18.1 Informal Resolution of Disputes. The Company and EGS shall use good faith and commercially reasonable efforts to informally resolve all disputes arising out of the implementation of this Tariff and/or the conduct of Coordination Activities hereunder. The EGS's point of contact for all information, operations, questions, and problems regarding Coordination Activities shall be the Company's Alternative Supplier Coordination Section and the website.

18.2 Internal Dispute Resolution Procedures. Internal Dispute Resolution Procedures. Any dispute between the Company and an EGS under this Tariff or Individual Coordination Agreement shall be referred to a designated senior representative of each of the parties for resolution on an informal basis as promptly as practicable. In the event the designated representatives are unable to resolve the dispute within thirty (30) days (or such other period as the parties may agree upon) such dispute, by mutual agreement, may be referred to mediation in accordance with Section 8 of the Interim Code of Conduct in the EDC Tariff or may be submitted to arbitration and resolved in accordance with the arbitration procedures set forth below.

18.3 External Arbitration Procedures. If the amount in dispute is $500,000 or less, the arbitration initiated under the Tariff or any Individual Coordination Agreement shall be conducted before a single neutral arbitrator appointed by the parties. If the parties fail to agree upon a single arbitrator within twenty (20) days of the referral of the dispute to arbitration the parties shall request the American Arbitration Association to appoint a single neutral arbitrator. If the amount in dispute exceeds $500,000, each party shall choose one neutral arbitrator who shall sit on a three (3)-member arbitration panel. The two (2) arbitrators so chosen shall, within twenty (20) days of their selection, select a third arbitrator to chair the arbitration panel. In any case, the arbitrators chosen shall be knowledgeable in electric utility matters, including electric transmission and bulk power issues, and shall not have any current or past substantial business or financial relationships with any party to the arbitration (except prior arbitration). The arbitrator(s) shall provide each of the parties an opportunity to be heard and, except as otherwise provided herein, shall generally conduct the arbitration in accordance with the then current Commercial Arbitration Rules of the American Arbitration Association.

18.4 Arbitration Decisions. Unless otherwise agreed, the arbitrator(s) shall render a decision within ninety (90) days of their appointment and shall notify the parties in writing of such decision and the reasons therefor. The arbitrator(s) shall be authorized only to interpret and apply the provisions of the Tariff and any Individual Coordination Agreement and shall have no power to modify or change any provisions in any manner. The decision of the arbitrator(s) shall be final and binding upon the Parties, and judgment on the award may be entered in any court of competent jurisdiction. The decision of the arbitrator(s) may be appealed solely on the grounds that the conduct of the arbitrator(s), or the decision itself, violated the standards set forth in 42 Pa. C.S.A. § 7341. The final decision of the arbitrator must also be filed with FERC and PaPUC, if it affects their respective jurisdictional rates, terms and conditions of service or facilities.

PPL Electric Utilities Corporation

ALTERNATIVE DISPUTE RESOLUTION (CONTINUED)

18.5 Costs. Each Party shall be responsible for its own costs incurred during the arbitration process and for the following costs, if applicable:

(a) the cost of the arbitrator chosen by the party to sit on the three-member panel and a proportionate share of the cost of the third arbitrator chosen; or
(b) a proportionate share of the cost of the single arbitrator jointly chosen by the parties.

18.6 Rights under the Federal Power Act. Nothing in this Section shall restrict the rights of any party to file a complaint with FERC under relevant provisions of the Federal Power Act.

18.7 Rights under the Pennsylvania Public Utility Code. Nothing in this Section shall restrict the rights of any party to file a complaint with the Pa PUC under relevant provisions of the Pennsylvania Public Utility Code.

PPL Electric Utilities Corporation

RULES AND REGULATIONS

19. MISCELLANEOUS

19.1 Notices. Unless otherwise stated herein, any notice contemplated by this Tariff shall be in writing and shall be given to the other party at the addresses stated in the notice section of the Individual Coordination Agreement. If given by electronic transmission (including fax, telex, telecopy or Internet email), notice shall be deemed given on the date sent and shall be confirmed by a written copy sent by first class mail. If sent in writing by first class mail, notice shall be deemed given on the fifth business day following deposit in the United States mail (as noted by the postmark), properly addressed, with postage prepaid. If sent by same-day or overnight delivery service, notice shall be deemed given on the day of delivery. The Company and an EGS may change their representative for receiving notices contemplated by this Tariff by delivering written notice of their new representatives to the other.

19.2 No Prejudice of Rights. The failure by either the Company or the EGS to enforce any of the terms of this Tariff or any Individual Coordination Agreement shall not be deemed a waiver of the right of either to do so.

19.3 Gratuities to Employees. The Company's employees are strictly forbidden to demand or accept any personal compensation, or gifts, for service rendered by them while working for the Company on the Company's time.

19.4 Assignment.

19.4.1 An Individual Coordination Agreement hereunder may not be assigned by either the Company or the EGS without (a) any necessary regulatory approval and (b) the consent of the other party, which consent shall not be unreasonably withheld.

19.4.2 Any assignment occurring in accordance with Rule 19.4.1 hereunder shall be binding upon, and oblige and inure to the benefit of, the successors and assigns of the parties to the Individual Coordination Agreement.

19.5 Governing Law. To the extent not subject to the exclusive jurisdiction of FERC, the formation, validity, interpretation, execution, amendment and termination of this Tariff or any Individual Coordination Agreement shall be governed by the laws of the Commonwealth of Pennsylvania.

The Tariff or any Individual Coordination Agreement, and the performance of the parties' obligations thereunder, is subject to and contingent upon (i) present and future local, state and federal laws, and (ii) present and future regulations or orders of any local, state or federal regulating authority having jurisdiction over the matter set forth herein.

If at any time during the term of the Tariff or any Individual Coordination Agreement, the FERC, the PaPUC or a court of competent jurisdiction issues an order under which a party hereto believes that its rights, interests and/or expectations under the Agreement are materially affected by said order, the party so affected shall within thirty (30) days of said final order provide the other party with notice setting forth in reasonable detail how said order has materially affected its rights, interests and/or expectations in the Agreement. Within thirty (30) days from the receiving party's receipt of said notice the parties agree to

PPL Electric Utilities Corporation

MISCELLANEOUS (CONTINUED)

attempt through good faith negotiations to resolve the issue. If the parties are unable to resolve the issue within thirty (30) days from the commencement of negotiations, either party may at the close of said thirty (30) day period terminate the Agreement, subject to any applicable regulatory requirements, following an additional thirty (30) days prior written notice to the other party without any liability or responsibility whatsoever except for obligations arising prior to the date of service termination.

19.6 Tax indemnification. If the Company becomes liable, under Section 2806(g) or 2809(c) of the Public Utility Code, 66 Pa. C.S.§§ 2806(g) and 2809 (c), for any Pennsylvania state taxes not paid by an electric generation supplier, the non-tax-compliant electric generation supplier shall indemnify the Company for the full amount of additional state tax liability imposed upon it by the Pennsylvania Department of Revenue due to the failure of the electric generation supplier to pay, or remit to the Commonwealth, the tax imposed on the electric generation supplier's gross receipts under Section 1101 of the Tax Report Code of 1971 or Chapter 28 of Title 66.

PPL Electric Utilities Corporation

CHARGES

Load Data Supply Charge

AVAILABILITY/APPLICABILITY

The Company will fulfill, with Customer consent only, a request for Customer load information available on its information system once per calendar year for no charge. The Company will provide additional or other information, with Customer consent only, but will do so only for a Charge, in accordance with the Table of Charges below.

TABLE OF CHARGES

An EGS must pay the charges stated below per request to which the Company responds in the following instances:

- All available historic load information other than electronically available historic hourly load information- $106.
- Any electronically available load data if requested in a calendar year in which the Company has already provided such data once for no charge - the Company's actual cost, using an hourly labor rate of $53, and based on the time spent to fulfill the request to be determined at fifteen minute intervals.

CONDITIONS

No Customer-specific information will be supplied to an EGS before the Company's receipt of a Customer's written authorization to release such data to such EGS.

PPL Electric Utilities Corporation

CHARGES

Technical Support and Assistance Charge

AVAILABILITY/APPLICABILITY

Technical Support and Assistance is defined as support and assistance that may be provided by the Company to a licensed EGS in connection with questions raised, and research requests, by the EGS in support of its energy supply business. The Company is under no obligation to provide any such support and assistance, with the exception of the services described in the "Conditions" section below. Such technical support and assistance is categorized in three general areas:

1. Explanation of the Company's communications related to information posted to the website and /or sent via the Alternative Supplier Coordination Internet e-mail address;
2. Manual verification and confirmation of Customer account data beyond the information and messages available through the standard automated process; and
3. Explanation and definition of Company filings, PUC rulings and FERC orders

Such Technical Support and Assistance may include time spent by Company personnel conducting research in connection with an EGS inquiry.

TABLE OF CHARGES

First 10 hours ("Allowed Hours") per month per EGS: No charge.

Any time beyond Allowed Hours: $53/hour

CONDITIONS

There will be no time recorded against an EGS's Allowed Hours in connection with inquiries covering required business interactions, specifically:

1. Normal daily forecasting and scheduling;
2. Standard automated processing of EGS data files by the Company;
3. Website availability and access; and
4. Erroneous data communicated by the Company via the Internet address and the website.

PPL Electric Utilities Corporation

INDIVIDUAL COORDINATION AGREEMENT RIDER

1.0 This Individual Coordination Agreement ("Agreement"), dated as of is entered into, by and between PPL Electric Utilities Corporation (“PPL Electric” or the "Company") and ("EGS").

2.0 The Company agrees to supply, and the EGS agrees to have the Company supply, all "Coordination Services" specified in the Electric Generation Supplier Coordination Tariff ("EGS Coordination Tariff"), including but not limited to load forecasting, load scheduling, and reconciliation services. Both Parties agree that such services are necessary to coordinate the delivery of Competitive Energy Supply to Customers located within the Company's service territory.

3.0 Representations and Warranties.

(a) The EGS hereby represents, warrants and covenants as follows:

(i) If an EGS will utilize Sections 6-9 of this tariff, the EGS is a member of the PJM and is in compliance, and will continue to comply either directly or through the EGS's Scheduling Coordinator, with all obligations, rules and regulations, as established and interpreted by the PJM OI, that are applicable to LSEs serving Customers located in the PJM Control Area; and

(ii) The EGS is licensed by the PaPUC to provide Competitive Energy Supply to Customers in Pennsylvania and has and will continue to satisfy all other PaPUC requirements applicable to EGSs.

(b) The Company and the EGS, individually referred to hereafter as the "Party," each represents, warrants and covenants as follows:

(i) Each Party's performance of its obligations hereunder has been duly authorized by all necessary action on the part of the Party and does not and will not conflict with or result in a breach of the Party's charter documents or bylaws or any indenture, mortgage, other agreement or instrument, or any statute or rule, regulation, order, judgment, or decree of any judicial or administrative body to which the Party is a party or by which the Party or any of its properties is bound or subject.

(ii) This Agreement is a valid and binding obligation of the Party, enforceable in accordance with its terms, except as such enforceability may be limited by applicable bankruptcy, insolvency or similar laws from time to time in effect that affect creditors' rights generally or by general principles of equity.

4.0 The EGS shall provide notice to the Company via facsimile, with a copy delivered pursuant to overnight mail, at such time that the EGS learns that any of the representations, warranties, or covenants in Section 3.0 of this Agreement have been violated.

5.0 As consideration for Coordination Services provided by the Company, the EGS shall pay the Company those Coordination Services Charges billed to the EGS in accordance with the terms and conditions of the EGS Coordination Tariff.

PPL Electric Utilities Corporation

INDIVIDUAL COORDINATION AGREEMENT RIDER (CONTINUED)

6.0 Coordination Services between the Company and the EGS will commence on _____. .

7.0 Any notice or request made to or by either Party regarding this Agreement shall be made to the representative of the other Party as indicated below.

To PPL Electric:

Telephone: _____
Facsimile: _____
Internet E-Mail: _____

To the EGS:

_____
_____

PPL Electric Utilities Corporation

SCHEDULING COORDINATOR DESIGNATION FORM

1.0 This Scheduling Coordinator Designation Form, dated _____, is being submitted to PPL Electric Utilities Corporation (the "Company") by the following Electric Generation Supplier ("EGS"):

_____

2.0 By submitting this form, the EGS hereby notifies the Company that it has appointed the following entity to act as its Scheduling Coordinator in accordance with Rule 9 of the Company's Electric Generation Supplier Coordination Tariff (the "EGS Coordination Tariff"):

_____

3.0. The EGS further notifies the Company that it is designating the person identified in the preceding paragraph as its Scheduling Coordinator for the specific purpose(s) (please check and/or fill in):

_____ Load Scheduling

_____ Installed Capacity Obligations

_____ Import Capability

_____ Reconciliation Rights and Responsibilities

_____ Other: _____

The Scheduling Coordinator appointed by the EGS shall be responsible for the performance of all Coordination Obligations of the EGS that are specifically delegated to said Scheduling Coordinator in this Form.

4.0. The Company may utilize the Scheduling Coordinator as the sole point of contact with the EGS in connection with the Company's provision of Coordination Services if requested to do so by the EGS.

5.0 The EGS agrees that the Company may bill the Scheduling Coordinator directly for all Coordination Services Charges attributable to the EGS and that the Scheduling Coordinator will pay the Company such charges on behalf of the EGS in accordance with the terms and conditions in the EGS Coordination Tariff.

6.0 The EGS and its appointed Scheduling Coordinator shall comply with all terms and conditions of the EGS Coordination Tariff, including those pertaining to Scheduling Coordinators and to payment and billing.

PPL Electric Utilities Corporation

SCHEDULING COORDINATOR DESIGNATION FORM (CONTINUED)

7.0 All inquiries, communications or notices relating to the EGS's use of the Scheduling Coordinator designated above may be directed to the following representatives:

PPL Electric Utilities Corporation

PPL Electric Competitive Metering Specifications Rider

Definition and Terms for Advanced Meters and Advanced Meter Services

1. Advanced meters must meet all applicable Pennsylvania Public Utility Commission ("Commission") and ANSI standards and the Company's applicable standards and codes for providing metering, metering devices and metering services contained in the Company's Tariff.
2. PPL Electric has the right of physical access to all metering and associated equipment for operational and emergency response purposes.
3. Advanced Meter Services can be defined and divided into two components:
   a) the installation, removal, and maintenance of the physical meter required on a premise to measure the required variables.
   b) reading the meter and validating the raw meter outputs and applying, editing, and estimating rules, adding corollary information needed to characterize the customer, and making requested customer information available to authorized parties.
4. In accordance with the "Joint Petition for Full Settlement of PPL Electric Restructuring Plan and Related Court Proceedings" approved by the Commission on August 27, 1998 at Docket No. R-00973954, effective January 1, 1999, a Commission-licensed EGS may provide, finance, own, calibrate and remotely read advanced meters for service to residential customers located in PPL Electric service territory subject to the ability of the EGS to comply with these Competitive Metering Specifications.
5. An EGS may request that the PUC allow that EGS to provide Advanced Meters and Advanced Meter Services in the licensing process.
   a) An EGS that is currently licensed with the PUC and proposes to offer Advanced Meters and Advanced Meter Services shall file an amendment to its license to allow it to offer such services.
   b) An EGS must submit to the PUC proof of its technical fitness to warrant expansion of its license to allow it to offer Advanced Meters and Advanced Meter Services. Such fitness standards will include, but will not be limited to, the ability of the EGS and/or its certified subcontractor to adhere to the same metering safety and installation standards and practices imposed upon PPL Electric.
   c) and the technical ability to transfer data and information according to prescribed standards.
   d) A licensed EGS and the Company who currently provide advanced metering in the Commonwealth or elsewhere will be presumed to be technically fit to provide advanced metering in Pennsylvania and shall file the appropriate documents with the Commission.

6. List of "Grandfathered" Advanced Meters

Pursuant to a Commission Secretarial Letter, dated May 13, 1999, at Docket M-00991233, a listing of "Grandfathered" Advanced Meters applicable to the PPL Electric service area is provided on Attachment D.

The Advanced Meter Standards report provides that devices and systems currently in use by any Pennsylvania EDC will continue to be valid for the length of their commercial life, assuming they generate the billing parameters required by the marketplace in a timely and appropriate fashion

PPL Electric Utilities Corporation

Testing/Calibrating of Meters

Testing and calibration of meters must meet all applicable Commission standards. PPL Electric's testing requirements for advanced metering are Attachment B to this document.

PPL Electric Utilities Corporation

Attachment B

Informal Complaints to EDC

PPL Electric Utilities Corporation

PPL Electric Competitive Metering Specifications Rider

Advanced Meter Installation

An EGS providing advanced metering services who wishes to replace the PPL Electric meter must give notice to PPL Electric at least four business days prior to the date it proposed to change the meter. Such notice shall be given electronically. Business processes and required data to be exchanged will be in accordance with the Electronic Data Exchange Working Group Standards and the Data Transfer Schedule.

The transaction shall include the scheduled date that the EGS will change the meter.

An EGS providing advanced metering service may arrange for the installation of an advanced meter and the removal of the existing meter. The existing meter must be returned by the EGS to PPL Electric within five business days. An advanced meter cannot be installed within four (4) business days prior to the customer's regularly scheduled meter reading date or one-business day after the customer's regularly scheduled meter reading date. PPL Electric will provide 60-days advance notice so that parties that disagree with PPL Electric's decision to modify the timing may request the Commission to overrule or modify PPL Electric's decision.

An EGS installing an advanced meter must comply with all applicable Commission standards and PPL Electric's electric service requirements manuals.

PPL Electric will not require removal of an Advanced Meter that meets PPL Electric's required specifications as a condition of a customer's return to PLR service.

Transformer-Rated Meter Installations.

Current Transformers (CT) & Voltage Transformers (VT)

- PPL Electric will own all CT & VT installations.
- PPL Electric will install and replace all CT's & VT's at the request of an EGS providing metering service.
- An EGS providing metering service will be responsible for verifying all CT's & VT's operate accurately, with their meter, and ensuring compliance with PUC installation requirements. PPL Electric will be responsible for the accuracy testing of CT's and VT's (ratio and phase angle) prior to installation. If necessary, PPL Electric will provide a copy of the test results to the EGS upon request.
- An EGS providing metering service is responsible for coordinating any customer outages required for changes to the customer's meter, CT's & VT's, or associated equipment.

Instrument Transformer Wiring

- PPL Electric will own all CT & VT wiring (color-coded), from the CT & VT up to the meter test switch the "line of demarcation", where PPL Electric responsibility ends and the responsibility of the EGS providing metering service begins, is at the load-side (meter side) of the meter test switch.
- PPL Electric is responsible to connect and disconnect meter wiring from the meter test switch, unless a qualified EGS providing metering service chooses to do so.

PPL Electric Utilities Corporation

Meter Panels

- PPL Electric will own and provide a meter panel for all transformer rated meter installations. The meter panel must be kept in place at all times, with wiring and components left intact.
- PPL Electric will leave the existing meter panel in place for use by an EGS providing metering service.
- The EGS providing metering services can elect to install their meter into the PPL Electric meter panel or provide a wiring extension from the load side (meter side) of the test switch to an EGS provided meter and/or panel, if the standard ANSI socket configuration is not acceptable.
- PPL Electric will not be responsible for wiring past the load side (meter side) of the test switch if the EGS decides to install an adjacent meter panel. The PPL Electric provided meter panel must remain in place at all times and will act as the demarcation point for the metering wiring.
- PPL Electric will install and maintain meter panels for all existing and new installations.
- An EGS provided meter panel must be removed from service after termination of a customer contract unless arrangements are made for use by a future meter service provider.

Metering Credits

- If an existing or upgraded PPL Electric meter is required for metering a customer's account, the customer will not receive a metering credit
- PPL Electric's meter must be replaced by the meter of the EGS providing metering service, in order for the customer to receive the applicable metering credit.
- If an existing PPL Electric meter is removed by an EGS, it must be returned to PPL Electric in order for a customer to receive the applicable metering credit. The credit will be retroactive to the actual removal date.

Non-Transformer-Rated Meters

Meter Panels

- The Customer is responsible for meter panel / meter socket for all non-transformer rated meter installations, per PPL Electric's Rules for Electric Meter and Service Installations.

Metering Credits

- If an existing or upgraded PPL Electric meter is required for metering a customer's account, the customer will not receive a metering credit.
- PPL Electric's meter must be replaced by the meter of the EGS providing metering service, in order for the customer to receive the applicable metering credit.
- If an existing PPL Electric meter is removed by an EGS, it must be returned to PPL Electric in order for a customer to receive the applicable metering credit. The credit will be retroactive to the actual removal date.

7. Access to customer premise for meter installation and maintenance. The EGS is responsible to obtain access to customer premises or locked rooms within customer premises directly from the customer. PPL Electric will not provide an EGS with customer keys or access to PPL Electric's customer keys in order to gain access to restricted areas within the customer's facility.
8. PPL Electric will provide an EGS with security keys for PPL Electric's barrel lock rings.

PPL Electric Utilities Corporation

PPL Electric Competitive Metering Specifications Rider

Meter Reading

1. An EGS providing advanced metering service may request an adjustment to the meter reading schedule for an account which it meters and select from an existing PPL Electric defined meter reading route. PPL Electric will accommodate an EGS specified meter reading schedule for all rate schedules. The EGS must ask the Customer whether the Customer consents to the switch in meter reading schedule. The EGS must retain a record indicating the customer has consented to this change. If the record is not itself a hard copy document, but rather an electronic or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy upon request.
2. All data collected by an EGS providing advanced metering service, which is required by PPL Electric for billing and distribution service operation, shall be transmitted electronically consistent with the data transfer procedures established by the Electronic Data Exchange Working Group Standards and the Data Transfer Schedule.
3. If PPL Electric is providing the metering service and the EGS is providing the customer with a consolidated EGS bill, all metering data which is required by the EGS for billing shall be transmitted electronically to the EGS consistent with the data transfer procedures established by the Electronic Data Exchange Working Group Standards and the Data Transfer Schedule.
4. Any authorized party that is providing advanced metering is responsible for the safe installation, maintenance, authorized operation, the accuracy of such advanced metering, and for resolving theft of service issues. In the case of theft of service, the party that discovers a theft of service condition will notify the other party within five-business days.
5. Any party providing advanced metering service is required to keep the most recent 12 months of customer consumption data for each metered customer. Such data must be retained for a period of 36 months. Such data must be released on request to the customer or, if authorized by the customer, to any EGS or to PPL Electric.

PPL Electric Utilities Corporation

PPL Electric Competitive Metering Specifications Rider

Dispute Resolution

1. A dispute involving PPL Electric and an EGS shall be handled pursuant to Rule 18 of PPL Electric's Electric Generation Supplier Coordination Tariff. The PUC has final adjudication authorization of all disputes.
2. Customer disputes involving advanced meter reading issues shall be handled by the EGS as the entity responsible for the advanced meter. The EGS will coordinate with PPL Electric so that a proper investigation is made within the time period defined by 52 Pa. Code §56.151(5) and that the customer is informed of the results of the investigation. PPL Electric shall provide all information needed by the EGS relating to the customer's complaint and must do so within five (5) business days of the EGS's request if the information can be obtained without contact in the field with the customer. If field contact with the customer is required (e.g. access to meter for re-read), the information will be provided within ten (10) business days.

PPL Electric Utilities Corporation

PPL Electric Competitive Metering Specifications Rider

Termination of Service to Customers with Competitive Metering Services

1. PPL Electric will maintain responsibility for physically energizing, discontinuing, and terminating service to customers.
2. For any account that is metered by an EGS, PPL Electric may terminate service to an account, after proper notice to the customer in accordance with the Commission's regulations and PPL Electric's tariff.
3. At the time a field termination visit is scheduled, PPL Electric will notify the EGS of the scheduled time for such termination visit.

PPL Electric Utilities Corporation

PPL Electric Competitive Metering Specifications Rider

Requirements for Advanced Metering

An Advanced Meter Service Provider supplying metering systems for electric distribution customers of PPL Electric as the Electric Distribution Company ("EDC") will comply with the latest version of all applicable standards and codes for providing metering, metering devices, and metering services, including but not limited to the
following:

- Applicable parts of the Pennsylvania Code Title 52, Chapter 56 and 57;
- Any other applicable PA PUC guidelines; and
- All applicable ANSI standards, including specifically:
    - ANSI C12 standards
    - ANSI C57 standards
    - ANSI C2 standards

(National Electrical Safety Code)

- National Electrical Code Standards
- NEMA Standards
- PPL Electric "Rules for Electric Meter and Service Installations"
- PPL Electric Requirements for Commercial Electric Service
- OSHA requirements

The performance, accuracy, testing, calibration, and installation of the above-mentioned metering systems, including revenue meter, instrument transformers, and any other ancillary devices (e.g., recorders, test switches, relays, etc.), shall comply with all requirements in the Pennsylvania Code, Title 52, Chapter 57, and the latest version of all applicable ANSI C12 standards.

The Advanced Meter Service Provider shall assure that the following specific requirements are met.

For All Meters:

- All meters must be permanently tagged/labeled on the nameplate with the name of the EGS; PPL Electric or subcontractor providing meters for the EGS or PPL Electric.
- All meters are to have a nameplate with values for "CTR", "VTR", "PkH", kh, form and "Multiply by" as applicable.
- Certain invalidated, non-billing data, as mutually agreed upon, will be made available to the non-metering party.
- All meters must be equipped with a visual or optical watt-hour indicator for meter testing. This indicator is to be calibrated to the meter watt-hour constant (Kh).
- For each meter installed by the Advanced Meter Provider, the following shall be provided: accuracy test information, vendor serial number, all metering and billing constants, and any other meter records information as required by the PUC. This data shall be provided by the method agreed upon in the Data Exchange Working Group.
- All meters must comply with ANSI C12.1, ANSI C12.13, ANSI C12.18, and ANSI C12.19, as applicable.
- The Advanced Meter Provider will have their representative present at the customer site to meet a PPL Electric representative if PPL Electric exercises its right to test the meter, in lieu of providing meter application programs and passwords.
- All meters shall be tested and maintained as per PUC requirements and ANSI standards.

PPL Electric Utilities Corporation

For Electromechanical Watt-hour Meters:

- The accuracy and form designation of electromechanical watt-hour meters must comply with ANSI C12.1 and ANSI C12.10.
- Electromechanical watt-hour meters may only be used for customers with peak demands of less than 75 kW.

For Solid-state Electricity Meters:

- The accuracy and form designation of solid-state electricity meters must comply with ANSI C12.16 and ANSI C12.20.
- Solid-state electricity meters may be used for any customer, but must be used for customers with peak demands of 75 kW or greater.
- Solid-state electricity meters used for customers with peak demands of 75 kW or greater, must be 0.2 accuracy class.
- Solid-state electricity meters used for customers with peak demands of less than 75kW, must be 0.2 or 0.5 accuracy class.
- Solid-state electricity meters used with an internal *Transformer Loss Compensation* feature need only to meet ANSI 12.1 accuracy requirements if the same meter meets the above specified accuracy class without the feature.

For Metering Installations:

- Metering Installations shall conform to the metering installation requirements in the PPL Electric Rules for Electric Meter and Service Installations manual however these requirements will not limit the use of the latest technology and will be updated as necessary so as not to preclude the use of such new technology.
- Metering Installations for Self-Contained Meters must have an approved meter socket as defined in PPL Electric's listing of Approved Meter Base Tables. Meter socket locations will be specified by PPL Electric.
- All self-contained meters must be either socket based or K-based in configuration. The maximum nominal voltage cannot exceed 240 volts phase to phase.
- Metering Installations for Transformer-Rated Meters will be jointly coordinated by the EGS Meter supplier and PPL Electric. PPL Electric will supply and install the instrument transformers, meter panel, and wiring.
- Metering Installations must comply with ANSI C12.6, ANSI C12.7, ANSI C12.8, ANSI C12.9 and all applicable NEC codes.

PPL Electric Utilities Corporation

PPL Electric Competitive Metering Specifications Rider

PPL Electric - Electric Distribution Company

Installation Test Requirements for Advanced Metering

An Advanced Meter Service Provider supplying metering systems for electric distribution customers of the PPL Electric as the Electric Distribution Company ("EDC") will test all meters and associated devices in compliance with all requirements of the Pennsylvania Code Title 52, Chapter 57, and as specified in the table below. As required by the PA code, meters will be tested before installation, after removal, and for periodic maintenance as prescribed for each type of meter. Before installation and periodic in-service maintenance, a full test of all meter system components shall be made as specified below. After removal, only the as-found accuracy tests as described in the PA code are necessary.

	1	2	3	4	5	6	7	8	9	10
Type of Meters/Devices	Voltage Test	Light & Full Load Test	Inductive Load Test	Customer Load Test	Demand Test	Register Verification	Phase Angle Test	Separate Element Check	Burden Test	Communications Test
Self-Contained kWh Meters	X	X	2	2						3( )
Transformer-Rated kWh Meters	X	X	2	2				X	X	3( )
										( )
Transformer-Rated Multifunctional Meters	X	X	2	2			X	X	X	3(4)
										( )
Solid State Recorders	X				X					4
										( )
										( )

1 Performed if demand is present.

2 Performed when deemed necessary.

3 Performed if communications option is present and its proper operation is suspect.

Business Telephone Number: _____

1. Insurance Requirement: The Applicant shall maintain, and submit with this application proof of insurance, as described below:
   a) Worker's Compensation Insurance with required statutory limits.
   b) Comprehensive General Insurance with a combined single limit of not less than $1,000,000 per occurrence, which shall include vehicle liability.
   c) The Applicant may self-insure for the above coverages if Applicant is approved for self-insurance for worker's compensation or auto insurance under applicable Pennsylvania law.
2. Please attach a detailed description all of the Applicant's current employees' electric meter testing installation, maintenance, repair and removal experience, including their Meter Worker Level. The Applicant must have at least one full time employee who is a Level 2 or Level 3-Meter Worker.
3. Please attach a detailed description of the Applicant's hiring and retention policies with regard to employees providing testing, installation, maintenance, repairing or removing of metering devices, especially with regard to the screening and periodic review of the medical history, job history and record of criminal convictions of any prospective or existing personnel who enter onto customer premises or property. Additionally, attach a detailed description of training programs, procedures and policies regarding testing installation, maintenance, repairing, or removing of electrical meters or metering devices. Applicant's policies must provide that its employees wear uniforms and carry proper identification while on site for installation, maintenance, repairing, or removing of electrical meters or metering devices. If Applicant will also provide incidental or backup meter reading over and beyond routine and maintenance, attach a detailed description of the Applicant's training programs, procedures and policies regarding meter reading. Applicant's policies must provide that its employees wear uniforms and carry proper identification while on site for meter reading.
4. Please attach a detailed description of the educational and training requirements in electrical work and electrical safety that the applicant will require of its employees before they are allowed to install, maintain, repair, or remove electrical meters or metering devices.
5. By submitting this Application, Applicant agrees to comply with any and all of the Advanced Meter Services Provider Standards approved by the Pennsylvania Public Utility Commission, including but not limited to, *Meter Testing, Calibration and Installation* and *Meter Worker Qualifications.* Failure to comply shall be grounds for the Pennsylvania Public Utility Commission to revoke Advanced Meter Service Provider certification.

PPL Electric Utilities Corporation

6. By submitting this Application, Applicant agrees to comply with any and all of the Advanced Meter Services Provider reporting or filing requirements. Such filings shall include, but not be limited to, Applicant's list of qualified workers due each year to the Pennsylvania Public Utility Commission by January 31.
7. By submitting this Application, Applicant agrees to comply with the safety requirements applicable to metering services as found in the National Electrical Safety Code, ANSI, National Electric Code, and OSHA requirements for electrical metering work.
8. By submitting this Application, Applicant agrees to comply with any and all applicable laws, rules and regulations of the United States. Failure to comply shall be grounds for revoking Applicant's Meter Service Provider Certification.

Advanced Meter Services Provider – Services Performed

I. Advanced Meter Services Provider perform the following services:

a) The installation, removal, testing and maintenance of the physical meter required on a premise to measure the required variables.

b) reading the meter and validating the raw meter outputs and applying, editing, and estimating rules, adding corollary information needed to characterize the customer, and making requested customer information available to authorized parties.

Meter Worked Qualifications Requirements for Advanced Metering Services

INTRODUCTION

Three levels of meter worker qualifications are set forth as criteria for meter workers to perform the installation, removal, testing, and maintenance of physical meters within an EDC's service territory. Advanced metering services may be performed, by an electric distribution company ("EDC"), or an electric generation supplier ("EGS"), if certified to perform such services. EDC's and EGS's may perform these services through agreements with certified subcontractors.

GENERAL

If the EDC is subcontracting the meter services, then the EDC will ensure the Advanced Meter Services Provider issues to each meter worker or employee, who performs metering work, appropriate identification, indicating the worker's employer and the level of meter work the worker is qualified to perform. This identification must be carried by each meter worker during the performance of work. If the EGS is subcontracting the meter services then, the EGS will ensure that the Advanced Meter Services Provider issues to each meter worker or employee, who performs metering work, appropriate uniforms and identification, indicating the worker's employer and the Level of meter work the worker is qualified to perform. This identification must be carried by each meter worker during the performance of work.

All meter workers sub-contracted to perform meter services pursuant to this Agreement must have sufficient training to exercise due care for the tasks performed.

LEVEL DESCRIPTIONS AND REQUIREMENTS

Level 1

1. Metering Types and Voltages

   This level includes single-phase, socket-based meters, and A-Based meters, 300 volts phase-to-phase maximum and does not include transformer rated meters. Communication wiring must be outside of energized meter panels.

2. Work to be Performed

   Level 1 Meter Workers can install, remove and replace single-phase, 120/240-volt or 120/208-volt, self-contained meters in standard meter socket's, A-Based configurations in residential-commercial type metering equipment. Connections of communication conductors must be outside the energized meter panels.

3. Safety Skills

   a) Job performance in accordance with employing Advanced Meter Services Provider's procedures and safety rules.

   b) Knowledge of hazards of electricity and ability to perform work to avoid electrical hazards.

   c) Ability to comply with OSHA requirements and safety codes if applicable.

   d) On-site use of personal protective equipment.

   e) Ability to comply with ANSI-C2 (National Electric Safety Code).

4. Essential Technical Skills

   a) Understanding of single-phase electrical metering.

b) Understanding of electric distribution safety procedures.

c) Ability to identify energy diversion or tampering related to this Level of meter work.

d) Ability to install and remove damaged and un-damaged electric meters in this level of meter work.

e) Understanding of meter panel's, socket layouts and configuration of A-Base connections for the metering conditions related to this Level of meter work.

f) Ability to read meters used in this class.

g) Ability to properly use tools appropriate to the work in this class.

h) Ability to connect meter communications external to the meter panel.

i) Ability to initialize meter communication modules - not utilizing Type 2 optical ports and meter configuration software.

5. How Essential Technical and Safety Skills are Determined

a) Advanced Meter Services Providers will develop and implement a program to train their workers to perform Level 1 meter work safely and properly.

b) Employees will be certified by their employers, based on prior experience or, the successful completion of the Advanced Meter Services Provider's training program.

c) To facilitate agreements for performing meter work in this level, EGSs and EDCs may decide to share training programs, however, it is with the understanding that the appropriate non-disclosure agreements are executed.

d) EGS and Advanced Meter Services Provider employees currently employed in classifications performing these functions, or within the last three (3) years were previous employed in classifications performing these functions, are considered qualified.

e) Advanced Meter Services Providers will develop and implement a classroom training program (16 hrs.) to train their workers to perform Level 1 meter work safely and properly, including a minimum of forty (40) hours of on-the-job training (OJT) working alongside a meter worker with at least 6 months experience at Level 1, 2, or 3.

Level 2

1. Metering Types and Voltages

This Level includes all meter types in Level 1. Level 2 includes single-phase, two-phase, poly-phase, safety socket, standard socket-based meters, A-base, K-base, and transformer rated meters with internal diagnostics up to 600 volts phase to phase. Communication wiring may be routed inside the panel, and work can be in and around energized circuits.

2. Work to be Performed

In addition to Level 1 Meter Work, Level 2 Meter Workers can install, remove and replace single-phase, network, and poly-phase meters, 600-volt phase-to-phase maximum. Operate test-bypass facilities in self-contained safety sockets. Communication wiring may be installed inside the panel, and work can be performed in and around energized circuits. On panels without test-bypass facilities, poly-phase meters will not be removed or installed without first disconnecting the customer load.

Further, Level 2 Meter Workers can install, remove and replace all meters consistent with the above, including transformer-rated meters with internal diagnostics (if detected, metering problems with test switches, panel wiring or transformers and transformer wiring will be corrected by a Level 3 Meter Worker). Level 2 Meter Workers may operate test switches, but may not install, alter, maintain or replace wiring between the meter, test switch, test block and associated equipment.

3. Safety Skills

a) Cumulative including all skills and safety knowledge for Level 1.

PPL Electric Utilities Corporation

b) Electrical safety knowledge and work skills appropriate for three-phase metering up to 600V phase-to-phase, including the ability to identify and refer to a Level 3 or higher meter installer services above 600V phase-to-phase prior to performing work in the service equipment, or if voltage rating is not labeled, at the time of initial voltage check.

c) Ability to perform phase rotation assessments and wiring verification.

d) Ability to operate test-bypass facilities or test blocks in a self-contained safety socket.

e) Ability to perform work required to route communication wiring to accommodate meter communications.

f) Additionally, must have the knowledge needed for up to 600 volts, poly-phase, (two-phase and three phase) services and the forms and voltages applicable to Level 2 Meter Work.

g) Ability to understand, interpret and take appropriate action based on built-in diagnostics of solid-state meters.

h) Ability to work with transformer rated meters and operate test switches of 600 volts or less.

i) Awareness of instrument transformer operating characteristics including ability of potential transformer to back feed to primary system.

4. Essential Technical Skills

a) Cumulative of all Technical Skills for Levels 1.

b) Ability to perform work required to route communication wiring to accommodate meter communications.

c) Ability to understand, interpret, identify and take appropriate actions based upon built-in diagnostics of solid-state meters.

d) Ability to perform meter accuracy tests in locations other than in the meter socket using semi-automatic meter test equipment at the customer site or in truck mounted equipment.

5. How Essential Technical and Safety Skills Are Determined

a) Advanced Meter Services Providers will develop and implement a classroom training program (16 hrs.) to train their workers to perform Level 2 meter work safely and properly, including a minimum of forty (40) hours of on the job training (“OJT”) working alongside a meter worker with at least 6 months experience at Level 2, or 3.

b) Employees will be certified by their employers, based on successfully completing the MSP’s training program.

c) To facilitate agreements for performing meter work in this level, EGSs and EDCs may decide to share training programs, however, it is with the understanding that the appropriate non-disclosure agreements are executed.

d) Advanced Meter Services Providers work can be reviewed by the EDC’s.

6. Experience Requirements

Minimum experience requirements that must be demonstrated prior to qualification for individuals wanting to become a Level 2 Meter Worker.

a) After 12 months OJT working with a Level 2 or Level 3 meter worker who has at least 6 months experience and upon successfully completing the Advance Meter Services Provider training program a worker may be certified as a Level 2 Meter Worker,

or

b) If an employee has a two- or four-year degree in a related subject, then after four (4) months OJT working alongside a Level 2 or Level 3 meter worker with at least six months of experience and upon successful completion of the Advanced Meter Services Provider training program (16 hrs.) a worker may be certified as a Level 2 Meter Worker,

or

c) If entry level experience of any employee is that of a journeyman 16-hour OJT level electrician, journeyman level electric metering worker, or journeyman level line worker (e.g., lineman, troubleman),

PPL Electric Utilities Corporation

then upon successful completion of the advance meter services provider training program (16 hrs.) the worker may be certified as a Level 2 Meter Worker.

Level 3

1. Metering Types and Voltages

   This Level includes all meter types in Levels 1 and 2. Level 3 work includes all metering up to 600V, including transformer rated meters with primary and secondary voltages less than 600V plus the additional skills needed to perform work on metering systems with instrument transformer primary side voltages over 600V. Communication wiring may be behind the panel, and work can be in and around energized circuits.

2. Work to be Performed

   In addition to Level 1 and 2 Meter Work, Level 3 Meter Workers can install, remove and replace all meters consistent with the above including transformer-rated meters. Complete understanding of operating characteristics of metering transformers and operates test switches. May perform in-field meter accuracy tests, burden test, calibrations and perform all types of meter maintenance and troubleshooting on all meters. Programs and verifies internal programs and software in solid state meters.

3. Metering Types and Voltages

   a) Cumulative of all safety skills for Levels 1 and 2.

   b) Ability to recognize and understand electrical hazards and complexities associated with metering switchboards, instrument transformers, testing meters and maintaining meters.

   c) Awareness of instrument transformer operating characteristics including ability of potential transformer to back feed to primary system.

4. Essential Technical Skills

   a) Cumulative of Levels 1 and 2.

   b) Ability to perform work on metering panels.

   c) Ability to understand the operating characteristics of metering transformers and how to operate test switches.

   d) Ability to perform calibration, repair, retrofit, troubleshooting, data collection of electric meters and install, maintain and program advanced metering technologies, including time of use, interval data, real time pricing, remote meter communication, and load control devices.

5. How Essential Technical and Safety Skills Are Determined

   a) Advanced Meter Services Provider’s will develop and implement a classroom training program (40 hrs.) to train their workers to perform Level 3 meter work safely and properly, including a minimum of 6 months of on the job training (“OJT”) working alongside a meter worker with at least 6 months experience at Level 3.

   b) All workers will be certified by the test process outlined below.

   c) Advanced Meter Services Provider's work can be reviewed by the EDC’s.

6. Experience Requirements

   a) All individuals seeking to perform advanced metering services as a Level 3 Meter Worker must successfully pass written and practical (demonstrative) tests. These tests will be administered by the Advanced Meter Services Provider.

   b) Prerequisites for taking the written and practical tests include demonstrated knowledge or certificate of a state certified apprenticeship training program or a degree in electrical/electronic technology from an accredited institution of higher education and demonstrated experience in at least one of the following areas:

PPL Electric Utilities Corporation

1) Minimum of one year experience as a Level 2 Meter Worker, including 6 months OJT with a Level 3 Meter Worker, with at least 6 months experience,

or

2) in the event a standardized test program created by a professional organization is created and is approved or authorized by the Pennsylvania Public Utility Commission or other appropriate regulatory authority, for certifying Level 3 Meter Worker (or equivalent level) then, any person who passes such test shall be qualified as a Level 3 Meter Worker,

or

3) employment as a journeyman metering employee.

7. Testing and Re-Certification Requirements

a) Once an individual takes and passes the Level 3 Meter Worker Test and is otherwise qualified as a Level 3 Meter Worker they are qualified to perform that level of advanced metering work anywhere in Pennsylvania.

b) If after being qualified a meter worker does not perform metering work for three (3) years or more, re-certification will be required prior to performing that Level of meter work.

Continuing Education

As part of a Level 3 Meter Worker's ongoing ability to remain qualified the individual must participate in at least twelve (12) hours annually of the Advanced Meter Services Provider's training program regarding technical metering standards, safety-related issues, and up-dating of meter software programs and PC skills.

PPL Electric Utilities Corporation

PPL Electric Competitive Billing Specifications Rider

Availability of Competitive Billing Services

1. An EGS that is qualified and plans to offer consolidated EGS billing to its customers beginning in January, 1999 as defined in the Joint Petition for Full Settlement of PP&L Utilities's Restructuring Plan and Related Court Proceedings, subject to the provisions of Paragraph H.7 of the settlement agreement, must inform PPL Electric 60 days prior to the scheduled implementation date determined by the requirements of Paragraph H.7 of its intention to offer EGS consolidated billing.
2. A customer may choose to change his/her billing option. The customer can switch billing options through his/her EGS or through PPL Electric when the customer wishes to return to PLR service. The change will be effective as of the next scheduled meter read date provided that PPL Electric has received at least 16 calendar days prior notice.
3. An EGS is not required to offer consolidated EGS billing in order to participate as a supplier in PPL Electric's service territory.

PPL Electric Utilities Corporation

PPL Electric Competitive Billing Specifications Rider

Billing Service Options

Consolidated EDC Billing

1. PPL Electric will render a consolidated EDC bill monthly and in accordance with the Public Utility Code and the Commission's regulations (52 Pa. Code §56.1 et seq.)
2. If PPL Electric is providing metering services, PPL Electric will transmit Meter Data (e.g., meter reads, consumption, demand, dates and type of reading) to the EGS. If the EGS is providing advanced metering services, the EGS will transmit Meter Data to PPL.
3. The EGS will calculate its customers' charges and will send its customers' basic charges including date of billing period, consumption, usage, rate and resulting calculation ("EGS Charges") to PPL Electric in accordance with the data transfer procedures established by the Electronic Data Exchange Working Group Standards. PPL Electric and an EGS may develop, for future consideration, a fee structure to enable PPL Electric to include non-basic EGS charges on a PPL Electric consolidated bill.
4. PPL Electric will provide the EGS up to two lines, each 80 characters in length, on its standard bill for messages directly related to the calculation or understanding of the EGS portion of the bill.
5. PPL Electric and EGSs will transmit Meter Data and billing charges to each other in accordance with the data transfer procedures established by the Electronic Data Exchange Working Group Standards and the attached interim monthly billing schedule (Attachment E -Data Transfer Schedule.) The Data Transfer Schedule will remain in effect until December 31, 1999. In the fourth quarter 1999, the Data Transfer Schedule will be revisited by PPL Electric and the parties and PPL will determine whether to modify the timing reflecting in the Data Transfer Schedule beyond December 31, 1999 and PPL Electric will provide 60-days advance notice to EGSs before any modification takes effect so that parties that disagree with the discontinuance of the Data Transfer Schedule may request the Commission to overrule or modify PPL Electric's decision.
6. EGS Charges must be received by PPL Electric in accordance with the Data Exchange Standards and the Transfer Schedule.
7. If PPL Electric does not receive EGS charges in accordance with the Data Transfer Schedule, PPL Electric will place the EGS charges into the next billing cycle and the delayed EGS charges will appear on the customer's bill the following month. The customer's bill for the current billing period will state that the EGS charges for the current billing period are not available. The remittance period for EGS charges will begin when EGS charges actually appear on the bill. Any transactions with EGS charges sent to PPL Electric which are not in accordance with the Data Exchange Standards established by the Electronic Data Exchange Working Group or after the time periods outlined in the Data Transfer Schedule, will be rejected and the EGS will need to resubmit this data the following month.
8. PPL Electric will collect customer's payments and will process payments in accordance with the Commission's Chapter 56 standards and payment priority set forth in Docket No. M-00960890F.001 and Rule 9 of PPL Electric's EDC Tariff.
9. This section is applicable only to the Large Commercial and Industrial (Large C&I) Customer Class, which includes Rate Schedules LP-4, LP-5, and standby service for Rate Schedules LP-4 and LP-5. PPL Electric will pay the EGS for amounts owed for all undisputed EGS charges regardless of whether the customer has paid PPL Electric. An amount is deemed disputed if the customer contacts PPL Electric questioning the charges on the bill and he/she does not agree with PPL Electric's and/or the EGS's position regarding the amount due for EGS charges. If the EGS charges are not in dispute, PPL Electric will remit all applicable

PPL Electric Utilities Corporation

monies due the EGS, even if the PPL Electric portion of the bill is disputed. A customer's claim of the inability to pay shall not constitute a dispute for purposes of PPL Electric's obligation to pay the EGS its undisputed charges. If PPL Electric is required to make payment to the EGS for electricity delivered to the customer for which the customer has not made timely payment to PPL Electric, then PPL Electric shall be subrogated and succeed to the EGS's rights of recovery with respect to the electricity delivered to the customer from whom payment has not been received by PPL Electric. In no event may PPL Electric terminate a customer for any unpaid EGS charges subrogated to PPL Electric under this provision.

EGSs are permitted to perform credit checks and require deposits for large C&I customers and are permitted to deny serving large C&I customers for credit-related reasons.

10. PPL Electric will pay the EGS in accordance with the following schedule:

    a) Residential Rate Classes - PPL Electric will send the EGS the amount of its undisputed EGS Charges, regardless of whether the customer has paid PPL Electric, within 25-calendar days from the date of the electronic transmission of the EGS Charges.

    b) Non Residential Rate Classes. - PPL Electric will send the EGS the amount of its undisputed EGS Charges within 20-calendar days from the date of the electronic transmission of the EGS Charges.

    c) Payment will not be made to the EGS when EGS Charges are not received by PPL Electric within the specified time period, as explained in paragraph 6 above. Payment for these charges will be made according to the applicable schedule in the following month, if they are received within the appropriate time period along with the current month charges.

    d) PPL Electric will make payments of funds payable to the EGS by ACH with remittance advice to a bank designated by the EGS.

11. This section is applicable only to the Large C&I Customer Class, as defined in Section 9. Undisputed accounts that are 90 days or three billing cycles overdue, whichever is shorter, will be considered seriously delinquent and, at the request of either the EDC or EGS, will revert to two-bill status.

12. Budget Billing. The EDC and EGS must provide a budget billing option for their charges. If an EGS does not offer a budget billing option (and the Commission waives any applicable requirement), the following process will apply:

    - EGS transmits its CURRENT charges to PPL Electric.
    - PPL Electric places EGS CURRENT charges on the PPL Electric bill.
    - PPL Electric sends bill to customer.
    - PPL Electric pays EGS within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for EGS CURRENT charges.
    - Customer pays PPL Electric and EGS CURRENT and PPL Electric charges.

    If an EGS does offer a budget billing option, the following process will apply:

    - EGS calculates its budget amount based on its own budget billing protocol and transmits its BUDGET charges to PPL Electric.
    - PPL Electric calculates BUDGET charges for its portion and places them on the PPL Electric bill.
    - PPL Electric applies combined BUDGET charges to the bill and sends bill to customer.
    - PPL Electric pays EGS within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for BUDGET charges.
    - Customer pays PPL Electric for EGS BUDGET and PPL Electric BUDGET charges.

PPL Electric Utilities Corporation

General Rules for Budget Billing:

- Under EDC consolidated billing, both PPL Electric and the EGS will be responsible for calculating and managing the deferred balance for their respective budget charges.
- A customer can elect budget billing option for PPL Electric charges, EGS charges, or both.
- PPL Electric's reconciliation occurs in month 12 (not necessarily December), or immediately when a customer ends budget billing.
- All rates classes are eligible for EDC budget billing option.
- PPL Electric will provide information of a customer's budget billing status to an EGS when confirming a customer switch.
- An EGS can notify PPL Electric electronically, after receiving customer permission, to change or end the EDC budget billing option.
- The customer will stay on PPL Electric budget billing if no indication is made by the EGS at the time of the customer switch.
- PPL Electric must display actual, budget and budget billing balance on the bill.

13. PPL Electric charges and EGS charges shall be based on the PPL Electric defined meter reading route. An EGS providing advanced metering services may request an adjustment to the meter reading schedule for an account which it meters. The EGS may select another PPL Electric defined meter reading schedule for that account. PPL Electric will accommodate an EGS specified meter reading schedules for all rate schedules. The EGS must ask the Customer whether the Customer consents to the switch in meter reading schedule. The EGS must retain a record indicating the customer has consented to this change. If the record is not itself a hard copy document, but rather an electronic or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy upon request. The request must be received sixteen (16) days prior to the customer's currently scheduled meter read date and the change will take effect after that meter reading.
14. Dispute Process.
    a) Residential Dispute Process.
        1. PPL Electric shall process all disputes in accordance with the Public Utility Code and the Commission regulations (52 Pa. Code 56.1 et seq.). PPL Electric, as the entity responsible for the consolidated bill, must coordinate with the EGS so that a proper investigation of a customer dispute is conducted and completed within the time period prescribed by 52 Pa. Code 56.151(5) and that the customer and the EGS (if the EGS is involved in the dispute) are informed of the results of the investigation. The EGS shall cooperate fully with PPL Electric and shall provide all information needed by PPL Electric relating to the customer's dispute and must do so within five (5) business days of PPL Electric's request if no field visit is needed, and within ten (10) business days of PPL Electric's request if a field visit is needed. **Attachment A** outlines PPL Electric's customer inquiry and dispute procedure for EDC consolidated billing.
    b) Residential Informal Complaints.
        1. PPL Electric shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. PPL Electric, as the entity responsible for the consolidated bill, must coordinate with the customer's EGS so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission. **Attachment B** outlines PPL Electric's informal complaint procedure for EDC consolidated billing.
        2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by PPL Electric, as determined by the Commission, during EDC consolidated billing and the handling of the informal complaint are the responsibility of PPL Electric.
    c) Non-Residential Dispute Process.

PPL Electric Utilities Corporation

1. PPL Electric, as the entity responsible for the consolidated bill, will coordinate with the EGS so that the proper investigation is made and that the customer and the EGS (if the EGS is involved in the dispute) are informed of the results of the investigation. The EGS shall provide all information needed by PPL Electric relating to the customer's complaint and must do so within five (5) business days of PPL Electric's request if no field visit is needed, and within ten (10) business days of the EGS's request if a field visit is needed.

d) Non-Residential Informal Complaints.

1. PPL Electric shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. PPL Electric, as the entity responsible for the consolidated bill, must coordinate with the customer's EGS so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission.
2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by PPL Electric, as determined by the Commission, during EDC consolidated billing and the handling of the informal complaint are the responsibility of the EDC.

15. PPL Electric will follow its current credit and collection policies for collections. Outstanding prior balances are not transferred when a customer switches from PPL Electric to an EGS, switches from one EGS to another, switches from an EGS to PLR or when the customer chooses another billing option, unless mutually agreed to by PPL Electric and the individual EGS.

Consolidated EGS Billing

1. The EGS will render a consolidated EGS bill monthly and in accordance with the Public Utility Code and the Commission's applicable regulations (52 Pa. Code §56.1 et seq.).
2. If PPL Electric is providing the metering services to the customer, PPL Electric will transmit Meter Data to the EGS. If the EGS is providing advanced metering services to the customer, the EGS will transmit the Meter Data to PPL Electric.
3. PPL Electric will calculate its customers' charges and will send its unbundled charges ("PPL Electric charges") to the EGS via VAN or Internet protocol.
4. EGS will provide space to enable PUC mandated messages in accordance with Chapter 56.
5. PPL Electric and EGSs will transmit Meter Data and billing charges to each other in accordance with the attached interim monthly billing schedule (**Attachment E-**Data Transfer Schedule.) The Data Transfer Schedule will remain in effect until December 31, 1999. In fourth quarter 1999, the Data Transfer Schedule will be revisited by PPL Electric and the parties and PPL Electric will determine whether to modify the timing reflecting in the Data Transfer Schedule beyond December 31, 1999 and PPL Electric will provide 60-days advance notice to EGSs before any modification takes effect so that parties that disagree with the discontinuance of the Data Transfer Schedule may request the Commission to overrule or modify PPL Electric's decision.
6. PPL Electric charges will be provided to the EGS in accordance with the data transfer procedures established by the Electronic Data Exchange Standards and the Data Transfer Schedule.
7. If PPL Electric charges are not received by the EGS in accordance with the Data Transfer Schedule. The EGS will place the PPL Electric charges into the next billing cycle and the delayed PPL Electric charges will appear on the customer's bill the following month. The customer's bill for the current billing period will state that the PPL Electric charges for the current billing period are not available. The remittance period for EGS charges will begin when EGS charges actually appear on the bill. Any transactions with PPL Electric charges sent to an EGS after the time periods outlined in the Data Transfer Schedule will be rejected and PPL Electric will need to resubmit this data the following month.
8. The EGS will pay PPL Electric for the customer's amounts owed for all undisputed PPL Electric Charges regardless of whether the customer has paid the EGS. An amount is deemed disputed if the customer contacts the EGS questioning the charges on the bill and he/she does not agree with the EGS's and/or PPL Electric's position regarding the amount due for PPL Electric charges. If PPL Electric charges are not in dispute, the EGS will remit all applicable monies due

PPL Electric Utilities Corporation

to PPL Electric, even if the EGS portion of the bill is disputed. A customer's claim of an inability to pay shall not constitute a dispute for purposes of the EGS's obligation to pay PPL Electric its undisputed charges. If the EGS is required to make payment to PPL Electric for electricity delivered to the customer for which the customer has not made timely payment to the EGS, then the EGS shall be subrogated and succeed to PPL Electric's rights of recovery with respect to the electricity delivered to the customer from whom payment has not been received by the EGS. In no event, however, may an EGS terminate a customer's PLR service or PPL Electric's EDC service.

9. The EGS will pay PPL Electric in accordance with the following schedule:
   a) Residential Rate Classes - The EGS will send PPL Electric the amount of the undisputed PPL Electric charges within 25-calendar days from the date of the electronic transmission of the PPL Electric charges.
   b) Non Residential Classes. - The EGS will send the PPL Electric the amount of its undisputed PPL Electric charges within 20-calendar days from the date of the electronic transmission of the PPL Electric charges.
   c) Payment will not be made to PPL Electric when PPL Electric charges are not received by the EGS within the specified time period, as explained in paragraph 6 above. Payment for these charges will be made according to the applicable schedule in the following month, if they are received within the appropriate time period along with the current month charges.
   d) The EGS will make payments of funds payable to PPL Electric by ACH with remittance advice to a bank designated by PPL Electric.
10. Budget Billing. The EGS will include on its bill the budget-billing amount for PPL Electric customers who choose the budget billing option offered by PPL Electric. The following process will apply:
    If the EGS does not offer its own budget billing option (and the Commission waives any applicable requirement):
    - PPL Electric will transmit its BUDGET charges (including previous balance and current actual) to the EGS.
    - EGS places PPL Electric BUDGET charges on the EGS bill.
    - EGS sends bill to customer.
    - EGS pays PPL Electric within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for BUDGET charges.
    - Customer pays EGS for PPL Electric BUDGET and EGS charges.

    Month 12 Process:

    - PPL Electric transmits the previous balance (credit or debit) plus CURRENT charges.
    - EGS places PPL Electric CURRENT and previous balance (credit or debit) charges on the EGS bill.
    - EGS sends bill to customer.
    - EGS pays PPL Electric within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for BUDGET balance and CURRENT charges.
    - Customer pays EGS for CURRENT and previous balances.

    If the EGS offers its own budget billing option, the following process will apply:

    - EGS calculates its BUDGET charges and places them on the EGS bill with PPL Electric budget charges.
    - EGS sends bill to customer.
    - EGS pays PPL Electric within 25-calendar days for residential customers and 20 days for non-residential customers for BUDGET charges.
    - Customer pays EGS for PPL Electric and EGS BUDGET charges

PPL Electric Utilities Corporation

General Rules for Budget Billing:

- Under EGS consolidated billing, both PPL Electric and the EGS will be responsible for calculating and managing the deferred balance for their respective budget billing charges.
- An EGS will provide information of a customer's budget status to PPL Electric when confirming a customer switch.
- An EGS can notify PPL Electric electronically, after receiving customer permission, to change or end the PPL Electric budget billing option.
- The customer will stay on PPL Electric budget billing if no indication is made by the EGS at the time of the switch.
- PPL Electric must transmit actual, budget and budget balance for display on the bill.

11. PPL Electric charges and EGS charges shall be based on the EDC defined meter reading route. An EGS providing advanced metering services may requests an adjustment to the meter reading schedule for an account, which it meters. The EGS may select another EDC defined meter reading schedule for all rate schedules. The EGS must ask the Customer whether the Customer consents to the switch in meter reading schedule. The EGS must retain a record indicating the customer has consented to this change. If the record is not itself a hard copy document, but rather an electronic or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy upon request. The request must be received sixteen (16) days prior to the customer's currently scheduled meter read date and the change will take effect after that meter reading.
12. Dispute Process.
    a) Residential Disputes.
        1. The EGS shall process all complaints in accordance with the Public Utility Code and the Commission's regulations (52 Pa. Code 56.1 et seq.). The EGS, as the entity responsible for the consolidated bill, must coordinate with PPL Electric so that a proper investigation of a customer dispute is conducted and completed within the time period prescribed by 52 Pa. Code 56.151(5) and that the customer and PPL Electric (if PPL Electric is involved in the dispute) are informed of the results of the investigation. PPL Electric shall cooperate fully with the EGS and shall provide all information needed by the EGS relating to the customer's dispute and must do so within five (5) business days of the EGS request if no field visit is needed, and within ten (10) business days of the EGS's request if a field visit is needed. **Attachment C** outlines the EGS's customer inquiry and dispute procedure for EGS consolidated billing.
    b) Residential Informal Complaints.
        1. The EGS shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. The EGS, as the entity responsible for the consolidated bill, must coordinate with PPL Electric so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission. PPL Electric will provide the EGS, to the extent is has the data, information relating to the customer's previous EGSs during the previous two years to assist the EGS in providing the Commission's required two year billing history. **Attachment D** outlines the EGS informal complaint procedure for EGS consolidated billing.
        2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by the EGS, as determined by the Commission, during EGS consolidated billing and the handling of the informal complaint are the responsibility of the EGS.
    c) Non-Residential Dispute Process.
        1. The EGS, as the entity responsible for the consolidated bill, will coordinate with PPL Electric so that the proper investigation is made and that the customer and PPL Electric (if PPL Electric is involved in the dispute) are informed of the results of the investigation. PPL Electric shall provide all information needed by the EGS, relating to the customer's complaint and must do so within five (5) business days of the EGS's

PPL Electric Utilities Corporation

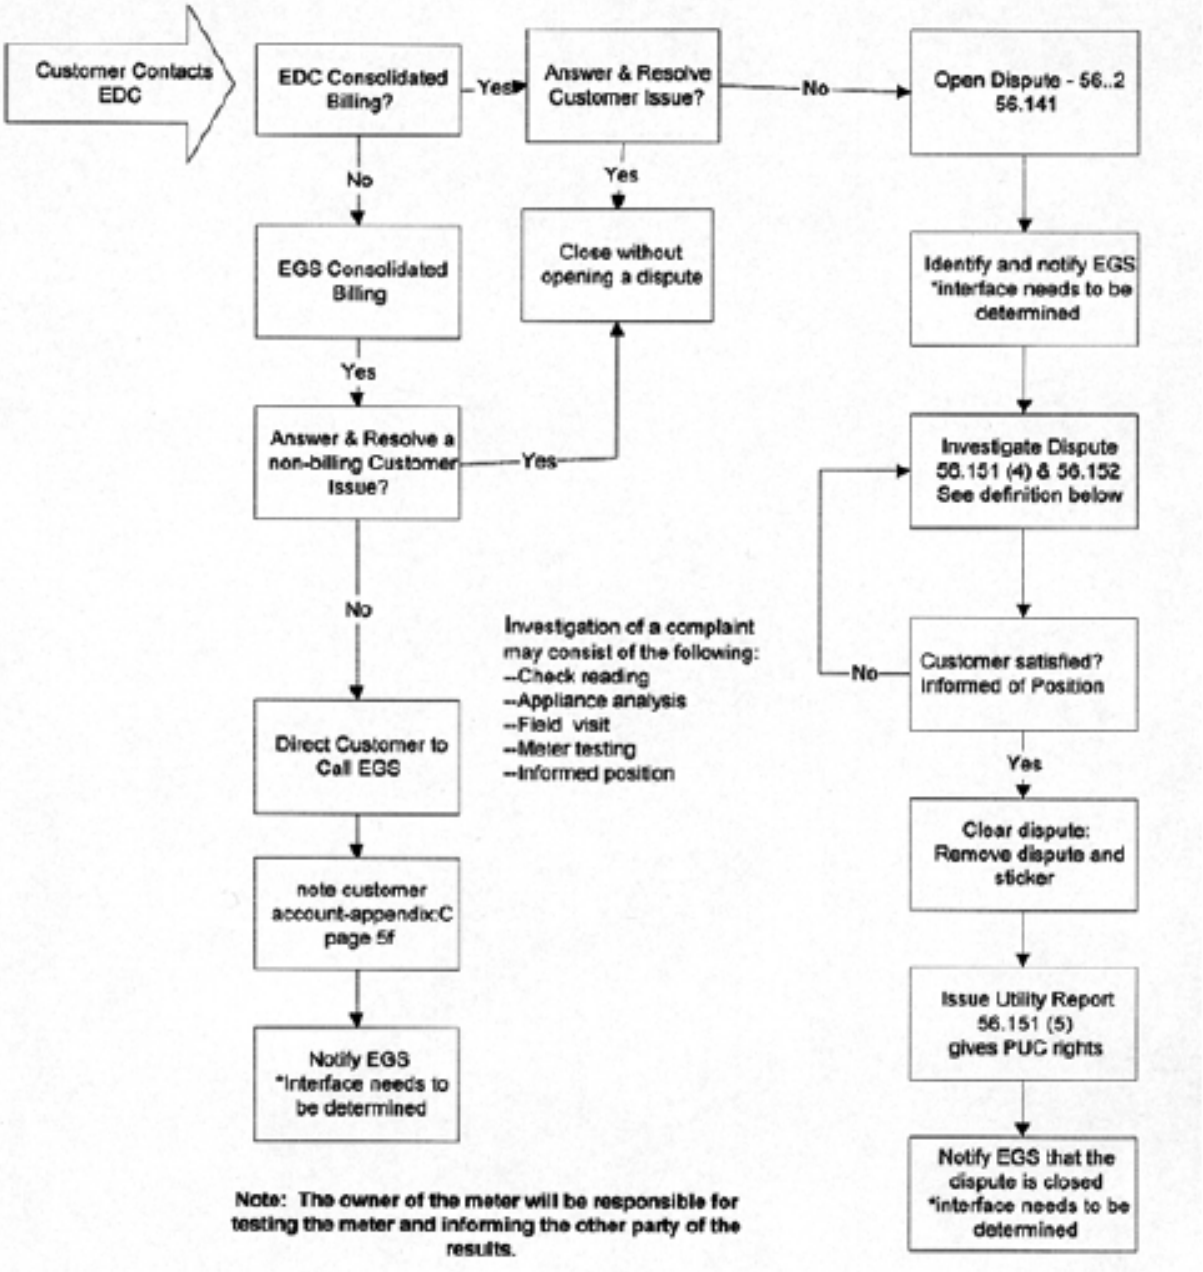
request if no field visit is needed, and within ten (10) business days of the EGS's request if a field visit is needed.

2. Non-Residential Informal Complaints

d) Non-Residential Informal Complaints.

1. The EGS shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. The EGS, as the entity responsible for the consolidated bill, must coordinate with PPL Electric so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission. PPL Electric will provide the EGS, to the extent is has the data, information relating to the customer's previous EGSs during the previous two years to assist the EGS in providing the Commission's required two year billing history. **Attachment D** outlines the EGS informal complaint procedure for EGS consolidated billing.
2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by the EGS, as determined by the Commission, during EGS consolidated billing and the handling of the informal complaint are the responsibility of the EGS.

13. The EGS will follow credit and collection policies in compliance with the applicable Commission regulations. Outstanding balances are not transferred when a customer switches from the EGS to PPL Electric, switches from one EGS to another or when the customer chooses another billing option, unless mutually agreed to by PPL Electric and the individual EGS.



Separate EDC/EGS Billing

1. PPL Electric and the EGS will separately send their bills directly to the customer.
2. If PPL Electric is providing the metering services to the customer, PPL Electric will transmit Meter Data to the EGS. If the EGS is providing advanced metering services to the customer, the EGS will transmit the Meter Data to PPL Electric.

Service Terms & Conditions

1. If PPL Electric does not receive payment for undisputed charges within 25-calendar days for residential customers or 20-calendar days for non-residential customers after the charges are communicated to the EGS, then PPL may provide notice of breach to the EGS at any time thereafter, at PPL Electric's discretion. Upon notice of a breach, the EGS shall have 20-calendar days to cure it. If the EGS has not cured the breach within 20-calendar days, PPL Electric may terminate consolidated EGS billing and take over billing functions for the customer. In no event shall these procedures result in a customer being sent two bills covering the same service.

2. If an EGS does not receive payment for undisputed charges within 25-calendar days for residential customers or 20-calendar days for non-residential customers after the charges are communicated to PPL Electric, then the EGS may provide notice of breach to PPL Electric at any time thereafter, at the EGS's discretion. Upon notice of a breach, PPL Electric shall have 20-calendar days to cure it. If PPL Electric has not cured the breach within 20-calendar days, PPL Electric will pay simple interest on the unpaid amount calculated at the lower of the (a) Interest Index, as defined in PPL Electric's Electric Generation Supplier Coordination Tariff, of (b) six (6) percent.

PPL Electric Utilities Corporation

DEFINITION OF TERMS AND EXPLANATION OF ABBREVIATIONS

Active Load Management ~~- the~~ – The process for arranging to have firm load become interruptible in accordance with criteria established by the PJM OI.

Appropriate Similar Day ~~- hourly~~ – Hourly forecasted load comparable based on ~~week day~~weekday, month, season, and weather.

~~**Bad Credit** - an EGS has bad credit if it is insolvent (~~

Bad Credit - Insolvency (liabilities exceeding assets or generally failing to pay debts as they become due, as evidenced by a credit report prepared by a reputable credit bureau or credit reporting agency or public financial data~~, liabilities exceeding assets)~~ or ~~generally failing to pay debts as they become due) or has failed~~failure to pay Company invoices when they ~~became~~become due on two (2) or more occasions within the last twelve (12) billing cycles.

~~**Charge** - any fee or charge that is billable by the Company to an EGS under this Tariff, including any Coordination Services Charge.~~

Basic Electric Supply – Energy (including renewable energy) and renewable energy or alternative energy credits (RECs/AECs) procured by an EGS, provided that the RECs/AECs are bundled with the associated delivered energy. For residential Customers, Basic Electric Supply does not include early contract cancellation fees, late fees, or security deposits imposed by an EGS.

Company – PPL Electric Utilities Corporation.

Competition Act ~~- the~~ – The Electricity Generation Customer Choice and Competition Act, 66 Pa.C.S. § 2801, et seq.

Competitive Energy Supply ~~- unbundled~~ – Unbundled electric energy~~ and/or~~, capacity, transmission, and ancillary services provided by an Electric Generation Supplier.

Competitive Retail Electric Service – Retail electric generation, aggregation, power marketing, and/or power brokerage services supplied to Customers of the Company by an EGS.

Consolidated EDC Billing – When the EDC bills both the EDC and EGS charges by issuing a single bill to a Customer.

Coordination Activities ~~- all~~ – All activities related to the provision of Coordination Services.

Coordination Agreement – An agreement between the Company and an EGS that arranges for the provision of Coordination Services. The form Coordination Agreement is provided in the Individual Coordination Agreement Rider.

Coordination Obligations ~~- all~~ – All obligations identified in ~~Rule 4 of the~~this Tariff~~,~~ relating to the provision of Coordination Services.

Coordination Services ~~- those~~ – Those services that permit the type of interface and coordination between EGSs and the Company in connection with the delivery of Competitive Energy Supply to serve Customers located within the ~~Company's service territory, including: load forecasting, certain scheduling-related functions and reconciliation~~Company's service territory including, but not limited to, provision of metering information to PJM. Coordination Services do not include Network Integration Transmission Service and ancillary services

PPL Electric Utilities Corporation

which are offered under the PJM Tariff.

~~**Company** - PP&L, Inc.~~

PPL Electric Utilities Corporation

DEFINITION OF TERMS AND EXPLANATION OF ABBREVIATIONS (CONTINUED)

Coordination Services Charges – All charges stated in the charges section of this Tariff that are billed by the Company for Coordination Services performed hereunder.

Coordinated Supplier ~~– an~~ – An Electric Generation Supplier that has appointed a Scheduling Coordinator as its designated agent for the purpose of submitting energy schedules to the PJM OI.

Creditworthy ~~– a~~ – A creditworthy EGS pays the Company's charges as and when due and otherwise complies with the Rules and Regulations of this Tariff or the PaPUC. To determine whether an EGS is creditworthy, the Company will evaluate the EGS's record of paying Company charges~~,~~ and may also take into consideration the EGS's credit history.

Customer ~~– any~~ – Any person, partnership, association, or corporation receiving Competitive Energy Supply from an Electric Generation Supplier in accordance with the Competition Act ~~at a single metered location~~.

~~**Deliver –**~~
Default Service – Service provided pursuant to ~~"Deliver" a document or other item under this Tariff shall mean~~ Default Service Program to ~~tender by certified mail, hand delivery, or overnight express package~~ a Default Service Customer.

Default Service Customer – A delivery service Customer not receiving service from an EGS.

~~**Issued August 12, 1998 Effective August 27, 1998**~~

PPL Electric Utilities Corporation

~~PP&L Inc. Tariff Electric Pa. P.U.C. No. 1s~~

Direct Access ~~- "Direct Access"~~– The term shall have the meaning set forth in the Competition Act.

EDC Tariff ~~- the~~– The Company's Electric Service Tariff, denominated Electric Pa. P.U.C. No. ~~P.U.C. No. 201.~~ 202.

Electric Distribution Company or "EDC" ~~- a public utility that owns electric distribution facilities. At times, this~~– The term ~~is used to refer to~~shall have the ~~role of the Company as a deliverer of Competitive Energy Supply in a Direct Access environment as contemplated~~meaning set forth in the Competition Act.

Electric Generation Supplier or "EGS" ~~- a supplier of electric generation~~– Any person, corporation or other entity that has ~~been certified or licensed by the Pennsylvania Public Utility~~ received a certification from the Commission that it is eligible and licensed to supply electric energy, capacity, transmission and ancillary services to Customers in the Company's service territory under and pursuant to ~~sell electricity to retail customers within the Commonwealth of Pennsylvania in accordance with~~ the Competition Act.

EGS Representative ~~- any~~– Any officer, director, employee, consultant, contractor, or other agent or representative of an EGS in connection with the EGS's activity solely as an EGS. ~~To the extent an EGS is a division or group of a company, the term EGS Representative does not include any person in that company who is not part of the EGS division.~~

~~FERC -~~

Electronic Data Exchange Working Group ("EDEWG") – Commission group developing standardized formats and methodology for exchanging information electronically within the Pennsylvania deregulated electric market.

Electronic Data Interchange ("EDI") – Guidelines that represent the standard electronic communication method for exchanging data between an EDC and an EGS.

PPL Electric Utilities Corporation

DEFINITION OF TERMS AND EXPLANATION OF ABBREVIATIONS (CONTINUED)

FERC – The Federal Energy Regulatory Commission.

Hourly or Sub-Hourly Metering Equipment ~~–~~ – Electric metering equipment that supplies ~~half-hourly readings of kW and power factor via remote communications, and not metering equipment from which quarter~~hourly or sub-hourly ~~or hourly demand readings may be obtained through on-site querying of the metering equipment.~~data of Customer consumption.

Interest Index ~~– an~~ – An annual interest rate determined by the average of 1-Year Treasury Bills for September, October and November of the previous year.

~~**Kilowatt or kW** - unit of measurement of useful power equivalent to 1000 watts.~~

Load Bus – ~~as~~As used in this ~~tariff~~Tariff, shall have the same meaning ascribed to the term in the PJM Tariff.

Load Serving Entity or "LSE" ~~– an~~ – An entity that has been granted the authority or has an obligation pursuant to ~~State or local~~applicable law, regulation or franchise to sell electric energy to end-users located within the PJM Control Area as that term is defined by the PJM Tariff.

Locational Marginal Price or "LMP" ~~– the hourly integrated~~ – The marginal price ~~to serve load~~for energy at ~~individual locations throughout PJM, calculated by~~the location where the ~~PJM O~~energy is delivered or received as specified in the PJM Tariff.

~~**Megawatt or MW** - one thousand kilowatts.~~

Market Participant – The term has the same meaning as set forth in the PJM Tariff.

Meter Read Date ~~– the~~ – The date on which the Company schedules a meter to be read for purposes of producing a ~~customer~~Customer bill in accordance with the regularly scheduled billing cycles of the Company~~.~~, as may be modified from time to time.

Month ~~– a~~ – A month under this Tariff means 1/12 of a year, or the period of approximately 30 days between two regular consecutive readings of the Company's meter or meters installed on the ~~customer's~~Customer's premises.

Network Integration Transmission Service ~~**Reservation** - a reservation under the PJM Tariff of~~ – Network Integration Transmission Service~~, which~~ as set forth in the PJM Open Access Transmission Tariff and any direct Transmission Owner charged expense.

North American Energy Industry Standards Board ("NAESB", formerly known as the Gas Industry Standards Board, "GISB") – The Board which sets standards associated with the electronic method of communication for data transfer that allows ~~a~~information to be sent and received electronically using the Internet. This method must meet the following minimum criteria:

• Security and/or encryption of transactions and Customer information.

PPL Electric Utilities Corporation

• Proof of transmission ~~customer to integrate~~and receipt.

~~Issued August 12, 1998~~ ~~Effective August 27, 1998~~

PPL Electric Utilities Corporation

and economically dispatch generation resources located at one or more points in the PJM Control Area to serve its Network load as that term is defined by the PJM Tariff.

- Positive identity of sender and recipient (non-repudiation).
- Reliability.
- Data and file integrity.
- Network performance and availability.
- Recoverability and archiving of data.

PaPUC or Commission – The Pennsylvania Public Utility Commission.

PJM - the Pennsylvania-New Jersey-Maryland

PJM – The regional transmission organization operated by PJM Interconnection LLC, L.L.C., or its Successor.

PJM Control Area - that certain Control Area encompassing systems in Pennsylvania, New Jersey, Maryland, Delaware and the District of Columbia and which is recognized by the North American Electric Reliability Council as the "PJM Control Area."

PPL Electric Utilities Corporation

DEFINITION OF TERMS AND EXPLANATION OF ABBREVIATIONS (CONTINUED)

PJM Control Area – The term has the same meaning as set forth in the PJM Tariff.

PJM eScheduler System ~~- software~~ – Software program administered by the PJM OI through which energy load schedules may be submitted.

PJM OI ~~- the~~ – The PJM Office of Interconnection, the system operator for the PJM Control Area.

PJM Tariff ~~- the~~ – The PJM Open Access Transmission Tariff, including schedules and exhibits.

Rate ~~- on file~~*Ready* – When an EGS that employs Consolidated EDC Billing provides an EDC with EGS rate information that the EDC uses to calculate the ~~FERC and which sets forth the rates, terms and conditions of transmission service over transmission facilities located in the PJM Control Area~~Customer's EGS charges to be billed.

Scheduling Coordinator ~~- an~~ – An entity that performs one or more of an EGS's Coordination Obligations~~, including the submission of energy schedules to the PJM OI, and that either is (1) a member of the PJM Interconnection, L.L.C. or (2) is the agent, for scheduling purposes, of one or more Electric Generation Suppliers that are members of the PJM Interconnection, L.L.C~~.

Tangible Net Worth – Total assets less intangible assets and total liability. Intangible assets include benefits such as goodwill, patents, copyrights, and trademarks.

Tariff ~~- this~~ – This Electric Generation Supplier Coordination Tariff.

~~1. The Tariff~~

~~1.1~~

PPL Electric Utilities Corporation

RULES AND REGULATIONS

1. THE TARIFF

1.1 Filing And Posting. A copy of this Tariff, which comprises the Charges, Rules and Regulations and Riders under which the Company will provide Coordination Services to ~~Electric Generation Suppliers~~EGSs, is on file with the Commission and is posted and open to inspection at the offices of the Company.

1.2 Revisions. This Tariff may be revised, amended, supplemented or otherwise changed from time to time in accordance with the Pennsylvania Public Utility Code, and such changes, when effective, shall have the same force as the present Tariff.

1.3 Application. The Tariff provisions apply to all EGSs providing Competitive Energy Supply to Customers located in the ~~Company's~~Company's service territory ~~including an affiliate or division of the Company that provides Competitive Energy Supply,~~ and with whom the Company has executed ~~an Individual~~a Coordination Agreement as required herein. ~~In addition, the Charges~~The obligations and charges herein shall apply to anyone providing or receiving service unlawfully or to any unauthorized or fraudulent provision or receipt of Coordination Services in addition to any other remedies available to the Company.

1.4 Rules And Regulations. The Rules and Regulations, filed as part of this Tariff, are a part of every ~~Individual~~ Coordination Agreement entered into by the Company pursuant to this Tariff and govern all Coordination Activities~~, unless specifically modified by a Charge or Rider provision. The obligations imposed on EGSs in the Rules and Regulations shall apply as well to everyone receiving service unlawfully or to any unauthorized or fraudulent receipt of Coordination Services~~.

~~**1.5 Use Of Riders.** The terms governing the supply of Coordination Services under this Tariff or a Charge therein may be modified or amended only by the application of those standard Riders, filed as part of this Tariff.~~

~~**1.6**~~

1.5 Statement By Agents. No Company representative has authority to modify a Tariff rule or provision, or to bind the Company by any promise or representation contrary thereto or inconsistent therewith.

~~**Issued August 12, 1998** **Effective August 27, 1999**~~

PPL Electric Utilities Corporation

~~PP&L, Inc.~~ ~~Tariff Electric Pa. P.U.C. No. 1s~~

PPL Electric Utilities Corporation

RULES AND REGULATIONS

~~2. Scope and Purpose of Tariff~~

2. SCOPE AND PURPOSE OF TARIFF

2.1 Scope And Purpose Of Tariff. This Tariff sets forth the basic requirements for interactions and coordination between the Company as the ~~Electric Distribution Company~~EDC and EGSs necessary for ensuring the delivery of Competitive Energy Supply from EGSs to their Customers ~~commencing on January 1, 1999~~.

2.2 Applicability of Terms to Scheduling Coordinators. As used in this Tariff, the term "EGS" shall apply equally to a Scheduling Coordinator for an ~~EGS's~~EGS for the responsibilities and rights properly assigned to that Scheduling Coordinator by the EGS.

2.3 FERC Jurisdictional Matters. The inclusion of FERC-jurisdictional matters within the scope of ~~this~~the Tariff is intended solely for informational purposes and is not intended to accord any jurisdictional authority over such matters to the PaPUC. ~~If~~Furthermore, to the extent that anything stated herein is found by ~~the~~ FERC to conflict with or to be ~~inconsistant~~inconsistent with any provision of the Federal Power Act ~~(~~("FPA~~),~~"), as amended, or any rule, regulation, order or determination of ~~the~~ FERC under ~~the~~ FPA ~~the applicable~~, then such FERC rule, regulation, order or determination of the ~~FPA~~FERC shall control. To the extent required under any provision of the FPA, or any rule, regulation, order or determination of ~~the~~ FERC under the FPA, the Company shall endeavor to secure, from time to time, all ~~appropriate~~necessary orders, approvals, and determinations from ~~the~~ FERC necessary to implement this Tariff.

PPL Electric Utilities Corporation

RULES AND REGULATIONS

3. ~~Commencement of~~ COMMENCEMENT OF EDC/EGS ~~Coordination~~COORDINATION

3.1 Registration for Coordination Services. An EGS seeking to obtain Coordination Services hereunder must deliver to the Company a completed registration, consisting of the following:
~~an Individual~~

(a) a fully executed Coordination Agreement~~, as contained in a Rider hereto, fully executed in triplicate~~ by a duly authorized representative of the EGS;

(b) a service agreement for Network Integration Transmission Service under the PJM Tariff, fully executed by a duly authorized representative of the EGS;

(c) a Market Participant Agreement as defined under the PJM Tariff, fully executed by a duly authorized representative of the EGS;

(d) a copy of the EGS's license issued by the PaPUC to provide Competitive Retail Electric Service to the Company's retail Customers;

(e) a fully completed credit history form;

(f) for EGSs that use Consolidated EDC Billing, a copy of the EGS's rate schedule must be provided to the Company. When an EGS requests the implementation of "Standard Rates" on or after registration, or revisions to existing Standard rate schedules, the Company will implement the requested EGS rate schedule(s) within 14 calendar days. Standard Rates include fixed cents per kWh rates, starting from $0.0500 through $0.1199 per kWh in $0.0001 increments, and up to four decimal place precision. A "percent off" of shopping rates would be available from 1% through 50% off the Price to Compare in one-half percent increments. An EGS will be limited to no more than 200 discrete Rate Ready rates per calendar quarter. Additionally, any rate design other than the one specified in Rule 12.1 may delay power flow to a Customer billed under Consolidated EDC Billing;

(g) if an EGS will utilize Sections 6 through 9 of this tariff, written evidence that the EGS is a signatory to the Operating Agreement and Reliability Assurance Agreement of the PJM Interconnection, L.L.C., or ~~their~~its successors~~, if any; and~~;

(h) a completed Supplier Communication Details form (available on the Company's website);

(i) a completed W-9 form;

(j) banking information (Bank Name, Routing Number, and Account Number) provided on EGS letterhead with a signature; and

(k) the EGS's Pennsylvania sales tax identification number~~;~~.

3.2 Incomplete Registrations. In the event the EGS submits an incomplete registration application, the Company shall provide written notice to the EGS of the ~~registration's~~application's deficiencies within ten (10) business days after the date of service of the application, as determined under 52 Pa. Code § 1.56~~, of the registration. An~~,. The Company will not process an incomplete ~~registration is not deemed to be ready for processing by the Company~~ application until ~~it is completed by~~ the EGS ~~and Delivered~~corrects the deficiencies and delivers a completed application to the Company.

PPL Electric Utilities Corporation

COMMENCEMENT OF EDC/EGS COORDINATION (CONTINUED)

3.3 Credit Check. A registration for Coordination Services shall constitute authorization to the Company to conduct a background credit check on the EGS.

3.4 Processing of Registrations. The Company shall complete the processing of each registration for Coordination Services within ten (10) business days after the date of service of the completed registration, as determined under 52 Pa. Code § 1.56~~, of the completed registration.~~,. The Company shall approve all completed registrations unless grounds for rejecting the registration exist, as defined below~~, exist~~.

3.5 Grounds for Rejecting Registration. The Company may reject any registration for Coordination Services on any of the following grounds:

(a) the EGS has undisputed outstanding debts to the Company arising from its previous receipt of Coordination Services from the Company under this Tariff;

(b) the EGS has failed to comply with ~~credit~~the payment and billing requirements specified in Rule 12 of the Tariff; ~~and~~or

(c) the Company has provided written notice to the EGS that a registration is deficient, and the EGS has failed to submit a completed registration within thirty (30) calendar days ~~after the date of service of the registration, as determined under 52 Pa. Code § 1.56, of written notice of the registration's~~of deficiency notification.

The Company may also petition the PaPUC to reject the registration of an EGS with Bad Credit~~.~~ as to PaPUC jurisdictional transactions. The Company need not provide Coordination Services to the EGS pending the ~~PaPUC's~~PaPUC's review of said Petition unless the EGS has provided security to the Company as provided for in Rule 12.~~4~~5. The EGS must comply with all applicable requirements of the PJM Tariff in order for its registration to be accepted as complete.

3.6 Offer of Conditional Acceptance of Registration. Where grounds for rejection of a registration exist due to an ~~EGS's~~EGS's outstanding and undisputed debts~~ to the Company~~ arising from its previous receipt of Coordination Services from the Company under the Tariff, the Company may offer the affected EGS a conditional acceptance if the EGS pays such debts before it receives Coordination Services. ~~If the EGS~~If the EGS rejects the Company's offer of conditional acceptance under this Rule or if the EGS does not act upon the Company's offer of conditional acceptance within thirty (30) calendar days following the offer, then the EGS's registration for Coordination Services will be deemed rejected.

~~**Issued August 12, 1998** **Effective August 27, 1999**~~

PPL Electric Utilities Corporation

rejects the Company's offer of conditional acceptance under this Rule, then its registration for Coordination Services will be deemed rejected.

3.7 Rejection of Registration. Upon rejection of any registration, the Company shall provide the affected EGS with written notice of rejection within the time periods set forth in Section 3.4ten (10) days of date of service of the registration (as determined consistently with the provisions of 52 Pa. Code § 1.56) or the date of the end of the thirty (30) day period for corrections of deficiencies or conditional acceptance, and shall state the basis for its rejection.

3.8 Approval of Registration. Upon its approval of a registration for Coordination Services, or pursuant to an order of the Commission approving a registration, the Company shall execute the Individual Coordination Agreement tendered by the registrant and shall file a copy with the PaPUC, shall provide one copy to the EGS by delivering such within the period set forth in Section 3.4 and shall maintain a copy for its own records.

PPL Electric Utilities Corporation

COMMENCEMENT OF EDC/EGS COORDINATION (CONTINUED)

3.9 Identification Numbers. Upon its approval of a registration for Coordination Services, the Company will assign to the EGS a supplier identification number to be used in subsequent electronic information exchange between the EGS and the Company. This number shall be consistent with the EGS's Dunn & Bradstreet Business number. In addition, the Company may also assign ~~to the EGS~~ identification numbers to the EGS that may be required by PJM in connection with the submission and/or confirmation of load schedules for serving load in the Company's service territory.

3.10 Commencement of Coordination Services. Coordination Services shall commence within fifteen (15) days after the ~~Company's acceptance~~Company's approval of an ~~EGS's~~EGS's registration for Coordination Services provided that all of the information necessary for the Company to provide Coordination Services has been provided to the Company and any conditions ~~required~~established under Rule 3.6 have been satisfied by the EGS.

~~**Issued August 12, 1998** **Effective August 27, 1999**~~

PPL Electric Utilities Corporation

PPL Electric Utilities Corporation

RULES AND REGULATIONS

4. ~~Coordination Obligations~~ COORDINATION OBLIGATIONS

4.1 Provision of Coordination Services. The Company shall provide all Coordination Services, as provided herein, necessary for the delivery of an EGS's ~~energy and/or capacity~~Competitive Energy Supply to serve ~~retail access load~~Customers located within the Company's service territory.

4.2 Timeliness and Due Diligence. EGSs shall exercise due diligence in meeting their obligations and deadlines under this Tariff so as to facilitate Direct Access.

4.3 ~~Duty of Cooperation.~~ Duty of Cooperation. The Company and each EGS will cooperate in order to ensure delivery of Competitive Energy Supply to Customers as provided for by this Tariff, the EDC Tariff, the PJM Tariff, and the Competition Act.

4.4 State Licensing. An EGS must have and maintain in good standing a license from the PaPUC as an authorized EGS. The EGS shall notify the Company within three (3) business days of any amendment, revocation, termination or other change in its License applicable to the Company's service territory.

4.5 Energy, Capacity, and AEPS Procurement. An EGS ~~must make~~is responsible for all necessary arrangements for ~~obtaining Competitive Energy Supply~~supply and delivery of electric energy and capacity in a quantity sufficient to serve its own Customers under the PJM Tariff and to also satisfy AEPS obligations associated with its supply.

4.6 ~~PJM~~ Transmission Services and Obligations. An EGS is responsible for arranging, procuring, taking and paying for those services provided by ~~the~~ PJM ~~OI~~ that are necessary for the delivery of Competitive Energy Supply to its Customers~~. In addition, an EGS must satisfy all obligations which are imposed on LSEs in~~ pursuant to the PJM ~~Control Area~~Tariff and this Tariff. Failure to do so will result in a suspension of the EGS's registration until resumption of such services by the EGS occurs.

4.7 Energy Scheduling. An EGS must make all necessary arrangements for scheduling the delivery of energy ~~through the PJM OI. The Company shall assist in that process as set forth in Rule 7~~with PJM.

4.8 Reliability Requirements. An EGS shall satisfy those reliability requirements issued by the PaPUC, PJM, or any other governing reliability council with authority over the EGS~~, that apply to EGSs~~.

4.9 Determination of Load and Location. The Company and EGS shall coordinate with the PJM OI to determine the magnitude and location of the EGS's actual or projected load, as required by the PJM OI, for the purpose of calculating a Network Integration Transmission Service Reservation, an installed capacity obligation, or other requirements under the PJM Tariff.

4.10 Supply of Data. An EGS and the Company shall supply to each other all data, materials or other information specified in this Tariff, or otherwise reasonably required by the EGS or Company in connection with the provision of Coordination Services, in a thorough and timely manner.

PPL Electric Utilities Corporation

COORDINATION OBLIGATIONS (CONTINUED)

4.11 Communication Requirements. An EGS must be equipped with the following communications capabilities:

- Internet electronic mail (e-mail), including the capability to receive ASCII file attachments;
- Internet browser capable of access to the ~~PP&L~~PPL Electric web-site and file uploads and downloads;
- Internet EDI peer-to-peer communication with push and pull capability, and

~~VAN and single Internet file transfer protocol;~~ • NAESB standards which is the preferred method of communication (EDI), as determined by the Electronic Data Exchange Working Group (EDEWG) and Pa PUC Docket No. M-00960890.F0015.

~~**Issued August 12, 1998** **Effective August 27, 1998**~~

PPL Electric Utilities Corporation

4.12 Record Retention. ~~Record Retention.~~ An EGS and the Company shall comply with all applicable laws and PaPUC rules and regulations for record retention, including but not limited to those Rules of Chapter 56 of the PaPUC's regulations.

4.13 Payment Obligation. The Company's provision of Coordination Services to an EGS is contingent upon the EGS's payment of all charges provided for in this Tariff~~.~~ and the PJM Tariff.

4.14 ~~**Data Exchange.**~~ Credit Requirements

~~(a) The Company shall at a minimum, comply and adhere to the terms and requirements of the Consensus Plan submitted by the Electronic Data Exchange Working Group (Electronic Data Exchange Standards for Electric Deregulation in The Commonwealth of Pennsylvania) reviewed and approved by the Pilot Implementation Committee and the Pa. PUC. (Docket No. M-00960890F.0015). These standards, as they currently are written, shall address the necessary data transfer and exchange to accommodate registration and switching of customers, metering and billing information, and current customer information. The Company shall follow these standards as they currently exist, and as they may change from time-to-time, for all data exchange procedures and requirements.~~

The Company will apply, on a non-discriminatory and consistent basis, reasonable financial standards to assess and examine an EGS's Creditworthiness. These standards will take into consideration the scope of operations of each EGS and the level of risk to the Company. This determination will be aided by appropriate data concerning the EGS, including load data or reasonable estimates thereof, where applicable.

The Company requires an initial credit amount of $250,000 and shall adjust the amount required commensurate with the financial risks placed on the Company by an EGS, including recognition of an EGS's performance. An EGS shall satisfy its Creditworthiness requirement and receive an unsecured credit limit which will be a maximum of 5% of an EGS's Tangible Net Worth by demonstrating that it has, and maintains, investment grade long-term bond ratings from any two of the following four rating agencies:

AGENCY	**SENIOR SECURITIES RATING (BONDS)**
Standard & Poor's	BBB- or higher
Moody's Investors' Services	Baa3 or higher
Fitch IBCA	BBB- or higher
Duff & Phelps Credit Rating Company	BBB- or higher

PPL Electric Utilities Corporation

COORDINATION OBLIGATIONS (CONTINUED)

The EGS will provide the Company with its or its parent's most recent independently-audited financial statements (if applicable) and its or its parent's most recent Form 10-K and Form 10-Q (if applicable).

The Company shall make reasonable alternative credit arrangements with an EGS that is unable to meet the aforementioned criteria and with those EGSs whose credit requirements exceed their allowed unsecured credit limit. The EGS may choose from any of the following credit arrangements in a format acceptable to the Company: an irrevocable Letter of Credit; a cash deposit established with the Company; including the Company as a beneficiary; or other mutually agreeable security or arrangement. The alternate credit arrangements may be provided by a party other than the EGS, including one or more ultimate Customers. The fact that an irrevocable Letter of Credit or Cash Deposit is provided by a party other than the EGS shall not be a factor in the determination of the reasonableness of any alternative credit arrangement, as long as such party and the related credit arrangements meet the Company's standard credit requirements.

4.15 Data Exchange.

(a) An EGS shall implement NAESB standards which is the preferred method of communication (EDI), as determined by the EDEWG and PaPUC Docket No. M-00960890F.0015. NAESB standards must meet the minimum criteria of, and be endorsed by, the EDEWG. An EGS shall have appropriate software for access to the Company's Internet site for file viewing, uploads and downloads.

(b) The Company shall make available to an EGS, on a daily basis, the following information regarding that EGS's Customers in electronic files available on the ~~PP&L~~PPL Electric supplier website:

~~PP&L~~ (i) PPL Electric Account Number
(ii) Billing Route
(iii) Customer Name

4.18 Coordination Service Charges. EGSs shall be required to pay the following as part of Coordination Service Charges to facilitate the transfer of data between the Company and EGSs.

(a) EDI Transaction Fees – Each distinct transfer of data through EDI is considered a transaction. PPL Electric incurs a per transaction fee for every EDI transaction. The Company will directly assign EDI Transaction fees to each EGS for their EDI transactions. PPL Electric will charge its actual costs incurred for EDI transaction fees.

(b) DUNS Testing Fees – Coordination Service Charges will include the costs of testing a new Data Universal Numbering System ("DUNS") that the Company needs to set up for each EGS. There are two types of DUNS fees: (1) "Full" testing, which is to test DUNS activity for a new supplier; and (2) "Abbreviated" testing, which is to test DUNS activity for an existing supplier requesting an additional DUNS number. The DUNS fees will be directly assigned to the EGS for each test performed.

~~**Issued August 12, 1998** **Effective August 27, 1998**~~

(b) The list of enrolled Customers that the Company provides to all EGSs pursuant to Rule 5.1.2, above, shall contain the following information about Customers that have not consented to the release of Customer information:

Name, address, PPL Account Numberxxii. Default Service Indicator
xxiii. Interval Meter Indicator
xxiv. Capacity and Transmission Obligations (including current and future Capacity and Transmission Peak Load Contributions)
xxv. Net Metering Flag
xxvi. Tax Status Flag

5.2 Interval Meter Data. A licensed EGS is expected to maintain appropriate Customer authorization when requesting historical Interval Meter data. The Interval Meter data will be provided at no cost to an EGS and will be transferred in a standardized format and sent to the EGS via EDI and will include 12 months of data. Alternatively, an EGS may access the data through a secured portion of the Company's supplier website. The EGS will share its records of Customer authorization with the Company upon request and those records shall be subject to audit by the Commission.

5.3

i. *Rate* Class

5.1.4 Manner of Customer Consent. Manner of Customer Consent. An EGS that enrolls a Customer in accordance with Rules 5.1 of this Tariff must ask the Customer whether the Customer consents to the disclosure to all EGSs by the Company of Customer-specific information. The EGS must retain a record indicating whether the Customer consented to such disclosure. If the record is not itself a hard copy document, but rather an electronic or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy.

5.2 Initial EGS Selection for 1998.

This Rule 5.2 delineates the process of Customer selection of an EGS for the first time during the initial enrollment period. The process for a Customer's selection of an EGS for the first time thereafter is governed by Rule 5.3.

5.2.1

(a) An EGS must notify its Customers that by signing up for Competitive Energy Supply with the EGS, the Customer is consenting to the disclosure by the Company to the EGS of certain basic information about the Customer, as listed in Rule 4.14(a). At minimum, the notice shall inform the Customer that the following information will be disclosed: the Customer's PP&L account number, data about meter readings, rate class and electric usage, the Customer's address(es) and telephone number, and whether or not the Customer is on a budget billing plan or payment arrangement or as otherwise approved by the PUC Bureau of Consumer Services.

(b) If an enrolled Customer or person authorized to act on the enrolled Customer's behalf contacts the Company via telephone to select an EGS, the Company will direct the Customer to contact that EGS and will provide the telephone number of the EGS to the Customer, if required.

PPL Electric Utilities Corporation

~~(c) The EGS will obtain appropriate authorization from the Customer, or from the person authorized to act on the Customer's behalf, indicating the Customer's choice of EGS. The authorization shall include the Customer's acknowledgment that the Customer has received the notice required by Rule 5.2.1(a). It is the EGS's responsibility to maintain records of the Customer's authorization in the event of a dispute, in order to provide documented evidence of authorization to the Company or the Commission.~~

~~(d) The EGS shall provide an electronic file to the Company. The required electronic file shall include, at a minimum, EGS ID, PP&L Account Number, Action (ADD), Billing Option, Transaction Date and Transaction Time. Upon receipt of the electronic file from the EGS, the Company will automatically confirm receipt of the file. Within three (3) business days of receipt of the electronic file, through November 1, 1998 and one business day thereafter, the Company will validate the records contained in the file, and will provide an electronic validation, including the number of records received and the reason for any rejections. Such validation shall include appropriate control totals such as number of records received, and the reason for any rejections (e.g., invalid account number). Such validation also shall include information an EGS can use to identify rejected records. If a Customer selects more than one EGS, the EGS that submitted the EGS selection record with the latest valid EGS contract date to the Company before the end of the EGS selection period will be eligible to become the EGS of record on the Customer's regularly scheduled Meter Read Date in January, 1999.~~

~~Issued August 12, 1998~~ **~~Effective August 27, 1998~~**

PPL Electric Utilities Corporation

(e) The Company will send, within ten (10) business days until November 1, 1998 and one business day thereafter, a confirmation letter to all Customers who have made an initial EGS selection. Included in this letter shall be notification of a 10-day waiting period in which the Customer may cancel its selection of an EGS. The confirmation letter shall include the Customer's Name, Address, PP&L Account Number, selected EGS, selected Billing Option (1-bill, 2-bills), Service Effective Date and Initial Billing Date. The waiting period shall begin on the day the letter is mailed to the Customer. If the 10-day waiting period expires, and the Customer has not contacted the Company to dispute the EGS selection, the EGS will become the EGS of record for delivery in January, 1999. If the Customer elects to rescind its EGS selection, the Company will notify the rejected EGS, electronically. In the event the Customer rescinds its EGS selection after the 10-day waiting period, the Customer will be advised that the rescinding period has expired and a switch must be requested via the normal EGS selection process.

5.2.2 If an enrolled Customer contacts the Company by mail to inform the Company that it wishes to obtain Competitive Energy Supply from a particular EGS, the Company will inform the customer that they need to contact the EGS to select the EGS as supplier consistent with the Commissions Standards or Enrollment. The EGS will verify its desire to serve the Customer and follow the process outlined in Rule 5.2.1, before the end of the initial EGS selection period.

5.3 Switching Among EGSs (or between an EGS and the Company as the Provider-of-Last Resort**), and Initial Selection of an EGS Beginning in January, 1999**
As of January 1999, initial). EGS selection switching by Customers shall occur in accordance with the Direct Access Procedures contained in this Tariff.

5.3.1 An EGS must notify its Customers that by signing up for Competitive Energy Supply with the EGS, the Customer is consenting to the disclosure by the Company to the EGS of certain basic information about the Customer, as listed in Rule 4.14(b). At minimum, the notice shall inform the Customer that the following information will be disclosed: the Customer's PP&L account number, data about meter readings, rate class and electric usage, the Customer's address(es) and telephone number, and whether or not the Customer is on a budget billing plan or payment arrangement or as otherwise approved by the PUC Bureau of Consumer Services.

5.3.2

PPL Electric Utilities Corporation

DIRECT ACCESS PROCEDURES (CONTINUED)

5.3.1

(a) If a Customer contacts a new EGS to request a change of EGS and the new EGS agrees to serve the Customer, the ~~Customer's~~Customer's new EGS shall obtain appropriate authorization from the Customer, or person authorized to act on the ~~Customer's~~Customer's behalf, indicating the ~~Customer's~~Customer's choice of EGS. ~~The authorization shall include the Customer's acknowledgment that the Customer has received the notice required by Rule 5.3.1.~~ It is the ~~EGS's~~EGS's responsibility to maintain records of the ~~Customer's~~Customer's authorization in the event of a dispute~~,~~ in order to provide documented evidence of authorization to the Company or the Commission.

(b) The ~~Customer's~~Customer's new EGS ~~also~~ shall also submit the ~~Customer's~~ Customer's enrollment information using ~~a file format designated by~~ the ~~Company that complies with Commission requirements, if any, electronically.. The required electronic files shall include, at a minimum, EGS ID, PP&L Account Number, Action (ADD), Billing Option, Transaction Date and Transaction Time.~~PA EDI 814 transaction. Upon receipt of the ~~electronic file~~814 enrollment transaction from the EGS, the Company will automatically confirm receipt of the file. ~~Within one (1) business days of receipt of the electronic file, the Company will respond electronically and validate records contained in the file, including the number of records received and the reason for any rejections. Such validation shall include appropriate control totals such as number of records received, and the reason for any rejections (e.g., invalid account number). Such validation shall also include information an EGS can use to identify rejected records.~~

~~(a)~~ (c) The Company will send the Customer a confirmation letter ~~within one~~ before the end of the next business day ~~notifying the Customer of the right to rescind within ten (10) days. If the Customer does not contact the Company~~

~~**Issued August 12, 1998** **Effective August 27, 1998**~~

PPL Electric Utilities Corporation

within ten (10) days of the date on the confirmation letter, then the Company will process theto confirm the Customer's EGS selection. The EGS selection will be effective as of the next scheduled Meter Read Date and the EGS will become the EGS of record for delivery provided that: (1) the Company has received at least sixteen (16) days prior notice from the EGS and all Customer information provided to the Company is accurate and complete; (2) the 10-day waiting period has expired; andwithin three (3) the Customer has not contacted the Company to dispute the EGS business days after processing the selection. In such circumstances, the Company will make available to the new EGS an electronic file, containing information for the newThe confirmation letter shall include notice to residential and small commercial Customers of record for that particular EGS, in accordance with Rule 4.14(b).

If, during the 10-day waiting period, the Customer elects to rescind its new EGS selection, the Company will notify the rejected EGS of the rescission electronically. In the event the Customer rescinds their EGS selection after the 10-day waiting period, the Customer willthat the Customer's service may be advised that the rescinding period has expired and a switch must be requested via the normal EGS selection processterminated for failure to pay for generation service provided by an EGS and billed by the EDC.

(d) Once the preceding process is complete, the Company will notify the Customer'sCustomer's prior EGS, of the discontinuance of service to the Customer from that prior EGS.

5.3.3 2 If a Customer contacts the Company to request a change of its EGS to another EGS, the Company will informshall notify the Customer that the newly selected EGS must be contacted to process a supplier switch consistent withdirectly by the Commissions Standards of enrollment and switching.Customer in order to initiate the change.

5.3.43 If an EGS wishes to obtain from the Company confidential Customer-specific information about a Customer with whom it is discussing the possibility of providing Competitive Energy Supply but who has restricted access to the information, the Company will only provide such information if the EGS provides to the Company a copy of after receiving written documentation indicating, electronic or telephonic customer authorization from the requesting supplier or attestation from the supplier that the it has such authorization. The EGS will share its records of Customer has authorized the release of Customer informationauthorization with the Company upon request and those records shall be subject to audit by the EGS or if the Customer has agreed to release the information during the enrollment processCommission.

5.3.5 4 If a Customer contacts the Company to request a change of EGS to the Company's tariffed Energy and Capacity Charges forCompany's Default PLR Service, the Company will process the request as follows. The Company willand send the Customer a confirmation letter notifyingbefore the Customerend of the right to rescind. Ifnext business day confirming the Customer does not contact the Company Customer's return to Default Service. The selection will be effective within ten (10)three (3) business days ofafter processing the request. Once the date on the confirmation letter, thenpreceding process is complete, the Company will complete the request. The request will be effective as of the next scheduled Meter Read Date and the Company as the Provider-of-Last Resort will become the supplier of record for delivery provided that: (1) the Company has received at least sixteen (16) days prior notice from the Customer; and (2) the 10-day waiting period has expired; and (3) the Customer has not contacted the Company to rescind or dispute the switch to Default PLR Service. The Company will notify the
Customer's Customer's prior EGS of the discontinuance of service to the Customer from that prior EGS.
Nothing contained herein will result in discontinuance of service to the customer in the event of a default by an EGS.
5.3.6

(a) If a Customer contacts the Company to discontinue electric service at the Customer'sCustomer's then current location, and initiates a request for service at a new location in the Company'sCompany's service territory, the Company will notify the current EGS, of the Customer's discontinuance of service for the account at the Customer's old location. The Company will also send an electronic transaction to the Customer's selected EGS for its new location, which may

PPL Electric Utilities Corporation

~~or may not be the current EGS. If the selected EGS is not the same EGS that served the Customer at the old location, the Company will inform the customer that the EGS must be contacted to establish service consistent with the Commissions Standards for switching.~~adhere to the processes set forth in the Company's Plan for Seamless Moves and Instant Connects approved at Docket No. M-2014-2401103.

PPL Electric Utilities Corporation

DIRECT ACCESS PROCEDURES (CONTINUED)

(b) If a Customer contacts the Company to discontinue electric service ~~and indicates that the Customer will be relocating outside of the Company's service territory,~~ the Company will notify the current EGS~~, via electronic file,~~ via an EDI drop transaction of the ~~Customer's~~Customer's discontinuance of service for the ~~account at the Customer's~~ location. ~~If~~

~~**Issued August 12, 1998** **Effective August 27, 1998**~~

PPL Electric Utilities Corporation

available, the Company will provide the EGS that served the Customer at the old location with the Customer's new mailing address or forwarding address.

5.3.7 5 If the Company elects to change the account number for a Customer receiving generation service from an EGS, the Company will notify the EGS of the change in account number at the same Customer location, via electronic fileEDI transaction.
5.4

5.4 Provisions relating to an EGS's Customers.

5.4.1 Arrangements with EGS Customers. Arrangements with EGS Customers. EGSs shall be solely responsible for having appropriate contractual or other arrangements with their Customers necessary to implement Direct Access consistent with all applicable laws, PaPUC requirements, the PJM Tariff and this Tariff. The Company shall not be responsible for monitoring, reviewing or enforcing such contracts or arrangements.
5.4.2 Transfer of Cost Obligations Between EGSs and Customers.
5.4.2 Transfer of Cost Obligations Between EGSs and Customers. Nothing in this Tariff is intended to prevent an EGS and a Customer from agreeing to reallocate between them any charges that this Tariff imposes on the EGS, provided that any such agreement shall not change in any way the EGS's obligation to pay such charges to the Company, and that any such agreement shall not confer upon the Company any right to seek recourse directly from the EGS's Customer for any charges owed to the Company by the EGS.

5.4.3 Customer Obligations. Customer Obligations. Customers of an EGS remain bound by the rules and requirements of the applicable EDC RatePPL Electric Tariff under which they receive retail service from the Company withrespect to service received from the Company under the applicable EDC Rate Tariff.

PPL Electric Utilities Corporation

PPL Electric Utilities Corporation

RULES AND REGULATIONS

6. ~~Load Forecasting~~ LOAD FORECASTING

6.1 Customer Load Forecasting. The Company, in conjunction with an EGS, shall perform a Customer load forecasting process for each EGS's load requirements which shall approximate EGS's anticipated aggregate hourly Customer load. The aggregate hourly load forecast shall define the hourly energy requirements for an EGS. Energy will be delivered to the Company's electric distribution system using the PJM power scheduling policies and procedures.

6.2 Forecasting Methodology.

6.2.1 Monthly Metered Customer Forecasts. For each EGS, the Company will provide hourly load profiles by rate class for Customers with monthly metering equipment, which will establish the hourly supply obligations of the EGS for serving such Customers. The Company has developed and will maintain, based on load survey data, load forecast categories corresponding to the Company's current rate class load profile identified in the EDC Tariff. The load curves of these rate classes will be the basis for the forecasts prepared by the EGS for the aggregate of monthly metered Customers' load in each rate class load profile.

6.2.2 Hourly Metered Customer Forecasts. An EGS shall provide hourly load forecasts for their Customers with Hourly or Sub-Hourly Metering Equipment.

6.2.3 Typical Load Curve Data. On or before the day of energy scheduling, the Company will make available to EGSs the typical load and all algorithms and data necessary to calculate the hourly forecast for monthly metered Customers. This information will be available on an ongoing basis for an EGS to download from the ~~web-site~~supplier website and will permit an EGS to develop forecasts for any future period using the same methodology as the Company will use.

6.2.3.1 Updates to Typical Load Profile Data. The Company shall review annually its methodology, algorithms and load forecasting results and shall perform additional load studies to update the load curve data as required.

6.2.4 Right to Aggregate. EGSs may aggregate their Customers' loads. Such right to aggregate shall not mean that if a Customer of an EGS has multiple PPL Electric accounts, the Customer's PPL Electric charges may be billed conjunctively. Such right also shall not mean that the PPL Electric charges of an EGS's aggregated Customers may be billed conjunctively.

6.3 Customer Loads.

6.3.1 Determination of Customers for Pro-rata Share of Load. The Company will consider the Rate Schedules of LP-4~~, LP-5, LP-6, IS-P, LPEP,~~ and ~~IS-T~~LP-5 as large Commercial and Industrial Customers and, if over-subscribed, will receive a 'pro-rata' share of the available rate schedule class load for competitive supply during phase-in. All other customers will be able to have all of their load served by competitive supply if they are so chosen under the provisions of enrollment in their rate class. These customers shall be enrolled on a first come-first served basis pursuant to the Commission's procedures for customer enrollment.

PPL Electric Utilities Corporation

LOAD FORECASTING (CONTINUED)

6.3.2 Process Description for Forecasting. Except as provided in Rule 6.2.5 and 6.2.6, a customer at a single metered location purchasing Competitive Energy Supply from an EGS may not simultaneously purchase energy or capacity from the Company.

~~Issued August 12, 1998~~ ~~Effective August 27, 1999~~

PPL Electric Utilities Corporation

~~**6.3.2.1 Partial Purchase from Company during Phase-In.** The Company shall allow partial competitive supply for large commercial and industrial customers for the duration of the phase-in (January 1, 1999 through January 1, 2000). The partial load from a competitive supplier will be first through the meter on a percent share for any given hour. The percent share shall be at a minimum of 61 percent (in the event of full participation in a rate class with full participation of pilot participating customers continuing their 5 percent of class load into phase-in). The pro-rata percent figure for industrial and large commercial rate classes will be released beginning on August 28, 1998 or as modified by Commission directive. All requirements and responsibilities based upon load and capacity share whether by the Company, PJM or the FERC will be applicable to the amount of the partial load being served by the EGS. Multiple suppliers are prohibited under partial load conditions.~~
~~**6.3.3**~~

Purchase of Energy and Capacity from More Than One EGS. Customers may choose to be supplied with energy and/or capacity from more than one EGS. Customers or their EGSs will be responsible to the Company for any additional costs the Company incurs that result from a Customer purchasing energy and/or capacity from more than one EGS. Where one or more of the EGSs serving the customer fails to fulfill its obligation to supply energy or capacity, the customer may receive service from the Company. However, in order for the customer to continue to receive service from the customer's other EGS(s), the customer must arrange for a replacement for the non-supplying EGSs by the end of the second full monthly billing cycle after the customer receives notice of the EGS's failure to supply. If, by that time, the customer has not replaced the non-supplying EGS(s), the customer must either discontinue receiving service from the Company or receive service from the Company for its entire load.

~~**6.3.3.1 Nature of Split Load Service.** Customers may choose to be supplied with energy and/or capacity from more than one EGS starting with the first full billing cycle in the Year 2000, following the completion of the phase-in and when Rule 6.2.5.2 Partial Load Service therefore becomes unavailable.~~ If a customer receives electric supply from more than one EGS, the Company is not obligated to supply consolidated EDC billing.

6.4 Daily Forecasting Process.

6.4.1 Business Days and Scheduling Window. The daily forecasting process shall be performed on each business day. A business day is a weekday excepting Company holidays. The daily forecasting process shall be performed on each business day for a scheduling window consisting of all following days through the next business day.
~~For example, the~~
The daily forecasting process shall be performed Monday through Thursday (except holidays) for a scheduling window that covers the following day (midnight to midnight). If the following day is a holiday, then the scheduling window shall include the holiday and be extended to include the first business day following the holiday. Similarly, the daily forecasting process shall be performed on Friday for a scheduling window consisting of the following Saturday, Sunday, and Monday. If the Monday is a holiday, then the scheduling window shall include the holiday and extend through the first business day following the holiday.

In addition to the forecasts required of EGSs hereunder, the EGS may provide advance-hourly forecasts for each of its Customers with Hourly or Sub-Hourly Metering Equipment. Forecasts are not final until the business day before those forecasts are to apply.

PPL Electric Utilities Corporation

6.4.2 Process Description for Forecasting. The following process shall be followed on each business day:

Step 1:

~~Issued August 12, 1998~~ ~~Effective August 27, 1999~~

PPL Electric Utilities Corporation

Each EGS will calculate the load forecast for each monthly metered rate class load profile by multiplying the load profile for the appropriate day type by the number of an EGS's Customers (including Customers of any Coordinated Suppliers that have a designated EGS as their Scheduling Coordinator) in that rate class load profile. These values will have been adjusted upward by an amount necessary to cover line losses based on current line loss percentages for the Customer Class to which each Customer belongs.

PPL Electric Utilities Corporation

LOAD FORECASTING (CONTINUED)

Step 2a:

By 10:00 a.m. Eastern Prevailing Time of the business day, an EGS shall enter the load forecast for each of an EGS's hourly metered Customers and for each hourly metered Customer of any Coordinated Suppliers that have a designated EGS as their Scheduling Coordinator and the aggregated forecast for monthly metered customers. Forecasts for hourly metered Customers should include estimated losses based on current loss factors for each rate class. If an EGS fails to enter a load forecast for any of its required hourly metered Customers by 10:00 a.m. Eastern Prevailing Time the business day before the load forecast is to apply, the Company will use its forecast values calculated for the hourly load of the EGS previously entered for an Appropriate Similar Day. Such default values shall be binding on an EGS that fails to enter load forecasts as required as if it had entered the values itself.

Step 2b:

The Company and the EGS shall seek to reach an agreement as to the load forecasts submitted by an EGS under Step 2a, provided that nothing in this Step 2b shall limit the Company's right to reject a forecast and submit a Company forecast pursuant to Step 3.

Step 3:

The Company will accept or reject an EGS load forecast by 11:00 a.m. Eastern Prevailing Time. If the Company's Alternative Supplier Coordination (ASC) personnel determine that a forecast is going to be rejected and conditions permit, then ~~a~~an ASC staff member will attempt to contact an EGS to explain the reason for rejection and resolve forecast problems. If the reason for rejecting an EGS load forecast values or changes cannot be resolved by 12:00 noon Eastern Prevailing Time, the scheduling process will continue using the Company forecast values.

6.5 Real-Time Load Following. To the extent an EGS has installed and pays for the necessary metering and telecommunications equipment for actual load following, an EGS may follow such Customers' load. To the extent that an EGS's total supply is for such Customers, an EGS shall be obligated to follow such Customers' loads on a real-time basis.

For real-time load following, including interruptible Customers claimed with PJM as Active Load Management, an EGS will have special obligations with respect to both the Company and PJM that must be dealt with on a Customer-by-Customer basis to ensure operational integrity. An EGS and the Company shall work cooperatively to address the technical and operational issues posed by real-time load following as the need arises. The loads of Customers using real-time load following will not be incorporated into an EGS's hourly load forecasts except as required for PJM operation and transmission purposes.

To the extent an EGS's commencement of real-time load following requires modifications of the Company's computer, telemetering, telecommunication, and other systems to enable such activity, the EGS making such request shall be responsible for paying the

PPL Electric Utilities Corporation

Company's incremental costs associated with such modifications. The Company shall bill the EGS for any such costs in accordance with Rule 13 of this Tariff.

~~**Issued August 12, 1998** **Effective August 27, 1999**~~

PPL Electric Utilities Corporation

~~PP&L, Inc.~~ ~~Tariff Electric Pa. P.U.C. No. 1s~~

PPL Electric Utilities Corporation

LOAD FORECASTING (CONTINUED)

6.6 Adequacy of Forecast. An EGS may provide, at its own discretion, its own forecast for the aggregate requirements of its monthly metered Customers, independent of the Company's forecast. The EGS and the Company shall concur on the compatibility of the forecasting methodology to be used by the EGS. The Company may review, for operational reasons, an EGS's forecast. By executing an Individual Coordination Agreement, an EGS agrees that the Company's load forecast for monthly metered Customers will be used for scheduling absent a specific load forecast by the EGS and will be adequate for this purpose. An EGS's remedies for any claimed deficiency in the Company's forecast for monthly metered Customers shall be limited to either:

(1) arranging, at its own expense, for the installation pursuant to PaPUC rules and procedures of Hourly or Sub-Hourly Metering Equipment at Customer's premises in order to permit the Customer's load to be forecasted, billed and reconciled as an hourly Customer; or
(2) entering, at its own expense, into a joint load study with the Company to develop new load curves.

6.7 Provision of Load Profile Data. The Company agrees that it will make Company personnel available to EGSs to explain and discuss the Company's load forecasting procedure, and the ~~applicablity~~applicability of its methodology. In addition, the Company will provide EGSs, upon request, the data points used in the Company's load research system to develop the company's Load forecasts, provided, however, that nothing in this tariff will obligate the Company to disclose the customer specific metering data used to develop these data points.

6.8 Line Losses. For purposes of forecasting, scheduling, and reconciliation in sections 6-8 of this Supplier Coordination Tariff, the combined transmission and distribution line losses for the Secondary voltage level (Rate Schedules RS, ~~RTS, RTD,~~ GS-1, GS-3, ~~GH,~~ BL~~, IS-1~~, and those applicable to street and area lighting), the Primary voltage level (Rate Schedules LP-4 ~~and IST~~), and the Transmission voltage level (Rate Schedules LP-5~~, LP-6, IST, LPEP, and Interruptible Service by Agreement Rider,~~ and Standby Service) shall be calculated by multiplying hourly kWh sales delivered to customer(s) served at these voltage levels by the applicable line loss factor. The applicable line loss factors are:

- Secondary voltage level - 1.08047231
- Primary voltage level - 1.05364821
- Transmission voltage level - 1.02682410

The Company reserves the right to file to revise these factors from time to time to reflect changes in system line losses. The Company will revise these line loss factors if the PJM imposes or changes any separate charges on its transmission customers for the level of line losses that is included in these factors. Any such revision will be filed with the FERC and the Commission, provided to EGSs via Internet electronic mail and posting on ~~PPL's~~the Company's supplier website, and become effective thirty (30) days after filing unless otherwise ordered by the Commission or the FERC. PPL Electric will file any such revision and propose that it becomes effective concurrently with any change in or

imposition of separate PJM line loss charges. The Company will make a good faith effort to advise EGSs of any change in these loss factors more than thirty (30) days in advance of a change when warranted.

~~Issued August 12, 1998~~ ~~Effective August 27, 1999~~

PPL Electric Utilities Corporation

PPL Electric Utilities Corporation

RULES AND REGULATIONS

7. ~~Load Scheduling~~ LOAD SCHEDULING

7.1 Net Load Schedules. The net load schedule for an EGS shall be equal to the aggregate forecast value for all of the monthly metered and hourly metered Customers of that EGS and any Coordinated Suppliers that have designated the EGS as their Scheduling Coordinator.

7.2 Rounding to Whole Megawatts. For as long as the PJM OI or its successor requires the scheduling and delivery of power only in whole MW, the Company will round the aggregate forecast value for each hour to a whole MW value for load scheduling purposes according to the following rules:

- If the aggregate forecast value for an hour is less than 1.0 MW, the value will be rounded to 1.0 MW.
- If the aggregate forecast value for an hour is greater than 1.0 MW, the value will be rounded downward to the nearest whole MW if the decimal portion is less than 0.5.
- If the aggregate forecast value for an hour is greater than 1.0 MW, the value will be rounded upward to the nearest whole MW if the decimal portion is greater than or equal to 0.5.

7.3 Daily Load Scheduling Process.

7.3.1 Uploading Schedules. The Company will upload the load schedule for the scheduling window to PJM by 12:00 noon Eastern Prevailing Time on each business day using the PJM eScheduler System according to PJM requirements. The schedule uploaded by the Company shall be binding on that EGS.

7.3.2 Load Schedule Changes. An EGS may initiate changes to the load schedule using the PJM eScheduler System. It is the responsibility of an EGS to make any necessary changes to the PJM eScheduler System and submit a revised load forecast to the Company. The EGS will notify the Company by contacting a member of the Alternative Supplier Coordination Section by telephone and indicate that changes have been made and a general description of the operational reasons for the changes. The Company will make reasonable efforts to review and, if the reason for the changes ~~are~~is determined by the Company to be operationally valid, confirm the load schedule changes using the PJM eScheduler System~~, prior to~~ before the PJM designated deadline. In the absence of confirmation by the Company, the prior load schedule value will remain in effect. In light of deadlines imposed by the PJM OI for the submission of load schedule changes, an EGS should initiate any necessary changes and notify the Company well before the cut off time to increase the likelihood that the changes will be accepted.

~~Issued August 12, 1998~~ ~~Effective August 27, 1999~~

PPL Electric Utilities Corporation

~~PP&L, Inc.~~ ~~Tariff Electric Pa. P.U.C. No. 1s~~

RULES AND REGULATIONS

8. ~~Reconciliation Service~~ RECONCILIATION SERVICE

8.1 General Description. Reconciliation service accounts for mismatches between an EGS's load schedule (with PJM approved load schedule changes) for serving its Customers and the energy that was actually used by those Customers. This service differs from Energy Imbalance Service - a related service performed exclusively by the PJM OI under the PJM Tariff - because the latter accounts for differences between an EGS's scheduled energy obligation and the quantity of energy actually delivered by the EGS. ~~Because at the absence of~~Without universal real-time metering, the calculation of reconciliation quantities typically must occur after the monthly reading of Customers' meters.

8.2 Billing. The Company and the EGS will rely on PJM to perform calculations to determine the monetary value of reconciliation quantities and to bill and/or credit EGSs and the Company for oversupplies and undersupplies at an hourly price through the PJM grid accounting system. ~~Effective April 1, 1998, with the implementation of Locational Marginal Pricing within PJM, the~~The oversupplies and undersupplies will be calculated at the LMP as warranted.

8.3 The Company's Role. The Company will assist PJM in accounting for reconciliation quantities by (1) collecting all Customer usage data; (2) determining hourly reconciliation quantities for each EGS or Scheduling Coordinator; (3) calculating monthly reconciliation quantities for each EGS or Scheduling Coordinator; and (4) submitting the reconciliation quantities to the PJM OI. The Company also shall provide all algorithms and data necessary for an EGS to independently determine the reconciliation calculations.

8.4 Meter Data Collection. Meter data supplied to or collected by the Company shall be utilized to calculate the quantity of energy actually consumed by an EGS's Customers for a particular reconciliation period. The meter data shall be available for use following the time of a Customer's monthly meter reading. Thus, in order to measure the energy consumed by all Customers on a particular day, at least one month is required for data collection. In general, on each day that new metered-usage data is posted, one or more days in the previous month will become "fully metered."

8.4.1 Monthly Metered Customers. Data from monthly metered Customers is collected in subsets corresponding to customer billing cycles (billing routes), which close on different days of the month. To reconcile energy mismatches on an hourly basis, the Company shall convert such meter data for Customers to the equivalent hourly usage. Rate class load profiles adjusted for system load values will be applied to metered usage to derive an estimate for the hour-by-hour usage.

8.4.2 Hourly Metered Customers. Data from hourly metered Customers will also be collected by or provided to the Company monthly on a billing route basis.

~~8.5~~

8.5 Daily Reconciliation. Each business day that new fully metered days are available, the Company will determine hourly reconciliation quantities for that portion of the previous month's usage corresponding to new fully metered days. This information will be made available to the EGS via the website and enable EGSs and the Company to track the day-by-day buildup toward the monthly reconciliation billing that the Company and the EGS will rely on PJM to perform.

PPL Electric Utilities Corporation

RECONCILIATION SERVICE (CONTINUED)

8.5 Daily Reconciliation. Each business day that new fully metered days are available, the Company will determine hourly reconciliation quantities for that portion of the previous month's usage corresponding to new fully metered days. This information will be made available to the EGS via the website and enable EGSs and the Company to track the day-by-day buildup toward the monthly reconciliation billing that the Company and the EGS will rely on PJM to perform.

The following calculations will be used to determine the reconciliation quantities:

Step 1:
Monthly-metered Customers' actual usage (the billing usage reported by or to the Company) will be
spread over each hour in the usage period based on each Customer's weather-adjusted hourly usage

~~Issued August 12, 1998~~ ~~Effective August 27, 1999~~

curve using actual hourly weather data for the usage period. The monthly-metered Customer's weather-adjusted usage by hour will be multiplied by the loss factor determined by Customer rate class to determine the Customer's gross usage by hour.

Each hourly-metered Customer's hourly usage will be multiplied by a loss factor determined by Customer rate class to determine the Customer's gross usage by hour.

Step 2:
The gross hourly usage quantity for each Customer will be aggregated by the Company to arrive at a total gross Customer usage quantity by hour for each EGS for use in Step 3 of this Rule 8.5. For Scheduling Coordinators, this aggregation will account for usage of Coordinated Suppliers' Customers.

Step 3:
The hourly reconciliation quantity for each hour will be calculated by subtracting an EGS's hourly total gross Customer usage amount from the hourly load schedule submitted to PJM for that EGS, including the effect of any confirmed changes to the load schedule entered before the PJM accounting deadline.

8.6 Monthly Reconciliation. By the third business day after a calendar month becomes fully metered, the Company will compute and make available the complete hourly reconciliation quantities for the entire month to the Company Website.

By the third business day after a calendar month becomes fully metered, the Company will also transfer the monthly reconciliation quantity to PJM. The Company and the EGS will rely on PJM to calculate the EGS reconciliation dollar amounts for each hour. The Company and the EGS will rely on PJM to include EGS reconciliation dollar amounts in the monthly PJM bills to each EGS or Scheduling Coordinator.

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

RULES AND REGULATIONS

~~9. Utilization of Scheduling Coordinators~~

9. UTILIZATION OF SCHEDULING COORDINATORS

9.1 Participation Through a Scheduling Coordinator. If an EGS chooses not to interact directly with PJM for scheduling purposes or cannot schedule directly with PJM because its schedules do not meet the "whole megawatt" requirements set by PJM for scheduling, an EGS may become a Coordinated Supplier by entering into a business arrangement with another EGS or other person that will act as a Scheduling Coordinator. A Coordinated Supplier may enter into this business arrangement with a Scheduling Coordinator(s) for an individual service such as load scheduling, or for a variety of services encompassing installed capacity, import capability, load scheduling, and reconciliation rights and responsibilities. To the extent it is responsible for the following activities, the Scheduling Coordinator's transmission service obligation, installed capacity obligation, import capability, load scheduling and reconciliation rights and responsibilities shall include its own Customers and the Customers of its Coordinated Suppliers. All actions of the Scheduling Coordinator that relate to one of its Coordinated Suppliers are binding on, and attributable to, said Coordinated Supplier.

9.2 Designation of a Scheduling Coordinator. To designate a Scheduling Coordinator, an EGS must provide the Company with a completed Scheduling Coordinator Designation Form, included as a Rider hereto, fully executed by both the EGS and the Scheduling Coordinator. The Scheduling Coordinator Designation Form is not intended to supplement or replace any agency contract between an EGS and a Scheduling Coordinator.

9.3 Change in or Termination of Scheduling Coordinator. To change a Scheduling Coordinator, or cease using a Scheduling Coordinator, an EGS shall notify the Company in writing and said notice shall specify the effective month of the change or termination. The effective day of the change or termination shall be the first day of the month indicated in the notification letter unless notification is received by the Company less than ten business days before the first day of that month, in which case the effective day of the change shall be the first day of the subsequent month.

In the event an EGS ceases using a Scheduling Coordinator, an EGS shall immediately resume the direct performance of all EGS obligations under this Tariff.

9.4 Load Scheduling through a Scheduling Coordinator. Coordinated Suppliers cannot submit individual load schedules to the PJM OI, nor can Coordinated Suppliers propose scheduling changes on an individual basis. Rather, the Scheduling Coordinator is responsible for submitting all schedules and changes thereto on behalf of itself as well as its Coordinated Suppliers.

9.5 Primary Obligations of ~~A~~a Coordinated Supplier. Notwithstanding their designations of Scheduling Coordinators, each and every EGS remains primarily responsible for fully satisfying the requirements of this Tariff.

RULES AND REGULATIONS

~~**12. Payment and Billing**~~

12. PAYMENT AND BILLING

12.1 Customer Billing by the Company or EGS. All customer billing by either the Company or EGS shall be done in accordance with the Competitive Billing Specifications attached as a Rider to this tariff.

12.2 EGS Payment of Obligations to the Company. An EGS shall pay all Coordination Services Charges or any other Charge it incurs hereunder in accordance with the following provisions:

12.2.1 Billing Procedure. Each month for EGSs not participating in POR, the Company shall submit an invoice to the EGS for all Coordination Services Charges provided under this Tariff. The invoice may be transmitted to the EGS by any reasonable method requested by the EGS. An EGS shall make payment for Coordination Service Charges incurred on or before the due date shown on the bill. The due date shall be determined by the Company and shall not be less than fifteen (15) days from the date of transmittal of the bill.

12.2.2 Billing Corrections and Estimated Billings. Notwithstanding anything stated herein bills shall be subject to adjustment for any errors in arithmetic, computation, meter readings, estimating or other errors for a period for six (6) months from the date of such original monthly billing.

12.2.3 Manner of Payment. The EGS may make payments of funds payable to the Company by wire transfer to a bank designated by the Company. The Company may require that an EGS that is not creditworthy tender payment by means of a certified, cashier's, teller's, or bank check, or by wire transfer, or other immediately available funds. If disputes arise regarding an EGS bill, the EGS must pay the undisputed portion of disputed bills under investigation.

12.2.4 Late Fee for Unpaid Balances. If payment is made to the Company after the due date shown on the bill, a late fee will be added to the unpaid balance until the entire bill is paid. This late fee will be 2% per month on the unpaid balance.

12.2.5 EGS Default. In the event the EGS fails, for any reason other than a billing dispute as described below, to make payment to the Company on or before the due date as described above, and such failure of payment is not corrected within thirty (30) calendar days after the Company notifies the EGS to cure such failure, a Default by the EGS shall be deemed to exist. In the event of a billing dispute between the Company and the EGS, the Company will continue to provide service pursuant to the Individual Coordination Agreement and the Tariff as long as the EGS continues to make all payments not in dispute. A billing dispute shall be dealt with promptly in accordance with the dispute resolution procedures set forth below in Rule 18.

12.3 Billing for Supplier Obligations to Other Parties. The Company will assume no responsibility for billing between an EGS and PJM, an EGS and any energy source, or a Scheduling Coordinator and any Coordinated Suppliers.

PPL Electric Utilities Corporation

PAYMENT AND BILLING (CONTINUED)

12.4 Guarantee of Payments. Before the Company will render service or continue to render service, the Company may require an applicant for Coordination Service or an EGS currently receiving such service that has Bad Credit to provide a cash deposit, letter of credit, surety bond, or other guarantee, satisfactory to the Company. The Company will hold the deposit as security for the payment of final bills and compliance with the Company's Rules and Regulations. In addition, the Company may require an EGS to post a deposit at any time if the Company determines that the EGS is no longer creditworthy or has Bad Credit. An EGS shall have the right to submit to the Commission for resolution any reasonable dispute regarding such deposit, letter of credit, surety bond or other guarantee sought by the Company if the EGS believes such a requirement is inappropriately based or assessed.

~~Issued December 23, 2010~~ ~~Effective January 1, 2011~~

PPL Electric Utilities Corporation

12.5~~.~~ Amount of Deposits. The deposit shall be equal to the value of Coordination Services Charges the Company projects the EGS will incur during the next two billing periods based on that EGS's forecasted load obligation.

12.6~~.~~ Return of Deposits. Deposits secured from an EGS shall either be applied with interest to the EGS's account or returned to the EGS with interest when the EGS becomes creditworthy. In cases of discontinuance or termination of service, deposits will be returned with accrued interest upon payment of all service charges and guarantees or with deduction of unpaid accounts.

12.7~~.~~ Interest on Deposits. The Company will allow simple interest on cash deposits calculated at the lower of the Interest Index or six (6) percent. Deposits shall cease to bear interest upon discontinuance of service (or, if earlier, when the Company closes the account).

12.8~~.~~ Credit Information. In addition to information required otherwise hereunder, an EGS shall be required to provide to the Company such credit information as the Company requires. The Company will report to a national credit bureau the EGS's credit history with the Company.

12.9~~.~~ Purchase Of EGS Receivables (POR) Program. PPL Electric will purchase the accounts receivable, without recourse, associated with EGS sales of retail electricity supply, comprised of generation and transmission services, to consolidated EDC billing customers within PPL Electric's service territory served under the following Rate Schedules: RS, ~~RTS(R), RTD(R),~~ GS-1, GS-3, ~~GH-1(R), GH-2(R), IS-1(R),~~ BL, SA, SM(R), SHS, SLE, SE, TS(R) and SI-1(R), and standby service for the foregoing rate schedules. Under the POR ~~program~~Program, PPL Electric will reimburse EGSs for their customer billings regardless of whether PPL Electric receives payment from the customer, subject to the limitations set forth below~~.~~; provided, however, that for an EGS participating in the POR Program, the Company will offset its payments to the EGS by the EGS's Coordinated Service Charge. PPL Electric will seek to recover the EGS receivables from EGS customers consistent with PPL Electric's existing collection procedures for recovery of billings to ~~POLR~~default service customers~~,~~ and will incur any uncollectible accounts expense related to billings for EGSs. PPL Electric will purchase only those receivables that are associated with basic electric supply services and not receivables associated with charges for other products or services. Participating EGSs will be required to certify that purchased receivables are associated with only basic electric supply service.

~~The POR program set forth herein will become effective on January 1, 2011, and will remain in effect through May 31, 2013, and will terminate on May 31, 2013. PPL Electric may propose to continue the POR program under such terms and conditions as it deems appropriate pursuant to the provisions of the settlement agreement approved by the Commission in its Order entered on June 30, 2009 at Docket No. P-2008-2060309.~~

PPL Electric Utilities Corporation

PAYMENT AND BILLING (CONTINUED)

12.9.1 Eligibility Requirements. PPL Electric will perform consolidated billing for EGSs that voluntarily choose this option. An EGS that chooses the Company's consolidated EDC billing option for all or a portion of its residential accounts will be required to sell its accounts receivables to PPL Electric for those residential customers for whom PPL Electric issues a consolidated bill. An EGS will be permitted to choose the consolidated billing option for less than all of its customers in the residential class. Pursuant to the Commission Order entered December 21, 2010 at Docket No. R-2010-2161694, an EGS may issue its own bills [dual billing] for any residential customers upon one of the two following conditions: (1) PPL Electric's billing system cannot accommodate consolidated billing for the EGS; or (2) the EGS residential customer purchases products from the EGS that are bundled with non-basic services. An EGS that issues its own bills to residential customers will not be eligible to participate in the POR Program for those residential customers that receive dual billing.

An EGS will be permitted to choose the consolidated billing option for less than all of its customers in the small C&I class. An EGS that chooses the Company's consolidated EDC billing option for all or a portion of its small C&I accounts will be required to sell its accounts receivables to PPL Electric for those small C&I customers for whom PPL Electric issues a consolidated bill. An EGS may continue to issue its own

~~Issued December 23, 2010~~ ~~Effective January 1, 2011~~

PPL Electric Utilities Corporation

bills [dual billing] for basic supply service, for all or a portion of its small C&I customers, but will not be eligible to participate in the POR Program for those small C&I customers that receive dual billing.

EGSs may choose to participate in the POR programProgram with consolidated EDC billing at any time during the term of the POR program, as long as the EGS does not remove customer accounts from consolidated EDC billing and the POR program prior to December 31, 2010Program. A customer whose service is terminated or who voluntarily switches from the EGS' service to another generation provider is not considered to have been removed by the EGS from consolidated EDC billing and the POR programProgram. In addition, this section is not intended to interfere with an EGS'EGS's ability to offer customers product terms that are shorter in duration than the POR program.Program.

EGSs participating in the residential POR Program will agree not to reject for enrollment a new residential customer covered by the residential POR Program based on credit-related issues and will agree not to require a deposit for providing service to such residential customers. Any residential customer who wishes to be served by an EGS participating in the residential POR Program will be accepted by that EGS if that EGS is actively serving the residential customer class.

EGSs are permitted to perform credit checks and require deposits for small C&I customers and are permitted to deny serving small C&I customers for credit-related reasons.

12.9.2 Purchase Price Discount. EGSs accounts receivables associated with electric generation and transmission services will be purchased at a discount. The discount rate will be calculated separately for the residential customer class and the small C&I customer class. The rate will be comprisedconsist of two components that reflect: (1.)the cost of PPL Electric's uncollectable accounts expense, which will be fixed throughout the term of the program, unless and until modified upon Commission approval; and (2.) recovery of the initial and ongoing development, operation and administrative costs associated with the POR programProgram. The discount rate for electric generation and transmission services to the residential customer class will equal 2.311.80%, which is the sum of 2.311.80% for the first component and 0.00% for the second component. The discount rate for electric generation and transmission services to the small C&I customer class will equal 0.2326%, which is the sum of 0.2326% for the first component and 0.00% for the second component.

12.9.2.1 Merchant Function Charge (MFC). During the term of the POR program, which begins on January 1, 2011 and ends on May 31, 2013, the MFC will reflect PPL Electric's most recent estimate of the unbundled generation supply-related uncollectible accounts expense and will be charged to each residential or small C&I customer receiving default service from PPL Electric.
12.9.2.2

PPL Electric Utilities Corporation

PAYMENT AND BILLING (CONTINUED)

12.9.2.1 Timing Of Payments. Payments to EGSs will occur electronically---25 days after consolidated EDC bills are issued to residential customers and 20 days after consolidated EDC bills are issued to ~~nonresidential~~non- residential (small commercial and industrial) customers---and will continue throughout the billing cycle. If either the 25th day for residential customers or 20th day for non-residential customers falls on a weekend, PPL Electric holiday or bank holiday, payments will occur on the next business day.

12.9.2.~~3~~2 Other Payment Provisions. EGS customers on consolidated EDC billing will be able to select budget billing. The Company will pay EGSs based on actual billed supplier charges less the POR discount (versus budget amounts), and suppliers will not be impacted in any way by the budget billing program. The Company will inform customers that they can select a supplier and their budget payment plan will only be impacted to the extent necessary to assure that savings are reflected.

12.9.2.~~4~~3 Transfer Of Collection Responsibilities ~~And~~and Rights. Under the POR ~~program~~Program, PPL Electric is entitled to receive and retain all payments from customers. PPL Electric is authorized to conduct collection activities and, if necessary, terminate its delivery service and EGS generation and transmission services to residential and/or small C&I customers whose accounts receivables were purchased and who

~~Issued June 15, 2016~~ ~~Effective January 1, 2016~~

PPL Electric Utilities Corporation

fail to make payment of amounts due on the consolidated EDC bill, including the full amount of the purchased EGS accounts receivables. Any customer termination shall be consistent with the Pennsylvania Public Utility Code and the Commission's regulations.

An EGS residential and/or small C&I customer in the POR ~~program~~Program that has been terminated for ~~nonpayment~~non- payment may be reconnected upon paying the sum of unpaid distribution charges (plus any applicable reconnection fees or deposits) and the amount billed for EGS generation and transmission services. That customer will remain a customer of the EGS as long as the payment of unpaid amounts is made before the account is finalized.

12.9.2.~~5~~4 Dispute Resolution. To the extent concerns arise regarding the implementation of the provisions of the POR ~~program~~Program, parties shall attempt to resolve such disputes according to the dispute resolution procedures described in Section 18 of this supplier tariff. Parties also shall have the right to resolve such disagreements through the Commission's dispute resolution process.

12.9.2.~~6~~5 PURCHASE PRICE DISCOUNT ADJUSTMENT FOR AN INDIVIDUAL EGS THAT DOES NOT SELL ALL OF ITS SMALL C&I ACCOUNTS RECEIVABLES TO THE COMPANY: PPL Electric will monitor individual EGS uncollectible accounts percentages (measured as any unpaid amounts 60 days or older divided by that EGS' total annual consolidated billings) for those EGSs that sell a portion of, but not all of, their small C&I accounts receivables to the Company, to determine whether any individual EGS is engaging in unusual business behavior that results in an increase to the total uncollectible accounts expense percentage for the small C&I customer class. If, based on this monitoring, PPL Electric determines that an individual ~~EGS'~~EGS's uncollectible accounts percentage exceeds 1.5% for the small C&I customer class, then PPL Electric, at its discretion, may increase the discount rate for that individual EGS' accounts to reflect the increased costs associated with the ~~EGS'~~EGS's uncollectible accounts by the difference between the ~~EGS'~~EGS's uncollectible accounts percentage and 0.75% for the small C&I customer class. For purposes of this calculation, PPL Electric shall rely on the most recent 12-month period (or shorter if less data is available) to

PPL Electric Utilities Corporation

PAYMENT AND BILLING (CONTINUED)

calculate the ~~EGS's~~EGS's uncollectible accounts percentage. PPL Electric, in its discretion, may opt to waive the imposition of the additional discount if the increase in the uncollectible accounts percentage primarily is the result of providing service to previously poor paying customers currently on ~~POLR~~default service, and the individual EGS is able to provide a reasonable explanation that the significant increase in its uncollectible accounts percentage is not the result of a particular price offering, marketing strategy, selling selective accounts receivables, or other actions of the individual EGS. If, however, PPL Electric determines that an additional discount is appropriate, the EGS may challenge that determination pursuant to the dispute resolution procedures discussed above. Should the result of those procedures uphold the ~~EGS's~~EGS's position, PPL Electric will refund to the EGS the additional discount withheld from its receivables. In the course of the dispute resolution, the EGS may be called upon to provide customer payment history for those customers it serves, generation and transmission services pricing, and other such information deemed appropriate, subject to a confidentiality agreement. The discount will be lowered to the level applicable to other EGSs when and if the particular ~~EGS's~~EGS's uncollectible account percentage decreases to a level of 0.75%, or below, for the small C&I customer class over a 12-month period. If the particular EGS stops providing service to a customer under the POR ~~program~~Program, the EGS must pay to PPL Electric an amount equal to the increase to the discount multiplied by that customer's prior year's billings (or for the time the EGS served the customer, whichever is shorter), to the extent that such amount has not already been paid on the date the EGS stops providing service to that customer.

RULES AND REGULATIONS

13. ~~**Withdrawal by**~~ WITHDRAWAL BY EGS ~~**from Retail Service**~~FROM RETAIL SERVICE

13.1 Notice of Withdrawal to the Company. An EGS shall provide electronic notice to the Company in a form specified by the Company of withdrawal by the EGS from retail service in a manner consistent with the PaPUC's rulings in Docket No. M-00960890F.0013, and any subsequent applicable PaPUC rulings.

13.2 Notice to Customers. An EGS shall provide notice to its Customers of withdrawal by the EGS from retail service in accordance with the PaPUC's rulings in Docket No. M-00960890F.0013 and any subsequent applicable PaPUC rulings.

13.3 Costs for Noncompliance. An EGS that withdraws from retail service and fails to provide at least ninety (90) days written notice of said withdrawal shall reimburse the Company for any of the following costs associated with the withdrawal:

(a) mailings by the Company to the EGS's Customers to inform them of the withdrawal and their options;
(b) non-standard/manual bill calculation and production performed by the Company;
(c) EGS data transfer responsibilities that must be performed by the Company; and
(d) charges or penalties imposed on the Company by PJM or other third parties resulting from EGS ~~nonperformance~~non- performance.

RULES AND REGULATIONS

~~14. Discontinuance of Customers~~

14. DISCONTINUANCE OF CUSTOMERS

14.1 Notice of Discontinuance to the Company. An EGS shall provide electronic notice to the Company in a form specified by the Company of all intended discontinuances of service to Customers in a manner consistent with applicable PaPUC rules, which apply to all Customer classes.

14.2 Notice to Customers. An EGS shall provide a minimum of thirty (30) days advance notice to residential customers prior to canceling generation supply service except as set forth below. An EGS may cancel generation supply service to a residential customer for theft of service, fraud or failure to pay overdue charges consistent with applicable Pa PUC orders and regulations. With respect to all other classes of Customers, it will be the EGS's responsibility to provide notice to a Customer of its intention to discontinue service in accordance with the EGS's contractual obligations with the Customer.

14.3 Effective Date of Discontinuance. Any discontinuance will be effective on a Meter Read Date and in accordance with the EGS switching rules in this Tariff and the EDC Tariff.

PPL Electric Utilities Corporation

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

RULES AND REGULATIONS

15. ~~Liability~~ LIABILITY

15.1 General Limitation on Liability. The Company shall have no duty or liability with respect to electric energy before it is delivered by an EGS to a point of delivery on the Company's distribution system. After its receipt of electric energy and capacity at the point of delivery, the Company shall have the same duty and liability for distribution service to customers receiving Competitive Energy Supply as to those receiving electric energy and capacity from the Company.

15.2 Limitation ~~On~~on Liability ~~For~~for Service Interruptions ~~And~~and Variations. The Company does not guarantee continuous, regular and uninterrupted supply of service. The Company may, without liability, interrupt or limit the supply of service for the purpose of making repairs, changes, or improvements in any part of its system for the general good of the service or the safety of the public or for the purpose of preventing or limiting any actual or threatened instability or disturbance of the system. The Company is also not liable for any damages due to accident, strike, storm, riot, fire, flood, legal process, state or municipal interference, or any other cause beyond the Company's control.

15.3 Additional Limitations ~~On~~on Liability ~~In~~in Connection ~~With~~with Direct Access. Other than its duty to deliver electric energy and capacity, the Company shall have no duty or liability to an EGS providing Competitive Energy Supply arising out of or related to a contract or other relationship between an EGS and a Customer of the EGS.

The Company shall implement Customer selection of an EGS consistent with applicable rules of the Commission and shall have no liability to an EGS providing Competitive Energy Supply arising out of or related to switching EGSs, unless the Company is negligent in switching or failing to switch a customer.

15.4 Company's Indemnification of EGS. Subject to Rule 15.2, in the event the Company is not able to render continuous, regular, and uninterrupted supply of service due to interruption or service limitations not caused by the EGS, the Company shall hold the EGS harmless for any penalties, fines, or other costs that the Company may incur.

~~Issued August 12, 1998~~ ~~Effective August 27, 1999~~

PPL Electric Utilities Corporation

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

RULES AND REGULATIONS

16. BREACH OF COORDINATION OBLIGATIONS

16.1 Breach of ~~Coordination~~ Obligations.

~~16.1 Breach of Obligations.~~ The Company or an EGS shall be deemed to be in breach of its Coordination Obligations under the Individual Coordination Agreement and this Tariff upon its failure to observe any material term or condition of this Tariff, including any Rule and Regulation, Charge or Rider thereof.

16.2 Events of Breach. A material breach of Coordination Obligations hereunder, as described in Rule 16.1, shall include, but is not limited to, the following:

(a) a breach of any Rule or Regulation of the Tariff;
(b) an EGS's failure to maintain license or certification as an electric generation supplier or electricity supplier from the PaPUC;
(c) an EGS's failure to make payment of any undisputed Coordination Services Charges in the time prescribed;
(d) the involuntary bankruptcy/insolvency of the EGS, including but not limited to, the appointment of a receiver, liquidator or trustee of the EGS, or a decree by such a court adjudging the EGS bankrupt or insolvent or sequestering any substantial part of its property or a petition to declare bankruptcy as to reorganize the EGS; or
(e) an EGS's filing of a voluntary petition in bankruptcy under any provision of any federal or state bankruptcy law, or its consent to the filing of any bankruptcy or reorganization petition against it under any similar law; or without limiting the generality of the foregoing, an EGS admits in writing its inability to pay its debts generally as they become due or consents to the appointment of a receiver, trustee or liquidator of it or of all or any part of its property.

16.3 Cure and Default. If either the Company or an EGS materially breaches any of its Coordination Obligations (hereinafter the "Breaching Party"), the other party (hereinafter the ~~"Non~~"Non Breaching Party") shall provide the Breaching Party a written notice describing such breach in reasonable detail and demanding its cure. The Breaching Party shall be deemed to be in default ("Default") of its obligations under this Tariff and the Individual Coordination Agreement if: (i) it fails to cure its breach within thirty (30) days after its receipt of such notice; or (ii) the breach cannot be cured within such period and the Breaching Party does not commence action to cure the breach within such period and, thereafter, diligently pursues such action to completion.

16.4 Rights Upon Default. Notwithstanding anything stated herein, upon the occurrence of any Default, the party not in Default shall be entitled to (i) commence an action to require the party in Default to remedy such Default and specifically perform its duties and obligations hereunder in accordance with the terms and conditions hereof, and (ii) exercise such other rights and remedies as it may have in equity or at law.

PPL Electric Utilities Corporation

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

PPL Electric Utilities Corporation

RULES AND REGULATIONS

~~**17. Termination of Individual Coordination Agreement**~~

17. TERMINATION OF INDIVIDUAL COORDINATION AGREEMENT

17.1 Termination. An Individual Coordination Agreement will or may be terminated as follows:

(a) Withdrawal of the EGS from Retail Service. In the event the EGS ceases to participate in or otherwise withdraws the provision of Competitive Energy Supply to Customers in the Company's Service Territory, the Individual Coordination Agreement between the EGS and the Company shall terminate thirty (30) days following the date on which the EGS has no more active Customers.

(b) The Company's Termination Rights ~~Upon~~upon Default by EGS. In the event of a Default by the EGS, the Company may terminate the Individual Coordination Agreement between the EGS and the Company by providing written notice to the EGS in Default, without prejudice to any remedies at law or in equity available to the party not in Default by reason of the Default.

17.2 Effect of Termination. Termination of Individual Coordination Agreements will have the same effect on an EGS's Customers as the EGS's discontinuance of supply to such Customers described in the EDC Tariff: If a Customer of a terminated EGS has not switched to another EGS prior to termination, said Customer will receive Default PLR Service (as defined in the EDC Tariff) pending its selection of another EGS.

17.3 Survival of Obligations. Termination of an Individual Coordination Agreement for any reason shall not relieve the Company or an EGS of any obligation accrued or accruing prior to such termination.

PPL Electric Utilities Corporation

~~PP&L, Inc.~~ ~~Tariff Electric Pa. P.U.C. No. 1s~~

PPL Electric Utilities Corporation

RULES AND REGULATIONS

~~**18. Alternative Dispute Resolution**~~

18. ALTERNATIVE DISPUTE RESOLUTION

18.1 Informal Resolution of Disputes. The Company and EGS shall use good faith and commercially reasonable efforts to informally resolve all disputes arising out of the implementation of this Tariff and/or the conduct of Coordination Activities hereunder. The EGS's point of contact for all information, operations, questions, and problems regarding Coordination Activities shall be the Company's Alternative Supplier Coordination Section and the ~~web-site~~website.

18.2 Internal Dispute Resolution Procedures. Internal Dispute Resolution Procedures. Any dispute between the Company and an EGS under this Tariff or Individual Coordination Agreement shall be referred to a designated senior representative of each of the parties for resolution on an informal basis as promptly as practicable. In the event the designated representatives are unable to resolve the dispute within thirty (30) days (or such other period as the parties may agree upon) such dispute, by mutual agreement, may be referred to mediation in accordance with Section 8 of the Interim Code of Conduct in the EDC Tariff or may be submitted to arbitration and resolved in accordance with the arbitration procedures set forth below.

18.3 External Arbitration Procedures. If the amount in dispute is $500,000 or less, the arbitration initiated under the Tariff or any Individual Coordination Agreement shall be conducted before a single neutral arbitrator appointed by the parties. If the parties fail to agree upon a single arbitrator within twenty (20) days of the referral of the dispute to arbitration the parties shall request the American Arbitration Association to appoint a single neutral arbitrator. If the amount in dispute exceeds $500,000, each party shall choose one neutral arbitrator who shall sit on a three (3)-member arbitration panel. The two (2) arbitrators so chosen shall, within twenty (20) days of their selection, select a third arbitrator to chair the arbitration panel. In any case, the arbitrators chosen shall be knowledgeable in electric utility matters, including electric transmission and bulk power issues, and shall not have any current or past substantial business or financial relationships with any party to the arbitration (except prior arbitration). The arbitrator(s) shall provide each of the parties an opportunity to be heard and, except as otherwise provided herein, shall generally conduct the arbitration in accordance with the then current Commercial Arbitration Rules of the American Arbitration Association.

18.4 Arbitration Decisions. Unless otherwise agreed, the arbitrator(s) shall render a decision within ninety (90) days of their appointment and shall notify the parties in writing of such decision and the reasons therefor. The arbitrator(s) shall be authorized only to interpret and apply the provisions of the Tariff and any Individual Coordination Agreement and shall have no power to modify or change any provisions in any manner. The decision of the arbitrator(s) shall be final and binding upon the Parties, and judgment on the award may be entered in any court of competent jurisdiction. The decision of the arbitrator(s) may be appealed solely on the grounds that the conduct of the arbitrator(s), or the decision itself, violated the standards set forth in 42 Pa. C.S.A. § 7341. The final decision of the arbitrator must also be filed with FERC and PaPUC, if it affects their respective jurisdictional rates, terms and conditions of service or facilities.

PPL Electric Utilities Corporation

ALTERNATIVE DISPUTE RESOLUTION (CONTINUED)

18.5 Costs. Each Party shall be responsible for its own costs incurred during the arbitration process and for the following costs, if applicable:

(a) the cost of the arbitrator chosen by the party to sit on the three-member panel and a proportionate share of the cost of the third arbitrator chosen; or
(b) a proportionate share of the cost of the single arbitrator jointly chosen by the parties.

18.6 Rights ~~Under The~~under the Federal Power Act. Nothing in this Section shall restrict the rights of any party to file a complaint with FERC under relevant provisions of the Federal Power Act.

~~Issued August 12, 1998~~ ~~Effective August 27, 1998~~

PPL Electric Utilities Corporation

18.7 Rights ~~Under The~~under the Pennsylvania Public Utility Code. Nothing in this Section shall restrict the rights of any party to file a complaint with the Pa PUC under relevant provisions of the Pennsylvania Public Utility Code.

PPL Electric Utilities Corporation

PPL Electric Utilities Corporation

RULES AND REGULATIONS

19. ~~Miscellaneous~~ MISCELLANEOUS

19.1 Notices. Unless otherwise stated herein, any notice contemplated by this Tariff shall be in writing and shall be given to the other party at the addresses stated in the notice section of the Individual Coordination Agreement. If given by electronic transmission (including fax, telex, telecopy or Internet email), notice shall be deemed given on the date sent and shall be confirmed by a written copy sent by first class mail. If sent in writing by first class mail, notice shall be deemed given on the fifth business day following deposit in the United States mail (as noted by the postmark), properly addressed, with postage prepaid. If sent by same-day or overnight delivery service, notice shall be deemed given on the day of delivery. The Company and an EGS may change their representative for receiving notices contemplated by this Tariff by delivering written notice of their new representatives to the other.

19.2 No Prejudice of Rights. The failure by either the Company or the EGS to enforce any of the terms of this Tariff or any Individual Coordination Agreement shall not be deemed a waiver of the right of either to do so.

19.3 Gratuities to Employees. The Company's employees are strictly forbidden to demand or accept any personal compensation, or gifts, for service rendered by them while working for the Company on the Company's time.

19.4 Assignment.

19.4.1 An Individual Coordination Agreement hereunder may not be assigned by either the Company or the EGS without (a) any necessary regulatory approval and (b) the consent of the other party, which consent shall not be unreasonably withheld.

19.4.2 Any assignment occurring in accordance with Rule 19.4.1 hereunder shall be binding upon, and oblige and inure to the benefit of, the successors and assigns of the parties to the Individual Coordination Agreement.

19.5 Governing Law. To the extent not subject to the exclusive jurisdiction of FERC, the formation, validity, interpretation, execution, amendment and termination of this Tariff or any Individual Coordination Agreement shall be governed by the laws of the Commonwealth of Pennsylvania.

The Tariff or any Individual Coordination Agreement, and the performance of the parties' obligations thereunder, is subject to and contingent upon (i) present and future local, state and federal laws, and (ii) present and future regulations or orders of any local, state or federal regulating authority having jurisdiction over the matter set forth herein.

If at any time during the term of the Tariff or any Individual Coordination Agreement, the FERC, the PaPUC or a court of competent jurisdiction issues an order under which a party hereto believes that its rights, interests and/or expectations under the Agreement are materially affected by said order, the party so affected shall within thirty (30) days of said final order provide the other party with notice setting forth in reasonable detail how said order has materially affected its rights, interests and/or expectations in the Agreement. Within thirty (30) days from the receiving party's receipt of said notice the parties agree to

PPL Electric Utilities Corporation

MISCELLANEOUS (CONTINUED)

attempt through good faith negotiations to resolve the issue. If the parties are unable to resolve the issue within thirty (30) days from the commencement of negotiations, either party may at the close of said thirty
(30) day period terminate the Agreement, subject to any applicable regulatory requirements, following an additional thirty (30) days prior written notice to the other party without any liability or responsibility whatsoever except for obligations arising prior to the date of service termination.

~~**Issued February 5, 1999** **Effective February 6, 1999**~~

PPL Electric Utilities Corporation

19.6 Tax indemnification. If the Company becomes liable, under Section 2806(g) or 2809(c) of the Public Utility Code, 66 Pa. C.S.§§ 2806(g) and 2809 (c), for any Pennsylvania state taxes not paid by an electric generation supplier, the non-tax-compliant electric generation supplier shall indemnify the Company for the full amount of additional state tax liability imposed upon it by the Pennsylvania Department of Revenue due to the failure of the electric generation supplier to pay, or remit to the Commonwealth, the tax imposed on the electric generation supplier's gross receipts under Section 1101 of the Tax Report Code of 1971 or Chapter 28 of Title 66.

~~Technical Support and Assistance Charge~~

~~AVAILABILITY/APPLICABILITY~~

~~Technical Support and Assistance is defined as support and assistance that may be provided by the Company to a licensed EGS in connection with questions raised, and research requests, by the EGS in support of its energy supply business. The Company is under no obligation to provide any such support and assistance, with the exception of the services described in the "Conditions" section below.~~ Such support and assistance is categorized in three general areas:

1. Explanation of the Company's communications related to information posted to the website and /or sent via the Alternative Supplier Coordination Internet e-mail address;
2. Manual verification and confirmation of Customer account data beyond the information and messages available through the standard automated process; and

Explanation and definition of PP&L filings, PUC rulings and FERC orders

~~Such Technical Support and Assistance may include time spent by Company personnel conducting research in connection with an EGS inquiry.~~

~~**TABLE OF CHARGES**~~

~~First 10 hours ("Allowed Hours") per month per EGS:~~

~~No charge.~~

~~Any time beyond Allowed Hours:~~

~~$53/hour~~

~~CONDITIONS~~

~~There will be no time recorded against an EGS's Allowed Hours in connection with inquiries covering required business interactions, specifically:~~

1. ~~Normal daily forecasting and scheduling;~~
2. ~~Standard automated processing of EGS data files by the Company;~~
3. ~~Website availability and access; and~~
4. ~~Erroneous data communicated by PP&L via the Internet address and the website.~~

~~CHARGES~~
Load Data Supply Charge

AVAILABILITY/APPLICABILITY

The Company~~AVAILABILITY/APPLICABILITY~~
~~PP&L~~ will fulfill, with Customer consent only, a request for Customer load information available on its information system once per calendar year for no charge. ~~PP&L~~The Company will provide additional or other information, with Customer consent only, but will do so only for a Charge, in accordance with the Table of Charges~~,~~ below.

TABLE OF CHARGES

An EGS must pay the charges stated below per request to which ~~PP&L~~the Company responds in the following instances:

- All available historic load information other than electronically available historic hourly load information- $106.
- Any electronically available load data if requested in a calendar year in which ~~PP&L~~the Company has already provided such data once for no charge - ~~PP&L's~~the Company's actual cost, using an hourly labor rate of $53, and based on the time spent to fulfill the request to be determined at fifteen minute intervals.

CONDITIONS

No Customer-specific information will be supplied to an EGS before the Company's receipt of a Customer's written authorization to release such data to such EGS.

~~Individual Coordination Agreement Rider~~

1. Normal daily forecasting and scheduling;
2. Standard automated processing of EGS data files by the Company;
3. Website availability and access; and
4. Erroneous data communicated by the Company via the Internet address and the website.

PPL Electric Utilities Corporation

INDIVIDUAL COORDINATION AGREEMENT RIDER

1.0 This Individual Coordination Agreement ("Agreement"), dated as of is entered into, by and between ~~PP&L, Inc. (~~PPL Electric Utilities Corporation ("PPL Electric" or the "Company") and ("EGS").
~~("EGS").~~

2.0 The Company agrees to supply, and the EGS agrees to have the Company supply, all "Coordination Services" specified in the Electric Generation Supplier Coordination Tariff ("EGS Coordination Tariff"), including but not limited to load forecasting, load scheduling, and reconciliation services. Both Parties agree that such services are necessary to coordinate the delivery of Competitive Energy Supply to Customers located within the Company's service territory.

3.0 Representations and Warranties.

(a) The EGS hereby represents, warrants and covenants as follows:

(i) If an EGS will utilize Sections 6-9 of this tariff, the EGS is a member of the PJM and is in compliance, and will continue to comply either directly or through the EGS's Scheduling Coordinator, with all obligations, rules and regulations, as established and interpreted by the PJM OI, that are applicable to LSEs serving Customers located in the PJM Control Area; and

(ii) The EGS is licensed by the PaPUC to provide Competitive Energy Supply to Customers in Pennsylvania and has and will continue to satisfy all other PaPUC requirements applicable to EGSs.

(b) The Company and the EGS, individually referred to hereafter as the "Party," each represents, warrants and covenants as follows:

(i) Each Party's performance of its obligations hereunder has been duly authorized by all necessary action on the part of the Party and does not and will not conflict with or result in a breach of the Party's charter documents or bylaws or any indenture, mortgage, other agreement or instrument, or any statute or rule, regulation, order, judgment, or decree of any judicial or administrative body to which the Party is a party or by which the Party or any of its properties is bound or subject.

(ii) This Agreement is a valid and binding obligation of the Party, enforceable in accordance with its terms, except as such enforceability may be limited by applicable bankruptcy, insolvency or similar laws from time to time in effect that affect creditors' rights generally or by general principles of equity.

4.0 The EGS shall provide notice to the Company via facsimile, with a copy delivered pursuant to overnight mail, at such time that the EGS learns that any of the representations, warranties, or covenants in Section 3.0 of this Agreement have been violated.

5.0 As consideration for Coordination Services provided by the Company, the EGS shall pay the Company those Coordination Services Charges billed to the EGS in accordance with the terms and conditions of the EGS Coordination Tariff.

PPL Electric Utilities Corporation

INDIVIDUAL COORDINATION AGREEMENT RIDER (CONTINUED)

6.0 Coordination Services between the Company and the EGS will commence on _____.

RIDERS

~~Scheduling Coordinator Designation Form~~

PPL Electric Utilities Corporation

SCHEDULING COORDINATOR DESIGNATION FORM

1.0 This Scheduling Coordinator Designation Form, dated _____, is being submitted to ~~PP&L~~PPL Electric Utilities Corporation (the "Company") by the following Electric Generation Supplier ("EGS"):

_____
_____

2.0 By submitting this form, the EGS hereby notifies the Company that it has appointed the following entity to act as its Scheduling Coordinator in accordance with Rule 9 of the Company's Electric Generation Supplier Coordination Tariff (the "EGS Coordination Tariff"):

_____

_____

3.0. The EGS further notifies the Company that it is designating the person identified in the preceding paragraph as its Scheduling Coordinator for the specific purpose(s) (please check and/or fill in):

_____ Load Scheduling

_____ Installed Capacity Obligations

_____ Import Capability

_____ Reconciliation Rights and Responsibilities

_____ Other: _____

The Scheduling Coordinator appointed by the EGS shall be responsible for the performance of all Coordination Obligations of the EGS that are specifically delegated to said Scheduling Coordinator in this Form.

4.0. The Company may utilize the Scheduling Coordinator as the sole point of contact with the EGS in connection with the Company's provision of Coordination Services if requested to do so by the EGS.

5.0 The EGS agrees that the Company may bill the Scheduling Coordinator directly for all Coordination Services Charges attributable to the EGS and that the Scheduling Coordinator will pay the Company such charges on behalf of the EGS in accordance with the terms and conditions in the EGS Coordination Tariff.

6.0 The EGS and its appointed Scheduling Coordinator shall comply with all terms and conditions of the EGS Coordination Tariff, including those pertaining to Scheduling Coordinators and to payment and billing.

PPL Electric Utilities Corporation

SCHEDULING COORDINATOR DESIGNATION FORM (CONTINUED)

7.0 All inquiries, communications or notices relating to the EGS's use of the Scheduling Coordinator designated above may be directed to the following representatives:

To the EGS:

Definition and Terms for Advanced Meters and Advanced Meter Services

~~1.~~

1. Advanced meters must meet all applicable Pennsylvania Public Utility Commission ("Commission") and ANSI standards and the Company's applicable standards and codes for providing metering, metering devices and metering services contained in the Company's Tariff.
2. ~~2. PP&L~~PPL Electric has the right of physical access to all metering and associated equipment for operational and emergency response purposes.
3. ~~3.~~ Advanced Meter Services can be defined and divided into two components:
   a) the installation, removal, and maintenance of the physical meter required on a premise to measure the required variables.
   b) reading the meter and validating the raw meter outputs and applying, editing, and estimating rules, adding corollary information needed to characterize the customer, and making requested customer information available to authorized parties.
4. ~~4.~~ In accordance with the "Joint Petition for Full Settlement of ~~PP&L~~PPL Electric Restructuring Plan and Related Court Proceedings" approved by the Commission on August 27, 1998 at Docket No. ~~R00973954~~R-00973954, effective January 1, 1999, a Commission-licensed EGS may provide, finance, own, calibrate and remotely read advanced meters for service to residential customers located in PPL Electric service territory subject to the ability of the EGS to comply with these Competitive Metering Specifications. ~~An EGS shall not install, initially test or maintain advanced meters for service to residential customers located in PP&L Electric service territory prior to January 1, 2003. Prior to January 1, 2003, all advanced meters for residential customers shall be installed, initially tested and maintained by PP&L Electric employees.~~
5. ~~5.~~ An EGS may request that the PUC allow that EGS to provide Advanced Meters and Advanced Meter Services in the licensing process.
   a) An EGS that is currently licensed with the PUC and proposes to offer Advanced Meters and Advanced Meter Services shall file an amendment to its license to allow it to offer such services.
   b) An EGS must submit to the PUC proof of its technical fitness to warrant expansion of its license to allow it to offer Advanced Meters and Advanced Meter Services. Such fitness standards will include, but will not be limited to, the ability of the EGS and/or its certified subcontractor to adhere to the same metering safety and installation standards and practices imposed upon PPL Electric.
   c) and the technical ability to transfer data and information according to prescribed standards.
   d) A licensed EGS and the Company who currently provide advanced metering in the Commonwealth or elsewhere will be presumed to be technically fit to provide advanced metering in Pennsylvania and shall file the appropriate documents with the Commission.
6. ~~6.~~ **List of "Grandfathered" Advanced Meters**

PPL Electric Utilities Corporation

Pursuant to a Commission Secretarial Letter, dated May 13, 1999, at Docket M-00991233, a listing of “Grandfathered” Advanced Meters applicable to the PPL Electric service area is provided on Attachment D.

The Advanced Meter Standards report provides that devices and systems currently in use by any Pennsylvania EDC will continue to be valid for the length of their commercial life, assuming they generate the billing parameters required by the marketplace in a timely and appropriate fashion.

Advanced Meter Installation

An EGS providing advanced metering services who wishes to replace the ~~PP&L~~PPL Electric meter must give notice to ~~PP&L~~PPL Electric at least four~~-~~ business days prior to the date it proposed to change the meter. Such notice shall be given electronically. Business processes and required data to be exchanged will be ~~defined by November 1, 1998 consistent~~in accordance with the ~~data transfer procedures established by the~~ Electronic Data Exchange Working Group Standards and the Data Transfer Schedule.

The transaction shall include the scheduled date that the EGS will change the meter.

An EGS providing advanced metering service may arrange for the installation of an advanced meter and the removal of the existing meter. The existing meter must be returned by the EGS to ~~PP&L~~PPL Electric within five~~-~~ business days. An advanced meter cannot be installed within four (4) business days prior to the customer's regularly scheduled meter reading date or one-business day after the customer's regularly scheduled meter reading date. ~~In the fourth quarter 1999, this time period will be revisited by the parties and PP&L will determine whether to modify the timing. PP&L~~PPL Electric will provide 60-days advance notice so that parties that disagree with ~~PPL's~~PPL Electric's decision ~~not~~ to modify the timing may request the Commission to overrule or modify ~~PP&L's~~PPL Electric's decision.

An EGS installing an advanced meter must comply with all applicable Commission standards and ~~PP&L's~~PPL Electric's electric service requirements manuals.

~~PP&L~~PPL Electric will not require removal of an Advanced Meter that meets ~~PP&L's~~PPL Electric's required specifications as a condition of a customer's return to PLR service.

Transformer-~~rated meter installations~~Rated Meter Installations.

Current Transformers (CT) & Voltage Transformers (VT)

- ~~PP&L~~PPL Electric will own all CT & VT installations.
- ~~PP&L~~PPL Electric will install and replace all CT's & VT's at the request of an EGS providing metering service.
- An EGS providing metering service will be responsible for verifying all CT's & VT's operate accurately, with their meter, and ensuring compliance with PUC installation requirements. ~~PP&L~~PPL Electric will be responsible for the accuracy testing of CT's and VT's (ratio and phase angle) prior to installation. If necessary, PPL Electric~~PP&L~~ will provide a copy of the test results to the EGS upon request.
- An EGS providing metering service is responsible for coordinating any customer outages required for changes to the customer's meter, CT's & VT's, or associated equipment.

Instrument Transformer Wiring

- ~~PP&L~~PPL Electric will own all CT & VT wiring (color-coded), from the CT & VT up to the meter test switch

- the “line of demarcation”, where ~~PP&L~~PPL Electric responsibility ends and the responsibility of the EGS providing metering service begins, is at the load-side (meter side) of the meter test switch.
- ~~PP&L~~PPL Electric is responsible to connect ~~/~~and disconnect meter wiring from the meter test switch, unless a qualified EGS providing metering service chooses to do so.

Meter Panels

- ~~PP&L~~PPL Electric will own and provide a meter panel for all transformer rated meter installations. The meter panel must be kept in place at all times, with wiring and components left intact.
- ~~PP&L~~PPL Electric will leave the existing meter panel in place for use by an EGS providing metering service.
- The EGS providing metering services can elect to install their meter into the ~~PP&L~~PPL Electric meter panel or provide a wiring extension from the load side (meter side) of the test switch to an EGS provided meter and/or panel, if the standard ANSI socket configuration is not acceptable.

- PP&L will not be responsible for wiring past the load side (meter side) of the test switch if the EGS decides to install an adjacent meter panel. The PP&L PPL Electric provided meter panel must remain in place at all times and will act as the demarcation point for the metering wiring.
- PP&L PPL Electric will install and maintain meter panels for all existing and new installations.
- An EGS provided meter panel must be removed from service after termination of a customer contract unless arrangements are made for use by a future meter service provider.

Metering Credits

- If an existing or upgraded PP&L PPL Electric meter is required for metering a customer's account, the customer will not receive a metering credit
- PP&L's PPL Electric's meter must be replaced by the meter of the EGS providing metering service, in order for the customer to receive the applicable metering credit.
- If an existing PP&L PPL Electric meter is removed by an EGS, it must be returned to PP&L PPL Electric in order for a customer to receive the applicable metering credit. The credit will be retroactive to the actual removal date.

Non-Transformer-Rated Meters

Meter Panels

- The Customer is responsible for meter panel / meter socket for all non-transformer rated meter installations, per PP&L's PPL Electric's Rules for Electric Meter and Service Installations.

Metering Credits

- If an existing or upgraded PP&L PPL Electric meter is required for metering a customer's account, the customer will not receive a metering credit.
- PP&L's PPL Electric's meter must be replaced by the meter of the EGS providing metering service, in order for the customer to receive the applicable metering credit.
- If an existing PP&L PPL Electric meter is removed by an EGS, it must be returned to PP&L PPL Electric in order for a customer to receive the applicable metering credit. The credit will be retroactive to the actual removal date.

7. Access to customer premise for meter installation and maintenance. The EGS is responsible to obtain access to customer premises or locked rooms within customer premises directly from the customer. PP&L PPL Electric will not provide an EGS with customer keys or access to PP&L PPL Electric's customer keys in order to gain access to restricted areas within the customer's facility.

~~7.~~ PP&L PPL Electric will provide an EGS with security keys for PP&L's PPL Electric's barrel lock rings.

Meter Reading

1. An EGS providing advanced metering service may request an adjustment to the meter reading schedule for an account which it meters and select from an existing ~~PP&L~~PPL Electric defined meter reading route. ~~On January 1, 1999,~~ PPL Electric will accommodate an EGS specified meter reading schedule for ~~Rate Schedules LP4, LP5, LP6, LPEP, IST, ISP, ISA, PR-1, and PR-2. By the end of the second quarter 1999 PP&L will accommodate EGS specified meter reading schedules for its remaining~~all rate schedules. The EGS must ask the Customer whether the Customer consents to the switch in meter reading schedule. The EGS must retain a record indicating the customer has consented to this change. If the record is not itself a hard copy document, but rather an electronic or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy upon request.
2. All data collected by an EGS providing advanced metering service, which is required by ~~PP&L~~PPL Electric for billing and distribution service operation, shall be transmitted electronically consistent with the data transfer procedures established by the Electronic Data Exchange Working Group Standards and the Data Transfer Schedule.
3. If ~~PP&L~~PPL Electric is providing the metering service and the EGS is providing the customer with a consolidated EGS bill, all metering data which is required by the EGS for billing shall be transmitted electronically to the EGS consistent with the data transfer procedures established by the Electronic Data Exchange Working Group Standards and the Data Transfer Schedule.
4. Any authorized party that is providing advanced metering is responsible for the safe installation, maintenance, authorized operation, the accuracy of such advanced metering, and for resolving theft of service issues. In the case of theft of service, the party that discovers a theft of service condition will notify the other party within five-business days.
5. Any party providing advanced metering service is required to keep the most recent 12 months of customer consumption data for each metered customer. Such data must be retained for a period of 36 months. Such data must be released on request to the customer or, if authorized by the customer, to any EGS or to ~~PP&L~~PPL Electric.

Dispute Resolution

1. A dispute involving ~~PP&L~~PPL Electric and an EGS shall be handled pursuant to Rule 18 of ~~PP&L's~~PPL Electric's Electric Generation Supplier Coordination Tariff. The PUC has final adjudication authorization of all disputes.

2. Customer disputes involving advanced meter reading issues shall be handled by the EGS as the entity responsible for the advanced meter. The EGS will coordinate with ~~PP&L~~PPL Electric so that a proper investigation is made within the time period defined by 52 Pa. Code §56.151(5) and that the customer is informed of the results of the investigation. ~~PP&L~~PPL Electric shall provide all information needed by the EGS relating to the customer's complaint and must do so within five (5) business days of the EGS's request if the information can be obtained without contact in the field with the customer. If field contact with the customer is required (e.g. access to meter for re-read), the information will be provided within ten (10) business days.

Termination of Service to Customers with Competitive Metering Services

~~PP&L~~

1. PPL Electric will maintain responsibility for physically energizing, discontinuing, and terminating service to customers.
2. For any account that is metered by an EGS, ~~PP&L~~PPL Electric may terminate service to an account, after proper notice to the customer in accordance with the Commission's regulations and ~~PP&L's~~PPL Electric's tariff.
3. At the time a field termination visit is scheduled, ~~PP&L~~PPL Electric will notify the EGS of the scheduled time for such termination visit.

Requirements for Advanced Metering

An Advanced Meter Service Provider supplying metering systems for electric distribution customers of ~~An Advanced Meter Service Provider supplying metering systems for electric distribution customers of~~ PPL Electric as the ~~PP&L Local~~Electric Distribution Company ~~(LDC)~~("EDC") will comply with the latest version of all applicable standards and codes for providing metering, metering devices, and metering services, including but not limited to the ~~following:~~ following:

- Applicable parts of the Pennsylvania Code Title 52, Chapter 56 and ~~Chapter~~ 57;
- Any other applicable PA PUC guidelines; and
- All applicable ANSI standards, including specifically:
  - ANSI C12 standards
  - ANSI C57 standards
  - ANSI C2 standards

(National Electrical Safety Code)

- National ~~Electric~~Electrical Code ~~standards~~Standards
- NEMA ~~standards~~Standards
- PPL Electric "Rules for Electric Meter and Service Installations"
- PPL Electric Requirements for Commercial Electric Service
- OSHA requirements

The performance, accuracy, testing, calibration, and installation of the above-mentioned metering systems, including revenue meter, instrument transformers, and any other ancillary devices (e.g., recorders, test switches, relays, etc.), shall comply with all requirements in the Pennsylvania Code, Title 52, Chapter 57, and the latest version of all applicable ANSI C12 standards.

The Advanced Meter Service Provider shall assure that the following specific requirements are met.

For All Meters:

- All meters must be permanently tagged/labeled on the nameplate with the name of the EGS; ~~PP&L~~PPL Electric or subcontractor providing meters for the EGS or ~~PP&L~~PPL Electric.
- All meters are to have a nameplate with values for "CTR", "VTR", "PkH", kh, form and "Multiply by" as applicable.
- Certain invalidated, non-billing data, as mutually agreed upon, will be made available to the non-metering party.
- All meters must be equipped with a visual or optical watt-hour indicator for meter testing. This indicator is to be calibrated to the meter watt-hour constant (Kh).
- For each meter installed by the Advanced Meter Provider, the following shall be provided: accuracy test information, vendor serial number, all metering and billing constants, and any other meter records information as required by the PUC. This data shall be provided by the method agreed upon in the Data Exchange Working Group.
- All meters must comply with ANSI C12.1, ANSI C12.13, ANSI C12.18, and ANSI C12.19, as applicable.
- The Advanced Meter Provider will have their representative present at the customer site to meet a ~~PP&L~~PPL Electric representative if ~~PP&L~~PPL Electric exercises its right to test the meter, in lieu of providing meter application programs and passwords.

PPL Electric Utilities Corporation

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

- All meters shall be tested and maintained as per PUC requirements and ANSI standards.

For Electromechanical Watt-hour Meters:

- The accuracy and form designation of electromechanical watt-hour meters must comply with ANSI C12.1 and ANSI C12.10.
- Electromechanical watt-hour meters may only be used for customers with peak demands of less than 75 kW.

For Solid-state Electricity Meters:

- The accuracy and form designation of solid-state electricity meters must comply with ANSI C12.16 and ANSI C12.20.
- Solid-state electricity meters may be used for any customer, but must be used for customers with peak demands of 75 kW or greater.
- Solid-state electricity meters used for customers with peak demands of 75 kW or greater, must be 0.2 accuracy class.
- Solid-state electricity meters used for customers with peak demands of less than 75kW, must be 0.2 or 0.5 accuracy class.
- Solid-state electricity meters used with an internal *Transformer Loss Compensation* feature need only to meet ANSI 12.1 accuracy requirements if the same meter meets the above specified accuracy class without the feature.

For Metering Installations:

- Metering Installations shall conform to the metering installation requirements in the ~~PP&L~~PPL Electric Rules for Electric Meter and Service Installations manual~~,~~ however these requirements will not limit the use of the latest technology and will be updated as necessary so as not to preclude the use of such new technology.
- Metering Installations for Self-Contained Meters must have an approved meter socket as defined in ~~PP&L's~~PPL Electric's listing of Approved Meter Base Tables. Meter socket locations will be specified by ~~PP&L~~PPL Electric.
- All self-contained meters must be either socket based or K-based in configuration. The maximum nominal voltage cannot exceed 240 volts phase to phase.
- Metering Installations for Transformer-Rated Meters will be jointly coordinated by the EGS Meter supplier and ~~PP&L. PP&L~~PPL Electric. PPL Electric will supply and install the instrument transformers, meter panel, and wiring.
- Metering Installations must comply with ANSI C12.6, ANSI C12.7, ANSI C12.8, ANSI C12.9 and all applicable NEC codes.

~~**Issued August 12, 1998** **Effective August 27, 1999**~~

Meter ~~Worker Qualification~~Worked Qualifications Requirements for Advanced Metering Services

INTRODUCTION

Three levels of meter worker qualifications are set forth as criteria for meter workers to perform the installation, removal, testing, and maintenance of physical meters within an ~~EDC's~~EDC's service territory. Advanced metering services may be performed, by an electric distribution company ~~(~~("EDC~~),~~"), or an electric generation supplier ~~(~~("EGS~~),~~"), if certified to perform such services. EDC's and EGS's may perform these services through agreements with certified subcontractors.

GENERAL

If the EDC is subcontracting the meter services, then the EDC will ensure the Advanced Meter Services Provider issues to each meter worker or employee, who performs metering work, appropriate identification, indicating the worker's employer and the level of meter work the worker is qualified to perform. This identification must be carried by each meter worker during the performance of work.

If the EGS is subcontracting the meter services then, the EGS will ensure that the Advanced Meter Services Provider issues to each meter worker or employee, who performs metering work, appropriate uniforms and identification, indicating the worker's employer and the Level of meter work the worker is qualified to perform. This identification must be carried by each meter worker during the performance of work.

All meter workers sub-contracted to perform meter services pursuant to this Agreement must have sufficient training to exercise due care for the tasks performed.

LEVEL DESCRIPTIONS AND REQUIREMENTS

Level 1

~~1.~~

1. Metering Types and Voltages

This level includes single-phase, socket-based meters, and A-Based meters, 300 volts phase-to-phase maximum and does not include transformer rated meters. Communication wiring must be outside of energized meter panels.

2. ~~2.~~ Work to be Performed

Level 1 Meter Workers can install, remove and replace single-phase, 120/240-volt or 120/208-volt, self-contained meters in standard meter socket's, A-Based configurations in residential-commercial type metering equipment. Connections of communication conductors must be outside the energized meter panels.

3. ~~3.~~ Safety Skills

a) Job performance in accordance with employing Advanced Meter Services Provider's procedures and safety rules.

b) Knowledge of hazards of electricity and ability to perform work to avoid electrical hazards.

c) Ability to comply with OSHA requirements and safety codes if applicable.

d) On-site use of personal protective equipment.

e) Ability to comply with ANSI-C2 (National Electric Safety Code).

4. ~~4.~~ Essential Technical Skills

PPL Electric Utilities Corporation

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

~~a)~~ Understanding of single ~~-~~ phase electrical metering.

PPL Electric Utilities Corporation

a) Understanding of electric distribution safety procedures.

b) Ability to identify energy diversion or tampering related to this Level of meter work.

c) Ability to install and remove damaged and un-damaged electric meters in this level of meter work.

d) Understanding of meter panel's, socket layouts and configuration of A-Base connections for the metering conditions related to this Level of meter work.

e) Ability to read meters used in this class.

f) Ability to properly use tools appropriate to the work in this class.

g) Ability to connect meter communications external to the meter panel.

h) Ability to initialize meter communication modules - not utilizing Type 2 optical ports and meter configuration software.

5. ~~5.~~ How Essential Technical and Safety Skills are Determined

~~1. How Essential Technical and Safety Skills Are Determined~~

a) Advanced Meter Services Providers will develop and implement a program to train their workers to perform Level 1 meter work safely and properly.

b) Employees will be certified by their employers, based on prior experience or, the successful completion of the Advanced Meter Services Provider's training program.

c) To facilitate agreements for performing meter work in this level, EGSs and EDCs may decide to share training programs, however, it is with the understanding that the appropriate non-disclosure agreements are executed.

d) EGS and Advanced Meter Services Provider employees currently employed in classifications performing these functions, or within the last three (3) years were previous employed in classifications performing these functions, are considered qualified.

e) Advanced Meter Services Providers will develop and implement a ~~class room~~classroom training program (16 hrs.) to train their workers to perform Level 1 meter work safely and properly, including a minimum of forty (40) hours of on~~-~~the~~-~~job training (OJT) working alongside a meter worker with at least 6 months experience at Level 1, 2, or 3.

Level 2

~~2.~~1. Metering Types and Voltages

This Level includes all meter types in Level 1. Level 2~~,~~ includes single-phase, two-phase, poly-phase, safety socket, standard socket-based meters, A-base, K-base, and transformer rated meters with internal diagnostics up to 600 volts phase to phase. Communication wiring may be routed inside the panel, and work can be in and around energized circuits.

~~3.~~2. Work to be Performed

In addition to Level 1 Meter Work, Level 2 Meter Workers can install, remove and replace single-phase, network, and poly-phase meters, 600-volt phase~~-~~to~~-~~phase maximum. Operate test-bypass facilities in self-contained safety sockets. Communication wiring may be installed inside the panel, and work can be performed in and around energized circuits. On panels without test-bypass facilities, poly-phase meters will not be removed or installed without first disconnecting the customer load.

Further, Level 2 Meter Workers can install, remove and replace all meters consistent with the above, including transformer-rated meters with internal diagnostics (if detected, metering problems with test switches, panel wiring or transformers and transformer wiring will be corrected by a Level 3 Meter Worker). Level 2 Meter Workers may operate test switches, but may not install, alter, maintain or replace wiring between the meter, test switch, test block and associated equipment.

~~4.~~3. Safety Skills

PPL Electric Utilities Corporation

~~a)~~ Cumulative including all skills and safety knowledge for Level 1.

b) Electrical safety knowledge and work skills appropriate for three-phase metering up to 600V phase-to-

PPL Electric Utilities Corporation

a) phase, including the ability to identify and refer to a Level 3 or higher meter installer services above 600V phase-to-phase prior to performing work in the service equipment, or if voltage rating is not labeled, at the time of initial voltage check.

b) Ability to perform phase rotation assessments and wiring verification.

c) Ability to operate test-bypass facilities or test blocks in a self-contained safety socket.

d) Ability to perform work required to route communication wiring to accommodate meter communications.

e) Additionally, must have the knowledge needed for up to 600 volts, poly-phase, (two-phase and three phase) services and the forms and voltages applicable to Level 2 Meter Work.

f) Ability to understand, interpret and take appropriate action based on built-in diagnostics of solid-state meters.

g) Ability to work with transformer rated meters and operate test switches of 600 volts or less.

h) Awareness of instrument transformer operating characteristics including ability of potential transformer to back feed to primary system.

~~5.~~4. ~~4.~~ Essential Technical Skills

a) Cumulative of all Technical ~~skills~~Skills for Levels 1.

b) Ability to perform work required to route communication wiring to accommodate meter communications.

c) Ability to understand, interpret, identify and take appropriate actions based upon built-in diagnostics of solid-state meters.

d) Ability to perform meter accuracy tests in locations other than in the meter socket using semi-automatic meter test equipment at the customer site or in truck mounted equipment.

~~5. How Essential Technical and Safety Skills Are Determined~~

5. How Essential Technical and Safety Skills Are Determined

a) Advanced Meter Services Providers will develop and implement a ~~class room~~classroom training program (16 hrs.) to train their workers to perform Level 2 meter work safely and properly, including a minimum of forty (40) hours of on the job training ("OJT") working alongside a meter worker with at least 6 months experience at Level 2, or 3.

b) Employees will be certified by their employers, based on successfully completing the MSP's training program.

c) To facilitate agreements for performing meter work in this level, EGSs and EDCs may decide to share training programs, however, it is with the understanding that the appropriate non-disclosure agreements are executed.

d) Advanced Meter Services Providers work can be reviewed by the EDC's.

6. ~~6.~~ Experience Requirements

Minimum experience requirements that must be demonstrated prior to qualification for individuals wanting to become a Level 2 Meter Worker.

a) After 12 months OJT working with a Level 2 or Level 3 meter worker who has at least 6 months experience and upon successfully completing the Advance Meter Services Provider training program a worker may be certified as a Level 2 Meter Worker,

or

b) If an employee has a two- or four-year degree in a related subject, then after four (4) months OJT working alongside a Level 2 or Level 3 meter worker with at least six months of experience and upon successful completion of the Advanced Meter Services Provider training program (16 hrs.) a worker may be certified as a Level 2 Meter Worker,

or

c) If entry level experience of any employee is that of a journeyman 16 ~~hr~~ hour OJT level electrician, journeyman level electric metering worker, or journeyman level line worker (e.g., lineman, troubleman),

PPL Electric Utilities Corporation

then upon successful completion of the advance meter services provider training program (16 hrs.) ~~the~~the worker may be certified as a Level 2 Meter Worker.

PPL Electric Utilities Corporation

worker may be certified as a Level 2 Meter Worker.

Level 3

1.

Level 3

1. Metering Types and Voltages

   This Level includes all meter types in Levels 1 and 2. Level 3 work includes all metering up to 600V, including transformer rated meters with primary and secondary voltages less than 600V plus the additional skills needed to perform work on metering systems with instrument transformer primary side voltages over 600V. Communication wiring may be behind the panel, and work can be in and around energized circuits.

2. 2. Work to be Performed

   In addition to Level 1 and 2 Meter Work, Level 3 Meter Workers can install, remove and replace all meters consistent with the above including transformer-rated meters. Complete understanding of operating characteristics of metering transformers and operates test switches. May perform in-field meter accuracy tests, burden test, calibrations and perform all types of meter maintenance and troubleshooting on all meters. Programs and verifies internal programs and software in solid state meters.

3. Safety Skills

3. Metering Types and Voltages

a) Cumulative of all safety skills for Levels 1 and 2.

b) Ability to recognize and understand electrical hazards and complexities associated with metering switchboards, instrument transformers, testing meters and maintaining meters.

c) Awareness of instrument transformer operating characteristics including ability of potential transformer to back feed to primary system.

3.4. 4. Essential Technical Skills

a) Cumulative of Levels 1 and 2.

b) Ability to perform work on metering panels.

c) Ability to understand the operating characteristics of metering transformers and how to operate test switches.

d) Ability to perform calibration, repair, retrofit, troubleshooting, data collection of electric meters and install, maintain and program advanced metering technologies, including time of use, interval data, real time pricing, remote meter communication, and load control devices.

4.5. 5. How Essential Technical and Safety Skills Are Determined

a) Advanced Meter Services Provider's will develop and implement a class roomclassroom training program (40 hrs.) to train their workers to perform Level 3 meter work safely and properly, including a minimum of 6 months of on the job training ("OJT") working alongside a meter worker with at least 6 months experience at Level 3.

b) All workers will be certified by the test process outlined below.

c) Advanced Meter Services Provider's work can be reviewed by the EDC's.

5.6. 6. Experience Requirements

PPL Electric Utilities Corporation

a) All individuals seeking to perform advanced metering services as a Level 3 Meter Worker must successfully pass written and practical (demonstrative) tests. These tests will be ~~administrated~~administered by the Advanced Meter Services Provider.

~~a)~~ Prerequisites for taking the written and practical tests include demonstrated knowledge or certificate of a state certified apprenticeship training program or a degree in electrical ~~/ /~~electronic technology from an accredited institution of higher education and demonstrated experience in at least one of the following areas:

b) ~~1)~~

1) Minimum of one year experience as a Level 2 Meter Worker, including 6 months OJT with a Level 3 Meter Worker, with at least 6 months experience,

or

2) in the event a standardized test program created by a professional organization is created and is approved or authorized by the Pennsylvania Public Utility Commission or other appropriate regulatory authority, for certifying Level 3 Meter Worker (or equivalent level) then, any person who passes such test shall be qualified as a Level 3 Meter Worker,

or

3) employment as a journeyman metering employee. ~~7.~~

7. Testing and Re-Certification Requirements

a) Once an individual takes and passes the Level 3 Meter Worker Test and is otherwise qualified as a Level 3 Meter Worker they are qualified to perform that level of advanced metering work anywhere in Pennsylvania.

b) If after being qualified a meter worker does not perform metering work for three (3) years or more, ~~re-certification~~re-certification will be required prior to performing that Level of meter work.

Continuing Education

As part of a Level 3 Meter Worker's ongoing ability to remain qualified the individual must participate in at least twelve (12) hours annually of the Advanced Meter Services Provider's training program regarding technical metering standards, safety~~-~~related issues, and up-dating of meter software programs and PC skills.

~~PP&L, Inc. Tariff~~PPL Electric ~~Pa. P.U.C. No. 1S~~

~~PP&L~~ Competitive Billing Specifications Rider

Availability of Competitive Billing Services

1. An EGS that is qualified and plans to offer consolidated EGS billing to its customers beginning in January, 1999 as defined in the Joint Petition for Full Settlement of PP&L Utilities's Restructuring Plan and Related Court Proceedings, subject to the provisions of Paragraph H.7 of the settlement agreement, must inform ~~PP&L~~PPL Electric 60 days prior to the scheduled implementation date determined by the requirements of Paragraph H.7 of its intention to offer EGS consolidated billing.
2. A customer may choose to change his/her billing option. The customer can switch billing options through his/her EGS or through ~~PP&L~~PPL Electric when the customer wishes to return to PLR service. The change will be effective as of the next scheduled meter read date provided that PPL Electric has received at least 16 calendar days prior notice.
3. An EGS is not required to offer consolidated EGS billing in order to participate as a supplier in ~~PP&L's~~PPL Electric's service territory.

~~PP&L~~ Competitive Billing Specifications Rider

Billing Service Options

Consolidated EDC Billing

1. PPL Electric will render a consolidated EDC bill monthly and in accordance with the Public Utility Code and the Commission's regulations (52 Pa. Code §56.1 et seq.)
2. If PPL Electric is providing metering services, PPL Electric will transmit Meter Data (e.g., meter reads, consumption, demand, dates and type of reading) to the EGS. If the EGS is providing advanced metering services, the EGS will transmit Meter Data to PPL.
3. The EGS will calculate its customers' charges and will send ~~its'~~its customers' basic charges including date of billing period, consumption, usage, rate and resulting calculation ("EGS Charges") to PPL Electric in accordance with the data transfer procedures established by the Electronic Data Exchange Working Group Standards. PPL Electric and an EGS may develop, for future consideration, a fee structure to enable PPL Electric to include non-basic EGS charges on a PPL Electric consolidated bill.
4. PPL Electric will provide the EGS up to two lines, each 80 characters in length, on its standard bill for messages directly related to the calculation or understanding of the EGS portion of the bill.
5. PPL Electric and EGSs will transmit Meter Data and billing charges to each other in accordance with the data transfer procedures established by the Electronic Data Exchange Working Group Standards and the attached interim monthly billing schedule (Attachment E -~~–~~Data Transfer Schedule.) The Data Transfer Schedule will remain in effect until December 31, 1999. In the fourth quarter 1999, the Data Transfer Schedule will be revisited by PPL Electric and the parties and PPL will determine whether to modify the timing reflecting in the Data Transfer Schedule beyond December 31, 1999 and PPL Electric will provide 60-days advance notice to EGSs before any modification takes effect so that parties that disagree with the discontinuance of the Data Transfer Schedule may request the Commission to overrule or modify ~~PPL's~~PPL Electric's decision.
6. EGS Charges must be received by PPL Electric in accordance with the Data Exchange Standards and the Transfer Schedule.
7. If PPL Electric does not receive EGS charges in accordance with the Data Transfer Schedule, PPL Electric will place the EGS charges into the next billing cycle and the delayed EGS charges will appear on the customer's bill the following month. The customer's bill for the current billing period will state that the EGS charges for the current billing period are not available. The remittance period for EGS charges will begin when EGS charges actually appear on the bill. Any transactions with EGS charges sent to PPL Electric which are not in accordance with the Data Exchange Standards established by the Electronic Data Exchange Working Group or after the time periods outlined in the Data Transfer Schedule, will be rejected and the EGS will need to resubmit this data the following month.
8. PPL Electric will collect customer's payments and will process payments in accordance with the Commission's Chapter 56 standards and payment priority set forth in Docket No. M-00960890F.001 and Rule 9 of PPL Electric's EDC Tariff.

~~1.~~ This section is applicable only to the Large Commercial and Industrial (Large C&I) Customer Class, which includes Rate Schedules LP-4, ~~IS-P (R),~~ LP-5, ~~LP-6, LPEP, IS-T (R),~~ and standby service for Rate Schedules LP-4 and LP-5. PPL Electric will pay the EGS for amounts owed for all undisputed EGS charges regardless of whether the

PPL Electric Utilities Corporation

~~Issued November 30, 2009~~ ~~Effective January 1, 2010~~

PPL Electric Utilities Corporation

9. customer has paid PPL Electric. An amount is deemed disputed if the customer contacts PPL Electric questioning the charges on the bill and he/she does not agree with PPL Electric's and/or the EGS's position regarding the amount due for EGS charges. If the EGS charges are not in dispute, PPL Electric will remit all applicable

monies due the EGS, even if the PPL Electric portion of the bill is disputed. A customer's claim of the inability to pay shall not constitute a dispute for purposes of PPL Electric's obligation to pay the EGS its undisputed charges. If PPL Electric is required to make payment to the EGS for electricity delivered to the customer for which the customer has not made timely payment to PPL Electric, then PPL Electric shall be subrogated and succeed to the EGS's rights of recovery with respect to the electricity delivered to the customer from whom payment has not been received by PPL Electric. In no event may PPL Electric terminate a customer for any unpaid EGS charges subrogated to PPL Electric under this provision.

EGSs are permitted to perform credit checks and require deposits for large C&I customers and are permitted to deny serving large C&I customers for credit-related reasons.

~~9.~~10. ~~10.~~ PPL Electric will pay the EGS in accordance with the following schedule:

a) Residential Rate Classes - PPL Electric will send the EGS the amount of its undisputed EGS Charges, regardless of whether the customer has paid PPL Electric, within 25-calendar days from the date of the electronic transmission of the EGS Charges.

b) Non Residential Rate Classes. - PPL Electric will send the EGS the amount of its undisputed EGS Charges within 20-calendar days from the date of the electronic transmission of the EGS Charges.

c) Payment will not be made to the EGS when EGS Charges are not received by PPL Electric within the specified time period, as explained in paragraph 6 above. Payment for these charges will be made according to the applicable schedule in the following month, if they are received within the appropriate time period along with the current month charges.

d) PPL Electric will make payments of funds payable to the EGS by ACH with remittance advice to a bank designated by the EGS.

~~10.~~11. ~~11.~~ This section is applicable only to the Large C&I Customer Class, as defined in Section 9. Undisputed accounts that are 90 days or three billing cycles overdue, whichever is shorter, will be considered seriously delinquent and, at the request of either the EDC or EGS, will revert to two-bill status.

~~11.~~12. ~~12.~~ Budget Billing. The EDC and EGS must provide a budget billing option for their charges. If an EGS does not offer a budget billing option (and the Commission waives any applicable requirement), the following process will apply:

- EGS transmits its CURRENT charges to PPL Electric.
- PPL Electric places EGS CURRENT charges on the PPL Electric bill.
- PPL Electric sends bill to customer.
- PPL Electric pays EGS within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for EGS CURRENT charges.
- Customer pays PPL Electric and EGS CURRENT and PPL Electric charges.

If an EGS does offer a budget billing option, the following process will apply:

- EGS calculates its budget amount based on its own budget billing protocol and transmits its BUDGET charges to PPL Electric.

~~Issued November 30, 2009~~ ~~Effective January 1, 2010~~

PPL Electric Utilities Corporation

- ~~PPL~~ calculates BUDGET charges for its portion and places them on the PPL Electric bill.
- PPL Electric applies combined BUDGET charges to the bill and sends bill to customer.
- PPL Electric pays EGS within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for BUDGET charges.
- Customer pays PPL Electric for EGS BUDGET and PPL Electric BUDGET charges.

PPL Electric Utilities Corporation

General Rules for Budget Billing:

- Under EDC consolidated billing, both PPL Electric and the EGS will be responsible for calculating and managing the deferred balance for their respective budget charges.
- A customer can elect budget billing option for PPL Electric charges, EGS charges, or both.
- ~~PPL's~~PPL Electric's reconciliation occurs in month 12 (not necessarily December), or immediately when a customer ends budget billing.
- All rates classes are eligible for EDC budget billing option.
- PPL Electric will provide information of a customer's budget billing status to an EGS when confirming a customer switch.
- An EGS can notify PPL Electric electronically, after receiving customer permission, to change or end the EDC budget billing option.
- The customer will stay on PPL Electric budget billing if no indication is made by the EGS at the time of the customer switch.
- PPL Electric must display actual, budget and budget billing balance on the bill.

~~12.~~13. PPL Electric charges and EGS charges shall be based on the PPL Electric defined meter reading route. An EGS providing advanced metering services may request an adjustment to the meter reading schedule for an account which it meters. The EGS may select another PPL Electric defined meter reading schedule for that account. ~~On January 1, 1999,~~ PPL Electric will accommodate an EGS specified meter reading ~~for Rate Schedules LP4, LP5, LP6 LPEP, IST, ISA, PR-1, PR-2, and ISP. By the end of the second quarter 1999 PPL will accommodate EGS specified meter reading~~ schedules for ~~its remaining~~all rate schedules. The EGS must ask the Customer whether the Customer consents to the switch in meter reading schedule. The EGS must retain a record indicating the customer has consented to this change. If the record is not itself a hard copy document, but rather an electronic or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy upon request. The request must be received sixteen (16) days prior to the customer's currently scheduled meter read date and the change will take effect after that meter reading.

~~13.~~14. Dispute Process.

a) ~~a)~~ Residential Dispute Process.

1. ~~1.~~ PPL Electric shall process all disputes in accordance with the Public Utility Code and the Commission regulations (52 Pa. Code 56.1 et seq.). PPL Electric, as the entity responsible for the consolidated bill, must coordinate with the EGS so that a proper investigation of a customer dispute is conducted and completed within the time period prescribed by 52 Pa. Code 56.151(5) and that the customer and the EGS (if the EGS is involved in the dispute) are informed of the results of the investigation. The EGS shall cooperate fully with PPL Electric and shall provide all information needed by PPL Electric relating to the customer's dispute and must do so within five (5) business days of ~~PPL's~~PPL Electric's request if no field visit is needed, and within ten (10) business days of ~~PPL's~~PPL Electric's request if a field visit is needed. **Attachment A** outlines ~~PPL's~~PPL Electric's customer inquiry and dispute procedure for EDC consolidated billing.

~~**Issued November 30, 2009** **Effective January 1, 2010**~~

PPL Electric Utilities Corporation

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

b) ~~b)~~ Residential Informal Complaints.

1. PPL Electric shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. PPL Electric, as the entity responsible for the consolidated bill, must coordinate with the customer's EGS so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission. **Attachment B** outlines ~~PPL's~~PPL Electric's informal complaint procedure for EDC consolidated billing.
2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by PPL Electric, as determined by the Commission, during EDC consolidated billing and the handling of the informal complaint are the responsibility of PPL Electric.

~~c)~~ Non-Residential Dispute Process.

c) ~~1.~~

1. PPL Electric, as the entity responsible for the consolidated bill, will coordinate with the EGS so that the proper investigation is made and that the customer and the EGS (if the EGS is involved in the dispute) are informed of the results of the investigation. The EGS shall provide all information needed by PPL Electric relating to the customer's complaint and must do so within five (5) business days of PPL Electric's request if no field visit is needed, and within ten (10) business days of the EGS's request if a field visit is needed.

~~c)~~d) ~~d)~~ Non-Residential Informal Complaints.

1. PPL Electric shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. PPL Electric, as the entity responsible for the consolidated bill, must coordinate with the customer's EGS so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission.
2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by PPL Electric, as determined by the Commission, during EDC consolidated billing and the handling of the informal complaint are the responsibility of the EDC.

~~14.~~15. ~~15.~~ PPL Electric will follow its current credit and collection policies for collections. Outstanding prior balances are not transferred when a customer switches from PPL Electric to an EGS, switches from one EGS to another, switches from an EGS to PLR or when the customer chooses another billing option, unless mutually agreed to by PPL Electric and the individual EGS.

Consolidated EGS Billing

1. The EGS will render a consolidated EGS bill monthly and in accordance with the Public Utility Code and the Commission's applicable regulations (52 Pa. Code §56.1 et seq.).
2. If PPL Electric is providing the metering services to the customer, PPL Electric will transmit Meter Data to the EGS. If the EGS is providing advanced metering services to the customer, the EGS will transmit the Meter Data to PPL Electric.
3. PPL Electric will calculate its customers' charges and will send its unbundled charges ("PPL Electric charges") to the EGS via VAN or Internet protocol.
4. EGS will provide space to enable PUC mandated messages in accordance with Chapter 56.

~~1.~~ PPL Electric and EGSs will transmit Meter Data and billing charges to each other in accordance with the attached interim monthly billing schedule (**Attachment E-**Data Transfer Schedule.) The Data Transfer Schedule will remain in effect until December 31, 1999. In

~~**Issued November 30, 2009** **Effective January 1, 2010**~~

PPL Electric Utilities Corporation

~~PP&L, Inc. Tariff Electric Pa. P.U.C. No. 1s~~

5. ~~the~~ fourth quarter 1999, the Data Transfer Schedule will be revisited by PPL Electric and the parties and PPL Electric will determine whether to modify the timing reflecting in the Data Transfer Schedule beyond December 31, 1999 and PPL Electric will provide 60-days advance notice to EGSs before any modification takes effect so that parties that disagree with the discontinuance of the Data Transfer Schedule may request the Commission to overrule or modify ~~PPL's~~PPL Electric's decision.

~~6.~~ PPL Electric charges will be provided to the EGS in accordance with the data transfer procedures

6. established by the Electronic Data Exchange Standards and the Data Transfer Schedule.
7. ~~7.~~ If PPL Electric charges are not received by the EGS in accordance with the Data Transfer Schedule. The EGS will place the PPL Electric charges into the next billing cycle and the delayed PPL Electric charges will appear on the customer's bill the following month. The customer's bill for the current billing period will state that the PPL Electric charges for the current billing period are not available. The remittance period for EGS charges will begin when EGS charges actually appear on the bill. Any transactions with PPL Electric charges sent to an EGS after the time periods outlined in the Data Transfer Schedule will be rejected and PPL Electric will need to resubmit this data the following month.
8. ~~8.~~ The EGS will pay PPL Electric for the customer's amounts owed for all undisputed PPL Electric Charges regardless of whether the customer has paid the EGS. An amount is deemed disputed if the customer contacts the EGS questioning the charges on the bill and he/she does not agree with the EGS's and/or ~~PPL's~~PPL Electric's position regarding the amount due for PPL Electric charges. If PPL Electric charges are not in dispute, the EGS will remit all applicable monies due

to PPL Electric, even if the EGS portion of the bill is disputed. A customer's claim of an inability to pay shall not constitute a dispute for purposes of the EGS's obligation to pay PPL Electric its undisputed charges. If the EGS is required to make payment to PPL Electric for electricity delivered to the customer for which the customer has not made timely payment to the EGS, then the EGS shall be subrogated and succeed to ~~PPL's~~PPL Electric's rights of recovery with respect to the electricity delivered to the customer from whom payment has not been received by the EGS. In no event, however, may an EGS terminate a customer's PLR service or ~~PPL's~~PPL Electric's EDC service.

~~8.~~9.~~9.~~ The EGS will pay PPL Electric in accordance with the following schedule:

a) Residential Rate Classes ~~(Rate Schedules RS, RTD, RTS)~~ - The EGS will send PPL Electric the amount of the undisputed PPL Electric charges within 25-calendar days from the date of the electronic transmission of the PPL Electric charges.

b) Non Residential Classes. - The EGS will send the PPL Electric the amount of its undisputed PPL Electric charges within 20-calendar days from the date of the electronic transmission of the PPL Electric charges.

c) Payment will not be made to PPL Electric when PPL Electric charges are not received by the EGS within the specified time period, as explained in paragraph 6 above. Payment for these charges will be made according to the applicable schedule in the following month, if they are received within the appropriate time period along with the current month charges.

d) The EGS will make payments of funds payable to PPL Electric by ACH with remittance advice to a bank designated by PPL Electric.

~~10.~~ Budget Billing. The EGS will include on its bill the budget-billing amount for PPL

~~9.~~10. Electric customers who choose the budget billing option offered by PPL Electric. The following process will apply:

If the EGS does not offer its own budget billing option (and the Commission waives any applicable requirement):

- PPL Electric will transmit its BUDGET charges (including previous balance and current actual) to the EGS.

~~**Issued November 30, 2009** **Effective January 1, 2010**~~

PPL Electric Utilities Corporation

- EGS places PPL Electric BUDGET charges on the EGS bill.
- EGS sends bill to customer.
- EGS pays PPL Electric within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for BUDGET charges.
- Customer pays EGS for PPL Electric BUDGET and EGS charges.

Month 12 Process:

- PPL Electric transmits the previous balance (credit or debit) plus CURRENT charges.
- EGS places PPL Electric CURRENT and previous balance (credit or debit) charges on the EGS bill.
- EGS sends bill to customer.
- EGS pays PPL Electric within 25-calendar days for residential rate classes and 20-calendar days for non-residential rate classes for BUDGET balance and CURRENT charges.
- Customer pays EGS for CURRENT and previous balances.

If the EGS offers its own budget billing option, the following process will apply:

- ~~PPL transmits its BUDGET charges to EGS.~~
- EGS calculates its BUDGET charges and places them on the EGS bill with PPL Electric budget charges.
- EGS sends bill to customer.
- EGS pays PPL Electric within 25-calendar days for residential customers and 20 days for non-residential customers for BUDGET charges.
- Customer pays EGS for PPL Electric and EGS BUDGET charges

General Rules for Budget Billing:

- Under EGS consolidated billing, both PPL Electric and the EGS will be responsible for calculating and managing the deferred balance for their respective budget billing charges.
- An EGS will provide information of a customer's budget status to PPL Electric when confirming a customer switch.
- An EGS can notify PPL Electric electronically, after receiving customer permission, to change or end the PPL Electric budget billing option.
- The customer will stay on PPL Electric budget billing if no indication is made by the EGS at the time of the switch.
- PPL Electric must transmit actual, budget and budget balance for display on the bill.

~~10.~~11. PPL Electric charges and EGS charges shall be based on the EDC defined meter reading route. An EGS providing advanced metering services may requests an adjustment to the meter reading schedule for an account, which it meters. The EGS may select another EDC defined meter reading schedule for ~~that account. On January 1, 1999, PPL will accommodate an EGS specified meter reading of Rate Schedules LP4, LP5, LP6 LPEP, IST, PR-1, PR-2, ISA and ISP. By the end of the second quarter 1999 PPL will accommodate EGS specified meter reading schedules for its remaining rate schedules.~~all rate schedules. The EGS must ask the Customer whether the Customer consents to the switch in meter reading schedule. The EGS must retain a record indicating the customer has consented to this change. If the record is not itself a hard copy document, but rather an electronic or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy upon request. The request must be received sixteen (16) days prior to the customer's currently scheduled meter read date and the change will take effect after that meter reading.

~~Issued November 30, 2009 Effective January 1, 2010~~

~~or computer record, the EGS must be able to print or otherwise reproduce the record in hard copy upon request. The request must be received sixteen (16) days prior to the customer's currently scheduled meter read date and the change will take effect after that meter reading.~~

~~11.~~12. ~~12.~~ Dispute Process.

a) ~~a)~~ Residential Disputes.

1. ~~1.~~ The EGS shall process all complaints in accordance with the Public Utility Code and the Commission's regulations (52 Pa. Code 56.1 et seq.). The EGS, as the entity responsible for the consolidated bill, must coordinate with PPL Electric so that a proper investigation of a customer dispute is conducted and completed within the time period prescribed by 52 Pa. Code 56.151(5) and that the customer and PPL Electric (if PPL Electric is involved in the dispute) are informed of the results of the investigation. PPL Electric shall cooperate fully with the EGS and shall provide all information needed by the EGS relating to the customer's dispute and must do so within five (5) business days of the EGS request if no field visit is needed, and within ten (10) business days of the EGS's request if a field visit is needed. **Attachment ~~-~~ C** outlines the EGS's customer inquiry and dispute procedure for EGS consolidated billing.

b) ~~b)~~ Residential Informal Complaints.

1. The EGS shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. The EGS, as the entity responsible for the consolidated bill, must coordinate with PPL Electric so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission. PPL Electric will provide the EGS, to the extent is has the data, information relating to the customer's previous EGSs during the previous two years to assist the EGS in providing the Commission's required two year billing history. **Attachment D** outlines the EGS informal complaint procedure for EGS consolidated billing.
2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by the EGS, as determined by the Commission, during EGS consolidated billing and the handling of the informal complaint are the responsibility of the EGS.

c) Non-Residential Dispute Process.

1. The EGS, as the entity responsible for the consolidated bill, will coordinate with PPL Electric so that the proper investigation is made and that the customer and PPL Electric (if PPL Electric is involved in the dispute) are informed of the results of the investigation. PPL Electric shall provide all information needed by the EGS, relating to the customer's complaint and must do so within five (5) business days of the EGS's request if no field visit is needed, and within ten (10) business days of the EGS's request if a field visit is needed.
2. Non-Residential Informal Complaints

d) Non-Residential Informal Complaints.

1. The EGS shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations. ~~PPL~~The EGS, as the entity responsible for the consolidated bill, must coordinate with PPL Electric so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission. PPL Electric will provide the EGS, to the extent is has the data, information relating to the customer's previous EGSs during the previous two years to assist the EGS in providing the Commission's required two year billing history. **Attachment D** outlines the EGS informal complaint procedure for EGS consolidated billing.
2. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by the EGS, as determined by the Commission, during EGS consolidated billing and the handling of the informal complaint are the responsibility of the EGS.

PPL Electric Utilities Corporation

~~c)~~a) ~~c) Non-Residential Dispute Process.~~

~~1. The EGS, as the entity responsible for the consolidated bill, will coordinate with PPL so that the proper investigation is made and that the customer and PPL (if PPL is involved in the dispute) are informed of the results of the investigation. PPL shall provide all information needed by the EGS, relating to the customer's complaint and must do so within five (5) business days of the EGS's request if no field visit is needed, and within ten (10) business days of the EGS's request if a field visit is needed.~~

~~d)~~a) ~~d) Non-Residential Informal Complaints.~~

~~1. The EGS shall process all informal complaints in accordance with the Public Utility Code and the Commission's regulations.~~ The EGS, as the entity responsible for the consolidated bill, must coordinate with PPL so that the proper information is submitted to the Commission's Bureau of Consumer Services within the time period required by the Commission. PPL ~~will provide the EGS, to the extent is has the data, information relating to the customer's previous EGSs during the previous two years to assist the EGS in providing the Commission's required two year billing history.~~ ~~**Attachment D**~~ ~~outlines the EGS informal complaint procedure for EGS consolidated billing.~~

~~1. Any violation letter sent by the Commission shall be addressed to the billing entity at the time of the alleged violation. All violations committed by the EGS, as determined by the Commission, during EGS consolidated billing and the handling of the informal complaint~~

~~**Issued November 30, 2009** **Effective January 1, 2010**~~

~~are the responsibility of the EGS.~~

13. ~~13.~~ The EGS will follow credit and collection policies in compliance with the applicable Commission regulations. Outstanding balances are not transferred when a customer switches from the EGS to PPL Electric, switches from one EGS to another or when the customer chooses another billing option, unless mutually agreed to by PPL Electric and the individual EGS.

Separate EDC/EGS Billing

1. PPL Electric and the EGS will separately send their bills directly to the customer.
2. If PPL Electric is providing the metering services to the customer, PPL Electric will transmit Meter Data to the EGS. If the EGS is providing advanced metering services to the customer, the EGS will transmit the Meter Data to PPL Electric.

PPL Electric Exhibit LN-2

Summary List of Supplier Tariff Changes

1. Title Page and Table of Contents – Added to improve clarity and ease of navigation in the tariff.

2. Definitions – Changes to improve clarity, reflect current or proposed practice, add newly defined terms, reflect other changes to the Supplier Tariff, and correct any small typographical errors.

3. Rule 1 – Changes to improve clarity and correct any small typographical errors. Edits to Rule 1.4 regarding the incorporation of the tariff in Coordination Agreement and applicability to those customers receiving service unlawfully or in an unauthorized or fraudulent manner. Deletion of Rule 1.5 regarding "Use of Riders."

4. Rule 2 – Changes to improve clarity and correct any small typographical errors.

5. Rule 3 – Changes to improve clarity and correct any small typographical errors. Updates to provisions governing registration for coordination services, incomplete registrations, grounds for rejecting registration, offer of conditional acceptance of registration, rejection of registration, and approval of registration.

6. Rule 4 – Changes to improve clarity and correct any small typographical errors. Updates to provisions about state licensing, procurement of energy, capacity, and AEPS, and transmission service and obligations. Updates to communication requirements and data exchange to reflect current practice. Updates to Coordination Services Charges, including the EDI transaction fees and DUNS testing fees described in PPL Electric witness Lisa Norden's direct testimony (PPL Electric St. No. 18). Incorporation of updated credit requirements for EGSs.

7. Rule 5 – Changes to improve clarity and correct any small typographical errors. Edits to data access, exchange, and maintenance provisions, including updates to reflect current practice. Updates to provisions regarding customer notice and switching from one EGS to another EGS, switching from one EGS back to default service, and discontinuing service.

8. Rule 6 – Changes to improve clarity and correct any small typographical errors. Deletion of references to retail tariff rate schedules that have been or are being eliminated. Removal of provisions applicable to the phase-in of the competitive market for retail electric supply.

9. Rule 7 – Changes to improve clarity and correct any small typographical errors.

10. Rule 8 – Changes to improve clarity and correct any small typographical errors. Addition of daily reconciliation provision.

11. Rule 9 – Changes to improve clarity and correct any small typographical errors.

12. Rule 10 – No substantive changes.

13. Rule 11 – Changes to improve clarity and correct any small typographical errors.

14. Rule 12 – Changes to improve clarity and correct any small typographical errors. Updates to reflect changes in billing of Coordination Services Charges described in PPL Electric witness Lisa Norden's direct testimony (PPL Electric St. No. 18). Deletion of references to retail tariff rate schedules that have been or are being eliminated. Removal of old provisions applicable to the initial POR Program. Updates to discount rates to reflect the percentages set forth in PPL Electric witness Katelyn Arnold's direct testimony (PPL Electric St. No. 13).

15. Rule 13 – Changes to improve clarity and correct any small typographical errors.

16. Rule 14 – No substantive changes.

17. Rule 15 – Changes to improve clarity and correct any small typographical errors.

18. Rule 16 – Changes to improve clarity and correct any small typographical errors.

19. Rule 17 – Changes to improve clarity and correct any small typographical errors.

20. Rule 18 – Changes to improve clarity and correct any small typographical errors.

21. Rule 19 – No substantive changes.

22. Load Data Supply Charge – Changes to improve clarity and correct any small typographical errors.

23. Technical Support and Assistance Charge – Changes to improve clarity and correct any small typographical errors.

24. Individual Coordination Agreement Rider – Changes to improve clarity and correct any small typographical errors.

25. Scheduling Coordinator Designation Form – Changes to improve clarity and correct any small typographical errors.

26. Competitive Metering Specifications Rider – Changes to improve clarity and correct any small typographical errors. Removal of outdated language, including provisions applicable to installation of advanced meters before January 1, 2003.

27. Competitive Billing Specifications Rider – Changes to improve clarity and correct any small typographical errors. Deletion of references to retail tariff rate schedules that have been or are being eliminated.

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to electric plant as of June 30, 2025. Summaries of the original cost, annual accruals and the book depreciation reserve are presented in Tables 1 and 2, beginning on page I-3 of the attached report.

A description of the methods and procedures upon which the study was based is set forth in a companion report, "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of June 30, 2026".

Respectfully submitted,

GANNETT FLEMING VALUATION

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

The results of the depreciation study are summarized in Table 1, which sets forth the calculated annual depreciation related to Electric Plant in Service as of June 30, 2025. Table 2 presents the experienced gross salvage and cost of removal associated with regular retirements during the five-year period, 2020-2024 and the annual amortization of net salvage.

DETAILED TABULATIONS OF DEPRECIATION CALCULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on II-6. The original cost, calculated accrued depreciation, allocated book depreciation reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2020 through 2024, beginning on pages III-2 through III-5.

PPL Electric Utilities Corporation
827 Hausman Road
Allentown, PA 18104

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to electric plant in service. The results of our study as of June 30, 2026 are presented in the attached report. The results of our study as of June 30, 2025 are presented in our report titled "2025 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of June 30, 2025". The same methods, procedures and estimates are used in both studies.

The attached report sets forth a description of the methods and procedures upon which the studies were based, the estimates of survivor curves and the calculated annual depreciation rates as of June 30, 2026.

Respectfully submitted,

GANNETT FLEMING VALUATION

DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study conducted for PPL Electric Utilities Corporation to determine the annual depreciation accrual rates and amounts for ratemaking purposes applicable to the original cost of electric plant as of June 30, 2026.

The depreciation accrual rates and amounts presented herein are based on estimated survivor curves and on methods and procedures set forth in previous orders approved by the Pennsylvania Public Utility Commission. The estimated survivor curves presented herein were based on the results of a service life study incorporating statistical analyses of data through 2021.

BASIS OF STUDY

Depreciation and Amortization

Depreciation, as defined in the Uniform System of Accounts, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs over a period of time by allocating annual amounts to expense. Each annual amount of

such depreciation expense is part of that year's total cost of providing utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

The calculation of annual and accrued depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. These subjects are discussed in the sections which follow. For most plant accounts, depreciation accruals and accrued depreciation were calculated using the straight line method, the remaining life basis and the average service life (ASL) procedure. The calculations were based on the attained ages and estimated service life characteristics for each depreciable group of gas property. For certain general plant accounts, the amortization amounts, annual and accrued, were based on the age of the vintage and the selected amortization period.

Survivor curves were used to reflect the expected dispersion of retirements, thus providing a consistent method of estimating service lives and depreciation for mass property. Iowa type curves were used to depict the estimated survivor curves. For life span groups, the estimate of life characteristics is consistent because the calculated lives of the units within a group are obtained by employing a single probable retirement date for the entire group.

Service Life Estimates

The method of estimating service life consisted of compiling the service life history of the plant accounts, subaccounts or depreciable groups, reducing this history to trends through the use of acceptable actuarial techniques, and forecasting the trend of survivors for each depreciable group on the basis of interpretations of past trends and consideration of Company plans for the future. The combination of the historical trend and the estimated future trend yielded a complete pattern of life characteristics from which the average service life was derived.

The Company's service life estimates used in the depreciation calculation incorporated historical data compiled through 2021 from the property records of the Company. Such data included plant additions, retirements, transfers and other activity. Generally, retirement data for the years 1937 through 2021 were used in the actuarial life table computations which were the primary statistical support of the service life estimates.

A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirement was obtained through field trips conducted during the course of the service life study. Discussions with operating and management personnel also provided information regarding plans for the future which was incorporated in the interpretation and extrapolation of the statistical analyses.

AMORTIZATION OF NET SALVAGE

Inasmuch as this report relates primarily to Pennsylvania rate regulation practices, under which experienced costs of negative net salvage are amortized after their occurrence, no adjustments for expected net salvage were made to either the annual depreciation accrual or the calculated accrued depreciation for the individual accounts. The annual provision for recovering negative net salvage is based on the amortization of net salvage over a five-year period.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below, and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

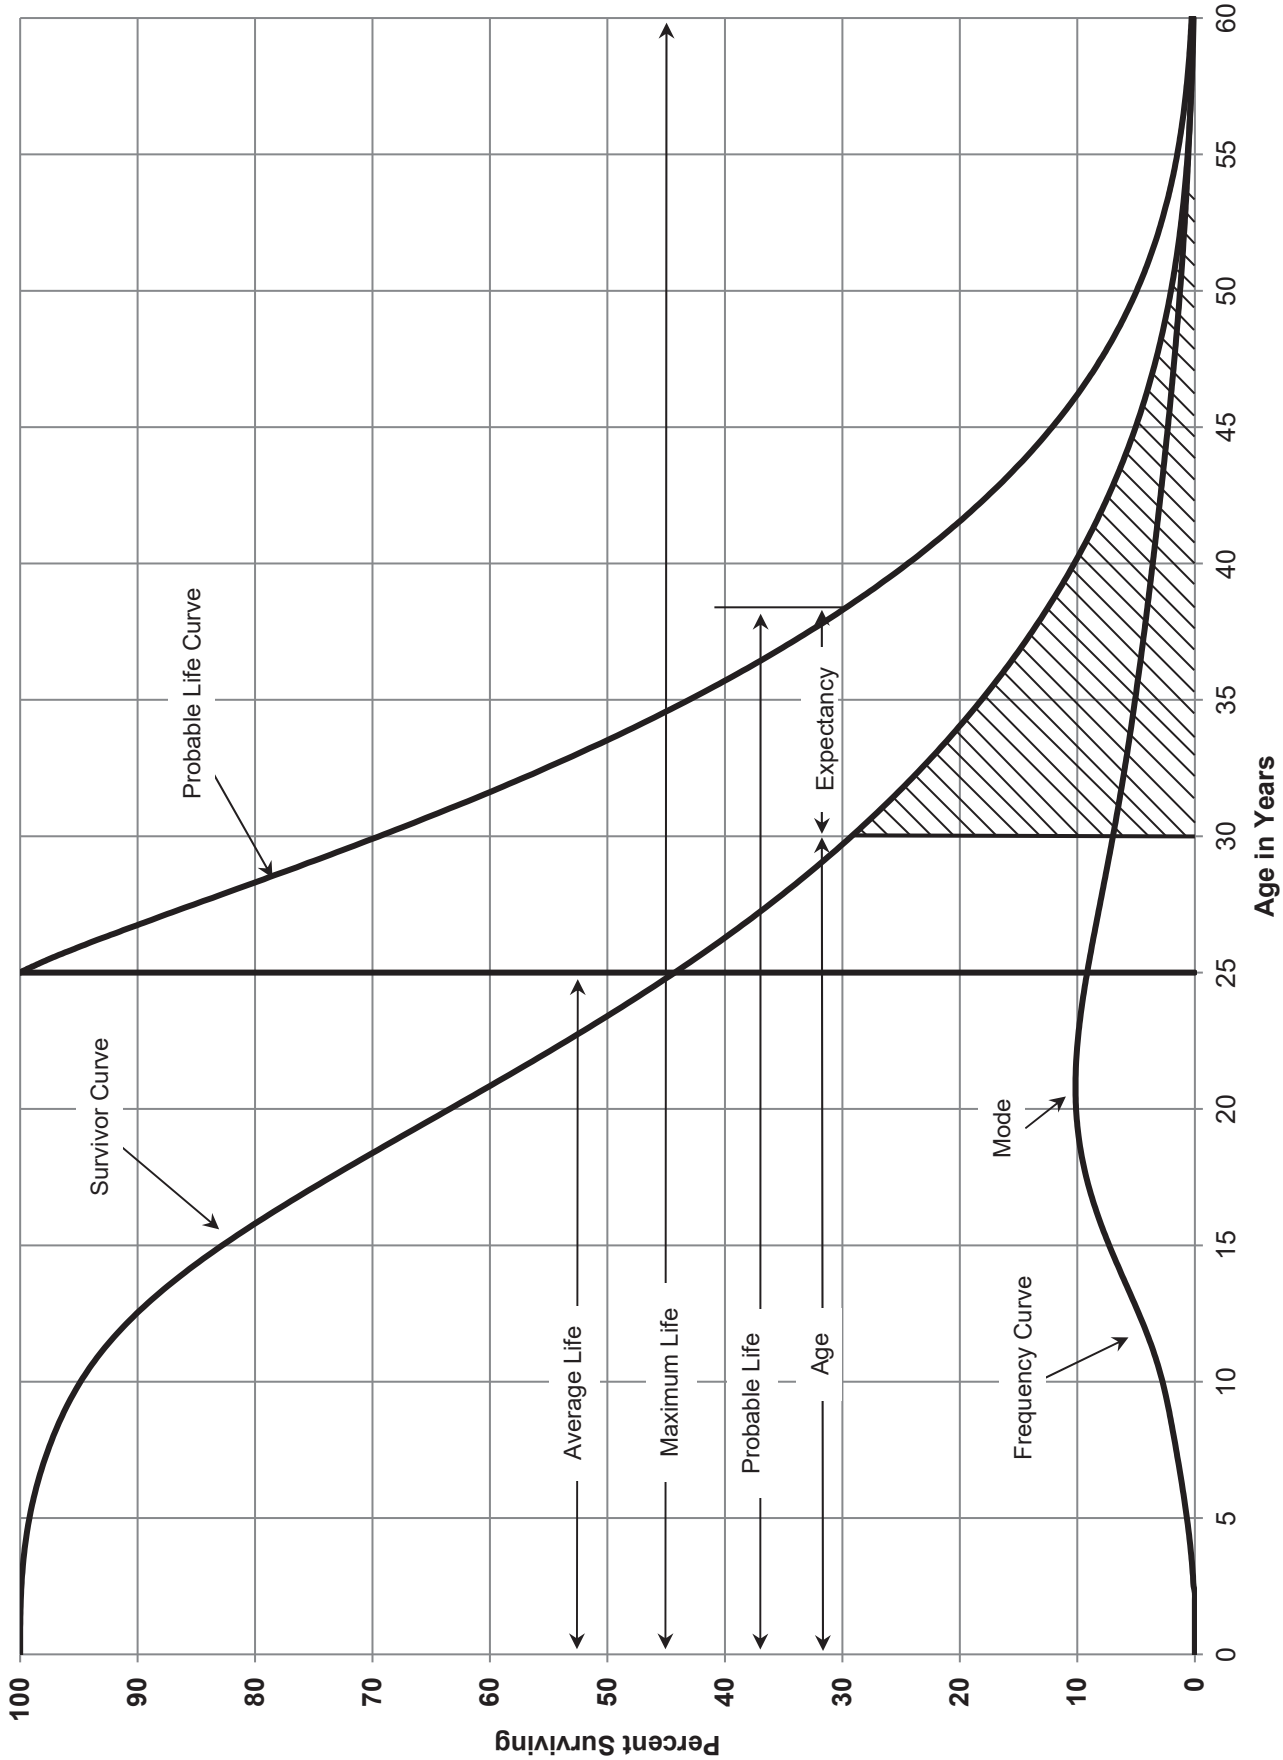

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

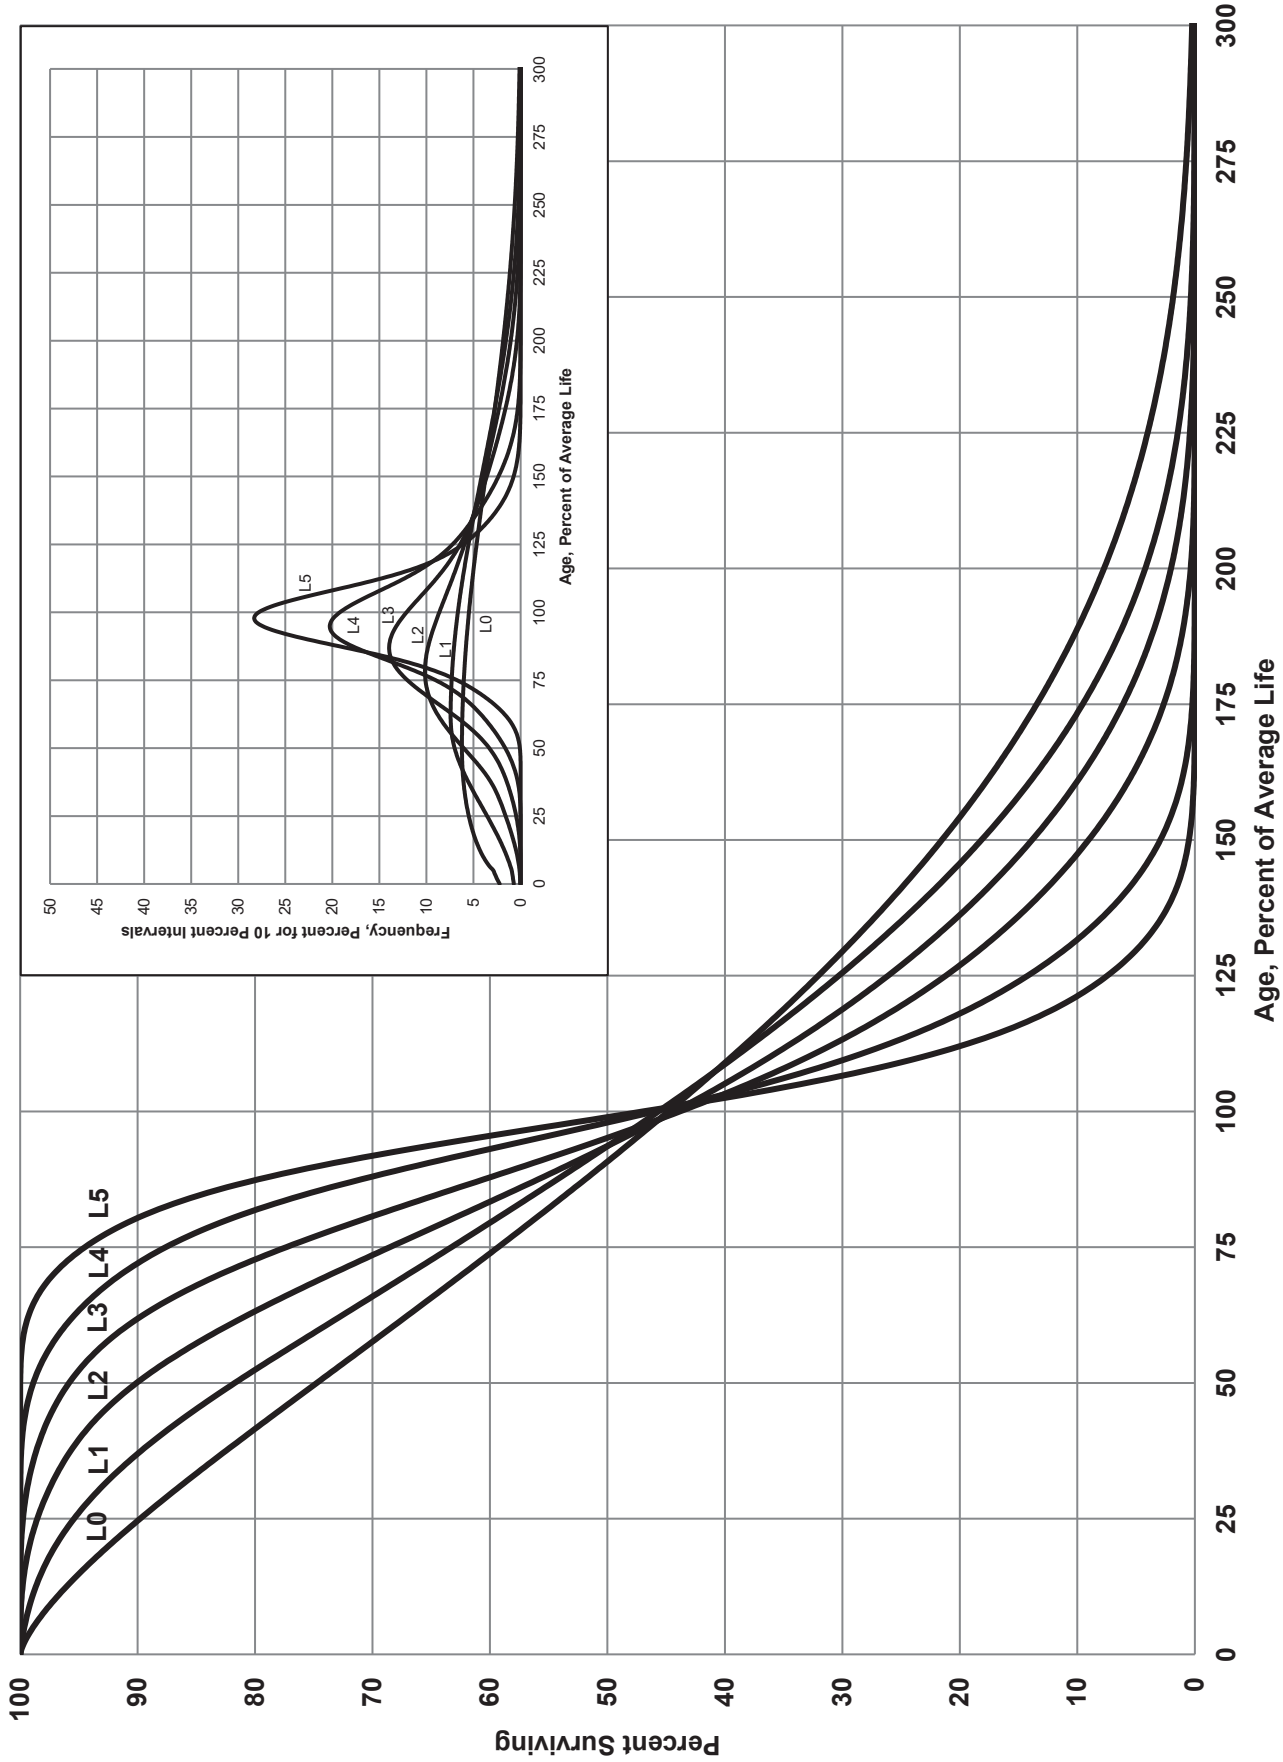

FIGURE 2.. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

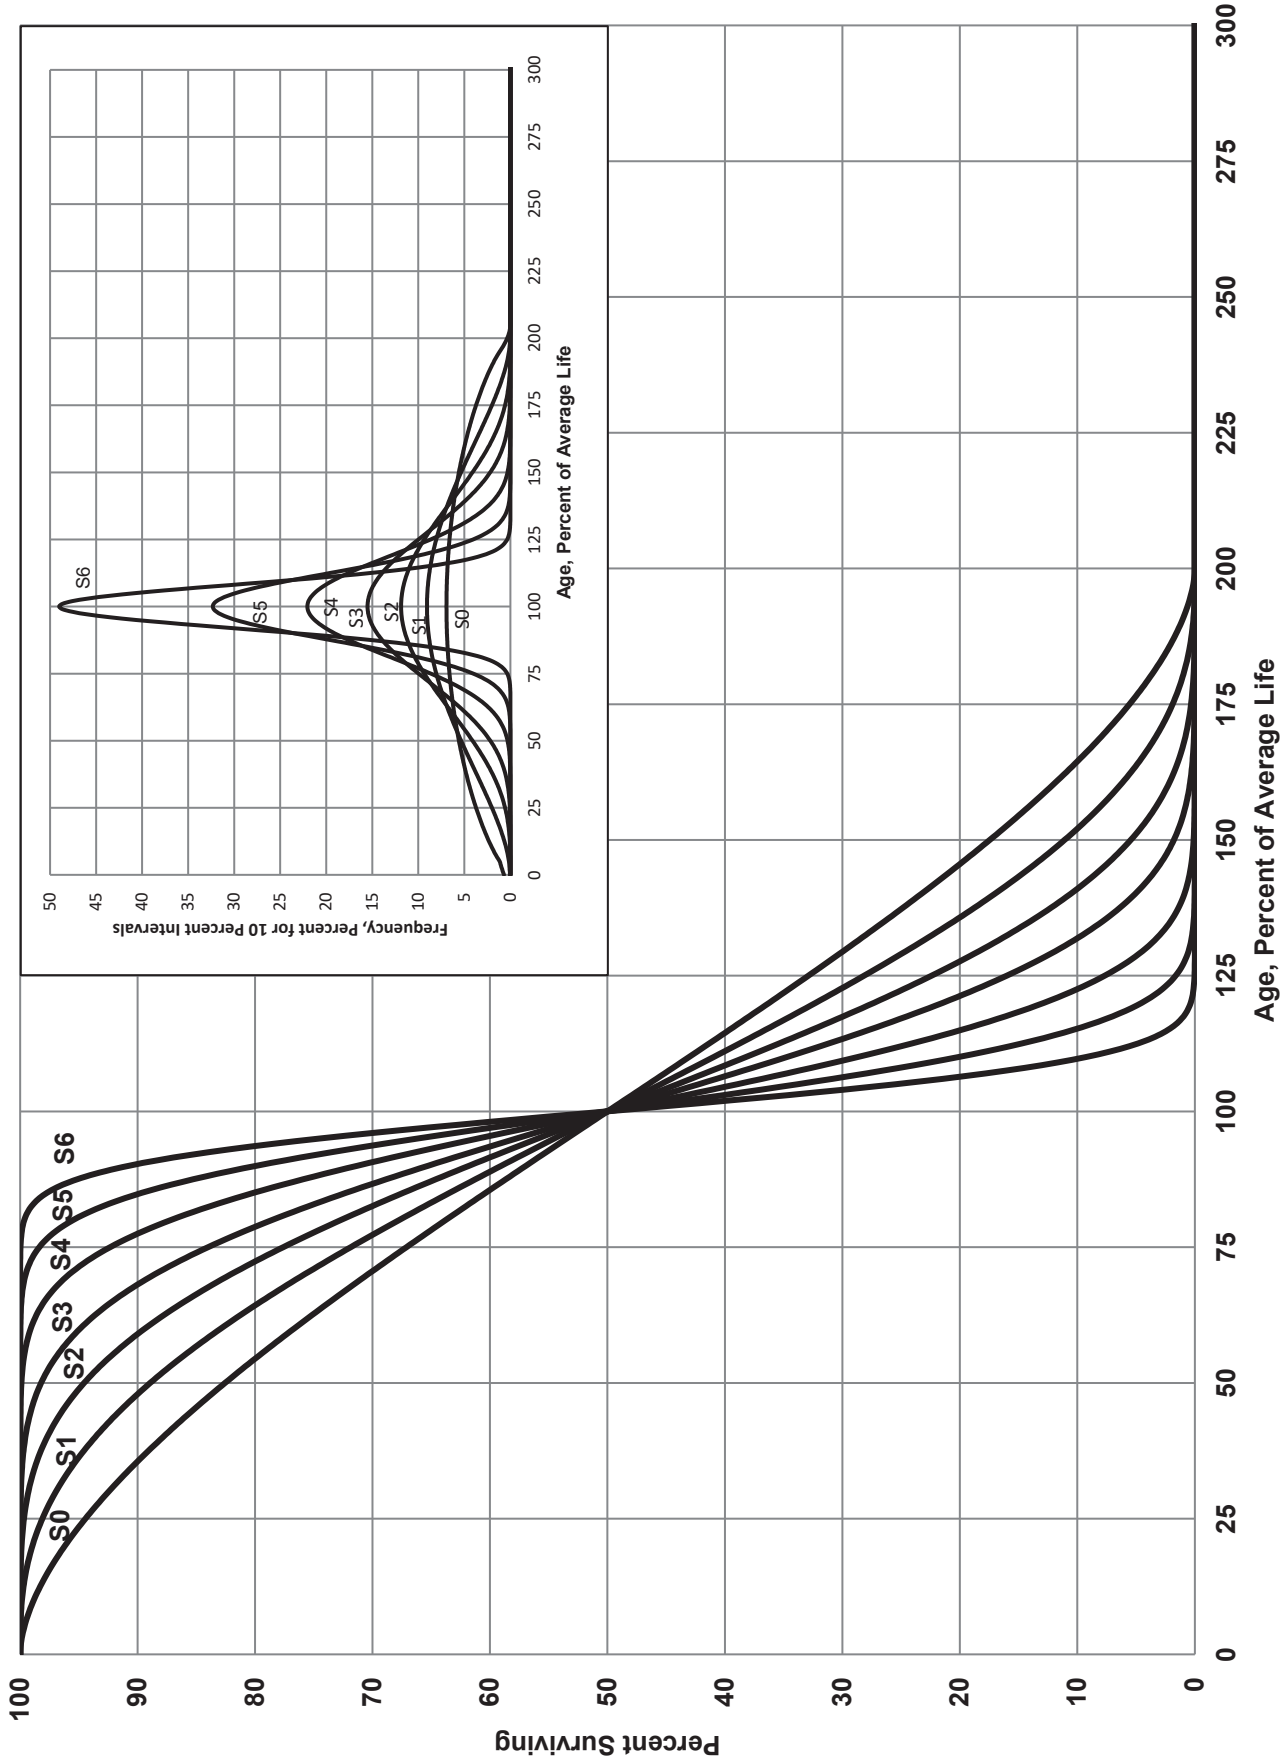

FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

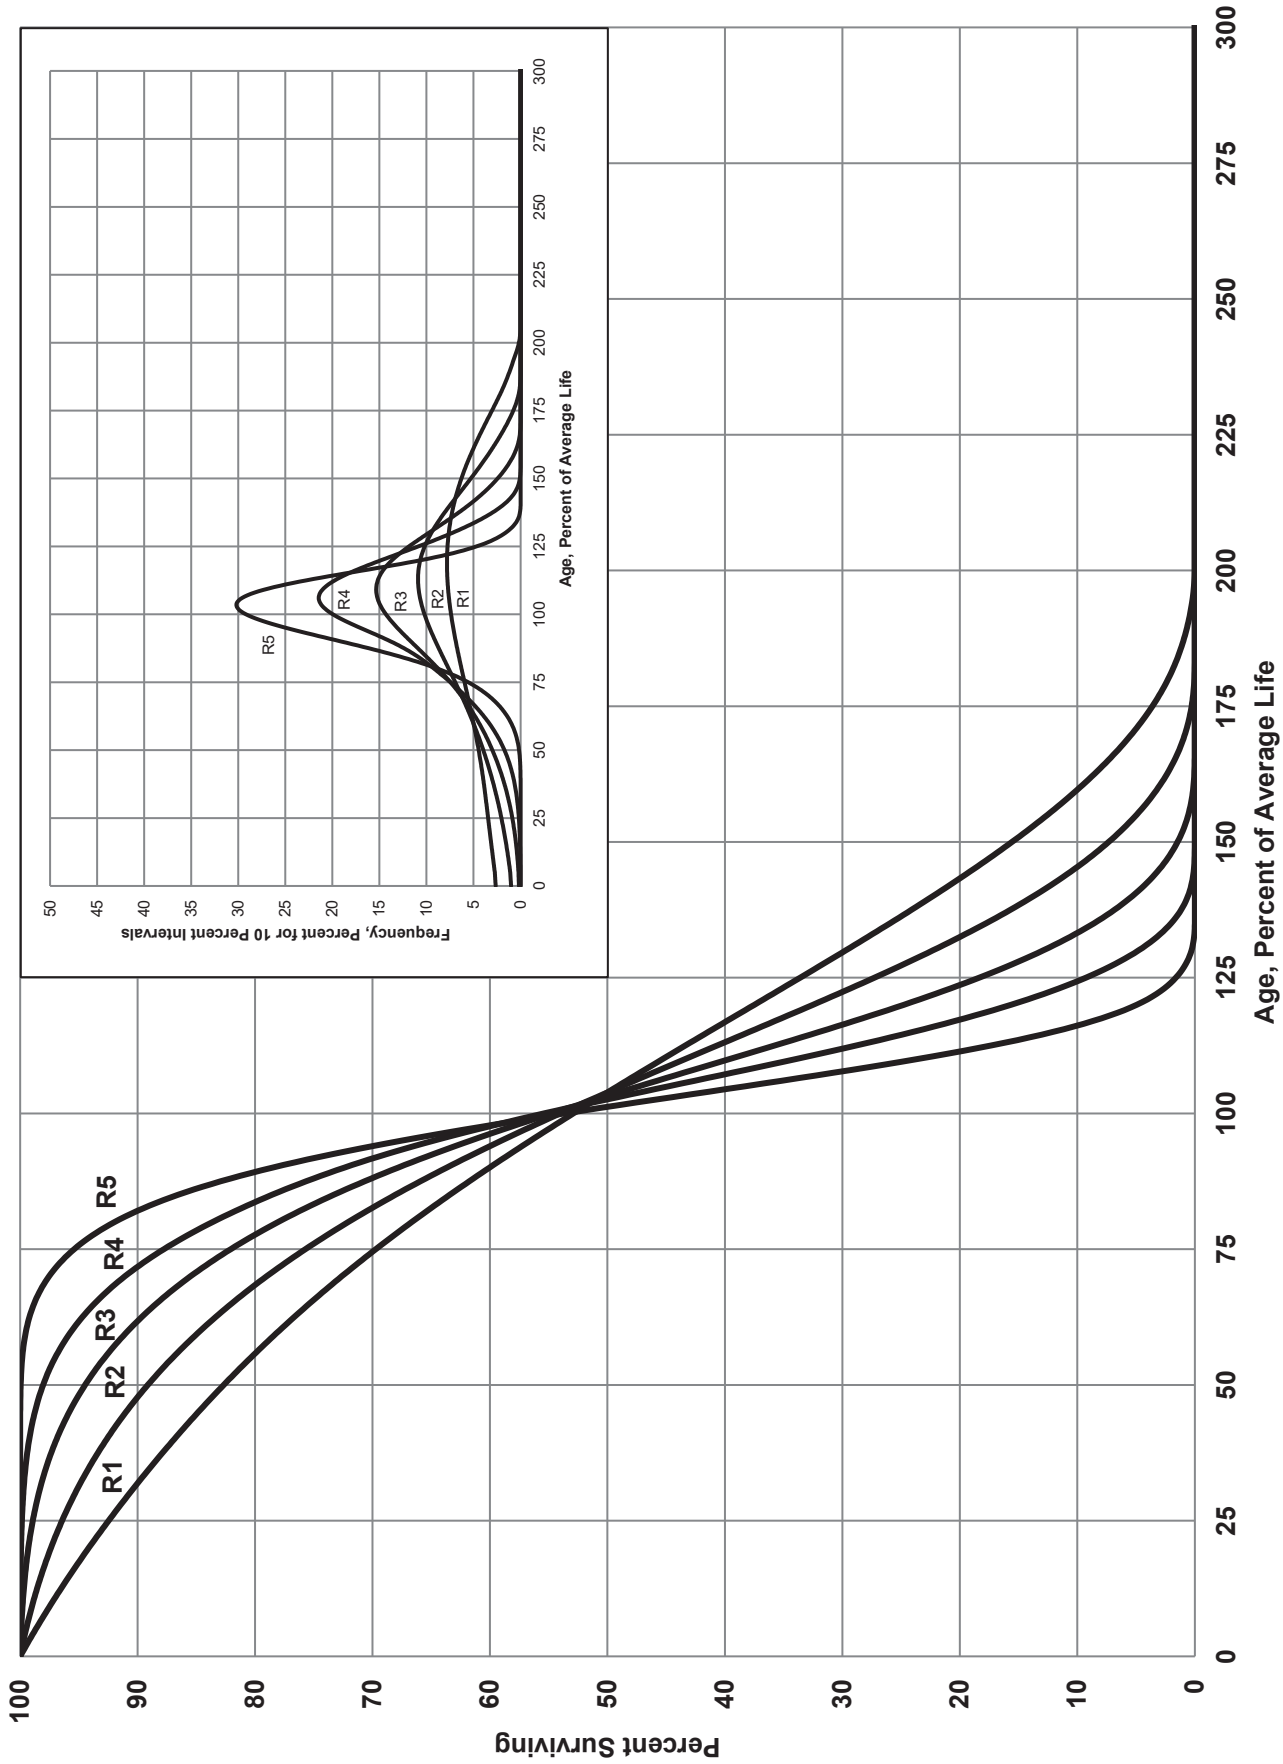

FIGURE 4.. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

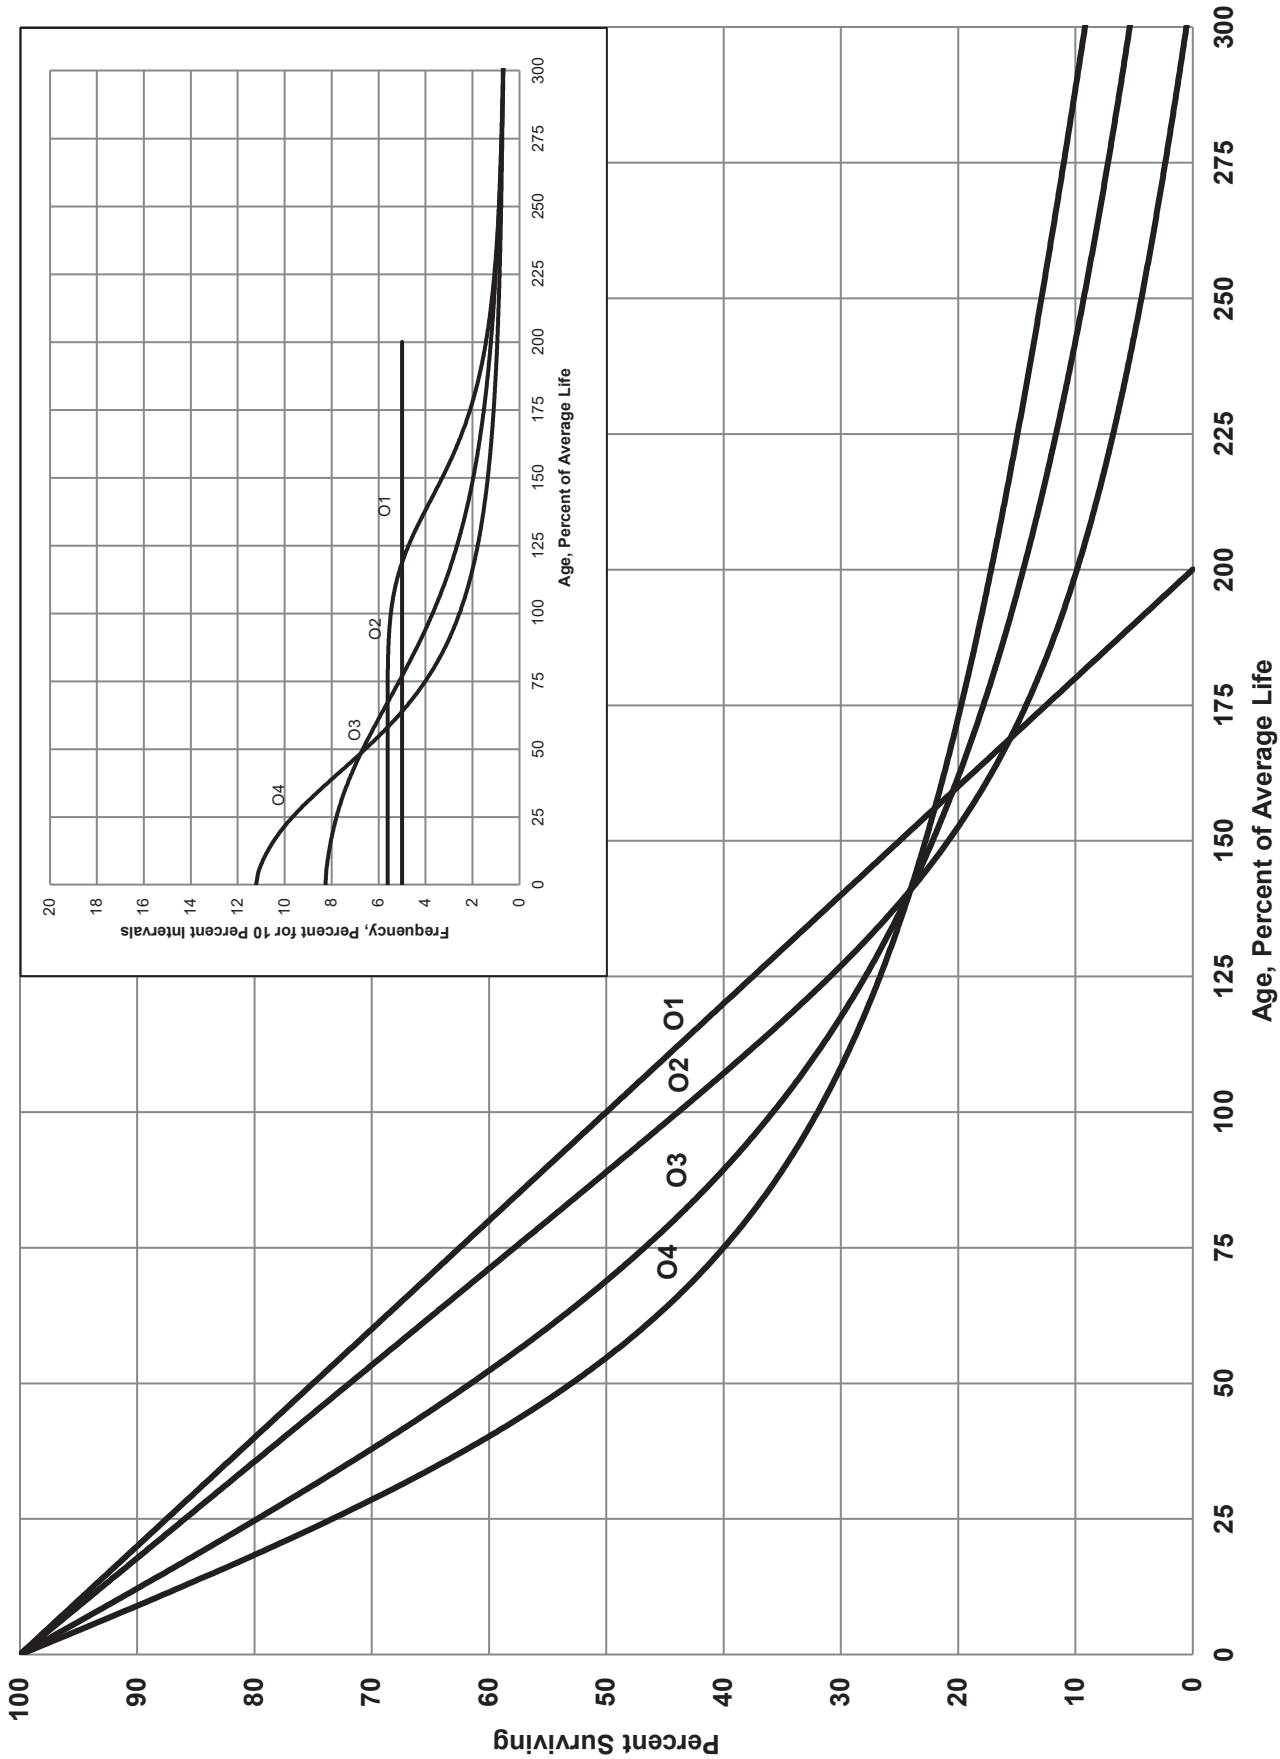

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2015-2024 for which there were placements during the years 2010-2024. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2010 were retired in 2015. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2015 retirements of 2010 installations and ending with the 2024 retirements of the 2019 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

[a] Transfer Affecting Exposures at Beginning of Year

[b] Transfer Affecting Exposures at End of Year

[c] Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2015 through 2024 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2020 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2015-2024, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2015-2024 Placement Band 2010-2024

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval

13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

Field Trips

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips have been conducted periodically. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during these field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

During the extensive period of years our firm has been conducting depreciation studies for the Company, the field trips have resulted in numerous reviews of the Company's operating areas. The following is a list of the locations visited during our most recent trips.

August 16, 2022
- West Shore Service Center
- Hampden Substation
- Mechanicsburg Substation
- Williams Grove Substation

June 20, 2017
- Allentown General Office
- Lehigh Service Center
- Central Allentown Substation
- Allentown Substation

June 13, 2013
- Siegfried Substation
- West Trexlertown Substation
- Schwenksville Substation
- Schnecksville Substation
- Breinigsville Substation
- Walbert Training Center
- Lehigh Service Center
- Data Control Center
- Allentown General Office

Judgment

The survivor curve estimates were based on informed judgment which considered a number of factors. The primary factors were retirement rate analyses of historical service life data; current Company policies and outlook as determined during the discussions with management personnel and during field trips; and the survivor curve estimates from previous studies of this company and other electric companies.

The statistical analyses resulted in good to excellent indications of the survivor patterns experienced for most of the major accounts. The plant accounts or subaccounts for which the statistical analyses were significant factors in the judgments of the survivor curves are as follows:

TRANSMISSION PLANT
- 352.00 Structures and Improvements
- 353.00 Station Equipment
- 354.00 Towers and Fixtures
- 355.00 Poles and Fixtures
- 356.00 Overhead Conductors and Devic
- 358.00 Underground Conductors and De

DISTRIBUTION PLANT
- 361.00 Structures and Improvements
- 362.00 Station Equipment
- 362.10 Station Equipment – RF Mesh
- 364.40 Poles, Towers and Fixtures – Po
- 365.00 Overhead Conductors and Devic
- 367.00 Underground Conductors and De
- 371.40 Area Lighting Fixtures
- 373.20 Street Lighting and Signal Syster

GENERAL PLANT
- 390.20 Structures and Improvements – Buildings
- 390.40 Structures and Improvements – Air Conditioning
- 392.20 Transportation Equipment – Light Duty Trucks
- 392.30 Transportation Equipment – Heavy Duty Trucks
- 392.40 Transportation Equipment – Trailers
- 392.50 Transportation Equipment – Large Tankers / Tractors
- 392.60 Transportation Equipment – Large Crane Trucks
- 396.00 Power Operated Equipment

The analyses for Account 365.00, Overhead Conductor and Devices, is used to illustrate the manner in which the study was conducted for the groups in the preceding list. It is a significant account and serves as a typical illustration. Aged plant accounting data have been compiled for the years 1912 through 2021. These data were coded by type of transaction, year in which the transaction took place, and year in which the plant was placed in service. The data were analyzed by the retirement rate method to obtain an indication of the experienced service life characteristics.

The estimated Iowa 55-R0.5 survivor curve is based on the experience band, 1912 through 2021. The estimated survivor curve is a good fit of the observed data, has an average service life slightly longer than the previous estimates for this account, and is within the typical range of lives used by the electric utility industry.

For Account 364.40, Poles, Towers and Fixtures - Poles, the estimate of survivor characteristics is based on the 1912-2021 experience band. Most retirements have been due to wear and tear. Typical service lives for poles and fixtures range from 45 to 60 years. Most of the poles included in this account are wood poles. Wood poles are a natural product subject to decay and rot. The climate and pole treatment are the predominant factors regarding the service life of wood poles. This is the reason for the wide range of lives experienced within the industry. During the past 20 plus years, PPL Electric Utilities Corporation has embarked on a change to the pole treatment plan in order to maintain a reasonable service lives of poles. The Iowa 55-R0.5 survivor curve reflects the outlook of management, is within the range of estimates used by other utilities and is a reasonable interpretation of a significant portion of the survivor curve through age 73.

The estimate for Account 367.00, Underground Conductors and Devices, the 56-R2.5, is based on management's expectation that direct buried conductor of ages 40-70 years will have a shorter life going forward than in the past as direct buried conductor represents a significant portion of the account. Most of the remaining direct buried conductor included in this account was added between the early 1970s and 1983. The Company has an active program in place to remove the remaining investment of direct buried conductor, which is almost complete, causing the increased overall average service life. Management's expectation of retirements to slow down for the next few years is reflected in the increase to a 56-year average service life.

The life span technique was used for large office buildings and service centers in Account 390.20, Structures and Improvements. For these large structures in Account 390.20, a life span was estimated for each structure based on its type of construction, use, age, condition and management's plans within the foreseeable future. In Account 390.2, Structures and Improvements - Buildings - Major, an interim survivor curve was estimated for each location, since interim retirements are normal for such structures and, in fact, have been experienced.

Generally, the survivor curve estimates for the remainder of the accounts were based on engineering judgment, considering the nature of the plant and equipment, review of available historical retirement data and a general knowledge of the service lives for similar equipment in other electric companies.

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART IV. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

Group Depreciation Procedures

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally, the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recovered prior to average life is balanced by the cost recovered subsequent to average life.

Remaining Life Annual Accruals

For the purpose of calculating remaining life accrual rates as of June 30, 2026, the estimated book depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation for the vintages calculated by the average service life procedure and for the vintages calculated by the equal life group procedure follow. The detailed calculations are set forth in the Results of Study section of the report.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve)

by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future whole life depreciation accruals if current forecasts of life characteristics are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account, based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life\ Expectancy}{Average\ Service\ Life}.$$

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization, as defined in the Uniform System of Accounts, is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization periods and service lives used by other

utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is appropriate for certain General Plant accounts that represent numerous units of property, but a very small portion of depreciable gas plant in service. The accounts and their amortization periods are as follows:

Account		Amortization Period, Years
391.00	Office Furniture and Equipment	
	RF Mesh AMR Computer Equipment	5
	Furniture	20
	Equipment	15
	Computers	5
393.00	Stores Equipment	25
394.00	Tools and Work Equipment	
	L&S Line Crews	20
	Tools	20
	Construction Department	20
	Other	20
	Garage Equipment	20
395.00	Laboratory Equipment	20
397.00	Communication Equipment	15
398.00	Miscellaneous Equipment	20

For the purpose of calculating annual amortization amounts as of June 30, 2026, the book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The book reserve assigned to vintages with an age greater than the amortization period is equal to the vintage's original cost. The remaining book reserve is allocated among vintages with an age less than the amortization period in proportion to the calculated accrued amortization. The calculated accrued amortization

is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the future amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

AMORTIZATION OF NET SALVAGE

Experienced net salvage is incorporated in the results of the study, as it was reported on the Company's books and records for the period January 1, 2021 through June 30, 2025 and estimated for the six months ended December 31, 2025.

Net salvage experienced and estimated during the five-year period is presented in this manner to determine the amount of negative net salvage to be amortized for book purposes. In developing the amount to be amortized, the data for the accounts which experienced positive net salvage have been netted with those for accounts which experienced negative net salvage.

In order to be consistent with this manner of recognizing net salvage, no adjustments for net salvage were made to the annual accruals and accrued depreciation calculated for each individual account. There were no exclusions from the 2021 through 2025 net salvage accrual.

PART V. RESULTS OF STUDY

PART V. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 4 presented on pages V-4 through V-11 summarize the results of the depreciation study as of June 30, 2026. Table 1 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2026, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 2 presents the bringforward of the book depreciation reserve to June 30, 2026. Table 3 sets forth the calculation of the depreciation accruals for the twelve months ended June 30, 2026. Table 4 presents the annual amortization of experienced and estimated net salvage based on the period 2021 through 2025.

DESCRIPTION OF DETAILED TABULATIONS

Supporting statistical data for the estimates of average service lives and survivor curves, the annual depreciation calculations, and gross salvage and cost of removal for the years 2021-2025 are presented in three sections.

The section beginning on page VI-2 sets forth, for each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table(s) plotted on the chart. A cumulative summary, by year installed, for gas plant and the supporting data for the original cost depreciation calculations are presented in the section beginning on page VII-2. The tabulations of experienced and estimated net salvage by year by account for the five-year period, 2021-2025, are presented in the section beginning on page VIII-2.

In the first section, the survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the type curve designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. In cases where only a segment of the estimated curve is used in the depreciation calculation, the numeral used for identification purposes is not a designation of the average life of the group. The titles of the charts indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which the retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation related to original cost are presented in the second section and indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, allocated book reserve, future book accruals, remaining life expectancy and the calculated annual accrual.

Detailed tabulations setting forth the cost of removal and gross salvage amounts, by plant account for each year, are presented beginning on page VIII-2. The total gross salvage and removal costs, by year, were used to calculate the five-year net salvage amortization presented in Table 4 on page V-11.

Allentown, PA 18104

Ladies and Gentlemen:

Pursuant to your request, we have determined the annual depreciation accruals applicable to electric plant as of June 30, 2027. The results of our study as of June 30, 2026 are presented in our report titled "2026 Depreciation Study - Calculated Annual Depreciation Accruals Related to Electric Plant as of June 30, 2026". The same methods, procedures and estimates are used in both studies.

Summaries of the original cost, annual accruals, book depreciation reserve and amortization of net salvage are presented in Tables 1 through 4, beginning on page I-3 of the attached report.

Respectfully submitted,

GANNETT FLEMING VALUATION

DEPRECIATION STUDY

PART I. RESULTS OF STUDY

DESCRIPTION OF SUMMARY TABULATIONS

Tables 1 through 4 presented on pages I-3 through I-10 summarize the results of the depreciation study as of June 30, 2027. Table 1 sets forth, by depreciable group, the estimated survivor curve, original cost, book depreciation reserve as of June 30, 2027, future book accruals, calculated annual accrual amount and rate, and composite remaining life for plant in service. Table 2 presents the bringforward of the book depreciation reserve to June 30, 2027. Table 3 sets forth the calculations of the depreciation accruals for the twelve months ended June 30, 2027. Table 4 presents the annual amortization of experienced and estimated net salvage based on the period 2022 through 2026.

DESCRIPTION OF DETAILED TABULATIONS

The supporting data for the depreciation calculations are presented in account sequence in the section beginning on page II-6. The original cost, calculated accrued depreciation, allocated book depreciation reserve, future accruals, remaining life and annual accrual are shown for each vintage of each account or subaccount. The amounts of regular retirements, gross salvage and cost of removal are set forth by account for the years 2022 through 2026, beginning on pages III-2 through III-6.

Rating Methodology

Regulated Electric and Gas Utilities

This rating methodology replaces the *Regulated Electric and Gas Utilities* methodology published on June 23, 2017. We have reordered and made editorial updates to various sections of the methodology. These updates do not change our methodological approach.

Scope

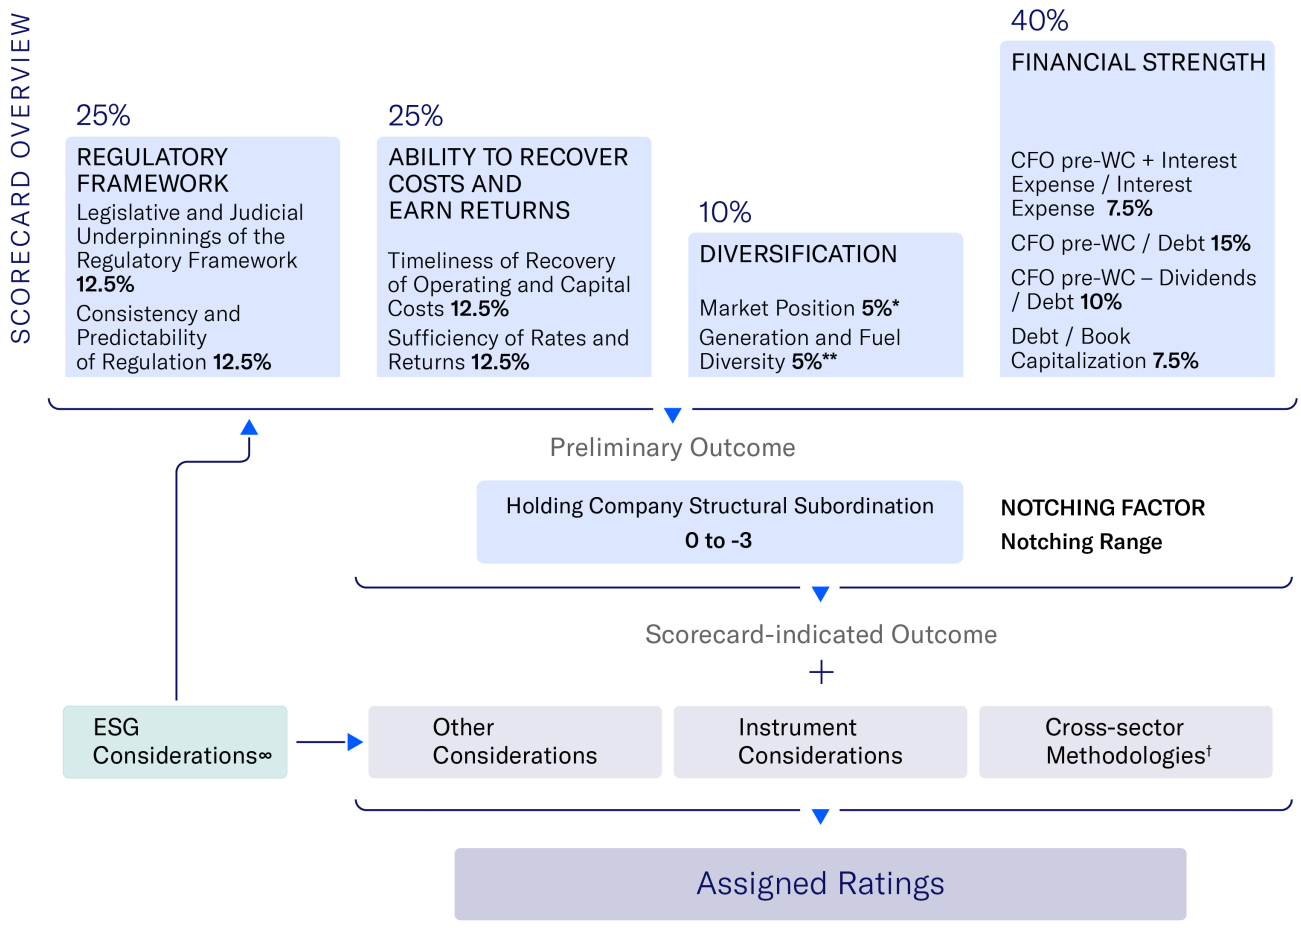
This methodology applies to rate-regulated electric and gas utilities globally whose predominant business is the sale of electricity and/or gas or related services under a rate-regulated framework, in most cases to retail customers. Companies in many industries are regulated. We use the term rate-regulated to distinguish companies whose rates (by which we also mean tariffs or revenues in general) are set by regulators. Rate-regulated utilities that own generating assets as any material part of their business, utilities whose charges or bills to customers include a meaningful component related to the electric or gas commodity, utilities whose rates are regulated at a sub-sovereign level (e.g., by provinces, states or municipalities), and companies providing an independent system operator function to an electric grid are also rated using this methodology. Companies rated using this methodology are primarily rate-regulated monopolies or, in certain circumstances, companies that may not be outright monopolies but where government regulation effectively sets prices and limits competition.

We generally consider a company to be predominantly a regulated electric and gas utility when a majority of its cash flows, prospectively and on a sustained basis, are derived from regulated electric and gas utility businesses. Since cash flows can be volatile (such that a company might have a majority of utility cash flows simply due to a cyclical downturn in its non-utility businesses), we may also consider the breakdown of assets and/or debt of a company to determine which business is predominant.

This methodology applies to a wide variety of companies, including vertically integrated utilities, transmission and distribution utilities with retail customers and/or sub-sovereign regulation, natural gas local distribution utility companies (LDCs), independent system operators, and regulated generation companies. These companies may be operating companies or holding companies.

This methodology does not apply to regulated electric and gas networks, which are rated using a separate methodology. Regulated electric and gas networks are companies whose predominant business is purely the transmission and/or distribution of electricity and/or natural gas without involvement in the procurement or sale of electricity and/or gas; whose charges to customers thus do not include a meaningful commodity cost component; which sell mainly (or in many cases exclusively) to non-retail customers; and which are rate-regulated under a national framework.

Unregulated utilities and power companies, public power utilities, municipal joint action agencies, electric cooperatives, regulated water companies, natural gas pipelines and midstream energy companies are also rated using separate methodologies.[1]



Rating approach

In this rating methodology, we explain our general approach to assessing credit risk of regulated electric and gas utilities globally, including the qualitative and quantitative factors that are likely to affect rating outcomes in this sector. We seek to incorporate all material credit considerations in ratings and to take the most forward-looking perspective that visibility into these risks and mitigants permits.

The following schematic illustrates our general framework for the analysis of regulated electric and gas utilities, which includes the use of a scorecard. The scorecard-indicated outcome is not expected to match the actual rating for each company. For more information, see the "Other considerations" and "Limitations" sections.

Exhibit 1

Illustration of the regulated electric and gas utilities methodology framework

* 10% weight for issuers that lack generation.
** 0% weight for issuers that lack generation.
∞ Environmental, social and governance (ESG) considerations, including, where available, our opinions of exposure to them as expressed in Issuer Profile Scores (IPSs), may affect scorecard factors and other considerations outside of the scorecard. For more information, see the "Other considerations" section.
† Some of the methodological considerations described in one or more cross-sector rating methodologies may be relevant to ratings in this sector. A link to a list of our sector and cross-sector methodologies can be found in the "Moody's related publications" section.

Regulated electric and gas utilities scorecard

For general information about how we use the scorecard and for a discussion of scorecard mechanics, please see the "Using the scorecard to arrive at a scorecard-indicated outcome" section. The scorecard does not include or address every factor that a rating committee may consider in assigning ratings in this sector. Please see the "Other considerations" and "Limitations" sections.

Exhibit 2

Regulated electric and gas utilities scorecard

	Weight	Aaa	Aa	A	Baa	Ba	B	Caa
Factor: Regulatory Framework (25%)								
Legislative and Judicial Underpinnings of the Regulatory Framework	12.5%	Utility regulation occurs under a fully developed framework that is national in scope based on legislation that provides the utility a nearly absolute monopoly [1] within its service territory, an unquestioned assurance that rates will be set in a manner that will permit the utility to make and recover all necessary investments, an extremely high degree of clarity as to the manner in which utilities will be regulated and prescriptive methods and procedures for setting rates. Existing utility law is comprehensive and supportive such that changes in legislation are not expected to be necessary; or any changes that have occurred have been strongly supportive of utilities credit quality in general and sufficiently forward-looking so as to address problems before they occurred. There is an independent judiciary that can arbitrate disagreements between the regulator and the utility should they occur, including access to national courts, very strong judicial precedent in the interpretation of utility laws, and a strong rule of law. We expect these conditions to continue.	Utility regulation occurs under a fully developed national, state or provincial framework based on legislation that provides the utility an extremely strong monopoly [1] within its service territory, a strong assurance, subject to limited review, that rates will be set in a manner that will permit the utility to make and recover all necessary investments, a very high degree of clarity as to the manner in which utilities will be regulated and reasonably prescriptive methods and procedures for setting rates. If there have been changes in utility legislation, they have been timely and clearly credit supportive of the issuer in a manner that shows the utility has had a strong voice in the process. There is an independent judiciary that can arbitrate disagreements between the regulator and the utility, should they occur including access to national courts, strong judicial precedent in the interpretation of utility laws, and a strong rule of law. We expect these conditions to continue.	Utility regulation occurs under a well-developed national, state or provincial framework based on legislation that provides the utility a very strong monopoly[1] within its service territory, an assurance, subject to reasonable prudency requirements, that rates will be set in a manner that will permit the utility to make and recover all necessary investments, a high degree of clarity as to the manner in which utilities will be regulated, and overall guidance for methods and procedures for setting rates. If there have been changes in utility legislation, they have been mostly timely and on the whole credit supportive for the issuer, and the utility has had a clear voice in the legislative process. There is an independent judiciary that can arbitrate disagreements between the regulator and the utility, should they occur, including access to national courts, clear judicial precedent in the interpretation of utility law, and a strong rule of law. We expect these conditions to continue.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation that provides the utility a strong monopoly within its service territory that may have some exceptions such as greater self-generation,[1] a general assurance that, subject to prudency requirements that are mostly reasonable, rates will be set in a manner that will permit the utility to make and recover all necessary investments, reasonable clarity as to the manner in which utilities will be regulated and overall guidance for methods and procedures for setting rates; or (ii) under a new framework where independent and transparent regulation exists in other sectors. If there have been changes in utility legislation, they have been credit supportive or at least balanced for the issuer but potentially less timely, and the utility had a voice in the legislative process. There is either (i) an independent judiciary that can arbitrate disagreements between the regulator and the utility, including access to courts at least at the state or provincial level, reasonably clear judicial precedent in the interpretation of utility laws, and a generally strong rule of law; or (ii) regulation has been applied (under a well-developed framework) in a manner such that redress to an independent arbiter has not been required. We expect these conditions to continue.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation or government decree that provides the utility a monopoly within its service territory that is generally strong but may have a greater level of exceptions,[1] and that, subject to prudency requirements which may be stringent, provides a general assurance (with somewhat less certainty) that rates will be set in a manner that will permit the utility to make and recover necessary investments; or (ii) under a new framework where the jurisdiction has a history of less independent and transparent regulation in other sectors. Either: (i) the judiciary that can arbitrate disagreements between the regulator and the utility may not have clear authority or may not be fully independent of the regulator or other political pressure, but there is a reasonably strong rule of law; or (ii) where there is no independent arbiter, the regulation has mostly been applied in a manner such redress has not been required. We expect these conditions to continue.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation or government decree that provides the utility monopoly within its service territory that is reasonably strong but may have important exceptions, and that, subject to prudency requirements which may be stringent or at times arbitrary, provides more limited or less certain assurance that rates will be set in a manner that will permit the utility to make and recover necessary investments; or (ii) under a new framework where we would expect less independent and transparent regulation, based either on the regulator's history in other sectors or other factors. The judiciary that can arbitrate disagreements between the regulator and the utility may not have clear authority or may not be fully independent of the regulator or other political pressure, but there is a reasonably strong rule of law. Alternately, where there is no independent arbiter, the regulation has been applied in a manner that often requires some redress adding more uncertainty to the regulatory framework. There may be a periodic risk of creditor-unfriendly government intervention in utility markets or rate-setting.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation or government decree that provides the utility a monopoly within its service territory, but with little assurance that rates will be set in a manner that will permit the utility to make and recover necessary investments; or (ii) under a new framework where we would expect unpredictable or adverse regulation, based either on the jurisdiction's history in other sectors or other factors. The judiciary that can arbitrate disagreements between the regulator and the utility may not have clear authority or is viewed as not being fully independent of the regulator or other political pressure. Alternately, there may be no redress to an effective independent arbiter. The ability of the utility to enforce its monopoly or prevent uncompensated usage of its system may be limited. There may be a risk of creditor-unfriendly nationalization or other significant intervention in utility markets or rate-setting.

	Weight	Aaa	Aa	A	Baa	Ba	B	Caa
Factor: Regulatory Framework (25%)								
Consistency and Predictability of Regulation	12.5%	The issuer's interaction with the regulator has led to a strong, lengthy track record of predictable, consistent and favorable decisions. The regulator is highly credit supportive of the issuer and utilities in general. We expect these conditions to continue.	The issuer's interaction with the regulator has a led to a considerable track record of predominantly predictable and consistent decisions. The regulator is mostly credit supportive of utilities in general and in almost all instances has been highly credit supportive of the issuer. We expect these conditions to continue.	The issuer's interaction with the regulator has led to a track record of largely predictable and consistent decisions. The regulator may be somewhat less credit supportive of utilities in general, but has been quite credit supportive of the issuer in most circumstances. We expect these conditions to continue.	The issuer's interaction with the regulator has led to an adequate track record. The regulator is generally consistent and predictable, but there may some evidence of inconsistency or unpredictability from time to time, or decisions may at times be politically charged. However, instances of less credit supportive decisions are based on reasonable application of existing rules and statutes and are not overly punitive. We expect these conditions to continue.	We expect that regulatory decisions will demonstrate considerable inconsistency or unpredictability or that decisions will be politically charged, based either on the issuer's track record of interaction with regulators or other governing bodies, or our view that decisions will move in this direction. The regulator may have a history of less credit supportive regulatory decisions with respect to the issuer, but we expect that the issuer will be able to obtain support when it encounters financial stress, with some potentially material delays. The regulator's authority may be eroded at times by legislative or political action. The regulator may not follow the framework for some material decisions.	We expect that regulatory decisions will be largely unpredictable or even somewhat arbitrary, based either on the issuer's track record of interaction with regulators or other governing bodies, or our view that decisions will move in this direction. However, we expect that the issuer will ultimately be able to obtain support when it encounters financial stress, albeit with material or more extended delays. Alternately, the regulator is untested, lacks a consistent track record, or is undergoing substantial change. The regulator's authority may be eroded on frequent occasions by legislative or political action. The regulator may more frequently ignore the framework in a manner detrimental to the issuer.	We expect that regulatory decisions will be highly unpredictable and frequently adverse, based either on the issuer's track record of interaction with regulators or other governing bodies, or our view that decisions will move in this direction. Alternately, decisions may have credit supportive aspects, but may often be unenforceable. The regulator's authority may have been seriously eroded by legislative or political action. The regulator may consistently ignore the framework to the detriment of the issuer.
Factor: Ability to Recover Costs and Earn Returns (25%)								
Timeliness of Recovery of Operating and Capital Costs	12.5%	Tariff formulas [2] and automatic cost recovery mechanisms provide full and highly timely recovery of all operating costs and essentially contemporaneous return on all incremental capital investments, with statutory provisions in place to preclude the possibility of challenges to rate increases or cost recovery mechanisms. By statute and by practice, general rate cases are efficient, focused on an impartial review, quick, and permit inclusion of fully forward-looking costs.	Tariff formulas [2] and automatic cost recovery mechanisms provide full and highly timely recovery of all operating costs and essentially contemporaneous or near-contemporaneous return on most incremental capital investments, with minimal challenges by regulators to companies' cost assumptions. By statute and by practice, general rate cases are efficient, focused on an impartial review, of a very reasonable duration before non-appealable interim rates can be collected, and primarily permit inclusion of forward-looking costs.	Automatic cost recovery mechanisms provide full and reasonably timely recovery of fuel, purchased power and all other highly variable operating expenses. Material capital investments may be made under tariff formulas [2] or other rate-making permitting reasonably contemporaneous returns, or may be submitted under other types of filings that provide recovery of cost of capital with minimal delays. Instances of regulatory challenges that delay rate increases or cost recovery are generally related to large, unexpected increases in sizeable construction projects. By statute or by practice, general rate cases are reasonably efficient, primarily focused on an impartial review, of a reasonable duration before rates (either permanent or non-refundable interim rates) can be collected, and permit inclusion of important forward-looking costs.	Fuel, purchased power and all other highly variable expenses are generally recovered through mechanisms incorporating delays of less than one year, although some rapid increases in costs may be delayed longer where such deferrals do not place financial stress on the utility. Incremental capital investments may be recovered primarily through general rate cases with moderate lag, with some through tariff formulas.[2] Alternately, there may be formula rates that are untested or unclear. Potentially greater tendency for delays due to regulatory intervention, although this will generally be limited to rates related to large capital projects or rapid increases in operating costs.	There is an expectation that fuel, purchased power or other highly variable expenses will eventually be recovered with delays that will not place material financial stress on the utility, but there may be some evidence of an unwillingness by regulators to make timely rate changes to address volatility in fuel, or purchased power, or other market-sensitive expenses. Recovery of costs related to capital investments may be subject to delays that are somewhat lengthy, but not so pervasive as to be expected to discourage important investments.	The expectation that fuel, purchased power or other highly variable expenses will be recovered may be subject to material delays due to second-guessing of spending decisions by regulators or due to political intervention. Recovery of costs related to capital investments may be subject to delays that are material to the issuer, or may be likely to discourage some important investment.	The expectation that fuel, purchased power or other highly variable expenses will be recovered may be subject to extensive delays due to second-guessing of spending decisions by regulators or due to political intervention. Recovery of costs related to capital investments may be uncertain, subject to delays that are extensive, or that may be likely to discourage even necessary investment.

	Weight	Aaa	Aa	A	Baa	Ba	B	Caa
Factor: Ability to Recover Costs and Earn Returns (25%)								
Sufficiency of Rates and Returns	12.5%	Sufficiency of rates to cover costs and attract capital is (and will continue to be) unquestioned.	Rates are (and we expect will continue to be) set at a level that permits full cost recovery and a fair return on all investments, with minimal challenges by regulators to companies' cost assumptions. This will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are strong relative to global peers.	Rates are (and we expect will continue to be) set at a level that generally provides full cost recovery and a fair return on investments, with limited instances of regulatory challenges and disallowances. In general, this will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are generally above average relative to global peers, but may at times be average.	Rates are (and we expect will continue to be) set at a level that generally provides full operating cost recovery and a mostly fair return on investments, but there may be somewhat more instances of regulatory challenges and disallowances, although ultimate rate outcomes are sufficient to attract capital without difficulty. In general, this will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are average relative to global peers, but may at times be somewhat below average.	Rates are (and we expect will continue to be) set at a level that generally provides recovery of most operating costs but return on investments may be less predictable, and there may be decidedly more instances of regulatory challenges and disallowances, but ultimate rate outcomes are generally sufficient to attract capital. In general, this will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are generally below average relative to global peers, or where allowed returns are average but difficult to earn. Alternately, the tariff formula may not take into account all cost components and/or remuneration of investments may be unclear or at times unfavorable.	We expect rates will be set at a level that at times fails to provide recovery of costs other than cash costs, and regulators may engage in somewhat arbitrary second-guessing of spending decisions or deny rate increases related to funding ongoing operations based much more on politics than on prudency reviews. Return on investments may be set at levels that discourage investment. We expect that rate outcomes may be difficult or uncertain, negatively affecting continued access to capital. Alternately, the tariff formula may fail to take into account significant cost components other than cash costs, and/or remuneration of investments may be generally unfavorable.	We expect rates will be set at a level that often fails to provide recovery of material costs, and recovery of cash costs may also be at risk. Regulators may engage in more arbitrary second-guessing of spending decisions or deny rate increases related to funding ongoing operations based primarily on politics. Return on investments may be set at levels that discourage necessary maintenance investment. We expect that rate outcomes may often be punitive or highly uncertain, with a markedly negative impact on access to capital. Alternately, the tariff formula may fail to take into account significant cash cost components, and/or remuneration of investments may be primarily unfavorable.
Factor: Diversification (10%)								
Market Position	5% [3]	A very high degree of multinational and regional diversity in terms of regulatory regimes and/or service territory economies.	Material operations in three or more nations or substantial geographic regions providing very good diversity of regulatory regimes and/or service territory economies.	Material operations in two to three nations, states, provinces or regions that provide good diversity of regulatory regimes and service territory economies. Alternately, operates within a single regulatory regime with low volatility, and the service territory economy is robust, has a very high degree of diversity and has demonstrated resilience in economic cycles.	May operate under a single regulatory regime viewed as having low volatility, or where multiple regulatory regimes are not viewed as providing much diversity. The service territory economy may have some concentration and cyclicality, but is sufficiently resilient that it can absorb reasonably foreseeable increases in utility rates.	Operates in a market area with somewhat greater concentration and cyclicality in the service territory economy and/or exposure to storms and other natural disasters, and thus less resilience to absorbing reasonably foreseeable increases in utility rates. May show somewhat greater volatility in the regulatory regime(s).	Operates in a limited market area with material concentration and more severe cyclicality in service territory economy such that cycles are of materially longer duration or reasonably foreseeable increases in utility rates could present a material challenge to the economy. Service territory may have geographic concentration that limits its resilience to storms and other natural disasters, or may be an emerging market. May show decided volatility in the regulatory regime(s).	Operates in a concentrated economic service territory with pronounced concentration, macroeconomic risk factors, and/or exposure to natural disasters.
Generation and Fuel Diversity	5% [4]	A high degree of diversity in terms of generation and/or fuel sources such that the utility and rate-payers are well insulated from commodity price changes, no generation concentration, and very low exposures to Challenged or Threatened Sources (see definitions below).[5]	Very good diversification in terms of generation and/or fuel sources such that the utility and rate-payers are affected only minimally by commodity price changes, little generation concentration, and low exposures to Challenged or Threatened Sources.	Good diversification in terms of generation and/or fuel sources such that the utility and rate-payers have only modest exposure to commodity price changes; however, may have some concentration in a source that is neither Challenged nor Threatened. Exposure to Threatened Sources is low. While there may be some exposure to Challenged Sources, it is not a cause for concern.	Adequate diversification in terms of generation and/or fuel sources such that the utility and rate-payers have moderate exposure to commodity price changes; however, may have some concentration in a source that is Challenged. Exposure to Threatened Sources is moderate, while exposure to Challenged Sources is manageable.	Modest diversification in generation and/or fuel sources such that the utility or rate-payers have greater exposure to commodity price changes. Exposure to Challenged and Threatened Sources may be more pronounced, but the utility will be able to access alternative sources without undue financial stress.	Operates with little diversification in generation and/or fuel sources such that the utility or rate-payers have high exposure to commodity price changes. Exposure to Challenged and Threatened Sources may be high, and accessing alternate sources may be challenging and cause more financial stress, but ultimately feasible.	Operates with high concentration in generation and/or fuel sources such that the utility or rate-payers have exposure to commodity price shocks. Exposure to Challenged and Threatened Sources may be very high, and accessing alternate sources may be highly uncertain.

[1] The strength of the monopoly refers to the legal, regulatory and practical obstacles for customers in the utility's territory to obtain service from another provider. Examples of a weakening of the monopoly would include the ability of a city or large user to leave the utility system to set up their own system, the extent to which self-generation is permitted (e.g., cogeneration) and/or encouraged (e.g., net metering, DSM generation). At the lower end of the ratings spectrum, the utility's monopoly may be challenged by pervasive theft and unauthorized use. Since utilities are generally presumed to be monopolies, a strong monopoly position in itself is not sufficient for a strong score in this sub-factor, but a weakening of the monopoly can lower the score.
[2] Tariff formulas include formula rate plans as well as trackers and riders related to capital investment.
[3] 10% weight for issuers that lack generation.
[4] 0% weight for issuers that lack generation.
[5] Challenged Sources are generation plants that face higher but not insurmountable economic hurdles resulting from penalties or taxes on their operation, or from environmental upgrades that are required or likely to be required. Some examples are carbon-emitting plants that incur carbon taxes, plants that must buy emissions credits to operate, and plants that must install environmental equipment to continue to operate, in each where the taxes/credits/upgrades are sufficient to have a material impact on those plants' competitiveness relative to other generation types or on the utility's rates, but where the impact is not so severe as to be likely require plant closure. Threatened Sources are generation plants that are not currently able to operate due to major unplanned outages or issues with licensing or other regulatory compliance, and plants that are highly likely to be required to de-activate, whether due to the effectiveness of currently existing or expected rules and regulations or due to economic challenges.
[6] When debt/book capitalization is negative, the score is Caa.

Sector overview

Regulated electric and gas utilities globally are engaged in the production, transmission, coordination, distribution and/or sale of electricity and/or natural gas, and they are either investor-owned companies, commercially oriented government-owned companies or, in the case of independent system operators, not-for-profit or similar entities.

An over-arching consideration for regulated utilities is the regulatory environment in which they operate. The nature of regulation can vary significantly from jurisdiction to jurisdiction and is dynamic and subject to political intervention. The direct relationship that a regulated utility has with the retail customer, including billing for electric or gas supply that has substantial price volatility, can lead to a more politically charged rate-setting environment. Similarly, regulation at the sub-sovereign level is often subject to intervention from disaffected customers and influenced by public officials . Our views of regulatory environments evolve over time in accordance with our observations of regulatory, political and judicial events that affect issuers in the sector.

The principal categories of companies rated using this methodology include the following:

Vertically integrated utility: Vertically integrated utilities are regulated electric or combination utilities (see below) that own generation, distribution and (in most cases) electric transmission assets. Vertically integrated utilities are generally engaged in all aspects of the electricity business. They build power plants, procure fuel, generate power, build and maintain the electric grid (including high and low voltage lines, transformers and substations) that delivers power from a group of power plants to end-users , and generally meet all of the electric needs of the customers in a specific geographic area (also called a service territory). The rates or tariffs for all of these monopolistic activities are set by the relevant regulatory authority.

Transmission and distribution utility: Transmission and distribution utilities (T&Ds) typically operate in deregulated markets where generation is provided under a competitive framework. T&Ds own and operate the electric grid that transmits and/or distributes electricity within a specific state or region.

T&Ds provide electrical transportation and distribution services to carry electricity from power plants and transmission lines to retail, commercial, and industrial customers. T&Ds are typically responsible for billing customers for electric delivery and/or supply, and most have an obligation to provide a standard supply or provider-of-last-resort (POLR) service to customers that have not switched to a competitive supplier. These factors distinguish T&Ds from networks, whose customers are retail electric suppliers and/or other electricity companies. In a smaller number of cases, T&Ds rated using this methodology may not have an obligation to provide POLR services, but are regulated in sub-sovereign jurisdictions. The rates or tariffs for these monopolistic T&D activities are set by the relevant regulatory authority.

Natural gas local distribution company: Distribution is the final step in delivering natural gas to customers. While some large industrial, commercial, and electric generation customers receive natural gas directly from high capacity pipelines that carry gas from gas producing basins to areas where gas is consumed, most other users receive natural gas from their local gas utility, also called a local distribution company (LDC). LDCs are regulated utilities involved in the delivery of natural gas to consumers within a specific geographic area. Specifically, LDCs typically transport natural gas from delivery points located on large-diameter pipelines (that usually operate at fairly high pressure) to households and businesses through thousands of miles of small-diameter distribution pipe (that usually operate at fairly low pressure). LDCs are typically responsible for billing customers for gas delivery and/or supply, and most also have the responsibility to procure gas for at least some of their customers, although in some markets gas supply to all customers is on a competitive basis. These factors distinguish LDCs from gas networks, whose customers are retail gas suppliers and/or other natural gas companies. The rates or tariffs for these monopolistic activities are set by the relevant regulatory authority.

Integrated gas utility : Integrated gas utilities are regulated utilities that deliver gas to all end users in a particular service territory by sourcing the commodity; operating transport infrastructure that often combines high pressure pipelines with low pressure distribution systems and, in some cases, gas storage, re-gasification or other related facilities; and performing other supply-related activities, such as customer billing and metering. The rates or tariffs for the totality of these activities are set by the relevant regulatory authority. Many integrated gas utilities are national in scope.

Combination utility: Combination utilities are those that combine an LDC or integrated gas utility with either a vertically integrated utility or a T&D utility. The rates or tariffs for these monopolistic activities are set by the relevant regulatory authority.

Regulated generation utility: Regulated generation utilities (regulated gencos) are utilities that almost exclusively have generation assets, but their activities are generally regulated like those of vertically integrated utilities. This typically means that the purchasers of their output (typically other investor-owned, municipal or cooperative utilities) pay a regulated rate based on the total allowed costs of the regulated genco, including a return on equity, based on a capital structure designated by the regulator. Companies that have been included in this group include certain generation companies that are not rate-regulated in the usual sense of recovering costs plus a regulated rate of return on either equity or asset value.

Independent system operator: An independent system operator (ISO) is an organization formed in certain regional electricity markets to act as the sole chief coordinator of an electric grid. In the areas where an ISO is established, it coordinates, controls and monitors the operation of the electrical power system to assure that electric supply and demand are balanced at all times, and, to the extent possible, that electric demand is met with the lowest-cost sources. ISOs seek to assure adequate transmission and generation resources, usually by identifying new transmission needs and planning for a generation reserve margin above expected peak demand. In regions where generation is competitive, they also seek to establish rules that foster a fair and open marketplace, and they may conduct price-setting auctions for energy and/or capacity. The generation resources that an ISO coordinates may belong to vertically integrated utilities or to independent power producers. ISOs may not be rate-regulated in the traditional sense but fall under governmental oversight. All participants in the regional grid are required to pay a fee or tariff (often volumetric) to the ISO that is designed to recover its costs, including costs of investment in systems and equipment needed to fulfill their function. ISOs may be for profit or not-for-profit entities.

Transmission-only utility: Transmission-only utilities are solely focused on owning and operating transmission assets. The transmission lines these utilities own are typically high-voltage and allow energy producers to transport electric power over long distances from where it is generated (or received) to the transmission or distribution system of a T&D or vertically integrated utility.

Utility holding company (utility holdco): As detailed in Appendix B, regulated electric and gas utilities are often part of corporate families under a parent holding company. The operating subsidiaries of utility holdcos are overwhelmingly regulated electric and gas utilities.

Hybrid holding company (hybrid holdco): Some utility families contain a mix of regulated electric and gas utilities and other types of companies, but the regulated electric and gas utilities represent the majority of the consolidated cash flows, assets and debt. The parent company is thus a hybrid holdco.

Discussion of the scorecard factors

In this section, we explain our general approach for scoring each scorecard factor or sub-factor, and we describe why they are meaningful as credit indicators.

Factor: Regulatory Framework (25%)

Why it matters

The regulatory framework is important because it provides the basis for decisions that affect utilities, including rate-setting as well as the consistency and predictability of regulatory decision-making. Core aspects of a regulatory framework are its legislative and judicial underpinnings, and the consistency and predictability of regulatory decisions and rule-making.

Utility rates are set in a political/regulatory process rather than a competitive or free-market process; thus, the regulatory framework is a key determinant of the credit quality of a utility. In jurisdictions where utility revenues include material government subsidy payments, we consider utility rates to be inclusive of these payments, and we thus evaluate sub-factors under the first two factors in light of both rates and material subsidy payments. For example, we would consider the legal and judicial underpinnings and consistency and predictability of subsidies as well as rates. The regulatory framework has many components: the governing body and the utility legislation or decrees it enacts, the manner in which regulators are appointed or elected, the rules and procedures promulgated by those regulators, the judiciary that interprets the laws and rules and that arbitrates disagreements, and the manner in which the utility manages the political and regulatory process. In many cases, utilities have experienced credit stress or default because of a breakdown or obstacle in the regulatory framework – for instance, laws that prohibited regulators from including , in rates, the recovery of investments in uncompleted power plants or plants not deemed “used and useful,” or a disagreement about rate-making that could not be resolved until after the utility had defaulted on its debts.

How we assess it for the scorecard

Scoring for this factor is based on two sub-factors: Legislative and Judicial Underpinnings of the Regulatory Framework; and Consistency and Predictability of Regulation.

Legislative and Judicial Underpinnings of the Regulatory Framework

For this sub-factor, we consider the scope, clarity, transparency, supportiveness and granularity of utility legislation, decrees, and rules as they apply to the issuer. We also consider the strength of the regulator's authority over rate-making and other regulatory issues affecting the utility, the effectiveness of the judiciary or other independent body in arbitrating disputes in a disinterested manner, and whether the utility's monopoly has meaningful or growing carve-outs. In addition, we consider how well-developed the framework is – both how fully fleshed out the rules and regulations are and how well-tested it is – and the extent to which regulatory or judicial decisions have created a body of precedent that help determine future rate-making. We consider how effective the utility is in navigating the regulatory framework – both the utility's ability to shape the framework and adapt to it.

A utility operating in a regulatory framework that is characterized by legislation that is credit-supportive of utilities and eliminates doubt by prescribing many of the procedures that the regulators use in determining fair rates (which legislation may show evidence of being responsive to the needs of the utility in general or specific ways), a long history of transparent rate-setting, and a judiciary that has provided ample precedent by impartially adjudicating disagreements in a manner that addresses ambiguities in the laws and regulations typically receives higher scores for this sub-factor. A utility operating in a regulatory framework that, by statute or practice, allows the regulator to arbitrarily prevent the utility from recovering its costs or earning a reasonable return on prudently incurred investments, or where regulatory decisions may be reversed by politicians, typically receives a lower score.

In general, we view national utility regulation as being less susceptible to political intervention than regulation by state, provincial or municipal entities, so the highest scoring in this sub-factor is typically reserved for this category. However, we acknowledge that states and provinces in some countries may be larger than small nations, such that their regulators may be equally impartial. In such cases, issuers are likely to receive higher scores for this sub-factor.

The relevant judicial system can be a major factor in the regulatory framework, particularly in countries like the US, where disagreements between a utility and its state or municipal regulator may eventually be adjudicated in a federal district court or even by the US Supreme Court. In addition, bankruptcy proceedings in the US occur in federal courts, which have at times been able to impose rate settlement agreements on state or municipal regulators. As a result, the range of decisions available to state regulators may be effectively circumscribed by court precedent at the state or federal level, which we generally view as a favorable characteristic of the regulatory framework.

We consider regulated electric and gas utilities generally to have strong monopolies that are likely to continue, which allows these companies to have high leverage. Thus, the existence of a monopoly in itself is unlikely to be a driver of strong scoring in this sub-factor. On the other hand, a strong challenge to the monopoly could result in lower scores because of the potential loss of customers and revenue. A utility can only recover its costs and investments and service its debt if customers purchase its services. Examples of incursions into utilities' monopoly include the takeover of the utility by a municipality, self-generation such as rooftop solar panels, distributed generation with net metering, in which customers generate power and sell excess power to the utility, or unauthorized use beyond the level for which the utility receives compensation in rates. Incursions that are growing significantly or are having a meaningful impact on rates for customers that remain with the utility could have a negative impact on the scoring of this sub-factor and on the Ability to Recover Costs and Earn Returns factor.

The scoring of this sub-factor may not be the same for every utility in a particular jurisdiction. Some utilities appear to have greater sway over the relevant utility legislation and promulgation of rules than other utilities – even those in the same jurisdiction. The content and tone of publicly filed documents and regulatory decisions sometimes indicates that the management team at one utility has better responsiveness to and credibility with its regulators or legislators than the management at another utility.

While the underpinnings to the regulatory framework tend to change relatively slowly, they do evolve, and our scoring reflects that evolution. For instance, a new regulatory framework typically becomes tested over time as regulatory decisions are issued, or perhaps litigated, thereby setting a body of precedent. Utilities may seek changes to laws in order to permit them to securitize certain costs or collect interim rates, or a jurisdiction in which rates were previously recovered primarily in base rate proceedings may institute riders

and trackers. These changes would likely affect scoring of the Timeliness of Recovery of Operating and Capital Costs sub-factor, but they may also be sufficiently significant to indicate a change in the regulatory underpinnings.

The regulatory framework may also change as a result of a judiciary that had formerly been independent of the executive branch, but which may start to issue decisions that indicate it is conforming its decisions to the expectations of an executive branch that wants to mandate lower rates.

Consistency and Predictability of Regulation

In assessing this sub-factor, we consider the track record of regulatory decisions in terms of consistency, predictability and supportiveness. We evaluate the utility's interactions in the regulatory process as well as the overall stance of the regulator toward the utility.

In most jurisdictions, the laws and rules seek to make rate-setting a primarily technical process that examines costs the utility incurs and the returns on investments the utility needs to earn so it can make investments that are required to build and maintain the utility infrastructure, which includes power plants, electric transmission and distribution systems, and/or natural gas distribution systems. Where the process remains technical and transparent such that regulators can support the financial health of the utility while balancing their public duty to assure that reliable service is provided at a reasonable cost, and where the utility is able to align itself with the policy initiatives of the governing jurisdiction, the utility typically receives higher scores for this sub-factor. Where the process includes substantial political intervention, which could take the form of legislators or other government officials publicly second-guessing regulators, dismissing regulators who have approved unpopular rate increases, or preventing the implementation of rate increases, or where regulators ignore the laws/rules to deliver an outcome that appears more politically motivated, the utility typically receives a lower score for this sub-factor.

As with the prior sub-factor, we may score different utilities in the same jurisdiction differently, based on outcomes that are more or less supportive of credit quality over a period of time. Some utilities are better able to meet the expectations of their customers and regulators, whether through better service, greater reliability, more stable rates or simply more effective regulatory outreach and communication. These utilities typically receive more consistent and credit-supportive outcomes, so they typically score higher for this sub-factor. Conversely, if a utility has multiple, rapid rate increases, chooses to submit major rate increase requests during a sensitive election cycle or a severe economic downturn, has chronic customer service issues, is viewed as frequently providing incomplete information to regulators, or is tone-deaf to the priorities of regulators and politicians, it may receive less consistent and supportive outcomes and thus receive a lower score for this sub-factor.

In scoring this sub-factor, we primarily evaluate the actions of regulators, politicians and jurists rather than their words. Nonetheless, words matter when they are an indication of future action. We seek to differentiate between political rhetoric that is perhaps oriented toward gaining attention for the viewpoint of the speaker and rhetoric that is indicative of future actions and trends in decision-making.

Factor: Ability to Recover Costs and Earn Returns (25%)

Why it matters

The ability of a utility to recover its costs and earn a return, including during different market and economic conditions, directly affects its ability to generate cash flow and service its debt. Core aspects of this factor are the timeliness of recovery of operating and capital costs, and the sufficiency of rates and returns.

The ability to recover prudently incurred costs on a timely basis and to attract debt and equity capital are crucial credit considerations. The inability to recover costs, for instance if fuel or purchased power costs ballooned during a rate freeze period, has been one of the greatest drivers of financial stress in this sector, as well as the cause of some utility defaults. In a sector that is typically free cash flow negative (due to large capital expenditures and dividends) and that routinely needs to refinance very large maturities of long-term debt, investor concerns about a lack of timely cost recovery or the sufficiency of rates can, in an extreme scenario, strain access to capital markets and potentially lead to insolvency of the utility. While our scoring for this factor may primarily be influenced by our assessment of the regulatory relationship, it can also be highly affected by the management and business decisions of the utility.

The timeliness and sufficiency of rates are interrelated. Timeliness can have an impact on our view of what constitutes sufficient returns, because a strong assurance of timely cost recovery reduces risk. Conversely, utilities may have a strong assurance that they will earn a full return on certain deferred costs until they are able to collect them, or their generally strong returns may allow them to weather some rate lag on recovery of construction-related capital expenditures. The timeliness of cost recovery is particularly important in a period of rapidly rising costs. For example, fuel is a large component of total costs for vertically integrated utilities and for natural gas utilities, and fuel prices are highly volatile, so the timeliness of fuel and purchased power cost recovery is especially important.

The first two factors are closely interrelated, but utilities may receive different scores for each of these. For example, a utility could have a regulatory framework that causes considerable credit concerns, perhaps because it is untested or undergoing a transition to de-regulation, but where the track record of rate-case outcomes is positive. This could result in a higher score for the Ability to Recover Costs and Earn Returns factor than for the Regulatory Framework factor. Conversely, there may be instances of strong Legislative and Judicial Underpinnings of the regulatory framework where a commission ignores the framework, which affects the Consistency and Predictability of Regulation as well as the Ability to Recover Costs and Earn Returns. In some cases, a commission has used extraordinary measures to prevent or defer a rate increase that might have been justifiable from a cost perspective but would have caused rate shock.

Scoring for the Ability to Recover Costs and Earn Returns factor places more emphasis on our expectation of timeliness and sufficiency of rates over time; whereas financial metrics may be affected by one-time events, market conditions or construction cycles, which are trends that could normalize or even reverse.

How we assess it for the scorecard

Scoring for this factor is based on two sub-factors: Timeliness of Recovery of Operating and Capital Costs; and Sufficiency of Rates and Returns.

Timeliness of Recovery of Operating and Capital Costs

In assessing this sub-factor, we consider provisions and cost recovery mechanisms for operating costs, mechanisms that allow operating and/or capital expenditures to be trued up periodically in rates without having to file a rate case (this may include formula rates, rider and trackers, or the ability to periodically adjust rates for construction work in progress). We also consider the process and time frame of rate proceedings and the track record of recovery. For instance, having a formula rate plan is positive, but if the actual process has included reviews that are delayed for long periods, it may diminish the benefit to the utility. In addition, we consider the lag between the time that a utility incurs a major construction expenditure and the time that the utility will start to recover and/or earn a return on that expenditure.

Sufficiency of Rates and Returns

In assessing this sub-factor, we consider statutory protections that assure full cost recovery and a reasonable return for the utility on its investments, the regulatory mechanisms used to determine what a reasonable return should be, and the track record of the utility in actually recovering costs and earning allowed returns.

We examine outcomes of rate cases/tariff reviews and compare them to the request submitted by the utility, to prior rate cases/tariff reviews for the same utility and to recent rate/tariff decisions for a peer group of comparable utilities. In this context, comparable utilities are typically utilities in the same or similar jurisdiction. In cases where the utility is unique or nearly unique in its jurisdiction, we compare it to other peers with an adjustment for local differences, including prevailing rates of interest and returns on capital, as well as the timeliness of rate-setting . We consider regulatory disallowances of costs or investments, with a focus on their financial severity and also on the reasons provided by the regulator, in order to assess the likelihood that such disallowances will be repeated in the future.

Factor: Diversification (10%)

Why it matters

Diversification of overall business operations is important because it helps to mitigate the risk that economic cycles, material changes in a single regulatory regime, or commodity price movements have on the cash flow and credit quality of a utility. While utilities' sales

volumes have lower exposure to economic downturns than many non-financial corporate issuers, some sales components, including industrial sales, are directly affected by economic trends that result in lower production and/or plant closures. In addition, economic activity performs a role in the commercial sector or rate of customer growth in the service territory and, absent energy efficiency and conservation, can often affect usage per customer.

The economic strength or weakness of the service territory can affect the political and regulatory environment for rate increase requests by the utility. For utilities in areas prone to severe storms and other natural disasters, the utility's geographic diversity or concentration can be a key determinant for creditworthiness.

Diversity among regulatory regimes can mitigate the impact of a single unfavorable decision affecting one part of the utility's footprint.

For utilities with electric generation, fuel-source diversity can mitigate the impact to the utility and to its rate-payers of changes in commodity prices, hydrology and water flow, and environmental or other regulations affecting plant operations and economics; so fuel diversity typically leads to more stable rates over time.

Regulatory environments are most likely to become unfavorable during periods of rapid rate increases, which are more important than absolute rate levels. Fuel diversity can be important even if fuel and purchased power expenses are an automatic pass-through to the utility's rate-payers, because rapid price increases can cause regulators or utilities to seek recovery over a more prolonged period than the pass-through mechanism allows. Changes in environmental, safety and other regulations have caused vulnerabilities for certain technologies and fuel sources. These vulnerabilities have varied widely in different countries and have changed over time.

How we assess it for the scorecard
Scoring for this factor is based on two sub-factors: Market Position, and Generation and Fuel Diversity.

Market Position

In assessing market position, we consider the economic diversity of the utility's service territory and the diversity of its regulatory regimes, as well as the size and scale of a utility's operations. We also consider the diversity of utility operations (e.g., regulated electric, gas, water, steam) where there are material operations in more than one area.

Economic diversity is typically a function of the population, size and breadth of the territory and the businesses that drive its gross domestic product (GDP) and employment. For the size of the territory, we typically consider the number of customers and the volume of generation and/or throughput. For breadth, we consider the number of sizable metropolitan areas served, the economic diversity and vitality in those metropolitan areas, and any concentration in a particular area or industry. In our assessment, we may consider various information sources. We also consider the mix of the utility's sales volumes among customer types, as well as the track record of volume sales and any notable payment patterns during economic cycles. For diversity of regulatory regimes, we typically look at the number of regulators and the percentages of revenues and utility assets that are under the purview of each. Issuers regulated in multiple jurisdictions typically receive the highest scores in the Market Position sub-factor. Where there is only one regulator, we make a differentiation of regimes perceived as having lower or higher volatility. Size of the utility is also considered, since a larger utility can better absorb the impact of temporary, or one-time, adverse events.

Issuers with multiple supportive regulatory jurisdictions, a balanced sales mix among residential, commercial, industrial and governmental customers in a large service territory with a robust and diverse economy generally receive a higher score for this sub-factor than issuers that lack these characteristics. Issuers with a small service territory economy that has a high dependence on one or two sectors , especially highly cyclical industries, generally receive lower scores for this sub-factor, as do issuers with meaningful exposure to economic dislocations caused by natural disasters.

For issuers that are vertically integrated utilities having a meaningful amount of generation, this sub-factor has a weighting of 5%. For electric transmission and distribution utilities without meaningful generation and for natural gas local distribution companies, this sub-factor has a weighting of 10%.

Generation and Fuel Diversity

We consider the fuel type of the issuer's generation and important power purchase agreements, the ability of the issuer to shift its generation and power purchases when there are changes in fuel prices, the extent to which the utility and its rate-payers are exposed to or insulated from changes in commodity prices, and exposure to challenged sources and threatened sources (see the explanations for how we generally characterize these generation sources in the table below).

A regulated utility's capacity mix may not in itself be an indication of fuel diversity or the ability to shift fuels, because utilities may keep old and inefficient plants (e.g., natural gas boilers) to serve peak load. For this reason, we do not incorporate set percentages reflecting an "ideal" or "sub-par" mix for capacity or even generation. In addition to looking at a utility's generation mix to evaluate fuel diversity, we consider the efficiency of the utility's plants, their placement on the regional dispatch curve, and the demonstrated ability/inability of the utility to shift its generation mix in accordance with changing commodity prices.

Issuers having a balanced mix of fuel types as well as low exposure to challenged and threatened sources of generation typically receive higher scores for this sub-factor. Issuers that have concentration in one or two sources of generation, especially if they are threatened or challenged sources, typically receive lower scores.

In assessing an issuer's extent of exposure to challenged and threatened sources , we consider not only the existence of those plants in the utility's portfolio, but also the relevant factors that determine the impact on the utility and on its rate-payers. For instance, an issuer that has a fairly high percentage of its generation from challenged sources could be assessed very differently if its peers experience the same magnitude of those issues than if its peers have no exposure to challenged or threatened sources. In assessing threatened sources, we consider a utility's progress in its plan to replace those sources, its reserve margin, the availability of purchased power capacity in the region, and the overall impact of the replacement plan on the issuer's rates relative to its peer group. We also consider the extent to which the utility's generation resources plan is aligned with the relevant government's fuel/energy policy and the economic support of the underlying economy (e.g., if the fuel or plants are important sources of jobs and tax revenue).

Factor: Financial Strength (40%)

Why it matters

Financial strength is necessary for a regulated electric and gas utility to attract capital at a reasonable cost in order to invest in its generation, transmission and distribution assets, so the utility can fulfill its service obligations at a reasonable cost to rate-payers and service debt. The financial strength of utilities, which are characterized by large investments in long-lived property, plant and equipment, includes the ability to service debt and provide a return to shareholders.

The financial statements of regulated electric and gas utilities have certain aspects that affect financial analysis, including disparate treatment of certain elements under US Generally Accepted Accounting Principles (GAAP) compared with International Financial Reporting Standards (IFRS). Regulatory accounting may permit utilities to defer certain costs (thereby creating regulatory assets) that a non-utility corporate entity would have to expense. For instance, a regulated utility may be able to defer a substantial portion of costs related to recovery from a storm based on the general regulatory framework for those expenses, even if the utility does not have a specific order to collect the expenses from rate-payers over a set period. A regulated utility may be able to accrue and defer a return on equity (in addition to capitalizing interest) for construction work in progress for an approved project based on the assumption that it will be able to collect that deferred equity return once the asset comes into service. Because of the disparate treatment of certain elements under the different accounting standards , we focus more on a utility's cash flow than on its reported net income.

Conversely, utilities may collect certain costs in rates well ahead of the time they must be paid (for instance, pension costs), thereby creating regulatory liabilities. Many of our metrics focus on Cash Flow from Operations Before Changes in Working Capital (CFO Pre-WC) because, unlike Funds from Operations (FFO), it captures the changes in long-term regulatory assets and liabilities.

However, under IFRS the two metrics are essentially the same. In general, we view changes in working capital as being less useful in the financial analysis of a utility because such changes are often seasonal (for example, power demand is generally greatest in the summer) or caused by changes in fuel prices that are typically a relatively automatic pass-through to the customer. We nonetheless consider the impact of working capital changes in analyzing a utility's liquidity (see the "Liquidity" section in "Other rating considerations").

CFO Pre-Working Capital Plus Interest Expense / Interest Expense

This metric is an indicator of a utility's ability to cover the cost of its borrowed capital.

CFO Pre-Working Capital / Debt

This metric provides important indications of the cash-generating ability of a utility compared to its total debt.

CFO Pre-Working Capital Minus Dividends / Debt

This ratio is an indicator for financial leverage as well as an indicator of the strength of a utility's cash flow after dividend payments are made. Dividend obligations of utilities are often substantial, quasi-permanent outflows that can affect the ability of a utility to cover its debt obligations, and this ratio can also provide insight into the financial policies of a utility or utility holding company. The higher the level of retained cash flow relative to a utility's debt, the more cash the utility has to support its capital expenditure program.

Debt / Book Capitalization

This ratio is a traditional measure of balance sheet leverage. Total capitalization includes minority interest and deferred taxes in addition to total debt, preferred stock, other hybrid securities, and common equity. Since the presence or absence of deferred taxes is a function of national tax policy, comparing utilities using this ratio may be more meaningful among utilities in the same country or in countries with similar tax policies. High debt levels in comparison to capitalization can indicate higher interest obligations, can limit the ability of a utility to raise additional financing if needed, and can lead to leverage covenant violations in bank credit facilities or other financing agreements. We also examine debt/capitalization ratios as defined in applicable covenants (which typically exclude deferred taxes from capitalization) relative to the covenant threshold level. A high ratio may result from a regulatory framework that does not permit a robust cushion of equity in the capital structure, or from a material write-off of an asset, which may not have affected current period cash flows but could affect future period cash flows relative to debt.

How we assess it for the scorecard
Scoring for this factor is based on four quantitative sub-factors: CFO Pre-Working Capital Plus Interest Expense/Interest Expense ; CFO Pre-Working Capital/Debt; CFO Pre-Working Capital Minus Dividends/Debt; and Debt/Book Capitalization.

There are two sets of thresholds for three of these ratios based on the level of the issuer's business risk – the Standard Grid and the Lower Business Risk (LBR) Grid. In our view, the different types of utility entities rated using this methodology have different levels of business risk.

Generation utilities and vertically integrated utilities generally have a higher level of business risk because they are engaged in power generation, so we apply the Standard Grid. We view power generation as the highest-risk component of the electric utility business, as generation plants are typically the most expensive part of a utility's infrastructure (representing potential asse t concentration risk) and are subject to the greatest risks in both construction and operation, including the risk that incurred costs will either not be recovered in rates or recovered with material delays.

Other types of utilities may have lower business risk, such that we consider that they are more appropriately assessed using the LBR Grid, due to factors that could include a generally greater transfer of risk to customers, very strong insulation from exposure to commodity price movements, good protection from volumetric risks, fairly limited capex needs and/or low exposure to storms, major accidents and natural disasters. For instance, we consider many US natural gas LDCs and certain US electric T&Ds , which lack generation but generally retain some procurement responsibilities for customers, as typically having a lower business risk profile than their vertically integrated peers. In cases of T&Ds that we do not view as having materially lower risk than their vertically integrated peers, we apply the Standard grid. This could result from a regulatory framework that exposes them to energy supply risk, large capital expenditures for required maintenance or upgrades, a heightened exposure to catastrophic climate events , increased regulatory scrutiny due to poor reliability or other considerations. The Standard Grid also applies to LDCs that in our view do not have materially lower risk; for instance, due to their ownership of high pressure pipes or older systems requiring extensive gas main replacements, where gas commodity costs are not fully recovered in a reasonably contemporaneous manner, where the LDC is not well-insulated from declining volumes, or if the jurisdiction of operation has aggressive policies to limit or reduce its business.

CFO Pre-Working Capital Plus Interest Expense / Interest Expense

The numerator is the sum of CFO Pre-WC and interest expense, and the denominator is interest expense.

CFO Pre-Working Capital / Debt

The numerator is CFO Pre-WC, and the denominator is total debt.

CFO Pre-Working Capital Minus Dividends / Debt

The numerator is CFO Pre-WC minus dividends, and the denominator is total debt.

Debt / Book Capitalization

The numerator is total debt, and the denominator is book capitalization.

Notching factor: Structural Subordination of Holding Companies

Our assessment of the Structural Subordination of Holding Companies may result in a downward adjustment to the preliminary outcome that results from the four weighted factors. We apply this adjustment in whole-notch increments, with a maximum of three alphanumeric notches down from the preliminary scorecard-indicated outcome to arrive at the scorecard-indicated outcome.

In cases where we consider that the credit weakness or credit strength represented by the notching factor is greater than the scorecard range, we incorporate this view into the rating, which may be different from the scorecard-indicated outcome. For a discussion of scorecard mechanics, please see the "Using the scorecard to arrive at a scorecard-indicated outcome" section.

Why it matters

Notching for the structural subordination of holding companies is important because in the regulated utility sector, barriers to movement of cash among companies in the corporate family can vary, depending on the regulatory framework. These barriers can lead to significantly different probabilities of default for holding companies (HoldCos) and operating subsidiaries (OpCos).

A typical utility company structure consists of a HoldCo that owns one or more OpCos. OpCos may be regulated utilities or non-utility companies. A HoldCo typically has no operations – its assets are mostly limited to its equity interests in subsidiaries, and potentially other investments in subsidiaries that are structured as equity, debt or even hybrid instruments.

Most HoldCos present their financial statements on a consolidated basis that blurs legal considerations about priority of creditors based on the legal structure of the family, and scorecard scoring is thus based on consolidated ratios. However, HoldCo creditors typically have a secondary claim on the group's cash flows and assets after OpCo creditors. We refer to this as structural subordination because it is the corporate legal structure, rather than specific subordination provisions, that causes creditors at each of the utility and non-utility subsidiaries to have a more direct claim on the cash flows and assets of their respective OpCo obligors. By contrast, the debt of the HoldCo is typically serviced primarily by dividends that are up-streamed by the OpCos. The HoldCo and OpCo may also have intercompany agreements, including tax sharing agreements, that can be another source of cash to the HoldCo. Under normal circumstances, these dividends are made from net income, after payment of the OpCo's interest and preferred dividends.

Structural subordination also affects loss given default. Under most default scenarios, an OpCo's creditors will be satisfied from the value residing at that OpCo before any of the OpCo's assets can be used to satisfy claims of the HoldCo's creditors. Actual priority in a default scenario will be determined by many factors, including the corporate and bankruptcy laws of the jurisdiction, the asset value of each OpCo, specific financing terms, inter-relationships among members of the family, etc. The prevalence of debt issuance at the OpCo level is another reason that structural subordination is usually a more serious concern in the utility sector than for investment-grade issuers in other non-financial corporate sectors.

The first four factors are primarily oriented to OpCos (and to some extent for HoldCos with minimal structural subordination; for example, there is no current structural subordination to debt at the operating company if all of the utility family's debt and preferred stock is issued at the HoldCo level, although there is structural subordination to other liabilities at the OpCo level). The additional risk from structural subordination is addressed via a notching adjustment to bring scorecard-indicated outcomes (on average) closer to the actual ratings of HoldCos.

How we assess it for the scorecard

Scorecard-indicated outcomes of holding companies may be notched down based on structural subordination. The risk factors and mitigants that impact structural subordination are varied and can be present in different combinations, such that a formulaic approach is not practical and case-by-case analyst judgment of the interaction of all pertinent factors that may increase or decrease its importance to the credit risk of an issuer is essential.

Some of the potentially pertinent features that could increase the extent or impact of structural subordination include the following:

» Regulatory or other barriers to cash movement from OpCos to HoldCo

» Specific ring-fencing provisions

» Strict financial covenants at the OpCo level

» Higher leverage at the HoldCo level While higher leverage at the HoldCo does not increase structural subordination per se, it exacerbates the impact of any structural subordination that exists.

» Significant dividend limitations at an important OpCo

» HoldCo exposure to subsidiaries with high business risk or volatile cash flows

» Strained liquidity at the HoldCo level

» The group's investment program is primarily in businesses that are higher risk or new to the group

Some of the potentially mitigating features that could decrease the extent and/or impact of structural subordination include the following:

» Substantial diversity in cash flows from a variety of utility OpCos

» Meaningful dividends to HoldCo from unlevered utility OpCos

» Dependable, meaningful dividends to HoldCo from non-utility OpCos

» The group's investment program is primarily in strong utility businesses

» Inter-company guarantees - however, in many jurisdictions the value of an upstream guarantee may be limited by certain factors, including by the value that the OpCo received in exchange for granting the guarantee

Notching for structural subordination within the scorecard may range from 0 to three downward notches. Instances of extreme structural subordination are relatively rare, so the scorecard convention does not accommodate wider differences, although in the instances where we believe it is present, actual ratings do reflect the full impact of structural subordination.

A related issue is the relationship of ratings within a utility family with multiple operating companies, and sometimes intermediate holding companies. Some of the key issues are the same, such as the relative amounts of debt at the holding company level compared to the operating company level (or at one OpCo relative to another), and the extent to which operating companies have credit insulation due to regulation or other protective factors. Appendix A has additional insights on ratings within a utility family.

Other considerations

Ratings may reflect consideration of additional factors that are not in the scorecard, usually because the factor's credit importance varies widely among the issuers in the sector or because the factor may be important only under certain circumstances or for a subset of issuers. Such factors can include financial controls and the quality of financial reporting; corporate legal structure; the quality and experience of management; assessments of corporate governance, as well as environmental and social considerations; exposure to uncertain licensing regimes; and possible government interference in some countries. Regulatory, litigation, liquidity, technology and reputational risk, as well as changes to consumer and business spending patterns, competitor strategies and macroeconomic trends can also affect ratings.

The following are examples of additional considerations that may be reflected in our ratings and that may cause ratings to be different from scorecard-indicated outcomes.

Environmental, social and governance considerations

Where environmental, social and governance (ESG) issues are meaningful for credit profiles, we incorporate them into our ratings analysis in a variety of ways in the application of our sector-specific methodologies. As one part of our overall credit analysis, we consider how ESG risks could affect the qualitative and quantitative factors and sub-factors in the scorecard.

Even where ESG considerations do not affect the measures in the scorecard, or where they cannot be quantified, we incorporate them into our overall analysis of credit drivers that are meaningful to the rating. As a result, we may incorporate these ESG risks qualitatively outside of the scorecard. As part of our ratings analysis, we may establish Issuer Profile Scores (IPSs), which indicate our opinion of the extent to which a given issuer is exposed to E, S and G risks (incorporating ESG-specific mitigants) or benefits from its exposure to E, S or G. The IPSs are inputs to credit ratings. For more information, please see our methodology that describes our general principles for assessing ESG risks.[2]

Increasing requirements and efforts to reduce greenhouse gas emissions (known as carbon transition) may lead to higher costs for many regulated electric and gas utilities. In addition, the ownership or operation of assets that may become "stranded" (i.e., assets that become unprofitable due to carbon transition) may indicate higher risk.

We also consider the impact of decarbonization efforts on the electrification of heating, transportation and industry. In our assessment of the net impact of decarbonization on issuers in this sector, we consider the share of generation in the business mix, the location of generation assets and the technology employed and exposure to natural gas transportation and distribution. Pressure for issuers to decarbonize and implementation timelines may be affected by regulation, policies and the potential for renewable energy to displace carbon intensive generation in each market. In general, carbon-intensive generation assets such as coal-fired plants are most exposed to carbon transition risk, followed by gas-fired plants. Renewable energy projects and other low-carbon power generation assets are well-positioned to benefit from carbon transition. Our assessment of the net impact of decarbonization also takes into account the central role of electricity networks in decarbonization efforts. In contrast, decarbonization may reduce demand for gas networks in many markets, particularly for residential heating supply.

We also consider waste and pollution risks, including emissions of non-carbon air pollutants, which can also impose significant compliance costs on thermal generators, as well as long-term storage costs for nuclear generators, particularly in regions where the generators are fully or partially responsible for those costs. Issuers in this sector are also exposed to physical risks associated with climate change, including damage to electricity networks caused by storms or wildfires. For example, operators of hydro generators and water-cooled thermal plants may experience lower output during periods of low rainfall. Conversely, generators in hydro-dominated markets may be exposed to lower electricity prices during unusually wet periods. Issuers in this sector are also exposed to weather-related disasters and other catastrophic events, including nuclear accidents and natural gas pipeline explosions, as well as costs to enhance climate resilience or remediate environmental damage.

Social issues are often important considerations. Regulated electric and gas utilities are highly exposed to socially driven policy agendas resulting from public concern about affordable energy, energy security and the environment, often enabled by the direct involvement of governments and regulators in setting energy policy. In addition to health and safety risks associated with maintaining heavy equipment and machinery, the sector is also prone to event risks with social risk repercussions, such as nuclear and hydropower disasters and gas pipeline explosions.

Among the areas of focus in corporate governance are audit committee financial expertise, the incentives created by executive compensation packages, related-party transactions, interactions with outside auditors, and ownership structure.

Liquidity

Liquidity is an important rating consideration for all electric and gas utilities, and extremely weak liquidity can heavily affect ratings in many cases. However, the relative strength or weakness of liquidity may not have a substantial impact in discriminating between two issuers with an otherwise similar credit profile. Liquidity can be particularly important where issuers have large short-term demands on liquidity, for example in highly seasonal operating environments where working capital needs must be considered. We form an

opinion on likely near-term liquidity requirements from the perspective of both sources and uses of cash. For more information on our approach, please see our liquidity cross-sector methodology.[3]

Liquidity encompasses a company's ability to generate cash from internal sources as well as the availability of external sources of financing to supplement these internal sources. Liquidity and access to financing are of particular importance in this sector. Utility assets can often have a very long useful life- 30, 40 or even 60 years is not uncommon, as well as high costs. Partly as a result of construction cycles, the utility sector has experienced prolonged periods of negative free cash flow – essentially, the sum of its dividends and its capital expenditures for maintenance and growth of its infrastructure frequently exceeds cash from operations, such that a portion of capital expenditures must routinely be financed by debt or equity. Utilities are among the largest debt issuers in the corporate universe and typically require consistent access to the capital markets to assure adequate sources of funding and to maintain financial flexibility. Substantial portions of capital expenditures are non-discretionary (for example, maintenance, adding customers to the network, or meeting environmental mandates); however, utilities have been swift to cut or defer discretionary spending during economic downturns. Dividends represent a quasi-permanent outlay, because utilities typically only rarely cut their dividends. Liquidity is also important to meet maturing obligations, which can often be large,, and to meet collateral calls under any hedging agreements.

Due to the importance of liquidity, incorporating it as a factor with a fixed weighting in the scorecard would suggest an importance level that is often far different from the actual weight in the rating. In normal circumstances, most companies in the sector have good access to liquidity. The industry generally requires, and for the most part has, large, syndicated, multi-year committed credit facilities. In addition, utilities have demonstrated strong access to capital markets , even under difficult conditions. As a result, liquidity generally has not been an issue for most utilities, and a utility with very strong liquidity may not warrant a rating distinction compared to a utility with strong liquidity. However, when there is weakness in liquidity or liquidity management, it can be the dominant consideration for ratings.

Our assessment of liquidity for regulated utilities involves an analysis of total sources and uses of cash over the next 12 months or more, as is done for all corporates. Using our financial projections of the utility and our analysis of its available sources of liquidity (including an assessment of the quality and reliability of alternate liquidity such as committed credit facilities), we consider how its projected sources of cash (cash from operations, cash on hand and existing committed multi-year credit facilities) compare to its projected uses (including all or most capital expenditures, dividends, maturities of short and long-term debt, our projection of potential liquidity calls on financial hedges, and important issuer-specific items such as special tax payments). We assume no access to capital markets or additional liquidity sources, no renewal of existing credit facilities, and no cut to dividends. We assess a company's liquidity profile under this scenario, its ability to make adjustments to improve its liquidity position, and any dependence on liquidity sources with lower quality and reliability.

Management strategy

The quality of management is an important factor supporting the credit strength of a regulated utility or utility holding company. Assessing the execution of business plans over time can be helpful in assessing management's business strategies, policies, and philosophies and in evaluating management performance relative to performance of competitors and our projections. Management's track record of adhering to stated plans, commitments and guidelines provides insight into management's likely future performance, including in stressed situations.

We assess financial policy (including dividend policy and planned capital expenditures) and how management balances the potentially competing interests of shareholders, fixed income investors and other stakeholders. Dividends and discretionary capital expenditures are the two primary components over which management has the greatest control in the short term. For holding companies, we consider the extent to which management stretches its payout ratio (through aggressive increases or delays in needed decreases) in order to satisfy common shareholders. For a utility that is a subsidiary of a parent company with several utility subsidiaries, dividends to the parent may be more volatile depending on the cash generation and cash needs of that utility, because parents typically want to assure that each utility maintains the regulatory debt/equity ratio on which its rates have been set. The effect is that utility subsidiaries typically pay higher dividends when they have lower capital needs and lower dividends when they have higher capital expenditures or other cash needs. Any dividend policy that cuts into the regulatory debt/equity ratio is a material credit negative.

Size

Size can be a very important factor in our assessment of certain risks that affect ratings in this sector, including exposure to natural disasters, customer concentration, primarily to industrial customers in a single sector, and construction risks associated with large projects. While the scorecard incorporates the first two of these risks into the Diversification factor, for some issuers these considerations may be sufficiently important that the rating reflects a greater weight for these risks. Construction projects typically carry the risk of cost overruns and delays, but these risks are materially heightened for projects that are very large relative to the size of the utility.

While size brings certain economies of scale that can somewhat affect the utility's cost structure and competitiveness, rates are more heavily affected by costs related to fuel and fixed assets. Smaller utilities have sometimes been better able to focus their attention on meeting the expectations of a single regulator than their multi-state peers.

Interaction of utility ratings with government policies and sovereign ratings

Government actions can have a credit impact on regulated utilities directly through rate regulation, and indirectly through energy, environmental and tax policies. Government actions affect fuel prices, the mix of generating plants, the certainty and timing of revenues and costs, and the likelihood that regulated utilities will experience financial stress. While our evolving view of the impact of such policies and the general economic and financial climate is reflected in the ratings of each utility, some considerations do not lend themselves to incorporation in a simple scorecard.[4]

Non-utility operations

In some cases, regulated utilities have non-utility operations that are segments within the utility company, compared with the more common practice of housing such operations in one or more separate affiliates. In general, we evaluate the other businesses that are material in accordance with the appropriate methodology, and the rating on the regulated electric and gas utility reflects considerations from such methodologies. There may be analytical limitations in evaluating the utility and non-utility businesses where segment financial results are not fully available , and these may be addressed through estimation based on available information. Diversified non-utility operations generally increase the business risk profile of a regulated utility, which is a relatively low-risk business . To reflect this heightened risk, we may assign ratings that are lower than scorecard-indicated outcomes for companies with diversified operations.

Event risk

We also recognize the possibility that an unexpected event could cause a sudden and sharp decline in a utility's fundamental creditworthiness, which may cause actual ratings to be lower than the scorecard-indicated outcome. Event risks — which are varied and can range from leveraged recapitalizations to sudden regulatory changes or liabilities from an accident — can overwhelm even a stable, well-capitalized utility. Some other types of event risks include M&A, asset sales, spinoffs, shareholder distributions, litigation, pandemics, significant cybercrime events and geopolitical conflicts.

Financial controls

We rely on the accuracy of audited financial statements to assign and monitor ratings in this sector. The quality of financial statements may be influenced by internal controls, including the proper tone at the top, centralized operations, and consistency in accounting policies and procedures. Auditors' reports on the effectiveness of internal controls, auditors' comments in financial reports and unusual restatements of financial statements or delays in regulatory filings may indicate weaknesses in internal controls.

Parental support

Ownership can provide ratings lift for a particular company in the regulated electric and gas utilities sector if it is owned by a highly rated owner(s) and is viewed to be of strategic importance to those owners. In our analysis of parental support, we consider whether the parent has the financial capacity and strategic incentives to provide support to the issuer in times of stress or financial need (e.g., a major capital investment or advantaged operating agreement), or has already done so in the past. Conversely, if the parent puts a high dividend burden on the issuer, which in turn reduces its flexibility, the ratings would reflect this risk.

Government-related issuers may receive ratings uplift due to expected government support. However, for certain issuers, government ownership can have a negative impact on the underlying Baseline Credit Assessment.[5] For example, price controls, onerous taxation and high distributions can have a negative effect on an issuer's underlying credit profile.

Other institutional support

In some countries, large corporate issuers have received government or banking support in the event of financial difficulties because of their overall importance to the functioning of the economy. In Japan, our corporate ratings consider the support that has operated there for large and systemically important organizations. Over the years, this has resulted in lower levels of default than might otherwise have occurred. Our approach considers whether the presence of group and banking relationships may provide support when systemically important companies encounter significant financial stress.

Using the scorecard to arrive at a scorecard-indicated outcome

1. Measurement or estimation of factors in the scorecard

In the "Discussion of the scorecard factors" section, we explain our analytical approach for scoring each scorecard factor or sub-factor, and we describe why they are meaningful as credit indicators. When a factor comprises sub-factors, we score at the sub-factor level. Some factors do not have sub-factors, in which case we score at the factor level.

The information used in assessing the sub-factors is generally found in or calculated from information in the company's financial statements or regulatory filings, derived from other observations or estimated by Moody's analysts. We may also incorporate non-public information.

Our ratings are forward-looking and reflect our expectations for future financial and operating performance. However, historical results are helpful in understanding patterns and trends of a company's performance, as well as for peer comparisons. Financial metrics, unless otherwise indicated, are typically calculated based on an average of the most recent three years of reported results. However, the factors in the scorecard can be assessed using various time periods. For example, rating committees may find it analytically useful to examine both historical and expected future performance for periods of several years or more.

Given the long-term nature of utility assets and the often uneven nature of their capital expenditures, we consider a utility's historical financial performance as well as its prospective future performance. Multi-year periods are usually more representative of credit quality because utilities can experience swings in cash flows from one-time events, including such items as rate refunds, storm cost deferrals that create a regulatory asset, or securitization proceeds that reduce a regulatory asset. Nonetheless, we also look at trends in metrics for individual periods, which may influence our view of future performance and ratings.

All of the quantitative credit metrics incorporate our standard adjustments[6] to income statement, cash flow statement and balance sheet amounts for items such as restructuring, impairment, off-balance sheet accounts, receivable securitization programs, under-funded pension obligations, and recurring operating leases. We may also make other analytical adjustments that are specific to a particular issuer.

2. Mapping scorecard factors to a numeric score

After estimating or calculating each factor or sub-factor, each outcome is mapped to a broad Moody's rating category (Aaa, Aa, A, Baa, Ba, B, or Caa, also called alpha categories).

Qualitative factors are scored based on the description by broad rating category in the scorecard. The numeric value of each alpha score is based on the scale below.

Exhibit 3

Numeric equivalents for factor and sub-factor scores

Aaa	Aa	A	Baa	Ba	B	Caa	Ca
1	3	6	9	12	15	18	20

Source: Moody's Ratings

3. Determining the overall scorecard-indicated outcome

The numeric score for each weighted sub-factor (or each factor, when the factor has no sub-factors) is multiplied by the weight for that sub-factor (or factor), with the results then summed to produce an aggregate numeric score before notching factors (the preliminary outcome). We then consider whether the preliminary outcome that results from the four weighted factors should be notched downward in order to arrive at an aggregate numeric score after notching factors, based on Holding Company Structural

Subordination. Numerically, a downward notch adds 1 to the score, and an upward notch subtracts 1 from the score. In aggregate, the notching factor can result in a total of up to three downward notches from the preliminary outcome to arrive at the scorecard-indicated outcome.

The aggregate numeric score before and after notching factors is mapped to an alphanumeric]. For example, an issuer with an aggregate numeric score before notching factors of 11.7 would have a Ba2 preliminary outcome, based on the ranges in the table below. If the combined notching factors totaled two downward notches, the aggregate numeric score after notching factors would be 13.7, which would map to a B1 scorecard-indicated outcome.

Exhibit 4
Scorecard-indicated outcome

Aggregate numeric score	Scorecard-indicated outcome
x < 1.5	Aaa
1.5 ≤ x < 2.5	Aa1
2.5 ≤ x < 3.5	Aa2
3.5 ≤ x < 4.5	Aa3
4.5 ≤ x < 5.5	A1
5.5 ≤ x < 6.5	A2
6.5 ≤ x < 7.5	A3
7.5 ≤ x < 8.5	Baa1
8.5 ≤ x < 9.5	Baa2
9.5 ≤ x < 10.5	Baa3
10.5 ≤ x < 11.5	Ba1
11.5 ≤ x < 12.5	Ba2
12.5 ≤ x < 13.5	Ba3
13.5 ≤ x < 14.5	B1
14.5 ≤ x < 15.5	B2
15.5 ≤ x < 16.5	B3
16.5 ≤ x < 17.5	Caa1
17.5 ≤ x < 18.5	Caa2
18.5 ≤ x < 19.5	Caa3
x ≥ 19.5	Ca

Source: Moody's Ratings

In general, the scorecard-indicated outcome is oriented to the corporate family rating (CFR) for speculative-grade issuers and to the senior unsecured rating for investment-grade issuers. For issuers that benefit from rating uplift from parental support, government ownership or other institutional support, we consider the underlying credit strength or Baseline Credit Assessment for comparison to the scorecard-indicated outcome. For an explanation of the Baseline Credit Assessment, please refer to *Rating Symbols and Definitions* and to our cross-sector methodology for government-related issuers.[7]

Assigning issuer-level and instrument-level ratings

After considering the scorecard-indicated outcome, other considerations and relevant cross-sector methodologies, we typically assign a corporate family rating (CFR) to speculative-grade issuers or a senior unsecured rating for investment-grade issuers. For issuers that benefit from rating uplift from government ownership, we may assign a Baseline Credit Assessment.[8]

Individual debt instrument ratings may be notched up or down from the CFR or the senior unsecured rating to reflect our assessment of differences in expected loss related to an instrument's seniority level and collateral. The documents that provide broad guidance for such notching decisions are the rating methodology on loss given default for speculative-grade non-financial companies, the methodology for notching corporate instrument ratings based on differences in security and priority of claim, and the methodology for assigning short-term ratings.[9]

Key rating assumptions

For information about key rating assumptions that apply to methodologies generally, please see *Rating Symbols and Definitions*.[10]

Limitations

In the preceding sections, we have discussed the scorecard factors and many of the other considerations that may be important in assigning ratings. In this section, we discuss limitations that pertain to the scorecard and to the overall rating methodology.

Limitations of the scorecard

There are various reasons why scorecard-indicated outcomes may not map closely to actual ratings.

The scorecard in this rating methodology is a relatively simple tool that can be used in most cases to approximate credit profiles of issuers in this sector and to explain, in summary form, many of the factors that are generally most important in assigning ratings to these issuers. Credit loss and recovery considerations, which are typically more important as an issuer gets closer to default, may not be fully captured in the scorecard. The scorecard is also limited by its upper and lower bounds, causing scorecard-indicated outcomes to be less likely to align with ratings for issuers at the upper and lower ends of the rating scale.

The weights for each factor and sub-factor in the scorecard represent an approximation of their importance for rating decisions across the sector, but the actual importance of a particular factor may vary substantially based on an individual company's circumstances.

Factors that are outside the scorecard, including those discussed above in the "Other considerations" section, may be important for ratings, and their relative importance may also vary from company to company. In addition, certain broad methodological considerations described in one or more cross-sector rating methodologies may be relevant to ratings in this sector.[11] Examples of such considerations include the following: how sovereign credit quality affects non-sovereign issuers, the assessment of credit support from other entities, the relative ranking of different classes of debt and hybrid securities, and the assignment of short-term ratings.

We may use the scorecard over various historical or forward-looking time periods. Furthermore, in our ratings we often incorporate directional views of risks and mitigants in a qualitative way.

General limitations of the methodology

This methodology document does not include an exhaustive description of all factors that we may consider in assigning ratings in this sector. Companies in the sector may face new risks or new combinations of risks, and they may develop new strategies to mitigate risk. We seek to incorporate all material credit considerations in ratings and to take the most forward-looking perspective that visibility into these risks and mitigants permits.

Ratings reflect our expectations for an issuer's future performance; however, as the forward horizon lengthens, uncertainty increases and the utility of precise estimates, as scorecard inputs or in other considerations, typically diminishes. Our forward-looking opinions are based on assumptions that may prove, in hindsight, to have been incorrect. Reasons for this could include unanticipated changes in any of the following: the macroeconomic environment, general financial market conditions, industry competition, disruptive technology, or regulatory and legal actions. In any case, predicting the future is subject to substantial uncertainty.

Appendix A: Approach to ratings within a utility family

Typical composition of a utility family

A typical utility company structure consists of a HoldCo that owns one or more OpCos). OpCos may be regulated utilities or non-utility companies. Financing of these entities varies by region, in part due to the regulatory framework. A HoldCo typically has no operations – its assets are mostly limited to its equity interests in subsidiaries, and potentially other investments in subsidiaries or minority interests in other companies. However, in certain cases there may be material operations at the HoldCo level. Financing can occur primarily at the OpCo level, primarily at the HoldCo level, or at both HoldCo and OpCos in varying proportions. When a HoldCo has multiple utility OpCos, they will often be located in different regulatory jurisdictions. A HoldCo may have both levered and unlevered OpCos.

General approach to a utility family

In our analysis, we generally consider the stand-alone credit profile of an OpCo and the credit profile of its ultimate parent HoldCo (and any intermediate HoldCos), as well as the profile of the family as a whole, while acknowledging that these elements can have cross-family credit implications in varying degrees, principally based on the regulatory framework of the OpCos and the financing model (which has often developed in response to the regulatory framework).

In addition to considering individual OpCos under this (or another applicable) methodology, we typically[12] approach a HoldCo rating by assessing the qualitative and quantitative factors in this methodology for the consolidated entity and each of its utility subsidiaries. Ratings of individual entities in the issuer family may be pulled up or down based on the interrelationships among the companies in the family and their relative credit strength.

In considering how closely aligned or how differentiated ratings should be among members of a utility family, we assess a variety of factors, including:

- Regulatory or other barriers to cash movement among OpCos and from OpCos to HoldCo
- Differentiation of the regulatory frameworks of the various OpCos
- Specific ring-fencing provisions at particular OpCos
- Financing arrangements – for instance, each OpCo may have its own financing arrangements, or the sole liquidity facility may be at the parent; there may be a liquidity pool among certain but not all members of the family; certain members of the family may be better able to withstand a temporary hiatus of external liquidity or access to capital markets
- Financial covenants and the extent to which an Event of Default by one OpCo limits availability of liquidity to another member of the family
- The extent to which higher leverage at one entity increases default risk for other members of the family
- An entity's exposure to or insulation from an affiliate with high business risk
- Structural features or other limitations in financing agreements that restrict movements of funds, investments, provision of guarantees or collateral, etc.
- The relative size and financial significance of any particular OpCo to the HoldCo and the family

Our approach to a Hybrid HoldCo depends in part on the importance of its non-utility operations and the availability of information on individual businesses. If the businesses are material and their individual results are fully detailed in financial disclosures, we may be able to assess each material business individually by reference to the relevant Moody's methodologies to arrive at a composite assessment for the combined businesses.[13] If non-utility operations are material but are not available in financial disclosures, we may look at the consolidated entity under more than one methodology. When non-utility operations are less material but could still impact the overall credit profile, the difference in business risks and our estimation of their impact on financial performance will be qualitatively incorporated in the rating.

Higher barriers to cash movement with financing predominantly at the OpCos

Where higher barriers to cash movement exist at an OpCo or OpCos due to the regulatory framework or debt structural features, ratings among family members are likely to be more differentiated. The degree of separateness may be greater or smaller and is assessed on a case-by-case basis, because situational considerations are important.

One area we consider is financing arrangements. For instance, there will tend to be greater differentiation if each member of a family has its own bank credit facilities and difficulties experienced by one entity would not trigger events of default for other entities. While the existence of a money pool might appear to reduce separateness between the participants, there may be regulatory barriers within money pools that preserve separateness. For instance, non-utility entities may have access to the pool only as a borrower, only as a lender, and even the utility entities may have regulatory limits on their borrowings from the pool or their credit exposures to other pool members. If the only source of external liquidity for a money pool is borrowings by the HoldCo under its bank credit facilities, there would be less separateness, especially if the utilities were expected to depend on that liquidity source. However, the ability of an OpCo to finance itself by accessing capital markets must also be considered. Inter-company tax agreements can also have an impact on our view of how separate the risks of default are.

For a HoldCo, the greater the regulatory, economic, and geographic diversity of its OpCos, the greater its potential separation from the default probability of any individual subsidiary. Conversely, if a HoldCo's actions have made it clear that the HoldCo will provide support for an OpCo encountering some financial stress (for instance, due to delays and/or cost over-runs on a major construction project), we would be likely to perceive less separateness.

Even where high barriers to cash movement exist, onerous leverage at a parent company may not only give rise to greater notching for structural subordination at the parent, it may also pressure an OpCo's rating, especially when there is a clear dependence on an OpCo's cash flow to service parent debt.

While most of the regulatory barriers to cash movement are very real, they are not absolute. Furthermore, while it is not usually in the interest of an insolvent parent or its creditors to bring an operating utility into a bankruptcy proceeding, such an occurrence is not impossible.

The greatest separateness occurs where strong regulatory insulation is supplemented by effective ring- fencing provisions that fully separate the management and operations of the OpCo from the rest of the family and limit the parent's ability to cause the OpCo to commence bankruptcy proceedings as well as limiting dividends and cash transfers. Typically, most entities in US utility families (including HoldCos and OpCos) are rated within 3 notches of each other. However, it is possible for the HoldCo and OpCos in a family to have much wider notching due to the combination of regulatory imperatives and strong ring-fencing that includes a significant minority shareholder who must agree to important corporate decisions, including a voluntary bankruptcy filing.

Lower barriers to cash movement with financing predominantly at the OpCos

Our approach to rating issuers within a family where there are lower regulatory barriers to movement of cash from OpCos to HoldCos places greater emphasis on the credit profile of the consolidated group. Individual OpCos are considered based on their individual characteristics and their importance to the family, and their assigned ratings are typically banded closely around the consolidated credit profile of the group due to the expectation that cash will transit relatively freely among family entities.

Some utilities may have OpCos in jurisdictions where cash movement among certain family members is more restricted by the regulatory framework, while cash movement from and/or among OpCos in other jurisdictions is less restricted. In these situations, OpCos with more restrictions may vary more widely from the consolidated credit profile while those with fewer restrictions may be more tightly banded around the other entities in the corporate family group.

Appendix B: Regional and other considerations

Notching considerations for US first mortgage bonds

In most regions, our approach to notching between different debt classes of the same regulated utility issuer follows the guidance on notching corporate instrument ratings based on differences in security and priority of claim, including a one notch differential between senior secured and senior unsecured debt.[14] However, in most cases we have two notches between the first mortgage bonds and senior unsecured debt of regulated electric and gas utilities in the US. Wider notching differentials between debt classes may also be appropriate in speculative-grade issuers.[15]

First mortgage bond holders in the US generally benefit from a first lien on most of the fixed assets used to provide utility service, including such assets as generating stations, transmission lines, distribution lines, switching stations and substations, and gas distribution facilities, as well as a lien on franchise agreements. In our view, the critical nature of these assets to the issuers and to the communities they serve has been a major factor that has led to very high recovery rates for this class of debt in situations of default, thereby justifying a two-notch uplift. The combination of the breadth of assets pledged and the bankruptcy-tested recovery experience has been unique to the US.

In some cases, there is only a one-notch differential between US first mortgage bonds and the senior unsecured rating. For instance, this is likely when the pledged property is not considered critical infrastructure for the region, or if the mortgage is materially weakened by carve-outs, lien releases or similar creditor-unfriendly terms.

Securitization

The use of securitization, a financing technique utilizing a discrete revenue stream (typically related to recovery of specifically defined expenses) that is dedicated to servicing specific securitization debt, has primarily been used in the US, where it has been pervasive in the past. The first generation of securitization bonds were primarily related to recovery of the negative difference between the market value of utilities' generation assets and their book value when certain states switched to competitive electric supply markets and utilities sold their generation (so-called stranded costs). This technique was then used for significant storm costs (especially hurricanes) and was eventually broadened to include environmental related expenditures, deferred fuel costs, or even deferred miscellaneous expenses. In its simplest form, a securitization isolates and dedicates a stream of cash flow into a separate special purpose entity (SPE). The SPE uses that stream of revenue and cash flow to provide annual debt service for the securitized debt instrument. Securitization is typically underpinned by specific legislation to segregate the securitization revenues from the utility's revenues to assure their continued collection, and the details of the enabling legislation may vary from state to state. The utility benefits from the securitization because it receives an immediate source of cash (although it gives up the opportunity to earn a return on the corresponding asset), and ratepayers benefit because the cost of the securitized debt is lower than the utility's cost of debt and much lower than its all-in cost of capital, which reduces the revenue requirement associated with the cost recovery.

In the presentation of US securitization debt in published financial ratios, we make our own assessment of the appropriate credit representation but in most cases follow the accounting in audited statements under US Generally Accepted Accounting Principles (GAAP), which in turn considers the terms of enabling legislation. As a result, accounting treatment may vary. In most states, utilities have been required to consolidate securitization debt under GAAP, even though it is technically non-recourse.

In general, we view securitization debt of utilities as being on-credit debt, in part because the rates associated with it reduce the utility's headroom to increase rates for other purposes while keeping all-in rates affordable to customers. Thus, where accounting treatment is off balance sheet, we adjust the company's ratios by including the securitization debt and related revenues for our analysis. Where the securitized debt is on balance sheet, our credit analysis focuses on the ratios that exclude securitization debt and related revenues. Since securitization debt amortizes mortgage-style, including it makes ratios look worse in early years (when most of the revenue collected goes to pay interest) and better in later years (when most of the revenue collected goes to pay principal).

Appendix C: Treatment of Power Purchase Agreements ("PPAs")

Although many utilities own and operate power stations, some have entered into PPAs to source electricity from third parties to satisfy retail demand. The motivation for these PPAs may be one or more of the following: to outsource operating risks to parties more skilled in power station operation, to provide certainty of supply, to reduce balance sheet debt, to fix the cost of power, or to comply with regulatory mandates regarding power sourcing, including renewable portfolio standards. While we regard PPAs that reduce operating or financial risk as a credit positive, some aspects of PPAs may negatively affect the credit of utilities. The most conservative treatment would be to treat a PPA as a debt obligation of the utility as, by paying the capacity charge, the utility is effectively providing the funds to service the debt associated with the power station. At the other end of the continuum, the financial obligations of the utility could also be regarded as an ongoing operating cost, with no long-term capital component recognized.

Under most PPAs, a utility is obliged to pay a capacity charge to the power station owner (which may be another utility or an Independent Power Producer – IPP); this charge typically covers a portion of the IPP's fixed costs in relation to the power available to the utility. These fixed payments usually help to cover the IPP's debt service and are made irrespective of whether the utility calls on the IPP to generate and deliver power. When the utility requires generation, a further energy charge, to cover the variable costs of the IPP, will also typically be paid by the utility. Some other similar arrangements are characterized as tolling agreements, or long-term supply contracts, but most have similar features to PPAs and thus we analyze them as PPAs.

PPAs are recognized qualitatively to be a future use of cash whether or not they are treated as debt-like obligations in financial ratios

The starting point of our analysis is the issuer's audited financial statements – we consider whether the utility's accountants determine that the PPA should be treated as a debt equivalent, a capitalized lease, an operating lease, or in some other manner. PPAs have a wide variety of operational and financial terms, and it is our understanding that accountants are required to have a very granular view into the particular contractual arrangements in order to account for these PPAs in compliance with applicable accounting rules and standards. However, accounting treatment for PPAs may not be entirely consistent across US GAAP, IFRS or other accounting frameworks. In addition, we may consider that factors not incorporated into the accounting treatment may be relevant (which may include the scale of PPA payments, their regulatory treatment including cost recovery mechanisms, or other factors that create financial or operational risk for the utility that is greater, in our estimation, than the benefits received). When the accounting treatment of a PPA is a debt or lease equivalent (such that it is reported on the balance sheet, or disclosed as an operating lease and thus included in our adjusted debt calculation), we generally do not make adjustments to remove the PPA from the balance sheet.

However, in relevant circumstances we consider making adjustments that impute a debt equivalent to PPAs that are off-balance sheet for accounting purposes.

Regardless of whether we consider that a PPA warrants or does not warrant treatment as a debt obligation, we assess the totality of the impact of the PPA on the issuer's probability of default. Costs of a PPA that cannot be recovered in retail rates create material risk, especially if they also cannot be recovered through market sales of power.

Additional considerations for PPAs

PPAs have a wide variety of financial and regulatory characteristics, and we may treat each particular circumstance differently. Factors which determine where on the continuum we treat a particular PPA include the following:

» **Risk management:** An overarching principle is that PPAs have normally been used by utilities as a risk management tool and we recognize that this is the fundamental reason for their existence. Thus, we will not automatically penalize utilities for entering into contracts for the purpose of reducing risk associated with power price and availability. Rather, we will look at the aggregate commercial position, evaluating the risk to a utility's purchase and supply obligations. In addition, PPAs are similar to other long-term supply contracts used by other industries and their treatment should not therefore be fundamentally different from that of other contracts of a similar nature.

- **Pass-through capability:** Some utilities have the ability to pass through the cost of purchasing power under PPAs to their customers. As a result, the utility takes no risk that the cost of power is greater than the retail price it will receive. Accordingly we regard these PPA obligations as operating costs with no long-term debt-like attributes. PPAs with no pass-through ability have a greater risk profile for utilities. In some markets, the ability to pass through costs of a PPA is enshrined in the regulatory framework, and in others can be dictated by market dynamics. As a market becomes more competitive or if regulatory support for cost recovery deteriorates, the ability to pass through costs may decrease and, as circumstances change, our treatment of PPA obligations will alter accordingly.
- **Price considerations:** The price of power paid by a utility under a PPA can be substantially above or below the market price of electricity. A below-market price will motivate the utility to purchase power from the IPP in excess of its retail requirements, and to sell excess electricity in the spot market. This can be a significant source of cash flow for some utilities. On the other hand, utilities that are compelled to pay capacity payments to IPPs when they have no demand for the power or at an above-market price may suffer a financial burden if they do not get full recovery in retail rates. We will focus particularly on PPAs that have mark-to-market losses, which typically indicates that they have a material impact on the utility's cash flow.
- **Excess reserve capacity:** In some jurisdictions, there is substantial reserve capacity and thus a significant probability that the electricity available to a utility under PPAs will not be required by the market. This increases the risk to the utility that capacity payments will need to be made when there is no demand for the power. We may determine that all of a utility's PPAs represent excess capacity, or that a portion of PPAs are needed for the utility's supply obligations plus a normal reserve margin, while the remaining portion represents excess capacity. In the latter case, we may impute debt to specific PPAs that are excess or take a proportional approach to all of the utility's PPAs.
- **Risk-sharing:** Utilities that own power plants bear the associated operational, fuel procurement and other risks. These must be balanced against the financial and liquidity risk of contracting for the purchase of power under a PPA. We will examine on a case-by case basis the relative credit risk associated with PPAs in comparison to plant ownership.
- **Purchase requirements:** Some PPAs are structured with either options or requirements to purchase the asset at the end of the PPA term. If the utility has an economically meaningful requirement to purchase, we would most likely consider it to be a debt obligation. In most such cases, the obligation would already receive on-balance sheet treatment under relevant accounting standards.
- **Default provisions:** In most cases, the remedies for default under a PPA do not include acceleration of amounts due, and in many cases PPAs would not be considered as debt in a bankruptcy scenario and could potentially be cancelled. Thus, PPAs may not materially increase Loss Given Default for the utility. In addition, PPAs are not typically considered debt for cross-default provisions under a utility's debt and liquidity arrangements. However, the existence of non-standard default provisions that are debt-like would have a large impact on our treatment of a PPA. In addition, payments due under PPAs are senior unsecured obligations, and any inability of the utility to make them materially increases default risk.

Methods for estimating a liability amount for PPAs

According to the weighting and importance of the PPA to each utility and the level of disclosure, we may approximate a debt obligation equivalent for PPAs using one or more of the methods discussed below. In each case, we look holistically at the PPA's credit impact on the utility, including the ability to pass through costs and curtail payments, the materiality of the PPA obligation to the overall business risk and cash flows of the utility, operational constraints that the PPA imposes, the maturity of the PPA obligation, the impact of purchased power on market-based power sales (if any) that the utility will engage in, and our view of future market conditions and volatility.

- **Operating cost:** If a utility enters into a PPA for the purpose of providing an assured supply and there is reasonable assurance that regulators will allow the costs to be recovered in regulated rates, we may view the PPA as being most akin to an operating cost. Provided that the accounting treatment for the PPA is, in this circumstance, off-balance sheet, we will most likely make no adjustment to bring the obligation onto the utility's balance sheet.

- **Annual obligation x 6:** In some situations, the PPA obligation may be estimated by multiplying the annual payments by a factor of six (in most cases). This method is sometimes used in the capitalization of operating leases. This method may be used as an approximation where the analyst determines that the obligation is significant but cannot otherwise be quantified due to limited information.
- **Net present value:** Where the analyst has sufficient information, we may add the NPV of the stream of PPA payments to the debt obligations of the utility. The discount rate used will be our estimate of the cost of capital of the utility.
- **Debt look-through:** In some circumstances, where the debt incurred by the IPP is directly related to the off-taking utility, there may be reason to allocate the entire debt (or a proportional part related to share of power dedicated to the utility) of the IPP to that of the utility.
- **Mark-to-market:** In situations in which we believe that the PPA prices exceed the market price and thus will create an ongoing liability for the utility, we may use a net mark-to-market method, in which the NPV of the utility's future out-of-the-money net payments will be added to its total debt obligations.
- **Consolidation:** In some instances where the IPP is wholly dedicated to the utility, it may be appropriate to consolidate the debt and cash flows of the IPP with that of the utility. If the utility purchases only a portion of the power from the IPP, then that proportion of debt might be consolidated with the utility.

If we have determined to impute debt to a PPA for which the accounting treatment is not on-balance sheet, we will, in some circumstances, use more than one method to estimate the debt equivalent obligations imposed by the PPA, and compare results. If circumstances (including regulatory treatment or market conditions) change over time, the approach that is used may also vary.

Moody's related publications

Credit ratings are primarily determined through the application of sector credit rating methodologies. Certain broad methodological considerations (described in one or more cross-sector methodologies) may also be relevant to the determination of credit ratings of issuers and instruments. A list of sector and cross-sector methodologies can be found here.

(collectively, the "Moody's Non-NRSRO CRAs") are all indirectly wholly-owned credit rating agency subsidiaries of MCO. None of the Moody's Non-NRSRO CRAs is a Nationally Recognized Statistical Rating Organization.
Additional terms for Australia only: Any publication into Australia of this document is pursuant to the Australian Financial Services License of MOODY'S affiliate, Moody's Investors Service Pty Limited ABN 61 003 399 657AFSL 336969 and/or Moody's Analytics Australia Pty Ltd ABN 94 105 136 972 AFSL 383569 (as applicable). This document is intended to be provided only to "wholesale clients" within the meaning of section 761G of the Corporations Act 2001. By continuing to access this document from within Australia, you represent to MOODY'S that you are, or are accessing the document as a representative of, a "wholesale client" and that neither you nor the entity you represent will directly or indirectly disseminate this document or its contents to "retail clients" within the meaning of section 761G of the Corporations Act 2001. MOODY'S credit rating is an opinion as to the creditworthiness of a debt obligation of the issuer, not on the equity securities of the issuer or any form of security that is available to retail investors.
Additional terms for India only: Moody's credit ratings, Assessments, other opinions and Materials are not intended to be and shall not be relied upon or used by any users located in India in relation to securities listed or proposed to be listed on Indian stock exchanges.
Additional terms with respect to Second Party Opinions (as defined in Moody's Investors Service Rating Symbols and Definitions): Please note that a Second Party Opinion ("SPO") is not a "credit rating". The issuance of SPOs is not a regulated activity in many jurisdictions, including Singapore. JAPAN: In Japan, development and provision of SPOs fall under the category of "Ancillary Businesses", not "Credit Rating Business", and are not subject to the regulations applicable to "Credit Rating Business" under the Financial Instruments and Exchange Act of Japan and its relevant regulation. PRC: Any SPO: (1) does not constitute a PRC Green Bond Assessment as defined under any relevant PRC laws or regulations; (2) cannot be included in any registration statement, offering circular, prospectus or any other documents submitted to the PRC regulatory authorities or otherwise used to satisfy any PRC regulatory disclosure requirement; and (3) cannot be used within the PRC for any regulatory purpose or for any other purpose which is not permitted under relevant PRC laws or regulations. For the purposes of this disclaimer, "PRC" refers to the mainland of the People's Republic of China, excluding Hong Kong, Macau and Taiwan.

This publication does not announce a credit rating action. For any credit ratings referenced in this publication, please see the issuer/deal page on https://ratings.moodys.com for the most updated credit rating action information and rating history.

Corporate Methodology

January 7, 2024

*(**Editor's Note:** On July 7, 2025, we republished this criteria article to make nonmaterial changes. See the "Revisions And Updates" section for details.)*

1. These criteria present S&P Global Ratings' methodology for rating corporate industrial companies and utilities. The criteria organize the analytical process according to a common framework and articulate the steps in developing the stand-alone credit profile (SACP) and issuer credit rating (ICR) for a corporate entity. For the credit factors and typical assumptions that we use in our analysis of specific corporate sectors, see "Sector-Specific Corporate Methodology."
2. This article is related to our criteria article "Principles Of Credit Ratings."

SUMMARY OF THE CRITERIA

3. The criteria describe the methodology we use to determine the SACP and ICR for corporate industrial companies and utilities. Our assessment reflects these companies' business risk profiles, their financial risk profiles, and other factors that may modify the SACP outcome (see "General Criteria: Stand-Alone Credit Profiles: One Component Of A Rating," for the definition of SACP). The criteria provide clarity on how we determine an issuer's SACP and ICR and are more specific in detailing the various factors of the analysis. The criteria also provide clear guidance on how we use these factors as part of determining an issuer's ICR. S&P Global Ratings intends for these criteria to provide the market with a framework that clarifies our approach to fundamental analysis of corporate credit risks.
4. The business risk profile comprises the risk and return potential for a company in the markets in which it participates, the competitive climate within those markets (its industry risk), the country risks within those markets, and the competitive advantages and disadvantages the company has within those markets (its competitive position). The business risk profile affects the amount of financial risk that a company can bear at a given SACP level and constitutes the foundation for a company's expected economic success. We combine our assessments of industry risk, country risk, and competitive position to determine the assessment for a corporation's business risk profile.
5. The financial risk profile is the outcome of decisions that management makes in the context of its business risk profile and its financial risk tolerances. This includes decisions about the manner in which management seeks funding for the company and how it constructs its balance sheet. It also reflects the relationship of the cash flows the organization can achieve, given its business risk profile, to the company's financial obligations. The criteria use cash flow/leverage analysis to determine a corporate issuer's financial risk profile assessment.

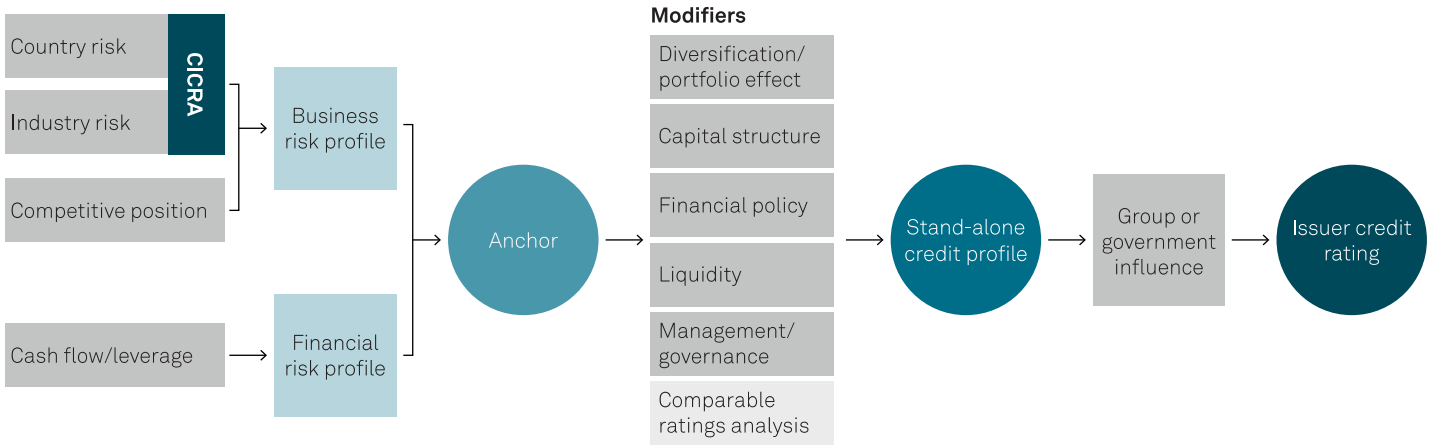
6. We then combine an issuer's business risk profile assessment and its financial risk profile assessment to determine its anchor (see table 3).
7. Additional rating factors can modify the anchor. These are: diversification/portfolio effect, capital structure, financial policy, liquidity, and management and governance. Comparable ratings analysis is the last analytical factor under the criteria to determine the final SACP on a company.
8. These criteria are complemented by "Sector-Specific Corporate Methodology." The sector-specific criteria provide guidelines on the analytical factors we consider when applying the corporate criteria to certain sectors, and may supersede certain provisions of these criteria in the analysis.

SCOPE OF THE CRITERIA



9. This methodology applies to nonfinancial corporate issuer credit ratings globally. Please see "Recovery Rating Criteria For Speculative-Grade Corporate Issuers," and "Reflecting Subordination Risk In Corporate Issue Ratings," for further information on our methodology for determining issue ratings.
10. This methodology does not apply to the following sectors, based on the unique characteristics of these sectors, which require either a different framework of analysis or substantial modifications to one or more factors of analysis: project finance entities, project developers, commodities trading, investment holding companies and companies that maximize their returns by buying and selling equity holdings over time, Japanese general trading companies, corporate securitizations, nonprofit and cooperative organizations (other than agricultural cooperatives), and other entities whose cash flows are primarily derived from partially owned equity holdings.

METHODOLOGY

A. Corporate Ratings Framework

11. The corporate analytical methodology organizes the analytical process according to a common framework, and it divides the task into several factors so that S&P Global Ratings considers all salient issues. First, we analyze the company's business risk profile, then evaluate its financial risk profile, then combine those to determine an issuer's anchor. We then analyze six factors that could potentially modify our anchor conclusion.
12. To determine the assessment for a corporate issuer's business risk profile, the criteria combine our assessments of industry risk, country risk, and competitive position. Cash flow/leverage analysis determines a company's financial risk profile assessment. The analysis then combines the corporate issuer's business risk profile assessment and its financial risk profile assessment to determine its anchor. In general, the analysis weighs the business risk profile more heavily for investment-grade anchors, while the financial risk profile carries more weight for speculative-grade anchors.
13. After we determine the anchor, we use additional factors to modify the anchor. These factors are: diversification/portfolio effect, capital structure, financial policy, liquidity, and management and governance. The assessment of each factor can raise or lower the anchor by one or more notches--or have no effect. These conclusions take the form of assessments and descriptors for each factor that determine the number of notches to apply to the anchor.
14. The last analytical factor the criteria call for is comparable ratings analysis, which may raise or lower the anchor by one notch based on a holistic view of the company's credit characteristics.

Corporate criteria framework

CICRA--Corporate industry and country risk assessment. Source: S&P Global Ratings.

15. The three analytic factors within the business risk profile generally are a blend of qualitative assessments and quantitative information. Qualitative assessments distinguish risk factors, such as a company's competitive advantages, that we use to assess its competitive position. Quantitative information includes, for example, historical cyclicality of revenues and profits that we review when assessing industry risk. It can also include the volatility and level of profitability we consider in order to assess a company's competitive position. The assessments for business risk profile are: 1, excellent; 2, strong; 3, satisfactory; 4, fair; 5, weak; and 6, vulnerable.
16. In assessing cash flow/leverage to determine the financial risk profile, the analysis focuses on quantitative measures. The assessments for financial risk profile are: 1, minimal; 2, modest; 3, intermediate; 4, significant; 5, aggressive; and 6, highly leveraged.
17. The ICR results from the combination of the SACP and the support framework, which determines the extent of the difference between the SACP and the ICR, if any, for group or government influence. Extraordinary influence is then captured in the ICR. Please see "Group Rating Methodology," and "Rating Government-Related Entities: Methodology And Assumptions," for our methodology on group and government influence.
18. Ongoing support or negative influence from a government (for government-related entities), or from a group, is factored into the SACP (see "SACP criteria"). While such ongoing support/negative influence does not affect the industry or country risk assessment, it can affect any other factor in business or financial risk. For example, such support or negative influence can affect: national industry analysis, other elements of competitive position, financial risk profile, the liquidity assessment, and comparable ratings analysis.
19. The application of these criteria will result in an SACP that could then be constrained by the relevant sovereign rating and transfer and convertibility (T&C) assessment affecting the entity when determining the ICR. In order for the final ICR to be higher than the applicable sovereign rating or T&C assessment, the entity will have to meet the conditions established in "Ratings Above The Sovereign--Corporate And Government Ratings: Methodology And Assumptions."

1. Determining the business risk profile assessment

20. Under the criteria, the combined assessments for country risk, industry risk, and competitive

position determine a company's business risk profile assessment. A company's strengths or weaknesses in the marketplace are vital to its credit assessment. These strengths and weaknesses determine an issuer's capacity to generate cash flows in order to service its obligations in a timely fashion.

21. Industry risk, an integral part of the credit analysis, addresses the relative health and stability of the markets in which a company operates. The range of industry risk assessments is: 1, very low risk; 2, low risk; 3, intermediate risk; 4, moderately high risk; 5, high risk; and 6, very high risk. The treatment of industry risk is in section B.

22. Country risk addresses the economic risk, institutional and governance effectiveness risk, financial system risk, and payment culture or rule of law risk in the countries in which a company operates. The range of country risk assessments is: 1, very low risk; 2, low risk; 3, intermediate risk; 4, moderately high risk; 5, high risk; and 6, very high risk. The treatment of country risk is in section C.

23. The evaluation of an enterprise's competitive position identifies entities that are best positioned to take advantage of key industry drivers or to mitigate associated risks more effectively--and achieve a competitive advantage and a stronger business risk profile than that of entities that lack a strong value proposition or are more vulnerable to industry risks. The range of competitive position assessments is: 1, excellent; 2, strong; 3, satisfactory; 4, fair; 5, weak; and 6, vulnerable. The full treatment of competitive position is in section D.

24. The combined assessment for country risk and industry risk is known as the issuer's Corporate Industry and Country Risk Assessment (CICRA). Table 1 shows how to determine the combined assessment for country risk and industry risk.

Table 1

Determining The CICRA

	--Country risk assessment--					
Industry risk assessment	**1 (very low risk)**	**2 (low risk)**	**3 (intermediate risk)**	**4 (moderately high risk)**	**5 (high risk)**	**6 (very high risk)**
1 (very low risk)	1	1	1	2	4	5
2 (low risk)	2	2	2	3	4	5
3 (intermediate risk)	3	3	3	3	4	6
4 (moderately high risk)	4	4	4	4	5	6
5 (high risk)	5	5	5	5	5	6
6 (very high risk)	6	6	6	6	6	6

25. The CICRA is combined with a company's competitive position assessment in order to create the issuer's business risk profile assessment. Table 2 shows how we combine these assessments.

Table 2

Determining The Business Risk Profile Assessment

	--CICRA--					
Competitive position assessment	**1**	**2**	**3**	**4**	**5**	**6**
1 (excellent)	1	1	1	2	3*	5
2 (strong)	1	2	2	3	4	5
3 (satisfactory)	2	3	3	3	4	6

Table 2

Determining The Business Risk Profile Assessment (cont.)

	--CICRA--					
Competitive position assessment	**1**	**2**	**3**	**4**	**5**	**6**
4 (fair)	3	4	4	4	5	6
5 (weak)	4	5	5	5	5	6
6 (vulnerable)	5	6	6	6	6	6

*See paragraph 26.

26. A small number of companies with a CICRA of 5 may be assigned a business risk profile assessment of 2 if all of the following conditions are met:

- The company's competitive position assessment is 1.
- The company's country risk assessment is no riskier than 3.
- The company produces significantly better-than-average industry profitability, as measured by the level and volatility of profits.
- The company's competitive position within its sector transcends its industry risks due to unique competitive advantages with its customers, strong operating efficiencies not enjoyed by the large majority of the industry, or scale/scope/diversity advantages that are well beyond the large majority of the industry.

27. For issuers with multiple business lines, the business risk profile assessment is based on our assessment of each of the factors--country risk, industry risk, and competitive position--as follows:

- Country risk: We use the weighted average of the country risk assessments for the company across all countries where companies generate more than 5% of sales or EBITDA, or where more than 5% of fixed assets are located.
- Industry risk: We use the weighted average of the industry risk assessments for all business lines representing more than 20% of the company's forecasted earnings, revenues or fixed assets, or other appropriate financial measures if earnings, revenue, or fixed assets do not accurately reflect the exposure to an industry.
- Competitive position: We assess all business lines identified above for the components competitive advantage, scope/scale/diversity, and operating efficiency (see section D). They are then blended using a weighted average of revenues, earnings, or assets to form the preliminary competitive position assessment. The level of profitability and volatility of profitability are then assessed based on the consolidated financials for the enterprise. The preliminary competitive position assessment is then blended with the profitability assessment, as per section D.5, to assess competitive position for the enterprise.

2. Determining the financial risk profile assessment

28. Under the criteria, cash flow/leverage analysis is the foundation for assessing a company's financial risk profile. The range of assessments for a company's cash flow/leverage is 1, minimal; 2, modest; 3, intermediate; 4, significant; 5, aggressive; and 6, highly leveraged. To determine the financial risk profile assessment for a company that operates in more than one industry sector, we

use a specific ratio benchmark table (see tables 17, 18, and 19). We choose the appropriate benchmark table based on the company's fit into one of the sector descriptions as detailed in "Sector-Specific Corporate Methodology." The choice of which core and supplemental ratios to apply is also governed by the same industry sector, even if the company is engaged in several industry sectors such that its business risk profile assessment reflects a blended industry approach. Guidelines about which core and supplemental ratios to apply for each industry sector are also found in "Sector-Specific Corporate Methodology." For the full treatment of cash flow/leverage analysis, see section E.

3. Merger of financial risk profile and business risk profile assessments

29. An issuer's business risk profile assessment and its financial risk profile assessment are combined to determine its anchor (see table 3). If we view an issuer's capital structure as unsustainable or if its obligations are currently vulnerable to nonpayment, and if the obligor is dependent upon favorable business, financial, and economic conditions to meet its commitments on its obligations, then we will determine the issuer's SACP using "Criteria For Assigning 'CCC+', 'CCC', 'CCC-', And 'CC' Ratings." If the issuer meets the conditions for assigning 'CCC+', 'CCC', 'CCC-', and 'CC' ratings, we will not apply Table 3.

Table 3

Combining The Business And Financial Risk Profiles To Determine The Anchor

	--Financial risk profile--					
Business risk profile	**1 (minimal)**	**2 (modest)**	**3 (intermediate)**	**4 (significant)**	**5 (aggressive)**	**6 (highly leveraged)**
1 (excellent)	aaa/aa+	aa	a+/a	a-	bbb	bbb-/bb+
2 (strong)	aa/aa-	a+/a	a-/bbb+	bbb	bb+	bb
3 (satisfactory)	a/a-	bbb+	bbb/bbb-	bbb-/bb+	bb	b+
4 (fair)	bbb/bbb-	bbb-	bb+	bb	bb-	b
5 (weak)	bb+	bb+	bb	bb-	b+	b/b-
6 (vulnerable)	bb-	bb-	bb-/b+	b+	b	b-

30. When two anchor outcomes are listed for a given combination of business risk profile assessment and financial risk profile assessment, an issuer's anchor is determined as follows:

- When a company's financial risk profile is 4 or stronger (meaning, 1-4), its anchor is based on the comparative strength of its business risk profile. We consider our assessment of the business risk profile for corporate issuers to be points along a possible range within its category (e.g., "strong"). Consequently, each of these assessments that ultimately generate the business risk profile for a specific issuer can be at the upper or lower end of such a range. Issuers with a stronger business risk profile for the range of anchor outcomes will be assigned the higher anchor. Those with a weaker business risk profile for the range of anchor outcomes will be assigned the lower anchor.
- When a company's financial risk profile is 5 or 6, its anchor is based on the comparative strength of its financial risk profile. Issuers with stronger cash flow/leverage ratios for the range of anchor outcomes will be assigned the higher anchor. Issuers with weaker cash flow/leverage ratios for the range of anchor outcomes will be assigned the lower anchor. For example, a company with a business risk profile of (1) excellent and a financial risk profile of (6) highly leveraged would generally be assigned an anchor of 'bb+' if its ratio of debt to EBITDA

was 8x or greater and there were no offsetting factors to such a high level of leverage.

4. Building on the anchor

31. The analysis of diversification/portfolio effect, capital structure, financial policy, liquidity, and management and governance may raise or lower a company's anchor. The assessment of each modifier can raise or lower the anchor by one or more notches--or have no effect in some cases (see tables 4 and 5). We express these conclusions using specific assessments and descriptors that determine the number of notches to apply to the anchor. However, this notching in aggregate can't lower an issuer's anchor below 'b-' (see "Criteria For Assigning 'CCC+', 'CCC', 'CCC-', And 'CC' Ratings," for the methodology we use to assign 'CCC' and 'CC' category SACPs and ICRs to issuers).

32. The analysis of the modifier diversification/portfolio effect identifies the benefits of diversification across business lines. The diversification/portfolio effect assessments are 1, significant diversification; 2, moderate diversification; and 3, neutral. The impact of this factor on an issuer's anchor is based on the company's business risk profile assessment and is described in Table 4. Multiple earnings streams (which are evaluated within a firm's business risk profile) that are less-than-perfectly correlated reduce the risk of default of an issuer (see Appendix D). We determine the impact of this factor based on the business risk profile assessment because the benefits of diversification are significantly reduced with poor business prospects. The full treatment of diversification/portfolio effect analysis is the subject of section F.

Table 4

Modifier Step 1: Impact Of Diversification/Portfolio Effect On The Anchor

	--Business risk profile assessment--					
Diversification/portfolio effect	**1 (excellent)**	**2 (strong)**	**3 (satisfactory)**	**4 (fair)**	**5 (weak)**	**6 (vulnerable)**
1 (significant diversification)	+2 notches	+2 notches	+2 notches	+1 notch	+1 notch	0 notches
2 (moderate diversification)	+1 notch	+1 notch	+1 notch	+1 notch	0 notches	0 notches
3 (neutral)	0 notches	0 notches	0 notches	0 notches	0 notches	0 notches

33. After we adjust for the diversification/portfolio effect, we determine the impact of the other modifiers: capital structure, financial policy, liquidity, and management and governance. We apply these four modifiers in the order listed in Table 5. As we go down the list, a modifier may (or may not) change the anchor to a new range (one of the ranges in the four right-hand columns in the table). We'll choose the appropriate value from the new range, or column, to determine the next modifier's effect on the anchor. And so on, until we get to the last modifier on the list--management and governance. For example, let's assume that the anchor, after adjustment for diversification/portfolio effect but before adjusting for the other modifiers, is 'a'. If the capital structure assessment is very negative, the indicated anchor drops two notches, to 'bbb+'. So, to determine the impact of the next modifier--financial policy--we go to the column 'bbb+ to bbb-' and find the appropriate assessment--in this theoretical example, positive. Applying that assessment moves the anchor up one notch, to the 'a- and higher' category. In our example, liquidity is strong, so the impact is zero notches and the anchor remains unchanged. Management and governance is neutral, and thus the anchor remains 'a-' (see chart following table 5).

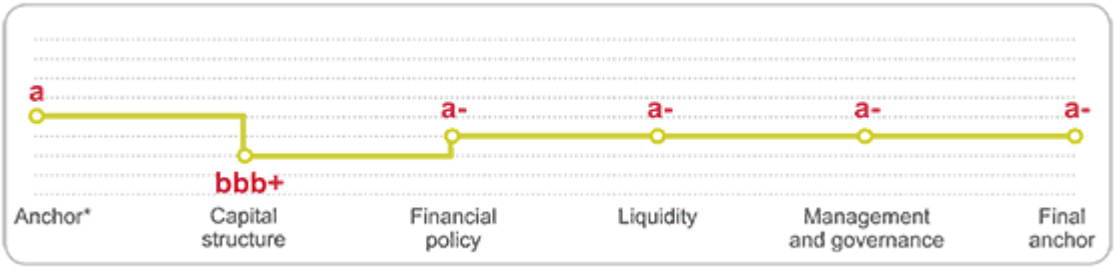

Table 5

Modifier Step 2: Impact Of Remaining Modifier Factors On The Anchor

	--Anchor range--			
	'a-' and higher	**'bbb+' to 'bbb-'**	**'bb+' to 'bb-'**	**'b+' and lower**
Factor/Assessment				
Capital structure (see section G)				
1 (Very positive)	2 notches	2 notches	2 notches	2 notches
2 (Positive)	1 notch	1 notch	1 notch	1 notch
3 (Neutral)	0 notches	0 notches	0 notches	0 notches
4 (Negative)	-1 notch	-1 notch	-1 notch	-1 notch
5 (Very negative)	-2 or more notches	-2 or more notches	-2 or more notches	-2 notches
Financial policy (FP; see section H)				
1 (Positive)	+1 notch if M&G is at least neutral	+1 notch if M&G is at least neutral	+1 notch if liquidity is at least adequate and M&G is at least neutral	+1 notch if liquidity is at least adequate and M&G is at least neutral
2 (Neutral)	0 notches	0 notches	0 notches	0 notches
3 (Negative)	-1 to -3 notches(1)	-1 to -3 notches(1)	-1 to -2 notches(1)	-1 notch
4 (FS-4, FS-5, FS-6, FS-6 [minus])	N/A(2)	N/A(2)	N/A(2)	N/A(2)
Liquidity (see section I)				
1 (Exceptional)	0 notches	0 notches	0 notches	+1 notch if FP is positive, neutral, FS-4, or FS-5 (3)
2 (Strong)	0 notches	0 notches	0 notches	+1 notch if FP is positive, neutral, FS-4, or FS-5 (3)
3 (Adequate)	0 notches	0 notches	0 notches	0 notches
4 (Less than adequate [4])	N/A	N/A	-1 notch(5)	0 notches
5 (Weak)	N/A	N/A	N/A	'b-' cap on SACP
Management and governance (M&G; see section J)				
1 (Positive)	0 notches	0 notches	0, +1 notches(6)	0, +1 notches(6)
2 (Neutral)	0 notches	0 notches	0 notches	0 notches
3 (Moderately Negative)	-1 notch	0, or -1 notches(7)	0, or -1 notches(7)	0, or -1 notches(7)
4 (Negative)	-2 or more notches(7)	-2 or more notches(7)	-1 or more notches(7)	-1 or more notches(7)

(1) Number of notches depends on potential incremental leverage. (2) See "Financial Policy," section H.2. (3) Additional notch applies only if we expect liquidity to remain exceptional or strong. (4) See "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers." SACP is capped at 'bb+.' (5) If issuer SACP is 'bb+' due to cap, there is no further notching. (6) This adjustment is one notch if we have not already captured benefits of positive management and governance in the analysis of the issuer's competitive position. (7) Number of notches depends upon the degree of negative effect to the enterprise's risk profile.

Example: How Remaining Modifiers Can Change The Anchor

*After adjusting for diversification/portfolio effect. See paragraph 33.

34. Our analysis of a firm's capital structure assesses risks in the firm's capital structure that may not arise in the review of its cash flow/leverage. These risks include the currency risk of debt, debt maturity profile, interest rate risk of debt, and an investments subfactor. We assess a corporate issuer's capital structure on a scale of 1, very positive; 2, positive; 3, neutral; 4, negative; and 5, very negative. The full treatment of capital structure is the subject of section G.

35. Financial policy serves to refine the view of a company's risks beyond the conclusions arising from the standard assumptions in the cash flow/leverage, capital structure, and liquidity analyses. Those assumptions do not always reflect or adequately capture the long-term risks of a firm's financial policy. The financial policy assessment is, therefore, a measure of the degree to which owner/managerial decision-making can affect the predictability of a company's financial risk profile. We assess financial policy as 1) positive, 2) neutral, 3) negative, or as being owned by a financial sponsor. We further identify financial sponsor-owned companies as 'FS-4', 'FS-5', 'FS-6', or 'FS-6 (minus)'. The full treatment of financial policy analysis is the subject of section H.

36. Our assessment of liquidity focuses on the monetary flows--the sources and uses of cash--that are the key indicators of a company's liquidity cushion. The analysis also assesses the potential for a company to breach covenant tests tied to declines in earnings before interest, taxes, depreciation, and amortization (EBITDA). The methodology incorporates a qualitative analysis that addresses such factors as the ability to absorb high-impact, low-probability events, the nature of bank relationships, the level of standing in credit markets, and the degree of prudence of the company's financial risk management. The liquidity assessments are 1, exceptional; 2, strong; 3, adequate; 4, less than adequate; and 5, weak. An SACP is capped at 'bb+' for issuers whose liquidity is less than adequate and 'b-' for issuers whose liquidity is weak, regardless of the assessment of any modifiers or comparable ratings analysis. (For the complete methodology on assessing corporate issuers' liquidity, see "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers.")

37. The analysis of governance considers the system of rules, procedures, statutory frameworks, and practices by which entities are directed and controlled, how they make decisions, comply with the law, and strike a balance between the interests of the company and those of its stakeholders with emphasis on creditors. The analysis of management relates to how effectively an entity's executives respond to strategic risks and opportunities, as well as management's depth and the reliability of its communications with stakeholders. We assess management and governance as: 1, positive; 2, neutral; 3, moderately negative; and 4, negative. Typically, investment-grade anchor outcomes reflect positive or neutral management and governance, so there is no incremental benefit. Alternatively, a moderately negative or negative assessment of management and governance can lead to a lower anchor. Also, we view a positive assessment for management and governance for a weaker entity as a favorable factor, under the criteria, which can have a positive

impact on the final SACP outcome. For the full treatment of management and governance, see "Management And Governance Credit Factors For Corporate Entities."

5. Comparable ratings analysis

38. The anchor, after adjusting for the modifiers, could change one notch up or down in order to arrive at an issuer's SACP based on our comparable ratings analysis, which is a holistic review of a company's stand-alone credit risk profile, in which we evaluate an issuer's credit characteristics in aggregate. A positive assessment leads to a one-notch improvement, a negative assessment leads to a one-notch reduction, and a neutral assessment indicates no change to the anchor. The application of comparable ratings analysis reflects the need to 'fine-tune' ratings outcomes, even after the use of each of the other modifiers. A positive or negative assessment is therefore likely to be common rather than exceptional.

B. Industry Risk

39. The analysis of industry risk addresses the major factors that S&P Global Ratings believes affect the risks that entities face in their respective industries. (See "Methodology: Industry Risk.")

C. Country Risk

40. The analysis of country risk addresses the major factors that S&P Global Ratings believes affect the country where entities operate. Country risks, which include economic, institutional and governance effectiveness, financial system, and payment culture/rule of law risks, influence overall credit risks for every rated corporate entity. (See "Country Risk Assessment Methodology And Assumptions.")

1. Assessing country risk for corporate issuers

41. The following paragraphs explain how the criteria determine the country risk assessment for a corporate entity. Once it's determined, we combine the country risk assessment with the issuer's industry risk assessment to calculate the issuer's CICRA (see section A, table 1). The CICRA is one of the factors of the issuer's business risk profile. If an issuer has very low to intermediate exposure to country risk, as represented by a country risk assessment of 1, 2, or 3, country risk is neutral to an issuer's CICRA. But if an issuer has moderately high to very high exposure to country risk, as represented by a country risk assessment of 4, 5, or 6, the issuer's CICRA could be influenced by its country risk assessment.

42. Corporate entities operating within a single country will receive a country risk assessment for that jurisdiction. For entities with exposure to more than one country, the criteria prospectively measure the proportion of exposure to each country based on forecasted EBITDA, revenues, or fixed assets, or other appropriate financial measures if EBITDA, revenue, or fixed assets do not accurately reflect the exposure to that jurisdiction.

43. Arriving at a company's blended country risk assessment involves multiplying its weighted-average exposures for each country by each country's risk assessment and then adding those numbers. For the weighted-average calculation, the criteria consider countries where the company generates more than 5% of its sales or where more than 5% of its fixed assets are located, and all weightings are rounded to the nearest 5% before averaging. We round the assessment to the nearest integer, so a weighted assessment of 2.2 rounds to 2, and a weighted

assessment of 2.6 rounds to 3 (see table 6).

Table 6

Hypothetical Example Of Weighted-Average Country Risk For A Corporate Entity

Country	Weighting (% of business*)	Country risk§	Weighted country risk
Country A	45	1	0.45
Country B	20	2	0.4
Country C	15	1	0.15
Country D	10	4	0.4
Country E	10	2	0.2
Weighted-average country risk assessment (rounded to the nearest whole number)	--	--	2

*Using EBITDA, revenues, fixed assets, or other financial measures as appropriate. §On a scale from 1-6, lowest to highest risk.

44. A weak link approach, which helps us calculate a blended country risk assessment for companies with exposure to more than one country, works as follows: If fixed assets are based in a higher-risk country but products are exported to a lower-risk country, the company's exposure would be to the higher-risk country. Similarly, if fixed assets are based in a lower-risk country but export revenues are generated from a higher-risk country and cannot be easily redirected elsewhere, we measure exposure to the higher-risk country. If a company's supplier is located in a higher-risk country, and its supply needs cannot be easily redirected elsewhere, we measure exposure to the higher-risk country. Conversely, if the supply chain can be re-sourced easily to another country, we would not measure exposure to the higher risk country.

45. Country risk can be mitigated for a company located in a single jurisdiction in the following narrow case. For a company that exports the majority of its products overseas and has no direct exposure to a country's banking system that would affect its funding, debt servicing, liquidity, or ability to transfer payments from or to its key counterparties, we could reduce the country risk assessment by one category (e.g., 5 to 4) to determine the adjusted country risk assessment. This would only apply for countries where we considered the financial system risk subfactor a constraint on the overall country risk assessment for that country. For such a company, other country risks are not mitigated: economic risk still applies, albeit less of a risk than for a company that sells domestically (potential currency volatility remains a risk for exporters); institutional and governance effectiveness risk still applies (political risk may place assets at risk); and payment culture/rule of law risk still applies (legal risks may place assets and cross-border contracts at risk).

46. Companies will often disclose aggregated information for blocks of countries, rather than disclosing individual country information. If the information we need to estimate exposure for all countries is not available, we use regional risk assessments. Regional risk assessments are calculated as averages of the unadjusted country risk assessments, weighted by gross domestic product of each country in a defined region. The criteria assess regional risk on a 1-6 scale (strongest to weakest). Please see Appendix A, Table 26, which lists the constituent countries of the regions.

47. If an issuer does not disclose its country-level exposure or regional-level exposure, its individual country risk exposures or regional exposures will be estimated.

2. Adjusting the country risk assessment for diversity

48. We will adjust the country risk assessment for a company that operates in multiple jurisdictions and demonstrates a high degree of diversity of country risk exposures. As a result of this diversification, the company could have less exposure to country risk than the rounded weighted average of its exposures might indicate. Accordingly, the country risk assessment for a corporate entity could be adjusted if an issuer meets the conditions outlined in paragraph 49.

49. The preliminary country risk assessment is raised by one category to reflect diversity if all of the following four conditions are met:

- If the company's head office, as defined in paragraph 51, is located in a country with a risk assessment stronger than the preliminary country risk assessment;
- If no country, with a country risk assessment equal to or weaker than the company's preliminary country risk assessment, represents or is expected to represent more than 20% of revenues, EBITDA, fixed assets, or other appropriate financial measures;
- If the company is primarily funded at the holding level, or through a finance subsidiary in a similar or stronger country risk environment than the holding company, or if any local funding could be very rapidly substituted at the holding level; and
- If the company's industry risk assessment is '4' or stronger.

50. The country risk assessment for companies that have 75% or more exposure to one jurisdiction cannot be improved and will, in most instances, equal the country risk assessment of that jurisdiction. But the country risk assessment for companies that have 75% or more exposure to one jurisdiction can be weakened if the balance of exposure is to higher risk jurisdictions.

51. We consider the location of a corporate head office relevant to overall risk exposure because it influences the perception of a company and its reputation--and can affect the company's access to capital. We determine the location of the head office on the basis of 'de facto' head office operations rather than just considering the jurisdiction of incorporation or stock market listing for public companies. De facto head office operations refers to the country where executive management and centralized high-level corporate activities occur, including strategic planning and capital raising. If such activities occur in different countries, we take the weakest country risk assessment applicable for the countries in which those activities take place.

D. Competitive Position

52. Competitive position encompasses company-specific factors that can add to, or partly offset, industry risk and country risk--the two other major factors of a company's business risk profile.

53. Competitive position takes into account a company's: 1) competitive advantage, 2) scale, scope, and diversity, 3) operating efficiency, and 4) profitability. A company's strengths and weaknesses on the first three components shape its competitiveness in the marketplace and the sustainability or vulnerability of its revenues and profit. Profitability can either confirm our initial assessment of competitive position or modify it, positively or negatively. A stronger-than-industry-average set of competitive position characteristics will strengthen a company's business risk profile. Conversely, a weaker-than-industry-average set of competitive position characteristics will weaken a company's business risk profile.

54. These criteria describe how we develop a competitive position assessment. They provide guidance on how we assess each component based on a number of subfactors. The criteria define the

weighting rules applied to derive a preliminary competitive position assessment. And they outline how this preliminary assessment can be maintained, raised, or lowered based on a company's profitability. S&P Global Ratings' competitive position analysis is both qualitative and quantitative.

1. The components of competitive position

55. A company's competitive position assessment can be: 1, excellent; 2, strong; 3, satisfactory; 4, fair; 5, weak; or 6, vulnerable.

56. The analysis of competitive position includes a review of:

- Competitive advantage;
- Scale, scope, and diversity;
- Operating efficiency; and
- Profitability.

57. We follow four steps to arrive at the competitive position assessment. First, we separately assess competitive advantage; scale, scope, and diversity; and operating efficiency (excluding any benefits or risks already captured in the issuer's CICRA assessment). Second, we apply weighting factors to these three components to derive a weighted-average assessment that translates into a preliminary competitive position assessment. Third, we assess profitability. Finally, we combine the preliminary competitive position assessment and the profitability assessment to determine the final competitive position assessment. Profitability can confirm, or influence positively or negatively, the competitive position assessment.

58. We assess the relative strength of each of the first three components by reviewing a variety of subfactors (see table 7). When quantitative metrics are relevant and available, we use them to evaluate these subfactors. However, our overall assessment of each component is qualitative. Our evaluation is forward-looking; we use historical data only to the extent that they provide insight into future trends.

59. We evaluate profitability by assessing two subcomponents: level of profitability (measured by historical and projected nominal levels of return on capital, EBITDA margin, and/or sector-specific metrics) and volatility of profitability (measured by historically observed and expected fluctuations in EBITDA, return on capital, EBITDA margin, or sector specific metrics). We assess both subcomponents in the context of the company's industry.

Table 7

Competitive Position Components And Subfactors

Component	Explanation	Subfactors
1. Competitive advantage (see Appendix B, section 1)	The strategic positioning and attractiveness to customers of a company's products or services, and the fragility or sustainability of its business model	• Strategy • Differentiation/uniqueness/product positioning/bundling • Brand reputation and marketing • Product and/or service quality • Barriers to entry and customers' switching costs • Technological advantage and capabilities and vulnerability to/ability to drive technological displacement • Asset base characteristics
2. Scale, scope, and diversity (see Appendix B, section 2)	The concentration or diversification of business activities	• Diversity of products or services • Geographic diversity • Volumes, size of markets and revenues, and market share • Maturity of products or services
3. Operating efficiency (see Appendix B, section 3)	The quality and flexibility of a company's asset base and its cost management and structure	• Cost structure • Manufacturing processes • Working capital management • Technology
4. Profitability		• Level of profitability (historical and projected return on capital, EBITDA margin, and/or sector-relevant measure) • Volatility of profitability

© Standard & Poor's 2013.

2. Assessing competitive advantage, scale, scope, and diversity, and operating efficiency

60. We assess competitive advantage; scale, scope, and diversity; and operating efficiency as: 1, strong; 2, strong/adequate; 3, adequate; 4, adequate/weak; or 5, weak. Tables 8, 9, and 10 provide guidance for assessing each component.

61. In assessing the components' relative strength, we place significant emphasis on comparative analysis. Peer comparisons provide context for evaluating the subfactors and the resulting component assessment. We review company-specific characteristics in the context of the company's industry, not just its narrower subsector. (See list of industries and subsectors in "Sector-Specific Corporate Methodology.") For example, when evaluating an airline, we will benchmark the assessment against peers in the broader transportation-cyclical industry (including the marine and trucking subsectors), and not just against other airlines. Likewise, we will compare a home furnishing manufacturer with other companies in the consumer durables industry, including makers of appliances or leisure products. We might occasionally extend the comparison to other industries if, for instance, a company's business lines cross several

industries, or if there are a limited number of rated peers in an industry, subsector, or region. Additionally, our qualitative assessment of a company's competitive position can be influenced by environmental and social credit factors that, in our view, could positively or negatively affect an obligor's competitive position. If material and sufficiently certain, we could, for example, capture such environmental and social credit factors in the subfactors of brand reputation and cost structure. For example, a negative compliance track record, or the prospect of rapidly increasing pressure with respect to carbon emissions regulation, can result in wide-ranging adverse credit impacts, including a decline in market position and a significant hit to brand reputation.

62. An assessment of strong means that the company's strengths on that component outweigh its weaknesses, and that the combination of relevant subfactors results in lower-than-average business risk in the industry. An assessment of adequate means that the company's strengths and weaknesses with respect to that component are balanced and that the relevant subfactors add up to average business risk in the industry. A weak assessment means that the company's weaknesses on that component override any strengths and that its subfactors, in total, reveal higher-than-average business risk in the industry.

63. Where a component is not clearly strong or adequate, we may assess it as strong/adequate. A component that is not clearly adequate or weak may end up as adequate/weak.

64. Although we review each subfactor, we don't assess each individually--and we seek to understand how they may reinforce or weaken each other. A component's assessment combines the relative strengths and importance of its subfactors. For any company, one or more subfactors can be unusually important--even factors that aren't common in the industry. The "Sector-Specific Corporate Methodology" can identify subfactors that are consistently more important, or happen not to be relevant, in a given industry.

65. Not all subfactors may be equally important, and a single one's strength or weakness may outweigh all the others. For example, if notwithstanding a track record of successful product launches and its strong brand equity, a company's strategy doesn't appear adaptable, in our view, to changing competitive dynamics in the industry, we will likely not assess its competitive advantage as strong. Similarly, if its revenues came disproportionately from a narrow product line, we might view this as compounding its risk of exposure to a small geographic market and, thus, assess its scale, scope, and diversity component as weak.

66. From time to time, companies will, as a result of shifting industry dynamics or strategies, expand or shrink their product or service lineups, alter their cost structures, encounter new competition, or have to adapt to new regulatory environments. In such instances, we will reevaluate all relevant subfactors (and component assessments).

Table 8

Competitive Advantage Assessment

Qualifier	What it means	Guidance
Strong	• The company has a major competitive advantage due to one or a combination of factors that supports revenue and profit growth, combined with lower-than-average volatility of profits. • There are strong prospects that the company can sustain this advantage over the long term. • This should enable the company to withstand economic downturns and competitive and technological threats better than its competitors can. • Any weaknesses in one or more subfactors are more than offset by strengths in other subfactors that produce sustainable and profitable revenue growth.	• The company's business strategy is highly consistent with, and adaptable to, industry trends and conditions and supports its leadership in the marketplace. • It consistently develops and markets well-differentiated products or services, aligns products with market demand, and enhances the attractiveness or uniqueness of its value proposition through bundling. • Its superior track record of product development, service quality, and customer satisfaction and retention support its ability to maintain or improve its market share. • Its products or services command a clear price premium relative to its competitors' thanks to its brand equity, technological leadership, or quality of service; it is able to sustain this advantage with innovation and effective marketing. • It benefits from barriers to entry from regulation, market characteristics, or intrinsic benefits (such as patents, technology, or customer relationships) that effectively reduce the threat of new competition. • It has demonstrated a commitment and ability to effectively reinvest in its asset base, as evidenced by a continuous pipeline of new products and/or improvement in key capabilities, such as employee retention, customer care, distribution, and supplier relations. These tangible and intangible assets support long term prospects of sustainable and profitable growth.
Adequate	• The company has some competitive advantages, but not so large as to create a superior business model or durable benefit compared to its peers'. • It has some but not all drivers of competitiveness. Certain factors support the business' long-term viability and should result in average profitability and average profit volatility during recessions or periods of increased competition. However, these drivers are partially offset by the company's disadvantages or lack of sustainability of other factors.	• The company's strategy is well adapted to marketplace conditions, but it is not necessarily a leader in setting industry trends. • It exhibits neither superior nor subpar abilities with respect to product or service differentiation and positioning. • Its products command no price premium or advantage relative to competing brands as a result of its brand equity or its technological positioning. • It may enjoy some barriers to entry that provide some defense against competitors but don't overpower them. It faces some risk of product/service displacement or substitution longer term. • Its metrics of product or service quality and customer satisfaction or retention are in line with its industry's average. The company could lose customers to competitors if it makes operational missteps. • Its asset profile does not exhibit particularly superior or inferior characteristics compared to other industry participants. These assets generate consistent revenue and profit growth although long-term prospects are subject to some uncertainty.

Weak	• The company has few, if any, competitive advantages and a number of competitive disadvantages. • Because the company lacks many competitive advantages, its long-term prospects are uncertain, and its profit volatility is likely to be higher than average for its industry. • The company is less likely than its competitors to withstand economic, competitive, or technological threats. • Alternatively, the company has weaknesses in one or more subfactors that could keep its profitability below average and its profit volatility above average during economic downturns or periods of increased competition.	• The company's strategy is inconsistent with, or not well adapted to, marketplace trends and conditions. • There is evidence of little innovation, slowness in developing and marketing new products, an inability to raise prices, and/or ineffective bundling. • Its products generally enjoy no price premium relative to competing brands and it often has to sell its products at a lower price than its peers can command. • It has suffered or is at risk of suffering customer defections due to falling quality and because customers perceive its products or services to be less valuable than those of its competitors. • Its revenues and market shares are vulnerable to aggressive pricing by existing or new competitors or to technological displacement risks over the near to medium term. • Its metrics of product or service quality and customer satisfaction or retention are weaker than the industry average. • Its reinvestment in its business is lower than its peers', its ability to retain operational talent is limited, its distribution network is inefficient, and its revenue could stagnate or decline as result.

© Standard & Poor's 2013.

Table 9

Scale, Scope, And Diversity

Qualifier	What it means	Guidance
Strong	• The company's overall scale, scope, and diversity supports stable revenues and profits by rendering it essentially invulnerable to all but the most disruptive combinations of adverse factors, events, or trends. • Its significant advantages in scale, scope, and diversity enable it to withstand economic, regional, competitive, and technological threats better than its competitors can.	• The company's range of products or services is among the most comprehensive in its sector. It derives its revenue and profits from a broader set of products or services than the industry average. • Its products and services enjoy industry-leading market shares relative to other participants in its industry. • It does not rely on a particular customer or small group of customers. If it does, the customer(s) is/are of high credit quality, their demand is highly sustainable, or the company and its customer(s) have significant interdependence. • It does not depend on any particular supplier or related group of suppliers that it could not easily replace. If it does, the supplier(s) is/are of high credit quality, or the company and its supplier(s) have significant interdependence. • It enjoys broader geographic diversity than its peers and doesn't overly depend on a single regional or local market. If it does, the market is local, often for regulatory reasons. The company's production or service centers are diversified across several locations. • It holds a strategic investment that provides positive business diversification.
Adequate	• The company's overall scale, scope, and diversity is comparable to its peers'. • Its ability to withstand economic, competitive, or technological threats is comparable to the ability of others within its sector.	• The company has a broad range of products or services compared with its competitors and doesn't depend on a particular product or service for the majority of its revenues and profits. • Its market share is average compared with that of its competitors. • Its dependence on or concentration of key customers is no higher than the industry average, and the loss of a top customer would be unlikely to pose a high risk to its business stability. • It isn't overly dependent on any supplier or regional group of suppliers that it couldn't easily replace. • It doesn't depend excessively on a single local or regional market, and its geographic footprint of production and revenue compares with that of other industry participants.

Weak	• The company's lack of scale, scope, and diversity compromises the stability and sustainability of its revenues and profits. • The company's vulnerability to, or reliance on, various elements of scale, scope, and diversity leaves it less likely than its competitors to withstand economic, competitive, or technological threats.	• The company's product or service lineup is somewhat limited compared to those of its sector peers. The company derives its profits from a narrow group of products or services, and has not achieved significant market share compared with its peers. • Demand for its products or services is lower than for its competitors', and this trend isn't improving. • It relies heavily on a particular customer or small group of customers, and the characteristics of the customer base do not mitigate this risk. • It depends on a particular supplier or group of suppliers, which it would not be able to easily replace without incurring high switching costs. • It depends disproportionately on a single local or regional economy for selling its goods or services, and the company's industry is global. • Key production assets are concentrated by location, and the company has limited ability to quickly replace them without incurring high costs relative to its profits.

© Standard & Poor's 2013.

Table 10

Operating Efficiency Assessment

Qualifier	What it means	Guidance
Strong	• The company maximizes revenues and profits via intelligent use of assets and by minimizing costs and increasing efficiency. • The company's cost structure should enable it to withstand economic downturns better than its peers.	• The company has a lower cost structure than its peers resulting in higher profits or margins even if capacity utilization or demand are well below ideal levels and during down economic and industry cycles. • It has demonstrated its ability to efficiently manage fixed and variable costs in cyclical downturns, and has a history of successful and often ongoing cost reductions programs. • Its capacity utilization is close to optimal at the peak of the industry cycle and outperforms the industry average over the cycle. • It has demonstrated that it can pass along increases in input costs and we expect this will continue. • It has a very high ability to adjust production and labor costs in response to changes in demand without repercussions for product quality, or has demonstrated the ability to operate very profitably in a more costly or less flexible labor environment. • Its suppliers have demonstrated an ability to meet swings in demand without causing bottlenecks or quality issues, and can absorb all but the most severe supply chain disruptions. • It has superior working capital management, as evidenced by a consistently better-than-average "cash conversion cycle" and other working capital metrics, supporting higher cash flow and lower funding costs. • Its investments in technology are likely to increase revenue growth and/or improve its cost structure and operating efficiency.

Adequate	• A combination of cost structure and efficiency should support sustainable profits with average profit volatility relative to the company's peers. Its cost structure is similar to its peers'.	• The company has demonstrated the ability to manage some fixed and most variable costs except during periods of extremely weak demand, and has some history of cutting costs in good and bad times. • Its cost structure permits some profitability even if capacity utilization or customer demand is well below ideal levels. The company can at least break even during most of the industry/demand cycle. • Its cost structure is in line with its peers'. For example, its selling, general, and administrative (SG&A) expense as a percent of revenue is similar to its peers' and is likely to be stable. • It has demonstrated an ability to adjust labor costs in most scenarios without hurting product output and quality, or can operate profitability in a more costly or less flexible labor environment; it has some success passing on input cost increases, although perhaps only partially or with time lag. • Its suppliers have met typical swings in demand without causing widespread bottlenecks or quality issues, and the company has some capacity to withstand limited supply chain disruptions. • It has good working capital management, evidenced by its cash conversion cycle and working capital metrics that are on par with its peers'. • Its investments in technology are likely to help it at least maintain its cost structure and current level of operating efficiency.
Weak	• The company's operating efficiency leaves it with lower profitability than its peers' due to lower asset utilization and/or a higher, less flexible cost structure.	• The company's cost structure permits better-than-marginal profitability only if capacity utilization is at the top of the cycle or during periods of strong demand. The company needs solid and sustained industry conditions to generate fair profitability. • It has limited success or capability of managing fixed costs and even most typically variable costs are fixed in the next two to three years. • It has a limited track record of successful cost reductions, such as reducing labor costs in the face of swings in demand, or it has limited ability to pass along increases in input costs. • Its costs are higher than its peers'. For example, the company's SG&A expense as a percent of revenue is above that of its peers, and likely to remain so. • Its suppliers may face bottlenecks or quality issues in the event of modest swings in demand, or have limited technological capabilities. There is evidence that a limited supply chain disruption would make it difficult for suppliers to meet their commitments to the company. • Its working capital management is weak, as evidenced by working capital metrics that are significantly worse than those of its peers, resulting in lower cash flow and higher funding costs. • It lacks investments in technology, which could hurt is revenue growth and/or result in a higher cost structure and less efficient operations relative to its peers'.

© Standard & Poor's 2013.

3. Determining the preliminary competitive position assessment: Competitive position group profile and category weightings

67. After assessing competitive advantage; scale, scope, and diversity; and operating efficiency, we determine a company's preliminary competitive position assessment by ascribing a specific weight to each component. The weightings depend on the company's Competitive Position Group Profile (CPGP).

68. There are six standard CPGPs: 1) services and product focus, 2) product focus/scale driven, 3) capital or asset focus, 4) commodity focus/cost driven, 5) commodity focus/scale driven, and 6) national industry and utilities (see table 11 for definitions and characteristics).

Table 11

Standard Competitive Position Group Profile (CPGP)

	Definition and characteristics	Examples
Services and product focus	Brands, product quality or technology, and service reputation are typically key differentiating factors for competing in the industry. Capital intensity is typically low to moderate, although supporting the brand often requires ongoing reinvestment in the asset base.	Typically, these are companies in consumer-facing light manufacturing or service industries. Examples include branded drug manufacturers, software companies, and packaged food.
Product focus/scale driven	Product and geographic diversity, as well as scale and market position are key differentiating factors. Sophisticated technology and stringent quality controls heighten risk of product concentration. Product preferences or sales relationships are more important than branding or pricing. Cost structure is relatively unimportant.	The sector most applicable is medical device/equipment manufacturers, particularly at the higher end of the technology scale. These companies largely sell through intermediaries, as opposed to directly to the consumer.
Capital or asset focus	Sizable capital investments are generally required to sustain market position in the industry. Brand identification is of limited importance, although product and service quality often remain differentiating factors.	Heavy manufacturing industries typically fall into this category. Examples include telecom infrastructure manufacturers and semiconductor makers.
Commodity focus/cost driven	Cost position and efficiency of production assets are more important than size, scope, and diversification. Brand identification is of limited importance	Typically, these are companies that manufacture products from natural resources that are used as raw materials by other industries. Examples include forest and paper products companies that harvest timber or produce pulp, packaging paper, or wood products.
Commodity focus/scale driven	Pure commodity companies have little product differentiation, and tend to compete on price and availability. Where present, brand recognition or product differences are secondary or of less importance.	Examples range from pure commodity producers and most oil and gas upstream producers, to some producers with modest product or brand differentiation, such as commodity foods.
National industries and utilities	Government policy or control, regulation, and taxation and tariff policies significantly affect the competitive dynamics of the industry (see paragraphs 72-73).	An example is a water-utility company in an emerging market.

69. The nature of competition and key success factors are generally prescribed by industry characteristics, but vary by company. Where service, product quality, or brand equity are important competitive factors, we'll give the competitive advantage component of our overall assessment a higher weighting. Conversely, if the company produces a commodity product, differentiation comes less into play, and we will more heavily weight scale, scope, and diversity as well as operating efficiency (see table 12).

Table 12

Standard Competitive Position Group Profiles (CPGPs) And Category Weightings

Component	--(%)--					
	Services and product focus	**Product focus/scale driven**	**Capital or asset focus**	**Commodity focus/cost driven**	**Commodity focus/scale driven**	**National industries and utilities**
1. Competitive advantage	45	35	30	15	10	60
2. Scale, scope, and diversity	30	50	30	35	55	20
3. Operating efficiency	25	15	40	50	35	20
Total	100	100	100	100	100	100
Weighted-average assessment*	1.0-5.0	1.0-5.0	1.0-5.0	1.0-5.0	1.0-5.0	1.0-5.0

*1 (strong), 2 (strong/adequate), 3 (adequate), 4 (adequate/weak), 5 (weak).

70. We place each of the defined industries (see "Sector-Specific Corporate Methodology") into one of the standard CPGPs as detailed in table 12, or apply a different CPGP, as identified in the "Sector-Specific Corporate Methodology" or in the "Key Credit Factors For The Real Estate Industry." This is merely a starting point for the analysis, since we recognize that some industries are less homogenous than others, and that company-specific strategies do affect the basis of competition.

71. In fact, the criteria allow for flexibility in selecting a company's group profile (with its category weightings). This could be because:

- The industry is heterogeneous, meaning that the nature of competition differs from one subsector to the next, and possibly even within subsectors. The "Sector-Specific Corporate Methodology" will identify such circumstances.
- A company's strategy could affect the relative importance of its key factors of competition.

72. For example, in the capital goods industry, a construction equipment rental company may be analyzed under the capital or asset focus group profile, owing to the importance of efficiently managing the capital spending cycle in this segment of the industry, whereas a provider of hardware, software, and services for industrial automation might be analyzed under the services and product focus group profile, if we believe it can achieve differentiation in the marketplace based on product performance, technology innovation, and service.

73. In some industries, the effects of government policy, regulation, government control, and taxation and tariff policies can significantly alter the competitive dynamics, depending on the country in which a company operates. That can alter our assessment of a company's competitive advantage; scale, size, and diversity; or operating efficiency. When industries in given countries have risks that differ materially from those captured in our global industry risk profile and assessment (see "Methodology: Industry Risk," section B), we will weight competitive advantage more heavily to capture the effect, positive or negative, on competitive dynamics. The assessment of competitive advantage; scale, size, and diversity; and operating efficiency will reflect advantages or disadvantages based on these national industry risk factors. Table 13 identifies the circumstances under which national industry risk factors are positive or negative.

Table 13

National Industry Risk Factors	
National industry risk factors are positive	• Government policy including regulation, ownership, and taxation is supportive and has a good track record of mitigating risks to the stability of industry margins. • Any government ownership, tariff, and taxation policy supports growth prospects for revenues and profit generation. • There is very little discernible risk of negative policy, regulatory, ownership, or taxation changes that could threaten business stability.
National industry risk factors are negative	• Government policy and regulation has a weak track record of stabilizing margins and reducing industry risks. • Any government ownership, tariff, and taxation policy undermine growth prospects for revenues and profit generation. • There is an increasing risk of negative policy, ownership, and taxation changes that could undermine industry stability.

© Standard & Poor's 2013.

74. When national industry risk factors are positive for a company, typically they support revenue growth, profit growth, higher EBITDA margins, and/or lower-than-average volatility of profits. Often, these benefits provide barriers to entry that impede or even bar new market entrants, which should be reflected in the competitive advantage assessment. These benefits may also include risk mitigants that enable a company to withstand economic downturns and competitive and technological threats better in its local markets than its global competitors can. The scale, scope, and diversity assessment might also benefit from these policies if the company is able to withstand economic, regional, competitive, and technological threats better than its global competitors can. Likewise, the company's operating efficiency assessment may improve if, as a result, it is better able than its global competitors to withstand economic downturns, taking into account its cost structure.

75. Conversely, when national industry risk factors are negative for a company, typically they detract from revenue growth and profit growth, shrink EBITDA margins, and/or increase the average volatility of profits. The company may also have less protection against economic downturns and competitive and technological threats within its local markets than its global competitors do. We may also adjust the company's scale, scope, and diversity assessment lower if, as a result of these policies, it is less able to withstand economic, regional, competitive, and technological threats than its global competitors can. Likewise, we may adjust its operating efficiency assessment lower if, as a result of these policies, it is less able to withstand economic downturns, taking into account the company's cost structure.

76. For example, we might use a national industry risk factor for a wholesale fiber network. By contrast with a retail telecommunications company, our analysis of the company's competitive position would focus more heavily on the monopoly nature of its operations, as well as the nature and reliability of the operator's regulatory framework in supporting future revenue and earnings. If we considered that it had a sustainable monopoly position and we viewed the regulatory framework as being supportive of the group's future earnings stability, it would strengthen our assessment of the group's competitive position.

77. The weighted average assessment translates into the preliminary competitive position

assessment on a scale of 1 to 6, where one is best. Table 14 describes the matrix we use to translate the weighted average assessment of the three components into the preliminary competitive position assessment.

Table 14

Translation Table For Converting Weighted-Average Assessments Into Preliminary Competitive Position Assessments

Weighted average assessment range	Preliminary competitive position assessment
1.00 – 1.50	1
>1.50 – 2.25	2
>2.25 – 3.00	3
>3.00 – 3.75	4
>3.75 – 4.50	5
>4.50 – 5.00	6

4. Assessing profitability

78. We assess profitability on the same scale of 1 to 6 as the competitive position assessment.

79. The profitability assessment consists of two subcomponents: level of profitability and the volatility of profitability, which we assess separately. We use a matrix to combine these into the final profitability assessment.

a) Level of profitability

80. The level of profitability is assessed in the context of the company's industry. We most commonly measure profitability using return on capital (ROC) and EBITDA margins, but we may also use sector-specific ratios. Importantly, as with the other components of competitive position, we review profitability in the context of the industry in which the company operates, not just in its narrower subsector. (See list of industries and subsectors in "Sector-Specific Corporate Methodology.")

81. We assess level of profitability on a three-point scale: above average, average, and below average. We may establish numeric guidance, for instance by stating that an ROC above 12% is considered above average, between 8%-12% is average, and below 8% is below average for the industry, or by differentiating between subsectors in the industry. In the absence of numeric guidance, we compare a company against its peers across the industry. When establishing numeric guidance for assessing profitability within an industry or subsector, we typically consider the distribution of profitability measures across rated issuers in the sector. Depending on the shape of the distribution, we choose logical breakpoints between above average, average, and below average profitability. For instance, for a distribution that resembles a normal curve, we typically assess the top quartile of the relevant profitability indicator to be above average, the two middle quartiles average, and the bottom quartile below average. For a relatively flat distribution curve, we typically assess the top third to be above average, the middle third to be average, and the bottom third to be below average. We also may take averages of historical data or adjust the thresholds between the three ranges to consider factors such as variation over the business cycle and across regions. Finally, we may incorporate our expertise in the sector to adjust for underlying M&A trends or other distortions, as appropriate. For numerical guidance on the level of profitability assessment,

by industry sector, see "Sector-Specific Corporate Methodology."

82. We calculate profitability ratios generally based on a five-year average, consisting of two years of historical data, our projections for the current year (incorporating any reported year-to-date results and estimates for the remainder of the year), and the next two financial years. There may be situations where we consider longer or shorter historical results or forecasts, depending on such factors as availability of financials, transformational events (such as mergers or acquisitions [M&A]), cyclical distortion (such as peak or bottom of the cycle metrics that we do not deem fully representative of the company's level of profitability), and we take into account improving or deteriorating trends in profitability ratios in our assessment. For example, a company's profitability trend may be forecast to decline over the next two years because of levied carbon taxes and our anticipation that such carbon tax rates will increase each year as regulations tighten.

b) Volatility of profitability

83. We base the volatility of profitability on the standard error of the regression (SER) for a company's historical EBITDA, EBITDA margins, or return on capital. "Sector-Specific Corporate Methodology" details which measures are most appropriate for a given industry or set of companies. For each of these measures, we divide the standard error by the average of that measure over the time period in order to ensure better comparability across companies.

84. The SER is a statistical measure that is an estimate of the deviation around a 'best fit' linear trend line. We regress the company's EBITDA, EBITDA margins, or return on capital against time. A key advantage of SER over standard deviation or coefficient of variation is that it doesn't view upwardly trending data as inherently more volatile. At the same time, we recognize that SER, like any statistical measure, may understate or overstate expected volatility and thus we will make qualitative adjustments where appropriate (see paragraphs 86-90). Furthermore, we only calculate SER when companies have at least seven years of historical annual data and have not significantly changed their line of business during the timeframe, to ensure that the results are meaningful.

85. As with the level of profitability, we evaluate a company's SER in the context of its industry group. For most industries, we establish a six-point scale with 1 capturing the least volatile companies, i.e., those with the lowest SERs, and 6 identifying companies whose profits are most volatile. We have established industry-specific SER parameters using the most recent seven years of data for companies within each sector. We believe that seven years is generally an adequate number of years to capture a business cycle. (See "Sector-Specific Corporate Methodology" for industry-specific SER parameters.) For companies whose business segments cross multiple industries, we evaluate the SER in the context of the organization's most dominant industry--if that industry represents at least two-thirds of the organization's EBITDA, sales, or other relevant metric. If the company is a conglomerate and no dominant industry can be identified, we will evaluate its profit volatility in the context of SER guidelines for all nonfinancial companies.

86. In certain circumstances, the SER derived from historical information may understate--or overstate--expected future volatility, and we may adjust the assessment downward or upward. The scope of possible adjustments depends on certain conditions being met as described below.

87. We might adjust the SER-derived volatility assessment to a worse assessment (i.e., to a higher assessment for greater volatility) by up to two categories if the expected level of volatility isn't apparent in historical numbers, and the company either:

- Has a weighted country risk assessment of 4 or worse, which may, notwithstanding past performance, result in a less stable business environment going forward;

- Operates in a subsector of the industry that may be prone to higher technology or regulation changes, or other potential disruptive risks that have not emerged over the seven year period;
- Is of limited size and scope, which will often result in inherently greater vulnerability to external changes; or
- Has pursued material M&A or internal growth projects that obscure the company's underlying performance trend line. As an example, a company may have consummated an acquisition during the trough of the cycle, masking what would otherwise be a significant decline in performance.

88. The choice of one or two categories depends on the degree of likelihood that the related risks will materialize and our view of the likely severity of these risks.

89. Conversely, we may adjust the SER-derived volatility assessment to a better assessment (i.e., to a lower assessment reflecting lower volatility) by up to two categories if we observe that the conditions historically leading to greater volatility have receded and are misrepresentative. This will be the case when:

- The company grew at a moderately faster, albeit more uneven, pace relative to the industry. Since we measure volatility around a linear trend line, a company growing at a constant percentage of moderate increase (relative to the industry) or an uneven pace (e.g., due to "lumpy" capital spending programs) could receive a relatively unfavorable assessment on an unadjusted basis, which would not be reflective of the company's performance in a steady state. (Alternatively, those companies that grow at a significantly higher-than-average industry rate often do so on unsustainable rates of growth or by taking on high-risk strategies. Companies with these high-risk growth strategies would not receive a better assessment and could be adjusted to a worse assessment;)
- The company's geographic, customer, or product diversification has increased in scope as a result of an acquisition or rapid expansion (e.g., large, long-term contracts wins), leading to more stability in future earnings in our view; or
- The company's business model is undergoing material change that we expect will benefit earnings stability, such as a new regulatory framework or major technology shift that is expected to provide a significant competitive hedge and margin protection over time.
- The company has experienced a sharp drop in demand for its products and services due to the materialization of social credit factors related to health and safety, such as a pandemic, which had a significant negative impact on commercial activity for a period of time, but which we view as temporary and not indicative of future earnings trends.

90. The choice of one or two categories depends on the degree of likelihood that the related risks will materialize and our view of the likely severity of these risks.

91. If the company either does not have at least seven years of annual data or has materially changed its business lines or undertaken abnormally high levels of M&A during this time period, then we do not use its SER to assess the volatility of profitability. In these cases, we use a proxy to establish the volatility assessment. If there is a peer company that has, and is expected to continue having, very similar profitability volatility characteristics, we use the SER of that peer entity as a proxy.

92. If no such matching peer exists, or one cannot be identified with enough confidence, we perform an assessment of expected volatility based on the following rules:

- An assessment of 3 if we expect the company's profitability, supported by available historical evidence, will exhibit a volatility pattern in line with, or somewhat less volatile than, the industry

average.

- An assessment of 2 based on our confidence, supported by available historical evidence, that the company will exhibit lower volatility in profitability metrics than the industry's average. This could be underpinned by some of the factors listed in paragraph 89, whereas those listed in paragraph 87 would typically not apply.
- An assessment of 4 or 5 based on our expectation that profitability metrics will exhibit somewhat higher (4), or meaningfully higher (5) volatility than the industry, supported by available historical evidence, or because of the applicability of possible adjustment factors listed in paragraph 87.
- Assessments of either 1 or 6 are rarely assigned and can only be achieved based on a combination of data evidence and very high confidence tests. For an assessment of 1, we require strong evidence of minimal volatility in profitability metrics compared with the industry, supported by at least five years of historical information, combined with a very high degree of confidence that this will continue in the future, including no country risk, subsector risk or size considerations that could otherwise warrant a worse assessment as per paragraph 87. For an assessment of 6 we require strong evidence of very high volatility in profitability metrics compared with the industry, supported by at least five years of historical information and very high confidence that this will continue in the future.

93. Next, we combine the level of profitability assessment with the volatility assessment to determine the final profitability assessment using the matrix in Table 15.

Table 15

Profitability Assessment

	--Volatility of profitability assessment--					
Level of profitability assessment	**1**	**2**	**3**	**4**	**5**	**6**
Above average	1	1	2	3	4	5
Average	1	2	3	4	5	6
Below average	2	3	4	5	6	6

5. Combining the preliminary competitive position assessment with profitability

94. The fourth and final step in arriving at a competitive position assessment is to combine the preliminary competitive position assessment with the profitability assessment. We use the combination matrix in Table 16, which shows how the profitability assessment can confirm, strengthen, or weaken (by up to one category) the overall competitive position assessment.

Table 16

Combining The Preliminary Competitive Position Assessment And Profitability Assessment

	--Preliminary competitive position assessment--					
Profitability assessment	**1**	**2**	**3**	**4**	**5**	**6**
1	1	2	2	3	4	5
2	1	2	3	3	4	5
3	2	2	3	4	4	5
4	2	3	3	4	5	5
5	2	3	4	4	5	6
6	2	3	4	5	5	6

95. We generally expect companies with a strong preliminary competitive position assessment to exhibit strong and less volatile profitability metrics. Conversely, companies with a relatively weaker preliminary competitive position assessment will generally have weaker and/or more volatile profitability metrics. Our analysis of profitability helps substantiate whether management is translating any perceived competitive advantages, diversity benefits, and cost management measures into higher earnings and more stable return on capital and return on sales ratios than the averages for the industry. When profitability differs markedly from what the preliminary/anchor competitive position assessment would otherwise imply, we adjust the competitive position assessment accordingly.

96. Our method of adjustment is biased toward the preliminary competitive position assessment rather than toward the profitability assessment (e.g., a preliminary competitive assessment of 6 and a profitability assessment of 1 will result in a final assessment of 5).

E. Cash Flow/Leverage

97. The pattern of cash flow generation, current and future, in relation to cash obligations is often the best indicator of a company's financial risk. The criteria assess a variety of credit ratios, predominately cash flow-based, which complement each other by focusing on the different levels of a company's cash flow waterfall in relation to its obligations (i.e., before and after working capital investment, before and after capital expenditures, before and after dividends), to develop a thorough perspective. Moreover, the criteria identify the ratios that we think are most relevant to measuring a company's credit risk based on its individual characteristics and its business cycle.

98. For the analysis of companies with intermediate or stronger cash flow/leverage assessments (a measure of the relationship between the company's cash flows and its debt obligations as identified in paragraphs 106 and 124), we primarily evaluate cash flows that reflect the considerable flexibility and discretion over outlays that such companies typically possess. For these entities, the starting point in the analysis is cash flows before working capital changes plus capital investments in relation to the size of a company's debt obligations in order to assess the relative ability of a company to repay its debt. These "leverage" or "payback" cash flow ratios are a measure of how much flexibility and capacity the company has to pay its obligations.

99. For entities with significant or weaker cash flow/leverage assessments (as identified in paragraphs 105 and 124), the criteria also call for an evaluation of cash flows in relation to the carrying cost or interest burden of a company's debt. This will help us assess a company's relative and absolute ability to service its debt. These "coverage"- or "debt service"-based cash flow ratios

are a measure of a company's ability to pay obligations from cash earnings and the cushion the company possesses through stress periods. These ratios, particularly interest coverage ratios, become more important the further a company is down the credit spectrum.

1. Assessing cash flow/leverage

100. Under the criteria, we assess cash flow/leverage as 1, minimal; 2, modest; 3, intermediate; 4, significant; 5, aggressive; or 6, highly leveraged. To arrive at these assessments, the criteria combine the assessments of a variety of credit ratios, predominately cash flow-based, which complement each other by focusing attention on the different levels of a company's cash flow waterfall in relation to its obligations. For each ratio, there is an indicative cash flow/leverage assessment that corresponds to a specified range of values in one of three given benchmark tables (see tables 17, 18, and 19). We derive the final cash flow/leverage assessment for a company by determining the relevant core ratios, anchoring a preliminary cash flow assessment based on the relevant core ratios, determining the relevant supplemental ratio(s), adjusting the preliminary cash flow assessment according to the relevant supplemental ratio(s), and, finally, modifying the adjusted cash flow/leverage assessment for any material volatility.

2. Core and supplemental ratios

a) Core ratios

101. For each company, we calculate two core credit ratios--funds from operations (FFO) to debt and debt to EBITDA--in accordance with S&P Global Ratings' ratios and adjustments criteria (see "Corporate Methodology: Ratios And Adjustments"). We compare these payback ratios against benchmarks to derive the preliminary cash flow/leverage assessment for a company. These ratios are also useful in determining the relative ranking of the financial risk of companies.

b) Supplemental ratios

102. The criteria also consider one or more supplemental ratios (in addition to the core ratios) to help develop a fuller understanding of a company's financial risk profile and fine-tune our cash flow/leverage analysis. Supplemental ratios could either confirm or adjust the preliminary cash flow/leverage assessment. The confirmation or adjustment of the preliminary cash flow/leverage assessment will depend on the importance of the supplemental ratios as well as any difference in indicative cash flow/leverage assessment between the core and supplemental ratios as described in section E.3.b.

103. The criteria typically consider five standard supplemental ratios, although "Sector-Specific Corporate Methodology" may introduce additional supplemental ratios or focus attention on one or more of the standard supplemental ratios. The standard supplemental ratios include three payback ratios--cash flow from operations (CFO) to debt, free operating cash flow (FOCF) to debt, and discretionary cash flow (DCF) to debt--and two coverage ratios, FFO plus interest paid to cash interest paid and EBITDA to interest.

104. The criteria provide guidelines as to the relative importance of certain ratios if a company exhibits characteristics such as high leverage, working capital intensity, capital intensity, or high growth.

105. If the preliminary cash flow/leverage assessment is significant or weaker (see section E.3), then two coverage ratios, FFO plus cash interest paid to cash interest paid and EBITDA to interest, will

be given greater importance as supplemental ratios. For the definition of these metrics please see "Corporate Methodology: Ratios And Adjustments".

106. If the preliminary cash flow/leverage assessment is intermediate or stronger, the criteria first apply the three standard supplemental ratios of CFO to debt, FOCF to debt, and DCF to debt. When FOCF to debt and DCF to debt indicate a cash flow/leverage assessment that is lower than the other payback-ratio-derived cash flow/leverage assessments, it signals that the company has either larger than average capital spending or other nonoperating cash distributions (including dividends). If these differences persist and are consistent with a negative trend in overall ratio levels, which we believe is not temporary, then these supplemental leverage ratios will take on more importance in the analysis.

107. If the supplemental ratios indicate a cash flow/leverage assessment that is different than the preliminary cash flow/leverage assessment, it could suggest an unusual debt service or fixed charge burden, working capital or capital expenditure profile, or unusual financial activity or policies. In such cases, we assess the sustainability or persistence of these differences. For example, if either working capital or capital expenditures are unusually low, leading to better indicated assessments, we examine the sustainability of such lower spending in the context of its impact on the company's longer term competitive position. If there is a deteriorating trend in the company's asset base, we give these supplemental ratios less weight. If either working capital or capital expenditures are unusually high, leading to weaker indicated assessments, we examine the persistence and need for such higher spending. If elevated spending levels are required to maintain a company's competitive position, for example to maintain the company's asset base, we give more weight to these supplemental ratios.

108. For capital-intensive companies, EBITDA and FFO may overstate financial strength, whereas FOCF may be a more accurate reflection of their cash flow in relation to their financial obligations. The criteria generally consider a capital-intensive company as having ongoing capital spending to sales of greater than 10%, or depreciation to sales of greater than 8%. For these companies, the criteria place more weight on the supplementary ratio of FOCF to debt. Where we place more analytic weight on FOCF to debt, we also seek to estimate the amount of maintenance or full cycle capital required (see Appendix C) under normal conditions (we estimate maintenance or full-cycle capital expenditure required because this is not a reported number). The FOCF figure may be adjusted by adding back estimated discretionary capital expenditures. The adjusted FOCF to debt based on maintenance or full cycle capital expenditures often helps determine how much importance to place on this ratio. If both the FOCF to debt and the adjusted (for estimated discretionary capital spending) FOCF to debt derived assessments are different from the preliminary cash/flow leverage assessment, then these supplemental leverage ratios take on more importance in the analysis.

109. For working-capital-intensive companies, EBITDA and FFO may also overstate financial strength, and CFO may be a more accurate measure of the company's cash flow in relation to its financial risk profile. Under the criteria, if a company has a working capital-to-sales ratio that exceeds 25% or if there are significant seasonal swings in working capital, we generally consider it to be working-capital-intensive. For these companies, the criteria place more emphasis on the supplementary ratio of CFO to debt. Examples of companies that have working-capital-intensive characteristics can be found in the capital goods, metals and mining downstream, or the retail and restaurants industries. The need for working capital in those industries reduces financial flexibility and, therefore, these supplemental leverage ratios take on more importance in the analysis.

110. For all companies, when FOCF to debt or DCF to debt is negative or indicates materially lower cash flow/leverage assessments, the criteria call for an examination of management's capital spending and cash distribution strategies. For high-growth companies, typically the focus is on FFO to debt

instead of FOCF to debt because the latter ratio can vary greatly depending on the growth investment the company is undergoing. The criteria generally consider a high-growth company one that exhibits real revenue growth in excess of 8% per year. Real revenue growth excludes price or foreign exchange related growth, under these criteria. In cases where FOCF or DCF is low, there is a greater emphasis on monitoring the sustainability of margins and return on capital and the overall financing mix to assess the likely trend of future debt ratios. In addition, debt service ratio analysis will be important in such situations. For companies with more moderate growth, the focus is typically on FOCF to debt unless the capital spending is short term or is not funded with debt.

111. For companies that have ongoing and well entrenched banking relationships we can reflect these relationships in our cash flow/leverage analysis through the use of the interest coverage ratios as supplemental ratios. These companies generally have historical links and a strong ongoing relationship with their main banks, as well as shareholdings by the main banks, and management influence and interaction between the main banks and the company. Based on their bank relationships, these companies often have lower interest servicing costs than peers, even if the macro economy worsens. In such cases, we generally use the interest coverage ratios as supplemental ratios. This type of banking relationship occurs in Japan, for example, where companies that have the type of bank relationship described in this paragraph tend to have a high socioeconomic influence within their country by way of their revenue size, total debt quantum, number of employees, and the relative importance of the industry.

c) Time horizon and ratio calculation

112. A company's credit ratios may vary, often materially, over time due to economic, competitive, technological, or investment cycles, the life stage of the company, and corporate or strategic actions. Thus, we evaluate credit ratios on a time series basis with a clear forward-looking bias. The length of the time series is dependent on the relative credit risk of the company and other qualitative factors and the weighting of the time series varies according to transformational events. A transformational event is any event that could cause a material change in a company's financial profile, whether caused by changes to the company's capital base, capital structure, earnings, cash flow profile, or financial policies. Transformational events can include mergers, acquisitions, divestitures, management changes, structural changes to the industry or competitive environment, product development and capital programs, and/or business disruptions, including those that arise from the materialization of substantial environmental or social risks. This section provides guidance on the timeframe and weightings the criteria apply to calculate the indicative ratios.

113. The criteria generally consider the company's credit ratios for the previous one to two years, current-year forecast, and the two subsequent forecasted financial years. There may be situations where longer--or even shorter--historical results or forecasts are appropriate, depending on such factors as availability of financials, transformational events, or relevance. For example, a utility company with a long-term capital spending program may lend itself to a longer-term forecast, whereas for a company experiencing a near-term liquidity squeeze even a two-year forecast will have limited value. Alternatively, for most commodities-based companies we emphasize credit ratios based on our forward-looking view of market conditions, which may differ materially from the historical period.

114. Historical patterns in cash flow ratios are informative, particularly in understanding past volatility, capital spending, growth, accounting policies, financial policies, and business trends. Our analysis starts with a review of these historical patterns in order to assess future expected credit quality. Historical patterns can also provide an indication of potential future volatility in ratios, including

that which results from seasonality or cyclicality. A history of volatility could result in a more conservative assessment of future cash flow generation if we believe cash flow will continue to be volatile.

115. The forecast ratios are based on an expected base-case scenario developed by S&P Global Ratings, incorporating current and near-term economic conditions, industry assumptions, and financial policies. The prospective cyclical and longer-term volatility associated with the industry in which the issuer operates is addressed in the industry risk criteria (see section B) and the longer-term directional influence or event risk of financial policies is addressed in our financial policy criteria (see section H).

116. The criteria generally place greater emphasis on forecasted years than historical years in the time series of credit ratios when calculating the indicative credit ratio. For companies where we have five years of ratios as described in section E.3, generally we calculate the indicative ratio by weighting the previous two years, the current year, and the forecasted two years as 10%, 15%, 25%, 25%, and 25%, respectively.

117. This weighting changes, however, to place even greater emphasis on the current and forecast years when:

- The issuer meets the characteristics described in paragraph 113, and either shorter- or longer-term forecasts are applicable. The weights applied will generally be quite forward weighted, particularly if a company is undergoing a transformational event and there is moderate or better cash flow certainty.
- The issuer is forecast to generate negative cash flow available for debt repayment, which we believe could lead to deteriorating credit metrics. Forecast negative cash flows could be generated from operating activities as well as capital expenditures, share buybacks, dividends, or acquisitions, as we forecast these uses of cash based on the company's track record, market conditions, or financial policy. The weights applied will generally be 30%, 40%, and 30% for the current and two subsequent years, respectively.
- The issuer is in an industry that is prospectively volatile or that has a high degree of cash flow uncertainty. Industries that are prospectively volatile are industries whose competitive risk and growth assessments are either high risk (5) or very high risk (6) or whose overall industry risk assessments are either high risk (5) or very high risk (6). The weights applied will generally be 50% for the current year and 50% for the first subsequent forecast year.
- An issuer experienced a significant business disruption due to exceptional events that are temporary and are not assumed to be repeated. These circumstances may stem, for example, from the materialization of environmental or social credit factors (e.g., an epidemic or pandemic health event, or man-made or natural environmental disaster). In such cases, we may take the view that historical financial performance is not indicative of the issuer's current and future earnings trends and put more weight on future year ratios.

118. When the indicative ratio(s) is borderline (i.e., less than 10% different from the threshold in relative terms) between two assessment thresholds (as described in section E.3 and tables 17, 18, and 19) and the forecast points to a switch in the ratio between categories during the rating timeframe, we will weigh the forecast even more heavily in order to prospectively capture the trend.

119. For companies undergoing a transformational event, the weighting of the time series could vary significantly.

120. For companies undergoing a transformational event and with significant or weaker cash flow/leverage assessments, we place greater weight on near-term risk factors. That's because

overemphasis on longer-term (inherently less predictable) issues could lead to some distortion when assessing the risk level of a speculative-grade company. We generally analyze a company using the arithmetic mean of the credit ratios expected according to our forecasts for the current year (or pro forma current year) and the subsequent financial year. A common example of this is when a private equity firm acquires a company using additional debt leverage, which makes historical financial ratios meaningless. In this scenario, we weight or focus the majority of our analysis on the next one or two years of projected credit measures.

3. Determining the cash flow/leverage assessment

a) Identifying the benchmark table

121. Tables 17, 18, and 19 provide benchmark ranges for various credit ratios we associate with different cash flow/leverage assessments for standard volatility, medial volatility, and low volatility industries. The tables of benchmark ratios differ for a given ratio and cash flow/leverage assessment along two dimensions: the starting point for the ratio range and the width of the ratio range.

122. If an industry exhibits low volatility, the threshold levels for the applicable ratios to achieve a given cash flow/leverage assessment are less stringent than those in the medial or standard volatility tables, although the range of the ratios is narrower. Conversely, if an industry exhibits medial or standard levels of volatility, the threshold for the applicable ratios to achieve a given cash flow/leverage assessment are elevated, albeit with a wider range of values.

123. The relevant benchmark table for a given company is based on our Corporate Industry and Country Risk Assessment, or the CICRA (see section A, table 1), as described in the bullet points below, unless otherwise indicated in "Sector-Specific Corporate Methodology."

- The low volatility table (table 19) will generally apply when a company's CICRA is '1' but can infrequently also apply to a company with a CICRA of '2' if the company exhibits or is expected to exhibit low levels of volatility.
- The medial volatility table (table 18) will generally apply for a company with a CICRA of '2' but can infrequently also apply to a company with a CICRA of '1' if the company exhibits or is expected to exhibit medial levels of volatility.
- The standard volatility table (table 17) generally serves as the relevant benchmark table that is used for all CICRA scores other than '1' or '2', and we will always use it for companies with a CICRA of '1' or '2' whose competitive position is assessed as '5' or '6'.

Table 17

Cash Flow/Leverage Analysis Ratios--Standard Volatility

	--Core ratios--		--Supplementary coverage ratios--		--Supplementary payback ratios--		
	FFO/debt (%)	Debt/EBITDA (x)	FFO/cash interest(x)	EBITDA/interest (x)	CFO/debt (%)	FOCF/debt (%)	DCF/debt (%)
Minimal	60+	Less than 1.5	More than 13	More than 15	More than 50	40+	25+
Modest	45-60	1.5-2	9-13	10-15	35-50	25-40	15-25
Intermediate	30-45	2-3	6-9	6-10	25-35	15-25	10-15
Significant	20-30	3-4	4-6	3-6	15-25	10-15	5-10

	--Core ratios--		--Supplementary coverage ratios--		--Supplementary payback ratios--		
	FFO/debt (%)	Debt/EBITDA (x)	FFO/cash interest (x)	EBITDA/interest (x)	CFO/debt (%)	FOCF/debt (%)	DCF/debt (%)
Minimal	35+	Less than 2	More than 8	More than 13	More than 30	20+	11+
Modest	23-35	2-3	5-8	7-13	20-30	10-20	7-11
Intermediate	13-23	3-4	3-5	4-7	12-20	4-10	3-7
Significant	9-13	4-5	2-3	2.5-4	8-12	0-4	0-3
Aggressive	6-9	5-6	1.5-2	1.5-2.5	5-8	(10)-0	(20)-0
Highly leveraged	Less than 6	Greater than 6	Less than 1.5	Less than 1.5	Less than 5	Less than (10)	Less than (20)

b) Aggregating the credit ratio assessments

124. To determine the final cash flow/leverage assessment, we make these calculations:
1) First, calculate a time series of standard core and supplemental credit ratios, select the relevant benchmark table, and determine the appropriate time weighting of the credit ratios.

- Calculate the two standard core credit ratios and the five standard supplemental credit ratios over a five-year time horizon.
- Consult "Sector-Specific Corporate Methodology," which may identify additional supplemental ratio(s). The relevant benchmark table for a given company is based on our assessment of the company's associated industry and country risk volatility, or the CICRA.
- Calculate the appropriate weighted average cash flow/leverage ratios. If the company is undergoing a transformational event, then the core and supplemental ratios will typically be calculated based on S&P Global Ratings' projections for the current and next one or two financial years.

2) Second, we use the core ratios to determine the preliminary cash flow assessment.

- Compare the core ratios (FFO to debt and debt to EBITDA) to the ratio ranges in the relevant benchmark table.
- If the core ratios result in different cash flow/leverage assessments, we will select the relevant core ratio based on which provides the best indicator of a company's future leverage.

3) Third, we review the supplemental ratio(s).

- Determine the importance of supplemental ratios based on company-specific characteristics, namely, leverage, capital intensity, working capital intensity, growth rate, or industry. "Sector-Specific Corporate Methodology" may identify preferred ratios for a particular sector.

4) Fourth, we calculate the adjusted cash flow/leverage assessment.

- If the cash flow/leverage assessment(s) indicated by the important supplemental ratio(s) differs from the preliminary cash flow/leverage assessment, we might adjust the preliminary cash flow/leverage assessment by one category in the direction of the cash flow/leverage assessment indicated by the supplemental ratio(s) to derive the adjusted cash flow/leverage assessment. We will make this adjustment if, in our view, the supplemental ratio provides the best indicator of a company's future leverage.
- If there is more than one important supplemental ratio and they result in different directional deviations from the preliminary cash flow/leverage assessment, we will select one as the relevant supplemental ratio based on which, in our opinion, provides the best indicator of a company's future leverage. We will then make the adjustment outlined above if the selected supplemental ratio differs from the preliminary cash flow/leverage assessment and the selected supplemental ratio provides the best overall indicator of a company's future leverage.

5) Lastly, we determine the final cash flow/leverage assessment based on the volatility adjustment.

- We classify companies as stable for these cash flow criteria if cash flow/leverage ratios are expected to worsen by up to one category during periods of stress based on their business risk profile. The final cash flow/leverage assessment for these companies will not be modified from the adjusted cash flow/leverage assessment.
- We classify companies as volatile for these cash flow criteria if cash flow/leverage ratios are expected to move one or two categories worse during periods of stress based on their business risk profiles. Typically, this is equivalent to EBITDA declining about 30% from its current level. The final cash flow/leverage assessment for these companies will be modified to one category weaker than the adjusted cash flow/leverage assessment; the adjustment will be eliminated if cash flow/leverage ratios, as evaluated, include a moderate to high level of stress already.
- We classify companies as highly volatile for these cash flow criteria if cash flow/leverage ratios

are expected to move two or three categories worse during periods of stress, based on their business risk profiles. Typically, this is equivalent to EBITDA declining about 50% from its current level. The final cash flow/leverage assessment for these companies will be modified to two categories weaker than the adjusted cash flow/leverage assessment; the adjustment will be eliminated or reduced to one category if cash flow/leverage ratios, as evaluated, include a moderate to high level of stress already.

125. The volatility adjustment is the mechanism by which we factor a "cushion" of medium-term variance to current financial performance not otherwise captured in either the near-term base-case forecast or the long-term business risk assessment. We make this adjustment based on the following:

- The expectation of any potential cash flow/leverage ratio movement is both prospective and dependent on the current business or economic conditions.
- Stress scenarios include, but are not limited to, a recessionary economic environment, technology or competitive shifts, loss or renegotiation of major contracts or customers, the materialization of ESG credit risks, and key product or input price movements, as typically defined in the company's industry risk profile and competitive position assessment.
- The volatility adjustment is not static and is company specific. At the bottom of an economic cycle or during periods of stressed business conditions, already reflected in the general industry risk or specific competitive risk profile, the prospect of weakening ratios is far less than at the peak of an economic cycle or business conditions.
- The expectation of prospective ratio changes may be formed by observed historical performance over an economic, business, or product cycle by the company or by peers.
- The assessment of which classification to use when evaluating the prospective number of scoring category moves will be guided by how close the current ratios are to the transition point (i.e., "buffer" in the current scoring category) and the corresponding amount of EBITDA movement at each scoring transition.

F. Diversification/Portfolio Effect

126. Under the criteria, diversification/portfolio effect applies to companies that we regard as conglomerates. They are companies that have multiple core business lines that may be operated as separate legal entities. For the purpose of these criteria, a conglomerate would have at least three business lines, each contributing a material source of earnings and cash flow.

127. The criteria aim to measure how diversification or the portfolio effect could improve the anchor of a company with multiple business lines. This approach helps us determine how the credit strength of a corporate entity with a given mix of business lines could improve based on its diversity. The competitive position factor assesses the benefits of diversity within individual lines of business. This factor also assesses how poorly performing businesses within a conglomerate affect the organization's overall business risk profile.

128. Diversification/portfolio effect could modify the anchor depending on how meaningful we think the diversification is, and on the degree of correlation we find in each business line's sensitivity to economic cycles. This assessment will have either a positive or neutral impact on the anchor. We capture any potential factor that weakens a company's diversification, including poor management, in our management and governance assessment.

129. We define a conglomerate as a diversified company that is involved in several industry sectors.

Usually the smallest of at least three distinct business segments/lines would contribute at least 10% of either EBITDA or FOCF and the largest would contribute no more than 50% of EBITDA or FOCF, with the long-term aim of increasing shareholder value by generating cash flow. Industrial conglomerates usually hold a controlling stake in their core businesses, have highly identifiable holdings, are deeply involved in the strategy and management of their operating companies, generally do not frequently roll over or reshuffle their holdings by buying and selling companies, and therefore have high long-term exposure to the operating risks of their subsidiaries.

130. In rating a conglomerate, we first assess management's commitment to maintain the diversified portfolio over a longer-term horizon. These criteria apply only if the company falls within our definition of a conglomerate.

1. Assessing diversification/portfolio effect

131. A conglomerate's diversification/portfolio effect is assessed as 1, significant diversification; 2, moderate diversification; or 3, neutral. An assessment of moderate diversification or significant diversification potentially raises the issuer's anchor. To achieve an assessment of significant diversification, an issuer should have uncorrelated diversified businesses whose breadth is among the most comprehensive of all conglomerates'. This assessment indicates that we expect the conglomerate's earnings volatility to be much lower through an economic cycle than an undiversified company's. To achieve an assessment of moderate diversification, an issuer typically has a range of uncorrelated diversified businesses that provide meaningful benefits of diversification with the expectation of lower earnings volatility through an economic cycle than an undiversified company's.

132. We expect that a conglomerate will also benefit from diversification if its core assets consistently produce positive cash flows over our rating horizon. This supports our assertion that the company diversifies to take advantage of allocating capital among its business lines. To this end, our analysis focuses on a conglomerate's track record of successfully deploying positive discretionary cash flow into new business lines or expanding capital-hungry business lines. We assess companies that we do not expect to achieve these benefits as neutral.

2. Components of correlation and how it is incorporated into our analysis

133. We determine the assessment for this factor based on the number of business lines in separate industries (as described in "Sector-Specific Corporate Methodology") and the degree of correlation between these business lines as described in table 20. There is no rating uplift for an issuer with a small number of business lines that are highly correlated. By contrast, a larger number of business lines that are not closely correlated provide the maximum rating uplift.

Table 20

Assessing Diversification/Portfolio Effect

	--Number of business lines--		
Degree of correlation of business lines	**3**	**4**	**5 or more**
High	Neutral	Neutral	Neutral
Medium	Neutral	Moderate diversification	Moderate diversification
Low	Moderate diversification	Significant diversification	Significant diversification

134. The degree of correlation of business lines is high if the business lines operate within the same industry, as defined by the industry designations in "Sector-Specific Corporate Methodology." The

degree of correlation of business lines is medium if the business lines operate within different industries, but operate within the same geographic region (for further guidance on defining geographic regions, see Appendix A, table 26). An issuer has a low degree of correlation across its business lines if these business lines are both a) in different industries and b) either operate in different regions or operate in multiple regions.

135. If we believe that a conglomerate's various industry exposures fail to provide a partial hedge against the consolidated entity's volatility because they are highly correlated through an economic cycle, then we assess the diversification/portfolio effect as neutral.

G. Capital Structure

136. S&P Global Ratings uses its capital structure criteria to assess risks in a company's capital structure that may not show up in our standard analysis of cash flow/leverage. These risks may exist as a result of maturity date or currency mismatches between a company's sources of financing and its assets or cash flows. These can be compounded by outside risks, such as volatile interest rates or currency exchange rates.

1. Assessing capital structure

137. Capital structure is a modifier category, which adjusts the initial anchor for a company after any modification due to diversification/portfolio effect. We assess a number of subfactors to determine the capital structure assessment, which can then raise or lower the initial anchor by one or more notches--or have no effect in some cases. We assess capital structure as 1, very positive; 2, positive; 3, neutral; 4, negative; or 5, very negative. In the large majority of cases, we believe that a firm's capital structure will be assessed as neutral. To assess a company's capital structure, we analyze four subfactors:

- Currency risk associated with debt,
- Debt maturity profile (or schedule),
- Interest rate risk associated with debt, and
- Investments.

138. Any of these subfactors can influence a firm's capital structure assessment, although some carry greater weight than others, based on a tiered approach:

- Tier one risk subfactors: Currency risk of debt and debt maturity profile, and
- Tier two risk subfactor: Interest rate risk of debt.

139. The initial capital structure assessment is based on the first three subfactors (see table 21). We may then adjust the preliminary assessment based on our assessment of the fourth subfactor, investments.

Table 21

Preliminary Capital Structure Assessment

Preliminary capital structure assessment	Subfactor assessments
Neutral	No tier one subfactor is negative.
Negative	One tier one subfactor is negative, and the tier two subfactor is neutral.

Table 21

Preliminary Capital Structure Assessment (cont.)

Preliminary capital structure assessment	Subfactor assessments
Very negative	Both tier one subfactors are negative, or one tier one subfactor is negative and the tier two subfactor is negative.

140. Tier one subfactors carry the greatest risks, in our view, and, thus, could have a significant impact on the capital structure assessment. This is because, in our opinion, these factors have a greater likelihood of affecting credit metrics and potentially causing liquidity and refinancing risk. The tier two subfactor is important in and of itself, but typically less so than the tier one subfactors. In our view, in the majority of cases, the tier two subfactor in isolation has a lower likelihood of leading to liquidity and default risk than do tier one subfactors.

141. The fourth subfactor, investments, as defined in paragraph 153, quantifies the impact of a company's investments on its overall financial risk profile. Although not directly related to a firm's capital structure decisions, certain investments could provide a degree of asset protection and potential financial flexibility if they are monetized. Thus, the fourth subfactor could modify the preliminary capital structure assessment (see table 22). If the subfactor is assessed as neutral, then the preliminary capital structure assessment will stand. If investments is assessed as positive or very positive, we adjust the preliminary capital structure assessment upward (as per table 22) to arrive at the final assessment.

Table 22

Final Capital Structure Assessment

	--Investments subfactor assessment--		
Preliminary capital structure assessment	Neutral	Positive	Very positive
Neutral	Neutral	Positive	Very positive
Negative	Negative	Neutral	Positive
Very negative	Very negative	Negative	Negative

2. Capital structure analysis: Assessing the subfactors

a) Subfactor 1: Currency risk of debt

142. Currency risk arises when a company borrows without hedging in a currency other than the currency in which it generates revenues. Such an unhedged position makes the company potentially vulnerable to fluctuations in the exchange rate between the two currencies, in the absence of mitigating factors. We determine the materiality of any mismatch by identifying situations where adverse exchange-rate movements could weaken cash flow and/or leverage ratios. We do not include currency mismatches under the following scenarios:

- The country where a company generates its cash flows has its currency pegged to the currency in which the company has borrowed, or vice versa (or the currency of cash flows has a strong track record and government policy of stability with the currency of borrowings), examples being the Hong Kong dollar which is pegged to the U.S. dollar, and the Chinese renminbi which is managed in a narrow band to the U.S. dollar (and China's foreign currency reserves are

mainly in U.S. dollars). Moreover, we expect such a scenario to continue for the foreseeable future;

- A company has the proven ability, through regulation or contract, to pass through changes in debt servicing costs to its customers; or
- A company has a natural hedge, such as where it may sell its product in a foreign currency and has matched its debt in that same currency.

143. We also recognize that even if an entity generates insufficient same-currency cash flow to meet foreign currency-denominated debt obligations, it could have substantial other currency cash flows it can convert to meet these obligations. Therefore, the relative amount of foreign denominated debt as a proportion of total debt is an important factor in our analysis. If foreign denominated debt, excluding fully hedged debt principal, is 15% or less of total debt, we assess the company as neutral on currency risk of debt. If foreign-denominated debt, excluding fully hedged debt principal, is greater than 15% of total debt, and debt to EBITDA is greater than 3.0x, we evaluate currency risks through further analysis.

144. If an entity's foreign-denominated debt in a particular currency represents more than 15% of total debt, and if its debt to EBITDA ratio is greater than 3.0x, we identify whether a currency-specific interest coverage ratio indicates potential currency risk. The coverage ratio divides forecasted operating cash flow in each currency by interest payments over the coming 12 months for that same currency. It is often easier to ascertain the geographic breakdown of EBITDA as opposed to operating cash flow. So in situations where we don't have sufficient cash flow information, we may calculate an EBITDA to interest expense coverage ratio in the relevant currencies. If neither cash flow nor EBITDA information is disclosed, we estimate the relevant exposures based on available information.

145. In such an instance, our assessment of this subfactor is negative if we believe any appropriate interest coverage ratio will fall below 1.2x over the next 12 months.

b) Subfactor 2: Debt maturity profile

146. A firm's debt maturity profile shows when its debt needs to be repaid, or refinanced if possible, and helps determine the firm's refinancing risk. Lengthier and more evenly spread out debt maturity schedules reduce refinancing risk, compared with front-ended and compressed ones, since the former give an entity more time to manage business- or financial market-related setbacks.

147. In evaluating debt maturity profiles, we measure the weighted average maturity (WAM) of bank debt and debt securities (including hybrid debt) within a capital structure, and make simplifying assumptions that debt maturing beyond year five matures in year six. WAM = (Maturity1/Total Debt)*tenor1 + (Maturity2/Total Debt)* tenor2 +... (Thereafter/Total Debt)* tenor6

148. In evaluating refinancing risk, we consider risks in addition to those captured under the 12-month to 24-month time-horizons factored in our liquidity criteria (see "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers"). While we recognize that investment-grade companies may have more certain future business prospects and greater access to capital than speculative-grade companies, all else being equal, we view a company with a shorter maturity schedule as having greater refinancing risk compared to a company with a longer one. In all cases, we assess a company's debt maturity profile in conjunction with its liquidity and potential funding availability. Thus, a short-dated maturity schedule alone is not a negative if we believe the company can maintain enough liquidity to pay off debt that comes due in the near term.

149. Our assessment of this subfactor is negative if the WAM is two years or less, and the amount of

these near-term maturities is material in relation to the issuer's liquidity so that under our base-case forecast, we believe the company's liquidity assessment will become less than adequate or weak over the next two years due to these maturities. In certain cases, we may assess a debt maturity profile as negative regardless of whether or not the company passes the aforementioned test. We expect such instances to be rare, and will include scenarios where we believed a concentration of debt maturities within a five-year time horizon poses meaningful refinancing risk, either due to the size of the maturities in relation to the company's liquidity sources, the company's leverage profile, its operating trends, lender relationships, and/or credit market standings.

c) Subfactor 3: Interest rate risk of debt

150. The interest rate risk of debt subfactor analyzes the company's mix of fixed-rate and floating-rate debt. Generally, a higher proportion of fixed-rate debt leads to greater predictability and stability of interest expense and therefore cash flows. The exception would be companies whose operating cash flows are to some degree correlated with interest rate movements--for example, a regulated utility whose revenues are indexed to inflation--given the typical correlation between nominal interest rates and inflation.

151. The mix of fixed versus floating-rate debt is usually not a significant risk factor for companies with intermediate or better financial profiles, strong profitability, and high interest coverage. In addition, the interest rate environment at a given point in time will play a role in determining the impact of interest rate movements. Our assessment of this subcategory will be negative if a 25% upward shift (e.g., from 2.0% to 2.5%) or a 100 basis-point upward shift (e.g., 2% to 3%) in the base interest rate of the floating rate debt will result in a breach of interest coverage covenants or interest coverage rating thresholds identified in the cash flow/leverage criteria (see section E.3).

152. Many loan agreements for speculative-grade companies contain a clause requiring a percentage of floating-rate debt to be hedged for a period of two to three years to mitigate this risk. However, in many cases the loan matures after the hedge expires, creating a mismatched hedge. We consider only loans with hedges that match the life of the loan to be--effectively--fixed-rate debt.

d) Subfactor 4: Investments

153. For the purposes of the criteria, investments refer to investments in unconsolidated equity affiliates, other assets where the realizable value isn't currently reflected in the cash flows generated from those assets (e.g., underutilized real-estate property), we do not expect any additional investment or support to be provided to the affiliate, and the investment is not included within S&P Global Ratings' consolidation scope and so is not incorporated in the company's business and financial risk profile analysis. If equity affiliate companies are consolidated, then the financial benefits and costs of these investments will be captured in our cash flow and leverage analysis. Similarly, where the company's ownership stake does not qualify for consolidation under accounting rules, we may choose to consolidate on a pro rata basis if we believe that the equity affiliates' operating and financing strategy is influenced by the rated entity. If equity investments are strategic and provide the company with a competitive advantage, or benefit a company's scale, scope, and diversity, these factors will be captured in our competitive position criteria and will not be used to assess the subfactor investments as positive. Within the capital structure criteria, we aim to assess nonstrategic financial investments that could provide a degree of asset protection and financial flexibility in the event they are monetized. These investments must be noncore and separable, meaning that a potential divestiture, in our view, has no impact on the company's existing operations.

154. In many instances, the cash flows generated by an equity affiliate, or the proportional share of the associate company's net income, might not accurately reflect the asset's value. This could occur if the equity affiliate is in high growth mode and is currently generating minimal cash flow or net losses. This could also be true of a physical asset, such as real estate. From a valuation standpoint, we recognize the subjective nature of this analysis and the potential for information gaps. As a result, in the absence of a market valuation or a market valuation of comparable companies in the case of minority interests in private entities, we will not ascribe value to these assets.

155. We assess this subfactor as positive or very positive if three key characteristics are met. First, an estimated value can be ascribed to these investments based on the presence of an existing market value for the firm or comparable firms in the same industry. Second, there is strong evidence that the investment can be monetized over an intermediate timeframe--in the case of an equity investment, our opinion of the marketability of the investment would be enhanced by the presence of an existing market value for the firm or comparable firms, as well as our view of market liquidity. Third, monetization of the investment, assuming proceeds would be used to repay debt, would be material enough to positively move existing cash flow and leverage ratios by at least one category and our view on the company's financial policy, specifically related to financial discipline, supports the assessment that the potential proceeds would be used to pay down debt. This subfactor is assessed as positive if debt repayment from the investment sale has the potential to improve cash flow and leverage ratios by one category. We assess investments as very positive if proceeds upon sale of the investment have the potential to improve cash flow and leverage ratios by two or more categories. If the three characteristics are not met, this subfactor will be assessed as neutral and the preliminary capital structure assessment will stand.

156. We will not assess the investments subfactor as positive or very positive when the anchor is 'b+' or lower unless the three conditions described in paragraph 155 are met, and:

- For issuers with less than adequate or weak liquidity, the company has provided a credible near-term plan to sell the investment.
- For issuers with adequate or better liquidity, we believe that the company, if needed, could sell the investment in a relatively short timeframe.

H. Financial Policy

157. Financial policy refines the view of a company's risks beyond the conclusions arising from the standard assumptions in the cash flow/leverage assessment (see section E). Those assumptions do not always reflect or entirely capture the short-to-medium term event risks or the longer-term risks stemming from a company's financial policy. To the extent movements in one of these factors cannot be confidently predicted within our forward-looking evaluation, we capture that risk within our evaluation of financial policy. The cash flow/leverage assessment will typically factor in operating and cash flows metrics we observed during the past two years and the trends we expect to see for the coming two years based on operating assumptions and predictable financial policy elements, such as ordinary dividend payments or recurring acquisition spending. However, over that period and, generally, over a longer time horizon, the firm's financial policies can change its financial risk profile based on management's or, if applicable, the company's controlling shareholder's (see Appendix E) appetite for incremental risk or, conversely, plans to reduce leverage. We assess financial policy as 1) positive, 2) neutral, 3) negative, or as being owned by a financial sponsor. We further identify financial sponsor-owned companies as 'FS-4', 'FS-5', 'FS-6', or 'FS-6 (minus)' (see section H.2).

1. Assessing financial policy

158. First, we determine if a company is owned by a financial sponsor. Given the intrinsic characteristics and aggressive nature of financial sponsor's strategies (i.e., short- to intermediate-term holding periods and the use of debt or debt-like instruments to maximize shareholder returns), we assign a financial risk profile assessment to a firm controlled by a financial sponsor that reflects the likely impact on our credit metrics due to these strategies and we do not separately analyze management's financial discipline or financial policy framework.

159. If a company is not controlled by a financial sponsor, we evaluate management's financial discipline and financial policy framework. Management's financial discipline measures its tolerance for incremental financial risk or, conversely, its willingness to maintain the same degree of financial risk or to lower it compared with recent cash flow/leverage metrics and our projected ratios for the next two years. The company's financial policy framework assesses the comprehensiveness, transparency, and sustainability of the entity's financial policies. We do not assess these factors for financial sponsor controlled firms.

160. The financial discipline assessments can have a positive or negative influence on an enterprise's overall financial policy assessment, or can have no net effect. Conversely, the financial policy framework assessment cannot positively influence the overall financial policy assessment. It can constrain the overall financial policy assessment to no greater than neutral.

161. The separate assessments of a company's financial policy framework and financial discipline determine the financial policy adjustment.

162. We assess management's financial discipline as 1, positive; 2, neutral; or 3, negative. We determine the assessment by evaluating the predictability of an entity's expansion plans and shareholder return strategies. We take into account, generally, management's tolerance for material and unexpected negative changes in credit ratios or, instead, its plans to rapidly decrease leverage and keep credit ratios within stated boundaries.

163. A company's financial policy framework assessment is: 1, supportive or 2, nonsupportive. We make the determination by assessing the comprehensiveness of a company's financial policy framework and whether financial targets are clearly communicated to a large number of stakeholders, and are well defined, achievable, and sustainable.

Table 23

Financial Policy Assessments

Assessment	What it means	Guidance
Positive	Indicates that we expect management's financial policy decisions to have a positive impact on credit ratios over the time horizon, beyond what can be reasonably built in our forecasts on the basis of normalized operating and cash flow assumptions. An example would be when a credible management team commits to dispose of assets or raise equity over the short to medium term in order to reduce leverage. A company with a 1 financial risk profile will not be assigned a positive assessment.	If financial discipline is positive, and the financial policy framework is supportive
Neutral	Indicates that, in our opinion, future credit ratios won't differ materially over the time horizon beyond what we have projected, based on our assessment of management's financial policy, recent track record, and operating forecasts for the company. A neutral financial policy assessment effectively reflects a low probability of "event risk," in our view.	If financial discipline is positive, and the financial policy framework is non-supportive. Or when financial discipline is neutral, regardless of the financial policy framework assessment.

Table 23

Financial Policy Assessments (cont.)

Assessment	What it means	Guidance
Negative	Indicates our view of a lower degree of predictability in credit ratios, beyond what can be reasonably built in our forecasts, as a result of management's financial discipline (or lack of it). It points to high event risk that management's financial policy decisions may depress credit metrics over the time horizon, compared with what we have already built in our forecasts based on normalized operating and cash flow assumptions.	If financial discipline is negative, regardless of the financial policy framework assessment
Financial Sponsor*	We define a financial sponsor as an entity that follows an aggressive financial strategy in using debt and debt-like instruments to maximize shareholder returns. Typically, these sponsors dispose of assets within a short to intermediate time frame. Accordingly, the financial risk profile we assign to companies that are controlled by financial sponsors ordinarily reflects our presumption of some deterioration in credit quality in the medium term. Financial sponsors typically include private equity firms, hedge funds, and other types of investors that consistently use aggressive financial strategies that we believe will lead to the deterioration of credit quality.	We define financial sponsor-owned companies as nonfinancial corporate entities in which one or more financial sponsors own at least 40% of the entity's common equity, or retain the majority of the voting rights and control through preference shares, and where we consider that the sponsors exercise control of the company either solely or jointly.

*Assessed as FS-4, FS-5, FS-6, or FS-6 (minus).

2. Financial sponsor-controlled companies

164. We define a financial sponsor as an entity that follows an aggressive financial strategy in using debt and debt-like instruments to maximize shareholder returns. Typically, these sponsors dispose of assets within a short-to-intermediate time frame. Financial sponsors typically include private equity firms, hedge funds, and other types of investors that consistently use aggressive financial strategies that we believe will lead to the deterioration of credit quality.

165. We define financial sponsor-owned companies as nonfinancial corporate entities in which one or more financial sponsors own at least 40% of the entity's common equity, or retain the majority of the voting rights and control through preference shares, and where we consider that the sponsors exercise control of the company either solely or jointly. "Control" refers to the sponsors' ability to dictate an entity's strategy and cash flow. The strategic goals of the sponsors must be aligned for us to consider the sponsors as having joint control.

166. We differentiate between financial sponsors and other types of controlling shareholders and companies that do not have controlling shareholders based on our belief that short-term ownership--such as exists in private equity sponsor-owned companies--generally entails financial policies aimed at achieving rapid returns for shareholders typically through aggressive debt leverage.

167. Financial sponsors often dictate policies regarding risk-taking, financial management, and corporate governance for the companies that they control. There is a common pattern of these investors extracting cash in ways that increase the companies' financial risk by utilizing debt or debt like instruments. Accordingly, the financial risk profile we assign to companies that are controlled by financial sponsors ordinarily reflect our presumption of some deterioration in credit quality or steadily high leverage in the medium term.

168. We assess the influence of financial sponsor ownership as 'FS-4', 'FS-5', 'FS-6', and 'FS-6 (minus)', depending on how aggressive we assume the sponsor will be and assign a financial risk

profile accordingly (see table 24). Similar to non-financial sponsor-owned issuers, we calculate two core credit ratios--funds from operations (FFO) to debt and debt to EBITDA--to derive the preliminary cash flow/leverage assessment for sponsor-owned companies as described in our "Cash Flow/Leverage" section above. We then use our supplemental ratios to either confirm or adjust the preliminary cash flow/leverage assessment.

169. Generally, financial sponsor-owned issuers will receive an assessment of 'FS-6' or 'FS-6 (minus)', leading to a financial risk profile assessment of '6', under the criteria. A 'FS-6' assessment indicates that, in our opinion, forecasted weighted core and supplemental ratios are likely be to be consistent with a '6' financial risk profile, based on our assessment of the financial sponsor's financial policy and track record. A 'FS-6' assessment also indicates that a financial sponsor-owned issuer may have weighted core and supplemental ratios consistent with a financial risk profile better than a '6', and we believe there is a reasonable likelihood that the issuer's weighted ratios will deteriorate to levels consistent with a '6', or its liquidity assessment is less than adequate or worse. A 'FS-6 (minus)' will likely be applied to companies that we forecast to have weighted core and supplemental ratios consistent with a '6' financial risk profile, but we believe the financial sponsor to be very aggressive and that leverage could increase materially even further from our forecasted levels.

170. In a small minority of cases, a financial sponsor-owned entity could receive an assessment of 'FS-5'. This assessment will apply only when we project that the company's weighted core and supplemental ratios will be consistent with a '5' (aggressive) financial risk profile (see tables 17, 18, and 19), we perceive that the risk of the weighted credit metrics deteriorating further is low based on the company's financial policy and our view of the owner's financial risk appetite, and liquidity is at least adequate.

171. In even rarer cases, we could assess the financial policy of a financial sponsor-owned entity as 'FS-4'. This assessment will apply only when all of the following conditions are met: other shareholders own a material (generally, at least 20%) stake, we expect the sponsor to relinquish control over the intermediate term, we project that the company's weighted core and supplemental ratios are currently consistent with a '4' (significant) financial risk profile (see tables 17, 18, and 19), the company has said it will maintain credit ratios at or better than these levels, and liquidity is at least adequate.

Table 24

Financial risk profile implications for sponsor-owned issuers

Assessment	What it means	Conditions for each assessment
FS-4	Financial risk profile set at '4'	Issuer must meet all of the following conditions: -- Other shareholders must own a material (no less than 20% stake); -- We anticipate the sponsor will relinquish control over the medium term; -- Weighted credit metrics that are consistent with a '4' or better financial risk profile. For example, issuers subject to Table 17 (standard volatility), weighted debt to EBITDA is less than 4x, and we estimate that it will remain less than 4x. For issuers that are subject to Table 18 (medial volatility), weighted debt to EBITDA is below 4.5x and we forecast it to remain below that level. Or for issuers subject to Table 19 (low volatility), weighted debt to EBITDA is less than 5x and our estimation is it will remain below that level; -- The company has indicated a financial policy stipulating a level of credit metrics consistent with a 'significant' or better financial risk profile (for example, weighted debt to EBITDA of less than 4x when applying standard volatility tables, 4.5x when applying medial volatility tables, or less than 5x when applying low volatility tables); and -- We assess liquidity to be at least adequate, with adequate covenant headroom.

Table 24

Financial risk profile implications for sponsor-owned issuers (cont.)

Assessment	What it means	Conditions for each assessment
FS-5	Financial risk profile set at '5'	Issuer must meet all of the following conditions: -- Weighted credit metrics that are consistent with a '5' or better financial risk profile. For example, for issuers subject to the standard volatility table, weighted debt to EBITDA is less than 5x, and we estimate that it will remain less than 5x. For issuers that are subject to the medial volatility table, weighted debt to EBITDA is below 5.5x and we forecast it to remain below that level. Or for issuers subject to the low volatility table, weighted debt to EBITDA is less than 6x and our estimation is it will remain below that level; -- We believe the risk of the issuer's weighted credit metrics deteriorating to the '6' financial risk profile is low. For example, weighted Debt/ EBITDA not likely to exceed 5x (standard volatility issuer), 5.5x (medial volatility issuer), or six (low volatility issuer); and -- We assess liquidity to be at least adequate, with adequate covenant headroom.
FS-6	Financial risk profile set at '6'	Weighted credit metrics that are consistent with a '6' financial risk profile, or weighted credit metrics consistent with a better financial risk profile which are expected to deteriorate to levels consistent with a '6' financial risk profile, but not meaningfully beyond.For example, weighted debt to EBITDA is greater than 5x (when applying the standard volatility table), greater than 5.5x (when applying the medial volatility table), or greater than 6x (when applying the low volatility table), and we believe that leverage is unlikely to increase meaningfully beyond these levels.
FS-6 (minus)	Financial risk profile set at '6' and anchor reduced by one notch (unless this results in a final rating below 'B-')	In determining the anchor, the financial risk profile is a '6', but we believe the track record of the financial sponsor indicates that the issuer's weighted credit metrics, such as leverage, could increase materially from already high levels.

3. Companies not controlled by a financial sponsor

172. For companies not controlled by a financial sponsor we evaluate management's financial discipline and financial policy framework to determine the influence on an entity's financial risk profile beyond what is implied by recent credit ratios and our cash flow and leverage forecasts. This influence can be positive, neutral, or negative.

173. We do not distinguish between management and a controlling shareholder that is not a financial sponsor when assessing these subfactors, as the controlling shareholder usually has the final say on financial policy.

a) Financial discipline

174. The financial discipline assessment is based on management's leverage tolerance and the likelihood of event risk. The criteria evaluate management's potential appetite to incur unforeseen, higher financial risk over a prolonged period and the associated impact on credit measures. We also assess management's capacity and commitment to rapidly decrease debt leverage to levels consistent with its credit ratio targets.

175. This assessment therefore seeks to determine whether unforeseen actions by management to increase, maintain, or reduce financial risk are likely to occur during the next two to three years, with either a negative or positive effect, or none at all, on our baseline forecasts for the period.

176. This assessment is based on the leverage tolerance of a company's management, as reflected in its plans or history of acquisitions, shareholder remuneration, and organic growth strategies (see Appendix E).

177. We assess financial discipline as positive, neutral, or negative, based on its potential impact on our forward-looking assessment of a firm's cash flow/leverage, as detailed in table 25. For example, a neutral assessment for leverage tolerance reflects our expectation that management's financial policy will unlikely lead to significant deviation from current and forecasted credit ratios. A negative assessment acknowledges a significant degree of event risk of increased leverage relative to our base-case forecast, resulting from the company's acquisition policy, its shareholder remuneration policy, or its organic growth strategy. A positive assessment indicates that the company is likely to take actions to reduce leverage, but we cannot confidently incorporate these actions into our baseline forward-looking assessment of cash flow/leverage.

178. A positive assessment indicates that management is committed and has the capacity to reduce debt leverage through the rapid implementation of credit enhancing measures, such as asset disposals, rights issues, or reductions in shareholder returns. In addition, management's track record over the past five years shows that it has taken actions to rapidly reduce unforeseen increases in debt leverage and that there have not been any prolonged periods when credit ratios were weaker than our expectations for the rating. Management, even if new, also has a track record of successful execution. Conversely, a negative assessment indicates management's financial policy allows for significant increase in leverage compared with both current levels and our forward-looking forecast under normal operating/financial conditions or does not have observable time limits or stated boundaries. Management has a track record of allowing for significant and prolonged peaks in leverage and there is no commitment or track record of management using mitigating measures to rapidly return to credit ratios consistent with our expectations.

179. As evidence of management's leverage tolerance, we evaluate its track record and plans regarding acquisitions, shareholder remuneration, and organic growth strategies (see Appendix E). Acquisitions could increase the risk that leverage will be higher than our base-case forecast if we view management's strategy as opportunistic or if its financial policy (if it exists) provides significant headroom for debt-financed acquisitions. Shareholder remuneration could also increase the risk of leverage being higher than our base-case forecast if management's shareholder reward policies are not particularly well defined or have no clear limits, management has a tolerance for shareholder returns exceeding operating cash flow, or has a track record of sustained cash returns despite weakening operating performance or credit ratios. Organic growth strategies can also result in leverage higher than our base-case forecast if these plans have no clear focus or investment philosophy, capital spending is fairly unpredictable, or there is a track record of overspending or unexpected or rapid shifts in plans for new markets or products.

180. We also take into account management's track record and level of commitment to its stated financial policies, to the extent a company has a stated policy. Historical evidence and any deviations from stated policies are key elements in analyzing a company's leverage tolerance. Where material and unexpected deviation in leverage may occur (for example, on the back of operating weakness or acquisitions), we also assess management's plan to restore credit ratios to levels consistent with previous expectations through rapid and proactive nonorganic measures. Management's track record to execute its deleveraging plan, its level of commitment, and the scope and timeframe of debt mitigating measures will be key differentiators in assessing a company's financial policy discipline.

Table 25

Assessing Financial Discipline

Descriptor	What it means	Guidance
Positive	Management is likely to take actions that result in leverage that is lower than our base-case forecast, but can't be confidently included in our base-case assumptions. Event risk is low.	Management is committed and has capacity to reduce debt leverage and increase financial headroom through the rapid implementation of credit enhancing measures, in line with its stated financial policy, if any. This relates primarily to management's careful and moderate policy with regard to acquisitions and shareholder remuneration as well as to its organic growth strategy. The assessments are supported by historical evidence over the past five years of not showing any prolonged weakening in the company's credit ratios, or relative to our base-case credit metrics' assumptions. Management, even if new, has a track record of successful execution.
Neutral	Leverage is not expected to deviate materially from our base-case forecast. Event risk is moderate.	Management's financial discipline with regard to acquisitions, shareholder remuneration, as well as its organic growth strategy does not result in significantly different leverage as defined in its stated financial policy framework.
Negative	Leverage could become materially higher than our base-case forecast. Event risk is high.	Management's financial policy framework does not explicitly rule out a significant increase in leverage compared to our base-case assumptions, possibly reflecting a greater event risk with regard to its M&A and shareholder remuneration policy as well as to its organic growth strategy. These points are supported by historical evidence over the past five years of allowing for significant and prolonged peaks in leverage, which remained unmitigated by credit supporting measures by management.

b) Financial policy framework

181. The company's financial policy framework assesses the comprehensiveness, transparency, and sustainability of the entity's financial policies (see Appendix E, paragraphs 264-268). This will help determine whether there is a satisfactory degree of visibility into the issuer's future financial risk profile. Companies that have developed and sustained a comprehensive set of financial policies are more likely to build long-term, sustainable credit quality than those that do not.

182. We will assess a company's financial policy framework as supportive or nonsupportive based on evidence that supports the characteristics listed below. In order for an entity to receive a supportive assessment for financial policy framework, there must be sufficient evidence of management's financial policies to back that assessment.

183. A company assessed as supportive will generally exhibit the following characteristics:

- Management has a comprehensive set of financial policies covering key areas of financial risk, including debt leverage and liability management. Financial targets are well defined and quantifiable.
- Management's financial policies are clearly articulated in public forums (such as public listing disclosures and investor presentations) or are disclosed to a limited number of key stakeholders such as main creditors or to the credit rating agencies. The company's adherence to these policies is satisfactory.
- Management's articulated financial policies are considered achievable and sustainable. This assessment takes into consideration historical adherence to articulated policies, existing financial risk profile, capacity to sustain capital structure through nonorganic means, demands of key stakeholders, and the stability of financial policy parameters over time.

184. A company receives a nonsupportive assessment if it does not meet all the conditions for a supportive assessment. We expect a nonsupportive assessment to be uncommon.

I. Liquidity

185. Our assessment of liquidity focuses on monetary flows--the sources and uses of cash--that are the key indicators of a company's liquidity cushion. The analysis assesses the potential for a company to breach covenant tests related to declines in EBITDA, as well as its ability to absorb high-impact, low-probability events (such as those that may arise from the materialization of ESG risks), the nature of the company's bank relationships, its standing in credit markets, and how prudent (or not) we believe its financial risk management to be (see "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers").

J. Management And Governance

186. The methodology describing our analytical framework for evaluating management and governance factors that are relevant to the analysis of credit risk is detailed in our criteria article "Management And Governance Credit Factors For Corporate Entities".

K. Comparable Ratings Analysis

187. The comparable ratings analysis (CRA) is our last step in determining the SACP on a company, after adjusting for the previous five modifiers. This analysis can lead us to raise or lower our anchor by one notch. The CRA is based on our overall assessment of the issuer's credit characteristics for all subfactors considered in arriving at the SACP. This involves taking a holistic review of a company's stand-alone credit risk profile, in which we evaluate an issuer's credit characteristics in aggregate. A positive assessment leads to a one-notch upgrade, a negative assessment leads to a one-notch downgrade, and a neutral assessment indicates no change to the anchor.

188. The application of comparable ratings analysis reflects the need to "fine-tune" ratings outcomes, even after the use of each of the other modifiers. A positive or negative assessment is therefore likely to be common rather than exceptional.

189. We consider our assessments of each of the underlying subfactors to be points within a possible range. Consequently, each of these assessments that ultimately generate the SACP can be at the upper or lower end, or at the mid-point, of such a range:

- A company receives a positive assessment if we believe, in aggregate, its relative ranking across the subfactors typically to be at the higher end of the range;
- A company receives a negative assessment if we believe, in aggregate, its relative ranking across the subfactors typically to be at the lower end of the range;
- A company receives a neutral assessment if we believe, in aggregate, its relative ranking across the subfactors typically to be in line with the middle of the range.

190. The most direct application of the comparable ratings analysis is in the following circumstances:

- Business risk assessment. If we expect a company to sustain a position at the higher or lower end of the ranges for the business risk category assessment, the company could receive a positive or negative assessment, respectively.

- Financial risk assessment and financial metrics. If a company's actual and forecasted metrics are just above (or just below) the financial risk profile range, as indicated in its cash flow/leverage assessment, we could assign a positive or negative assessment.

191. We also consider additional factors not already covered, or existing factors not fully captured, in arriving at the SACP. Such factors will generally reflect less frequently observed credit characteristics, may be unique, or may reflect unpredictability or uncertain risk attributes, both positive and negative. See Appendix F for additional guidance and examples on the application of the CRA.

B. Competitive Position

1. Analyzing subfactors for competitive advantage

192. Competitive advantage is the first component of our competitive position analysis. Companies that possess a sustainable competitive advantage are able to capitalize on key industry factors or mitigate associated risks more effectively. When a company operates in more than one business, we analyze each segment separately to form an overall view of its competitive advantage. In assessing competitive advantage, we evaluate the following subfactors:

- Strategy;
- Differentiation/uniqueness, product positioning/bundling;
- Brand reputation and marketing;
- Product/service quality;
- Barriers to entry, switching costs;
- Technological advantage and capabilities, technological displacement; and
- Asset profile.

a) Strategy

193. A company's business strategy will enhance or undermine its market entrenchment and business stability. Compelling business strategies can create a durable competitive advantage and thus a relatively stronger competitive position. We form an opinion as to the source and sustainability (if any) of the company's competitive advantage relative to its peers'. The company may have a differentiation advantage (i.e., brand, technology, regulatory) or a cost advantage (i.e., lower cost producer/servicer at the same quality level), or a combination.

194. Our assessment of a company's strategy is informed by a company's historical performance and how realistic we view its forward-looking business objectives to be. These may include targets for market shares, the percentage of revenues derived from new products, price versus the competition's, sales or profit growth, and required investment levels. We evaluate these objectives in the context of industry dynamics and the attractiveness of the markets in which the company

participates.

b) Differentiation/uniqueness, product positioning/bundling

195. The attributes of product or service differentiation vary by sector, and may include product or services features, performance, durability, reliability, delivery, and comprehensiveness, among other measures. The intensity of competition may be lower where buyers perceive the product or service to be highly differentiated or to have few substitutes. Conversely, products and services that lack differentiation, or offer little value-added in the eyes of customers, are generally commodity-type products that primarily compete on price. Competition intensity will often be highest where limited or moderate investment (R&D, capital expenditures, or advertising) or low employee skill levels (for service businesses) are required to compete. Independent market surveys, media commentaries, market share trends, and evidence of leading or lagging when it comes to raising or lowering prices can indicate varying degrees of product differentiation.

196. Product positioning influences how companies are able to extend or protect market shares by offering popular products or services. A company's abilities to replace aging products with new ones, or to launch product extensions, are important elements of product positioning. In addition, the ability to sell multiple products or services to the same customer, known as bundling or cross-selling, (for instance, offering an aftermarket servicing contract together with the sale of a new appliance) can create a competitive advantage by increasing customers' switching costs and fostering loyalty.

c) Brand reputation and marketing

197. Brand equity measures the price premium a company receives based on its brand relative to the generic equivalent. High brand equity typically translates into customer loyalty, built partially via marketing campaigns. One measure of advertising effectiveness can be revenue growth compared with the increase in advertising expenses.

198. We also analyze re-investment and advertising strategies to anticipate potential strengthening or weakening of a company's brand. A company's track record of boosting market share and delivering attractive margins could indicate its ability to build and maintain brand reputation.

d) Product/service level quality

199. The strength and consistency of a value proposition is an important factor contributing to a sustainable competitive advantage. Value proposition encompasses the key features of a product or a service that convince customers that their purchase has the right balance between price and quality. Customers generally perceive a product or a service to be good if their expectations are consistently met. Quality, both actual and perceived, can help a company attract and retain customers. Conversely, poor product and service quality may lead to product recalls, higher-than-normal product warnings, or service interruptions, which may reduce demand. Measures of customer satisfaction and retention, such as attrition rates and contract renewal rates, can help trace trends in product/service quality.

200. Maintaining the value proposition requires consistency and adaptability around product design, marketing, and quality-related operating controls. This is pertinent where product differentiation matters, as is the case in most noncommodity industries, and especially so where environmental or human health (concerns for the chemical, food, and pharmaceutical industries) adds a liability dimension to the quality and value proposition. Similarly, regulated utilities (which often do not set

their own prices) typically focus on delivering uninterrupted service, often to meet the standards set by their regulator.

e) Barriers to entry, switching costs

201. Barriers to entry can reduce or eliminate the threat of new market entrants. Where they are effective, these barriers can lead to more predictable revenues and profits, by limiting pricing pressures and customer losses, lowering marketing costs, and improving operating efficiency. While barriers to entry may enable premium pricing, a dominant player may rationally choose pricing restraint to further discourage new entrants.

202. Barriers to entry can be one or more of: a natural or regulatory monopoly; supportive regulation; high transportation costs; an embedded customer base that would incur high switching costs; a proprietary product or service; capital or technological intensiveness.

203. A natural monopoly may result from unusually high requirements for capital and operating expenditures that make it uneconomic for a market to support more than a single, dominant provider. The ultimate barrier to entry is found among regulated utilities, which provide an essential service in their 'de juris' monopolies and receive a guaranteed rate of return on their investments. A supportive regulatory regime can include rules and regulations with high hurdles that discourage competitors, or mandate so many obligations for a new entrant as to make market entry financially unviable.

204. In certain industrial sectors, proprietary access to a limited supply of key raw materials or skilled labor, or zoning laws that effectively preclude a new entrant, can provide a strong barrier to entry. Factors such as relationships, long-term contracts or maintenance agreements, or exclusive distribution agreements can result in a high degree of customer stickiness. A proprietary product or service that's protected by a copyright or patent can pose a significant hurdle to new competitors.

f) Technological advantage and capabilities, technological displacement

205. A company may benefit from a proprietary technology that enables it to offer either a superior product or a commodity-type product at a materially lower cost. Proven research and development (R&D) capabilities can deliver a differentiated, superior product or service, as in the pharmaceutical or high tech sectors. However, optimal R&D strategies or the importance or effectiveness of patent protection differ by industry, stage of product development, and product lifecycle.

206. Technological displacement can be a threat in many industries; new technologies or extensions of current ones can effectively displace a significant portion of a company's products or services.

g) Asset profile

207. A company's asset profile is a reflection of its reinvestment, which creates tangible or intangible assets, or both. Companies in similar sectors and industries usually have similar reinvestment options and, thus, their asset profiles tend to be comparable. The reinvestment in "heavy" industries, such as oil and gas, metals and mining, and automotive, tends to produce more tangible assets, whereas the reinvestment in certain "light" industries, such as services, media and entertainment, and retail, tends to produce more intangible assets.

208. We evaluate how a company's asset profile supports or undermines its competitive advantage by reviewing its manufacturing or service creation capabilities and investment requirements, its

distribution capabilities, and its track record and commitment to reinvesting in its asset base. This may include a review of the company's ability to attract and retain a talented workforce; its degree of vertical integration and how that may help or hinder its ability to secure supply sources, control the value-added part of its production chain, or adjust to technological developments; or its ability develop a broad and strong distribution network.

2. Analyzing subfactors for scale, scope, and diversity

209. In assessing the relative strength of this component, we evaluate four subfactors:

- Diversity of product or service range;
- Geographic diversity;
- Volumes, size of markets and revenues, and market shares; and
- Maturity of products or services.

210. In a given industry, entities with a broader mix of business activities are typically lower risk, and entities with a narrower mix are higher risk. High concentration of business volumes by product, customer, or geography, or a concentration in the production footprint or supplier base, can lead to less stable and predictable revenues and profits. Comparatively broader diversity helps a company withstand economic, competitive, or technological threats better than its peers.

211. There is no minimum size criterion, although size often provides a measure of diversification. Size and scope of operations is important relative to those of industry peers, though not in absolute terms. While relatively smaller companies can enjoy a high degree of diversification, they will likely be, almost by definition, more concentrated in terms of product, number of customers, or geography than their larger peers in the same industry.

212. Successful and continuing diversification supports a stronger competitive position. Conversely, poor diversification weakens overall competitive position. For example, a company will weaken its overall business position if it enters new product lines and countries where it has limited expertise and lacks critical mass to be a real competitor to the incumbent market leaders. The weakness is greater when the new products or markets are riskier than the traditional core business.

213. Where applicable, we also include under scale, scope, and diversity an assessment of the potential benefits derived from unconsolidated (or partially consolidated) investments in strategic assets. The relative significance of such an investment and whether it is in an industry that exhibits high or, conversely, low correlation with the issuer's businesses would be considered in determining its potential benefits to scale, scope, and diversity. This excludes nonstrategic, financial investments, the analysis of which does not fall under the competitive position criteria but, instead, under the capital structure criteria.

a) Diversity of product or service range

214. The concentration of business volumes or revenues in a particular or comparatively small set of products or services can lead to less stable revenues and profits. Even if this concentration is in an attractive product or service, it may be a weakness. Likewise, the concentration of business volumes with a particular customer or a small group of customers, or the reliance on one or a few suppliers, can expose the company to a potentially greater risk of losing and having to replace related revenues and profits. On the other hand, successful diversification across products, customers, and/or suppliers can lead to more stable and predictable revenues and profits, which supports a stronger assessment of scale, scope, and diversity.

215. The relative contribution of different products or services to a company's revenues or profits helps us gauge its diversity. We also evaluate the correlation of demand between product or services lines. High correlation in demand between seemingly different product or service lines will accentuate volume declines during a weak part of the business cycle.

216. In most sectors, the share of revenue a company receives from its largest five to 10 customers or counterparties reveals how diversified its customer base is. However, other considerations such as the stability and credit quality of that customer base, and the company's ability to retain significant customers, can be mitigating or accentuating factors in our overall evaluation. Likewise, supplier dependency can often be measured based on a supplier's share of a company's operating or capital costs. However, other factors, such as the degree of interdependence between the company and its supplier(s), the substitutability of key supply sources, and the company's presumed ability to secure alternative supply without incurring substantial switching costs, are important considerations. Low switching costs (i.e., limited impact on input price, quality, or delivery times as a result of having to adapt to a new supply chain partner) can mitigate a high level of concentration.

b) Geographic diversity

217. We assess geographic diversity both from the standpoint of the breadth of the company's served or addressable markets, and from the standpoint of how geographically concentrated its facilities are.

218. The concentration of business volumes and revenues within a particular region can lead to greater exposure to economic factors affecting demand for a company's goods or services in that region. Even if the company's volumes and revenues are concentrated in an attractive region, it may still be vulnerable to a significant drop in demand for its goods and services. Conversely, a company that serves multiple regions may benefit from different demand conditions in each, possibly resulting in greater revenue stability and more consistent profitability than a more focused peer's. That said, we consider geographic diversification in the context of the industry and the size of the local or regional economy. For instance, companies operating in local industries (such as food retailers) may benefit from a well-entrenched local position.

219. Generally, though, geographically concentrated production or service operations can expose a company to the risk of disruption, and damage revenues and profitability. Even when country risks don't appear significant, a company's vulnerability to exogenous factors (for example, natural disasters, an epidemic, labor or political unrest) increases with geographic concentration.

c) Volumes, size of markets and revenues, market share

220. Absolute sales or unit volumes and market share do not, by themselves, support a strong assessment of scale, scope, and diversity. Yet superior market share is a positive, since it may indicate a broad range of operations, products, or services.

221. We view volume stability (relative to peers') as a positive especially when: a company has demonstrated it during an economic downturn; if it has been achieved without relying on greater price concessions than competitors have made; and when it is likely to be sustained in the future. However, volume stability combined with shrinking market share could be evidence of a company's diminishing prospects for future profitability. We assess the predictability of business volumes and the likely degree of future volume stability by analyzing the company's performance relative to peers' on several industry factors: cyclicality; ability to adapt to technological and regulatory threats; the profile of the customer base (stickiness); and the potential life cycle of the company's products or services.

222. Depending on the industry sector, we measure a company's relative size and market share based on unit sales; the absolute amount of revenues; and the percentage of revenues captured from total industry revenues. We also adjust for industry and company specific qualitative considerations. For example, if an industry is particularly fragmented and has a number of similarly sized participants, none may have a particular advantage or disadvantage with respect to market share.

d) Maturity of products or services

223. The degree of maturity and the relative position on the lifecycle curve of the company's product or service portfolio affect the stability and sustainability of its revenues and margins. It is important to identify the stage of development of a company's products or services in order to measure the life cycle risks that may be associated with key products or services.

224. Mature products or services (e.g., consumer products or broadcast programming) are not necessarily a negative, in our view, if they still contribute reliable profits. If demand is declining for a company's product or service, we examine its track record on introducing new products with staying power. Similarly, a company's track record with product launches is particularly relevant.

3. Analyzing subfactors for operating efficiency

225. In assessing the relative strength of this component, we consider four subfactors:

- Cost structure,
- Manufacturing processes,
- Working capital management, and
- Technology.

226. To the extent a company has high operating efficiency, it should be able to generate better profit margins than peers that compete in the same markets, whatever the prevailing market conditions. The ability to minimize manufacturing and other operational costs and thus maximize margins and cash flow--for example, through manufacturing excellence, cost control, and diligent working capital management--will provide the funds for research and development, marketing, and customer service.

a) Cost structure

227. Companies that are well positioned from a cost standpoint will typically enjoy higher capacity utilization and be more profitable over the course of the business cycle. Cost structure and cost control are keys to generating strong profits and cash flow, particularly for companies that produce commodities, operate in mature industries, or face pricing pressures. It is important to consider whether a company or any of its competitors has a sustainable cost advantage, which can be based on access to cheaper energy, favorable manufacturing locations, or lower and more flexible labor costs, for example.

228. Where information is available, we examine a company's fixed versus variable cost mix as an indication of operating leverage, a measure of how revenue growth translates into growth in operating income. A company with significant operating leverage may witness dramatic declines in operating profit if unit volumes fall, as during cyclical downturns. Conversely, in an upturn, once revenues pass the breakeven point, a substantial percentage of incremental revenues typically becomes profit.

b) Manufacturing process

229. Capital intensity characterizes many heavy manufacturing sectors that require minimum volumes to produce acceptable profits, cash flow, and return on assets. We view capacity utilization through the business cycle (combined with the cost base) as a good indication of manufacturers' ability to maintain profits in varying economic scenarios. Our capacity utilization assessment is based on a company's production capacity across its manufacturing footprint. In addition, we consider the direction of a company's capacity utilization in light of our unit sales expectations, as opposed to analyzing it plant-by-plant.

230. Labor relations remain an important focus in our analysis of operating efficiency for manufacturers. Often, a company's labor cost structure is driven by its history of contractual negotiations and the countries in which it operates. We examine the rigidity or flexibility of a company's labor costs and the extent to which it relies on labor rather than automation. We analyze labor cost structure by assessing the extent of union representation, wage and benefit costs as a share of cost of goods sold (when available), and by assessing the balance of capital equipment vs. labor input in the manufacturing process. We also incorporate trends in a company's efforts to transfer labor costs from high-cost to low-cost regions.

c) Working capital management

231. Working capital management--of current or short-term assets and liabilities--is a key factor in our evaluation of operating efficiency. In general, companies with solid working capital management skills exhibit shorter cash conversion cycles (defined as days' investment in inventory and receivables less days' investment in accounts payable) than their lower-skilled peers. Short cash-conversion cycles could, for instance, demonstrate that a company has a stronger position in the supply chain (for example, requiring suppliers or dealers to hold more of its inventory). This allows a company to direct more capital than its peers can to other areas of investment.

d) Technology

232. Technology can play an important role in achieving superior operating efficiency through effective

yield management (by improving input/output ratios), supply chain automation, and cost optimization.

233. Achieving high yield management is particularly important in industries with limited inventory and high fixed costs, such as transportation, lodging, media, and retail. The most efficient airlines can achieve higher revenue per available seat mile than their peers, while the most efficient lodging companies can achieve a higher revenue per available room than their peers. Both industries rely heavily on technology to effectively allocate inventory (seats and rooms) to maximize sales and profitability.

234. Effective supply chain automation systems enable companies to reduce investments in inventory and better forecast future orders based on current trends. By enabling electronic data interchange between supplier and retailer, such systems help speed orders and reorders for goods by quickly pinpointing which merchandise is selling well and needs restocking. They also identify slow moving inventory that needs to be marked down, making space available for fresh merchandise.

235. Effective use of technology can also help hold down costs by improving productivity via automation and workflow management. This can reduce selling, general, and administrative costs, which usually represent a substantial portion of expenditures for industries with high fixed costs, thus boosting earnings.

C. Cash Flow/Leverage Analysis

1. The merits and drawbacks of each cash flow measure

a) EBITDA

236. EBITDA is a widely used, and therefore a highly comparable, indicator of cash flow, although it has significant limitations. Because EBITDA derives from the income statement entries, it can be distorted by the same accounting issues that limit the use of earnings as a basis of cash flow. In addition, interest can be a substantial cash outflow for speculative-grade companies and therefore EBITDA can materially overstate cash flow in some cases. Nevertheless, it serves as a useful and common starting point for cash flow analysis and is useful in ranking the financial strength of different companies.

b) Funds from operations (FFO)

237. FFO is a hybrid cash flow measure that estimates a company's inherent ability to generate recurring cash flow from its operations independent of working capital fluctuations. FFO estimates the cash flow available to the company before working capital, capital spending, and discretionary items such as dividends, acquisitions, etc.

238. Because cash flow from operations tends to be more volatile than FFO, FFO is often used to smooth period-over-period variation in working capital. We consider it a better proxy of recurring cash flow generation because management can more easily manipulate working capital depending on its liquidity or accounting needs. However, we do not generally rely on FFO as a guiding cash flow measure in situations where assessing working capital changes is important to judge a company's cash flow generating ability and general creditworthiness. For example, for working-capital-intensive industries such as retailing, operating cash flow may be a better

indicator than FFO of the firm's actual cash generation.

239. FFO is a good measure of cash flow for well-established companies whose long-term viability is relatively certain (i.e., for highly rated companies). For such companies, there can be greater analytical reliance on FFO and its relation to the total debt burden. FFO remains very helpful in the relative ranking of companies. In addition, more established, healthier companies usually have a wider array of financing possibilities to cover potential short-term liquidity needs and to refinance upcoming maturities. For marginal credit situations, the focus shifts more to free operating cash flow--after deducting the various fixed uses such as working capital investment and capital expenditures--as this measure is more directly related to current debt service capability.

c) Cash flow from operations (CFO)

240. The measurement and analysis of CFO forms an important part of our ratings assessment, in particular for companies that operate in working-capital-intensive industries or industries in which working capital flows can be volatile. CFO is distinct from FFO as it is a pure measure of cash flow calculated after accounting for the impact on earnings of changes in operating assets and liabilities. CFO is cash flow that is available to finance items such as capital expenditures, repay borrowing, and pay for dividends and share buybacks.

241. In many industries, companies shift their focus to cash flow generation in a downturn. As a result, even though they typically generate less cash from ordinary business activities because of low capacity utilization and relatively low fixed-cost absorption, they may generate cash by reducing inventories and receivables. Therefore, although FFO is likely to be lower in a downturn, the impact on CFO may not be as great. In times of strong growth the opposite will be true, and consistently lower CFO compared to FFO without a corresponding increase in revenue and profitability can indicate an untenable situation.

242. Working capital is a key element of a company's cash flow generation. While there tends to be a need to build up working capital and therefore to consume cash in a growth or expansion phase, changes in working capital can also act as a buffer in case of a downturn. Many companies will sell off inventories and invest a lower amount in raw materials because of weaker business activities, both of which reduce the amount of capital and cash that is tied up in working capital. Therefore, working capital fluctuations can occur both in periods of revenue growth and contraction and analyzing a company's near-term working capital needs is crucial for estimating future cash flow developments.

243. Often, businesses that are capital intensive are not working-capital-intensive: most of the capital commitment is upfront in equipment and machinery, while asset-light businesses may have to invest proportionally more in inventories and receivables. That also affects margins, because capital-intensive businesses tend to have proportionally lower operating expenses (and therefore higher EBITDA margins), while working-capital-intensive businesses usually report lower EBITDA margins. The resulting cash flow volatility can be significant: because all investment is made upfront in a capital-intensive business, there is usually more room to absorb subsequent EBITDA volatility because margins are higher. For example, a capital-intensive company may remain reasonably profitable even if its EBITDA margin declines from 30% to 20%. By contrast, a working-capital-intensive business with a lower EBITDA margin (due to higher operating expenses) of 8% can post a negative EBITDA margin if EBITDA volatility is large.

d) Free operating cash flow (FOCF)

244. By deducting capital expenditures from CFO, we arrive at FOCF, which can be used as a proxy for a company's cash generated from core operations. We may exclude discretionary capital expenditures for capacity growth from the FOCF calculation, but in practice it is often difficult to discriminate between spending for expansion and replacement. And, while companies have some flexibility to manage their capital budgets to weather down cycles, such flexibility is generally temporary and unsustainable in light of intrinsic requirements of the business. For example, companies can be compelled to increase their investment programs because of strong demand growth, technological changes, or to meet environmental regulatory requirements. Regulated entities might also face significant investment requirements related to their concession contracts (the understanding between a company and the host government that specifies the rules under which the company can operate locally).

245. Positive FOCF is a sign of strength and helpful in distinguishing between two companies with the same FFO. In addition, FOCF is helpful in differentiating between the cash flows generated by more and less capital-intensive companies and industries.

246. In highly capital-intensive industries (where maintenance capital expenditure requirements tend to be high) or in other situations in which companies have little flexibility to postpone capital expenditures, measures such as FFO to debt and debt to EBITDA may provide less valuable insight into relative creditworthiness because they fail to capture potentially meaningful capital expenditures. In such cases, a ratio such as FOCF to debt provides greater analytical insight.

247. A company serving a low-growth or declining market may exhibit relatively strong FOCF because of diminishing fixed and working capital needs. Growth companies, in contrast, exhibit thin or even negative FOCF because of the investment needed to support growth. For the low-growth company, credit analysis weighs the positive, strong current cash flow against the danger that this high level of cash flow might not be sustainable. For the high-growth company, the opposite is true: weighing the negatives of a current cash deficit against prospects of enhanced cash flow once current investments begin yielding cash benefits. In the latter case, if we view the growth investment as temporary and not likely to lead to increased leverage over the long-term, we'll place greater analytical importance on FFO to debt rather than on FOCF to debt. In any event, we also consider the impact of a company's growth environment in our business risk analysis, specifically in a company's industry risk analysis (see section B).

e) Discretionary cash flow (DCF)

248. For corporate issuers primarily rated in the investment-grade universe, DCF to debt can be an important barometer of future cash flow adequacy as it more fully reflects a company's financial policy, including decisions regarding dividend payouts and share buybacks. In addition, potential M&A can represent a very significant use of cash and is an important component in cash flow analysis.

249. The level of dividends depends on a company's financial strategy. Companies with aggressive dividend payout targets might be reluctant to reduce dividends even under some liquidity pressure. In addition, investment-grade companies are less likely to reduce dividend payments following some reversals--although dividends ultimately are discretionary. DCF is the truest reflection of excess cash flow, but it is also the most affected by management decisions and, therefore, does not necessarily reflect the potential cash flow available.

D. Diversification/Portfolio Effect

1. Academic research

250. Academic research recently concluded that, during the global financial crisis of 2007-2009, conglomerates had the advantage over single sector-focused firms because they had better access to the credit markets as a result of their debt co-insurance and used the internal capital markets more efficiently (i.e., their core businesses had stronger cash flows). Debt co-insurance is the view that the joining-together of two or more firms whose earnings streams are less-than-perfectly correlated reduces the risk of default of the merged firms (i.e., the co-insurance effect) and thereby increases the "debt capacity" or "borrowing ability" of the combined enterprise. These financing alternatives became more valuable during the crisis. (Source: "Does Diversification Create Value In The Presence Of External Financing Constraints? Evidence From The 2007-2009 Financial Crisis," Venkat Kuppuswamy and Belen Villalonga, Harvard Business School, Aug. 19, 2011.)

251. In addition, fully diversified, focused companies saw more narrow credit default swap spreads from 2004-2010 vs. less diversified firms. This highlighted that lenders were differentiating for risk and providing these companies with easier and cheaper access to capital. (Source: "The Power of Diversified Companies During Crises," The Boston Consulting Group and Leipzig Graduate School of Management, January 2012.)

252. Many rated conglomerates are either country- or region-specific; only a small percentage are truly global. The difference is important when assessing the country and macroeconomic risk factors. Historical measures for each region, based on volatility and correlation, reflect regional trends that are likely to change over time.

E. Financial Policy

1. Controlling shareholders

253. Controlling shareholder(s)--if they exist--exert significant influence over a company's financial risk profile, given their ability to use their direct or indirect control of the company's financial policies for their own benefit. Although the criteria do not associate the presence of controlling shareholder(s) to any predefined negative or positive impact, we assess the potential medium- to long-term implications for a company's credit standing of these strategies. Long-term ownership--such as exists in many family-run businesses--is often accompanied by financial discipline and reluctance to incur aggressive leverage. Conversely, short-term ownership--such as exists in private equity sponsor-owned companies--generally entails financial policies aimed at achieving rapid returns for shareholders typically through aggressive debt leverage.

254. The criteria define controlling shareholder(s) as:

- A private shareholder (an individual or a family) with majority ownership or control of the board of directors;
- A group of shareholders holding joint control over the company's board of directors through a shareholder agreement. The shareholder agreement may be comprehensive in scope or limited only to certain financial aspects; and
- A private equity firm or a group of private equity firms holding at least 40% in a company or with

majority control of its board of directors.

255. A company is not considered to have a controlling shareholder if it is publicly listed with more than 50% of voting interest listed or when there is no evidence of a particular shareholder or group of shareholders exerting 'de facto' control over a company.

2. Financial discipline

a) Leverage influence from acquisitions

256. Companies may employ more or less acquisitive growth strategies based on industry dynamics, regulatory changes, market opportunities, and other factors. We consider management teams with disciplined, transparent acquisition strategies that are consistent with their financial policy framework as providing a high degree of visibility into the projected evolution of cash flow and credit measures. Our assessment takes into account management's track record in terms of acquisition strategy and the related impact on the company's financial risk profile. Historical evidence of limited management tolerance for significant debt-funded acquisitions provides meaningful support for the view that projected credit ratios would not significantly weaken as a result of the company's acquisition policy. Conversely, management teams that pursue opportunistic acquisition strategies, without well-defined parameters, increase the risks that the company's financial risk profile may deteriorate well beyond our forecasts.

257. Acquisition funding policies and management's track record in this respect also provide meaningful insight in terms of credit ratio stability. In the criteria, we take into account management's willingness and capacity to mobilize all funding resources to restore credit quality, such as issuing equity or disposing of assets, to mitigate the impact of sizable acquisitions on credit ratios. The financial policy framework and related historical evidence are key considerations in our assessment.

b) Leverage influence from shareholder remuneration policies

258. A company's approach to rewarding shareholders demonstrates how it balances the interests of its various stakeholders over time. Companies that are consistent and transparent in their shareholder remuneration policies, and exhibit a willingness to adjust shareholder returns to mitigate adverse operating conditions, provide greater support to their long-term credit quality than other companies. Conversely, companies that prioritize cash returns to shareholders in periods of deteriorating economic, operating, or share price performance can significantly undermine long-term credit quality and exacerbate the credit impact of adverse business conditions. In assessing a company's shareholder remuneration policies, the criteria focus on the predictability of shareholder remuneration plans, including how a company builds shareholder expectations, its track record in executing shareholder return policies over time, and how shareholder returns compare with industry peers'.

259. Shareholder remuneration policies that lack transparency or deviate meaningfully from those of industry peers introduce a higher degree of event risk and volatility and will be assessed as less predictable under the criteria. Dividend and capital return policies that function primarily as a means to distribute surplus capital to shareholders based on transparent and stable payout ratios--after satisfying all capital requirements and leverage objectives of the company, and that support stable to improving leverage ratios--are considered the most supportive of long-term credit quality.

c) Leverage influence from plans regarding investment decisions or organic growth strategies

260. The process by which a company identifies, funds, and executes organic growth, such as expansion into new products and/or new markets, can have a significant impact on its long-term credit quality. Companies that have a disciplined, coherent, and manageable organic growth strategy, and have a track record of successful execution are better positioned to continue to attract third-party capital and maintain long-term credit quality. By contrast, companies that allocate significant amounts of capital to numerous, unrelated, large and/or complex projects and often incur material overspending against the original budget can significantly increase their credit risk.

261. The criteria assess whether management's organic growth strategies are transparent, comprehensive, and measurable. We seek to evaluate the company's mid- to long-term growth objectives--including strategic rationales and associated execution risks--as well as the criteria it uses to allocate capital. Effective capital allocation is likely to include guidelines for capital deployment, including minimum return hurdles, competitor activity analysis, and demand forecasting. The company's track record will provide key data for this assessment, including how well it executes large and/or complex projects against initial budgets, cost overruns, and timelines.

3. Financial policy framework

a) Comprehensiveness of financial policy framework

262. Financial policies that are clearly defined, unambiguous, and provide a tight framework around management behavior are the most reliable in determining an issuer's future financial risk profile. We assess as consistent with a supportive assessment, policies that are clear, measurable, and well understood by all key stakeholders. Accordingly, the financial policy framework must include well-defined parameters regarding how the issuer will manage its cash flow protection strategies and debt leverage profile. This includes at least one key or a combination of financial ratio constraints (such as maximum debt to EBITDA threshold) and the latter must be relevant with respect to the issuer's industry and/or capital structure characteristics.

263. By contrast, the absence of established financial policies, policies that are vague or not quantifiable, or historical evidence of significant and unexpected variation in management's long-term financial targets could contribute to an overall assessment of a nonsupportive financial policy framework.

b) Transparency of financial policies

264. We assess as supportive financial policy objectives that are transparent and well understood by all key stakeholders and we view them as likely to influence an issuer's financial risk profile over time. Alternatively, financial policies, if they exist, that are not communicated to key stakeholders and/or where there is limited historical evidence to support the company's commitment to these policies, are nonsupportive, in our view. We consider the variety of ways in which a company communicates its financial policy objectives, including public disclosures, investor presentation materials, and public commentary.

265. In some cases, however, a company may articulate its financial policy objectives to a limited

number of key stakeholders, such as its main creditors or to credit rating agencies. In these situations, a company may still receive a supportive classification if we assess that there is a sufficient track record (more than three years) to demonstrate a commitment to its financial policy objectives.

c) Achievability and sustainability of financial policies

266. To assess the achievability and sustainability of a company's financial policies, we consider a variety of factors, including the entity's current and historical financial risk profile; the demands of its key stakeholders (including dividend and capital return expectations of equity holders); and the stability of the company's financial policies that we have observed over time. If there is evidence that the company is willing to alter its financial policy framework because of adverse business conditions or growth opportunities (including M&A), this could support an overall assessment of nonsupportive.

4. Financial policy adjustments--examples

267. Example 1: A moderately leveraged company has just been sold to a new financial sponsor. The financial sponsor has not leveraged the company yet and there is no stated financial policy at the outset. We expect debt leverage to increase upon refinancing, but we are not able to factor it precisely in our forecasts yet.
Likely outcome: FS-6 financial policy assessment, implying that we expect the new owner to implement an aggressive financial policy in the absence of any other evidence.

268. Example 2: A company has two owners––a family owns 75%, a strategic owner holds the remaining 25%. Although the company has provided S&P Global Ratings with some guidance on long-term financial objectives, the overall financial policy framework is not sufficiently structured nor disclosed to a sufficient number of stakeholders to qualify for a supportive assessment. Recent history, however, does not provide any evidence of unexpected, aggressive financial transactions and we believe event risk is moderate.
Likely outcome: Neutral financial policy impact, including an assessment of neutral for financial discipline. Although the company's financial framework does not support long-term visibility, historical evidence and stability of management suggest that event risk is not significant. The unsupportive financial framework assessment, however, prevents the company from qualifying for an overall positive financial policy assessment, should the conditions for positive financial discipline be met.

269. Example 3: A company (not owned by financial sponsors) has stated leverage targets equivalent to a significant financial risk profile assessment. The company continues to make debt-financed acquisitions yet remains within its leverage targets, albeit at the weaker end of these. Our forecasts are essentially built on expectations that excess cash flow will be fully used to fund M&A or, possibly pay share repurchases, but that management will overall remain within its leverage targets.
Likely outcome: Neutral financial policy impact. Although management is fairly aggressive, the company consistently stays within its financial policy targets. We think our forecasts provide a realistic view of the evolution of the company's credit metrics over the next two years. No event risk adjustment is needed.

270. Example 4: A company (not owned by a financial sponsor) has just made a sizable acquisition (consistent with its long-term business strategy) that has brought its credit ratios out of line. Management expressed its commitment to rapidly improve credit ratios back to its long-term ratio targets––representing an acceptable range for the SACP--through asset disposals or a rights issue. We see their disposal plan (or rights issue) as realistic but precise value and timing are

uncertain. At the same time, management has a supportive financial policy framework, a positive track record of five years, and assets are viewed as fairly easily tradable.
Likely outcome: Positive financial policy impact. Although forecast credit ratios will remain temporarily depressed, as we cannot fully factor in asset disposals (or rights issue) due to uncertainty on timing/value, or without leaking confidential information, the company's credit risk should benefit from management's positive track record and a supportive financial policy framework. The anchor will be better by one notch if management and governance is at least neutral and liquidity is at least adequate.

271. Example 5: A company (not owned by a financial sponsor) has very solid financial ratios, providing it with meaningful flexibility for M&A when compared with management's long-term stated financial policy. Also, its stock price performance is somewhat below that of its closest industry peers. Although we have no recent evidence of any aggressive financial policy steps, we fundamentally believe that, over the long-term term, the company will end up using its financial flexibility for the right M&A opportunity, or alternatively return cash to shareholders.
Likely outcome: Negative financial policy impact. Long-term event risk derived from M&A cannot be built into forecasts nor shareholder returns (share buybacks or one-off dividends) be built into forecasts to attempt aligning projected ratios with stated long-term financial policy levels. This is because our forecasts are based on realistic and reasonably predictable assumptions for the medium term. The anchor will be adjusted down, by one notch or more, because of the negative financial policy assessment.

F. Application Of Comparable Rating Analysis Modifier (CRA)

272. Most credit factors analyzed in deriving the SACP are based, to some extent, on a relative analysis with peers. But certain key analytical factors may warrant a higher or lower weighting when aggregating our view of the relative strength of an entity's SACP. Our application of the CRA modifier does not always require an explicit peer comparison, but relative ranking is at the core of our analysis--both when analyzing individual rating factors and when considering the holistic view of an entity's stand-alone credit risk profile. This would be the case, for example, when we look at business or financial risk profile assessments or one of the rating modifiers, within the ranges provided by our criteria.

273. For example, if an issuer is at or near the cusp of a range for cash flow leverage analysis, but falls into the riskier category, and we expect the entity to remain at the "less risky end" of the financial risk profile assessment, we may conclude that the issuer is well positioned within the range of that particular assessment even without specifically comparing the entity to peers. As long as that benefit is not offset by a weaker position within the business risk profile assessment, for example, we may view the issuer's credit characteristics, in aggregate, as more positive, and thus apply a positive comparable ratings modifier.

274. When we do look at peers in the application of CRA, we typically choose entities whose SACPs are similar to the entity we are evaluating. For example, if the issuer we are evaluating has an anchor of 'b+' and we've applied no notching using the other five rating modifiers, we would choose peers with a 'b+' SACP for comparison. If the recommendation is for a negative CRA, we might also choose peers with a 'b' SACP for comparison. Such peers would generally be included in the same peer analysis section that we use for assessing competitive position and profitability, for example.

275. The CRA can also be applied to incorporate other factors not already covered or not fully captured in the anchor, or via the other rating modifiers. Such factors may include contingent risks that have not be fully captured in our base case for business or financial risk analysis. This may be the case because our criteria cover what we view as key drivers of credit risk, that is, elements that are common drivers of risk for most issuers. However, companies are not all created equal. Some may

present unique characteristics, or face special circumstances that happen infrequently, thus subjecting them to risks or advantages that are specific to them.

276. We may apply a positive or negative adjustment to reflect the expected impact of such elements on the credit quality of the company when the criteria do not incorporate provisions to factor in such positive or negative characteristics. We may also apply a positive or negative CRA adjustment when such elements are incorporated in the criteria framework, but we view them as more significant than usual for a particular issuer. As such, the criteria do not give them sufficient weight to properly reflect their impact on credit risk.

277. The following are some more common examples that we typically expect could lead to a positive or negative assessment using CRA:

- Companies with short operating track record or companies undergoing transformational events;
- Industry or macroeconomic trends not fully captured elsewhere in the criteria framework;
- Unusual funding structures not sufficiently captured and reflected in other criteria parameters;
- Contingent risk exposures and risk management;
- ESG credit risk considerations that are not sufficiently reflected elsewhere in the criteria framework; and
- Consolidated holding structures that contain partially owned (yet controlled) subsidiaries.

Using the CRA in ratings surveillance

278. We use the CRA modifier to reflect a holistic view of an issuer's credit fundamentals. Given that those fundamentals and their impact on the analysis of the SACP evolve over time, the use of the CRA modifier can vary during the life of the credit. That is, in our rating committees we may review the application of the CRA modifier incorporating the issuer's new circumstances as a whole, its relative performance, changing or evolving circumstances, etc. As a result, prior usage and rationale of the CRA modifier for a given issuer, in any direction, is not necessarily an indicator of the likelihood of future applications, their direction, or their specific rationale.

G. Corporate Criteria Glossary

Anchor: The combination of an issuer's business risk profile assessment and its financial risk profile assessment determine the anchor. Additional rating factors can then modify the anchor to determine the final rating or SACP.

Asset profile: A descriptive way to look at the types and quality of assets that comprise a company (examples can include tangible versus intangible assets, those assets that require large and continuing maintenance, upkeep, or reinvestment, etc.).

Business risk profile: This measure comprises the risk and return potential for a company in the market in which it participates, the country risks within those markets, the competitive climate, and the competitive advantages and disadvantages the company has. The criteria combine the assessments for Corporate Industry and Country Risk Assessment (CICRA), and competitive position to determine a company's business risk profile assessment.

Capital-intensive company: A company exhibiting large ongoing capital spending to sales, or a large amount of depreciation to sales. Examples of capital-intensive sectors include oil production

and refining, telecommunications, and transportation sectors such as railways and airlines.

Cash available for debt repayment: Forecast cash available for debt repayment is defined as the net change in cash for the period before debt borrowings and debt repayments. This includes forecast discretionary cash flow adjusted for our expectations of any share issuance and M&A. Discretionary cash flow is defined in our Ratios And Adjustments criteria.

Competitive position: Our assessment of a company's: 1) competitive advantage; 2) operating efficiency; 3) scale, scope, and diversity; and 4) profitability.

- Competitive advantage--The strategic positioning and attractiveness to customers of the company's products or services, and the fragility or sustainability of its business model.
- Operating efficiency--The quality and flexibility of the company's asset base and its cost management and structure.
- Scale, scope, and diversity--The concentration or diversification of business activities.
- Profitability--Our assessment of both the company's level of profitability and volatility of profitability.

Competitive Position Group Profile (CPGP): Used to determine the weights to be assigned to the three components of competitive position other than profitability. While industries are assigned to one of the six profiles, individual companies and industry subsectors can be classified into another CPGP because of unique characteristics. Similarly, national industry risk factors can affect the weighing. The six CPGPs are:

- Services and product focus,
- Product focus/scale driven,
- Capital or asset focus,
- Commodity focus/cost driven,
- Commodity focus/scale driven, and
- National industry and utilities.

Conglomerate: Companies that have at least three distinct business segments, each contributing between 10%-50% of EBITDA or FOCF. Such companies may benefit from the diversification/portfolio effect.

Controlling shareholders: Equity owners who are able to affect decisions of varying effect on operations, leverage, and shareholder reward without necessarily being a majority of shareholders.

Corporate Industry and Country Risk Assessment (CICRA): The result of the combination of an issuer's country risk assessment and industry risk assessment.

Debt co-insurance: The view that the joining-together of two or more firms whose earnings streams are less-than-perfectly correlated reduces the risk of default of the merged firms (i.e., the co-insurance effect) and thereby increases the "debt capacity" or "borrowing ability" of the combined enterprise. These financing alternatives became more valuable during the global financial crisis of 2007-2009.

Financial headroom: Measure of deviation tolerated in financial metrics without moving outside or above a pre-designated band or limit typically found in loan covenants (as in a debt to EBITDA multiple that places a constraint on leverage). Significant headroom would allow for larger

deviations.

Financial risk profile: The outcome of decisions that management makes in the context of its business risk profile and its financial risk tolerances. This includes decisions about the manner in which management seeks funding for the company and how it constructs its balance sheet. It also reflects the relationship of the cash flows the organization can achieve, given its business risk profile, to its financial obligations. The criteria use cash flow/leverage analysis to determine a corporate issuer's financial risk profile assessment.

Financial sponsor: An entity that follows an aggressive financial strategy in using debt and debt-like instruments to maximize shareholder returns. Typically, these sponsors dispose of assets within a short to intermediate time frame. Financial sponsors typically include private equity firms, hedge funds, and other types of investors that we feel consistently use aggressive financial strategies that lead to the deterioration of credit quality.

Profitability ratio: Commonly measured using return on capital and EBITDA margins but can be measured using sector-specific ratios. Generally calculated based on a five-year average, consisting of two years of historical data, and our projections for the current year and the next two financial years.

Shareholder remuneration policies: Management's stated shareholder reward plans (such as a buyback or dividend amount, or targeted payout ratios).

Stand-alone credit profile (SACP): S&P Global Ratings' opinion of an issue's or issuer's creditworthiness, in the absence of extraordinary intervention or support from its parent, affiliate, or related government or from a third-party entity such as an insurer.

Transfer and convertibility assessment: S&P Global Ratings' view of the likelihood of a sovereign restricting nonsovereign access to foreign exchange needed to satisfy the nonsovereign's debt service obligations.

Unconsolidated equity affiliates: Companies in which an issuer has an investment, but which are not consolidated in an issuer's financial statements. Therefore, the earnings and cash flows of the investees are not included in our primary metrics unless dividends are received from the investees.

Upstream/midstream/downstream: Referring to exploration and production, transport and storage, and refining and distributing, respectively, of natural resources and commodities (such as metals, oil, gas, etc.).

Volatility of profitability/SER: We base the volatility of profitability on the standard error of the regression (SER) for a company's historical EBITDA. The SER is a statistical measure that is an estimate of the deviation around a 'best fit' trend line. We combine it with the profitability ratio to determine the final profitability assessment. We only calculate SER when companies have at least seven years of historical annual data, to ensure that the results are meaningful.

Working-capital-intensive companies: Generally a company with large levels of working capital in relation to its sales in order to meet seasonal swings in working capital. Examples of working-capital-intensive sectors include retail, auto manufacturing, and capital goods.

FREQUENTLY ASKED QUESTIONS

A. Volatility of cash flows

If a company exhibits volatile cash flow metrics, does S&P Global Ratings capture this in the cash flow volatility adjustment or in the financial policy assessment?

We capture this in either analytic factor, as appropriate. As per paragraph 125, the volatility adjustment is the mechanism by which we factor a "cushion" of medium-term variance to current financial performance not otherwise captured in either the near-term base-case forecast or the long-term business risk assessment. We make this adjustment based on the following:

- The expectation of any potential cash flow/leverage ratio movement is both prospective and dependent on the current business or economic conditions.
- Stress scenarios include, but are not limited to, a recession, technology or competitive shifts, loss or renegotiation of major contracts or customers, and key product or input price movements, as typically defined in the company's industry risk profile and competitive position assessment.
- The volatility adjustment is not static and is company-specific. At the bottom of an economic cycle or during periods of stressed business conditions, already reflected in the general industry risk or specific competitive risk profile, the prospect of weakening ratios is far less than at the peak of an economic cycle or business conditions.
- The expectation of prospective ratio changes may be formed by observed historical performance over an economic, business, or product cycle by the company or by peers.
- The assessment of which classification to use when evaluating the prospective number of scoring category moves will be guided by how close the current ratios are to the transition point (i.e., "buffer" in the current scoring category) and the corresponding amount of EBITDA movement at each scoring transition.

As per paragraph 157, financial policy refines our view of a company's risks beyond the conclusions arising from the standard assumptions in the cash flow/leverage assessment. Those assumptions do not always reflect or entirely capture the short-to-medium term event risks or the longer-term risks stemming from a company's financial policy. To the extent movements in one of these factors cannot be confidently predicted within our forward-looking evaluation of cash flow/leverage, we capture that risk in our evaluation of financial policy.

What constitutes a period of stress when assessing whether a company has a volatile or highly volatile level of cash flow/leverage?

As guidance, our global default studies demonstrate significant correlation of defaults with weak points in business cycles and banking crises. The 1991 peak default rate occurred after a mild recession in the U.S., a severe but short recession in the U.K., and the Nordic banking crisis. Other developed-market speculative-grade default peaks were the U.S., at 10.6% in 2001 (the U.S. recession) and 11.4% in 2009 (the global banking crisis and recession); and Europe, at 12.3% in

2002 (due in part to the bursting of the technology/Internet bubble and failures of a large number of telecom start-ups).

Additional guidance can be found in "Methodology: Industry Risk," Appendix 1 where we considered sensitivity to economic cycles, as measured by the historical cyclical peak-to-trough decline in profitability and revenues for major recessions ('BBB' and 'BB' stress) mapped to specific industry sectors.

B. Profitability

Can you explain your approach to choosing supplemental profitability indicators, and what additional factors and considerations may affect your assessment of the level of profitability?

For most sectors, we use EBITDA margin as the primary indicator of profitability and return on capital as a supplementary indicator. For sectors where this isn't the case, or where we also consider sector-specific ratios, the analytical approach is detailed in our "Sector-Specific Corporate Methodology."

We may use a supplemental indicator to refine our assessment when a primary metric is close to the thresholds for below average or above average. For instance, if a company's EBITDA margin is at the high end of the range for average but its return on capital is comfortably in the above average range, we could assess its level of profitability as above average.

In some cases, the application of local accounting rules (for non-U.S. generally accepted accounting principles [GAAP] or non-International Financial Reporting Standards [IFRS] reporting companies) may warrant using different thresholds to account for financial reporting differences.

We may also consider other reporting factors in our assessment of profitability. For instance, in certain sectors or regions, companies may either report revenue on a gross or net basis, and the difference in revenue reporting can meaningfully affect EBITDA margins. We seek to assess profitability based on the revenue basis that we view as more reflective of the company's business economics and, thus, a better measure of profitability.

As stated in the "Level of profitability" section, we may adjust our calculation of the profitability indicator to consider different forecast horizons and deteriorating or improving trends. In addition, when the profitability indicator is close to the boundary of a threshold, we may decide to assess profitability in either bucket depending on our view of trends. For example, if the range for average was 8%-12% and we had a company whose profitability was 12.1%, we may decide to score profitability as average rather than above average.

If a company operates in a region or in a country where local inflation is high, and you believe that this affects the comparability of its profitability measures with industry peers', how do you incorporate this in your assessment?

When analyzing level of profitability, we use, where available, the numeric guidance developed by considering the distribution of profitability measures within an industry or subsector. These thresholds apply globally irrespective of the underlying level of inflation, although we also consider trends in the profitability ratio to determine the level of profitability assessment.

However, high inflation environments are often associated with exposure to countries with a high country risk, in which case as per paragraph 87 we may adjust the volatility of profitability assessment to account for this exposure. Finally, to the extent not captured elsewhere in the analysis, we may incorporate this factor as part of the comparable ratings analysis.

C. Country risk

For a company exposed to more than a single jurisdiction, what financial or operating measures do you apply to determine its jurisdictional exposure?

We typically assess a company's exposure to country risk by considering its forecast EBITDA, forecast revenue, or fixed assets. These measures are consistently available in most sectors and allow us to adequately measure a company's exposure to different jurisdictions.

To select the most-appropriate measure for each company, we look at its sector, the nature of its assets, how export-oriented it is, and where its production facilities are located. Thus, we generally use fixed assets to evaluate exposure to country risk if a company's revenue is generated in a lower-risk country but its assets, production facilities, sourcing, or R&D are based or occur in higher-risk countries.

Conversely, if a company's fixed assets are in a low-risk country, but it exports its goods to a high-risk country and cannot easily redirect these sales, we would typically measure the company's exposure to the high-risk country by determining what share of its forecast EBITDA (or forecast revenue) is derived from the high-risk country.

We may use other financial or operating measures if we consider them more indicative of the country risk exposure. For example, because transportation assets are movable, measures that use asset location are less useful for assessing exposure in the transportation or railroad sectors. If available, we use transportation volumes instead. Similarly, we may use unit sales to evaluate country risk in the auto and commercial vehicle manufacturing sector.

REVISIONS AND UPDATES

This article was originally published on Jan. 7, 2024.

Changes introduced after original publication:

- On July 7, 2025, we republished this criteria article to make nonmaterial changes. Specifically, we amended some references to the telecommunication industry in the examples used in paragraphs 72, 76, and 244, following publication of provisions for the digital infrastructure sector in the revised "Sector-Specific Corporate Methodology." We also amended paragraphs 68 and 70 to clarify that we may apply a different CPGP weighting if we believe it better reflects the competitive characteristics of the industry or company, and is consistent with the "Sector-Specific Corporate Methodology."
- On April 17, 2025, we republished this criteria article to correct a processing error and to make nonmaterial changes. We corrected an inconsequential processing error in paragraph 123 to explain the use of the standard volatility table. We made nonmaterial changes to clarify in paragraphs 121, 169, 170, and 171, and Table 24 that we use both our core and supplemental ratios, which are measures of cash flow and leverage, to assess an issuer's financial risk profile. We also clarified our definition of financial sponsors in paragraph 164 and in the

glossary. In addition, we edited Table 24 to improve consistency with paragraphs 169-171.

- On April 4, 2024, we republished this criteria article to make nonmaterial changes. As announced on Oct. 1, 2021, we are phasing out guidance documents. As part of that process, we have fully superseded "Guidance: Corporate Methodology," July 1, 2019, and moved the majority of the content to "Sector-Specific Corporate Methodology," published April 4, 2024. We moved guidance content applicable to all corporate sectors into paragraph 28, Appendix F, and Frequently Asked Questions B and C of these criteria. In addition, we moved the "Corporate Criteria Glossary" to Appendix G. The previous Appendix G and table 27 have been deleted from this article and superseded by the sector-specific corporate criteria. We also edited paragraph 187 to enhance its clarity, removed all references to the now fully superseded corporate guidance and replaced them with references to the sector-specific corporate criteria where applicable.

This article is a criteria article. Criteria are the published analytic framework for determining credit ratings. Criteria include fundamental factors, analytical principles, methodologies, and /or key assumptions that we use in the ratings process to produce our credit ratings. Criteria, like our credit ratings, are forward-looking in nature. Criteria are intended to help users of our credit ratings understand how S&P Global Ratings analysts generally approach the analysis of issuers or issues in a given sector. Criteria include those material methodological elements identified by S&P Global Ratings as being relevant to credit analysis. However, S&P Global Ratings recognizes that there are many unique factors / facts and circumstances that may potentially apply to the analysis of a given issuer or issue. Accordingly, S&P Global Ratings Criteria is not designed to provide an exhaustive list of all factors applied in our rating analyses. Analysts exercise analytic judgement in the application of criteria through the rating committee process to arrive at rating determinations.

This report does not constitute a rating action.

Sector-Specific Corporate Methodology

July 7, 2025

These criteria are effective July 7, 2025, subject to local registration requirements where applicable.

This criteria article contains detailed guidance for applying S&P Global Ratings' global corporate methodology to 41 corporate and nonbank financial services sectors, under the framework laid out in "Corporate Methodology."

This criteria article should be read in conjunction with our corporate methodology, which provides the general framework. The framework is applied using:

- The sector-specific provisions contained in this methodology;
- Management and governance considerations, as contained in "Management And Governance Credit Factors For Corporate Entities";
- Adjustments to financial metrics and ratio calculations, as described in "Corporate Methodology: Ratios And Adjustments"; and
- Liquidity considerations, as described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

For information about the initial publication of this article as of July 7, 2025, including key changes, the impact on ratings, and superseded criteria, see "Updated Sector-Specific Corporate Methodology Published."

Methodology

Overview

These criteria primarily address sector-specific considerations related to competitive position, cash flow/leverage, and in some cases, certain of the modifiers shown in the framework below. The article applies globally to all corporate ratings and to certain nonbank financial institution entities that we rate using our global corporate methodology. Although our overall approach is the same for all sectors, we incorporate sector-specific provisions into our analysis.

Corporate criteria framework

Source: S&P Global Ratings.

Primarily, the criteria describe the relevant factors used to assess the competitive position for each sector as part of the business risk profile analysis. We assess competitive advantage; scale, scope, and diversity; and operating efficiency by reviewing a variety of subfactors that may reinforce or weaken each other. For any company, our assessment of these elements reflects the relative strengths and importance of its subfactors in the context of its industry.

In line with our corporate methodology, we assess each factor as strong, strong/adequate, adequate, adequate/weak, or weak. For each sector, the criteria include tables that summarize the characteristics that we typically expect to see across this range. The tables do not specify the characteristics expected at the adequate level: we assess a component as adequate if the characteristics fall between those for a strong or strong/adequate assessment, and those for an adequate/weak or weak assessment.

For each sector covered by these criteria, we list the competitive position group profiles (CPGPs) we would typically apply for each subsector. In some cases, the most appropriate CPGP differs from the one listed; for example, because the company has a monopoly position in its market or benefits from regulatory protection. The CPGP affects the weighting we ascribe to each element of our competitive position assessment within our framework.

The criteria also notes the sector-specific approaches we use when assessing the financial risk profile or the modifiers that apply to it, including the typical supplementary ratios used, the volatility adjustment and benchmark volatility tables, or the financial policy.

Please see appendix 1 for a glossary of terms, appendix 2 for the metrics we use to calculate volatility of profitability, and appendix 3 for the sector and industry variables.

Section 1 | Aerospace And Defense

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the aerospace and defense (A&D) sector based on:

- Business strategy and market position;
- Product or service range;
- Technological capabilities;
- Record of program execution; and
- Position in the supply chain.

Aerospace

Commercial aerospace companies gain a competitive advantage from being higher in the supply chain. Given that the number of players is generally limited, the following market participants are usually in a better position to compete:

- Aircraft original equipment manufacturers (OEMs);
- Companies that design, assemble, and market complete aircraft; and
- Tier 1 suppliers, which produce large assemblies or components.

Conversely, Tier 2 and lower suppliers--which produce smaller assemblies, commoditized parts, or basic components--generally face more competition and have less power when negotiating with their customers.

Business strategy and market position: When evaluating companies' strategic positioning, we include their reputation and safety record, as well as their product development plans. For a company higher up the supply chain, strategic positioning includes considering market segments in which it participates; the size and attractiveness of each segment; and the size and trajectory of its market share in each segment.

Product or service range: Each major market segment has subsegments. Commercial airliners include widebody and narrowbody aircraft; business jets are subdivided by cabin size. Commercial airliner OEMs can gain a competitive advantage if they can offer airlines a full family of aircraft to match their route network. Similarly, offering competitive products in each size and range category benefits business jet OEMs because customers tend to demonstrate strong brand loyalty.

Technological capabilities: We consider robust development plans to be positive for an aircraft OEM's competitive position. A company may plan to address gaps in its line-up or may aim to replace aging models. In evaluating an aircraft OEM's technological capabilities, we consider whether it has:

- A record of developing new aircraft or engines that incorporate the latest technologies, on time and within budget, and with limited post-rollout problems;

Sector description

Companies that derive more than half of their revenue from designing, manufacturing, or repairing commercial (civilian) aircraft or weapons systems; from supplying parts, components, or systems to build and service aircraft or defense systems; or from providing defense-related services to government agencies or the military.

Subsectors	Typical CPGP
Aerospace	Services and product focus
Defense	Services and product focus
Aerospace and defense (capital intensive)	Capital or asset focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

- Good subcontractor oversight and system integration skills; and
- The ability to provide a global aftermarket support network.

For companies that provide services to the aviation industry, such as airframe or engine maintenance, we consider not only the firm's technological capabilities, but also which manufacturer and aviation authority approvals it has gained. These allow it to work on specific aircraft or engines.

For suppliers lower down the supply chain, we consider:

- Their presence in popular aircraft or engine program markets;
- Their design and engineering capabilities; and
- Whether they own or have licensed the intellectual property (IP) rights to the part being supplied.

Retaining the IP rights offers protection; if a company is simply building to the customer's specifications (build-to-print), the customer can switch suppliers more easily. That said, any new supplier might need to gain manufacturer and aviation authority approvals before it can take over manufacturing of the part. When evaluating the technological capabilities of suppliers at the tier 2 level or below, we consider their range and whether they offer any unique capabilities or possess highly specialized machinery or tooling.

Defense

Market position: Market share is not generally a particularly meaningful measure for defense contractors because the industry has so few prime contractors. In some cases, only one contractor is selected (that is, authorized) to produce a particular weapons platform.

The most important element in assessing strategic positioning, therefore, is whether we consider that the contractor operates in high-priority areas of the defense market that are likely to continue to receive government funding. This depends on the type and breadth of weapons platforms or related services that the company provides. For suppliers, we consider whether the programs they supply are high priority.

Technological capabilities: We also consider a defense contractor's technological capabilities, especially its ability to integrate complex, highly sophisticated weapon systems, and to manage subcontractors. Government selection processes favor contractors that have a record of successful program execution, in terms of both schedule and cost.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Commercial aerospace OEM, prime defense contractor, or tier 1 supplier that has a solid record of successful program execution and new product development.	Tier 2 and lower supplier with limited, subpar, or no record of successfully developing and executing programs.
Commercial aerospace OEM	
Leading market positions in growing market segments.	Market share is small, or markets have limited growth prospects.
Offers a choice of aircraft that address all, or almost all, customer size and range requirements.	Product line is narrow or has large gaps.
Strong capacity to design, develop, market, produce, and support aircraft.	Little ability in one or more areas of design, development, marketing, production, or aftersales support.
Commercial aerospace supplier (including engine makers)	
Revenue is almost all related to supplying parts or services for aircraft platforms that are popular and expanding, likely in a range of market segments.	Most revenue generated in market segments with unfavorable medium/long-term growth prospects, or by supplying aircraft platforms that are less popular or due to be retired.
Supplier has the capacity to design most products.	Work is largely build-to-print.
Lower-tier suppliers would only be assessed as strong if they offer unique capabilities that cannot be replicated.	Supplier has limited or no design capabilities and produces commoditized parts or parts that are not technologically sophisticated.
Defense contractor	
Most programs are considered high priority for government funding.	Most programs are likely to see funding cuts.
Offers a broad range of technological and system integration capabilities.	Offers few products, or products that are not technologically sophisticated.

Scale, scope, and diversity

Many A&D companies participate in multiple markets, each of which has different cycles and characteristics. Markets may include commercial aerospace, defense, and related industrial and service markets.

Aerospace

We assess scale, scope, and diversity in the aerospace sector based on:

- Breadth of product offering;
- Platform or program concentration;
- Degree of diversity of its end markets;
- Geographic balance of its sales; and
- Degree of customer concentration.

Commercial aerospace OEMs typically benefit from offering a comprehensive choice of aircraft that differ by price point, seat capacity, and range. Business jet OEMs, in particular, find that customers prefer to choose another aircraft from the same manufacturer when their needs change. The breadth of a company's product line is therefore key to our assessment of their scale, scope, and diversity.

Customer concentration: We assess OEMs' customer diversity in several ways; number of customers; sales concentration by customer; geographic diversity; and type of customer. We consider geographic diversity positively because, although commercial aerospace is a global business, growth prospects and economic cycles differ by region. Similarly, commercial aerospace OEMs benefit from selling to both legacy airlines and low-cost carriers, which target different markets.

Program concentration: Commercial aerospace suppliers sell to the relatively small universe of aircraft OEMs, which amplifies customer concentration and limits geographic diversity. Therefore, we consider concentration in terms of the individual aircraft programs to which the company provides parts or systems, and the relative attractiveness of each program. We also consider whether the company supplies different subsegments within the commercial market (that is, commercial jetliners, business jets, piston engine aircraft, and helicopters), and whether they have diversified into the defense or related industrial markets. When assessing geographic diversity, we consider the customers that ultimately buy the aircraft or engine built using the supplier's parts.

Breadth of product offering: We evaluate the range of its capabilities; for example, whether it can provide larger assemblies or systems, as well as components. We also consider what proportion of the company's products are used to build new aircraft, and how many are sold as replacements in the aftermarket. Not only do the two markets have different dynamics, but also aftermarket sales are typically much more profitable.

For companies that provide aviation services, such as airframe or engine maintenance, we consider what aircraft or engines the company has OEM or regulatory authorization to work on.

Defense

In most countries, defense spending is allocated to four main uses--personnel, procurement, R&D, and operations and maintenance (O&M)--and the spending priorities can change over time with political or security developments. The primary sources of funding for most defense contractors are R&D and procurement budgets and, to a lesser extent, O&M for services such as training and maintenance.

We assess scale, scope, and diversity in the defence sector based on:

- Revenue diversity (the proportion of sales for each program and its funding source);
- Contract type;
- Customer diversity; and
- Breadth of product offering.

Revenue diversity: Typically, new weapons platforms will be developed under a program, funded from an R&D budget. Although their margins are often lower, a successful development program can lead to a higher-margin production program and aftermarket support, which are typically funded through procurement budgets. In most cases, the contractor that developed a weapons system will be selected to produce it. We consider that participating in both development and production programs implies stronger revenue visibility.

Contract type: The contract types to which a firm is party are also key to our assessment of program diversity. Under cost-plus contracts, firms are reimbursed for the costs they incur, plus a fee. Although this means that the customer will bear the risk of any cost overruns, most cost-plus contracts offer low margins to reflect the lower risk. Fixed-price contracts, on the other

hand, shift all of the risk of cost overruns to the contractor. They generally offer much higher margins if the company can control costs. Contracts in the defense sector also come in numerous variants that mix the characteristics of cost-plus and fixed-price contracts.

Customer diversity: We look at how sales are broken down by different military services, intelligence agencies (military or civilian), and civilian government agencies. The budget prospects for each of these can vary. We also consider sales to foreign governments and, in some cases, to commercial customers. For subcontractors, we regard the ultimate end user of the product or service as more important than the prime contractor. Demand is driven by end users.

Breadth of product offering: We consider the range of weapons systems, subsystems, components, and related services the firm offers.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Commercial aerospace OEM	
Offers a wide selection of aircraft to meet a range of customer needs.	Sales are concentrated in few products, or in markets with poor growth prospects.
Customers are well diversified by geography and type, with little customer concentration.	Limited regional or customer diversity.
Commercial aerospace supplier (including engine maker)	
Participates in several popular programs, across different market segments (that is, jetliners, business jets, turboprop or prop planes or helicopters), as well as defense and industrial markets.	Generates most sales through a small number of aircraft programs or from programs that have less favorable growth prospects.
Offers a broad range of products/capabilities and can offer components, higher-level assemblies, or systems.	Offers few products, or lacks ability to produce higher-level assemblies or systems.
Sales are well-balanced between new aircraft or engines and aftermarket sales.	Participates in only a few market subsegments, or limited participation in the higher-margin aftermarkets, or makes few sales to defense and industrial markets.
Defense contractors	
Low geographic, customer, or program concentration.	Sales concentration by military service or civilian government agency or by weapons program (especially programs with declining funding).
Broad product or service offering.	Limited product or service offering
Good mix of domestic funding sources, including foreign sales.	Funding sources show little diversity and there are few, or no, foreign or commercial sales.
Good balance between development and production programs and cost-plus and fixed-price contracts.	Development programs are few in number and mostly fixed-price contracts.

Operating efficiency

We assess operating efficiency in the A&D sector based on:

- A company's relative cost position compared with industry peers;
- Its ability to control costs and improve efficiency;
- Its ability to be flexible when managing capacity and workforce to match demand; and
- Its record of successfully integrating acquisitions.

Cost position: We consider this relative to its peers, in terms of EBITDA margin, SG&A-to-sales ratio, and capex-to-sales ratio. The overall cost and margin profile is evaluated alongside those of the company's various reporting segments.

Ability to control costs and improve efficiency: In addition, sticking to the agreed schedule and budget is key for both aerospace OEMs and defense contractors (when developing and delivering programs) with minimal delays or cost overruns. Aircraft OEMs benefit if they can quickly apply what they learn during development to reduce per-unit costs. Defense contractors require the ability to properly bid and structure contracts to ensure that they are appropriately compensated for the risk they are taking.

Flexibility to manage capacity and workforce to match demand: Flexibility is key to maintaining control over costs in a sector that requires skilled labor, especially where production may be rapidly reduced or ramped up. Key indicators include operating leverage, vertical integration, outsourcing, and pension costs. In addition, we consider factors that may affect the flexibility of labor costs, such as unionization.

Ability to successfully integrate acquisitions: Our assessment of cost management also incorporates the company's record of cost reductions throughout the cycle; the effectiveness of its restructuring programs and lean manufacturing programs, where applicable; and its ability to integrate acquisitions successfully.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
EBITDA margins consistently exceed peers after taking into account differences in sales mix.	EBITDA margins, adjusted to account for differences in sales mix, are consistently below peers and highly sensitive to fluctuations in the cost of raw materials.
Cost structure is relatively flexible, with lower-than-peers operating leverage.	Cost structure is less flexible than average, with high fixed or semifixed costs, inflexible labor contracts, vertical integration that creates inefficiencies, or outdated assets or technologies.
Cost position has been improved in both good times and bad (for example, by reducing structural labor costs or input costs, or by altering the footprint).	A history of operational missteps or restructuring without tangible savings.
Commercial aerospace company	
A record of introducing new products with minimal delays or costs overruns, and of reducing per-unit costs quickly as production increases.	A history of significant delays or cost overruns on new products, or difficulty in increasing production and improving profitability.
Defense contractor	
Programs rarely fall materially behind schedule or exceed their target cost.	Programs are frequently above cost or behind schedule and/or a history of underestimating the cost or complexity of programs, or of agreeing to unfavorable contract terms to win business.

Financial Risk Profile

Supplementary ratios

We use FOCF to debt as our preferred supplementary ratio for the sector. A&D companies often invest heavily when developing new products and their contracts may include advance payments that create lumpy working capital flows. Long-term service agreements can also eat into FOCF, making A&D companies more volatile in this regard compared with some other industries.

Section 2 | Agribusiness, Commodity Foods, And Agricultural Cooperatives

Table of contents

If an agribusiness, commodity foods company, or agricultural cooperative engages in commodities trading operations (often the case for grain merchandisers), we look at how much these contribute to normalized EBIT, EBITDA, or gross margin:

- If the contribution is below 10%, we apply these criteria without change.
- If the contribution is between 10% and 20%, we apply this methodology and make the accounting adjustment for adjusted readily marketable inventories (ARMI), as described in our ratios and adjustments criteria.
- If the contribution is between 20% and 70%, we apply section IV of our commodities trading industry methodology to analyze the trading segment.
- If the contribution is above 70%, we apply the commodities trading industry methodology.

Business Risk Profile

Competitive advantage

Agribusiness and commodity foods

We assess competitive advantage in the agribusiness and commodity foods sector based on:

- The company's evolving share in key regional and global markets;
- The strength and breadth of its product offerings and its customer base; and
- The overall effectiveness of its operating strategy.

Market share: We consider the size and growth prospects of the markets in which the company participates, and whether its position is strengthening or declining. Companies that have a presence in multiple growing regions, or that either trade or process globally in several agricultural commodities, are better placed to ride out poor seasons in one of their markets. Certain markets also offer participants a competitive advantage because sourcing is favorable, or they offer opportunities to trade/process more value-added products or to serve multiple channels. Substitution risk is higher for pure commodities than for tailored offerings, such as value-added natural ingredients, sweeteners, or texturizers, which would require significant investment to duplicate.

Strength and breadth of product offerings and the customer base: We assess the degree to which a company has invested in a deep product portfolio and more value-added products. The latter include ingredients and other value-added solutions for food manufacturers, or having some branded products supported by intellectual property (for example, low-calorie natural sweeteners). In our view, strong product offerings are more solutions-oriented and include additional services that address specific problems, such as financial and risk management

Sector description

Companies that derive more than half of their revenue from sourcing and distributing crops and crop inputs; processing and marketing commodity food products; or trading or processing agricultural commodities. Alternatively, agricultural cooperatives that have been established to help their member-owners benefit from economies of scale by taking on tasks such as marketing and processing agricultural commodities; or buying and distributing farming supplies to farmer-owners and others.

Subsectors	Typical CPGP
Agricultural products	Commodity focus/scale driven
Branded agricultural products (if more than 50% of the offering)	Services and product focus
Cooperatives that sell branded products	Services and product focus
Marketing cooperatives	Commodity focus/cost driven
Supply cooperatives	Commodity focus/scale driven

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

solutions, or agronomical services that could improve a farmer's crop performance and minimize volatility. We also evaluate the strength of the relationships these companies have developed with their customers and suppliers.

Effectiveness of operating strategy: We evaluate the degree to which a company's structure and strategy enables it to maintain above-average profitability and growth prospects. For example, vertical integration across various phases of distribution and production may enable a company to achieve above-market-average processing margins or manage their logistics more effectively than competitors. Other possible sources of advantage include the management of inter-regional price and cost disparities, superior market intelligence (such as profit optimization decisions among trading, storing, processing, and other strategies that maximize the profits), and reduced exposure to food safety risks such as disease and food supply contamination.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
One of the top two or three players in at least three of the key growing/processing regions, or trades in at least three global agricultural commodities, with the stronger companies leading more attractive markets with good growth prospects.	Overall market position is below average or below the mid-tier; leadership of a very narrow segment of the market, such as a single agricultural crop; or dominates just one region. Participates in markets that have weak growth prospects.
A significant proportion of the portfolio comprises products that have a value-added aspect or service and can be distinguished from a pure commodity.	The portfolio comprises products that are pure commodities, with very limited value-added characteristics.
Above-average sourcing capabilities or customer retention rates and long-lasting, strong supply relationships with farmers or leading global food manufacturers because the company offers its customers a broad spectrum of services.	Substitution risk is high or customer retention rates low because the company's offer is limited.
A distinct strategic advantage over competitors that leads to more stable performance compared with peers or above-average processing margins.	The company's business strategy offers limited or no discernible advantage in terms of logistics or procurement that would distinguish it from the competition.
A favorable regulatory environment (such as tariffs and quotas that protect the company).	A sector-specific regulatory framework that compromises profit stability (for example, overly restrictive pricing directives, tariffs, or trade restrictions on certain commodity foods).

Agricultural cooperatives

The business model of an agricultural cooperative reflects the purpose it is intended to fulfil (marketing or supply cooperative, including those that sell branded products) and affects the factors we use to assess competitive advantage.

Marketing cooperatives

A marketing cooperative is intended to provide a cost-effective way for member-owners to sell products at a better price than they could achieve individually.

We assess competitive advantage for marketing cooperatives based on:

- Barriers to entry, including regulatory barriers such as tariffs and quotas, and diversity of sourcing or specific production attributes;
- Product differentiation or brand strength, mitigating substitution risk; and
- The commitment shown by the farmer member base to remaining within the cooperative, which enhances cost effectiveness and competitive strength.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A distinct strategic advantage over other competitors that leads to above-average market returns for its member-owners.	The marketing strategy offers farmers no advantage and generates commodity returns that are no higher than those members could earn elsewhere.
A significant proportion of the portfolio comprises products that have a value-added aspect or service and can be distinguished from a pure commodity.	Products are exclusively marketed as pure commodities that have little differentiation to distinguish them from the competition.
Members are long-tenured, stable, and economically viable, and keen to remain part of the cooperative.	Members are economically challenged or significant turnover in the membership limits the cooperative's ability to manage the amount and timing of member payments.
Farmer-members have a distinct agronomical advantage (land quality, or climatic conditions of the farming region) that results in higher crop returns for the marketed commodity, compared with substitute crops.	The cooperative's farming territories offer limited or no discernible agronomical advantage.
A favorable and predictable regulatory environment that protects the pricing and supplies of a particular commodity.	A sector-specific regulatory framework that compromises profit stability (for example, overly restrictive pricing directives, tariffs, or trade restrictions on certain commodity foods).

Supply cooperatives

A supply cooperative's goal is to deliver cost-effective and value-added services to its member-owners, who benefit from the profits generated. It may also supply non-member-owners.

We assess competitive advantage for supply cooperatives based on:

- The strength and breadth of their products and services, based on earnings generation;
- Their ability to develop new and value-added products and solution-oriented services to meet the needs of members and customers; and
- Their record of profitably maintaining and expanding sales volumes and the size of their member and customer base.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A broad portfolio of agricultural products and services that can easily be distinguished from competitors and includes more commodity-based farm products, as well as more value-added, customer-centric agronomic services.	A narrow set of product offerings that are primarily commodity-based and have limited product differentiation.
A strong reputation for service, and for offering innovative product solutions (for example, agronomy services).	Limited focus on customer service or product innovation.
A dominant and growing market presence or membership base in the territories it services.	A modest market presence in the territories it services and a weak membership base.

Scale, scope, and diversity

We assess scale, scope, and diversity in this sector based on:

- Size of the earnings base relative to close competitors;
- Geographic diversity in terms of manufacturing or sourcing locations and presence in different product categories and markets;
- Size and reach of asset base or logistics infrastructure;
- Diversification by business function, including the range of commodity merchandising, distribution, processing, and other services offered;
- Customer and counterparty diversification; and
- On top of that, for a cooperative: the size, stability, growth profile, and diversification of its member base.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
A comprehensive origination, distribution, and manufacturing footprint covering more than three key agricultural growing/herding/fishing regions around the globe to help limit supply concentrations during weak crop cycles, harvests, herd growth, or catches.	Significant sourcing concentration, including participation in only a few regions (typically fewer than three).
Strong earnings diversity, reinforced by offering a variety of product, logistics, hedging, and agronomy solutions to farmers, or ingredients solutions to industrial users.	Limited earnings diversity or processing is concentrated in just one or two primary commodities, so that the company produces only one commodity protein or one agricultural commodity.
Processed products demonstrate strong diversity and the product mix is a balance between pure commodity inputs to other manufacturers and value-added branded offerings (including private-label commodity offerings to retailers).	Significant concentration in manufacturing or production makes the company reliant on fewer than three manufacturing plants; grain merchandisers or crop input wholesalers may be reliant on a limited number of storage or mixing facilities.
Limited customer concentrations, so that the top customer contributes no more than 30% of overall sales; grain merchandisers would have no counterparty exposures exceeding 15% of consolidated operating earnings.	High customer concentration, so that one or more customers account for more than 30% of revenue each; or, in merchandising, significant counterparty exposures so that one customer accounts for more than 15% of earnings.
Agricultural cooperatives	
Membership base is market-leading, stable, and diversified (no single member accounts for more than 20% of earnings). Cooperative benefits from significant economies of scale in its manufacturing or process or has a large number of members distributed across several regions. Earning sources are diversified across products.	Membership base or member retention is weak, or membership is concentrated enough to compromise the cooperative's competitive position.

Operating efficiency

We analyze operating efficiency in this sector based on whether:

- The company has strategically located its storage facilities, distribution hubs (such as port and rail terminals), and sourcing or processing facilities so that its asset positioning provides it with a distinct logistical advantage over its peers;
- The company's manufacturing processes offer an advantage in terms of cost or procurement and production efficiencies, including utilization rates; and
- On top on that, for cooperatives, we consider whether there is a willingness and ability to reduce significant recurring payments to member-owners, either to reinvest in its product offerings or to stabilize operating performance during weaker market cycles.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Assets are positioned to create an advantage in terms of profitability--for example, locating facilities in a key commodity growing area lowers procurement and transportation costs and offers a stable source of supply; similarly, protein producers that have plants located closer to key cattle herding regions tend to have lower sourcing costs.	Plant locations or regional sourcing concentrations create a disadvantage.
Above-average plant operating efficiencies or harvest yields, including better manufacturing utilization rates than peers.	Inconsistent manufacturing performance, including more volatile utilization rates or harvest yields than peers.
Extensive reach and a well-established distribution infrastructure, either globally or in a leading economy, that makes the business more stable and evens out working capital requirements.	Substantial seasonality in the business and working capital requirements that could lead to excess inventory if seasonal demand is weaker than anticipated.
Above-average sourcing and logistics management, including better basis management and above-average distribution or manufacturing margins. Economies of scale and efficiencies lead to better profit margins versus peers, taking into account differences in sales mix and average selling prices.	A poor record of executing its strategy, including a history of operating underperformance or operating disruptions that could contribute to supply-chain deficiencies and operating inefficiency.
Agricultural cooperatives	
The cooperative's cost structure is more flexible because the cooperative can reduce or adjust member payments as needed.	The cooperative shows no willingness or ability to reduce member payments to stabilize operating performance.

Profitability

Agribusiness and commodity foods

For most companies in this sector, the EBITDA margin gives a good indication of the level of profitability. That said, price inflation can distort our analysis of EBITDA margins at low-margin activities, particularly in the grain processing and merchandising segments. Where this occurs, or the EBITDA margin is close to the thresholds for below average or above average, we may refine our assessment by comparing EBITDA or EBIT per unit sold, if available. Alternatively, we may use ROC to evaluate profitability. Our ROC analysis incorporates adjusted capital, including the adjustment that we make for ARMI, where applicable.

For grain processors and merchandisers, we generally calculate ROC based on a three-year average using results from the previous two years and our current-year estimate, which incorporates any reported year-to-date results and our forecast for the remainder of the year. Our analysis also takes into account profitability trends, and we normalize results if we consider trading conditions to be extraordinary.

Because of regional and product variations in margin structures in this sector, we may give greater weight to peer comparisons than to the profitability thresholds when assessing the level of a company's profitability.

Agricultural cooperatives

Marketing cooperatives, including those that sell branded products
Commodity-focused marketing cooperatives exist to maximize price for agricultural commodities. Given that profitability measures such as the EBITDA margin may not be comparable across products, we generally analyze whether the cooperative achieved a significant premium over the market value of the commodity. If market price information is unavailable, we determine relative profitability by comparing the level and trend of a cooperative's ROC with that of its peers. The branded products sold by marketing cooperatives compete directly with other consumer nondurables, primarily packaged food offerings.

For services and product focus marketing cooperatives that sell branded products, we consider the EBITDA margin to be important when evaluating profitability at cooperatives that market value-added, branded products. These generate most of their earnings from products that are sold and compete directly with other consumer nondurables, primarily packaged food offerings. Where relevant, we may also consider additional profit measures, such as ROC.

Supply cooperatives
For most supply cooperatives, our primary indicator of the level of profitability is the EBITDA margin. When the EBITDA margin is close to the thresholds for below average or above average, we generally refine our analysis by looking at other ratios--such as EBITDA or EBIT per unit.

Financial Risk Profile

Supplementary ratios

Agribusiness and commodity foods

FOCF to debt is our preferred supplementary ratio for most agribusiness companies. Although we do not define them as capital-intensive companies (ongoing capital spending to sales is generally less than 10% and depreciation to sales is less than 8%), we still view commodity food processing as somewhat capital-intensive. For companies that make significant dividend distributions, we use DCF to debt to refine our preliminary cash flow/leverage assessment.

Working capital investment needs tend to show significant swings at highly seasonal companies such as crop input wholesalers. This typically increases intrayear borrowing, so we supplement our analysis using the interest coverage ratios--EBITDA to interest and FFO plus cash interest paid to cash interest paid--in order to capture all annual interest costs. We also focus on these ratios if a company has high working capital or capital needs, or if the preliminary cash flow/leverage assessment is significant or weaker.

Volatility adjustment: Because several sectors of the agribusiness and commodity foods industry have a history of earnings and cash flow volatility, we often need to include a volatility adjustment to our final cash flow/leverage assessment. This is done by applying the volatility adjustment, as defined in our corporate methodology.

Agricultural cooperatives

Cooperatives may benefit from ongoing and well-entrenched relationships with banks or nationalized agricultural-focused lending institutions through lower-than-peers' interest costs or a minority interest held by nationalized lending institutions. In these cases, our preferred supplementary ratios are EBITDA to interest and FFO plus interest paid to cash interest paid.

Volatility tables: Some cooperatives have significant discretion over the amount and timing of payments made to cooperative members, reducing their cash flow volatility.

- We may apply the medial volatility table if a cooperative is willing and able to effectively reduce member payments, provided that it operates in a country with a CICRA of '3' or better, its preliminary competitive position assessment is satisfactory or better, and its profitability assessment is fair or better.
- We may apply the low volatility table if a cooperative meets the conditions listed above and has a track record lasting several years of curtailing member payments or increasing member equity retentions, as needed, to support cash flow and leverage ratios. We would only apply the low volatility table if any curtailments were not simply deferrals, and we considered the cooperative highly likely to maintain its policy on reducing member payments at need.
- In all other cases, we apply the standard volatility table.

Modifiers

Comparable ratings analysis

Grain merchandisers and vertically integrated livestock companies typically make heavy use of derivatives to hedge against price risk in their commodity positions. This can lead to significant cash collateral calls, counterparty exposures, and even debt-like obligations for significantly out-of-the-money derivative positions. Therefore, we examine a company's use of derivative positions and consider whether it might lead to outsize losses, payment obligations, or margin calls that could compromise the company's financial leverage and liquidity position. If such credit risks are more prevalent for a company when compared with its peers at the same rating level, we may use a negative comparable rating assessment.

Section 3 | Auto And Commercial Vehicle Manufacturing

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage for an auto and commercial vehicle manufacturer based on:

- Market share;
- Product profile and differentiation strategy;
- Technological expertise;
- Distribution strategy; and
- Financing options.

Market share: Manufacturers of cars and commercial vehicles depend on offering products that customers want to drive at an affordable price for the end consumer. A successful product mix enables vehicle manufacturers to maintain or increase their share of the market and solidify their market position. We track the evolution of market share by country, region, and globally, and across product segments (defined by the vehicle's size, powertrain, price, and purpose). The cyclicality and growth prospects of markets in each region differ, even when downturns are globally correlated.

Specifically, we review market share:

- Relative to industry peers and for a company's main product segments;
- In the premium segments, where pricing competition is less than the industry average; and
- In specific submarkets that we consider particularly profitable.

Differentiation strategy: Although the overall breadth of a company's product line matters, we also consider the marketing of each brand and the potential for cannibalization. If brands target the same end markets or are insufficiently distinct, an increase in sales of one product could depress the sales of another within the group. For a premium auto manufacturer, quality, reliability, and brand perception are key differentiating factors. At the lower end of the market, differentiation depends on affordability and value-for-money. As electrification and autonomous drive features becomes more popular, customers are likely to expect vehicles to meet ever-higher standards on safety and reliability. Aftersales support can bolster customer loyalty and encourage repeat sales. For example, customers consider resilient residual values to be an important indicator of quality, and these may benefit from servicing contracts supported by an extensive and exclusive repair network tied to distribution channels.

Technological expertise: Car technology is evolving quickly, especially in electrification, software, driver assistance systems, and energy consumption. Such features improve pricing

Sector description

Companies that derive more than half of their revenue from manufacturing and selling passenger cars, vans, light trucks, heavy-duty trucks, and buses.

Subsectors	Typical CPGP
Automobile and truck manufacturers (including original equipment manufacturers [OEMs])	Capital or asset focus

Other adjustments

Details of the relevant adjustments are given in "Methodology: The Impact Of Captive Finance Operations On Nonfinancial Corporate Issuers."

power, especially at the premium end of the market--new advances may offer a manufacturer price leadership. Given the ongoing demand from customers for new or stronger functionality, an auto or commercial vehicle manufacturer needs strong product development and software engineering skills to maintain its market position. In assessing these, we consider:

- A company's technological and engineering expertise, and its record of innovation;
- Its R&D capabilities, product renewal and rollout plans, and the average age of its models, and the time to market;
- Measures of reliability and quality, including residual values for second-hand vehicles, presented in benchmarking surveys; and
- Environmental and safety record, including moves to mitigate energy transition risk and compliance with environmental regulations and safety standards.

Distribution strategy: Here, we consider the effectiveness of a company's distribution and marketing strategy, including its distributor or dealership network, the development of alternative channels (including digital), the characteristics of its sales force, and, where applicable, the financing capabilities that support its network.

Financing options: Both auto and truck manufacturers can gain a significant competitive advantage by offering end buyers competitive financing options. We therefore examine the reliability and efficiency of the funding mechanisms that support a company's vehicle distribution and sales process. In particular, we assess the diversity of funding alternatives offered to customers and their availability during weaker market conditions. Auto and truck manufacturers frequently operate as original equipment manufacturers (OEMs) and can achieve efficient funding by owning a captive finance business or captive financing unit, or through partnerships with external financing partners.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Has a leading market share that is stable or growing in its key markets (typically, a leading market share exceeds 10%). Consistently offers products that customers want, enabling it to increase or protect its share of key retail markets.	Low or declining market shares in key markets.
At each price point, vehicles meet customer expectations in terms of the key differentiators.	A lack of differentiated brands or products.
Offers an extensive lineup of products with advanced technology that commands name and brand recognition or offers price leadership.	Pricing power is weak and the company is a price follower, if not a discounter, with limited ability to set prices that are higher than peers.
Strong leverage when negotiating with component suppliers, so that the manufacturer can retain control over intellectual property and negotiate annual price reductions.	A lack of leverage with key suppliers.
Repeat sales indicates strong customer loyalty, with positive customer satisfaction surveys. This may be supported by long-term financing and servicing contracts; an extensive and exclusive distribution and repair network; and a broad range of sales channels, which may include an established direct-to-consumer online sales channel.	Customer retention is low compared with industry peers.

Scale, scope, and diversity

We assess scale, scope, and diversity in the auto and commercial vehicle manufacturing sector based on:

- Revenue and profit by region and the correlation between end markets
- Geographic concentration of the production facilities;
- The size of any captive finance subsidiary, its penetration rate in terms of unit sales financed, and its contribution to earnings;
- Concentration by supplier; and
- Record of strategic alliances.

Regional breakdown: We commonly measure scale through overall unit sales and diversity through a breakdown of earnings by region.

Product and brand offering: In our view, manufacturers that specialize in mass-market passenger cars may benefit from diversifying into commercial vehicles. We see strong positioning in premium or luxury segments as even more positive because these segments typically make a superior contribution to earnings. We also review the number of brands, sales by brand, and the degree of differentiation across platforms and vehicles featured in a company's catalog. The recent rise in R&D costs and shift toward supply-chain insourcing have increased the value of scale for commercial vehicle manufacturers, but we still see flexibility in production, good access to the supply chain, and a well-developed service network as equally important to sustaining profit margins.

Captive finance subsidiary: Captive finance businesses may facilitate the sale of new and used vehicles, as well as services. We factor in the size of the captive finance subsidiary, its penetration in terms of unit sales financed, and its contribution to earnings through the cycle.

Strategic alliances: These are common in the auto industry but have a mixed track record. If successful, they enable partners to share the significant cost of developing new products and technologies, or setting up new dedicated supply chains, and could add diversity by enabling them to tap new market segments or to avoid disruptions. Customer demands are increasingly differentiated by segment; alliances can make diversification less risky while a company develops its knowledge of the new sector. Operational integration within a strategic alliance can cover the development of certain models, the use of common platforms and components, the manufacturing of products in shared facilities, and the pooling of spare-parts procurement. A long-term strategic partnership that has successfully generated revenue synergies or mutual cost savings is positive to our assessment of an auto manufacturer's scale, scope, and diversity.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Participates in numerous end markets in different countries, including emerging markets that we consider have favorable long-term growth prospects.	Participation in only a few end markets and countries.
Sales show diversification between mass-market, commercial vehicles, and premium segments, and may include other region-specific subsegments, such as pickup trucks.	Relatively small by industry standards or has limited growth prospects.
Production capacity, including joint ventures, is geographically diversified.	Revenue and profit sources are not diversified and production facilities are geographically concentrated.
No significant supplier concentration that is unmitigated.	No meaningful strategic partnerships that could mitigate the effect of small size.

Operating efficiency

We assess operating efficiency in the auto and commercial vehicle manufacturing sector based on:

- Operating indicators;
- Supply chain;
- Cost structure and flexibility; and
- Success in vertical integration.

Operating indicators: We analyze several operating indicators over the cycle and relative to industry peers. For example, we compare gross margins and evaluate a company's variable cost position over the cycle. The cost position comprises the cost of materials, warranty, product recall, labor, R&D, engineering, and freight. In addition, we compare SG&A expenses, which comprise advertising, promotion and other costs not directly related to the development and production of vehicles, parts, accessories, and services. Finally, we track FOCF to sales as a measure of a company’s ability to convert earnings into cash and manage its investments efficiently.

Our analysis of these operating indicators often covers an extended period, including historical and projected years; this helps us to normalize the impact of heavy investments in future growth or large restructuring charges. Indications of operational weakness include restructuring actions that bring no tangible saving benefits, or operational missteps that lead to lower quality, long lead times, rising warranty costs, or frequent recalls.

Supply chain: Our assessment of operating efficiency also incorporates the ability to manage the supply chain to reduce production disruption. We consider use of overtime to mitigate problems to be a weakness, while the ability to secure long-term procurement contracts for critical inputs, potentially by cutting out intermediaries, is a strength.

Cost structure flexibility: The ability to cut costs quickly and to effectively reduce capacity and break-even points are vital to our assessment of operating efficiency. In evaluating the flexibility of a company's cost structure (including the proportion of fixed to variable costs), we consider its record of reducing costs, adjusting capacity, and maintaining strong labor relations through the cycle. An auto manufacturer's ability to reduce costs and manage inventories in a downcycle, or pass on increases in input costs, depend heavily on its current capacity utilization.

An auto manufacturer may achieve efficiencies through use of low-cost production facilities or automation that supports high volumes; by increasing the commonality of its production

platforms and using preassembled modules and specialized assembly lines for certain key car components (such as the chassis or powertrain). It may also indirectly benefit from long-standing strategic alliances or technology-focused agreements. Conversely, higher costs may stem from structural overcapacity; higher-than-average input costs; labor inflexibilities; outdated asset base or production technologies; or high SG&A expenses due to small size or low volumes.

Vertical integration: We view vertical integration as positive if it results in structurally higher profitability that justifies the associated higher investments or offers material benefits with respect to competitiveness or security of supply. In addition, it should not create an overreliance on specific technologies that may be subject to rapid changes. We also assess a company's ability to successfully integrate acquired businesses.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Capacity utilization rates above peers.	Capacity utilization rates below peers.
Better-than-average cost position based on economies of scale or production efficiencies. The cost structure is relatively flexible and enables costs, such as labor costs, to be cut during a downcycle.	The cost structure is less flexible than average; for example, due to labor inflexibilities, outdated asset base/production technology, small size, and insufficient volumes to spread overhead costs more efficiently.
The ratio of overhead costs to revenue is lower than peers and working capital metrics are favorable.	Previous restructuring actions have not offered tangible savings or there have been operational missteps that frequently prompted recalls, marred quality, or lengthened lead times. The company suffers from excessive inventory levels or unfavorable working capital metrics.
The sensitivity of profits or margins to fluctuations in raw material costs has been limited or effectively mitigated.	The sensitivity of profits or margins to fluctuations in raw material costs is higher than average.
Supply-chain management has been strong, so that disruptions have a limited impact on production compared with peers.	Supply-chain issues more frequently disrupt production and weaken earnings than is typical for the overall industry.

Profitability

Our primary indicator of profitability at auto and commercial vehicle manufacturers is our adjusted EBITDA margin. To calculate the EBITDA margin, we deconsolidate the earnings of any material captive finance subsidiaries. However, for some captives, we may not be able to fully disaggregate all items. This may happen, for example, when the captive has leasing that is closely intertwined with the industrial business. In those cases, we may use other metrics, such as adjusted EBIT. We may even use the respective consolidated metric, if we feel the deconsolidated metric is not representative. In addition, if the five-year average EBITDA margin is close to the thresholds for below average or above average, we may use the five-year average ROC as a supplementary indicator.

Section 4 | Auto Suppliers

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the auto suppliers sector based on:

- Market position;
- Product mix;
- Value proposition;
- Ability to adapt to technological change and the increasingly stringent regulatory standards on fuel economy, safety, and emissions, while absorbing the related costs, which create a barrier to entry; and
- Investment in and extent of R&D capabilities, and of design and engineering skills.

Market position: Global auto suppliers operate in a complex and evolving regulatory and political environment. Tightening standards for fuel economy, safety, and emissions give those with strong design and engineering capabilities a competitive advantage, which translates to improved market position and increased scale. Suppliers can also gain an advantage through their marketing, distribution, and purchasing practices. We consider suppliers' records of using smaller acquisitions to improve revenue growth, expand product lines, consolidate market share, achieve cost synergies, enhance supply-chain integration, or access superior technology.

Product mix: Given the variety of end markets and segments within the auto suppliers sector, it can be tricky to put a value on a given market share. Instead, we monitor longer-term trends in the product portfolio (by segment, product line, and geography) to help us evaluate how the product mix compares with marketplace demand.

Value proposition: Innovation can help protect margins when input costs are rising. We examine whether a supplier's vertical integration is likely to help them protect margins, win new business, and develop strong relationships with large auto original equipment manufacturers (OEMs).

Given that many auto suppliers have little pricing power when negotiating with their much-larger OEM customers, a proven ability to reduce costs and so offset the annual price reductions demanded by customers is an advantage. Offering a wide range of products, or the ability to develop products quickly, enables auto suppliers to spread their fixed costs as well as their R&D costs.

Technological change: Auto suppliers continually enhance their offerings to meet customer demands for new or greater functionality. The degree of innovation in the sector also exposes them to the risk of technological disruption. The shift to electric vehicles from internal combustion engines poses a particular threat, especially where OEMs have indicated plans to insource manufacturing of key aspects of their newer electric powertrains to increase efficiency. We track the

Sector description

Companies that derive more than half of their revenue from producing and assembling parts for car and truck manufacturers, or from offering services to manufacturers.

Subsectors	Typical CPGP
Auto parts and equipment	Capital or asset focus

progress of suppliers' plans to handle the displacement of their legacy products. Some auto suppliers offset this risk by developing a reputation for technological leadership. Those that combine this with a pipeline of new contracts are best placed to address the emerging technological and regulatory requirements for vehicles, such as new powertrains, autonomous driving, and vehicle digitization and connectivity.

Investment in R&D: Above-average investment in R&D is linked to a reputation for product quality and can lead to above-average growth. Suppliers that can provide custom-engineered products enhance their value to customers and may reduce customer churn. By becoming not merely a supplier of parts, but rather a supplier of technologies and capabilities, auto suppliers can also create barriers to entry for competitors. We therefore monitor how much a company invests in R&D, as a percentage of sales, compared with peers. Where possible, we also analyze the supplier's record of success with its new products.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Ability to command a price premium relative to other suppliers, based on dominant market position within a subsegment.	No significant pricing leverage with its larger and more powerful customer base. Negotiating leverage with auto manufacturer customers and their own vendors is relatively weak, for example, because the supplier adds little content to each vehicle.
Presence in subsegments characterized by high barriers to entry in terms of capital allocation and specific expertise.	Operates in subsegments with lower barriers to entry because they are less capital-intensive--this applies to some suppliers at the tier 2 and 3 level, and to aftermarket suppliers.
Portfolio of high-value-added, technologically advanced products (such as turbochargers, advanced powertrain, active safety, or autonomous driver assistance system components) rather than commodity-like products such as automotive interiors or metal stampings.	Products are mostly commoditized, particularly in the aftermarket, which increases vulnerability to economic downturns; or technological risk is rising in its business segments.
Organic growth prospects above the industry average because of their sizable pipeline, sustainable new business wins, or advantages gained through high-volume platforms and technology. Where a supplier makes legacy products that face high displacement risk (for example, those for internal combustion engine powertrains), a strong backlog of new products with strong sales.	Weak perception of business strategy based on an auto supplier's historical performance and how realistic are its forward-looking business objectives, in our view, given price versus competitors, sales or profit growth, and required investment levels.
Good record of using small bolt-on acquisitions to enhance market position.	Record suggests supplier is likely to lose substantial contracts with existing customers or could lose market share within their end markets because of price competition or inferior technology. This could occur where competitors benefit from lower labor costs, lower tax rates, export subsidies, or reduced-cost raw materials.
Proven ability to develop a wide range of products in large quantities at low cost and maintain strong relationships with large auto manufacturers in order to win new business.	Business strategy is unlikely to enhance its market position and stability or limited responsiveness to market changes is unlikely to foster growth.
Proven R&D capabilities that are likely to deliver a differentiated, superior product or service and help solidify business relationships with large auto manufacturer customers.	Unproven record of innovation through R&D, or still building up a reputation (for example, following emergence from Chapter 11 or a recent foray into new end markets).

Scale, scope, and diversity

We assess scale, scope, and diversity in the auto suppliers sector based on:

- End-market diversity by customer base, platform and segment, and geography;
- The degree of alignment with global production;
- Exposure to supply-chain events; and
- Presence in relatively stable aftermarkets.

Diversity: The extent of an auto supplier's diversification determines its ability to offset the impact of regional regulatory, environmental, product liability, or safety issues. At the same time, the size of its revenue base and its position within the industry help to determine its business strength and operating flexibility.

Alignment with global production: In our view, the globalization of vehicle platforms and powertrains have made size and scale key competitive differentiators for auto suppliers. Auto manufacturers require global capabilities, scalability, product innovation, and solid financial health, especially from their tier 1 suppliers. In particular, when auto manufacturers consolidate, they tend to reduce the number of suppliers to which they are exposed.

Exposure to supply-chain events: A high-impact, low-probability event can break even the most sophisticated supply chain, even if only temporarily. In our experience, it is rare for an auto supplier to be able to secure alternative supplies without incurring substantial switching costs. That said, if the supply-chain failure cannot be resolved, the issue can quickly gain momentum, which may be detrimental to creditworthiness.

Presence in stable aftermarkets: Aftermarket businesses are seen as countercyclical and thus a presence in them acts as a mitigant to the volatility of earnings. Typically, we observe stronger pricing power in aftermarket businesses compared with OEM sales.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Broad range of customers, with the top three customers typically accounting for less than 30% of revenue; manufacturing footprint closely aligned to global production; and wide range of products that could lead to cross-selling and potentially winning new business across different subsegments within the auto sector.	Customer concentration, such that the top three customers account for more than 50% of revenue or most customers are in one region; significant concentration of manufacturing capacity; and lack of product diversity or exposure to the more-stable aftermarket.
Generate revenue from a wide product range across multiple platforms or subsegments (for example, infotainment, safety, fuel efficiency, and aftermarket) that are not closely correlated. That said, although the sale of replacement parts and components for heavy trucks does not tend to be as volatile as the production of vehicles, we also consider the level of competition within any countercyclical segments.	Generate most revenue from a narrow product line, especially one exposed to a small geographic market, with no credible plan to increase customer diversity through profitable new business wins during the next three to five years.
Strong bargaining position with auto manufacturers (customers) and raw material or subcomponent suppliers, and the ability to secure alternative supplies if needed without incurring substantial switching costs.	Weak negotiating position with larger auto manufacturers and vendors, especially if the supplier lacks the scale to manufacture at a low cost.
Meaningful market share that indicates a broad range of operations, products, or services. We apply qualitative haircuts to market shares if a company operates within a niche segment such as tire pressure monitoring and valve manufacturing.	Shrinking market share or loss of profitable contracts, suggesting diminishing prospects for future profitability.
Proven ability to deliver sustainable growth, or the supplier is large enough (by revenue) to affect business trends and industry pricing.	Price follower with limited impact on business trends.
Volumes are more stable than peers, especially if this has been demonstrated during an economic downturn, or if stable volumes have been maintained without matching competitor price cuts.	Volumes fluctuate, especially if economic cycle turns.
Demonstrate above-average resilience to typical supply-chain risks such as weak suppliers, geographic concentration, or natural or manmade disasters.	Overreliance on a critical supplier increases exposure to supply-chain risks.

Operating efficiency

We assess operating efficiency for global auto suppliers based on:

- The degree of flexibility in the cost structure;
- Sensitivity to raw material and energy costs and ability to pass on cost increases; and
- Working capital management through the business cycle.

Cost structure: The ability to keep costs down, including labor costs, is critical. Auto manufacturers are themselves under pressure to reduce costs and raise weak profits, and in turn they demand low prices from their suppliers. Suppliers that are well positioned to maintain strong operational efficiency tend to have a record of adjusting their excess capacity in a timely manner. They can do this, for example, by sourcing components and subassemblies from countries where labor is cheaper and more readily available, and the workforce can be flexed up and down.

Operating leverage (a company's sales minus variable costs--that is, its contribution margin--divided by profit) is typically high in the industry. When we assess this element, we consider the supplier's ability to manage capacity utilization in line with its OEM customers' peak-to-trough guidelines.

The industry is highly capital-intensive; ongoing investment in the efficiency of production capabilities is often necessary to maintain a company's cost position. Underinvestment could lead to potential downtime and production losses, which could severely damage short-term

profitability. More importantly, it could also lead to long-term volume losses for auto manufacturer (customers). We combine our assessment of suppliers' historical performance with our view of their ability to manage costs in future. We may also consider trends in FOCF to sales, relative to peers across the sector. Our analysis often incorporates extended periods (historical and projected years) to help give context to the data from periods during which a company is investing heavily in future growth or is incurring high restructuring costs.

Working capital management and the ability to pass on costs: Auto suppliers' success in managing costs varies considerably across the industry. Working capital needs tend to increase when raw material prices rise. If suppliers lack an effective means of passing the rise in costs onto customers, they can find themselves in financial distress. Similarly, short-term changes in exchange rates can present a problem for global auto suppliers. As the industry becomes more globalized and competitive, a supplier's ability to adjust prices to pass on the effect of foreign currency movements also becomes more important.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Better able to manage costs than peers, including preventing fixed costs (as a proportion of sales) from rising during an upcycle.	Poor record of managing input costs, especially for vertically integrated companies that should benefit from improved sourcing (for example, battery recycling or casting and machining).
Proactively manages capacity utilization in line with OEM customers' peak-to-trough guidelines.	Inability to restructure manufacturing operations in a timely fashion to improve capacity utilization.
Demonstrated ability to mitigate exposure to fluctuations in commodity prices through long-standing pass-through mechanisms with customers; value-added products or services that increase pricing power; or a surcharge that is adjusted regularly to reflect the composition and timing of input costs.	Inability to recover more than 50% of an increase in costs through pass-through mechanisms; and exposure to commodity price volatility, especially if margins are below the industry average.
Ability to timely adjust the fixed cost base in downturns.	High operating leverage; limited record of sustaining profit margins through the cycle; or sustained operating losses.
Record of success in adjusting inventory levels in response to customers' volatile production schedules.	Evidence of operational missteps, including one-off events that caused factory downtime; and lack of consistency in investing in and maintaining production assets.
Proven ability to mitigate the impact of foreign exchange movements by using hedging or other financial tools, or by working with customers or subsidiaries to adapt the pricing of component parts.	Profitability often affected by foreign exchange movements.
Flexible labor costs (for example, hiring more workers on short-term or temporary contracts, especially in regions where severance costs are high) and a good relationship with workforce unions to minimize the risk of costly strikes.	Limited cost flexibility.
Short cash conversion cycles (defined as days' investment in inventory and receivables, less days' investment in accounts payable), which gives companies more flexibility to redeploy capital.	Longer cash conversion cycle than peers, leading to working capital outflows.

Profitability

The EBITDA margin is our primary indicator of an auto supplier's profitability. We also consider qualitative factors such as a supplier's capital intensity because capex is necessary to maintain the asset base and so sustain profitability. Suppliers are judged against the wider pool of their industry peers, rather than just peers in their subsectors. In our view, depreciation often closely approximates the capex required to maintain the asset base so, in rare cases, we may use ROC as a supplementary ratio, to help us compare companies that have similar capital structures.

Financial Risk Profile

Supplementary ratios

Given that the auto suppliers are generally capital-intensive companies with moderately high working-capital requirements, FOCF to debt is the most useful supplementary ratio for the sector. FOCF is typically volatile and can vary from year to year, depending on the timing of product launches and the extent to which the company has won or lost contracts during the year.

When analyzing an auto supplier's financial risk profile, we closely evaluate its working capital cycle and capex requirements. When auto suppliers win several supply agreements for new platforms at once, CFO will decrease because of the fixed launch costs and working capital investment needed to execute on those business wins. CFO typically improves considerably as production ramps up.

Working capital can be a significant drain on cash. Suppliers typically invest in inventories and receivables when sales are growing, which depresses cash generation and can cause funding needs to jump. We therefore evaluate working capital management using the company's record of managing inventories and payment terms (which are often dictated by OEMs) over the business cycle. Some suppliers have released working capital from inventory and receivables when sales are declining. Consequently, we focus on FOCF across longer periods or even whole cycles, rather than on FFO.

Although we view consistent free cash flow as key to identifying auto suppliers with stronger financial risk profiles, we do not usually penalize companies for growth-related spending if we consider the new business investment will support future cash flow generation and could make the company's products and services more competitive.

Section 5 | Building Materials

Table of contents

Business Risk Profile

Competitive advantage

To assess competitive advantage in the building materials sector, we consider:

- Market share;
- Product differentiation and demand;
- Product distribution;
- Pricing power and purchasing power; and
- Brand equity.

Market position: Market position can offer companies a significant competitive advantage, dictating whether a company can pass through cost increases and mitigating the effect of inflation on vendor costs. By comparing the trends in gross margin across direct competitors, we gain a quantitative measure of a company's relative ability to pass along cost increases. We also evaluate market share by revenue and sales volume in each of a company's product categories, key markets, and regions. In some cases, we compare market share in terms of production capacity in a market. Our assessment incorporates the size and growth prospects of each market, their geographic diversity, and the degree of market penetration.

Diversity and differentiation: Some companies in the building materials sector offer only one, basic product; others offer thousands of different lines. Basic commodities, such as cement or aggregates, offer little or no opportunity for differentiation. By contrast, highly specialized, value-added products--such as tools, plumbing fixtures, or kitchen cabinets--can be strongly differentiated. When assessing product mix, we consider the diversity of goods offered, the price points being targeted, and whether products are discretionary or not.

Product distribution: How products are brought to market can have a significant impact and typically depends on the target customer. Some companies own their distribution channels; others prefer third-party channels. With the rise of e-commerce, we have also seen a change in how direct sales are managed, especially if the company sells directly to end users, rather than to retailers. Exclusive distribution arrangements can bolster a company's pricing power with its most important customers, and may increase purchasing power with key suppliers.

Pricing and brand: Historically, a sizable market share has helped companies by offering a pricing advantage and supporting sales performance during adverse market conditions. To evaluate the degree to which a company may benefit from this effect, we consider its reputation and brand recognition, and the company's record of maintaining market share when market conditions are adverse or evolving. Tactics used to maintain market share may include product innovation, pricing, or adjusting market strategies.

Sector description

Companies that derive more than half of their revenue from manufacturing, distributing, and selling construction materials and building products.

Subsectors	Typical CPGP
Building products (finished or semifinished goods that require additional labor or installation, such as flat and specialty glass; wallboard; roofing materials; plumbing and lighting fixtures; doors; windows; tools: hardware, heating, ventilation, and air conditioning [HVAC] equipment; and other products used in the construction, repair, maintenance, and remodeling of buildings)	Services and product focus
Construction materials (cement, bricks, concrete, and aggregates such as sand, rock, and gravel)	Capital or asset focus

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Ranks No. 1 or No. 2 in its markets, by market share.	Highly fragmented markets, subject to intense competition.
Products or materials demonstrate stable demand characteristics or command high prices and margins because they add value and are well-differentiated from competitors' products.	Limited product offerings.
The ability to raise prices when costs rise. Pricing power is bolstered by product differentiation, high service levels, or strong brand loyalty.	Limited ability to adjust pricing to offset the impact of cost pressures or competition.
Relatively attractive and diverse end markets that show good growth potential.	Lack of product differentiation and brand recognition, or few value-added products compared with competitors.
Business strategy has proved effective at maintaining or strengthening market share through cycles.	Business strategy has proved ineffective at maintaining market share or penetrating new markets.
Distribution network is well established or would be difficult and expensive for competitors to replicate.	Lack of well-established distribution network.

Scale, scope, and diversity

We assess scale, scope, and diversity in the building materials sector based on:

- The size of the revenue base, compared with that of close competitors;
- The extent to which the company derives its revenue and cash flow from products, end markets, or geographic regions that are independent or have limited correlation with each other;
- The number of producing assets;
- Product diversity;
- Geographic diversity; and
- The degree of concentration by customer and supplier.

Scope: Most companies in the building materials sector serve multiple end markets, such as residential, commercial, and infrastructure markets. The cyclicality of these tends to vary widely. For example, demand from homebuilders is highly cyclical, while demand for nondiscretionary repair and replacement materials is very stable. We assess the attractiveness of a company's product mix based on the maturity, growth potential, and competitive advantages of its products. Specific items may compete on price or performance, depending on how commoditized the item is, or how specialized.

Diversity: A company that participates in a variety of attractive markets and has good operating scale will have more stable financial performance in market downturns than smaller peers that operate in fewer markets. To measure the diversity of a building material company, we consider the breakdown of sales volume or revenue by geography, brands, and product category. We also look for concentrations that could expose the company to risk; for example, reliance on a few customers, a few manufacturing or sourcing locations, or key commodities.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Larger than peers, with higher revenue, wider geographic and customer distribution, and stronger brand recognition than its nearest competitors.	A small or minority market share relative to its peers.
Multiple manufacturing or distribution assets. Markets for its products are relatively attractive and have growth potential.	A limited number (five or fewer) of manufacturing or distribution facilities.
A diverse range of products, serving different end markets at multiple price points.	Limited product offering and little brand strength or differentiation from its competitors' products.
Distinct regional or international markets, which can offset regional cyclicality.	Sales or customers are concentrated in one or two geographic regions.
The ability to serve various construction markets, such as new residential, repair, or commercial, each of which is subject to different economic cycles.	Limited ability to service various construction markets or has focused on one or a few segments.
No single-customer concentrations of over 10% of sales. An exception may be made if a building materials company supplies a large "big box" retailer with multiple, distinct, and unique products.	High customer or supplier concentrations with more than 20% of sales or purchases from one entity.

Operating efficiency

We assess operating efficiency in the building materials sector based on:

- Investment in production assets, combined with their age, size, efficiency, location, and maintenance needs;
- SG&A expenses and margins, including the ability to raise prices to pass on cost increases; and
- Vertical integration.

Characteristics of production assets: Operational efficiency is heavily influenced by the age, size, and location of a company's production assets. Newer, more-scalable production assets that are well-maintained are typically more efficient and require fewer staff and less energy to run. Although companies can reduce the cost of logistics by locating production plants close to customers, they need to balance this against the availability and cost of labor, energy, and key raw materials (such as wood, metals, and resins). The building materials industry is moderately capital-intensive. Although this varies considerably by subsector and among companies, ongoing investment in efficient production is often necessary to maintain a company's cost position.

SG&A: Costs can be significant--most building materials companies invest in their sales infrastructure and have extensive distribution assets. The ability to control these costs when a company is undergoing rapid expansion and reduce them when business is contracting, as well as the capacity to pass on cost increases through price increases, can have a meaningful effect on profitability. We view positively companies that own the distribution channel or have an efficient and short distribution chain for their finished products (such as heating, ventilation, and air conditioning products; roofing materials; or flooring products). In our experience, margins are generally higher and more stable where distribution is efficient.

Vertical integration: Although it requires more capital, when done well, vertical integration may also enable a company to benefit from sourcing its own component parts, rather than paying a supplier to produce them. Using a supplier carries a cost in terms of the supplier's margin and logistics. Some companies also access raw materials such as sand, gravel, extruded vinyl, and aluminum castings through vertical integration, although this practice is less common.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Low-cost production and distribution compared with peers.	Production assets cost more to run than those of peers.
SG&A expense margins are stable over the cycle.	SG&A expenses are higher, on average, than those of similarly sized peers.
Ability to quickly reduce costs when demand is falling.	Limited ability to raise prices to pass on increases in the cost of raw materials and energy.
Vertical integration in manufacturing operations provides a cost advantage.	Lack of vertical integration.

Profitability

When determining the level of profitability, we compare against a pool of companies that operate in the same subsector and geography, and with similar level of vertical integration. We also consider where the subsector is in the cycle because this may significantly alter profitability compared with peers in the wider sector.

Financial Risk Profile

Supplementary ratios

If the preliminary cash flow/leverage assessment is intermediate or stronger, our preferred supplementary ratio for most manufacturers and distributors of building materials is CFO to debt. This ratio helps us allow for the large intrayear and multiyear working capital swings that affect sources and uses of cash.

In other cases, FOCF to debt allows us to gain additional insight into the cash flow available to meet capex requirements and other obligations. For example, we find FOCF to debt useful where heavy material or other asset-intensive building materials companies have curtailed their capex for a sustained period in response to low capacity utilization.

Section 6 | Business And Consumer Services

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage for a company in the business and consumer services sector based on:

- Business strategy;
- Brand equity and reputation; and
- Market position.

Business strategy: A company's ability to successfully establish leadership positions in the markets in which it competes, and to protect or grow its share of those markets profitably, is heavily influenced by its business strategy. Poor choices may lead to missed opportunities and increases risks relative to competition. Some companies focus on cost leadership, others on differentiation; some pursue both. We look for evidence that the company's actions are consistent with its strategy. In addition, we track market share in key markets and regions, and how it is evolving. We also evaluate the attractiveness of the markets and regions in which the business operates.

A sound marketing strategy and an effective sales force are especially important for companies pursuing a differentiation strategy or expanding into new segments. We compare the relationship between revenue growth and sales force or advertising growth to judge the success of investments in these areas. Many business and consumer services issuers--especially those participating in highly fragmented markets, where scale can provide an advantage--supplement organic growth with growth through acquisitions. We monitor the degree to which a company's execution of its acquisition strategy enhances its competitive advantage.

Brand equity and reputation: Brand strength is typically created through superior service quality and leads to market-share gains and above-average profitability. Superior quality helps a company attract and retain customers, while strong brands can command a clear price premium over competitors. We use contract retention rates and cross-selling of new services to measure the quality of service and strength of customer satisfaction.

Strong brand equity and reputation can also help companies to successfully harness existing brand names when expanding into new service categories. By contrast, where brand equity and reputation are poor, there is potential for asset impairments.

Market position: Companies can use their market position to create barriers to entry. For example, a company that can integrate its service offerings into a customer's operations or bundle services increases switching costs, and thereby enhancing its market position. Higher switching costs are typically linked to higher customer retention and contract renewal rates. Conversely, a lack of

Sector description

Companies that derive more than half of their earnings by offering businesses a more cost-effective way to carry out noncore activities, or by providing a variety of services to consumers.

Subsectors	Typical CPGP
Consumer services	Services and product focus
Distributors	Services and product focus
Facilities services	Services and product focus
General support services	Services and product focus
Professional services, including contract research organizations	Services and product focus

differentiation, poor service quality, and ease of migration to a new provider typically makes companies more vulnerable to competitive pressure. Revenue may decline following relatively small pricing movements by competitors.

We also consider the ability to match the national and multinational reach of larger customers to be important because these customers usually prefer to limit the number of service providers they contract with. This also creates a barrier to entry for new competitors.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Market leadership is supported by customer retention rates above those of peers and a consistent business strategy that maximizes opportunities and mitigates risks relative to competition.	An inconsistent business strategy that leads to missed opportunities and increased risks because it is not well-adapted to marketplace conditions. Customer retention rates are below those of peers, or the company's actions are inconsistent with its strategy.
Competitors find it difficult to achieve a comparable low-cost position or provide a comparable service offering.	Competitors typically have either a better cost position or better differentiation.
Strong brand equity and reputation is bolstered by strong service quality and customers are confident that the price of their purchase is justified by its quality.	Company has been unable to increase the volume of existing service offerings or expand through new ones and its poor brand equity and reputation make its portfolio of services susceptible to extraneous factors.
Favorable market position, with barriers to entry that effectively reduce--or even eliminate--the threat of new market entrants.	Unfavorable market position and a lack of barriers to entry makes the company vulnerable to competitor actions.

Scale, scope, and diversity

We assess scale, scope, and diversity for a company in the business and consumer services sector based on:

- Market share, relative to peers; and
- Revenue and profit diversity by customers, suppliers, geography, and services.

Market share: Participating in a variety of attractive target markets, combined with greater operating scale, typically results in more stable financial performance during market downturns, in our experience. As such, we evaluate the market share of a company relative to that of close competitors, while considering the size of the target markets. Scale is especially important for a company that aims to lead the market by having the lowest cost of operation.

Diversity: Depending on information availability, we measure diversity in terms of revenue and profitability by customer, end market, and service. We also examine a company's revenue and profit mix between developing and developed markets. In addition, we measure supplier concentration as a percentage of total purchases. Being reliant on a particular supplier or group of suppliers is particularly problematic for distributors, which have less control over the price of the products being distributed, especially if they distribute products where demand is discretionary. We look at both direct and indirect exposure to product pricing; indirect exposure relates to the potential for volume declines because a price increase has reduced consumption.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
No customer or end-market concentrations that would create a dependency.	Concentrations create reliance on one or more customers or end markets.
Group purchasing organizations (GPOs) do not exist or have little negotiating power.	Existing GPOs have strong negotiating power.
No reliance on a particular supplier or group of suppliers.	Reliant on a particular supplier or group of suppliers, especially for distributors exposed to product pricing.
Broad geographic diversification, so that the company is not overly dependent on a single regional or local market.	Narrow geographic focus and reliance on a single regional or local market.
Offers a wide range of services.	Offers a limited range of services and has been unable to expand its service offerings.

Operating efficiency

We assess operating efficiency for a company in the business and consumer services sector based on:

- Expense structure;
- Working capital management;
- Per unit metrics; and
- Reinvestment needs.

Overall, our aim is to measure a company's ability to withstand lower demand or input cost pressures, relative to industry peers.

Expense structure: A flexible cost structure can bolster a company's ability to adjust staff or inventory levels without damaging its service quality, enabling companies to achieve above-average profitability, even if capacity utilization or demand is less than ideal. For example, distributors can reduce expenses by improving their route density. For sales and marketing agencies, the use of full-time, part-time, and seasonal staff can enable them to maintain a staffing level and national presence appropriate to the changing demand level. Where available, we assess the expense structure by examining trends in direct labor expense as a percentage of revenue.

For some segments, such as distribution services, inventory management is a major part of the business model; in these cases, we also assess fill rates (that is, product shipped as a percentage of product ordered).

Working capital management: Most business and consumer service companies have low inventory requirements, except for distribution services companies. Therefore, trends in accounts receivable generally drive their working capital management and we focus on the company's cash conversion cycle and total asset turnover. Volatility in the level of working capital typically stems from delays to the receipt of customer payments. We consider that a company which generates significant revenue from government agencies may be vulnerable to payment delays.

Per unit metrics: Generally, we consider revenue and profit per employee, per facility, and per vehicle, and find that peer comparisons are most useful if we limit the peer group to close competitors operating in similar markets. For asset-light general support services and professional services companies, we typically find per-employee metrics to be the most relevant;

per-facility and per-vehicle metrics are usually most relevant for asset-intense distribution services companies.

Reinvestment needs: Our assessment looks at the reinvestment required to maintain existing operations. Most commonly, we base our view on the level of capital spending on maintenance, as a percentage of revenue. A company's history of overinvestment or underinvestment in its operations will influence its reinvestment needs. In some cases, management provides an estimate of maintenance capex; in other cases, we use our own estimate.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A flexible cost position that supports above-average profitability, even when demand dips.	Cost position is weaker than peers, for example, because labor is unionized or facilities less efficient.
Ability to adjust staff levels to changes in demand without hurting product and service quality.	Limited capability to manage fixed costs, most of which are staffing costs.
Superior working capital management, such that the level of working capital remains consistent.	Poor working capital management, such that the level of working capital shows swings and volatility.
Solid investment in technology and infrastructure that has boosted growth prospects in terms of revenue and profitability.	Lack of investment in technology and infrastructure has led to a higher cost structure and operations that are less efficient than peers.

Profitability

The EBITDA margin is our primary metric for evaluating the profitability of companies in this sector. However, because margins across the industry's various segments vary significantly, when assessing profitability we may give greater weight to peer comparisons than to the profitability thresholds. For example, food service distribution companies typically have lower EBITDA margins than the rest of the distribution services sector. By comparing against peers that have a similar product mix and regional focus, we can more appropriately assess profitability.

Most significant merger and acquisition transactions in this sector are leveraged buyouts, which distort ROC because asset values are typically written up following these transactions. Given that significant acquisitions can also distort EBITDA, we may instead calculate the SER for a company's historical EBITDA margins. This is usually part of our assessment of the volatility of profitability.

Similarly, where EBITDA has been distorted by currency fluctuations, we will determine SER based on EBITDA margins or ROC.

Financial Risk Profile

Supplementary ratios

Our preferred supplementary ratio for companies that have low working capital or capex requirements is FOCF to debt because we consider that FOCF gives a more accurate indication of how cash flow relates to their financial obligations.

That said, for companies that have high dividend payout ratios in addition to low working capital and capex requirements, we generally consider DCF to debt to be more appropriate because the cash flow available after dividends is a more accurate measure of how much is available for debt service.

Many business and consumer services companies that are owned by financial sponsors have issued debt that requires or allows a portion of interest to be accrued or paid-in-kind. In these cases, we give greater importance to FFO plus cash interest paid to cash interest paid.

Section 7 | Capital Goods

Table of contents

Business Risk Profile

Competitive advantage

We assess the competitive advantage in the capital goods sector based on:

- Business strategy and market position;
- Product or service mix, including differentiation attributes, and bundling potential;
- Effectiveness of the distribution strategy; and
- Business backlog and record of execution on project work.

Market positioning: Our view of competitive advantage for capital goods companies depends on their relative position in the markets in which they operate, and the characteristics of those industry segments. Strong strategic positioning enables a company to protect or expand its market share while maintaining profitability. We evaluate industry segments on their growth prospects, barriers to entry, capital intensity, and supply-and-demand profile.

Product or service mix: Our assessment of a capital goods company's product or service profile incorporates the degree of uniqueness, customization, or specification in a product portfolio, as well as its expertise in manufacturing, technology, and engineering, and its product development and innovation capabilities. In our view, a company's competitive position is enhanced if it can sell both new equipment and aftermarket parts or services. Aftersales care, including servicing contracts, can increase customer switching costs and provide companies with a more stable income stream that typically has a higher margin.

Effectiveness of distribution strategy: Strong distribution channels often act as effective barriers to entry. In some segments, the ability to provide financing to customers can also help companies differentiate themselves and effectively support product sales. In reviewing distribution strategy, we consider the company's sales force and its distributor or dealership network. We also assess its ability to support technical product sales and cross-sell products, its coverage for technical support and repairs, the timeliness of responses to customer demands, and whether it benefits from exclusivity.

Record of project execution: For capital goods companies that are involved in engineering projects, a demonstrated strong record of project execution, in addition to technical competencies, will often be a key advantage in securing new contracts and customer loyalty and will enhance pricing power. Conversely, a subpar record of project execution, in addition to hurting profitability, will often hinder a company's ability to win new contracts, create a backlog of products, and may limit pricing power.

Sector description

Companies that derive more than half of their revenue from manufacturing, servicing, renting, or distributing industrial equipment or industrial equipment parts.

Subsectors	Typical CPGP
Construction equipment for hire	Capital or asset focus
Electrical components and equipment	Capital or asset focus
Heavy equipment and machinery	Capital or asset focus
Industrial componentry and consumables	Capital or asset focus
Industrial distributors that have an identifiable brand and competitive standing in their market segment	Services and product focus
Companies that have below-average fixed capital intensity and generate more than one-third of revenue from the sale of services	Services and product focus

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Successful strategic positioning, with a stable or growing share of the key markets in which it competes.	No clear strategic advantage, such that market positions are eroding or show a lack of leadership.
Participates in one or more industry segments that have favorable medium-to-long term growth prospects or are well-balanced in terms of supply and demand.	Participates in one or more industry segments that have unfavorable mid-to-long term growth prospects, or where demand is weaker than industry supply.
Achieved pricing power or leadership by using product technology, quality, or service to differentiate its brand and gain recognition.	Unable to differentiate its brands or products in order to command pricing power or leadership.
Generated customer loyalty and gained a degree of negotiating power through one or more of the following: long-term supply contracts, long-standing relationships, product specification into customers' end products, an extensive or exclusive distribution network, proprietary aftermarket parts, and servicing contracts.	Customer loyalty is weak, with low retention or contract renewal rates, and high cancellation rates affecting the backlog. This may be exacerbated by the ease of switching. Revenue from aftermarket sales or service contracts is lacking.
Good bargaining power with suppliers.	A lack of leverage with key vendors and suppliers.
Strong record of project execution.	Record on project and contract execution is lacking or subpar.

Scale, scope, and diversity

We assess scale, scope, and diversity in the capital goods sector based on:

- Size of revenue base, compared with size of target markets;
- Depth and breadth of the product offering;
- End-market diversity;
- Geographic balance of sales, profits, and manufacturing presence; and
- Concentration by customer and supplier.

Although some downturns are severe enough to affect all markets, participating in a variety of attractive markets generally supports more stable financial performance at capital goods companies. Our assessment of scale, scope, and diversity is influenced by the relative attractiveness of a company's markets, in terms of size, expected growth, cyclicality, barriers to entry, and intensity of competition, and how the company has positioned itself in those markets.

Demand for capital goods companies' products may be correlated to the general economic cycle and is therefore often characterized as early, mid, or late cycle. In addition, the length of the production cycle for capital goods may be very short--counted in days--or may last months or even years. Capital goods companies that have a balanced market and product profile typically see more stable revenue and profitability than those that have a more concentrated product portfolio.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Significant product breadth across a variety of business segments and target markets offers a good mix of revenue and profit sources and supports a higher market share.	Limited revenue base or fewer target markets than competitors, or the product mix, revenue, and profit sources demonstrate a lack of diversity.
Participates in a variety of industrial end markets that generally have favorable long-term growth prospects or are not closely correlated.	Participates in only a few markets, in markets that have limited growth prospects, or in markets that are closely correlated.
A good balance of new equipment and replacement, aftermarket, and service revenue.	Narrow product or service breadth, with some commoditization in aftermarket parts and service.
A geographically diversified revenue base and production presence.	Limited geographic diversification (especially for capital goods companies operating in segments of the industry where competition is global) or a concentrated production footprint.
No significant concentration, by customer or supplier, that is not mitigated.	An elevated degree of customer or supplier concentration (for instance, the largest customer accounts for 10% or more of sales or operating profit or the 10 largest customers account for 25% or more of sales or operating profits) that is not mitigated by the customer's or supplier base's characteristics.

Operating efficiency

We assess operating efficiency in the capital goods sector based on:

- Relative cost position compared with industry peers;
- Cost structure and its ability to absorb a decline in demand or rising input costs; and
- Cost management and working capital characteristics.

Exposure to cyclical demand patterns often makes operating efficiency the most significant determinant of competitiveness in this sector.

Cost position: The main measure we use to compare a capital goods company's cost position with that of its peers is its EBITDA margin profile. We supplement our analysis by using a variety of ratios that highlight different aspects of cost efficiency and capital intensity, such as gross margin, SG&A expenses to sales, and capex to sales. We also compare the company's overall cost and margin profile with those at its various reporting segments in our assessment.

Capital goods companies can achieve efficiencies by using low-cost production facilities or automation, improving the utilization of plant capacity or the rental fleet, and even through proximity to their customers. Conversely, weaker efficiency may stem from structural overcapacity; higher-than-average input costs; labor inflexibilities; outdated asset base or production technologies; or high SG&A expenses.

Cost flexibility: The more flexible a company's cost structure, the more likely it is to be able to limit margin deterioration in a downcycle by reducing costs and passing on increases in input costs. An ability to adjust labor costs in a downcycle or to limit labor cost inflation, and the capacity to pass through raw material prices, are important drivers of flexible cost structures and lower operating leverage compared with peers. We evaluate cost flexibility based on indicators including:

- The proportion of fixed and variable costs (operating leverage);
- Vertical integration and outsourcing;
- The cost of labor, including characteristics such as unionization rates and pension costs; and
- Exposure to raw material or component costs, and the related pass-through profile.

Cost management: Cost management is evaluated by reviewing a company's record of reducing costs, in both good and bad times; the effectiveness of its restructuring programs or lean manufacturing programs; its record of successfully integrating acquisitions; and its working capital management metrics. Some companies--such as power equipment, rail infrastructure, or other companies that undertake engineering procurement and construction contracts--typically carry a backlog of orders or project work. For these, we also compare their production lead times against their peers; the margins associated with the projects in backlog; and the degree of project risks to which companies are exposed.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
EBITDA margins are consistently higher than peers, considering any differences in sales mix.	EBITDA margins are consistently lower than peers, considering any differences in sales mix.
Able to sustain a cost advantage and has demonstrated stronger-than-peers cost management over the business cycle.	At a disadvantage in terms of costs and cost management metrics are weaker than peers.
The cost structure is relatively flexible.	The cost structure is less flexible than average.
Ongoing improvements to the cost structure through the economic cycle, such as lowering structural labor costs; implementing low-cost sourcing; or reducing the number of production facilities and eliminating bottlenecks.	Previous restructuring has not offered tangible savings or there have been operational missteps that frequently prompted recalls, marred quality, or lengthened lead times.

Financial Risk Profile

Supplementary ratios

FOCF to debt is our preferred supplementary ratio for capital goods companies because working capital and capex cycles can significantly shape cash flow generation patterns through the cycle. Historically, capital released by liquidating inventories and trade receivables has meant that FOCF to debt may be stronger than FFO to debt in the early stages of a downturn. Conversely, during an upturn, the need to fund additional working capital can often depress FOCF to debt. Although we may choose to adjust our cash flow/leverage assessment based on the supplementary ratio analysis, if core ratios are improving, we may choose not to adjust.

Equipment rental companies typically incur significant capex during an upturn to maintain and rejuvenate their rental fleet. During a downturn, by contrast, they let the fleet age and often cut capex to a minimum. Therefore, we frequently adjust the cash flow/leverage assessment in the direction of the FOCF-to-debt ratio, if they diverge.

Section 8 | Commodity Chemicals

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the commodity chemicals sector based on:

- Market position, and whether we view the company's business strategy as robust and sustainable; and
- Record of executing projects successfully and maintaining sufficient capital investment.

Business strategy: Commodity chemical companies can build up a competitive advantage by selecting and executing strategies that align with their strengths in the markets they participate in. Those that have a more favorable cost position than peers are better able to defend or expand their market share.

Project execution and capital investment: Because many capital projects take several years to complete, we view a record of competent market forecasting and good project execution as imperative to maintaining long-term profitability in the commodity chemicals market. This should be supported by strong technological skills and a history of successful R&D.

Sector description

Companies that derive more than half of their revenue from producing commodity chemicals such as petrochemicals, inorganic chemicals, or fertilizers and other agricultural chemicals.

Subsectors	Typical CPGP
Commodity chemicals	Commodity focus/cost driven
Diversified chemicals	Commodity focus/cost driven
Fertilizers and agricultural chemicals	Commodity focus/cost driven

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Leading or near-leading market positions and has demonstrated the success of its strategic positioning by profitably protecting or growing its share of the key industry segments in which it competes.	Market position is weak, or eroding, and strategic positioning is much weaker than those of the leaders in the industry segments in which it competes.
Participates in one or more industry segments that have favorable growth prospects over the medium-to-long term, and where the balance of supply and demand is advantageous.	Participates in one or more industry segments that have unfavorable growth prospects over the medium-to-long term, and where the balance of supply and demand is detrimental.
Long-term supply contracts or long-standing relationships show that the company has leverage with customers, including recurring customers.	Less stable customer base.
Strong R&D and technology capabilities.	Limited or no R&D or technology capabilities.
Strong record of executing capacity expansions in a timely and efficient manner.	Limited, or no record of expanding capacity or product lines in a timely manner and on budget.

Scale, scope, and diversity

We assess scale, scope, and diversity in the commodity chemicals sector based on:

- Size of revenue base, compared with the size of target markets;
- Diversity of product mix;
- Supplier and customer concentrations;
- Diversity of raw material inputs and end markets; and
- Geographic diversity of its sales, profits, and manufacturing.

Where we assess scale, scope, and diversification as stronger for a commodity chemical company, we would expect exposure to event risk and fluctuations in the market to be lower, and therefore earnings and cash flow to be more stable. Many rated issuers in the commodity chemicals industry are relatively small, niche players that have limited product and geographic diversity and are heavily dependent on a small number of customers or end markets. As a result, they tend to be highly sensitive to small changes in demand, any loss of market share, or adverse market conditions.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Revenue base or target markets are larger than those of other industry players.	Revenue base or target markets are smaller than those of other industry players.
Portfolio is well diversified and products are not all subject to the same external factors--for example, they use different raw materials, and are subject to different regulations and economic cycles.	Portfolio has a narrow focus because the company participates in a very small number of end markets, regions, or product categories, and these have limited growth prospects or are closely correlated to one another.
Products are aimed at variety of end markets that are not closely correlated and have favorable supply and demand fundamentals, with cyclical and noncyclical demand well balanced.	Supply and demand show unfavorable imbalances.
The revenue base and production facilities are both spread across developed and developing markets in different geographic regions or countries.	Production is concentrated at a single location or a very small number of facilities.
There is little reliance on specific suppliers, no significant dependency on a single raw material, and customers are well-diversified.	Customer, supplier, or raw material concentration is high (for instance, the largest customer accounts for 10% or more of sales or operating profit), and this is not mitigated by the characteristics of the customer or supplier base.

Operating efficiency

We assess operating efficiency in the commodity chemicals sector based on:

- Cost position relative to industry peers;
- Flexibility to absorb volatility of demand or input costs through the cost structure; and
- Flexibility of production.

Cost position relative to peers and flexibility of production: These factors are particularly important in the commodity chemical sector. The cost of raw materials and production typically varies by region, so the relative cost and availability of raw materials, energy, and labor can significantly affect a company's cost of production and, thus, its profitability. Companies that focus on bulky or hard-to-ship chemicals can benefit from proximity to key end markets, which can cut transportation costs significantly. Some companies gain a cost advantage through economies of scale or efficient production, including low-cost sourcing and more-efficient production technology. Conversely, structural overcapacity, suboptimal operating rates, outdated production technology, and poorly situated production facilities can weigh on the cost position.

Flexibility of the cost structure: A flexible cost structure offers many benefits, including lower operating leverage than peers, the ability to cut labor costs in a downcycle, and the ability to invest in ongoing efficiency improvements. Combined with good working capital management, it can reduce a company's profit sensitivity to fluctuations in costs. In some cases, commodity chemical companies can change the amount or type of raw material they use as production

inputs, either selecting an entirely different material or a different grade of the same material. This bolsters profitability and improves the company's competitive position, relative to peers.

The main measure we use to compare a commodity chemical company's cost position with that of its peers is its EBITDA margin profile. We supplement our analysis by using a variety of ratios that highlight different aspects of cost efficiency and capital intensity, such as the margin over raw material costs, the capacity utilization rate, and the ratio of capital spending to sales.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Profitability is consistently higher than peers, taking into account any differences in sales mix that would affect EBITDA margins.	Profitability is consistently lower than peers, taking into account any differences in sales mix that would affect EBITDA margins.
Able to sustain its cost advantage relative to peers through low-cost production and sourcing.	Cost management is weaker than peers.
Raw materials are internally sourced or raw materials and energy are supplied under beneficial long-term contracts.	Access to raw materials is somewhat constrained.
The cost structure is relatively flexible.	A cost structure that is less flexible than average.
Global production can be optimized by altering the balance of raw material inputs or shifting production to more favorable facilities.	Limited or lack of production flexibility.
Operations show a high degree of vertical or horizontal integration.	Limited integration of operations, which hampers efficiency improvements.

Financial Risk Profile

Supplementary ratios

FOCF to debt is our preferred supplementary ratio for commodity chemicals companies where the core ratios indicate a cash flow/leverage assessment of intermediate or stronger because working capital and capex cycles can significantly shape cash flow generation patterns.

Where the core ratios indicate a cash flow/leverage assessment of significant or weaker, we prioritize a company's ability to service outstanding debt on a near-term basis and would use EBITDA to interest. It is less common for noncash interest to represent a significant portion of interest expense, but in these cases, we may use FFO plus cash interest paid to cash interest paid.

Section 9 | Consumer Durables

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the consumer durables sector based on:

- Market position, including approach to balancing volume growth and margins;
- Presence in a range of consumer markets and distribution channels;
- Product range and differentiation, including brand equity, product innovation, and underlying price power compared with competitors;
- Degree of focus on sustainability; and
- Reinvestment in production, innovation, sales, and marketing.

Market position: Companies in this sector frequently need to adjust their strategy in light of evolving market conditions. Market changes may include a market's pattern of demand and growth prospects, supply capacity in the industry, or the level of promotional activity. When reviewing a company's business strategy, we assess its ability to establish leadership positions in the markets in which it competes, and to protect or increase its market share while maintaining profitability. In our view, even the larger players have limited ability to achieve procurement discounts on raw materials sourcing. That said, strong brand equity can protect gross margin by enabling the company to raise prices without significantly affecting sales volumes.

Market presence and distribution channels: We assess companies on their ability to get products to customers, on their presence in large consumer markets, and on their distribution strategy. Broad, fast-growing distribution channels can enable a company to reach more prospective customers, so we see a variety of channels and strong relationships with the main retailers as positive. Manufacturers may participate in promotional activity to support sales growth and may support their key retail accounts by offering favorable payment terms.

Product range: We look at the number of product segments in which a company operates and the size of its product range in each of these segments. In our view, consumer durables companies that can offer differentiated products or services, or can capitalize on a strong brand name, will generally benefit from greater pricing power. Therefore, we assess the company's record of success with new product launches, and the degree of customization in a company's products, against those of competitors. Products that have innovative features and are more unique tend to inspire greater customer loyalty than more-commoditized products.

Reinvestment: Reinvestment is vital to maintaining a manufacturer's competitive advantage. We expect to see a consistent pattern of cash flow being ploughed back into modernizing production capacities to improve productivity; into R&D to support product innovation and differentiation; into sales infrastructure to increase

Sector description

Companies that derive more than half of their revenue from manufacturing and marketing a variety of durable goods for consumer use.

Subsectors	Typical CPGP
Home furnishings	Services and product focus
Household appliances	Services and product focus
Housewares and specialties	Services and product focus
Leisure products	Services and product focus
Small appliances	Services and product focus

the presence in all distribution channels and to reach consumers; and into marketing to promote the brand and support the pricing power.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Global or regional leading market positions, and a business strategy that supports profitable growth.	Business strategy is inconsistent or poorly adapted to market conditions.
A significant presence in the largest consumer markets, or in fast-growing markets.	Small, local manufacturer in a declining market.
Large product range and presence in the most dynamic product segments, and a history of superior product innovation and strong customer satisfaction.	Most products are commoditized and could be replicated at lower cost by competitors.
Strong brand equity that gives the product a clear price premium relative to most competitors.	Branding is weak and offers no price premium relative to competing brands.
Proven ability and willingness to reinvest in the manufacturing base, combined with a record of successful product launches.	Limited investment in product innovation or production capacity.
Ability to maintain volume growth and strong pricing power.	When the cost of raw materials increases, the company is unable to raise prices without losing market share.
Strong focus on sustainability, which encompasses product design, manufacturing, energy efficiency, service, and repair.	Low or no focus on sustainability.

Scale, scope, and diversity

We assess scale, scope, and diversity in the consumer durables sector based on:

- Geographical diversity by volume of sales and earnings;
- For each product segment, the size and growth potential of each market;
- Depth and breadth of the product offering;
- Localization and variety of production capacities and presence in main distribution channels; and
- Concentration by supplier and customer.

Geographical diversity: Although some downturns are severe enough to depress multiple markets, we consider that participating in a variety of markets will generally support more stable financial performance during market downturns. Our assessment of both scale, scope, diversity, and of competitive advantage is influenced by a consumer durable company's position in its markets and the attractiveness of those markets by size, expected growth, cyclicality, barriers to entry, and intensity of competition. Geographical diversity can protect companies against a decline in demand for durable goods in a particular region or country. Compared with national players, we expect worldwide manufacturers to be better positioned to offset a drop in demand in a specific region, because they can pivot to another region or country that displays more positive market dynamics.

Product diversity: Consumers generally show a preference for brands that meet their needs through a wide range of innovative options. Therefore, a product mix that encompasses a large number of products across several segments also tends to support more stable revenue, by enabling companies to offset a decline in sales within a particular segment.

Production capacities and distribution channels: Manufacturers frequently have to adapt their production capacities and supply chains to meet changes in demand trends, and their ability to

do this quickly generally depends on the size and location of their production facilities. We view both size and global reach as important to maintaining access to consumers. Our assessment incorporates how products are distributed and whether companies use multiple online and store-based retail distribution networks.

Customer and supplier concentrations: Manufacturers of consumer durables typically sell to retailers, rather than directly to end buyers, and this can expose them to customer concentration risk. The failure of a major retailer could leave the manufacturer with a large number of unsold products, which will depress revenue and operating cash flow. In cases where the manufacturer recovers its merchandise, it typically incurs additional inventory and transportation costs. Ultimately, the products may be sold at a discount.

We also watch out for supplier concentrations. A default or operational issues at a key supplier can severely disrupt a manufacturer's supply chain and may halt production entirely, weighing on volumes and delaying deliveries to the manufacturer's own customers.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Industry-leading market share.	Low market share and limited growth prospects.
Production facilities are large, as are the revenue and EBITDA base.	Small in terms of production capacity, revenue, or earnings base.
A comprehensive range of products or service offerings, or a large portfolio of well-known brands.	A single product, or limited range of products.
Geographically diverse earnings, generated in markets that have favorable growth prospects.	Present in only a few markets.
Geographically diverse manufacturing base, with little dependence on specific suppliers.	A concentrated manufacturing base, or reliance on a specific or declining distribution channel.
Diverse customer and distribution channels with no large single-name concentrations.	Significant manufacturing and sourcing concentration, or heavy reliance on a single or few customers.

Operating efficiency

We assess operating efficiency in the consumer durables sector based on:

- Flexibility of the cost structure, and its ability to absorb a decline in demand or rising input costs;
- Quality of cost management and working capital management;
- Use of technology and automation; and
- Cost position relative to industry peers.

Cost structure: A flexible cost structure reinforces a company's ability to reduce costs to limit margin deterioration in a downcycle, or to pass on increases in input costs. In assessing cost flexibility, we calculate the proportion of fixed to variable costs, the degree of operating leverage, and productivity and capacity rates. We also evaluate exposure to the price of raw materials and components and to labor and pension costs, as well as examining the flexibility of labor contracts.

Cost position: We consider a company's cost management by reviewing its record of cost reduction during good and bad times, the effectiveness of its restructuring and lean manufacturing programs, its record of successfully integrating acquisitions, and its working capital management, especially when managing inventory and cash conversion. Metrics that have a bearing on our assessment include EBITDA margin, gross margin, and SG&A expenses to revenue. We compare these metrics against peers.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Strong ability to manage working capital swings and operate with high capacity utilization.	Low average capacity utilization at manufacturing facilities.
Size and scale are large enough to enhance purchasing power.	Small size or poor procurement creates an inability to adequately source raw materials or hedge prices, and labor costs are high and rigid.
High productivity levels.	Supply-chain deficiencies prevent the company from controlling costs when the cost of raw materials rises.
Profitability is supported by a lower share of fixed costs and better sourcing capacities than peers.	Cost structure includes a higher share of fixed costs than peers, leading to swings in profitability as soon as demand for products drops.
Extensive use of technology to improve efficiency in manufacturing, logistics, and distribution.	Lack of automation creates inefficiencies in manufacturing, logistics, and distribution.

Financial Risk Profile

Supplementary ratios

FOCF to debt is our preferred supplementary ratio for companies in the consumer durables sector because working capital and capex cycles can significantly shape cash flow generation patterns through the cycle. Historically, cash released from working capital has meant that FOCF to debt may be stronger than FFO to debt in the early stages of a downturn. Conversely, during an upturn, increased working capital needs can depress FOCF to debt. Although we may choose to adjust our cash flow/leverage assessment based on the supplementary ratio analysis, if core ratios are improving, we may choose not to apply a negative adjustment based on a weaker supplementary ratio.

If the preliminary cash flow/leverage assessment is significant or weaker, then we generally give the two coverage ratios--FFO plus cash interest paid to cash interest paid and EBITDA to interest--greater importance. These ratios are important in our analysis of companies that have highly seasonal businesses and therefore demonstrate significant intrayear swings in their working capital investment needs. Such companies typically borrow to fund their increased working capital investment--the coverage ratios capture all their annual interest costs.

Volatility adjustment

We may adjust our cash flow/leverage assessment using the volatility adjustment, depending on company-specific factors, economic cycles, or the company's historical performance within the various subsectors or markets it operates in. For instance, we may classify furniture manufacturers as either volatile or highly volatile.

Section 10 | Consumer Staples And Branded Nondurables

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the consumer staples and branded nondurables sector based on:

- Brand equity;
- Market share and ability to defend and increase market share;
- Effectiveness of the marketing strategy and sales force; and
- Pricing and purchasing power.

Brand equity: We would expect a company that has strong brand equity and a good reputation to command a clear price premium. A strong brand name can also enable companies to successfully extend its use into new product categories. By contrast, asset impairments or the potential for brand impairments may indicate poor brand equity and reputation. Where available, we use third-party independent brand rankings and valuations to support our assessment of brand equity. These measure the strength of brands and provide year-on-year trends.

Market share: To assess a company's current market share and its ability to defend it or increase it, we evaluate the size of its markets and their growth prospects; its share in its key categories, markets, and regions; and its recent and projected performance. In our view, a company that can defend and increase its market share is more likely to adjust its strategy in response to evolving market conditions; be more innovative; enjoy some pricing advantage; and maintain sales growth and profitability, even during adverse economic conditions. Where a company's business strategy is not well adapted to marketplace conditions, it may miss opportunities and be exposed to higher risks than competitors.

Marketing strategy and sales force: An effective marketing strategy and sales force will support the introduction of new products and innovation. We measure revenue from new products as a percentage of total revenue to assess effectiveness. We also examine how favorable a company's sales mix is, and whether it benefits overall margins. Some companies pursue a business strategy based on cost leadership, while others focus on product differentiation. We expect a company's actions to be consistent with its chosen strategy.

Pricing and purchasing power: Pricing power bolsters the company's ability to pass through cost increases to key customers. On the other hand, purchasing power with key suppliers would enable it to avoid accepting cost increases. We compare gross margin trends with those of direct competitors to gauge the company's strength in these areas. We also take into account the company's relationships with customers and suppliers.

Sector description

Companies that derive more than half of their revenue from manufacturing, marketing, and selling branded or private-label nondurable products for consumer use.

Subsectors	Typical CPGP
Alcoholic beverages	Services and product focus
Apparel, footwear, accessories, and luxury goods	Services and product focus
Household products	Services and product focus
Nonalcoholic beverages	Services and product focus
Packaged foods	Services and product focus
Personal products	Services and product focus
Tobacco	Services and product focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Products typically command a price premium relative to competitors thanks to its brand equity.	Poor brand equity or high private-label penetration limits the price premium that the company's products can command.
Industry-leading market shares--typically a No. 1 or No. 2 position in its markets, or globally--and a relatively stable or growing share of sizable categories. Key markets and regions have attractive growth prospects.	Market share indicates that it is a follower in its key markets. It may have a stronger position in smaller product categories that have poor growth prospects or are subject to private-label competition.
A realistic business strategy that has proved effective at maintaining or strengthening market share. Competitors typically find it difficult to achieve a comparable low-cost position or offer a comparable product.	Business strategy is inconsistent, poorly executed, or not well-adapted to marketplace conditions. Competitors typically have a better cost position or stronger product differentiation.
Strong product development and innovation has given the company a continuous pipeline of successful high-margin new products.	Innovation has not consistently been successful, and the company is slow to develop and market new products, which limits its ability to raise prices.
Gross margins remain at or above the peer average, even during periods of high inflation.	Gross margins are weaker than peers.
A strong focus on sustainability across product design, sourcing, manufacturing, the supply chain, and customer use.	Sustainability is not well integrated into the business strategy and is limited to a few product lines or business processes.

Scale, scope, and diversity

We assess scale, scope, and diversity in the consumer staples and branded nondurables sector based on:

- Size of revenue base, relative to close competitors;
- Range of products or services; and
- Diversity of sources of revenue and cash flow, in terms of products, brands, and price points.

A company that participates in a variety of attractive markets and has good operating scale will have more stable financial performance in market downturns. To measure diversity, we consider sales volume or revenue, and profitability by geography, brands, and product category. We also examine a company's exposure to emerging and mature markets and look for concentrations that could expose the company to risk. These may include reliance on a few customers, a few manufacturing or sourcing locations, or on key commodities.

Companies that operate several sizable brands, or across multiple product categories, have greater protection against concentration risk. Smaller companies may be reliant on one or a few manufacturing facilities or have sourcing concentrations that could expose them to supply-chain disruptions or production delays. That said, we note that concentrations in very large, global product categories carry less risk.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Net sales base is larger than competitors and the company has a dominant market share at the regional or global level. Companies that significantly outpace competitors on net sales and dominate both global and regional markets are typically assessed as strong; those that have net sales below those of the global leaders and lead only in regional markets would be assessed as strong/adequate.	A leading, but not dominant, share of a fragmented and relatively small product category (or a subset of a larger category) that has limited growth prospects, on a regional or national basis.
A comprehensive range of products, product categories, and service offerings.	Offers only a few products and participates in only one or a few niche product categories.
More than five sizable brands and brand extensions with limited brand or category concentration. No more than 50% of revenue is generated from one brand or category.	Few, lesser known, small, or regional brands.
Revenue is generated in several regions and the company is exposed to a mix of developed and developing markets, with no country concentrations over 50%.	Participates in only one region, or a few regions, with limited growth prospects.
A diverse manufacturing base as well as sourcing. The company can switch manufacturing to other facilities, if necessary, and is not reliant on specific key commodities or suppliers.	Significant manufacturing and sourcing concentrations and reliant on a few key suppliers for its top raw material needs.
No single customer contributes more than 25% of net revenue and distribution channels, including e-commerce, are varied.	The company relies on few distribution channels and on one or a few customers, with a single customer accounting for more than 25% of revenue.

Operating efficiency

We assess operating efficiency in the consumer staples and branded nondurables sector based on:

- Operating leverage;
- Cost position and flexibility relative to peers; and
- Sensitivity to volatility in the cost of raw materials and energy.

Operating leverage: We measure operating leverage (that is, fixed costs, relative to variable costs) using statistics such as the percentage change in EBIT over the percentage change in sales; return on assets; or invested capital. We also evaluate working capital productivity based on the company's total asset turnover, inventory turnover, and cash conversion cycle. Higher operating leverage provides a company with the ability to realize scale benefits in product development and production, but can lead to lower profits when sales decline.

Cost position and flexibility relative to peers: Companies that produce consumer staples and branded nondurables can achieve efficiencies by using superior technology and their size and scale to gain cost advantages. For example, they may be able to push suppliers for discounts or improve their profits (measured by gross or EBITDA margin) compared with the peer group, through economies of scale, automation, and investment in technology. Stronger companies are likely to have greater penetration and well-established sales and distribution networks, including a robust e-commerce presence, especially in developed markets. In emerging markets, stronger companies bolster their reach by establishing relationships with large customers or by engaging in joint ventures.

We evaluate cost flexibility based on indicators including:

- The proportion of fixed and variable costs;
- The degree of operating leverage;
- Vertical integration and outsourcing; and
- The cost of labor and other characteristics, such as how much of a company's workforce is unionized and other cost considerations that affect its workforce remuneration.

Sensitivity to volatility in the cost of raw materials and energy: A company that is sensitive to the cost of raw materials and energy may be less able to limit margin deterioration when costs are rising, or mitigate or offset exposure to volatile commodity price swings. Less-sensitive companies are more able to reduce costs and pass on increases in input costs to customers.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Profitability is consistently higher than peers, taking into account any differences in sales mix and average selling price that would affect profit margins.	Profitability is consistently below that of peers.
Strong purchasing power--for example, the volume of its purchases enables the company to demand discounts on key input costs.	Less able than peers to source an adequate supply of raw materials at a good price, potentially because of a lack of size or scale, or because of less-sophisticated procurement processes.
Operating costs as a percentage of sales are below the peer average.	Sales can only be increased by raising operating expenses to noncompetitive levels.
Demand is supported by extensive reach and strong distribution networks, including online channels.	Substantial seasonality in the business and working capital requirements that could lead to excess inventory if seasonal demand is weaker than anticipated.
Extensive use of technology to improve efficiency in manufacturing, logistics, and distribution.	Underutilization of manufacturing facilities.
Focus on energy efficiency, water conservation, waste reduction, and raw material usage through continued investment in production processes, the supply chain, and logistics.	A record of execution issues or disruptions that are likely to contribute to supply-chain deficiencies and operating inefficiency.
Ability to adjust costs through internal efficiencies or outsourcing.	Operating issues or weak execution leading to higher costs.

Profitability

We may adjust our view of a company's profitability based on qualitative factors such as asset turnover or comparison with the peer group. A company with an EBITDA margin slightly below the profitability thresholds may have excellent asset turnover, which boosts ROC. In such a case, we may assess the profitability as stronger than the EBITDA margin table would indicate. Conversely, poor asset turnover may dampen our view of profitability, even when a company has an EBITDA margin slightly above the guideline range. Similarly, we may view profitability as stronger than indicated by the EBITDA margin alone, for a private-label company whose profitability exceeds that of its closest competitors.

Section 11 | Containers And Packaging

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the containers and packaging sector based on:

- Market position and attractiveness;
- Product differentiation;
- Stability of demand;
- Substitution risk from alternative materials; and
- Record of executing strategies to support long-term profitability.

Market position and attractiveness: The packaging industry is typically segmented by the materials it uses: for example, metal, glass, plastic (rigid and flexible), and paper. In assessing the market attractiveness of packaging segments, we evaluate the extent of industry consolidation, and the balance between supply and demand. The level of consolidation among packaging companies and customers affects the competitive dynamics of the various packaging segments, as does pricing discipline among industry players. For example, concentration in the metal can and glass container segments, combined with downsized operations, has tightened the supply/demand balance, allowing companies to raise prices. Meanwhile, overcapacity and intense competition in segments that focus on commoditized products, such as oriented polypropylene film and stretch film, make it difficult to fully pass through increases in the cost of raw materials. Accordingly, we view participation in these segments as a negative rating factor. Although the plastics segment remains highly fragmented, companies can gain a competitive advantage by acquiring complementary products and technologies, or by expanding their geographic and customer bases. Some companies in the segment have also chosen to focus on gaining a leading position in niche markets that attract fewer large players.

Product differentiation: Packaging products are used as advertising at the point of sale, and consumer product companies often relaunch products through improved or distinctive packaging. Therefore, companies typically enjoy higher, more stable profitability if they offer value-added products; for example, offering innovative or unique product designs, or using proprietary technology in the development of products. In our view, graphic design, and features that enhance convenience or functionality are key product differentiators and enable a company to stand out from its competitors. Strong product innovation and the use of innovative technology also serve as barriers to entry and enable packaging companies to build stronger relationships with customers. The stringent requirements that apply to packaging for medical and certain food products, especially the strict regulatory approvals required for pharmaceutical packaging, typically limit a customer's ability to switch between packaging suppliers.

Sector description

Companies that derive more than half of their revenue from manufacturing packaging products out of plastic, paper, metal, or glass.

Subsectors	Typical CPGP
Metal and glass containers	Capital or asset focus
Paper packaging	Capital or asset focus
Plastic packaging	Capital or asset focus

Stability of demand: We consider most packaging demand to be recession-resistant, as the industry primarily serves relatively stable end markets, such as beverages, food, household cleaning products, personal care products, and medical products. To a large extent, the higher the proportion of sales generated in nondiscretionary, stable end markets; the more stable the demand for a company's products will be. Therefore, we view participation in less-stable markets, such as industrial and protective packaging applications, as less favorable. Demand for many containers is seasonal and may be weather-dependent. For companies that rely heavily on the sale of beverage containers, unseasonably cold weather during the peak months (that is, spring and summer) is likely to weigh on operating performance. Demand for agricultural packaging, such as metal food can and fiber-based boxes and containers, is also driven by seasonal changes. These affect both food production and consumer buying habits--volumes may fall if disease, drought, or excessive rain makes vegetable or fruit harvests smaller.

Substitution risk: For packaging companies, substitution risk can arise because a customer switches to a direct competitor, or because it chooses to use an alternative material for its packaging. Some customers also have in-house capabilities that could pose a threat to their suppliers. This is a particular threat for companies that make commodity-like products.

Record of executing strategies: Packaging companies that can demonstrate reliable results have an advantage when bidding for new contracts and find it easier to maintain existing contracts. A strong record of executing changes, such as expanding capacity and launching new products, combined with a history of successful product innovations, ultimately translates into greater pricing power. It also helps companies develop long-standing customer relationships. Conversely, a subpar record can make it more difficult to retain existing customers or secure new contracts.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Able to profitably protect or grow leading market shares in the key industry segments in which it competes, indicating a strong market position.	Low or declining market share in the key industry segments in which it competes, indicating a weak market position.
Participates in attractive markets that have favorable medium- and long-term growth prospects or a good balance between supply and demand.	Participates in unattractive markets that have unfavorable medium- and long-term growth prospects and excess capacity.
Strong pricing power, or price leadership, based on a high degree of product differentiation and innovation.	Limited pricing power and few products that can easily be differentiated from competitors.
Sells a high percentage of products into stable end markets where substitution risk from alternative materials is low.	Sells relatively few products into stable end markets and has high exposure to substitution risk.
Long-term supply contracts, long-standing relationships, or products tailored to meet a customer's specifications provide a strong bargaining position when negotiating with customers and there is evidence of customer loyalty.	High switching rates compared with peers indicate that customers show little loyalty and commoditized products with minimal innovation limit the company's ability to negotiate with customers.
Strong position when negotiating with suppliers of raw materials.	Weak position when negotiating with suppliers of raw materials.
Pricing power and profitability are supported by strong record of executing capacity expansions, developing innovative products, and winning contracts with new and existing customers.	Pricing power and profitability are undermined by a weak record of executing capacity expansions, developing innovative products, or winning contracts with new and existing customers.

Scale, scope, and diversity

We assess scale, scope, and diversity in the containers and packaging sector based on:

- Depth and breadth of a company's product offerings;
- Size of its revenue base, relative to that of its target markets;
- Customer and supplier concentrations;
- Diversity of types of packaging material;
- Diversity of its end markets; and
- Geographic balance of its sales, profits, and manufacturing presence.

Product and target market depth and breadth: Increasingly, size and scale are becoming key competitive differentiators, as many customers are choosing to work with fewer suppliers. Packaging companies that have significant market share and scale can spread their overhead costs, better serve customers globally, and make more efficient use of their R&D spending over a wider range of products. They may also benefit from marketing, distribution, purchasing, and economy-of-scale advantages. We consider smaller suppliers to be more vulnerable. They have a weaker negotiating position with customers and their lack of scale undermines their ability to manufacture at a lower cost.

Often, larger operations with greater size and scale also have stronger product diversity, which we view as essential. A broad product mix provides better credit protection and can make earnings and cash flow more stable. Conversely, a narrow product mix makes a company vulnerable to competitive pressures, substitution from alternative materials, and changes in customer preferences.

Customer and supplier concentrations: Levels of interdependence between packaging suppliers and customers vary across the industry subsegments. This could somewhat offset the risks associated with a dependence on a few customers, but in general, we find that significant customer concentrations typically limit pricing flexibility. Where sales to a single customer exceed 10% of total sales, operating performance could be damaged if that customer were to face its own business or financial challenges. That said, we see sole-supplier arrangements with customers as favorable, and product development and proprietary technologies can often result in long-standing customer relationships.

Packaging material and end-market diversity: Offering packaging in a variety of materials can mitigate substitution risk, to some extent, especially where a rise in input costs makes one material less convenient than another. Regulatory changes or consumer preferences sometimes trigger a rapid change in packaging preferences in a specific end market. In these cases, diversity by packaging type or end market can reduce the impact. End-market diversity also protects beverage and food packaging companies against seasonal- or weather-related declines in demand.

Geographic diversity: Successful companies that have global leadership positions in their respective products are better able to serve the growing needs of multinational customers that operate in food and beverage end markets. Demand for packaging in developed countries is generally stable, reflecting the maturity of the markets. Companies can benefit from growing demand if they successfully expand into emerging regions, where product penetration and per-capita consumption may be low. That said, they may also face increased country risks, including those stemming from political issues or adverse foreign exchange movements. In addition, competition may be more intense in markets that have higher long-term growth potential.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Significant product breadth and diversity in terms of business segments, substrates, revenue mix, or profit sources enables the company to achieve a larger revenue base or target larger markets than other industry participants.	Revenue base or target markets are smaller than those of other industry participants because of a narrow product mix or limited diversity in terms of business segments, substrates, and sources of revenue and profit.
The markets in which the company participates are varied, not closely correlated, and generally have favorable long-term growth prospects.	The markets in which the company participates are limited in number, have limited growth prospects, or are closely correlated to one another.
Good balance of revenue and profit, generated from different substrates.	Concentrated in one substrate or a subsegment of one substrate.
Revenue base and production facilities show geographic diversity.	Revenue base and production facilities are geographically concentrated.
Customer or supplier concentrations are either insignificant or mitigated.	The largest customer accounts for 10% or more of sales or operating profits, indicating a high degree of customer concentration and the customer or supplier base has no characteristics that could mitigate concentrations.

Operating efficiency

We assess operating efficiency in the containers and packaging sector based on:

- Cost position compared with industry peers;
- Ability to pass through the cost of raw material;
- Capacity utilization rates;
- Proximity of manufacturing facilities to customer locations; and
- Use of lean manufacturing practices.

Cost position and management: We primarily analyze a packaging company's cost position on its EBITDA margin profile. We also consider various indicators of cost efficiency and capital intensity, such as the mix of raw materials, what percentage of contracts include pass-through provisions for raw material costs, the time lag before any increase in these costs are passed through, and capex to sales. Our analysis takes into account the overall cost and margin profile for a packaging company, as well as those of its various reporting segments.

A record of successfully improving working capital management, integrating systems, or integrating acquisitions indicates strong cost management. Packaging companies can achieve efficiencies through economies of scale; production efficiencies and higher operating rates; lower costs or better sourcing arrangements; proximity to customers; effective quality controls; or lower overhead costs.

Conversely, where a company's cost-management measures are unsuccessful, we may see structural overcapacity; suboptimal operating rates; higher-than-average input costs for labor and raw materials; or high SG&A expenses. Companies may also operate at a greater distance from customers and apply limited quality controls.

Maintaining its focus on enhancing operating efficiency and reducing costs is critical to preserving a company's profitability over time, in our view. Competition has become so intense that some companies grant pricing concessions during renewal negotiations, in order to retain multiyear contracts with customers. Maximizing operating rates is key to producing glass and metal containers profitably; companies typically achieve some capacity enhancement as they make ongoing improvements to their operating efficiency. By contrast, in the plastic packaging industry, optimal operating rates vary because products come in a much broader range of shapes

and sizes. Sometimes, plastic packaging manufacturers make shorter runs because the required volume for a customized product is much lower.

Proximity of manufacturing facilities to customer locations: Although imports pose a growing threat for packaging that is easier to transport, such as commodity-type films, shipping heavier containers over long distances remains uneconomical. We consider that having manufacturing facilities close to customer locations still bolsters operating efficiency, in most cases. Proximity lowers shipping costs and improves logistics for most types of packaging, and can strengthen customer relationships in general.

Ability to pass through the cost of raw materials: Excluding disposable foodservice packaging and film and flexible plastic packaging, the contracts under which metal, glass, and rigid plastic packaging products are sold mostly include clauses allowing producers to pass through fluctuations in the cost of raw materials or energy to customers, after a time lag. We consider this ability to be a critical factor when determining the operating efficiency of packaging companies.

Raw materials such as plastic resins, steel, and aluminum account for about 50%-60% of the cost of goods sold for plastic and metal packaging. If suppliers lack an effective means of passing on the often-volatile price of these materials to customers, it is difficult to preserve operating margins, which affects our assessment of business risk at packaging companies.

This is particularly important for manufacturers of glass packaging, which is significantly more capital- and energy-intensive and susceptible to swings in the cost of raw materials such as soda ash. We view the ability of glass packaging manufacturers to hedge energy costs and pass through higher energy and raw material costs as crucial for preserving operating profitability.

We generally view film and flexible packaging producers less favorably than we view more value-added rigid plastic packaging producers, because the former have limited ability to pass through higher costs to customers, compared with the latter. For example, when resin costs increase, film and flexible packaging producers must temporarily absorb them. This erodes their operating results and depresses internally generated cash flow.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Profitability is consistently higher than peers, taking into account any differences in sales mix that would affect profit margins.	Profitability is consistently lower than peers, taking into account any differences in sales mix that would affect profit margins.
Benefits from a sustainable cost advantage compared with peers over the business cycle, based on successful cost-management measures.	At a disadvantage in terms of costs, so that cost management metrics are weaker than peers.
A strong ability to pass through raw material costs and a high percentage of contracts that include raw material pass-through provisions	A lack of contractual or other protections makes it difficult to pass through raw material costs effectively.
Ongoing improvements to the cost structure, such as reducing the cost of labor, implementing low-cost sourcing, rationalizing capacity or other lean manufacturing practices that have a measurable effect.	Lack of measurable lean manufacturing practices and limited record of cost-reduction initiatives, which have not offered tangible savings, so that labor or sourcing costs remain above the industry average and there is excess capacity.

Financial Risk Profile

Supplementary ratios

FOCF to debt is our preferred supplementary ratio for packaging companies because working capital and capex cycles can significantly shape their cash flow generation patterns. Historically, capital released from working capital has meant that FOCF to debt may be stronger than FFO to debt in the early stages of a downturn. Conversely, during an upturn, the need to fund additional working capital can often depress FOCF to debt. Although we may choose to adjust our preliminary cash flow/leverage assessment based on the supplementary ratio analysis, if the preliminary assessment is improving, we may choose not to apply a negative adjustment based on a weaker supplementary ratio.

For companies that return more than one-half of their FOCF to shareholders through dividends, we may consider DCF to debt to be the most relevant supplementary ratio.

Section 12 | Contract Drilling

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the contract drilling sector based on:

- Technological complexity of equipment and asset quality;
- Revenue predictability, measured through the business backlog;
- Market position and customer relationships; and
- Operating record.

Asset quality: Over the course of a business cycle, we would expect a contract drilling company that has a fleet of higher-quality assets to achieve higher margins and less volatile profits. Customers will pay a premium for newer rigs that have the latest technical capabilities, especially those that can be used for ultra deep-water or harsh-environment drilling.

Revenue predictability: The length and terms of the company's contracts may enhance the stability and predictability of its revenue and cash flow and bolster the quality of its backlog. In reviewing the business strategy and market positioning of a contract driller, we consider characteristics such as growth prospects and the balance between supply and demand of the specific industry subsegments, markets, and regions in which the company operates. Where applicable, we take into account whether drilling activities are seasonal.

Customer relationships and operating record: Contract drilling companies that maintain their equipment well and have exemplary safety and environmental records, and skilled crews, can foster strong, lasting relationships with the most desirable customers: major oil companies and large independent companies. These customers typically plan sizable, multiyear drilling programs, well in advance. In addition, their capex tends to be larger and less volatile than that of smaller upstream firms, which supports stronger credit quality. We see safety and environmental controls as important because these reduce the risk of a catastrophic operating failure.

Sector description

Companies that derive more than half of their revenue by leasing drilling rigs to exploration and production companies, enabling them to find and extract crude oil and natural gas.

Subsectors	Typical CPGP
Offshore	Capital or asset focus
Onshore	Commodity focus/scale driven

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A fleet of relatively new, high-specification rigs that can command a premium, such as drillships, late-generation semisubmersibles, and heavy-duty jack-up rigs.	A fleet weighted toward commodity drilling rigs such as low horsepower onshore rigs or standard jack-ups, or that comprises older and less technically capable assets.
Most business is subject to long-term contracts so that revenue and margins are protected from a potential drop in market day rates or competition from other companies.	A prevalence of short-term or spot contracts, or revenue is highly seasonal.
Participation in industry segments that have favorable medium- and long-term growth prospects or positive supply-and-demand characteristics.	Participation in industry segments that have unfavorable medium- and long-term growth prospects or negative supply-and-demand characteristics.
A strong operating record, including good safety and environmental records, well-maintained equipment, skilled crews, excellent customer service, and long-standing relationships with high-quality customers.	A weak or short operating record and few established relationships with major oil companies, or customers present higher risks.

Scale, scope, and diversity

We assess scale, scope, and diversity in the contract drilling sector based on:

- Relative size of the fleet;
- Geographic and product diversity; and
- Concentration by customer.

Fleet size: Contract drilling companies that have large fleets tend to exhibit less performance volatility than those with smaller fleets.

Geographic and product diversity: A driller's presence in multiple markets improves its geographic diversity and competitive position by enhancing its ability to serve larger customers. Major exploration and production (E&P) companies prefer to contract with companies that have greater geographic reach and are better able to support global operations. Therefore, geographically diverse fleets tend to improve performance and reduce volatility for contract drilling companies. Offshore contract drillers can follow demand and redeploy assets to other geographic regions, which we view as a positive rating factor.

Certain country or jurisdiction risk factors relevant to the contract drilling industry may not be captured in our country risk assessment. Examples include the requirement to use local logistics support and infrastructure, and the nature and extent of regulations specific to drilling for oil and gas.

Customer diversity: Our assessment of customer diversity is based on the percentage of revenue and profit derived from each of the top 10 customers. We also consider our own assessment of the major customers' prospects, their likely future spending on exploration and development, and their record of paying suppliers on time. Certain national oil companies have historically paid suppliers erratically.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A sizable fleet with multiple classes of equipment.	A small number of rigs.
Participation in five or more basins, with assets showing no significant concentration in any one of those basins.	Participation in only one or two regions, which account for most of a company's assets employed.
Participation in several uncorrelated geographical markets and regions that have generally favorable characteristics, long-term growth prospects, and relatively low country risk.	Participation in one or a few correlated geographical markets that have unfavorable characteristics, such as limited growth prospects, high country risk, or unfavorable regulation specific to the sector.
No significant customer concentration that is unmitigated.	Significant customer concentration.

Operating efficiency

We assess operating efficiency in the contract drilling sector based on:

- Cost position compared with industry peers;
- Flexibility of its cost structure; and
- Cost management practices.

Cost position: We primarily base our view of contract drilling companies' cost positions, relative to peers, on their EBITDA margin profile over the cycle. In addition, we consider various indicators of cost efficiency and capital intensity, such as gross margin, SG&A expenses to sales, and capex to sales. Our analysis considers the overall cost and margin profile for a contract drilling company, as well as those of its various reporting segments.

Flexibility of the cost structure: A flexible cost structure will enable companies to absorb declining demand or withstand rising input costs. In our assessment, we consider the company's ability to contain its operating costs during both good and bad times, and its ability to maintain profitability, even when the cycle has reached its trough. This may be affected by the degree to which costs have escalated, labor cost characteristics, and its success in implementing cost-cutting actions. Other indicators include the company's historical asset utilization rates, compared with industrywide asset utilization rates; and its record of successfully integrating acquisitions. On the technology side, we evaluate its ability to construct, mobilize, and start up new rigs, and its capacity to develop improved technology.

Cost management practices: In reviewing cost management practices, we may assess customer contracts based on their provisions. For example, we look at the extent to which contracts protect against cost escalations affecting raw materials and other inputs; payment terms; the extent of counterparty credit risk and currency risks; and force majeure and other termination provisions. We also consider the enforceability of contracts. Pragmatic, commercial considerations may outweigh the legally enforceability of a contract, in some cases. It is unlikely, for example, that the company would take legal action against a major customer, when it could agree to renegotiate the contract provisions.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
High asset utilization rates over the cycle, compared with the industry average.	Low asset utilization rates, compared with the industry average.
Profitability measures exceed those of peers over the cycle.	Profitability lags that of peers due to a cost disadvantage.
The cost structure is relatively flexible and includes the ability to lower labor costs during a downturn.	A cost structure that is less flexible than the industry average.
Ongoing improvements to the cost structure over the cycle, such as lowering structural labor costs; implementing low-cost sourcing; or reducing the number of production facilities and eliminating bottlenecks.	Cost structure is burdened by high fixed or semifixed costs, labor inflexibilities, outdated asset base or production technologies, or vertical integration that did not create tangible savings.
Good record of acquiring or constructing new rigs and mobilizing them.	Poor record of acquiring or constructing new rigs and mobilizing them.

Profitability

Because the performance of contract drillers is subject to cyclical fluctuations, we do not assess profitability based on global benchmarks over a whole cycle. Instead, we compare financial measures against peers within the oilfield service and contract drilling sector: the top 25% of the peer group are classified as above average, the middle 50% as average, and the bottom 25% as below average. Some companies may have strengths and weaknesses that create a bias toward above- or below-average profitability, in which case we may override the quartile-based assessment.

Financial Risk Profile

Supplementary ratios

FOCF to debt is our preferred supplementary ratio for contract drilling companies because capital spending cycles can significantly shape cash flow generation patterns through the cycle. These companies typically incur significant capex in an upturn because they have to maintain and upgrade their fleet. During a downturn, by contrast, they typically let their fleets age and often cut capex to a minimum. Therefore, we frequently adjust the cash flow/leverage assessment in the direction of the FOCF-to-debt ratio.

We may use DCF to debt for companies that pay a material proportion of their cash flow to shareholders as dividends or via share repurchases. This helps us to evaluate how they use cash and how that may affect debt repayment. Companies that make more aggressive shareholder returns, as indicated by a weak ratio, may see reduced liquidity when crude oil and natural gas prices are falling and demand for rigs is declining, which could weaken their ability to service their debt.

Modifiers

Financial policy

If a company lacks a credible plan to finance the high cost of a new rig well ahead of the delivery date, we typically view this as negative to our rating and may adjust our anchor down to reflect this risk. Most new rigs are tied to multiyear contracts, signed in advance. Speculative newbuilds, which are not tied to a pre-signed contract, are especially risky.

Section 13 | Digital Infrastructure

Table of contents

Industry Risk

Under our "Methodology: Industry Risk," digital infrastructure companies have an industry risk score of 2 (low risk), which reflects the sector's low cyclicality and low competitive risk and growth assessment.

Historical information to evaluate cyclicality and analyze the industry's performance during recessions is more limited than that for other industries. Given the industry's rapid development globally since 2000, we expect to have more relevant peak-to-trough data in future years. Until then, based on the industry dynamics demonstrated so far, and the cyclicality assessment assigned to the sectors (utilities, infrastructure, real estate, and telecommunications) that we see as its closest peers, we assess cyclicality in the digital infrastructure industry as low risk.

Business Risk Profile

Competitive advantage

We assess competitive advantage in the digital infrastructure sector based on:

- Market position and competitive environment;
- Contractual framework and regulation;
- Asset quality; and
- Quality of customers.

Market position and competitive environment: The competitive advantage of a digital infrastructure company is heavily influenced by its position in the markets in which it operates. This generally depends not only on the company's market share but also on the existence of barriers to entry. These stem from:

- The need for high upfront investments;
- The lack of available alternative sites;
- Elevated switching costs; and
- The difficulty of replicating coverage.

In our assessment of competitive advantage, we regard a comprehensive market presence as favorable, especially if a company has sites in desirable locations where the number of competitors is limited for the reasons mentioned above. In addition, we evaluate the company's reputation and the prospective growth in demand for its services.

Contractual framework and regulation: The contractual context that protects the revenue structure, and thus the stability of a company's earnings and cash flow can provide a competitive advantage, especially if it protects against potential variation in profit margins. Some companies achieve stable earnings by entering into long-term lease contracts with counterparties that are creditworthy and highly likely to renew leases on similar terms; others via predictable, regulated

Sector description

Companies that derive more than half of their revenue or earnings from developing, providing, or leasing access to essential digital infrastructure assets, or for which such assets comprise more than half of their asset base. Such companies typically operate infrastructure assets that bear limited technological and operational risk, and enjoy some degree of revenue predictability. They include telecommunication tower companies, fiber optic network providers, and data centers.

Subsectors	Typical CPGP
Telecommunication tower companies	50/30/20
Wholesale fiber network providers	National industry and utilities: 60/20/20
Data centers	50/30/20

revenue. In our assessment, we monitor the weighted-average remaining life of contracts, the terms governing renewals, and the risk of contract termination.

Renewal risk is not typically factored into our analysis if the average remaining lease tenor is exceptionally long--10 years or more. For progressively shorter remaining lease life, we increasingly consider whether renewal risk is mitigated via contractual clauses; for example, automatic renewals or all-or-nothing clauses that could increase switching costs. We also assess the availability of alternative providers, the competitive position and pricing of the assets, and customer demand--these become the dominant considerations if the average remaining lease tenor is less than five years. In addition, we evaluate the impact on revenue visibility of contractual features such as the presence of automatic escalators, and the presence of any performance requirements beyond typical infrastructure provision, such as the management of active equipment or maintenance of key performance indicators.

For regulated markets, we look at how regulated revenue is determined, and the regulator's record of ensuring cash flow stability through review cycles. A supportive regulatory framework is positive for our assessment.

Asset quality: While we regard digital infrastructure as critical, the quality and attractiveness of a company's assets is still key to ensuring that demand and earnings remain strong in the long term, as users' needs evolve. We therefore monitor:

- The assets' age and reinvestment needs;
- The attractiveness of the assets' locations;
- The reliability and proximity of the assets' energy sources; and
- The company's ability to maintain and deploy assets in a timely manner and so meet user demand.

Companies gain more control over the infrastructure they operate if they own their assets, the real estate, or the land. In the digital infrastructure sector, greater control offers operating benefits and, for landlords, is associated with lower lease renewal risk. Ownership may also improve financial flexibility by enabling the company to either monetize its assets directly or use them as a source of funding to support their capital expenditure (capex), development, acquisition, or other funding needs.

Quality of customers: Our analysis of customer quality is not limited to credit quality--it also incorporates other factors that affect long-term demand and churn rates. Digital infrastructure companies can gain a competitive advantage by achieving a favorable customer mix, strong contractual relationships, and a record of retaining customers and selling additional space or services to them.

Tower companies

Market position and competitive environment: As telecommunications markets mature, ownership of the towers that house the critical network infrastructure for wireless communication frequently migrates to independent tower companies (towercos) from integrated telecom companies (telcos). At the start of this process, the sale of tower portfolios can create new towercos that need to ramp up their tenant base, making earnings less predictable. By contrast, in a mature market, we typically see an established ecosystem of towercos and more-stable competitive dynamics. In our view, towercos that operate in markets where the incumbent telcos have retained their tower portfolios are more vulnerable because incumbents could sell these towers off in the future, creating new entrants to the towerco market and exposing existing players to additional competition and merger and acquisition risk.

We consider the location and physical characteristics of a towerco's network, as well as the degree of coverage it provides. Those that have advantageous sites (that is, ones where there are no alternatives or that are hard to replicate) typically benefit from more repeat customers and reduced churn risk when contracts come up for renewal. Similarly, those that operate market wide can provide a one-stop solution for mobile network operators.

Contractual framework and regulation: Visibility is key to our assessment of the quality of the contractual revenue provisions in place. Supportive features include escalator clauses that automatically increase revenue by reference to an index, especially those that use fixed indexation, rather than variable. Escalators linked to inflation may be more credit-supportive in markets where inflation is typically high and unpredictable. Conversely, contracts that impose a step-up in a towerco's responsibilities or include performance requirements enforced by revenue penalties could weigh on a towerco's competitive advantage. We also consider the risks that can be incurred by actively operating equipment on the towers, as opposed to only passively managing the towers.

Regulatory requirements that create obstacles for new entrants or less-established competitors can create an advantage for more-established towercos that have demonstrated an ability to navigate these complex regulatory environments. Examples of potential barriers include limiting the number of permits available or requiring that tower site locations meet specific conditions.

Relative pricing is a consideration when assessing renewal risk. When telcos use sale-and-leaseback transactions to sell off their tower portfolios, they may achieve a higher sale price by agreeing to pay above-market rates in the initial lease contract. In our view, this creates a larger renewal risk compared with contracts in which terms are in line with the market. Such contracts may also contribute a significant proportion of revenue, creating a repricing risk as they approach maturity. Towercos can mitigate the risk and allow time for contingency planning by negotiating extensions early.

Asset quality: Although towerco assets are not that technologically complex, there have been innovations in tower design. A company can gain an advantage if, on top of maintaining its portfolio, it upgrades the amenities to accommodate the specifications of newer mobile technology demands and deploys new or updated network facilities. This includes connecting towers using high-speed fiberoptic cables to support advanced mobile networks and facilities for edge computing.

Conversely, demand for tower infrastructure could be disrupted by the spread of competing mobile technologies over the long term. Increased adoption of satellite mobile connectivity, for example, could in principle increase risks across the asset class in the future.

Quality of customers: The quality of the tower company's customer base can provide a significant competitive advantage. For example, premium wireless carriers and those that have large end-user customer bases may have more incentive to renew contracts. In addition to the cost of moving a more-extensive network of equipment, there may be greater risks and reputational impacts related to coverage quality or service interruption when switching tower providers.

Fiber companies

Where wholesale fiber companies (fibercos) benefit from regulated monopoly positions, our analysis differs from that of other types of digital infrastructure. Because there is no direct competition in such cases, we focus on underlying consumer demand for the product, and on the regulatory regime, rather than any contractual protections. However, where fiber companies

compete, we continue to apply the factors generally used to assess competitive advantage in the digital infrastructure sector, in addition to the provisions below.

Contractual framework and regulation: We generally view fibercos that are regulated monopolies operating under an established regime most favorably, because of their highly predictable and stable earnings. For example, a setup in which a single fiber network provider serves all the internet service providers (ISPs) in a region would minimize competition risk for the fiberco. In addition, as long as the total fiber market remains stable, subscriber churn between the ISPs has no revenue effect on the fiberco.

Some regulatory frameworks include features that mitigate the fiberco's exposure to volume risk. For example, "wash-up" mechanisms adjust for differences between projected and actual levels of demand, thus keeping revenue steady, albeit with some lag for the revenue affected. We consider this particularly supportive for less-mature fiber networks, where it is not yet clear how quickly customers will adopt fiber, or how many subscribers the market will ultimately sustain.

The use of concessions that grant a fiberco monopoly may eliminate the duplication of infrastructure (known as overbuild) and mitigate potential churn and volume risks. To a lesser extent, regulatory barriers may discourage new players, without expressly forbidding them. Awarding subsidies to a single player also limits new entrants to a market by making it more difficult for others to compete economically.

We examine the reliability of the regulatory regime to establish the likelihood of regulatory shifts or resets. Credit-positive factors include:

- Longer regulatory periods between resets that can recalibrate earnings;
- An established record of regulatory independence; and
- A predictable and transparent response to material changes in market dynamics that require regulatory resets.

Market position and competitive environment: Outside of regulated monopoly markets, the key credit factors we assess to determine a fiberco's competitive advantage are: level of competing network overbuild; market share; market maturity; and the scale of the fiberco's network coverage.

If fixed volume or payment commitments exist, we give them credit in our assessment, similar to our approach for contracted towers and data centers. However, wholesale fiber contracts typically lack such commitments to assure stable revenue. Fluctuations in an ISP's retail customer base therefore flow through, creating variability in a fiberco's wholesale revenue. As a result, we regard the quality of wholesale customers as important.

Where network overbuild exists, competitive dynamics can more closely match those in retail broadband. Exclusivity provisions can prevent an ISP from splitting its business with a competing network provider, and ensure that its entire retail customer base benefits one fiberco's take-up rate. Nevertheless, where a fiberco's share of the wholesale market is directly affected by changes in its customers' combined share of the consumer broadband market, we consider revenue stability to be weaker, depending on the market share of its customers. This can weigh heavily on our assessment of competitive advantage.

In competitive fiber markets, we expect the networks with the widest service area to attract and retain wholesale customers more easily. Operators of these networks also benefit from natural barriers to entry because of the high upfront costs involved in rolling out a fiber network. In extreme cases, this may enable a fiberco to enjoy what is, in practice, a monopoly, with a much lower risk that an alternative, competing network will enter the market. Again, the larger the

network in the service area, the greater the protection from new competitors with a similar offering.

We regard take-up rate (subscribers per homes passed) as a key measure, and one that is dependent on competition and the market's maturity. Take-up risk is higher where there is competing network overbuild, and in markets where fiber penetration rates (subscribers per total households) are low. As markets mature, commercial risks recede as the threat of competitive disruption from new fiber providers declines. Higher penetration rates in a market indicate diminished take-up prospects for new entrants and sharply reduce the incentive to overbuild, given the high capex required. The customer base is not only divided, but must be won away from the incumbent. In addition, for a company where take-up has stabilized and matured, ongoing development needs and execution risk are likely to be minimal.

Asset quality: The penetration rate of fiber varies across markets, depending on the availability and popularity of alternative modes of data transmission. In some regions, the conversion to fiber from copper may be delayed, or other broadband alternatives take market share. In addition, all regions contain some households that never take up broadband services at all.
