

It has been fifteen years since Cromby shut down, and in that time our community has grown, not just in population, but in quality of life. Re-opening a power-generating plant in the middle of these hard-won improvements would be a step backward.

My concern is the very real, long-term environmental and health impacts that a gas-powered generating facility would impose on nearby neighborhoods. Air-quality degradation and persistent low-frequency noise are not hypothetical risks; they are well-documented consequences of facilities of this type, and they would affect residents indefinitely.

The PATER study itself makes clear that it did not evaluate environmental impacts, including pollution, noise, or other quality-of-life factors. Because of that omission, the public still has no meaningful information about how a gas-powered plant at Cromby Road would affect surrounding homes, schools, businesses, parks, hospitals, people, pets, and wildlife.

Until a comprehensive, transparent environmental impact assessment is completed, one that fully addresses air emissions, noise pollution, public-health risks, and ecological effects, moving forward with this proposal would be irresponsible and contrary to the community's best interests.

Thank you,

John Livecchi
