Data Requirements of the Pennsylvania Public Utility Commission
Depreciation Study

FR VI.5

Pennsylvania-American Water Company
VI. Depreciation

5. Supply a schedule by account and depreciable group showing the survivor curve and annual accrual rate estimated to be appropriate:

   a. For the purposes of this filing.

   b. For the purposes of the most recent rate increase filing prior to the current proceedings.

Answer:

a. Refer to Table 2 in Exhibit Nos. 11-A through 11-N.

b. Refer to pages FR VI.5 (2) to FR VI.5 (10) for survivor curves and annual accrual rates estimated to be appropriate in the most recent prior water rate filing, and pages FR VI.5 (11) to FR VI.5 (20) for survivor curves and annual accrual rates estimated to be appropriate in the most recent prior wastewater rate filing.

FR VI.6

Pennsylvania-American Water Company
VI. Depreciation

6. Provide an exhibit showing gross salvage, cost of removal, and net salvage for the five most recent calendar or fiscal years by account.

Answer:

The information is presented on pages III-2 through III-6 of Exhibit No. 11-A for the historic test year, on pages VIII-2 through VIII-6 of Exhibit No. 11-B for the future test year, and on pages III-2 through III-6 of Exhibit No. 11-C for the fully forecasted test year for water assets.

The information is presented in Part III. Experienced Net Salvage of Exhibit Nos. 11-D, 11-G and 11-J for the historic test year, in Part VIII, Experienced and Estimated Net Salvage of Exhibit Nos. 11-E, 11-H, 11-K and 11-M of the future test year, and in Part III. Experienced and Estimated Net Salvage of Exhibit Nos. 11-F, 11-I, 11-Land 11-N of the fully forecasted test year for wastewater assets.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant as of June 30, 2025. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 through 3, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of June 30, 2026".

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

PART I. RESULTS OF STUDY

PENNSYLVANIA-AMERICAN WATER COMPANY

WATER OPERATIONS

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of net original cost used in the study. The net original cost is the original cost of water plant less advances, contributions and property to be excluded pursuant to Commission audits. The results of the depreciation study are summarized in Table 2, which sets forth the book reserve and the calculated annual depreciation related to net original cost as of June 30, 2025, and the annual amortization of net negative salvage. Table 3 presents the calculation of the amortization of experienced net salvage, by account, based on the five-year period, 2020-2024.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-8. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2020 through 2024, on pages III-2 through III-6.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant. The results of our study as of June 30, 2026 are presented in the attached report. The results of our study as of June 30, 2025 are presented in our report, "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of June 30, 2025." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2026.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

PENNSYLVANIA-AMERICAN WATER COMPANY
WATER OPERATIONS
DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report presents the results of the depreciation study prepared for Pennsylvania-American Water Company (the Company) as applied to water plant in service as of June 30, 2026. The study results include annual depreciation rates and amounts for regulatory reporting. The regulatory rates and amounts are based on the straight line remaining life method of depreciation. The report also describes the concepts, methods and basic judgments which underlie recommended annual depreciation accrual rates and amounts related to current water plant in service.

PLAN OF REPORT

Part I, Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and the methods used in the service life and net salvage studies. Part III, Service Life Considerations, presents the factors and judgment utilized in the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents a summary by depreciable group of annual depreciation accrual rates and amounts. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates; Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation; and Part VIII, Experienced and Estimated Net Salvage, presents the cost of removal and gross salvage recorded for the period 2021-2025.

BASIS OF THE STUDY

Depreciation

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

For most accounts, the annual depreciation was calculated by the straight line remaining life method using the equal life group procedure. For certain General Plant accounts, the annual depreciation is based on amortization accounting. Both types of calculations were based on original cost, attained ages of plant in service and the estimated service life characteristics of each depreciable group.

Service Life Estimates

The service life estimates used in the depreciation and amortization calculations were based on informed judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the water utility industry, and comparisons

of the service life estimates from our studies of other water utilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for water plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and estimates of future experience yielded estimated survivor curves from which the average service lives were derived.

The Company's service life estimates used in the depreciation calculation incorporated historical data compiled through December 2021 from the property records of the Company. This represents the last service life study approved. Such data included plant additions, retirements, transfers and other activity. Generally, retirement data for the years through 2021 were used in the actuarial life table computations which were the primary statistical support of the service life estimates.

A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirement was obtained through discussions with operating and management personnel conducted during the course of the service life study. Information regarding plans for the future was incorporated in the interpretation and extrapolation of the statistical analyses.

DEVELOPMENT OF NET ORIGINAL COST

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting customer advances, contributions in aid of construction and excluded property.

The excluded property consists of: (1) a portion of the cost of the White Deer filter plant excluded pursuant to the Commission's Order at R-832511 adopted July 20, 1984 in the amount of $942,914; (2) the cost of utility plant in the Berwick District excluded in compliance with recommendations made by the Commission Bureau of Audits in a continuing property records audit completed in 1989 in the amount of $180,764; and (3) an exclusion to reflect the removal of contractor retention balances from amounts on which an Allowance for Funds Used During Construction was calculated in the amount of $434,336 pursuant to the Commission's Order at R-932670 adopted July 21, 1994.

The development of net original cost by plant account is set forth in Table 1 on pages V-5 and V-6.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

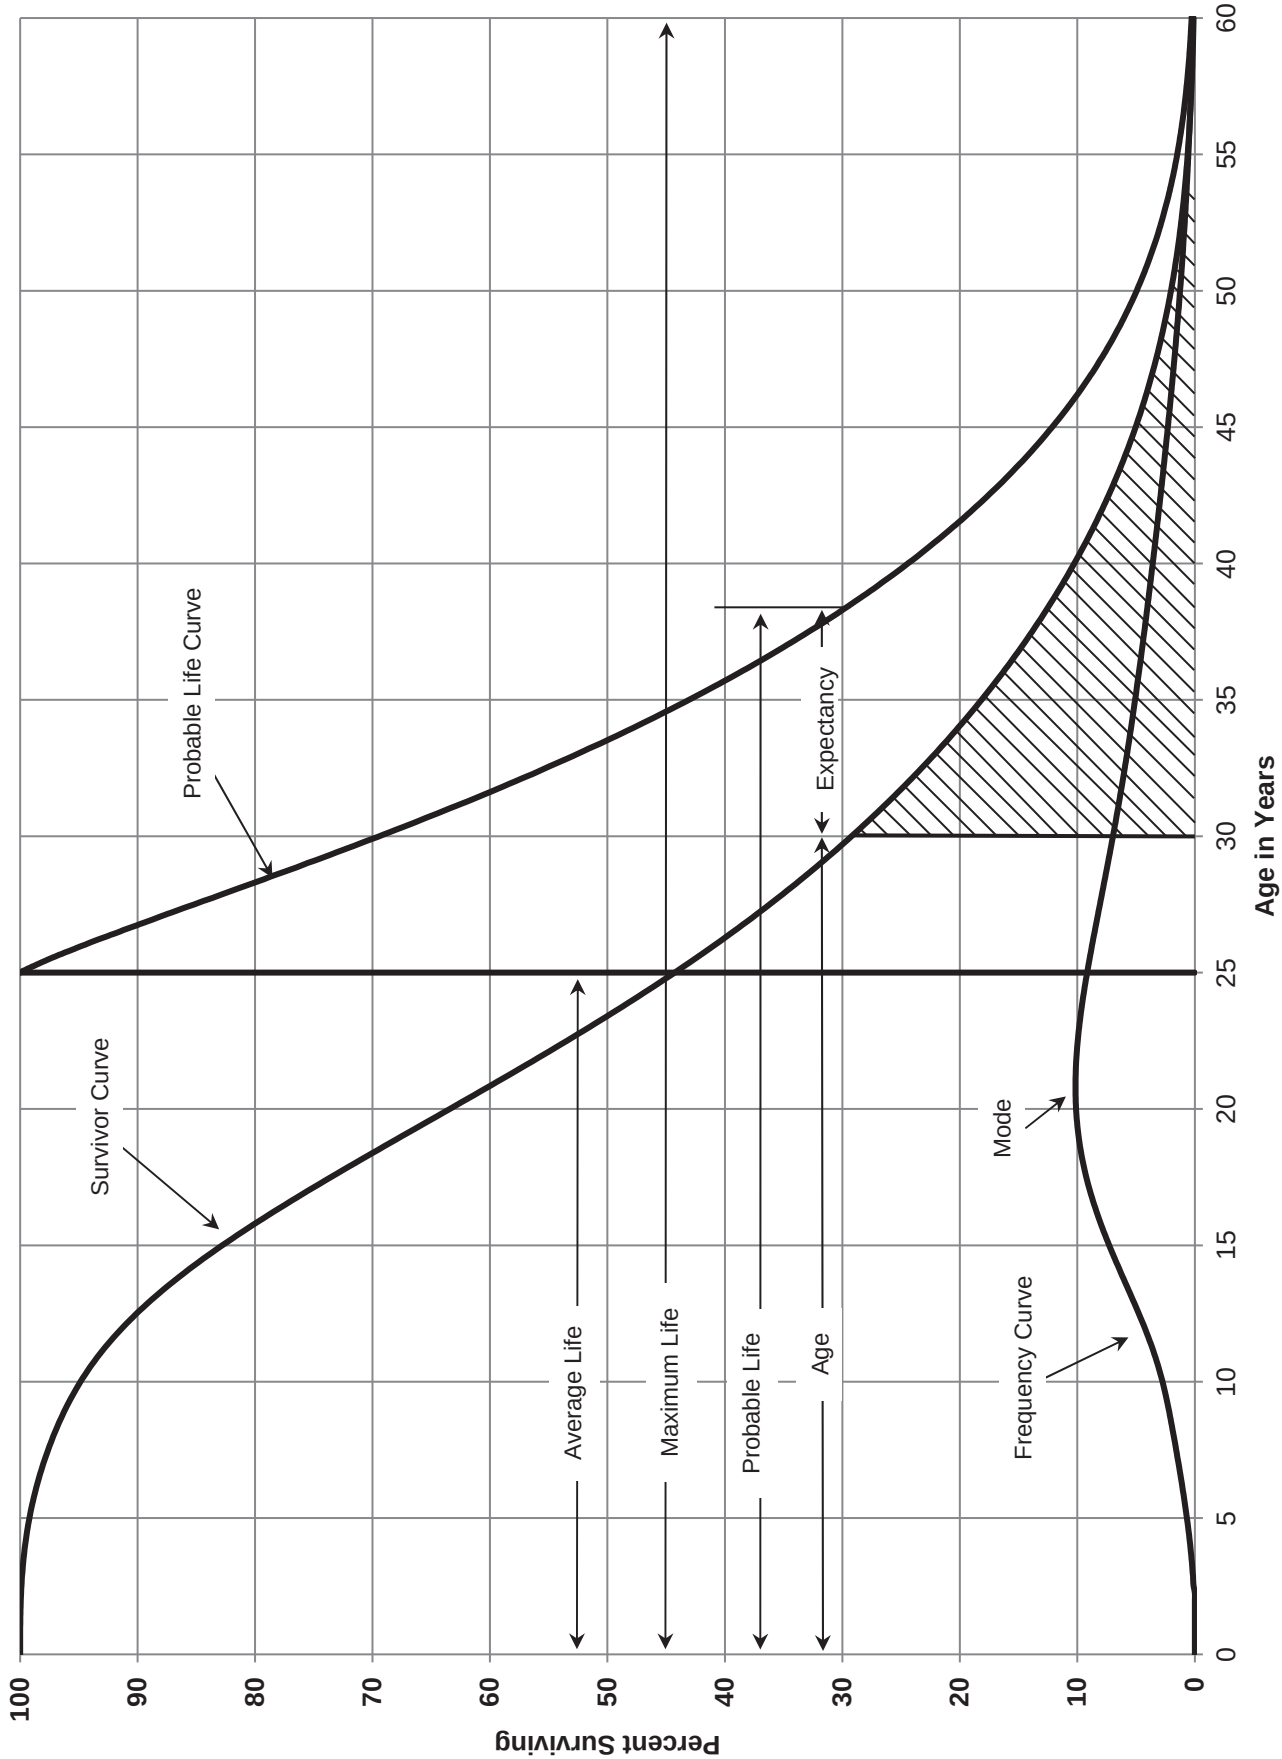

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

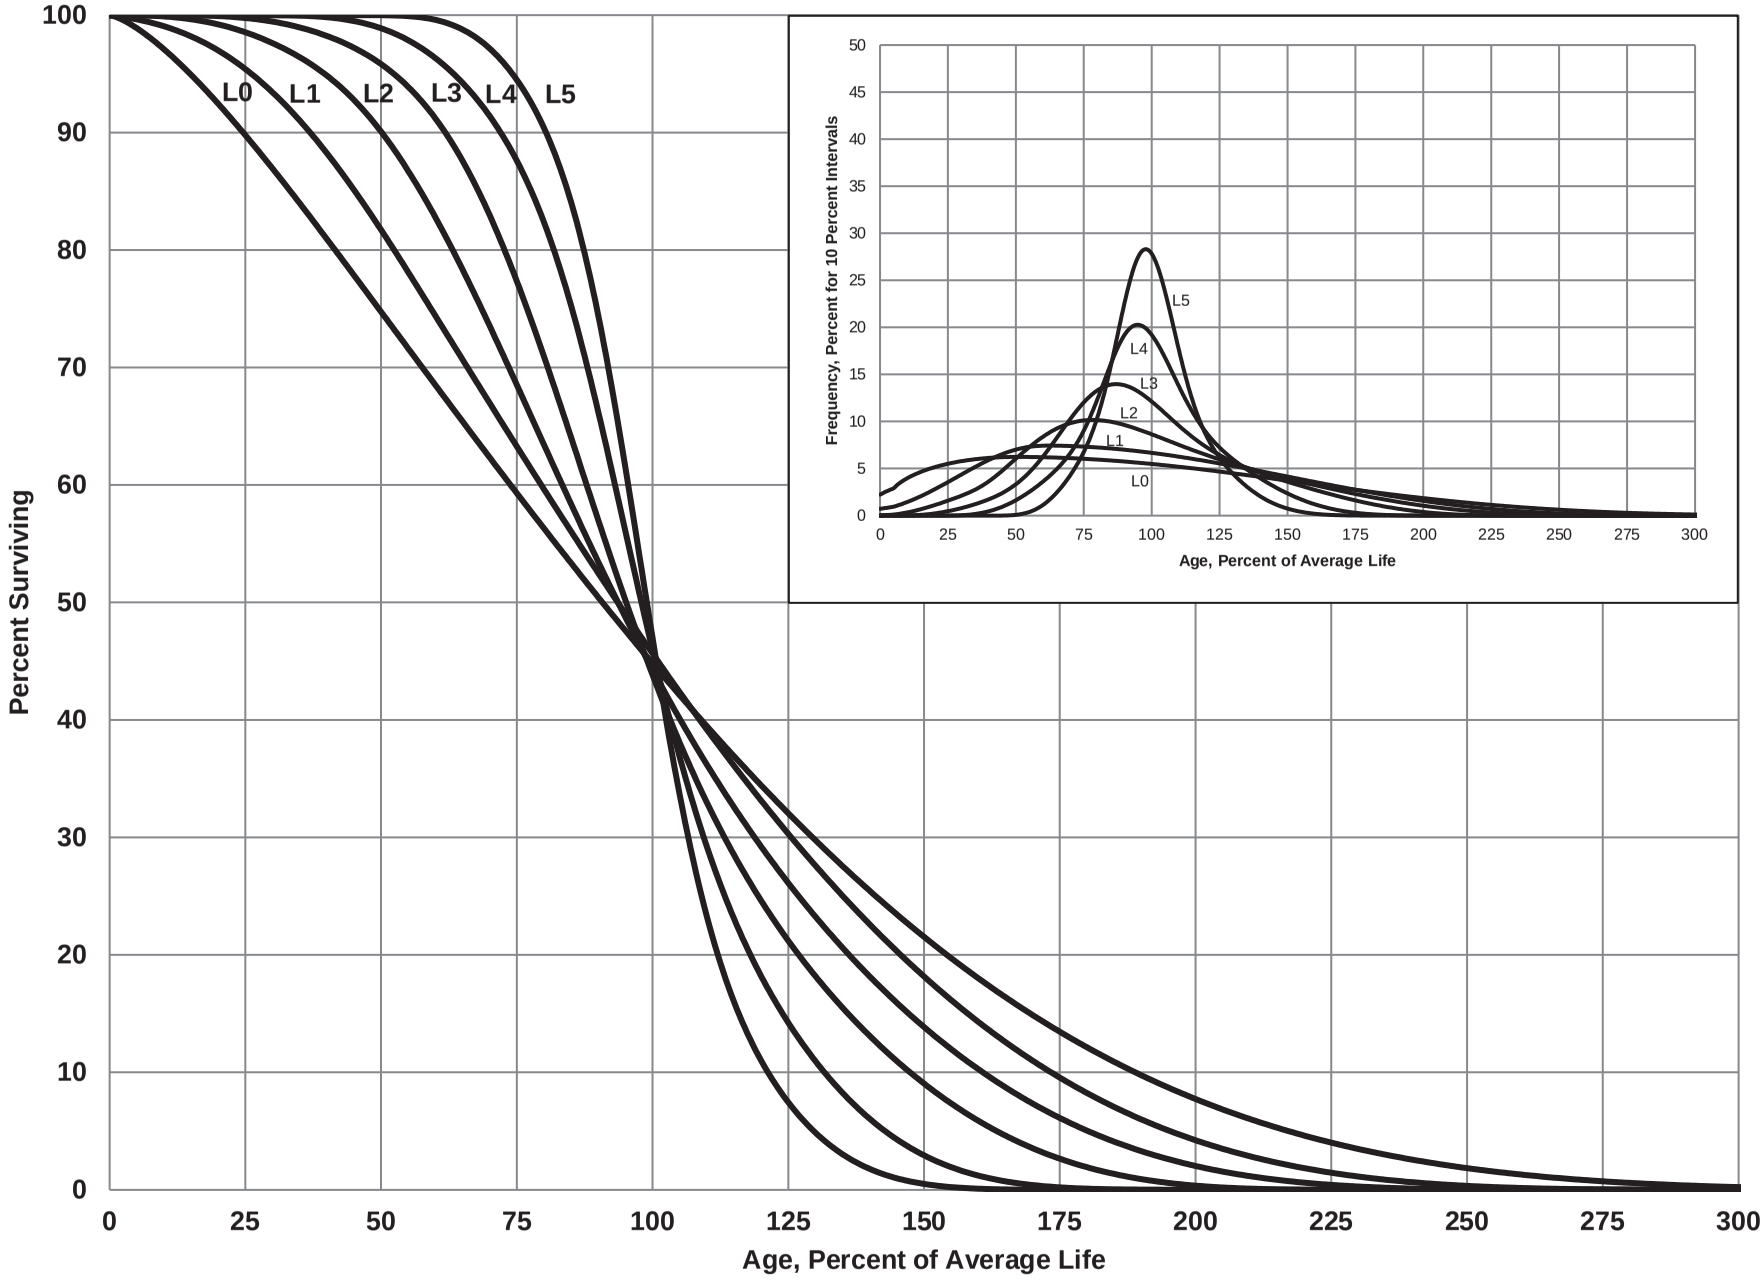

FIGURE 2. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

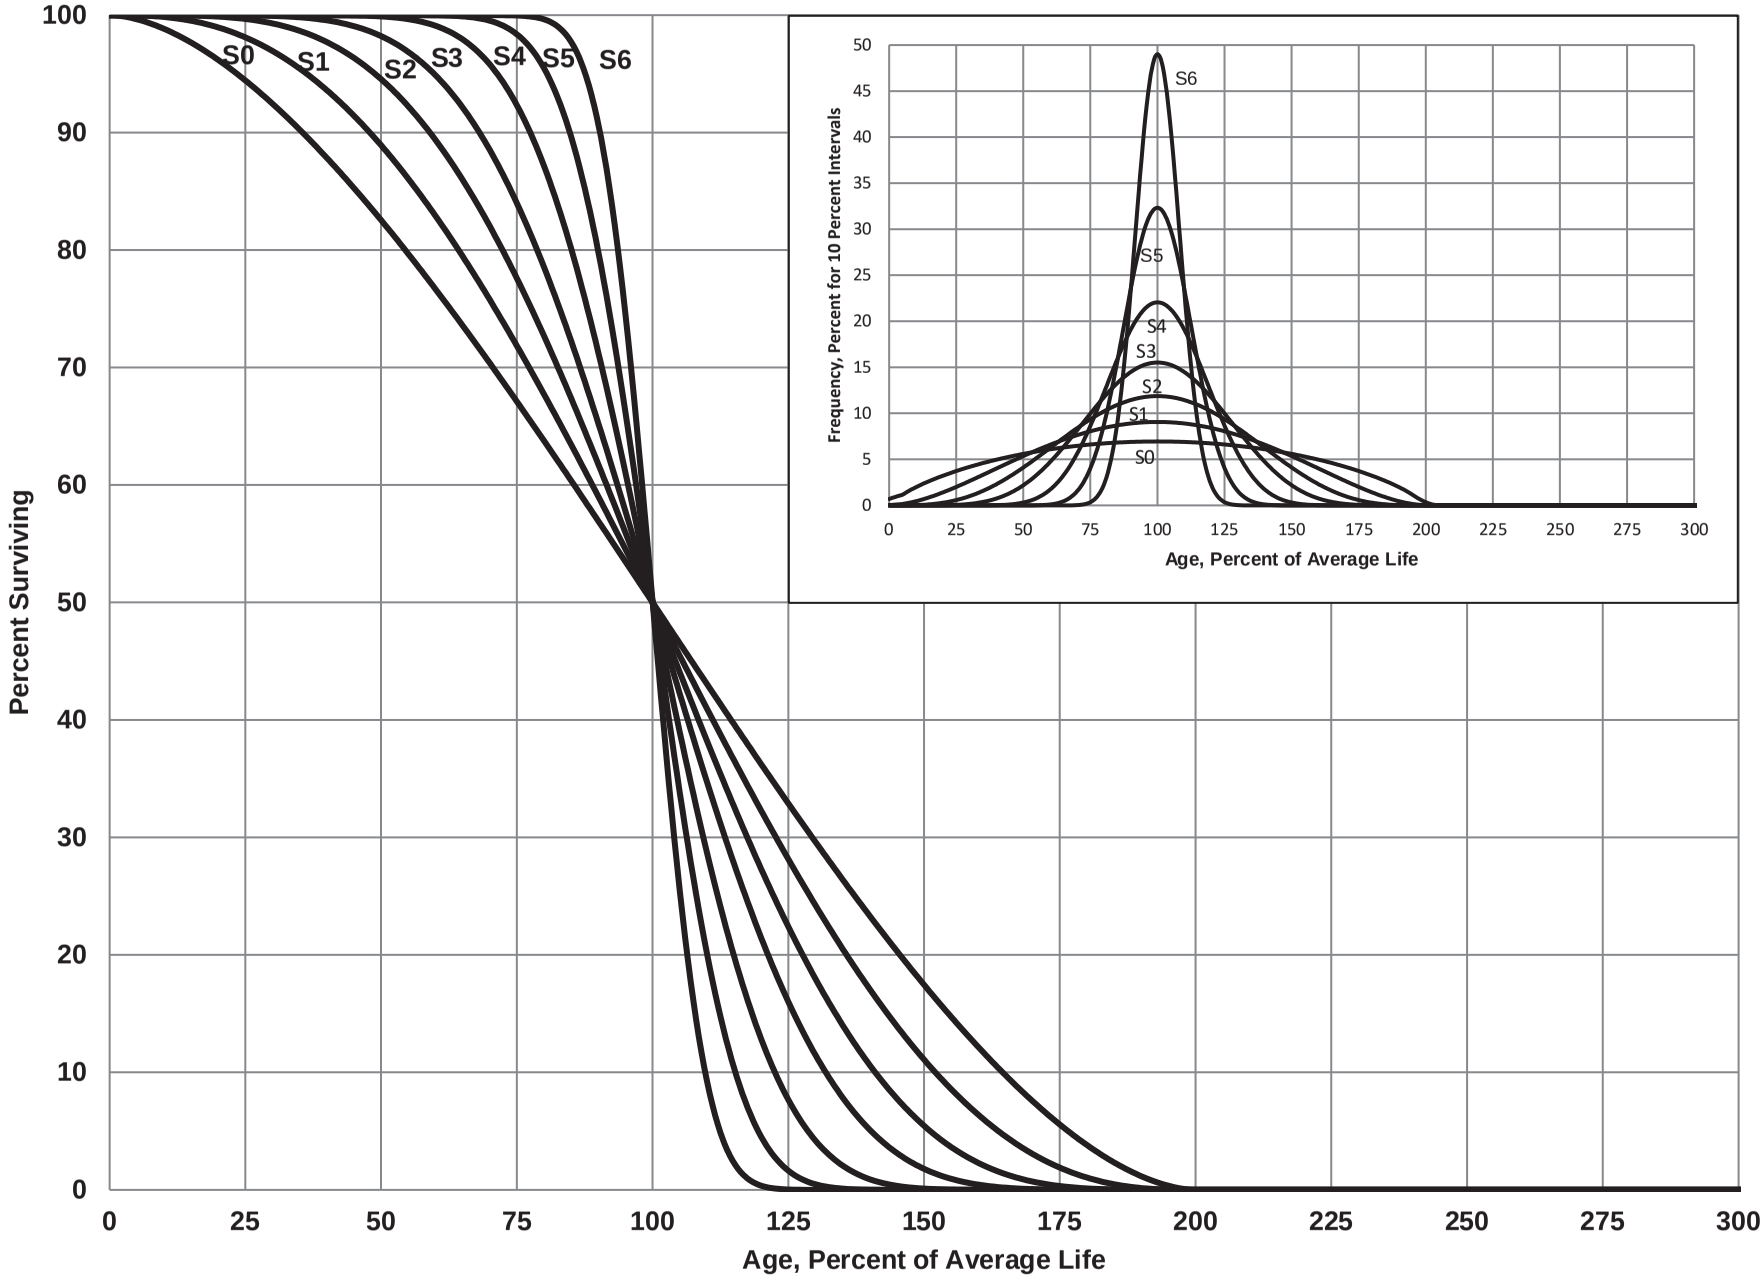

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

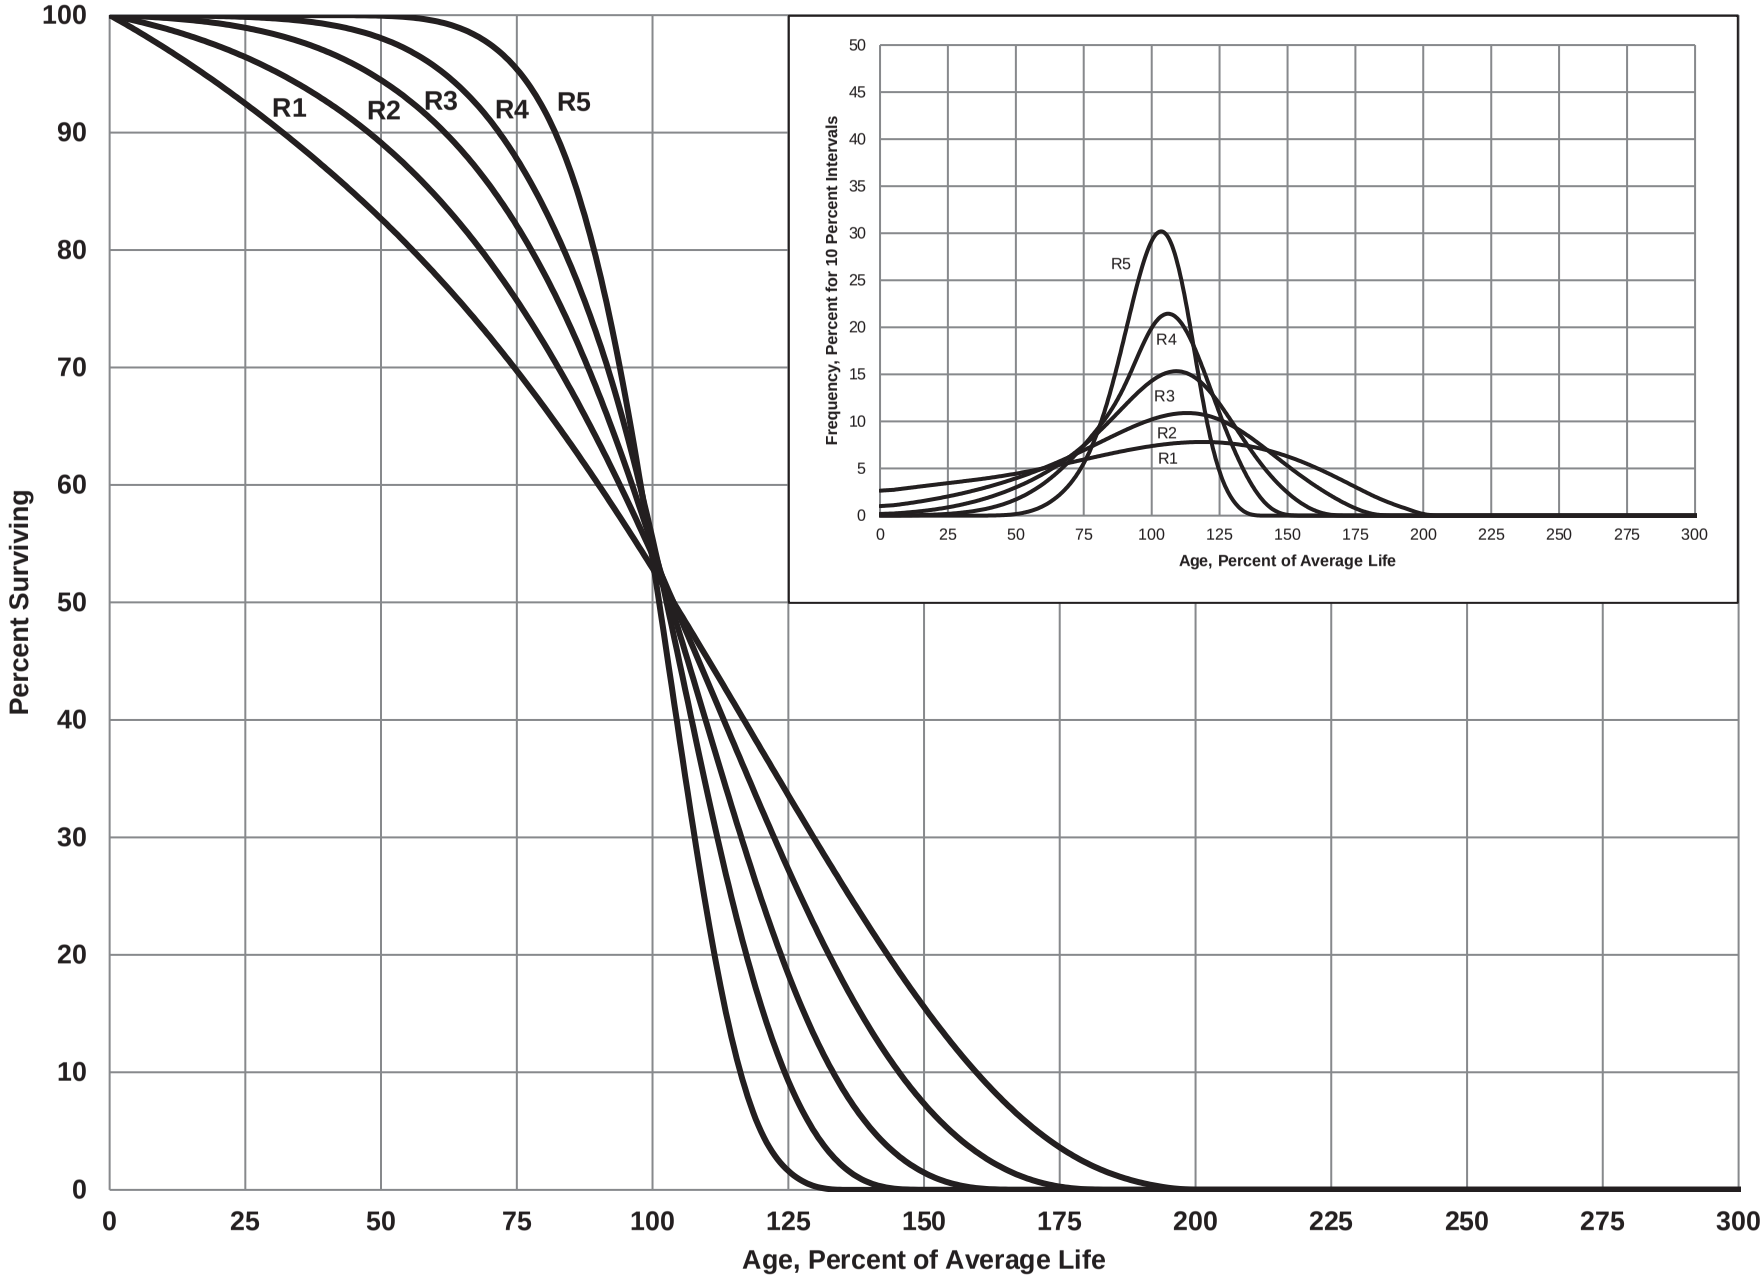

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

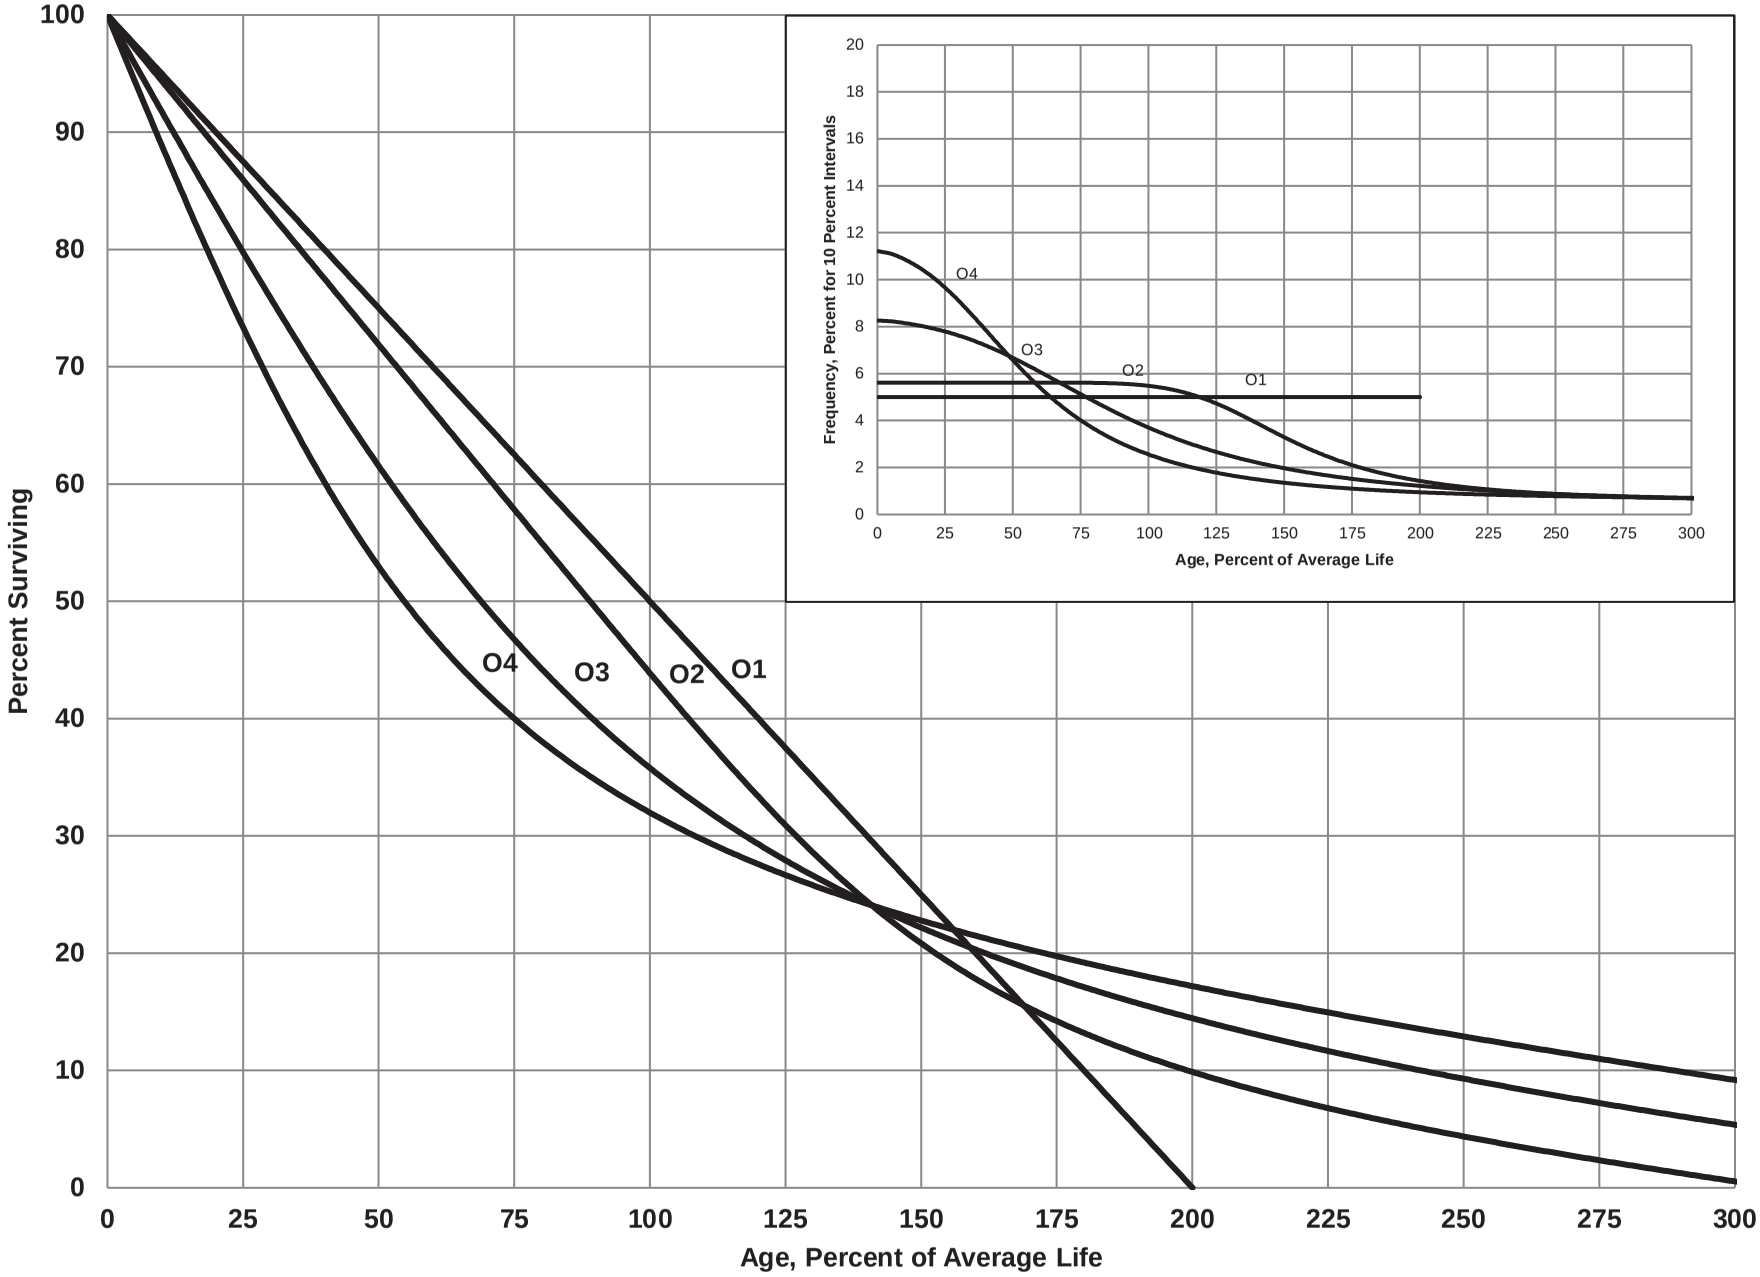

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

Year Placed	Retirements, Thousands of Dollars During Year										Total During Age Interval	Age Interval

[a] Transfer Affecting Exposures at Beginning of Year

[b] Transfer Affecting Exposures at End of Year

[c] Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024

Placement Band 2010-2024

Year Placed	Exposures, Thousands of Dollars — Annual Survivors at the Beginning of the Year										Total at Beginning of Age Interval	Age Interval
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
2010	255	245	234	222	209	195	239	216	192	167	167	13½-14½
2011	279	268	256	243	228	212	194	174	153	131	323	12½-13½
2012	307	296	284	271	257	241	224	205	184	162	531	11½-12½
2013	338	330	321	311	300	289	276	262	242	226	823	10½-11½
2014	376	367	357	346	334	321	307	297	280	261	1,097	9½-10½
2015	420[a]	416	407	397	386	374	361	347	332	316	1,503	8½-9½
2016		460[a]	455	444	432	419	405	390	374	356	1,952	7½-8½
2017			510[a]	504	492	479	464	448	431	412	2,463	6½-7½
2018				580[a]	574	561	546	530	501	482	3,057	5½-6½
2019					660[a]	653	639	623	628	609	3,789	4½-5½
2020						750[a]	742	724	685	663	4,332	3½-4½
2021							850[a]	841	821	799	4,955	2½-3½
2022								960[a]	949	926	5,719	1½-2½
2023									1,080[a]	1,069	6,579	½-1½
2024										1,220[a]	7,490	0-½
Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024 Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93

10.5	823	83	0.1009	0.8991	61.84
11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips are conducted for each service life study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the past field trips.

SERVICE LIFE CONSIDERATIONS

The service life estimates were based on judgment which considered a number of factors. The primary factors were the statistical analyses of data, current Company policies and outlook as determined during field reviews of the property and other conversations with management, and the survivor curve estimates from other water companies.

For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group. The judgments for a life span group were made by

estimating the life of the major facility in the group and assigning lives to the related items of property which terminate at the probable retirement date of the major facility.

The life span estimates for structures and equipment in Accounts 303, 304, 305, 306 and 320 were based on the type of construction, attained age and specific plans of management. The following tabulation sets forth the estimated life span for each life span group.

Life Span Group	Life Span
Account 303.35, Waste Handling and Treatment Land	
Sanitary Landfill	50
Account 304.20, Power and Pumping Structures	
Booster Stations	50,60
Account 304.30, Purification Buildings	
Filter Plants	60-80
Tank Painting	10
Waste Handling and Treatment Structures	50
Account 304.61, Office Buildings	
Regional Offices	45
Corporate Office	65
Account 304.62, Stores, Shop and Garage Structures	
Distribution Centers	45, 50
Account 305.00, Collecting and Impounding Reservoirs	
Large Reservoirs	100, 120, 150
Account 306.00, Lake, River and Other Intakes	
Intakes	80
Account 320.10, Purification System - Large Structures	
Filters and Related Structures	55-75
Painting	10

For capitalized painting, the expectation is that there will be very minor retirements prior to the final retirement of the group. A square survivor curve, that is, no dispersion of retirements, was estimated for these groups. For the reservoirs, intakes, structures and filters, the expectation is that there will be retirements prior to the final retirement of the plant. Interim survivor curves were estimated for the plant based on prior studies and judgment. The interim survivor curves are as follows:

Account		Interim Survivor Group
303.35	Waste Handling and Treatment Land	100-R3
304.20	Power and Pumping Structures	75-S0.5
304.30	Purification Buildings	55-S1
304.36	Waste Handling and Treatment Structure	55-S1
304.61	Office Buildings	55-S0
304.62	Stores, Shop and Garage Structures	55-S0.5
305.00	Collecting and Impounding Reservoirs	130-R2
306.00	Lake, River and Other Intakes	55-S1.5
320.10	Purification System - Large Structures	50-S1

The average survivor curves estimated for depreciable groups with numerous similar items were based on statistical analyses, Company policies, and previous estimates made for this and other companies. For 27 of the mass plant accounts and subaccounts for which survivor curves were estimated, the statistical analysis resulted in good indications of the survivor patterns experienced. Generally, the statistical analyses were the primary bases for the estimates for the following accounts:

	Property Group	Survivor Curve
304.15	Other Water Source Structures	50-S0.5
304.63	Miscellaneous Structure and Improvements	35-S0.5
307.00	Wells and Springs	55-S0
310.00	Power Generation Equipment	45-S0.5
311.20 - 311.54	Electric Pumping Equipment	39-S0
320.20	Purification System – Chemical Treatment	42-R0.5

320.30	Granular Activated Carbon	11-L0.5
320.37	Waste Handling and Treatment – Equipment	30-R3
330.00 - 330.40	Distribution Reservoirs and Standpipes	65-S0.5
331.00	Mains and Accessories	90-R2
333.00	Services	65-R2.5
334.00	Meters and Meter Installations	20-L1.5
335.00	Fire Hydrants	60-R2
341.00 - 341.40	Transportation Equipment	10-L2.5
345.00	Power Operated Equipment	21-S0.5

The average survivor curve estimate for Account 334.00, Meters and Meter Installations, is the 20-L1.5 which reflects the Company policy that retirements of installations will be based on the retirement of the meter.

The average survivor curves for the remaining minor depreciable accounts and subaccounts were based on judgment incorporating the size and nature of the property and the previous studies for this and other companies.

The amortization periods selected for general plant Accounts 340.00, 342.00, 343.00, 346.00, 347.00 and 348.00 are discussed in the section, “Amortization of General Plant Accounts.”

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

BOOK RESERVE

The book reserve as of June 30, 2025, is the result of a bringforward of the book reserves established by the Commission for each of the companies that were merged to become Pennsylvania-American Water Company in the following rate orders:

Company	Order Entered	Docket No.
Keystone Water Company	March 29, 1985	R-842755
Riverton Consolidated Water Company	March 21, 1985	R-842675
Western Pennsylvania Water Company	January 24, 1985	R-842621

The book reserve activity subsequent to those dates consists of accruals, retirements, cost of removal, gross salvage and other debits and credits recorded to the book reserve through June 30, 2025. The actual reserve as recorded on the books of Pennsylvania Gas & Water and previously used for ratemaking purposes, was recorded as a credit to the Company's book reserve at the date of acquisition. The projected book reserve as of June 30, 2026, is a bringforward of the June 30, 2025 book reserve based on projected accruals, retirements, cost of removal, gross salvage and other credits.

CALCULATION OF DEPRECIATION

The annual depreciation accruals as of June 30, 2026, are based on the straight line remaining life method and the equal life group procedure. For the purpose of calculating the remaining life accruals as of June 30, 2026 , the book reserve is allocated among vintages in proportion to the calculated accrued depreciation as of June 30, 2026.

Group Depreciation Procedures. A group procedure for depreciation is appropriate when considering more than a single item of property. Normally, the items within a group do not have identical service lives, but have lives that are dispersed over a range of time.

In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

In the equal life group procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. This procedure eliminates the need to base depreciation on average lives, inasmuch as each group is equivalent to a unit having a single life. The full costs of short-lived units are accrued during their lives, leaving no deferral of accruals required to be added to the annual costs associated with long-lived units. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

Remaining Life Annual Accruals. For the purpose of calculating remaining life accrual rates as of June 30, 2026, the estimated book depreciation reserve for each plant

account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation based on the equal life group procedure follow. The detailed calculations are set forth in the Results of Study section of the report.

Equal Life Group Procedure. In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\sum(\frac{\text{Book Cost}}{\text{Life}} \text{ x Remaining Life})}{\sum \frac{\text{Book Cost}}{\text{Life}}}.$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining Life} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost - Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}.$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$Ratio = 1 - \left(\frac{Remaining\ Life}{Service\ Life}\right)$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$Ratio = \left(\frac{Age}{Service\ Life}\right)$$

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment

which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is appropriate for certain General Plant accounts that represent numerous units of property, but a very small portion of depreciable water plant in service. The accounts and their amortization periods are as follows:

Account	Amortization Period, Years
340, Office Furniture and Equipment	
Furniture	20
Computers and Peripheral Equipment	5
Computer Software	5
Computer Software – Enterprise Solutions	10
Other Office Equipment	10
342, Stores Equipment	20
343, Tools and Work Equipment	20
344, Laboratory Equipment	20
346, Communication Equipment	
Equipment	15
Non-Telephone	15
Remote Control and Instrumentation	10
Telephone	10
347, Miscellaneous Equipment	25
348, Other Tangible Equipment	25

The annual amortization amount is determined by dividing the original cost for vintages whose age is less than the amortization period by the period of amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period.

NET SALVAGE

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2021 through June 30, 2025, and estimated for the period July 1, 2025 through December 31, 2025. The calculation of the amortization is shown in Table 5 on page V-14. The amounts of gross salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and net salvage and for the change of the composition of property in service. The annual accrual rates were calculated in accordance with the straight line remaining life method of depreciation, using the equal life group procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

The annual depreciation accrual rates are applicable specifically to the water plant in service as of June 30, 2026. For most plant accounts, the application of such rates to future balances that reflect additions subsequent to June 30, 2026, is reasonable for a period of three to five years.

DESCRIPTION OF DETAILED TABULATIONS

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2026 of the book reserve as of June 30, 2025. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months

ended June 30, 2026. Table 5 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2021-2025. The total amortization amount is incorporated in the total annual accrual in Table 2.

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021-2025 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2021-2025, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 5, which presents the five-year amortization of net salvage.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to water plant as of June 30, 2027. The results of our study as of June 30, 2026 are presented in our report titled "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Water Plant as of June 30, 2026". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 5 presented on pages I-3 through I-14 summarize the results of the depreciation study as of June 30, 2027. Table 1 sets forth the development of the net original cost by account as of June 30, 2027. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2027. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2027. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-7. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026, beginning on pages III-2 through III-6.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2025. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 through 3, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2026".

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of net original cost used in the study. The net original cost is the original cost of wastewater plant less advances and contributions. The results of the depreciation study are summarized in Table 2, which sets forth the book reserve and the calculated annual depreciation related to net original cost as of June 30, 2025, and the annual amortization of net negative salvage. Table 3 presents the calculation of the amortization of experienced net salvage, by account, based on the five-year period, 2020 through 2024.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2020 through 2024, on pages III-2 through III-5.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2026 are presented in the attached report. The results of our study as of June 30, 2025 are presented in our report, "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2025." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2026.

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

PART I. INTRODUCTION

PENNSYLVANIA-AMERICAN WATER COMPANY
WASTEWATER SSS GENERAL OPERATIONS
DEPRECIATION STUDY
PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2026. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2026.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates, Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation and Part VIII, Experienced and Estimated Net Salvage, presents the cost of removal and gross salvage recorded for the period 2021-2025.

BASIS OF THE STUDY

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2026. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of Iowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

DEVELOPMENT OF NET ORIGINAL COST

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

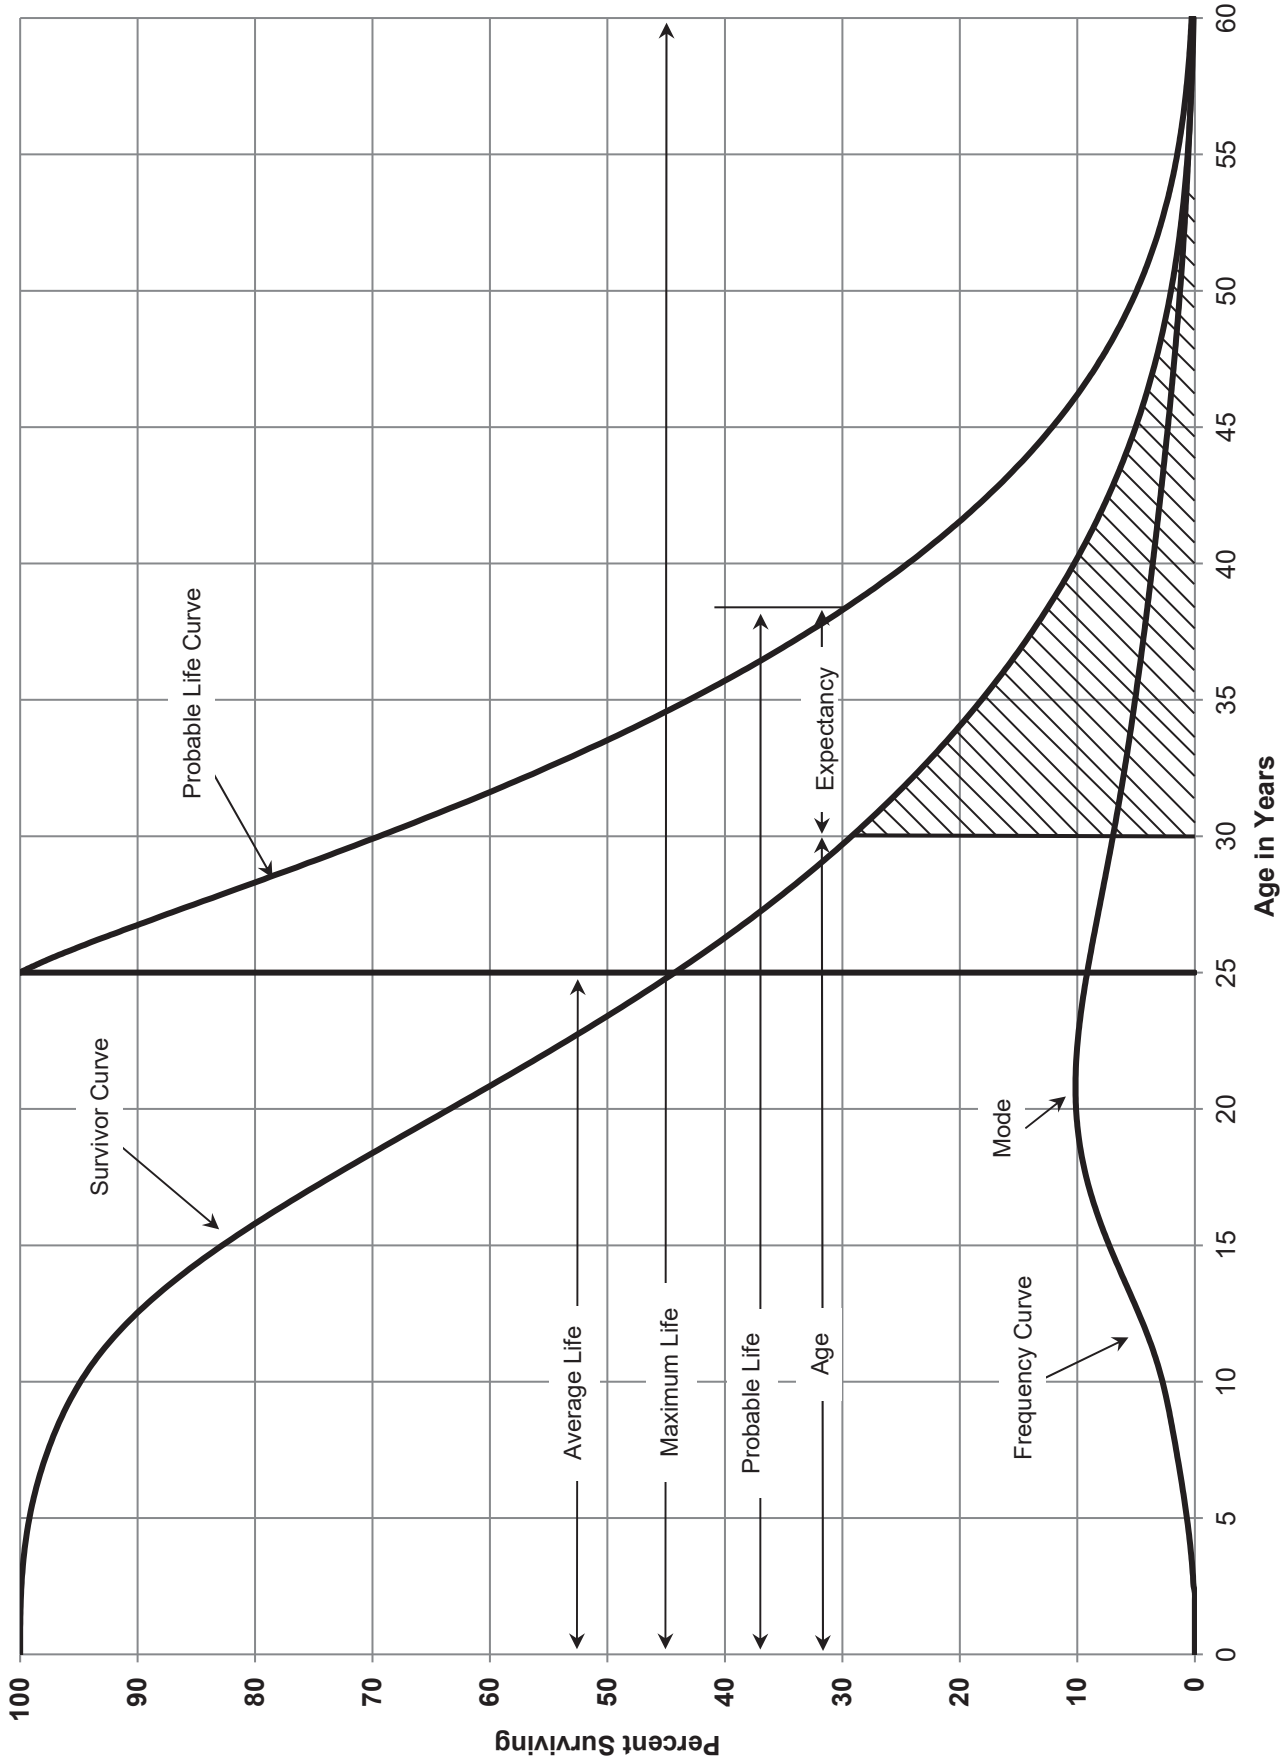

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

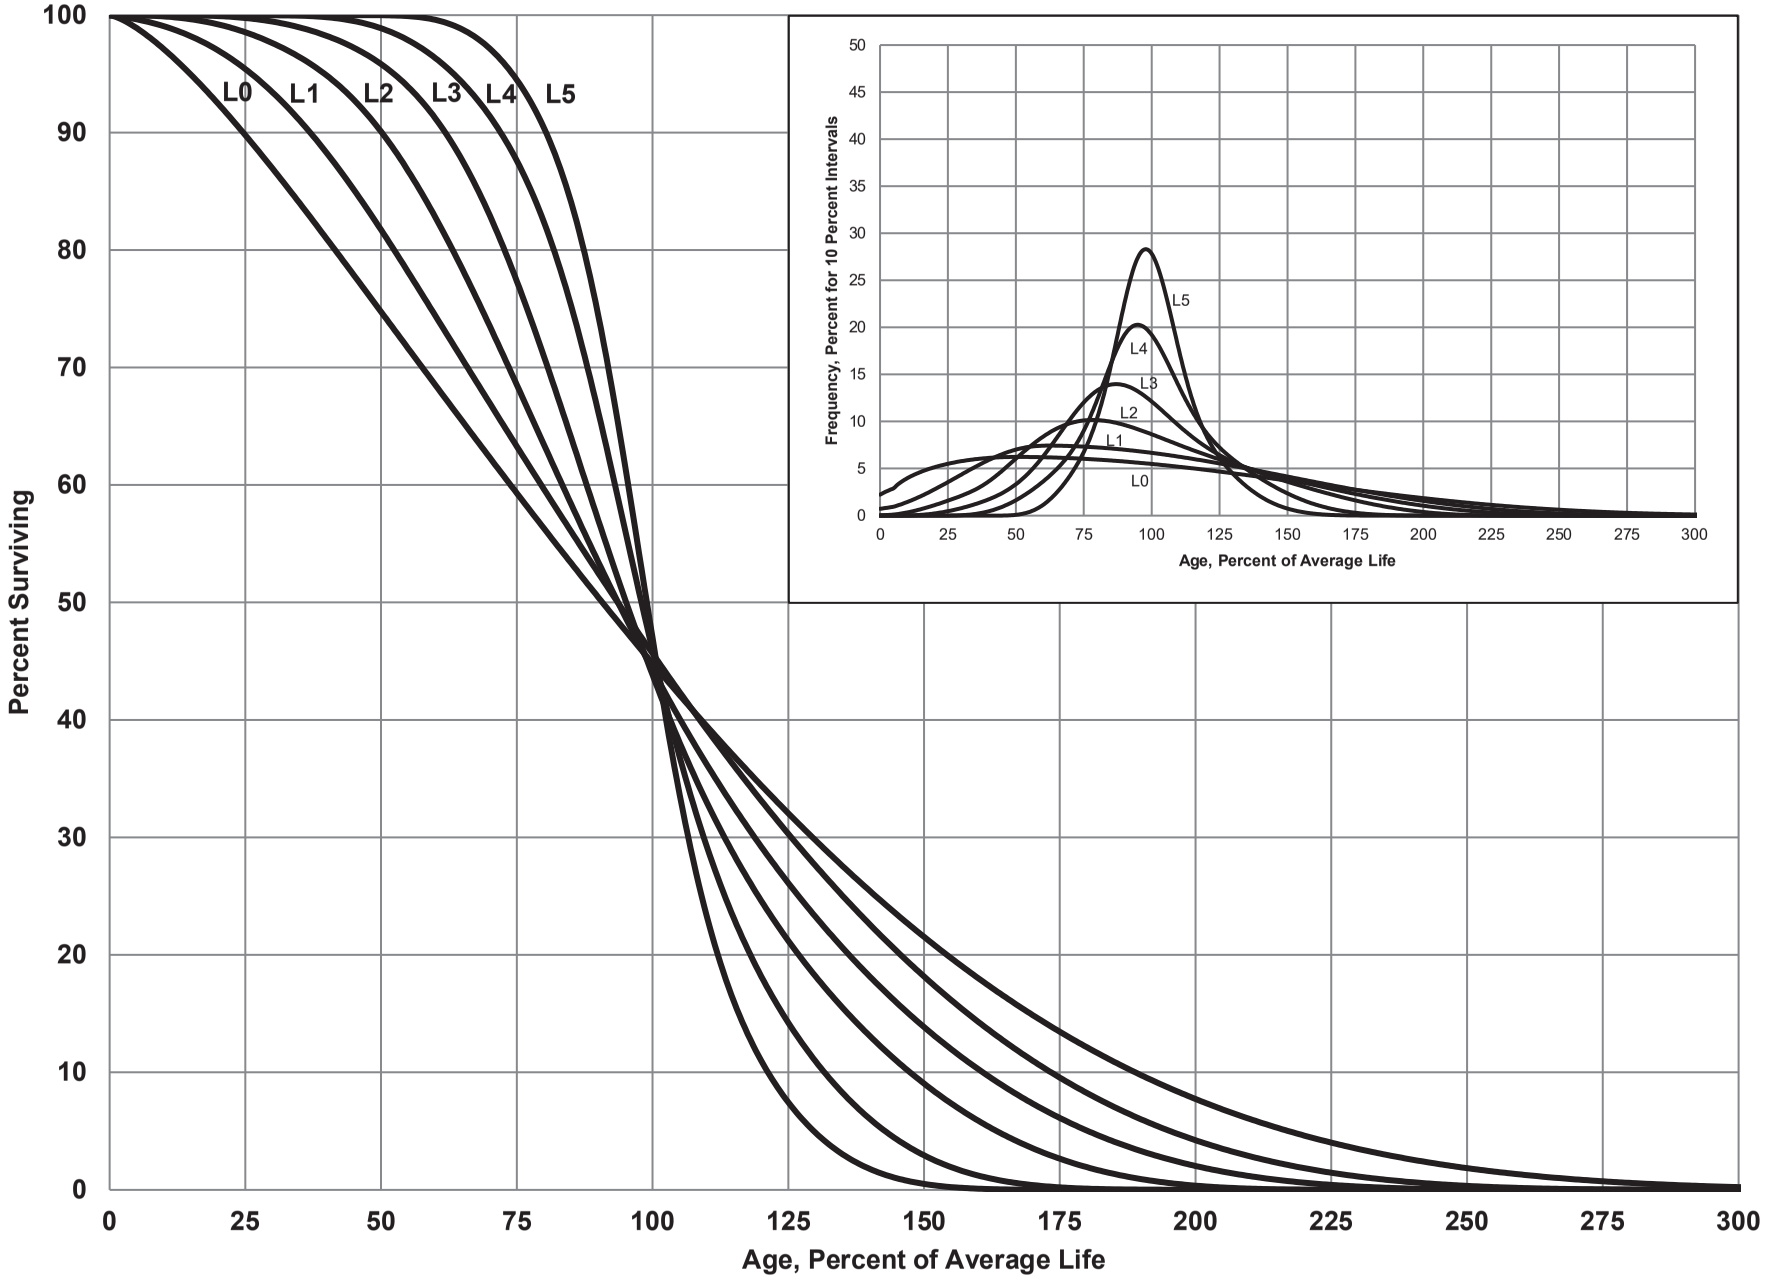

FIGURE 2. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

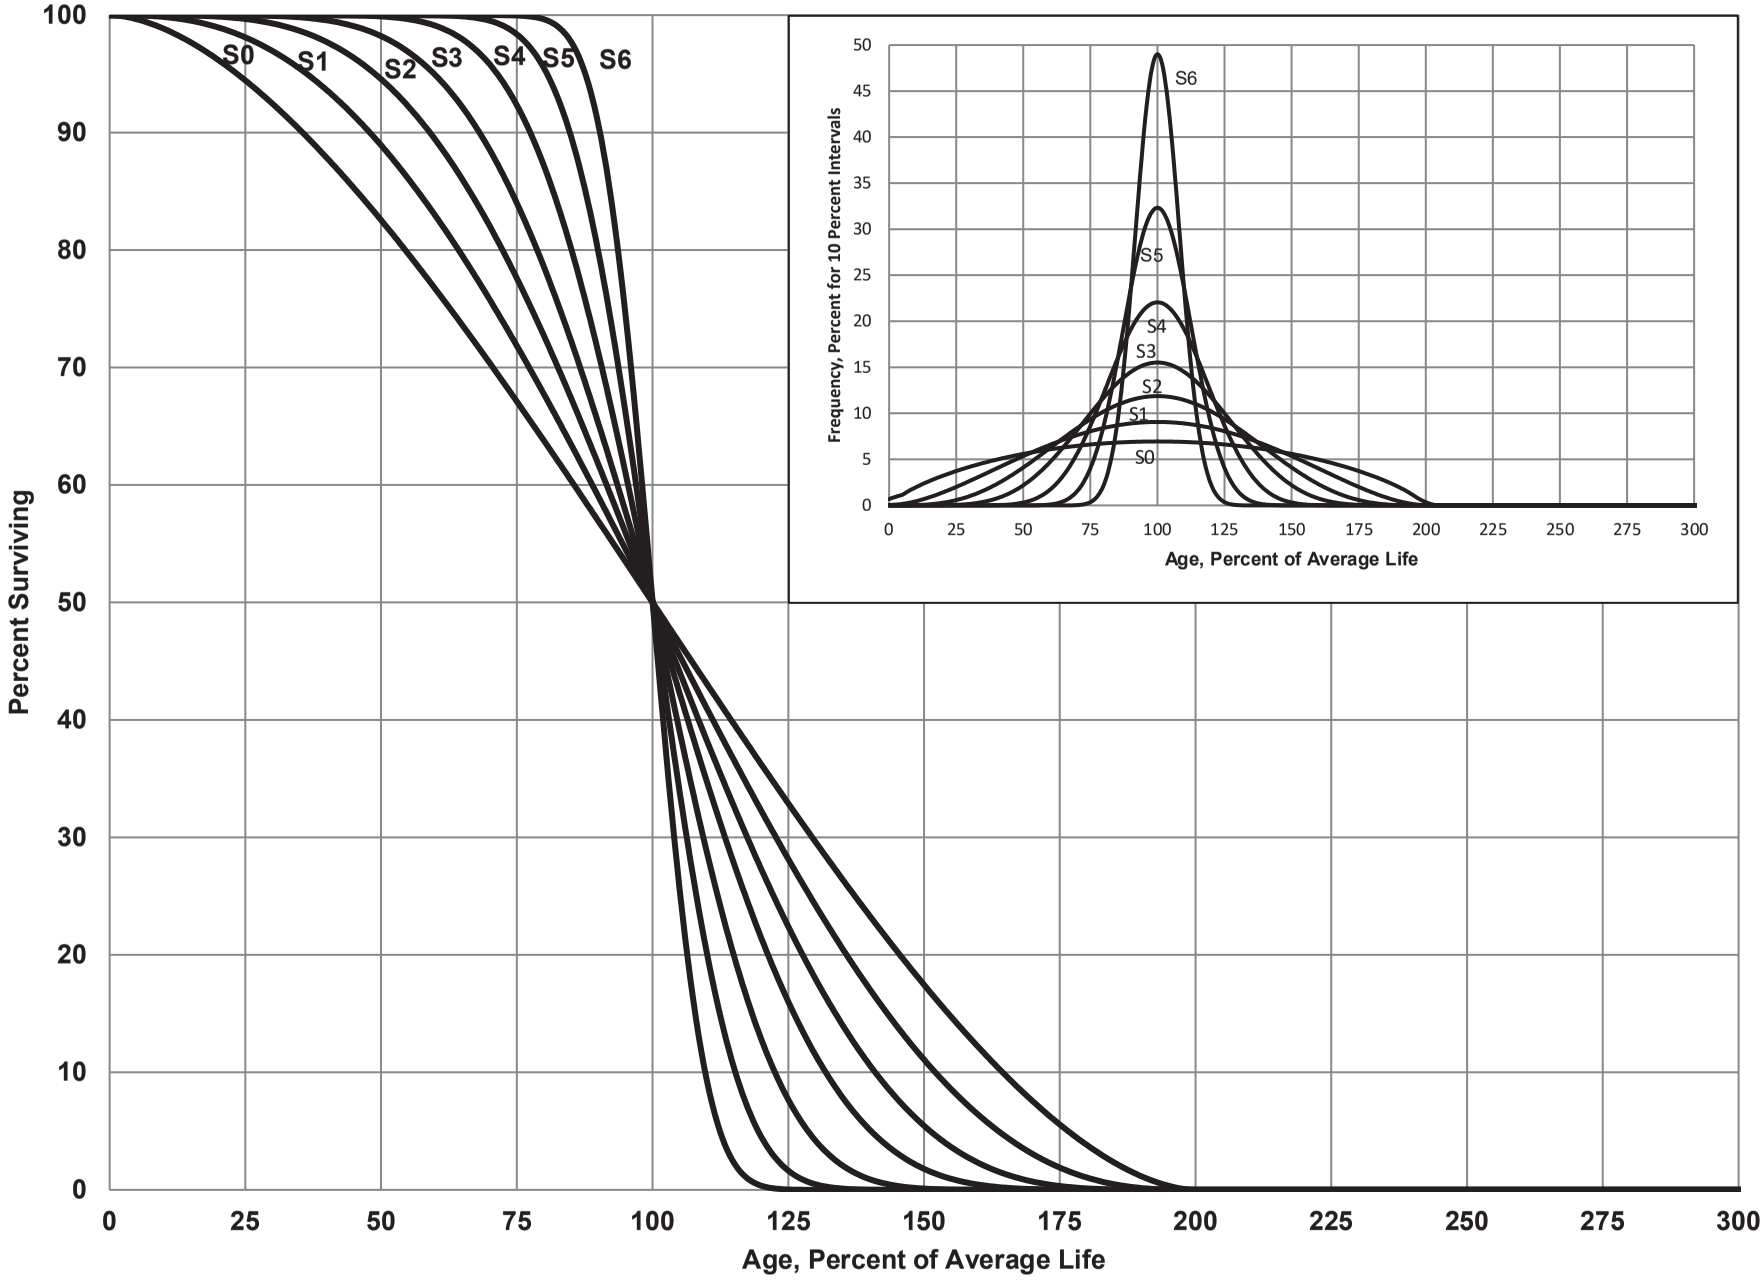

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

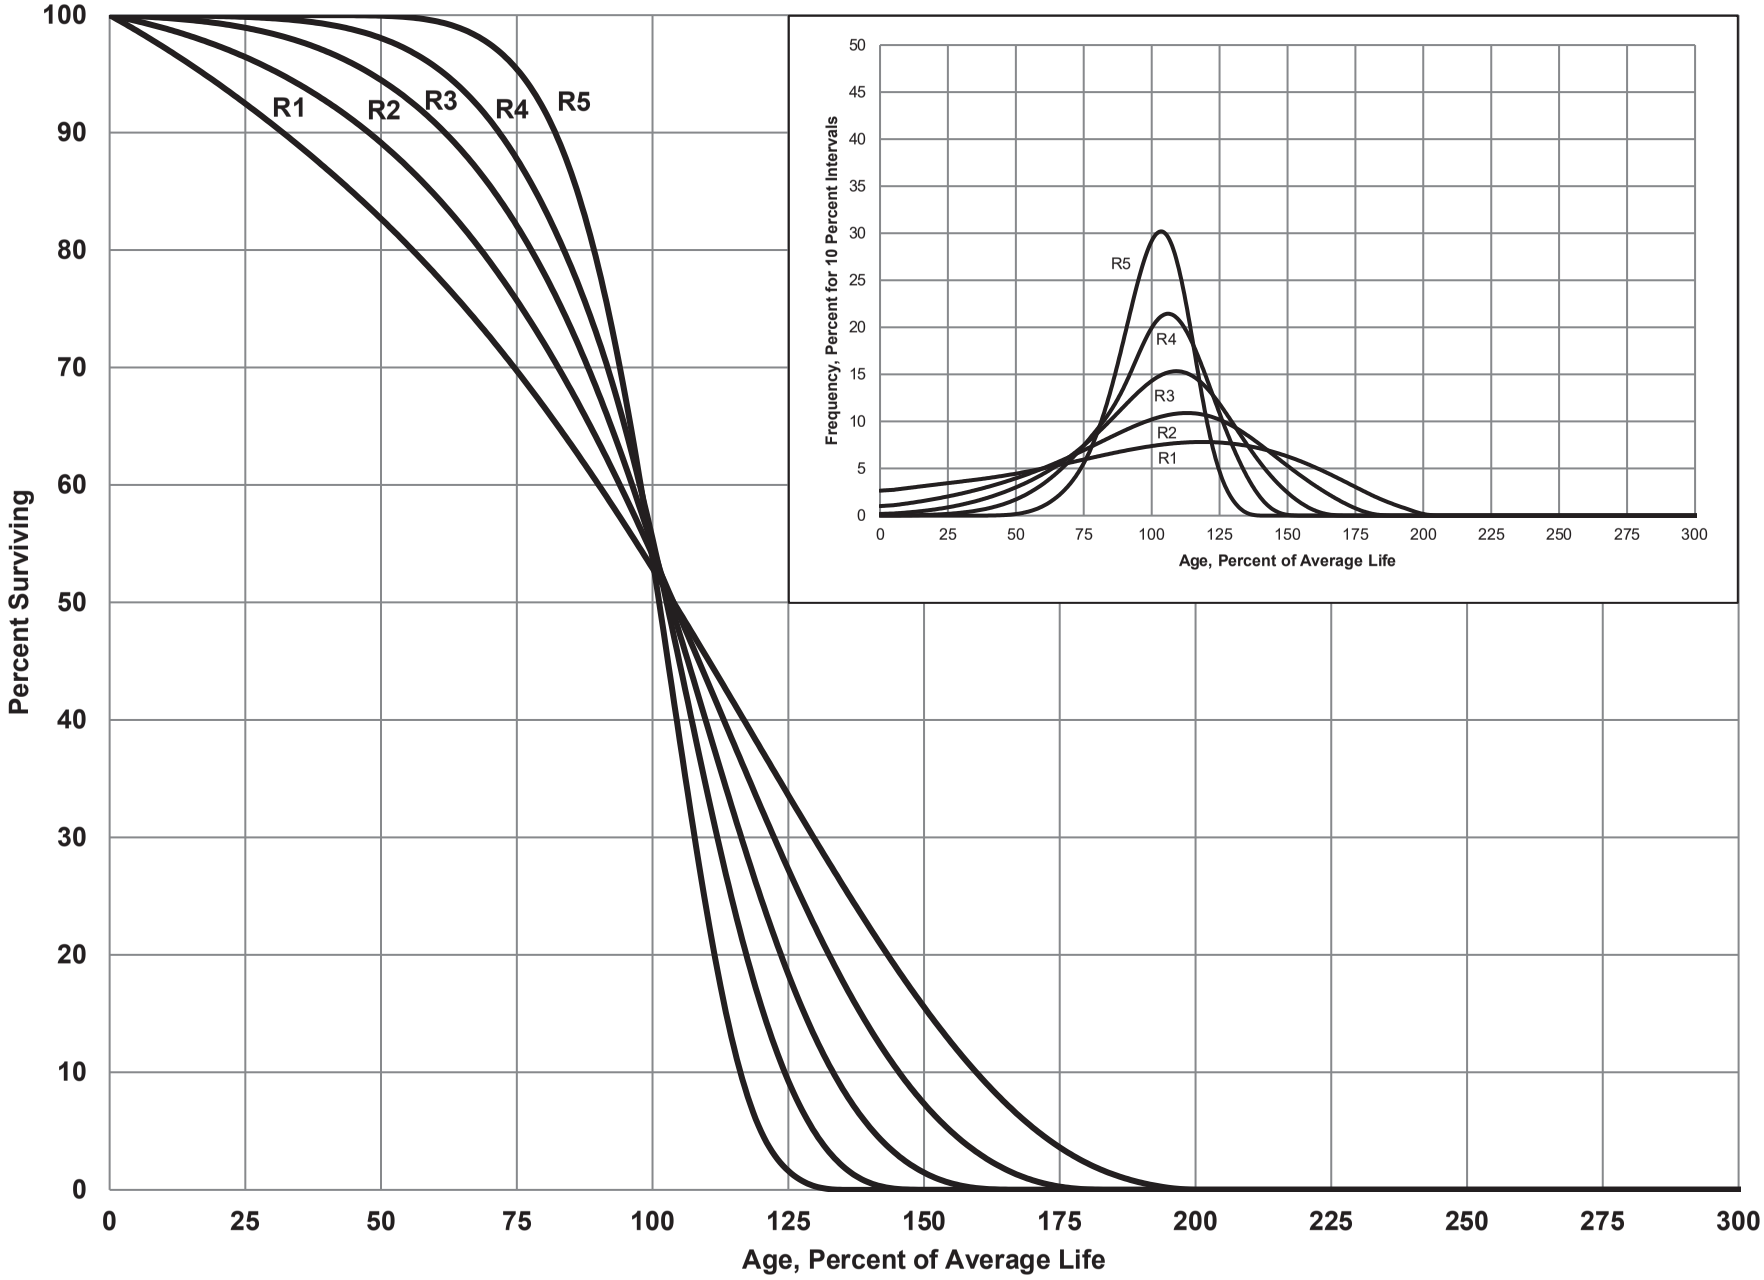

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

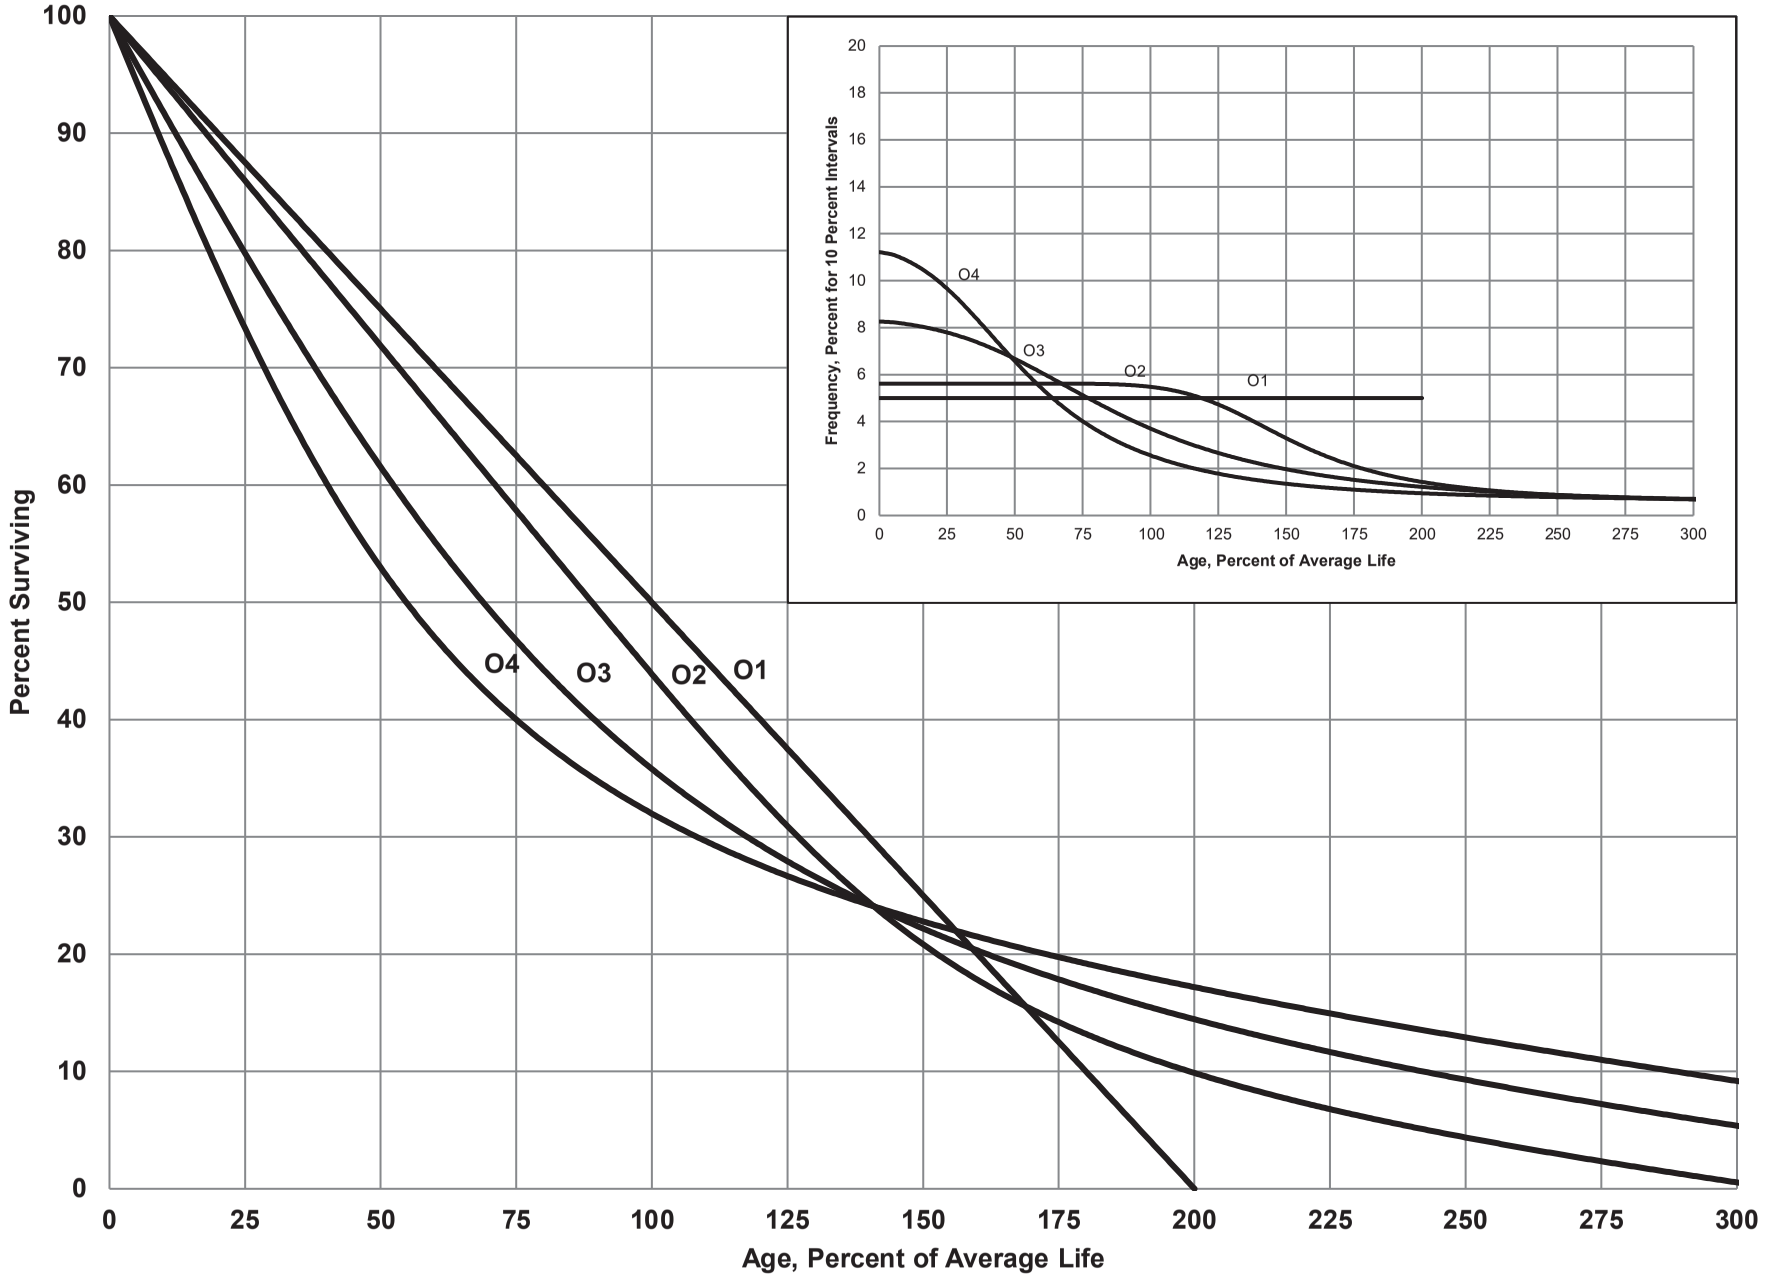

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024

[a] Transfer Affecting Exposures at Beginning of Year

[b] Transfer Affecting Exposures at End of Year

[c] Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024 Placement Band 2010-2024

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips are conducted for each study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during our recent field trips.

September 14, 2016
- Blue Mountain Lake Wastewater Plant
- Winona Lake Lift Station
- Saw Creek Wastewater Plant
- Marcel Lake Wastewater Plant
- Pocono Wastewater Plant

September 6, 2016
- Clarion Wastewater Plant
- Paint Elk Wastewater Plant
- Shippensville Wastewater Plant

September 1, 2016
- Franklin Wastewater Plant
- Hamilton Ban Pump Station
- Franklin Sand Mound Facility
- Fairview North Wastewater Plant
- South Fairview Wastewater Plant

March 16, 2010
- Coatesville Wastewater Plant
- Lehman Pike Wastewater Plant
- Winona Lake Lift Station

July 28, 2008
- Claysville Treatment Plant

Judgments. The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of the predecessor wastewater systems, as well as other wastewater companies. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

Account 363.00, Services, is used to illustrate the manner in which the study was conducted for the accounts in the preceding list. Aged plant accounting data have been compiled for the years through 2019. These data have been coded according to account or property group, type of transaction, year in which the transaction took place, and year in which the utility plant was placed in service. The retirements, other plant transactions and plant additions were analyzed by the retirement rate method.

The survivor curve estimate for this account is the 47-R3 and is based on the statistical indication for the period 1999-2019. The 47-R3 is a good fit of the significant portion of the original survivor curve as set forth on page VI-25, is consistent with management outlook for a continuation of the historical experience and is within the typical service life range of 40 to 55 years for services.

The amortization periods selected for general plant Accounts 390.00, 392.00, 393.00, 394.00, 396.00, 397.00 and 398.00 are discussed in the section, “Amortization of General Plant Accounts.”

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

BOOK RESERVE

The book reserve as of June 30, 2025, is the result of a bringforward of the book reserves established by the Commission for all Wastewater SSS Operations systems. The projected book reserve as of June 30, 2026, is a bringforward of the June 30, 2025 book reserve based on projected accruals, retirements, cost of removal, gross salvage and other credits.

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000\left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of June 30, 2026, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2026, are set forth in the Results of Study section of the report.

Equal Life Group Procedure

In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\sum\left(\frac{\text{Book Cost}}{\text{Life}} \text{ x Remaining Life}\right)}{\sum\frac{\text{Book Cost}}{\text{Life}}}.$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining Life} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost - Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}.$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$Ratio = 1 - \left(\frac{Remaining\ Life}{Service\ Life}\right)$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$Ratio = \left(\frac{Age}{Service\ Life}\right)$$

AMORTIZATION OF GENERAL PLANT ACCOUNTS

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390.00, 392.00, 393.00, 394.00, 396.00, 397.00 and 398.00, amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts are that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for

each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

Account Number	Description	Amortization Period, Years
390.00	Office Furniture and Equipment	20
392.00	Stores Equipment	25
393.00	Tools, Shop and Garage Equipment	20
394.00	Laboratory Equipment	15
396.00	Communication Equipment	15
397.00	Miscellaneous Equipment	15
398.00	Other Tangible Plant	25

NET SALVAGE

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2021 through June 30, 2025, and estimated for the period July 1, 2025 through December 31, 2025. The calculation of the amortization is shown in Table 5 on page V-8. The amounts of salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2026 of the book reserve as of June 30, 2025. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2026. Table 5 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2021-2025. The total amortization amount is incorporated in the total annual accrual in Table 2.

DESCRIPTION OF DETAILED TABULATIONS

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021-2025 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2021-2025, are presented in the section beginning on

page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 5, which presents the five-year amortization of net salvage.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2027. The results of our study as of June 30, 2026 are presented in our report titled "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2026". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2027. Table 1 sets forth the development of the net original cost by account as of June 30, 2027. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2027. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2027. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026, beginning on pages III-2 through III-4.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2025. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 through 3, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2026".

Respectfully submitted,

BASA WASTEWATER OPERATIONS

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of net original cost used in the study. The net original cost is the original cost of wastewater plant less advances and contributions. The results of the depreciation study are summarized in Table 2, which sets forth the book reserve and the calculated annual depreciation related to net original cost as of June 30, 2025, and the annual amortization of net negative salvage. Table 3 presents the calculation of the amortization of experienced net salvage, by account, based on the five-year period, 2020 through 2024.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2020 through 2024, on page III-2.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2026 are presented in the attached report. The results of our study as of June 30, 2025 are presented in our report, "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2025." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2026.

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

PART I. INTRODUCTION

PENNSYLVANIA-AMERICAN WATER COMPANY

BASA WASTEWATER OPERATIONS

DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2026. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2026.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates and Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation.

BASIS OF THE STUDY

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2026. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of Iowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

DEVELOPMENT OF NET ORIGINAL COST

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

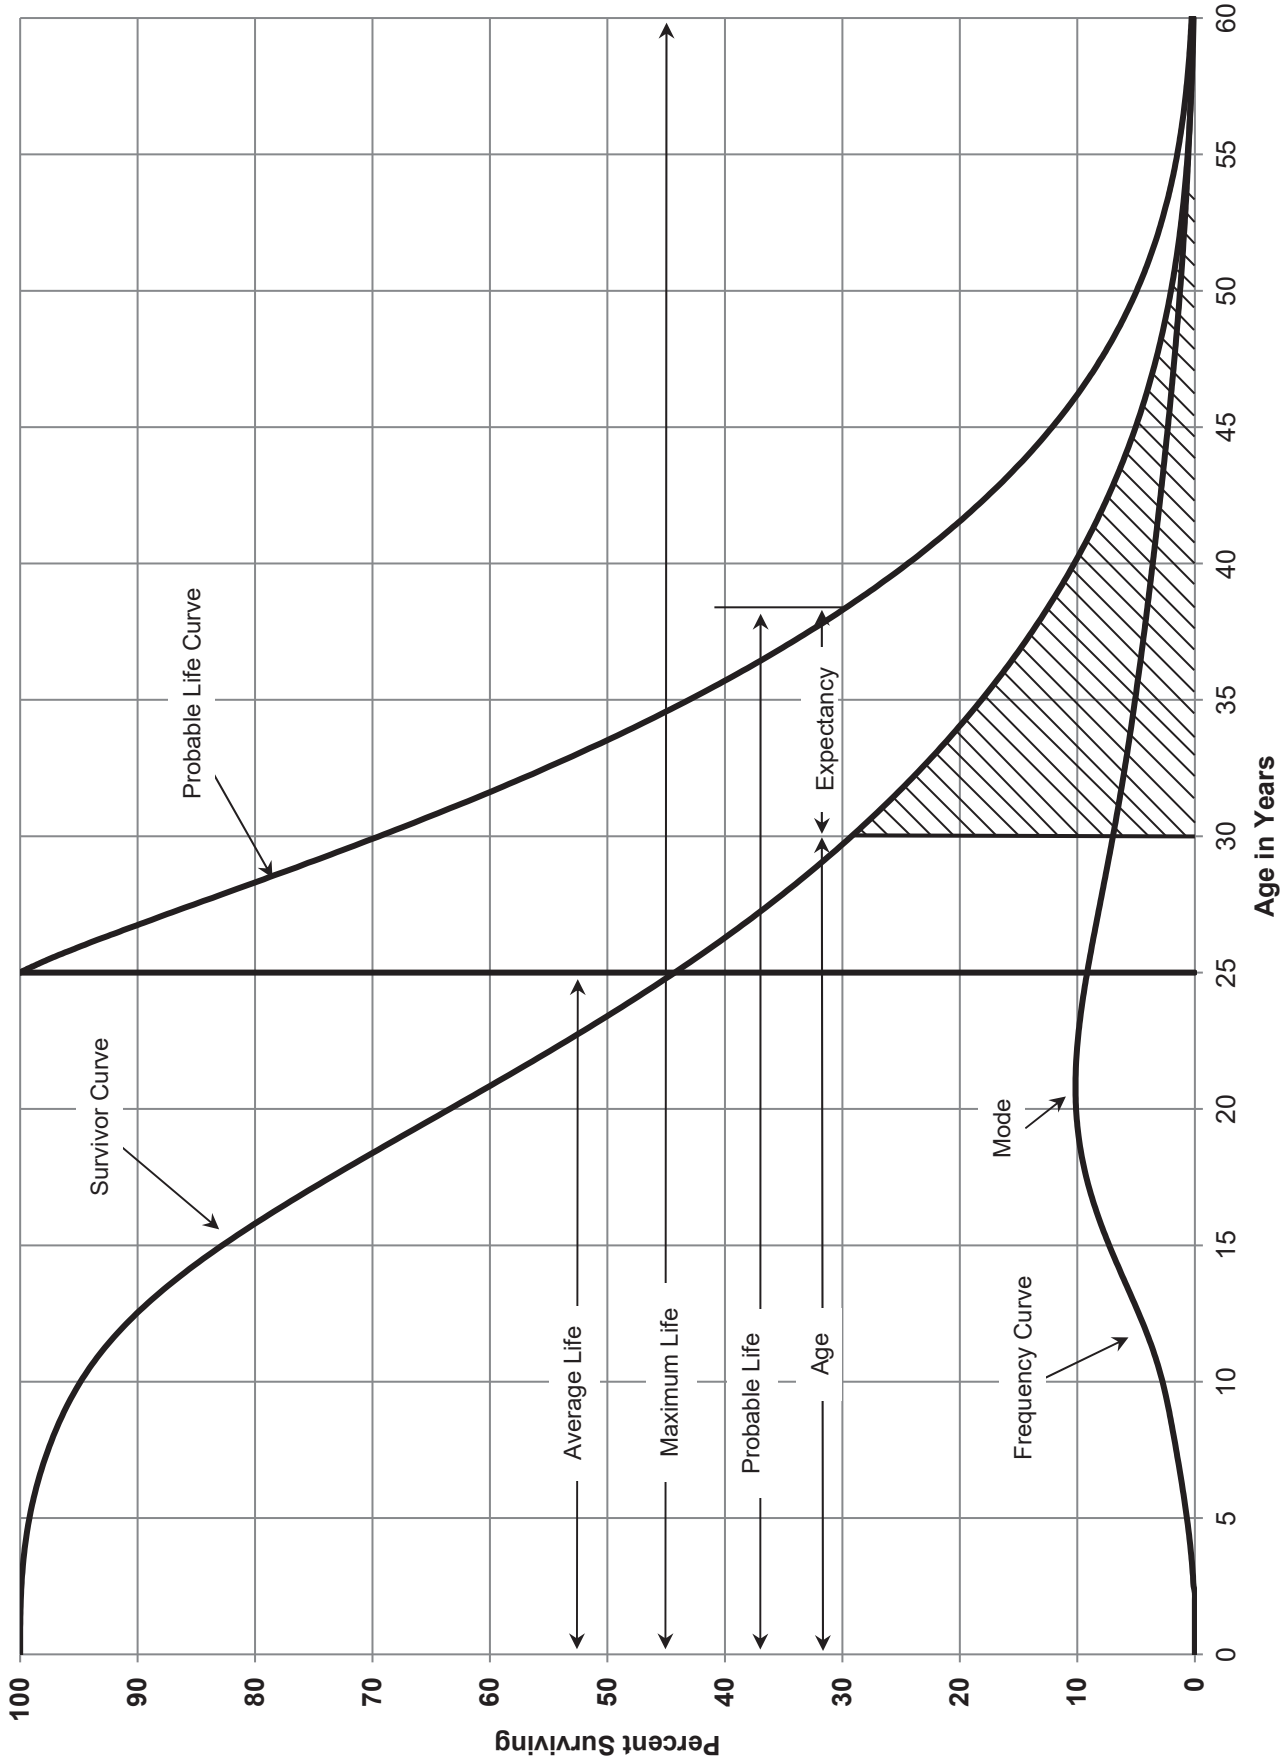

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

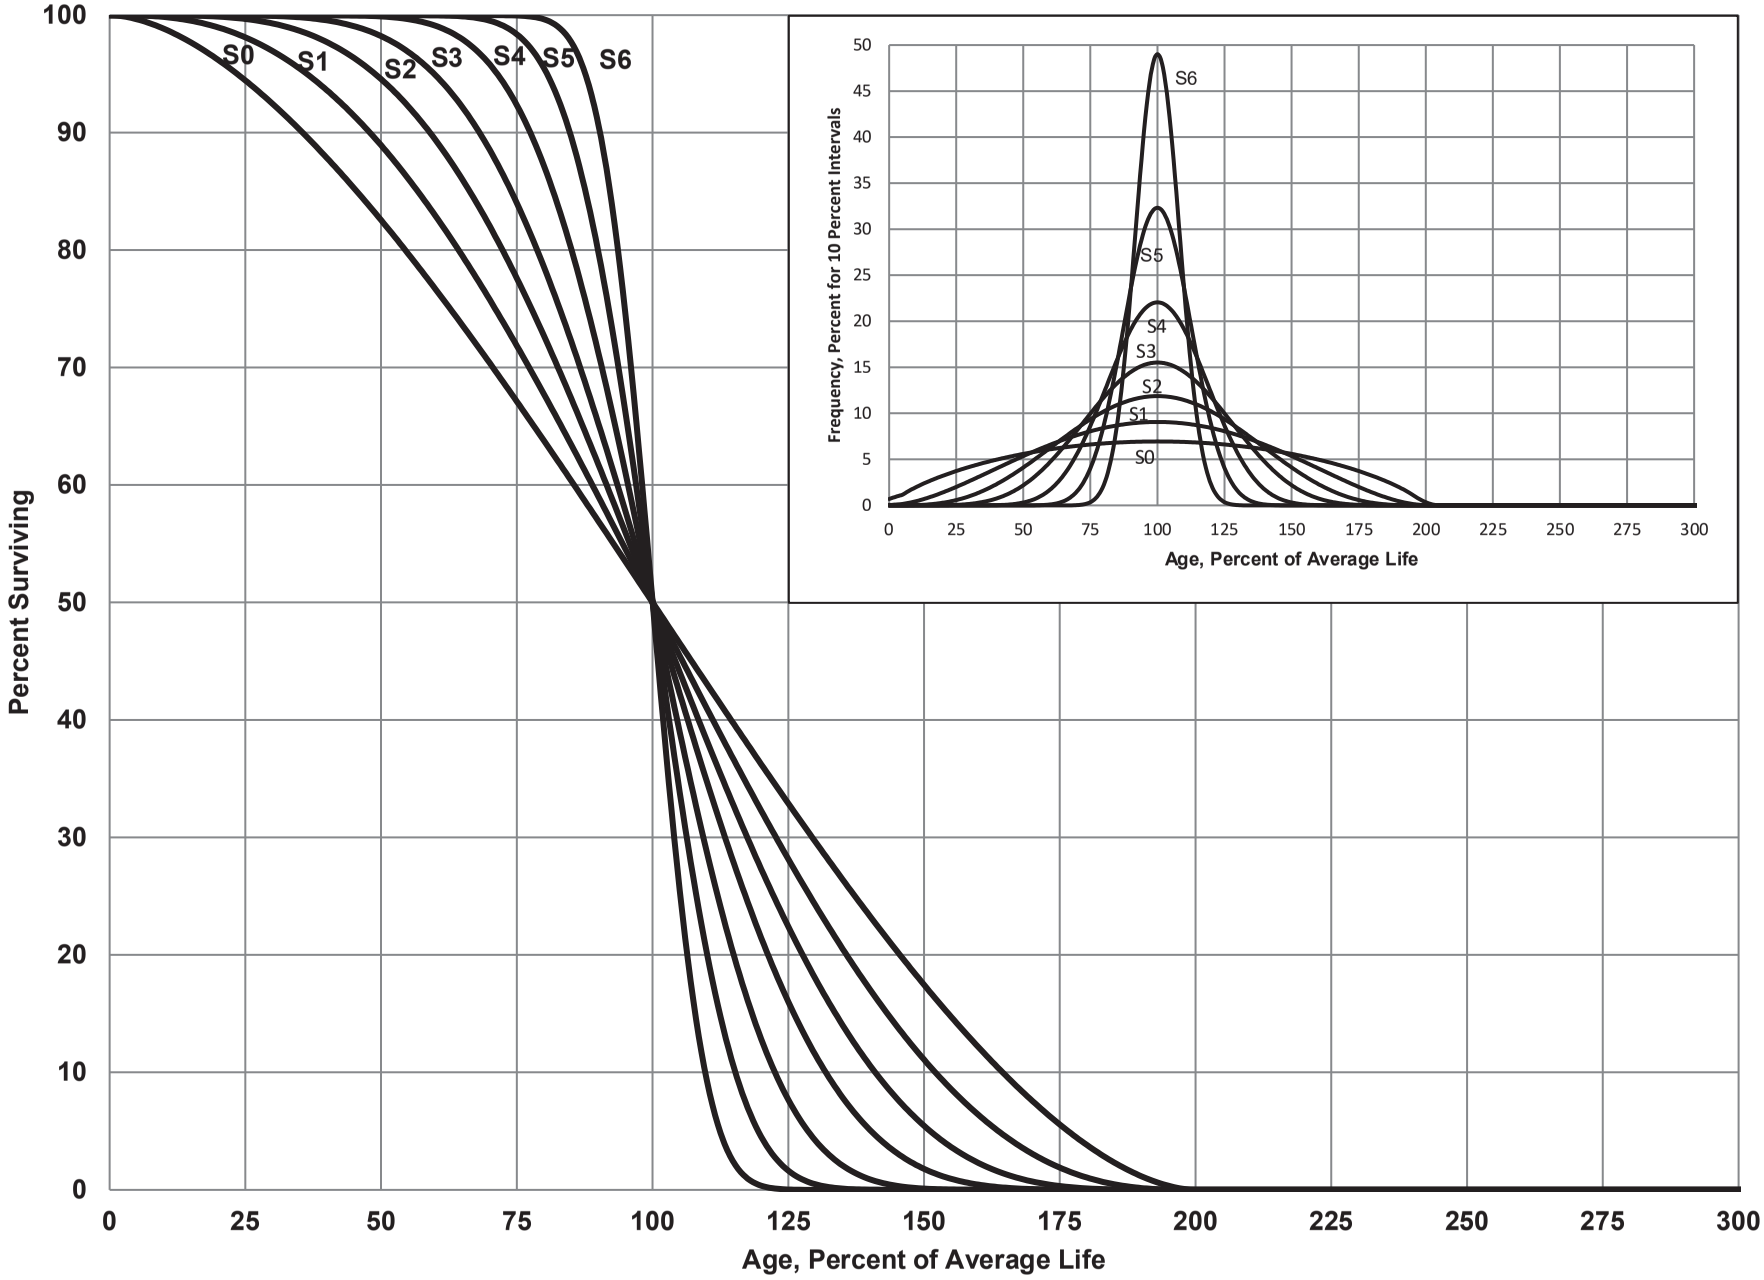

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

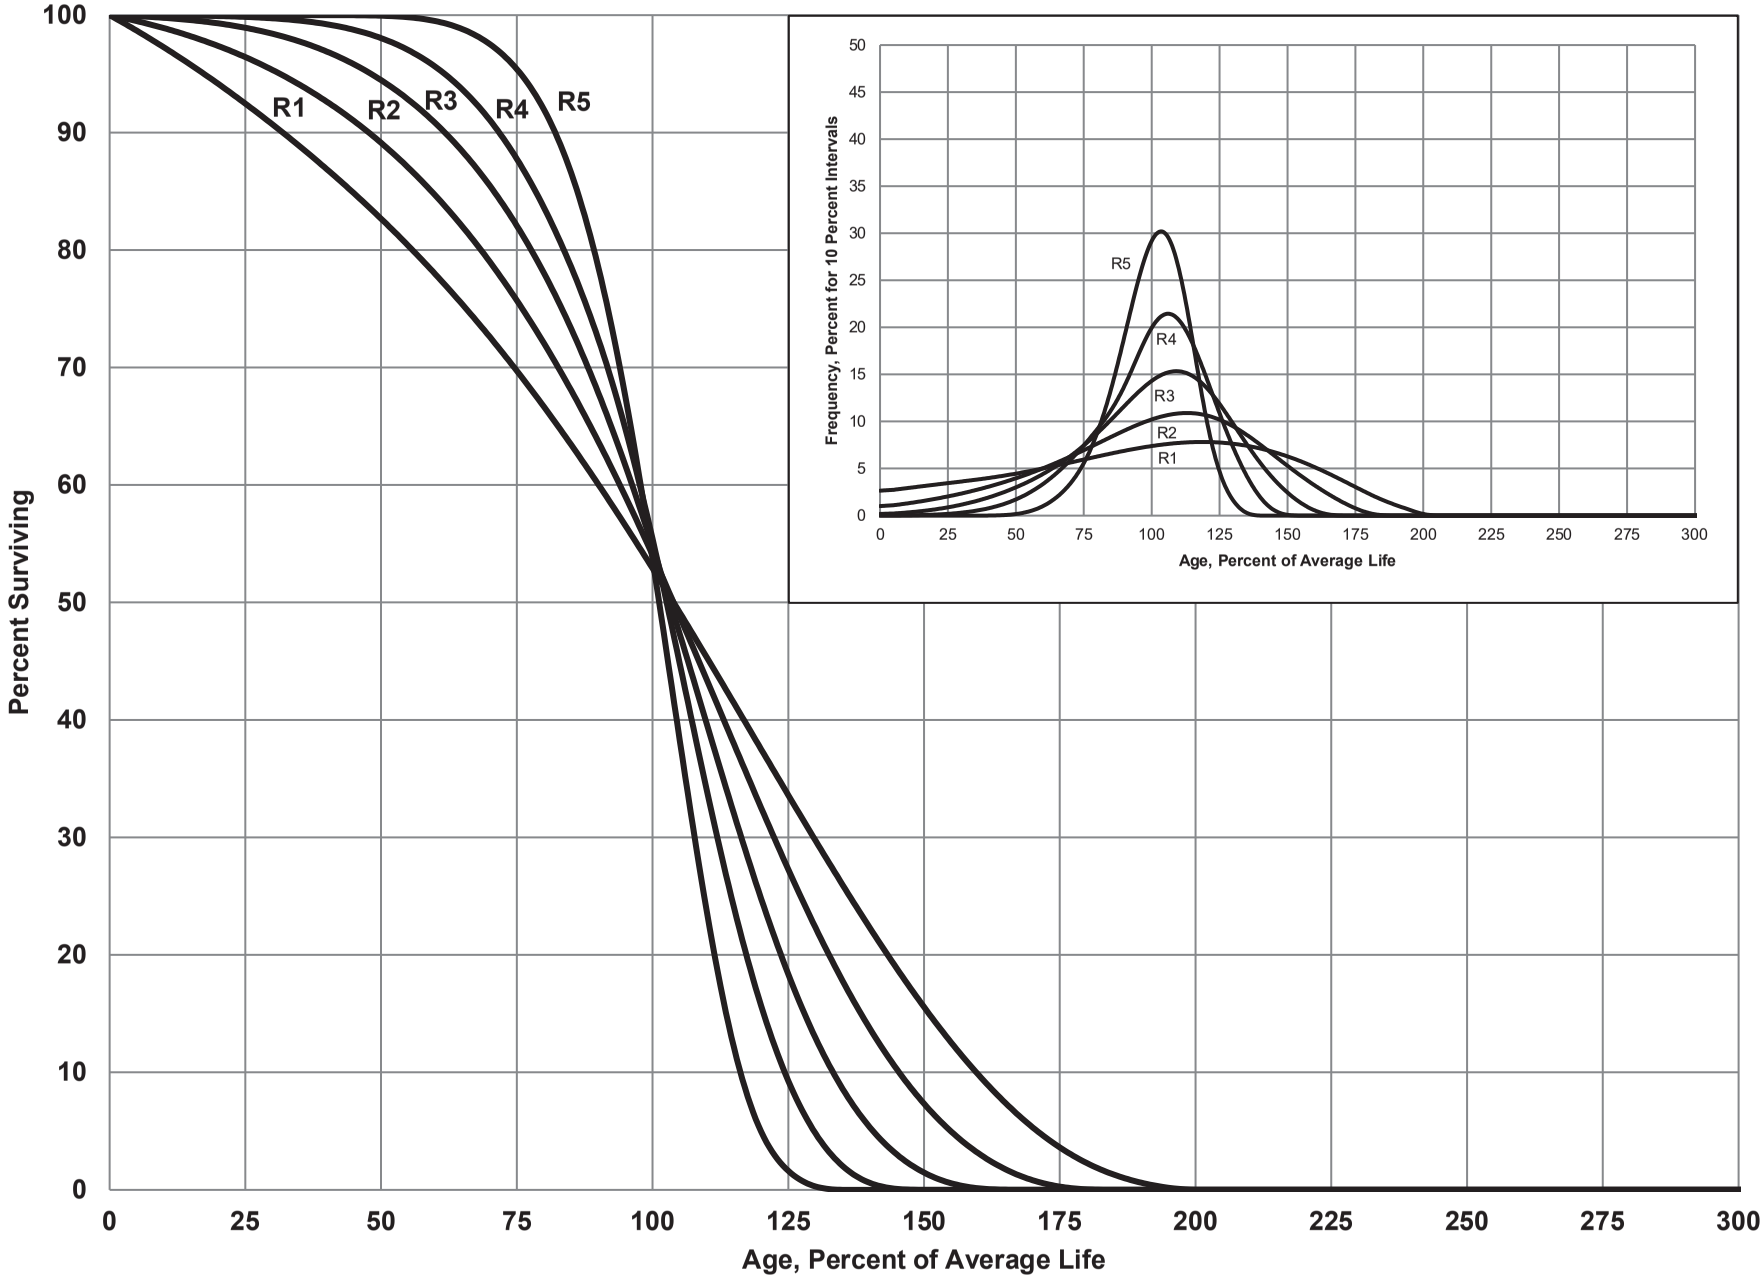

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

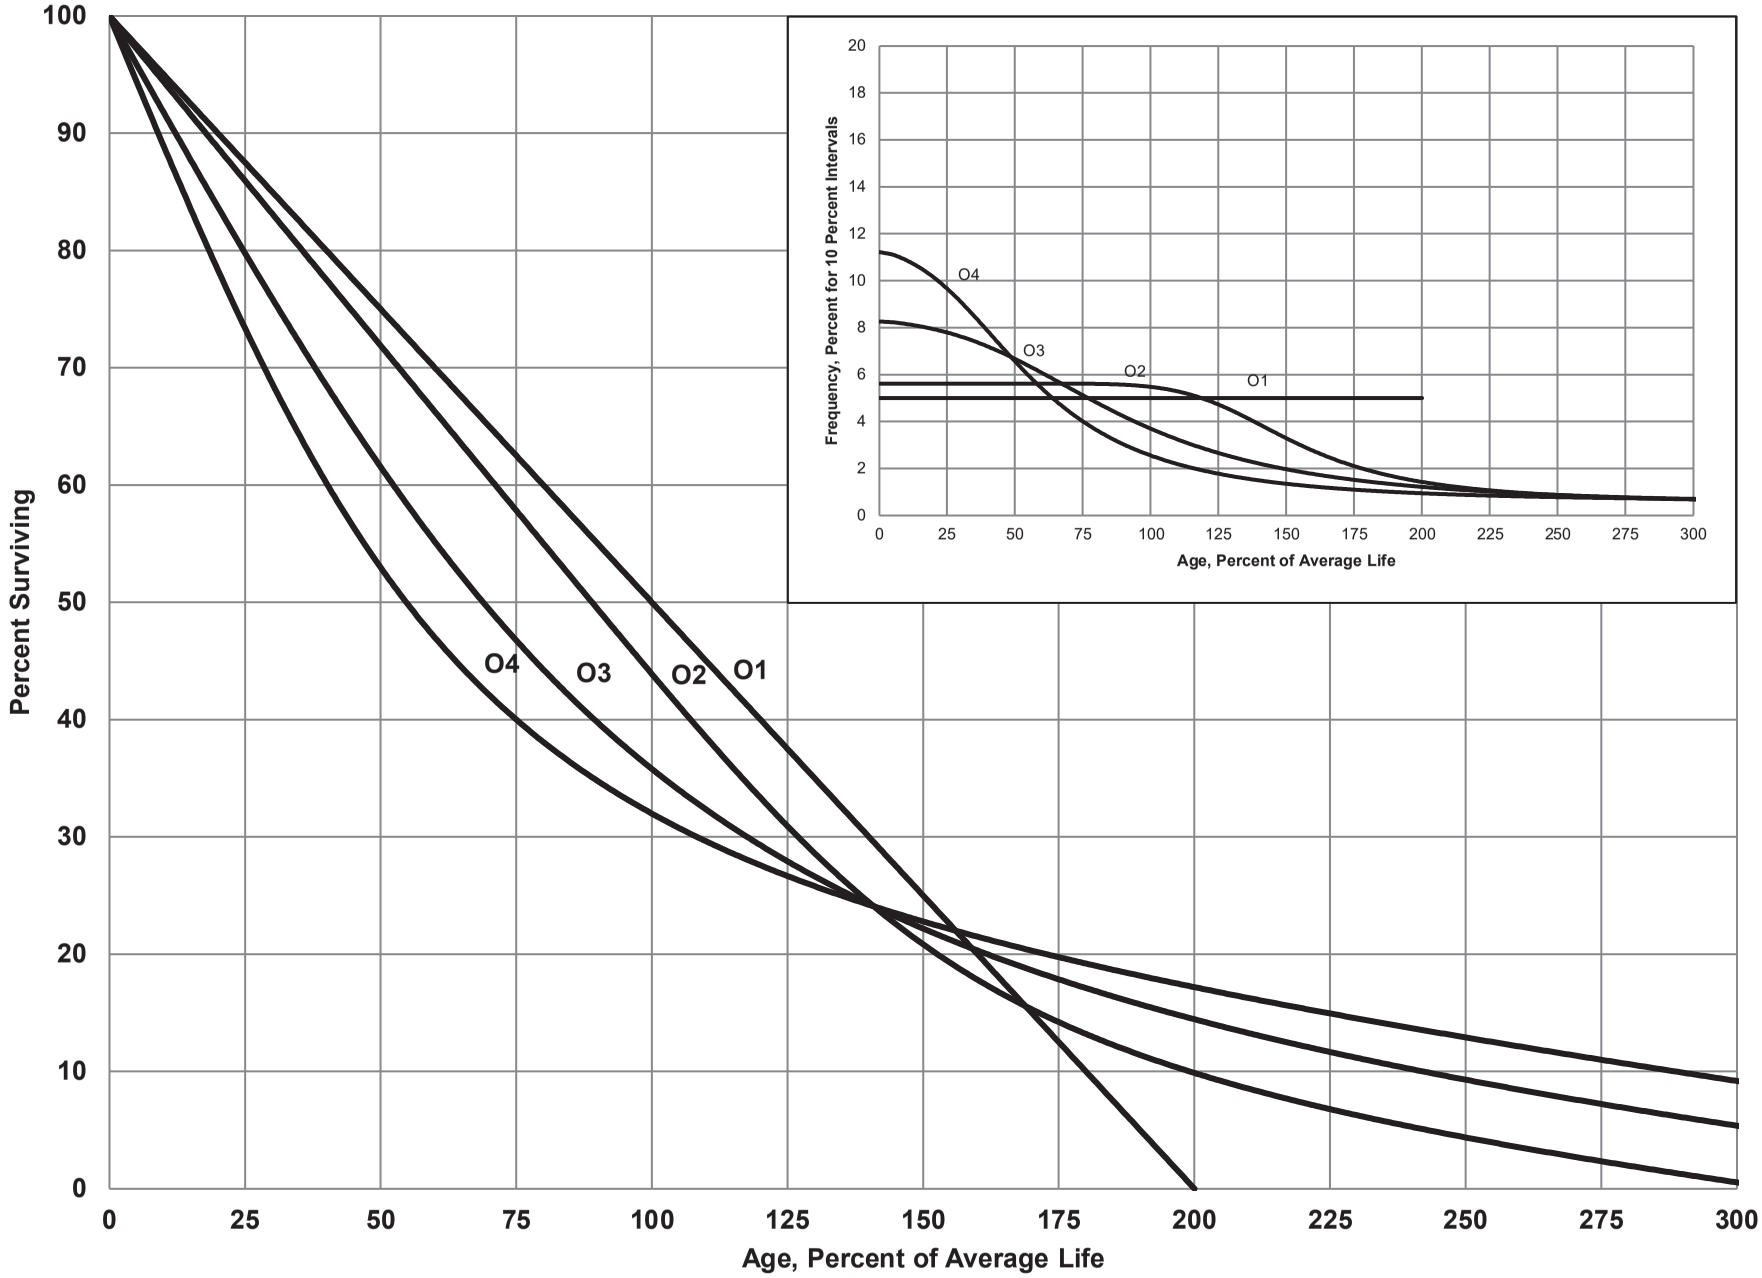

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024

[a] Transfer Affecting Exposures at Beginning of Year

[b] Transfer Affecting Exposures at End of Year

[c] Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0 = amount of addition	= $750,000
Exposures at age ½ = $750,000 - $ 8,000	= $742,000
Exposures at age 1½ = $742,000 - $18,000	= $724,000
Exposures at age 2½ = $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½ = $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

JUDGMENTS

The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of other Pennsylvania-American wastewater systems. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

Account 363.00, Services, is used to illustrate the manner in which the study was conducted for the accounts in the preceding list. Aged plant accounting data have been compiled for the years through 2019. These data have been coded according to account or property group, type of transaction, year in which the transaction took place, and year in which the utility plant was placed in service. The retirements, other plant transactions and plant additions were analyzed by the retirement rate method.

The survivor curve estimate for this account is the 47-R3 and is based on the statistical indication for the period 1999-2019. The 47-R3 is a good fit of the significant portion of the original survivor curve as set forth on page VI-25, is consistent with management outlook for a continuation of the historical experience and is within the typical service life range of 40 to 55 years for services.

The amortization periods selected for general plant amortized Accounts 390.00, 393.00, 394.00, 396.00 and 397.00 are discussed in the section, “Amortization of General Plant Accounts.”

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

BOOK RESERVE

The book reserve as of June 30, 2025, is the result of a bringforward of the book reserves established by the Commission for the BASA wastewater operation at the time of acquisition. The projected book reserve as of June 30, 2026, is a bringforward of the June 30, 2025 book reserve based on projected accruals, retirements, cost of removal, salvage and other credits.

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000\left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of June 30, 2026, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2026, are set forth in the Results of Study section of the report.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics

are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life}{Average\ Service\ Life}.$$

AMORTIZATION OF GENERAL PLANT ACCOUNTS

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390, 393, 394, 396 and 397; amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts is that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in

these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

Account Number	Description	Amortization Period, Years
390.00	Office Furniture and Equipment	20
393.00	Tools, Shop and Garage Equipment	20
394.00	Laboratory Equipment	15
396.00	Communication Equipment	15
397.00	Miscellaneous Equipment	15

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2026 of the book reserve as of June 30, 2025. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2026. The total amortization amount is incorporated in the total annual accrual in Table 2.

DESCRIPTION OF DETAILED TABULATIONS

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021 - 2025 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life

derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2027. The results of our study as of June 30, 2026 are presented in our report titled "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2026". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2027. Table 1 sets forth the development of the net original cost by account as of June 30, 2027. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2027. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2027. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026 on page III-2.

Attention Dominic DeGrazia
Director Rates and Regulatory

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2025. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 through 3, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based, as well as support for the service life estimates, is set forth in a companion report "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2026".

Respectfully submitted,

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of net original cost used in the study. The net original cost is the original cost of wastewater plant less advances and contributions. The results of the depreciation study are summarized in Table 2, which sets forth the book reserve and the calculated annual depreciation related to net original cost as of June 30, 2025, and the annual amortization of net negative salvage. Table 3 presents the calculation of the amortization of experienced net salvage by account, based on the five-year period, 2020-2024.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage, and cost of removal are set forth by account for the years 2020 through 2024, on pages III-2 through III-4.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2026 are presented in the attached report. The results of our study as of June 30, 2025 are presented in our report, "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2025." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2026.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

PENNSYLVANIA-AMERICAN WATER COMPANY

WASTEWATER CSS OPERATIONS

DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2026. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2026.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates, Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation and Part VIII, Experienced and Estimated Net

Salvage, presents the cost of removal and gross salvage recorded for the period 2021-2025.

BASIS OF THE STUDY

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2026. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of Iowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

DEVELOPMENT OF NET ORIGINAL COST

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

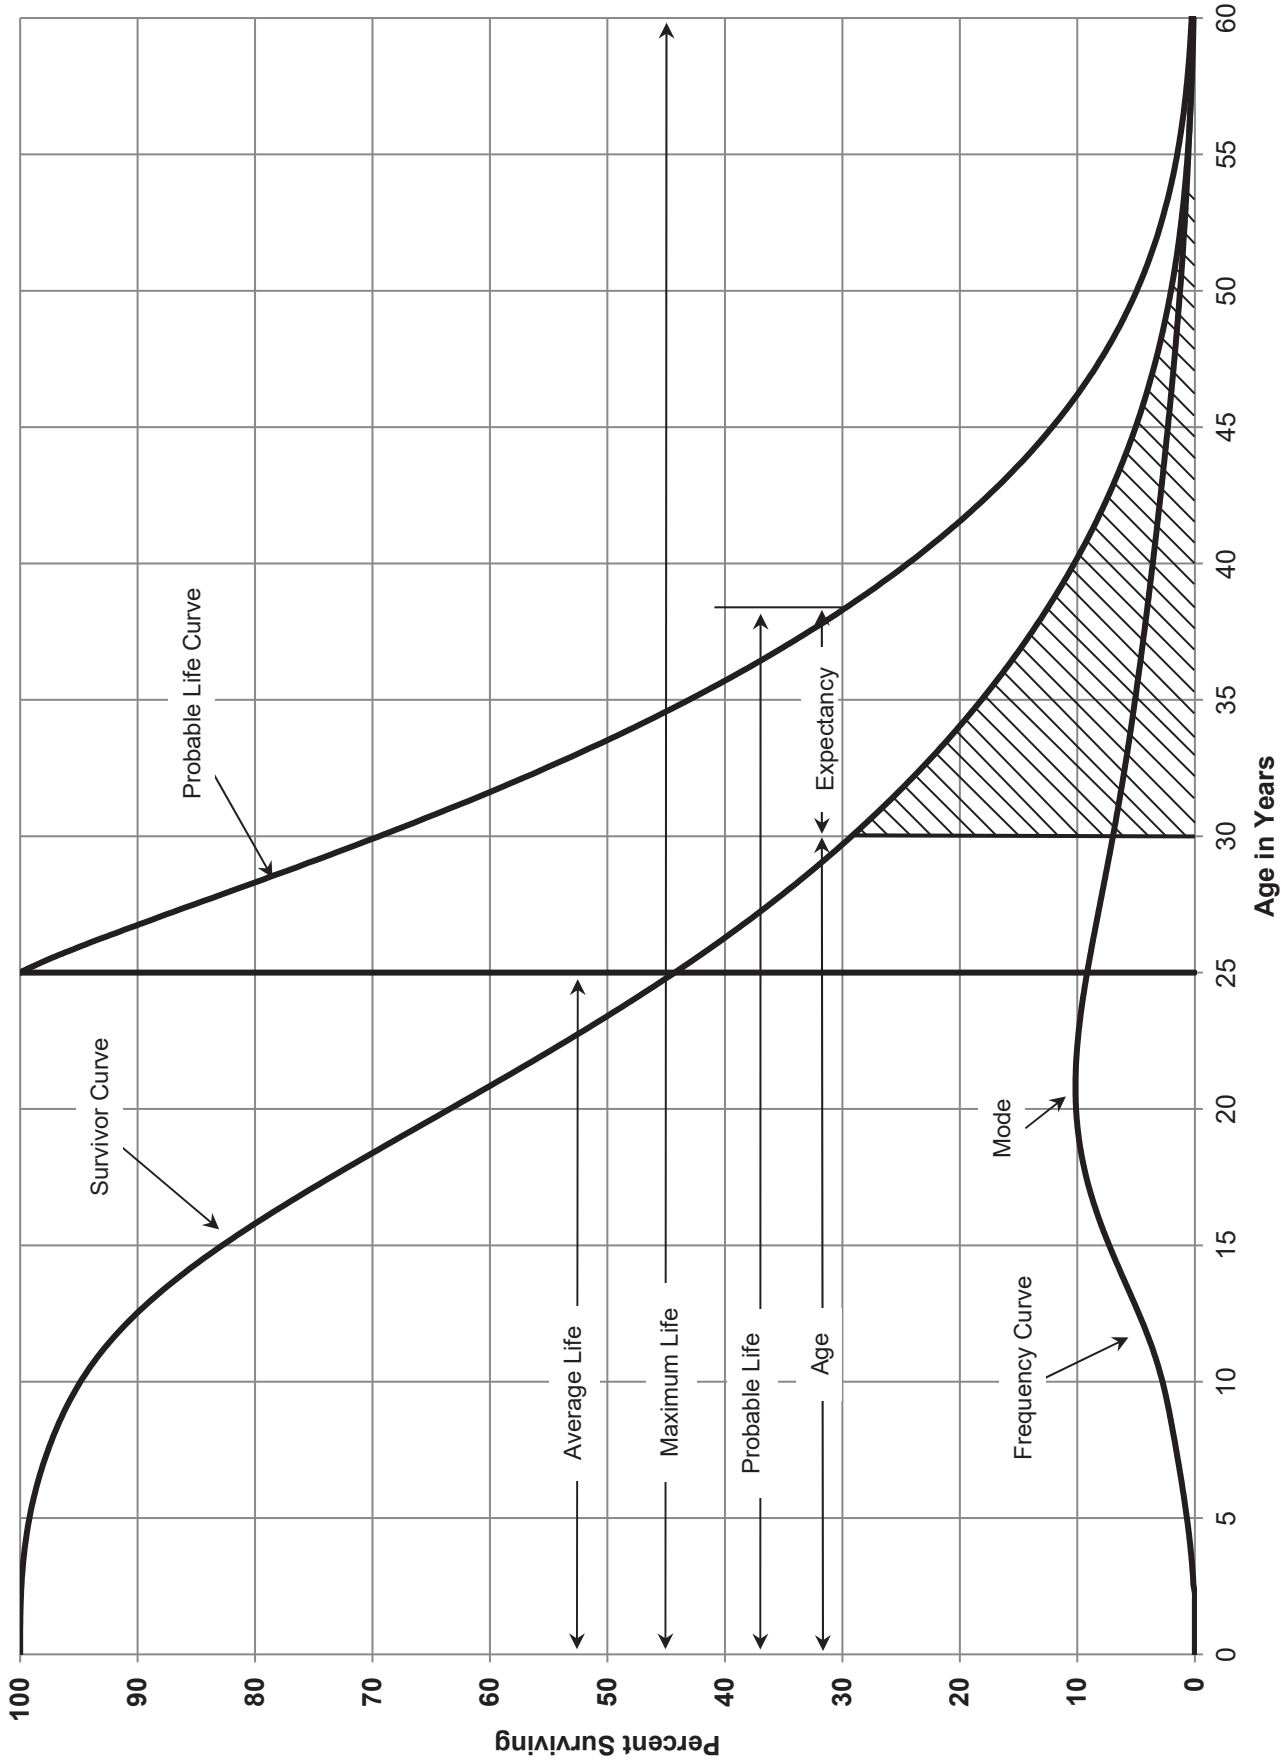

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

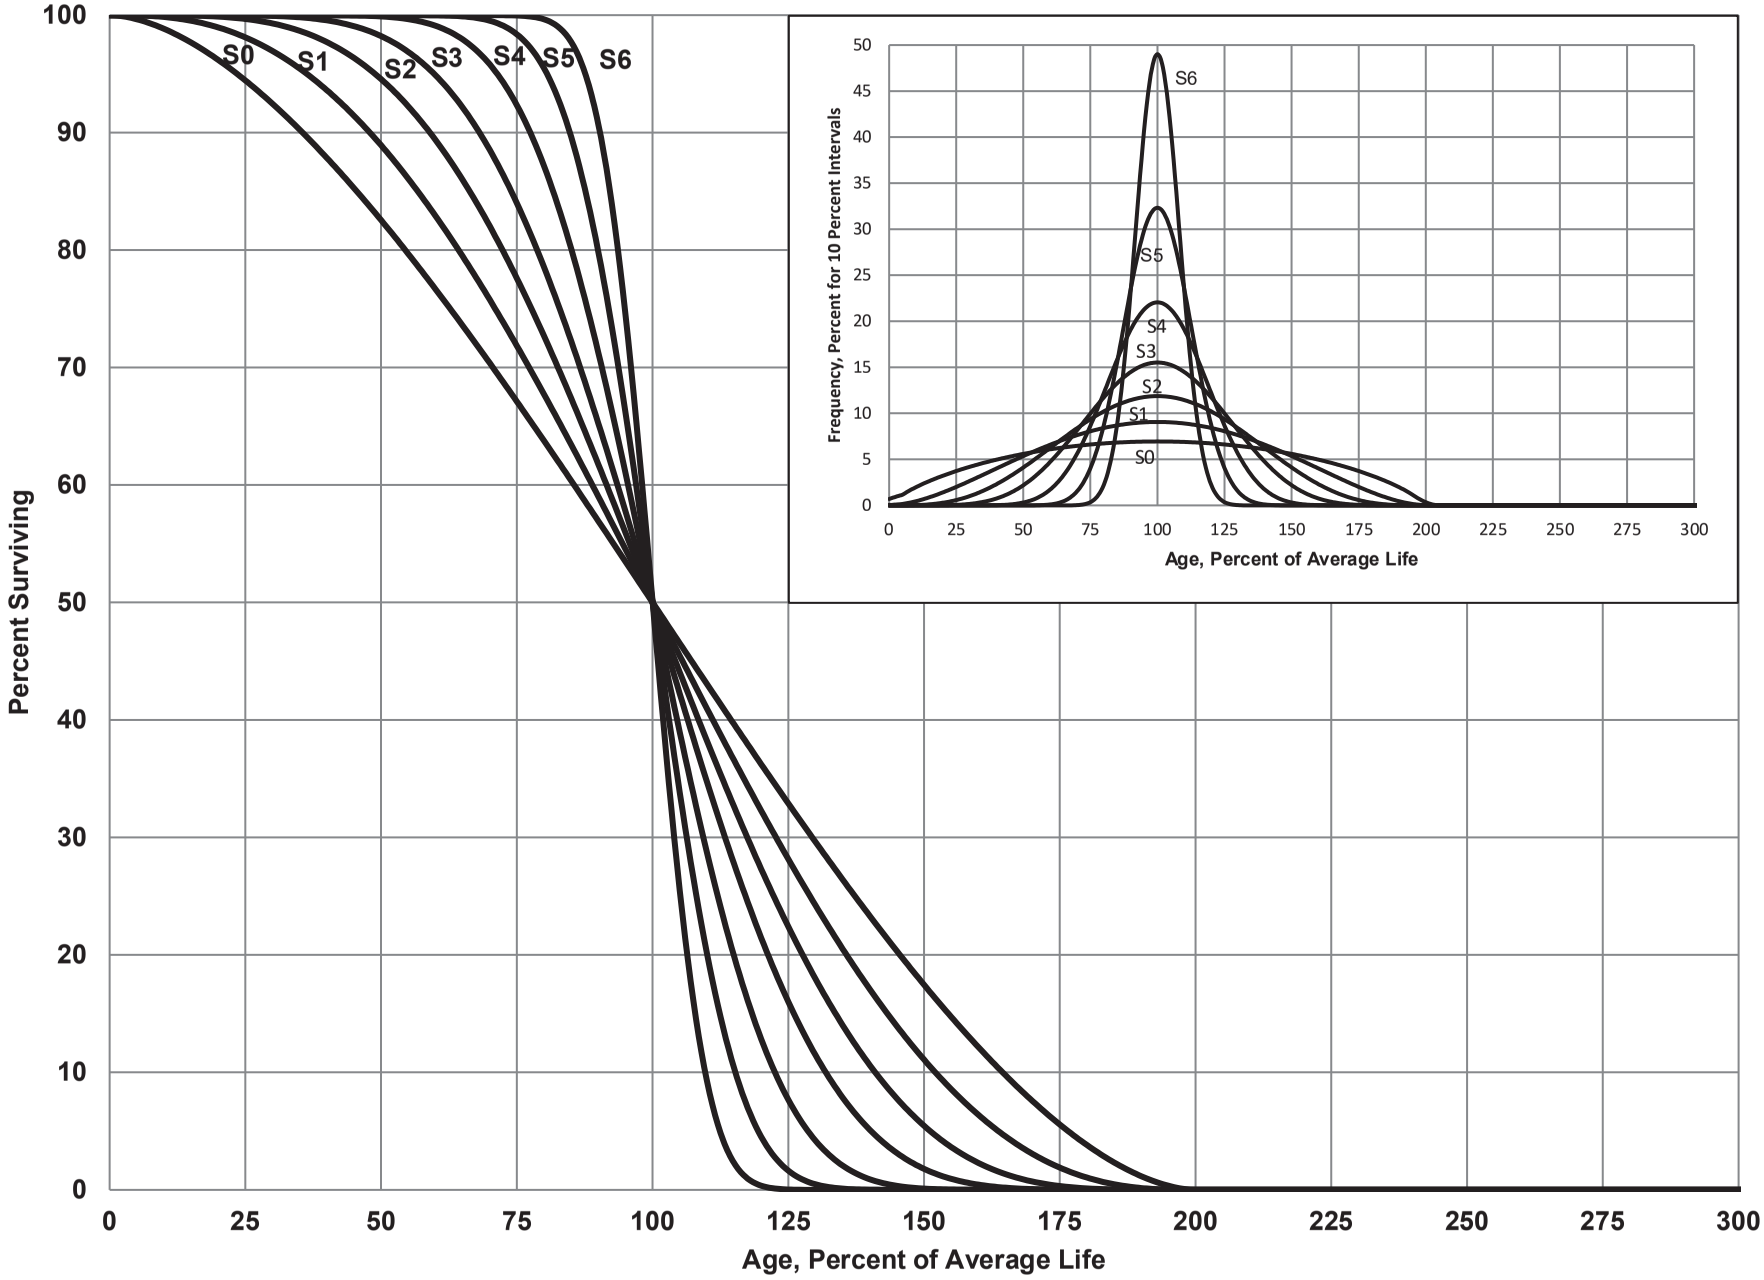

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

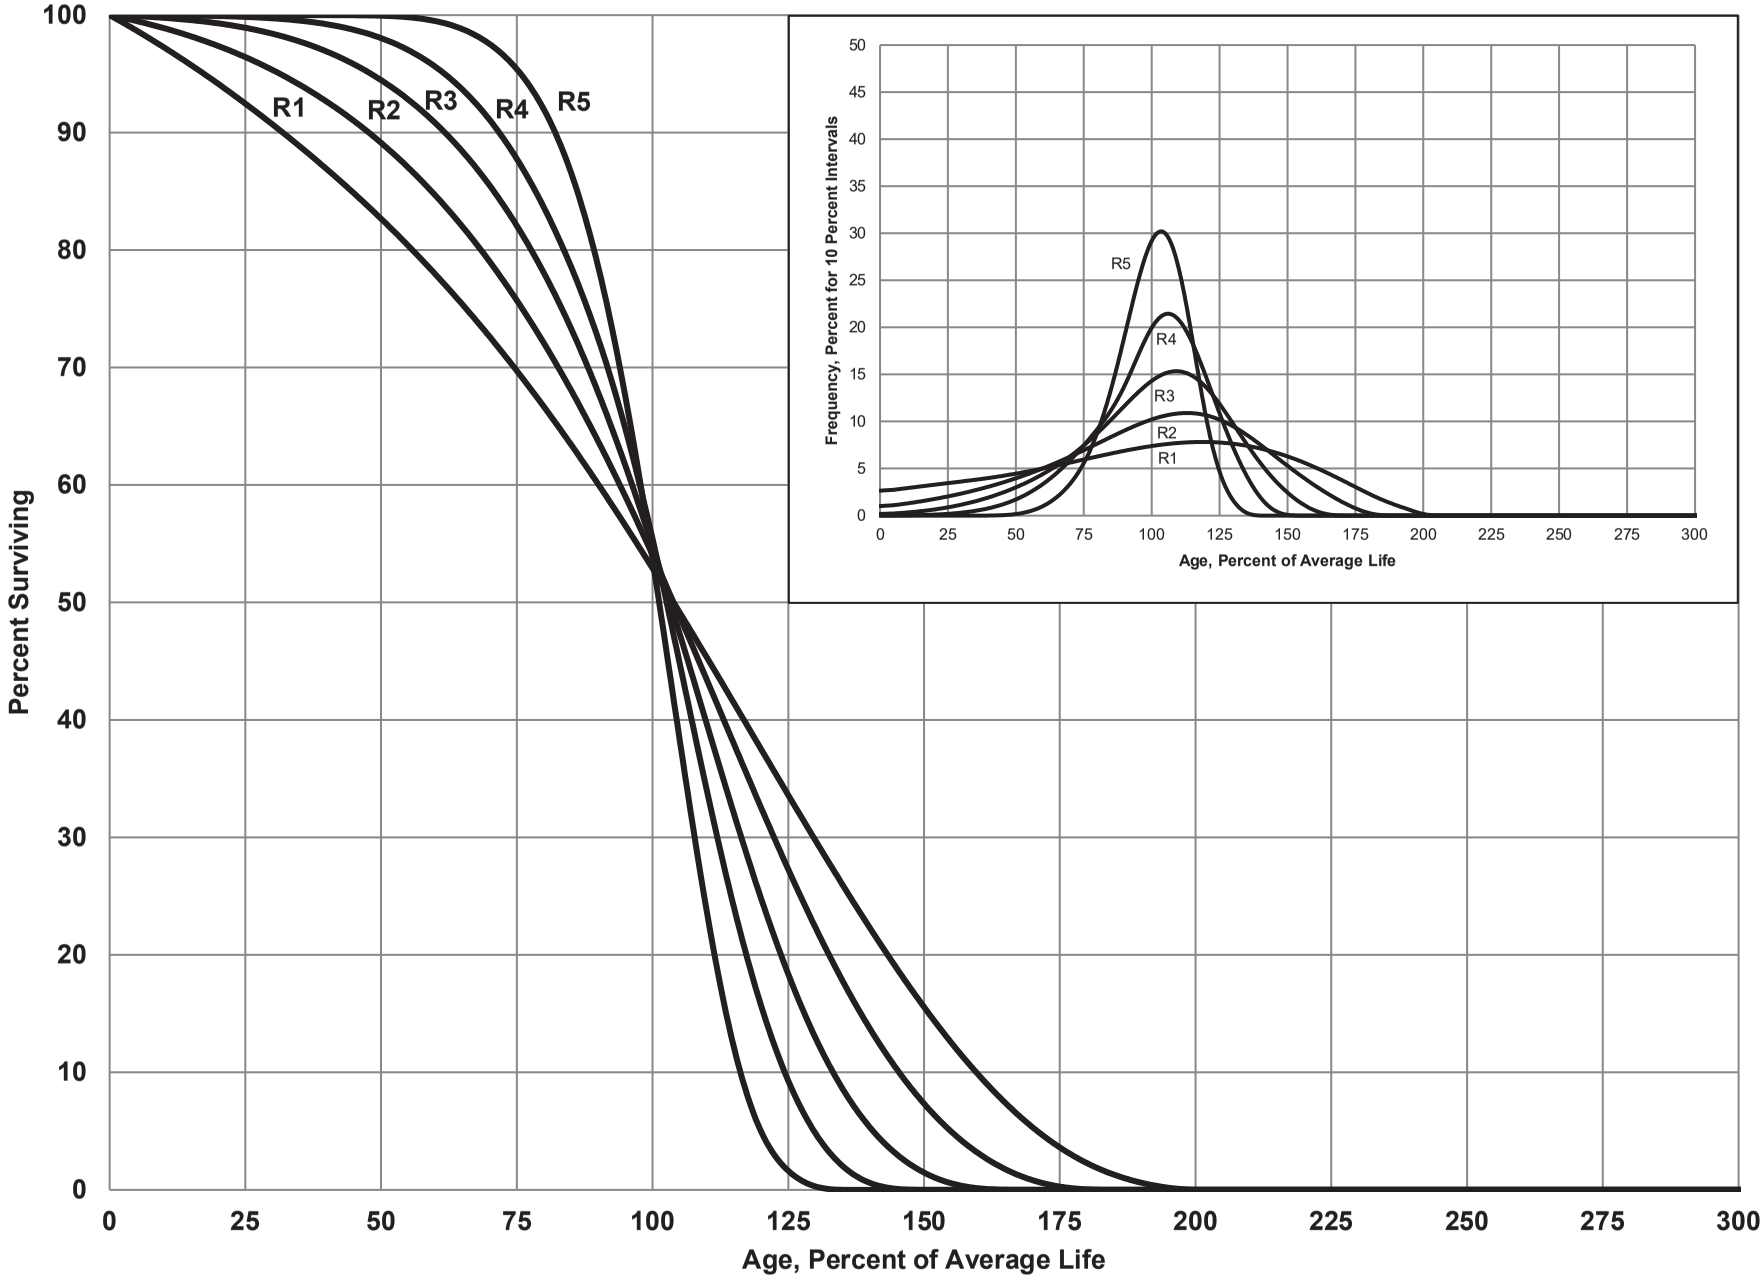

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

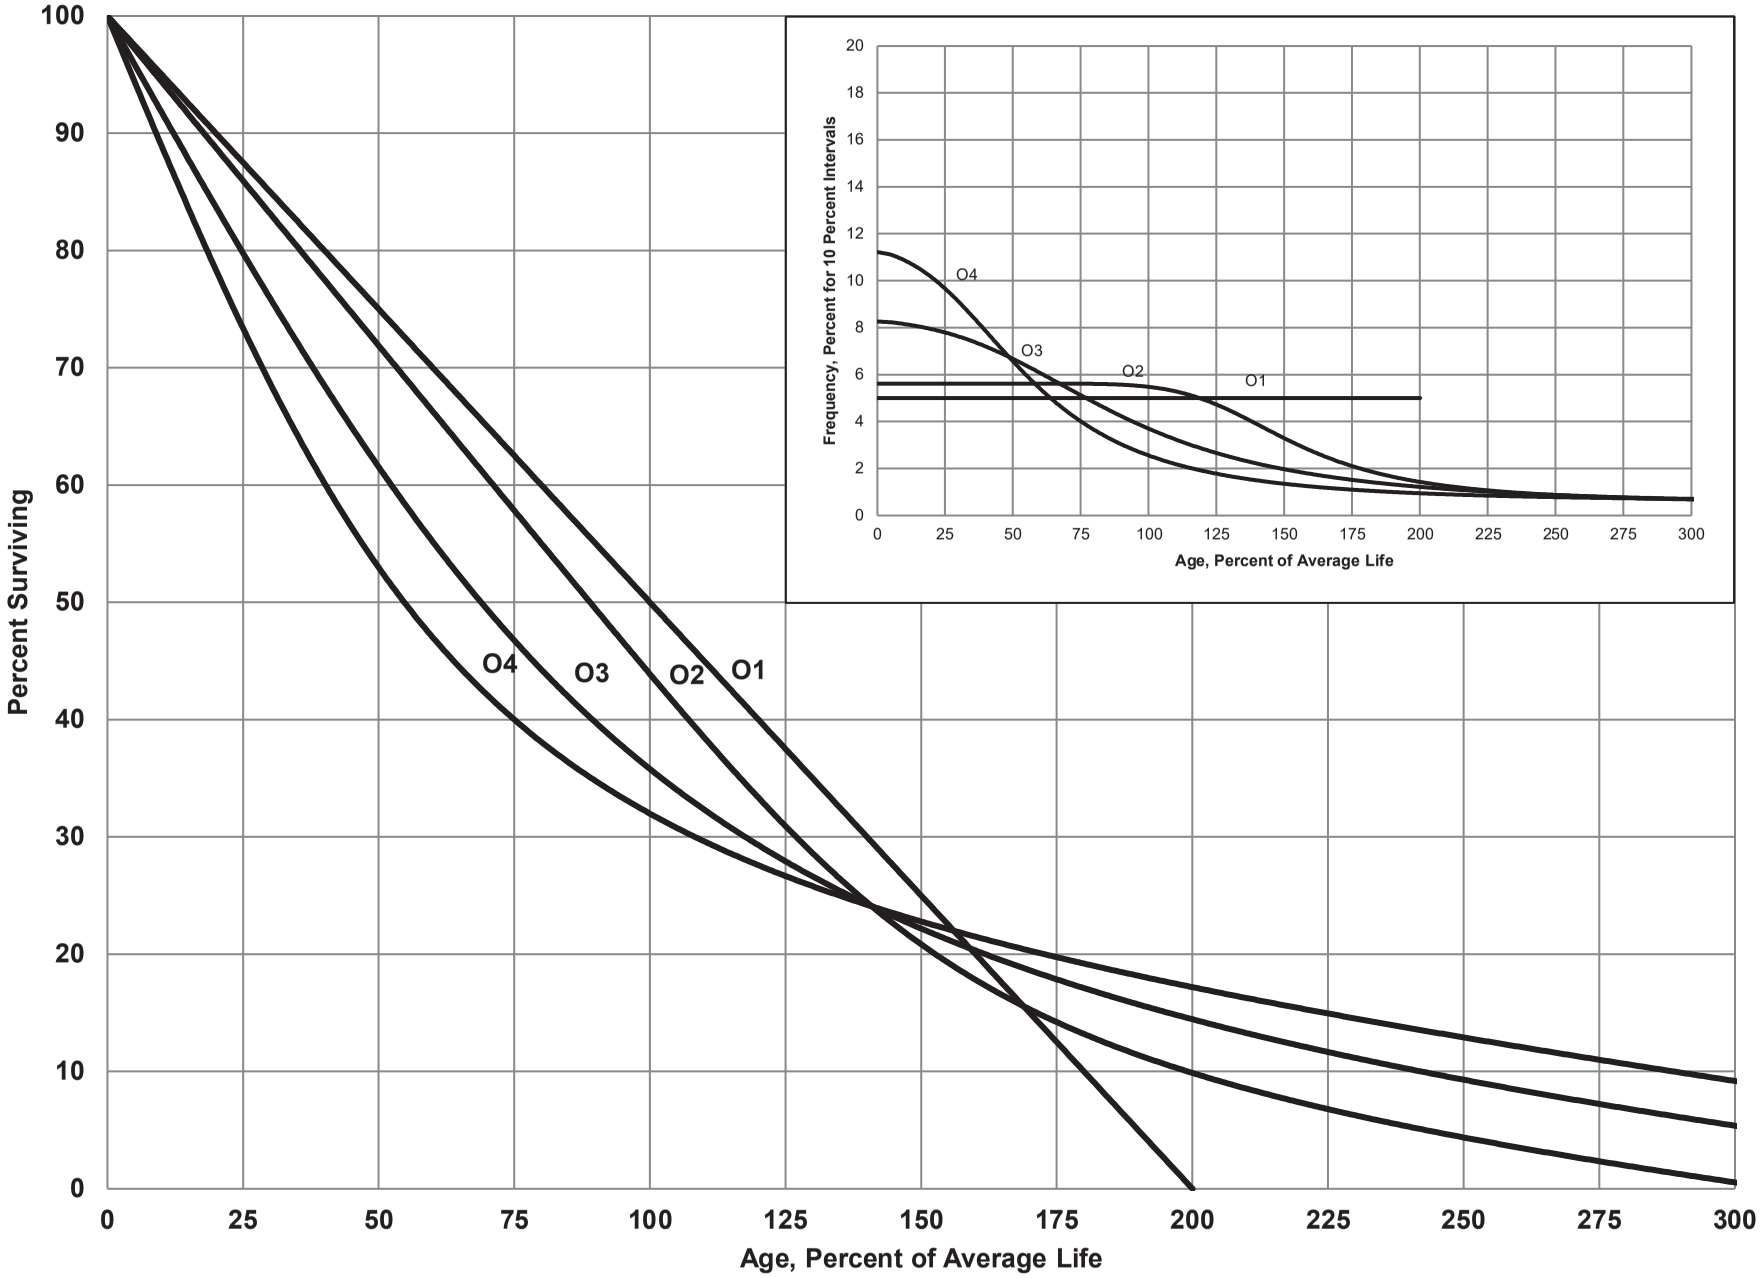

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

Year Placed	Retirements, Thousands of Dollars During Year										Total During Age Interval	Age Interval
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024

[a] Transfer Affecting Exposures at Beginning of Year

[b] Transfer Affecting Exposures at End of Year

[c] Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024 Placement Band 2010-2024

Year Placed	Exposures, Thousands of Dollars — Annual Survivors at the Beginning of the Year										Total at Beginning of Age Interval	Age Interval
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
2010	255	245	234	222	209	195	239	216	192	167	167	13½-14½
2011	279	268	256	243	228	212	194	174	153	131	323	12½-13½
2012	307	296	284	271	257	241	224	205	184	162	531	11½-12½
2013	338	330	321	311	300	289	276	262	242	226	823	10½-11½
2014	376	367	357	346	334	321	307	297	280	261	1,097	9½-10½
2015	420[a]	416	407	397	386	374	361	347	332	316	1,503	8½-9½
2016		460[a]	455	444	432	419	405	390	374	356	1,952	7½-8½
2017			510[a]	504	492	479	464	448	431	412	2,463	6½-7½
2018				580[a]	574	561	546	530	501	482	3,057	5½-6½
2019					660[a]	653	639	623	628	609	3,789	4½-5½
2020						750[a]	742	724	685	663	4,332	3½-4½
2021							850[a]	841	821	799	4,955	2½-3½
2022								960[a]	949	926	5,719	1½-2½
2023									1,080[a]	1,069	6,579	½-1½
2024										1,220[a]	7,490	0-½
Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024 Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93
1.5	5,719	151	0.0264	0.9736	96.62
2.5	4,955	150	0.0303	0.9697	94.07
3.5	4,332	146	0.0337	0.9663	91.22
4.5	3,789	143	0.0377	0.9623	88.15
5.5	3,057	131	0.0429	0.9571	84.83
6.5	2,463	124	0.0503	0.9497	81.19
7.5	1,952	113	0.0579	0.9421	77.11
8.5	1,503	105	0.0699	0.9301	72.65

10.5	823	83	0.1009	0.8991	61.84
11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips have been conducted for the system. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the most recent field trip.

January 28, 2020

McKeesport Wastewater Treatment Plant
West Shore Pump Station
28th Street Pump Station
Long Run Pump Station
Dravosburg Wastewater Treatment Plant
Duquesne Wastewater Treatment Plant

March 27, 2017

Keyser Valley Pump Station
Parrott Avenue Pump Station
Scranton Wastewater Treatment Facility

Judgments. The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of other Pennsylvania-American wastewater systems. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

The amortization periods selected for general plant Accounts 390.00, 392.00, 393.00, 394.00, 396.00 and 397.00 are discussed in the section, “Amortization of General Plant Accounts.”

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

BOOK RESERVE

The book reserve as of June 30, 2025, is the result of a bringforward of the book reserves established by the Commission for the CSS wastewater operations. The projected book reserve as of June 30, 2026, is a bringforward of the June 30, 2025 book reserve based on projected accruals, retirements, cost of removal, gross salvage and other credits.

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000\left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of June 30, 2026, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2026, are set forth in the Results of Study section of the report.

Equal Life Group Procedure

In the equal life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the composite remaining life for the surviving original cost of that vintage. The composite remaining life is derived by compositing the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\sum(\frac{\text{Book Cost}}{\text{Life}} \text{ x Remaining Life})}{\sum \frac{\text{Book Cost}}{\text{Life}}}.$$

The book costs and lives of the several equal life groups which are summed in the foregoing equation are defined by the estimated survivor curve.

Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining Life} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost - Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}.$$

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals for all vintages divided by the account's total original cost. The account's "composite remaining life" is calculated by dividing the sum of the future book accruals for all vintages by the sum of the remaining life annual accruals for all vintages.

The calculated accrued depreciation in the equal life group procedure also represents that portion of depreciable cost which will not be allocated to expense through future accruals. However, the calculation is based at the equal life group level rather than the vintage group level and does not require the use of averages. The equal life group accrued depreciation ratio is calculated as follows:

$$Ratio = 1 - \left(\frac{Remaining\ Life}{Service\ Life}\right)$$

Inasmuch as service life minus remaining life equals age, when averages are not employed, the foregoing equation reduces to:

$$Ratio = \left(\frac{Age}{Service\ Life}\right)$$

AMORTIZATION OF GENERAL PLANT ACCOUNTS

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390, 392, 393, 394, 396 and 397; amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts are that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for

each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

Account Number	Description	Amortization Period, Years
390.00	Office Furniture and Equipment	20
392.00	Stores Equipment	25
393.00	Tools, Shop and Garage Equipment	20
394.00	Laboratory Equipment	15
396.00	Communication Equipment	15
397.00	Miscellaneous Equipment	15

NET SALVAGE

Experienced net salvage is incorporated in the results of the study as it was reported on the Company's books and records for the period January 1, 2021 through June 30, 2025, and estimated for the period July 1, 2025 through December 31, 2025. The calculation of the amortization is shown in Table 5 on page V-8. The amounts of gross salvage and removal cost by account for each year are set forth in the section beginning on page VIII-2.

Net salvage is presented in this manner to determine the amount of net salvage to be amortized to the cost of service for ratemaking purposes. In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual depreciation calculated for the individual accounts.

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2026 of the book reserve as of June 30, 2025. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2026. Table 5 presents the amortization of experienced and estimated net salvage, by account, based on the five-year period, 2021-2025. The total amortization amount is incorporated in the total annual accrual in Table 2.

DESCRIPTION OF DETAILED TABULATIONS

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021-2025 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3. The tabulations of experienced and estimated net salvage, by year and account for the five-year period 2021-2025, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section. The net salvage amounts, by account and year, are carried forward to Table 5, which presents the five-year amortization of net salvage.

Attention Dominic DeGrazia
Director Rates and Regulatory

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2027. The results of our study as of June 30, 2026 are presented in our report titled "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2026. The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2027. Table 1 sets forth the development of the net original cost by account as of June 30, 2027. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2027. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2027. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-2. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026, beginning on pages III-2 through III-4.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant. The results of our study as of June 30, 2026 are presented in the attached report. The results of our study as of June 30, 2027 are presented in our report, "2027 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2027." The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves, and the calculated annual depreciation as of June 30, 2026.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

PENNSYLVANIA-AMERICAN WATER COMPANY

BASA WASTEWATER OPERATIONS

DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Pennsylvania-American Water Company to determine the annual depreciation accrual rates and amounts applicable to the original cost of wastewater plant as of June 30, 2026. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to wastewater plant in service as of June 30, 2026.

Part I, Introduction, contains statements with respect to the basis of the study and the development of net original cost. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part V, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VI, Service Life Statistics, presents the statistical analysis of service life estimates and Part VII, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation.

BASIS OF THE STUDY

The purpose of the depreciation study was to determine the annual depreciation accruals applicable to the original cost of wastewater plant in service as of June 30, 2026. For most accounts, the straight line remaining life method using attained ages, the book depreciation reserve and estimated survivor curves, was the basis for the calculation of annual depreciation. For certain accounts, the annual and accrued amortization amounts were based on the age of the property and the selected amortization period.

The survivor curve estimates were based on judgment which incorporated (1) analyses of historical data related to wastewater property for all Pennsylvania-American Water Company Wastewater Operations; (2) consideration of the character, use and location of the property; (3) probable future events and management plans; and (4) a general knowledge of wastewater property lives. The use of Iowa type survivor curves is a generally-accepted method of estimating average service life when the actual lives of individual property units are dispersed.

DEVELOPMENT OF NET ORIGINAL COST

The original cost data used in this study were obtained from the Company's continuing property records and work order system which show in detail the original cost of the property including descriptions, locations and years of installation of property units. The net original cost was developed from the original cost data by deducting contributions in aid of construction. The development of net original cost by plant account is set forth in Table 1 on page V-4.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

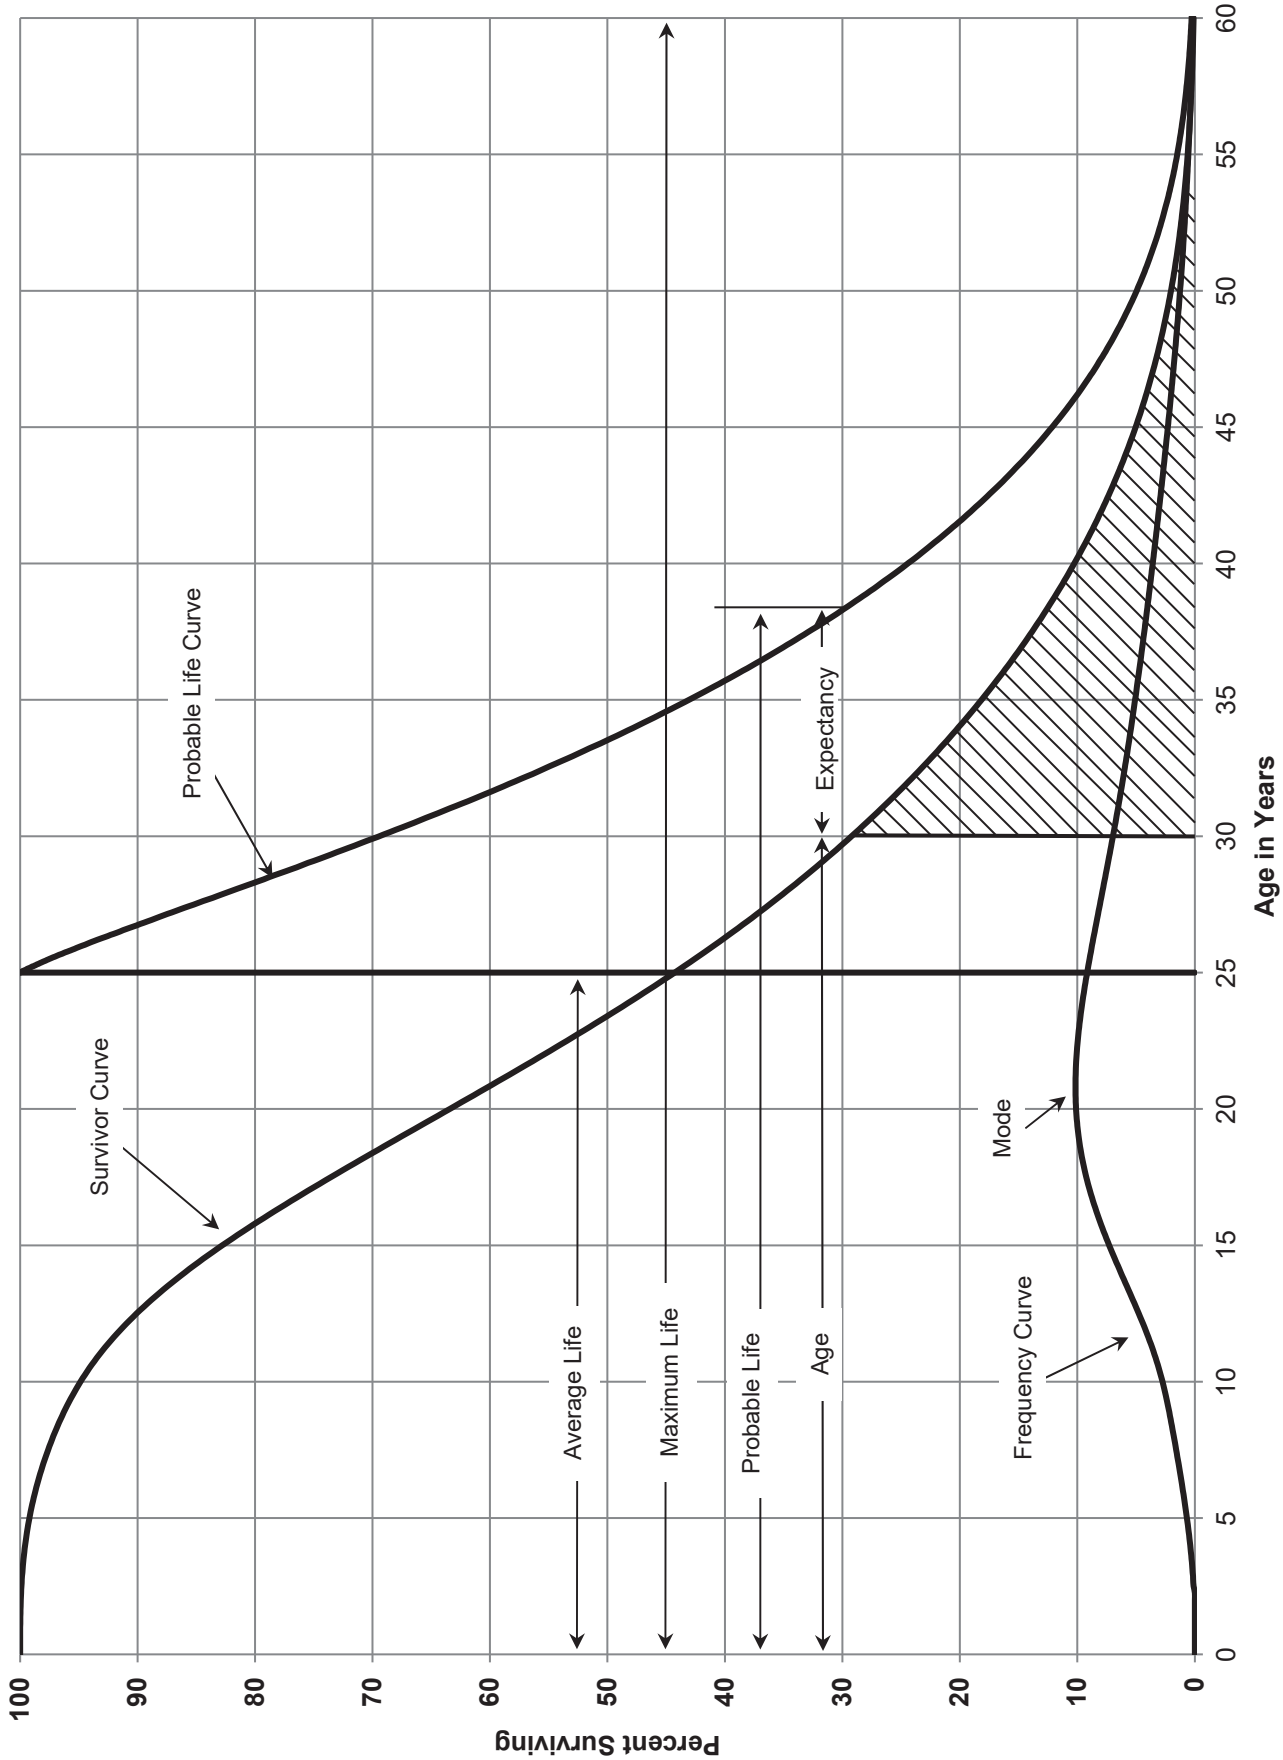

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

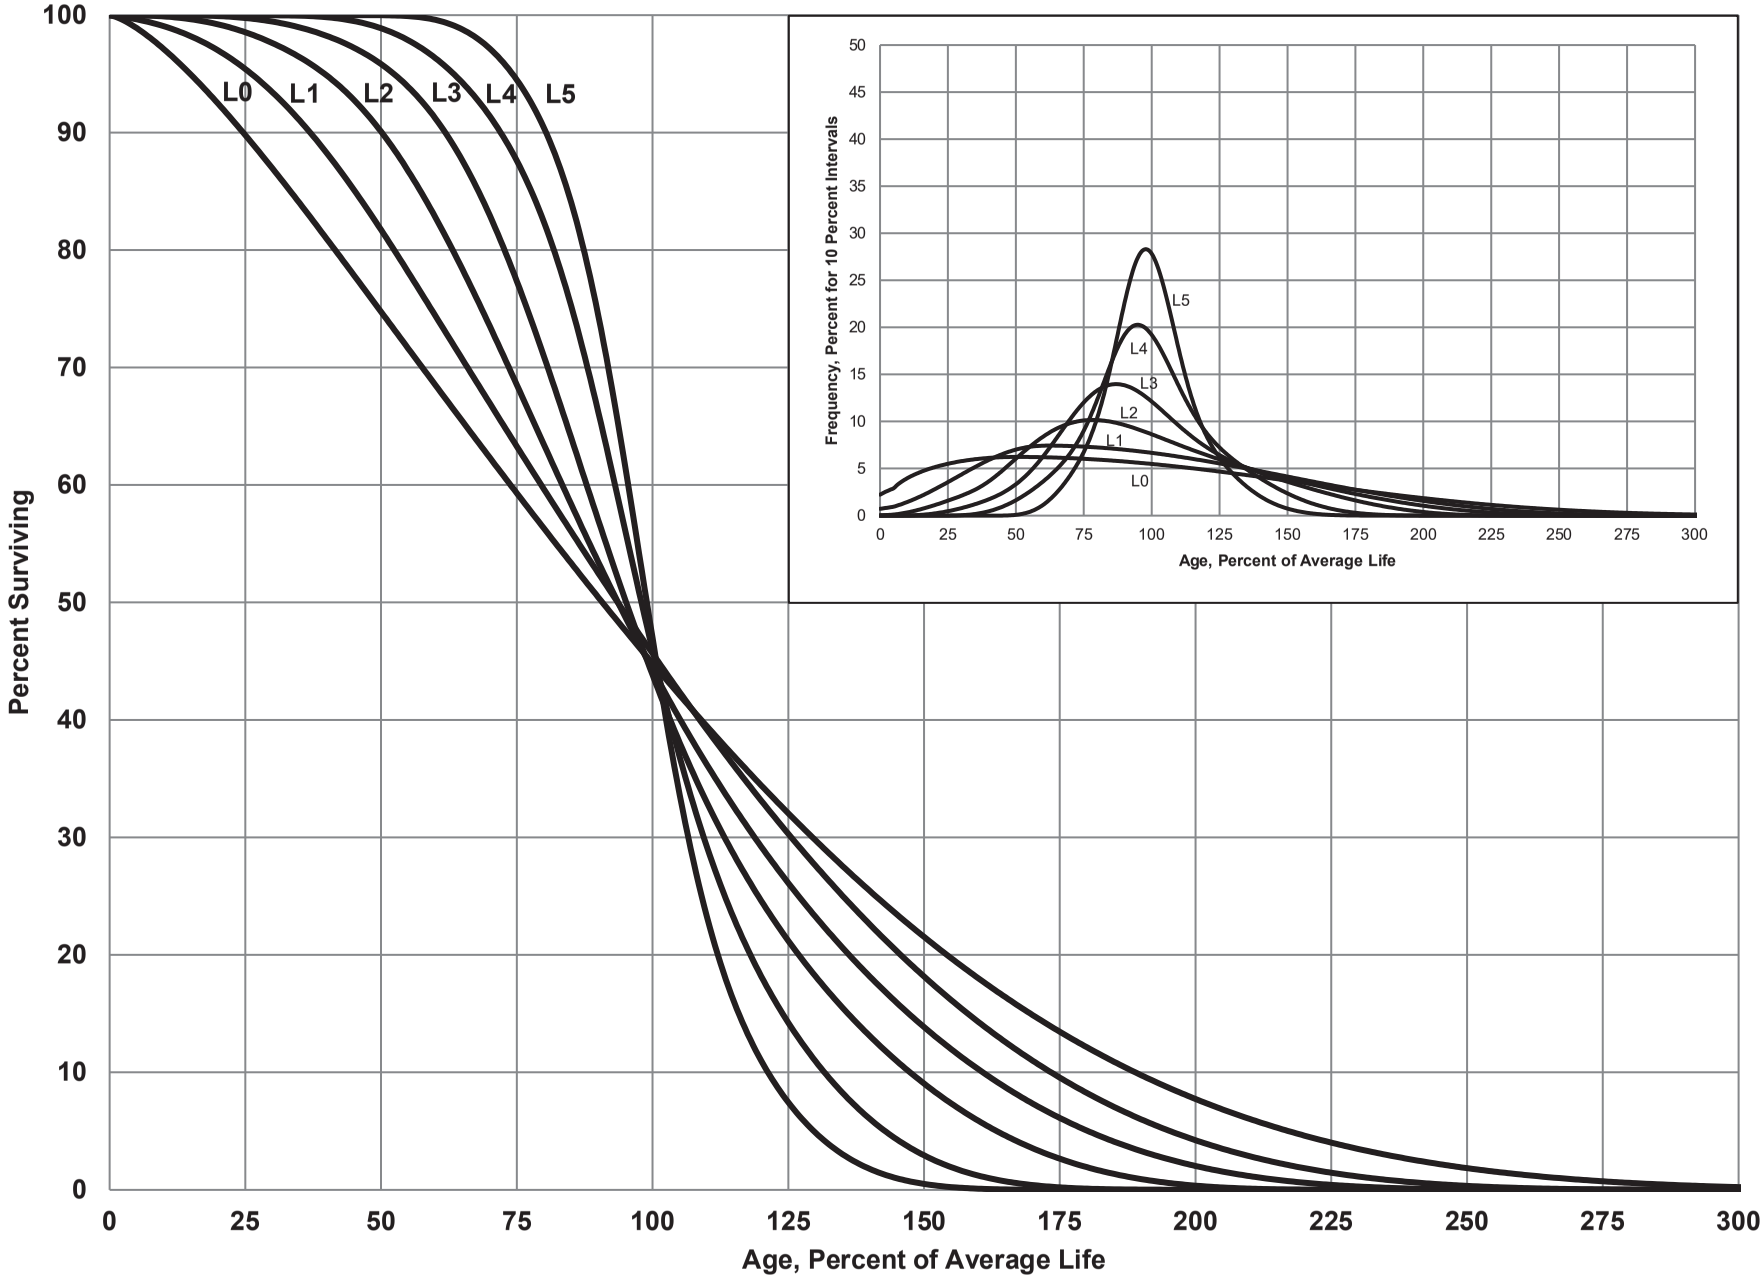

FIGURE 2. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

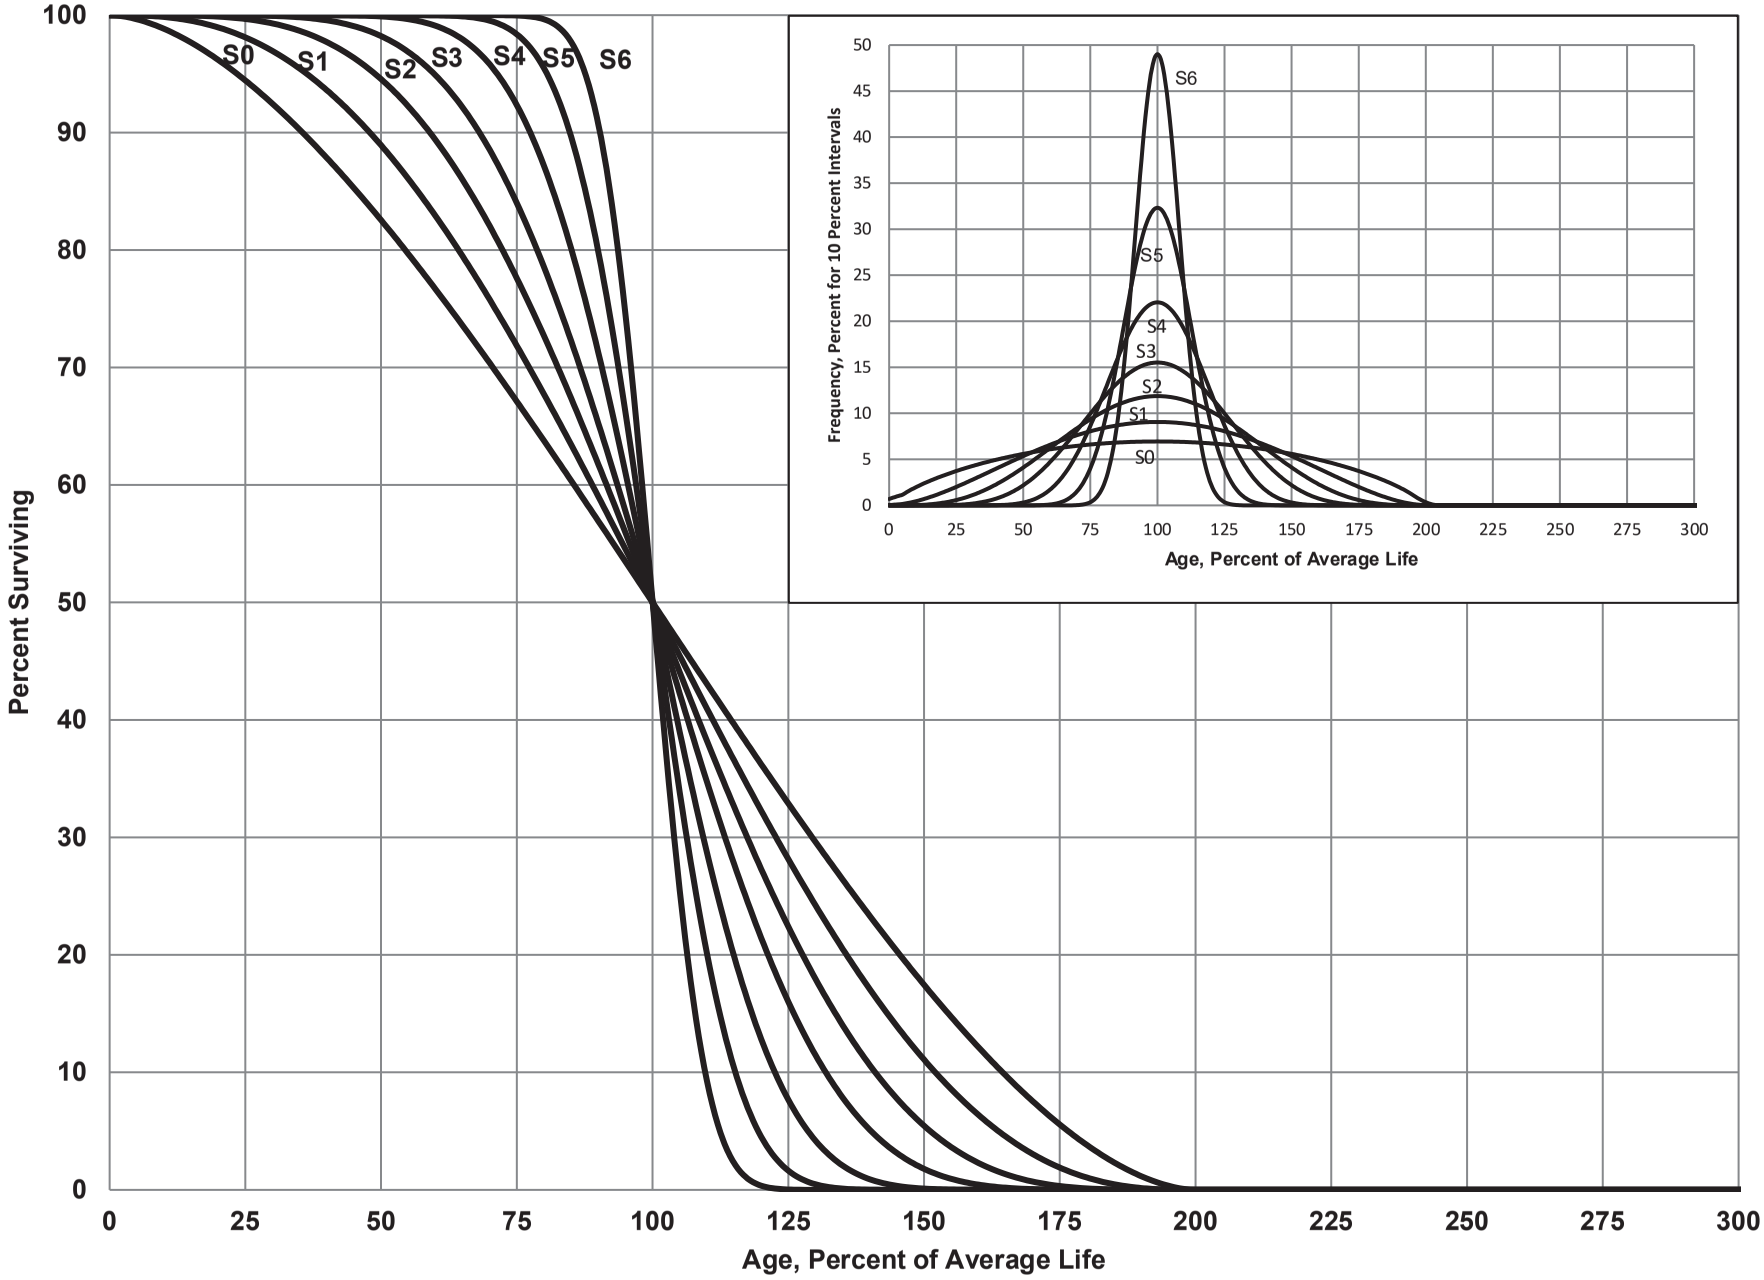

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

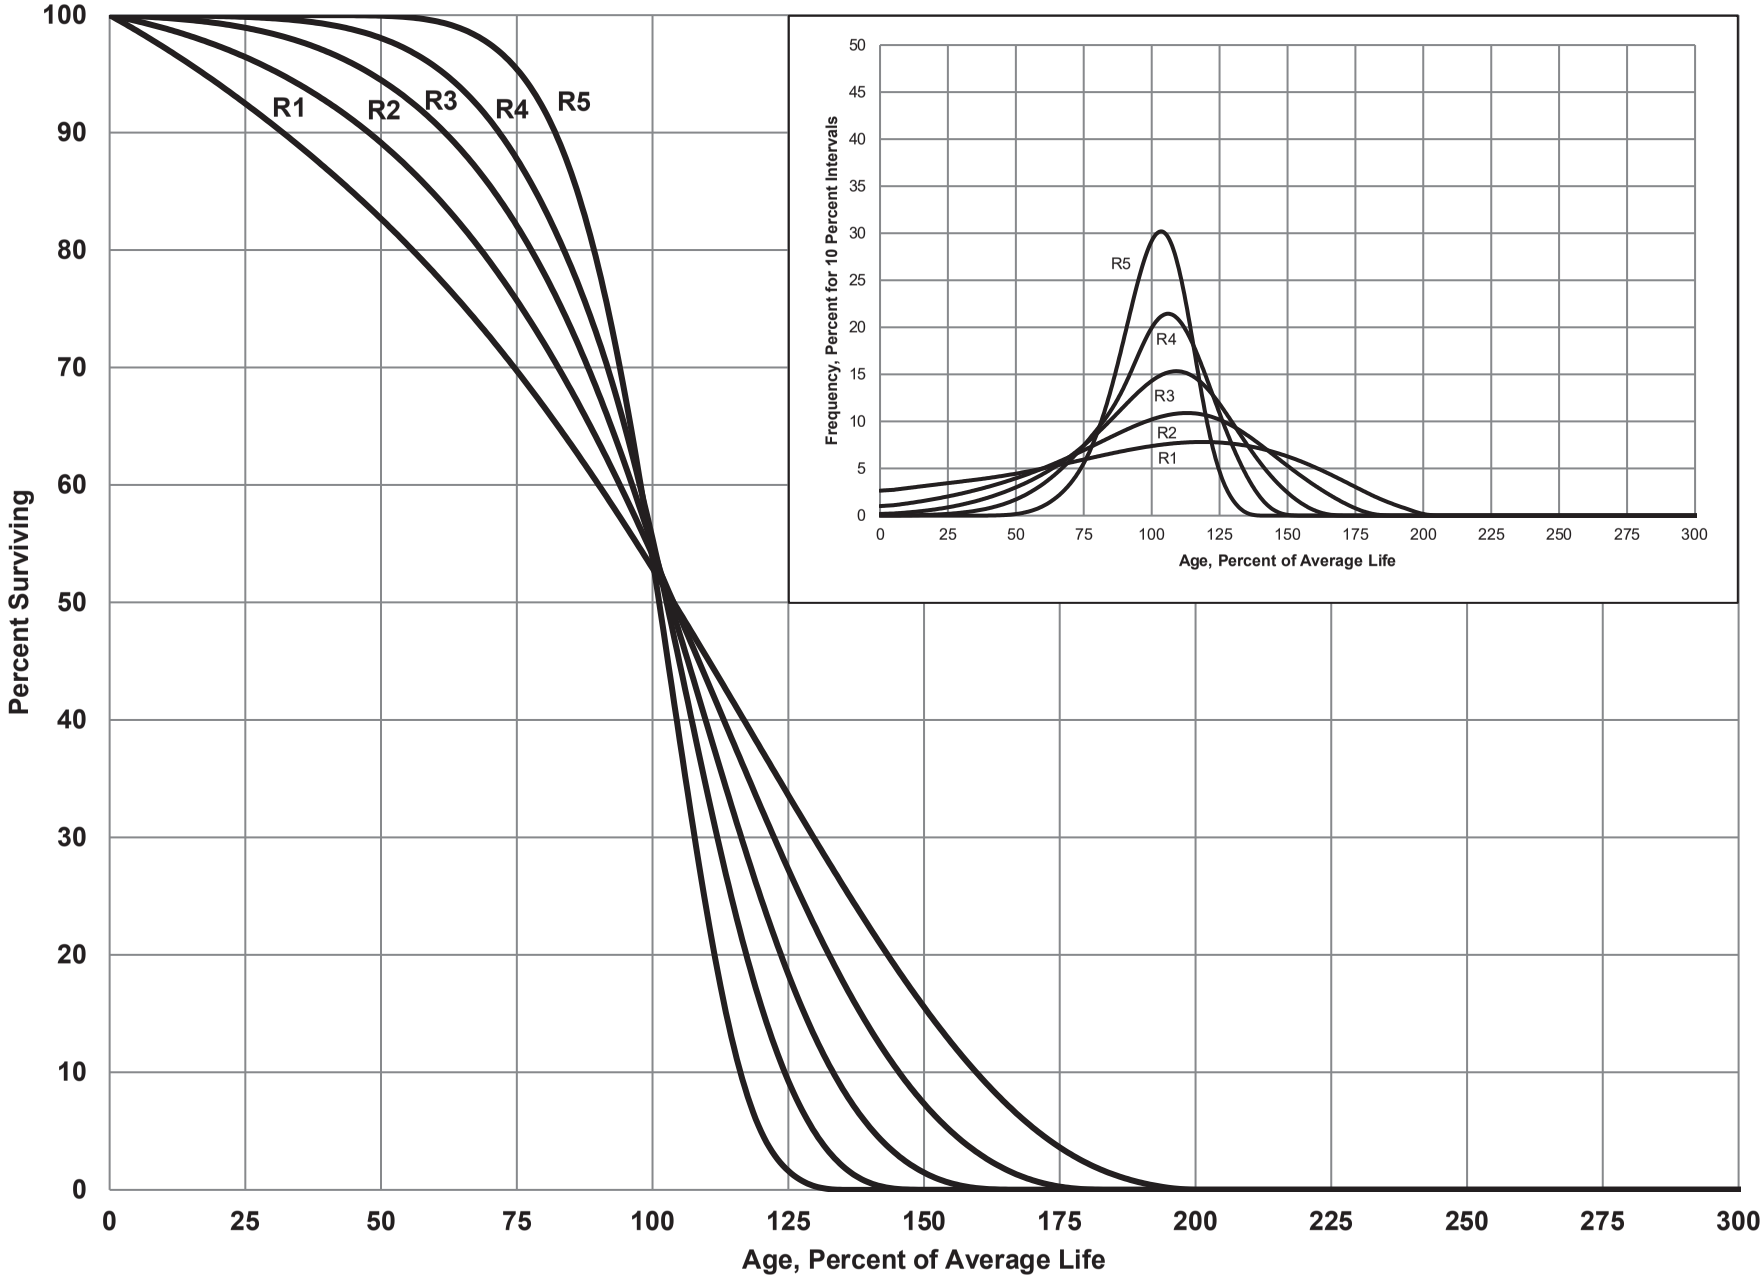

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

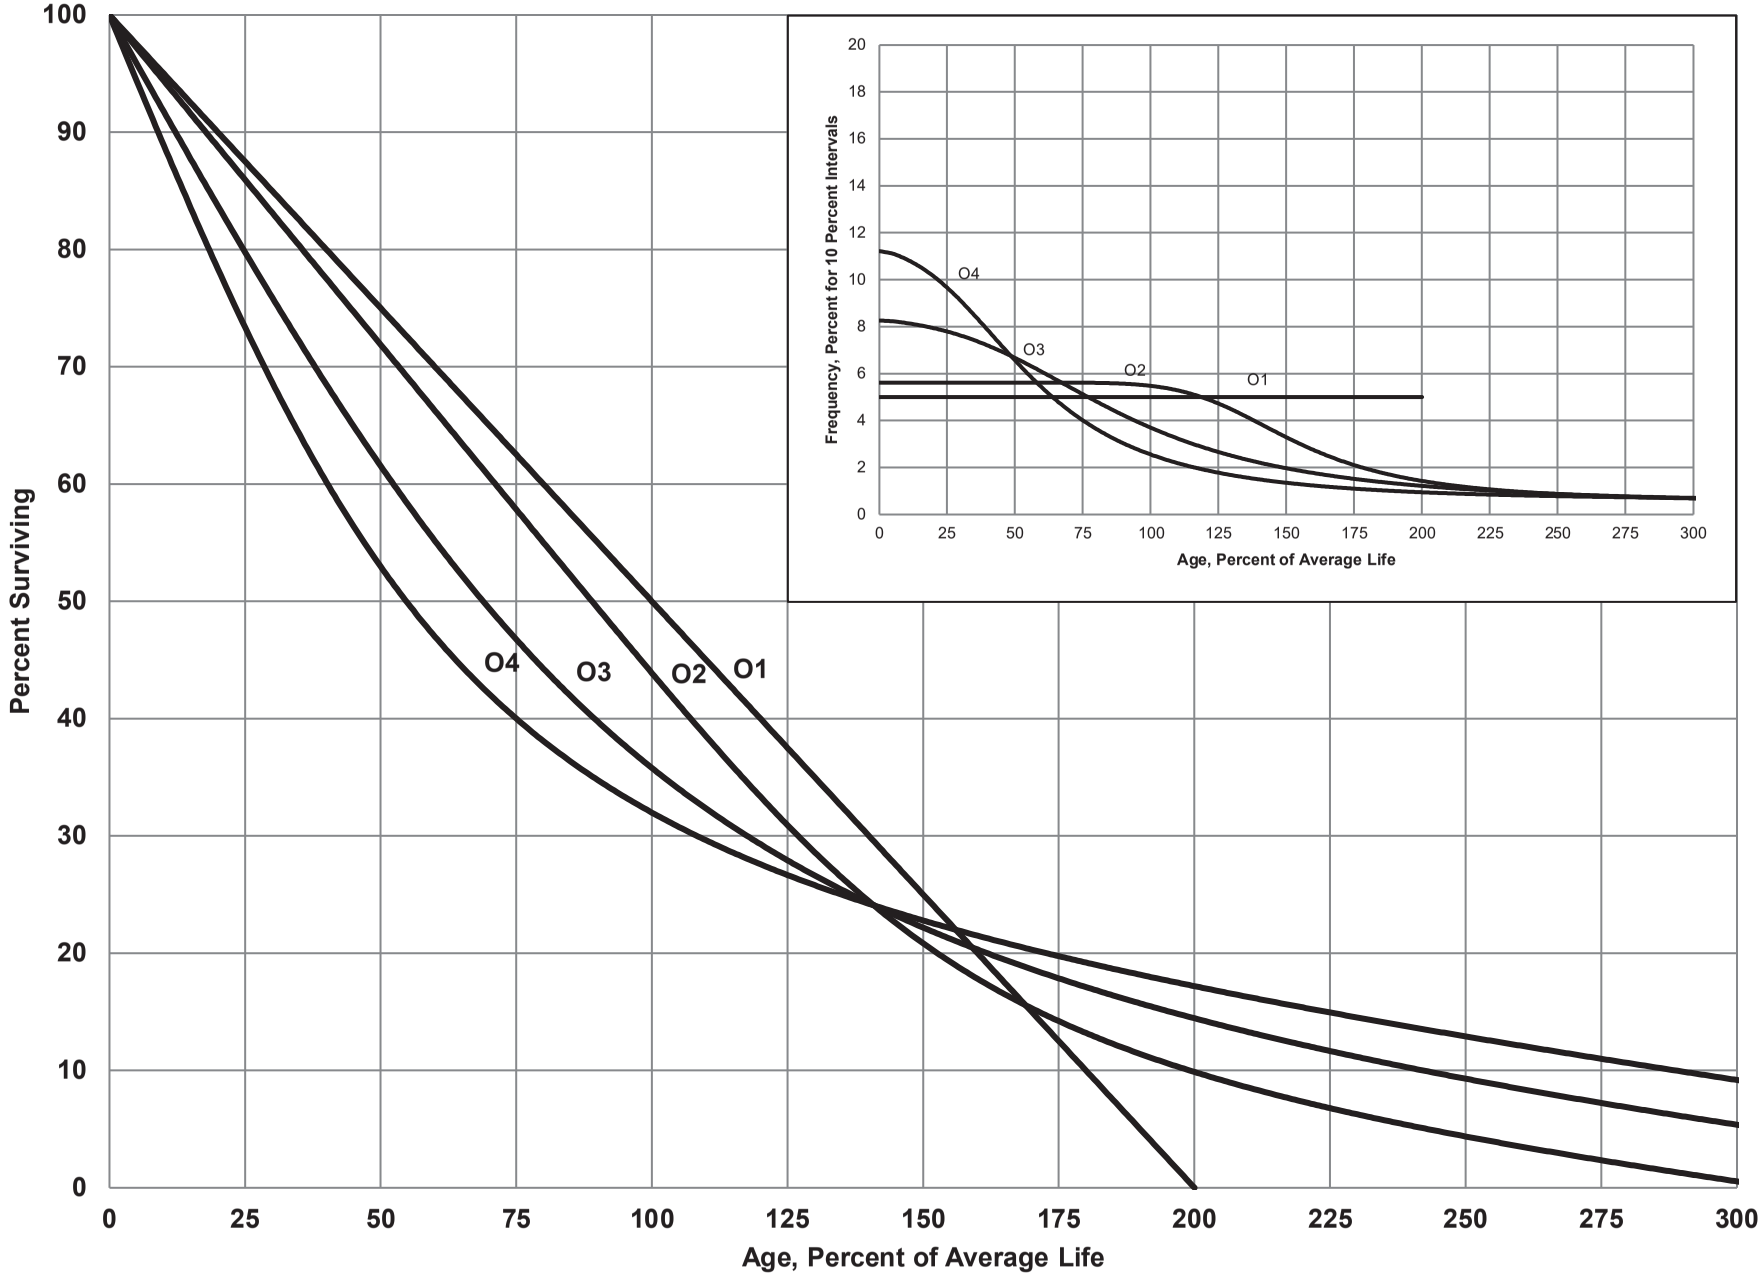

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

[a] Transfer Affecting Exposures at Beginning of Year
[b] Transfer Affecting Exposures at End of Year
[c] Sale with Continued Use
Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2015-2024
SUMMARIZED BY AGE INTERVAL

Experience Band 2015-2024

Placement Band 2010-2024

Year Placed	Exposures, Thousands of Dollars — Annual Survivors at the Beginning of the Year										Total at Beginning of Age Interval	Age Interval

Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024 Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval

13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

JUDGMENTS

The survivor curve estimates were based on judgment which considered factors including statistical analyses of retirements, Company policies and outlook as determined during discussions with management, and survivor curve estimates from previous studies of other Pennsylvania-American wastewater systems. For depreciable groups which consist of numerous similar items of property, the distribution of the lives of the units in the group was judged on the basis of an average survival pattern for the entire group.

Account 363.00, Services, is used to illustrate the manner in which the study was conducted for the accounts in the preceding list. Aged plant accounting data have been compiled for the years through 2019. These data have been coded according to account or property group, type of transaction, year in which the transaction took place, and year in which the utility plant was placed in service. The retirements, other plant transactions and plant additions were analyzed by the retirement rate method.

The survivor curve estimate for this account is the 47-R3 and is based on the statistical indication for the period 1999-2019. The 47-R3 is a good fit of the significant portion of the original survivor curve as set forth on page VI-25, is consistent with management outlook for a continuation of the historical experience and is within the typical service life range of 40 to 55 years for services.

The amortization periods selected for general plant amortized Accounts 390.00, 393.00, 394.00, 396.00 and 397.00 are discussed in the section, “Amortization of General Plant Accounts.”

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

BOOK RESERVE

The book reserve as of June 30, 2025, is the result of a bringforward of the book reserves established by the Commission for the Elizabeth Borough wastewater operation at the time of acquisition.. The projected book reserve as of June 30, 2026, is a bringforward of the June 30, 2025 book reserve based on projected accruals, retirements, cost of removal, salvage and other credits.

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000 \left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of June 30, 2026, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2026, are set forth in the Results of Study section of the report.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics

are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life}{Average\ Service\ Life}.$$

AMORTIZATION OF GENERAL PLANT ACCOUNTS

In order to use a more efficient and cost effective accounting process for equipment recorded in general plant Accounts 390, 393, 394, 396 and 397; amounts capitalized in these accounts are amortized rather than depreciated. Amortization as defined in the Uniform System of Accounts is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

The primary reasons for the amortization of certain general plant accounts is that the effort required to unitize additions, periodically inventory equipment and determine amounts to be retired for equipment recorded in these accounts is disproportionate to the original cost of the equipment when compared to other wastewater plant accounts.

Accounting for such equipment using an amortization concept consists of capitalization of amounts to these accounts based on the same criteria as used previously under depreciation accounting, amortization of the asset over a fixed period, retirement of the equipment at the end of the amortization period and recognition of any net salvage related to disposition of equipment in these accounts as a gain or loss. For equipment in

these accounts that was placed in service prior to implementation of amortization accounting, the net book value by vintage amortized over the remaining amortization period specified for each account and the original cost will be retired at the end of this period.

The amortization periods selected for each account or subaccount are based on a review of the existing depreciation rates for the accounts, typical service lives used for each type of equipment and a consideration of the period during which it is anticipated that most of the benefit of the equipment will be realized. The amortization periods are as follows:

Account Number	Description	Amortization Period, Years
390.00	Office Furniture and Equipment	20
393.00	Tools, Shop and Garage Equipment	20
394.00	Laboratory Equipment	15
396.00	Communication Equipment	15
397.00	Miscellaneous Equipment	15

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Table 1 presents the development of the net original cost used in the study. The results of the depreciation study are summarized in Table 2 which sets forth, by depreciable group, the estimated survivor curve, calculated annual accruals and book reserve related to net original cost and the annual amortization of net salvage. Table 3 presents the bringforward to June 30, 2026 of the book reserve as of June 30, 2025. Table 4 sets forth the calculation of estimated depreciation accruals for the twelve months ended June 30, 2026. The total amortization amount is incorporated in the total annual accrual in Table 2.

DESCRIPTION OF DETAILED TABULATIONS

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021 - 2025 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the chart. A cumulative summary, by year installed, for utility plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-3.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life

derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to net original cost are presented in account sequence in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, remaining life expectancy, and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal, gross salvage and net salvage amounts, by account and year, are presented in the third section.

Attention Dominic DeGrazia
Director Rates and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to wastewater plant as of June 30, 2027. The results of our study as of June 30, 2026 are presented in our report titled "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Wastewater Plant as of June 30, 2026". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 5, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 5 presented on pages I-3 through I-7 summarize the results of the depreciation study as of June 30, 2027. Table 1 sets forth the development of the net original cost by account as of June 30, 2027. Table 2 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 3 presents the bringforward of the book reserve to June 30, 2027. Table 4 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2027. Table 5 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-4. The original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026 on page III-2.

R-2025-3058051 (WASTEWATER)

DATE: NOVEMBER 14, 2025

DIRECT TESTIMONY OF

GREGORY R. HERBERT

Q. Please state your name and address.

A. My name is Gregory R. Herbert. My business address is 300 Sterling Parkway, Suite 200, Mechanicsburg, Pennsylvania (formerly 207 Senate Avenue, Camp Hill, Pennsylvania.)

Q. By whom are you employed?

A. I am employed by Gannett Fleming Valuation and Rate Consultants, LLC.

Q. Please describe your position with Gannett Fleming Valuation and Rate Consultants, LLC, and briefly state your general duties and responsibilities.

A. My title is Assistant Project Manager, Rate Studies. My duties and responsibilities include the preparation of accounting and financial data for revenue requirements, the allocation of cost of service to customer classifications, and the design of customer rates in support of public utility rate filings.

Q. Have you presented testimony in rate proceedings before a regulatory agency?

A. Yes. I have testified before the Pennsylvania Public Utility Commission ("Commission" or "PUC"), the Virginia State Corporation Commission, the New Jersey Board of Public Utilities, the Illinois Commerce Commission, the Public Utilities Commission of Ohio, the North Carolina Utilities Commission, and the Public Utility Commission of Texas concerning revenue requirements, cost of service allocation, rate design and revenue requirements. A list of cases in which I have testified is attached to my testimony.

Q. What is your educational background?

A. I have a Bachelor of Science in Economics from the Pennsylvania State University, University Park, Pennsylvania.

Q. Would you please describe your professional affiliations?

A. I am a member of the American Water Works Association ("AWWA"), the Pennsylvania Municipal Authorities Association and the National Association of Water Companies.

Q. Briefly describe your work experience.

A. I joined the Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming") in May 2017 as a Rate Analyst. In December 2023, I was promoted to my current position as Assistant Project Manager, Rate Studies, where I assist utilities with the preparation of accounting and financial data regarding revenues under present and proposed rates, including pro forma adjustments to the test year revenues, and the design of customer rates. I also develop pro forma revenue requirements and conduct cost allocations by customer class, capital recovery fee, lead-lag, and depreciation studies for investor-owned and municipal-owned utilities. Prior to my employment at Gannett Fleming, I was a Senior Analyst in the Performance Reporting Group of Cambridge Associates, LLC, where I oversaw the financial preparation of monthly and annual performance and benchmarking reports for public and private endowment fund clients.

Q. What is the purpose of your testimony in this proceeding?

A. The purpose of my testimony is to explain the cost of service allocation studies conducted under my direction and supervision for Pennsylvania-American Water

Company ("PAWC" or the "Company") and to describe the results produced by those studies.

Q. What revenue requirement data did you use to prepare PAWC's cost of service studies?

A. The cost of service studies I performed are based on data from PAWC's separate revenue requirement studies for the following operations: (1) Water Operations; (2) Sanitary Sewer System ("SSS") Operations; (3) Combined Sewer System ("CSS") Operations; (4) Butler Area Sewer Authority ("BASA") Operations; and (5) Elizabeth Borough Municipal Authority ("EBMA") Operations. The Company's revenue requirements for each of those operations are developed in PAWC Exhibit No. 3-A which is sponsored by PAWC witness Dr. Christina Chard and discussed in her direct testimony.

Q. Have you prepared exhibits presenting the results of your studies?

A. Yes. The exhibits identified below accompany my testimony and are described in detail further in my testimony.

Exhibit Number	Type of Study	Operation	Rate Zones
12-A Confidential (pp. A35-A37)	Cost of Service	Water Operations	Water Zones 1-9
12-B Confidential (p. A-16)	Cost of Service	SSS Operations	Wastewater Zones 1, 1a, 1b, 1c, 1e, 1f, and 1g
12-C	Cost of Service	CSS Operations	Wastewater Zones 2 and 2a
12-D	Cost of Service	BASA Operations	Wastewater Zone 1d
12-E	Cost of Service	EBMA Operations	Acquisition

Q. Is the Company presenting separate cost of service and rate design studies for CSS and SSS wastewater operations?

A. Yes. A CSS collects and conveys a wastewater stream that consists of flows of sewage from homes and businesses, infiltration and in-flow ("I&I"), and storm water. In PAWC's last base rate case proceeding, the Commission directed the Company to provide a separate revenue requirement study for CSS systems it owns and a cost of service study that separately identifies all storm water costs for CSS operations.[1] Accordingly, I prepared a separate cost of service study to identify the cost of collecting, treating, and disposing of storm water in the CSS wastewater systems PAWC acquired from the Municipal Authority of the City of Scranton in 2016, the Municipal Authority of the City of McKeesport in 2017, and the Borough of Kane Authority in 2020. In addition, I prepared a separate cost of service study for the CSS wastewater system currently owned and operated by the EBMA, which PAWC expects to acquire under Section 1329 of the Public Utility Code ("Code"), 66 Pa. C.S. § 1329, in December 2025.

Q. Why is the Company presenting a separate cost of service study for PAWC's BASA and EBMA wastewater operations?

A. The Company is submitting separate cost of service studies in this proceeding pursuant to the 2023 Rate Case Order (pp. 217-18) directing PAWC to prepare separate cost of service studies for new Section 1329 acquisitions in the first base rate case where those systems are included in the Company's revenue requirement. PAWC closed on its acquisition of the BASA wastewater assets under Section 1329 of the Code on

[1] *See Pa. P.U.C. v. Pa.-Am. Water Co.*, Docket Nos. R-2023-3043189 and R-2023-3043190 (Opinion and Order entered Jul. 22, 2024) ("2023 Rate Case Order"), p. 217 n. 94.

October 29, 2024. PAWC also has an application pending before the Commission to acquire the wastewater assets of the EBMA. On October 9, 2025, the Commission approved the EBMA acquisition with the commitments provided in a unanimous settlement reached by all parties to the Section 1329 acquisition proceeding.[2] As previously noted, PAWC anticipates closing on the EBMA acquisition approved by the Commission before the end of 2025. Company witness Don Wieczenski provides a detailed description of the BASA and EBMA acquisitions in his direct testimony.

COST OF SERVICE ALLOCATION – WATER OPERATIONS

Q. Please describe the revenue requirements included in the cost of service study for PAWC's water operations being presented in this case.

A. The cost of service study for Water Operations prepared for this case is based upon the Company's revenue requirement for the fully projected future test year ("FPFTY") ending June 30, 2027, including a portion of the revenue requirement of PAWC's wastewater operations, as authorized by Section 1311(c) of the Code. The development of the revenue requirements for Water Operations, including the revenue requirement allocated to Water Operations from the Company's Wastewater Operations, is explained by Dr. Chard in PAWC Statement No. 2.

Using the total revenue requirement for the FPFTY developed by the Company in the manner described by Dr. Chard, I prepared the cost of service study set forth in Exhibit No. 12-A (Water Operations). The cost of service study presented in Exhibit

[2] *See Application of Pa-Am. Water Co. under Sections 1102(a) and 1329 of the Pa. Pub. Util. Code, 66 Pa.C.S. §§ 1102(a) and 1329, for approval of (1) the transfer, by sale, to Pa-Am. Water Co, of substantially all of the assets, properties and rights related to the wastewater treatment plant and collection system owned and operated by the Elizabeth Borough Municipal Auth. and (2) the rights of Pa-Am. Water Co. to begin to offer or furnish wastewater service to the public in the Borough of Elizabeth, and portions of the Borough of Lincoln, and the Twps. of Elizabeth and Forward, in Allegheny Cnty., Pa.*, Docket No. A-2025-3052983 (Opinion and Order entered Oct. 9, 2025).

No. 12-A allocates among customer classes: (1) the entire revenue requirement of the Company's Water Operations; and (2) the portion of the revenue requirement of the Company's Wastewater Operations that will not be recovered from wastewater customers under the Company's proposed wastewater rates, which I will refer to, collectively, as the cost of service or total revenue requirement for the FPFTY.

Q. Briefly describe the purpose of your cost of water service allocation study.

A. The study applies generally accepted cost of service principles and procedures to allocate the total revenue requirement to the residential, commercial, industrial, public, other water utilities, private fire protection and public fire protection classifications. The results of the cost of service study indicate the relative cost responsibilities of each class of customers. The allocated cost of service is one of several criteria that are appropriately considered in designing customer rates to produce the required revenues.

Q. Have you prepared exhibits that set forth the results of your study?

A. Yes. As I previously noted, Exhibit No. 12-A sets forth the results of my allocation of the pro forma cost of service for Water Operations as of June 30, 2027.

Q. Please describe the method of cost allocation that was used in your study.

A. For Exhibit No. 12-A, the base-extra capacity method, as described in the 2017 (seventh edition) and prior editions of the Water Rates Manual published by AWWA, was used to allocate the pro forma costs that comprise the total revenue requirement. It is a recognized method for allocating the cost of providing water service to customer classifications in proportion to each classification's use of the commodity, facilities, and services of a water utility and has been accepted by this Commission for that purpose. Indeed, it is the method that was used in the Company's prior rate cases,

including its last base rate case at Docket No. R-2023-3043189, and has been accepted by the Commission for use by the Company and other water utilities in the Commonwealth.

Q. Is the base-extra capacity method described in Exhibit No. 12-A?

A. Yes. It is described on pages 3 and 4 of the exhibit.

Q. Please describe the procedure followed in the cost allocation studies.

A. Each identified category of cost in the pro forma cost of service was allocated to the customer classifications using appropriate allocation factors. This allocation is presented in Schedule D of Exhibit No. 12-A. The categories of cost, which consist of operation and maintenance expenses, depreciation expense, taxes and income available for return, are identified in columns 1 and 2 of Schedule D. The costs in each category, shown in column 4, are allocated to the several customer classifications based on allocation factors referenced in column 3. The development of the allocation factors is presented in Schedule E of each exhibit.

I will use some of the larger cost items to illustrate the principles and considerations used in the cost allocation methodology. Purchased water, purchased electric power, and treatment chemicals are examples of costs that tend to vary with the amount of water consumed and are, therefore, considered base costs. These costs are allocated to the several customer classifications in direct proportion to the average daily consumption of those classifications using Factor 1. The development of Factor 1 is shown in Schedule E of Exhibit No. 12-A.

Other sources of supply, water treatment, and transmission costs are associated with meeting maximum day requirements usage requirements. Costs of this nature were allocated to customer classifications partially as base costs (i.e., in proportion to

average daily consumption, pursuant to Factor 1), partially as maximum day extra capacity costs (i.e., in proportion to maximum day extra capacity, pursuant to Factor 2) and, for certain pumping stations and transmission mains, partially as fire protection costs (i.e., pursuant to Factor 3). Factors 2 and 3 are developed in Schedule E of Exhibit No. 12-A.

Costs associated with storage facilities, and the capital costs of distribution mains were allocated partly based on average consumption and partly based on maximum hour extra demand, including the demand for fire protection service, because these facilities are designed to meet maximum hour and fire demand requirements. The development of Factor 4, which is used for these allocations, is shown in Schedule E of Exhibit No. 12-A. Fire demand costs were allocated to public and private fire protection service and to general service in proportion to the relative potential demands on the system from hydrants and fire services and from commercial service lines sized to provide both fire protection and general service.

Costs associated with pumping facilities and the operation and maintenance of mains were allocated on the combined bases of maximum day and maximum hour extra capacity because these facilities serve both functions. The relative weightings of Factor 3 (maximum day) and Factor 4 (maximum hour) for pumping facilities and the operation and maintenance of mains were based on the functional use of pumps and footage of mains, respectively, serving maximum day and maximum hour functions. The weighted factors, identified as Factor 5, Factor 5A and Factor 8, are developed on Schedule E of Exhibit No. 12-A.

Costs associated with meters and services were allocated to customer classifications in proportion to the capital costs of the sizes and quantities of meters

and services serving each classification. The factors for allocating the cost of meters and services, identified as Factor 10 and Factor 11, are developed on Schedule E of Exhibit No. 12-A.

The costs of customer accounting, billing and collections were allocated based on the number of customers for each customer classification. The costs of meter reading were allocated based on the pro forma number of meters by classification. These factors, identified as Factor 14 and Factor 15, are developed on Schedule E of Exhibit No. 12-A. Bad debt expense, except for bad debt expenses related to the Company's Arrearage Management Program, was allocated based on the average net write-offs for 2022, 2023, and 2024 (Factor 22). The bad debt expense related to the Company's Arrearage Management Program was directly assigned to the Residential class.

Administrative and general costs (except those that are directly assignable to the Residential class, such as Customer Assistance Program costs) were allocated based on allocated direct costs excluding those costs that require little administrative and general expense, such as purchased water, power, chemicals, and waste disposal. The factor for this allocation is identified as Factor 16.

Annual depreciation accruals were allocated based on the function of the facilities in each plant account to which depreciation expense is recorded. The original cost less accrued depreciation of utility plant in service was also allocated based on the function of the plant recorded in each account for the purpose of developing Factor 19, which is used to allocate items such as return and income taxes.

Q. What was the source of the total cost of service data set forth in column 4 of Schedule D of Exhibit No. 12-A?

A. The pro forma costs of service were furnished by the Company and are the same as those set forth in PAWC Exhibit No. 3-A for Water Operations.

Q. Refer to Schedule E of Exhibit No. 12-A and explain the source of the system maximum day and maximum hour ratios used in the development of Factors 2, 3 and 4.

A. The ratios were based on a review of experienced Company data. The maximum day ratio of 1.4 times the average day approximates the ratio of maximum daily sendout experienced by the Company in 1988, 1995, 1996, 1999 and 2003. The maximum hour ratio of 2.1 times the average hour approximates the results of an analysis that was performed to determine the peak hour consumption experienced by the Company's three largest operating districts.

Q. These maximum day and maximum hour ratios were recorded 20 years ago. Why are you using these ratios rather than more recent ones?

A. A water system must be designed to meet the highest peak demand that potentially could be experienced – not just the highest peak demand that was experienced within a recent historical period. Peak demands can vary based on contingencies that do not reoccur on a regular or predictable basis. The facilities needed to produce and distribute water have a long lead-time to design and construct and have a correspondingly long service life. Given those inherent characteristics of water utility facilities, responsible waterworks practice necessitates building a system that can meet peak demands whenever they may occur because the system cannot be expanded (or contracted) to meet only those demands that appear within a limited historical study

period, such as a ten-year look-back. Additionally, the water usage on the maximum days in areas within the Company's overall water operations are often more than 1.4 times the average usage for that year. Given PAWC's obligation to furnish safe and reliable service, the Company must be prepared to meet customers' peak demands whenever they occur and, therefore, it is not reasonable to ignore the maximum day ratios that the Company has actually experienced.

Q. Did the Company perform an analysis of recent system-wide maximum hour demands for this proceeding consistent with the 2023 Rate Case Order (p. 209)?

A. Yes. Exhibit No. 12-A, Schedule G reflects the analysis completed for the system-wide maximum demand. PAWC provided hourly sendouts for the years 2021 through 2024 for 13 of the Company's treatment facilities that are located in different regions around the Commonwealth with readily available SCADA reads. The sampled set of facilities makes up about 60% of the system-wide sendout for the years 2021 through 2024. There were many gaps in hourly reads for 2021 and 2022 because the Company began tracking these reads on a more consistent basis starting in 2021 for the 13 facilities analyzed. In order to fill in the missing gaps of SCADA data to develop the maximum hour ratios for the years 2021 through 2024, I calculated average hourly reads for each hour of the day for each treatment facility and filled in missing reads with these average hourly usages.

Table 1 presents the maximum hour ratios by year with the missing gaps of data filled in with average hourly usages. Table 2 presents the maximum hourly ratios excluding average hourly reads for the missing data gaps, which results in a wide range of maximum hour ratios due to the variability of the average and maximum hour sendout values.

Table 1

Year	Average Hr. (AH) Sendout (MGD)*	Max Hr. (MH) Sendout*	Ratio, MH/AH	Date/Time of Max Hr.
2021	4.75	5.03	1.06	10/13/21, 8 PM
2022	4.85	5.63	1.16	12/26/22, 8 PM
2023	4.71	5.72	1.21	9/5/23, 11 PM
2024	4.76	6.19	1.30	7/8/24, 7 PM

*Analysis including average hourly reads for missing data gaps.

Table 2

Year	Average Hr. Sendout (MGD)*	Max Hr. Sendout*	Ratio, MH/AH	Date/Time of Max Hr.
2021	0.63	2.83	4.52	12/24/21, 4 PM
2022	2.88	4.32	1.50	12/27/22, 2 PM
2023	4.06	5.61	1.38	9/5/23, 11 PM
2024	4.69	6.07	1.30	7/8/24, 7 PM

*Analysis excluding average hourly reads for missing data gaps.

The maximum hour sendout dates and times begin to align in 2023 and 2024, due to improved accuracy in the hourly SCADA reads and a corresponding reduction in data gaps.

Q. Are you changing the actual system-wide maximum hourly capacity demands recorded in 1988 based on the results of your analysis?

A. No. As I explained earlier in my testimony, there were significant data gaps for the sample set of treatment facilities studied that create challenges in accurately measuring maximum hour demand. The 2024 hourly reads have minimal data gaps and the accuracy of future hourly reads will continue to improve. It would be reasonable to compile three years of accurate hourly reads, at a minimum, before such data can be used to calculate system-wide maximum hour demands in PAWC's future rate cases.

Q. Does the AWWA M1 Manual, Seventh Edition, address system-wide maximum day demand factors for use in the base extra capacity method?

A. The AWWA M1 Manual does not directly prescribe a specific system-wide maximum day factor. However, Appendix A to the manual addresses the diversity ratio, which is calculated using the system-wide peaking factor. Specifically, the diversity ratio is the non-coincident peaking factor divided by the system peaking factor. In Appendix A, the manual recommends that a reasonable diversity ratio should be between 1.1 and 1.4. The 1.4 system-wide maximum day demand factor employed in the water cost of service study produces a diversity factor that is reasonable based on the range recommended in the AWWA manual.

Q. Please explain the calculation of a diversity ratio using the Company's system-wide maximum day factor.

A. The Company's non-coincident peaking factor (the dividend, which is divided by the system-wide maximum day factor to derive the diversity factor) is calculated based on the non-coincident maximum day volumes found on Schedule E, in Exhibit 12-A. The total average daily consumption (in 100 gallons) shown in this schedule totals 1,206,606. The maximum day extra capacity (in 100 gallons) totals 1,143,107. The factors (column 3) that produce this amount were obtained from a demand study completed by the Company from January 2013 through October 2015. If these volumes of average day and maximum day extra capacity are added together, the sum equals the non-coincident maximum day volume (in 100 gallons) of 2,349,713. The ratio of the non-coincident peak volume (in 100 gallons) of 2,349,713 to average day volume (in 100 gallons) of 1,206,606 equals 1.95. This non-coincident ratio is then divided by the system-wide peaking factor (coincident peaking factor) to develop the

diversity ratio. The Company's system-wide peaking factor of 1.4 produces a diversity factor of 1.39 (1.95/.40), which is reasonable based on the recommended range of diversity ratios set forth in the AWWA Manual. In short, calculating the diversity ratios using the system-wide maximum day factors of PAWC, fully supports the reasonableness of the system-wide maximum day factor used in the COSS.

Q. Are the system maximum day and maximum hour ratios the same as those used in studies presented on behalf of the Company in prior proceedings before this Commission?

A. Yes, they are.

Q. Are you proposing to change the maximum day and maximum hour ratios for the water cost of service study in this proceeding?

A. No, I am not.

Q. Are the customer class extra capacity factors the same as those used in the most recent prior study for the Company?

A. Yes, the extra capacity factors used in Exhibit No. 12-A reflect the results of PAWC's most recent customer class demand study submitted in the Company's 2017 base rate case. A detailed explanation of the methods and procedures used, the sampling techniques, the areas and customers monitored, the results of the monitoring during the 2013-2015 period, and the conclusions from the study results are described in the text of the study provided in Appendix A of Exhibit No. 12-A.

Consistent with the 2023 Rate Case Order (p. 214), on July 25, 2025, PAWC filed a feasibility study for updating the 2017 customer class demand study as recommended by the Pennsylvania-American Water Large Users Group in that case. The feasibility study sets forth the overall scope of the demand study, the methods for

selecting the customers to be monitored, the equipment to be used, and the overall estimated cost of the study ($75,000). If the parties, and ultimately the Commission, approve the overall scope and cost, a full-scale demand study would be undertaken prior to PAWC's next base rate case.

Q. For Exhibit No. 12-A, did you make any adjustments to the cost allocation study?

A. Yes, four adjustments were made to the study. I will describe each adjustment and explain why it was made.

Q. Please explain the first adjustment.

A. The first adjustment was made to exclude the volume of contract sales under Riders DIS (Demand Industrial Sales) and DRS (Demand Resale Sales) in developing the allocation factors for the industrial classification and the sales for resale – Group A classification. As a result, costs are allocated only to the non-Rider DIS and non-Rider DRS customers.

Riders DIS and DRS authorize the Company to negotiate contracts at rates, with specified minimum and maximum levels, designed to retain or attract industrial and resale load for which the customer or applicant for service has a viable competitive alternative to service from PAWC, which the customer intends to select to the detriment of the Company and its other customers. In the 2023 Rate Case Order (p. 218), the Commission directed PAWC to create separate classes in the cost of service study for these Rider DIS and DRS customers instead of deducting these revenues received from those contract sales from the total cost of service and from each of the classes of service. Exhibit No. 12-A (or the water operations cost of service study) reflects Rider DIS and Rider DRS customers as separate customer classes.

Q. Why did you make this adjustment?

A. This adjustment was made to implement the Commission's directive in the 2023 Rate Case Order. However, in future rate cases, I believe excluding these contract customers from the cost of service study would provide a more meaningful comparison of allocated costs and revenues. Including contract sales inappropriately reduces the relative rate of return for the applicable class because revenues from the contract sales reflect contract rates that, to address competitive situations and avoid loss of load (or gain incremental load), are lower than the non-Rider DIS and non-Rider DRS rates. By excluding contract sales, the resulting cost of service and revenues properly reflect the costs and the rates for non-contract customers. When it approved Riders DIS and DRS, the Commission found that those riders create benefits for all the Company's customers by preserving or attracting incremental sales that, because of competitive forces, could not otherwise be made. Accordingly, the revenues derived from Rider DIS and Rider DRS customers should be reflected as deductions from all classes' cost of service in future rate cases.

Q. Please describe the second adjustment.

A. The second adjustment excludes from the extra capacity portion of Factors 2, 3 and 4 the curtailment volumes associated with service provided under the Company's industrial curtailment rate schedule. This adjustment properly accounts for the fact that curtailment volumes are interruptible and that a customer, to be eligible for this service, is required to meet certain minimum load factor requirements and have sufficient on-site storage capacity to meet its demands during periods of curtailment or interruption. This adjustment reflects the fact that a customer on this rate does not impose extra-capacity demand costs.

Q. Are the volumes associated with curtailment service included in the base portion of Factors 2, 3 and 4 in Exhibit No. 12-A?

A. Yes, they are.

Q. Please describe the third adjustment.

A. The third adjustment reallocates the unrecovered portion of public fire protection costs to the residential, commercial, industrial and public classifications. This was done to comply with Section 1328 of the Code, which provides that public fire hydrant rates may only recover 25% of the cost of public fire protection service and that the unrecovered portion should be recovered in the fixed charges of other customer classifications.

Q. How did you allocate the unrecovered portion of public fire service costs in Exhibit No. 12-A?

A. Consistent with the statutory requirement that these costs are to be recovered in fixed charges, I allocated the unrecovered public fire costs using Factor 21, which is based on the meter equivalents of the residential, commercial, industrial and public classifications.

Q. Please describe the fourth adjustment.

A. The fourth adjustment to the water cost of service study in Exhibit No. 12-A allocates a portion of the Company's total wastewater cost of service to the Company's Water Operations. The wastewater cost of service allocated to Water Operations is the cost of wastewater service less the revenues the Company's proposed wastewater rates are expected to produce.

Q. What is the total amount of wastewater revenue requirement allocated to the Company's Water Operations?

A. As shown in column 3 of Schedule A of Exhibit No. 12-A, the wastewater cost of service allocated to the cost of service for PAWC's Water Operations totals $53,010,182.

Q. How are the Wastewater Operations revenue requirements allocated to the customer classes in Exhibit No. 12-A?

A. The wastewater operations revenue requirements are allocated to the customer classes in Exhibit No. 12-A in the manner described in the direct testimony of Company Witness Max McClellan.

Q. Have you summarized the results of your cost allocation study in Exhibit No. 12-A?

A. Yes. In Exhibit No. 12-A, the results for the combined water and wastewater operations are summarized in columns 2, 3 and 4 of Schedule A. Column 5 presents each customer classification's cost responsibility as a percent of the total cost.

Q. Have you compared these cost responsibilities with the proportionate revenue under existing rates for each customer classification in Exhibit 12-A?

A. Yes. Allocated cost responsibilities can be compared to the percentage revenue under present rates, as shown on Schedule A. The percentage cost responsibilities (relative cost of service) can be compared to the percentage of pro forma revenues (relative revenues) under proposed rates, as shown on Schedule A in Exhibit No. 12-A.

COST OF SERVICE ALLOCATION – WASTEWATER SSS OPERATIONS

Q. Please describe the overall cost of service allocation studies for the Company's SSS Operations.

A. The cost of service allocation study for the Company's SSS Operations includes the combined wastewater revenue requirements for PAWC's Wastewater Rate Zones 1, 1a, 1b, 1c, 1e, 1f and 1g. As previously noted, I performed a separate cost of service allocation study for the Company's BASA Operations (Rate Zone 1d).

The purpose of each of those studies was to allocate the total cost of service, which is the total revenue requirement, to the several customer classifications. In the studies, the total costs were allocated to the residential, non-residential, large industrial, and bulk use customer classifications in accordance with generally accepted cost of service principles and procedures.

For the purposes of cost allocation in the SSS Operations study presented in Exhibit No. 12-B, small industrial customers are included in the non-residential class, which also includes commercial and public customers. In Exhibit No. 12-B, two large industrial customers are included in the large industrial class. The bulk user class also includes the Veterans Administration Hospital, which is served from the Coatesville system. Finally, Exhibit 12-B includes a separate class for adjacent municipal and utility wastewater systems that have entered into Wastewater Treatment and Conveyance Agreements to treat their wastewater flows at the York treatment plant.

In Exhibit No. 12-D, BASA Operations, costs were allocated to the residential and non-residential classes.

Q. Have you prepared exhibits presenting the results of your studies?

A. Yes. The results of my allocations of the pro forma cost of service as of June 30, 2027 are presented in Exhibit Nos. 12-B (SSS Operations) and 12-D (BASA Operations).

Q. Please describe the method of cost allocation that was used in your studies presented in Exhibit Nos. 12-B and 12-D.

A. I used the functional cost allocation methodology described in "Financing and Charges for Wastewater Systems," Manual of Practice No. 27, published by the Water Environment Federation ("Manual of Practice No. 27"). This method allocates the cost of providing wastewater service to customer classifications in proportion to each classification's use of the service provider's facilities and services. Costs are assigned to cost components using predominant operational purposes as cost-causative factors. The functional cost method is generally accepted as a sound method for allocating the cost of wastewater service.

Q. What procedures did you use to apply the cost allocation methodology for wastewater operations?

A. Each element of the cost of service is allocated to customer classifications according to the functional categories of flow, I&I, customer facilities and customer accounting. Except for certain depreciation and rate base items that are directly assigned to the Bulk User/VA Hospital class in Exhibit No. 12-B, the functional costs are allocated to customer classifications based on the amount of flow contributed to the system, the amount of I&I allocated to each class, and the number and relative size of customers.

Q. What costs have you directly assigned to the Bulk User/VA Hospital class for the Company's SSS Operations in Exhibit No. 12-B?

A. I have directly assigned certain components of rate base and annual depreciation expense related to wastewater treatment, gravity mains, and manholes based on the result of the allocation in the 2010 Coatesville cost of service study in Docket R-2010-2166212 ("Prior Cost of Service Study"). This study allocated Coatesville Wastewater System capital costs to their bulk users in accordance with the design-basis methodology described in Manual of Practice No. 27 and the I&I study submitted in compliance with the terms of the settlement at Docket No. R-2008-2032689. Pursuant to the terms of that settlement, the Company conducted a comprehensive study to determine the current and future flow volumes for each classification and the volume of I&I in the system as it relates to direct and bulk customers. The study was submitted with the Company's wastewater base rate filing at Docket No. R-2010-2166212 and was used in determining the cost of service for the bulk user class in that case. In this case, it is appropriate to continue to allocate certain capital costs related to treatment and mains to the remaining bulk users in the Coatesville area in Exhibit No. 12-B based on the Prior Cost of Service Study and I&I study.

Q. What is the basis for the volumes used to allocate costs to customer classifications in Factor 1?

A. Factor 1 is used to allocate costs related to wastewater treatment. In Factor 1, for the residential and non-residential classes, the flows were based on pro forma water usage billing determinants multiplied by a factor of 88%, consistent with the Coatesville I&I study, which determined that 88% of water use is returned to the sewer system. I then added average daily I&I in column 3 of Schedule E. In Exhibit No. 12-B, using the

Company's flow records, it was determined that 50.1% of the average daily flow was from I&I. Except for the bulk user classes for SSS Operations, 1/3 of I&I was allocated to the customer classes based on average daily flow and 2/3 was allocated based on service equivalents. The I&I allocated to the bulk user/VA Hospital class and the Bulk Users – Contract classes in Exhibit No. 12-B was based on 25% of the ratio of I&I to customer flow of 50.1%, as the flows from bulk users already contain I&I from their own collection systems.

Q. Please give a similar description of Factor 2 for Exhibit Nos. 12-B and 12-D.

A. Factor 2 is used to allocate costs related to collection. This factor was calculated in a similar manner as Factor 1. However, based on Company records, maximum day volumes were found to be 3.0 times the total average flow for PAWC's SSS Operations and this ratio was used for all areas. Except for the bulk use classes for PAWC's SSS Operations, one-third of I&I was allocated to the customer classes based on average daily flow and two-thirds was allocated based on service equivalents. The I&I allocated to the Bulk User/VA Hospital class in Exhibit No. 12-B was based on 25% of the ratio of I&I to customer flow. The Bulk User – Contract class was not allocated any costs related to the collection system.

Q. Please explain the factors used to allocate capital costs.

A. Factors 3 and 3A are similar to Factors 1 and 2 except that Factors 3 and 3A exclude the Bulk User/VA Hospital class in Exhibit No. 12-B because assets for these customers have been directly assigned. Factors 3 and 3A are not used in Exhibit No. 12-D as that area does not have bulk customers who have specific allocations related to a wastewater treatment plant.

Q. Please explain the remaining cost allocation factors.

A. Factors 4 and 5 were used to allocate customer facilities and customer accounting costs. These factors were based on the number and relative size of the customers.

Factor 6 is a composite factor used to allocate employee pension and benefit expenses and payroll taxes. Factor 6 is based on the allocation of direct labor expense.

Factors 7 and 8 are based on the allocation of plant in service and rate base, respectively. Factor 7 allocates other rate base elements and Factor 8 is used to allocate return and taxes.

Factor 9 is based on the total cost of service and is used to allocate regulatory commission expense and other revenues.

Factor 10 is used to allocate administrative and general expenses and is based on the allocation of all other operating expenses exclusive of power, chemicals and waste disposal. Factor 11 allocates cash working capital and is based on the allocation of all operating expenses.

Q. Please explain the procedure for allocating costs to the several customer classifications.

A. The items of cost, which include operation and maintenance expenses, depreciation expense, taxes and income available for return, are identified in column 1 of Schedule D in Exhibit Nos. 12-B and 12-D. The cost of each item, shown in column 3, is allocated to the several customer classifications based on allocation factors referenced in column 2. The development of the allocation factors is presented in Schedule E of each exhibit.

Q. What was the source of the total cost of service data set forth in column 3 of Schedule D of Exhibit Nos. 12-B and 12-D?

A. The pro forma costs of service were furnished by the Company and are the same as those set forth in Exhibit No. 3-A. The pro forma cost of service in Exhibit Nos. 12-B and 12-D was reduced by the $12,710,621 and $30,380,040 in revenue requirement, respectively, that is proposed to be recovered in water rates.

Q. Have you summarized the results of your cost allocation studies for the Company's SSS Operations?

A. Yes. The results are summarized in columns 1, 2 and 3 of Schedule A of Exhibit Nos. 12-B and 12-D. Column 2 sets forth the total allocated pro forma cost of service as of June 30, 2027, for each customer classification identified in column 1. Column 3 presents each customer classification's cost responsibility as a percent of the total cost.

Q. Have you compared these cost responsibilities with the proportionate revenue under existing rates for each customer classification?

A. Yes. A comparison of the allocated cost responsibilities and the percentage revenue under existing rates can be made by comparing columns 3 and 5 of Schedule A of Exhibit Nos. 12-B and 12-D. A similar comparison of the percentage cost responsibilities (relative cost of service) and the percentage of pro forma revenues (relative revenues) under proposed rates can be made by comparing columns 3 and 7 of Schedule A of each exhibit. The rate of return by customer classification under present and proposed rates is set forth on Schedules B and C, respectively.

COST OF SERVICE ALLOCATION – WASTEWATER CSS OPERATIONS

Q. Please describe the cost of service allocation for the Company's CSS Operations.

A. The cost of service allocation study is based on the revenue requirements developed by the Company in Exhibit 3-A for its CSS Operations. The study allocated the combined cost of service of the Scranton, McKeesport and Kane operations to residential, non-residential, industrial, bulk, and stormwater classifications. As previously noted, I performed a separate cost of service allocation study for the Company's EBMA Operations.

Q. Have you prepared exhibits presenting the results of your studies?

A. Yes. The results of my allocation of the pro forma cost of service as of June 30, 2027 are shown in Exhibit Nos. 12-C (CSS Operations) and 12-E (EBMA Operations).

Q. Please describe the method of cost allocation that was used in your studies.

A. For Exhibit Nos. 12-C and 12-E, I also used the functional cost allocation methodology described in Manual of Practice No. 27. I modified the allocation method to determine the incremental cost related to handling stormwater for a CSS and combined sewer overflows ("CSO").

Q. What procedures did you use to apply the cost allocation methodology for CSS Operations and EBMA Operations?

A. Each element of the cost of service is allocated to customer classifications according to the functional categories of sanitary flow (including normal I&I), stormwater introduced from surface sources, customer facilities and customer accounting. Except for certain operating costs, depreciation, and rate base items that are directly assigned to either the sanitary system or to the stormwater function, the functional costs are allocated to customer classifications based on the amount of flow contributed to the

system, the amount of I&I allocated to each class, the volume of stormwater, and the number and relative size of customers.

Q. What costs have you directly assigned to the sanitary sewer classifications?

A. I directly assigned rate base items and annual depreciation expense associated with pumping stations, wastewater treatment structures and equipment, gravity mains, and manholes to the sanitary sewer classes (residential, non-residential and large industrial). The wastewater collection system in the Scranton operating district is not entirely a combined system. Approximately 63% of the collection system is combined sewers and the remaining 37% comprises sanitary sewers only. Therefore, for gravity mains, after assigning specific stormwater assets to the stormwater class described below, I allocated 37% of the remaining costs of gravity mains to the sanitary classes, and I allocated 63% on a combined system basis. The cost of manholes in Account 361.2 were allocated in the same manner. For the McKeesport operating district, the collection system is a combined system except for the Port Vue area where approximately 25% is combined sewers and 75% is sanitary only. For the Kane operating district, the collection system inside the Borough is a combined system and the collection system outside the Borough is sanitary only. For the EBMA operating district, the collection system is a combined system and approximately 60% is combined sewers and the remaining 40% is sanitary sewers. The collection system assets allocated to sanitary only, allocated on a combined system basis and directly assigned to stormwater for each CSS operating district were aggregated and used to allocate the combined investment to customer classifications. For pumping system assets, the Froude Avenue pumping station in the Scranton operating district serves only sanitary sewers and, therefore, its cost was assigned solely to the sanitary

classifications. The remaining pumping stations were allocated on a combined system basis.

For the wastewater treatment plants, a detailed analysis of the structures account and the equipment account was performed to identify the portions of the plants specifically related to secondary sanitary treatment. The portions of the plants thus identified were allocated to the sanitary classifications.

The remaining portions of the wastewater treatment structures and equipment accounts in the Scranton operating district, sized to handle 60 mgd of flow, was assigned 41.67% (25 mgd) to the sanitary classes and 58.33% (35 mgd) to stormwater. For the McKeesport operating district, the wastewater treatment plant costs were assigned based on the capacity of the McKeesport wastewater treatment plant (the largest treatment plant). This plant is sized to handle 66 mgd of combined flow, and 45.45% (30 mgd) was assigned to the sanitary classes and 54.54% (36mgd) to stormwater. The Kinzua and Pine Street wastewater treatment plants in the Kane operating district are sized to handle 7.25 mgd of combined flow. This capacity was assigned 27.6% (2 mgd) to the sanitary classes and 72.5% (5.25 mgd) to stormwater. The EBMA wastewater treatment plant is sized to handle 3 mgd of flow and was assigned 40% (1.2 mgd) of combined flow and 60% (1.8 mgd) to stormwater.

Q. What costs have you directly assigned to the stormwater classification?

A. I directly assigned approximately 10.9% of collection operating labor to stormwater for seven collection system employees who are specifically tasked with operating and maintaining the CSO assets within the collection systems. In addition to the pumping stations and portions of the treatment plant related to stormwater that I previously discussed, I also identified rate base items and associated annual depreciation expense

for specific CSO assets within Account 361.10, Gravity Mains. These assets include catch basins, CSO outfalls, regulator chambers, diversion manholes, culverts, detention basins, and biofiltration catch basin systems. The costs of these assets were directly assigned to the stormwater classification.

Q. What other costs were directly assigned to the stormwater function?

A. For Account 391, Transportation Equipment, the cost of one vactor truck and the cost of a street sweeper in Scranton, vactor truck assets in McKeesport and Kane, and 17% of EBMA Transportation Equipment (60% of non-light duty trucks) were allocated directly to stormwater.

Q. What is the basis for the volumes used to allocate costs to customer classifications for operating and maintenance expenses?

A. Factors 1 and 2 are used to allocate operation and maintenance costs related to wastewater collection and treatment. For Factor 1, for the residential, non-residential, industrial, and bulk classes, the flows were based on pro forma water usage billing determinants multiplied by a factor of 88%, consistent with the Coatesville I&I study. I then added average daily I&I in column 3 of Schedule E. Using Company flow records for SSS Operations, it was determined that 50.1% of the average daily flow was from I&I. One-third of the I&I was allocated to the customer classes based on average daily flow and two-thirds was allocated based on service equivalents using Factor 1A.

Factor 2 is based on average daily sanitary flows from Factor 1 plus average daily stormwater flow. The total wastewater flow (sanitary and stormwater for Scranton, McKeesport and Kane combined) is based on the experienced average daily

total flow for 2024 of 26.0 mgd and the EBMA total wastewater flow is based on an average daily total flow for 2024 of 0.993 mgd.

Q. Please explain the factors used to allocate the capital costs.

A. Factors 3 and 4 are similar to Factors 1 and 2 except that Factors 3 and 4 include peak flows. For Factor 3, the total peak sanitary flow is based on 57 mgd (sum of Scranton at 25 mgd, McKeesport at 30 mgd and Kane at 2 mgd) and 1.2 mgd (EBMA), which reflects additional I&I under peak conditions. For Factor 4, the total peak wastewater flow capacity is based on 1,333 mgd, with the addition of 76.25 mgd of peak stormwater flow (sum of Scranton at 35 mgd, McKeesport at 36 mgd and Kane at 5.25 mgd), and 4.8 mgd with the addition of 1.8 mgd of peak stormwater flow (EBMA).

Q. Please explain the remaining cost allocation factors.

A. Factors 5 and 6 were used to allocate customer facilities and customer accounting costs. These factors were based on the number and relative size of the customers.

Factor 7 is a composite factor used to allocate employee pension and benefit expenses and payroll taxes. Factor 7 is based on the allocation of direct labor expenses.

Factors 8 and 9 are based on the allocation of plant in service and rate base, respectively. Factor 8 allocates other rate base elements, and Factor 9 is used to allocate return and taxes.

Factor 10 is based on the total cost of service and is used to allocate regulatory commission expense and other revenues. Factor 10A is based on the total cost of service with stormwater costs reallocated to the sanitary classes and is used to allocate the portion of the CSS wastewater cost of service to be recovered through water rates.

Factor 11 is used to allocate administrative and general expenses and is based on the allocation of all other operating expenses exclusive of power, chemicals and waste disposal. Factor 12 allocates cash working capital and is based on the allocation of all operating expenses.

Q. Please explain the procedure for allocating costs to the several customer classifications.

A. The items of cost, which include operation and maintenance expenses, depreciation expense, taxes and income available for return, are identified in column 1 of Schedule D of Exhibit Nos. 12-C and 12-E. The cost of each item, shown in column 3, is allocated to the several customer classifications based on allocation factors referenced in column 2. The development of the allocation factors is presented in Schedule E of the exhibit.

Q. What was the source of the total cost of service data set forth in column 3 of Schedule D of Exhibit Nos. 12-C and 12-E?

A. The pro forma cost of service was furnished by the Company and are the same as those set forth in Exhibit No. 3-A. This pro forma cost of service was reduced by $7,062,475 (CSS Operations) and $2,957,046 (EBMA Operations), which is the amount the Company proposes to recover in water rates. The revenues under proposed rates for the CSS Operations and EBMA Operations are sufficient to recover the remaining revenue requirement.

Q. Have you summarized the results of your cost allocation studies for the Company's CSS Operations and EBMA Operations?

A. Yes. The results are summarized in columns 1, 2 and 3 of Schedule A of Exhibit Nos. 12-C and 12-E. Column 2 sets forth the total allocated pro forma cost of service as of

June 30, 2027 for each customer classification identified in column 1. Column 3 presents each customer classification's cost responsibility as a percentage of the total cost. The total cost of service associated with stormwater for the combined systems is $42,748,417 (CSS Operations) and $2,149,096 (EBMA Operations), as shown in column 7 of Schedule D of Exhibit No. 12-C and 12-E, respectively. This cost was reallocated to the sanitary classes based on Factor 1A.

Q. Have you compared these cost responsibilities with the proportionate revenue under existing rates for each customer classification?

A. Yes. A comparison of the allocated cost responsibilities and the percentage revenue under existing rates can be made by comparing columns 3 and 5 of Schedule A of Exhibit Nos. 12-C and 12-E. A similar comparison of the percentage cost responsibilities (relative cost of service) and the percentage of pro forma revenues (relative revenues) under proposed rates can be made by comparing columns 3 and 7 of Schedule A of Exhibit Nos. 12-C and 12-E. The rate of return by customer classification under present and proposed rates is set forth on Schedules B and C.

CONCLUSION

Q. Does this complete your direct testimony at this time?

A. Yes, it does.

GREGORY R. HERBERT – LIST OF CASES TESTIFIED OR ASSISTED FORMER GANNETT FLEMING STAFF

Attention: Ashley E. Everette
VP, Rates & Regulatory

Pursuant to your request, we have conducted a cost of service allocation study based on pro forma revenue requirements estimated for the test year ended June 30, 2027.

The attached report presents the results of the allocation study, as well as supporting schedules which set forth the detailed cost allocation calculations. Schedule A presents a comparison of the cost of service by customer classification with the pro forma revenues produced by each classification under present and proposed rates.

Respectfully submitted,

PART I. INTRODUCTION

PENNSYLVANIA AMERICAN WATER COMPANY

WATER COST OF SERVICE ALLOCATION STUDY
AS OF JUNE 30, 2027

PART I. INTRODUCTION

PLAN OF REPORT

The report sets forth the results of the cost of service allocation study for the water operations based on pro forma costs as of June 30, 2027, or the fully forecasted future test year (FFTY), for Pennsylvania- American Water Company. Part I, Introduction, contains statements with respect to the basis of the study, the procedures employed, and a summary of the results of the study. Schedule A summarizes the cost allocation for the water and wastewater operations and total revenues under present and proposed rates. Part II, Cost of Service by Customer Classification - Water Operations, presents detailed schedules of the allocation of costs to customer classifications, as well as the basis for the allocations for the FFTY. Schedule A in Part II summarizes the water cost allocation and the revenues produced under present and proposed rates.

BASIS OF STUDY

The purpose of the cost allocation study was to determine the relative cost of service responsibilities of the several customer classifications based on considerations of quantity of water consumed, variability of rate of consumption, and costs associated with customer metering, billing and accounting. The allocation study incorporated generally- accepted principles and procedures for allocating the several categories of cost to customer classifications in proportion to each classification's use of facilities,

commodities and services required in providing water service.

ALLOCATION PROCEDURES

The allocation study was based on the Base-Extra Capacity Method for allocating costs to customer classifications. The method is described in the 2017 and prior editions of the Water Rates Manual published by the American Water Works Association. The four basic categories of cost responsibility are base, extra capacity, customer, and fire protection costs. The following discussion presents a brief description of these costs and the manner in which they were allocated.

Base Costs are costs that tend to vary with the quantity of water used, plus costs associated with supplying, treating, pumping, and distributing water to customers under average load conditions, without the elements necessary to meet peak demands. Base costs were allocated to customer classifications on the basis of average daily usage.

Extra Capacity Costs are costs associated with meeting usage requirements in excess of the average. They include operating and capital costs for additional plant and system capacity beyond that required for average use. The extra capacity costs in this study are subdivided into costs necessary to meet maximum day extra demand and costs to meet maximum hour extra demand. The extra capacity costs were allocated to customer classifications on the bases of each classification's maximum day and hour usage in excess of average usage.

Customer Costs are costs associated with serving customers regardless of their usage or demand characteristics. Customer costs include the operating and capital costs related to meters and services, meter reading costs, and billing and collecting costs. The customer costs were allocated on the bases of the capital cost of meters and services,

the man-hours required to read meters and the number of customers.

Fire Protection Costs are costs associated with providing the facilities to meet the potential peak demand of fire protection service. Fire Protection costs are subdivided into costs to meet Public Fire Protection and Private Fire Protection demands. The extra capacity costs assigned to fire protection service were allocated to Public and Private Fire Protection and Commercial General Service on the basis of the total relative demands of the hydrants, fire service lines, and commercial service lines sized to provide fire protection, as well as general service.

RESULTS OF STUDY

The results for the cost of service allocation study is set forth on the following pages. The data summarized in Schedule A, Comparison of Pro Forma Cost of Service with Revenues Under Present and Proposed Rates for the Twelve Months Ended June 30, 2027, constitute the principal results of the cost allocation studies and subsequent rate design.

The water operations cost of service by customer classification is shown in column 2 of Schedule A and are developed in Schedule D, Allocation of Cost of Service to Customer Classifications water operations. The allocation of the total cost of service to the several customer classifications was performed by applying the allocation factors referenced in column 2 of Schedule D to the cost of service set forth in column 3. The bases for the allocation factors are presented in Schedule E. The other cost of service shown in column 3 includes wastewater cost of service not recovered by wastewater rates.

Schedule F presents the calculation of the firm standby service and interruptible

standby service commodity-demand rates based on the unit costs of service by function for the water operation.

Schedule G sets forth the average day, maximum day system sendout, and maximum day ratios.

.

PART II. COST OF SERVICE BY CUSTOMER CLASSIFICATION

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

COMPARISON OF PRO FORMA COST OF SERVICE WITH REVENUES UNDER PRESENT AND PROPOSED RATES
FOR THE TWELVE MONTHS ENDED JUNE 30, 2027

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1. ALLOCATION OF COSTS WHICH VARY WITH THE AMOUNT OF WATER CONSUMED.

Factors are based on the pro forma future test year average daily consumption for each customer classification.

Customer Classification	Average Daily Consumption, 100 Gallons	Allocation Factor
(1)	(2)	(3)
Residential	693,579	0.5268
Commercial	334,278	0.2539
Industrial	99,034	0.0752
Industrial - *Contract Sales*	17,176	0.0130
Public	49,101	0.0373
Other Water Utilities A	2,439	0.0019
Other Water Utilities B	10	0.0000
Other Water Utilities - *Contract Sales*	24,840	0.0189
Private Fire Protection	15,675	0.0119
Public Fire Protection	80,411	0.0611
Total	1,316,544	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE AND MAXIMUM DAY EXTRA CAPACITY FUNCTIONS.

(Factor 1) and the factors derived from maximum day extra capacity demand for each customer classification, as follows:

	Average Daily Consumption		Maximum Day Extra Capacity		
Customer Classification	Allocation Factor 1	Weighted Factor	Allocation Factor	Weighted Factor	Allocation Factor
(1)	(2)	(3)=(2)x 0.7143	(4)	(5)=(4)x 0.2857	(6)=(3)+(5)
Residential	0.5268	0.3763	0.6067	0.1734	0.5497
Commercial	0.2539	0.1814	0.3217	0.0919	0.2733
Industrial	0.0752	0.0537	0.0373	0.0106	0.0644
Industrial - *Contract Sales*	0.0130	0.0093	0.0075	0.0021	0.0115
Public	0.0373	0.0266	0.0172	0.0049	0.0315
Other Water Utilities A	0.0019	0.0013	0.0009	0.0002	0.0016
Other Water Utilities B	0.0000	0.0000	0.0001	0.0000	0.0000
Other Water Utilities - *Contract Sales*	0.0189	0.0135	0.0087	0.0025	0.0160
Private Fire Protection	0.0119	0.0085			0.0085
Public Fire Protection	0.0611	0.0436			0.0436
Total	1.0000	0.7143	1.0000	0.2857	1.0000

The derivation of the maximum day extra capacity factors in column 4 and the basis for the column 3 and column 5 weightings are presented on the following page.

::

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE AND MAXIMUM DAY EXTRA CAPACITY FUNCTIONS, cont.

		Maximum Day Extra Capacity		
Customer Classification	Average Daily Consumption, 100 Gallons	Factor*	Rate of Flow, 100 Gallons Per Day	Allocation Factor
(1)	(2)	(3)	(4)	(5)
Residential	693,579	1.0	693,579	0.6067
Commercial	334,278	1.1	367,706	0.3217
Industrial	85,183	0.5	42,592	0.0373
Industrial - *Contract Sales*	17,176	0.5	8,588	0.0075
Public	49,101	0.4	19,640	0.0172
Other Water Utilities A	2,439	0.4	976	0.0009
Other Water Utilities B	10	9.0	90	0.0001
Other Water Utilities - *Contract Sales*	24,840	0.4	9,936	0.0087
Total	1,206,606		1,143,107	1.0000

The weighting of the factors is based on the maximum day ratio of 1.4, based on a review of maximum day ratios experienced by the company. (See Schedule G)

	Maximum Day Ratio	Weight
Average Day	1.0	0.7143
Maximum Day Extra Capacity	0.4	0.2857
Total	1.4	1.0000

* Ratio of maximum day to average day minus 1.0.

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 3. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE, MAXIMUM DAY EXTRA CAPACITY AND FIRE PROTECTION FUNCTIONS.

Factors are based on the weighting of the average daily consumption, the maximum day extra capacity demand, and the fire protection demand for each customer classification.

	Average Daily Consumption		Maximum Day Extra Capacity		Fire Protection		
Customer Classification	Allocation Factor 1	Weighted Factor	Allocation Factor	Weighted Factor	Allocation Factor	Weighted Factor	Allocation Factor
(1)	(2)	(3)=(2) X 0.7111	(4)	(5)=(4) X 0.2844	(6)	(7)=(6) X 0.0044	(8)=(3)+ (5)+(7)
Residential	0.5268	0.3746	0.6067	0.1726			0.5472

Other Water Utilities B	0.0000	0.0000	0.0001	0.0000			0.0000
Other Water Utilities - *Contract Sales*	0.0189	0.0134	0.0087	0.0025			0.0159
Private Fire Protection	0.0119	0.0085			0.1417	0.0006	0.0091
Public Fire Protection	0.0611	0.0434			0.8369	0.0037	0.0471
Total	1.0000	0.7111	1.0000	0.2844	1.0000	0.0044	1.0000

The basis for the column 3, column 5 and column 7 weightings are presented on the following page.

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 3. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE, MAXIMUM DAY EXTRA CAPACITY AND FIRE PROTECTION FUNCTIONS, cont.

The weighting of the factors is based on the potential demand of general and fire protection service. The bases for the potential demand of general service are the maximum day ratio of 1.4 and the average pumpage for the year ended 12/31/2024. The system demand for fire protection is 20,000 gpm, for 10 hours.

	Ratio	Rate of Flow, (GPD)	Weight
Average Day	1.0	1,921,730,800	0.7111
Maximum Day Extra Capacity	0.4	768,692,320	0.2844
Subtotal	1.4	2,690,423,120	0.9956
Fire Protection		12,000,000	0.0044
Total		2,702,423,120	1.0000

The allocation factors in column 6 on the preceding page are based on the relative potential fire demands of General Service and Public and Private Fire Protection Service.

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 4. ALLOCATION OF COSTS ASSOCIATED WITH FACILITIES SERVING BASE AND MAXIMUM HOUR EXTRA CAPACITY FUNCTIONS.

Factors are based on the weighting of the average hourly consumption, the maximum hour extra capacity demand, and fire protection demand for each customer classification.

		Average Hourly Consumption		Maximum Hour Extra Capacity		Fire Protection		
Customer Classification	100 Gals.	Allocation Factor	Weighted Factor	Allocation Factor	Weighted Factor	Allocation Factor	Weighted Factor	Allocation Factor

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 12. ALLOCATION OF TRANSMISSION AND DISTRIBUTION OPERATION SUPERVISION AND ENGINEERING AND OTHER OPERATION DEPARTMENT EXPENSES.

The factors are based on the allocation of Transmission and Distribution Operation Salaries and Wages, as follows:

Customer Classification	Transmission & Distribution Operation Salaries & Wages	Allocation Factor
(1)	(2)	(3)
Residential	$ 2,406,087	0.6358
Commercial	956,022	0.2526
Industrial	155,286	0.0410
Industrial - *Contract Sales*	9,630	0.0025
Public	95,924	0.0253
Other Water Utilities A	4,888	0.0013
Other Water Utilities B	149	0.0000
Other Water Utilities - *Contract Sales*	13,087	0.0035
Private Fire Protection	25,336	0.0067
Public Fire Protection	117,952	0.0312
Total	$ 3,784,361	1.0000

FACTOR 13. ALLOCATION OF TRANSMISSION AND DISTRIBUTION MAINTENANCE SUPERVISION AND ENGINEERING AND OTHER MAINTENANCE DEPARTMENT EXPENSES.

The factors are based on the allocation of Transmission and Distribution Maintenance Salaries and Wages, as follows:

Customer Classification	Transmission & Distribution Maintenance Salaries & Wages	Allocation Factor
(1)	(2)	(3)
Residential	$ 2,086,854	0.6398
Commercial	594,152	0.1822
Industrial	76,634	0.0235
Industrial - *Contract Sales*	4,872	0.0015
Public	56,814	0.0174
Other Water Utilities A	2,343	0.0007
Other Water Utilities B	143	0.0000
Other Water Utilities - *Contract Sales*	6,258	0.0019
Private Fire Protection	19,354	0.0059
Public Fire Protection	414,124	0.1270
Total	$ 3,261,548	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 14. ALLOCATION OF CUSTOMER ACCOUNTING, BILLING AND COLLECTING COSTS.

Factors are based on the pro forma number of customers, as follows:

Customer Classification	Proforma Number of Customers	Allocation Factor
(1)	(2)	(3)
Residential	645,015	0.91873
Commercial	49,358	0.07030
Industrial	607	0.00086
Industrial - *Contract Sales*	30	0.00004
Public	2,397	0.00341
Other Water Utilities A	6	0.00001
Other Water Utilities B	8	0.00001
Other Water Utilities - *Contract Sales*	9	0.00001
Private Fire Protection	4,235	0.00603
Public Fire Protection	409	0.00058
Total	702,074	1.00000

FACTOR 15. ALLOCATION OF METER READING COSTS.

Factors are based on the number of meters by class.

Customer Classification	Pro Forma Number of Meters	Allocation Factor
(1)	(2)	(3)
Residential	645,015	0.92471
Commercial	49,358	0.07076
Industrial	607	0.00087
Industrial - *Contract Sales*	30	0.00004
Public	2,397	0.00344
Other Water Utilities A	6	0.00001
Other Water Utilities B	8	0.00001
Other Water Utilities - *Contract Sales*	9	0.00001
Private Fire Protection	99	0.00014
Total	697,529	1.00000

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 16. ALLOCATION OF ADMINISTRATIVE AND GENERAL EXPENSES.

The factors are based on the allocation of all other operation and maintenance expenses excluding purchased water, power, fuel, chemicals and waste disposal expenses.

Customer Classification	Operation & Maintenance Expenses	Allocation Factor
(1)	(2)	(3)
Residential	$ 52,409,345	0.6669
Commercial	16,366,118	0.2082
Industrial	3,029,114	0.0385
Industrial - *Contract Sales*	398,271	0.0051
Public	1,549,292	0.0197
Other Water Utilities A	72,659	0.0009
Other Water Utilities B	2,193	0.0000
Other Water Utilities - *Contract Sales*	549,877	0.0070
Private Fire Protection	500,988	0.0064
Public Fire Protection	3,713,447	0.0473
Total	$ 78,591,304	1.0000

FACTOR 16A. ALLOCATION OF CASH WORKING CAPITAL - EXPENSES

The functions are based on the allocation of all other operation and maintenance expenses excluding regulatory commission expense.

Customer Classification	Operation & Maintenance Expenses	Allocation Factor
(1)	(2)	(3)
Residential	$ 186,217,512	0.6593
Commercial	58,390,981	0.2067
Industrial	12,020,552	0.0426
Industrial - *Contract Sales*	1,744,668	0.0062
Public	6,156,117	0.0218
Other Water Utilities A	290,659	0.0010
Other Water Utilities B	6,538	0.0000
Other Water Utilities - *Contract Sales*	2,451,507	0.0087
Private Fire Protection	2,080,955	0.0074
Public Fire Protection	13,073,996	0.0463
Total	$ 282,433,485	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 17. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

The factors are based on the allocation of direct salaries and wages as follows:

Customer Classification	Salaries and Wages	Allocation Factor
(1)	(2)	(3)
Residential	$ 42,290,775	0.6429
Commercial	14,550,277	0.2212
Industrial	2,752,466	0.0418
Industrial - *Contract Sales*	355,703	0.0054
Public	1,418,891	0.0216
Other Water Utilities A	66,273	0.0010
Other Water Utilities B	2,099	0.0000
Other Water Utilities - *Contract Sales*	490,520	0.0075
Private Fire Protection	425,124	0.0065
Public Fire Protection	3,426,468	0.0521
Total	$65,778,594	1.0000

FACTOR 18. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS, OTHER INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

The factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	$ 3,838,915,055	0.6125
Commercial	1,503,448,816	0.2399
Industrial	284,848,363	0.0454
Industrial - *Contract Sales*	29,815,156	0.0048
Public	153,610,839	0.0245

Other Water Utilities B	182,178	0.0000
Other Water Utilities - *Contract Sales*	41,380,895	0.0066
Private Fire Protection	49,036,703	0.0078
Public Fire Protection	358,766,843	0.0572
Total	$ 6,267,828,494	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 19. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

The factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below:

Customer Classification	Original Cost Measure of Value	Allocation Factor
(1)	(2)	(3)
Residential	$ 3,171,005,715	0.6128
Commercial	1,239,669,771	0.2396
Industrial	234,552,482	0.0453
Industrial - *Contract Sales*	24,732,262	0.0048
Public	127,169,766	0.0246
Other Water Utilities A	6,474,914	0.0013
Other Water Utilities B	150,751	0.0000
Other Water Utilities - *Contract Sales*	34,328,950	0.0066
Private Fire Protection	40,487,072	0.0078
Public Fire Protection	296,271,804	0.0573
Total	$ 5,174,843,486	1.0000

FACTOR 20. ALLOCATION OF REGULATORY COMMISSION EXPENSES, ASSESSMENTS AND OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor
(1)	(2)	(3)
Residential	$ 653,900,492	0.6298
Commercial	236,658,470	0.2279
Industrial	45,350,230	0.0437

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 21. ALLOCATION OF UNRECOVERED PUBLIC FIRE PROTECTION.

Factors are based on the relative cost of meters by size for the Residential, Commercial, Industrial, and Public classifications, as follows:

Customer Classification	5/8" Dollar Equivalents	Allocation Factor
(1)	(2)	(3)
Residential	$ 672,058	0.7791
Commercial	167,588	0.1943
Industrial	7,010	0.0081
Industrial - *Contract Sales*	514	0.0006
Public	15,492	0.0180
Total	$ 862,662	1.0000

FACTOR 22. ALLOCATION OF BAD DEBT EXPENSE.

Factors are based on the historic net charge offs by class.

Customer Classification	Net Charge Off	Allocation Factor
(1)	(2)	(3)
Residential	$ 10,207,248	0.9068
Commercial	979,077	0.0870
Industrial	24,187	0.0021
Industrial - *Contract Sales*	-	0.0000
Public	6,066	0.0005
Other Water Utilities A	-	0.0000
Other Water Utilities B	-	0.0000
Other Water Utilities - *Contract Sales*	-	0.0000
Private Fire Protection	40,077	0.0036
Public Fire Protection	-	0.0000
Total	$ 11,256,655	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY - WATER OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS, cont.

FACTOR 23. ALLOCATION OF LATE PAYMENT FEES.

Factors based on collection of Late Payment fees by class.

Customer Classification	Late Payment Fees	Allocation Factor
(1)	(2)	(3)
Residential	$ 3,745,571	0.8475
Commercial	492,038	0.1113
Industrial	99,500	0.0225
Industrial - *Contract Sales*	-	0.0000
Public	41,488	0.0094
Other Water Utilities A	12,994	0.0029
Other Water Utilities B	766	0.0002
Other Water Utilities - *Contract Sales*	-	0.0000
Private Fire Protection	27,154	0.0061
Public Fire Protection	-	0.0000
Total	$ 4,419,511	1.0000

APPENDIX A

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

a. A description of the allocation methods used. A comparison of the allocated cost of service by class with the present and proposed revenues. A cost of service schedule showing the Rate of Return produced by present and proposed rates by class of service.

RESPONSE

A description of the methods used for the cost of service study is provided on Exhibit 12-A and in PAWC Statement No. 12. A comparison of the allocated cost of service by class with the present and proposed revenues is provided on Schedule A of Exhibit 12-A. Schedules B and C showing the rate of return produced by present and proposed rates by customer classification are provided in Exhibit 12-A.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

b. Indicate if the method used for establishing the allocation factors in the Cost of Service Study deviates from the previous study submitted in the last rate case. If yes, indicate which allocation factors were changed and discuss the reason for the changes.

RESPONSE

The methods used for establishing the allocation factors in the cost of service study have not deviated from the previous study submitted in the last case. However, the Industrial DIS Contract customers and Other Water Utilities DRS Contract customers are included in the cost allocation study as separate customer classes per the Order of Docket Nos. R-2023-3043189 and R-2023-3043189.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

c. Supply the average day, the maximum day and the maximum hour deliveries to the system adjusted for storage for the test year and two prior years. Also provide workpapers, analyses, comparative data or other documentation supporting the estimated maximum day and peak hour demands by customer class reflected in the Company's cost of service study.

RESPONSE

Refer to Schedule G of Exhibit 12-A for the average day and maximum day system deliveries for the years 1987 through 2024. Support for the system maximum hour ratio is provided below and on the attached schedules.

The peak hour consumption analysis in support of the 2.1 system peak hour ratio is attached and summarized below.

Analyses were made to determine hourly water consumption during 1988 peak periods of sendout for PAWC's three largest operating districts, as follows:

Pittsburgh	July 5, 6 and 7, 1988
Riverton	July 6 and 7, 1988
Norristown	July 6, 7 and 8, 1988

These dates had the greatest sendouts experienced in recent years.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1c., cont.

Recording charts or other hourly logs of total production were read to derive total hourly delivery to each of the districts. Recording charts for storage reservoirs were read to derive hourly draw or fill from each reservoir. The total hourly delivery plus hourly draw less hourly fill equals hourly consumption.

District	Average M.G.D.	Max Hour M.G.D.	Max Hour Ratio
Pittsburgh	69.28	140.88	2.03
Riverton	10.16	26.17	2.58
Norristown	12.68	22.53	1.78
Total	92.12	189.58	2.06

The attachments set forth the hourly deliveries, storage draws and fills and hourly consumption for the several days and districts which support the above amounts.

Support for the customer class demand factors is provided on the attached pages, Customer Class Demand Study, which was included in the Company's 2017 Rate Case that was filed on April 28, 2017 (Docket No. R-2017-2595853).

800 West Hersheypark Drive
Hershey, PA 17033-2400

Attention John Cox
Manager of Rates and Regulations

Gentlemen:

Pursuant to your request, we have prepared a customer class demand study. The study was conducted to provide a basis for the selection of class maximum day and hour demand ratios for use in the cost of service allocation study.

The attached report presents a description of the methods and procedures used, the usage data for each monitored customer, and the detailed calculations of maximum day and hour ratios by classification. The results of the study are presented on page I-9 of the report.

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. INTRODUCTION

PLAN OF REPORT

The report sets forth the results of the customer class demand study conducted during the period of January 2013 through October 2015 for Pennsylvania American Water Company (Company). The study is organized into three parts. Part I, Introduction, contains statements with respect to the basis and purpose of the study, a description of the methods and procedures used, and a summary of the study results. Part II, Maximum Day and Hour Ratios, describes the calculations of the maximum day and maximum hour ratios for each customer class using the observed demand data. Part III, Daily and Hourly Usage Data, provides the daily usage for each monitored location and the hourly usage for selected days during the study period. Unless noted otherwise, all residential usage units are gallons and non-residential units are hundred gallons.

BASIS OF STUDY

Pursuant to the Join Petition for Settlement at Docket No. R-2011-2232243, approved by the Commission's Final Order entered November 10, 2011, the Joint Petitioners agreed that the Company would prepare and submit a study on the feasibility and costs of conducting a customer class demand study including the timetable required to complete such a study. In February 2012, the Company submitted the required Feasibility Study to the Joint Petitioners for their review and comment. The Feasibility Study outlined the scope of the proposed demand study, the facilities and equipment that would be required, and an estimate of the total costs. Subsequent to a meeting of the Joint Petitioners to discuss the Feasibility Study, the parties decided to move forward with the Demand Study.

PURPOSE OF STUDY

In the Base Extra-Capacity method of cost allocation, as described in AWWA Manual M1 - Principles of Water Rates, Fees, and Charges, the extra capacity portion of the water system is allocated to customer classifications based on the non-coincident demands of each classification. The non-coincident demand is the sum of the peaks for each class regardless of the day or hour such peaks may occur. The purpose of a customer class demand study is to establish a basis for selecting maximum day and maximum hour ratios for each customer classification. The ratios will be used for allocating maximum day and hour extra capacity costs in the cost of service allocation study prepared for the Company's rate filing. The results of the cost of service allocation study are used as a guide for designing the proposed rate structure.

METHOD AND PROCEDURES

Overview

The customers were selected for the study with the objective of obtaining a representative sample of customers in each class. Originally, customer usage was to be monitored for one year, with an extension possible if the weather was deemed insufficiently dry to capture typical peak water use behaviors. In order to determine whether to extend the study in subsequent years, the Palmer Drought Severity Index (PDSI) was used. The National Oceanic and Atmospheric Administration publishes the PDSI, among other measures of drought conditions. The PDSI is a long term measure that is used in determining the severity of droughts. The decision criterion for applying the PDSI to the demand study was that, if there was not at least one summer month (June-August) in which the PDSI was less than 1.0, the study would continue. As shown by the presence of green shading in Table 1-1 below, this threshold was met in the first study year for all but two climate divisions and had been met by August 2014 for all climate divisions. Since neither 2013 nor 2014 had remarkably dry summers, it was deemed worthwhile to continue monitoring through a third summer.

Table 1-1
Palmer (Long Term) Drought Severity Index for Summer 2013, 2014 , and 2015

		2013			2014			2015		
	Cimate Division	June	July	August	June	July	August	June	July	August

Table 1-2 below displays the values for a short-term soil moisture index, the Palmer Moisture Anomaly or "Z" index. This index better reflects the immediate term weather conditions that influence water use for lawn and garden watering. The blue shading indicates relatively moist months and the light orange shading relatively dry months. The table displays that the driest months in general were experienced in late summer of 2015.

	Moderately to very dry (negative 1.25 and lower)

Residential Sample

The source of the usage data for the residential sample is the Company's SCADA information system. The SCADA information system continuously monitors flows through a pump or valve and relays the information to a central location. Some of these monitored pumps or valves serve a closed loop of customers, allowing the data to be used to measure daily and hourly flows for the *group* of residential customers consuming water that passes through that pump or valve.

In order to make the results of the customer demand study representative, residential customers are categorized by housing density to insure that each type of residential user is included. Residential peak demands are primarily influenced by income, lawn size and the amount of precipitation and evapotranspiration. Housing density is used to categorize monitoring points because it represents a measure of both income level and lawn size. The residential monitoring points are located throughout the Company's service area, as indicated in the locator map in Attachment A. The residential class sample consists of approximately 2,500 customers from the following ten SCADA monitoring points that serve a closed loop of exclusively or predominantly residential customers.

System	Housing Density	Residential Customers
Shire Oaks	Low	306
Linnwood	Low	93
Sandy Ridge	Low	31
Sutton Hills	Low	76
Thornburgh and Rosslyn	Medium	649
Winter Road	Medium	212
Ridge Road	Medium	62
Silver	Medium	347
North Strabane	High	106
Millview	High	660
Total		2,542

Commercial Sample

Because the Company serves a large and diverse set of commercial customers, statistical stratified sampling techniques were applied to the design of the commercial sample. The sample design for this report was based on the recommendations of Dr. Berwood Yost, Director of the Floyd Institute's Center for Opinion and Research at Franklin and Marshall College. The sampling used consumption records available for the most recent twelve month period prior to sample design. The customer consumption records were stratified by consumption level into nine strata, using generally accepted statistical techniques for determining strata boundaries. Strata numbers six through nine encompass customers that consume less than 37,000 gallons per year (3,075 gallons per month). The total 2011 consumption by these customers accounted for approximately two percent of total commercial consumption. Because the consumption within these strata is too small to have an impact on the ratio estimates, the customers in these strata were not included in the sampling.

For the five study strata, simple random sampling was used to draw a sample within each stratum. The sampling approach and sample sizes are designed such that each stratum sample yields a reasonable estimate of the consumption for the population of customers within the stratum. This approach of stratification by size, which is common in large populations with skewed distributions, achieves desired precision levels with smaller sample sizes than can be achieved with simple random sampling from the entire population. The total number of customers and the minimum required and actual sample sizes for each stratum are shown in Table 1-3 below. The stratum boundaries and number of customers monitored in each stratum are for the time period when the sample was drawn. The proportion of all commercial customers in each stratum is fixed for the study period by the stratification design; the stratum boundaries vary slightly from year to year as the consumption totals for each customer change. The monitored customers are placed in the stratum for each year based on how their consumption for the year compares to the stratum boundaries for the year. For this reason the number of monitoring points in each stratum varies slightly from year to year.

The commercial customer sample includes monitoring points in each of the Company's six service regions and a broad variety of types including but not limited to apartments, mobile home parks, nursing homes, hotels, office buildings, golf courses, medical facilities, health clubs, stores, restaurants, and private schools.

Table 1-3
Commercial Sample Design

Stratum	Stratum Lower Boundary (1,000 gallons / year)	Number of Customers	Recommended Sample Size	Customers Monitored
1	13,587	94	13	17
2	3,101	597	18	21
3	708	2,790	19	25
4	162	8,163	19	22
5	37	16,053	17	21
Total		27,697	86	106

Monitoring data results support the accuracy of the sample design and selection. The total commercial consumption estimated from the sample varied from the actual total billed consumption for the class by no more than seven percent. This performance exceeds the target used to determine the minimum sample size, which was set in order to produce a 95% likelihood of being within twenty percent of the actual population amount.

Industrial and Public Samples

Both the industrial and public customer classes are characterized by the concentration of consumption among a small number of very large customers. This concentration allows for the production of reasonably reliable estimates with relatively modest sample sizes. The industrial sample included 29 monitoring points representing 25 customer accounts. The consumption at these monitoring points constituted 42% to 44% of total industrial class consumption in the three study years. The public sample included 32 customers, which accounted for 50% to 57% of total public class consumption in the three study years.

Sales for Resale Sample

The study included all six sales for resale customers and a total of nine monitoring points, with one customer having four different meter locations.

Data Collection and Processing Procedures

SCADA monitoring data for residential customers was processed by Company staff on a monthly basis. Hourly flows were estimated by averaging the flows reported for fifteen minute intervals. For systems which included a storage tank, the change in tank level was used to calculate flows into and out of the tank and used in determining net flows to customers for each hour. Because the tank level change and average hourly flow data do not line up precisely, sometimes the net flow calculated after the tank adjustment can appear to indicate a negative flow or an extreme high hour. Another adjustment was made for Thornburgh and Rosslyn, a residential system with two significant non-residential customers. The usage of the large customers was monitored with data logging devices and deducted from the flows for the SCADA monitoring point to yield a net flow for the remaining customers.

Radio read data logging devices were installed on the non-residential sample customers. The device attaches to a customer's meter head and records hourly usage for a fixed period of time, which is then periodically read by a mobile device. The majority of the data logging devices were the "Hot Rod" sold by Mueller/Hersey. The Mueller Hot Rod can store approximately five months of data. Most of the remaining devices were "e-coders" by Neptune, which store data for approximately three months. Several non-residential customers had been fitted with Sensus r900i meters, which have built-in data logging capability, but only keep approximately 31 days of data. Regardless of the device used, Company personnel were on a monthly schedule to download the monitoring data. The accuracy of the data was verified by comparing the logged data to consumption recorded by meter reading for billing purposes.

The hourly and daily monitoring data for each location and customer are summarized in spreadsheet format for each customer class, where each sampled customer's data is in a column, with each day (hour) on a different row. Part III of this report contains the spreadsheets with the daily monitoring data along with hourly data for the day on which the maximum hour occurs. For each day (hour), a consumption per sampled customer is calculated. This amount per average customer is the sum of each customer's consumption divided by the number of customers reporting that day. The *average* customer is calculated because technical difficulties with the data logging equipment or anomalous events at the customer locations can result in the absence of data on any given day for one or several customers. Having a missing data point would result in the simple sum of usage representing an underestimate of the total for that day. As a result, a potential maximum day might be missed.

For sales for resale customers, a total consumption is calculated, because all of the customers are monitored. Use of a total rather than average is advised in this case because the high variance in customer size means that occasional missing datapoints can significantly alter the calculated average and produce false peaks.

Identifying Peaks and Calculating Maximum Day and Hour Ratios

The maximum day (hour) is the highest day (hour) of consumption in the class or stratum as a whole for the year. It is the peak that occurs in the calculated average usage per customer in the stratum or class. The maximum day ratios were calculated for each customer and for the class by dividing the peak day consumption by the annual average consumption per day. Maximum hour ratios were calculated similarly, using hourly peaks and annual hourly averages. For the residential monitoring stations, the annual average usages were calculated from the SCADA monitoring station data. For the non-residential customers, the annual average usages were determined from the billing records over a twelve-month period.

RESULTS OF STUDY

A description and results of the calculations of the maximum day and hour ratios for each customer classification are provided in Part II of the report. Part III contains the detailed tables of monitoring data for each customer and residential SCADA monitoring area. A summary of the resulting calculated ratios for the samples is shown in the Table I-4 below and Figure I-1 on the following page. The selected ratios for use in the Company's future cost of service allocation study are summarized in Table 1-5 below.

Table I-4
Ratio Results from Study Samples

	Maximum Day Ratios			Maximum Hour Ratios		
	2013	2014	2015	2013	2014	2015
Residential	1.79	1.72	1.98	5.68	5.29	6.17
Commercial	2.12	1.96	1.63	4.61	4.02	3.95

Public	1.4	2.4
Sales for Resale	1.4	3.2

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

d. Explain thoroughly the methodology employed if the Company distinguishes between transmission and distribution mains in its allocation of costs.

RESPONSE

For cost allocation purposes, mains that are 10-inch and larger are considered to be transmission mains and are allocated using Factor 3, which is based on average and maximum day extra capacity demands plus the daily requirement for fire demand. Mains sized under 10-inch are considered distribution mains and are allocated using Factor 4, which is based on average and maximum hour extra capacity demands plus the hourly requirement for fire demands.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

e. Provide a detailed explanation of how storage is utilized to meet base, maximum day and maximum hour demands.

RESPONSE

Storage facilities have been considered to be adequate if the effective volume of the facility, or groups of facilities acting together, provided sufficient volume during peak hour demands and to meet equalization needs on the maximum day and provide a fire protection reserve. The effective volume of storage is that quantity, which can be used from the tank while maintaining adequate system pressures under the domestic, and fire flow conditions for distribution mains. The equalization volume is that quantity of water needed to allow production plant or booster station output rates to be constant and equal to the daily demand on the maximum day of the year. The use of equalization storage enables a reasonably constant rate of treatment plant operation and thereby promotes overall system efficiently and economy. Existing storage capacity has also been analyzed on a case-by-case basis to determine its contribution to overall system reliability. Where appropriate recommendations are made if additional storage will significantly improve a system's reliability (e.g., its ability to maintain service to its customers during an emergency, such as a spill or power outage.)

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

f. Provide workpapers, calculations and supporting documentation which develop the equivalent meters and equivalent service weights reflected in the Company's cost of service study.

RESPONSE

The 5/8-inch dollar equivalent was developed using actual installation costs by meter size, provided by the Company for the years 2011-2022, as follows:

Meter Size	Actual Installation Cost 2011-2022	5/8-Inch Dollar Equivalent
5/8"	$ 190.27	1.0
3/4"	289.45	1.5
1"	372.56	2.0
1-1/2"	420.36	2.2
2"	567.97	3.0
3"	1,556.79	8.2
4"	3,864.30	20.3
6"	5,633.17	29.6
8"	6,282.93	33.0
10"	9,745.75	51.2

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1f., cont.

The 3/4-inch dollar equivalent was developed using the actual installation costs by size, for the years 2011-2022, provided by the Company, as follows:

Service Size	Actual Installation Cost 2011-2022	1-Inch Equivalent
3/4" & 1"	$2,186.38	1.00
1-1/2"	3,135.14	1.43
2"	5,589.98	2.56
4"	4,343.38	1.99
6"	6,119.45	2.80
8"	25,508.47	11.67
10"	14,235.83	6.51
12"	27,619.60	12.63

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

g. Provide all workpapers and supporting documentation for the fire flow requirement and duration utilized in the cost of service study.

RESPONSE

The source for the estimated fire protection demand of 20,000 gpm is published fire flow criteria for the population served. The 20,000 gpm estimate is the maximum fire flow requirement generally accepted by published authorities, regardless of population size. This maximum has been established by the National Board of Fire Underwriters (now the American Insurance Association).

General fire-fighting requirements, based on population established by the National Board of Fire Underwriters, are as follows:

a) For populations of 200,00 or less, $Q = 1020 \sqrt{P} (1 - 0.01\sqrt{P})$, where Q is the fire draft in gpm and P is the population in thousands.

b) For populations in excess of 200,00, Q = 12,000 gpm plus 2,000 to 8,000 gpm for a potential second fire.

Inasmuch as PAWC serves a population in excess of 1.6 million, the maximum fire flow of 12,000 gpm would apply. Also, in consideration of the population being well over 200,000, the maximum of the additional allowance to provide for a second fire was selected for a maximum fire flow of 20,000 gpm.

The foregoing requirements were published in Volume I, "Water and Wastewater Engineering," by Fair, Geyer & Okon, published in 1966 by John Wiley & Sons, Inc.

The required fire flow duration is ten hours.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

h. Provide a breakdown of the number and size of private fire services according to the general water service class of customer.

RESPONSE

Please refer to Filing Requirement Section II, Question OR-10a.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

i. Provide a calculation of the Company's base cost of water per unit of consumption.

RESPONSE

The calculation of the base cost of water per hundred gallons is as follows:

Base Cost of Water (See attached Functional Allocation)	$460,475,105
Pro Forma Water Consumption (Hundred Gallons)	445,466,846
Base Cost per Hundred Gallons	$1.0337

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

j. Provide a detailed cost analysis that supports the Company's customer charges, by meter size, showing all direct and indirect costs included.

RESPONSE

Please refer to the attached schedules for the year ended June 30, 2025.

Attention Ashley E. Everette
VP, Rates & Regulatory

Pursuant to your request, we have conducted a cost of service allocation study based on pro forma revenue requirements estimated for the test year ended June 30, 2027.

The attached report presents the results of the allocation study, as well as supporting schedules which set forth the detailed cost allocation calculations. Schedule A presents a comparison of the cost of service by customer classification with the pro forma revenues produced by each classification under present and proposed rates.

Respectfully submitted,

PART I. INTRODUCTION

PENNSYLVANIA AMERICAN WATER COMPANY

WASTEWATER SANITARY SEWER SYSTEM
GENERAL OPERATIONS

COST OF SERVICE ALLOCATION STUDY AS OF
JUNE 30, 2027

PART I. INTRODUCTION

PLAN OF REPORT

The report sets forth the results of the cost of service allocation study for the Sanitary Sewer System General ("SSS") Operations based on pro forma costs as of June 30, 2027, for Pennsylvania-American Water Company. Part I, Introduction, contains statements with respect to the basis of the study, the procedures employed, and a summary of the results of the study. Schedule A summarizes the cost allocation for the SSS Operations and total revenues under present and proposed rates. Part II, Cost of Service by Customer Classification, presents detailed schedules of the allocation of costs to customer classifications, as well as the basis for the allocations.

BASIS OF STUDY

The method used for the allocation of wastewater cost of service incorporates the functional cost allocation methodology described in the text “Financing and Charges for Wastewater Systems,” Manual of Practice No. 27, published by the Water Environment Federation. This method is recognized for allocating the cost of providing wastewater service to customer classifications in proportion to the classifications' use of the commodity, facilities, and services. It is generally accepted as a sound method for allocating the cost of wastewater service. Under the functional cost method, costs are assigned to cost components using

predominant operational purposes as cost-causative factors.

Each element of the cost of service is allocated to customer classifications according to the functional categories. The cost functions are flow, infiltration and inflow (I&I), customer facilities and customer accounting. The functional costs are allocated to customer classifications based on the amount of flow contributed to the system, the amount of I&I allocated to each class, and the number and relative size of customers.

The results for the allocation of SSS Operations cost of service are summarized on Schedule A, column 2. The cost allocation results can be compared with revenues under present and proposed rates in columns 4 and 6 of Schedule A. The proposed increase and percentage increase in revenues are shown in columns 8 and 9.

The cost of service by customer classification is developed in Schedule D. The allocation factors referenced in column 2 are applied to the costs by account in column 3. The allocation factors are set forth in Schedule E.

PART II. COST OF SERVICE BY CUSTOMER CLASSIFICATION

WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1. ALLOCATION OF COSTS ASSOCIATED WITH WASTEWATER TREATMENT

Factors are based on the pro forma test year average daily consumption for each customer classification with adjustments. The detail regarding calculation of adjusted flows can be found on the following page.

Classification	Total Adjusted Average Daily Customer Flow 100 gallons (a)	I&I Gallons Per Day 100 gallons (b)	Total I&I And Average Flow	Allocation Factor	
(1)	(2)	(3)	(4)=(2)+(3)	(7)	
Residential	50,253	46,221	96,474	0.4527	0.6497
Non-Residential	27,491	16,672	44,163	0.2072	0.2974
Large Industrial	1,433	413	1,846	0.0087	0.0124
Bulk Users/VA Hospital	5,336	669 (c)	6,005	0.0282	0.0404
Bulk Users - Contract	57,412	7,198 (c)	64,610	0.3032	
Total	141,925	71,174	213,099	1.0000	

(a) Customer Flow.
(b) Allocation based on Factor 1A for Residential, Non-Residential and Large Industrial.
(c) Equal to 25% of total I&I portion.

FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification	Total Adjusted Average Daily Flow 100 gallons	Average Daily Flow		Number of Service Equivalents	Number of Customers		Allocation Factor
		Factor	Weight		Factor	Weight	
(1)	(2)	(3)	(4)=(3) x 0.3333	(5)	(6)	(7)=(6) x 0.6667	(8)=(4)+(7)
Residential	50,253	0.6347	0.2115	52,591	0.7778	0.5186	0.7301
Non-Residential	27,491	0.3472	0.1157	14,973	0.2214	0.1476	0.2634
Large Industrial	1,433	0.0181	0.0060	50	0.0007	0.0005	0.0065
Total	79,177	1.0000	0.3333	67,614	1.0000	0.6667	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH THE COLLECTION SYSTEM

Factors are based on peak daily flow for each customer classification.

Customer Classification	Ave. Flow Consumption, 100 gpd	Peak I&I Flow 100 gallons (a)	Total Peak I&I And Average	Allocation Factor
(1)	(2)	(3)	(4)=(2)+(3)	(5)
Residential	50,253	262,072	312,325	0.7011
Non-Residential	27,491	94,532	122,023	0.2739
Large Industrial	1,433	2,342	3,775	0.0085
Bulk Users/VA Hospital	5,336	2,007 (b)	7,343	0.0165
Bulk Users - Contract	0	0	-	0.0000
Total	84,513	360,953	445,466	1.0000

(a) Allocation based on Factor 1A.
(b) Equal to 25% of total I&I percentage.

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 3. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PROJECTED AVERAGE DAILY FLOW INCLUDING INFILTRATION AND INFLOW EXCLUDING COATESVILLE BULK USERS

Factors are based on the projected average daily consumption for each customer classification.

Classification	Total Average Daily Flow 100 gallons	Direct I&I Gallons Per Day 100 gallons (a)	Total Direct I&I And Average	Allocation Factor
(1)	(2)	(3)	(4)=(2)+(3)	(7)
Residential	50,253	46,221	96,474	0.4616
Non-Residential	27,491	16,672	44,163	0.2113
Large Industrial	1,433	413	1,846	0.0088
Bulk Users Excl. Coatesville	1,700	213	1,913	0.0092
Bulk Users - Contract	57,412	7,198	64,610	0.3091
Total	138,289	70,718	209,007	1.0000

(a) Allocation based on Factor 1A.
(b) Allocated based on Column 4

FACTOR 3A. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PROJECTED MAXIMUM DAILY FLOW INCLUDING INFILTRATION AND INFLOW EXCLUDING COATESVILLE BULK USERS

Factors are based on the projected average daily consumption for each customer classification.

Classification	Ave. Flow Consumption, 100 gpd	Direct I&I Peak I&I Flow 100 gallons (a)	Total Peak I&I And Average	Allocation Factor
(1)	(2)	(3)	(4)=(2)+(3)	(7)
Residential	50,253	262,072	312,325	0.7091
Non-Residential	27,491	94,532	122,023	0.2770
Large Industrial	1,433	2,342	3,775	0.0086
Bulk Users Excl. Coatesville	1,700	639	2,339	0.0053
Bulk Users - Contract	-	-	-	-
Total	80,877	359,586	440,463	1.0000

(a) Allocation based on Factor 1A.
(b) Allocated based on Column 4

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 4. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

Customer Classification	Number of Customers	Service Equiv. Ratio (a)	Service Equivalents	Allocation Factor
(1)	(2)	(3)	(2)X(3)=(4)	(5)
Residential	52,591	1.0	52,591	0.7718
Non-Residential	5,989	2.5	14,973	0.2197
Large Industrial	2	25.0	50	0.0007
Bulk Customers/VA	14	25.0	350	0.0051
Bulk Users - Contract	7	25.0	175	0.0026
Total	58,604		68,139	1.0000

(a) Based on ratio by class for Coatesville service area.

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

Customer Classification	Number of Customers	Allocation Factor
(1)	(2)	(3)
Residential	52,591	0.89537
Non-Residential	5,989	0.10196
Large Industrial	2	0.00003
Bulk Customers/VA	148	0.00252
Bulk Users - Contract	7	0.00012
Total	58,737	1.00000

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 6. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

Customer Classification	Direct Labor Expense	Allocation Factor
(1)	(2)	(3)
Residential	$ 3,016,057	0.5100
Non-Residential	1,274,408	0.2155
Large Industrial	49,419	0.0084
Bulk Users/VA Hospital	149,806	0.0253
Bulk Users - Contract	1,424,458	0.2409
Total	$ 5,914,147	1.0000

FACTOR 7. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS, MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	$ 423,797,162	0.5810
Non-Residential	172,552,958	0.2366
Large Industrial	5,884,966	0.0081
Bulk Users/VA Hospital	11,453,906	0.0157
Bulk Users - Contract	115,714,014	0.1586
Total	$ 729,403,006	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER SANITARY SEWER SYSTEM GENERAL OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 8. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

Factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below.

Customer Classification	Original Cost Measure of Value	Allocation Factor
(1)	(2)	(3)
Residential	$ 384,051,109	0.5808
Non-Residential	156,342,185	0.2365
Large Industrial	5,333,803	0.0081
Bulk Users/VA Hospital	10,401,601	0.0157
Bulk Users - Contract	105,064,199	0.1589
Total	$ 661,192,897	1.0000

FACTOR 9. ALLOCATION OF REGULATORY COMMISSION EXPENSES, ASSESSMENTS AND OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor
(1)	(2)	(3)
Residential	$ 71,481,182	0.5670
Non-Residential	28,685,337	0.2275

APPENDIX A

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

a. A description of the allocation methods used. A comparison of the allocated cost of service by class with the present and proposed revenues. A cost of service schedule showing the Rate of Return produced by present and proposed rates by class of service.

RESPONSE

A description of the methods used for the cost of service study is provided in Exhibit 12-B and in PAWC Statement No. 12. A comparison of the allocated cost of service by class with the present and proposed revenues is provided on Schedule A of Exhibit 12-B.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

b. Indicate if the method used for establishing the allocation factors in the Cost of Service Study deviates from the previous study submitted in the last rate case. If yes, indicate which allocation factors were changed and discuss the reason for the changes.

RESPONSE

The methods used for establishing the allocation factors in the cost of service study have not deviated from the previous study submitted in the last case.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

c. Supply the average day, the maximum day and the maximum hour deliveries to the system adjusted for storage for the test year and two prior years. Also provide workpapers, analyses, comparative data or other documentation supporting the estimated maximum day and peak hour demands by customer class reflected in the Company's cost of service study.

RESPONSE

Not applicable.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

d. Explain thoroughly the methodology employed if the Company distinguishes between transmission and distribution mains in its allocation of costs.

RESPONSE

Not applicable.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

e. Provide a detailed explanation of how storage is utilized to meet base, maximum day and maximum hour demands.

RESPONSE

There is no storage for this system.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

f. Provide workpapers, calculations and supporting documentation which develop the equivalent meters and equivalent service weights reflected in the Company's cost of service study.

RESPONSE

There are no meter or service equivalents calculated for this study.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

g. Provide all workpapers and supporting documentation for the fire flow requirement and duration utilized in the cost of service study.

RESPONSE

Because this is a wastewater operation, there is no fire flow requirements.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

h. Provide a breakdown of the number and size of private fire services according to the general water service class of customer.

RESPONSE

Not applicable.

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

i. Provide a calculation of the Company's base cost of water per unit of consumption.

RESPONSE

The calculation of the average flow cost per hundred gallons is as follows:

Total Flow Cost	$63,146,750
Pro Forma Usage (Hundred Gallons) (Includes Estimated Unmetered)	51,802,635
Flow Cost per Hundred Gallons	$1.21899

PENNSYLVANIA AMERICAN WATER COMPANY

RESPONSES TO RATE STRUCTURE
AND COST OF SERVICE FILING REQUIREMENTS

RS1. Provide a complete (fully allocated) cost of service study if an interval of approximately three years has passed between a previous cost of service study and the historic test year date of the current filing. The cost of service study shall provide the necessary data to determine if the water rate structure is fair and equitable to all classifications of water users (including public and private fire protection customers) and reflects, as nearly as possible, the cost of providing the service. The study shall correspond to the test year proposed revenue requirements (future test year only, if used). Summaries of conclusions and all back-up calculations shall be made part of the submission of the cost of service study, and shall include the following:

j. Provide a detailed cost analysis that supports the Company's customer charges, by meter size, showing all direct and indirect costs included.

RESPONSE

Please refer to the attached schedules.

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTORS 1 and 2. ALLOCATION OF COSTS ASSOCIATED WITH AVERAGE DAILY FLOWS.

Factors are based on the pro forma test year average daily consumption for each customer classification.

Classification	Total Average Daily Customer Flow 100 gallons (a)	I&I Average Day 100 gallons (b)	Total Sanitary Average Flow	Allocation Factor 1	Average Day CSO 100 gallons	Total Average Day Wastewater Flow	Allocation Factor 2
(1)	(2)	(3)	(4)=(2)+(3)	(5)	(6)	(7)=(4)+(6)	(8)
Residential	35,973	23,203	59,176	0.5101		59,176	0.2273
Non-Residential	24,959	11,150	36,109	0.3112		36,109	0.1387
Industrial	2,878	1,042	3,920	0.0338		3,920	0.0151
Bulk	14,038	2,775	16,813	0.1449		16,813	0.0646
Stormwater CSO	-	-	-	-	144,320	144,320	0.5544
Total	77,848	38,170	116,018	1.0000	144,320	260,338	1.0000

(a) Customer water usage from bill analysis, adjusted to reflect 88% returned to sewer system. See below.
(b) Allocation based on Factor 1A for Residential, Non-Residential and Industrial.

Classification	Annual Usage 100 gallons	Average Day 100 gallons	Percent to Sewer System	Adjusted Average Day 100 gallons
(1)	(2)	(3)=(2)/365	(6)	(7)
Residential	14,920,458	40,878	88.0%	35,973
Non-Residential	10,352,440	28,363	88.0%	24,959
Industrial	1,193,733	3,271	88.0%	2,878
Bulk	5,822,549	15,952	88.0%	14,038
Total	32,289,180	88,464		77,848

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification	Total Average Daily Flow 100 gallons	Average Daily Flow		Service Equivalents (Factor 5)			Allocation Factor 1A
		Factor	Weight	Number	Factor 5	Weight	
(1)	(2)	(3)	(4)=(3) x 0.3333	(5)	(6)	(7)=(6) x 0.6667	(8)=(4)+(7)
Residential	35,973	0.4621	0.1540	40,926	0.6808	0.4539	0.6079
Non-Residential	24,959	0.3206	0.1069	16,705	0.2779	0.1853	0.2921
Industrial	2,878	0.0370	0.0123	1,350	0.0225	0.0150	0.0273
Bulk	14,038	0.1803	0.0601	1,135	0.0189	0.0126	0.0727
Total	77,848	1.0000	0.3333	60,116	1.0000	0.6667	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTORS 3 and 4. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PEAK DAILY FLOW.

Factors are based on the peak daily flow for each customer classification.

Classification	Total Average Daily Customer Flow 100 gallons (a)	I&I Peak Day 100 gallons (b)	Total Sanitary Peak Flow	Allocation Factor 3	Peak Day CSO 100 gallons	Total Peak Day Wastewater Flow	Allocation Factor 4
(1)	(2)	(3)	(4)=(2)+(3)	(5)	(6)	(7)=(4)+(6)	(8)
Residential	35,973	299,176	335,149	0.5880		335,149	0.2515
Non-Residential	24,959	143,769	168,728	0.2960		168,728	0.1266
Industrial	2,878	13,433	16,311	0.0286		16,311	0.0122
Bulk	14,038	35,774	49,812	0.0874		49,812	0.0374
Stormwater CSO	-	-	-	-	762,500	762,500	0.5722
Total	77,848	492,152	570,000	1.0000	762,500	1,332,500	1.0000

(a) See Factor 1.
(b) Allocated based on Factor 1A

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

Customer Classification	Number of Customers	Service Equiv. Ratio	Service Equivalents	Allocation Factor
(1)	(2)	(3)	(2)X(3)=(4)	(5)
Residential	40,926	1.0	40,926	0.6808
Non-Residential	6,682	2.5	16,705	0.2779
Industrial	54	25.0	1,350	0.0225
Bulk	553	*	1,135 *	0.0189
Stormwater CSO	-	-	-	-
Total	48,215		60,116	1.0000

* Based on 529 aggregated residential customers and 26 Bulk customers at 25.0 service equivalent ratio.

FACTOR 6. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

Customer Classification	Number of Customers	Allocation Factor
(1)	(2)	(3)
Residential	40,926	0.8488
Non-Residential	6,682	0.1386
Industrial	54	0.0011
Bulk	553	0.0115
Stormwater CSO	-	-
Total	48,215	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 7. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

Customer Classification	Direct Labor Expense	Allocation Factor
(1)	(2)	(3)
Residential	$ 1,786,833	0.2411
Non-Residential	1,002,906	0.1353
Industrial	105,667	0.0143
Bulk	454,745	0.0614
Stormwater CSO	4,061,957	0.5480
Total	$ 7,412,109	1.0000

FACTOR 8. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS, MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	$ 186,716,230	0.3183
Non-Residential	93,020,001	0.1586
Industrial	8,947,764	0.0153
Bulk	27,269,320	0.0465
Stormwater CSO	270,581,415	0.4613
Total	$ 586,534,730	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
WASTEWATER COMBINED SEWER SYSTEM OPERATIONS

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 9. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

Factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below.

Customer Classification	Original Cost Measure of Value	Allocation Factor
(1)	(2)	(3)
Residential	$ 165,629,458	0.3183
Non-Residential	82,514,716	0.1586
Industrial	7,937,303	0.0153
Bulk	24,191,881	0.0465
Stormwater CSO	240,019,751	0.4613
Total	$ 520,293,109	1.0000

FACTOR 10 and 10A. ALLOCATION OF REGULATORY COMMISSION EXPENSES, ASSESSMENTS, OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor 10	Total Cost of Service with Stormwater Reallocated	Allocation Factor 10A
(1)	(2)	(3)	(4)	(5)
Residential	$ 30,872,042	0.3238	$ 56,924,476	0.5959
Non-Residential	15,337,230	0.1609	27,858,998	0.2916
Industrial	1,487,349	0.0156	2,657,170	0.0278
Bulk	4,967,186	0.0521	8,082,608	0.0846
Stormwater CSO	42,679,063	0.4476	-	-
Total	$ 95,342,871	1.0000	$ 95,523,251	1.0000

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1. ALLOCATION OF COSTS ASSOCIATED WITH WASTEWATER TREATMENT

Factors are based on the pro forma test year average daily consumption for each customer classification with adjustments. The detail regarding calculation of adjusted flows can be found on the following page.

Classification	Total Adjusted Average Daily Customer Flow 100 gallons (a)	I&I Gallons Per Day 100 gallons (b)	Total I&I And Average Flow	Allocation Factor
(1)	(2)	(3)	(4)=(2)+(3)	(7)
Residential	13,729	21,018	34,748	0.6773
Non-Residential	8,775	7,392	16,167	0.3151
VA Hospital	239	153	391	0.0076
Total	22,743	28,563	51,306	1.0000

(a) Customer Flow.
(b) Allocation based on Factor 1A for Residential, Non-Residential and Large Industrial.

FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification	Total Adjusted Average Daily Flow 100 gallons	Average Daily Flow		Number of Service Equivalents	Number of Customers		Allocation Factor
		Factor	Weight		Factor	Weight	
(1)	(2)	(3)	(4)=(3) x 0.3333	(5)	(6)	(7)=(6) x 0.6667	(8)=(4)+(7)
Residential	13,729	0.6037	0.2012	14,398	0.8019	0.5346	0.7358
Non-Residential	8,775	0.3858	0.1286	3,506	0.1953	0.1302	0.2588
VA Hospital	239	0.0105	0.0035	50	0.0028	0.0019	0.0054
Total	22,743	1.0000	0.3333	17,954	1.0000	0.6667	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
BUTLER AREA SEWER AUTHORITY ("BASA") OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 2. ALLOCATION OF COSTS ASSOCIATED WITH THE COLLECTION SYSTEM

Factors are based on peak daily flow for each customer classification.

Customer Classification	Ave. Flow Consumption, 100 gpd	Peak I&I Flow 100 gallons (a)	Total Peak I&I And Average	Allocation Factor
(1)	(2)	(3)	(4)=(2)+(3)	(5)
Residential	13,729	98,646	112,375	0.7167
Non-Residential	8,775	34,694	43,469	0.2772
VA Hospital	239	718	956	0.0061
Total	22,743	134,057	156,800	1.0000

(a) Allocation based on Factor 1A.

FACTOR 3. ALLOCATION OF CAPITAL COSTS ASSOCIATED WITH PROJECTED AVERAGE DAILY FLOW INCLUDING INFILTRATION AND INFLOW

Factors are based on the projected average daily consumption for each customer classification.

Classification	Total Average Daily Flow 100 gallons	I&I Gallons Per Day 100 gallons (a)	Total Direct I&I And Average	Allocation Factor
(1)	(2)	(3)	(4)=(2)+(3)	(7)
Residential	13,729	21,018	34,748	0.6773
Non-Residential	8,775	7,392	16,167	0.3151
VA Hospital	239	153	391	0.0076
Total	22,743	28,563	51,306	1.0000

(a) Allocation based on Factor 1A.

FACTOR 3A. NOT USED IN THIS ALLOCATION

PENNSYLVANIA AMERICAN WATER COMPANY
BUTLER AREA SEWER AUTHORITY ("BASA") OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 4. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

Customer Classification	Number of Customers	Service Equiv. Ratio (a)	Service Equivalents	Allocation Factor
(1)	(2)	(3)	(2)X(3)=(4)	(5)
Residential	14,398	1.0	14,398	0.8019
Non-Residential	1,403	2.5	3,506	0.1953
VA Hospital	2	25.0	50	0.0028
Total	15,803		17,954	1.0000

(a) Based on ratio by class for Coatesville service area.

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

Customer Classification	Number of Customers	Allocation Factor
(1)	(2)	(3)
Residential	14,398	0.9111
Non-Residential	1,403	0.0888
VA Hospital	2	0.0001
Total	15,803	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
BUTLER AREA SEWER AUTHORITY ("BASA") OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 6. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

Customer Classification	Direct Labor Expense	Allocation Factor
(1)	(2)	(3)
Residential	$ 788,181	0.6773
Non-Residential	366,716	0.3151
VA Hospital	8,879	0.0076
Total	$ 1,163,776	1.0000

FACTOR 7. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS, MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	$ 170,830,921	0.6954
Non-Residential	73,118,779	0.2976
VA Hospital	1,704,614	0.0069
Total	$ 245,654,315	0.9999

PENNSYLVANIA AMERICAN WATER COMPANY
BUTLER AREA SEWER AUTHORITY ("BASA") OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 8. ALLOCATION OF INCOME TAXES AND INCOME AVAILABLE FOR RETURN.

Factors are based on the allocation of the original cost measure of value rate base as shown on the following pages and summarized below.

Customer Classification	Original Cost Measure of Value	Allocation Factor
(1)	(2)	(3)
Residential	$ 170,845,523	0.6958
Non-Residential	72,981,811	0.2972
VA Hospital	1,700,680	0.0069
Total	$ 245,528,015	1.0000

FACTOR 9. ALLOCATION OF REGULATORY COMMISSION EXPENSES, ASSESSMENTS AND OTHER WATER REVENUES.

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor
(1)	(2)	(3)
Residential	$ 32,645,560	0.7013
Non-Residential	13,593,650	0.2920
VA Hospital	314,162	0.0067
Total	$ 46,553,371	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY
BUTLER AREA SEWER AUTHORITY ("BASA") OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 9A. ALLOCATION OF REVENUE FROM WATER RATES

The factors are based on the allocation of the total cost of service, excluding those items being allocated.

Customer Classification	Total Cost of Service	Allocation Factor
(1)	(2)	(3)
Residential	$ 32,645,560	0.7013
Non-Residential	13,593,650	0.2920
VA Hospital	314,162	0.0067
Total	$ 46,553,371	1.000

PENNSYLVANIA AMERICAN WATER COMPANY
BUTLER AREA SEWER AUTHORITY ("BASA") OPERATIONS
FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 10. ALLOCATION OF ADMINISTRATIVE AND GENERAL EXPENSES

Factors are based on the allocation of all other operation and maintenance expenses excluding purchased water, power, chemicals and waste disposal.

Customer Classification	Operation & Maintenance Expenses	Allocation Factor
(1)	(2)	(3)
Residential	$ 2,433,975	0.7305
Non-Residential	878,695	0.2637
VA Hospital	19,463	0.0058
Total	$ 3,332,134	1.0000

FACTOR 11. ALLOCATION OF CASH WORKING CAPITAL

Factors are based on the allocation of operation and maintenance expenses including purchased water, power, chemicals and waste disposal.

Customer Classification	Operation & Maintenance Expenses	Allocation Factor
(1)	(2)	(3)
Residential	$ 5,205,552	0.7187
Commercial	1,992,077	0.2750
VA Hospital	45,156	0.0062
Total	$ 7,242,785	1.0000

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 1A. ALLOCATION OF INFILTRATION AND INFLOW BY CUSTOMER CLASS.

Factors are based on a 1/3-2/3 weighting of flow and number of customers, as follows:

Customer Classification	Total Average Daily Flow 100 gallons	Average Daily Flow		Service Equivalents (Factor 5)			Allocation Factor 1A
		Factor	Weight	Number	Factor 5	Weight	
(1)	(2)	(3)	(4)=(3) x 0.3333	(5)	(6)	(7)=(6) x 0.6667	(8)=(4)+(7)
Residential	607	0.2903	0.0968	602		0.1676	0.2644
Non-Residential	103	0.0493	0.0164	165	0.0689	0.0459	0.0624
Bulk	1,381	0.6604	0.2201	1,627	0.6797	0.4531	0.6733
Total	2,091	1.0000	0.3333	2,394	0.7486	0.6667	1.0000

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 5. ALLOCATION OF COSTS ASSOCIATED WITH CUSTOMER FACILITIES.

Factors are based on the estimated relative cost of customer facilities, as follows:

Customer Classification	Number of Customers	Service Equiv. Ratio	Service Equivalents	Allocation Factor
(1)	(2)	(3)	(2)X(3)=(4)	(5)
Residential	602	1.0	602	0.2514
Non-Residential	66	2.5	165	0.0689
Bulk	1,627	*	1,627 *	0.6797
Stormwater CSO	-	-	-	-
Total	2,295		2,394	1.0000

* Based on 514 aggregated residential customers and 49 Bulk customers at 25.0 service equivalent ratio.

FACTOR 6. ALLOCATION OF COSTS ASSOCIATED WITH BILLING AND COLLECTING.

Factors are based on the number of customers.

Customer Classification	Number of Customers	Allocation Factor
(1)	(2)	(3)
Residential	602	0.2623
Non-Residential	66	0.0288
Bulk	1,627	0.7089
Stormwater CSO	-	-
Total	2,295	1.0000

FACTORS FOR ALLOCATING COST OF SERVICE TO CUSTOMER CLASSIFICATIONS

FACTOR 7. ALLOCATION OF LABOR RELATED TAXES AND BENEFITS.

Factors are based on the allocation of direct labor expense.

Customer Classification	Direct Labor Expense	Allocation Factor
(1)	(2)	(3)
Residential	$ 28,125	0.1320
Non-Residential	4,222	0.0198
Bulk	37,830	0.1775
Stormwater CSO	142,946	0.6707
Total	$ 213,123	1.0000

FACTOR 8. ALLOCATION OF ORGANIZATION, FRANCHISES AND CONSENTS, MISCELLANEOUS INTANGIBLE PLANT AND OTHER RATE BASE ELEMENTS.

Factors are based on the allocation of the original cost less depreciation other than those items being allocated, as follows:

Customer Classification	Original Cost Less Depreciation	Allocation Factor
(1)	(2)	(3)
Residential	$ 4,783,246	0.1741
Non-Residential	1,095,519	0.0399
Bulk	11,952,033	0.4350
Stormwater CSO	9,643,416	0.3510
Total	$ 27,474,214	1.0000

PENNSYLVANIA AMERICAN WATER COMPANY

X. CONCLUSIONS AND RECOMMENDATION 70

I. WITNESS IDENTIFICATION AND QUALIFICATIONS

Q. Please state your name, occupation and business address.

A. My name is Ann E. Bulkley. I am employed by The Brattle Group as a Principal. My business address is One Beacon Street, Suite 2600, Boston, Massachusetts 02108.

Q. On whose behalf are you submitting this testimony?

A. I am submitting this testimony before the Pennsylvania Public Utility Commission ("Commission") on behalf of Pennsylvania-American Water Company ("PAWC" or the "Company"), a wholly owned subsidiary of American Water Works Company, Inc. ("AWK").

Q. Please describe your background and professional experience in the energy and utility industries.

A. I hold a Bachelor of Art degree in Economics and Finance from Simmons College and a Master of Science degree in Economics from Boston University, with over 30 years of experience consulting to the energy industry. I have advised numerous energy and utility clients on a wide range of financial and economic issues with primary concentrations in valuation and utility rate matters. Many of these assignments have included the determination of the cost of capital for valuation and ratemaking purposes. My qualifications are presented in more detail in Attachment A.

II. PURPOSE AND OVERVIEW OF TESTIMONY

Q. What is the purpose of your Direct Testimony?

A. The purpose of my testimony is to present evidence and provide a recommendation regarding the appropriate return on equity ("ROE") for the Company's water and wastewater operations in Pennsylvania to be used for ratemaking purposes, as well as assess the reasonableness of the Company's proposed capital structure.

Q. Are you sponsoring any exhibits in support of your Direct Testimony?

A. Yes. My analyses and recommendations are supported by the data presented in Schedules 1 through 20 of Exhibit No. 13-A.

Q. Please provide a brief overview of the analyses that led to your ROE recommendation.

A. I estimate the market-based cost of equity by applying traditional estimation methodologies to a proxy group of comparable utilities, including the constant growth form of the Discounted Cash Flow ("DCF") model, the Capital Asset Pricing Model ("CAPM"), and the Empirical Capital Asset Pricing Model ("ECAPM"). My recommendation also takes into consideration the business and regulatory risk of the Company relative to the proxy group, and the Company's proposed capital structure as compared with the capital structures of the operating utilities of the proxy group companies. While I do not make specific adjustments to my ROE recommendation for these factors, I do consider them in the aggregate when determining where my recommended ROE falls within the range of the analytical results.

Q. How is the remainder of your Direct Testimony organized?

A. The remainder of my testimony is organized as follows:

- Section III provides a summary of my analyses and conclusions.
- Section IV reviews the regulatory guidelines pertinent to the development of the cost of capital.
- Section V discusses current and projected capital market conditions and the effect of those conditions on PAWC's cost of equity.
- Section VI explains my selection of the proxy group for PAWC.
- Section VII describes my analyses and the analytical basis for my recommendation of the appropriate ROE for PAWC.
- Section VIII provides a discussion of specific regulatory, business, and financial risks that have a direct bearing on the ROE to be authorized for PAWC in this case.
- Section IX provides an assessment of the reasonableness of PAWC's proposed capital structure relative to the proxy group.
- Section X presents my conclusions and recommendations.

III. SUMMARY OF ROE ANALYSES AND CONCLUSIONS

Q. Please provide a brief overview of the analysis that led to your ROE recommendation.

A. The key factors that I consider in my cost of equity analyses and recommended ROE for the Company in this proceeding are:

- The United States Supreme Court's *Hope* and *Bluefield* decisions[1] established the standards for determining a fair and reasonable authorized ROE for public utilities, including consistency of the allowed return with the returns of other businesses having similar risk, adequacy of the return to provide access to capital and support credit quality, and the requirement that the result lead to just and reasonable rates.

- The effect of current and prospective capital market conditions on the cost of equity estimation models and on investors' return requirements.

- The results of several analytical approaches that provide estimates of the Company's cost of equity. Because the Company's authorized ROE should be a forward-looking estimate over the period during which the rates will be in effect, these analyses rely on forward-looking inputs and assumptions (e.g., projected analyst growth rates in the DCF model, forecasted risk-free rate and market risk premium in the CAPM analysis).

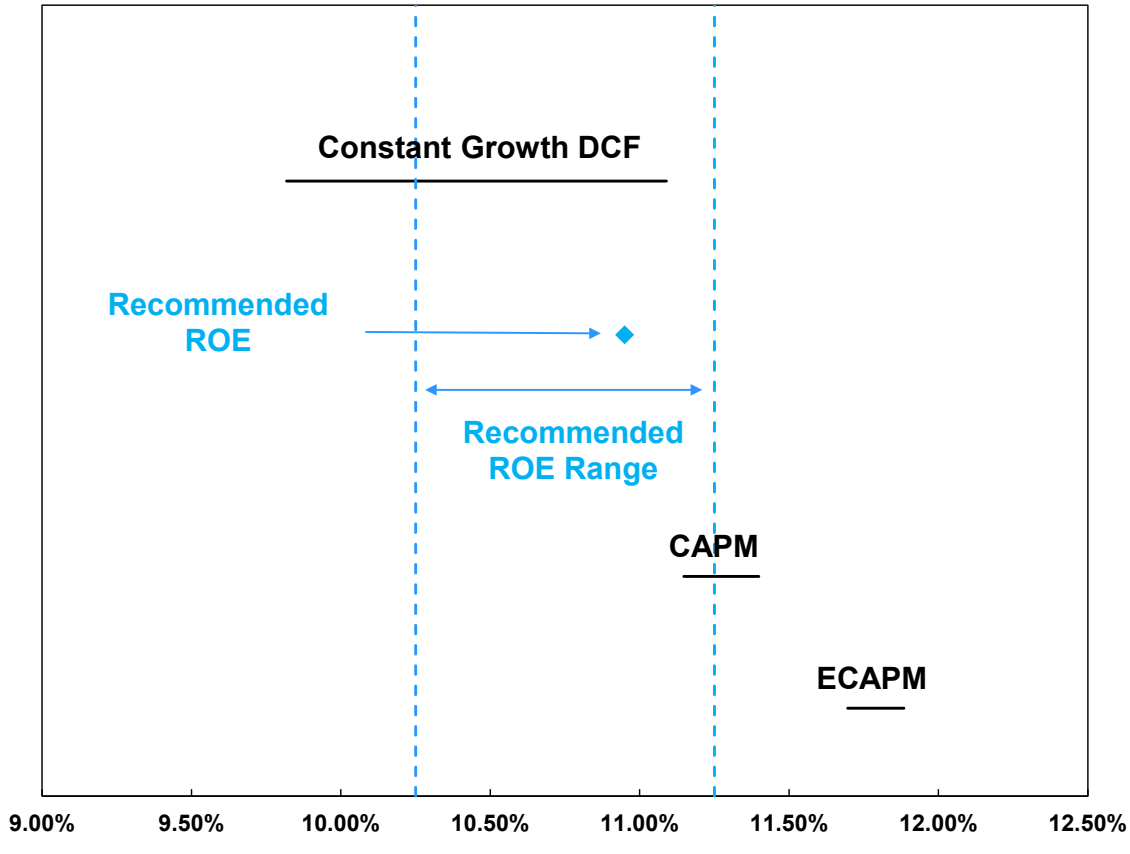
- Although the companies in my proxy group are generally comparable to PAWC, each company is unique, and no two companies have the exact same business and financial risk profiles. Accordingly, I have considered the Company's regulatory, business, and financial risks relative to the proxy group of comparable companies in determining where the Company's ROE should fall within the reasonable range of analytical results to appropriately account for any residual differences in risk.

Q. What are the results of the models that you have used to estimate the cost of equity for PAWC?

A. Figure 1 (also see Schedule 1 of Exhibit No. 13-A) summarizes the range of results produced by the Constant Growth DCF, CAPM, and ECAPM analyses.

[1] *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591 (1944) ("*Hope*"); *Bluefield Waterworks & Improvement Co., v. Public Service Commission of West Virginia*, 262 U.S. 679 (1923) ("*Bluefield*").

Figure 1: Summary of Cost of Equity Results



Q. What is your conclusion regarding the appropriate authorized ROE for PAWC in this proceeding?

A. Considering the analytical results presented in Figure 1 current and prospective capital market conditions, as well as the level of regulatory, business, and financial risk faced by PAWC's water operations relative to the proxy group, a range for the authorized ROE from 10.25 percent to 11.25 percent, which takes into consideration both the low and high end of the range of results in the models, is reasonable. Taking into consideration the results of the analytical models, current market conditions, and the Company's relative risk, and strong management performance, an ROE of 10.95 percent is reasonable and appropriate.

Q. Is the Company's requested capital structure reasonable and appropriate?

A. Yes. The Company's proposed common equity ratio of 55.33 percent for the thirteen-month period ending June 30, 2027, is within the equity ratio range of the utility operating subsidiaries of the proxy group companies, and well within the range of the equity ratios for those same companies.

IV. REGULATORY PRINCIPLES

Q. Please describe the principles that guide the establishment of the cost of capital for a regulated utility.

A. The United States Supreme Court's *Hope* and *Bluefield* decisions established the standards for determining the fairness or reasonableness of a utility's authorized ROE. Among the standards established by the Court in those cases are: (1) consistency with other businesses having similar or comparable risks; (2) adequacy of the return to support credit quality and access to capital; and

(3) the principle that the specific means of arriving at a fair return are not important, only that the end result leads to just and reasonable rates.[2]

Q. How did the Court connect the achievement of a fair rate of return to the provision of utility service?

A. In *Bluefield*, a proper rate of return not only assures "confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit [but also] enable[s the utility] to raise the money necessary for the proper discharge of its public duties."[3]

Q. Has the Commission provided similar guidance in establishing the appropriate return on common equity?

A. Yes. The Commission follows the precedents of the *Hope* and *Bluefield* cases and acknowledges that utility investors are entitled to a fair and reasonable return. This position was set forth by the Commission as follows:

> In determining a fair rate of return, the Commission must adhere to the constitutional standards established by the United States Supreme Court in the seminal cases *Bluefield Water Works and Improvement Co. v. Public Service Comm'n of West Virginia*, 262 U.S. 679, 692-93 (1923) (Bluefield) and *Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591*, 603 (1944) (Hope Natural Gas). In *Bluefield*, the Supreme Court stated:
>
> A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be

[2] *Bluefield*, 262 U.S. at 692-93; *Hope*, 320 U.S. at 603.
[3] *Bluefield*, 262 U.S. at 693.

> reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be too high or too low by changes affecting opportunities for investment, the money market and business conditions generally.

Twenty years later in *Hope Natural Gas*, the Supreme Court reiterated:

> From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. By that standard the return to equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital.[4]

Q. Why is it important for a utility to be allowed the opportunity to earn a return that is adequate to attract equity capital on reasonable terms?

A. An authorized ROE that is adequate to attract capital on reasonable terms enables PAWC to continue providing safe, reliable water and wastewater service while maintaining its financial integrity. That return should be commensurate with returns expected elsewhere in the market for investments of equivalent risk. If the authorized ROE is not comparable to the returns available for comparable risk investments, it is not just the value to current equity holders that will be harmed, but rather, access to incremental equity is also affected. It is reasonable to expect that equity investors will seek alternative investment opportunities for which the

[4] Pennsylvania Public Utility Commission, Opinion and Order, PECO Energy Company – Gas Division, Docket No. R-2020-3018929, June 17, 2021, at 8.

expected return reflects the perceived risks, thereby inhibiting the Company's ability to attract new equity capital at a reasonable cost. When the Company is afforded a reasonable opportunity to earn its market-based cost of capital, a fair and reasonable balance will be achieved between customers' and shareholders' interests.

Q. Is a utility's ability to attract capital also affected by the ROEs that are authorized for other utilities?

A. Yes. Utilities compete directly for capital with other investments of similar risk, which include other water, natural gas and electric utilities. Therefore, the ROE authorized to a utility sends an important signal to investors regarding whether there is regulatory support for financial integrity, dividends, growth, and fair compensation for business and financial risk. The cost of capital represents an opportunity cost to investors. If higher returns are available elsewhere for other investments of comparable risk over the same time period, investors have an incentive to direct their capital to those investments. Thus, an authorized ROE significantly below authorized ROEs for other comparable utilities can inhibit a utility's ability to attract capital for investment.

Q. What is the standard for setting the ROE in any jurisdiction?

A. The stand-alone ratemaking principle is the foundation of jurisdictional ratemaking. This principle requires that the rates charged in any operating jurisdiction be for the costs incurred in that jurisdiction. The stand-alone ratemaking principle ensures that customers in each jurisdiction only pay for the costs of the service provided in that jurisdiction, which is not influenced by the business operations in

other operating companies. In order to maintain this principle, the cost of equity analysis is performed for an individual operating company as a stand-alone entity. As such, I have evaluated the investor-required return for PAWC's operations in Pennsylvania.

Q. Does the fact that the Company is wholly owned by AWK, a publicly traded company, affect your analysis?

A. No. In this proceeding, consistent with stand-alone ratemaking principles, it is appropriate to establish the cost of equity for PAWC, not its publicly traded parent, AWK. More importantly, however, it is appropriate to establish a cost of equity and capital structure that provides PAWC the ability to attract capital on reasonable terms, both on a stand-alone basis and within AWK. Although the Company is committed to investing the required capital to provide safe and reliable service, because it is a subsidiary of AWK, the Company competes with the other AWK subsidiaries for proactive investment capital. In determining how to allocate its finite proactive capital resources, it would be reasonable for AWK to consider the authorized ROE of each of its subsidiaries.

Q. Is the regulatory framework and the authorized ROE and equity ratio important to the financial community?

A. Yes. The regulatory framework is one of the most important factors in debt and equity investors' assessments of risk. Specifically, regarding debt investors, credit rating agencies consider the authorized ROE and equity ratio for regulated utilities to be very important for two reasons: (1) they help determine the cash flows and credit metrics of the regulated utility; and (2) they provide an indication of the

degree of regulatory support for credit quality in the jurisdiction. To the extent that the authorized returns in a jurisdiction are lower than the returns that have been authorized more broadly, credit rating agencies will consider this in the overall risk assessment of the regulatory jurisdiction in which the company operates. Not only do credit ratings affect the overall cost of borrowing, they also act as a signal to equity investors about the risk of investing in the equity of a company.

Q. What are your conclusions regarding regulatory guidelines?

A. The ratemaking process is premised on the principle that, in order for investors and companies to commit the capital needed to provide safe and reliable utility services, a utility must have a reasonable opportunity to recover the return of, and the market-required return on, its invested capital. Accordingly, the Commission's order in this proceeding should establish rates that provide the Company with a reasonable opportunity to earn an ROE that is (1) adequate to attract capital at reasonable terms; (2) sufficient to ensure its financial integrity; and (3) commensurate with returns on investments in enterprises with similar risk. It is important for the ROE authorized in this proceeding to take into consideration current and projected capital market conditions, as well as investors' expectations and requirements for both risks and returns. Because utility operations are capital-intensive, regulatory decisions should enable the utility to attract capital at reasonable terms under a variety of economic and financial market conditions. Providing the opportunity to earn a market-based cost of capital supports the financial integrity of the Company, which is in the interest of both customers and shareholders.

V. CAPITAL MARKET CONDITIONS

Q. Why is it important to analyze capital market conditions?

A. Capital market conditions influence cost of equity models by affecting inputs in the model at the time the analysis is performed. While the ROE that is established in a rate proceeding is intended to be forward-looking, the analyst uses current and projected market data, specifically stock prices, dividends, growth rates and interest rates, in the models to estimate the required return for the subject company.

Analysts and regulatory commissions recognize the importance of considering how these conditions impact cost of equity estimation models when determining the appropriate range and recommended ROE for a future period. If investors do not expect current market conditions to be sustained in the future, it is possible that the cost of equity estimation models will not provide an accurate estimate of investors' required return during that rate period. Therefore, it is important to consider projected market data to estimate the return of the forward-looking period.

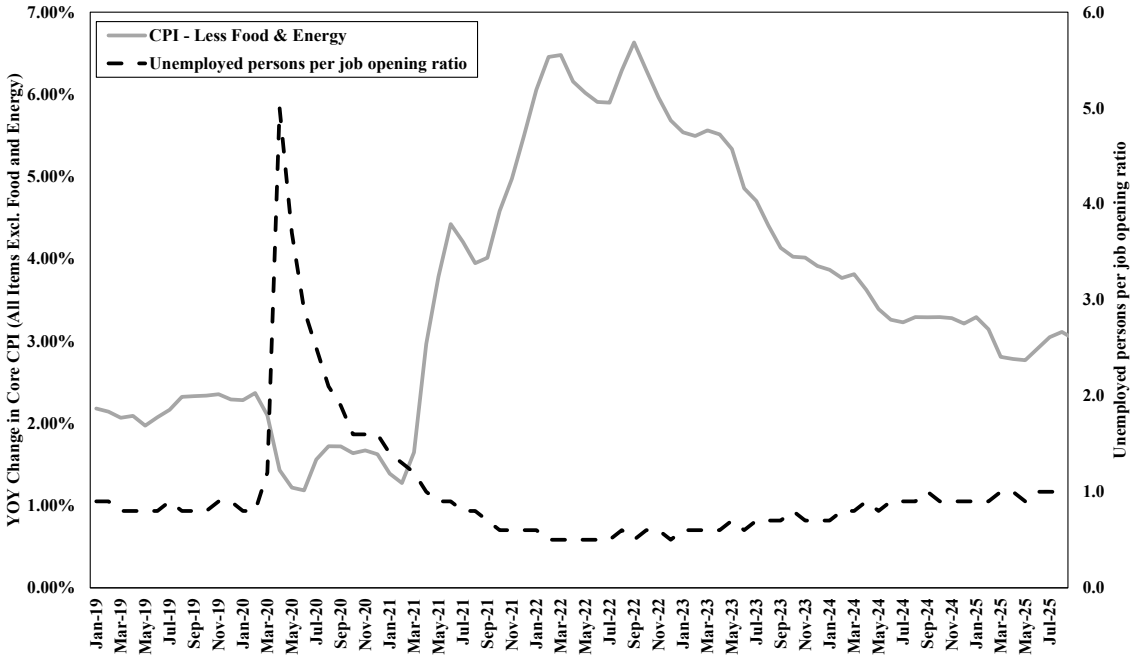
Q. What has the level of inflation been over the past few years?

A. As shown in Figure 2 core inflation increased steadily beginning in early 2021, rising from 1.40 percent in January 2021 to a high of 6.64 percent in September 2022, which was the largest 12-month increase since 1982.[5] While core inflation had declined, it continues to remain above the Federal Reserve's target level of 2.00 percent.

[5] *Bloomberg,* Pickert, Reade, "Core US Inflation Rises to 40-Year High, Securing Big Fed Hike," Oct. 13, 2022.

Because the Federal Reserve's dual mandate is to promote stable prices and employment, considering employment data, in addition to inflation, is important. The ratio of unemployed persons per job opening was 1.0 in August 2025 (the most recent data available at the time of this testimony) and has been consistently at or below 1.00 since April 2021, suggesting a tighter labor market. The strength in the labor market has allowed the Federal Reserve to prioritize reducing inflation by pursuing the necessary restrictive monetary policy needed to achieve its 2.00 percent target benchmark.

Figure 2: Core Inflation and Unemployed Persons-to-Job Openings, January 2019 to September 2025[6]



Q. What policy actions did the Federal Reserve enact to respond to increased inflation?

A. The dramatic increase in inflation prompted the Federal Reserve to pursue an aggressive normalization of monetary policy, removing the accommodative policy programs used to mitigate the economic effects of COVID-19. Between the March 2022 Federal Open Market Committee ("FOMC") meeting and the July 2023

[6] Bureau of Labor Statistics. Figure 3 presents the year-over-year ("YOY") change in core inflation, as measured by the Consumer Price Index ("CPI") excluding food and energy prices as published by the Bureau of Labor Statistics. I consider core inflation because it is the preferred inflation indicator of the Federal Reserve for determining the direction of monetary policy. Core inflation is preferred by the Federal Reserve because it removes the effect of food and energy prices, which can be highly volatile.

FOMC meeting, the Federal Reserve increased the target federal funds rate through a series of increases from a range of 0.00 – 0.25 percent to a range of 5.25 percent to 5.50 percent.

Q. How did yields on long-term government bonds respond to the Federal Reserve's normalization of monetary policy?

A. Since the Federal Reserve's December 2021 meeting, the yield on 10-year Treasury bonds has increased by over 350 basis points, increasing from 1.47 percent on December 15, 2021, to a peak of 4.98 percent in October 2023. It currently remains well above 2021 levels (i.e., 4.16 percent as of September 30, 2025).[7]

Q. Has the Federal Reserve reduced the federal funds rates?

A. Yes. The Federal Reserve reduced the federal funds rate by 50 basis points in September 2024, 25 basis points in November 2024, 25 basis points in December 2024, and more recently 25 basis points in September 2025 and October 2025. At the September 2025 meeting, the Federal Reserve noted that it was continuing to assess the risks to both inflation and employment, but that the "downside risks to employment have risen" and, as a result, concluded that it was the appropriate time for a rate decrease after having kept rates unchanged in 2025.[8]

Q. What is the expected path of monetary policy over the near-term?

A. At the September 2025 FOMC meeting, Chairman Powell noted that while inflation has increased and remains "somewhat" elevated, the unemployment rate has

[7] S&P Capital IQ Pro.
[8] Federal Reserve, Press Release, September. 17, 2025.

"edged up" and "job gains have slowed" indicating an increase in the downside risks to employment.[9] As a result, the FOMC reduced the federal rate by 25 basis points to a range of 4.00 percent to 4.25 percent.[10] Regarding the possible path of monetary policy, Chairman Powell acknowledged increased uncertainty due to the implementation of government policy changes by the Trump administration, in particular, the changes in tariffs, and that there is still uncertainty whether the effect of tariffs on inflation will be "short-lived" or "more persistent."[11] Given the risks to both inflation and employment, Chairman Powell stated the stance of monetary policy will continue to be based on incoming data and the "balance of risks" and the Federal Reserve remains well positioned to respond to economic developments.[12] The FOMC is currently forecasting two additional rate cuts before the end of 2025 and one rate cut in 2026.[13] At the October meeting, Chairman Powell indicated that a "further reduction in the policy rate at the December meeting is not a foregone conclusion. Far from it… Policy is not on a preset course."[14]

Q. What has happened to the yields on long-term government bonds since the FOMC reduced the Federal Funds Rate in September 2024?

A. As shown in Figure 3 below, while the yield on the 10-year Treasury bond declined prior to the time of the first federal funds rate cut, the yield has generally increased

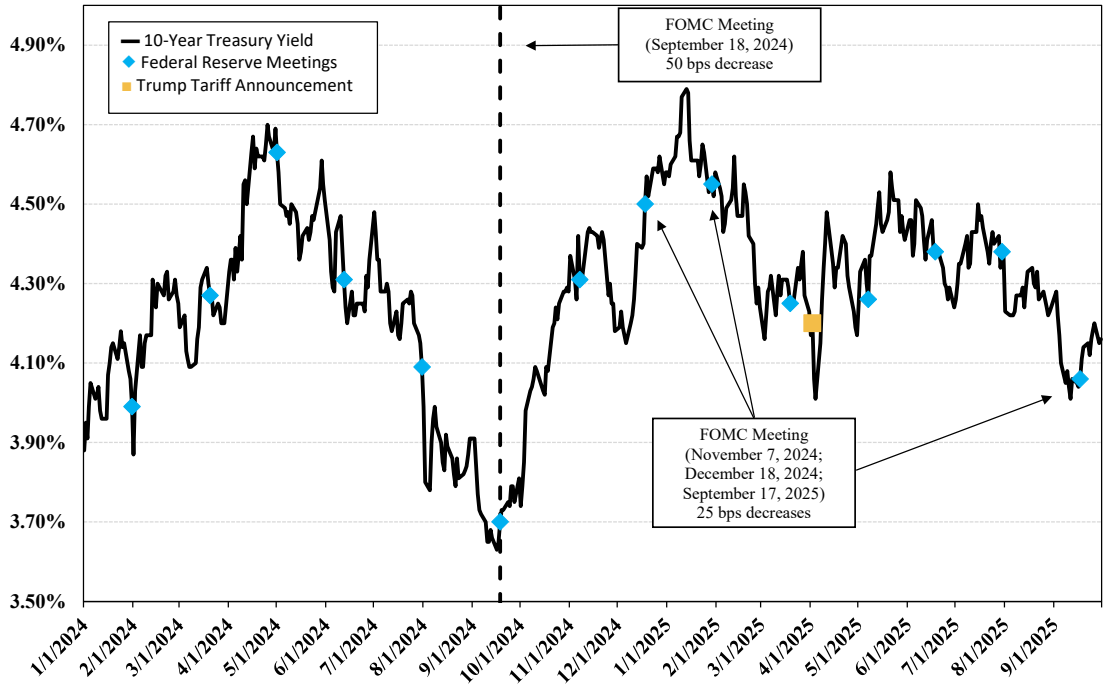
since the September 2024 FOMC meeting. As of September 30, 2025, the 10-year Treasury bond yield was 4.16 percent, which is consistent with levels seen in July 2024, several months prior to the reductions in the federal funds rate.

Figure 3: 10-Year Treasury Bond Yield – January 2024 through September 2025[15]



Q. Why have long-term interest rates increased since the federal reserve reduced the federal funds rate in September 2024?

A. Investors view key elements of President Trump's economic plan, such as tax cuts, immigration policy, and tariffs, as inflationary.[16] For example, since his

[15] S&P Capital IQ Pro.

[16] The increase in long-term government bond yields was initially related to investors responding to an increasing probability of a Trump Administration in 2025 and has continued since President Trump's re-election and inauguration. (Davide Barbuscia and Lewis Krauskopf, "Bond rebound uncertain as Trump plans overshadow Fed rate cuts," *Reuters*, November. 8, 2024.)

inauguration in January 2025, President Trump announced several sets of tariffs on each of the U.S.'s trading partners, including but not limited to his announcement on April 2, 2025, implementing a "baseline line" tariff of 10 percent on all imports, reciprocal tariffs on countries that failed to negotiate a trade deal that went into effect on August 7, 2025, as well as the 50 percent tariffs on steel, aluminum, and copper and 25 percent tariffs on imported cars.[17] The implemented tariffs are largely viewed as inflationary. Inflation affects bonds, in particular long-term government bonds, because it erodes the value of future bonds payments. Therefore, in an inflationary environment, investors will demand higher returns on bonds to compensate for the added risk of inflation, thus bond prices decline and the yields on bonds increase. The longer the duration of the bond, the greater the effect of inflation, which is why inflation risk is greater for long-term government bonds. The significant tariff policy increases the risk that inflation will remain elevated, which is why the yields on long-term bonds have not decreased and in fact have increased since the Federal Reserve first reduced the federal funds rate in September 2024. Further, the use of tariffs strains the relationship with trading partners, which could result in a reduction in the foreign demand for long-term U.S. government bonds and lead to additional upward pressure on long-term government bond yields.[18]

[17] Jennifer Clarke, "What Are Tariffs, How Do They Work and Why Is Trump Using Them?" *BBC News*, Aug. 27, 2025.

[18] Karishma Vanjani, "U.S. Treasury Bonds Sell Off as 30-Year Yield Rises Most Since 1982," *Barron's*, Apr. 9, 2025.

Q. What are expectations for the yields on long-term government bonds?

A. While the Federal Reserve is forecasting additional cuts to the federal funds rate in 2025 and 2026, economists are still expecting elevated long-term interest rates. In the most recently published report by *Blue Chip Financial Forecasts*, the consensus estimate of economists is that the 30-year Treasury bond yield will remain stable and decrease only slightly from 4.70 percent in Q4/2025 to 4.60 percent in Q1/2027.[19] This is important because it means that long-term interest rates are expected to remain elevated during the period that the Company's rates will be in effect.

Q. What are your conclusions regarding the effect of current market conditions on the cost of equity for the Company?

A. It is important to consider current and projected market conditions in setting the forward-looking ROE due to its effect on the estimated cost of equity. While the FOMC reduced the federal funds rate at its September and October 2025 meetings, Chairman Powell has indicated that the Federal Reserve will continue to rely on incoming data to determine future adjustments to the federal funds rate. Further, long-term interest rates remain elevated and are expected to continue to remain elevated due to inflationary policies such as tariffs, immigration policy, and tax cuts. With long-term interest rates expected to remain relatively high, borrowing also remains relatively more expensive, which means the cost of capital has increased. As a result, investors demand a higher cost of equity, which means

[19] *Blue Chip Financial Forecasts*, Vol. 44, No. 6, June 2, 2025, at 14.

the cost of equity has increased and is expected to remain elevated over the near term.

VI. PROXY GROUP SELECTION

Q. Please provide a brief profile of PAWC.

A. PAWC is a wholly owned subsidiary of AWK that provides water distribution service to approximately 688,000 customers and wastewater service to approximately 115,000 customers in Pennsylvania.[20] In 2024, PAWC's total operating revenues were $1,039 million, which is 24.20 percent of total regulated operating revenues for PAWC's parent company, AWK.[21] The Company can access debt markets through American Water Capital Corp. ("AWCC") or independently. The current credit ratings for PAWC are as follows: (1) S&P: A- (Outlook: Stable);[22] and (2) Moody's: A3 (Outlook: Positive).[23] Additionally, the current credit ratings on senior unsecured debt for AWK and AWCC are as follows: (1) S&P: A (Outlook: Stable);[24] and (2) Moody's: Baa1 (Outlook: Stable).[25]

Q. Why have you used a group of proxy companies to estimate the cost of equity for PAWC?

A. In this proceeding, I estimate the cost of equity for PAWC, which is a rate-regulated subsidiary of AWK. Because the ROE is a market-based concept, and given the fact that PAWC's operations do not make up the entirety of a publicly traded entity, it is necessary to establish a group of companies that is both publicly traded and

[20] American Water Works Company, Inc., 2024 SEC Form 10-K, at 4.
[21] *Id*.

[23] Moody's Investors Service.
[24] S&P Capital IQ.
[25] Moody's Investors Service.

comparable to the Company in certain fundamental business and financial respects to serve as its "proxy" for purposes of the ROE estimation process. Even if the Company is publicly traded, it is possible that transitory events could bias its market value over a given period. A significant benefit of using a proxy group is that it moderates the effects of unusual events that may be associated with any one company. The proxy companies used in my analyses all possess a set of operating and financial risk characteristics that are substantially comparable to PAWC, and, therefore, provide a reasonable basis for deriving the appropriate ROE.

Q. How did you select the companies in your proxy group?

A. I began with the group of U.S. utilities that *Value Line* classifies as "Water Utilities" and "Natural Gas Distribution Companies." That combined group includes 15 domestic U.S. utilities.[26] I simultaneously applied the following screening criteria to select companies that:

- pay consistent quarterly cash dividends because companies that do not cannot be analyzed using the Constant Growth DCF model;
- have an investment grade long-term issuer rating;
- have positive long-term earnings growth forecasts from at least two equity analysts;
- derive more than 70.00 percent of their total operating income from regulated operations; and
- were not parties to a merger or transformative transaction during the analytical periods relied on.

[26] Includes nine natural gas companies and six water companies.

Q. Do you include AWK in your proxy group?

A. No. It is not appropriate to include AWK in the proxy group used to determine the authorized ROE for PAWC because of the circular logic that would occur. For example, in the current proceeding, the ROE for PAWC is being determined, which in turn contributes to the ROE of its parent company, AWK. PAWC is a significant subsidiary of AWK. For its regulated businesses, PAWC has the most customers among AWK subsidiaries, and accounts for 24.20 percent of AWK's operating revenues, the second only to New Jersey American Water.[27] If AWK were included in the proxy group, AWK would be used to determine its own subsidiary's ROE. Therefore, to avoid the circular logic, I have excluded AWK from my proxy group for PAWC.

Q. Does your proxy group include Essential Utilities ("WTRG")?

A. Yes. As seen in Schedule 3, WTRG meets both my operating income screening criterion and Pennsylvania's Bureau of Investigation & Enforcement's ("I&E's") preferred revenue screening criterion, which requires companies to generate at least 50.00 percent of total revenue from water operations.[28] As of 2024, WTRG generates 58.57 percent of revenue from water operations.[29]

---

[27] American Water Works Company, Inc., 2024 SEC Form 10-K, at 4; New Jersey accounts for 24.50 percent of operating revenue, the highest share among all states where AWK operates.

[28] Essential Utilities Inc. 2024 SEC Form 10-K, at 118; Pennsylvania Public Utility Commission, Docket Nos. 2023-3043189 & R-2023-304190, Direct Testimony of D.C. Patel, Feb. 1, 2024, at 9.

[29] As of October 27, 2025, American Water Works Company, Inc. and Essential Utilities announced an intention to merge; however, the analyses presented in my Direct Testimony rely on data through September 30, 2025, which does not include the effects of this merger. Therefore, the proxy group currently includes Essential Utilities.

Q. Why did you consider natural gas distribution companies in the proxy group?

A. *Value Line* currently classifies only six companies as water utilities and there is limited analyst coverage for these companies. Therefore, the universe of water utilities is already small before a set of screening criteria are applied. Additionally, there is currently a trend towards consolidation in the utility industry, which reduces the number of available proxy companies.[30] Because there are a small number of companies that are available for inclusion in the proxy group, I also consider natural gas distribution companies that meet the screening criteria.

Q. Are natural gas distribution companies reasonably comparable to water utilities to be included in a proxy group used to estimate the cost of equity for a water utility?

A. Yes, it is reasonable to consider natural gas distribution companies for purposes of establishing a proxy group of companies that are reasonably comparable to PAWC. PAWC is a regulated utility distribution company, which is similar to other regulated utility distribution companies that provide natural gas service. The screening criteria I have specified requires that a company derive more than 70.00 percent of its operating income from regulated operations. Therefore, the natural gas distribution companies included in my proxy group generate a large portion of

[30] Chediak, Mark, et al. "Utility M&A Is So Hot Not Even Berkshire's Billions Won a Bid." Bloomberg.com, Bloomberg, 3 Jan. 2018, www.bloomberg.com/news/articles/2018-01-03/utility-m-a-is-so-hot-not-even-berkshire-s-billions-won-a-bid.

their operating income from regulated operations similar to PAWC and the water utilities included in the proxy group.

Recent consolidation in the utility industry demonstrates the similar nature of water and natural gas distribution utilities. Consolidation within the water utility industry is not limited to water-only utilities; there have also been acquisitions that have involved the merger of a natural gas utility with a water utility and an electric utility with a water utility. For example, in 2017, Northwest Natural Gas Company ("Northwest Natural") acquired Salmon Valley Water Company and Falls Water Company, two water utilities operating in the Pacific Northwest, and one of the reasons cited for the merger was the similarity in operating characteristics and risk profiles of the natural gas and water utilities. In an interview regarding the transaction, the CEO of Northwest Natural noted:

> While these transactions and the companies' continuing operations are not expected to have a material impact on NW Natural's financial results, we view these acquisitions as the first step in a broader strategy. The water utility sector has a risk profile and business model that is similar to our core gas utility. There are also substantial investment opportunities over the long term, as water infrastructure needs to be replaced and upgraded to serve growing communities with safe, clean drinking water.[31]

Similarly, in 2020, Essential completed the acquisition of PNG Companies, LLC, a natural gas utility operating in Pennsylvania, West Virginia, and Kentucky. In discussing the acquisition, Essential's Chairman and CEO Chris Franklin noted

[31] Northwest Natural Gas Company, Press Release, "NW Natural Expands into Regulated Water Utility Sector with Acquisitions in Oregon and Idaho," Dec. 21, 2017.

that "both gas and water utilities are underground utilities, and that the systems share a common burden of being old and in need of replacement." However, he said, "rates will not go up for 'a number of years,' and … any increase would require approval from the PUC."[32]

Q. Have other regulators considered the inclusion of other utility industry segments in the proxy group used to estimate the cost of equity for a water utility?

A. Yes. The Massachusetts Department of Public Utilities ("MDPU"), the Florida Public Service Commission ("FPUC") and the Illinois Commerce Commission ("ICC") have considered the results of a proxy group that includes natural gas companies when determining the authorized ROE for water utilities. For example:

- In Docket No. 17-90, the MDPU determined that the use of a natural gas utility proxy group was appropriate for the purpose of demonstrating the comparability of the investment risk of the proxy group to Aquarion Water Company.[33]

- In Docket No. 20180006-WS, the FPUC modified the methodology used to estimate the ROE for water and wastewater utilities in Florida to include a combined proxy group of natural gas and water utilities.[34] The FPUC has previously relied on a natural gas only proxy group to estimate the ROE for water and wastewater utilities;[35] however, to increase the size of the proxy group, the FPUC decided to rely on a combined proxy group. Specifically, the FPUC noted:

---

[32] Margaret J. Krauss, "Aqua America Will Buy Peoples Gas For $4.3 Billion," 90.5 WESA (NPR), Jan. 16, 2020.

[33] Massachusetts Department of Public Utilities, Docket No. 17-90, Oct. 31, 2018, at 286-287.

[34] Florida Public Service Commission, Docket No. 20180006-WS, Order No. PSC-2018-0327-PAA-WS, June 26, 2018, at 7.

[35] Florida Public Service Commission, Docket No. 170006-WS, Order No. PSC-17-0249-PAA-WS, June 26, 2017, at 2.

> The leverage formula methodology shall be modified to include a combined proxy group of natural gas and WAW utilities as proxy companies in calculating the leverage formula. We find that the selected natural gas utilities and WAW utilities that derive at least 50 percent of their revenue from regulated rates. These utilities have market power and are influenced significantly by economic regulation. In Attachment 1, the returns calculated using the proxy group are adjusted to reflect the risks faced by Florida WAW utilities. The updated index consists of five natural gas companies and seven WAW companies that derive at least 50 percent of their total revenue from regulated operations. These companies have a median Standard and Poor's bond rating of "A."[36]

In Case No. 22-0210, for Illinois-American Water Company, the ICC agreed that a proxy group of water and public utility companies was a reasonable sample upon which to apply the various COE estimation models.[37]

Q. Have you compared financial risk metrics of the water utilities and natural gas utilities in your proxy group?

A. Yes. I review *Value Line* safety rankings,[38] *Value Line* timeliness rankings,[39] *Value Line* betas, and standard deviation of daily price returns data since 2020. As shown in Figure 4 below, these metrics demonstrate that the natural gas companies and water companies in my proxy group have similar risk characteristics.

---

[36] Florida Public Service Commission, Docket No. 20180006-WS, Order No. PSC-2018-0327-PAA-WS, June 26, 2018, at 8.

[37] Illinois Commerce Commission, Docket No. 22-0210, Order, Dec. 15, 2022, at 102.

[38] *Value Line's* Safety ranking measures the risk associated with a stock, considering financial strength and volatility. The ranking is from 1 (highest) to 5 (lowest).

[39] *Value Line's* Timeliness ranking measures the forecasted relative market performance in the next 12 months. The ranking is from 1 (highest and most likely to outperform most stocks) to 5 (lowest and most likely to underperform most stock).

Figure 4: Water and Natural Gas Companies Comparison[40]

	Water	Natural Gas
Safety Ranking	2.00	1.83
Timeliness Ranking	3.60	3.80
Beta	0.80	0.75
Annualized Std. Dev.	31.00%	29.50%

Q. What is the composition of your proxy group?

A. The screening criteria discussed above resulted in a proxy group consisting of the companies in Figure 5.

Figure 5: Proxy Group

Essential Utilities, Inc.	WTRG

[40] Bloomberg Professional; *Value Line*, July 4, 2025 and Aug. 22, 2025.

Q. Is there sufficient analyst coverage of the water and natural gas proxy group companies?

A. While there is limited analyst coverage of the water utilities, there is more coverage of the natural gas utilities. As discussed in more detail later in my testimony, I rely on three sources for growth rates: *Value Line*, *S&P Capital IQ*, and *Zacks Investment Research* ("*Zacks")*. An individual analyst prepares each of the *Value Line* reports for all companies. *S&P Capital IQ* reports the number of estimates that contribute to their projected growth rates. As shown in Figure 6**.** below, the only water utility proxy company that has multiple analysts contributing to the forecast is Essential Utilities, whereas there are multiple analysts contributing estimates for the majority of the natural gas utilities in the proxy group. Further, in many cases, the growth rate reported by *Zacks* is the same growth rate as the *S&P Capital IQ* estimate. In those cases, so as not to overweight the projections of an analyst, I do not include the duplicate estimate reported by *Zacks* in my analysis. Therefore, as shown in Schedule 4 of Exhibit No. 13-A, the number of growth rate estimates relied upon from *Zacks* that are independent from the *S&P Capital IQ* growth rates is limited.

VII. COST OF EQUITY ESTIMATION

Q. Please briefly discuss the ROE in the context of the regulated rate of return ("ROR").

A. The overall ROR for a regulated utility is based on its weighted average cost of capital, in which the costs of the individual sources of capital are weighted by their respective book values. While the costs of debt and preferred stock can be directly observed, the cost of equity is market-based and, therefore, must be estimated based on observable market data.

Q. How is the required ROE determined?

A. The required ROE is estimated by using multiple analytical techniques that rely on market-based data to quantify investor expectations regarding required equity returns, adjusted for certain incremental costs and risks. Quantitative models produce a range of reasonable results from which the market-required ROE is selected. That selection must be based on a comprehensive review of relevant data and information and does not necessarily lend itself to a strict mathematical solution. The key consideration in determining the cost of equity is to ensure that

the methodologies employed reasonably reflect investors' views of the financial markets in general and of the subject company (in the context of the proxy group) in particular.

Q. What methods did you use to determine PAWC's cost of equity?

A. I consider the results of the Constant Growth DCF model, the CAPM, and the ECAPM. As discussed in more detail below, a reasonable ROE estimate appropriately considers alternative methodologies and the reasonableness of their individual and collective results.

A. Importance of Multiple Analytical Approaches

Q. Why is it important to use more than one analytical approach?

A. Because the cost of equity is not directly observable, it must be estimated based on both quantitative and qualitative information. When faced with the task of estimating the cost of equity, analysts and investors are inclined to gather and evaluate as much relevant data as reasonably can be analyzed. Several models have been developed to estimate the cost of equity, and I use multiple approaches to estimate the cost of equity. As a practical matter, however, all of the models available for estimating the cost of equity are subject to limiting assumptions or other methodological constraints. Consequently, many well-regarded finance texts recommend using multiple approaches when estimating the cost of

equity. For example, Copeland, Koller, and Murrin[42] suggest using the CAPM and Arbitrage Pricing Theory model.

Q. Has the Commission made similar findings regarding the reliance on multiple models?

A. Yes, the Commission has recognized the benefits of using multiple models in two recent proceedings. In its 2024 decision in PAWC's most recent rate proceeding, the Commission rejected I&E's recommendation to ignore the CAPM results and gave equal weight to I&E's DCF and CAPM results in determining an appropriate ROE for the Company. In doing so, the Commission concurred with the Administrative Law Judge's conclusion that the Company had "convincingly argued" that higher inflation, higher interest rates and capital costs exist and are likely to continue.[43]

In a 2012 decision for PPL Electric Utilities, while noting that the Commission has traditionally relied primarily on the DCF method to estimate the cost of equity for regulated utilities, the Commission recognized that market conditions were causing the DCF model to produce results that were much lower than other models such as the CAPM and Risk Premium. The Commission's Order explained:

> Sole reliance on one methodology without checking the validity of the results of that methodology with other cost of equity analyses does not always lend itself to responsible ratemaking. We conclude that methodologies other than the DCF can be used as a check

[42] Tom Copeland, Tim Koller and Jack Murrin, Valuation: Measuring and Managing the Value of Companies, 3d ed. (New York: McKinsey & Company, Inc., 2000), at 214.

[43] Pennsylvania Public Utility Commission, Pennsylvania-American Water Company, R-2023-3043189 and R-2023-3043190, July 11, 2024, at 194.

> upon the reasonableness of the DCF derived equity return calculation.[44]

The Commission ultimately concluded:

> As such, where evidence based on the CAPM and RP methods suggest that the DCF-only results may understate the utility's current cost of equity capital, we will give consideration to those other methods, to some degree, in determining the appropriate range of reasonableness for our equity return determination.[45]

Q. Are you aware of any other regulatory commissions that have recognized the importance of considering the results of multiple models?

A. Yes, several regulatory commissions consider the results of multiple ROE estimation methodologies such as the DCF, CAPM, and ECAPM in determining the authorized ROE, including the Minnesota Public Utilities Commission,[46] the Michigan PSC,[47] the Iowa Utilities Board ("IUB"),[48] the Washington Utilities and Transportation Commission ("Washington UTC"),[49] and the New Jersey Board of Public Utilities ("NJBPU").[50] For example, the Washington UTC has repeatedly emphasized that it "places value on each of the methodologies used to calculate

the cost of equity and does not find it appropriate to select a single method as being the most accurate or instructive."[51] The Washington UTC has also explained that "[f]inancial circumstances are constantly shifting and changing, and we welcome a robust and diverse record of evidence based on a variety of analytics and cost of capital methodologies."[52]

Additionally, in its recent order for DTE Gas Company ("DTE Gas") in Case No. U-18999, the Michigan PSC considered the results of each of the models presented by the ROE witnesses, which included the DCF, CAPM, and ECAPM in the determination of the authorized ROE.[53] The Commission also considered authorized ROEs in other states, increased volatility in capital markets and the company-specific business risks of DTE Gas.

B. Constant Growth DCF Model

Q. Please describe the DCF approach.

A. The DCF approach is based on the theory that a stock's current price represents the present value of all expected future cash flows. In its most general form, the DCF model is expressed as follows:

$$P_0 = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \cdots + \frac{D_\infty}{(1+k)^\infty} \qquad [1]$$

[51] *Wash. Utils. & Transp. Comm'n v. PacifiCorp*, Docket UE-130043, Order 05, n.89 (Dec. 4, 2013).

[52] *Wash. Utils. & Transp. Comm'n v. PacifiCorp*, Docket UE-100749, Order 06, ¶ 91 (Mar. 25, 2011).

[53] Michigan Public Service Commission Order, DTE Gas Company, Case No. U-18999, Sept. 13, 2018, at 45-47.

Where P_0 represents the current stock price, $D_1 \ldots D_\infty$ are all expected future dividends, and k is the discount rate, or required ROE. Equation [1] is a standard present value calculation that can be simplified and rearranged into the following form:

$$k = \frac{D_0(1+g)}{P_0} + g \qquad [2]$$

Equation [2] is often referred to as the Constant Growth DCF model in which the first term is the expected dividend yield and the second term is the expected long-term growth rate.

Q. What assumptions are required for the Constant Growth DCF model?

A. The Constant Growth DCF model requires the following four assumptions: (1) a constant growth rate for earnings and dividends; (2) a stable dividend payout ratio; (3) a constant price-to-earnings ratio; and (4) a discount rate greater than the expected growth rate. To the extent that any of these assumptions are not objectively valid, considered judgment and/or specific adjustments should be applied to the results.

Q. What market data did you use to calculate the dividend yield in your Constant Growth DCF model?

A. The dividend yield in my Constant Growth DCF model is based on the proxy companies' current annual dividend and average closing stock prices over the 30-, 90-, and 180-trading days as of September 30, 2025.

Q. Why do you use three averaging periods for stock prices?

A. I use an average of recent trading days to calculate the term P_0 in the DCF model to reflect current market data, while also ensuring that the result of the model is not skewed by anomalous events that may affect stock prices on any given trading day.

Q. Do you make any adjustments to the dividend yield to account for periodic growth in dividends?

A. Yes. Since utility companies tend to increase their quarterly dividends at different times throughout the year, it is reasonable to assume that dividend increases will be evenly distributed over calendar quarters. Given that assumption, it is reasonable to apply one-half of the expected annual dividend growth rate for purposes of calculating the expected dividend yield component of the DCF model. This adjustment ensures that the expected first-year dividend yield is, on average, representative of the coming 12-month period, and does not overstate the aggregated dividends to be paid during that time.

Q. Why is it important to select appropriate measures of long-term growth in applying the DCF model?

A. In its Constant Growth form, the DCF model (i.e., Equation [2]) assumes a single long-term growth rate in perpetuity. One must assume that the dividend payout ratio remains constant and that earnings per share, dividends per share, and book value per share all grow at the same constant rate in order to reduce the long-term growth rate to a single measure. Over the long run, however, dividend growth can

only be sustained by earnings growth. For example, earnings growth rates tend to be least influenced by capital allocation decisions that companies may make in response to near-term changes in the business environment. Since such decisions may directly affect near-term dividend payout ratios, estimates of earnings growth are more indicative of long-term investor expectations than are dividend or book value growth estimates.

Q. What sources of long-term growth rates did you rely on in your Constant Growth DCF model?

A. My Constant Growth DCF model incorporates the following sources of long-term earnings growth rates: (1) *Zacks Investment Research* ("*Zacks*"); (2) *S&P Capital IQ Pro*; and (3) *Value Line*.

Q. Why do you believe that projected earnings growth rates are the appropriate growth rates in the DCF model?

A. Earnings are the fundamental driver of a company's ability to pay dividends; therefore, projected EPS growth is the appropriate measure of a company's long-term growth. In contrast, changes in a company's dividend payments are based on management decisions related to cash management and other factors. For example, a company may decide to retain earnings rather than pay out a portion of those earnings to shareholders through dividends. Therefore, dividend growth rates are less likely than earnings growth rates to reflect accurately investor perceptions of a company's growth prospects.

Q. How did you calculate the range of results for the Constant Growth DCF model?

A. I calculate a low-end result for my DCF model using the minimum growth rate of the three sources (i.e., the lowest of the *Zacks*, *S&P Capital IQ Pro*, and *Value Line* projected earnings growth rates) for each of the proxy group companies. I use a similar approach to calculate a high-end result, using the maximum growth rate of the three sources for each proxy group company. Lastly, I calculate the mean results using the average growth rate from all three sources for each proxy group company.

Q. Is your DCF approach generally consistent with I&E's past methods?

A. Yes. In PAWC's prior rate case, I&E used a Constant Growth DCF. I&E's growth rates were based on the average of five-year analyst forecasted earnings from *Yahoo! Finance*, *Zacks*, and *Value Line,* which is consistent with the assumption used in my DCF analysis except that *Yahoo! Finance* no longer reports consensus projected three- to five-year earnings growth rates. I rely on consensus three- to five-year earnings growth rates reported by *S&P Capital IQ Pro* in my DCF.

I&E's dividend yield assumption was based on the average of the spot dividend yield and a 52-week average dividend yield. I&E's recommended ROE was based on the average of the individual proxy group company cost of equity estimates

using the DCF model.[54] Additionally, as discussed above, I rely on expected dividend yields.

Q. Please summarize the results of your Constant Growth DCF analyses.

A. The results of my Constant Growth DCF analyses are presented in Schedule 4 of Exhibit No. 13-A, and Figure 7 summarizes the results.

Figure 7: Constant Growth DCF Results

	Minimum Growth Rate	Average Growth Rate	Maximum Growth Rate
30-Day Avg. Stock Price	9.78%	10.39%	11.05%
90-Day Avg. Stock Price	9.83%	10.43%	11.10%
180-Day Avg. Stock Price	9.84%	10.45%	11.12%
Average	9.82%	10.42%	11.09%

Q. Did you perform a sensitivity analysis using an alternative dividend yield calculation?

A. Yes. Although I do not endorse this methodology, I perform a DCF analysis that is generally consistent with the methodology used by I&E in the Company's last rate proceeding.[55] In that proceeding, I&E relied on the same analyst earnings growth rates that I relied upon. However, as noted previously, since *Yahoo! Finance* no longer reports a long-term growth rate, I have substituted S&P *Capital IQ* growth rates to maintain three sources. In this scenario, I rely on I&E's assumptions as used in the last proceeding: a water utility proxy group including

[54] Pennsylvania Public Utility Commission, Docket Nos. 2023-3043189 & R-2023-304190, Direct Testimony of D.C. Patel, Feb. 1, 2024, at 29 and 30; I&E Exhibit No. 2, Schedules 4-6.

[55] Pennsylvania Public Utility Commission, Docket Nos. 2023-3043189 & R-2023-304190, Direct Testimony of D.C. Patel, Feb. 1, 2024, at 29; I&E Exhibit No. 2, Schedule 4.

AWK, projected dividends, spot prices and the 52-week low price, and 52-week high price as reported by Value Line to calculate dividend yields. The result from this scenario is a cost of equity estimate of 9.59 percent as shown in Schedule 5 of Exhibit No. 13-A. While this result is slightly below the low end of my DCF results, reflecting the lowest growth rates for the proxy group companies used in my analysis, it is higher than PAWC's current authorized ROE.[56]

C. CAPM and ECAPM Analyses

Q. Please briefly describe the Capital Asset Pricing Model ("CAPM").

A. The CAPM is a risk premium approach that estimates the cost of equity for a given security as a function of a risk-free return plus a risk premium to compensate investors for the non-diversifiable or "systematic" risk of that security. Systematic risk is the risk inherent in the entire market or market segment. This form of risk cannot be diversified away using a portfolio of assets. Non-systematic risk is the risk of a specific company that can be mitigated through portfolio diversification.

The CAPM is defined by four components, each of which must theoretically be a forward-looking estimate:

$$K_e = r_f + \beta(r_m - r_f) \qquad [3]$$

Where:

K_e = the required market COE;

[56] While the data as of September 30, 2025 does not likely include any effects of the merger of AWK and WTRG that was announced on October 27, 2025, removing these two companies from the proxy group, the DCF result would be 9.92 percent.

β = Beta coefficient of an individual security;

r_f = the risk-free ROR; and

r_m = the required return on the market.

In this specification, the term (r_m – r_f) represents the Market Risk Premium. According to the theory underlying the CAPM, since unsystematic risk can be diversified away, investors should only be concerned with systematic risk. Systematic risk is measured by Beta. Beta is a measure of the volatility of a security as compared to the market as a whole. Beta is defined as:

$$\beta = \frac{Covariance(r_e, r_m)}{Variance(r_m)} \qquad [4]$$

Variance (r_m) of the market return is a measure of the uncertainty of the general market. The covariance (r_e, r_m) represents the covariance between the return on a specific security and the general market, which reflects the extent to which the return on that security will respond to a given change in the general market return. Thus, beta represents the risk of the security relative to the general market.

Q. What risk-free rate did you use in your CAPM analysis?

A. I rely on three sources for my estimate of the risk-free rate: (1) the current 30-day average yield on 30-year U.S. Treasury bonds, which is 4.79 percent;[57] (2) the average projected 30-year U.S. Treasury bond yield for the first quarter of 2026 through the first quarter of 2027, which is 4.62 percent;[58] and (3) the average

[57] *Bloomberg Professional*, as of Sept. 30, 2025.

[58] *Blue Chip Financial Forecasts*, Vol. 44, No. 10, Oct. 1, 2025, at 2.

projected 30-year U.S. Treasury bond yield for 2027 through 2031, which is 4.40 percent.[59]

Q. What Beta coefficients did you use in your CAPM analysis?

A. As shown in Schedule 6 of Exhibit No. 13-A, I use the average beta coefficients for the proxy group companies as reported by *Value Line*. The beta coefficients reported by *Value Line* are calculated based on five years of weekly returns relative to the New York Stock Exchange Composite Index. Additionally, as shown on Schedule 8 of Exhibit No. 13-A, I also consider an additional CAPM analysis that relies on the long-term average beta coefficient reported by *Value Line* for the companies in my proxy group from 2013 through 2024.

Q. How did you estimate the Market Risk Premium in the CAPM?

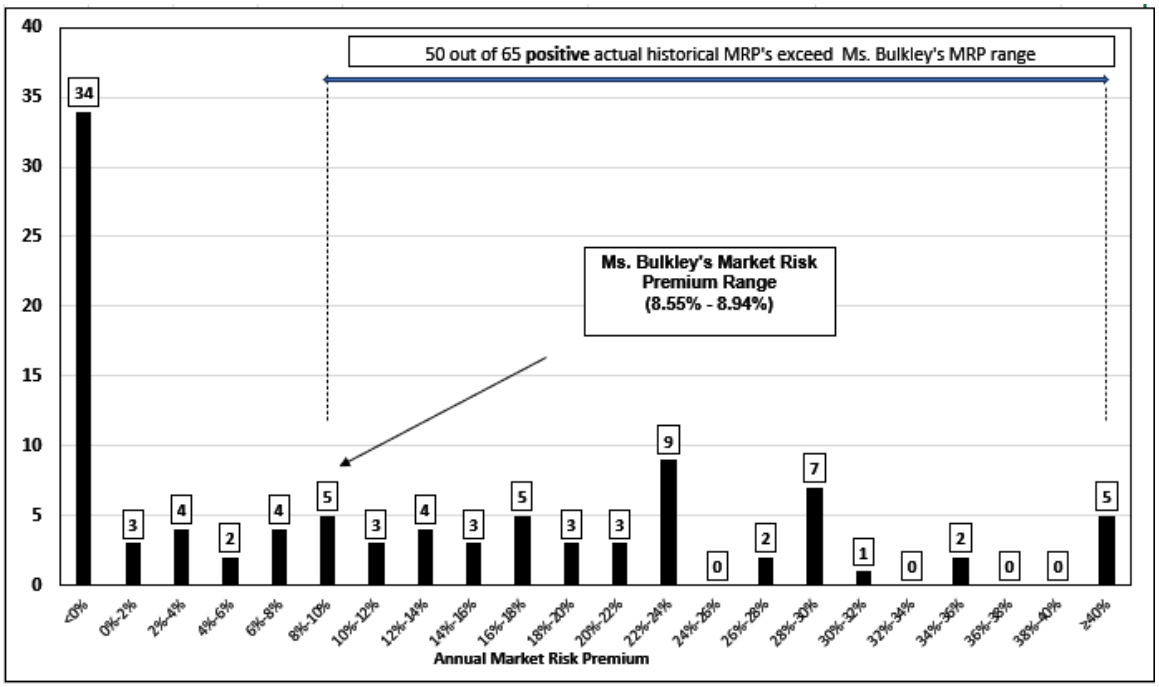
A. I estimate the Market Risk Premium as the difference between the implied expected equity market return and the risk-free rate. As shown in Schedule 9 of Exhibit No. 13-A, the expected return on the S&P 500 Index is calculated using the Constant Growth DCF model discussed earlier in my testimony for the companies in the S&P 500 Index. The Market Risk Premia used in my CAPM are in the range of 8.55 percent to 8.94 percent as seen in Schedule 6 of Exhibit No. 13-A.

[59] *Blue Chip Financial Forecasts*, Vol. 44, No. 6, June 2, 2025, at 14.

Q. How does the current expected market risk premia compare to observed historical market risk premia?

A. As shown in Figure 8 below, the vast majority of positive historical MRP observations (50 out of 65) are at or above the MRP range of 8.55 percent to 8.94 percent.

Figure 8: Realized U.S. Market Risk Premia (1926-2024)[60]



Q. Did you consider another form of the CAPM in your analysis?

A. Yes. I have also considered the results of an ECAPM in estimating the cost of equity for PAWC.[61] The ECAPM calculates the product of the adjusted beta coefficient and the market risk premium and applies a weight of 75.00 percent to

[60] Depicts total annual returns on large company stocks, as reported in the 2022 Duff & Phelps SBBI Yearbook. Years 2023 and 2024 were derived using *S&P Capital IQ* data.

[61] *See, e.g.*, Roger A. Morin, New Regulatory Finance, Public Utilities Reports, Inc., 2006, at 189.

that result. The model then applies a 25.00 percent weight to the market risk premium without any effect from the beta coefficient. The results of the two calculations are summed, along with the risk-free rate, to produce the ECAPM result, as noted in Equation [5] below:

$$k_e = r_f + 0.75\beta(r_m - r_f) + 0.25(r_m - r_f) \quad [5]$$

Where:

k_e = the required market-based cost of equity;
β = adjusted Beta coefficient of an individual security;
r_f = the risk-free rate of return; and
r_m = the required return on the market as a whole

The empirical form of the CAPM addresses the tendency of the "traditional" CAPM to underestimate the cost of equity for companies with low beta coefficients such as regulated utilities. In that regard, the ECAPM is not redundant to the use of adjusted betas in the traditional CAPM; rather, it recognizes the results of academic research indicating that the risk-return relationship is different (in essence, flatter) than estimated by the CAPM, and that the CAPM underestimates the "alpha," or the constant return term.[62]

Consistent with my CAPM, my application of the ECAPM uses the same three yields on the 30-year Treasury bonds as the risk-free rate, forward-looking market risk premium estimate, and beta coefficients.

[62] *Id*. at 191.

Q. What are the results of your CAPM and ECAPM analysis?

A. The results of my CAPM and ECAPM analyses are presented in Schedule 6 of Exhibit No. 13-A, and Figure 9 below summarizes my results.

Figure 9: Mean CAPM Results

	30-Year Treasury Bond Yield		
	Current 30-Day Avg	Near-Term Projected	Longer-Term Projected
CAPM:			
Current *Value Line* Beta	11.40%	11.36%	11.31%
Long-term Avg. *Value Line* Beta	11.24%	11.20%	11.15%
ECAPM:			
Current *Value Line* Beta	11.88%	11.86%	11.82%
Long-term Avg. *Value Line* Beta	11.77%	11.74%	11.70%

Q. Do you perform a sensitivity analysis using an alternative risk-free rate and market return calculation?

A. Yes. Although I support using a DCF-based market return with the 30-year Treasury yield, I acknowledge that in PAWC's prior case, the Commission relied on I&E's CAPM, including I&E's risk-free rate and market return.[63] I&E relied on the 10-year Treasury bond yield, and calculated the market return by averaging the average historical S&P 500 market return with *Value Line's Summary & Index* derived market return. Although I do not endorse this method, I perform CAPM and ECAPM analyses using a water utility proxy group including AWK, the yield on the 10-year Treasury bond as the risk-free rate and I&E's alternative market

[63] *Id.*

return as shown in Schedule 10 of Exhibit No. 13-A. These assumptions result in a cost of equity estimate of 10.09 percent for the CAPM.[64]

D. Commission ROE Methodology in the Company's Last Rate Proceeding

Q. Please describe the Commission's approach to determining the authorized ROE in the Company's last rate proceeding.

A. The Commission determined the Company's authorized return of 9.45 percent by averaging I&E's DCF (8.44 percent) and CAPM (10.44 percent) results.[65]

Q. Have you estimated the return that would be derived using the Commission's approach of averaging the results of the DCF and CAPM analyses to estimate the cost of equity?

A. Yes. As noted above, although I do not support I&E's methodology for calculating the DCF and CAPM, I developed alternative versions of the DCF and CAPM analyses using the methodology relied on by I&E in the Company's last rate proceeding. This resulted in a DCF result of 9.59 percent and a CAPM result of 10.09 percent. As shown in Figure 10, averaging the results of the alternative DCF and CAPM analyses produces a cost of equity of 9.84 percent.[66] Therefore,

---

[64] Removing AWK and WTRG from the proxy group used for this analysis in recognition of the merger announcement on October 27, 2025, the CAPM result using this methodology would be 9.90 percent.

[65] Pennsylvania Public Utility Commission, Opinion and Order, Pennsylvania-American Water Company, Docket Nos. R-2023-3043189 (Water) and R-2023-3043190 (Wastewater), July 11, 2024, at 194.

[66] Removing AWK and WTRG from the proxy group used for this analysis in recognition of the merger announcement on October 27, 2025, would result in a weighted ROE (equally weighting the DCF and CAPM performed using the I&E methodology) of 9.91 percent.

applying the Commission's approach for determining the cost of equity in the Company's last rate proceeding produces an ROE of 9.84 percent, which is significantly greater than the Company's currently approved return of 9.45 percent. Thus, it is reasonable to conclude that the cost of equity has increased since the Company's last rate proceeding.

Figure 10: ROE using the Commission's Methodology in the Company's Last Rate Proceeding

I&E DCF	9.59%
I&E CAPM	10.09%
Average	**9.84%**

VIII. BUSINESS RISKS AND MANAGEMENT PERFORMANCE

Q. Do the DCF, CAPM, and ECAPM results for the proxy group, taken alone, provide an appropriate estimate of the cost of equity for PAWC?

A. No. These results provide only a range of the appropriate estimate of PAWC's cost of equity. Several additional factors must be considered when determining where the Company's cost of equity falls within the range of results. These factors, discussed below, should be considered with respect to their overall effect on PAWC's risk profile relative to the proxy group.

Q. What additional considerations apply to PAWC?

A. There are several factors: the Company's substantial capital expenditure program, regulatory risk, flotation costs, revenue stabilization mechanisms, and, related, its anticipated investments to ensure its water and wastewater systems comply with state and federal water standards. These factors, discussed below, should be considered with respect to their overall effect on PAWC's risk profile relative to the

proxy group. Additionally, consistent with Section 523 of the Pennsylvania Code and the Commission's Policy Statement on Small Nonviable Water and Wastewater Systems at 52 Pa. Code § 69.711, the Company's superior management should also be considered in the determination of the ROE.

Q. How do you account for these additional factors in your assessment?

A. Although there are several positive aspects of Pennsylvania regulation that render PAWC somewhat less risky than the proxy group as a whole, the Company is not without unique risks as compared to the proxy group that suggest that the ROE should be within the range established by the average to the high end of the range of returns estimated for the proxy group companies. Furthermore, the Company's excellent management performance supports an ROE at the midpoint of the range of returns estimated for the proxy group companies.

A. Capital Expenditures

Q. How is PAWC's risk profile affected by its substantial capital expenditure program?

A. PAWC projects that the Company will spend approximately $3.50 billion on capital investments for the period from 2026-2030, including significant investment to replace aging infrastructure necessary to meet the needs of its customers and to comply with various regulations.

From a credit perspective, the additional pressure on cash flows associated with high levels of capital expenditures exerts corresponding pressure on credit metrics and, therefore, credit ratings. An S&P report explains:

> [T]here is little doubt that the U.S. electric industry needs to make record capital expenditures to comply with the proposed carbon pollution rules over the next several years, while maintaining safety standards and grid stability. We believe the higher capital spending and subsequent rise in debt levels could strain these companies' financial measures, resulting in an almost consistent negative discretionary cash flow throughout this higher construction period. To meet the higher capital spending requirements, companies will require ongoing and steady access to the capital markets, necessitating that the industry maintains its high credit quality. We expect that utilities will continue to effectively manage their regulatory risk by using various creative means to recover their costs and to finance their necessary higher spending.[67]

While this S&P report refers to electric utilities, the same applies to water utilities.

In an August 2016 report, S&P explains the importance of regulatory support for large capital projects:

> When applicable, a jurisdiction's willingness to support large capital projects with cash during construction is an important aspect of our analysis. This is especially true when the project represents a major addition to rate base and entails long lead times and technological risks that make it susceptible to construction delays. Broad support for all capital spending is the most credit-sustaining. Support for only specific types of capital spending, such as specific environmental projects or system integrity plans, is less so, but still favorable for creditors. Allowance of a cash return on construction work-in-progress or similar ratemaking methods historically were extraordinary measures for use in unusual circumstances, but when construction costs are rising, cash flow support could be crucial to maintain credit quality through the spending program. Even more favorable are those jurisdictions that present an opportunity for a higher return on capital projects as an incentive to investors.[68]

---

[67] S&P, Ratings Direct, "U.S. Regulated Electric Utilities' Annual Capital Spending is Poised to Eclipse $100 Billion," July 2014.

[68] S&P Global Ratings, "Assessing U.S. Investor-Owned Utility Regulatory Environments," Aug. 10, 2016, at 7.

Q. Does PAWC have a capital tracking mechanism to recover some of the costs associated with its capital expenditures plan between rate cases?

A. Yes. PAWC has a Water and Wastewater Distribution System Improvement Charge ("DSIC"), which allows PAWC to recover the costs associated with replacing and repairing aging water and wastewater infrastructure. The presence of these clauses is certainly a positive aspect of Pennsylvania regulation, but they have become quite commonplace in utility regulation. As shown in Schedule 12 of Exhibit No. 13-A, approximately 78.00 percent of the proxy group companies have infrastructure and capital recovery mechanisms that address significant capital expenditure requirements. Consequently, the presence of the DSIC, while a positive regulatory mechanism, does not reduce the Company's risk vis-à-vis that of the proxy group.

Q. Why is it important that PAWC's capital tracking mechanism recover these costs?

A. As noted previously, over the next five years, PAWC is proposing to invest $3.50 billion in infrastructure improvements. On an annual basis, PAWC's capital investment program is greater than its allowance for depreciation, which results in negative Free Cash Flow. Therefore, the Company will need to seek financing for its capital investments beyond any internally generated cash flow. Similar to the credit rating agencies, discussed previously, investors consider the stability and supportiveness of the regulatory environment in the assessment of overall risk of investment. The use of tracking mechanisms for the recovery of capital

investments has become a key component of the strategy to address regulatory lag that results from significant investments in supportive regulatory jurisdictions.[69]

Q. Has Pennsylvania been viewed as a supportive regulatory jurisdiction?

A. Yes. S&P conducts a ranking of regulatory jurisdictions, using a scale of nine steps ranging from a low of Below Average to Above Average, with each ranking having three notches, "3" being the low end of the ranking and "1" being the high end of the ranking. These rankings are assigned from an investor perspective and are intended to indicate the relative regulatory risk associated with the ownership of securities issued by the utilities in the jurisdiction. The evaluation is intended to assess the level and quality of earnings realized by the state utilities as a result of regulatory, legislative and court actions. Pennsylvania has been ranked Above Average 2 since 2019. S&P indicates that this ranking is based on a constructive regulatory climate, relying on forward test years, year, end rate base and reducing regulatory lag.[70]

Q. What is your conclusion regarding the regulatory environment in Pennsylvania as it relates to PAWC's capital investment plan?

A. The Company's capital plan demonstrates a need to access external capital for financing. Therefore, it is important that the constructive regulatory environment

[69] S&P Global Market Intelligence, RRA Regulatory Focus: Adjustment Mechanisms, Nov. 12, 2019, at 1.

[70] *S&P Capital IQ.*

that has been established by the Commission be maintained to ensure that the Company continues to be able to secure capital on favorable terms.

B. Regulatory Risk

Q. How does the regulatory environment affect investors' risk assessments?

A. The ratemaking process is premised on the principle that, for investors and companies to commit the capital needed to provide safe and reliable utility service, the subject utility must have the opportunity to recover the return of, and the market-required return on, invested capital. Regulatory commissions recognize that because utility operations are capital intensive, regulatory decisions should enable the utility to attract capital at reasonable terms, and doing so balances the long-term interests of investors and customers. To achieve this balance, the Company must be able to finance its operations assuming a reasonable opportunity to earn an appropriate return on invested capital to maintain an acceptable financial profile. In that respect, the regulatory environment is one of the most important factors considered in both debt and equity investors' risk assessments.

From the perspective of debt investors, the authorized return should enable the utility to generate the cash flow needed to meet its near-term financial obligations, make the capital investments needed to maintain and expand its systems, and maintain the necessary levels of liquidity to fund unexpected events. This financial liquidity must be derived not only from internally generated funds, but also by efficient access to capital markets. Moreover, because fixed income investors

have many investment alternatives, even within a given market sector, the utility's financial profile must be adequate on a relative basis to ensure its ability to attract capital under a variety of economic and financial market conditions.

Equity investors require that the authorized return be adequate to provide a risk-comparable return on the equity portion of the utility's capital investments. Because equity investors are the residual claimants on the utility's cash flows (which is to say that the equity return is subordinate to interest payments), they are particularly concerned with the strength of regulatory support and its effect on future cash flows.

Q. Do credit rating agencies consider regulatory risk in establishing a company's credit rating?

A. Yes. Both S&P and Moody's consider the overall regulatory framework in establishing credit ratings. Moody's establishes credit ratings based on four key factors: (1) business profile; (2) financial policy; (3) leverage and coverage; and (4) uplift for structural considerations. Within the business profile criteria, stability and predictability of regulatory environment and cost and investment recovery (sufficiency and timeliness) are each given a broad rating factor of 15.00 percent, while revenue risk is given a rating factor of 5.00 percent. Therefore, Moody's assigns regulatory risk a 35.00 percent weighting in the overall assessment of business and financial risk for regulated utilities.[71]

[71] Moody's Investors Service, Rating Methodology: Regulated Water Utilities, August 18, 2023, at 3.

S&P also identifies the regulatory framework as an important factor in credit ratings for regulated utilities, stating: "we assess regulatory advantage because the influence of the regulatory framework and regime is of critical importance. It defines the environment in which a utility operates and has a significant bearing on a utility's financial performance."[72] S&P identifies four specific factors that it uses to assess the credit implications of the regulatory jurisdictions of investor-owned regulated utilities: (1) regulatory stability; (2) tariff-setting procedures and design; (3) financial stability; and (4) regulatory independence and insulation.[73]

Q. Do equity analysts monitor regulatory risk?

A. Yes. For example, Morningstar notes that PAWC's prior rate case was "disappointing" and remarked that "regulatory risk remains elevated in Pennsylvania."[74] Bank of America Global Research analysts specifically note that regulatory risk for AWK can be an upside or downside, and further comments on regulatory risk for several other water utilities including assigning a 5.00 percent premium to American States Water Co.'s valuation due to constructive regulatory outlook.[75] Because analysts monitor regulatory risk, it is reasonable to conclude that investors consider the regulatory environment when making capital allocation decisions.

73 *Id*.

74 *Morningstar*, American Water Work Co Inc, August 1, 2024, at 1 and 6.

75 Bank of America, Global Research, "US & Utilities, Watt's the Number for US water utilities?", July 21, 2025.

Q. How does the regulatory environment in which a utility operates affect its access to and cost of capital?

A. The regulatory environment can significantly affect both the access to, and cost of capital in several ways. First, the proportion and cost of debt capital available to utility companies are influenced by the rating agencies' assessment of the regulatory environment. As noted by Moody's, "the characteristics and transparency of the concession(s) and regulations under which the utility operates, the track record of the regulatory regime in setting tariffs and applying regulations consistently are core aspects of the overall stability of a water utility's business profile."[76]

Q. Have you conducted any analysis of the risk associated with the regulatory framework in Pennsylvania relative to the jurisdictions in which the utility operating subsidiaries of the companies in your proxy group operate?

A. Yes. I have evaluated the regulatory framework in Pennsylvania on three factors that are important in terms of providing a regulated utility a reasonable opportunity to earn its authorized ROE: (1) test year convention (i.e., use of a forecast vs. historical test year); (2) the use of revenue decoupling mechanisms or other clauses that provide revenue stabilization; and (3) the prevalence of capital cost recovery between rate cases. The results of this regulatory risk assessment are shown in Schedule 12 of Exhibit No. 13-A and are summarized as follows:

1. Test Year Convention: PAWC is proposing to rely on a fully forecasted

[76] Moody's Investors Service, Rating Methodology: Regulated Water Utilities, August 18, 2023, at 9.

test year for the period ending June 30, 2027. Approximately 60.00 percent of the operating utilities of the proxy group companies provide service in jurisdictions that use a fully or partially forecast test year. Forecasted test years have been relied on for several years and produce cost estimates that are more reflective of future costs, which results in more accurate recovery of incurred costs and mitigates the regulatory lag associated with historical test years

2. Revenue Stabilization / Volumetric Risk: PAWC does not currently have protection against volumetric risk in Pennsylvania. However, approximately 56.00 percent of the operating companies held by the proxy group have some form of protection against volumetric risk through either decoupling, formula-based rates, and/or straight-fixed variable rate design that allow them to break the link between customer usage and revenues.

3. Capital Cost Recovery: PAWC has the DSIC surcharge that provides for recovery of a limited portion of the Company's capital investment costs. This is consistent with the proxy group, as 78.00 percent of the operating utilities of the proxy group companies have some form of capital cost recovery mechanism in place.

Q. What is the effect on PAWC of having relatively few timely cost recovery mechanisms?

A. The lack of timely cost recovery mechanisms can result in regulatory lag. Regulatory lag occurs when a regulated utility is not able to recover its just and reasonable costs of providing service to customers on a timely basis. Regulatory lag is reflected in a utility's financial performance through earnings attrition, which is the inability of the utility to earn its authorized ROE due to delays in the recovery

of allowable costs that have been incurred to provide regulated service to customers.

C. Flotation Costs

Q. What are flotation costs?

A. Flotation costs are the costs associated with the sale of new issues of common stock. These costs include out-of-pocket expenditures for preparation, filing, underwriting, and other issuance costs.

Q. Why is it important to consider flotation costs in the allowed ROE?

A. A regulated utility must have the opportunity to earn an ROE that is both competitive and compensatory to attract and retain new investors. To the extent that a company is denied the opportunity to recover prudently incurred flotation costs, actual returns will fall short of expected (or required) returns, thereby diluting equity share value.

Q. Are flotation costs part of the utility's invested costs or part of the utility's expenses?

A. Flotation costs are part of the invested costs of the utility, which are properly reflected on the balance sheet under "paid in capital." They are not current expenses, and, therefore, are not reflected on the income statement. Rather, like investments in rate base or the issuance costs of long-term debt, flotation costs are incurred over time. As a result, the great majority of a utility's flotation cost is incurred prior to the test year but remains part of the cost structure that exists during the test year and beyond, and as such, should be recognized for ratemaking

purposes. Therefore, it is irrelevant whether an issuance occurs during the test year or is planned for the test year because failure to allow recovery of past flotation costs may deny PAWC the opportunity to earn its required rate of return in the future.

Q. Please provide an example of why a flotation cost adjustment is necessary to compensate investors for the capital they have invested.

A. As shown in Schedule 13 of Exhibit No. 13-A, the offering price in AWK's 2023 stock issuance was $135.50 per share of common stock. After paying flotation costs associated with the equity issuance, which include fees paid to underwriters and attorneys, among others, AWK's net proceeds were only $133.41 per share invested. The net proceeds (i.e., $133.41 per share) can then be invested in plant used to serve its customers, which becomes part of rate base on which a return can be earned. Absent a flotation cost adjustment, the investor will thereafter earn a return on only the rate base funded by the proceeds from the $133.41 per share issued, even though their equity contribution was $135.50 per share of common stock. Therefore, making a small flotation cost adjustment in establishing the authorized ROE would provide the investor a reasonable opportunity to earn the authorized return, rather than the lower return that results when the authorized return is applied to an amount less than what the investor contributed.

Q. Is the need to consider flotation costs eliminated because PAWC is a wholly owned subsidiary of AWK?

A. No. Although PAWC is a wholly owned subsidiary of AWK, it is appropriate to consider flotation costs because wholly owned subsidiaries receive equity capital from their parent and provide returns on the capital that roll up to the parent, which is designated to attract and raise capital based upon the returns of those subsidiaries. To deny recovery of issuance costs associated with the capital that is invested in the subsidiaries ultimately penalizes the investors that fund the utility operations and could inhibit the utility's ability to obtain new equity capital at a reasonable cost. This is important for PAWC because, as I have previously discussed, the Company is planning significant capital expenditures in the near term.

Q. Is the need to consider flotation costs recognized by the academic and financial communities?

A. Yes. The need to reimburse shareholders for the lost returns associated with equity issuance costs is recognized by the academic and financial communities in the same spirit that investors are reimbursed for the costs of issuing debt. This treatment is consistent with the philosophy of a fair rate of return. According to Dr. Shannon Pratt:

> Flotation costs occur when new issues of stock or debt are sold to the public. The firm usually incurs several kinds of flotation or transaction costs, which reduce the actual proceeds received by the firm. Some of these are direct out-of-pocket outlays, such as fees paid to underwriters, legal expenses, and prospectus preparation costs. Because of this reduction in proceeds, the firm's required

> returns on these proceeds equate to a higher return to compensate for the additional costs. Flotation costs can be accounted for either by amortizing the cost, thus reducing the cash flow to discount, or by incorporating the cost into the cost of capital. Because flotation costs are not typically applied to operating cash flow, one must incorporate them into the cost of capital.[77]

Q. How did you calculate the flotation costs for PAWC?

A. My flotation cost calculation is based on the costs incurred by AWK in its most recent equity offering in February 2023. That flotation cost percentage is then applied to the DCF analysis to estimate impact of the flotation cost on the cost of equity. As shown in Schedule 13, based on the flotation costs incurred in the most recent AWK issuance, the impact on the cost of equity is approximately five basis points (i.e., 0.05 percent) based on the median results of the proxy group.

Q. Do your final cost of equity results include an adjustment for flotation cost recovery?

A. No. While the final cost of equity results do not incorporate an explicit adjustment for flotation costs, the estimated effect of flotation cost on the cost of equity is considered in identifying a recommended ROE within the range of cost of equity estimates from the various models.

[77] Shannon P. Pratt, *Cost of Capital Estimation and Applications*, Second Edition, at 220-221.

D. Risks Associated with Environmental and Water Quality Regulation

Q. Please provide an overview of the risks associated with water quantity, water quality and other environmental regulations applicable to PAWC's water supply facilities and operations.

A. Water supply utilities are subject to a complex array of regulations at the federal, state and river basin commission levels with respect to water quantity, water quality and other environmental aspects of their facilities and operations.

The testimony of Mr. Anthony Nokovich at PAWC Statement No. 4 provides a detailed description of the environmental and regulatory risks facing water and wastewater utilities. In addition to the requirement to make significant investments to extend facilities to accommodate applicants for service, there are multiple levels of authorization and regulation that apply to a public water system that wants to add a new source of supply or increase its withdrawals from existing sources. These factors add to the costs and lead time for obtaining new, or increasing existing, water sources to meet new demands that may arise in portions of the Company's system. These are additional risk factors that can directly affect PAWC's ability to furnish safe, adequate and reliable service, and increase the costs PAWC incurs to provide that service.

There are significant regulations that require the monitoring and treatment of water supplies to ensure the safety of and reliability of drinking water. Further, there is increased research and awareness of contaminants on an ongoing basis that, once identified, require investment to meet more stringent regulatory standards

related to new contaminants. While the Company intends to comply with all state and federal regulatory standards for safe and reliable drinking water, the upstream releases of chemicals that are then found in the Company's water supplies that must be remediated present an ongoing business risk.

Q. Provide an overview of the risks associated with environmental regulation with respect to PAWC's wastewater system operations.

A. As is the case with regard to drinking water system operations, the operation of wastewater collection and treatment systems face a range of environmental regulatory risks. These risks are discussed in detail in the testimony of Mr. Anthony Nokovich at PAWC Statement No. 4. Wastewater operations are also regulated at both the federal and state levels pursuant to numerous statutes and regulations. At the federal level, wastewater systems are regulated pursuant to the Clean Water Act and numerous regulations adopted by the Environmental Protection Agency ("EPA") under that law. At the state level, the Pennsylvania Clean Streams Law, Sewage Facilities Act, Solid Waste Management Act, Storage Tank and Spill Prevention Act and other laws administered by the DEP, coupled with the regulations adopted under those statutes, set standards and requirements for virtually every aspect of wastewater system operations. Similar to water regulation meeting regulatory compliance requirements, including evolving permitting requirements, and more stringent limits can be challenging and can result in significant increases in operating costs. Furthermore, wastewater systems face significant regulatory and environmental liability risks enforceable by governmental agencies through penalties and through citizen lawsuits.

Finally, combined sewer systems present further risks, particularly in periods of storms, during which times water flows can exceed the treatment system capacity, resulting in excess untreated water discharging through combined sewer outfalls. These systems can present increased risk as they often cannot be separated; however, the EPA seeks to reduce the number of these systems that operate.

Q. What is your conclusion with respect to the effect of the risk associated with environmental regulations and water quality regulations on PAWC's cost of equity?

A. PAWC has significant risk and uncertainty associated with environmental and water quality regulations, and the recovery of costs to comply with those regulations. It is clear that the financial community recognizes the additional risks to credit quality associated with the capital investment required to meet environmental and water quality regulations. As discussed in Section VI of my direct testimony; in order to establish a proxy group of sufficient size, the group is composed of water utilities and natural gas utilities. All of these factors, including the issues faced by electric and natural gas utilities in the proxy group, these environmental risk factors, and the magnitude of the capital program that the Company has planned to ensure compliance, support an ROE above the proxy group mean and median.

E. Management Performance and Recognition

Q. Please summarize the Public Utility Code as it pertains to consideration of performance factors in the utility's revenue requirement.

A. Section 523 of the Pennsylvania Public Utility Code states that the Commission consider "the efficiency, effectiveness and adequacy of service of each utility when determining just and reasonable rates under this title." Additionally, the Commission's Policy Statement on Small Nonviable Water and Wastewater Systems at 52 Pa. Code § 69.711 states that the Commission will consider acquisition incentives including "rate of return premiums," "acquisition adjustments," "deferral of acquisition improvement costs" and "plant improvement surcharges" to encourage the acquisition of troubled water and wastewater systems by viable utilities.

Q. What are the specific performance factors that are to be considered by the Commission?

A. As discussed in more detail in the testimony of Company Witness Mr. Justin Ladner (Statement No. 1), Sections 523 (a) and (b) address the factors considered in evaluating the performance of water and wastewater utilities. These provisions include 1) the efficiency, effectiveness and adequacy of service, 2) management effectiveness and operating efficiency, 3) action or inaction to encourage cost-effective conservation by customers of water, and 4) other relevant evidence that relates to efficiency, effectiveness and adequacy of service.

Q. Mr. Justin Ladner's testimony highlights recent Company activities that demonstrate exemplary management performance, including operating cost-saving measures and acquisitions and receiverships of small and troubled water and wastewater systems. How have you considered the management performance of PAWC in your recommendation?

A. Similar to other business risks, I have not made a specific adjustment for management performance; however, I consider it in setting the overall range and the recommendation of the appropriate ROE within that range.

IX. CAPITAL STRUCTURE AND COST OF DEBT

Q. Is the capital structure of the Company an important consideration in the determination of the appropriate ROE?

A. Yes. It is a fundamental tenet of finance that the greater the amount of financial risk borne by common shareholders, the greater the return required by shareholders in order to be compensated for the added financial risk imparted by the greater use of senior debt financing. In other words, assuming all else equal, the greater the debt ratio, the greater the risk to equity investors, and thus the greater the return required by equity investors. This is because the claim of equity holders on the cash flows of the Company is secondary to debt holders, meaning the greater the debt service requirement, the less cash flow is available for common equity holders.

In this proceeding, a proxy group of comparable companies is being used to determine the Company's ROE. The returns that are required by investors for the

proxy companies take into consideration the risk related to the capitalization of those companies. Thus, to the extent that the capital structure authorized for the Company was to deviate significantly from the range established by the proxy group used to determine the ROE, that risk difference must be reflected in the equity return.

Q. What is PAWC's proposed capital structure?

A. Because there is specific debt that has been identified for wastewater services, the capital structures for water and wastewater services were calculated separately. These are summarized in Figure 11 below.

Figure 11: Ratemaking Capital Structures for the Fully Projected Future Test Year ending June 30, 2027

Total Company[78]	
Common Equity	55.33%
Preferred Stock	0.01%
Long-Term Debt	44.66%
Water Services[79]	
Common Equity	56.31%
Preferred Stock	0.01%
Long-Term Debt	43.68%
Wastewater Services[80]	
Common Equity	51.52%
Preferred Stock	0.01%
Long-Term Debt	41.49%
WW Specific Debt	6.88%

78 *See* Exhibit No. 13-A, Schedule 15.
79 *Id.*, at Schedule 16.
80 *Id.*, at Schedule 17.

Q. How were the proposed capital structures calculated?

A. The capital structure for the total company was calculated first, including all debt issuances and all sources of capital. As shown in Schedule 15 of Exhibit No. 13-A, the total company projected permanent capital structure includes 44.66 percent long-term debt, 0.01 percent preferred stock and 55.33 percent common equity for the fully projected future test year ending June 30, 2027. The total company capital structure includes three issuances that can be specifically assigned to the wastewater services: Pennvest Exeter; Pennvest Kinzua Road; and Pennvest Butler. These issuances are shown on Schedule 18 of Exhibit No. 13-A. The capital structure for water (wastewater) service was calculated by removing the wastewater (water) specific debt instruments from the total long-term debt of the company and recalculating the ratios of the remaining capital stock.

Q. Do you conduct any analysis to determine if the requested equity ratio was reasonable?

A. Yes. I review the Company's proposed capital structure as compared with the actual capital structures of the operating utilities of the proxy group companies for the most recent three years.

Q. Why is it appropriate to consider the equity ratio for the proxy companies?

A. The determination of the ROE is based on the expected return for a proxy group of companies that are comparable in risk to PAWC. The equity ratio is a measure of the financial risk of the company, and the authorized ROE is the return to compensate investors for that risk. If the Commission is going to rely on the ROE

estimates for the proxy companies to establish the authorized ROE for PAWC, it is important that the financial risk of PAWC be similar to the financial risk of the proxy group. This is accomplished when the equity ratio of the subject company (in this case PAWC) is within the range established by the proxy group.

Q. What is the result of your analysis of the proxy group capital structures?

A. I calculated the mean proportions of common equity, long-term debt and preferred equity for the most recent year for each of the companies in the proxy group at the operating subsidiary level.[81] As shown in Schedule 14 of Exhibit No. 13-A, the mean common equity ratio for the proxy group at the operating subsidiary level for the past three years was 53.09 percent, within a range from 45.97 percent to 60.16 percent. PAWC's proposed water services equity ratio is consistent with the mean equity ratio and well within the range of equity ratios established by the proxy group. The wastewater services equity ratio is well below the mean equity ratio for the proxy companies.

Q. Are there other factors to be considered in setting the Company's capital structure?

A. Yes, there are other factors that should be considered in setting the Company's capital structure, namely the challenges that the credit rating agencies have highlighted as placing pressure on the credit metrics for utilities.

[81] Long-term debt includes the current portion of long-term debt, assuming that the current portion would be refinanced with debt at maturity.

For example, Moody's recently maintained its "stable" 2025 outlook for the regulated gas and electric utilities sector on the expectation of continued regulatory support, which includes supportive legislature, timely recovery of excess purchased power costs, and weather-related cost recovery. Moody's "stable" rating also considers its expectation for declining interest rates and inflation, as well as favorable natural gas prices. Moody's makes clear that constructive regulatory outcomes that promote timely cost recovery is the key factor in supporting utility credit quality.[82]

S&P continues to maintain a negative outlook for the utility industry, noting that downgrades have outpaced upgrades for the fifth consecutive year and the most common investor-owned utility credit rating is a "BBB+".[83] S&P expects the industry to have increased cash flow deficits as a result of significant capital spending.[84] Weak common equity issuance contributes pressure to the industry's financial health. The utility industry will need ongoing access to capital markets to fund the capital expenditures. Furthermore, S&P also notes that there is a significant increase physical risk due to climate change and elevated wildfire risk.

Fitch Ratings ("Fitch") has a "neutral" outlook for the utility industry noting that moderation in inflation and "subdued" commodity costs have eased pressures on customer bills. However, Fitch cautions that utility capital expenditures are

[82] Moody's Investors Service, Outlook. "Outlook Stable; regulatory support, economic factors offset financial pressure." November 7, 2024.
[83] S&P Global Ratings. Industry Credit Outlook 2025, "North American Regulated Utilities: Capex and climate change pressure credit quality." January 14, 2025.
[84] *Id.*

expected to grow at a “double-digit rate” and thus, rate case outcomes will be key to watch as regulators balance rate requests and customer bill pressures.[85]

The credit ratings agencies’ continued concerns over increased capital expenditures underscore the importance of maintaining adequate cash flow metrics for the Company in the context of this proceeding.

Q. Will the capital structure and ROE authorized in these proceedings affect the Company’s access to capital at reasonable rates?

A. Yes. The level of earnings authorized by the Commission directly affects the Company’s ability to fund its operations with internally generated funds. Both bond investors and rating agencies expect a significant portion of ongoing capital investments to be financed with internally generated funds. In addition, it is important to recognize that because a utility’s investment horizon is very long, investors require the assurance of a sufficiently high return to satisfy the long-term financing requirements of the assets placed into service. Those assurances, which often are measured by the relationship between internally generated cash flows and debt (or interest expense), depend quite heavily on the capital structure. As a consequence, both the ROE and capital structure are very important to debt and equity investors, particularly given the capital market conditions discussed previously.

[85] Fitch Ratings, “North American Utilities, Power & Gas Outlook 2025,” December 5, 2024, at 1.

Q. What is PAWC's proposed cost of long-term debt?

A. PAWC is proposing a long-term debt cost for water service of 4.71 percent for the fully projected future test year ending June 30, 2027, as shown on page 2 of Schedule 20 of Exhibit No. 13-A. The wastewater services debt is projected in two components. The wastewater specific issuances, shown on page 1 of Schedule 18 of Exhibit No. 13-A, have a projected debt cost of 2.20 percent for the fully projected future test year ending June 30, 2027. The remainder of the wastewater debt is projected to be financed at the total company rate of 4.71 percent, as seen on page 2 of Schedule 20 of Exhibit No. 13-A, for the fully projected future test year ending June 30, 2027.

Q. Do you believe PAWC's proposed cost of long-term debt is reasonable?

A. Yes, I do. I have reviewed the underlying calculations supporting the cost of long-term debt for PAWC, and I find them to be methodologically correct. I conclude that PAWC's proposed long-term debt costs for the fully projected future test year ending June 30, 2027, are reasonable and should be approved by the Commission.

X. CONCLUSIONS AND RECOMMENDATION

Q. What is your conclusion regarding a fair ROE for PAWC?

A. Figure 12 below provides a summary of my analytical results. Based on the various quantitative analyses discussed in my Direct Testimony and the qualitative analyses presented in my Direct Testimony, a reasonable range of ROE results for PAWC is from 10.25 percent to 11.25 percent. I am recommending that the

Commission set the Company's rate of return on common equity at 10.95 percent which is well within my range of COE results and comparable to my recommended ROE.

In addition, the recommended ROE takes into consideration the current conditions in capital markets including the expectation for rising interest rates, and increase in inflationary pressures, both of which increase the cost of capital. Finally, the recommendation takes into consideration the relative business and financial risk of PAWC as compared to the proxy group. This ROE would enable the company to attract capital at reasonable terms under a variety of economic and financial market conditions, while continuing to provide safe, reliable and affordable water and wastewater service to customers in Pennsylvania.

Figure 12: Summary of Analytical Results

Constant Growth DCF

	Minimum Growth Rate	Average Growth Rate	Maximum Growth Rate
DCF			
30-Day Avg. Stock Price	9.78%	10.39%	11.05%
90-Day Avg. Stock Price	9.83%	10.43%	11.10%
180-Day Avg. Stock Price	9.84%	10.45%	11.12%
Average	9.82%	10.42%	11.09%

CAPM and ECAPM

	Current 30-Day Avg	Near-Term Projected	Longer-Term Projected
CAPM:			
Current *Value Line* Beta	11.40%	11.36%	11.31%
Long-term Avg.	11.24%	11.20%	11.15%

Value Line Beta			
ECAPM:			
Current *Value Line* Beta	11.88%	11.86%	11.82%
Long-term Avg. *Value Line* Beta	11.77%	11.74%	11.70%

Q. Do your sensitivity analyses indicate that the cost of equity has increased for PAWC since the prior proceeding?

A. Yes. Using consistent methodologies as I&E from the previous proceeding, the resulting cost of equity estimates are 9.59 percent and 10.09 percent for the DCF and CAPM, respectively. Giving equal weight to these two results, as did the Commission in the prior proceeding,[86] yields an ROE of 9.84 percent. Although I do not support these methods, the results indicate that the cost of equity has increased since the prior proceeding and exceeds the Company's current authorized 9.45 percent ROE, despite being below my cost of equity estimates.

Q. What is your conclusion with respect to PAWC's proposed capital structure for water distribution service and wastewater service?

A. PAWC's proposed capital structure for the fully projected future test year ending June 30, 2027, summarized in Figure 13 for both water service and wastewater service, is reasonable compared to the mean and range established by the capital structures of the utility operating subsidiaries of the proxy group companies.

[86] Pennsylvania Public Utility Commission, Opinion and Order, Pennsylvania-American Water Company, Docket Nos. R-2023-3043189 (Water) and R-2023-3043190 (Wastewater), July 11, 2024, at 194.

Figure 13: Rate-Making Capital Structures for the Fully Projected Future Test Year ending June 30, 2027

SELECTED CONSULTING EXPERIENCE & EXPERT TESTIMONY

REGULATORY ANALYSIS AND RATEMAKING

Have provided a range of advisory services relating to regulatory policy analysis and many aspects of utility ratemaking, with specific services including:

- Cost of capital and return on equity testimony, cost of service and rate design analysis and testimony, development of ratemaking strategies
- Development of merchant function exit strategies

- Analysis and program development to address residual energy supply and/or provider of last resort obligations
- Stranded costs assessment and recovery
  Performance-based ratemaking analysis and design
- Many aspects of traditional utility ratemaking (e.g., rate design, rate base valuation)

COST OF CAPITAL

Have provided expert testimony on the cost of capital and capital structure in nearly 100 regulatory proceedings before state and federal regulatory commissions in the United States.

RATEMAKING

Have assisted several clients with analysis to support investor-owned and municipal utility clients in the preparation of rate cases. Sample engagements include:

- Assisted several investor-owned and municipal clients on cost allocation and rate design issues including the development of expert testimony supporting recommended rate alternatives.
- Worked with Canadian regulatory staff to establish filing requirements for a rate review of a newly regulated electric utility. Along with analyzing and evaluating rate application, attended hearings and conducted investigation of rate application for regulatory staff and prepared, supported, and defended recommendations for revenue requirements and rates for the company. Additionally, developed rates for gas utility for transportation program and ancillary services.

VALUATION

Have provided valuation services to utility clients, unregulated generators, and private equity clients for a variety of purposes, including ratemaking, fair value, ad valorem tax, litigation and damages, and acquisition. Appraisal practices are consistent with the national standards established by the Uniform Standards of Professional Appraisal Practice.

Representative projects/clients have included:

- Prepared appraisals of electric utility transmission and distribution assets for ad valorem tax purposes.
- Prepared appraisals of hydroelectric generating facilities for ad valorem tax purposes.
- Conducted appraisals of fossil fuel generating facilities for ad valorem tax purposes.
- Conducted appraisals of generating assets for the purposes of unwinding sale-leaseback agreements.
- For a confidential utility client, prepared valuation of fossil and nuclear generation assets for financing purposes for regulated utility client.

- Conducted a strategic review of the acquisition of nuclear generation assets. Review included the evaluation of the operating costs of the facilities and the long-term liabilities associated with the assets including the decommissioning of the assets.
- Prepared a valuation of a portfolio of generation assets for a large energy utility to be used for strategic planning purposes. Valuation approach included an income approach, a real options analysis, and a risk analysis.
- Assisted clients in the restructuring of NUG contracts through the valuation of the underlying assets. Performed analysis to determine the option value of a plant in a competitively priced electricity market following the settlement of the NUG contract.
- Prepared market valuations of several purchase power contracts for large electric utilities in the sale of purchase power contracts. Assignment included an assessment of the regional power market, analysis of the underlying purchase power contracts, and a traditional discounted cash flow valuation approach, as well as a risk analysis. Analyzed bids from potential acquirers using income and risk analysis approached. Prepared an assessment of the credit issues and value at risk for the selling utility.
- Prepared appraisal of a portfolio of generating facilities for a large electric utility to be used for financing purposes.
- Conducted a valuation of regulated utility assets for the fair value rate base estimate used in electric rate proceedings in Indiana.
- Prepared an appraisal of a fleet of fossil generating assets for a large electric utility to establish the value of assets transferred from utility property.
- Conducted due diligence on an electric transmission and distribution system as part of a buy-side due diligence team.
- Provided analytical support and prepared testimony regarding the valuation of electric distribution system assets in five communities in a condemnation proceeding.
- Prepared feasibility reports analyzing the expected net benefits resulting from municipal ownership of investor-owned utility operations.
- Prepared independent analyses of proposal for the proposed government condemnation of the investor-owned utilities in Maine and the formation of a public power district.
- Valued purchase power agreements in the transfer of assets to a deregulated electric market.

STRATEGIC AND FINANCIAL ADVISORY SERVICES

Have assisted several clients across North America with analytically-based strategic planning, due diligence, and financial advisory services.

Representative projects include:

- Preparation of feasibility studies for bond issuances for municipal and district steam clients.
- Assisted in the development of a generation strategy for an electric utility. Analyzed various NERC regions to identify potential market entry points. Evaluated potential competitors and alliance partners. Assisted in the development of gas and electric price forecasts. Developed a framework for the implementation of a risk management program.
- Assisted clients in identifying potential joint venture opportunities and alliance partners. Contacted interviewed and evaluated potential alliance candidates based on company-established criteria for several LDCs and marketing companies. Worked with several LDCs and unregulated marketing companies to establish alliances to enter into the retail energy market. Prepared testimony in support of several merger cases and participated in the regulatory process to obtain approval for these mergers.
- Assisted clients in several buy-side due diligence efforts, providing regulatory insight and developing valuation recommendations for acquisitions of both electric and gas properties.

EXPERT TESTIMONY

Ms. Bulkley has provided expert testimony before the following regulatory commissions, courts and boards:

- **Arizona Corporation Commission**
- **Arkansas Public Service Commission**
- **California Public Utilities Commission**
- **Colorado Public Utilities Commission**
- **Connecticut Public Utilities Regulatory Authority**
- **Federal Energy Regulatory Commission**
- **Idaho Public Utilities Commission**
- **Illinois Commerce Commission**
- **Indiana Utility Regulatory Commission**
- **Iowa Utilities Board**
- **Kansas Corporation Commission**
- **Kentucky Public Service Commission**
- **Maine Public Utilities Commission**
- **Maryland Public Service Commission**

- Massachusetts Appellate Tax Board
- Massachusetts Department of Public Utilities
- Michigan Public Service Commission
- Michigan Tax Tribunal
- Minnesota Public Utilities Commission
- Missouri Public Service Commission
- Montana Public Service Commission
- Public Utilities Commission of Nevada
- New Hampshire - Board of Tax and Land Appeals
- New Hampshire Public Utilities Commission
- New Hampshire-Merrimack County Superior Court
- New Hampshire-Rockingham Superior Court
- New Jersey Board of Public Utilities
- New Mexico Public Regulation Commission
- New York State Department of Public Service
- North Dakota Public Service Commission
- Oklahoma Corporation Commission
- Oregon Public Service Commission
- Oregon Public Service Commission

Notes:
[1] Equals sum of Col. [9]
[2] Equals sum of Col. [11]
[3] Equals ([1] x (1 + (0.5 x [2]))) + [2]
[4] Bloomberg Professional as of September 30, 2025
[5] Bloomberg Professional as of September 30, 2025
[6] Equals [4] x [5]
[7] Equals weight in S&P 500 based on market capitalization [6] if Growth Rate >0% and ≤20%
[8] Bloomberg Professional, as of September 30, 2025
[9] Equals [7] x [8]
[10] Value Line, as of September 30, 2025
[11] Equals [7] x [10]

ALTERNATIVE MARKET RETURN DERIVED FROM VALUE LINE SUMMARY & INDEX AND THE HISTORICAL MARKET RETURN

Value Line Derived Market Return		
Median Estimated Dividend Yield	[1]	2.10%
Median Estimated 3 to 5 Year Price Appreciation	[2]	40.00%
Growth Rate	[3]	8.78%
Expected Market Return	[4]	10.88%
S&P 500 Historical Return	[5]	12.30%
Average	[6]	11.59%

Notes:

[1] Median estimated dividend yields (next 12 months) of all dividend paying stocks; Value Line Summary & Index as of September 26, 2025

[2] Value Line's median estimated 3 to 5 year price appreciation potential of all stocks in the Value Line universe is 40.00%; Value Line Summary & Index as of September 26, 2025

[3] Equals ((1 + 40.00%)1/4) - 1

[4] Equals [1] + [2]

[5] Kroll (1926-2022), S&P Capital IQ for S&P 500 Return (2023-2024)

[6] Equals the average of [4] and [5]

FLOTATION COST ADJUSTMENT

Company	Ticker	Date [i]	[1] Shares Issued (000)	[2] Offering Price	[3] Under-writing Discount [ii]	[4] Offering Expense ($000)	[5] Net Proceeds Per Share	[6] Total Flotation Costs ($000)	[7] Gross Equity Issue Before Costs ($000)	[8] Net Proceeds ($000)	[9] Flotation Cost Percentage	
American Water Works Company	AWK	2/28/2023	12,650	135.50	2.033	700	133.41	26,411	1,714,075	1,687,664	1.54%	[iii]

[i] Offering Completion Date
[ii] Underwriting discount is calculated as the market price minus the offering price when not explicitly given in the prospectus.
[iii] American Water Works Company: AWK Prospectus 424B7 02.28.2023

The flotation cost adjustment is derived by dividing the dividend yield by 1 − F (where F = flotation costs expressed in percentage terms), or by 0.9846, and adding that result to the constant growth rate to determine the cost of equity. Using the formulas shown previously in my testimony, the Constant Growth DCF calculation is modified as follows to accommodate an adjustment for flotation costs:

$$k = \frac{D \times (1 + 0.5g)}{P \times (1 - F)} + g$$

Notes to Debt Schedule

(1) Re-issuance 12/21/12 from Parent at a coupon rate of 4.30% for 30 years
(2) New unsecured borrowing at a coupon rate of 4.30% for 30 years
(3) Issuances costs included make whole premium of $10M
(4) Issuances costs included make whole premium of $7.2M
(5) Refinanced June 2019 at a lower rate for the remaining term of the bond
(6) Refinanced Dec 2019 at a lower rate for the remaining term of the bond
(7) Sligo/Shippenville, Interest rate 1.385% for first 86 months and 2.763% (06/2013) for remainder
(8) Hanover & Collier 1.274% first 2009 - 2014 and 2.547% starting Oct 2014
(9) Mount Pleasant Water System Extension 1.559% first 2011 - 2016 and 2.69% starting March 2016
(10) Rock Run WTP 2.414% first 2011 - 2016 and 3.117% starting Dec 2017
(11) Silver Spring Clearwell 2.376% first 2012 - 2016 and 3.098% starting Jan 2017
(12) Wallaceton Municipal Authority 1.00% for 30 years starting March 2012
(13) Pittsburgh Meter Improvements 1.799% first 2012 - 2017 and 2.81% starting April 2017
(14) Pittsburgh Meter Improvement Project Phase II 1.559% first 60 months and 2.69% starting May 2016
(15) Southwest PA Pipeline Exts Phase II - Interest 1.591% first 5 years - 2.196% starting April 2018
(16) Clarion WW Act 537 Implementation Project - Interest rate is 1.0% for the life of the loan
(17) Paint Twp #1 - Interest rate is 1% for the remaining life of the Bond
(18) Paint Twp #2 - Interest rate is 1% for the remaining life of the Bond
(19) Fairview Water Main Extension - Interest rate is 1.356% for the first 5 years, 1.985% June 2022 for remaining 5 years
(20) Debt assumed as part of Scranton Sewer acquisition
(21) Washington County Main Extension Project - Interest rate is 1.439% until Oct 2021 - 2.027% for the remaining term
(22) Unsecured borrowing at a coupon rate of 2.80% for 10 years
(23) Unsecured borrowing at a coupon rate of 3.45% for 30 years
(24) Issuance costs include make whole premium of $1.2M
(25) Unsecured borrowing at a coupon rate of 3.25% for 30 years
(26) Unsecured borrowing at a coupon rate of 4.45% for 10 years
(27) Unsecured borrowing at a coupon rate of 4.20% for 26 years
(28) Unsecured borrowing at a coupon rate of 5.05% for 15 years
(29) Unsecured borrowing at a coupon rate of 5.06% for 15 years
(30) Unsecured borrowing at a coupon rate of 4.20% for 15 years
(31) Unsecured borrowing at a coupon rate of 5.06% for 15 years
(32) Unsecured borrowing at a coupon rate of 4.75% for 15 years
(33) Unsecured borrowing at a coupon rate of 5.14% for 17 years
(34) Unsecured borrowing at a coupon rate of 3.625% for 3 years
(35) Unsecured borrowing at a coupon rate of 5.15% for 10 years
(36) Unsecured borrowing at a coupon rate of 5.45% for 30 years
(37) Unsecured borrowing at a coupon rate of 5.25% for 10 years

(9) Mount Pleasant Water System Extension 1.559% first 2011 - 2016 and 2.69% starting March 2016
(10) Rock Run WTP 2.414% first 2011 - 2016 and 3.117% starting Dec 2017
(11) Silver Spring Clearwell 2.376% first 2012 - 2016 and 3.098% starting Jan 2017
(12) Wallaceton Municipal Authority 1.00% for 30 years starting March 2012
(13) Pittsburgh Meter Improvements 1.799% first 2012 - 2017 and 2.81% starting April 2017
(14) Pittsburgh Meter Improvement Project Phase II 1.559% first 60 months and 2.69% starting May 2016
(15) Southwest PA Pipeline Exts Phase II - Interest 1.591% first 5 years - 2.196% starting April 2018
(16) Clarion WW Act 537 Implementation Project - Interest rate is 1.0% for the life of the loan
(17) Paint Twp #1 - Interest rate is 1% for the remaining life of the Bond
(18) Paint Twp #2 - Interest rate is 1% for the remaining life of the Bond
(19) Fairview Water Main Extension - Interest rate is 1.356% for the first 5 years, 1.985% June 2022 for remaining 5 years
(20) Debt assumed as part of Scranton Sewer acquisition
(21) Washington County Main Extension Project - Interest rate is 1.439% until Oct 2021 - 2.027% for the remaining term
(22) Unsecured borrowing at a coupon rate of 2.80% for 10 years
(23) Unsecured borrowing at a coupon rate of 3.45% for 30 years
(24) Issuance costs include make whole premium of $1.2M
(25) Unsecured borrowing at a coupon rate of 3.25% for 30 years
(26) Unsecured borrowing at a coupon rate of 4.45% for 10 years
(27) Unsecured borrowing at a coupon rate of 4.20% for 26 years
(28) Unsecured borrowing at a coupon rate of 5.05% for 15 years
(29) Unsecured borrowing at a coupon rate of 5.06% for 15 years
(30) Unsecured borrowing at a coupon rate of 4.20% for 15 years
(31) Unsecured borrowing at a coupon rate of 5.06% for 15 years
(32) Unsecured borrowing at a coupon rate of 4.75% for 15 years
(34) Unsecured borrowing at a coupon rate of 3.625% for 3 years
(35) Unsecured borrowing at a coupon rate of 5.15% for 10 years
(36) Unsecured borrowing at a coupon rate of 5.45% for 30 years
(38) New unsecured borrowing at a coupon rate of 5.70% for 30 years
(39) New unsecured borrowing at a coupon rate of 5.65% for 10 years
(40) New unsecured borrowing at a coupon rate of 6.15% for 30 years
(41) new Pennvest Loan - Old Steubenville Pike and Campbell Rd Waterline Extension - 1.74%
(42) new Pennvest Loan - Avella Rd (Sr50) Waterline Extension - 1.74%
(43) new Pennvest Loan - Exeter WW Collection System I & I Repair - 1.00%
(44) new Pennvest Loan - Pittsburgh LSLR Phase 1-29th Ward and Mt Oliver - 1.00%
(45) new Pennvest Loan - Kinzua Rd WW Treatment Plant CAP Improvement - 1.00%

Notes to Debt Schedule

(1) Re-issuance 12/21/12 from Parent at a coupon rate of 4.30% for 30 years
(2) New unsecured borrowing at a coupon rate of 4.30% for 30 years
(3) Issuances costs included make whole premium of $10M
(4) Issuances costs included make whole premium of $7.2M
(5) Refinanced June 2019 at a lower rate for the remaining term of the bond
(6) Refinanced Dec 2019 at a lower rate for the remaining term of the bond
(8) Hanover & Collier 1.274% first 2009 - 2014 and 2.547% starting Oct 2014
(9) Mount Pleasant Water System Extension 1.559% first 2011 - 2016 and 2.69% starting March 2016
(10) Rock Run WTP 2.414% first 2011 - 2016 and 3.117% starting Dec 2017
(11) Silver Spring Clearwell 2.376% first 2012 - 2016 and 3.098% starting Jan 2017
(12) Wallaceton Municipal Authority 1.00% for 30 years starting March 2012
(13) Pittsburgh Meter Improvements 1.799% first 2012 - 2017 and 2.81% starting April 2017
(14) Pittsburgh Meter Improvement Project Phase II 1.559% first 60 months and 2.69% starting May 2016
(15) Southwest PA Pipeline Exts Phase II - Interest 1.591% first 5 years - 2.196% starting April 2018
(17) Paint Twp #1 - Interest rate is 1% for the remaining life of the Bond
(18) Paint Twp #2 - Interest rate is 1% for the remaining life of the Bond
(19) Fairview Water Main Extension - Interest rate is 1.356% for the first 5 years, 1.985% June 2022 for remaining 5 years
(21) Washington County Main Extension Project - Interest rate is 1.439% until Oct 2021 - 2.027% for the remaining term
(22) Unsecured borrowing at a coupon rate of 2.80% for 10 years
(23) Unsecured borrowing at a coupon rate of 3.45% for 30 years
(24) Issuance costs include make whole premium of $1.2M
(25) Unsecured borrowing at a coupon rate of 3.25% for 30 years
(26) Unsecured borrowing at a coupon rate of 4.45% for 10 years
(27) Unsecured borrowing at a coupon rate of 4.20% for 26 years
(28) Unsecured borrowing at a coupon rate of 5.05% for 15 years
(29) Unsecured borrowing at a coupon rate of 5.06% for 15 years
(30) Unsecured borrowing at a coupon rate of 4.20% for 15 years
(31) Unsecured borrowing at a coupon rate of 5.06% for 15 years
(32) Unsecured borrowing at a coupon rate of 4.75% for 15 years
(33) Unsecured borrowing at a coupon rate of 5.14% for 17 years
(35) Unsecured borrowing at a coupon rate of 5.15% for 10 years
(36) Unsecured borrowing at a coupon rate of 5.45% for 30 years
(37) Unsecured borrowing at a coupon rate of 5.25% for 10 years
(38) New unsecured borrowing at a coupon rate of 5.70% for 30 years
(39) New unsecured borrowing at a coupon rate of 5.65% for 10 years
(40) New unsecured borrowing at a coupon rate of 6.15% for 30 years
(41) new Pennvest Loan - Old Steubenville Pike and Campbell Rd Waterline Extension - 1.74%
(42) new Pennvest Loan - Avella Rd (Sr50) Waterline Extension - 1.74%
(43) new Pennvest Loan - Exeter WW Collection System I & I Repair - 1.00%
(44) new Pennvest Loan - Pittsburgh LSLR Phase 1-29th Ward and Mt Oliver - 1.00%
(46) New unsecured borrowing at a coupon rate of 5.65% for 10 years
(47) New unsecured borrowing at a coupon rate of 6.15% for 30 years
(48) New unsecured borrowing at a coupon rate of 5.75% for 10 years
(49) New unsecured borrowing at a coupon rate of 6.30% for 30 years
(50) new Pennvest Loan - Pittsburgh LSLR Phase 2-Homestead Borough - 1.00%
(51) new Pennvest Loan - Summit Point PFAS/Mn Treatment Improvements - 1.00%
(52) new Pennvest Loan - New Castle LSLR Phase 1 - 1.00%
(53) new Pennvest Loan - Coatesville LSLR Phase 1 - 1.00%
(54) new Pennvest Loan - Marshwood Dam Rehabilitation - 1.00%
(55) new Pennvest Loan - Maple Lake Dam Rehabilitation - 1.00%

PENNSYLVANIA AMERICAN WATER COMPANY
SCHEDULE OF PREFERRED STOCK AT JUNE 30, 2025 through JUNE 30, 2027

SERIES	DATE OF ISSUE	DATE OF MATURITY	AVG TERM (YRS) (1) (3)	SHARES ISSUED	SHARES OUTSTANDING	PRINCIPAL AMOUNT ISSUED	AMOUNT OUTSTANDING	EXPENSE	NET PROCEEDS	SINKING REQUIR.	ANNUAL DIVIDEND	PERCENT TO TOTAL	EFFECTIVE COST RATE (2)	WEIGHTED COST RATE

Notes:

(1) Determined by taking into account the effect of the annual sinking fund requirements which are met by the retirement of stock which reduce the term of each issue.
(2) The effective cost for each issue is the yield to maturity using as inputs the average term of issue, stated dividend rate, and net proceeds ratio.

(3) Series without sinking fund requirements are outstanding in perpetuity. For those series, the effective cost rate is the stated dividend rate divided by the net proceeds ratio.

Introduction

Q. Please state your name and business address.

A. My name is John Popiolek. My business address is Willis Towers Watson ("WTW"), 1900 Market Street Floor 8, Philadelphia, Pennsylvania 19103.

Q. On whose behalf are you testifying in this proceeding?

A. I am filing testimony on behalf of Pennsylvania-American Water Company (the "Company" or "PAWC").

Q. By whom are you employed and in what position?

A. I am employed by WTW as a retirement plan actuary and I am a Director in WTW's Retirement line of business.

Q. Please describe your educational background.

A. I attended Cornell University, where I received a Bachelor of Arts degree majoring in Physics.

Q. Please describe your professional experience.

A. I have 38 years of experience consulting with organizations on the valuation and financing of their pension programs.

Q. Are you a member of any professional organizations?

A. Yes. I am a Fellow of the Society of Actuaries, member of the American Academy of Actuaries, and an Enrolled Actuary under the Employee Retirement Income Security Act of 1974 ("ERISA").

Q. What experience do you have working with pension and postretirement welfare plans sponsored by regulated utilities?

A. I have broad experience working with pension plan sponsors in the healthcare, transportation, and utility industries to help address the funding, compliance, and administrative challenges involved in managing their pension plans. I have worked with utility clients related to pension plan de-risking, collective bargaining support, multiemployer plan strategy, executive pension plan funding, and retirement plan design. I serve as a national resource on multiemployer plan funding issues, consulting with clients on multiemployer plan exit and financial strategy. Since 2018, I have served on the Retirement Plans Experience Committee of the Society of Actuaries, developing the next generation of mortality assumptions for U.S. actuaries.

Q. Have you previously submitted testimony before the Pennsylvania Public Utility Commission (the "Commission" or "PUC")?

A. Yes, I testified on behalf of the Company in its 2022 base rate proceeding at Docket Nos. R-2022-3031672 and R-2022-3031673.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to present projections developed by WTW of the forecast of pension cost and postretirement welfare plan income for the American Water Pension Plan and the American Water Postretirement Welfare Plan and, in addition, PAWC's share of these expenses. These projections are included with the Company's initial filing in response to FR III.14. These projections are the basis for the Company's calculation of its pension and other post-employment benefits ("OPEB") expense claim in this case in accordance with Financial Account Standards Board Accounting Standards Codification Topic 715 or "ASC 715" (formerly Statement of Financial Accounting Standards 87).

Company witness Lori O'Malley addresses the Company's pension and OPEB expense claim in PAWC Statement No. 6. I will also explain why WTW's forecast should serve as the basis for the Company's calculation of its pension and OPEB expense claims based on accrual accounting.

PENSION COST AND POSTRETIREMENT WELFARE PLAN INCOME

Q. Please provide an overview of how American Water's pension and OPEB plans are funded.

A. In order for companies to be able to make tax-qualified pension payments to retirees, companies must establish a pension trust and fund the plan prior to the time such retiree payments are to occur. Annual pension plan funding amounts are determined by the plan sponsor but are subject to the minimum required contribution requirements of the ERISA and the maximum deductible limits based on Internal Revenue Service ("IRS") rules. The minimum and maximum deductible funding requirements must comply with IRS requirements regarding the assumptions and methods used, which differ from those used for cost accounting (where assumptions must represent the plan sponsor's best estimate of future experience). The minimum required contribution is calculated as the value of benefits earned in a plan year plus an amortization of the plan's shortfall, generally over 15 years. The goal of these requirements is to ensure that assets in the plan are available to fund retiree benefit payments from the plan when due and to encourage organizations to fund their pension obligations over a reasonable period. Additionally, the IRS imposes penalties and other limitations for less well-funded pension plans and the Pension Benefit Guarantee Corporation ("PBGC") requires participant notices for missed contributions and additional reporting for such plans. As a result, companies have significant flexibility in determining the amount of cash they fund each year, subject to the IRS and ERISA imposed

requirements described above, but which are otherwise determined by their internal objectives regarding plan funding.

In addition to pensions, many employers provide other retiree benefits such as for medical costs and life insurance, and the accounting rules for OPEBs are similar to those of pensions. However, ERISA minimum contributions and PBGC reporting requirements do not apply to OPEB plans, so companies that pre-fund OPEBs (including most regulated utility companies) do so on a basis that meets other objectives, such as annually funding the service cost (i.e., the value of benefits earned by participants in the current year), so that assets accumulate over the same period that benefits are earned.

Q. How did WTW develop its projections that are the basis of the Company's pension and OPEB expense claims in this case?

A. Under generally accepted accounting principles in the US ("GAAP"), companies are required to reflect the cost of providing pension benefits to employees on their income statement during the time that those employees provide service to the company. Costs are determined annually based on an actuarial valuation of a plan's participant population, its assets held for investment, and the provisions of the pension plan. Because of the long-term nature of the pension promise to employees, companies must make assumptions about future economic and demographic conditions. These assumptions are revised over time as actual experience and projections of future conditions result in revisions to the company's projected pension benefit obligation. Because of the long-term nature of the obligation, companies are not required to reflect the effect of assumption changes or plan changes in earnings as they occur. Those gains and losses and prior service costs are amortized over future periods. WTW prepares such studies for the Company on an annual basis. We understand that the Company's claim for OPEB expense in this proceeding is based on the

results of WTW's 2025 actuarial valuation of the pension and OPEB plans, which will be updated when the 2026 actuarial valuations become available.

Q. Q. Does PAWC use an accrual or cash contribution methodology to record pension and OPEB expenses for ratemaking purposes?

A. It has been PAWC's practice since its 2017 rate case to record pension and OPEB expense on an accrual basis for ratemaking purposes, instead of using a cash contribution method, to smooth out volatile cash contributions that can vary based on funding requirements and the year's cash flow. *See Pa. P.U.C. v. Penn.-Am. Water Co.*, Docket No. R-2017-259-5853. As such, the Company's pension and OPEB claims in this case are based on the 2025 actuarial reports I discussed above that determine the amount of pension and OPEB expense (or income) PAWC will record on its books in accordance with ASC 715. GAAP pension expense is meant to accrue the pension cost of an employee over the period in which the employee provides service to the company with the objective of attributing the cost of the program to each year of the employee's service. Cash contribution requirements for pension plans are determined under ERISA and related IRS rules, which provide limits on the minimum required contribution and maximum tax-deductible contribution. Actual plan sponsor contributions can be any amount within these limits. The ERISA cash contribution rules were developed with the primary objective of ensuring that pension plan assets are available to fund retiree benefit payments when due. Given the differences in objectives between these methods, the GAAP pension expense is a preferred method for attributing costs to individual years.

Q. Is the Company's approach to calculating its pension and OPEB expense in this case consistent with its proposal in its 2023 base rate case at Docket Nos. R-2023-3043189 and R-2023-3043190?

A. Yes.

Q. Are you familiar with the Commission's decision in that case with respect to the Company's pension and OPEB expense?

A. Yes. The Commission adopted a proposal to adjust the Company's claimed pension and OPEB expense by utilizing the Company's three-year historic average of pension and OPEB ASC 715 accruals instead of the forward-looking projections developed by WTW.

Q. Is the use of a three-year average instead of actuarial projections appropriate to determine a rate allowance for pension and OPEB expense?

A. No. The use of historic information does not inform how future pension and OPEB costs (or income) will be recorded because economic and demographic variables change each year, which makes each annual actuarial report unique and independent of prior year projections. As I discuss in further detail below, the use of historical averages instead of actuarial projections also fails to recognize known changes in future amortization components that will occur. Please also refer to the testimony of Company witness Dr. Christina Chard, PAWC Statement No. 2, in which Dr. Chard describes the variance between the authorized amount for pension and OPEB expense in the Company's prior rate case and the actual pension and OPEB expense recorded by the Company.

Q. Are pension and OPEB costs determined on an accrual basis difficult to predict with certainty?

A. Yes. Pension and OPEB costs calculated in accordance with GAAP (i.e., ASC 715) can fluctuate from year to year because of changes in economic or demographic variables used

to determine those costs. Actuaries, including WTW, must make reasonable assumptions to supply the values for those variables, including interest rates, salary increases, inflation, and the performance of the investment markets. In addition, demographic assumptions related to the composition of the population that will receive retirement benefits, the behavior of members of that population (e.g., decisions about when to retire) and the life expectancy of the recipients of retirement benefits all impact the assumptions and variables of the calculation.

Among the primary economic factors that drive fluctuations in retirement costs are: (1) variations between the returns that are projected on the investments made to fund current and future retirement costs and returns actually achieved on those investments; and (2) variations between assumed discount rates and actual discount rates during the period for which costs are being projected. If investment returns and discount rates are higher than expected, retirement cost obligations measured at year-end decrease (compared to the prior year-end) and current-year costs generally decrease as compared to the prior year. If investment returns and discount rates are lower than expected, retirement cost obligations measured at year-end increase, and current-year costs generally increase as compared to the prior period.

Although demographic assumptions have exhibited less year-to-year volatility than investment returns and discount rates, there have been demographic factors that produced material variations in retirement costs. For example, in 2014, the Society of Actuaries' Retirement Plans Experience Committee released a report that showed a population-wide increase in life expectancy, causing many actuarial experts to reassess their populations and reconsider previous assumptions. Longer life expectancy means that retirement

benefits will be paid for a longer period of time in the future, and therefore the current costs to fund those future benefits increased.

Q. Why does use of a three-year average of historic actual pension and OPEB expense fail in aligning base year costs with known changes in actual costs?

A. Pension accounting under GAAP requires that changes in the plan provisions for pension and OPEB plans be recognized through pension and OPEB costs over the average future working lifetime of the affected population. This is referred to as a "Net Prior Service Cost" or "Net Prior Service Credit." Such Net Prior Service Cost (or Credit) amortizations are included in pension and OPEB costs until fully amortized. This can introduce wholly predictable changes in cost from one year to the next as such amortization bases expire. The chart below summarizes the portion of net periodic pension and postretirement benefit cost allocated to PAWC based on Net Prior Service Cost Amortization Payments as of January 1, 2024, and shows how expiring amortizations impact PAWC's annual costs:

	Active Pension Plan		OPEB Plan	
PAWC Allocation	Net Prior Service Cost Amortization Payment	Increase/ (Decrease) in Pension Expense from Prior Year	Net Prior Service Cost/(Credit) Amortization Payment	Increase/ (Decrease) in OPEB Expense from Prior Year
Fiscal Year			**Total**	
2024	496,247		(7,245,612)	
2025	467,582	(28,665)	(7,282,705)	(37,094)
2026	302,779	(164,804)	(6,041,054)	1,241,652
2027	(1,398)	(304,177)	(3,839,665)	2,201,388
2028	(1,398)	-	(3,839,665)	-
2029	(1,398)	-	670,358	4,510,023
2030	(1,398)	-	121,106	(549,252)
2031	(1,130)	268	121,106	-
2032	-		121,106	-
2024 PA allocation%	17.29%		23.44%	
2025+ PA allocation %	16.34%		23.56%	

This shows that the net periodic pension cost amortization payment allocated to PAWC is expected to reduce pension expense by $164,804 in FY2026 compared to the prior year and further reduce pension expense by $304,177 in FY2027.

For the OPEB plan, where PAWC has been able to effectively manage program costs through the collective bargaining process, the effects are larger and extend over a longer period. The total amortization of net prior service cost shown is made up of five separate amortization bases first recognized between 8/1/2016 and 12/31/2022. OPEB expense allocated to PAWC is expected to increase $1,241,652 in FY2026 compared to the prior year and further increase $2,201,388 in FY2027 as these prior service cost amortizations expire.

The three-year average of historic actual pension and OPEB expense methodology, if maintained, would not recognize these known and significant changes in cost until many years after their effects and result in a significant mismatch in the timing of costs and recovery.

Q. Which methodology is most appropriate for ratemaking purposes?

A. The Company's use of actual expense is most appropriate because it recognizes known and significant changes in cost and avoids a significant mismatch in the timing of costs and recovery. This is consistent with Dr. Chard's testimony, which shows the methodology proposed in the Company's prior case – the same methodology the Company is proposing in this case – was more closely aligned with actual experience than the three-year average methodology.

Conclusion

Q. Does this conclude your direct testimony at this time?

A. Yes, it does.
