I. INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Matthew T. Hoyt. I am employed by Exeter Associates, Inc. ("Exeter") as a Senior Analyst and Principal. My business address is 10480 Little Patuxent Parkway, Suite 300, Columbia MD 21044.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND QUALIFICATIONS.

A. I hold separate Bachelor of Arts degrees in English and Government from Georgetown University's College of Arts and Sciences. I also hold a Master of Public Administration from the John Glenn College of Public Affairs at Ohio State University.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.

A. I have been employed at Exeter since 2016 in various roles, most recently as a Principal of the firm, beginning in 2023. At Exeter, my work is primarily related to retail and wholesale electricity markets; energy procurement; electrification; rate design assessment; and state electricity policy design, implementation, and evaluation. Recent projects that I have led include technical audits of several electric utility programs and their accompanying riders, assessments of energy procurement strategies related to default electric service, and comprehensive evaluations of rules, regulations, and policies related to electric vehicles, large load additions, and resource adequacy constructs. I primarily support state utility commission, state energy office, office of consumer advocate, and non-profit association clients with this work.

Prior to joining Exeter, I worked as a Data Scientist at AEP Energy, a competitive retail electric generation service supplier, and as a Senior Analyst at TargetPoint Consulting, a market research and energy consulting firm. Please see Exhibit A for my complete resume.

Q. HAVE YOU PREVIOUSLY TESTIFIED IN REGULATORY PROCEEDINGS?

A. Yes. I have testified on behalf of Maryland Public Service Commission's Technical Staff in Case Nos. 9696 and 9741. My testimony addressed technical considerations related to Baltimore Gas & Electric's ("BGE's") and Potomac Edison Company's proposals to implement electric school bus pilot programs. I also put forth testimony on behalf of the Maryland Office of People's Counsel in Case No. 9744 addressing cost of service and rate design issues. Finally, I testified, on behalf of the Maryland Department of Natural Resource's Power Plant Research Program, in Case No. 9748, BGE's Certificate of Public Convenience and Necessity for the Brandon Shores Retirement Mitigation Project.

Q. ON WHOSE BEHALF ARE YOU APPEARING?

A. I am presenting testimony on behalf of the Office of Consumer Advocate ("OCA").

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?

A. I have been retained by the OCA to assist in the evaluation of the application of PPL Electric Utilities Corporation ("PPL" or "Company") as it relates to three topics: electric reliability, large load additions, and the Company's proposed Residential Electric Vehicle ("EV") Time-of-Use ("TOU") Charging Rebate Program ("Proposed EV Program"). My testimony will address the Testimony of Company Witness Joseph Lookup regarding the Company's pipeline of large load additions, approach to large load interconnections, and proposed changes to the LP-5 tariff, among other topics; the testimonies of Company Witnesses Katelyn Arnold, Nicole Howell, Joseph Lookup and others regarding the Company's system reliability, including its existing practice, vegetative management, and expanded right-of-way ("ROW") proposals, among other

topics; and the Testimony of Company Witness James Conrad addressing the Proposed EV Program.

Q. PLEASE SUMMARIZE YOUR FINDINGS AND RECOMMENDATIONS WITH REGARD TO LARGE LOAD ADDITIONS, PPL RELIABILITY, AND TO THE COMPANY'S PROPOSED EV PROGRAM.

A. For a summary of findings and recommendations regarding large load, please see **Section II, "Evaluation of Issues Related to Large Load Interconnections"** on page 5 of my testimony. For a summary of findings and recommendations regarding the Company's reliability, please see **Section III, "Evaluation of PPL Reliability"** on page 61 of my testimony. Finally, for a summary of findings and recommendations regarding the Company's Proposed EV program, please see **Section IV, "Evaluation of the Proposed Residential EV TOU Charging Rebate Program"** on page 100 of my testimony.

Q. HOW IS THE REMAINDER OF YOUR TESTIMONY ORGANIZED?

A. Section I is an introduction. Section II addresses my analysis and findings regarding large load additions within the Company's service territory, the Commonwealth of Pennsylvania, and PJM Interconnection ("PJM")[1] more broadly. In this section, I specifically address PPL's proposed treatment of large load interconnections, the broader risks and impacts of large load interconnections and particularly large data centers, and my recommendations intended to support the Commission's decision-making in this proceeding and in related proceedings addressing large load interconnections.

[1] PJM is short for PJM Interconnection, LLC. PJM is the regional transmission organization and independent system operator that manages the bulk power system serving PPL and most of Pennsylvania along with 12 other states and Washington, D.C.

Section III addresses my analysis and findings regarding the Company's electric reliability. In this section, I specifically address the Company's reliability performance, assess the efficacy of the Company's proposed reliability investments (specifically, vegetative management and expanded rights of way), and recommend standards the Commission should assess the Company on a going-forward basis.

Finally, Section IV addresses my analysis and findings regarding the Company's Proposed EV Program. In this section, I specifically address the need for the Proposed EV Program, provided justifications for major proposal elements, program objectives, cost benefit considerations, and comparisons to other EV programs. In each of these sections I summarize the Company's testimony and the information used to derive my above findings and recommendations.

II. EVALUATION OF ISSUES RELATED TO LARGE LOAD INTERCONNECTIONS

A. Purpose and Principles

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY REGARDING LARGE LOAD INTERCONNECTIONS?

A. My testimony has three related objectives. First, I evaluate PPL's proposed treatment of large load interconnections, including the status quo, the Company's proposed tariff revisions, and the extent to which PPL's approach is consistent with the Commission's proposed model large load tariff and established Commission policy. This evaluation focuses on the testimony of Company Witness Mr. Joseph Lookup.

Second, I identify and explain the broader risks and impacts that large load interconnections—particularly large data centers—can impose on PPL's system and on Pennsylvania customers more generally. Specifically, I discuss potential direct and indirect cost and reliability impacts associated with serving large new loads, including local and regional transmission upgrades, resource adequacy, wholesale energy and capacity, and PJM planning implications.

Third, intermeshed with the above assessment, I provide recommendations intended to support the Commission's decision-making in this proceeding and in related proceedings addressing large load interconnections. These recommendations are designed to ensure that large load interconnections are addressed in a manner consistent with longstanding ratemaking principles— particularly cost causation, cost-based differentiated service, and the obligation to ensure existing customers are no worse off—through clear tariff provisions, transparent oversight, and protections that reduce the risk of cost shifting and stranded assets.

Q. WHAT RATEMAKING PRINCIPLES DID YOU CONSIDER WHEN EVALUATING PPL'S EXISTING APPROACH TO LARGE LOAD INTERCONNECTIONS?

A. In evaluating the topics listed above, I specifically focused on assessing whether PPL's approach is consistent with three fundamental ratemaking principles: cost causation, cost-based differentiated service, and customer protection.

First and foremost, cost causation is central to any consideration of large load interconnections. New large load customers should bear the costs they cause for the electric system, rather than shifting those costs onto existing customers. Likewise, when a new entrant drives the need for incremental infrastructure, that entrant should absorb most, if not all, of the associated financial burden.

Second, tariffs should reflect material differences in how customers can and do use the system. Large loads with unique size, ramp rates, and reliability requirements can drive unique infrastructure and reliability risks, and therefore should face service terms and pricing that are commensurate with those impacts. The Commission and other stakeholders should play a direct role in evaluating the justness and reasonableness of differentiated service provisions for distinct customers groups.

Finally, a foundational ratemaking objective is to ensure existing customers are no worse off as a result of accommodating new customers, services, or load. Accommodating new large loads should not degrade service quality, system reliability, or affordability for incumbent customers. Any treatment of large load interconnections must ensure that all existing customers are protected from higher rates, increased outage risk, or cost responsibility for infrastructure that primarily serves new entrants. Where that standard cannot be met, additional conditions, cost recovery mechanisms,

or alternative service arrangements should be required consistent with the cost-based differentiated service and cost causation concepts identified above.

Ultimately, just and reasonable rates require that customers pay charges that reasonably reflect the costs and risks of serving them. Rates, rate designs, and policies that allow large new loads to impose system expansion costs or reliability risks on existing customers without commensurate compensation are neither just nor reasonable. Further, the Pennsylvania PUC, as the relevant retail rate authority for PPL, has a responsibility to ensure the justness and reasonableness of PPL retail service even when such service is at a transmission system level.

Q. WHAT ARE YOUR RECOMMENDATIONS FOR THIS PROCEEDING RELATED TO LARGE LOAD INTERCONNECTIONS?

A. I offer the following recommendations, grouped by subject area.

- The Commission should not approve PPL's proposed LP-5 revisions as a substitute for a comprehensive large load tariff framework. Rather, the Commission should require that PPL develop a separate, cost-based, large load rate schedule and associated standardized terms tailored to customers whose size and system impacts materially differ from the existing LP-5 customer base. This tariff should be considered before the Commission in a litigated proceeding that allows for stakeholder review and comment.

- If the Commission approves the proposed LP-5 tariff including the Company's revisions, the Commission should (1) approve revisions to the proposed LP-5 tariff language that are consistent with my recommendations and concerns herein; (2) retain explicit review and approval authority of agreements entered into between PPL and large load customers pursuant to the approved LP-5 schedule; and (3) retain explicit review and approval authority over determinations that interconnection-related upgrades provide benefits to the Company's transmission system. Further, the Commission

should subject "system benefits" determinations to clear standards to ensure that costs are not shifted to existing customers absent a demonstrated and quantifiable system benefit consistent with cost causation and customer protection principles.

- In either the proposed LP-5 tariff or a future large load tariff, the Commission should require specific safeguards including:
  - Explicit tariff provisions addressing transmission stranded cost risk;
  - Mandatory filing of and Commission access to large load contracts;
  - Assignment of certain risks of non-payment to the sponsoring utility, rather than all ratepayers, in the case of distribution costs incurred;
  - Assignment of 100% of costs to the large load customer, regardless of benefit calculations, when a network upgrade meets a "but for" development requirement; and
  - Application of Commission-prescribed methods to quantify system benefits from upgrades, rather than studies undertaken at the discretion of individual utilities.
  - Mandatory revenue guarantees whenever a large load interconnection results in upgrades that are included in transmission rate base.
- In either the proposed LP-5 tariff or a future large load tariff, the Commission should condition whether PPL may interconnect and commence service to new large load customers on a positive Commission finding that the proposed load can be served reliably from both a transmission deliverability and resource adequacy perspective, and without degrading the reliability of service to existing customers.
- If the Commission does not accept the above reliability requirement or otherwise allows connection without making a positive finding, then I

recommend that the following are addressed in LP-5 or a future large load tariff:

- Establish enforceable curtailment / interruptibility obligations for new large loads during emergencies, including as a condition of interconnection, with clear performance expectations and consequences for noncompliance;
- Require large loads to curtail prior to broader firm load shed affecting other customer classes;
- Require physical and operational readiness measures that facilitate targeted curtailment (including dedicated or otherwise segregable feeders where practicable; separation of any "critical" load segments behind the meter; and telemetry and communications capability sufficient for PPL to execute and confirm curtailment actions during emergency operations); and
- Align tariff provisions with emergency procedures and require corresponding updates to PPL's Emergency Load Control Procedure ("ELCP").

- The Commission should require that PPL's load forecasts and all information used in deriving those forecasts be made available to the Commission as part of a regulatory proceeding, during which time stakeholders and the Commission have an opportunity to scrutinize large load requests and provide feedback. This process should occur during the preliminary stages of PJM load forecast development to enable PJM to receive state-level feedback before finalizing its forecasts.

- When issuing forecasts to PJM, PPL should be required to provide PJM, at a minimum, the following information for each expected large load:
  - All pertinent information about the stage of development;

- Project development status (including whether the project has executed relevant service agreements, demonstrated site control, met permitting milestones, or other objective indicators of readiness);
- Disclosure regarding duplicative interconnection requests (including whether the customer has made other large load interconnection requests within or outside of PJM, the number of such duplicative sites, and the associated megawatts), and any inclusion of duplicative requests supported by a clear justification;
- Expected ramping schedules (anticipated in-service date, interim load levels, and full build-out timing);
- Detailed information regarding customer commitments (including deposits, construction obligations, or other sureties) and how those commitments meaningfully reduce attrition risk; and
- Confirmation that customer non-disclosure agreements permit full information sharing with PJM, and that all relevant large load information has in fact been shared.

- The Commission should require that the Company include in a future PPL large load tariff affiliate conflict of interest safeguards that prohibit PPL from reducing, crediting, or otherwise offsetting large load interconnection or service costs based on system benefit where those benefits either directly or indirectly accrue to a PPL affiliate.

B. Status Quo and Company Proposal

Q. WHAT IS PPL'S DEFINITION OF A LARGE LOAD CUSTOMER?

A. PPL does not provide a standalone definition of a "large load customer." However, Mr. Lookup addresses the topic of large load interconnection in relation to at least one type

of customer: data centers.[2] PPL also identifies large load customers based on their tariff and service characteristics, specifically customers that take "service at or above 69 kV" under Rate Schedule LP-5.[3]

Q. HOW DOES PPL CURRENTLY TREAT LARGE LOAD INTERCONNECTIONS?

A. Consistent with the above definition of a large load customer, large load interconnections are currently treated in the same manner as applicable to Rate Schedule LP-5 customers under PPL's existing Commission-approved tariff. Prior to the load-incurring interconnection costs, PPL undertakes a process including initial study of the interconnection request, execution of an electric service agreement ("ESA") that defines the terms of the interconnection, project development specific to the interconnection, and, finally, construction of associated service infrastructure.[4] Mr. Lookup explains that PPL "generally requires the customer to pay for all interconnection costs" when taking service under this rate.[5]

Mr. Lookup describes the current ESA in his testimony and makes particular note of four provisions: a minimum load guarantee ("80% of contracted load until service commitment is satisfied"), a load ramp schedule requirement, requirements for security instruments tied to rate-based investments, and the application of early termination terms and conditions.[6] Mr. Lookup further defines the involved customer guarantees as entailing commitments that new customers will "take service in an amount that the customer will pay electric service rates equal to the upgrade costs that

[2] Direct Testimony of Joseph Lookup at 15, lines 5.
[3] Id. at 17, lines 14-15.
[4] PPL summarized this process as recently as its September 16, 2025 presentation to PJM's Load Analysis Subcommittee. See: https://www.pjm.com/-/media/DotCom/committees-groups/subcommittees/las/2025/20250916/20250916-item-04g---ppl-large load-request.pdf.
[5] Lookup Dir. at 17, lines 15-16.
[6] Id. at 16, lines 16-21.

are socialized through transmission rates." This guarantee is in addition to contributions-in-aid-of-construction ("CIAC") obligations.[7]

Q. DOES PPL'S EXISTING TARIFF ADDRESS THE INTERCONNECTION OF LARGE LOAD CUSTOMERS OUTSIDE OF RATE SCHEDULE LP-5?

A. PPL addresses the interconnection of new customers in its Rules for Electric Service, specifically in Rule 2 – Requirements for Service, Rule 3 – Extension of Service, and Rule 4 – Supply of Service, as set forth in its currently effective tariff.[8] Rule 2 establishes the foundational contractual relationship between PPL and a new customer. It provides that every non-residential applicant for electric service may be required to sign a contract specifying, among other things, the intended use of service, the applicable rate schedule, and other service conditions. In addition, Rule 2 authorizes PPL to require deposits or guarantees satisfactory to the Company as security for payment of bills before commencing or continuing service. Together, these provisions give PPL discretion to impose reasonable requirements on new customers as a condition of interconnection.

Rule 3 is applicable to service extensions at voltages less than 69 kV. As such, it is not applicable to large load interconnections as defined above. Nevertheless, certain Rule 3 language mirrors the requirements that PPL imposes on larger customers through the ESA, according to the testimony of PPL.[9] Among other provisions, Rule 3 allows PPL to require minimum revenue guarantees for a stated guarantee period and that customers pay all estimated excess costs of construction prior to service. Subsection C also explicitly addresses "speculative line extensions," defined as

[7] Id. at 18, lines 1-4.

[8] PPL Electric Utilities Corporation General Tariff. (Approved October 31, 2025, Effective December 1, 2025), p. 6-8E.

[9] "The load commitment language in the ESA is similar to the Company's line extension guarantee terms in Rule 3 of the tariff for lower voltage line extension." (Lookup Dir. at 17, line 23 and 18, line 1.)

circumstances "when, in the Company's judgement, the continued future use of the facilities by any customer is uncertain."[10] In these circumstances, the Company requires a guarantee based on fully allocated installation and removal costs and may require surety bonds or other security in addition to deposits.

Rule 4, like Rule 3, addresses guarantee, advance payments, and security applicable to PPL distribution customers, including prospective customers deemed "speculative." The Rule 4 tariff also specifically states that "this definition does not affect the Company's obligations under the Federal Power Act and/or the Public Utility Code, as applicable: (1) to provide safe, reliable and adequate retail electric service to customers taking service at voltages of 69 kV and above."[11] This final provision establishes an obligation—to provide "safe, reliable and adequate retail electric service"—that is subject to scrutiny both at a federal (i.e., Federal Energy Regulatory Commission, or "FERC") and state (i.e., PA PUC) level.

Q. IS PPL'S EXISTING TARIFF INSTRUCTIVE FOR HOW THE COMPANY SHOULD APPROACH LARGE LOAD INTERCONNECTIONS?

A. Yes. The existing tariff outlines several essential strategies that the Company may apply when interconnecting new loads. These include allowances for the Company to require:

- Deposits or guarantees as security for payment of bills *prior to* commencing or continuing service;
- Minimum revenue guarantees;
- Surety bonds or other security in addition to deposits; and
- Additional security and required payments.

[10] PPL Electric Utilities Corporation General Tariff. (Approved October 31, 2025, Effective December 1, 2025). p. 7A.
[11] Id., p. 8.

These "tools" are well understood and Commission-supported mechanisms for the Company to protect consumers and ensure cost causation. As such, they should be considered by the Commission when evaluating the Company's proposed requirements for LP-5 customers, as discussed below.

Q. WHAT CHANGES IS PPL PROPOSING TO RATE SCHEDULE LP-5?

A. PPL proposes to revise LP-5 to incorporate certain ESA provisions directly into the tariff.[12] Proposed tariff-level requirements include minimum load guarantees, revenue guarantees, and security equal to the costs being placed into rates. Specific characteristics of PPL's current ESA and proposed LP-5 tariff are summarized below in Table 1. The proposed changes will apply to both existing and new LP-5 customers.[13]

Q. DOES PPL EXPLAIN WHY TARIFF-LEVEL CHANGES TO RATE SCHEDULE LP-5 CHANGES ARE REQUIRED IN ADDITION TO THE ESA?

A. Yes. Mr. Lookup states that, while PPL's use of the ESA process has been successful, the Company wants to "memorialize its large load interconnection terms in its tariff for transparency and consistency."[14]

Q. DO YOU AGREE WITH MR. LOOKUP THAT THE CURRENT ESA PROCESS "HAS BEEN SUCCESSFUL"?

A. No. Mr. Lookup's characterization of the current ESA process as "successful" appears to rest primarily on the fact that it has been adopted by certain prospective customers: "…Company has not experienced any significant pushback to the ESA terms and has successfully executed ESAs with these terms for load additions in the pipeline."[15] I

[12] Lookup Dir. at 17, lines 4-5.
[13] PPL Response to OCA XXIII-4.
[14] Lookup Dir. at 18, lines 19-20.
[15] Id., lines 12-13.

believe characterizing the current ESA as "successful" solely on this basis is misleading for two reasons.

First, describing the ESA as "successful" implies that it has achieved its intended purpose. I disagree with PPL's perspective equating success solely with prospective customer adoption rather than demonstrated performance. None of the customers that have executed the new ESA are currently taking service.[16] As a result, there is no basis to evaluate how the ESA functions in practice. An agreement cannot reasonably be deemed successful when it has not yet been tested through actual service to customers. Prospective customers are not the same as customers in service.

Second, the purpose of an ESA should not be limited to facilitating customer onboarding. It should also ensure compliance with the fundamental service standards established in PPL's tariff, as described above. These standards include reasonable allocation of risk, adequate protections for existing customers, and appropriate financial and operational safeguards.[17] An ESA may be widely adopted without meaningfully addressing these objectives. Indeed, we would expect an agreement that places minimal obligations or risk on prospective customers to achieve higher adoption and no "significant pushback" for precisely that reason.

Q. ARE THE TYPES OF NEW LARGE LOAD CUSTOMERS SEEKING RATE SCHEDULE LP-5 SERVICE SIMILAR TO EXISTING CUSTOMERS TAKING SERVICE UNDER LP-5?

A. No Recent requests for LP-5 service reflect customers who are larger than the existing LP-5 customer base. In response to Discovery Request CAUSE-PA IV-25 and CAUSE-PA IV-26, PPL produces counts of both historical and projected participation

[16] Id., lines 10-11.

[17] See below discussion of the Commission's model large load tariff. Motion of Chairman Stephen M. DeFrank. Docket No. M-2025-3054271. March 28, 2025. p. 1.

in Rate Schedule LP-5 based on size. Table 1 below shows these counts based on the end of the historical test year (June 2025) and one year past the fully projected test year (June 2028). As apparent in this table, PPL projects the number of customers taking service at levels greater than 50 MW to increase by 700% (from two to 16) within a three-year period.

Table 1. Actual and Forecast Rate Schedule LP-5 Customer Counts by Peak Demand Size Range

	June 2025 (actual)	June 2028 (forecast)	Change
Number of customers	**162**	**172**	10
Less than 5 MW	80	76	-4
More than 5 MW but less than 10 MW	37	36	-1
More than 10 MW but less than 20 MW	27	27	0
More than 20 MW but less than 50 MW	16	17	1
More than 50 MW but less than 75 MW	1	2	1
More than 75 MW but less than 100 MW	0	2	2
More than 100 MW	1	12	11

Derived from CAUSE-PA IV-26 Attachment 1.

The Company also produced a count of customers requesting LP-5 service with a projected peak demand greater than 25 MW. This list, which spans August 25, 2023 through November 5, 2025, includes 268 requests. All but four of these requests (98.5%) have a projected load (MW) of more than 50 MW.[18] Both the potential pipeline and the forecast additions for new large load customers reflect customers of substantially larger expected size than existing Rate Schedule LP-5 participants. This is in addition to potential differences in system impacts and risk that I address below.

Q. WHAT OTHER CHANGES IS PPL PROPOSING TO THE TREATMENT OF LARGE LOAD CUSTOMERS?

[18] PPL Response to OCA VIII-1 Attachment 1.

A. As noted above, the changes in LP-5 memorialize the ways that PPL is already approaching large load interconnection through the ESA process. As such, PPL is not changing its treatment of large load customers with respect to the large load customer's requirements for service. However, PPL does propose changing the way it recovers certain interconnection costs from large load customers. Specifically, the proposed LP-5 tariff includes a provision that the Company "not charge the customer directly for line extension upgrades that provide benefits to the Company's transmission system, as determined by PPL Electric."[19] The tariff subsequently presumes that upgrades to the 230-kV and 500-kV networked bulk system provide offsetting reliability benefits.[20] Other potential offsetting benefits include, but are not limited to, "increased capacity, lower system congestion, service to multiple customers, increased resiliency and operational flexibility, and expanded capacity for new generation and interconnections."[21] PPL further clarified in response to OCA VIII-9 that "it is PPL Electric's policy that upgrades to the networked bulk electric system made in connection with LP-5 customer interconnections will generally be excluded from the customer's obligation and included in transmission rate base."[22] One "minimum" obligation is the "customer's direct connection cost" including, "more specifically, the transmission lines sourced from PPL Electric's substation/switchyard that terminate into the customers substation."[23] All other upgrades, including PPL substations/switchyards, will be evaluated on a case-by-case basis.[24]

[24] Id.

Q. DO YOU HAVE CONCERNS ABOUT PPL'S PROPOSED CHANGES TO RATE SCHEDULE LP-5 AND THE COMPANY'S APPROACH TO LARGE LOAD INTERCONNECTIONS?

A. Yes. PPL's proposed LP-5 revisions and its broader approach to large load interconnections raise significant consumer protection concerns. At a high level, those concerns fall into two related categories: (1) the proposal does not constitute a complete or fit-for-purpose large load tariff that provides for cost-based differentiated service to large load customers; and (2) it weakens enforceable cost causation and "no worse off" protections through discretionary cost-sharing provisions.

First, PPL's proposal is incomplete as a "large load tariff" and should not be treated as such. As discussed below in my comparison to the Commission's proposed model tariff and tariffs developed in other jurisdictions, LP-5 omits several elements that regulators are actively considering as requirements for large load service. Additionally, the Company's proposed approach does not address the substantial size differences between most existing LP-5 customers and those currently in the pipeline, as summarized above. I am concerned that the result is a patchwork approach that may facilitate rapid onboarding of a new type of large load customer without fully aligning the tariff with consumer protection objectives.

Second, the cost-sharing language in the proposed LP-5 tariff revisions undermines cost causation and potentially makes existing customers worse off. This may occur as a result of the proposed LP-5 tariff language that permits PPL to offset certain interconnection costs from direct customer responsibility based on the Company's unilateral determination that the upgrades provide system benefit. Absent clear, objective limits on when and how such costs may be shifted, this structure risks

socializing the but-for costs of serving individual large load customers in contravention of foundational cost causation principles.

The above concerns are heightened to the extent that PPL has an incentive to facilitate large load development and accelerate capital investment. I address these incentive concerns, and related issues of potential conflicts of interest, later in my testimony, including within the discussion of PPL Corporation's joint-venture activities. These structural deficiencies also frame the analysis that follows regarding the Commission's model tariff, forecast uncertainty, cost impacts, and reliability risks associated with large load interconnections.

Q. WHAT RECOMMENDATIONS DO YOU OFFER TO THE COMMISSION GIVEN THESE CONCERNS?

A. I recommend that the Commission not approve PPL's proposed LP-5 revisions as a substitute for a comprehensive large load tariff framework. Instead, consistent with the objectives and ratemaking principles described above, the Commission should require that PPL develop a separate, cost-based, large load rate schedule and associated standardized terms. The specific parameters of PPL's proposed tariff should be evaluated before the Commission in a litigated proceeding that allows for stakeholder review and comment.

Alternatively, if the Commission approves the proposed LP-5 tariff including the Company's revisions, I recommend that the Commission retain explicit review and approval authority over determinations that interconnection-related upgrades provide "benefits to the Company's transmission system benefits." Such determinations should be subject to clear standards and Commission oversight to ensure that costs are not shifted to existing customers absent a demonstrated and quantifiable system benefit consistent with cost causation and customer protection principles.

C. Model Large load Tariff

Q. HAS THE COMMISSION CONSIDERED LARGE LOAD INTERCONNECTIONS OUTSIDE OF THIS PROCEEDING?

A. Yes. In recognition of the current and forecasted grid impacts of large load customers at a local, regional, and national level, the PA PUC initiated proceedings to develop a model tariff for large load customers on March 28, 2025. Through this process, the Commission seeks to create a tariff that would "protect the Commonwealth's ratepayers […] against the risk of utility investments for projects that may not materialize," "ensure fair cost allocation for projects that do go forward," and "provide [large load customers] with certainty regarding the time interconnection will take and the costs they will have to incur."[25] On November 22, 2025, the Commission issued a Tentative Order with an attached proposed model tariff in the Pennsylvania Bulletin Vol. 55, No. 47. Table 2 summarizes the key characteristics of the proposed model tariff alongside PPL's proposed LP-5 tariff and currently applicable large load ESA.

[25] Motion of Chairman Stephen M. DeFrank. Docket No. M-2025-3054271. March 28, 2025, p. 1.

Table 2. Comparison of Key Characteristics of PA PUC's Model Tariff, PPL's Proposed LP-5 Tariff, and PPL's Current Large load ESA

	PUC Model Tariff[26]	PPL LP-5 Tariff[27]	PPL Large load ESA[28]
Eligibility	Customers at or over 50 MW individually or 100 MW in aggregate (p. 8040)	Based on service voltage >69 kV	Based on service voltage >69 kV (p. 1)
Service Term	5-year initial term, 3-year notice for termination or contract capacity modification (p. 8041)	1-year service minimum for tariff in general, 5-year service minimum for line/service extensions, no termination or modification requirements	5-year initial term, 30 days' notice for termination after initial term (p. 2)
Minimum Monthly Charges	Minimum billing demand: greater of 80% of contract capacity or 80% of the highest previously established monthly billing demand from the past 11 months (p. 8041)	Customer pays applicable rates based on greater of actual peak demand values or 80% of load ramp schedule load until revenue guarantee is satisfied	Transmission service charge for the greater of the actual amount supplied during the month or the Minimum Contract Capacity (Schedule A of ESA) (p. 2)
Cost Responsibility	In accordance with CIAC: Fee for Interconnection Facilities plus Network Improvement Costs based on share of benefits received from Network Improvements (pp. 8032, 8041)	All costs associated with line and service extensions except when PPL determines the upgrades provide reliability/other benefits to the whole system. PPL has an existing CIAC calculation process.	All costs associated with a separate Construction Agreement. Associated Rate Base expenses are estimated and subsequently adjusted in Schedule A of the ESA. (pp. 2-3)
Financial Security	Requires collateral tied to the Interconnection Facility and Network Improvement Costs (p. 8041)	Requires security equal to the amount of line extension that was not directly charged to the customer. PPL can draw upon security in the event of default	Requires credit support (ESA Schedule B) that meets obligations of the ESA and Tariff (p. 3)
Exit Procedure/Fee	42 months prior notice required to reduce capacity by 20% in the first 5 years without payment. Subject to the exit fee, capacity reduction can be greater than 20% after the first 5 years. Exit fee is the greater of the remaining facilities and network cost obligations or the remaining minimum capacity charge for each remaining contract year. (p. 8042)	None	In event of termination, customer will pay Termination Payment* in addition to any other costs still owed under the agreement (pp. 8,14)
Interconnection Study Process	Imposes a 6-month time limit on interconnection studies from the date application is accepted (p. 8042)	None	None
Interruption/ Curtailment	Company will provide interruptible service based on its existing interruptible tariffs. Company reserves the right to evaluate the customer's ability to curtail. Penalty imposed based on interruptible tariff if customer fails to curtail when directed (pp. 8042-8,043)	None	None
Miscellaneous	Requires an annual company hardship fund contribution by the large load customer (p. 8043)	None	Sets a maximum allowable harmonic voltage distortion level and holds customer responsible for corrective measures (p. 6)

* Termination Payment defined on page 14 of redlined ESA provided in response to OCA XXIII-6 Attachment 1.

Q. HOW DO PPL'S PROPOSED LP-5 TARIFF AND EXISTING ESA DIFFER FROM THE COMMISSION'S MODEL LARGE LOAD TARIFF AS PROPOSED?

A. The two documents differ in a number of ways. I summarize several of these differences in the subsequent bullets:

- The Commission's model tariff applies to large load customers at or over 50 MW individually or 100 MW in aggregate, in the case that a group of sites with common ownership, local electric infrastructure, or control exceed the threshold collectively. PPL's proposed LP-5 schedule and associated Agreement for Large Load Electric Service apply to customers based solely on taking service voltage of 69 kV or higher.

- The model tariff, LP-5 tariff, and proposed ESA include a mandatory five-year initial service term for large load customers requiring line/service extension work. The model tariff, however, includes a three-year notice requirement for service termination or capacity contract modifications, while PPL's ESA only requires 30 days' notice after the initial five-year term. A notice period is not included in PPL's LP-5 tariff.

- The model tariff more explicitly outlines exit procedures and fees that would apply to a customer in the event of termination. Both the model tariff and PPL's ESA require coverage of remaining cost obligations if termination occurs. This is outlined in PPL's proposed ESA, but not included in the LP-5 tariff.

- The model tariff references interruptible tariffs and allows them to be mandated for large load customers. It includes a penalty for a customer's

[26] Pennsylvania Bulletin Volume 55, Number 47, pp. 8040-8043 (Model Tariff for Customers at or Over 50 MW Individually or 100 MW in the Aggregate).

[27] PPL Electric Exhibit GEO-1, pp. 97-99 (Rate Schedule LP-5).

[28] Agreement for Large Load Electric Service, Attachment 1 of Response to OCA XXIII-6.

failure to curtail when directed to do so. PPL's proposed changes do not include similar curtailment requirements/penalties.

Q. HOW SHOULD THE COMMISSION UNDERSTAND THE ABOVE GAPS AND DIFFERENCES?

A. The gaps and differences identified above demonstrate that PPL's proposed revisions to Rate Schedule LP-5 do not constitute a comprehensive or fit-for-purpose large load tariff as contemplated by the Commission. In several instances, the LP-5 tariff omits protections that exist only in the ESA, such as termination notice provisions, leaving those protections unenforceable at the tariff level and outside routine Commission review. In other instances, neither the ESA nor LP-5 includes provisions that the Commission has explicitly identified as relevant to large load service, including differentiated service options such as curtailment or interruption authority. Taken together, these omissions underscore that LP-5 is not aligned with the Commission's stated objectives of protecting existing customers, ensuring fair cost allocation, and mitigating the risk of stranded or speculative investments associated with large load interconnections.

Q. WHAT RECOMMENDATIONS WOULD YOU MAKE GIVEN THE ABOVE GAPS AND DIFFERENCES?

A. Because Docket No. M-2025-3054271 is ongoing and its outcome remains uncertain, it is necessary for the Commission to address large load tariff provisions in this proceeding. In that context, the deficiencies identified above reinforce my recommendation that the Commission not approve PPL's proposed revisions to Rate Schedule LP-5 as a *de facto* large load tariff applicable to the distinct types of customers seeking service in recent history. Instead, the Commission should require PPL to develop a separate, cost-based, large load rate schedule with standardized terms specifically tailored to customers whose size and system impacts materially differ from

the existing LP-5 customer base. Any such proposal should be subject to the same level of regulatory scrutiny as a base rate case, including discovery and the opportunity for testimony or comments by intervenors.

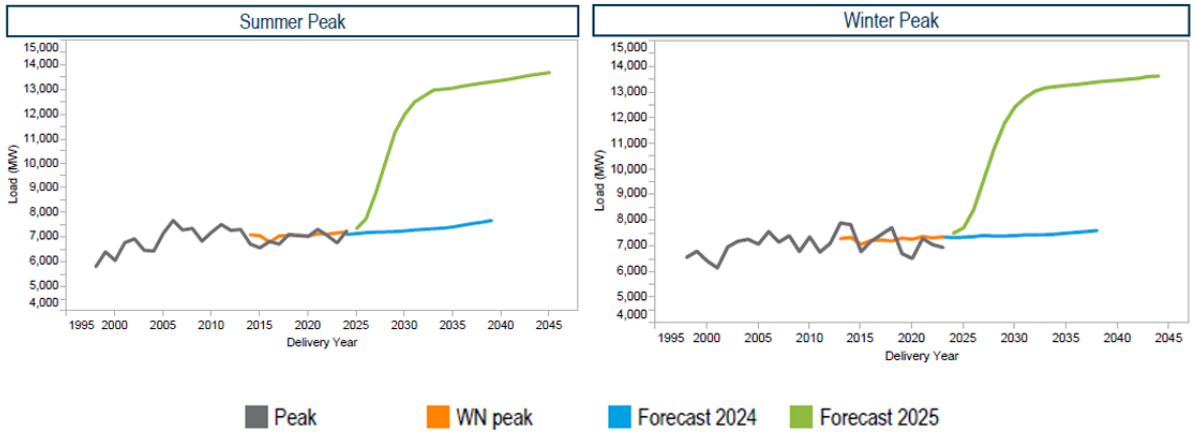
D. Forecasts and Future System Conditions

Q. WHAT NEAR-TERM SYSTEM CONDITIONS AND CUSTOMER ACTIVITY DOES PPL IDENTIFY AS DRIVING ITS PROPOSED CHANGES TO RATE SCHEDULE LP-5 AND THE TREATMENT OF LARGE LOAD CUSTOMERS?

A. PPL identifies rapid data center growth as among the underlying drivers for the proposed changes outlined above. Specifically, Mr. Lookup states that the Company's "pipeline of projects exceeds the Company's current peak load of 7.8 GW" and that the Company is preparing "to more than double its system demand in 5–6 years."[29]

Q. HAS PPL PUBLICLY SHARED INFORMATION ABOUT ITS ANTICIPATED LOAD GROWTH IN OTHER FORUMS?

A. Yes, it has done so with PJM. PPL is a transmission-owning member of PJM. In this capacity, PPL actively contributes to various PJM subcommittees, including the Load Analysis Subcommittee ("LAS"). Among the responsibilities of the LAS is to coordinate the collection of information related to electric peak demand energy forecasts from PJM member entities. This information subsequently informs PJM's load forecasts that impact transmission and resource adequacy planning.[30]



PPL regularly provides information to the PJM LAS regarding its anticipated load growth. As recently as September 16, 2025, PPL proposed Load Forecast

[29] Lookup Dir. at 15, lines 12-14.

[30] See below for additional discussion of the nature of these impacts.

Adjustments for the PPL service territory for purposes of PJM's 2026 load forecasts.[31] These forecasts reflect additional increases in expected peak demand beyond the already substantial upward revision in load forecast reflected in the 2025 forecast. Figure 1 shows the final 2024 and 2025 forecasts adopted by PJM. This graph highlights the significant upwards change in forecast from 2024 to 2025. Figure 2 shows the preliminary 2026 summer forecasts provided by PPL.

Figure 2. PPL Summer Load Adjustment for 2026 Forecast (Sep. 16, 2025)

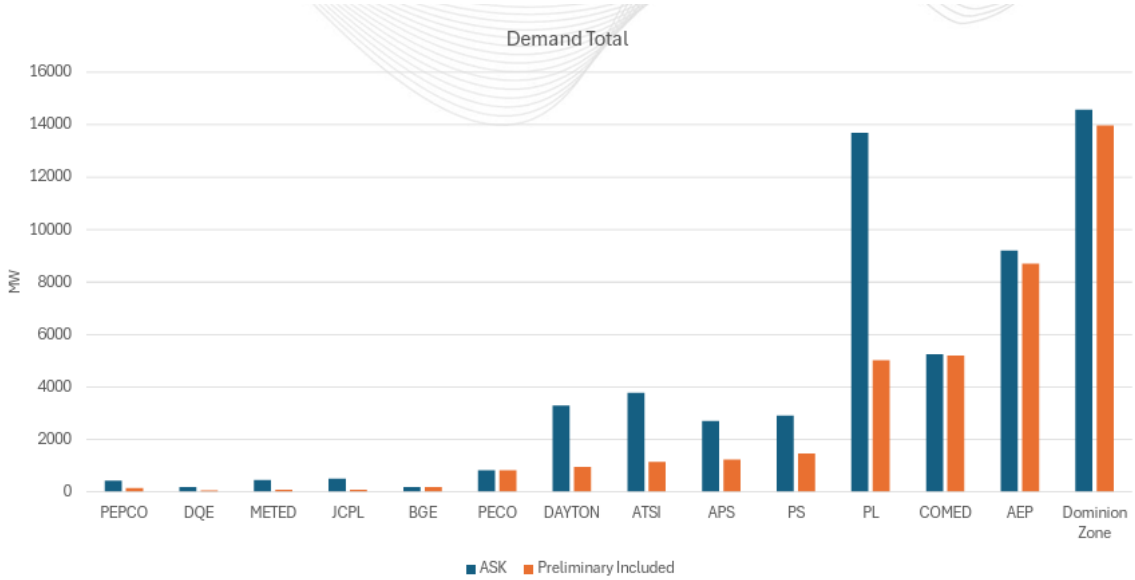
Source: https://www.pjm.com/-/media/DotCom/committees-groups/subcommittees/las/2025/20250916/20250916-item-04g---ppl-large load-request.pdf.

Q. ON WHAT BASIS DOES PPL INCORPORATE LARGE LOAD INTERCONNECTIONS INTO THE LOAD GROWTH ESTIMATES IT PROVIDES TO PJM?

A. PPL only includes data center load with a signed letter of authorization. Additionally, the Company conducts an initial screening to ensure it does not include multiple requests for the same parcel.[32]

Q. IS THERE REASON TO BE SKEPTICAL OF PPL'S LOAD FORECASTS?

A. Yes. There are multiple reasons to be skeptical, many of which are detailed at length in the subsection below discussing the risks associated with investments to serve large load interconnections. As an initial matter, though, I will highlight PJM's own perspective on the load forecasts put forth by its member transmission owners and utilities. PJM's November 24, 2025 presentation describes the process by which PJM filters and adjusts load requests from various entities to create an accurate forecast.[33]



[32] PPL Response to OCA VIII-7.

[33] Mooney, Molly. Load Adjustment Requests Summary for 2026 Load Forecast – Preliminary. November 24, 2025. https://www.pjm.com/-/media/DotCom/committees-groups/subcommittees/las/2025/20251124/20251124-item-03---large load-adjustment-requests-summary.pdf.

Among other adjustments, PJM investigates ramp rates, utilization rates, and economic data. The subsequent changes PJM makes are intended to mitigate double-counting and differentiate firm and non-firm load requests.

Subsequent to the above process, PJM produced a comparison of requested versus preliminary included forecasts. Among the steepest discounts for any utility service territory is the one applied to PPL. Figure 3 shows this adjustment, such that a nearly 14-GW increase put forth by PPL was revised to approximately 5 GW. The raw amount of load requested, which reflects at least a letter of authorization, exceeds the portion that PJM believes reasonable to include in its preliminary load forecasts after screening. While this does not imply that PPL's expected load forecasts cannot be realized, it does suggest that there is good cause to be skeptical of PPL's large load additional forecasts. Notably, the magnitude of reduction applied to PPL's load forecast far exceeds that for any other transmission zone.

Figure 3. PPL Summer Load Adjustment for 2026 Forecast (Sep. 16, 2025)

Source: Mooney, Molly. Load Adjustment Requests Summary for 2026 Load Forecast – Preliminary. November 24, 2025. p. 30. https://www.pjm.com/-/media/DotCom/committees-groups/subcommittees/las/2025/20251124/20251124-item-03---large load-adjustment-requests-summary.pdf.

I discuss further below the risks that projects may never get built or may arrive later than anticipated.

Q. IF THE LOAD FORECAST IS TOO HIGH, WHAT ARE THE POTENTIAL CONSEQUENCES?

A. An inaccurate large load forecast can drive real, irreversible costs and reliability decisions that do not unwind simply because the load fails to materialize or arrives later than assumed. PJM's capacity and transmission planning processes are forecast-driven: higher expected load increases capacity procurement requirements and can trigger or accelerate transmission upgrades through the Regional Transmission Expansion Plan ("RTEP") process. If those forecasts later prove inaccurate, the region may still procure "just-in-case" capacity and advance transmission projects whose costs are largely fixed once committed. Because many of these costs are recovered through broadly allocated wholesale rates, the consequence of an over-forecast is not merely an internal planning error; it can become a multi-year, socialized cost exposure for customers that did not trigger the underlying investments.

Q. COULD THE COMPANY BENEFIT FROM SPECULATIVE LOAD FORECASTS?

A. The Company would not incur any harm, and could possibly benefit, from load forecasts that exceed realistic estimations of growth under PJM's planning framework. As noted above, load forecasts are a key input to RTEP reliability analyses. Higher forecasted load, even if it does not ultimately materialize, can trigger the identification of transmission needs and the approval or acceleration of network upgrades. PPL, as the incumbent transmission owner, is a direct beneficiary when it constructs local transmission projects assigned to it via PJM planning processes and places them into transmission rate base. In fact, PPL plays a direct role in the identification of the

supplemental transmission projects that a large load interconnection creates; PPL studies new customer requests and, "if [reliability] violations are identified, PPL Electric develops solutions to be included as network upgrades. The network upgrades are submitted as part of the supplemental project to PJM."[34] The Company has not denied or rejected any large load service request it has received since January 2023.[35]

E. Large Load Interconnection Risks

Q. WHAT RISKS ARE ASSOCIATED WITH LARGE LOAD INTERCONNECTION?

Large load interconnections—particularly those driven by data center demand—introduce a distinct set of risks for utilities and customers. These risks arise from demand uncertainty, project execution challenges, macroeconomic and policy volatility, and a fundamental mismatch between the time horizons of grid investments and emerging technology markets. I will address each of these categories of risk in turn.

Demand Uncertainty

A central risk associated with large load interconnections is the overestimation of demand. Data center developers frequently submit multiple interconnection requests across regions to preserve optionality, with only a subset of projects ultimately constructed.[36] As a result, interconnection queues may include speculative or duplicative requests that do not translate into realized load.

[34] PPL Response to OCA XVII-4.

[35] PPL Response to OCA XVII-5.

[36] Martucci, Brian. *A fraction of proposed data centers will get built. Utilities are wising up.* May 15, 2025. Utility Dive. https://www.utilitydive.com/news/a-fraction-of-proposed-data-centers-will-get-built-utilities-are-wising-up/748214/.

In addition, data center demand is highly heterogeneous. Hyperscale facilities, colocation data centers, edge computing sites,[37] and AI-focused "neo-cloud" facilities differ substantially in their power profiles, reliability requirements, and sensitivity to price and latency. [38,39] Certain workloads, such as AI training loads, are more flexible and location-independent, making them more likely to relocate in response to market or system conditions. Other loads tied to critical services require zero latency and near-perfect reliability. In this case, the load may not materialize if there are system conditions that comprise those requirements. Moreover, the intended application of a data center may change during development, altering its load characteristics and grid requirements after planning assumptions have already been made.

Demand uncertainty is further exacerbated by efficiency improvements in computing hardware, software, and cooling technologies. Improvements can significantly reduce power consumption per unit of computation and cause realized load to fall well below initial interconnection requests.[40]

Project Execution Challenges

Like other large projects, data center developments involve complex coordination among multiple parties, in this case potentially including data providers, data center developers, utilities, EPC (Engineering, Procurement, and Construction)

[37] *Understanding the Differences Between 5 Common Types of Data Centers.* May 18, 2022. Data Center Frontier. https://www.datacenterfrontier.com/sponsored/article/11427373/belden-understanding-the-differences-between-5-common-types-of-data-centers.

firms, landowners, investors, tenants, and equipment suppliers.[41] The involvement of many interdependent actors creates sequencing and execution risk, particularly when progress by one party serves as a bottleneck for the entire project.

Supply chain constraints pose a notable risk. Delays in obtaining critical equipment—such as transformers or switchgear on the power site or specialized computing hardware on the data center site—can prevent data centers from operating at planned capacity or within their intended timelines.[42,43] Uncertainty during the development process can also complicate project financing, increase costs, or cause sponsors to reassess their commitment to a project altogether.[44]

Macroeconomic and Policy Volatility

Macroeconomic conditions introduce additional uncertainty into large load interconnections. Data center growth is driven by expectations of future demand.[45] This demand may not materialize in the event of an economic downturn. Additionally, the investment capital required to finance large data center projects may not materialize or be sustained in response to changes in interest rates, inflation shocks, or other shifts in capital markets. Because many data center projects are intended to respond to forward-looking needs, adverse macroeconomic conditions can materially affect their viability.

[45] *The murky economics of the data-centre investment boom.* September 30, 2025. The Economist. https://www.economist.com/business/2025/09/30/the-murky-economics-of-the-data-centre-investment-boom? .

Policy risk further complicates long-term planning. Federal and state incentives, energy policies, or siting regulations may change, altering the relative attractiveness of different locations.[46] Even favorable policy changes can influence project timing, encouraging developers to shift investment toward jurisdictions with faster permitting or earlier in-service dates.

Mismatch Between Grid Investment Horizons and AI Growth

Finally, there is a fundamental mismatch between the long-lived nature of electric grid investments and the uncertainty surrounding AI-driven data center growth. To serve large loads, utilities and wholesale market participants must plan and finance investments in transmission, distribution, and generation assets with useful lives often exceeding 20 years. Associated capital expenditures are typically justified based on projected load growth.

Short-term contracts, preliminary agreements, or authorization letters provide limited assurance that either the load will materialize or that it will persist over the full life of associated utility assets. This asymmetry creates significant risk that utility investments may be stranded, with costs ultimately borne by parties other than the data center. This risk is magnified when interconnection costs are small relative to the developer's market capitalization.[47] Data center developers may be more willing to initiate projects that they later abandon when they are insensitive to the nominal costs of initiating interconnection proceedings.

[46] Sandalow, David. McCormick, Colin. Jacobson, Rory. Bostwick, Ben. Yuan, Angela. Zurofsky, Adam. *Data Centers and Their Energy Use: Trends in State Capitals.* December 15, 2025. Center on Global Policy at Columbia. https://www.energypolicy.columbia.edu/data-centers-and-their-energy-use-trends-in-state-capitals/.

[47] For example, Amazon, which has a market capitalization of $2.430 trillion as of December 2025, has received approval to build a data center near the Salem Township within PPL's territory. While not publicly available, the associated interconnection costs are undoubtedly a small fraction of Amazon's market capitalization.

Q. WHAT TYPES OF MEASURES HAVE OTHER JURISDICTIONS CONTEMPLATED TO ADDRESS THE ABOVE RISKS?

A. In much the same way that the Commission seeks to develop a model large load tariff in Docket No. M-2025-3054271, many other utilities, regulatory commissions, and stakeholders in other jurisdictions have taken steps to develop large load tariffs as a means to protect existing customers and to maintain objective ratemaking on the basis of cost causation. Smart Electric Power Alliance ("SEPA") and the North Carolina Clean Energy Technology Center ("NCCETC") maintain a database of emerging large load tariffs showing both proposed and approved tariffs across the United States. Their database currently shows 26 states with at least one approved tariff and another seven states with proposed or pending tariffs as of December 2025, not including Pennsylvania.[48]

SEPA and NCCETC's database, along with similar analyses by the Energy Futures Group ("EFG")[49] and Lawrence Berkeley National Laboratory,[50] document a wide variety of tariff features. I reproduce a summary table below (Figure 4) from a recent EFG report highlighting several categories of "safeguards." As apparent from this analysis, contract length, minimum demand, minimum investment, and cost assignment provisions are all repeated features of large load tariffs. Additional

[48] Database of Emerging Large load Tariffs ("DELTa"). SEPA and NCCETC. Retrieved December 15, 2025, from https://sepapower.org/large%20load-tariffs-database/. To be included, a tariff must address at least one of the following: "Improving transparency, customer protections, and risk mitigation around large loads; Specifying the customer commitments essential for the utility to begin investing in large load service; Incentivizing large customers to help manage peak load and support new clean energy; and Defining customer size and operational thresholds beyond which new structures may help achieve system requirements and policy goals."

Q. WHAT DO THE ABOVE RISKS AND RESPONSE MEASURES SUGGEST ABOUT PPL'S PROPOSED LP-5 TARIFF?

A. The range of safeguards available to regulatory commissions suggests that the risks associated with large load interconnection are addressable problems. This makes it all the more essential that the Commission require PPL to develop a separate, cost-based, large load rate schedule that is evaluated before the Commission in a proceeding that allows for stakeholder review and comment.

I also note the following areas as specific safeguards that I recommend the Commission contemplate for PPL's tariff that are not otherwise included in LP-5 or addressed in the model large load tariff:

- Explicit tariff provisions addressing transmission stranded cost risk;
- Mandatory filing of and Commission access to large load contracts;
- Assignment of certain risks of non-payment to the sponsoring utility, rather than all ratepayers, in the case of distribution costs incurred;

- Assignment of 100% of costs to the large load customer, regardless of benefit calculations, when a network upgrade meets a "but for" development requirement; and
- Application of Commission-prescribed methods to quantify system benefits from upgrades, rather than studies undertaken at the discretion of individual utilities.

This is not an exhaustive list. The above items, however, suggest there are a variety of important considerations, many of which the Commission has already signaled it expects to evaluate within Docket No. M-2025-3054271, that should be addressed in a comprehensive large load tariff framework put forth by PPL.

F. Cost Impacts

Q. WHAT ARE THE POTENTIAL IMPACTS OF NEW LARGE LOAD INTERCONNECTIONS ON ENERGY PRICES?

A. In PJM, wholesale energy prices are set at locational marginal prices ("LMPs"): the marginal cost to serve the next megawatt-hour ("MWh") at a specific node, including energy, congestion, and losses. Large new data center load increases total demand and can push PJM to dispatch higher-cost generators more often, thereby raising clearing prices, especially during high-load hours. The costs of higher-priced energy are passed on to customers through both third-party and default service supply rates. These cost impacts are potentially compounded for PPL consumers to the extent that data centers cluster within PPL's service territory, as PPL's load projections might suggest. A concentrated number of very large customers has the potential to increase congestion, which is one of the determinants of LMP noted above.

Potential offsetting effects may exist to the extent data centers can collocate with generation that matches their hour-to-hour energy needs. There is no such

obligation that they do so, to date, at a PJM-wide level or at the direction of the Commission. Load flexibility in the form of demand response participation or voluntary curtailment can also mitigate certain peak demand-related costs. However, large loads currently have no obligation to undertake such measures.

Q. WHAT ARE THE POTENTIAL IMPACTS OF NEW LARGE LOAD INTERCONNECTIONS ON CAPACITY MARKET PRICES?

A. PJM's Reliability Pricing Model ("RPM") procures capacity to meet forecast peak load plus a reserve margin that is calibrated to minimize loss of load expectation, referred to as the reliability requirement. Large load interconnections increase the forecast load that drives the reliability requirement, thereby increasing the quantity procured and the clearing price, all else equal. Similar to energy prices, there is the potential for capacity impacts to be more acute in areas that add large data center loads, such as PPL's service territory. PJM's capacity prices can be higher in Locational Deliverability Areas ("LDAs") when transmission limits constrain capacity imports. If data centers concentrate within LDAs that have limited transmission capacity (or the existing capacity becomes limited as a result of the new load), capacity prices can rise above the rest of PJM.

Capacity prices have already increased by more than an order of magnitude, from $28.92/MW-day for the 2024/25 delivery year ("DY") to $269.92/MW-day for DY 2025/26, $329.17/MW-day for DY 2026/27, and $333.44/MW for DY 2027/28.[51,52] The prices in the two most recent cleared auctions (covering DY 2026/27 and DY 2027/28) reflect a negotiated price cap and floor established following an

[51] Howland, Ethan. *PJM capacity prices hit record high as grid operator falls short of reliability target, December 18, 2025.* https://www.utilitydive.com/news/pjm-interconnection-capacity-auction-data-center/808264/.

[52] PJM delivery years run from June 1 through May 31.

agreement between PJM and the Pennsylvania Governor's Office.[53] PJM estimates that the most recent capacity auction (for DY 2027/28) would have cleared at nearly $530/MW-day absent this cap.[54] The remarkable shift in the last several years corresponds with sudden and sharp upward increases in load forecasts (i.e., demand) coupled with compounding supply issues related to new resource interconnection, resource retirements, capacity accreditation, and more.

While the challenges associated with PJM's capacity market are complex, the impacts of new large load interconnections are straightforward. Data centers add demand at the same time PJM is managing generator retirements and resource adequacy risks. If supply additions lag load growth, the market tightens and capacity prices rise. Associated capacity costs are allocated to third-party retail suppliers and default service providers serving retail customers, typically based on their respective customers' contributions to PJM's peak load (and related peak-load measures). These costs, in turn, are reflected in default service supply rates and rates within competitive retail contracts.

Q. DO NEW LARGE LOADS FACE INCREASED CAPACITY COSTS AS WELL?

A. Yes, but only to the extent that they do not manage their usage to during peak-load time to avoid or reduce capacity cost assignment. All customers have the ability to deliberately manage their load to avoid using power during the peak-load periods which determine capacity cost allocation. In theory, over the long run, these adjustments can

[53] PJM Interconnection. (2025). Capacity Market Demand Curve Adjustments Pursuant to Proposed Settlement (Special Members Committee presentation). https://www.pjm.com/-/media/DotCom/committees-groups/committees/mc/2025/20250207-special/item-01a---1-capacity-market-demand-curve-adjustments-pursuant-to-proposed-settlement.pdf.

[54] PJM, 2027/2028 Base Residual Auction Report, December 17, 2025. https://www.pjm.com/-/media/DotCom/markets-ops/rpm/rpm-auction-info/2027-2028/2027-2028-bra-report.pdf.

reduce PJM's capacity requirement. In tight supply conditions and in the face of uncertain load forecasts, however, this potential benefit is speculative. For short-run conditions, the only impact of capacity cost avoidance by a given customer is to shift additional costs to other customers, such as households, who do not or cannot reduce their peak contribution.

Q. ARE CAPACITY PRICES STILL IMPACTED IF A LARGE LOAD DOES NOT MATERIALIZE ON ITS PROPOSED SCHEDULE, OR AT ALL?

A. Yes, capacity prices may rise even if large loads do not materialize. This is because including large load additions in PJM's forecast is sufficient to instigate procurement of additional capacity resources.

Q. WHAT ARE THE POTENTIAL IMPACTS OF NEW LARGE LOAD INTERCONNECTIONS ON TRANSMISSION SYSTEM COSTS?

A. PJM identifies transmission "needs" through planning studies based on load forecasts, generator interconnections/retirements, and power flow models. PJM then approves transmission upgrades through its RTEP process. Projects can be driven by reliability violations (e.g., overloads or voltage violations), congestion/market efficiency, or public policy, depending on the project type and sponsorship. When large load interconnections increase projected demand at specific substations and in specific transmission corridors, subsequent reliability upgrades (e.g., new lines, transformers, breakers, reactive support, etc.) are typically concentrated within the affected transmission zone.

Recent RTEP approvals illustrate the potential cost magnitude of these load-driven needs. PJM's 2023 RTEP (finalized March 2024) identified $6.6 billion in baseline reliability projects driven at least in part by "the proliferation of new data

centers, creating major pockets of significant, increasing demand."[55] PJM's 2024 RTEP (finalized April 2025) identified an additional $5.9 billion in baseline projects once again driven in part by data center load.[56] The total cost is magnified when including supplement projects;[57] PJM evaluated over $9 billion of transmission owner supplemental projects for the 2024 Local Plan, with the plurality associated with customer service including the provision of power to new customers.[58]

For network upgrades, FERC-approved formula rates establish each transmission owner's revenue requirement, inclusive of new RTEP investments. Those costs are then allocated to load-serving entities ("LSEs") based on their contribution to Network Service Peak Load ("NSPL"), producing zonal Network Integration Transmission Service ("NITS") rates charged by PJM. Finally, LSEs flow these NITS charges through to retail customers via transmission components in default service rates and competitive supply contracts, with state regulatory commissions exercising jurisdiction over this retail allocation step, while FERC retains jurisdiction over the planning, revenue requirement, and wholesale cost allocation steps.

Q. DOES PPL ADDRESS THE IMPACTS OF NEW LARGE LOAD INTERCONNECTIONS ON TRANSMISSION NEEDS AND COSTS?

A. Yes. Mr. Lookup indicates that PPL will need to make significant investments in the transmission system to interconnect these new customers.[59] Mr. Lookup also asserts that, notwithstanding these investments, large loads will put downward pressure on

[55] PJM, Regional Transmission Expansion Plan 2023, March 7, 2024. https://www.pjm.com/-/media/DotCom/library/reports-notices/2023-rtep/2023-rtep-report.pdf.

[56] PJM, Regional Transmission Expansion Plan 2024, April 17, 2025. https://www.pjm.com/-/media/DotCom/library/reports-notices/2024-rtep/2024-rtep-report.pdf.

[57] Supplemental projects are not required for compliance with system reliability, operational performance or market efficiency economic criteria. They are put forward by [Transmission Owners] as transmission expansions or enhancements" to support various customer service, resilience, security, operation, safety, and asset health needs, among other reasons. RTEP 2024, p. 74.

[58] RTEP 2024, p. 75.

[59] Lookup Dir. at 16.

PPL's PJM-jurisdictional transmission rates, stating that "customers should see significant reductions in their transmission costs."[60] This conclusion implies that the transmission rate base will grow more slowly than PPL's coincident peak (i.e., NSPL) which is the primary allocator of PJM transmission costs to the service territory.

Q. DO YOU AGREE WITH PPL'S ASSESSMENT OF TRANSMISSION COST IMPACTS?

A. No. The transmission cost impacts of new large load interconnections can be either positive (cost-reducing) or negative (cost-increasing) for existing customers, depending on how incremental transmission investment compares to changes in NSPL; they are not uniformly positive, as PPL suggests. Moreover, the level of certainty implied in Mr. Lookup's testimony is not supported by PPL's own analysis. In discovery, when asked whether the Company evaluates the expected contribution of new large load customers to PJM transmission peaks, PPL responded that it "does not perform the evaluation described in this discovery request."[61]

As with capacity costs, large loads have an incentive to manage or suppress their contribution to NSPL to minimize transmission cost responsibility. If fixed network transmission costs associated with new upgrades increase more rapidly than NSPL, average transmission rates will rise rather than fall. Further, as detailed above, a variety of risks apply to large load interconnections. Once approved and placed into transmission rate base, transmission system upgrades associated with new large load interconnections put upward pressure on transmission rates irrespective of whether or when the load comes online.

[60] Lookup Dir. at 19, line 15.
[61] PPL Response to OCA XVII-12.

Q. HAVE OTHERS ALSO IDENTIFIED THE ABOVE ENERGY, CAPACITY, AND TRANSMISSION IMPACTS ASSOCIATED WITH LARGE LOAD INTERCONNECTIONS?

A. Yes, the above observations have also been made by a variety of researchers, industry analysts, utilities, and regulators. The PJM Board, for example, has discussed how rapid demand growth, coming primarily from data centers, poses resource adequacy concerns and has placed upward pressure on electricity prices.[62] The PJM Board also notes that the exact severity of these concerns is not known given the "large cone of uncertainty around the trajectory and amplitude of future growth."[63]

In its most recent market monitoring assessment for PJM, the Independent Market Monitor ("IMM") for PJM found that data center load growth is the principal ("but for") cause of recent capacity market's tight supply and demand balance and its high clearing prices. In fact, the IMM found that "based on actual auction clearing prices and quantities and uplift MW, inclusion of existing and forecast data center load in the peak load forecast for 2026 resulted in a $7,271,197,971 or an 82.1 percent increase in capacity market revenues for the 2026/2027 RPM Base Residual Auction."[64] Beyond the capacity market, the IMM also found that large data center load additions have already caused higher transmission and energy prices.[65]

Regarding transmission costs, recent analysis by the Environmental and Energy Law Program at Harvard Law School finds that rapid growth in large data center loads is a significant driver of new regional transmission investments in PJM.[66] Consistent

[62] Mills, David, PJM Board of Managers Chair. August 8, 2025. p. 1. 20250808-pjm-board-letter-re-implementation-of-critical-issue-fast-path-process-for-large-load-additions.pdf.
[63] Id.

[65] Id.
[66] Martin, Eliza. Peskoe, Ari. *Extracting Profits from the Public: How Utility Ratepayers Are Paying for Big Tech's Power.* March 2025. Environmental & Energy Law Program. p. 16.

with that conclusion, a recent Union of Concerned Scientists ("UCS") policy brief reports that "Costs are also rising because all customers pay for the new transmission lines required to connect new, large data centers."[67] UCS further finds that "in 2024 alone, utilities in seven PJM states passed more than $4.3 billion in additional costs on to customers" for transmission upgrades "made to provide transmission-level service directly to data centers," with "billions more still to come."[68]

Q. WHAT STEPS CAN THE COMMISSION TAKE TO MITIGATE THE ABOVE IMPACTS AT THE POINT OF LARGE LOAD INTERCONNECTION?

A. The Commission has clear authority to mitigate the impacts of large load interconnections through its jurisdiction over retail cost allocation, line extension policies, and tariffed service conditions. These tools allow the Commission to require protections that ensure cost causation and prevent existing customers from being made worse off as a result of speculative or concentrated large load growth. Commission action is particularly important because PJM has acknowledged limits on its ability to address these risks within its own jurisdiction.[69]

The specific safeguards that I recommend the Commission consider are similar to those I identified above in the context of risks and the model load tariff. A key recommendation is that the Commission require mandatory revenue guarantees whenever a large load interconnection results in upgrades that are included in transmission rate base. As reflected in PPL's response to OCA VIII-9, the Company

[67] Union of Concerned Scientists. (September 2025). Connection Costs: Loophole Costs Customers Over $4 Billion to Connect Data Centers to the Power Grid (policy brief).
[68] Id.
[69] PJM, *Jurisdictional and Legal Principles relating to CIFP – Large Load Additions*, September 15, 2025. https://www.pjm.com/-/media/DotCom/committees-groups/cifp-lla/2025/20250915/20250915-item-08---jurisdictional-and-legal-principles-relating-to-cifp--large load-additions---pjm-presentation.pdf.

currently proposes only discretionary use of revenue guarantees.[70] That approach is insufficient. Where transmission investments are driven by a specific large load, enforceable guarantees should be required to protect customers from the risk of delayed, reduced, or abandoned load.

More broadly, and consistent with my earlier recommendations, the Commission should ensure that costs primarily required to serve large loads are not socialized absent clear and demonstrated system benefits. Pennsylvania customers should not broadly fund transmission expansions needed to serve a small number of very large customers without those customers bearing an appropriate share through enforceable tariff provisions.

Q. ARE THERE RECENT EXAMPLES OF A PENNSYLVANIA UTILITY APPLYING REQUIREMENTS RELATED TO ASSIGNMENT OF FERC-JURISDICTIONAL COSTS?

A. Yes, this was recently demonstrated by the Transmission Security Agreement ("TSA") between PECO Energy Company ("PECO") and Amazon Data Services relating to a large data center planned in Falls Township, Pennsylvania.[71] Under their arrangement, Amazon's data center will take retail electric service pursuant to a rate schedule approved by the Commission while also following TSA requirements regarding transmission-related cost responsibilities. The TSA includes several cost protection mechanisms designed to prevent transmission costs from being shifted to other customers if the data center fails to materialize, is delayed, or ramps more slowly than forecast. These mechanisms include milestone-based shortfall payments, termination fees, and a committed review contribution equal to 80% of expected load-related transmission revenues.

[70] PPL Response to OCA VIII-9, Attachment 1.
[71] FERC Docket No. ER25-3492.

I make no claims regarding the adequacy of the above provisions. I do note, however, that these provisions are intended to align cost responsibility with cost causation and mitigate the risk of stranded or prematurely incurred transmission costs. This example demonstrates that PPL may implement mechanisms to allocate or secure recovery of FERC-jurisdictional costs associated with large load interconnections.

Q. IS PECO'S TSA INSTRUCTIVE FOR HOW PPL SHOULD APPROACH LARGE LOAD INTERCONNECTIONS?

A. Yes. The PECO TSA provides an example of a Pennsylvania utility implementing requirements to protect other customers from transmission revenue requirement risk. By comparison, PPL's proposed LP-5 revisions contemplate excluding many networked bulk system upgrades from direct customer charges when PPL determines they provide "system benefits," with the costs instead socialized through transmission rates. This focus on cost sharing instead of cost obligations is an additional reason that PPL's proposed LP-5 revisions are not a sufficient substitute for a comprehensive large load tariff and do not provide durable, tariff-level customer protections consistent with cost causation and consumer protection principles.

G. Reliability Impacts

Q. WHAT ARE THE POTENTIAL IMPACTS OF NEW LARGE LOAD INTERCONNECTIONS ON RELIABILITY?

A. Large load interconnections can materially affect electric system reliability through both resource adequacy and transmission deliverability impacts. First, large increases in load raise peak demand and, in turn, the amount of planning reserves that must be procured to maintain reliability. If new generation and other capacity resources are not developed and placed into service on a timeline that keeps pace with the load increase,

system reliability is degraded. This risk is heightened under current market conditions, where generation development faces well-documented challenges including supply chain constraints, longer construction timelines, interconnection delays, and heightened financing uncertainty.[72] Record-high PJM capacity prices in recent auctions—including those associated with a reported 6.6-gigawatt ("GW") capacity shortfall—are consistent with a system experiencing tightening resource adequacy conditions.[73]

Second, reliability is determined by the ability to deliver power to specific load pockets where large loads, such as data centers, are interconnected. Rapid concentration of large loads in a given area can stress the transmission system and give rise to localized reliability concerns, including:

- Thermal overloads on lines/transformers;
- Voltage and reactive power deficiencies;
- Protection system and short-circuit duty concerns; and
- Higher contingency risk (N-1/N-1-1 planning and operating constraints).

Either inadequate generation supply or insufficient transmission deliverability can reduce reliability. These concerns are especially acute at the bulk power system level, where the scale and concentration of large load interconnections can quickly exceed the assumptions embedded in prior planning studies and infrastructure configurations. For customers in PPL's service territory, these reliability risks have direct and tangible consequences: increased risk of manual load shed in response to PJM-initiated brown- or black-outs.

[72] The Brattle Group & Sargent & Lundy. April 9, 2025. Brattle 2025 CONE report for PJM.
[73] PJM 2027/2028 Base Residual Auction Report. December 17, 2025. 2027-2028-bra-report.pdf.

Q. HOW ARE LARGE LOADS CURRENTLY TREATED BY PJM DURING MANUAL LOAD SHED EVENTS?

A. There are no existing provisions to differentiate treatment of large loads at a PJM level. During an emergency, PJM follows a stepped approach to balance the system consistent with the provisions of PJM Manual 13 (Emergency Operations).[74] Initially, PJM deploys all available operating reserves and emergency generation, issues maximum generation and load management actions, and calls on committed demand response resources. If, however, conditions continue to deteriorate, subsequent steps lead to PJM declaring a load management emergency and directing transmission owners and distribution utilities to implement manual firm load shed. Load shed amounts and locations are determined by real-time system needs, transmission constraints, and voltage conditions, and are executed by local utilities.

Q. HOW ARE LARGE LOADS CURRENTLY TREATED BY PPL DURING MANUAL LOAD SHED EVENTS?

A. Large loads are not subject to any differentiated treatment during manual load shed events under PPL's current tariff or Emergency Load Control Procedure. Further, in response to discovery, PPL specified that "large load customers will be treated like all other customers during a manual load shed process."[75] At a tariff level, the applicable requirements for load shed are addressed in "Rule 4 – Supply of Service," which defines when a load emergency situation exists. Rule 4 also defines PPL's responsibility during emergency conditions as follows:

> In such case, the utility shall take such reasonable steps as the time available permits to bring the demands within the then-available capacity or to otherwise control load. Such steps shall include but shall not be limited to reduction or

[74] PJM Interconnection. PJM Manual 13 : Emergency Operations, Rev. 97 (Effective Nov. 20, 2025).
[75] PPL Response to OCA XVII-11.

> interruption of service to one or more customers, in accordance with the utility's procedures for controlling load.

PPL's Emergency Load Control Procedure does not include further details regarding large load customer treatment.[76,77]

Q. IN WHAT WAYS DOES PPL CONSIDER RELIABILITY AT THE POINT OF LARGE LOAD INTERCONNECTION?

A. As it relates to reliability, PPL's primary efforts are directed to identify supplemental transmission project needs: "[The Company] completes modeling and analysis of initial steady state customer load additions and identifies overloads, voltage violations, or other criteria violations. If violations are identified PPL Electric develops solutions to be included as network upgrades. The network upgrades are submitted as part of the supplemental project to PJM."[78] This process strictly looks for violations in PJM's planning criteria, not broader resource adequacy challenges. PPL does not perform an evaluation of PJM's ability to maintain system-level resource adequacy following the interconnection of a given large load customer prior to approving the interconnection.[79] Likewise, PPL does not evaluate PJM's ability to supply the incremental demand associated with new large load customers.[80]

Q. WHAT REQUIREMENTS SHOULD THE COMMISSION APPLY TO PPL LARGE LOAD INTERCONNECTIONS AS IT RELATES TO RELIABILITY?

[76] PPL Response to OCA XVII-11 (Attachment 1). PPL Electric Utilities Emergency Load Control Procedure (ELCP), Revision 23. Effective Date October 30, 2025.

[77] PPL Response to OCA XVII-11. PPL Electric Utilities Emergency Load Control Procedure (ELCP), Revision 23. Effective Date October 30, 2025.

[78] PPL Response to OCA XVII-4.

[79] PPL Response to OCA XVII-8.

[80] PPL Response to OCA XVII-7.

A. New large load interconnections can materially increase both resource adequacy risk and deliverability risk. PPL's current approach primarily evaluates the latter through transmission studies and the identification of supplemental network upgrades. This is necessary, but it is not sufficient. If the Commission's objective is to ensure existing customers are no worse off as a result of large load growth, then reliability protections must extend beyond "no planning criteria violations" to include how these loads affect emergency operations and system adequacy outcomes.

Accordingly, I recommend that whether PPL may interconnect and commence service to new large load customers be based on a positive Commission finding that the proposed load can be served reliably from both a transmission and distribution deliverability and resource adequacy perspective, and without degrading the reliability of service to existing customers. This review should occur through a required utility filing triggered by receipt of a qualifying large load service request, and the governing tariff and associated ESAs should expressly provide that energization may be postponed, staged, or otherwise conditioned pending Commission review and approval. In this way, large load interconnections would not proceed as a ministerial outcome of completing planning-criteria studies alone, but rather as a Commission-reviewed determination that the interconnection is consistent with Pennsylvania's customer protection objectives.

If the Commission does not accept the above requirement or otherwise allows connection without making a positive finding, then I recommend the following provisions be incorporated into a fit-for-purpose large load tariff:

- <u>Establish enforceable curtailment / interruptibility obligations for new large loads during emergencies</u>. PPL's current tariff and Emergency Load Control Procedure do not provide differentiated treatment for large loads during manual load shed events, and PPL has stated that

large load customers will be treated like all other customers. That approach is not aligned with the scale of risk created by rapid large load growth. The Commission should require that new large loads be interruptible or curtailable during PJM- or utility-directed emergency conditions, including as a condition of interconnection, with clear performance expectations and consequences for noncompliance.

- Require large loads to curtail prior to broader firm load shed affecting other customer classes. To protect residential and small commercial customers from disproportionate harm during emergency conditions, the Commission should require that qualifying large loads agree to curtail before broader rolling outages are imposed on other customers. This reduces the risk that a small number of large, price-insensitive new loads effectively "free ride" on system reliability while shifting outage impacts to customers who lack comparable mitigation options.

- Require physical and operational readiness measures that facilitate targeted curtailment. Large loads should be required to support implementation measures that make curtailment workable and verifiable, including: service on dedicated or otherwise segregable feeders where practicable; clear identification of any "critical" load segments, with those segments separated behind the meter to the extent the customer seeks higher continuity of service; and telemetry and communications capability sufficient for PPL to execute and confirm curtailment actions during emergency operations.

- Align tariff provisions with emergency procedures and require corresponding updates to PPL's Emergency Load Control Procedure ("ELCP"). Reliability-related service conditions should not exist solely in bespoke agreements. They should be reflected in enforceable tariff language, and PPL should be directed to update its ELCP to implement the Commission-approved priority and curtailment framework for large loads in a transparent and administrable manner.

These reliability requirements are consistent with the same foundational ratemaking principles discussed earlier in my testimony. If new large loads increase the probability or severity of emergency operating actions, then it is appropriate that they face differentiated service conditions designed to mitigate the incremental reliability risk they introduce. Existing customers should not bear increased outage exposure as a result of accommodating a subset of very large new loads.

H. Other Issues

Q. IS THE QUALITY OF LOAD FORECASTS PROVIDED TO PJM IMPORTANT?

A. Yes. PJM relies on load forecasts submitted by transmission owners and electric distribution companies (like PPL) when assessing future resource adequacy and determining the need for new transmission infrastructure. Given the magnitude of the projected load increases cited by the Company, the accuracy of those forecasts is especially important. Overstated or speculative load assumptions can lead to premature or unnecessary capacity procurement and transmission investment, the costs of which are ultimately borne by customers. Accordingly, close coordination with PJM's forecasting and planning processes, including efforts to support the identification and removal of duplicative, speculative, and unlikely interconnection requests, is an essential risk mitigation measure to protect customers from avoidable cost increases.

Q. DO THE COMPANY'S EXISTING PROCESSES INCLUDE ADEQUATE STEPS TO IDENTIFY AND REMOVE DUPLICATIVE, SPECULATIVE, AND UNLIKELY PROJECTS FROM ITS LOAD FORECASTS?

A. No. The Company's existing processes do not include adequate steps to identify and remove duplicative, speculative, or unlikely projects from its load forecasts. The

Company's only effort to remove duplicative loads is to exclude requests for the same parcel.[81] The company does not identify any steps taken to identify and remove speculative or unlikely projects from its forecasts. Rather, the Company currently includes any project that has reached the letter of authorization stage in its load forecasts.[82] The Company justifies this approach by stating that it has "found that projects that reach this stage are sufficient committed to moving forward to be included in load forecast."[83]

The Company's justifications for its current approach are unpersuasive. First, the nature and scale of recent large load interconnection requests differ from historical experience, rendering reliance on past precedent regarding project realization beyond the letter of authorization stage unreliable.

Second, excluding requests tied to the same parcel does not address other common sources of duplication and speculation. These include multiple competing or alternative proposals submitted by the same developer or end-user across different sites or configurations; projects advanced primarily to preserve optionality (e.g., line extension or interconnection study positioning); and attrition risk, where projects are abandoned notwithstanding the payment of deposits.

Third, by relying on a procedural milestone rather than independent indicators of commercial, financial, and permitting viability, the Company does not adequately evaluate key measures of project likelihood. As discussed above, PJM appears to have reached a similar conclusion about the Company's load forecasts and, as a consequence, has very recently taken steps to adjust downwards PPL's forecasts in proposed PJM planning documents.

[81] PPL Response to OCA VII-8.
[82] Id.
[83] PPL Response to OCA XVIII-7.

Q. WHAT INFORMATION SHOULD PPL PROVIDE TO PJM REGARDING EXPECTED LARGE LOAD REQUIREMENTS?

A. Load forecasting must rely on uniform, transparent, and verifiable information and commitments for large load interconnections. As an initial matter, I recommend that the Commission require that PPL's load forecasts and all information used in deriving those forecasts be made available to the Commission as part of a regulatory proceeding, during which time stakeholders and the Commission have an opportunity to scrutinize large load requests and provide feedback. This process should occur during the preliminary stages of PJM load forecast development to enable PJM to account for state-level feedback before finalizing its forecasts.

Additionally, I recommend that the Commission require PPL to provide PJM, at a minimum, the following information for each expected large load:

- All pertinent information about the stage of development;
- Project development status, including whether the project has executed relevant service agreements, demonstrated site control, met permitting milestones, or other objective indicators of readiness;
- Disclosure regarding duplicative interconnection requests, including information collected by PPL from customer applications identifying whether the customer has made other large load interconnection requests within or outside of PJM, the number of such duplicative sites, and the associated megawatts. Any inclusion of duplicative requests should be supported by a clear justification explaining why such loads are reasonably expected to materialize;
- Expected ramping schedules, including the anticipated in-service date, interim load levels, and full build-out timing, to avoid overstating near-term load impacts;

- Detailed information regarding customer commitments, including deposits, construction obligations, or other sureties, together with an explanation of how those commitments meaningfully reduce attrition risk; and
- Confirmation that customer non-disclosure agreements permit full information sharing with PJM, and that all relevant large load information has in fact been shared.

While the above list is not exhaustive, it represents a necessary baseline. I recommend that the above proposed Commission proceeding also addresses supplementary requirements, and that PPL's load forecast requirements be subject to periodic review as industry practices evolve and as experience with large load forecasting continues to develop.

Q. PLEASE SUMMARIZE PPL CORPORATION'S JOINT VENTURE WITH BLACKSTONE INFRASTRUCTURE AND ITS IMPLICATIONS FOR LARGE LOAD INTERCONNECTIONS.

A. On July 15, 2025, PPL Corporation entered into a joint venture with Blackstone Infrastructure ("Joint Venture") to build, own, and operate new electricity generation stations in Pennsylvania.[84] In PPL Corp.'s July 31, 2025 Investor Presentation, PPL Corp. characterized the joint venture as a "shareowner-friendly solution" to "build, own and operate new electric generation stations to power data centers"[85] The presentation also describes PPL Corp. as having "[a]ctively engaged with hyperscalers, landowners, natural gas pipeline companies and turbine manufacturers, and has secured multiple

[84] PPL Corporation and Blackstone Infrastructure create joint venture to build natural gas generation in Pennsylvania in support of data center development, July 15, 2025. https://investors.pplweb.com/2025-07-15-PPL-Corporation-and-Blackstone-Infrastructure-create-joint-venture-to-build-natural-gas-generation-in-Pennsylvania-in-support-of-data-center-development.

[85] PPL Corporation, *2nd Quarter 2025 Investor Update*, July 31, 2025. p. 8. https://filecache.investorroom.com/mr5ir_pplweb2/1245/PPL_2025_Q2_Investor_Update_vFINAL.pdf.

land parcels to enable this new generation buildout."[86] What makes the Joint Venture "uniquely positioned" appears to be the relationship PPL has "supporting data center developers and hyperscalers" to interconnect.[87] While no projects have been developed as of yet, "there is nothing preventing PPL Corporation and Blackstone Infrastructure's joint venture to build, own and/or operate new electric generation stations within PPL Electric's service territory."[88]

Q. DOES PPL IDENTIFY PROTECTIONS PUT INTO PLACE TO AVOID POTENTIAL CONFLICTS OF INTEREST AS A RESULT OF THE JOINT VENTURE?

A. Yes. In response to discovery, PPL confirmed that it will "not be party to the joint venture" and "PPL Electric continues to be managed separately with appropriate structure protections."[89] PPL also stated that it "will comply with all applicable laws and regulations including, but not limited to, the Electricity Generation Customer Choice and Competition Act (66 Pa. C.S. § 2801, et seq.), Chapter 54 of the PUC's regulations (52 Pa. Code §§ 54.1, et seq.), and the FERC Standards of Conduct (18 C.F.R. § 358.1, et seq.)."[90]

Q. WHAT CONCERNS DO YOU HAVE REGARDING PPL'S JOINT VENTURE WITH BLACKSTONE INFRASTRUCTURE?

A. The Joint Venture heightens the same consumer protection risks that I identify throughout my testimony. PPL Corp.'s ownership interest in a venture whose purpose is to build generation intended to serve data centers potentially creates an added structural incentive for PPL, as an affiliate, to accelerate large load interconnections

[86] Id.
[87] Id., p. 9.
[88] PPL Response to OCA XVII-3.
[89] EE II-3.
[90] Id.

and associated transmission upgrades. The proposed LP-5 tariff is especially troubling because it allows PPL to socialize interconnection costs based on asserted "system benefits," including transmission upgrades that could partially or solely advantage the Joint Venture's generation assets. This concern reinforces my previous recommendation that the Commission consider mandatory, Commission-reviewed analyses of system benefits for all large load-driven transmission upgrades. I also recommend that a future PPL large load tariff expressly include affiliate conflict of interest safeguards that prohibit PPL from reducing, crediting, or otherwise offsetting large load interconnection or service costs based on system benefit where those benefits either directly or indirectly accrue to a PPL affiliate.

Q. HOW DO LARGE LOAD INTERCONNECTIONS AFFECT THE OVERALL IMPACT OF THE PROPOSED RATE INCREASE?

A. As discussed above, large load interconnections have the potential to increase multiple categories of bulk power system costs reflected in the supply component of customer bills, including energy, capacity, and transmission charges. These cost impacts arise through PJM market outcomes and FERC-jurisdictional investments triggered or accelerated by the additional large loads.

Because PPL oversees the interconnection of retail customers within its service territory, and because the retail rates paid by all customers are Commission-jurisdictional, the treatment of large load interconnection is directly relevant to PPL's distribution service base rate case. In particular, increases in FERC-jurisdictional costs as a result of large load interconnections flow through to retail supply costs borne by customers and therefore magnify the overall bill impacts of the proposed distribution rate increase. These incremental cost pressures are especially concerning given affordability challenges faced by many PPL customers. For additional testimonial of

customer bill stress and payment difficulties, see the testimonies of OCA Witnesses Ms. Leanne Wise and Mr. Roger Colton.

Q. ARE ADDITIONAL CUSTOMER PROTECTIONS WARRANTED?

A. The potential negative impacts of large load interconnections warrant consideration of additional consumer protections. OCA Witness Mr. Roger Colton addresses one such customer protection in his direct testimony: implementation of a two-step, non-bypassable system benefits charge to be imposed on large load customers. I agree with Mr. Colton's analysis regarding the impacts of large loads on residential rates, including increased energy cost burdens for existing Customer Assistance Program ("CAP") participants, increased pressure on customers to enroll in CAP, and increased CAP credit requirements for existing CAP participants. As Mr. Colton notes, the Commission has also acknowledged the applicability of applying a systems benefit charge for large load customers: "We agree with CAUSE-PA and TURN that the addition of Large Load Customers has an impact on the rates all customers pay for electricity […] As such, we have proposed a requirement that Large Load Customers contribute to the utility's hardship fund annually."[91] Mr. Colton additionally cites comments from Commissioner Vice Chairperson Barrow and Commissioner Zerfuss identifying universal service charge obligations as one mechanism to address the impacts of large load customers on Pennsylvania's most vulnerable customers.[92] The changes proposed by Mr. Colton address the Commission's interest in the topic as well as satisfy the customer protection ratemaking objective I discuss above.

[91] Interconnection Tariffs for Large Load Customers, Docket M-2025-3054271 (November 22, 2025).
[92] Roger Colton Direct Testimony, December 22. 2025.

I. Conclusions and Recommendations

Q. PLEASE RESTATE YOUR FINDINGS AND RECOMMENDATIONS REGARDING LARGE LOAD INTERCONNECTIONS.

A. I offer the following recommendations, grouped by subject area:

- The Commission should not approve PPL's proposed LP-5 revisions as a substitute for a comprehensive large load tariff framework. Rather, the Commission should require that PPL develop a separate, cost-based, large load rate schedule and associated standardized terms tailored to customers whose size and system impacts materially differ from the existing LP-5 customer base. This tariff should be considered before the Commission in a litigated proceeding that allows for stakeholder review and comment.

- If the Commission approves the proposed LP-5 tariff including the Company's revisions, the Commission should (1) approve revisions to the proposed LP-5 tariff language that are consistent with my recommendations and concerns herein; (2) retain explicit review and approval authority of agreements entered into between PPL and large load customers pursuant to the approved LP-5 schedule; and (3) retain explicit review and approval authority over determinations that interconnection-related upgrades provide benefits to the Company's transmission system. Further, the Commission should subject "system benefits" determinations to clear standards to ensure that costs are not shifted to existing customers absent a demonstrated and quantifiable system benefit consistent with cost causation and customer protection principles.

- In either the proposed LP-5 tariff or a future large load tariff, the Commission should require specific safeguards including:
  - Explicit tariff provisions addressing transmission stranded cost risk;
  - Mandatory filing of and Commission access to large load contracts;

- Assignment of certain risks of non-payment to the sponsoring utility, rather than all ratepayers, in the case of distribution costs incurred;
- Assignment of 100% of costs to the large load customer, regardless of benefit calculations, when a network upgrade meets a "but for" development requirement; and
- Application of Commission-prescribed methods to quantify system benefits from upgrades, rather than studies undertaken at the discretion of individual utilities.
- Mandatory revenue guarantees whenever a large load interconnection results in upgrades that are included in transmission rate base.

- In either the proposed LP-5 tariff or a future large load tariff, the Commission should condition whether PPL may interconnect and commence service to new large load customers on a positive Commission finding that the proposed load can be served reliably from both a transmission deliverability and resource adequacy perspective, and without degrading the reliability of service to existing customers.

- If the Commission does not accept the above reliability requirement or otherwise allows connection without making a positive finding, then I recommend that the following are addressed in LP-5 or a future large load tariff:
  - Establish enforceable curtailment / interruptibility obligations for new large loads during emergencies, including as a condition of interconnection, with clear performance expectations and consequences for noncompliance;
  - Require large loads to curtail prior to broader firm load shed affecting other customer classes;

- Require physical and operational readiness measures that facilitate targeted curtailment (including dedicated or otherwise segregable feeders where practicable; separation of any "critical" load segments behind the meter; and telemetry and communications capability sufficient for PPL to execute and confirm curtailment actions during emergency operations); and

- Align tariff provisions with emergency procedures and require corresponding updates to PPL's Emergency Load Control Procedure ("ELCP").

- The Commission should require that PPL's load forecasts and all information used in deriving those forecasts be made available to the Commission as part of a regulatory proceeding, during which time stakeholders and the Commission have an opportunity to scrutinize large load requests and provide feedback. This process should occur during the preliminary stages of PJM load forecast development to enable PJM to receive state-level feedback before finalizing its forecasts.

- When issuing forecasts to PJM, PPL should be required to provide PJM, at a minimum, the following information for each expected large load:
  - All pertinent information about the stage of development;
  - Project development status (including whether the project has executed relevant service agreements, demonstrated site control, met permitting milestones, or other objective indicators of readiness);
  - Disclosure regarding duplicative interconnection requests (including whether the customer has made other large load interconnection requests within or outside of PJM, the number of such duplicative sites, and the associated megawatts), and any inclusion of duplicative requests supported by a clear justification;

- Expected ramping schedules (anticipated in-service date, interim load levels, and full build-out timing);
- Detailed information regarding customer commitments (including deposits, construction obligations, or other sureties) and how those commitments meaningfully reduce attrition risk; and
- Confirmation that customer non-disclosure agreements permit full information sharing with PJM, and that all relevant large load information has in fact been shared.

- The Commission should require that the Company include in a future PPL large load tariff affiliate conflict of interest safeguards that prohibit PPL from reducing, crediting, or otherwise offsetting large load interconnection or service costs based on system benefit where those benefits either directly or indirectly accrue to a PPL affiliate.

Q. DOES THIS CONCLUDE YOUR TESTIMONY REGARDING LARGE LOAD INTERCONNECTIONS?

A. Yes.

III. EVALUATION OF PPL RELIABILITY

A. Purpose

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY REGARDING PPL RELIABILITY?

A. The purpose of my testimony regarding PPL's reliability is to evaluate the Company's distribution reliability as a stated rationale for the requested rate case. Specifically, I assess PPL's performance on key reliability metrics, including performance relative to Commission benchmarks, peer Pennsylvania utilities, and the Company's internal targets; evaluate whether the Company's past and proposed reliability-related expenditures are reasonably targeted and supported by measurable reliability benefits; and recommend performance measures and reporting requirements that the Commission should apply on a forward-looking basis if it approves reliability-driven expenditures. This evaluation focuses on the testimonies of Company Witnesses Joseph Lookup, Nicole Howell, and Christine Martin.

Q. IN WHAT WAYS IS RELIABILITY A DRIVER FOR THIS CASE?

A. Reliability is the first identified reason for initiating this distribution base rate case; the Company identifies "accelerated capital investment to maintain and improve system reliability and to reduce service outages, especially during major storms" on page 1 of its Statement of Reasons for initiating this proceeding.[93] PPL's Statement of Reasons also underlines that the Company has invested over $5 billion of capital since its last base rate case and intends to invest an additional $4 billion in capital going forward that includes "advanced technologies that will provide new monitoring and control capabilities" as well "additional storm hardening measures to strengthen the

[93] Volume 7, Exhibit Fully Projected Future 1, Summary of Rate Base & Rate of Return, A-1 Statement of Reasons, p. 1.

distribution system, protecting against increasing weather-related outages, and improve the customer experience" to maintain system reliability.[94] The Company anticipates a need to raise "substantial capital in the marketplace" to meet the above needs.[95]

Q. WHAT ARE YOUR RECOMMENDATIONS FOR THIS PROCEEDING RELATED TO PPL RELIABILITY?

A. I offer the following findings and recommendations based on the subsequent evaluation:

- PPL is not currently meeting most of the Commission-ordered targets for reliability, and its reliability scores for major metrics have trended upward (i.e., worsened) in recent years, including in comparison to peer Pennsylvania utilities in 2024. Particularly poor metric scores in 2024 are attributed to storms; however, when 2024 data is excluded, PPL's metric trends have still worsened since 2015.

- My analysis indicates that PPL's reliability-related investments have produced mixed or uneven results, with the relationship between spending and reliability outcomes varying materially by investment category and timing. Some categories of investment appear directionally aligned with improved reliability outcomes over time, while others show little evidence of producing sustained or measurable reliability benefits.

- PPL's recent performance relative to Commission benchmarks and my analysis of investment efficacy both support the need for explicit accountability should the Commission approve additional reliability-driven expenditures.

- At a minimum, I recommend that the Commission require PPL to:

[94] Id., p. 5.
[95] Id., p. 7.

- File an annual reliability accountability report in this docket that tracks the Company's approved reliability programs in relation to the Commission's existing reliability metric targets, and includes program-level reporting addressing spending, work completed, locations targeted, justification, and reliability outcomes. This reporting should continue until the next base rate proceeding.

- Demonstrate in its next base rate case that reliability performance has improved and is being maintained at or above Commission benchmarks.

- To the extent the Commission approves PPL's requested rate increase, it should be subject to a mid-course review (e.g., in 18-24 months) in which the Company must demonstrate progress in addressing the reliability objectives. Absent progress, costs should be subject to heightened prudence review and potential disallowance in the next base rate case or an interim proceeding.

- As a condition of approving the vegetation I&M change, the Commission should require PPL to continue planning and executing I&M work based on system risk and need, rather than cycle length alone. The reliability impacts of incremental O&M expenditure should also be subject to the above-recommended Commission review as it relates to performance.

- The Commission should not approve the capitalization of the initial tree trimming related to expansion of ROWs, as doing so is inconsistent with FERC accounting principles. This issue is addressed further in the testimony of OCA Witness Morgan.

- If the Commission approves the enhanced ROW program, it should direct PPL to file an annual report describing the program and detailing measures such as the extent of expanded ROWs obtained, the scope of associated tree removal, and estimated changes in relevant reliability metrics attributable to the expanded ROWs. The Commission should also objectively evaluate enhanced ROW performance relative to the Company's stated benefit of an additional

7% improvement in SAIFI over five years. Failure to demonstrate progress towards this specific metric should result in enhanced prudence review and potential disallowance of enhanced ROW-related costs. This review should be conducted in the same manner I recommend above for the Commission evaluation of the entirety of the Company's reliability performance.

B. Reliability Performance

Q. WHAT ARE THE COMPANY'S OBLIGATIONS WITH REGARDS TO RELIABILITY?

A. Under the regulatory compact and Pennsylvania law, an electric utility is granted the exclusive right to serve customers within a defined service territory and the opportunity to recover incurred costs and earn a reasonable return on prudently invested capital. In exchange, the utility is obligated to provide safe, reliable, and adequate service at just and reasonable rates, subject to Commission oversight.

Consistent with longstanding Pennsylvania ratemaking principles, the Commission recognizes that utilities must make ongoing investments to maintain and improve system reliability. The Commission is also charged, however, with ensuring that customers are not required to fund expenditures that are excessive, insufficiently targeted, or unsupported by demonstrable benefits.[96] Reliability performance is therefore a central component of the Commission's prudence and reasonableness review.

Accordingly, the Company's obligation with respect to reliability extends beyond making expenditures or proposing capital programs. It includes demonstrating that reliability-related investments are reasonably designed to address identified system risks, that they are implemented efficiently, and that they result in service reliability

[96] In accordance with statutory guidelines governing public utility rate cases, the Commission must evaluate the "efficiency, effectiveness, and adequacy of service." 66 Pa. C.S. Section 523.

that meets measurable standards. When reliability is cited as a justification for increased rates, the Commission, appropriately, should evaluate performance outcomes and require accountability as part of determining whether increased rates are reasonable.

Q. HOW DOES THE COMPANY MEASURE RELIABILITY?

A. The Company uses the following metrics to review its distribution system reliability:

- System Average Interruption Frequency Index ("SAIFI")
- System Average Interruption Duration Index ("SAIDI")
- Customer Average Interruption Duration Index ("CAIDI")
- Momentary Average Interruption Frequency Index ("MAIFI")
- Customers Experiencing Multiple Interruptions ("CEMI")
- Customers Experiencing Recent Interruptions ("CERI") at the 7-day, 30-day, and 90-day measures
- Customers Experiencing Long Interruption Duration ("CELID")
- Worst Performing Circuits
- Worst Performing Segments[97]

PPL's management also uses dashboards and key performance indictors ("KPIs") to understand its reliability performance and assist in investment and operational decision-making.[98]

SAIFI, SAIDI, CAIDI, and MAIFI are all core reliability indices applied by the Commission for evaluating electric distribution system performance and are reported through the Company's quarterly and annual reliability filings.[99] These metrics are also

[97] Lookup Dir. at 4, lines 3-9.
[98] Id., lines 20-22.
[99] Reliability Reports (Annual & Quarterly), Docket No. M-2023-3039027, PPL.

defined by Institute of Electrical and Electronics Engineers ("IEEE") standards and are widely used across the electric utility industry.

Q. WHAT ARE THE COMPANY'S TARGETS WITH RESPECT TO THE ABOVE METRICS AND HOW ARE THEY SET?

A. The Company has established its own performance targets for SAIFI, SAIDI, CAIDI, and MAIFI metrics.[100] The Company's SAIFI, SAIDI, and CAIDI targets are weather-normalized values developed using IEEE-based methodologies and reviewed or updated on an annual basis.[101] The Company's MAIFI target is also reviewed annually.[102] Table 3 reflects the Company's current stated targets for SAIFI, SAIDI, and CAIDI alongside equivalent targets set by the Commission. The Company also tracks MAIFI, IEEE CEMI-4, and IEEE CEMI-10 metrics,[103] also shown in Table 3, that it periodically reviews and updates.[104]

[100] PPL Response to OCA XIX-3 CONFIDENTIAL.
[101] Id.
[102] Id.
[103] CEMI-4 measures the number of customers with four or more sustained outages over a year, while CEMI-10 does the same using 10 outages.
[104] PPL Response to OCA XIX-3 CONFIDENTIAL.

Table 3. Commission and Company 2025 Benchmarks[105]

	Commission	Company
SAIFI	0.98	0.68
SAIDI	142	75
CAIDI	145	115.4
MAIFI	-	7.8
IEEE CEMI-4	-	3% of customers
IEEE CEMI-10	-	0

The Company does not establish numeric benchmarks for worst-performing circuits or worst-performing segments, as these metrics are maintained as lists used for identification and prioritization rather than performance targets.[106] Likewise, CERI and CELID are recorded via a dashboard but the Company does not have associated benchmarks for these metrics.[107]

Q. HOW IS THE COMPANY PERFORMING RELATIVE TO ITS OWN TARGETS?

A. As the Company did not provide weather-adjusted reliability metrics in its filing, I am only able to compare the Company's performance to its targets for CEMI-4, CEMI-10 and MAIFI as an initial matter.[108] As shown in Table 3, PPL's CEMI-4 target is 3% of total customers. PPL did not meet this target in 2023 and 2024, with 3.9% and 6.7%,

[105] Derived from PPL Response to OCA XIX-3 CONFIDENTIAL.

[106] PPL Response to OCA XIX-3 CONFIDENTIAL.

[107] Id.

[108] I reserve the right to perform additional analyses if I receive the data for weather-normalized SAIFI, SAIDI, and CAIDI metrics in the course of this proceeding. I also reserve the right to perform additional analyses of performance over time. Note that, in response to OCA CONFIDENTIAL XIX-3, the Company only provided 2025 targets while OCA requested all 2015-present information.

respectively, of customers experiencing four or more sustained outages per year.[109] PPL has thus far missed this goal in 2025 (accurate through the end of October) with a 3.4% score.[110] For 2023, 2024, and 2025 through October, the Company had 520, 2,426 and 295 customers, respectively, with 10 or more sustained outages, which equates to approximately 0% of total customers.[111] Since the Company's CEMI-10 target does not specify whether the zero target is in number or percentage terms, it is unclear whether the Company meets its target. The Company's reported monthly MAIFI score from January 2015 to September 2025 ranges from 0.001 to 1.67, which is magnitude smaller than the Company's target of 7.8.[112] Overall, the Company appears to meet some of its own targets based on the limited data I have reviewed.

Q. WHAT RELIABILITY METRICS DOES THE COMMISSION REQUIRE PPL TO TRACK TO EVALUATE SYSTEM PERFORMANCE?

A. The Commission requires PPL to track SAIFI, SAIDI, CAIDI, and MAIFI, but the Commission only establishes benchmarks and standards for SAIFI, SAIDI, and CAIDI. The Commission produces an annual report, the *Pennsylvania Electric Reliability Report*, that discusses the reliability metrics for Pennsylvania electric utilities, individual utility performance for relevant metrics, trends, and reliability issues. Pennsylvania electric utilities also provide quarterly reports in Docket No. M-2023-3039027.

Q. HOW IS THE COMPANY PERFORMING RELATIVE TO COMMISSION TARGETS?

[109] Calculated using data from PPL Response to OCA XIX-2 Confidential Attachment 1 and OCA VII-79 CONFIDENTIAL Attachment 1.

[110] Id.

[111] Id.

[112] PPL Response to OCA XIX-2 CONFIDENTIAL Attachment 1 and OCA VII-79 CONFIDENTIAL Attachment 1.

A. Table 4 compares PPL's quarterly reliability metrics with the Commission-determined benchmarks for the most recent four quarters, as well as the magnitude by which the metric is or is not achieved. PPL has consistently not achieved its benchmarks for SAIDI and CAIDI over the last two years.[113] PPL has achieved its SAIFI Rolling 12-Month Standard in most quarters over the last two years but, again, has not consistently met its benchmarks.[114]

Table 4. Q4 2024 – Q3 2025 Reliability Metrics and Associated Benchmarks[115]

		Q3 2025	Q2 2025	Q1 2025	Q4 2024

[114] Id.
[115] Complied and calculated from Docket No. M-2023-3039027, PPL.

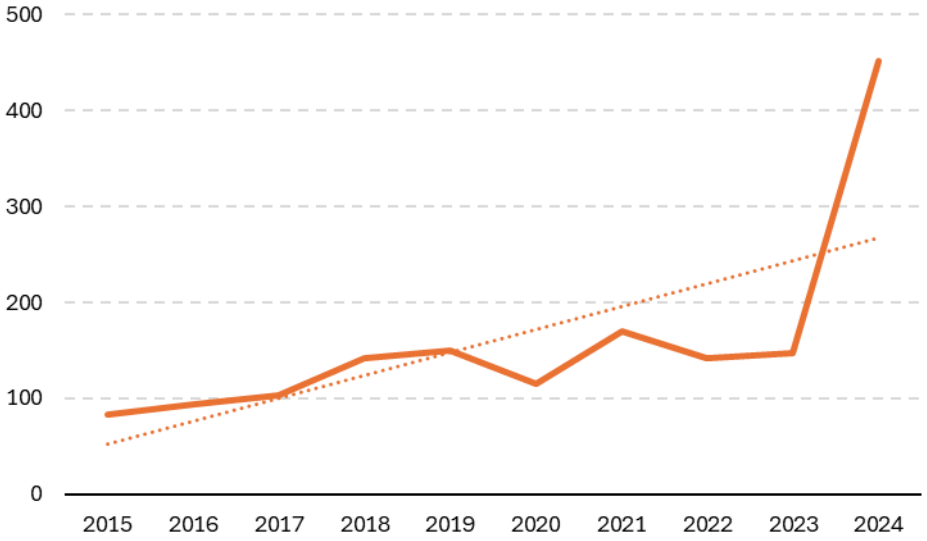
Q. HOW HAS THE COMPANY'S PERFORMANCE CHANGED OVER TIME?

A. The Company's scores on CAIDI (in average minutes per interruption), SAIDI (in total minutes), and SAIFI (in times per year) have trended upward (worsened) from 2015 to 2024, as shown in Figure 5, Figure 6, and Figure 7, respectively. This upward trend is only partially attributable to higher scores in 2024; when 2024 scores are excluded there is still an upward trend, albeit at a more gradual slope.

Figure 5. PPL CAIDI 2015-2024[116]

[116] PPL Response to OCA VII-79 Confidential Attachment 1 and OCA XIX-2 Confidential Attachment 1.

Figure 6. PPL SAIDI 2015-2024[117]



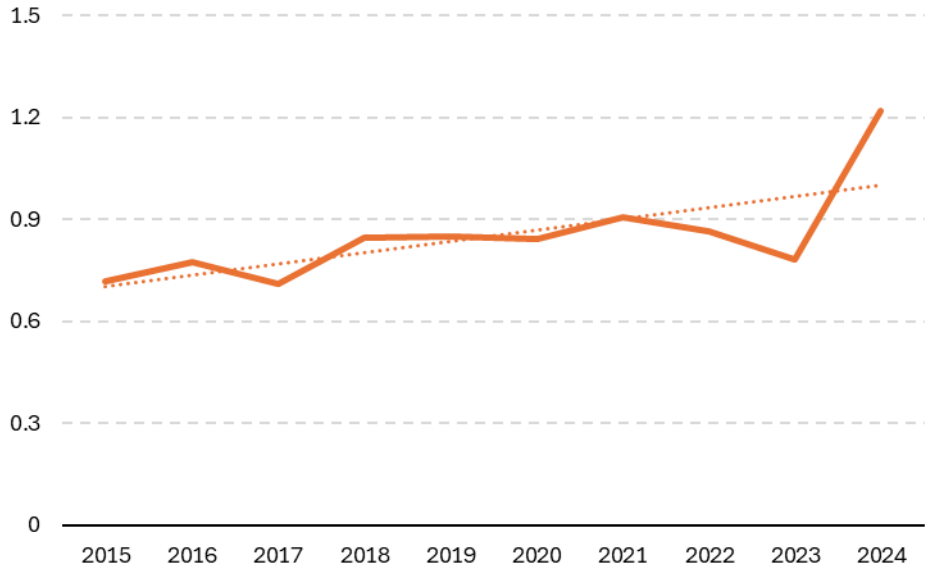


Figure 7. PPL SAIFI 2015-2024[118]

Q. HOW DOES THE COMPANY'S PERFORMANCE COMPARE TO PEER UTILITIES BASED ON THE ABOVE METRICS?

[117] Id.
[118] Id.

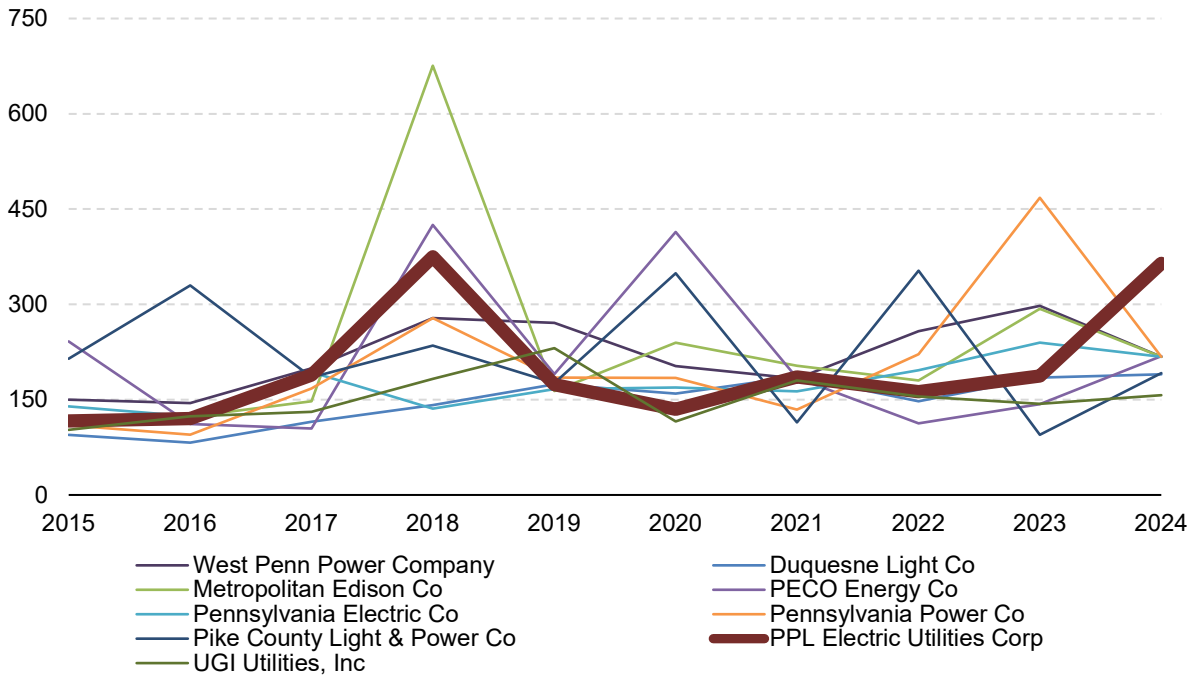
A. I evaluated PPL's performance in terms of SAIFI, SAIDI, and CAIDI utilizing public data from the U.S. Department of Energy's Energy Information Administration ("EIA") spanning the period of 2015-2024.[119] This data presents information in two ways: metrics with and without the inclusion of Major Event Days ("MED").[120] For purposes of comparison, I assessed PPL's performance relative to other major Pennsylvania utilities for the same time period.[121] I find that, when comparing PPL to peer utilities with MED or excluding MED, PPL performed similar to its peers.

Q. PLEASE EXPLAIN YOUR OBSERVATIONS REGARDING PPL'S COMPARATIVE PERFORMANCE.

A. The following bullets provide an account of key comparative observations for each of the major metrics I evaluated based on the assessment described above. When including MED:

- For most years of the sample set, PPL's SAIFI, SAIDI, and CAIDI scores vary in a manner consistent with equivalent peer values in Pennsylvania, including some years with scores above or below the group average.

- In 2024, PPL's SAIDI value increased 204% year over year (from 150 in 2023 compared to 455.1 in 2024), and exceeded the equivalent SAIDI values for all evaluated peers. PPL's performance on other reliability metrics also worsened in 2024; PPL's SAIFI increased from 0.8 in 2023 to 1.2 in 2024, and PPL's CAIDI increased from 187 in 2023 to 365 in 2024, highest among all peer utilities.



[119] U.S. Department of Energy, Energy Information Administration, *Form EIA-861, Annual Electric Power Industry Report*, various years (2015-2024).

[120] Major Event Days are defined in IEEE Standard 1366 as days on which daily system interruptions exceed statistically derived thresholds. These events are typically associated with severe weather or other extraordinary circumstances.

[121] Peer Company Analysis focused on Duquesne Light Co, FirstEnergy Pennsylvania Electric Co, Metropolitan Edison Co, PECO Energy Co, Pennsylvania Electric Co, Pennsylvania Power Co, Pike County Light & Power Co, UGI Utilities, Inc, and West Penn Power Company. These utilities are of similar size to PPL and are all investor-owned.

Figure 8 illustrates the typical pattern for most metrics (i.e., clustered results most years, worst performance in 2024) using CAIDI as the basis of comparison.

Figure 8. Example of PPL Performance Compared to Peer Pennsylvania Utilities: CAIDI, including MED (2015-2024)

Source: EIA Form 861.
Note: Values converge for Metropolitan Edison Co., West Penn Power Co., Pennsylvania Power Co., and Pennsylvania Electric Co. in 2024 on account of FirstEnergy combining its operations and reporting for its Pennsylvania affiliates.

When excluding MED:

- PPL's reliability metrics are much more stable when excluding versus including MED, as would be expected when excluding events that reflect definitionally worse reliability performance.

- PPL's SAIDI scores are generally lower than the peer average (peer average of 132.4 compared to PPL's average of 79.57) across the review period and reflect a moderate increase of 19% over the past 10 years. Since 2020, PPL's SAIDI increased at a faster rate, growing by 32%.

- PPL's SAIFI scores remained essentially flat over the review period, with scores ranging from 0.602 to 0.738.

- PPL's CAIDI metrics range from 99.42 to 142.5. This range is slightly lower than Pennsylvania Electric Co.'s metrics but in line with Pennsylvania Power Co. Since 2020, PPL's CAIDI score increased by 37%, from 99.4 to 136.6.

Q. DO THE ABOVE PERFORMANCE METRICS AND COMPARISONS REFLECT THE COMPANY MEETING ITS OBLIGATIONS?

A. In recent history, no. First, as described above, PPL is not currently meeting most of the Commission-ordered targets for reliability. Second, in recent years, the Company has begun performing worse than Pennsylvania peer utilities. This worse performance, particularly when including MED, may suggest that PPL has high risk exposure to weather-related reliability issues. Third, while the Company meets some of its metric targets, it did not provide sufficient information for me to evaluate performance consistency over time.[122] Lastly, although the Company has performed better for many reliability metrics in the past, reliability outcomes have trended upwards (i.e., worsened) over the past 10 years. PPL's historical scores show that the Company has the ability to improve.

Q. DOES THE COMPANY REQUEST ANY PERFORMANCE-BASED INCENTIVE ADDERS FOR MEETING RELIABILITY OPERATIONAL GOALS AS A PART OF THIS RATE CASE?

A. No, the Company does not request any management, performance, or efficiency adders as a result of meeting reliability operational goals.[123]

[122] In response to OCA CONFIDENTIAL XIX-3, the Company only included 2025 targets while 2015-present was requested. I reserve the right to reevaluate my conclusions following subsequent discovery on Company targets and performance.

[123] PPL Response to OCA XVIII-2.

Q. WHAT JUSTIFICATIONS DOES THE COMPANY PROVIDE FOR ITS RECENT PERFORMANCE?

A. The Company attributes its recent reliability performance primarily to the increasing frequency and intensity of storm events and the compounding effects of vegetation-related outages.[124] PPL identifies 2024 in particular as being among the most challenging year on record due to an unprecedented number of storm events, and cites these events as causing its worst storm-related reliability outcomes and its highest (i.e., worst) SAIFI levels in recent history.[125]

PPL further notes that both reportable and non-reportable storm events have increased materially, with the Company experiencing an average of approximately 40 storm events per year in recent years, compared to a historical average of 23.6 events per year in the prior decade.[126] The Company expects this trend to continue, asserting that severe weather events will become more frequent in future years.[127] In addition, the Company identifies vegetation encroachment as a significant factor that exacerbates storm-related reliability impacts, particularly when weakened or overgrown trees come into contact with distribution facilities during severe weather.[128]

Q. IS THIS CASE THE FIRST TIME STORM AND VEGETATION ENCROACHMENT ISSUES ARE BEING RAISED BEFORE THE COMMISSION?

A. No. As addressed in the questions of the testimony of Mr. Lookup, "One of the three reasons for which the Company filed its last rate case in 2015 was because of the accelerated capital investments it was making to maintain and improve system

[124] Lookup Dir. at 8, lines 5-9.
[125] Id. at 6, lines 9-10.
[126] Id. at 11, lines 7-9 and 12, lines 4-6.
[127] Id. at 12, lines 12-15.
[128] Howell Dir. at 3.

reliability in the face of major storms."[129] The Company has also identified storm and vegetation management issues, and was subsequently awarded additional spending on a temporary basis, at PPL's last Distribution System Improvement Charge ("DSIC") proceeding.[130] As shown above, however, the Company's reliability metrics have trended upwards (i.e., worsened) both in recent history and over the last decade.

Q. DO YOU AGREE WITH THE COMPANY'S JUSTIFICATION FOR ITS POOR RELIABILITY PERFORMANCE?

A. I agree that severe weather and vegetation conditions can materially affect reliability outcomes, and that major storm activity can increase both the frequency and duration of outages. However, the Company's explanation does not, by itself, demonstrate that the observed level of performance is reasonable or that the proposed reliability-related expenditures, discussed below, are appropriately targeted and supported by measurable benefits.

An electric distribution company operating under Commission oversight is expected to plan for the conditions reasonably foreseeable in its service territory—including storm exposure and vegetation risk—through system design standards, vegetation management practices, and efficient outage response. Accordingly, the relevant question for this proceeding is not whether storms occurred, but whether PPL's practices and investments are sufficient to mitigate the impacts of storms and vegetation to an extent consistent with Commission reliability benchmarks and prudent utility management.

Q. WHAT RECOMMENDATIONS DO YOU HAVE FOR THE COMMISSION GIVEN PPL'S RELIABILITY PERFORMANCE?

[129] Lookup Dir. at 9, lines 9-12.

[130] *Petition of PPL Electric Utilities Corporation for a Waiver of the Distribution System Improvement Charge Cap of 5% of Billed Revenues,* Docket No. P-2024-3048732, Opinion and Order, p. 10.

A. I further address PPL's requests for this proceeding in the subsequent portions of my testimony. As an initial matter, though, PPL's recent performance relative to Commission benchmarks supports the need for explicit accountability should the Commission approve additional reliability-driven expenditures in this case. Accordingly, I recommend that the Commission condition recovery of the incremental, reliability-justified costs on demonstrated reliability improvements over a defined period.

At a minimum, the Commission should require PPL to:

- File an annual reliability accountability report in this docket that tracks the Company's major reliability programs in relation to the Commission's existing reliability metric targets. This report should go beyond what PPL already files with the Commission on a quarterly basis and include program-level reporting addressing spending, work completed, locations targeted, justification, and reliability outcomes, among other details. This reporting should continue until the next base rate proceeding.

- Demonstrate in its next base rate case that reliability performance has improved, and is being maintained at or above Commission benchmarks.

I also recommend that, to the extent the Commission approves PPL's requested rate increase, it approve such an increase subject to a mid-course review (e.g., in 18-24 months) in which the Company must demonstrate progress in addressing the above reliability objectives. Absent progress, costs should remain subject to heightened prudence review and potential disallowance in the next rate case or an interim proceeding.

C. Analysis

Q. DID YOU EVALUATE THE EFFICACY OF ANY PORTION OF PPL'S APPROACH TO RELIABILITY?

A. Yes, I prepared an initial analysis using the data made available by the Company prior to the deadline to file direct testimony. This analysis examines the relationship between certain reliability-related investments and reliability outcomes using inputs provided in response to OCA data requests. I note, as an initial matter, that I reserve the right to update my analysis in subsequent stages of the case as additional data and information become available.

Q. PLEASE DESCRIBE YOUR ANALYSIS.

A. I used two types of reliability data for purposes of analysis. First, I examined a table provided by the Company that identifies all outage events from 2015 to the present.[131] For each outage, the dataset includes a unique incident identifier, outage date and time, duration in minutes, number of customers impacted, a cause description, and an event type classification (i.e., PUC Reportable, PUC Major, Non-Reportable, or N/A for outages not associated with a defined event). Second, I examined aggregate SAIFI, SAIDI, CAIDI, MAIFI and CEMI metrics consistent with the values discussed above.

The above data were assessed in relation to PPL reliability investment data collected through discovery. Specifically, I evaluated the capital expenses related to storm hardening, damage, and response;[132] capital investments related to infrastructure replacement programs;[133] operations and maintenance ("O&M") investments related to infrastructure replacement programs;[134] capital investments and work order count

[131] PPL Response to OCA XVIII-1.
[132] PPL Response to OCA XVIII-19.
[133] PPL Response to OCA XVIII-20.
[134] PPL Response to OCA XVIII-18.

related to storm-hardening and reliability initiatives under the inspection and maintenance ("I&M") plan, including Asset Health Management, Chronic Reliability Remediation, and Smart Grid investments;[135] and capital investments and O&M expenses associated with the vegetative management program.[136] This information was provided and analyzed on an annualized basis.

To facilitate comparison between annual investment data, outage-level information was aggregated to annual reliability metrics, including total outage duration (minutes), total customers impacted, number of outage events, and total outage duration per customer (calculated as total outage minutes divided by total customers impacted). Investment data and reliability metrics for 2025 were excluded from the analysis because they were incomplete at the time of review.

In terms of analysis method, I primarily derived correlation coefficients between selected investment categories and aggregated reliability metrics. Correlation coefficients are used to examine potential relationships between variables of interest, in this case investment levels and investment type in relation to various formulations of concurrent and lagged reliability outcomes. Each estimated correlation coefficient measures the strength and direction of a linear relationship between two variables, with values ranging from −1 to +1. Values closer to ±1 indicate stronger relationships, while values near zero indicate little or no linear association. Correlation results are interpreted as descriptive rather than causal, given the influence of external factors and the limited number of annual observations. For purposes of this analysis, correlation coefficients are interpreted as very weak when the absolute value is less than 0.2, weak when between 0.2 and 0.4, moderate when between 0.4 and 0.6, and strong when 0.6 or greater.

[135] PPL Response to OCA XVIII-6.
[136] PPL Response to OCA XVIII-10.

Q. DID YOU MAKE ANY INITIAL OBSERVATIONS REGARDING OUTAGE CAUSES BASED ON THE PROVIDED OUTAGE DATA?

A. Yes, I identified several patterns from a descriptive analysis of the provided outage data set. My observations include:

- PPL has experienced 296,210 outages between 1/1/2015 and 11/30/2025.
- The median and average outage affected 5 and 48 customers, respectively.
- The median and average outage lasted 27.8 and 93.2 minutes per customer, respectively.
- PPL experienced an average of 26,928 outage events per year from 2015-2024, with a range spanning 17,131 in 2015 to 37,517 in 2024.
- The outage reasons (identified using the provided "cause description") associated with the highest total outage duration and total outage duration per customer are "Trees–Not Trimming Related," followed by "Equipment Failures" and "Trees–Trimming Related outages." Outages attributed to "Unknown" causes, "Trees—Not Trimming Related" and "Trees—Trimming Related," exhibit the highest average outage duration per affected customer and average duration. Table 5 presents the frequency of cause codes in the complete outage data set alongside several descriptive statistics.
- Events attributed to "Improper Installation," "Improper Operation," and "Improper Design" affect the largest average number of customers per event.
- The outage causes of "Trees—Not Trimming Related," "Equipment Failures," and "Vehicles" account for the greatest total number of customers impacted overall.

Table 5. Summary of Select Reliability Metrics by Cause of Trouble/Outage Event[137]

Cause	Sum of Duration in Minutes Per Customer Impacted	Average of Duration in Minutes Per Customer Impacted	Sum of Customers Impacted	Average of Number of Customers Impacted	Sum of Duration in Minutes	Average of Duration in Minutes
Trees-Not Trimming Related	12,132,298	132	5,580,116	61	54,405,792	593

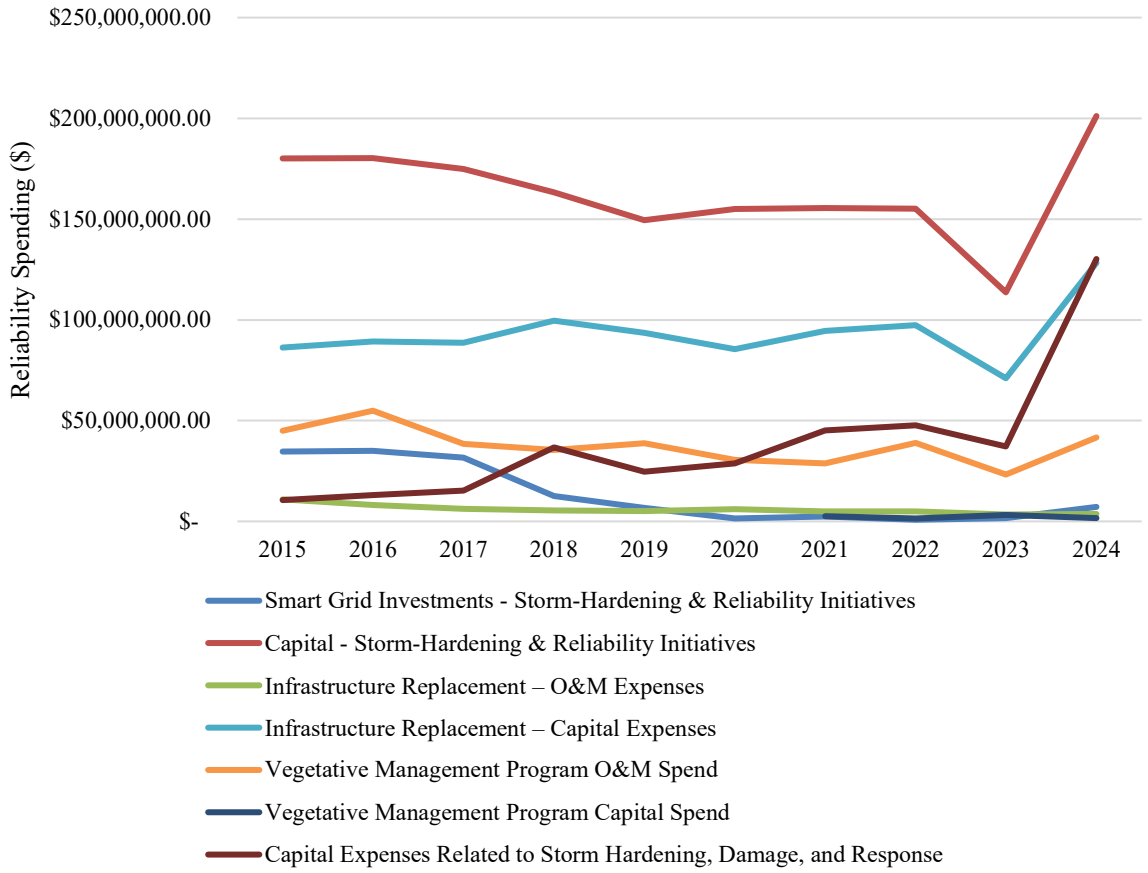
- Since 2015, the system has experienced one PUC Major Event,[138] which occurred in 2018 and was classified as a wind event. The primary contributors

[137] Derived from PPL Response to OCA XVIII-1.

[138] Per the Company's attachment to its response to OCA XVIII-14, PUC Major Event is a storm classification in which 10% of all customers are interrupted in one event.

to the severity of this event were causes labeled "Trees–Not Trimming Related" and "Equipment Failures."

- Among PUC Reportable Events, wind (49 events) and thunder and lightning (39 events) have been the most frequent event types since 2015.



Q. WHAT DID YOU OBSERVE REGARDING THE RELATIONSHIP OF OUTAGES WITH PPL SYSTEM INVESTMENT?

A. The following notes outline my observations regarding trends and correlations based on the analysis described above. For ease of reference, I organize my notes by key relationships examined. I also include some illustrative figures where useful to show the relationships discussed in accompanying text.

<u>Trends Since 2015</u>

- Smart Grid investments (a part of storm-hardening and reliability initiatives under the I&M plan) and vegetative management program O&M spending have declined since 2015. From 2023 to 2024, investment rose markedly across all categories except Vegetative Management Program Capital Spend following a period of gradual decline. Figure 9 shows annual investment levels across all examined categories from 2015 to 2024.

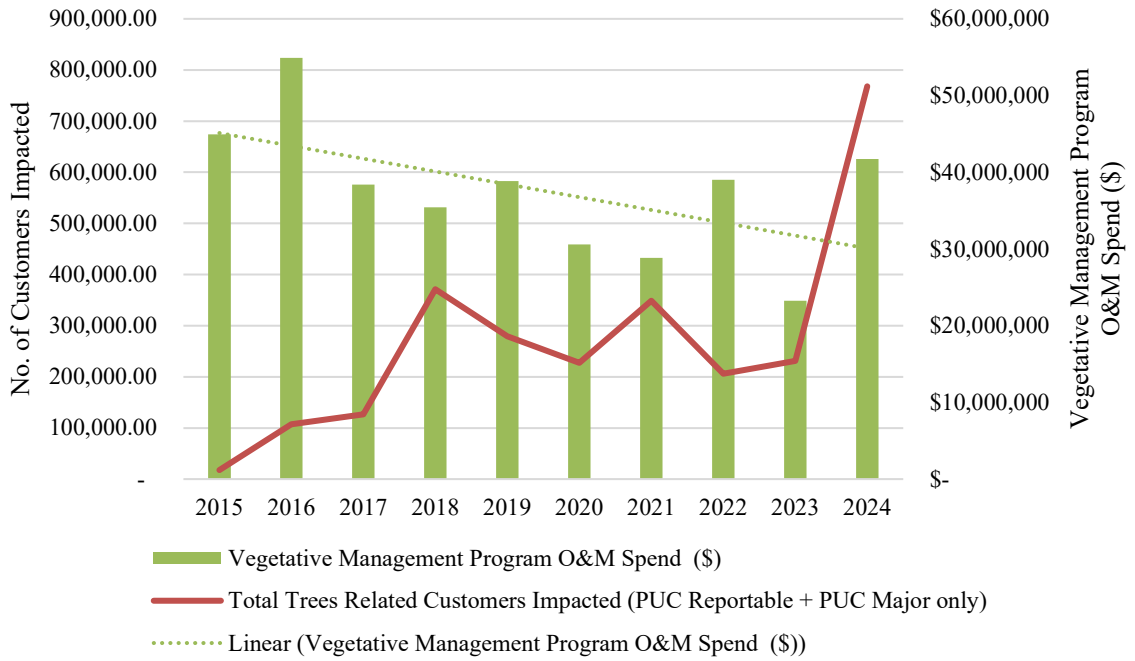


Figure 9. PPL Reliability Spending by Category (2015-2024)

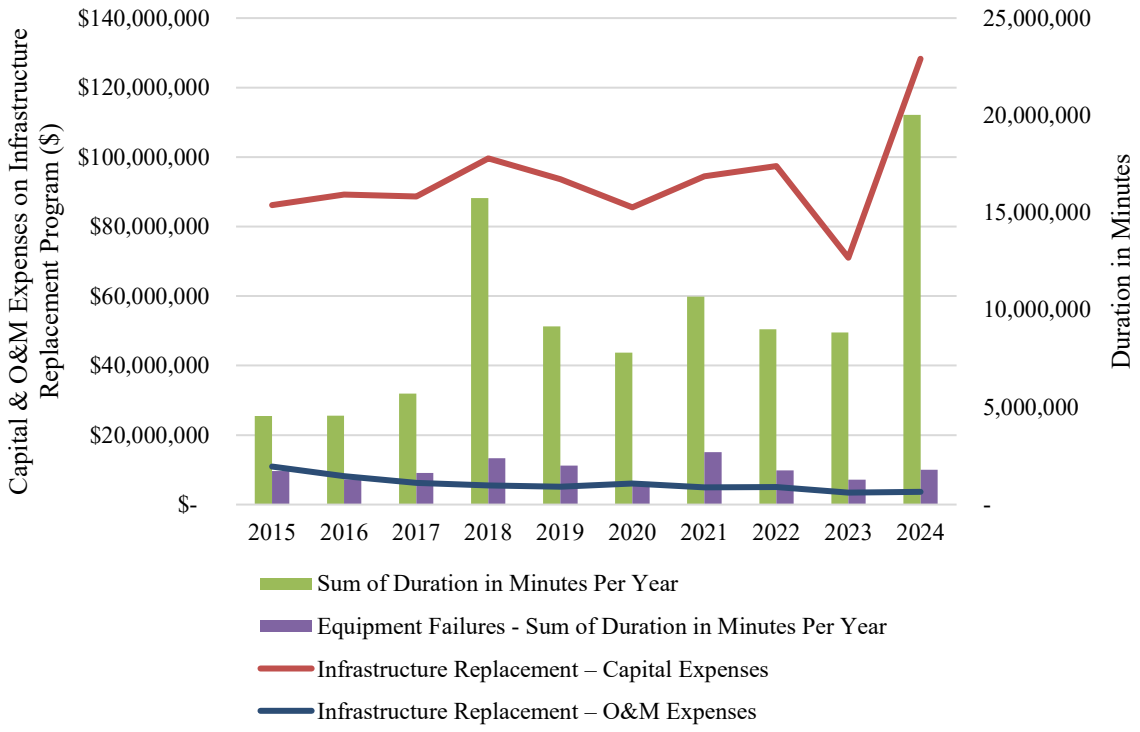
Vegetation Management Expenditures and Tree-Related Outages

- For PUC Reportable and PUC Major events, same-year Vegetation Management Program O&M spending exhibits a very weak, negative association with most tree-related outage metrics. This may indicate little immediate relationship between spending and reliability outcomes in the year in which expenditures occur. Figure 10 graphs this relationship using one reliability metric, the number of customers impacted by tree-related outage causes.

Figure 10. Vegetative Management Program O&M Spending Versus Customers Impacted by Total Trees Related Outage (PUC Reportable and PUC Major events only)

- Prior-year Vegetation Management Program O&M spending shows a stronger and more consistent negative association with "Trees-Trimming Related" outage duration, customer impacts, number of events, and outage duration per customer. This may suggest that larger O&M investments in vegetative management are associated with reduced outages following a time lag (i.e., in future years), and vice versa.

- Across most reliability metrics, lagged vegetative management O&M spending exhibits stronger associations with "Trees-Trimming Related" outages than other causes, consistent with the expected role of routine maintenance activities such as tree trimming in reducing "Trees-Trimming Related" outages and outage impacts over time.



- Across most reliability metrics, Vegetative Management Program Capital Spending is associated with "Trees-Not Trimming Related" outage metrics. This may suggest that capital investments in vegetative management address broader vegetation risks beyond routine trimming. However, this relationship

is modest. Additionally, interpretation of capital spending results is limited by the small available sample size (2021-2024).

Investments Related to Infrastructure Replacement Programs

- Same-year correlations indicate that infrastructure replacement program capital spending is strongly positively associated with reliability metric performance (i.e., higher spending levels correlate with worst reliability performance). This may reflect higher capital investment in years with elevated outages, as would be the case if investments follow worsened reliability conditions. Figure 11 shows Duration in Minutes aggregated by year due to all outage causes and due to "Equipment Failures" alongside Capital and O&M Expenses associated with the Infrastructure Replacement Programs.

Figure 11. Total Duration of Outages Due to All Causes and Due to Equipment Failures Versus Infrastructure Replacement Program Spending (Capital & O&M Expenses)

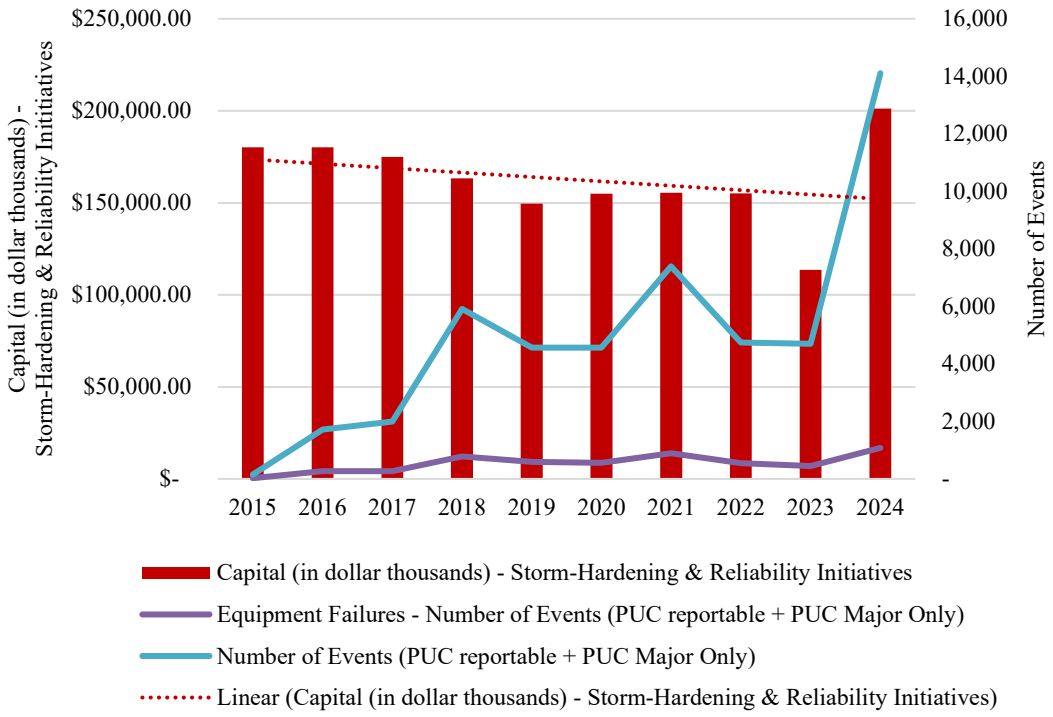
- One-year lagged correlations with O&M expenses related to infrastructure

- replacement programs have a consistently negative relationship with multiple reliability metrics. This may indicate that higher capital infrastructure replacement spending is associated with reduced outage impacts in the following year and vice versa.

- One-year lagged capital and O&M investments related to infrastructure replacement programs exhibit a weak association with most equipment failure-related reliability metrics. Correlations with capital infrastructure replacement program spending show a moderate to strong negative association with improper design-related outage metrics. Both of these correlations may suggest that there is a need to more closely align capital infrastructure replacement investments with addressing equipment failure outcomes than design-related deficiencies.

Storm-Hardening and Reliability Initiatives under the I&M Plan

- The analysis under this sub-header was limited to PUC Reportable and PUC Major Events.



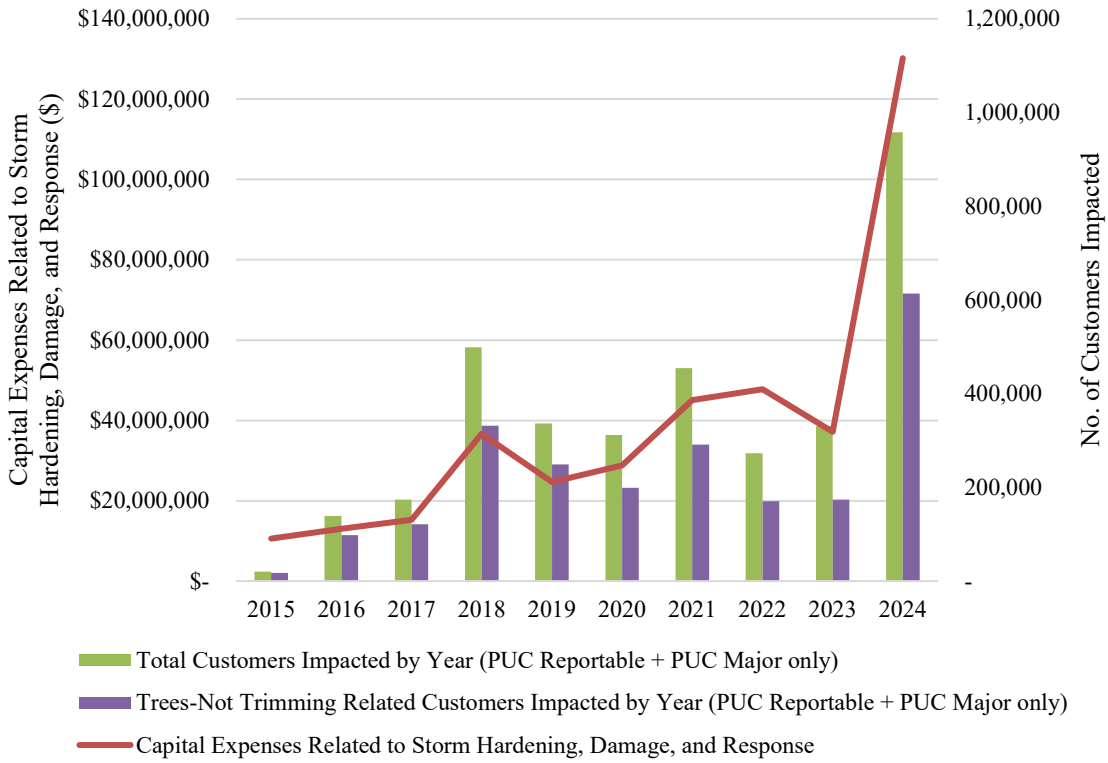
- The same-year correlations between capital spending on storm-hardening and reliability initiatives (including Asset Health Management, Chronic Reliability Remediation, and Smart Grid investments) and reliability metrics for equipment failure-related outages is near zero. This may indicate little immediate association between the above I&M efforts and equipment failures. For all cause reliability performance, same-year correlations are weak and positive (approximately 0.22 to 0.33).

- Smart Grid investments (specifically) show moderate to strong negative correlations (approximately −0.45 to −0.69) across all causes and equipment failure-related metrics when evaluated without a lag. This may indicate an association of this form of spending with reduced outage frequency and severity during reportable and major events.

- One- and two-year lagged correlations are negative for capital spending on storm-hardening and reliability initiatives. This may suggest that reliability

benefits from these initiatives apply over longer time horizons. Figure 12 below highlights the general decreases in storm-hardening and reliability initiative expenditures alongside the increase in number of events due to all causes between 2015 to 2024. The figure also shows the number of events due to Equipment Failure cause.

Figure 12. Storm Hardening and Reliability Initiatives Spending Compared with the Number of Events (PUC Reportable and PUC Major Events)



Capital Expenses Related to Storm Hardening, Damage, and Response

- The analysis under this sub-header was limited to PUC Reportable and PUC Major Events.

- Same-year correlations between storm hardening capital spending and reliability performance are very strong and positive (approximately 0.81–0.95) (i.e., expenditures correlate with worse reliability outcomes). This may indicate that capital expenditures closely track the severity of reportable and major storm events. This strong contemporaneous relationship may also suggest that storm hardening, damage, and response spending is scaled to the

magnitude of storm impacts within the same year. Figure 13 illustrates the above relationship by showing Capital Expenses related to Storm Hardening, Damage and Response alongside the total number of customers impacted each year between 2015 to 2024 due to all causes as well as due to the "Trees-Not Trimming Related" cause.

Figure 13. Capital Expenses Related to Storm Hardening, Damage and Response Versus the Sum of Customers Impacted by Year

- Lagged correlations between reliability metrics and the prior year's investment are generally very weak to moderate and positive. This may indicate that higher capital spending in one year is not consistently followed by measurable reductions in outage severity in the subsequent year and vice versa.

Investments and PPL's SAIFI, SAIDI, CAIDI, MAIFI and CEMI

- This analysis utilized SAIFI, SAIDI, and CAIDI provided by PPL.[139]

- Same-year correlations indicate that Smart Grid investments and Infrastructure Replacement Program-related O&M expenses have a moderate negative correlation with a variety of reliability indices.

- Infrastructure replacement program-related capital expenses and storm hardening, damage, and response capital are positively correlated with reliability indices.

- The persistence of beneficial reliability outcomes and certain expenditures vary by expenditure and the length of lag. One-year lagged correlations indicate an inverse relationship between Capital Expenses on storm-hardening and reliability initiatives under the I&M plan, vegetation management O&M expenses, Smart Grid investments, and Infrastructure Replacement Program capital and O&M expenses in relation to various reliability indices. Two-year lag correlations show attenuated but still negative associations for Smart Grid, Infrastructure Replacement Program O&M Expenses, and storm-hardening and reliability initiatives capital investments. A weaker relationship exists for Vegetation Management Program O&M spend.

- Figure 14 shows a range of correlations between the investment and the reliability metrics examined.

[139] PPL Response to OCA VII-79 Confidential Attachment 1 and OCA XIX-2 Confidential Attachment 1.

Q. WHAT DOES YOUR ANALYSIS SUGGEST REGARDING PPL'S INVESTMENTS TO DATE?

A. My analysis indicates that PPL's reliability-related investments have produced mixed and uneven results, with the relationship between spending and reliability outcomes varying materially by investment category and timing. Some categories of investment appear directionally aligned with improved reliability outcomes over time, while others show little evidence of producing sustained or measurable reliability benefits.

Specifically, lagged investments in O&M expenses associated with the vegetative management program, infrastructure replacement (both capital and O&M), Smart Grid technologies, and storm hardening and reliability initiatives under the I&M plan generally exhibit moderate to strong inverse relationships with outage frequency

and severity metrics. These results are consistent with the expectation that such investments, when appropriately targeted and given sufficient time to take effect, can contribute to improved reliability performance.

At the same time, the analysis highlights notable areas of concern. Investments related to storm hardening, damage, and response exhibit strong positive correlations with worsening reliability metrics in the same year and weak or inconsistent relationships in subsequent years. This pattern suggests that these expenditures may be reactive, meaning they track the severity of storm impacts rather than mitigating future outage frequency or duration. As such, these expenditures appear to function more as cost recovery for storm damage than as investments that measurably improve system resilience.

In addition, reliability outcomes associated with equipment failure-related outages show weak or inconsistent relationships with several major investment categories, including infrastructure replacement and storm-hardening capital. This raises questions about whether these investments are sufficiently targeted toward addressing underlying equipment condition, design deficiencies, or failure modes, or whether their benefits are being diluted when assessed at an aggregate system level.

These observations reinforce my previous recommendation that the Commission should require stronger accountability, particularly if such investments are relied upon as a primary justification for increased rates in this proceeding. These observations also inform my subsequent analysis of PPL's proposals in this case.

D. Proposal Overview

Q. WHAT DOES THE COMPANY PROPOSE TO DO TO ADDRESS RELIABILITY AS PART THIS CASE?

A. PPL proposes a set of reliability-related actions that fall into two primary categories: (1) continuation of the Company's storm hardening and system modernization initiatives; and (2) changes to the Company's vegetative management approach, including the acquisition of expanded ROWs.

First, PPL proposes to continue and fund storm hardening efforts implemented since the last base rate case.[140] PPL specifically describes four programs—Asset Health Management, Chronic Remediation, Engineering Design Standards, and Smart Grid—intended to improve the Company's equipment performance, and represents that these programs are intended to improve equipment resistance and performance in response to storms.[141]

Second, PPL proposes to modify its vegetative management plan. Specifically, PPL proposes to shorten the vegetation I&M cycle for its distribution circuits from a condition-based five-to-eight-year cycle to a five-year cycle, and to acquire additional ROW areas.[142] Both of these changes are intended to reduce the tree and vegetation related impacts and hazards to the distribution system.[143] To support these changes, the Company proposes $50 million increase in its distribution vegetation management budget in its Fully Projected Future Test Year ("FPFTY").[144] For the ROW enhancement, PPL proposes to include $25 million in its capital budget.[145] I will address each of these proposals in further detail over the subsequent discussion.

Q. WHY DOES THE COMPANY PROPOSE ADDITIONAL STORM HARDENING?

[140] Lookup Dir. at 12, lines 17-22 and 13, lines 1-2.
[141] Id. at 13, lines 3-20.
[142] Howell Dir. at 7-8.
[143] Id. at 5, lines 18-22 and 6, lines 1-10.
[144] Id. at 6, lines 16-17.
[145] Id. at 14, lines 3-8.

A. PPL describes an increased focus on proactive storm hardening in response to rising storm frequency and severity.[146] The Company explains that it has developed and implemented updated design and construction standards to harden its distribution system, including the use of stronger poles, insulated conductors, and underground facilities, with the goal of preventing outages rather than solely improving restoration times.[147] The Company states that its overall storm hardening design does not differ based on type of storm or natural disaster. However, the Company's design standards are applicable for all weather experienced in its service territory.[148,149]

The Company claims that the combined impact of Asset Health Management, Chronic Reliability Remediation, Engineering Design Standards, and Smart Grid has resulted in a 0.052 improvement in PUC SAIFI from 2015 to present, or 5.6%. The Company does not provide documentation detailing the basis of this counterfactual. In addition, the Company claims that Smart Grid investments over that time period have prevented over 3 million customer interruptions since 2015.[150] These figures support the Company's intention to continue utilizing these programs to support its storm hardening response.

Q. DO YOU HAVE ANY CONCERNS WITH PPL'S PROPOSALS?

A. Generally, no. Targeted storm hardening and system modernization can be a prudent component of a reliability strategy, particularly given the Company's stated exposure to increased storm frequency. Additionally, the programs identified by the Company are, in principle, consistent with proactive reliability management.

[146] Lookup Dir. at 12-13.
[147] Id. at 12, lines 19-22.
[148] PPL Response to OCA XVIII-22 a.
[149] PPL Response to OCA XVIII-22 c.
[150] PPL Response to OCA XVIII-6.

That said, my above analysis suggests that the relationship between spending and reliability outcomes has been uneven across storm hardening expense categories. In particular, certain storm-related spending appears to track storm severity contemporaneously rather than demonstrating reductions in reliability metrics in subsequent periods. By contrast, some investment categories—most notably Smart Grid—show more favorable associations with improved reliability outcomes. These patterns underscore the importance of ensuring that continued funding is targeted toward measures that deliver demonstrable reliability benefits.

Consistent with my earlier recommendations, and given PPL's recent failure to consistently meet Commission reliability benchmarks, I recommend that any approval of incremental storm hardening expenditures should be accompanied by clear performance expectations and enhanced, transparent reporting that links program-level expenditures to measurable reliability outcomes over time.

Q. WHY DOES THE COMPANY PROPOSE TO SHORTEN ITS I&M CYCLE?

A. The Company states that this change will allow it to "proactively identify and mitigate potential vegetation-related risks, thereby improving system reliability and reducing the likelihood of outages or safety hazards."[151] Further, the Company states that it believes a five-year I&M cycle balances costs and routine work.[152]

Q. DO YOU HAVE ANY COMMENTS REGARDING THIS PROPOSED CHANGE?

Yes. Shortening the I&M cycle may be reasonable, but it can also be a cost driver with uneven reliability benefits if the cycles, and subsequent investment, are not well targeted. That is, moving from condition-based (5-8 years depending on need) to a flat

[151] Howell Dir. at 6, lines 1-3.

[152] PPL Response to OCA XVIII-11 b.

5-year cycle may shift spending from risk-based to routine work. As a condition of approval, I recommend that the Commission require PPL to continue planning and executing I&M work based on system risk and need, rather than cycle length alone. Additionally, in line with earlier recommendations regarding performance, the reliability impacts of incremental O&M expenditure associated with this change should also be subject to Commission review as it relates to performance.

Q. WHY DOES THE COMPANY PROPOSE ENHANCED ROW?

A. PPL proposes to expand and restore distribution ROW corridors by acquiring enhanced easement rights, particularly to address Off-ROW trees, which the Company states have caused approximately 82% of vegetation-related outages over the past 10 years.[153] The Company explains that many existing easements are insufficient to meet current clearance specifications and, in some cases, were never recorded.[154] As a result, PPL also proposes to obtain and record new easement rights that allow removal of hazards and danger trees.[155] PPL's proposed enhanced corridor specifications include increasing clearances to 30' for single-phase and 40' for three-phase from center line, and ground to sky.[156]

The Company is requesting $25 million for the expanded ROW program, which includes acquisition of the new easement rights, and initial tree trimming for the new ROW and off-ROW.[157] The Company also requests to capitalize the initial tree trimmings.[158] As a result of this program, the Company projects an additional 7% improvement in SAIFI over five years attributable to these efforts.[159]

[154] Id. at 9-10.
[155] Id. at 11.
[156] PPL Response to OCA XVIII-9a.
[157] Howell Dir. at 14, lines 3-6.
[158] Id. at 11, lines 7-10.
[159] Id. at 15.

Q. DO YOU HAVE ANY CONCERNS WITH THE COMPANY'S PROPOSAL TO ACQUIRE ENHANCED ROWs?

A. Yes. I have two concerns with PPL's proposal related to the acquisition of enhanced ROWs. First, I do not recommend that the Company be able to capitalize tree trimming related to expansion of ROWs. Per the FERC Uniform System of Accounts, ROWs are an intangible asset, and the ROW costs "incurred in connection with first clearing and grading of land..." should not be capitalized.[160] Please see the testimony of OCA Witness Lafayette Morgan for additional discussion of associated issues and proposed adjustments made to the Company's requested revenue requirement.

Second, I am concerned that the Company's proposal lacks corresponding reporting and accountability requirements tied to the approval of these additional costs. If the Commission approves the program, I recommend that it direct PPL to file an annual report describing its enhanced ROW program and, at a minimum, detailing measures such as the extent of expanded ROWs obtained in square miles (or other similar unit), the scope of associated tree removal, and estimated changes in relevant reliability metrics attributable to the expanded ROWs. I also recommend that the Commission objectively evaluate performance of the program relative to the estimated improvement that PPL provides an additional 7% improvement in SAIFI over five years. Failure to demonstrate progress toward this stated reliability improvement should result in enhanced prudence review and potential disallowance of enhanced ROW-related costs.

[160] FERC Uniform System of Accounts, Section Electric Plant Instructions, 7. Land and Land Rights. https://www.ecfr.gov/current/title-18/chapter-I/subchapter-C/part-101.

E. Conclusions and Recommendations

Q. PLEASE RESTATE YOUR FINDINGS AND RECOMMENDATIONS REGARDING PPL RELIABILITY.

A. Based on the above evaluation, I offer the following findings and recommendations:

- PPL is not currently meeting most of the Commission-ordered targets for reliability, and its reliability scores for major metrics have trended upward (i.e., worsened) in recent years, including in comparison to peer Pennsylvania utilities in 2024. Particularly poor metric scores in 2024 are attributed to storms; however, when 2024 data is excluded, PPL's metric trends have still worsened since 2015.

- My analysis indicates that PPL's reliability-related investments have produced mixed or uneven results, with the relationship between spending and reliability outcomes varying materially by investment category and timing. Some categories of investment appear directionally aligned with improved reliability outcomes over time, while others show little evidence of producing sustained or measurable reliability benefits.

- PPL's recent performance relative to Commission benchmarks and my analysis of investment efficacy both support the need for explicit accountability should the Commission approve additional reliability-driven expenditures.

- At a minimum, I recommend that the Commission require PPL to:

  - File an annual reliability accountability report in this docket that tracks the Company's approved reliability programs in relation to the Commission's existing reliability metric targets, and includes program-level reporting addressing spending, work completed, locations targeted, justification, and reliability outcomes. This reporting should continue until the next base rate proceeding.

- Demonstrate in its next base rate case that reliability performance has improved and is being maintained at or above Commission benchmarks.

- To the extent the Commission approves PPL's requested rate increase, it should be subject to a mid-course review (e.g., in 18-24 months) in which the Company must demonstrate progress in addressing the reliability objectives. Absent progress, costs should be subject to heightened prudence review and potential disallowance in the next base rate case or an interim proceeding.

- As a condition of approving the vegetation I&M change, the Commission should require PPL to continue planning and executing I&M work based on system risk and need, rather than cycle length alone. The reliability impacts of incremental O&M expenditure should also be subject to the above-recommended Commission review as it relates to performance.

- The Commission should not approve the capitalization of the initial tree trimming related to expansion of ROWs, as doing so is inconsistent with FERC accounting principles. This issue is addressed further in the testimony of OCA Witness Morgan.

- If the Commission approves the enhanced ROW program, it should direct PPL to file an annual report describing the program and detailing measures such as the extent of expanded ROWs obtained, the scope of associated tree removal, and estimated changes in relevant reliability metrics attributable to the expanded ROWs. The Commission should also objectively evaluate enhanced ROW performance relative to the Company's stated benefit of an additional 7% improvement in SAIFI over five years. Failure to demonstrate progress towards this specific metric should result in enhanced prudence review and potential disallowance of enhanced ROW-related costs. This review should be conducted in the same manner I recommend above for the Commission evaluation of the entirety of the Company's reliability performance.

Q. DOES THIS CONCLUDE YOUR TESTIMONY REGARDING PPL RELIABILITY?

A. Yes.

IV. EVALUATION OF THE PROPOSED RESIDENTIAL EV TOU CHARGING REBATE PROGRAM

A. Purpose

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY REGARDING PPL'S PROPOSED EV PROGRAM?

A. The purpose of my testimony regarding PPL's Proposed EV Program is to assist the Commission in determining whether the Program is justified, reasonably designed, and appropriately conditioned to protect customers while generating decision-useful information for future EV rate and program design. I summarize and evaluate the Company's stated need for the Program and its underlying assumptions about EV growth and distribution system impacts; assess the reasonableness of key design elements, including the off-peak charging threshold, definition of on-peak hours, incentive level, and participation cap; and examine whether the Program's objectives, data collection approach, and evaluation framework are sufficient to support meaningful conclusions. This evaluation focuses on the testimony of Company Witness Mr. James Conrad.

Q. WHAT ARE YOUR RECOMMENDATIONS FOR THIS PROCEEDING RELATED TO THE PROPOSED EV PROGRAM?

A. Based on the below assessment, I offer the following recommendations to be addressed prior to Commission approval of the Proposed EV Program:

- The Company must develop a comprehensive evaluation plan with detailed objectives that will be utilized in the evaluation of the Program during the duration of the Program and at the end of its initial term. This evaluation plan should clearly identify all relevant evaluation metrics and KPIs along with their respective targets and the data used to measure each metric or KPI. This full evaluation plan should include milestones tied to distinct start and end

dates, preferably ones that align with the Phase V Act 129 Energy Efficiency and Conservation ("EE&C") Plan (referenced hereafter as the "Phase V EV Program").

- The comprehensive evaluation plan should also describe how the Company will compare the data derived from the Proposed EV Program with data obtained from Phase V EV Program customers and customers not participating in either program, as well as how the Company intends to collect data from customers not participating in either program.

- At the conclusion of the Program, any decisions regarding Program continuation should be subject to Commission review as part of a standalone regulatory proceeding, base rate case, or in conjunction with the Commission's evaluation of a future Act 129 EE&C Plan. Stakeholders should be afforded an opportunity to participate in the applicable proceeding.

- Data collected by the Company should be shared with external stakeholders both during the course of and at the conclusion of the initial Program period.

I also recommend several changes and/or clarifications to the Program's design:

- The TOU design should be revised to utilize a definition that, at a minimum, includes the entirety of the on-peak period applied to the Generation TOU Rate during the six non-shoulder months.

- The Company should modify the proposed tariff language for the Program to explicitly indicate that the Program is temporary and will be reevaluated prior to its continuation beyond 2030.

- The Company should implement targeted marketing to constrained areas from the onset of the Program. The definition of "constrained area" should only include distribution infrastructure where the marginal contribution of EVs is anticipated to create system overload conditions.

- The Company should limit enrollment in non-constrained areas to 1,000 customers. The definition of "constrained area" should only include distribution infrastructure where the marginal contribution of EVs is anticipated to create system overload conditions.

- The Company should collect customer feedback or satisfaction data, in addition to the data outlined in the Company's response to discovery, on at least an annual basis.

B. Proposal Overview and Need

Q. PLEASE SUMMARIZE PPL'S PROPOSED EV PROGRAM.

A. PPL's Proposed EV Program, as presented in the Direct Testimony of Witness Conrad, is, in brief, a temporary program that rewards eligible customers for charging their EVs during designated off-peak hours. Specifically, PPL is proposing that eligible EV customers that conduct 80% of their charging during designated off-peak periods will receive a $10.00 rebate per applicable billing period.[161] The program's "on-peak" periods are:[162]

- Summer (June – August) from 4:00–7:00 PM
- Winter (December, January, February) from 6:00–9:00 AM and 6:00–8:00 PM

All other periods, including the six "shoulder months" (March – May, September – November) not included in the peak period, are considered off-peak per this program.[163] The Company will cap program participation at 2,000 customers.[164] Residential customers are eligible for the program if they own or lease an EV and own or operate Level 2 chargers that are furnished with approved telematics.[165]

[161] Direct Testimony of James Conrad at 5, lines 12-14.
[162] PPL Response to CAUSE-PA V-17.
[163] PPL Response to CAUSE-PA V-20.
[164] Conrad Dir. at 5, lines 17-18.
[165] PPL Response to OCA XVI-2.

PPL also states that the Company may market the program to customers in areas where the Company forecasts system constraints in the next five to seven years due to residential EV charging adoption.[166] As discussed in the Testimony of OCA Witness Barbara R. Alexander, the Company did not provide examples of marketing materials.

Q. DOES THE COMPANY INTEND TO PAY THE $10.00 INCENTIVE IN THE SHOULDER MONTHS WITH NO ON-PEAK PERIODS?

A. No. In response to discovery, the Company clarified that it "does not intend to pay out the incentive of $10 per customer during the shoulder months."[167]

Q. WHAT REASONS DOES THE COMPANY OFFER TO JUSTIFY THE NEED FOR THE PROPOSED EV PROGRAM?

A. The Company cites analysis that finds EV adoption will contribute to constraints on its distribution system, particularly local feeders and substations, during peak hours.[168] In response to discovery, the Company produced projections of the number of EV customers through 2032 alongside associated line load impacts.[169]

Q. DO YOU AGREE WITH THE COMPANY'S ASSESSMENT OF NEED?

A. In part. I reviewed the Company's calculations and inputs in OCA I-3 Confidential Attachment 8.[170] Based on the information provided regarding the loadings of existing circuits and the potential impacts of incremental EV additions with uncontrolled charging behavior, I agree with the Company's assessment that there is a non-trivial impact of EV growth to the Company's system.

[166] Conrad Dir. at 5, lines 18-20.

[167] PPL Response to OCA XXII-2.

[168] Conrad Dir. at 4, lines 9-16.

[169] This analysis was provided in PPL Response to OCA I-3 Confidential Attachment 8. The OCA has confirmed with PPL that the reference to the Company's response to OCA Set I-3 Confidential Attachment 8 included in my testimony does not need to be marked as Confidential.

[170] The OCA has confirmed with PPL that the reference to the Company's response to OCA Set I-3 Confidential Attachment 8 included in my testimony does not need to be marked as Confidential.

However, I also observed that several of the growth rates used by PPL in developing a range of circuit-level estimates do not reflect realistic growth conditions. Compound annual growth rates ("CAGRs") during the last 10 years, during which time EV adoption grew from an extremely low level to the modest levels observed today, are inflated by the relatively low starting point. For example, PPL utilizes Pennsylvania Department of Transportation data showing an increase from four EVs in 2013 to 334 in 2024 in Columbia County, which is exclusively served by PPL. The implied CAGR of 50%, if applied on a forward basis, would suggest continued doubling of EVs in this county every two years. Static assumptions like this are inconsistent with recent policy headwinds facing residential EV adoption, most notably the recent end of federal EV tax credits on September 30, 2025.[171] Even the lowest EV growth rate (15% per year) modeled by PPL is subject to considerable uncertainty. Besides adoption level, other uncertainties include the actual charging impact of each EV, the specific clustering and locations of EVs, and the coincidence of EV charging with individual feeder peaks.

Given these uncertainties, I believe it is appropriate to conduct a temporary program that is limited in size and has a defined information-gathering purpose. I address whether the Company's Proposed EV Program meets these requirements below. Additional comments about the program's needs in relation to PPL's existing EV programs are also addressed below.

Q. IS THE EV PROGRAM PROPOSED AS A PERMANENT PROGRAM?

A. No. In response to discovery, the Company states that the Program is to be offered on a "temporary" basis through 2030.[172] The Company intends to review the results after

[171] IRS.gov, "Credits for new clean vehicles purchased in 2023 or after." https://www.irs.gov/credits-deductions/credits-for-new-clean-vehicles-purchased-in-2023-or-after; BBC, *Ford to scale back electric vehicle plans, taking $1.95bn hit.* https://www.bbc.com/news/articles/c0l9j65w30eo

[172] PPL Response to OCA XVI-10.

this period and then determine what changes should be made.[173] For all intents and purposes, I consider this Program to be a pilot, although not titled as such.

Q. HOW DOES THE COMPANY PLAN TO CONCLUDE THE PROPOSED EV PROGRAM?

A. The Company did not provide information as to how it intends to conclude the Program, including whether it would seek approval of an extension of the Program through another proceeding or suspend the project subject to Commission review in 2030. In the Company's proposal, there is also no discussion of involving other stakeholders in the review of the Program nor in sharing of program outcomes prior to proposing continuation, cessation, or changes to the program.

Q. IS PPL'S PLAN TO REVALUATE THE PROPOSED EV PROGRAM IN 2030 APPROPRIATE?

A. I do not think the Company's 2030 revaluation plan is sufficient. However, the Company's proposed revaluation plan has aspects that are appropriate. A 2030 timeline roughly aligns with the timeline of PPL's separately proposed Phase V EV program in its ongoing EE&C proceeding, which is intended to run from 2026 to 2031.[174] As discussed below, the Company proposes to compare the results of the Proposed EV Program (in this case) with its separately proposed Phase V EV program (in the EE&C case). Therefore, it is appropriate for these programs to have the same timeline. Additionally, a five-year time frame provides sufficient time to gather additional information about the scale of impact that EV adoption has on PPL's distribution system given the abovementioned uncertainties. I recommend that the Company modify the proposed tariff language for this program to explicitly indicate that the

[173] Id.

[174] Specifically, the programs are proposed to run from June 1, 2026 through May 31, 2031. https://www.puc.pa.gov/pcdocs/1894167.pdf.

program is temporary and will be reevaluated prior to its continuation beyond 2030. This clarification is essential to avoid setting the expectation among enrolling customers that the project will last indefinitely.

In terms of other plan features, I recommend PPL: (1) develop more detailed objectives that it intends to utilize in its evaluation; (2) incorporate other stakeholders in the 2030 program review; and (3) subject program continuation to Commission review and approval as part of a standalone regulatory proceeding, base rate case, or in conjunction with the Commission's evaluation of a future Act 129 EE&C Plan. These recommendations are addressed further as part of the below discussion regarding the Proposed EV Program objectives.

C. Justification for Proposal Elements

Q. WHAT JUSTIFICATION DOES PPL PROVIDE FOR THE 80% OFF-PEAK THRESHOLD?

A. PPL indicates that, following review of "comparable utility programs," it selected the 80% off-peak threshold with the aim of balancing customer flexibility with program effectiveness.[175] In response to OCA Discovery Set XVI, Question 16, PPL indicates that the utility programs it reviewed included the EV programs and pilots of Duquesne Light Company ("DLC"), Louisville Gas and Electric and Kentucky Utilities ("LG&E/KU"), Rhode Island Energy, National Grid (New York), and BGE.[176] When describing how the Proposed EV Program's customer obligations compare to other utility programs, PPL contrasts its off-peak charging requirement to programs with "mandatory event participation or minimum charging thresholds."[177]

[175] PPL Response to OCA XVI-7.
[176] PPL Response to OCA XVI-16.
[177] Id.

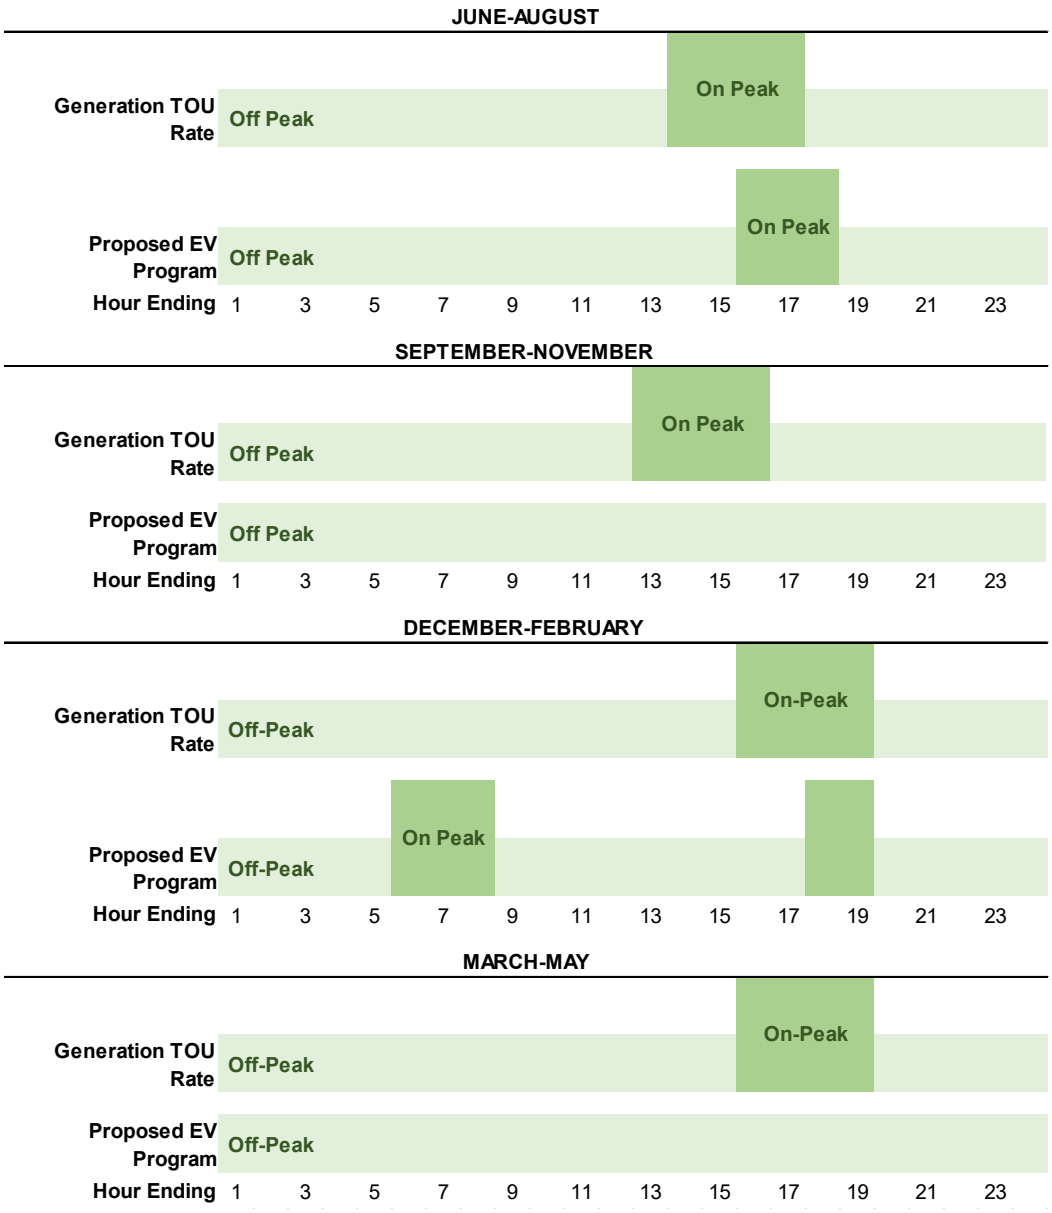
Q. DID PPL PROVIDE SUFFICIENT JUSTIFICATION FOR THE CUSTOMER OFF-PEAK CHARGING OBLIGATION?

A. No. From the comparative analysis provided, it is unclear how the Company determined the 80% off-peak threshold, nor does it appear that PPL evaluated alternative thresholds. Further, the Company did not provide analysis of current residential customer EV charging behaviors to determine the typical or anticipated on- or off-peak charging behavior it wishes to address. PPL indicated that it expects to collect this data through the Proposed EV Program.[178] I provide recommendations regarding data collection requirements below.

Q. HOW DOES PPL DETERMINE THE PROGRAM-SPECIFIC "ON-PEAK" HOURS?

A. PPL based the time-of-use design for this program on its review of distribution system peaks, specifically the hours at which the Company's system demand is near its daily peak in the summer and winter seasons.[179] PPL is unable to isolate residential EV charging's impact on load growth or the daily peaks, and therefore cannot tailor the TOU times to specific EV charging daily peaks with its current data.[180] Again, PPL indicates that it expects to collect relevant EV usage data through the Proposed EV Program.

Q. DO YOU FIND ANY ISSUE WITH PPL'S TOU DEFINITIONS FOR THE PROPOSED EV PROGRAM?



A. Yes. The current design does not align with PPL's existing tariffed TOU rate offering, creating a potential mismatch where the targeted behavior under one program may impede the success of the other program in meeting its load-shifting objectives. Eligible

[178] PPL Response to EI-PPL-II-9.
[179] PPL Response to OCA VII-73 & EI-PPL-II-9.
[180] PPL Response to EI-PPL-II-9.

customers under Rate Schedule RS (Residential Service) can currently opt-in to a TOU generation supply rate, referred to as Time-Of-Use Program – Residential and Small Commercial/Industrial under Generation Supply Charge-1 ("Generation TOU Rate").[181] Figure 15 compares the peak period definitions of the existing Generation TOU Rate and the Proposed EV Program.

[181] See original page No. 24C of Volume XII of the company filing.

Figure 15. Typical On-Peak Periods for Generation TOU Rate and Proposed Residential EV Charging TOU Rebate Program

The Generation TOU Rate applies year-round and defines the "summer" (6/1-11/30) and winter (12/1-5/31) on-peak period as 2:00–6:00 PM and 4:00–8:00 PM, respectively. Under the Generation TOU Rate, weekends and select holidays are automatically classified as off-peak. This definition is "designed to coincide with the

PJM system peaks."[182] By comparison, the Proposed EV Program makes no exceptions for weekends and holidays, does not apply in shoulder months, and uses alternative TOU periods as defined above. The Proposed EV Program TOU definition is designed to address distribution system peak load, "where constraints are typically at the substation or feeder level."[183] The differences, therefore, are understandable insofar as distribution system peaks may or may not overlap with transmission or bulk system constraints. However, by defining distinct TOU periods, one program may encourage customers to shift usage in such a way that increases the other program's peak, potentially imposing costs on all customers. This risk is particularly pronounced for EVs, where EV TOU programs are often addressed by customers programming their chargers to cease charging during the on-peak period. As a consequence of this programming, load is particularly pronounced immediately before the on-peak period starts and after it ends.[184]

Given the above concern, I recommend that the Company revise its Proposed EV Program TOU design to utilize a definition that, at a minimum, includes the entirety of the on-peak period applied to the Generation TOU Rate during the six non-shoulder months. Specifically, I propose the Proposed EV Program define on-peak hours as 2:00–7:00 PM in June – August and 6:00–9:00 AM and 4:00–8:00 PM in December – February. This change avoids unintended consequences for all customers as a result of PJM system impacts. Given that residential EV charging is typically addressed through programmable Level 2 charges, this change can be accomplished with relatively minor adjustments in the programmed "no charge" periods.

[182] PPL Response to OCA VII-73.

[183] Id.

[184] Also known as "bounce back" or "rebound" charging. This phenomenon occurs when EV charging rapidly ramps up or down at the start or end of the designated off-peak, creating sudden changes in load.

Q. WHAT SUPPORT DID PPL PROVIDE FOR ITS PROPOSED $10/PP/MONTH INCENTIVE MECHANISM?

A. PPL indicates that it selected the $10-per-month rebate as an "introductory offering" intended to "balance customer affordability, program cost-effectiveness, and the incentive strength necessary to drive initial participation.[185] The Company also states that the incentive "aligns with comparable pilot scale programs" of utilities in Pennsylvania and other Mid-Atlantic states, as well as by PPL's affiliated utilities, that have annual payouts of between $60 and $180.[186] In response to Discovery OCA XVI-16, PPL specifically compared its proposed rebate to BGE's EV program that offers $10 per month for Level 2 participants and National Grid's EV program that offers $24 per month.[187] Under the Proposed EV Program, participants would receive an annual payout of up to $60 assuming successful performance.

Q. DID PPL PROVIDE A BASIS FOR ITS PROPOSED 2,000 CUSTOMER CAP?

A. Yes, PPL states that that the proposed cap is "designed to provide a sample size that is both statistically robust and considerate of affordability concerns for evaluating program performance."[188] PPL further describes the cap, which represents "approximately 3.8 percent of PPL Electric's total forecasted eligible customer base in 2030," as consistent with similar pilot programs.[189] The estimated percentage reflects PPL's assumption that the customer base will increase to approximately 52,000 in 2030, an over 100% increase over five years from the current (December 2025)

[185] PPL Response to I&E-RE-III-9(D).
[186] Id.
[187] PPL Response to OCA XVI-16.
[188] PPL Response to OCA VII-75.
[189] Id.

estimated level of 20,000.[190] As noted earlier, I believe PPL's projected growth is potentially overstated. Additionally, as a statistical matter, a customer sample size as high as 1,100 is sufficient to provide a margin of error of less than +/-3% even with a population as big as 100,000. Nevertheless, I find that the 2,000-customer cap is a meaningful number of participants on which to collect data, and that a cap is necessary to manage program cost-related risk.

D. Program Objectives

Q. WHAT ARE THE OBJECTIVES OF THE PROPOSED EV PROGRAM?

A. The Company has two stated objectives for the program: "1) alleviate potential constraints on the distribution system caused by residential EV charging; and 2) determine the capability to shift EV charging load through offering customer incentives."[191]

Q. HOW WILL PPL ACCOMPLISH THE FIRST OBJECTIVE?

A. In theory, if enough EV customers shift their charging to off-peak times in response to the Program incentives, the shift will reduce the strain on individual feeders and substations during potential future distribution system peaks. Meeting this objective, however, depends on a variety of highly contingent factors, most especially targeted enrollment of customers in constrained areas. Although the Company indicates that it "may deploy targeted marketing to customers in areas where EV growth is forecasted to start causing system constraints in the next 5-7 years,"[192] it does not commit to do so and intends to allow all otherwise eligible customers to enroll.[193] By not restricting

[190] PPL Response to OCA XVI-4.
[191] PPL Response to OCA XVI-12.
[192] Conrad Dir. at 5, lines 18-20.
[193] PPL Response to OCA XIV-15.

eligibility to constrained areas, PPL undermines the potential that the Program itself will reduce strain and delay the need for upgrades on certain feeders.

Q. HOW DOES THE COMPANY JUSTIFY THE BROAD ENROLLMENT OF RESIDENTIAL CUSTOMERS GIVEN THE FIRST PROGRAM OBJECTIVE?

A. PPL views any constraints on enrollment that limit participation in the Program as reducing "the validity of the collected data set to inform future programs in a statistically significant manner."[194] I interpret this to suggest that the Company's second objective, information gathering, is the primary purpose of the Program. The Company states as much in response to OCA XVI-9, stating "The intent of the program is to gain information on residential customer charging behavior and response to incentives to inform future program design."[195]

Q. DO YOU AGREE WITH THE COMPANY'S JUSTIFICATION FOR ALLOWING ALL CUSTOMERS TO ENROLL WITHOUT LIMITATION?

A. No. As an initial matter, if the intent of the Program was to develop a statistically valid sample that represents the broader population of potential EV customers in the PPL service territory, then the Company would not rely solely on self-selection to develop its sample set. Rather, it would develop a stratified sample and target enrollment within representative groups of EV owners. This may include targeted over-samples of certain groups to ensure representative samples, as is common practice for statistical survey research.

In this case, I believe that targeted sampling of customers in constrained areas is essential to the Company's information-gathering objective. PPL's current proposal only allows that the Company *may* market the program in constrained areas. As such,

[194] PPL Response to OCA XVI-9(a).
[195] Id.

there is no assurance that any participants will be located in constrained areas or that PPL will learn anything about the areas where purported program benefits are expected to first apply. I recommend that the Commission require targeted marketing to constrained areas from the beginning of the program, and that enrollment in non-constrained areas be capped at 1,000 customers. Further, I recommend that the definition of "constrained area" be clearly established to only include feeders where the marginal contribution of EVs is anticipated to create system overload conditions, not other anticipated loads or organic load growth. PPL's methodology for identifying such areas, as applied in OCA I-3 Confidential Attachment 8, is acceptable while applying an assumed 15% CAGR for EVs.[196]

Q. HOW WILL PPL ACCOMPLISH THE SECOND OBJECTIVE?

A. The Company intends to collect data measuring "enrollment, participation persistence, and behavioral response to incentive periods" as measured through metrics including "the percentage of participants aligning charging with off-peak hours, kWh shifted off-peak, and the persistence of these behaviors over time."[197] To evaluate impact, the Company intends to conduct counterfactual analysis by comparing customer data among participants in the Proposed EV Program, the Phase V EV program proposed in PPL's ongoing EE&C case (described below), and EV owners not participating in either program.[198]

In response to discovery regarding the current impact of EV charging on load, the Company indicated that it does not currently have the ability to segregate the

[196] The OCA has confirmed with PPL that the reference to the Company's response to OCA Set I-3 Confidential Attachment 8 included in my testimony does not need to be marked as Confidential.

[197] PPL Response to OCA XVI-12.

[198] PPL Response to OCA VII-76.

impacts on residential EV charging from other load growth.[199] It is therefore unclear how PPL intends to compare data obtained from EV customers not enrolled in any program. The Company should clarify what data it has, how it has obtained this data, and how it will use the data for evaluation of the Proposed EV Program. At this time, the Company has not provided an evaluation plan that further explains the key performance indicators and targets that it will use to evaluate Program success. The Company states, "the specific metrics and KPIs [sic] values will be finalized and refined during program implementation as additional data becomes available."[200] The Company will collect and review this data at least monthly and consolidate the data into quarterly and annual internal reports.[201]

Q. WHAT TYPE OF DATA DOES PPL INTEND TO COLLECT AS PART OF THE PROPOSED EV PROGRAM AND HOW DOES IT INTEND TO COLLECT SUCH DATA?

A. As a condition of enrollment in the Proposed EV Program, PPL will require participating customers to authorize the collection of charging data, including charging start and end time, interval-level consumption (kilowatt-hours, or kWh) and maximum demand, and the EV's battery state of charge.[202] This type of data will inform metrics such as customer behavioral response to incentive periods, the percentage of participants aligning charging behavior with off-peak hours, the amount of energy shifted to off-peak periods (kWh), and the persistence of charging behavior changes over time.[203] Administrative data, including enrollment and participation persistence,

[199] PPL Response to EI-PPL-II-9(C). In response to OCA XVI-11, PPL implies that the Proposed EV Program is a "passively managed charging program," as compared to the Phase V EV program which is an "actively managed charging program."

[200] PPL Response to OCA XXII-3.

[201] Id.

[202] PPL Response to OCA XVI-11 and EI-PPL-III-12a.

[203] PPL Response to OCA XVI-12.

will also be tracked.[204] PPL will use EV supply equipment telematics and third-party vendor software to both collect and manage the data available from the Proposed EV Program.[205] The Company intends to supplement the data collected from customers with Advanced Metering Infrastructure ("AMI") and feeder/substation data.[206]

Q. IS THERE ADDITIONAL DATA YOU BELIEVE THE COMPANY SHOULD COLLECT?

A. Yes. The Company should regularly collect customer feedback or satisfaction data as part of the information collected. This type of data is collected to describe more qualitative impacts of the Program that may not be captured in customers' usage patterns. I recommend that acceptance of the Program be conditioned on the collection of the data proposed by the Company in response to discovery, as summarized above, as well as additional measures of customer feedback or satisfaction.

Q. IS THE COMPANY'S PLAN TO EVALUATE THE DATA IT COLLECTS SUFFICIENT?

A. No. Foremost, I recommend that the Commission condition approval of the Proposed EV Program on the Company providing a formal evaluation plan that identifies the KPI and targets the Company will use to evaluate Program success. The Company's plan to finalize metrics and KPIs during program implementation does not give the Commission or stakeholders sufficient transparency into the Program. In the absence of this information, the Proposed EV Program is potentially a "fishing" expedition where program resources are expended *in search of* justification, rather than *subject to* justification.

[204] Id.
[205] PPL Response to OCA XVI-11.
[206] PPL Response to OCA XXII-3.

Second, I find the Company's plan to create summaries of quarterly and annual data from this Program to be sufficient.[207] Data collection of this frequency will allow for course correction. I recommend that the Company make these quarterly and annual summaries available to stakeholders. Finally, I recommend that any data the Company collects be shared with stakeholders. Further, I recommend that stakeholders have an opportunity to comment on available data and findings as part of any proceeding undertaken to evaluate the continuation of the Program beyond 2030.

E. Cost and Benefit

Q. DID PPL PROVIDE A FORMAL COST-BENEFIT ANALYSIS TO SUPPORT THE PROPOSED EV PROGRAM?

A. No. PPL explicitly states that it did not perform a cost-benefit analysis.[208]

Q. WHAT ARE THE TOTAL COSTS OF THE PROPOSED EV PROGRAM AND HOW DOES THE COMPANY PROPOSE TO RECOVER THESE COSTS?

For this Program, costs include expenses associated with rebates, third-party vendor software, and marketing. The cost of rebates, if participation is at the program cap and all customers meet their off-peak charging requirement, is $120,000 annually.[209] The maximum rebate amount, $120,000, is including in the Fully Projected Future Test Year ("FPFTY") O&M expense category.[210] Besides rebate costs, setup and management of the third-party vendor's platform is estimated to cost approximately $125,000 annually if utilized by up to 1,250 customers, and $152,000 annually if

[207] Id.

[208] PPL Response to EJA-PPL-III-35.

[209] $120,000 = $10/mo. * 2,000 customers * 6 mo./yr.

[210] PPL Response to OCA VII-74. As stated in the response, this cost was included in the FPFTY capital costs in the Company's initial application, but is supposed to be included in the O&M category and will be addressed by the Company in rebuttal.

enrollment is at the cap.[211] An additional one-time $5,000 setup fee also applies. Marketing costs are included in the third-party vendor platform costs.[212] The third-party vendor costs are included in the FPFTY as plant in service for IT Capital Plan – Grid & Pipeline Value.[213]

Table 6 below shows the maximum annual costs of the Program if PPL's projected enrollment is actualized. The results of the table assume that each projected participant participates for all 12 months in the applicable year and meets the 80% off-peak charging obligation. These cost estimates do not include Company labor or other resources needed for oversight of the Program.

Table 6. Annual Cost of Proposed EV Program Given Participation Projections

	2026	2027	2028	2029	2030
Projected enrollment (no. of customers)[1]	959	1,168	1 ,414	1,690	2,000
Rebate Costs	$57,540	$70,080	$84,840	$101,400	$120,000
Vendor Costs	$130,000	$122,048	$130,904	$140,840	$152,000
Total Costs	**$187,540**	**$192,128**	**$215,744**	**$242,240**	**$272,000**

[1] PPL Response to OCA XVI-5.

The O&M expense included in the FPFTY generally aligns with the projected rebate costs in the first year. However, if the Company includes the whole cost of the vendor services, $157,000, for each (or any) year of the FPFTY, then it is overstated. In no year would the vendor costs reach $157,000, as shown in Table 6, given the Company's projected enrollment.

The costs of the Program are recovered from all customers, not just residential customers. This is appropriate to the extent that the ultimate goal of the Program is to

[211] PPL Response to OCA VII-74.
[212] Id.
[213] Id.

mitigate grid impacts and delay grid improvements, which will theoretically benefit all customers.

Q. WHAT ARE THE BENEFITS OF THE PROPOSED EV PROGRAM?

A. With respect to benefits, the primary objective of the Program—data collection regarding customers' charging behavior responses to incentives—is valuable. As stated by PPL, this information can be used to design future residential EV programs with data specific to the Company's customer base. PPL's broader objective to mitigate distribution system impacts from EV adoption and defer costly grid updates is also valuable. The value is difficult to measure but it incorporates considerations of reliability and operational planning that are beyond the upfront value of slowing cost increases to customers. To date, PPL has not been able to isolate cost impacts related to EV growth.[214]

Q. WILL THE CURRENT DESIGN OF THE PROPOSED EV PROGRAM PROVIDE THE EXPECTED BENEFITS?

A. Some portions of the current Program support the above benefits, while others do not. If the Program is approved, and the Company determines adequate enrollment, it is likely that the Company would gain insight into customers' charging behaviors in relation to the proposed incentive. This form of information gathering is enhanced by the above recommendations I offer regarding targeted enrollment, more regular data evaluation, improved data collection, and defined evaluation parameters.

As previously detailed, I am less certain that the Program itself will result in a reduction in distribution system constraints. Another Program feature that does not provide a clear benefit is the absence of performance requirements during the six

[214] PPL Response to OCA VII-72.

shoulder months. PPL has not indicated how this part of the Program design furthers its Program objectives, such as how data collection from these months provide benefit.

F. Comparison to Other EV Programs

Q. DID THE COMPANY CONSIDER OTHER POTENTIAL EV PROGRAM DESIGNS?

A. Yes. PPL evaluated the merits of implementing an EV-specific TOU rate design for distribution rates but found that EV adoption is too low to produce meaningful system benefits and follow cost of service principles, and therefore rejected this option.[215]

Q. DOES PPL HAVE OTHER PROPOSED OR EXISTING EV PROGRAMS?

A. Yes. Separate from the Proposed EV Program in this case, PPL is also proposing a managed EV charging program within the Phase V EV program under Docket No. M-2025-3052826.[216] The Phase V EV program, as proposed, consists of a "Persistent Peak Demand" program that actively manages residential EV charging through scheduled charge times that avoid peak hours. This program, like other Phase V activities, is proposed to run from 2026 through 2031.

The Commission has also previously approved residential EV programing as part of the Company's Phase IV Act 129 EE&C Plan (hereafter referred to as the "Phase IV EV Program"). This program provides rebates for charger installation to residential customers that install a qualified charger and agree to share charging data with the Company. In the Company's petition for the Phase IV EV Program, it argued that the

[215] PPL Response to EI-PPL-II-10.

[216] Act 129 of 2008 established an energy efficiency and conservation program for Pennsylvania electric distribution utilities in which, every five years, the PA PUC must evaluate the costs, benefits, and impacts of the utilities' EE&C programs. Part of these proceedings includes the review of utility-proposed programs, including proposed evaluation methods and cost-effectiveness.

program would allow the Company to collect data to inform future EV rate design.[217] The Phase IV EV Program does not appear to be included in the Company's Phase V Act 129 EE&C Plan.

Q. HOW DO PPL'S PHASE V AND PHASE IV EV PROGRAMS DIFFER FROM THE PROPOSED EV PROGRAM?

A. First, the Phase V EV Program entails active Company management of charging, as compared to assigning such responsibility to customers in the Proposed EV Program. The Phase IV EV program, meanwhile, differs from both the Phase V EV Program and the Proposed EV Program insofar as it solely incentivizes data sharing rather than behavior shifts.

Second, for the Phase V EV Program, PPL includes much more detail than the Proposed EV Program, including more explicit proposed targets, and implementation, marketing, and risk management parameters.[218]

Third, the broader Phase V and Phase IV EE&C Plans, including their respective EV programs, include annual filing provisions and stakeholder engagement opportunities. The Company did not include either of these provisions in its Proposed EV Program. I offer recommendations above related to an evaluation plan and information sharing that address the second and third differences, at least in part.

Q. ARE THERE OTHER RESIDENTIAL EV PROGRAMS RECENTLY APPROVED BY THE COMMISSION?

A. There are several other electric distribution utilities in Pennsylvania that have residential EV programs. Most recently, on November 7, 2024, the Commission approved Duquesne Light Company's ("DLC's") Managed Home Charging Pilot in

[217] PPL Electric Utilities Corporation Act 129 Phase IV Energy Efficiency & Conservation Plan. Docket No. M-2020-3020824, OPINION AND ORDER, p. 20.

[218] PPL Electric Utilities Corporation Act 129 Phase V Energy Efficiency & Conservation Plan. Docket No. M-2025-3057329, Attachment A: PPL V EE&C Plan, pp. 69-72.

Docket No. R-2024-3046523.[219] Unlike the Proposed EV Program, however, DLC's Pilot includes provisions for DLC to directly notify residential customers to encourage reduced EV charging during peak times, akin to a demand response notification. Notably, DLC's Pilot also includes a detailed evaluation and assessment plan that incorporates DLC's objectives, KPI targets, and the data to be used to evaluate the Pilot.[220]

Q. ARE THERE OTHER SIMILAR EV PROGRAMS ACTIVE IN OTHER STATES?

A. Yes. PPL specifically indicated that it looked at comparable programs and pilots of DLC, LG&E/KU (a sister company of PPL), Rhode Island Energy (a sister company of PPL), National Grid (New York), and BGE.[221] Of note, many device-specific rates and programs exist that reward customers for shifting their usage to avoid peak times. The parameters of these programs, such as the compensation, eligibility criteria, on-peak and off-peak times, and more, vary. I observe, however, that the proposed program is particularly similar to one program not identified by PPL: Connecticut's Baseline Off-Peak program. Connecticut's program rewards customers with up to $120 annually in rebates for charging EVs 80% of the time during off-peak hours.[222]

Q. HOW DOES THE PROPOSED EV PROGRAM DIFFER FROM THE CONNECTICUT BASELINE OFF-PEAK PROGRAM?

A. The programs are very similar in terms of design. However, for the Connecticut program, the participating utilities included specific evaluation approaches that

[219] *Pennsylvania Public Utility Commission, et al. v. Duquesne Light Company*. Docket No. R-2024-3046523, Order.

[220] Id. DLC Direct Testimony of Sarah Olexsak, SO-1, Transportation Electrification Portfolio Evaluation and Assessment Report.

[221] PPL Response to OCA XVI-16.

[222] Connecticut PURA Docket No. 24-08-06, Attachment 5, p. 160. June 14, 2024. https://www.dpuc.state.ct.us/dockcurr.nsf/8e6fc37a54110e3e852576190052b64d/3bdbc883f8dc04ab85258b3f00498da7/$FILE/ATT%205%20CT_EV_Infrastructure_Program_Cycle_I_EMV_Report.pdf.

described how the Off-Peak program data will be used to compare to the utilities' other EV programs and an identified control group.[223] This level of specificity is absent from PPL's proposal. While PPL intends to compare the EV TOU Rebate program with its other proposed EV programs, the Company does describe how it will compare the programs for evaluation purposes, the KPIs or metrics it intends to compare, or its respective approaches to evaluation.

Q. WHAT LESSONS SHOULD THE COMMISSION DRAW FROM OTHER EV PROGRAMS IN PENNSYLVANIA OR OTHER STATES?

A. As apparent from the comparison above, other EV programs are often coupled with detailed evaluation plans and subject to stakeholder feedback. Both of these features are absent from PPL's Proposed EV Program. I recommend changes to address both program evaluation and stakeholder engagement in my discussion of program objectives, above.

G. Conclusions and Recommendations

Q. DOES THE PROPOSED EV PROGRAM HAVE SUFFICIENT INFORMATION FOR YOU TO RECOMMEND APPROVAL?

A. No. Based on my review of the Proposed EV Program, other residential EV programs, and general knowledge of pilot programs, PPL's Proposed EV Program has several important flaws that must be addressed prior to Commission approval. My recommendations are addressed below. Additionally, prior to approval, I agree with OCA Witness Alexander. The Company should produce customer communications and marketing materials for stakeholders to review.

[223] Id., p. 167.

Q. PLEASE RESTATE YOUR FINDINGS AND RECOMMENDATIONS REGARDING THE PROPOSED EV PROGRAM.

A. I offer the following recommendations regarding Program metrics and evaluation that I recommend the Commission require PPL to address prior to Commission approval of the Proposed EV Program:

- The Company must develop a comprehensive evaluation plan with detailed objectives that will be utilized in the evaluation of the Program during the duration of the Program and at the end of its initial term. This evaluation plan should clearly identify all relevant evaluation metrics and KPIs along with their respective targets and the data used to measure each metric or KPI. This full evaluation plan should include milestones tied to distinct start and end dates, preferably ones that align with the Phase V EV Program.

- The comprehensive evaluation plan should also describe how the Company will compare the data derived from the Proposed EV Program with data obtained from Phase V EV Program customers and customers not participating in either program, as well as how the Company intends to collect data from customers not participating in either program.

- At the conclusion of the Program, any decisions regarding Program continuation should be subject to Commission review as part of a standalone regulatory proceeding, base rate case, or in conjunction with the Commission's evaluation of a future Act 129 EE&C Plan. Stakeholders should be afforded an opportunity to participate in the applicable proceeding.

- Data collected by the Company should be shared with external stakeholders both during the course of and at the conclusion of the initial Program period.

I also recommend several changes and/or clarifications to the Program's design:

- The TOU design should be revised to utilize a definition that, at a minimum, includes the entirety of the on-peak period applied to the Generation TOU Rate during the six non-shoulder months.

- The Company should modify the proposed tariff language for the Program to explicitly indicate that the Program is temporary and will be reevaluated prior to its continuation beyond 2030.

- The Company should implement targeted marketing to constrained areas from the onset of the Program. The definition of "constrained area" should only include distribution infrastructure where the marginal contribution of EVs is anticipated to create system overload conditions.

- The Company should limit enrollment in non-constrained areas to 1,000 customers. The definition of "constrained area" should only include distribution infrastructure where the marginal contribution of EVs is anticipated to create system overload conditions.

- The Company should collect customer feedback or satisfaction data, in addition to the data outlined in the Company's response to discovery, on at least an annual basis.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes, it does. However, I reserve the right to update any portion of my testimony as needed if additional relevant information is obtained in the course of this proceeding.

APPENDIX A

Resume of Matthew T. Hoyt

EXETER
ASSOCIATES, INC.
10480 Little Patuxent Parkway, Suite 300
Columbia, Maryland 21044

MATTHEW T. HOYT

Mr. Hoyt is a Vice President and Principal with Exeter Associates, Inc., with over a decade of experience in the energy industry. At Exeter, Mr. Hoyt develops utility service assessments, provides bill and tariff analysis, audits utility programs, and conducts economic and feasibility assessments of renewable energy, retail supply, electrification, and demand response opportunities. Additionally, Mr. Hoyt evaluates utility sector policy and regulation for private, federal, and state clients, as well as supports clients in complex utility service and rate negotiations.

Mr. Hoyt's graduate coursework focused on electricity policy, applied economics, and utility regulation. He wrote two capstone papers: an econometric assessment of community aggregation policy in retail electric markets and a theoretical assessment of the economic theory of regulatory capture.

2016-2018	Economic Analyst

Previous Employment

2015-2016	Market Research Analyst, Customer Data Science AEP Energy Columbus, OH
2011-2014	Senior Analyst and Project Manager TargetPoint Consulting Alexandria, VA

Professional Experience

Mr. Hoyt's work at Exeter is primarily related to competitive retail electricity markets; energy supply acquisition; utility bill and rate analysis; rate design; residential electrification; and policy or program design, implementation, and evaluation. Recent projects that Mr. Hoyt has led include: multiple assessments of resource adequacy constructs in organized wholesale markets for the Consumer Advocates of the PJM States; a comprehensive evaluation of residential time-of-use

rate design and implementation on behalf of the Maine Public Utility Commission staff; a review of energy storage research, development, and deployment strategies on behalf of the National Association of State Energy Officials; a wide-ranging assessment of utility-scale battery energy storage safety, siting, and economic considerations on behalf of the Indiana Office of Energy Development; multiple assessments of energy storage, transmission, solar, electric school bus, nuclear energy, and renewable portfolio standard policies for the state of Maryland; multiple utility management and performance audits on behalf of the Public Utility Commission of Ohio Staff, including evaluations of statutory compliance, economic impacts, budget, and utility rate-setting approach; and comprehensive reviews of default electric service procurement practices on behalf of consumer advocate and state department of energy entities in several New England-area states. In addition to these projects, Mr. Hoyt works with the U.S. Corps of Engineers Commercial Utilities Program, Department of Energy Federal Energy Management Program, and U.S. Air Force Utilities Rate Management Team to support utility service reviews at Army, Department of Energy, and Air Force sites, respectively.

Prior to joining Exeter Associates, Mr. Hoyt worked in a variety of analytical roles managing and analyzing large-scale utility data as well as conducting econometric assessment. As a data scientist at AEP Energy, Mr. Hoyt assessed electricity and gas customer data to address research questions regarding consumer behavior and preferences. At TargetPoint Consulting, Mr. Hoyt supervised stratified surveys, built and maintained large-scale relational databases, and developed predictive models for a variety of corporate clients, including electric utilities and energy-sector trade associations.

I. INTRODUCTION 1

II. SUMMARY OF AND RESPONSE TO EI'S EV PROGRAM PROPOSAL 1

A. PPL's EV Program Proposal 1

B. EI's EV Program Proposal 2

C. Conclusions and Recommendations 7

I. INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Matthew T. Hoyt. I am employed by Exeter Associates, Inc. ("Exeter") as a Senior Analyst and Principal. My business address is 10480 Little Patuxent Parkway, Suite 300, Columbia MD 21044.

Q. ARE YOU THE SAME MATTHEW HOYT WHO PRESENTED DIRECT TESTIMONY IN THIS PROCEEDING ON BEHALF OF THE OFFICE OF CONSUMER ADVOCATE?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?

A. The purpose of my rebuttal testimony is to summarize and respond to certain recommendations related to electric vehicle ("EV") programs put forth by Environmental Intervenors ("EI") witness Ron Nelson in his Direct Testimony.

Q. PLEASE SUMMARIZE YOUR CONCLUSIONS.

A. I continue to endorse the recommendations and findings listed on pages 100-102 of my Corrected Direct Testimony (OCA Statement 5 Corrected). Further, I recommend that the Commission reject EI's proposed EV TOU rate proposal without prejudice.

II. SUMMARY OF AND RESPONSE TO EI'S EV PROGRAM PROPOSAL

A. PPL's Proposed EV Program

Q. WHAT PROGRAM DID PPL ELECTRIC UTILITIES CORPORATION ("PPL" OR "COMPANY") PROPOSE IN THIS PROCEEDING?

A. The Company proposed a temporary EV program that rewards a capped number of Residential customers for charging their EVs during designated off-peak hours ("Proposed EV Program"). The Program is generally limited in scope as, per the

Company's proposal, it only runs through 2030, is capped at 2,000 participants (approximately 3% of eligible customers), and would cost less than $275,000 annually. For additional summary, including discussion of program features, need, and objectives, please see pages 102-120 of my Corrected Direct Testimony.

B. EI's EV Program Proposal

Q. PLEASE SUMMARIZE EI'S FINDINGS AND RECOMMENDATIONS REGARDING EVs.

A. EI witness Nelson recommends that the Commission reject PPL's Proposed EV Program for the following reasons:

- The proposed on and off-peak periods are different than the Company's Time-Of-Use Program – Residential and Small 2 Commercial/Industrial under Generation Supply Charge-1 ("Generation TOU 3 Rate") and could cause customer confusion;[1]
- Rebate programs are more expensive and less effective than price signals;[2]
- PPL does not justify the costs of the Program, and costs may outweigh benefits;[3] and
- Program participants could have no behavior change yet reap financial benefits from the Program.[4]

[1] Direct Testimony of EI Witness Ron Nelson ("Nelson Dir.") at 57:10-15.
[2] Id. at 57:15-17.
[3] Id. at 57:17-21.
[4] Id. at 58:1-2.

Mr. Nelson also recommends that PPL implement a time-varying residential delivery rate option that is marketed to EV customers but open to all customers.[5]

Q. DO YOU AGREE WITH EI'S CONCLUSIONS REGARDING PPL'S PROPOSED EV PROGRAM?

A. In part. I am in agreement with EI witness Nelson's conclusions regarding the time-of-use ("TOU") periods, and that Program participants could see financial benefits without behavior changes. I also partially agree with his conclusion regarding cost justification.

Q. PLEASE DESCRIBE YOUR THOUGHTS ON EI'S CONCERNS REGARDING DIFFERENCES BETWEEN THE PROPOSED EV PROGRAM TOU PERIODS AND THE COMPANY'S EXISTING TOU RATE DEFINITIONS.

A. I agree that the Proposed EV Program's TOU periods differ from the Company's Generation TOU 3 Rate, and that these differences may cause customer confusion. Further, I identify that this mismatch may result in alternative TOU rate and Program incentives counteracting each other's success. See my Corrected Direct Testimony, pages 107-110, for additional discussion. I ultimately recommended that the Company revise its Proposed EV Program TOU design to utilize a definition that includes the entirety of the on-peak period applied to the Generation TOU 3 Rate during the six non-shoulder months. I also proposed specific TOU periods for the Proposed EV Program (at p. 110). I continue to make these recommendations.

[5] Id. at 60:20-21 and 61:1-2.

Q. PLEASE DESCRIBE YOUR ASSESSMENT OF THE POTENTIAL FOR PARTICIPANTS IN THE PROPOSED EV PROGRAM TO RECEIVE FINANCIAL BENEFITS WITHOUT CHANGING THEIR CHARGING PATTERNS.

A. I agree that Program participants could receive financial benefit without positive behavior change if a customer already charges 80% off-peak without the $10 incentive. However, the Company does not currently have information on residential EV customers' charging behaviors and intends to collect that data through this Program.[6] Therefore, it is difficult to determine whether the above outcome (i.e., customers receive financial benefit without position behavior change) is likely to apply to a significant portion of participants. One of the two benefits of the Proposed EV Program is data collection, specifically regarding customers' charging behavior in response to incentives. Therefore, the data collected through the Proposed EV Program, if appropriately evaluated as recommended in my direct testimony, could still provide value to PPL customers even if Program participants receive financial benefit without positive behavior change.

Q. PLEASE EXPLAIN YOUR EVALUATION OF EI'S STATEMENTS REGARDING THE COMPANY'S COST JUSTIFICATION OF THE PROPOSED EV PROGRAM.

A. Regarding the lack of cost justification, the direct testimony of EI witness Nelson states, "the Company has not shown that the benefits of its proposal will outweigh its implementation costs, which increases my concern that this may not be an efficient solution to the problem PPL is trying to solve."[7] I somewhat agree with this statement in that PPL has not quantified the benefits from the Proposed EV Program to justify

[6] PPL Response to EI-PPL-II-9.
[7] Nelson Dir. at 57:19-21.

the costs, as might be conducted in a cost-benefit analysis. However, the two main benefits that I identified from the Company's application—data collection regarding customers' charging behavior responses to incentives, and mitigation of distribution system impacts from EV adoption to defer costly grid updates—both have value if achieved. For this reason, I make recommendations to improve aspects of the Proposed EV Program, as well as the data collection, evaluation plan, and reporting requirements for the Program, prior to Commission approval.

Q. DO YOU FIND ISSUE WITH ANY OF EI'S CONCLUSIONS?

A. Yes. I do not believe EI witness Nelson provided sufficient evidence to support his assertion that rebate programs are less effective than price signals. Further, I find issue with Mr. Nelson's proposal to put into place a TOU delivery rate marketed to EV customers as a substitute for the Proposed EV Program. Specifically, I am concerned that the proposed TOU delivery rate lacks supporting detail and is a significant change to residential rate design.

Q. PLEASE SUMMARIZE EI'S PROPOSED EV TOU RATE AS PART OF THIS PROCEEDING.

A. EI proposes that PPL implement a time-varying residential delivery rate option that is marketed to EV customers but available to all residential customers.[8] The on- and off-peak periods would be aligned with the Company's Generation TOU 3 Rate.[9] The rates for the on-peak and off-peak periods would be based on the base residential distribution rate but adjusted up and down, respectively, by a 2.8 ratio to establish an on-peak rate that is higher than base rates and an off-peak rate that is lower than base rates.[10]

[8] Id. at 60:20-21 and 61:1-2.
[9] Id. at 61:5-7.
[10] Id. at 61:10-13.

Q. DOES EI PROVIDE JUSTIFICATION FOR THE EV TOU RATE COMPONENTS?

A. EI provides justification for components of its proposed EV TOU rate. The proposed TOU periods align with the Generation TOU 3 Rate's TOU period, as an alternative period may be confusing for customers as noted by Mr. Nelson's critique of PPL's Proposed EV Program. Further, EI proposes a 2.8 on-peak to off-peak rate ratio because it is based on a derivation of the relative costs of on-peak and off-peak consumption for residential customers, and it is consistent with Commonwealth Edison Illinois's ratio.[11]

Q. DOES THIS PROPOSAL REPRESENT A SIGNIFICANT CHANGE TO RESIDENTIAL RATES?

A. Yes. Unlike the Company's Proposed EV Program, which is limited in scope, capped in participation, temporary in duration, and explicitly designed to inform future rate design through data collection and evaluation, EI's proposed TOU delivery rate would apply broadly and indefinitely to residential customers.

Q. ARE THERE GAPS IN EI'S PROPOSAL?

A. Yes. Significant changes to residential rate design, such as EI's proposed TOU delivery rate, should be supported by detailed rate design and rate implementation analysis. These analyses are absent from the record to date. For example, EI's proposal does not provide details regarding potential residential delivery TOU rate implementation costs (e.g., technology requirements), individual customer bill impacts, equity considerations, and ongoing evaluation plans. In the absence of this information, approval of EI witness Nelson's proposal would be premature.

[11] Id. at 61:15-19 and respective workpapers.

C. Conclusions and Recommendations

Q. DO YOU HAVE ANY NEW RECOMMENDATIONS NOT INCLUDED IN YOUR DIRECT TESTIMONY?

A. Yes. I recommend that the Commission reject EI's proposed EV TOU rate, without prejudice, for the reasons outlined above. While both the Company's Proposed EV Program and EI's proposed TOU delivery rate require further development, a residential TOU delivery rate would constitute a fundamental and potentially permanent change to residential delivery service rate design. As such, it warrants a more robust evidentiary record, including supporting analysis, than is provided in this proceeding. Accordingly, EI's proposed TOU delivery rate should not be considered by the Commission at this time. My other findings and recommendations remain unchanged.

Q. PLEASE RESTATE YOUR FINDINGS AND RECOMMENDATIONS REGARDING THE PROPOSED EV PROGRAM.

A. I offer the following recommendations regarding Program metrics and evaluation that I recommend the Commission require PPL to address prior to Commission approval of the Proposed EV Program:

- The Company must develop a comprehensive evaluation plan with detailed objectives that will be utilized in the evaluation of the Program during the duration of the Program and at the end of its initial term. This evaluation plan should clearly identify all relevant evaluation metrics and key performance indicators ("KPIs") along with their respective targets and the data used to measure each metric or KPI. This full evaluation plan should include milestones tied to distinct start and end dates, preferably ones that align with the Phase V EV Program.

- The comprehensive evaluation plan should also describe how the Company will compare the data derived from the Proposed EV Program with the data obtained from Phase V EV Program customers and customers not participating in either program, as well as how the Company intends to collect data from customers not participating in either program.

- At the conclusion of the Program, any decisions regarding Program continuation should be subject to Commission review as part of a standalone regulatory proceeding, base rate case, or in conjunction with the Commission's evaluation of a future Act 129 Energy Efficiency and Conservation Plan. Stakeholders should be afforded an opportunity to participate in the applicable proceeding.

- Data collected by the Company should be shared with external stakeholders both during the course of and at the conclusion of the initial Program period.

I also recommend several changes and/or clarifications to the Proposed EV Program's design:

- The TOU design should be revised to utilize a definition that, at a minimum, includes the entirety of the on-peak period applied to the Generation TOU 3 Rate during the six non-shoulder months.

- The Company should modify the proposed tariff language for the Program to explicitly indicate that the Program is temporary and will be reevaluated prior to its continuation beyond 2030.

- The Company should implement targeted marketing to constrained areas from the onset of the Program. The definition of "constrained area" should only include distribution infrastructure where the marginal contribution of EVs is anticipated to create system overload conditions.

- The Company should limit enrollment in non-constrained areas to 1,000 customers. The definition of "constrained area" should only include

distribution infrastructure where the marginal contribution of EVs is anticipated to create system overload conditions.

- The Company should collect customer feedback or satisfaction data, in addition to the data outlined in the Company's response to discovery, on at least an annual basis.

Q. DOES THIS CONCLUDE YOUR REBUTTAL TESTIMONY?

A. Yes, it does. However, I reserve the right to update any portion of my testimony as needed if additional relevant information is obtained in the course of this proceeding.

I. INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Matthew T. Hoyt. I am employed by Exeter Associates, Inc. ("Exeter") as a Senior Analyst and Principal. My business address is 10480 Little Patuxent Parkway, Suite 300, Columbia MD 21044.

Q. ARE YOU THE SAME MATTHEW HOYT WHO PRESENTED DIRECT AND REBUTTAL TESTIMONY IN THIS PROCEEDING ON BEHALF OF THE OFFICE OF CONSUMER ADVOCATE ("OCA")?

A. Yes. I submitted Direct Testimony on behalf of the OCA on December 22, 2025 (OCA Statement 5 Corrected), and Rebuttal Testimony on behalf of the OCA on January 23, 2026 (OCA Statement 5R).

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to respond to the rebuttal testimonies of PPL Electric Utilities Corporation ("PPL" or "Company") Witnesses Bethany Johnson (PPL St. No. 5-R), Joseph Lookup (PPL St. No. 16-R), Nicole Howell (PPL St. No. 17-R), and James Conrad (PPL St. No. 20-R). To the extent I do not specifically address a statement made in the Company's rebuttal testimony filed in this case, it should not constitute my agreement with such testimony.

Q. PLEASE SUMMARIZE YOUR CONCLUSIONS.

A. I continue to endorse the conclusions and recommendations listed on pages 57-60 (addressing large load interconnections), 97-99 (addressing PPL reliability), and 123-125 (addressing PPL's Proposed EV Program) of my Direct Testimony (OCA Statement 5 Corrected). Additionally, for the Commission's consideration, I provide recommended clarifications and improvements to the Company's newly proposed LP-6 Tariff, which the Company proposed in the Rebuttal Testimony of Witness Lookup.

II. SUMMARY OF AND RESPONSE TO PPL'S REBUTTAL ADDRESSING LARGE LOAD INTERCONNECTIONS

Q. DID INTERVENORS PRESENT TESTIMONY ADDRESSING LARGE LOAD AND DATA CENTER ISSUES IN THIS PROCEEDING?

A. Yes. A large number of parties presented testimony on PPL's proposed approach to large load interconnections, including Office of Small Business Advocate ("OBSA") Witness Ewen; Public Utility Commission's ("PUC's") Bureau of Investigation and Enforcement ("I&E") Witnesses Walker and Tarr; Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania ("CAUSE-PA") Witness Havumaki; Energy Justice Advocates ("EJA") Witness Rábago; Environmental Intervenors ("EI") Witness Nelson; and PP&L Industrial Customer Alliance ("PPLICA") Witness LaConte. These are in addition to testimony from myself as well as OCA Witnesses Colton and Wise.

Q. PLEASE SUMMARIZE THE ISSUES RAISED BY OTHER PARTIES AND HOW THEY ALIGN WITH YOUR INITIAL RECOMMENDATIONS.

A. The issues raised, and positions taken, by other parties generally align closely with my initial recommendations in my Direct Testimony, particularly with respect to cost causation, consumer protection, and the need for a fit-for-purpose large load tariff. Multiple witnesses, including Mr. Ewen,[1] Mr. Nelson,[2] and Ms. LaConte,[3] raise concerns that PPL's proposed modifications to tariff LP-5 risk socializing system costs that are primarily or solely caused by large new customers. These parties echo my recommendation that large load customers should bear the full cost of system upgrades they trigger, and that any cost socialization must be subject to objective standards,

[1] Ewen Direct at 15-18.
[2] Nelson Direct at 6-45.
[3] LaConte Direct at 10-15.

robust financial security, and regulatory oversight to avoid cost shifting to existing customers.

There is also broad alignment around the need for a separate or re-designed large load rate class rather than incremental changes to LP-5. Mr. Havumaki,[4] Mr. Rábago,[5] Mr. Ewen,[6] and Ms. LaConte recommend the creation of a new tariff or rate class specifically for very large loads,[7] in some cases with deference to the Commission's model tariff proceeding. This mirrors my conclusion that LP-5 is not a fit-for-purpose rate for addressing the scale, risk profile, and system impacts of emerging large load customers, and that a distinct, cost-based tariff subject to Commission review is necessary to address differentiated service requirements.

Q. WHAT ARE YOUR OBSERVATIONS ABOUT WHAT THE RECORD SHOWS REGARDING LARGE LOAD ISSUES IN THIS CASE?

A. Taken together, the testimony of other parties largely corroborates my findings that PPL's proposal understates the costs and risks associated with large load interconnections and that stronger tariff design, cost responsibility, and oversight are required to protect customers and to uphold core ratemaking principles. Those principles include cost causation, cost-based differentiated service, and the obligation to ensure existing customers are no worse off.[8] The record underlies the significance and relevance of the large load interconnection issues raised in this case.

[4] Havumaki Direct at 3-25.
[5] Rábago Direct at 66-79.
[6] Ewen Direct at 15-18.
[7] LaConte Direct at 10-15.
[8] Hoyt Direct at 6:4-24 and 7:1-9.

Q. PLEASE SUMMARIZE COMMON THEMES IN HOW COMPANY WITNESSES MR. LOOKUP AND MS. JOHNSON RESPOND TO INTERVENOR TESTIMONY IN REBUTTAL.

A. Both witnesses defend the Company's proposed approach to large load interconnections and disagree with many of the recommendations put forward by other parties. One common theme is that "the Company's and the Commission's ability to affect ratemaking changes in this proceeding pertain only to the distribution network."[9] This position underlies an argument that many of the impacts of large loads interconnection are outside the scope of this proceeding.

Another common theme is that, in their respective rebuttal testimonies, both Company witnesses agree with the general point made by many intervenors that affordability is a relevant concern in relation to large load interconnection: "The Company shares concerns about customer affordability,"[10] and "PPL Electric is also mindful of keeping rates affordable for customers"[11] However, both Mr. Lookup and Ms. Johnson segue from this point to another shared theme: that other intervenors' findings regarding the customer impact of large load interconnections are incorrect. Both Company witnesses provide parallel arguments that the impact of large load interconnections on distribution costs is *de minimis* (stating "new large load customers do not have any impact on distribution rates",[12] and "data centers have little to no impact on the Company's distribution system or distribution rates");[13] the impact on Federal Energy Regulatory Commission ("FERC")-regulated transmission costs is

[9] Johnson Rebuttal at 4:14-15; Lookup Rebuttal at 5:19-22 and 6:1-2.
[10] Johnson Rebuttal at 11:18.
[11] Lookup Rebuttal at 5:18.
[12] *Id.* at 5:19-20.
[13] Johnson Rebuttal at 12:1-2.

likely (if not certain) to be positive (i.e., reduced customer costs);[14] and the impact on generation is significant but outside the scope of this proceeding.[15]

A. Scope of the Case

Q. HOW DO MR. LOOKUP AND MS. JOHNSON CHARACTERIZE THE SCOPE OF THIS PROCEEDING IN THEIR RESPECTIVE REBUTTAL TESTIMONIES REGARDING LARGE LOAD ISSUES?

A. PPL frames many of the cost, planning, and risk issues associated with large load interconnections as matters governed at the federal level and, therefore, outside the scope of this proceeding. In making this argument, PPL attempts to draw a clear distinction between transmission and generation matters regulated by the FERC and distribution matters regulated by the Commission. Ms. Johnson describes "the important distinction between transmission rates regulated by the [FERC] and distribution rates regulated by the Commission."[16] She also states that "both the Company's and the Commission's ability to affect ratemaking changes in this proceeding pertain [sic] only to the distribution network."[17]

Mr. Lookup applies a similar framing to issues of resource adequacy. He states that he "disagree[s] that a PPL Electric distribution base rate case is the appropriate forum to address generation and capacity resource adequacy concerns," and he adds that "the Company is without authority to turn customers away because of a lack of generation capacity."[18] He concludes that "[t]he appropriate venues to address these concerns are at FERC, and with the Pennsylvania General Assembly…"[19]

[14] Johnson Rebuttal at 12:7-22 and 13:1-13; Lookup Rebuttal at 6:11-22 and 7:1-4.
[15] Johnson Rebuttal at 13:14-19 and 14:1-14; Lookup Rebuttal at 7:13-19.
[16] Johnson Rebuttal at 2:5-7.
[17] *Id.* at 4:14-17.
[18] Lookup Rebuttal at 20:7-9.
[19] *Id.* at 20:9-11.

Q. HOW DO YOU RESPOND TO PPL'S ASSERTION THAT IT LACKS MEANINGFUL ABILITY IN THIS PROCEEDING TO AFFECT THE OUTCOMES ASSOCIATED WITH LARGE LOAD INTERCONNECTIONS?

A. I agree with distinguishing PPL Electric's responsibilities as it relates to transmission, distribution, generation, and retail service. However, in presenting the distinct role of PPL Electric relative to other PPL Corporation affiliates, it appears that the Company is disclaiming responsibility for the well-understood interrelationships between these categories of service. It is incorrect to suggest that because a particular service segment is regulated in another forum, it functions wholly independently or cannot be influenced by actions undertaken to affect another service segment.

Large load interconnections clearly illustrate this point. Recent growth in demand for additional generation capacity and transmission infrastructure is driven by the introduction of new large load customers. Except in limited circumstances where a customer takes direct access wholesale service, these new loads interconnect to the broader bulk power system ***through*** electric distribution companies ("EDCs"). EDCs in Pennsylvania operate pursuant to the authority of the Pennsylvania PUC, and pursuant to, in relevant part, tariffs approved by the PUC for distribution and retail service. PPL's tariff provisions addressing interconnection, line extensions, and service to large customers therefore have a direct and foreseeable connection to the costs and reliability risks that manifest on the broader electric system as a result of the Company serving new large loads. To disclaim this direct relationship is to disregard the practical operation of the electric system.

PPL also argues that it lacks the ability to materially influence the above relationship because the Company "must extend service to customers in its service

territory, subject to the line extension provisions of its tariff, due to its obligations as a regulated monopoly operating in a certified service territory."[20] This argument again understates the Company's agency and responsibilities. While PPL does have a duty to provide service, that duty is expressly conditioned on compliance with Commission-approved tariff terms and service requirements as provided under statute, regulation, and relevant case law. Those requirements include, among other things, customer payment of applicable charges, satisfaction of line extension and interconnection conditions, adherence to construction and operational standards, and acceptance of service limitations necessary to maintain system reliability.

Q. IS IT POSSIBLE TO INCORPORATE ADDITIONAL CUSTOMER PROTECTION MEASURES INTO PPL'S TARIFF WITHOUT EXCEEDING THE SCOPE OF THE COMMISSION'S JURISDICTION?

A. Yes. PPL's own rebuttal testimony demonstrates the Company's willingness to propose specific terms of service applicable to large load customers. Although transmission planning and wholesale energy market rules are regulated at the federal level, the Commission has clear authority and tools to mitigate the potential impacts of large load interconnections on existing customers and system reliability through retail tariffs and service conditions. Although I am not an attorney, I am advised by the OCA's attorneys of the same, and this understanding is consistent with my lay understanding of the Commission's oversight of public utilities and its authority under the Public Utility Code, as well as the statutory obligation to ensure public utilities provide safe, reasonable, and adequate service.[21]

[20] Johnson Rebuttal at 14, 6-9.
[21] See, e.g., 66 Pa. C.S. §§ 501, 508, 1501, 1502, 1505, and 2805(a).

Q. IN SUMMARY, WHAT IS YOUR OPINION ABOUT THE SCOPE OF THIS PROCEEDING REGARDING LARGE LOAD INTERCONNECTIONS?

A. The major issue within the scope of this proceeding is the protection of PPL customers from the costs and risks arising from the interconnection and service of new large loads, principally artificial intelligence ("AI") data centers. AI data centers are the predominant driver of new large load interconnection requests and differ materially from legacy large load customers in scale, pace of development, and operational characteristics. These facilities and campuses interconnect to the regional bulk power grid through PPL's distribution system and receive utility service subject to Commission-approved retail tariffs and service conditions.

As customers, AI data centers present unique risks to reliable electric utility service due to their large peak demands, development uncertainty, and ability to materially influence transmission and generation planning outcomes. Those impacts, while reflected upstream in transmission and generation systems, are initiated through distribution-level interconnection and retail service decisions that fall within the Commission's jurisdiction. At the same time, AI data centers will increase costs for bulk grid services and present unique cost-shifting risks to existing customers if interconnection and service proceed without adequate customer protection mechanisms. I document these factors at length in my Direct Testimony.

These considerations must be addressed to the maximum extent allowable within the PUC's regulatory jurisdiction for the protection of all other customers. This includes through enforceable tariff provisions governing cost responsibility, load forecasting transparency, and operational readiness and curtailment obligations. These topics are addressed further in the ensuing discussion as they relate to PPL's rebuttal.

B. Distribution Rate Impacts

Q. MR. LOOKUP ASSERTS THAT INTERCONNECTING NEW LARGE LOAD CUSTOMERS HAS ALMOST NO IMPACT ON DISTRIBUTION RATES.[22] HOW DO YOU RESPOND?

A. While I agree that these customers have almost no impact on distribution rates, I believe it is important to explain the reason, because this outcome is not simply a truism but rather a result of retail tariff design and electrical system configuration. PPL's distribution tariff permits the interconnection of the large load customers to PPL's distribution system so that the customer's usage can be metered. PPL installs, operates, and maintains the meter and applies a customer charge related thereto. The electrical configuration of the distribution interconnection involves a near immediate tie into PPL's high-voltage transmission lines.

However, there is still a distribution-level interconnection. The distribution facilities involved with that interconnection include all equipment necessary to transform or step-down the energy from a high-voltage transmission line down to a voltage suitable for end-use consumption. PPL's tariff requires the customer to furnish and maintain all equipment necessary to transform the energy from the high-voltage line. This has the same effect as requiring the customer to issue a Contribution in Aid of Construction ("CIAC") to cover the cost of the interconnection facilities. Due to PPL's structuring of the electrical configuration of the interconnection, with the immediate tie into PPL's transmission line, distribution system upgrades can be avoided.

As for other distribution-related costs that may be impacted by large load customers, I refer to OCA witness Colton's Surrebuttal Testimony.

[22] Lookup Rebuttal at 5:19-20; Johnson Rebuttal at 12:1-2.

C. Transmission Impacts

Q. WHAT ASSERTIONS DOES PPL MAKE IN REBUTTAL REGARDING THE IMPACT OF LARGE LOAD INTERCONNECTIONS ON TRANSMISSION COSTS?

A. The Company does not dispute that large load interconnections increase transmission system usage and the overall transmission system revenue requirement.[23] However, as noted above, both Ms. Johnson and Mr. Lookup make similar claims asserting that large load interconnections will reduce transmission costs for PPL consumers. These claims also ***ascribe certainty*** to this outcome. Specifically, Mr. Lookup states that adding large load customers is "extremely likely" to create "a downward pressure on transmission rates," because PPL Electric's transmission costs "are allocated to customers based on their contribution to the Company's system peak."[24] As illustration, he resurfaces an example first provided in response to discovery in which a 1-GW load addition would be allocated responsibility for approximately 12% of the transmission revenue requirement, causing lower average rates for other customers.[25] Ms. Johnson builds on this example and describes the outcome which she expects in more detail:

> PPL Electric's analysis, as shown in PPL Electric Exhibit JL-1R, has shown that approximately $100 million of transmission capital investment (spread over 40 years) for a 1-GW data center, results in approximately $12 million incremental annual revenue requirement. PPL Electric's (as the TO) Network Service Rate at the time of the analysis had a starting point of $797,094,549 revenue requirement divided by a single coincident peak of 7,459.6 MW equaling a rate of $106,855/MW/Yr. If you add the $11,799,855 million/year incremental revenue requirement, you now have $808,894,404 divided by

[23] Johnson Rebuttal at 12:7-8.
[24] *Id.* at 6:14-17.
[25] *Id.* at 6:15-21.

8,459.6 MW, which equals a rate $95,619.[26]

Ms. Johnson's conclusion is that "transmission costs will be reduced by data centers."[27] The complete analysis relied upon by Ms. Johnson and Mr. Lookup is contained in Exhibit JR-1R, titled "Data Center – TSC Analysis Talking Points," as originally prepared for a Q3 2024 earnings call.

Q. WHAT ASSUMPTIONS ARE MADE IN PRODUCING THE ABOVE ESTIMATES?

A. The assumptions driving the above estimates are ***highly*** simplified, speculative, and unsubstantiated. The most consequential assumption is the premise that "all load & cost scenarios are instantaneous (not phased in over time)."[28] This assumption implies a one-for-one correspondence of incremental transmission costs and incremental load growth. This precludes all load ramping, which is standard behavior for these large load interconnections. Another simplification is the presumed 100:1 ratio of costs to load in kilowatts. In response to discovery, PPL confirms that $100 million per 1 GW is an "assumption" and that "actual upgrade costs, and the CIAC/socialized split, are highly dependent on the specifics of the customer's interconnection request."[29]

Going further, both the costs and load components of PPL's estimate rely on hypothetical outcomes. As explained in my Direct Testimony, there are multiple, well-documented cost-shifting risks associated with the quantity of load that materializes from a large load interconnection request.[30] This includes the risk that:

1. Load may not materialize at all;
2. Load may ramp more slowly or reach lower levels than projected; and

[26] *Id.* at 12:15-22 and 12:1-7.
[27] *Id.* at 14:21.

[30] Hoyt Direct at 5-60.

3. Load may materialize ***but avoid system peaks through load-shifting strategies targeted at avoiding costs.***

The last item in particular calls into question Ms. Johnson's and Mr. Lookup's respective assertion that large load customers are "anticipated to run 24x7 and therefore would impact that peak,"[31] and that it is "safe to assume that adding a 1 GW large load customer will increase the system peak to 8.5 GW because the new large load customers are expected to have stable continuous operations."[32] A similar assumption cannot be made about other large load customers, i.e., industrial users, who regularly engage in cost avoidance strategies that rely on shifting or reducing load during limited hours, including the single network service peak. The same cost-shifting risks are not limited to traditional industrial customers and are, in fact, especially salient for AI data center loads which comprise the bulk of new large load additions.[33]

It is widely recognized that AI data centers can shift their operations between data center facilities and campuses, all of which may not be located at the same interconnection point.[34] Additionally, data centers usually develop substantial backup generation systems that may be available to avoid peaks.[35] The ability to shift operations between data centers or temporarily offset peak requirements through on-site generation means that these customers have the opportunity and means to avoid system peaks within PPL's zone. By avoiding system peaks within the zone, under a policy favoring socialized transmission costs, these customers can shift all or a major portion of the cost burden of the transmission upgrades caused by their interconnection, i.e., the upgrades that would not have been needed but for the AI data center's

[31] Johnson Rebuttal at 12:14.
[32] Lookup Rebuttal at 6:17-19.
[33] Hoyt Direct at 40-42.
[34] See, for example, discussion in the context of reducing carbon emissions: https://www.electricitymaps.com/technology/google-data-centers.
[35] Lawrence Berkeley National Laboratory & Brattle Group (2025). "Electricity Rate Designs for Large Loads: Evolving Practices and Opportunities." https://eta-publications.lbl.gov/sites/default/files/2025-01/electricity_rate_designs_for_large_loads_evolving_practices_and_opportunities_final.pdf.

interconnection, to all other consumers paying PPL transmission rates. Furthermore, due to the unique characteristics of AI data center load, the customer may experience unintentional load drops during peak periods, which may affect the appropriate assignment of cost responsibility despite the lack of intentional behavior on the AI data center's part.

Besides demand uncertainty, there are also reasons to be concerned that the transmission revenue requirement will increase more than PPL might suggest. Transmission infrastructure costs—and therefore transmission revenue requirements—are at risk of rising across transmission owners due to the significant increase in demand for transmission equipment driven by new large load interconnections, particularly data centers. Consistent with basic supply and demand principles, sharply rising demand combined with constrained supply has increased costs. These constraints persist due to ongoing supply chain challenges and the long lead times required to expand manufacturing capacity for critical transmission equipment. Morningstar DBRS has highlighted this risk, noting that "[c]apital plans anchored in historical unit costs may increasingly underestimate future investment needs, raising the risk of regulatory friction as actual project costs diverge from legacy assumptions."[36]

Finally, there is also a clear mismatch between short customer investment horizons and long-lived transmission assets. PPL's analysis examines just one year while transmission costs apply over 40 years. Per-unit costs would be higher if the load exits the system after a period of time. This last risk is particularly consequential because, as discussed in my Direct Testimony, PJM's planning process is "forecast-driven." Higher expected load can "trigger or accelerate transmission upgrades through the Regional Transmission Expansion Plan ("RTEP") process," and once approved,

[36] MORNINGSTAR DBRS: https://dbrs.morningstar.com/research/473377.

those costs are "largely fixed once committed."[37] Transmission costs, therefore, grow regardless of whether the anticipated load ultimately appears or remains in service.

Taken together, the above confirms that the Company's claimed transmission benefit relies on broad illustrative and speculative assumptions, ***with material elements left dependent on project- and customer-specific facts that PPL has not substantiated***.

Q. CAN YOU PROVIDE AN EXAMPLE SHOWING HOW PPL'S ASSUMPTIONS MATERIALLY AFFECT THE RESULTS?

A. Yes. When the level of costs and the timing of load change, so does the apparent customer impact. For example, consider a scenario in which the hypothetical increase in annual revenue requirement is double PPL's hypothetical level (i.e., $23.6 million instead of $11.8 million), while the incremental load contribution is only 10 percent of the assumed 1-GW peak due to customer ramping and cost-avoidance strategies (i.e., 100 MW instead of 1,000 GW, altering the presumed network service to 7,559.6 instead of 8,459.6). Under these conditions, the resulting average rate is $108,563.19 per MW-year—an increase relative to the status quo.[38]

Q. DO YOU BELIEVE THE TRANSMISSION BENEFITS DESCRIBED BY THE COMPANY ARE CERTAIN, AS SUGGESTED BY MR. LOOKUP AND MS. JOHNSON?

A. Unequivocally, no. The simple example I provide above is an illustration of the lack of certainty. I also find the language used by both Mr. Lookup and Ms. Johnson to be highly misleading. To suggest extreme likelihood conveys a degree of confidence

[37] Hoyt Direct at 28:7-12.

[38] This analysis adopts the same assumptions as described in Ms. Johnson's Rebuttal aside from the change in peak load and change in revenue requirement. Following the same method quoted above: PPL Electric's Network Service Rate at the time of the Company's analysis had a starting point of $797,094,549 revenue requirement divided by a single coincident peak of 7,459.6 MW, equaling a rate of $106,855/MW/year. By adding the $23,599,710 million/year incremental revenue requirement and 1 GW of load operating at partial capacity, the total is $820,694,259, divided by 7,559.6 MW, which equals a rate $108,563.19 per MW-year.

usually only attributed to conclusions supported by direct, incontrovertible evidence. Here, the claims rest entirely on a hypothetical scenario involving customers unlike any previously served by PPL, both in scale and in risk profile. Additionally, if the benefit was as incontrovertible as suggested, other utilities (e.g., PECO) would not feel the need to enter into Transmission Service Agreements with new large loads ***assuring contributions toward the transmission revenue requirement***.

Q. WHAT ACTION CAN BE TAKEN, GIVEN THE ABOVE CONSIDERATIONS?

A. As discussed further below, a range of terms and conditions can be incorporated into a large load tariff to mitigate these risks and ensure neutral outcomes for existing customers. I address further below the Company's proposed minimum load guarantee and standby charges below as they relate to transmission impacts.

D. Load Forecasts

Q. HOW DOES PPL RESPOND TO YOUR CONCERN THAT THE COMPANY'S LOAD FORECASTS RESULT IN "UNNECESSARY CAPACITY PROCUREMENT AND TRANSMISSION INVESTMENT"?

A. In my Direct Testimony, I explain that the quality of load forecasts has a material impact on the quantity of investment in both transmission and capacity infrastructure, with "overstated or speculative" load forecasts causing inflated costs.[39] EI Witness Mr. Nelson makes similar arguments in his Direct Testimony.[40] In rebuttal, Mr. Lookup acknowledges my and Mr. Nelson's concern about overstatement risk. He also, however, claims an equal risk of underestimating load growth and states that, if load materializes without sufficient advance signals for new generation, "the price shock for

[39] *Id.* at 10-19.
[40] Nelson Direct at 39-45.

capacity will likely be similar to an overestimate."[41] Mr. Lookup does not directly address the corollary for overstated transmission costs.

Mr. Lookup also describes the Company's commitment to transparency: "The Company endeavors to be transparent with its load forecasts so that those responsible for ensuring resource adequacy have information in time to take appropriate action."[42] To this end, Mr. Lookup indicates that PPL "is willing to share [Electric Service Agreements] ESAs and load growth forecasts with its regulators with proper confidentiality protections in place."[43] This includes providing "load forecast information […] broken down by new load under an ESA, under an [Letter of Authorization] LOA, and load that has made inquiries."[44] Provision of this information is also required by law following adoption of the Load Forecast Accountability Act, which requires Pennsylvania EDCs to submit load forecast data and supporting assumptions to the Commission and subject those forecasts to Commission review and validation.[45]

Q. DOES PPL'S RESPONSE ADEQUATELY ADDRESS THE ISSUES WITH LOAD FORECASTS THAT YOU IDENTIFY?

A. No. Although understatement may pose challenges as Mr. Lookup supposes, the evidence presented in my Direct Testimony clearly indicates that overstatement is a known problem in the face of large load interconnection requests.[46] Further, this problem is particularly acute for PPL, as evidenced by the magnitude of load forecast reductions applied to PPL's load forecast by PJM as part of the 2026 load forecast

[41] Lookup Rebuttal at 22:15-20.
[42] *Id.* at 22:12-13.
[43] *Id.* at 23:11-12.
[44] *Id.* at 23:20-21.
[45] Originally proposed as House Bill 1924, subsequently incorporated into the state budget via HB 416, and enacted into statute as Act No. 45 of 2025. For additional information, see: https://kleinmanenergy.upenn.edu/commentary/blog/new-pennsylvania-law-aims-to-protect-ratepayers-from-speculative-data-center-demand/.
[46] Hoyt Direct at 24-29.

process. Mr. Lookup does not address this observation other than to indicate that "I do not know why PJM reduced PPL Electric's load forecasts or if it was advisable."[47]

Q. ARE THE PROPOSED IMPROVEMENTS TO INFORMATION SHARING SUFFICIENT TO ADDRESS YOUR CONCERNS?

A. In part. I appreciate the Company's commitment to transparency and willingness to share information, with sufficient protections in place. However, implementation details are relevant to a successful outcome. The items listed above represent only a first step, and confidentiality concerns will continue to be a barrier to stakeholder review without clear Commission direction. I continue to recommend that the Commission require PPL to provide "all information" used in deriving its load forecasts and provide stakeholders, including statutory advocates, with an opportunity to scrutinize and provide feedback. I also recommend that the Commission apply its authority beyond the minimum stipulations of the Load Forecast Accountability Act and require PPL to provide PJM the specific pieces of information I list in my Direct Testimony for each expected large load:

- All pertinent information about the stage of development;
- Project development status, including whether the project has executed relevant service agreements, demonstrated site control, met permitting milestones, or other objective indicators of readiness;
- Disclosure regarding duplicative interconnection requests, including information collected by PPL from customer applications identifying whether the customer has made other large load interconnection requests within or outside of PJM; the number of such duplicative sites; and the associated megawatts. Any inclusion of duplicative requests should be supported by a clear justification explaining why such loads are reasonably expected to materialize;

[47] Lookup Rebuttal at 23:6.

- Expected ramping schedules, including the anticipated in-service date, interim load levels, and full build-out timing, to avoid overstating near-term load impacts;

- Detailed information regarding customer commitments, including deposits, construction obligations, or other sureties, together with an explanation of how those commitments meaningfully reduce attrition risk; and

- Confirmation that customer non-disclosure agreements permit full information sharing with PJM, and that all relevant large load information has in fact been shared.

As noted in my Direct Testimony, the above list is not exhaustive. All of the above recommendations are consistent with the investigatory and oversight duties vested in the PUC following the Load Forecast Accountability Act, as well as the affirmative regulatory authority stemming from the law.

E. Reliability and Load Shed

Q. HOW DOES PPL RESPOND TO RELIABILITY CONCERNS RAISED IN YOUR DIRECT TESTIMONY?

A. In my Direct Testimony, I explain that rapid concentration of large loads can stress the transmission system and create localized reliability concerns (e.g., thermal overloads, voltage deficiencies, and higher contingency risk). I also state that either inadequate generation supply or insufficient transmission deliverability can reduce reliability, and that these issues can increase the risk of manual load shed in response to PJM-initiated brownouts or blackouts.[48]

In his Rebuttal Testimony, Mr. Lookup states that he does not believe a transmission system reliability problem exists because the Company evaluates each interconnection application to ensure safe and reliable interconnection.[49] He therefore

[48] Hoyt Direct at 44-50.
[49] Lookup Rebuttal at 19:21-22 and 20:1.

characterizes the primary concern as relating to whether there will be enough generation capacity to serve the new load. Although Mr. Lookup considers that generation capacity concerns may be valid, he does not view a distribution base rate case as the proper forum to address such issues, and he asserts the Company lacks authority to turn customers away based on generation capacity.[50]

Q. DOES MR. LOOKUP ADEQUATELY ADDRESS YOUR CONCERNS?

A. No. As discussed above, I disagree with Mr. Lookup's assertions regarding both the scope of the Company's input and the relevance of this proceeding to broader reliability risks. I also disagree with the implication that initial transmission evaluations provide durable assurance of system reliability. Rapidly changing load conditions, particularly at the scale contemplated here, undermine the assumption that aggregate load additions will not eventually create network risks. This risk may not be apparent when load additions are initially evaluated and approved in isolation.

Ultimately, Mr. Lookup's response does not address the underlying risk management point in my Direct Testimony: that the scale and timing of large load interconnections can create customer-facing reliability exposure if interconnection proceeds without a framework that accounts for deliverability and resource adequacy constraints. Consequently, I continue to recommend that the Commission condition whether PPL may interconnect or commence service to new large load customers on a positive Commission finding that the proposed load can be served reliably from both a transmission and resource adequacy perspective.

[50] *Id.* at 20:7-9.

Q. HOW DOES PPL RESPOND TO YOUR RECOMMENDATIONS FOR NEW INTERRUPTION / CURTAILMENT OBLIGATIONS APPLICABLE TO LARGE LOAD CUSTOMERS?

A. Mr. Lookup rejects a mandatory requirement that large load customers take interruptible service. In doing so, he cites "the Company's obligation to provide non-discriminatory service" and disagrees that the Company has the authority "to single out a type of customer based on their end use of the service and treat them differently."[51] Instead, he states PPL is willing to offer a voluntary interruptible option that would "allow the Company to curtail certain customers during times of system stress."[52]

Q. WHAT IS YOUR RESPONSE?

A. Large load customers are seeking and are expected to seek firm transmission service, necessitating the build-out of the bulk electric system and the addition of new generation supply, all of which takes years to complete in construction. However, if large loads are not prevented from interconnecting and using electricity until adequate generation and transmission capacity exists to meet their demand, their individual and collective interconnections to the grid can have reliability impacts. Emergency load-shedding is implemented by the EDC, not the transmission owner. That means the EDC controls the curtailment of end-use customers.

I disagree with Mr. Lookup's suggestion that targeted curtailment requirements are unreasonable. Differentiated service obligations based on load size, operational characteristics, and system risk are a routine and well-accepted feature of utility regulation and do not constitute undue discrimination. For example, interruptible distribution rates have long been a feature of natural gas service, with large loads expected to disconnect from the system to preserve service to residential customers,

[51] *Id.* at 21:17-18.
[52] *Id.* at 21:18-20.

small business customers, and emergency services and infrastructure. Large load electric customers, like large gas customers, impose materially different reliability risks than typical retail customers, particularly during system emergencies, due to their size, concentration, and load profiles. Treating such customers differently for purposes of emergency curtailment, which is implemented at the distribution level, reflects those objective differences and is directly related to legitimate reliability objectives.

Moreover, curtailment prioritization during emergency conditions is inherently non-uniform, as system operators must shed load in a manner that preserves overall system stability and minimizes harm to the broader customer base. Requiring large load customers to meet specific curtailment and operational readiness obligations is therefore a reasonable, risk-based condition of service. Such requirements would be applied uniformly to all customers meeting defined large load criteria and would be consistent with other differentiated service offerings approved by the Commission.

Q. DOES PPL'S PROPOSED VOLUNTARY CURTAILMENT OPTION ADDRESS YOUR RECOMMENDATIONS REGARDING LOAD SHED?

A. No. PPL's proposal does not resolve the concern raised in my Direct Testimony because the Company does not establish an enforceable approach to prioritize curtailment of large loads ahead of other customers during manual load-shed events. A voluntary offering is wholly insufficient given the significant reliability risk imposed by these customers. I continue to recommend, to preserve service reliability for all other consumers, enforceable curtailment or interruption obligations as a condition of interconnection, prioritization of large load curtailment prior to broader firm load shed, physical and operational readiness requirements that would allow targeted curtailment, and alignment of tariff provisions with emergency procedures.

Q. HAVE RECENT EVENTS ILLUSTRATED THE IMPORTANCE OF THESE PROVISIONS?

A. Yes. During Winter Storm Fern, PJM reached out to data centers on its system as a potential source of emergency load reduction.[53] The fact that PJM sought such reductions underscores the importance of ensuring that large loads, at a minimum, establish the operational readiness necessary to support targeted curtailment during system emergencies. Failure to require these measures, including separation of critical loads, appropriate telemetry and communications capabilities, and connection to isolated feeders, exposes the broader grid to increased reliability risk.

F. Large Load Tariff

Q. HAS THE COMPANY REVIEWED THE COMMISSION'S MODEL TARIFF AND LARGE LOAD PROCEEDING?

A. Yes, Mr. Lookup states that he has "reviewed and considered it in preparing the Company's comments submitted in that docket." He also states that his rebuttal "will address many of the topics raised in the model tariff now that the Company has the benefit of having reviewed it."

Q. HOW DOES THE COMPANY RESPOND TO INTERVENOR RECOMMENDATIONS REGARDING THE CREATION OF A SEPARATE LARGE LOAD RATE CLASS?

A. Despite disputing the need for a separate rate class, Mr. Lookup describes the Company's willingness ("not opposed") to create a separate tariff/class structure for

[53] Howland, E. (Jan. 30, 2026). "PJM prepares to call on data center, large load backup generation to avoid blackouts." *Utility Dive*. https://www.utilitydive.com/news/pjm-interconnection-data-center-large-load-backup-generation/810950/.

large load customers, referred to as LP-6, and incorporates into the proposal revised customer commitments.[54]

Q. WHAT CONCERNS DO YOU HAVE REGARDING THE MANNER BY WHICH PPL PROPOSES THE LP-6 RATE CLASS?

A. I have several concerns. First, a base rate case with strict procedural schedules is not well suited to support the development of a novel, forward-looking rate tariff intended to govern unprecedented levels of projected large load growth. The existence of these service requirements raises complex and evolving questions related to transmission and capacity planning, load forecasting uncertainty, stranded asset exposure, and the interaction between state and federal jurisdiction. These issues are better addressed in a dedicated proceeding, as the Commission has already recognized through its establishment of Docket No. M-2025-3054271.

Second, even if the Commission considers that a base rate case could serve as an appropriate forum, PPL's LP-6 proposal was not presented in its initial filing. Instead, it was introduced for the first time in rebuttal. Introducing a new rate class at this late stage constrains the ability of parties to conduct appropriate discovery, meaningfully evaluate the proposal, and develop responsive evidence. This procedural consideration is particularly problematic given that LP-6 is not a minor refinement of an existing rate, but a new class intended to address a policy-driven category of customers with distinct system impacts.

Third, the LP-6 proposal lacks many of the critical details necessary for informed Commission review. As presented, the proposal does not address the operational conditions of service, requirements related to ramping and contract initiation, gating criteria affecting service provision, detail regarding financial security

[54] Lookup Rebuttal at 29:3-8.

and collateral requirements, termination provisions, and more. Without these details, stakeholders are left to evaluate the proposal largely on the basis of conceptual assertions rather than concrete tariff language and supporting analysis.

Finally, PPL's rebuttal testimony frames LP-6 primarily as a mechanism to allocate a portion of universal service costs to large load customers. That narrow framing understates the broader policy implications of creating a new rate class for data centers and other large loads. Once established, LP-6 would serve as the basis for how these customers are treated across multiple dimensions of electricity service, including rate design and cost allocation in future base rate proceedings, interconnection and line-extension standards, and financial security and default remedies.

Q. HOW DOES A SEPARATE PROCEEDING BETTER ADDRESS THESE ISSUES?

A. A separate proceeding would allow the Commission to fully consider large load and data center impacts with appropriate notice, stakeholder participation, and evidentiary development. Such a forum would support evaluation of alternative approaches, clarification of jurisdictional boundaries, and development of consistent principles applicable beyond a single utility or case. The Commission's existing proceeding under Docket No. M-2025-3054271 serves as a suitable forum for such considerations.

Q. IF THE COMMISSION ADDRESSES A LARGE LOAD TARIFF IN THIS PROCEEDING, WHAT DO YOU RECOMMEND?

A. I continue to recommend that the Commission decline to resolve statewide large load policy issues solely through this base rate case or through a tariff proposal introduced in rebuttal. However, should the Commission wish to resolve PPL's large load tariff in this proceeding, I recommend that it require PPL to conform LP-6 to address all major

sections on the model tariff. I also recommend that the Commission adopt a series of specific policies for each of the model tariff sections, addressed below.

Q. HOW DOES PPL'S REVISED LARGE LOAD FRAMEWORK (LP-6) COMPARE WITH THE COMMISSION'S MODEL TARIFF, AND WHAT GAPS REMAIN?

A. Building on a similar table in my Direct Testimony, Table 1 summarizes and compares the Commission's proposed model tariff, PPL's initially proposed LP-5 tariff, PPL's initially proposed large load ESA terms, PPL's newly proposed LP-6 tariff, the OCA's previously provided comments regarding the model tariff, and my own recommendations for this proceeding. As shown in this table, the Commission's model tariff is built around MW-based eligibility (50 MW individual / 100 MW aggregate) and includes defined customer protection terms, particularly on contract duration and exit provisions, minimum billing demand, cost responsibility/CIAC and collateral, and study/curtailment provisions.[55] By contrast, PPL's existing framework for large loads starts from a voltage screen and relies on ESA terms to implement minimum load guarantees, credit support, and termination provisions.[56] PPL's proposed LP-6 moves closer to the model tariff by adopting a 100-MW threshold and adding a longer minimum term and minimum load construct. However, as shown in Table 1, several model tariff protections remain either unspecified or unaddressed in the initial LP-6 tariff language.

[55] PUC Model Tariff, pp. 8032, 8040-8043.
[56] ESA, pp. 1-3, 8, 14.

Table 1. Comparison of Key Characteristics of PA PUC's Model Tariff, PPL's Proposed LP-5 Tariff, and PPL's Current Large Load ESA

	PUC Model Tariff[1]	PPL LP-5 Tariff[2]	PPL Large load ESA[3]	PPL LP-6 Tariff[4]	OCA Comments	Hoyt Recommendation
Eligibility	Customers at or over 50 MW individually or 100 MW in aggregate (p. 8040)	Based on service voltage >69 kV, with the customer furnishing and maintaining all equipment necessary to transform the energy from the line voltage	Based on service voltage >69 kV (p. 1)	Customers with peak demands of 100 MW and above based on service voltage >69 kV,[5] with the customer furnishing and maintaining all equipment necessary to transform the energy from the line voltage	Customers with peak demands of 25 MW. (p. 10) Peak demand threshold includes aggregated facilities (p. 12)	Peak demand in excess of 20 MW individually or 50 MW in aggregate based on service voltage >69 kV, with the customer furnishing and maintaining all equipment necessary to transform the energy from the line voltage.
Service Term and Load Ramping	5-year initial term, 3-year notice for termination or contract capacity modification (p. 8041) Load-ramped period of no more than five years Contract begins after load ramp	1-year service minimum for tariff in general, 5-year service minimum for line/service extensions, no termination or modification requirements	5-year initial term, 30 days' notice for termination after initial term (p. 2)	10-year minimum term	No less than 10 years following the load ramp period. If EDC signs contract with large loads for <20 years, the large load should be required to provide explanation of how this won't result in stranded costs (p. 21) 4-year load ramping schedule with contract term that is separate and begins after (pp. 31-32)	No less than 10 years following completion of load ramping, with load ramp schedules capped at 4-5 years. Contract obligations commence only after the ramp is complete.
Minimum Monthly Charges	Minimum billing demand: greater of 80% of contract capacity or 80% of the highest previously established monthly billing demand from the past 11 months (p. 8041)	Customer pays applicable rates based on greater of actual peak demand values or 80% of load ramp scheduled load until revenue guarantee is satisfied	Transmission service charge for the greater of the actual amount supplied during the month or the Minimum Contract Capacity (Schedule A of ESA) (p. 2)	Minimum load guarantee of 80% for first 5 years and 50% for next 5 years of initial term	Minimum demand charge of 90% of the customer's size (p. 31)	Minimum demand of at least 90% of contracted capacity for full contract term.

	PUC Model Tariff[1]	PPL LP-5 Tariff[2]	PPL Large load ESA[3]	PPL LP-6 Tariff[4]	OCA Comments	Hoyt Recommendation
Cost Responsibility	In accordance with CIAC: Fee for Interconnection Facilities plus Network Improvement Costs based on share of benefits received from Network Improvements (pp. 8032, 8041)	All costs associated with line and service extensions except when PPL determines the upgrades provide reliability/other benefits to the whole system; PPL has an existing CIAC calculation process	All costs associated with a separate Construction Agreement. Associated Rate Base expenses are estimated and subsequently adjusted in Schedule A of the ESA (pp. 2-3)	Not specified. Likely determined in part by ESA PPL will credit the minimum load guarantee payments to transmission rate base, which will lower the amount of rate base. PPL St. 16-R at 13.	CIAC requirements that ensure that Large Load Customers pay 100% of the costs of their Direct Interconnection Facilities (T+D investments that don't materially benefit other customers) (p. 14) Large load customers, through some combination of minimum demand charges and exit fees which are utilized as credits against the utility's transmission rate base balance, should incur cost responsibility for the addition to transmission network upgrades necessary to interconnect that customer (i.e., the "but-for" costs) (pp. 16-17) Voluntary CIAC for the "but-for" costs of the transmission network upgrades may be used for the purpose of expediting the interconnection of the customer, notwithstanding conformance with all reliability standards (p. 19)	Assign 100% of direct and "but-for" network upgrade costs to large load customers to be recovered through CIAC, minimum demand charges, exit fees, or a combination thereof. Where minimum demand charges and/or existing fees are applicable, PPL will credit the payments against the utility's transmission rate base balance for the benefit of other customers. Voluntary CIAC may be appropriate as an option tied to expedited interconnection, but cost responsibility must remain with the large load customer.
Financial Security	Requires collateral tied to the Interconnection Facility and Network Improvement Costs (p. 8041)	Requires security equal to the amount of line extension that was not directly charged to the customer. PPL can draw upon security in the event of default	Requires credit support (ESA Schedule B) that meets obligations of the ESA and Tariff (p. 3)	Not specified. Likely determined in part by ESA	Financial security (collateral requirements) should be sufficient to cover cost of any Large Load's share of network upgrades for which the Large Load is the majority beneficiary (as provided in the PUC Model Tariff) (p. 13)	Require collateral sufficient to cover large load's entire cost responsibility. Security should scale with ramp progress and remain in place until investment risk is retired.
Exit Procedure/Fee	42 months' prior notice required to reduce capacity by 20% in the first 5 years without payment. Subject to the exit fee, capacity reduction can be greater than 20% after the first 5 years. Exit fee is the greater of the remaining facilities and network cost obligations or the remaining minimum capacity charge for remaining contract years (p. 8042)	None	In event of termination, customer will pay Termination Payment[6] in addition to any other costs still owed under the agreement (pp. 8, 14)	The remaining minimum load guarantee obligation of ESA term	5-year (60-month) notice provision for exit or early contract termination (p. 32)	Require a 5-year or greater notice for exit or material reduction. Exit fees equal to the greater of remaining minimum demand charges or unrecovered facility and network costs, with proceeds credited against transmission rate base.

	PUC Model Tariff[1]	PPL LP-5 Tariff[2]	PPL Large load ESA[3]	PPL LP-6 Tariff[4]	OCA Comments	Hoyt Recommendation
Interconnection Study Process	Imposes a 6-month time limit on interconnection studies from the date application is accepted (p. 8042)	None	None	Not specified	The interconnection study process should comply with all NERC guidelines (p. 19) Interconnection of a large load should be contingent on determination that there is sufficient resource adequacy (p. 27)	Interconnection contingent on a positive Commission finding that the proposed load can be served without degrading the reliability of service to existing customers (including transmission deliverability and resource adequacy).
Interruption/ Curtailment	PPL will provide interruptible service based on its existing interruptible tariffs. PPL reserves the right to evaluate the customer's ability to curtail. Penalty imposed based on interruptible tariff if customer fails to curtail when directed (pp. 8042-8,043)	None	None	Voluntary interruptible option that would reduce load guarantee to 60% (first 5 years) and 30% (next 5 years)	Support consideration of interruptible service. PUC needs to define the prescribed conditions under which a large load might be curtailed if an interruptible option is provided for large loads (p. 33) Interruption should be available an unlimited number of times in delivery year, and for an unlimited number of hours (p. 34) Large loads should be curtailed before residential loads in emergency situations (p. 2)	Require enforceable curtailment obligations during emergency load shedding. Large load customers subject to priority curtailment (i.e., before residential or small commercial customers), with no limit on the number or duration of curtailment events and penalties for non-compliance.
Miscellaneous	Requires an annual company hardship fund contribution by the large load customer (p. 8043)	None	Sets a maximum allowable harmonic voltage distortion level and holds customer responsible for corrective measures (p. 6)	LP-6 rate class responsible for $10 million towards the Universal Service Rider (USR). USR will be updated 3x/year instead of annually to spread costs to newly connected LP-6 customers	Electric service agreements (ESAs) should be filed with the PUC for review and approval before service is initiated (p. 5) Large loads should not be allowed to net meter using their onsite generation (p. 35)	Require Commission filing and approval of ESAs. Require explicit, non-bypassable universal service contributions.

Q. PLEASE EXPLAIN YOUR RECOMMENDATIONS IN THE ABOVE TABLE BY ROW.

A. The following overview provides brief explanation of my recommendations to improve upon LP-6 and support a fit-for-purpose large load tariff.

- Eligibility: Size-based thresholds are necessary to capture customers whose system impacts materially differ from the legacy LP-5 customer base. I propose a threshold of greater than 20 MW in alignment with FERC definition (Docket No. RM26-4). 20 MW is also the smallest size threshold where additional LP-5 customers are anticipated as a result of large load additions, as shown in Table 1 of my Direct Testimony. Additionally, consistent with PPL's proposal, I propose that the LP-6 be available at service voltage greater than 69 kV, with the customer furnishing and maintaining all equipment necessary to transform the energy from the line voltage.

- Service Term and Load Ramping: Short service terms and limited termination notice materially increase stranded cost risk given the long-lived nature of transmission and distribution investments. A contract term that begins only after completion of load ramping, paired with long minimum service obligations, is necessary to align customer commitments with utility investment horizons. I recommend a ramping period of 4-5 years and for the contract term to begin following ramping, as initially proposed by the Commission in the model large load tariff proceeding.

- Minimum Monthly Charges: Minimum demand provisions must be sufficiently stringent to protect against under-utilization risk during and after ramp periods. Existing LP-5 and ESA provisions allow customers to manage or suppress peak contributions while leaving fixed system costs unrecovered. I recommend adopting a minimum billing demand of at least 90% of contracted capacity, with higher minimums during early service years. Minimum charges should persist throughout the contract term and be enforceable regardless of customer operational decisions.

- Cost Responsibility: Discretionary determinations of "system benefit" create a material risk of cost shifting and undermine cost causation principles. Transmission and distribution upgrades that are "but-for" a specific large load should not be socialized absent a demonstrated, Commission-verified benefit to existing customers. I recommend that the Tariff require large load customers to bear 100% of the costs of direct interconnection facilities and all "but-for" transmission network upgrades, through CIAC, minimum demand charges, exit fees, or a combination thereof. Voluntary CIAC may be appropriate as an option tied to expedited interconnection, but cost responsibility must remain with the large load customer. Where minimum demand charges and/or existing fees are applicable, PPL must commit to credit the payments against the utility's transmission rate base balance for the benefit of other customers.[57] PPL should also commit to file a report with the Commission and serve copies on the statutory advocates if and when this crediting to transmission rate base occurs.

- Financial Security: Financial security provisions must reflect the magnitude and duration of transmission investments driven by large load interconnections. I recommend requiring collateral sufficient to cover the large load's entire direct interconnection and network upgrade cost responsibility, consistent with the PUC Model Tariff. Security should scale with ramp progress and remain in place until investment risk is retired.

- Exit Procedure/Fee: Short notice periods are incompatible with multi-decade grid investments. I recommend that LP-6 require a minimum 5-year (60-month) notice for exit or material capacity reduction. Exit fees should equal the greater of remaining minimum demand charges or unrecovered facility and network costs, with proceeds credited against transmission rate base as proposed by the Company.

- Interconnection Study Process: Studies that focus solely on planning-criteria violations are insufficient to protect customers from broader system risks. I

[57] Lookup Rebuttal at 13.

recommend that interconnection be contingent on a positive Commission finding that the proposed load can be served without degrading the reliability of service to existing customers after accounting for both transmission deliverability and resource adequacy.

- Interruption/Curtailment: Large loads materially increase the probability and severity of emergency operating actions and should face differentiated service conditions. I recommend that, as a condition of interconnection, the Commission require enforceable interruptible or curtailable service for large loads. Further, large load customers should be subject to priority curtailment (i.e., before residential or small commercial customers), with no limit on the number or duration of curtailment events and penalties for non-compliance.

- Miscellaneous: I recommend Commission filing and approval of all ESAs prior to service initiation as a transparency measure. Additionally, I recommend that LP-6 ensure large load contributions to universal service or hardship programs are explicit, non-bypassable, and scalable with load size.

Q. BASED ON THE ABOVE ANALYSIS TABLE AND YOUR RECOMMENDATIONS, WHAT GAPS DO YOU SEE IN PPL'S PROPOSED LP-6 TARIFF?

A. PPL's proposed LP-6 tariff, while a step in the right direction, remains incomplete. Several omissions or limitations are especially acute. First, while the proposed 10-year minimum term better aligns with long-lived transmission and distribution investments, LP-6 does not clearly tie the commencement of the contract term to the completion of the load-ramping period. Absent this linkage, existing customers remain exposed if the customer fails to achieve projected load levels within the ramp period or materially underperforms thereafter.

Second, the proposed step-down in the minimum load guarantee from 80 percent in years one through five to 50 percent in years six through ten materially

weakens stranded-cost protection achieved through a longer contract term. This structure prioritizes customer optionality over system risk and undermines the cost-causation objectives that motivate the creation of a separate large-load rate class in the first place.

Third, LP-6 continues to rely on Electric Service Agreements, or ESAs, to define key elements of cost responsibility and financial security. This replicates a central deficiency of the existing LP-5 framework. Core provisions related to cost assignment, collateral requirements, and exit obligations should be embedded directly into a standardized tariff. Customer-specific provisions subject to explicit Commission review.

This list is not exhaustive, and additional deficiencies, such as the absence of enforceable curtailment obligation and differences in presumed cost responsibility, are also addressed elsewhere in my Surrebuttal Testimony.

Q. DOES PPL CONTEND THAT ITS LARGE-LOAD COST-ALLOCATION AND CUSTOMER-PROTECTION APPROACH IS ALREADY CONSISTENT WITH APPLICABLE LAW AND REGULATORY REQUIREMENTS?

A. Yes. Mr. Lookup states that PPL Electric "is following FERC precedent in socializing network upgrades that benefit other customers,"[58] and he argues that other parties' recommendations are "asking the PUC to exceed its jurisdictional authority and dictate the terms of transmission ratemaking."[59] With respect to the speculative nature of large load interconnections, Mr. Lookup asserts that the Company "proposed a minimum load guarantee that will cover the cost of socialized upgrades to address any risk that

[58] *Id.* at 10:8-9.
[59] *Id.* at 10:9-10.

load does not materialize as expected."[60] While Mr. Lookup acknowledges that the minimum load guarantee "may be technically" unable to cover the full revenue requirement, he argues that this outcome is acceptable because "once a new large load customer begins taking service it will continue to take service for decades," and therefore will "likely pay for those upgrades several times over."[61]

Q. DO YOU AGREE WITH MR. LOOKUP'S ABOVE CONTENTIONS, INCLUDING HIS ASSERTION THAT THE PROPOSED "MINIMUM LOAD GUARANTEES AND STANDBY CHARGES" ENSURE THAT NEW LARGE LOAD CUSTOMERS ARE "PAYING THEIR FAIR SHARE FOR THE TRANSMISSION SYSTEM"?[62]

A. No. First, I disagree with Mr. Lookups position regarding the limited scope of potential interventions to address risk. My positions on this matter are addressed above, and retail-level terms and conditions, as specified in the retail tariff, are appropriate given that the ESA is a retail-level agreement in part and therefore within the PUC's jurisdictional oversight in part. Second, the proposed 80 percent minimum load guarantee is tied to the assumed load ramp schedule rather than to the magnitude and timing of transmission investments that may be triggered or accelerated by the interconnection request. As discussed earlier in my testimony, transmission system upgrades can be required well in advance of full load materialization and may be sized to accommodate the customer's ultimate projected demand rather than its near-term realized load. In such cases, a slow-ramping or strategically managed load can impose significant transmission costs while contributing materially less to system peak than assumed.

[60] *Id.* at 12: 3-4.
[61] *Id.* at 14:7-8.
[62] *Id.* at 12:16-17.

Third, the minimum load guarantee only addresses the cost of the initial upgrade, and not the entire contribution of the incremental large load addition to the transmission revenue requirement, based on the assumption that new large load customers will be long lived. As discussed throughout my Direct and Surrebuttal Testimony, this assumption is speculative and inconsistent with the documented risks associated with large load interconnections, including delayed ramping, partial build-out, load-shifting strategies, and early exit. Customer protection mechanisms should be designed to withstand these risks rather than rely on optimistic assumptions about long-term customer behavior. For these reasons and others articulated elsewhere, I continue to recommend that minimum load guarantees, exit fees, and related protections be sized to cover the full "but-for" transmission cost exposure created by the interconnection, not merely the initial upgrade costs.

Q. DO YOU AGREE WITH THE PROPOSED STANDBY PROVISIONS THAT REDUCE CUSTOMER PAYMENT OBLIGATIONS IN EXCHANGE FOR VOLUNTARY INTERRUPTIBILITY?

A. No. I do not believe it is appropriate to reduce a large load customer's financial obligation for volunteering to mitigate reliability risks that the customer itself creates. Curtailment capability is a necessary reliability and risk management condition for large load service, not a discretionary option that should weaken cost-recovery protections. I further address considerations related to curtailment or interruption in the preceding section of my Surrebuttal.

Q. DOES PPL AGREE THAT MINIMUM LOAD GUARANTEE PAYMENTS SHOULD BE CREDITED IN A MANNER THAT BENEFITS OTHER CUSTOMERS?

A. Mr. Lookup clarifies that PPL proposes to "credit the minimum load guarantee payments to transmission rate base," and he states that "this has always been the Company's intent, and it is not opposed to further clarifying this in the Retail Tariff." I support making this clarification explicit in the tariff. Specifically, the tariff should clearly specify that minimum load guarantee payments credited to transmission rate base are applied regardless of whether the customer subsequently defaults or exits service. In addition, such credits should continue until the relevant transmission rate base associated with the customer's "but-for" upgrades has been fully offset.

Q. HOW DOES THE COMPANY RESPOND TO TRANSPARENCY CONCERNS

A. Mr. Lookup states that PPL "is not opposed to submitting ESAs for information,"[63]

Q. DO YOU BELIEVE SUBMISSION OF ESAS "FOR INFORMATION" IS SUFFICIENT?

A. No. I am advised by the OCA's attorneys that the ESA can be viewed technically as a three-party agreement—between the large load customer, the interconnecting EDC providing electric retail distribution service, and the transmission owner. However, in most cases, the interconnecting EDC and the transmission owner fall under the same corporate parentage, and thus the agreement is presented to the FERC as a bilateral agreement between the company and the large load. Given that the interconnecting EDC is a party to these agreements to the extent there is distribution-level interconnection and retail-level service, the ESA is PUC-jurisdictional.

[63] *Id.* at 17:18.

Additionally, while submission of ESAs for information improves transparency, it does not substitute for standardized tariff provisions that clearly establish cost responsibility, minimum demand, financial security, and exit protections. Core customer-protection requirements should be embedded directly in the tariff rather than left to customer-specific agreements. Additionally, I continue to recommend that the Commission retain a role in reviewing and approving requests to interconnect new large load customers.

Q. HOW DOES THE COMPANY ADDRESS CONCERNS REGARDING THE TERM OF THE ESA OR OTHER CONTRACTUAL ARRANGEMENTS?

A. Mr. Lookup acknowledges that "there is general concern that the length of the ESA is not long enough, and that the minimum term should be between 10 and 20 years" in order to limit stranded cost risk.[64] He further states that the Company is "not opposed to having a 10-year term for its large load ESAs."[65]

Q. DO YOU AGREE THAT A 10-YEAR ESA TERM, BY ITSELF, ADEQUATELY ADDRESSES STRANDED COST RISK?

A. No. While a longer minimum term is directionally helpful, term length alone is insufficient. Effective risk mitigation also requires minimum demand obligations, financial security, and exit provisions that align customer commitments with the long-lived nature of transmission investments. Without these complementary protections, stranded cost exposure to existing customers remains.

[64] *Id*. at 18:11-13.
[65] *Id.* at 19:3-4.

G. Other Issues

Q. HOW DOES THE COMPANY RESPOND TO YOUR CONCERNS REGARDING POTENTIAL CONFLICT OF INTEREST IN THE BLACKSTONE JOINT VENTURE?

A. In my Direct Testimony, I identify concerns about potential conflicts of interest with affiliates, especially as they relate to PPL Corporation's announced joint venture with Blackstone Infrastructure, as well as the downstream benefits that large load interconnection might provide to other PPL Corporation affiliates.[66] This concern was also shared by EI Witness Nelson.[67]

In response, PPL argues that the Company has "robust internal affiliate transaction protections" that already addresses the above concerns.[68] The Company further contends that any future relationship between PPL Electric and the Joint Venture would require Commission approval, at which time it would be appropriate to evaluate the necessity of additional conflict of interest protections.[69] Additionally, Ms. Johnson states that, "While I agree that the joint venture should not realize any special benefits from being an affiliate with PPL Electric, it is also true that the joint venture should not be treated at a disadvantage to other customers simply because it is an affiliate."[70]

[66] Hoyt Direct at 53-55.
[67] Nelson Direct at 47-50.
[68] Lookup Rebuttal at 28:1.
[69] Johnson Rebuttal at 33:13-16.
[70] *Id.* at 33:16-19.

Q. DOES THE COMPANY'S POSITION ALTER YOUR RECOMMENDATIONS REGARDING APPROPRIATE CONFLICT OF INTEREST PROTECTIONS?

A. No. I acknowledge the Company's reliance on existing affiliate protections and Commission review of future agreements; however, my concern is not limited to a direct contractual relationship between PPL Electric and the joint venture. Rather, it arises from the indirect incentive created when large load interconnections and associated transmission upgrades facilitate outcomes that benefit PPL Corporation affiliates. Even where PPL Electric complies with existing rules, it remains possible for large load customers' interconnection or service cost obligations to be reduced or offset based on asserted system benefits that advantage affiliated generation assets. The safeguard I recommend would operate consistently with existing affiliate protections by clarifying, at the tariff level, that such cost reductions are not appropriate where system benefits accrue primarily or exclusively to PPL Electric affiliates. For these reasons, I continue to recommend that the Commission require PPL Electric to incorporate the recommended safeguards into its large load tariff.

III. SUMMARY OF AND RESPONSE TO PPL'S REBUTTAL ADDRESSING RELIABILITY

Q. PLEASE SUMMARIZE THE TOPICS MS. HOWELL AND MR. LOOKUP ADDRESS IN RESPONDING TO YOUR DIRECT TESTIMONY.

A. Ms. Howell's Rebuttal Testimony responds to the portions of my Direct Testimony addressing the Company's vegetative management practices. Specifically, she discusses my evaluation of the relationship between vegetation management expenditures and reliability outcomes, vegetative management reporting, and the prioritization of vegetative management inspection and maintenance ("I&M") activities. She also addresses the OCA's proposed treatment of enhanced right-of-way ("ROW") activities.

Mr. Lookup's Rebuttal Testimony responds to my analysis of PPL's system-level reliability performance. His testimony focuses on my assessment of reliability trends relative to Commission-ordered standards and peer benchmarks, and he attributes recent performance outcomes to external factors such as storm frequency and severity.

Q. DO MS. HOWELL AND MR. LOOKUP AGREE THAT THERE IS A NEED FOR PPL TO CONTINUE IMPROVING RELIABILITY WITHIN ITS SERVICE TERRITORY?

A. Yes. Both witnesses expressly acknowledge the need for continued improvement in reliability performance. Mr. Lookup states that PPL "acknowledges that there is room to improve its reliability performance" which he ties to the requested rate relief.[71] Likewise, Ms. Howell justifies requested vegetative management activity as intended to "improve reliability."[72] Their testimony aligns with the purpose of my Direct

[71] *Id.* at 37:15.
[72] Howell Rebuttal at 3:6.

Testimony, which evaluates reliability performance relative to past and potential investments.

Q. DOES MS. HOWELL ACCEPT ANY OF THE RECOMMENDATIONS OR ANALYTICAL FINDINGS FROM YOUR DIRECT TESTIMONY?

A. Yes. Ms. Howell accepts (or does not oppose) several of my recommendations and analytical findings. She states that she "does not disagree" with my recommendation for the additional reporting related to the enhanced ROW program as a condition of its acceptance.[73] She also agrees with my recommendation that PPL continue to plan and execute I&M work based on system risk and need if the Commission approves the requested adoption of a five-year I&M cycle period.[74] In addition, Ms. Howell acknowledges that my findings regarding the relationship of same-year and prior-year vegetative management O&M spending with reliability outcomes are consistent with Company expectations.[75]

Ms. Howell states that she does not agree with my analytical findings regarding the observed relationships between vegetative management capital expenditure and various reliability outcomes, holding that any such relationship cannot be established due to the nature of those expenditures.[76] However, my Direct Testimony does not rely on past vegetative management capital expenditures to draw prospective conclusions regarding proposed investments. Rather, as stated in my Direct Testimony, "interpretation of [the vegetative management] capital spending results is limited due to the small available sample size."[77] Accordingly, I do not interpret Ms. Howell's

[73] Howell Rebuttal at 5:11-16; reference to Hoyt Direct at 63:23-27.
[74] Howell Rebuttal at 10:17-21; reference to Hoyt Direct at 63:14-18.
[75] Howell Rebuttal at 11:14-20.
[76] *Id.* at 6:9-16.
[77] Hoyt Direct at 85:1-2.

testimony on this issue as reflecting a substantive disagreement with my analysis, but rather reinforcing the limitations I already identified.

Q. HOW DOES MS. HOWELL ADDRESS THE OCA'S RECOMMENDATIONS TO DISALLOW CAPITALIZATION OF THE INITIAL TREE TRIMMING EXPENSE RELATED TO THE PROPOSED EXPANSION OF ROW?

A. Ms. Howell disagrees with the OCA's position, as was also adopted by I&E Witness Walker.[78] As basis for this disagreement, Ms. Howell reiterates previously provided reasoning for the enhanced ROW program. She additionally comments that the cost of vegetation management "can be" more than five times higher than other unspecified vegetation management activities, and compares the proposed activity to tree trimming required for greenfield construction.[79]

Q. DO MS. HOWELL'S COMMENTS ALTER YOUR OPINION OF THE APPROPRIATE TREATMENT OF INITIAL TREE TRIMMING EXPENSE?

A. No. The OCA's initial position, as also addressed in the testimony of OCA Witness Morgan, was provided on the basis of FERC accounting rules. Ms. Howell does not address the underlying accounting inconsistency in her rebuttal. These positions are instead advanced by PPL Witness Sharon Leskowsky in related Rebuttal.[80] Mr. Morgan addresses the arguments put forth by Witness Leskowsky in Surrebuttal. I continue to recommend the initially proposed treatment addressed in Mr. Morgan's Direct Testimony.

[78] Walker Rebuttal at 29.
[79] Howell Rebuttal at 4:17-21.
[80] Leskowsky Rebuttal at 11-13.

Q. HOW DOES MR. LOOKUP CHARACTERIZE YOUR RELIABILITY PERFORMANCE ANALYSIS?

A. Mr. Lookup disagrees with my empirical observation that the Company is not currently meeting most Commission-ordered reliability targets and that its reliability performance has worsened in recent years. He advances three "general points" in response. First, he asserts that PPL "generally performs well compared to peers" as reflected in various benchmarking surveys, stating that despite "year-to-year variance," the Company "generally outperforms each peer."[81]

Second, Mr. Lookup reiterates arguments from his Direct Testimony that increases in the frequency and severity of storms impacting PPL's territory, coupled with certain "major event" reporting mechanics, make it increasingly difficult for PPL to satisfy reliability criteria.

Finally, he argues that "each of the Pennsylvania peers" addressed in my analysis "has sought and obtained at least one base rate increase since 2015."[82] This point is intended to demonstrate that the Company "manages the reliability of its system well."[83]

Q. ARE THE POINTS PROVIDED IN MR. LOOKUP'S TESTIMONY RELEVANT TO THE UNDERLYING CLAIM?

A. No. Mr. Lookup addresses conclusions I do not make or otherwise fails to engage with my core empirical observations by raising non-related points. Mr. Lookup frames his rebuttal around the statement in my Direct Testimony that PPL "is not currently meeting most of the Commission-ordered targets for reliability, and its reliability scores for major metrics have trended upwards (i.e., worsened) in recent years, including in

[81] Lookup Rebuttal at 32:10-22.
[82] *Id.* at 33:19-20.
[83] *Id.* at 34:3-4.

comparison to peer Pennsylvania utilities in 2024."[84] This statement notably does *not* assert that PPL underperforms its peers outside of the year 2024. My testimony expressly notes that for "most years of the sample set, PPL's SAIFI, SAID, and CAIDI scores vary in a manner consistent with equivalent peer values in Pennsylvania."[85]

Mr. Lookup also characterizes my exclusion of 2024 data in certain analyses as an attempt to "justify" my interpretation.[86] In fact, excluding 2024 would tend to make reliability trends appear more favorable, not less. The persistence of adverse trends even when the most severe year is excluded is precisely what makes those trends relevant. Mr. Lookup does not address the empirical basis of my finding, instead intending to dispute it without directly engaging with the data on which those findings are based.

Finally, Mr. Lookup's reliance on the absence of a base rate case since 2015 is not probative of reliability performance. The decision to pursue a rate case rests with the Company, and does not, in itself, demonstrate whether Commission-ordered reliability standards have been met. If the Company determines that additional resources are necessary to meet its reliability obligations, it has the ability to seek such relief. Moreover, this argument overlooks the fact that the Company has pursued reliability-related funding through non-base-rate mechanisms (e.g., Storm Damage Expense Rider).

[84] Hoyt Direct at 62:8-1.
[85] *Id.* at 72:13-15.
[86] Lookup Rebuttal at 33:9.

Q. ARE YOU CONVINCED BY MR. LOOKUP'S POSITION THAT MEETING COMMISSION RELIABILITY STANDARDS IS MORE CHALLENGING TODAY THAN IN THE PAST?

A. Mr. Lookup contends that the Company's ability to meet Commission-approved reliability targets has become more difficult due to changes in storm severity and the "near impossibility of excluding storms as major events under the benchmarks," both of which have "made the Company's ability to achieve its PUC targets increasingly challenging."[87] Regardless of whether these conditions have changed, the Company remains obligated to meet the Commission's approved standards. Those standards are intended to be satisfied under a range of operating conditions and are not contingent on favorable classification of events. Moreover, Mr. Lookup does not demonstrate that the standards themselves are unreasonable or unattainable. To the extent changing conditions increase reliability risks, that underscores the importance of effective planning, investment, and execution in areas within the Company's control. If the Company believes the existing standards are no longer appropriate, the proper course is to seek their modification through the Commission.

Q. DOES THE EVIDENCE MR. LOOKUP PROVIDES REGARDING PPL'S PERFORMANCE RELATIVE TO PEERS ALTER YOUR ANALYSES OR CONCLUSIONS?

A. No. Evidence regarding PPL's relative performance compared to peer utilities does not alter my analysis because peer benchmarking, on its own, does not determine whether the Company has met Commission-ordered reliability targets or whether its performance has improved or deteriorated over time. My analysis is focused on trends in publicly available reliability metrics and their relationship to Commission standards

[87] *Id.* at 35:4-6.

and Company investment decisions. Even if PPL performs similarly to or better than peer utilities, that fact would not rebut evidence that reliability targets are not being met or that performance has worsened in recent years.

Q. IS MR. LOOKUP'S RESPONSE TO YOUR COMMENT REGARDING THE AVAILABILITY OF INFORMATION ACCURATE?

A. No. Mr. Lookup responds to the statement in my Direct Testimony that the Company "did not provide sufficient information for me to evaluate performance consistency over time" by noting that the data he cites in rebuttal is publicly available.[88] However, that statement refers specifically to the absence of Company-provided, weather-adjusted internal reliability metrics, not the availability of high-level public reports. As discussed on pages 66-68 of my Direct Testimony, "the Company did not provide weather-adjusted reliability metrics in its filing" and, as a result, I was "only able to compare the Company's performance" to a limited set of available targets.[89]

Q. WHAT IS MR. LOOKUP'S POSITION REGARDING YOUR ACCOUNTABILITY AND ENHANCED REPORTING RECOMMENDATIONS?

A. Mr. Lookup generally opposes the additional accountability and reporting requirements I recommend.[90] He contends that my recommendations resemble a form of performance-based regulation, raise legal issues, and would rely on hindsight review that attempts to evaluate the prudency of localized investments using systemwide metrics. He further argues that the additional reporting I recommend would impose additional labor and/or IT costs, and that I did not demonstrate that the incremental benefits would exceed those costs.

[88] Hoyt Direct at 75:13-14.
[89] *Id.* at 67:9-11.
[90] Lookup Rebuttal at 38:4-22 and 39:1-4.

Q. DOES MR. LOOKUP'S RESPONSE ALTER YOUR RECOMMENDATIONS REGARDING ACCOUNTABILITY AND ENHANCED REPORTING?

A. No. As an initial matter, my recommendations are distinct from performance-based ratemaking, which I do not address. The Commission's traditional base rate review is grounded by its obligation under 66 Pa.C.S. § 1501, including ensuring that public utilities provide safe and adequate service. Reliability of service is an appropriate and necessary subject of inquiry in a base rate proceeding by this standard.

Prudency review evaluates whether a utility's decisions and expenditures were reasonable based on the information available at the time they were made. In contrast, performance-based ratemaking links revenues or cost recovery directly to measured performance results, often through predefined metrics, incentives, or penalties applied after the fact. My recommendations do not establish performance targets, impose incentives or penalties, or condition cost recovery on the attainment of specific reliability outcomes. Rather, they seek to improve the transparency and completeness of the information available to the Commission so that it can apply the existing prudence standard to assess PPL's fulfillment of its statutory service obligations.

To the extent cost-benefit considerations are relevant to the evaluation of these recommendations, I would welcome the Company to provide reasonable estimates of the costs associated with producing the requested information. Ultimately, determinations regarding the appropriate level of accountability and reporting rest with the Commission, not the Company, and require access to the best available information.

Q. HOW DOES MR. LOOKUP ADDRESS OTHER ANALYTICAL FINDINGS FROM YOUR DIRECT TESTIMONY?

A. Mr. Lookup generally disagrees with my remaining analytical findings and states that my analysis should not be relied upon for evaluating the relationship between the Company's capital investments and system-level reliability outcomes. In doing so, he focuses on methodological concerns, including the use of system-wide reliability metrics to assess localized or category-specific investments, the timing of reliability impacts, and the influence of external factors such as storm activity. He also raises concerns regarding the comparability of different reliability metrics and the consistency of time periods used in the analysis. Based on these considerations, Mr. Lookup concludes that my analysis does not provide a reliable basis for drawing conclusions regarding investment effectiveness.[91]

Q. DO YOU AGREE WITH MR. LOOKUP'S CHARACTERIZATION OF YOUR ANALYSIS?

A. No. Mr. Lookup first argues that investments affecting specific portions of the system should not be evaluated using system-wide reliability metrics. However, the purpose of my analysis is to assess the combined impact of categories of investment on overall system performance, not to evaluate the merits of individual projects. Limiting evaluation only to narrowly defined, project-specific outcomes would overlook whether aggregated investment strategies are effectively addressing broader system-level reliability challenges. It is appropriate for the Commission to assess reliability on a holistic basis as PPL's reliability obligations encompass the overall quality and consistency of service provided to customers across the service territory.

[91] *Id.* at 40-42.

Second, Mr. Lookup asserts that my analysis ignores relevant variables, which mischaracterizes my work, as the analysis does not purport to establish deterministic or project-specific causation and expressly acknowledges confounding factors and analytical limitations.

Third, Mr. Lookup critiques the use of differing data levels and time lags, despite the fact that all correlations, including same-year and lagged relationships, are transparently presented in tabular form in my testimony.[92] Evaluating lagged relationships is a deliberate and appropriate method for exploring potential delayed impacts of investments, rather than a methodological flaw, and is undertaken subject to the stated constraints of the analysis. Likewise, comparison of different investments across multiple reliability metrics allows for a more comprehensive assessment of how various categories of spending may relate to different dimensions of reliability performance.

Mr. Lookup's arguments, as a whole, seem to suggest that reliability cannot be meaningfully evaluated using available system-level expenditure and reliability data. I strongly disagree. Evaluating observed relationships, trends, and limitations in reliability performance is both necessary and appropriate for informing Commission oversight. Absent such analysis, the Commission would lack a reasonable basis to assess whether aggregate investment strategies are aligned with stated reliability objectives and whether proposed expenditures are likely to produce system-wide benefits for customers.

[92] Hoyt Direct at 90.

IV. SUMMARY OF AND RESPONSE TO PPL'S REBUTTAL ADDRESSING THE PROPOSED EV PROGRAM

Q. PLEASE SUMMARIZE MR. CONRAD'S RESPONSE TO PARTIES' DIRECT TESTIMONY REGARDING PPL'S PROPOSED EV PROGRAM.

A. Mr. Conrad consolidates parties' critiques, comments, and recommendations regarding PPL's proposed EV program into five buckets: alignment of time periods; evaluation, metrics and reporting; targeting and cost discipline; customer communication and implementation materials; and program duration and review.[93] Mr. Conrad also corrects errors from his Direct Testimony, and responds to recommendations by EI Witness Nelson and Walmart Witness Lyon to develop new or substantially altered EV programs. My recommendations regarding EI Witness Nelson's proposed EV program are addressed in my Rebuttal Testimony (OCA 5R) and I do not intend to comment on that proposal in my Surrebuttal Testimony.

Q. WHAT CONCLUSIONS DOES MR. CONRAD MAKE REGARDING PARTIES' COMMENTS?

A. Mr. Conrad states "the other parties' testimony generally reflects support for the concept of encouraging off peak charging through a limited, opt-in program, with suggested refinements."[94]

Q. DO YOU AGREE WITH THIS CHARACTERIZATION OF PARTIES' COMMENTS?

A. Yes, I view the above statement as generally accurate. However, agreement on the general concept of a program should not be interpreted as a recommendation for its approval. As discussed in my Direct Testimony, I do not recommend that the

[93] Conrad Rebuttal at 4:19-21 and 5:1-12. Parties addressed include SEF Witness Costlow, EI Witness Nelson, Walmart Witness Lyon, and OCA Witness Hoyt.
[94] Conrad Rebuttal at 4:17-19.

Commission approve the proposed EV program without the proposed changes and clarifications I list on pages 100-102 of my Direct Testimony.

Q. DOES MR. CONRAD ADDRESS PARTIES' RECOMMENDATIONS REGARDING THE ALIGNMENT OF THE PROPOSED EV PROGRAM AND DEFAULT SERVICE TOU PERIODS?

A. No. SEF Witness Costlow,[95] EI Witness Nelson,[96] and I all recommended that PPL synchronize the peak and off-peak definitions used for the Proposed EV Program with the existing Default Service TOU period for clarity, protection against unintended supply cost consequences, and avoidance of customer confusion, among other reasons. In response, Mr. Conrad states that PPL "agrees that time-period definitions should be clear and administrable and should minimize customer confusion."[97] Mr. Conrad goes on, however, to disagree with alignment by arguing that the program is strictly "distributed-focused."[98] He also states that expanding the on-peak definition "to mirror the generation TOU on-peak period (particularly in the six shoulder months) would require customers to avoid or shift additional charging during months with off-peak EV charging provides little or no distribution system value."[99] In place of an altered definition, Mr. Conrad proposes to "refine time periods in future iterations" of the program.[100]

Q. DOES THE COMPANY'S RESPONSE SATISFY YOUR CONCERNS REGARDING THE TOU PERIOD?

A. No. Mr. Conrad does not substantively engage with the core concerns raised by multiple witnesses. While he acknowledges the general importance of clarity and

[95] Costlow Direct at 25-26.
[96] Nelson Direct at 57-61.
[97] Conrad Rebuttal at 8:4-5.
[98] *Id.* at 8:9.
[99] *Id.* at 8:12-15.
[100] *Id.* at 9:1.

minimizing customer confusion, he does not explain why those principles should not be met through alignment with the existing Default Service TOU periods during non-shoulder months, as I originally recommended. Labeling the program as "distribution-focused" does not resolve concerns regarding unintended supply cost impacts or customer misunderstanding. Further, the proposal to "refine time periods in future iterations" effectively defers resolution of a known design flaw, leaving customers exposed in the interim. I continue to recommend that the EV Program's on-peak period definition include the entirety of the Generation TOU Rate on-peak period. My proposed approach does not preclude future adjustment based on further data obtained through the program, does not impose additional costs during shoulder months (i.e., I only include non-shoulder months), and continues to include times relevant to distribution costs (i.e., I expand, rather than shift, the on-peak period). As a result, it addresses the parties' reasons for synchronization without unduly affecting the Program.

Q. PLEASE SUMMARIZE MR. CONRAD'S RESPONSE TO YOUR EVALUATION, METRICS, AND REPORTING RECOMMENDATIONS.

A. Mr. Conrad states that PPL "agrees that the Proposed EV Program should be evaluated" and that some period reporting and data collection is appropriate.[101] However, PPL "disagrees that the Commission should require the Company to develop a comprehensive evaluation plan that establishes fixed, quantitative targets and milestones as a condition of program approval."[102]

[101] *Id.* at 9:4-5.
[102] *Id.* at 9:9-12.

Q. WHAT ASPECTS OF YOUR EVALUATION RECOMMENDATIONS DOES PPL DISAGREE WITH?

A. PPL does not believe that it should submit an evaluation plan with targets or milestones prior to approval. Specifically, Mr. Conrad states that "requiring targets/milestones at the outset is not appropriate for a learning-focused program intended to establish baseline charging behavior and to inform future program and rate design."[103] Mr. Conrad also argues that data collection and comparison methodologies are more "appropriately addressed in program implementation" after accounting for "data availability, privacy considerations, and the final vendor approach."[104]

Q. DOES THE COMPANY'S PROPOSED APPROACH PROVIDE CONFIDENCE THAT IT WILL ACCOMPLISH ITS LEARNING OBJECTIVE?

A. No. As explained in my Direct Testimony, the program's learning value is its primary claimed benefit; without a clear, Commission-reviewed pathway to inform customer behavior, I cannot confidently conclude that the program will produce any behavioral adjustments or that the program's benefits justify its costs. Accordingly, I continue to recommend that PPL be required to submit a comprehensive evaluation plan for stakeholder and Commission review prior to program approval.

However, I recognize that certain program details (e.g., the final vendor approach) may not yet be available at this stage of program development. If the Commission approves the program absent the requested details, I recommend, at a minimum, that the Commission require PPL to provide draft evaluation, metrics, and reporting materials to stakeholders for review prior to pilot implementation. Stakeholders should be afforded a meaningful opportunity to provide input.

[103] *Id.* at 9:9-14.
[104] *Id.* at 9:18-22 and 10:1.

Q. HOW DOES MR. CONRAD RESPOND TO YOUR RECOMMENDATIONS FOR TARGETED ENROLLMENT AND A CAP ON PARTICIPATION IN NON-CONSTRAINED AREAS?

A. Mr. Conrad indicates that PPL "agrees that marketing and enrollment strategies should be designed to promote participation where managed charging is most likely to provide operational value."[105] It is unclear whether the Company agrees that marketing should occur at the onset of the program, as I recommend in my Direct Testimony.[106]

Regarding participation caps, the Company disagrees "that participation must be restricted solely to narrowly defined constrained areas or that separate caps for non-constrained areas are necessary to achieve the Proposed EV Program's objectives." Mr. Conrad further argues that "Overly prescriptive restrictions could reduce program participation and limit the representativeness of results needed to evaluate charging behavior across the service territory."[107]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIMS REGARDING THE NATURE OF THE CAP OR ITS IMPACT?

A. No. First, I reject the notion that a straightforward requirement that at least half of participants be located in constrained areas is "overly prescriptive," particularly given that addressing operational constraints was one of the program's two stated objectives. Second, reduced participation is not inherently problematic if the program fails to attract customers in locations where meaningful learning is possible; in that case, limiting enrollment appropriately reflects the program's underlying purpose and avoids unproductive rebate costs. Finally, from a statistical standpoint, a sample size of 1,000 customers is more than sufficient to produce representative results for a much larger

[105] *Id.* at 10:5-7.
[106] Hoyt Direct at 114:3-4.
[107] Conrad Rebuttal at 10:8-13.

population using standard confidence parameters (e.g., a 95% confidence level with a ±5% margin of error). Accordingly, the claim that a participation cap would undermine representativeness is incorrect. To the contrary, enforcing a cap helps ensure that the Company achieves its stated objective of generating actionable insights in constrained areas. I therefore continue to recommend targeted marketing in constrained areas and enrollment limits to ensure that at least half of participants are located in such areas.

Q. DOES PPL'S PROPOSED APPROACH TO CUSTOMER COMMUNICATION AND IMPLEMENTATION MATERIALS ADDRESS THE OCA'S CONCERNS?

A. In part. Mr. Conrad states that "the Company agrees that customer-facing materials are important and will finalize the necessary communications, program descriptions, and enrollment materials in advance of program launch and share them with stakeholders."[108] While this general approach is acceptable, I recommend that the Commission require PPL to share draft versions of these materials with stakeholders prior to pilot implementation. Additionally, stakeholders should be afforded a meaningful opportunity to provide input following receipt of draft materials.

Q. HOW DOES MR. CONRAD ADDRESS YOUR COMMENTS REGARDING PROGRAM DURATION AND REVIEW?

A. The Company agrees that the program is of limited duration and subject to Commission review before continuation following the initial term.[109] However, the Company does not provide updated tariff pages to clarify such detail. I continue to propose specification in the tariff that the term runs through May 31, 2030 in alignment with the Phase V EV program in PPL's ongoing Act 129 Energy Efficiency and Conservation Plan proceeding.

[108] *Id.* at 10:18-22.
[109] *Id.* at 11:2-6.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes, it does. However, I reserve the right to update any portion of my testimony as needed if additional relevant information is obtained in the course of this proceeding.

I. Introduction

Q. **PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

A. My name is Lafayette K. Morgan, Jr. My business address is 10480 Little Patuxent Parkway, Suite 300, Columbia, Maryland, 21044. I am a Public Utilities Consultant working with Exeter Associates, Inc. ("Exeter"). Exeter is a consulting firm specializing in issues pertaining to public utilities.

Q. **PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND QUALIFICATIONS.**

A. I received a Master of Business Administration degree from The George Washington University. The major area of concentration for this degree was Finance. I received a Bachelor of Business Administration degree with concentration in Accounting from North Carolina Central University. I was previously a CPA licensed in the state of North Carolina, however, in 2009, I elected to place my license in an inactive status as I focused on start-up activities for other business interests.

Q. **PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.**

A. From May 1984 until June 1990, I was employed by the North Carolina Utilities Commission - Public Staff in Raleigh, North Carolina. I was responsible for analyzing testimony, exhibits, and other data presented by parties before the North Carolina Utilities Commission. I had the additional responsibility of performing the examination of books and records of utilities involved in rate proceedings and summarizing the results into testimony and exhibits for presentation before that Commission. I was also involved in numerous special projects, including participating in compliance and prudence audits of a major utility, and conducting research on several issues affecting natural gas and electric utilities.

From June 1990 until July 1993, I was employed by Potomac Electric Power Company ("Pepco") in Washington, D.C. At Pepco, I was involved in the preparation of the cost of service, rate base and ratemaking adjustments supporting Columbia's requests for revenue increases in the State of Maryland and the District of Columbia.

From July 1993 through 2010, I was employed by Exeter as a Senior Regulatory Analyst. During that period, I was involved in the analysis of the operations of public utilities, with emphasis on utility rate regulation. I reviewed and analyzed utility rate filings, focusing primarily on revenue requirements determination. This work involved natural gas, water, electric, and telephone companies.

In 2010, I left Exeter to focus on start-up activities for other ongoing business interests. In late 2014, I returned to Exeter continuing to work in a similar capacity as prior to my hiatus.

Q. **HAVE YOU PREVIOUSLY TESTIFIED IN REGULATORY PROCEEDINGS ON UTILITY RATES?**

A. Yes. I have previously presented testimony and affidavits on numerous occasions before the Regulatory Commission of Alaska, the Colorado Public Utilities Commission, the Georgia Public Service Commission, the Illinois Commerce commission, the Kansas Corporation Commission, the Kentucky Public Service Commission, the Louisiana Public Service Commission, the Maine Public Utilities Commission, the Maryland Public Service Commission, the Massachusetts Department of Public Utilities the North Carolina Utilities Commission, the Public Utilities Commission of Ohio, the Corporation Commission of Oklahoma, the Pennsylvania Public Utility Commission, the Philadelphia Gas Commission, the Philadelphia Water, Sewer and Storm Water Rate Board, the Public Utilities Commission of Rhode Island,

the Public Service Commission of South Carolina, the Public Utility Commission of Texas, the Vermont Public Service Board, the Virginia Corporation Commission, the West Virginia Public Service Commission, the Wyoming Public Service Commission, and the Federal Energy Regulatory Commission ("FERC"). My resume is attached hereto as Appendix A.

Q. **ON WHOSE BEHALF ARE YOU APPEARING?**

A. I am presenting this testimony on behalf of the Pennsylvania Office of Consumer Advocate ("OCA").

Q. **WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?**

A. Exeter has been retained by the OCA to assist in the evaluation of the general rate filing submitted by PPL Electric Utilities Corporation (PPL Electric or the "Company"). I have been asked by the OCA to present my findings with respect to the Company's revenue requirement and its proposed rate increase. I calculate the Company's rate base, pro forma operating income under present rates, and overall revenue deficiency based upon my recommended adjustments to the Company's claims. My findings are based upon incorporating the recommendations and findings of other OCA witnesses who are also presenting testimony in this proceeding.

Q. **PLEASE IDENTIFY THE OCA'S OTHER EXPERT WITNESSES WHO ARE PRESENTING TESTIMONY IN THIS PROCEEDING.**

A. In addition to my testimony, there are eight other witnesses presenting testimony on behalf of the OCA.

- In OCA Statement No. 2, Ms. Grace Koenig provides testimony regarding the Company's requested cash working capital allowance and the results of its lead/lag study.

- In OCA Statement No. 3, Mr. David Garrett provides testimony on the appropriate rate of return and cost of capital issues, and also issues related to the determination of the depreciation rates.

- In OCA Statement No. 4, Mr. Clarence Johnson is the OCA's witness who provides testimony on class cost of service and rate design issues.

- In OCA Statement No. 5, Mr. Matthew Hoyt will be presenting testimony regarding the Company's electric vehicle programming proposal, reliability performance, and large load tariff proposal.

- In OCA Statement No. 6, Mr. Zach Teti provides a discussion regarding the proposed adjustment to the definition of "maximum registered peak load."

- In OCA Statement No. 7, Ms. Barbara Alexander will present the OCA's recommendations regarding customer service and quality of service.

- In OCA Statement No. 8, Mr. Roger Colton will present the OCA's recommendations regarding affordability of service, low-income customer assistance programs, and tariffs.

- In OCA Statement No. 9, Ms. LeeAnn Wise will present Direct testimony on behalf of the OCA to discuss the issues raised by the Company's customers at the Public Input Hearings in this proceeding.

Q. **IN CONNECTION WITH THIS CASE, HAVE YOU PERFORMED AN EXAMINATION AND REVIEW OF THE COMPANY'S TESTIMONY AND EXHIBITS?**

A. Yes. I have reviewed the Company's testimonies, exhibits and its rate filing. I have also reviewed the Company's responses to interrogatories propounded by the OCA, the Office of Small Business Advocate ("OSBA"), and the Bureau of Investigation & Enforcement ("I&E").

Q. **WHAT PERIOD HAVE YOU USED IN MAKING YOUR DETERMINATION OF THE COMPANY'S REVENUE REQUIREMENTS?**

A. I used the Fully Projected Future Test Year (FPFTY) ending June 30, 2027, as the basis for determining the FPFTY revenue requirements, the same as that requested by the Company.

Q. **HAVE YOU PREPARED SCHEDULES TO ACCOMPANY YOUR TESTIMONY?**

A. Yes. I have prepared Exhibits LKM-1 through LKM-20 Exhibit LKM-1 provides a summary of revenues and expenses under present and proposed rates. Exhibit LKM-2 summarizes my adjustments to the Company's FPFTY rate base. Exhibit LKM-3 provides a summary of my adjustments to the FPFTY revenues and expenses and the resulting operating income. The supporting schedules for each of the adjustments that I am recommending to the Company's claimed rate base, revenues and operating expenses are presented on Exhibits LKM-4 through LKM-20.

Q. **HOW IS THE REMAINDER OF YOUR TESTIMONY ORGANIZED?**

A. This section, Section I, provides the introductory information to my testimony. Section II presents a summary of my findings and conclusions. In Section III, I document and

explain each of the accounting adjustments that I have made to the rate base and operating income to arrive at the test year revenue increase shown on Exhibit LKM-1. Additionally, attached to this testimony, I present the exhibits that support my adjustments and summarize my revenue requirement recommendation. Appendix A, attached to this testimony, provides my resumé which summarizes my professional experience.

II. Summary and Recommendations

Q. **PLEASE SUMMARIZE THE RATE RELIEF REQUESTED BY THE COMPANY IN ITS FILING.**

A. On September 30, 2025, the Company filed its base rate case with the Pennsylvania Public Utility Commission (the "Commission") seeking a general rate increase pursuant to 66 Pa. C.S. § 1308(d) of the Public Utility Code. If PPL Electric's full requested increase is granted, the Company's annual base rate distribution revenue would increase by approximately $356.3 million, resulting in a total system average increase of approximately 33.42%.[1] This level of rate relief is designed to provide the Company with an opportunity to earn an 8.56% overall rate of return on rate base, including a 11.30% return on common equity, on a rate base of $5.818 billion.[2]

According to the Company, the principal reasons for the filing are: (i) accelerated capital investment to maintain and improve system reliability and to reduce service outages, especially during major storms; (ii) investments in our customer service offerings to meet or exceed customer expectations including improved payment options, easier customer service interactions, and increased service levels; (iii) upgrading the Company's aging IT infrastructure to improve cybersecurity, customer

[1] PPL Electric Volume 7, Exhibit Fully Projected Future 1, A-1, Page 1.
[2] Direct Testimony of Christine M. Martin at 8:12-15.

interactions, and employee facing systems; (iv) flat residential and commercial sales as a result of a slow economic growth and increased levels of distributed generation from alternative energy systems/net metering; and (v) setting rates based on cost of service.[3]

Q. **PLEASE SUMMARIZE YOUR FINDINGS AND RECOMMENDATIONS.**

A. As shown on Exhibit LKM-1, I have determined that the Company's should be allowed to increase its annual revenue $150.0 million for the FPFTY ending June 30, 2027. This represents a decrease of $206.3 million from the Company's requested increase of $356.3 million. This is the amount by which revenues exceed those required to generate an overall rate of return on rate base of 6.48% percent after accounting for the OCA's adjustments to the Company's claimed rate base and operating income. The 6.48% overall rate of return represents OCA witness Garrett's findings regarding the Company's rate of return. In comparison, the Company is seeking an overall rate of return of 8.56%.

III. Revenue Requirement Issues

1. Cash Working Capital

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO CASH WORKING CAPITAL.**

A. OCA witness Koenig is the OCA witness who has reviewed the Company's cash working capital claim in this proceeding. In addition to her analysis, I have provided Ms. Koenig with my adjustments to O&M expenses which she has incorporated in the results of her cash working capital calculations. After incorporating my O&M expense adjustments, she provided me with the final cash working capital amount which I have

[3] PPL Electric Volume 7, Exhibit Fully Projected Future 1, A-1, Page 1.

included in rate base. Her adjusted cash working capital amount results in a decrease in the allowance for cash working capital of $7.2 million.

2. Payroll Expense

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO PAYROLL EXPENSES.**

A. The Company calculated its FPFTY payroll expense based on the average monthly payroll expense per employee and the year end forecasted number of employees. The Company indicates that it plans to hire 23 new employees for the Customer Service group. However, given that the hiring process occurs over time, it cannot be assumed that all 23 new positions will be filled. The usual approach, when onboarding customer service representatives, is that they must undergo training before beginning the work for which they were hired. It is not uncommon to find that some who begin the training do not successfully complete the training program. Additionally, some companies experience high turnover of Customer Service employees. Recognizing these challenges, I have assumed that an average number of Customer Service employees will be on staff during the year. Therefore, I have adjusted the number of new customer service employees to reflect 12 employees.

The Company also used 8.0% for the Social Security/Medicare taxes in its calculation of the payroll increase. The Company explained the higher tax rate stating:

> The calculation uses an 8% rate on wages and overtime to get a forecasted amount. That calculation does not consider other items that get taxed, like variable pay. This is why the percentage is slightly higher than the current Social Security percentage of 6.2% and Medicare of 1.45%.[4]

I disagree with this method because the Social Security/Medicare tax rates remain the same for variable pay. Therefore, I have revised the tax rate to reflect the actual

[4] OCA XXV-24

combined rate of 7.65%. The combination of the change in the number of customer service representatives and revision of the Social Security/Medicare tax rates changes result in a decrease in labor expenses of $747,000, as presented on Exhibit LKM-4.

3. Incentive Compensation Expense

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO INCENTIVE COMPENSATION EXPENSE.**

A. PPL Electric offers four incentive compensation plans to its employees. The PPL Electric Utilities Short-Term Incentive (STI) plan is a variable cash component of the employee's total compensation package that aligns employee pay with the company's short-term, annual performance. The 2025 plan metric were weighted based on a combination of operational goals, corporate strategic initiatives and individual achievement.[5]

The Executive Annual Cash Short-term Incentive Program is the executive employee's "at risk pay" and not guaranteed compensation. This plan's awards measure and reward performance against the company's financial and operational goals for the year and the individual contributions towards the achievement of those goals.[6]

Restricted Stock Units (RSUs) are awarded to employees in certain roles. Restricted stock units are PPL Electric stock-equivalent units representing a future delivery of a specified number of shares of PPL Electric common stock delivered over a three-year period.[7]

Employees in executive level roles are also eligible for Performance Units. Performance units are awards in which executive officers receive a target number of performance units at the beginning of the performance period. The actual number of

[5] I&E-RE-II-11-D Attachment 1, page 2.
[6] I&E-RE-II-11-D Attachment 2b.
[7] *Id.*

shares of common stock earned at the end of the performance period is determined based on PPL Electric's actual three-year total shareowner return.[8] As described above, some of the plans are based upon financial performance. Though the Company was asked to provide a breakdown of the cost data based upon each type of plan, the requested data was not made available.[9] However, in my opinion incentive plans whose payouts are based on earnings goals and increasing shareholder value are not properly recoverable from ratepayers.

Q. **WHY IS IT APPROPRIATE TO REMOVE INCENTIVE COMPENSATION BASED ON EARNINGS GOALS FROM THE COST OF SERVICE?**

A. These costs are not properly recoverable from ratepayers for two reasons. First, because PPL has not adequately explained why the Company's ability to meet financial metrics is directly related to ratepayer benefits, such as safety, customer care, customer satisfaction, or other benefits, and that this incentive compensation is necessary to provide adequate service.[10] Second, because if the financial targets are set properly, achieving the financial targets would generate the funds needed to pay incentive compensation. In other words, the incentive plan should be self-funding.

The purpose of an incentive plan is to provide a reward for achieving a goal that would not be easily attained absent the reward. In this instance, the goal is to achieve a specific income level. The assumption is that if the threshold income level were not established as a goal to work towards, it would not be attained. Therefore, the net income level established as a threshold for payments should already be established high

[8] *Id.*
[9] I&E-RE-II-11-D (D).
[10] I am advised by counsel that the Commission recently rejected a utility's claim for incentive compensation expense associated with achieving financial goals because there is no direct connection between earnings targets and ratepayer benefits. *See Pa. PUC v. Columbia Gas of Pa., Inc.*, Docket No. R-2025-3053499 (Order entered Dec. 9, 2025).

enough such that the additional earnings achieved as a result of the incentive compensation cover the costs of incentive compensation. Asking ratepayers to pay the incentive compensation for achieving the threshold income is unfair and inappropriate because once the income level is attained, a rebate is not given to the ratepayer. Instead, the shareholder retains the additional income. Consequently, paying the incentive compensation related to earnings does not serve the ratepayer's interest.

As shown on Exhibit LKM-5, this adjustment reduces FPFTY O&M expenses by $955,000.

4. Goodwill and Institutional Advertising Expense

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO GOODWILL AND INSTITUTIONAL ADVERTISING EXPENSE.**

A. The Company has claimed $130,000 in goodwill and institutional advertising in the cost of service.[11] The related advertisements promote PPL Electric's corporate image depicting the Company as a caring corporate citizen and celebrating women of influence.

While the Company may choose to advertise or publicize its community activities, those types of advertisements are generally not acceptable forms of advertising whose costs should be passed on to ratepayers. Advertisements that depict the Company as being a good corporate citizen serve only to benefit the Company's image for the purpose of making PPL a more attractive investment option, and, therefore, it is more appropriate for shareholders to bear those costs. These advertisements do virtually nothing to inform customers of safe and reliable service, conservation or ways they can save on their utility bills. Hence, under traditional

[11] Response to OCA XII-16.

ratemaking practices, goodwill and institutional advertising cost are not borne by ratepayer. Therefore, on Exhibit LKM-6, I am recommending an adjustment which decreases operating expenses by $130,000.

5. Customer Payment Transaction Fees

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO CUSTOMER PAYMENT TRANSACTION FEES.**

A. PPL Electric proposes to include the costs of the transaction fees for payment of customers' bills in the cost of service. According to PPL Electric, these fees are assessed to those customers who pay their bills by credit and debit cards, as well as electronic payment methods such as Venmo and PayPal.[12] Additionally, a customer who makes a payment using a credit or debit card or makes a payment via a walk-in location, such as through Western Union or Fiserv, is charged a separate fee that is set by the outside vendor.[13] In other words, the customers making these alternate forms of bill payments must absorb the fees.

The Company argues that it has become a customer expectation to be able to make payments using the alternate or newer forms of payment that differ from the traditional payment methods.

Q. **ARE YOU SUPPORTIVE OF THE COMPANY'S PROPOSAL REGARDING INCLUSION OF THE FEES IN THE COST OF SERVICE?**

A. In this proceeding, I am not the expert who is reviewing customer service issues. However, I concur with OCA witness Alexander that PPL Electric's proposal to eliminate transaction fees for the payment of customer bills should be approved.[14] I defer to Ms. Alexander with respect to her recommendations on the evaluation that is

[12] Direct Testimony of Lisa Norden at 7:13-21.
[13] OCA XXV-13.
[14] Direct Testimony of Barbara R. Alexander at 7:18 – 8:4.

needed to ensure that the customer payment fees are the lowest possible and that reasonable efforts have been undertaken to ensure competitive based costs.[15]

Q. **DO YOU HAVE ANY OTHER CONCERNS ABOUT THE INCLUSION OF THESE FEES IN THE COST OF SERVICE?**

A. Yes. I have reviewed the Company's calculation of the fees and disagree with the amount. The Company's projection of the number of alternate payment transactions assumes a 30% growth rate. However, for the most recent 2 years provided by PPL, the growth rate has been 15.2% and 14.4%, respectively.[16] Even though it shows a slight decrease, I question whether there is a rapid growth in the alternate forms of payment absent further explanation by PPL. I believe it would be more reasonable to use a 15% growth rate to predict the number of transactions. However, this will only apply if the Commission accepts the Company's proposal to include these payment transaction fees in the cost of service. If the Commission accepts the Company's proposal to include the transaction costs in the cost of service, I recommend the projected number of transactions should be based on the 15% growth rate. Hence, I am recommending an adjustment to operating expenses which reduces the cost of the customer payment transaction fees by $792,000 on Exhibit LKM-7.

6. Infrastructure Investment and Jobs Act (IIJA) Regulatory Asset Amortization

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO THE INFRASTRUCTURE INVESTMENT AND JOBS ACT (IIJA) REGULATORY ASSET AMORTIZATION.**

A. In this proceeding, PPL Electric is making a claim for approximately $633,000, amortized over three years for an annual cost of service amount of $211,000.[17] The cost

[15] *Id*.
[16] I&E-RE-II-19-D Attachment 1, Tab RE_II_19_A.
[17] Direct Testimony of Sharon Leskowsky at 5:1-3.

being claimed are primarily consulting fees relating to IIJA projects. However, the Company has not provided any evidence or claim that any grants were received, nor any infrastructure project was built based upon IIJA grants received.

According to the Company, it submitted a notice (presumably to the Commission) that PPL Electric establish a regulatory asset for certain IIJA-related incremental expenditures for costs incurred in order to participate in IIJA funding opportunities.[18] The IIJA is a federal program that was enacted on November 15, 2021 to provide federal funds for investment in utility infrastructure improvements. According to PPL Electric's filing, the establishment of the regulatory asset was predicated on the Commission's Order issued on July 13, 2023, in Docket No. P-2022-3032929. [19]

Q. **WHAT IS YOUR CONCERN WITH RESPECT TO THE COMPANY'S REGULATORY ASSET CLAIM?**

A. It is important to note that Docket No. P-2022-3032929 was not a proceeding that was specific to PPL Electric. The proceeding involved UGI, though, in some respects, the decision in that proceeding was intended to apply to other utilities in the Commonwealth. The Order on which the Company based its decision to defer the IIJA costs and recover them in this proceeding gives the Company neither the explicit authority to defer the costs nor assurance that the costs would be recovered.

With respect to the establishment of a deferred asset, the Commission stated:

> We will, accordingly, make explicit that costs incurred by utilities to prepare, apply, administer and otherwise execute on opportunities for federal funding made available by the IIJA will qualify for regulatory

[18] Direct Testimony of Sharon Leskowsky at 4:22.
[19] Direct Testimony of Sharon Leskowsky at 4:21.

> asset accounting treatment, along with related offsetting funding receipts.[20]

Here, I believe the term "qualify" does not equate to receiving authorization to defer and recover the IIJA costs. The Commission appears to be concerned about an intervening party raising retroactive ratemaking as the reason why the deferred IIJA costs can not be recovered. The Commission further stated:

> In prior proceedings involving Commission authorization for deferral accounting, the requesting utility has been required to show that the expense item appears to be within the scope of the type of items that the Commission has allowed as an exception to the general rule against retroactive recovery of past expenses.[21]
>
> However, petitions seeking authorization for deferral accounting are not intended to create a factual record.[22]
>
> As such, the burden of proof will remain with the utility to establish in any subsequent proceeding that costs associated with seeking federal funding made available by the IIJA are: (1) extraordinary and substantial; (2) non-recurring; and (3) unanticipated. We are simply determining here that the IIJA-related expenses are within the scope of the type allowed to be deferred and tracked as a regulatory asset as an exception to retroactive recovery.[23]

My concern is that it is not reasonable to allow recovery of the deferred IIJA costs. First, PPL Electric states that it submitted notice to the Commission that it would defer the costs, but it has not provided a Commission Order that authorizes the deferral.[24] Based on the Order in Docket No. P-2022-3032929, this current proceeding would be the case that formally authorizes the deferral and cost recovery. However, the Commission stated:

[20] Docket No. P-2022-3032929 order at 9.
[21] *Id.*
[22] *Id.* At 10
[23] *Id.*
[24] Direct Testimony of Sharon Leskowsky at 4:22.

> To be clear, the establishment of an IIJA-specific regulatory asset is not a finding of prudency and does not provide a predetermined certainty of cost recovery for those expenses. Further the allowance granted is not a directive that a utility must defer these costs, nor is it making a determination of the appropriate treatment for the recovery of any allowable costs in a future period. [25]

Second, the amount for which recovery is sought is not extraordinary and substantial. For a company the size of PPL, recovery of $633,000 does not negatively impact its financial ratings or detract from its status as a financially fit public utility. Third, the costs were not unanticipated. Unlike new tax legislation, natural disaster or some other event that could costs millions of dollars, the deferred costs are not significant as in the case of a catastrophic event. For these reasons, I am recommending an adjustment that removes the amortization of the IIJA cost of $211,000 from the cost of service on Exhibit LKM-8.

7. Research & Development ("R&D") Expenses

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO R&D EXPENSES.**

A. The cost of service includes internal R&D expenses of $275,000[26] and external R&D expenses of $400,000. Combined, these costs represent a $321,000 increase to R&D expenses, but it is unclear why there is a need for these increases. The increase in external R&D expenses of $200,000 relates to the National Electric Energy, Testing, Research and Applications Center ("NEETRAC"), which is a non-profit member-supported electric energy research, development and testing center.[27] Regarding the increase in internal R&D expenses, PPL Electric explained the increase as being due to more coordination and participation with the Transmission and Distribution businesses.

[25] Docket No. P-2022-3032929 order at 9.11.
[26] PPL Volume I, Part II, Attachment II-D-7e.
[27] *Id*.

I am respectfully requesting that the Company more fully explain these increases in its rebuttal testimony. Specifically, PPL Electric should provide the budget justification for the increased NEETRAC expenditure and the benefits to ratepayers from the NEETRAC research. With respect to the Internal R&D activities, PPL Electric should fully explain why more coordination and participation with the Transmission and Distribution businesses would result in an increase in expenses of $121,000. Because PPL Electric has not adequately explained why these expenses are necessary to provide safe and adequate utility service, nor has it demonstrated the cause of these increases, I am recommending an adjustment to decrease R&D expenses by $321,000 on Exhibit LKM-9.

8. Membership Dues

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO MEMBERSHIP DUES.**

A. The Company included in the FPFTY $2,878,000 for membership dues.[28] This amount reflected an increase of $1,409,000. In response to an OCA discovery request, the Company explained there was an error in the amount presented which resulted in an $808,339 overstatement of membership dues.[29] Consequently, on Exhibit LKM-10, I am recommending an adjustment to decrease membership dues by $808,000.

9. Eligible Customer Listing Expenses

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO ELIGIBLE CUSTOMER LISTING ("ECL") EXPENSES.**

A. The ECL is associated with the administration of the Competitive Enhancement Rider. PPL Electric is proposing to eliminate the CER from its tariff. However, costs associated with the ECL are the only costs currently being recovered through the CER.

[28] PPL Volume I, Part II, Attachment II-D-7a
[29] OCA XII-11.

The cost of compiling the ECL is incurred once every 5 years, so the Company is proposing to include a 5-year amortization of the ECL cost of $500,000 in the cost of service. This would result in an annual increase of $100,000.[30]

I am recommending an adjustment to remove the $100,000 from the cost of service because the next ECL update is not due to until 2029, beyond the scope of the ratemaking test year used in this proceeding. Therefore, it is inappropriate to begin recovering costs in the FPFTY that will not be incurred until 2029. Those costs fall outside of the test year and are not eligible for recovery in this proceeding. On Exhibit LKM-11, I present my adjustment which reduces O&M Expenses by $100,000 to remove the post-test year expenses related to the ECL.

10. Rate Case Expenses

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO RATE CASE EXPENSES.**

A. PPL Electric is claiming rate case expenses of $2,222,000 which it proposes to normalize over a 3- year period. According to the Company, it expects to file another rate case in 3 years, meaning that the company views the 3-year period as reasonable.

However, when the information supplied by the Company is analyzed the 3-year period is not reasonable. PPL Electric's filed a base rate case on March 31, 2010 at Docket No. R-2010-2161694. In 2012, PPL Electric filed a base rate case on March 30, 2012 at Docket No. R-2012-2290597. Then in 2015, PPL Electric filed a base rate case on March 31, 2015 at Docket No. R-2015-2469275.[31] Using those dates the average timespan between rate cases is 5 years. Therefore, I am recommending a 5-year period be used to normalize rate case expenses because it more accurately reflects PPL's historic filing frequency than the proposed 3-year period. Therefore, on Exhibit

[30] I&E-RE-I-7-D.
[31] Response to I&E-RE-I-10-D.

LKM-12, I am recommending an adjustment to decrease operating expenses by $297,000 to reflect the change in rate case expense normalization.

11. Company Sponsorships

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO COMPANY SPONSORSHIPS EXPENSE.**

A. The Company has claimed $120,000 in Company Sponsorships in the cost of service.[32] Company Sponsorships are similar to Goodwill and Corporate Image advertising because they promote PPL Electric's corporate image and depict the Company as a good corporate citizen. However, these types of expenses contribute virtually nothing to enhance the provision of safe and reliable service to PPL Electric's ratepayers. Hence, under traditional ratemaking practices, Company Sponsorships costs are not borne by ratepayers. Therefore, on Exhibit LKM-13, I am recommending an adjustment which decreases operating expenses by $120,000.

12. Affiliate Support- Engineering & Construction Expense

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO AFFILIATE SUPPORT-ENGINEERING & CONSTRUCTION EXPENSE.**

A. The Company indicates that it created new group, the Engineering & Construction Group, in August 2024.[33] As of the FPFTY, the indicates that there were approximately 13 newly created positions not yet posted for recruitment.[34] Given that this is a new group, I believe that it would be necessary for the Company to explain, in its rebuttal testimony, the budget purpose and justification for the additional new positions. I have removed the costs of the unfilled positions because they are currently unfilled. On

[32] Response to I&E-RE-I-12-D.
[33] PPL Volume I, Part II, Attachment II-D-8e, page 1.
[34] Response to OCA XII-21 Attachment 1.

Exhibit LKM-14, I present this adjustment which reduces operating expenses by $88,000.

13. PURTA Tax

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO PURTA EXPENSE.**

A. In PPL Electric's cost of service, it included $1,410,000 in Public Utility Realty Tax Act (PURTA) expense. The Pennsylvania Department of Revenue has released notices indicating that the PURTA rate for calendar years 2025 and 2026, the PURTA rate will be 0 mills. This means there will be no PURTA expense for those years. Therefore, I am recommending an adjustment on Exhibit LKM-15 that reduces PURTA expense by $1,410,000.

14. Depreciation

Q. **WHAT ADJUSTMENT ARE YOU RECOMMENDING TO DEPRECIATION EXPENSE?**

A. OCA witness David Garrett is recommending changes to the Company's proposed depreciation rates. On Exhibit LKM- 16 I am recommending an adjustment to decrease depreciation expense to reflect Mr. Garrett's recommendations. This adjustment results in a decrease to Depreciation Expense of $4,247,000.

Q. **BASED ON THE ADJUSTMENT TO DEPRECIATION EXPENSE, ARE YOU MAKING ANY ADDITIONAL ADJUSTMENTS?**

A. Yes. I am also adjusting the Company's claimed accumulated depreciation balance. As explained in detail by OCA witness Garrett, annual depreciation expense accruals are summed and included in the utility's accumulated depreciation balance as an offset to gross plant in service. I have made a downwards adjustment of $4,247,000 to PPL's accumulated depreciation claim consistent with OCA witness Garrett's depreciation

expense adjustment, resulting in an increase to the Company's claimed rate base balance of the same amount.

15. Economic Development

Q. **PLEASE SUMMARIZE THE COMPANY'S ECONOMIC DEVELOPMENT PROPOSAL.**

A. PPL Electric proposes to implement its Opportunity Pennsylvania Program, which is proposed to be a proactive initiative to support communities in securing funding through the Pennsylvania SITES ("PA SITES") initiative and other state, federal, or regional programs.[35] The Company argues that economic development ensures better-paying jobs for families, increased tax revenues for local governments, and an overall higher quality of life for residents. The Company further argues that by supporting business attraction, retention, and expansion through reliable infrastructure and strategic partnerships, PPL Electric can help foster sustainable growth and prosperity across its service territory. Also, as new companies connect to the grid, they increase overall system utilization, which helps spread fixed costs across a broader customer base.

PPL witness Hunt states that the Opportunity Pennsylvania Program is designed to support communities in preparing strategic sites for the types of industrial activity that best align with their local strengths, workforce, and long-term development goals.[36] It does not target specific industries or customer classes. The types of customers that may locate in communities that receive support through the Program are unknown at this point. It is also unknown what communities will apply for and receive support through the Program.

[35] Direct Testimony of Jason Hunt at 2:22 – 3:3
[36] Direct Testimony of Jason Hunt at 4:1-6.

Q. **WHAT IS PENNSYLVANIA SITES ("PA SITES")?**

A. The Pennsylvania Strategic Investments to Enhance Sites Program (PA SITES) was established to provide grant and loan funding to eligible applicants to develop competitive sites for businesses to relocate or expand within the Commonwealth. The funding for the program includes two components that support the development of competitive sites within the Commonwealth: (i) Planning Grants and (ii) Construction Grants and Loans.[37]

The Planning Grants component provides grants to conduct a plan or feasibility study for a prospective site that may include the best future use of the parcel(s) for best economic growth opportunities for redevelopment or new development. The Construction Grants and Loans component provides grants and loans to serve as gap financing for strategic sites that need financial assistance to help reduce development risk for businesses. The grant and loan funding is intended to help finance strategic investments that will enhance sites across the Commonwealth to effectively compete for expanding and relocating businesses. The program will help reduce development risk for businesses by timeline reduction from the development of public infrastructure or reducing unknown development costs.

Q. **WHAT IS THE COST OF THE PROPOSED ECONOMIC DEVELOPMENT PROGRAM?**

A. It is proposed that the economic development program have an annual budget of $400,000. However, the cost of the program may exceed $400,000 because PPL Electric has not accounted for labor costs associated with the program.

[37] *Pennsylvania Strategic Investments to Enhance Sites Program (PA SITES)*, Pa. Department of Community & Economic Development (last accessed Dec. 22, 2025), https://dced.pa.gov/programs/pennsylvania-strategic-investments-to-enhance-sites-program-pa-sites/

Q. **HAS PPL IDENTIFIED WHAT SPECIFIC COSTS WILL BE INCURRED TO IMPLEMENT THIS PROGRAM?**

A. No. PPL Electric only states that the annual budget was developed using market information for similar services offered by utilities in other states, including PPL Electric's affiliates, LG&E and KU.[38] However, PPL Electric does not disclose what the specific services were. PPL Electric also states that discussions with communities and vendors that have successfully secured PA SITES funding indicate that the cost of such technical assistance typically ranges from $100,000 to $120,000 per site, depending on the complexity of the site and the availability of existing data.[39]

The Company concludes that the $400,000 requested annual budget is reasonable and prudent.[40] However, there is insufficient information to conclude prudence because the Company has relied upon third party hearsay.

Q. **WILL PPL ELECTRIC SHAREHOLDERS CONTRIBUTE TO THIS PROGRAM?**

A. No. The Opportunity Pennsylvania Program is proposed to be funded through distribution base rates and not by shareholders.

Q. **WHAT IS YOUR UNDERSTANDING OF THE BENEFITS OF THE PROGRAM?**

A. The broad benefits of the program are that it supports strategic site development and helps communities attract new businesses that create jobs for the Company's customers. The Company states that the program strengthens the electric grid, promotes

[38] Direct Testimony of Jason Hunt at 9:19-10:11.
[39] I&E-RE-IV-1.
[40] Direct Testimony of Jason Hunt at 9:7-15.

efficient use of the electric system, and enhances affordability by spreading fixed costs across a larger customer base.[41]

Q. **DO YOU RECOMMEND THAT THE ECONOMIC DEVELOPMENT PROGRAM BE AUTHORIZED?**

A. No. The broad benefits of the program – supporting strategic site development; helping communities attract new businesses; and creating new jobs for the Company's customers – are governmental functions and not functions of a utility. The $400,000 cost that PPL Electric proposes to pass on to ratepayers amounts to a hidden tax that will be used to finance the governmental functions that the utility will be taking on. The strengthening of the electric grid, promoting efficient use of the electric system, and enhancing affordability by spreading fixed costs across a larger customer base will naturally occur when system expansion is driven by economic decisions that are feasible and financially viable. PPL Electric does not identify a specific area nor a specific project that it has identified as needing to the economic development program in order to reach fruition. In my opinion, this is a classic case of subsidizing projects that are not economically feasible. I urge the Commission to recognize that the more you subsidize uneconomic projects the more uneconomic projects crop up. Ultimately, this results in higher costs to all customers. Consequently, I am recommending an adjustment to remove the $400,000 Economic Development program from the cost of service. This adjustment is presented on Exhibit LKM-17.

[41] CAUSE-PA V-21

16. Universal Services Rider Salaries

Q. **PLEASE EXPLAIN YOUR ADJUSTMENT TO THE UNIVERSAL SERVICES PROGRAM SALARIES AND WAGES.**

A. The Universal Service and Energy Conservation Plan ("USECP") is the overall program under which the Company administers several forms of assistance to customers to help them pay their electric service bills and pay down their balances in arrears. PPL Electric proposes to recover the costs of the salaries and wages of the employees who staff the programs through the USECP Rider.

OCA witness Colton recommends in his Direct Testimony that PPL's proposal to move internal administrative wages and salaries out of base rates to instead be collected through the USR should be denied. Based upon his recommendation, I have presented an adjustment to reverse the Company's adjustment to O&M expenses. This adjustment results in an increase of $1,410,000 to operating expense and is presented on Exhibit LKM-18.

17. Interest Synchronization

Q. **PLEASE EXPLAIN YOUR INTEREST SYNCHRONIZATION ADJUSTMENT.**

A. To determine the tax deductible interest expense for ratemaking, I have multiplied the OCA's recommended rate base by the weighted cost of debt included in the capital structure recommended by OCA witness Garrett. This procedure synchronizes the interest expense deduction for tax purposes with the interest component of the return on rate base to be recovered from ratepayers. As shown at the bottom of Exhibit LKM-19, this adjustment increases the interest expense deduction by $41,802,000 to a total of $171,541,000 compared to the interest deduction of $129,739,000 calculated by PPL

Electric. This decreases state and federal income taxes by $3,026,000 and $8,143,000, respectively.

18. Vegetation Management

Q. **PLEASE SUMMARIZE THE COMPANY'S VEGETATION MANAGEMENT PROPOSALS.**

A. PPL Electric's current vegetation management activities are based on a five-to-eight-year inspection and maintenance cycle for its distribution circuits using a variety of vegetation management activities, including tree pruning, tree removal, brush control, and herbicide application. The goal of the vegetation management program is to safeguard the reliability of PPL Electric's distribution system and to reduce the negative impacts of storms and weather events.[42]

The current five-to-eight year vegetation maintenance cycle means that every distribution circuit is expected to be inspected and have any necessary maintenance activities performed at least once every five to eight years. The Company is proposing to increase this vegetation management cycle to once every 5 years. PPL Electric claims the increased inspection and maintenance frequency will allow the Company to proactively identify and address vegetation that may cause issues in the future. This has the benefit of potentially eliminating the cause of an outage before it happens, which improves reliability for customers and lessens storm response costs.[43]

To address the Company's ongoing vegetation management challenges, the Company proposes to increase the vegetation management budget in the FPFTY from $35.6 million and $31.8 million in the HTY and FTY, respectively, to approximately $50 million.[44] This expanded budget will support a higher frequency in the cycle of

[42] Direct Testimony of Nicole Howell at 4:3-21.
[43] Direct Testimony of Nicole Howell at 5:18-6:10.
[44] Direct Testimony of Nicole Howell at 6:14-17.

vegetation inspection and maintenance and proactively identify and mitigate potential vegetation-related risks, thereby improving system reliability and reducing the likelihood of outages or safety hazards. The Company also proposes to begin addressing off right-of-way trees (trees that exist beyond the current distribution ROW but nevertheless pose a threat to the distribution system).[45]

Q. **HAVE YOU PROPOSED AN ADJUSTMENT TO THE VEGETATION MANAGEMENT EXPENSE?**

A. No, I have not because there are additional pieces of information that need to be understood about the Company's Vegetation management program. These are relevant concerns that were not addressed during the initial discovery period but are needed to reasonably address the vegetation management program.

First, despite the increase in the vegetation management budget, one of the goals of the reduction in the cycle maintenance from 5-8 years to 5 years is cost reduction from storms. To my knowledge, the Company has not reflected any cost savings in the cost of service. Second, PPL should provide an analysis of the most recent 5 years actual versus budget vegetation management spend by vegetation management activity (e.g., ROW maintenance, ground to sky clearance, insect control, the expected costs of additional easements, etc.). Third, PPL did not provide its 5-year vegetation management operating budget for review. This budget should have been provided by vegetation management activity (e.g., ROW maintenance, ground to sky clearance, insect control, the expected costs of additional easements, etc.). Fourth, PPL should provide a breakdown of the vegetation management capital budget with enough detail to determine the incremental amount expected to be spent on the enhanced Row

[45] Direct Testimony of Nicole Howell at 6-8.

program. Finally, PPL Electric should provide details with respect to negotiation with contractors to perform the work. For example, have RFP's been issued to select contractors? Are agreements in place to carry out the work? When is the work expected to begin? The OCA respectfully request that PPL Electric address these issues in its rebuttal testimony.

Q. **WHAT OTHER CONCERNS DO YOU HAVE WITH RESPECT TO VEGETATION MANAGEMENT EXPENSE?**

A. As part of acquiring additional rights-of-way to address "Off ROW" trees, the Company proposes that the Commission grant it the authority to "capitalize the first removal of hazard and danger trees after the acquisition of these additional rights."[46] I recommend that this request be denied. According to the Electric Plant Instructions, Section 7, *Land and Land Rights*, Paragraph A, of the FERC Uniform System of Accounts,

> The accounts for land and land rights shall include the cost of land owned in fee by the utility and rights. Interests, and privileges held by the utility in land owned by others, such as leaseholds, easements, water and water power rights, diversion rights, submersion rights, rights-of-way, and other like interests in land. **Do not include in the accounts for land and land rights and rights-of-way costs incurred in connection with first clearing and grading of land and rights-of-way and the damage costs associated with the construction and installation of plant**. [Emphasis added][47]

In addition to FERC prohibition of capitalizing the cost of first clearing and grading of land and rights-of-way, the cost of the first clearing of the ROW land (which is part of vegetation management activity) is appropriately recorded as an expense. The Commission would create a very bad precedent by allowing the Company to capitalize

[46] Direct Testimony of Nicole Howell at 11:7-10.
[47] Electronic Code of Federal Regulations, e-CFR data current as of July 7, 2021, Title 18 ~ Chapter I ~ Subchapter C ~ Part 101.

these costs especially given that there is no extenuating circumstance that necessitates the capitalization.

Q. **DOES THIS COMPLETE YOUR DIRECT TESTIMONY?**

A. Yes, it does.

I. Introduction

Q. **PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

A. My name is Lafayette K. Morgan, Jr. My business address is 10480 Little Patuxent Parkway, Suite 300, Columbia, Maryland, 21044. I am a Public Utilities Consultant working with Exeter Associates, Inc. ("Exeter"). Exeter is a consulting firm specializing in issues pertaining to public utilities.

Q. **ARE YOU THE SAME LAFAYETTE K. MORGAN, JR. WHO SUBMITTED PRE-FILED DIRECT TESTIMONY IN THIS PROCEEDING?**

A. Yes, I am.

Q. **WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?**

A. The purpose of my surrebuttal testimony is to respond to the rebuttal testimonies of PPL Electric witnesses Dennis A. Urban, Jr., Bethany L. Johnson, Daniel S. Dane, Andrew W. Elmore, Katelyn Arnold, Nicole Howell, Lisa Norden, James Conrad, Jason Hunt, Sharon Leskowsky, and Vincent Poplaski which were filed on January 23, 2026. In this surrebuttal testimony, I will respond to these witnesses' disagreements with the adjustments I recommended in my direct testimony and further explain why I continue to recommend the adjustments I made. However, in certain instances, the Company has accepted some of my adjustments, or I have either revised or withdrawn adjustments that I initially recommended.

Q. **HAVE YOU PREPARED EXHIBITS TO ACCOMPANY YOUR SURREBUTTAL TESTIMONY?**

A. Yes. I have prepared Surrebuttal Exhibits LKM-1SR through LKM-20SR. In PPL Electric's rebuttal testimony, certain changes were reflected in its cost of service. As a result, the amounts presented in my cost of service need to be updated to reflect the

changes made by PPL Electric. Also, in the accompanying exhibits, I have reflected changes I have made to four adjustments.

As a result of incorporating these changes, the OCA's revenue requirement has been revised. Any changes I have made are discussed below. After reflecting PPL Electric's and the OCA's changes to the cost of service, the OCA's recommended increase in rates is now $186,785,000. This amount is $36,750,000 more than the $150,035,000 I recommended in my direct testimony, but $169,4487,000 less than PPL Electric's requested increase of $356,272,000. The cause of the significant change in the OCA's increase in revenue requirement is primarily driven by recognition of the negative net salvage adjustment which was inadvertently left out of the depreciation expense that was included in the schedules for developing the Company's revenue requirement.[1]

II. Revenue Requirement Issues

1. Company Sponsorships

Q. **PLEASE RESPOND TO MR. URBAN'S DISAGREEMENT WITH YOUR ADJUSTMENT TO COMPANY SPONSORSHIPS.**

A. In my direct testimony, I recommended an adjustment to remove $120,000 from the cost of service related to Company Sponsorships because I believe that they promote PPL Electric's corporate image and contribute little to enhance the provision of safe and reliable service to PPL Electric's ratepayers.[2]

Mr. Urban disagrees with the amount I have removed from the cost of service because he states that the $120,000 is not the amount included in PPL Electric's cost of service for Company Sponsorships. Instead, he indicates that only $27,510 was

[1] PPL Electric Exhibit JJS-3, p. I-7.
[2] Direct Testimony of Lafayette K. Morgan, Jr. at 19:6-13.

included in the cost of service for these sponsorships, and that the Company will not oppose the removal of the $27,510 from the cost of service. He cites the response to I&E-RE-I-12-D as the support for the $27,510.[3] After reviewing the documentation, I will accept the $27,510 as the appropriate amount to be removed from the cost of service.

2. Membership Dues

Q. **PLEASE RESPOND TO THE COMPANY'S DISAGREEMENT WITH YOUR ADJUSTMENT TO MEMBERSHIP DUES.**

A. In my direct testimony, I recommended an adjustment to decrease membership dues by $808,000 based on an error that overstated membership dues. [4]According to Mr. Urban's testimony, the Company agrees with the adjustment but proposes that the full amount of $808,339 be removed for overstatement of membership dues instead of the $808,000 I recommended.[5] I accept the revised amount as recommended by Mr. Urban in his rebuttal testimony.

3. Payroll Expense

Q. **PLEASE RESPOND TO MR. URBAN'S AND MR. DANE'S DISAGREEMENT WITH YOUR ADJUSTMENT TO PAYROLL EXPENSE.**

A. In my direct testimony, I explained that I adjusted the FPFTY payroll expense to reflect the average number of newly hired employees for the Customer Service group. I explained that because of the onboarding process for customer service representatives, it is not likely that the proposed 23 new positions will be filled during the entire FPFTY. Recognizing the onboarding process, as explained in my direct testimony, I have assumed that an average number of Customer Service employees will be on staff during

[3] Rebuttal Testimony of Dennis Urban at 7:8-10.
[4] Direct Testimony of Lafayette K. Morgan, Jr. at 17:13-17.
[5] *Id*.

the year. Therefore, I have adjusted the number of new customer service employees to reflect 12 employees. [6]

In disagreeing with my adjustment, Mr. Urban explains that the Customer Service functional group applied a 5% vacancy reserve to its payroll expense and explained that the reduction I proposed does not factor in contractors who could support the customer service function, if the actual number of employees are less than proposed.[7]

Also, in his rebuttal, Mr. Dane stated that I have not provided supporting evidence that it is appropriate to reduce the staffing level in calculating payroll expenses for the FPFTY.[8] However, I would point out the Company has not refuted the statements I made in my direct testimony regarding the hiring, training and testing of customer service representatives, or the turnover rate of customer service representatives. Hence, I believe my decision to use the average number of customers is valid.

With respect to claims made by Mr. Urban that my reduction in the number of customer service employees is not appropriate because the Company included a 5% vacancy rate, I do not believe that the Company has clearly demonstrated this claim. I&E witness Christopher Keller also makes a similar observation in his direct testimony.[9] The Company uses a generalized approach in determining its FPFTY payroll expense. This approach calculates the payroll based on applying the average payroll expense per employee to the total number of employees. Hence the Company has not demonstrated it applied a 5% vacancy rate to customer service representatives

[6] Direct Testimony of Lafayette K. Morgan, Jr. at 8:15-16.
[7] Rebuttal Testimony of Dennis Urban at 12:18-13:2.
[8] Rebuttal Testimony of Daniel S. Dane at 17:11-12.
[9] Direct Testimony of Christopher Keller at 5:16-6:2.

in that calculation and my adjustments should be accepted, as they appropriately address the likelihood that the posted positions will be filled by the close of the FPFTY.

I believe that any consideration of Mr. Urban's statement about the use of contractors to fill the void left by unfilled customer service positions should be limited. Mr. Urban's statement that the Company "could" use contractors is an indication that there is no definitive plan to hire contractors to fill the customer service representatives' functions. He makes the statement without revealing a definitive action plan. If there were a definitive plan, there would be a contingency budgeted. If a contingency exists, then the Company has overstated its costs, and the contingency costs should be removed if the full cost of 23 employees are included in the cost of service.

Q. **WITH RESPECT TO THE ADDITIONAL CUSTOMER SERVICE EMPLOYEES, ARE THERE OTHER REASONS THAT MAKES IT PLAUSIBLE THAT ALL OF THE EMPLOYEES WILL NOT BE HIRED DURING THE ENTIRE FPFTY?**

A. Yes. In OCA witness Alexander's surrebuttal testimony, she mentions that PPL Electric witness Norden acknowledges that improvement in the customer service function is needed. However, Ms. Norden only indicates a plan exists but provided no details of such a plan, nor was the plan provided. Hence, even though I recommended an adjustment to decrease customer service labor expense, and Ms. Alexander raised concerns about PPL Electric customer service, one would expect PPL Electric to provide more details to buttress its claim. PPL Electric did not do so. Failure to provide the plan, limits the evaluation of the plan and the potential hiring of additional staff.

4. Incentive Compensation Expense

Q. **PLEASE RESPOND TO THE COMPANY'S DISAGREEMENT WITH YOUR ADJUSTMENT TO INCENTIVE COMPENSATION EXPENSE.**

A. In my direct testimony, I explained the rationale for my adjustment to the incentive compensation expense.[10] In short, I believe that incentive compensation that are based on achieving earnings goals are more aligned with increasing shareholder value and are not properly recoverable from ratepayers.

One of the arguments made by the Company in support of its incentive compensation expense is that it must pay market-based compensation to attract and retain employees.[11] However, it should be noted that my adjustment in no way claims that PPL Electric should not be allowed to pay competitive market-based compensation. Instead, the adjustment I have made to reduce incentive compensation is an adjustment to assign a portion of the incentive compensation to shareholders. In other words, I believe the portion of incentive compensation tied to achieving earnings goals should be the responsibility of shareholders because they gain the most from achieving earnings goals.

Q. **ARE THE PRACTICES OF OTHER JURISDICTIONS RELEVANT TO THE RECOVERY OF INCENTIVE COMPENSATION IN THIS PROCEEDING?**

A. No. The practices of other jurisdictions that are cited by Mr. Dane address the payment of competitive compensation to employees to meet the competition for employees in the labor marketplace. As I explained above, my adjustment does not challenge the payment of competitive compensation. In addition, the Commission should decide each case based on the merit of the evidence presented.

[10] Direct Testimony of Lafayette K. Morgan, Jr. at 9:5 -11:8.
[11] Rebuttal Testimony of Daniel Dane at 19:7-11.

Q. **MR. POPLASKI STATES YOUR ADJUSTMENT FAILS TO RECOGNIZE THAT 100% OF THE RESTRICTED STOCK COMPENSATION (RSUS) ARE NOT DEPENDENT ON FINANCIAL METRICS, SO ANY ADJUSTMENT TO LIMIT THE RECOVERY OF THOSE AMOUNTS SHOULD BE REJECTED.[12] WHAT IS YOUR RESPONSE?**

A. In my direct testimony, I address this issue. I stated: "Though the Company was asked to provide a breakdown of the cost data based upon each type of plan, the requested data was not made available."[13] Mr. Poplaski offers his critique, but the Company has not supplemented its data request response, which would allow me to revise my testimony. Hence, unless the data has been provided, Mr. Poplaski's statement that my adjustment should be rejected is not valid and should be disregarded. The Commission should reject the Company's position on this issue for the failure of the Company to provide the requested data.

5. Goodwill and Institutional Advertising Expense

Q. **PLEASE RESPOND TO MR. URBAN'S DISAGREEMENT WITH YOUR ADJUSTMENT TO GOODWILL AND INSTITUTIONAL ADVERTISING EXPENSE.**

A. In my direct testimony, I recommended an adjustment to remove $130,000 in goodwill and institutional advertising from the cost of service.[14] While Mr. Urban states he disagrees with my adjustment, he does not present specific reasons for his disagreement.[15]

Q. **WHAT IS THE BASIS OF YOUR ADJUSTMENT?**

[12] Rebuttal Testimony of Vincent Poplaski at 7:6-10.
[13] Direct Testimony of Lafayette Morgan at 10:3-5.
[14] Id. at 11:9-12:3.
[15] Rebuttal Testimony of Dennis Urban at 13:19-14:15.

A. My adjustment is based on my understanding of the definition of goodwill and institutional advertising expenses and the limits of their recovery for ratemaking purposes. It should be noted that it is the Company that classified these expenses as goodwill and institutional advertising expenses. Hence, the characterization of the advertisements was not based on my judgement.

Q. **WHY SHOULD THOSE EXPENSES BE REMOVED FROM THE COST OF SERVICE.**

A. Under traditional ratemaking, it has been a long-held position that institutional and goodwill advertising should not be recovered from ratepayers because they are designed to enhance the image of the utility and its name recognition. While this type of advertising comes at a cost, it provides little benefit to ratepayers. Therefore, I continue to take the position that these costs should be removed from the cost of service. Therefore, the Commission should reject the Company claim for this expense.

6. Research & Development ("R&D") Expenses

Q. **PLEASE RESPOND TO MR. URBAN'S DISAGREEMENT WITH YOUR ADJUSTMENT TO RESEARCH AND DEVELOPMENT EXPENSES.**

A. In my direct testimony, I recommended an adjustment to R&D expenses which removed a total of $321,000 from the cost of service. There are two cost components associated with this adjustment. First, PPL Electric claimed external R&D expenses of $200,000 that relates to the National Electric Energy, Testing, Research and Applications Center ("NEETRAC"), which is a non-profit member- supported electric energy research, development and testing center.[16] The other R&D expense was an internal cost increase that PPL Electric explained as being due to more coordination

[16] Direct Testimony of Lafayette Morgan at 16:19-22.

and participation with its Transmission and Distribution businesses. I requested the Company to more fully explain these increases in its rebuttal testimony.

In Mr. Urban's rebuttal testimony, he explained that NEETRAC is an organization that helps address emerging electric grid challenges. This center provides a platform for research and knowledge sharing. According to Mr. Urban, NEETRAC research is needed to adapt to industry changes, find lower cost solutions, and drive innovation in grid modernization for improved reliability, safety and efficiency Mr. Urban states that NEETRAC work involves projects with The Electric Power Research Institute ("EPRI"), and entity generally recognized as a R&D entity that provides benefits to electric power industry.[17]

With respect to the $121,000 increase in R&D expenses related to the coordination and participation of PPL Electric's Transmission and Distribution businesses, the Company has offered no further explanation or insight as to why the coordination and participation of the two business units would cause an increase in R&D expenses. As presented by the Company in Attachment II-D-7e, the increase in these internal costs appears to be independent of the Company's support of external R&D support..

Based on the additional information I have gained about NEETRAC, I am revising my adjustment to R&D expenses to include the $200,000 related to NEETRAC. However, I am still recommending the disallowance of the $121,000 related to internal R&D expenses.

[17] Rebuttal Testimony of Dennis Urban at 15:13-22.

7. Rate Case Expenses

Q. **PLEASE RESPOND TO MS. JOHNSON'S AND MR. DANE'S DISAGREEMENT WITH YOUR ADJUSTMENT TO RATE CASE EXPENSES.**

A. PPL Electric is claiming rate case expenses of $2,222,000 which it proposes to normalize over a 3-year period. However, in my direct testimony, I recommended a 5-year normalization of rate case expenses based on PPL Electric's historical rate case filings.[18]

Ms. Johnson and Mr. Dane disagree with my adjustment and are seeking a 3-year normalization based on the Company's anticipation of filing a rate case in 3 years. Other than the statement that the Company anticipates filing a rate case in 3-years, there is nothing that provides any certainty that it will happen.

Mr. Dane, on page 25 of his rebuttal testimony, presents data that purportedly supports a 33-month interval between rate cases. The problem with the data set he provides is that he chooses to omit the interval between the prior rate case and this current rate case. This omission significantly distorts the conclusion he presents. Therefore, this analysis should be disregarded, and the Commission should deny the Company's claim for a 3-year normalization of rate case expenses.

8. Economic Development

Q. **PLEASE RESPOND TO THE COMPANY'S DISAGREEMENT WITH YOUR ADJUSTMENT TO REMOVE THE COMPANY'S INCLUSION OF THE $400,000 EXPENDITURE FOR ECONOMIC DEVELOPMENT EXPENSE.**

[18] Direct Testimony of Lafayette Morgan at 18:6-21.

A. In my direct testimony, I recommended an adjustment to remove the $400,000 because the broad benefits of the program and design of the program are governmental functions and not the functions of a utility.

Company witnesses Dane and Hunt disagree with my adjustment. In his rebuttal testimony, Mr. Dane characterizes the economic development expense in the revenue requirement as intended to recover the reasonable and necessary costs incurred by the Company to provide electric distribution service during the period in which rates will be in effect.[19] However, this claim is not consistent with the information provided by Mr. Hunt because, as discussed below, these cost are not related to the provision of electric distribution services.

Mr. Hunt states that PPL Electric's Economic Development proposal, (also referred to as the Opportunity Pennsylvania Program) is reasonable and aligned with the Company core obligations and designed to benefit customers by helping communities prepare competitive sites and attract investment.[20] These are not activities related to the provision of electric distribution services, but are more akin to donor activities.

Mr. Hunt argues that when communities attract new or expanding businesses, the additional load helps to further optimize infrastructure utilization.[21] Here, Mr. Hunt is essentially offering the economic theory argument about spreading fixed costs across a broader base to lower unit costs to customers.[22] However, it is not a utility's role to donate funds for the recruitment and activities related to seeking out and bringing new and expanding businesses to its service area. That is a proposition that places an

[19] Rebuttal Testimony of Daniel Dane at 11:3-5.
[20] Rebuttal Testimony of Jason Hunt at 1:17-21.
[21] Rebuttal Testimony of Jason Hunt at 2:15-19.
[22] *Id*.

enormous burden on the utility's capital resources which would take away resources that should be used for the development of the electric grid and investments in infrastructure.

It is well known that operating a utility is capital intensive and there is a constant need to raise capital to fund growth. It is beyond the utility's scope of operation to also fund the attraction of businesses and new customers to a particular section of its service territory. There are numerous factors that attract the movement of business and people to a region. For example, tax policy, education and healthcare, social factors, and the proximity to factors that affect the quality of life. These are issues that the governmental authorities are better equipped to handle and are part of their mandates.

In Mr. Hunt's direct testimony, he states that the "Opportunity Pennsylvania Program is a proactive economic development initiative that offers two key forms of support to communities within PPL Electric's service territory: (1) reimbursement funding for completed site development work; and (2) technical assistance to help communities secure additional state and federal funding."[23] He further stated that "The Opportunity Pennsylvania Program is designed to help communities take a proactive approach to attracting job creation and private investment through strategic site development. The goal is to improve 'speed to market,' helping communities become more competitive for high-impact investments and advancement of economic development."[24] In my opinion, PPL Electric's proposal has not offered a clearly articulated program that aligns with the role and operation of the utility. For example, it is not clear the type of state and federal funding PPL Electric would be providing assistance to secure. It is also not clear whether projects being pursued are primarily

[23] Direct Testimony of Jason Hunt, at 5:21-6:2.
[24] *Id*. at 7:14-18.

electric utility-related projects or what PPL Electric's funding of technical assistance is intending to secure. In other words, the programs that PPL Electric identified (reimbursement funding for completed site development work; technical assistance to help communities secure additional state and federal funding; and the proactive approach to attracting job creation and private investment through strategic site development) sound like broad corporate giving rather than a well-defined economic development program.

Essentially, the Company's rebuttal is attempting to change the perception of the program by claiming the program focuses on community preparedness rather than subsidization. However, the fact is that subsidization would occur under the program because a third-party, PPL Electric, would be funding efforts to attract development in the community. The subsidization essentially is making funds available to attract activity to an area that may not attract the activity without the funding. Despite these arguments, Mr. Hunt admits that the program is a way to help communities complete essential site-readiness steps and compete for larger state and federal awards.[25]

The fact that the adjustment proposed by the Company is to provide funding to create economic development rather than provide electric utility service, is a clear indication that the activity the Company is seeking to fund is beyond the scope of providing utility service. Therefore, I recommend the Commission deny this adjustment proposed by the Company.

9. Infrastructure Investment and Jobs Act (IIJA) Regulatory Asset Amortization

Q. **PLEASE RESPOND TO THE COMPANY'S DISAGREEMENT WITH YOUR ADJUSTMENT TO THE IIJA REGULATORY ASSET AMORTIZATION.**

[25] Rebuttal Testimony of Jason Hunt at 2:19-22.

A. In my direct testimony, I recommended an adjustment to remove the IIJA regulatory asset amortization from the cost of service in this proceeding for three reasons. First, while PPL Electric states that it submitted notice to the Commission that it would defer the costs, the Commission did not issue an Order that authorizes the deferral. Second, the amount for which recovery is sought is not extraordinary and substantial. For a company the size of PPL Electric, recovery of $633,000 does not negatively impact its financial ratings or detract from its status as a financially fit public utility. Third, the costs were not unanticipated.[26]

Company witnesses Dane and Leskowsky disagree with my adjustment. First, they believe the costs incurred meet the criteria for cost deferral in that the costs resulted from new legislation that required utilities to incur new, incremental costs that were not part of normal, ongoing O&M prior to the enactment of the legislation. Second, the witnesses state the Commission explicitly authorized utilities to utilize deferred accounting to track costs related to IIJA in a regulatory asset in Docket No. P-2022-3032929.[27]

Q. **DO YOU AGREE WITH THE COMPANY'S WITNESSES?**

A. No. In my direct testimony, I explained more fully why the positions of the Company's witnesses are not valid. I also explained that even if the Commission had notified utilities that it incurred IIJA costs that qualified for regulatory asset treatment, PPL Electric failed to obtain a Commission order to defer the costs. The Commission's Order is needed to support the creation of a regulatory asset account that entitles the utility to recover future revenues. Importantly, PPL Electric did not provide support for its argument that the IIJA costs are extraordinary and substantial which are necessary

[26] Direct Testimony of Lafayette Morgan at 15:21-16:10.
[27] Rebuttal Testimony of Daniel Dane at 12:2-4, and Rebuttal Testimony of Sharon Leskowsky at 7:7-9.

elements for recovery of deferred expenses. Therefore, PPL Electric does not qualify for recovery and the Commission should deny the recovery of these costs.

Q. **PPL ELECTRIC WITNESS SHARON LESKOWSKY STATE THAT YOU HAVE MISINTERPRETED THE COMMISSION'S ORDER TO ESTABLISH AN IIJA REGULATORY ASSET.[28] PLEASE RESPOND TO HER ASSERTION.**

A. I have not misinterpreted the Commission's Order as I will explain below. The Financial Accounting Standards Board's Accounting Standards Codification No. 980-340-25-1 ("ASC 980") provides the following guidance in order to recognize a regulatory asset:

> Rate actions of a regulator can provide reasonable assurance of the existence of an asset. An entity shall capitalize all or part of an incurred cost that would otherwise be charged to expense if both of the following criteria are met:
>
> a. It is probable (as defined in Topic 450) that future revenue in an amount at least equal to the capitalized cost will result from inclusion of that cost in allowable costs for rate-making purposes.
>
> b. Based on available evidence, the future revenue will be provided to permit recovery of the previously incurred cost rather than to provide for expected levels of similar future costs. If the revenue will be provided through an automatic rate-adjustment clause, this criterion requires that the regulator's intent clearly be to permit recovery of the previously incurred cost.
>
> A cost that does not meet these asset recognition criteria at the date the cost is incurred shall be recognized as a regulatory asset when it does meet those criteria at a later date.

These are the criteria set by the FASB which is recognized as the authority on financial accounting standards in the United States. As presented in Ms. Leskowsky's rebuttal

[28] Rebuttal Testimony of Sharon Leskowsky at 7:6-9.

testimony, I am re-presenting Ordering Paragraphs 2 and 3 from the July 2023 Order in Docket No. P-2022-3032929 (the IIJA proceeding):

> 2. That jurisdictional utilities choosing to pursue federal funding for infrastructure projects under the Infrastructure Investment and Jobs Act, Pub. L. No. 117-58, 135 Stat. 429 (2021), are authorized, subject to the following conditions, to defer and record as an IIJA-specific regulatory asset for accounting purposes those costs incurred in order to prepare, apply, administer, and otherwise execute on federal funding opportunities made available by the Infrastructure Investment and Jobs Act, Pub. L. No. 117-58, 135 Stat. 429 (2021):
>
> a. **That the authorization granted for deferred accounting treatment carries no assurance of future rate recovery** [Emphasis Added];
>
> b. That the utility shall make a claim of the deferred expenses at the first available opportunity;
>
> c. That the authorization for deferred accounting treatment be limited to actual operations and maintenance costs and not include capitalized costs; and,
>
> d. **That this Opinion and Order will in no way limit the ability of any party to a future rate case to contest recovery of any of the costs deferred pursuant to the limited authorization therein** [Emphasis Added].
>
> 3. That a utility shall file a notice with the Commission at Docket No. P-2022-3032929 upon establishing an IIJA-specific regulatory asset as described in this Opinion and Order. Such notification shall be served on the Commission's Bureau of 14 Investigation and Enforcement, the Office of Consumer Advocate, and the Office of Small Business Advocate.

The key factor, under ASC 980, for an expense to be recorded as a regulatory asset is that the Commission's Order should make it probable that in the future revenue will be authorized to permit recovery of the previously incurred cost. As I have highlighted, Ordering Paragraphs 2(a) and 2(d) makes it clear that the cost recovery

was not probable. Therefore, the IIJA costs do not qualify as a regulatory asset, and it should not be assumed that the Commission has agreed that the costs can be recovered through rates. Moreover, in my direct testimony, I explained that these costs did not meet the Commission's three requirements that the costs be: (1) extraordinary and substantial; (2) non-recurring; and (3) unanticipated.[29] The Company's rebuttal testimonies have focused on what they described as my interpretation of the Commission's Order and spent little time demonstrating that the costs for which recovery is being sought meet the Commission's three requirements for the costs to recovered. Based on the foregoing, I recommend the Commission deny recovery of these costs.

10. Customer Payment Transaction Fees

Q. **PLEASE RESPOND TO MR. DANE'S AND MS. NORDEN'S DISAGREEMENT WITH YOUR ADJUSTMENT TO PAYMENT TRANSACTION FEES.**

A. In my direct testimony, I explained that I derived the FPFTY payment transaction fees based on an annual growth rate of 15%. This rate was used to project the number of transactions on which the payment transaction costs were derived. The 15% growth rate is based on the historical growth in payment transaction fees.[30]

While both witnesses Dane and Norden disagree with my adjustment, Mr. Dane offers the critique of my adjustment. He states that "applying a historical growth rate assumes that customer behavior will remain unchanged despite a fundamental change in pricing structure. Reliance solely on historical data is likely to materially understate future transaction volumes."[31] However, it is important to recognize that PPL Electric's

[29] Direct Testimony of Lafayette Morgan at 15:21-16:14.
[30] *Id*. at 13:6-8.
[31] Rebuttal Testimony of Daniel Dane at 16:6-8.

30% growth is not supported by any data. PPL Electric simply assumes the 30% growth and offers no evidentiary data to show how the 30% growth rate was derived. On the other hand, my 15% growth rate is not simply an assumption to use half of the Company's claim. Instead, my 15% growth rate is supported by historical data supplied by the Company. In fact, the most recent raw data, provided by the Company, suggests that the growth in the number of transactions decreased from 15.2% to 14.4%.[32] Yet, I have used the 15% rate as a reasonable growth rate. Given, that my adjustment is driven by a growth rate that is based on data, and the Company's adjustment is based on an unsupported assumption, I recommend the Commission deny the Company's claim with respect to the payment transaction fee growth.

11. PURTA Tax

Q. **PLEASE RESPOND TO THE COMPANY'S REBUTTAL ON YOUR ADJUSTMENT TO THE PURTA TAX EXPENSE.**

A. In my direct testimony, I recommended an adjustment to remove the PURTA tax expense based released notices from the Pennsylvania Department of Revenue. PPL Electric witness Elmore explains that it is the PURTA surcharge whose millage rate has been set to 0 (zero) and not the foundational PURTA rate. After review, I accept the clarification made by Mr. Elmore, and have revised the cost of service to remove the adjustment of $1,410,000 that I initially recommended.

12. Vegetation Management

Q. **PLEASE RESPOND TO MS. LESKOWSKY'S DISAGREEMENT WITH YOUR RECOMMENDATION RELATING VEGETATION MANAGEMENT EXPENSE.**

[32] I&E-RE-II-19-D Attachment 1, Tab RE_II_19_A.

A. In my direct testimony, I explained that as part of acquiring additional rights-of-way to address "Off ROW" trees, the Company requested that the Commission grant it the authority to capitalize the cost of the first clearing of the newly acquired rights-of-way after the acquisition. I disagreed with the request and recommended that the Commission deny the request.[33] I supported my position on the Company's request by citing the relevant section of the FERC Uniform System of Accounts ("USOA") that state that the first clearing of related to rights of way cannot be capitalized.

Ms. Leskowsky claims that I incorrectly asserted that FERC prohibits the capitalization of the first clearing and grading of land and rights-of-way.[34] However, because the language in the USOA is clear, Ms. Leskowsky has chosen to attempt to needlessly complicate the issue by conflating the instances when first clearing of land may be capitalized as part of plant construction activities concepts or installation of equipment. Essentially, Ms. Leskowsky argues, in her rebuttal testimony, that I have selectively chosen the plant instruction section of the FERC USOA that supports my position and ignored sections that do not support my position.[35] This is conjecture on her part.

Before responding to Ms. Leskowsky's claim that I have selectively chosen only the plant instruction section of the FERC USOA that supports my position, I wish to make it clear that if the FERC USOA did not prohibit the capitalization of the first clearing of rights of way, a vegetation management function, there would be no need for PPL Electric to seek the Commission's approval of an exception to allow it to capitalize the costs.

[33] Direct Testimony of Lafayette Morgan at 28:8-11.
[34] Rebuttal Testimony of Sharon Leskowsky at 11:8-9.
[35] Id. at 11:23-13:1.

Another point to clarify is how Vegetation Management is normally treated from an operation and accounting perspective. Vegetation Management is a maintenance activity. "These activities include tree pruning, tree removal, brush control, and herbicide application".[36] "Vegetation management improves system reliability, allows electric utilities to provide safe electric service, and plays a role in reducing wildfires. Vegetation encroachment into Company assets can make it difficult to access facilities during storm restoration. Providing clearance between PPL Electric's assets and vegetation will support safer working conditions for line workers and tree trimmers and will allow for quicker restoration of service to customers after a storm."[37] It does not involve preparation of a site for construction or installation of equipment. Hence, it is recorded as an expense and not capitalized. In fact, this is part of the reason the Company has to seek Commission authorization to move away from the normal accounting in order to capitalize the costs. To equate vegetation management to preparation of a site for construction, as Ms. Leskowsky does in her rebuttal testimony, is misleading. It is important to recall that PPL Electric proposes to "acquire additional rights which will allow it to clear vegetation more easily and eliminate further risk to its power lines and other assets. Specifically, the Company wants to acquire rights that will allow it to address hazard and danger trees outside of its existing ROW."[38] It is the first clearing of the additional ROW that the Company is seeking to capitalize.

There are three plant instruction sections related to land and land rights that Ms. Leskowsky presents in her rebuttal testimony. The first plant instruction section that

[36] Direct Testimony of Nicole Howell at 3:17-18.
[37] Id. at 2:18 -3:2.
[38] Direct Testimony of Nicole Howell at 9:8-11.

Ms. Leskowsky discusses in her rebuttal testimony is this section[39], which I referenced in my testimony, and which reads as follows:

> The accounts for land and land rights shall include the cost of land owned in fee by the utility and rights. Interests, and privileges held by the utility in land owned by others, such as leaseholds, easements, water and water power rights, diversion rights, submersion rights, rights-of-way, and other like interests in land. Do not include in the accounts for land and land rights and rights-of-way costs incurred in connection with first clearing and grading of land and rights-of-way and the damage costs associated with the construction and installation of plant.

Notice the prohibition of including the cost of the first clearing and grading of land and rights-of-way in the land accounts. This instruction also prohibits the inclusion of damage costs associated with the construction and installation of plant in the land account. As I interpreted this plant instruction, the damage costs associated with the construction and installation of plant, refers to incidental damage caused during vegetation management activities. This instruction was cited because it is more relevant to vegetation management.

The second plant instruction section Ms. Leskowsky cites in her rebuttal testimony[40] reads as follows:

> The accounts for land and land rights shall include the cost of land owned in fee by the utility and rights. Interests, and privileges held by the utility in land owned by others, such as leaseholds, easements, water and water power rights, diversion rights, submersion rights, rights-of-way, and other like interests in land. **Do not include in the accounts for land and land rights and rights-of-way costs incurred in connection with first clearing and grading of land and rights-of-way and the damage costs associated with the construction and installation of plant. Such costs shall be**

[39] Rebuttal Testimony of Sharon Leskowsky at 11:8.
[40] Id. at 11:23.

> **included in the appropriate plant accounts directly benefited.** [Emphasis added.]

Notice this section also includes the prohibition of including cost of the first clearing and grading of land and rights-of-way in the land accounts. This instruction also prohibits the inclusion of damage costs associated with the construction and installation of plant in the land account but allows it to be capitalized as part of plant. This implies that the clearing and grading of the land was for the preparation of the site for plant construction. The preparation of the site for plant construction is the important distinction here, as compared to the plant instruction that I have referenced. In fact, a plant account, to which the clearing costs can be charged, is contemplated. I did not cite this instruction because it is not relevant to vegetation management, a maintenance function. This plant instruction target plant being constructed.

The third plant instruction section Ms. Leskowsky presents in her rebuttal testimony[41] reads as follows:

> The cost of equipment chargeable to the electric plant accounts, unless otherwise indicated in the text of an equipment account, includes the net purchase price thereof, sales taxes, investigation and inspection expenses necessary to such purchase, expenses of transportation when borne by the utility, labor employed, materials and supplies consumed, and expenses incurred by the utility in unloading and placing the equipment in readiness to operate**. Also include those costs incurred in connection with the first clearing and grading of land and rights-of-way and the damage costs associated with construction and installation of plant.** [Emphasis added]

This section deals with the installation equipment and the construction of plant. This plant instruction allows the cost of clearing to be included in the cost of construction

[41] Rebuttal Testimony of Sharon Leskowsky at 12:16.

and installation of the plant. Because the cost is related to construction, the instruction allows the costs of clearing to be included in the cost of the plant, not the land.

Q. **PLEASE SUMMARIZE YOUR CONCLUSION AFTER RESPONDING TO MS. LESKOWSKY'S CLAIMS THAT YOU SELECTIVELY CHOSE A SECTION OF THE PLANT INSTRUCTIONS WHICH SUPPORTED YOUR POSITION THAT THE COMMISSION SHOULD DENY THE CAPITALIZATION OF THE FIRST CLEARING COST OF THE ADDITIONAL ROW.**

A. Clearing ROWs is a vegetation management function and an operating expense. It is not appropriate to capitalize those costs. If capitalization of vegetation management costs were allowed, PPL Electric would not have to seek approval to capitalize the costs. My discussion of each of the plant instructions (that Ms. Leskowsky uses to suggest my recommendation is incorrect) reveals that there are no instances where FERC allows the inclusion of the first clearing of vegetation to be capitalized as part of land or land rights. The only instances where the first clearing is allowed to be capitalized is when there is construction or installation of equipment. In such a scenario, the clearing cost may be allowed as part of the asset being installed or constructed. Therefore, Ms. Leskowsky's criticism of my recommendation is not valid and should be disregarded.

Q. **DOES THIS COMPLETE YOUR SURREBUTTAL TESTIMONY?**

A. Yes, it does.

II. SUMMARY AND RECOMMENDATIONS 4

IV. LEAD/LAG 10

Exhibits Accompanying Direct Testimony:

- Appendix A – Resume of Grace N. Koenig
- Exhibits GNK-1 Through GNK-7

I. INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Grace N. Koenig. My business address is 10480 Little Patuxent Parkway, Suite 300, Columbia, Maryland, 21044. I am an Economist at Exeter Associates, Inc. ("Exeter"). Exeter is a consulting firm specializing in issues pertaining to public utilities.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND QUALIFICATIONS.

A. I received a Bachelor of Science in Economics and a Bachelor of Science in Public Policy Analysis, with a minor in Business, from the Ohio State University. I have also attended the National Association of Regulatory Utility Commissioners ("NARUC") Utility Rate School.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.

A. I have been employed with Exeter since 2023, initially as a Research Assistant before being promoted to Economist. At Exeter, I review utility rate filings and analyze revenue requirement issues, as well as conduct research on default electricity service and the social and economic impacts of electric market regulation. I also provide client support through bill audits, load processing, and evaluations of renewable energy needs. My resume is attached hereto as Appendix A.

Q. HAVE YOU PREVIOUSLY TESTIFIED IN REGULATORY PROCEEDINGS ON UTILITY RATES?

A. No. I have not previously provided testimony in regulatory proceedings on utility rates.

Q. ON WHOSE BEHALF ARE YOU APPEARING?

A. I am presenting testimony on behalf of the Pennsylvania Office of Consumer Advocate ("OCA").

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?

A. Exeter has been retained by OCA to assist in the evaluation of the general rate increase filing of PPL Electric Utilities Corporation ("PPL" or "Company"). I have been asked to review the lead/lag study and the claim for cash working capital allowance filed by the Company to determine its reasonableness. My direct testimony presents my findings with respect to PPL's cash working capital requirements and its lead/lag study. In addition, OCA Witness Lafayette K. Morgan, Jr. has made adjustments to certain of PPL-proposed operations and maintenance ("O&M") expenses. Since the allowance for cash working capital is determined based upon O&M expenses, I have incorporated Mr. Morgan's adjustments to O&M expenses in my determination of PPL's cash working capital allowance. Additionally, I have incorporated OCA Witness Mr. David Garrett's recommended long-term debt ratio and embedded cost of debt in my analysis.

II. CASH WORKING CAPITAL

Q. HOW DO YOU DEFINE CASH WORKING CAPITAL?

A. For ratemaking purposes, cash working capital is the investment a utility needs to have on hand to fund its daily operations and bridge the gap between when utilities pay for the operational costs of providing service and when they receive payments from customers. Cash working capital is reflected in the rate base because it is a necessary investment to maintain reliable and continuous service and to reflect the nature of the risk the utility bears in paying for expenses which it has not yet

recovered in rates. Positive cash working capital represents funds provided by investors that should be included in the rate base so the utility can earn a return on it and reward shareholders for the risk borne between the time the expense is incurred and when it is paid-for. Negative cash working capital represents funds supplied by ratepayers that should be accounted for as a rate base offset to reflect funds advanced for operations by ratepayers.

Q. HOW DOES THE COMPANY REFLECT CASH WORKING CAPITAL IN ITS FILING?

A. The Company's cash working capital allowance has been determined based upon the results of a lead/lag study. A lead/lag study is an in-depth analysis that measures the difference between when a company receives payment for the provision of a service and when it pays for the costs of providing that service. A separate expense lag is calculated for each major operating expense category (payroll, employee benefits, affiliate support costs, and other operating expenses). This difference is expressed as a number of days and is used to calculate the level of investor-supplied funds advanced for operations or the funds provided by customers for operations. A longer revenue lag or expense lead increases the requirement for cash working capital because the utility needs to cover its expenses over a more extended period of time before receiving payment.

Q. HOW DOES THE COMPANY CALCULATE THE CASH WORKING CAPITAL REQUIREMENT?

A. To calculate the amount of cash the Company needs to have available on a day-to-day basis, the Company calculates the working capital requirement separately for O&M expenses, average prepayments, accrued taxes, and interest payments. The

Company then summed them to obtain the total cash working capital requirement of $16.755 million.[1]

Q. PLEASE DESCRIBE HOW THE COMPANY CALCULATED ITS O&M EXPENSES FOR CASH WORKING CAPITAL.

A. PPL's cash working capital allowance is derived, in part, from the use of a lead/lag study. The Company calculated its working capital requirement for O&M expenses by taking the total *pro-forma* O&M expenses, netting all non-cash items, and dividing this total by 365 to determine the daily O&M expense. It then multiplied this daily expense by the average number of lag days between paying O&M expenses and receiving revenue, which were identified in the lead/lag study.[2]

II. SUMMARY AND RECOMMENDATIONS

Q. PLEASE SUMMARIZE YOUR FINDINGS AND RECOMMENDATIONS.

A. As shown on Exhibit GNK-1, I have determined that PPL's proposed cash working capital should be reduced by $7.17 million for the FPFTY.

Q. IN CONNECTION WITH THIS PROCEEDING, WHAT DOCUMENTS HAVE YOU EXAMINED AND REVIEWED IN DETERMINING YOUR RECOMMENDATIONS?

A. I have reviewed PPL's rate filing, testimony, and exhibits. I also reviewed the Company's responses to data requests propounded by the OCA, CAUSE-PA, CGC, Convergent, EI, EJA, Epstein, I&E JSA, OSBA, PDMP, PPLICA, RESA, SEF, and Walmart.

[1] Company filing Volume VII, Section C-4, page 1 shows the Company's calculation method, Company response to I&E-I-5-D-Attachment 2, page 1, contains the Company's calculation for just distribution. Both calculations are shown on my Schedule GNK-1.
[2] Company filing Volume VII, Section C-4, page 2.

Q. HAVE YOU PREPARED EXHIBITS TO ACCOMPANY YOUR TESTIMONY?

A. Yes. I have prepared Exhibits GNK-1 through GNK-7. Exhibit GNK-1 provides a summary of the calculation of cash working capital before and after reflecting the adjustments proposed by the OCA. Exhibit GNK-2 reflects the adjustments that OCA Witness Mr. Morgan makes to the total pro-forma O&M expense in his testimony, and provides my recommended changes to the O&M expenses included in the cash working capital calculation. My recommended changes to the accrued taxes included in the cash working capital calculation are provided in Exhibit GNK-3. Exhibit GNK-4 reflects my recommended changes to the interest payments included in the cash working capital calculation. A summary of my adjustments to the lead/lag study is provided in Exhibit GNK-5. Exhibit GNK-6 shows my adjustments to the weighted-average lag in the payment of other expenses. Exhibit GNK-7 summarizes all amortizations the Company claimed in its filing, which I recommend removing from the O&M expenses used to calculate cash working capital.

Q. PLEASE EXPLAIN HOW THE REMAINING SECTIONS OF YOUR TESTIMONY ARE ORGANIZED.

A. The discussion of my findings and recommendations related to cash working capital is presented in Section III. Section IV discusses my findings and recommendations regarding the lead/lag study. Where I recommend an adjustment to a particular component of the cash working capital or the lead/lag study, I document and explain the reason for the adjustment, and note the related Exhibit in which the detailed calculations can be found.

Q. WHY SHOULD NON-CASH EXPENSES BE REMOVED FROM THE CASH WORKING CAPITAL CALCULATION?

A. Non-cash expenses should be excluded from the cash working capital calculation because cash working capital measures the actual cash a utility must have on hand to meet its day-to-day operating expenses. Non-cash expenses do not require cash on hand and, therefore, do not require financing or the use of investor-supplied funds. Including non-cash expenses in the cash working capital calculation would overstate the utility's cash requirements and improperly inflate the amount of investor-supplied funds included in the rate base.

Q. WHAT NON-CASH ITEMS HAVE BEEN INCLUDED IN THE COMPANY'S PROPOSED CASH WORKING CAPITAL?

A. The Company has identified and removed several non-cash items from its proposed cash working capital, including uncollectible accounts expense, deferred storm damage costs, deferred Infrastructure Investment and Jobs Act ("IIJA") costs, and depreciation.[3] I identified three additional non-cash items that should also be excluded. These items are the normalization of rate case expenses, the normalization of Competitive Enhancement Rider costs, and the amortization of several expenses.

The normalization of rate case expenses and the Competitive Enhancement Rider are non-cash items because they do not represent current cash expenditures. Normalization is a ratemaking mechanism that spreads the recovery of costs incurred in other periods over multiple years for rate-setting purposes. As a result, the normalized amounts included in operating expenses do not correspond to actual cash payments during the test year and do not require the Company to have additional cash on hand.

[3] Company filing Volume VII, Section C-4, page 2.

Like normalizations, amortizations are non-cash expenses, as they are an accounting principle used to allocate the cost of an intangible asset over a period of years. However, the expense of these assets is paid up front, so amortizations do not reflect the actual cash the company requires to pay them.

Q. PLEASE EXPLAIN YOUR ADJUSTMENT CALCULATIONS FOR NON-CASH ITEMS.

A. For the reasons explained above, I recommend removing the normalization of rate case expenses, the normalization of Competitive Enhancement Rider costs, and all claimed amortizations from the cash working capital. Company Witness Mr. Daniel S. Dane is proposing an adjustment of $733 million to normalize the expenses related to the filing of the distribution rate case.[4] Company Witness Mr. Dane also proposes an adjustment of $100 million to normalize and include the expenses associated with the Company's proposal to eliminate the Competitive Enhancement Charge and recover expenses through base rates.[5] I recommend removing both adjustments from the O&M expenses used to calculate cash working capital, since, as previously stated, normalized amounts do not reflect actual cash needed on hand.

Additionally, I recommend removing all the amortized values that the Company claimed in its filing. A summary of these amortizations can be found on GNK-7. All my adjustments to the non-cash items included in cash working capital are shown on Exhibit GNK-2.

[4] Direct Testimony of Daniel S. Dane, page 13, lines 18 to 20 and Company filing Volume VII, Section D-6, page 1.
[5] Direct Testimony of Daniel S. Dane, page 14, lines 8 to 11, and Company filling Volume VII, Section D-8, page 1.

Q. DID YOU REMOVE ANY OF THE COMPANY'S IDENTIFIED NON-CASH ITEMS?

A. Yes. I removed the deferred IIJA Costs, as presented by the Company, from the cash working capital O&M expense calculation to account for OCA Witness Mr. Morgan's adjustment to remove deferred IIJA expenses from O&M. If I included PPL's removal of deferred IIJA costs as a non-cash item and reflected Mr. Morgan's adjustments to the total pro-forma O&M expense, the removal of the amortization of the IIJA would be double-counted. This adjustment is shown on Exhibit GNK-2.

Q. PLEASE EXPLAIN ANY ADDITIONAL ADJUSTMENTS TO OPERATIONS AND MAINTENANCE EXPENSES.

A. In addition to the adjustments I made to non-cash expenses, I have reflected OCA Witness Mr. Morgan's adjustments to total pro-forma operation and maintenance expenses. These changes are all reflected in Exhibit GNK-2. My adjustments result in an O&M expense per day that is $212,000 less than the Company's proposed value, to arrive at a total O&M expense per day of $920,000. This value is multiplied by the OCA's adjusted net lag days, which will be further described in Section IV of my testimony, to arrive at a total downward adjustment of $1.62 million to the O&M expense used to calculate cash working capital.

Q. PLEASE EXPLAIN YOUR ADJUSTMENTS TO ACCRUED TAXES.

A. The Company included a $1.410 million expense in its accrued taxes calculation to account for the Pennsylvania Public Utility Realty Tax Act (PURTA) at present rates, based on a Notice of Determination dated July 30, 2025.[6] Since then, the Pennsylvania Department of Revenue has released an updated notice, dated September 20, 2025, stating that the PURTA tax rate would be set at zero mills (0.00)

[6] Company filling Volume VII, Section D-16, page 2 shows the Company's determination of the tax rate. Company response to I&E-RE-I-5-D-Attachment 2, page 4, shows the base distribution calculation.

beginning January 1, 2026.[7] Since the most up-to-date rate information indicates that there will be no PURTA assessed on the utility in the upcoming years, I recommend removing the PURTA expense from accrued taxes used in the cash working capital calculation, as shown in Exhibit GNK-3. After accounting for the 12-month accrued factor applied to the PURTA expense, this results in a $101,000 reduction in accrued taxes used to calculate cash working capital.

Q. PLEASE EXPLAIN YOUR ADJUSTMENTS TO INTEREST PAYMENTS.

A. Interest payment lag days are calculated by subtracting the revenue lag days from the days to the midpoint of interest payments. The Company used 90 days to reflect the midpoint of interest payments.[8] Interest payments are generally made semiannually. To calculate the number of days to the midpoint of interest payments, I have divided 365 by 4, which results in 91.25 days. On Exhibit GNK-4, I adjusted the days to the midpoint of interest payments to reflect this more accurate value. I then subtract revenue lag days from this revised midpoint to determine the interest payment lag of 43.47 days.

To calculate total interest payments, the rate base is multiplied by the long-term debt ratio and the embedded cost of long-term debt to determine pro forma interest. The pro forma interest amount is then multiplied by the interest payment lag days. In my calculation of interest payments, I incorporated the adjustment to rate base recommended by OCA Witness Mr. Morgan in his direct testimony and reflected the long-term debt ratio and embedded cost of long-term debt recommended by OCA Witness Mr. Garrett. These adjustments result in a $5.45 million reduction to the interest payments used in the cash working capital calculation, as shown on GNK-4.

P. 1309m Sept. 20, 2025. https://www.pacodeandbulletin.gov/Display/pabull?file=/secure/pabulletin/data/vol55/55-38/1309.html

[8] Company filing Volume VII, Section C-4, page 5.

IV. LEAD/LAG

Q. PLEASE DESCRIBE THE COMPANY'S LEAD/LAG STUDY.

A. Company Witness Ms. Katelyn Arnold prepared the company's lead/lag study, which is found in Company filing Volume I and II, Attachment II-B-4. In its lead/lag study, the Company separately calculated the lag days for four operating expense categories: payroll, benefits, affiliate support costs, and other operating expenses. The Company determined the overall average lag for all expenses to be 42.6 days. To calculate the payroll payment lag, the Company calculated the difference between the midpoint of the 14-day payroll period and payday. According to the Company, the payroll period ends on a Sunday, and employees are paid the following Friday, five days after the end of the payroll period. This results in a net payroll lag of 12 days.[9]

The lag in benefits and affiliate support costs was determined to be 35 days. To calculate this, the Company took the difference between the midpoint of the month when services are provided and the payment date, which occurs on the 20th of the following month. To calculate the lag of other operating expenses, the Company computed a weighted-average lag based on the lag and expenses for 11 expense categories during the test year. The expense categories included: Employee Expenses, Materials and Supplies, Printing and Office Supplies, Tree Trimming, Work by Outsiders, Services, Postage, Telephone and Leased Wires, Rents, Advertising, and Miscellaneous.[10]

For Employee Expenses, the Company states that most employee expenses are processed on a pay-period basis. Accordingly, the Company determined that a 12-

[9] Company filing Volume I and II, Attachment II-B-4, page 2.
[10] Company filing Volume I and II, Attachment II-B-4, page 3.

day payroll lag is representative of this expense category and applied that lag in its analysis. [11]

For all other expense categories, the Company calculated the lag based on a review of selected invoices. For Tree Trimming and Work by Outsiders, when possible, the Company determined the difference between the midpoint of the period during which services were provided and the payment date. For the expense categories other than Employee Expenses, Tree Trimming, and Work by Outsiders, the Company uses the difference between the invoice date and the payment date to determine the lag days. Additionally, the Company uses this methodology to determine lag days for Work by Outsiders when service period information is unavailable. [12]

After determining the lag days for each sampled invoice, the Company weighted those lag days by the associated invoice amounts. The resulting weighted values were summed for each expense category and divided by the total invoice amount for that category to determine the lag for that category used in the analysis. [13] The lag for each expense category ranged from -4.72 to 158.7 days. Using the same methodology applied to the individual expense categories, the Company determined a weighted-average lag of 67.07 days for all Other Operating Expenses. [14]

Q. DO YOU AGREE WITH THE COMPANY'S APPLICATION OF THE PAYROLL LAG TO EMPLOYEE EXPENSES?

A. No, I do not. In its lead/lag study, the Company states that the majority of employee expenses are processed on a pay-period basis. [15] However, this is not true for all

[11] Company filing Volume I and II, Attachment II-B-4, page 3.
[12] Company response to OCA I-1, Attachment 229, Arnold SUPPLEMENTAL.
[13] Company filing Volume I and II, Attachment II-B-4, pages 3-13.
[14] Company filing Volume I and II, Attachment II-B-4, page 3.
[15] Company filing Volume I and II, Attachment II-B-4, page 3.

expenses, and this claim is not supported by the invoices that the Company provided for employee expenses which, as discussed below, reflect a higher weighted average lag.[16] Additionally, although the Company states that employees submit expenses every two weeks, this does not account for any administrative lag or indicate the timing of actual refunds.[17]

A more accurate measure of this lag would be to calculate using the actual invoice and payment dates for employee expenses incurred during the historical test year. Accordingly, on page 2 of Exhibit GNK-6, I calculate a weighted-average lag for employee expenses using the same methodology the Company applied to its other expense categories, based on all employee expense invoices provided for the historical test year.[18] Based on my analysis, I adjusted the lag for Employee Expenses to 27.31 days, from the Company's 12 days. The 27.31-day lag should be used in determining the weighted average lag for Other Operating Expenses because it reflects the actual payment lag, rather than an assumption made by the Company.

Q. WHAT OTHER ADJUSTMENTS DID YOU MAKE TO THE LAG DAYS FOR OTHER OPERATING EXPENSES?

A. For Materials and Supplies, Printing and Office Supplies, Services, Postage, Telephone and Leased Wires, Rents, Advertising, and Miscellaneous expenses, I recalculated the weighted average lag days for each expense category using all the invoices provided in OCA-I-1 Attachment 229 Arnold SUPPLEMENTAL, rather than the Company's selected sample. Larger data sets increase the accuracy of an analysis and better reflect actual conditions, and an analysis of the full data set therefore provides the most accurate representation of actual lag days. In my analysis,

[16] Company Response to OCA I-1, Attachment 229 Arnold, SUPPLEMENTAL.
[17] Company Response to OCA XIII-12.
[18] Company Response to OCA I-1, Attachment 229 Arnold, SUPPLEMENTAL.

I excluded any invoices without an invoice date, since an invoice date or information on the midpoint of service is required to calculate lag days. My adjustments to the lag days for each expense category result in a weighted-average lag in payment for Other Operating Expenses of 68.63 days, which is greater than the Company's calculation of 67.07 days. A summary of my adjustments to lag days for each expense category is presented on Exhibit GNK-6, page 1. This schedule shows the Company's calculation of the weighted average lag days in payment of Other Operating Expenses to be 67.08 days, due to differences in rounding. The calculations for each expense category's weighted average lag can be found on Exhibit GNK-6, pages 3 through 10.

Q. DID YOU EXCLUDE ANY OTHER INVOICES IN YOUR RECALCULATION OF LAG DAYS?

A. Yes. For Materials and Supplies, I excluded the NJUNS, Inc. invoice (Invoice No. 15170). In response to OCA XIII-14, the Company stated that this invoice belongs to Rhode Island Energy and was inadvertently charged to PPL, and that it should have been removed from the scope of the lead-lag study. To ensure that only PPL-related charges are reflected, I removed this invoice from the weighted average lag days calculation for Materials and Supplies. Additionally, in OCA-I-1 Attachment 229 Arnold SUPPLEMENTAL, the Company left a comment on a cell for invoice 72302, stating that this invoice should be eliminated from the calculation of lag days for Materials and Supplies due to duplication and retraction. Based on this comment, I removed the invoice from my calculation to avoid misrepresenting actual expenses and lag days in my analysis.

Q. WHY DID YOU NOT RECALCULATE THE TREE TRIMMING AND WORK BY OUTSIDERS EXPENSE CATEGORIES?

A. Unlike the other expense categories, the Company did not use the invoice date as a proxy for the midpoint of the service period for all of the invoices included in the calculation of lag days for Tree Trimming and Work by Outsiders. When appropriate, the Company provided information regarding the period of service for the invoices in its sample. However, the Company did not provide the period of service information for invoices *not* used in its sample. Therefore, it is not possible to expand on the Company's analysis to include all invoices in the historical test year, without misrepresenting the service period, leading to inaccurate lag days. If the Company is able to supply additional information in rebuttal regarding the period of service for all invoices related to these two operating expense groups, I may adjust this recommendation.

Q. DID YOU MAKE ANY OTHER CHANGES TO HOW THE EXPENSE LAG WAS CALCULATED?

A. Yes. The Company rounded its total expense lag calculation to 1 decimal point. This is inconsistent with its calculation of each operating expense component. I expanded the results of my analysis to two decimal places to be consistent, resulting in a 43.14-day average lag for payment of operating expenses. This calculation can be found on Exhibit GNK-5.

Q. HOW DID THE COMPANY CALCULATE THE REVENUE LAG?

A. The Company divides its customers into three billing groups, each with a different bill due date. Commercial customers are assigned a 15-day due date after bill posting; residential customers are assigned a 20-day due date; and government accounts are

assigned a 30-day due date.[19] For each billing group, the Company separately calculated the revenue lag by summing the midpoint of the 30-day service period, with the lag between the meter reading and billing date, and the lag between the billing date and the payment date. For all billing groups, the Company used 15 days as the midpoint in service and a 1-day lag between meter reading and billing date. To calculate the lag between billing date and payment date, the Company divided the daily total revenue by the total accounts receivable for each billing group.[20] For the 15-day customer group, the billing lag was 20.14 days, resulting in a total average lag of 36.14 days. For the 20-day customers, the billing lag was determined to be 43.78 days, for a total average lag of 59.78 days. For the 30-day customers, the billing lag was determined to be 26.28 days for a total average lag of 42.28 days. To calculate the weighted average lag in the receipt of operating revenue across all billing groups, the Company weighted each group's revenue by its associated average lag. The weighted revenues were then summed and divided by total revenue, resulting in an overall revenue receipt lag of 47.8 days.[21]

Q. DO YOU HAVE ANY ADJUSTMENTS TO THE COMPANY'S CALCULATION OF REVENUE LAG?

A. Yes. The Company rounded its revenue lag calculation to one decimal place. This is inconsistent with its calculation of each billing group's lag and the calculation of other expenses lag in the lead/lag study. I expanded the results of my analysis to two decimal places to be consistent, resulting in a 47.78-day average lag for receipt of revenue. This calculation can be found on Exhibit GNK-5.

[19] Company Response to OCA XIII-2.
[20] Company Response to OCA XIII-5, Attachment 1.
[21] Company filing Volume V, Section C-4, page 2.

Q. HOW IS THE AVERAGE LAG IN DAYS BETWEEN PAYMENT OF OPERATING EXPENSES AND RECEIPT OF REVENUE CALCULATED?

A. The average lag in days between payment of operating expenses and receipt of revenue is calculated by subtracting the average lag in payment of operating expenses from the average lag in receipt of revenue. The Company calculated this value to be 5.2 days.[22]

Q. WHAT AVERAGE LAG IN DAYS BETWEEN PAYMENT OF OPERATING EXPENSES AND RECEIPT OF REVENUE DID YOU CALCULATE?

A. As a result of the adjustments I made to both the average lag in receipt of revenue and the average lag in payment of operating expenses, as discussed earlier in my testimony, I calculate the average lag in days between payment of operating expenses and receipt of revenue to be 4.64 days. This is shown on Exhibit GNK-5. Ultimately, this adjustment to net lag days, combined with my previously discussed adjustments to the O&M expenses included in cash working capital, results in a $1.62 million adjustment downward to cash working capital. This is shown on Exhibit GNK-1 and GNK-2.

Q. ARE THERE ANY OTHER POTENTIAL ADJUSTMENTS THAT COULD BE MADE TO CASH WORKING CAPITAL?

A. Yes. In response to I&E RE-I-2-D, the Company states that it identified an error with the O&M expenses in Row 2, Column 5 in the Company filing Volume V, Section D-1. According to the Company, the corrected value would result in the average lag days in between payment of operating expenses and receipt of revenue decreasing from 5.2 days to 5.1 days. The Company stated that it would prepare and provide revised

[22] Company filing Volume V, Section C-4, page 2

schedules for the historic, future, and fully projected future test year to correct this error in all impacted schedules as a supplement to this response. I was unable to identify where the Company provided the updated calculation that resulted in the revised average lag days of 5.1 days. If the revised schedules are identified or provided in the future, I reserve the right to update my testimony as appropriate.

Q. BASED ON YOUR ADJUSTMENTS DESCRIBED ABOVE, WHAT IS YOUR TOTAL ADJUSTMENT TO CASH WORKING CAPITAL?

A. My overall adjustment to cash working capital is a reduction of $7.17 million. As seen on Exhibit GNK-1, this is calculated by summing my adjustments discussed previously in this testimony to Operations and Maintenance Expenses, Average Prepayments, Accrued Taxes, and Interest payments.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes, it does.

ON BEHALF OF THE

PENNSYLVANIA OFFICE OF THE CONSUMER ADVOCATE

December 22, 2025

EXETER ASSOCIATES, INC.
10480 Little Patuxent Parkway, Suite 300
Columbia, Maryland 21044

APPENDIX A – Resume of Grace N. Koenig

EXETER
ASSOCIATES, INC.
10480 Little Patuxent Parkway, Suite 300
Columbia, Maryland 21044

GRACE N. KOENIG

Ms. Koenig is an Economist with Exeter Associates, Inc. with four years of experience in the energy industry. At Exeter, Ms. Koenig assists senior staff on various projects, including conducting research on default service, balancing authority interconnection queues, rate case filings, and regulatory developments. Prior to joining Exeter, Ms. Koenig spent two years conducting research on default service in Ohio in collaboration with faculty at the Ohio State University.

Education

B.S. (Economics) – The Ohio State University, 2023

B.S. (Public Policy Analysis) – The Ohio State University, 2023

Research Experience

2021-Current	Energy Markets Research Assistant Ohio State University, Dr. Noah Dormady Lab Columbus, OH

Exeter Associates Employment

2025-current	Economist
2023-2024	Research Assistant

Previous Employment

2022-2023	Undergraduate Course Grader Ohio State University Columbus, OH
2022-2022	Congressional Relations Intern Peace Corps Headquarters Washington, D.C.

Professional Experience

Ms. Koenig is experienced in competitive retail electricity markets. At Exeter, Ms. Koenig has supported research and reporting on default electricity service in multiple states, including New Hampshire and Maine. Further, as a research assistant at the Ohio State University, Ms. Koenig drafts portions of research papers, designs tariff databases, reviews public utility regulatory proceedings, and collects data to help determine the social and economic effects of electric market deregulation.

Ms. Koenig also provides support to the U.S. Department of Energy's Northern California national laboratories through bill audits and evaluation of renewable energy needs. This work includes reviewing and tracking the Laboratories' energy use. Ms. Koenig also supports senior staff in assisting the U.S. Air Force Civil Engineer Center in completing utility service assessments to

identify areas for potential utility cost savings, providing detailed analysis of energy usage, supply contracts, and a review of billing practices.

Ms. Koenig helps administer SmartDG+, a GIS screening tool for potential utility-scale solar and wind projects for Maryland, working regularly with the Maryland Department of Natural Resources' Power Plant Research Program (PPRP), the Maryland Energy Administration, and the Maryland Department of Commerce. In addition to her SmartDG+ work, Ms. Koenig assists PPRP in drafting a Renewable Energy Portfolio Factsheet each year.

Ms. Koenig contributed to regional interconnection queue studies in partnership with researchers at Lawrence Berkeley National Laboratory and provides regulatory expertise on public utility commission filing requirements for a small commercial client, including maintaining regular filings and ensuring compliance with changing policies.

Ms. Koenig has supported senior staff in various stages of rate cases, including reviewing filings, drafting data requests, and providing analysis. Ms. Koenig has certificates of completion from the National Association of Regulatory Utility Commissioners (NARUC) Utility Rate School and its "How to Read a Basic Rate Case" online course.
