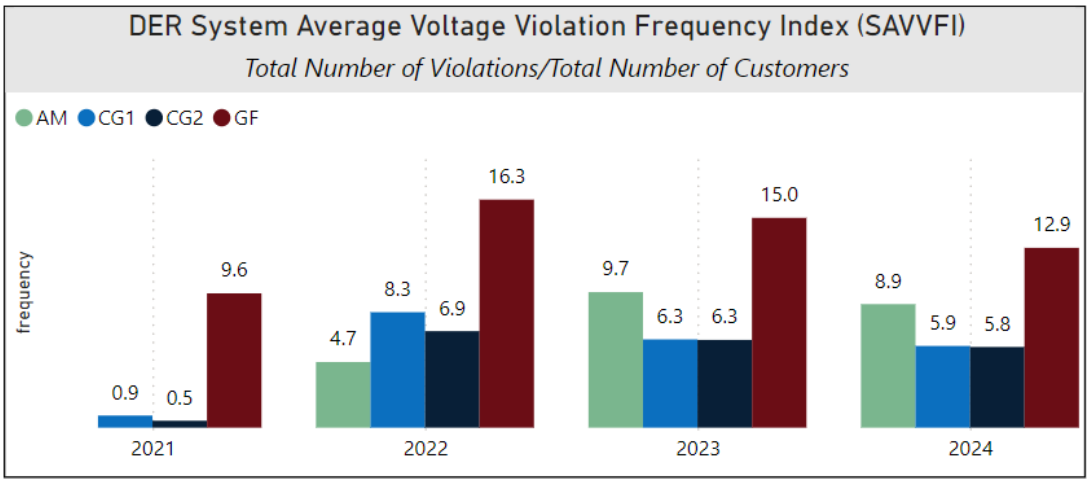

Figure 6. DER Customer SAVVFI Results by Calendar Year

DER POI Voltage Violation Severity

PPL Electric has continued to expand on its SAVVDI and SAVVFI analysis by adding a metric depicting the voltage violation severity, as a percentage, at the POI. The compilation of this data is limited to daylight hours and details the number of customer meter readings within each depicted percentage band. By compiling the metered data, voltage violations have been observed to occur less at Pilot participating customer meters, than non-participating meters. Additionally, the overall recorded voltage violations represent an extremely small portion of customer meter readings for Pilot and non-Pilot participants.

The compilation of these results is set forth in Figure 7.

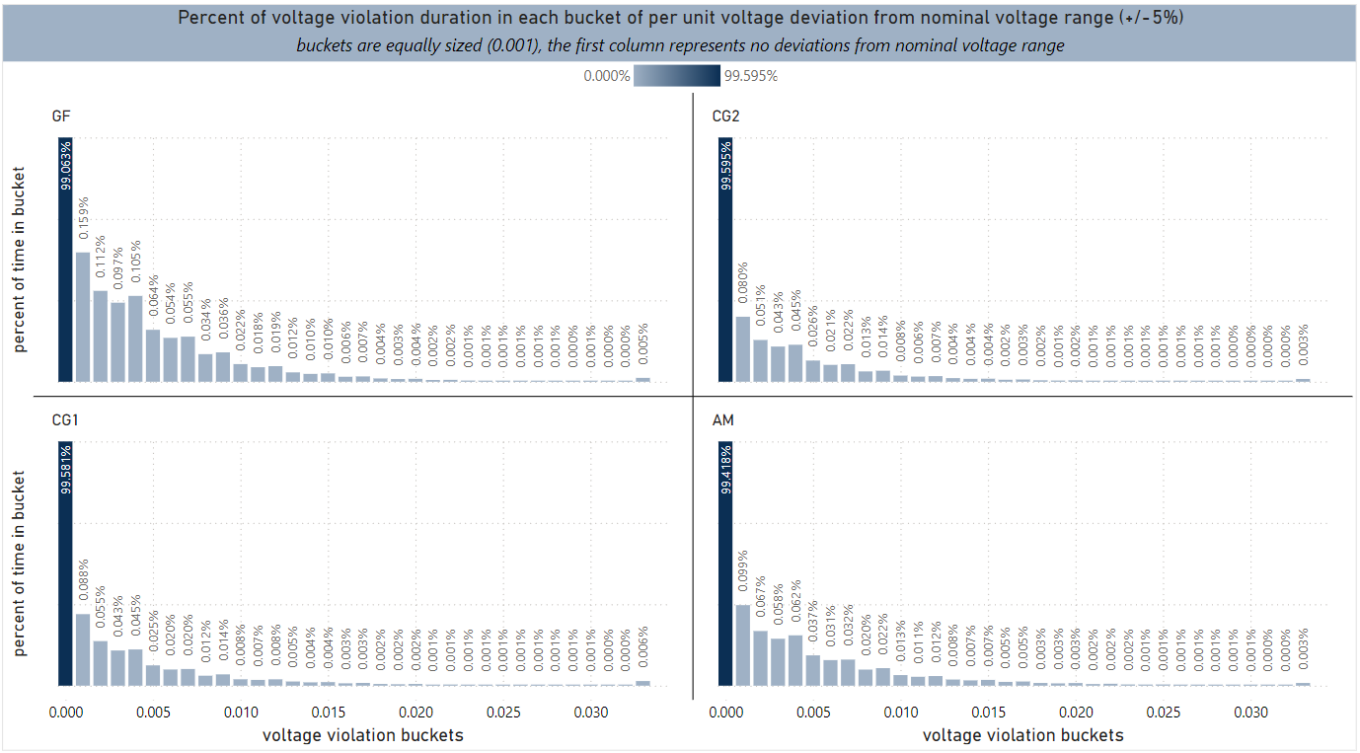

Figure 7. Voltage Severity Results by Pilot Group

Presenting the voltage violation severity results in a different form, Figure 8 excludes the customer meter periods without any voltage violations. The remaining data points have been converted to percentages. Through this revision of the data presentation, the cumulative number of periods in which a customer's voltage has fallen within each area of violation severity have been accumulated as a percentage of the total voltage violations observed. Non-pilot participating DERs (GF) tend to have higher voltage violation severities, for a larger number of periods, than Pilot participants (CG1, CG2, and AM). Accordingly, participation in the DER Pilot appears to have reduced the overall severity of voltage violations.

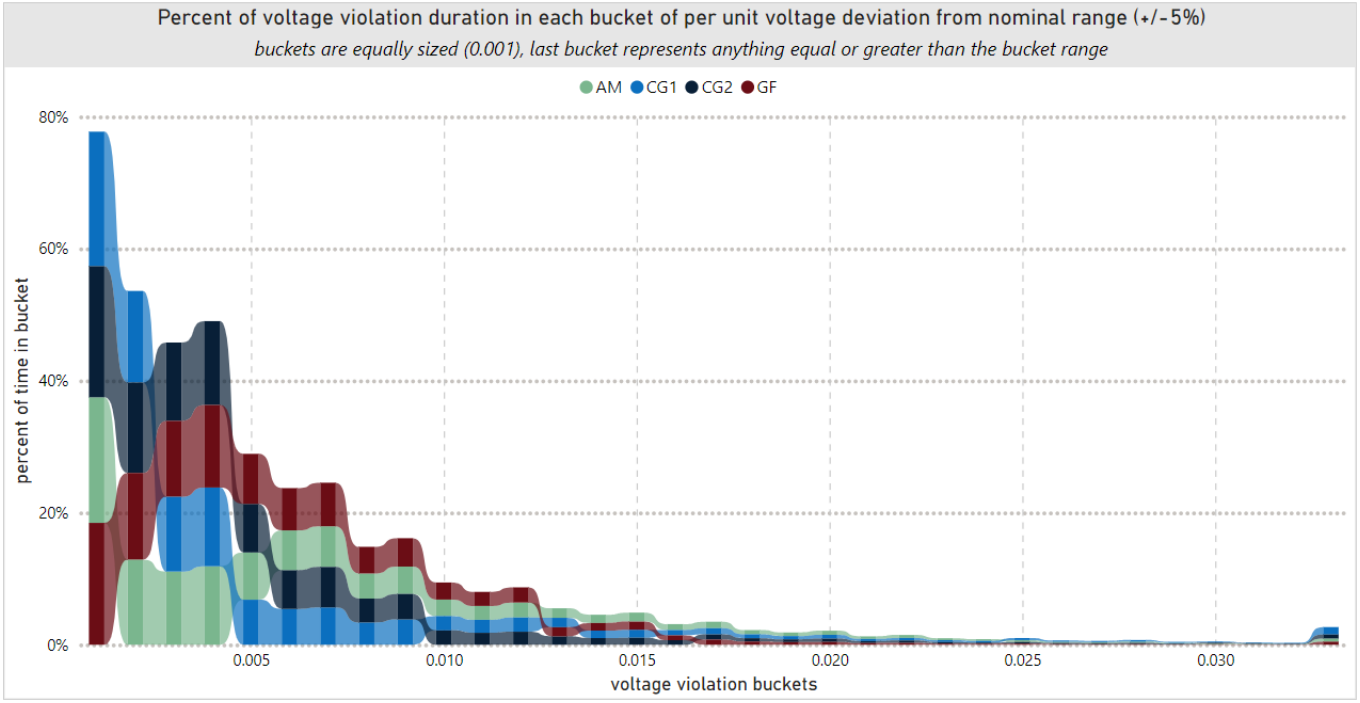

Figure 8. Voltage Severity Comparative Results by Pilot Group, Y-axis is stacked by size from smallest to largest percentage

From the analysis presented within Figure 7Figure 7 and Figure 8Figure 8, participation in the DER Pilot has helped reduce voltage violation severity, when compared against non-Pilot participating DERs. As non-Pilot participating DERs are most likely present on all feeders with Pilot participating DERs, the impact of Pilot participation may be potentially masked by the influence of the non-Pilot participating DERs.

Pilot Feeder SAVVDI and SAVVFI - Historical Trends

While customer meter voltage data, on its own, indicates the performance of each DER (participants and non-participants of the Pilot alike), such data does not fully encompass the voltage performance throughout the supplying feeder. Improving the overall understanding requires examining the DER penetration rate and all other parameters potentially influencing the feeder's overall voltage performance. When accounting for the DER penetration rate, the Company's data shows that DERs participating in the Pilot can improve the feeder's overall voltage performance. Further, the inclusion of those components reveals the influence and effectiveness of uniquely assigned VVCs and active management of DERs.

PPL Electric collected customer meter data to demonstrate the improvements of SAVVFI and SAVVDI performance on feeders in the DER Pilot. The data was parsed into AM and CG1 feeders. The annual SAVVFI and SAVVDI calculations are presented within Figure 9 and Figure 10. Unlike the previous analysis iterations, the data presented includes all Pilot feeders, from pre-Pilot implementation through to the end of 2024. As noted previously, DER adoption has continued to increase throughout the Pilot's duration. Through this increase, participation within the DER Pilot has increased to the maximum annual threshold from 2023 onward. With the increase in Pilot participation, the positive impact of VVCs and active management have demonstrated their influence in resisting voltage variations, as observed within the SAVVDI and SAVVFI calculations presented in Figure 9 and Figure 10 below.

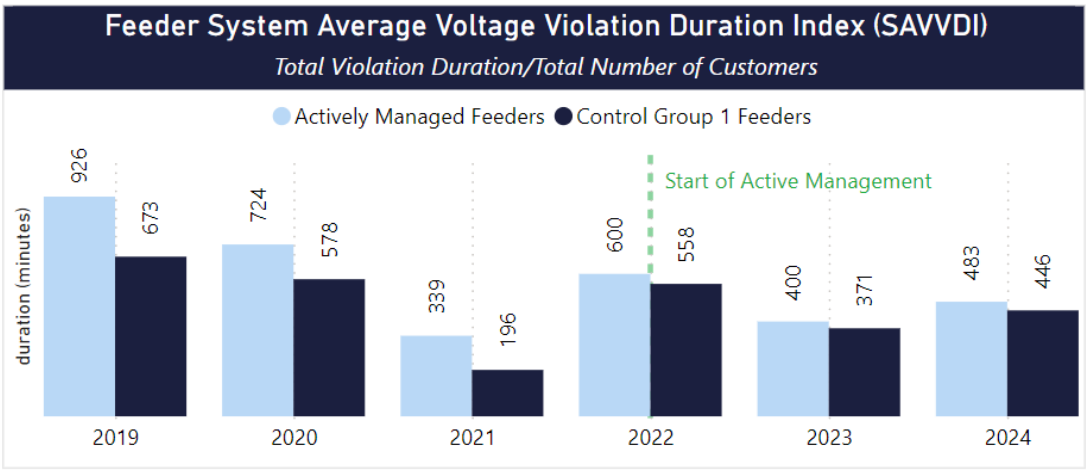

Figure 9. Feeder-Level SAVVDI Comparison Results by Calendar Year

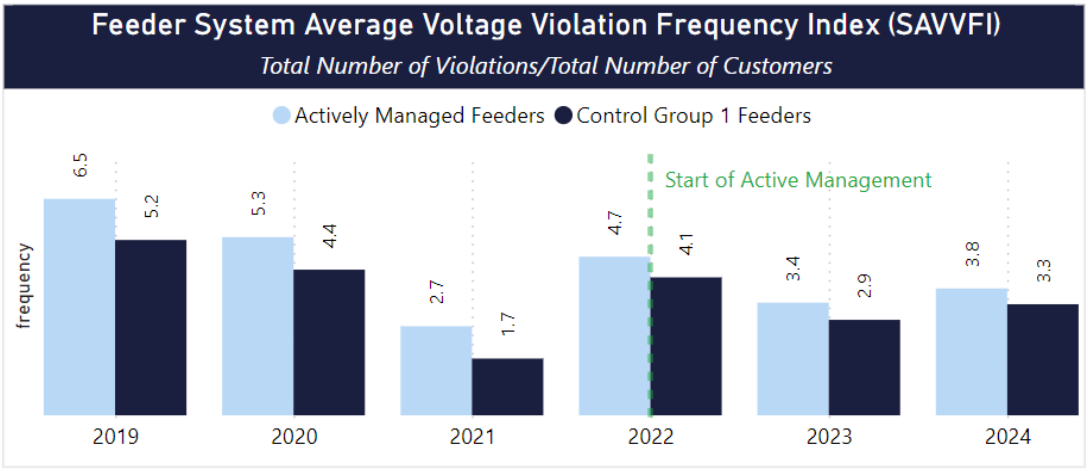

Figure 10. Feeder-Level SAVVFI Comparison Results by Calendar Year

In summary, Figure 9 and Figure 10 illustrate SAVVDI and SAVVFI for each feeder group and the incremental improvements seen, starting prior to the-Pilot's commencement (2019-2020) through observed DER penetration increases (2023 onwards). Figure 11 is an extension of Figure 9 and Figure 10 and demonstrates the difference within the SAVVDI and SAVVFI calculations between the two feeder groups, throughout the review period. From these three figures, the average system voltage violation has reduced more for actively managed feeders than it has for the CG1 feeders, following the commencement of DER active management in 2022. This highlights the anticipated benefits of active management in maintaining system voltage.

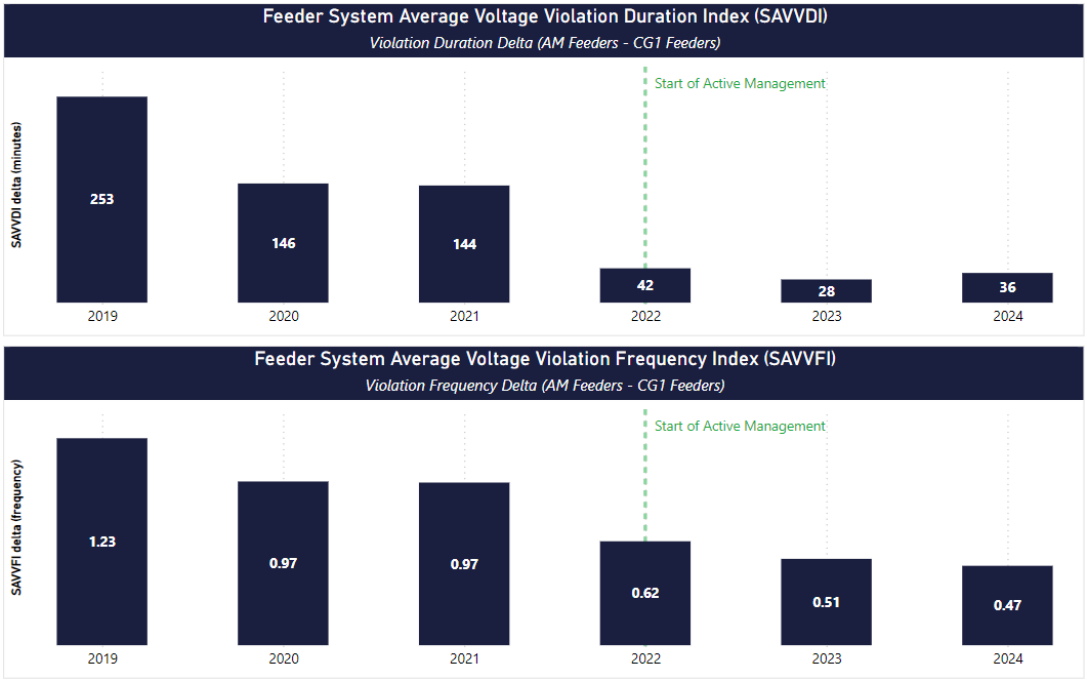

Figure 11. Feeder- SAVVDI & SAVVFI Comparison By Control Method by Calendar Year

Feeder Voltage Violation Severity

As a continuation of the SAVVDI and SAVVFI calculations above, calculating voltage violation severity at a feeder level provides a more significant comparison between CG1 feeders and those with DERs that can be actively managed. A review of the impact of autonomous only feeders (CG1) versus autonomous and AM illustrates the cumulative impact of integrating both Pilot management types, as seen within Figure 12. While CG1 feeders demonstrate the benefit of autonomous functions, AM feeders demonstrate the added benefit of active management.

As noted previously, through the inclusion of each of these feeder categories, from the Pilot's inception forward, the total nameplate capacity of DERs has continued to increase. Further, DER installations continue to increase on the AM feeders at a larger rate than observed amongst the 75 feeders comprising CG1. Non-Pilot participating DERs continue to be interconnected and disbursed throughout PPL Electric's distribution system, potentially influencing the results of both examined feeder categories.

As denoted within Figure 12, prior to the start of active management events in 2022, customers on feeders with actively managed DERs experienced a relatively lower incidence of the most severe voltage violations when compared to their peers on CG1 feeders. This gap widened by the end of 2023 due to the number of actively managed DERs and active management events significantly increasing. Although this gap narrowed in 2024, PPL Electric's Pilot data has shown that active management can have a clear impact on customer power quality.

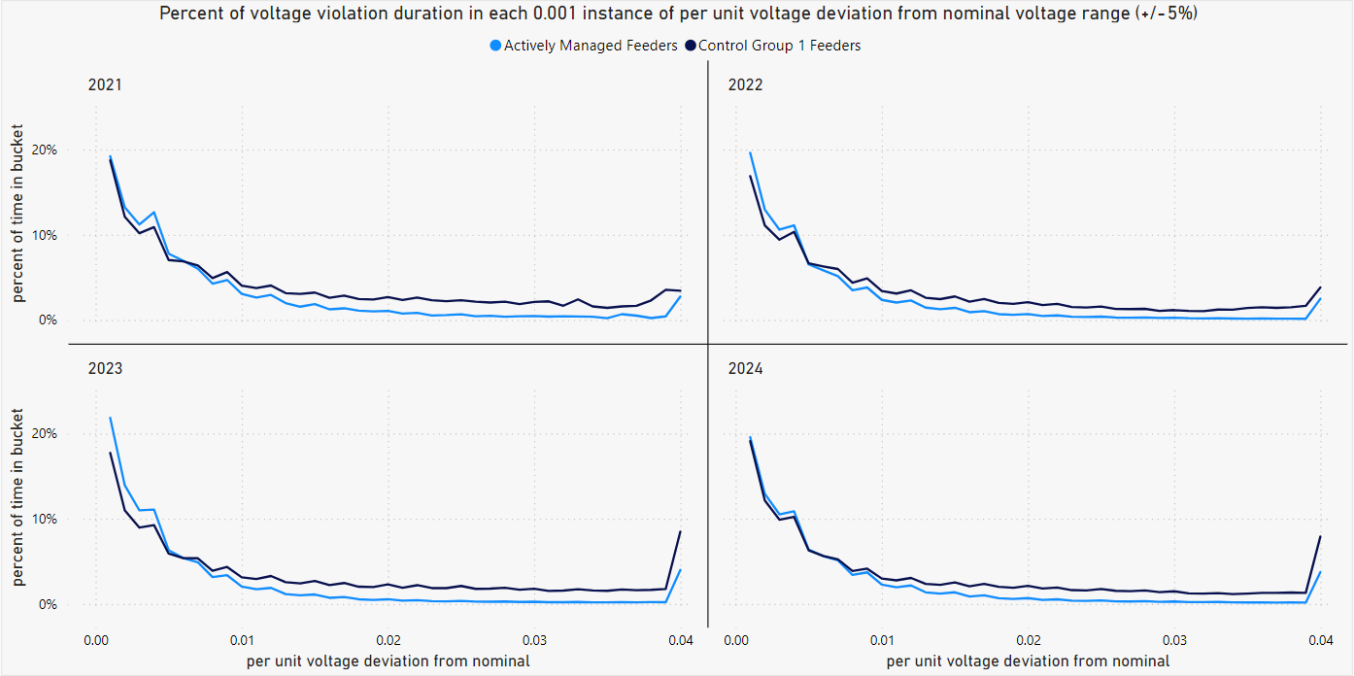

Figure 12. Feeder Level Voltage Severity Results Comparison

Voltage Violation Conclusions

Key takeaways from the comprehensive review of the figures in this section and their associated explanations are

1. **Trend of Shorter and Less Frequent Violations:** The Grandfathered Group has longer and more frequent voltage violations than Control Group 1, Control Group 2, and the Active Management Group. The trend of shorter and less frequent voltage violations for the latter three groups demonstrates that the DER Pilot is improving grid conditions.

2. **Historical Challenges in Actively Managed Feeders:** Feeders with actively managed DER historically faced a higher frequency of voltage violations, compared to those in CG1. However, the disparity in violation frequency between these groups has started to decrease beginning in 2022, showcasing how actively managing the DERs has gradually improved the feeders' performance.

3. **Response vs. Prevention:** PPL Electric's systems, including ADMS/DERMS, are configured more towards responding to existing voltage violations, rather than preventing them. This reactive approach results in less pronounced impacts on violation frequency, as interventions are primarily aimed at resolving the current sustained issues or preventing a recurrence within the same day. However, with DER management, the potential exists for significant enhancements in how voltage violations are managed through advancements in operational forecasting. With better predictive capabilities, it may become feasible to proactively manage and reduce the frequency of voltage violations before they occur, shifting from a reactive to a preventative management style.

4. **Quantifying Severity:** The development of new metrics to understand the severity of voltage violations adds another layer of depth to grid management. These metrics help quantify the delta between the permissible

range and the voltage measured, providing a clearer picture of the feeder's health and the effectiveness of voltage regulation strategies.

5. **Understanding Impact Over Time:** The analysis of severity across different times and conditions (such as daylight time intervals) helps in understanding the dynamic nature of voltage violations and the operational effectiveness of DER management across different scenarios.

Operational Efficiency Improvements Attributed to Active Management

Active management commands are communicated to the required devices via PPL Electric's ADMS and its accompanying LVM module. Through LVM, several scenarios are simulated, based on the incoming SCADA telemetry and customer meter data, to assess the needs of the distribution system. The resulting LVM solution is an optimally selected scenario and specifies the number of actively managed DERs to be included. Through the execution of these scenarios, a portion of the reported voltage violations is anticipated to be resolved.

Further analysis of these resolutions has led to the development of a metric indicating the number of potential technician site visits reduced, due to the resolution of voltage violations. Within each LVM plan period, a portion of impacted customers is anticipated to have their voltage violations resolved. With this, the number of customers with at least one voltage violation resolved, within an LVM plan period, is multiplied by the completion rate of LVM plans, which is currently 84.3%. The completion of an LVM plan includes the initiation and resolution of planned actions. Customer count is used rather than violation count to avoid counting multiple resolutions for a single customer as multiple truck rolls, and because not all resolutions are directly attributable to active management.

The completion rate is then multiplied by 75%, which is the frequency that PPL Electric deploys a truck and personnel in response to a voltage violation complaint based on the Company's power service problem ("PSP") data. The resulting figure is then multiplied by the cost PPL Electric incurs per truck roll to resolve a voltage violation. This provides an estimate of the overall cost effectiveness of active management in identifying, mitigating, and resolving voltage violations.

Table 15. Avoided Truck Roll Cost, per year, Attributed to DER Management Influence

Year	Truck Roll Rate	Voltage Violations that could have resulted in Truck Rolls	Total Cost to Respond to Voltage Violations that were Avoided
2022	$711	796	$565,956.00
2023	$535	13,586	$7,268,510.00
2024	$656	17,624	$11,561,493.00
2025*	$263	3,062	$603,935.00
Total			**$19,999,894.00**

*2025 values are inclusive of the end of PY3, March 21,2025.

DER Management Functions and Operations

Active Management Functionality and Operation

Per Implementation Plan Section G.1.11 - Operational descriptions of how active management was executed and implemented

PPL Electric has compiled a report of data captured from the ADMS/DERMS system. This report identifies the operational issues face, the active management action taken, and the expected resulting impact of the action for each instance of active management. As noted previously, within Active Management Benefits portion of this report, the data has been exported from the ADMS/DERMS event logs and presented within Appendix F. The data indicates the number and severity of voltage violations present before and after ADMS/DERMS executes the management plan. In contrast to the approach detailed previously within the Active Management Benefits, smart meter measured data is utilized but does not determine the relative role of each DER.

Prior to the execution of an active management event, ADMS/DERMS completes an iterative simulation of the impacted feeder to determine which devices will be included and their necessary power factor adjustments. The results reflect the best information available at the time the management action was taken and incorporates some voltage and load measurements received through SCADA but does not include measured smart meter voltages.

When the ADMS/DERMS is managing system voltage, it identifies voltage violations within the operational model, determines an optimal plan to mitigate voltage violations, and then calculates the hypothetical future state expected to result from that plan. The pre- and post-plan calculated values are recorded within the event log files, as well as the participating DERs and issued commands. From the pre and post event data, the estimated number of voltage violations, resolved by the ADMS/DERMS action, are calculated.

The calculated voltage violations resolved are higher than the observed voltage violations resolved, due to a variety of factors. Slight variances between the simulated and measured results are to be expected. ADMS power flow calculations incorporate real time data and utilize trend data for very near-term forecasting to project the simulated results in study area. Most observed voltage violations occur slightly outside of permissible voltage limits, as presented in Figure 8. Through the integration of the power flow solution within the active management simulations, an overestimation (and sometimes underestimation) of event responses may occur. Each power flow and optimization cycle, currently occurring approximately every 15 minutes, is largely independent from the previous cycle, potentially resulting in the same set of customer voltage violations resolutions being attributed to multiple system interventions. Additionally, the estimated voltage violation resolutions do not account for any failed communication with a participating DER Management device, resulting in a decrease in anticipated participation and subsequently realization of anticipated benefits. Finally, the power flow solution does not fully account for the actions of autonomously operating devices outside of the system's control, such as switchable capacitors and voltage regulators, which are capable of changing state or position independently of the scheduled system intervention of DER Management devices. The ability to operate independently between the pre-and post-plan results further adds to the variance between anticipated and actual voltage violation resolutions.

ADMS/DERMS also attempts to reduce the severity of voltage violations, as part of the voltage management process. While there may not yet be sufficient penetration of actively managed DERs to resolve voltage violations in all areas, ADMS/DERMS still utilizes the available resources to improve system voltage conditions. The results of these actions are also presented within Appendix F, on a per event basis.

Active Management Validation

To validate the performance of the ADMS/DERMS in addressing voltage violations, PPL Electric has compared DERMS plan logs to the observed customer voltages impacted during the 15-minute meter intervals prior to and after the execution of the planned event. The customer meter data has been sourced via the smart meter data repositories. Given the fluidity of the distribution system within each smart meter 15-minute interval, there are a multitude of contributing factors influencing distribution system, as well as customer service voltages, thereby increasing the difficulty in attributing the resolution of a voltage violation solely to DER management. It is possible, however, to assess whether the ADMS/DERMS plans generally align with and support voltage changes that are needed to improve voltage violation conditions.

Successful DER management utilizes DERs to positively impact customer and distribution system voltages during periods of high and low voltages. This has contributed to a reduction in observed customer voltage violations. PPL Electric has examined the ADMS/DERMS event logs to identify events in which a portion of participating DERs had been directed to influence the observed voltage, in the same direction so as to resist the violation. From these events, customer smart meter voltages, on the same feeder and phase as the managed DERs, are examined pre and post event to determine the influence of the subject planned event.

Due to the complexity and factors impacting the distribution system's voltage, certain events involve a mixture of DER management actions; with a portion of the DERs increasing kVAR absorption and others increasing the kVAR injection. These multi-directional events are difficult to analyze at scale and have been excluded from this analysis, to increase the clarity and understanding of DER Management action effectiveness. The results illustrated in Figure 13 below exclude said complex events.

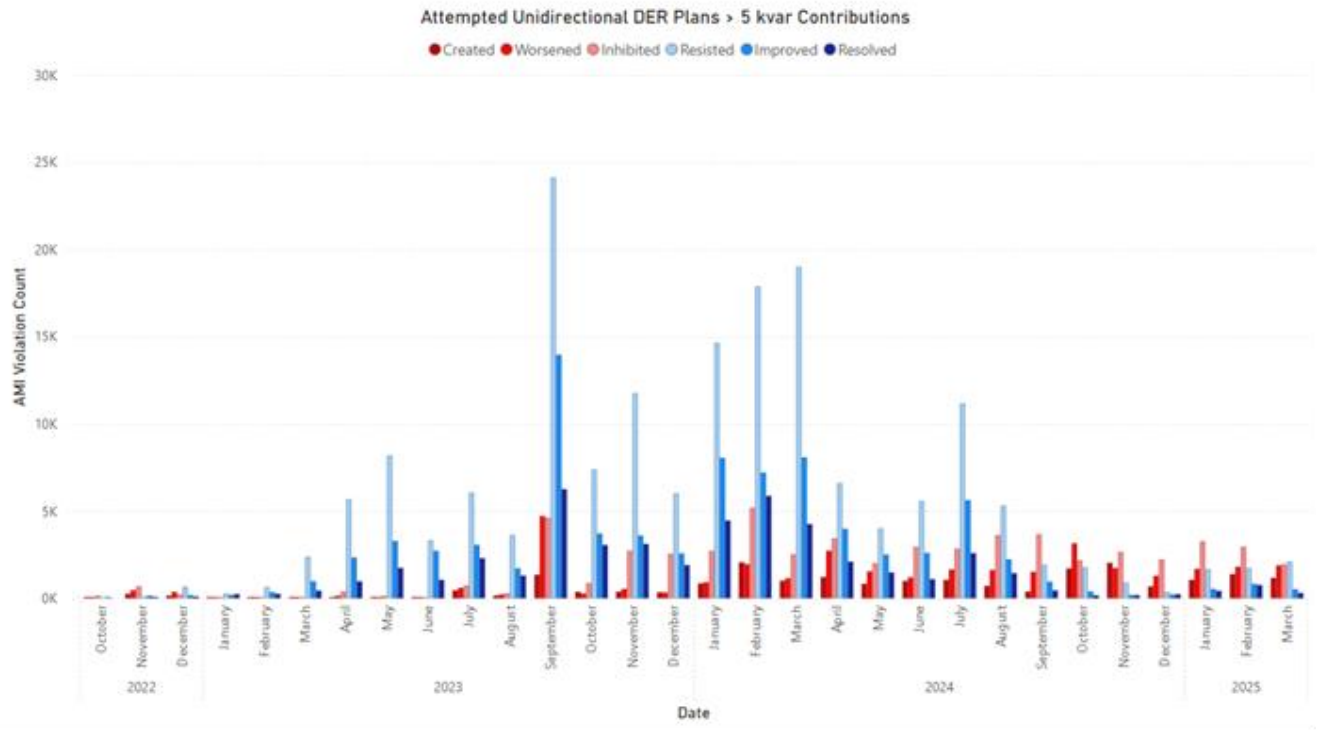

Figure 13. DER Management Plan Contribution Results

Within Figure 13, the contribution of each DER management's contribution to the change of voltage violation was categorized as follows:

- *Created*: A new voltage violation has been observed after the execution of a DER management plan, at the end of a smart meter reporting period, that did not exist prior to the management action
    - Ex: A participating DER injects kVAR which would raise system voltage, and a customer's voltage changes from 1.049 per unit to 1.051 per unit
- *Worsened*: A voltage violation was more severe in the direction of the DER management planned voltage contribution, at the end of a smart meter reporting period, than prior to the management action
    - Ex: A participating DER injects kVAR which would raise the voltage, and a customer's voltage changes from 1.051 to 1.052 per unit
- *Inhibited*: A voltage violation was less severe at the end of a smart meter reporting period, but the DER management plan's voltage contribution was in the opposite direction
    - Ex: A participating DER injects kVAR which would raise the voltage, and a customer's voltage changes from 1.052 to 1.051 per unit.
- *Resisted*: A voltage violation was more severe at the end of a smart meter reporting period, despite the DER management plan's voltage contribution in the direction opposite the violation
    - Ex: A participating DER absorbs kVAR which would lower the voltage, and a customer's voltage changes from 1.051 to 1.052 per unit.
- *Improved*: A voltage violation was less severe at the end of a smart meter reporting period in the direction of the DER management plan's voltage contribution
    - Ex: A participating DER absorbs kVAR which would lower the voltage, and a customer's voltage changes from 1.052 to 1.051 per unit.
- *Resolved*: A voltage violation existed at the start of a smart meter reporting period that did not exist at the end of the period and attributed to the DER management plan's voltage contribution
    - Ex: A participating DER absorbs kVAR which would lower the voltage, and a customer's voltage changes from 1.051 to 1.049 per unit.

Within one of the incremental software updates PPL Electric's ADMS/DERMS had received, modified the allowable minimum power factor for actively managed DERs. The ADMS/DERMS restricted impacted devices from operating outside of +/-90% power factor. Due to this process revision, the subject DERs were removed from operating autonomously, via their unique VVC, and issued power factor adjustment commands, to raise (or lower) their power factor to the +/-90% threshold, reducing available kVAR support. Previously, these DERs would have remained following their autonomous VVC settings and been permitted to contribute (or absorb) kVAR up to the programmed 44% of the kW nameplate rating, as outlined within IEEE 1547-2018. Through the issuance of these power factor adjustments, the subject DERs' contribution to local voltage violations had been reduced, resulting in the potential to contribute to an increase in the observed voltage violations, as presented within Figure 13, after September 2024. This and other potential contributing factors are currently being examined by PPL Electric, with solutions forthcoming.

Through the DER Pilot, participating DERs help support the distribution system's voltage autonomously, via unique VVCs and active management. As DER penetration continues to increase, the intertwined DER management effectiveness has become evident. Through each Pilot DER's autonomous VVC settings, DER are capable of instantaneously resisting any voltage variations outside of the individual VVC deadbands. Through this resistance to voltage changes, each DER attempts to restore the measured voltage, at the inverter, within the deadband range. During periods of excessive and/or sustained voltage outside of the DER's VVC deadband, the Company's ADMS/DERMS can intervene and establish a suitable solution and include additional actively managed DERs, if necessary. Through these solutions, commands are dispatched to DERs to improve the observed voltage and resist further voltage variances, while influencing attempts to restore the distribution system voltage within its permissible limits. Through the use of autonomous and active management techniques, PPL Electric's participating DERs have aided in the resolution of observed voltage violation conditions, improved voltage violation magnitudes (severity), and resisted other factors that contribute to the

occurrence of or increase the severity of voltage violations. While creating, worsening, or inhibiting the resolution of voltage violations are not generally desirable, nor the intention of the DER Pilot, the optimization of the distribution system is very complex and can result in trade-offs, with overall net positive results continuing to be observed. For example, creating one new voltage violation with a relatively small magnitude in order to resolve five voltage violations elsewhere on the system is a significant net positive from the system perspective.

The results of active management provided to date are a direct result of the growth in number and nameplate of actively managed DERs. As DER penetration continues to increase, the total amount of available reactive power support will continue to increase as well. While the existing DER penetration throughout PPL Electric's distribution system varies, those areas that have transitioned from low to medium, or medium to high, penetration throughout the Pilot have increased their resiliency because of the additional support provided through actively managing DERs. Active management has contributed to a decrease in instances, duration, and severity of voltage violations, as the use of fixed power factors provides a larger area of influence than available with autonomous scenarios. From Figure 14 below, most of the executed DERMS plans resulted in less than 20 kVAR, of change within the managed DER. This is attributed to the average active management DER participant's nameplate being slightly less than 16.3 kW.

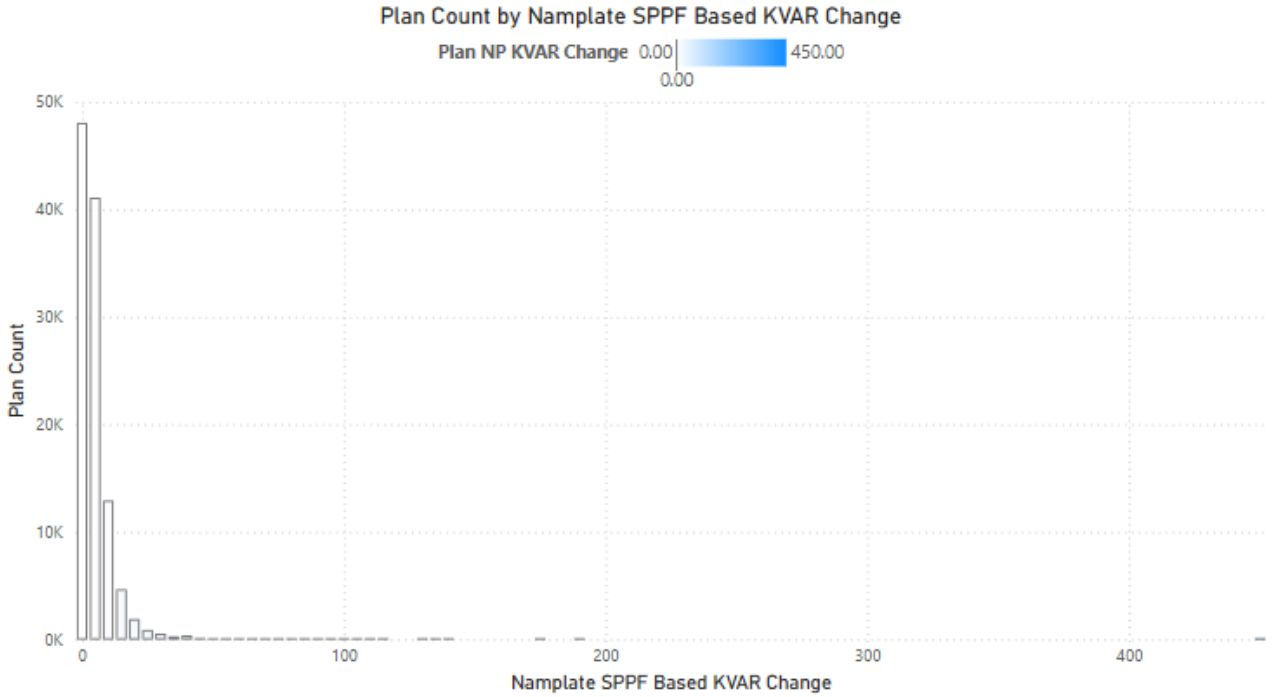

Figure 14. Relative Frequency of Total Planned kVAR Change

Active Management Communications Performance Measures

Per Implementation Plan Section G.1.12 - Performance measures related to active management

PPL Electric has developed performance tracking metrics to monitor communication reliability and overall data quality for each DER Management device installation. PPL Electric's communication systems continue to perform at a high level, even as the number of DER Management devices has increased. As noted within Table 1, the total number of device installations at the end of PY3 has reached 9,678. PPL Electric remains committed to maintaining and improving the reliability of its AMI network.

PPL Electric monitors communication between each participating customer's communication device and the AMI head-end system, ensuring overall reliability and performance of the AMI network layer. Within the AMI network, commands are transmitted via the AMI head-end system to the endpoint devices, and each endpoint device responds to the head-end system's command. One execution of this cycle is called a "round trip." The AMI layer of communications reliability and performance is measured by the percentage of successful round trips. PPL Electric strives to maintain an overall communications success rate of 95% between the AMI head-end system and DER Management devices.

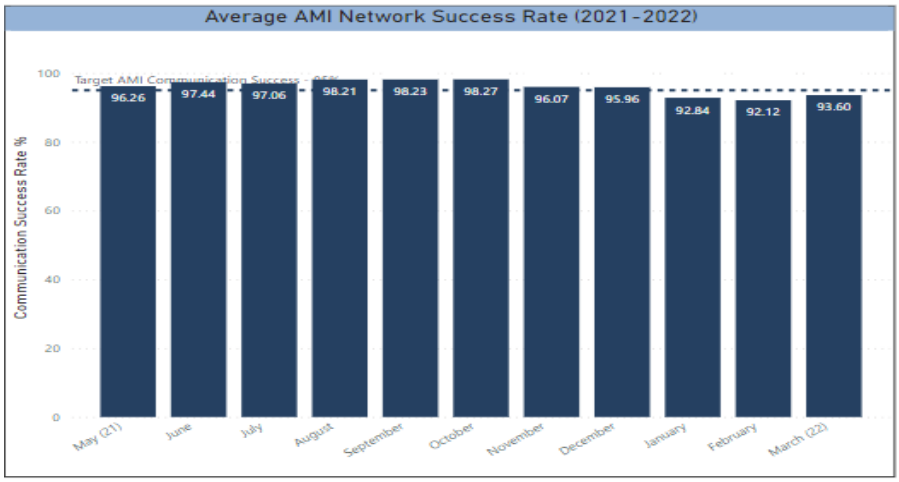

Figure 15. Average AMI Communication Success Rate by Month, 2021-2022

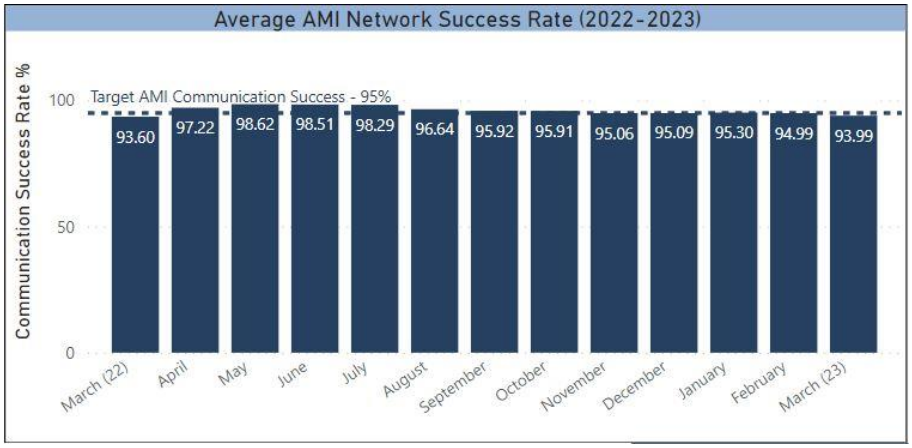

Figure 16. Average AMI Communication Success Rate by Month, 2022-2023

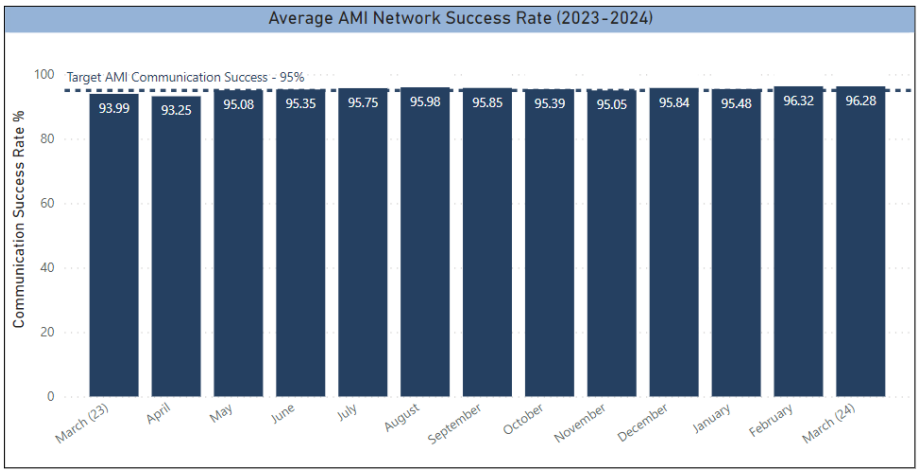

Figure 17. Average AMI Communication Success Rate by Month, 2023-2024

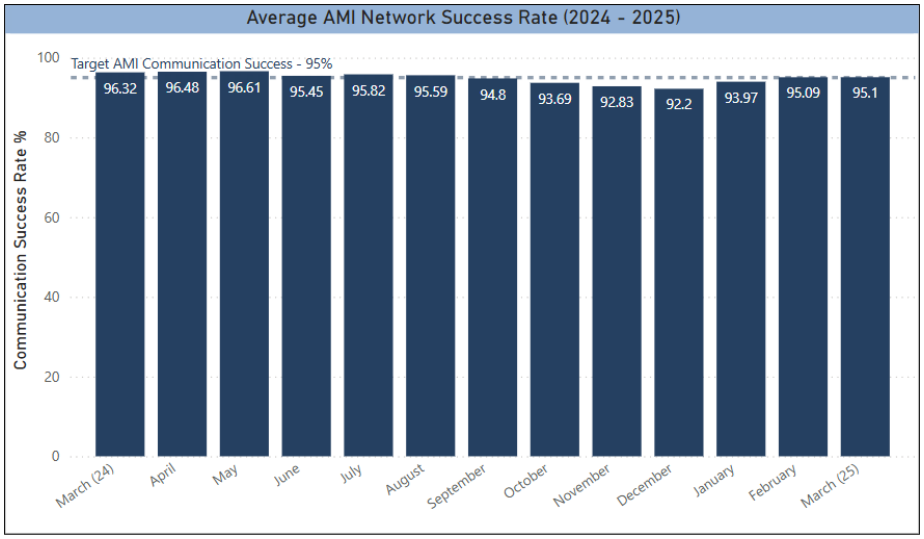

Figure 18. Average AMI Communication Success Rate by Month, 2024-2025

Within Figure 15 to Figure 18 above, the AMI communication success data excludes locations where AMI communication could not be established, as their performance is not indicative of overall network performance. As of March 2025, 587 devices have been removed from this data set. This accounts for 6.07% of DER installations enrolled in the Pilot. These locations are being investigated by PPL Electric.

Another important AMI network performance indicator is Average Round-Trip Time. This indicator measures the amount of time it takes for a command to be sent from the head-end system and the response to be returned by the radio. PPL Electric strives to maintain 60 seconds as a maximum duration of the average round trip time, to ensure reliable communications performance. Based on historical performance data, an improved target of 30 second round trip time target had been implemented for the 2023-2024 reporting timeframe and beyond. Through these decreases, round trip time monitoring continues to indicate no significant changes in network performance have occurred.

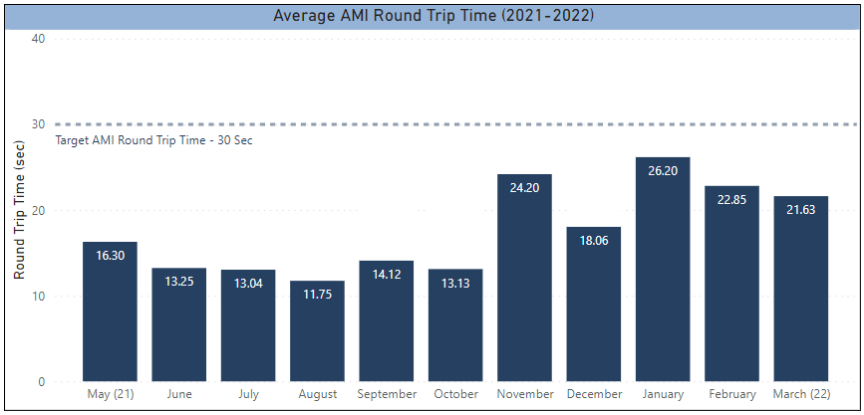

Figure 19. Average AMI Round Trip Time by Month, 2021-2022

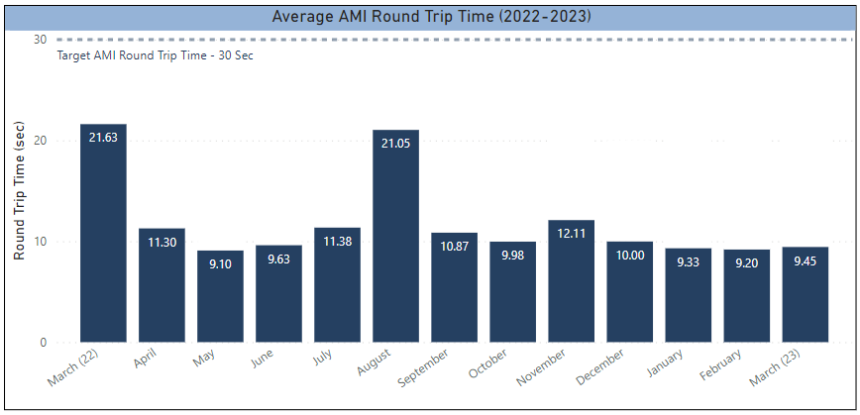

Figure 20. Average AMI Round Trip Time by Month, 2022-2023

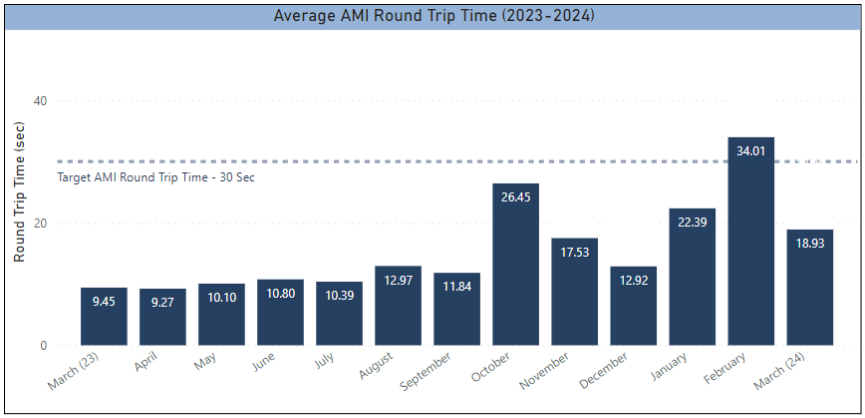

Figure 21. Average AMI Round Trip Time by Month, 2023-2024

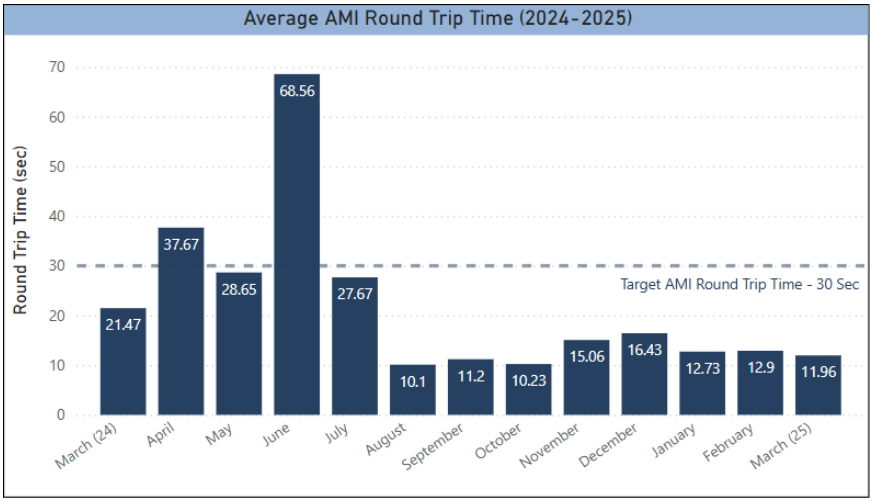

Figure 22. Average AMI Round Trip Time by Month, 2024-2025

Each DER Management device provides 5-minute interval data, increased from customer smart meters' 15-minute interval. Through this increased sampling rate, data quality is pivotal to overall communications health. With respect to active DER management, a communications interval is determined to be a "quality" interval when at least one reading within any 15-minute interval during daylight hours (5AM – 9PM) is received and the data is within reasonable limits for key parameters (i.e. voltage, kW, Volt-VAR curve points, etc.). Within the historical DER data, a new challenge had been observed: a number of inverters reported real power measurements above their rated nameplate, at times exceeding the nameplate by more than 10%. This has potential to negatively impact data quality, despite other parameters being within expected ranges.

Quality data intervals, between March 22, 2024, and March 21, 2025, decreased to 86.50% of communications intervals, from the 89.93% previously reported. PPL Electric continually monitors data quality and has identified and implemented enhancements to improve overall data quality and is committed to continuing these efforts for the foreseeable future.

Use Case Findings and Details

Per Implementation Plan Section G.1.13 - Findings and information on PPL Electric's use cases

PPL Electric has continued to compile and investigate information within each of the eight use case areas identified in the Pilot Implementation Plan. Additional investigations have also been completed, providing support for future DER Management Plan iterations. Each investigation includes a comparison of benefits between Pilot and non-Pilot participation, with related benefits detailed. Through the completion of each study, PPL Electric's knowledge base continues to expand, enhancing the Company's the benefits of active management.

The total number of uses cases, per category and reporting year, are presented in Table 16 below. As noted previously, additional detailed studies have been completed. Those studies pursued further areas of Pilot-related study but do not fall within the defined categories.

Table 16. DER Management Pilot Supporting Use Cases by Program Year

	Year 1	Year 2	Year 3
Use Case 1	0	0	
Use Case 2	6	9	10
Use Case 3	0	2	3
Use Case 4	0	1	2
Use Case 5	0	1	1
Use Case 6	4	5	3
Use Case 7	3	3	
Use Case 8	0	0	
Supplemental	0	2	3

Use Case #1 – Voltage Violation at DER Point of Interconnection (POI)

PPL Electric must maintain its distribution voltage within the parameters set forth by the Commission's regulations.[6] The threshold voltages detailed are similar to those indicated within ANSI C84.1. Maintaining the distribution system voltage within these limits is a component of ensuring safe and reliable power quality for customers. As DER penetration continues to increase, there is potential for the distribution system voltage to be negatively influenced, particularly at the POI, leading to customer voltage falling outside the allowable limits, for periods of time. The introduction of DER Management devices has increased PPL Electric's overall visibility of its distribution system. Through continuous monitoring of distribution system and customer meter voltages, PPL Electric has been able to observe and detail the benefits each Pilot group has contributed to the distribution system's voltage performance, including aiding in the mitigation of voltage violations.

For the PY3 period, 40,409 voltage violations were recorded at the meters of Pilot participants (i.e., CG1, CG2, and AM groups). As noted previously, as the number of Pilot participants increases, the number of documented POI voltage violations is anticipated to increase, based on the increasing sample sizes year over year.

Table 17. POI Voltage Violation Counts by Program Year

	Year 1	Year 2	Year 3
POI Voltage Violations	6,559	39,156	40,409

Use Case #2 – Voltage Violation Mitigated by DER on the Circuit

As noted previously, increased DER penetration can create or intensify voltage issues, particularly if no measures are in place help mitigate them. As DER penetration continues to increase, system operations and planning engineers will continue to struggle with the challenges associated with various levels of DER penetration throughout PPL Electric's distribution system. Through DER Pilot, the Company has increased visibility and management capabilities throughout its distribution system.

The Company has conducted detailed reviews of past voltage events to determine the measurable impact of active DER management. Most of these examinations have considered the integration and impact of all existing DERs. Additionally, detailed examinations of DERMS operations have detailed the influence of specific DERMS actions on the observed voltage violations.

[6] *See* 52 Pa. Code § 57.14.

As of March 21, 2025, 10 whitepapers focusing on this use case have been completed. From Table 18, 8 of these studies show a total of 887 potential voltage violations being mitigated through the application of autonomous VVCs and an additional 878 voltage violations being mitigated via active management. Additionally, PPL Electric has conducted a detailed examination of one DER management event by comparing the DERMS-calculated voltage violation mitigation estimates against the actual smart meter data readings over the same intervals. This examination indicated 3 voltage violations were mitigated via active management intervention, during the intervals identified within the DERMS calculation.

Table 18. Use Case 2 - Voltage Violation Studies, Program Year 3

	Trigger	Customers Violations	Violations Resolved - Autonomous	Additional Resolved – Active Management
WP-0050	Switching	136	90	46
WP-0053	High Voltage	436	78	289
WP-0055	High Bus Voltage	743	439	113
WP-0060	Switching	151	34	117
WP-0061	Ride Through Settings	n/a	n/a	n/a
WP-0063	High Bus Voltage	152	49	103
WP-0064	Low Voltage	202	194	8
WP-0065	High Voltage	223	3	199
WP-0066	LVM Review	49		3
WP-0072	Customer Reporting	n/a	n/a	n/a

Use Case #3 – Voltage Violation During Planned Switching

Portions of the distribution system must be reconfigured routinely under planned switching events. Through these events, all or a portion of a feeder may be transferred from its normally assigned source to an alternate, placing the impacted areas in an abnormal state. These events enable planned maintenance and upgrade activities to be completed and can allow for portions of the distribution system to be de-energized.

Through each planned switching event, all interconnected DERs within the transferred area are transferred to the new source. These transfers may increase the potential for an increase in observed voltage violations. Before these events are executed, PPL Electric completes proactive switching reviews to identify any loading and voltage issues that may be anticipated and determines the paths to mitigate these issues. Attempts to mitigate these are assessed based on the complexity of implementation (i.e., adjustments to voltage and power factor correcting device settings, phase balancing, additional load transfers, etc.).

The DER Management team may further examine these studies in detail to assess the potential impact DER Pilot participants may have in providing an alternate or supportive function in resolving the anticipated voltage issues. Through these examinations, both autonomous and active management functions are assessed to determine their potential impact throughout the abnormal configuration period.

As of March 21, 2025, 3 studies have been completed that have identified the ability to utilize DER Management participants to reduce anticipated voltage violations and aid in the reduction of additional reconfigurations or installation of temporary voltage and power factor correcting devices. Through these examinations, a potential reduction of $499,000 in planned switching costs has been determined, as illustrated in Table 19.

Table 19. Potential Cost Savings Attributed to Use Case 3 – Voltage Violations During Planned Switching Studies, Program Year 3

	Trigger	Potential Cost Savings
WP-0049	Substation Maintenance	$154,000
WP-0051	Substation Maintenance	$ n/a
WP-0052	Substation Maintenance	$345,000

Use Case #4 – System Restoration

If an outage occurs for a period longer than the programmed ride-through settings (as detailed within Ride-Through Curve Parameters, above), all IEEE 1547-2018 compliant devices are programmed to disconnect from the distribution system in order to avoid potential unintentional islanding. Currently, all Pilot participating DERs are programmed with a 5-minute delay, upon restoration occurring, while non-Pilot participants do not have this delay programmed. During this restoration window, the feeder/substation is required to supply all customer load, via the supplying transmission system, without any support from the aforementioned DERs. Therefore, the observed cold load pick-up at the point of restoration is dependent on the outage duration and includes the native load, without DER masking, and a reduction in load diversity.

Throughout PY3, PPL Electric has not identified any system restoration events that have resulted in overloaded equipment attributed to the inclusion of masked load (load masked by DERs) during cold load pick-up periods. Analysis has been completed on several feeders, with an emphasis on assessing potential risks in the future due to these conditions. A further examination considering the impact of residential EV charging during system restoration, has also been examined, as highlighted within Table 20 below.

Table 20. Use Case 4 – System Restoration Switching Studies, Program Year 3

	Driver
WP-0067	Evaluation of masked loading towards ability to defer capital investments
WP-0071	System Restoration with consideration of residential EV charging

Use Case #5 – Masked Load Impact on Load Forecasting

PPL Electric reviews each feeder's summer and winter peak loading to assess potential device overloading risks. In addition to these semi-annual assessments, a review of the current load masked by DERs, throughout the distribution system, is conducted. The assessment of masked load is required within native load calculations and determines non-telemetered DERs' contributions to the distribution system. The calculated masked load, along with the telemetered DERs and measured load, comprise the native load. The completion of native load calculations within load forecasting helps ensure that capital investments are appropriately timed, particularly for periods when DERs may not be available.

As of the end of PY3, PPL Electric has calculated 38.8 MW of masked load, during system peak loading period, July 2024. This value was calculated by monitoring the output data from 64.08 MW of DER nameplate capacity at the system peak. Detection of the masked load has resulted in 25.28 MW of additional system capacity during these peak loading periods. PPL Electric has also performed analysis on several feeders to evaluate the potential impact of masked load on future load forecasting, with these results detailed within the associated studies referenced within Table 21.

Table 21. Use Case 5 - Masked Load Impact on Load Forecasting White Paper Results, Year 3

	Driver
WP-0067	Evaluation of masked loading towards ability to defer capital investments
WP-0069	Evaluation of masked loading towards ability to defer capital investments

Use Case #6 – DER Management Impact on Voltage Management

PPL Electric's DER Pilot has increased the overall number of telemetered devices deployed throughout the distribution system. With the addition of these new telemetered devices and the previous deployment of smart meters, PPL Electric can better study and monitor its distribution system's operation. In particular, the addition of these devices has increased the resolution within reliability focused investigations and has enabled a greater overall understanding of each feeder's profile.

PPL Electric's DER Pilot also enables the Company to assess participating DERs' impact on feeder and substation voltage. Based on this analysis, participating DERs have reduced the overall number, duration, and severity of voltage violations. As DER penetration continues to increase, the ability for participating DER to positively impact the distribution system voltage will continue.

As part of each interconnection and DER management study, PPL Electric investigates DERs' impacts on distribution system voltage. Modeling accuracy has continued to increase by integrating DER Pilot telemetered data as well as smart meter data for each participating DER customer location. This has enabled a greater number of scenarios to be examined, reducing the deviation between simulated/anticipated results and observed results. Within these studies, the assignment of existing and new DERs into the appropriate group enables further assessment of anticipated impacts throughout a variety of situations.

At the conclusion of DER Pilot's PY3, 3 studies have been completed, assessing potential interconnection capital investment reductions, attributed to DERs becoming Pilot participants. An overview of each of these studies, and corresponding potential capital avoidance, can be found in Table 22 below.

Table 22. Use Case 6 - DER Management Impact on Voltage Management White Paper Results, Program Year 3

	Trigger	Avoided Capital	Violation Reduction
WP-0048	3MW DER Addition	$105,000	34
WP-0057	3MW DER Addition	$900,000	n/a
WP-0059	21MW DER Addition	$560,440	153

Use Case #7 – DER Active Management Impact on Hosting Capacity Increase and Deferral of Capital Upgrade

Hosting capacity is the amount of DERs that can be added to a portion of the distribution system before system reinforcements are needed to prevent a load or voltage violation. The cumulative value for each feeder and/or substation bus represents the total DER hosting capacity available, based on the dates and times selected for the completed analysis. Currently, DER hosting capacity is calculated annually, in support of preparing this report. Through the DER Pilot, PPL Electric has increased the total number of DER telemetry points available and has improved each successive iteration of the DER hosting capacity calculations as well as DER system impact examinations.

The DER hosting capacity compares four iterations of DER output and management to assess variances: DER nameplate capacities, monitored output, autonomous functions and active management. While the first iterations of the

comparison utilize all PV DER within the calculations, the latter two iterations are dependent on the DER Pilot group assignments, as not all DERs are Pilot participants.

Based on customer DER interconnection applications, the scenarios detailed above are utilized to determine whether participating DERs can alleviate interconnection restrictions or reduce potential customer funded capital investment requirements. At the conclusion of PY3, only one study has been completed, within this use case category.

Table 23. Use Case 7 - DER Active Management Impact Study Results, Year 3

	Trigger	DER Hosting Capacity Increase – Autonomous	DER Hosting Capacity Increase – Active Management
WP-0072	Year 3 DER Hosting Capacity	18 MW	35 MW

Use Case #8 – DER Operations in Emergency Conditions and in Active Work Zones

Every utility needs to be prepared to respond to emergency situations, as they arise. Through PPL Electric's preparedness, field personnel are dispatched to investigate and support the resolution of reported fires, gas leaks, downed conductor, etc. Through these responses, portions of the distribution system may need to be de-energized, to ensure public and equipment safety, during this time. With the DER Pilot, PPL Electric system operators can remotely disconnect Pilot participants, within these work areas, reducing the potential for areas to be accidentally re-energized. While reductions in potential safety hazards may be possible within work areas, continued vigilance and safety measures are still necessary.

There were 1,723 outage events during PY3, where DER Pilot participants were present and potentially presented a risk of unintentional islanding, though continued operation. Because of Pilot participation, the status of the impacted DERs was able to be verified, and no instances of unintentional islanding were detected. Also, in PY3, there were no instances where a participating DER was intentionally disconnected through communications with the inverter.

Additional Study: Flexible Interconnection

In addition to the studies detailed within the Pilot Implementation Plan, 3 flexible interconnection investigations were completed. Each of these studies examined the integration of DERs with additional parameters beyond those currently available under the DER Pilot. The future integration of flexible interconnection will enable an increase in local DER penetration, while avoiding costly capital investments, by reducing participating DERs' output during peak distribution congestion periods. An overview of the results of these studies can be found in Table 24 below.

Table 24. Additional Areas of Study - Flexible Interconnection Study Results

	Driver	Avoided Capital Investment
WP-0058	10 MW DER Addition	$1,480,000
WP-0062	2.5 MW DER Addition	$365,000
WP-0068	21 MW DER Addition	$560,440

	:	
Citizens' Electric Company of Lewisburg, PA	**:**	

DIRECT TESTIMONY OF KATHY STAUDER
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name and business address.

A. My name is Kathy Stauder, and my business address is 1775 Industrial Blvd., Lewisburg, Pennsylvania.

Q. By whom are you employed and in what capacity do you serve at Citizens' Electric Company of Lewisburg, PA?

A. I am employed by C&T Enterprises, Inc. ("C&T"), and assigned to Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company") as Treasurer.

Q. Please describe your duties in this capacity.

A. My duties are to organize, direct, and coordinate the financial department. I provide administrative direction and oversight for billing for electric service to consumers. I also advise the President & CEO of the financial aspects of the company, manage the financial record keeping, coordinate the budget, coordinate with computer services, and coordinate with consumer services.

Q. Please describe your employment and educational background.

A. I have an Accounting and MBA degrees from Bloomsburg University. Before joining C&T, I was Vice-President of Finance at Remmey Pallet Company and Director of Finance at Playworld Systems.

Q. What are your responsibilities with respect to this filing?

A. As Treasurer, I am responsible for coordinating with our auditors and representatives of Company witness Mr. Gorman to ensure that historic and test year expenses, taxes, revenues, and rate base are appropriately reflected.

Q. Are Citizens' records regularly audited by a licensed accounting firm?

A. Yes. The accounting firm of FORVIS MAZARS, LLP ("FORVIS") audits the Company's financial records. They prepare an annual report of the Company operations and assist Company personnel with specific PUC filings, such as our State Tax Adjustment Surcharge ("STAS") filings. They also prepare our tax returns. A copy of our Annual Report for the year ended December 31, 2024, is attached as Exhibit__(KS-1). Our most recent Federal and State tax returns are included in Volume III of the filing as Joint Confidential Exhibit 4 and Citizens' Confidential Exhibit 3.

Q. Is Citizens' proposing to roll-in its STAS?

A. Yes. Mr. Gorman has reflected the current levels of state taxes in his analysis. As a result, the current STAS is being rolled-into base rates. When the new rates take effect, we will adjust the then-applicable STAS rate to reflect any difference between the then-applicable tax levels and the ones that were rolled-into base rates. Our most recent STAS filing is included as Exhibit__(KS-2).

Q. Do you have any comments regarding the future test year expenses?

A. Yes. Attached as Exhibit__(KS-3) is a table showing the operating expenses for the Historic Test Year ("HTY"), Future Test Year ("FTY") and Fully-Projected Future Test Year ("FPFTY"). The table includes our actual FTY expenses through March 31, 2025. Our expenses are tracking as we would expect through March 31, 2025. We will continue to update this information on a quarterly basis during the proceeding.

Q. Did you compile a similar comparison of future test year plant?

A. Yes. Attached as Exhibit__(KS-4) is a table showing the utility plant for the HTY, FTY and FPFTY, as well as actual plant as of March 31, 2025.

Q. What depreciation changes is the Company proposing for this filing?

A. We are proposing to reduce the useful life of our computer equipment and software from 5 years to 3 years. This is consistent with the replacement cycle for IT equipment that we follow, and is also consistent with the warranty period on new equipment. If this change is accepted by the Commission, we will make it going forward in 2026.

Q. Is it unusual for Citizens' expenses and plant by Account to vary from quarter to quarter during the year?

A. No. For many of our Accounts, our actual expenses vary quarter-to-quarter based on the activities that our workers and contractors are doing. Over the entire year, there can be some overall variation if more of our work is done on projects that are expensed rather than projects that are capitalized. Mr. Johnson will explain how the types of projects and focus of our workers may vary during the various quarters of the year. The expenses can also vary due to unexpected weather or other circumstances.

Q. How did the Company develop the financial data provided to HSG Group?

A. The HTY data is based on actual experiences during the historic test year ending December 31, 2024. The FTY data is based largely on our operating budget for the year ending December 31, 2025, with updates for any known and measurable changes that we have identified between the date that budget was approved by our Board of Directors and April 2025 when we are submitting this filing. The FPFTY data is based on our projections for the year ending December 31, 2026.

Q. Please discuss the major expense categories for Citizens'.

Citizens' expenses are budgeted and tracked in the following categories: (1) Labor & Overheads, including C&T Shared Services; (2) Transportation; (3) Materials & Supplies (4) Administrative & General; (5) Outside Services; (6) Uncollectibles; (7) Depreciation & Amortization; (8) Regulatory Fees; and (9) Taxes. Citizen's also reports by account, corresponding to the FERC chart of accounts. Each Operating and Maintenance includes (as appropriate) costs for Labor, Overhead, Material and Transportation. The information provided to Mr. Gorman is by FERC account, with subaccounts for Labor, Overhead, Material and Transportation.

Q. What is the largest expense category?

A. Labor & Overheads constitute the largest expense item. This category includes our employees and the various benefits that we provide (health, dental, vision, retirement, etc.). To develop the projected 2025 costs for Labor & Overheads, we examined the wages and benefits for our employees. This included the impacts of the Wage & Salary Study discussed by Mr. Johnson and the annual compensation adjustment discussed by Ms. Sullivan. In doing so, we made several adjustments to the prior year to reflect positions

that were open and also to reflect new positions that we will be adding during 2025. Ms. Sullivan's testimony discusses the C&T Shared Services and insurance benefits.

Q. Have you prepared an exhibit showing the impact of the salary changes and the position changes for the FTY and FPFTY?

A. Yes. Attached as Exhibit__(KS-5) is an analysis that supports that impact. The impact of these changes are distributed among the various FERC accounts that Mr. Gorman reflects in his analysis according to where the employee's time is booked (based on activities performed).

Ms. Sullivan's testimony discusses the 2025 and projected 2026 C&T base compensation adjustments. Ms. Sullivan also discusses the C&T Shared Services that are included in our Labor & Overheads for 2024, 2025 and 2026.

Q. Please discuss the Transportation projections.

A. This item reflects the costs of our vehicles and other equipment, including fuel and maintenance expenses. For 2025 and 2026, we are projecting vehicle and equipment purchases, including a $425,000 bucket truck in 2025.

Q. Is Citizens' projecting increased Materials and Supplies costs?

A. Yes. The various materials and supplies for our business have increased consistent with general inflation of many items. We included a 3% increase for office supplies. Mr. Johnson will address the increases in our materials.

Q. Please discuss the costs incurred by Citizens' for Administrative and General.

A. The items in this category include the general costs to heat, furnish and maintain our office space and warehouses.

Q. What costs are included in Outside Services?

A. Outside Services includes the charges by various vendors for their service. This includes attorneys, accountants, auditors, consultants, cleaning vendors and contractors that we hire for capital projects. Most of the construction contractor expense would be capitalized rather than expensed.

Q. Could costs in the other categories that you addressed above be capitalized rather than being expensed?

A. Yes. As part of this filing, we have made assumptions regarding the portion of Labor & Overheads, Transportation, Materials & Supplies and Administrative & General that will be capitalized rather than expensed. We have done this based on both historic experience and projected 2025 and 2026 capital projects.

Q. How did Citizens' develop the Uncollectible expenses?

A. Uncollectible expense is based on historical experience.

Q. Please discuss the Depreciation and Amortization expense reflected in the filing.

A. Depreciation expense is developed by Mr. Gorman, Exhibit__(HSG-1), Schedule C3 and explained in his testimony.

Q. Finally, what Regulatory Fees and Taxes are reflected in the filing?

A. These are developed by Mr. Gorman, Exhibit__(HSG-1), Schedule C1-3, and explained in his testimony.

CITIZENS' FINANCING ACTIVITIES

Q. Please explain the Company's financing arrangements.

A. Citizens' primary source of financing is its parent company, C&T Enterprises, Inc., which obtains long-term loans, lines of credit and letters of credit on Citizens' behalf through the National Cooperative Servicing Corporation ("NCSC"). Each long-term loan is

supported by a Securities Certificate approved by the Commission. Ms. Sullivan provides an exhibit with details of each loan. We also have access to a short-term line of credit through C&T, as described by Ms. Sullivan.

Finally, we maintain a local banking relationship with Mifflinburg Bank & Trust Company.

AFFILIATE CHARGES

Q. Does Citizens' have any affiliate charges in the HTY, FTY or FPFTY in addition to the ones with C&T that are discussed by Ms. Sullivan?

A. No.

Q. Does this conclude your testimony at this time?

A. Yes.

Independent Auditor's Report

Board of Directors
Citizens' Electric Company of Lewisburg, Pa.
Lewisburg, Pennsylvania

Opinion

We have audited the financial statements of Citizens' Electric Company of Lewisburg, Pa. (Company), which comprise the balance sheets as of December 31, 2024 and 2023, and the related statements of income, stockholder's equity, and cash flows for the years then ended, and the related notes to the financial statements.

In our opinion, the accompanying financial statements present fairly, in all material respects, the financial position of the Company as of December 31, 2024 and 2023, and the results of its operations and its cash flows for the years then ended in accordance with accounting principles generally accepted in the United States of America.

Basis for Opinion

We conducted our audits in accordance with auditing standards generally accepted in the United States of America (GAAS). Our responsibilities under those standards are further described in the "Auditor's Responsibilities for the Audit of the Financial Statements" section of our report. We are required to be independent of the Company and to meet our other ethical responsibilities, in accordance with the relevant ethical requirements relating to our audits. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Responsibilities of Management for the Financial Statements

Management is responsible for the preparation and fair presentation of the financial statements in accordance with accounting principles generally accepted in the United States of America, and for the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

In preparing the financial statements, management is required to evaluate whether there are conditions or events, considered in the aggregate, that raise substantial doubt about Company's ability to continue as a going concern within one year after the date that these financial statements are available to be issued.

Auditor's Responsibilities for the Audit of the Financial Statements

Our objectives are to obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement, whether due to fraud or error, and to issue an auditor's report that includes our opinion. Reasonable assurance is a high level of assurance but is not absolute assurance and therefore is not a guarantee that an audit conducted in accordance with GAAS will always detect a material misstatement when it exists. The risk of not detecting a material misstatement resulting from fraud is higher than for one resulting from error, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control. Misstatements are considered material if there is a substantial likelihood that, individually or in the aggregate, they would influence the judgment made by a reasonable user based on the financial statements.

In performing an audit in accordance with GAAS, we:

- Exercise professional judgment and maintain professional skepticism throughout the audit.

- Identify and assess the risks of material misstatement of the financial statements, whether due to fraud or error, and design and perform audit procedures responsive to those risks. Such procedures include examining, on a test basis, evidence regarding the amounts and disclosures in the financial statements.

- Obtain an understanding of internal control relevant to the audit in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of Company's internal control. Accordingly, no such opinion is expressed.

- Evaluate the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluate the overall presentation of the financial statements.

- Conclude whether, in our judgment, there are conditions or events, considered in the aggregate, that raise substantial doubt about Company's ability to continue as a going concern for a reasonable period of time.

We are required to communicate with those charged with governance regarding, among other matters, the planned scope and timing of the audit, significant audit findings, and certain internal control-related matters that we identified during the audit.

Supplementary Information

Our audits were conducted for the purpose of forming an opinion on the financial statements that collectively comprise the Company's basic financial statements. The supplementary information listed in the table of contents is presented for purposes of additional analysis and is not a required part of the basic financial statements. Such information is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the basic financial statements.

The information has been subjected to the auditing procedures applied in the audit of the basic financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the basic financial statements or to the basic financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the information is fairly stated in all material respects in relation to the basic financial statements as a whole.

The basic financial statements of Citizens' Electric Company of Lewisburg, Pa. for the years ended December 31, 2022, 2021, and 2020, (none of which is presented herein) were audited by us in accordance with auditing standards generally accepted in the United States of America, and we expressed an unmodified opinion on those basic financial statements. In our opinion, the information for 2022, 2021, and 2020, presented on page 19 is fairly stated, in all material respects, in relation to the basic financial statements as a whole.

Citizens' Electric Company of Lewisburg, Pa.
Notes to Financial Statements
December 31, 2024 and 2023

Note 1. Nature of Operations and Summary of Significant Accounting Policies

Nature of Operations

Citizens' Electric Company of Lewisburg, Pa. ("Company"), a wholly-owned subsidiary of C&T Enterprises, Inc. ("C&T"), is a regulated public utility distributing electric service to customers in parts of Union and Northumberland Counties, Pennsylvania. The Company's operations are regulated by the Pennsylvania Public Utility Commission ("PUC"). The Company extends unsecured credit to its customers.

Basis of Accounting

The Company maintains its accounting records in accordance with the Federal Energy Regulatory Commission's ("FERC") uniform system of accounts for public utilities as modified and adopted by the PUC. The accompanying financial statements and the related notes have been prepared on the basis of U.S. generally accepted accounting principles ("GAAP").

In accordance with FERC guidelines, the Company also maintains its accounts in accordance with Codification Topic 980, *Regulated Operations*. On a regular basis, the Company reevaluates its application of accounting for regulated operations. The Company has determined that regulatory assets and liabilities should continue to be accounted for under provisions of Codification Topic 980 because it is reasonable to assume that the Company will continue to be able to charge and collect its cost of service-based rates.

Purchased Power

The Company purchases power under a default service plan that utilizes a third party generator to fulfill its requirements under the current plan. The plan, which was approved by the PUC, allows for full recovery of the cost of energy supply and all related costs, including legal and consulting fees and allows adjustments to rates to reflect current market conditions. Power costs can be different than what is recovered in base charges, resulting in over or under collected power costs.

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from those estimates. Significant estimates include unbilled revenues, depreciation, goodwill and postretirement benefits.

Cash and Cash Equivalents

The Company considers all liquid investments with original maturities of three months or less to be cash equivalents. At December 31, 2024 and 2023, cash equivalents consisted primarily of a daily investment fund account.

At December 31, 2024, the Company's cash accounts did not exceed federally insured limits.

Accounts Receivable

Accounts receivable include billed and unbilled amounts for services provided to customers for which the Company has an unconditional right to payment. The Company provides an allowance for credit losses, which is based upon a review of outstanding receivables, historical collection information and existing economic conditions adjusted for current conditions and reasonable and supportable factors.

Accounts receivable are ordinarily due 20 days after the issuance of the invoice. Accounts that are unpaid after the due date bear interest at 1.50% per month. Accounts past due more than 30 days are considered delinquent. Interest continues to accrue on delinquent accounts until the account is no longer classified as delinquent.

Delinquent receivables are written off based on individual credit evaluation and specific circumstances of the customer.

During the years ended December 31, 2024 and 2023, credit loss expense related to doubtful accounts receivable, where collectability is not reasonably assured, was approximately $27,000 and $32,000, respectively.

Inventories

Inventories consist of materials and supplies and are stated at the lower of cost or net realizable value. Cost is determined based on average cost.

Utility Plant

Utility plant and equipment are carried at cost. Additions to utility plant and replacements of property are capitalized at cost. Retirements of electric plant or replacements are removed from electric plant accounts at cost and these costs plus cost of removal less salvage are charged to accumulated depreciation. Assets under finance lease obligations are amortized over the shorter of the lease term or respective estimated useful lives. Depreciation of utility plant is provided over the estimated useful life of the respective assets on a straight line basis as follows:

Utility Plant	Years
Distribution plant	25
General plant	33
Equipment	8-15

Maintenance and repairs of property and replacements are charged to expense.

Nonutility Property

Nonutility property consists of land not currently used for utility purposes.

Cash Surrender Value of Life Insurance

The Company has purchased a life insurance policy on a certain individual. Company owned life insurance is recorded at the amount that can be realized under the insurance contract at the balance sheet date, which is the cash surrender value adjusted for other charges or other amounts due that are probable at settlement.

Impairment of Long-Lived Assets

The Company reviews the carrying amount of an asset for possible impairment whenever events or changes in circumstances indicate that such amounts may not be recoverable. If a long-lived asset is tested for recoverability and the undiscounted estimated future cash flows expected to result from the use and eventual disposition of the asset is less than the carrying amount of the asset, the asset cost is adjusted to fair value and an impairment loss is recognized as the amount by which the carrying amount of a long-lived asset exceeds its fair value. No asset impairment was recognized during the years ended December 31, 2024 and 2023.

Goodwill

Goodwill is evaluated annually for impairment or more frequently if impairment indicators are present. The quantitative impairment test consists of calculating the fair value of a reporting unit and comparing it to the carrying amount, including goodwill. The goodwill impairment loss, if any, is measured as the amount by which the carrying amount of a reporting unit, including goodwill, exceeds its fair value. Subsequent increases in goodwill value are not recognized in the consolidated financial statements.

The Company did not record any impairment charges for 2024 or 2023.

Income Taxes

The Company is included in the consolidated federal income tax return filed by C&T. The Company files its own tax return in Pennsylvania. The Company's federal income tax expense is computed using the separate return method for intercorporate tax allocation.

The Company accounts for income taxes in accordance with income tax accounting guidance (Financial Accounting Standards Board ("FASB") Accounting Standards (ASC) 740, *Income Taxes*). The income tax accounting guidance results in two components of income tax expense: current and deferred. Current income tax expense reflects taxes to be paid or refunded for the current period by applying the provisions of the enacted tax law to the taxable income or excess of deductions over revenues. The Company determines deferred income taxes using the liability (or balance sheet) method. Under this method, the net deferred tax asset or liability is based on the tax effects of the differences between the book and tax bases of assets and liabilities, and enacted changes in tax rates and laws are recognized in the period in which they occur. Deferred income tax expense results from changes in deferred tax assets and liabilities between periods. Deferred tax assets are reduced by a valuation allowance if, based on the weight of evidence available, it is more likely than not that some portion or all of a deferred tax asset will not be realized.

Tax positions are recognized if it is more likely than not, based on the technical merits, that the tax position will be realized or sustained upon examination. The term more likely than not means a likelihood of more than 50%; the terms examined and upon examination also include resolution of the related appeals or litigation processes, if any. A tax position that meets the more likely than not recognition threshold is initially and subsequently measured as the largest amount of tax benefit that has a greater than 50% likelihood of being realized upon settlement with a taxing authority that has full knowledge of all relevant information. The determination of whether or not a tax position has met the more likely than not recognition threshold considers the facts, circumstances and information available at the reporting date and is subject to the management's judgment.

The Company recognizes interest and penalties on income taxes as a component of income tax expense.

Regulatory Matters

The Company is subject to the authoritative accounting guidance applicable to rate-regulated organizations. The Pennsylvania PUC has full authority to establish electric rates. Certain items collected in rates have been recorded as regulatory liabilities. These amounts will be recognized as revenue in future periods as costs for which the amounts have been collected are incurred, or when authorized by the Pennsylvania PUC. Certain expenses have been recorded as regulatory assets, and management believes these amounts are probable of future rate recovery.

Revenue Recognition

Revenues from the sale of electricity are recognized as electricity is delivered to customers. Revenues also include amounts receivable from or payable to customers through purchased power clauses, which are adjusted semi-annually.

Costs that are recoverable or refundable in future periods through purchase power recovery are deferred. Costs that are refundable or recoverable in future periods through purchased power recovery rates are subject to audit and approval by the appropriate regulatory body. Changes to the related asset or liability amounts that result from these audits are recorded as a charge to current operations.

The amount and timing of revenue recognition varies based on the nature of the goods or services provided and the terms and conditions of the customer contract. Unbilled revenues of $1,100,909 and $1,020,029 at December 31, 2024 and 2023, respectively, represent amounts delivered through December 31 and not billed to the members until the following month. Customer deposits of $299,385 and $257,839 at December 31, 2024 and 2023, respectively, represent amounts received in advance of services provided. See Note 11 for additional information about the Company's revenue.

For significant financing components, the Company elected a practical expedient, which allows an entity to recognize the promised amount of consideration without adjusting for the time value of money if the contract has a duration of one year or less, or if the reason the contract extended beyond one year is because the timing of delivery of the product is at the customer's discretion. As the Company's contracts are typically less than one year in length and do not have significant financing components, the Company has not presented revenue on a present value basis.

Leases

The Company determines if an arrangement is a lease or contains a lease at inception. Leases result in the recognition of right-of-use (ROU) assets and lease liabilities on the balance sheets. ROU assets represent the right to use an underlying asset for the lease term, and lease liabilities represent the obligation to make lease payments arising from the lease, measured on a discounted basis. The Company determines lease classification as operating or finance at the lease commencement date. The ROU asset for finance leases are included in utility plant in our balance sheets.

At lease commencement, the lease liability is measured at the present value of the lease payments over the lease term. The ROU asset equals the lease liability adjusted for any initial direct costs, prepaid or deferred rent, and lease incentives. The Company has made a policy election to use a risk-free rate (the rate of a zero-coupon U.S. Treasury instrument) for the initial and subsequent measurement of all lease liabilities. The risk-free rate is determined using a period comparable with the lease term.

The lease term may include options to extend or to terminate the lease that the Company is reasonably certain to exercise. Lease expense is generally recognized on a straight-line basis over the lease term.

The Company has elected not to record leases with an initial term of 12 months or less on the balance sheets. Lease expense on such leases is recognized on a straight-line basis over the lease term.

Treasury Stock

Common stock shares repurchased are recorded at cost. Cost of shares retired or reissued is determined using the first-in, first-out method.

Taxes Collected from Customers and Remitted to Governmental Authorities

Sales and gross receipts taxes collected from customers and remitted to governmental authorities are presented in the accompanying statements of income on a net basis.

Note 2. Leases

Nature of Leases

The Company has entered into the following lease arrangements:

Finance Leases

These leases mainly consist of vehicles for the use of the Company. Termination of the leases generally are prohibited unless there is a violation under the lease agreement.

All Leases

The Company has no material related-party leases. The Company's lease agreements do not contain any material residual value guarantees or material restrictive covenants.

Quantitative Disclosures

The lease cost and other required information for the years ended December 31, 2024 and 2023 are:

	2024	2023
Lease cost		
Finance lease cost		
Amortization of right-of-use asset	$ 89,922	$ 76,700
Interest on lease liabilities	14,931	13,927
Short-term lease cost	530	520
Total lease cost	$ 105,383	$ 91,147
Other information		
Cash paid for amounts included in the measurement of lease liabilities		
Financing cash flows from finance leases	$ 64,996	$ 110,652
Weighted-average remaining lease term		
Finance leases	2.38 years	1.78 years
Weighted-average discount rate		
Finance leases	5.51%	4.95%

See Note 6 for future minimum lease payments and reconciliation to the balance sheet at December 31, 2024.

Note 3. Utility Plant

Utility plant consists of the following at December 31:

	2024	2023
Electric plant in service		
Distribution plant	$ 27,120,698	$ 25,895,278
General plant	1,099,144	1,042,086
Equipment	2,582,919	2,572,517
	30,802,761	29,509,881
Construction work-in-progress	119,314	175,214
	30,922,075	29,685,095
Accumulated depreciation	(15,229,615)	(14,740,113)
	$ 15,692,460	$ 14,944,982

Citizens' Electric Company of Lewisburg, Pa.
Notes to Financial Statements
December 31, 2024 and 2023

Note 4. Regulatory Assets and Liability

Regulatory assets consist of the following at December 31:

	2024	2023	Amortization Period
Rate case - 2022	$ 80,155	$ 147,203	3 years
POLR/PJM - 2021	7,533	25,614	3 years
POLR/PJM - 2024	24,893	-	* 3 years
	$ 112,581	$ 172,817	

* Amortization period has not begun

For the years ended December 31, 2024 and 2023, the Company recorded a regulatory liability of $176,954 and $187,771, respectively, for other postretirement benefits that resulted from unrecognized gains. The Company expects to recover the deferred other postretirement benefits consistent with the anticipated income recognition of other postretirement income.

Amortization expense was $86,292 and $106,756 for the years ended December 31, 2024 and 2023, respectively.

Note 5. Line of Credit

The Company has a $4,000,000 revolving line of credit with C&T payable on demand. At December 31, 2024 and 2023, there was $3,300,000 and $2,600,000 borrowed against this line, respectively. Interest varies based on the CoBank quoted variable rate. The rate was 6.39% and 7.41% on December 31, 2024 and 2023, respectively, and is payable monthly.

While the line of credit above is due on demand, the Company utilizes the financing for long-term operating purposes and does not have liquid funds available to repay the balance. The borrowings are available as a result of a line of credit agreement that C&T has with a third party, which is due in July 2026. C&T has no intentions of calling the debt before July 2026.

Citizens' Electric Company of Lewisburg, Pa.
Notes to Financial Statements
December 31, 2024 and 2023

Note 6. Long-Term Debt and Finance Lease Liabilities

	2024	2023
Note payable, C&T, quarterly principal and interest payments of $22,323; interest at 2.37%; collateralized by substantially all Company assets, due June 2025	$ 41,016	$ 121,606
Note payable, C&T, quarterly principal and interest payments of $19,117; interest at 3.925%; collateralized by substantially all Company assets, due December 2041	945,319	983,737
Note payable, C&T, quarterly principal and interest payments of $13,660; interest at 4.175%; collateralized by substantially all Company assets, due December 2041	662,770	689,050
Finance lease liabilities for equipment, requiring monthly principal and interest payments ranging from $620 to $3,280; collateralized by leased equipment, payments due in varying amounts through August 2031	523,224	313,523
	2,172,329	2,107,916
Less current maturities	198,985	202,873
	$ 1,973,344	$ 1,905,043

Aggregate annual maturities of long-term debt and payments on finance lease liabilities at December 31, 2024 are:

	Long-Term Debt	Finance Lease Liabilities
2025	$ 108,359	$ 115,017
2026	70,096	106,153
2027	72,962	112,219
2028	75,945	97,039
2029	79,049	39,361
Thereafter	1,242,694	134,276
	$ 1,649,105	604,065
Less amount representing interest		80,841
Present value of future minimum lease payments		$ 523,224

Transportation equipment under finance lease liabilities is as follows:

	2024	2023
Transportation equipment	$ 728,483	$ 724,293
Accumulated depreciation	(268,878)	(430,125)
	$ 459,605	$ 294,168

C&T has a Master Letter of Credit agreement with National Cooperative Services Corporation. This Letter of Credit is for $7,000,000 and expires October 2029. The Company has the ability to post letters of credit with wholesale electric suppliers under the terms of this agreement. As of December 31, 2024 and 2023, the Company had no outstanding letters of credit.

Note 7. Income Taxes

The provision (credit) for income taxes includes these components:

	2024	2023
Taxes currently payable	$ 121,810	$ 89,977
Deferred income taxes	(53,000)	(166,500)
Income tax expense (benefit)	$ 68,810	$ (76,523)

A reconciliation of income tax expense at the statutory rate to the Company's actual income tax expense (benefit) is shown below:

	2024	2023
Computed at the statutory rate (21%)	$ 83,230	$ 41,974
Increase resulting from		
State income taxes	5,893	(7,427)
Utilization of federal net operating losses	-	(166,500)
Other	(20,313)	55,430
Actual tax expense (benefit)	$ 68,810	$ (76,523)

The tax effects of temporary differences related to deferred taxes shown on the balance sheets were:

	2024	2023
Deferred tax assets		
Allowance for credit losses	$ 9,600	$ 9,700
Post retirement benefits	183,300	202,100
Other	95,700	98,500
	288,600	310,300
Deferred tax liabilities		
Depreciation	(1,894,400)	(1,950,100)
Other	(39,500)	(58,500)
	(1,933,900)	(2,008,600)
Net deferred tax liability	$ (1,645,300)	$ (1,698,300)

At December 31, 2024 and 2023, the Company had no allocation of C&T consolidated unused federal operating loss carryforwards.

Note 8. Pension and Postretirement Plans

Multiemployer Pension Plans

C&T is a member of the National Rural Electric Cooperative Association ("NRECA") Retirement Security Plan ("RS Plan"), a defined benefit pension plan qualified under Section 401 and tax-exempt under Section 501(a) of the Internal Revenue Code. It is a multiemployer plan under the accounting standards. The Plan sponsor's Employer Identification Number is 53-0116145 and the Plan Number is 333.

A unique characteristic of a multiemployer plan compared to a single-employer plan is that all plan assets are available to pay benefits of any plan participant. Separate asset accounts are not maintained for participating employers. This means that assets contributed by one employer may be used to provide benefits to employees of other participating employers.

C&T contributions to the RS Plan in 2024 and 2023 represented less than 5% of the total contributions made to the plan by all participating employers. C&T made contributions to the plan of $3,497,266 and $3,441,415 for years ended December 31, 2024 and 2023, respectively. The Company reimbursed C&T $476,390 and $495,173 for its share of the contributions for the years ended December 31, 2024 and 2023, respectively. There have been no significant changes affecting the comparability of the 2023 and 2023 contributions.

In the RS Plan, a "zone status" determination is not required, and therefore not determined, under the *Pension Protection Act* ("PPA") of 2006. In addition, the accumulated benefit obligations and plan assets are not determined or allocated separately by individual employer. In total, the RS Plan was over 80% funded on January 1, 2024 and 2023, based on the PPA funding target and PPA actuarial value of assets on those dates.

Because the provisions of the PPA do not apply to the RS Plan, funding improvement plans and surcharges are not applicable. Future contribution requirements are determined each year as a part of the actuarial valuation of the plan and may change as a result of plan experience.

C&T is also a member of the NRECA SelectRE Pension Plan. C&T makes a matching contribution of 200% of the employees' contributions up to 2.5% of compensation. The Company reimbursed C&T $89,357 and $85,819 for its share of contributions for the years ended December 31, 2024 and 2023, respectively.

Other Postretirement Benefit Plans

C&T has a postretirement health care plan covering substantially all employees. The Plan is unfunded. The estimated costs that will be paid after retirement are generally being accrued over the employees' active service periods to the dates they are fully eligible for benefits. The Company expects to contribute $32,000 to the Plan in 2025. The following table sets forth the Plan's funded status and the amounts of accrued benefit cost of the C&T plan and the Company's allocation based on an actuarial valuation as of December 31, 2024 and 2023.

Citizens' Electric Company of Lewisburg, Pa.
Notes to Financial Statements
December 31, 2024 and 2023

	2024	2023
C&T's benefit obligation	$ 5,587,931	$ 5,725,208
Company's allocation of benefit obligation	$ 669,250	$ 727,262
C&T's accrued benefit cost	$ 5,587,931	$ 5,725,208
Company's allocation of accrued benefit cost	$ 669,250	$ 727,262
Amounts recognized in the Company's balance sheets		
Current liability, included in accrued expenses	$ 113,386	$ 113,328
Non-current liability	555,864	613,934
	$ 669,250	$ 727,262
C&T's benefit expense	$ 472,064	$ 480,148
Company's allocation of benefit expense	$ 42,284	$ 42,284

The Company uses a December 31 measurement date for the plans. For measurement purposes, a 6.50% annual rate of increase in the per capita cost of covered health care benefits was assumed in 2024. The rate was assumed to decrease gradually to 4.75% in 2030 and remain at that level thereafter.

The benefit obligation was calculated assuming a weighted average discount rate of 5.15% and 5.10% in 2024 and 2023, respectively.

The amount of net gain and net prior service cost expected to be recognized by the Company during 2025 is $7,801 and $-0-, respectively.

Benefits expected to be paid by the Company in each of the next five years and in the aggregate for the five years thereafter are as follows:

2025	$ 113,386
2026	$ 91,048
2027	$ 84,731
2028	$ 87,596
2029	$ 111,884
2030-2034	$ 107,841

Because the Company is subject to regulation in the states in which it operates, it is required to maintain its accounts in accordance with the regulatory authority's rules and regulations, which may differ from other authoritative accounting pronouncements. In those instances, the Company follows the guidance of accounting for regulated operations. Based on prior regulatory practice, and in accordance with the related guidance, the Company recorded an unfunded postretirement obligation, which otherwise would be recognized as other comprehensive income, as a regulatory asset, and expects to recover those costs in rates charged to customers.

Note 9. Related Party Transactions

The Company has a contract for services with C&T to purchase all employee services. The contract automatically renews annually unless terminated by either party.

In the ordinary course of business, the Company's activities involve significant transactions with C&T. The activity between the Company and C&T for the years ended December 31, 2024 and 2023, and the effected account balances at December 31, 2024 and 2023, were as follows:

	2024	2023
Allocation of overhead recorded as operating expense	$ 473,098	$ 434,514
Other costs in accounts receivable - other	$ 43,800	$ 43,800
Accounts payable - related party	$ 229,797	$ 218,124
Accrued vacation liability in accrued expenses	$ 173,588	$ 167,762
Payroll costs paid in advance and included in advances, affiliate	$ 90,700	$ 90,700
Interest expense	$ 280,375	$ 256,329
Acquisition debt expense	$ 556,189	$ 556,189

The Company paid C&T $2,057,330 and $2,000,621 for payroll and $920,419 and $883,969 for benefits in 2024 and 2023, respectively.

Note 10. Commitments and Contingencies

The Company has guaranteed payments on notes payable that are obligations of C&T. At December 31, 2024, the amounts outstanding on these obligations are $5,803,792, of which $1,649,105 is recorded by the Company, see Note 6. These obligations are being repaid in quarterly payments of principal and interest through 2041. The amounts outstanding that are not recorded by the Company are being repaid through acquisition debt expense. The Company would be required to perform under this guarantee if C&T were to default under the notes payable and the bank were to demand the Company's performance.

Note 11. Revenue from Contracts with Customers

Performance Obligations

The Company's revenues are derived primarily from the sale of electric power to customers. Customers consist of commercial, industrial and residential accounts within dedicated territories in and around Lewisburg, Pennsylvania.

Rates charged for electric power sales to customers are established by the Pennsylvania PUC. The Company provides energy and capacity to customers as one stand-ready performance obligation. Electric power revenue is recognized by the Company upon transfer of control of promised services to customers in an amount that reflects the consideration expected to be received in exchange for those services.

The Company transfers control of the electric power to customers at each customer's meter point and the customers simultaneously receive and consume the benefits of the energy provided. Electric power provided to customers is accounted for as a series of performance obligations. Progress towards completion is measured using the output method [kilowatt hour (kwh) received by the customer], meter readings are taken at the end of

the month for billing purposes, the quantity of energy transferred is determined after the meter readings. Payments from customers are received in accordance with each customer's contract, which is ordinarily 20 days from the invoice date.

Revenue associated with the electric power performance obligation to customers are recorded as sales of electric energy and capacity to customers in the accompanying statements of income.

The Company has determined that the nature, amount, timing and uncertainty of revenue and cash flows are primarily affected by factors that impact demand.

Contract Balances

The following table provides information about the Company's accounts receivable and customer deposits from contracts with customers:

	2024	2023
Accounts receivable - customers, beginning of year	$ 1,456,491	$ 1,470,719
Accounts receivable - customers, end of year	$ 1,173,451	$ 1,456,491
Unbilled revenues, beginning of year	$ 1,020,029	$ 1,357,715
Unbilled revenues, end of year	$ 1,100,909	$ 1,020,029
Customer deposits, beginning of year	$ 257,839	$ 223,974
Customer deposits, end of year	$ 299,385	$ 257,839

Note 12. Subsequent Events

Subsequent events have been evaluated through March 12, 2025, which is the date the financial statements were available to be issued.

RE: Citizens' Electric Company of Lewisburg, PA
Supplement No. 170 to Tariff Electric PA. P.U.C. No. 14 (State Tax Adjustment Surcharge Recalculation); Docket No. _____

Dear Secretary Chiavetta:

Attached for filing with the Commission is Citizens' Electric Company of Lewisburg, PA's ("Citizens'" or "Company") Supplement No. 170 to Tariff Electric-Pa. P.U.C. No. 14 ("Supplement No. 170"). Supplement No. 170 reflects a recalculation of the State Tax Adjustment Surcharge ("STAS"). Supplement No. 170 contains an issued date of December 19, 2024, and an effective date of January 1, 2025. This complies with the ten (10) day notice period for STAS modifications specified on page 37 of the Company's tariff.

This filing adjusts Citizens' STAS to refund a prior period overcollection and to reflect changes in the Company's Corporate Net Income Tax and Utility Realty Tax. The documents supporting the Company's recalculation are set forth in Tab A, Attachments A, B, C, D, E, and F (computation of STAS for period January 1, 2025, through December 31, 2025). For completeness, a copy of proposed Supplement No. 170 is attached at Tab B. The supporting documents at Tab A demonstrate that the Company's STAS rate will decrease from a surcredit of -0.0126% to a surcredit of -0.0255%, effective January 1, 2025. See Tab A.

If you have any questions regarding the documents, please feel free to contact the undersigned. Thank you.

Very truly yours,

Adeolu A. Bakare

CITIZENS' ELECTRIC COMPANY OF LEWISBURG Thirty-Eighth Revised Page No. 37
Cancelling
Thirty-Seventh Revised Page No. 37

STATE TAX ADJUSTMENT SURCHARGE

In addition to the charges provided in this tariff, a surcredit of -0.0255% will apply to all bills for service rendered on or after January 1, 2025. (D) (C)

The State Tax Adjustment Surcharge will be recomputed using the elements prescribed by the Commission whenever the Company experiences a material change in any of the taxes used in calculation of the surcharge. Such recalculation will be submitted to the Commission within 10 days after the occurrence of the event which occasions such re-computation. If the recomputed surcharge is less than the one in effect the utility will, or if the recomputed surcharge is more than the one in effect the utility may, submit such re-computation a tariff or supplement to reflect such recomputed surcharge. The effective date of such tariff or supplement shall be ten days after filing. Any charges or credits in the surcharge shall be rolled into the base rates in the Company's next base rate proceeding.

(D) Indicates Decrease (C) Indicates Change

v.	:	**Docket No. R-2025-3054394**
	:	
Citizens' Electric Company of Lewisburg, PA	:	

REBUTTAL TESTIMONY OF KATHY STAUDER
ON BEHALF OF CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

Q. Please state your name and business address.

A. My name is Kathy Stauder, and my business address is 1775 Industrial Blvd., Lewisburg, Pennsylvania.

Q. Are you the same Kathy Stauder who previously submitted Direct Testimony in this proceeding on behalf of Citizens' Electric Company of Lewisburg, PA ("Citizens'" or "Company")?

A. Yes. Terms defined in my Direct Testimony have the same meaning in this Rebuttal Testimony.

Q. What is the purpose of your testimony today?

A. The purpose of my testimony is to rebut the testimony of Witnesses Keller, Walters, and Farr, representing the Bureau of Investigation and Enforcement ("I&E"), Office of Consumer Advocate ("OCA"), and Office of Small Business Advocate ("OSBA"), respectively, regarding their proposed adjustments to the Company's Expense Claims. Additionally, I respond to OCA Witness Wise, regarding her recommendations for the Company to implement various changes to its practices related to one-time payment fees and residential customer security deposits.

O&M EXPENSES

Q. Do any of the parties recommend adjustment to the Company's General and Administrative Expense claims?

A. Yes, I&E recommends a decrease of $51,964, OCA recommends a decrease of $62,848, and OSBA recommends a decrease of $8,298.

Q. Please explain the I&E recommendation.

A. I&E's recommended adjustment is based on the individual factors summarized in the table below:

Amount	Reference	Description
$ 8,298	I&E Statement No. 1, p. 9	Generation costs were included by error
$ 380	I&E Statement No. 1, pp. 14-15	"Advertising" is unnecessary and should be disallowed.
$ 330	I&E Statement No. 1, pp. 14-15	Dues are unclear and should be disallowed.
$ 1,030	I&E Statement No. 1, p. 18	Sponsorships should be disallowed.
$ 1,267	I&E Statement No. 1, p. 18	Lobbying should be disallowed.
$ 23,426	I&E Statement No. 1, p 21	Increased meter expense should be disallowed.
$ 17,233	I&E Statement No. 1, p 23	CWC claim recalculated based on above numbers.

Q. Do you agree with these recommendations?

A. Partially, some parts of the recommendation are reasonable, and the Company has included them in Mr. Gorman's Rebuttal Testimony. Others seek to disallow reasonable and well-substantiated expenses that are appropriate to include in our expense claim. I adjust the I&E recommendation in the table below and subsequently address each item in the list following it.

I&E Adjustment	Company Adjustment
$ 8,298	$ 8,298
$ 380	$ 0
$ 330	$ 0
$ 1,030	$ 780
$ 1,267	$ 38
$ 23,426	$ 23,426
$ 17,233	*See Explanation*

- Generation Costs ($8,298)

The Company acknowledges this error in its response to I&E discovery requests and Mr. Gorman will exclude the costs in his revised calculations presented in his Rebuttal Testimony. The same adjustment was proposed by OSBA.

- Advertising ($380)

I&E Witness Walker refers to this expense as "advertising" in his testimony, but in the corresponding exhibit upon which he bases his recommendation[1], the expense is clearly listed as a subscription. In fact, it is the Company's subscription to the local newspaper, which is reviewed daily by the executive team. The local paper includes legal notices that may impact our operations, such as customer bankruptcy and estate notices. Awareness of local, national, and international news is critical to the responsible operation of the Company. In our case, the newspaper is still relied upon as a valuable, and sometimes exclusive, source of information on local events. The $380 expense should be allowed in its entirety.

- Dues ($330)

Upon review of its response referenced in Witness Walker's recommendation[2], the Company finds that the dues in question were mislabeled as "Pennsylvania Department

[1] I&E Exhibit No. 1, Schedule 5, p. 1.
[2] I&E Exhibit No. 1, Schedule 4, p. 2.

of Labor and Industry." They are, in fact, dues for the PA Chamber of Business and Industry. Membership in relevant industry groups provides value to our customers by increasing Company management's awareness of business trends, best practices and proposed legal and regulatory changes affecting our industry, as well as providing training, networking, and benchmarking opportunities. The $330 expense should be allowed in its entirety.

- Sponsorships ($1,030)

The Company acknowledges that a portion of these expenses are used for community engagement rather than direct customer education. I would contest that community engagement does bring value to our ratepayers, and that they expect such interaction from us, but the Company is willing to concede $780 of the expense claim. The remainder of the expense is used for advertising and listings that either inform our customers of relevant utility activities and changes or lists the Company in directories such as the Union County Township Supervisors directory. Witness Farr claims that "this information is easily accessible at all hours of the day on the Company's website, social media, or can be found on customer bills and inserts[3]." A portion of our ratepayers are not on social media and may not have ready access to the website, especially older adults; however, that portion of the ratepayers does rely on print publications. Moreover, Witness Farr is not in a position to dictate what means of communication our ratepayers and other organizations with which we interact prefer.

[3] I&E Statement No. 1, p. 18

- Lobbying ($1,267)

The Company's response to I&E-RE-9-D breaks out the portion of our EAP membership costs that are attributable to lobbying, and the Company agrees that this portion of the expense ($38) should not be included in our expense claim. The remainder is for a valuable industry association membership that the PA Public Utilities Commission ("PUC") and I&E both frequently engage with and seek out to facilitate constructive and beneficial conversations and efforts in conjunction with gas and electric utilities. The adjustment inappropriately excludes the entire EAP dues, rather than just the lobbying portion.

- Meter Expense ($23,426)

Witness Farr asserts that the Company "indicates that the increase between the HTY and FTY in the claim is not due to the purchase of used meters and provided no other reason for the increase in this expense[4]." On August 12, 2025, the Company provided the supplemental response to I&E-RE-11-D, which is attached as Exhibit__(KS-1R). The supplemental response explains that the primary driver for the increase in Account 586 costs from HTY 2024 to FTY 2025 is the decrease in contra labor. Contra labor is meter expense that is capitalized when new meters are installed. In 2024 the Company substantially completed a multi-year programmatic meter replacement initiative. This initiative was executed in lieu of normal cyclical meter and service inspections. With the completion of the capital initiative, maintenance inspections have resumed. The result is that total crew hours identified for meter service work remain the same, but

[4] *Id.* at p. 21.

accounting for that time will shift towards expense rather than capital. We apologize for any confusion created by the delayed service of the revised response.

The $23,426 should be allowed in its entirety.

- CWC Claim ($17,233)

Mr. Gorman will recalculate the CWC Claim in his Rebuttal Testimony based on the final adjusted O&M claim.

Q. Please discuss the OCA's expense adjustments.

A. OCA's recommended adjustment is based on the individual factors summarized in the table below:

Amount	Reference	Description
$ 695	OCA Statement No. 1, pp. 21-22	Sponsorships should be disallowed.
$ 1,267	OCA Statement No. 1, pp. 21-22	Lobbying should be disallowed.
$ 61,739	OCA Statement No. 1, pp. 19-21	Non-labor G&A expenses are not supported.

Q. Do you agree with these recommendations?

A. Partially, some parts of the recommendation are reasonable, and the Company has included them in Mr. Gorman's Rebuttal Testimony. I adjust the OCA recommendation in the table below and subsequently address each item in the list following it.

OCA Adjustment	Company Adjustment
$ 695	$ 405
$ 1,267	$ 38
$ 61,739	$ 0

- Sponsorships ($695)

Please see my response to I&E's recommended adjustment to sponsorships, the Company has adjusted FTFPY projected expenses to $250 for this category.

- Lobbying ($1,267)

Please see my response to I&E's recommended adjustment to lobbying, the Company accepts that $38 should be removed for lobbying expense.

- Non-Labor G&A ($61,379)

The increase in non-labor G&A costs is primarily driven by increases in employee benefits costs that follow staffing levels and G&A labor expenses. This includes the modifications to the salaries and employee complement in the Fully Projected Future Test Year ("FPFTY") that is explained by Mr. Johnson. A small portion of the labor and non-labor G&A costs ($20,508 for non-labor) are for the overlap of my position (Treasurer) because I intend to retire in 2026. Planning for a position overlap is a normal business expense, especially for a small workforce like ours. This overlap occurs for many of our positions due to the need to transition the knowledge necessary for the position. It can occur in any year when a retirement occurs. It should also be noted that a similar overlap is expected in 2027 to accommodate the expected retirement of another employee in the same department, but with a longer planned overlap. This is an ordinary business expense and should be allowed. Also, Witness Meyer's suggestion to use a historical growth factor of 5% ignores the Company's well-supported Wage & Salary plan implementation that will result in an approximately 7.5% increase rather than 5%.

Q. Are there any other O&M adjustments or recommendations by the parties that you would like to address?

A. Yes, OSBA recommends a reduction in projected expenses of $16,501 based on inflationary factor calculations, and OCA recommends a $191,571 reduction in overhead line expense. Mr. Johnson will address the overhead line expense item.

Q. Please explain OSBA's recommended reduction.

A. OSBA Witness Farr also recommends a decrease of $16,501 based on his assessment of the Company's use of a "generic inflationary factor[5]." Witness Farr acknowledges that the Company uses a reasonable approach to applying an inflationary factor to project future expenses but recommends omitting the normalization of past year expenses and applying a 2% rather than 3% inflationary factor. Mr. Farr also suggests that using actual 2024 year-end numbers would be the best method to determine 2025 and 2026 projected costs.

Q. Do you agree with this adjustment?

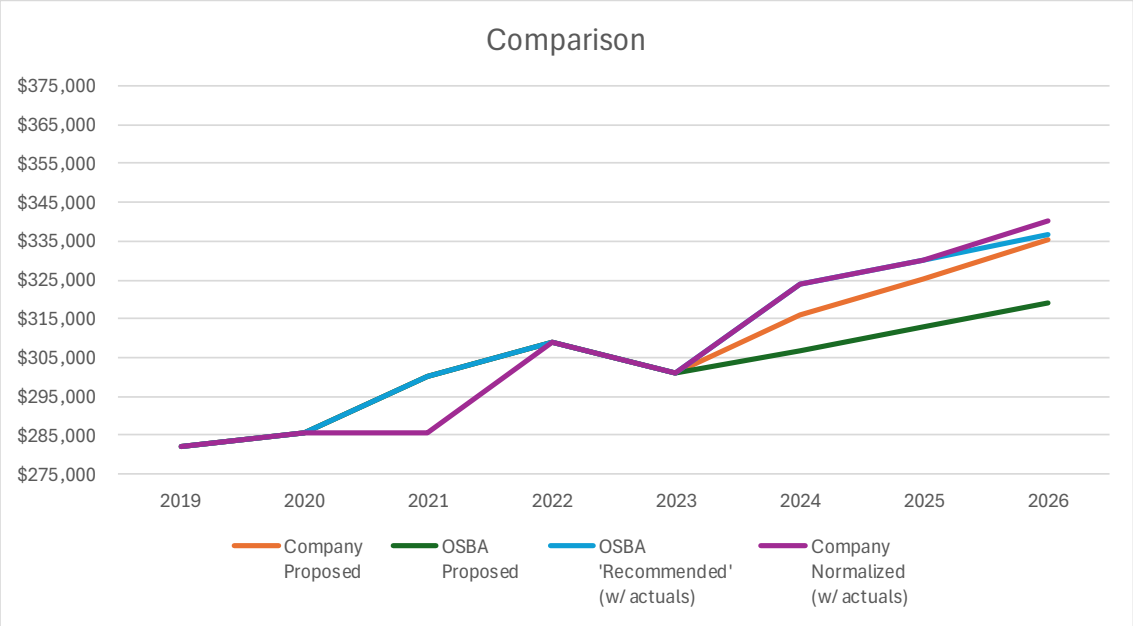
A. No, Witness Farr's omission of a normalization factor of past year expenses undervalues them. He acknowledges inflation but then neglects to normalize past-year actuals for that inflation.

I recalculated FPFTY 2026 expenses with both Witness Farr's "recommended method" of using only actual 2024 expenses[6] and the Company's normalized average method also using actual 2024 expenses. The table and chart below compare both parties' original proposals as well as the two calculations using actual 2024 expenses. OSBA's proposed adjustment to $319,137 is clearly the outlier of the four, while both recalculated expense projections come in slightly higher than the Company's original proposal. I recommend

[5] OSBA Statement No. 1, p. 6
[6] *Id.* at p. 8

that the Company's original proposed expenses for these accounts be accepted as presented in Mr. Gorman's Direct Testimony.

Year	Company Proposed	OSBA Proposed	OSBA 'Recommended' *(w/ actuals)*	Company Normalized *(w/ actuals)*
2019	$ 282,046	$ 282,046	$ 282,046	$ 282,046
2020	$ 285,428	$ 285,428	$ 285,428	$ 285,428
2021	$ 300,083	$ 300,083	$ 300,083	$ 285,428
2022	$ 309,146	$ 309,146	$ 309,146	$ 309,146
2023	$ 300,888	$ 300,888	$ 300,888	$ 300,888
2024	$ 315,946	$ 306,744	$ 323,808	$ 323,808
2025	$ 325,425	$ 312,879	$ 330,284	$ 330,237
2026	$ 335,188	$ 319,137	$ 336,890	$ 340,145



RATE CASE EXPENSE

Q Do any of the parties oppose or recommend adjustments to the Company's proposed rate case expenses?

A Yes, I&E recommends removal of $272,222 in 'amortized' rate case expense, and OSBA recommends a reduction of $5,000 in expected "Printing, other" expenses.

Q Do you agree with these recommendations?

A I will defer to Mr. Gorman's testimony to address the $272,222 expense in his Rebuttal Testimony.

Regarding the $5,000 reduction recommended by OSBA, the Company has already incurred $7,328.92 of actual printing, postage and notices expenses against the expected total of $10,000.

Desc	Expense
Rate Case Notice Printing	$ 3,542.19
Rate Case Notice Postage	$ 2,023.28
Newspaper Notice	$ 745.25
Hearing Notices	$ 1,018.20
Total (to date)	$ 7,328.92

Additional expenses can be expected as the Company proceeds with the filing. Specifically, we expect to incur expenses associated with the public input hearings recently ordered by Commissioner DeFrank. We also will have employee travel, lodging and meal expenses for the hearings, which will be reflected in the "Printing, other" category. A total of $10,000 is not unreasonable given that over $7,000 has been spent already.

ONE-TIME PAYMENT FEES

Q. Please summarize OCA's proposal regarding the $3.95 transaction fee for credit card payments.

A. OCA Witness Wise recommends that the company eliminate fees for credit or debit card payments made through the SmartHub system. Witness Wise further recommends that those fees be included in the Company's O&M expenses and the revenue requirement be adjusted accordingly to recover them.

Q. How do you respond to this recommendation?

A. First, I would clarify that the $3.95 transaction fee is not a fee for using the SmartHub system, it is a fee charged by a third-party payment vendor for all 'one-time' electronic payments, meaning any credit card, debit card, or one-time bank draft, regardless of whether those transactions are made through SmartHub, the pay-by-phone, or any other future system that might be implemented.

In general, I question Witness Wise's assertions that fee-free card payments are "normative[7]," customers are "penalized[8]" by fees, and that elimination of fees is a "growing trend among Pennsylvania Utilities[9]." Witness Wise's suggestion that one-time electronic payment fees are similar to the costs associated with accepting in-person or mailed payments by cash or check ignores the order-of-magnitude disparity in cost of accommodating the different methods. Processing a cash or check payment can be accomplished in just a few seconds of an employee's time, costing $0.25 per transaction[10] or less. Additionally, the Company does not charge any internal labor associated with the management of one-time electronic payment options to customers using those methods, so its treatment of the labor costs associated with customer payments is equitable, regardless of the method used.

Q. Do you believe that fee-free card transactions are normative or a growing trend?

A. No, while it is true that many customers do prefer to use electronic payment methods, and that *many* businesses do not impose extra fees, including *some* Pennsylvania utilities, it is an exaggeration to claim that this is prevailing practice among all businesses or utilities.

[7] OCA Statement No. 4 at p 4, ln 1.
[8] *Id.* at p 4, ln 2.
[9] *Id.* at p 7, ln 12.
[10] Assumes 30s or less per transaction at $30/hr direct wage.

A recent JD Power Study found that 34% of small businesses add a surcharge for card payments.[11] Similarly, the majority of Pennsylvania regulated electric utilities still pass on one-time payment surcharges to individual customers. OCA's suggestion that three water utilities eliminating fees represents a growing trend ignores the remainder of utilities that continue to pass fees through.

Q. Does passing through a one-time payment fee 'penalize' the customer?

A. No, when one-time payment fees are charged to the customer incurring the fee, they are paying exactly for the service they receive. They want the convenience of using the card and they pay the passthrough fee for that convenience. I would also note that some cards offer incentives such as "cash back" rewards or airline miles as an incentive to the card users. Characterizing the current fee as a 'penalty' implies that the fee is over and above actual costs incurred, or that it is intended to disincentivize use of these payment methods, neither of which is true.

Q. What do you feel is the most fair way to recover costs incurred for one-time payment transactions?

A. I believe that the Company's current practice of passing transaction fees through to the Customer's incurring those costs is the most fair and equitable way to recover the costs. The better question may be "what is fair to customers who do not use one-time electronic payments?" To answer this question, I look at three discreet circumstances associated with one-time electronic payments:

1) The company continues as-is, in which case no customer is charged for a service they do not utilize.

[11] https://www.jdpower.com/sites/default/files/file/2025-01/2025002%20U.S.%20Merchant%20Services.pdf

2) The Company eliminates one-time payment fees and absorbs them into distribution rates, in which case customers using one-time payment fees receive this service at a slight discount from actual cost, while customers who do not use it pay increased rates to cover those costs.

3) The Company eliminates one-time payment fees and all customers adopt these methods, in which case all customers would pay the same as they would if they were explicitly charged for the fee, but without any knowledge that their payment methods inflate the cost of service.

Of the three circumstances above, the second—suggested by OCA—is the only one that results in customers paying for a service that they do not benefit from. Ultimately, I believe the Public Utility Commission should address this issue and, should they feel that one-time payment fees are inappropriate, make corresponding changes in regulation to mandate fee-free payment methods.

Q. Do you agree with the OCA's calculation of the revenue requirement impact of eliminating the fee?

A. No. The OCA based its adjustment on historic aggregate fees paid directly by customers; however, we expect that use of the payment method will increase if it becomes free. In conjunction with Valley Energy, Inc., and Wellsboro Electric Company, we analyzed the experiences of a New York utility that eliminated the directly-charged one-time payment fee and assumed the expense into regulated rates. That utility saw a substantial increase in the use of these payment methods once the fee was eliminated. Exhibit__(KS-2) shows the increases that the New York utility experienced and is projecting for the future. If, as OCA suggests, the fee presents a barrier preventing customers from using one-time

payment methods, then it stands to reason that removing the fee would result in increased utilization. Mr. Meyer has not accounted for increased adoption of credit card payments in his calculation of the revenue requirement impact.

Q. What is your recommendation if the Commission were to eliminate the credit card fee?

A. If the Commission eliminates the fee over our objections, then Citizens' should be kept whole if actual annual costs exceed those that have been assumed in the revenue requirement. We should be permitted to book excess fees as a regulatory asset for recovery in our next rate case.

SECURITY DEPOSITS

Q. What changes to the Company's practices regarding security deposits does OCA recommend?

A. OCA Witness Wise recommends that 1) the Company should show that it has formal policies and procedures in place to address how it verifies income levels of new customers before requiring a deposit, and then refunds a deposit if it later finds one should not have been charged, and 2) customers eligible for a refunded deposit should be allowed to decide if the deposit should be credited to their account balance or refunded to them directly in its entirety.

Q. Is the Company providing formal policies and procedures in response to the first recommendation?

A. No, the existence of formal policies and procedures does not change the Company's practices, it only documents them. The Company has already described how it handles deposit collection and income verification of new customers. With only three employees

handling all new customer accounts, formal written policies and procedures are not necessary to train employees or to assure consistent practice throughout the customer service staff.

Q. Do you believe the Company should change its current practices related to refunded deposits?

A. No, the Company's practice on refunding deposits to customers is reasonable. I would note that we refund deposits for a number of reasons, including the customer demonstrating sufficient payment performance or a customer alerting us that they have a change in circumstances that may warrant waiving the security deposit. In all situations, the customer is given the option to credit the entire security deposit balance to their account for their convenience, this is voluntary. If the customer would rather their deposit be returned to them, the Company will return the deposit less any outstanding balance on the account. This practice has no effect on customers who pay their bills on time. For those that are behind on payment, it is only logical to cover outstanding charges with the deposit, rather than return the funds to the customer who immediately owes some or all of that amount back to cover their balance.

Q. Finally, is the Company willing to ensure that low-income households have the opportunity to explore a waiver of a security deposit?

A. Yes. We can do this by asking the customer whether they want to explore whether they qualify for a waiver after we inform them that we need a deposit.

UPDATED FTY PLANT AND EXPENSES

Q. Have you prepared updated actual plant and expense exhibits through the 2nd Quarter 2025?

A. Yes. Those updates are included as Exhibit__(KS-3R) and Exhibit__(KS-4R).

Q. Does this complete your Rebuttal Testimony?

A. Yes.

KATHY STAUDER

ON BEHALF OF

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA

AUGUST 13, 2025

CITIZENS' ELECTRIC COMPANY OF LEWISBURG, PA
DOCKET NO. R-2025-3054394

I&E-RE-11-D

Reference Company Exhibit HSG-1, Schedule C1-1, p. 1 concerning Meter Expense (Account 586), provide the following:

A. A detailed breakdown for the following: 2023 - $25,262; HTY 2024 - $24,042; FTY 2025 - $48,958; FPFTY 2026 - $50,712.
B. A detailed explanation for the 103.6% [{($48,958 - $24,042) ÷ $24,042} x 100] anticipated increase between HTY 2024 and FTY 2025.

Response Provided By:
Nathan Johnson, President & Chief Executive Officer, Citizens' Electric Company

Date: June 3, 2025

Response:

A. See the attachment titled I&E-RE-11-D Attachment A for a detailed breakdown of costs.

B. The Company has been provided with an opportunity to purchase a large quantity of recently installed, used meters from another utility as that utility phases out its TWACS system in the coming years. These purchases, though in excess of current operational needs, will provide a substantial savings over time compared to the cost of purchasing the same quantity of meters new from the manufacturer.

SUPPLEMENTAL RESPONSE TO SUBPART B

B. As shown in the detailed breakdown provided for part (A) of this response, the primary driver for the increase in Account 586 costs from HTY 2024 to FTY 2025 is the decrease in contra labor. Contra labor is meter expense that is capitalized when new meters are installed. In 2024 the Company substantially completed a multi-year programmatic meter replacement initiative. This initiative was executed in lieu of normal cyclical meter and service inspections. With the completion of the capital initiative, maintenance inspections have resumed. The result is that total crew hours identified for meter service work remain the same, but accounting for that time will shift towards expense rather than capital.

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Zachari Walker, and my business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission or PUC) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. WHAT IS YOUR EDUCATION AND EMPLOYMENT BACKGROUND?

A. My education and employment background is attached as Appendix A.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for representing the public interest in rate and other proceedings before the Commission. I&E's analysis in these proceedings is based on its responsibility to represent the public interest. This responsibility requires the balancing of the interests of the ratepayers, the regulated utility, and the regulated community as a whole.

Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?

A. The purpose of my direct testimony is to review the base rate filing of Wellsboro Electric Company (Wellsboro or Company), and recommend adjustments to the Company's proposed operating and maintenance (O&M) expenses, state income tax expense, and rate base for the fully projected future test year (FPFTY) ending December 31, 2026.

Q. DOES YOUR DIRECT TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 1 contains schedules that support my direct testimony.

Q. WHAT ARE THE TEST YEARS USED BY THE COMPANY IN THIS PROCEEDING?

A. Wellsboro uses the twelve months ended December 31, 2024, as the historic test year (HTY), the twelve months ending December 31, 2025, as the future test year (FTY), and the twelve months ending December 31, 2026, as the FPFTY.

Q. WHAT IS THE EFFECTIVE DATE PROPOSED FOR NEW RATES?

A. The Company indicates that its effective date for new rates is January 30, 2026, however, the rate change could be effective earlier if the parties agree to a settlement that includes an accelerated effective date and that settlement is approved by the Commission.[1]

[1] Wellsboro Statement No. 1, p. 2.

Q. DO YOU AGREE WITH THE POSSIBILITY THAT NEW RATES MAY GO INTO EFFECT PRIOR TO THE JANUARY 30, 2026 EFFECTIVE DATE?

A. Not entirely. Under any circumstances, rates should not go into effect prior to the beginning of the FPFTY which is January 1, 2026. This date is the beginning of the twelve-month period on which new rates are based. For this reason, it would be unjust and unreasonable for ratepayers to pay the increase in rates prior to the beginning of the first day of the FPFTY.

Q. PLEASE SUMMARIZE THE COMPANY'S REQUESTED REVENUE INCREASE.

A. The Company's base rate case was filed on April 30, 2025, with a total requested increase of $2,899,388 to the claimed present rate revenues of $6,729,636 resulting in an overall revenue requirement of $9,629,025.[2]

Q. PLEASE SUMMARIZE YOUR RECOMMENDED ADJUSTMENTS.

A. The following table summarizes my recommended adjustments:

[2] Wellsboro Exhibit HSG-1, Schedule C1.

	Wellsboro FPFTY Claim	I&E Recommended Allowance	I&E Adjustment
O&M Expenses:			
Rate Case Expense	$110,393	$66,236	($44,157)
Membership Dues and Subscriptions	$12,804	$0	($12,804)
Miscellaneous Distribution Expense	$285,688	$0	($285,688)
Total O&M Adjustments			**($342,649)**
Taxes:			
State Income Tax Expense	$186,526	$100,549	($85,978)
Total Tax Adjustments			**($85,978)**
Rate Base Adjustments:			
Unamortized Rate Case Expense	$275,981	$0	($275,981)
Cash Working Capital	($517,744)	($474,913)	($42,831)
Total Rate Base Adjustments			**($318,812)**

SUMMARY OF I&E OVERALL POSITION

Q. WHAT IS I&E'S TOTAL RECOMMENDED REVENUE REQUIREMENT?

A. I&E's total recommended revenue requirement for Wellsboro is $9,008,787. This recommended revenue requirement represents an increase of $2,279,151 to the claim for present rate revenues of $6,729,636. This total recommended allowance incorporates my adjustments made in this testimony to O&M expenses and rate base, and those made in the testimonies of I&E witnesses Christopher Keller[3] and Ethan Cline.[4]

[3] I&E Statement No. 2.
[4] I&E Statement No. 3.

A calculation of the I&E recommended revenue requirement is shown in the table below:

RATE CASE EXPENSE

Q. BRIEFLY DESCRIBE THE NATURE AND TYPES OF EXPENDITURES TYPICALLY ALLOWED AS PART OF A REGULATED UTILITY'S OVERALL RATE CASE EXPENSE.

A. The nature and types of individual expenditures that comprise a regulated utility's allowable claim for rate case expense are those directly incurred to compile, present, and defend a utility's request for a base rate increase before the Commission. The actual expenditures and estimated costs typically found in an

allowable rate case expense claim include legal fees for outside counsel, fees to outside consultants, and the cost of printing, document assembly, and postage.

Q. HOW HAS THE COMMISSION TRADITIONALLY TREATED RATE CASE EXPENSE FOR RATEMAKING PURPOSES?

A. The Commission has historically stated that it considers prudently incurred rate case expense as an ongoing expense, occurring at irregular intervals, related to the rendering of utility service. The Commission has also cited the importance of considering the involved utility's history regarding the frequency of rate case filings as an essential element in determining the normalized level of rate case expense for ratemaking purposes.[5]

Q. HOW IS THE FREQUENCY OF RATE CASE FILINGS DETERMINED?

A. The frequency is determined by calculating the average number of months between the filing dates of a utility's recently filed base rate cases.

Q. WHAT IS THE COMPANY'S CLAIM FOR RATE CASE EXPENSE?

A. Wellsboro is claiming a rounded FPFTY rate case expense claim of $110,393.[6]

[5] "A Guide to Utility Ratemaking," by James H. Cawley and Norman J. Kennard (2018 Edition), p. 112, https://www.puc.pa.gov/General/publications_reports/pdf/Ratemaking_Guide2018.pdf, accessed July 2, 2025.

[6] Wellsboro Exhibit HSG-1, Schedule C1-3.

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company's claim is based on estimated total rate case expenses of $331,178[7] expensed over three years – its anticipated interval between the instant proceeding and the Company's next base rate case filing. Wellsboro contends that despite its previous rate case having been filed in 2019, the Company expects it will file a rate case every three years going forward.[8] The result is the Company's proposed FPFTY claimed rate case expense of $110,393.[9]

Q. WELLSBORO INTERCHANGEABLY REFERENCES ITS RATE CASE EXPENSE CLAIM AS AN AMORTIZED COST AND A NORMALIZED COST.[10] BRIEFLY DISCUSS THE CONCEPT OF AMORTIZATION.

A. Amortization is an accounting procedure that writes off a non-recurring or infrequently recurring asset over a predetermined number of years by incrementally charging to expense the total cost over the selected amortization period. Amortization for ratemaking purposes is generally limited to expense events that have been authorized for deferral by the Commission through specific company petitions for which a regulatory asset is established. Although a claim for an unrecovered normalized expense would be disallowed if requested in a subsequent base rate case, an amortized expense allowance could be claimed in a

---

7 *Id.*
8 I&E Exhibit No. 1, Schedule 1, p. 2.
9 Wellsboro Exhibit HSG-1, Schedule C1-3.
10 Wellsboro Statement No. 1, pp. 10-11; Wellsboro Exhibit HSG-1, Schedules C1 and C1-3.

succeeding rate case if there is a remaining unamortized balance.

Q. DO YOU AGREE WITH THE COMPANY'S PROPOSED AMORTIZATION TREATMENT FOR RATE CASE EXPENSE?

A. No. The Company's rate case expense claim should be normalized for ratemaking purposes.

Q. WHAT IS NORMALIZATION?

A. Normalization is a ratemaking concept that describes the transformation of an operating expense that recurs at irregular intervals into a "normal" annual test year allowance. Normalization specifically addresses the prospective recovery of an ongoing expense that recurs sporadically. Normalized expenses are no different than other O&M expenses in that the utility is given the opportunity to achieve full recovery.

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR RATE CASE EXPENSE?

A. I recommend an allowance of $66,236 for rate case expense, or a reduction of $44,157 ($110,393 - $66,236) to the Company's claim.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. First, I recommend that Wellsboro be required to normalize its rate case expense as opposed to amortizing it, since the Commission recognizes rate case expense as an ongoing expense occurring at irregular intervals, related to the rendering of utility service. As such, rate case expense is subject to normalization for ratemaking purposes and expensing amounts for prior proceedings should not be allowed.

Next, the Company's historic filing frequency does not support a three-year recovery period for rate case expense. The Company's three most recent base rate case filing dates and corresponding details for the current filing are as follows:

Docket No.	Date Filed[11]	Filing Interval
R-2025-3054392	April 30, 2025	70 months
R-2019-3008208	July 3, 2019	40 months
R-2016-2531551	March 1, 2016	69 months
R-2010-2172662	June 3, 2010	

Including the current rate case, filed on April 30, 2025, the average historic filing frequency is approximately 60 months [(70 months +40 months + 69 months) ÷ 3]. Therefore, I recommend the 60-month average historic filing frequency be used as the normalization period, consistent with the Commission's emphasis on the importance of considering the utility's history of rate case filings when determining the normalization period of rate case expenses. Normalizing

[11] I&E Exhibit No. 1, Schedule 1, p. 1.

the total claims over the average historic filing frequency of 60 months yields my recommended FPFTY allowance of $66,236 [($331,178 ÷ 60 months) x 12 months] for rate case expense. My recommended FPFTY allowance represents a reduction of $44,157 ($110,393 - $66,236) to the Company's FPFTY claimed rate case expense.

Q. HAVE OTHER UTILITIES BEEN GRANTED A NORMALIZATION PERIOD BASED ON SPECULATION OF FUTURE RATE CASE FILINGS?

A. Yes. In 2012, the Commission granted PPL Electric Utilities Corporation (PPL) permission to normalize its rate case expense over a 24-month period based on the expected timing of future base rate case filings.[12] That base rate case was filed on March 30, 2012; however, PPL did not file its next rate case until March 31, 2015, which was 36 months after the 2012 rate case filing. I&E's recommended normalization period in the 2012 PPL proceeding was a 32-month interval based on PPL's historic filing frequency.[13] I&E's recommendation in that instance produced a much more accurate result than PPL's stated future intention to file a rate case.

[12] *Pa. PUC v. PPL Electric Utilities Corporation*, Docket No. R-2012-2290597, pp. 47-48 (Order Entered December 28, 2012).

[13] I&E Statement No. 2, pp. 13-14 at Docket No. R-2012-2290597.

Q. ARE THERE ANY RECENT COMMISSION DECISIONS THAT SUPPORT YOUR RECOMMENDATION FOR A RATE CASE FILING INTERVAL BASED ON HISTORIC FILING FREQUENCY?

A. Yes. The following six cases resulted in the Commission using each utility's historic average filing frequency.

First, in a base rate case filed by Emporium Water Company, the Commission adopted I&E's recommended historic filing frequency finding in favor of I&E's recommended five-year normalization based on historic average filing frequency that was rounded down from 64 months.[14]

Second, in a 2016 base rate case filed by the City of DuBois the Commission agreed with I&E's recommendation to use an historic filing frequency finding in favor of I&E's recommended 64-month normalization which matched the actual historic filing frequency.[15]

Third, in Columbia Gas of Pennsylvania, Inc.'s (Columbia) 2020 base rate case filing, the Commission held that the normalization period should align with the frequency of historic filings rather than Columbia's stated intent to file its subsequent rate case.[16]

Fourth, in PECO Energy Company – Gas Division's (PECO Gas) 2020 base rate filing, the Commission granted I&E's recommended five-year

---

[14] *Pa. PUC v. Emporium Water Company*, Docket No. R-2014-2402324, p. 50 (Order Entered January 28, 2015).

[15] *Pa. PUC v. City of DuBois - Bureau of Water*, Docket No. R-2016-2554150, pp. 65-66 (Order Entered March 28, 2017); *PA PUC v. City of DuBois - Bureau of Water*, Docket No. R-2016-2554150, p. 13 (Order Entered May 18, 2017).

[16] *Pa. PUC v. Columbia Gas,* Docket No. R-2020-3018835, Opinion and Order, pp. 78-79 (Order Entered February 19, 2021).

normalization period rather than PECO Gas' claim based on a three-year period because the Commission determined a normalization period based on actual historic filing frequency is more reliable than future speculation.[17]

Fifth, in a base rate case filed by Philadelphia Gas Works' (PGW) in 2023, the Commission agreed with I&E's recommended 53-month normalization period rather than PGW's claim based on a three-year period because the Commission granted a normalization period based on actual historic filing frequency and not based on PGW's future intention to file a rate case.[18]

Finally, in the most recent base rate case filed by the Columbia Water Company in 2023, the Commission held that the normalization period should align with the historic filing frequency rather than that company's intent to file its next rate case, and that the intent to file a base rate case does not justify deviating from the Commission's practice of relying on historic filing frequency.[19]

Q. GIVEN THESE COMMISSION ORDERS AND THE COMPANY'S FILING HISTORY, IS THE CLAIMED 36-MONTH RECOVERY PERIOD REASONABLE?

A. No. As explained above, the Company's demonstrated historic filing frequency is 60 months, therefore, normalizing the total claims over this average historic filing

[17] *Pa. PUC v. PECO Energy Company (Gas Division)*, Docket No. R-2020-3018929, Opinion and Order, p. 119 (Order Entered June 22, 2021).

[18] *Pa. PUC v. Philadelphia Gas Works*, Docket No. R-2023-3037933, Opinion and Order, pp. 65-66 (Order Entered November 9, 2023).

[19] *Pa. PUC v. Columbia Water Company*, Docket No. R-2023-3040258, Opinion and Order, p. 34 (Order Entered January 18, 2024).

frequency is more appropriate.

Q. DO YOU HAVE ANY OTHER ISSUE TO ADDRESS RELATED TO RATE CASE EXPENSE?

A. Yes. The Company improperly claims the unamortized portion of rate case expense as a regulatory asset in rate base. This issue is addressed in the following section.

UNAMORTIZED RATE CASE EXPENSE IN RATE BASE

Q. WHAT IS INCLUDED IN THE COMPANY'S RATE BASE CLAIM FOR RATE CASE EXPENSE?

A. The Company is claiming a regulatory asset in rate base that represents unamortized rate case expense.[20]

Q. WHAT IS THE COMPANY'S CLAIM FOR UNAMORTIZED RATE CASE EXPENSE IN RATE BASE?

A. The Company is claiming $275,981 in a regulatory asset.[21]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company opines that it must recover both the cost of the asset as well as the

[20] I&E Exhibit No. 1, Schedule 2, pp. 1-2.
[21] Wellsboro Exhibit HSG-1, Schedule C1-5, p. 2.

carrying cost of the unrecovered funds expended to obtain the asset.[22]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT DO YOU RECOMMEND?

A. I recommend the entire claim of $275,981 be disallowed.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. It is well established that rate case expense, which is a routine operating expense for a regulated utility and not an asset, should be normalized and not amortized for ratemaking purposes. Thus, regulatory asset treatment for an unamortized rate case expense balance is inappropriate.

Q. WHY WOULD IT BE INAPPROPRIATE TO INCLUDE UNAMORTIZED RATE CASE EXPENSE IN RATE BASE?

A. If the Company were allowed to include unamortized rate case expense in rate base along with capturing an amount on the expense side, it would earn a return on and a return of rate case expense, a routine operating expense. Any allowance for return on an expense, in addition to a return of such an expense, is not an appropriate ratemaking practice. Also, as stated previously, with respect to rate

[22] I&E Exhibit No. 1, Schedule 2, p. 2.

case expense, normalization of such a claim, rather than amortization, is the appropriate ratemaking treatment, and normalization does not include a remaining balance nor allow for a remaining balance to be captured in rate base. Rate case expense represents a routine operating expense which is not extraordinary in nature. As such, rate base treatment of this cost should not be granted.

MEMBERSHIP DUES AND SUBSCRIPTIONS

Q. WHAT IS THE COMPANY'S CLAIM FOR MEMBERSHIP DUES AND SUBSCRIPTIONS?

A. In response to I&E-RE-10-D, Wellsboro identified $12,804 ($6,000 + $3,400 + $32 + $3,372) in membership dues and subscriptions for the FPFTY.[23] Wellsboro's FPFTY claim consists of bank fees of $6,000, subscriptions of $3,400, lobbying expenses and political campaign donations of $32, and membership dues & subscriptions of $3,372.[24]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company states the bank fees are incurred when managing customer payments and processing transactions.[25] The subscriptions claim is based on costs to support administrative tasks and access up to date industry information.[26] The

[23] I&E Exhibit No. 1, Schedule 3, p. 1.
[24] *Id.*
[25] *Id*. at p. 2.
[26] *Id.*

lobbying expenses represent indirect lobbying efforts by the Company.[27] Finally, the membership dues are paid to industry associations to access regulatory updates, best practices, and training opportunities.[28]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM FOR MEMBERSHIP DUES AND SUBSCRIPTIONS?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR MEMBERSHIP DUES AND SUBSCRIPTIONS CLAIM?

A. I recommend disallowing the entire $12,804 membership dues and subscriptions claims for ratemaking purposes.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. In response to I&E-RE-10-D, when asked to provide details by year, identifying the account name and number, the payee(s), and the expense amount claimed in the HTY, FTY, and FPFTY, and to include the basis for each of the listed expense categories, the Company did not identify the account number nor the payee for any of the expenses.[29] My recommendation to disallow the entire claim for ratemaking purposes is therefore based on the lack of support for the identified expenses.

[27] *Id.*
[28] *Id.*
[29] I&E Exhibit No. 1, Schedule 3, pp. 1-2.

MISCELLANEOUS DISTRIBUTION EXPENSE

Q. WHAT IS THE COMPANY'S CLAIM FOR MISCELLANEOUS DISTRIBUTION EXPENSE?

A. Wellsboro's FPFTY claim for miscellaneous distribution expense is $285,688.[30]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company's miscellaneous distribution expense FPFTY claim consists of labor costs of $140,466, overhead costs of $123,422, and other costs of $21,800;[31] and is based on increased labor and overhead costs due to the FTY redistribution of responsibilities and duties of a previously vacant position.[32]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM FOR MISCELLANEOUS DISTRIBUTION EXPENSE?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR MISCELLANEOUS DISTRIBUTION EXPENSE?

A. I recommend the entire $285,688 FPFTY claim be disallowed for ratemaking purposes.

---

30 Wellsboro Exhibit HSG-1, Schedule C1-1, p. 1.
31 Wellsboro Exhibit HSG-1, Schedule WP_C2, pp. 1 & 3.
32 I&E Exhibit No. 1, Schedule 4, p. 1.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. In response to request for a detailed breakdown of the annual costs at I&E-RE-12-D,[33] and for further breakdown of the labor and overhead costs at I&E-RE-13-D, [34] the Company did not provide a breakdown sufficient enough to be able to determine whether the items included its miscellaneous distribution expense claim are appropriate for ratemaking purposes.

In response to I&E-RE-12-D, Wellsboro states that the increase in labor costs from the HTY to the FTY are related to a redistribution of responsibilities for a previously vacant position resulting in increased labor and overhead costs.[35] However, the basis for the redistribution methodology lacks sufficient detail to determine whether this is appropriate to include for ratemaking purposes or if this is accounted for in other expense accounts.

Additionally, while Wellsboro's filing does provide an additional breakdown of the miscellaneous distribution expense account; [36] it is not apparent if the costs included in each subaccount are appropriate for ratemaking purposes.

Without being provided greater specificity, it is not evident whether any part of the miscellaneous distribution expense is necessary for the safe and reliable supply of electric service and subsequently appropriate for ratemaking purposes.

[33] I&E Exhibit No. 1, Schedule 4, p. 1.
[34] I&E Exhibit No. 1, Schedule 5, p. 1.
[35] I&E Exhibit No. 1, Schedule 4, p. 1.
[36] Wellsboro Exhibit HSG-1, Schedule WP_C1, p. 13.

Therefore, I recommend the entire $285,688 FPFTY claim be disallowed for ratemaking purposes.

CASH WORKING CAPITAL

Q. WHAT IS A CASH WORKING CAPITAL (CWC) ALLOWANCE FOR RATEMAKING PURPOSES?

A. CWC is defined as the amount of funds necessary to operate a utility during the interim between the rendition of service, including the payment of related expenses and the receipt of revenues in payment of services rendered.

Q. WHAT IS THE COMPANY'S CWC CLAIM?

A. The Company's claim for CWC is $517,744.[37]

Q. HOW DID THE COMPANY CALCULATE ITS CWC CLAIM?

A. The Company used the 1/8 Method, which is also known as the 45-Day Method. The Company's claim was determined by adding all its cash-based operating expenses to arrive at a total of $4,141,955.[38] The resulting figure was multiplied by 1/8 to arrive at a CWC amount of $517,744 [$4,141,955 x (1/8)].[39]

[37] Wellsboro Exhibit HSG-1, Schedule C1-5.
[38] *Id*.
[39] *Id*.

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No. I disagree with the Company's CWC claim in as much as I disagree with its cash-based operating expense claims as described above.

Q. WHAT IS YOUR RECOMMENDED ALLOWANCE FOR CWC?

A. I recommend an allowance of $474,913 or a reduction of $42,831 ($517,744 - $474,913) to the Company's claim.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on the reflection of all my O&M adjustments to the O&M expenses as discussed above. My recommendation is calculated as follows:

Company's CWC Claim		$517,744
I&E Recommended O&M Expense Adjustments	($342,649)	
1/8 of Total O&M Adjustments		($42,831)
I&E Recommended CWC Allowance		$474,913

Q. IS YOUR RECOMMENDED CWC ALLOWANCE A FINAL RECOMMENDATION?

A. No. All adjustments to the Company's claims for revenues, expenses, taxes, and rate base must be consistently brought together in the Administrative Law Judge's Recommended Decision and again in the Commission's Final Order. This process, which is known as iteration, effectively prevents the determination of a

precise calculation until such time as all adjustments have been made to the Company's claim.

STATE INCOME TAX EXPENSE

Q. WHAT IS THE COMPANY'S CLAIM FOR STATE INCOME TAX EXPENSE?

A. The Company's claim for state income tax expense is $186,526.[40]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company's state income tax expense claim is based on the 2022 tax year Pennsylvania corporate net income tax rate of 9.99%.[41]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT DO YOU RECOMMEND FOR STATE INCOME TAX EXPENSE?

A. I recommend an allowance of $100,549 or a reduction of $85,978 ($186,526 - $100,549) to the Company's claim for state income taxes.

[40] Wellsboro Exhibit HSG-1, Schedule C1-4, Line 16.
[41] *Id*.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. On July 8, 2022, Pennsylvania House Bill 1342 was signed into law as Act 53 of 2022. Act 53 lowered the 2022 tax year 9.99% corporate net income tax rate to 7.49% for tax year 2026 (the Company's claimed FPFTY) and will decrease the tax rate by 0.5% each year until 2031, when the tax rate will be 4.99%.[42] Therefore, I recommend a Pennsylvania income tax rate of 7.49% to reflect the Pennsylvania corporate income tax rate that will be in effect for the FPFTY. This change is reflected in my recommended revenue requirement in Table I above[43] and incorporates the state income tax effect of my other recommended adjustments and those of I&E witness Christopher Keller[44] and Ethan Cline.[45]

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

[42] I&E Exhibit No. 1, Schedule 6, p. 1.
[43] I&E Statement No. 1, p. 5.
[44] I&E Statement No. 2.
[45] I&E Statement No. 3.

5/1/2025	2205528	RATE CASE NOTICES	CLARE PRINTING	3,262.54
				58,073.11

E. There are none.

F. The Company expects to file a rate case every three years, due to the continuing need for capital investment to meet demand, and due to normal cost inflation. Althought the Company has not filed a rate case since 2019, this period is considered unusual due to several new larger loads that were added. The Company's sister companies, as well as many other utilities, file rate cases every three years.

G. There are none.

H.

	2023	2024	2025	2026
General Assessment	32,144	42,985	43,000	43,000
Rate Case Expense	36,222	-	-	110,393
Total	68,366	42,985	43,000	153,393

The expense shown in FTY 2025 includes an estimate for the General Assessment, which is not expected to be received until August or September 2025. The FPFTY reflects the same estimated amount for the General Assessment, along with the initiation of amortization for projected rate case expenses.

I&E-RE-22

Reference Wellsboro Exhibit HSG-1, Schedule C1-5 concerning the regulatory asset claim. Provide the following:

A. Explanation and detailed calculations/breakdown for what the $331,178 FTY claim represents.

B. Explanation and detailed calculations/breakdown for what the $275,981 FPFTY claim represents.

C. State whether the regulatory asset claim of $275,981 represents unamortized rate case expense, and if not, explain in detail what it represents.

D. State why the difference between the FTY and FPFTY claims, $55,197 ($331,178 - $275,981), is approximately half of the claimed annual rate case expense, $110,394 ($55,197 x 2), shown on Schedule C1-3, line 21, $110,393.

E. The basis for why it is appropriate to include the regulatory asset in rate base for ratemaking purposes.

Howard Gorman, President, HSG Group, Inc.

Date: July 11, 2025

Response:

A. The amount of $331,178 on Schedule C1-5, line 45, for FTY 2025, represents the total Rate Cass expense the Company expects to incur. The details have been previously provided, appearing on the Company's response I&E-RE-1 Attachment A, on tab C1-3, cells M29:O37. They are repeated below for convenience.

McNees fully litigated		180,000
HSG Group	Fixed	100,000
HSG Group	Travel	3,000
ScottMadden	Initial	11,667
ScottMadden	Additional	25,000
BKD		2,000
Prior overcollection		(489)
Printing, other		10,000
		331,178

The amount of $331,178 is included in the total $35,399 on Schedule C1-5, line 9, for FTY 2025.

B. The amount of $275,981 on Schedule C1-5, line 25, for FPFTY 2026, is computed as follows:

Rate Case expense incurred	$331,178
50% of 2026 amortization	(55,197)
Average balance for FPFTY 2026	$275,981

The amortization period is 3 years, equal to annual amortization of $110,393, and 50% of that is $55,197.
The amount of $275,981 is included in the total ($19,798) on Schedule C1-5, line 9, for FPTFY 2025.

C. Yes.

D. As discussed in part B, this represents the average balance during the FPFTY 2026.

E. Rate case expense is a cost the Company must incur to have rates that allow it to recover its costs, which are necessary to provide service. As with any asset, the Company needs to recover both the cost of the asset, and the carrying cost of the unrecovered funds expended to obtain the asset.

WELLSBORO ELECTRIC COMPANY
DOCKET NO. R-2025-3054392

I&E-RE-10-D

Reference Company Exhibit HSG-1, Schedule C1-1. For each of the following, provide details by year identifying the account name/number, the payee(s), the expense amount claimed in HTY 2024, FTY 2025, and FPFTY 2026, and the basis for why each expense is appropriate to include for ratemaking purposes:

A. Fines and penalties.
B. Bank charges.
C. Clearinghouse fees.
D. Subscriptions.
E. Company sponsorships.
F. Lobbying expenses/Political campaign donations.
G. Membership dues and subscriptions.
H. Donations.
I. Charitable or civic contributions.

Response Provided By:
Jill L. Campbell, VP of Finance and Administration, Wellsboro Electric Company

Date: June 3, 2025

Response: See chart below

		2024	2025	2026
A.	Fines & Penalties	-	-	-
B.	Bank Charges	5,134	6,000	6,000
C.	Clearinghouse Fees	-	-	-
D.	Subscriptions	2,961	3,400	3,400
E.	Company Sponsorships	-	-	-
F.	Lobbying Expenses/Political Campaign Donations	29	32	32
G.	Membership Dues & Subscriptions	3,372	3,372	3,372
H.	Donations	-	-	-
I.	Charitable or Civic Contributions	-	-	-

A. None
B. Bank fees are incurred in the normal course of business for managing customer payments and processing transactions. These services help to maintain reliable and secure financial practices that ultimately benefit the ratepayers. To ensure that fees remained competitive, in 2021 the Company solicited proposals from multiple banking institutions and based on that evaluation the selected banking partner offered the most cost -effective solution which demonstrates the Company's commitment to prudent financial management and controlling costs on the customer's behalf.

C. None
D. Subscriptions are used to support operational efficiency, streamline administrative tasks and enhance overall productivity. Professional subscriptions are used to access up to date industry information. These tools enable staff to work more effectively.
E. None
F. A small portion of industry association dues are designated for lobbying activities conducted by the association and not through direct lobbying efforts by the Company.
G. Membership dues to industry associations provide access to critical regulatory updates, best practices, and training opportunities. These resources help the Company's ability to manage its operations effectively while staying compliant with evolving regulations.
H. None
I. None

No. 2022-193
July 11, 2022

Pennsylvania: Changes to corporate net income tax laws, other tax changes

House Bill 1342 was signed into law in Pennsylvania on July 8, 2022. The bill makes significant changes to the Commonwealth's corporate net income tax laws, as discussed below.

Corporate net income tax rate reduction

The Commonwealth's current corporate net income tax rate is 9.99%, which is one of the highest in the country. House Bill 1342 reduces that rate incrementally to 4.99%. These rate reductions are scheduled to occur automatically and are not contingent on state tax revenues meeting or exceeding specific thresholds.

The rate is first reduced to 8.99% for the 2023 tax year—the tax year beginning on or after January 1, 2023 through December 31, 2023. The rate is further reduced as follows:

- 8.49% for tax year 2024
- 7.99% for tax year 2025
- 7.49% for tax year 2026
- 6.99% for tax year 2027
- 6.49% for tax year 2028
- 5.99% for tax year 2029
- 5.49% for tax year 2030
- 4.99% for tax years beginning January 1, 2031 and thereafter

KPMG observation

Previous corporate net income rate reductions were included in bills that would also have adopted unitary combined reporting. However, unitary combined reporting is not included in this legislation.

Sales factor changes

Under current law, specific sourcing rules apply to receipts from sales of services and receipts from sales of tangible personal property. All other receipts are sourced under the statutory income-producing activity test and

© 2022 KPMG LLP, a Delaware limited liability partnership and a member firm of the KPMG global organization of independent member firms affiliated with KPMG International Limited, a private English company limited by guarantee. All rights reserved.

are included in the Pennsylvania sales factor numerator if the income-producing activity is performed in Pennsylvania, or if a greater proportion of the income-producing activity is performed in Pennsylvania, based on costs of performance. House Bill 1342 adopts comprehensive customer-based sourcing rules for a number of "other" types of receipts, including:

- Gross receipts from the lease or license of intangible property
- Gross receipts from sales of intangibles
- Gross receipts from the sale, redemption, maturity or exchange of securities held by a taxpayer primarily for sale to customers
- Gross receipts related to lending activities involving real property and tangible personal property
- Gross receipts received from interest, fees, and penalties from credit card holders
- Gross receipts received from interest not otherwise addressed in the revised law

Any gross receipts associated with intangible property that are not specifically addressed will be excluded from both the numerator and denominator of the sales factor. The state tax authority is directed to promulgate rules and regulations to implement the new sourcing rules, which are effective for tax years beginning after December 31, 2022.

KPMG observation

There is ongoing litigation in Pennsylvania over the application of the income-producing activity test as applied to service receipts. The *Synthes* case, currently pending before the Pennsylvania Supreme Court, involves the interpretation of the statutory income-producing activity test in years prior to 2014 before the legislature revised the law to provide that service receipts are sourced to the location where the services are delivered. In *Synthes*, the state tax authority and the taxpayer were on the same side and argued that the tax authority's market-based interpretation of the income-producing activity test, which resulted in a refund for Pennsylvania-based taxpayer, was entitled to deference. The Attorney General, however, disagreed that the tax authority's interpretation was entitled to deference. The Commonwealth Court held in favor of the taxpayer and the tax authority, the Attorney General appealed to the Pennsylvania Supreme Court, and oral arguments were held in March 2022. Although *Synthes* involves service receipts, the outcome may be instructive as to application of the income-producing activity test to other types of receipts for years prior to 2023.

Codification of economic nexus standards

House Bill 1342 codifies Corporation Tax Bulletin 2019-04, issued post-*Wayfair*, in which the state tax authority announced that for tax years beginning on or after January 1, 2020, corporations meeting an economic nexus standard would be required to file corporate net income tax returns (unless protected under Public Law 86-272). The bulletin set forth a rebuttable presumption that a corporate taxpayer without a physical presence in Pennsylvania that had $500,000 or more of direct or indirect gross receipts sourced to Pennsylvania from any combination of (1) gross receipts from the sale, rental, lease, or licensing of tangible personal property; (2) gross receipts from the sale of services; or (3) gross receipts from the sale or licensing of intangibles, including franchise agreements, would have a filing responsibility.

Effective for tax years beginning after December 31, 2022, House Bill 1342 codifies the rebuttable presumption that a corporation with $500,000 or more of receipts sourced to Pennsylvania will have substantial nexus with the Commonwealth, despite the lack of a physical presence. However, an exception applies to affiliated entities domiciled in foreign nations that have entered into comprehensive income tax treaties with the United States. The treaties must provide "for the allocation of all categories of income subject to taxation, or the withholding of tax, on royalties, licenses, fees and interest for the prevention of double taxation of the respective nations' residents and the sharing of information."

KPMG observation

It is important to consider the economic nexus standard in conjunction with the revised sourcing rules that apply

beginning with the 2023 tax year. A taxpayer that previously sourced receipts under the income-producing activity test may not have had the requisite level of receipts sourced to the Commonwealth. However, that may no longer be the case when those receipts are sourced using the new customer-based rules.

Sales and use tax and other tax changes

Effective January 1, 2023, House Bill 1342 requires peer-to-peer car sharing marketplace facilitators (as defined) to collect sales and use tax on facilitated shared vehicle rentals. The up-to-$2 per day fee that applies to vehicle rentals is extended to vehicles rented as part of a peer-to-peer car sharing program. However, the Commonwealth's 2% vehicle rental tax does not apply to a shared vehicle that is rented through a peer-to-peer car sharing program. The bill also extends the computer data center sales tax exemption qualification period from 15 years to 25 years for qualified purchases of equipment installed in the computer data center.

For individual (personal) income tax purposes, effective for tax years beginning after December 31, 2022, the bill conforms the Commonwealth to the section 179 expensing provisions and the section 1031 deferral provisions. A new refundable tax credit is adopted for eligible taxpayers who receive the federal child and dependent care tax credit. Finally, the bill increases the annual cap for the research and development and film production tax credits and makes certain changes to the keystone opportunity zone provisions.

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Zachari Walker, and my business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission or PUC) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. ARE YOU THE SAME ZACHARI WALKER WHO SUBMITTED I&E STATEMENT NO. 1 AND I&E EXHIBIT NO. 1?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to respond to the rebuttal testimony of Wellsboro Electric Company (Wellsboro or Company) witnesses Howard Gorman[1] and Jill Campbell.[2] I also present I&E's updated position based on my

[1] Wellsboro Statement No. 1-R.
[2] Wellsboro Statement No. 5-R.

updated recommended operating and maintenance (O&M) expense adjustments and the updated adjustments of the other I&E witnesses.

Q. DOES YOUR SURREBUTTAL TESTIMONY INCLUDE AN EXHIBIT?

A. No. However, I reference my direct testimony and accompanying exhibit as I&E Statement No.1 and I&E Exhibit No. 1, respectively.

EFFECTIVE DATE OF NEW RATES

Q. WHAT IS THE EFFECTIVE DATE PROPOSED FOR NEW RATES?

A. The Company indicates that its effective date for new rates is January 30, 2026, however, the rate change could be effective earlier if the parties agree to a settlement that includes an accelerated effective date and that settlement is approved by the Commission.[3]

Q. SUMMARIZE YOUR DIRECT TESTIMONY REGARDING WHETHER NEW RATES SHOULD BE ALLOWED TO GO INTO EFFECT PRIOR TO THE JANUARY 30, 2026 EFFECTIVE DATE.

A. As stated in my direct testimony, rates should not go into effect prior to the beginning of the fully projected future test year (FPFTY) which is January 1, 2026. This date is the beginning of the twelve-month period on which new rates

[3] Wellsboro Statement No. 1, p. 2.

are based. For this reason, it would be unjust and unreasonable for ratepayers to pay the increase in rates prior to the beginning of the first day of the FPFTY.[4]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. No.

SUMMARY OF COMPANY'S UPDATED REQUEST

Q. SUMMARIZE THE COMPANY'S UPDATED REQUESTED REVENUE INCREASE.

A. In rebuttal testimony, the Company updated its requested revenue increase to $2,848,804 to the updated claimed present rates revenues of $6,696,602 resulting in an overall revenue requirement of $9,545,406.[5]

Q. SUMMARIZE YOUR RECOMMENDED ADJUSTMENTS TO THE COMPANY'S REBUTTAL POSITION.

A. The following table summarizes my updated recommended adjustments:

[4] I&E Statement No. 1, p. 3.
[5] Wellsboro Exhibit HSG-1-R, Schedule C1-R.

	Wellsboro FPFTY Claim	I&E Recommended Allowance	I&E Adjustment
O&M Expenses:			
Rate Case Expense	$110,393	$66,236	($44,157)
Membership Dues and Subscriptions	$12,804	$9,365	($3,439)
Miscellaneous Distribution Expense	$285,688	$278,888	($6,800)
Total O&M Adjustments			**($54,396)**
Rate Base Adjustments:			
Unamortized Rate Case Expense	$275,981	$0	($275,981)
Cash Working Capital	$512,714	$505,914	($6,800)
Total Rate Base Adjustments			**($282,781)**

Q. HAS THE COMPANY ACCEPTED ANY OF YOUR RECOMMENDED ADJUSTMENTS FROM DIRECT TESTIMONY?

A. Yes. The Company accepted my recommendation to use the correct tax rate, 7.49%,[6] to calculate the FPFTY corporate state income tax expense.[7]

SUMMARY OF I&E OVERALL UPDATED POSITION

Q. WHAT IS I&E'S UPDATED RECOMMENDED REVENUE REQUIREMENT?

A. I&E's recommended revenue requirement for Wellsboro is $9,299,442. This recommended revenue requirement represents an increase of $2,602,840 to the updated claim for present rate revenues of $6,696,602. This total recommended

[6] I&E Statement No. 1, pp. 22-23.
[7] Wellsboro Statement No. 1-R, p. 3.

allowance incorporates my adjustments made in this testimony to O&M expenses, taxes, and rate base, and those made in the testimony of I&E witness Christopher Keller.[8]

An updated calculation of the I&E recommended revenue requirement is shown in the table below:

Wellsboro Electric Company		TABLE I			
R-2025-3054392		INCOME SUMMARY

[8] I&E Statement No. 2.

RATE CASE EXPENSE

Q. SUMMARIZE YOUR RECOMMENDATION FOR RATE CASE EXPENSE AS PRESENTED IN YOUR DIRECT TESTIMONY.

A. I recommended that Wellsboro be required to normalize its rate case expense as opposed to amortizing it, since the Commission recognizes rate case expense as an ongoing expense occurring at irregular intervals, related to the rendering of utility service.[9] My recommended annual allowance for rate case expense of $66,236 was based on normalizing the Company's total claim over its historical average filing frequency of approximately 60 months as determined by the filing date of this rate proceeding and that of the Company's three most recent rate cases. My recommendation is consistent with the Commission's emphasis on the importance of considering the utility's history of rate case filings when determining the normalization period of rate case expenses. My recommended annual rate case expense allowance of $66,236 represented a reduction of $44,157 ($110,393 - $66,236) to the Company's FPFTY claimed rate case expense.[10]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. Wellsboro witness Howard Gorman disagrees with my recommendation.

[9] I&E Statement No. 1, p. 9.
[10] I&E Statement No. 1, pp. 8-13.

Q. SUMMARIZE WITNESS GORMAN'S RESPONSE.

A. Mr. Gorman contends that Wellsboro's normalization period should be determined based on the Company's anticipated three-year period between base rate filings rather than the historical average filing frequency. According to Mr. Gorman, Wellsboro was able to avoid filing a rate case in 2022 due to abnormal load growth and the Company's participation in temporary funding programs available during the COVID-19 pandemic, both of which are not forecasted to occur again going forward. Mr. Gorman also notes that Wellsboro's sister company, Citizens' Electric Company of Lewisburg, PA (Citizens'), proposed a three-year normalization period and did not receive objection to that proposal from other parties to that case.[11]

Q. WHAT IS YOUR RESPONSE TO MR. GORMAN'S TESTIMONY CONCERNING RATE CASE EXPENSE?

A. First, Mr. Gorman did not directly address my recommendation that Company be required to normalize its rate case expense claim rather than be allowed to amortize it; however, he does state that Wellsboro proposed normalizing its rate case expense claim over 36 months.[12] Presumably, Mr. Gorman is accepting normalization treatment for the Company's rate case expense.

[11] Wellsboro Statement No. 1-R, p. 4.
[12] Wellsboro Statement No. 1-R, p. 4.

Next, I am also the I&E witness reviewing Citizens' base rate filing, so I can state that the reason I did not propose an alternate normalization period in that proceeding is because Citizens' historical average filing frequency aligned with the Company's proposed normalization period. His argument against using a historical average filing frequency to determine the annual rate case expense allowance is the very reason why this method is appropriate. Using the historical average filing frequency to determine the interval over which to normalize rate case expenses provides protection for ratepayers from potentially significant over-recoveries of expenses in rates when the expense occurs less frequently than anticipated.

If the Company begins to file rate cases on a shorter regular filing interval, that new regular filing interval will naturally align with the historical average filing frequency. Until such time as that occurs, normalization protects the customers from being overcharged in rates for rate case expense if the anticipated regular filing interval does not occur.

Wellsboro has not historically demonstrated that it is likely to file its next base rate case within 36 months of the instant filing, and therefore, my recommendation to normalize rate case expense over the historic filing frequency is more appropriate.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR RATE CASE EXPENSE?

A. No. I continue to recommend that the Company's rate case expense be normalized over the historical average filing frequency interval of 60 months. The result is my recommended annual expense allowance of $66,236 for rate case costs, a reduction of $44,157 to the Company's claim. My recommendation is consistent with the Commission's emphasis on the importance of considering the utility's history of rate case filings when determining the normalization period of rate case expenses.

UNAMORTIZED RATE CASE EXPENSE IN RATE BASE

Q. SUMMARIZE YOUR RECOMMENDATION FOR UNAMORTIZED RATE CASE EXPENSE IN RATE BASE AS PRESENTED IN YOUR DIRECT TESTIMONY.

A. I recommended the entire rate base claim of $275,981 for unamortized rate case expense be disallowed for ratemaking purposes based on my recommendation to normalize Wellsboro's total O&M claim for rate case expense. Normalization transforms an irregularly-recurring, routine operating expense into a "normal" annual test year expense. Normalization also addresses the prospective recovery of an ongoing expense that recurs sporadically and gives the Company the opportunity to achieve full recovery of rate case costs. However, if the Company were allowed to include a claim for unamortized rate case expense in rate base,

along with capturing an amount on the expense side, it would earn a return on and a return of rate case expense. Any allowance for return on an expense, in addition to a return of such an expense, is not an appropriate ratemaking practice.[13]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. Wellsboro witness Howard Gorman disagrees with my recommendation.

Q. SUMMARIZE WITNESS GORMAN'S RESPONSE.

A. Mr. Gorman opines that allowing the Company to earn a return on the balance of unamortized rate case expense compensates the Company for the delay between paying the rate case expenses costs and receiving post-proceeding distribution revenues over the normalization period. He additionally contends that rate case expense is equivalent to the inclusion of purchased materials and supplies in rate base prior to their use.[14]

Q. WHAT IS YOUR RESPONSE TO MR. GORMAN'S ASSERTION?

A. First, Mr. Gorman's conflates purchasing physical materials and supplies and the costs incurred to conduct a rate case, typically mailings and payment for contracted services. In one instance, inventories are held on hand as an asset until used in the normal course of business; on the other hand, the costs experienced to

[13] I&E Statement No. 1, pp. 8-12.
[14] Wellsboro Statement No. 1-R, p. 5.

conduct a rate case are incurred during the rate proceeding for which the Company previously received an embedded normalized expense in distribution revenues to fund. The normalization process is to fund rate case expenses prospectively between occurrences, not to reimburse current rate case expenses after the fact. This methodology further reinforces my position that any rate base treatment of current expenses is highly inappropriate as the Company received revenues designated for the current case in the years that have elapsed since the prior rate case. If rate base treatment were allowed, then the logical counter to that is that the Company should have been building a regulatory liability for ratepayer funds received via rate case expense during all the intervening years as an offset to the current expenses claimed as a regulatory asset. Clearly that is not the intent for a regularly recurring, non-extraordinary.

Given Mr. Gorman's presumed acceptance of my recommendation in direct testimony as stated in the rate case expense section above,[15] it is not appropriate to also request amortization treatment for rate case expenses.

Normalization is the appropriate ratemaking treatment for rate case costs. The ratemaking practice of normalization does not include any provision for a remaining balance nor allow for a remaining balance to be captured in rate base. Rate case expense represents a routine operating expense which is not extraordinary in nature.

[15] I&E Statement No. 1-SR, p. 7.

Q. DO YOU HAVE ANY CHANGE TO YOUR RECOMMENDATION?

A. No. For the reasons explained above and in my direct testimony, I continue to recommend that the Commission disallow the Company's claimed $275,981 unamortized rate case expense in rate base for the FPFTY.

MEMBERSHIP DUES AND SUBSCRIPTIONS

Q. SUMMARIZE YOUR RECOMMENDATION FOR MEMBERSHIP DUES AND SUBSCRIPTIONS IN YOUR DIRECT TESTIMONY.

A. I recommended disallowing the entire $12,804 membership dues and subscriptions claims for ratemaking purposes based on the lack of support for the identified expenses.[16]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. Wellsboro witness Jill Campbell disagrees with my recommendation.

Q. SUMMARIZE MS. CAMPBELL'S RESPONSE.

A. Ms. Campbell opines the table included in her rebuttal testimony, with payee and account details, fully supports the Company's claim for membership dues and subscription.[17]

[16] I&E Statement No. 1, p. 16.
[17] Wellsboro Statement No. 5-R, p. 2.

Q. WHAT IS YOUR RESPONSE TO MS. CAMPBELL'S REBUTTAL TESTIMONY REGARDING MEMBERSHIP DUES AND SUBSCRIPTIONS?

A. The additional information provided in Ms. Campbell's testimony makes it possible to determine which of the included claims are appropriate to include for ratemaking purposes.[18]

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION?

A. Yes. Based on the additional details provided in the Company's rebuttal testimony, I am updating my recommendation. The chart below illustrates my updated position regarding the Company's membership dues and subscriptions claims:

Vendor Description	**Company FPFTY Claim**	**I&E Recommended Allowance**	**I&E Recommended FPFTY Adjustment**
C&N Bank	$6,000	$6,000	$0
Handy-Whitman Index	$175	$175	$0
Wellsboro Gazette	$100	$65	($35)
Adobe Pro for Teams Subscription	$1,900	$1,900	$0
Notary Fees	$1,050	$1,050	$0
Zoom Subscription	$175	$175	$0
Energy Assoc. – Subscription	$957	$0	($957)
PA Chamber of Business & Industry	$1,450	$0	($1,450)
Voam	$190	$0	($190)
Wellsboro Chamber of Commerce	$775	$0	($775)
Energy Assoc. – Lobbying Expenses	$32	$0	($32)
Total	$12,804	$9,365	($3,439)

[18] Wellsboro Statement No. 5-R, p. 2.

I accept the claims for bank charges, notary fees, and Handy Whitman Index[19] for ratemaking purposes. Likewise, after checking the advertised subscription fees, the claimed amounts for Adobe Pro for Teams[20] and Zoom[21] are reasonable and appropriate for ratemaking consideration.

Next, I recommend the $190 claim for Voam be disallowed entirely as it is unclear what benefit this provides to ratepayers; to that point, the $190 claim is unsupported and therefore inappropriate to include for ratemaking purposes.

Also, I recommend the membership dues and subscriptions claim of $775 for the Wellsboro Chamber of Commerce (Wellsboro Chamber) be disallowed for ratemaking purposes. Upon reviewing Wellsboro Chamber's website, it appears this membership does not provide benefits to ratepayers.[22]

Finally, I recommend the claims for Energy Association of PA (EAP) lobbying expenses of $32, EAP membership dues and subscriptions of $957, and PA Chamber of Business and Industry (PA Chamber) membership dues and subscriptions of $1,450 be disallowed for ratemaking purposes because they represent expenditures for political advertising as described in the following:

66 Pa. C.S. § 1316(a) states that "[f]or purposes of rate determinations, no public utility may charge to its consumers as a permissible operating expense for ratemaking purposes any direct or indirect expenditure by the utility for political

[19] Wellsboro Statement No. 5-R, p. 2.

[21] Plans & Pricing for Zoom Workplace | Zoom, accessed August 20, 2025.
[22] Home - Wellsboro Area Chamber of Commerce | PA, accessed August 20, 2025.

advertising."[23] 66 Pa. C.S. § 1316(d) states:

> As used in this section the term "political advertising" means any advertising for the purpose of influencing public opinion with respect to any legislative, administrative action, or candidate election or with respect to any controversial issue to be decided by public voting. The term includes money spent for lobbying but not money spent for appearances before regulatory or other governmental bodies in connection with a public utility's existing or proposed operations.[24]

Q. HOW DID YOU DETERMINE THESE CLAIMS ARE EXPENDITURES FOR POLITICAL ADVERTISING?

A. According to EAP's website, "[EAP] is an advocate for its members on policy issues before the General Assembly, the PUC, and various other state governmental agencies."[25] Any funds paid to EAP likely represent the Company's intent to have EAP influence policy issues in favor of Wellsboro. Therefore, the Company's claims are inappropriate for ratemaking purposes, and I recommend the EAP claims of $957 and $32 be disallowed for ratemaking purposes.

As stated on the PA Chamber's website, "the Chamber serves as the frontline advocate for business on Capitol Hill in Harrisburg…through lobbying, testifying, developing key relationships…promot[ing] pro-business legislation, and fight[ing] anti-business legislation…"[26] Similar to the EAP costs above, this $1,450 PA Chamber expense claim represents political advertising or lobbying costs and is not appropriate expenses to include for ratemaking purposes. As a

[23] 66 Pa. C.S. § 1316(a).
[24] 66 Pa. C.S. § 1316(d).
[25] Who We Are | Energy Association of PA, accessed August 20, 2025.
[26] Advocacy - PA Chamber, accessed August 20, 2025.

result, I recommend the PA Chamber claim be disallowed for ratemaking purposes.

MISCELLANEOUS DISTRIBUTION EXPENSE

Q. SUMMARIZE YOUR RECOMMENDATION FOR MISCELLANEOUS DISTRIBUTION EXPENSE IN YOUR DIRECT TESTIMONY.

A. I recommended the entire $285,688 FPFTY claim be disallowed for ratemaking purposes based on a lack of sufficient support for the miscellaneous distribution expense is necessary for the safe and reliable supply of electric service and subsequently appropriate for ratemaking purposes.[27]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. Wellsboro witness Jill Campbell disagrees with my recommendation.

Q. SUMMARIZE MS. CAMPBELL'S RESPONSE.

A. Ms. Campbell provides a detailed breakdown of the miscellaneous distribution expense account, explaining that the proposed increase in future costs is due to a previous vacancy in 2024, a rebalancing of capitalized versus expensing labor following a realignment of responsibilities among existing staff to cover the 2024 vacancy, and an increase in training, safety and labor costs to develop apprentices

[27] I&E Statement No. 1, pp. 17-19.

and journeymen. [28] At one point, Ms. Campbell also opines that part of the Company's increased expense level represents a contingency for repair of customer property, tree replacement, and other expenses.[29]

Q. DO YOU HAVE ANY CHANGES IN YOUR RECOMMENDATION IN RESPONSE TO MS. CAMPBELL'S EXPLANATION?

A. Yes. After reviewing Ms. Campbell's rebuttal testimony, the projections presented, and investigating corresponding historical miscellaneous distribution expense levels, I accept that most of the projected expense level is reasonable; however, the proposed allowance for customer property repair, miscellaneous distribution expense subaccount 588.00, of $6,800 is unsupported. In fact, the Company has incurred a net negative cost for customer property repairs over the most recent historical two years.[30] It is also inappropriate to build a contingency for damage to customers' property into the revenue requirement for ratemaking purposes. Therefore, I recommend that the claim miscellaneous distribution expense of $6,800 related to the contingency for damage to customers' property be disallowed for ratemaking purposes. This represents my recommended allowance of $278,888 ($285,688- $6,800) for FPFTY miscellaneous distribution expenses.

[28] Wellsboro Statement No. 5-R, pp. 2-5.
[29] Wellsboro Statement No. 5-R, p. 4.
[30] Wellsboro Statement No. 5-R, p. 3.

CASH WORKING CAPITAL (CWC)

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR CWC.

A. I recommended an allowance of $474,913 or a reduction of $42,831 ($517,744 - $474,913) to the Company's claim. My recommendation was based on the 1/8th method in line with the Company's calculation method and reflected all my adjustments to O&M expenses as presented in direct testimony.[31] My recommendation was calculated as follows:

Company's CWC Claim		$517,744
I&E Recommended O&M Expense Adjustments	($342,649)	
1/8 of Total O&M Adjustments		($42,831)
I&E Recommended CWC Allowance		$474,913

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. Wellsboro witness Howard Gorman disagrees with my recommended CWC allowance in as much as the Company witnesses disagree with my recommended adjustments.[32]

Q. DID THE COMPANY UPDATE ITS CWC CLAIM?

A. Yes. The Company's FPFTY CWC claim has been updated to $512,714.[33]

[31] I&E Statement No. 1, pp. 21-22.
[32] Wellsboro Statement No. 1-R, pp. 5-6.
[33] Wellsboro Exhibit HSG-1R, Schedule C1-5R.

Q. DO YOU AGREE WITH CITIZENS' UPDATED CWC CLAIM?

A. No.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR CWC?

A. Yes. I am updating my CWC recommendation to reflect my updated recommended adjustments and the Company's updated CWC claim. My updated recommended CWC allowance is $505,914, or a reduction of $6,800 ($512,714 - $505,914) to the Company's updated FPFTY claim. This recommendation is calculated as follows.

Company's Updated CWC Claim		$512,714
I&E Updated Recommended O&M Expense Adjustments	($54,396)	
1/8 of I&E Updated Total O&M Adjustments		($6,800)
I&E Updated Recommended CWC Allowance		$505,914

Q. IS YOUR RECOMMENDED CWC ALLOWANCE A FINAL RECOMMENDATION?

A. No. All adjustments to the Company's claims for revenues, expenses, taxes, and rate base must be consistently brought together in the Administrative Law Judge's Recommended Decision and again in the Commission's Final Order. This process, which is known as iteration, effectively prevents the determination of a

precise calculation until such time as all adjustments have been made to the Company's claim.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

OVERALL RATE OF RETURN RECOMMENDATION **53**

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Christopher Keller. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. SUMMARIZE YOUR EDUCATION AND EMPLOYMENT HISTORY.

A. An outline of my education and employment history is attached as Appendix A.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for protecting the public interest in proceedings before the Commission. I&E's analysis in this proceeding is based on its responsibility to represent the public interest. This responsibility requires balancing the interests of ratepayers, the regulated utility, and the regulated community as a whole.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to review the base rate filings of Wellsboro

Electric Company (Wellsboro) and Citizens' Electric Company of Lewisburg (Citizens'), collectively referred to in this testimony as "the Companies," and make recommendations regarding the Companies' rate of return, including capital structure, cost of long-term debt, cost of equity, and the overall fair rate of return for the fully projected future test year (FPFTY) ending December 31, 2026.

Q. DOES YOUR TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 2 contains schedules that support my direct testimony.

BACKGROUND

Q. WHAT IS THE GENERAL DEFINITION OF RATE OF RETURN IN THE CONTEXT OF A BASE RATE CASE?

A. Rate of return is one of the components of the revenue requirement formula. Rate of return is the amount of revenue an investment generates in the form of net income. It is typically expressed as a percentage of the amount of an asset base at a particular point in time, which in base rate proceedings, is the projected rate base balance at the end of the test year.

Q. WHAT IS THE REVENUE REQUIREMENT FORMULA?

A. The revenue requirement formula used in base rate cases is as follows:

$$RR = E + D + T + (RB \times ROR)$$

Where:

RR = Revenue Requirement

E = Operating Expenses

D = Depreciation Expense

T = Taxes

RB = Rate Base

ROR = Overall Rate of Return

In the above formula, the rate of return is expressed as a percentage. The calculation of that percentage is independent of the determination of the appropriate rate base value for ratemaking purposes. As such, the appropriate total dollar return is dependent upon the proper computation of the rate of return and the proper valuation of the company's rate base.

Q. WHAT CONSTITUTES A FAIR AND REASONABLE OVERALL RATE OF RETURN?

A. A fair and reasonable overall rate of return is one that will allow the utility an *opportunity* to recover those costs prudently incurred by all classes of capital used to finance the rate base during the prospective period in which its rates will be in effect. The Commission has the authority to determine the fair revenue requirement and rate of return, which the utility has the opportunity to earn, but is not guaranteed to earn.

The *Bluefield Water Works & Improvements Co. v. Public Service Comm. of West Virginia,* 262 U.S. 679, 692-93 (1923), and the *Federal Power Commission et al v. Hope Natural Gas Co.,* 320 U.S. 591, 603 (1944) cases set forth the principles

that are generally accepted by regulators throughout the country as the appropriate criteria for measuring a fair rate of return:

1. A utility is entitled to a return similar to that being earned by other enterprises with corresponding risks and uncertainties, but not as high as those earned by highly profitable or speculative ventures.
2. A utility is entitled to a return level reasonably sufficient to assure financial soundness.
3. A utility is entitled to a return sufficient to maintain and support its credit and raise necessary capital.
4. A fair return can change (increase or decrease) along with economic conditions and capital markets.

Q. EXPLAIN HOW THE OVERALL RATE OF RETURN IS TRADITIONALLY CALCULATED IN BASE RATE PROCEEDINGS.

A. In base rate proceedings, the overall rate of return is traditionally calculated using the weighted average cost of capital method. To calculate the weighted average cost of capital, a company's capital structure must first be determined by comparing the percentage of each capitalization component, which has financed rate base, to total capital. Next, the effective cost rate of each capital structure component must be determined. The historical component of the cost rate of debt can be computed accurately, and any future debt issuances are based on estimates. The cost rate of common equity is not fixed and is more difficult to measure.

Because of this difficulty, a proxy group is used as discussed later in this testimony. Next, each capital structure component percentage is multiplied by its corresponding effective cost rate to determine the weighted capital component cost rate. The I&E table in the *"I&E Position"* section below demonstrates the interaction of each capital structure component and its corresponding effective cost rate. Finally, the sum of the weighted cost rates produces the overall rate of return. This overall rate of return is multiplied by the rate base to determine the return portion of a company's revenue requirement.

COMPANIES' RATE OF RETURN CLAIM

Q. WHO ARE THE COMPANIES' RATE OF RETURN WITNESSES?

A. In the Companies' initial filing, Dylan W. D'Ascendis and Ryan M. Kucan were the primary witnesses that provided joint testimony addressing rate of return.[1] Subsequent to the initial filing, Mr. D'Ascendis and Mr. Kucan provided separate testimony where Mr. D'Ascendis provided testimony addressing the cost of common equity for the Companies and Mr. Kucan addressing the capital structure and long-term debt for the Companies. In my testimony, I will be referencing the Companies' subsequent testimony from Mr. D'Ascendis[2] and Mr. Kucan.[3] Additionally, Citizens' witness Nathan Johnson[4] and Wellsboro witness Byron

[1] As discussed at the prehearing conference held on June 3, 2025, the Companies were asked to submit revised testimony as the submission of written testimony sponsored by more than one witness violates Commission regulations. *See* 52 Pa. Code § 5.412.
[2] Citizens'/Wellsboro Statement No. 2.
[3] Citizens'/Wellsboro Statement No. 2A.
[4] Citizens' Statement No. 4.

Farnsworth, Jr.[5] provide testimony regarding the Companies' "Performance Factor Adjustment" claim.

Q. PLEASE SUMMARIZE THE COMPANIES' RATE OF RETURN CLAIMS.

A. Mr. D'Ascendis and Mr. Kucan recommend the following rate of return for the Companies based on the FPFTY ending December 31, 2026:[6]

Summary of Cost of Capital

Type of Capital	Ratio	Cost Rate	Weighted Cost
Citizens' Electric Company of Lewisburg			
Long-Term Debt	51.06%	5.47%	2.79%
Common Equity	48.94%	11.65%	5.70%
Total	100.00%		8.49%

Summary of Cost of Capital

Type of Capital	Ratio	Cost Rate	Weighted Cost
Wellsboro Electric Company			
Long-Term Debt	51.06%	4.85%	2.48%
Common Equity	48.94%	11.65%	5.70%
Total	100.00%		8.18%

[5] Wellsboro Statement No. 4.

[6] Citizens'/Wellsboro Filings, Exhibit (DWD-1), Schedule DWD-1, p. 1; Citizens'/Wellsboro Statement No. 2, p. 3, line 14 through p. 4, line 2; Citizens'/Wellsboro Statement No. 2A, p. 4, line 1 through line 4.

I&E POSITION

Q. PLEASE SUMMARIZE YOUR RATE OF RETURN RECOMMENDATION.

A. I recommend the following rate of return for the Companies:[7]

Type of Capital	Summary of Cost of Capital Ratio	Cost Rate	Weighted Cost
Citizens' Electric Company of Lewisburg			
Long-Term Debt	51.06%	5.47%	2.79%
Common Equity	48.94%	10.78%	5.28%
Total	100.00%		8.07%

Type of Capital	Summary of Cost of Capital Ratio	Cost Rate	Weighted Cost
Wellsboro Electric Company			
Long-Term Debt	51.06%	4.85%	2.48%
Common Equity	48.94%	10.78%	5.28%
Total	100.00%		7.76%

PROXY GROUP

Q. WHAT IS A PROXY GROUP AS USED IN BASE RATE CASES?

A. A proxy group is a set of companies that have similar traits in comparison to the subject utility. This group of companies acts as a benchmark for determining the subject utility's rate of return in a base rate case.

[7] I&E Exhibit No. 2, Schedule 1.

Q. WHAT ARE THE REASONS FOR USING A PROXY GROUP?

A. A proxy group's cost of equity is used as a benchmark to satisfy the long-established guideline of utility regulation that seeks to provide the subject utility with the opportunity to earn a return similar to that of enterprises with corresponding risks and uncertainties.

A proxy group is typically utilized since the use of data exclusively from one company may be less reliable. The lower reliability occurs because the data for one company may be subject to events that can cause short-term anomalies in the marketplace. The rate of return on common equity for a single company could become distorted in these circumstances and would therefore not be representative of similarly situated companies. Therefore, a proxy group has the effect of smoothing out potential anomalies associated with a single company.

Q. WHAT CRITERIA DID YOU USE IN SELECTING YOUR ELECTRIC UTILITY PROXY GROUP?

A. The criteria for my proxy group was designed to select companies that are representative of the Companies. I applied the following criteria to Value Line's East Electric Utility group:

1. Fifty percent or more of the company's revenues must be generated from the regulated electric utility industry.
2. The company's stock must be publicly traded.

3. Investment information for the company must be available from more than one source, which includes Value Line.

4. The company must not be currently involved in an announced merger or the target of an acquisition.

5. The company must have four consecutive years of historic earnings data.

6. The company must be operating in a state that has a deregulated electric utility market.

Q. WHAT CRITERIA DID MR. D'ASCENDIS USE IN SELECTING HIS ELECTRIC PROXY GROUP COMPANIES?

A. Mr. D'Ascendis determined his proxy group of fifteen electric companies by using the following criteria:[8]

1. The company is included in the East, Central, or West Electric Utility Group of Value Line's Standard Edition.

2. The company has 70% or greater of 2023 total operating income from, and 70% greater of 2023 total assets attributable to regulated electric operations.

3. At the time of the preparation of Mr. D'Ascendis' testimony, the company must not have publicly announced it was involved in any major merger or acquisition activity.

[8] Citizens'/Wellsboro Statement No. 2, p. 15, line 8 through p. 16, line 2.

4. The company must not have cut or omitted its common dividends during the five years ended 2023 or through the time of the preparation of Mr. D'Ascendis' testimony.

5. The company must have Value Line and Bloomberg Professional Services (Bloomberg) adjusted betas.

6. The company must have a positive Value Line five-year dividends per share (DPS) growth rate projection.

7. The company must have Value Line, Zacks, or S&P Capital IQ consensus five-year earnings per share (EPS) growth rate projections.

Q. WHAT PROXY GROUP DID YOU USE IN YOUR ANALYSIS?

A. I include the following nine companies in my proxy group:[9]

Dominion Energy	D
Duke Energy Corp.	DUK
Consolidated Edison Inc.	ED
Eversource Energy	ES
Exelon Corporation	EXC
FirstEnergy Corp.	FE
NextEra Energy Inc.	NEE
Public Service Enterprise Group Inc.	PEG
PPL Corporation	PPL

[9] I&E Exhibit No. 2, Schedule 2.

Q. WHAT PROXY GROUP DID MR. D'ASCENDIS USE IN HIS ANALYSIS?

A. Mr. D'Ascendis included the following fifteen companies in his Electric Group:[10]

Alliant Energy Corporation	LNT
Ameren Corp.	AEE
American Electric Power Company Inc.	AEP
Duke Energy Corp.	DUK
Edison International	EIX
Entergy Corp.	ETR
Evergy, Inc.	EVRG
IDACORP Inc.	IDA
NorthWestern Corporation	NWE
OGE Energy Corporation	OGE
Pinnacle West Capital Corporation	PNW
Portland General Electric Company	POR
Southern Company	SO
TXNM Energy, Inc.	TXNM
Xcel Energy Inc.	XEL

Q. DO YOU AGREE WITH MR. D'ASCENDIS' ELECTRIC PROXY GROUP?

A. No. While we do have one company that matches, I have eight companies that Mr. D'Ascendis does not and Mr. D'Ascendis includes fourteen companies that I do not.

[10] Citizens'/Wellsboro Exhibit (DWD-1), Schedule DWD-3, p. 1.

Q. PLEASE LIST THE COMPANIES MR. D'ASCENDIS HAS INCLUDED THAT YOU DO NOT AND EXPLAIN WHY YOU HAVE EXCLUDED IT FROM YOUR PROXY GROUP.

A. I have excluded all but Duke Energy Corp. from my proxy group. I excluded each of the remaining electric companies from Mr. D'Ascendis' electric group except Southern Company because they did not meet my criterion that they must be classified in the Electric Utility *East* group in The Value Line Investment Survey. I excluded Southern Company because it violates my sixth criterion as it does not operate in a state that has a deregulated electric utility market**.**

Q. YOU EXCLUDED SOUTHERN COMPANY FOR NOT OPERATING IN A STATE WITH A DEREGULATED MARKET. EXPLAIN WHAT IS MEANT BY A DEREGULATED ELECTRIC UTILITY MARKET.

A. A deregulated electric market is a market in which the utility is responsible only for the distribution of electricity, not generation. Deregulation permits electric suppliers to compete and sell electricity directly to consumers and allows consumers the ability to seek competitive rates.

Q. WHY DID YOU INCLUDE THE CRITERION THAT A COMPANY MUST OPERATE IN A STATE THAT HAS A DEREGULATED ELECTRIC UTILITY MARKET?

A. I included the criterion that a company must operate in a deregulated market, like

Pennsylvania, so that the companies included in my proxy group would all be of similar risk to the Companies. Unlike regulated markets, which contain largely vertically integrated utilities, deregulated markets permit electricity providers to compete and sell electricity directly to the consumers. This criterion helps to ensure that each company in the proxy group is operating in a similar market and under similar circumstances as the Companies. Furthermore, by virtue of the vertically integrated nature of regulated utilities, generation is owned and operated by the utility, which could place the companies in a substantially different risk profile based on the types and ages of generation plant owned and operated.

Q. PLEASE LIST THE COMPANIES YOU INCLUDE THAT MR. D'ASCENDIS DOES NOT AND EXPLAIN WHY HE HAS EXCLUDED THEM FROM HIS ELECTRIC GROUP.

A. The eight companies in question and the reasons for Mr. D'Ascendis' exclusion are as follows:

Company	Symbol	Criteria Violated from Above[11]
Dominion Energy	D	2 & 4
Consolidated Edison Inc.	ED	2
Eversource Energy	ES	2
Exelon Corporation	EXC	4 & 5
FirstEnergy Corp.	FE	3
NextEra Energy Inc.	NEE	2
Public Service Enterprise Group Inc.	PEG	2
PPL Corporation	PPL	4 & 6

[11] I&E Exhibit No. 2, Schedule 3.

All of the above except Exelon Corporation, FirstEnergy Corp., and PPL Corporation violated his second criterion that the company has 70% or greater of 2023 total operating income and 70% or greater of 2023 total assets attributable to regulated electric operations. FirstEnergy Corp. violated his third criterion that the company must not have publicly announced it was involved in any major merger or acquisition activity at the time of the preparation of his testimony. Dominion Energy, Exelon Corporation, and PPL Corporation violated his fourth criterion that the company must not have cut or omitted its common dividends during the five years ended 2023 or through the time of the preparation of his testimony. Exelon Corporation also violated his fifth criterion that the company must have Value Line and Bloomberg adjusted betas. Finally, PPL Corporation also violated his sixth criterion that the company must have a positive Value Line five-year DPS growth rate projection.

CAPITAL STRUCTURE

Q. WHAT IS A CAPITAL STRUCTURE?

A. A capital structure represents how a firm has financed its rate base with different sources of funds. The primary funding sources are long-term debt and common equity. A capital structure may also include preferred stock and/or short-term debt, which is not the case for the Companies.

Q. WHAT IS THE CLAIMED CAPITAL STRUCTURE USED BY THE COMPANIES'?

A. The Companies are proposing a hypothetical capital structure which is summarized in the table below:[12]

Type of Capital	Ratio
Long-Term Debt	51.06%
Common Equity	48.94%
Total	**100.00%**

Q. WHAT IS THE BASIS FOR THE COMPANIES' CLAIMED CAPITAL STRUCTURE?

A. Mr. Kucan's recommendation is based on the Companies' parent company C&T Enterprises' capital structure. He correctly explains that Citizens' and Wellsboro's actual equity ratios of 86.62% and 20.46%, respectively, are inappropriate for ratemaking purposes as they are not consistent with equity ratios of comparable utilities.[13]

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE COMPANIES' CAPITAL STRUCTURE?

A. I recommend using the Companies' claimed hypothetical capital structure as presented in the table above.

[12] Citizens'/Wellsboro Statement No. 2A, p. 4, lines 9-11.
[13] Citizens'/Wellsboro Statement No. 2A, p. 4, line 12 through, p. 5, line 4.

Q. WHAT IS THE BASIS FOR YOUR CAPITAL STRUCTURE RECOMMENDATION?

A. I agree with Mr. Kucan that the Companies' actual capital structures are unreasonable for ratemaking purposes. Although the Companies' proposed hypothetical capital structure falls outside the range of my proxy group's 2024 (most recent available) capital structures where the most recent five-year average range contains individual company capital structure ratios from 51.64% to 69.80% long-term debt and 30.20% to 48.36% equity, with an overall five-year average of 56.92% long-term debt and 42.49% common equity,[14] I recommend using the Companies' claimed hypothetical capital structure as I believe it is reasonable. Further, a capital structure that is closer to 50% long-term debt and 50% common equity is optimal when trying to balance the financial integrity of a utility, as well as trying to control costs to ratepayers, in this proceeding.

COST OF LONG-TERM DEBT

Q. WHAT IS THE COMPANIES' CLAIMED COST RATE OF LONG-TERM DEBT?

A. The Companies' claimed long-term debt cost rates are 5.47% and 4.85% for the FPFTY for Citizens' and Wellsboro, respectively.[15]

[14] I&E Exhibit No. 2, Schedule 2.
[15] Citizens'/Wellsboro Statement No. 2A, p. 5, lines 16-19.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE COMPANIES' COST RATE OF LONG-TERM DEBT?

A. I recommend using the Companies' claimed long-term debt cost rates of 5.47% and 4.85% for the FPFTY for Citizens' and Wellsboro, respectively.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION TO USE THE COMPANIES' COST RATES OF LONG-TERM DEBT?

A. Although Citizens' falls outside my proxy group's implied long-term debt cost range of 3.09% to 5.30%, with an average implied long-term debt cost of 4.62% for 2024,[16] the Companies' cost rates of long-term debt are below the Mergent Bond Record average yield of 5.61% for the period May 2024 through April 2025 for A-rated public utility bonds.[17] I recommend that the Companies' cost rates of long-term debt be used since they are reasonable and fall within the metrics described above.

COST OF COMMON EQUITY

Common Methods

Q. WHAT METHODS ARE COMMONLY PRESENTED BY UTILITIES IN DETERMINING THE COST OF COMMON EQUITY?

A. Four methods commonly presented to estimate the cost of common equity are the

[16] I&E Exhibit No. 2, Schedule 4.
[17] I&E Exhibit No. 2, Schedule 5.

Discounted Cash Flow (DCF) Method, the Capital Asset Pricing Model (CAPM), the Risk Premium (RP) Method, and the Comparable Earnings (CE) Method.

Q. WHAT IS THE THEORETICAL BASIS FOR THE DCF METHOD?

A. The DCF method is the "dividend discount model" of financial theory, which maintains that the value (price) of any security or commodity is the discounted present value of all future cash flows. The DCF method assumes that investors evaluate stocks in the traditional economic framework, which maintains that the value of a financial asset is determined by its earning power, or its ability to generate future cash flows. The DCF method is also considered a forward-looking model to estimate the cost of common equity.

Q. WHAT IS THE THEORETICAL BASIS FOR THE CAPM?

A. The CAPM describes the relationship of a stock's investment risk and its market rate of return. It identifies the rate of return investors expect so that it is comparable with returns of other stocks of similar risk. This method hypothesizes that the investor-required return on a company's stock is equal to the return on a "risk free" asset plus an equity premium reflecting the company's investment risk. In the CAPM, two types of risk are associated with a stock: (1) firm-specific risk (unsystematic risk); and (2) market risk (systematic risk), which is measured by a firm's beta. The CAPM allows for investors to receive a return only for bearing

systematic risk. Unsystematic risk is assumed to be diversified away, and therefore, does not earn a return.

Q. WHAT IS THE THEORETICAL BASIS FOR THE RP METHOD?

A. The theoretical basis for the RP method is a simplified version of the CAPM. The RP method's theory is that common stock is riskier than debt, thus, investors require a higher expected return on stocks than bonds. In the RP approach, the cost of equity is made up of the cost of debt and a risk premium. While the CAPM uses the market risk premium, it also directly measures the systematic risk of a company group through the use of beta. The RP method does not measure the specific risk of a company.

Q. WHAT IS THE THEORETICAL BASIS FOR THE CE METHOD?

A. The CE method utilizes the concept of opportunity cost. This means that investors will likely dedicate their capital to the investment offering the highest return with similar risk to alternative investments. Unlike the DCF, CAPM, and the RP methods, the CE method is not market-based and relies upon historic accounting data. Similar to the RP method, the CE method does not measure the specific risk of a company. The most problematic issue with the CE method is determining what constitutes comparable companies.

Q. WHAT METHOD DO YOU RECOMMEND USING TO DETERMINE AN APPROPRIATE COST OF COMMON EQUITY FOR THE COMPANIES?

A. I recommend using the DCF method as the primary method to determine the cost of common equity. Additionally, I provide a CAPM analysis to be used as a comparison, not as a check, to the DCF results. The DCF method has the most wide-spread regulatory acceptance, and while the Commission has more recently based its ROE decisions on a combination of methods, I still recommend primary reliance on the DCF method due to the shortcomings associated with the CAPM method.

Q. PLEASE EXPLAIN WHY YOU CHOSE TO USE THE DCF TO DETERMINE YOUR RECOMMENDED RETURN ON EQUITY.

A. I have used the DCF for a variety of reasons. First, the DCF is appealing to investors as it is based upon the concept that the receipt of dividends in addition to the expected appreciation is the total return requirement determined by the market.[18] Second, the use of a growth rate and expected dividend yield are also strengths of the DCF, as this recognizes the time value of money and is forward-looking. Third, the use of the utilities' own, or in this case, the proxy group's stock prices and growth rates directly in the calculation also causes the DCF to be industry and company specific. Finally, current inflationary and economic trends are most certainly reflected in a stock's price, which is used in determining the

[18] David C. Parcell, "The Cost of Capital – A Practitioner's Guide," 2020 Edition, p. 153.

dividend yield, and by analysts who generate forecasted earnings growth rates. Therefore, the DCF contains the most up-to-date projected information of any model and is the superior method for determining the rate of return for the current economic market because it measures the cost of equity directly.

Q. PLEASE EXPLAIN WHY YOU CHOSE TO USE THE CAPM AS A COMPARISON TO THE DCF IN YOUR ANALYSIS.

A. I have included a CAPM analysis only as a comparison, and not as a basis, for my recommendation because both the CAPM and the DCF include inputs that allow the results to be specific to the utility industry. However, the CAPM is based on the performance of U.S. Treasury bonds and the performance of the market as measured through the S&P 500 and is company-specific only through the use of beta. Beta reflects a stock's volatility relative to the overall market, thereby incorporating an industry-specific aspect to the CAPM, but only as a measure of how reactive the industry is compared to the market as a whole. Although changes in the utility industry are more likely to be accurately reflected in the DCF, which uses the companies' actual prices, dividends, and growth rates, I have also included the results of my CAPM analysis because changes in the market, whether as a whole or specific to the utility industry, can affect the outcome of each method in different ways. Although I have provided the results of the CAPM as a comparison, and not as a check, it does have several disadvantages and should not be given comparable weight to the DCF method.

Q. EXPLAIN THE DISADVANTAGES OF THE CAPM.

A. The CAPM, and the RP method by virtue of its similarities to the CAPM, give results that indicate to an investor what the equity cost rate should be if current economic and regulatory conditions are the same as those present during the historical period in which the risk premiums were determined. This is because beta, which is the only company-specific variable in the CAPM model, measures the *historical* volatility of a stock compared to the *historical* overall market return. Reliance on historical values is especially problematic now given the recent events that have impacted economic conditions. Although the CAPM and RP results can be useful to investors in making rational buy and sell decisions within their portfolios, the DCF method is the superior method for determining the rate of return for the current economic market and measuring the cost of equity directly. The CAPM, and similarly the RP method, are less reliable indicators because they measure the cost of equity indirectly and risk premiums vary depending on the debt and equity being compared. Additionally, regulators can never be certain that economic and regulatory conditions underlying the historical period during which the risk premiums were calculated are the same today or will be the same in the future.

Q. IS THERE ANY ACADEMIC EVIDENCE THAT QUESTIONS THE CREDIBILITY OF THE CAPM MODEL?

A. Yes. An article, "Market Place; A Study Shakes Confidence in the Volatile-Stock

Theory," which appeared in the *New York Times* on February 18, 1992, summarized a CAPM study conducted by professors Eugene F. Fama and Kenneth R. French.[19] Their study examined the importance of beta, CAPM's risk factor, in explaining returns on common stock. In CAPM theory a stock with a higher beta should have a higher expected return. However, they found that the model did not do well in predicting actual returns and suggested the use of more elaborate multi-factor models.

A more recent article, "The Capital Asset Pricing Model: Theory and Evidence," which appeared in the *Journal of Economic Perspectives,* states that "the attraction of the CAPM is that it offers powerful and intuitively pleasing predictions about how to measure risk and the relation between expected return and risk. Unfortunately, the empirical record of the model is poor - poor enough to invalidate the way it is used in applications."[20] As a result, I conclude that the CAPM's relevance to the investment decision making process does not carry over into the regulatory rate setting process.

Q. PLEASE EXPLAIN WHY YOU HAVE CHOSEN TO EXCLUDE THE RP METHOD FROM YOUR ANALYSIS.

A. The RP method is excluded because it is a simplified version of the CAPM and is subject to the same faults explained above. The RP method has a number of

[19] Berg, Eric N. "Market Place; A Study Shakes Confidence in the Volatile-Stock Theory," *The New York Times*, February 18, 1992, *nytimes.com*, March 23, 2016.

[20] Fama, Eugene F. and French, Kenneth R., "The Capital Asset Pricing Model: Theory and Evidence." *Journal of Economic Perspectives* (2004): Volume 18, Number 3, pp. 25-46.

underlying assumptions and the most critical one, as well as the most disputed one, is the assumption that the equity risk premium is constant over the time.[21] More importantly, unlike the CAPM, the RP method does not recognize company-specific risk through beta.

Q. EXPLAIN WHY YOU HAVE CHOSEN TO EXCLUDE THE CE METHOD IN YOUR ANALYSIS.

A. The CE method is excluded because the choice of which companies are comparable is highly subjective, and it is debatable whether historic accounting values are representative of the future. Moreover, its historical usage in this regulatory forum has been minimal.

Q. HAVE YOU IDENTIFIED ANY SPECIFIC PROBLEMS WITH THE COMMISSION'S RECENT USE OF THE CAPM METHOD AS A FACTOR IN ESTABLISHING A RETURN ON EQUITY?

A. Yes. The Commission indicated in Aqua Pennsylvania, Inc.'s (Aqua) 2021 base rate case order that its method "for determining Aqua's ROE shall utilize both I&E's DCF and CAPM methodologies"[22] and that "I&E's DCF and CAPM produce a range of reasonableness for the ROE …",[23] which deviates from the historical Commission practice of primarily relying on the DCF. Additionally, the

[21] David C. Parcell, "The Cost of Capital – A Practitioner's Guide," 2020 Edition, pp. 167-168.
[22] *Pa. PUC v. Aqua Pennsylvania, Inc.,* Docket Nos. R-2021-3027385 & R-2021-3027386, p. 154 (Order Entered May 16, 2022).
[23] *Id.* at p. 178.

Commission's Columbia Water Company (Columbia Water) base rate case order relied on the results of I&E's DCF and CAPM analyses for determining Columbia Water's ROE.[24] Finally, in the most recent Pennsylvania-American Water Company case, the Commission agreed with the ALJ's recommended ROE which was based on the average of I&E's DCF and CAPM analyses.[25]

In a report issued by Regulatory Research Associates, a group within S&P Global Market Intelligence,[26] Aqua's return on equity of 10.00% is stated as being above the national average for water utility base rate cases and above the Distribution System Improvement Charge (DSIC) authorized by the Commission of 9.80%[27] for water and wastewater utilities based on a period ended March 31, 2022. The above referenced report also states that the average return on equity for water utility base rate cases that have been completed during the first four months of 2022 was 9.63% and for the twelve months ended April 30, 2022 was 9.53% which were well below the 10.00% return on equity authorized by the Commission for Aqua. Although this is related specifically to the water utility industry, it demonstrates the unreasonable skewing of results associated with using the CAPM as a ceiling for determining a utility's return on equity.

---

[25] *Pa. PUC v. Pennsylvania-American Water Company,* Docket Nos. R-2023-30433189 & R-2023-3043190, p. 194 (Order Entered July 22, 2024).

[26] Regulatory Research Associates, "Commission authorizes management performance bonus for Aqua Pennsylvania," *S&P Global Market Intelligence*, May 16, 2022. CIQ Pro: RRA Regulatory Focus: Commission authorizes management performance bonus for Aqua Pennsylvania (spglobal.com) (Accessed January 23, 2024).

[27] PA Public Utility Commission, Bureau of Technical Utility Services Report on the Quarterly Earnings of Jurisdictional Utilities for the Year Ended March 31, 2022, approved at Public Meeting on August 4, 2022 at Docket No. M-2022-3032561.

In the Columbia Water order, the Commission noted that I&E's DCF and CAPM produced a range of reasonableness for the ROE from 7.84% to 11.09% and approved an ROE of 9.75% as reasonable and appropriate for that company, which is based upon consideration of a variety of factors such as increasing inflation leading to increases in interest rates and capital costs.[28] I respectfully disagree with the Commission's basis (current inflation and interest rates) for determining Columbia Water's ROE of 9.75%. I have presented and discussed below the forecasted lower-level inflation rates, and the Federal Reserve's intention to cut interest rates in 2025-2026, which would have the effect of reducing potential inflation and interest rate risks on capital costs during 2026, when the Companies' new rates will be in effect.

Additionally, as explained above, the CAPM should not be used as a primary method, and it should only be used as a comparison (not as a check) of the DCF. Also, as demonstrated below, the use of the CAPM in this proceeding would result in a significant burden to ratepayers during a time of increased levels of inflation. Therefore, I disagree with providing the CAPM comparable weight to the DCF method.

[28] *Pa. PUC v. Columbia Water Company,* Docket No. R-2023-3040258, pp.108-109 (Order Entered January 18, 2024).

Q. PLEASE COMMENT ON CURRENT INFLATION AND INTEREST RATE CONCERNS.

A. First, while I cannot dispute the recent economic conditions with respect to increased interest rates and government bond yields, it is important to note that all companies, including regulated utilities, are impacted by high interest rates. It is my understanding that the Federal Reserve may consider resuming interest rate cuts later this year which would impact the Companies' FPFTY when the new rates will be in effect.[29]

With respect to inflation rates, per the most recent monthly Blue Chip Financial Forecasts,[30] the 2026 inflation rates by two measures are forecasted to be in the range of 2.3% to 2.8% as shown in the table below:

	Q2 2025	Q3 2025	Q4 2025	Q1 2026	Q2 2026	Q3 2026
Consumer Price Index	3.4%	3.7%	3.1%	2.8%	2.5%	2.4%
PCE Price Index	3.5%	3.4%	3.0%	2.6%	2.4%	2.3%

Potential future reductions in interest rates could have the effect of reducing debt cost rates in the capital costs in 2026, when the Companies' new rates will be in effect. Lastly, it is important to note that unlike unregulated companies, public utilities may file rate cases to address unforeseen or increased expenses, increases

[29] https://www.reuters.com/business/fed-keep-rates-hold-least-until-september-inflation-risks-linger-2025-06-10/, (accessed June 23, 2025).

[30] Blue Chip Financial Forecasts Vol. 44, No. 5, May 1, 2025.

in the costs of borrowing, and equity and/or revenue shortfalls due to changes in market conditions.

SUMMARY OF THE COMPANIES' RESULTS

Q. WHAT ARE THE RESULTS OF THE COMPANIES' COST OF EQUITY ANALYSES?

A. Mr. D'Ascendis used the DCF, CAPM, and the RP methods in analyzing the Companies' cost of equity. Mr. D'Ascendis also used the Predictive Risk Premium Method (PRPM) and the Empirical Capital Asset Pricing Model (ECAPM) in forming his recommendations under the RP and the CAPM methods, respectively. Mr. D'Ascendis applied these methods using his proxy group of regulated electric utilities and averaged the results of the methods for his non-price regulated proxy group. Mr. D'Ascendis then listed the results for each method for the regulated utility group and the average of the median and mean of the results of the methods for the non-price regulated group. Mr. D'Ascendis recommended that the cost of equity be increased by 85 basis points due to the Companies' small size. Finally, Mr. D'Ascendis recommended that the cost of equity also be increased by five basis points to reflect a performance factor adjustment. Ultimately, Mr. D'Ascendis opined that a cost of equity of 11.65% is warranted.[31]

[31] Citizens'/Wellsboro Statement No. 2, p. 4, line 14 through p. 6, line 8 and Exhibit (DWD-1), Schedule DWD-1.

I&E RECOMMENDATION

Q. WHAT IS YOUR RECOMMENDED COST OF COMMON EQUITY FOR THE COMPANIES?

A. Based upon my analysis, I recommend a cost of common equity of 10.78%.[32]

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on the use of the DCF method. As explained above, I used my CAPM result only to present to the Commission a comparison and not as a check to my DCF results. My DCF analysis uses a spot dividend yield, a 52-week dividend yield, and earnings growth forecasts.

Discounted Cash Flow

Q. PLEASE EXPLAIN YOUR DCF ANALYSIS.

A. My analysis employs the constant growth DCF model as portrayed in the following formula:

$$K = D_1/P_0 + g$$

Where:

K	=	Cost of equity
D_1	=	Dividend expected during the year
P_0	=	Current price of the stock
g	=	Expected growth rate

[32] I&E Exhibit No. 2, Schedule 1.

When a forecast of D_1 is not available, D_0 (the current dividend) must be adjusted by one half of the expected growth rate to account for changes in the dividend paid in period one. As forecasts for each company in my proxy group were available from Value Line, no dividends were adjusted for the purpose of my analysis.

Q. PLEASE EXPLAIN HOW YOU DEVELOPED THE DIVIDEND YIELDS USED IN YOUR DCF ANALYSIS.

A. A representative dividend yield must be calculated over a time frame that avoids the problems of both short-term anomalies and stale data series. For my DCF analysis, the dividend yield calculation places equal emphasis on the most recent spot and the 52-week average dividend yields. The following table summarizes my dividend yield computations for the proxy group:[33]

Nine-Company Proxy Group	Dividend Yield
Spot	4.03%
52-week Average	4.05%
Average	4.04%

Q. WHAT INFORMATION DID YOU RELY UPON TO DETERMINE YOUR EXPECTED GROWTH RATE?

A. I have used five-year earnings per share projected growth rate estimates from S&P,

[33] I&E Exhibit No. 2, Schedule 6.

Zacks, and Value Line.

Q. WHAT WERE THE RESULTS OF YOUR FORECASTED EARNINGS GROWTH RATES?

A. The expected average growth rates for my proxy group ranged from 5.61% to 10.33% with an overall average of 6.92%. For the purpose of determining the growth estimate, I subsequently eliminated Dominion Energy's Zacks growth estimate of 13.60% to determine a new adjusted average of 6.74%.[34]

Q. WHY DID YOU ELIMINATE DOMINION ENERGY'S ZACKS PROJECTED GROWTH RATE?

A. While the use of a proxy group largely smooths out various anomalies, Zacks' growth projection for Dominion Energy is extremely inconsistent and would have an unreasonable and unwarranted impact on my DCF analysis. This would adversely affect my recommendation for the Companies' cost of common equity because it is harmful to ratepayers by creating an unjustified increase in return on equity and consequently pressures rates upward, which is not in the public interest. Zacks' estimate of 13.60% is almost double, and greater than three standard deviations over the originally calculated 6.92% overall average. Additionally, I was unable to find any explanation or justification of why this estimate was so high.

[34] I&E Exhibit No. 2, Schedule 7.

Q. WHAT IS THE RESULT OF YOUR DCF ANALYSIS BASED ON YOUR RECOMMENDED DIVIDEND YIELD AND GROWTH RATE?

A. The results of my DCF analysis is calculated as follows:[35]

K	=	D_1/P_0	+	g
10.78%	=	4.04%	+	6.74%

Capital Asset Pricing Model

Q. PLEASE EXPLAIN YOUR CAPM ANALYSIS.

A. My analysis employs the traditional CAPM as portrayed in the following formula:

$$K = R_f + \beta(R_m - R_f)$$

Where:

K	=	Cost of equity
R_f	=	Risk-free rate of return
R_m	=	Expected rate of return on the overall stock market
β	=	Beta measures the systematic risk of an asset
$R_m - R_f$	=	Equity Risk Premium (ERP)

Q. WHAT IS BETA AS EMPLOYED IN YOUR CAPM ANALYSIS?

A. Beta is a measure of the systematic risk of a stock in relation to the rest of the stock market. A stock's beta is estimated by calculating the linear regression of a

[35] I&E Exhibit No. 2, Schedule 8.

stock's return against the return on the overall stock market. The beta of a stock with a price pattern identical to that of the overall stock market will equal one. A stock with a price movement that is greater than the overall stock market will have a beta that is greater than one and would be described as having more investment risk than the market. Conversely, a stock with a price movement that is less than the overall stock market will have a beta of less than one and would be described as having less investment risk than the overall stock market.

Q. HOW DID YOU DETERMINE BETA FOR YOUR CAPM ANALYSIS?

A. In estimating an equity cost rate for my proxy group of nine electric companies, I used the average of the betas for the companies as provided in the Value Line Investment Survey. The average beta for my proxy group is 0.80.[36] It should be noted that Value Line did not have a beta for one of the companies in my proxy group, Exelon Corporation.

Q. WHAT RISK-FREE RATE OF RETURN HAVE YOU USED FOR YOUR FORECASTED CAPM ANALYSIS?

A. I used the risk-free rate of return (R_f) from the projected yield on 10-year Treasury Notes. While the yield on the short-term T-Bill is a more theoretically correct parameter to represent a risk-free rate of return, it can be extremely volatile. The volatility of short-term T-Bills is directly influenced by Federal Reserve policy. At

[36] I&E Exhibit No. 2, Schedule 9.

the other extreme, the 30-year Treasury Bond exhibits more stability but is not risk-free. Long-term Treasury Bonds have substantial maturity risk associated with market risk and the risk of unexpected inflation. Long-term treasuries normally offer higher yields to compensate investors for these risks. As a result, I used the yield on the 10-year Treasury Note because it mitigates the shortcomings of the other two alternatives. Additionally, the Commission has historically agreed with I&E and recognized the 10-year Treasury Note as the superior measure of the risk-free rate of return.[37]

The forecasted yield on the 10-year Treasury Note, as seen in Blue Chip Financial Forecasts, is trending downward from 4.20% in the third quarter of 2025 to 4.10% in the third quarter of 2026, and it is forecasted to be 4.00% from 2026-2030. For my CAPM analysis, I used 4.10%, which is the average of all the yield forecasts I observed.[38]

Q. HOW DID YOU DETERMINE THE RETURN ON THE OVERALL STOCK MARKET IN YOUR FORECASTED CAPM ANALYSIS?

A. To arrive at a representative expected return on the overall stock market, I observed Value Line's 1700 stocks and the historical returns of the S&P 500.

Columbia Water Company*, Docket No. R-2023-3040258 (Order Entered January 18, 2024). *See generally* Disposition of Cost of Common Equity, pp. 107-108; *Pa. PUC v. Pennsylvania-American Water Company*, Docket Nos. R-2023-3043189 & R-2023-3043190 (Order Entered July 22, 2024). *See generally* Disposition of Capital Asset Pricing Model (CAPM), pp. 171-172.

[38] I&E Exhibit No. 2, Schedule 10.

Value Line expects its universe of approximately 1700 stocks to have an average yearly return of 13.88% over the next three to five years based on a forecasted dividend yield of 2.30% and a yearly index appreciation of 55%. The S&P 500 Index has had an average return of 12.29% over the past 99 years (1926-2024).[39] I have averaged these two figures which results in an estimated market return of 13.09%.[40]

Q. WHAT IS THE COST OF EQUITY RESULT FROM YOUR CAPM ANALYSIS USING A FORECASTED OVERALL MARKET RETURN?

A. The result of my analysis is as follows:[41]

K	=	R_f	+	$\beta(R_m - R_f)$
11.29%	=	4.10%	+	0.80 (13.09% - 4.10%)

Q. HAVE YOU PROVIDED AN ADDITIONAL CAPM ANALYSIS?

A. Yes. I have provided an additional CAPM analysis using Kroll's (formerly Duff & Phelps) recommended U.S. Equity Risk Premium (ERP) paired with the 20-year U.S. Treasury yield. Kroll is a trusted and publicly available source that bases their recommended ERP on current and forecasted economic and financial market conditions.

[39] I&E Exhibit No. 2, Schedule 11.
[40] I&E Exhibit No. 2, Schedule 12.
[41] I&E Exhibit No. 2, Schedule 13.

Q. WHAT IS KROLL'S CURRENT RECOMMENDED ERP?

A. As of April 15, 2025, Kroll recommends an ERP of 5.50%.

Q. WHAT IS THE CURRENT 20-YEAR U.S. TREASURY YIELD?

A. As of May 14, 2025, the 20-Year U.S. Treasury yield was 4.95%.

Q. WHAT IS THE COST OF EQUITY RESULT FROM YOUR CAPM ANALYSIS USING KROLL'S RECOMMENDED ERP AND THE 20-YEAR U.S. TREASURY YIELD?

A. The result of my analysis is as follows:[42]

K	=	R_f	+	β(ERP)
9.35%	=	4.95%	+	0.80 (5.50%)

Q. WHAT IS THE RESULT OF YOUR CAPM ANALYSIS BASED ON THE AVERAGE OF USING A FORECASTED OVERALL MARKET RETURN AND USING KROLL'S RECOMMENDED ERP AND 20-YEAR TREASURY YIELD?

A. The average of my CAPM analyses is 10.32% ((11.29% + 9.35%) ÷ 2).[43]

[42] I&E Exhibit No. 2, Schedule 13.
[43] *Id.*

Q. DO YOU HAVE ANY ADDITIONAL COMMENTS REGARDING YOUR CAPM ANALYSIS?

A. Yes. As discussed earlier in my testimony, and as I&E has historically reasoned, my recommended cost of equity is based upon my DCF analysis. My CAPM analyses are only presented to the Commission as a comparison and not for recommendation purposes as the inputs are highly subjective, and other than beta, not company or industry specific.

Q. IS IT NECESSARY OR APPROPRIATE TO APPLY THE CAPM WITH SIMILAR WEIGHT TO THE DCF WHEN DETERMINING A SPECIFIC RETURN ON EQUITY DUE TO RECENT INFLATIONARY TRENDS?

A. No. My use of the DCF as a primary method in determining an appropriate return on equity already sufficiently takes inflationary trends into consideration. As mentioned above, the DCF includes a spot stock price in the dividend yield calculation and analysts who generate forecasted earnings growth almost certainly take inflation into consideration as well, so it contains the most up-to-date projected information of any model. In other words, the inputs of the DCF capture all known economic factors, including inflation.

CRITIQUE OF MR. D'ASCENDIS' PROPOSED COST OF EQUITY

Q. DO YOU AGREE WITH MR. D'ASCENDIS' 11.65% PROPOSED COST OF EQUITY?

A. No. I disagree with Mr. D'Ascendis' proposed cost of equity analysis for several reasons. First, I disagree with the weights given to the results of his DCF, CAPM, RP, PRPM, and ECAPM analyses in his recommendation. Second, I disagree with the use of a proxy group of companies he used in the Companies' cost of equity calculation that are not regulated electric utilities. Third, I disagree with his inclusion of a size adjustment and a performance factor adjustment. Finally, I disagree with his reliance on the 30-year Treasury Bond for his risk-free rate.

Weights Given to the CAPM and RP Methods

Q. DO YOU AGREE WITH MR. D'ASCENDIS' RELIANCE ON THE CAPM AND RP MODELS?

A. No. While I am not opposed to providing the Commission the results of the CAPM for a point of comparison to the results of the DCF calculation, I am opposed to giving the CAPM and RP considerable weight. For the reasons discussed above, it is not appropriate to give the CAPM and RP models similar weight to the DCF as Mr. D'Ascendis has done in creating his recommended cost of equity range.[44] As discussed above, the CAPM measures the cost of equity indirectly and can be manipulated by the time period chosen. Since the RP is a

[44] Citizens' Statement No. 2, p. 7, line 1.

simplified version of the CAPM, it suffers these same flaws. Also, as discussed in more detail below, the results of the lesser-used ECAPM and PRPM models should also be rejected. I have not used the ECAPM because it only weights the results of the CAPM in order to flatten the Security Market Line, but it does not correct the previously discussed problems with the CAPM. I have not used Mr. D'Ascendis' Predicative Risk Premium Model, because it is not a widely accepted method and investors must have a statistical software package to use the PRPM.

Predictive Risk Premium Model

Q. WHAT IS THE PREDICTIVE RISK PREMIUM MODEL?

A. The PRPM is a method published in August 2011 by Pauline M. Ahern, Frank J. Hanley, and Richard A. Michelfelder in the article *New Approach to Estimating the Cost of Common Equity Capital for Public Utilities.*[45] Mr. D'Ascendis' PRPM requires Eviews© statistical software to compute.[46]

Q. DO YOU AGREE WITH MR. D'ASCENDIS' USE OF THE PRPM?

A. No. Mr. D'Ascendis' PRPM is not a commonly used method and cannot be evaluated or recreated without the software. I am also unaware of any state that

[45] Ahern, Pauline M., Hanley, Frank J., Michelfelder, Richard A. (December 2011, Volume 40, Issue 3). *New Approach to Estimating the Cost of Common Equity Capital for Public Utilities*. Journal of Regulatory Economics, pp. 261-278.

[46] Citizens'/Wellsboro Statement No. 2, pp. 27-28.

has accepted the use of the PRPM. Finally, the PRPM does not solve the problem of the RP method because it is still an indirect measure of the cost of equity, and the PRPM complicates the RP method with the introduction of a measurement that requires the use of specialized software.

Empirical Capital Asset Pricing Model

Q. WHAT DOES MR. D'ASCENDIS CLAIM IS THE BASIS FOR HIS USE OF THE ECAPM?

A. Mr. D'Ascendis opines that the Security Market Line (SML) defined by the CAPM is not as steeply sloped as the predicted SML.[47] Mr. D'Ascendis used a formula to account for the systematic risk that is not accounted for with beta in the CAPM formula. This methodology, called ECAPM, uses a factor, alpha, to account for the additional systematic risk not captured by beta.

Q. DO YOU AGREE WITH MR. D'ASCENDIS' USE OF THE ECAPM?

A. No. The use of the ECAPM in estimating the cost of capital does not increase the validity of the result, but instead it injects another measure of subjectivity to the CAPM in an attempt to make the Security Market Line more accurate. The ECAPM reduces the purpose of the beta, which is the only company-specific variable in the CAPM model. This additional layer of subjectivity provides an even stronger basis to rely on the DCF, as I have done, as the primary method to

[47] Citizens'/Wellsboro Statement No. 2, p. 35, line 19 through p. 36, line 2.

calculate a utility's cost of equity. Additionally, I am not aware of any instances where a utility commission overseeing base rate proceedings explicitly relied on the ECAPM when determining an appropriate cost of equity for a regulated utility..

Risk-Free Rate

Q. WHAT RISK-FREE RATE DOES MR. D'ASCENDIS USE IN HIS RP AND CAPM MODELS?

A. Mr. D'Ascendis calculated his risk-free rate of 4.55% by using the 30-year Treasury Bonds.[48]

Q. DO YOU AGREE WITH MR. D'ASCENDIS' USE OF THE 30-YEAR TREASURY BOND TO DETERMINE THE RISK-FREE RATE?

A. No. As discussed above, long-term Treasury Bonds have substantial maturity risk associated with the market risk and the risk of unexpected inflation and normally offer higher yields to compensate investors for these risks. Using the 10-year Treasury Note is more appropriate to balance the short-term volatility risk and the long-term inflation risk. Further, as noted above the Commission has recognized the 10-year Treasury Note as the superior measure of the risk-free rate of return.

[48] Citizens'/Wellsboro Statement No. 2, p. 38, lines 7-13.

Domestic Non-Price Regulated Companies

Q. DOES MR. D'ASCENDIS RELY ON ANY MARKET DATA INPUTS SPECIFIC TO COMPANIES THAT ARE NOT REGULATED UTILITIES?

A. Yes. Mr. D'Ascendis asserted that in the *Hope* and *Bluefield* cases, the U.S. Supreme Court did not specify that comparable risk companies had to be utilities. Consequently, he assembled a proxy group consisting of 47 non-price regulated firms which he asserted are comparable in terms of total risk to the Electric Utility Proxy Group.[49] After forming his proxy group of 47 non-price regulated firms, Mr. D'Ascendis calculated common equity costs with data inputs specific to these companies using the DCF, RP, and CAPM methods.[50] The average of the mean and median results of these analyses of 11.84% was incorporated into Mr. D'Ascendis' final calculation of the Companies' return on equity of 11.65%.[51]

Q. DO YOU AGREE WITH MR. D'ASCENDIS' APPROACH OF USING THE MARKET DATA OF NON-UTILITY COMPANIES TO CALCULATE CITIZENS' RETURN ON EQUITY?

A. No. The process of choosing a proxy group of non-utility companies similar in risk to the Companies is highly speculative and subjective. In effect, Mr. D'Ascendis has blended the CE approach into the DCF, RP, and CAPM models.

[49] Citizens'/Wellsboro Statement No. 2, pp. 41-45.
[50] Citizens'/Wellsboro Exhibit (DWD-1), Schedule DWD-7.
[51] Citizens'/Wellsboro Exhibit (DWD-1), Schedule DWD-1.

As stated earlier, the Commission has ruled on the use of the CE approach, specifically, the use of non-utility companies in comparable groups, and stated:

> The use of nonregulated companies as a comparable group for regulated firms requires numerous unsupportable assumptions which results in a highly speculative finding.[52]

Additionally, in the 2018 UGI Utilities, Inc. – Electric Division base rate case, the Commission made the following comments regarding the CE method, specifically the use of non-utility companies in comparable groups, and stated:[53]

> With respect to the CE method, as noted above, this cost of equity method utilizes data for non-regulated firms. Thus, by its very nature, determining which companies are comparable is entirely subjective. In addition, the record indicates that the companies UGI utilized in its CE group results in the selection of companies such as Coca-Cola Company, Kellogg Company, and Walmart Stores, Inc. . . . Each of these companies operate in industries that are very different from a utility company and have significantly more competition, which would require a higher return for the associated additional risk.

If the non-price regulated company proxy group is truly similar in total risk to the Companies, I would expect to see similar results in the calculation of the DCF, RP, and CAPM between the Electric Utility and Non-Price Regulated Company proxy groups used by Mr. D'Ascendis. However, all three Non-Price Regulated Company proxy group results were higher. This clearly demonstrates the Commission's ruling that "[t]he use of nonregulated companies as a comparable group for regulated firms … results in a highly speculative finding."[54]

Size Adjustment

Q. WHAT SIZE ADJUSTMENT HAS MR. D'ASCENDIS PROPOSED?

A. Mr. D'Ascendis added 85 basis points to his cost of common equity because he opined that smaller companies are less able to cope with significant events affecting sales, revenues, or earnings. He further stated that the loss of revenue from a few larger customers would have a greater effect on a small company. Mr. D'Ascendis relied upon technical literature including Kroll's Cost of Capital Navigator – U.S. Guide to Cost of Capital, "Size as a Predictor of Equity Returns," a Fama and French study entitled "The Capital Asset Pricing Model: Theory & Evidence," and Professor Eugene Brigham's textbook entitled "Fundamentals of Finance Management." Mr. D'Ascendis quantified his size adjustment based on size premiums for portfolios of New York Stock Exchange, American Stock Exchange, and NASDAQ listed companies ranked by deciles for the 1926 to 2024 period. While Mr. D'Ascendis' proxy group companies fell in the 3rd decile, he asserted that the Companies fell in the 10th decile for size. He stated that while this indicates an upward equity risk premium adjustment of 398 basis points, he chose an upward adjustment of 85 basis points. Finally, Mr. D'Ascendis points to a 2019 Commission order where the Commission considered a size adjustment.[55]

Q. DO YOU AGREE WITH MR. D'ASCENDIS' SIZE ADJUSTMENT?

A. No. Mr. D'Ascendis' proposed size adjustment is unnecessary because the

[55] Citizens'/Wellsboro Statement No. 2, pp. 47-51.

technical literature he cited supporting investment adjustments related to the size of a company is not specific to the utility industry; therefore, it has no relevance in this proceeding. Furthermore, any expense impact resulting from the lesser buying power of a smaller utility is reflected in the revenue requirement and the dollar-for-dollar recovery that applies to expenses. To apply an additional size adjustment to a smaller regulated utility would only duplicate the burden to ratepayers.

Q. IS THERE ACADEMIC EVIDENCE THAT SUPPORTS YOUR CONCLUSION THAT THE SIZE ADJUSTMENT FOR RISK IS NOT APPLICABLE TO UTILITY COMPANIES?

A. Yes. In the article "Utility Stocks and the Size Effect: An Empirical Analysis," Dr. Annie Wong concludes:

> The objective of this study is to examine if the size effect exists in the utility industry. After controlling for equity values, there is some weak evidence that firm size is a missing factor from the CAPM for the industrial but not for utility stocks. This implies that although the size phenomenon has been strongly documented for the industriales, the findings suggest that there is no need to adjust for the firm size in utility rate regulation.[56]

The Companies have presented no evidence to support application of a non-utility study regarding a size adjustment for risk to a utility setting. Absent any credible article to refute Dr. Wong's findings, Mr. D'Ascendis' size adjustment to his cost

[56] Dr. Annie Wong, "Utility Stocks and the Size Effect: An Empirical Analysis," *Journal of Midwest Finance Association* 1993, pp. 95-101.

of common equity results should be rejected. Furthermore, the Commission has rejected the application of a size adjustment to the cost of equity calculation.[57]

Q. DID THE COMMISSION AWARD A SIZE ADJUSTMENT IN THE REFERENCED COMMISSION ORDER FOR CITIZENS'?

A. No. The Commission did not, in fact, award an explicit 100-basis point size adjustment that was recommended by Citizens' as the Commission determined that there was not enough evidence as to whether size is specifically a risk for utilities:

> Consistent with the foregoing discussion, like the ALJs, we shall not specify an exact size adjustment. Instead, we shall adopt the ALJs' recommendation that Citizens' be awarded a DCF cost of common equity of 9.49%. In our view, this cost of equity is reasonable and strikes an appropriate balance by recognizing the general inverse relationship between a company's size and its risk, while acknowledging that there is not substantial evidence in the record to prove that an explicit size basis point adjustment is warranted in this case.[58]

Q. BASED ON THE COMPANIES' FILED RATE BASE AND CLAIMED CAPITAL STRUCTURES, WHAT IS THE VALUE OF AN ADDITIONAL 85 BASIS POINTS TO THE COST OF EQUITY?

A. The example below illustrates the impact of 85 additional basis points to the Companies' cost of equity:

---

[57] *Pa. PUC v. UGI Utilities, Inc. – Electric Division*, Docket No. R-2017-2640058 (Order Entered October 25, 2018). *See generally* Disposition of Capital Asset Pricing Model (CAPM), p. 100.

[58] *Pa. PUC v. Citizens Electric Company of Lewisburg, PA;* Docket No. R-2019-3008212 (Order Entered April 27, 2020). *See generally* Disposition of Cost of Common Equity, pp. 103-104.

Citizens' Electric Company of Lewisburg, PA	
Claimed Equity Percentage of Capital Structure	51.06%
Additional Basis Points to Calculated Cost of Equity	85
Claimed Rate Base[59]	$17,092,345
Impact Prior to Gross Revenue Conversion Factor (0.5106 x 0.0085 x $17,092,345)	**$74,182**
Gross Revenue Conversation Factor[60]	1.494488
Total Impact (1.494488 x $74,182)	**$110,864**

Wellsboro Electric Company	
Claimed Equity Percentage of Capital Structure	51.06%
Additional Basis Points to Calculated Cost of Equity	85
Claimed Rate Base[61]	$25,857,280
Impact Prior to Gross Revenue Conversion Factor (0.5106 x 0.0085 x $25,857,280)	**$112,223**
Gross Revenue Conversation Factor[62]	1.49449
Total Impact (1.49449 x $112,223)	**$167,716**

[59] Citizens' Exhibit (HSG-1), Schedule C1-5.
[60] I&E Exhibit No. 2, Schedule 14.
[61] Wellsboro Exhibit (HSG-1), Schedule C1-5.
[62] I&E Exhibit No. 2, Schedule 15.

In this example, an addition of 85 basis points to the cost of equity would force ratepayers to fund an unwarranted additional amount of $110,864 and $167,716 for Citizens' and Wellsboro, respectively.

Performance Factor Adjustment

Q. WHAT IS THE COMPANIES' CLAIM REGARDING A PERFORMANCE FACTOR ADJUSTMENT?

A. Mr. D'Ascendis explains that his 11.65% cost of equity recommendation includes five basis points in consideration of the Companies' exemplary management performance. Mr. D'Ascendis points to Citizens' 2019 base rate case[63] and Valley Energy, Inc.'s, the Companies' affiliate, 2019 base rate case[64] where the Commission considered a management performance adjustment. Mr. D'Ascendis primarily relied upon the direct testimony of Citizens' witness Nathan Johnson[65] and Wellsboro witness Byron Farnsworth, Jr.[66] to support the consideration of additional basis points for the Companies' management performance.[67]

---

63 *Pa. PUC v. Citizens Electric Company of Lewisburg, PA*, Docket No. R-2019-3008212 (Order Entered April 27, 2020). *See generally* Disposition of Return on Equity: Management Effectiveness Adjustment, pp. 108-110.

64 *Pa. PUC v. Valley Energy, Inc.*, Docket No. R-2019-3008212 (Order Entered April 27, 2020). *See generally* Disposition of Return on Equity: Management Effectiveness Adjustment, pp. 118-120.

65 Citizens' Statement No. 4.

66 Wellsboro Statement No. 4.

67 Citizens'/Wellsboro Statement No. 2, p. 51, line 21 through p. 52, line 9.

Q. WHAT INFORMATION DO MR. JOHNSON AND MR. FARNSWORTH PROVIDE TO SUPPORT THE COMPANIES' MANAGEMENT PERFORMANCE CLAIMS?

A. Mr. Johnson claims that Citizens' exemplary management performance is demonstrated through among other things, low customer complaints, favorable customer feedback, high responsiveness to customer support calls and energizing new service locations, excellent reliability metrics, zero reportable injuries, technology adoption of SmartHub use and tablets for line crews, increased pole attachment billing, "Tree Line USA" designation, and significant capital investments.[68]

Mr. Farnsworth claims that Wellsboro's exemplary management performance is demonstrated through among other things, excellent reliability metrics, low customer complaints, favorable customer feedback, high responsiveness to customer support calls, significant capital investments, technology adoption of SmartHub use, very low reportable injuries, and street light upgrades.[69]

[68] Citizens' Statement No. 4, p. 9, line 20 through p. 12, line 11.
[69] Wellsboro Statement No. 4, p. 8, line 1 through p. 10, line 5.

Q. ARE YOU AWARE OF ANY COMPANIES THAT HAVE RECENTLY RECEIVED ADDITIONAL BASIS POINTS IN RECOGNITION OF MANAGEMENT PERFORMANCE?

A. Yes. The Commission recently awarded Aqua Pennsylvania, Inc. (Aqua) an addition of 25 basis points for its management performance efforts.[70] However, it is important to recognize that this addition was based specifically on Aqua rescuing troubled water and wastewater systems at the Commission's request. The Commission stated: [71]

> We specifically recognize Aqua's efforts and willingness to quickly provide emergency aid to various water and wastewater systems that needed substantial improvement. Aqua has often provided this emergency aid on short notice and at the request of the Commission or other parties to protect the public from egregious health and safety threats and to protect the Commonwealth's drinking water resources from catastrophic damage.

Q. DOES THE COMMISSION'S PAST ISSUANCE OF ADDITIONAL EQUITY POINTS TO RECOGNIZE MANAGEMENT PERFORMANCE MEAN THAT THE COMPANIES SHOULD ALSO RECEIVE AN ADJUSTED RETURN ON EQUITY IN THIS PROCEEDING?

A. No. The issuance of equity points to recognize management performance should be analyzed on a case-by-case basis. The situation in the Aqua proceeding as discussed above was very specific to Aqua acquiring troubled water and

[70] *Pa. PUC v. Aqua Pennsylvania, Inc.,* Docket Nos. R-2021-3027385 & R-2021-3027386, pp. 168-173 (Order Entered May 16, 2022).
[71] *Id.*

wastewater systems and preventing health and safety concerns regarding drinking water. This scenario does not apply to the Companies in this base rate case.

Q. BASED ON THE COMPANIES' FILED RATE BASE AND CLAIMED CAPITAL STRUCTURES, WHAT IS THE VALUE OF AN ADDITIONAL 5 BASIS POINTS TO THE COST OF EQUITY?

A. The example below illustrates the impact of 5 additional basis points to the Companies' cost of equity:

Citizens' Electric Company of Lewisburg, PA	
Claimed Equity Percentage of Capital Structure	51.06%
Additional Basis Points to Calculated Cost of Equity	5
Claimed Rate Base[72]	$17,092,345
Impact Prior to Gross Revenue Conversion Factor (0.5106 x 0.0005 x $17,092,345)	**$4,364**
Gross Revenue Conversation Factor[73]	1.494488
Total Impact (1.494488 x $4,364)	**$6,522**

[72] Citizens' Exhibit (HSG-1), Schedule C1-5.
[73] I&E Exhibit No. 2, Schedule 14.

Wellsboro Electric Company	
Claimed Equity Percentage of Capital Structure	51.06%
Additional Basis Points to Calculated Cost of Equity	5
Claimed Rate Base[74]	$25,857,280
Impact Prior to Gross Revenue Conversion Factor (0.5106 x 0.0005 x $25,857,280)	**$6,601**
Gross Revenue Conversation Factor[75]	1.49449
Total Impact (1.49449 x $6,601)	**$9,865**

In this example, an addition of 5 basis points to the cost of equity would force ratepayers to fund an unwarranted additional amount of $6,522 and $9,865 for Citizens' and Wellsboro, respectively.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE CONSIDERATION OF THE COMPANIES' MANAGEMENT PERFORMANCE IN DETERMINING THE COMPANIES' RETURN ON EQUITY?

A. I am aware that under 66 Pa. C.S. § 523 the Commission has authority to *consider* a utility's performance, however, it is not mandatory that the Commission grant additional basis points to the ROE.[76] Ultimately, true strong management

[74] Wellsboro Exhibit (HSG-1), Schedule C1-5.
[75] I&E Exhibit No. 2, Schedule 15.
[76] 66 Pa. C.S. § 523(a).

performance is earning a higher return through efficient use of resources and cost cutting measures. The greater net income resulting from cost savings and true efficiency in management and operations is available to be passed on to both ratepayers and shareholders. I do not believe that the Companies, or any utility, should be gifted additional basis points for doing what they are required to do to provide adequate, efficient, safe, and reasonable service.[77] For these reasons, I recommend that any addition of basis points to the cost of equity for management performance be disallowed.

OVERALL RATE OF RETURN RECOMMENDATION

Q. WHAT IS THE COMPANIES' PROPOSED COST OF EQUITY AND OVERALL RATE OF RETURN?

A. The Companies recommend a cost of equity of 11.65% and an overall rate of return of 8.49% and 8.18% for Citizens' and Wellsboro, respectively.[78]

Q. WHAT IS I&E'S RECOMMENDED COST OF EQUITY AND OVERALL RATE OF RETURN?

A. I&E Exhibit No. 2, Schedule 1, shows the calculation of an appropriate cost of equity to be 10.78% for the Companies with an overall rate of return for Citizens' and Wellsboro to be 8.07% and 7.76%, respectively.

[77] *See* 66 Pa. C.S. § 1501.
[78] Citizens'/Wellsboro Statement No. 2, p. 3, lines 12-15.

Q. DO YOU HAVE ANY FINAL COMMENTS REGARDING THE COMPANIES' PROPOSED RETURN ON EQUITY?

A. Yes. First, a report issued by Regulatory Research Associates, a group within S&P Global Market Intelligence, shows that the average return on equity authorized for electric utilities was 9.74% for cases decided in 2024, which was based on 55 rate cases across the nation and 9.72% for cases decided in the first quarter of 2025.[79] The Companies request is 191 basis points above the average for 2024.

Second, when asked, Mr. D'Ascendis indicated he was unaware if any electric utilities throughout the United States were granted a commission-authorized return of 11.65% or higher cost of common equity in the past two years.[80]

Third, a very recent paper from the American Economic Liberties Project[81] written in January 2025 expresses many good points explaining how and why the returns on equity for investor-owned utilities are irrationally high. A few of the points this paper argues is that (1) over the past decade, utilities have been awarded ROEs that are roughly double what is "just and reasonable," (2) although regulated utilities enjoy lower risk than the market as a whole, authorized ROEs are notably higher that what is projected for the overall market, and (3) the author challenges the usefulness of the RP and CE methods used in calculating ROEs and

[79] Regulatory Research Associates, "Major energy rate case decisions in the US – January-March 2025, Quarterly update on decided rate cases," *S&P Global Market Intelligence*, April 25, 2025.
[80] I&E Exhibit No. 2, Schedule 16.
[81] Mark Ellis, "Rate of Return Equals Cost of Capital: A Simple, Fair Formula to Stop Investor-Owned Utilities From Overcharging the Public," *American Economic Liberties Project,* January 2025.

notes that in 2022, the Federal Energy Regulatory Commission began to prohibit the use of these models.

Finally, I believe it is important to consider the impact of what the Companies' excessive return on equity requests of 11.65% would have on rates. As illustrated in the various charts above, any additional basis points beyond the I&E recommended ROE of 10.78% based on a DCF (market-determined) result are unnecessary and will put an enormous burden on ratepayers. The impact to ratepayers of each of the disputed adjustments is summarized as follows:

Citizens' Electric Company of Lewisburg, PA	
Adjustment	**Total Impact**
Size Adjustment to CAPM	$110,864
Performance Adjustment Factor	$6,522

Wellsboro Electric Company	
Adjustment	**Total Impact**
Size Adjustment to CAPM	$167,716
Performance Adjustment Factor	$9,865

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

I&E-RR-5-D

Reference Citizens' Statement No. 2, p. 17, line 6 through p. 18, line 8. Identify each company from Value Line's Electric Utility East, Central, and West groups that were excluded from Mr. D'Ascendis and Mr. Kucan's Electric Utility Proxy Group. Specifically, state which of Mr. D'Ascendis and Mr. Kucan's criteria each company violated in order to be excluded.

Response Provided By:
Dylan W. D'Ascendis, Partner, ScottMadden, Inc.
Ryan M. Kucan, Manager, ScottMadden, Inc.

Date: May 30, 2025

Response:

Please refer to I&E-RR-5-D Attachment A.

I&E-RR-5-D

Reference Wellsboro Statement No. 2, p. 17, line 6 through p. 18, line 8. Identify each company from Value Line's Electric Utility East, Central, and West groups that were excluded from Mr. D'Ascendis and Mr. Kucan's Electric Utility Proxy Group. Specifically, state which of Mr. D'Ascendis and Mr. Kucan's criteria each company violated in order to be excluded.

Response Provided By:
Dylan W. D'Ascendis, Partner, ScottMadden, Inc.
Ryan M. Kucan, Manager, ScottMadden, Inc.

Date: May 30, 2025

Response:

Please refer to I&E-RR-5-D Attachment A.

I&E-RR-11-D

Reference Citizens' Exhibit_(HSG-1), Schedule C1, concerning the revenue requirement calculation. Provide the calculation for the gross revenue conversion factor for the HTY, FTY, and FPFTY to account for the need to gross-up revenue for taxes, uncollectibles, assessments, etc.

Response Provided By:
Howard Gorman, President, HSG Group, Inc.

Date: May 23, 2025

Response:

The calculation of the Revenue increase needed for the FPFTY is presented below.
There was no gross-up for uncollectibles or for assessments; however, including these amounts would cause the Revenue increase to be higher by a minor amount.

A	Rate base	17,092,345	A = Sch C1, Line 3(
B	Required return	8.490%	B= Schedule C1-2

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Christopher Keller. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. ARE YOU THE SAME CHRISTOPHER KELLER WHO IS RESPONSIBLE FOR THE DIRECT TESTIMONY CONTAINED IN I&E STATEMENT NO. 2 AND THE SCHEDULES IN I&E EXHIBIT NO. 2?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to respond to the rebuttal testimony of Wellsboro Electric Company (Wellsboro) and Citizens' Electric Company of Lewisburg (Citizens'), collectively referred to in this testimony as "the

Companies," witness Dylan W. D'Ascendis[1] and Office of Consumer Advocate (OCA) witness Christopher C. Walters[2] regarding rate of return topics including the cost of common equity and the overall fair rate of return, which will be applied to the Companies' rate base. I will also address the Companies' size adjustment and performance factor claims discussed by Mr. D'Ascendis, Citizens' witness Nathan Johnson,[3] and Wellsboro witness Byron Farnsworth, Jr.[4]

Q. DOES YOUR SURREBUTTAL TESTIMONY INCLUDE AN ACCOMPANYING EXHIBIT.

A. No, however, I will make references to my direct testimony[5] and its accompanying exhibit.[6]

SUMMARY OF MR. WALTERS' REBUTTAL TESTIMONY

Q. SUMMARIZE MR. WALTERS' RESPONSE IN REBUTTAL TESTIMONY TO YOUR RECOMMENDATIONS MADE IN DIRECT TESTIMONY.

A. Mr. Walters takes issue with my overall return on equity recommendation stating that my return on equity recommendation would be the highest allowed return on equity for an electric distribution company since at least 2010 and deviates from

1 Citizens'/Wellsboro Statement No. 2R.
2 OCA Statement No. 2R (Citizens') and OCA Statement No. 2R (Wellsboro).
3 Citizens' Statement No. 4R.
4 Wellsboro Statement No. 4R.
5 I&E Statement No. 2.
6 I&E Exhibit No. 2.

industry norms for distribution-only electric utilities and vertically integrated electric utilities. Mr. Walters disagrees with certain aspects of my Discounted Cash Flow (DCF) analysis claiming the growth rate in my DCF analysis is excessive and I should have considered a multiple-stage DCF model. Finally, Mr. Walters claims that I failed to consider the results of cost of equity models other than the DCF model.[7]

Q. WHAT IS MR. WALTERS' SPECIFIC CRITICISM REGARDING YOUR DCF ANALYSIS?

A. Mr. Walters opines that the result of my DCF analysis is unreasonably high because it exceeds the projected growth rate of the U.S. economy which he bases on the projected long-term U.S. Gross Domestic Product (GDP) at the time of his analysis of 4.09%. Mr. Walters states that the GDP growth projections are a reasonable upper limit as public utilities cannot sustain a growth rate that exceeds the U.S. economy. Mr. Walters states that I believe that utilities can indefinitely sustain a growth rate that exceeds the growth rate of the U.S. economy. Finally, Mr. Walters opines I should have considered using a multi-stage DCF model in addition to my constant growth DCF model in order to balance the result of my "flawed" constant growth rate DCF result. Mr. Walters recalculates my DCF result to include a multi-stage DCF result which he averages with my constant

[7] OCA Statement No. 2R (Citizens'), p. 4, lines 5-19 and OCA Statement No. 2R (Wellsboro), p. 4, lines 3-17.

growth rate model result to produce an overall DCF analysis of 9.7% which is in between his recommended range of 9.00% to 10.00%.[8]

Q. HOW DO YOU RESPOND TO MR. WALTERS' CRITICISMS OF YOUR DCF ANALYSIS?

A. First, it should be noted, in the context of recommending an appropriate return on equity and overall rate of return, I&E's role is to perform an unbiased analysis using current and reputable sources. In determining an appropriate growth rate for my DCF analysis, I relied upon the forecasted earnings estimates from S&P, Zacks, and Value Line.[9] These resources are trusted and used industry wide, including by most Company, advocate, and Commission witnesses who submit rate of return testimony. Mr. Walters, Mr. D'Ascendis, and I all utilize these sources in our respective DCF analyses.

Next, the estimates I use from the sources listed above are five-year growth forecasts which are not short-term, nor are they intended to be viewed as sustainable indefinitely as Mr. Walters seems to suggest is my intention.[10] I believe the five-year growth estimates are reasonable as they cover the time period of the Fully Projected Future Test Year (FPFTY) and rate case filing frequency of many utilities. In this proceeding, I&E witness Zachari Walker determined the

[8] OCA Statement No. 2R (Citizens'), p. 8, line 1 through p. 10, line 10 and OCA Statement No. 2R (Wellsboro), p. 8, line 1 through p. 10, line 10.
[9] I&E Exhibit No. 2, Schedule 7.
[10] OCA Statement No. 2R (Citizens'), p. 9, lines 11-15 and OCA Statement No. 2R (Wellsboro), p. 9, lines 11-15.

rate case filing frequency to be 36 months (3 years)[11] and 60 months (5 years)[12] for Citizens' and Wellsboro, respectively.

Additionally, the Commission has repeatedly confirmed I&E's DCF methodology for determining a fair return on common equity. Specifically, in the 2020 Columbia Gas rate case, the 2021 Aqua Pennsylvania, Inc. rate case, the 2023 Columbia Water rate case, and mostly recently, the 2023 Pennsylvania-American Water Company rate case, the Commission agreed with the ALJ's recommendation to use I&E's cost of equity methodology, which included using five-year growth estimates in the DCF analysis.[13]

Finally, Mr. Walters acknowledges that despite my DCF analysis based on the constant growth rate DCF model being "flawed," my DCF result of 10.78% is nearly identical to his DCF result based on the constant growth rate model of 10.79%.[14]

Q. PLEASE RESPOND TO MR. WALTERS' ASSERTION THAT YOU RELIED SOLELY ON THE DCF.

A. As stated in my direct testimony, while my recommendation was based on the

[11] R-2025-3054394, I&E Statement No. 1, p. 9, lines 15-20.

R-2021-3027385 & R-2021-3027386, pp. 154-155 (Order Entered May 16, 2022); *Pa. PUC v. Columbia Water Company*, Docket No. R-2023-3040258, p. 105 (Order Entered January 18, 2024); and *Pa. PUC v. Pennsylvania-American Water Company*, Docket Nos. R-2023-3043189 and R-2023-3043190, pp. 194-195 (Order Entered July 22, 2024).
[14] OCA Statement No. 2R (Citizens'), p. 11, lines 5-8 and fn. 6 and OCA Statement No. 2R (Wellsboro), p. 11, lines 5-8.

results of my DCF analysis, I also employed the Capital Asset Pricing Model (CAPM) only as a comparison because the DCF method is the most reliable.[15] The DCF method has the most wide-spread regulatory acceptance, and while the Commission has more recently based its ROE decisions on a combination of methods, I still stand by my method of using the DCF with a CAPM comparison.

SUMMARY OF MR. D'ASCENDIS' REBUTTAL TESTIMONY

Q. SUMMARIZE MR. D'ASCENDIS' RESPONSE IN REBUTTAL TESTIMONY TO YOUR RATE OF RETURN RECOMMENDATIONS.

A. Mr. D'Ascendis disputes my recommendations regarding an overall fair rate of return. Specifically, Mr. D'Ascendis claims that I failed to consider the results of cost of equity models other than the DCF model. Next, he criticizes my application of the CAPM, claiming that I have incorrectly relied on the 10-year Treasury Bond for my risk-free rate and have not employed the Empirical CAPM (ECAPM). Further, he claims that I fail to account for the Companies' size-specific risk, takes issue with my dismissal of his Non-Price Regulated Proxy Group, and disagrees with my recommended disallowance of additional basis points for management performance. Finally, although Mr. D'Ascendis expresses disagreement with my rate of return analysis for the reasons stated above, he states

[15] I&E Statement No. 2, pp. 20-21.

that since our analyses led to comparable results, he will not discuss his concerns with our approaches or the bases of their recommendations.[16]

Q. DID MR. D'ASECNDIS PROVIDE AN UPDATE TO HIS RATE OF RETURN ANALYSIS?

A. Yes. Mr. D'Ascendis provided an update to its analysis using data through July 18, 2025 and updated his proxy based on 2024 data. Ultimately, Mr. D'Ascendis' return on equity recommendation of 11.65% from his direct testimony remains unchanged.[17]

DISCOUNTED CASH FLOW

Q. SUMMARIZE MR. D'ASCENDIS' REBUTTAL TESTIMONY REGARDING YOUR DCF ANALYSIS.

A. Mr. D'Ascendis opines that I have inappropriately relied solely on the DCF model for my cost of equity recommendations.[18] He presents three cases where he claims the Commission has considered multiple cost of equity models.[19]

[16] Citizens'/Wellsboro Statement No. 2R, p. 7, lines 5-13.
[17] Citizens'/Wellsboro Statement No. 2R, p. 4, line 3 through p. 6, line 3.
[18] Citizens'/Wellsboro Statement No. 2R, p. 7, lines 7-9.
[19] Citizens'/Wellsboro Statement No. 2R, p. 16, line 26, through p 18, line 7.

Q. PLEASE RESPOND TO MR. D'ASCENDIS' ASSERTION THAT YOU RELIED SOLELY ON THE DCF.

A. As stated in my direct testimony, while my recommendation was based on the results of my DCF analysis, I also employed the CAPM only as a comparison because the DCF method is the most reliable.[20] The DCF method has the most wide-spread regulatory acceptance, and while the Commission has more recently based its ROE decisions on a combination of methods, I still stand by my method of using the DCF with a CAPM comparison.

Q. WHICH CASES DOES MR. D'ASCENDIS MENTION WHERE HE CLAIMS THE COMMISSION HAS CONSIDERED MULTIPLE COST OF EQUITY MODELS?

A. Mr. D'Ascendis mentions the 2013 Columbia Water Company (Columbia Water),[21] the 2014 Emporium Water Company (Emporium),[22] and the 2021 Aqua Pennsylvania, Inc. (Aqua)[23] cases to suggest the Commission has considered multiple cost of common equity models.[24]

[20] I&E Statement No. 2, pp. 20-21.
[21] *Pa. PUC v. The Columbia Water Company*, Docket No. R-2013-2360798 (Order Entered January 23, 2014).
[22] *Pa. PUC v. Emporium Water Company*, Docket No. R-2014-2402324 (Order Entered January 28, 2015).
[23] *Pa. PUC v. Aqua Pennsylvania, Inc.,* Docket Nos. R-2021-3027385 & R-2021-3027386 (Order Entered May 16, 2022).
[24] Citizens'/Wellsboro Statement No. 2R, pp. 16-18.

Q. WHAT COMMENTS DO YOU HAVE REGARDING THE CASES MR. D'ASCENDIS MENTIONS?

A. First, within the citation Mr. D'Ascendis presents regarding the Columbia Water case, the Commission specifically states that it used the DCF method as the foundation in determining the cost of equity.[25] Any adjustments to the cost of equity after the fact are at the Commission's discretion and independent of the result of any other cost of equity model. Regarding the Emporium case, the Commission simply summarized the recommendations presented by OCA, I&E, and Emporium; it did not specifically comment on which model(s) it relied on.[26] Regarding the Aqua case, as I stated in my direct testimony, Aqua's return on equity of 10.00% was well above the national average for water utility base rate cases. Finally, as stated in my direct testimony, I did in fact employ the CAPM as a comparison to my DCF result.[27]

CAPITAL ASSET PRICING MODEL

Q. SUMMARIZE MR. D'ASCENDIS' RESPONSE TO YOUR CAPM ANALYSIS.

A. Mr. D'Ascendis disputes my use of the 10-year U.S. Treasury Note as a proxy to measure the risk-free rate that I use in my CAPM analysis. He also disagrees with

[25] Citizens'/Wellsboro Statement No. 2R, p. 16, lines 30-33.
[26] Citizens'/Wellsboro Statement No. 2R, p. 17, lines 7-25.
[27] I&E Statement No. 2, p. 20, lines 1-9.

my exclusion of the ECAPM method of computing the Companies' return on equity.

Risk-Free Rate

Q. WHAT IS MR. D'ASCENDIS' RESPONSE TO YOUR USE OF THE YIELD ON THE 10-YEAR U.S. TREASURY NOTE?

A. Mr. D'Ascendis claims his use of the yield on a 30-year U.S. Treasury Bond is more appropriate than my use of the yield on a 10-year Treasury Note because it better reflects the life of the underlying investment. He also opines that long-term treasury notes are not subject to maturity risk as the cost of equity is a long-term concept, and the investment horizon of an individual investor is irrelevant. [28]

Q. IS THE LIFE OF THE INVESTMENT THE ONLY FACTOR THAT SHOULD BE CONSIDERED IN THE CHOICE OF A RISK-FREE RATE?

A. No. The risk-free rate is the return that can be earned without accepting any risk, and while the life of the investment can be considered in the choice of risk-free rates, the most important consideration is that the rate be as risk-free as possible. As explained in my direct testimony, I chose the 10-year Treasury Note as it mitigates the shortcomings of the short-term Treasury-Bill and the 30-year Treasury Bond.[29] Although long-term Treasury Bonds have less risk of being

[28] Citizens'/Wellsboro Statement No. 2R, pp. 24-25.
[29] I&E Statement No. 2, p. 33-34.

influenced by federal policies, they have substantial maturity risk associated with market risk. In addition, long-term Treasury Bonds bear the risk of unexpected inflation. As such, my choice of a 10-year Treasury Note is appropriate. Further, as also pointed out in my direct testimony, the Commission recently agreed with I&E that the 10-year Treasury Note is the superior measure of the risk-free rate of return.[30]

Q. DO YOU AGREE WITH MR. D'ASCENDIS' ASSERTION THAT LONG-TERM TREASURY BONDS ARE NOT SUBJECT TO MATURITY RISK?

A. No. As discussed in my direct testimony, while long-term Treasury Bonds exhibit more stability, they are not risk-free. Long-term Treasury Bonds have substantial maturity risk associated with market risk and the risk of unexpected inflation which is why long-term treasuries normally offer higher yields to compensate investors for these risks.[31]

[30] *Pa. PUC v. UGI Utilities, Inc. – Electric Division*, Docket No. R-2017-2640058 (Order Entered October 25, 2018). *See generally* Disposition of Capital Asset Pricing Model (CAPM), p. 99; *Pa. Pennsylvania-American Water Company*, Docket Nos. R-2023-3043189 & R-2023-3043190 (Order Entered July 22, 2024). *See generally* Disposition of Capital Asset Pricing Model (CAPM), pp. 171-172.

[31] I&E Statement No. 2, p. 33, line 21 through p. 34, line 4.

Exclusion of the ECAPM

Q. PLEASE SUMMARIZE MR. D'ASCENDIS' RESPONSE TO YOUR EXCLUSION OF THE ECAPM IN YOUR ANALYSIS.

A. Mr. D'Ascendis asserts that the empirical Security Market Line (SML) described by the traditional CAPM is not as steeply sloped as the CAPM model predicts and that tests of the CAPM have measured the level of which security returns and betas are related as predicted by the CAPM.[32]

Q. WHY HAVE YOU EXCLUDED THE ECAPM FROM YOUR ANALYSIS?

A. The ECAPM is a modified version of the CAPM which attempts to address the belief that the actual risk vs. return correlation is flatter than what is predicted by the CAPM. The implication is that the CAPM underestimates returns with lower levels of risk and over-estimates the returns associated with higher levels of risk. The model entails assigning 25% weight to the market beta and 75% weight to the individual company or proxy group.[33]

Further, the use of the ECAPM in estimating the cost of capital does not increase the validity of the result but merely adds another measure of subjectivity to the CAPM, attempting to make the SML more accurate. The ECAPM reduces the purpose of the beta, which is the only company-specific variable in the CAPM

[32] Citizens'/Wellsboro Statement No. 2R, pp. 21-23.
[33] David C. Parcell, "The Cost of Capital – A Practitioner's Guide," 2010 Edition, p. 104.

model. This additional layer of subjectivity provides an even stronger basis to rely on the DCF as the primary method to calculate a utility's cost of equity.

Q. HAVE YOU CHANGED YOUR CAPM RETURN ON EQUITY RECOMMENDATION AS A RESULT OF MR. D'ASCENDIS' REBUTTAL TESTIMONY?

A. No. Even though it is lower, I continue to recommend using my CAPM result of 10.32%[34] only as a comparison to my higher DCF result of 10.78%.[35]

NON-PRICE REGULATED PROXY GROUP

Q. WHAT WAS YOUR RECOMMENDATION IN DIRECT TESTIMONY CONCERNING MR. D'ASCENDIS' UTILIZATION OF A NON-REGULATED PROXY GROUP?

A. I recommended the Commission reject all analyses performed using the non-price regulated company proxy group as it is highly speculative and subjective. Mr. D'Ascendis' non-regulated proxy group in effect blends the CE approach into the DCF, RP, and CAPM models, and I cited that the Commission has ruled on the use of non-utility companies in comparable groups for the CE approach as being highly speculative.[36]

[34] I&E Exhibit No. 1, Schedule 13.
[35] I&E Exhibit No. 1, Schedule 8.
[36] I&E Statement No. 2, pp. 42-43.

Q. SUMMARIZE MR. D'ASCENDIS RESPONSE REGARDING YOUR DISAGREEMENT WITH HIS USE OF A NON-REGULATED PROXY GROUP.

A. In rebuttal testimony, Mr. D'Ascendis attempts to justify the use of the companies contained in his non-regulated proxy group based on the betas and standard errors of the regression being similar to that of the companies in his electric company proxy group and, therefore, opining they are similar to the Companies.[37]

Q. HAS MR. D'ASCENDIS PROVEN THAT THE RISKS FACED BY HIS NON-REGULATED PROXY GROUP ARE SIMILAR TO THAT OF HIS ELECTRIC UTILITY GROUP?

A. No. The risks faced in each industry for the companies used in Mr. D'Ascendis' unregulated group differ from the risks faced by his electric utility group. Specifically, the level of competition between non-price regulated companies and monopolies, which utilities largely are, is too difficult a factor to control. Although beta is an indicator of a company's investment risk in relation to the entire stock market, beta is not a quantification of the total investment risk of a given company. Mr. D'Ascendis' unregulated proxy group may have a beta comparable to that of his electric group, but that does not mean the companies face sufficiently similar risks to be used as a substitute for an industry's market. Both

[37] Citizens'/Wellsboro Statement No. 2R, pp. 27-30.

beta and the standard error of regression are measures of the past performance of a stock and as such do not necessarily reflect where an industry is going or what risks it is expected to face.

Additionally, the Commission made the following comments in the 2018 UGI Electric case regarding the CE method, specifically, the use of non-utility companies in comparable groups, and stated:

> With respect to the CE method, as noted above, this cost of equity method utilizes data for non-regulated firms. Thus, by its very nature, determining which companies are comparable is entirely subjective. In addition, the record indicates that the companies UGI utilized in its CE group results in the selection of companies such as Coca-Cola Company, Kellogg Company, and Walmart Stores, Inc. . . . Each of these companies operate in industries that are very different from a utility company and have significantly more competition, which would require a higher return for the associated additional risk.[38]

Finally, I am advised by counsel that this premise defies the principle set forth in the *Hope* and *Bluefield* cases that a utility is entitled to a return similar to that being earned by companies with similar risks and uncertainties, but not as high as those earned by highly profitable or speculative ventures.[39]

---

[38] *Pa. PUC v. UGI Utilities, Inc. – Electric Division*, Docket No. R-2017-2640058, p. 105 (Order Entered October 25, 2018). The Commission has also ruled "[t]he use of nonregulated companies as a comparable group for regulated firms requires numerous unsupportable assumptions which results in a highly speculative finding." *Pennsylvania Public Utility Commission v. Philadelphia Electric Co.*, 33 PUR 4th 319, 341 (Pa. PUC 1980).

[39] *See Bluefield Water Works & Improvements Co. v. Public Service Comm. of West Virginia,* 262 U.S. 679, 692-93 (U.S. 1923) and *FPC v. Hope Natural Gas Co.,* 320 U.S. 591, 603 (U.S. 1944).

Finally, considering there is a range of 277[40] basis points for his Electric Proxy Group DCF results and a range of 508[41] basis points for his Non-Price Regulated Proxy Group DCF results, overlap is almost inevitable.

SIZE ADJUSTMENT

Q. SUMMARIZE YOUR DIRECT TESTIMONY REGARDING MR. D'ASCENDIS' CLAIM FOR AN ADJUSTMENT FOR THE COMPANIES' SMALL SIZE.

A. In direct testimony, I stated that Mr. D'Ascendis' 85-basis point adjustment is unnecessary because none of the technical literature cited in his direct testimony supporting an adjustment related to the size of a company is specific to the utility industry. Additionally, I stated that any expense impact resulting from the lesser buying power of a smaller utility is reflected in the revenue requirement and the dollar-for-dollar recovery that applies to expenses and to apply an additional size adjustment to a smaller regulated utility would only duplicate the burden to ratepayers. I also presented an article by Dr. Annie Wong that demonstrated there is no need to make an adjustment for the size of a company in utility rate regulation. Finally, I indicated that the Commission has recently rejected the application of a size adjustment to the cost of equity calculation.[42]

[40] Citizens'/Wellsboro Statement No. 2R, p. 30 (10.90% - 8.13% = 2.77%).
[41] Citizens'/Wellsboro Statement No. 2R, p. 30 (12.30% - 7.22% = 5.08%).
[42] I&E Statement No. 2, pp. 44-48.

Q. SUMMARIZE THE COMPANIES' RESPONSE IN REBUTTAL TESTIMONY REGARDING A SIZE RISK FACTOR ADJUSTMENT.

A. Mr. D'Ascendis opines that firms of smaller size are less able to cope with significant events affecting sales, are less diverse in their operations, and have less financial flexibility. He supports these statements by pointing to a Fama and French study relating the size of a company to its return on equity. Mr. D'Ascendis also attempts to discredit a study performed by Dr. Wong, which I&E relied upon in rejection of his size adjustment, by citing a review of her study authored by Thomas M. Zepp. Additionally, Mr. D'Ascendis points to a 2019 Commission order where the Commission considered a size adjustment. Finally, Mr. D'Ascendis calculated the standard deviation of my DCF results.[43]

Additionally, Mr. Johnson points to Citizens' 2019 rate case order where he states that the Commission accepted a size adjustment and should apply a size adjustment in this proceeding for regulatory consistency.[44]

Finally, Mr. Farnsworth states that the Commission should include a size adjustment opining that Wellsboro received a size adjustment in the past and it is used in planning their system improvements and projecting Wellsboro's financial situation.[45]

[43] Citizens'/Wellsboro Statement No. 2R, pp. 8-12.
[44] Citizens' Statement No. 4R, p. 6.
[45] Wellsboro Statement No. 4R, p. 4, lines 1-5.

Q. ARE MR. D'ASCENDIS' ASSERTIONS REGARDING FIRMS OF SMALLER SIZE RELEVANT TO THE REGULATED UTILITY INDUSTRY?

A. No. The study performed by Dr. Wong provides empirical evidence that refutes Mr. D'Ascendis' claim that I will further elaborate upon below.

Q. WHAT ARE YOUR OBSERVATIONS REGARDING THE FAMA AND FRENCH STUDY MR. D'ASCENDIS RELIES ON TO SUPPORT HIS CLAIM OF A SIZE ADJUSTMENT?

A. The Fama and French study is not specific to the utility industry. While I&E relied upon the Fama and French study in this proceeding, as Mr. D'Ascendis correctly points out, the purpose for which I&E cited the study was to empirically demonstrate the shortcomings of the CAPM. The Fama and French study is irrelevant toward the determination of the size risk factor because it is not specific to the utility industry.

Q. PLEASE COMMENT ON THE REVIEW OF DR. WONG'S STUDY PERFORMED BY DR. ZEPP.

A. The article Mr. D'Ascendis references from Dr. Zepp does not recreate Dr. Wong's study; it simply speculates on other possible reasons for her results and references the results of two other studies. The first study, completed by the California Public Utilities Commission Staff in 1991, is not included in the article,

and, therefore, Dr. Zepp's opinions cannot be properly evaluated. Dr. Zepp also draws his conclusions about an entire industry based on the second study, which examines the effects of size on only four water utility companies. This article does not contain enough credible evidence to refute Dr. Wong's findings.

Q. HAVE YOU FOUND FURTHER EVIDENCE TO SUPPORT YOUR RECOMMENDATION REGARDING SIZE ADJUSTMENTS?

A. Yes. The difficulty in predicting the risk effect of a company's size is demonstrated in the variance from year to year of the measurement of difference between the annual returns on the large and small-capitalization stocks of the NYSE/AMEX/NASDAQ in the Ibbotson *Stocks, Bonds, Bills & Inflation: 2015 Yearbook.* As stated on page 100:

> While the largest stocks actually declined in 2001, the smallest stocks rose more than 30%. A more extreme case occurred in the depression-recovery year of 1933, when the difference between the first and 10th decile returns was far more substantial. The divergence in the performance of small- and large- cap stocks is evident. In 30 of the 89 years since 1926, the difference between the total returns of the largest stocks (decile 1) and the smallest stocks (decile 10) has been greater than 25 percentage points.

Page 109 states:

> In four of the last 10 years, large-capitalization stocks (deciles 1-2 of NYSE/AMEX/NASDAQ) have outperformed small-capitalization stocks (deciles 9-10). This has led some market observers to speculate that there is no size premium. But statistical evidence suggests that periods of underperformance should be expected.

Page 112 states:

> Because investors cannot predict when small-cap returns will be higher than large-cap returns, it has been argued that they do not expect higher rates of return for small stocks.

Q. WHAT IS YOUR RESPONSE TO MR. D'ASCENDIS' REBUTTAL TESTIMONY REGARDING THE REFERENCED COMMISSION ORDER FOR CITIZENS'?

A. Although the Commission in the Citizens' 2019 proceeding agreed that there is an inverse relationship between size and risk, the Commission concluded that there is not substantial evidence that size is specifically a risk for utilities as follows:

> At the same time, however, we echo the ALJs that the Parties have presented offsetting arguments such that there is not substantial evidence to determine whether size is specifically a risk for utilities. As I&E and the OCA both noted, the technical literature presented by Citizens' is not specific to the utility industry and also may not definitively support a size adjustment. Additionally, as I&E observed, the empirical study undertaken by the Company's witness Mr. D'Ascendis illustrates the difficulty in predicting the risk effect of a company's size. More specifically, while Mr. D'Ascendis used market information from the NYSE, the AMEX, and the NASDAQ, we find that I&E offered evidence indicating that for certain periods, large-capitalization stocks have outperformed small-capitalization stocks such that there is not sufficient correlation to prove that size is a specific risk for utilities. I&E St. 2-SR at 23-24. Therefore, we are not persuaded by the Company's argument that the ALJs erred by not awarding Citizens' a greater size adjustment. For this reason, we decline to award an explicit 100-basis point size adjustment, as advocated by Citizens'.[46]

[46] *Pa. PUC v. Citizens' Electric Company of Lewisburg, PA*, Docket No. R-2019-3008212 (Order Entered April 29, 2020). *See generally* Disposition of Cost of Common Equity, pp. 103-104.

Finally, as stated in my direct testimony, the Commission has specifically rejected the application of a size adjustment to the cost of equity calculation.[47]

Q. WHAT IS YOUR RESPONSE TO MR. JOHNSON'S REBUTTAL TESTIMONY REGARDING THE REFERENCED COMMISSION ORDER FOR CITIZENS'?

A. The Commission did not, in fact, award an explicit size adjustment as the Commission determined that there was not enough evidence as to whether size is specifically a risk for utilities:

> Consistent with the foregoing discussion, like the ALJs, we shall not specify an exact size adjustment. Instead, we shall adopt the ALJs' recommendation that Citizens' be awarded a DCF cost of common equity of 9.49%. In our view, this cost of equity is reasonable and strikes an appropriate balance by recognizing the general inverse relationship between a company's size and its risk, while acknowledging that there is not substantial evidence in the record to prove that an explicit size basis point adjustment is warranted in this case.[48]

Finally, as I stated above and in my direct testimony, the Commission has rejected the application of a size adjustment to the cost of equity calculation in the 2017 UGI Electric rate case.[49]

---

[47] I&E Statement No. 2, p. 46, lines 1-2.

[48] *Pa. PUC v. Citizens' Electric Company of Lewisburg, PA*, Docket No. R-2019-3008212, pp. 103-04 (Order Entered April 29, 2020).

[49] *Pa. PUC v. UGI Utilities, Inc. – Electric Division;* Docket No. R-2017-2640058, p. 100 (Order Entered October 25, 2018).

Q. DO YOU AGREE WITH MR. FARNSWORTH THAT THE COMMISSION'S PAST ISSUANCE OF ADDITIONAL EQUITY POINTS TO RECOGNIZE SIZE MEANS THAT THE COMPANIES SHOULD ALSO RECEIVE AN ADJUSTED RETURN ON EQUITY IN THIS PROCEEDING?

A. No. The issuance of equity points to recognize size should be done on a case-by-case basis.

Q. HAS YOUR RECOMMENDATION REGARDING MR. D'ASCENDIS' SIZE ADJUSTMENT CHANGED SINCE YOUR DIRECT TESTIMONY?

A. No. I continue to recommend that any adjustments in consideration of the Companies' size be disallowed.

PERFORMANCE FACTOR ADJUSTMENT

Q. SUMMARIZE MR. D'ASCENDIS', MR. JOHNSON'S, AND MR. FARNSWORTH'S REBUTTAL TESTIMONY REGARDING A PERFORMANCE FACTOR ADJUSTMENT.

A. Mr. D'Ascendis simply states, "the Companies should each be awarded a five-basis point upward adjustment to their indicated ROE based on Code 66 Pa. C.S. § 523 regarding performance factor."[50] He further states, "[s]imply put, Code 66 Pa.

[50] Citizens'/Wellsboro Statement No. 2R, p. 13, lines 5-6.

C.S. § 523 is in existence to incentivize companies to 'do their job' at a high level. The Companies in this case fulfill the requirement of the statute and should receive the benefit of doing so."[51] He does not offer an explanation beyond what he argued in his direct testimony.

Mr. Johnson states that I ignored the specific examples given that he opines exceed regulatory requirements. Mr. Johnson provides specific examples such as low customer complaints, favorable customer feedback, customer support calls, energizing new service locations, reliability, zero reportable injuries, technology adoptions, pole attachments, tree line designation, and capital investment. Mr. Johnson states that Citizens' agrees that there is no obligation or entitlement for Citizens' to receive a management performance adjustment. Finally, he notes that Citizens' received basis points for management performance in Citizens' 2019 proceeding and should so again for regulatory consistency.[52]

Mr. Farnsworth provides specific examples that he opines is exemplary management performance such as improvements to reliability and resiliency, reduction in customer complaints, implementation of capital projects to improve overall reliability and resilience to Wellsboro's distribution system, reconductoring its three-phase lines, expedited its wood pole replacement program, and installed vacuum reclosers that replaced high maintenance hydraulic reclosers. Additionally, Mr. Farnsworth states that the Commission should

[51] Citizens'/Wellsboro Statement No. 2R, p. 13, lines 11-13.
[52] Citizens' Statement No. 4R, pp. 2-5.

include a performance factor adjustment opining that Wellsboro received a performance factor adjustment in the past and that Wellsboro relies on receiving consistent treatment by the Commission as it is used in planning system improvements and projecting Wellsboro's financial situation.[53]

Q. WHAT IS YOUR RESPONSE TO MR. D'ASCENDIS', MR. JOHNSON'S, AND MR. FARNSWORTH'S REBUTTAL TESTIMONY REGARDING MANAGEMENT PERFORMANCE?

A. My position remains unchanged from the arguments made in my direct testimony. Awarding the Companies management effectiveness points would add an increased cost to ratepayers for service. Any savings from effective operating and maintenance cost measures should flow through to ratepayers and investors. These claimed savings would likely be offset by the addition of basis points for management effectiveness as ratepayers would have to fund the additional costs. This defeats the purpose of implementing cost saving measures to benefit ratepayers.

Additionally, the Companies should not be awarded management performance points in order to provide a sufficient return on equity or to affect investment decisions and planning for future financial activities, including the timing of rate cases. The purpose of base rate cases is to allow a utility to recover

[53] Wellsboro Statement No. 4R, p. 2-4.

its costs and provide it the *opportunity* to earn a reasonable return on capital investments where additional basis points for management performance would not be necessary if management was as effective as they claim.

The Companies should also not be rewarded for management performance for not utilizing the Distribution System Improvement Charge (DSIC) when it replaced its mains. The Commission offers risk reducing mechanisms such as the DSIC and the FPFTY to help reduce any regulatory lag in recovery of infrastructure investment or other unforeseen expenditures, however, the DSIC and the use of a FPFTY were not designed to eliminate the need for periodic base rate filings. The DSIC was specifically designed to encourage its use and to incentivize accelerated pipeline replacement and infrastructure upgrades to bring the existing aging infrastructure closer to meeting safety and reliability requirements in between base rate filings. It is irrational to wait until after the fact to hopefully receive additional basis points on its return on equity for management performance.

Furthermore, past issuance of additional equity points for management performance in prior proceedings as stated by Mr. Farnsworth does not guarantee such issuance in future proceedings. The issuance of equity points to recognize management performance should be done on a case-by-case basis. Additionally, this idea presented by Mr. Farnsworth contradicts Citizens' witness Johnson who

states that Citizens' agrees that there is no obligation or entitlement for Citizens' to receive a management performance adjustment.[54]

Finally, as discussed in my direct testimony, true management effectiveness is earning a higher return through efficient use of resources and cost cutting measures. The greater net income resulting from cost savings and true efficiency in management and operations is available to be passed on to shareholders. The Companies, or any utility, should not be awarded additional basis points for doing what they are required to do in order to provide adequate, efficient, safe, and reasonable service.[55]

OVERALL RATE OF RETURN

Q. HAS YOUR OVERALL RATE OF RETURN RECOMMENDATION FOR THE COMPANIES CHANGED FROM YOUR DIRECT TESTIMONY?

A. No. I continue to support each recommendation made in I&E Statement No. 2.

Q. WHAT IS YOUR OVERALL RATE OF RETURN RECOMMENDATION?

A. I recommend the following rate of return for the Companies:

[54] Citizens' Statement No. 4R, p. 2, line 20 through p. 3, line 1.
[55] *See* 66 Pa. C.S. § 1501.

Summary of Cost of Capital			
Type of Capital	**Ratio**	**Cost Rate**	**Weighted Cost**
Citizens' Electric Company of Lewisburg			
Long-Term Debt	51.06%	5.47%	2.79%
Common Equity	48.94%	10.78%	5.28%
Total	100.00%		8.07%

Summary of Cost of Capital			
Type of Capital	**Ratio**	**Cost Rate**	**Weighted Cost**
Wellsboro Electric Company			
Long-Term Debt	51.06%	4.85%	2.48%
Common Equity	48.94%	10.78%	5.28%
Total	100.00%		7.76%

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

INTRODUCTION

Q. WOULD YOU PLEASE STATE YOUR NAME AND BUSINESS ADDRESS?

A. My name is Ethan H. Cline. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, Pennsylvania 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed as a Fixed Utility Valuation Engineer in the Pennsylvania Public Utility Commission's ("Commission") Bureau of Investigation and Enforcement ("I&E").

Q. WHAT IS YOUR EDUCATIONAL AND PROFESSIONAL BACKGROUND?

A. My education and professional background are set forth in Appendix A, which is attached.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for protecting the public interest in proceedings before the Commission. The I&E analysis in this proceeding is based on its responsibility to represent the public interest. This responsibility requires the balancing of the interests of ratepayers, the regulated utility, and the regulated community as a

whole.

Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?

A. The purpose of my direct testimony is to present recommendations regarding Wellsboro Electric Company ("Wellsboro" or "Company") request for a base rate revenue increase of $2,899,388[1]. I will address issues including rate base, cost of service study, and rate structure.

TEST YEAR

Q. WHAT TEST YEARS HAS THE COMPANY USED IN THIS PROCEEDING?

A. Wellsboro has selected the year ended December 31, 2024, as the historic test year ("HTY"), the year ending December 31, 2025, as the future test year ("FTY"), and the year ending December 31, 2026, as the fully projected future test year ("FPFTY")[2].

Q. WHAT TEST YEAR HAS THE COMPANY BASED ITS REVENUE REQUIREMENT ON IN THIS PROCEEDING?

A. Wellsboro based its requested revenue requirement on the FPFTY ending December 31, 2026.[3]

---

1 Wellsboro Exhibit HSG-1, Schedule C1.
2 Wellsboro Statement No. 1, p. 2.
3 *Id.*

RATE BASE

Q. WHAT IS RATE BASE?

A. Rate base is the depreciated original cost of a utility's investment in plant a utility has in place to serve customers plus other additions and deductions that the Commission determines to be necessary in order to keep the utility operating and providing safe and reliable service to its customers.

Q. HOW IS RATE BASE USED WITHIN THE RATEMAKING FORMULA?

A. Rate base is one part of the financial equation used by the Commission to determine the appropriate revenue that a utility is granted in a rate proceeding. The revenue determination allows the utility to meet its expense obligations and gives it the opportunity to earn the rate of return established by the Commission in a rate proceeding. The equation used to determine the proper revenue requirement level is:

Revenue Requirement = (Rate Base x Rate of Return) + Operating Expenses + Depreciation Expenses + Taxes.

CUSTOMER DESPOSTIS

Q. WHAT RATE BASE IS THE COMPANY CLAIMING FOR THE FPFTY ENDING DECEMBER 31, 2026?

A. The Company's claimed rate base for the FPFTY ending December 31, 2026, is

$25,857,280.[4]

Q. HAS THE COMPANY STATED ITS INTENTION TO ADJUST ITS RATE BASE CLAIM IN REBUTTAL TESTIMONY?

A. Yes. In its response to I&E-RB-8, the Company stated its intent to reflect in its rebuttal testimony an update to its claim for Customer Deposits in the FPFTY rate base claim.[5] The updated claim is based on the 13-month average of actual claims ended December 31, 2024, rather than the asset balance at December 31, 2024, as filed.

Q. WHAT IS THE COMPANY'S PROPOSED CHANGE TO ITS CUSTOMER DEPOSITS CLAIM?

A. The Company will update its customer deposits claim by decreasing the claim by $80,450 from $195,713 to $115,263.[6]

Q. WHAT IS THE TOTAL UPDATE TO RATE BASE THAT THE COMPANY INDICATED IT WILL PROPOSE?

A. As shown on I&E Exhibit No. 3, Schedule 2, line 10, the Company's updates will result in an increase to the Company's as filed rate base claim of $80,450 from $25,857,280 to $25,937,730.

[4] Wellsboro Exhibit_(HSG-1), Schedule C1-5, line 13.
[5] Company responses to I&E-RB-8 attached as I&E-Exhibit No. 3, Schedule 1.
[6] *Id*.

Q. DO YOU AGREE WITH THE COMPANY'S UPDATED CUSTOMER DEPOSITS AND RATE BASE CLAIMS BASED ON ACTUAL 13-MONTH AVERAGE BALANCES?

A. Partially. While I do agree that using a 13-month average of actual monthly balances is the proper methodology to customer deposits claims in the FPFTY, I do not agree that the Company used the correct time period in projecting these claims. Specifically, I recommend the customer deposits claims be based on a 13-month average of the most recent actual balances available.

Q. WHAT IS THE CUSTOMER DEPOSITS AMOUNT BASED ON THE MOST RECENT 13-MONTH AVERAGE OF ACTUAL CLAIMS?

A. The result of calculating the customer deposits amount by using the most recent 13-month average of actual balances available is $120,033.[7] This is an increase of $4,769[8] from the Company's updated customer deposits claim of $115,263 to $120,033.[9] Because customer deposits is a net reduction to rate base, the increase to the customer deposits claim represents a reduction to rate base of the same amount.

[7] I&E Exhibit No. 3, Schedule 3.
[8] The $1 mathematical error in this calculation is due to rounding.
[9] I&E Exhibit No. 3, Schedule 2, line 5, columns C-E.

Q. WHY DO YOU RECOMMEND THE PROJECTED CUSTOMER DEPOSITS CLAIMS BE BASED UPON A 13-MONTH AVERAGE OF THE MOST RECENT ACTUAL BALANCES AVAILABLE?

A. Basing the FPFTY projection of customer deposits on the most recent data available is reasonable because it provides a more accurate and reasonable projection for the FPFTY.

Q. IF THE COMPANY PROVIDES FURTHER UPDATES THROUGH THE COURSE OF THIS PROCEEDING, SHOULD THE CUSTOMER DEPOSITS CLAIMS BE ADJUSTED?

A. Yes. It is appropriate to use the most recent 13-month average available to determine the customer deposits balances.

MATERIALS AND SUPPLIES

Q. WHAT IS THE COMPANY'S CLAIM FOR MATERIALS AND SUPPLIES?

A. The Company claimed $247,983 for Materials and Supplies. The Company's claim for materials and supplies is simply the asset amount at December 31, 2024.[10]

[10] Wellsboro response to I&E-RB-1, attached as I&E Exhibit No. 3 Schedule 4.

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM FOR MATERIALS AND SUPPLIES?

A. No. As with its customer deposits claim, described above, the materials and supplies claim in the FPFTY should be determined through a 13-month average of the most recent actual materials and supplies balances available.

Q. WHAT DO YOU RECOMMEND REGARDING THE CLAIM FOR MATERIALS AND SUPPLIES?

A. I recommend that Wellsboro's materials and supplies claim be increased by $54,313 from $247,983 to $302,296.[11]

Q. HOW DID YOU DETERMINE THE $302,296 MATERIALS AND SUPPLIES AMOUNT?

A. In its response to I&E-RB-1, the Company provided a list of month end materials and supplies balances from January 2023 through the most recent month available, or April 2025.[12] I&E Exhibit No. 3, Schedule 5 shows the calculation of the 13-month average of materials and supplies based on the most recent 13-months of actual data available.

[11] I&E Exhibit No. 3, Schedule 2, line 7.
[12] I&E Exhibit No. 3, Schedule 4.

Q. WHAT TOTAL ADJUSTMENT TO RATE BASE DO YOU RECOMMEND?

A. As a result of my recommended adjustments to customer deposits and materials and supplies, I am recommending an increase to the Company's total, as filed, rate base of $129,993 from $25,857,280 to $25,987,273.[13]

CUSTOMER COST ANALYSIS

Q. WHAT IS A CUSTOMER COST ANALYSIS AND HOW IS IT USED?

A. A customer cost analysis is part of a cost of service study that includes only customer costs to determine the appropriate customer charges for the various classes.

Q. WHAT IS WELLSBORO PROPOSING REGARDING CUSTOMER CHARGES?

A. Wellsboro is proposing to increase the customer charge of each rate class as shown on Wellsboro Exhibit_(HSG-1), Schedule B7 and summarized below:

Customer Charges			
Rate Class	Present Rate	Proposed Rate	Percent Increase
RS and RSAE	$12.00	$16.50	37.5%
NRS and NRH	$12.22	$16.50	35.0%
CS	$32.03	$32.03	0.0%
CSH	$45.81	$45.81	0.0%
IS	$85.00	$150.00	76.5%

[13] I&E Exhibit No. 3, Schedule 2, line 10.

Q. ARE THE COMPANY'S PROPOSED CUSTOMER CHARGES CONSISTENT WITH ITS CUSTOMER COST ANALYSIS?

A. Partially. The following table, which is a comparison of the Company's proposed customer charges and the results of the customer cost analysis depicted on Wellsboro Exhibit_(HSG-1), Sch. E-1C, shows that the RS, RSAE, NRS, and NRH rate classes include proposed rates consistent with the customer cost analysis and the CS and CSH are not proposed customer charge increases because their present rates are currently above the results of the customer cost analysis. However, the Company is proposing a significant increase to the IS rate class customer charge despite the present rates are above the results of the customer cost analysis.

Customer Charges			
Rate Class	Present Rate	Proposed Rate	Customer Cost Analysis
RS and RSAE	$12.00	$16.50	$17.59
NRS and NRH	$12.22	$16.50	$17.59
CS	$32.03	$32.03	$26.35
CSH	$45.81	$45.81	$26.35
IS	$85.00	$150.00	$71.80

Q. ARE YOU RECOMMENDING AN ADJUSTMENT TO THE PROPOSED IS CLASS CUSTOMER CHARGE?

A. No. While the customer cost analysis shows that the IS class customer charge should not be above $71.80, the IS class generally consists of larger users where a

higher customer charge and lower usage rate could be beneficial. Therefore, I recommend that the IS class customer charge be included in a scale back of rates as discussed below.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE APPROPRIATE LEVEL OF CUSTOMER CHARGES FOR EACH CLASS?

A. As described below, I recommend that the increase in the customers charges that are proposed an increase be scaled back if the Commission grants an increase less than the full increase.

SCALE BACK OF RATES

Q. WHAT DO YOU RECOMMEND IF THE COMMISSION GRANTS LESS THAN THE FULL INCREASE?

A. If the Commission grants less than the Company's requested increase, I recommend that the proposed increase be scaled back based on the cost of service study ultimately approved by the Commission. As I stated above, I also recommend that the customer charges that have a proposed increase be included in any scale back of rates.

Q. WHY DO YOU RECOMMEND THE CUSTOMER CHARGES THAT HAVE BEEN PROPOSED AN INCREASE BE INCLUDED IN A SCALE BACK OF RATES?

A. Despite the RS, RSAE, NRS, and NRH customer charges being supported by the customer cost analysis, as discussed above, the increases to each charge represent significant increases to the fixed portion of the customer's bill of 37.5% for the RS and RSAE classes and 35.0% for the NRS and NRH, classes, as shown above. Therefore, it is reasonable to include these rates in any scale back of rates. Furthermore, if a lower increase is authorized, it is reasonable to expect that the lower revenue authorization would be related to accepted expense and return adjustments that would likely impact the outcome of the customer cost analysis, so including a scale back of customer charges is a logical approach in this scenario.

Q. DID THE COMMISSION DETERMINE IN A RECENT ELECTRIC RATE CASE THAT IT WAS PREFERABLE TO SCALE BACK THE CUSTOMER CHARGES EVEN IF THE CUSTOMER COST ANALYSIS SUPPORTS THE FULL INCREASE?

A. Yes. In the UGI Utilities, Inc. – Electric Division rate case at Docket No. R-2017-2640058, the Commission determined that despite the higher customer cost determination in the cost of service study, the customer charges should be reduced for all customers[14]. My recommendation is consistent with the Commission's

[14] *Pa. PUC v. UGI Utilities, Inc. – Electric Division*, R-2017-2640058, p. 175 (Order Entered October 25, 2018).

decision in this Order.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

Concerning:

Rate Base
Customer Cost Analysis
Scale Back of Rates

WELLSBORO ELECTRIC COMPANY
DOCKET NO. R-2025-3054392

I&E-RB-8

Reference Wellsboro Electric Exhibit HSG-1, Schedule C2. Regarding the Company's claim for customer deposits in the amount of $195,713, provide the following:

A. A detailed explanation of the method used to develop the claim for customer deposits.

B. Provide the actual balance for each month from January 2023 through the latest month available.

Response Provided By:
Howard Gorman, President, HSG Group, Inc.
Jill L. Campbell, VP of Finance of Administration, Wellsboro Electric Company

Date: June 13, 2025

Response:

A. The Company's claim for Customer deposits, which is an amount that reduces the Company's rate base, is equal to the liability on the Company's balance sheet at December 31, 2024.

The liability on the financial statements includes credit balances in Customer accounts receivable; for rate case purposes, credit balances in Customer accounts receivable should be offset against Customer accounts receivable and not reflected in Customer deposits.

As noted in the response to part B below, the actual balance of Customer deposits at December 31, 2024 was $121,200 and the 13-month average was $115,263; the Company will correct its filing in Rebuttal to reflect the 13-month average.

WELLSBORO ELECTRIC COMPANY

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Ethan H. Cline, and my business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation and Enforcement (I&E) as a Fixed Utility Valuation Engineer.

Q. ARE YOU THE SAME ETHAN H. CLINE THAT SUBMITTED DIRECT TESTIMONY ON JULY 15, 2025?

A. Yes. I submitted I&E Statement No. 3 and I&E Exhibit No. 3 on July 15, 2025.

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to address the rebuttal testimony of Wellsboro Electric Company (Wellsboro or Company) witness Howard S. Gorman.[1] I will also address the rebuttal testimony of the Office of Consumer Advocate (OCA) witness Michael Deupree.[2]

[1] Wellsboro Statement No. 1R.
[2] OCA Statement No. 3R.

Q. DOES YOUR TESTIMONY INCLUDE AN EXHIBIT?

A. No.

CUSTOMER DESPOSITS AND MATERIALS AND SUPPLIES

Q. WHAT DID YOU RECOMMEND REGARDING THE COMPANY'S CUSTOMER DEPOSITS AND MATERIALS AND SUPPLIES CLAIMS?

A. I recommended that the customer deposits and materials and supplies claims be calculated based on the most recent 13-month average of actual balances.[3]

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATIONS?

A. Yes. The Company agreed with my recommendation and updated its claims in rebuttal testimony.[4]

CUSTOMER COST ANALYSIS

Q. DID YOU RECOMMEND ANY CHANGES TO THE COMPANY'S CUSTOMER COST ANALYSIS?

A. No. I based my analysis of the Company's proposed customer charges on the customer cost analysis presented in the filing.[5]

---

3 I&E Statement No. 3, pp. 3-7.
4 Wellsboro Statement No. 1R, p. 6.
5 I&E Statement No. 3, pp. 8-10.

CUSTOMER CHARGE SCALE BACK

Q. WHAT DID YOU RECOMMEND REGARDING THE PROPOSED CUSTOMER CHARGES IF THE COMMISSION GRANTS LESS THAN THE INCREASE REQUESTED BY THE COMPANY?

A. I recommended that the proposed customer charges be included in any scale back of rates.[6]

Q. DID THE COMPANY AGREE WITH YOUR RECOMMENDATION?

A. No. Wellsboro witness Gorman disagreed with my recommendation and stated that the proposed customer charges are consistent with the Commission's policy and should be approved as submitted, unless an updated customer cost analysis indicates otherwise.[7]

Q. DO YOU AGREE THAT USING A CUSTOMER COST ANALYSIS TO ASSIST IN DETERMINING PROPOSED CUSTOMER CHARGES IS CONSISTENT WITH COMMISSION POLICY?

A. Yes. The Company is correct that using a customer cost analysis to assist in determining proposed customer charges is consistent with Commission policy. As described above, I did not object to the customer cost analysis submitted by the Company in its filing.

---

6 I&E Statement No. 3, pp. 10-11.
7 Wellsboro Statement No. 1R, p. 6.

Q. IS INCLUDING CUSTOMER CHARGES IN A SCALE BACK OF RATES WITHOUT UPDATING THE CUSTOMER COST ANALYSIS CONSISTENT WITH COMMISSION PRECEDENT?

A. Yes. As I stated in my direct testimony, the Commission determined in the 2017 UGI Electric base rate case that, despite the higher customer cost determination in the cost of service study, the customer charges should be reduced for all customers.[8] The Company did not provide any reason or rationale for the Commission to reverse its previous decision.

Q. SHOULD THE COMMISSION REQUIRE THAT AN UPDATED CUSTOMER COST ANALYSIS BE SUBMITTED IN ORDER TO ADJUST THE CUSTOMER CHARGES PROPOSED BY THE COMPANY?

A. No. By the time the Commission provided its final determination regarding the factors that would be needed to adjust the customer cost analysis, the record for this proceeding would be closed. This would deprive the parties of the chance to review the updated customer cost analysis for accuracy and reasonableness. As such, simply including the customer charges in a scale back of rates is a more reasonable method to adjust customer charges. Furthermore, including customer charges in a scale back acknowledges that authorizing a reduced revenue increase corresponds to reductions in the underlying claims, which would include the costs

[8] I&E Statement No. 3, p. 11.

assigned in the customer cost analysis.

Q. DID ANY OTHER PARTY RESPOND TO YOUR PROPOSAL TO INCLUDE THE CUSTOMER CHARGES IN THE SCALE BACK OF RATES?

A. Yes. OCA witness Deupree objected to my recommendation because it is based on the results of the Company's customer cost analysis. Mr. Deupree's position is that the customer cost analysis should not use the Company's requested rate of return (ROR) but instead use either the ROR under present rates or the ROR proposed by the OCA.[9]

Q. DO YOU AGREE WITH THE OCA'S POSITION REGARDING THE ROR USED TO CALCULATE THE CUSTOMER COST ANALAYSIS?

A. No. Using the Company's claimed ROR under proposed rates to determine the customer cost analysis is appropriate because it properly aligns the Company's expenses with its proposed rates whereas using the ROR under present rates to determine proposed customer charges would be a misalignment. Furthermore, while I have no comment on the OCA's proposed ROR itself, the fact that using the OCA's ROR would cause a reduction in the results of the customer cost analysis supports my recommendation to include the customer charges in the scale

[9] OCA Statement No. 3R, pp. 2-5.

back of rates because this change to the ROR directly affects the results of the customer cost analysis. Including the customer charges in the scale back of rates is a simple, reasonable method to account for these changes.

Q. DO YOU WISH TO CHANGE YOUR RECOMMENDATION TO INCLUDE THE CUSTOMER CHARGE IN THE SCALE BACK OF RATES?

A. No. I continue to recommend that the proposed customer charges be included in the scale back of rates if the Commission grants less than the Company's fully requested increase.

SCALE BACK OF RATES

Q. WHAT DID YOU RECOMMEND IF THE COMMISSION GRANTS LESS THAN THE FULL INCREASE?

A. If the Commission grants less than the Company's requested increase, I recommended that the proposed increases be scaled back based on the cost of service study ultimately approved by the Commission. I also recommended that the customer charges that have a proposed increase be included in any scale back of rates.[10]

[10] I&E Statement No. 3, pp. 10-12.

Q. DID ANY PARTY RESPOND TO YOUR SCALE BACK RECOMMENDATIONS?

A. Yes. In response to my scale back recommendation, the Company proposed that if the Commission accepts the Company's allocated cost of service study but reduces its requested revenue requirement, a proportionate scale back to allocate the increase.[11] This proposal is consistent with my recommendation. I discussed the other parties' response to my recommendation to include the customer charges in the scale back above.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

Citizens' Electric Company of Lewisburg, PA,	)	

Direct Testimony of Greg R. Meyer

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Greg R. Meyer. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q WHAT IS YOUR OCCUPATION?

A I am a consultant in the field of public utility regulation and a Senior Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A This information is included in Appendix A to my testimony.

Q ON WHOSE BEHALF ARE YOU APPEARING IN THIS PROCEEDING?

A I am appearing on behalf of the Pennsylvania Office of Consumer Advocate ("OCA").

Q HAVE YOU TESTIFIED BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION ("COMMISSION") IN PRIOR PROCEEDINGS?

A Yes, I have. I provided testimony in Docket R-2024-3046519 (Columbia Gas of Pennsylvania) on behalf of the OCA.

Q PLEASE GIVE A BRIEF OVERVIEW OF YOUR TESTIMONY.

A My testimony will provide a brief overview of the case and discuss various aspects of the revenue requirement of Citizens' Electric Company of Lewisburg, PA ("Citizens" or "Company").

My silence in regard to any issue should not be construed as an endorsement of or acquiescence to the Company's position.

CASE OVERVIEW AND WITNESS INTRODUCTION

Q PLEASE DESCRIBE THE RATE INCREASE THAT CITIZENS FILED.

A On April 30, 2025, Citizens filed a Statement of Reason seeking approval to increase base rates by $1.79 million. Citizens filed the Direct Testimony of five witnesses. Citizens serves approximately 7,176 customers. Citizens uses a Fully Projected Future Test Year ("FPFTY") ending December 31, 2026, a Future Test Year ("FTY") ending December 31, 2025, and a Historical Test Year ("HTY") ending December 31, 2024. Citizens stated in its filing that it must seek a general increase in its rates to recover its costs and to earn a fair return on capital.

Q CAN YOU DESCRIBE THIS RATE FILING IN RELATION TO THE COMPANY'S PRIOR GENERAL RATE INCREASE FILINGS?

A Citizens has filed for general rate increases in 2016, 2019, and 2022, each of which resulted in a grant of a rate increase with an effective date somewhere near nine months of the filing date in each case.

Q PLEASE SUMMARIZE THE TESTIMONY OF OCA'S OTHER EXPERTS IN THIS PROCEEDING.

A The OCA's witnesses touch on most aspects of the Company's rate case.

- My testimony, OCA Statement 1, addresses the Company's proposed claims for its proposed increase in its revenue requirement based on the FPFTY 2026 and makes recommendations for reasonable adjustments to reflect appropriate and normalized revenues and expenses for ratemaking purposes.

- Mr. Christopher Walters, OCA Statement 2, addresses the appropriate capital structure for ratemaking, the Return on Equity ("ROE"), and the impact of the Company's claims for an additional 25 basis points for management performance and size adjustment on the ROE. Mr. Walters recommends a market-based ROE of 9.50%, which is the midpoint of his reasonable range of 9.00% to 10.00% based on the analytical methods he used. The negative adjustment to the Company's revenue requirement based on Mr. Walters' recommended ROE is reflected in the recommended revenue requirement increase presented in my testimony.

- Mr. Michael W. Deupree, OCA Statement 3, is the OCA's expert witness on cost-of-service studies, revenue allocation, and rate design. Mr. Deupree provides adjustments to the Company's allocated class cost of service study, recommendations regarding proposed revenue allocation and rate design for the customer charge.

- Ms. LeeAnn Wise, OCA Statement 4, is the OCA's expert witness on quality of customer service issues, including customer payment fees, security deposits, and payment plans. Ms. Wise recommends that the Company eliminate the $3.95 processing fee charged to customers who pay their utility bills by credit card. Given this recommendation, the resulting increase to the revenue requirement will be reflected in my revenue requirement recommendation.

SUMMARY OF RECOMMENDATIONS

Q PLEASE SUMMARIZE YOUR CONCLUSIONS AND RECOMMENDATIONS.

A My conclusions and recommendations are as follows:

1. I recommend that Citizens' annualized revenues be increased.
2. I recommend that Citizens' uncollectible expense be decreased.
3. I recommend that Citizens' annualized payroll expense be decreased.
4. I recommend that Citizens' non-labor expenses be decreased in Accounts 593 and 920.
5. Finally, I recommend that certain Citizens' Sponsorships and Lobbying costs be disallowed.

Q DO YOU BELIEVE AN INCREASE IN CITIZENS' REVENUES OF APPROXIMATELY $1.79 MILLION WILL RESULT IN JUST AND REASONABLE RATES FOR CITIZENS' CUSTOMERS?

A No. I believe that the base rate increase proposed by Citizens is overstated. I have prepared Table GRM-1 (Citizens) that shows the adjustments I am proposing that reduces the revenue increase sought by Citizens by a total of $686,208. With my recommended adjustments, and the adjustments recommended by OCA Witness Walters (ROE) and OCA Witness Wise (credit card payment fees), Table GRM-1 (Citizens) shows that the Company is only entitled to a $1,108,317 revenue requirement increase.

Table GRM-1 (Citizens)

OCA Revenue Requirement Adjustments

Line	Description	Amount
1	Company Proposed Revenue Requirement Increase[1]	$ 1,794,525
	OCA Adjustments:	
2	Return on Equity	$ (268,215)
3	Rate Revenue	$ (56,136)
4	Uncollectible Expense	$ (5,111)
5	Labor	$ (125,320)
6	Acct 593 and 920	$ (272,331)
7	Sponsorship and Lobbying	$ (2,109)
8	Credit Card Fee	$ 43,014
9	Total OCA Adjustments	$ (686,208)
10	OCA Proposed Revenue Requirement Increase	$ 1,108,317

Source:
[1]OCA-I-1 Attachment A (Schedule A-D) Tab "C1."

REVENUES

Q HAVE YOU REVIEWED THE LEVEL OF ANNUALIZED REVENUES PROPOSED BY CITIZENS FOR INCLUSION IN THIS RATE CASE?

A Yes, I have.

Q DO YOU AGREE WITH THE LEVELS OF ANNUALIZED REVENUES INCLUDED IN CITIZENS' REVENUE REQUIREMENT?

A No. I believe Citizens has understated the Residential, Commercial, and Industrial levels of revenues.

Q PLEASE EXPLAIN WHY YOU BELIEVE CITIZENS HAS UNDERSTATED THE LEVEL OF RESIDENTIAL REVENUES.

A The usage per customer (kilowatt-hour ("kWh") per customer) proposed by Citizens for the Residential class is understated when compared to a 10-year average of usage from 2015-2024 Company annual reports. I have prepared Table GRM-2 (Citizens) below to show the levels of Residential usage from different time periods and the usage level proposed by Citizens.

Table GRM-2 (Citizens)

Residential Usage Analysis

Time Period	Usage (kWh) per Customer
5-Year Average[1]	14,487
10-Year Average[1]	14,617
15-Year Average[1]	14,644
Company Proposed FPFTY[2]	14,488

Sources:

[1]Calculated based on Company Annual reports from 2010 to 2024.

[2]Company Schedule B3.

As can be seen from Table GRM-2 (Citizens), the Residential usage levels proposed by Citizens matches the five-year historical usage level experienced. I recommend using the 10-year usage patterns for the Residential class to annualize revenues. The table also shows that the 10- and 15-year usage patterns are very close to each other and slightly greater than the five-year usage level. Overall, this indicates that the recent years have had milder weather and a longer time period of annualization is warranted.

Q WHAT IS THE RESIDENTIAL REVENUE ADJUSTMENT IMPACT FROM YOUR PROPOSED USAGE PER CUSTOMER?

A Utilizing the 10-year usage per customer results in an increase in annualized Residential revenues of $26,456. I would note that my adjustment to increase Residential revenues also recognizes the effects of uncollectible expense. The adjustment to Residential usage per customer is calculated in Exhibit GRM-1 (Citizens), page 3, and the impact is shown on Exhibit GRM-1 (Citizens), page 2. The energy proposed for Residential customers is shown on Exhibit GRM-1 (Citizens), page 6.

Q DO YOU BELIEVE THE CITIZENS' COMMERCIAL REVENUES ARE ALSO UNDERSTATED?

A Yes, I do. I have prepared Table GRM-3 (Citizens) to show the levels of Commercial usage from different time periods and the usage level proposed by Citizens.

Table GRM-3 (Citizens)

Commercial Usage Analysis

Time Period	Usage (kWh) per Customer
5-Year Average[1]	24,152
10-Year Average[1]	25,907
15-Year Average[1]	26,284
Company Proposed FPFTY[2]	24,027

Sources:

[1]Calculated based on Company Annual reports from 2010 to 2024.

[2]Company Schedule B3.

As can be seen from Table GRM-3 (Citizens) above, the Commercial usage levels proposed by Citizens are lower than the five-, 10-, and 15-year historical usage levels experienced. I recommend using the 10-year usage patterns for the Commercial class to annualize revenues. The table also shows that the 10- and 15-year usage patterns are very close to each other and significantly greater than the five-year usage level. Overall, this indicates that the recent years have had milder weather and a longer time period of annualization is warranted.

Q WHAT IS THE COMMERCIAL REVENUE ADJUSTMENT IMPACT FROM YOUR PROPOSED USAGE PER CUSTOMER?

A Utilizing the 10-year usage per customer results in an increase in annualized Commercial revenues of $21,134. I would note that my adjustment to increase Commercial revenues also recognizes the effects of uncollectible expense. The adjustment to Commercial usage per customer is calculated in Exhibit GRM-1 (Citizens), page 3, and the impact is shown on Exhibit GRM-1 (Citizens), page 2. The energy proposed for Commercial customers is shown on Exhibit GRM-1 (Citizens), page 6.

Q FINALLY, DO YOU BELIEVE CITIZENS' INDUSTRIAL REVENUES ARE ALSO UNDERSTATED?

A Yes, I do. I have prepared Table GRM-4 (Citizens) to show the levels of Industrial usage from different time periods and the usage level proposed by Citizens.

Table GRM-4 (Citizens)

Industrial Usage Analysis

Time Period	Usage (kWh) per Customer
5-Year Average[1]	1,133,866
10-Year Average[1]	1,301,308
15-Year Average[1]	1,290,608
Company Proposed FPFTY[2]	1,109,527

Sources:

[1]Calculated based on Company Annual reports from 2010 to 2024.

[2]Company Schedule B3.

As can be seen from Table GRM-4 (Citizens) above, the Industrial usage levels proposed by Citizens is lower than the five-, 10-, and 15-year historical usage levels experienced. I recommend using the 10-year usage patterns for the Industrial class to annualize revenues. The table also shows that the 10- and 15-year usage patterns are very close to each other and significantly greater than the five-year usage level. Overall, this indicates that the recent years have had milder weather and a longer time period of annualization is warranted.

Q WHAT IS THE INDUSTRIAL REVENUE ADJUSTMENT IMPACT FROM YOUR PROPOSED USAGE PER CUSTOMER?

A Utilizing the 10-year usage per customer results in an increase in annualized Industrial revenues of $8,296. I would note that my adjustment to increase Industrial revenues recognizes the effects of uncollectible expense. The adjustment to Industrial usage per customer is calculated in Exhibit GRM-1 (Citizens), page 4, and the impact is shown on Exhibit GRM-1 (Citizens), page 2. The energy proposed for Industrial customers is shown on Exhibit GRM-1 (Citizens), page 6.

Summing the three rate class revenue adjustments results in a total Citizens' increase to Citizens' revenues of $55,886 and a resulting decrease to Citizens' revenue requirement of $56,136. This is shown on Exhibit GRM-1 (Citizens), page 2.

UNCOLLECTIBLE EXPENSE

Q HAVE YOU REVIEWED THE COMPANY'S PROPOSAL FOR UNCOLLECTIBLE EXPENSE?

A Yes, I have.

Q DO YOU HAVE CONCERNS WITH THE LEVEL OF UNCOLLECTIBLE EXPENSE INCLUDED IN CITIZENS' REVENUE REQUIREMENT?

A Yes. I believe Citizens has overstated the level of uncollectible expenses.

Q PLEASE DISCUSS YOUR RATIONALE ON WHY YOU BELIEVE CITIZENS HAS OVERSTATED THE LEVEL OF UNCOLLECTIBLE EXPENSES.

A Citizens is proposing a level of uncollectible expenses of $30,900. This level of uncollectible expenses reflects a 0.167% bad debt write-off factor. I contend that this bad debt write-off factor is too high, and therefore, the uncollectible expense is too high.

Q WHAT INFORMATION DO YOU HAVE TO SHOW THE BAD DEBT WRITE-OFF FACTOR UTILIZED BY CITIZENS IS TOO HIGH?

A I have prepared Table GRM-5 (Citizens) below that shows the historical levels of bad debt write-offs experienced by Citizens.

Table GRM-5 (Citizens)

Historical Bad Debt Write-off %

Year	Revenues	Net Write-offs	% of Rev
2020	$13,603,836	$ 18,770	0.138%
2021	$13,692,112	$ 18,429	0.135%
2022	$16,929,825	$ 20,270	0.120%
2023	$20,304,827	$ 31,823	0.157%
2024	$16,279,186	$ 24,932	0.153%
5 Year Total	$80,809,786	$ 114,225	0.141%
Company Proposed FPFTY	$18,458,350	$ 30,900	0.167%

Sources:
1. 2020 to 2024 revenues sourced from Company annual reports.
2. 2020 and 2024 Net Write-offs sourced from Company Resposne to OCA Data Request 7-17
3. Company Proposed FPFTY sourced from Company Schedule C1 and C1-1.

As can be seen from the Table GRM-5 (Citizens), the bad debt write-off factor used by Citizens in its FPFTY 2026 of 0.167% is overstated when compared to the five-year historical average of 0.141%. I propose to use the five-year percentage average of bad debt write-offs for annualizing uncollectible expense. Using a five-year average of bad debt write-offs of 0.141% reduces Citizens' uncollectible expenses by $4,809. My adjustment to uncollectible expense results in a decrease to Citizens' revenue requirement of $5,111. My proposed uncollectible expense is calculated on Exhibit GRM-1 (Citizens), page 5, and the revenue requirement impact is shown on Exhibit GRM-1 (Citizens), page 2.

PAYROLL EXPENSE

Q HAVE YOU REVIEWED THE LEVEL OF PAYROLL EXPENSE INCLUDED IN CITIZENS' REVENUE REQUIREMENT?

A Yes, I have.

Q DO YOU BELIEVE THE LEVEL OF PAYROLL EXPENSE INCLUDED IN CITIZENS' REVENUE REQUIREMENT REPRESENTS A REASONABLE LEVEL?

A No. I believe Citizens has overstated the level of payroll expenses for the FPFTY 2026. Citizens is proposing to increase payroll expense by approximately 21%[1] over the payroll level recorded in the HTY 2024.

[1]Percent Change of Schedule C1-1 Total Operating & Maintenance Expense between FPFTY 2026 and HTY 2024.

Q IN YOUR REVIEW OF CITIZENS' PAYROLL EXPENSE, DID YOU DISCOVER THAT CITIZENS IS PROPOSING TO ADD NEW EMPLOYEES TO ITS WORKFORCE?

A Yes. I discovered that Citizens is proposing to add two new employees to its workforce.

Q WHAT IS CITIZENS' CURRENT WORKFORCE NUMBERS?

A I have prepared Table GRM-6 (Citizens) below that shows the historical level of Citizens' employees.

Table GRM-6 (Citizens)

Citizens' Employee Levels

Year	Employee Count (1)
2020	16
2021	18
2022	19
2023	18
2024	18
FTY	19
FPFTY	20

Source:
2020 to 2024 from annual reports;
TYs from OCA 7-12

As can be seen from Table GRM-6 (Citizens), Citizens has included two new employees in its level of payroll expenses for the FPFTY 2026 in this case.

Q DID CITIZENS PROVIDE ANY EXPLANATION IN THEIR DIRECT TESTIMONY FOR THE ADDITION OF TWO NEW EMPLOYEES?

A No. I could not find any reference in the Direct Testimony discussing the need to add two new employees. Therefore, my payroll annualization will not recognize the addition of two new employees.

Q PLEASE DISCUSS THE PROCESS YOU UTILIZED TO ANNUALIZE CITIZENS' PAYROLL EXPENSES.

A I increased the HTY 2024 level of payroll by 4% to reflect a reasonable level of FTY 2025 payroll expenses. I then applied a 4% payroll increase to the FTY 2025 level of payroll expenses to reflect a reasonable FPFTY 2026 annualized level of payroll expenses.

Q WHY DID YOU CHOSE A 4% PAYROLL INCREASE FIGURE?

A It is my experience that a typical range for annual payroll increases are between 3.5% to 4% per year. Therefore, I chose 4% to annualize Citizens' payroll expense.

Q WHAT WAS THE EFFECT OF YOUR PAYROLL ANNUALIZATION?

A My annualized level of payroll expenses resulted in a reduction of payroll expenses of $116,567. This results in a decrease to revenue requirement of $125,320. My proposed payroll expenses are shown on Exhibit GRM-1 (Citizens), pages 14 and 15. The impact of this adjustment is shown on Exhibit GRM-1 (Citizens), page 2.

NON-LABOR OPERATION & MAINTENANCE ("O&M") EXPENSES

Q HAVE YOU PERFORMED A REVIEW OF CITIZENS' NON-LABOR O&M EXPENSE?

A Yes, I have. In reviewing Citizens' expenses, I noticed that the non-labor expenses projected for Accounts 593 (Maintenance of Overhead Lines) and 920 (Administrative and General ("A&G") Salaries) were much greater than recent history would suggest appropriate.

Q WAS THE NON-LABOR EXPENSE GROWTH PROJECTIONS ASSOCIATED WITH THESE TWO ACCOUNTS ADDRESSED IN CITIZENS' TESTIMONY?

A No, not specifically. Citizens' Witness Kathy Stauder notes that "[t]he FPFTY data is based on our projections for the year ending December 31, 2026."[2]

Q WHAT DID YOU FIND WITH RESPECT TO THE NON-LABOR EXPENSES ASSOCIATED WITH ACCOUNT 593 MAINTENANCE OF OVERHEAD LINES?

A In reviewing the non-labor breakout for this account from both the last case and the current case in the workpapers for Exhibit (HSG-1) Schedule C, from the years 2020 to HTY 2024, there was an annual growth of 5.73%.[3] The growth rate projected by Citizens for FTY 2025 non-labor expenses is 20.19%. Then 31.07% growth was added for FPFTY 2026 on top of the FTY 2025 amount. This results in a non-labor expense

[2] *See* Direct Testimony of Kathy Stauder at page 4, lines 5-6.

[3] Compound Annual Growth Rate calculated as (418,821 / 335,141) ^ (1 / (2024-2020)) – 1 = 5.73%.

for this account that is 1.57 times the highest level experienced within the past five years. I have summarized this in Table GRM-7 (Citizens) below.

Table GRM-7 (Citizens)

Account 593 Non-Labor Expense

Year	Expense
2020	$335,141
2021	359,785
2022	N/A*
2023	421,331
2024 HTY	418,821

Forecast	Expense	Growth
2025 FTY	$503,361	20.19%
2026 FPFTY	659,768	31.07%

*Actual non-labor expense for 2022 was not included in the workpapers for either the last case or the current case.

Q HAS THE COMPANY PROVIDED AN EXPLANATION OF HOW EXPENSES WERE PROJECTED?

A Yes. In response to Data Request I&E-RE-14-D, the Company provided the following list of reasons for the increase shown for FTY 2025:

> a. Vegetation Management contract costs came in slightly under budget in 2024 as a result of lower than expected T&E work by the contractor. T&E work is highly influenced by customer requests and, though typically stable, can vary at times. FTY 2025 is budgeted for a higher overall cost based on field assessment of overhead lines and the expectation that T&E work will remain at average levels.
>
> b. Pole Inspection Management contract costs are expected to increase as a result of the geographic area identified for traditional pole inspections, as well as the introduction of an aerial drone inspection

> program that was piloted in 2023 and budgeted for full implementation in 2025.
>
> c. Increase in labor costs driven by additional hires in 2024 and 2025. For budgeting purposes, available field worker labor is forecast to be split across various labor accounts based on historical distributions. In the labor distribution for 2025, a full year's wages for the new lineworker hire from 2024 are reflected, as well as partial year's wages for two expected new hires in 2025.

For FPFTY 2026 increases, the Company provided the following explanation:

> The primary driver for the $159,625 increase from FTY 2025 to FPFTY 2026 is the substantial expected increase in vegetation management contract costs. See Exhibit NJ-6 for copies of the 2025 bids received. The Company was fortunate to secure a bid at near budget for FTY 2025, but the rest of the bid field, as well as verbal communications from contractor representatives indicate that costs are likely to increase substantially in FPFTY 2026.

Q PLEASE RESPOND TO THE EXPLANATION.

A When looking at these explanations, I am struck that there is no discussion of how the Company is exercising cost control. We must keep in mind that the Company is requesting a 57.5% increase over the HTY 2024 non-labor expenses for this account. With growth of that size projected, it is incumbent on the Company to show that it has done all it can to hold the line on expense growth. Absent that showing, it is difficult to say that the requested increase is warranted.

At this point we are to accept merely the bald assertion that costs will increase drastically in the future, well beyond what has been experienced in the recent past. Additionally, one might expect the aerial drone program to provide unaccounted for efficiencies that would serve to offset additional costs.

Q WHAT DID YOU FIND WITH RESPECT TO THE NON-LABOR EXPENSES ASSOCIATED WITH ACCOUNT 920 A&G SALARIES?

A In reviewing the non-labor breakout for this account from both the last case and the current case in the workpapers for Exhibit (HSG-1) Schedule C, from the years 2020 to HTY 2024, there was an annual growth of 3.48%.[4] The growth rate projected by Citizens for FTY 2025 non-labor expenses is 3.59%. Then 19.16% growth was added for FPFTY 2026 on top of the FTY 2025 amount. This results in a non-labor expense for this account that is 1.19 times the highest level experienced within the past five years. I have summarized this in Table GRM-8 (Citizens) below.

Table GRM-8 (Citizens)

Account 920 Non-Labor Expense

Year	Expense
2020	$329,134
2021	328,029
2022	N/A*
2023	391,193
2024 HTY	377,412

Forecast	Expense	Growth
2025 FTY	$390,975	3.59%
2026 FPFTY	465,884	19.16%

*Actual non-labor expense for 2022 was not included in the workpapers for either the last case or the current case.

[4]Compound Annual Growth Rate calculated as (377,412 / 329,134) ^ (1 / (2024-2020)) – 1 = 3.48%.

Q HAS THE COMPANY PROVIDED ANY EXPLANATION OF HOW EXPENSES WERE PROJECTED?

A Yes. In response to Data Request I&E-RE-17-D, the Company provided the following explanation for the growth in the total cost of the account (both the labor and non-labor increases):

> D. The 20.8% increase expected from FTY 2025 to FPFTY 2026 is primarily driven by the planned overlap of positions during 2026. Expected administrative position retirements in 2027 necessitate overlap to allow for knowledge transfer and provide continuity.

Q PLEASE RESPOND TO THE EXPLANATION.

A With my review, I was primarily focused on the non-labor expense recorded to Account 920, and the explanation provided appears to be focused on labor costs. However, even accepting that this explanation addresses the non-labor costs as well, it describes a non-normal operating condition. As such, it is inappropriate to set rates based on non-normal operations. The overlap in positions represents merely a temporary state in operations, and shortly thereafter one can reasonably expect that the cost of the overlapping labor will be discontinued. Normalizing costs improves the utility's incentive to control costs, while awarding one-for-one recovery of expenses in non-normal operating conditions reduces the utility's incentive to control costs.

Q HOW DO YOU PROPOSE TO ADDRESS THE NON-LABOR EXPENSE FOR THESE TWO ACCOUNTS?

A I propose that the historical growth rates between 2020 and HTY 2024 be applied to develop the costs for FTY 2025 and FPFTY 2026. For Account 593, this results in a

non-labor expense level of $468,197, a reduction of $191,571 to the Company's proposed expense. For Account 920, this results in a non-labor expense level of $404,145, a reduction of $61,739 to the Company's proposed expense.

My adjustments to Accounts 593 and 920 result in a decrease to expense of $253,310. This results in a reduction to revenue requirement of $272,331. My adjusted non-labor expense for these two accounts can be seen on Exhibit GRM-1 (Citizens), pages 14 through 17. The impact of my adjustments can be seen on Exhibit GRM-1 (Citizens), page 2.

SPONSORSHIP AND LOBBYING

Q HAVE YOU PERFORMED A REVIEW OF CITIZENS' SPONSORSHIP AND LOBBYING EXPENSE?

A Yes, I have. In response to Data Request I&E-RE-9-D, Citizens provided the Company's Sponsorships and Lobbying expenses that were included in the FPFTY 2026. Citizens is proposing to include $695 and $1,267 in FPFTY 2026 for Sponsorships and Lobbying, respectively.

Q DO YOU BELIEVE THAT THE ABOVE LEVELS OF SPONSORSHIP AND LOBBYING EXPENSES IS APPROPRIATE TO INCLUDE IN THIS CASE?

A No, customers should not have to pay for Sponsorships and Lobbying expenses that are not necessary or beneficial to providing safe and reliable service. These types of activities and expenses are solely for burnishing the reputation of the Company.

Q WHAT IS YOUR RECOMMENDATION REGARDING SPONSORSHIP AND LOBBYING EXPENSES?

A I recommend that these expenses be removed from the revenue requirement. This adjustment would lower the revenue requirement by $2,109. My adjusted expenses are shown on Exhibit GRM-1 (Citizens), page 13. The impact of my adjustment is shown on Exhibit GRM-1 (Citizens), page 2.

OTHER ADJUSTMENTS

Q ARE YOU REFLECTING OTHER ADJUSTMENTS IN YOUR RECOMMENDED REVENUE INCREASE?

A Yes. In Exhibit GRM-1 (Citizens), page 2, and in Table GRM-1 (Citizens), I reflect the adjustment to the Company's revenue requirement increase recommended by OCA Witnesses Walters and Wise, in OCA Statement Nos. 2 and 4, respectively.

Q PLEASE EXPLAIN HOW YOU ADDRESS OCA WITNESS WALTERS' ADJUSTMENT.

A OCA Witness Walters recommends a market-based ROE of 9.50%, which is the midpoint of his reasonable range of 9.00% to 10.00% based on the analytical methods he used. Applying Mr. Walters' recommended ROE results in a negative adjustment to the Company's revenue requirement claim by $268,215.

Q PLEASE EXPLAIN HOW YOU ADDRESS OCA WITNESS WISE'S ADJUSTMENT.

A OCA Witness Wise recommends that the Company eliminate the $3.95 processing fee charged to customers who pay their utility bills by credit card. The total annual revenue that the Company collects in these fees from customers and then forwards to a third-party vendor is $40,010. Applying Ms. Wise's recommendation results in a positive adjustment of $43,014 to the Company's claimed revenue requirement increase.

CONCLUSION

Q DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A Yes, it does.

QUALIFICATIONS OF GREG R. MEYER

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Greg R. Meyer. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q PLEASE STATE YOUR OCCUPATION.

A I am a consultant in the field of public utility regulation and a Senior Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE SUMMARIZE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A I graduated from the University of Missouri in 1979 with a Bachelor of Science Degree in Business Administration, with a major in Accounting. Subsequent to graduation I was employed by the Missouri Public Service Commission. I was employed with the Commission from July 1, 1979 until May 31, 2008.

I began my employment at the Missouri Public Service Commission as a Junior Auditor. During my employment at the Commission, I was promoted to higher auditing classifications. My final position at the Commission was an Auditor V, which I held for approximately ten years.

As an Auditor V, I conducted audits and examinations of the accounts, books, records and reports of jurisdictional utilities. I also aided in the planning of audits and investigations, including staffing decisions, and in the development of staff positions in

which the Auditing Department was assigned. I served as Lead Auditor and/or Case Supervisor as assigned. I assisted in the technical training of other auditors, which included the preparation of auditors' workpapers, oral and written testimony.

During my career at the Missouri Public Service Commission, I presented testimony in numerous electric, gas, telephone and water and sewer rate cases. In addition, I was involved in cases regarding service territory transfers. In the context of those cases listed above, I presented testimony on all conventional ratemaking principles related to a utility's revenue requirement. During the last three years of my employment with the Commission, I was involved in developing transmission policy for the Southwest Power Pool as a member of the Cost Allocation Working Group.

In June of 2008, I joined the firm of Brubaker & Associates, Inc. as a Consultant. Since joining the firm, I have presented testimony and/or testified in the state jurisdictions of Arkansas, Florida, Idaho, Illinois, Indiana, Iowa, Kentucky, Maryland, Missouri, Montana, New Mexico, Ohio, Utah, Washington, Wisconsin and Wyoming. I have also appeared and presented testimony in Alberta and Nova Scotia, Canada. In addition, I have filed testimony at the Federal Energy Regulatory Commission ("FERC"). These cases involved addressing conventional ratemaking principles focusing on the utility's revenue requirement. The firm Brubaker & Associates, Inc. provides consulting services in the field of energy procurement and public utility regulation to many clients including industrial and institutional customers, some utilities and, on occasion, state regulatory agencies.

More specifically, we provide analysis of energy procurement options based on consideration of prices and reliability as related to the needs of the client; prepare rate,

feasibility, economic, and cost of service studies relating to energy and utility services; prepare depreciation and feasibility studies relating to utility service; assist in contract negotiations for utility services, and provide technical support to legislative activities.

In addition to our main office in St. Louis, the firm also has branch offices in Corpus Christi, Texas; Louisville, Kentucky and Phoenix, Arizona.

Direct Testimony of Greg R. Meyer

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Greg R. Meyer. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q WHAT IS YOUR OCCUPATION?

A I am a consultant in the field of public utility regulation and a Senior Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A This information is included in Appendix A to my testimony.

Q ON WHOSE BEHALF ARE YOU APPEARING IN THIS PROCEEDING?

A I am appearing on behalf of the Pennsylvania Office of Consumer Advocate ("OCA").

Q HAVE YOU TESTIFIED BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION ("COMMISSION") IN PRIOR PROCEEDINGS?

A Yes, I have. I provided testimony in Docket R-2024-3046519 (Columbia Gas of Pennsylvania) on behalf of the OCA.

Q PLEASE GIVE A BRIEF OVERVIEW OF YOUR TESTIMONY.

A My testimony will provide a brief overview of the case and discuss various aspects of the revenue requirement of Valley Energy, Inc. ("Valley" or "Company").

My silence in regard to any issue should not be construed as an endorsement of or acquiescence to the Company's position.

CASE OVERVIEW AND WITNESS INTRODUCTION

Q PLEASE DESCRIBE THE RATE INCREASE THAT VALLEY FILED.

A On April 30, 2025, Valley filed a Statement of Reason seeking approval to increase base rates by $1.6 million. Valley filed the Direct Testimony of six witnesses. Valley serves more than 7,420 customers. Valley uses a Fully Projected Future Test Year ("FPFTY") ending December 31, 2026, a Future Test Year ("FTY") ending December 31, 2025, and a Historical Test Year ("HTY") ending December 31, 2024. Valley stated in its filing that it must seek a general increase in its rates to recover its costs and to earn a fair return on capital.

Q CAN YOU DESCRIBE THIS RATE FILING IN RELATION TO THE COMPANY'S PRIOR GENERAL RATE INCREASE FILINGS?

A Valley has filed for general rate increases in 2019 and 2022, each of which resulted in a grant of a rate increase with an effective date somewhere near nine months of the filing date in each case.

Q PLEASE SUMMARIZE THE TESTIMONY OF OCA'S OTHER EXPERTS IN THIS PROCEEDING.

A The OCA's witnesses touch on most aspects of the Company's rate case.

- My testimony, OCA Statement 1, addresses the Company's proposed claims for its proposed increase in its revenue requirement based on the FPFTY 2026 and makes recommendations for reasonable adjustments to reflect appropriate and normalized revenues and expenses for ratemaking purposes.

- Mr. Christopher Walters, OCA Statement 2, addresses the appropriate capital structure for ratemaking, the Return on Equity ("ROE"), and the impact of the Company's claims for an additional 25 basis points for management performance and size adjustment on the ROE. Mr. Walters recommends a market-based ROE of 9.50%, which is the midpoint of his reasonable range of 9.00% to 10.00% based on the analytical methods he used. The negative adjustment to the Company's revenue requirement based on Mr. Walters' recommended ROE is reflected in the recommended revenue requirement increase presented in my testimony.

- Mr. Michael W. Deupree, OCA Statement 3, is the OCA's expert witness on cost-of-service studies, revenue allocation, and rate design. Mr. Deupree provides recommendations solely regarding proposed revenue allocation and rate design for the customer charge.

- Ms. LeeAnn Wise, OCA Statement 4, is the OCA's expert witness on quality of customer service issues, including customer payment fees, security deposits, and payment plans. Ms. Wise recommends that the Company eliminate the $3.95 processing fee charged to customers who pay their utility bills by credit card. Given this recommendation, the resulting increase to the revenue requirement will be reflected in my revenue requirement recommendation.

SUMMARY OF RECOMMENDATIONS

Q PLEASE SUMMARIZE YOUR CONCLUSIONS AND RECOMMENDATIONS.

A My conclusions and recommendations are as follows:

1. I recommend that Valley's annualized payroll expense be decreased.
2. I recommend a reduction to Valley's non-labor expenses in Accounts 880 and 925.
3. I recommend that Valley's proposed depreciation expense be decreased.
4. I raise a concern about the apparent mismatch between the revenues and expenses related to the purchased gas adjustment clause.

Q DO YOU BELIEVE AN INCREASE IN VALLEY'S REVENUES OF APPROXIMATELY $1.6 MILLION WILL RESULT IN JUST AND REASONABLE RATES FOR VALLEY'S CUSTOMERS?

A No. I believe that the base rate increase proposed by Valley is overstated. I have prepared Table GRM-1 (Valley) that shows the adjustments I am proposing that reduces the revenue increase sought by Valley by a total of $662,469. With my adjustments, and the adjustments of OCA Witness Walters (ROE) and OCA Witness Wise (credit card payment fees), Table GRM-1(Valley) shows that the Company is only entitled to a $963,630 revenue increase.

Table GRM-1 (Valley)

OCA Revenue Requirment Adjustments

Line	Description	Amount
1	Company Proposed Revenue Requirement Increase[1]	$ 1,626,099
	OCA Adjustments:	
2	Return on Equity	$ (375,363)
3	Labor	$ (19,892)
4	Acct 880 and 925	$ (67,810)
5	Depreciation	$ (267,031)
6	Credit Card Fee	$ 67,627
7	Total OCA Adjustments	$ (662,469)
8	OCA Proposed Revenue Requirement Increase	$ 963,630

Source:
[1]OCA-I-1 Attachment A (Schedule A-D) Tab "C1."

PAYROLL EXPENSE

Q HAVE YOU REVIEWED THE LEVEL OF PAYROLL EXPENSE INCLUDED IN VALLEY'S REVENUE REQUIREMENT?

A Yes, I have.

Q DO YOU BELIEVE THE LEVEL OF PAYROLL EXPENSE INCLUDED IN VALLEY'S REVENUE REQUIREMENT REPRESENTS A REASONABLE LEVEL?

A No. I believe Valley has overstated the level of payroll expenses for the FPFTY 2026. Valley is proposing to increase payroll expense by approximately 10%[1] over the payroll level recorded in the HTY 2024.

Q PLEASE DISCUSS THE PROCESS YOU UTILIZED TO ANNUALIZE VALLEY'S PAYROLL EXPENSES.

A I increased the HTY 2024 level of payroll by 4% to reflect the level of FTY 2025 payroll expenses. I then applied a 4% payroll increase to the FTY 2025 level of payroll expenses to reflect the FPFTY 2026 annualized level of payroll expenses.

Q WHY DID YOU CHOSE A 4% PAYROLL INCREASE FIGURE?

A It is my experience that a typical range for annual payroll increases is between 3.5% to 4% per year. Therefore, I chose 4% to annualize Valley's payroll expense.

Q WHAT WAS THE EFFECT OF YOUR PAYROLL ANNUALIZATION?

A My annualized level of payroll expenses resulted in a reduction of payroll expenses of $19,488. This results in a reduction to revenue requirement of $19,892. My proposed

[1]Percent Change of Schedule C1-1 Total Operating & Maintenance Expense between FPFTY 2026 and HTY 2024.

payroll expenses are shown on Exhibit GRM-1 (Valley), page 7. The impact of this adjustment is shown on Exhibit GRM-1 (Valley), page 2.

NON-LABOR OPERATIONS AND MAINTENANCE ("O&M") EXPENSES

Q HAVE YOU REVIEWED VALLEY'S O&M EXPENSES?

A Yes, and I noticed that the projections for Accounts 880 (Other Distribution Expenses) and 925 (Injuries and Damages Expense) were much greater than recent history would suggest appropriate.

Q WERE EITHER OF THESE ACCOUNTS SPECIFICALLY ADDRESSED IN TESTIMONY?

A Yes. Account 880 was specifically addressed. Valley Witness Jamie Beale states that "[f]or 2025, we made an adjustment to the HTY expenses to include expenses that were previously allocated to Account 880.45 and for a new recuring expense for Environmental System Research Institute (ESRI) cloud services that will work with the Company's Geographic Information System (GIS)."[2] Reviewing the projections for this account included in Exhibit JB-4, we can see that the account drops from $114,706 in HTY 2024 to $54,435 in FTY 2025 and then grows to $70,684 in FPFTY 2026.

And while Account 925 (where liability insurance premiums and injury claim costs are typically booked) is not specifically mentioned in testimony, Valley Witness Melissa Sullivan notes that "C&T has obtained reasonable premiums for Directors &

[2] *See* Direct Testimony of Jamie Beale at page 5, lines 5-9.

Officers ("D&O"), liability, and property insurance for its electric affiliates through Federated Rural Electric Cooperative Insurance Company."[3]

Beyond these two statements, I found no other specific mentions of these accounts and saw no support for their projected balances in the testimony provided by Valley.

Q PLEASE EXPLAIN YOUR CONCERNS REGARDING ACCOUNT 880.

A My concern is that even with the balances forecasted to be less than the HTY 2024 expense level, the account appears to be extremely overstated when compared with historical levels. From at least 2010 to 2023, the expense level ranged from around $1,900 to $7,250 and did not exceed that amount. And without explanation, in HTY 2024 the expense then grows by 1,482% to $114,706. I have summarized this history, along with the Company's forecast in Table GRM-2 (Valley).

[3] *See* Direct Testimony of Melissa Sullivan at page 11, lines 13-15.

Table GRM-2 (Valley)

Review of Account 880

Year	Expense
Historical	
2010	$1,921
2011	2,020
2012	1,931
2013	1,855
2014	2,073
2015	2,687
2016	2,555
2017	3,642
2018	3,893
2019	3,958
2020	4,416
2021	4,393
2022	4,903
2023	7,250
2024	**114,706**
Forecast	
2025	$54,435
2026	70,684

Sources:

2010-2024: Valley Energy, Inc. Annual Reports to the Pennsylvania Public Utility Commission

2025-2026: Exhibit__(HSG-1), Schedule C1-1

Even if the expense is then dropped to the proposed FPFTY 2026 level of $70,684, it represents an 875% growth over the 2023 level. These projections represent a massive growth in this account over the historical levels and have not been adequately supported by specific evidence by the Company.

Q WHAT IS YOUR PROPOSAL FOR THE ACCOUNT 880 EXPENSE LEVEL?

A Looking at the Company's response to Data Request I&E-RS-1-D, Attachment A,[4] it appears that there was no labor expense charged to this account prior to the projections for FTY 2025 and FPFTY 2026. Since I address labor in another part of this testimony, I propose to reduce the non-labor portion of this account down to the 2023 level. According to Exhibit__(HSG-1), Schedule C1-1, the non-labor portion of the account projected for FPFTY 2026 is $42,702. Reducing this amount to $7,250 would reduce the Company's Account 880 expense by $35,452.

Q PLEASE EXPLAIN YOUR CONCERNS REGARDING ACCOUNT 925.

A Similar to my concern with the projections for Account 880, the Account 925 forecast is also significantly higher than recent history would suggest appropriate. Given that this account includes the costs associated with injury claims, one would expect it to bounce around a bit and a review of the history confirms that expectation. From the period 2010 through HTY 2024, we see the account oscillate up and down between a low of $49,652 (2013) and the high of $93,900 (2024). I have summarized this history, along with the Company's forecast in Table GRM-3 (Valley).

[4]In this attachment, *See* Tab C1-1.

Table GRM-3 (Valley)

Review of Account 925

Year	Expense
Historical	
2010	$69,015
2011	72,650
2012	52,213
2013	49,652
2014	56,396
2015	55,419
2016	60,294
2017	56,695
2018	55,616
2019	79,058
2020	89,148
2021	87,139
2022	70,051
2023	83,066
2024	**93,900**
Forecast	
2025	$108,657
2026	124,881

Sources:

2010-2024: Valley Energy, Inc. Annual Reports to the Pennsylvania Public Utility Commission

2025-2026: Exhibit__(HSG-1), Schedule C1-1

As can be seen from this review, the projections increase the HTY 2024 expense by 16% for FTY 2025 and another 15% in FPFTY 2026. This growth in expense has not been adequately supported by specific evidence by the Company.

Q WHAT IS YOUR PROPOSAL FOR THE ACCOUNT 925 EXPENSE LEVEL?

A Absent specific evidence for increasing this expense 33% over 2024 levels,[5] I propose an adjustment to hold Account 925 to the HTY 2024 level of expense. This results in a decrease of $30,981 to the Company's proposed expense in FPFTY 2026.

My adjustments to Accounts 880 and 925 result in a decrease to expense of $66,433 and reduces revenue requirement by $67,810. My adjusted expense levels are shown on Exhibit GRM-1 (Valley), pages 7 through 9, and the impacts of these adjustments are shown on Exhibit GRM-1 (Valley), page 2.

DEPRECIATION

Q HAVE YOU REVIEWED THE LEVEL OF DEPRECIATION EXPENSE INCLUDED IN VALLEY'S REVENUE REQUIREMENT?

A Yes. I have reviewed Valley's depreciation calculation.

Q DID YOU DISCOVER ANY ISSUES WITH THE LEVEL OF DEPRECIATION EXPENSE PROPOSED BY VALLEY?

A Yes. I found two accounts where I contend the depreciation expense included in Valley's revenue requirement is incorrect.

[5] (124,881 / 93,900) – 1 = 33%.

Q WHAT TWO PLANT ACCOUNTS DO YOU BELIEVE DO NOT REFLECT THE CORRECT LEVEL OF DEPRECIATION EXPENSE?

A I contend that Plant Accounts 391 and 396 do not reflect the proper level of depreciation expense.

Q PLEASE DESCRIBE THE PLANT INVESTMENT IN ACCOUNTS 391 AND 396.

A The investment in each account is listed below:

- Plant Account 391 – Office Furniture & Equipment
- Plant Account 396 – Power Operated

Q PLEASE DISCUSS YOUR CONCERNS WITH THE ANNUALIZED DEPRECIATION EXPENSE INCLUDED IN PLANT ACCOUNT 391.

A Valley proposes to include $161,942 of depreciation expense in its FPFTY 2026 revenue requirement.[6] However, Plant Account 391 will be fully depreciated in FTY 2025. Therefore, there is no need to depreciate those assets for purposes of the FPFTY 2026. I, therefore, propose that the $161,942 be removed from Valley's expense.

[6]Schedule C3 at page 2, line 24.

Q PLEASE DISCUSS YOUR CONCERNS WITH PLANT ACCOUNT 396.

A Annualized depreciation expense for Plant Account 396, as proposed by Valley in the FPFTY 2026, is $58,744.[7] Applying that total to the plant investment results in an accumulated depreciation reserve balance overcollection of $199 at the end of the FPFTY 2026. I, therefore, propose to reduce the annual level of depreciation expense for Plant Account 396 to reflect three-year recovery of the annual expense ($58,545). In this way, Plant Account 396 will be fully recovered during the period new rates are in effect in this rate case and will not create an overcollection of depreciation expense for Plant Account 396.

Q WHAT ADJUSTMENT ARE YOU PROPOSING FOR PLANT ACCOUNT 396?

A I am proposing to reduce the annual level of depreciation expense to reflect a three-year recovery of $58,545 or an adjustment of $39,229 to Valley's proposed annualized level of depreciation expense.

Q WHAT IS THE TOTAL DEPRECIATION EXPENSE ADJUSTMENT YOU ARE PROPOSING FOR PLANT ACCOUNTS 391 AND 396?

A I propose to reduce Valley's annualized depreciation expense by $201,171. This adjustment would also lower Valley's proposed revenue requirement by $267,031. My adjusted depreciation expense is shown on Exhibit GRM-1 (Valley), pages 5 and 6. The impact of my adjustments can be seen on Exhibit GRM-1 (Valley), page 2.

[7]Schedule C3 at page 2, line 29.

REVENUE/EXPENSE PURCHASED GAS ADJUSTMENT ("PGA")

Q HAVE YOU REVIEWED THE REVENUE REQUIREMENT ADJUSTMENT PROPOSED BY VALLEY TO REMOVE PURCHASED GAS EXPENSE FROM THE REVENUES AND EXPENSES OF VALLEY?

A Yes, I have.

Q DO YOU HAVE ANY CONCERNS WITH THE ADJUSTMENTS PROPOSED BY VALLEY?

A Yes. The PGAs proposed by Valley create a significant revenue requirement impact for the distribution rate case. Specifically, Valley proposes to reduce revenues associated with purchase gas by approximately $2.6 million.[8] In addition, Valley proposes a purchase gas expense adjustment of approximately $3.7 million.[9] These PGAs create a negative revenue requirement impact of approximately $1.1 million due to the difference in the revenue and expense PGAs.

Q MUST THESE TOTALS EQUAL?

A Not necessarily. However, there is an approximate 18% difference between the revenue adjustment and the expense adjustment proposed by Valley. This is a significant difference between expense and revenue recognition.

[8]As shown on Company Schedule C1, Per Books Total Revenue $8,529,574 minus Distribution Only Revenues of $5,955,553 equals $2,574,021.

[9]Company Schedule C1 at line 10.

Q HOW WOULD YOU LIKE TO PROCEED IN THIS RATE CASE?

A I would propose that Valley be given the opportunity to explain the difference between the revenue and expense adjustments. Parties can then review these explanations and determine if they are reasonable. At this point in time, I am not proposing an adjustment to set the revenue and expense adjustments equal to each other. I reserve the right to propose an adjustment in later testimonies.

Q ARE YOU AWARE OF THE OTHER UTILITIES (CITIZENS' ELECTRIC COMPANY OF LEWISBURG ("CITIZENS") AND WELLSBORO ELECTRIC COMPANY ("WELLSBORO") HAVING SIMILAR ADJUSTMENTS?

A Citizens does not have this concern as Citizens adjusted its revenues and expenses by the same totals. Wellsboro has a similar problem as Valley, but the revenue requirement effect is opposite of that effect for Valley.

Q DO YOU HAVE ANY OTHER CONCERNS REGARDING VALLEY'S PROPOSED REVENUE REQUIREMENT?

A Yes. I have some concerns regarding Industrial revenues. OCA has issued discovery on this issue but the response is still outstanding. I reserve the right to file Supplemental Testimony once that response has been provided.

OTHER ADJUSTMENTS

Q ARE YOU REFLECTING OTHER ADJUSTMENTS IN YOUR RECOMMENDED REVENUE INCREASE?

A Yes. In Exhibit GRM-1 (Valley), page 2, and in Table GRM-1 (Valley), I reflect the adjustments to the Company's revenue requirement increase recommended by OCA Witnesses Walters and Wise, in OCA Statements 2 and 4, respectively.

Q PLEASE EXPLAIN HOW YOU ADDRESS OCA WITNESS WALTERS' ADJUSTMENT.

A OCA Witness Walters recommends a market-based ROE of 9.50%, which is the midpoint of his reasonable range of 9.00% to 10.00% based on the analytical methods he used. Applying Mr. Walters' recommended ROE results in a negative adjustment to the Company's revenue requirement claim by $375,363.

Q PLEASE EXPLAIN HOW YOU ADDRESS OCA WITNESS WISE'S ADJUSTMENT.

A OCA Witness Wise recommends that the Company eliminate the $3.95 processing fee charged to customers who pay their utility bills by credit card. The total annual revenue that the Company collects in these fees from customers and then forwards to a third-party vendor is $66,253. Applying Ms. Wise's recommendation results in a positive adjustment of $67,627 to the Company's claimed revenue requirement increased.

CONCLUSION

Q DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A Yes, it does.

QUALIFICATIONS OF GREG R. MEYER

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Greg R. Meyer. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q PLEASE STATE YOUR OCCUPATION.

A I am a consultant in the field of public utility regulation and a Senior Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE SUMMARIZE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A I graduated from the University of Missouri in 1979 with a Bachelor of Science Degree in Business Administration, with a major in Accounting. Subsequent to graduation I was employed by the Missouri Public Service Commission. I was employed with the Commission from July 1, 1979 until May 31, 2008.

I began my employment at the Missouri Public Service Commission as a Junior Auditor. During my employment at the Commission, I was promoted to higher auditing classifications. My final position at the Commission was an Auditor V, which I held for approximately ten years.

As an Auditor V, I conducted audits and examinations of the accounts, books, records and reports of jurisdictional utilities. I also aided in the planning of audits and investigations, including staffing decisions, and in the development of staff positions in

which the Auditing Department was assigned. I served as Lead Auditor and/or Case Supervisor as assigned. I assisted in the technical training of other auditors, which included the preparation of auditors' workpapers, oral and written testimony.

During my career at the Missouri Public Service Commission, I presented testimony in numerous electric, gas, telephone and water and sewer rate cases. In addition, I was involved in cases regarding service territory transfers. In the context of those cases listed above, I presented testimony on all conventional ratemaking principles related to a utility's revenue requirement. During the last three years of my employment with the Commission, I was involved in developing transmission policy for the Southwest Power Pool as a member of the Cost Allocation Working Group.

In June of 2008, I joined the firm of Brubaker & Associates, Inc. as a Consultant. Since joining the firm, I have presented testimony and/or testified in the state jurisdictions of Arkansas, Florida, Idaho, Illinois, Indiana, Iowa, Kentucky, Maryland, Missouri, Montana, New Mexico, Ohio, Utah, Washington, Wisconsin and Wyoming. I have also appeared and presented testimony in Alberta and Nova Scotia, Canada. In addition, I have filed testimony at the Federal Energy Regulatory Commission ("FERC"). These cases involved addressing conventional ratemaking principles focusing on the utility's revenue requirement. The firm Brubaker & Associates, Inc. provides consulting services in the field of energy procurement and public utility regulation to many clients including industrial and institutional customers, some utilities and, on occasion, state regulatory agencies.

More specifically, we provide analysis of energy procurement options based on consideration of prices and reliability as related to the needs of the client; prepare rate,

feasibility, economic, and cost of service studies relating to energy and utility services; prepare depreciation and feasibility studies relating to utility service; assist in contract negotiations for utility services, and provide technical support to legislative activities.

In addition to our main office in St. Louis, the firm also has branch offices in Corpus Christi, Texas; Louisville, Kentucky and Phoenix, Arizona.

VERIFICATION

I, Greg R. Meyer, hereby state that the facts above set forth in my Direct Testimony, OCA Statement No. 1, are true and correct to the best of my knowledge, information, and belief and that I expect to be able to prove the same at a hearing held in this matter. I understand that the statements herein are made subject to the penalties of 18 Pa.C.S. § 4904 (relating to unsworn falsification to authorities).

Direct Testimony of Greg R. Meyer

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Greg R. Meyer. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q WHAT IS YOUR OCCUPATION?

A I am a consultant in the field of public utility regulation and a Senior Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A This information is included in Appendix A to my testimony.

Q ON WHOSE BEHALF ARE YOU APPEARING IN THIS PROCEEDING?

A I am appearing on behalf of the Pennsylvania Office of Consumer Advocate ("OCA").

Q HAVE YOU TESTIFIED BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION ("COMMISSION") IN PRIOR PROCEEDINGS?

A Yes, I have. I provided testimony in Docket R-2024-3046519 (Columbia Gas of Pennsylvania) on behalf of the OCA.

Q PLEASE GIVE A BRIEF OVERVIEW OF YOUR TESTIMONY.

A My testimony will provide a brief overview of the case and discuss various aspects of the revenue requirement of Wellsboro Electric Company ("Wellsboro" or "Company").

My silence in regard to any issue should not be construed as an endorsement of or acquiescence to Wellsboro's position.

CASE OVERVIEW AND WITNESS INTRODUCTION

Q PLEASE DESCRIBE THE RATE INCREASE THAT WELLSBORO FILED.

A On April 30, 2025, Wellsboro filed a Statement of Reason seeking approval to increase base rates by $2.9 million. Wellsboro filed the Direct Testimony of five witnesses. Wellsboro serves approximately 6,478 customers. Wellsboro uses a Fully Projected Future Test Year ("FPFTY") ending December 31, 2026, a Future Test Year ("FTY") ending December 31, 2025, and a Historical Test Year ("HTY") ending December 31, 2024. Wellsboro stated in its filing that it must seek a general increase in its rates to recover its costs and to earn a fair return on capital.

Q CAN YOU DESCRIBE THIS RATE FILING IN RELATION TO THE COMPANY'S PRIOR GENERAL RATE INCREASE FILINGS?

A Wellsboro has filed for general rate increases in 2016 and 2019, each of which resulted in a grant of a rate increase with an effective date somewhere near nine months of the filing date in each case.

Q PLEASE SUMMARIZE THE TESTIMONY OF OCA'S OTHER EXPERTS IN THIS PROCEEDING.

A The OCA's witnesses touch on most aspects of the Company's rate case.

- My testimony, OCA Statement 1, addresses the Company's proposed claims for its proposed increase in its revenue requirement based on the FPFTY 2026 and makes recommendations for reasonable adjustments to reflect appropriate and normalized revenues and expenses for ratemaking purposes.

- Mr. Christopher Walters, OCA Statement 2, addresses the appropriate capital structure for ratemaking, the Return on Equity ("ROE"), and the impact of the Company's claims for an additional 25 basis points for management performance and size adjustment on the ROE. Mr. Walters recommends a market-based ROE of 9.50%, which is the midpoint of his reasonable range of 9.00% to 10.00% based on the analytical methods he used. The negative adjustment to the Company's revenue requirement based on Mr. Walters' recommended ROE is reflected in the recommended revenue requirement increase presented in my testimony.

- Mr. Michael W. Deupree, OCA Statement 3, is the OCA's expert witness on cost-of-service studies, revenue allocation, and rate design. Mr. Deupree provides adjustments to the Company's allocated class cost of service study, recommendations regarding proposed revenue allocation and rate design for the customer charge.

- Ms. LeeAnn Wise, OCA Statement 4, is the OCA's expert witness on quality of customer service issues, including customer payment fees, security deposits, and payment plans. Ms. Wise recommends that the Company eliminate the $3.95 processing fee charged to customers who pay their utility bills by credit card. Given this recommendation, the resulting increase to the revenue requirement will be reflected in my revenue requirement recommendation.

SUMMARY OF RECOMMENDATIONS

Q PLEASE SUMMARIZE YOUR CONCLUSIONS AND RECOMMENDATIONS.

A My conclusions and recommendations are as follows:

1. I recommend that Wellsboro's annualized revenues be increased.
2. I recommend a reduction to Wellsboro's annualized payroll expense.
3. I recommend an adjustment to the non-labor expenses charged to Accounts 920 and 932.
4. I recommend a reduction to Wellsboro's expenses related to Advertising and Lobbying.
5. I raise a concern about the apparent mismatch between the revenues and expenses related to the purchased power adjustment clause.

Q DO YOU BELIEVE AN INCREASE IN WELLSBORO'S REVENUES OF APPROXIMATELY $2.9 MILLION WILL RESULT IN JUST AND REASONABLE RATES FOR WELLSBORO'S CUSTOMERS?

A No. I believe that the base rate increase proposed by Wellsboro is overstated. I have prepared Table GRM-1 (Wellsboro) that shows the adjustments I am proposing that reduces the revenue increase sought by Wellsboro by a total of $690,664. With my adjustments, and the adjustments recommended by OCA Witness Walters (ROE) and OCA Witness Wise (credit card payment fees), Table GRM-1 (Wellsboro) shows that Wellsboro is only entitled to a $2,208,724 revenue requirement increase.

Table GRM-1 (Wellsboro)

OCA Revenue Requirment Adjustments

Line	Description	Amount
1	Company Proposed Revenue Requirement Increase[1]	$ 2,899,388
	OCA Adjustments:	
2	Return on Equity	$ (405,756)
3	Rate Revenue	$ (28,210)
4	Labor	$ (139,491)
5	Acct 920 and 932	$ (152,463)
6	Sponsorship and Lobbying	$ (2,389)
7	Credit Card Fee	$ 37,645
8	Total OCA Adjustments	$ (690,664)
9	OCA Proposed Revenue Requirement Increase	$ 2,208,724

Source:
[1]OCA-I-1 Attachment A (Schedule A-D) Tab "C1."

REVENUES

Q HAVE YOU REVIEWED THE LEVEL OF ANNUALIZED REVENUES PROPOSED BY WELLSBORO FOR INCLUSION IN THIS RATE CASE?

A Yes, I have.

Q DO YOU AGREE WITH THE LEVELS OF ANNUALIZED REVENUES INCLUDED IN WELLSBORO'S REVENUE REQUIREMENT?

A No. I believe Wellsboro has understated the Commercial and Industrial levels of revenues.

Q PLEASE EXPLAIN WHY YOU BELIEVE WELLSBORO HAS UNDERSTATED THE LEVEL OF COMMERCIAL REVENUES.

A The usage per customer (kilowatt-hour ("kWh") per customer) proposed by Wellsboro for the Commercial class is understated when compared to a 10-year average of usage from the 2015-2024 Company annual reports. I have prepared Table GRM-2 (Wellsboro) below to show the levels of Commercial usage from different time periods and the usage level proposed by Wellsboro.

Table GRM-2 (Wellsboro)

Commercial Usage Analysis

Time Period	Usage (kWh) per Customer
5-Year Average[1]	24,605
10-Year Average[1]	25,920
15-Year Average[1]	26,369
Company Proposed FPFTY[2]	25,358

Sources:
[1]Calculated based on Company Annual reports from 2010 to 2024.
[2]Company Schedule B3.

As can be seen from Table GRM-2 (Wellsboro), the Commercial usage levels proposed by Wellsboro are lower than the 10- and 15-year historical usage levels experienced. I recommend using the 10-year usage patterns for the Commercial class to annualize revenues. The table also shows that the 10- and 15-year usage patterns are close to each other and greater than the five-year usage level. Overall, this indicates that the recent years have had milder weather and a longer time period of annualization is warranted.

Q WHAT IS THE COMMERCIAL REVENUE ADJUSTMENT IMPACT FROM YOUR PROPOSED USAGE PER CUSTOMER?

A Utilizing the 10-year usage per customer results in an increase in annualized Commercial revenues of $21,854. I would note that my adjustment to increase Commercial revenues recognizes the effects of uncollectible expense. The adjustment to Commercial usage per customer is calculated in Exhibit GRM-1 (Wellsboro), page 3, and the impact is shown on Exhibit GRM-1 (Wellsboro), page 2. The energy proposed for Commercial customers is shown on Exhibit GRM-1 (Wellsboro), page 4.

Q FINALLY, DO YOU BELIEVE WELLSBORO'S INDUSTRIAL REVENUES ARE ALSO UNDERSTATED?

A Yes, I do. I have prepared Table GRM-3 (Wellsboro) to show the levels of Industrial usage from different time periods and the usage level proposed by Wellsboro.

Table GRM-3 (Wellsboro)

Industrial Usage Analysis

Time Period	Usage (kWh) per Customer
5-Year Average[1]	2,129,794
10-Year Average[1]	2,364,313
15-Year Average[1]	2,608,906
Company Proposed FPFTY[2]	2,057,407

Sources:
[1]Calculated based on Company Annual reports from 2010 to 2024.
[2]Company Schedule B3.

As can be seen from Table GRM-3 (Wellsboro) above, the Industrial usage levels proposed by Wellsboro are lower than the five-, 10-, and 15-year historical usage levels experienced. I recommend using the 10-year usage patterns for the Industrial class to annualize revenues. The 10-year usage is a conservative recommendation that captures some effects of milder weather while recognizing that weather has been abnormal in recent years.

Q WHAT IS THE INDUSTRIAL REVENUE ADJUSTMENT IMPACT FROM YOUR PROPOSED USAGE PER CUSTOMER?

A Utilizing the 10-year usage per customer results in an increase in annualized Industrial revenues of $6,211. I would note that my adjustment to increase Industrial revenues recognizes the effects of uncollectible expense. The adjustment to Industrial usage per

customer is calculated in Exhibit GRM-1 (Wellsboro), page 3, and the impact is shown on Exhibit GRM-1 (Wellsboro), page 2. The energy proposed for Industrial customers is shown on Exhibit GRM-1 (Wellsboro), page 4.

Summing the two rate class revenue adjustments results in a total Wellsboro increase to Wellsboro's revenues of $28,065. This results in a decrease to revenue requirement of $28,210. This is shown on Exhibit GRM-1 (Wellsboro), page 2.

PAYROLL EXPENSE

Q HAVE YOU REVIEWED THE LEVEL OF PAYROLL EXPENSE INCLUDED IN WELLSBORO'S REVENUE REQUIREMENT?

A Yes, I have.

Q DO YOU BELIEVE THE LEVEL OF PAYROLL EXPENSE INCLUDED IN WELLSBORO'S REVENUE REQUIREMENT REPRESENTS A REASONABLE LEVEL?

A No. I believe Wellsboro has overstated the level of payroll expenses for the FPFTY 2026. Wellsboro is proposing to increase payroll expense by approximately 20%[1] over the payroll level recorded in the HTY 2024.

[1]Percent Change of Schedule C1-1 Total Operating & Maintenance Expense between FPFTY 2026 and HTY 2024.

Q PLEASE DISCUSS THE PROCESS YOU UTILIZED TO ANNUALIZE WELLSBORO'S PAYROLL EXPENSES.

A I increased the HTY 2024 level of payroll by 4% to a reasonable level of FTY 2025 payroll expenses. I then applied a 4% payroll increase to the FTY 2025 level of payroll expenses to reflect a reasonable FPFTY 2026 annualized level of payroll expenses.

Q WHY DID YOU CHOSE A 4% PAYROLL INCREASE FIGURE?

A It is my experience that a typical range for annual payroll increases is between 3.5% to 4% per year. Therefore, I chose 4% to annualize Wellsboro's payroll expense.

Q WHAT WAS THE EFFECT OF YOUR PAYROLL ANNUALIZATION?

A My annualized level of payroll expenses resulted in a reduction of payroll expenses of $129,798. This results in a decrease to the revenue requirement of $139,491. My proposed payroll expenses are shown on Exhibit GRM-1 (Wellsboro), pages 19 through 24. The impact of this adjustment is shown on Exhibit GRM-1 (Wellsboro), page 2.

NON-LABOR OPERATION & MAINTENANCE ("O&M") EXPENSES

Q HAVE YOU REVIEWED WELLSBORO'S O&M EXPENSES?

A Yes, I have. In reviewing Wellsboro's expenses, I have noticed that the projections for Account 920 (Administrative and General ("A&G") Salaries) and Account 932 (Maintenance of General Property) were much greater than recent history would suggest appropriate.

Q WAS THE GROWTH IN EXPENSE ASSOCIATED WITH THESE ACCOUNTS ADDRESSED IN WELLSBORO'S TESTIMONY?

A Yes, but not on the account level. The testimony from Wellsboro witness Byron Farnsworth Jr. addressed A&G expense generally, which includes both accounts, stating "our Administrative & General Expenses and our Customer Account and Collection Expenses have increased."[2]

Q WHAT DID YOU FIND WITH RESPECT TO THE NON-LABOR EXPENSES ASSOCIATED WITH ACCOUNT 920 A&G SALARIES?

A In reviewing the response to Data Request I&E-RE-16-D, I found a shocking lack of explanation for the growth requested in this account. The request asked the Company to supply detailed explanations for the growth in this account's expense from 2023 through the projections for FPFTY 2026. Wellsboro merely referenced Mr. Farnsworth's testimony and exhibits as well as the testimony of Wellsboro witness Jill Campbell. Neither of these testimonies provides a specific analysis of the expense booked to the A&G salaries account.

Additionally, this response provides a breakdown of the expense between labor and non-labor categories. I have excerpted this below.

A.

	2023	2024	2025	2026
Labor	301,608	355,049	401,562	426,497
Overhead	351,031	402,852	468,335	484,732
Transportation	-	-	-	-
Material	-	-	-	-
	652,639	757,901	869,897	911,229

[2] *See* Direct Testimony of Byron Farnsworth, Jr. at page 6, lines 9-10.

As can be seen in this breakdown, the Company proposes to increase the non-labor portion by $81,880 over the HTY 2024 level. This represents a growth of 20.3%.

Q WHAT IS YOUR CONCERN WITH THIS PROJECTED GROWTH IN THIS ACCOUNT?

A My concern is that this forecasted growth has not been justified by specific and concrete evidence. If we are asking customers to pay for an $81,880 increase in additional A&G overhead cost, Wellsboro should provide convincing reasons why it is necessary.

Q WHAT DO YOU PROPOSE FOR THIS ACCOUNT?

A Since I address salaries elsewhere in this testimony, I will only address the overhead component of Account 920. I believe that absent justification, no increase in the overhead should be allowed. This will reduce the Company's proposed expense by $81,880.

Q WHAT DID YOU FIND WITH RESPECT TO THE EXPENSES ASSOCIATED WITH ACCOUNT 932 MAINTENANCE OF GENERAL PROPERTY?

A For Account 932, in reviewing the response to Data Request I&E-RE-20-D, the Company has proffered a string of assertions to the increasing cost, but no breakdown as to how much each item contributes to the overall growth we see in the account:

> The projected 84.0% increase in expenses from HTY 2024 to FTY 2025 is primarily due to the return to normal operations following the completion of construction, along with planned investments in key areas. IT and cybersecurity costs are expected to

> rise as the Company continues to strengthen system security and maintain critical software and support services. Utility expenses are expected to increase with the full facility back in use, leading to higher consumption of gas, water, and related services. Grounds maintenance will also return to normal levels, including increased lawn care now that construction is complete and full property upkeep has resumed. In addition, FTY 2025 includes preparation for a typical winter season, with a corresponding increase in snow plowing costs. The increase also accounts for scheduled blacktop maintenance, specifically sealing half of the complex as part of a planned alternating-year maintenance cycle.

Additionally, the Company provided a breakdown of the expense between labor and non-labor categories in response to Data Request I&E-RE-21-D that I have excerpted below.

A.

	2023	2024	2025	2026
Labor	50,565.49	11,363.62	12,378.00	12,746.00
OH	-	-	5,643.00	5,979.00
Other	62,014.46	60,822.23	114,826.00	114,826.00
	112,579.95	72,185.85	132,847.00	133,551.00

As can be seen in this breakdown, the Company proposes to increase the non-labor portion by $59,983 over the HTY 2024 level. This represents a growth of 98.6%.

Q WHAT IS YOUR CONCERN WITH THIS PROJECTED GROWTH IN THIS ACCOUNT?

A My concern is that this forecasted growth has not been justified by specific and concrete evidence. If we are asking customers to pay for a $59,983 increase in additional non-labor general plant maintenance cost, Wellsboro should provide convincing reasons why it is necessary.

Q WHAT DO YOU PROPOSE FOR THIS ACCOUNT?

A Since I address salaries elsewhere in this testimony, I will only address the overhead and other components of Account 932. I believe that absent justification, no increase in the overhead and other non-labor cost should be allowed. This will reduce the Company's proposed expense by $59,983.

My adjustments to Accounts 920 and 932 result in a decrease to expense of $141,863 and decrease revenue requirement by $152,463. My adjusted expense levels are shown on Exhibit GRM-1 (Wellsboro), pages 23 and 24, and the impacts of these adjustments are shown on Exhibit GRM-1 (Wellsboro), page 2.

ADVERTISING AND LOBBYING

Q HAVE YOU PERFORMED A REVIEW OF WELLSBORO'S ADVERTISING AND LOBBYING EXPENSE?

A Yes, I have. In response to Data Request I&E-RE-10-D and OCA-VII-20, Wellsboro provided the Company's Advertising and Lobbying expenses that were included in the FPFTY. Wellsboro is proposing to include $2,191 and $32 in the FPFTY for Advertising and Lobbying expenses, respectively.

Q DO YOU BELIEVE THAT THE ABOVE LEVELS OF ADVERTISING AND LOBBYING EXPENSES IS APPROPRIATE TO INCLUDE IN THIS CASE?

A No, customers should not have to pay for Advertising and Lobbying expenses that are not necessary or beneficial to providing safe and reliable service. These types of activities mentioned are solely for burnishing the reputation of the Company.

Q WHAT IS YOUR RECOMMENDATION REGARDING ADVERTISING AND LOBBYING EXPENSES?

A I recommend that these expenses be removed from the revenue requirement. This adjustment would lower the revenue requirement by $2,389. My adjusted expense levels can be seen on Exhibit GRM-1 (Wellsboro), pages 10 and 11. The impact of my adjustments can be seen on Exhibit GRM-1 (Wellsboro), page 2.

REVENUE/EXPENSE PURCHASED POWER ADJUSTMENT ("PPA")

Q HAVE YOU REVIEWED THE REVENUE REQUIREMENT ADJUSTMENT PROPOSED BY WELLSBORO TO REMOVE PURCHASED POWER EXPENSE FROM THE REVENUES AND EXPENSES OF WELLSBORO?

A Yes, I have.

Q DO YOU HAVE ANY CONCERNS WITH THE ADJUSTMENTS PROPOSED BY WELLSBORO?

A Yes. The PPAs proposed by Wellsboro create a significant revenue requirement impact for the distribution rate case. Specifically, Wellsboro proposes to reduce revenues associated with purchase power by approximately $6.9 million.[3] In addition, Wellsboro proposes a purchase power expense adjustment of approximately $5.7 million.[4] These PPAs create an increase to revenue requirement of approximately $1.2 million due to the difference in the revenue and expense PPAs.

[3]As shown on Company Schedule C1, Per Books Total Revenue $13,158,392 minus Distribution Only Revenues of $6,255,065 equals $6,903,327.

[4]Company Schedule C1 at line 13.

Q MUST THESE TOTALS EQUAL?

A Not necessarily. However, there is an approximate 20% difference between the revenue adjustment and the expense adjustment proposed by Wellsboro. This is a significant difference between expense and revenue recognition.

Q HOW WOULD YOU LIKE TO PROCEED IN THIS RATE CASE?

A I would propose that Wellsboro be given the opportunity to explain the difference between the revenue and expense adjustments. Parties can then review these explanations and determine if they are reasonable. At this point in time, I am not proposing an adjustment to set the revenue and expense adjustments equal to each other. I reserve the right to propose an adjustment in later testimonies.

Q ARE YOU AWARE OF THE OTHER UTILITIES (CITIZENS' ELECTRIC COMPANY OF LEWISBURG ("CITIZENS") AND VALLEY ENERGY, INC. ("VALLEY")) HAVING SIMILAR ADJUSTMENTS?

A Citizens does not have this concern, as Citizens adjusted its revenues and expenses by the same totals. Valley has a similar problem as Wellsboro, but the revenue requirement effect is opposite of that effect for Wellsboro.

OTHER ADJUSTMENTS

Q ARE YOU REFLECTING OTHER ADJUSTMENTS IN YOUR RECOMMENDED REVENUE INCREASE?

A Yes. In Exhibit GRM-1 (Wellsboro), page 2, and in Table GRM-1 (Wellsboro), I reflect the adjustments to the Company's revenue requirement increase recommended by OCA Witnesses Walters and Wise, in OCA Statements 2 and 4, respectively.

Q PLEASE EXPLAIN HOW YOU ADDRESS OCA WITNESS WALTERS' ADJUSTMENT.

A OCA Witness Walters recommends a market-based ROE of 9.50%, which is the midpoint of his reasonable range of 9.00% to 10.00% based on the analytical methods he used. Applying Mr. Walters' recommended ROE results in a negative adjustment to the Company's revenue requirement claim by $405,756.

Q PLEASE EXPLAIN HOW YOU ADDRESS OCA WITNESS WISE'S ADJUSTMENT.

A OCA Witness Wise recommends that the Company eliminate the $3.95 processing fee charged to customers who pay their utility bills by credit card. The total annual revenue that the Company collects in these fees from customers and then forwards to a third-party vendor is $35,029. Applying Ms. Wise's recommendation results in a positive adjustment of $37,645 to the Company's claimed revenue requirement increased.

CONCLUSION

Q DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A Yes, it does.

QUALIFICATIONS OF GREG R. MEYER

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Greg R. Meyer. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q PLEASE STATE YOUR OCCUPATION.

A I am a consultant in the field of public utility regulation and a Senior Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE SUMMARIZE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A I graduated from the University of Missouri in 1979 with a Bachelor of Science Degree in Business Administration, with a major in Accounting. Subsequent to graduation I was employed by the Missouri Public Service Commission. I was employed with the Commission from July 1, 1979 until May 31, 2008.

I began my employment at the Missouri Public Service Commission as a Junior Auditor. During my employment at the Commission, I was promoted to higher auditing classifications. My final position at the Commission was an Auditor V, which I held for approximately ten years.

As an Auditor V, I conducted audits and examinations of the accounts, books, records and reports of jurisdictional utilities. I also aided in the planning of audits and investigations, including staffing decisions, and in the development of staff positions in

which the Auditing Department was assigned. I served as Lead Auditor and/or Case Supervisor as assigned. I assisted in the technical training of other auditors, which included the preparation of auditors' workpapers, oral and written testimony.

During my career at the Missouri Public Service Commission, I presented testimony in numerous electric, gas, telephone and water and sewer rate cases. In addition, I was involved in cases regarding service territory transfers. In the context of those cases listed above, I presented testimony on all conventional ratemaking principles related to a utility's revenue requirement. During the last three years of my employment with the Commission, I was involved in developing transmission policy for the Southwest Power Pool as a member of the Cost Allocation Working Group.

In June of 2008, I joined the firm of Brubaker & Associates, Inc. as a Consultant. Since joining the firm, I have presented testimony and/or testified in the state jurisdictions of Arkansas, Florida, Idaho, Illinois, Indiana, Iowa, Kentucky, Maryland, Missouri, Montana, New Mexico, Ohio, Utah, Washington, Wisconsin and Wyoming. I have also appeared and presented testimony in Alberta and Nova Scotia, Canada. In addition, I have filed testimony at the Federal Energy Regulatory Commission ("FERC"). These cases involved addressing conventional ratemaking principles focusing on the utility's revenue requirement. The firm Brubaker & Associates, Inc. provides consulting services in the field of energy procurement and public utility regulation to many clients including industrial and institutional customers, some utilities and, on occasion, state regulatory agencies.

More specifically, we provide analysis of energy procurement options based on consideration of prices and reliability as related to the needs of the client; prepare rate,

feasibility, economic, and cost of service studies relating to energy and utility services; prepare depreciation and feasibility studies relating to utility service; assist in contract negotiations for utility services, and provide technical support to legislative activities.

In addition to our main office in St. Louis, the firm also has branch offices in Corpus Christi, Texas; Louisville, Kentucky and Phoenix, Arizona.

VERIFICATION

I, Greg R. Meyer, hereby state that the facts above set forth in my Direct Testimony, OCA Statement No. 1, are true and correct to the best of my knowledge, information, and belief and that I expect to be able to prove the same at a hearing held in this matter. I understand that the statements herein are made subject to the penalties of 18 Pa.C.S. § 4904 (relating to unsworn falsification to authorities).

Direct Testimony of Christopher C. Walters

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Christopher C. Walters. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q WHAT IS YOUR OCCUPATION?

A I am a consultant in the field of public utility regulation and a Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A This information is included in Appendix A to my testimony.

Q ON WHOSE BEHALF ARE YOU APPEARING IN THIS PROCEEDING?

A I am appearing on behalf of the Pennsylvania Office of Consumer Advocate ("OCA").

Q PLEASE GIVE A BRIEF OVERVIEW OF YOUR TESTIMONY.

A The purpose of my testimony is to provide a recommendation to the Pennsylvania Public Utility Commission ("Commission") on behalf of OCA regarding an appropriate return on equity ("ROE") the Commission should authorize for Valley Energy, Inc. ("Valley"), Citizens' Electric Company of Lewisburg, PA ("Citizens"), and Wellsboro Electric Company ("Wellsboro"), (collectively the "Companies"), in this general rate case.

My silence with regard to any position taken by the Companies in the application or direct testimony in this proceeding does not indicate my endorsement of that position.

I. SUMMARY

Q PLEASE SUMMARIZE THE REST OF YOUR TESTIMONY.

A In Section II of my testimony, I review and analyze the regulated utility industry's access to capital, credit rating trends, and outlooks, as well as the overall trend in the authorized ROE for utilities throughout the country. I conclude that the trend in authorized ROEs for utilities has declined over the last several years and has remained below 10.0% in more recent history. I also review the impact that the Federal Reserve's ("the Fed") monetary policy actions have had on the cost of capital.

In Section III of my testimony, I address the Companies' proposed capital structure and cost of long-term debt and explain why I am not taking issue with the Companies' claim on either. I then outline how a fair ROE should be established, provide an overview of the market's perception of the Companies' investment risk, and present the analyses I relied on to estimate an appropriate ROE for the Companies. Based on the results of several cost of equity estimation methods performed on publicly

traded utility companies, I estimate the current fair market ROE to fall within the range of 9.00% to 10.00%. Based on my assessment of the Companies' overall risk profile and the results of the analytical methods, I recommend the Companies be awarded an ROE of 9.50%, which is the mid-point of my overall estimated range. As shown in the Direct Testimony of Greg Meyer, OCA Statement 1 for Citizens, Wellsboro, and Valley, my recommended ROE of 9.50% would result in downward adjustments to the proposed revenue requirement for each Company.

In Section IV of my testimony, I respond to the recommendations offered by the Companies' cost of capital witness Mr. Dylan D'Ascendis as it relates to the overall rate of return ("ROR"). Mr. D'Ascendis recommends the Companies be authorized an ROE of 11.65%, which is the average of his analytical results adjusted for flotation costs. I demonstrate that his ROE recommendation is excessive and should be rejected.

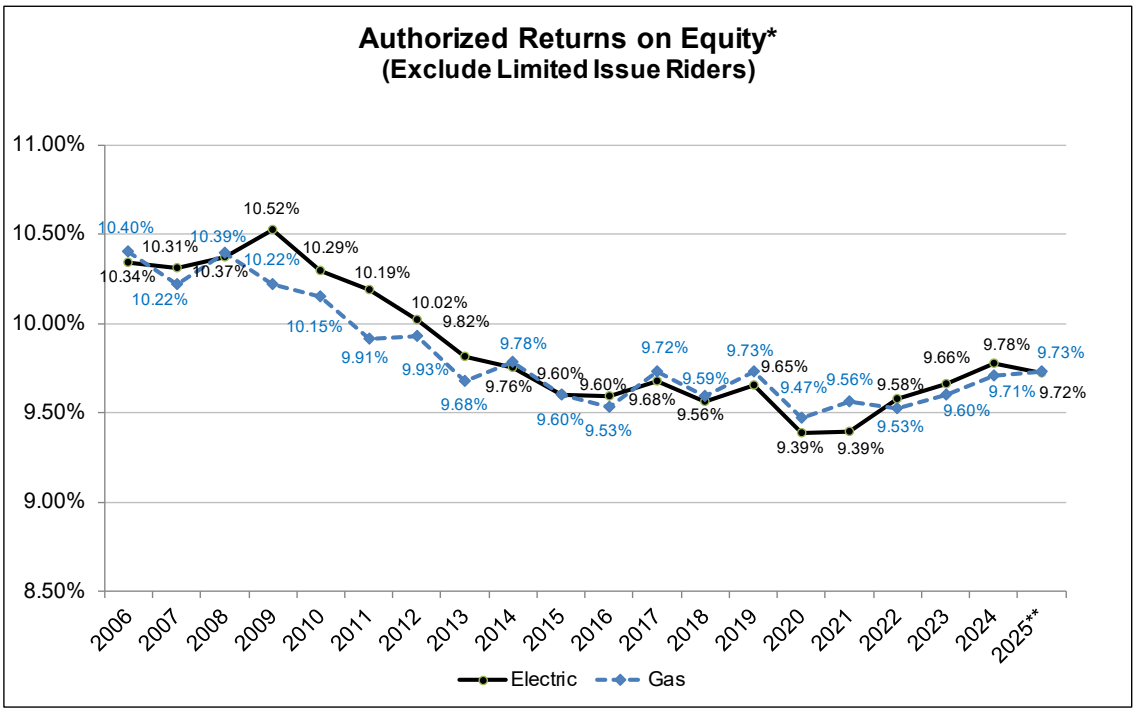
II. INDUSTRY TRENDS AND ECONOMIC ENVIRONMENT

A. Regulated Utility Industry Authorized ROEs Access to Capital and Credit Strength

Q PLEASE DESCRIBE THE OBSERVABLE EVIDENCE ON TRENDS IN AUTHORIZED ROES FOR ELECTRIC AND GAS UTILITIES.

A Authorized ROEs for both electric and gas utilities have declined below 10.0% for about the last 13 years, as illustrated in Figure CCW-1.

FIGURE CCW-1



Source and Notes:
* Electric Returns exclude Limited Issue Riders.
** *S&P Global Market Intelligence*, RRA Regulatory Focus, Major Rate Case Decisions -- January - March 2025, April 25, 2025 at page 3.

Q PLEASE DESCRIBE THE DISTRIBUTION OF AUTHORIZED ROES FOR ELECTRIC UTILITIES FOR THE LAST FEW YEARS.

A The distribution of authorized returns, annually, since 2016 is summarized in Table CCW-1.

TABLE CCW-1

Distribution of Authorized ROEs

	Electric[1]					Natural Gas[1]				
Year	Average	Median	Share of Decisions ≤ 9.5%	Share of Decisions ≤ 9.7%	Share of Decisions ≤ 10.0%	Average	Median	Share of Decisions ≤ 9.5%	Share of Decisions ≤ 9.7%	Share of Decisions ≤ 10.0%
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(6)

2018[2]	9.56%	9.58%	45%	61%	100%	9.59%	9.60%	46%	67%	95%
2019	9.65%	9.65%	36%	58%	88%	9.73%	9.73%	19%	48%	87%
2020[3]	9.39%	9.48%	64%	79%	98%	9.47%	9.44%	60%	77%	100%
2021	9.39%	9.50%	57%	80%	97%	9.56%	9.60%	44%	67%	98%
2022	9.58%	9.53%	50%	59%	79%	9.53%	9.60%	48%	76%	97%
2023	9.66%	9.60%	38%	65%	90%	9.60%	9.55%	46%	73%	92%
2024	9.78%	9.78%	24%	37%	85%	9.71%	9.73%	33%	50%	95%
2025	9.68%	9.75%	38%	44%	94%	9.74%	9.80%	18%	27%	100%
Average	9.60%	9.61%	43%	60%	91%	9.62%	9.61%	41%	63%	93%
Median	9.62%	9.60%	41%	60%	92%	9.59%	9.60%	45%	69%	95%

Source and Notes:
S&P Global Market Intelligence, data through May 30, 2025.
[1]Includes authorized base ROE of 9.4% for Nevada Power Company, which excludes incentives associated with the Lenzie facility.
[2]Includes authorized base ROE of 9.6% for Interstate Power & Light Co., which excludes allowed ROE for generating facilities subject to special ratemaking principles.
[3]Includes authorized base ROE of 9.8% for Interstate Power & Light Co., which excludes allowed ROE for generating facilities subject to special ratemaking principles.
*Excludes Limited Issue Rider Cases.

The distribution shows that the majority of authorized ROEs since 2016 have been below 9.7%, with many being below 9.5%.

Q HOW HAS THE AUTHORIZED COMMON EQUITY RATIO FLUCTUATED OVER THE SAME TIME PERIOD FOR UTILITIES?

A In general, the utility industry's common equity ratio has not deviated much from the range of 50.0% to 52.0%. As shown in Table CCW-2, I have provided the authorized common equity ratios for utilities around the country, excluding the reported common

equity ratios for Arkansas, Florida, Indiana, and Michigan. For my overall market analysis, I have excluded the reported authorized common equity ratios for these states because these jurisdictions include sources of capital outside of investor-supplied capital such as accumulated deferred income taxes. As such, the reported common equity ratios in these states would result in a downward bias in the reported permanent common equity ratios authorized for ratemaking purposes within my trend analysis.

TABLE CCW-2

Trends in State Authorized Common Equity Ratios
(Industry)

		Electric[1]		Natural Gas[1]		Water[2]	
Line	Year	Average	Median	Average	Median	Average	Median

- Excludes Arkansas, Florida, Indiana and Michigan because they include non-investor capital.

Q HAVE UTILITIES BEEN ABLE TO ACCESS EXTERNAL CAPITAL TO SUPPORT CAPITAL EXPENDITURE PROGRAMS?

A Yes. Regulatory Research Associates' ("RRA") October 22, 2024 Utility Capital Expenditures report, *RRA Financial Focus*, a division of *S&P Global Market Intelligence*, made several relevant comments about utility investments generally:[1]

- Energy utility capex estimates for 2025, 2026 and 2027 indicate successively higher spending levels, reaching $192 billion, $196.5 billion and $197 billion, respectively. Spending in these years is likely to increase further, as the companies' plans for future projects continue to solidify around federal and state legislation supporting infrastructure investment.

- Multiple drivers are expected to elevate utility capital expenditures over the next several years. Pent-up demand to replace aging equipment is already pushing utilities to make considerable investments in infrastructure. Meanwhile, the renewable energy portfolio standards for multiple states continue to ramp up, with the plans specifying large expansions of low-carbon energy generation capacity. Amplifying these factors are federal infrastructure investment plans, including the Inflation Reduction Act of 2022, which aim to convert the US power generation network to a majority of zero-carbon sources by 2035.

- Forecast aggregate utility investments in 2025, 2026 and 2027 are expected to reach new records of $192 billion, $196.5 billion and $197 billion, respectively. The increases are being driven in large part by federal legislation enacted in 2021 and 2022, supporting infrastructure investment and state-level energy transition plans and incentives, as well as robust growth in demand from datacenters, as the explosion in implementation of AI and cloud computing continues.

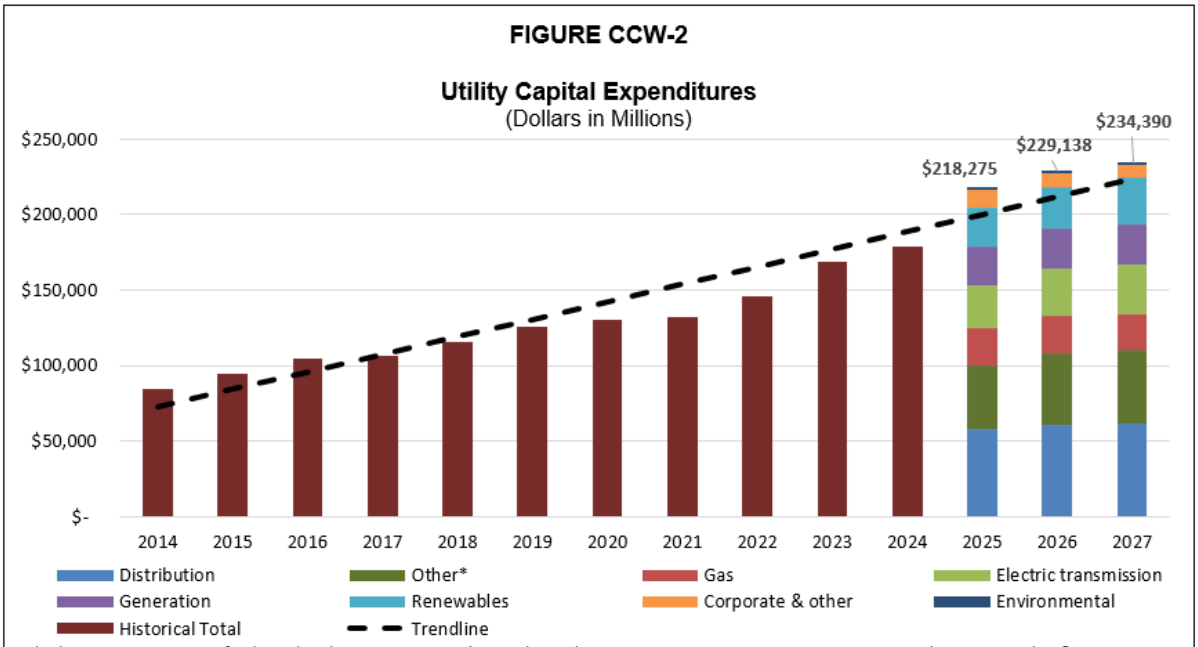
- Utilities have multiple opportunities to finance and support energy investments through mechanisms available within the Inflation Reduction Act and the Infrastructure Investment and Jobs Act of 2021. These pieces of legislation provide billions of dollars for power infrastructure investments, financial incentives for nuclear

[1] *S&P Global Market Intelligence, RRA Financial Focus*: "Utility capital expenditures update," October 22, 2024.

power plants and funding for battery storage technology, among other provisions.

As shown in Figure CCW-2 below, capital expenditures for the regulated electric and natural gas delivery utilities have increased considerably over the period 2023 into 2024, and the forecasted capital expenditures remain elevated through the end of 2026.

FIGURE CCW-2



*Other category consists of utilities that do not report capital expenditures by category: Avista, Dominion Energy, MDU, NorthWestern, and PG&E.
Source: *S&P Global Market Intelligence, RRA Financial Focus*, Utility Capital Expenditures Update, March 24, 2025, Tables 1 and 3.

As demonstrated in Figure CCW-2, and in the comments made by *RRA S&P Global Market Intelligence*, capital investments for the utility industry continue to stay at elevated levels, and these capital expenditures are expected to fuel utilities' profit growth into the foreseeable future. This is clear evidence that these capital investments are enhancing shareholder value and are attracting both equity and debt capital to the utility industry in a manner that allows for funding these elevated capital investments. While capital markets embrace these profit-driven capital investments, regulatory commissions also must be careful to maintain reasonable prices and tariff terms and

conditions to protect customers' needs for reliable utility service at reasonable rates. If this is not done, utility rates will expand beyond the ability of customers to pay, resulting in revenue constraints for utilities, which will impact their financial integrity.

Q IS THERE EVIDENCE OF ROBUST VALUATIONS OF REGULATED UTILITY EQUITY SECURITIES?

A Yes. Strong valuations demonstrate that utilities can issue securities at favorable prices and price multiples, signaling their ability to access equity capital on reasonable terms and at a relatively low cost. As shown on Exhibit CCW-1, the historical valuation of utilities followed by *The Value Line Investment Survey* ("*Value Line*"), based on a Price-to-Earnings ("P/E") ratio, Price-to-Cash Flow ratio, and Market Price-to-Book value ratio, indicates utility security valuations today are very strong and robust relative to the last several years. These strong valuations of utility stocks indicate that utilities have access to equity capital under reasonable terms and at lower costs.

Q WHAT CONCLUSION DO YOU DRAW FROM THIS OBSERVABLE MARKET DATA IN FORMING YOUR RECOMMENDED ROE AND OVERALL ROR?

A Generally, authorized ROEs, credit standing, and access to capital have been quite robust for utilities over the last several years, even throughout the duration of the global pandemic. It is critical that the Commission ensure that utility rates are increased no more than necessary to provide fair compensation and maintain financial integrity.

B. Impact of Monetary Policy

Q ARE THE FEDERAL OPEN MARKET COMMITTEE'S ("FOMC") ACTIONS KNOWN TO THE MARKET PARTICIPANTS, AND IS IT REASONABLE TO BELIEVE THEY ARE REFLECTED IN THE MARKET'S VALUATION OF BOTH DEBT AND EQUITY SECURITIES?

A Yes, to both questions. The FOMC communicates its monetary policy objectives with a high degree of transparency, including its dual mandate to achieve maximum employment and stable inflation near 2%. To achieve these objectives, the FOMC adjusts its policy stance in phases depending on economic conditions. For example, in response to the pandemic-induced downturn, the FOMC adopted an accommodative stance by lowering the federal funds rate to near zero and engaging in Quantitative Easing, purchasing Treasury securities and agency mortgage-backed securities to support market liquidity and economic growth.

Beginning in March 2022, the FOMC transitioned to a tightening phase, raising the target federal funds rate. In June 2022, it began reducing its balance sheet (Quantitative Tightening) by allowing maturing Treasury and agency Mortgage Backed Securities to roll off its balance sheet without reinvestment. That phase of policy tightening persisted into 2024.

Since September 2024, the FOMC has lowered the federal funds rate three times, signaling a shift toward a more accommodative or neutral stance in response to evolving economic data. While balance sheet reduction continues, the pace has slowed considerably, especially for Treasury securities, reflecting a more measured policy approach.

Market reactions to these actions are reflected in the valuation of debt and equity securities. A visualization of the market's response to the federal funds rate changes is shown in Figure CCW-3 below.

FIGURE CCW-3

Mergent Bond Record.

As shown in Figure CCW-3, the federal funds rate has risen more rapidly than Utility and Treasury bond yields. Meanwhile, the yield spread between Utility bonds and Treasury bonds has narrowed and is currently below its long-term average. This narrower spread suggests that investors perceive lower relative risk in Utility bonds

compared to Treasuries, requiring less additional yield to hold them. This trend typically reflects greater confidence in the financial stability and creditworthiness of utilities, driven by factors such as stable earnings, favorable regulatory environments, or improved credit fundamentals.

Q HAS THE FED MADE RECENT COMMENTS CONCERNING MONETARY POLICY AND THE POTENTIAL IMPACT ON INTEREST RATES?

A Yes. On May 7, 2025, the FOMC released the following statement:

> Although swings in net exports have affected the data, recent indicators suggest that economic activity has continued to expand at a solid pace. The unemployment rate has stabilized at a low level in recent months, and labor market conditions remain solid. Inflation remains somewhat elevated.
>
> The Committee seeks to achieve maximum employment and inflation at the rate of 2 percent over the longer run. Uncertainty about the economic outlook has increased further. The Committee is attentive to the risks to both sides of its dual mandate and judges that the risks of higher unemployment and higher inflation have risen.
>
> In support of its goals, the Committee decided to maintain the target range for the federal funds rate at 4-1/4 to 4-1/2 percent. In considering the extent and timing of additional adjustments to the target range for the federal funds rate, the Committee will carefully assess incoming data, the evolving outlook, and the balance of risks. The Committee will continue reducing its holdings of Treasury securities and agency debt and agency mortgage-backed securities. The Committee is strongly committed to supporting maximum employment and returning inflation to its 2 percent objective.
>
> In assessing the appropriate stance of monetary policy, the Committee will continue to monitor the implications of incoming information for the economic outlook. The Committee would be prepared to adjust the stance of monetary policy as appropriate if risks emerge that could impede the attainment of the Committee's goals. The Committee's assessments will take into account a wide range of information, including

readings on labor market conditions, inflation pressures and inflation expectations, and financial and international developments.[2]

The Fed's May 7, 2025, FOMC statement indicates that economic activity continues to expand at a solid pace, with labor market conditions remaining strong and inflation somewhat elevated. However, the Committee noted increased uncertainty about the economic outlook, citing heightened risks of both higher unemployment and higher inflation. To support its dual mandate of maximum employment and 2% inflation, the Fed maintained the federal funds rate target range at 4.25% to 4.5%. The Committee also decided to continue reducing its holdings of Treasury securities and agency debt and mortgage-backed securities, with Treasury redemptions capped at $5 billion per month and agency securities at $35 billion per month. The Fed emphasized its commitment to monitoring incoming data and is prepared to adjust monetary policy as appropriate to achieve its goals.

Q WHAT DO INDEPENDENT ECONOMISTS' OUTLOOKS FOR FUTURE INTEREST RATES AND INFLATION LEVELS INDICATE?

A Independent economists, surveyed by *Blue Chip Financial Forecasts,* expect long-term bond yields to remain relatively flat to marginally increase over the near term, while maintaining levels that are still relatively low by historical levels. For example, independent projections show that the consensus is the federal funds rate will decrease while long-term interest rates, as measured by the 30-year Treasury bond, are expected to remain relatively flat. Inflation, as measured through the Gross Domestic

[2] Federal Reserve Board - Federal Reserve issues FOMC statement, May 7, 2025.

Product ("GDP") price index, is expected to be a mix of marginal increases and decreases over the near to intermediate term. This indicates that levels of inflation are expected to be relatively flat over that period. The consensus projections for the next several quarters are provided in Table CCW-3 below.

Actual Yields in Bold.

Q WHAT IS THE OUTLOOK FOR LONG-TERM INTEREST RATES, AND WHY DOES IT MATTER?

A The outlook for long-term interest rates in the intermediate to long-term is also impacted by the current Fed actions and the expectation that eventually the Fed's monetary actions will return to more normal levels.

Long-term interest rate projections are illustrated in Table CCW-4:

TABLE CCW-4

Source and Note:
Blue Chip Financial Forecasts, January 2019 through June 2025.
*Average of all 3 reports in Quarter.

As outlined in Table CCW-4, the outlook for interest rates has moderated more recently relative to 2020 and part of 2021. For example, when actual interest rates were in the range of 1.4% to 2.1%, the near-term projections for 30-year Treasury yields ranged from 1.9% to 2.8% in 2020-2021, while the projections five to ten years out were in the range of 2.8% to 3.9%. Most recently, actual interest rates were approximately 4.5%, with near and intermediate projections in the range of 4.2% to 4.3%. While interest rates were expected to increase drastically from their actual levels in the 2020-2021 period, those same projections are now flat to declining, which indicates the cost of long-term capital might be near its peak.

C. Market Sentiments and Utility Industry Outlook

Q PLEASE DESCRIBE THE CREDIT RATING OUTLOOK FOR REGULATED UTILITIES.

A All credit rating agencies see rate affordability as an important consideration in assessing utility credit, including Standard & Poor's ("S&P") and Moody's Investors Service ("Moody's") as discussed below.

In its 2025 Outlook,[3] S&P reports that North American regulated utilities face continued credit pressure due to elevated capital spending, persistent cash flow deficits (exceeding $100 billion), and increasing physical risks such as wildfires and extreme weather. In 2024, downgrades again outpaced upgrades, a five-year trend driven by high capex, rising wildfire risk, and uneven regulatory outcomes. Despite ongoing investment in the energy transition and data center growth (which may modestly lift

[3]S&P Global Credit Ratings, "Industry Credit Outlook 2025 – North America Regulated Utilities", January 14, 2025.

electricity sales by ~1% annually), financial metrics are deteriorating due to underwhelming common equity issuance and high leverage. Hybrid security issuance hit a record $26 billion in 2024 and is expected to continue helping credit support. Regulatory frameworks remain broadly credit supportive, though S&P downgraded its view of Connecticut due to inconsistent returns and rising lag. Customer bill affordability remains a key consideration, especially as capacity prices rise and new infrastructure costs must be equitably allocated. Wildfire risk—particularly litigation and insurance constraints—is becoming a systemic credit concern, now affecting nearly all regions. S&P made several specific observations about affordability in the context of regulated utilities' credit quality:

1. Electric bills as a share of household income: S&P noted that the average electric customer bill is about 2% of U.S. median household income, which it characterizes as "good value" relative to other typical household expenses. Preserving this affordability is critical to maintaining the industry's credit quality, as it underpins public and regulatory support.

2. Risk from cost shifts due to data centers: S&P cautioned that if utilities assign a significant portion of new infrastructure costs related to data center growth to existing residential customers, it could lead to higher customer bills. This would, in turn, pressure regulators to limit future rate case increases, potentially impairing utilities' ability to recover costs or earn authorized returns.

3. Capacity price increases: S&P warned that higher PJM capacity prices—which are directly passed on to customers—could result in greater customer dissatisfaction. This could prompt regulators to limit increases in other parts of the customer bill, indirectly constraining utilities' ability to maintain financial performance and manage regulatory risk.

In sum, S&P views affordability as a cornerstone issue for the sector: sustained rate increases or cost shifts that threaten affordability could erode regulatory support, triggering credit risk.

In a recent industry report, Moody's explained that the regulated electric and gas utilities' outlook remains "Negative" largely due to increased pricing pressures on customers. Moody's stated that it changed its outlook from "Stable" to "Negative" due to the following:

> We have revised our outlook on the US regulated utilities sector to negative from stable. We changed the outlook because of increasingly challenging business and financial conditions stemming from higher natural gas prices, inflation and rising interest rates. These developments raise residential customer affordability issues, increasing the level of uncertainty with regard to the timely recovery of costs for fuel and purchased power, as well as for rate cases more broadly.[4]

Also, in a report published in January of 2024, S&P specifically mentioned commodity price volatility, in combination with significant increases in capital investments, driving utility rate increases which may strain affordability concerns.[5]

Finally, Fitch opined that the regulated electric and gas utilities' outlook is deteriorating due to elevated capex that put pressure on credit metrics. Fitch also notes the bill affordability concerns for ratepayers, and regulators' ability to balance the rate requests with increasing customer bills.

Specifically, Fitch states:

> Fitch Ratings' deteriorating outlook for the North American Utilities, Power & Gas sector reflects continuing macroeconomic headwinds and elevated capex that are putting pressure on credit metrics in the high-cost funding environment. Bill affordability concerns for ratepayers continue to persist despite the pull back in natural gas prices and inflationary pressures. Fitch expects utility capex to grow by double digits in 2024, underpinned by investments needed to make the electric infrastructure more resilient against extreme weather events and to accommodate renewable generation, including distributed sources. Rate case outcomes

[4] *Moody's Investors Service Outlook*: "Regulated Electric and Gas Utilities – US 2023 outlook negative due to higher natural gas prices, inflation and rising interest rates," November 10, 2022 at page 1. (Emphasis Added).

[5] *S&P Global Ratings*: "Industry Credit Outlook 2024: North America Regulated Utilities," January 9, 2024 at page 8.

> are key to watch as regulators balance more rate requests with increases in customer bills. Authorized ROEs could prove to be sticky despite an increase in cost of capital. Higher weather-normalized retail electricity sales, driven by datacenter growth and onshoring of manufacturing activities, and tax transferability provisions of the Inflation Reduction Act could somewhat offset headwinds to utilities. Ongoing management actions to sell assets and issue equity, in some cases, is supportive of parent companies' ratings. Within Fitch's coverage, 90% of ratings hold Stable Rating Outlooks. We expect limited rating movement in 2024. The number of upgrades in 2023 so far exceeds the number of downgrades, and is driven by positive rating actions on several parent holding companies and their regulated subsidiaries.[6]

As outlined by Moody's, S&P, and Fitch above, credit analysts are focusing on rate affordability as an important factor needed to support strong credit standing. Customers must be able to afford to pay their utility bills in order for utilities to maintain their financial integrity and strong investment grade credit standing. For this reason, this Commission should carefully assess the reasonableness of cost of service in this proceeding, including an appropriate overall ROR necessitated by a reasonably cost-effective balanced ratemaking capital structure, and a ROE that represents fair compensation but also maintains competitive, just, and reasonable rates.

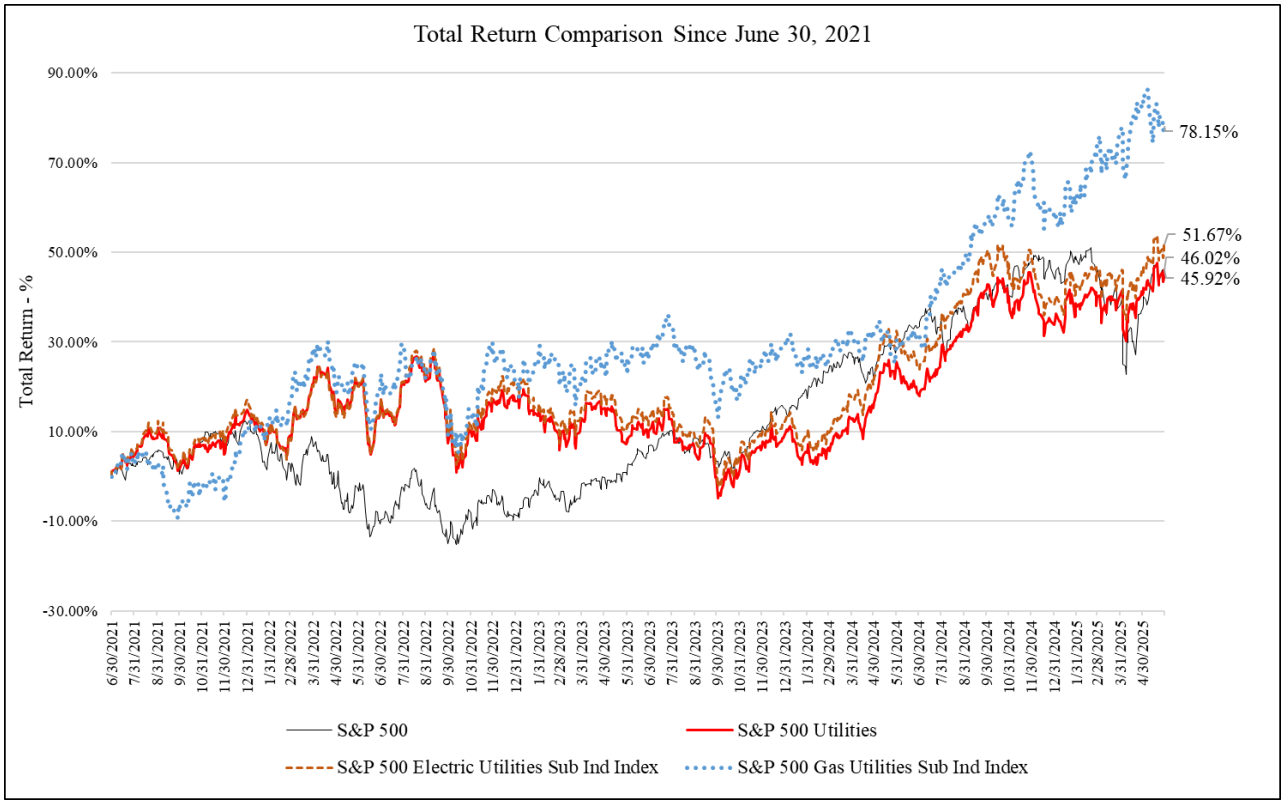
[6] *FitchRatings.* "North American Utilities, Power & Gas Outlook 2024," December 6, 2023 at page 1. (Emphasis Added).

D. Additional Remarks

Q IN LIGHT OF HIGHER LEVELS OF INFLATION, EXPECTATIONS OF HIGHER INTEREST RATES, AND GEOPOLITICAL EVENTS AROUND THE WORLD, HOW HAS THE MARKET PERCEIVED UTILITIES AS INVESTMENT OPTIONS?

A Since the beginning of the second half of 2021, the natural gas utility sector has significantly outperformed the S&P 500, with a total return of 78.15% compared to the market's total return of 45.92%. Similarly, the electric utility sector has also outperformed the broader market with a total return of 51.67% over the same period, as shown in Figure CCW-4 below.

Figure CCW-4



It is important to note that the S&P 500's strong performance in 2023 and early 2024 was largely driven by a small group of "mega-cap" companies known as the Magnificent 7. The Magnificent 7's stocks were among the most valuable companies in the S&P 500 index and rallied significantly over this time. Those seven stocks accounted for a majority of the S&P 500's returns even though there were 493 other companies in the index. This is because the S&P 500 is a market capitalization-weighted index, meaning companies with larger market capitalizations have a greater impact on the index's overall performance. This is explained in the S&P Dow Jones Indices report "U.S. Equity Market Attributes April 2024," stating that:

> Year-to-date, the S&P 500 remained up 5.57% (with 10 of the 11 sectors up; Real Estate was down 9.86%), as breadth declined but remained positive (302 up and 199 down, compared to last March's 369 and 134 YTD, respectively). The Magnificent 7 as a group still dominated, accounting for 51% of the index return (which included Apple's 11.5% YTD decline and Tesla's 26.2% YTD decline), as NVIDIA (up 74.5% YTD) represented 41% of the S&P 500's YTD gain.[7]

While the S&P 500's strong performance in 2023 and early 2024 was largely driven by a small group of "mega-cap" technology companies known as the Magnificent 7, the utility sector demonstrated positive and relatively stable returns over this period. This reflects the defensive characteristics of regulated utilities, which are often viewed by investors as safer assets during times of macroeconomic and geopolitical uncertainty. Utilities' essential service nature, predictable cash flows, and supportive regulatory environments helped them remain attractive to investors even amid elevated inflation, rising interest rates, and global instability.

[7]S&P Dow Jones Indices, "Market Attributes: U.S. Equities April 2024". (Emphasis Added).

III. RATE OF RETURN

Q PLEASE GENERALLY DESCRIBE WHAT IS MEANT BY THE OVERALL ROR AS IT RELATES TO RATEMAKING FOR REGULATED UTILITIES.

A The overall ROR in utility ratemaking represents the weighted average cost of capital a utility is allowed to earn on its rate base. It combines the cost of debt and the authorized ROE, weighted by the utility's capital structure.

A. Capital Structure

Q WHAT ARE THE COMPANIES' PROPOSED CAPITAL STRUCTURE?

A The Companies' proposed capital structure is summarized in Table CCW-5 below:

Table CCW-5

Investor-Supplied Capital Structure

Description	Weight
Long-term Debt	51.06%
Common Equity	48.94%
Total	100.00%[8]

*Total may not add due to rounding

Q DO YOU HAVE ANY COMMENTS ON THE COMPANIES' PROPOSED CAPITAL STRUCTURE?

A Yes. As shown, the Companies' proposed equity ratio of 48.94% is relatively higher than the equity ratio for the proxy group used to estimate the cost of equity for the

[8] *See,* Joint Statement No. 2A at 4.

Companies. As shown on Exhibit CCW-2, the proxy group has an average common equity ratio of 40.4% (including short-term debt) and 44.6% (excluding short-term debt). However, because the Companies do not access external capital on their own, and the actual equity ratios are unreasonable for ratemaking purposes, the Companies' proposal to use the actual capital structure of the parent company, C&T Enterprises, is reasonable and should be used.

B. Cost of Debt

Q WHAT COST OF DEBT ARE THE COMPANIES PROPOSING?

A The Companies are proposing an embedded cost of long-term debt of 5.03% (Valley), 5.47% (Citizens) and 4.85% (Wellsboro).

Q ARE YOU TAKING ISSUE WITH THE COMPANIES' PROPOSED COST OF DEBT?

A No, I am not.

C. Cost of Equity

Q PLEASE DESCRIBE WHAT IS MEANT BY A "UTILITY'S COST OF COMMON EQUITY."

A A utility's cost of common equity is the expected return that investors require on an investment in the utility. Investors expect to earn their required return from receiving dividends and through stock price appreciation. This rate is designed to ensure the utility can attract investment, maintain financial stability, and provide reliable service

while balancing the interests of shareholders and ratepayers. Regulatory commissions set the ROE based on market conditions and the utility's specific risk profile.

Q PLEASE DESCRIBE THE FRAMEWORK FOR DETERMINING A REGULATED UTILITY'S COST OF COMMON EQUITY.

A In general, determining a fair cost of common equity for a regulated utility has been framed by two hallmark decisions of the U.S. Supreme Court ("Supreme Court"): Bluefield Water Works & Improvement Co. v. Pub. Serv. Comm'n of W. Va., 262 U.S. 679 (1923) and Fed. Power Comm'n v. Hope Natural Gas Co., 320 U.S. 591 (1944). In these decisions, the Supreme Court found that just compensation depends on many circumstances and must be determined by fair and enlightened judgments based on relevant facts. The Supreme Court also found that a utility is entitled to such rates as would permit it to earn a return on a property devoted to the convenience of the public that is generally consistent with the same returns available in other investments of corresponding risk. The Supreme Court continued that the utility has "no constitutional rights to profits" such as those "realized or anticipated in highly profitable enterprises or speculative ventures,"[9] and defined the ratepayer/investor balance as follows:

> The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties.[10]

As such, a fair ROR is based on the expectation that the utility's costs reflect efficient and economical management, and the return will support its credit standing

[9] *Bluefield,* 262 U.S. at pages 692-693.
[10] *Id*. at 693 (Emphasis Added).

and access to capital, but the return will not be in excess of this level. Utility rates that are consistent with these standards will be just and reasonable, and compensation to the utility will be fair and support financial integrity and credit-standing, under economic management of the utility.

Q PLEASE DESCRIBE THE PROCESS YOU HAVE USED TO ESTIMATE THE COMPANIES' COST OF COMMON EQUITY.

A First, I assess the market's perspective of the Companies' risk. Then, I developed a proxy group of publicly traded utility companies that have similar risks and characteristics to the Companies and compared potential differences in risks. I then perform several models based on financial theory to estimate the Companies' cost of common equity. These models are: (1) a constant growth Discounted Cash Flow ("DCF") model using consensus analysts' growth rate projections; (2) a constant growth DCF model using sustainable growth rate estimates; (3) a multi-stage growth DCF model; (4) a Risk Premium method; and (5) a Capital Asset Pricing Model ("CAPM").

Q WHY MUST THE COST OF EQUITY BE ESTIMATED RATHER THAN DIRECTLY OBSERVED?

A The cost of equity cannot be directly observed because equity investors do not receive fixed, contractual payments like debt holders do. Instead, they are compensated through uncertain and variable returns in the form of dividends and capital appreciation. These returns depend on a range of unpredictable factors, including company performance,

market conditions, and investor sentiment. As such, the cost of equity represents an investor's required ROR, which must be estimated using financial models rather than measured directly from observable market transactions.

Q WHY IS IT NECESSARY TO APPLY MULTIPLE METHODS TO ESTIMATE THE COST OF EQUITY?

A Because the cost of equity is an estimate based on forward-looking expectations and assumptions, no single model can definitively or universally capture the "true" cost. Each model, such as the DCF model, the CAPM, and the Risk Premium approach, has its own theoretical foundation, strengths, and limitations. These models rely on different assumptions and input variables such as projected growth rates or equity risk premiums which can vary in reliability. Using multiple models provides a more comprehensive and balanced view, helps identify outlier results, and increases confidence that the final estimate reasonably reflects investor expectations under current market conditions.

Q DOES THE USE OF MULTIPLE METHODS IMPROVE THE ACCURACY OF THE ESTIMATE?

A Yes. Employing multiple methods helps to cross-check and validate the results, mitigate the impact of any one model's limitations or potentially flawed assumptions, and reduce reliance on any single uncertain input. By considering results from different perspectives, a more informed and credible estimate can be made. This approach is

consistent with both sound financial practice and regulatory expectations for fair and reasonable return determinations.

D. Investment Risk Assessment of the Companies

Q PLEASE DESCRIBE THE MARKET'S ASSESSMENT OF THE COMPANIES' INVESTMENT RISK.

A The market's assessment of a company's investment risk is generally best described by credit rating analysts' reports.

E. Development of Proxy Group

Q PLEASE BRIEFLY DESCRIBE WHY A PROXY GROUP IS NEEDED IN ESTIMATING THE COST OF EQUITY.

A There are a few reasons why a proxy group is needed to estimate the cost of equity. As an initial matter, to be consistent with the *Hope* and *Bluefield* standards, as described above, the allowed return should be commensurate with returns on investments in other forms of comparable risk. A proxy group of similarly situated companies of comparable risk is needed to assess the Companies' proposal under this standard.

Even if the Companies were a publicly traded company whose securities could be used to estimate its cost of equity, there exists the potential for certain errors and biases which would make the reliance on a single estimate undesirable and potentially less accurate. A proxy group of comparable risk companies adds reliability to the estimates by mitigating the potential for bias that may be introduced by measurement errors of model inputs.

Q PLEASE DESCRIBE HOW YOU IDENTIFIED A PROXY UTILITY GROUP THAT COULD BE USED TO ESTIMATE THE COMPANIES' CURRENT MARKET COST OF EQUITY.

A I started with the same utility company proxy group relied on by the Companies' Witness. I then reviewed each company to see if there were any significant factors that would potentially impact the overall risk level. Such factors would include significant merger and/or acquisition activity, credit ratings upgrades/downgrades, or dividend cuts. I also reviewed to make sure they were covered by an analyst in the *Value Line Investment Survey*. Based on my review, I found that the Companies' Witness' initial proxy group was sufficient with the exception of one company: TXNM Energy. On May 19, 2025, TXNM Energy announced that they had reached a definitive agreement to be acquired by Blackstone Infrastructure Partners for approximately $11.94 billion. Because TXNM Energy is party to a significant transaction, it must be excluded.

Q HOW DOES THE INVESTMENT RISK OF THE COMPANIES COMPARE TO THAT OF THE PROXY GROUP?

A As shown on my Exhibit CCW-2, the proxy group has average credit ratings of BBB+ and Baa1 from S&P and Moody's, respectively. The Companies are not rated entities by the major ratings agencies. However, they only operate in Pennsylvania, and Pennsylvania has a regulatory assessment of "Highly Credit Supportive" from S&P Global Ratings Direct. In my opinion, the Companies would be rated comparatively at worst, if not higher than the proxy group.

As shown on the same exhibit, the proxy group has an average common equity ratio of 40.4% (including short-term debt) and 44.6% (excluding short-term debt) as calculated by *S&P Global Market Intelligence* and *Value Line*, respectively. The Companies' Witness' proposed common equity ratio of 48.94% for the Companies is marginally higher than the proxy group's equity ratio as described above, but not excessive for ratemaking. As described by the Companies' Witness, the actual equity ratios for the Companies are 69.9%, 86.6%, and 20.5% for Valley, Citizens, and Wellsboro, respectively.

F. DCF Model

Q PLEASE DESCRIBE THE DCF MODEL.

A The DCF model posits that a stock price equals the sum of the present value of expected future cash flows discounted at the investor's required ROR or cost of capital.

This model is expressed mathematically as follows:

$$P_0 = \frac{D_1}{(1+K)^1} + \frac{D_2}{(1+K)^2} + \ldots . \frac{D_\infty}{(1+K)^\infty} \qquad \text{(Equation 1)}$$

P_0 = Current stock price
D = Dividends in periods 1 - ∞
K = Investor's required return

This model can be rearranged in order to estimate the discount rate or investor-required return, known as "K." If it is reasonable to assume that earnings and dividends will grow at a constant rate, then Equation 1 can be rearranged as follows:

$$K = D_1/P_0 + G \qquad \text{(Equation 2)}$$

K = Investor's required return
D_1 = Dividend in first year
P_0 = Current stock price
G = Expected constant dividend growth rate

Equation 2 is referred to as the annual "constant growth" DCF model.

Q PLEASE DESCRIBE THE INPUTS TO YOUR CONSTANT GROWTH DCF MODEL.

A As shown in Equation 2 above, the DCF model requires a current stock price, the expected dividend, and the expected growth rate in dividends.

Q WHAT STOCK PRICE HAVE YOU RELIED ON IN YOUR CONSTANT GROWTH DCF MODEL?

A I relied on the average of the weekly high and low stock prices of the utilities in the proxy group over a 13-week period ending on May 30, 2025. An average stock price is less susceptible to market price variations than a price at a single point in time. Therefore, an average stock price is less susceptible to aberrant market price movements, which may not reflect the stock's long-term value.

Q WHAT DIVIDEND DID YOU USE IN YOUR CONSTANT GROWTH DCF MODEL?

A I used each proxy company's most recently paid quarterly dividend as reported in *Value Line*.[11] This dividend was annualized (multiplied by 4) and adjusted for next year's growth to produce the D_1 factor for use in Equation 2 above. In other words, I calculate D_1 by multiplying the annualized dividend (D_0) by (1+G).

Q WHAT DIVIDEND GROWTH RATES HAVE YOU USED IN YOUR CONSTANT GROWTH DCF MODEL?

A There are several methods that can be used to estimate the expected growth in dividends. However, regardless of the method, for purposes of determining the market-required return on common equity, one must attempt to estimate investors' expectations about what the dividend, or earnings growth rate, will be, and not what an individual investor or analyst may use to make individual investment decisions.

As predictors of future returns, securities analysts' growth estimates have been shown to be more accurate than growth rates derived from historical data.[12] That is, assuming the market generally makes rational investment decisions, analysts' growth projections are more likely to influence investors' decisions, which are captured in observable stock prices, than growth rates derived only from historical data.

For my constant growth DCF analysis, I have relied on a consensus, or mean, of professional securities analysts' earnings growth estimates as a proxy for investors'

[11]The *Value Line Investment Survey*, March 7, April 18, May, 9, and May 23, 2025.

[12]*See*, e.g., David Gordon, Myron Gordon, and Lawrence Gould, Choice Among Methods of Estimating Share Yield, The Journal of Portfolio Management, Spring 1989.

dividend growth rate expectations. I used the average of analysts' growth rate estimates from three sources: Zacks, S&P Capital IQ Market Intelligence ("MI"), and Institutional Brokers' Estimate System ("I/B/E/S") from LSEG Workspace. All such projections were available on May 30, 2025, and all were reported online.[13]

Each growth rate projection is based on a survey of independent securities analysts. There is no clear evidence whether a particular analyst is most influential on general market investors. Therefore, a single analyst's projection does not predict investor outlooks as reliably as does a consensus of market analysts' projections. The consensus of estimates is a simple arithmetic average, or mean, of surveyed analysts' earnings growth forecasts. A simple average of the growth forecasts gives equal weight to all surveyed analysts' projections. Therefore, a simple average, or arithmetic mean, of analysts' forecasts is a good proxy for investor expectations.

The growth rates I used in my DCF analysis are shown in Exhibit CCW-3. The average growth rate for my proxy group is 6.87% and a median growth rate of 6.70%.

Q WHAT ARE THE RESULTS OF YOUR CONSTANT GROWTH DCF MODEL?

A As shown in Exhibit CCW-4, page 1, the average and median constant growth DCF returns for my proxy group for the 13-week analysis are 10.79% and 10.31%, respectively.

[13] www.zacks.com; LSEG Workspace; https://www.capitaliq.spglobal.com/.

Q ARE THERE LIMITATIONS OF THE CONSTANT GROWTH DCF ANALYSIS?

A Yes. The constant growth DCF analysis for my proxy group is based on a group average long-term growth rate of 6.87%. The three- to five-year growth rates are approximately 68% higher than the long-term projected GDP growth rate of 4.09%, described below. As I explain in detail below, a utility's growth rate cannot exceed the growth rate of the economy in which it provides services in perpetuity, which is the time period assumed by the DCF model.

Q HOW DID YOU IDENTIFY THE LONG-TERM PROJECTED GDP GROWTH RATE?

A Although there may be short-term peaks, the long-term sustainable growth rate for a utility stock cannot exceed the growth rate of the economy in which it sells its goods and services. The long-term maximum sustainable growth rate for a utility investment is limited by the projected long-term GDP growth rate, as that reflects the projected long-term growth rate of the economy. The consensus projection for U.S. GDP, as published by Blue Chip Financial Forecasts, is an annual growth rate of approximately 4.09% over the next 10 years. In my opinion, this is a reasonable proxy of long-term growth.

Later in this testimony, I discuss academic and investment-practitioner support for using the projected long-term GDP growth outlook as a maximum long-term growth rate projection. Using the long-term GDP growth rate as a conservative projection for

the maximum growth rate is logical and is generally consistent with academic and practitioner accepted practices.

G. Sustainable Growth DCF

Q PLEASE DESCRIBE WHAT THE SUSTAINABLE GROWTH DCF METHOD IS AND HOW YOU ESTIMATED A SUSTAINABLE GROWTH RATE FOR YOUR SUSTAINABLE GROWTH DCF MODEL.

A The sustainable growth rate, also referred to as the internal growth rate, is determined by the proportion of the utility's earnings that is retained and reinvested in its plant and equipment. These reinvested earnings enhance the earnings base, also known as the rate base. The earnings grow as the plant, funded by the reinvested earnings, is put into operation, allowing the utility to receive its authorized return on the additional rate base investment.

The internal growth approach is linked to the percentage of earnings retained within a company, as opposed to being paid out as dividends. The earnings retention ratio is calculated as 1 minus the dividend payout ratio. As the payout ratio decreases, the retention ratio increases, leading to stronger growth as a company funds more investments using retained earnings.

The payout ratios of the proxy group are shown in my Exhibit CCW-5. These dividend-payout ratios and earnings-retention ratios then can be used to develop a long-term growth rate driven by earnings retention.

The data used to estimate the long-term sustainable growth rate is based on the Companies' current market-to-book ratio and on *Value Line*'s three-to-five year projections of earnings, dividends, earned returns on book equity, and stock issuances.

As shown in Exhibit CCW-6, the average and median sustainable growth rates for the proxy group using this internal growth rate model are 4.46% and 4.20%, respectively.

Q WHAT IS THE DCF ESTIMATE USING THESE SUSTAINABLE GROWTH RATES?

A A DCF estimate based on these sustainable growth rates is developed in Exhibit CCW-7. As shown there, and using the same formula in Equation 2 above, a sustainable growth DCF analysis produces proxy group average and median DCF results for the 13-week period of 9.59% and 9.57%, respectively.

H. Multi-Stage Growth DCF Model

Q HAVE YOU CONDUCTED ANY OTHER DCF STUDIES?

A Yes. As previously noted, the DCF model is intended to represent the present value of an endless series of future cash flows. Nevertheless, the initial constant growth DCF that I created is based on analysts' growth-rate projections, providing a plausible representation of rational investment expectations over the next three-to-five years. The limitation of this constant growth DCF model is that it cannot reflect a reasonable expectation of a shift in growth from a high or low short-term rate to a rate that aligns more with long-term sustainable growth. To accommodate changing growth

expectations, I conducted a multi-stage DCF analysis that reflects growth rate change over time.

Q WHY DO YOU BELIEVE GROWTH RATES CAN CHANGE OVER TIME?

A The growth rate projections by analysts for the next three-to-five years are subject to change as the outlook for utility earnings-growth evolves. Utility companies experience fluctuations in their investment cycles. When these companies are undertaking substantial investments, the growth of their rate base accelerates, leading to an increase in earnings growth. However, once a major construction cycle reaches completion or plateaus, the growth in the utility rate base slows down, and its earnings growth rate declines from an abnormally high three-to-five-year rate to a lower, sustainable growth rate.

As construction cycles become longer in duration, even with an aggressive construction plan, the growth rate of the utility will naturally slow due to a decrease in rate base growth as the utility has limited human and capital resources to expand its construction activities. Therefore, the three-to-five-year growth rate projection should be viewed as a long-term sustainable growth rate, but not without considering the current market conditions, industry trends, and determining whether the three-to-five-year growth outlook is feasible and sustainable.

Q PLEASE DESCRIBE YOUR MULTI-STAGE DCF MODEL.

A The multi-stage DCF model reflects the possibility of non-constant growth for a company over time. The multi-stage DCF model reflects three growth periods: (1) a

short-term growth period consisting of the first five years; (2) a transition period, consisting of the next five years (6 through 10); and (3) a long-term growth period starting in year 11 and extending into perpetuity.

For the short-term growth period, I relied on the consensus of analysts' growth projections described above in relationship to my constant growth DCF model. For the transition period, the growth rates were reduced or increased by an equal factor reflecting the difference between the analysts' growth rates and the long-term sustainable growth rate. For the long-term growth period, I assumed each company's growth would converge to the maximum sustainable long-term growth rate.

Q WHY IS THE GDP GROWTH PROJECTION A REASONABLE PROXY FOR THE MAXIMUM SUSTAINABLE LONG-TERM GROWTH RATE?

A As discussed above, utilities cannot indefinitely sustain a growth rate that exceeds the growth rate of the economy in which they sell services. A utility's earnings and dividend growth is created by increased utility investment in its rate base. Examples of what can drive such investment are: service area economic growth, system reliability upgrades, or state and federal green energy initiatives. As such, nominal GDP growth is a reasonable upper limit for utility sales growth, rate base growth, and earnings growth in the long-run. Therefore, the U.S. GDP nominal growth rate is a conservative proxy for the highest sustainable long-term growth rate of a utility.

Q IS THERE RESEARCH THAT SUPPORTS YOUR POSITION THAT, OVER THE LONG-TERM, A COMPANY'S EARNINGS AND DIVIDENDS CANNOT GROW AT A RATE GREATER THAN THE RATE OF GROWTH OF THE U.S. GDP?

A Yes. This concept is supported in published analyst literature and academic work. Specifically, in a textbook titled *Fundamentals of Financial Management*, published by Eugene Brigham and Joel F. Houston, the authors state as follows:

> The constant growth model is most appropriate for mature companies with a stable history of growth and stable future expectations. Expected growth rates vary somewhat among companies, but dividends for mature firms are often expected to grow in the future at about the same rate as nominal gross domestic product (real GDP plus inflation).[14]

The use of the economic growth rate is also supported by investment practitioners as outlined as follows:

> **Estimating Growth Rates**
>
> One of the advantages of a three-stage discounted cash flow model is that it fits with life cycle theories in regards to company growth. In these theories, companies are assumed to have a life cycle with varying growth characteristics. Typically, the potential for extraordinary growth in the near term eases over time and eventually growth slows to a more stable level.
>
> * * *
>
> Another approach to estimating long-term growth rates is to focus on estimating the overall economic growth rate. Again, this is the approach used in the *Ibbotson Cost of Capital Yearbook*. To obtain the economic growth rate, a forecast is made of the growth rate's component parts. Expected growth can be broken into two main parts: expected inflation and expected real growth. By analyzing these components separately, it is easier to see the factors that drive growth.[15]

[14] *Fundamentals of Financial Management*, Eugene F. Brigham and Joel F. Houston, Eleventh Edition 2007, Thomson South-Western, a Division of Thomson Corporation at page 298 (Emphasis Added).

[15] Morningstar, Inc., Ibbotson SBBI 2013 Valuation Yearbook at pages 51 and 52.

Q HOW DID YOU DETERMINE A LONG-TERM GROWTH RATE THAT REFLECTS THE CURRENT CONSENSUS OF INDEPENDENT MARKET PARTICIPANTS?

A I relied on the consensus of long-term GDP growth projections by independent economists. Blue Chip Financial Forecasts publishes the consensus for GDP growth projections twice a year. These projections reflect current outlooks for GDP and are likely to be influential on investors' expectations of future growth outlooks. The consensus of projected GDP growth is about 4.09% over the next 10 years.[16]

Q DO YOU CONSIDER OTHER SOURCES OF PROJECTED LONG-TERM GDP GROWTH?

A Yes, and these alternative sources corroborate the consensus analysts' projections I relied on. Several projections are shown in Table CCW-6.

[16]Blue Chip Financial Forecasts, June 2, 2025, at page 14.

TABLE CCW-6

GDP Forecasts

Source	Projected Period	Real GDP	Inflation	Nominal GDP
Blue Chip Financial Forecasts [1]	5-10 Yrs	2.0%	2.1%	4.1%
EIA - Annual Energy Outlook[2]	26 Yrs	1.8%	2.1%	3.9%
Congressional Budget Office[3]	30 Yrs	1.6%	2.0%	3.7%
Moody's Analytics[4]	31 Yrs	2.0%	2.1%	4.1%
Social Security Administration[5]	76 Yrs	1.6%	2.4%	4.0%
Economist Intelligence Unit[6]	31 Yrs	1.6%	2.3%	3.9%

Sources:

[1]Blue Chip Financial Forecasts, June 2, 2025 at 14.

[2]U.S. Energy Information Administration (EIA), Annual Energy Outlook 2025, April 15, 2025.

[3]Congressional Budget Office, Long-Term Budget Outlook, March 27, 2025.

[4]Moody's Analytics Forecast, last updated January 13, 2025.

[5]Social Security Administration, "2024 OASDI Trustees Report," Table VI.G6. May 6, 2024.

[6]S&P MI, Economist Intelligence Unit, downloaded on March 4, 2025.

As shown in the table above, the real GDP and the inflation fall in the range of 1.6% to 2.0% and 2.0% to 2.4%, respectively. This results in a nominal GDP in the range of 3.7% to 4.1%. Therefore, the nominal GDP growth projections made by these independent sources support my use of 4.09% as a reasonable estimate of market participants' expectations for long-term GDP growth. The real GDP and nominal GDP growth projections made by these independent sources support my use of 4.09% as a reasonable estimate of market participants' expectations for long-term GDP growth.

Q WHAT STOCK PRICE, DIVIDEND, AND GROWTH RATES DID YOU USE IN YOUR MULTI-STAGE DCF ANALYSIS?

A I relied on the same 13-week average stock prices and the most recent quarterly dividend payment data discussed above. For the first stage, I used the consensus of analysts' growth rate projections discussed above in my constant growth DCF model. The first stage covers the first five years, consistent with the time horizon of the securities analysts' growth rate projections. The second stage, or transition stage, begins in year 6 and extends through year 10. The second stage growth transitions the growth rate from the first stage to the third stage using a straight linear trend. For the third stage, or long-term sustainable growth stage, starting in year 11, I used a 4.09% long-term sustainable growth rate based on the consensus of economists' long-term projected nominal GDP growth rate.

Q WHAT ARE THE RESULTS OF YOUR MULTI-STAGE DCF MODEL?

A As shown in Exhibit CCW-8, the average and median DCF ROEs for my proxy group using the 13-week average stock price are 8.62% and 8.39%, respectively.

Q PLEASE SUMMARIZE THE RESULTS FROM YOUR DCF ANALYSES.

A The DCF results are summarized in Table CCW-7. As described above, the results of the constant growth DCF using analysts' growth rates assume an average long-term growth rate of 6.87%, which is approximately 68% higher than the long-term projected GDP growth rate of 4.09%. This is an unsustainable assumption, and likely leads to an overstatement in the cost of equity for a low risk regulated utility. As such, it is my

opinion that primary weight should be given to the sustainable growth and multi-stage models of the DCF while minimal weight should be given to the constant growth DCF model based on three-to-five year analyst growth rates.

Table CCW-7

Summary of DCF Results

	Proxy Group	
Description	**Mean**	**Median**
Constant Growth DCF Model (Analysts' Growth)	10.79%	10.31%
Constant Growth DCF Model (Sustainable Growth)	9.59%	9.57%
Multi-Stage DCF Model	8.62%	8.39%

I. Risk Premium Model

Q PLEASE DESCRIBE YOUR BOND YIELD PLUS RISK PREMIUM MODEL.

A This model is based on the principle that investors require a higher return to assume greater risk. Common equity investments have greater risk than bonds because bonds have more security of payment in bankruptcy proceedings than common equity and the coupon payments on bonds represent contractual obligations. In contrast, companies are not required to pay dividends or guarantee returns on common equity investments. Therefore, common equity securities are riskier than bond securities.

This risk premium model is based on two estimates of an equity risk premium. First, I quantify the difference between regulatory commission-authorized returns on

common equity and contemporary U.S. Treasury bonds. The difference between the authorized return on common equity and the Treasury bond yield is the risk premium. I estimated the risk premium on an annual basis for each year since January 1986. The authorized ROEs were based on regulatory commission-authorized returns for utility companies. Authorized returns are typically based on expert witnesses' estimates of the investor-required return at the time of the proceeding.

The second equity risk premium estimate is based on the difference between regulatory commission-authorized returns on common equity and contemporary "A" rated utility bond yields by Moody's. I selected the period beginning in 1986 because public utility stocks consistently traded at a premium to book value during that period. This is illustrated in Exhibit CCW-9, which shows the market-to-book ratio since 1986 for the utility industry was consistently above a multiple of 1.0x. Over this period, an analyst can infer that authorized ROEs were sufficient to support market prices that at least exceeded book value. This is an indication that commission-authorized returns on common equity supported a utility's ability to issue additional common stock without diluting existing shares. It further demonstrates that utilities were able to access equity markets without a detrimental impact on current shareholders.

Based on this analysis, as shown in Exhibit CCW-10, the average indicated equity risk premium over U.S. Treasury bond yields has been 5.69%. Since the risk premium can vary depending upon market conditions and changing investor risk perceptions, I believe using an estimated range of risk premiums provides the best

method to measure the current return on common equity for a risk premium methodology.

In addition, I assessed the five-year and ten-year rolling average risk premiums over the study period to gauge the variability over time. These rolling average risk premiums mitigate the impact of anomalous market conditions and skewed risk premiums over an entire business cycle. As shown on my Exhibit CCW-10, the five-year rolling average risk premium over Treasury bonds ranged from 4.25% to 7.09%, while the ten-year rolling average risk premium ranged from 4.38% to 6.91%.

As shown on my Exhibit CCW-11, the average indicated equity risk premium over contemporary "A" rated Moody's utility bond yields was 4.34%. The five-year and ten-year rolling average risk premiums ranged from 2.88% to 5.91% and 3.20% to 5.74%, respectively.

Q WHY IS THE TIME PERIOD USED TO DERIVE THESE EQUITY RISK PREMIUM ESTIMATES APPROPRIATE TO FORM ACCURATE CONCLUSIONS ABOUT CONTEMPORARY MARKET CONDITIONS?

A Contemporary market conditions can change dramatically during the period that rates determined in this proceeding will be in effect. A relatively long period of time where stock valuations reflect premiums to book value indicates that the authorized ROEs and the corresponding equity risk premiums were supportive of investors' return expectations and provided utilities access to the equity markets under reasonable terms and conditions. Further, this period is long enough to smooth abnormal market movement that might distort equity risk premiums. While market conditions and risk

premiums do vary over time, this historical period is a reasonable period to estimate contemporary risk premiums.

Q PLEASE EXPLAIN OTHER MARKET EVIDENCE YOU RELIED ON IN DETERMINING AN APPROPRIATE EQUITY RISK PREMIUM.

A The equity risk premium should reflect the market's perception of risk in the utility industry today. I have gauged investor perceptions in utility risk today in Exhibit CCW-12, where I show the yield-spread between utility bonds and Treasury bonds since 1980. As shown in this exhibit, the average utility bond yield-spreads over Treasury bonds for "A" and "Baa" rated utility bonds for this historical period are 1.47% and 1.88%, respectively.

A current three-month average "A" rated utility bond yield of 5.89% when compared to the current Treasury bond yield of 4.74%, as shown in Exhibit CCW-13, page 1, implies a yield-spread of 1.15%. This current utility bond yield-spread is lower than the long-term average-spread for "A" rated utility bonds of 1.47%. The three-month average yield on "Baa" rated utility bonds is 6.08%. This indicates a current spread for the "Baa" rated utility bond yield of 1.34%, which is lower than the long-term average of 1.88%.

Q WHAT DOES THE CURRENT TREND IN UTILITY BOND SPREADS RELATIVE TO TREASURY BONDS INDICATE ABOUT THE MARKET'S PERCEPTION OF UTILITY RISK?

A The decline in the yield spread of utility bonds over Treasury bonds, to levels below historical averages, indicates that the market currently views utilities as relatively low-risk investments. Investors are demanding less additional yield to hold utility bonds, reflecting strong confidence in utilities' financial stability and creditworthiness under current market conditions.

Q HOW IS THE DECLINE IN UTILITY BOND SPREADS RELEVANT TO ESTABLISHING A FAIR ROE FOR UTILITIES?

A The narrowing of utility bond spreads demonstrates that investors require less compensation for utility credit risk today than they have historically. Because the cost of equity must reflect prevailing market conditions, lower perceived risk implies a lower investor-required ROE. A high ROE would overcompensate utilities and burden customers unnecessarily, given that the market clearly prices utilities as safer investments than in the past. This information supports a below-average equity risk premium.

Q WHY SHOULD REGULATORS CONSIDER UTILITY BOND SPREADS WHEN SETTING AN AUTHORIZED ROE?

A Bond spreads provide an objective, real-time market measure of risk that regulators should consider when setting the allowed ROE. If the bond market, which represents

large, sophisticated investors, views utilities as low-risk, it follows that equity investors also perceive lower risk and require a correspondingly lower return. Ignoring this evidence could result in rates that are not just and reasonable for customers.

Q WHAT ARE THE RESULTS BASED ON YOUR RISK PREMIUM ANALYSES?

A I give primary consideration to the Risk Premium results using Treasury bonds and A-rated utility bonds. My recommendation also takes the results of adding the Baa-rated utility bond yield to the equity risk premium over A-rated utility bonds into consideration.

Considering the current and projected economic environment, current yield-spreads and equity risk premiums, as well as current levels of interest rates and interest rate projections, I believe an equity risk premium between the average and most recent two-year average equity risk premiums are warranted. As such, I believe an electric equity risk premium over Treasury yields in the range of 5.32% and 5.69% is appropriate. The midpoint of this risk premium range is 5.50%. Adding this risk premium to the most recent consensus projected Treasury yield of 4.50% produces a ROE of 10.00%. Applying a similar methodology to the gas equity risk premiums shows a long-term average equity risk premium of 5.61% and the recent two-year average of 5.28%. The midpoint of this range for the gas equity risk premium over Treasury yields is 5.44%. Adding the 5.44% gas risk premium to the projected Treasury yield of 4.5% produces a ROE of 9.94%.

Applying a similar methodology as described above, the most recent two-year average equity risk premium over A-rated utility bonds is 4.10%, while the long-term

average risk premium is 4.34%. The midpoint of this risk premium range is 4.22%. Similarly, the long-term average gas equity risk premium over A-rated utility bond yields is 4.26% while the most recent two-year average is 4.06%. The midpoint of the gas equity risk premium range is 4.16%. The A-rated utility bond yield has averaged 5.89% over the three-month period through May 2025 while the Baa-rated utility bond yield has averaged 6.08% over the same period. Adding the indicated equity risk premiums of 4.22% (electric) and 4.16% (gas) to the three-month average A-rated utility bond yield of 5.89% produces cost of equity estimates of 10.11% (electric) and 10.05% (gas). Adding the same equity risk premiums to the three-month average Baa-rated utility bond yield of 6.08% produces cost of equity estimates of 10.30% (electric) and 10.24% (gas).

The A-rated utility bond yield has averaged 5.81% over the six-month period ending May 2025 while the Baa-rated utility bond yield has averaged 6.00% over the same period. Adding the indicated equity risk premiums of 4.22% (electric) and 4.16% (gas) to the six-month average A-rated utility bond yield of 5.81% produces cost of equity estimates of 10.03% (electric) and 9.97% (gas). Adding the same equity risk premium to the six-month average Baa-rated utility bond yield of 6.00% produces cost of equity estimates of 10.22% (electric) and 10.16% (gas).

The results of my risk premium analyses are summarized in Table CCW-8.

Table CCW-8

Summary of Risk Premium Results

Description	Elec. RP	Gas RP
Projected Treasury Yield	10.00%	10.00%
3-Month Average Yields		
A-Rated Utility Bond	10.11%	10.05%
Baa-Rated Utility Bond	10.30%	10.24%
6-Month Average Yields		
A-Rated Utility Bond	10.03%	9.97%
Baa-Rated Utility Bond	10.22%	10.16%

J. Capital Asset Pricing Model

Q PLEASE DESCRIBE THE CAPM.

A The CAPM method of analysis is based upon the theory that the market-required ROR for a security is equal to the risk-free rate, plus a risk premium associated with the specific security. This relationship between risk and return can be expressed mathematically as follows:

$R_i = R_f + B_i \times (R_m - R_f)$ where:

R_i = Required return for stock i
R_f = Risk-free rate
R_m = Expected return for the market portfolio
B_i = Beta - Measure of the risk for stock

The term "beta" in the equation represents the stock-specific risk that cannot be reduced through diversification. In a well-diversified portfolio, specific risks related to individual stocks can be reduced by balancing the portfolio with securities that offset

the impact of firm-specific factors, such as business cycle, competition, product mix, and production limitations.

Non-diversifiable risks, on the other hand, are related to market conditions and are referred to as systematic risks. These risks cannot be reduced through diversification and are considered market risks. Conversely, non-systematic risks, also known as business risks, can be reduced through diversification.

According to the CAPM, the market does not compensate investors for taking on risks that can be diversified away. Thus, investors are only compensated for taking on systematic, or non-diversifiable, risks. Beta is a measure of these systematic risks.

Q PLEASE DESCRIBE THE INPUTS TO YOUR CAPM.

A The CAPM requires an estimate of the market risk-free rate, the stock's beta, and the Market Risk Premium ("MRP"). The MRP is the difference between the expected market return and the risk-free rate.

Q WHAT DID YOU USE AS AN ESTIMATE OF THE MARKET RISK-FREE RATE?

A As previously noted, *Blue Chip Financial Forecasts*' projected 30-year Treasury bond yield is 4.50%.[17] The current 30-year Treasury bond yield is 4.74%, as shown in Exhibit CCW-13 at page 1. I used *Blue Chip Financial Forecasts*' projected 30-year Treasury bond yield of 4.50% for my CAPM analysis.

[17] *Blue Chip Financial Forecast* June 2, 2025.

Q WHAT BETA DID YOU USE IN YOUR ANALYSIS?

A As shown in Exhibit CCW-14, the current proxy group average and median *Value Line* beta estimates are 0.84 and 0.80, respectively. In my experience, these beta estimates are abnormally high and are unlikely to be sustained over the long-term. As such, I have also reviewed the historical average of the proxy group's *Value Line* betas. The historical average *Value Line* beta since 2014 is 0.78 and has ranged from 0.56 to 0.94. Prior to the recent pandemic, the high end of this range was 0.75.

In addition to *Value Line*, I have also included adjusted beta estimates as provided by Market Intelligence's Beta Generator Model. This model relied on a five-year period on a weekly basis ending May 30, 2025. The average and median Market Intelligence betas are 0.46 and 0.46, respectively. Market Intelligence betas, as calculated using its Beta Generator Model, are adjusted using the Vasicek method and calculated using the S&P 500 as the proxy for the investable market. This is in stark contrast with the *Value Line* beta estimates that are adjusted using a constant weighting of 67%/35% to the raw beta/market beta and use the New York Stock Exchange ("NYSE") as the proxy for the investable market. Because I rely on the S&P 500 to estimate the expected return on the investable market, it makes sense to rely on beta estimates that are calculated using the S&P 500 as the benchmark for the market. Further, as S&P explains:

> The Vasicek Method is a superior alternative to the Bloomberg Beta adjustment. The Bloomberg adjustment is not appropriate for a vast number of situations, as it assigns constant weighting regardless of the standard error in the raw beta estimation (Bloomberg Beta = 1/3*market beta + 2/3*Raw Beta). Given the statistical fact that a larger sample size yields a smaller error, the Vasicek method more appropriately adjusts the raw beta via weights determined by the variance of the individual security versus the variance of a larger sample of comparable companies.

> The weights are designed to bring the raw beta closer to whichever beta estimation has the smallest error. This is a feature the Bloomberg beta cannot replicate.[18]

Notably, while S&P makes reference to the Bloomberg method of applying 2/3 and 1/3 weights to the raw beta and market beta, respectively, the comparison still applies to *Value Line's* methodology of applying 67% and 35% weights. Both methods are forms of the Blume adjustment.[19] While the weights are slightly different between the Bloomberg and *Value Line* methods, they are similar and apply a constant weight without any regard to accuracy. As such, S&P's criticisms apply to both Bloomberg betas and *Value Line* betas.

Because current beta estimates are based on the most recent five years of historical stock returns and volatility, they are being heavily impacted by the market fallout in early 2020 as the global pandemic set in and the market reacted, with this S&P 500 falling more than 40%. For this reason, it is not reasonable to assume current beta estimates, particularly Blume-adjusted betas such as those published by *Value Line*, are reflective of investor expectations at this time.

[18]S&P Market Intelligence, Beta Generator Model.

[19]The Blume adjustment is a tool used to refine a beta measurement in finance. In general, beta attempts to explain how much a particular investment's price moves compared to the overall market. But beta is often based on historical data, which may not be an accurate method for predicting the future. The Blume adjustment tries to address this by considering the idea that, in the long run, most investments tend to become more similar in their riskiness to the overall market (represented by a beta of 1).

Q IS THERE AN EXPLANATION FOR WHY THE VASICEK-ADJUSTED BETAS FROM S&P ARE SIGNIFICANTLY LOWER THAN THE *VALUE LINE* BETAS IN YOUR ANALYSIS?

A The Vasicek-adjusted betas, which average 0.46 for the proxy group, are significantly lower than the *Value Line* betas, which average 0.85, due to differences in how each method corrects for estimation error. The Vasicek method adjusts each company's raw beta toward a lower industry-specific mean when the underlying data is less reliable. This is especially relevant for utilities, which typically have stable earnings, limited volatility, and weaker correlations with overall market returns. As a result, the Vasicek method often pulls utility betas closer to a range of 0.4 to 0.6. In contrast, *Value Line's* method adjusts toward the broader market average of 1.0, which inflates the final estimate relative to Vasicek. In the current environment, utility stocks have exhibited particularly low volatility and reduced market sensitivity, making the Vasicek adjustment more pronounced. Both approaches use five years of weekly returns, but they differ in how they respond to the statistical quality of the input data. The lower Vasicek betas reflect utilities' defensive and low-risk investment profile more conservatively.

Q YOU MENTION THAT THE CURRENT 5-YEAR VALUE LINE BETA ESTIMATES MIGHT NOT BE REFLECTIVE OF INVESTOR EXPECTATIONS, AND POTENTIALLY OVERSTATE THE COST OF EQUITY. DO YOU HAVE EVIDENCE TO SUPPORT THAT HYPOTHESIS?

A Yes. As mentioned above, *Value Line's* beta estimates calculated over a 5-year historical price period will include the unprecedented volatility and market prices caused by the onset of the COVID-19 pandemic in early 2020. It is unreasonable to assume that those prices and resulting volatility resemble investor expectations going forward. Prior to the market fallout from the pandemic, utility beta estimates were at several year lows. Subsequent to the period of peak volatility from the pandemic, utility betas have actually declined back toward their normalized levels. This is demonstrated in Table CCW-9. In this table, I present the raw unadjusted beta estimates for *Value Line's* reported 5-year period as well as a 3-year period ending May 30, 2025. I then apply the Blume adjustment using the same weighting applied by *Value Line*.[20]

[20]The *Value Line* method to calculate adjusted betas is as follows: $B_{adjusted} = 0.35 + 0.67 \times B_{unadjusted.}$

Table CCW-9

Beta Comparison

Proxy Group	5-Year Value Line Beta[1]		3-Year Beta[3]	
	Unadjusted[2]	Reported	Unadjusted	Adjusted[4]

Source:

[1] *The Value Line Investment Survey* , March 7, April 18, May, 9, and May 23, 2025.

[2] Estimated the unadjusted beta by removing *Value Line* 's Blume adjustment methodology: (Unadjusted Beta - 0.35) / 0.67.

[3] S&P Global Market Intelligence, betas for the period 5/30/2022 - 5/30/2025.

[4] Adjusted using *Value Line* 's Blume adjustment methodology: 0.35+(0.67 x Unadjusted Beta).

This data clearly demonstrates that systematic market risk has subsided for regulated utilities after controlling for the impacts of the global pandemic with average and median beta estimates of 0.72 and 0.72, respectively.

Q HOW DID YOU DERIVE YOUR MRP ESTIMATES?

A My MRP estimates are derived using two general approaches: a risk premium approach and a DCF approach. I also consider the normalized MRP of 5.50% with the normalized risk-free rate of 4.77% as recommended by Kroll, formerly known as Duff & Phelps.[21] Based on this methodology and utilizing a "normalized" risk-free rate of 4.77%, Kroll concludes that the current expected, or forward-looking, MRP is 5.50%, implying an expected return on the market of 10.27%.[22]

Q PLEASE DESCRIBE YOUR MRP ESTIMATE DERIVED USING THE RISK PREMIUM METHODOLOGY.

A The forward-looking risk premium-based estimate was derived by estimating the expected return on the market (as represented by the S&P 500) and subtracting the risk-free rate from this estimate. I estimated the expected return on the S&P 500 by adding an expected inflation rate to the long-term historical arithmetic-average real return on the market. The real return on the market represents the achieved return above the rate of inflation.

Morningstar Direct calculates the historical arithmetic-average real-market return over the period 1926 to 2023 to be 9.02%.[23] A current consensus for projected inflation is 2.50%.[24] Using these estimates, the expected market return is 11.75%.[25]

[21]Kroll, and its predecessor Duff & Phelps, is a provider of economic, financial, and valuation data that is often relied on by finance professionals and cited in ROR testimony.

[22]Kroll, *Kroll Recommended U.S. Equity Risk Premium and Corresponding Risk-Free Rates to be Used in Computing Cost of Capital: January 2008 - Present* (Apr. 15, 2025). The current 20-year yield of 4.77% exceeds the "normalized" yield of 3.5%. In accordance with Kroll's prescribed method, the greater of the two shall be used under the normalized Kroll methodology, i.e., 4.77%.

[23]Morningstar Direct, data through 2023.

[24]Blue Chip Financial Forecast June 2, 2025.

[25][(1 + 9.02%) ∗ (1 + 2.50%) - 1] ∗ 100.

The MRP then is the difference between the 11.75% expected market return and the projected risk-free rate of 4.50%, or 7.20%.

Q PLEASE DESCRIBE YOUR MRP ESTIMATES DERIVED USING THE DCF METHODOLOGY.

A I employed two versions of the constant growth DCF model to develop estimates of the MRP. I first employed the Federal Energy Regulatory Commission's ("FERC") method of estimating the expected return on the market that was established in its Opinion No. 569-A. FERC's method for estimating the expected return on the market is to perform a constant growth DCF analysis on each of the dividend-paying companies of the S&P 500 index. The growth rate component is based on the average of the growth projections excluding companies with growth rates that were negative or greater than 20%.[26] The weighted average growth rate for the remaining companies is 10.40%. After reflecting the FERC prescribed method of adjusting the dividend yield by (1 + 0.5g), the weighted average expected dividend yield is 1.79%. Thus, the DCF-derived expected return on the market is the sum of those two components, or 12.19%. The MRP then is the expected market return of 12.19%, less the projected risk-free rate of 4.50%, or approximately 7.70%.

My second DCF-based MRP estimate was derived by performing the same DCF analysis described above, except I used all companies in the S&P 500 index rather than just the dividend-paying companies. The weighted average growth rate for these companies is 10.90%. After reflecting the FERC-prescribed method of adjusting the

[26]Opinion No. 569-A at page 210.

dividend yield by (1 + 0.5g), the weighted average expected dividend yield is 1.58%. Thus, the DCF-derived expected return on the market is the sum of those two components, or 12.48%. The MRP then is the expected market return of 12.48% less the projected risk-free rate of 4.50%, or approximately 8.00%.

The average expected market return based on the DCF model is 12.34% and the average MRP based on the two DCF estimates is 7.85%.

Q HOW DO YOUR EXPECTED MARKET RETURNS COMPARE TO CURRENT EXPECTATIONS OF FINANCIAL INSTITUTIONS?

A As shown in Table CCW-10, my average expected market return of 11.45%[27] exceeds long-term market expectations of several financial institutions.

[27] 11.45% = (10.27% + 12.34% + 11.75%) / 3.

TABLE CCW-10

Long-Term Expected Return on the Market

Source	Term	Expected Return Large Cap Equities
BlackRock Capital Management[1]	10 Years	6.70%
JP Morgan Chase[2]	10 - 15 Years	6.70%
Vanguard[3]	10 Years	2.8% - 4.8%
Research Affiliates[4]	10 Years	3.92%
Invesco[5]	10 Years	5.0% - 6.3%
Goldman Sachs[6]	10 Years	3.00%
Fidelity[7]	20 Years	5.70%
Schwab[8]	10 Years	6.00%

[7]Fidelity, Capital market assumptions
[8]Schwab's 2025 Long-Term Capital Market Expectations, January 3, 2025

When compared to the expected market returns of financial institutions above, my average expected market return of 11.45% is greater than all of them. For these reasons, my expected market returns, and the associated MRPs, should be considered reasonable, if not high-end estimates.

Q HOW DO YOUR ESTIMATED MRPS COMPARE TO THAT ESTIMATED BY KROLL?

A On its Cost of Capital portal, Kroll's MRP falls somewhere in the range of 5.50% to 7.17%. My MRP estimates are in the range of 5.50% to 7.85%.

Q HOW DOES KROLL MEASURE A MRP?

A Kroll's range is based on several methodologies. First, Kroll estimated a MRP of 7.17% based on the difference between the total market return on common stocks (S&P 500) less the income return on 20-year Treasury bond investments over the 1926-2023 period.[28]

Second, Kroll used the Ibbotson & Chen supply-side model which produced a MRP estimate of 6.22%.[29] Kroll explains that the historical MRP based on the S&P 500 was influenced by an abnormal expansion of P/E ratios relative to earnings and dividend growth. To control for the volatility of extraordinary events and their impacts on P/E ratios, Kroll takes into consideration the three-year average P/E ratio as the current P/E ratio. Therefore, Kroll adjusted this MRP estimate to normalize the growth in the P/E ratio to be more in line with the growth in dividends and earnings.

Finally, Kroll developed its own recommended equity, or MRP, by employing an analysis that takes into consideration a wide range of economic information, multiple risk premium estimation methodologies, and the current state of the economy by observing measures such as the level of stock indices and corporate spreads as indicators

[28]Kroll Cost of Capital Navigator.
[29]*Id.*

of perceived risk. Based on this methodology, and utilizing a "normalized" risk-free rate of 4.77%, Kroll concludes that the current expected, or forward-looking, MRP is 5.50%, implying an expected return on the market of 10.27%.[30]

Q WHAT ARE THE RESULTS OF YOUR CAPM ANALYSIS?

A As shown in Exhibit CCW-15, I have provided the results of twelve different applications of the CAPM. The first three results presented are based on the proxy group's current average *Value Line* beta of 0.84. The results of the CAPM based on these inputs range from 9.38% to 11.08%.

The next set of three results presented are based on the proxy group's historical *Value Line* beta of 0.78. The results of the CAPM based on these inputs range from 9.07% to 10.64%.

The third set of results presented are based on the proxy group's current *S&P Global Market Intelligence* beta of 0.46. The results of the CAPM based on these inputs range from 7.29% to 8.09%.

The final set of results presented are based on the proxy group's three-year beta estimate of 0.72. The results of the CAPM based on these inputs range from 8.74% to 10.17%.

My CAPM results are summarized in Table CCW-11.

[30]Kroll, *Kroll Increases U.S. Normalized Risk-Free Rate from 3.0% to 3.5%, but Spot 20-Year U.S. Treasury Yield Preferred When Higher* (Jun. 16, 2022).

Table CCW-11

CAPM Results Summary

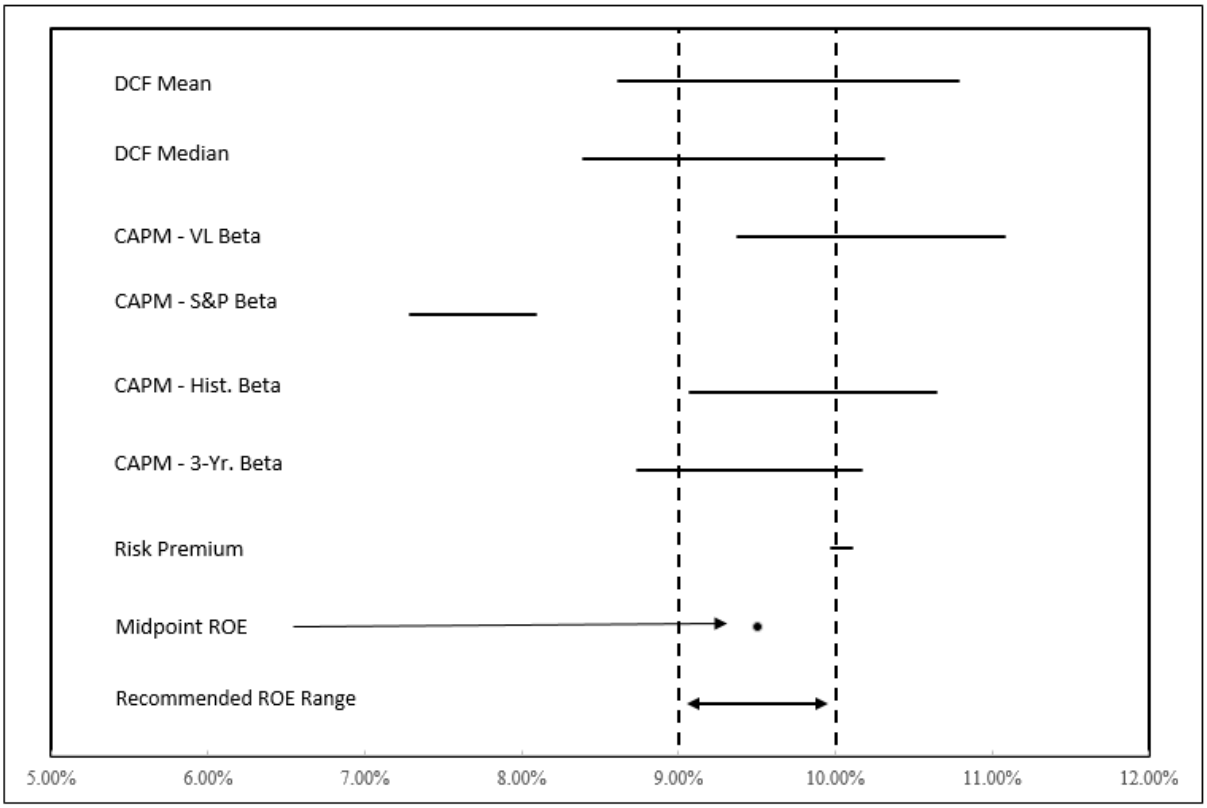
Description	Current VL Beta	Historical VL Beta	Current S&P Beta	3-Year Beta
Kroll Method	9.38%	9.07%	7.29%	8.74%
RP Method	10.53%	10.13%	7.80%	9.70%
FERC DCF Method	11.08%	10.64%	8.09%	10.17%
Average	**10.33%**	**9.95%**	**7.73%**	**9.54%**

K. Return on Equity Summary

Q BASED ON THE RESULTS OF YOUR RETURN ON COMMON EQUITY ANALYSIS DESCRIBED ABOVE, WHAT RETURN ON COMMON EQUITY DO YOU RECOMMEND FOR THE COMPANIES?

A The results of my analyses are summarized in Figure CCW-5. In this figure, I present the various measures of central tendency (i.e., the mean and median results) for each of my analytical models.

Figure CCW-5



Based on my analyses of the various methodologies described above, I estimate the Companies' current market ROE to be in the reasonable range of 9.00% to 10.00%. My recommended range accounts for the unsustainable growth rates assumed in the constant growth DCF model and the irrational assumption that *Value Line's* current beta estimates are reflective of current investor expectations. As described above, the results of the constant growth DCF using analysts' growth rates assume an average long-term growth rate of 6.87%, which is approximately 68% higher than the long-term projected GDP growth rate of 4.09%. This is an unsustainable assumption, and likely leads to an overstatement in the cost of equity for a low risk regulated utility. As such, it is my opinion that primary weight should be given to the sustainable growth and multi-stage models of the DCF. Based on my assessment of the Companies' overall risk profile and

the results of these analytical methods, I would recommend that this Commission authorize the Companies a ROE of 9.50%, which is the midpoint of my recommended range produced by these models.

IV. RESPONSE TO THE COMPANIES' WITNESS D'ASCENDIS

A. Summary of Direct

Q PLEASE DESCRIBE THE COMPANIES' WITNESSES ON THIS SUBJECT MATTER.

A Based on a revised submission of written direct, Witness Dylan D'Ascendis, in Revised Statement No. 2, provides written Direct Testimony on behalf of the Companies addressing the appropriate ROE for each Company. Witness Ryan M. Kucan, in Statement No. 2A, provides written Direct Testimony on behalf of the Companies addressing the ratemaking capital structure and cost of long-term debt for each Company. As noted above, I am not taking issue with the proposed ratemaking capital structure or cost of long-term debt proposed by Witness Kucan. However, the remainder of my testimony will address Mr. D'Ascendis' testimony, in which he recommends the Companies be authorized an ROE of 11.65%, which is the average of his analytical results adjusted for flotation costs. I demonstrate below that his ROE recommendation is excessive and should be rejected.

Q WHAT RETURN ON COMMON EQUITY IS WITNESS D'ASCENDIS PROPOSING FOR THIS PROCEEDING?

A Witness D'Ascendis estimates a market ROE in the range of 10.12% to 10.95% based on the results of various financial models applied to their proxy group of seven natural gas utility companies and 15 electric utility companies. Specifically, Witness D'Ascendis relies on the results of a DCF model, a traditional CAPM, an Empirical CAPM ("ECAPM"), and a Risk Premium method. In addition, Mr. D'Ascendis performs these financial models to two additional groups of non-price regulated companies. Importantly, the results of the models as applied to the non-price regulated companies establishes the top end of his ranges.

After adjusting the ROE for the Companies' relative size of 1.00% for Valley and 0.85% for Wellsboro and Citizens, and a performance adder up to 0.05% for the Companies, Witness D'Ascendis' adjusted range is 11.22% to 12.97%. Witness D'Ascendis recommends that the Companies be awarded an ROE of 11.65%.[31] The results of Witness D'Ascendis (Statement No. 2) recommendations are summarized in Table CCW-12.

[31] Joint Statement No. 2 at 5.

TABLE CCW-12

Summary of Results for Witnesses Kucan and D'Ascendis

Description	Gas & Electric Combined Results
DCF	10.29% - 10.32%
Risk Premium Model	10.79% - 10.86%
CAPM	10.75% - 11.12%
Non-Utility Range	11.84% - 11.92%
Unadjusted ROE Range	10.29% - 11.92%
Size Risk Adjustment	0.85% - 1.00%
Performance Adder	0.05%
Adjusted Recommended ROE Range	**11.22% - 12.97%**
Recommended ROE	**11.65%**

Q IS THE RECOMMENDED ROE OF THE COMPANIES' WITNESS D'ASCENDIS REASONABLE?

A No. For the reasons outlined below, several flaws and assumptions used by Witness D'Ascendis have led to a significant overstatement in the Companies' cost of equity and demonstrate that my recommended ROE of 9.50% is within the range of reasonable outcomes. As such, Witness D'Ascendis' recommendations should be rejected.

B. Witness D'Ascendis' DCF Analysis

Q PLEASE DESCRIBE THE WITNESS D'ASCENDIS' DCF ANALYSIS.

A The Companies' Witness performed a traditional constant growth DCF analyses on their proxy groups. He relied on analysts' earnings growth rate projections from S&P Capital IQ, *Value Line*, and Zack's. The average growth rate for their Gas Group is 6.48%. After he removes the results of Portland General Electric Company and TXNM Energy, the average growth rate for their Electric Group is 6.43%. Witness D'Ascendis used an annualized dividend and the closing stock prices as of February 28, 2025, to calculate each proxy company's dividend yield. His DCF for the Gas Group is 10.29%. After removing the DCF results of Portland General Electric Company and TXNM Energy for being more than two standard deviations from the Electric Group's mean, DCF results are 10.32%.

Q DO YOU HAVE ANY CONCERNS WITH THE WITNESS' DCF RETURN ESTIMATES?

A Yes. The Companies' Witness' DCF model is based entirely on analysts' projected growth. His proxy group's average DCF return is based on growth rates of 6.48% (Gas Group) and 6.43% (Electric Group). These growth rates are nearly 60% higher than the consensus economists' long-term projected growth rate of 4.09% for the economy described above. In other words, the Companies' Witness thinks it is reasonable for the proxy group to grow, on average, at a rate of 1.6x that of the economy. As explained above, it is unrealistic to expect utilities to maintain a growth rate that is well in excess of the anticipated growth in GDP. Accordingly, relying solely on a Constant Growth

DCF tends to overstate the DCF result. The Companies' Witness should have considered the results of a multi-stage DCF analysis as I have done. Had the Companies' Witness included a multi-stage DCF analysis, the low-end of their range would be consistent with mine near 9.0%.

C. Witness D'Ascendis' Risk Premium Model Analysis

Q PLEASE DESCRIBE THE COMPANIES' WITNESS' RISK PREMIUM ANALYSIS.

A The Companies' Witness estimated a risk premium return of 10.86% based on the results for the Gas Group and 10.79% for their Electric Group.[32] For the Gas Group, his Risk Premium results are derived using estimates of the equity risk premium based on the adjusted total market approach (5.68%/5.25%), the holding period return approach (4.76%) and the regression-derived Predicted Equity Risk Premium approach (4.73%/4.77%).[33] The average of his three equity risk premiums is 5.15%.[34] Adding his average equity risk premium of 5.15% to their estimate of the adjusted prospective proxy group bond yield (5.49%) produces a Risk Premium result of 10.64%.[35]

Q DO YOU HAVE ANY CONCERNS WITH THE COMPANIES' WITNESS' RISK PREMIUM METHODOLOGY?

A Yes, I do. First, it must be noted that even their lowest Risk Premium model result, after averaging together 16 different estimates of the equity risk premium, of 10.79%, is

[32] Joint Statement No. 2, at Schedule DWD-4.
[33] *Id.*, at Schedule DWD-4 at page 5.
[34] *Ibid.*
[35] *Id.*, at Schedule DWD-4, page 1.

higher than the highest authorized ROE for an electric distribution utility since at least 2012.[36] This clearly speaks to the unreasonableness of Mr. D'Ascendis' approach.

Second, Mr. D'Ascendis prepared his own estimate of what a projected yield will be for A2 rated utility bonds. This is not a consensus estimate or forecast made by market participants, but rather a yield of his own derivation. There is no evidence the market is relying on Mr. D'Ascendis' method of projecting yields for utility bonds. This is particularly concerning that he takes an average yield spread of utility bond yields over Aaa-rated corporate bonds based on a recent three-month average and assumed that relationship will hold true up to 10 years into the future as he relies on forecasted Aaa-rated corporate bond yields through 2035.

Third, the results of Mr. D'Ascendis' equity Risk Premium analysis are based on a total of 16 measurements of the equity risk premium between gas and electric. Those 16 equity risk premiums range from 4.16% (historical equity risk premium based on S&P's public utility index returns over utility bond yields) to 7.81% (beta-adjusted Equity Risk Premium Based on Bloomberg, *Value Line*, and S&P Global Market Intelligence S&P 500 Companies).[37] When looking at what the individual equity risk premium estimates are before they are mitigated by an averaging approach, his Risk Premium method would produce a cost of equity estimate as high as 13.61% for their Gas Group. That is clearly an outlier result and should not be relied upon.

[36]Based on my review of authorized ROEs tracked by Regulatory Research Associates, a division of S&P Global.

[37]7.81% = 0.79 x 9.88% from Schedule DWD-7, page 7. Schedule DWD-7, page 7.

Finally, Mr. D'Ascendis' use of the Predictive Risk Premium ("PRPM") approach is not widely used or frequently accepted by regulators in establishing the cost of equity.

D. Witness D'Ascendis' CAPM Analysis

Q HOW DID THE COMPANIES' WITNESS DERIVE HIS CAPM RETURN ESTIMATE FOR THE COMPANIES?

A The Companies' Witness developed his CAPM return estimate on their Schedule DWD-5. As shown on that schedule, he relied on a Gas Group beta of 0.79 and an Electric Group beta of 0.73, which was the average of the mean and median betas published by Bloomberg and *Value Line* for their proxy companies, an average MRP of 8.15% and a projected risk-free rate of 4.55%. These inputs produce a traditional CAPM return estimate of 10.96% (Gas Group) and 10.47% (Electric Group).

Q DO YOU HAVE ANY INITIAL COMMENTS CONCERNING THE COMPANIES' WITNESS' CAPM?

A Yes, I do. The CAPM results are based, in part, on *Value Line* beta estimates that are excessive. For example, Mr. D'Ascendis' Gas Group's average *Value Line* beta at the time of his study was 0.92. Currently, as of the most recently published reports from May 23, 2025, his Gas Group betas have declined to an average of 0.81. Notably, all seven gas companies in the Gas Group experienced a meaningful decline in their *Value Line* beta. Simply updating Mr. D'Ascendis' *Value Line* betas will reduce the Gas Group's traditional CAPM by approximately 45 basis points.

Q DO YOU HAVE ANY ISSUES WITH THE COMPANIES' WITNESS' CAPM STUDY?

A Yes, I do. I have concerns with certain of his MRP estimates used to calculate their average MRP. Specifically, his third and fifth MRP.

Q PLEASE DESCRIBE THE COMPANIES' WITNESS' ESTIMATED MRPS, GENERALLY.

A Witness D'Ascendis averages five MRP estimates to develop his recommended MRP of 8.15%.

His first MRP estimate is based on historical Ibbotson data. With this methodology, he estimates a MRP of 7.31%. His second MRP is based on a regression analysis and produced a risk premium of 7.94%. Mr. D'Ascendis' third MRP is based on the application of the PRPM applied to historical market returns data which produced a MRP of 818%. His fourth method is based on *Value Line's* 3-5 year projected market return of 11.20% less their risk-free rate of 4.55% to derive an expected MRP on the *Value Line* index of 6.65%. Mr. D'Ascendis' fifth MRP is based on a projected return on the S&P 500 of 15.23%, which produced a risk premium of 10.68% after their risk-free rate is subtracted. The average of these five MRPs is 8.15%.[38]

Q PLEASE COMMENT ON THE COMPANIES' WITNESS' MRP ESTIMATES.

A As an initial matter, Mr. D'Ascendis' average MRP of 8.15% is slightly above the high-end of the range 5.00% to 8.00% that is indicated by empirical evidence. I will

[38]Schedule DWD-5, page 2.

note that I agree with certain of their MRP estimates. It is the estimates that fall outside of the range suggested by the empirical evidence that are a cause for concern.

In particular, Mr. D'Ascendis' third MRP of 8.18% based on the PRPM model and his fifth MRP (10.68%) based on a projected return on the market of 15.23% are excessive. These MRP estimates exceed the high end of the empirical evidence by as much as 33.5%. For example, Dr. Morin notes in his book, Modern Regulatory Finance, that several studies of the MRP have concluded that a MRP in the range of 5.0% to 8.0% is a reasonable estimate for the United States.[39] For example, the Duarte and Rosa study that Dr. Morin cites concludes that the historical mean is "quite difficult to improve upon when considering out-of-sample performance measures."[40] Dr. Morin also notes that a survey of professional practices showed that 71% of textbooks/tradebooks used a historical average as the MRP, and 60% of financial advisors used a MRP in the range of 7.0% to 7.4% (similar to a long-term arithmetic average MRP).[41]

For these reasons, the Companies' Witness' traditional CAPM results are excessive and unreliable. Simply removing the most excessive MRP of 10.68% would reduce their average MRP from 8.15% to 7.52%, a reduction of 63 basis points. If we also remove the other MRP of 8.18% that falls outside the empirical range, the average MRP would be reduced to 7.30%, an 85-basis point reduction. Updating Mr. D'Ascendis' CAPM with a more recent average of his beta of 0.73 described above and the adjusted average MRP of 7.30% with his risk-free rate of 4.55% indicates a

[39]Dr. Morin references studies by Duarte & Rosa; Professors Ross, Westerfield, and Jordan; Mahera; and Brealey, Myers, and Allen. See *Modern Regulatory Finance,* Dr. Roger A. Morin, at 190-192. Dr. Morin notes in his textbook that there is a "slight preference" for the upper end of the range (i.e., 8%) during tumultuous times in capital markets with examples being the 2008-2009 credit crisis and the 2020 pandemic.

[40]*See Modern Regulatory Finance,* Dr. Roger A. Morin, at 191, citing the Duarte and Rosa study.

[41]See *Modern Regulatory Finance,* Dr. Roger Morin, at 190, footnote 35.

traditional CAPM ROE of 9.91%, a 105-basis point reduction to his Gas Group's CAPM.

E. Witness D'Ascendis' ECAPM Analysis

Q PLEASE DESCRIBE THE COMPANIES' WITNESS' ECAPM ANALYSIS.

A The Companies' Witness applies the same beta, MRP and risk-free rate that he used in his CAPM for his ECAPM. The ECAPM analysis modifies the traditional CAPM equation by including a risk premium weighted by the utility beta, and the overall market beta of 1.0. The original ECAPM analysis was designed to use raw, or unadjusted, regression betas. In the Companies' Witness' ECAPM analysis, he adds two weighted risk premiums to a risk-free rate: a 75% weighted risk premium based on a 0.76 utility beta, and a 25% weighted risk premium based on a beta equal to the overall market beta of 1.0. The theory of the ECAPM is that a beta of less than 1.0 will increase toward the market beta of 1.0 over time, which is necessary because the risk of securities will be increasing over time. The ECAPM formula employed by Mr. D'Ascendis is as follows:

$$R_i = R_f + [(.75) \times B_i \times (R_m - R_f)] + [(.25) \times B_m \times (R_m - R_f)] \text{ where:}$$

R_i = Required return for stock i
R_f = Risk-free rate
R_m = Expected return for the market portfolio
B_i = Beta coefficient for the stock (0.95)
B_m = Beta coefficient for the market (1.0)

Q WHAT ISSUES DO YOU TAKE WITH THE COMPANIES' WITNESS' ECAPM ANALYSIS?

A The biggest issue I have with Mr. D'Ascendis' ECAPM analysis is his use of an adjusted beta as published by *Value Line*. The impact of his ECAPM adjustment is to increase his beta estimate from 0.79 to 0.843.[42] The weighting adjustments applied in the ECAPM are mathematically consistent with the adjustments made to create the *Value Line* adjusted betas since the inputs are all multiplicative as shown in the formula above.

Mr. D'Ascendis' reliance on an adjusted *Value Line* beta in his ECAPM study is inconsistent with the academic research that I am aware of supporting the development of the ECAPM.[43] The *Value Line* adjusted betas are already adjusted for a stock's long-term tendency to converge to 1.00. Importantly, the timing of that convergence is not known, and therefore, a constant weighting is applied when adjusting raw betas using the Blume method, as done by *Value Line* and Bloomberg. Thus, the end result of using the *Value Line* adjusted betas in the ECAPM is essentially an expected return line that has been flattened by two duplicative adjustments. In other words, the vertical intercept has been raised twice and the security market line has been flattened twice: once through the adjustments *Value Line* made to the raw beta, and again by weighting the risk-adjusted MRP as Mr. D'Ascendis has done.

Moreover, he further increases the intercept and flattens the security market line by using projected long-term Treasury yields that are at odds with current market

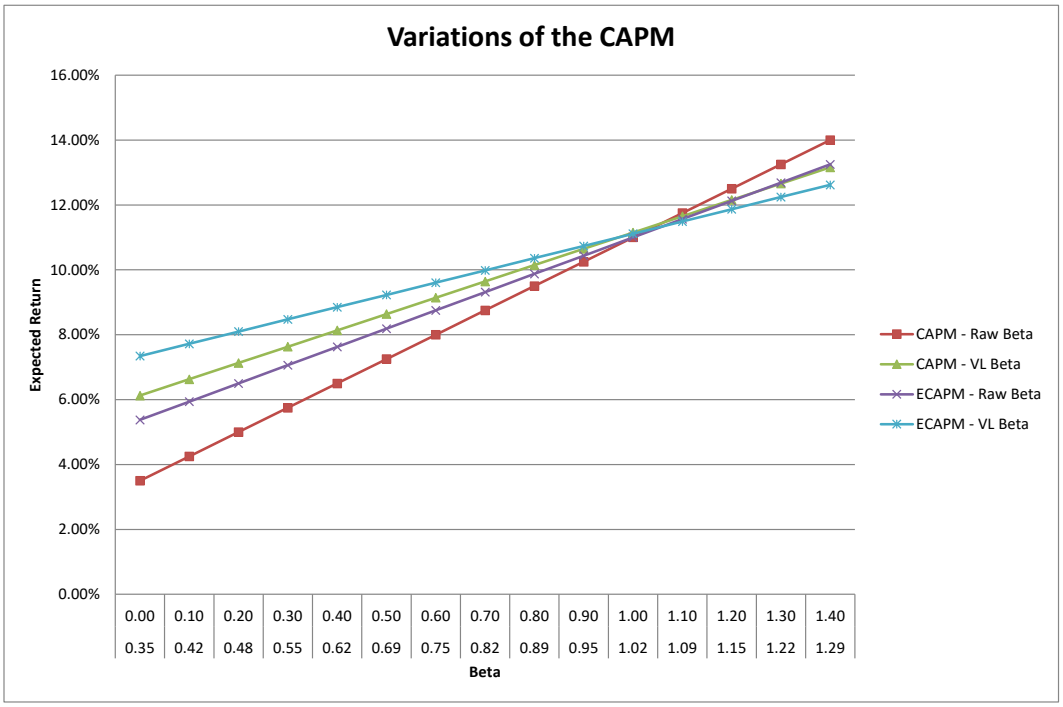
[42] 75% x 0.79 + 25% x 1 = 0.843.

[43] *See* Black, Fischer, "Beta and Return," *The Journal of Portfolio Management,* Fall 1993, 8-18; and Black, Fischer, Michael C. Jensen and Myron Scholes, "The Capital Asset Pricing Model: Some Empirical Tests," 1972.

expectations and inconsistent with the Federal Reserve's projections and monetary policy.

The ECAPM will raise the intercept point of the security market line and flatten the slope. Again, this has the effect of increasing CAPM return estimates for companies with betas less than 1, and decreasing the CAPM return estimates for companies with betas greater than 1. I have modeled the expected return line resulting from the application of the various forms of the CAPM/ECAPM below in Figure CCW-6.

FIGURE CCW-6



Along the horizontal axis in Figure CCW-6, I have provided the raw unadjusted beta (top row) and the corresponding adjusted *Value Line* beta (bottom row). As shown in Figure CCW-6, the CAPM using a *Value Line* beta compared to the CAPM using an unadjusted beta shows that the *Value Line* beta raises the intercept point and flattens the slope of the security market line. As shown in the figure above, the two variations with the most similar slope are the CAPM with the *Value Line* beta, and the ECAPM with a

raw beta. This evidence shows that the ECAPM adjustment has a very similar impact on the expected return line as a *Value Line* adjusted beta. Another observation that can be made from the figure above is the magnifying effect that the ECAPM using a *Value Line* adjusted beta has on raising the vertical intercept and flattening the slope relative to all other variations. There is simply no legitimate basis to use an adjusted beta within an ECAPM because it unjustifiably alters the security market line and materially inflates a CAPM return for a company with a beta less than 1.

F. Witness D'Ascendis' Non-Price Regulated Proxy Group Analysis

Q PLEASE DESCRIBE THE ANALYSIS DONE BY THE COMPANIES' WITNESS ON THEIR NON-PRICE REGULATED PROXY GROUPS.

A The Companies' Witness performed the same financial models described above to two groups of non-price regulated companies. One group consisted of 47 companies, while the other group consisted of 49 companies.

The indicated ROE produced by Mr. D'Ascendis' analysis applied to his proxy group of non-price regulated companies is 11.84% to 11.92%.

Q IS THE COMPANIES' WITNESS' ADDITIONAL ANALYSES REASONABLE?

A No. The Companies' Witness' use of non-price regulated companies to estimate the Companies' cost of equity is fundamentally unreasonable because it relies on companies that operate in speculative, highly competitive, and profit-maximizing sectors of the economy. These companies are not subject to the same regulatory oversight, earnings

constraints, or obligations to serve as Valley, a regulated natural gas distribution utility, or as Wellsboro and Citizens, regulated electric distribution companies.

By referencing non-price regulated companies, the Companies' Witness introduces a systematic upward bias into their ROE estimate, improperly inflating the return level that is appropriate for a stable, regulated utility. The risk profiles of these companies, many of which pursue aggressive growth strategies or operate in sectors subject to economic and technological disruption, bear no resemblance to the lower-risk, asset-intensive, and heavily regulated environment in which the Companies operate.

Ultimately, the Companies' Witness' analysis leads to an overstated and unjustified cost of equity estimate that is inconsistent with the standards requiring that rates be "just and reasonable" for both customers and investors.

G. Witness D'Ascendis' Proposed Performance Adder

Q PLEASE DESCRIBE THE PERFORMANCE ADDER PROPOSED BY THE COMPANIES' WITNESS.

A The Companies' Witness wants to reward shareholders and burden ratepayers by increasing the allowed ROE by 0.05%, or 5 basis points.

The Companies' Witness' subjective decision to add a 5-basis point management adder is entirely based on the testimony of Valley's Witness Mr. Rogers, Citizens' Witness Mr. Johnson, and Wellsboro's Witness Farnsworth.[44]

[44]Joint Statement No. 2 at 51-52.

As described above, the *Hope and Bluefield Standards* conclude that the utility has "no constitutional rights to profits"[45] and defined the ratepayer/investor balance as follows:

> The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties.[46]

As such, a fair ROR is based on the expectation that the utility's costs reflect efficient and economical management, and the return will support its credit standing and access to capital, but the return will not be in excess of this level. Mr. D'Ascendis' proposal to further reward shareholders for its "exemplary performance" is counter to the *Hope and Bluefield Standards* as such standards are assumed the Company will operate under efficient and economical management. Adding an additional 5 basis points to an ROE that would be the highest ROE allowed for a gas utility in the lower 48 United States since at least 2012 is egregious and should be rejected.

In addition, I am unaware of any financial literature or textbooks that suggest a Company's cost of equity includes a premium to compensate shareholders for exemplary management performance.

[45] *Bluefield,* 262 U.S. at 692-93.
[46] *Id*. at 693 (Emphasis Added).

Q DID THE COMPANIES' WITNESS PERFORM AN INDEPENDENT ASSESSMENT OF WHAT THE PERFORMANCE ADDER SHOULD BE, IF ANY?

A No. He does not. Again, he relies entirely on the testimony of the Companies' implicitly biased, highest ranking member of management of each Valley, Citizens, and Wellsboro.[47]

H. Witness D'Ascendis' Proposed Size Adjustment

Q PLEASE DESCRIBE THE SIZE ADJUSTMENT PROPOSED BY THE COMPANIES' WITNESS.

A Mr. D'Ascendis proposes to add a ROE adder of 0.85% (85 basis points) for Citizens and Wellsboro, and 1.00% (100 basis points) for Valley, to reflect his belief that the Companies have greater risk relative to that of their proxy group companies due to the relative size of the Companies.[48]

Q HOW DID THE COMPANIES' WITNESS ESTIMATE THIS SIZE ADJUSTMENT?

A Mr. D'Ascendis approximates a market value for the Companies (the Companies are not publicly traded and do not have a market value) and compares this market size to the actual market capitalization size for their utility proxy groups. He estimates the Companies' market capitalization by applying the proxy group's average market-to-book ratio of 1.62x (Gas) to 2.01x (Electric) to the book value of the

[47] Joint Statement No. 2 at 51-52.
[48] Joint Statement No. 2 at 51.

Companies' equity. Mr. D'Ascendis estimates that the utility proxy group market valuation is between 253.8x to 913.2x larger than their estimated market value for the Companies.

He then compares the actual market capitalization size for the proxy groups, and his estimates of market value for the Companies, to the market capitalization size deciles published by Kroll. He relies on Kroll's estimated CAPM return difference for companies that fall within market capitalization size deciles. The Companies' Witness estimates that the proxy group market capitalization size puts them in the 3rd (Electric Group) and 5th (Gas Group) deciles of returns as estimated by Kroll, and his estimates of market capitalization for the Companies puts it in the 10th decile size return category. The difference between the 3rd decile and the 10th decile indicates a ROE adder of around 3.98%, to reflect the difference in risk caused by market capitalization size. While the spread from the 10th decile to the 5th indicates a ROE adder of around 3.73%. However, using his judgment, Witness D'Ascendis recommends a ROE size adder of 0.85% for Citizens and Wellsboro and 1.00% for Valley.[49]

Q IS THE COMPANIES' WITNESS' PROPOSED SIZE ADJUSTMENT FOR THE COMPANIES REASONABLE?

A No. There are several fundamental errors and flaws in Mr. D'Ascendis' quantitative estimate and logic. First and foremost, the Companies are not a publicly traded companies. For this reason, Mr. D'Ascendis does not know what the market value capitalization is for the Companies. His approximation simply is not meaningful and

[49] *Id.*

cannot be used to make an accurate measurement of a ROE adder if one is so justified, which it is not.

Second, Mr. D'Ascendis has not demonstrated that size premiums are applicable to the utility industry. For example, the average unadjusted betas for the 3rd, 5th, and 10th deciles in the Kroll risk premium study are 1.10, 1.17, and 1.38. These unadjusted betas are significantly higher than Mr. D'Ascendis' proxy group adjusted betas. In addition, there is empirical evidence which concludes that, while size premiums are present in industrial companies, such a size premium is not present in utility companies, nor are they appropriate to include in valuing utilities.[50]

Finally, modern portfolio theory operates under the assumption that the market does not compensate investors for taking on risks that can be diversified away. Thus, investors are only compensated for taking on systematic, or non-diversifiable market risks. The size adjustment as proposed by the Companies' Witness is not appropriate and should be denied.

Q DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A Yes, it does.

[50]Wong, Annie, 1993, Utility stocks and the size effect: An empirical analysis, Journal of the Midwest Finance Association, at 95-101.

QUALIFICATIONS OF CHRISTOPHER C. WALTERS

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Christopher C. Walters. My business address is 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017.

Q PLEASE STATE YOUR OCCUPATION.

A I am a consultant in the field of public utility regulation and a Principal with the firm of Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

Q PLEASE STATE YOUR EDUCATIONAL BACKGROUND AND PROFESSIONAL EMPLOYMENT EXPERIENCE.

A I received a Bachelor of Science Degree in Business Economics and Finance from Southern Illinois University Edwardsville. I have also received a Master of Business Administration Degree from Lindenwood University.

As a Principal at BAI, I perform detailed technical analyses and research to support regulatory projects including expert testimony covering various regulatory issues. Since my career at BAI began in 2011, I have held the positions of Analyst, Associate Consultant, Consultant, Senior Consultant, and Associate. Throughout my tenure, I have been involved with several regulated projects for electric, natural gas and water and wastewater utilities, as well as competitive procurement of electric power and gas supply. My regulatory project work includes estimating the cost of equity capital, capital structure evaluations, assessing financial integrity, merger and acquisition

related issues, risk management related issues, depreciation rate studies, and other revenue requirement issues.

BAI was formed in April 1995. BAI and its predecessor firm have participated in more than 700 regulatory proceedings in 40 states and Canada.

BAI provides consulting services in the economic, technical, accounting, and financial aspects of public utility rates and in the acquisition of utility and energy services through RFPs and negotiations, in both regulated and unregulated markets. Our clients include large industrial and institutional customers, some utilities and, on occasion, state regulatory agencies. We also prepare special studies and reports, forecasts, surveys and siting studies, and present seminars on utility-related issues.

In general, we are engaged in energy and regulatory consulting, economic analysis and contract negotiation. In addition to our main office in St. Louis, the firm also has branch offices in Corpus Christi, Texas; Louisville, Kentucky and Phoenix, Arizona.

Q HAVE YOU EVER TESTIFIED BEFORE A REGULATORY BODY?

A Yes. I have sponsored testimony before state regulatory commissions including: Arizona, Arkansas, Colorado, Delaware, Florida, Georgia, Illinois, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nevada, New Mexico, North Carolina, Ohio, Oklahoma, Oregon, South Carolina, Texas, Utah, and Wyoming. In addition, I have also sponsored testimony before the City Council of New Orleans and an affidavit before the FERC.

Q PLEASE DESCRIBE ANY PROFESSIONAL REGISTRATIONS OR ORGANIZATIONS TO WHICH YOU BELONG.

A I earned the Chartered Financial Analyst ("CFA") designation from the CFA Institute. The CFA charter was awarded after successfully completing three examinations which covered the subject areas of financial accounting and reporting analysis, corporate finance, economics, fixed income and equity valuation, derivatives, alternative investments, risk management, and professional and ethical conduct. I am a member of the CFA Institute and the CFA Society of St. Louis.

VI. CONCLUSIONS AND RECOMMENDATIONS 38

I. INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS?

A. My name is Michael W. Deupree. My business address is 5800 One Perkins Place Drive, Suite 5-F, Baton Rouge, Louisiana, 70808.

Q. PLEASE STATE YOUR OCCUPATION AND CURRENT PLACE OF EMPLOYMENT?

A. I am a Senior Research Consultant with the Acadian Consulting Group ("ACG"), a research and consulting firm that specializes in the analysis of regulatory, economic, financial, accounting, statistical, and public policy issues associated with regulated and energy industries. ACG is a Louisiana-registered partnership, formed in 1995, and is located in Baton Rouge, Louisiana.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL QUALIFICATIONS.

A. I hold a Bachelor of Arts degree in Business Economics from Buena Vista University in Storm Lake, Iowa, and a Master of Arts degree in Economics from the University of Kansas in Lawrence, Kansas. I began my professional career with the Staff of the Kansas Corporation Commission in 2008 while in graduate school conducting analyses of topics related to energy and economy as a Research Assistant, eventually being promoted to a Research Analyst and later Senior Research Economist after graduation. I left the Kansas Corporation Commission to take a position with ACG in late 2011, where I have been promoted to positions of increasing responsibility since, including my current position which I started in mid-2021. Appendix A provides my professional resume, which includes a listing of my publications, presentations, pre-filed expert witness testimony, expert reports, and expert legislative testimony.

Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THIS COMMISSION?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I have been retained by the Pennsylvania Office of Consumer Advocate ("OCA") to address matters related to the general rate case filed by Citizens' Electric Company of Lewisburg ("Citizens" or the "Company"). I specifically have been asked to review the Company's proposed Allocated Class Cost of Service Study ("ACOS") and rate design.

Q. ARE YOU SPONSORING ANY EXHIBITS?

A. Yes. I am sponsoring the following Exhibits MWD-1 (Citizens) through MWD-4 (Citizens).

- Exhibit MWD-1: Summary of Results of Company's Proposed ACOS
- Exhibit MWD-2: Summary of Results of Alternative ACOS
- Exhibit MWD-3: Summary of Company's Proposed Revenue Allocation
- Exhibit MWD-4: Summary of Results of Alternative Revenue Allocation

II. SUMMARY OF RECOMMENDATIONS

Q. WHAT ARE YOUR ACOS FINDINGS FOR CITIZENS'?

A. My alternative ACOS analyses shows that Citizens' incorrect classification of secondary-voltage distribution plant skews the allocation of costs and revenue responsibilities away from larger customers and onto residential and small commercial customers. I recommend the Commission rely on the results of my alternative ACOS as a fair and reasonable estimation of relative costs of service between Citizens' customer classes.

Q. WHAT IS YOUR RECOMMENDATION REGARDING CITIZENS' PROPOSED REVENUE DISTRIBUTION?

A. I recommend that the Commission adopt a more reasonable revenue distribution allocation method based on my alternative ACOS results that also limits the rate increase to the municipal lighting ("MBL") customer class to 1.25 times the overall system average increase. Under Citizens' proposed overall distribution revenue increase of 29.64 percent this reduces the revenue increase to this rate class to 37.05 percent, compared to the Company's proposed distribution rate increase of 75.0 percent.

Q. WHAT IS YOUR RECOMMENDATION REGARDING CITIZENS' PROPOSED RATE DESIGN FOR CUSTOMER CHARGES?

A. I recommend the Commission reject Citizens' proposed increases in customer charges because they disproportionately impact low-income customers and reduce customer incentives to reduce usage, contrary to public goals of promoting energy efficiency. Furthermore, Citizens' existing residential and small commercial customer charges are already higher than the regional average of peer investor-owned utilities, and the proposed increase would make the charges the highest of peers. Finally, a correct analysis of customer-related costs from Citizens' ACOS finds that all residential and commercial rate classes are currently recovering *all* customer-related costs through monthly customer charges.

III. ALLOCATED COST OF SERVICE STUDY

A. Introduction

Q. WHAT IS THE PURPOSE OF AN ACOS?

A. An ACOS is a modeling approach that reconciles utility costs and revenues across different customer classes. The goal of an ACOS is to evaluate the cost of providing service and revenue responsibility for each individual customer class. ACOS results are used to estimate class specific rates of return and can serve as a guidepost for class revenue responsibilities and ultimately rates.

Q. HOW IS AN ACOS PREPARED?

A. An ACOS utilizes a set of historic or projected cost information that is (1) functionalized, (2) classified, and (3) allocated. The functionalization process simply categorizes costs based upon the functions they serve within a utility's overall operations (i.e. production, transmission, and distribution). The classification process characterizes costs by type, including those that are (1) demand-related, (2) energy/commodity-related, or (3) customer-related. The last step of the process allocates each of these costs to a respective jurisdiction or customer class as appropriate.

Q. PLEASE EXPLAIN DEMAND-RELATED COSTS.

A. Demand-related costs are associated with meeting maximum electricity demands. At the distribution level, electric substations and line transformers are designed, in part, to meet the maximum customer demand requirements. The most common demand allocation factors used in an ACOS are those related to system Coincident Peaks ("CP") or Non-Coincident Peaks ("NCP"). At the production level, most power plants, also referred to as production plants or electric generation units ("EGU"), are typically viewed as being designed to serve both the energy/commodity and demand/capacity needs of

the utility. The exact degree of this split between energy and demand depends on the individual EGU in question and how that unit is dispatched with baseload units serving more of the utility's energy needs and peak units serving more of the utility's capacity or demand needs. Therefore, it is not uncommon to develop composite energy and demand allocators to allocate plant-in-service costs associated with a utility's generation fleet.

Q. HOW ARE ENERGY-RELATED COSTS DEFINED?

A. Energy-related costs are defined as those that tend to change with the amount or volume of electricity (i.e., kilowatt-hour ("kWh")) sold. Electric generation costs and high-voltage transmission lines, for instance, can be allocated, in part, based on some measure of electricity sales.

Q. WHAT ABOUT CUSTOMER-RELATED COSTS?

A. Customer-related costs are those associated with connecting customers to the distribution system, metering household or business usage, and performing a variety of other customer support functions.

Q. IS THIS A RELATIVELY SIMPLE PROCESS?

A. No. Some costs can be clearly identified and directly assigned to a function , while other costs are more ambiguous and difficult to assign. The primary challenge in conducting an ACOS is the treatment of what are known as "joint and common" costs. Given their shared or integrated nature, these joint and common costs can often be difficult to compartmentalize. Therefore, unique allocation factors are utilized in an ACOS to classify joint and common costs. The process of developing these cost allocation factors can become subjective and is often imbued with policy considerations.

Q. HOW DOES AN ACOS RELATE TO COMMONLY QUOTED ECONOMIC PRINCIPLES?

A. An ACOS is referred to as a "fully allocated cost study" since it allocates test year revenues, rate base, expenses, and depreciation to various jurisdictions and customer classes based upon a series of different allocation factors. The purpose of the ACOS is to develop cost responsibility estimates for each customer class, which in turn, can be used to develop rates. An ACOS is based upon a set of historic utility book costs that have accumulated over decades. Rates are, therefore, based upon historic average costs, whereas economic theory suggests that the most efficient form of pricing in perfectly competitive markets should be based upon marginal costs. However, regulated utilities do not operate in perfectly competitive markets and, by their very nature, are natural monopolies. Thus, reaching the ideal pricing formula outlined in economic theory is impossible since the nature of natural monopolies makes pricing in the presence of declining average costs, coupled with the presence of joint and common costs, difficult.

Q. ARE THERE ANY OTHER CONFOUNDING PROBLEMS THAT CAN ARISE WITH AN ACOS?

A. Yes. The problems listed above are confounded by the fact that cost information utilized in an ACOS is usually historic and static, or based on potentially inaccurate projections in the context of Fully Projected Future Test Years ("FPFTY"). These analytic deficiencies undermine many experts' cost causation/pricing claims. As a result, in regular practice there is no single correct answer that is revealed in an ACOS. It is often up to regulators to exercise an appropriate level of judgment regarding the nature of these costs, the results of the ACOS, and the implications both have in setting fair, just, and

reasonable rates. This is one of the reasons why many regulators use ACOS results as a "guide" in setting rates and do not consider themselves unnecessarily bound by the ACOS results.

Q. WHAT CONTROVERSIES ARISE IN THE ANALYSIS AND COMPARISON OF VARIOUS ACOS METHODOLOGIES?

A. The ACOS process is significantly different from the revenue requirement or cost of capital phase of a typical rate case. While the latter two processes focus on determining how much revenue will be recovered through rates, the ACOS process determines how those costs (revenue requirements) will be recovered through customer rates. The primary controversy with the evaluation of various ACOS results often rests with determining whether costs (revenue requirements) will be recovered by the relative customer share of each class, the peak load contributions of each customer class, or whether and how the approach will be tempered through the use of customer, peak, and off-peak usage considerations. Methodologies that are heavily skewed toward customer and peak considerations, for instance, can shift costs more than proportionally to relatively lower load-factor customers, such as residential and small commercial customers, and less costs to larger high load factor customer classes and off-peak customers. These approaches can also fail to capture the service being provided by the utility (i.e., electric service in this case), and how the value of that service varies by the amount purchased by different customer classes.

Q. PLEASE EXPLAIN THE BIAS IN METHODOLOGIES THAT ARE SKEWED TOWARD PEAK CONSIDERATIONS.

A. Residential and small commercial customer electricity loads are typically weather sensitive. On the other hand, larger industrial customers use electricity in processes that are generally not weather sensitive, and electric use thus tends not to cycle up and down, but rather runs on a more continuous basis. Because of this, daily and annual usage patterns for these two customer classes are significantly different. The peak loads for residential and small commercial customers tend to be more "peaked" than those for industrial customers, which are steadier and more evenly distributed across peak and non-peak hours. For example, an average residential customer may have relatively little electricity use during overnight hours and during weekday daytime working hours. Residential customers exhibit relatively significant use during early summer evening hours corresponding to returning home from work, and potentially during chilly early winter morning hours if the customer uses electric resistance heating. Similarly, small commercial customers see limited electricity use outside of workday hours. Thus, residential and small commercial customers tend to have relatively lower load factors than large industrial customers.

Q. PLEASE DEFINE "LOAD FACTOR."

A. A load factor is defined as the ratio of the average load in kilowatt hours supplied during a designated period to the peak or maximum load in kilowatts occurring in that period. The load factor is expressed as a percentage and may be derived by taking the energy used during a period and dividing it by the product of the maximum demand and the number of hours in the period. A system that is estimated to have a high load factor is often thought to be utilizing electricity more efficiently, since usage is consistent and does not swing significantly between average and peak periods. Conversely, systems

with low load factors must maintain idle capacity in order to meet the relatively large swings in load between average and peak periods.

Q. DOES A HIGH LOAD FACTOR INDICATE GREATER SYSTEM EFFICIENCY?

A. Yes, since a higher system load factor can be indicative of, or lead to better system resource utilization, other things being equal. However, it should be recognized that all utilities inherently have customers with different load profiles due to differences in how customers use electricity. Furthermore, the development of integrated wholesale bulk electricity transmission systems has allowed utilities to collectively diversify generation resources and individual system demands, which has reduced the impact of individual system load characteristics on generation needs in recent years. While rates should recognize and promote the efficient utilization of utility system resources, caution should be used in placing too much emphasis on this principle of rewarding high load factor industrial customers to the detriment of low load factor residential and small commercial customers.

Q. WHAT IMPACT DOES COST ALLOCATION HAVE ON REVENUE RECOVERY?

A. Higher use customers, such as industrial customers, are inherently more price sensitive than lower use customers due to the relative impact increases in rates can have on these customers' total utility bills and the margins of produced goods. These higher use industrial customers tend to have more energy supply alternatives, including fuel switching and self-generation, which is part of the reason why they are more price sensitive. These considerations can result in differences in revenue generation given the

differences in the price elasticities of demand (i.e., price sensitivities) for the two sets of customers (residential, industrial).

Q. EXPLAIN HOW SOME ACOS METHODS CAN BE BIASED AGAINST LOWER LOAD-FACTOR CUSTOMERS.

A. Utilities by their nature are capital intensive industries with high levels of capital expenditures required to develop systems to generate and transmit power to customers. Therefore, deciding the appropriate allocation of costs associated with utility capital investments (e.g., utility "plant in service") largely affects the cost of providing service. Utilities can often over-emphasize peak demand factors in allocating these large plant costs in order to assign more costs away from their price sensitive customers. Likewise, utilities can emphasize non-diversified single CP demands, NCP demands, and individual customer demands in allocating costs associated with transmission and distribution plant facilities to favor high-load factor customers relative to low-load factor customers. Finally, utilities can over-emphasize customer connection aspects of lower voltage distribution facilities to favor high-use customers relative to low-use customers.

B. Overview of Company's ACOS

Q. PLEASE DESCRIBE CITIZENS' ACOS APPROACH.

A. The Company states that it developed its ACOS with four goals in mind: (1) recognition of cost causality as opposed to value of service, (2) stability of results over time, (3) logical consistency and completeness, and (4) ease of implementation.[1] To this end the Company utilizes the traditional three-step approach to ACOS. First the Company functionalizes its costs to six separate functions: supply; transmission; sub-transmission;

[1] Direct Testimony of Howard S. Gorman at 15:2-9.

primary distribution; secondary distribution; and billing.[2] Second, the Company classifies these functionalized costs to two separate purposes: demand and customer costs.[3] Finally, the Company defines a series of individual allocators to allocate these functionalized and classified costs to individual rate classes.[4]

Q. PLEASE EXPLAIN HOW THE COMPANY CLASSIFIES ITS DISTRIBUTION PLANT INVESTMENTS.

A. The Company classifies all distribution plant investment costs as either customer- or demand-related, or a combination of these two factors.[5] The Company utilized what it refers to as a "zero-load analysis" to define a portion of secondary distribution system costs associated with utility poles (FERC Account 364), overhead conductors (FERC Account 365), underground conductors (FERC Account 366), underground conduit (FERC Account 367), and line transformers (FERC Account 368) as partially customer-related, while classifying all other non-customer-related distribution as fully demand-related.[6]

[4] Direct Testimony of Howard S. Gorman at 16:10-11, and Company Response to OCA-I-1, Attachment A.

[5] Company Response to OCA-I-1, Attachment A.

[6] Direct Testimony of Howard S. Gorman at 16:10-11, and Company Response to I&E-RE-1D, Attachment A.

Table 1: Summary of Results of Company's ACOS

	Total Citizens	Residential Service (RS)	Commercial and Industrial Service: Space Heating (SH)	Commercial and Industrial Service: General L&P (GLP-1)	Commercial and Industrial Service: General L&P (GLP-3)	Lighting Service: Municipal (MBL)	Lighting Service: Outdoor (OL)
Net Operating Income							
Total Operating Revenues	$ 6,159,008	$ 3,971,574	$ 8,889	$ 1,108,954	$ 927,024	$ 26,383	$116,184
Total Operating Expenses	5,908,628	3,997,072	7,448	912,930	840,465	55,471	95,242
Net Operating Income	**$ 250,380**	**$ (25,498)**	**$ 1,441**	**$ 196,024**	**$ 86,559**	**$ (29,088)**	**$ 20,942**
Total Rate Base	**$17,092,345**	**$11,451,271**	**$ 21,081**	**$ 2,564,908**	**$ 2,328,190**	**$282,749**	**$444,146**
Rate of Return on Rate Base	**1.46%**	**-0.22%**	**6.84%**	**7.64%**	**3.72%**	**-10.29%**	**4.72%**
Relative Rate of Return (RRO	**1.00**	**-0.15**	**4.67**	**5.22**	**2.54**	**-7.02**	**3.22**

Q. HAVE YOU EXAMINED THE COMPANY'S ACOS RESULTS?

A. Yes. Exhibit MWD-1 (Citizens), summarized in Table 1 above, presents the results of the Company's ACOS which estimates an overall FPFTY rate of return ("ROR") of current rates of 1.46 percent. Estimated individual class returns range from negative 10.29 percent for the municipal lighting or MBL class to 7.64 percent for the general light and power-1 ("GLP-1") class. The residential service ("RS") rate class is estimated by the Company to have achieved an ROR of negative 0.22 percent during the test year under current rates, which is negative 0.15 of the system average on a relative rate of return ("RROR") basis.

Q. DO YOU DISAGREE WITH ANY OF THE ASSUMPTIONS OR ALLOCATION FACTORS INCORPORATED IN THE COMPANY'S PROPOSED ACOS?

A. Yes. I disagree with the Company's reliance on the results of its zero-load analysis and minimum size analysis to classify secondary distribution plant assets as being partially customer-related. The Company's zero-load analysis for secondary distribution plant other than transformers and minimum size analysis for transformers are forms of what is referred to as a Minimum System Study ("MSS") that are not aligned with cost-causation.

C. Use of a "Minimum System Study" to Classify Distribution Plant Costs

Table 2: Summary of Results of Company's Zero-Load Analysis

FERC Account Description	Demand Allocation	Customer Allocation
364 Secondary Poles, Towers and Fixtures	19.31%	80.69%
365 Secondary Overhead Conductors and Devices	22.60%	77.40%
366 Secondary Underground Conduit	42.89%	57.11%
367 Secondary Underground Conductors and Devices	42.89%	57.11%
368 Secondary Line Transformers	64.15%	35.85%

Source: Company's Response to I&E-RE-1-D, Attachment A.

Q. PLEASE DESCRIBE HOW THE COMPANY CLASSIFIES THE CUSTOMER AND DEMAND COMPONENTS OF ITS SECONDARY-VOLTAGE DISTRIBUTION PLANT COSTS.

A. The Company's witness Mr. Gorman conducted a zero load analysis to determine the customer-related component of secondary-voltage distribution system costs included in FERC Account 364 – Overhead Electric Poles; FERC Account 365 – Overhead Conductors; FERC Account 366 – Underground Conductors; FERC Account 367 – Underground Conduits; and a minimum size analysis to determine the customer-related component of secondary-voltage transformer costs included in FERC Account 368 – Line Transformers.[7] Table 2 presents a summary of the results of the Company's zero load and minimum size analyses. The Company's zero load and minimum size analyses estimates customer-related classification from a low of 35.85 percent (FERC Account 368) to a high of 80.69 percent (FERC Account 364).[8]

[7] Direct Testimony of Howard S. Gorman at 16:10-11, and Company Response to I&E-RE-1D, Attachment A.

[8] Company Response to I&E-RE-1D, Attachment A.

Q. PLEASE DESCRIBE THE ZERO-LOAD ANALYSIS MR. GORMAN USES TO ESTIMATE THE CUSTOMER-RELATED PORTION OF UPSTREAM SECONDARY DISTRIBUTION PLANT OTHER THAN LINE TRANSFORMERS.

A. Mr. Gorman examined the total inventory of Citizens' poles, overhead conductors and underground conductors.[9] He then examined what appears to be the cost that would be required to replace this inventory based on recent workorders, separating these expenses into four categories: Labor, Overhead, Vehicle, and Materials.[10] All non-materials costs were viewed as labor-related (i.e. Labor, Overhead, and Vehicle expenses) and classified as customer-related with the balance being defined as demand-related.[11] As Mr. Gorman states in this proceeding, "The zero-load component of the Secondary system represents the cost of extending service to all customers, without regard to peak or average load, and is therefore customer-related."[12] Since this "zero-load component" has no load-carrying capacity, no adjustment to the demand allocators is proposed by Mr. Gorman.

Q. PLEASE DESCRIBE MR. GORMAN'S "MINIMUM SIZE ANALYSIS" FOR CLASSIFYING A PORTION OF LINE TRANSFORMERS AS CUSTOMER-RELATED.

A. Similar to his zero-load analysis, Mr. Gorman first examined the total inventory of Citizens' line transformers. He then claims he defined a minimum size transformer of 50 kilovolt amperes ("kVa") serving four customers, or 12.5 kVa per customer.[13] Finally, Mr.

---

[9] *Id.*

[10] *Id.*

[11] Direct Testimony of Howard S. Gorman at 20:6-10.

[12] Direct Testimony of Howard S. Gorman at 20:10-12.

[13] Direct Testimony of Howard S. Gorman at 20:17-19.

Gorman multiplied this minimum size transformer cost by the number of line transformers on Citizens' system to arrive at the portion of total line transformer costs that he defines as customer-related.[14]

Q, DO YOU AGREE WITH MR. GORMAN'S ZERO-LOAD ANALYSIS FOR SECONDARY PLANT OTHER THAN TRASNFORMERS OR MINIMUM SIZE ANALYSIS FOR TRANSFORMERS?

A. No. As stated, both Mr. Gorman's zero-load analysis and minimum size analysis are forms of a MSS that are not aligned with cost-causation, which I explain more fully below, and I disagree with Mr. Gorman's reliance on the results of his zero-load analysis and minimum size analysis to classify secondary distribution plant assets as being partially customer-related.

Q. PLEASE EXPLAIN THE THEORETICAL BASIS FOR A "MINIMUM SYSTEM" STUDY OR MSS.

A. Such studies are often advocated by those holding the view that certain distribution plant investments are made to serve a dual-nature: one consisting of meeting system load requirements, the other being focused on customer interconnection or access that requires a customer-based allocation component. This minimum system component is determined through an MSS (referred to by Mr. Gorman in this proceeding as a "zero-load analysis") or a related "zero-intercept study."

Q. WHAT ARE MSS AND ZERO-INTERCEPT STUDIES?

[14] Direct Testimony of Howard S. Gorman at 20:16-23.

A. MSS and zero-intercept studies are cost allocation methodologies that attempt to estimate separate customer-related versus load-related costs. An MSS does this by estimating the hypothetical costs of developing a “minimum” system that only provides customers with connection to a utility’s electric distribution system but not a system sufficient to actually serve the customer’s electrical requirements. Likewise, a zero-intercept study utilizes regression analysis techniques to estimate the relationship between the electric demand requirements on a system and costs associated with installation of new distribution plant assets. Using these regression analyses, a zero-intercept study then calculates a hypothetical minimum cost by calculating the costs of the distribution plant assets given zero demand requirements.

Q. PLEASE DESCRIBE THE MECHANICS OF AN MSS.

A. It is argued that many distribution system assets can be classified as having both a customer and a demand component. For instance, distribution substations are built to serve customers but are often expanded to meet increases in customer loads. An MSS study attempts to separate the customer-related portion of total system costs from those associated with serving loads (or service volumes). An MSS study estimates the hypothetical costs of developing a minimum system to serve customers with no load. These calculations involve subjectivity since they use accounting and engineering analyses to develop assumptions about the minimum sizes and costs associated with various distribution system components, while still satisfying system requirements such as pole height and efficient conductor and transformer sizes. The costs associated with these “minimum” components are then added together to derive the total minimum costs associated with the hypothetical system with no energy usage. This estimate is then

divided by total actual system costs to approximate the customer-related share of overall distribution system costs.

Q. ARE THERE ANY THEORETICAL SHORTCOMINGS TO USING MSS AND ZERO-INTERCEPT STUDIES FOR CLASSIFICATION OF DISTRIBUTION PLANT ASSETS?

A. Yes. Both MSS and zero-intercept studies depend on deeply flawed counterfactual theoretical premises. MSS-based analyses deal in hypotheticals that do not exist in the real world, including the assumption that somehow there is an electric distribution system out there in the world that could or would be plausibly built to serve customers but not load. No such system exists, making the underlying assumptions and modeling of a "minimum system" difficult, if not impossible, to verify. Even if a minimum electric distribution system could be constructed in real life, it would still have the ability to service at least a portion of customers' loads, undermining this modeling approach's fundamental premise.

Q. DOES THE NARUC COST ALLOCATION MANUAL RECOGNIZE THESE CHALLENGES?

A. Yes. The National Association of Regulatory Utility Commissioners ("NARUC") Electric Cost Allocation Manual ("NARUC Manual") recognized this fundamental failing of MSS approaches in its discussion of the approach:

> Cost analysts disagree on how much of the demand costs should be allocated to customers when the minimum-size distribution method is used to classify distribution plant. When using this distribution method, the analyst must be aware that the minimum-size distribution equipment has a certain load-

carrying capability, which can be viewed as a demand-related cost.[15]

Q. WHAT ARE THE THEORETICAL FAILINGS OF ZERO-INTERCEPT BASED STUDIES?

A. A zero-intercept-based approach is simply a statistically based MSS approach and suffers, conceptually, from the same shortcomings. A zero-intercept analysis attempts to model an empirical relationship that does not exist. One should recognize that the argument that electric distribution costs are related to the number of customers on a utility's system is not a new argument, and the academic literature in utility regulation has questioned for quite some time the use of both MSS and zero-intercept studies.

Q. HOW HAS THE ACADEMIC LITERATURE IN UTILITY REGULATION QUESTIONED THE USE OF MSS AND ZERO-INTERCEPT STUDIES?

A. Dr. James Bonbright, in his seminal work on public utility regulation, published originally in the 1970s, raises a number of questions about the use of MSS and zero-intercept methodologies in classifying costs. Dr. Bonbright's primary concern was the lack of empirical support in the academic literature for a causal relationship between distribution system costs and the number of customers. The true driving factors of utility distribution system costs are much more complicated and depend on a host of other factors, such as the size of a service territory and the population density within. The incremental cost of constructing an appropriate distribution system to serve an additional customer within an urban area with existing nearby infrastructure is substantially less than the cost to extend an existing utility system by potentially miles to serve an additional

[15] Electric Utility Cost Allocation Manual (January 1992), NARUC, p. 95.

customer located in a rural area, a fact inherently ignored by MSS and zero-intercept methodologies:

> …the annual costs of this phantom, minimum-sized distribution system are treated as customer costs and are deducted from the annual costs of the existing system, only the balance being included among those demand-related costs to be mentioned in the following section. Their [minimum distribution costs] inclusion among the customer costs is defended on the ground that, since they vary directly with the area of the distribution system (or else with the lengths of the distribution lines, depending on the type of distribution system), they therefore vary directly with the number of customers. Alternatively, they are calculated by the "zero-intercept" method whereby regression equations are run relating cost to various sizes of equipment and eventually solving for the cost of a zero-sized system (Sterzinger, 1981).
>
> What this last-named cost imputation overlooks, of course, is the very weak correlation between the area (or the mileage) of a distribution system and the number of customers served by this system. For it makes no allowance for the density factor (customers per linear mile or per square mile). Our casual empiricism is supported by a more systematic regression analysis in (Lessels, 1980) where no statistical association was found between distribution costs and number of customers. Thus, if the company's entire service area stays fixed, an increase in number of customers does not necessarily betoken any increase whatever in the costs of a minimum-sized distribution system.[16]

Q. WHAT WAS DR. BONBRIGHT'S CONCLUSION REGARDING THE USE OF MSS AND ZERO-INTERCEPT STUDIES?

A. Dr. Bonbright found that attempts to classify costs associated with a minimum-sized distribution system, whether determined through the use of an MSS or a zero-intercept study, as something other than demand-related as potentially of merit.

[16] James C. Bonbright, *et al*. Principles of Public Utility Rates. 1988 Edition. Arlington, VA: Public Utilities Reports, Inc., p. 491.

However, he ultimately concluded that classifying these costs as customer-related as the Company has done in the current proceeding is "clearly indefensible,"[17] due to the lack of a relationship between changes in the number of customers on a utility system and its distribution costs.

Table 3: Correlation of Customers and Distribution Network Additions

Year	Change in Average Number of Customers	Net Distribution Plant Addition	Poles, Towers, and Fixtures Additions	Overhead Conductors Additions	Underground Conduits Additions	Underground Conductors Additions	Line Transformers Additions
		($000)

Source: Company's Annual Reports

Q. HAVE YOU QUANTITATIVELY ASSESSED THE HISTORIC CORRELATION BETWEEN INCREASES IN COMPANY DISTRIBUTION PLANT AND INCREASED NUMBER OF CUSTOMERS?

A. Yes. Table 3 examines trends between changes in average number of customers on the Company's system and distribution plant accounts 364-368 for the years 2008

[17] *Id* at 492.

through 2024. This analysis finds that additions to the relevant distribution plant accounts are not highly correlated with changes in the Company's average number of customers. Specifically, I estimate the correlation coefficient for the individual FERC accounts in question to range from negative 0.0338 to positive 0.5121, and I estimate the correlation coefficient of these distribution plant accounts in total to be 0.3062. Overall, this demonstrates very weak correlation, as observed by Dr. Bonbright decades ago.

Q. HAVE OTHER JURISDICTIONS REJECTED THE USE OF AN MSS?

A. Yes. In 2021, the Michigan Public Service Commission rejected a proposal that Consumers Energy be required to submit an MSS in its next rate case.[18] Likewise, in 2010, the Rhode Island Public Utilities Commission rejected a request that it require the use of a minimum system study for Narragansett Electric Company D/B/A National Grid.[19]

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE RELIANCE ON AN MSS TO ALLOCATE COSTS ASSOCIATED WITH DISTRIBUTION PLANT ASSETS?

A. I recommend the Commission reject the Company's proposed MSS approaches in the classification of secondary-voltage distribution plant costs included in FERC Accounts 364-368. MSS and related zero-intercept approaches are fundamentally flawed and provide little to no value as to the just and reasonable setting of rates. Research has shown these methods are flawed, and some state regulatory commissions have gone so far as to expressly reject their use. Further, while MSS is used by some utilities, it is not

[18] In the Matter of the Application of Consumers Energy Co. for Authority to Increase its Rates for the Generation and Distribution of Electricity and for Other Relief, Case No. U-20963, Order, dated December 22, 2021.

[19] In re: the Application of The Narragansett Elec. Co. D/B/A National Grid For Approval of A Change in Electric Base Distribution Rates, Docket No. 4065, Decision and Order, dated April 29, 2010.

commonly used by all utilities. Thus, I recommend the Commission appropriately classify assets included in the relevant distribution plant accounts as 100 percent demand-related.

Q. DO YOU HAVE ANY OTHER QUALITATIVE COMMENTS ABOUT MR. GORMAN'S ANALYSIS TO CLASSIFY SECONDARY DISTRIBUTION PLANT BESIDES LINE TRANSFORMERS AS PARTIALLY CUSTOMER-RELATED?

A. Yes. As explained before, there is no direct relationship between the number of customers and the cost of these secondary distribution plant. For example, when a distribution line is upgraded, the costs of doing so are integrated and capitalized. If a new conductor is added, or new poles installed, there is no rationale to separating out the costs of labor, vehicle, and overhead as customer-related while only the costs of the materials of the poles and the conductor are related to demand. Without the poles and the conductor there would be no distribution line upgrade, and that upgrade was no doubt required because the expected future coincident demand to be imposed on those facilities required the upgrade, undermining the concept of attempting to identify a 'minimum' cost of interconnection since all of these costs are based on coincident demand considerations. Mr. Gorman's separation of these installation costs into customer- and demand-related is artificial and merely has the effect of shifting cost responsibility to low-load factor customer classes with numerous small customers.

Q. DO YOU HAVE ANY OTHER QUALITATIVE COMMENTS ABOUT MR. GORMAN'S ANALYSIS TO CLASSIFY LINE TRANSFORMERS AS PARTIALLY CUSTOMER-RELATED?

A. Yes. Similar to my observation concerning other secondary distribution network costs, upgrades to transformer capacity will depend upon the coincident demand that

must be met by the local distribution systems. The reasons for making transformer investments is the need to meet these local coincident loads. Again, this undermines the concept of attempting to identify a 'minimum' cost since even this so-called minimum size transformer has significant load-carrying capability and its investment is made in recognition of these demand considerations and not simply to connect the customer to the system. For all these reasons, Mr. Gorman's classification of these costs should be rejected and 100 percent of these costs should be classified as demand-related.

D. Summary of ACOS Findings

Table 4: Summary of Results of Alternative ACOS

	Total Citizens	Residential Service (RS)	Commercial and Industrial Service			Lighting Service	
			Space Heating (SH)	General L&P (GLP-1)	General L&P (GLP-3)	Municipal (MBL)	Outdoor (OL)

Q. PLEASE SUMMARIZE YOUR ACOS FINDINGS.

A. Exhibit MWD-2 (Citizens), summarized in Table 4 above, presents the results of my alternative ACOS which appropriately classifies costs associated with secondary-voltage distribution plant accounts included in FERC Accounts 364-368 as 100 percent demand-related. My alternative ACOS show that the Company's incorrect classification of production plant and secondary-voltage distribution plant assets skews the allocation of costs and revenue responsibilities away from larger customers and onto residential customers and small commercial customers. I recommend the Commission rely on the results of my alternative ACOS as a fair and reasonable estimation of the relative costs of service between Company customer classes.

Table 5: Comparison of ACOS Results

	Total Citizens	Residential Service (RS)	Commercial and Industrial Service			Lighting Service	
			Space Heating (SH)	General L&P (GLP-1)	General L&P (GLP-3)	Municipal (MBL)	Outdoor (OL)

Relative Rate of Return	1.00	0.35	1.58	5.05	0.25	-6.99	3.34

IV. REVENUE DISTRIBUTION

Q. PLEASE EXPLAIN THE PURPOSE OF THE REVENUE DISTRIBUTION PROCESS IN SETTING RATES.

A. The revenue distribution process allocates a utility's overall revenue deficiency across customer classes, which in turn, is used to establish a new set of retail rates. The revenue distribution process often uses the results from the ACOS as its starting point, but not necessarily as its ending point. Class-specific revenue responsibilities are established by allocating the system-wide revenue deficiency to classes that are under-earning, relative to their estimated ROR, and assigning, at least in theory, revenue decreases to those classes that are over-earning relative to their ACOS-estimated class returns. The final class revenue responsibilities are then used, in conjunction with each class's billing determinants, to determine rates. In summary, the revenue distribution process can be thought of as the initial step taken to establish rates.

Q. DOES THE REVENUE DISTRIBUTION PROCESS INCLUDE ANY POLICY CONSIDERATIONS?

A. Yes. Allocating the overall system-wide revenue deficiency entirely on a full cost of service basis can result in a very significant and adverse rate impact for under-earning classes. Given this, regulators often determine the revenue responsibilities assigned to

various customer classes by considering a set of generally accepted ratemaking principles.

Q. WHAT ARE THOSE GENERALLY ACCEPTED RATEMAKING PRINCIPLES?

A. There are several generally accepted rate-making principles used in utility regulation that include:

1) Rates should be fair, just, and reasonable, and not unduly discriminatory.

2) To the extent possible, gradualism should be used to protect customers from rate shock.

3) Rate continuity should be maintained.

4) Rates should be informed by costs, but class cost of service results need not be the only factor used in rate development.

5) Rates should be understandable to customers.

Q. HOW ARE THE ABOVE PRINCIPLES APPLIED IN DEVELOPING RATES FOR A REGULATED UTILITY?

A. It is important to consider all of the ratemaking principles I reference above. However, any principle's relative weight can change depending upon the importance of certain policy goals. Rate design should strike a balance between policy goals and resulting rates that are fair, just, and reasonable. There is no pre-set or universally accepted formula for developing rates or rate design, and, as a result, sound judgment is necessary to formulate a rate design that meets these objectives.

Table 6: Summary of Company's Proposed Revenue Allocation

	Total Citizens	Residential Service (RS)	Commercial and Industrial Service: Space Heating (SH)	Commercial and Industrial Service: General L&P (GLP-1)	Commercial and Industrial Service: General L&P (GLP-3)	Lighting Service: Municipal (MBL)	Lighting Service: Outdoor (OL)
Allocated Cost of Service Results							
Rate of Return	1.46%	-0.22%	6.84%	7.64%	3.72%	-10.29%	4.72%
Relative Rate of Return	1.00	-0.15	4.68	5.23	2.55	-7.05	3.23
Proposed Revenue Allocation							
Current Distribution Revenues	$ 6,055,143	$ 3,903,746	$ 8,741	$ 1,092,138	$ 909,143	$ 26,151	$115,224
Proposed Distribution Revenue Increase	1,794,525	1,244,862	2,078	250,793	243,980	19,613	33,199
Proposed Distribution Revenues	**$ 7,849,668**	**$ 5,148,608**	**$ 10,819**	**$ 1,342,931**	**$ 1,153,123**	**$ 45,764**	**$148,423**
Proposed Revenue Change	**29.64%**	**31.89%**	**23.77%**	**22.96%**	**26.84%**	**75.00%**	**28.81%**
Relative Proposed Revenue Increase	**1.00**	**1.08**	**0.80**	**0.77**	**0.91**	**2.53**	**0.97**

Q. PLEASE EXPLAIN THE COMPANY'S APPROACH TO REVENUE DISTRIBUTION.

A. The Company states that cost of service is just one consideration in developing its proposed revenue allocation. Specifically, while the Company proposes to move each class closer to cost of service, it does so with an objective of mitigating extreme rate impacts on rate classes and on customer subgroups.[20] Exhibit MWD-3 (Citizens), summarized in Table 6 above, presents the Company's estimated current class RROR and its proposed revenue distribution.

Q. WHAT DO YOU MEAN BY RROR?

A. The RROR effectively standardizes the class-specific ROR estimated by an ACOS to the overall system average. In other words, it divides the estimated class ROR by the estimated system ROR. For instance, assume that the residential class is earning a class-specific eight percent ROR, and further assume that the system-wide average ROR estimated by the same ACOS is also eight percent. The residential class, in this example, can be said to be earning a 1.0 RROR if the estimated ROR is the same as the overall system (*i.e.*, eight percent divided by eight percent equals 1.0). Put another way, any class earning a 1.0 RROR can be said to be making its full contribution to the system's overall ROR (*i.e.*, there is no cross-subsidy). A RROR that is greater than 1.0 indicates that a particular class is contributing more than the system average contribution to the Company's overall return. Likewise, a class that earns a RROR less than 1.0 but greater than zero can be said to be making a less-than-average contribution to the overall system.

[20] Direct Testimony of Howard S. Gorman at 28:10-12.

Q. DO YOU AGREE THAT A CLASS RROR LESS THAN 1.0 IS PROBLEMATIC OR INEQUITABLE?

A. Not necessarily. Consistent with the ratemaking principles identified above, there may be policy reasons to support a result that reflects a cross-subsidization. For example, the presence and/or continuation of a RROR below 1.0 could be the result of a prior agreed-upon rate freeze that prevents class rates from increasing to correct a revenue deficiency (relative to cost of service). In this example, the presence of a RROR below 1.0 is simply a function of a prior policy decision, not necessarily the result of some arbitrary or intentionally designed unreasonable inequity.

Q. WHAT ARE THE CLASS RATE INCREASES UNDER THE COMPANY'S PROPOSED REVENUE DISTRIBUTION?

A. The Company proposes to increase base rates by 29.64 percent on a system-wide average basis. Under the Company's proposal individual classes would receive increases ranging from a 22.96 percent increase for GLP-1 customers to as high as a 75.0 percent for the MBL customers. This proposed increase to MBL customers is equal to more than 2.5 times the overall system average increase of 29.64 percent.

Q. DO YOU AGREE WITH THE COMPANY'S PROPOSED REVENUE DISTRIBUTIONS?

A. No. The Company's proposed revenue distributions suffer from two deficiencies. First, the Company's proposal is based on the results of a faulty ACOS that overstates the extent of any current subsidy from commercial and industrial customers to residential customers. Second, the Company's proposed increase to the MBL customer class is inconsistent with the principles of gradualism.

Table 7: Summary of Alternative Proposed Revenue Allocation

	Total Citizens	Residential Service (RS)	Commercial and Industrial Service: Space Heating (SH)	Commercial and Industrial Service: General L&P (GLP-1)	Commercial and Industrial Service: General L&P (GLP-3)	Lighting Service: Municipal (MBL)	Lighting Service: Outdoor (OL)
Allocated Cost of Service Results							
Rate of Return	1.46%	0.35%	2.31%	7.37%	0.37%	-10.20%	4.87%
Relative Rate of Return	1.00	0.24	1.58	5.05	0.25	-6.99	3.34
Proposed Revenue Allocation							
Current Distribution Revenues	$ 6,055,143	$ 3,903,746	$ 8,741	$ 1,092,138	$ 909,143	$ 26,151	$115,224
Proposed Distribution Revenue Increase	1,794,524	1,210,041	2,532	255,316	283,887	9,688	33,060
Proposed Distribution Revenues	**$ 7,849,667**	**$ 5,113,787**	**$ 11,273**	**$ 1,347,454**	**$ 1,193,030**	**$ 35,839**	**$148,284**
Proposed Revenue Change	**29.64%**	**31.00%**	**28.97%**	**23.38%**	**31.23%**	**37.05%**	**28.69%**
Relative Proposed Revenue Increase	**1.00**	**1.05**	**0.98**	**0.79**	**1.05**	**1.25**	**0.97**

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE COMPANY'S PROPOSED REVENUE DISTRIBUTION?

A. I recommend that the Commission adopt a more reasonable revenue distribution allocation method based on my alternative ACOS results that also limits the rate increase to the MBL customer class to 1.25 times the overall system average increase. Under the Company's proposed overall distribution revenue increase of 29.64 percent this reduces the revenue increase to this rate class to 37.05 percent, compared to the Company's proposed distribution rate increase of 75.0 percent.

Table 8: Comparison of Class Revenue Allocations

	Total Citizens	Residential Service (RS)	Commercial and Industrial Service: Space Heating (SH)	Commercial and Industrial Service: General L&P (GLP-1)	Commercial and Industrial Service: General L&P (GLP-3)	Lighting Service: Municipal (MBL)	Lighting Service: Outdoor (OL)
Citizens' Proposed							
Distribution Revenue Increase	$ 1,794,525	$ 1,244,862	$ 2,078	$ 250,793	$ 243,980	$ 19,613	$ 33,199
Percentage Increase	29.64%	31.89%	23.77%	22.96%	26.84%	75.00%	28.81%
OCA Alterantive							
Distribution Revenue Increase	$ 1,794,524	$ 1,210,041	$ 2,532	$ 255,316	$ 283,887	$ 9,688	$ 33,060
Percentage Increase	29.64%	31.00%	28.96%	23.38%	31.23%	37.05%	28.69%

Q. HAVE YOU PREPARED A SUMMARY OF THE EFFECTS OF YOUR PROPOSED REVENUE DISTRIBUTION?

A. Yes. Exhibit MWD-4 (Citizens) presents an illustrative summary of the effects of my proposed revenue allocation at the Company's proposed revenue requirement

increase. My proposed revenue distribution would increase base rates for the residential class by 31.00 percent, compared to the Company's proposal, which would increase such rates by 31.89 percent.

V. RATE DESIGN

Table 9: Summary of Company's Proposed Customer Charges

Rate Schedule	Current Charge	Proposed Charge	Percent Increase
Schedule RS - Residential Service	$13.10	$16.50	26.0%
Schedule SH - Space Heating	$20.19	$24.00	18.9%
Schedule GLP-1 - General Light and Power Service	$16.00	$21.00	31.3%
Schedule GLP-3 - General Light and Power Service	$55.00	$100.00	81.8%

Source: Company's Response to I&E-RE-1-D, Attachment A

Q. PLEASE DISCUSS THE COMPANY'S PROPOSED CUSTOMER CHARGE INCREASES.

A. As summarized by Table 9, the Company is proposing to increase the monthly customer charges for all rate classes. This includes a proposed increase in Residential Service ("RS") customer charge from $13.10 to $16.50 per month, representing a 26 percent increase. Likewise, the Company proposes to increase the commercial Space Heating ("SH") monthly customer charge from $16.00 to $21.00 per month, representing a 31 percent increase.

Table 10: Survey of Regional Customer Charges

Company	State	Residential Customer Charge ($/month)	Commercial Customer Charge ($/month)
Citizens Electric Company (Current)	**PA**	**$ 13.10**	**$ 16.00**
Citizens Electric Company (Proposed)	**PA**	**$ 16.50**	**$ 21.00**
Black Diamond Power Company	WV	8.00	10.12
Kentucky Utilities Company	VA	12.00	30.00
Pennsylvania Electric Company	NY	8.50	10.50
Pike County Light & Power Company	PA	8.80	17.26
Rockland Electric Company	NJ	5.75	16.00
The Toledo Edison Company	OH	4.00	7.00
UGI Utilities, Inc.	PA	10.75	17.00
Wellsborough Electric Company	PA	12.00	12.22
Wheeling Power Company	WV	12.50	15.00
Peer Group Average		**$ 9.14**	**$ 15.01**

Source: Utility Tariffs

Q. HAVE YOU COMPARED THE COMPANY'S PROPOSED RESIDENTIAL CUSTOMER CHARGES TO OTHER REGIONAL ELECTRIC UTILITIES?

A. Yes, and this analysis is presented in Table 10, which surveys current residential and small commercial customer charges among other regional electric utility companies. The analysis shows that the Company's current residential customer charge of $13.10 per month is the highest in the region out of the nine electric utility companies included in the survey. The average across all regional peers is $9.14, which is lower than the Company's current rate and significantly lower than the proposed customer charge of $16.50 per month. Likewise, the Company's proposed increase in SH customer charge to $21.00 per month would be the second highest in the region, and its current SH customer charge of $16.00 per month is higher than the regional average of $15.01 per month.

Q. WHAT IS THE BASIS OF THE COMPANY'S PROPOSED CUSTOMER CHARGE INCREASES?

A. The Company provides information supporting a claim that its ACOS supports a $36.56 monthly residential customer charge.[21] Likewise, the Company provides information supporting a claim that its ACOS supports a $40.94 monthly SH customer charge.[22]

Q. DO YOU AGREE WITH THE MANNER IN WHICH THE COMPANY MADE THESE CALCULATIONS?

A. No. The Company's analysis significantly overstates the cost directly attributable to residential customers. Specifically, it includes secondary distribution costs as customer-related based on its flawed zero-load analysis and minimum size analysis allocations, as discussed earlier.

Table 11: Analysis of Company Customer-Related Costs

Line No.	Description	Residential Service (RS)	Commercial and Industrial Service: Space Heating (SH)	General L&P (GLP-1)	General L&P (GLP-3)
1	Customer-Related Costs per Company's ACOS				
2	Class Functionalized Customer Billing Expenses	$939,683	$ 529	$ 199,286	$ 23,169
3	Number of Bills	72,612	36	13,644	504
4	**Monthly Customer-Related Costs/Customer**	**$ 12.94**	**$ 14.68**	**$ 14.61**	**$ 45.97**
5	Customer Charge Revenue at Current Rates				
6	Customer Charge Revenue at Current Rates	$951,217	$ 727	$ 218,304	$ 27,720
7	Number of Bills	72,612	36	13,644	504
8	**Monthly Customer Charge Revenue/Customer**	**$ 13.10**	**$ 20.19**	**$ 16.00**	**$ 55.00**

Source: Company's Response to OCA-I-1, Attachment A (Schedule E)

Q. HAVE YOU PREPARE AN ANALYSIS OF COSTS COMMONLY ASSOCIATED WITH CUSTOMER CHARGES?

[21] Direct Testimony of Howard Gorman, Exhibit HSG-1, Schedule E-1B.

[22] *Id.*

A. Yes. That analysis is provided in Table 11. "Customer-related" expense accounts are those typically allocated on the basis of customers and can include: removing and setting meters; maintenance of meters; services expense; maintenance of service drops; meter reading expense; dispatch applications and orders; customer records and collections; customer billing and accounting; customer service and information; and sales expense. These costs can also include the depreciation expense associated with the service drop and meter plant accounts and property taxes, as well as the carrying charges (at the Company's requested rate of return) for the customer portion of services investment and 100 percent of the meters investment.

Q. HOW DO THE COMPANY'S CUSTOMER CHARGE REVENUES COMPARE WITH THE RESULTS OF YOUR ANALYSIS?

A. The Company's current customer charge revenue associated with the residential class is more than 101 percent of the class' customer-related cost responsibilities. Likewise, the Company's current customer charge revenue associated with the SH class is 137.5 percent of the class' customer-related cost responsibilities.

Q. DO THESE RESULTS INDICATE ANY PRESSING NEED TO INCREASE MONTHLY CUSTOMER CHARGE RATES?

A. No. All Citizens' residential and commercial service rate classes currently cover *all* of their customer-related costs through monthly customer charges. The lowest, the residential class, still recovers more than 101 percent of its customer-related costs through its monthly customer charge.

Q. IS THE COMPANY'S PROPOSAL TO INCREASE THE CUSTOMER CHARGE CONSISTENT WITH PROMOTING ENERGY EFFICIENCY AND CONSERVATION?

A. No. The Company's rate design proposal is inconsistent with energy efficiency, since it reduces economic incentives for ratepayers to control their monthly utility bills through energy efficiency and conservation efforts, because only the variable component of bills is avoidable.

Q. HAVE OTHER REGULATORS RECOGNIZED THE NEGATIVE IMPACTS THAT CUSTOMER CHARGE INCREASES CAN HAVE FOR ENERGY EFFICIENCY?

A. Yes. In rejecting a request by Baltimore Gas and Electric ("BGE") to increase customer charges as part of a larger rate design proposal, the Maryland Public Service Commission ("MPSC") recognized the need to allow customers the opportunity to control their monthly bills by reducing energy usage.

> Even though this issue was virtually uncontested by the parties, we find we must reject Staff's proposal to increase the fixed customer charge from $7.50 to $8.36. Based on the reasoning that ratepayers should be offered the opportunity to control their monthly bills to some degree by controlling their energy usage, we instead adopt the Company's proposal to achieve the entire revenue requirement increase through volumetric and demand charges. This approach also is consistent with and supports our EmPOWER Maryland goals.[23]

Q. CAN YOU POINT TO ANY OTHER REGULATORY EXAMPLES?

A. Yes. The Montana Public Service Commission ("MT PSC") addressed this issue in evaluating, and rejecting, a proposal by Energy West Montana to eliminate volumetric charges and only have one fixed monthly customer charge (known as a "straight-fixed variable" or "SFV" rate design):

[23] Maryland Public Service Commission Case No. 9299, In the Matter of the Application of Baltimore Gas and Electric Company for Adjustment in its Electric and Gas Base Rates (*"Case No. 9299"*). Order No. 85374 at p. 99, rel. February 22, 2013.

> The Commission agrees that most distribution costs are not avoidable, and that volumetric distribution charges may encourage conservation actions that, all other things being equal, reduce the utility's embedded cost recovery between rate cases and contribute to future rate increases.
>
> …
>
> The Commission agrees that an SFV rate design is a clean and administratively inexpensive way to decouple revenue from volume. An often-cited public policy justification for revenue decoupling is to remove the volume disincentive for cost-effective conservation investment by a gas distribution company, which through SFV and other decoupling methods is rendered indifferent to the volume of gas consumed. Yet, SFV rates decouple revenue at the cost of decreasing returns to conservation investment by customers. For this reason the net conservation benefit of revenue decoupling via SFV rates is not clear, and may be negative.[24]

Q. HAVE ANY REGULATORY RESEARCH INSTITUTES ADDRESSED THE ISSUE OF THE RELATIONSHIP BETWEEN HIGH CUSTOMER CHARGES AND ENERGY EFFICIENCY?

A. Yes. A research document presented for consideration by the membership of NARUC also notes that extreme increases in customer charges, that typically happen under SFV rate design proposals, are problematic because of its effects on customer incentives to conserve energy:

> **Straight-Fixed Variable Rate Design.** This mechanism eliminates all variable distribution charges and costs are recovered through a fixed delivery services charge or an increase in the fixed customer charge alone. With this approach, it is assumed that a utility's revenues would be unaffected by changes in sales levels if all its overhead or fixed costs are recovered in the fixed portion of customers' bills. <u>This approach has been criticized for having the unintended effect of reducing customers' incentive to use less</u>

[24] In The Matter Of Energy West Montana, Application To Establish Increased Service Rates In Its Great Falls, Cascade, And West Yellowstone Service Areas, Montana Public Service Commission, Docket No. D2010.9.90, Order No, 7132c, at 29–30, rel. November 17, 2011.

> electricity or gas by eliminating their volumetric charges and billing a fixed monthly rate, regardless of how much customers consume.[25]

Q. HAS ANY NATIONAL PUBLIC POLICY ANALYSIS NOTED THE EFFICIENCY DISINCENTIVES ASSOCIATED WITH HIGH CUSTOMER CHARGES?

A. Yes. The National Action Plan for Energy Efficiency ("NAPEE"), a joint venture of the U.S. Department of Energy and U.S. Environmental Protection Agency, published a whitepaper on various rate design effects on encouraging energy efficient behaviors. The NAPEE postulated that rate designs over-emphasizing customer charges, like SFV, can deter or weaken the economic signals sent to customers to change their energy usage behavior and make investments in energy efficiency devices:

> Because [SFV] tends to shift costs out of volumetric charges, it tends to reduce customers' efficiency incentive, because the marginal price of additional consumption is reduced. While SFV rates are being considered to better reflect the utility's costs behind the rate, these rates do not encourage customers to change energy usage behavior or invest in efficiency technologies. Such customer disincentives persist even when SFV rates are applied to individual components of the bill, such as charges for distribution service.[26]

Q. SHOULD THE COMMISSION BE MINDFUL OF THE EFFECT OF THE COMPANY'S PROPOSED RATE DESIGN ON LOW-USE RESIDENTIAL CUSTOMERS?

---

[25] "Decoupling for Electric & Gas Utilities: Frequently Asked Questions (FAQ)" Grants & Research Department, National Association of Regulatory Utility Commissioners, at 5 (Sept. 2007) (emphasis added).

[26] Customer Incentives for Energy Efficiency Through Electric and Natural Gas Rate Design, National Action Plan for Energy Efficiency at 13-14, prepared by William Prindle, ICF International, Inc. (Sept. 2009) (emphasis added).

A. Yes. There are numerous studies in the academic literature supporting the hypothesis that electricity is a "normal good."[27] That is, the consumption of electricity is directly correlated with household income level, meaning that higher-use electrical customers are typically higher income individuals and lower-use electrical customers are typically lower income individuals. These are important factual considerations the Commission should bear in mind.

Figure 1: Analysis of Electricity Usage and Household Income

White, 2005, "Household electricity demand revisited," Review of Economic Studies 72, 853-858; and Swan L.G., V. I. Ugursan, 2009, "Modeling of end-use energy consumption in the residential sector: A review of modeling techniques," Renewable and Sustainable Energy Reviews 13, 1819-1835.

Q. HAVE YOU CONDUCTED ANY ANALYSES EXAMINING THE RELATIONSHIP OF ELECTRICITY USAGE AND INCOME?

A. Yes. Figure 1 provides the results of an analysis I have performed using data from the 2020 Residential Electricity Consumption Survey ("RECS") produced by the United States Energy Information Administration ("EIA") and household data from the Census division in which the Pennsylvania is located.[28] The results show a positive relationship between electricity consumption (in kWh terms) and income. This clearly shows that as income increases, electricity consumption increases, and vice versa: as income decreases, electricity usage decreases.

Q. WHAT ARE YOUR CUSTOMER CHARGE RECOMMENDATIONS AND CONCLUSIONS?

A. I recommend that the Commission reject the Company's proposed increase in customer charges for several reasons. First, the Company's proposal is based upon an inaccurate accounting of customer-related costs. A correct analysis of customer-related costs from Citizens' ACOS finds that all residential and commercial rate classes are currently recovering *all* customer-related costs through monthly customer charges. Second, the Company's existing residential and SH customer charges of $13.10 and $20.19 are already higher than the regional average of peer investor-owned utilities, and the proposed increase would make the charges the highest among peers. Third, the proposal would negatively impact the public policy goals of energy efficiency and would burden low-use customers with a greater than average portion of any proposed increase

[28] This census division also includes the states of Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, and Vermont. This is the most detailed level of aggregation available in the RECS.

in the case. The Commission should keep Citizens' current customer charges for all customers.

VI. CONCLUSIONS AND RECOMMENDATIONS

Q. WHAT ARE YOUR ACOS FINDINGS FOR CITIZENS'?

A. My alternative ACOS analyses shows that Citizens' incorrect classification of secondary-voltage distribution plant skews the allocation of costs and revenue responsibilities away from larger customers and onto residential customers. I recommend the Commission rely on the results of my alternative ACOS as a fair and reasonable estimation of relative costs of service between Citizens' customer classes.

Q. WHAT IS YOUR RECOMMENDATION REGARDING CITIZENS' PROPOSED REVENUE DISTRIBUTION?

A. For Citizens', I recommend that the Commission adopt a more reasonable revenue distribution allocation method based on my alternative ACOS results that also limits the rate increase to the MBL customer class to 1.25 times the overall system average increase. Under Citizens' proposed overall distribution revenue increase of 29.64 percent this reduces the revenue increase to this rate class to 37.05 percent, compared to the Company's proposed distribution rate increase of 75.0 percent.

Q. WHAT IS YOUR RECOMMENDATION REGARDING CITIZENS' PROPOSED RATE DESIGN FOR CUSTOMER CHARGES?

A. I recommend the Commission reject Citizens' proposed increases in customer charges because they disproportionately impact low-income customers and reduce customer incentives to reduce usage, contrary to public goals of promoting energy efficiency. Furthermore, Citizens' existing residential and small commercial customer

charges are already higher than the regional average of peer investor-owned utilities, and the proposed increase would make the charges the highest among peers. Finally, a correct analysis of customer-related costs from Citizens' ACOS finds that all residential and commercial rate classes are currently recovering *all* customer-related costs through monthly customer charges.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

On behalf of the

PENNSYLVANIA OFFICE OF CONSUMER ADVOCATE

OCA Statement 3

Date Served: July 15, 2025

Table of Contents

I. INTRODUCTION 1

II. COST OF SERVICE AND REVENUE DISTRIBUTION 2

III. RATE DESIGN 3

IV. CONCLUSIONS AND RECOMMENDATIONS 10

I. INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS?

A. My name is Michael W. Deupree. My business address is 5800 One Perkins Place Drive, Suite 5-F, Baton Rouge, Louisiana, 70808.

Q. PLEASE STATE YOUR OCCUPATION AND CURRENT PLACE OF EMPLOYMENT?

A. I am a Senior Research Consultant with the Acadian Consulting Group ("ACG"), a research and consulting firm that specializes in the analysis of regulatory, economic, financial, accounting, statistical, and public policy issues associated with regulated and energy industries. ACG is a Louisiana-registered partnership, formed in 1995, and is located in Baton Rouge, Louisiana.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL QUALIFICATIONS.

A. I hold a Bachelor of Arts degree in Business Economics from Buena Vista University in Storm Lake, Iowa, and a Master of Arts degree in Economics from the University of Kansas in Lawrence, Kansas. I began my professional career with the Staff of the Kansas Corporation Commission in 2008 while in graduate school conducting analyses of topics related to energy and economy as a Research Assistant, eventually being promoted to a Research Analyst and later Senior Research Economist after graduation. I left the Kansas Corporation Commission to take a position with ACG in late 2011, where I have been promoted to positions of increasing responsibility since, including my current position which I started in mid-2021. At ACG I managed research teams supporting expert testimony and have overseen dozens of litigated preceding, including multiple proceedings on behalf of the AG. Appendix A provides my professional

resume, which includes a listing of my publications, presentations, pre-filed expert witness testimony, expert reports, and expert legislative testimony.

Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THIS COMMISSION?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I have been retained by the Pennsylvania Office of the Consumer Advocate ("OCA") to address matters related to the general rate case filed by Valley Energy, Inc. ("Valley" or "the Company"). I specifically have been asked to review the Company's filing pertaining to issues involving an Allocated Class Cost of Service Study ("ACOS"), Cost of Service Study ("COSS") and rate design.

II. COST OF SERVICE AND REVENUE DISTRIBUTION

Q. HAS THE COMPANY PREPARED AN ACOS OR COSS IN THE CURRENT PROCEEDING?

A. No. The Company has not prepared an ACOS or COSS in the current proceeding. Instead, the Company proposes to increase all rate classes, other than contract transportation customers, equally by 29.56 percent.[1]

Q. HAVE YOU REVIEWED ANY PRIOR ACOS OR COSS FOR THE COMPANY?

A. No. According to the Company, it is unaware of any prior ACOS or COSS that has been conducted for Valley.[2]

[1] Direct Testimony of Howard S. Gorman at 18:14-15.

[2] Company's Response to OCA-IX-1.

Q. WHAT ARE YOUR RECOMMENDATIONS REGARDING THE PROPOSED REVENUE DISTRIBUTION FOR THE COMPANY?

A. In light of the Company having no cost basis, either in the current proceeding or prior proceedings, for which to allocate the proposed revenue increase between rate classes, I have reviewed the Company's proposed equal allocation of its proposed revenue increase in the current proceeding and find the proposal to be reasonable.

III. RATE DESIGN

Table 1: Summary of Company's Proposed Customer Charges

Rate Schedule	Current Charge	Proposed Charge	Percent Increase
Rate R - Residential	$12.35	$14.00	13.4%
Rate C - Commercial	$21.95	$25.00	13.9%
Rate IS - Interruptible Service	$82.00	$100.00	22.0%
Rate SI - Small Industrial	$82.00	$100.00	22.0%
Rate ST - Transport Firm	$82.00	$100.00	22.0%
Transport Firm - DDQ	$21.95	$25.00	13.9%
Rate I - Large Industrial Firm	$0.00	$300.00	-
Transport - Interruptible	$82.00	$100.00	22.0%

Source: Company's Response to I&E-RE-1-D, Attachment A

Q. PLEASE DISCUSS THE COMPANY'S CUSTOMER CHARGE PROPOSAL.

A. As summarized by Table 1, the Company is proposing to increase the residential ("Rate R") customer charge from $12.35 to $14.00 per month, representing a 13.4 percent increase.[3] Likewise, the Company proposes increasing the commercial ("Rate C") customer charge from $21.95 to $25.00 per month, representing a nearly 13.9 percent increase.[4]

[3] Direct Testimony of Howard Gorman, Exhibit HSG-1, Schedule B5.

[4] *Id.*

Q. DOES THE COMPANY HAVE A COST OF SERVICE BASIS FOR ITS PROPOSED CUSTOMER CHARGES?

A. No. The Company has not performed a COSS in the current proceeding,[5] nor is it aware of any prior COSS that has been performed for its system in the past.[6] Instead, its proposed customer charges are based on comparisons to those charged by other Pennsylvania utilities.[7]

Table 2: Survey of Regional Customer Charges

Company	State	Residential Customer Charge ($/month)	Commercial Customer Charge ($/month)
Valley Energy, Inc (Current)	**PA**	**$ 12.35**	**$ 21.95**
Valley Energy, Inc (Proposed)	**PA**	**$ 14.00**	**$ 25.00**
Atmos Energy Corporation	VA	13.24	20.52
Chesapeake Utilities	MD	8.00	22.50
Columbia Gas of Maryland, Inc.	MD	16.50	68.00
Consumers Gas Utility Company	WV	16.80	9.90
Corning Natural Gas Corporation	NY	22.00	33.29
Peoples Gas	WV	8.50	12.50
Southern Public Service Company	WV	13.95	7.05
Southwestern Virginia Gas Company	VA	12.00	17.00
Union Oil & Gas, Inc.	WV	13.13	13.13
Peer Group Average		**$ 13.79**	**$ 22.65**

Q. HAVE YOU COMPARED THE COMPANY'S PROPOSED RESIDENTIAL AND COMMERCIAL CUSTOMER CHARGES TO OTHER REGIONAL NATURAL GAS UTILITIES?

A. Yes, and this analysis is presented in Table 2, which surveys current residential and small commercial customer charges among other regional gas utility companies. The

[5] Direct Testimony of Howard S. Gorman at 18:14-15.

[6] Company's Response to OCA-IX-1.

[7] Direct Testimony of Howard S. Gorman at 18:15-16.

Company's current residential customer charge of $12.35 per month is slightly below the average regional residential customer charge of $13.79 for other regional utilities. This survey also shows that there are only three (out of nine) gas utility companies in the survey that have residential customer charges greater than the Company's proposed charge of $14.00 per month. Likewise, the Company's current commercial customer charge of $21.95 per month is slightly below the average regional commercial customer charge of $22.65 per month. This survey also shows that there are only two (out of nine) gas utility companies in the survey that have commercial customer charges greater than the Company's proposed charge of $25.00 per month.

Q. IS THE COMPANY'S PROPOSAL TO INCREASE THE CUSTOMER CHARGE CONSISTENT WITH PROMOTING ENERGY EFFICIENCY AND CONSERVATION?

A. No. The Company's rate design proposal is inconsistent with energy efficiency, since it reduces economic incentives for ratepayers to control their monthly utility bills through energy efficiency and conservation efforts, because only the variable component of bills is avoidable.

Q. HAVE OTHER REGULATORS RECOGNIZED THE NEGATIVE IMPACTS THAT CUSTOMER CHARGE INCREASES CAN HAVE FOR ENERGY EFFICIENCY?

A. Yes. In rejecting a request by Baltimore Gas and Electric ("BGE") to increase customer charges as part of a larger rate design proposal, the Maryland Public Service Commission ("MPSC") recognized the need to allow customers the opportunity to control their monthly bills by reducing energy usage.

> Even though this issue was virtually uncontested by the parties, we find we must reject Staff's proposal to increase the fixed customer charge from $7.50 to $8.36. Based on the reasoning that ratepayers should be offered the opportunity to

> control their monthly bills to some degree by controlling their energy usage, we instead adopt the Company's proposal to achieve the entire revenue requirement increase through volumetric and demand charges. This approach also is consistent with and supports our EmPOWER Maryland goals.[8]

Q. CAN YOU POINT TO ANY OTHER REGULATORY EXAMPLES?

A. Yes. The Montana Public Service Commission ("MT PSC") addressed this issue in evaluating, and rejecting, a proposal by Energy West Montana to eliminate volumetric charges and only have one fixed monthly customer charge (known as a "straight-fixed variable" or "SFV" rate design):

> The Commission agrees that most distribution costs are not avoidable, and that volumetric distribution charges may encourage conservation actions that, all other things being equal, reduce the utility's embedded cost recovery between rate cases and contribute to future rate increases.
>
> …
>
> The Commission agrees that an SFV rate design is a clean and administratively inexpensive way to decouple revenue from volume. An often-cited public policy justification for revenue decoupling is to remove the volume disincentive for cost-effective conservation investment by a gas distribution company, which through SFV and other decoupling methods is rendered indifferent to the volume of gas consumed. Yet, SFV rates decouple revenue at the cost of decreasing returns to conservation investment by customers. For this reason the net conservation benefit of revenue decoupling via SFV rates is not clear, and may be negative.[9]

Q. HAVE ANY REGULATORY RESEARCH INSTITUTES ADDRESSED THE ISSUE OF THE RELATIONSHIP BETWEEN HIGH CUSTOMER CHARGES AND ENERGY EFFICIENCY?

A. Yes. A research document presented for consideration by the membership of the National Association of Regulatory Utility Commissioners ("NARUC") also notes that extreme increases in customer charges, that typically happen under SFV rate design proposals, are problematic because of their effects on customer incentives to conserve energy:

> **Straight-Fixed Variable Rate Design.** This mechanism eliminates all variable distribution charges and costs are recovered through a fixed delivery services charge or an increase in the fixed customer charge alone. With this approach, it is assumed that a utility's revenues would be unaffected by changes in sales levels if all its overhead or fixed costs are recovered in the fixed portion of customers' bills. This approach has been criticized for having the unintended effect of reducing customers' incentive to use less electricity or gas by eliminating their volumetric charges and billing a fixed monthly rate, regardless of how much customers consume.[10]

Q. HAS ANY NATIONAL PUBLIC POLICY ANALYSIS NOTED THE EFFICIENCY DISINCENTIVES ASSOCIATED WITH HIGH CUSTOMER CHARGES?

A. Yes. The National Action Plan for Energy Efficiency ("NAPEE"), a joint venture of the U.S. Department of Energy and U.S. Environmental Protection Agency, published a whitepaper on various rate design effects on encouraging energy efficient behaviors. The NAPEE postulated that rate designs over-emphasizing customer charges, like SFV, can

[10] "Decoupling for Electric & Gas Utilities: Frequently Asked Questions (FAQ)" Grants & Research Department, National Association of Regulatory Utility Commissioners, at 5 (Sept. 2007) (emphasis added).

deter or weaken the economic signals sent to customers to change their energy usage behavior and make investments in energy efficiency devices:

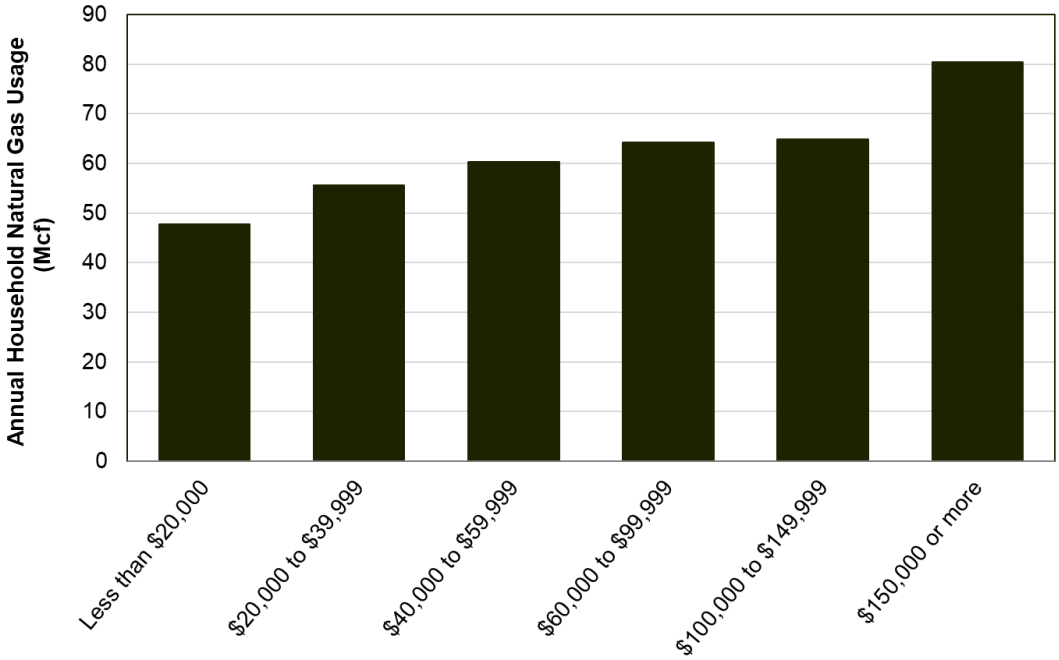
> Because [SFV] tends to shift costs out of volumetric charges, it tends to reduce customers' efficiency incentive, because the marginal price of additional consumption is reduced. While SFV rates are being considered to better reflect the utility's costs behind the rate, these rates do not encourage customers to change energy usage behavior or invest in efficiency technologies. Such customer disincentives persist even when SFV rates are applied to individual components of the bill, such as charges for distribution service.[11]

Q. CAN HIGH CUSTOMER CHARGES LEAD TO OTHER PROBLEMS?

A. Yes. In addition to disincentivizing energy efficiency, increased customer charges also shift the rate burden within a customer class to lower-use customers. This results in equity concerns as lower-use customers have been shown to be consistently associated with lower-income households in empirical research.

[11] Customer Incentives for Energy Efficiency Through Electric and Natural Gas Rate Design, National Action Plan for Energy Efficiency at 13-14, prepared by William Prindle, ICF International, Inc. (Sept. 2009) (emphasis added).

Figure 1: Analysis of Natural Gas Usage and Household Income



Source: EIA 2020 Residential Energy Consumption Survey

Q. HAVE YOU CONDUCTED ANY ANALYSES EXAMINING THE RELATIONSHIP OF NATURAL GAS USAGE AND INCOME?

A. Yes. Figure 1 provides the results of an analysis I have performed using data from the 2020 Residential Electricity Consumption Survey ("RECS") produced by the United States Energy Information Administration ("EIA") and household data from the Census division in which the state of Pennsylvania is located.[12] The results show a positive relationship between natural gas consumption (in Mcf terms) and income. This clearly shows that as income increases, electricity consumption increases, and vice versa: as income decreases, electricity usage decreases.

[12] This census division also includes the states of Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, and Vermont. This is the most detailed level of aggregation available in the RECS.

Q. WHAT ARE YOUR CUSTOMER CHARGE RECOMMENDATIONS AND CONCLUSIONS?

A. I recommend that the Commission reject the Company's proposed increase in customer charges since the Company has no cost basis for its proposed customer charges. The Company's current residential and commercial customer charges are similarly near the average of other similarly situated natural gas distribution utilities in the region. Finally, the proposal would negatively impact the public policy goals of energy efficiency and would burden low-use customers with a greater than average portion of any proposed increase in the case.

Q. DO YOU HAVE AN ALTERNATIVE RECOMMENDATION IF THE COMMISSION DETERMINES AN INCREASE IN THE COMPANY'S CUSTOMER CHARGE IS WARRANTED?

A. Yes. If the Commission determines that increases in the Company's customer charges are warranted, I recommend that the Commission cap these increases to no more than the overall system average increase. This will prevent Company rates from becoming more reliant on fixed monthly charges relative to volumetric charges as a result of this proceeding.

IV. CONCLUSIONS AND RECOMMENDATIONS

Q. WHAT ARE YOUR RECOMMENDATIONS REGARDING THE PROPOSED REVENUE DISTRIBUTION FOR THE COMPANY?

A. In light of the Company having no cost basis, either in the current proceeding or prior proceedings, for which to allocate the proposed revenue increase between rate

classes, I agree with the Company's proposed equal allocation of its proposed revenue increase in the current proceeding.

Q. WHAT ARE YOUR CUSTOMER CHARGE RECOMMENDATIONS AND CONCLUSIONS?
