Historically, fiber networks have provided superior performance in terms of capacity, speed, reliability, and latency compared with alternative technologies (that is, copper and hybrid fiber-coaxial cable, fixed wireless access, and satellite). Fiber also has a longer life cycle, potentially lasting decades. By comparison, we expect that fixed wireless access will have a similar life cycle to mobile technology and the low Earth orbits used by satellite broadband providers decay after about five years, on average, and must be replaced on an ongoing basis.

We therefore expect alternative modes of data transmission to fare best in areas where it is not cost-efficient to roll out fiber. As a result, alternative technologies are likely to have largely complementary footprints, rather than being direct competitors. That said, we monitor the potential long-term impact of technology disruption for each network. We see technologies such as 5G fixed-wireless access and low Earth orbit satellite broadband as potential risks. Although their capacity and reliability limitations compared with fiber are likely to result in a durable performance gap, improvements may unexpectedly reduce the performance gap in future. Market demand for premium fiber products remains key to our assessment of asset quality and we assess factors such as consumers' appetite for price, convenience, and brand.

Quality of customers: Unlike towers and data centers, the potential customer base for a fiberco is largely determined by the extent of its network, and specifically by the number of physical households and businesses that exist within it. Revenue depends on the number of homes passed and on take-up rates. A high-income, premium customer base is more likely to support the penetration of fiber, and the purchase of faster fiber speed offerings.

Data centers

The core business of data center operators is the collection of rent for the provision of space and power. Data center operators exhibit more real estate characteristics than other digital infrastructure companies because they enter into contractual leases and commonly own the underlying assets, that is, buildings which may be repurposed as warehouses or other property types, if necessary. Wholesale providers, in particular, may own a high proportion of the assets they operate, and these assets may carry substantial value. Conversely, retail operators may lease all or part of their properties from a real estate owner.

When evaluating the operating risk associated with renewals for leased properties, we consider:

- The timing and magnitude of lease expirations;

- The landlord's business strategy; and
- The presence of buyout options and whether the operator can afford to purchase leased properties.

We consider a data center operator's business model to determine which factors to focus on in our assessment of competitive advantage. For wholesale providers, the predictability of its revenue is based on remaining contract length, asset location, demand characteristics, use of preleasing to offset the construction risk, and the creditworthiness of tenants. In addition to these factors, another key consideration for retail colocation providers is the level of customer interconnection. In our view, this increases customer switching costs and underpins a company's pricing power, barriers to entry for competitors, and the degree of customer loyalty. If we regard the company's position as strong enough to make renewal risk remote, this could be sufficient to offset risks associated with a shorter remaining average life.

Market position and competitive environment: The factors driving competitive advantage depend on location, and specifically on a data center's access to robust, reliable, and low-cost power. This is particularly key to our assessment of wholesale providers that serve large-scale deployments because it is critical to managing prices and the value proposition offered to tenants. The nature of the energy source can also affect our assessment--some tenants favor green energy, to support their net emission targets. That said, this is typically a secondary consideration. For retail providers, power costs may be less of a consideration, given the small size of tenant deployments. Greater interconnection density could add sufficient value to the customer to mitigate the potential impact of higher power costs.

We also consider the tax incentives available at the location--tax breaks give operators a pricing advantage. Given that customers view continuous service as essential, it is important that buildings are situated in areas that have a low risk of natural disaster, show building design resiliency to extreme events, or both.

The importance of proximity to internet exchange points or the end user depends on the tenant's needs. This is crucial where the use case is latency sensitive (for example, in cloud computing nodes or for AI inferencing). The need for low-latency interconnections creates a clustering effect that supports major data center hubs in certain markets. Typically, we view participation in an established hub favorably because the risk that it will prove difficult to find new tenants if contracts are terminated is lower. Our assessment is also supported by our evaluation of supply-and-demand characteristics.

Conversely, tenants that require data center space to store data or train a large language model may choose to locate in more-remote areas where land or sources of power may be more widely available--these use cases are not latency sensitive. That said, facilities outside of major hubs are more vulnerable to renewal risks and pricing pressure when the original lease expires.

Contractual framework: The contractual agreements that data center operators use to lease their assets to tenants generally do not include cancellation clauses. This makes their revenue highly stable. That said, in case of long-term agreements with exit options, or short-term agreements with extension options, we evaluate the extent to which the contractual features that have been put in place protect against the loss of tenants.

Other terms in the leases may vary:

- Wholesale data centers typically use net lease structures with a tenor of five to 10 years, or more. These provide a higher degree of visibility and more-predictable cash flow.
- Retail colocation data centers typically use shorter gross leases lasting one to four years. These increase their exposure to the risk of customer churn or rising operating costs.

Under net lease structures, rental revenue is net of taxes, insurances and operating costs, and owners can pass on cost increases to tenants. These lease agreements generally contain extension options and rent may be adjusted during the contract based on a fixed escalator rate or a tie to the local consumer price index (CPI). This helps to mitigate inflationary pressures.

Asset quality: Design characteristics such as the level of redundancy, energy efficiency, and age of a building can affect its performance and future capex requirements. We evaluate the level of operational redundancy, for example, because tenants view data centers as mission-critical facilities and typically expect operators to maintain a continuous service, with no interruptions. As such, we regard as favorable the implementation of increased redundancy for power and cooling, which would shield a data center operator from disruptive events such as power outages.

Power is a key cost for data center tenants and a more-efficient building can offer customers more-competitive prices. This is especially important for large-scale deployments, which are power intensive. To assess energy efficiency for data centers, we may use measures such as the power usage efficiency (PUE) ratio, which measures how much incoming power is utilized by IT equipment. Our assessment factors in potential regional differences, which may result in variation in PUE ratios, depending on humidity levels and temperatures.

At a given price point and location, modern purpose-built data centers tend to be more efficiently designed and better able to support the industry's high-density computation and cooling needs, giving them a competitive edge over older facilities. That said, older properties that have undergone major capital improvements to improve the integrity of the building, updates to cooling systems, or infrastructure improvements that reinforce redundancy would not be penalized in our assessment of competitive advantage. Although properties that house internet exchange points tend to be older, the presence of the interconnections to other customers are more important than the age of the building, especially considering the relatively small amount of space and power consumed per customer.

Technology innovations or shifts in demand that could reduce the need for the space and power provided by data centers may result in overcapacity or pricing pressure. For example, tenants who are making or planning a strategic shift toward self-built data centers, or who require less equipment, may be less likely to renew their contracts on similar terms.

We examine a data center operator's appetite for new development opportunities and its record of completing previous projects on time and within budget. Compared with many other asset classes, the complexity of construction for data centers is typically lower. That said, new developments are exposed to completion risks such as permitting delays, cost overruns, timely procurement of equipment, adequate staffing, and successful connection to a reliable power source. Development risk could be significant if the pipeline is sizable relative to the data center operator's stabilized asset base. Speculative development projects that require a company to fund construction costs over an extended period can significantly increase risk exposure--the ability to stabilize the property by securing tenants at favorable terms is subject to market conditions and other uncertainties. When evaluating development and lease-up risk, we consider the location, the operator's experience, and the nature of its expansion projects.

In some cases, operators can mitigate development risk by making "build to suit" or "powered shell" arrangements with anchor tenants that incorporate agreed upon forward-dated leases. Operators can also enter into joint ventures with third parties to mitigate risk; these enable them to split the funding costs and risks but may mean forgoing full control.

Quality of customers: An interconnected customer base and the ability to monetize these connections is the primary competitive advantage a retail colocation operator can have. The

presence of attractive customers that serve as a magnet for others can create a powerful ecosystem. Typically, multiple high-quality telecom network carriers that connect with each other within a facility create a "network effect" that attracts cloud service providers; this network can, in turn, attract enterprise customers. Data centers that exhibit significant physical interconnectivity and operate as internet exchange points are known as carrier hotels. These facilities could also house the connections required to exchange traffic from AI inferencing nodes, due to their unique capacity to provide high-bandwidth connectivity and low-latency access to a diverse pool of networks. These factors are critical to deploying AI applications that require real-time data processing and rapid response times.

In our view, a carrier hotel is very difficult to replicate, once established in a market. The high level of customer cross-connections creates a very loyal customer base and imposes high switching costs, despite the premium charged for capacity at such facilities.

If there is no such highly interconnected customer base, we view retail colocation as more commodity-like, with lower barriers to entry.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Strong market position and meaningful barriers to entry, including high upfront costs, unique subsidies or tax breaks, lack of available alternative sites, and high switching costs.	High level of competition with few barriers to entry for new entrants, including low upfront costs and available sites.
The contractual structure or regulatory framework under which the company operates is predictable, with regulatory hurdles affecting siting and permitting for new entrants, and counterparties are creditworthy. Remaining lease life is at least five years, or strong mitigants limit renewal risk, offering long-term revenue visibility.	The contractual structure or regulatory framework is unfavorable or unpredictable, exposing the company to greater competition, and uncertainty regarding margins. Shorter term leases increase exposure to renewal risk with no mitigants to protect operators.
Contracts include strong provisions to protect revenue (such as annual rent escalators and cost pass-throughs) and the provider benefits from considerable pricing power.	Lack of predictable rent escalators; limited ability to pass on cost increases; limited pricing power; and rents that are below market rates.
High-quality assets located in premium sites/markets with growth potential and access to a reliable source of power.	Unfavorable site locations and assets that are more outdated or of lower quality.
High proportion of owned assets, giving the operator full control over its assets.	High proportion of leased assets, which reduces flexibility and can expose operators to renewal risk with a landlord.
Customers lead their markets and have large end-user bases, reducing churn risks.	Customer base is lower in quality and the risk of customer churn is higher.
Strong customer satisfaction metrics and a record of attracting and retaining creditworthy customers.	Poor customer satisfaction metrics, and a limited record of contract renewal.
Tower companies	
Operates in established infrastructure markets, which reduces market disruption risks.	Operates in markets where integrated players still hold large portfolios that, if spun off, could disrupt the independent tower market.
Provides or facilitates a full suite of products, including small cells; rooftop coverage; facilities for edge computing; and fiber connections to towers, that are not dilutive to the strength of core tower lease revenue in terms of long-term predictability and stability.	Limited availability of differentiated sites, which hinders the provision of a suite of products.
The towerco owns most of the land on which its towers sit, which can minimize ground lease renewal.	Exposure to exceptional ground lease renewal and price increase risks.
Fiber companies	
Limited competition or a natural monopoly within a supportive, predictable regulatory framework that provides meaningful barriers to entry, earnings stability, or protection against volume risk.	A history of regulatory framework instability; operates within a regulatory framework that weighs on earnings predictability; or overbuild exposes the fiberco to higher volume risk.

A dominant market position and network coverage allow counterparty ISPs to connect to a large customer base, which can raise customer switching costs and protect a fiberco's bargaining power.	Limited network service area reduces the fiberco's bargaining power if overbuilt. ISPs may also face integration issues if they have to contract with multiple smaller fibercos.
Operates in mature, established fiber markets.	Operates in greenfield markets subject to significant penetration risk.
Data centers	
Located in markets that offer low-cost, reliable power sources and robust fiber connections, reducing latency and contract renewal risk.	Located in markets where power is more expensive or latency is higher, increasing contract renewal risk and jeopardizing long-term profitability.
Dominant market position and a high degree of customer cross-connections, within facilities that serve as primary internet exchange points in a market and thus command premium pricing and benefit from a network effect that may include cloud on-ramps.	Weaker market position, with fewer customer cross-connections; competition from a well-established internet exchange point in a market; or a higher proportion of managed service offerings, making it subject to greater competition and technology risk.
Situated in markets with depth and breadth of tenants, often to support cloud availability zones, reducing renewal risk.	Situated in markets that have a shallow tenant base.
High-quality assets protected from potential disruption events by a high level of redundancy; strong energy efficiency; and modern infrastructure.	Assets are housed in buildings where redundancy is limited, energy efficiency is weaker, and the infrastructure itself is older.
Limited development risk, mitigated by build-to-suit or a high level of forward-dated leases.	High exposure to speculative development projects.

Scale, scope, and diversity

We assess scale, scope, and diversity in the digital infrastructure sector based on:

- Scale of operations, relative to the markets in which the company operates;
- Geographic diversity, considering the size and maturity of the markets;
- Customer diversity and creditworthiness; and
- Diversity of contract tenors.

Scale of operations: In general, a larger portfolio of assets, or a larger service territory, is positive for digital infrastructure companies. Greater scale insulates the company from asset-specific risk, while allowing it to spread fixed costs and achieve economies of scale. That said, large scale and high diversity are not preconditions for scale, scope, and diversity to be assessed as strong. Our assessment is influenced by several factors related to how the company has positioned itself in its market, the maturity of the jurisdiction it operates in, the size of the property portfolio, the ability of the tenant to pay through the life of the contract, and the timing of the contract expiry dates.

Geographic diversity: Geographic diversity can mitigate market-specific risk. However, market quality gives context to our assessment of geographic diversity; diversifying into less-mature markets can increase risks, despite the growth opportunities. The additional operational or country risks introduced when digital infrastructure companies expand into markets that have less stable competitive dynamics; underdeveloped electricity networks or a shortage of sites with good access to power; unpredictable regulatory or legal frameworks; or more-volatile currencies can weaken our assessment of scale, scope, and diversity.

Customer diversity and creditworthiness: Most providers of digital infrastructure operate a wholesale business model, leading to an inherently concentrated customer base. That said, a diverse tenant base can support greater cash flow stability. Where companies rely heavily on a few tenants, or a single tenant, we consider the counterparty risk presented by the tenants. The ability and willingness of counterparties to make the payments due throughout the contract directly affects the digital infrastructure company's earnings and the quality of its cash flow.

Diversity of contract tenors: An evenly distributed portfolio of contract maturities can help maintain a high remaining weighted-average contract life, which contributes to long-term cash flow predictability. As such, we view a staggered lease maturity schedule favorably. In addition, diversification of contracts leads to more staggered contract renewal dates, reducing the repricing risk associated with concentrated renewal dates and eventually strengthening the negotiation power.

Tower companies

Scale of operations: Nearly all the mobile network operators (MNO) that are customers of a tower operator are looking for marketwide coverage. Therefore, we assess scale for towercos in terms of their market, and not by the absolute number of tower assets being operated. Operating leverage for towercos depends not only on having more towers but also more comprehensive coverage than other players in a market.

Our analysis of scale also incorporates a towerco's product offering. If the earnings quality of the complementary businesses matches that of the towerco business, the availability of complementary products and services can increase revenue and create more loyal customers. However, non-telecom-tower businesses may have less robust contract terms and weaker margins than the core business, as well as less predictable underlying demand. If this is the case, we may view diversification beyond the core business as negative because it increases renewal risk and revenue volatility.

Geographic diversity: Diversification across geographic markets can provide some protection for towercos against risks such as:

- The insolvency of a customer in a geography;
- Nonrenewal of contracts; or
- Market consolidation among the MNO customer base.

We could limit our assessment of scale, scope, and diversity to strong/adequate if a lack of diversity exposes a towerco to greater market-specific risk (for example, a change to the telco or towerco market structures). However, this would not be the case if the maturity and scale of a towerco's single market were superior enough to mitigate the increased exposure to single-market risk, including a track record of orderly renewal cycles in a fully independent towerco market, and structural stability amongst the towercos and telcos.

Most MNOs manage their operations at the market level, even when they are present in multiple markets. This limits the synergistic benefits for towercos of operating in multiple markets. For the towerco, this means that diversification may carry more risks than benefits. Specifically, operating in emerging markets can expose towercos to less-reliable electricity networks; a less-predictable regulatory framework; a less-stable customer market structure; or foreign exchange rate fluctuations. To offer customers the continuous service they demand, towercos may need to maintain onsite power facilities, such as diesel generators. This exposes them to commodity risks via their backup means of power generation, making it important that contractual provisions allow for the pass-through of fuel costs.

Customer diversity and creditworthiness: It is common for tenant concentration risk to be relatively high for towercos because the size of their potential customer base depends on the number of MNOs, which is typically fairly small. The earnings and cash flow quality of a towerco may therefore depend on a single tenant.

Generally, we would not cap our ratings on towercos based on exposure to a limited number of revenue counterparties because, in our view, towers provide infrastructure critical to the

provision of the MNO's own mobile service. For as long as the MNO is a going concern, and even through financial distress, we anticipate that it would prioritize maintaining access to the tower infrastructure (provided that the MNO counterparty has supportive network traffic needs). That said, the degree of MNO concentration, the weakness of the counterparty creditworthiness, and the specific contract terms with a struggling MNO may affect our assessment. For example, if out-of-market contract terms were signed to support a tower sale-and-leaseback valuation, the contract could be at greater risk of modification or breach, in the event of counterparty distress (or of nonrenewal at maturity).

Fiber companies

Scale of operations: Fiberco networks that pass more homes typically achieve better operating leverage and a lower cost per home passed relative to peers in the same market. Scale in these terms offers a fiberco greater bargaining power, thus supporting return on investment and margins by helping it negotiate on pricing and exclusivity. That said, we consider market coverage to be even more important than the absolute number of homes passed, because it factors into our competitive advantage assessment above.

Geographic diversity: Geographic diversity is not typically a key factor for fibercos that operate in concessions or monopoly markets. However, fibercos that operate in competitive wholesale markets can benefit from greater diversity, which increases their resilience to company-specific or market changes.

Customer diversity and creditworthiness: In concession markets or monopoly structures, we do not consider customer diversity to be material, so long as the same wholesale contract terms apply to all the ISPs that are a fiberco's customers. In these markets, the underlying consumer demand for fiber may be channeled through multiple ISPs but they are all ultimately supplied by a single fiberco.

Conversely, fibercos operating in competitive wholesale markets can benefit from customer diversification, which can partially mitigate the risk of churn to another provider. That said, we would not expect a fiberco to be able to secure contracts with all ISPs in a market where it competes with other fibercos, so only partial protection can be achieved.

Data centers

Scale of operations: Large-scale data center operators are often able to streamline the process of bringing additional capacity online. They may also benefit from lower construction costs due to more-efficient procurement and a deeper labor pool.

The scalability of the operator's equipment, including its access to power and cooling capacity, is key to its ability to meet customer requirements, in our view. Data center operators that can scale up within their existing facilities, or quickly expand their capacity, are better positioned to win new contracts and retain customers as their needs expand.

The absolute size of the portfolio, in terms of number of properties and square footage, could also affect its operating stability.

Geographic diversity: Customers that aim to deploy across multiple geographies may find operators with a presence in many markets more attractive as it allows for streamlined customer decision making. In addition, a geographically diverse portfolio can insulate an operator from market-specific risks.

Customer diversity and creditworthiness: We view tenant diversity favorably because:

- Wholesale providers typically cater to a single tenant, or a small number of tenants, in each building. Therefore, a larger portfolio helps to mitigate the risk that any single customer may opt to leave a given facility.
- It undermines the bargaining power that a large tenant may have at contract renewal, easing the potential downward pressure on pricing.
- Tenants from diverse industry sectors can help mitigate fluctuations in demand.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Larger than its competitors, in terms of both size and scale, in the markets in which it operates, or a leading infrastructure provider in a growing market.	Relatively small, in terms of size and scale, compared with other infrastructure providers in the market.
Sufficient geographic diversity in attractive and mature markets to insulate the company from market-specific risks.	Concentration in one market that is small, immature, or exhibits volatility.
Tenant base is diverse, with no meaningful customer or contract maturity concentration risk. Where customer concentration is structural, customers are highly creditworthy or contractual relationships are strong enough that we can rely on payments continuing for the remaining life of the contract.	The company depends on one or more tenants that have poor credit quality, or is exposed to clustered lease maturities within the next few years.
Focus on high-quality digital infrastructure businesses, without significant dilution from other businesses that may have weaker contractual structures.	High dilution from other businesses that have weaker contractual structures.
Strong likelihood that the contract is renewed.	Contract renewal is uncertain.
Tower companies	
Has gained sufficient scale in its market to address customer coverage needs.	Operates a network with limited services or has limited network market coverage.
Diversification across complementary product lines that increase customer loyalty without being dilutive of earnings quality.	Diversification to riskier assets that have a weaker quality of earnings (for example, they are less profitable or less stable).
Fiber companies	
Operates in one or several jurisdictions where regulation is predictable or in markets that have healthy supply-and-demand conditions; these characteristics support higher penetration and take-up rates.	Operations are concentrated in a jurisdiction where regulation is unpredictable or in a market that has unfavorable supply-and-demand conditions.
Data centers	
Scalable platform to quickly roll out additional capacity and meet evolving customer needs while benefitting from efficient procurement of equipment.	Small in scale or unable to expand in line with customer needs.
Global presence, a strong market position, and high-quality assets that enable large tenants to streamline their decision making as they deploy across multiple regions.	Assets are lower in quality and the company is concentrated in one or a few markets, or participates in several markets where its competitive position is weak.

Operating efficiency

We assess operating efficiency in the digital infrastructure sector based on:

- Cost structure and competitiveness, or contract type;
- Capacity utilization and operational resilience; and
- Capital intensity, including property management and development pipeline.

Our key consideration when assessing the operating efficiency of digital infrastructure companies is the degree to which its long-term contracts support cost pass-through. The higher the proportion of costs that can be passed through, the better, in our view. Contracts may also include price escalators or other features that reduce the company's exposure to cost volatility. Our assessment also examines how companies offset their high operating leverage by optimizing capacity utilization and increasing the operational resilience of their assets (based on measures such as level of network operational uptime).

Tower companies

Cost structure and competitiveness: In many markets, it is standard for towercos to pass through a significant range of costs to MNOs. These may include:

- The cost of fuel and power;
- Rental costs; and
- Maintenance costs.

Cost pass-throughs shift operational costs to the tenant, thus protecting the towerco's earnings stability. That said, a towerco's exposure to commodity risk is typically not perfectly passed through and this can increase margin volatility and weaken credit quality. Commodity risk is incurred in markets where grid reliability is poor and the towerco uses diesel fuel to power back-up generators.

Some towercos report both revenue and expenses on a gross basis, that is, including pass-through costs. Because this understates their EBITDA margins, we endeavor to consider margins net of the pass-through costs, in such cases.

Capacity utilization and operational resilience: Operating leverage is typically high for towercos. Onboarding colocation tenants can boost this, bringing in incremental revenue without requiring a similar level of operating expenditure. The capex needed to support colocation is also much lower than that needed to build a new site. To monitor the level of colocation, we track the average number of tenants per tower (known as the tenancy ratio).

We measure operational resilience, another key indicator, by the percentage of network operational uptime and the towerco's record of adhering to its contractual parameters. Given the passive nature of the assets, operational risk is low--uptime is typically close to 100%. In regions subject to physical risk from extreme weather events, we expect towercos to ensure that assets under their control are hardened and resistant to outages. In emerging markets, we evaluate the reliability of its power provider and check that it has implemented back-up power generation.

Capital intensity: Maintenance costs for towers are largely passed through to customers and the need to invest in existing sites is relatively low, given that they are passive assets. In addition, tower infrastructure use has matured in most markets, even where towers are still predominantly held by integrated telcos--there are almost no pure greenfield buildouts, outside of build-to-suit expansions. Therefore, we expect maintenance and investment costs to only rarely have a negative effect on operating efficiency.

However, if a towerco were to aggressively invest its capital in expansion and development, our view of its operating efficiency would weaken, especially if the projects were speculative, rather than precontracted build-to-suit projects, or if the tower company had a weak record of developing projects on time and within budget.

Fiber companies

Cost structure and competitiveness: Typically, the higher the penetration and take-up rates for fiber in a given market, the wider the base over which operating expenses are spread and the higher a fiberco's EBITDA margin. For wholesale fibercos, the key operating expenses are their overhead expenses. Their sales and marketing costs are low to nonexistent, giving them higher operating leverage compared with retail fibercos. For regulated fibercos, key operating costs would typically be expected to be recouped in the allowed returns.

Capacity utilization and operational resilience: Our calculation of the maximum potential demand for fiber infrastructure by ISPs is based on the size of the population and the number of households in each market. This, in turn, affects a fiberco's maximum profitability. In the case of concessionaires, we analyze the pricing regime and the margins that it allows the fiberco. For mature assets where penetration is high and there is little competition, margins can surpass 70%.

Capital intensity: While a fiberco is still building out its network, its cash flow conversion is likely to remain weak and its capex requirements high. However, transitioning to an operational phase from a predominantly build phase causes execution and cost escalation risks to plummet. Once past the build phase, capital intensity is likely to be low, given that fiber has lower maintenance needs than traditional fixed networks and cash flow conversion, especially after take-up has advanced, is high.

In some cases, the buildout of the fiber network is undertaken as a private-public partnership. In others, the government or regulator may provide some or all of the funding, which we view as credit-positive because it eases the capital intensity of the project and reduces the company's cash needs.

Data centers

Cost structure and contract type: Energy supply is typically the largest operating expense for data center operators. Hence, we regard the degree of exposure to the cost of power as critical to our assessment. We view triple-net leases (under which all operating costs and risks are passed to the tenant, including taxes, insurance, and electricity costs) as the most favorable. Wholesale providers also commonly use contracts such as modified gross leases, which allow for full power cost pass-throughs (that is, "metered power").

Conversely, retail colocation operators typically bear more of the risk of cost increases. These providers may mitigate this through contractual provisions that allow for price adjustments if power costs spike. We also consider whether their hedging strategy is supportive or whether other factors improve their ability to pass along cost increases. For example, customers may be willing to absorb price increases for data centers they consider mission-critical or that exhibit significant cross-connects within the facility.

Retail operators may also have sizable rental expenses if they do not own their properties. Their labor costs are typically higher than those of wholesale providers because they cater to a larger customer base and so require a larger sales and engineering team. This can cause EBITDA margins to be lower. For these operators, we may also review operating metrics such as EBITDA per square foot, which indicate an operator's success at monetizing its space.

Capacity utilization and operational resilience: In our view, capacity utilization is a more uniform and relevant measure of operating efficiency than operating margins. To calculate it, we first measure vacancy by power availability or square footage. We then measure how well the space in use is being monetized based on pricing indicators (such as U.S. dollar per kilowatt per month or monthly recurring revenue per cabinet).

Wholesale providers often maintain high occupancy levels that support stable cash flow growth when combined with rental growth. In addition, they may have fewer tenants with longer leases in each building and typically use forward-dated leases when expanding the space available. By contrast, facilities used by retail colocation providers typically operate at a somewhat lower utilization rate. This is because retail properties are not subject to forward-dated leases and operators typically aim to have space available so that they can offer immediate access to additional capacity.

Capital intensity: We regard the effective management of development or redevelopment projects as an important aspect of operating efficiency. It is important that projects be completed on time and within budget if the profit potential of the investment they represent is to be fully realized. We view favorably a company that undertakes significant development and redevelopment projects and completes them on time and within the initial budget.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Competitive cost structure with a high level of cost pass-through, including power costs, or the presence of built-in price escalators or other features that can reduce the digital infrastructure company's exposure to cost volatility.	Lower-than-average proportion of costs are passed through to tenants, and contracts lack other features to protect against increases in costs, especially the cost of power.
High utilization and revenue per asset unit results in an EBITDA margin consistently above peers.	Low utilization and revenue per asset unit results in an EBITDA margin consistently lower than peers.
Maintenance and development projects are effectively managed. Projects are either limited in size, relative to the overall company, or execution risks such as the risk of a delay in reaching full occupancy have been limited.	Development projects are subject to delays or cost overruns, or are highly speculative.
Tower companies	
Above-average number of tenants per tower and high lease renewal rates.	Lower-than-average tenancy ratios.
High network operational uptime and a record of adhering to contractual parameters.	A history of failing to meet the network operational uptime defined in contracts, which could lead to higher churn rates and compensation payments.
Fiber companies	
High fiber penetration and take-up rates, reflecting a mature market. Management makes proactive efforts to anticipate demand by increasing the residential homes passed in areas with higher growth prospects.	Low penetration and take-up rates that weigh on EBITDA margins.
Low execution and cost escalation risks because the buildout is complete or substantially complete, or the government has provided partial or full funding for the buildout stage.	Exposed to the material execution and cost escalation risks associated with the build phase of fiber networks.
Data centers	
High occupancy levels and low customer churn rates.	Vacancy levels or customer churn rates are above the industry average
Operating costs are below the industry average.	Operating costs exceed the industry average.
Favorable lease contract terms that allow the raising of rents, combined with high renewal rates.	Leases have a shorter term and the lease renewal rate is below average.
Portfolio of properties that perform well and have above-average capacity utilization and above-average yield per square foot.	Outmoded properties that do not function as efficiently, so that rents are below the market average and utilization by total space or power output is low. Higher vacancy rates depress the yield per square foot.
Effective management of property developments and a record of on-time completion and ramp up.	Poor project management of property development, with projects late to completion and ramp up.

Profitability

In line with our corporate methodology, our key indicator of profitability when assessing a digital infrastructure company is our adjusted EBITDA margin.

Financial Risk Profile

Core ratios

Digital infrastructure companies typically pay significant debt service costs due to their stable cash flows and ability to support higher debt loads; therefore, funds from operations (FFO) to debt is an important measure of their cash flow/leverage and ability to service debt. We also consider debt to EBITDA to be a core ratio, in accordance with our general corporate methodology.

Supplementary ratios

For digital infrastructure companies, we use the supplemental ratios provided in our general corporate methodology. In addition, for data center companies that own significant real estate assets, we typically consider debt to debt-plus-equity ratio (that is, the debt-to-capital ratio) to be the best supplemental ratio for analyzing this aspect of their business. If we determine that the value of the real estate assets under ownership provides additional financial flexibility not already captured by our core ratios, we may use this supplementary ratio in our cash flow leverage assessment.

Our debt to debt-plus-equity benchmarks differ according to the accounting method a company uses to value its properties. For companies that use historical cost-basis accounting, the standardized depreciation of assets for financial reporting purposes may not convey real market values. Indeed, the value of well-positioned properties may appreciate over time, even as the equipment in the building--such as generators, power distribution units, uninterruptable power supplies, transformers, and air conditioning--depreciates. This equipment generally has a long useful life lasting 20 to 40 years. For this reason, in assessing the financial leverage of such companies, we consider the debt-to-debt-plus-equity supplementary ratio on an undepreciated basis; that is, we add accumulated depreciation back to equity.

Where property values are marked to market (for example, under International Financial Reporting Standards), we apply somewhat stricter benchmarks because the property values used are typically higher than those used when properties are valued on a historical cost basis.

Digital infrastructure: Debt to debt-plus-equity

	Historical cost basis (undepreciated basis) (%)	Fair value (%)*
Minimal	Less than 30	Less than 25
Modest	>= 30-40	>= 25-35
Intermediate	> 40-55	> 35-50
Significant	> 55-65	> 50-60
Aggressive	> 65-70	> 60-65
Highly leveraged	Greater than 70	Greater than 65

*Used where property values are marked to market.

Time horizon and ratio calculation

While not typical, if we believe that the current and two subsequent forecast financial years are not fully representative of a company's financial risk profile, we may calculate ratios over a longer period, in accordance with our corporate methodology. For example, digital infrastructure assets often require heavy upfront investments that depress credit metrics; this is then followed by periods of high revenue visibility. If we consider a company's long-term financial policy commitment to be credible and supportive, while development risks are low and forecast revenue depends on reliable contractual offtake agreements, we may extend our forecast horizon to four years from the typical two years.

Volatility tables

We apply the low volatility table to a digital infrastructure company if it fulfils all the characteristics below:

- Has a CICRA of at least '2';
- Has a competitive position assessment of at least strong;
- Is forecast to derive at least 90% of its operating cash flow from revenue streams that we view as predictable because they are supported by firm, long-term contracts that typically have an average remaining life of about 10 years, with renewal on similar terms highly likely; or because they operate in an established regulatory, contractual, and legal framework we view as supportive, with a low risk that political intervention would have a significantly negative effect; and
- If the company has engaged in other activities, they are not seen as high-risk or volatile.

We apply the medial volatility table to a digital infrastructure company if it does not qualify to have the low volatility table applied but does fulfil all the characteristics below:

- Has a CICRA of at least '3';
- Has a competitive position assessment of at least satisfactory;
- Is forecast to derive at least two-thirds of its operating cash flow from revenue streams that we view as predictable, because they are supported by firm contracts with limited or low renewal risk; or because they operate in a regulatory, contractual, and legal framework we view as supportive, with a low risk that political intervention would have a significantly negative effect; and
- If the company has engaged in other activities, they are not seen as high-risk or volatile.

In all other cases, we apply the standard volatility table.

Digital infrastructure glossary

AI inferencing--Real-time processing that occurs when a trained large language model makes predictions or draws conclusions about new data.

Build-to-suit-- A facility designed and built to meet the specific needs of a single tenant.

Churn rate--The proportion of customers who terminate their contract within a specific time period, typically calculated as a percentage of towers' leases or fiber lines, or of total revenue for data centers.

Cloud availability zone--A geographically isolated data center or group of data centers within a region, designed to ensure high availability and fault tolerance by isolating critical components like power, cooling, and networking from other zones, thus allowing cloud applications to continue functioning even if one zone experiences an outage.

Cloud on-ramp--A direct, private connection offered by a cloud provider inside a colocation data center, bypassing the public internet.

Fiber penetration rate--The percentage of total customers in a market that have subscribed to a fiber service.

Fiber take-up rate--The percentage of customers passed by a fiber network that have subscribed to its services.

Interconnected data center--A type of retail data center that has a large number of tenants whose equipment is physically cross-connected to that of other tenants within the same building, using fiber links.

Internet exchange point--A physical location that forms part of the internet's backbone because internet service providers, content delivery networks, cloud providers, and other participants connect within it to exchange data traffic.

Internet service provider (ISP)--A company that provides retail consumer and business subscribers with access to the internet.

Lease-up risk--Risk that a facility, particularly a development project, is not fully leased. Can include recontracting risk at the end of initial leases.

Powered shell--A wholesale data center that provides the exterior structure, power, and connectivity but leaves the interior empty for the tenant to customize with racks, cooling systems, backup generators, and other necessary equipment.

Retail data center--A smaller facility that provides space, power, and cooling to a variety of tenants. Operators sometimes lease space from wholesale providers.

Take-up risk--Risk that a fiber network fails to achieve a given take-up rate; for example, because of the low fiber penetration rate in its market or competition from other fiber providers.

Wholesale data center--A large-capacity facility that provides space, power, and cooling to a few or a single large enterprise, technology company, or retail colocation tenant.

Section 14 | Engineering And Construction

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the engineering and construction (E&C) sector based on the company's:

- Share of its key markets or regions, as an indicator of its brand effectiveness or ability to execute;
- Reputation and brand recognition;
- Perceived financial stability; and
- Technology offering.

Market position: A strong market position offers a significant competitive advantage. In our experience, most E&C companies that have a sizable backlog under contract and larger market shares relative to the addressable market are able to gain a pricing advantage and those with effective sales teams can maintain sales performance when market conditions are unfavorable.

Reputation and brand recognition: Clients in the E&C sector are reluctant to award contracts to lesser-known companies that may not have the experience to successfully execute a contract. A strong reputation is therefore vital if an E&C company is to secure contracts--particularly larger ones. Reputation can also influence customer loyalty and pricing power. In our view, the leaders in this sector have demonstrated the capacity to operate in various regions and successfully execute projects around the world. In assessing reputation, we consider a company's history of completing contracted work on time and on budget, while complying with local and regional laws and regulations. We also examine safety records, including the frequency of safety incidents.

Perceived financial stability: Large E&C projects can sometimes take years to complete. Clients do not want to have to change contractors in the middle of the project because their contractor is in financial distress. Indeed, they sometimes require companies to provide letters of credit (LOCs) from banks or surety bonding lines in order to bid for and secure work. If an E&C company is to continue to secure work, it is therefore important that both clients and the providers of LOCs and surety bonds perceive it as financially stable.

This provides customers with the necessary assurance that an E&C company has sufficient financial strength to withstand unexpected occurrences, such as large cost overruns. In assessing the perception of financial stability, however, we also incorporate the company's record of winning long-term projects and of providing ample surety bonding and LOC capacity for bidding purposes. Where companies exhibit a willingness to take on more leverage, or have little or no capacity to offer surety bonds or LOCs, we see perceived financial stability as weaker.

Technology offering: E&C companies can gain a considerable competitive advantage through a strong technology and engineering offering. Those that can

offer differentiated services generally benefit from stronger pricing power than those offering more commoditized services. Customers may also prove more loyal to companies that have more-specialized technology offerings, such as in-demand, proprietary technologies or designs. We see companies that provide commoditized E&C services as vulnerable to new competitors entering their markets and to increased pricing pressure from customers.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A strong reputation and brand recognition.	A weak reputation and limited brand recognition.
A stronger market position compared with peers.	A weaker market position compared with peers.
An ability to win projects based on perceived financial stability and surety bond capacity or LOCs for bidding purposes.	Not perceived as financially stable, or limited surety bond or LOC capacity when bidding on contracts.
A more-specialized technology offering.	A more-commoditized product offering.

Scale, scope, and diversity

We assess scale, scope, and diversity in the E&C sector based on:

- Size of a company's revenue base or sales volume, by number of projects or contracts;
- Diversity and attractiveness of the end markets it participates in;
- Degree of concentration by customer and type of contract; and
- Range of services provided.

Revenue base: The size of an E&C company's revenue base, compared with the size of its target markets, can indicate the strength of its market position. Because E&C companies that have larger revenue bases typically also have the market share, reach, scale, and capacity to operate in various regions, they gain an advantage when bidding for contracts. Clients, especially those with complex global projects, are reluctant to award contracts to companies that may lack the scale or resource infrastructure to successfully execute them.

When assessing the revenue base, we may exclude any flowthrough revenue derived by purchasing material or equipment on behalf of clients without making any profit on the transaction. Conversely, we may include revenue that was excluded from total sales because the E&C company attributed it to a joint venture.

Diversification: Participating in a variety of attractive end markets generally supports more stable financial performance at E&C companies, especially if the various end markets operate on different cycles. Although some downturns are severe enough to affect all markets, diversification helps E&C companies limit exposure to risks related to any one of its projects, or to a single region, end market, or client. Our assessment of scale, scope, and diversity is influenced by the number of contracts a company typically works on, and their diversity in terms of contracted amount. We also consider the degree of concentration in the backlog by end markets, geographies, and clients. If we regard diversification as stronger than average, we would not expect the company to be significantly hampered by difficulties affecting a single project or customer.

Range of services: In general, we expect a broader range of service offerings to boost a company's scale, scope, and diversity. The types of service most commonly offered by E&C companies are engineering and design, construction, and maintenance work. Of these, we

consider that construction carries the most risk, with large, complex, first-of-a-kind, fixed-price construction projects being the riskiest because of their higher potential for cost overruns.

As projects become more complex, E&C companies that can provide a range of services throughout the project life cycle gain an advantage. Such companies tend to be more successful in securing repeat contracts and can capitalize on their long-term relationships with customers. In some cases, construction companies will collaborate with their client throughout the construction process to minimize costs for the client.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Revenue base and target market are larger than those of other industry participants.	Revenue base and target market are limited in size compared with those of other industry participants.
Contracts and backlogs are well-diversified by geography, end market, client, and contract size.	Contracts and contract backlogs show some concentration to a single or a few regions, end markets, clients, or contracts.
Offers a wide range of services, including engineering and design, procurement, construction, and maintenance work.	Offers a limited range of services or provides a niche service.

Operating efficiency

We assess operating efficiency in the E&C sector based on:

- The company's record on contract wins; changes to the value of its contract backlog; and the rate of order cancellations by market, compared with peers;
- Project execution, measured by the size and frequency of realized contract losses; and
- The degree of flexibility in the company's cost structure.

Contracts: Highly competitive bidding processes can distort rates of contract wins for E&C issuers, particularly if the process is undisciplined. If the number of contract wins is temporarily elevated or unsustainably high, it could signal weaker operating efficiency and margin degradation. We look at each company's contract wins, the changes in the value of its backlog, and its record of order cancellations, over a period of time, to normalize for one-time events.

Execution: Completing an E&C project profitably and on time is difficult. As a result, reported results can be highly variable. Project execution risks inherent in the industry include client cancellations and delays, change orders, client litigation, the availability of raw materials, problems with labor availability and productivity, weather events, and subcontractor risk. That said, an E&C company can significantly improve its operational performance if it has effective internal risk management policies and procedures. These may relate to project selection, contract provisions, management of subcontractors, or pricing, and can steer a company away from projects that are exposed to more risk.

We acknowledge that it is impossible to avoid all project risks, all the time. Therefore, all E&C companies, even those we assess as strong, will experience occasional cost overruns. However, in our view, companies that experience infrequent, smaller cost overruns are better operators than those that more frequently incur charges against projects or face very large cost overruns. Historically, fixed-priced contracts have proved to be most exposed to cost overruns--reimbursable contracts mitigate cost volatility and typically generate steady earnings and cash flow.

Cost structure: Most companies in the E&C industry have a relatively low proportion of fixed costs, which is an advantage. A low fixed-cost base allows a company to quickly scale back

overhead expenses during a cyclical downturn. Nevertheless, because the level of vertical integration varies from company to company, so does their cost structure. Some companies are deeply vertically integrated and have in-house building material sites and machinery fleets. This can provide them with direct access to strategic raw materials, often at a low cost. Although this is an advantage when capacity utilization is high or raw materials are in short supply, it can be a burden when capacity utilization falls. Where the bulk of services are performed in-house, cost flexibility in a cyclical downturn is generally lower and capital intensity may be relatively high.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Compared with peers, contract win rate is high, the backlog is sizable, and there are fewer order cancellations.	Lower contract win rate and smaller backlog than peers.
Contract losses are infrequent compared with peers.	Frequent contract losses or prolonged delays.
Project execution has been successful over several years, with most projects being profitable for the contractor and delivered on time and on budget.	Project execution has been poor for several years, with the contractor making sustained losses on projects following delays or cost overruns.
A relatively flexible cost structure, as demonstrated by lower operating leverage than peers.	Cost structure is less flexible than average because of high fixed or semifixed costs.
Profitability is less sensitive than peers to inflation or other fluctuations in the cost of labor or raw materials.	Profitability and margins are highly sensitive to inflation or other fluctuations in the cost of labor or raw materials.

Financial Risk Profile

Supplementary ratios

Because E&C companies are often subject to high working capital swings, FOCF to debt is our preferred supplementary ratio. We consider it likely to offer a more accurate measure of a company's cash flow in relation to its financial risk profile than EBITDA or FFO, which may overstate financial strength. Working capital may be affected by advanced payments on projects, delays in collecting accounts receivable in a downturn, or fast growth.

Capex on maintenance, as a percentage of sales, is typically fairly low for E&C companies, which supports their FOCF generation. Where a company's capex as a percentage of sales is relatively high, compared with peers, CFO to debt may be a more useful supplementary ratio.

Volatility adjustment

CFO at many E&C companies is volatile because they experience large working capital swings and may be subject to unexpected (and often large) cost overruns. Therefore, our final cash flow/leverage assessment for some E&C companies may include a volatility adjustment.

Modifiers

Liquidity

E&C companies--especially general contractors that take on large, fixed-price contracts--often receive sizable payments in advance. These are worked off over a relatively short period of time as the project moves from the engineering phase to the procurement and construction stages. Thus, the total cash balance, by itself, does not allow us to assess liquidity in full. Our assessment

of liquidity therefore incorporates the potential for working capital swings associated with advanced payments or contract-related liabilities.

In addition, clients often require E&C companies to offer a large LOC as proof of financial security when they bid on a contract. In our view, such a financing arrangement can erode the overall liquidity position. The banks typically take the amount covered by a LOC out of an existing line of credit, such as a revolving credit agreement. For each project requiring a LOC that a company bids on, or is executing, it has to restrict a portion of its liquidity. Therefore, we subtract the LOC outstanding from the available revolving credit facility.

Section 15 | Environmental Services

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the environmental services sector based on:

- Market position;
- Quality of service; and
- Asset base.

Market position: Having a leading share of a market can give a company a significant competitive advantage over peers, by helping to bolster pricing and protect sales performance in a downturn. When assessing market position, we consider the size of a company's revenue base, its market share by region and segment, and the degree of competition in the markets in which it participates. In some specialized markets, environmental services companies benefit from contractual protections, which increase their pricing power and make their customer base more stable. Therefore, we consider companies that focus on specialized markets more favorably than those that are heavily exposed to price-competitive markets. Market position may also be strengthened by effective marketing strategies, a strong sales force, and demonstrated technical expertise, particularly as new opportunities for growth arise.

Quality of service: Demonstrably better service quality, as measured by the timeliness of service and low number of missed pick-ups, can also give environmental services companies an advantage and help them generate sales. Other measures we consider when evaluating the quality of service include contract renewal rates, reputation, and brand recognition in the marketplace.

Asset base: Access to suitable waste stream disposal facilities that have ample capacity can represent a significant barrier to entry. Fixed assets such as landfill sites and incinerators are important, highly profitable, and rarely available for acquisition. Constructing new facilities, including installing the plant and equipment required, is time-consuming and entails significant capital investment. Most importantly, it is usually difficult to secure the government support and permits necessary to construct such facilities. In our view, companies that only control one aspect of the waste disposal process are at a disadvantage, compared with vertically integrated environmental services companies. In our view, integrated firms are more likely to sustain solid profitability through commodity price cycles. We consider specialized equipment, such as truck fleets enabled with telematics to optimize routing efficiency or those that run on alternative fuels or power sources to optimize operational costs, to be part of a healthy asset base.

Sector description

Companies that derive more than half of their revenue from the collection, treatment, transportation, and disposal of various waste streams.

Subsectors	Typical CPGP
Environmental facilities	Services and product focus
Solid waste	Capital or asset focus

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Leading market share positions in the markets in which it competes.	Rarely holds a leadership or near-leadership position in the markets in which it participates.
Participation in favorable markets, such as those where contractual protections apply.	Operates in unfavorable markets subject to intense price competition, where pricing gains are difficult to achieve.
High contract renewal rates, timely collections, greater ease of billing, favorable brand recognition, and other factors indicate that quality of service is high.	Quality of service is average or poor.
Vertical integration offers control over multiple aspects of the value chain, including the possession of (or cost-effective access to) key fixed assets such as landfill sites and incinerators that have sufficient capacity.	Operations are not vertically integrated, or the company is unable to obtain access to disposal sites and other fixed assets at an affordable price, forcing it to pay high prices to suppliers for access.

Scale, scope, and diversity

We assess scale, scope, and diversity in the environmental services sector based on:

- The location and diversity of the markets in which the company operates;
- Market characteristics such as supply and demand and the range of services on offer; and
- Concentration by customers and suppliers.

Although some downturns are severe enough to affect all markets, we generally expect participation in a variety of attractive markets to support more stable financial performance during market downturns. We evaluate the relative attractiveness of markets based on size, demographics, growth prospects, and the intensity of competition. Potential profitability and exposure to downside risks are both heavily influenced by the diversity and attractiveness of the markets in which an environmental services company competes, and how it has positioned itself in those markets. We therefore examine its pricing and service offerings in each market. Customer and supplier relationships and concentrations are also important to our assessment.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Participates in multiple markets that have favorable supply-and-demand fundamentals and are not closely correlated.	Participates in only a few markets and these have limited growth prospects, are highly competitive, or are closely correlated to one another.
Offers a range of services that cover different aspects of waste management, or different types of waste.	Services are narrowly focused on a particular customer segment or type of waste stream, especially a competitive or downscale segment that is more capital-intensive, cyclical, or commodity price-dependent.
Customers and suppliers show broad diversification.	Customers or suppliers are highly concentrated.

Operating efficiency

We assess operating efficiency in the environmental services sector based on:

- The company's ability to achieve economies of scale;
- Cost position, relative to peers;
- Relative flexibility of the cost structure; and
- Productivity, including how that is affected by the efficiency of the company's route network.

Economies of scale: More efficient operations generally enable an environmental services company to generate larger profit margins than its peers, whatever the prevailing market conditions. Companies typically achieve better operating margins than their peers by commanding higher prices and through the stronger operating leverage provided by scale. Larger companies gain an advantage when competing at a national level for contracts with commercial customers. If they have centralized purchasing functions, they can harness their size to obtain lower prices from fleet and equipment suppliers and negotiate lower interest rates and insurance costs. They also have the resources required to invest in technology, including up-to-date information systems and routing software. In small, local markets, scale may boost the pricing power of an environmental services company, but only by a limited amount.

Cost position: We also consider its relative cost position versus industry peers; whether its cost structure is flexible enough to absorb declines in demand; the ability of the company to withstand input cost pressures, including those pertaining to labor, fuel, and commodities; and its working capital management characteristics.

Our primary measure of a company's cost position is its EBITDA margin profile. We also monitor other measures that help us evaluate the company's cost efficiency and capital intensity. These include gross margin, SG&A expenses to sales, and capex to sales. We consider both the overall cost and margin profile of the company and those of its various reporting segments to be important aspects of our analysis. For example, the ratio of SG&A expenses to sales is compared against peers to establish whether overhead costs are being managed at a competitive level.

Cost structure: A flexible cost structure reinforces a company's ability to reduce costs to limit margin deterioration in a downcycle, or to pass on increases in input costs. In assessing cost flexibility, we calculate the proportion of fixed to variable costs, the operating leverage, and exposure to fuel costs and third-party disposal costs (including the pass-through profile for such costs). We also evaluate the effectiveness of vertical integration and outsourcing, the extent of unionization in the workforce, and any pension cost considerations.

Route efficiency: Efficient routing is vital for transport-intensive services such as solid waste collection. The strongest companies are able to ensure that their collection routes are optimized to reduce the time and expense required to service a given route. Relevant factors include route length, number of customers served, and types of waste collected. Increasingly, services companies have outfitted truck fleets with telematics and sensors to assist in this effort.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Economies of scale and other efficiencies enable profitability to consistently exceed the peer average.	Profitability is consistently weaker than peers.
Effective and cost competitive administrative functions (as measured by SG&A costs as a percentage of revenue)	Ineffective or costly administrative functions (as measured by SG&A costs as a percentage of revenue)
Routing is executed in a highly efficient manner and the efficiency of routing is continuously monitored to improve productivity.	A poor record of timely and efficient waste collection, which may be indicative of suboptimal route efficiency and inadequate planning.
Strong relationships with the labor force, including any unions.	A history of workforce disruptions and delays in negotiating amenable bargaining agreements with organized labor that have significantly dented profitability.

Financial Risk Profile

Supplementary ratios

If the preliminary cash flow/leverage assessment is intermediate or stronger, our preferred supplementary ratio for companies that provide environmental services is FOCF to debt. This enables us to incorporate the impact of working capital and capital spending cycles, which can significantly shape cash flow generation patterns through the cycle. If the preliminary cash flow/leverage assessment is significant or weaker, we may give greater importance to FFO plus cash interest paid to cash interest paid and EBITDA to interest.

Volatility tables

We apply the low volatility table to an environmental services company if it meets all of the following conditions:

- It has a CICRA of '2' or lower;
- It derives most of its revenue or EBITDA from its participation in less-cyclical segments of the industry that are not particularly exposed to commodity price volatility (such as franchise-protected markets in municipal waste, or medical waste);
- It has a preliminary competitive position assessment of strong or better; and
- Volatility of profitability has historically been assessed at '1', and is expected to remain at that level.

We apply the medial volatility table if a company:

- Has a CICRA of '2' or lower;
- Derives most of its revenue or EBITDA from its participation in less-cyclical segments of the industry that are not particularly exposed to commodity price;
- Has a preliminary competitive position assessment of satisfactory or better; and
- Volatility of profitability has historically been assessed as '2' or better, and is expected to remain at that level.

In all other cases, we apply the standard volatility table.

Section 16 | Forest And Paper Products

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the forest and paper products sector based on:

- Business strategy and market position, based on market share and the attractiveness of end markets;
- The proportion of revenue or earnings derived from value-added products;
- Any barriers to entry that could protect participants in a company's key segments; and
- Commitment and ability to sustain reinvestment in production assets.

Business strategy: Most products in the forest and paper products industry are commodities and offer limited opportunity for differentiation. In addition, demand in some markets is subject to structural, long-term decline because of the rise of competing technologies and materials. As a result, we consider the relative attractiveness of a company's end markets and its market share by sales or position.

Product mix: To assess the attractiveness of a company's product mix, we consider product-line maturity; growth potential; substitution risks; and the balance between value-added and commodity-grade products. Although demand for graphic paper is in structural decline, we see adequate long-term growth potential for certain wood fiber-based products (such as corrugated packaging, biofuels, etc.).

In our view, there is less scope for a forest and paper products company to achieve higher-value products through quality, service, and brand recognition, compared with other industry sectors. Nevertheless, it can be an important consideration in some instances--such as biofuels or specialty pulp.

Barriers to entry: The high capital intensity of the industry creates a barrier to entry. In addition, because transportation costs are high, relative to the value of most forest and paper products, close proximity to key raw materials, such as wood fiber, can also provide a strong barrier to entry. Some companies mitigate this through vertical integration.

Sector description

Companies that derive more than half of their revenue from harvesting timber or converting wood or recycled cellulose fiber into products to be sold as pulp, paper, or converted wood products.

Subsectors	Typical CPGP
Forest	Commodity focus/cost driven
Paper	Commodity focus/cost driven

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A strategy that is well-aligned with industry trends and is expected to enable the company to maintain its market position within relatively attractive product markets.	Weak market share and position in unattractive product markets.
A higher-than-average proportion of value-added products, giving the company the ability to influence pricing.	The company typically follows others on pricing or has material exposure to structural declining product segments, for example, graphic paper.
Able to sustain capital investment, combined with affordable energy sources, proximity to raw materials, and access to customers.	Low barriers to entry in its key product segments.
A demonstrated commitment to reinvesting in its production assets throughout the cycle.	An inability to sustain the required level of investment in its production assets throughout the cycle.

Scale, scope, and diversity

We assess scale, scope, and diversity in the forest and paper products sector based on:

- The size of a company's revenue base and unit sales volumes;
- The extent to which cash flow is derived from products or geographic regions that are independent or that have low correlation;
- The number of producing assets operated; and
- Concentration by customer or supplier.

Revenue base: Size typically offers forest and paper products companies a competitive advantage. Greater breadth and scope of operations, combined with economies of scale, contribute to higher profitability. In addition, we expect a company that operates more producing assets, across multiple locations, to find it easier to mitigate the risks to its operating performance associated with unforeseen or required maintenance shutdowns of its plants or mills.

Geographic and product diversity: Where companies offer a portfolio of products across different geographic regions, they typically see less volatility in their operating and financial performance. The less correlated the regions, the greater the protection against adverse changes to economic prospects in one of the regions or a fall in demand or pricing pressures affecting a particular product. For example, globally diverse forest and paper products companies that have exposure to the growing forest and paper products markets in emerging economies are typically better able to mitigate demand risks within mature or declining product markets, such as in North America and Western Europe.

Concentration by customer or supplier: We view a concentrated customer base as a risk because the loss of a key customer (for commercial or other reasons) could negatively affect the company. We also consider whether reliance on certain suppliers could cause operational problems. Levels of interdependence between suppliers and customers in the forest and paper products industry vary; this may somewhat offset the risks associated with a dependence on a few customers. In our view, sole-supplier arrangements, such as a long-term agreement to supply wood fiber to a customer, are favorable. Forest and paper products companies may also harness proprietary technologies or joint product development to create or bolster long-standing relationships with customers.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Larger than peers by revenue (linked to production capacity).	Smaller than peers by revenue.
Offers a broad range of products serving different end markets; typically, the various products are subject to different economic cycles in their respective geographies.	A narrow range of product offerings serving a single end market.
Operates multiple production assets.	Few production assets, or just one.
No significant customer concentrations, or any dependence is mitigated.	Assets, customers, or end markets show geographic concentration.
Raw materials are readily available from multiple sources, or stocks have been secured through long-term arrangements with well-capitalized suppliers.	An overreliance on a single supplier, which cannot be easily replaced, for raw materials.

Operating efficiency

We assess operating efficiency in the forest and paper products sector based on:

- Age, size, and location of production assets;
- Affordability and access to raw materials and energy (including the benefits of any vertical integration); and
- Flexibility of labor costs.

Operating efficiency is important to our view of competitive position in this industry because most forest and paper products are commodities that offer no price differentiation. Therefore, profitability is ultimately determined by efficiency.

Characteristics of production assets: Newer or larger machines offer efficiency benefits, not only by lowering energy costs but also by improving staff productivity. Although logistical costs will be lower if production is located near customers, we consider whether there are disadvantages in terms of labor cost flexibility and energy and fiber supply costs.

Raw materials: Access to low-cost raw materials is key. For most paper and wood products manufacturers, fiber costs comprise a significant proportion of total operating costs. Therefore, we view access to low-cost fiber as a competitive strength. Likewise, companies may purchase energy at favorable prices thanks to favorable market or contract conditions in specific countries or regions, through direct ownership of energy generation, or by integrating pulp and paper production. Integrated production is generally more energy and cost-efficient than stand-alone production. The ability to hedge costs can also offer a competitive advantage.

Vertical integration is capital-intensive but can offer advantages. Where a company sources its own raw materials (for example, wood fiber, recycled fiber, and pulp) or energy, it pays only the production cost. If using an external provider, it would pay the production and logistics cost, and the supplier's margin. We usually view a high degree of forward integration into converted and finished products--for example, a containerboard manufacturer that also produces boxes--as positive because box prices are higher and more stable than containerboard prices, and the manufacturer is less exposed to volatile open-market sales. On the other hand, a high degree of vertical integration also leads to lower capacity utilizations in an economic downturn.

Labor cost: Labor legislation and agreements can directly affect how operations are set up and their cost flexibility. A good relationship between a company and its workforce, including any relationship with unions, can minimize the risk of costly strikes.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Efficient production assets lead to lower costs than those of peers.	Production assets are more expensive to run than those of peers.
The company has proved its ability to reduce costs and manage fixed and variable costs during cyclical downturns.	Limited ability to pass along increases in the cost of raw materials and energy.
Vertically integrated operations that offer the company a high degree of self-sufficiency regarding its key input costs.	Third-party providers supply a substantial proportion of the company's raw materials and energy.
Relatively flexible labor costs compared with peers.	The labor cost structure is less flexible than that of peers.
EBITDA margins exceed the peer average, based on peers operating in similar product markets.	EBITDA margins are below the peer average, based on peers operating in similar product markets.

Financial Risk Profile

Volatility adjustment

Over an economic cycle, pulp, paper, and wood products producers frequently experience a high degree of cash flow volatility, which may not be captured in our quantitative analysis. To account for the understatement of volatility, we typically adjust our cash flow/leverage assessment for these companies by up to two categories.

Section 17 | Health Care Equipment

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the health care equipment sector based on:

- The size and nature of the markets in which a company competes; and
- The bases of competition, and the way in which it distinguishes itself from competitors.

Markets: Health care equipment manufacturers gain a competitive advantage if their products are used in well-established global markets with good growth prospects. We also evaluate how medically necessary the product is--those used in discretionary procedures will be more sensitive to economic conditions.

Competition: Barriers to entry are defined mostly by the level of technological sophistication and complexity required to develop and manufacture its products. The technological sophistication of companies that develop, manufacture, and market health care equipment varies widely. Some employ cutting-edge science to produce patent-protected products that address highly specific therapeutic and diagnostic applications. Others focus on producing more-generic, commoditized, and conventional medical equipment.

Companies that target the high-technology subsector benefit from stronger pricing flexibility and high technological and regulatory barriers to entry. Although these products can be complex to design and produce, if they demonstrate clinical utility, they often command premium prices and attractive margins. Items such as implantable cardiovascular and orthopedic devices, and some surgical instruments, can also be patented, which limits competition. Because competitors may release superior products at any time, making older products obsolete, we view ongoing investment in R&D as critical. In addition, new products typically command higher prices than aging products, which can help sustain or improve a company's competitive position.

In the lower-technology subsectors, where barriers to entry are lower and products are standardized, price plays greater role in customer decision-making and market share is often more volatile. For example, for conventional supplies, market competition is largely focused on price. Still, certain products engender a high degree of customer loyalty--for example, consumers can be reluctant to switch brand for their contact lens. Similarly, physicians are often hesitant to switch orthopedic implants and related surgical tools with which they have had good experiences. That said, although brand recognition and good relationships with distributors, physicians, and hospitals can give some protection, when purchasing is undertaking by hospital administrators, who tend to have less direct contact with the equipment, substitution risk tends to increase.

Sector description

Companies that derive more than half of their revenue from developing, manufacturing, or marketing medical equipment at various levels of technology.

Subsectors	Typical CPGP
High technology	Product focus/scale driven
Low technology	Commodity focus/scale driven

Other adjustments

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

Competitive advantage: typical characteristics*

Strong or strong/adequate	Adequate/weak or weak
Established position in a sizable global market	Market or subsector is fragmented and there are many competitors; or is small and unproven.
Market or subsector has shown above-average growth.	Mature market or subsector that has declining prospects and where consumer demand is faltering.
High medical necessity of the products offers some resistance against recession.	Products have relatively low medical necessity, are used in discretionary procedures, or are costly and more sensitive to economic conditions.
The company has a strong pipeline of new or enhanced products.	Narrow product pipeline and a lack of significant growth drivers.
Products offer proven benefits, such as higher treatment rates, fewer adverse events, or faster or less-invasive treatment; use more sophisticated and superior technology than competing products; and have favorable brand recognition.	Products are low-tech and not differentiated, and volume and market share are potentially volatile; or reputation and sales have been damaged by a history of material or repeated product recalls, regulatory sanctions for marketing practices, or manufacturing problems.
Products engender a high degree of customer loyalty.	Purchase decisions for its products are made by hospital administrators; products are vulnerable to substitution from within or outside the industry.
Consumables, especially those used with proprietary products, account for a significant percentage of sales, creating a stable and recurring revenue stream.	Sales comprise mostly of large equipment that can be volatile over business cycles.
The company uses direct distribution channels in local and key foreign markets, and its sales force has a strong relationship with customers.	The company sells a significant percentage of its products through distributors; or lacks clout with distributors, physicians, and hospitals.
Its R&D spending (both on an absolute basis and as a percentage of revenue) is at least comparable to peers'. The company's R&D strategy is consistent with its capabilities and market conditions, and it's willing and able to buy desired technology.	Its R&D spending is low relative to peers' (on an absolute basis and as a percentage of revenue); or its R&D efforts are overly ambitious, spread too thin, or inadequate.
Complex technology and patents deter competition, and nearly all sales are in countries where patent protection laws are strong (more relevant for high-tech products).	Its products are subject to rapid obsolescence, and the company is likely to fall behind technologically.

*Excluding contract manufacturers.

Contract manufacturers: Health care equipment companies may outsource manufacturing to contract manufacturers, which specialize in certain materials or technologies and can provide the service at lower price. The contract manufacturers subsegment is fragmented, highly competitive, and price-sensitive. Generally, we assess contract manufacturers as having only a weak or adequate/weak competitive advantage because their customers have much stronger bargaining power than they do. Price sensitivity is lower in faster-growing, innovative end markets, which improves the market dynamics for contract manufacturers in these sectors. Special manufacturing expertise and development capabilities, as well as physical proximity to clients' facilities, give contract manufacturers a competitive advantage.

Scale, scope, and diversity

We assess scale, scope, and diversity in the health care equipment sector based on:

- Diversity of products, medical specialties and end use, and geographies;
- Market share and performance; and
- The company's size (generally defined by revenue).

Diversity: Diversity is the main factor in our overall assessment of scale, scope, and diversity in this sector. Product diversity reduces exposure to recalls and permanent product withdrawals, new competition, patent challenges, recognition of adverse side-effects or events, and

manufacturing problems. Diversity of end uses also reduces exposure to changes in therapeutic techniques. Geographic diversity can protect a company against a decline in profit resulting from unfavorable economic, reimbursement, regulatory, or other developments in a specific country or region.

Market share and performance: We consider a company's absolute market share and relative to its competitors. Some markets are not clearly defined; for example, medical devices can sometimes compete head-on with pharmaceuticals that treat the same medical condition.

We view companies that are gaining market share more favorably. A first-mover advantage, for example, can help a company establish a leading market position and engender customer loyalty. Consumers have historically been hesitant to switch to alternatives, which benefits the manufacturers of certain products sold directly to consumers--such as contact lenses. A similar effect protects the leading manufacturer of many complex medical devices and tools, such as orthopedic implants and ancillary surgical tools. Having mastered one option, many physicians have shown reluctance to retrain on a competing product. Maintaining market share may be harder if companies produce lower-technology, commodity-like products, or operate in more-fragmented and competitive markets where sales depend more on price. Many countries operate single-payor government systems and put out a tender for product purchases. Price is a key factor in deciding which company is awarded the contract in these cases. Similarly, private hospitals may be part of a system that uses a group purchasing organization.

Scale and size: A large revenue base can bolster a company's market position because its greater scale is associated with greater resources. These enable the company to discover or acquire cutting-edge technologies, develop new products, maintain a robust product pipeline, and conduct clinical trials. Given medical device manufacturers' high fixed costs, economies of scale can lead to higher margins and offset pricing pressures. By contrast, a small revenue base can limit a company's ability to invest in R&D, its sales force, information technology (IT), and other paths to growth.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Its products have varied end uses in multiple medical specialties.	The company has a narrow end user or customer base, or it has a single medical specialty.
A broad range of specific products within each category or line.	It offers a single product or a narrow product line.
Sales are balanced between the large U.S. market and other markets, with no concentration in one country, and the company participates in favorable emerging markets.	Sales are all in one country or are concentrated in a small region.
Within its subsectors, it has a leading market share and few formidable competitors.	The company competes with larger players that have greater resources.
Market share is growing or stable.	Market share is declining.
Revenue base is larger than that of competitors, and its economies of scale in manufacturing and marketing give it an advantage when developing new products.	Revenue base is small, so that resources for R&D, sales force and IT are limited.
Life science companies	
Life sciences products are sold to diverse end markets, such as pharmaceuticals, education, health care, energy, chemicals, and food.	Relies on sales to governments, or to entities that depend on government funding.
Contract manufacturers	
Its top customer or product accounts for less than 5% of revenue.	One customer or product accounts for 20% or more of revenue.
Its top 10 customers or products account for less than 50% of revenue.	Its top five customers or products account for 80% or more of revenue.

Contract manufacturers: These companies are especially exposed to customer and product concentration risks. Their customers may move production of a product in-house, cancel production entirely, or select a competitor to develop the next generation of a product. Less often, quality problems or financial distress at the customer end may prompt them to decrease the volume of business or even sever their relationship with the contract manufacturer entirely.

Operating efficiency

We assess operating efficiency in the health care equipment sector based on:

- Cost position compared with peers in the same subsector;
- Cost management and working capital characteristics; and
- Ability to navigate complex patent and regulatory approval processes.

Cost position and management: A strong cost position will bolster profitability even when growth slows or revenue falls. To evaluate the cost position relative to peers, we examine trends in the EBITDA margin. We also consider ratios such as inventory turnover and days' sales outstanding (DSOs), which highlight different aspects of working capital management.

Management of regulatory process: For companies that make more complex medical equipment, which can be patented and may also be regulated, we look for indications that the company is able to navigate the patent and regulatory approval process smoothly. We would see a history of regulatory sanctions (whether for marketing practices or manufacturing problems) as a weakness. A reputation for high quality is essential to success in this industry. Material or repeated quality problems or product recalls would limit our assessment, especially if the company was unable to remedy the problem quickly. To maintain a robust and resilient supply chain, we consider that companies need to look beyond their own facilities. This makes capacity management especially relevant for contract manufacturers.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Superior cost position boosts profit margins and ROC above that of peers.	Cost structure is less flexible than average; cost increases cannot be passed through; and profitability is declining because of slower growth or a decline in revenue.
Margins remain stable, even in adverse conditions.	A pronounced decline in profitability when revenue falls or growth slows.
Skilled at navigating the patent and regulatory approval processes.	Limited experience or a poor record of navigating patent or regulatory approval processes.
It has multiple manufacturing and distribution facilities; the company is able to move production lines from one site to another relatively easily.	Reliance on one or a few manufacturing facilities or a dependence on suppliers that have had problems in the past.
Supply chain is robust and resilient.	History of quality problems and product recalls that were not quickly remedied; or regulatory sanctions prompted by marketing practices or manufacturing issues.
Record of good working capital management so that inventory turnover is above-average, and receivables are not left outstanding for long.	Poor working capital management; physical capacity is not well matched to requirements or is not flexible; or staffing cannot be easily adjusted.

Financial Risk Profile

Supplementary ratios

If the preliminary cash flow/leverage assessment indicated by the core ratios is significant or weaker, we typically focus on EBITDA to interest when refining our view. When a company has PIK debt, PIK preferred stock, or low-coupon convertible debt, we may also consider FFO plus cash interest paid to cash interest paid to recognize the lower ongoing cash expense. Interest coverage ratios enable us to incorporate the ongoing lack of or low mandatory cash expense.

We use CFO to debt, FOCF to debt, or DCF to debt to provide additional insight for issuers that are lower rated; have large amounts of floating-rate debt; or whose capital requirements or working capital requirements are higher than those of peers, such as companies that lease large equipment to customers or contract manufacturers that need to invest in new machinery in order to win new contracts.

Section 18 | Health Care Services

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the health care services sector based on:

- The company's position in its markets, and the competitive environments in which it operates;
- The mechanisms used for payments and reimbursement, and the company's relationships with private payors; and
- How services are differentiated from competitors, including in terms of quality.

It is rare for us to classify a health care services provider as having a strong competitive advantage as they are subject to government influence, face limited price flexibility, and tend to operate in fragmented local markets.

Competitive environment: Each health care service provider usually operates in numerous local markets. When assessing the competitive landscape in a specific market, we focus on the number of competitors and the degree of consolidation. In addition, we compare organic growth at the company with that of its subsector or market. Where service provision is subject to tender, we assess the company's record of winning and retaining contracts.

Competitors may include government-owned and other not-for-profit facilities. The former may provide services to a large number of patients who are insured through government programs and incur few, or no direct costs. Not-for-profit facilities may enjoy tax advantages, subsidies, or other benefits that give them a competitive advantage.

Payment and reimbursement: Health services are typically provided under a country-specific regulatory framework. The frameworks and contracts under which a specific company operates may bolster or limit a company's competitive position. For example, where governments provide reimbursements, the transparency and predictability of the payments may vary, even where services are provided under contract. We also consider whether the portion of revenue a company receives from private insurers compares favorably or unfavorably with that received by other providers.

Differentiation and service quality: In health care, providers may need to demonstrate the quality of their services to multiple stakeholders: consumers; professionals; the government agencies that provide referrals; those who award contracts to provide services; and other third-party payors. A company that can effectively differentiate itself can not only gain a competitive advantage, it may also operate more efficiently. For each company, we consider the location of facilities and monitor specific service quality indicators such as readmission rates, rates of hospital-acquired infections, and patient satisfaction scores. In the U.S., we track star ratings for Medicare-managed care. In some markets, patient loyalty, in the form of return visits for further treatment, can help us distinguish providers where quality is strong.

Sector description

Companies that derive more than half of their revenue by providing for-profit health care services to patients.

Subsectors	Typical CPGP
Health care services	Commodity focus/scale driven

Competitive advantage: typical characteristics

Strong or strong/adequate*	Adequate/weak or weak
Competes in markets that has few participants or has a dominant share of its local markets.	Competes in a subsector or market that has numerous competitors and low barriers to entry.
Operates under a regulatory environment and government payment regime that is transparent and predictable.	The regulatory framework or national health care system is volatile or underdeveloped; government policies could result in material stranded assets.
It is paid or reimbursed under long-term government contracts that include upward-only adjustments or allow for upward adjustments for external economic factors such as inflation; it consistently wins and retains contracts in contract-based markets.	It is exposed to competitive bidding.
It has a strong bargaining position with private insurers or other private third-party payors (for example, employers) and obtains favorable payments compared with those of other providers in its subsector and market.	Receives unfavorable payments from private insurers, compared with those of other providers in its subsector and market.
Volume and revenue growth consistently outpaces that in its subsector or markets and same-store volume and revenue growth trends are favorable.	Volume and revenue growth lags that in its subsector or markets; or revenue is significantly more volatile than that in the wider health care services industry or its subsector and markets.
Consumers, professionals, and government agencies that provide referrals, those who award contracts to provide services, and other third-party payors view the company positively; quality measures are above average, including measures of patient loyalty such as repeat visits, which facilitates the attraction and retention of professional staff.	Quality metrics are weak, or are reputed to be poor, and its facilities are poorly located.
If it chooses to compete for payors/patients on the basis of price, it is a low-cost provider.	Its cost structure, operating practices, or quality are poorly suited for its business model, which is based on population health management.

*Strong is rarely applied.

Scale, scope, and diversity

We assess scale, scope, and diversity in the health care services sector based on:

- The diversity of services offered and subsectors served;
- Geographic diversity; and
- The payor profile, that is, the diversity and stability of revenue sources.

Although large scale can provide a platform for good operating efficiency, we tend to view scale as less important to our assessment. In addition, market share has limited impact on our credit analysis because limited data is available and many health care service markets are highly fragmented. In addition, health care service providers generally lack pricing power, particularly if patients are insured through government programs. That said, where a company is typically the sole or a leading provider in markets that have very few competitors, market share may support our assessment of both scale, scope, and diversity, and competitive advantage.

Services and markets: A provider that focuses on a single field of medicine, or a specific service, is exposed to changes in medical practice, as well as the risk that the government may cut the reimbursement rate for a particular service. Either could trigger a sharp drop in earnings and cash flow at a narrowly focused health care service provider. For similar reasons, we consider a company that participates in multiple subsectors to be stronger than one that targets only one subsector, such as behavioral hospitals, cancer centers, or nursing homes.

Geographic diversity: We view favorably companies that operate in geographically diverse markets where demographic trends, economic environments, payment regimes, and payors

differ. Those that focus on a specific country or region are more exposed to the risk that profits will be hit by unfavorable economic, reimbursement, regulatory, or other developments. In the U.S., the payment rates and other criteria used in the Medicaid program are established at state level. As a result, if a company generates a significant proportion of its revenue from Medicaid, we monitor concentration at the state level. Similarly, even though employers or insurers typically pay for workers' compensation care, we evaluate concentration by state because payment rates are set at the state level in the U.S.

The payor profile: Payor concentration, which causes revenue and profit concentration, affects a large number of health care service providers. As a result, very few players in this sector are assessed as having strong scale, scope, and diversity. Most health care services providers generate all their revenue from governments, private insurers, and patients. Typically, private payors pay a higher price than the government. Therefore, we view private revenue sources more favorably than government sources. In some cases, such as for companies that provide outsourced services, the company generates a material proportion of its revenue from employers and other health care service providers, such as hospitals and doctors; it may have greater flexibility to negotiate prices with such customers.

When evaluating the diversity and stability of revenue sources, we consider the percentage of revenue generated from any single government or private source. Some central governments make direct payments for health services or operate national organizations such as Medicare or the U.K.'s National Health Service. Payments may also come from regional government sources, such as state Medicaid programs or U.K. local authorities. Where companies provide services under contracts, we evaluate the percentage of revenue generated through its largest contracts. In addition, we compare the payor mix against the market average and determine the degree of concentration by private insurer.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate*	Adequate/weak or weak
Offers a wide range of services and treats or monitors patients that have a wide variety of medical conditions (examples include acute care or general hospitals or clinical labs that have extensive test menus).	Treats or monitors patients that have only a few narrowly defined medical conditions (examples include treatment for end-stage renal disease or substance abuse, or anatomic pathology laboratory services).
Dependence on government revenue is low, or mitigated by a payment mechanism that provides multiyear revenue and stable profits.	Dependence on government revenue is high and unmitigated; or revenue depends on a small number of private contracts.
Generates no more than 35% of revenue from a single government source.	Generates more than 50% of revenue from one government source or a single government contract.
Generates no more than 25% of revenue (or EBITDA, if available) from a single government contract.	Generates more than 80% of revenue from its top two contracts.
Generates no more than 10% of revenue from all Medicaid programs combined.	Generates more than 25% of revenue from all Medicaid programs combined.
Generates no more than 15% of revenue from a single private insurer.	Generates more than 30% of revenue from a single private insurer.
Generates no more than 5% of revenue from any customer, excluding governments and insurers.	Generates more than 25% of revenue from any customer, excluding governments and insurers.
It operates in multiple countries, of which at least two contribute 30% or more of revenue each (or EBITDA, if available); 20 or more local markets (or catchment areas, if available); or more than 10 states or regions.	It operates in fewer than 10 local markets or states.
It generates less than 20% of revenue in its top region and less than 50% in the top five combined.	It generates more than 80% of revenue from its top two local markets.
For companies that provide workers' compensation care, and where employers pay state-regulated rates, no state accounts for more than 10% of revenue.	For companies that provide workers' compensation care, and where employers pay state-regulated rates, one state accounts for more than 25% of revenue.
Has the flexibility to set prices for 20% or more of its revenue.	Limited price-setting flexibility.

*Strong is rarely applied.

Operating efficiency

We assess operating efficiency in the health care services sector based on:

- Profitability compared with subsector peers, based on factors including economies of scale, and measured by EBITDA margins or ROC;
- Ability to set terms with suppliers and landlords (where relevant);
- Capacity utilization relative to subsector peers and, for population health managers, its ability to estimate utilization and costs;
- The cost and flexibility of the labor pool, and turnover among the professional staff;
- Management of bad debts and level of uncompensated care (if relevant); and
- Service quality relative to subsector peers.

When we assess a health care services company's operating efficiency, we generally compare its profitability and cost structure against a peer group of companies that provide similar services and receive similar payment rates, in the same subsector and country.

In our view, strong operating efficiency is most important for companies that use a business model based on population health management. We consider good underwriting, demonstrated by accuracy in estimating utilization and costs, and strong price negotiation skills to be indicators of strong operating efficiency. Providers with stronger operating efficiency may also use centralized billing, sophisticated revenue cycle management, inbound or outbound call centers,

and sophisticated electronic health records to achieve economies of scale and higher service quality than peers.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
EBITDA margin or ROC is higher than peers in its subsector due to factors including economies of scale.	It has lower EBITDA margins or returns on capital than its peers in its subsector;
Labor is more flexible or lower in cost than peers in its subsector or direct competitors and it can adjust staffing in line with volumes, while maintaining quality.	Labor costs are inflexible or subject to rigid rules imposed by a union or the government; staffing cannot be adjusted in line with volumes; and pension costs are high.
Capacity utilization is above average for its subsector or it maintains solid profitability, even when capacity utilization is weaker.	Capacity utilization is below-average for its subsector.
Turnover of professional staff is below average for its subsector.	Turnover of professional staff is higher than average for its subsector.
It obtains favorable terms from suppliers.	A history of unsuccessful cost reduction programs and limited ability to reduce variable or fixed costs has made it less efficient than competitors in its subsector.
The cost of bad debts has been relatively stable, enabling the company to accurately estimate such losses without needing significant adjustments.	It has had erratic bad debt expenses.
Quality measures are well above the peer average for its subsector.	Reimbursement has been meaningfully reduced because of substandard quality.
If it uses a population health management business model, it has a record of accurately estimating costs.	Uncompensated care costs are above average for its subsector, with no mitigants.
Favorable lease terms for its core facilities.	Lease terms for its core facilities are onerous (for example, rents can be escalated steeply).

Financial Risk Profile

Supplementary ratios

If the preliminary cash flow/leverage assessment is significant or weaker, our preferred supplementary ratio is usually EBITDA to interest. When a company has PIK debt, PIK preferred stock, or low-coupon convertible debt, we may also consider FFO plus cash interest paid to cash interest paid to recognize the lower ongoing cash expense.

Because health care services companies often carry a high adjusted debt burden, we view their ability to meet cash interest and lease payments as critical. If they have high rent expenses, we may use EBITDAR coverage as a supplementary ratio. This ratio enables us to incorporate a company's ability to cover all fixed charges and is especially important for companies at the lower end of the credit spectrum, where coverage of interest and rent may be marginal. In addition, the ratio helps us compare companies that own more property (potentially financed with debt) against companies that lease most of their properties. When calculating EBITDAR coverage, we use reported rent expenses for historical periods and estimate actual rent expenses for future periods.

Health care services: EBITDAR coverage scale

	EBITDAR to interest plus rent (x)
Minimal	>8.0
Modest	>5.0-8.0
Intermediate	>3.0-5.0
Significant	>2.5-3.0
Aggressive	=>2.2-2.5
Highly leveraged	<2.2

We use CFO to debt, FOCF to debt, and DCF to debt less often. Not only do few health care services companies have a preliminary cash flow/leverage assessment of intermediate or stronger but also, we find these ratios do not generally provide additional insight. In part, this is because health care service companies generally have moderate fixed and working capital requirements, relative to all other industries.

Section 19 | Homebuilders And Real Estate Developers

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the homebuilders and real estate developers sector based on:

- Size and market share;
- Business strategy;
- Marketing strategy;
- Approach to land procurement; and
- Capacity to offer sales support.

Size and market share: Market position is key to our assessment of competitive advantage for homebuilders and real estate developers. Greater scale can offer significant competitive advantages. We consider size in terms of revenue base and unit sales, and market share. Typically, larger real estate companies find it easier to attract capital, which improves their access to land parcels in well-located areas. Large homebuilders and developers can also make use of economies of scale and retain access to the best subcontractors and vendors. These factors are important to maintaining a pricing advantage, even in a downturn. Larger companies also benefit from investment in customer relationship management systems.

Business strategy: The ability to execute on business strategy is also critical, especially for developers. We examine management's ability to plan and implement projects that bring in sufficient returns without exposing the company to undue risks. A developer may differentiate itself from the competition by successfully undertaking large-scale, complex projects such as those that incorporate multiple property types. However, such projects increase delivery, execution, and concentration risks. In certain markets, developers must also consider whether to focus on residential or commercial projects and determine whether to sell properties for an immediate return or hold them to garner recurring income.

Marketing strategy: We also consider the company's ability to adapt to changing market conditions, and the stability of its markets. Companies that operate in emerging markets are exposed to greater risks as demand may be more volatile and reliable market data is generally not available.

In assessing the effectiveness of a company's marketing strategy, relative to similarly constituted peers, we consider:

- The rate of new orders;
- Contract backlog value;
- Order cancellation rates by market; and
- Average selling price per unit, compared with market averages.

Sector description

Companies that develop or acquire properties for sale. While homebuilders derive more than half of their EBITDA from the sale of newly constructed, detached, single-family houses; real estate developers derive more than half of their EBITDA from the development and sale of other types of newly constructed residential or commercial properties.

Subsectors	Typical CPGP
Homebuilders	Capital or asset focus
Real estate developers	Capital or asset focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

In broad terms, reputation and brand recognition offer developers relatively limited competitive advantages, compared with most consumer-related industry sectors. A company's marketing strategy may bolster its reputation through the variety and attractiveness of its designs, development areas, and communities (including location and amenities). In addition, developers that have a reputation for completing construction projects on time and to the agreed quality, may see repeat business from end purchasers. However, few customers are frequent buyers, especially in the residential sector.

Another component of marketing strategy is pricing strategy. Pricing strategies may vary among industry players. In our view, some of the pricing options weaken profitability and dilute franchise value. For example, some companies are particularly aggressive about lowering selling prices or offering sales incentives during periods of weakening demand. They may offer free or enhanced property features, pay closing costs or mortgage points, or subsidize tax costs. Companies typically report the cost of these incentives as contra revenue or as expenses.

Approach to land procurement: The ability to source sufficient land in attractive locations is critical to growth and we therefore consider the risks associated with a company's chosen land procurement strategy. Some homebuilders and developers maintain very large land banks. Although this reduces the risk that revenue could be constrained in the future due to a lack of suitable land, it is a capital-intensive strategy. In addition, a large land portfolio carries exposure to changing land prices. The value of land positions could suffer, should industry sales be significantly curtailed during a recession, or if changing demographics cause demand to fall.

Other homebuilders and developers use options to secure their land supply or maintain a smaller number of lots on their balance sheets--perhaps enough to cover their needs for the next two to three years. This approach is less capital-intensive, minimizes capital costs, and facilitates quick adjustments to the inventory during industry downturns. That said, it can be difficult to orchestrate and requires strong relationships with landowners and other suppliers. In addition, it may be difficult to sustain should rapid industry growth intensify competition for land parcels in good locations. Given the scarcity of urban land suitable for development, sourcing land is especially challenging for developers that primarily operate in densely populated urban areas. Whatever means a developer uses to control land, the end purchasers of the property must be able to exercise full ownership rights if the property is to be attractive from the purchaser's perspective.

Sales support: Some homebuilders and developers gain a competitive advantage by offering mortgage finance or mortgage brokerage services. Although this practice increases funding requirements for the homebuilder or developer, it helps customers to obtain financing on favorable terms in a timely fashion, while generating a fee income. In certain countries, homebuilders offer rent-to-own programs, which are effectively a form of long-term financing. However, most homebuilders and developers arrange with a financial institution to sell the loans quickly. Such sales are typically made on a nonrecourse basis, but we assess ongoing representation and warranty contingencies that are borne by the homebuilder or developer. Being subject to more contingencies than peers, such as having to repurchase nonperforming loans, weighs on our assessment of competitive advantage.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Consistent, proven, and adaptable business strategy, including an ability to tap into new or growing markets and offer products that are attractive to end purchasers.	Inconsistent or aggressive business strategy.
Large volumes and a leading market share.	Volumes are small and market shares lag the leaders.
Some degree of name or brand recognition and product differentiation.	Lack of differentiated brands and product offerings.
Control of sufficient land in attractive locations to support growth, and the ability to replenish land reserves while maintaining high quality.	Insufficient control of attractively located land to support growth.
Able to outperform the market in terms of sales volume and unit pricing, net of incentives.	Sales volume and unit pricing, net of incentives, are below the market average and the company follows others on pricing.
Demonstrates strong sales support capabilities and the ability to adapt quickly to changing market conditions.	Unable to demonstrate strong sales support capabilities or the ability to adapt to changing market conditions.

Scale, scope, and diversity

We assess scale, scope, and diversity in the homebuilders and real estate developers sector based on:

- Geographic diversity,
- Relative attractiveness of the markets served, and
- Diversity in terms of product type and price segment.

Geographic diversity: We view the ability to switch focus between geographical markets or property segments in response to changing market conditions as positive, and an important advantage. Participating in a variety of regional markets enables companies to reduce their exposure to cyclical downturns or long-term changes in market conditions.

Relative attractiveness of the markets served: Larger markets that demonstrate growing demand based on factors such as demographic and employment trends have greater market attractiveness. Competitive dynamics also factor into our assessment. We consider markets where homebuilding and development activity is fragmented among relatively weak local players to be less mature than markets that are dominated by large industry participants. In addition, we consider the likely degree of correlation of supply and demand among the markets served.

The operating environment for homebuilders and developers is affected by government regulation and policy with respect to the real estate sector. Regulations and policy may be set at the local, regional, or national level. We assess:

- The ease and predictability of permitting/licensing/entitlement processes related to real estate development and sales;
- The extent to which the government seeks to stimulate the property market, or depress it (for example, by altering the availability of tax credits and rebates, or through subsidized mortgage financing programs); and
- The government's record of participation in the property sector and the extent to which government actions have either stabilized or destabilized the market.

Product diversity: Similarly, the ability to offer a broader range of products--for example, both residential and office properties--can help homebuilders and developers react more quickly to

shifts in buyer preferences, or to regulatory changes. That said, increased diversity may also add to management challenges.

Diversity by product type encompasses the scope of a company's offerings. For example, residential property developments may offer one or more of the following:

- Single-family detached homes;
- Townhomes or attached homes (for example, terraced housing); or
- Mid- and high-rise blocks of apartments.

Our assessment of diversity of product offerings considers the trade-off between expertise and diversity. In our view, it is difficult for a homebuilder or developer to be effective across the price spectrum because the resources required to offer a comprehensive range of attractive products can be prohibitive. Because correlation across price segments is generally high, we regard a focus on upscale residential properties as offering only a limited competitive advantage. Positively, during a recession, upscale consumers in some residential markets may be somewhat less affected and retain access to financing. The higher selling price on an upscale property may also provide the company with a more substantial cushion in a downturn. This is offset by the more discretionary nature of many upscale consumer purchases (for example, the purchase of second homes). In addition, land and construction costs are typically higher when building upscale properties.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Participation in a variety of markets that are not closely correlated and that have favorable supply and demand fundamentals.	Participation in only a few markets.
Operating ability to offer a broad range of product types.	Limited ability to offer a variety of product types.
Demonstrated strength in markets/segments/price points that afford better-than-average profitability.	Concentration in markets that have limited growth prospects or are intensely competitive.

Operating efficiency

We assess operating efficiency in the homebuilders and real estate developers sector based on:

- Ability to procure attractively situated land parcels on a cost-effective basis;
- Working capital management, including control of land and building inventory; and
- Cost structure (which is influenced by building/construction, marketing, and overhead costs).

Land procurement strategy: For homebuilders and developers, procuring competitively priced, well-located land parcels is key to their operating efficiency. Land costs are often the largest element of the cost structure and a company's land procurement strategy will affect its asset intensity and operating risks. For developers, local market characteristics may determine whether they lease or purchase land, or it may simply reflect their operating strategy.

Working capital management: As part of our assessment, we consider working capital management and track record of completing construction projects on time and within budget. Typically, homebuilders and developers rely heavily on subcontractors during the construction period, which can expose them to the risk of delays caused by subcontractors. Project management and execution skills, including cost management, are assessed against peers.

Although below-average construction costs indicate strength, we also consider the company's ability to pass along potential cost increases. Operating efficiency also benefits from standardized, integrated operations management, particularly if the company is involved in multiple projects in different locations. We would expect this to include design, procurement, construction, and sales processes.

Developers undertaking large-scale projects generally use third-party resources for at least part of the project management and construction work. They are therefore exposed to counterparty performance risk and reputational risk making the quality and reliability of the third parties a crucial element. Where relevant, we consider the key terms of the contracts between a developer and its builders, and the quality of their relationship. Contracts usually include provisions to govern responsibility for cost overruns and penalties for delays, but they may be difficult to enforce in certain jurisdictions. Our assessment incorporates any such risks to which the developer may be exposed.

Cost structure: The cost structure for a homebuilder or developer depends on its relative land costs, unit construction costs, marketing costs, corporate overhead, and financing costs. Although scale may afford the company only limited pricing power, it can contribute to operating efficiency and margins, for example, through:

- Pricing power when negotiating with building material suppliers, especially if purchasing functions are centralized;
- The ability to attract and retain experienced subcontractors with good reputations, and so avoid subcontractor-related cost overruns and construction delays;
- The ability to attract designers who can create a variety of cost-effective, attractive, and up-to-date designs;
- Competitive overhead costs, including the ability to pass on increases in input costs;
- Efficient management of fixed and variable costs in a cyclical downturn; and
- Systems to support marketing and sales, including online channels.

Our view of operating efficiency also encompasses the management of property inventory. The longer the gap between time of construction and time of sale, the greater the risk for the homebuilder or developer. Market norms or regulations may limit companies' ability to reduce the risk and shorten the gap. In some markets, homebuilders construct a certain number of homes to serve as models for marketing purposes, but the bulk of the construction will begin only after the homebuilder has entered into sales contracts with customers, who typically pay a significant amount in advance. The homes built on spec or for marketing purposes are sold to customers who do not care to wait out the construction period. We monitor the percentage of total inventory that comprises speculative homes against the homebuilder's peer group. A homebuilder that has a substantial proportion of such houses in its inventory will be disproportionately exposed to a sudden downturn in the market.

In other markets, houses need to be fully constructed before sale, particularly where homes are built as part of government-sponsored, affordable housing programs. Some regulators allow properties to be presold, but only after construction has begun or the project has passed certain milestones; for example, they may require that at least two-thirds of a building's planned height is constructed before preselling can commence.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Profit margins, calculated as EBITDA to revenue and ROC, are above-average relative to similarly constituted peers (adjusted to account for sales mix and average selling price) due to economies of scale, process standardization, and other efficiencies.	High construction costs and below-average profit margins compared with similarly constituted peers (adjusted to account for sales mix and average selling price) because of inefficiencies, including a lack of economies of scale.
Development projects incorporate a high proportion of presold space and work-in-progress or finished-but-unsold property inventory is well-balanced against future demand.	A low level of pre-sold space in its development projects, with excessive levels of work in process or finished but unsold property inventory.
Efficient management of land inventory, at levels sufficient to support growth for several years in a stable market environment, but not excessive. Land holdings are actively managed to adapt to changing market conditions.	Land inventory that is inefficiently managed and either insufficient to support growth for several years in a stable market environment, or excessive.
Competitive overhead costs, calculated as SG&A expenses as a percentage of revenue.	Uncompetitive overhead costs, calculated as SG&A expenses as a percentage of revenue.

Profitability

The financial performance of homebuilders and developers is characterized by wide cyclical fluctuations, and the industry demonstrates structural differences from one country to another. Therefore, we assess a company's profitability against that of similarly constituted peers, but not against global benchmarks, as we typically do in other corporate sectors. In most cases, our primary indicator of profitability is the EBITDA margin. Where a company's strategy emphasizes a high turnover of assets, we consider ROC to be a more meaningful indicator of profitability.

Financial Risk Profile

Accounting

Under U.S. GAAP and IFRS, revenue and related profit for homebuilders and developers are generally recognized when the sale closes and title to and possession of the property are transferred to the buyer. Some companies based in Latin America, Southeast Asia, and Australia have historically recognized revenue using the percentage-of-completion method. We consider this method less conservative. In certain market environments, it can lead to a significant divergence between revenue and cash flow and may cause certain of our profitability and cash flow/leverage metrics to be overstated or understated. in those cases, we are unlikely to use them in our cross-border peer comparisons.

Supplementary ratios

Although our standard supplementary payback ratios--CFO to debt, FOCF to debt, and DCF to debt--are subject to wide swings, they indicate the extent to which working capital affects cash generation. FOCF at companies undergoing sustained growth may be negative for an extended period, heightening risks. We consider two coverage ratios--FFO plus cash interest paid to cash interest paid and EBITDA to interest--because they focus on a company's ability to meet ongoing debt service requirements. We also use debt to debt-plus-equity as an additional supplementary ratio to help us gauge financial leverage. This can be particularly useful where the results indicated by our core and standard supplementary ratios diverge. In our experience, this can help us evaluate how the company has chosen to fund its operations and how much leeway it has to sustain losses.

Our debt to debt-plus-equity benchmarks differ according to the accounting method a company uses to value its properties. Where property values are marked to market (for example, under IFRS), we apply somewhat stricter benchmarks to account for the typically higher values used, compared with properties valued on a historical cost basis.

Homebuilders and real estate developers: debt to debt-plus-equity

	Historical cost basis (%)	Fair value basis (%)*
Minimal	Less than 25	Less than 20
Modest	25-35	20-30
Intermediate	35-45	30-40
Significant	45-50	40-45
Aggressive	50-60	45-55
Highly leveraged	Greater than 60	Greater than 55

*Used where property values are marked to market.

Section 20 | Leisure And Sports

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the leisure and sports sector based on:

- The degree of brand recognition or franchise strength;
- How attractive and competitive the market is, compared with peers; and
- The quality of the asset or service.

These factors manifest in various ways in the subsectors within the leisure and sports industry, as shown below.

Sector description

Companies that derive more than half of their revenue from the provision of leisure and sporting facilities and goods.

Subsectors	Typical CPGP
Cruise lines	Services and product focus
Gaming	Services and product focus
Leisure facilities, (theme parks and other visitor attractions)	Services and product focus
Lodging and hospitality (hotels and resorts)	Services and product focus
Sports companies (fitness club operators)	Services and product focus
Timeshare operators	Services and product focus
Toy companies and other leisure goods manufacturers	Services and product focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Gaming	
Located in markets that have a large resident or visiting population who are likely to game, or where demand for gaming is likely to remain higher than local gaming capacity (that is, the number of gamers that could be accommodated).	Located in less-favorable markets that have a smaller resident or visiting population who are likely to game, or where gaming capacity is higher than demand.
Operates in markets that have high barriers to entry, such as a fixed number of gaming licenses.	Operates in markets that are highly competitive, with few barriers to entry, or in jurisdictions that do not limit the number of gaming licenses.
Maintains the high quality of its assets and also reinvests regularly to refresh its properties, especially in more-competitive markets.	Assets are of poor quality and there is limited ability to reinvest to maintain or improve the assets.
A leading market share or market share premium; strong revenue per user or machine; or, for online gaming, a high number of active users in the installed base. In assessing market share premium for casinos, we compare a casino's share of gaming revenue from a market against its share of the market's gaming capacity.	Market share is low; revenue per user or machine is weak; or, for online gaming, there are few active users in the installed base.
The ability to create a superior visitor experience that encompasses gaming, entertainment, lodging, dining, and shopping. This encourages customers to stay longer and spend more.	Few additional amenities are offered, reducing the opportunity to benefit from ancillary spending or encourage users to stay longer.
Strong brand recognition and the ability to create value through customer loyalty programs.	Weak brand recognition or an inability to encourage customer loyalty through marketing programs.

Strong or strong/adequate	Adequate/weak or weak
Lodging and hospitality	
Broad and consistently favorable brand recognition, combined with successful and growing loyalty programs and shared marketing and reservation services.	Brand recognition is poor, inconsistent, or periodically unfavorable.
A record of sustaining successful long-term franchise and management contracts with hotel owners, even when there is a change in hotel ownership.	A record of turnover in franchise and management contracts with hotel owners
Above-average asset quality, thanks to the ability to attract third-party development capital over multiple economic cycles and to increase the net number of rooms marketed by the brand each year throughout the economic cycle. For hotel owners, highly desirable real estate in markets that have high barriers to entry.	Asset quality is below average.
A significant and sustainable market position in a deep travel market.	Operates in markets that have few barriers to entry. For example, the large, mid-tier, and economy lodging segments are exposed to competition from suburban and roadside markets, where land for new construction is readily available and zoning restrictions less onerous.
Cruise lines	
Strong brand recognition and a value proposition that is consistently viewed as favorable.	Poor or inconsistent brand recognition.
Proven ability to design ships that can command higher prices or stronger yields than the existing fleet and competitors.	Limited record of successfully building and launching ships.
High-quality ships with amenities that are desirable to the target market and enable the company to deliver a superior guest experience.	A history of frequently underperforming against service level targets or of mishaps that threaten market share or prompt the company to discount more deeply on price than peers over a sustained period.
Customer satisfaction and retention are high, bolstering the ability to maintain and improve market share.	Poor customer satisfaction and retention.
Sports team or other sports issuers	
Strong franchise and enthusiastic and sizable fan base that translates into predictable attendance at events.	Weak franchise, fan base shows weak engagement, and attendance at events is volatile.
Long-lasting, highly profitable sponsorship and media contracts, supported by strong and consistent demand for media rights.	Demand for media rights is relatively weak.
Leisure facilities such as theme park and other visitor attractions	
Strong brand differentiation and long-lasting reputation as a premier destination that attracts a loyal visitor base, despite premium ticket prices compared with competitors.	Limited brand differentiation leads to frequent strategic discounting.
Reliably high attendance compared with industry peers.	Attendance is highly seasonal compared with industry peers.
Tickets are purchased in advance.	Cost of postponing a visit--for example, because of bad weather--is low, with few tickets sold before the day of entry, and few overnight visits.
High asset and service quality and a strong safety record, thanks to investment in new rides and attractions and in refreshing existing ones.	Asset and service quality are below average, due to limited investment.
Operates in markets that have high barriers to entry.	Operates in markets that have low barriers to entry and intense competition.
Toy companies and other leisure goods manufacturers	
Long-established and positive brand awareness.	Limited brand longevity and awareness.
Record of clearing items from the inventory before they become obsolete.	Frequent need to clear outdated items from the inventory.
Few supply-chain disruptions or product recalls, combined with a record of successfully handling them.	Supply-chain disruptions or product recalls often delay or prevent distribution.
Resilient demand, thanks to the ability to retain, expand, and profitably monetize licensing agreements and entertainment properties.	Volatile demand due to a limited ability to retain, expand, and profitably monetize licensing agreements and entertainment properties.

Certain subsectors are rarely assessed as having a strong or strong/adequate competitive advantage. This is the case for fitness club operators, where the very low barriers to entry have created strong competition and high customer attrition.

Similarly, timeshare operators compete with other leisure and vacation options for consumers' discretionary spending, face high levels of sales execution risk, and incur high new customer acquisition costs. Buying a timeshare means buying an interest in a property that includes the right to use it for a specific amount of time each year. Therefore, it is a relatively high-ticket investment compared with the cost of travel and a hotel for a one-off vacation, or the cost of a cruise, and this often leads timeshare operators to arrange financing for customers.

Competitive advantage: typical characteristics*

Adequate	Adequate/weak or weak
Sports companies such as fitness club operators	
Customer retention is supported by a reputation for offering good service in well-maintained, clean clubs, including the offer of personal training services.	Customer retention has been uneven even when offered personal training services.
Customer attrition rates are below the industry average, indicating good customer loyalty.	Customer attrition rates are higher than peers.
Clubs operate from easy-to-access, high-quality buildings located in population centers.	Club buildings are less attractive, and locations are less desirable.
Timeshare operators	
History of successfully executing sales to new timeshare owners throughout the economic cycle.	Uneven record of selling to new timeshare owners, even when the economy is strong.
Fewer than 50% of total timeshare sales rely on external borrowing to finance consumer loans.	Sales are highly sensitive to the potential loss of external financing for consumer loans during periods of financial stress.
Brand recognition is strong, and the loyalty program is affiliated with a widely recognized, high-quality hotel brand.	Brand recognition is relatively weak.
Operator offers a network of high-quality real estate in popular resort locations.	Operator offers less-desirable real estate in less-attractive resort locations.
Most existing owners consider the purchase to be good value.	Heavy reliance on selling additional timeshare products to existing owners.

*Subsectors assessed as adequate or below.

Scale, scope, and diversity

We assess scale, scope, and diversity in the leisure and sports sector based on:

- Diversity across geographic markets;
- Concentration by brand, asset, and segment; and
- Scale, especially when this affects its ability to make large capital investments.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Gaming	
Portfolio shows broad geographic diversity, and the company operates across different gaming markets or platforms.	Limited geographic diversity within the portfolio of properties.
High revenue diversity--that is, the company derives revenue from both gaming (slot machines, table games, sports betting) and nongaming amenities (entertainment, lodging, dining, and retail).	Limited revenue diversity and asset concentration.
Lodging and hospitality	
Multiple successful brands that are widely distributed.	Brand concentration.
Offers rooms at a variety of price points, targeting the luxury, upscale, midscale, and/or economy markets.	Price segment concentration.
Broad geographic diversity.	Limited geographic diversity.
Cruise lines	
Multiple successful brands that are widely known and have geographically diverse itineraries.	Brand concentration.
Sufficient scale to enable investment in the building of expensive ships, funded from internally generated cash flow.	Scale is limited and cash flow is insufficient to fund the heavy investment required to build a ship; as a result, capacity growth relies on external financing.
Cruise ships are able to target the luxury, premium, and contemporary markets, with offerings at different price points.	Price segment concentration.
Sports team or other sports issuers	
Wide range of events or facilities.	Limited diversity in terms of events or facilities.
Diverse revenue sources including events, attendance, sponsorship, media, and ancillary revenue.	Revenue is largely derived from one or a few events.
Broad event and product distribution and global sales diversification.	Limited distribution.
Leisure facilities such as theme park and other visitor attractions	
Distribution of multiple successful brands targeting multiple price points and demographic groups.	Limited distribution of brands.
Company operates a variety of sites that are geographically diverse and include both indoor and outdoor attractions, enabling it to reliably mitigate seasonal risk factors such as weather.	Limited geographic and site diversity.
Toy companies and other leisure goods manufacturers	
High product diversity across multiple age and demographic groups.	Limited product diversity.
Broad product distribution and global sales diversification.	Narrow product distribution and geographic sales concentration.
Manufacturing locations are geographically diverse and the company uses multiple suppliers.	Manufacturing facilities are concentrated.
Sports companies such as fitness club operators	
Geographic diversity across markets.	Limited geographic diversity.
Good diversification of revenue sources, including membership fees, ancillary products, and other services.	Limited revenue diversity.
Club locations are near large customer populations.	Clubs are located in areas that have small customer populations.
Timeshare operators	
Resorts are widely distributed across multiple desirable markets, enabling the operator to offer timeshare owners a network of attractive vacation spots.	Limited diversity in terms of resort and region, so that the vacation network is limited.
Large and growing owner base.	Number of existing owners is relatively small.
Sources of revenue are well diversified across timeshare sales, home ownership association (HOA) management fees, and financing revenue.	Limited revenue diversity.

Operating efficiency

We assess operating efficiency in the leisure and sports sector based on:

- Asset utilization and efficiency metrics, such as revenue per unit, where applicable;
- Success at managing fixed and variable costs in a downturn, compared with peers; and
- Record of managing large capital investment programs, where applicable.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Gaming	
Revenue per user is above the industry average, or the casino's win per unit per day for slot machines and tables is relatively high.	Revenue per user is below the industry average.
Operates in markets that tax gaming at relatively low rates.	Operates in markets that tax gaming relatively heavily.
Proven ability to lower labor costs at a casino or resort during a down cycle and to limit labor cost inflation.	Limited ability to lower labor costs at a casino or resort during a down cycle and to limit labor cost inflation.
Ability to effectively manage promotional allowances and other marketing costs across economic cycles.	Promotional spending is frequently high because the company operates in highly competitive gaming markets.
Lodging and hospitality	
Revenue per available room (RevPAR) is frequently higher than peers, across multiple brands and segments.	RevPAR is generally below peers on most offerings.
The cost structure is flexible; for example, the company sells franchise rights or manages the brand, rather than owning a hotel.	Ability to manage fixed and variable costs during economic downturns is limited, compared with peers.
Relatively low capital investment requirements.	High capital investment requirements.
Cruise lines	
Net revenue yield across the fleet is frequently higher than peers throughout the economic cycle, or the company outperforms peers in terms of year-on-year yield growth.	Net revenue yield consistently underperforms peers.
Discounts are rarely deep and are only offered as part of the company's typical promotions, rather than as compensation for poor service.	Deep discounts are frequently offered as compensation for poor service.
The company consistently manages dry dock, fuel, corporate, and other expenses to support profitability throughout the economic cycle.	Frequent cost overruns have undermined the company's profitability.
Sports team or other sports issuers	
The company consistently manages the cost of commissions, payroll, corporate, and other expenses to support profitability.	The cost of commissions, payroll, corporate, and other expenses frequently rises more quickly than revenue.
Revenue from sponsorship, media rights, or other ancillary revenue is predictable and consistently supports improved profitability.	Uneven ancillary revenue weighs on profitability.
Strong and consistent attendance at events supports the sale of tickets at premium prices as well as boosting other event revenue.	Poor or declining attendance not only erodes revenue from ticket sales but also weighs on any ancillary revenue sources.
Leisure facilities such as theme park and other visitor attractions	
Discounts on price are consistently and successfully used to optimize park attendance throughout the economic cycle.	Underperformance of the park has led to significant and sustained use of price discounts.
Maintenance, labor, and other park operating costs are successfully managed over the economic cycle.	Maintenance, labor, and other park operating costs are frequently managed inefficiently and rise faster than revenue.
Toy companies and other leisure goods manufacturers	
It is rarely necessary to discount prices excessively in order to clear obsolete items from the inventory.	It is frequently necessary to discount prices to clear obsolete items from the inventory
Commodity, labor, and other manufacturing input costs are effectively managed to reduce volatility in the gross margin.	A volatile gross margin because commodity, labor, and other input costs are highly variable.

Strong or strong/adequate	Adequate/weak or weak
Revenue mix is weighted toward evergreen products and long-lived brands, rather than entertainment-based products.	Revenue mix relies on transient brands or products.
Sports companies such as fitness club operators	
The proportion of revenue derived from high-margin ancillary services, especially personal training, is higher than peers.	Very little revenue is derived from high-margin ancillary services such as personal training.
Proven ability to manage price discounting and high fixed-cost structure, to support profitability.	Frequent and sustained use of price discounting to attract members, resulting in profitability that is consistently below average for the leisure and sport industry
A measured approach to expansion that limits the negative EBITDA margin impact of opening new clubs. Until they attract enough members to cover their fixed costs, new clubs are a drain on EBITDA.	Aggressive expansion, with new club openings causing EBITDA margins to decline for multiple years.
Timeshare operators	
Most timeshares sold are high-margin, commission-based sales of third-party inventory.	A minimal proportion of revenue is derived from high-margin, commission-based sales of third-party inventory.
A significant proportion of revenue comes from high-margin, less-volatile HOA management fees.	Revenue from HOA management fees is minimal.
Ability to absorb drops in sales during periods of economic stress, by rapidly reducing costs to preserve cash flow.	History of failing to reduce the cost base during periods of economic stress.

Financial Risk Profile

Supplementary ratios

Although our preferred supplementary ratio for leisure and sports companies is EBITDA to interest, especially when the cash flow and leverage score is significant or weaker, we may use other supplementary ratios to refine our view, as shown below.

Supplementary ratios by subsector: leisure and sports

Gaming	FOCF to debt gives us insight into the effect of the need for periodic development capex and maintenance capex, while DCF to debt may be used for companies that pay high dividends, especially Native American gaming entities.
Lodging and hospitality	FOCF to debt applies in most cases because of high investment needs, including investing in hotel renovations, while DCF to debt may be used for companies that pay dividends.
Cruise lines	FOCF to debt applies because of the capital cost of shipbuilding, while DCF to debt may be used for companies that pay dividends.
Toy companies and other leisure goods manufacturers	CFO to debt applies because of the heavy working capital requirements.
Sports teams and other sport issuers	CFO to debt applies because of high payroll costs and limited capex needs.
Theme parks and other visitor attractions	FOCF to debt applies because maintenance capex on attractions is relatively high.
Fitness club operators	FOCF to debt applies because clubs tend to grow by opening new clubs.
Timeshare operators	CFO to debt applies because of the heavy working capital required to fund inventory and receivables.

Native American gaming entities

When assessing the financial policy of Native American gaming entities, we view the governing tribe's financial discipline as a key element.

We do not typically assess financial discipline as positive because we do not expect Native American gaming entities to prioritize debt repayment over distributions. We have observed that, typically, if they reduce distributions, it is in response to weaker-than-expected operating performance, rather than as a credit-enhancing measure that reduces leverage.

We may assess financial discipline as neutral if we view distributions, as a percentage of FOCF, as relatively predictable. This implies that distributions are sufficiently flexible and the governing tribe would be willing and able to lower them if the gaming entity were under operating stress. To determine the flexibility available, we ask for the Tribe's financial statements and discuss budgetary flexibility with its elected officials. We also analyze its financial position, policy, and track record in using the flexibility.

We assess financial discipline as negative if we consider that distributions as a percentage of FOCF could be unpredictable over time because we are unable to assess the tribe's flexibility in terms of distributions or have limited visibility on the government's budget.

When rating debt issued by Native American gaming entities, we do not assign recovery ratings, because the exercise of creditor rights against a sovereign nation is associated with significant uncertainty. In particular, it is unclear whether the U.S. bankruptcy code would apply, whether a U.S. court would ultimately be the appropriate venue to settle such a matter, and to what extent a creditor could enforce judgment against a sovereign nation.

Section 21 | Media And Entertainment

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the media and entertainment sector based on:

- Brand strength;
- Market position;
- Revenue stability;
- Asset quality; and
- Ability to lead on price.

Sector description

Companies that derive more than half of their revenue from creating, publishing, or broadcasting entertainment or other content, or by selling advertising.

Subsectors	Typical CPGP
Ad-supported online content platforms	Services and product focus
Advertising agencies and marketing services	Services and product focus
Broadcast networks	Services and product focus
Cable TV networks and streaming services	Services and product focus
Cinema chains	Services and product focus
Data publishing	Services and product focus
E-commerce services	Services and product focus
Educational publishing	Services and product focus
Film and TV program production	Capital or asset focus
Music publishing and recording	Services and product focus
Newspapers and magazines	Commodity focus/scale driven
Other media and entertainment	Services and product focus
Outdoor advertising	Services and product focus
Printing	Commodity focus/scale driven
Radio stations	Services and product focus
Local TV stations	Services and product focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Advertising and marketing services	
Ad agencies have strong networks; marketing services companies have established brands.	Lack of business diversity and brand recognition.
Fees are stable or increasing and clients remain loyal and consider the company adds value.	High client turnover, which undermines fees stability and growth.
Net business volumes from new or existing accounts increase consistently, providing steady organic revenue growth.	Net business volumes are flat or declining.
Ability to adapt to shifts in technology.	Inability to adapt to shifts in technology.
Multiple service offerings in both traditional and digital formats across different geographic regions.	Limited presence in emerging markets and digital services.
Ad-supported online content platforms	
Strong and stable market share.	Market share is low and volatile.
Strong targeting and demographic reporting capability.	Weak analytical reporting capabilities.
Strong brand recognition.	Traffic is largely driven by external search engines or social media platforms, such that a change to algorithms could significantly dent audience reach.
Sizable audience, with a demographic mix that is attractive to advertisers.	Limited global presence and product appeal (for example, a focus on a highly specialized market or niche).
Content has reached a critical mass that makes the company's services highly valuable to users and imposes high switching costs.	Content base is small and not seen as valuable to users.
Ability to monetize content and audience traffic.	Uses a tailored pricing model, instead of industry-standard measures, such as cost per thousand impressions or cost per lead.
Proprietary technology that is difficult or very costly to duplicate.	The platform lacks the technology to monetize content.
Customers are highly engaged and use the platform frequently.	Heavy dependence on ad exchanges, resulting in unstable customer base.
Broadcast networks	
Country-specific regulation supports only a limited number of national free-to-air or public broadcasters, thus reducing competition and making it easier to acquire programming, audience ratings, or advertising share.	Regulation and the structure of the national TV market are unfavorable and there are multiple over-the-air private or public broadcasters, creating tough competition for programming/audience/advertising.
Leads its market in terms of audience ratings, and ratings have declined by less than the market average.	Audience ratings have been declining more steeply than peers.
Affiliated stations pay high fees for permission to retransmit national programming content.	Considered to be a second-tier network. due to its weaker programming slate and weaker audience ratings.
Consistently schedules successful slate of prime-time programming and commissions new shows that prove successful.	Slate of prime-time programming is limited and it is inconsistent in commissioning new shows that prove successful.
Able to charge advertisers an industry-leading cost per thousand impressions and to consistently increase this cost.	Inability to charge an increased cost per thousand impressions.
Cable TV and streaming services	
Distributed to a high proportion of homes or has sufficient scale to distribute content digitally or direct to the consumer.	Has less distribution among linear TV subscribers and limited digital distribution capabilities.
Affiliate or subscriber fees are higher than peers or the industry average.	Affiliate or subscriber fees are lower than peers or the industry average.
Leads the market in premium categories such as sports, news, or specialized programming.	Lower audience ratings than similar channels (that is, other general interest or high-interest, niche channels).
Leads the market in terms of audience ratings or ratings have declined by less than the industry average.	Audience ratings have been declining more steeply than comparable channels.

Strong or strong/adequate	Adequate/weak or weak
Data publishing	
Has access to exclusive data or expertise that increases its pricing power; barriers to entry are high and there are few substitutes; and clients have proved loyal.	Content is niche or exclusive content falls within a narrow scope.
Ability to raise prices consistently due to necessity of product or data.	Limited or no pricing power.
Onboarding of new clients is smooth, and the company has the technological expertise to reliably migrate client data from other platforms. Print products make a limited contribution to revenue.	Company is unable to consistently migrate data successfully from one platform to another, in line with client needs.
Record of continuously improving the product or service while maintaining low downtime and minimal service delays.	Service is poor, with frequent downtime.
E-commerce services	
Maintains a strong and stable share of the market.	Most traffic comes from third parties such as external search engines.
Strong brand recognition, with a good proportion of users returning to the service or making repeat purchases.	Few or no products are exclusive to the site and there is no clear differentiation to make it stand out from its competitors.
Able to convert a good proportion of online traffic to revenue.	Making a purchase requires multiple clicks or choices.
Feedback is easy to give, with a consumer-friendly interface.	Customer service is poor.
Educational publishing	
Commanding share of the various age-based educational publishing markets.	Low share of the various age-based educational publishing markets.
Proven success at targeting the key subjects studied in the final two years of college/university, including numerous titles that are important in their fields; these markets are more stable because the books are less likely to be sold on or rented.	Main success is with books aimed at the first two years of college/university, which are more likely to be sold or rented and more price-sensitive, or some success with textbooks for subjects studied in the final two years of college/university.
Ability to develop and provide digital learning products.	Produces few widely used digital learning resources.
Established backlist of accepted textbooks, so that only a small share of sales is from first editions, which are more expensive and risky to develop.	Depends on the for-profit college/university sector, where enrollment has been falling.
Ability to increase the price of textbooks and publish revised editions with minimal impact on volume.	Volumes are sensitive to price increases.
Film and TV program production	
Top-tier studio with a demonstrated ability to develop, market, finance, and distribute films and TV shows that are consistently profitable in global markets.	Limited ability to create and distribute content globally. Minimal record of success in developing hit films and TV shows.
Local TV	
A majority of stations in the portfolio have the largest or second-largest full-day or news audience in their local markets, and therefore get a larger share of in-market advertising sales.	Audience ratings for news and consolidated across the full day are lower than peers, so it has a lower share of in-market advertising sales.
Large percentage of market duopolies where there is more than one TV station in a market.	Market is fragmented with many network-affiliated broadcasters.
Owns valuable content and brands that have a strong recognition, or has diversified affiliations with large broadcast networks that offer appealing content.	Affiliated with few broadcast networks, or with smaller networks.
More than 30% of broadcast revenue stems from the sale of retransmission rights (pay-TV distributors retransmit original content)	Less than 15% of broadcast revenue stems from the sale of retransmission rights.
Music publishing and recording	
Large catalog, which includes leading, well-known artists and bands, which venues, media services, and streaming platforms consider to be "must have" content.	Catalog is smaller and includes few widely known artists and bands.

Strong or strong/adequate	Adequate/weak or weak
Proven ability to support a strong roster of artists and catalog of recordings, with good artist and repertoire (A&R) development capabilities.	Limited ability to develop new artists, and lack of a consistent history of strong album sales, indicating a weakness in A&R capabilities.
Sufficient bargaining power to enable the company to offer writers and artists different rights fees, depending on how easy it is to market the artists and their music.	Limited or no ability to alter rights fees.
Outdoor advertising	
Yield, measured as revenue per display, is above the industry average.	Yield is below the industry average.
Digital displays comprise a higher share of the company total than the relevant regional market average.	Digital displays comprise a lower-than-average share of the total.

The shift to digital technology has disrupted every subsector within the media and entertainment field. Our assessment of competitive advantage therefore includes consideration of how well industries and companies have adapted. Although we assess competitive advantage in the context of the overall media and entertainment industry, certain subsectors, listed below, have suffered persistent structural declines. As a result, we are unlikely to assess companies that primarily operate in these industries as having a strong or strong/adequate competitive advantage.

For example, newspaper and magazine publishers have seen a steady fall in revenue and EBITDA as customers switch to online alternatives. In turn, much of the print industry that served the publishers has seen modest, but persistent reductions in revenue and EBITDA. Cinema chains have struggled to recover since they had to close during the pandemic. Their cost structure is inflexible, and they lack negotiating leverage with production studios. Studios have also undermined the theatrical release business model by releasing films on streaming platforms more quickly.

Competitive advantage: typical characteristics*

Adequate	Adequate/weak or weak
Cinema chains	
Easy-to-reach locations with high footfall.	Poor locations leading to persistently weak performance compared with peers (based on metrics such as attendance per screen).
Robust concession offerings and modern amenities (for example, recliner seats and screens that can display films in premium formats such as IMAX), enable the company to generate concession revenue per patron above the industry average.	Weaker concession offerings and lack of modern amenities or luxury formats result in lower ticket prices and lower concession revenue per patron than peers.
Newspapers and magazines	
Content leadership in a niche, category, or geography that supports growth in circulation revenue, combined with steady or growing ad rates despite the industrywide decline.	Failure to lead the market in any category has caused circulation to decline faster than the industry average. In addition, ad rates are dropping in line with the decline across the industry.
Well-developed online or multimedia presence that represents a sizable percentage of total sales and supports digital subscriptions and growing ad revenue.	Inability to monetize online or multimedia presence and revenue from digital subscriptions has not offset the decline in circulation.
Printing	
Significant, consumer-focused online presence, or offers ancillary marketing and consulting solutions.	Minimal consumer-focused online presence.
Sufficient scale to enable mass customization at premium prices.	Because ability to compete on quality and service is limited, the company relies on heavy discounting to retain clients.
Targets end markets that have stronger fundamentals and offer higher margins.	The company is exposed to end markets that have weak fundamentals and to commodity-like print jobs.

Adequate	Adequate/weak or weak
Radio stations	
No. 1 in terms of audience ratings during key parts of the day, such as the morning rush hour.	Audience ratings are lower than peers.
Harnesses a higher share of advertising spending relative to its local audience, supported by leading audience ratings	Has captured a smaller share of advertising spending than peers, measured against its share of the local audience.
Strong presence in large markets that typically attract more advertising spending.	Limited presence in large and dynamic markets.
Comprehensive digital strategy that provides advertisers with data analytics and marketing services.	No clear digital strategy designed to offset declining broadcast revenue.

*Subsectors assessed as adequate or below.

Scale, scope, and diversity

We assess scale, scope, and diversity in the media and entertainment sector based on:

- Diversification in terms of products and services, content, audience, titles, and market segment;
- Geographic concentration; and
- Operational size.

These factors have the potential to support revenue generation, profitability, and cash flow stability at media and entertainment companies. In this sector, achieving a critical mass, in terms of operational size, will tend to offer self-sustaining benefits. We view scale in context, as consolidation/fragmentation differs by subsector.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Profitable diversification across a variety of market segments.	Lack of clear leadership in stable or growing categories; offers a more limited range of products and services than direct competitors; depends heavily on a few brands, products, services, talent, or titles; is a niche player in terms of its brands, products, or services; or focuses on clients in end markets that have questionable long-term staying power.
Good international presence or distribution capabilities; or a broad domestic presence, where applicable (for example, for local TV stations).	Lack of international presence.
Good selection of online or mobile products, content, or services, where relevant.	Limited offering targeted at online or mobile markets and have failed to develop relationships across other media platforms that would support business reinvention, ease a shift to new technologies, or halt a decline in revenue from online businesses, where applicable.
Broad customer base, audience, or distribution channels.	Declining customer base; concentration in business segments that primarily compete on price; or dependence on a small number of distributors.

Because of the ongoing structural decline affecting certain subsectors within the media and entertainment industry, we do not typically assess companies in those subsectors as having strong or strong/adequate scale, scope, and diversity. Even to achieve a scale, scope, and diversity assessment of adequate:

- A newspaper or magazine company would likely need to offer numerous titles, each of which are leaders in their niche or category; be distributed internationally, across multiple platforms; have diversified its sources of revenue; be vertically integrated with content providers that target more-stable media formats; have a sizable and profitable online and mobile presence; and participate in a variety of multimedia relationships with large social media networks.
- A radio station network would likely need to own a large number of geographically diversified stations, targeting markets of all sizes; and to have diversified beyond broadcast revenue, for example, by generating revenue from digital advertising and live events.
- A printing company would likely have to operate at the national or international scale and have a broad offering of profitable products and services.

Operating efficiency

We assess operating efficiency in the media and entertainment sector based on:

- Cost structure;
- Ability to reduce costs in response to client or competitive pressure; and
- The appropriate measure of operating profit (most often, the EBITDA margin).

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Above-average EBITDA margins due to economies of scale and other efficiencies. Margins also benefit from satisfactory audience ratings and ability to change program formats that support rapid growth.	Below-average EBITDA margins due to a failure to gain from economies of scale or other efficiencies, especially where competition on price is intense. EBITDA margin also suffers from unsatisfactory audience ratings or unsuccessful changes to program formats, combined with the inability to improve EBITDA margins rapidly.
Ability to control operationally critical costs, such as programming, marketing, distribution, content, labor, or overheads, to maintain profitability.	Key costs such as programming, marketing, distribution, content, labor, or overheads are higher than peers.
Costs can be reduced without sacrificing content quality, or cost increases can be passed on.	Limited ability to pass on cost increases or cut costs without sacrificing content quality or reducing efficiency.
Limited price competition alleviates pressure on margins.	Fierce price competition leads to a dependence on costly marketing and promotions to retain market share and maintain margins.

Again, structural decline precludes us from assessing companies in the certain subsectors as having strong or strong/adequate operating efficiency.

Newspaper or magazine companies

To attain an adequate assessment, these would require an above-average EBITDA margin gained through economies of scale or effective outsourcing and the ability to cut costs or establish cost-sharing ventures as revenue declines. If any of their titles are losing money, we would not assess a newspaper or magazine company as adequate.

Radio stations and networks

We may assess operating efficiency as adequate if fixed costs are low and the network has proved willing and able to reduce broadcast expenses fast enough to keep pace with the decline in broadcast revenue. In addition, we would look for proven ability to identify the highest-margin formats for its program costs.

Cinema chains

These would typically need to demonstrate that they have the right balance of screens for each location and be able to reduce some of their variable costs, including staff, during slower times. To keep money-losing cinemas to a minimum, cinema chains would need the flexibility to close locations when needed, which might require options such as staggered lease expirations.

Printing companies

To be assessed as having adequate operating efficiency, these would typically need to maximize margins through investment in the latest technology; demonstrate the ability to moderate margin erosion by reducing capacity; and report an EBITDA margin above 15%.

Profitability

Although the EBITDA margin is our primary metric for evaluating the profitability of media and entertainment companies, we may also complement our analysis by using sector-specific measures.

TV broadcasters and local TV networks

These see a rise in audience numbers when high-profile events such as elections or the Olympics take place. Other events such as the FIFA World Cup or the UEFA European Championship can have a similar impact. Given that many such events have a four-year cycle, we consider EBITDA margin data for TV broadcasters over four years (one historical, the current year and two forecast years). This prevents the outsized EBITDA margins in event years from skewing our assessment. In the local TV subsector, the effect is strongest in the U.S. but may also affect our analysis of some European broadcasters. To adjust, we use a trailing EBITDA margin over eight quarters and divide it by two.

Ad agencies

For these, we supplement our view of operating profitability by combining the EBITDA margin with metrics such as staff costs to revenue.

Cinema chains

Comparing the standard lease-adjusted EBITDA margin with the non-lease-adjusted EBITDA margin enables us to judge management's skill at locating cinemas in sites with high potential, and at negotiating terms with landlords.

Financial Risk Profile

Supplementary ratios

U.S. local TV stations

To avoid skewing our results toward years with high-profile events, or toward either an election/Olympic or nonelection/non-Olympic year, we may consider debt to average trailing eight quarters' average EBITDA, as an additional supplementary ratio. The same thresholds as for the core debt-to-EBITDA ratio apply to our analysis of this supplementary ratio.

Media and entertainment companies

There is considerable diversity of practice around expense recognition in this subsector. By using FOCF to debt as a supplementary ratio, we can increase comparability, which is especially useful where the recognition of revenue and expenses is not matched to the cash payment. For instance, most media and entertainment companies recognize revenue when services are performed, but cash collections related to the sale may be spread over three to four years. Given the variability of these issuers' underlying cash flows, the standard profitability metrics may be insufficient. The timing of revenue recognition under U.S. GAAP and IFRS may also vary, making it more difficult to compare entertainment producers across regions.

Further complicating matters, where a show is classed as repeatable entertainment, programming expenses are typically recognized on the first airing. However, recognition may be accelerated if the program is underperforming against audience or revenue expectations. We track audience ratings to help us identify the likelihood that a show may fail, because this may accelerate cash expenditure on the replacement show. Write-offs may also be warranted.

Volatility adjustment

We assess cash flow volatility for each company in the context of its industry subsector. Typically, companies in the video game development, newspapers/magazines, and printing subsectors are assessed as volatile. Pure-play feature film producers are likely to be classified as highly volatile. We typically assess companies in the e-commerce and ad-supported online content subsectors as volatile or highly volatile due to low barriers to entry.

Section 22 | Metals Production And Processing

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the metals production and processing sector based on:

- Value added to products;
- Predictability of prices and volumes, based on contracts and the degree of product differentiation or specialization; and
- Relationships with customers.

For most metal production and processing companies, competitive advantage has little effect on our ratings analysis. Many produce commodity products that can be obtained from other producers or imported. Some metals companies differentiate themselves from peers by producing niche or specialty products, which typically sell for higher prices in more stable volumes. Companies may gain some advantage by producing a mix of metals, operating in attractive segments, and from the size of their market share. Long-standing relationships with customers may also offer an advantage, especially if customers have agreed contracts that make pricing and volumes more predictable.

Where the market is dominated by a handful of producers, pricing behavior may be more rational, which offers better stability. Companies that have strong market positions can also reinvest in fixed assets and in R&D, which can help them maintain their leading position.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Produces tailor-made or specialty value-added products that offer more pricing power and higher margins.	Produces common-grade materials, such as hot-rolled coil steel, rebar, or primary aluminum.
Products have more-specialized uses or company has a leading share of a more-commoditized market.	Pricing and volumes are unpredictable due to reliance on independent distributors or use of short-term contracts.
Customer relationships are strong.	Market is highly competitive, lacks protective barriers, and is vulnerable to imports.

Scale, scope, and diversity

We assess scale, scope, and diversity in the metals production and processing sector based on:

- Production capacity, and the number and location of plants;
- Product breadth; and
- Scale and diversity from integrated activities, such as mining and material outsourcing.

Sector description

Companies that derive more than half of their revenue from manufacturing, processing, or distributing metals, especially steel and aluminum. This sector is sometimes referred to as metals and mining downstream.

Subsectors	Typical CPGP
Aluminum	Commodity focus/cost driven
Commoditized metals that compete on price and availability	Commodity focus/scale driven
Specialized metals that require investment in fixed assets and are sold under contract	Capital or asset focus
Steel	Commodity focus/cost driven

For a metals company, scale typically offers an advantage by making it easier to translate the breadth and scope of operations into economies of scale, which contributes to better profitability. Prices for many metals are correlated and may even be based on a common benchmark. Therefore, the value of product diversity lies in the ability to mitigate the effect of volatile metals prices by lowering the cost of inputs. That said, if diversity by product or geography is to provide significant credit protection, it needs to offer the company broad exposure to a variety of end markets that have relatively independent cycles. Operating risks are increased if the company is dependent on one producing asset or numerous products that all are exposed to the same external factors.

We analyze the company's exposure to the volatile spot market. Fixed sales prices or volumes offer greater protection. Integration into upstream mining or captive downstream businesses can also make earnings more stable, as can strong customer relationships.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
More large production facilities than peers; good end-market diversity; and a wide range of products, including higher added-value products.	Dependence on a single plant, a single product, or only a few clients in a particular sector.
Exposure to different regions.	Limited geographic diversity (for example, the company only operates in one region) or operates in regions where competition is particularly intense or undisciplined.
Diversity and scale provided by integration into raw materials or downstream manufacturing.	Concentration in markets that have low growth potential, or where there has been excess capacity for a prolonged period.

Operating efficiency

We assess operating efficiency in the metals production and processing sector based on:

- Cost profile, especially for raw materials, energy, and labor;
- Capacity utilization, cost flexibility, and the state of its asset base; and
- Return on investment.

We evaluate each company's ability to source raw materials at a competitive price and its exposure to fluctuations in the cost of raw materials and electricity. If an input has a high weight-to-value ratio that affects transportation costs, we regard proximity to an adequate supply as important. In our experience, producers that are vertically integrated and have good access to their own low-cost raw materials will have a more-stable cost base than less-integrated competitors. That said, sourcing of materials in-house is only an advantage if the cost is competitive and supports a good margin. The capex requirements for vertical integration into raw materials could be a drag on cash flow in a downturn.

Our view of capacity utilization depends on the company's ability to adjust its production level without eroding its margins. The structure of its fixed costs governs whether costs can be reduced in times of low demand.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
The cost of production is low and the company has access to cheap raw materials and energy inputs, while also benefiting from low-cost or flexible labor.	The cost of production is high because of high energy costs, poor availability of raw materials, or an inflexible labor market.
Capacity utilization is high.	Capacity utilization is low and fixed costs are high.
Modern production facilities and flexible manufacturing systems allow the company to adjust operations to market conditions.	Technology is dated and limits the ability to adjust operations to market conditions.

Profitability

The metals sector is not homogenous, and the capital intensity of different metals and technologies varies. Therefore, although our primary indicator of profitability at metals companies is the EBITDA margin, we often supplement this by evaluating absolute EBITDA in U.S. dollars per ton of metal produced. We also consider ROC, ability to generate cash through the cycle, and ability to adapt operations and recover quickly from industry downturns, relative to peers.

Financial Risk Profile

Our assessment of the financial risk profile makes use of S&P Global Ratings' commodity price assumptions for metals.

Supplementary ratios

Given the sector's high capital intensity, based on its high investment and working capital needs, we typically view FOCF to debt and CFO to debt are the most relevant supplementary ratios. Given the importance of capex to the cash flow profile of the company, we pay particular attention to willingness and ability to reduce capex when market conditions are weaker. We base our evaluation on the company's statements and any incentives that apply. We also consider its record of reducing capex during previous industry downturns.

Section 23 | Midstream Energy

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the midstream energy sector based on:

- Resiliency of volume flows;
- The company's contract profile;
- Exposure to commodity prices; and
- The regulatory framework under which the company operates.

Resiliency of production volumes: We examine a company's volume flow records through different commodity price and economic cycles to assess the stability of its commodity-related production volumes. For example, volumes could be more volatile at a company that operates a gathering system in a mature basin or in a region that has a relatively high cost structure, with production declining by over 10% in some years.

Contract profile: Longer-term contracts with counterparties that have strong creditworthiness support the competitive position of midstream energy companies. We assess the extent to which contracts protect against potential variation in profit margins. For example, contracts that include clauses such as minimum-volume guarantees can lead to more stable revenue. In addition, we may evaluate the company's insurance coverage, especially for single-asset midstream companies that are exposed to geopolitical and weather-related risks.

Exposure to commodity prices: We measure the sensitivity of a company's profitability to the relevant commodity price swings. The more sensitive EBITDA is to commodity prices, the more volatile the cash flow is likely to be.

Regulatory framework: These differ from country to country and may offer additional credit support. For example, in certain jurisdictions, regulators allow pipeline operators to raise tariffs to offset high operating expenses and competition, enabling the operator to generate a stable ROC. In general, we consider the effect to be minor, but a supportive regulatory framework can be positive for our assessment.

Sector description

Companies that derive more than half of their revenue from transporting, processing, storing, and marketing hydrocarbons, chiefly commodities such as natural gas, natural gas liquids, and crude oil (or products refined from crude oil, like gasoline and diesel). The sector connects oil and gas exploration and production (or "upstream") activities with oil refiners and retail marketers (the "downstream" sector), export facilities, utilities, and industrial users. In addition, some midstream operators handle other commodities such as ethanol, ammonia, asphalt, coal, biofuels, biomass, carbon dioxide, and hydrogen (see section 29 for rate-based midstream assets owned by regulated utilities).

Subsectors	Typical CPGP
Diversified energy	Capital or asset focus
Gathering and processing	Commodity focus/scale driven
Natural gas or crude oil storage	Capital or asset focus
Natural gas or oil pipelines	National industry and utilities, or capital or asset focus

Other adjustments

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Highly predictable revenue through take-or-pay contracts or stable volumes.	Revenue and volumes are uncertain because of a lack of contractual arrangements.
Assets are located in low-cost basins that have significant growth potential and where alternative transportation carries a high price.	Assets are poorly situated or there is low-cost alternative transportation.
The services provided are essential to the customer (for example, a pipeline to a refinery).	The services provided face significant competition.
A high proportion of EBITDA comes from fee-based activities.	More than 50% of cash flow comes from contracts with multiple weaker counterparties.
Contracts have long terms, with eight or more years remaining on average.	Few long-term contracts.
Minimal exposure to commodity prices.	High exposure to commodity prices.
A regulatory environment that provides mechanisms to support stable rates of return.	Minimal regulatory barriers to entry and a lack of credit support.

Scale, scope, and diversity

We assess scale, scope, and diversity in the midstream energy sector based on:

- Operating scale;
- Diversity by geography, commodity, and customer base; and
- Integration with other, complementary business lines.

Operating scale: Large-scale midstream energy companies tend to have stronger business risk profiles, more operating flexibility, and greater economies of scale than smaller peers.

Degree of diversification: In general, diversification provides protection against fluctuations in price and volume. Geographical diversification can mitigate the risk of localized changes in prices or other risk factors, such as a basin's geological quality. Likewise, a lack of diversification in the customer base, or in commodity type, could lead to material cash flow volatility and operational disruptions if key customers encounter problems or demand and price patterns change.

Integration between business lines: We consider the degree of correlation between a midstream energy company's main area of operation and its other business lines. An integrated model with diversity across the value chain enhances a company's scale and product offerings. If it allows it to maintain a mostly fee-based revenue model and acceptable ROC, this will have a favorable impact on our assessment. That said, some integrated models increase commodity price exposure without materially improving scale or the company's product offerings, and these weigh on our assessment.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
The company's activities are large in scale and scope and it has a high market share in its operational areas.	Low market share, limited number of assets, or narrow scope of operations.
The company's assets are typically located in three or more geographically diverse basins with robust drilling economics, or the assets are located in one or two very large, cost-competitive basins (such as the Canadian oil sands area).	Geographic diversity is limited to one or two relatively small basins that are not cost-competitive.
Diversification by commodity type.	High exposure to one commodity type.
Diversified consumer base.	Reliance on a limited number of customers.
Integration across many parts of the midstream value chain (such as gathering and processing, transportation, and storage assets), which are connected, even though they operate independently.	Limited integration across business lines.

Operating efficiency

We assess operating efficiency in the midstream energy sector based on:

- The scalability of its growth-oriented capex;
- Maintenance capex as a proportion of total budgeted capex;
- Cost profile of the operating assets; and
- Asset utilization.

Growth-oriented and maintenance capex: When assessing the scalability of its growth-oriented capex, we consider how likely a company is to encounter cash flow lags or cost overruns during construction. Cash flow lags occur when companies incur debt to finance construction of a project but do not receive any cash flow until the project is completed. The potential for cost overruns depends on the project type; the company's experience with similar projects; the level of risk assumed by the engineering and construction company; and any mitigating factors, such as purchasing the raw materials in advance at a fixed price.

To assess maintenance capex, we consider a company's safety record and history of properly maintaining its assets to be good leading indicators for operational risk.

Cost profile of the operating assets and asset utilization: The cost profile is a key element of operating efficiency--where a high proportion of an operating asset's costs are fixed, a decline in utilization could erode cash flow. That said, when utilization is high, having a lower proportion of variable costs could boost profitability. Where available, we review asset utilization data by asset, to determine which affects operating efficiency the most.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Highly scalable growth capex and limited maintenance spending needs per unit.	Low scalability of growth capex and high maintenance capital required, relative to the company's size and cash flow generation.
Operational and fixed costs are low, as a percentage of revenue.	Operational or fixed costs are high, which limits flexibility.
Asset utilization of about 80% or more, on a normalized basis.	Asset utilization of less than 50% on a normalized basis, for example, due to weak commodity prices.

Profitability

ROC and EBITDA margins vary materially across midstream subsectors. For instance, ROC is generally lower for regulated long-haul pipelines than for pipelines that are exposed to commodity prices. As a result, we use two sets of thresholds: one for low-risk midstream companies and one for all other companies.

Where companies report under local accounting rules, rather than U.S. GAAP or IFRS, we may adjust our assessments. In addition, we do not consider the EBITDA margin an appropriate measure of profitability for certain companies, for example, pipelines that do not take title to the product or that pass through costs to their customers.

Financial Risk Profile

Supplementary ratios

In calculating FOCF to debt, our preferred supplementary ratio for midstream energy companies, we may consider only the maintenance-related capex. Spending to support growth is typically both discretionary and high, so including it could skew ratio expectations when the company is not undergoing significant expansion.

Volatility tables

The midstream energy industry encompasses a large variety of companies, from highly stable long-haul pipelines to companies with material, direct commodity price exposure.

We apply the low volatility table to a midstream energy company if it fulfils all the characteristics below:

- Has a CICRA of '2';
- Has a competitive position assessment of at least satisfactory;
- Is forecast to derive at least 90% of its operating cash flow from firm, long-term contracted revenue streams or fee-based activities with very low volume risk; and
- If a company has diversified into other industries, we would only apply the low volatility table if its other cash flow comes from highly stable business lines (for example, regulated utilities or merchant power, with long-term power purchase agreements).

Or

- Has a CICRA of '3';
- Has a competitive position assessment of at least satisfactory;
- Is forecast to derive at least 90% of its operating cash flow from firm, long-term contracted revenue streams or fee-based activities with very low volume risk;
- If a company has diversified into other industries, its midstream operations must meet the previous condition (that is, have long-term contracted revenue streams or fee-based activities with very low volume risk), and its other cash flow must come from highly stable business lines;
- Its assets have a long remaining life and are difficult to substitute;

- It has strong contractual foundations that provide long-term cash flow visibility and stability, and a majority of contracts are with investment-grade counterparties (as rated by S&P Global Ratings or according to our internal estimate of their creditworthiness); and
- Its capex needs are relatively low, adding to the stability of FOCF.

We apply the medial volatility table to a midstream energy company if it meets all of the following requirements:

- The CICRA is generally '2' but in certain circumstances may be '3';
- The competitive position assessment is at least fair;
- The company is forecast to derive at least two-thirds of its operating cash flow from firm contracted revenue streams or fee-based activities with very low volume risk; and
- If the company is engaged in other activities and has an overall CICRA of '3', its midstream operations must meet the previous condition (that is, have long-term contracted revenue streams or fee-based activities with very low volume risk), and its other cash flow must come from highly stable business lines.

In all other cases, we use the standard volatility table.

Other Considerations

Counterparty exposure

If a midstream energy company is exposed to a material counterparty, we may cap the SACP of the midstream entity at the level of the credit quality of the counterparty. We view a counterparty as material if its contracts represent a high proportion of the midstream company's revenue streams, and we consider the company unlikely to be able to enter into alternative contracts at similar or better rates.

If we have capped the rating on a midstream company at the level of a counterparty and the credit quality of that counterparty has deteriorated, in our view, we may also lower the rating on the midstream company. For example, if the principal or only asset was a demand-pull pipeline that could only be used to supply the counterparty, we would likely lower the SACP on the midstream company. However, a company that has multiple assets, each with several potential customers likely to be willing to pay similar rates to those previously contracted, would be in a stronger position. If we considered that it also had sufficient liquidity to give it time to replace the lost revenue streams, we might not lower the SACP of the midstream company if we were to downgrade the counterparty.

Section 24 | Mining

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the mining sector based on:

- Ability to maintain production and reserves through internal development;
- Corporate strategy and growth potential; and
- Market access, sales contracts, or pricing power, if those are relevant.

Internal development: A company's reserve base and pipeline of projects are critical to its ability to maintain or increase production and reserves through internal development. We monitor a mining company's record of bringing projects into production and assess the riskiness of its growth strategy, given its resources and capabilities. Successfully converting nonproducing reserves and resources into output at an attractive operating cost and ROC demonstrates its ability to implement its strategy. Declining production could indicate poor prospects for meeting medium-to-long-term debt service requirements.

Growth strategy: Where a company pursues an aggressive growth strategy, we assess whether this is stretching management resources, straining funding sources, or exposing the company to high execution risks. Example of aggressive growth strategies include undertaking the construction of a single project that is bigger than a company's existing operations or making acquisitions in unfamiliar jurisdictions--a particular risk, given the socially sensitive nature of the industry.

Market access, contracts, and pricing power: In some markets, mining companies can gain a competitive advantage through better market access, longer-term sales contracts, or greater pricing power. For example, mining companies where production is concentrated may see higher or more stable pricing and the existence of captive infrastructure (such as railway lines and ports) is especially relevant for bulk commodity producers. We also consider long-term contracts, if any, and the location of preferred suppliers and customers.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A development pipeline that offers potential growth projects over five to 10 years.	Limited growth potential or a risk that production will decline.
Good record of taking projects to production.	Dependence on the success of one big project.
A moderate, achievable, capital investment strategy that preserves management resources and funding capacity.	An aggressive growth strategy.
Better-than-peers access to market, contract terms, or pricing power, where relevant.	Access to markets is weaker than peers, contracts are relatively unfavorable or short term, or the company has limited pricing power.

Sector description

Companies that derive more than half of their revenue from exploring and extracting metals and minerals through mining, or from operations that support mining, such as smelting and refining. This sector is sometimes referred to as metals and mining upstream.

Subsectors	Typical CPGP
Coal and consumable fuels	Commodity focus/cost driven
Diversified metals and mining	Commodity focus/cost driven
Miners that have a small asset base (for example, a single mine or a cluster of mines in a single region)	Commodity focus/scale driven
Precious metals and minerals, including gold	Commodity focus/cost driven

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Scale, scope, and diversity

We assess scale, scope, and diversity in the mining sector based on:

- Asset diversity, measured by the number and size of a company's operations;
- Diversity of production, measured by range of commodities produced;
- Geographic diversity of operations;
- Reserve life of the assets, and
- Exposure to mining-specific jurisdiction risk.

Asset, production, and geographic diversity: Greater asset and commodity diversification offers mining companies protection against adverse events or fluctuations in commodity and end markets. Earnings and cash flows are more stable at well-diversified companies; that is, those that receive meaningful EBITDA contributions from a range of mines or from three or four commodities that demonstrate little correlation in terms of price and volume drivers.

Reserve life: Longer reserve lives typically support a stronger assessment. We generally measure reserve life by dividing proved ore reserves by expected production volumes, using current production rates (or future production rates, if the company expects to significantly increase production in the next few years). Our assessment also incorporates the prospective capex required to extract proven reserves. A company that has proven a reserve through drilling but has yet to construct the necessary mining infrastructure will need to invest significant cash over several years before it can generate any meaningful revenue from this source.

Jurisdiction risk: In many cases, a mining company will be exposed to risk factors specific to a country or jurisdiction that are relevant to mining but may not affect other industries. Government policies frequently affect the predictability of the operating environment; for example, there may be mining-specific environmental regulations or other environmental pressures; infrastructure critical to mining may be inadequate; and mining-specific regulations, taxes, and export regulations may be subject to change. In addition, mining companies face elevated social considerations because of safety and local labor relations and the impact on communities of pollution; water or land usage conflicts; and economic or landscape changes.

We incorporate these industry-specific geographic or jurisdiction risks here, because those risks may not be captured in our country risk score. At the same time, we evaluate any offsetting factors that could reduce the impact of these risks, such as a demonstrated record in the industry, local ownership, or captive infrastructure.

Scale, scope, and diversity: typical characteristics*

Strong or strong/adequate	Adequate/weak or weak
Typically, at least five to 10 large-scale assets.	Dependent on one large asset, or a few small-to-midsize assets, such as a regional cluster of mines.
Proven and probable reserves in major operations have a long life of at least 10 years.	Proved reserves in the company's assets have a short life of one to three years.
Product diversity that helps moderate earnings swings (usually, diversification across at least three commodities).	Limited product diversity.
Exposure to countries where mining-specific jurisdiction or country risks are high is limited, or well-diversified.	Significant exposure to a country where mining-specific jurisdiction or country risks are high.

*Although we would not typically assess a single-commodity producer that is reliant on a single mining cluster as having adequate scale, scope, and diversity, we may do so if it has large-scale assets in production, a reserve life of well over 10 years, and low-risk operations (for example, it may have multiple operating faces in the same pit, or several different independent production streams).

Operating efficiency

We assess operating efficiency in the mining sector based on:

- The position of the company's assets on the industry cost curve;
- Nonmining cash costs, such as the cost of delivering to end markets; and
- The quality of the company's reserves, the nature of its mining operations, and the cost of energy and labor.

The industry cost curve plots the cost of all mining operations for a given commodity, in ascending order. In a downturn, assets in the first and second quartiles often remain cash flow positive because of their below-average cash costs. Assets in the fourth quartile, however, could generate negative cash flow if prices were weak and are at risk of being idled (temporary suspension of operations).

Cash costs can be influenced by:

- The quality of the commodity, its byproducts, and the associated infrastructure;
- The risk of higher expenses or stoppages;
- The skill level and flexibility of the work force; and
- The company's exposure to currency fluctuations.

In addition, if a company uses off-take contracts, we evaluate their impact on operating efficiency. Off-take contracts are usually most important when evaluating smaller mining companies. If the counterparty is sufficiently creditworthy, the contract may increase the stability of earnings by fixing volumes and prices for the produced commodity.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Most assets are in the first or second quartile of the global industry cash cost curve.	Most assets are in the third or fourth quartile of the global industry cash cost curve.
Ore grades are above-average and stable.	Ores are low-grade or unstable.
Modern equipment for concentrating, refining, and smelting is in use.	Equipment is outdated or old.

Profitability

Level of profitability: We use EBITDA margin as our primary indicator of profitability for mining companies. That said, the mining sector is not homogenous, and the capital intensity and technologies required to mine and process different ore bodies vary. Therefore, we may complement our analysis by assessing ROC, relative to peers.

Where we do not think that the five years of data described in our corporate methodology would be representative of the full commodity cycle, we may use a longer period to assess profitability. In addition, if capex requirements are persistently high, we may set more-demanding profitability thresholds than the through-the-cycle margins, or lower them if capex requirements are expected to remain low.

Volatility of profitability: Volatility of profitability at most mining companies is assessed as '3' or '4'--only a few companies in the mining sector will be assessed at '1' or '2', indicating lower volatility. We frequently adjust the volatility of profitability in the mining sector by one or two categories, especially for smaller, less-diversified companies. We often apply qualitative adjustments of one or two categories to reflect factors such as:

- Elevated country risk;
- The company's small size compared with peers;
- Concentrated cash flow and event risks;
- Rapid growth in production volumes from start-up operations;
- Exposure to technology changes; or
- A possible change in the pattern of volatility in a specific commodity.

Financial Risk Profile

Supplementary ratios

Our assessment of the financial risk profile uses S&P Global Ratings' commodity price assumptions for metals.

If a company has significant exposure to a metal or bulk commodity for which we do not have price assumptions, we develop a set of prices for the next three years. Where forward curves for the commodity are available, we use these as a starting point and modify them according to our supply-and-demand expectations for the industry. Our analysis of cash flow coverage ratios incorporates company-specific considerations related to volatility of cash flow and capex--both are typically significant in the mining industry.

Given the sector's high capital intensity, we generally find FOCF to debt to be the most relevant supplementary ratio, if the core ratios indicate a preliminary cash flow/leverage assessment of intermediate or better. If the cash flow/leverage assessment indicated by the core ratios is significant or weaker we consider FFO plus cash interest paid to cash interest paid, EBITDA to interest, and FOCF to debt if the company has embarked on an ambitious capex program that would be difficult to curtail in the case of a commodity downturn.

Fluctuations in working capital and CFO to debt are of limited importance in the mining industry because margins are fairly high and the cash conversion cycle is short. In addition, working capital outlays tend to coincide with a strong industry environment, when FFO is high.

Volatility adjustment

Given the cyclicality of the industry, many mining companies have a cash flow/leverage assessment of volatile or highly volatile; this implies that their cash flow/leverage ratios could weaken by up to three categories during a market downturn.

Section 25 | Oil And Gas Exploration And Production

Table of contents

Business Risk Profile

Competitive advantage

Companies in the oil and gas exploration and production (E&P) sector depend on the availability of suitable reserves that can be profitably extracted. Competitive advantage for these upstream companies largely depends on their ability to manage the risks associated with replacing and increasing reserves.

We assess competitive advantage for an integrated company in the E&P sector based on:

- The growth prospects inherent in its acreage (the area on which it has an oil and gas license);
- The quality of liquids and gas produced;
- Unit revenue realized at each producing region; and
- Extent of vertical integration, if any, among its operating segments.

Growth prospects inherent in its acreage: We assess a company's ability to increase production and reserves through internal development (that is, finding and exploiting reserves in the fields where it already has a license), based on:

- Its history of successful exploration and development; technical resources and capabilities; and required capital spending;
- Its acreage position (geological conditions and accessibility of its fields); and
- The length of its project queue, based on the reserve life index (RLI; defined as reserves divided by annual production).

Where a company's reserves are not growing, it can indicate poor prospects for its ability to continue to meet its debt service requirements. On the other hand, the upfront investment associated with sustained high growth can put a strain on funding sources.

Production quality: Hydrocarbons are subject to price differentials based on type and quality. Therefore, the quality of hydrocarbons produced by a company affects its revenue and cash flow. For example, light, sweet crudes require less refining treatment and yield more high-priced byproducts such as gasoline, kerosene, and jet fuel. Therefore, they command a higher price than heavy, sour crudes which cost more to refine. Similarly, wet gas, which contains natural gas liquids, commands a premium over dry gas because of its higher energy content.

Unit revenue at each producing region: Revenue at E&P companies is also affected by basis differentials--the difference between the price in a particular region and the benchmark price. These usually arise because of transportation costs or supply and demand characteristics in the production area. If a company's acreage is in a region where the cost of transportation to market is high, or limited capacity makes hydrocarbons difficult to transport out of the region, it typically

Sector description

Companies that derive more than half of their revenue, either from developing and producing oil and natural gas hydrocarbons or from integrated operations in the oil and gas sector.

Subsectors	Typical CPGP
Exploration and production	Commodity focus/scale driven
Integrated	Commodity focus/scale driven
Government-controlled or subject to government policy, regulation, taxation, and tariffs	National industry and utilities

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

sells at a discount to the benchmark price. We view this as an adverse factor. On the other hand, if it is supplying hydrocarbons to a region where demand is high or transportation costs are low, the regional price may include a premium compared with the benchmark. The company will therefore benefit from higher unit revenue, cash flow, and earnings.

Extent of vertical integration: Strategic approaches to integration vary considerably, but it is common for larger E&P companies to operate a cluster of ancillary related businesses.

Related businesses that an E&P company may integrate with include:

- Natural gas processing plants;
- Oil and gas common long-haul or gathering pipelines; and
- Oilfield services operations and assets, such as drilling rigs and pressure pumping equipment.

Participation in pipeline operations that carry third-party volumes can sometimes offer an E&P company a highly stable source of earnings that is not closely correlated with its base earnings. When capacity among third-party suppliers is constrained, vertical integration (for example, ownership of oilfield services operations and assets) can benefit E&P companies by facilitating cost-effective growth in reserves and production. That said, it requires capital, adds to fixed costs, and can exacerbate a downturn's adverse effects. Although integration and diversification can enhance an E&P company's competitive position and increase the stability of its financial performance, the financial results are not always positive.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A strong record of project execution, with production and costs that compare favorably with operators that have adjacent acreage.	Project execution has historically been poor, so that costs are higher and production inferior to that of operators with adjacent acreage.
A record of allocating capital to basins that have favorable internal rates of return (typically exceeding 30%).	Limited record of allocating capital to basins that have favorable internal rates of return.
Diversification that demonstrably improves profitability or the stability of financial performance throughout the business cycle;	Operations have shown inferior profitability or more volatile financial performance throughout the business cycle.
Where transportation and services, such as drilling rigs, are integrated, unit costs are lower than the available alternatives, sourced through a third party.	A lack of integration with transportation, or equipment and services.
Some degree of leverage with customers and suppliers.	Little or no leverage with customers and suppliers.

Scale, scope, and diversity

We assess scale, scope, and diversity in the E&P sector based on:

- Size of the reserves, because larger reservoirs offer potential economies of scale;
- Geographic diversity of production sources;
- Diversity of hydrocarbons produced;
- Operational risk required to exploit the reserves; and
- Quality of the reserves.

Hydrocarbon reserves, as an E&P company's main assets, are critical to our assessment of the company's scale, scope, and diversity.

Reserve size: If the reserve base is larger than that of peers, we would expect the company to benefit from greater operating flexibility, more geographic diversity, and larger economies of scale. In our view, the size and type of a company's individual reservoirs is important. Large onshore or offshore reservoirs allow companies to spread overhead costs and capital investment across more production, and so provide greater economies of scale. Size can also give companies access to more favorable financing terms, which can significantly boost their competitive advantage when developing or buying properties. During industry downturns, large E&P companies may have greater financial flexibility than their smaller competitors.

Geographic diversity of production: A geographically diversified portfolio can provide opportunities for cost-effective reserves and production growth, if regional factors affect production or reinvestment in a particular area. In addition, by operating in multiple, geographically diverse fields, a large E&P company can reduce its dependence on the operational performance of a small cluster of wells or fields, and make itself less susceptible to regional price volatility. We view production as less diversified if a company operates in several basins but generates most of its earnings from just a few of them. Nevertheless, we may assess a company as having strong/adequate scale, scope, and diversity, even if it operates in just one major basin as long as we expect it to generate above-average profitability, it has an extensive acreage position, and its production profile is clear for at least 10 years.

Diversity of hydrocarbons produced: We would expect a company with a broader production profile to be less volatile. For example, we view the production of a mix of liquids (oil or natural gas liquids) and natural gas as credit positive, in markets where these show low price correlation. A company that has the flexibility to shift production across a range of hydrocarbons is also better positioned to respond to changes in market dynamics.

Operational risk: Most of the easy-to-access oil and gas reserves have already been exploited--exploration now entails drilling in more-difficult conditions, often using novel extraction methods. E&P companies can develop meaningful scale, scope, and diversification in their operations by effectively adapting extraction technologies to exploit newly discovered reservoirs. However, the complexity of the task tends to give rise to greater operational risks. Deepwater drilling techniques, for example, are much riskier than those used in onshore operations. Similarly, it is difficult to make geological assessments in remote locations--uncertain outcomes increase operational risk. Health and safety concerns can also give rise to operational risk.

Quality of reserves--Proved developed producing reserves: Business risk tends to be better for companies with a high proved developed producing (PDP) ratio (the ratio of PDP reserves to total proven reserves). This is because PDP reserves have lower future development costs and production risks than undeveloped reserves. This implies that they have less chance of incurring

cost overruns or suffering shortfalls in production. However, the optimal portfolio includes reserves at different stages of development. A PDP ratio of more than 80% (implying a low stock of undeveloped reserves) indicates that, as producing reserves decline, they could be difficult to replace.

Where we see little risk associated with developing reserves, we do not place much emphasis on the distinction between reserves that are proved developed, and those that are proved undeveloped (PUD). For example, recovery of oil sands where the reserves are close to the surface uses a low-risk technique akin to strip mining. There is little geological risk associated with converting reserves to proved from probable, in such cases. We could extend this analysis to other forms of unconventional oil and gas reserves.

Reserve life index (RLI): We use reserves divided by annual production (RLI) to indicate how long a company would take to deplete its existing reserves, at current production rates. RLI is assessed in the context of the company's total reserve base, prospects for organic or acquisition reserve growth, capital position, and operating team. In assessing reserves, we also evaluate the underlying assumed depletion rate. A steep depletion curve could imply a risk of a significant decline in production beyond the next few years if reserves are not replaced. A short RLI of less than five years may indicate that the company has been unsuccessful at replacing its reserves or that it has limited capital for organic and acquisition-related growth. A long RLI of 10 years or more may indicate a company that has a low-risk reserve base and relatively stable production outlook. This is generally the case for companies that focus on oil sands or shale oil. In some cases, however, a long RLI implies that reserves are overstated or indicates a company that has proved itself unable to ramp up production.

Reserve replacement ratio: As E&P companies produce hydrocarbons, they need to find or acquire new sources of future growth. This may be achieved by drilling (organic growth) or by acquisitions. We assess a company's reserve replacement strategy using the reserve replacement ratio (RRR, the amount added to reserves divided by the amount extracted for production) along with its unit finding, development, and acquisition (FD&A) costs (see "Operating efficiency").

Our opinion is largely influenced by the size of the company's existing reserves, and its stage of development. It is not uncommon for an E&P company that has a small reserve base and is growing rapidly to add far more to its reserves in a year than its produces annually. In such a case, we would expect RRR to be a multiple of annual production. On the other hand, an extremely large E&P company with a high annual production rate might need to bolster its organic development with acquisitions. An RRR over 100% could be viewed as excellent for the major E&P company, but mediocre for a small company at the initial stage of its life cycle. Where a company reports an RRR of more than 100% for several years, we see potential for future production growth, and could improve our assessment of the business risk profile.

Reserve disclosures: The U.S. Securities and Exchange Commission, and equivalent authorities in other areas, define the standards used to categorize reported reserves. Although this provides a basis for comparison, management has some discretion about how to apply the standards--this may affect whether reserves are reported as proved developed, proved undeveloped, or probable. Proved developed reserves are the most direct source of current production and cash flow. Capex is required to convert reserves categorized as proved undeveloped or probable or possible resources into proved developed reserves.

We generally quantify reserves and production by industry standards such as barrel of oil equivalent (boe) or thousand cubic feet (mcf) of natural gas equivalent. We determine these based on the energy content equivalency ratio--six mcf of natural gas to one barrel of crude oil or

natural gas liquids. We also consider the composition of the sources of ongoing revenue because the energy equivalent can be significantly out of synch with market prices.

Most countries require that E&P companies disclose their reserves at the end of each year; these disclosures are a necessary input to our rating on the E&P company. Cross-country comparisons can be complicated by differences in the definitions used and the level of disclosure required.

In our view, reserve reports that are prepared and audited by internationally recognized third-party engineers have greater credibility than reports prepared internally by the company itself and only audited by third-party engineers, or reports prepared and audited by less well-known engineering firms.

We evaluate the reliability of reserve disclosures based on whether a company has a record of posting substantial or frequent negative technical revisions. Where a company's policy on reserve bookings has historically been aggressive, we may hold it to a higher standard than similarly rated peers. Specifically, we would look for a higher proportion of proved developed reserves when assessing reserve size and quality. That said, we typically have a greater tolerance for negative revisions based on changing prices when analyzing reserve bookings. Such revisions generally occur when oil and gas prices are declining and are reversed when prices improve.

Mergers, acquisitions, and divestitures: E&P companies frequently buy assets to enter new areas or consolidate their interest in existing properties. At the same time, they may divest noncore or high-cost assets to streamline their portfolios or to raise funds. In considering the effect of acquisitions, we focus on how much the company paid for the assets; the opportunities the assets represent for yielding reserves and production; whether they will help the company generate economies of scale; and whether the company has the capacity to manage the new properties. In our view, E&P companies that operate their own properties have a better control of cash outflows than those that rely on third-party operators.

We typically assess scale, scope, and diversity at E&P companies as stronger where they are acquiring assets and increasing their reserve size and production, while managing costs and obtaining higher rates of return on their investments.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Large in scale, typically defined as having reserves of more than 1 billion boe and production of over 350,000 boe per day.	Small in scale, typically defined as having total proved developed reserves of less than 50 million boe and production of less than 30,000 boe per day.
An RLI of 10 years or greater.	An RLI of five years or less.
An average RRR that exceeds 100%, over at least three years, and good prospects for production growth, given its drilling inventory and planned investment projects.	An RRR of less than 100% over the past three years, and limited prospects for production growth.
A well-balanced reserve mix that includes both liquids (crude oil and natural gas liquids) and natural gas.	An unbalanced reserve mix.
Exceptionally low production risk and high certainty of reserve replacement, even where the company operates in a relatively small number of fields (typical for certain Canadian oil sands projects).	Significant uncertainty with respect to sustainability of production and reserve replacement.
Fields or projects are geographically diverse and located in countries that have a country risk score of '3' or lower. Most have well-established records of development activity.	Most cash flow comes from one basin, indicating high geographical concentration.

Operating efficiency

We assess operating efficiency in the E&P sector based on:

- Operating and production costs; and
- Exploration and development costs (including capital efficiency and reserve replacement costs).

An E&P company's costs largely depend on the specific hydrocarbons it produces; for example, the operating cost for crude oil is generally higher than that for natural gas. The region in which production is taking place may also affect how costs compare with those of peers. In addition, a company's exploration and development program, and thus its ability to maintain and increase both reserves and production, depends on its capex.

Operating and production costs: Because E&P companies produce commodities, they have no control over selling prices, except through hedging. Controlling the cost of current production (that is, the operating and production costs) is therefore critical to an E&P company's credit profile and we view it as an important indicator of long-term operating strength. By managing their costs, companies may be able to expand and so generate additional cash flow. However, most E&P companies depend on third-party companies to provide critical services such as drilling, pressure pumping, and hydraulic fracturing (fracking), which reduces their control over the related costs.

Exploration and development costs: E&P companies that cannot replace their reserves at an economical cost will eventually fail. Therefore, exploration and development costs--those associated with finding and developing new reserves--significantly affect financial performance. They usually comprise more than half of the total unit cost base. In some cases, particularly offshore production projects, capex reaches its peak well before production can begin. To ensure we take this into consideration, we compare cash operating costs against capital costs.

We evaluate the capital efficiency of exploration by assessing finding and development (F&D) costs relative to peers, which we view as the best measure of organic growth capabilities. We also consider the unit finding, development, and acquisitions (FD&A, also known as all-sources finding and development) cost which indicates how much capital a company spends in all forms to replace a unit of hydrocarbon produced. Most companies that generate a unit cash margin significantly higher than their unit FD&A cost should be capable of delivering annual increases in reserves and production without any external funding requirements. We would expect the largest players to at least maintain reserves and production at a constant level.

Comparisons of F&D costs and FD&A costs can be distorted if there is a significant increase in PUDs or unproved resources. FD&A costs and reserve recognition can be uneven year to year. Therefore, we typically focus on unit FD&A costs over a three-year period. This removes some of the volatility while still being sensitive to underlying trends.

A company's break-even point can be identified using the recycle ratio, which we calculate by comparing the unit netback (gross profit per barrel) with its unit F&D, or unit FD&A. Unit netback is synonymous with the operating margin per unit, for an upstream company. A recycle ratio of less than 1x indicates that the company may not remain viable; we would typically assess operating efficiency as weak in this case.

Our assessment also considers the upfront costs required to develop basins. Developing offshore fields and certain other projects requires sizable capital outlays. For example, the pipeline infrastructure needed for Canadian oil sands or tertiary projects can be very costly and must be

completed before production begins. High upfront exploration and development costs generally mean that start-ups will report poor unit FD&A costs for some years. The degree of volatility in an E&P company's financial performance depends on the balance between its fixed and variable costs.

Unless they are operating in a mature field, start-up companies or those developing new production typically incur high cash operating costs, which heighten risk by dampening financial performance. These largely comprise lease operating expenses and general and administrative costs, which will be disproportionately high at the early stage. Later, as the company increases its production, these expenses can be spread over a larger base.

This effect can give a cost advantage to companies that have a large, stable production base and sustainable growth prospects. However, if these companies experience production shutdowns because of maintenance requirements, pipeline outages, or weather, their cash operating costs per unit of production will rise.

We use the unleveraged full-cycle costs to rank operating efficiency. The unleveraged cost is calculated by combining unit cash operating cost, excluding interest expense, with the unit FD&A costs.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Unit cash operating and unit FD&A costs are consistently below those of peers that have a similar hydrocarbon mix.	Consistently higher unit cash costs (for instance, costs to extract oil and gas) and consistently higher FD&A costs than peers with a similar hydrocarbon mix.
Revenue per unit of production is consistently higher, and expected to remain consistently higher, than unit unleveraged costs, based on our pricing assumptions, and unit cash margins are sufficient to cover unit FD&A costs.	Revenue per unit of production that are consistently lower than unit unleveraged costs (and that we expect to remain so) under our pricing assumptions, with unit cash margins that cannot fund unit FD&A costs internally (external financing is essential for the company's growth).

National oil companies

In addition to the factors considered above, for national oil companies, we place special emphasis on national industry-specific factors that derive from being a national company, and that may positively or negatively affect the company's competitive position compared with peers.

In particular, our analysis considers:

- To what extent heavy taxes or domestic price regulations affect the company's profitability through the cycle;
- To what extent regulations have a stabilizing effect on national oil companies' profits (that is, whether taxes act as a natural hedge);
- Whether the company has any advantages due to barriers to entry created by the regulatory framework in the hydrocarbon industry; and
- How stable the regulatory regime is and how resilient it is to potential changes in international oil prices.

Profitability

Because performance in the E&P industry is affected by natural hydrocarbon price volatility and possible changes in company operating efficiency metrics, we do not assess profitability based on standard global benchmarks over a whole cycle. Instead, we rank E&P companies against their peers annually, using the profitability measures listed below.

- Adjusted unit EBIT;
- ROC; and
- Adjusted unit earnings before interest.

We calculate adjusted unit earnings by applying our off-balance-sheet adjustments to unhedged earnings before interest and after taxes, for each unit of production. We may also include the unit EBIT as a proxy metric, depending on the availability of data and its relevance to the peer group used to benchmark a company.

Financial Risk Profile

Supplementary ratios

In our view, the most likely source of financial stress for an E&P company is an inability to fund its minimum ongoing investment requirements, or its maintenance capex. Reserve replacement, and thus production stability, rely on substantial access to capital. Our preferred supplementary ratios in the sector are FOCF to debt and DCF to debt. In calculating FOCF, we assume that maintenance capex, at least, is required. We view DCF to debt as most relevant for companies that pay out a portion of excess cash flow to shareholders.

We use our price assumptions for oil and natural gas when assessing the financial risk profile. To capture the higher volatility typical of speculative-grade companies, we generally focus on financial performance in the current and next year. We add an additional forecast year when assessing more stable companies. The diversified operations of the major integrated companies should enable them to demonstrate some stability through a price cycle, in our view. Therefore, in assessing these groups, we take into account historical ratios for the previous two years, as well as our estimate for the current and our forecast for the two subsequent years.

Section 26 | Oilfield Services And Equipment

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the oilfield services and equipment sector based on:

- The technological complexity of the company's services and equipment,
- The value to customers of the services and equipment being provided,
- The company's ability to set prices for its services and equipment, and
- The company's ability to quickly service or replace equipment and relative market position.

Technological complexity: The most-challenging oilfield projects require use of the latest technology. This can create a barrier to entry that protects oilfield services and equipment companies that have the strong technical skills and equipment needed to assist customers in executing these projects. Similarly, providers that can offer a suite of services and equipment have a competitive advantage over those that offer a single product or service.

Customer value: In our view, access to the leading technology also helps companies add value to their existing services and equipment, and so increase demand for their offering. By enhancing the customers' ability to recover oil reserves, for example, providers can strengthen their pricing power.

Sensitivity to prices: Companies that are more susceptible to price competition generally find profitability is eroded during cyclical downturns, or when the supply of equipment exceeds demand. Pricing pressures have the strongest effect on oilfield services and equipment companies that provide more-commoditized services and less-complex equipment. This is because the limited opportunities for differentiation available to them can impede their ability to protect their market share.

Responsiveness and market position: Market-leading companies have stronger reputations and pricing power, and can access global markets, easing the impact of regional changes in demand. They are also able to respond more quickly to customer demands. Given the significant cost of downtime, the ability to service equipment in a timely manner is key to achieving market acceptance and improving brand reputation.

Sector description

Companies that derive more than half of their revenue from providing services and equipment to the exploration and production industry and are therefore largely dependent on capex in that industry.

Subsectors	Typical CPGP
Barges and vessels	Commodity focus/scale driven
Diversified providers that use proprietary technology	Capital or asset focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Leading positions in its market segments.	Second-tier position in key market segments.
Technological leadership has enabled the company to research and develop successful new services and equipment, bolstering its favorable industry reputation and utilization rates.	Utilization of services and equipment falls when market conditions are weak because they do not materially improve exploration and production (E&P) companies' success rates or reduce their production costs.
Offering includes a suite of services and equipment that adds customer value and affords barriers to entry and pricing power.	Profitability is volatile because the company is highly susceptible to price competition.

Scale, scope, and diversity

We assess scale, scope, and diversity in the oilfield services and equipment sector based on:

- The company's relative size (measured by revenue and EBITDA);
- The depth and breadth of its product offerings;
- Its geographic diversity (measured by revenue and EBITDA); and
- Customer concentration.

Relative size: Larger oilfield services and equipment companies generally also lead the market in terms of technological innovations because they have the resources to invest a significant amount into R&D and are able to bring new services and equipment to market on time. In turn, this helps them maintain their market position and boosts their pricing power. We expect them to offer large-scale services in multiple countries or regions that carry relatively low risk (that is, where the country risk score is '3' or better).

The depth and breadth of its product offerings: Although some downturns are severe enough to affect all markets, we would expect companies that offer a diverse range of products to enjoy greater flexibility and more financial stability during downturns because they are less dependent on any one product. We consider that companies can gain an advantage by balancing the services and equipment they sell across the production, exploration, and development phases of oil and gas projects. Ratings can also be strengthened if a company targets multiple different hydrocarbon markets, notably natural gas and crude oil. Conversely, smaller players, especially those that focus on commodity-like oilfield services and equipment, are generally less able to command favorable terms and can find that slow collections become a particular problem.

Geographic and customer diversity: Our assessment of scale, scope, and diversity is influenced by the relative attractiveness of a company's markets, in terms of size, expected growth, cyclicality, barriers to entry, and intensity of competition, and how the company has positioned itself in those markets. Smaller oilfield services and equipment companies are more likely to serve smaller customers, whose demand for services and equipment can fluctuate depending on the price environment. Conversely, companies that we assess as having greater scale, scope, and diversification tend to sell to large, established E&P or integrated oil companies, which operate across a broad geographic range and themselves display good customer diversification and more predictable capex. The need for oilfield services and equipment at larger E&P and integrated oil companies is more stable, even in a downturn.

Although it is not common for companies in the oilfield services and equipment sector to enter into long-term contracts with clients, where they do, we analyze how much the use of these contracts bolsters cash flow predictability.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Leading market share across three or more broad product and service segments, so that revenue base is in the top tier for the industry.	Operations are limited in scale and breadth.
Participation in multiple product lines mitigates a firm's exposure to the risks of a single market or commodity.	Product offerings are limited and may focus on low-value-added items that are subject to very high competition.
Operations and cash flow are geographically diverse and the company's service provision is mainly in relatively low-risk countries and regions.	High geographical concentration or significant exposure to high-risk countries.
Strong, long-term customer relationships and a diversified customer base.	Customer base shows limited diversification or the company depends on smaller customers with more-cyclical needs.
A significant amount of business is conducted under contracts that have favorable provisions, including clauses that protect against the risk of order cancelations.	High exposure to investment in exploration, which is the more-cyclical part of the E&P industry.

Operating efficiency

We assess operating efficiency in the oilfield services and equipment sector based on:

- The flexibility of a company's cost structure;
- Working capital management when market conditions are weak; and
- The efficiency and quality of equipment manufacturing.

Flexibility of the cost structure and working capital management: Because demand for services and equipment can be volatile in this sector, we see a flexible cost structure as key to maintaining performance through the business cycle. Many oilfield services and equipment companies are able to release working capital during downturns--for example, by reducing inventory purchases or releasing crews--while continuing to collect on existing contracts.

Efficiency and quality of equipment manufacturing: Order backlogs at equipment manufacturers are common and fulfilling these orders can provide a buffer when market conditions weaken. We also analyze an equipment manufacturing company's manufacturing efficiency, operating margin, and reputation for quality when assessing their operating efficiency. Operations in the energy industry are coming under increasing regulatory scrutiny. Given the stringent requirements being imposed, we consider high quality to be essential; if a manufacturer's services and equipment cannot be relied upon, it will find itself at a disadvantage to peers.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Cost structure is flexible and enables the company to quickly reduce operating costs, especially labor costs, when markets weaken.	Cost structure is less flexible, so that it is difficult to quickly adjust to market conditions.
Able to limit working capital needs when growth slows.	High working capital requirements, even when growth slows.
An extensive record of constructing equipment on time and on budget, while also meeting the customers' needs.	Limited record of delivering equipment on time and on budget.

Financial Risk Profile

Supplementary ratios

FOCF to debt is our preferred supplementary ratio for oilfield services and equipment companies because working capital and capex cycles can significantly shape cash flow generation patterns through the cycle. During an upturn, companies need to increase their working capital and capex to meet the elevated demand for equipment and services. This can limit the benefit to cash flow and frequently leads to negative FOCF. Conversely, in the early stages of a downturn, capital released by liquidating inventories and trade receivables, combined with lower capex, can benefit free cash flow.

Companies that offer diversified oilfield services and have their own proprietary technology typically have less cyclical capex needs, but spend more on R&D. To capture these elements more effectively, we may choose to use FOCF to debt as a supplementary ratio.

Alternatively, we may use DCF to debt to refine our analysis of companies that pay higher dividends to shareholders or pursue share repurchase programs. This helps us to evaluate how they use cash and how that may affect debt repayment. Companies that make more aggressive shareholder returns, as indicated by a weak ratio, may see reduced DCF when crude oil and natural gas prices are falling, which could weaken their ability to service their debt.

Section 27 | Pharmaceuticals

Table of contents

Business Risk Profile

Competitive advantage

When we evaluate competitive advantage for pharmaceutical companies, the nature and focus of our analysis differs across the three pharmaceutical subsectors.

Branded

We assess competitive advantage in the branded pharmaceuticals sector based on:

- Pipeline quality, by number of compelling new prospects, market potential, and ability to replace lost sales;
- Market exclusivity profile;
- Number of blockbuster drugs;
- R&D spending level and productivity;
- Marketing and brand recognition; and
- Negotiating power with payors.

Pipeline quality: In considering the quality of a company's new product pipeline, we examine the products that are at an advanced stage of development, or have just started to be commercialized, and evaluate them primarily based on their capacity to replace lost sales and offset revenue declines from patent expirations. In our view, the number of products undergoing late-stage (phase III) trials is important, but so is their relative value. Trials for new molecular entities (NMEs) are viewed as more innovative, and therefore more valuable, than those focused on gaining approval for an existing drug to be used to treat additional medical conditions (known as indications), or those that expand dosing options or delivery forms (for example, offering drugs already being taken orally as a patch).

Market exclusivity profile: This measures the scale of the potential loss of sales from patent expiration and competition, and is defined as the percentage of total sales that are derived from drugs that face generic competition within the next three years. In some cases, we adjust the percentage to account for nonpatent barriers to entry, such as those for orphan drugs. When evaluating the risk posed by the proportion of sales exposed to generic competition within three years, we also consider pipeline quality and the ability to replace those lost sales. The lower the sales at risk and the higher the ability to replace them, the better for competitive advantage.

Blockbuster drugs: Blockbuster drugs are those that bring in sales of at least $1 billion a year. Their high profit margins help companies fund further R&D to generate future earnings and cash flow.

R&D spending and productivity: We evaluate pharmaceutical companies on their ability to maintain revenue growth and profit margins as individual products

Sector description

Companies that generate more than half of their revenue from developing, manufacturing, or marketing branded or generic drugs.

Subsectors	Typical CPGP
Branded	Services and product focus
Generic	Commodity focus/scale driven
Contract development and manufacturing organizations (CDMOs)	Capital or asset focus

progress through their life cycles. In particular, we consider how well they manage the sharp decline in earnings at the end of the patented period, when low-cost generic versions appear. Successful branded pharmaceutical companies harness their R&D capabilities and conduct acquisitions to enhance their new product pipelines. This enables them to produce new products that can replace aging ones. We evaluate their success by estimating potential revenue losses from loss of market exclusivity on older drugs and comparing it with potential revenue gains from products in the pipeline.

Marketing and brand recognition: Branded pharmaceutical companies can gain a substantial competitive advantage by getting branded drugs to market well ahead of competing products. Marketing capabilities generally play a lesser role but may distinguish the stronger companies.

Negotiating power with payors: In this sector, negotiating power mostly operates at the individual drug level and depends on the nature of the medical condition being addressed, the product's clinical efficacy, and its side effect profile. We also consider the number of competing alternatives, how well-entrenched they are, and how each company's products compare.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Strong: it can replace 90% or more of lost sales from its pipeline. Strong/adequate: it can replace 70% or more of lost sales from its pipeline.	Adequate/weak: it can replace 50% or less of lost sales from its pipeline. Weak: it can replace less than 30% of lost sales from its pipeline.
Less than 10% sales exposed to loss of exclusivity in the next three years, that is, we do not expect it to lose more than 10% of its sales to generic competitors over the next three years.	More than 30% of its sales are at risk of being lost to generic competitors within the next three years.
It consistently develops new blockbuster drugs and has seven or more of them in production.	It has three blockbuster drugs or less.
Its R&D strategy is consistent with its capabilities and market conditions.	Insufficient or unproductive R&D spending.
Strong marketing strategy that supports favorable brand recognition and products are successfully marketed, both to professionals who prescribe and to consumers.	Poor marketing practices and manufacturing problems have historically triggered substantial or repeated regulatory sanctions.
Its high volumes enable it to command favorable terms from distributors, hospitals, and retailers.	It ranks below the top 100 in terms of global drug sales, indicating that it lacks clout with distributors, hospitals, and retailers.

Generic

We assess competitive advantage in the generic pharmaceuticals sector based on:

- Speed-to-market,
- Manufacturing expertise, and
- Volume-derived clout with customers.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
It is consistently the first to file a drug application, before other generic competitors. Under the abbreviated new drug application (ANDA) process in the U.S., being first to file gives it six months exclusivity to sell its generic version alongside the patent holder.	It lacks the capabilities needed to attain first-to-file status.
It has a significant amount of special manufacturing expertise (for example, topical applications, liquid dosing, or transdermal patches).	It has limited ability to manufacture special formulations.
Its high volumes enable it to command favorable terms from distributors, hospitals, and retailers.	It ranks below the top 100 in terms of global drug sales, indicating that it lacks clout with distributors, hospitals, and retailers.
A proven history of working with regulators without any serious adverse findings.	It has a history of substantial or repeated regulatory sanctions because of manufacturing problems or its marketing practices.

Contract development and manufacturing organizations (CDMOs)

Both branded and generic pharmaceutical companies may outsource manufacturing or development to a CDMO. This market is extremely fragmented, highly competitive, and price-sensitive, giving the pharmaceutical companies a much stronger bargaining position. We rarely assess competitive advantage for a CDMO as strong.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Special manufacturing expertise, for example, in liquids or transdermal patches.	No special manufacturing expertise.
A proven history of working with regulators without any serious adverse findings.	A history of regulatory issues, especially if they resulted in the temporary or permanent closing of a plant (for example, in the U.S., adverse findings from the Food and Drug Administration)

Scale, scope, and diversity

Branded

We assess scale, scope, and diversity in the branded pharmaceuticals sector based on:

- Product diversity;
- Geographic diversity, including presence in the U.S.;
- Therapeutic diversity; and
- Market leadership.

Product diversity: The percentages of sales derived from a company's top product, and from its top three products, determine our view of product diversity. Product diversity mitigates the sales impact of new competition or the loss of market exclusivity. It also mitigates the risk that a manufacturing misstep or serious side-effects could force them to withdraw a product from the market. In our view, a product that has many different indications is subject to less risk than a product that is used to treat only a single medical condition. Successive generations of a product that all address the same indication provide less product diversity than a group of products that address different indications. Products that target animal health support both product and therapeutic diversity.

Geographic diversity and presence in the U.S.: Geographic diversity can blunt the effect of unfavorable economic, regulatory, or other developments in a specific country or region. We view a strong presence in the U.S. as positive if it is part of a geographically diverse portfolio, due to the larger size, higher growth, higher prices and profitability of the market, though if sales are highly concentrated in the U.S. the company's profitability may be more volatile. When assessing the geographic diversity of a branded pharmaceutical company, we consider the geographic mix of sales relative to the global industry average.

Therapeutic diversity: Branded drug companies always face the risk that a competitor could introduce a breakthrough product in a therapeutic area that they target. Diversifying across therapeutic areas (such as oncology or diabetes) reduces the potential damage. In our assessment, we consider the diversity of a company's exposure to different diseases within each therapeutic category, the size of the category, and the company's ability to lead the market in each category. The percentages of sales derived from a company's largest therapeutic category, and from its three largest therapeutic categories, also helps us determine the depth of its therapeutic diversity.

Market leadership: Therapeutic markets can differ markedly in size--for example, cardiovascular is much larger than gastrointestinal. To assess market leadership, we identify the largest therapeutic category served by the company and calculate its market share within that therapeutic category, based on revenue and prescriptions. Revenue in the smallest, weakest therapeutic categories comprises less than 1% of the industry total; revenue from the largest, strongest categories can be over 10% of the industry total. We regard a market share of over 20% as strong, and under 5% as weak. Our view of market leadership gives equal weight to the strength of the market share and the size of the therapeutic category.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Product diversity is considered strong when the company derives less than 25% of sales from its top product and less than 50% from its top three products. It is considered strong/adequate when the company derives 25%-30% of sales from its top product and 50%-60% from its top three products.	Product diversity is considered adequate/weak when the company derives 40%-60% of sales from its top product, and more than 70% from its top three products. It is considered weak when the company derives more than 60% of sales from its top product.
Therapeutic diversity is considered strong when the largest therapeutic category represents less than 35% of sales and the top three less than 60%. It is considered strong/adequate when the company derives less than 35%-45% of its sales from one category and 60%-70% from the top three.	Therapeutic diversity is considered adequate/weak when the largest therapeutic category represents 55%-70% of sales and the top three more than 80%. It is considered weak when the company derives more than 70% of sales from one category.
Nearly all of its sales are in countries with strong patent protection.	More than 20% of its sales are in countries with weak patent protection.
Presence in the top largest markets--the U.S., EMEA, and Japan.	It derives more than 50% of its sales from one country, other than the U.S.
Its percentage of sales from emerging markets is at least equal to the industry average.	It derives less than 10% of its revenue from emerging markets.
Market leadership is strong if it is established in at least three products/therapeutic categories, and in large growing markets. It is strong/adequate if it has established leadership positions, but in fewer than three categories.	Market leadership is adequate/weak is the company's only leadership positions are in markets that are more limited in terms of size and growth prospects. It is weak if it has minimal leadership positions.

Generic

We assess scale, scope, and diversity in the generic pharmaceuticals sector based on:

- Overall market penetration, indicated by a company's global sales ranking among generic drug companies;
- Market share trends;
- Geographic diversity of revenue base and manufacturing footprint; and
- Technical capabilities.

Leading generic drug companies address nearly all major therapeutic categories, whereas the leading branded drug companies address only a few. Therefore, we do not explicitly measure therapeutic diversity for a generic drug company since we consider its sales ranking captures its therapeutic diversity. Similarly, the frequent changes to their product portfolios make product diversity less relevant compared with branded peers. Instead, technical capabilities become more important to our view of diversity; that is, the company's ability to produce specialized or more-complex products, such as injectable medicines, topical drugs, transdermal patches, extended-release drugs, and biosimilars.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
One of the top five global generic drug companies, based on revenue.	Ranks below the top 10 global generic drug companies, based on revenue;
Growing share of the global market.	Market share is trending down.
Strong presence in all major geographic drug markets, including the U.S. and EMEA.	Revenue is concentrated in one country, other than the U.S.
Manufacturing base is reliable and geographically diversified.	Manufacturing is concentrated (for example, it has only one facility), so that a failure could halt production.
Capable of handling more-complex products and producing specialized generic drugs in a variety of formulations.	Minimal ability to produce specialized or more-complex generic formulations.

Contract development and manufacturing organizations (CDMOs)

In assessing scale, scope, and diversity for CDMOs, we take a qualitative view of their therapeutic and geographic diversity. CDMOs are especially exposed to customer and product concentration risks because their customers may move production of a product in-house, cancel production entirely, or select a competitor at any time. Less often, quality problems or financial distress at the customer end may prompt them to sever their relationship with the CDMO.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Its top customer accounts for less than 10% of its revenue.	Its top customer accounts for 30% or more of its revenue.
Its top 10 customers account for less than 50% of its revenue.	Its top five customers account for 80% or more of its revenue.
Much of its client base comprises large pharmaceutical and biotech companies.	It has a high exposure to small pharmaceutical and biotech companies.
It participates in product development as well as manufacturing services.	Its relationship with clients is limited to manufacturing.

Operating efficiency

We assess operating efficiency in the pharmaceuticals sector based on:

- A company's ability to maintain profit margins during stressful periods (for example, when a key drug loses market exclusivity);
- The nature and flexibility of the cost structure;
- Working capital management; and
- The absence or presence of manufacturing problems.

We do not necessarily view outsourcing of research, manufacturing, or sales as positive or negative. However, we take into account how companies incorporate new products in their portfolio. We do recognize that EBITDA margins may be overstated--companies that rely heavily on acquisitions to add new products to their portfolios do not spend as much on R&D as companies that are more focused on internal development.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Maintains stable margins even during adverse conditions.	Profitability shows a pronounced decline during adverse conditions.
Record of success in bringing new products to market in a timely manner through development.	Record of material or repeated regulatory sanctions because of its marketing practices or manufacturing problems that it cannot remedy quickly.
Proven ability to navigate the patent and regulatory approval processes.	Staffing is not well matched to manufacturing capacity.
Raw material costs are relatively modest (higher for CDMOs).	The cost of raw materials is high or volatile.
Good working capital management.	Poor working capital management.

Financial Risk Profile

Supplementary ratios

If the preliminary cash flow/leverage assessment indicated by the core ratios is significant or weaker, we place more emphasis on EBITDA interest coverage as a supplementary ratio. If the company has PIK debt, PIK preferred stock, or low-coupon convertible debt, we use FFO plus cash interest paid to cash interest paid as a supplementary ratio because it enables us to incorporate the lower level of cash interest.

Section 28 | Railroad, Package Express, And Logistics

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the railroad, package express, and logistics sector based on:

- Overall route network by coverage area, position of hubs, and investments in major infrastructure;
- Market position within the markets a company serves;
- Size of revenue base and unit sales;
- Service standards and reputation; and
- Effectiveness of the marketing strategy and sales force.

Railroad

We assess whether railroads have direct access to factories, utilities, mines, and ports, all of which could generate substantial freight traffic. We also consider the safety record and reputation, especially if the railroad transports hazardous materials such as chemicals.

Package express

New products and complementary offerings can bolster the competitive advantage of package express companies. These are often inspired by increased technological capabilities and can help companies deepen their customer relationships by meeting specific customer needs. Technology can also lower costs, improve service, and increase efficiency--thus making it less likely that customers will switch to a competitor.

Logistics

We consider how involved they are in supply chain management for their major customers, and whether they provide value-added services, or a more commoditized offering. In addition to pricing, we consider key contract terms that can affect the potential to make an increased profit, or can protect against exposure to downside risks. For example, some contracts include provisions that impose material switching costs on customers.

Sector description

Companies that derive more than half of their revenue from transporting freight and packages, and providing services that support the movement of goods through the supply chain (logistics).

Subsectors	Typical CPGP
Asset-lite logistics	Services and product focus
Logistics that includes warehousing and inventory management	Capital or asset focus
Monopolistic railroads	National industry and utilities
Package express	Services and product focus
Railroads	Capital or asset focus

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Operates in large and growing markets, with barriers to entry.	Operates in a smaller market with low growth potential or with few barriers to entry.
A leading or very substantial market share in the markets where the company competes.	Has a relatively modest market share.
Control of scarce infrastructure or long-term contracts that establish barriers to entry and thereby bolster pricing power or make revenue more stable.	Lacks infrastructure, long-term contracts, or clearly differentiated service, leaving the company to compete mostly on price.
Strong technological capabilities that allow a company to build and maintain complex transportation networks and information systems.	Lacks leverage with key product manufacturers, vendors, and suppliers and is typically a price follower.
Varied service offerings that, from a consumer perspective, enable differentiation from peers.	Has not sufficiently developed its information technology resources.
Better-than-average service (based on metrics such as on-time performance, computerized billing, and tracking services).	Service offering is limited and the company has a history of operational or service challenges.
Long-standing relationships with key customers.	Limited record of maintaining long-standing relationships with key customers.
Strong name or brand recognition, particularly for package express companies.	Limited or no brand recognition.

Scale, scope, and diversity

Railroad

For railroads, we measure scale by freight revenue, volumes, track miles, diversity of customers and end markets served, and types of services provided. The characteristics of the area covered by a railroad's network can also boost our assessment of its scale, scope, and diversity.

Package express

In this subsector, we analyze whether the company has access to major markets and can provide national and global coverage, as well as whether it has an integrated network that can handle various products. Other key factors include the company's route network and the position of hubs. We also examine regional diversity (based on the breakdown of revenue and operating profit) as well as the range of different customers and industries they serve.

Logistics

In this subsector, we measure scale by revenue and the number and specialization of the services provided. Our assessment of scale, scope, and diversity also incorporates the size of the company's end markets and customers, as well as their diversity by geography and other characteristics.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Participates in a variety of markets that have favorable supply and demand fundamentals and that are not closely correlated.	Participates in only a few markets, especially if those markets have unfavorable growth prospects or are intensely competitive.
The size of the equipment fleet and IT resources supports above-average revenue generation and profit by enabling better utilization and economies of scale.	Small market share that leaves the company vulnerable to larger competitors and may force it to compete mainly on price.
The company offers a wide and diverse range of services that are attractive to customers.	Concentration in terms of service offering, and end markets served.
Good customer diversity.	Concentrated customer base.

Operating efficiency

We assess operating efficiency in the railroad, package express, and logistics sector based on:

- Economies of scale;
- Labor costs;
- The efficiency of equipment; and
- Management of route: networks, equipment, and employees.

Railroad and package express

To identify operating efficiency at railroads, we calculate the operating ratio (operating expenses, including depreciation, as a percentage of operating revenue). For package express companies, we consider operating margins, chiefly EBIT margins. Revenue per unit is a key metric for both subsectors. Typically, for railroads, the unit will be a carload or a container, but for a package express company we often simply look at revenue per package. We also monitor measures related to service quality, such as on-time delivery statistics for both railroads and package express companies. Given that market characteristics can vary greatly among countries and regions, we take into consideration geographic concentrations when assessing these operating statistics for package express companies.

Logistics

Companies in this subsector provide a variety of different services, which can make it difficult to compare their operating efficiency. We view EBIT margins as key to our assessment. To evaluate working capital management, which is particularly important in this subsector, we consider statistics such as days' receivables against close peers that have a similar service offering. In addition, where the information is available, we consider what percentage of a company's real estate properties (for example, its warehouses) are empty, to identify the efficiency of its asset management.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Economies of scale, lower labor costs, more fuel-efficient equipment, or process efficiencies have created a sustainable advantage in terms of operating costs.	Operating profitability is below average because higher operating costs are not offset by higher revenue, compared with peers.
Efficient management of route networks, equipment, and employees boosts revenue generation while controlling operating costs.	Revenue generation is below average because of poor management of assets and employees.
Revenue-generating equipment or IT resources are newer or more suitable than those of competitors.	Revenue-generating equipment or IT resources are lacking or dated versus competitors.
Relatively stable and positive labor relations that supports the availability of labor under reasonable contracts.	Labor relations or provisions in labor contracts have the potential to affect a company's ability to operate efficiently.
Regulations that do not impose a competitive disadvantage.	Regulations that impose a competitive disadvantage.
Good working capital management, particularly for logistics companies.	Poor working capital management.
Effective management of capacity additions.	Poor management of capacity additions.

Financial Risk Profile

Volatility tables

We apply the medial volatility table to railroad companies that are not monopolistic railroads and that:

- Generate most of their revenue from the movement of freight;
- Have a CICRA of '2' or better; and
- Have a business risk profile assessment of fair or better.

In all other cases, we use the standard volatility table.

Supplementary ratios

A railroad or package express company is more likely to default because it has run out of cash than because its capital structure proved unsustainable during a downturn. Therefore, our preferred supplementary ratios are FFO plus cash interest paid to cash interest paid and EBITDA to interest. In addition, we use FOCF to debt to capture capital intensity, particularly for railroad companies.

Section 29 | Refining And Marketing

Table of contents

Business Risk Profile

Competitive advantage

Competitive advantage typically has limited effect on our analysis of refining and marketing companies because refiners engage in marketing commodities, so they have limited ability to gain a competitive edge or increase profitability through product differentiation or branding. Therefore, we generally assess competitive advantage as adequate. That said, we may assess competitive advantage as strong or strong/adequate when the refining and marketing company is integrated with other business lines, such as midstream or retail, that extend its operations sufficiently to enable the company to benefit from higher, more stable profitability across its entire operations. Conversely, we may assess competitive advantage as adequate/weak or weak if the company has limited integration with other business lines and competes mainly with larger, more-diversified companies. In particular, private, independent refiners can be at a disadvantage in countries where refining operations are subsidized.

Scale, scope, and diversity

We assess scale, scope, and diversity in the refining and marketing sector based on:

- Total refining capacity and number of refineries;
- Geographical diversity in terms of feedstock supply, logistics, and end markets;
- Product mix and complexity; and
- Integration with midstream and downstream lines of business, and the extent of its marketing operations.

Refining capacity and number of refineries: The number of refineries that a company operates and its total refining capacity are key to our assessment of its scale, scope, and diversity. We define companies that can refine at least 500,000 barrels per day (bpd) as having a large total capacity base. High production volumes enable companies to achieve economies of scale and spread their overhead costs more widely. In addition, large refining companies have stronger purchasing power and can often negotiate more favorable prices for crude oil and other raw materials than smaller companies. Ultimately, larger scale should contribute to lower unit production costs.

Over time, we would also expect refining companies that operate multiple refineries and enjoy high production diversity to benefit from higher utilization rates than less-diversified refiners. In our view, potential downside from operating hazards can be minimized by spreading operations over at least three different facilities.

Sector description

Companies that derive more than half of their revenue from refining crude oil into products such as gasoline, diesel, or jet fuel; or companies that derive more than half of their revenue from converting other organic or waste feedstocks into biomass, biofuels, and renewable fuels. These companies market refined commodities, such as gasoline and diesel to retail outlets such as gas stations on a wholesale basis.

Subsectors	Typical CPGP
Refining and marketing	Commodity focus/scale driven

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

Geographic diversity: We consider geographic diversity in terms of the markets in which a company competes, and the location and regional concentration of its refining and marketing assets. Given that market conditions vary considerably across regions and countries, being able to switch between serving domestic and export markets in response to fluctuations in demand and pricing conditions can offer a distinct advantage. Nevertheless, a small-scale refinery may be highly profitable if its entrenched or niche position gives it greater pricing power, in a market that is insulated from competition. In addition, the risks associated with having assets concentrated in one region may be offset if the company can take advantage of favorable supply-and-demand trends, has more crude oil feedstock options, or has access to markets in which demand for refined products is strong.

Product mix and complexity: Crude oil comes in a variety of different types and typically accounts for well over 80% of a refinery's cash costs. We consider the mix of crude oil sourced by a refining company to be key to its competitive profile. Light, sweet crudes are generally more expensive, but require less treatment, and can be refined into a number of high-value products, such as gasoline, kerosene, and jet fuel. Heavy, sour crudes are generally used to produce heavier, lower-priced refined products, such as asphalt and residual fuel oil.

The more complex the refinery, the more flexible it can be with regard to its feedstock. Less-complex refineries offer only simple distillation and desulfurization of heavy, sour crude oil. By contrast, facilities with greater complexity can process a range of different crude oil feedstocks, including those that are heavier or have higher sulfur content, into high-value-added products. In comparing facilities and companies, we use third-party indices such as the Nelson Complexity Index.

Having more feedstock options enables a refinery to take advantage of the differential between heavy sour and light sweet crude prices. However, complexity does not always protect against adverse market conditions because this differential will change, depending on global production. That said, in our experience, profits at companies with highly complex refineries are higher and more stable, over time. We therefore consider that complexity offers a competitive advantage.

Integration with other business lines: Refining and marketing companies that have midstream and downstream operations typically have greater flexibility in sourcing different types of crude oil. This minimizes feedstock costs and makes it easier for the refinery to bring its finished products to market. Downstream integration and diversification may include:

- Participation in oil and gas common-carrier pipelines that have regulated tariffs;
- Ownership of logistics networks; and
- Integration into high-value-added petrochemicals.

In some cases, logistics networks are extensive and may be supported by a fuel marketing business that encompasses transportation, distribution, and retail operations, such as a chain of branded gas stations.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Total refining capacity of at least 500,000 bpd.	Small scale, based on total refining capacity.
Operates at least three different refineries and is not overly reliant on any one asset to generate its cash flow.	Operates only one or two refineries, or is overly reliant on one asset to generate its cash flow.
The asset base is geographically diverse or, if assets show regional concentration, they are in markets that have attractive supply and demand characteristics, where crude oil feedstock options are advantageous, and there is strong demand for premium refined products.	Participates in a single market, or in several closely correlated markets that are also served by several competitors; and has no market advantage in terms of low-cost feedstock or refined products that command a premium.
A high degree of complexity, with a value-added product mix.	Facilities have limited complexity and finished products are low in value.
Downstream integration with an established player, such as a midstream company or a retail network.	Limited or no midstream or downstream integration.

Operating efficiency

We assess operating efficiency in the refining and marketing sector based on:

- Operating and processing costs;
- Operating flexibility compared with peers;
- Utilization rates and record of unplanned outages;
- Ability to source feedstock and market its products; and
- Insurance coverage.

Operating and processing costs: We define operating and processing costs as cash operating expenses per barrel of throughput. Energy typically represents the second-largest cost for a refinery, after raw materials. In some regions, such as the U.S., companies have access to low-cost natural gas, giving them a significant cost advantage over companies that use fuel oil. As complexity also has a considerable effect on the cost structure, we compare costs against those of peers of a similar complexity.

New refineries are generally more efficient and reliable than old ones, but the difference largely disappears if an older facility has been well-maintained and has undergone extensive retrofitting. Therefore, we view ongoing operating results as a better gauge of cost-competitiveness than age, in such circumstances.

Operating flexibility compared with peers: Large-scale refineries, with a capacity of at least 150,000 bpd, are typically the most efficient. In many cases, the companies that operate large-scale facilities benefit from economies of scale and may have invested in features such as hydrocrackers and cokers to improve their yield of high-value-added products.

Utilization rates and record of unplanned outages: Because fixed costs are typically high in the refining business, companies generally aim to maintain high utilization rates so that fixed costs per unit remain low and profitability is satisfactory. In assessing operating efficiency, we compare peer companies based on the operating rates they disclose, to understand how they define these rates and the circumstances surrounding any major unplanned outages.

Ability to source feedstock and market its products: Some refining and marketing companies maintain extensive proprietary pipelines for both crude oil and refined products. This is expensive, but gives them a significant and defensible advantage over regional peers when

sourcing feedstock and in marketing. For example, a refining company that owns its own pipeline can direct products to the market that offers the greatest return.

Location can support a refining company's cost-competitiveness and operating flexibility. The closer a refinery is to its supply of crude oil, and to its end users, the less it will pay to transport feedstock and finished products. Compared with landlocked refineries, their coastal competitors have far greater flexibility in sourcing relatively low-cost feedstocks and are better placed to exploit sales opportunities in export markets. However, they also face more competition from waterborne imports to their home territories.

Insurance coverage: Given the potential for significant operating hazards, many refining companies maintain extended third-party property and casualty insurance coverage. This typically includes protection against business interruptions caused by operating hazards, which may include hurricanes and terrorist attacks. Standard insurance contracts generally provide limited and incomplete protection against hurricane damage and apply very broad exclusions to terrorism risk coverage.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Lower-than-average operating or processing costs.	Higher-than-average operating or processing costs.
Consistently high utilization rates.	Inconsistent utilization rates.
Minimal unplanned downtime or outages.	Inconsistent operating performance, characterized by a high level of unplanned downtime or outages.
An extensive network of proprietary crude oil and refined product pipelines.	Sole reliance on third-party logistics assets to source feedstock and market products.
Insurance coverage that is at least in line with industry standards and includes protection against business interruptions.	Limited insurance coverage.

Profitability

Given the pass-through nature of refining, operating margins tend to fluctuate in line with the price of crude oil, making them less useful as a measure of profitability. We therefore rely more on a refiner's ROC. Because profitability can vary so widely from year to year depending on industry conditions, we generally forecast ROC using near-term market conditions (typically for the current year and for the following year) based on current trends, but we use normalized, or midcycle, expectations for later years. We define "midcycle" conditions as a long-term average that typically encompasses the past 10 years, provided that the period contains both strong and weak market conditions.

Financial Risk Profile

Supplementary ratios

We generally use FOCF to debt as the supplementary ratio for refining and marketing companies. Our FOCF calculation generally considers only the capex required to maintain the integrity of the refinery, including the cost of meeting environmental, safety, and regulatory requirements. This is because including large growth-based capex could skew the ratio.

Volatility adjustment

Our use of the volatility adjustment varies according to the point in the commodity cycle.

When we believe that prices are at or near the peak, we typically consider cash flow ratios to be highly volatile and adjust our cash flow/leverage assessment down by two categories as the high refining margins associated with strong market conditions may contract sharply when prices fall.

When market conditions reflect our midcycle assumptions, we typically assess cash flow ratios as volatile and modify our cash flow/leverage assessment down by one category to account for the intrinsic volatility of the sector.

We do not typically make a volatility adjustment if market conditions indicate a cycle at the trough or if our forecasts use assumptions based on the trough of the cycle. Such forecasts already assume stressed market conditions. Regardless of the above, if the refinery has or is expected to maintain minimal debt, and we expect our assessment of cash flow/leverage to remain minimal, even during times of severe market stress, we may not apply a volatility adjustment.

Section 30 | Regulated Utilities

Table of contents

Business Risk Profile

Regulatory advantage

Market forces are not typically the main driver of competitive position for regulated utilities, and therefore we do not measure competitive advantage in the same way as we do for competitive firms. Instead, we assess regulatory advantage because the influence of the regulatory framework and regime is of critical importance. It defines the environment in which a utility operates and has a significant bearing on a utility's financial performance.

Regulations vary across different regulatory jurisdictions, that is, the area over which a regulator has oversight. Each regulatory jurisdiction can include one or more subsectors (water, gas, and power). A geographic region may have several regulatory jurisdictions.

We determine the regulatory advantage assessment by combining:

- Our preliminary regulatory advantage assessment, resulting from our review of the four subfactors that we believe are key for a utility to recover all its costs--on time and in full-- and to earn a return on the capital it deploys; and
- Our view of the utility's business strategy--in particular, its regulatory strategy and its ability to manage the tariff-setting process.

We assess the preliminary regulatory advantage assessment for each regulatory jurisdiction based on:

- Regulatory stability,
- Tariff-setting procedures and design,
- Financial stability, and
- Regulatory independence and insulation.

Regulatory stability: Our view is based on how transparent the key components of the rate-setting process are, and how they are assessed. We also monitor the predictability and consistency of the regulatory framework over time. Greater consistency reduces uncertainty for the utility and its stakeholders.

Tariff-setting procedures and design: Our view is based on whether all operating and capital costs can be recovered in full, and how the rate scheme balances the interests and concerns of all stakeholders. We look for incentives that are achievable, contained, and symmetrical (that is, mostly indexed to overperformance and underperformance).

Financial stability: If costs are recovered in a timely manner, cash flow volatility can be avoided. We see greater flexibility as favorable, because it allows for the recovery of unexpected costs. Financial stability also depends on the framework's ability to attract long-term capital, and the availability of capital support during construction, to alleviate funding and cash flow pressure when heavy investment is needed.

Sector description

Companies that provide an essential or near-essential infrastructure product, commodity, or service that has few or no substitutes and are shielded from competition, while also being subject to comprehensive regulation by a regulatory body or oversight by a public body.

Subsectors	Typical CPGP
Electricity	National industry and utilities
Gas	National industry and utilities
Multi-utilities	National industry and utilities
Water	National industry and utilities

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

Regulatory independence and insulation: We consider this to be stronger where the market framework and energy policies support the long-term financial stability of the utilities, are clearly enshrined in law, and protect the regulator's independence. Where there is limited risk of political intervention, the regulator is more able to efficiently protect the utility's credit profile, even during a stressful event.

Preliminary regulatory advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
From a credit perspective, the utility operates in a regulatory climate that is transparent, predictable, and consistent.	The utility operates in an opaque regulatory climate that lacks transparency, predictability, and consistency.
The utility can fully and timely recover all its fixed and variable operating costs, investments, and capital costs (depreciation and a reasonable return on the asset base).	The utility cannot recover its fixed and variable operating costs, investments, and capital costs (depreciation and a reasonable return on the asset base) fully and/or in a timely fashion.
Any regulatory incentives are limited and mainly symmetrical. The tariff setting includes mechanisms allowing for an adjustment for the timely recovery of volatile or unexpected operating and capital costs.	The utility must make significant capital commitments with no solid legal basis for the full recovery of capital costs.
The tariff setting may include a pass-through mechanism for major expenses--such as commodity costs--or a higher return on new assets, effectively shielding the utility from volume and input cost risks.	Ratemaking practices actively harm credit quality.
There is a record of earning a stable, compensatory rate of return in cash through various economic and political cycles and a projected ability to maintain that record.	There is a record of earning minimal or negative rates of return in cash through various economic and political cycles and a projected inability to improve that record sustainably.
The utility operates under a regulatory system that is sufficiently insulated from political intervention to protect the utility's credit risk profile, even during stressful periods. There is support for cash flow during construction of large projects, and preapproval of capital investment programs and large projects lowers the risk of subsequent disallowances of capital costs.	The utility is regularly subject to overt political influence.

Natural monopolies: Where a utility has a natural monopoly and its tariffs are controlled, but it is not subject to a detailed regulatory framework or oversight by a regulatory body, we may still assess regulatory advantage, rather than competitive advantage. We would assess it using the same four subfactors, as follows:

- For regulatory stability, we evaluate the stability of the setup, and give more emphasis to the historical record and our expectations regarding future changes.
- For tariff-setting procedures and design, we examine the utility's ability to fully recover operating costs, its investment requirements, and its debt-service obligations.
- For financial stability, we consider tariff flexibility, and whether this is sufficient to counter volume risk or commodity risk. In addition, we consider indirect competition, for example, while Nordic district heating companies operate under a natural monopoly, their tariff flexibility is partly restricted by customers' option to change to a different heating source if tariffs are increased significantly.
- For regulatory independence and insulation, we evaluate the risk that political intervention could change the setup, and in turn, affect the utility's credit profile. Although political intervention tends to be mostly negative, state ownership might positively influence tariff determination.

Because these four subfactors effectively capture the benefit of the close relationship with the state as owner, we do not typically modify our regulatory advantage assessment for natural monopolies based on business strategy.

Business strategy: After determining the preliminary regulatory advantage assessment, we assess the utility's business strategy as positive, neutral, negative, or very negative, and may modify the preliminary regulatory advantage assessment as a result. This factor chiefly addresses the effectiveness of a utility's regulatory risk management in the jurisdictions where it operates. In certain jurisdictions, a utility can create a sustainable competitive advantage through its regulatory strategy and ability to manage the tariff-setting process effectively. Ensuring that revenue changes with costs is a key regulatory risk factor, especially if the risk of political intervention is high. Our assessment of the utility's business strategy is informed by historical performance and business objectives in the context of industry dynamics and the regulatory climate.

We assess the utility's business strategy as positive and modify the preliminary regulatory advantage assessment upward if we consider the business strategy effectively bolsters the utility's regulatory advantage through favorable commission rulings, beyond what is typical for a utility in that jurisdiction. Where business strategy has limited effect relative to peers, our assessment is neutral. Where the business strategy leads to worse regulatory outcomes than peers, such as failing to achieve recovery of typical costs, we may see the implications as negative or very negative, and would apply the downward modifications as shown in the table below.

Regulated utilities: determining the final regulatory advantage assessment

	--Business strategy modifier--			
Preliminary regulatory advantage score	**Positive**	**Neutral**	**Negative**	**Very negative**
Strong	Strong	Strong	Strong/adequate	Adequate
Strong/adequate	Strong	Strong/adequate	Adequate	Adequate/weak
Adequate	Strong/adequate	Adequate	Adequate/weak	Weak
Adequate/weak	Adequate	Adequate/weak	Weak	Weak
Weak	Adequate/weak	Weak	Weak	Weak

Scale, scope, and diversity

We assess scale, scope, and diversity in the regulated utilities sector based on:

- Operational scale; and
- The geographic, economic, and regulatory diversity of a utility's markets and service territories.

These characteristics can contribute to cash flow stability while dampening the effect of economic and market threats. We generally believe a larger service territory--with a diverse customer base and average to above-average economic growth prospects--provides a utility with cushion and flexibility in the recovery of operating costs and ongoing investments (including replacement and growth capital spending). It also lessens the effect of external shocks (such as extreme local weather) because the incremental effect on each customer declines as the scale increases.

We consider that residential and small commercial customers have more stable usage patterns and are less exposed to periodic economic weakness, even after accounting for some weather-driven usage variability. Significant industrial exposure--combined with a local economy that

largely depends on one or few cyclical industries--could contribute to the cyclicality of a utility's load and financial performance, magnifying the effect of an economic downturn.

A utility's cash flow generation and stability can benefit from operating in multiple geographic regions that exhibit average to better-than-average levels of wealth, and where employment and growth levels underpin the local economy and support long-term growth. Operating in a single geographic region carries a risk that can be ameliorated if the region is sufficiently large, demonstrates economic diversity, and has at least average demographic characteristics. In addition, if a utility operates in a single large geographic area and has a strong regulatory assessment, the benefit of diversity can be incremental.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Stability of its revenue and profits limits its vulnerability to most combinations of adverse factors, events, or trends.	Revenue and profits are unstable and unsustainable, so that the utility is vulnerable to economic, competitive, or technological threats.
Customer base is large and diverse, with no meaningful customer concentration risk; that is, residential and small and midsize commercial customers typically provide most of the operating income.	Customer base is small and demonstrates customer or industry concentrations, combined with little economic diversity and average to below-average economic prospects.
Exposed to a wider range of service territories than others in the sector.	Exposed to a single service territory.
Operates in multiple regulatory jurisdictions where we assess the final regulatory advantage as adequate or stronger; or operates in a single regulatory jurisdiction where we assess final regulatory advantage as strong or strong/adequate.	Operates in a single regulatory jurisdiction where we assess the final regulatory advantage as adequate or adequate/weak.
No meaningful concentrations by asset or supplier that could weigh on operations; or assets and suppliers can easily be replaced.	Dependence on a single supplier or asset that cannot easily be replaced and that could damage the utility's operations.

Operating efficiency

We assess operating efficiency in the regulated utilities sector based on:

- A utility's compliance with the terms of its operating license--including safety, reliability, and environmental standards;
- Its cost management; and
- The scale, scope, and management of its capital spending.

We analyze management's record in these three key areas, relative to peers, and the resulting cash flow stability. In addition, we consider how management reduces the prospect of penalties for noncompliance; operating costs being greater than allowed; or capital projects running over budget and time--all of which could impair the company's ability to recover its full costs.

The relative importance of the above three factors, particularly cost and capital spending management, is determined by the type of regulation under which the utility operates. Utilities operating under robust cost-plus regimes tend to be more insulated given the high degree of confidence that costs will invariably be passed through to customers. Utilities operating under incentive-based regimes are likely to be more sensitive to achieving regulatory standards. This is particularly so where regulatory regimes involve active consultation between regulator and utility, and market testing, as opposed to just handing down an outcome on a more-arbitrary basis. In some jurisdictions, absolute performance standards are less relevant than how the utility performs against the regulator's performance benchmarks. This performance will drive any penalties or incentive payments and can determine the utility's credibility on operating and asset management plans with its regulator.

Therefore, we believe that well-managed utilities are more likely to maximize the likelihood of cost recovery and full inclusion of capital spending in their asset bases. When regulatory resets are more at the discretion of the utility, effective cost management--including of labor--may allow for more control over the timing and magnitude of rate filings. This would maximize the chances of a constructive outcome--such as full operational and capital cost recovery--while protecting against reputational risks.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Cost structure is better than that of peers and volatility is limited. Generates revenue and profits by minimizing costs, increasing efficiencies, and asset utilization.	Cost structure is worse than that of peers; its cost position and efficiency factors do not support profit sustainability; and volatility is above-average.
Asset profile (including age and technology) is such that we have confidence that it could sustain favorable performance against targets.	The capital spending program is so large and complex that overall operating efficiency is compromised.
Strong safety record.	Poor safety performance
Strong service reliability, with a record of meeting the operating performance requirements of stakeholders (including regulators).	Service reliability has been sporadic or nonexistent, with a track record of not meeting operating performance requirements of stakeholders (including regulators); we do not believe the utility can consistently meet performance targets without additional capital spending.
Where applicable, well-placed to meet current and potential future environmental standards.	Where applicable, the utility is challenged to comply with current environmental standards and is highly vulnerable to more onerous standards.
Management maintains very good control over both fixed and variable costs, in line with regulatory expectations (including labor and working capital management being in line with regulator's allowed collection cycles).	Management typically exceeds operating costs authorized by regulators.
Strong record of projects managed almost invariably within regulatory allowances for timing and budget.	Inconsistent project management skills, as demonstrated by cost overruns and delays, including for maintenance capital spending.

Profitability

A utility with above-average profitability would, relative to its peers, generally earn a rate of return at or above what regulators authorize and has minimal exposure to earnings volatility from affiliated unregulated business activities or market-sensitive regulated operations. Conversely, a utility with below-average profitability would generally earn rates of return well below the authorized return relative to its peers or have significant exposure to earnings volatility from affiliated unregulated business activities or market-sensitive regulated operations.

We typically use the EBITDA margin as key indicator of profitability, unless it is distorted--for example, by pass-through costs like congestion revenue or collection of third-party revenue, or by accelerated asset depreciation that we do not view as sustainable in the long run. In such cases, we would use ROC or ROE to benchmark the company against peers.

For regulated utilities subject to full cost-of-service regulation and return-on-investment requirements, we normally measure profitability using ROE, the ratio of net income available for common stockholders to average common equity. When setting rates, the regulator ultimately bases its decision on an authorized ROE. However, different factors--such as variances in costs and usage--may influence the return a utility is actually able to earn. Consequently, our analysis of profitability for cost-of-service-based utilities centers on the utility's ability to consistently earn the authorized ROE.

Volatility of profitability: We may observe a clear difference between the volatility of actual reported profitability and the volatility of underlying regulatory profitability. In these cases, we could use the regulatory accounts as a proxy to judge earnings stability.

Financial Risk Profile

Accounting characteristics

Important accounting practices for utilities include:

- For integrated electric utilities that meet native load obligations partly by using third-party power contracts, we use our purchased power methodology to adjust measures for such contracts' debt-like obligations.
- Where substantial seasonal working capital requirements--for example, at natural gas distribution utilities--distort leverage measures, we adjust inventory and debt balances by netting the value of inventory against outstanding short-term borrowings. This adjustment informs balance sheet analysis by reducing seasonal debt balances when we are very confident of near-term cost recovery.
- We deconsolidate securitized debt (and associated revenue and expense) that has been accorded specialized recovery provisions.

In the U.S. and certain other regions, utilities employ "regulatory accounting," which permits a rate-regulated company to defer some revenue and expense to match the timing of the recognition of those items in rates, as determined by regulators. A utility subject to regulatory accounting therefore records assets and liabilities that an unregulated corporation--or even regulated utilities in other global regions--cannot record. We do not adjust GAAP earnings or balance-sheet figures to remove the effects of regulatory accounting. While IFRS does not currently provide for any recognition of the effects of rate-setting for financial reporting purposes, our financial analysis focuses on the economics and actual cash flow generation.

Volatility tables

We apply the low volatility benchmark table to regulated utilities where:

- They derive about two-thirds or more of their operating cash flows or profits from regulated operations that are predominantly at the low end of the utility risk spectrum (such as a network or distribution/transmission business unexposed to commodity risk and with very low operating risk);
- Their regulated operations have a regulatory advantage assessment of strong;
- They are expected to maintain their established record of achieving stable credit measures and low funding costs; and
- No other activities contribute significantly to the group's overall risk profile and are viewed as high-risk or volatile.

We apply the medial volatility table to regulated utilities that do not qualify for low volatility and that either:

- Derive about 50% or more of their operating cash flows or profits from regulated activities that have a regulatory advantage assessment of at least adequate and operate in a jurisdiction where the country risk is '4' or better; or
- Derive about one third or more of their consolidated operating cash flows or profits from regulated utility activities that have a regulatory advantage assessment of strong; or a regulatory advantage assessment of strong/adequate and a CICRA of '3' or better.

In both cases, the competitive position for the remaining activities must be assessed as at least satisfactory.

In all other cases, we use the standard volatility benchmark table.

Section 31 | Retail And Restaurants

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the retail and restaurant sector based on:

- Whether the merchandising strategy is clear, focused, and consistent enough to maintain customer loyalty;
- Ability to effectively target a specific customer segment by offering a concept, product, or shopping experience that can be differentiated from competitors;
- Effectiveness of brand reputation and marketing, which may include strong exclusive private-label products; and
- Quality of the product or service, and whether quality and price are appropriately balanced to provide a compelling value proposition.

Merchandising strategy: A retailer's merchandising strategy and brand management has a strong influence on its overall competitive position and underpins our assessment of business risk. Retailers depend on their strategies, whether broad or narrow, to position themselves in a niche or across a category. A successful, strong brand can help create high levels of customer acceptance and loyalty, while supporting consistently healthy sales and allowing for above-average margins by commanding a price premium.

Quality of service/ product and value proposition: For retailers and restaurants, success depends on providing a compelling reason to shop or eat at their outlets. Selecting appealing products and effectively displaying and marketing them attracts higher customer traffic. Meanwhile, introducing new items and moving into new categories and price points can reinvigorate sales and image. That said, if a new merchandising concept is not aligned with customer needs, or is not well-executed, it can alienate a loyal customer base. Restaurants can also gain a competitive advantage based on the range and depth of their menu offering, use of healthy ingredients, food safety and hygiene, and value positioning across customer demographics. In addition, casual dining restaurants may benefit from the quality of the dine-in experience they offer customers.

Product and service differentiation: Retailers differentiate themselves by offering unique product design, quality products, good service, compelling assortment, and appealing presentation. Differentiation is often the key to success in crowded and highly competitive retail markets. Given the intense competition in almost every product category from big-box players, large national retail chains, or e-commerce giants, a small regional or niche retailer that is unable to compete based on price will need a high degree of differentiation to receive an assessment of strong or strong/adequate.

Sector description

Companies that derive more than half of their revenue from selling goods or services directly to the individual consumer. The sector includes auto retailers and grocery wholesalers because the fundamentals of operating these businesses are largely the same as general retailing, with similar unit economics.

Subsectors	Typical CPGP
Apparel retail	Services and product focus
Automotive retail	Services and product focus
Computer and electronics retail	Services and product focus
Department stores	Services and product focus
DIY and home improvement retail	Services and product focus
Grocery	Services and product focus
Home furnishing retail	Services and product focus
Internet retail	Services and product focus
Restaurants	Services and product focus
Specialty stores	Services and product focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Discounters and value retailers have widened their reach and offer tough price competition in many countries. One tactic traditional retailers can use to combat the loss to market share to discounters, or to improve price perception among customers, is to expand their range of exclusive, private-label offerings. These products are tailor-made for the retailer, produced in lower stock-keeping units (SKUs), and carry lower marketing costs, enabling retailers to benefit from higher margins while offering customers lower prices. By undercutting the pricing of branded products, successful private-label products typically boost volume growth.

Brand and marketing strategy: Specialty retailers have also developed private brands, which target niche markets and can compete with national brands. In some cases, specialty retailers target specific customer segments by offering a highly differentiated product mix and store experience. We see these developments as representing a competitive advantage because they allow for above-average gross margins while also helping to build customer loyalty.

To maintain the relevance of the store concept and increase sales, retail companies regularly invest in reinvigorating their properties, or build new properties. We view store remodeling programs and upgrades as critical to attract customers and maintain competitiveness. Therefore, our assessment is influenced by the retailer's record of investing in renovation, beyond the normal cost of maintenance, especially in more competitive markets.

Capturing and analyzing customer data enables companies to target and customize their marketing and may also provide important insights into emerging customer behaviors. These, in turn, can lead to an effective merchandising strategy. Effective digital apps and loyalty programs, especially on mobile devices, further increase customer engagement for both retailers and restaurants. A strong digital infrastructure also supports online sales, which enable consumers to prioritize convenience and now contribute a significant percentage of overall retail sales in many markets. By investing in digital operations and the omnichannel model, retailers aim to provide customers with a seamless, customized shopping experience across all channels. Even restaurants can diversify their customer base and increase their competitive advantage by increasing their takeaway and food-to-go options, often in partnership with delivery services. Our assessment of business risk treats such investments as favorable, especially in more-mature sectors, such as department stores. Conversely, we see underinvestment in digital channels as increasingly risky, except in those pockets of the sector where the in-person operation is intrinsic, such as convenience stores, or integral to the retailer's competitive advantage (for example, retailers that offer a treasure hunt experience).

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Compelling value proposition for its products or services and a consistently successful merchandising strategy.	Products or services offer customers a limited value proposition, and merchandise and assortments differ from customers' expectations or their image of the store.
A strong consumer franchise, with highly differentiated concept or products.	Little differentiation of the concept or product.
Successful positioning of the product or brand.	Brand positioning is weaker than peers.
A digital strategy that captures and employs customer data to customize communication, anticipate trends, and facilitate shopping across channels.	Lacks significant digital operations that enable effective use of customer data; significant technology investment is required to catch up with industry leaders.
Strong store development with attractive locations.	Store development has been weak; stores are outdated or poorly maintained; retailer has exited certain markets following failed expansions.
Penetration of private-label programs is increasing.	Limited focus on developing attractive private-label products.
Auto retailers	
Operates a variety of desirable franchises that offer exposure to diverse brands.	Concentration by franchise and brand exposure.
High revenue contribution from premium/luxury brands.	Low revenue contribution from premium/luxury brands.

Scale, scope, and diversity

We assess scale, scope, and diversity in the retail and restaurant sector based on:

- Diversity of the product, channels, and service range;
- Geographic presence in terms of store base, maturity of the digital operations, and growth prospects within the company's core markets;
- Volumes, size, market share, or niche position in chosen segment; and
- Relative attractiveness of core markets in terms of size, demographics, expected growth, and intensity of competition.

Size and market position: Retailing is generally fragmented, but in certain subsectors, such as supermarkets and drugstores, large retailers can command a very significant share of the overall market. Other sectors, such as specialty apparel or household goods are highly fragmented and even the largest players only account for a very small portion of the overall market.

Although size alone does not ensure profitability and growth, there are economies of scale available in procurement, distribution, advertising, overhead, and information systems. Larger companies can also spread out costs more than their competitors. Market leaders benefit from greater clout with suppliers, which enables them to obtain purchasing discounts.

Product and geographic diversity: Where diversity is not teamed with good profitability, we do not consider that diversity provides a meaningful benefit. Retailers that have good geographic or product diversification can struggle because of poor execution of store expansion or merchandising strategy across different markets. Although we may view significant concentration in one state or region as unfavorable, numerous regional retailers have achieved a strong share of their regional markets, despite limited geographic diversity.

We do not typically view brand diversity as important to our ratings in the retail sector. Although some retailers operate or manage multiple concepts in different subsectors, or target distinct

segments through dissimilar product offerings at various price points, we do not consider this necessary for success. Concept diversification is of value where it offers the retailer multiple brands, each of which dominates the niche segments it serves and accounts for a significant portion of operating income. Ideally, each brand should target a distinct customer or product segment, so that the growth of one does not cannibalize the sales of another. The development of smaller brands may consume management's time and resources and weaken the primary brand, causing it to operate in a similar way to a singular concept that is weakly positioned.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Sizable market share, or a leadership position in the retailer's core markets or industry subsector.	Weak market position in a crowded sector.
Able to use large scale to command strong bargaining power with suppliers.	Lack of scale and limited bargaining power with suppliers.
Scale enables greater absorption of marketing and other operational costs.	Smaller scale limits capacity to invest in strategic, enterprisewide initiatives.
A successful niche position within a subsector; a category leader.	Has lost market share to stronger players in its core markets.
Sufficient geographic diversity to mitigate volatility. For example, a presence in international markets may offset a small domestic market and operating in different regions may offset the effect of differing consumption trends.	Lack of geographic diversity, little or no presence in international markets, or little or no diversity in different regions with different consumption trends to mitigate volatility.
Auto retailers	
For large auto retailers, a history of growth through successful acquisitions and sufficient scope and scale to implement technology that would increase the efficiency of their operations.	Limited experience of using acquisitions to bolster growth and insufficient scale and scope to implement technology that would increase the efficiency of their operations.
Restaurants	
Company-operated and franchised restaurants generally contribute a significant percentage of revenue to advertising funds. As a result, large brands tend to have large advertising budgets and can market their products and promotions more aggressively than smaller brands.	Smaller or regional brands lack scale and scope and could have small advertising budgets that hinder their ability to promote products.

Operating efficiency

We assess operating efficiency in the retail and restaurant sector based on:

- Same-store sales or like-for-like sales;
- Gross margin;
- SG&A expenses to sales;
- Sales per square foot;
- Capacity utilization of delivery infrastructure, for e-commerce sales;
- EBITDA margin;
- Inventory turnover;
- Accounts payable days; and
- Cash conversion cycles.

In addition, for auto retailers, we look at the ratio of SG&A to gross profits.

Retail comprises diverse subsectors, and operating metrics for each sector can vary widely. Therefore, we compare retailers against peers in the same subsector that have a similar product mix and cost structure, and operate in similar geographies.

Same-store sales: Consistent same-store sales growth is a positive, in our view. It indicates that the company is using its assets efficiently to make the most of its fixed costs base (primarily, rent and labor costs). Same-store sales may also be referred to as comparable-store sales or like-for-like sales. Stronger same-store sales than peers may indicate the retailer is gaining market share. Conversely, where same-store sales trends lag peers or consistently decline, it may indicate underperformance compared with peers or other retail formats.

Sales density or sales per square foot: To identify retailers with above-average store productivity, we compare their sales density, measured as sales per square meter or per square foot, against the peer average. Where sales density is lower than peers, it may indicate underutilized assets and subpar operating performance. Retail is a very diverse sector and sales density is strongly affected by the product mix and store format. Typically, we benchmark against a peer group that operates in the same subsector and location, and has a similar product mix and cost structure.

Gross margin: To gain insight into how well a retailer is managing its inventory purchases, cost increases, and pricing strategies, we examine the trends in its gross margin compared with peers. Inventory planning is critical for retailers: excess inventory can lead to steep markdowns, which damage profitability. In our view, retailers that maintain their gross margins by passing on cost increases when inflation is high demonstrate a superior market position and customer appeal; we view retailers that underperform their peers, or have highly volatile or declining gross margins, more negatively. For most food and nonfood retailers, gross margin trends depend heavily on global commodity prices and labor costs. The sector also relies on manufacturing in Asia, especially in China; therefore, conditions in the region may affect margins.

EBITDA margin: Although we consider sales metrics useful, we also monitor operating margins and SG&A expenses to sales when assessing operating efficiency. To grow while maintaining profitability, retailers must control their SG&A expenses, which are typically fixed costs. Operating leverage varies from retailer to retailer--to achieve the same increase in profit, some will need a larger increase in same-store sales than others. For example, rent is generally higher

in malls than in off-mall formats and out-of-town locations. We assess more favorably those retailers that have a proven ability to use the existing fixed cost base to achieve higher sales growth, and so drive margin expansion.

Working capital management: How the company uses liquidity to invest in inventory ahead of sales is crucial. We consider strength in this area to be particularly important for seasonal retailers, but any retailer will benefit from strong working capital management, which we identify by the following characteristics:

- Higher turnover of its inventory than peers, and fewer inventory markdowns, indicating that the retailer's stock was sufficient in terms of type and quantity to meet customer demand on a timely basis without tying up excess capital;
- Accounts payable are on terms that minimize net investment in inventory (for example, vendors are willing to extend the period before the outstanding obligation must be paid); and
- A shorter cash conversion cycle compared with peers. This demonstrates that a company has a stronger position in the supply chain and can, for example, require suppliers or dealers to hold more of its inventory. It also frees up the company's own capital so that it may be directed to other areas of investment.

Many retailers, particularly speculative-grade issuers, rely on revolving credit facilities to fund seasonal inventory purchases during the months leading up to their critical sales period. High seasonality leaves little room for error during the peak sales quarters. We may assess seasonality risk as negative if a retailer is unable to lower the impact of seasonal risk factors on its business performance (for example, poor summer weather tends to weigh on sales at DIY retailers; our view of seasonality risk reflects whether we expect such a retailer to be able to offset or soften the slump). If a company fails to achieve its sales targets; underperforms against peers; or mismanages inventory investments during seasonal peaks, so that it has to make heavy markdowns, its profitability will take a hit.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Same-store sales growth is consistent, positive and harnesses the growth in the fixed cost base.	Same-store sales trends lag peers or consistently decline, indicating a loss of market share.
Unit-level productivity above the peer average, such as sales per square foot for retailers or average unit volume for restaurants.	Lower-than-average sales per square foot or average unit volumes, indicating underutilized resources.
Gross margins show consistent, predictable trends, indicating strong working capital management. This is particularly important for seasonal retailers.	Gross margin shows high volatility, indicating poor inventory management in response to market conditions.
Cost structure, measured as SG&A to sales, is competitive and can be adjusted when sales are falling.	SG&A to sales is less competitive because of higher rent or labor expenses.
EBITDA margin is above the peer average and consistent sales growth absorbs fixed expenses.	Profitability is consistently below peers due to subpar sales trends or less-competitive cost structure.
Efficient working capital management, leading to higher turnover of inventory and limited markdown risk.	Weak working capital management, so that investment in inventory is higher, low turnover of inventory, and a higher-than-expected level of markdowns.
Sophisticated operations across channels.	Lack of a comprehensive omnichannel strategy.
Auto retailers	
A high degree of automation enables operations and sales to be integrated, so that, for example, pricing can be improved by giving the	For auto retailers, same-store sales growth is volatile, the cost structure cannot be varied when necessary, and inventory control is inconsistent because of less-sophisticated systems automation.

sales team access to market data, and customer information is gathered to support the sale of parts and servicing.	
Excellent relationships with profitable auto manufacturers, which can influence which operators are awarded franchises and may offer dealers financing to for inventory.	Relationship with auto manufacturers is less entrenched.
Restaurants	
High proportion of units are franchised, reducing exposure to fluctuations in the cost of commodities, packaging, and labor; this offers a more predictable cost structure.	Sales are inconsistent and exposure to cost fluctuations is higher in company-operated restaurants. Limited franchise network and lower opportunities to reduce operating costs.

Financial Risk Profile

Supplementary ratios

We generally include EBITDA to interest coverage, FOCF to debt, and DCF to debt in our analysis. Given the high adjusted debt burden at many retailers and restaurants, we view their ability to meet cash interest and lease payments as critical. In light of retailers' significant lease liabilities, we may consider FOCF after lease payments, in addition to other supplementary ratios. However, for retailers and restaurants whose FOCF generation is constrained by significant capex, we will use CFO to debt as the preferred supplementary ratio.

In some cases, we use adjusted EBITDAR coverage as a supplementary ratio. This enables us to adapt our analysis if we think lease-adjusted EBITDA to interest or other cash flow ratios may overstate the company's ability to cover their fixed costs. Using adjusted EBITDAR to cash interest plus rent can also enables us to compare companies that own most of their properties with companies that lease most of their properties.

Retail and restaurants: financial assessment based on adjusted EBITDAR coverage

	Adjusted EBITDAR to cash interest plus rent (x)
Minimal	>8.0
Modest	>5.0-8.0
Intermediate	>3.0-5.0
Significant	>2.5-3.0
Aggressive	=>2.2-2.5
Highly leveraged	<2.2

Section 32 | Specialty Chemicals

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the specialty chemicals sector based on:

- Market position, and whether we view the company's business strategy as robust and sustainable;
- Record of executing projects successfully and maintaining sufficient capital investment;
- Differentiation by product or service mix; and
- Technical expertise, service capabilities, and ability to invest in R&D.

Market position: By adjusting their strategies in response to market conditions, leading specialty chemical producers are typically able to gain a pricing advantage and sustain revenue and profitability, even in a downturn. Revenue and margin trends are generally fairly similar across peers and reflect the prevailing industry conditions; where they do not, it can indicate an improving or deteriorating competitive advantage.

Differentiation in product and service mix, capex, and R&D: Most specialty chemical companies aim to develop innovative products that can be differentiated from competitor's offerings through their value-added formulations and high-performance attributes. These qualities, combined with strong technical services, can create brand recognition and greater customer loyalty. They may also improve a specialty chemical company's ability to increase prices regularly and to maintain higher and more stable margins. Successful R&D and capital projects in the industry tend to rely on market knowledge and strong product innovation.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Leading or near-leading market positions and has demonstrated the success of its strategic positioning by profitably protecting or growing its share of the key industry segments in which it competes.	Market position is weak, or eroding, and strategic positioning is much weaker than those of the leaders in the industry segments in which it competes.
Participates in one or more industry segments that have favorable growth prospects over the medium- to long-term, and where the balance of supply and demand is advantageous.	Participates in one or more industry segments that have unfavorable growth prospects over the medium- to long-term, and where there is more competition.
Strong negotiating position with customers, including recurring customers, achieved through a high degree of product differentiation; scientific or technical expertise; or product specification.	Weak negotiating position with customers, including recurring customers because products lack differentiation, or the company has limited technical expertise.
Strong R&D and technical capabilities that enable the company to develop new product formulations; bring them to market; and identify new applications in response to market demand.	Limited or no R&D or technology capabilities and constrained technical abilities prevents the company from developing new product formulations or applications.

Sector description

Companies that derive more than half of their revenue from the production of specialty chemicals, such as industrial gases, coatings, and other advanced materials.

Subsectors	Typical CPGP
Industrial gases	Capital or asset focus
Specialty chemicals	Capital or asset focus

Scale, scope, and diversity

We assess scale, scope, and diversity in the specialty chemicals sector based on:

- Diversity of product mix, raw material inputs, and end markets;
- Size of the revenue base, compared with the size of the target markets;
- Geographic diversity by sales, profits, and manufacturing; and
- Supplier and customer concentrations.

The stronger our assessment of a specialty chemical company's scale, scope, and diversification, the lower we would expect its exposure to event risk and fluctuations in the market to be. This should lead to more stable earnings and cash flow. We consider customer concentration to be high where the largest customer accounts for 10% or more of sales or operating profit. Many rated issuers in the specialty chemicals industry are relatively small, niche players that have limited product and geographic diversity and are heavily dependent on a small number of customers or end markets. As a result, they tend to be highly sensitive to small changes in demand, any loss of market share, or adverse market conditions.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Revenue base or target markets are larger than those of other industry players.	Revenue base or target markets are smaller than those of other industry players.
Portfolio is well diversified and products are not all subject to the same external factors--for example, they use different raw materials, and are subject to different regulations and economic cycles.	Portfolio has a narrow focus because the company participates in a very small number of end markets, regions, or product categories, and these have limited growth prospects or are closely correlated to one another.
Products are aimed at a variety of end markets that are not closely correlated and have favorable supply and demand fundamentals, with cyclical and noncyclical demand well balanced.	Reliance on a single raw material or single supplier.
The revenue base and production facilities are both spread across developed and developing markets in different geographic regions or countries.	Production is concentrated at a single location or a very small number of facilities.
There is little reliance on specific suppliers and no significant dependency on a single raw material, and customers are well-diversified.	Customer or supplier concentration is high, and this is not mitigated by the characteristics of the customer or supplier base.

Operating efficiency

We assess operating efficiency in the specialty chemicals sector based on:

- Cost position relative to industry peers,
- Flexibility of the cost structure in absorbing volatility of demand or input costs,
- Record of passing through raw material costs, and
- Flexibility of production.

Cost position and ability to pass through raw material costs: The cost of raw materials and energy often accounts for more than 50% of the cost of goods sold in the specialty chemical industry. Therefore, we expect to see more-stable margins and better operating efficiency at specialty chemical companies that can pass through increases in these costs. The main measure we use to compare a specialty chemical company's cost position with that of its peers is its

EBITDA margin profile. We supplement our analysis by using a variety of ratios that highlight different aspects of cost efficiency and capital intensity, such as gross margin, SG&A expenses to sales, margin over raw material costs, time lag in passing through raw material costs, percentage of contracts that include raw material pass-through provisions, and capex to sales.

Flexibility of the cost structure and production: In some cases, specialty chemical companies can change the amount or type of raw material they use as production inputs, either selecting an entirely different material or a different grade of the same material. We evaluate flexibility of production in the industry on a company's ability to reduce its raw material input requirements, shift raw material inputs, or optimize production across facilities. Greater flexibility may bolster profitability and improve the company's competitive position, relative to peers.

We also look for ongoing and measurable improvements through lean manufacturing practices, and a history of optimizing variable costs and reducing labor and sourcing costs, as well as strong working capital management and rationalization of capacity, where appropriate.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Profitability is consistently higher than peers, taking into account any differences in sales mix that would affect profit margins.	Profitability is consistently lower than peers, taking into account any differences in sales mix that would affect profit margins.
A record of continuous improvement to the cost structure.	Cost-reduction initiatives have been inconsistent, so that labor and sourcing costs exceed those of peers or there is excess capacity.
The company has demonstrated its ability to pass through increases in the cost of raw materials; for example, most contracts include pass-through provisions.	The company has limited ability to pass through increases in the cost of raw materials and has few protections built into its contracts.
Global production can be optimized by altering the balance of raw material inputs or shifting production to more favorable facilities.	Limited or lack of production flexibility.

Financial Risk Profile

Supplementary ratios

FOCF to debt is our preferred supplementary ratio for specialty chemicals companies where the core ratios indicate a cash flow/leverage assessment of intermediate or stronger, because working capital and capex cycles can significantly shape cash flow generation patterns. Alternatively, we might use CFO to debt for companies that have a high working capital-to-sales ratio of more than 25% or DCF to debt for companies that distribute more than 50% of FOCF as dividends.

Section 33 | Technology Hardware And Semiconductors

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the technology hardware and semiconductors sector based on:

- The extent of a company's intellectual property (IP);
- Its technology positioning, operating performance, and distribution capabilities;
- Any manufacturing or process technology advantages;
- Relationships with customers and ability to impose price increases; and
- The company's reputation and brand recognition.

Manufacturers of technology hardware and semiconductors typically require strong R&D capabilities to maintain a product advantage over competitors. Product cycles can be short, exacerbating the issue. Those companies that have the ability and capacity to collaborate with customers on development have the opportunity to gain a considerable advantage, as switching costs in such cases will be far higher. However, many subsectors within the industry are more commoditized, making it easy for customers to switch to a competitor.

While a strong brand can enable companies to command a price premium, especially in consumer-oriented segments, most companies are exposed to continuous price erosion as new products are launched. In such cases, we look for evidence that they can maintain margins through process efficiencies or by outsourcing manufacturing. We also consider the size and growth prospects of the markets in which a company operates.

Sector description

Companies that derive more than half of their revenue from the manufacture or sale of technology hardware and semiconductors.

Subsectors	Typical CPGP
Communications equipment	Capital or asset focus
Computer hardware	Capital or asset focus
Computer storage and peripherals	Capital or asset focus
Consumer electronics	Capital or asset focus
Electronic components	Capital or asset focus
Electronic equipment and instruments	Capital or asset focus
Electronic manufacturing services	Capital or asset focus
Office electronics	Capital or asset focus
Semiconductor equipment	Capital or asset focus
Semiconductors	Capital or asset focus
Technology distributors	Capital or asset focus
Technology hardware that has unique capabilities, differentiated products, or identifiable brands; or strong competitive standings in consumer-oriented segments, and that have low capital requirements or outsourced manufacturing.	Services and product focus

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Product advantage derived from extensive IP that helps to differentiate the product.	IP is insufficient to differentiate products from competitors', or competitors can replicate the features.
Strong position in emerging technologies that have strong growth prospects, supported by effective investment in R&D.	Weak position in emerging technologies that have strong growth prospects, or mainly present in markets that have limited growth prospects.
Good position in a relatively concentrated or less competitive market.	Weak position in a relatively fragmented or competitive market.
Operating performance consistently ahead of peers because of product differentiation or the ability to command a price premium.	Poor record of operating performance relative to peers.
Multiyear product cycles.	Short product cycles in segments where technology changes quickly.
Manufacturing technology or design processes that offer sustainable advantages.	Manufacturing technology is average or lags that of competitors, leading to inefficiencies.
Strong bargaining power when negotiating with key product manufacturers and suppliers.	Limited bargaining power when negotiating with key product manufacturers and suppliers.
Robust distribution network.	Limited distribution capabilities.
High level of brand recognition that enables the company to impose price increases.	Lack of brand recognition limits pricing power.
Long-term customer relationships, including those where parties cooperate on R&D.	High customer turnover.
Strong distribution capabilities.	Limited distribution capabilities.

Scale, scope, and diversity

We assess scale, scope, and diversity in the technology hardware and semiconductors sector based on:

- Operating metrics such as revenue, EBITDA, and free cash flow, relative to peers;
- Market share, and how it is changing;
- Supplier and customer concentration; and
- Diversity in terms of end markets, products, and geographies.

The technology hardware and semiconductors industry is characterized by rapid technological changes, which can offer smaller, more innovative companies an opening. That said, larger, more-established companies also tend to have the resources to invest in R&D, as well as in sales, marketing, and distribution.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Generates a significant proportion of the total market's revenue, EBITDA, or cash flow.	Generates a much small proportion of the total market's revenue, EBITDA, or cash flow.
Customer base is diverse, or revenue is well spread across multiple large contracts. No customer or contract contributes more than 10% of revenue and the top 10 customers or contracts contribute less than half of revenue.	Concentrated customer or contract base (that is, one or more customers or contracts account for more than 10% of revenue each, or the top 10 customers or contracts represent more than half of revenue).
Manufacturing is spread across multiple locations and facilities and there is limited reliance on single suppliers.	The supplier base is concentrated and the company has limited manufacturing operations, making it more prone to delays if the supply chain gets disrupted or a manufacturing facility has to close.
Offers a wide variety of products and services.	Offers products that have a narrow focus, or participates in intensely competitive or closely correlated markets.
A broad array of end markets, none of which contributes more than one-third of total revenue.	Focused on a particular end market or geography.

Operating efficiency

We assess operating efficiency in the technology hardware and semiconductors sector based on:

- Ability to maintain profitability during downturns;
- Capacity utilization compared to peers; and
- Capital intensity.

Ability to maintain profitability during downturns: We measure profitability using metrics such as gross margin, EBITDA margin, and ROC. Manufacturing technology hardware and semiconductors requires a high degree of flexibility, given that volumes often fluctuate. The more flexible a company's cost structure, the lower the pressure on EBITDA and cash flow during industry downturns. We would expect a semiconductor or technology hardware company that had stronger operating efficiency to generate larger profit margins than its peers, even in a downturn. We also track SG&A expenses as a percentage of revenue to identify how well the company controls its overhead costs.

Capacity utilization and capital intensity: Companies in this sector can gain an advantage by utilizing their manufacturing capacity better than their peers across the industry cycle. Flexible manufacturing capabilities allow for efficient and timely product transitions in existing plants. This is particularly important for semiconductor companies. If the data is available, we compare capacity utilization against peers; monitor the percentage of production capacity that is outsourced; and track how gross margins vary, relative to capacity utilization, during the industry cycle.

To evaluate operating efficiency for technology distributors, we also consider the relative speed of fixed asset turnover (net sales to average fixed assets); inventory turns (COGS to average inventory); the length of cash-conversion cycles (days sales outstanding); the return on invested capital; the stability of operating margins; and the length of free cash flow cycles. Similarly, we compare additional measures against those of peers when assessing electronic manufacturing services companies. These include the proportion of the product mix that comprises low-margin, high-volume items (rather than higher-margin, specialty items); asset turnover; and the degree of concentration in more-cyclical end markets. In addition, to evaluate the effectiveness of the company's R&D spending, we compare its R&D-to-sales ratio and the size of its R&D budget against peers.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Economies of scale and other efficiencies enable profitability to consistently exceed the peer average.	Profitability is consistently lower than or more volatile than that of peers.
Company is able to maintain an effective team while controlling overhead costs.	Operating margins are only positive when industry conditions are favorable.
Investment in R&D is more effective than that of peers (where the peer group has a similar market positions and product set).	High SG&A expenses and inefficient R&D investment frequently leads to business restructuring.
Few disruptions or bottlenecks in the supply chain, even after disruptive events, indicating that these are flexible and effective.	Inflexible cost structures due to rigid labor laws or high fixed costs.
Capital intensity is low, with a high level of variable costs--this implies a cost structure that is relatively flexible.	Capital intensity is high and this is combined with high fixed costs and limited outsourcing of production.
Manufacturing capabilities have demonstrated sufficient flexibility to boost capacity utilization above the industry average.	Inflexible or vulnerable supply chains have historically caused bottlenecks; a build-up or shortfall in inventory; or quality issues.
Company incurs restructuring and other one-off costs relatively infrequently.	Manufacturing capacity is underutilized or inefficient and cannot easily be adjusted when necessary.
Effective working capital management that limits the need for cash.	Inefficient working capital management frequently creates cash flow volatility.

Profitability

Some conglomerates or large groups operate in several subsectors within the technology hardware and semiconductors sector. In these cases, if the company discloses the EBITDA margin for each subsector, or it can be estimated, we assess the level of profitability of each subsector. We then assess the overall level of profitability on a weighted-average basis. If EBITDA margins are not available for each subsector, or if a company's business model does not allow for this type of analysis, we would emphasize ROC in our assessment of the level of profitability.

Financial Risk Profile

Supplementary ratios

If the preliminary cash flow/leverage assessment is intermediate or stronger, we typically refine our analysis using FOCF to debt, to capture the impact of working capital and capex requirements. If the preliminary cash flow/leverage assessment is significant or weaker, we typically refine our analysis using EBITDA to interest, which gives us more insight into the company's ability to service its debt, or FOCF to debt (for an earlier indication of any change in financial risk). In our view, a semiconductor and technology hardware manufacturer is most likely to default during or after a downturn because of a failure to cover a cash interest payment or redeem debt at maturity.

Volatility adjustment

We typically assess semiconductor equipment companies as highly volatile, and companies in all other subsectors as volatile, unless cash flow volatility at the company supports a stronger assessment. For example, within the semiconductors subsector, we often assess memory chipmakers as highly volatile but analog chipmakers as stable. Historically, we have classified some consumer electronics makers, office electronics producers, and distributors as stable. We may also regard some communications equipment makers as stable, depending on the proportion of revenue they generate from software, maintenance, and managed or professional services. Our cash flow volatility adjustments reflect a specific point in time and may change because they incorporate the business cycle and a company's credit metrics relative to key thresholds.

Section 34 | Technology Software And Services

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the technology software and services sector based on:

- The extent of a company's intellectual property (IP);
- The level of competition in the industry;
- The company's reputation and brand recognition;
- The proportion of recurring revenue;
- Record on customer retention and the switching costs customers would incur; and
- The company's operating performance record.

The type of revenue that a technology software and services company predominately generates--recurring or not--and the longevity of its customer relationships both have a strong bearing on its operating performance. Companies typically use license sales agreements or software-as-a-service contracts to generate recurring revenue. We also evaluate the level of competition and any barriers that may protect companies in the markets they participate in. For example, some software is embedded within a customer's operations, making switching far riskier and more difficult for customers.

Customers expect continuous improvements to the software and services offered, making strong investments in R&D vital to customer retention. We measure the strength of a company's reputation and its brand recognition by the tenure and performance of its contracts with clients, and the nature of these relationships. Well-differentiated products can command a price premium, especially if switching costs are high. Developing new or related products and services offers the opportunity to cross-sell and increases product and service loyalty.

Sector description

Companies that derive more than half of their revenue from providing information technology software and services.

Subsectors	Typical CPGP
Application software	Services and product focus
Capital-intensive IT outsourcing	Capital or asset focus
Consumer software	Services and product focus
Data processing and outsourced services	Services and product focus
Internet software and services	Services and product focus
IT consulting and other services	Services and product focus
Systems software	Services and product focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Strong operating performance supported by extensive existing IP and robust R&D investments.	Limited technological differentiation relative to peers.
Good position in a relatively concentrated or less competitive market.	Weak position in a relatively fragmented or competitive market; competes with multiple large players that have strong financial resources or with rising niche players that have strong product or service offerings.
Recurring revenue exceeds 70% of total revenue.	Recurring revenue comprises less than 50% of total revenue.
Operating performance consistently ahead of peers because of product differentiation or the ability to command a price premium.	Poor record of operating performance relative to peers.
Strong reputation or brand recognition.	Limited brand recognition.
Customer retention above 90% because switching is expensive or carries high risks (for example, because solutions are embedded in customer operations).	Weak customer retention and low switching costs, so that customers are relatively open to considering use of competitors' products.
Revenue growth prospects are supported by high proportion of long-term contractual client arrangements, or a high likelihood of favorable terms when contracts are renewed.	Few long-term contracts or long-lasting customer relationships.

Scale, scope, and diversity

We assess scale, scope, and diversity in the technology software and services sector based on:

- Operating metrics such as revenue, EBITDA, and free cash flow, relative to peers;
- Market share and how it is changing;
- Supplier and customer concentration; and
- Diversity in terms of end markets, products, and geographies.

The different software and technology services markets differ in size, with some dominated by a single player, and others being much more fragmented. Although scale offers some degree of competitive advantage, rapid technological changes can enable rising players to seize market share. To evaluate the evolution of market share, we measure scale by a range of different operating metrics. There is some scope for larger, more-established companies to benefit from efficiencies of scale or because they have the resources to invest more in R&D.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Leading player in more fragmented markets, with significant gap ahead of second and third players; or leading player within consolidated markets. Large scale, so that it generates a significant proportion of the total market by revenue, EBITDA, or cash flow.	No leading market positions (or only in small, niche markets) or many competitors have a similar market share.
Addressable end markets are large.	Addressable end markets are small and the company serves only a few verticals and has limited geographic diversity.
Customer base is geographically diverse and the company is not reliant on any of its customers (that is, the top customer contributes less than 10% of revenue and the top 10 customers contribute less than half of revenue).	Customer base is concentrated, so that one or more customers account for more than 10% of revenue each or the top 10 customers represent more than half of revenue.
Offers a broad array of products and services and serves multiple end markets, none of which exceed more than one-third of total revenue.	Solutions have a narrow focus in intensely competitive or cyclical markets.

Operating efficiency

We assess operating efficiency in the technology software and services sector based on:

- Economies of scale;
- Gross margin and EBITDA margin;
- The percentage of revenue spent on SG&A expenses and R&D;
- ROC;
- Flexibility of the cost structure; and
- Frequency of restructuring.

The more flexible a company's cost structure, the more likely it is to be able to limit margin deterioration in a downcycle. Working capital and capex requirements are relatively low in technology software and services--where we assess operating efficiency as strong, capital investment may represent just 3%-6% of revenue. We compare the R&D-to-sales ratio, and the size of the R&D budget, to evaluate whether a company is investing more in developing its product portfolio than its close peers; the success of the resulting products can be seen in a company's customer retention and record of revenue growth.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Profitability is above the industry average because of economies of scale and other efficiencies.	Profitability is consistently lower than or more volatile than that of peers.
Company is able to maintain an effective team while controlling overhead costs (based on SG&A as a percentage of revenue).	Spending on SG&A exceeds that of peers and this frequently leads to organizational restructuring.
Lower R&D-to-sales ratio compared with peers that have a similar market position and product set.	Ineffective investment in R&D has weakened the positioning of the product set.
The cost structure is relatively flexible.	Inflexible cost structures resulting from rigid labor laws, strong unions, problems with contracted service delivery, or high contract churn.
Effective working capital management that limits cash flow volatility.	Inefficient working capital management frequently creates cash flow volatility.
Capital intensity is low, such that capex represents just 3%-6% of revenue.	Capital intensity is high and this is combined with high fixed costs and limited outsourcing in production.
Operating margins are consistently positive.	Operating margins are only positive when industry conditions are favorable.
Strong order and backlog growth relative to peers through the cycle.	Limited growth or decline of orders and backlog through a cycle.

Financial Risk Profile

Supplementary ratios

If the preliminary cash flow/leverage assessment is intermediate or stronger, we typically refine our analysis using FOCF to debt or CFO to debt, which captures the lower working capital or capex requirements. If the preliminary cash flow/leverage assessment is significant or weaker, we typically refine our analysis using FOCF to debt or EBITDA to interest, which gives us more insight into the company's ability to service its debt.

Volatility adjustment

Commercial IT services, transaction processors, and enterprise and consumer software companies can easily differentiate their products from those of competitors, which increases the cost of migrating to another provider. As a result, we typically consider a high proportion of their revenue to be recurring and assess cash flow volatility as stable.

Some companies have low recurring revenue; for example, we may classify as volatile a software company that chiefly sells perpetual licenses, rather than subscriptions. A perpetual license sale is a one-time sale and changes in IT spending can affect timing of perpetual license sales. In addition, a decline in perpetual license sales can have a disproportionate effect on profit because of their high margins--gross margins often exceed 90%.

Section 35 | Telecommunications

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the telecommunications sector based on:

- Market position and competitive environment;
- Regulatory environment;
- Installed technology; and
- Customer quality.

Market position and competitive environment: In our view, market position for telecoms companies depends not only on market share but also on barriers to entry and the number of competitors. For example, we would expect a successful incumbent wireless telephone company to have preserved its dominant share of voice traffic in its market. By contrast, we would judge a wireless carrier competing against several other carriers as successful if it has increased its market share.

Regulatory environment: Regulatory stances vary widely from jurisdiction to jurisdiction. Pro-competition regulators often require the incumbent firm to lease its network to other operators at below-cost prices; in essence, to subsidize its competition. Other regulators protect incumbent firms by erecting substantial barriers that effectively prevent, or at least discourage, new entrants to their market.

Technology: The rapid pace of technological improvement in the sector has enabled industry providers to deliver more services, at higher speeds, and at a declining cost. As technology continues to advance, the state of a telecom company's installed technology can easily become dated. We consider the state of the company's technology, relative to its industry segment and competitors in its market:

- For a wireless provider, we would assess the availability of the latest technology, such as fixed wireless access offerings and 4G and 5G wireless standards; and
- For fixed-line broadband, including cable companies, we consider the deployment of digital technology and the extent of high-speed connectivity offerings, such as fiber to the premises.

A telecom company that has superior technology and can support more services at higher quality levels can demand premium pricing while attracting more customers and reducing churn. A company with a high level of installed technology can also invest in expansion and marketing initiatives to increase revenue. In contrast, a company with lagging technology is at a clear competitive disadvantage because it cannot offer a full array of market-competitive services. To remain a viable competitor, it will need to divert cash to making basic network upgrades, instead of investing in cutting-edge technology.

Sector description

Companies that derive more than half of their revenue by providing data connectivity services, including voice and video transmission or by leasing satellite capacity to companies such as wireless providers or broadcasters. For digital infrastructure companies, refer to section 13.

Subsectors	Typical CPGP
Cable and satellite	Services and product focus
Alternative carriers	Services and product focus
Integrated telecommunication services	Services and product focus
Wireless service providers	Services and product focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Customer quality: A favorable customer mix, in terms of contractual relationships and premium, creditworthy customers, can provide a competitive advantage. For providers of services that have limited differentiation and low switching costs, such as wireless services and wholesale voice and transport, an enforceable customer contract bolsters revenue stability, reduces marketing costs, and supports strategic planning by enhancing revenue visibility. In contrast, where a significant proportion of revenue is not under contract or the average remaining contract length is shorter than peers', providers of such services are at a competitive disadvantage.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Limited competition within a supportive, predictable regulatory framework that provides meaningful barriers to entry.	High level of competition within a regulatory regime that lacks stability and establishes few barriers to entry.
Successful market position, demonstrated by a leading or substantial (more than one-third) market share.	Lagging market penetration, or competition with far larger and better-capitalized operators, including global companies.
Favorable brand recognition and reputation; factors that support premium pricing; superior customer growth or retention; and lower marketing costs.	Unfavorable reputation that results in below-market pricing and inferior customer retention, leading to elevated marketing costs.
Participation in industry segments that have favorable longer-term growth prospects; or delivering services with demand characteristics more like those of utilities.	Reliance on commoditized or mature product offerings in structural decline.
Government policies that stimulate demand, such as durable subsidies for certain residential telecommunication services.	Government policies mandate the inclusion of influential domestic investors, which impairs operational flexibility and efficiency.
State of the art technology and, for wireless carriers, adequate spectrum for the predicted demand.	Limited ability to maintain adequate customer service levels and meet future demand due to lagging technology or lack of operational resources (for example, wireless spectrum or satellite orbital slots).
Predictable revenue and factors that reduce customer churn, such as contractual relationships or material switching costs for customers.	Revenue visibility is hampered by limited contractual relationships with customers.

Scale, scope, and diversity

We assess scale, scope, and diversity in the telecommunications sector based on:

- The size of the operator's service area and customer base, network, or other segment-relevant measures;
- Geographic diversity; and
- Product diversity, including the ability to offer a competitive suite of services.

The scale, scope, and diversity of a telecom company depends on its business stability and ability to realize economies of scale.

Service area and customer base: We examine how an operator's customer base and network assets affect its ability to realize economies of scale. For example, wireless and wireline service providers with larger service areas can carry more of their traffic "on-network," rather than paying for third-party carriage. This improves the utilization of and margins on network and spectrum assets with high operating leverage.

Scale enables wireless operators to offer customers broader service coverage without roaming, which is an added competitive advantage. Thus, regional wireless providers may be at a disadvantage as they offer nationwide service plans, but then pay substantial amounts to other wireless providers in order to service customers that roam off their own limited network.

Scale may confer bargaining power when negotiating for network and consumer premise equipment (CPE). For fixed-line players like cable or direct-to-home (DTH) operators, it can help them negotiate favorable terms with wireless mobile virtual network operators (MVNOs) or programming content providers.

Geographic diversity: In our view, participating in a variety of attractive and geographically diverse markets improves financial resilience should there be a regional market downturn. It also reduces the impact of exposure to aggressive competitors or specific local regulators. That said, diversification benefits may be offset by participation in less credit-supportive markets and may increase a company's exposure to country, regulatory, or competitive risks.

We assess diversity as weaker where significant proportion of a company' revenue come from weaker customers. Customer concentration is also a particular risk for companies that rely on a single major customer or tenant, with no visibility on replacement; this may affect satellite operators.

Product diversity: In reviewing product diversity, we consider a telecom company's ability to offer a competitive suite of products such as advanced fixed line and wireless connectivity, video, and other value-added services. An array of attractive bundled package offerings increases revenue per customer and improves customer retention. The telecom industry frequently sees customers substitute products and services for newer alternatives, as well as changes in customer demand; this makes product diversity particularly valuable. For example, many residential customers no longer pay for a physical telephone line because wireless services offer a suitable substitute for voice calls. The loss of these customers mostly affected companies that only offered wired telephone services--for integrated telecom companies, the impact was offset by growth in other segments, such as wireless, enterprise, and data centers.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Sufficient scale to optimize operating leverage or achieve economies of scale, given the significant fixed-cost component of network-intensive segments such as wireless and wireline, cable, long-haul transport, and satellite-based services.	A small customer base across which to spread fixed costs, or an inability to achieve economies of scale in procurement negotiations.
A service area sufficiently large to enable most traffic (terrestrial or wireless) to be originated, transported, and terminated on-network, with minimal need to pay for third-party carriage.	Limited service area or network coverage, forcing the provider to pay third parties to originate, transport, and terminate a material proportion of traffic.
Operations in several attractive and geographically and economically diverse markets.	Market concentration, particularly in a less-attractive market or jurisdiction where regulation and public policy are unstable, leaves an operator exposed to volatility.
Diversification across wired and wireless broadband product lines, which enables telecommunications providers to offer the attractive, integrated service bundles that improve customer satisfaction and retention and minimize the risk of product substitution.	Limited product diversification exposes the company to changing customer preferences. Customer churn is likely to increase where a provider cannot offer a service package that bundles and integrates wireline and wireless services, especially in converged commercial markets.

Operating efficiency

We assess operating efficiency in the telecommunications sector based on:

- The industry segment and related capacity utilization measures;
- The maturity of the market and cost management practices; and
- Customer service and quality metrics.

The operating efficiency of a telecom company is measured through metrics adjusted according to its industry subsector and the nature and maturity of its markets. We look at asset utilization, capex as a percentage of revenue, EBITDA margin, and the segment-specific measurements as detailed in the table below. We consider these factors in relation to peers; specifically, those that have a similar sales mix and operate in markets of similar maturity. For example, we may view a 50% EBITDA margin as consistent with adequate operating efficiency for a satellite operator, but consistent with strong operating efficiency for a wireless services provider.

Market maturity: The maturity of the market in which a company operates is also an important consideration. EBITDA margins at startups are depressed by the initial marketing costs and customer subsidies, combined with the impact of having fewer customers over which to spread fixed costs. Conversely, growth potential in absolute terms is limited in a mature market but the EBITDA margin is likely to be at its peak because per unit expenses such as marketing are lower and spread over a larger installed base.

Customer service and quality metrics: The company's performance in terms of customer churn has a knock-on effect on its operating efficiency. We therefore consider customer satisfaction and service metrics, as well as other quality metrics. These include customer call wait times, percentage of problems resolved on the first customer call and, for wireless operators, network quality measures.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
High revenue per customer or asset unit that results in an EBITDA margin consistently above peers.	Low per unit revenue that results in an EBITDA margin consistently lower than peers.
Capex as a percentage of revenue is lower than peers and ROC is higher than peers.	Capex as a percentage of revenue is higher than peers and ROC is low.
Superior customer satisfaction metrics that result in low customer churn	High customer churn that increases marketing costs.
Management actively works to anticipate which business segments show declining potential and mitigate this by expanding into areas with higher potential growth.	Management has a record of failing to anticipate and effectively mitigate the impact of declining business segments.
Residential wireline voice providers	
A record of reducing operating expenses to reflect weak long-term trends.	A record of failing to actively lower operating costs.
Wireless and fixed broadband providers	
Superior marketing performance leading to high ARPU and low SAC.	Subpar marketing or operational performance, resulting in inferior customer satisfaction, elevated churn with a low ARPU and high SAC.
Wireless operators	
Large service areas that can carry most traffic on-network and minimize payments to other carriers for off-network customer roaming.	Significant payments to other carriers to provide service when customers roam (particularly for regional operators that have a limited service area).
Fixed-satellite service	
High utilization of satellite transponder capacity.	Low utilization of satellite transponder capacity.

ARPU--Average revenue per user. SAC--Subscriber acquisition costs.

Financial Risk Profile

Supplementary ratios

In recognition of the capital intensity of most telecom companies, we primarily use FOCF to debt as a supplementary ratio. DCF to debt is also useful where companies make high dividend payouts.

Section 36 | Transportation Cyclical

Table of contents

Business Risk Profile

Competitive advantage

Cyclical transportation companies depend on the revenue potential of the segments and regions they operate in to gain a competitive advantage. Sizable shares of strong markets can give them a pricing advantage and bolster sales performance when economic conditions weaken. The factors we consider when evaluating competitive advantage vary by subsector.

Airlines

For airlines, we consider:

- Characteristics of the route network, such as access to major markets; national and global coverage, including alliances; whether hubs are well-positioned to serve connecting traffic flows; and the degree of competition from other airlines' hubs.
- The attractiveness of the markets served, in terms of growth prospects; proportion of premium traffic, which is usually more profitable; degree of competition within the market; and the effect of regulation on revenue and potential profit.
- The strength of the airline's position within the markets it serves, based on share of local traffic at the major airports being served; share of traffic on the airline's own largest routes; barriers to entry in core markets and airports served.
- Service standards and reputation, which are particularly important on intercontinental routes and for attracting business travelers and other passengers willing to pay a premium price.

Sector description

Companies that derive more than half of their revenue from operating airlines (including heavy air freight), shipping companies, trucking companies, or certain other types of transportation firms, such as bus companies.

Subsectors	Typical CPGP
Airlines	Capital or asset focus
Shipping	Capital or asset focus
Trucking	Capital or asset focus
Buses	Services and product focus

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

Shipping

For shipping companies, we consider:

- The attractiveness of the shipping industry segment in which the company participates, compared with other shipping segments. For example, we consider the dry bulk sector to be far more volatile and less predictable than the liquefied natural gas and liquefied petroleum gas tanker segments because companies in the gas shipping segments operate under very-long-term, take-or-pay contracts, with counterparties that are typically reputable. Thus, amendments or defaults under the charter agreements are rare.
- Size of fleet, based on the number of owned and chartered-in vessels.
- Overall attractiveness of the fleet, as measured by age, fuel efficiency, and technical characteristics of vessels.
- The size of the route network and its appeal to global customers. This will depend on the trade lanes in which the shipping companies operate and we generally view international operators with a global route network more favorably than regional players. That said, most international shipping segments are highly fragmented, with the largest operators typically having a 2%-4% share of the market. An exception is for container liners and shipping companies that operate domestically within the boundaries of just one country and may be protected by cabotage laws (that exclude outside competitors).

Trucking

For trucking companies, we consider:

- The degree of fragmentation, intensity of competition, and stability of volumes in the trucking segments in which the company operates. For example, gasoline volumes are relatively stable compared with construction material volumes.
- The attractiveness of the services provided (or the product mix) in terms of growth prospects; portion of contractual revenue versus spot revenue; and effect of supply and demand on revenue and margin potential.
- Position or geographic presence in key markets. For example, we may evaluate the depth of service or level of penetration in a specific lane or corridor between cities, or assess market share by tonnage in key lanes.
- Fleet size, because customers are increasingly choosing to rationalize their truck transportation arrangements to focus on fewer key suppliers.
- Service standards and reputation, which are particularly important for contractual business, for intermodal moves, and the transportation of hazardous materials such as chemicals and fuel.
- New products and complementary offerings, which are often driven by technological capabilities. These can be used to deepen customer relationships, by enabling the company to meet specific customer needs. They may also result in lower costs, improved service, and increased efficiency, thus raising switching barriers.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A leading or very substantial market share in the markets where the company operates.	Market share is modest or lags that of peers.
Participation in markets whose size, growth prospects, and competitive dynamics offer an opportunity to generate above-average revenue; or participation in markets that have much more stable demand and pricing than is usual for the cyclical transportation sector.	Below-average revenue generation because of participation in smaller, low-growth, or very competitive markets.
An ability to translate market leadership into higher revenue or stronger operating profits than its competitors.	Competes mostly on price, due to a lack of control over scarce infrastructure, spot or short-term contracts, or an inability to clearly differentiate its service.
Barriers to entry, established by controlling scarce infrastructure or by signing long-term contracts, that give the company more pricing power or more stable revenue.	Low barriers to entry, that give the company limited pricing power.
Participation in subsegments that have more favorable characteristics than average for the cyclical transportation industry, such as certain highly concentrated and stable bus markets.	Participation in segments that have less favorable characteristics than average for the cyclical transportation industry. For example, shipping bulk commodities (such as crude oil, coal, or iron ore) internationally is a highly fragmented segment that is very price competitive.

Scale, scope, and diversity

Cyclical transportation companies tend to have high operating leverage because they invest a substantial amount in fixed assets. Most also operate transportation networks so wide coverage of various regional markets makes it easier to attract customers. In our view, the volatility of their revenue and profitability can be mitigated somewhat by serving a diverse range of regions and customers.

The factors and statistics that we use in evaluating scale, scope, and diversity vary by subsector within the wider cyclical transportation industry.

Airlines

For airlines, we consider:

- Scale, measured as traffic in revenue passenger miles or kilometers, number of flights, and number of passengers.
- Geographic coverage of the route network. We expect revenue to be more stable if the airline targets a range of markets, globally or within a country.
- Balance between different types of travelers, such as business or leisure travelers. On average, premium travelers are more profitable, but if an airline relies too heavily on one type of traveler the potential for revenue volatility increases.
- Diversification in terms of nonpassenger businesses, such as air cargo, maintenance-repair-overhaul (MRO) or the sale of frequent flyer miles, and ancillary fees such as baggage and seat selection. Air cargo tends to have more volatile demand than passenger transport. The sale of frequent flyer miles typically offers high margins and relatively low risks.
- Airlines dedicated to freight services tend to be smaller and less diversified. In this subsegment, we focus on scale measured by revenue ton miles or kilometers or hours flown; length and terms of any contracts; regional or global coverage; diversity by products transported; and customer diversity.

Shipping

For shipping companies, we consider:

- The scale of the vessel fleet, which can improve end-market and customer diversity. Operators that have multiple classes of vessels (tankers, containerships, and bulk commodity ships) that are of various sizes, or those that participate in commercial pools, can carry a broad range of commodities and meet the needs of customers with widely different capacity requirements.
- The diversity of the customer base and the proportion of reputable charterers included; this limits counterparty risk and makes revenue more predictable.
- Geographic coverage of the route network. Having a route network with broad geographic coverage can serve as a natural hedge against weak demand and help an operator ride out cyclical downturns.

Trucking

For trucking companies, we consider:

- Their geographic coverage and diversity by end markets. Companies gain greater revenue stability by serving a variety of end markets within each country.
- Characteristics of the sectors and end markets to which they are exposed. Some sectors are more volatile than others (for example, retail is more volatile than fuel) and changes in demand will have a knock-on effect on trucking company revenue.
- Volume, based on tonnage per day and number of shipments per day. These metrics are particularly useful where a trucking company may benefit from economies of scale and gain a competitive advantage from providing extensive services on high-volume traffic lanes.
- Degree of customer concentration. Reliance on a key customer exposes companies to counterparty risk, which is mitigated if the company has a long-term relationship with its key customer and the customer has good long-term growth prospects.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
A sizable equipment fleet and broad service offerings, which can support above-average revenue generation and profit potential by offering better utilization, economies of scale, or a wide range of services that is attractive to customers.	Modest scale that leaves the company vulnerable to larger competitors and may force it to compete mainly on price.
Participation in a variety of markets with favorable supply and demand fundamentals, especially where demand in those markets is not closely correlated.	Participation in only a few markets, particularly if those markets have unfavorable growth prospects or are intensely competitive.
Diversity of customers, so that the loss of any single account does not have a material adverse effect on revenue and profitability.	High customer concentration or heavy reliance on one or a few customers.

Operating efficiency

A cyclical transportation company that has a high degree of operating efficiency should generate stronger profit margins under all market conditions. We focus on:

- Cost structure;
- Asset utilization and efficiency measures such as revenue or cost per unit of capacity; and
- Operating profit margins.

Revenue generation tends to vary according to market conditions. Therefore, we view cost structure as a more consistent means of differentiating companies and place greater emphasis on operating costs.

Airlines

For airlines, we consider:

- Revenue generated per unit of capacity based on metrics such as passenger revenue per available seat mile (PRASM), passenger revenue per available seat kilometer (PRASK), or revenue per ton kilometer (RTK). Airlines tend to report different metrics in different countries and regions. Reporting on a per ton kilometer basis is useful for airlines that generate a significant proportion of their revenue from carrying freight. We may also assess revenue generation by looking at yield, which helps us assess pricing; and load factor, which helps us judge utilization.
- An airline's operating cost per unit of capacity, based on measures such as operating cost per available seat mile (CASM), operating cost per available seat kilometer (CASK), or operating cost per available ton kilometer. We may also look at fuel and labor costs. The cost of labor, in particular, can be a good way to differentiate airline cost structures. Operating statistics are most useful when compared across direct competitors because market characteristics can vary significantly by country or region.
- The age and fuel efficiency of the aircraft fleet: Younger and more fuel-efficient planes generally have lower operating costs.
- Whether the fuel exposure is hedged. Although fuel hedging is expensive and adds to operating costs, it can guard against sharp increases in fuel prices that could weigh on profits.

Shipping

For shipping lines, we consider:

- The proportion of vessel revenue days (calculated as ship available days, minus the days that vessels are not available for employment--for example, due to repairs or dry-docking) that are committed to long-term charter agreements, rather than being sold via the spot market. Long-term, fixed-rate, noncancellable charters normally translate to less volatile and more predictable revenue streams, compared with spot contracts.
- The length of any charter agreements. This indicates the pricing and utilization risks the shipping company will be exposed to when the contracts come up for renewal.
- Vessel utilization compared with peers. This can be influenced by the proportion of ships under long-term charters or in pooling arrangements.
- Physical condition of the fleet, based on age, engine-type, fuel consumption, and technological advancements. Younger and more fuel-efficient ships generally have lower running costs and are preferred.

- The degree to which the shipping company bears the risk of changes in bunker fuel (which is used to power ships) prices. Operators whose vessels are subject to time charters are generally able to pass fuel costs to their customers; spot market operators bear the risk of fuel price volatility.
- Daily operating break-even costs, compared with peers and industry averages. Operating costs typically include vessel costs (such as crew, and technical and management fees) and voyage expenses (such as fuel costs, and port and canal tolls).
- Operating flexibility, measured by the proportion of tonnage chartered-in, versus owned. Operators that have chartered-in ships can return ships when their charters expire, which is particularly valuable during cyclical downturns.
- For unionized shipping companies, we evaluate labor relations and labor costs, and assess whether the union or unions could disrupt operations in the event of a contract dispute.

Trucking

For trucking companies, we consider:

- Operating efficiency metrics, such as the operating ratio (operating expenses, including depreciation, as a percentage of operating revenue) and operating margin before and after depreciation.
- Asset utilization metrics, such as the proportion of empty miles (where no freight is being carried) and the deadhead percentage (trips for truckload companies with no cargo needed to reposition the trucks for another assignment).
- Measures related to pricing, such as revenue per hundredweight (for less-than-truckload companies) or revenue per loaded mile (for truckload companies).
- Physical condition of the truck fleet, measured by age. Younger fleets generally have lower operating costs (including maintenance), require less capex, and comply more fully with regulatory requirements.
- For unionized trucking companies, we evaluate labor relations and labor costs, and assess whether the union could disrupt operations in the event of a contract dispute.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Sustainable operating cost advantage, caused by economies of scale, lower labor costs, more fuel-efficient equipment, or process efficiencies, and measured by segment-specific operating statistics.	Below-average operating profitability because operating costs exceed those of competitors and are not offset by sustainable, stronger revenue generation.
Sustainable revenue advantage, caused by stronger asset utilization or product differentiation, measured using segment-specific operating statistics.	Below-average revenue generation that is not offset by consistently lower costs, resulting in subpar operating profitability.
Transportation equipment that is newer, more fuel-efficient, and more suitable for the services provided than that of competitors.	A fleet that is less fuel-efficient on average than those of competitors.
Relatively stable and positive labor relations, particularly for passenger transportation companies, where morale can affect service and reputation.	Labor relations or provisions in labor contracts have the potential to affect a company's ability to operate efficiently.
Regulations, if any, that do not materially erode operating efficiency, relative to competitors. Examples of regulations and other government policies that can be supportive of an airline industry include government investment in airports and air traffic control, competition policy that does not block mergers of airlines that otherwise might fail, and environmental regulations that do not place airlines at a disadvantage compared with competitors in other countries or regions.	Volatile operating profitability because of exposure to risks from stronger competitors or other unfavorable underlying market characteristics or changes.

Financial Risk Profile

Core and supplementary ratios

We view transportation cyclical as prospectively volatile. Accordingly, as stated in our corporate methodology, we typically calculate our ratios by applying a 50% weight to the current year and a 50% weight to the first forecast year. Where a company operates in a subsector and segment that is less volatile than most cyclical transportation segments, such as certain bus markets, we may calculate our ratios based on five years, as we do for most corporates.

Section 37 | Transportation Infrastructure

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the transportation infrastructure sector based on:

- The transparency and predictability of the regulatory framework, or the concession or contract, under which the company operates; and the potential for changes to regulatory policy and/or to government intervention (negative or supportive); and
- The demand risk, which depends on the size and attractiveness of the catchment area, including location, population served, wealth and economic strength and growth potential, and contribution to the regional development.

Regulatory or contractual framework: We consider how tariffs are set; how regulated revenue is determined and shared; and the regulator's record on oversight, protection of stakeholders, and enforcement of legal or contractual constraints. Mandatory investments, with no legal or contractual means of recovering these capital costs, may place some transportation infrastructure companies at a competitive disadvantage.

Demand risk: We consider the company's specific role and relative value added to users and economies relative to other modes of transportation, as well as the stability and type of traffic. Key competitive drivers are market share dynamics and the nature of competition, including the number of competitors and the presence of alternative modes of transportation.

Airports

Regulation, oversight, and tariff-setting mechanism: Regulated airports may benefit from transparency and visibility on the determination of tariffs, while commercial airports may be more exposed to competition but enjoy greater tariff-setting ability. For regulated airports, we assess the independence and predictability of the regulatory framework underpinning the operation of the airport. We focus, in particular, on the ability to adjust tariffs and recover costs in a timely manner, as well as earn a reasonable return supporting access to markets. Pricing frameworks include "single till," "dual till," and "hybrid till" models:

- The single-till method caps the maximum return on total airport assets, including commercial revenue sources (such as retail, parking, or property revenue). This provides more certainty to returns and earnings, and is generally considered as more credit protective by reducing volatility, lowering downside but also limiting upside.
- Under the dual-till method, the returns on aeronautical assets are regulated or subject to oversight, while the commercial revenue sources (such as retail, car parking, or property) are unregulated. This method permits substantial upside from growing airport revenue, and gives the airport management a greater role

Sector description

Companies that derive more than half of their revenue from (or for which more than half of their assets are) the regulated or commercial operations of airports, road networks, railways system (including rail tracks, passenger, and state-owned freight railway), and other assets and services, such as navigable waterways, or air and marine controllers.

Subsectors	Typical CPGP
Commercial transportation infrastructure such as car parks and ports exposed to competitive pressures such as short-term agreements with shipowners, tariff structures, or competitive factors	Capital or asset focus
Regulated infrastructure, such as airports, roads, ports, mass transit, and railways, which is typically subject to government policy and regulation that limits competitive pressures and supports stable profitability	National industry and utilities

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

but, equally, could represent more downside risk during economic downturns or unsuccessful commercial strategies.

Finally, we factor in any obligations or constraints under license and permits, future development rights, operating conditions such as curfew hours, noise or environmental restrictions, and related penalties.

Demand risk: We consider:

- The size and attractiveness of the airport's catchment area and markets, including wealth and economic strength and growth potential. We also incorporate environmental trends, which differ by region, and their potential impact on the airport's profitability.
- The stability and type of passenger traffic. Transit passenger numbers tend to fluctuate more than origin-and-destination (O&D) passengers. In addition, domestic (long-distance) traffic may be more essential than certain international routes that could be subject to higher geopolitical or health and safety (for example, pandemic outbreaks) risks. Similarly, tourist numbers tend to be more affected by economic trends than flying to visit friends and relatives.
- The competition from other airports in the catchment area or alternative modes of transport (for short-haul). Lack of alternatives may make airports essential to remote areas or islands, and good connectivity with other transport links can also offer protection to volume risk. International hubs, in particular, can gain a competitive advantage through their aeronautical charges, airport facilities, airline network, or connectivity.

Roads

Regulatory framework: For roads, we assess how closely their regulatory or contractual framework is aligned with the government's infrastructure policies and long-term plans, and the road financial design and stability. A strong framework that includes clear pricing or tariff-setting mechanisms, will attract long-term capital and offer operators the ability to recover their operating and capital costs in a timely manner.

Demand risk: We consider:

- The location, wealth, and size of the populations and markets the road serves, its connectivity with the regional economy and other roads, the purposes of the trips being made, and user affordability.
- The stability and nature of traffic volumes. For example, commercial traffic (heavy goods vehicles) typically reacts more than light traffic vehicles under adverse macroeconomic conditions, heightening the impact of an economic downturn on the road. Roads that collect availability payments are exposed to lower traffic risks than those that collect tolls.
- The competition in terms of existing or future transportation alternatives and other operators. When analyzing the value for money a project offers users, we focus mainly on time savings and security, compared with alternatives.

Car parks

We analyze car parks that operate under long-term concessions, with tariff setting mechanisms and contractual protections that resemble those of toll road operators, as infrastructure companies under our criteria. When assessing this sector, we consider the size and diversification of the portfolio, as well as the location of key assets and their proximity to users' final destinations; parking alternatives (such as on-street parking); and long-term changes that

may fuel an increase in demand for parking, such as the development of event facilities, or the area becoming a tourism or business destination.

Ports

Regulatory framework: For ports operating under concessions, we consider the legal strength of any contractual provisions implemented to prevent overcharging and the transparency of components such as mandatory capex requirements and conditions for unions working on site. At the same time, we assess the extent to which a port depends on the service decisions made by shipping lines.

Demand risk: We consider the ports' location, connectivity, and position with respect to global or regional trade routes; the catchment area it serves; and its past record of volume patterns during economic downturns versus peers. To assess exposure to demand risk, we also consider the company's operating and traffic performance. In some cases, ports benefit from guaranteed revenue, or from harbor dues or fees that are subject to long-lasting agreements, making usage more predictable. By contrast, where ports have high exposure to commodities, traffic may be more volatile. Traffic will also be affected by physical constraints, such as the depth of an access channel or the port's network of intermodal transport connections (rail links, inland shipping, the road network, and pipelines).

Mass transit and railway

Regulatory framework: Mass transit and rail services (including passenger and freight rail networks) could be provided under a wide variety of regulatory, legal, political, or contractual frameworks and concession agreements. Competitive advantage is assessed by considering government policy, the scope of services provided, asset profiles, competition and affordability, and the provider's ability to access ancillary revenue.

Typically, rail services are provided under a bilateral agreement between the government and the provider that specifies which services are considered public service operations (PSO) and regulates their provision and remuneration. Because governments usually subsidize PSO services, a material part of the funding is exposed to approval of the public budget. We assess these agreements based on:

- The transparency of the key components used to set rates;
- How long they last and the clarity of the renewal process;
- Whether all operating and capital costs can be recovered; and
- What incentives exist to improve the service.

Some freight rail networks are operated under a franchise agreement with the government (that is, the company gets long-term licensing rights to operate the business during the franchise agreement, but the government retains step in rights).

Government policy: Close alignment with national and local infrastructure planning and policies is beneficial for mass transit providers and freight rail networks. Environmentally focused government policies could encourage investment in railways because trains are more environmentally friendly than airlines and automobiles. Large, densely populated cities could also significantly reduce transport congestion and improve commuting efficiency by developing an extensive metro network. The cost to users of mass transit systems can also be politically sensitive, making regulatory or governmental intervention to keep prices affordable likely. This can significantly affect the quality of cash flow. In some cases, governments regulate the fare at

a low level but provide regular operational subsidies to compensate the companies or will reimburse them by allowing land sales or access to property development earnings. Similar concepts apply to freight rail networks particularly if governments are focused on transition from road to rail freight.

Demand risk: Competition from alternative providers and alternative means of transport affect traffic stability, especially under adverse macroeconomic conditions. Long-distance mass transit competes with road networks and airports, and companies that depend on tourists are exposed to fluctuations in demand over the economic cycle. Although commuter traffic, including intercity commuting, is a more stable source of income, it remains exposed to the domestic economy and level of work-from-home activities. Customer choices are affected by the operating history and track record of transit companies, which is critical for the rail sector because it is exposed to alternative travel options. We consider metrics such as service punctuality, user satisfaction, and passenger safety when assessing the user view of quality of service and value for money. Rail networks may or may not carry volume risk depending on contractual arrangement/regulation. Customer loss and product concentration can affect traffic stability, unless the rail networks have the ability to spread their costs (operating and capital investment cost through contractual arrangements or regulatory mechanisms) across users, which would support the business through economic cycles and profitability.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
The company provides an essential service to a national or regional economy. The area the company serves is large and wealthy and includes a capital city, economic hub, or strategic routes.	The company serves a relatively small or weak economy and/or demand patterns can be considered as volatile or uncertain.
Limited competition.	Competition from operators or other transportation modes is meaningful, creating volatile demand and price pressure.
The company offers a strong value for money, benefitting from a strong asset rationale and a stable and resilient demand.	The value added by the company could be perceived as limited by end users, resulting in demand uncertainty.
The regulatory or contractual framework or concession agreement is transparent, predictable, and consistent, and enables adequate and timely cost recovery. Alternatively, the entity enjoys strong own tariff-setting ability.	The regulatory, legal, or political framework or concession agreement is unfavorable or unpredictable, and no compensating mechanism has historically been provided.
There is no history of adverse government or regulatory intervention on infrastructure assets, and we do not expect such intervention in future.	Recent history of adverse government or regulatory intervention in the transportation infrastructure industry or other regulated industries. Additional costs or investment requirements were not economically or financially compensated.
Airports	
The airport is dominant within its catchment area and competition from adjacent airports or alternative transportation modes is limited.	The airport is exposed to above-average competition from other airports in the catchment area or in the case of transit passengers, in the region; or there is greater competition from other modes like high-speed rail, in the case of short-haul traffic; or serves as an end point for a catchment area suffering from a structural economic decline.
The airport serves a variety of traffic flows, including a significant share of Origin & Destination traffic. Any significant share of transit passengers is mitigated by track-record and/or established position as an international hub.	The airport has a high share of transit passengers, or serves a niche market such as business, tourism or other travel if we see such traffic as more volatile and sensitive to economic or geopolitical drivers.
The airport is geographically well positioned and connected to road and railways networks.	The airport serves as an end point, and/or lacks accessibility, with limited connectivity to roads and railways

Strong or strong/adequate	Adequate/weak or weak
Airport routes are attractive to ensure that departing airlines could be replaced quickly.	Declining route attractiveness and/or high airline concentration, with non-competitive cost structure.
Aeronautical unit charges are in line with or lower than peers. If higher than peers, the charges are considered affordable by users.	Aeronautical unit charges are higher than peers; or weak ability to pass-through costs when tariffs are set by regulator.
Credit risks from environmental or other regulations are seen as manageable.	Opposition from the government or local communities on grounds of environmental concerns or noise pollution could be disruptive, and this is not mitigated in our view by the regulatory framework. One or more of the company's airports is exposed to extreme climate risk.
Roads and car parks	
The company is dominant within its market, and/or is part of a national or regional network. The asset(s) serves a developed, stable, and diversified local economy with high income per capita, low unemployment, and observed stable correlation to GDP.	Specialized asset with narrow end user universe. The asset(s) serves developing, volatile, and/or undiversified local economy; high unemployment; observed divergence between GDP and traffic growth.
Point of origin and destinations are linked to roads and their major economic or population centers.	Point of origin and destinations are not linked to major economic or population centers.
Track record and strong contracts ensuring passive protection (competing facilities will not be built or upgraded) and active protection involving government action (traffic-calming).	The company cannot recover its fixed and variable operating costs, investments, and capital costs (depreciation and a reasonable return on investment) in full or on a timely basis through the economic and political cycle.
Competition from other transportation links and infrastructure operators is limited and stable.	Stiff competition from other transportation links and infrastructure operators.
The road represents a significant proportion of the total end-to-end average journey and time saving is significant compared to alternative routes.	The road is a stand-alone facility with no link to any other major network.
Protective legislation is in place that could lessen the threat from alternative transportation modes and ensure robust cash return.	Several future threats can be identified that could affect growth prospects.
Clear pricing or tariff-setting mechanisms, with track record of its ability to adjust the tariff as per concession or contractual framework.	Record of riots or protest against tariff increases, which aren't economically or financially compensated on a timely basis.
Steady traffic profile due to high reliance on commuters or, for car parks, an access to a variety of destinations, such as shopping centers, airports, or industrial sites.	High recreational traffic (seasonal demand) and/or high reliance on commercial vehicles
Ports	
The port serves a broad catchment area where trade routes are active and attractive. It has a dominant market share, or limited threat of loss of market share to neighboring ports.	The port serves a narrow catchment area that is on secular decline, or reliance on a limited user base or single industry that has uncertain long-term prospects. It faces strong competition from nearby ports and is exposed to uncertain competitive dynamics or cannibalization from other ports over the medium to long-term.
The port enjoys a natural competitive advantage due to its geographic position, for example close to large population centers that provide robust local demand for goods, water depth of the access channel, and/or fit-for-purpose. The port benefits from interconnection with existing infrastructure in its hinterland.	The port has geographic or asset constrains, such as limited water depth or lackluster interconnection to hinterland.
Established and clear mechanism of setting port charges, with supportive leasing and commercial activities.	Unclear mechanism for setting port charges, with restrictions on leasing and commercial activities.
For market-determined charges, the port has high negotiating power with its customers.	The port has a track record of poor negotiating power with its customers.
Mass transit/railway	
The company is dominant within its market or markets, has a large network, and competition from other transportation links or modes and operators is limited and stable, contributing to stability in passenger or freight volumes.	High sensitivity to fluctuations in volume exposes the company to cash flow volatility; or volumes are expected to show a structural decline, with no offsetting mechanism, such as government support.
The catchment area is wealthy and there is some flexibility to raise tariffs.	Tariffs cannot be raised without causing user affordability to drop, or are kept low for socioeconomic reasons, and there is no ongoing support.

Strong or strong/adequate	Adequate/weak or weak
Price setting mechanism / subsidies is supportive and ensure adequate cost recovery, including return on investments. Mechanism to recover capex is clearly defined.	Price setting mechanism is ad hoc and do not cover costs. Mechanism to recover capex investment is not defined well.

Scale, scope, and diversity

We assess scale, scope, and diversity in the transportation infrastructure sector based on:

- The various revenue streams and their key drivers;
- Geographic footprint, including the size, diversity, and maturity of a company's assets; and
- Remaining asset or concession life.

Although transportation infrastructure assets require a high initial investment, the marginal cost of servicing additional demand once the asset is operational is relatively low, until the capacity has been fully utilized. Ultimately, the benefit of scale and diversity is that traffic demand and revenue are more stable. Therefore, when assessing scale, scope, and diversity, we typically focus on operations.

Participating in a variety of markets that have favorable supply-and-demand fundamentals and are not closely correlated is positive, but not a precondition for scale, scope, and diversity to be assessed as strong or strong/adequate.

Airports: We analyze the number of passengers relative to other facilities in the area; the traffic type (O&D versus transit, friends and family, for leisure, or for business); overall revenue diversity, and the extent to which revenue is correlated. We take into consideration the airport's split between aeronautical versus nonaeronautical, that is, commercial revenue (retail, property, or leased assets), as well as what proportion comes from cargo volumes. We analyze the factors underpinning revenue stability and growth, including contracts tenor.

Customer concentration would normally preclude us from viewing scale, scope, and diversity as strong. However, the negative impact of concentration may be offset if we believe the carrier(s) can be promptly replaced or if we believe that the default of a carrier would not result in traffic interruptions and materially affect the aeronautical payments or passenger volumes; the airport has strong credit fundamentals; or government support (to the airport and/or the carrier) or other mitigants are in place.

Roads and car parks: We analyze the company's revenue streams and their key drivers, including any long-term contractual income (for example, from property, leased assets, or availability payments); the remaining life of the asset or concession, or the weighted average in the case of a portfolio of assets, and the prospects of concession extension/renewal to sustain cash flow; and the size, geographical diversity, and maturity of the markets the company serves, and the number and diversity of its customers or users.

Ports: Port activity is affected by trade and economic cycles, political and economic policies, natural hazards, and exposure to cargo demand and interruptions, including from competition for handling cargo from other ports and regions. However, customer, regional and geographical diversity can mitigate the risks to port operations. Government policies concerning foreign trade, currency, and agriculture can have a significant impact on the amount of cargo flowing through a specific port. Ports well positioned to ride out any temporary or cyclical disruption to the flow of one or two products have serving catchment areas that have developed a broad array of trading

partners, handle a range of cargo types, and/or have a stable relationship with the communities in which they operate as well as major shipping lines that call on the port.

We also analyze the port's sources of revenue, including any long-term contractual income (for example, contractual agreements with shipping lines, port tenants, or leased assets). Key metrics include the revenue split in terms of regulated versus commercial, by cargo type, and across different ports, given the speed of loading and offloading and the relative distance to competing ports.

If a port's competitive advantage is adequate or below, significant customer concentration may present additional risks. In addition, ports are exposed to the volatility of the shipping industry which is vulnerable to system shocks and frequent supply-and-demand imbalances that are beyond their control. These may include exposure to commodities such as oil and gas, iron ore, and coal. A single or large tenant, commodity concentration or high proportion of trans-shipment cargo also expose the port operator to changes in global or regional markets, or supply chains.

Mass transit/railway: We analyze the company's revenue streams and their key drivers, including the share that is not regulated, such as retail and real estate revenue; the size, geographical diversity, and maturity of the markets the company serves, and the number and diversity of its customers or users. Where available, we consider the proportion of income from commuters versus noncommuters; and where relevant, the split between long- and short-haul transport. Diversification is less important in this sector because mass transit and rail assets are viewed as essential, and are typically monopolistic.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
The remaining asset or concession life is comfortable or in line with peers, typically 10 years or more.	Remaining life of the asset or concession is limited or less than five years, and it is unclear whether it will be renewed.
Airports	
High proportion of origin-and-destination passengers, of which we view those visiting friends and family to be the most resilient and stable group.	High share of transit passengers, especially if the number could be affected by competition from other hub airports.
High share of domestic or intraregional (for example, within the EU) passenger traffic, where these passengers are unlikely to switch to an alternative mode of travel.	Heavily reliant on more-volatile traffic, such as leisure, especially if tourism in the region is sensitive to economic and geopolitical risks.
The attractiveness and profitability of the routes suggest that the main carrier or carriers could be easily replaced within a short period, if these airlines were in financial distress.	Significant customer concentration, particularly when combined with a competitive advantage assessment of adequate or below.
Commercial revenue benefits from long-lasting contractual protections, such as long-term leases. Multiple and diverse revenue streams that demonstrate good resilience.	Revenue fluctuations caused by demand risk or exposure to short term leases and/or contracts.
Roads and car parks	
Mature assets that serve sizable and wealthy markets.	Small markets with limited wealth and poor growth prospects, or subject to intense competition.
Portfolio of assets	Single site/ asset
Ports	
Mature assets that serve sizable and wealthy markets.	Small markets with limited wealth and poor growth prospects, or subject to intense competition.
Large size of handling capacity and number of berths	Port operates a single berth or-has limited interconnexion with other infrastructures.
Regularly handles large shipping volumes and demonstrates diversity in terms of cargo, shipping lines, trade destinations, and the offtakers it serves, which are generally stable during different economic cycles.	Has experienced significant swings in tonnage or activity due to high reliance on a few commodities or industries.
If landlord revenue is part of its business model, typically has a diversified tenant base to procure its revenue and limited operating risk.	Significant customer concentration, especially where the company's competitive advantage is assessed as adequate or below.
Mass transit/railway	
Integrated operators, with diversified revenue streams, for example, responsible for managing the rail infrastructure and providing passengers rail services, such as retail and real estate. This could mitigate demand risk and support stability of cash flow.	Less integrated operator with limited variety of additional rail services.
Operate mature or strategic transportation assets that serve sizable and wealthy markets. For rail networks, diverse sectors and customers.	Small markets with limited wealth and poor growth prospects, or subject to intense competition.

Operating efficiency

We assess operating efficiency in the transportation infrastructure sector based on:

- A company's ability to manage its cost base to maintain profitability and free cash flow through the cycle;
- The cost of maintenance and investment needs, based on the age and quality of the assets and the extent to which capacity is utilized;
- Working capital management and the effectiveness of revenue collection; and
- Risk management, including quality of services and safety track record.

A transportation infrastructure provider that has a high degree of operating efficiency should generate stronger profit margins and be more able to adjust tariffs under the terms of its contract.

Ports: A port's ability to attract and retain shipping lines depends on it having sufficient capacity and delivering minimum service levels. Although the regulatory, legal, political, or contractual framework or concession agreement may enable the port to increase tariffs or be compensated for cost increases, we also look for indications that spending can be flexible, especially during periods of lower demand. Taking a modular approach to project development, for example, enables the port to defer aspects of new projects at need. In our view, this is vital to maintaining the port's underlying creditworthiness.

We assess the effect of government policies on maintenance and investment expenditure, the contracts the company has entered into, and its business plan. A company with greater operating efficiency will have a history of managing variable operating costs, for example, by using flexible outsourcing arrangements.

Mass transit/railway: We consider the company's record of investing in operational stability and resilience, including improvements to safety, given the industry's history of natural disasters and labor issues. In addition, we assess the effectiveness of any efforts to even out passenger (or freight) traffic volumes, such as use of dynamic pricing and any mechanisms within the regulatory, legal, political, or contractual framework or concession agreement that enable the company to increase tariffs or be compensated for cost increases, inflation, or higher interest costs. Conversely, we also consider whether the company can adjust expenditure when demand is lower based on our view of the effect of government policies on maintenance and investment costs, the contracts the company has entered into, and its business plan.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Ability to maintain profitability through most of the cycle, either by managing the operating cost base or by quickly adjusting tariffs in response to rising costs.	An inability to manage the cost base or adjust tariffs within the next two years.
Regulatory, legal, political, or contractual framework or concession agreement supports the ability to adjust tariffs in a timely fashion when costs increase.	Operates in a competitive price environment and lacks regulatory, legal, political, or contractual framework or concession agreement.
Limited need for maintenance capex as long as assets are operational and in good condition.	Significant investment needs without an agreed mechanism for recovering the cost, or remuneration is significantly back-ended.
Stable cashflow generation and good working capital management, including flexibility to reduced maintenance cost in during downturn period.	Poor working capital management, or exposure to late payments and customer defaults.
Maintain a good track record of quality of services and safety.	Below average quality of services key performance indicators (KPIs), and history of safety events within the operator's control.
Airports	
Capacity expansions are well planned and de-risked, supported by contractual agreements with potential customers.	Lack of mitigation for the significant construction execution risks associated with sizable capacity expansion projects, especially if we view the airport operator as having limited expertise.
Toll roads and car parks	
Use of effective tolling technology and history, with high control of toll leakage or improving trend.	Typically uses manual tolling or an unreliable tolling system so that, historically, toll leakage has been high.
Ports	
High capacity utilization and operating KPIs. Salaries and other labor payments do not weigh on profitability.	Capacity constraints can arise because of regulation, prevailing weather, ship size, or infrastructure. Below average operating KPIs. Restrictive labor standards in terms of pay, benefits, and rewards are highly influenced by the presence of labor unions.

Financial Risk Profile

Volatility tables

We apply the low volatility table to transportation infrastructure companies that derive more than two-thirds of their operating cash flow from transportation infrastructure activities that we view as predictable, with the rest of their activities being not seen as high-risk or volatile, or not contributing a significant amount to the group's overall risk profile.

In addition, the company must:

- Have a CICRA of '1' or '2' and have a competitive advantage assessment of strong or strong/adequate; or
- Have a CICRA of '3'; have a competitive advantage assessment of strong; and have limited exposure to competitive risks or revenue volatility; a regulatory, contractual, and legal framework we view as supportive; and low risk of major negative political intervention.

We apply the medial volatility table to transportation infrastructure companies that do not qualify for low volatility and have all of the following characteristics:

- Derive at least half of operating cash flow from transportation infrastructure activities we view as predictable;
- Do not engage in activities that we consider present a significant risk to the overall profile;
- Have a CICRA of '3' or better; and
- Have a competitive advantage assessment of at least adequate; a regulatory, contractual, and legal framework we view as supportive; and low risk of major negative political intervention.

In all other cases, we use the standard volatility table.

Core ratios

Debt service costs are typically significant for transportation infrastructure companies, making FFO to debt the preferred measure of their cash flow/leverage.

Supplementary ratios

Our preferred supplementary ratio in this sector is FFO cash interest coverage.

Modifiers

Financial policy

When a transportation infrastructure company operates under a concession, it is required to repay its debt before the assets are due to return to the concession grantor. As a result, we include the company's strategy for reducing leverage conditions or to replace the expiring cash flow well in advance, in our assessment of its financial policy. If a company lacks a credible plan to decrease its leverage well before the end of the concession, we would likely assess it as having negative leverage tolerance.

Section 38 | Unregulated Power And Gas

Table of contents

Industry Risk

Cyclicality

We assess cyclicality for the unregulated power and gas industry as moderately high risk (4). The industry has evolved over different periods of time around the world but, globally, it is considered to be relatively young. As such, the data available to analyze the industry's performance during recessions is more limited, and we consider the little we have to be inconclusive. The unregulated sector has rapidly developed into an integral component of the global power and gas industry; therefore, we expect to gain more directly relevant peak-to-trough data over time. Until then, based on the industry dynamics demonstrated so far, we align the cyclicality assessment with our competitive risk and growth assessment and consider that the level of cyclicality for the unregulated power and gas industry warrants a moderately high risk assessment.

Business Risk Profile

Competitive advantage

Unregulated power and gas companies, such as renewable generation companies, don't benefit from protective rate regulation. However, they may benefit from policy support and gain competitive strength from fixed-price or feed-in tariffs, or from long-term contractual arrangements with creditworthy off-takers.

We assess competitive advantage in the unregulated power and gas sector based on:

- Market structure and attractiveness;
- Earnings structure and stability; and
- Asset mix and quality or technological advantage.

Market structure and attractiveness: The risk level of an unregulated power and gas company is heavily influenced by the markets in which it operates. We anticipate that operating stability would be affected by public policies in areas such as energy and the environment. The market structure in the relevant national, regional, or state jurisdiction may also have an effect, based on the degree of market liberalization; types of contract in use; mix and age of generation assets; weather impact; quality of interconnections with other markets or price zones; risk of curtailment; contracting and pricing structures; structural balance between supply and demand; and market liquidity, transparency, and growth rate.

Earnings structure and stability: This can vary widely, depending on price volatility and the specific utility's contractual price protections. For entities that produce, buy, and resell power and gas, we analyze factors that may affect competitive pressure, such as barriers to entry; potential exposure to short positions;

Sector description

Companies that generate and sell electricity--or buy and resell power and/or gas in some combination of energy or capacity--through bilateral agreements with a variety of counterparties (for example, to utilities and other intermediaries, directly to end consumers, or to a market administrator or system operator). They may be supported by policies such as fixed-price or feed-in tariffs, or long-term contractual payments with creditworthy off-takers, but do not benefit from regulated rates.

Subsectors	Typical CPGP
High-risk pure retail supply in fragmented markets where price competition is intense	Commodity focus/scale driven
Independent power producers and energy traders, or vertically integrated energy companies that own retail or wholesale operations and require sizable capital investment	Capital or asset focus
Low-risk retail supply companies (for example, district heating, or companies that have a near-monopoly)	National industry and utilities
Merchant power	Capital or asset focus
Pure retail supply in markets where price competition and customer churn are modest	Service and product focus
Renewables, primarily sold under long-term contracts	Capital or asset focus

customer-base stability; ability to pass on cost increases to customers; and price structure and flexibility with end consumers. We also look at brand reputation; hedging and procurement risk; the range of products the company offers; customer satisfaction; customer churn rates; policy interference in market rates; and demographic trends. Credit-supportive features may include the ability to transfer pricing and, in some cases, volume risks.

For electricity generators and supply companies, long-term and attractive pricing certainty may be achieved via long-term contracts for differences (CfDs) or feed-in tariffs, or through flexible long-term off-take agreements (sometimes referred to as power-purchase agreements) with creditworthy counterparties. Separately, entities may mitigate pricing volatility through hedging, depending on the liquidity and depth of the energy derivatives market. In certain markets, part of the generation capacity may have firm energy obligations (also known as "must-dispatch status") for which companies are remunerated via capacity mechanisms that can enhance long-term cash flow predictability. Separately, renewables subsidy schemes may enhance predictability but can sometimes be subject to retroactive government interference.

Where companies are exposed to merchant risks or rely on spot markets to sell a high proportion of their volumes, we anticipate that earnings may be more volatile. A history of temporary short positions that force a company to source volumes in the spot market to meet its sale commitments would weigh on our assessment. This can occur where a company has committed to sell a certain volume at a fixed price and supplies are disrupted by unforeseen low-probability, high-impact operational, climate-related, or market events.

Asset mix and quality or technological advantage: Technological advantage--in particular, the quality and attractiveness of a company's generation portfolio--is key to ensuring long-term profitability in the sector, particularly for merchant power. We assess it based on:

- Generation type, fuel mix (thermal, hydro, renewables, or nuclear) and carbon intensity;
- Position in the merit order, which ranks all generating assets serving a market by marginal cost position, and dispatching profile (base, mid-merit, or peak load);
- Age profile and reinvestment needs (related to retrofits or replacement); and
- Location with respect to end customers and proximity to raw material inputs (such as integrated coal mines, a gas hub, or a major transmission line)

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Participates in a market or region that has well-established and predictable market rules, including transparent and reasonably predictable environmental rule-making processes.	Participates in a market or region that has poorly defined and unpredictable or transitory market rules; or a market that is undergoing significant structural changes and is subject to high uncertainty.
High barriers to entry, low market volatility, low competitive pressures, manageable structural changes (including from environmental net zero regulations or carbon taxes), and balanced supply-and-demand characteristics.	Low barriers to entry, high market volatility or uncertainty, weak medium- and long-term growth prospects, or supply-and-demand characteristics that are often unbalanced.

Has gained a technological advantage through its attractive and diverse mix of generation assets that have low variable costs, such as renewables.	Poor asset mix and quality.
Asset base is well-invested in diverse and favorable locations and has sufficient dispatchable capacities to limit supply shortages and exposure to extreme price spikes (this may include nuclear, hydropower, and--in some markets--gas-fired generation).	Asset base is in unfavorable locations (for example, it is exposed to curtailment) or has significant and unmitigated exposure to energy transition risks (for example, assets that have high greenhouse-gas emissions and may dispatch only under certain conditions).
Price risk has been sharply reduced or eliminated through regulatory or contractual protections or long-term off-take agreements with creditworthy counterparties, especially if the counterparties show diversity and the agreements last longer than eight years (or, for shorter agreements, renewal on similar terms is highly likely).	The earnings profile generally shows significant volatility over the short or medium term because most volumes are exposed to merchant risks, sold in spot markets, or sold at unfavorable prices, with only a modest level of hedging.
Strong retail market shares, or market position that benefits from generation dispatch and a generally stable retail market share that helps to limit load mismatch and lessen any reliance on selling into or procuring from a competitive market.	Shares in retail markets are relatively small and may be unstable; business model focuses on retail markets with only modest integration of operations and are typically subject to high competitive pressures or regulatory or country risks that impede the ability to pass along costs to end customers; or the company is a pure price taker.

Scale, scope, and diversity

We assess scale, scope, and diversity in the unregulated power and gas sector based on:

- The relative size of operations, earnings, and cash flow;
- The company's diversity in terms of the markets in which it operates;
- Customer and supplier concentrations;
- The breadth of the asset mix (including fuel type and plant diversity); and
- The degree of vertical integration--both forward (retail) and backward (generation or fuel).

Size of operations: We measure the scale of operations by power generation or distribution capacity, and by earnings and cash flow. Large-scale operations support stronger competitive positions, with more operating flexibility and economies of scale than small companies. For companies that supply the retail market, the position and size of the markets in which they participate can affect the degree to which they benefit from economies of scale.

Market diversity: We review the company's diversity across the markets it serves by looking at how its cash flow generation and stability benefit from operating in multiple geographic regions. We view companies more positively if they operate in regions that exhibit average to better-than-average levels of wealth, and where employment and growth levels underpin the local economy and support long-term growth and prices. The risk of operating in a single region may be mitigated if the region is sufficiently large, demonstrates economic diversity, and has at least average demographic characteristics. Increasingly, weak correlation of seasonal weather and extreme events across regions served may mitigate environmental risks.

Customer and supplier concentrations: These may expose any company in the unregulated power and gas market to higher risk of operational disruptions and cash flow volatility, especially in the case of retailers, as counterparty risk might be heightened by dependance on a few key customers. Customer diversity depends on the mix of residential, commercial, and industrial clients. Supplier diversity is driven by the company's needs; for example, having multiple natural gas pipeline alternatives indicates a diverse supplier base for a gas-fired power plant.

Asset mix: The broader the asset mix--whether by fuel type, dispatchability, geography, or markets--the greater the protection against risk factors that may affect one region and its market dynamics more than another, such as fluctuations in supply and demand, or price.

Degree of integration: Similarly, a greater degree of vertical integration provides a greater ability to withstand unexpected operational or market disruptions to any one aspect of the business.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Large scale relative to competitors, and a strong market position in its key markets.	Small in scale, with little pricing power, in a market that has low growth prospects.
Participates in a variety of attractive geographic or organized markets.	Concentration in one market that exhibits high volatility or risk.
Diversity and flexibility in terms of fuel mix and plants compares favorably with that of peers, based on factors such as number of plants and base/mid-merit/peak load. For example, in renewable generation, a company may see demonstrable benefits from its multiple assets and its resource risk may be strongly mitigated by uncorrelated geographic locations or use of different technologies, such as wind versus solar.	Company is exposed to operating availability risks at key plants because its diversity and flexibility in terms of fuel mix and number of plants is limited.
No meaningful supplier or customer concentrations, or counterparty or procurement risk.	Meaningful supplier or customer concentration or procurement risk that could lead to uncertain operational availability or increased cost risk.
Significant levels of forward and backward integration that reduces the volatility of operating earnings.	Full merchant or retail risk, with little meaningful integration or hedging that could mitigate price and volume volatility.

Operating efficiency

We assess operating efficiency in the unregulated power and gas sector based on:

- Cost competitiveness;
- Asset efficiency;
- Flexibility of the cost structure in absorbing demand declines (operating leverage) or input cost pressures; and
- Cost and operational risk management.

Cost competitiveness: Our assessment focuses on economies of scale; access to important commodity inputs (including via direct ownership, through attractively priced contracts, or based on location); and the fixed-cost profile.

Asset efficiency: Our assessment focuses on the nature and age of the technology deployed; its relative productive efficiency, availability, and capacity factors; and placement in the dispatch merit order, as appropriate.

Cost structure flexibility: Our assessment focuses on overall sensitivity to raw material cost fluctuations and commodity prices; the relative proportion of fixed costs to variable costs that--when elevated--could dampen cash flow if utilization rates decline; and cash flow dependence on actual asset utilization.

Cost and operational risk management: This is particularly relevant when we assess retail supply companies, where profit margins are narrow and highly dependent on adequate risk controls on hedging, contracting, and treasury management. For retail supply companies, we consider the relative cost of serving their customer base and their ability to manage collections, and, in particular, how this affects working capital management. We also evaluate suppliers' proficiency

at managing billing system upgrades or the introduction of new systems--a poorly implemented process has an adverse effect on cost and customer base management.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
Sustainable, leading cost position due to economies of scale, fuel flexibility or integration, and production efficiencies that support plant positioning at the low end of the merit order; high and stable capacity (load) factors through the cycle; and high availability and capacity factors and state-of-the-art technology.	Cost position is relatively weak due to high fuel cost or concentration risk, with key plants at the average-to-weak end of the merit order curve; or weak availability and capacity factors, perhaps influenced by aging technology.
Cost structure has relatively low fixed costs and the sensitivity of profit margins to fluctuations in the cost of raw materials or commodity prices, or supply-chain risks is limited, or effectively mitigated.	Profit margins show higher-than-average sensitivity to fluctuations in the cost of raw materials or commodity prices, or supply-chain risks.
Strong risk management policies and limited risk taking that can result from large contractual or commodity hedging positions, including an ability to limit volatility during periods of extreme price spike scenarios.	Risk management policies allow higher-than-average risk position due to extensive contractual commitments (operational or commodity hedging), including exposure to the risk of a sizable effect on profit during extreme price spikes.
Efficient working capital management, supported by a record of shorter-than-average cash conversion cycles.	Inefficient working capital management, supported by a track record of longer-than-average cash-conversion cycles.
Retail suppliers	
A sustainable and leading cost-to-serve position, supported by a record of stable, above-market-average operating margins.	A higher average cost-to-serve position, demonstrated by a record of below-average operating margins and stability.
Stronger-than-peers working capital management (based on number of unbilled customers), often underpinned by use of a single platform and proven technology.	Cash collection could be adversely affected by the higher number of unbilled customers, compared with peers.

Profitability

The two main benchmark measures we use in determining profitability are the EBITDA margin and ROC. We select the most appropriate benchmark for a particular company based on factors including the market location, position on the value chain, capital cycle, and even type of asset. For example:

- A hydro, wind, solar, or nuclear generator is likely to have reasonably high margins and low ROC, reflecting its low variable cost profile and high capital intensity. In this case, we generally view ROC as a better metric.
- An entity that mainly focuses on thermal generation may have stronger ROC and weaker EBITDA margins, reflecting its significant fuel costs, compared with fixed costs. In this case, the EBITDA margin is the more appropriate metric.
- A retail supplier is likely to have low margins, but a high ROC, because its business requires a limited capital commitment (excluding any liquidity buffer required to meet its hedging needs). Here, we rely primarily on EBITDA margins.

For integrated players, the appropriate measure depends on the degree of vertical and horizontal integration. If the company is undertaking a large capex program that has a long lead time, we generally focus on the EBITDA margin. When assessing the profitability of companies engaged in trading activity or more-frequent, event-driven activity--for example, where asset acquisitions or divestitures, which can distort margins, are part of the business strategy--we generally use the ROC.

An unregulated power and gas entity that we assess as having above-average profitability would be able to sustain a higher profitability than its peers in a similar market because of the

composition of its customer and asset portfolio, including the competitive position (merit order) within its markets. We would also expect the entity to have a history of managing its costs well. For traditional incumbents in mature markets, where demand growth is declining or even flat, the flexibility of their asset portfolios can be important in determining the stability of profitability.

For merchant power and integrated companies, fuel is a key input cost, while for those that have retail exposure, energy costs and operating costs are important. An entity with long-term contractual arrangements that give earnings more stability might earn a lower return than a more commodity-exposed issuer, but still be assessed as having above-average profitability. Conversely, a company we assess as having below-average profitability would generally have higher input costs, less-predictable asset performance, higher related maintenance expenses, or uneven experience in managing capital projects.

Financial Risk Profile

Accounting

For unregulated power and gas companies that enter into long-term power purchase agreements (PPAs), we make adjustments to account for those obligations, as we do for regulated utilities under our ratios and adjustments criteria.

Volatility tables

We use the medial volatility table only when assessing companies that derive a significant proportion of their operating cash flow or profits from lower-risk industries (typically regulated utility activities or those having particularly strongly protected unregulated revenue). "Strongly protected unregulated revenue" refers to revenue that benefits from long-term contractual arrangements that ensure high cash flow predictability with limited volume, price, and counterparty risk. In addition, use of the medial volatility table is restricted to companies that operate in jurisdictions with a supportive legal and regulatory environment, limited exposure to energy transition risks, and little likelihood of political interference or contractual renegotiation. Assuming that they meet the previous conditions, eligible arrangements may include capacity mechanisms; CfDs; feed-in tariffs; PPAs; and take-and/or-pay contracts that have minimal commodity price, inflation, and volume exposure. Typically, a baseload PPA would not qualify.

We apply the medial volatility table to companies with unregulated activities with country risk of '4' or better that meet either of the following characteristics:

- About 50% or more of forecast operating cash flows or profits come from regulated activities that have a regulatory advantage assessment of adequate or better and/or about two-thirds when adding strongly protected unregulated revenue; or
- About one-third or more of consolidated operating cash flows or profits comes from regulated activities that have a regulatory advantage assessment of strong/adequate or better and a CICRA of '3' or better.

In addition, in either case, the competitive position for the remaining activities must be assessed as at least satisfactory.

In all other cases, we apply the standard volatility table to unregulated power and gas companies.

Section 1 | Asset Managers

Traditional asset managers typically manage mutual funds--which invest in stocks, bonds, or money market instruments--on behalf of retail and institutional investors. Alternative asset managers typically manage private equity funds, hedge funds, debt (credit) funds, or fund of funds (of private equity or hedge funds)--mostly on behalf of wealthy individuals or institutional investors.

The primary source of revenue for a traditional asset manager is the management fees it charges. These are usually calculated as a percentage of assets under management (AUM). Although alternative asset managers also generate revenue from management fees, they have the potential to generate additional income by outperforming certain predetermined investment thresholds, known as hurdle rates. Earning performance fees is one of the primary business objectives at an alternative asset manager. Asset managers may also invest directly in their funds, alongside the third parties whose assets they are managing. By making principal investments, an asset manager can also generate investment income or dividend income.

Table of contents

Sector description

Companies that derive more than half of their revenue from the management and performance fees they earn by investing third-party money or assets on behalf of retail or institutional investors.

Subsectors	Typical CPGP
Asset managers	Services and product focus

Business Risk Profile

Competitive advantage

We assess competitive advantage for asset managers based on:

- Business strategy;
- Market position;
- Investment performance; and
- Net AUM flows.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Business strategy is to favor organic growth over aggressive growth fueled by acquisitions.	Business strategy is aggressive and acquisition-led, or has led to either a declining market share or product offerings for which there is little investor appetite.
Market position is supported by a sizable level of AUM that is typically sourced through global operations.	Market position is hampered by a small level of AUM, relatively short record of asset management, and few repeat clients.
Market position is backed by a sizable sales force and an increasing variety of distribution channels. Sales are high, stable, or growing.	Sales force is small and most AUM comes through a handful of distribution channels where the firm's market penetration is low.
Investment performance consistently outperforms its investment benchmarks or the investment performance of its peers.	Investment performance consistently underperforms its investment benchmarks and investment performance is weak compared with peers.
There is sustained growth in AUM and positive year-on-year net AUM flows.	AUM is declining because net AUM flows have been negative for an extended period in most of the firm's asset classes, or net AUM flows have been negative in the asset manager's key or largest funds and the outward flows were not reinvested in profitable alternative funds run by the asset manager.

Market position: Our assessment of market position depends on:

- The absolute level of an asset manager's AUM;
- Its market share in different geographies and products;
- Its brand reputation and record of managing AUM; and
- Its distribution capabilities.

In our analysis of traditional asset managers, we consider the level of AUM to be small if it is below $50 billion, midsize if it is $50 billion-$250 billion, and sizable if it is $250 billion-$500 billion (or equivalent amounts in other currency). We classify a traditional asset manager as global if it has more than $500 billion in AUM, particularly if its assets are geographically diverse. Alternative asset managers are typically much smaller and therefore we adjust our scale and AUM ranges when assessing market position. In addition, although their lower levels of AUM could be a weakness, many alternative asset managers offset it by structuring their funds in a way that locks up the assets for multiple years.

Investment performance: We examine investment performance, based on benchmarks (including its peer group) or indices, over three and five years.

Investment performance: asset managers

Performance relative to benchmark/peers	Typical characteristics
Positive	More than 70% of AUM performs in the top two quartiles over three or five years, or 70% or more of AUM outperforms the relevant three- and five-year benchmarks or indices.
Neutral	AUM performance is neither positive nor negative.
Negative	30% or more of AUM is in the bottom quartile over three or five years, or 40% of AUM or more underperforms the relevant three- or five-year benchmarks or indices.

Net AUM flows: Net AUM flows are very important to the competitive advantage assessment because they are a tangible metric of the effectiveness of an asset manager's business strategy, market position, and investment performance. We measure net AUM flows (defined as gross inflows minus redemptions and distributions plus or minus market impact) over one, three, and five years on an aggregate basis and by asset class and by channel. In our view, net AUM flows strengthen an asset manager's competitive advantage when it experiences positive net sales (that is, new investment exceeds redemptions). When outflows exceed new investments--that is, the asset manager experiences net redemptions over a period of three years--we see that as a weakness. During a year of very adverse industry conditions, like 2008, we could view asset managers that achieve a quicker recovery or turnaround relative to peers favorably in our competitive advantage assessment.

For alternative asset managers, we would not view fund distributions as negatively as we would view redemptions because fund distributions typically reflect realization activity, whereas redemptions are often a reflection of an investor's decision to withdraw capital. However, we expect a significant portion of the fund distributions to be reinvested into new funds.

Scale, scope, and diversity

We assess scale, scope, and diversity for an asset manager based on:

- AUM by asset class;
- AUM by distribution channel or investor base;
- AUM by geography;
- Variety of funds and strategies; and
- Revenue diversification by business line.

The pursuit of diversification can expose an asset manager to significant risks. To enter new markets and launch new products successfully, the asset manager will require adequate staffing and infrastructure, as well as strong expertise in the new area.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Robust and active diversification of AUM by asset class, distribution channel, geography, investor base, and strategies or funds offered.	AUM is concentrated in terms of asset class, geography, investor base, or number of strategies or funds offered.
Absence of reliance on a particular customer, product, or fund, or on a group of a few customers, products, or funds.	Reliance on a particular customer or market or on a group of customers or end markets.
Ability to expand its scale or diversify its AUM in the next 12-18 months.	Inability to expand its scale or diversify its AUM in the next 12-18 months.
Other lines of business, in addition to asset management, in aggregate contribute more than 10% to total revenue in areas where management has adequate experience and the required skill set.	Diversification into business lines where management does not possess the required expertise.

AUM by asset class: For asset managers, we consider the proportion of AUM investments across the various asset classes, and the variety of investment styles applied within each asset class. For a traditional asset manager, we look at equity; fixed income; money market; and alternative assets such as private equity, credit, or hedge funds; for an alternative asset manager, we consider private equity; debt (credit or hedge fund) assets, including both public and private debt; and alternative asset classes, such as real estate and infrastructure. Any concentration of invested AUM exceeding 80% in a single asset class would weigh on our assessment of scale, scope, and diversity. Our assessment is stronger where the asset manager has made use of different investment styles within each asset class, according to the volatility of the product. For example, an asset manager can achieve a well-diversified product mix within an asset class by balancing:

- Equity AUM between growth and value stocks; or
- Fixed-income AUM across governments, corporate bonds, and structured finance.

For credit-focused asset managers, AUM may be well-diversified across distressed, mezzanine, and senior debt.

AUM by distribution channel/investor base: Another means of reducing risk is by investing through different distribution channels or having a wider investor base.

In assessing this element, we consider:

- The proportion of AUM distributed through retail and institutional clients;
- AUM by top 10 retail distribution intermediaries (including national and regional brokerage firms, banks, and financial intermediaries);
- AUM by top 10 institutional clients (corporate and municipal pension plans, endowments and foundations, and other corporate and public funds); and
- Revenue contribution of the top three and top 10 clients (mostly institutional clients).

Generally, we see an investor base that includes retail and institutional investors as offering a more diverse revenue stream. Asset managers that focus largely or solely on the management and sales of retail mutual funds have a narrow investor base. They may mitigate this disadvantage by selling their mutual funds through a variety of distribution channels. This implies a well-established and well-diversified network of external sales people at national and regional brokerage firms, banks, insurance companies, and financial planning firms.

Stronger scale, scope, and diversity assessments for traditional asset managers typically reflect balanced exposure to retail and institutional investors, as well as to a diversity of retail intermediaries. A significant concentration in either may be considered a weakness. For alternative asset managers that typically invest on behalf of institutional clients, we focus more on the diversity or concentration of the institutional investor base.

AUM by geography: By investing AUM in different geographies, an asset manager can better protect itself against country-specific economic forces. For instance, if the U.S. stock market plummets, an asset manager with more than 90% of its AUM invested in that country could see an increase in redemptions as investors seek to exit the U.S. market. If the manager offers a choice of funds focused on different regions, investors may instead reallocate fund investments to funds managed by the same asset manager, but targeting other markets.

Variety of funds and strategies: We view concentration as detrimental for scale, scope, and diversity. Situations that we would weigh negatively include an asset manager where one fund or strategy represents more than 30% of its AUM or revenue or where the top three funds or strategies represent more than 50% of the AUM or of revenue. For this measure, we focus on revenue derived from asset management fees (as opposed to investment income or revenue derived from other business lines). Conversely, asset managers that have a large variety of funds/strategies without concentrations in any one investment style or product demonstrate stronger scale, scope, and diversity.

We also consider the life cycle of the funds, especially for alternative asset managers that have finite-life funds. An alternative asset manager whose funds are coming close to the end of funds' lives (typically 10-12 years) and for whom we expect a significant portion of AUM to trail off over the coming one to three years, would be in a weaker position, in our view.

Revenue diversification by business line: Although asset managers may already demonstrate strong diversification solely through their core competency--the asset management business--some have expanded into related lines of businesses which may enhance their position. Examples include brokerage or securities firm businesses; custody services; or advisory businesses that bring in fees, such as merger and acquisition advisory services.

Profitability

We measure profitability using adjusted EBITDA margin.

Asset managers generally derive revenue from three sources:

- Fee-related earnings: In most cases, these are contractual and recurring. We consider them high in quality as they are the most predictable source of revenue, in our view. Fee-related earnings include management fees, transaction fees, advisory fees, and interest income; they may also include a portion of dividend income.
- Performance fees: These are based on the performance of the funds under management and are typically subject to a hurdle rate. They are often volatile over an economic cycle, but are not negative.
- Investment income: This may include a portion of dividend income, but largely consists of principal gains (or losses) from investments made in funds alongside third-party investors.

Generally, we calculate profitability ratios based on a three-year average rather than five as for most corporate sectors: the previous year's results; our current-year estimate, which incorporates any reported year-to-date results and our forecast for the remainder of the fiscal year; and our forecast for the next fiscal year. It is difficult and often impractical to forecast beyond the next fiscal period because we lack visibility regarding top-line revenue. Management fees are largely based on AUM or, in some cases, commitments from investors. Like stock prices, these cannot be forecasted with a high degree of accuracy. Similarly, it is hard to predict whether and when an alternative asset manager may receive a performance fee, as this occurs only after their investment performance exceeds a certain hurdle rate. Our forecasts for realized performance fees consider the asset manager's on-balance-sheet net accrued performance fees. We view these as a good indicator of the potential performance fees that may be realized in future periods. Our forward-looking estimates incorporate upcoming debt maturities, as well as any expected debt issuance or refinancing.

When calculating the EBITDA margin, we may adjust the EBITDA measure to account for the volatility of investment income or performance fees. Income from management fees is more stable than that from investments or performance fees, which depend on the asset manager achieving positive investment returns above a hurdle rate. To account for that, we apply a haircut of at least 50% to the past five-year average realized performance fees and realized investment income, if these revenue sources represent more than 10% of the five-year average total revenue. If we expect these revenue streams to be significantly impaired for an extended period (at least three to five years), we could apply a haircut of up to 100% in our adjusted EBITDA calculation. As few traditional asset managers reach the 10% threshold because they do not generally receive performance fees, the haircut is more likely to be applied to alternative asset managers. Finally, to calculate the ratio, if we make adjustments to EBITDA (the numerator) related to realized performance fees and investment income, we make similar adjustments to revenue (the denominator).

We include both incentive fees and carried interest when calculating performance fees. In our view, these two sources of income exhibit a comparable level of volatility and should be given the same treatment. We exclude the unrealized portion of net performance fees and net investment income from our calculation of adjusted EBITDA because we consider a firm's ability to realize the cash flow benefit of unrealized revenue to be less certain, and it is difficult to predict the timing and amount that may be received. Our adjusted EBITDA also uses performance fees and investment income net of related compensation expense.

Carried interest (carry) is the percentage of a private fund's investment profits that a fund manager receives, and is primarily used in private equity strategies. Incentive fees are a form of performance fee typically related to funds where the underlying assets generate a coupon, for example, mezzanine debt mostly used in hedge fund strategies.

Where an asset manager has not provided the split between realized and unrealized performance fees and investment income, we calculate all performance fees and investment income as a percentage of total revenue, on average over the past five years. If this percentage is 10% or less, no haircut applies. Where it exceeds 10%, we make assumptions to estimate the proportion that is realized, and use that figure to apply our haircut.

Financial Risk Profile

Core ratios

Our preferred ratio to determine the cash flow/leverage assessment for an asset manager is debt to adjusted EBITDA as per our corporate methodology, and we apply the adjustments for realized performance fees and realized investment income described in the profitability section above.

However, we use debt to adjusted total equity for:

- Asset managers that operate a hybrid model that emphasizes investing their own funds' permanent capital as debt or equity investments in underlying portfolio companies, as well as managing third-party assets to generate management and performance fees; and
- Asset managers that carry significant on-balance-sheet investments, which are the result of seed capital for new funds or investments in alternative asset classes that diversify the business mix away from their core business of managing third-party assets. In such cases, solely focusing on cash flow/leverage would give us an incomplete picture of financial risk.

Adjusted total equity is calculated as reported equity less goodwill, intangible assets, and unrealized portfolio appreciation or depreciation. We exclude any equity investments in finance companies or equity in structured vehicles (such as collateralized loan obligations and collateralized debt obligations) managed by the firm because these investments amplify leverage.

Asset managers: assessing debt to adjusted total equity

Assessment	Debt to adjusted total equity (x)
Minimal	<0.4
Modest	0.4-0.8
Intermediate	0.8-1.5
Significant	1.5-2.0
Aggressive	2.0-3.0
Highly leveraged	>3.0

Time horizon ratio calculation: Typically, we emphasize forward-looking estimates more than historical ratios in our analysis, weighting the previous, current, and next fiscal forecast years at 20%, 40%, and 40%, respectively.

That said, the length of the time series applied depends on the company's relative credit risk and other qualitative factors. We may adjust our weighting of the time series if we consider a

transformational event has occurred (see "Time horizon and ratio calculation" in our corporate methodology).

Modifiers

Capital structure

In analyzing asset managers' capital structure, we add an assessment of the diversity of the capital structure to the four subfactors described in our corporate methodology. We view diversity of the capital structure as a tier one risk subfactor, which we assess as neutral or negative. We determine the preliminary capital structure assessment using the table below.

Asset managers: assessing preliminary capital structure

Assessment	Subfactor assessment
Neutral	No tier one subfactor is negative.
Negative	One tier one subfactor is negative and the tier two subfactor is neutral.
Very negative	Two or more tier one subfactors are negative; or only one tier one subfactor is negative but the tier two subfactor is also negative.

Diversity of the capital structure

To assess diversity of the capital structure, we evaluate how debt and equity are combined to form the company's capital and the degree of diversity within each of these two components. For debt, the key considerations are how many different debt sources the company has, its access to different bank lines, and the number of banks providing those lines. For equity, we consider whether the company is publicly traded and whether it can raise funds from public markets, as well as whether its equity includes any hybrid securities, such as preferred equity, in addition to common equity.

Confidence sensitivity at asset managers is somewhat higher than at nonfinancial corporate firms, which may make them more susceptible to a rapid reduction in funding flexibility under adverse market or economic conditions. We therefore view access to public equity markets as favorable for asset managers. In addition, reliance on one or a few financial institutions to raise debt increases an asset manager's exposure to an economic downturn. We view diversity of capital structure as negative if a company is reliant on a single source (such as one bank) to raise debt and is privately owned, with limited access to additional equity.

Investments

As described in table 22 of our corporate methodology, our assessment of investments may be used to adjust our preliminary assessment of capital structure. In the case of asset managers, investments are classified as neutral or positive.

Sizable investments are generally positive for our assessment of the investments subfactor. We define investments as sizable if they exceed outstanding gross funded debt (excluding operating leases or the unfunded pension liability adjustment) by at least 50%. This level allows for a liquidity discount, should the investments need to be liquidated. Investments may include general partnership or seed investments in underlying funds, direct investments to portfolio companies, or nonstrategic financial investments.

We only assess the investments subfactor as positive if:

- The asset manager has investments that have been sizable, on average, for at least a year, and are expected to remain so for at least a year;
- We use debt to adjusted EBITDA as our core ratio, rather than debt to adjusted total equity;
- Financial risk profile is assessed as modest or weaker;
- We can ascribe an estimated value to the investments;
- The investments demonstrate strong evidence of being able to provide financial flexibility if they were to be monetized over an intermediate timeframe;
- The asset manager's financial policy, as it relates to financial discipline, suggests that it would use the proceeds to pay down debt, in the event of monetization; and
- These proceeds would be sufficient to improve existing cash flow/leverage ratios by at least one category.
- Exposure to interest rates, credit spreads, foreign exchange rates, and commodity and equity prices is small or hedged.

Section 2 | Financial Market Infrastructure

Table of contents

Business Risk Profile

Competitive advantage

We assess competitive advantage in the financial market infrastructure sector based on:

- How critical the service provided is to the functioning of the markets it serves;
- The provider's reputation among its members and the cost of switching to another provider; and
- The provider's regulatory track record.

Some exchanges, clearinghouses, and central securities depositories (CSDs) enjoy special privileges or official monopoly protection in their home markets. We call these institutions "national champions" because of this special standing in the domestic financial markets. National champions typically have a competitive advantage assessment of strong.

A financial market infrastructure provider (FMI) that is not a national champion can still achieve a competitive advantage assessment of strong if it has both of the following characteristics:

- It is critical to the functioning of the financial markets or the national economy in its home jurisdiction; and
- It has a valuable brand and good reputation among its members based on providing fast, reliable, secure, and efficient services, and members would face high switching costs.

An FMI with a competitive advantage assessment of weak typically has all three of the following characteristics:

- It is not important to the functioning of the markets it serves;
- It has an inferior brand and poor reputation among its members based on providing subpar services and switching costs are low; and
- It has a mixed regulatory record.

Scale, scope, and diversity

We assess scale, scope, and diversity as outlined in table 9 in the corporate methodology, incorporating industry-specific measurements for volume and diversity as detailed below.

We focus our analysis on volume trends because these directly affect top-line revenue. We also consider the extent to which the FMI generates recurring revenue that is not volume-dependent, and may be relatively stable, irrespective of market conditions.

Sector description

Companies that derive more than half of their revenue from activities linked to the value chain of operating securities and derivatives markets or payment networks.

Subsectors	Typical CPGP
Financial market infrastructure companies (including exchanges, clearinghouse, and central securities depositories)	National industry and utilities

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

How we measure volume depends on the services that the FMI provides:

- For derivatives exchanges and clearinghouses, we consider open interest and the number of contracts traded and cleared;
- For stock exchanges, we evaluate the number and value of shares traded, as well as the total number of listed companies and their aggregate market capitalization;
- For CSDs, we assess the amount of assets under custody and the volume of settlement activity; and
- For payment networks, we use cash and payment volumes and the number of processed transactions, accounts, and cards.

Diversity offers an FMI more stable earnings across its principal business activities. We measure diversity based on three key variables: products, customers, and geography. For example, we consider the breadth and revenue mix of the instruments listed at derivative exchanges and the companies listed at stock exchanges. For stock exchanges, we also consider:

- The industries represented among the listed companies;
- The balance of domestic and foreign companies; and
- Whether specific members contribute a disproportionate amount of transaction volumes or revenue.

For payment networks, we also consider diversification in transaction volumes and revenue, by merchant name or industry sector.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
All	
A secure market position that is not threatened by competitors.	Vulnerable market position that faces a serious threat from competitors.
The financial benefits of large economies of scale.	Limited economies of scale.
Expanding volumes.	Shrinking volumes.
A revenue base well-diversified by listed (or cleared) instruments, membership (that is, customers), and geographic (domestic/foreign) markets served.	Concentrated revenue base by listed (or cleared) instruments, membership, or markets served.
Clearinghouses	
Lists and actively trades (clears) a large number of stocks in a cross section of uncorrelated industries.	Lists and trades a small number of stocks in a few correlated industries.

Operating efficiency

We assess operating efficiency as outlined in table 10 of the corporate methodology, incorporating one industry-specific characteristic.

Operating leverage in the FMI industry is typically high because a sizable proportion of revenue is transaction- or volume-based, and FMI companies require large upfront investments in processing platforms and telecommunications networks. At least initially, this means high fixed expenses.

Factors such as manufacturing processes and working capital management are not that relevant to our view of operating efficiency in FMI companies. Instead, our assessment focuses on economies of scale, expense structure, and technology. We monitor the overhead ratio

(operating expenses to operating revenue) closely to evaluate the extent to which economies of scale are helping to lower overall costs. That said, we de-emphasize the overhead ratio when assessing independent member-owned FMI companies that have utility-like characteristics.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Overhead ratio well below industry average.	Overhead ratio well above industry average.
State-of-the art technology, with ample capacity to absorb expanding volumes.	Technology that has little or no capacity for expansion and has already been surpassed by superior technology of its competitors.

Profitability

Generally, we calculate profitability ratios using EBITDA margin based on a three-year average: the previous year's results; our current-year estimate, which incorporates any reported year-to-date results and our forecast for the remainder of the fiscal year; and our forecast for the next fiscal year.

However, for independent member-owned institutions that have "utility-like" characteristics and return most, if not all, excess revenue to members, we do not assess profitability based on ratios. This is because our profitability analysis is geared toward profit-maximizing institutions whose shares are typically publicly listed and traded. Therefore, our usual metrics are less meaningful in assessing profitability at these institutions, which serve their member-owners, rather than third-party shareholders. Although they tend to operate at or near the break-even point and have high overhead ratios, they often have considerable flexibility to adjust fees or reduce rebates in response to changing market conditions. In addition, they typically exhibit strong member support. Therefore, we assess profitability at most independent member-owned FMI companies as either strong or strong/adequate.

Financial Risk Profile

Our forward-looking estimates incorporate upcoming debt maturities and expected debt issuance or refinancing. We calculate our core and supplementary ratios based on a three-year weighted average: the previous year's results (20%), our current-year estimate (40%), and our forecast for the next fiscal year (40%).

That said, the length of the time series applied depends on the company's relative credit risk and other qualitative factors. We may adjust our weighting of the time series if we consider a transformational event has occurred (see "Time horizon and ratio calculation" in our corporate methodology).

In the case of an independent member-owned (utility-like) FMI with nominal adjusted debt, we may assign a minimal financial risk profile assessment where we consider that the outcome implied by the financial risk metrics would provide a misleading view of the financial risk of the entity.

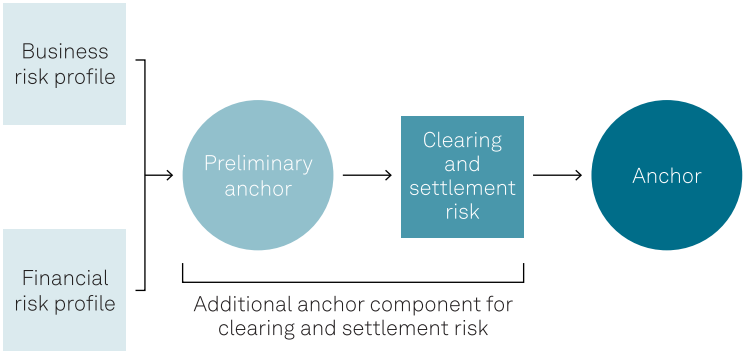
Supplementary ratios

Our preferred supplementary ratios are adjusted EBITDA to interest, and FOCF to debt.

Volatility tables

We generally apply the low volatility table to FMI companies that exhibit or are expected to exhibit low levels of revenue volatility and operate in an industry and region that has a CICRA of at least '2'. If volatility is low and the CICRA is '3', we apply the medial volatility table.

If the CICRA is '4' or higher, we use the standard volatility table.



Anchor

If we consider clearing and settlement (C&S) risk to be relevant to an FMI company's creditworthiness, we incorporate it into our assessment of the anchor. This is the key difference between our approach of FMIs and the general approach in corporate methodology. That said, C&S risk is not relevant in certain cases, for example, where a clearinghouse has outsourced the clearing function to an independent third party, on an arms-length basis; or if the company is highly diversified and clearing plays only a minor role in its activities and earnings.

To incorporate our view of C&S risk, we first combine the financial and business risk profile assessments and derive the preliminary anchor. We then incorporate our assessment of C&S risk, to determine the anchor. In most cases, the anchor will be in line with the preliminary anchor or up to eight notches below it. Rarely, a clearinghouse or CSD may demonstrate sufficient strength to prompt us to apply one notch of uplift.

Note that when deriving the preliminary anchor for an independent, member-owned FMI company with characteristics similar to a utility, we may apply the weaker of the two anchor outcomes listed in table 3 of the corporate methodology if we do not consider that its business risk profile fully reflects its weaker EBITDA margins and overhead ratios.

Financial market infrastructure companies: Determining the anchor

Source: S&P Global Ratings.

Clearing and settlement risk

A clearinghouse's most important function is to reduce credit risk among its members by acting as guarantor or central counterparty (CCP) to trades executed in its market. Similarly, a CSD acts to reduce settlement risk among its members by completing trades on a delivery-versus-payment (DVP) basis, and by following other well-established risk management policies and

procedures. In our opinion, the risk of a member default is the single largest risk that clearinghouses and many CSDs face.

C&S risk applies to clearinghouses, CSDs, and payment networks. Our assessment is based on the diversity and creditworthiness of the membership, as well as the institution's risk management policies and procedures, compared with international standards. It indicates:

- A clearinghouse's ability to protect itself from loss should a member default while it is acting as CCP or guarantor of a trade.
- A CSD's ability to protect itself from loss if the selling counterparty to a transaction does not deliver securities, or if the buying counterparty does not make payment, according to the terms of the transaction. Settlement failure may or may not be the result of a counterparty default.
- A payment network's ability to protect itself from loss should a member default when it is guaranteeing payments.

We assess C&S risk for clearinghouses and CSDs irrespective of whether they are independent entities or operate as subsidiaries or divisions of larger organizations.

Membership: The first line of defense against clearing or settlement loss is the creditworthiness and diversity of the institution's membership. High admission standards are a positive. In measuring the diversity of the membership, we consider the number of members less important than their relative contribution to the FMI company's aggregate risk exposure. For a clearinghouse, we evaluate creditworthiness using a weighted average of the creditworthiness of members, weighted by their initial margin requirements.

We generally assess as strong a membership group that is highly diversified, with a weighted average creditworthiness of 'A' or stronger. A concentrated membership group that has a weighted average creditworthiness weaker than 'BBB-' would generally be classified as weak. Adequate falls in between.

FMIs typically monitor the financial health of their members closely. We would expect an FMI company's risk department to:

- Review the financial status of each member;
- Surveil members' trading activities and clearing risk exposures on a near-real-time basis; and
- Generate risk exposure reports that are disseminated to a management team that has the authority to take appropriate action quickly if risk exposures become too large or breach pre-established limits.

If we see material deficiencies in an FMI company's ongoing membership surveillance, then we would assess its membership as weak.

Risk management policies and procedures: Clearinghouses and CSDs are subject to the standards laid out in the Principles for Financial Market Infrastructures (PFMI), published in April 2012 by the Committee on Payments and Market Infrastructures and the International Organization of Securities Commissions (CPMI-IOSCO). We therefore assess their risk management policies and procedures against these standards, using the information provided by the institution or official sources. Our assessment is based on the extent to which it observes the relevant PFMI standards, the most important of which are those covering credit risk (PFMI principle no. 4), collateral (no. 5), margin (no. 6), liquidity (no. 7), and business risk (no. 15).

We assess risk management policies and procedures at clearinghouses and CSDs as follows:

- Strong, if they greatly exceed those of the relevant standards;
- Adequate, if they fully or broadly observe the relevant standards;
- Less than adequate, if they partly observe the relevant standards, or
- Weak, if they do not observe the relevant standards.

Typically, FMIs that are not traditional clearinghouses or CSDs, such as card payment networks, are not subject to the PFMI standards. For these companies, we instead consider whether they maintain:

- Effective monitoring of counterparty credit risk exposure,
- Appropriate levels of high-quality collateral, and
- Sufficient liquidity, in the form of cash and/or lines of credit, to cover settlement exposure.

Risk management policies and procedures at payment networks is assessed as adequate if they meet these targets. We assign an assessment of less than adequate or weak if they underperform.

Impact of C&S risk: We combine our assessments of membership and risk management policies and procedures to gain a preliminary understanding of how C&S risk may affect the preliminary anchor (see table below). We then review the FMI to identify any serious deficiencies in specific components of its financial safeguard package, or any identifiable weaknesses in the banking system that could inhibit its ability to meet its obligations in a timely manner. If we identify additional risks, it will negatively affect how our C&S assessment affects the preliminary anchor.

Initial impact of C&S risk on the preliminary anchor

	Risk management policies and procedures			
Membership	**Strong**	**Adequate**	**Less than adequate**	**Weak**
Strong	1	0	-1	-3
Adequate	0	0	-2	-4
Weak	-1	-2	-3	-5

Numbers indicate the notches between the preliminary and final anchor, based on C&S risk. Additional risks may increase the downward impact by up to three more notches. C&S--Clearing and settlement.

The final stage of our assessment of C&S risks is to look for deficiencies in areas we did not cover when assessing membership and risk management policies and procedures.

For example, a clearinghouse will have a financial safeguard package, comprising readily available liquid resources that could be used if necessary to fulfill its clearing obligations. The package is most often used to cover losses stemming from a member default. We analyze a clearinghouse's financial safeguard package and its associated default waterfall in detail.

The most common components of the financial safeguard package are:

- The clearinghouse's own liquid capital,
- The margin collected from members,
- The guarantee funds, and
- Its assessment powers.

The guarantee fund and assessment powers enable the clearinghouse to mutualize the risk of default across its members. We view this as positive because mutualization of risk gives the members an incentive to police each other's trading activities. Their own contributions to the guarantee fund will be at risk if another member defaults, and they will face calls to replenish the guarantee fund, should it be tapped. If a clearinghouse were to rely entirely on its own capital to cover member defaults, with no mutualization of risk, we would consider this a negative factor.

We assess the various components of the financial safeguard package to understand the degree of protection that each provides to the clearinghouse. That said, we see the overall protection afforded by the package as more important than its individual components. Although our assessment of the components is typically more qualitative than quantitative, we consider certain practices to be a deficiency at any clearinghouse. In addition, we compare practices with those elsewhere in the market. There is no optimal structure, in our view. Very strong guarantee fund contributions can offset weakness in the margin calculation--some clearinghouses rely more on individual member margin requirements, while others rely more on the mutualized guarantee fund.

Some of the key deficiencies we may identify in the financial safeguard package include:

- Weak assumptions underlying the margin calculation;
- Concentrations of margin deposits by member;
- Aggressive margin offsets or portfolio margining;
- Illiquid, risky, or otherwise inferior forms of collateral;
- Margin exceptions that are outsized, or lead to sustained poor backtesting performance;
- Inability to impose extra or super margin requirements, as needed;
- Infrequent margin or guarantee fund calculations;
- Fixed or otherwise non-risk-based guarantee fund;
- Low minimum or maximum individual guarantee fund requirements;
- Weak assessment powers;
- Overreliance on the clearinghouse's own resources, such as its equity, within the default waterfall, as opposed to member collateral posting or default funds;
- Insufficient back-up lines or other sources of settlement liquidity; and
- History of losses stemming from member defaults.

For CSDs, we consider whether:

- There are identifiable weaknesses in the national banking system that could inhibit it from meeting its settlement obligations in a timely manner;
- Collateral management practices, where relevant, appear imprudent or expose the CSD to significant credit risk in the event of member default; or
- There are insufficient back-up lines or other sources of settlement liquidity.

If none of these apply, we would not modify the initial assessment of C&S risks shown in the table above.

Modifiers

Capital structure

A few FMIs are prudentially regulated by the national banking regulators. To a limited extent, these FMIs conduct banking operations, such as deposit-taking or granting credit facilities, linked to their core FMI business. For these companies, we assess the capital structure by calculating the risk-adjusted capital (RAC) ratio, as described in our risk-adjusted capital framework methodology. Based on the RAC ratio, we may then modify the anchor as shown in the table below.

Modifications to the anchor, based on capital structure

RAC ratio %	Notches
>15	2
10-15	1
7.0-9.9	0
5.0-6.9	(1)
<5	(2) or more

RAC--Risk-adjusted capital.

That said, an FMI that has an anchor in the 'a' category may only receive one notch of uplift and an FMI that has an anchor of 'aa-' or above will not receive any uplift because we would expect it to have strong capitalization.

Section 3 | Financial Services Finance Companies

Table of contents

Financial services finance companies (FSFCs) include:

- Consumer finance companies, which provide small-ticket loans, check cashing services, and other related consumer services, generally to consumers who have little or no access to traditional commercial banks.
- Originators and servicers, which originate and service loans such as residential or commercial mortgages and student loans, but do not retain the investment in these loans on their balance sheets, and are thus exposed to minimal credit risk.
- Auto fleet services companies, which provide services such as vehicle inventory management, fuel monitoring, vehicle maintenance, and fuel card payments solutions.
- Financial and professional real estate service providers, which offer services such as investment management, property services, brokerage, and research.
- Money transaction processors, which facilitate transactions such as money transfers and bill payments.
- Debt collectors and servicers, which invest in distressed debt portfolios, or service nonperforming loans and receivables for third parties.
- Other FSFCs provide a variety of commercial and consumer finance products.

The primary risks that FSFCs face differ from those faced by the nonbank financial institutions (NBFI) we rate under our financial institutions rating methodology. Specifically, we apply our financial institutions rating methodology where we consider that a company's greatest credit risks relate to asset quality, funding and liquidity, and tangible capital. For example, a NBFI is more likely to default because of a weakness in its balance sheet than because of an inability to service debt obligations from operating cash flow.

We apply the corporate methodology to FSFCs because we consider that their primary risks relate to their ability to generate cash flow, rather than to the amount of capital they may need to withstand credit losses. Although FSFCs may be prone to similar risks as NBFIs, these risks have a lesser effect on our view of creditworthiness. As a result, we incorporate an analysis of funding, credit quality, and tangible capital, but emphasize our analysis of cash flow, relative to debt and interest expense, more than we would in rating a NBFI.

Sector description

Companies that derive more than half of their revenue by offering financial services to commercial or consumer clients, and where the risk to their cash flow generation is greater than the risk to their capital buffers.

Subsectors	Typical CPGP
Financial services finance companies (including consumer finance companies, originators and servicers, auto-fleet services companies, real-estate services, distressed debt purchasers, and money transaction processors)	Services and product focus

Business Risk Profile

Our assessment of the competitive position of a FSFC uses the corporate framework and includes an additional factor: regulatory and legislative risk.

Competitive advantage

We assess a FSFC's competitive advantage based on its:

- Strategy;
- Brand equity, reputation, and marketing; and
- Market position.

Strategy: We analyze whether the company's strategy is consistent with its organizational capabilities and marketplace conditions. We consider the degree of success in establishing leadership positions in the markets in which it competes, and in protecting or growing its market share in a profitable manner without materially altering the company's risk profile.

Brand equity, reputation, and marketing: We consider a company's brand strength as well as market share by key markets and regions, if available. We also look for trends and consider the attractiveness of the key markets and regions in which a company operates. Brands commanding a clear price premium demonstrate strong brand equity and reputation. Brand strength is typically confirmed with market share gains, above-average profitability, and premium pricing. Brand equity can also come in the form of customer and supplier relationships when pricing is more competitive.

Market position: We assess a company's market share by business line (when data are available), pricing power, customer and supplier retention, quality of business and near-term prospects, ability to weather adversity, and business track record.

Competitive advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Business strategy has articulated long-term plans and has been successful in achieving goals.	Business strategy has been reactive, poorly defined, and has shown mixed results in achieving plans.
Business strategy supports market share, and is consistent with organizational capabilities and market conditions, which mitigate risks relative to competitors.	Business strategy is inconsistent or not well adapted to market conditions, which increases risks relative to competitors.
Competitors find it difficult to achieve a comparable low-cost position or to provide a comparable product or service offering.	A lack of differentiation, poor product or service quality, and ease of migration to a new provider increases vulnerability to competitors.
A superior record of product or service quality leads to strong brand equity and reputation.	Poor brand equity and reputation.
Favorable market position thanks to barriers to entry that effectively reduce, or even eliminate, the threat of new market entrants.	Unfavorable market position and a lack of barriers to entry that makes the company vulnerable to competitors' actions.

Scale, scope, and diversity

We assess a FSFC's scale, scope, and diversity based on its:

- Diversity of product or service range;
- Geographic diversity; and
- Volumes, size of markets and revenue, and market shares.

Diversity of product or service range: We consider the revenue and profitability mix from the FSFC's various business sources. We assess diversity through a variety of measures, which may include customer, geographic, supplier, end market, and product or service, depending on the information available.

Volumes, size of markets and revenue, and market shares: We consider a company's reliance on a particular customer or end market, or on a group of customers or end markets. In our view, participation in a variety of attractive target markets generally results in greater stability during market downturns. As such, we consider the size and diversity of a company's revenue base relative to close competitors. The overall size of a company's target markets also influences our assessment of scale, which is especially important for a company whose competitive strategy is to be the lowest-cost provider of a service (as opposed to a premium-price service provider).

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Wide variety of products or service offerings.	Limited range of products or service offerings, which are sometimes correlated; and limited prospects for expansion or diversification.
Broad geographic diversification.	Narrow geographic focus.
No reliance on a particular customer or end market, or on a limited number of customers or end markets.	Reliance on a particular customer or end market, or on a limited number of customers or end markets.
No reliance on a particular supplier, business partner, or small group of partners.	Reliance on a business partner or a small group of partners, which may cause volume declines if prices increase.

Operating efficiency

We assess an FSFC's operating efficiency based on its:

- Cost structure;
- Ability to withstand lower demand; and
- Reinvestment needs.

Cost structure and ability to withstand lower demand: We consider a company's ability to control costs without hurting product or service quality. Flexible cost structures limit pressures on operating margins during periods of lower demand or industry downturns. Companies with scalable business models that generate consistent sales growth using a fixed expense base often exhibit greater operating efficiency.

Reinvestment needs: We consider the level of reinvestment necessary to maintain existing operations. Maintenance capex, as a proportion of revenue, is a common metric we use in our assessment. A company's perceived historical over- or under-investment in its operations can also influence our assessment of reinvestment needs.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Superior cost position permits above-average profitability, even if capacity utilization or demand are below ideal levels.	Inferior cost position relative to peers, possibly because of inefficient facilities or processes.
Ability to adjust expenses in response to changes in demand without damaging product or service quality.	Limited capability to manage fixed costs or to withstand lower demand levels.
Solid investment in technology and infrastructure that supports revenue and profit growth prospects.	Lack of investment in technology and infrastructure that leads to a higher cost structure and operations that are less efficient than peers.

Regulatory and legislative risk

Our analysis focuses on the credit implications of the regulations that apply to FSFCs. We do not consider that our assessment of this subfactor can have a positive impact on the overall competitive position. Therefore, we assess a company's exposure to regulatory or legislative risks as either (1) adequate, (2) weak, or (3) vulnerable. If the regulatory and legislative risk assessment is (3) vulnerable, we cap competitive position at vulnerable. If the regulatory and legislative risk is assessment is (2) weak, we cap competitive position at weak. Where an FSFC is not exposed to regulatory policies--existing or prospective--that could meaningfully constrain profitability, we assess its regulatory and legislative risk as adequate and no cap applies.

Regulators can affect the operating environment and profitability in a variety of ways. For example:

- Profitability may be constrained by rules that cap the interest rates that clients may be charged or limit the type or range of clients a finance company can target; or
- Compliance costs may rise if new regulatory reporting standards are imposed.

Regulatory and legislative risk: typical characteristics

Weak	Vulnerable
Subject to ongoing regulatory scrutiny, sometimes in a loosely regulated industry, and profitability could be constrained if new policies were to be implemented.	Subject to ongoing regulatory scrutiny, and profitability will likely be constrained if new policies are implemented.
Exposed to regulatory and legislative changes, but diversification by product or geography may partially mitigate the risks.	Exposed to regulatory and legislative changes, exacerbated by product or geographical concentration.
Government policy or regulation has constrained profitability or altered business conduct standards in the past.	Government policy or regulation has significantly constrained profitability or greatly affected business conduct standards in the past.

Profitability

FSFCs operate using a wide variety of business models, and revenue sources vary across the sector. Therefore, in some cases, we assess profitability relative to the company's direct peers within its subsector, rather than within the FSFC industry as a whole. In subsectors characterized by stable profits and a high volume of transactions, we may consider a company to have an average level of profitability, even if its EBITDA margins are low, relative to the wider industry.

Generally, we calculate profitability ratios for FSFC based on a three-year average: the previous year's results; our current-year estimate; and our forecast for the next fiscal year.

Financial Risk Profile

We generally calculate our core and supplementary ratios based on a three-year weighted average, rather than five years as in most corporate sectors, because it is often impractical to make projections for FSFC beyond the next fiscal period given the lack of visibility regarding top-line revenue. We generally weight the previous year's results (20%), our current-year estimate (40%), and our forecast for the next fiscal year (40%). That said, we may use other periods or weights depending on the company's relative credit risk and the occurrence of transformational events.

Adjustments to debt

When a company uses short-term funding to purchase high-quality liquid assets that expose it to minimal credit risk, we may adjust our debt measures by netting the value of the short-term liquid assets against the value of the debt in our ratio calculations. At the same time, we reclassify related interest expenses to operating expenses.

For example, we may net the debt against the assets where a U.S. mortgage company has originated a pool of loans that conform to a government-sponsored enterprise's (GSE) guidelines, and market practice indicates that the GSE is certain to purchase eligible loans within a short period. The netting recognizes that the credit risk incurred is minimal and of short duration. We apply a similar approach to the debt used to finance advances provided by mortgage servicers, if the advances have a first-priority lien against an entire pool of mortgaged properties and are supported by significant overcollateralization.

There are exceptions to this approach. When stressed market conditions or some other factor suggests that a GSE could stop purchasing assets or abruptly change its criteria--or if a warehouse provider has the option to require significant additional margin with little notice to the FSFC--we would not net the asset-specific funding against the assets funded by the debt. Similarly, we would not net debt against a mortgage servicer's advance if we expected the value of the residential mortgage-backed security to decline below the value of the collateral against which the FSFC has advanced money. In addition, a GSE may reject nonconforming assets, which would then return to the mortgage originator's balance sheet. If this occurred, we would stop netting their value against the asset-specific funding.

Supplementary ratios

We consider two supplementary ratios--EBITDA to interest expense and debt to tangible equity.

We generally use debt to tangible equity when assessing FSFCs that have positive tangible equity and a balance sheet containing a substantive amount of financial assets (see the table below). Tangible equity is defined as total equity, less goodwill and nonservicing intangibles. The ratio helps us see how the FSFC funds its business and how much cushion it has to sustain unexpected losses.

Assessing debt-to-tangible equity ratio

Assessment	Debt-to-tangible equity ratio (x)
Minimal	<1.0
Modest	1.0-2.0
Intermediate	2.0-3.0
Significant	3.0-4.0
Aggressive	4.0-5.0
Highly leveraged	>5.0

Modifiers

Capital structure

Our analysis of capital structure at FSFCs includes an assessment of the company's dependence on revolving, short-term, asset-specific funding. We consider asset-specific funding to be an additional tier 1 risk subfactor, as described in our corporate methodology, and classify it as neutral, negative, or very negative.

A company that depends on asset-specific funding to facilitate origination volume may be susceptible to the disruption caused by adverse economic environments. If asset-specific funding options become unavailable, the FSFC's funding choices and the confidence-sensitivity of its assets will directly affect its ability to maintain business volumes and meet its obligations. That said, we rate FSFCs that have large confidence-sensitive funding exposures under the financial institutions rating methodology because we consider them more susceptible to changes in asset credit quality and tangible capital.

We assess asset-specific funding by considering stability during times of stress, the diversity of counterparties, the type of collateral being pledged, and the maturity of the asset-specific funding sources. These sources include secured and unsecured warehouse lending facilities; repurchase agreements; asset-backed security transactions; and residential mortgage-backed security transactions.

An FSFC that we regard as having a neutral asset-specific funding assessment generally has limited or no reliance on asset-specific funding sources to support ongoing business operations.

An FSFC we regard as having a negative asset-specific funding assessment is typically characterized by one or more of the following:

- Reliance on asset-specific funding sources to support ongoing business operations.
- A high proportion of debt maturities within 12 months, or the maturities show a concentration within a single quarter.
- Reliance on a concentrated group of financial counterparties.

We typically assess this subfactor as negative when asset-specific funding is used to finance assets, and we net the debt against the assets as described above.

Where an FSFC has all three of the characteristics associated with a negative asset-specific funding assessment and one or more facilities are also subject to substantial margin call exposure, we assess this subfactor as very negative.

We determine the preliminary capital structure assessment using the table below, rather than table 21 in our corporate methodology. We may then adjust the initial assessment based on our analysis of the investment subfactor (see table 22 of the corporate methodology).

Preliminary capital structure assessment for FSFCs

Assessment	
Neutral	No Tier 1 subfactor is negative.
Negative	One Tier 1 subfactor is negative, and the Tier 2 subfactor is neutral.
Very negative	Two or more Tier 1 subfactors are negative; or one Tier 1 subfactor is negative and the Tier 2 subfactor is negative; or asset-specific funding is very negative.

Adjustments for auto fleet leasing companies

Because the leasing of auto fleets is capital-intensive and the assets show high depreciation and amortization, cash flow/leverage metrics based on EBITDA are of limited use in assessing creditworthiness. Therefore, while we consider auto fleet leasing companies to be FSFCs, we use the analytical approach described in our key credit factors article for the operating leasing industry to assess the following elements:

- Profitability,
- Cash flow/leverage,
- Capital structure,
- Financial policy, and
- Liquidity.

Adjustments for distressed debt purchasers

Distressed debt purchasers (DDPs) acquire defaulted receivables at high discounts and aim to collect as much as possible from the portfolios acquired. They may sell the debt portfolios at any time to boost liquidity. Revenue is typically recognized using an assumed purchase multiple or internal rate of return based on the estimated amount and timing of future cash collections. In practice, principal collections typically exceed the estimates used to report revenue. Therefore, we believe the accounting reported EBITDA treatment typically underestimates the debt repayment capacity of these companies. Such a treatment will not reflect the flexibility provided by the principal collections or portfolio amortization, which can be used to support the timely repayment of debt obligations.

In our analysis, we typically adjust reported metrics to add an amount equal to 50% of collections applied to principal back to revenue and EBITDA. This enables us to capture that the cash flow associated with collections on distressed receivables could, in part, be used for debt repayment. It also recognizes the extra flexibility provided by the principal collected and the ability to resell portfolios in the market, and acknowledges that DDPs typically use at least part of this cash flow to replenish their income-generating asset base and maintain profitability over the cycle.

Although DDPs can choose when to buy defaulted receivables, a lack of investment can significantly deplete their future collections. We rate companies on the assumption that they will maintain their current activity level--that is, we do not assume a rapid contraction in activities or

a run-off scenario. Therefore, although industry practice for DDPs is to present cash-adjusted EBITDA metrics, we do not add back 100% of collections.

We calculate our supplementary ratios (debt to tangible equity and EBITDA interest coverage) applying these adjustments. In addition, we use a supplementary ratio of FOCF to debt to analyze distressed debt purchasers because FOCF is a proxy for the cash that a company generates from its core operations and has available for debt repayment after investments in new portfolios are made. We consider this information critical when rating companies that have aggressive capital structures and high investment needs. When calculating FOCF, we include the full amount of principal collected as well as investments in new portfolios. To assess a company's investment needs, we use either the amount necessary to maintain existing operations, or our own estimate of the future cash needed to purchase new portfolios.

Furthermore, for DDPs we do not typically deduct accessible cash and liquid investments from debt because we view these funds as transitory and expect them to be allocated to new portfolio investments.

Appendix 1 | Abbreviated Terms

Table of contents

The following acronyms and abbreviations are provided for reference.

Acronyms and abbreviations

Short form	Expanded term
Capex	Capital expenditure
CFO	Cash flow from operations
CICRA	Corporate industry and country risk assessment
CPGP	Competitive position group profile
DCF	Discretionary cash flow
EBIT	Earnings before interest and tax
EBITDA	Earnings before interest, taxes, depreciation, amortization
EBITDAR	Earnings before interest, taxes, depreciation, amortization, and rent
FFO	Funds from operations
FOCF	Free operating cash flow
GAAP	Generally accepted accounting principles
IFRS	International Financial Reporting Standards
PIK	Payment-in-kind
R&D	Research and development
ROC	Return on capital
ROE	Return on equity
SACP	Stand-alone credit profile
SER	Standard error of the regression
SG&A	Selling, general, and administrative

Appendix 2 | Profitability

Table of contents

We typically use the metrics shown below to calculate volatility of profitability in each sector.

Volatility of profitability

EBITDA margin	Nominal EBITDA	Return on capital
Asset managers	Aerospace and defense	Midstream energy
Auto and commercial vehicle manufacturing	Agribusiness, commodity foods, and agricultural cooperatives	Oil and gas exploration and production
Auto suppliers	Building materials*	Refining and marketing
Digital infrastructure	Business and consumer services	Transportation cyclical
Health care equipment	Capital goods	
Health care services	Commodity chemicals	
Homebuilders and real estate developers	Consumer durables	
Financial market infrastructure	Consumer staples and branded nondurables	
Financial services finance companies	Containers and packaging	
Media and entertainment	Contract drilling	
Oilfield services and equipment	Engineering and construction	
Pharmaceuticals	Environmental services	
Railroads, package express, and logistics	Forest and paper products	
Regulated utilities	Leisure and sports	
Retail and restaurants	Metals production and processing	
Technology hardware and semiconductors	Mining	
Technology software and services	Specialty chemicals	
Telecommunications	Transportation infrastructure	
Unregulated power and gas		

*For companies in the building materials sector that produce finished goods, we would use EBITDA margin.

Appendix 3 | Sector And Industry Variables

Table of contents

The sector and industry variables and associated details in this appendix are expected to be periodically updated and republished, as market conditions warrant.

Profitability thresholds

We use the thresholds in the following three tables to assess the level of profitability of entities in most of the sectors covered by our corporate methodology. Two sectors--homebuilders and real estate developers and regulated utilities--are excluded from these tables; we do not set fixed ranges to assess the level of profitability for these sectors. Instead, we emphasize comparisons with similarly constituted peers that use the same accounting basis or where the regulatory framework is comparable.

Thresholds for assessing the level of profitability: EBITDA margin

(%)	Below average	Average	Above average
Aerospace and defense	<10	10-18	>18
Agribusiness, commodity foods, and agricultural cooperatives			
Grain processors, merchandisers, and crop input wholesalers	<3	3-5	>5
Commodity food ingredient companies	<12	12-15	>15
Meat and other nondairy animal protein processors	<5	5-10	>10
Sugarcane crushers and processors	<32	32-42	>42
Marketing and supply cooperatives	<3	3-5	>5
Cooperatives that sell branded products	<10	10-20	>20
Auto and commercial vehicle manufacturing	<6	6-10	>10

*For grain processors and merchandisers, we generally calculate return on capital based on a three-year average. §Under midcycle conditions.

Calibration for standard error of the regression (SER) by industry

Our view of volatility of profitability is informed by our industry-specific SER parameters, which we established based on seven years of data.

SER calibration by industry based on EBITDA

Table of contents

Key Changes From Previous Criteria

These criteria incorporate the changes described in "Request for Comment: Sector-Specific Corporate Methodology: Global Digital Infrastructure." Specifically, the criteria were updated to add a new section (section 13) that lists the credit factors and assumptions we use in our analysis of digital infrastructure companies. All subsequent corporate and infrastructure sections were renumbered to accommodate the inclusion of the new section. We also amended the telecoms section to clarify that it no longer covers telecom infrastructure providers, as these will now be assessed using section 13.

The new section 13 of the criteria:

- Brings under a single sector the different types of essential infrastructure that pertain to the digital infrastructure industry; existing and future data center transactions that fall within the scope of our "Data Center Securitizations: Global Methodology And Assumptions" or our "General Project Finance Rating Methodology" will continue to be rated using those criteria.
- Reflects the specific risks linked to digital infrastructure businesses under our corporate methodology, in the context of the dynamic environment in which they operate.
- Recognizes, in the financial risk profile of digital infrastructure companies, the benefits of their relatively stable and predictable cash flows, which are underpinned by the largely contracted or regulated nature of their operations, and the value of their assets under ownership.

Impact On Outstanding Ratings

The only ratings affected are those that now come within the scope of the new digital infrastructure section. Currently, we publish ratings on 18 companies in this sector, and to date have used either the telecommunications section of "Sector-Specific Corporate Methodology" or our "Key Credit Factors For The Real Estate Industry" article.

These criteria will be effective on release, except in jurisdictions that require local registration. Upon release, we would expect to place up to 11 of the 18 issuer credit ratings within the scope of the criteria under criteria observation (UCO). We expect to resolve our review of ratings placed on UCO within six months, consistent with our procedures. We anticipate that rating actions, if any, taken as a result of this review would be positive, rather than negative actions.

All other ratings within the scope of the corporate methodology are unaffected.

This report does not constitute a rating action.

This article is a criteria article. Criteria are the published analytic framework for determining credit ratings. Criteria include fundamental factors, analytical principles, methodologies, and/or key assumptions that we use in the ratings process to produce our credit ratings. Criteria, like our credit ratings, are forward-looking in nature. Criteria are intended to help users of our credit ratings understand how S&P Global Ratings analysts generally approach the analysis of issuers or issues in a given sector. Criteria include those material methodological elements identified by S&P Global Ratings as being relevant to credit analysis. However, S&P Global Ratings recognizes that there are many unique factors / facts and circumstances that may potentially apply to the analysis of a given issuer or issue. Accordingly, S&P Global Ratings criteria is not designed to provide an exhaustive list of all factors applied in our rating analyses. Analysts exercise analytic judgement in the application of criteria through the rating committee process to arrive at rating determinations.

Some of the Content may have been created with the assistance of an artificial intelligence (AI) tool. Published Content created or processed using AI is composed, reviewed, edited, and approved by S&P personnel.

Credit-related and other analyses, including ratings, and statements in the Content are statements of opinion as of the date they are expressed and not statements of fact. S&P's opinions, analyses and rating acknowledgment decisions (described below) are not recommendations to purchase, hold, or sell any securities or to make any investment decisions, and do not address the suitability of any security. S&P assumes no obligation to update the Content following publication in any form or format. The Content should not be relied on and is not a substitute for the skill, judgment and experience of the user, its management, employees, advisors and/or clients when making investment and other business decisions. S&P does not act as a fiduciary or an investment advisor except where registered as such. While S&P has obtained information from sources it believes to be reliable, S&P does not perform an audit and undertakes no duty of due diligence or independent verification of any information it receives. Rating-related publications may be published for a variety of reasons that are not necessarily dependent on action by rating committees, including, but not limited to, the publication of a periodic update on a credit rating and related analyses.

To the extent that regulatory authorities allow a rating agency to acknowledge in one jurisdiction a rating issued in another jurisdiction for certain regulatory purposes, S&P reserves the right to assign, withdraw or suspend such acknowledgment at any time and in its sole discretion. S&P Parties disclaim any duty whatsoever arising out of the assignment, withdrawal or suspension of an acknowledgment as well as any liability for any damage alleged to have been suffered on account thereof.

S&P keeps certain activities of its business units separate from each other in order to preserve the independence and objectivity of their respective activities. As a result, certain business units of S&P may have information that is not available to other S&P business units. S&P has established policies and procedures to maintain the confidentiality of certain non-public information received in connection with each analytical process.

S&P may receive compensation for its ratings and certain analyses, normally from issuers or underwriters of securities or from obligors. S&P reserves the right to disseminate its opinions and analyses. S&P's public ratings and analyses are made available on its Web sites, www.spglobal.com/ratings (free of charge), and www.ratingsdirect.com (subscription), and may be distributed through other means, including via S&P publications and third-party redistributors. Additional information about our ratings fees is available at www.spglobal.com/usratingsfees.

OVERVIEW AND SCOPE

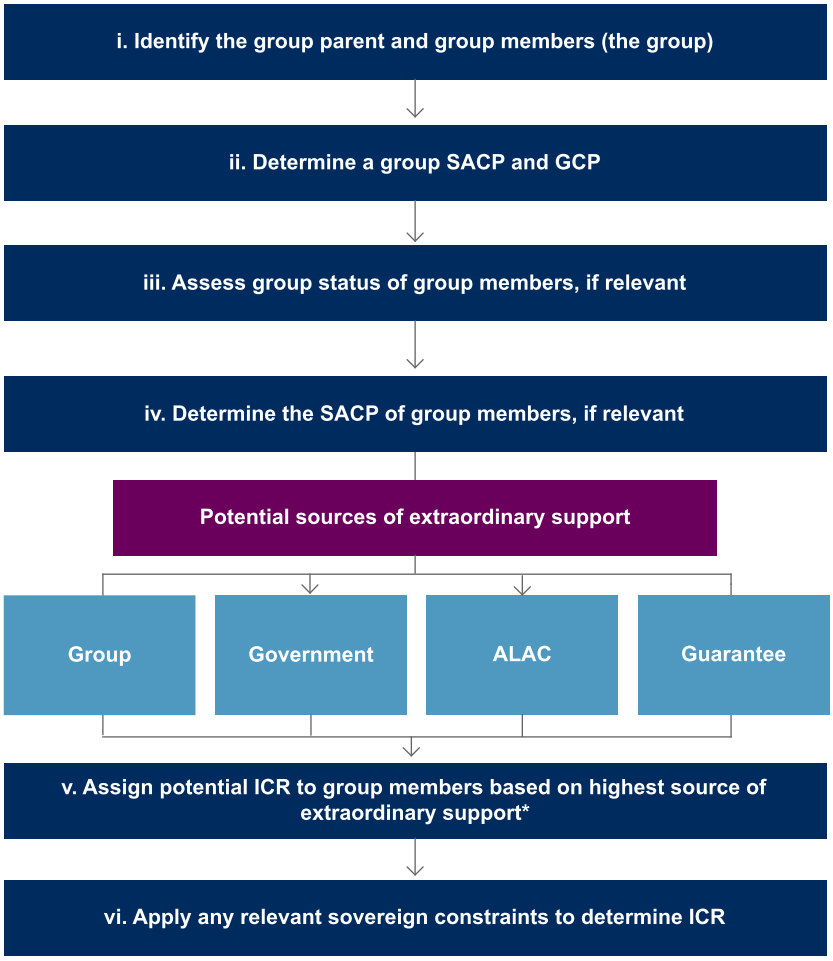
1. This article describes S&P Global Ratings' methodology for rating entities that are part of corporate, financial institutions, insurance, and international public finance groups, as well as U.S. public finance obligated groups.
2. These criteria articulate the steps in determining an issuer credit rating (ICR) on group members and their holding companies. This involves assessing the group credit profile (GCP; i.e. the group's overall creditworthiness), the stand-alone credit profiles (SACP) of group members, and the status of an entity relative to other group entities.
3. The criteria also describe how we assess the potential for support (or negative intervention) from group entities, or from other external sources such as a government.
4. These criteria apply to corporate, financial institution, insurance, and international public finance entities that we consider part of a group and U.S. public finance entities that we consider part of an obligated group. For these entities, we believe that their ownership, control, influence, or support by or to another entity could have a material bearing on their credit quality. Examples of entities that are outside the scope of these criteria include project finance and corporate securitizations.
5. These criteria may complement other criteria that address sector-specific support considerations.
6. This paragraph has been deleted.

METHODOLOGY

7. These criteria explain how we factor the potential for extraordinary support (or extraordinary negative intervention) into the ICR of an entity that is a member of a group. Such extraordinary support (or negative intervention) is beyond that which we already factor into the entity's SACP, as explained in "Stand-Alone Credit Profiles: One Component Of A Rating."
8. We factor the potential for extraordinary support or extraordinary negative intervention into the ICR even when the need for such support or the possibility for such negative intervention may appear remote.
9. We apply a six-step process for determining the ICR of group members (see chart 1), as follows:

(i) Identify the group parent and the group members (together called the group).

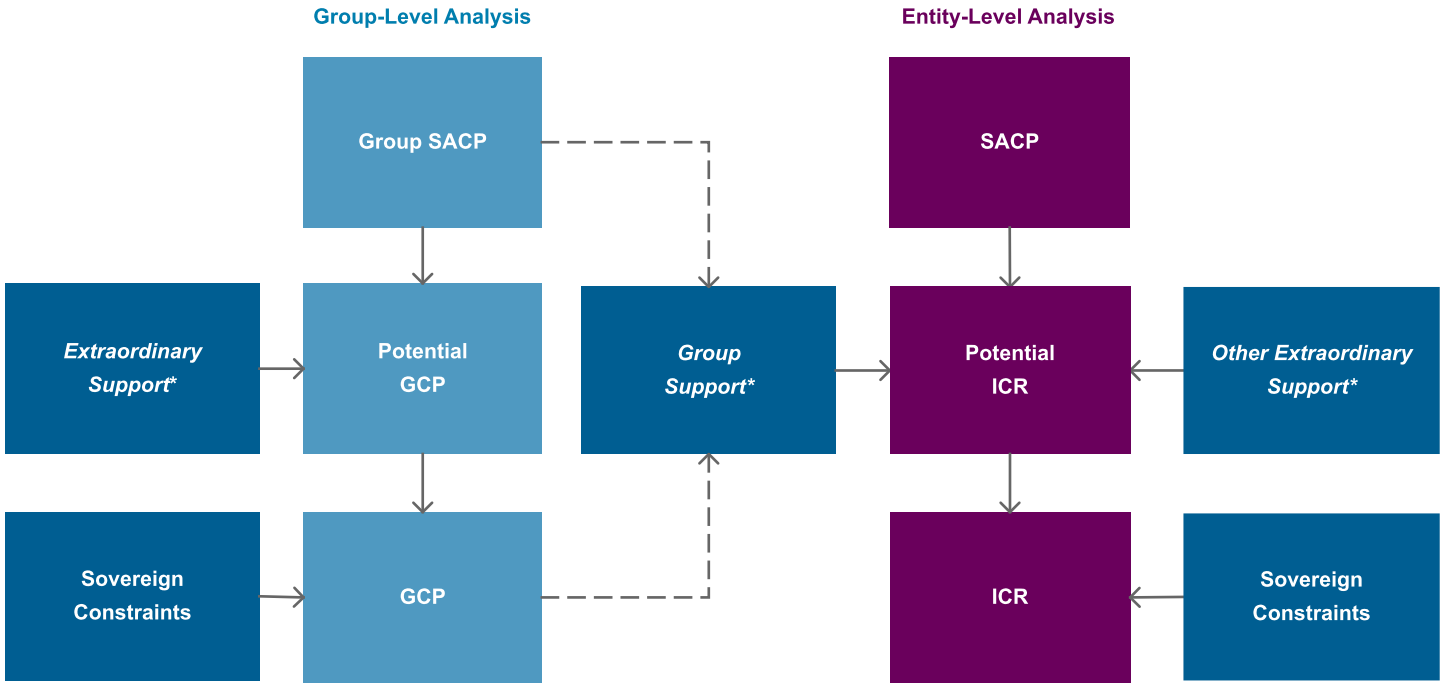
(ii) Assess the creditworthiness of the group (or subgroup) to determine a group SACP and GCP. The potential GCP is based on the group SACP, adjusted for potential external sources of extraordinary support if we believe such support will be extended to the group, or potential extraordinary negative intervention. Finally, we apply any relevant sovereign constraints to determine the GCP (see chart 2). See "Ratings Above The Sovereign—Corporate And Government Ratings: Methodology And Assumptions."



(iii) Assess the group status of each group member to be rated, if relevant.

(iv) Determine the SACPs of group members to be rated, if relevant.

(v) Assign a potential (indicative) ICR to group members. The potential ICR is based on the entity's SACP, if relevant, and the potential for extraordinary support (or extraordinary negative intervention). Extraordinary support is the higher of any group or government influence, or other external support factors (such as additional loss-absorbing capacity (ALAC) support or a guarantee). This step also factors in the degree of insulation, if any, that a group member has from potential negative influence by other weaker group entities.



(vi) Assign the final ICR after taking into consideration any relevant sovereign constraints (see "Ratings Above The Sovereign—Corporate And Government Ratings: Methodology And Assumptions").

10. These criteria define five categories of group status: core, highly strategic, strategically important, moderately strategic, and nonstrategic. These categories indicate our view of the likelihood that a group member will receive extraordinary support from the group (see table 1).

Table 1

Summary Of Associating An Entity's Group Status With A Potential ICR

Group status	Brief definition	Potential ICR*
Core	Integral to the group's current identity and future strategy. The rest of the group is likely to support these entities under any foreseeable circumstances.	GCP
Highly strategic	Almost integral to the group's current identity and future strategy. The rest of the group is likely to support these group members under almost all foreseeable circumstances.	One notch lower than the GCP, unless the SACP on that entity is equal to, or higher than, the GCP. In such a case, the potential ICR is equal to the GCP.
Strategically important	Less integral to the group than "highly strategic" group members. The rest of the group is likely to provide support in most foreseeable circumstances. However, some factors raise doubts about the extent of group support.	Three notches above SACP. This is subject to a cap of one notch below the GCP, unless the SACP is at least equal to the GCP, in which case the potential ICR is equal to the GCP.

Table 1

Summary Of Associating An Entity's Group Status With A Potential ICR (cont.)

Group status	Brief definition	Potential ICR*
Moderately strategic	Not important enough to warrant support from the rest of the group in some foreseeable circumstances. Nevertheless, there is potential for some support from the group.	One notch above SACP. This is subject to a cap of one notch below the GCP, unless the SACP is at least equal to the GCP, in which case, the potential ICR is equal to the GCP.
Nonstrategic	No strategic importance to the group.	SACP, subject to a cap defined by the GCP.

*** The above conventions do not apply where: potential ICRs exceed the GCP due to insulation (see "Insulated Entities" section); the group SACP is used to determine uplift for group support (see "External support factors in the GCP" section); the GCP is 'ccc+' or lower (see paragraph 13); and when paragraph 42 applies.**

11. A potential ICR on a group member that exceeds its SACP reflects our view of the likelihood of that entity, in a credit-stress scenario, receiving timely and sufficient group or government support (beyond that already factored into the SACP), thereby strengthening its creditworthiness. Examples of support include additional liquidity or capital to the group member, or one-off transfers of risk from the group member.
12. A potential ICR on a group member that is lower than its SACP reflects our view that if the group or relevant government were in a credit-stress scenario, the group or government would draw resources from the group member (an example of extraordinary negative intervention), thereby weakening its creditworthiness.
13. If the GCP is 'ccc+' or lower, the potential ICR on a group member cannot be lower than 'b-' unless the conditions for a potential ICR of 'ccc+' or lower are met (see "Criteria For Assigning 'CCC+', 'CCC', 'CCC-', And 'CC' Ratings," henceforth referred to as "CCC criteria"). The potential ICR would include the potential for extraordinary negative intervention from the group or government.

Identifying The Group And Its Members

14. For the purposes of these criteria, the term "group" refers to the group parent and all the entities (also referred to as group members) over which the group parent has direct or indirect control.
15. The group parent is not necessarily the ultimate holding company in the group structure but is the top entity in the structure that we believe is relevant to the group's credit quality. Accordingly, additional holding companies may exist above the group parent, but be excluded from our group assessment if we believe they have no material liabilities or operating assets and therefore no bearing on the group's overall credit quality. The control chain may include several successive layers of controlling or joint-control interest in other entities. We would generally not consider a natural person, or entities such as family firms, foundations, managed fund, or financial sponsors, to be a group parent. Where we determine that an entity (for instance, an investment holding company) does not have control of an investee company, we do not consider that entity to be the group parent.
16. "Control" refers to the ability to direct a group member's strategy and the disposition of its cash flow. Control may be present even if the group owns 50% or less of the group member's shareholder capital.
17. We generally apply this methodology to an entire group, but may also apply it to a distinct subgroup. A subgroup focus may be appropriate when the subgroup and its components have a distinct credit profile that is separate from that of the broader group. This could be due to factors

such as jurisdictional location, regulatory oversight, or support factors that apply only to the subgroup. References to the term "group" in this methodology can apply to either a subgroup or a group viewed in its entirety.

The Group SACP And Group Credit Profile (GCP)

18. The group SACP and GCP are our opinions of a group's creditworthiness as if it were a single legal entity (subject to any potential restrictions on cash flows associated with insulated entities).

19. The group SACP and GCP are not ratings. They are components contributing to the determination of the ICRs on group members. The group SACP does not take into account sources of potential extraordinary support or negative intervention that we consider external to the assessed group. However, the potential GCP incorporates extraordinary external support that we believe is available to the group, or conversely, extraordinary negative intervention. Finally, the GCP takes into consideration any relevant sovereign constraints. See "Ratings Above The Sovereign—Corporate And Government Ratings: Methodology And Assumptions."

20. Group SACPs and GCPs range from 'aaa' (the highest assessment) to 'd' (the lowest assessment), on a scale that parallels the ICR ('AAA' to 'D'). The lowercase letters indicate their status as a component of a rating rather than as a rating. Like ICRs, group SACPs and GCPs can carry the modifier "+" or "-". Typically, a group SACP or GCP is 'd' only in the case of a generalized group default. In the case of a legal entity within a group, we lower the ICR on that entity to 'D' or 'SD' (selective default) only if we determine the entity is in default (see "S&P Global Ratings Definitions").

21. To determine the group SACP and GCP, we assess the consolidated group using the relevant sector methodologies. The assessed group includes all group entities that we believe have a bearing on the group's credit quality (as per the explanation detailed in the section "Identifying The Group And Its Members"), and may potentially deconsolidate insulated entities as per the "Insulated Entities" section. We typically conduct the assessment of the group SACP and GCP as though the group were a single legal entity.

22. For cross-sector groups (including their holding companies), the specific rating methodology applied to assess the group SACP is the one relevant for the operations that most strongly influence the group's credit profile. This influence can reflect the amount of capital employed, level of earnings, cash flow, dividend contribution, or other relevant metric. However, where the analysis of consolidated financial statements using a single sector's criteria framework may not produce a meaningful picture of credit quality, we may apply a combination of rating methodologies to assess the group SACP. This may be done by applying the relevant methodologies to determine SACPs for the different group members. We would then aggregate these SACPs to derive the overall group SACP. The group SACP would also include adjustments to account for any benefits or risks not captured in the aggregation of the component SACPs.

a) Multiple ownership and joint ventures

23. If a group member is under the joint control of at least two parents--for example, a joint venture (JV)--the insolvency or financial difficulty of one parent may have less impact than if the entity had a single parent.

24. For JVs, we may attribute support from one of its owners (JV partner) even if the JV partner does not have majority ownership in the JV. We typically attribute support from the JV partner that would result in the highest potential ICR on the JV. This would apply where we believe the JV partner would support the JV, regardless of the actions of the other owners. This could include

situations where that JV partner makes day-to-day business decisions, or the JV is of critical importance to the supporting JV partner's operations or strategy. In such cases, however, the group status of the JV to the JV partner would typically not exceed strategically important. In addition, we would also take the potential resource demands of the JV on the JV partner into consideration when determining the JV partner's credit profile.

25. The analytical approach for a group's jointly owned business operations, such as whether to fully consolidate, partially consolidate, or equity account the operations when assessing the group SACP, is determined by the relevant methodologies for assessing corporates, financial institutions, insurance companies, or other entity types.

26. In cases where a shareholder agreement or similar arrangement exists that we believe would prevent an otherwise controlling parent from directing the strategy and cash flows of a group member, we may assess that control is not present. When we determine control is not present, we would typically treat the member as an equity affiliate and consider only the projected dividend flows from that member in our group SACP assessment.

b) Insulated entities

27. Where we determine that consolidating an insulated group member does not adequately capture the impact on the group SACP of any material restrictions on cash flows or financial resources within the group, we either:

- Adjust the group SACP down (typically by one or two notches); or
- Treat an insulated group member as an equity affiliate, and reflect this deconsolidated approach in determining the group SACP.

28. When assessing a group that has a bank subsidiary with a potential ICR that is above the GCP either because it is of high systemic or moderate systemic importance (as per "Financial Institutions Rating Methodology"), in the country where it is domiciled, or because of ALAC support, the group SACP will take into account the impact of any local restrictions on the flow of capital, funding, and liquidity, and any implications for the business and risk positions of the parent.

c) Entities owned by a financial sponsor

29. If the owner of a group entity is a "financial sponsor" (see Glossary), the potential ICR on that group entity does not directly factor in the likelihood of support from the financial sponsor, nor is it directly constrained by our view of the financial sponsor's creditworthiness. However, the financial sponsor's ownership may still affect the potential ICR through the application of the relevant sector-specific criteria.

30. The group SACP for a group owned by a financial sponsor may, however, include one or more intermediate holding companies of the operating entity, but would exclude the financial sponsor's own financials and its other holdings. This approach reflects our view that an intermediate holding company's primary purpose is to acquire, control, fund, or secure financing for its operating companies, and is generally reliant on those companies' cash flow to service its financial obligations.

d) U.S. public finance obligated groups

31. U.S. public finance obligated groups typically consist of a group of entities that are

cross-obligated as security for specific debt. Obligated group structures are most commonly used by not-for-profit hospitals, health systems, and senior living organizations.

32. Obligated groups are created for purposes of securing debt, and do not have operating or governance independence from the larger group. While debt covenants may contain some restrictions, for example limitations on the transfer of assets out of the obligated group, covenants are generally not strong enough to insulate the obligated group from the strategic and operating influence of the group. An obligated group, therefore, is typically not rated higher than the GCP.

33. Individual obligated group members may have separate legal incorporation and varying strategic value to the group. However, since the purpose of the obligated group is to secure debt on a joint and several basis, group status will be determined for the obligated group as a whole, not for its individual members. In applying these criteria, we consider obligated groups a single entity.

34. Most U.S. public finance ratings are issue ratings, although we sometimes assign ICRs. The issue rating could differ from the ICR based on the specific security package for the rated bonds. We expect that, barring subordination or structural enhancement, U.S. public finance issue ratings will generally be the same as the ICR.

e) External support factors in the GCP

35. **Government support.** The potential for extraordinary government support can be factored into either the ICRs of certain group members or the GCP, depending on the nature of this support (see Rating Government-Related Entities: Methodology And Assumptions [GRE criteria], and Financial Institutions Rating Methodology). We use the group SACP as a basis from which to determine the GCP when using the government support tables in the GRE criteria or bank criteria.

36. The assessment considers whether government support, driven by GRE status or systemic importance, would likely accrue to all or only some members of the group (see table 2).

37. To determine the potential ICR for a particular group member, where the assessment indicates that the government:

- Is likely to extend such extraordinary support directly to that entity (bypassing the group), any uplift for such support is added to the SACP of that entity in determining the potential ICR;
- Is likely to extend such extraordinary support indirectly, via the group, to the entity, the reference point for determining any uplift for group support (or negative group intervention) is the GCP (which would include uplift, if any, for extraordinary government support); or
- Is unlikely to extend such extraordinary support to the entity, the reference point for determining any uplift for group support is the lower of the group SACP or the GCP.

Table 2

Rating Government-Supported Entities--Likelihood Of Government Support Versus Group Support

SACP level	If the subsidiary is likely to benefit directly from extraordinary government support *	If the subsidiary is likely to benefit from extraordinary government support indirectly through the group	If the subsidiary is unlikely to benefit from extraordinary government support either directly or indirectly
SACP is lower than the group SACP	Potential ICR = Higher of (i) the SACP plus uplift for government support, or (ii) SACP plus uplift for group support. The outcome is subject to a cap at the level of the GCP (unless the subsidiary is insulated).	Potential ICR = SACP plus uplift for group support (with reference to the GCP)	Potential ICR = SACP plus uplift for group support (with reference to the lower of the group SACP or the GCP)
SACP is higher than or equal to the group SACP	Potential ICR = SACP plus uplift for government support, subject to a cap at the level of the GCP (unless the subsidiary is insulated)	If SACP < GCP, potential ICR = SACP plus uplift for group support (with reference to the GCP). If SACP >= GCP, potential ICR = SACP, subject to a cap at the level of the GCP (unless the subsidiary is insulated).	Potential ICR = SACP, subject to a cap at the level of the GCP (unless the subsidiary is insulated)
No SACP	SACP required, unless subsidiary is a GRE with almost certain likelihood of government support*	If core, potential ICR = GCP. If highly strategic, potential ICR = GCP - 1.	If core, potential ICR = lower of the GCP or group SACP. If highly strategic, potential ICR = lower of the GCP - 1 or group SACP - 1.

* See GRE criteria for further details, including when an SACP is not required for entities with almost certain likelihood of government support.
SACP--Stand-alone credit profile. ICR--Issuer credit rating.

38. **ALAC support.** The potential for extraordinary external ALAC support can be factored into either the ICRs on certain group members or the GCP, depending on the nature of this support (see "Financial Institutions Rating Methodology"). To determine the potential ICR on a particular group member, where the assessment indicates that ALAC support in the GCP:

- Is likely to extend indirectly, via the group, to the entity, the reference point for determining any uplift for group support (or negative group intervention) is the GCP; or
- Is unlikely to extend to the entity, the reference point for determining any uplift for group support is the lower of the group SACP or the GCP.

Assigning The Issuer Credit Rating

39. A potential ICR on a group member reflects its SACP (if relevant) and the potential for external extraordinary support (or negative intervention). We then determine the final ICR by applying any relevant sovereign constraints to the potential ICR.

40. We determine the potential ICR as follows, unless paragraph 41 applies:

- Core group entity is equal to the GCP;
- Highly strategic entity is one notch lower than the GCP, unless the SACP on that entity is equal to, or higher than, the GCP. In such a case, the potential ICR is equal to the GCP;
- Strategically important entity is rated three notches higher than its SACP. This is subject to a cap of one notch below the GCP, unless the SACP is at least equal to the GCP, in which case the

potential ICR is equal to the GCP;

- Moderately strategic entity is rated one notch higher than that entity's SACP. This is subject to a cap of one notch below the GCP, unless the SACP is at least equal to the GCP, in which case, the potential ICR is equal to the GCP; or
- Nonstrategic entity is rated the same as that entity's SACP, subject to a cap defined by the GCP.

41. The above conventions do not apply where: the potential ICR exceeds the GCP due to insulation (see "Insulated Entities" section); the group SACP is used to determine uplift for group support (see "External support factors in the GCP" section); the GCP is 'ccc+' or lower (see paragraph 13); or when paragraph 42 applies.

42. We may apply a one-notch adjustment to determine the potential ICR (as described in paragraph 40) to better reflect our holistic view of potential extraordinary group support. This adjustment is only applicable if we have determined an SACP and the gap between the potential ICRs, based on group status assessments of highly strategic and strategically important, is at least three notches. The adjustment, if applicable, is as follows:

- When the group status is highly strategic, we may apply a negative one-notch adjustment. The potential ICR could, therefore, be two notches lower than the GCP rather than one notch; or
- When the group status is strategically important, we may apply a positive one-notch adjustment. The potential ICR could, therefore, be four notches higher than its SACP rather than three notches.
- For example, if we determine an entity exhibits characteristics consistent with a highly strategic entity, while a change in group status to strategically important could lead to a potential ICR change of three notches, the potential ICR could be two notches below GCP while the group status remains highly strategic; alternatively, if we determine the entity now exhibits characteristics consistent with a strategically important entity, we will revise the group status to strategically important and the potential ICR could be four notches above the SACP.

Group Status Of Individual Members

43. A group member's group status reflects the extent and timeliness of extraordinary support we expect it will receive from the rest of the group when that entity is under credit stress. We may also assess a group member's group status to a subgroup and the group status of a subgroup to a broader group. This section describes the framework that supports the classification of a member's group status into one of five categories:

- Core;
- Highly strategic;
- Strategically important;
- Moderately strategic; or
- Nonstrategic.

44. The determination of an SACP for a group member categorized as core or highly strategic is not necessary unless otherwise required or analytically relevant. A group status is not necessary for insulated entities, unless otherwise required or analytically relevant.

a) Core entities

45. A core entity exhibits features highly consistent with the group's franchise, supports the realization of group strategic objectives, and is expected to attract extraordinary support, if required, under any foreseeable circumstance. A core entity would also generally be expected to exhibit all the following characteristics:

- Is highly unlikely to be sold;
- Operates in lines of business or functions (which may include group risk management and financing) that are very closely aligned with the group's mainstream business and customer base. The entity also often operates in the same target markets;
- Has a strong, long-term commitment of support from the group in benign and under stressful conditions, or incentives exist to induce such support (e.g., cross-default clauses in financing documents, or the entity plays an integral role in group risk management or financing);
- Is reasonably successful at what it does or does not have ongoing performance problems that could result in underperformance against the group's specific targets and group earnings norms over the medium to long term;
- Either constitutes a significant proportion of the consolidated group or is fully integrated with the group;
- Is closely linked to the group's reputation, name, brand, or risk management;
- Has typically been operating for about five years or more; and
- Has been established as a separate entity for legal, regulatory or tax reasons, but otherwise operates more as part of a profit center or division integral to the group.

b) Highly strategic entities

46. A highly strategic group entity generally exhibits almost all of the characteristics of a core entity, and differs only narrowly regarding the extent of expected extraordinary support from the group. An entity assessed as highly strategic is generally expected to have a long-term commitment from the group. There may be situations in which support for the highly strategic entity will be limited, for instance, to preserve the viability of core entities of the group.

c) Strategically important entities

47. We assess an entity as strategically important when we expect it to receive extraordinary support from the group in most foreseeable circumstances; however, there are some doubts about the extent of group support that precludes it from a higher support category. Strategically important subsidiaries would however typically exhibit all the following characteristics:

- Is unlikely to be sold;
- Is important to the group's long-term strategy;
- Has the long-term commitment of the group, or incentives exist to induce such support (e.g., cross-default clauses in financing documents); and
- Is reasonably successful at what it does or has realistic medium-term prospects of success relative to the group's specific expectations or group earnings norms.

d) Moderately strategic entities

48. When an entity does not exhibit the characteristics for a higher level of group support, but we expect it to receive extraordinary support in some foreseeable circumstances, it is typically considered moderately strategic. Moderately strategic entities are also typically important to the group's long-term strategy or are (or are expected to become) reasonably successful at what they do.

e) Nonstrategic entities

49. When an entity does not exhibit the characteristics of core, highly strategic, strategically important, or moderately strategic, it is categorized as nonstrategic.

Captive (re)insurer

50. A captive (re)insurer may also be assessed as core if it sources its (re)insurance business from companies within the group and writes no, or an immaterial amount, of third-party business. A captive (re)insurer may also be assessed as highly strategic if third-party business is a modest portion of its overall business operations.

Captive finance

51. When assessing group status for captive finance subsidiaries, the attributes we examine to determine group status should be considered within the context of all the following unique factors that captive finance subsidiaries typically provide to their group's marketing efforts:

- The percentage of the group's products sold via the subsidiary (penetration rate). For diversified groups, the percentage of total sales may be less important than the percentage of certain specific product lines. In turn, we consider the importance of these products to the overall performance of the group;
- The alternatives available to sell the group's products; and
- The costs and challenges in conducting its own financing. For some entities, funding costs may outweigh the benefits--or it may become difficult to gain access to capital.

Branches

52. For financial services entities, a branch is part of a legal entity that is typically at another geographic location. A branch therefore has the same creditworthiness as the legal entity, unless the branch is in another country and the actions of that sovereign could affect the branch's ability to service its obligations. See "Ratings Above The Sovereign--Corporate And Government Ratings." With respect to financial institutions, see also "Financial Institutions Rating Methodology."

U.S. public finance obligated groups

53. U.S. public finance obligated groups could be considered core if they contain the majority of the organization's primary operating facilities, such as its hospitals or senior living facilities.

Financing subsidiaries

54. A financing subsidiary of a financial institution or corporate group may be assessed as core when it plays an integral role in group financing, its sole activity is to raise debt on behalf of the group, and it is wholly owned. Such subsidiaries often share a related corporate name with their parents.

55. A financing subsidiary of an insurance group, while generally not assessed as core, is typically assigned a rating as if it is a holding company.

Credit-substitution guarantee of group entities

56. When all of a group member's present and future financial obligations are guaranteed, and the guarantor is obliged to pay that group member's obligations even if the group member defaults, we assign a rating to the group member that reflects the higher of two outcomes:

- A rating reflecting the creditworthiness of the group member absent the benefit of the guarantee; or
- A rating reflecting the creditworthiness of the guarantor (see "Guarantee Criteria").

57. Our assessment of the terms of any intragroup guarantees determines whether a payment default on the part of a group entity is viewed as a default by the guarantor (see "S&P Global Ratings Definitions").

Loan participation notes (LPNs)

58. We rate LPNs and equivalent securities (such as trust preferred) issued by a special-purpose vehicle (SPV) on behalf of a corporate, financial institution, or insurance entity (including their holding companies) at the same level as we would rate an equivalent-ranking debt of its underlying borrower (the LPN sponsor) (and treat the contractual obligations of the SPV as financial obligations of the LPN sponsor) provided that all the following conditions are met:

- All of the SPV's debt obligations are backed by equivalent-ranking obligations with equivalent payment terms issued by the LPN sponsor;
- The SPV is a strategic financing entity for the LPN sponsor set up solely to raise debt on behalf of the LPN sponsor's group; and
- We believe the LPN sponsor is willing and able to support the SPV to ensure full and timely payment of interest and principal when due on the debt issued by the SPV, including payment of any expenses of the SPV.

59. As a consequence, we assign a 'D' or 'SD' ICR to the LPN sponsor if the SPV fails to make payments on the debt when due, as we would typically do in case of default on a similarly ranking debt issuance of the LPN sponsor (see also "S&P Global Ratings Definitions").

60. For multiple LPN sponsor SPVs, or SPVs that do not meet all the conditions above, the relevant structured finance criteria apply, which may include "Asset Isolation And Special-Purpose Entity Criteria—Structured Finance" and "Global Methodology For Rating Repackaged Securities."

Dedicated supplier/purchaser relationships

61. Group members are typically owned or controlled by the group parent. However, a dedicated

supplier/purchaser relationship can create an economic incentive for the supplier to support the purchaser, despite having only a minority ownership interest or none at all. We define the group in this instance as the supplier and the purchaser. A supplier may provide support sufficient for the purchaser to be considered moderately strategic to the supplier when the purchaser comprises a meaningful portion of the supplier's sales, cash flow, volume, or other measure. Such relationships typically have all the following characteristics:

- The term of the supplier/purchaser agreement is either perpetual or long term;
- There is evidence of the supplier's willingness and ability to provide financial support to the purchaser. We determine this by looking at prior loans, capital investments, or marketing support given to the purchaser; and
- The purchaser is closely linked to the supplier's reputation, name, or brand.

Entities with interlocking business relations

62. We can apply this methodology to groups of entities with interlocking business relations even in the absence of control, as defined in the criteria. Group membership will be based on meeting at least four of the following conditions:

- Name affiliation;
- Common management;
- Common board composition or common board control;
- Shared corporate history;
- Common business ties;
- Common financing of group entities;
- Shared corporate support functions; or
- Cross ownership holdings.

In such cases, we determine the GCP by determining the group members' SACPs and aggregating them based on the relative importance of each group member, as we do for the cross-sector groups. Members of this type of group can only be assigned a group status of strategically important, moderately strategic, or nonstrategic.

Insulated Entities

63. Financial stress within the group can negatively affect the creditworthiness of group entities. Accordingly, in such cases a potential ICR on an entity is typically limited by the GCP. This is notably because:

- The group could potentially transfer assets from one group entity to another during financial stress, contributing to credit stress at other group entities;
- The distress at the group could trigger business or financial difficulties at the group member. For instance, the group's problems could cause reputational damage of the group member and a loss of business;
- The group member might rely on operational support from the group on an ongoing basis; and

- In some jurisdictions, a bankruptcy petition by one group entity could include or cause other group entities to go into bankruptcy or similar measures.

64. Some entities (which for the purposes of this section, could also apply to a subgroup) may be insulated, segmented, or ring-fenced from their group, from a credit risk perspective. Such insulation may lead to the rating on the entity being higher than the GCP. The lower the likelihood that the creditworthiness of the entity would be impaired by a credit stress scenario for the group, the greater the potential difference between the potential ICR on the entity and the GCP. That said, we would typically not apply insulation to a group member when group entities above the group member, including the group parent, have debt but do not have significant other assets, either directly or indirectly. In such a case, the financial resources of the group member (where insulation is being contemplated) would be the only source of repayment for debt issued by group entities above it.

65. The potential ICR of an insulated entity is one notch higher than the GCP in cases where the entity is operationally separated from the group and the entity's SACP (or the SACP plus the potential for government support or ALAC) is at least one notch higher than the GCP. Key characteristics of an operationally separated entity would generally include all of the following:

- The entity holds itself out as a separate entity, its financial performance and funding are highly independent from the group, it has no significant operational dependence on other group entities, and it maintains its own records and funding arrangements and does not commingle funds, assets, or cash flows with them;
- There is a strong economic basis for the group to preserve the entity's credit strength; and
- We do not expect a default of other group entities to directly lead to a default of the insulated entity.

66. The potential ICR of an insulated entity is two notches above the GCP if, in addition to being eligible for one notch of insulation, the group's control of the entity is limited by independent parties, and the entity's SACP (or the SACP plus the potential for government support or ALAC) is at least two notches above the GCP. Limited control would generally be characterized by at least one of the following:

- There are significant minority shareholders with an active economic interest;
- Independent directors have effective influence on decision making, including dividend policy and bankruptcy filings; or
- There are strong legislative, regulatory or similar restrictions that would inhibit the entity from supporting the group to an extent that would unduly impair the entity's stand-alone creditworthiness.

67. The potential ICR on an insulated entity is three notches above the GCP if, in addition to the entity being eligible for two notches of insulation, there are material structural safeguards to protect the entity from group influence, and the entity's SACP (or the SACP plus the potential for government support or ALAC) is at least three notches above the GCP. Structural safeguards that protect the entity from group influence would generally include at least one of the following:

- The regulator or appropriate legislative body is expected to act, or has acted, to protect the credit quality of the entity, for example to prevent the entity from supporting the group to an extent that would in turn impair its stand-alone creditworthiness;
- There are both: protective governance arrangements (such as independent directors with an effective influence on decision making); and either significant minority shareholders or joint

venture partners, with an active economic interest;

- There is an independent trustee or equivalent governance arrangement that can enforce the rights of third parties, and we expect the trustee (or equivalent) to act upon that right; or
- The government or other governmental agency (i) has the authority to change ownership of the entity via existing legislation or other legal powers to separate it from a troubled group; and (ii) we expect it to act upon that right, based, for example, on a statement of intent to do so, or a track record of proactive stress management under similar circumstances.

68. The potential ICR of an insulated entity could be de-linked and therefore not constrained by the creditworthiness of the group if the conditions in either (a) or (b) are met:

(a) In addition to being eligible for three notches of insulation as described in the preceding paragraph:

- We believe that the parent company doesn't exert control due to substantial creditor protections and as a result is unable to adversely impact the entity's credit quality; and
- The entity benefits from governance constraints that severely limit the influence of the parent, preventing it from determining matters such as strategy, material change of business, dividend payments and other material cash flows, and bankruptcy filings. These may arise, for example, due to statutory powers or contractual constraints.

(b) We determine that there is sufficient evidence that significant group credit stress has had minimal impact on the entity's credit profile, and that we do not expect it to have a material negative influence going forward.

69. With respect to our assessment of insulation of captive finance subsidiaries, we could view a captive finance entity as operationally separated from the group when it is able to stand on its own by taking over or subcontracting certain functions previously provided by other group entities. Given the nature of a captive finance entity's business model, we would expect it to retain commercial ties with its group.

70. The potential ICR of a bank subsidiary is typically not subject to a cap linked to the GCP where either: (i) the entity's SACP plus the potential for government support is above the GCP because it is of high systemic or moderate systemic importance (according to "Financial Institutions Rating Methodology"), in the country where it is domiciled; or (ii) the entity's SACP plus the potential for ALAC support is above the GCP (see "Financial Institutions Rating Methodology"). However, where we expect the nature and extent of extraordinary negative group intervention could impact the entity's creditworthiness, although to an extent sufficiently limited that a cap linked to the GCP would not apply, we may apply a one-notch negative adjustment when determining the potential ICR. This adjustment is to better capture our holistic view of potential extraordinary negative group intervention.

Holding Companies

71. For holding companies of corporate groups and nonregulated nonbank financial institutions, the ICR is typically the same as the GCP. For intermediate holding companies of corporate groups and nonregulated nonbank financial institutions, the ICR is typically the same as the rating on its core operating entities.

Holding companies of prudentially regulated financial services groups

72. Holding companies are typically reliant on dividends and other distributions from operating companies to meet their obligations. The rating of holding companies of prudentially regulated financial services groups reflects the difference in their creditworthiness relative to the group's operating entities. The rating differential is mainly due to the increased credit risk that arises from possible regulatory constraints to upstream resources and potentially different treatment under a default scenario.

73. For holding companies of prudentially regulated financial institution groups, the ICR is generally:

- One notch lower than the GCP if the GCP is 'bbb-' or higher; or
- At least two notches lower than the GCP if the GCP is 'bb+' or lower.

74. For holding companies of insurance groups, the ICR is generally:

- Two notches lower than the GCP if potential regulatory restrictions to payments are considered low in jurisdictions accounting for the majority of distributions (typically as measured by dividends, cash flows, or earnings) from operating entities to the holding company; or
- Three notches lower than the GCP if potential regulatory restrictions to payments are considered high in jurisdictions accounting for the majority of distributions (typically as measured by dividends, cash flows, or earnings) from operating entities to the holding company.

75. The notching from the GCP to derive the ICR of a holding company of a financial services group may be narrower than the standard notching in paragraphs 73 or 74, or potentially eliminated, if:

- The holding company directly controls multiple material operating units that are sufficiently diverse and independent such that the suspension of cash flows from any of its operating entities would not substantially weaken the holding company's financial position;
- The potential for regulatory restrictions to payments is significantly lower than we typically observe for prudentially regulated entities and is not adequately reflected in the standard notching;
- The holding company generates sufficient cash flows from its own business activities or from unregulated operating subsidiaries to meet its obligations; or
- The potential for regulatory restrictions on distributions from operating entities is mitigated by our expectation that the holding company will regularly maintain significant unencumbered cash or high-quality liquid fixed-income investments to meet its obligations.

76. The notching from the GCP to derive the ICR on a holding company of a financial services group may be wider than the standard notching in paragraphs 73 or 74 if:

- The holding company itself carries significant asset or liability risks that are not fully captured in our standard notching;
- There are elevated liquidity risks at the holding company, most notably when it has significant debt maturities and other financial obligations relative to its unencumbered cash and liquid assets held or to which is has ready access. For example, high double leverage for a financial institution can reflect elevated liquidity risks;
- There are heightened risks of regulatory constraints or other material restrictions to payments that are not adequately captured in the standard notching; or

- The GCP is higher than the group SACP owing to external extraordinary support that is not expected to accrue to the holding company. In this case, we apply the typical notching from the group SACP rather than the GCP.

77. If the GCP is 'b-' or lower, or if notching would otherwise result in a rating of 'CCC+' or lower, the ICR on a holding company is no lower than 'B-' unless the conditions for an ICR of 'CCC+' or lower are met (see "CCC criteria").

78. We typically notch down the ICR on an intermediate holding company of a financial services group or subgroup from the rating assigned to its core operating entities by applying the same notching we would to a holding company of the group. We may, however, narrow the notching or potentially eliminate the notching if we expect the group to provide extraordinary support for the subsidiaries of the intermediate holding company by investing in the intermediate holding company. We may widen the notching if there are additional risks relating to cash flows from its operating entities or risk relating to the expected extraordinary support from the group.

Rating Group Entities Above The Sovereign

79. The general criteria for rating a group member above the relevant sovereign rating, which is usually the country of domicile of the group member, are in ratings above the sovereign criteria (see Related Criteria).

80. The ICR on a group member is the lower of the potential ICR derived from these criteria or the relevant foreign currency sovereign rating. This would not be the case, however, in the situations outlined below, where we determine the group member's ICR as the highest of a, b, or c. Please also see paragraph 150.

(a) If the group member passes the appropriate sovereign stress test (without considering group or government support), the result from the combination of the potential ICR derived from these criteria (excluding uplift for group or government support) and the provisions in our ratings above the sovereign criteria;

(b) For a group member where the relevant foreign currency sovereign rating is lower than 'B-', the ICR is no lower than 'B-' (unless T&C restrictions in Ratings Above the Sovereign criteria are applicable) if the conditions for an ICR of 'CCC+' or lower are not met (see "CCC criteria"); or

(c) If we believe the group is willing and able to sufficiently support the group member during the stress associated with a sovereign default, the highest of (i) to (v) below:

- (i) For a group member that has a potential ICR based on a guarantee that meets our credit substitution criteria, the potential ICR;
- (ii) For a financial institution or insurance group member that has less than 10% exposure to the jurisdiction of domicile and we consider the risks (e.g. a deposit freeze or monetary-union exit) associated with that jurisdiction are immaterial, the potential ICR;
- (iii) For core group members of financial institution groups, the lower of the potential ICR derived from these criteria, or up to two notches above the relevant foreign currency sovereign rating;
- (iv) For core group members of insurance or corporate groups, the lower of the potential ICR derived from these criteria, or three notches above the relevant foreign currency sovereign rating; or
- (v) For highly strategic group members of insurance or corporate groups, the lower of the potential ICR derived from these criteria, or two notches above the relevant foreign currency

sovereign rating.

GLOSSARY

81. ALAC: Additional loss-absorbing capacity. These are securities issued by certain prudentially regulated entities (see Related Criteria) that can absorb losses at or near non-viability--for example, in the event of a bank resolution, in a way that reduces the risk of the bank defaulting, according to our definitions, on its senior unsecured obligations.

82. Captive finance subsidiary: A captive finance subsidiary (as opposed to a financing subsidiary) provides financing for the purchase of the group's products. (For a full definition, see "The Impact of Captive Finance Operations On Nonfinancial Corporate Issuers").

83. Captive (re)insurer: A member of an insurance, corporate, or financial institutions (FI) group that mainly insures risks of other group entities. Captive (re)insurers typically show a very high degree of integration with a group's financial and risk management strategy.

84. Double leverage (for financial institutions only): We define double leverage (DL) for FI groups as holding company investment in subsidiaries divided by holding company (unconsolidated) shareholder equity. Holding companies often issue hybrid capital securities that build regulatory capital. They invest the proceeds in operating subsidiaries as equity or as similarly structured hybrid securities. We calculate DL in two ways: (1) with a common equity double-leverage measure that treats hybrid capital as debt, and (2) with a total equity double leverage measure that treats hybrid capital as equity.

85. Equity affiliate: Also defined in our corporate criteria as "unconsolidated equity affiliates." These are entities that are not consolidated in an issuer's financial statements. Therefore, the earnings and cash flows of the affiliate are not typically included in our primary metrics (see "Corporate Methodology").

86. Extraordinary negative intervention: Potential extraordinary negative intervention by one or more members of a group. Examples include the extraction of unexpected extraordinary dividends or asset or cash stripping the issuer at the behest of the group to service other obligations of the group.

87. Extraordinary support: We consider support as extraordinary when it is entity specific, nonrecurring, and typically related to financial stress at the entity. Examples include but are not limited to recapitalization with common equity or hybrids, liquidity injections to the group member, or one-off transfers of risk from the group member.

88. Financial institution: Entities that are in-scope for our bank and nonbank FI methodologies.

89. Financial services sector: Consists of financial institutions and insurance companies.

90. Financial sponsor: We define a financial sponsor as an owner that does not have a long-term strategic interest in a company. Rather, the financial sponsor is a financial investment firm primarily motivated to increase the value of its investment by improving its management, capital, or both, typically with the ultimate goal of liquidating the investment. Financial sponsors include, but are not limited to, private-equity firms, hedge funds, and venture capital firms.

91. Holding company (may also be referred to as a group parent): A legal entity that is the owner of at least one group member that conducts business activities, though it may not carry out its own business activities (e.g. a non-operating holding company). A holding company may also provide services to subsidiaries such as investment and treasury management.

92. Insurance company (or insurers): Entities that are in scope for our insurance ratings methodologies.

93. Intermediate holding company: A legal entity that is a group member and legal owner of at least one other group member that conducts business activities, though it may not carry out its own business activities.

94. Parent: An entity with controlling or joint-control interest in another entity or a joint venture.

95. Prudentially regulated: This refers to the regulation of a financial services entity by one or more regulatory authorities who set standards for, among other things, capital adequacy and potential restrictions on distributions. We generally regard banks and insurers as prudentially regulated sectors.

APPENDIX

103. This appendix provides additional information and guidance relating to the analytical application of these criteria.

Extraordinary Support In The Group Credit Profile

104. Table 3 gives examples of how we determine uplift for group support when the group credit profile (GCP) includes extraordinary support. In the example, the group stand-alone credit profile (group SACP) is 'bbb+', and we determine there is a high likelihood of potential extraordinary government support to the group from an 'A+' rated sovereign (both local and foreign currency). Under our bank criteria, we determine the potential GCP is 'a', which includes two notches of uplift for potential extraordinary government support. The GCP is 'a' as the relevant sovereign rating of 'a+' does not constrain the GCP below the potential GCP.

Table 3

Determining Uplift For Group Support--GCP Includes Extraordinary Support

	Financial Institutions Group	Bank Entity A	Bank Entity B	Insurance Entity C	Asset Management Entity D
Group Analysis					
Group SACP	'bbb+'				
Extraordinary support	+2 notches				
Potential GCP	'a'				
Relevant sovereign rating*	'a+'				
Passes sovereign stress test	N.A.				
Impact of sovereign constraint	0				

Table 3

Determining Uplift For Group Support--GCP Includes Extraordinary Support (cont.)

	Financial Institutions Group	Bank Entity A	Bank Entity B	Insurance Entity C	Asset Management Entity D
GCP	'a'				
Entity Analysis					
SACP		N.A.	'bbb'	'bbb-'	'a-'
Group status		Core	Strategically important	Strategically important	Strategically important
Relevant reference point for group support uplift		GCP	GCP	Group SACP	Group SACP
Uplift for group support		N.A.	+2 notches	+1 notch	0
Potential ICR		'a'	'a-'	'bbb'	'a-'
Relevant sovereign rating*		'a+'	'a+'	'a+'	'a+'
Passes sovereign stress test		N.A.	N.A.	N.A.	N.A.
Impact of sovereign constraint		0	0	0	0
Issuer credit rating		'A'	'A-'	'BBB'	'A-'

N.A.--Not applicable. *The relevant sovereign rating is in lowercase to indicate that it is being used as a component of the determination of GCPs and ICRs and is determined in accordance with our "Ratings Above The Sovereign" criteria.

105. The financial institution (FI) group in the example has four group members comprising a bank with core group status and three subsidiaries assessed as strategically important. In the case of bank A and bank B the reference point for determining uplift for group support is the GCP of 'a' because we expect extraordinary government support in the GCP would extend to the bank entities. As a core group member, the issuer credit rating (ICR) on bank A is 'A', equal to the GCP. The ICR on Bank B, a strategically important group member, is 'A-' because we cap the uplift for group support at one notch below the GCP. For the insurance and asset management entities, the relevant reference point for determining potential uplift for group support is the group SACP of 'bbb+' because we expect extraordinary government support in the GCP is not likely to extend to these entities. The ICR of strategically important insurance subsidiary C is 'BBB' because we cap the uplift for group support at one notch below the group SACP. Given the SACP of asset management subsidiary D is higher than the group SACP, the ICR is 'A-' since we do not constrain the ICR at the level of the group SACP. Had the SACP of subsidiary D been above the GCP, we would need to determine that it is an insulated entity for subsidiary D's ICR to exceed the GCP.

106. The approach laid out in the example applies if the expected extraordinary support in the GCP was from additional loss-absorbing capacity (ALAC) rather than from government support. If we determine that ALAC support in the GCP extends to the banking entities, the relevant reference point for determining any uplift for group support is the GCP. If we determine the ALAC support in the GCP is unlikely to extend to the insurance and asset management entities, the relevant reference point for determining any uplift for group support is the group SACP.

Impact Of Sovereign Constraint On GCP

107. Consider an example where the potential GCP is 'a-' and the relevant sovereign rating is 'bbb'. The GCP would be 'bbb' (assuming the group does not pass the sovereign stress test) because the GCP is the lower of the potential GCP ('a-') or the relevant sovereign rating ('bbb'). We determine the relevant sovereign rating by applying "Ratings Above the Sovereign" criteria and consider, at a group level, the relevant foreign currency sovereign rating, the sovereign stress test (if relevant), the maximum rating differential above the relevant sovereign rating, and any transfer and convertibility constraints that are relevant for the group's local currency ratings (for example, cross-default clauses).

Determining The Potential ICR

108. The potential ICR includes any adjustment defined in sector criteria to determine the ICR. In our analysis of insulated entities, the SACP plus the potential for government support or ALAC includes any adjustment defined in sector criteria to determine the ICR.

Impact Of Sovereign Constraint On ICR

109. A financial institution group might provide a bank group member with hybrid capital instruments that can absorb losses of the entity at or near nonviability in a way that reduces the risk of the entity defaulting, according to our definitions, on its senior unsecured obligations (we generally refer to such instruments as group internal loss absorbing capacity). In applying our Group Rating Methodology (GRM), we consider such instruments to be ALAC support for the entity instead of extraordinary group support, if the entity and the instruments otherwise meet the conditions detailed in our ALAC criteria. We generally consider such ALAC instruments in determining whether the entity passes the sovereign stress test, if we assume that the entity's host regulator would enforce loss absorption by these instruments in a sovereign default scenario.

Identifying The Group And Its Members

110. To determine the identity of the group parent for purposes of conducting GRM analysis, we assess both the existence of control along with our judgment as to the relevance of the entity to the group's overall credit quality.

111. As a result, the group parent can be, but is not necessarily, the ultimate holding entity in the group structure. Any number of holding companies above the group parent may have been established for a variety of purposes (for example, tax considerations, regulatory requirements, or prefabricated platforms for future equity partners). If they do not hold material liabilities or operating assets (directly or indirectly), we may consider them inconsequential to the group's overall creditworthiness. As such, we may exclude these holding companies from our group analysis.

112. There are several types of owners that may control an entity we are rating but that we may not recognize as group parents because of our judgment as to their irrelevance to the group's overall creditworthiness. For example, we generally do not consider natural persons who directly hold controlling shares in an entity to be group parents. However, natural persons or families may control their businesses through one or more holding companies. Such holding structures may include several successive layers of holding corporations, the relevance of which to the group's

overall creditworthiness we will assess as described above.

113. There may be other structural holding variations where a person or family holds controlling shares through a holding vehicle that may itself hold other minority or controlling shares in other companies with meaningful business operations. Such family-owned holding companies would not qualify as "family firms" because we expect "family firms" to be devoid of (directly or indirectly held) material assets or liabilities--with the exception of the controlling shares in the rated company. Alternatively, such family-owned holding vehicles may not have other material direct or indirect business activities, but may carry a meaningful level of debt or other liabilities. Where structural holding variations exist and we view them as material or meaningful, as described above, we may consider such holding companies to be relevant to the group's overall creditworthiness and, as a result, they could qualify as group parents because of their potential relevance to the credit risk of the entity.

114. Our consideration of nonprofit organizations (including nongovernmental organizations [NGOs]), cooperative organizations, certain funds (for example, those that do not have asset management fees as a key component of their business model), and investment holding companies as potential group parents depends on our view of both their control and relevance to the group's overall credit quality. When we expect such parents to play an active role in the group, including during times of credit stress, we may consider them a group parent. For example, the determination of whether to define nonprofit organizations (including NGOs) and cooperative organizations as the group parent largely depends on their role, which includes charter mandates, track record, and relevant local regulations.

115. We may consider a mutual or cooperative group in the regulated financial services sector as a group even in the absence of a group parent or equity shareholdings between entities. For example, there may be legal, contractual, regulatory, or governance considerations that lead us to conclude that control is present and the entities collectively form the economic equivalent of a group. An example of such a group is a cooperative where all the entities in the group enter into a joint and several guarantee, the regulator and tax authorities view the entities as a single group, and there is a central body that exercises control such that we conclude that the entities form a group for purposes of defining the group and group members.

Identifying The Group And Its Members--BNDES

116. We consider an entity a group member and include it in the GCP where it is part of an "economic group" owing to "cross-default" clauses on borrowings from Brazil's Banco Nacional de Desenvolvimento Economico e Social (BNDES).

Identifying The Group And Its Members--Subgroups

117. We may determine there are two or more entities within a group that have common characteristics, or features, that are sufficiently unique or distinct from the larger group that warrants an evaluation of this group of entities as a separate group (also referred to as a subgroup).

118. The inclusion of entities within a subgroup is notional and can be separate from how a company operates or reports, and may change over time. Notionally grouping entities through the determination of a subgroup could, for example, be based on entities' location in a particular country.

119. Classification and recognition of group support for a subgroup will reflect our evaluation of the likelihood of the subgroup benefiting from extraordinary group support, similar to our evaluation

of group entities. For example, we may capture a number of legal entities in a particular country that, while small relative to the larger group, are expected to receive support. Collectively, the entities may provide diversification and growth prospects within a larger group supporting a subgroup assessment.

120. A complex group can have more than one GCP where we determine a subgroup analysis is analytically relevant. For example, a subgroup analysis may be analytically relevant where there are material liabilities at the intermediate holding company of a subgroup. For an entity that is part of a subgroup, we may also consider (i) the extent of insulation of the entity from the subgroup, and (ii) whether group support would flow directly to the entity from the wider group or through the subgroup.

The Group SACP And GCP--Extraordinary Support

121. Potential sources of extraordinary external support to a group include ALAC support or support coming from a government. To determine the GCP of a subgroup, we also consider support from the wider group as a form of extraordinary external support. Similarly, the potential sources of extraordinary negative intervention can also emanate from a government or from a wider group (in the case of subgroups).

The Group SACP And GCP--Cross-Sector Groups

122. We could derive the group SACP using more than one sector rating methodology if we determine that no single sector rating methodology adequately captures our view of overall creditworthiness. We may combine the SACPs derived from various sector rating methodologies to determine a preliminary group SACP. We could modify this preliminary group SACP to reflect our holistic view of credit quality. This would include taking into consideration factors such as diversification, other group debt, and other positive or negative credit factors that may not be reflected in the underlying SACPs.

123. For instance, suppose there is a group parent that owns one corporate entity and one insurance entity where we believe no single sector rating methodology will result in a group SACP that reflects our view of overall creditworthiness. If, in this case, the individual SACPs are 'bb' and 'a', respectively, and we consider both to have equal influence on the overall creditworthiness of the group, we could average the SACPs resulting in a group SACP of 'bbb'. We could then adjust this according to our analytic judgment to derive the group SACP. For example, we may view diversification benefits as sufficient to raise the group SACP to 'bbb+'.

124. Alternatively, if we determine that the two entities above do not equally influence the overall creditworthiness of the group, but their influence comprises 75% and 25%, respectively, this would suggest a group SACP of one to two notches (representing the weighted average of the six-notch differential) above the 'bb' SACP. This would indicate a group SACP of 'bb+' or 'bbb-'. We may further adjust our result on the basis of analytic judgment to determine the group SACP.

Government-Related Entities

125. There can be specific circumstances where we may choose to apply our Government Related Entities (GRE) methodology, rather than a combination of GRE and GRM, when analyzing an entity classified as a GRE (see the "Rating GRE Subsidiaries" section in our GRE criteria.) For instance, this may occur when a GRE is ultimately owned by the government through a holding company or asset management company, and we believe that the GRE is controlled by the government. In such

circumstances, we may not view the holding company or asset management company as a group parent because we don't view it as relevant to the analysis.

Assigning The Issuer Credit Rating

126. Consider the following example that illustrates the potential ICR outcomes where we determine the SACP of a group member is 'bb' and the relevant reference point for determining uplift for group support is the 'aa-' GCP.

Table 4

Potential ICRs

Group Status	--Potential ICR--	
Core	GCP	'aa-'
Highly strategic	GCP -1 or GCP -2	'a+' or 'a'
Strategically important	SACP +3 or SACP +4	'bbb' or 'bbb+'
Moderately strategic	SACP +1	'bb+'
Nonstrategic	SACP	'bb'

127. In this example, the one-notch adjustment to determine the potential ICR is applicable since we have determined an SACP and the gap between the potential ICRs based on group status assessments of highly strategic ('a+') and strategically important ('bbb') is at least three notches (in this case there is a four-notch gap).

128. We may apply the one-notch adjustment to better capture our holistic view of potential extraordinary group support. If we assess the group member as highly strategic, we may determine the potential ICR is 'a+' or apply a negative one-notch adjustment such that the potential ICR is 'a'. If we assess the group member as strategically important, we may determine the potential ICR is 'bbb' or apply a positive one-notch adjustment such that the potential ICR is 'bbb+'.

Group Status Of Individual Members--Potential Sale Of An Entity

129. We may include uplift for group support, even if there is the potential for the sale of the entity, if we have sufficient information to believe the entity would be sold to a group that would be supportive of the entity's current creditworthiness. For example, if a leasing company were for sale and it was responsible for financing a significant portion of transportation assets in a given country, we could maintain the existing group status if we believe that the creditworthiness of the entity would be no lower following a sale. This underscores that we consider the impact of the potential sale on the entity's creditworthiness to the extent possible.

Group Status Of Individual Members--Determining An SACP

130. Determining an SACP is necessary for group members that have strategically important, moderately strategic, or nonstrategic group status. Determining an SACP is not typically necessary for core or highly strategic group members. However, assessing an SACP for a core or highly strategic group member can be required or analytically relevant in situations such as:

- In the event that group status diminishes;

- To determine the group SACP of a diverse group;
- When the group member is insulated;
- When the SACP (or the SACP + ALAC uplift) is above the group SACP and the group SACP is the relevant reference point for group support uplift;
- When rating hybrid instruments that are issued by the group member and we determine group support in the ICR does not benefit the hybrid instrument;
- When uplift for group support is limited by sovereign-related risk but the entity is likely to pass the sovereign stress test; or
- In the case of highly strategic group members that are eligible for a one-notch adjustment to the potential ICR (as described in table 1 and paragraph 42 of the criteria) to better reflect our holistic view of potential extraordinary group support.

Group Status Of Individual Members--Core Entities

131. A core group entity generally either constitutes a significant proportion of the consolidated group or is integrated with the group. An integrated group entity refers to an entity that depends on the rest of the group for its administrative and operational activities and its infrastructure. These operational factors render it highly likely to benefit from group support if required. Examples can include booking or cost centers, captive insurers, captive financing operations, and group entities that exist solely to issue debt or carry on treasury operations on behalf of a group.

132. While a core group entity has typically been operating for about five years or more, there may be cases where a core group member has a shorter operating history because, for example, it has been established to serve an important customer segment or to comply with regulatory or tax requirements.

Financing Subsidiaries--Financial Institution Group

133. When a financing subsidiary of a financial institution group is wholly owned but its sole activity is to raise debt on behalf of the holding company, it is typically assigned a rating as if it were a holding company. This may be the case, for example, for financing subsidiaries of banking groups where we determine the support flowing to the operating company and reflected in the GCP does not support to the same extent obligations associated with the financing subsidiary.

Financing Subsidiaries--Insurance Group

134. We generally do not assess the group status of a financing subsidiary of an insurance group as core. However, we may assign core group status to a financing subsidiary of an insurance group where all of the following apply:

- It plays an integral role in issuing hybrid instruments that qualify as regulatory capital for the insurer;
- Its sole activity is to raise such capital for the insurer. For example, there is a clear written irrevocable commitment to stand behind the hybrid instruments of the financing subsidiary, thus reducing the importance of the legal separation of the entities;
- It is wholly-owned by the operating insurance company;

- It shares a related corporate name; and
- Issuance by the entity is motivated by regulations in the relevant jurisdiction.

Investment Holding Companies

135. We may consider some investment holding companies (IHCs) (as defined in our article "Methodology: Investment Holding Companies") as group parents while we may determine that others are not group parents. This will depend on both the existence of control as well as our judgment as to the relevance of the entity to the group's overall credit quality. For example, IHCs that own a noncontrolling equity stake cannot be group parents because they do not have control, as defined in GRM criteria.

136. Where we determine that an IHC is a group parent, the group status of its investee companies cannot be any higher than moderately strategic, given the nature of the strategic and financing relationship between IHCs and their investee companies (see "Other Rating Considerations" section in "Methodology: Investment Holding Companies").

Project Developers

137. Where we determine that a project development company is a group parent (as defined in "Methodology For Rating Project Developers"), the group status of its group members is typically classified as nonstrategic or moderately strategic to the developer.

Insulated Entities--Minority Shareholders

138. The presence of significant minority shareholders can place meaningful limitations on the group's control of an entity. These limitations support the insulation of the entity from the rest of the group and contribute to a potential ICR on the entity that is two notches above the GCP. Many jurisdictions have specific regulations in place to protect the rights of minority shareholders vis-à-vis the ruling majority. Examples of effective rights that limit the control of a majority shareholder include the requirement to attain a majority vote from the minority shareholders, in order to undertake any material changes in the entity's financial or business policies, or to file for voluntary bankruptcy. Even without targeted favorable legislative treatment, an organized minority block with adequate board representation often has sufficient power to prevent dividend payments and to influence decision-making effectively. Such minority shareholders would be unaffiliated with the majority shareholder and would have an active interest and role in corporate governance and the rights to ensure that the entity is adequately capitalized to conduct its business operations with a long-term view.

Insulated Entities--Structural Safeguards

139. To determine whether we expect a regulator to act to protect the credit quality of an entity, we may look to publicly stated policies.

Insulated Entities--Banks

140. We do not apply our typical insulation analysis, as per paragraphs 65-67 of the criteria, if paragraph 70 of the criteria applies to determine insulation. In addition, we consider the impact of

the insulation on the group SACP (see paragraphs 27 and 28 of the criteria).

Holding Companies of Corporate Groups--Notching

141. As stated in paragraph 71 of the criteria, the ICR on holding companies of corporate groups and nonregulated nonbank financial institutions is typically the same as the GCP. However, we may rate a holding company below the GCP if we believe that tight regulatory oversight of its operating subsidiaries increases the credit risk of the holding company, vis-à-vis that of their regulated operating subsidiaries. This may happen, for example, in the regulated utilities, regulated transportation infrastructure, and regulated nonbank financial institutions sectors. In these sectors, there can be significant regulatory constraints on the upstreaming of funds sources to the holding company, at a time when such holding company may be heavily reliant on dividends and other distributions from its regulated operating subsidiaries to meet its obligations. In such instances, to differentiate the credit risk of the holding level from that of the regulated operating level, the ICR on the holding company may be:

- One notch lower than the GCP if the GCP is 'bbb-' or higher; or
- Up to two notches lower than the GCP if the GCP is 'bb+' or lower.

Holding Companies--Insurance Standard Notching

142. To determine the ICRs on holding companies of insurance groups, we consider potential regulatory restrictions to payments. Where we think the regulation of insurance companies results in a higher likelihood of constraints on the movement of cash flows to the holding company, we consider potential regulatory restrictions to payments as high--for example, in the U.S. and Israel. For other jurisdictions, we typically consider regulatory restrictions to payments as low.

Holding Companies--Narrower Notching

143. In determining whether to apply narrower than standard notching for a holding company, we typically assume holding companies of financial institution groups will not retain significant unencumbered cash as their primary role is to lend or invest cash to generate earnings. For holding companies of insurance groups, we typically expect more than one of the characteristics in paragraph 75 of the criteria to be sustainably present in order to narrow the notching. In determining whether to eliminate the notching for insurance groups and prudentially regulated financial institution groups, we typically expect the holding company to generate sufficient cash flows from its own business activities or from unregulated operating subsidiaries and we consider the regulatory environment. For example, in the U.S., elimination would be unlikely.

144. For some financial institutions, for example those that are rated speculative-grade and whose anchors (see the relevant respective frameworks) are low and already reflect a weak regulatory environment, we may narrow the gap (number of rating notches) between the holding company ICR and the GCP from the standard notching because the assumption of regulatory restrictions to payments typically reflected in the standard gap does not apply.

Holding Companies Of Prudentially Regulated Financial Services Groups--Liquidity

145.

For holding companies of financial services groups, we typically include committed undrawn capacity of liquidity facilities available for general corporate purposes when considering the available liquidity resources. We do not include uncommitted facilities, facilities that require encumbrance, or revolvers.

Holding Companies Of Prudentially Regulated Financial Services Groups--Financial Institutions

146. For financial institutions, high double leverage can create elevated liquidity risks for the holding company that may lead us to apply wider than standard notching. In the absence of offsetting liquidity at the holding company, we may consider double leverage as high if, for example, it exceeds 120%. Alternatively, if we view net income as particularly germane to our assessment of the group, we may consider if the nominal amount of double leverage exceeds two years' net income of the group, which would also indicate high double leverage.

Holding Companies Of Prudentially Regulated Financial Services Groups--Intermediate Holding Companies

147. Treatment of intermediate holding companies depends on the role and nature of constraints on the transfer of cash flow across the group. Consider an insurance subgroup headed by an intermediate holding company that is part of a prudentially regulated financial institution group. The GCP is 'a-' and the ICR of the holding company is 'BBB+'. We determine the insurance subgroup is core to the group and its group members are core to the subgroup. The ICRs on the insurance operating entities are 'A-'. The ICR of the intermediate holding company is 'BBB+', because we apply the same notching that we apply to the holding company of the group. Furthermore, we determine there are no additional considerations to widen or narrow the notching.

148. Consider another example, an insurance subgroup that is part of a corporate group. We determine the group status of the insurance subgroup is nonstrategic, and it is eligible for three notches of insulation from the group. The GCP is 'bbb', the ICR on the holding company is 'BBB', and the insurance subgroup GCP is 'a'. The ICRs on the insurance operating entities are 'A' because we have determined that they are core to the subgroup. Although the ICR of the holding company is at the same level as the GCP, we conclude that wider notching applies to the intermediate holding company to reflect risks relating to cash flows from its regulated operating entities on which it is reliant. We set the ICR of the insurance intermediate holding company at 'BBB' because we conclude that potential regulatory restrictions to payment are high and determine in this case to widen the holding company notching to three notches, in line with the standard notching for holding companies of insurance groups.

Rating Group Entities Above The Sovereign

149. We may assign ratings to group members above the relevant sovereign rating when specific factors lessen the expected influence of sovereign risk. We apply GRM to determine whether uplift for group support can result in an ICR on a group member being higher than the relevant sovereign rating.

150. We apply the transfer and convertibility (T&C) test in ratings above the sovereign criteria to determine whether to assign a foreign currency ICR on a group member above the T&C assessment. As a result, uplift for group support does not result in a group member's foreign

currency ICR being higher than the T&C for the relevant sovereign.

151. When considering whether uplift for group support can result in the rating of a financial institutions core group member exceeding the sovereign in which the group member operates, we consider the willingness and ability of the parent to support the group member such that it will pay its financial obligations on a full and timely basis. We also consider the likelihood of the group member remaining core in case of major stress in the country of domicile of the group member. When considering the ability of the group to support the group member during the stress associated with a sovereign default, we consider the size of the group member relative to the group, the rating differential between the GCP and the relevant sovereign foreign currency rating for the group member, and the extent of financial resources available at the group. We typically rate a core group member no more than one notch above the relevant sovereign rating. However, we may rate a core group member two notches above the relevant sovereign rating on the basis of group support when the group parent and core group member are based in countries that operate under a single regulatory and supervisory framework, are expected to remain part of a single monetary union, and where we consider that the risks of introduction of a deposit freeze or other controls will not affect the parent's ability to support full and timely payment of financial obligations by the group member.

152. Table 5 lists five examples of how sovereign constraints can affect the ICR on group members.

Table 5

The Effects Of Sovereign Constraints On Group Member ICRs

	Entity A	Entity B	Entity C	Entity D	Entity E
Sector	**Bank**	**Corporate**	**Insurance**	**Corporate**	**Bank**
Group SACP	'a'	'a'	'a'	'a'	'a-'
GCP	'a'	'a'	'a'	'a'	'a'
SACP	'bbb'	'bbb+'	'bbb'	'bbb'	'bbb'
Group status	Strategically important	Strategically important	Core	Highly strategic	Strategically important
Uplift for group support	+2 notches	+1 notch	+3 notches	+2 notches	+2 notches
Potential ICR	'a-'	'a-'	'a'	'a-'	'a-'
Relevant sovereign rating*	'bbb'	'bbb'	'bbb'	'bbb'	'bbb'
Passes sovereign stress test	N.A.	Yes	N.A.	N.A.	Yes
Impact of sovereign constraint	-2 notches	-1 notch	0	-2 notches	-1 notch
ICR	'BBB'	'BBB+'	'A'	'BBB'	'BBB+'

N.A.--Not applicable. *The relevant sovereign rating is in lowercase to indicate that it is being used as a component of the determination of GCPs and ICRs and is determined in accordance with "Ratings Above the Sovereign" criteria.

153. Entity A. The potential ICR is 'a-' (SACP + 3 notches, but capped at one notch below the GCP), and the ICR is 'BBB' as the group member's ICR is the lower of the potential ICR ('a-') and the relevant sovereign rating, which in this case is the foreign currency sovereign rating ('bbb'). Uplift for group support does not result in the ICR on the group member being higher than the relevant sovereign rating for a strategically important group member.

154. Entity B. In this case, the entity passes the sovereign stress test and the maximum rating

differential above the sovereign foreign currency rating is limited to two notches (in this example, the corporate operates in a sector where we view sensitivity to country risk as high). The potential ICR is 'a-' and the ICR is 'BBB+' as the potential ICR on the group member (excluding uplift for group support) is 'bbb+', which is above the relevant foreign currency sovereign rating for the group member, and the group member passes the appropriate sovereign stress test. Ratings uplift for group support does not result in the ICR assigned to the group member being higher than the relevant sovereign rating for a strategically important group member.

155. Entity C. The potential ICR is 'a' (equal to the GCP). As a core group member, uplift for group support can result in the ICR on a group member being higher than the relevant sovereign rating. We determine the group is willing and able to support the group member during the stress associated with a sovereign default. The ICR is 'A' as the ICR on the group member is the lower of the potential ICR ('a') or three notches above the relevant sovereign foreign currency rating (i.e. 'a' which is 3 notches above 'bbb').

156. Entity D. The potential ICR is 'a-' (i.e., GCP - 1 notch). As a highly strategic group member, uplift for group support can result in the ICR on the group member being higher than the relevant sovereign rating. However, we determine that the group is willing but unable to support the group member during the stress associated with a sovereign default. The ICR is 'BBB' as the ICR on the group member is the lower of the potential ICR ('a-') or the relevant sovereign foreign currency rating ('bbb').

157. Entity E. The GCP includes uplift for ALAC support and we expect the extraordinary support in the GCP to extend indirectly through the group to the entity. We also determine the entity is eligible for one notch of extraordinary ALAC support based on group internal loss-absorbing capacity provided from the group parent. The two notches of uplift for group support represent the greatest source of extraordinary support (before considering any relevant sovereign constraints), therefore the potential ICR on the bank is 'a-'. As a strategically important entity, uplift for group support does not result in the ICR on the group member being higher than the relevant sovereign rating ('bbb'). However, we determine that including the ALAC instruments would enable the entity to pass the sovereign stress test. The ICR is 'BBB+' as the group member's potential ICR (but excluding uplift for group support) is 'bbb+' (SACP of 'bbb' + one notch of uplift for ALAC support), which is itself higher than the relevant foreign currency sovereign rating for the group member, and the group member passes the appropriate sovereign stress test. In this case, uplift for ALAC support is the highest source of extraordinary support, after considering any relevant sovereign constraints.

REVISIONS AND UPDATES

This article was originally published on July 1, 2019.

Changes introduced after original publication (other than to criteria cross-references or the contact list):

- On Aug. 20, 2025, we republished the criteria to make nonmaterial changes. We added a cross reference in paragraph 80 to the related paragraph 150 of this criteria.
- On Dec. 17, 2024, we republished this criteria article to make nonmaterial changes to clarify the criteria intent in paragraph 64 with respect to insulation of group members that are the only cash flow resource for the repayment of debt issued by other group members above.
- On Oct. 31, 2023, we republished this criteria article to make nonmaterial changes. We archived "Guidance: Group Rating Methodology," July 1, 2019, and included its content--without any substantive changes--in a new appendix of this article.

- On Nov. 1, 2022, we republished this criteria article to make nonmaterial changes to clarify the criteria intent in paragraph 62 with respect to how we determine the GCP for interlocking groups.
- On Aug. 27, 2020, we republished this criteria article to make nonmaterial changes. We deleted a sentence from the first paragraph citing the publication of a guidance article because the reference to the related guidance was included in "Key Publication Information." We also deleted a bullet point referring to the effective date from the section "Key Publication Information" because the criteria are now effective in all markets. In addition, we deleted the "Impact On Outstanding Ratings" section, which was related to the initial publication of the criteria and no longer relevant. We also deleted outdated references from the "Related Publications" section, updated article references in paragraphs 57 and 59, and added a "Related Research" section.

This article is a Criteria article. Criteria are the published analytic framework for determining Credit Ratings. Criteria include fundamental factors, analytical principles, methodologies, and /or key assumptions that we use in the ratings process to produce our Credit Ratings. Criteria, like our Credit Ratings, are forward-looking in nature. Criteria are intended to help users of our Credit Ratings understand how S&P Global Ratings analysts generally approach the analysis of Issuers or Issues in a given sector. Criteria include those material methodological elements identified by S&P Global Ratings as being relevant to credit analysis. However, S&P Global Ratings recognizes that there are many unique factors / facts and circumstances that may potentially apply to the analysis of a given Issuer or Issue. Accordingly, S&P Global Ratings Criteria is not designed to provide an exhaustive list of all factors applied in our rating analyses. Analysts exercise analytic judgement in the application of Criteria through the Rating Committee process to arrive at rating determinations.

This report does not constitute a rating action.

SURREBUTTAL TESTIMONY OF
BICKEY RIMAL
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Class Revenue Allocation**
Cost Allocation Studies

Dated: February 9, 2026

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name and business address.

A. My name is Bickey Rimal, and my business address is 1300 19th Street NW, Suite 620, Washington, DC 20036.

Q. By whom are you employed and in what capacity?

A. I am employed by Concentric Energy Advisors, Inc. ("Concentric") as a Vice President.

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted direct and rebuttal testimony on behalf of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") that is identified as PPL Electric Statement Nos. 7 and 7-R, respectively. My rebuttal testimony was accompanied by PPL Exhibit Nos. BR-1R and BR-2R, which, collectively, consist of the allocated cost of service study ("ACOSS") based on PPL Electric's Pennsylvania jurisdictional costs and operating conditions for a fully projected future test year ("FPFTY") ending June 30, 2027.

Q. What is the purpose of your surrebuttal testimony?

A. The purpose of my surrebuttal testimony is to respond to issues raised in the rebuttal testimony of other parties related to the Company's ACOSS, revenue allocation, Company's proposed residential customer charge, and unbundling of costs between default service and distribution. My surrebuttal testimony is limited to a discussion of certain issues raised by these witnesses in their rebuttal testimony, and the failure to address every

issue in each rebuttal statement submitted by witnesses for other parties does not mean or imply that I or the Company agrees with the positions taken by such parties with respect to those issues.

II. ALLOCATED COST OF SERVICE STUDY

Q. Please summarize the positions of the parties' witnesses that submitted rebuttal testimony relating to the Company's ACOSS.

A. Office of Consumer Advocate ("OCA") Witness Clarence Johnson disagrees with the positions taken by Office of Small Business Advocate ("OSBA") Witness Mark Ewen and PPL Industrial Customer Alliance ("PPLICA") Witness Billie LaConte, who accepted the results of the Company's ACOSS for purposes of revenue allocation in this case.[1] Specifically, Mr. Johnson's disagrees with the use of a minimum system study to identify the customer-related portion of distribution system costs in the Company's ACOSS.

Q. What is Ms. LaConte's position on Mr. Johnson's and Earth Justice Advocates ("EJA") Witness Karl Rabago's proposed modifications to the Company's ACOSS?

A. Ms. LaConte recommends that the Commission reject Mr. Johnson's and Mr. Rabago's proposed changes to the Company's ACOSS.[2] Ms. LaConte disagrees with Mr. Johnson's criticism of the minimum system study as well as his proposal to classify the entire primary distribution network costs as demand-related.[3] Ms. LaConte also disagrees with Mr.

[1] OCA Statement 4R, pp. 3, 4 and 9.
[2] PPLICA Statement No. 1R, p. 8.
[3] PPLICA Statement No. 1R, pp. 6-7.

Rabago's proposal to rely on what he characterizes as the "basic customer method" to allocate distribution system costs in the ACOSS. [4]

Q. Do you agree with Ms. LaConte?

A. Yes. As explained in my rebuttal testimony, distribution system costs are incurred to move electricity from generation and transmission facilities to individual customers that are distributed geographically throughout PPL Electric's service territory. A significant portion of those costs is incurred regardless of the peak demand of the customers. Increases or decreases in demand do not result in proportionate increases or decreases in the number of poles and miles of conductors and conduits required to distribute electricity geographically. For example, if the load of customers in PPL Electric service territory was significantly reduced, but the number of customers was unchanged, we would not expect the number of poles and miles of wires in the service territory to decrease by the same proportion. The reason we classify a portion of the distribution system costs as customer-related is that the distribution system exists to deliver electricity to hundreds of thousands of customers who are widely spread throughout the Company's service territory. Most of those costs are unrelated to peak demand.

Q. Is the classification of certain distribution plant as partially customer-related and partially demand-related a recognized industry practice?

A. Yes. As explained in my rebuttal testimony, the National Association of Regulatory Utility

[4] PPLICA Statement No. 1R, pp. 7-8.

Commissioners ("NARUC") *Electric Utility Cost Allocation Manual* ("NARUC Manual") dedicates an entire chapter to the classification and allocation of distribution plant (Chapter 6). All major electric distribution companies in Pennsylvania classify a portion of their distribution plant as being both demand-related and customer-related. In addition, the Commission has approved the use of minimum system studies in the past, for PPL Electric and other electric distribution companies, to identify the portion of distribution system costs that are customer related.

Q. What is Mr. Ewen's position on the Company's ACOSS?

A. At page 9, Mr. Johnson's summarizes OSBA Witness Ewen's position, as follows: "Mr. Ewan expresses agreement with PPL's CCOSS [Class Cost of Service Study] and appears to accept the Company's revenue allocation because it is 'directionally' consistent with the CCOSS."

Q. Do you agree with Mr. Ewen's assessment as summarized in Mr. Johnson's rebuttal testimony?

A. Yes, I do, for the same reasons I set forth in my discussion, above, responding to Mr. Johnson's criticism of Ms. LaConte's acceptance of the Company's ACOSS.

III. REVENUE ALLOCATION

Q. Please summarize the positions of the parties' witnesses that submitted rebuttal testimony relating to the Company's proposed revenue allocation.

A. The following is a brief summary of the parties' positions concerning the Company's proposed revenue allocation.

- Mr. Johnson states that "[i]f the Commission is inclined to accept some easing of the mitigation cap, my recommendation is to adopt a 140% cap." [5]
- Ms. LaConte recommends that the Commission reject Mr. Johnson's and Mr. Rabago's proposed changes to the Company's ACOSS.[6] She supports a 1.3 times the system increase cap for revenue allocation.[7]
- Mr. Ewen supports the Company's proposal to cap the rate increase at 1.5 times the system average increase. [8]

Q. What is Mr. Johnson's position on the Company's proposed revenue allocation?

A. At pages 7-8 of his rebuttal testimony, Mr. Johnson states "[i]f the Commission is inclined to accept some easing of the mitigation cap, my recommendation is to adopt a 140% cap. This provides more mitigation than proposed by the Company but still recognizes the importance of CCOSS results. Moreover, if the Commission adopts the OCA's CCOSS result, application of the 130% cap may be reasonable and appropriate, given the more significant impact on LP-4 customers."

[5] OCA Statement 4R, p. 7.
[6] PPLICA Statement No. 1R, p. 8.
[7] PPLICA Statement No. 1R, p. 11.
[8] OSBA Statement No. 1-R, p. 4.

Q. Is there any merit to Mr. Johnson's recommendation to lower the cap on individual class increases to 140% of the system average increase?

A. As explained in my direct and rebuttal testimony, the main goal of capping the increase to any class at 1.5 times (150% of) the system average increase, coupled with no reduction to any rate class, was to reduce inter-class subsidies and move classes closer to their cost of service, while ensuring the impact on any one particular class is moderated. Lowering the cap to 140% of the system average increase does not reduce the inter-class subsidies between the classes sufficiently and, therefore, the Company should continue to adhere to a cap on class increases of 1.5 times the system average increase.

Q. Should the Commission adopt a cap on individual class increases of 130% of the system average if, as Mr. Johnson proposes, it accepts the OCA's ACOSS?

A. No. As explained above and in my rebuttal testimony, Mr. Johnson's criticism of the Company's ACOSS is unfounded. As discussed earlier, the Company has relied on the same methodology approved previously by the Commission, and that methodology is consistent with the NARUC Manual and industry standards. Therefore, it is neither necessary nor appropriate to make any modifications to the Company's ACOSS and, correspondingly, there is no valid basis to adopt a cap of 130% of the system average increase based on OCA's ACOSS.

Q. What is Mr. Ewen's recommendation regarding the revenue increase cap in his rebuttal testimony?

A. At page 4, Mr. Ewen agrees with the Company's cap and states that "[f]or the purpose of this proceeding, I also support the Company's cap limiting rate increases to 1.5 times the system average."

Q. What is Ms. LaConte's recommendation regarding the revenue increase cap in her rebuttal testimony?

A. At page 11, Ms. LaConte supports a cap on the increase to any class of 1.3 times (130% of) the system increase.[9]

Q. Do you agree with her proposal?

A. No. As discussed earlier and in my rebuttal testimony, a cap of less than 1.5 times the system average increase does not reduce inter-class subsidies sufficiently and does not move classes closer to their cost of service.

IV. RESIDENTIAL CUSTOMER CHARGE

Q. At pages 10-12 of his rebuttal testimony, Mr. Johnson responds to the direct testimony of Sustainable Energy Fund ("SEF") Witness John Costlow. What did Mr. Costlow propose, and how did Mr. Johnson respond in his rebuttal testimony?

A. Mr. Johnson summarizes Mr. Costlow's position on the residential customer charge at page

[9] PPLICA Statement No. 1R, p. 11.

10 of his rebuttal testimony, stating "Mr. Costlow argues that the PPL proposed customer charge is too low and should be increased to the full cost ($42 per month) based on the Company's CCOSS." Mr. Johnson opposes Mr. Costlow's proposal and, in so doing, contends that the cost of $42 per month is not an accurate representation of customer costs because it includes the customer component of "distribution lines, poles, underground facilities, and transformers" as determined by the Company's minimum system study.[10] At the outset, it should be noted that the Company has not proposed increasing the residential customer charge to the full customer cost that includes the customer component of distribution costs identified by the minimum system study. Rather, PPL Electric is proposing a customer charge of $17.00 per month. The basis for the Company's proposed residential customer charge is also addressed by Company Witness Steven Wishart in PPL Statement No. 8-SR.

Q. Have you previously identified what customer costs would be if the customer component of the distribution system were removed from the calculation of total customer costs?

A. Yes. I provided that calculation in Table 1, at page 19 of my rebuttal testimony, which shows that even excluding the customer-related component of distribution costs, the remaining customer costs total $22.27, which is still well above the Company's proposed residential monthly customer charge of $17.00.

[10] OCA Statement 4R, p. 11.

Q. Do you have any other area of disagreement with Mr. Johnson's rebuttal testimony responding to Mr. Costlow?

A. Yes, Mr. Johnson cites, and relies upon, the Commission's 2020 decision in *Pa. P.U.C. v, Citizens' Electric Co. of Lewisburg PA.*[11] Mr. Johnson contends that Citizens' Electric "proposed a similar shifting of fixed costs to the customer charge" and that the Commission rejected the utility's position, stating "[w]e do not believe that this type of rate structure represents sound regulatory policy or best serves the public interest."[12] However, Mr. Johnson has seriously mischaracterized both what Citizens' Electric proposed in that case and the Commission's decision to reject Citizen Electric's proposal.

Q. What did Citizens' Electric actually propose in the case Mr. Johnson cites?

A. Contrary to Mr. Johnson's characterization, Citizens' Electric did not propose including *only* customer-related costs in its customer charge. Rather, as the Commission explained in its Order, Citizens' Electric also proposed to include costs that were explicitly demand-related:

> Citizens proposes to increase the monthly customer charge for residential customers from $11.24 to $15.00, with the balance of the revenue target to be recovered from the volumetric kWh charge. This proposed increase of 33.5% in the RS class customer charge reflects the Company's proposal to begin including a small portion of demand costs (equal to the minimum demand for residential customer pursuant to the ACCOSS) through its residential monthly customer charges. Specifically, Citizens proposed to base its residential customer charge on two components: (1) *customer-related costs* totaling $12.94 of the $15.00 proposed customer charge, which have been historically included in the fixed monthly charge, and (2) *demand-related costs* totaling $2.06 of the $15.00,

[11] Docket No. R-2019-3008212 (Apr. 14, 2020).
[12] OCA Statement 4R, p. 12.

> representing a portion of residential demand costs. Specifically, Citizens explained that the $2.06 represents the cost of 0.38 kW-month per user, based on the $5.40 per kW-month demand costs for the RS class set forth in Schedule E1-B of Citizens (HSG-1). Citizens St. 1 at 32. [13]

As the portion of the Commission's Order quoted above demonstrates, the *Citizens' Electric* Order does not support the proposition that any portion of customer-related costs should be disregarded in assessing the costs that may be included in a residential customer charge. Instead, *Citizens' Electric* supports a much narrower proposition that *demand-related* costs should not be included in computing *customer charge*. As I explained in my direct and rebuttal testimony, my calculation includes only customer-related costs and, as shown in Table 1 of my rebuttal testimony, even if the customer component of distribution system costs determined by my minimum system study were excluded, the remaining customer-related costs are higher than the Company's proposed $17.00 residential customer charge.

V. UNBUNDLING OF COSTS

Q. What is Mr. Johnson's recommendation regarding unbundling costs proposed by Mr. Lacey in his direct testimony?

A. Similar to the Company's position, Mr. Johnson disagrees with Mr. Lacey's recommendation that the Commission direct the Company to "conduct an exercise to unbundle all of PPL Electric's costs to serve customers and to allocate those costs

[13] *Pa. P.U.C. v. Citizens' Electric Co. of Lewisburg PA*, Docket No. R-2019-3008212 (Apr. 14, 2020) at p. 138 (emphasis in the original). Citizens' Electric explained its decision to include a minimum level of demand in the customer charges as follows: "To recognize cost of service in the proposal, Citizens' chose a demand level (0.38 kW) attained by 99% of the RS accounts at least annually, indicating that more than 98% had demand of 1.0 kW at least once per year." *Citizens' Electric* at page 139.

appropriately to default service and distribution-only customers to facilitate a much more fair and competitive electricity market."[14] Mr. Johnson states "[t]o the extent that Mr. Lacey is requesting that certain indirect costs should be shifted onto default customers, I disagree with his recommendation."[15] Similar to the Company's rebuttal, Mr. Johnson also points to the fact that the Commission has already ruled on this issue in PECO Electric's 2018 base rate case by rejecting this proposal.

Q. How does default service furnished by PPL Electric differ from the provision of generation supply by third-party competitive suppliers, according to Mr. Johnson?

A. At page 14, Mr. Johnson states "[i]n its role as default service provider, PPL must be prepared to meet the requirements of serving 100% of residential customers at any time. As such, PPL's default costs are not avoidable as PPL must stand ready to serve at all times. For that reason, the default service provider's obligations are not the same as EGS providers, and it is not reasonable to "force" the default service cost to be comparable to EGS costs."

Q. Do you agree with Mr. Johnson's assessment on this point?

A. Yes.

Q. Did any other witness comment on Mr. Lacey's recommendation to unbundle the costs?

[14] RESA St. No. 1, pp. 4-5.
[15] OCA Statement 7R, p. 13-14.

A. Yes. OCA Witness Alexander recommends that Mr. Lacey's recommendation to unbundle and allocate costs between default service and distribution-only customers should be rejected.[16] At page 6, Ms. Alexander states, "[t]his same proposal has been made by RESA and routinely rejected and/or not adopted in many default service proceedings."

Q. Do you agree with Ms. Alexander on this point?

A. Yes. As explained in my rebuttal testimony, the distribution revenue requirement in this proceeding is not related to providing supply services and, therefore, there are no costs to "unbundle" and allocate differently between default service and distribution service. The costs the Company incurs to furnish distribution service will continue to be incurred whether or not there are any default service customers. As explained in my rebuttal testimony, the Commission rejected a similar unbundling proposal for PECO Energy[17], and the Commonwealth Court of Pennsylvania affirmed the Commission's decision.[18]

VI. SUMMARY AND CONCLUSIONS

Q. Please describe your summary and conclusions.

A. The proposed changes to the ACOSS and revenue allocation are without merit and, as a result, PPL Electric's proposed ACOSS and revenue allocation are properly based on cost causation and accepted cost of service principles. I have listed below my specific conclusions and recommendations in response to the rebuttal testimony of intervenors' that

[16] RESA St. No. 1, p. 6.
[17] *Pa. P.U.C. v. PECO Energy Co.*, Docket No. R-2018-3000164 (Dec. 20, 2018), p. 74.
[18] *NRG Energy, Inc. v. Pa.P.U.C.*, Pa. Cmwlth. Ct., No. 58 C.D. 2019 (Jun. 2, 2020).

I addressed above:

- The Commission should accept the results of the Company's ACOSS provided in rebuttal as reasonable since it is based on cost causation and continues to employ the methodology previously approved by the Commission.
- The Commission should continue to accept the classification of certain distribution assets (poles, conductors, and line transformers) as being both customer-related and demand-related and reject any claims to classify these distribution assets as being solely demand-related, since increases or decreases in demand do not result in proportionate increases or decreases in the number of poles and miles of conductors and conduits required to distribute electricity geographically.
- The Commission should accept the revenue allocation and mitigation measures proposed by the Company because they reduce the inter-class subsidies and move classes closer to their cost of service, while ensuring that the impact on any one particular class is moderated.
- The Commission should reject Mr. Johnson's attempt to rely upon its 2020 decision in *Citizens' Electric* because that case does not stand for the proposition advanced by Mr. Johnson that customer-related costs may be excluded from consideration in determining costs recoverable in the customer charge.
- The Commission should reject any proposal to further "unbundle" PPL Electric's cost between default service and distribution service because the costs PPL Electric recovers in distribution rates properly reflect costs it actually incurs to provide that service. Further "unbundling" is neither necessary nor appropriate, as the

Commission and the Commonwealth Court have previously held for another electric distribution company.

Q. Does this conclude your prepared surrebuttal testimony?

A. Yes, it does.

SURREBUTTAL TESTIMONY OF
STEVEN W. WISHART
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Affordability**
Rate Design

Dated: February 9, 2026

I. INTRODUCTION

Q. Please state your name, position, and business address.

A. My name is Steven W. Wishart. I am an Assistant Vice President with Concentric Energy Advisors, Inc. ("Concentric"). My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. Did you previously submit testimony in this proceeding?

A. Yes, I previously submitted direct and rebuttal testimony on behalf of PPL Electric Utilities Corporation ("PPL Electric" or the "Company"), which were marked as PPL Electric Statement No. 8 and PPL Electric Statement No. 8-R, respectively.

Q. What is the purpose of your surrebuttal testimony?

A. The purpose of my surrebuttal testimony is to respond to specific issues raised in the rebuttal testimony of other parties that relate to rate design and customer bill impacts addressed in my prior testimony. In particular, my surrebuttal testimony addresses: (1) concerns raised by the Office of Consumer Advocate ("OCA") regarding the treatment of Rate Schedule RTS and the Company's proposal to transition remaining RTS customers to Rate Schedule RS; (2) rebuttal testimony of OCA and the Environmental Intervenors ("EI") addressing residential electric vehicle ("EV") rate design and proposals for a broadly available residential time-of-use ("TOU") rate; and (3) affordability and residential customer charge arguments raised in rebuttal testimony by OCA and the Sustainable Energy Fund ("SEF").

My surrebuttal testimony is limited in scope and is intended to clarify the record and explain why the rebuttal testimony does not alter the conclusions or recommendations presented in my direct and rebuttal testimony. I do not present new rate proposals or bill impact analyses in this surrebuttal testimony.

Q. Are you sponsoring any exhibits with your surrebuttal testimony?

A. No.

II. RESIDENTIAL THERMAL STORAGE ("RTS")

Q. Did any parties raise concerns regarding Rate Schedule RTS in their rebuttal testimony?

A. Yes. OCA Witness Mr. Clarence Johnson raised concerns regarding the treatment of Rate Schedule RTS under PPL Electric's proposed mitigation cap and class cost allocation framework.[1]

Q. What specific concerns does OCA Witness Johnson raise with respect to RTS?

A. Mr. Johnson focuses on the class-level cost allocation results for RTS under PPL Electric's proposed mitigation cap scenarios and characterizes those results as creating the potential for significant impacts on RTS customers. In discussing those impacts, however, Mr. Johnson acknowledges that the magnitude of any increase for RTS customers is not determined by the class cost allocation alone but instead depends on whether the Pennsylvania Public Utility Commission ("Commission") adopts PPL Electric's proposal

[1] OCA Statement 4R pp. 4, 8-9

to transition RTS customers to the standard Residential Service ("RS") tariff. Specifically, Mr. Johnson states:

> "Not necessarily. The impact depends on whether the Commission adopts PPL's proposal to roll RTS customers onto the RS tariff. If it is adopted, the magnitude of increase for current RTS customers is likely to be dictated by the difference between standard residential rates and current RTS rates."[2]

This acknowledgment confirms that the class-level allocation results cited by Mr. Johnson do not, by themselves, determine customer bill impacts.

Q. How are OCA Witness Johnson's RTS concerns addressed in the Company's surrebuttal?

A. To the extent Mr. Johnson's concerns relate to the allocation of costs and revenues to the RTS class under the Company's proposed mitigation cap, those issues are addressed by PPL Electric Witness Rimal. My surrebuttal testimony does not address class cost allocation or mitigation cap mechanics, and nothing in Mr. Johnson's rebuttal testimony identifies a flaw in the rate design or customer billing treatment applicable to RTS customers.

Q. Why does PPL Electric continue to recommend eliminating RTS and transitioning these customers to RS?

A. As discussed in my rebuttal testimony, PPL Electric's proposal to eliminate Rate Schedule RTS and transition the remaining customers on this schedule to Rate Schedule RS is driven by the fact that RTS is a legacy tariff that no longer reflects distinct service characteristics

[2] OCA Statement 4R, p. 9.

or operational benefits. RTS was originally designed to serve customers with electric thermal storage systems that provided load management benefits to the system. No party asserts that RTS customers today continue to provide distinct load management services that would justify maintaining RTS as a separate rate schedule.[3]

While PPL Electric is mindful of bill impacts associated with transitioning customers from RTS to RS, retaining RTS solely to moderate those impacts would preserve an outdated rate structure that lacks a current cost-based or operational justification. Maintaining RTS as a separate rate schedule also creates the potential for cross-subsidization within the residential class by continuing differential rate treatment that is no longer supported by differences in service or cost causation. For these reasons, nothing in OCA Witness Johnson's rebuttal testimony alters my conclusion that eliminating RTS and transitioning customers to RS is reasonable, appropriate, and consistent with sound rate design principles.[4]

III. RESIDENTIAL ELECTRIC VEHICLE RATES AND TIME-OF-USE RATE DESIGN

Q. Did any parties raise issues related to EV rate design or EV programs in their rebuttal testimony?

A. Yes. OCA Witness Mr. Matthew Hoyt addressed EV rate design and EV program issues in rebuttal testimony, responding primarily to the direct testimony of EI Witness Mr. Ron Nelson regarding PPL Electric's proposed EV program and related rate design considerations.[5]

[3] PPL Electric Statement No. 8-R, pp. 20–22.
[4] PPL Electric Statement No. 8-R, pp. 21–22.
[5] OCA Statement 5R, pp. 1–2.

Q. What is the nature of the disagreement between Mr. Hoyt and Mr. Nelson?

A. Mr. Nelson recommends that PPL Electric adopt a broadly available, optional residential TOU rate that would be marketed to EV customers but open to all residential customers. Mr. Nelson argues that such a rate would better align price signals with off-peak EV charging and advance electrification goals.[6]

Mr. Hoyt does not oppose encouraging off-peak EV charging, but he disagrees with adopting a broadly available residential TOU rate in this proceeding. Mr. Hoyt emphasizes that implementing a residential TOU rate represents a fundamental change to residential rate design and should not be adopted without extensive analysis, customer testing, and evaluation of bill impacts, participation levels, and equity considerations.[7]

Q. Why is adopting a broadly available residential TOU rate a significant undertaking?

A. Residential TOU rates are complex to design, implement, and evaluate. Based on my professional experience overseeing a multi-year residential TOU research pilot while at Xcel Energy, developing a residential TOU rate requires substantial investment in customer education, data collection, billing system changes, and rigorous measurement and verification. That effort spanned several years and cost millions of dollars before any decision was made regarding permanent rate adoption.

That experience demonstrated that customer understanding, enrollment behavior, and actual load shifting vary widely and cannot be assumed. As a result, residential TOU

[6] EI Statement No. 1, pp. 55–61.
[7] OCA Statement 5R, pp. 6–8.

rates are typically introduced only after extensive pilot testing and evaluation, rather than through immediate implementation as an optional rate available to all customers.

Q. What additional concerns arise with optional residential TOU rates?

A. Optional residential TOU rates present a risk of revenue erosion if customers can reduce their bills simply by switching rates without changing their usage behavior in a way that reduces system costs. Some customers naturally use a greater share of electricity during off-peak hours due to base-load characteristics such as additional refrigerators, freezers, or other continuously operating equipment. These customers may experience bill reductions under a TOU rate without making any behavioral changes or contributing to peak load reduction.

If customers receive bill reductions without corresponding reductions in system costs, the resulting revenue shortfall must be recovered from other customers in a future rate case. Providing bill discounts without meaningful changes in usage behavior or cost causation is not sound rate design and does not advance affordability on a system-wide basis.

Q. How do these considerations inform your response to the issues raised by Mr. Hoyt and Mr. Nelson?

A. Mr. Hoyt's rebuttal testimony appropriately recognizes that adopting a broadly available residential TOU rate is a major policy and rate design decision that should not be made without a comprehensive supporting record. While encouraging off-peak EV charging is

an important objective, that goal can be pursued through targeted programs and pilot efforts rather than immediate adoption of a permanent residential TOU rate.

Nothing in Mr. Nelson's testimony provides the level of analysis necessary to justify such a fundamental change to residential rate design in this proceeding. Accordingly, Mr. Hoyt's recommendation to reject EI's proposed residential TOU rate without prejudice is reasonable and consistent with prudent rate design practice.

IV. AFFORDABILITY AND RESIDENTIAL CUSTOMER CHARGE

Q. Were affordability or customer charge issues addressed in rebuttal testimony that relate to rate design issues discussed in your testimony?

A. Yes. Affordability and customer charge issues are addressed in rebuttal testimony by SEF Witness Mr. John Costlow and OCA Witness Mr. Roger Colton, primarily in the context of how fixed charges and volumetric rates affect different customer usage patterns.

Q. What affordability and customer charge claims do Mr. Costlow address in his rebuttal testimony?

A. Mr. Costlow responds to claims advanced by Energy Justice Advocates Witness Mr. Karl Rábago, Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania ("CAUSE-PA") Witness Mr. Patrick Cicero, and OCA Witness Mr. Clarence Johnson that higher fixed customer charges disproportionately harm low-income customers because such customers are generally low-usage customers. Mr. Costlow explains, using PPL Electric usage data, that many low-income customers, particularly those using electric

space heating, have usage levels that are comparable to or higher than non-low-income customers. Based on this analysis, Mr. Costlow concludes that reducing customer charges does not necessarily advance affordability objectives and may instead shift costs to other customers in a manner that is inconsistent with cost causation principles.[8]

Q. How does Mr. Colton respond to Mr. Costlow's direct testimony regarding affordability and customer charges?

A. Mr. Colton disputes Mr. Costlow's conclusions by arguing that low-income customers, when evaluated across the broader residential population, tend to be lower-usage customers and that higher fixed customer charges limit customer control over bills. Mr. Colton advocates greater reliance on volumetric rate recovery as a means of addressing affordability concerns and criticizes the use of fixed charges that are not closely aligned with minimum customer costs.[9]

Q. Do the rebuttal arguments raised by Mr. Costlow and Mr. Colton identify flaws in PPL Electric's proposed customer charge or overall rate design?

A. No. While Mr. Costlow and Mr. Colton disagree regarding the relationship between income levels, usage patterns, and the appropriate balance between fixed and volumetric charges, neither witness identifies a defect in the structure of PPL Electric's proposed rates or presents an alternative customer charge supported by a cost-of-service analysis. The customer charge arguments raised in rebuttal testimony are policy-based perspectives on

[8] SEF Statement No. 1-R, pp. 3–5.
[9] OCA Statement 8R, pp. 1–10.

affordability rather than demonstrations that PPL Electric's proposed rate design is unreasonable or unsupported by the record.

Q. How should the Commission evaluate the affordability and customer charge claims raised in rebuttal testimony?

A. As discussed in my rebuttal testimony, affordability concerns should be evaluated in the context of total customer bills and with appropriate consideration of cost causation. Distribution rates are only one component of overall electric bills, and long-term data show that PPL Electric's distribution rates remain below national benchmarks. Modifying customer charges or other elements of rate design to provide generalized bill reductions, without corresponding reductions in system costs, risks creating revenue shortfalls that must be recovered from other customers in future rate cases. Nothing in the rebuttal testimonies of Mr. Costlow or Mr. Colton alters my conclusion that PPL Electric's proposed customer charge and overall rate design appropriately balance affordability considerations with cost causation principles.[10]

Q. Does this conclude your surrebuttal testimony?

A. Yes, it does.

SURREBUTTAL TESTIMONY OF
GREGORY OLSEN
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Interconnection Process for Customer-Generators**

Dated: February 9, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Gregory Olsen, and my business address is 827 Hausman Rd. Allentown, PA 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Electric Utilities Corporation ("PPL Electric"), a subsidiary of PPL Corporation ("PPL Corp."), as Supervisor – Distribution Interconnections & Tariff Rules.

Q. Have you previously filed testimony in this matter?

A. Yes. I previously submitted direct testimony (PPL Electric St. No. 14) and rebuttal testimony (PPL Electric St. No. 14-R) on behalf of the Company.

Q. What is the purpose of your surrebuttal testimony?

A. The purpose of my surrebuttal is to respond to testimony by Customer-Generator Coalition ("CGC") Witness Sharfman regarding the Company's interconnection process for customer-generators.

Q. Are you sponsoring any exhibits or schedules as part of your surrebuttal testimony?

A. No.

II. INTERCONNECTION PROCESS FOR CUSTOMER-GENERATORS

Q. CGC Witness Sharfman makes various claims about the Company's interconnection process for customer-generators, including the Company's Interconnection Impact Review ("IIR"), the deposits that must be paid by customer-generators for necessary distribution system upgrades, and the speed at which these generating facilities connect to PPL Electric's distribution system. (CGC St. No. 1-R, pp. 5-6, 11-12.) Do you have any initial observations?

A. Yes. I am advised by counsel that if CGC had issues with the Company's IIR process, the deposits required under the existing or proposed Retail Tariff, or any alleged delays in interconnecting their projects, such issues should have been raised in CGC's direct testimony. *See* 52 Pa. Code § 5.243(e). In fact, after describing the IIR process, Mr. Sharfman provides the total amount of "costs" that CGC members have paid to PPL Electric for their projects and what is the remaining balance owed to PPL Electric. (CGC St. No. 1-R, pp. 5-6.) This testimony is not provided in response to any party's direct testimony. From my perspective, this testimony is simply supplementing his direct testimony as opposed to rebutting another party's testimony.

Q. Setting those issues aside, could you please provide a summary of the Company's interconnection process, including the IIR?

A. Yes. The Commission's regulations provide four different levels of review for interconnection applications. *See* 52 Pa. Code §§ 75.37-75.40. Relevant here, the no-load customer-generators' projects, like those undertaken by the CGC members, fall under the

Level 3 interconnection review process. *See id.* § 75.39. This process is used when: (a) the small generation facility has a nameplate capacity of 2 MW or less; and (b) the facility did not qualify under the Level 1 or Level 2 review procedures or was reviewed under one of those review procedures but was not approved for interconnection. Additionally, the Company uses the Level 3 review process when the small generator facility: (a) has an electric nameplate capacity of 5 MW or less; (b) is less than 5 MW and not certified; or (c) is less than 5 MW and non-inverter-based. The Level 3 review process is also utilized when the interconnection request is considered but not approved under a Level 2 or Level 4 review if the interconnection customer submits a new interconnection request for consideration under Level 3.

When an interconnection application is submitted, PPL Electric evaluates whether the request is complete. If a request is found to be incomplete, the applicant is informed and the missing and/or incorrect materials are identified. Once it is determined that a request is complete, the applicant pays an application fee, and PPL Electric's engineers review the applicant's one-line diagram. The applicant's one-line diagram is approved if it matches the application information and complies with PPL Electric's Rules for Electric Meter and Service Installations ("REMSI") and the Second Distributed Energy Resources ("DER") Management Plan. The applicant's project is then placed in the interconnection queue, with its position determined by the date and time that PPL Electric received all of the following: a valid interconnection request, the applicable interconnection application fee, and the approved one-line diagram.

After the requisite approvals and fees, the Company begins the IIR process on a

first-come, first-served basis. The IIR process is when PPL Electric's engineers model the impact of the proposed project on the Company's distribution system based on the project's design, location, size, and type of generation. The Company will perform several load flow and power flow analyses to determine how the distribution system will respond to the project's interconnection. Then, based on the results of those analyses, PPL Electric accurately scopes the system reinforcements, if any, that are required to safely and reliability interconnect the project. Within 45 days of receiving the completed IIR Letter from the Company, the applicant must return a signed Notification of Customer Intent ("NoCI") and a deposit equal to 25% of the cost estimate provided in the IIR. After PPL Electric receives the NoCI and deposit, it begins detailed engineering for the reinforcements identified in the IIR. Once the detailed engineering is complete, PPL Electric issues a final pre-construction invoice. This invoice is based on the difference between the final cost of the IIR's scoped reinforcements and the initial invoice.

Q. What is the purpose of the 25% deposit?

A. The deposit covers costs incurred by the Company between the IIR and construction. These costs include detailed engineering and Project Management time, and deposits that must be paid under vendor agreements to order long lead time equipment for the identified system reinforcements. After ordering, this long lead time equipment can take up to 2 years to receive. If this equipment arrives, the 25% deposit will apply to the costs of the equipment. If a project cancels before portions of the deposit are spent, PPL Electric will return the deposit. To the extent portions of the deposit have been spent, PPL Electric will

make efforts to determine if it can reuse the ordered equipment. If the equipment can be reused, the portion of the deposit spent on that equipment will also be refunded. PPL Electric will only retain those portions of the deposit that are spent and cannot be reappropriated. Further, if an item identified in the IIR is ultimately not needed for the project, PPL Electric will bear those costs. However, to PPL Electric's knowledge, this has never occurred.

Q. Would you consider the 25% deposit to be non-refundable?

A. No. As I noted previously, PPL Electric refunds the interconnection application for any unspent portions of the deposit. Also, the Company even refunds portions of the deposit that were spent on equipment that the Company can use elsewhere in its operations.

Q. Has the Company incorporated any language in its proposed Retail Tariff regarding its deposit requirement?

A. Yes, as noted in PPL Electric Exhibit GEO-1 attached to my direct testimony, PPL Electric has proposed adding language to the "Net Metering for Renewable Customer-Generators" section of its Retail Tariff that incorporate the existing deposit requirement with some modifications, such as making the deposit amount within the Company's discretion. (*See* PPL Electric Exhibit GEO-1, pp. 53-54.) Specifically, the proposed Retail Tariff provides, in pertinent part:

> When the Company determines that upgrades to its distribution system are necessary to interconnect the interconnection applicant's generating facility safely and reliably, the interconnection applicant shall be required to pay a deposit in advance of the Company performing final engineering and

> construction of the system upgrades. The amount of the deposit is in the discretion of the Company to ensure timely payment of system upgrade costs. If the interconnection applicant fails to pay such deposit within the communicated timeline of the Company's demand for the deposit, the interconnection applicant's project shall be removed from the interconnection queue. Unspent portions of the deposit shall be fully refundable. The interconnection applicant must pay all actual costs of the system upgrades, including but not limited to, the cost of studies, engineering, administering the interconnection request, equipment, and construction costs prior to interconnection of the interconnection applicant's generating facility. Any deposits paid by the interconnecting applicant will be credited towards what is owed to the Company in connection with the interconnection request.

(*Id.*) (emphasis added).

Q. Have any parties disputed these provisions in the Company's proposed Retail Tariff in this proceeding?

A. No.

Q. What is your response to Mr. Sharfman's claim that some CGC members have been "waiting years for PPL to approve their interconnection requests"? (CGC St. No. 1-R, p. 12.)

A. To be clear, PPL Electric works diligently to move projects along in its interconnection queue. However, these are complex projects that require distribution system upgrades to be constructed to interconnect them safely and reliably. The detailed engineering process alone can take up to 12 to 14 months. Moreover, PPL Electric must order and receive long lead time equipment for the distribution system upgrades. Such equipment can take up to 2 years to receive after PPL Electric places the order.

Also, interconnection applicants can experience issues with securing financing or local approvals to move forward with their projects. Any delays or cancellation of those projects can affect the projects behind them in the interconnection queue. Indeed, projects in interconnection queues very often depend on the projects ahead of them moving forward, as the projects ahead of them would bear the costs associated with necessary distribution system upgrades.

For example: Project 1 is required to pay $1,000,000 for distribution system upgrades that are needed to interconnect its project, while Project 2 is behind Project 1 in the interconnection queue and needs to pay $500,000 to cover the costs of the incremental distribution system upgrades for its project. Project 2's costs assume that Project 1's upgrades will be constructed. When Project 1 cancels, Project 2 could now be responsible to pay $1,500,000 to cover all the distribution system upgrade costs needed for its project. This cascading effect of cancellations on projects in the interconnection queue is a primary reason why the Company instituted its deposit requirement—to encourage "shovel ready" projects that are ready to move forward.

III. CONCLUSION

Q. Does this conclude your surrebuttal testimony?

A. Yes, it does.

SURREBUTTAL TESTIMONY OF
JOSEPH LOOKUP
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Large Load Interconnection**

Dated: February 9, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Joseph Lookup, and my business address is 827 Hausman Road, Allentown, Pennsylvania 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Services Corporation ("PPL Services") as Vice President – Transmission and Distribution Planning and Asset Management and provide services to PPL Electric Utilities Corporation ("PPL Electric" or the "Company").

Q. Have you previously filed testimony in this matter?

A. Yes. I previously submitted direct testimony (PPL Electric St. No. 16) and rebuttal testimony (PPL Electric St. No. 16-R) on behalf of the Company.

Q. What is the purpose of your surrebuttal testimony?

A. In my surrebuttal testimony, I respond to portions of the rebuttal testimony submitted by the Office of Small Business Advocate ("OSBA") Witness Ewen and PP&L Industrial Customer Alliance ("PPLICA") Witness LaConte. In particular, my surrebuttal testimony addresses issues pertaining to large load interconnections.

Q. Are you sponsoring any exhibits or schedules as part of your surrebuttal testimony?

A. No.

II. LARGE LOAD INTERCONNECTION

Q. OSBA Witness Ewen disagrees with several other parties' position that all customers, including Small C&I customers, should contribute to PPL Electric's Universal Service Rider ("USR"), as he distinguishes between small business and large load customers with respect to this issue. (OSBA St. No. 1-R, pp. 6-8.) Do you have a response?

A. Yes, and generally the Company agrees with Mr. Ewen's position that USR costs are appropriately assigned to residential customers because those are the customers that can benefit from the programs. This is why the Company's original proposal continued this practice of only assigning USR costs to residential customers (and a small number of Small C&I customers taking service at residential rates).

However, in my rebuttal testimony I provided revisions to the Company's large load tariff provisions. Specifically, the Company is proposing to assign $10 million of USR costs to the newly created LP-6 rate class that includes customers with a peak demand over 100 MW. I recognize that Mr. Ewen did not have the benefit of seeing my rebuttal testimony when he submitted his rebuttal testimony, but I believe the revised proposal addresses his concerns of not allocating USR costs to Small C&I customers.

Q. Does PPLICA Witness LaConte have similar concerns to Mr. Ewen?

A. Yes, Ms. LaConte is more focused on existing LP-5 and LP-4 customers not contributing to the USR. (PPLICA St. No. 1R, pp. 11-15.) The revised proposal in my rebuttal testimony should address Ms. LaConte's concerns. The Company specifically designed the LP-6 rate

schedule to include customers with a peak demand of 100 MW and above, so that any existing customers of the Company would be excluded. The new LP-6 rate schedule will only consist of new large load customers.

Q. Ms. LaConte recommends that the Company create a new rate schedule for very large load customers. (PPLICA St. No 1R, p. 17.) Do you have a response?

A. Yes, and the revised proposal detailed in my rebuttal testimony addresses Ms. LaConte's concerns. It creates a new rate schedule that will not include any existing LP-5 customer and that contains provisions that are specific to new large load customers.

Q. Ms. LaConte further recommends that the Pennsylvania Public Utility Commission ("Commission" or "PUC") defer ruling on the Company's large load tariff proposal until there is a determination in the Commission's Interconnection and Tariffs for Large Load Customers proceeding at Docket No. M-2025-3054271. (PPLICA St. No 1R, p. 17.) Do you agree?

A. No, and I think it is appropriate for the Commission to rule on the Company's proposal in the current proceeding. As I discussed previously, the Company is proposing a new rate schedule that will not include any existing LP-5 customers. This appears to resolve the majority of Ms. LaConte's concerns. Additionally, the revised proposal in my rebuttal testimony takes into account many aspects of the PUC's proposed model tariff and the recommendations of the parties in this proceeding. This includes creating a separate rate class, requiring a 10-year agreement with minimum load guarantees, exit fees for early termination, and USR

contributions, and providing the Commission with customer agreements for transparency and informational purposes (but not for approval). Further, it is my understanding that the Commission's model tariff at Docket No. M-2025-3054271 will be a guideline and not mandatory. If the Company's proposal is adopted in this rate case, the approved tariff provisions will have the force of law rather than being just guidelines. There is no reason that the Company's large load tariff proposal cannot be approved in this proceeding given that the Company has addressed most of the concerns raised by the other parties and has moved closer to the model tariff.

III. CONCLUSION

Q. Does this conclude your surrebuttal testimony?

A. Yes, it does.

SURREBUTTAL TESTIMONY OF
LISA NORDEN
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Universal Service Programs**
Low-Income Customer Shopping
Shopping Communications

Dated: February 9, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Lisa Norden, and my business address is PPL Electric Utilities 827 Hausman Road, Allentown, PA 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Electric Utilities Corporation ("PPL Electric" or the "Company"), a subsidiary of PPL Corporation, as Vice President Customer Services.

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted direct testimony (PPL Electric St. No. 18) and rebuttal testimony (PPL Electric St. No. 18-R) on behalf of the Company.

Q. What is the purpose of your surrebuttal testimony?

A. My surrebuttal testimony responds to certain portions of the rebuttal testimony submitted by other parties' witnesses, namely the Pennsylvania Public Utility Commission's ("Commission") Bureau of Investigation and Enforcement ("I&E") Witness Christopher Keller (I&E St. No. 2-R), the Office of Consumer Advocate ("OCA") Witness Barbara R. Alexander (OCA St. 7R), Retail Energy Supply Association ("RESA") Witness Frank Lacey (RESA St. No. 1R), and Sustainable Energy Fund ("SEF") Witness John Costlow (SEF St. No. 1-R). In particular, I address allegations and recommendations concerning: (1) the

Company's universal service programs; (2) low-income customer shopping; and (3) the Company's shopping communications.

Q. Have you prepared any exhibits or schedules in support of your surrebuttal testimony?

A. Yes. Attached to my surrebuttal testimony is PPL Electric Exhibit LN-1SR.

II. UNIVERSAL SERVICE PROGRAMS

Q. I&E Witness Keller and SEF Witness Costlow both address other parties' recommendations on whether to increase the LIURP budget (I&E St. No. 2-R, pp. 8-11, SEF St. No. 1-R, pp. 2-3). Do you have a response?

A. Yes, and the Company's position remains the same that there are advantages to addressing LIURP budgets in Universal Service and Energy Conservation Plan ("USECP") proceedings rather than base rate cases. LIURP is one component of the Company's overall universal service offerings. It is advantageous to look at the entire universal service portfolio at the same time to design a plan that best suits customers' needs while considering the impacts of the USECP programs' costs on customers' bills. However, the Company is willing to consider a reasonable increase in its LIURP budget during this base rate proceeding.

Q. Can you describe Mr. Costlow's recommendation regarding increasing the LIURP budget?

A. Yes, he proposes that the LIURP budget be increased "at a minimum" by $2 million in year one, with the budget increasing an additional 5% every year thereafter until 50% of low-

income households have received LIURP services or until the Company's next base rate case. (SEF Set. No. 1-R.)

Q. Do you agree with Mr. Costlow's proposal?

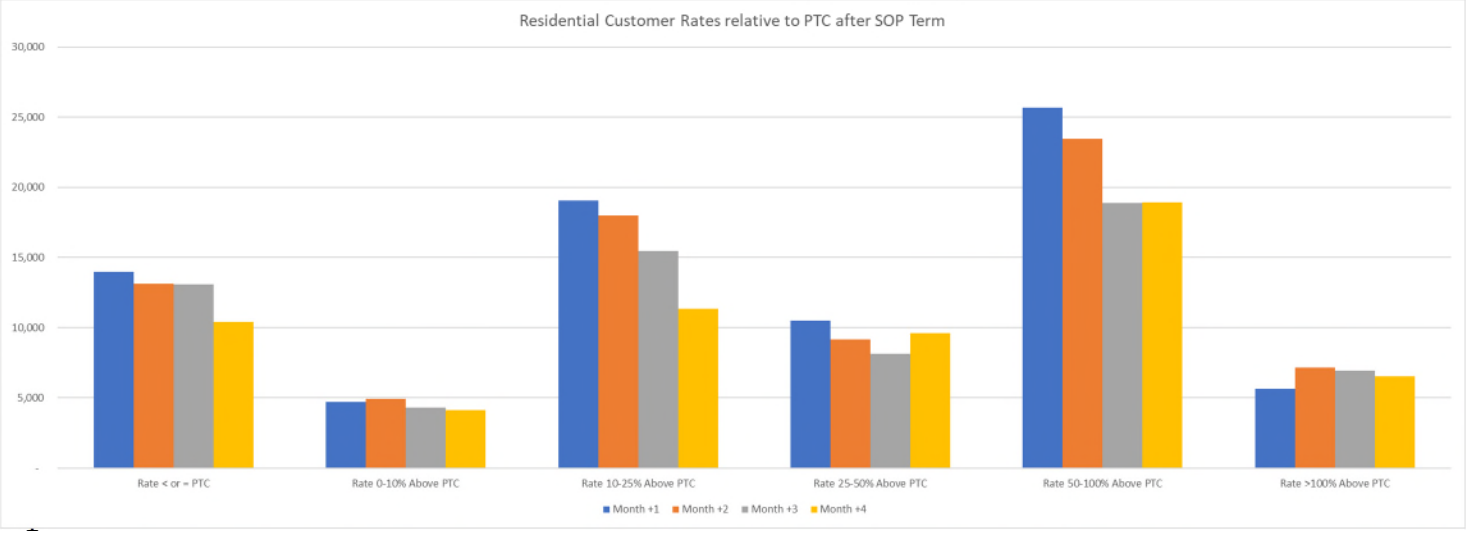
A. No. I first observe that Mr. Costlow failed to make this proposal in his direct testimony and is raising it for the first time in his rebuttal testimony. Further, his proposal far eclipses the competing LIURP budget proposals of Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania ("CAUSE-PA") Witness Cicero and Commission on Economic Opportunity ("CEO") Witness Warabak, who recommended increases of $2.4 million and $900,000, respectively, in the annual LIURP budget. (*See* CAUSE-PA St. No. 1, p. 133; CEO St. No. 1, pp. 7-9.) Mr. Costlow's proposal, by contrast, would initially increase the LIURP budget by $2 million in year one, making the annual LIURP budget $14 million (i.e., the existing $12 million budget plus $2 million). Then, Mr. Costlow's recommendation would increase the budget further by 5% each year thereafter. As such, year two would have a budget of $14.7 million (i.e., $2.7 million over the existing budget), year three would have a budget of approximately $15.4 million (i.e., $3.4 million over the existing budget), year four would have a budget of approximately $16.2 million (i.e., $4.2 million over the existing budget), and so on, unless and until PPL Electric provides LIURP services to 50% of low-income households or files a base rate case. I recognize that parties often make alternative recommendations in response to other parties' proposals, similar to how PPL Electric Witness Lookup presented an alternative proposal to address parties' concerns with the Company's initial large load interconnection tariff proposal (see PPL Electric St. No. 16-R). However,

Mr. Costlow's alternative recommendation goes far beyond the bounds of the proposals offered by Mr. Cicero and Ms. Warabak in their direct testimony. Thus, if he wanted to make such an expansive proposal regarding the Company's LIURP budget, I am advised by counsel that he should have presented it in his direct testimony.

In addition, Mr. Costlow's proposal would grow the program without any consideration for the feasibility of doing the work or costs to other customers. PPL Electric has approximately 218,000 confirmed low-income ("CLI") customers. Assuming Mr. Costlow's program budget growth rate of 5%, it would take approximately 35 years to serve 50% of the CLI customers (approx. 109,000) in one 5-year LIURP cycle. Moreover, to achieve that level of participation it would require an annual budget of $77 million. (*See* PPL Electric Exhibit LN-1SR.) This is not using inflation adjusted figures, with actual program costs likely to be much higher. I recognize that Mr. Costlow limited the recommendation to last until the 50% services level is achieved or until the Company's next base rate case. However, I provide this data to demonstrate that his plan is inadequate to achieve his stated goal of serving 50% of CLI customers in a 5-year LIURP cycle.

Lastly, achieving 50% LIURP participation in any 5-year period is an unrealistic goal to set. Setting LIURP budgets involves more than designating a dollar figure to allocate to the program. Rather, it must also consider customer interest in the program, and the availability of trained contractors to perform the work. While the Company is willing to consider an adjustment to its LIURP budget, PPL Electric does not think it is appropriate to increase the budget by the amount that Mr. Costlow has recommended.

III. LOW-INCOME CUSTOMER SHOPPING



Q. RESA Witness Lacey disagrees with OCA Witness Alexander's recommendation to eliminate shopping for low-income customers and in support of his position offers alleged benefits of shopping. (RESA St. No. 1R, p. 3-5.) What is your response?

A. After reviewing Mr. Lacey's rebuttal testimony, my position remains unchanged. Moreover, I disagree with Mr. Lacey's argument that low-income customers benefit from shopping. Mr. Lacey only tells one side of the story and ignores the majority of low-income customers that are paying prices higher than the Company's Price to Compare ("PTC"). In 2024, approximately 36,000 low-income customers who shopped paid $15.4 million more than they would if they were on default service. Mr. Lacey references that the 21,500 customers who paid less than the PTC saved an average of $168 in 2024 but fails to mention the 36,000 low-income customers who paid more than the PTC were charged on average $422 more a year than if they were on default service. This resulted in all low-income customers who shopped paying approximately $11.8 million more than if they all were on default service.

The trend of low-income shopping customers paying more than the PTC continued in 2025. The 35,000 low-income customers who shopped paid $18.5 million more than if they were on default service, or on average $527 a year per customer. There were 22,500 customers who paid less than the PTC and saved $5.3 million, or on average $236 less than the PTC a year per customer. In total, low-income customers paid $13.2 million more than if they were on default service. Mr. Lacey is correct that some low-income customers do pay less than the PTC, but the majority pay significantly more. Ultimately, those higher rates that they pay increase the total arrears on low-income customers' accounts, with the Company

typically seeing approximately 50% of low-income shopping customers having arrears. This leads to increases in the Company's uncollectible expenses that are recovered from residential customers.

I also question whether the customers who paid less than the PTC continued to do so in the long term. In my experience, Electric Generation Suppliers ("EGS") often offer an introductory rate that is below the PTC, but when the initial contract term expires the renewal rate is much higher than the PTC which eliminates any prior savings. In the Company's Default Service Plan VI proceeding (Docket No. P-2024-3047290) ("DSP VI"), the Company analyzed the prices customers were paying after their Standard Offer Program ("SOP") contract expired for the years 2018 and 2023. As the chart below shows, 82.45% of residential customers who remained with their SOP supplier after the conclusion of their SOP contract were paying a rate at or above the PTC in the first month following the end of their SOP contract. Even four months later, when approximately 18,000 customers had taken action, of the remaining customers, 82.91% were still paying rates at or above the PTC, with over 76.11% paying 10% or more above the PTC. Only 17.09% of these customers were paying rates at or below the PTC.

I acknowledge that this data is from several years ago and only relates to the SOP which the Company no longer offers. However, this example still demonstrates that even customers who are paying below the PTC at a given period in time, may not continue to save over the lifetime of their shopping experience. Over time, the Company has found that in the aggregate, customers who shop end up paying more than customers who remain on default service. Mr. Lacey is incorrect that encouraging customers to shop is a viable solution to the affordability issues raised by other parties.

IV. SHOPPING COMMUNICATIONS

Q. Mr. Lacey references the settlement PPL Electric reached with RESA to settle RESA Petition for Declaratory Order at Docket P-2022-3036985 ("RESA Petition"), in the Company's DSP VI proceeding and argues that such settlement should prevent OCA Witness Alexander from making recommendations about communications with customers about EGSs in this proceeding. (RESA St. No. 1R, pp. 10-11.) What is your

response?

A. I believe the propriety of Ms. Alexander's recommendations in light of the DSP VI settlement is a legal issue that can be addressed in the parties' briefs. The DSP VI settlement set forth a collaborative process for interested parties to discuss the timing, frequency, and content of PPL Electric's written communications sent directly to shopping customers about their contracts and rates for competitive electric generation supply service. In compliance with the DSP VI settlement PPL Electric held the collaborative meeting on January 27, 2025. This meeting included representatives from RESA and OCA. To date, that collaborative has not resulted in any consensus on these matters, and no party has invoked Paragraph 24 of the settlement to submit the matter to the Office of Competitive Market Oversight ("OCMO") for a staff decision. PPL Electric maintains that its communications to its customers prior to the DSP VI settlement were entirely proper, and at no time did the Company admit fault or that its communications were in any way unlawful. However, PPL Electric agreed to review the communications with RESA and other parties to amicably resolve the DSP VI matter.

In addition, Mr. Lacey should recognize that Paragraphs 24 and 25 of the DSP VI settlement identified several kinds of communications that would not be the subject of the collaborative and that the Company could continue to maintain or disseminate. For example, as noted in my rebuttal testimony, PPL Electric maintains a "Shop Smart" section on its website to educate customers. (*See* PPL Electric St. No. 18-R, p. 18.) Relevant here, Paragraph 25 of the DSP VI settlement states that it "will not affect the Company's ability to post information on its website."

V. CONCLUSION

Q. Does this conclude your surrebuttal testimony?

A. Yes, it does.

2025 Budget	$	12,000,000

SURREBUTTAL TESTIMONY OF
JAMES CONRAD
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Electric Vehicles**
Net Metering

Dated: February 9, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is James Conrad, and my business address is 827 Hausman Road, Allentown, PA 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Services Corporation, a subsidiary of PPL Corporation ("PPL Corp.") and an affiliate of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") as Senior Director of T&D Smart Grid & Automation.

Q. Have you previously filed testimony in this matter?

A. Yes, I previously filed direct testimony (PPL Electric St. No. 20) and rebuttal testimony (PPL Electric St. No. 20-R) on behalf of the Company.

Q. What is the purpose of your surrebuttal testimony?

A. The purpose of my surrebuttal testimony is to respond to rebuttal testimony submitted by other parties regarding: (1) the Company's Electric Vehicle ("EV") Time-of-Use ("TOU") Charging Rebate Program; and (2) net metering. In particular, I respond to the direct testimony of: Office of Consumer Advocate ("OCA") Witness Hoyt (OCA St. 5R) and IGS Solar ("IGS") Witness Rever (IGS St. No. 1R.)

Q. Have you prepared any exhibits in support of your surrebuttal testimony?

A. No.

II. ELECTRIC VEHICLES

Q. OCA Witness Hoyt submitted rebuttal testimony that addressed EI Witness Nelson's direct testimony regarding PPL Electric's proposed EV TOU Rebate Program. (OCA St. No. 5R, pp. 5-9.) Did you review Mr. Hoyt's rebuttal testimony?

A. Yes, I did.

Q. Did anything in Mr. Hoyt's rebuttal testimony cause you to reconsider any aspect of the proposed EV TOU Rebate Program?

A. Yes, the Company is willing to revise its EV TOU Rebate Program so that the on and off peak hours match the on and off peak hours of the Generation TOU 3 Rate. The Company originally proposed on and off peak hours that were specifically designed for EV usage patterns. However, the shift in on and off peak hours to match the Generation TOU 3 Rate is relatively small, and the Company agrees that reducing customer confusion will help encourage program participation. The Company's position for the remainder of the EV TOU Rebate Program proposals remains that the Commission should approve the program as described in my direct testimony and as revised by my rebuttal testimony.

III. NET METERING

Q. In her rebuttal testimony, IGS Witness Rever makes certain claims regarding the Company's net metering practices, particularly that the Company uses bi-directional meters and that "the utility" does not "ha[ve] any way of knowing the production of the solar system." (IGS St. No. 1R, pp. 5, 11.) Are those claims completely accurate?

A. No. Setting aside that PPL Electric's position is that the Coalition for Affordable Utility Service and Energy Efficiency in Pennsylvania's ("CAUSE-PA") proposal to make net metering customer-generators pay for the Act 129 Compliance Rider ("ACR") and Universal Service Rider ("USR") regardless of their generation would be more appropriately addressed in a Commission rulemaking (see PPL Electric St. No. 5-R, pp. 26-27), Ms. Rever's characterizations of the Company's equipment and capabilities are misplaced.

First, PPL Electric has deployed its advance metering infrastructure ("AMI") meters in its service territory. The meters for residential customers record usage and generation on two channels. One channel records the net usage of the customer's service address, while the second channel records the net generation. Those two figures are netted against each other at the end of the billing period to determine whether the customer-generator had excess generation that needs to be banked. If not, meaning that the customer-generator had total net usage at the property, the Company will bill the customer-generator based on the total net usage.

Second, PPL Electric can determine the standalone generation of certain customer-generators, namely those that are participating in the Company's Second Distributed

Energy Resource ("DER") Management Plan. The DER Management devices installed on the participating customer-generators' smart inverters under that Plan provide PPL Electric with the generation data, exclusive of any usage by the customer-generator.

IV. CONCLUSION

Q. Does this conclude your surrebuttal testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
CHRISTINE M. MARTIN
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Overview of Rejoinder Testimony**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Christine M. Martin. My business address is 827 Hausman Road, Allentown, PA 18104.

Q. By whom are you employed and in what capacity?

A. I am employed as the President of PPL Electric Utilities Corporation ("PPL Electric"), a subsidiary of PPL Corporation.

Q. Have you previously filed testimony in this matter?

A. Yes. I previously submitted direct testimony, PPL Electric Statement No. 1 and rebuttal testimony, PPL Electric Statement No. 1-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to provide an overview of other PPL Electric witnesses' rejoinder testimonies.

Q. Have you prepared any exhibits or schedules in support of your rejoinder testimony?

A. No, I have not.

Q. Before addressing those topics, do you have any initial observations regarding the other parties' surrebuttal testimony and the Company's rejoinder testimony?

A. Yes. I recognize and appreciate that I&E and OCA incorporated corrections to the revenue requirement that the Company identified in this proceeding, particularly the annual amortization of negative net salvage. Those corrections, coupled with other adjustments made by I&E and OCA, resulted in those parties updating their positions on the overall base rate revenue increase to approximately $298.12 million and $186.79 million, respectively.

As noted by PPL Electric Witness Dane, however, I&E and OCA made certain errors in their revenue requirement calculations as part of their surrebuttal case. When correcting for those errors, I&E's and OCA's proposed revenue increases should instead be approximately $301.98 million and $182.68 million, respectively. It is from those figures that the Commission should adjudge those parties' proposed increase in PPL Electric's base rate revenue.

II. OVERVIEW OF REJOINDER TESTIMONY

Q. Could you please provide an overview of the witnesses submitting rejoinder testimony on behalf of the Company and the subject matters of their testimony?

A. Yes, the following witnesses are submitting rejoinder testimony on behalf of PPL Electric:

- PPL Electric St. No. 2-RJ – Dennis A. Urban, Jr. – Rejoinder regarding membership dues and expenses, rate base, and payroll and benefits expense.
- PPL Electric St. No. 5-RJ – Bethany L. Johnson – Rejoinder regarding updates to the Company's revenue requirement, reconnection fees, and PPL Electric's joint venture with Blackstone.

- PPL Electric St. No. 6-RJ – Daniel S. Dane – Rejoinder regarding certain revenue requirement issues.

- PPL Electric St. No. 7-RJ – Bickey Rimal – Rejoinder regarding the Company's allocated cost of service study, and the proposed customer charge.

- PPL Electric St. No. 8-RJ – Steven W. Wishart – Rejoinder regarding affordability and energy burdens, the residential customer charge, and time-of-use rates.

- PPL Electric St. No. 10-RJ – Jennifer E. Nelson – Rejoinder to various witnesses regarding the appropriate return on equity and capital structure for PPL Electric.

- PPL Electric St. No. 11-RJ – John J. Spanos – Rejoinder regarding depreciation service lives.

- PPL Electric St. No. 13-RJ – Katelyn Arnold – Rejoinder regarding cash working capital.

- PPL Electric St. No. 14-RJ – Gregory Olsen – Rejoinder regarding issues related to non-exporting behind the meter battery energy storage systems.

- PPL Electric St. No. 15-RJ – Andrew Castanaro – Rejoinder regarding the Company's maximum registered peak load proposal.

- PPL Electric St. No. 16-RJ – Joseph Lookup – Rejoinder regarding large load interconnections.

- PPL Electric St. No. 18-RJ – Lisa Norden – Rejoinder regarding customer service and low income issues.

- PPL Electric St. No. 21-RJ – Jason Hunt – Rejoinder regarding economic development

- PPL Electric St. No. 22-RJ – Sharon Leskowsky – Rejoinder regarding historic test year schedules, and Infrastructure Investment & Jobs Act (IIJA) Cost Amortization.

- PPL Electric St. No. 23-RJ – Vincent Poplaski – Rejoinder regarding incentive compensation expense.

Q. Do you have any further comments about the Company's rejoinder testimony?

A. Yes. In its rejoinder testimony, PPL Electric limits its focus to addressing new arguments, recommendations, and adjustments raised in other parties' surrebuttal testimony. To the extent that the Company's witnesses do not address any such argument, recommendation, or adjustment that has been presented, it should not be interpreted as PPL Electric's agreement with that argument, recommendation, or adjustment.

III. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
DENNIS A. URBAN, JR.
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Membership Dues and Expenses**
Rate Base
Payroll and Benefits Expense

Dated: February 13, 2026

31959831v1

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Dennis A. Urban, Jr., and my business address is 645 Hamilton Street, Suite 9, Allentown, PA 18101.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Services Corporation ("PPL Services"), a subsidiary of PPL Corporation and an affiliate of PPL Electric Utilities Corporation ("PPL Electric" or the "Company"). I hold the position of Senior Director, Finance Transformation.

Q. Have you previously filed testimony in this matter?

A. Yes, my direct testimony in this matter is PPL Electric Statement No. 2, my rebuttal testimony is PPL Electric Statement No. 2-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to the surrebuttal testimonies of the following witnesses as they relate to membership dues and expenses, rate base, and to payroll and benefits expense for PPL Electric:

- Mr. Zachari Walker on behalf of the Bureau of Investigation and Enforcement ("I&E", "I&E St. No. 1-SR"); and

- Mr. Lafayette Morgan on behalf of the Office of Consumer Advocate ("OCA", "OCA St. No. 1-SR").

I collectively refer to these individual witnesses as the "Witnesses." My silence on a particular issue should not be construed as agreement with respect to that issue.

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. Yes. Attached to my testimony is PPL Electric Exhibit DAU-1RJ.

II. MEMBERSHIP DUES AND SUBSCRIPTIONS

Q. I&E Witness Walker argues that the Company's membership dues and subscriptions expense claim of $2 million should be denied because PPL Electric "did not produce additional support" for the claim. (I&E St. No. 1-SR, p. 19.) Do you agree?

A. No. In discovery, PPL Electric produced detailed support for this claim, breaking out each of the membership dues and subscriptions. Specifically, as seen in the relevant portions of I&E-RE-I-12-D Attachment 1 SUPPLEMENTAL (attached hereto as PPL Electric Exhibit DAU-1RJ), PPL Electric provided historic detail that was the basis for its claim. This historic detail included journal date, account, account description, payee name, and amount. Moreover, as I noted in my rebuttal testimony, PPL Electric's cost for memberships and subscriptions include employee training, professional development organizations, industry groups and associations, work-related travel, and online working tools. As such, the Company's

memberships and subscriptions are beneficial to PPL Electric and its customers. Indeed, memberships to the Edison Electric Institute ("EEI") and the Energy Association of Pennsylvania ("EAP") provide the Company with strategic business and market insights, access to industry data, and benchmarking, and networking and collaboration value. These benefits provide stronger and more reliable grids, improved service quality and resilience, cost efficiencies, and better storm response.

Therefore, the Commission should reject Mr. Walker's proposed adjustment that would disallow the Company's entire claim for these expenses.

III. RATE BASE

Q. I&E Witness Walker proposes a $25 million reduction in the Company's FPFTY rate base due to his opposition to PPL Electric's enhanced right-of-way ("ROW") rights proposal. (I&E St. No. 1-SR, pp. 22-24.) Is that adjustment appropriate?

A. No. Mr. Walker is under the impression that PPL Electric's FPFTY rate base claim includes $25 million associated with these costs. That is not the case. Although PPL Electric has requested accounting approval to capitalize this category of costs in this proceeding, the $25 million referenced by Mr. Walker was not included in PPL Electric's FPFTY rate base claim, nor was it included in the Company's FPFTY operating expenses. Accordingly, there is no capital or expense claim to adjust if the Commission rejects PPL Electric's proposed accounting treatment. I note, however, that the Company maintains that it should be permitted

to capitalize such costs, for the reasons explained in Ms. Leskowsky's testimony, and that PPL Electric should be able to seek recovery of such capitalized costs in a future proceeding.

Q. OCA Witness Morgan also adjusts the Company's rate base as part of his attempt to incorporate PPL Electric's negative net salvage. (OCA Exhibit LKM-2SR.) Was that correct?

A. No. Mr. Morgan errs in adjusting the Company's rate base by approximately $34.6 million based on the amount of the annual amortization of negative net salvage. PPL Electric's accumulated depreciation, and by extension its rate base, already included that adjustment. The Company only needed to correct its depreciation expense to include the annual amortization of negative net salvage. Thus, Mr. Morgan's adjustment to PPL Electric's rate base should be rejected.

IV. PAYROLL AND BENEFITS EXPENSE

Q. OCA Witness Morgan continues to propose an adjustment to the payroll expense for customer service employees, claiming that the Company's statement that it "could" use contractors indicates that there is no definitive plan to hire contractors and that if a contingency exists then PPL Electric has overstated its costs. (OCA St. 1SR, pp. 4-5.) Please respond.

A. In her rejoinder testimony, Ms. Norden rebuts Mr. Morgan's claim that there is no plan in place to hire these additional employees (see PPL Electric St. No. 18-RJ). My point in rebuttal

was that contractors can perform the functions of these employees but would be more expensive. Without these employees being hired, PPL Electric would be forced to hire these more expensive contractors to perform their functions. Also, PPL Electric's claim is conservative because it is based on a sound 5% vacancy reserve to its payroll expense. Thus, PPL Electric has not overstated its costs, and Mr. Morgan's proposal to disallow 48% of this expense should be rejected.

V. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

PPL Electric Utilities Corporation	:	

REJOINDER TESTIMONY OF
BETHANY L. JOHNSON
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **PPL Electric's Update to its Revenue Requirement**
Reconnection Fees
PPL Corporation Joint Venture with Blackstone

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Bethany L. Johnson, and my business address is 827 Hausman Road, Allentown, Pennsylvania, 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Services Corporation ("PPL Services"), an affiliate of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") which provides services to PPL Electric, as the Senior Director of Regulatory.

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted direct testimony on behalf of the Company, PPL Electric Statement No. 5, and rebuttal testimony, PPL Electric Statement No. 5-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to the surrebuttal testimonies of the following witnesses as they relate to the Company's updates to its revenue requirement, reconnection fees, and to PPL Corporation's joint venture with Blackstone:

- Mr. Patrick Cicero on behalf of the Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania ("CAUSE-PA", "CAUSE-PA St. 1-SR");

- Mr. Matthew T. Hoyt on behalf of the Office of Consumer Advocate ("OCA", "OCA St. 5-SR");
- Mr. Kevin M. Lucas on behalf of the Joint Solar Advocates ("JSA", "JSA St. 1-SR"); and
- Mr. Guy Sharfman on behalf of the Customer-Generator Coalition ("CGC", "CGC St. 1-SR").

My silence on a particular issue should not be construed as agreement with respect to that issue.

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. No.

II. PPL ELECTRIC'S UPDATE TO ITS REVENUE REQUIREMENT

Q. CAUSE-PA Witness Cicero alleges that PPL Electric should not be able to "redo the math" in the course of its base rate proceeding, so the Commission "should reject PPL's claim that its newly calculated revenue requirement creates any sort of baselines from which adjustments should be made." (CAUSE-PA St. No. 1-SR, p. 8.) Please respond.

A. Mr. Cicero is incorrect. If PPL Electric's projections turn out to be incorrect and need adjustment, the Company has a duty to correct the evidentiary record. Also, every public utility that files a base rate case using a forward-looking test year has an obligation to provide updates to its actual costs and expenses that are incurred during the Future Test Year ("FTY"). That obligation exists so that parties can review and adjust their positions during the course

of the proceeding, in case the utility's original projections require updating. Certainly, the Company recognizes that it cannot be granted an increase above the original filed revenue increase of approximately $356 million, as it has previously stated. However, that does not mean that any corrections to the Company's revenue requirement should not be reflected in other parties' positions. Indeed, I note that both I&E and OCA incorporated corrections identified by PPL Electric into their proposed base rate revenue increases. Lastly, I note that while the balance of PPL Electric's corrections resulted in an increase in the Company's revenue requirement, some corrections put downward pressure on the revenue requirement. Regardless of whether the corrections increase or decrease the revenue requirement, they need to be identified and should be incorporated into parties' position on the overall revenue increase. In fact, in PPL Electric's 2015 Rate Case, the Company identified corrections in its rebuttal testimony that resulted in PPL Electric's proposed base rate increase decreasing from $167.479 million to $147.234 million. Therefore, PPL Electric does not make these corrections solely for the sake of increasing its revenue requirement. The Company is required to do so, regardless of how those corrections affect the revenue requirement. By contrast, under Mr. Cicero's logic, a utility should not "redo the math" in the middle of a case" even if it resulted in the overall revenue increase going down. However, I doubt that Mr. Cicero would oppose such corrections in that scenario. Thus, Mr. Cicero's position is flawed and should be rejected.

III. RECONNECTION FEES

Q. If CAUSE-PA's proposal for PPL Electric to waive reconnection fees for low-income customers is adopted, CAUSE-PA Witness Cicero contends that the normalized expense amount for the reconnection fees should be $291,390 based on a five-year normalization, as opposed to the $500,000 that you recommended in your rebuttal testimony. (CAUSE-PA St. No. 1-SR, pp. 49-50.) Please respond.

A. I maintain that the $500,000 figure should be utilized, as it more reasonably reflects the total reconnection fees paid by low-income customers based on recent experience and that the Company projects for the Fully Projected Future Test Year ("FPFTY"). Notwithstanding, if the Commission ultimately decides to base the Company's claim off of the normalization period for PPL Electric's rate case expense, I continue to support using a three-year normalization period for rate case expense, as noted in my rebuttal testimony. That would result in an expense of $343,369 based on the data presented in Table 1 of CAUSE-PA St. No. 1-SR.

IV. PPL CORPORATION JOINT VENTURE WITH BLACKSTONE

Q. Due to PPL Corporation's announced joint venture with Blackstone, OCA Witness Hoyt "continue[s] to recommend that the Commission require PPL Electric to incorporate the recommended safeguards into its large load tariff." (OCA St. 5-SR, p. 38.) What reasoning does he provide?

A. Mr. Hoyt says that his concern about the joint venture "is not limited to a direct contractual relationship between PPL Electric and the joint venture"; "[r]ather, it arises from the indirect incentive created when large load interconnections and associated transmission upgrades facilitate outcomes that benefit PPL Corporation affiliates." (*Id.*) Therefore, Mr. Hoyt believes that "[e]ven where PPL Electric complies with existing rules, it remains possible for large load customers' interconnection or service cost obligations to be reduced or offset based on asserted system benefits that advantage affiliated generation assets." (*Id.*)

Q. Do you agree with Mr. Hoyt?

A. No. The Commission's and FERC's existing rules and requirements are more than appropriate to protect against any potential preferential treatment or outcomes in PPL Electric's decision-making. Further, Mr. Hoyt's position appears to be that PPL Electric may have an incentive to socialize transmission upgrades for large load interconnections to benefit the joint venture. However, if the Company were contracting directly with a project under that joint venture, then the contract would be subject to Commission review and approval under the Commission's affiliated interest agreement requirements. Conversely, if the joint venture were constructing a generation facility behind the meter and not contracting directly with PPL Electric, then the Company's decision to socialize transmission upgrades for large load interconnections would not affect that facility.

Additionally, under PPL Electric's Default Service Plan, the Company routinely requests and has been granted a waiver to allow for the participation of affiliates. The winning bids are subject to approval by the Commission, and in instances where an affiliate bidder would be approved, it would be because it's beneficial for customers, even though the affiliate would presumably also benefit.

Q. Mr. Cicero contends that PPL is not a "hapless actor in somebody else's drama" when it comes to generation and transmission costs. (CAUSE-PA St. No. 1-SR, p. 10.) Please respond.

A. Mr. Cicero fails to acknowledge the utility's obligation to serve customers. Whether the entity connecting is a residential, commercial, or industrial customer, or a generating facility, PPL Electric must allow the customer to connect in accordance with applicable tariffs and rules. I am advised by legal counsel that the Electricity Generation Customer Choice and Competition Act required Pennsylvania electric utilities to unbundle their rates and services and to provide open access to their transmission and distribution systems to allow competitive suppliers to generate and sell electricity directly to customers. *See, e.g.*, 66 Pa. C.S. §§ 2802(14), 2804(2)-(3), (6), 2806(d)-(e). It was also noted that electric service is essential to orderly economic development, and electric service should be available to all customers on reasonable terms and conditions. In summary, choosing whether to connect customers, even if they materially impact distribution, transmission, or generation is not an option for PPL Electric.

Q. JSA Witness Lucas brings up the joint venture when suggesting that the Maximum Registered Peak Load ("MRPL") proposal "is a way for PPL, who hopes to enter the generation business, to reduce amounts paid to what it calls merchant generators such as FTM DGs that would also be supplying load on the PPL grid." (JSA St. No. 1-SR, p. 14.) Do you agree with his statement?

A. Absolutely not. The Company's proposal is about appropriately classifying these large, no-load customer-generator projects and protecting non-customer-generators from bearing the weight of significant cost increases in their default service rates. Moreover, as alleged support for his claim, Mr. Lucas cites a PPL Corporation investor statement regarding the joint venture announced by PPL Corporation and Blackstone. As noted in that statement, the joint venture was created "to build, own and operate new generation to serve data centers under long-term energy services agreements and help mitigate rising electricity prices for our other customers."[1] Therefore, both the joint venture and PPL Electric's MRPL proposal have a common goal—mitigate rising electric rates for customers. Furthermore, gigawatts of generation assets are needed to serve data centers. It is unreasonable to suggest that no-load customer-generators' projects, which have, at most, 3 MW of capacity on an individual basis, would be capable of serving the load of data centers, even if they were to aggregate and serve as a virtual power plant. This is especially true when the no-load customer-generators' solar

[1] https://investors.pplweb.com/2026-01-20-PPL-Corporation-statement-on-Trump-Shapiro-call-for-new-power-auction-to-spur-construction-of-power-plants-paid-for-by-data-centers.

projects produce generation intermittently and the data centers require round-the-clock service.

Q. CGC Witness Sharfman also points to the PPL Corporation investor statement about the joint venture between PPL Corporation and Blackstone and says he is presenting it "only to show that PPL's asserted justification for MPRL in this proceeding should be evaluated based on the quantitative and operational evidence in the record, rather than assumed." (CGC St. No. 1-SR, p. 3.) Please respond.

A. Mr. Sharfman's reference to and reliance on the investor statement for a PPL Corporation endeavor has no relevance here, as I explained previously in response to Mr. Lucas's surrebuttal testimony on the subject.

V. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

PPL Electric Utilities Corporation	:	

REJOINDER TESTIMONY OF
DANIEL S. DANE
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Revenue Requirement**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Daniel S. Dane. My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. By whom are you employed and in what capacity?

A. I am the President of Concentric Energy Advisors, Inc. ("Concentric").

Q. Have you previously filed testimony in this matter?

A. Yes. I previously submitted direct testimony on behalf of PPL Electric Utilities Corporation ("PPL Electric" or the "Company"), which is pre-marked as PPL Electric Statement No. 6. I also submitted rebuttal testimony, which is marked as PPL Electric Statement No. 6-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to correct certain errors discussed herein that were presented in the Pennsylvania Public Utility Commission's ("Commission") Bureau of Investigation and Enforcement's ("I&E") and the Office of Consumer Advocate's ("OCA") updated revenue increase proposals.

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. Yes. Attached to my rejoinder testimony is PPL Electric Exhibit DSD-1RJ.

II. REVENUE REQUIREMENT

Q. As part of their surrebuttal testimony, I&E and OCA present updated proposals on the overall base rate revenue increase that should be granted to PPL Electric in this proceeding. Have you identified any errors in their calculations?

A. Yes, and I have made corrections to those errors as part of recalculating I&E's and OCA's proposed base rate revenue increases. Attached as PPL Electric Exhibit DSD-1RJ is an exhibit detailing my recalculation of I&E's and OCA's updated revenue increase proposals.

Q. What corrections did you make to I&E's updated revenue increase proposal?

A. First, in his surrebuttal testimony (I&E Statement No. 1-SR, p. 24), I&E Witness Zachari Walker presents "an updated recommendation that the Commission disallow the entire capitalized FPFTY claim for the first removal of hazard and danger trees after the acquisition of the enhanced ROW of $25,000,000." However, I&E erred in reducing rate base by $25 million for the enhanced right-of-way, first clearing work. As noted by PPL Electric Witness Urban (PPL Electric St. No. 2-SR), the Company did not include such costs as part of its Fully Projected Future Test Year ("FPFTY") rate base or expenses. Therefore, I&E's $25 million rate base adjustment should be removed. I also note that I&E did not make a corresponding adjustment to accumulated depreciation, so my recalculation of I&E's revenue increase removes the $25 million downward capital adjustment but does not change accumulated depreciation.

Second, I&E included the Company's rate base as updated in rebuttal for the starting point of its revenue requirement calculation ($5,820,790). When calculating the adjustment to rate base, I&E reduced rate base by the change in the cash working capital ("CWC") as updated in discovery ($16,529 - $10,717 = $5,812). The adjustment should have been calculated based on the CWC as updated in rebuttal ($16,491 - $10,717 = $5,744) to be consistent with the starting point in the calculation.

Third, when calculating interest expense in the CWC, rate base was not adjusted for the above adjustments ($25,000 + $5,812 = $30,812). For the purposes of my recalculation of I&E's revenue increase, I adjusted rate base by $5,744 to reflect the corrected proposed adjustment in the CWC. I also note that taxes were not updated in the CWC calculation.

Fourth, while I&E used the amounts as updated in rebuttal for the starting point of its surrebuttal calculations, I&E failed to recognize that the Company's rebuttal revenue requirement was already adjusted to remove $27,510 for Company sponsorships and to also reflect adjustments to payroll taxes. Therefore, I backed out I&E's adjustments to these expense categories from the recalculation of I&E's revenue requirement to be consistent with the starting point in the calculation.

Fifth and finally, I updated the gross-up factor to reflect the calculation of late payment revenue in the rate increase as presented in the Company's rebuttal.

Q. What corrections did you make to OCA's updated revenue increase proposal?

A. As an initial matter, OCA calculates its revenue requirement based on the "As Filed" version of the Company's revenue requirement. To be consistent with I&E's approach, my recalculation of OCA's updated revenue increase proposals uses the "As Updated in Rebuttal" amounts as the Company's starting point and makes corresponding adjustments to account for the fact that adjustments to expenses related to eligible customer lists, Company sponsorships and membership dues have already been reflected in the "As Updated in Rebuttal" starting point, as discussed in the Company's rebuttal testimony. My recalculation of OCA's updated revenue increase proposals also makes corresponding adjustments to account for the fact that negative net salvage was included in depreciation expense in the "As Updated in Rebuttal" amounts.

As for errors made by OCA, OCA reduced rate base by approximately $34.6 million for the inclusion of negative net salvage in the depreciation expense. However, this amount was already included in the Company's accumulated depreciation and, consequently, PPL Electric's rate base. Therefore, I have removed this adjustment by OCA to rate base.

In addition, OCA calculates an adjustment to the accrued taxes portion of CWC using an incorrect factor for PA Gross Receipts Tax. This is corrected in the recalculated revenue requirement.

Lastly, the gross-up factor was updated to reflect the calculation of late payment revenue in the rate increase as presented in rebuttal.

Q. To the extent that the Commission relies on I&E's and OCA's positions on revenue requirement, should these corrections be reflected in those positions?

A. Yes, as reflected in PPL Electric Exhibit DSD-1RJ.

III. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
BICKEY RIMAL
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Rejoinder Regarding ACOSS**
Rejoinder Regarding Proposed Customer Charge

Dated: February 13, 2026

REJOINDER TESTIMONY OF BICKEY RIMAL

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name and business address.

A. My name is Bickey Rimal, and my business address is 1300 19th Street NW, Suite 620, Washington, DC 20036.

Q. By whom are you employed and in what capacity?

A. I am employed by Concentric Energy Advisors, Inc. ("Concentric") as a Vice President.

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted direct, rebuttal, and surrebuttal testimony, on behalf of PPL Electric Utilities Corporation ("PPL Electric" or the "Company"). My direct, rebuttal, and surrebuttal testimony were identified as PPL Electric Statement Nos. 7, 7-R, and 7-SR, respectively.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to issues raised by Office of Consumer Advocate ("OCA") Witness Clarence Johnson related to the Company's Allocated Cost of Service Study ("ACOSS") and its proposed customer charge. My rejoinder testimony is limited to a discussion of certain issues raised by Mr. Johnson, and the failure to address every issue in each statement submitted by witnesses for other parties does not mean or imply that I or the Company agrees with the positions taken by such parties with respect to those issues.

II. ALLOCATED COST OF SERVICE STUDY

Q. At pages 6-7, Mr. Johnson cites *Bonbright* for the proposition that there is a "very weak correlation between the area (or the mileage) of a distribution system and the number of customers served by the system." Should this quotation from the *Bonbright* treatise be interpreted to mean that all costs should be allocated based on peak demand?

A. No. That quote simply means that some utilities have greater customer density than others, but it does not mean that all distribution system costs vary only by the amount of peak demand. For example, if we compare two systems that have the same number of customers and the same total peak demands, by definition, the utility with lower customer density should have more miles of distribution system than a high-density system. In such a case, we would expect, of course, that total peak demand also has a very weak correlation with the miles of distribution system served by the different utilities. As a result, the quotation Mr. Johnson references does not lead to the conclusion that all distribution costs are related to peak demand. Instead, because geographical coverage is unrelated to peak demand, it is appropriate for the customers to share equally in the minimum system costs of providing distribution system geographic coverage.

Although the minimum system costs per customer should be lower for a utility that serves a densely-populated territory, it is still reasonable for customers to share those costs equally (i.e., on a per-customer basis) because a large portion of distribution system costs are incurred to reaching, and connecting to one another, the numerous, geographically-

dispersed customers. The minimum system costs incurred to reach and interconnect those customers are not related to peak demand.

Q. At page 9, Mr. Johnson states that "Mr. Rimal expands the notion of 'simply connecting customers' to a broader definition of access which can include some indeterminant level of load carrying capacity. By expanding the notion of 'connecting' and 'attaching' customers to a broader scope of costs, he has muddled the purpose of the minimum system study." Is this an accurate characterization of your testimony?

No. In my direct testimony, at page 15, I state that "[t]he minimum system analysis compares the cost of a hypothetical minimum system (i.e., a system sized to simply connect customers) to the total cost of the entire system." In this context, the "system sized to simply connect the customers" is the portion of the entire distribution system including the poles, wires, and line transformers. Nothing in my statement implies that simply connecting the customer should not include some portion of the upstream distribution infrastructure. Additionally, Johnson continues to ignore the fact, as explained in my rebuttal testimony, that the Pennsylvania Public Utility Commission ("Commission") has consistently used minimum system studies to identify the customer-related portion of an EDC's distribution system. Mr. Johnson's arguments have been considered and rejected in prior Commission decisions. The same is true for Mr. Johnson's assertions regarding the fact that minimum system facilities have some load-carrying capacity. That fact has not impeded the

Commission's adoption of minimum system studies to identify the customer-related component of distribution system costs.

III. SUPPORT FOR RESIDENTIAL CUSTOMER CHARGE

Q. At page 13, Mr. Johnson states "Mr. Rimal recommends a $17 residential customer charge. My recommendation is to maintain the customer charge at $14.09 - $15.58 (depending on whether previous riders are included)." Would the application of existing distribution rider charges adequately reflect the costs that should be recovered in the customer charge, as Mr. Johnson suggests?

A. No. The monthly customer cost is about $44.13 for residential customers. As shown in Table 1 of my rebuttal testimony, even if you exclude the customer costs classified using the minimum system study, the customer cost is $21.86 per month. Since the customer charge of $17.00 proposed by the Company is still lower than the customer cost that excludes the cost of minimum system distribution facilities (i.e., $21.86), the proposed charge is just and reasonable.

Q. At page 14, Mr. Johnson claims that indirect costs should not be part of the customer charge calculations. Does the monthly customer cost of $21.86, which excludes the cost of minimum system distribution facilities, include some indirect and overhead costs?

A. Yes.

Q. Should the customer charge calculation exclude indirect and overhead costs as recommended by Mr. Johnson?

A. No. After excluding the minimum system distribution facilities costs, the remaining indirect and overhead costs that are allocated to the customer functions should properly be part of the customer charge. Indirect costs (such as an allocated portion of digital infrastructure used for metering and billing) associated with a particular function (for example, metering) are part of the cost of those functions used to provide service to customers. Assume a scenario where a company only provided metering services and nothing else. In that case, the indirect costs of such a utility are clearly part of providing metering services to the customer and, accordingly, should be considered a metering-related cost. One of the outcomes of conducting a fully allocated cost of service study is to determine the full cost of providing service by each function, and that full cost should include both direct and indirect costs. Such indirect costs are directly linked to the direct customer cost and not to demand or energy costs.

Q. Has the Commission authorized the inclusion of indirect and overhead costs in the monthly customer charge?

A. Yes. In the 2004 Aqua Pennsylvania, Inc. ("Aqua Pennsylvania") case, the Commission ruled on this exact issue. In its decision, the Commission stated:[1]

> On review of the evidentiary record herein, we shall adopt the ALJ's Recommendation on this issue. First, the ALJ correctly found that the cost of customer equipment, and also of meters and service line maintenance,

[1] *Pa. P.U.C. v. Aqua Pennsylvania, Inc.*, Docket Nos. R-00038805 and P-00032025, 2004 Pa. PUC LEXIS 39 at *98 (August 5, 2004).

> is properly includable in a cost study. We find that the OTS' proposed limitation of costs to only services and meters is unreasonably narrow.
>
> Second, we find that it is reasonable and proper to include allocated portions of indirect costs, such as employee benefits, local taxes and other general and administrative costs, in a cost study. We caution that these are costs which may be considered for inclusion in the customer charge, but such claims are subject to scrutiny on a case by-case basis.
>
> We note that in *Citizens, supra*, the Commission adopted the utility's claim to include the allocated portion of associated payroll taxes and benefits as part of customer expenses. In the matter before us, we find that AP met its statutory burden pursuant to Section 332(a) of the Code, of establishing the reasonableness of its claim. Accordingly, the Exceptions of the OTS and the OCA on this issue are denied.

Q. Has the Commission utilized the Aqua Pennsylvania method for PPL Electric in its last litigated base rate case?

A. Yes. In the 2012 PPL Electric base rate case, the Commission approved the customer charge proposed by the Company utilizing the Aqua Pennsylvania method. In its decision the Commission stated:[2]

> Additionally, we conclude that the recommendations of I&E and the OCA that the residential customer charge not be increased at all in this proceeding are equally unreasonable as they are not based on a proper cost analysis. We further conclude that the ALJ correctly recommended that, consistent with *Aqua*, other customer-related costs are properly includable in a customer charge cost analysis. We find that the I&E proposed limitation of costs to only services and meters excludes all other customer costs that should be included in a customer charge and is unreasonably narrow.

[2] *Pa. P.U.C. v. PPL Electric Utilities Corp.*, Docket No. R-2012-2290597 (Dec. 28, 2021), Order at 131.

Q. At page 15, Mr. Johnson cites the Commission's decision in the 2023 Columbia Water Company case and claims that the "decision rejected a customer charge which is comprised of components which do not vary directly with the number of customers." Is this an accurate representation of the Commission's decision?

A. No. The decision, in the paragraph immediately following what Mr. Johnson quoted from the Order in his surrebuttal testimony, states:[3]

> We agree with OCA and OSBA that the percentage of T&D expenses appropriate for allocation to the customer charge as customer-related should be 15.7% and not the 30% allocator applied by Columbia Water witness Fox. OSBA's allocator, as based upon the ratio of Columbia Water's total meters and services plant investment to Columbia Water's Transmission and Distribution Plant in service, is better supported than the Company's position that a 30% allocator is reasonable.
>
> * * *
>
> The Commission allows some allocation of expenses that are classically considered indirect expenses in recognition that some portion of these expenses are attributable to the cost to serve individual customers. I&E's exclusion of indirect expenses does not take this factor into account.

Contrary to Mr. Johnson's assertion, the Columbia Water decision confirms that the Commission does not limit the customer charge to just the direct customer costs and allows the inclusion of indirect and overhead costs in the determination of customer charge. This decision is consistent with Commission's ruling in the 2004 Aqua Pennsylvania case and the 2012 PPL Electric case.

[3] *Pa. P.U.C. v. Columbia Water Company,* Docket No. R-2023-3040258 (Jan. 18, 2024), Order at 155.

Q. Does this conclude your prepared rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
STEVEN W. WISHART
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Rejoinder Regarding Affordability and Energy Burden**
Rejoinder Regarding Residential Customer Charge
Rejoinder Regarding Time-of-Use Rates

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name, position, and business address.

A. My name is Steven W. Wishart. I am an Assistant Vice President with Concentric Energy Advisors, Inc. ("Concentric"). My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. Did you previously submit testimony in this proceeding?

A. Yes. I previously submitted direct testimony, rebuttal testimony and surrebuttal testimony, which were marked as PPL Electric Statement No. 8, PPL Electric Statement No. 8-R, and PPL Electric Statement No. 8-SR, respectively.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to certain new arguments raised in the surrebuttal testimony of other parties that relate to affordability, residential rate design, the residential customer charge, and time-of-use ("TOU") rate proposals addressed in my prior testimony.

Consistent with the scope of rejoinder testimony, my responses are limited to clarifying the record and addressing issues that were not fully developed in prior rounds of testimony. I do not present new rate proposals, cost-of-service analyses, or bill impact studies in this testimony.

Q. Are you sponsoring any exhibits with your rejoinder testimony?

A. No.

II. AFFORDABILITY AND ENERGY BURDEN

Q. Which intervenor surrebuttal testimonies address affordability-related issues raised in your prior testimony?

A. Several intervenors address affordability issues in their surrebuttal testimony. Energy Justice Advocates ("EJA") witness Karl R. Rábago challenges my use of national energy burden data and long-term expenditure trends and argues that the lowest-income decile experiences disproportionately high energy burdens.[1]

Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania ("CAUSE-PA") witness Patrick Cicero reiterates concerns that the proposed residential rate design disproportionately affects vulnerable households and disputes my characterization of the magnitude of residential bill impacts.[2]

Office of Consumer Advocate ("OCA") witness Roger Colton asserts that my affordability analysis understates the impact of proposed distribution rate changes on low-income customers and disputes my discussion of usage patterns among low-income households.[3]

[1] EJA Statement No. 1-SR (Rábago), at 6–15.
[2] CAUSE-PA Statement No. 1-SR (Cicero), at 4–12.
[3] OCA Statement No. 8-SR (Colton), at 15–23

Q. Did EJA Witness Rábago raise any new affordability-related arguments in his surrebuttal testimony that were not previously addressed in your direct, rebuttal, or surrebuttal testimony?

A. Yes, Mr. Rábago emphasizes that households in the lowest-income decile may experience energy burdens materially above broader averages. That observation does not alter the conclusions presented in my prior testimony. My affordability analysis focused on the magnitude of the proposed distribution rate adjustment, its share of the total residential bill, and long-term trends in electricity costs relative to other essential expenditures. As explained in my direct and rebuttal testimony, residential delivery rates remain below national averages and have declined in real terms over the past decade.

The fact that some households experience higher energy burdens due to income constraints does not demonstrate that the Company's proposed distribution rate design is unreasonable or inconsistent with cost-causation principles. Nor does it identify an error in the Company's bill impact calculations.

Mr. Rábago also characterizes my discussion of the 9.1 percent residential customer charge increase as "apples to oranges."[4] This does not reflect a new factual dispute. In my prior testimony, I explained that the 9.1 percent figure reflects the change in the effective customer charge after accounting for the roll-in and elimination of riders in this proceeding. That calculation is arithmetically correct and transparently presented in the record. Mr. Rábago's disagreement concerns how the change should be framed for policy purposes; his disagreement with my calculation does not demonstrate that the percentage increase is inaccurate or misleading.

[4] EJA Statement No. 1-SR (Rábago), at 16–18.

Finally, Mr. Rábago criticizes my illustrative example showing the impact of a 25 percent reduction in usage under alternative customer charge levels.[5] That example was presented to demonstrate the relative magnitude of bill-control effects under the proposed rate structure and was derived directly from the Company's updated bill impact analysis. Mr. Rábago does not identify a computational error in that example. Rather, he argues that even modest differences in monthly savings may be meaningful to certain customers. This is a policy argument, and not evidence that the example I supplied was incorrectly calculated or that the Company's rate design misstates customer impacts.

Q. Does CAUSE-PA witness Cicero raise any new affordability arguments in his surrebuttal testimony that warrant clarification?

A. Yes. In his surrebuttal testimony, Mr. Cicero characterizes my affordability analysis as overly "macro-level" and asserts that it fails to account for the specific financial conditions facing low-income households in PPL Electric's service territory.[6] He also reiterates his view that increasing fixed charges exacerbates affordability challenges and that greater reliance on volumetric charges would provide meaningful relief to vulnerable customers.[7]

To clarify, my affordability discussion does not rely solely on national macroeconomic data. Rather, it uses long-term expenditure and energy burden trends to provide context for evaluating the magnitude of the distribution rate changes at issue in this proceeding. That contextual data is relevant because they demonstrate that distribution

[5] Id. at 18–22.
[6] CAUSE-PA Statement No. 1-SR (Cicero), at 4–8.
[7] Id. at 8–12.

rates represent a limited portion of total household expenditures and that long-term electricity costs have grown more slowly than other essential expenses.

Mr. Cicero' also does not identify any Pennsylvania-specific data that contradicts these broader trends or demonstrates that the proposed distribution rate changes materially alter energy burden levels for low-income customers in PPL Electric's service territory relative to existing conditions. The bill impact analyses provided in this case quantify the expected distribution and total bill impacts under the proposed rates. Those impacts, while meaningful, are incremental and should be evaluated in the context of the full bill, of which distribution charges comprise approximately one-third of the average residential customer.

Mr. Cicero also continues to assert that shifting additional revenue recovery to volumetric charges would materially improve affordability outcomes.[8] As discussed previously, however, the quantitative effect of reducing the residential customer charge is limited when that charge represents less than ten percent of the total bill. Increasing volumetric charges beyond cost-based levels would not eliminate affordability concerns—and could actually exacerbate them as low-income customers are generally not lower-use customers—but would instead shift recovery among residential customers and potentially introduce additional cross-subsidies.

For these reasons, Mr. Cicero's surrebuttal does not provide new evidence demonstrating that the proposed residential rate design produces disproportionate affordability impacts beyond those already reflected in the record.

[8] Id. at 12–15.

Q. Did OCA Witness Colton raise new affordability-related arguments in his surrebuttal testimony that warrant clarification?

A. Yes. In Part 6 of his Surrebuttal Testimony, Mr. Colton raises several new arguments concerning: (1) the relevance of Pennsylvania-specific hardship data, including Household Pulse Survey ("HPS") results; (2) the relationship between low-income status and usage levels; and (3) the extent to which distribution rate design should be evaluated within Pennsylvania's statutory universal service framework.[9]

First, Mr. Colton introduces Pennsylvania Household Pulse Survey data regarding reported financial stress and self-reported hardship behaviors.[10] My prior testimony did not dispute that certain households experience financial hardship. Rather, my analysis focused on the magnitude of the proposed distribution rate changes, the share of total bills represented by distribution charges, and long-term expenditure trends. The HPS data cited by Mr. Colton do not isolate the impact of PPL Electric's proposed distribution rate adjustment. They instead reflect broader economic conditions, including supply, transmission, and non-utility cost pressures. While those data provide general context, they do not demonstrate that the specific distribution rate design proposed in this proceeding materially alters the hardship indicators cited.

Second, Mr. Colton reiterates that low-income customers are "generally, and disproportionately, low-use customers."[11] In his surrebuttal, he argues that my reliance on Company usage data improperly equates the concepts of "low-income" and "low-use."[12] My rebuttal testimony did not assert that the two groups are synonymous. Rather, I relied

[9] OCA Statement No. 8-SR (Colton), Part 6: Response to PPL Rebuttal Witness Steven Wishart, at 14–23.
[10] Id. at 18–21.
[11] Id. at 20–21.
[12] Id. at 20.

on PPL Electric's discovery responses to demonstrate that confirmed low-income customers, including Customer Assistance Program ("CAP") participants, often have usage levels comparable to or exceeding the residential average, particularly for electric heating households. Mr. Colton's surrebuttal does not refute the underlying usage data. Instead, it reframes the discussion as one of general tendencies. That policy disagreement does not undermine the factual record regarding observed usage levels.

Third, Mr. Colton suggests that my affordability analysis fails to align with Pennsylvania's statutory universal service framework.[13] My testimony does not address universal service eligibility or CAP design. Instead, it evaluates residential rate design and customer charge structure in the context of cost causation and bill impacts. Nothing in my testimony suggests that universal service protections should be diminished. Rather, the question before the Commission in this rate case is whether the proposed distribution rate structure is reasonable and supported by cost-of-service principles. Mr. Colton's broader policy discussion of universal service goals does not demonstrate that the Company's proposed rate design is inconsistent with those statutory objectives.

III. RESIDENTIAL CUSTOMER CHARGE

Q. Does OCA Witness Johnson raise new arguments in his surrebuttal testimony regarding the residential customer charge that warrant clarification?

A. Yes. In his surrebuttal testimony, Mr. Johnson continues to oppose the inclusion of distribution-related customer costs in the residential customer charge and questions

[13] Id. At 15-17

reliance on the minimum system study results.[14] He also references the Commission's decision in Citizens' Electric in support of his position.[15]

At the outset, it is important to clarify that the Company is not proposing to set the residential customer charge at the full customer-related cost identified in the ACOSS. As shown in PPL Electric Exhibit BR-1 and summarized in Table 3 of Mr. Rimal's direct testimony, the ACOSS identifies customer-related costs of approximately $42.96 per residential bill.[16] However, the Company proposes a residential customer charge of $17.00 per month, which recovers only a portion of those costs.

Mr. Johnson's criticism largely concerns the methodology used to classify a portion of distribution plant as customer-related under the minimum system study. That methodological issue is addressed in detail by Company Witness Rimal in his direct, rebuttal, and surrebuttal testimony.[17] My testimony does not sponsor or defend the technical mechanics of the minimum system study. Rather, my role in this proceeding is to evaluate rate design and bill impacts based on the cost-of-service results presented.

Even if one were to exclude the customer-related component of distribution plant identified in the minimum system study, Mr. Rimal demonstrated in his rebuttal testimony that the remaining customer-related costs exceed the proposed $17.00 residential customer charge.[18] Accordingly, Mr. Johnson's policy disagreement with the minimum system methodology does not alter the fact that the proposed customer charge remains below the embedded customer-related costs identified in the ACOSS.

[14] OCA Statement No. 4-SR (Johnson), at 7–12.
[15] Id. at 11–12.
[16] PPL Electric Exhibit BR-1; see also Direct Testimony of Bickey Rimal, at 24.
[17] PPL Electric Statement No. 7-SR (Rimal), at 4–8, 12–14.
[18] PPL Electric Statement No. 7-R (Rimal), at 19 (Table 1).

With respect to the Citizens' Electric decision, Mr. Johnson suggests that the Commission rejected inclusion of certain costs in a residential customer charge in that case. However, as explained by Mr. Rimal, the Commission's concern in Citizens' Electric related to the inclusion of demand-related costs in the customer charge.[19] The Company's proposed residential customer charge in this case does not include demand-related costs.

Therefore, Mr. Johnson's surrebuttal does not identify a computational error in the ACOSS, nor does it demonstrate that the proposed $17.00 residential customer charge exceeds customer-related costs. His position reflects a policy preference for greater volumetric recovery, rather than evidence that the proposed rate design is inconsistent with cost causation principles.

Q. Does SEF witness Costlow raise any new issues in his surrebuttal testimony regarding the residential customer charge that warrant clarification?

A. Yes. In his surrebuttal testimony, Mr. Costlow continues to support a much higher residential customer charge and recommends that such an increase be phased in over a five-to-seven-year period.[20]

The Company is not proposing to set the residential customer charge at that level in this proceeding. As explained in prior testimony, the proposed $17.00 residential customer charge reflects a measured step toward recovering a greater portion of customer-related costs through a fixed charge, while balancing gradualism and bill impacts.

Mr. Costlow's recommendation effectively asks the Commission to endorse a predetermined multi-year trajectory for the residential customer charge. In my view, that

[19] PPL Electric Statement No. 7-SR (Rimal), at 9–10.
[20] SEF Statement No. 1-SR (Costlow), at 4–6.

approach would not be consistent with how rate design decisions are typically evaluated. Each base rate proceeding requires the Commission to consider the specific cost-of-service results, revenue requirement, class allocation, and bill impacts presented in that record. The appropriate level of the residential customer charge in future years should be determined based on the facts and evidence presented in those future cases, not established in advance through a prospective phase-in commitment.

While the Company may agree with Mr. Costlow's ultimate goal of setting the residential customer charge higher than the $17.00 proposed in this case, the proposed $17.00 charge represents an incremental movement toward greater alignment between customer-related costs and fixed charge recovery. Any further adjustments should be evaluated in the context of updated cost-of-service studies and contemporaneous bill impact analyses presented in future proceedings.

Accordingly, Mr. Costlow's proposed five-to-seven-year phase-in does not alter my conclusion that the $17.00 residential customer charge proposed in this proceeding is reasonable and appropriately balanced.

IV. TIME-OF-USE RATES

Q. Does Environmental Intervenors witness Nelson raise new issues in his surrebuttal testimony regarding TOU rates that warrant clarification?

A. Yes. In his surrebuttal testimony, Mr. Nelson continues to recommend that the Commission reject the Company's EV TOU Charging Rebate Program and instead direct PPL to

implement a broader residential delivery TOU rate.[21] His proposal would constitute a material redesign of the residential distribution rate structure.

Developing and implementing a new residential delivery TOU rate would require substantial additional analysis, system configuration, customer education, and administrative expense. At a minimum, the Company would need to:

- Perform a comprehensive cost-of-service analysis to determine appropriate peak and off-peak differentials;
- Develop updated billing system configurations and rate codes;
- Create customer-facing educational materials explaining the new rate structure;
- Conduct marketing and outreach to ensure customers understand the risks and opportunities associated with TOU participation;
- Develop bill comparison tools to allow customers to assess potential impacts; and
- Monitor participation and revenue neutrality over time.

Those activities are not costless. The administrative, system modification, outreach, and evaluation costs associated with launching a new residential TOU rate would ultimately be recovered from customers through distribution rates. Even if the rate were designed to be revenueneutral from a rate design perspective, the incremental implementation and education costs would still be borne by customers.

Mr. Nelson's surrebuttal does not quantify these implementation costs, nor does it demonstrate that the benefits of launching a new residential TOU rate in this base rate proceeding would exceed the administrative and customer education costs required to implement it.

[21] EI Statement No. 1-SR (Nelson), at 31–35.

Moreover, a residential TOU rate is a structural rate design change affecting potentially hundreds of thousands of customers. Such a redesign is more appropriately considered in a dedicated proceeding with a fully developed evidentiary record addressing cost-of-service impacts, bill impacts across usage bands, customer education plans, and implementation costs. This base rate case does not contain that record.

Accordingly, while Mr. Nelson's proposal reflects a broader policy perspective regarding time-varying rates, it does not provide sufficient evidentiary support in this proceeding to justify directing the Company to incur the costs necessary to design, implement, market, and administer a new residential delivery TOU rate at this time.

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
JENNIFER E. NELSON
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Rejoinder Testimony of Jennifer E. Nelson

Topics: **Response to I&E Witness Breuning**
Response to OCA Witness Garrett
Response to EJA Witness Rábago

Dated: February 13, 2026

I. INTRODUCTION AND SUMMARY

Q. Please state your name and business address.

A. My name is Jennifer E. Nelson, and I am employed by Concentric Energy Advisors, Inc. ("Concentric") as a Vice President. My business address is 293 Boston Post Road West, Suite 500, Marlborough, MA 01752.

Q. Did you previously file testimony in this proceeding?

A. Yes. I submitted my direct testimony, PPL Electric Statement No. 10 ("PPL Electric St. No. 10") to the Pennsylvania Public Utility Commission ("PUC" or the "Commission") on behalf PPL Electric Utilities Corporation ("PPL Electric", or the "Company"), which is an indirect, wholly owned subsidiary of PPL Corporation, on September 30, 2025. I also submitted rebuttal testimony, PPL Electric Statement No. 10-R ("PPL Electric St. No. 10-R") to the Commission on behalf of PPL Electric on January 23, 2026.

Q. Are you sponsoring any rejoinder schedules in this case?

A. No, I am not.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to the surrebuttal testimonies of the following witnesses as they relate to the appropriate return on equity ("ROE") and capital structure for PPL Electric:

- Mr. Drew Breuning on behalf of the Bureau of Investigation and Enforcement ("I&E", "I&E St. No. 3-SR");

- Mr. David J. Garrett on behalf of the Pennsylvania Office of Consumer Advocate ("OCA", "OCA St. 3-SR");
- Mr. Karl R. Rábago on behalf of the Energy Justice Advocates ("EJA", "EJA St. No. 1-SR");
- Mr. Patrick M. Cicero on behalf of the Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania ("CAUSE-PA", "CAUSE-PA St. 1-SR")

I collectively refer to these individual witnesses as the "Witnesses." My silence on a particular issue should not be construed as agreement with respect to that issue.

Q. Please summarize your rejoinder testimony.

A. My analyses, positions, and recommendations made in my direct and rebuttal testimonies remain unchanged. My 11.30 percent ROE recommendation remains a just and reasonable estimate of PPL Electric's cost of equity, and I continue to support PPL Electric's requested 56.05 percent equity ratio. Further, I reiterate my responses to, and criticisms of, the Witnesses' direct testimonies that I discussed in my rebuttal testimony. I respond to select topics presented by the Witnesses in their surrebuttal testimonies; lack of a response on a particular issue does not mean that I agree with the Witness' position.

Q. How is the remainder of your rejoinder testimony organized?

A. My rejoinder testimony is organized by witness, as follows:

Section II – responds to the surrebuttal testimony of I&E Witness Breuning;

Section III – responds to the surrebuttal testimony of OCA Witness Garrett;

Section IV – responds to the surrebuttal testimony of EJA Witness Rábago;

Section V – responds to the surrebuttal testimony of CAUSE-PA Witness Cicero;

Section VI – concludes my rejoinder testimony.

II. RESPONSE TO I&E WITNESS BREUNING

Q. Mr. Breuning claims that "the inputs to the CAPM are highly subjective and can lead to wildly different results."[1] Do you agree with him?

A. No. I agree that the market risk premium is one of the more contentious inputs into the Capital Asset Pricing Model ("CAPM") because it is not observable and must be estimated. Since the CAPM uses inputs that are directly influenced by capital market conditions, the cost of equity estimate from the CAPM may fluctuate more than other models as it is more responsive to capital market changes.

That said, each of the ROE estimation techniques are influenced by the inputs applied by the analyst, and the CAPM is not unique in that respect. The DCF model is not immune to "subjectivity" in the selection of the growth rate and dividend yield calculation methodology. However, the influence that any single input has on the estimate can be mitigated by using multiple independent, credible data sources for that input. This is why I rely on three dividend yield averaging periods and three sources of earnings growth rates in the DCF model. Nevertheless, selecting appropriate inputs for each method requires informed judgment, and each of the inputs should be consistent with economic and financial theory and reflect investor expectations. The output of each ROE model is only

[1] I&E St. No. 3-SR, at 16.

as good as the inputs applied; inputs that violate economic or financial theory (as the Kroll equity risk premium estimate does) result in tenuous conclusions and unreliable ROE estimates.

Lastly, Mr. Breuning's concern can be mitigated by including the Risk Premium analysis. One of the benefits of the Risk Premium model is the reliance on inputs that are observable and less contentious (i.e., authorized ROEs and Treasury bond yields).[2] Additionally, the Risk Premium model provides a more direct estimate of the cost of equity using operating company-level inputs, compared to the DCF and CAPM approaches that use holding company-level inputs. For this reason (among others), I continue to recommend that the Commission consider the results of multiple methodologies, including the Risk Premium model.

Q. Mr. Breuning takes the position that the proxy group holding companies should be used throughout the cost of capital analysis, as opposed to referencing the proxy group operating companies when evaluating the subject company's proposed capital structure.[3] Do you agree with him?

A. No. One of the objectives of this proceeding is to estimate the cost of capital for PPL Electric. The cost of capital should accurately reflect PPL Electric's cost of debt and equity it pays to finance the assets it employs to provide safe and reliable service. Therefore, the analyses applied in estimating the cost of capital should use the best data available to conduct the analyses for that purpose.

[2] *See*, PPL Electric Statement No. 10-R, at 67, Figure 18.
[3] I&E St. No. 3-SR, at 27.

Nearly every utility has been restructured into a holding company structure; therefore, proxy group holding companies must be used to estimate PPL Electric's cost of equity because only holding companies are publicly traded and consequently have the necessary market data to apply to the ROE estimation models. The proxy group operating companies are not publicly traded, and as such, there is no market data for operating companies to apply in the DCF and CAPM approaches. As explained earlier, one of the benefits of the Risk Premium model is that it does not require proxy group holding company inputs and produces a cost of equity estimate at the operating company level. On the other hand, capital structure data is available for the proxy group operating companies, which are more comparable to PPL Electric as I explain in my rebuttal testimony.[4] Because operating subsidiaries are financed differently than the holding companies, the best available comparable data to evaluate PPL Electric's proposed capital structure is that of the proxy group operating companies.

III. RESPONSE TO OCA WITNESS GARRETT

Q. Mr. Garrett claims that you offered no evidence to support your "absurd" claim that "No rational investor would invest in PPL Electric if they could earn a higher return investing in any other electric utility" and explains that "investors invest in all types of securities with different levels of risk and expected return."[5] How do you respond?

A. Mr. Garrett misses the point. While investors do invest in securities with different risk and return levels, my point is that no rational investor would invest in a company (e.g., PPL

[4] PPL Electric St. No. 10-R, at 85-88.
[5] OCA St. 3-SR, at 2.

Electric) if he or she expected to receive a lower return from an investment in PPL Electric than he or she expects to receive from other investments that have ***equal***, or comparable, risk. Fundamentally, this is the economic concept of opportunity cost, in which the cost of equity is the return investors expect to earn from an equity investment of *comparable risk*. Mr. Garrett is implying that, if the Commission were to authorize his recommended 8.4 percent ROE recommendation, investors would willingly commit capital to PPL Electric when they could expect to earn a better return from an investment in another risk-comparable electric utility. I note that Mr. Garrett accepts my proxy group,[6] which indicates that he agrees that my proxy group is comparable in risk to PPL Electric. I am not aware of any utility within the proxy group that currently has an authorized ROE of 8.4 percent or lower.

In his direct testimony, Mr. Garrett agrees with the opportunity cost concept, citing an industry textbook that explains:

> Since by definition the cost of capital of a regulated firm represents precisely the expected return that investors could anticipate from other investments while bearing no more or less risk, and since investors will not provide capital unless the investment is expected to yield its opportunity cost of capital, the correspondence of the definition of the cost of capital with the court's definition of legally required earnings appears clear.[7]

Mr. Garrett's argument simply fails the test of economic logic and does not adhere to the *Hope* and *Bluefield* comparable return standard that he acknowledges is the legal standard governing the authorized rate of return on capital for public utilities.[8]

6 OCA St. 3, at 11.

7 OCA St. 3, at 7, citing A. Lawrence Kolbe, James A. Read, Jr. & George R. Hall, The Cost of Capital: Estimating the Rate of Return for Public Utilities, p. 21 (The MIT Press 1984).

8 *Id*., at 6-7.

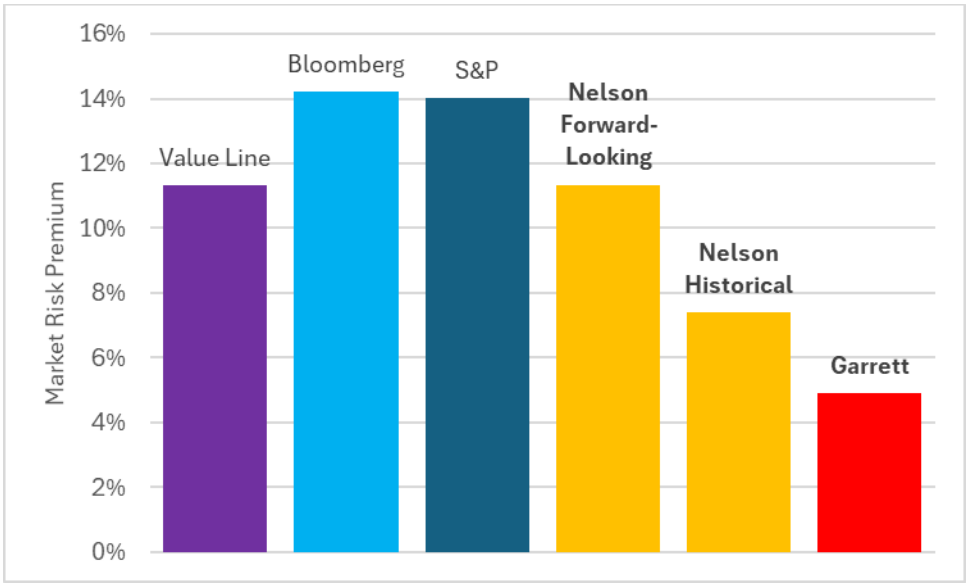
Q. Does your recommendation accurately and fairly reflect the lower risk of the proxy group relative to riskier companies?

A. Yes. Mr. Garrett states that "[r]egulated utilities in the U.S. are among the least risky companies in the country, which can be objectively measured through security betas. Thus, their cost of equity and required return estimates are lower than those of riskier companies. This fact should be accurate and fairly reflected in the Company's authorized ROE."[9] Mr. Garrett and I both rely on Beta coefficients from Value Line for the same companies in the proxy group and the Beta coefficient for each proxy company is less than 1.0, which reflects the proxy group's lower risk relative to riskier companies.

Q. Mr. Garrett contends that "authorized ROEs for U.S. utilities have consistently and significantly exceeded market-based cost of equity for decades."[10] Do you agree?

A. No. Mr. Garrett offers no evidence for this claim. The accusation that over 1,000 ROEs authorized by numerous commissions (including this Commission) across a diverse array of jurisdictions, with rigorous analysis and investigation, have "consistently and significantly" been too high is illogical and unsupported.

Q. Mr. Garrett includes a figure that tries to illustrate that the market risk premium ("MRP") that you use in your CAPM analysis "is clearly not within the range of



[9] OCA St. 3-SR, at 2.
[10] OCA St. 3-SR, at 3.

reasonableness" by comparing it to the "three reliable and objective" sources that he used.[11] How do you respond?

A. Mr. Garrett is using his unreasonable (as I explain in my rebuttal testimony)[12] MRPs to justify his CAPM results. To put this illustration in a different light, I provide a similar figure below (Figure 1), which presents the MRPs from the four reliable and objective investor sources that I reference. As can be seen in Figure 1, the forward-looking and historical MRPs that I use in my CAPM analyses to inform my 11.30 percent ROE recommendation are on the conservative end of the range of estimates; in contrast, Mr. Garrett's MRP is well below investors' forward-looking expectations, as well as long-term historical experience. Additionally, Mr. Garrett is incorrect when he calls the MRP I use in my CAPM analysis "Ms. Nelson's personal [MRP] estimate." As I explain in my direct testimony,[13] I develop the MRPs in my CAPM analyses using the two most conservative estimates from independent, investor-focused sources: Value Line's projected market return and the long-term historical average market return from Kroll. As explained in my rebuttal testimony, Mr. Garrett's MRPs are inconsistent with historical experience.[14] Mr. Garrett has provided no evidence to justify why expected MRPs would be so far removed from those actually experienced over the last nearly 100 years.

IV. RESPONSE TO EJA WITNESS RÁBAGO

Q. Mr. Rábago claims that you have a "callous disregard" for affordability and, similar to Mr. Garrett, concludes that your recommended ROE and ROEs of other utilities are "too high."[16] How do you respond?

A. Mr. Rábago mischaracterizes my rebuttal testimony related to affordability. As I explained, it is important that PPL Electric balance affordability with its ongoing system investment to meet its obligation to provide safe and reliable service.[17] If the Commission were to authorize an ROE that is over 100 basis points below all of PPL Electric's peers, as Mr. Rábago recommends with his 7.67 percent ROE, it would significantly impair the Company's ability to attract the capital needed to continue providing safe and reliable

[15] Source: PPL Electric Exhibit JEN-3R; Exhibit DJG-10. Value Line, Bloomberg, and S&P MRPs use the projected 30-year Treasury yield.

[17] PPL Electric Statement 10-R, at 11-12.

service. As explained in my rebuttal testimony, doing so would actually *raise* costs for customers,[18] not lower it as Mr. Rábago erroneously presumes. Additionally, my response to Mr. Garrett regarding the ROEs of other utilities being too high applies here as well.

V. RESPONSE TO CAUSE-PA WITNESS CICERO

Q. Mr. Cicero claims that a comparison to peers when setting a utility's ROE and capital structure "is harmful to consumers and ignores the circularity of setting capital structures and ROEs based on peers rather than objective market-based evidence" and "has the effect of increasing costs to consumers without commensurate gain to the public."[19] Do you agree?

A. No. First, as explained in my Direct Testimony, the cost of equity is an opportunity cost, which means that it is, by definition, estimated vis à vis a comparable peer analysis.[20] The *Hope* and *Bluefield* decisions explicitly recognize the economic concept of opportunity costs through the comparable return standard.[21]

Moreover, Mr. Cicero appears to contradict prior statements he has made; in a 2024 article in the *Pittsburgh Post Gazette*, Mr. Cicero suggests that regulators should ignore market-based evidence and instead set the return at the same (presumably below market) level without regard to differences in risk, stating, "If all PUCs across all the land started granting 8% [ROEs], that's what it would be."[22] As explained above, it is necessary to

compare PPL Electric to a proxy group of comparable peers, and the *Hope* and *Bluefield* comparable return standard requires it.

VI. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

WITNESS: Joseph Lookup

PPL Electric Utilities Corporation
Response to the Set VIII Data Requests of the
Office of Consumer Advocate (OCA)
Dated October 28, 2025
Docket No. R-2025-3057164

OCA VIII-9	Please provide the utilities policies, procedures, and analyses related to the assignment of large load interconnection costs to the interconnection load versus other ratepayers.
PPL Electric Response	See OCA VIII-9 Attachment 1.

PPL Electric Utilities Corporation – Policy on Cost Allocation for Large Customer Interconnections

PPL Electric serves customers taking service at 69 kV and above at its LP-5 rate class. LP-5 customers are required to pay for the costs of the upgrades necessary to serve their load. PPL Electric Retail Tariff, Rule 4 – (C).4. However, certain upgrades benefit other PPL customers and/or the transmission grid. The costs of these upgrades may be excluded from the interconnecting customer's obligation and added to PPL Electric's transmission rate base.

It is PPL Electric's policy that upgrades to the networked bulk electric system made in connection with LP-5 customer interconnections will generally be excluded from the customer's obligation and included in transmission rate base. This policy is informed by FERC policy, which generally favors charging network customers for the costs of network facilities without an individualized benefit calculation:

> "[D]ue to the integrated nature of the transmission network, network facilities benefit all network users," even if "the facilities were installed to meet a particular customer's request for service." "[T]here is no need to identify further actual benefits in order to include the costs of network transmission facilities in transmission rates."

City of Anaheim, Cal., 113 FERC ¶ 61,091, at P 58 (2005), *reh'g denied*, 114 FERC ¶ 61,311 (2006).

At a minimum, the customer's direct connection cost is the sole responsibility of the connecting customer, more specifically, the transmission lines sourced from PPL Electric's substation/switchyard that terminate into the customers substation.

All other upgrades, including PPL Electric substations/switchyards will be evaluated on a case-by-case basis to determine if they provide benefits to other customers and/or the transmission grid. Examples of benefits to other customers that would cause an upgrade to be included in transmission rates includes, but is not limited to:

- Added system reliability;
- Increased capacity/lower congestion;
- Improved asset condition of existing facilities;
- Service to multiple transmission customers and/or retail feeders;
- Increased resiliency and operational flexibility;
- Expanded capacity for new generation flow and interconnections

If the customer's interconnection results in upgrades that will be included in transmission rate base, the Company reserves the right to include revenue guarantee provisions in the customer's Electric Service Agreement.

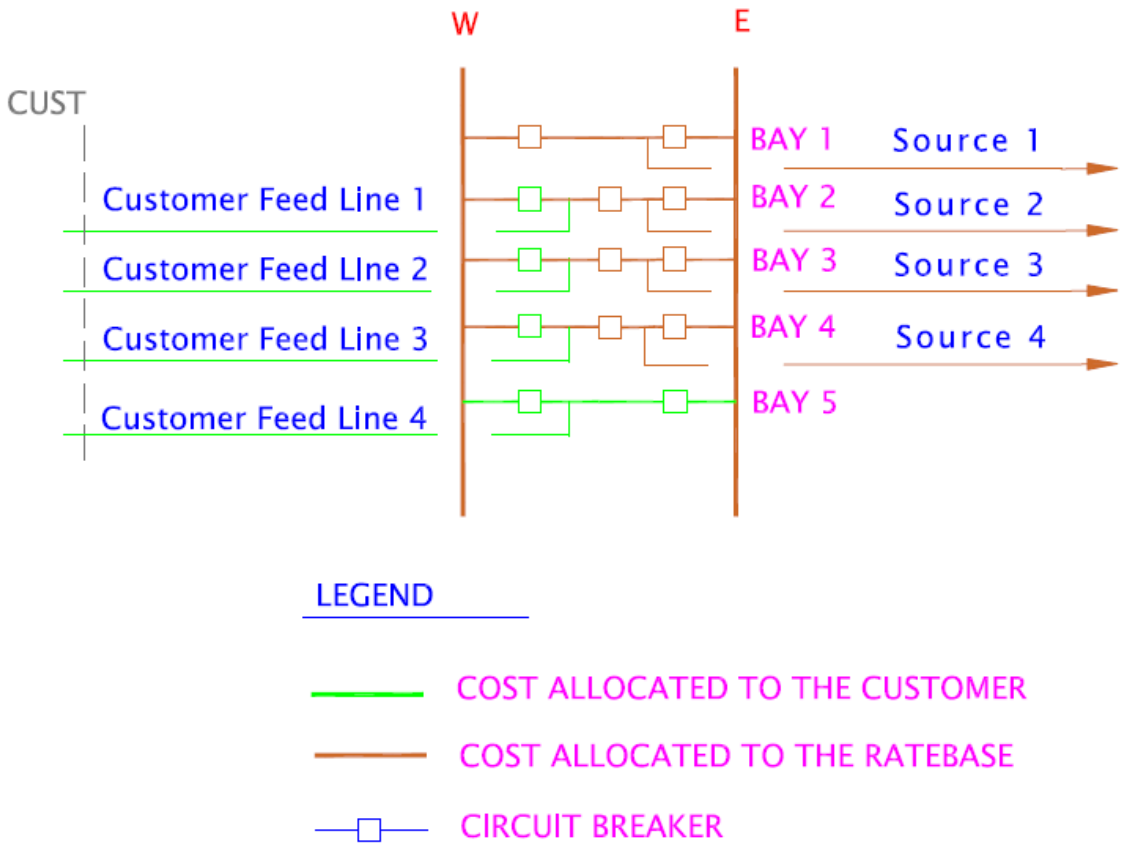
PPL Electric Utilities Corporation – Cost Allocation Review and Methodology for Large Customer Interconnections

Cost Allocation Review Process:

The Interconnection Affairs PM will pull together the following groups within Transmission Asset Management to review each project for their functional area:

- Interconnection Affairs – Rapid Response (RR) to interconnection request, Project Feasibility Report (PFR), Electrical Service Agreements (ESA), Construction Service Agreement (CSA), and confirmation of project costs.
- Planning – Line and sub equipment review and determination of dedicated vs network benefit.
- Project Development – Lead the development of deliverables for project scope, schedule and budget. Includes but not limited to project cost estimating, construction feasibility, confirmation of CSA scope and one-line, and financial budget.
- VP Planning and Asset Management – Provides approval for final cost allocation decision.

Cost Allocation Methodology is as follows for Direct Connect Transmission Line:



- All direct connection transmission lines that supplies customer substation. Below are typical assets but are not limited to:
    - Transmission Structures
    - Transmission conductor
    - Associated insulation and line hardware
    - Sectionalizing devices (i.e. switches, power circuit breakers, reclosers)
    - Grounding cable and hardware
    - Right of way easements and fee owned land

Cost Allocation Methodology is as follows for Substation equipment reviews:

The determining factor for cost allocation will be illustrated with the circuit breaker assets shown on Examples 1, 2, and 3 for ease of understanding at the highest level.

Interconnection Affairs will keep documented proof of each project site that is reviewed. A one-line will be color coded to denote direct customer costs vs network costs along with a cost spreadsheet.

Responsibility of Asset Matrix for Breaker and a Half (BAAH) Example 1:

Customer Responsible:

- Bay 1: No assets
- Bay 2:
  - Line: Customer Line 1
  - Sub: 2W down-lead and dead-end structure
  - Sub: CB 2W
  - Sub: Two switches: 2WW & 2WE
  - Sub: Three associated CCVT's
  - Sub: Three associated surge arrestors
- Bay 3:
  - Line: Customer Line 2
  - Sub: 3W down-lead and dead-end structure
  - Sub: CB 3W
  - Sub: Two switches: 3WW & 3WE
  - Sub: Three associated CCVT's

    - Sub: Three associated surge arrestors
- Bay 4:
    - Line: Customer Line 3
    - Sub: 4W down-lead and dead-end structure
    - Sub: CB 4W
    - Sub: Two switches: 4WW & 4WE
    - Sub: Three associated CCVT's
    - Sub: Three associated surge arrestors
- Bay 5:
    - Line: Customer Line 4
    - Sub: 5W down-lead, dead-end structure, bay conductor, and bay structures
    - Sub: CBs 5W & 5E
    - Sub: Four switches: 5WW, 5WE, 5TW, & 5EE
    - Sub: Three associated CCVT's
    - Sub: Three associated surge arrestors

All associated wiring, conduit, relays and other minor assets associated with the above equipment.

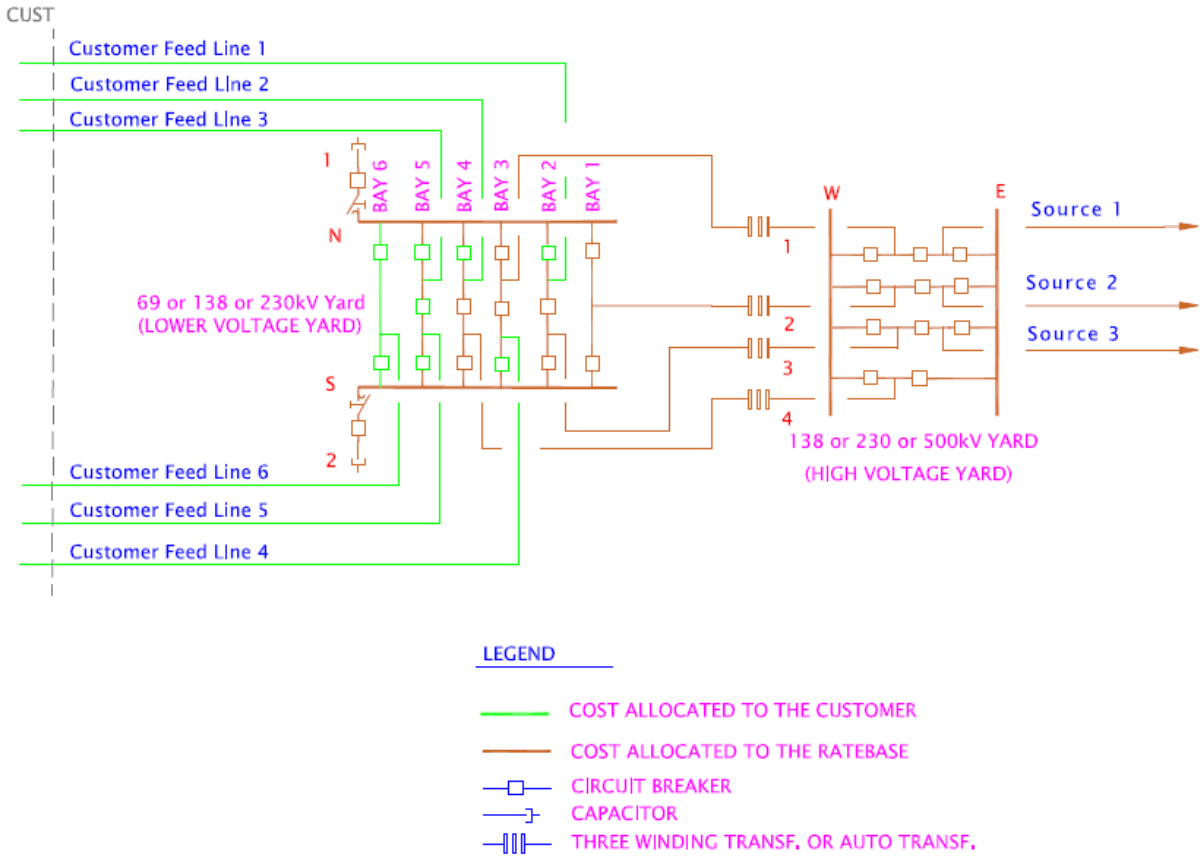
PPL Responsible:

- All other equipment and associated minor assets.

Responsibility of Asset Matrix for Double Breaker Double Buss (DBDB) Example 2:

Customer Responsible:

- Bay 1-4: No assets
- Bay 5:
  - Line: Customer Line 1
  - Sub: Bay 5 downleads, dead-end structure, bay conductor, and bay structures
  - Sub: CBs 5W &5E
  - Sub: Four switches: 5WW, 5WE, 5EW & 5EE
  - Sub: Three associated CCVT's
  - Sub: Three associated surge arrestors



- Bay 6:
    - Line: Customer Line 2
    - Sub: Bay 6 downleads, dead-end structure, bay conductor, and bay structures
    - Sub: CBs 6W & 6E
    - Sub: Four switches: 6WW, 6WE, 6EW & 6EE
    - Sub: Three associated CCVT's
    - Sub: Three associated surge arrestors
- Bay 7:
    - Line: Customer Line 3
    - Sub: Bay 7 downleads, dead-end structure, bay conductor, and bay structures
    - Sub: CBs 7W & 7E
    - Sub: Four switches: 7WW, 7WE, 7EW & 7EE
    - Sub: Three associated CCVT's
    - Sub: Three associated surge arrestors
- Bay 8:
    - Line: Customer Line 4
    - Sub: Bay 8 downleads, dead-end structure, bay conductor, and bay structures
    - Sub: CBs 8W & 8E
    - Sub: Four switches: 8WW, 8WE, 8EW & 8EE
    - Sub: Three associated CCVT's
    - Sub: Three associated surge arrestors

All associated wiring, conduit, relays and other minor assets associated with the above equipment.

<u>PPL Responsible:</u>

- All other equipment.

Responsibility of Asset Matrix for Step Down Substation Example 3:

Customer Responsible:

- Higher voltage yard:
  - No assets

- Lower voltage yard:
- Bay 1: No assets
- Bay 2:
  - Line: Customer Line 1
  - Sub: 2N downleads and dead-end structure
  - Sub: CB 1N

  - Sub: Two switches: 2NN & 2NS
  - Sub: Three associated CCVT's
  - Sub: Three associated surge arrestors
- Bay 3:
  - Line: Customer Line 4
  - Sub: 3S downleads and dead-end structure
  - Sub: CB 3S
  - Sub: Four switches: 3SS & 3SN
  - Sub: Three associated CCVT's
  - Sub: Three associated surge arrestors
- Bay 4:
  - Line: Customer Line 2
  - Sub: 4N downleads and dead-end structure
  - Sub: CB 4N
  - Sub: Two switches: 4NN & 4NS
  - Sub: Three associated CCVT's
  - Sub: Three associated surge arrestors
- Bay 5:
  - Line: Customer Line 3 & 5
  - Sub: 5N & 5S downleads, dead-end structures, bay conductors, and bay structures
  - Sub: CBs 5N, 5T, & 5S
  - Sub: Six switches: 5NN, 5NS, 5TN, 5TS, 5SN, & 5SS
  - Sub: Six associated CCVT's
  - Sub: Six associated surge arrestors
- Bay 6:
  - Line: Customer Line 6
  - Sub: 6S downleads, dead-end structure, bay conductors, and bay structures
  - Sub: CBs 6N & 6S
  - Sub: Four switches: 6NN, 6TS, 6SN, & 6SS
  - Sub: Three associated CCVT's
  - Sub: Three associated surge arrestors

All associated wiring, conduit, relays and other minor assets associated with the above equipment.

<u>PPL Responsible:</u>

All other equipment.

REJOINDER TESTIMONY OF
JOHN J. SPANOS
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Depreciation Service Lives**

Dated: February 13, 2026

31972507v1

I. INTRODUCTION

Q. Please state your name and business address.

A. John J. Spanos. My business address is 300 Sterling Parkway, Mechanicsburg, Pennsylvania, 17050 (formerly 207 Senate Avenue, Camp Hill, Pennsylvania, 17011).

Q. Are you the same John J. Spanos that presented direct and rebuttal testimony on behalf of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") in this proceeding?

A. Yes, I am.

Q. What is the purpose of your rejoinder testimony?

A. In my Rejoinder Testimony, I respond to the depreciation-related Surrebuttal Testimony of David J. Garrett on behalf of the Pennsylvania Office of Consumer Advocate ("OCA"). OCA Witness Garrett continues to propose average service life/survivor curve estimates for a few accounts that are not reasonable for those asset classes.

Q. Please summarize your rejoinder testimony.

A. My rejoinder testimony will address only the depreciation related issues of OCA Witness Garrett's surrebuttal. First, OCA Witness Garrett in his surrebuttal inaccurately discusses the process of life estimation and how mathematical analyses should be applied. Second, OCA Witness Garrett also misstates and mischaracterizes the concept of informed judgment, which is a critical component in proper life estimation that his estimates lack. Because these topics are intertwined, my rejoinder testimony will focus

on OCA Witness Garrett's discussion of Account 369.00, Services, and the proper use of informed judgment as it relates to the evidence in this case for that account.

Q. On Page 13 of his surrebuttal, OCA Witness Garrett appears to retreat from his mathematical approach to life estimation by asserting that he did not propose Iowa curves that are the best statistical fit to the data in the observed life tables. Do you agree with how he presents his position?

A. No. First, Mr. Garrett has only supported his proposed estimate for Account 369.00, Services, with statistical information. He did not follow any of the necessary steps that are prescribed by the authoritative texts for life estimation, such as site visits, discussions with management related to Company plans, estimates of others in the industry, the current estimate of this Company, and understanding the future expectations of the assets in the account. He merely discusses his statistical analysis. Additionally, by only reviewing the mathematical results and then selecting a curve that, while not precisely the same is still close to the best mathematical fit, is not appropriate for identifying a reasonable service life estimate. Applying statistical curve fitting to the historical results for Account 369.00 set forth in the observed life table is not an appropriate approach for an account that has only retirement data so old as not to be representative of the future of the assets in that account. Account 369.00 for PPL Electric provides a limited statistical analysis of the full life cycle of the property in that account because only approximately 50% of the assets that are exposed for retirement have been retired. This is known as a stub curve, and because stub curves do not depict the full life cycle of the assets in an account, they require the application of informed

judgment. Key factors for the exercise of informed judgment to which OCA Witness Garrett gave no weight are estimates of other companies, current estimates of PPL Electric, and a full understanding of the nature of the assets in the applicable account. If he had considered these factors and had given them appropriate weight, he would not view his proposed 68-R1.5 survivor curve as reasonable.

Q. If OCA witness Garrett is focusing on changing life estimates in this case, would it be appropriate to at least include the most up to date transactions?

A. If statistical analysis is as critical to Mr. Garrett's position as he claims it is, he should at least update his analysis through 2025. However, as I explained at page 18 of PPL Electric Statement No. 11-R, consistent with the intervals between service life studies set forth in the Commission's regulations and with Pennsylvania practice in this area, an updated service life study did not have to be presented in this case. Therefore, Mr. Garrett has not included any transactions that occurred during the period January 1, 2023, through June 30, 2025. If you primarily focus on statistical data, then you should include the most up-to-date transactional data in your analysis to capture all the factors that affect the life estimation process. Mr. Garrett is basing his estimates on statistical data that exclude those critical data.

Q. Why is a 68-R1.5 survivor curve not reasonable for Account 369.00?

A. The 68-R1.5 survivor curve has an average life of 68 years, but it has a maximum life of 130 years. Applying the accepted principal of depreciation that cost recovery should match the period of asset utilization, that means that all the cost of services will be

recovered, on average, over 68 years, but some property will stay in service for 130 years. One of the main drivers for replacing property (services) in this account is the need for the continued functionality of the service and the changing needs of the customers receiving electric service from their service lines. I do not believe customers want, or expect, that the electricity delivered to their homes and businesses should depend on assets that have been in service for as long as 130 years.

Q. Given that the historical data for Account 369.00, Services, is a stub curve, does the determination of a reasonable survivor curve require even more informed judgment than other accounts where there is a more complete data set?

A. Yes. Since, based on the stub curve data, which is all we have available in this case, we do not know retirement expectations as assets continue to age, we need to extrapolate the future. This is a component of informed judgment. In this case, we know, based on the nature of the assets in the account, that the rate of retirements will increase as services get older because there will be more forces of retirement acting upon the property. We know that other utilities that have older services have experienced greater levels of retirements after age 60, and we know that changes in demand are a big driver for replacement. Therefore, given the nature of the property in the account and the nature of the forces of retirement acting on that property, the evidence supports a life estimate that is more consistent with the 60-R2 Iowa curve than Mr. Garrett's estimate of 68-R1.5, which envisions some property in this account remaining in service for 130 years.

Q. What is the range of lives in the industry for Account 369.00, Services?

A. Many electric utilities have segregated overhead and underground services. However, many other electric utilities, like PPL Electric, maintain services as one combined asset class. The primary range of average lives for services is 50 to 65 years, with a few having lives less than 50 years, as well. None of these averages, as depicted by an applicable Iowa survivor curve, have estimated maximum lives as long as 130 years, as Mr. Garrett proposes with a 68-R1.5 Iowa curve. Notwithstanding Mr. Garrett's contentions to the contrary, I certainly did rely upon empirical evidence, consisting of the aforementioned data set and data averages, in applying my informed judgment to identify a reasonable service life estimate for Account 369.00. Mr. Garrett, on the other hand, disregards those data because he claims they are allegedly not "evidence." I disagree, the data that I relied upon, as explained above, are an appropriate and accepted source of empirical evidence that should properly be considered in determining the reasonable life characteristics for utility property.

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

Counsel for PPL Electric Utilities Corporation

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Andrew W. Elmore. My business address is 645 Hamilton Street, Allentown, PA.

Q. By whom are you employed and in what capacity?

A. I am employed as Vice President – Tax by PPL Services Corporation, which is an affiliate of PPL Electric Utilities Corporation ("PPL Electric" or the "Company").

Q. What are your responsibilities as Vice President – Tax?

A. I have held this position since September 2020, and in that role, I am responsible for all aspects of PPL Corp.'s income tax compliance and planning, tax accounting, and financial reporting for Securities and Exchange Commission ("SEC") and regulatory purposes related to tax matters.

Q. What is your educational background?

A. I earned a Bachelor's degree in French and political science from the University of Massachusetts in Boston in 1989 and a Juris Doctor degree from the University of Kentucky in 1993.

Q. Please describe your professional experience.

A. From 1993 until 1996, I was employed as an associate at a law firm in Providence, RI. I then worked at Arthur Andersen in Boston until 2000 and subsequently at Deloitte in

I. INTRODUCTION

A. Yes, I filed direct testimony at PPL Electric Statement No. 12.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to respond to concerns and recommendations made by the Pennsylvania Public Utility Commission's ("Commission") Bureau of Investigation and Enforcement ("I&E") and the Office of Consumer Advocate ("OCA") regarding tax issues. Specifically, I address testimony regarding payroll taxes and expenses, the Public Utility Realty Tax Act ("PURTA") tax, interest synchronization, and gross receipts tax from I&E Witness Keller and OCA Witness Morgan.

reliance on the minimum system study results.[14]

At the outset, it is important to clarify that the Company is not proposing to set the residential customer charge at the full customer-related cost identified in the ACOSS. As shown in PPL Electric Exhibit BR-1 and summarized in Table 3 of Mr. Rimal's direct testimony, the ACOSS identifies customer-related costs of approximately $42.96 per residential bill.[15] However, the Company proposes a residential customer charge of $17.00 per month, which recovers only a portion of those costs.

Mr. Johnson's criticism largely concerns the methodology used to classify a portion of distribution plant as customer-related under the minimum system study. That methodological issue is addressed in detail by Company Witness Rimal in his direct, rebuttal, and surrebuttal testimony.[16] My testimony does not sponsor or defend the technical mechanics of the minimum system study. Rather, my role in this proceeding is to evaluate rate design and bill impacts based on the cost-of-service results presented.

Even if one were to exclude the customer-related component of distribution plant identified in the minimum system study, Mr. Rimal demonstrated in his rebuttal testimony that the remaining customer-related costs exceed the proposed $17.00 residential customer charge.[17] Accordingly, Mr. Johnson's policy disagreement with the minimum system methodology does not alter the fact that the proposed customer charge remains below the embedded customer-related costs identified in the ACOSS.

[14] OCA Statement No. 4-SR (Johnson), at 7–12.
[15] PPL Electric Exhibit BR-1; see also Direct Testimony of Bickey Rimal, at 24.
[16] PPL Electric Statement No. 7-SR (Rimal), at 4–8, 12–14.
[17] PPL Electric Statement No. 7-R (Rimal), at 19 (Table 1).

Therefore, Mr. Johnson's surrebuttal does not identify a computational error in the ACOSS, nor does it demonstrate that the proposed $17.00 residential customer charge exceeds customer-related costs. His position reflects a policy preference for greater volumetric recovery, rather than evidence that the proposed rate design is inconsistent with cost causation principles.

Q. Does SEF witness Costlow raise any new issues in his surrebuttal testimony regarding the residential customer charge that warrant clarification?

A. Yes. In his surrebuttal testimony, Mr. Costlow continues to support a much higher residential customer charge and recommends that such an increase be phased in over a five-to-seven-year period.[18]

The Company is not proposing to set the residential customer charge at that level in this proceeding. As explained in prior testimony, the proposed $17.00 residential customer charge reflects a measured step toward recovering a greater portion of customer-related costs through a fixed charge, while balancing gradualism and bill impacts.

Mr. Costlow's recommendation effectively asks the Commission to endorse a predetermined multi-year trajectory for the residential customer charge. In my view, that

[18] SEF Statement No. 1-SR (Costlow), at 4–6.

reliance on the minimum system study results.[14] ~~He also references the Commission's decision in Citizens' Electric in support of his position.~~[15]

At the outset, it is important to clarify that the Company is not proposing to set the residential customer charge at the full customer-related cost identified in the ACOSS. As shown in PPL Electric Exhibit BR-1 and summarized in Table 3 of Mr. Rimal's direct testimony, the ACOSS identifies customer-related costs of approximately $42.96 per residential bill.[16] However, the Company proposes a residential customer charge of $17.00 per month, which recovers only a portion of those costs.

Mr. Johnson's criticism largely concerns the methodology used to classify a portion of distribution plant as customer-related under the minimum system study. That methodological issue is addressed in detail by Company Witness Rimal in his direct, rebuttal, and surrebuttal testimony.[17] My testimony does not sponsor or defend the technical mechanics of the minimum system study. Rather, my role in this proceeding is to evaluate rate design and bill impacts based on the cost-of-service results presented.

Even if one were to exclude the customer-related component of distribution plant identified in the minimum system study, Mr. Rimal demonstrated in his rebuttal testimony that the remaining customer-related costs exceed the proposed $17.00 residential customer charge.[18] Accordingly, Mr. Johnson's policy disagreement with the minimum system methodology does not alter the fact that the proposed customer charge remains below the embedded customer-related costs identified in the ACOSS.

[14] OCA Statement No. 4-SR (Johnson), at 7–12.
[15] ~~Id. at 11–12.~~
[16] PPL Electric Exhibit BR-1; see also Direct Testimony of Bickey Rimal, at 24.
[17] PPL Electric Statement No. 7-SR (Rimal), at 4–8, 12–14.
[18] PPL Electric Statement No. 7-R (Rimal), at 19 (Table 1).

~~With respect to the Citizens' Electric decision, Mr. Johnson suggests that the Commission rejected inclusion of certain costs in a residential customer charge in that case. However, as explained by Mr. Rimal, the Commission's concern in Citizens' Electric related to the inclusion of demand-related costs in the customer charge.[19] The Company's proposed residential customer charge in this case does not include demand-related costs.~~

Therefore, Mr. Johnson's surrebuttal does not identify a computational error in the ACOSS, nor does it demonstrate that the proposed $17.00 residential customer charge exceeds customer-related costs. His position reflects a policy preference for greater volumetric recovery, rather than evidence that the proposed rate design is inconsistent with cost causation principles.

Q. Does SEF witness Costlow raise any new issues in his surrebuttal testimony regarding the residential customer charge that warrant clarification?

A. Yes. In his surrebuttal testimony, Mr. Costlow continues to support a much higher residential customer charge and recommends that such an increase be phased in over a five-to-seven-year period.[20]

The Company is not proposing to set the residential customer charge at that level in this proceeding. As explained in prior testimony, the proposed $17.00 residential customer charge reflects a measured step toward recovering a greater portion of customer-related costs through a fixed charge, while balancing gradualism and bill impacts.

Mr. Costlow's recommendation effectively asks the Commission to endorse a predetermined multi-year trajectory for the residential customer charge. In my view, that

REJOINDER TESTIMONY OF
KATELYN ARNOLD
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Cash Working Capital**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Katelyn Arnold. My business address is 827 Hausman Road, Allentown, PA 18104-9392.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Services Corporation, a subsidiary of PPL Corporation ("PPL Corp.") and an affiliate of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") as Manager – Regulatory Strategy and Rates.

Q. Have you previously filed testimony in this matter?

A. Yes. I submitted my direct testimony, PPL Electric Statement No. 13, as well as my rebuttal testimony PPL Electric Statement No. 13-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to OCA Witness Koenig's response to the Company's lead/lag study and revised cash working capital calculation. Specifically, I address Ms. Koenig's assertion that the Company's need to review the invoices incorporated into its lead/lag study means that the Company does not have accurate records and to point to and explain the discovery response that provided Ms. Koenig with the information she required to incorporate the Company's revised lag days into her calculation.

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. Yes. I have attached Exhibit KEA 1-RJ.

II. CASH WORKING CAPITAL

Q. OCA Witness Koenig asserts that the Company's position on the invoices implies the Company does not have accurate records and that PPL Electric would only need to "spot-check a sample of invoices" to calculate an accurate number of weighted average lag days. (OCA St. 2SR, pp. 8-9.) Please respond.

A. PPL Electric has accurate records, but the review and validation process that the Company undertakes is critical to ensuring that the information used to calculate the lag days is valid. What Ms. Koenig fails to consider is how the Company would determine the midpoint of service for an invoice without this review. To determine the midpoint of service requires manually searching for the invoice, opening and reviewing the invoice to find the service period, and calculating that midpoint. Further, Ms. Koenig's "spot-check" approach provides less assurance. Essentially, she wants the Company to include all the invoices but "spot-check a sample of invoices." My position remains that if all the invoices are to be used, then PPL Electric would have to undertake a painstaking review of all the invoices to determine the midpoint of service, if applicable, and to ensure accuracy in the process. Therefore, Ms. Koenig's proposal to "spot-check" an unspecified number of invoices, which provides no

guidance on what the Company should do for purposes of the lag days calculation if any issues are found during that spot-check, should be rejected.

Q. Ms. Koenig also says that she cannot identify where the calculation and backup data are that resulted in the revised average lag days of 5.1 days. (OCA St. 2SR, pp. 11-12.) Could you please respond?

A. The calculation of the 5.1 average lag days was provided in discovery as I&E-RE-VI-2 Attachment 1, attached to my rejoinder testimony as PPL Electric Exhibit KEA-1RJ. It is the difference between the 47.8 days provided on line 10 of Page 2 and the 42.7 from line 11 of Page 2. The 47.8 days is the $92,481,374 provided on Line 4 of Page 2 divided by the $1,935,642 provided on Line 4 of Page 2. The 42.7 days is the $20,186,949 provided on line 9 of Page 2 divided by the $472,767 provided on line 9 of Page 2. The revision updated the starting point of (b) on Page 2, updating that value from $867,122 to $869,216, which also changed lines 8 and 9 on Page 2 and the downstream calculations from those values.

III. CONCLUSION

Q. Please summarize your rejoinder testimony.

A. I stand by my position that a manual review of the invoices included in the lead/lag study is necessary, noting that OCA Witness Koenig fails to consider how the Company would otherwise determine the midpoint of service. Additionally, I point to and explain the discovery response where Ms. Koenig could have referenced the data required to update her cash

working capital analysis to incorporate the Company's revised lag days.

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

PPL ELECTRIC UTILITIES CORPORATION

REVISED Cash Working Capital
As of June 30, 2025
(Thousands of Dollars)

Line No.	Description	Amount
1	Operation and maintenance expense (C-4, page 2)	$6,604

PPL ELECTRIC UTILITIES CORPORATION

REVISED Accrued Taxes
12 Months ended June 30, 2025
(Thousands of Dollars)

Line No.	Description	Amount	12-Month Accrued Factor (a)	Accrued Taxes
1	Federal income tax (D-1, line 6, col. 5)	$75,858	-11.62%	($8,817)
2	PA income tax (D-1, line 7, col. 5)	23,067	-9.54%	(2,201)
3	PA gross receipts tax (D-16, page 3)	55,294	27.96%	15,460
4	PA capital stock tax (D-16, Page 2)	0	0.00%	0
5	PA public utility reality tax (D-16, page 4)	3,110	7.13%	222
6	Total accrued taxes			$4,664

(a) The 12-month average factor represents, in the case of Federal and State income tax and capital stock tax, the portion of the tax liability which is available to the Company for the payment of other costs. This situation exists because revenue is available from customers prior to payment dates of the taxes. The factors for the other Pennsylvania taxes represent the portions of those tax liabilities which must be provided by the Company due to payment of the taxes before the revenue is available from customers. Exhibit Historic 1, Schedule C-4, pages 7 through 12 reflect the computation of such factors.

PPL ELECTRIC UTILITIES CORPORATION

REVISED Interest Payments
As of June 30, 2025
(Thousands of Dollars)

Line No.	Description		Amount

REJOINDER TESTIMONY OF
GREGORY OLSEN
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Rejoinder to Convergent**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Gregory Olsen, and my business address is 827 Hausman Rd. Allentown, PA 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Electric Utilities Corporation ("PPL Electric"), a subsidiary of PPL Corporation ("PPL Corp."), as Supervisor – Distribution Interconnections & Tariff Rules.

Q. Have you previously filed testimony in this matter?

A. Yes. Direct testimony at PPL Electric Statement No. 14, rebuttal testimony at PPL Electric Statement No. 14-R, and surrebuttal testimony at PPL Electric Statement No. 14-SR.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my Rejoinder Testimony is to respond to the surrebuttal testimony submitted by Convergent Witness Guerry (Convergent Statement No. 1-SR) regarding non-exporting behind the meter ("BTM") battery energy storage systems ("BESS").

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. No.

II. Rejoinder to Convergent Witness Guerry

Q. Is Convergent Witness Guerry correct that the Company's treatment of non-exporting BTM BESS "as" or "like" a generation source contradicts the Company's discovery responses that non-exporting BTM BESS is not generation and does not constitute a generation resource? (Convergent St. 1-SR, at pp. 1-3.)

A. No, she is not. PPL Electric has made clear that this is not a generation source. However, the Company has also been clear that from an engineering standpoint BESS units can be electrically coupled with the grid with characteristics that are nearly indistinguishable from a traditional generation resource in terms of their electrical physics and their interaction with the utility system. This means that a BESS can present similar risks to the utility system as a generation source, which justifies PPL Electric's treatment of BESS units like generation sources in the following examples. On the transmission side, utility-owned protection equipment may be required if certain thresholds are exceeded, due to the increased risk to the system should customer-owned protection equipment fail. Whereas on the distribution system, any BESS installed in parallel with the grid, whether or not it includes generation, must have an alternating-current ("AC") disconnect switch located between the utility meter and the BTM BESS. This ensures that the system can be safely de-energized if first responders need to access the site. While Ms. Guerry points to differences in how non-exporting BTM BESS are designed and operated as compared to generation, these differences do not contradict the fundamental similarities these resources have with generation and the risks to the system that they can share.

Q. Convergent Witness Guerry also claims that the Company's "Energy Storage Interconnection Policy and Guidance" distinguishes between BESS configurations with and without generation, and claims that "PPL Electric recognizes meaningful differences in how storage without generation interacts with the distribution system." (Convergent St. 1-SR, at p. 2.) Is this correct?

A. It is correct that PPL Electric's policy and guidance contains three BESS configurations. Two of these configurations are permitted to interconnect to the distribution system, either with or without generation while there is third configuration that addresses a BESS which is not coupled with the grid. Again, these configurations recognize that there are similarities in the risks presented by BESS units as compared to generation, which justify treating it like generation. It also recognizes, however, that just like different types of generation can present different risks, different BESS configurations can present different risks, which justify configuration-specific requirements.

III. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
JOSEPH LOOKUP
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Rejoinder Regarding Large Load Interconnections**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Joseph Lookup, and my business address is 827 Hausman Road, Allentown, Pennsylvania 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Services Corporation ("PPL Services") as Vice President – Transmission and Distribution Planning and Asset Management and provide services to PPL Electric Utilities Corporation ("PPL Electric" or the "Company").

Q. Have you previously filed testimony in this matter?

A. Yes. I previously submitted direct testimony (PPL Electric St. No. 16), rebuttal testimony (PPL Electric St. No. 16-R) and surrebuttal testimony (PPL Electric St. No. 16-SR) on behalf of the Company.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my Rejoinder Testimony is to respond to the surrebuttal testimony of Office of Consumer Advocate ("OCA") Witness Hoyt (OCA Statement No. 5SR), the Coalition for Affordable Utility Service and Energy Efficiency in Pennsylvania ("CAUSE-PA") Witness Havumaki (CAUSE-PA Statement No. 2-SR), the Environmental Justice Advocates ("EJA") Witness Rábago (EJA Statement No. 1-SR), and the Environmental Intervenors ("EI")

Witness Nelson (EI Statement No. 1-SR), regarding the interconnection of large load customers to the Company's system.

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. Yes. I have prepared PPL Electric Exhibit JL-1RJ and HIGHLY CONFIDENTIAL PPL Electric Exhibit 2-RJ

II. Rejoinder Regarding Large Load Interconnection Issues

A. Scope of the Case

Q. Witnesses for OCA, CAUSE-PA, EJA, and EI continue to claim that the Commission can, and should, assert jurisdiction over various transmission functions and aspects of the transmission service provided by PPL Electric to large load interconnection that take service under LP-5 (or would take service under LP-6 if the Company's proposal is adopted). (*See, e.g.*, OCA St. 5SR, at pp. 7-8, CAUSE-PA St. 2-SR, at p. 6, EJA St. No. 1-SR, at pp. 32-33, and EI St. 1-SR, at pp. 3-7.) How does the Company respond?

A. These witnesses appear to believe that there is confusion or a regulatory gap that exists regarding how the Company is regulated by the Commission and the FERC with respect to the services provided to these customers. There is not, as explained in the rebuttal testimony of PPL Electric Witness Ms. Bethany Johnson. (PPL Electric St. No. 5-R, at pp. 3-14.) It is my understanding from counsel that PPL Electric will fully address the legal issues at play on this point in its briefs. However, I want to emphasize that PPL Electric is not suggesting that

any aspect of how it interconnects, and ultimately provides service to large load customers under LP-5 (or would do so under LP-6), is not subject to regulatory review and oversight. Rather, PPL Electric's position is that certain aspects of this service are appropriately regulated by the Commission, while others are appropriately regulated by the FERC. The Company recognizes that this issue is complex, and it is not suggesting that this complexity should serve to shield it from regulatory scrutiny. Rather, the Company's position is that asking the Commission or the FERC to intrude upon the spaces and issues that are currently, and appropriately, regulated by the other agency will do nothing but add to this complexity and create jurisdictional overlaps that are neither appropriate or necessary.

B. Large Load Customers' Impacts on Transmission Rates and Allocation of Transmission Costs Under Transmission Service Charge

Q. Do other parties' witnesses continue to misunderstand how large load interconnections impact transmission costs and rates, and how transmission costs are allocated and ultimately passed-through to PPL Electric's customers by way of its Transmission Service Charge ("TSC")? (OCA St. 5SR, at pp. 6, 10-15, CAUSE-PA St. 2-SR, at pp. 3-4, 6-7, EJA St. No. 1-SR, at pp. 34-37, and EI St. No. 1-SR, at pp. 3-23.)

A. While I believe that these issues were adequately explained in my rebuttal testimony (PPL Electric St. No. 16-R, at pp. 5-10) and the rebuttal testimony of PPL Electric Witness Ms. Bethany Johnson (PPL Electric St. No. 5-R, at pp. 3-14), it still appears that these parties either misunderstand these issues and, perhaps more importantly, how PPL Electric has currently structured its ESAs to ensure that (a) large load customers are held responsible for

the costs they cause the Company to incur to interconnect them, (b) large load customers are allocated their fair share of transmission network costs, and (c) how these protections provided in the ESAs both protect and benefit PPL Electric's existing distribution customers by favorably impacting the rates they pay for transmission service. I am providing the following, simplified explanation as to how PPL Electric has structured the ESAs to protect and benefit its existing customers, in order to remove any doubts or perceived lack of clarity on this point.

First, the Company has ensured that these customers bear direct, up-front responsibility for the costs they require PPL Electric to incur by requiring a CIAC payment in advance of construction for all upgrades that only benefit the new large load customer. By providing for such a requirement in the ESA, PPL Electric is ensuring that only costs related to facilities and equipment that benefit the transmission system as a whole (i.e., all customers including existing customers served by the transmission system) are ultimately included in its FERC Transmission Formula Rate. Critically, despite having been provided the detail to show the types of facilities and equipment that a large load customer bears direct responsibility for vs. the types of facilities and equipment that benefit the entire transmission system in discovery (see PPL Electric Response to OCA-VIII-9 and OCA-VIII-9 Attachment 1, as PPL Electric's OCA VIII-10 HIGHLY CONFIDENTIAL Attachment 1), none of OCA, CAUSE-PA, EJA or EI point to a single instance where, in their view, this determination was incorrectly made. Thus, it is clear that the ESAs, and PPL Electric's application of such ESAs to specific customers, appropriate establishes their cost

responsibility. Copies of these discovery responses are provided in PPL Electric Exhibit JL-1RJ. (PPL Electric Response to OCA-VIII-9 and OCA-VIII-9 Attachment 1) and HIGHLY CONFIDENTIAL PPL Electric Exhibit JL-2RJ (PPL Electric's OCA VIII-10 HIGHLY CONFIDENTIAL Attachment 1).

Second, the ESA also contains a minimum load guarantee, which functions as a further protection in addition to the direct assignment of costs incurred to interconnect the large load customer that benefit only that customer. This guarantee results in the customer paying a minimum amount of revenue, regardless of their actual use, sufficient to ensure that Company receives transmission revenues equal to amount of upgrade costs socialized in rates. PPL Electric revised its proposal to include a minimum load guarantee for a 10 year term which will result in large load customers guaranteeing transmission revenues well in excess of the upgrade costs that are placed into rates.

Third, the ESA also contains a minimum peak load contribution provision, which states that these customers' peak load contribution for purposes of the allocation of transmission costs under the 5 CP method is based upon the greater of (a) the minimum peak load contribution comprised of 80% in the first five years and 50% in the second five years of the anticipated maximum peak load contribution by this customer or (b) their actual maximum peak load contribution during the 5 Coincident Peaks (CP). In this regard, while the interconnection of these customers may "increase the size of the pie" (i.e., the Company's transmission revenue requirement set by its FERC formula rate), they do so in a way that requires them to be allocated such a substantially larger portion of that pie that it shrinks the

relative "slice of the pie" applicable to residential and small commercial and industrial customers (i.e., the percentage and dollar amount of the transmission revenue requirement allocated to these customer classes under pursuant to the TSC).

In sum, the Company has proposed protections that will allow for large load customer growth while ensuring that other customers are not paying to interconnect these new facilities. In fact, it is likely that customers will see transmission rates decrease because of the interconnection of new large load customers. It is for these reasons that the Company has stated that the interconnection of, and service to these customers, is a "win-win" for the Company, and its existing customers, with respect to the impacts of large load customer interconnections upon transmission rates. This is why the Company's project impacts upon transmission rates set forth in PPL Electric Exhibit JL-1R (CAUSE-VIII-9 Attachment 1) are reasonable, and anticipated to occur.

Q. On what basis does the Company project that these benefits are more likely to occur than any harms alleged by other parties? (*See* OCA St. 5SR, at pp. 11-14, CAUSE-PA St. 2-SR, at pp. 5-6, EJA St. No. 1-SR, at p. 31, and EI St. No. 1-SR, at pp. 9-15.)

A. These parties are essentially suggesting that the Company has no experience with interconnecting and maintaining service to customers with large loads over the long term. That is not the case; PPL Electric provides such service to a number of customers and, in many cases, has done so for decades. The Company acknowledges that the maximum load for each of these new large load interconnections being discussed in this proceeding is larger

than those other existing customers. However, in each case these customers are investing substantial sums of money in order to (a) bring their operations online, and (b) interconnect those operations with PPL Electric's system in order to obtain service. It is PPL Electric's experience that these customers are not interested in simply cancelling or abandoning these operations in a near- or mid-term window after they have made these investments. Rather, it is the Company's experience that they are long-term customers and partners, whose presence in its service territory provides substantial benefits.

C. Load Forecasts

Q. Do you have any response to OCA Witness Mr. Hoyt's reliance upon how Dominion prepares its load forecasts? (OCA St. 5SR, at pp. 24-25.)

A. I do not dispute that there may be different ways to prepare load forecasts, but this does not demonstrate the Company's methodology is unreasonable. In addition, I believe that only including customers in load forecasts after an ESA has been signed can create problems for grid planning from a timing perspective. Specifically, by delaying until an ESA is signed, the transmission owner delays the ability of the RTO to plan for and execute necessary transmission planning steps, and determine if adequate resources are available for such load. PPL Electric's approach, on the other hand, strikes a balance from a timing and planning perspective by providing this information to the RTO while discounting the load forecast based upon the progress of that load coming to fruition based upon whether the customer has executed a CSA and/or an ESA.

D. LP-6 Rate Class

Q. Do other parties oppose the implementation of a new LP-6 rate class in their surrebuttal testimony?

A. Yes. OCA Witness Hoyt (OCA St. 5SR, at pp. 22-26), (CAUSE-PA St. 2-SR, at pp. 6-7), EJA Witness Rabago (EJA St. No. 1-SR, at pp. 31-32), and EI Witness Nelson (EI St. No. 1-SR, at pp. 20-21) all oppose the implementation of a new LP-6 rate class in their surrebuttal testimony, or claim that a different MW thresh-old should be implemented.

Q. How do you respond?

A. I have two points that should be recognized. First, while certain of these parties claim that there is not enough time to analyze this issue when it is introduced in rebuttal, it was introduced in response to the specific concerns and recommendations raised by various parties with respect to the Company's updates to rate LP-5. PPL Electric has attempted to be responsive to the recommendations of other parties and, in part, based its LP-6 proposal upon the testimony they presented. A full record has been established on the Company's proposal and there is no reason that the Commission cannot render a decision in this proceeding.

Second, while these parties focus on the model tariff 50 MW threshold, none of them actually demonstrate that the 100 MW threshold is unreasonable. Critically, this threshold strikes an appropriate balance between capturing new large loads with a maximum load at a level that necessitates the additional protections and restrictions imposed upon this class. In

addition, while certain of these parties claim that this threshold allows for "gaming" between LP-5 and LP-6, none of them can point to how this gaming would occur in light of the minimum requirements contained in the applicable ESAs. The ESA process includes PPL Electric working with prospective to customers to understand their load needs. A 1,000 MW customer will not be able to hide 900 MW of load to qualify for LP-5. It is unreasonable to suggest that these large load customers will be able to "game" the system at the other parties suggest. Furthermore, I note these parties' concerns about gaming would apply regardless of the MW threshold utilized, absent appropriate protections already being in place. PPL Electric has those protections in place under the ESAs.

Q. OCA, EJA, and EI all assert that the Company's voluntary interruptible service option under the new LP-6 class is insufficient and/or that PPL Electric should instead require this load to be interruptible. (OCA St. 5SR, at pp. 20-22, EJA St. No. 1-SR, at pp. 39, and EI St. No. 1-SR, at pp. 26-28.) Why is their recommendation flawed?

A. This recommendation is flawed for two reasons, in addition to the reasons described in my rebuttal testimony. (PPL Electric St. 16-R, at pp. 21-22.)

First, these witnesses all appear to assume that PPL Electric does not already have protections in place to require curtailment of load when necessary to protect the grid. That is incorrect. PPL Electric has such protections in place in its distribution tariff (*see* Rule 4.G. and H.). Moreover, PJM also has controls in place, which the Company is obligated to follow, for emergency load reductions when necessary on the transmission system. These protections

are sufficient to address the need to curtail load if the grid requires, and are fundamentally different from requiring a customer to take interruptible service, which would allow the Company to interrupt service to a customer for economic reasons (in addition to these reliability reasons) that would justify a different rate for such customers based upon those economics.

Second, OCA Witness Mr. Hoyt's specific comparison to interruptible gas service is highly flawed. It ignores that such customers voluntarily choose to obtain such service. And it also omits the fact that these customers are required to have other specific requirements in place before they would even qualify to obtain such interruptible service in the first place (e.g., alternative fuel requirements, and the ability to transfer between fuel sources, sometimes manually).

III. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

PPL Electric Utilities Corporation	:	

REJOINDER TESTIMONY OF
LISA NORDEN
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Customer Service and Low Income Issues**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Lisa Norden, and my business address is PPL Electric Utilities 827 Hausman Road, Allentown, PA 18104.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Electric Utilities Corporation ("PPL Electric" or the "Company"), a subsidiary of PPL Corporation, as Vice President Customer Services.

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted direct testimony (PPL Electric St. No. 18), rebuttal testimony (PPL Electric St. No. 18-R) and surrebuttal testimony (PPL Electric St. No. 18-SR) on behalf of the Company.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to issues raised by OCA Witness Morgan, OCA Witness Alexander, OCA Witness Colton, CAUSE-PA Witness Cicero, and SEF Witness Costlow. Specifically, I address customer service and low-income issues.

Q. Have you prepared any exhibits or schedules in support of your rejoinder testimony?

A. No.

II. CUSTOMER SERVICE AND LOW-INCOME ISSUES

Q. OCA Witness Morgan asserts that PPL Electric's claim that it will hire additional customer service representatives should have been supported by a written "plan" document for those hirings. (OCA St. 1SR, p. 5.) Do you agree?

A. No. I can confirm that as part of its ongoing efforts to improve its customer service performance, PPL Electric does plan to hire the full complement of customer service representatives mentioned by Mr. Morgan. While no written plan document may exist, it is simply incorrect to suggest that PPL Electric does not have a plan in place to hire those additional employees. As part of its normal course of business, PPL Electric will advertise the open positions, conduct interviews, and fill those positions with qualified candidates. If the Company is unsuccessful in its hiring efforts, then, as noted by Mr. Urban, PPL Electric would need to hire contractors to perform the functions of any customer service representative positions that are not filled, which will come at an increased expense.

Q. OCA Witness Alexander argues that PPL Electric should have known what data would be presented in the 2024 Customer Service Performance Report, so the Company should have addressed that data in its direct testimony. She also claims that PPL Electric's failure to discuss the data shows a "lack of any internal tracking, analysis, and affirmative action." (OCA St. 7SR, p. 3.) Please respond.

A. The Company obviously tracks and reports this data. That is how the Commission's Bureau of Consumer Services ("BCS") receives it (i.e., from the subject utility), and there is no question that PPL Electric's data has been accurately supplied to BCS. Further, the performance of PPL Electric's performance relative to its peers is an important benchmark. The point I was making in my rebuttal is that at the time of my direct testimony, recent data about PPL Electric's performance compared to its peers was not publicly available. The most recent Customer Service Performance Report at that time was published in June 2024 and for the year 2023. Providing standalone information on PPL Electric would have provided an incomplete picture, especially in areas where utilities may be reporting out data differently to BCS, like how the other major electric utilities included interactive voice response ("IVR") calls in their calls answered within 30 seconds performance data.

Q. Ms. Alexander acknowledges that she was referencing the wrong spreadsheet regarding payment arrangements and that the correct spreadsheet "reflects a good faith analysis of payment arrangement performance"; however, she questions whether the Company has taken any action in response to this analysis and recommends that the Company do so. (OCA St. 7SR, pp. 9, 17.) What are your thoughts?

A. As Ms. Alexander concedes, the Company does track and analysis the success of its payment arrangements. As noted in my surrebuttal testimony, PPL Electric maintains that its existing payment arrangement process is efficient and helps protect against potential regulatory liability for providing unduly discriminatory service to customers. Furthermore, PPL Electric

has already evaluated this analysis and factored it into its position that its existing payment arrangement process should remain in place. PPL Electric will continue to track, analyze, and evaluate the success of its payments arrangements going forward. Thus, I do not believe the Commission needs to adopt Ms. Alexander's recommendation.

Q. Related to transaction fees, Ms. Alexander claims that the "shared services" provided by PPL Corporation could provide these "shared services," i.e., handle the payment transactions internally, "in an efficient manner." (OCA St. 7SR, p. 14.) Do you agree?

A. No. As I explained in my rebuttal testimony, PPL Electric does not have expertise or infrastructure in handling these transactions internally. I have confirmed that this statement holds true enterprise-wide. Therefore, Ms. Alexander's suggestion cannot be implemented.

Q. OCA Witness Colton suggests that the Company should accept information about participation in public assistance programs to qualify the customers for cash security deposit exemptions and to identify them as confirmed low-income customers. (OCA St. 8SR, pp. 26-29.) Please respond.

A. Mr. Colton's proposals should be rejected. The Company's existing practices and process are consistent with the Commission's requirements. Furthermore, the Company has developed systems and processes regarding its cash security deposit exemptions and its identification of confirmed low-income customers. The Company also does not have the ability to verify participation in other public assistance programs, and it would effectively become customers

self-certifying low income status. Changing this process is not necessary and would result in costly IT system enhancements that have not been shown to be warranted by Mr. Colton.

Q. In alleged support of his proposal that PPL Electric place a 30-day hold on termination when a customer submits a Customer Assistance Program ("CAP") application, Mr. Colton says that his proposed 30-day hold would be the maximum delay allowed. (OCA St. 8SR, p. 30.) Does that resolve your concerns?

A. No. Mr. Colton appears to confirm that there would be no limit on the number of times a customer could apply to have the hold placed on the account. As Mr. Colton states, "Even if a customer applies for OnTrack knowing they have previously been found to be ineligible, it would not take long to identify that customer and to reject the customer's application." (OCA St. 8SR, p. 30.) Regardless of the time it may take to identify if they previously had an application rejected, PPL Electric's existing process is better. Under that process, an initial referral to OnTrack places a 21-day hold on the account so that the customer has time to apply. Subsequent referrals within one year are marked recurring and only create a one-day suspend on the account. Mr. Colton would enable those subsequent referrals to create a hold of 1 to 30 days, with the exact length dependent on how constrained PPL Electric's resources are to determine if the customer previously had an application rejected.

Q. CAUSE-PA Witness Cicero amends his recommendation to place a 21-day hold when a customer submits a CAP application. (CAUSE-PA St. 1-SR, p. 25.) What does he recommend?

A. Mr. Cicero states the initial referral of a customer should continue to result in a 21-day hold. However, once the application is submitted, the hold should continue until the completed CAP application is processed by the agency and a decision is made. Then, for a subsequent referral within the year, there would be a 15-day hold if the account is in active termination status. If the CAP application is submitted, the hold would remain in place until the CAP agency renders a decision. All subsequent referrals within 1 year of the initial referral would continue to receive the 1-day hold.

Q. Does Mr. Cicero's modifications resolve your concerns?

A. No. I continue to maintain that it is not necessary to layer on the 15-day hold process proposed by Mr. Cicero. As explained above and in my rebuttal testimony, the Company's existing practice for placing holds on accounts when CAP applications are received is reasonable and appropriate.

Q. As alleged support for his outcome metrics, OCA Witness Colton points to BCS's Universal Service Programs & Collections Performance Report for 2024 ("2024 BCS Report")[1] as support that a utility can reduce the number of customers not on payment

[1] Available at https://www.puc.pa.gov/media/3771/2024-universal-service-report-final.pdf

arrangements by 10% in a year and can reduce the number of defaulted payment arrangements by 10% in a year. (OCA St. 8SR, p. 39.) What is your response?

A. Although he cites pages 9 and 24 of the 2024 BCS Report, Mr. Colton fails to explain how the data presented on those pages supports his claim. In fact, it appears he is conflating the "number of customers not on payment arrangements" with the BCS data about "percent of total dollars in debt that are on arrangement or not on arrangement," given that he cites page 24 of the 2024 BCS Report as support for that point. (*See* OCA St. 8SR, p. 39 n.99.) However, customer arrears vary from customer to customer, so he is comparing apples and oranges. Mr. Colton should have looked at the number of residential customers in debt that are not on a payment arrangement, which is shown on page 16 of the 2024 BCS Report, and compared it to the same figure shown in the 2023 BCS Report.[2] If he did, he would see that the data proves the Company's point that achieving both these goals can be contradictory. In 2023, PPL Electric had 22,340 payment-troubled customers, whereas it had 32,629 in 2024, meaning that the number of broken payment arrangements increased in 2024 (see page 9 of 2024 BCS Report). Yet, PPL Electric's total number of residential customers in debt that are not on a payment arrangement decreased from 141,251 in 2023 (see page 19 of 2023 BCS Report) to 121,043 in 2024 (see page 16 of 2024 BCS Report).

Q. CAUSE-PA Witness Cicero recommends that PPL Electric amend its call scripting to: (1) inform CAP customers that a hold is placed on their account for them to complete

[2] Available at https://www.puc.pa.gov/media/3433/2023_universal_service_report-final_rev041525.pdf

the application; and (2) stress the benefits of CAP in assisting the customer if they are eligible for the program. (CAUSE-PA St. No. 1-SR, p. 26.) Please respond.

A. PPL Electric is willing to evaluate its call scripting for customers applying for CAP and to incorporate an advisement that a hold will be placed on the account for them to complete the application. The Company also could provide information about the benefits of OnTrack as part of that call scripting.

Q. Mr. Cicero also recommends that PPL Electric conduct a monthly check on whether average bill is better than PIP for the average bill customers, given that we do a monthly check to see if PIP is better than average bill for the PIP customers. (CAUSE-PA St. No. 1-SR, p. 28.) Do you agree with this recommendation?

A. After consideration, the Company is willing to agree to this recommendation. However, the Company needs additional time to update this process, so PPL Electric should only be required to implement this recommendation within 6 months of the Commission's Final Order in this proceeding.

Q. Mr. Cicero also clarifies that the elimination of the 5-year lookback would only be for households that received baseload measures, not full weatherization. (CAUSE-PA St. No. 1-SR, p. 35.) With that clarification, do you still oppose this recommendation?

A No. I had interpreted Mr. Cicero's original recommendation as applying to households that received full cost jobs. With this clarification, PPL Electric is willing to implement his proposal.

Q. Regarding medical certificates, Mr. Cicero maintains his recommendation that PPL review its call scripting and training materials to ensure that they correctly inform customers about medical certificates. (CAUSE-PA St. No. 1-SR, p. 26.) What is your response?

A. PPL Electric continues to disagree that its existing call scripting and training materials are lacking. However, the Company can agree to undertake a further review and make changes if necessary.

Q. Mr. Cicero also suggests that language could be added to the Company's bills that provides information about medical certificates or encourages the customer to reach out to PPL Electric to negotiate a payment arrangement or enroll in an assistance program. (CAUSE-PA St. No. 1-SR, p. 47.) Do you support this proposal?

A. No. PPL Electric already provides information to customers about medical certificates through several channels, including its website. Likewise, the Company actively encourages customers to negotiate payment arrangements or enroll in assistance programs as part of its collections process. PPL Electric also markets its assistance programs through several means, including electronic communications, social media posts, direct mail, partnerships with

community based organizations and in person outreach events. Moreover, the Company's bills provide the information required under the Commission's regulations, so no changes are necessary. Reworking the bill for all residential customers to incorporate these points should not be undertaken unless the added expense is worth a quantifiable benefit. Mr. Cicero presents no such analysis. Thus, Mr. Cicero's proposal should be denied.

Q. Mr. Cicero also takes issue with the Company's policy of applying security deposit refunds to confirmed low income customers' past due balances. (CAUSE-PA St. No. 1-SR, pp. 52-53.) Do you have any response?

A. PPL Electric will update its policy to give confirmed low income customers the option of whether to apply the refund to their bills or have them refunded to them directly, regardless of whether they have a past due balance, are enrolled in CAP, or have a payment arrangement.

Q. SEF Witness Costlow asserts that your position is that "LIURP funding and budget issues may only be addressed in a USECP proceeding and not in a base rate case." (SEF St. No. 1-SR, p. 2.) Is his characterization of your position correct?

A. No. I said that changes to the Universal Service and Energy Conservation Plan ("USECP") programs "should be" addressed in the USECP and that these issues are "best addressed in the context of the Company's USECP proceeding, where any interested parties and stakeholders can be heard on substantive changes to the Commission-approved USECP programs, including their design, operation, and funding." (PPL Electric St. No. 18-R, pp.

51-51.) Regardless, as noted in my surrebuttal testimony, PPL Electric is willing to consider a reasonable increase to its annual LIURP budget as part of this proceeding. (*See* PPL Electric St. No. 18-SR, p. 2.)

III. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
JASON HUNT
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Rejoinder Regarding Economic Development**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Jason Hunt. My business address is 320 Market Street, 4th Floor, Strawberry Square, Harrisburg, Pennsylvania 17101.

Q. By whom are you employed and in what capacity?

A. I am employed by PPL Services Corporation as Manager of Business and Economic Development, supporting PPL Electric Utilities Corporation ("PPL Electric" or the "Company").

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted direct testimony on behalf of the Company, PPL Electric Statement No. 21 and rebuttal testimony, PPL Electric Statement No. 21-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to the surrebuttal testimony of Office of Consumer Advocate ("OCA") Witness Morgan (OCA St. 1SR) concerning the Company's economic development proposal.

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. No

II. ECONOMIC DEVELOPMENT

Q. OCA Witness Morgan argues that a utility "donat[ing] funds for the recruitment and activities related to seeking out and bringing new and expanding businesses to its service area" is a "proposition that places an enormous burden on the utility's capital resources which would take away resources that should be used for the development of the electric grid and investments in infrastructure." (OCA St. 1SR, pp. 11-12.) Do you agree?

A. No. The Opportunity Pennsylvania Program is designed to invest in the communities served by PPL Electric to support long-term economic development. These investments are not charitable donations. They are strategic efforts to strengthen the economic health and well-being of the communities the company serves. A thriving local economy benefits all customers by creating a virtuous cycle where communities grow, customers have more employment opportunities, the grid is more fully utilized, and communities, customers, and the Company are all better off.

It is not entirely clear what "enormous burden" Mr. Morgan refers to in his statement. It seems unlikely that this proposal, which is 0.1% of the Company's total request, will pose such a burden. Regardless, PPL Electric's proposed Opportunity Pennsylvania Program is intentionally limited in scope, with an annual budget of just $400,000. It will not divert resources from PPL Electric's capital investments.

In addition, at no time has the Company communicated that the Opportunity Pennsylvania Program funds are to be used to "seek out and bring new and expanding businesses to the service area." Instead, these funds are to encourage communities to undertake site-preparation activities to improve their attractiveness to prospective employers, and to support them in seeking further funding for such activities. Community and regional economic development organizations across our service area already partner with the state to market themselves to prospective employers. The Opportunity Pennsylvania Program is meant to address a different challenge—the shortage of ready-to-develop sites, or "product," that these organizations can offer to potential investors. As I mentioned in my direct testimony, the experience of the Company's affiliate utilities in Kentucky indicates that a relatively modest investment in site readiness by the utility can be used to leverage significant public funding that will position a community to successfully attract significant business investment.

Q. Mr. Morgan also alleges that "it is not clear the type of state and federal funding PPL Electric would be providing assistance to secure." (OCA St. 1SR, p. 12.) Please respond.

A. As noted in my direct testimony, rebuttal testimony, and discovery responses, the PA SITES program is the main state funding program that PPL Electric is focused on assisting communities to access via the support of the Opportunity Pennsylvania Program. However, the Opportunity Pennsylvania Program does not solely intend to help the communities in the Company's service territory access state funding. It also intends to catalyze investment in

important site readiness work necessary to attract new employers through the program's reimbursement grants. This work will make communities' applications for any kind of site preparation programs which the state or federal government currently offers, or may offer in the future, more compelling. The purpose of the Company's proposal is to be flexible in helping communities to bring new sites to market. It is designed to allow them to leverage state grant and loan funding that exists today, but is not limited to only specific funding sources, as these can change over time. The work it is intended to reimburse is foundational to bringing sites to market. Such work will be useful with or without state or federal funding sources.

Q. Mr. Morgan further asserts that it is not clear "whether projects being pursued are primarily electric utility-related projects or what PPL Electric's funding of technical assistance is intending to secure." (OCA St. 1SR, pp. 12-13.) Could you please clarify?

A. It is not clear what Mr. Morgan means by "projects." If he means the ultimate end users of the sites prepared by our communities, these entities cannot be known in advance but are expected to be businesses that will be PPL Electric customers and that will employ residents of the communities that PPL Electric serves.

Further, to clarify, the goal of the Company's proposal is to support communities in laying the foundation for attracting business investment by improving site readiness. Attracting significant business investment is a nationally competitive process. Companies choosing where to expand look for locations that are prepared and can meet their needs, often

under tight timelines. Communities that invest in site preparation are far more likely to secure these projects than those that do not. If the communities PPL Electric serves fail to invest in site readiness, employers will choose other locations.

In conclusion, the Opportunity Pennsylvania Program is not about directly recruiting employers. It is about partnering with communities to prepare land and strengthen their competitiveness, so they can attract investments that enhance quality of life for their residents—who are, in turn, the Company's customers.

III. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
SHARON LESKOWSKY
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

Topics: **Historic Test Year (HTY) Schedules**
Infrastructure Investment & Jobs Act (IIJA) Cost Amortization

Dated: February 13, 2026

31972989v1

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Sharon Leskowsky, and my business address is 645 Hamilton Street, Suite 9, Allentown, PA 18101.

Q. By whom are you employed and in what capacity?

A. I am employed as Assistant Controller by PPL Services Corporation, which is an affiliate of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") and is a subsidiary of PPL Corporation. I note that my prior rounds of testimony misidentified my employer as PPL Corporation.

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted direct testimony on behalf of the Company, PPL Electric Statement No. 22 and rebuttal testimony, PPL Electric Statement No. 22-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to note a correction to Schedule D-5 of Exhibit Historic 1 and respond to Office of Consumer Advocate ("OCA") Witness Morgan regarding the Company's regulatory asset for the incremental expenses associated with the Infrastructure Investment & Jobs Act ("IIJA").

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. No.

II. HISTORIC TEST YEAR (HTY) SCHEDULES

Q. You sponsored Schedule D-5 of Exhibit Historic 1, which concerns the Company's *pro forma* adjustment to wages and benefits. As part of reviewing that schedule more recently, have you identified any corrections that need to be made?

A. Yes. I identified that the Historic Test Year (HTY) D-5 wage adjustment included wages associated with the Storm Damage Expense Rider (SDER). Removing those wages increases the *pro forma* adjustment on Line No. 8 by approximately $1,338,000 (i.e., approximately $4.445 million instead of the $3.107 million stated in the schedule). I note that those figures are for both transmission and distribution operations. Approximately $1,226,010 of the $1,338,000 is allocated to PPL Electric's distribution operations. This update does not change the calculation of lag days in the HTY CWC, so the impacts are isolated to the HTY.

III. INFRASTRUCTURE INVESTMENT & JOBS ACT (IIJA) COST AMORTIZATION

Q. OCA Witness Morgan claims that PPL Electric did not have authority per ASC 980 to record the IIJA incremental costs as a regulatory asset. (OCA St. 1SR, pp. 15-17.) What is your response?

A. Foremost, I note that Mr. Morgan omits any mention of how these costs directly led to ratepayer benefits and how the Commission's *July 2023 Order* incorporated the OCA's proposed conditions for establishment of these regulatory assets. Moreover, Mr. Morgan's position, if correct, essentially discourages utilities from pursuing these grants, for even if the utilities were successful in securing the grants, OCA would oppose the deferred expenses necessary to obtain them.

IV. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

REJOINDER TESTIMONY OF
VINCENT POPLASKI
ON BEHALF OF
PPL ELECTRIC UTILITIES CORPORATION

PUBLIC VERSION

Topics: **Incentive Compensation Expense**

Dated: February 13, 2026

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Vincent Poplaski. My business address is Two City Center, 645 Hamilton Street, 6th Floor, Allentown, PA 18101.

Q. By whom are you employed and in what capacity?

A. I am Vice President of Total Rewards for PPL Services Corporation, which provides services to PPL Electric Utilities Corporation ("PPL Electric" or the "Company").

Q. Have you previously filed testimony in this matter?

A. Yes, I previously submitted rebuttal testimony, PPL Electric Statement No. 23-R.

Q. What is the purpose of your rejoinder testimony?

A. The purpose of my rejoinder testimony is to respond to the surrebuttal testimony of Office of Consumer Advocate ("OCA") Witness Morgan (OCA St. 1SR) concerning the Company's incentive compensation expense.

Q. Have you prepared any exhibits in support of your rejoinder testimony?

A. No, I have not.

II. INCENTIVE COMPENSATION EXPENSE

Q. Before addressing OCA Witness Morgan's surrebuttal testimony, do you have any updates regarding the long-term sustainability metrics set for 2026 and 2027 performance unit ("PU") grants under the Company's long-term incentive compensation plan?

A. Yes. As observed in my rebuttal testimony, the long-term sustainability metrics for the 2026 PU award grants covering the 2026, 2027, and 2028 performance period were expected to be finalized by January 29, 2026.[1] They were in fact finalized and approved on January 29, 2026. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]** As previously noted, these metrics align executive compensation with improvements in operational performance outcomes, thereby further supporting the Company's recovery of the associated expenses as part of this base rate case.

Q. Mr. Morgan contends that PPL Electric should be denied recovery of 100% of the Restricted Stock Units ("RSUs") because, according to him, the Company did not

[1] On page 4 of my rebuttal testimony, I state that the "long-term sustainability metrics for the 2026 and 2027 awards are expected to be finalized by January 29, 2026." To clarify, I was referencing the metrics for the 2026 PU award grants covering the 2026, 2027, and 2028 performance period, not the 2027 PU award grants.

provide the "data" necessary for him "to revise [his] testimony." (OCA St. 1SR, p. 7.) Do you agree?

A. No. First, the discovery request referenced by Mr. Morgan was a Bureau of Investigation and Enforcement ("I&E") discovery request, not an OCA discovery request. Notably, I&E has had no trouble responding to the Company's rebuttal testimony on RSUs and, in fact, has accepted that PPL should be permitted to recover those costs. (*See* I&E St. No. 2-SR, p. 18.) Therefore, the Pennsylvania Public Utility Commission should reject Mr. Morgan's position and grant the Company rate recovery of 100% of the RSUs.

III. CONCLUSION

Q. Does this conclude your rejoinder testimony?

A. Yes, it does.

WITNESS: Joseph Lookup

PPL Electric Utilities Corporation
Response to the Set II Data Requests of
Eric Joseph Epstein
Dated November 24, 2025
Docket No. R-2025-3057164

EE II-6

"While that generation could be built by existing independent producers or the new joint venture, PPL notably said it could also be developed by PPL Electric Utilities 'if permitted.' PPL Corporation is today a fully regulated utility holding company with no competitive generation assets."

Please provide PPL EU's plans to transition to generating energy.

PPL Electric Response

PPL Electric has no immediate plans to transition to generating energy. Rather, the Company has been active in the ongoing public discussion regarding the resource adequacy challenges PJM will face in the near future. PPL Electric has advocated that there is a role for electric distribution companies ("EDC") in solving the resource adequacy issue. However, the Company has made clear that there would need to be legislative change before EDCs could include generating assets in rates.

WITNESS: Bethany L. Johnson

PPL Electric Utilities Corporation
Response to the Set III Data Requests of
Eric Joseph Epstein
Dated December 2, 2025
Docket No. R-2025-3057164

EE III-1

Please provide the cost of legal services billed by Post and Schell and **approved** by PPL for administrative costs, food and lodging, parking, legal fees, and transportation, relating to the following Distribution cases:

1a) Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation, Docket No. R-2010-2161694.

1b) Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation Supplement No. 118 to Tariff - Electric Pa. P.U.C. No. 201, Docket No. R-2012-229057.

1c) Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation, Docket No. R-2015-2469275.

PPL Electric Response

As agreed to by the Company and Mr. Epstein, the Company will respond to the following requests in lieu of the as-propounded Epstein Set III, Nos. 1 through 8:

1. Please provide the amount in legal costs that make up the Company's rate case expense claim in this proceeding.
2. Please explain why PPL Electric retained Post & Schell to represent the Company in this rate case, including any metrics that the Company used as part of that determination.
3. Please explain whether PPL Electric issued an RFP as part of selecting its legal counsel for this rate case.

    1. As provided in I&E-RE-10-D Attachment 9, the Company's request for rate case expense in PPL Electric Fully Projected Future Exhibit 1 Scheduled D-6 includes $1,500,000 in legal expenses.

2. PPL reviews the performance of all vendors, including law firms, on an ongoing basis. PPL evaluates the firm's effectiveness in representing the Company and achieving the Company's objectives at a reasonable cost. Legal services provided by Post & Schell, P.C. and all other outside legal counsel are provided pursuant to the ongoing management, oversight, and direction from PPL Electric and PPL's Office of General Counsel.

   The attorneys at Post & Schell, P.C. have represented PPL Electric in rate proceedings for many years. Post & Schell, P.C. has extensive knowledge of all aspects of rate case proceedings and is recognized as one of the preeminent regulatory law firms in the public utility field.

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Zachari Walker, and my business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission or PUC) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. WHAT IS YOUR EDUCATION AND EMPLOYMENT BACKGROUND?

A. My education and employment background is attached as Appendix A.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for representing the public interest in rate and other proceedings before the Commission. I&E's analysis in these proceedings is based on its responsibility to represent the public interest. This responsibility requires the balancing of the interests of the ratepayers, the regulated utility, and the regulated community as a whole.

Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?

A. The purpose of my direct testimony is to review the base rate filing of PPL Electric Utilities Corporation (PPL Electric or Company), and recommend adjustments to the Company's proposed operating and maintenance (O&M) expenses and rate base for the fully projected future test year (FPFTY) ending June 30, 2027.[1]

Q. DOES YOUR DIRECT TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 1 contains schedules that support my direct testimony.

Q. WHAT ARE THE TEST YEARS USED BY THE COMPANY IN THIS PROCEEDING?

A. PPL Electric uses the twelve months ended June 30, 2025, as the historic test year (HTY), the twelve months ending June 30, 2026, as the future test year (FTY), and the twelve months ending June 30, 2027, as the FPFTY.[2]

Q. PLEASE SUMMARIZE THE COMPANY'S REQUESTED REVENUE INCREASE.

A. The Company's base rate case was filed on September 30, 2025, with a total requested increase of $356,271,000 to the claimed jurisdictional present rate

[1] PPL Electric Volume VIII, Statement No. 6, p. 2.
[2] PPL Electric Volume VIII, Statement No. 6, p. 4.

revenues of $1,065,901,000 resulting in an overall revenue requirement of $1,422,173,000.[3]

Q. PLEASE SUMMARIZE YOUR RECOMMENDED ADJUSTMENTS.

A. The following table summarizes my recommended adjustments:

	PPL Electric FPFTY Claim	I&E Recommended Allowance	I&E Adjustment
O&M Expenses:			
Rate Case Expense	$741,000	$437,000	($304,000)
Storm Damage Expense	$42,500,000	$32,506,000	($9,994,000)
Bank Charges	$900,000	$512,000	($388,000)
Company Sponsorships	$28,000	$0	($28,000)
Membership Dues and Subscriptions	$2,800,000	$0	($2,800,000)
Vegetation Management Expense	$49,999,000	$34,420,000	($15,579,000)
Total O&M Adjustments			**($29,093,000)**

SUMMARY OF I&E'S OVERALL POSITION

Q. WHAT IS I&E'S TOTAL RECOMMENDED REVENUE REQUIREMENT?

A. I&E's total recommended revenue requirement for PPL Electric is $1,324,779,000. This recommended revenue requirement represents an increase of $258,878,000 to the claim for present rate revenues of $1,065,901,000. This total recommended allowance incorporates my adjustments made in this testimony

[3] PPL Electric Volume VII, Schedule D-1.

to O&M expenses, and those made in the testimony of I&E witnesses Christopher Keller[4] and Drew Breuner.[5]

A calculation of the I&E recommended revenue requirement is shown in the table below:

PPL Electric Utilities Corporation		TABLE I			
R-2025-3057164		INCOME SUMMARY			
	6/30/27	INVESTIGATION & ENFORCEMENT			
	Proforma	[			]

[5] I&E Statement No. 3.

RATE CASE EXPENSE

Q. BRIEFLY DESCRIBE THE NATURE AND TYPES OF EXPENDITURES TYPICALLY ALLOWED AS PART OF A REGULATED UTILITY'S OVERALL RATE CASE EXPENSE.

A. The nature and types of individual expenditures that comprise a regulated utility's allowable claim for rate case expense are those directly incurred to compile, present, and defend a utility's request for a base rate increase before the Commission. The actual expenditures and estimated costs typically found in an allowable rate case expense claim include legal fees for outside counsel, fees to outside consultants, and the cost of printing, document assembly, and postage.

Q. HOW HAS THE COMMISSION TRADITIONALLY TREATED RATE CASE EXPENSE FOR RATEMAKING PURPOSES?

A. The Commission has historically stated that it considers prudently incurred rate case expense as an ongoing expense, occurring at irregular intervals, related to the rendering of utility service. The Commission has also cited the importance of considering the involved utility's history regarding the frequency of rate case filings as an essential element in determining the normalized level of rate case expense for ratemaking purposes.[6]

[6] "A Guide to Utility Ratemaking," by James H. Cawley and Norman J. Kennard (2018 Edition), p. 112, https://www.puc.pa.gov/General/publications_reports/pdf/Ratemaking_Guide2018.pdf, accessed December 10, 2025.

Q. HOW IS THE FREQUENCY OF RATE CASE FILINGS DETERMINED?

A. The frequency is determined by calculating the average number of months between the filing dates of a utility's recently filed base rate cases.

Q. WHAT IS THE COMPANY'S CLAIM FOR RATE CASE EXPENSE?

A. PPL Electric's total rate case expense claim is $741,000.[7]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company's claim is based on estimated total rate case expenses of $2,222,000[8] expensed over its anticipated three-year interval between the instant proceeding and the Company's next base rate filing.[9] The result is PPL Electric's proposed annual expense amount of $741,000.[10]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR RATE CASE EXPENSE?

A. I recommend a normalized annual allowance of $437,000 for rate case expense, or a reduction of $304,000 ($741,000 - $437,000) for the Company's claim.

---

7 PPL Electric Volume VII, Schedule D-6.
8 PPL Electric Volume VII, Schedule D-6.
9 I&E Exhibit No. 1, Schedule 1, p. 3.
10 PPL Electric Volume VII, Schedule D-6.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on adjusting the normalization period to match the historic average base rate case filing frequency of 61 months as detailed below.

Q. PLEASE EXPLAIN YOUR RECOMMENDED ADJUSTMENT TO THE NORMALIZATION PERIOD.

A. The Company's historic filing frequency does not support a three-year recovery period for rate case expense. The Company's three most recent base rate case filing dates and corresponding details for the current filing are as follows:

Docket No.	Date Filed[11]	Filing Interval
R-2025-3057164	June 30, 2025	123 months
R-2015-2469275	March 31, 2015	36 months
R-2012-2290597	March 30, 2012	24 months
R-2010-2161694	March 31, 2010	

Including the current rate case, filed on June 30, 2025, the average historic filing frequency is 61 months [(123 months + 36 months + 24 months) ÷ 3]. Therefore, I recommend the 61-month average historic filing frequency be used as the normalization period, consistent with the Commission's emphasis on the importance of considering the utility's history of rate case filings when determining the normalization period of rate case expenses. Normalizing the total claim over the average historic filing frequency of 61 months yields my

[11] I&E Exhibit No. 1, Schedule 1, p. 2.

recommended FPFTY allowance of $437,000 [($2,222,000 ÷ 61 months) x 12 months] for rate case expense. My recommended FPFTY allowance represents a reduction of $304,000 ($741,000 - $437,000) to the Company's FPFTY claimed rate case expense.

Q. HAS PPL ELECTRIC PREVIOUSLY BEEN GRANTED A NORMALIZATION PERIOD BASED ON SPECULATION OF FUTURE RATE CASE FILINGS?

A. Yes. In 2012, the Commission granted PPL Electric permission to normalize its rate case expense over a 24-month period based on the expected timing of future base rate case filings.[12] That base rate case was filed on March 30, 2012; however, the Company did not file its next rate case until March 31, 2015, which was 36 months after the 2012 rate case filing. I&E's recommended normalization period in the 2012 proceeding was a 32-month interval based on PPL Electric's historic filing frequency.[13] I&E's recommendation in that instance produced a much more accurate result than the Company's stated future intention to file a rate case.

[12] *Pa. PUC v. PPL Electric Utilities Corporation*, Docket No. R-2012-2290597, pp. 47-48 (Order Entered December 28, 2012).

[13] I&E Statement No. 2, pp. 13-14 at Docket No. R-2012-2290597.

Q. ARE THERE ANY RECENT COMMISSION DECISIONS THAT SUPPORT YOUR RECOMMENDATION FOR A RATE CASE FILING INTERVAL BASED ON HISTORIC FILING FREQUENCY?

A. Yes. The following six cases resulted in the Commission using each utility's historic average filing frequency.

First, in a base rate case filed by Emporium Water Company, the Commission adopted I&E's recommended historic filing frequency finding in favor of I&E's recommended five-year normalization based on historic average filing frequency that was rounded down from 64 months.[14]

Second, in a 2016 base rate case filed by the City of DuBois the Commission agreed with I&E's recommendation to use an historic filing frequency finding in favor of I&E's recommended 64-month normalization which matched the actual historic filing frequency.[15]

Third, in Columbia Gas of Pennsylvania, Inc.'s (Columbia) 2020 base rate case filing, the Commission held that the normalization period should align with the frequency of historic filings rather than Columbia's stated intent to file its subsequent rate case.[16]

---

[14] *Pa. PUC v. Emporium Water Company*, Docket No. R-2014-2402324, p. 50 (Order Entered January 28, 2015).

[15] *Pa. PUC v. City of DuBois - Bureau of Water*, Docket No. R-2016-2554150, pp. 65-66 (Order Entered March 28, 2017); *PA PUC v. City of DuBois - Bureau of Water*, Docket No. R-2016-2554150, p. 13 (Order Entered May 18, 2017).

[16] *Pa. PUC v. Columbia Gas,* Docket No. R-2020-3018835, Opinion and Order, pp. 78-79 (Order Entered February 19, 2021).

Fourth, in PECO Energy Company – Gas Division's (PECO Gas) 2020 base rate filing, the Commission granted I&E's recommended five-year normalization period rather than PECO Gas' claim based on a three-year period because the Commission determined a normalization period based on actual historic filing frequency is more reliable than future speculation.[17]

Fifth, in a base rate case filed by Philadelphia Gas Works' (PGW) in 2023, the Commission agreed with I&E's recommended 53-month normalization period rather than PGW's claim based on a three-year period because the Commission granted a normalization period based on actual historic filing frequency and not based on PGW's future intention to file a rate case.[18]

Finally, in the most recent base rate case filed by the Columbia Water Company in 2023, the Commission held that the normalization period should align with the historic filing frequency rather than that company's intent to file its next rate case, and that the intent to file a base rate case does not justify deviating from the Commission's practice of relying on historic filing frequency.[19]

[17] *Pa. PUC v. PECO Energy Company (Gas Division)*, Docket No. R-2020-3018929, Opinion and Order, p. 119 (Order Entered June 22, 2021).

[18] *Pa. PUC v. Philadelphia Gas Works*, Docket No. R-2023-3037933, Opinion and Order, pp. 65-66 (Order Entered November 9, 2023).

[19] *Pa. PUC v. Columbia Water Company*, Docket No. R-2023-3040258, Opinion and Order, p. 34 (Order Entered January 18, 2024).

Q. GIVEN THESE COMMISSION ORDERS AND THE COMPANY'S FILING HISTORY, IS THE CLAIMED 36-MONTH RECOVERY PERIOD REASONABLE?

A. No. As explained above, the Company's demonstrated historic filing frequency is 61 months, therefore, normalizing the total claims over this average historic filing frequency is more appropriate.

STORM DAMAGE EXPENSE

Storm Damage Expense in Base Rates

Q. WHAT IS THE COMPANY PROPOSING FOR STORM DAMAGE EXPENSE?

A. The Company is proposing: (1) to increase the baseline for Commission-reportable storm damage expenses included in the Storm Damage Expense Rider (SDER) to $32,000,000;[20] (2) to recover a regulatory asset through a three-year amortization of $11,336,000, or $3,779,000 ($11,336,000 ÷ 3 years) annually, for SDER-eligible storm costs incurred in excess of the SDER cap;[21] (3) to modify the SDER mechanism to recover an additional $10,500,000 for expenses related to non-reportable storms that were previously recovered through base rates;[22] and (4) to

[20] PPL Electric Statement No. 13, p. 11.
[21] PPL Electric Statement No. 13, pp. 11-12.
[22] PPL Electric Statement No. 13, p. 12.

recover deferred expenses of $12,366,000, or $4,122,000 ($12,366,000 ÷ 3 years) annually, related to an extraordinary storm in February 2024.[23]

PPL Electric is proposing to establish a new baseline of $42,500,000 for the SDER to be recovered in base rates.[24] The proposed new SDER baseline includes $32,000,000 for Commission-reportable storm damage expenses and $10,500,000 for non-reportable storm damage expenses.[25]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. PPL Electric opines that without the acceptance of these proposals, the Company cannot optimize its expense budget and will suffer financially because of storms due to recovery of these expenses being delayed for years.[26]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR STORM DAMAGES EXPENSE?

A. First, I recommend that the Commission deny the Company's proposal to include non-reportable storm-related expenses of $10,500,000 in the SDER and instead

[23] PPL Electric Statement No. 13, p. 14.
[24] PPL Electric Exhibit GEO-1, p. 369.
[25] PPL Electric Statement No. 13, pp. 11-12.
[26] PPL Electric Statement No. 13, p. 13.

continue to allow these expenses to be recovered in base rates.

Next, I recommend the Commission require the Company to clarify the language in the tariff regarding a mandatory three-year recovery period for major storms to accurately indicate that this recovery period only applies to storms recovered via the SDER and not residual balances when the SDER resets to zero at a base rate proceeding. The inclusion of this term is misleading as the SDER no longer controls recovery of residual regulatory assets when the SDER is reset. Using the three-year amortization period subsequent to the last base rate case in 2015 resulted in the Company recovering fully amortized amounts in base rates for a minimum of seven years beyond full amortization. Residual regulatory assets from either not fully recovered SDER major storms or for amounts exceeding the revenue cap on the SDER should be recovered over the period established by the historic filing interval. As amortized expenses, these recoveries would continue through the next base rate proceeding if that occurred in an interval shorter than currently predicted by the Company filing historic filing interval. Therefore, I recommend the Commission require the Company to use the historical filing frequency, as explained above,[27] to determine the appropriate amortization period, and thus the reasonable expense level for recovery of the $11,336,000 expenses over the SDER cap. Using the historical average filing frequency of 61 months

[27] I&E Statement No. 1, pp. 7-8.

results in my recommended annual amortization of the expenses over the SDER cap of $2,230,000 [($11,336,000 ÷ 61 months) x 12 months].

Likewise, I recommend an adjustment to the unamortized expense balance from the February 2024 storm. Since a third of the expenses related to the February 2024 storm were included in the 2025 SDER calendar year, that leaves the remaining balance of $8,244,000 [($12,366,000[28] ÷ 3 years) x 2] to be amortized going forward. Using the historic filing frequency as explained in the rate case expense section above, my recommended allowance for the amortized expense included in the SDER is $1,622,000 [($8,444,000 ÷ 61 months) x 12 months].

To determine the total SDER baseline, I recommend that the three-year historical average of reportable storm expenses be used in conjunction with the amortized amounts for the expenses over the SDER cap of $2,230,000 and the February 2024 storm damage expenses of $1,622,000 to determine the reasonable SDER allowance as I explain next.

In response to I&E-RE-V-1, the Company provided the historic storm damage expense levels.[29] Using the three-year historical average for 2023, 2024, and the HTY storm damage expense of $18,154,000 to be included in the SDER prior to adding the amortized expenses. A calculation of this three-year average is shown below:

[28] PPL Electric Statement No. 13, p. 14.
[29] I&E Exhibit No. 1, Schedule 2.

	2023	2024	HTY
Storm Damage Expense	$10,351,000	$14,915,000	$29,196,000
Three-Year Historical Expense Total			$54,462,000
Three-Year Historical Average Expense			$18,154,000

Including the level of residual amounts subject to amortization, I recommend the reportable storm expenses included in the SDER be capped at $22,006,000 ($2,230,000 + $1,622,000 + $18,154,000).

Including the $10,500,000 non-reportable storm damage expenses and my recommended SDER reportable storm expense cap of $22,006,000, I recommend an allowance of $32,506,000 ($10,500,000 + $22,006,000) for storm damage expense to be recovered through base rates. My recommended allowance represents a reduction of $9,994,000 ($42,500,000 - $32,506,000) to the Company's FPFTY storm damage expense claim of $42,500,000 in base rates.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. To start with, the SDER was never intended to provide guaranteed dollar-for-dollar recovery of all storm expenses, and it should not be expanded to do so now. Expenses for non-reportable storms at an estimated annual amount of $10,500,000 are part of the normal cost of doing business. The SDER was intended to protect the Company from larger and more volatile storms, not normal weather conditions.

Likewise, my recommendations above serve to estimate a reasonable level of storm damage expense to be included in base rates that does not preclude the Company from seeking recovery of Commission-reportable storm damage expenses that exceed the cap in future rate cases. At the same time, it does not build inappropriate expense levels into rates.

Additionally, as stated in PPL Electric witness Joseph Lookup's direct testimony, the Company is proactively hardening the distribution system through various programs including the Company's Commission-approved $203,000,000 capital spending increase[30] to its Long-Term Infrastructure Investment Plan (LTIIP).[31] Because the Company is hardening the distribution system, as intended, the magnitude of the Company's projected increase is unreasonable.

Therefore, my recommended allowance of $22,006,000 for reportable storm damage expense in base rates to establish the baseline for the SDER and $10,500,000 for non-reportable storms to be recovered directly in base rates, a total of $32,506,000 ($10,500,000 + $22,006,000), is reasonable. It would not affect the Company's opportunity to request recovery of expenses in excess of the SDER cap and residual major storm amortizations in a future rate case.

[30] PPL Electric Part III of Filing Requirements, Attachment III-F-1a, p. 47.
[31] PPL Electric Statement No. 16, pp. 12-14.

Q. DOES YOUR ARGUMENT FOR THE USE OF THE COMPANY'S HISTORIC FILING FREQUENCY TO DETERMINE THE APPROPRIATE AMORTIZATION PERIOD FOR RESIDUAL REGULATORY ASSETS VIOLATE THE SDER REQUIREMENTS?

A. No. In mentioning the recovery of amortized expenses past the anticipated recovery period, I am emphasizing the importance of considering the historic filing frequency when determining appropriate expense levels for amortization. Ratepayers are not protected from the Company overrecovering amortized expenses and therefore must be protected in advance. By using the historic filing frequency to determine the recovery period of residual expenses, the Company is not precluded from recovering just and reasonable expenses and the ratepayers' risk of the Company overrecovering these expenses is mitigated. Once the rider has been reset to zero at a base rate proceeding, those residual amounts are no longer SDER recovered items but are instead conventional regulatory assets subject to analysis for recommendation of an appropriate amortization period.

SDER - Rider Recovery

Q. DO YOU HAVE ANY ADDITIONAL RECOMMENDATIONS RELATED TO THE SDER?

A. Yes. PPL Electric has added language to its tariff that states, "[t]he Company will consider storm damage expenses exceeding 5% of annual distribution net income

as extraordinary for SDER recovery purposes."[32] I recommend the Commission require the Company to remove this added language as existing criteria establishes a baseline for storms to be recovered over the SDER specified three-year rider recovery period. Adding this additional limit could result in large single-year rider recovery of storm damage expenses that would currently be designated major storms subject to the three-year rider recovery period.

BANK CHARGES

Q. WHAT IS THE COMPANY'S CLAIM FOR BANK CHARGES?

A. In response to I&E-RE-I-12-D, Part B, PPL Electric identified its FPFTY claim of $900,000 for outside service employed costs related to bank charges.[33]

Q. WHAT IS THE BASIS FOR PPL ELECTRIC'S CLAIM FOR BANK CHARGES?

A. In response to I&E-RE-I-12-D, Part B, the Company stated that the bank charges represent costs incurred for the Company's financing activities, allocated based on historical allocation percentages as provided in filing requirement II-D-8 of the Company's Cost Allocation Manual.[34] Additionally, in the accompanying

[32] PPL Electric Exhibit GEO-1, p. 369.
[33] I&E Exhibit No. 1, Schedule 3, p. 2.
[34] I&E Exhibit No. 1, Schedule 3, p. 2.

attachment, the Company identifies various historical transactions and bank credits.[35]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDED ALLOWANCE FOR BANK CHARGES?

A. I recommend an allowance of $512,000, or a reduction of $388,000 ($900,000 - $512,000) to the Company's claim. My recommendation represents the three-year historical net average of the annual fiscal year bank charges incurred and bank credits received, calculated using the data provided in I&E-RE-I-12-D Attachment 1 – Part B.[36] The calculation is shown below:[37]

		FY 2023	FY 2024	HTY
1	Charges Incurred	$310,000	$691,000	$716,000
2	Bank Credit	$0	($95,000)	($87,000)
3	Net Annual Total (Line 1 + Line 2)	$310,000	$596,000	$629,000
4	3-Year Historical Net Average (Sum of Line 3 ÷ 3)			$512,000
5	PPL Electric FPFTY Claim			$900,000
6	I&E Recommended Adjustment (Line 5 - Line 4)			($388,000)

[35] I&E Exhibit No. 1, Schedule 3, pp. 6-7.
[36] I&E Exhibit No. 1, Schedule 3, pp. 6-7.
[37] The calculation does not include the bank credit received in October 2020 as this is not relevant to the 3-year historical average.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. PPL Electric appears to be basing its FPFTY bank charges expense claim on historical data, but does not explicitly state this in its response. Nor does the Company identify the payees on which its FPFTY bank charges expense claim is based.

Since the Company has not fully supported its FPFTY bank charges expense claim, using the three-year historical average of the net bank charges produces a more reasonable expense level than the Company's FPFTY claim. Using this average produces my recommended allowance for bank charges expense of $512,000, or a reduction of $388,000 ($900,000 - $512,000) to the Company's FPFTY claim.

COMPANY SPONSORSHIPS

Q. WHAT IS PPL ELECTRIC'S CLAIM FOR COMPANY SPONSORSHIPS?

A. In response to I&E-RE-I-12-D, Part E, PPL Electric stated the FPFTY claim for company sponsorships is $28,000.[38]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company states the costs included are community and economic development sponsorships contending these are reasonable and prudent because they are

[38] I&E Exhibit No. 1, Schedule 3, p. 4.

strategic investments in the community.[39]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION?

A. I recommend the entire $28,000 claim be disallowed for ratemaking purposes.

Q. PLEASE EXPLAIN YOUR RECOMMENDED DISALLOWANCE OF THE COMPANY SPONSORSHIPS.

A. In response to I&E-RE-I-12-D, Part E, PPL Electric provided an accompanying attachment that identifies historically incurred sponsorship costs of $30,000 in fiscal year (FY) 2023; $44,000 in FY 2024; and $46,000 in FY 2025.[40] The sponsorship payments have historically been made to the Lehigh Valley Iron Pigs (a Minor League Baseball team), the Lehigh Valley Community Foundation (a charitable fund management platform), the Lehigh Valley Economic Development Corp. (an economic development agency), and the Greater Lehigh Valley Chamber of Commerce.[41]

First, 66 Pa. C.S. § 1316.1 states that "[n]o public utility may charge to its customers as a permissible operating expense for ratemaking purposes

[39] I&E Exhibit No. 1, Schedule 3, p. 4.
[40] I&E Exhibit No. 1, Schedule 3, p. 8.
[41] I&E Exhibit No. 1, Schedule 3, p. 8.

membership fees, dues, or charges to fraternal, social or sports clubs or organizations."[42] Therefore, the payments made to the Lehigh Valley Iron Pigs are not appropriate to include for ratemaking purposes.

The payments made to the Greater Lehigh Valley Chamber of Commerce (GLV Chamber) and the Lehigh Valley Economic Development Corp. (LVEDC) are not necessary for the safe and reliable provision of utility service and do not provide direct benefit to PPL Electric's ratepayers.

Furthermore, as stated on the GLV Chamber's website, its mission is supported by the benefits provided to both businesses and communities in the Lehigh Valley through "advocat[ing] for businesses for policies and regulations that benefit the business community" and "help[ing] shape policies and initiatives that benefit the community, such as infrastructure improvements, business-friendly regulations, and community development projects."[43] Additionally, as stated on LVEDC's website, part of its strategy is "[e]ngagement of policymakers and developers to create need product."[44]

I am informed by counsel that these payments meet the definition for political advertising as defined under the Public Utility Code and are therefore inappropriate for ratemaking purposes. 66 Pa. C.S. § 1316(a) states that "[f]or purposes of rate determinations, no public utility may charge to its consumers as a permissible operating expense for ratemaking purposes any direct or indirect

---

42 66 Pa. C.S. § 1316.1.
43 https://www.lehighvalleychamber.org/about.html, accessed December 10, 2025.
44 https://www.lehighvalley.org/mission-vision-strategy/, accessed December 10, 2025.

expenditure by the utility for political advertising."[45] 66 Pa. C.S. § 1316(d) states:

> As used in this section the term "political advertising" means any advertising for the purpose of influencing public opinion with respect to any legislative, administrative action, or candidate election or with respect to any controversial issue to be decided by public voting. The term includes money spent for lobbying but not money spent for appearances before regulatory or other governmental bodies in connection with a public utility's existing or proposed operations.[46]

Upon advice of counsel, given that PPL Electric's payments to the GLV Chamber and LVEDC represent direct or indirect expenditures to organizations that engage in influencing policymakers, these payments should be disallowed for ratemaking purposes.

Finally, according to the Lehigh Valley Community Foundation's (LVCF) website, LVCF is designed to "[help] donors with their charitable giving . . . ."[47] It is apparent that the payments to the LVCF represent charitable contributions. Charitable contributions are not an operational cost necessary to provide safe and reliable distribution service to ratepayers and these payments provide no direct benefit to ratepayers. Furthermore, ratepayers should not be required to finance the Company's decision to contribute to various charitable organizations that enhances the image of the Company in the community.

---

45 66 Pa. C.S. § 1316(a).
46 66 Pa. C.S. § 1316(d).
47 https://www.lehighvalleyfoundation.org/, accessed December 10, 2025.

Q. IS YOUR RECOMMENDATION AN ATTEMPT TO DICTATE WHETHER THE COMPANY MAKES CONTRIBUTIONS?

A. No. I am merely asserting that ratepayers should not be required to fund such contributions.

Q. PLEASE SUMMARIZE YOUR RECOMMENDATION FOR PPL ELECTRIC'S COMPANY SPONSORSHIP CLAIM.

A. PPL Electric's Company sponsorships claim is not necessary for the safe and reliable provision of distribution service, contains funds for political advertising, includes charitable contributions that ratepayers should not be required to fund, and therefore, is not appropriate to include for ratemaking purposes. Therefore, I recommend the entire $28,000 FPFTY company sponsorships expense claim be disallowed.

MEMBERSHIP DUES AND SUBSCRIPTIONS

Q. WHAT IS THE COMPANY'S CLAIM FOR MEMBERSHIP DUES AND SUBSCRIPTIONS?

A. PPL Electric's claim for membership dues and subscriptions is $2,800,000.[48]

[48] I&E Exhibit No. 1, Schedule 3, p.5.

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. In response to I&E-RE-I-12-D, Part G, the Company stated the FPFTY claim includes costs incurred and associated with memberships to chambers of commerce, employee training and professional development organizations, industry groups and associations, work-related travel, and online working tools, among other things.[49]

Q. DO YOU AGREE WITH THE COMPANY'S MEMBERSHIP DUES AND SUBSCRIPTIONS CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR MEMBERSHIP DUES AND SUBSCRIPTIONS?

A. I recommend disallowance of the entire $2,800,000 membership dues and subscriptions claim.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. The Company's response to I&E-RE-I-12-D provides the requested information for FY 2021 through the HTY; however, it does not provide the same data for the FPFTY claim.[50] Further, in the attachment accompanying the response to I&E-

[49] I&E Exhibit No. 1, Schedule 3, p. 5.
[50] I&E Exhibit No. 1, Schedule 3, pp. 4-5.

RE-I-12-D, PPL Electric provides historical data for membership dues, broken down to show direct charges, other allocations, and IT allocations with the number of payees and the amounts paid varying year to year.[51] Since the payees and amounts paid vary in the historical data from year to year, it is unclear what amounts and corresponding payees are included in the Company's FPFTY claim. Furthermore, none of these items listed in response to I&E-RE-I-12-D Attachment 1, Part E appear to be necessary for the provision of safe and reliable service to ratepayers. Therefore the entire $2,800,000 FPFTY claim is unsupported and should be disallowed for ratemaking purposes.

Q. ARE THERE ANY RECENT COMMISSION ORDERS THAT SUPPORT YOUR RECOMMENDATION?

A. Yes. In the 2025 Columbia Gas of Pennsylvania, Inc. (Columbia Gas) base rate case, the Commission denied that utility's request to recover chamber of commerce fees in base rates, adopting the Administrative Law Judge's recommendation "that the Company not be permitted to recover chamber of commerce membership costs."[52]

[51] I&E Exhibit No. 1, Schedule 3, p. 8.

[52] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.*, Docket No. R-2025-3053499, p. 158 (Order Entered December 9, 2025).

VEGETATION MANAGEMENT EXPENSE

Q. WHAT IS THE COMPANY'S CLAIM FOR VEGETATION MANAGEMENT EXPENSE?

A. In response to I&E-RE-III-7, Part A, PPL Electric identified its FPFTY vegetation management expense claim of $49,999,000.[53]

Q. WHAT IS THE BASIS FOR PPL ELECTRIC'S CLAIM FOR VEGETATION MANAGEMENT?

A. PPL Electric state that an expanded budget will support a higher frequency in the cycle of vegetation inspection and management.[54]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDED ALLOWANCE FOR VEGETATION MANAGEMENT?

A. I recommend an allowance of $34,420,000, or a reduction of $15,579,000 ($49,999,000 - $34,420,000) to the Company's claim. My recommendation represents the three-year historical average of the annual fiscal year vegetation

[53] I&E Exhibit No. 1, Schedule 4, p. 1.
[54] PPL Statement No. 17, p. 5.

management expense incurred, calculated using the data provided in I&E-RE-III-7, Part B.[55] The calculation is shown below:

		FY 2023	FY 2024	HTY
1	Vegetation Management Expense Incurred	$37,417,000	$30,326,000	$35,516,000
2	3-Year Historical Net Average (Sum of Line 1 ÷ 3)			$34,420,000
3	PPL Electric FPFTY Claim			$49,999,000
4	I&E Recommended Adjustment (Line 3 - Line 2)			($15,579,000)

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. The Company implements vegetation risk models to prioritize vegetation activities, integrated vegetation management (IVM) techniques including the use of herbicide applications,[56] and aerial Light Detection and Ranging (LiDAR) inspections.[57] In response to I&E-RE-III-7, Part G, the Company provided I&E-RE-III-7 Attachment 2 that states PPL Electric performs LiDAR every other year.[58] The efficiency of these systems creates a cycle of increasing returns and decreases the frequency for readdressing the same areas.

Additionally, as part of the Company's acquisition of off right-of-way (Off-ROW) program proposal, PPL Electric states it wishes to capitalize the first

[55] I&E Exhibit No. 1, Schedule 4, p. 2.
[56] PPL Statement No. 17, p. 4.
[57] I&E Exhibit No.1, Schedule 4, p. 4.
[58] I&E Exhibit No.1, Schedule 4, p. 4.

removal of hazard and danger trees after the acquisition of the additional rights.[59] If the Commission allows the Company to capitalize such vegetation management instances, than it is unreasonable to suggest that the Company's vegetation management expense will increase drastically.

The Company has not supported its FPFTY vegetation management expense claim. Therefore, in absence of support, using the three-year average of the historical vegetation management expense produces a reasonable expense level for ratemaking purposes. Using this average produces my recommended allowance for vegetation management expense of $34,420,000, or a reduction of $15,579,000 ($49,999,000 - $15,579,000) to the Company's FPFTY claim.

ADDITIONAL RECOMMENDATIONS

Q. DO YOU HAVE ANY ADDITIONAL RECOMMENDATIONS?

A. Yes. I have a recommendation regarding the data structure of the Company's distribution service base rate case filing.

Q. HOW DID THE COMPANY STRUCTURE THE DATA IN THE PRESENTATION OF ITS REVENUE REQUIREMENT CALCULATION?

A. The Company provides many of its exhibits and standard data requirements, for example Schedule D-17, at the PPL Electric total or the jurisdictional transmission

[59] PPL Statement No. 17, p. 11.

and distribution levels, but do not display the distribution-only portion of claims made.

Q. WHAT IS THE BASIS FOR THE COMPANY'S PRESENTATION OF ITS REVENUE REQUIREMENT CALCULATION?

A. In response to I&E-RE-I-1-D, Part D, when asked why it is appropriate for PPL Electric to provide schedules that do not exclusively provide distribution-level data in its distribution base rate case filings, the Company contended that PPL Electric has both distribution and transmission operations and removes non-jurisdictional plant from Schedule C-1 and non-jurisdictional expenses in Schedule D-1.[60]

Q. HOW DOES THE COMPANY'S DATA STRUCTURE CONTAINED IN THE FILING IMPACT THE REVIEW OF ITS CLAIMS?

A. As much of the Company's data is not presented at the jurisdictional distribution level in its supporting schedules and standard data requirements, it does not allow for effective analysis of the accuracy and reasonableness of the Company's claims. Throughout this proceeding, the parties have had to generate numerous interrogatories asking the Company to break out information for the jurisdictional distribution share.

[60] I&E Exhibit No. 1, Schedule 5, pp. 1-2.

Q. PROVIDE AN EXAMPLE THAT CLEARLY DEMONSTRATES HOW PPL ELECTRIC'S LACK OF JURISDICTIONAL DATA HAS IMPEDED I&E'S ABILITY TO DETERMINE THE ACCURACY AND REASONABLENESS OF THE COMPANY'S CLAIMS.

A. In response to I&E-RE-I-6-D, PPL Electric provided I&E-RE-I-6-D-Attachment 1 containing a distribution-level operations version of PPL Electric Volume VII, Schedule D-17, the computation of income taxes.[61] Had I not requested the distribution-level operations version of the computation of income taxes that includes the distribution-level operations interest expense claim of $129,739,000,[62] I instead would have relied on the interest expense value provided in the as-filed Schedule D-17 of $292,235,000 which includes non-jurisdictional operations interest expenses.[63] The effect of using the non-jurisdiction interest expense of $292,235,000, rather than the jurisdictional interest expense claim of $129,739,000, would have resulted in a difference of over $63,000,000 in I&E's recommended revenue requirement calculation – significantly skewing I&E's analysis of the accuracy and reasonableness of the Company's requested revenue requirement increase.

[61] I&E Exhibit No. 1, Schedule 6, pp. 1-4.
[62] I&E Exhibit No. 1, Schedule 6, p. 2, line 13.
[63] PPL Electric, Volume VII, Schedule D-17, p. 1, line 13.

Q. DO ANY OTHER PENNSYLVANIA ELECTRIC DISTRIBUTION COMPANIES PRODUCE BASE RATE FILINGS THAT PRESENT A CLEAR BREAKDOWN OF JURISDICTIONAL DATA OF THE REVENUE REQUIREMENT CALCULATION?

A. Yes. In each of the most recent base rate case filings, Citizens' Electric Company of Lewisburg, PA,[64] Duquesne Light Company,[65] FirstEnergy Company,[66] PECO Energy Company – Electric,[67] Pike County Light & Power Co. – Electric,[68] UGI Utilities, Inc. – Electric Division,[69] and Wellsboro Electric Company[70] all present clear breakdowns of jurisdictional data supporting the revenue requirement calculation.

Q. COULD AN EFFECTIVE ARGUMENT BE MADE THAT IT IS BURDENSOME TO PROVIDE A CLEAR BREAKOUT OF JURISDICTIONAL DISTRIBUTION-LEVEL DATA FOR THE CALCULATION OF THE REVENUE REQUIREMENT?

A. No. As shown in many of PPL Electric's responses, the Company is clearly capable of providing data for jurisdictional distribution-level operations.

---

68 *Pa. PUC v. Pike County Light & Power Co. - Electric*, Docket No. R-2024-3052359, Exhibit E-1.
69 *Pa. PUC v. UGI Utilities, Inc. - Electric Division*, Docket No. R-2022-3037368, Exhibit A.
70 *Pa. PUC v. Wellsboro Electric Company*, Docket No. R-2025-3054392, Exhibit HSG-1.

Q. WHAT IS YOUR RECOMMENDATION?

A. I recommend that the Commission require the Company to provide the breakdown of its supporting schedules and standard data requirements to the jurisdictional distribution level with the original filing in all future proceedings. Doing so is in the public interest as it will reduce the cost of legal fees for the parties' attorneys to handle and disseminate discovery questions, it will reduce the time of all parties' witnesses preparing, evaluating, and responding to discovery questions, and it ensures I&E's, and all other parties, ability to analyze all utility claims at the granular level, ultimately balancing the interests of the ratepayers, the regulated utility, and the regulated community as a whole which cannot be done without full evaluation of the accuracy and reasonableness of PPL Electric's claims at the jurisdiction level.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes. However, I reserve the right to update my position as affected by any information received subsequent to the preparation of this direct testimony.

Zachari Walker

Bureau of Investigation and Enforcement

Concerning:

OPERATING AND MAINTENANCE EXPENSES

WITNESS: Bethany L. Johnson

PPL Electric Utilities Corporation
Response to the RE Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 10, 2025
Docket No. R-2025-3057164

I&E-RE-I-10-D Reference PPL Volume VII, Schedule D-6, concerning rate case expenses. Provide the following:

A. The docket number, date of filing, and method of resolution (i.e., settlement or litigation) for each of the last three base rate cases filed with the Pennsylvania Public Utility Commission (PUC or Commission).

B. Requested distribution rate case expense and actual distribution rate case expense incurred for each of the base rate cases listed in response to Part A above.

C. Copies of all current outside service contract agreements for rate case-related services.

D. Invoices/receipts for the regulatory commission expenses incurred to date for the current filing and continue to provide updated invoices as regulatory commission expenses are incurred.

E. Identify any claimed expenses attributable to prior rate case proceedings included in PPL's current FPFTY distribution rate case expense claim.

F. A detailed explanation of the basis for the Company's claimed 3-year normalization period to recover rate case expenses.

G. Identify any claimed rate case-related expenses allocated to PPL from any affiliated entity providing a detailed breakdown and explanation of the allocation method along with any formulas used to determine the allocation.

H. A detailed breakdown of the $2,222,000 total distribution rate case expense claim.

WITNESS: Bethany L. Johnson

PPL Electric Response

A. PPL Electric's filed a base rate case on March 31, 2010 at Docket No. R-2010-2161694. A partial settlement was filed on August 26, 2010, with one issue reserved for hearing. The hearing was held on August 11, 2010.

In 2012, PPL Electric filed a base rate case on March 30, 2012 at Docket No. R-2012-2290597. The proceeding was litigated and evidentiary hearings were held on August 6-7, 2012 and August 9-10, 2012.

In 2015, PPL Electric filed a base rate case on March 31, 2015 at Docket No. R-2015-2469275. That proceeding reached full settlement on August 5, 2015.

B. For the 2010 and 2012 rate cases, the Company incurred and booked actual rate case expenses of $1.7 million and $1.8 million, respectively. In 2010, the Company requested $2 million in rate case expenses, and in 2012 $2 million was requested in rate case expenses. For the 2015 rate case, the Company requested $1.8 million in rate case expenses. Actual rate case expenses in 2015 were $1.5 million.

C. See the following attachments:
- I&E-RE-I-10-D CONFIDENTIAL Attachment 1
- I&E-RE-I-10-D CONFIDENTIAL Attachment 2
- I&E-RE-I-10-D CONFIDENTIAL Attachment 3
- I&E-RE-I-10-D CONFIDENTIAL Attachment 4
- I&E-RE-I-10-D CONFIDENTIAL Attachment 5
- I&E-RE-I-10-D CONFIDENTIAL Attachment 6
- I&E-RE-I-10-D CONFIDENTIAL Attachment 7
- I&E-RE-I-10-D CONFIDENTIAL Attachment 8

D. No regulatory commission expenses have been incurred to date for the Company's 2025 base rate case.

E. There are no claimed expenses attributable to prior rate case proceedings included in the Company's current FPFTY distribution rate case expense claim.

WITNESS: Bethany L. Johnson

F. PPL Electric believes that three years is appropriate for the normalization of the rate case expense because it reflects the Company's reasonable projection of the number of years between the instant proceeding and its next base rate case. Further, because distribution ratemaking is forward-looking, the projected interval until the Company's next base rate case should be used instead of PPL Electric's historical filing frequency.

G. Of the claimed rate case-related expenses, printing, Post & Schell, P.C. outside counsel and external witness expenses from Concentric Energy Advisors, Inc. are incurred by PPL Services and 100% directly charged to PPL Electric. The office supplies and Gannett Fleming Valuation and Rate Consultants, LLC rate case-related expenses are incurred by PPL Services and will be 100% directly charged to PPL Electric. PPL Electric expects that any other rate case-related expenses will be directly incurred by PPL Electric and not allocated to PPL Electric by an affiliate.

H. See I&E-RE-I-10-D Attachment 9.

WITNESS: Sharon Leskowsky

PPL Electric Utilities Corporation
Response to the RE Set V Data Requests of the
Bureau of Investigation and Enforcement
Dated November 3, 2025
Docket No. R-2025-3057164

I&E-RE-V-1 Reference PPL's response to I&E-RE-III-5, Part E regarding storm damage expenses from routine, non-reportable storms. Provide the actual expenses incurred by fiscal year in FY 2021, FY 2022, FY 2023, FY 2024, and the HTY.

PPL Electric Response Actual expenses for routine, non-reportable storms for the year ended June 30 are:

2021	2022	2023	2024	2025 (HTY)
$6,883,106	$16,171,252	$10,350,722	$14,914,783	$29,196,124

PPL Electric Utilities Corporation
Response to the RE Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 10, 2025
Docket No. R-2025-3057164

I&E-RE-I-12-D

Reference PPL Volume VII, Schedules D-1 through D-19. For each of the following, provide distribution-level details by year identifying (1) the account name/number, (2) the payee(s), (3) the expense amount incurred in FY 2021 through the HTY, forecasted for the FTY, and claimed for the FPFTY, and (4) the basis for why each expense is appropriate to include for distribution ratemaking purposes:

A. Fines and penalties.

B. Bank charges.

C. Clearinghouse fees.

D. Subscriptions.

E. Company sponsorships.

F. Lobbying expenses/Political campaign donations.

G. Membership dues and subscriptions.

H. Donations.

I. Charitable or civic contributions.

PPL Electric Response

A. Fines and Penalties are recorded to “Other income and (deductions),” Account 426, and not to operating expenses. Therefore, contributions of this type are not reflected in customer rates.

However, in preparing the response to this discovery request, the Company identified a $1,000 civil penalty recorded in May 2025 that was incorrectly charged to “Supervision – Customer Accounts”, Account 901.The Company will make a correction to move this expense to “Other income and (deductions),” Account

426 during the October 2025 accounting close period through its established process for making accounting corrections.

B. Bank Charges are recorded to Account 923 “Outside services employed”.

Total amounts for the 12 months ended June 30, 2021, through the HTY are $1.7 million. See I&E-RE-I-12-D Attachment 1 for all bank charges recorded to Account 921 for the 12 months ended June 30, 2021, through the HTY. The attachment also lists $0.2 million in bank rebates received by PPL Electric in relation to its US Bank P-Card program. These are all allocated costs which have been calculated based on historical allocation percentages contained within the Company’s records and in accordance with the Company’s Cost Allocation Manual (CAM) provided in filing requirement II-D-8.

The budget for the FTY is $0.9 million and for the FPFTY is $0.9 million. Charges of this type are reflected in customer rates based on the FERC account to which they are recorded and the definition of that FERC account. These are all allocated costs which have been calculated based on historical allocation percentages contained within the Company’s records and in accordance with the Company’s Cost Allocation Manual (CAM) provided in filing requirement II-D-8. These are reasonable and prudent costs incurred and associated with, among other things, bank analysis fees, wire fees, and Issuing and Paying Agent (IPA) fees, all of which are necessary to finance Company activities, and thus are appropriately included in the Company’s distribution rates.

C. Financing fees are recorded to Account 923 “Outside services employed”.

Total amounts for the 12 months ended June 30, 2021, through the HTY are $677,971. See I&E-RE-I-12-D Attachment 1 for all financing fees recorded to Account 923 or 930 for the 12 months ended June 30, 2021, through the HTY. These are all allocated costs which have been calculated based on historical allocation percentages contained within the Company’s records and in accordance with the Company’s Cost Allocation Manual (CAM) provided in filing requirement II-D-8.

The budget for the FTY is $0.1 million and for the FPFTY is $0.1 million. These are all of allocated costs which have been calculated based on historical allocation percentages contained within the Company’s records and in accordance with the

Company's Cost Allocation Manual (CAM) provided in filing requirement II-D-8.

Payment transaction fees are recorded to Account 910 "Miscellaneous customer service and informational expenses".

The Company did not incur any payment transaction fees for the 12 months ended June 30, 2021, through the HTY.

The budget for the FTY is $0.0 million and for the FPFTY is $5.2 million. The FPFTY claim is based on PPL Electric's proposal to recover payment transaction fees through base rates as described in PPL Electric Statement No. 18. See PPL Electric Statement No. 18 for an explanation as to why these costs are appropriate to recover in the Company's base rates. These are reasonable and prudent costs incurred and associated with rating agencies and bond trustee fees required to finance Company activities, and thus are appropriately included in the Company's distribution rates. Charges of this type are reflected in customer rates based on the FERC account to which they are recorded and the definition of that FERC account.

D. Subscriptions are recorded to Account 921 "Office supplies and expenses" and various other expense accounts as shown in I&E-RE-I-12-D Attachment 1.

Total amounts for the 12-months ended June 30, 2021, through the HTY were $683,915. See I&E-RE-I-12-D Attachment 1 for subscription expenses charged to Budget Item 26010 (Subscriptions & Publications) for subscriptions for the 12-months ended June 30, 2021, through the HTY. This includes $402,563 of allocated costs which have been calculated based on historical allocation percentages contained within the Company's records and in accordance with the Company's Cost Allocation Manual (CAM) provided in filing requirement II-D-8.

The budget for the FTY is $120,840 and for the FPFTY is $73,674. Charges of this type are reflected in customer rates based on the FERC account to which they are recorded and the definition of that FERC account. This includes allocated costs of $119,692 for FTY and $72,684 for FFTY which have been calculated based on historical allocation percentages contained within the Company's records and in accordance with the Company's Cost Allocation Manual (CAM) provided in filing requirement II-D-8. These are reasonable and prudent costs incurred and associated with, among other things, subscriptions to

news organizations for employee research and training, employee training and development organization resources, and workplace tools and thus are appropriately included in distribution ratemaking.

E. Company sponsorships are recorded to Account 930 "Advertising & Misc General".

The total amount for the 12 months ended June 30, 2021, through the HTY was $119,930. These were all allocated costs which have been calculated based on historical allocation percentages contained within the Company's records and in accordance with the Company's Cost Allocation Manual (CAM) provided in filing requirement II-D-8. See I&E-RE-I-12-D Attachment 1 for company sponsorships charged to Activity Code 000001C039 (Sponsorships – PA Only) for sponsorships for the 12 months ended June 30, 2021, through the HTY.

The budget for the FTY is $41,300 and for the FPFTY is $27,510. These are all allocated costs which have been calculated based on historical allocation percentages contained within the Company's records and in accordance with the Company's Cost Allocation Manual (CAM) provided in filing requirement II-D-8. Charges of this type are reflected in customer rates based on the FERC account to which they are recorded and the definition of that FERC account. These are reasonable and prudent costs incurred and associated with, among other things, PPL Electric's community and economic development sponsorships, which are strategic investments that promote the long-term health and economic vitality of the communities it serves. These efforts help attract and retain businesses, support workforce development, and strengthen local economies, which benefits all customers by fostering load stability and spreading fixed costs across a broader base, and thus are appropriately included in distribution ratemaking.

F. Lobbying expenses/Political campaign donations are recorded to "Other income and (deductions)," Account 426, and not to operating expenses. Therefore, contributions of this type are not reflected in customer rates.

G. Membership dues and subscriptions are recorded to Account 930 "Advertising & Misc General".

The total amount for the 12 months ended June 30, 2021, through the HTY was $7.1 million. This includes $405,204 of allocated costs which have been calculated based on historical allocation

percentages contained within the Company's records and in accordance with the Company's Cost Allocation Manual (CAM) provided in filing requirement II-D-8. See I&E-RE-I-12-D Attachment 1 for membership dues charged to Budget Item 47000 (Contrib, Dues & Membership Fee) for membership dues for the 12-months ended June 30, 2021, through the HTY.

The budget for the FTY is $1.4 million and for the FPFTY is $2.8 million. This includes $0.1 million for FTY and FPFTY of allocated costs which have been calculated based on historical allocation percentages contained within the Company's records and in accordance with the Company's Cost Allocation Manual (CAM) provided in filing requirement II-D-8. Charges of this type are reflected in customer rates based on the FERC account to which they are recorded and the definition of that FERC account.

In preparation of this response, PPL Electric has identified approximately $4,000 in Tab G of I&E-Re-I-12-D Attachment 1 across the 12-months ended June 30, 2021, through the HTY that should not have been included, as they relate to a private social organization. The remainder of the charges for the historic periods and the FTY and FPFTY are reasonable and prudent costs incurred and associated with, among other things, memberships to chambers of commerce, employee training and professional development organizations, industry groups and associations, work-related travel, and online working tools and thus are appropriately included in distribution ratemaking.

H. Donations are recorded to "Other income and (deductions)," Account 426, and not to operating expenses. Therefore, contributions of this type are not reflected in customer rates.

I. Charitable and civic contributions are recorded to "Other income and (deductions)," Account 426, and not to operating expenses. Therefore, contributions of this type are not reflected in customer rates.

PPL Electric Utilities Corporation
Response to the RE Set III Data Requests of the
Bureau of Investigation and Enforcement
Dated October 28, 2025
Docket No. R-2025-3057164

I&E-RE-III-7 Reference PPL Volume IX, Statement No. 17 regarding vegetation management. Provide the following:

A. The total FPFTY vegetation management expense claim, identifying the account(s) that include(s) vegetation management expense and provide the amounts included in each for ratemaking purposes.

B. The vegetation management expense incurred in FY 2023, FY 2024, the HTY, and the FTY to-date, as well as budgeted amounts for the remainder of the FTY fiscal year.

C. Identify any corresponding capitalized amounts associated with the responses to Part A and B.
D. State whether the Company has reflected the identified savings in response to Part B in its FPFTY claims.

E. A detailed calculation for the method used to determine the Company's proposed increase to its vegetation management budget.

F. State whether the Company is proposing to conduct vegetation management using techniques that will reduce the frequency and additional costs of revisits to previously treated areas.

G. A copy of PPL's vegetation management plan.

PPL Electric Response

A. The FPFTY vegetation management expense claim is $49,999,000. Those expenses are booked to Account 59340.

B.

FY 2023 (July 2022-June 2023)	FY 2024 (July 2023-June 2024)	HTY	FTY YTD (Through Sept)	FTY Budget (Oct through June)
$ 37,417,309	$ 30,326,092	$35,515,782	$ 6,288,080	$25,108,339

C. The vegetation capital budget was stated as $25M in testimony, reflecting the fiscal year budget.

FPFTY Vegetation Capital
Account: 365.0 overhead conductors and devices
Amount: $25,000,000

D. Vegetation management expenses are identified in Part B, not savings. Additionally, PPL Electric has not quantified O&M savings that may result from its vegetation management expenses in the FPFTY.

E. See I&E-RE-III-7 Attachment 1.

F. PPL Electric's Vegetation Management program utilizes integrated vegetation management techniques to promote compatible, low-growing, native plant species along the right-of-way floor. This is achieved through routine vegetation maintenance evaluations and routine property specific management prescriptions. These prescriptions are developed and reviewed by subject matter experts including ISA Certified Foresters, who evaluate vegetation conditions to ensure that the appropriate vegetation management techniques are utilized. Over time, this is designed to reduce the need for more intensive interventions, which would lower long-term maintenance costs.

G. See the following attachments:

- I&E-RE-III-7 Attachment 2 – Vegetation Management Excerpt from I&M Plan (includes Transmission)

- I&E-RE-III-7 Attachment 3 – Specification for Distribution Vegetation Management

PPL Electric Utilities Corporation

PPL Electric is again requesting acceptance of the following deviation from the intervals in the Commission standard as were included in the four previous I&M reports (2018-2019, 2020-2021, 2022-2023, and 2024-2025):

- Section 57.198(n)(8). Substation inspections.

52. Pa. Code § 57.198(m) Recordkeeping *An EDC shall maintain records of its inspection and maintenance activities sufficient to demonstrate compliance with its distribution facilities inspection, maintenance, repair and replacement programs as required by subsection (n). The records shall be made available to the Commission upon request within 30 days. Examples of sufficient records include: (1) Date-stamped records signed by EDC staff who performed the tasks related to inspection. (2) Maintenance, repair and replacement receipts from independent contractors showing when and what type of inspection, maintenance, repair or replacement work was done.*

Inspection and maintenance activities performed by PPL Electric employees are tracked by electronic work requests in the Company's work management platform which date-stamps transactions and captures an electronic signature of the employee certifying completion.

Inspection and maintenance activities performed by PPL Electric contractors are documented with itemized records which identify when and what type of work was performed before invoices for the work are paid.

52. Pa. Code § 57.198(n)(1). Vegetation Management *The Statewide minimum inspection and treatment cycle for vegetation management is between 4-8 years for distribution facilities. An EDC shall submit a condition-based plan for vegetation management for its distribution system facilities explaining its treatment cycle.*

Program Description

PPL Electric employs a condition based five- to eight-year inspection and maintenance cycle for its distribution circuits where trimming, hazard tree removals, and brush control are performed. All transmission lines have two complementary condition-based maintenance programs performed on four-year cycles. One focuses on herbicide application to manage vegetation on the floor of the corridor and the other focuses on trimming along the edge of the corridor. Inspections for and removals of hazard trees occur on both cycles. Each program is offset by two years, so each line receives a physical inspection and maintenance every two years. Additionally, to verify clearances of vegetation from transmission facilities, an aerial Light Detection and Ranging ("LiDAR") inspection is performed every other year for low kV lines. Based on conditions, the cycle schedule may be modified but not beyond established regulations.

- Purpose:

PPL Electric Utilities Corporation

To safeguard the reliability of its electric distribution system, PPL Electric has developed a comprehensive program to manage vegetation around power lines. Keeping trees and other vegetation away from high-voltage lines is vital, as tree contacts can result in short-circuits and subsequent service outages.

Taller species of trees grown under power lines eventually will contact the wires if not managed, causing service interruptions and unsafe conditions. It is necessary for PPL Electric to trim or remove these trees to continue safe and reliable electric service.

- Process:

Distribution

Trees within 10 feet of multi-phase lines will be pruned to the full extent of the established tree line, not to exceed 25 feet from centerline and ground to sky pruning will be utilized.

Trees within 10 feet of single-phase lines will be pruned to the full extent of the established tree line, not to exceed 15 feet from centerline and to a distance of 15 feet above the line. All dead or structurally weak limbs that could fall or blow into the conductor are removed regardless of their distance above the conductor.

Exceptions: Trees on the opposite side of any thoroughfare, where normal line construction exists (not alley arms), are considered for proper lateral pruning using the centerline of the thoroughfare as a guideline. Fast growing tree species may need more aggressive pruning.

"Hazard trees" are trees outside the right of way (ROW) that may be leaning, diseased, or otherwise pose a threat of falling on a distribution line. PPL Electric conducts the removal either based on ROW agreements or with the property owner's permission.

Transmission

PPL Electric operates thousands of miles of high-voltage transmission lines. The Company's vegetation management program is designed to promote the safe and reliable operation of the electric grid, while considering the concerns of property owners and obligations to electric customers. Low-growing grasses and other compatible species are permitted within the wire zone. In the remainder of the ROW, certain compatible trees and shrubs are allowed if they do not pose a reliability risk.

52. Pa. Code § 57.198 (n)(2). Pole Inspections *Distribution poles shall be inspected at least as often as every 10-12 years except for the new southern yellow pine creosoted utility poles which shall be initially inspected within 25 years, then within 12 years annually after the initial inspection. Pole inspections must include:*

PPL Electric Utilities Corporation
Response to the RE Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 10, 2025
Docket No. R-2025-3057164

I&E-RE-I-1-D

Reference PPL Electric Utilities Corporation (PPL or Company) rate case filing for distribution rates. Provide the following:

A. A detailed explanation for why it is appropriate to include claims for transmission operations for distribution ratemaking purposes.

B. Identify each account including the amount in which transmission operation-related expenses are included in PPL's FPFTY distribution operations claims.

C. State whether the Company considered I&E's previous recommendation at Docket No. R-2015-2469275, I&E Statement No. 2, p. 44 to "provide the breakdown of its supporting schedules and standard data requirements to the jurisdictional distribution level with the original filing in future proceedings", when filing the instant requested rate increase.

D. A detailed explanation for why it is appropriate that PPL not exclusively provide distribution-level schedules in its distribution base rate case filings.

PPL Electric Response

A. The Company is not proposing to include claims for transmission operations in this filing. As shown in PPL Exhibits Fully Projected Future 1 on Schedules C-1 and D-1, the Company has included only PA PUC Jurisdictional values in the calculation of its revenue requirement.

B. Not applicable.

C. The Company prepared the filing in accordance with the applicable PA PUC regulations.

D. The Company has both distribution and transmission operations. As such, the Company presents its total "per

books" values in its schedules and removes non-jurisdictional plant from Schedule C-1 and non-jurisdictional revenue and expenses in Schedule D-1.

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Christopher Keller. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. SUMMARIZE YOUR EDUCATION AND EMPLOYMENT HISTORY.

A. An outline of my education and employment history is attached as Appendix A.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for protecting the public interest in proceedings before the Commission. I&E's analysis in this proceeding is based on its responsibility to represent the public interest. This responsibility requires balancing the interests of ratepayers, the regulated utility, and the regulated community as a whole.

Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?

A. The purpose of my direct testimony is to review the base rate filing of PPL

Electric Utilities Corporation (PPL or Company), and make recommended adjustments to PPL's proposed operating and maintenance (O&M) expenses, taxes other than income, and cash working capital (CWC) for the fully projected future test year (FPFTY) ending June 30, 2027.

Q. DOES YOUR DIRECT TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 2 contains schedules that support my direct testimony.

Q. PLEASE SUMMARIZE YOUR RECOMMENDED O&M ADJUSTMENTS.

A. The following table summarizes my recommended adjustments.

	Company Claim	I&E Adjustment	I&E Recommended Allowance
O&M Expenses:			
Payroll and Benefits Expense	$81,900,000	($5,421,000)	$76,479,000
Payroll Taxes	$6,961,000	($2,368,000)	$4,593,000
Incentive Compensation	$4,412,000	($2,050,000)	$2,362,000
Advertising Expense	$923,000	($130,000)	$793,000
Infrastructure Investment & Jobs Act Cost Amortization	$211,000	($211,000)	$0
Payment Transaction Fees	$4,980,000	($1,149,000)	$3,831,000
Economic Development	$400,000	($400,000)	$0
Total O&M Expense Adjustments		($11,729,000)	
Rate Base Adjustments:			
Cash Working Capital	$16,775,000	($5,478,000)	$11,297,000
Total Rate Base Adjustments		($5,478,000)	

PAYROLL AND BENEFITS EXPENSE

Q. WHAT IS INCLUDED IN PAYROLL AND BENEFITS EXPENSE?

A. The Company's payroll claim includes amounts for regular and overtime wages. The benefits claim typically include costs for employee benefits such as medical, dental, life insurance, and retirement benefits.

Q. WHAT IS THE COMPANY'S CLAIM FOR PAYROLL EXPENSE?

A. The Company's claim for payroll expense is $64,357,000.[1] It should be noted that the Company's claim includes payroll expense of $1,400,000 related to employees that administer the Company's universal service programs that the Company is proposing to be recovered through its Universal Service Rider (USR Rider).[2] I will discuss later in my testimony why this proposal should be rejected.

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM FOR PAYROLL EXPENSE?

A. The Company's claim for payroll expense is based on the projected number of employees at the end of the FPFTY multiplied by the average monthly wages times twelve months.[3]

---

1 I&E Exhibit No. 2, Schedule 1, p. 3.
2 I&E Exhibit No. 2, Schedule 2.
3 PPL Exhibit Fully Projected Future 1, Schedule D-5.

Q. WHAT IS THE COMPANY'S CLAIM FOR BENEFITS EXPENSE?

A. The Company's claim for benefits expense is $17,543,000[4] based on the percentage of employee benefit costs to payroll expense.[5]

Q. PLEASE SUMMARIZE THE COMPANY'S TOTAL CLAIM FOR PAYROLL AND BENEFITS EXPENSE?

A. The Company's claim for payroll and benefits expense for the FPFTY is $81,900,000 ($64,357,000 + $17,543,000).

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM FOR PAYROLL AND BENEFITS EXPENSE?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR PAYROLL AND BENEFITS EXPENSE?

A. I recommend an allowance of $76,479,000 for payroll and benefits expense, or a reduction of $5,421,000 ($81,900,000 - $76,479,000) to PPL's claim.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation for payroll and benefits expense is based on applying a

[4] I&E Exhibit No. 2, Schedule 1, p. 3.
[5] PPL Exhibit Fully Projected Future 1, Schedule D-5.

vacancy adjustment as it is unreasonable to assume that the Company will maintain 100% full staffing based on its own historic vacancy records. Since there will always be search and placement time involved in filling vacancies, there will always be a certain level of vacancies on a day-to-day operating basis that should be reflected in PPL's payroll expense allowance. The adjustment for average historic vacancy levels is needed to reflect a more accurate employee complement in the FPFTY. My recommendation more accurately represents the payroll expense level that will be in effect at the end of the FPFTY.

Q. EXPLAIN HOW YOU DETERMINED YOUR ADJUSTMENT.

A. I determined a historical three-year average vacancy rate and applied this to the Company's claim for payroll and benefits expense.

Q. DID PPL TAKE VACANCIES INTO CONSIDERATION WHEN DEVELOPING ITS CLAIM?

A. No. The Company states in response to I&E-RE-II-3-D that it did not incorporate a general vacancy reserve when developing its claim for payroll and benefits expense.[6] PPL states that head count is done at the functional group level where some functional groups apply a 5% vacancy reserve, but the Company did not

[6] I&E Exhibit No. 2, Schedule 3.

provide any calculations to reflect any vacancy reserve for those functional groups.[7]

Q. WHAT VACANCY RATE DO YOU RECOMMEND?

A. I recommend vacancy rates of 4.3% and 10.3% for union and non-union payroll and benefits expense, respectively.

Q. PLEASE EXPLAIN HOW YOU CALCULATED YOUR PAYROLL EXPENSE VACANCY ADJUSTMENTS.

A. I reviewed PPL's response to I&E-RE-II-2-D, which requested the number of employees, number of vacancies, and vacancy rates broke down by union and non-union for the Twelve Months Ending (TME) June 30, 2023, June 30, 2024, and historic test year (HTY) 2025, future test year (FTY) 2026, and FPFTY 2027.[8] I calculated vacancy rates for the TME June 30, 2023, June 30, 2024, and HTY 2025 of 6.9%, 4.0%, and 2.1%, respectively, for union employees and 9.7%, 9.9%, and 11.3%, respectively, for non-union employees.[9] This resulted in a three-year average vacancy rate of 4.3% [(6.9% + 4.0% + 2.1%) ÷ 3] for union employees and 10.3% [(9.7% + 9.9% + 11.3%) ÷ 3] for non-union employees.

Next, I determined the percentage of union and non-union payroll expense to total payroll expense. To determine this, I reviewed PPL's response to I&E-RE-

[7] I&E Exhibit No. 2, Schedule 3.
[8] I&E Exhibit No. 2, Schedule 4.
[9] I&E Exhibit No. 2, Schedule 5.

II-1-D, which requested a breakdown of payroll and benefits broken down by expensed and capitalized, by union and non-union, and by distribution, transmission, and riders for the TME June 30, 2023, June 30, 2024, and HTY 2025, FTY 2026, and FPFTY 2027.[10] Based on this information, total distribution union and total distribution non-union payroll was $131,944,000 ($100,251,000 + $31,693,000) and $88,483,000 ($86,766,000 + $1,717,000), respectively resulting in total distribution payroll of $220,427,000 ($131,944,000 + $88,483,000). This results in union payroll representing 59.9% ($131,944,000 ÷ $220,427,000) of total payroll and non-union payroll representing 40.1% ($88,483,000 ÷ $220,427,000) of total distribution payroll.

I then determined the amount of the payroll expense claim to allocate between union and non-union payroll expenses. As noted above, the Company's total payroll expense claim is $64,357,000, which can be broken down based on my allocation factors calculated above to be $38,549,843 ($64,357,000 x 59.9%) which I rounded to $38,550,000 for union payroll expense and $25,807,157 ($64,357,000 x 40.1%) which I rounded to $25,807,000 for non-union payroll expense.

Next, I applied my average vacancy rate of 4.3% to the Company's payroll expense claim of $38,550,000 for union employees resulting in a downward adjustment of $1,657,650 ($38,550,000 x 4.3%) which I rounded to $1,658,000

[10] I&E Exhibit No. 2, Schedule 1, p. 3.

resulting in a payroll expense recommendation for union payroll expense of $36,892,000 ($38,550,000 - $1,658,000). I then applied my average vacancy rate of 10.3% to the Company's payroll expense claim of $25,807,000 for non-union employees resulting in a downward adjustment of $2,658,121 ($25,807,000 x 10.3%) which I rounded to $2,658,000 for a payroll expense recommendation for non-union payroll expense of $23,149,000 ($25,807,000 - $2,658,000).

This results in a total payroll expense recommendation of $60,041,000 ($36,892,000 + $23,149,000), or a downward adjustment of $4,316,000 ($64,357,000 – $60,041,000) to the Company's claim.

Q. PLEASE EXPLAIN HOW YOU CALCULATED YOUR BENEFITS EXPENSE VACANCY ADJUSTMENTS.

A. First, I determined the percentage of union and non-union benefit costs to total benefit costs. Total distribution benefit costs were $32,716,000 and $16,343,000[11] for union and non-union benefits costs, respectively resulting in total distribution benefit costs of $49,059,000 ($32,716,000 + $16,343,000). This results in union benefit costs representing 66.7% ($32,716,000 ÷ $49,059,000) of total benefits costs and non-union benefits costs representing 33.3% ($16,343,000 ÷ $49,059,000) of total distribution benefit costs.

[11] I&E Exhibit No. 2, Schedule 1, p. 3.

I then determined the amount of the Company's benefits expense claim to allocate between union and non-union. As noted above, the Company's total benefits expense claim is $17,543,000 which can be broken down based on my allocation factors calculated above to be $11,701,181 ($17,543,000 x 66.7%) which I rounded to $11,701,000 for union benefits expense and $5,841,819 ($17,543,000 x 33.3%) which I rounded to $5,842,000 for non-union benefits expense.

With this information, I applied my average vacancy rate of 4.3% to the Company's benefits expense claim of $11,701,000 for union employees resulting in a downward adjustment of $503,143 ($11,701,000 x 4.3%) which I rounded to $503,000 resulting in a union benefits expense recommendation of $11,198,000 ($11,701,000 - $503,000). I then applied my average vacancy rate of 10.3% to the Company's benefits expense claim of $5,842,000 for non-union employees resulting in a downward adjustment of $601,726 ($5,842,000 x 10.3%) which I rounded to $602,000 resulting in a benefits expense recommendation for non-union payroll expense of $5,240,000 ($5,842,000 - $602,000). This results in a total benefits expense recommendation of $16,438,000 ($11,198,000 + $5,240,000), or a downward adjustment of $1,105,000 ($17,543,000 – $16,438,000) to the Company's claim.

Q. PLEASE SUMMARIZE YOUR RECOMMENDATION FOR PAYROLL AND BENEFITS EXPENSE?

A. I recommend an allowance of $60,041,000 for payroll expense and $16,438,000 for benefits expense for a total recommended allowance for payroll and benefits expense of $76,479,000 ($60,041,000 + $16,438,000), or a reduction of $5,421,000 ($81,900,000 - $76,479,000) to PPL's claim.

PAYROLL TAXES

Q. WHAT IS INCLUDED IN PAYROLL TAXES?

A. Payroll taxes represent taxes imposed on employers and employees that are usually calculated as a percentage of the salaries paid to staff. Payroll taxes generally fall into two categories: (1) deductions from an employee's wages; and (2) taxes paid by the employer based on the employee's wages. PPL has made a claim in this filing for its employer share of those payroll taxes.

Q. WHAT IS THE COMPANY'S CLAIM FOR PAYROLL TAXES?

A. In its filing, PPL's claim for payroll taxes is $6,961,000.[12]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. PPL's claim consists of Social Security, federal unemployment tax (FUTA), and

[12] I&E Exhibit No. 2, Schedule 6, p. 2.

state unemployment tax (SUTA), which the Company calculated to be 8.5% of payroll expense, which is broken down by 8% for Social Security, 0.1% for FUTA, and 0.4% for SUTA.[13] This tax rate is applied to the payroll and benefits to determine the payroll tax claim.[14]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR PAYROLL TAXES?

A. I recommend an allowance of $4,593,000 for payroll taxes, or a reduction of $2,368,000 ($6,961,000 - $4,593,000) to the Company's claim.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on utilizing a payroll tax rate of 7.65% and the recognition of the payroll expense reduction from my vacancy adjustment, and on the percentage of total payroll taxes to total payroll. The Company's 8.5% claim for total payroll taxes is unsupported, particularly since the combination of Social Security and Medicare taxes should be 7.65%, and not the 8.0% total that PPL has indicated.[15] Additionally, I disagree with including employee benefits in the computation for payroll taxes.

[13] I&E Exhibit No. 2, Schedule 6, p. 1.
[14] I&E Exhibit No. 2, Schedule 6, p. 2.
[15] I&E Exhibit No. 2, Schedule 6, p. 1.

Q. WHY IS THE PAYROLL TAX RATE OF 7.65% APPROPRIATE?

A. The majority of payroll taxes paid by an employer are for the federally mandated taxes for Social Security and Medicare. The Social Security tax is paid at a tax rate of 6.2%, up to a $176,100 in individual salary cap for 2025 and $184,500 for 2026. The Medicare tax is paid at a rate of 1.45% for 2025 and 2026 with no salary cap.

Employers also pay federal and state unemployment compensation fund taxes. While employers pay taxes to the Pennsylvania state unemployment compensation fund at a variable rate up to 10.3734%, the salary limit applicable for tax purposes, $10,000 in 2025 and 2026, causes this tax to be a small share of total payroll taxes. The federal unemployment tax is even further limited to the first $7,000 for each employee, and it is reduced by payments to state funds, and thus, it represents a very minimal share of payroll taxes due. It is reasonable to apply the 7.65% federal tax rate (6.2% + 1.45%) as an estimation of payroll taxes due as opposed to the Company's unsupported 8.5% because of the cap of earnings on Social Security income which was stated to be $184,500 for 2026.[16] Given the fact that a number of employees will exceed the earnings subject to Social Security tax, using 7.65% is reasonable and should also account for any employer share of state and federal unemployment taxes.

[16] https://www.ssa.gov/OACT/COLA/cbb.html, accessed December 10, 2025.

Q. PLEASE EXPLAIN HOW YOU CALCULATED YOUR PAYROLL TAX ADJUSTMENT.

A. First, I applied my 7.65% payroll tax rate to the Company's claim for payroll expense of $64,357,000 (since the benefits portion should not be subject to payroll taxes) for a payroll tax recommendation prior to reflecting my vacancy adjustment of $4,923,311 ($64,357,000 x 7.65%) which I rounded to $4,923,000. As discussed earlier, I made a total downward adjustment for payroll expense of $4,316,000 which is 6.7% ($4,316,000 ÷ $64,357,000) of the Company's claim for payroll expense. I then applied the 6.7% to my payroll tax recommendation of $4,923,000 which reflects my payroll tax rate of 7.65% resulting in a reduction of $329,841 ($4,923,000 x 6.7%) which I rounded to $330,000 to the Company's claim. This results in a recommended allowance of $4,593,000 ($4,923,000 - $330,000), or a reduction of $2,368,000 ($6,961,000 - $4,593,000) to the Company's claim.

<u>UNIVERSAL SERVICE RIDER SALARIES AND WAGES</u>

Q. WHAT IS THE COMPANY PROPOSING TO CHANGE FOR ITS UNIVERSAL SERVICE RIDER RECOVERY?

A. The Company is proposing to recover salaries and wages that are currently recovered in base rates for employees that administer the Company's programs under its Universal Service and Energy Conservation Plan (USECP) such as its Customer Assistance Program (CAP Program) – OnTrack, its Low-Income Usage Reduction

Program (LIURP) – WRAP, its Hardship Fund – Operation HELP, and its Customer Assistance and Referral Evaluation Service (CARES) program through its Universal Service Rider (USR Rider).[17]

Q. WHY IS THE COMPANY PROPOSING TO RECOVER THESE SALARIES AND WAGES THROUGH ITS USR RIDER?

A. Company witness Lisa Norden opines that the Company can better adapt and budget its staff for USECP programs and that it would simplify recovery of USECP costs as all other USECP costs are recovered through its USR Rider. She asserts that the Company already recovers its salaries and wages in its Energy Efficiency and Conservation Plan through its Act 129 Compliance Rider. Additionally, she states that the salaries and wages would be subject to reconciliation where any over or under recovery would be trued up and be subject to interest. Finally, she states that it would eliminate the regulatory lag in recovering these USECP costs.[18]

Q. WHAT IS THE APPROXIMATE O&M COSTS THAT WOULD BE SHIFTED FROM BASE RATES TO THE USR RIDER?

A. The Company proposes to shift approximately $1,400,000 of annual USECP costs related to salaries and wages for employees that administer the Company's programs under its USECP through its USR Rider.[19]

---

[17] PPL Statement No. 18, p. 10, lines 8-11.
[18] PPL Statement No. 18, p. 12, line 3 through p. 13, line 5.
[19] PPL Statement No. 18, p. 13, lines 7-17.

Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL TO SHIFT RECOVERY OF THESE COSTS FROM BASE RATES TO ITS USR RIDER?

A. No. I recommend the Commission reject the Company's proposal to move salaries and wages for employees that administer programs under its USECP from base rates to the USR Rider for two reasons. First, moving these costs from base rates to USR Rider provides PPL a guaranteed recovery of USECP labor costs and eliminates the Commission's authority to review reasonableness and prudency of USECP labor costs. Second, shifting cost recovery of the salaries and wages from base rates to the Company's USR Rider would allow the Company to add or remove employees without scrutiny.

Q. HAS THE COMMISSION RECENTLY REJECTED A SIMILAR PROPOSAL?

A. Yes. In the most recent Columbia Gas of Pennsylvania, Inc. (Columbia Gas) base rate case proceeding, Columbia Gas proposed to recover labor costs related to universal service costs related to the Company's Energy Assistance Team (EAT) in its Universal Service Plan (Rider USP). The Commission denied Columbia Gas' proposal and stated the following:

> On consideration of the record evidence, we shall grant Columbia's Exception No. 7. Initially, we note that we concur with the ALJs' recommendation, to which no Party objected, that the Company be directed to continue to recover its EAT costs through its base rates. As I&E observed, shifting the recovery of EAT costs from the Company's base rates to its Rider USP provides Columbia with a *guaranteed* recovery of EAT labor

costs and eliminates the Commission's authority to review the reasonableness and prudency of such costs. See I&E M.B. at 29-30.

However, given that we shall adopt this recommendation of the ALJs, we disagree with the ALJs' corresponding recommendation to also apply a downward adjustment of $220,000 and thereby deny Columbia's recovery of the administrative costs associated with the Company's EAT through its base rates. As Columbia notes, the OCA opposed only the Company's proposal to shift the recovery of EAT costs from base rates to its Rider USP. Columbia Exc. at 15. However, as the OCA confirms in its Replies to Exceptions, it does not oppose the recovery of the $220,000 in EAT costs if such costs remain in the Company's base rates. OCA R. Exc. at 22-23; *see also* OCA R.B. at 80, 165-66. As such, we shall reverse the ALJs' recommendation that would have reduced the Company's claim by $220,000.[20]

Q. IF THE COMMISSION DECIDES TO ALLOW THE COMPANY'S PROPOSAL TO SHIFT THESE COSTS FROM BASE RATES TO THE COMPANY'S USR RIDER, WHAT OTHER RECOMMENDATION DO YOU HAVE REGARDING THESE EXPENSES?

A. As stated earlier, the Company's claim for payroll and benefits expense currently includes the $1,400,000 related to the salaries and wages that the Company is proposing to shift from base rates to its USR Rider. If the Commission decides to allow the Company's proposal, there will need to be corresponding downward adjustments to reflect a decrease in payroll and benefits expense as well as any other expenses that would be affected by the shift of the salaries and wages from base rates

[20] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc*., Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Recovery of Energy Assistance Team/Rider Universal Service Plan (Rider USP), pp. 167-168.

to the USR Rider. Without the corresponding reduction, expenses related to the salaries and wages shifted from base rates to the USR Rider, the Company would receive double recovery of these costs, once in base rates, and again in its USR Rider.

INCENTIVE COMPENSATION

Q. WHAT IS INCENTIVE COMPENSATION?

A. Incentive compensation is additional money or other rewards that are supplementary to base pay.

Q. WHAT IS THE COMPANY'S CLAIM FOR INCENTIVE COMPENSATION?

A. The Company's claim for incentive compensation is $4,412,000.[21]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. The Company's claim does not provide a specific basis for its claim for incentive compensation. In response to I&E-RE-II-11-D, which requests a breakdown of incentive compensation by financial, safety, and qualitative results for the TME June 30, 2023, June 2024, HTY 2025, FTY 2026, and FPFTY 2027, the Company states that its incentive compensation is based on operations goals that include

[21] I&E Exhibit No. 2, Schedule 7, p. 3.

individual performance and that it does not forecast individual components of its incentive compensation criteria.[22] This information provided by the Company indicates there are a number of factors that are taken into consideration when determining incentive compensation and the Company's broad descriptions of these factors provided little specificity.

In the Company's supplemental response to the above data request, the Company provided a breakdown by type of incentive compensation. This includes cash awards of $556,000, stock based compensation of $1,772,000, variable pay of $2,084,000 for a total claim of $4,412,000 ($556,000 + $1,772,000 + $2,084,000).[23]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR THE COMPANY'S INCENTIVE COMPENSATION CLAIM?

A. I recommend an allowance of $2,362,000 for incentive compensation, or a reduction of $2,050,000 ($4,412,000 - $2,362,000) to the Company's claim.

[22] I&E Exhibit No. 2, Schedule 8, pp. 1-2.
[23] I&E Exhibit No. 2, Schedule 7, p. 3.

Q. WHAT IS THE BASIS OF YOUR RECOMMENDATION?

A. My recommendation is based on the removal of 50% of the Company's claim related to cash awards and 100% removal of the Company's claim related to stock-based compensation as these are based on goals that are related to financial results which do not provide any benefit to ratepayers.

PPL's cash awards are based on corporate financial and corporate strategic goals where 55% for operating company presidents and 50% for operating company executives of the Company's cash awards are based on earnings per share.[24] Additionally, the Company's stock based compensation plan includes a Restricted Stock Unit Program which is based on PPL's common stock share price and Performance Units for executives that are based on earnings growth.[25]

Based on this information, I removed 50% of the Company's claim related to cash awards of $278,000 ($556,000 x 50%) and 100% of the Company's claim related to stock based compensation of $1,772,000 for a total downward adjustment of $2,050,000 ($278,000 + $1,772,000). This results in a recommended allowance of $2,362,000 ($4,412,000 - $2,050,000).

[24] I&E Exhibit No. 2, Schedule 8, p. 3.
[25] I&E Exhibit No. 2, Schedule 8, pp. 4-5.

Q. HAS THE COMMISSION RECENTLY ADJUSTED A COMPANY'S CLAIM FOR INCENTIVE COMPENSATION BASED ON THE REMOVAL INCENTIVE COMPENSATION RELATED TO FINANCIAL GOALS?

A. Yes. In the most recent Columbia Gas of Pennsylvania, Inc. (Columbia Gas) base rate case proceeding, the Commission removed 70% of Columbia Gas' total incentive compensation claim that was related to financial goals finding that it was not necessary in providing safe and reliable service to ratepayers. The Commission stated:

> We shall deny Columbia's Exception Nos. 3 and 4. We agree with the ALJs' recommendation to adopt the OCA's proposed downward adjustment of $1,798,165, to the Company's cash-based STI compensation expense claim of $2,568,807. As noted by the ALJs and the OCA, Columbia did not explain why 70% of the incentive compensation expense is necessary to provide adequate service to ratepayers, given that only 30% of this claimed expense is related to operational safety and customer experience. *See* OCA St. 2 at 18-19. Accordingly, we shall adopt the ALJs' recommendation to apply a downward adjustment of $1,798,165, [$2,568,807 x 70% = $1,798,165], to reflect a total allowance for cash-based STI compensation expense of $770,642. [$2,568,807 – $1,798,165 = $770,642].
>
> We also agree with the ALJs and the OCA that Columbia failed to present credible evidence that the totality of its LTI compensation plan is reasonable, given that only 30% of the plan is related to safety, customer care, customer satisfaction, or other benefits to ratepayers. Accordingly, we shall adopt the ALJs' recommendation that only 30% of the Company's LTI compensation expense claim of $754,446, or $226,334, [$754,446 x 30% = $226,334], be allowed for ratemaking purposes, resulting in a downward adjustment of $528,112. [$754,446 – $528,112 = $226,334].[26]

[26] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc*., Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Incentive Compensation, p. 123.

ADVERTISING EXPENSE

Q. WHAT IS INCLUDED IN ADVERTISING EXPENSE?

A. Advertising expense includes goodwill or institutional advertising, customer assistance programs, customer education, employment vacancy searches, and miscellaneous advertising.[27]

Q. WHAT IS THE COMPANY'S CLAIM FOR ADVERTISING EXPENSE?

A. PPL's claim for advertising expense is $923,000.[28]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR ADVERTISING EXPENSE?

A. I recommend an allowance of $793,000 for advertising expense, or a reduction of $130,000 ($923,000 - $793,000) to PPL's claim.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on the removal of goodwill and institutional advertising. In response to I&E-RE-II-17-D, the Company provided a breakdown and descriptions of each of the advertising programs as well as samples of each of

[27] PPL Exhibit II-D-7, Attachment II-D-7d.
[28] PPL Exhibit II-D-7, Attachment II-D-7d, p. 2.

the advertising programs.[29] This type of advertising relates to the Company's Partners in Power campaign, which the Company states "aims to build trust and community that is rooted in partnership" where the purpose is to "reach broad audiences with emotionally resonant stories" that offer "high reach, strong emotional impact, [and] credibility."[30]

These types of advertisements are typically more representative of goodwill advertising, or promotional advertising, that would provide little (if any) benefit to ratepayers. Ratepayers should not be required to finance PPL's decision to pay for such promotional advertising.

INFRASTRUCTURE INVESTMENT & JOBS ACT (IIJA) COST AMORTIZATION

Q. WHAT PROMPTED THE CLAIM FOR AN IIJA COST AMORTIZATION?

A. The Commission granted utilities the ability to defer costs associated with pursuing funds via the IIJA provided the utility files a notice with the Commission at the corresponding docket, and that the request for recovery of any such cost be made at the earliest possible time. The cost recovery was not guaranteed by the Commission and any party can contest recovery of such costs.[31]

---

[29] I&E Exhibit No. 2, Schedule 9.

[30] I&E Exhibit No. 2, Schedule 9, p. 2.

[31] *Petition of the Office of Consumer Advocate, the Office of Small Business Advocate, and the Pennsylvania Utility Law Project Requesting Initiation of a Proceeding on Federal Funding Opportunities for Utilities Under the Infrastructure Investment and Jobs Act*, Docket No. P-2020-3032929, pp. 12-13 (Order Entered July 13, 2023).

Q. DID PPL FILE THE REQUIRED NOTICE WITH THE COMMISSION?

A. Yes.

Q. DID THE COMPANY MAKE A RELATED CLAIM IN THE INSTANT PROCEEDING?

A. Yes. The Company is claiming $211,000.[32]

Q. WHAT IS THE BASIS OF THE COMPANY'S CLAIM?

A. The Company has spent a total of $633,000 in 2022 and 2023 and is requesting a three-year amortization of that amount.[33]

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT DO YOU RECOMMEND?

A. I recommend disallowance of the Company's entire claim.

Q. WHAT IS THE BASIS OF YOUR RECOMMENDATION?

A. I disagree with the concept of a deferral for such cost as allowed by the Commission in general, because a regulatory asset should be used for items that

[32] PPL Exhibit Fully Projected Future 1, Schedule D-10.
[33] PPL Statement No. 22, p. 4, line 18 through p. 5, line 3.

are: (1) extraordinary; (2) unanticipated; (3) nonrecurring; and (4) substantial.[34] While I appreciate the pursuit of regulated utilities applying for such grant funding, companies should be required and expected to apply for such funding in all possible scenarios, and this is not limited to the IIJA. These costs are not extraordinary for PPL, were not necessarily unanticipated, are most certainly recurring expenses because, as stated above, utilities should seek out such funding where available and likely do, and finally, I do not view these expenses as substantial as far as PPL is concerned ($633,000 spent over a two-year period).

Q. IF THE COMMISSION DECIDES TO ALLOW THE COMPANY'S PROPOSED DEFERRAL TREATMENT, WHAT MODIFICATION TO PPL'S CLAIM DO YOU RECOMMEND?

A. As stated above, I disagree with deferral treatment for this claim, however, if the Commission decides to allow it, I recommend that the 2022 and 2023 expense total of $633,000 be amortized over 61 months as opposed to three years, which is in line with the Company's actual historic filing frequency as discussed by I&E witness Zachari Walker.[35] This results in a recommended allowance of $124,525 ($633,000 ÷ 61 months x 12 months), which I rounded to $125,000, or a reduction of $86,000 ($211,000 - $125,000) to the Company's claim.

[34] *Petition of Columbia Gas of Pa., Inc. for Authority to Defer for Accounting and Financial Purposes Certain Start Up Expenses Assoc. with the Redesign of Upgrade of Financial Processes and Info. Systems*, Docket No. P-2012-2319920, p. 5 (Order Entered December 5, 2012).

[35] I&E Statement No. 1.

PAYMENT TRANSACTION FEES

Q. SUMMARIZE THE COMPANY'S PAYMENT TRANSACTION FEES PROPOSAL.

A. PPL proposes to include the costs of payment transactions fees in base rates. Currently, customers pay transaction fees separately when making payments through credit and debit cards, Western Union, walk-in payments, and other electronic payment methods such as Venmo and PayPal.[36]

Q. WHY IS THE COMPANY PROPOSING TO RECOVER PAYMENT TRANSACTION FEES IN BASE RATES?

A. Company witness Lisa Norden claims that including the costs of payment transaction fees in base rates would be convenient for customers as customers may be less willing to make timely payments if there are transaction fees. Additionally, Ms. Norden states that the Company's proposal would help customers avoid termination of service or late payments, eliminate the burden of the transaction fee on customers, reduce confusion between the third-party transaction fees and the Company's charges for electric service, increase customer satisfaction, and reduce the inconvenience of customers sending a check via mail. Finally, Ms. Norden states that the Company's proposal would benefit low-income customers.[37]

[36] PPL Statement No. 18, p. 7, lines 2-10.
[37] PPL Statement No. 18, p. 8, line 1 through p. 9, line 4.

Q. WHAT IS THE EXPENSE CLAIM ASSOCIATED WITH THE PAYMENT TRANSACTION FEE PROPOSAL?

A. PPL is proposing to collect $4,980,000 in base rates.[38]

Q. HOW DID THE COMPANY DETERMINE THE $4,980,000 TO RECOVER IN BASE RATES?

A. PPL based its claim on analysis of payment transaction fees from November 2023 through October 2024 where there were $1,527,569 payment transactions that incurred a transaction fee totaling $3,832,647. The Company then estimated a 30% increase in payment transaction fees based on its historical growth of 15% in payments that incurred a transaction fee from 2023 to 2025 where the Company states that it reasonably projects that the growth in these types of payments will exceed the historical 15% growth rate if transaction fees were eliminated. The Company's estimated 30% increase in payment transaction fees results in a total claim of $4,982,441 ($3,832,647 x 1.30) which the Company rounded to $4,980,000.[39]

[38] PPL Statement No. 18, p. 9, line 14.
[39] I&E Exhibit No. 2, Schedule 10.

Q. DO YOU ACCEPT THE PREMISE OF PPL'S OVERALL PROPOSAL FOR PAYMENT TRANSACTION FEES TO BE INCLUDED IN BASE RATES?

A. Yes.

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM AMOUNT TO BE RECOVERED FOR PAYMENT TRANSACTION FEES IN BASE RATES?

A. No.

Q. WHAT IS YOUR RECOMMENDATION FOR THE PAYMENT TRANSACTION FEE PROPOSAL?

A. I recommend an allowance of $3,831,000 for the payment transaction fee proposal, or a reduction of $1,149,000 ($4,980,000 - $3,831,000) to the Company's claim.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on the removal of the additional 30% that PPL claims will occur once the payment transaction fee is eliminated. While there may possibly be increased usage in payments that would have incurred a payment transaction fee due to the elimination of the payment transaction fee, the Company did not account for other benefits of eliminating the payment transaction fee that would offset the increase in usage. For example, as noted earlier in my testimony,

Ms. Norden acknowledges that the Company's transaction fee proposal would improve customer satisfaction which would also help to reduce uncollectibles and possibly reduce cash working capital needed by the Company. Additionally, the Company's claim does not reflect the cost savings realized for costs associated with customer service such as the call center, mail handling, uncollectibles, collection costs, etc. Most importantly, the Company's proposed 30% increase is speculative and should be rejected. Therefore, I recommend a reduction of the Company's claim to $3,830,769 ($4,980,000 ÷ 130%) which I rounded to $3,831,000 to remove the additional 30% requested. This produces a recommended adjustment of $1,149,000 ($4,980,000 - $3,831,000) to the Company's claim.

ECONOMIC DEVELOPMENT

Q. SUMMARIZE THE COMPANY'S ECONOMIC DEVELOPMENT PROPOSAL.

A. PPL proposes implementing its Opportunity Pennsylvania Program (Program). The Company states that the purpose of the Program is to be a proactive initiative to support communities by securing funding through the Pennsylvania SITES (PA SITES) initiative and other state, federal, or regional programs.[40] Under the Company's Economic Development proposal, the Program would support those in

[40] PPL Statement No. 21, p. 2, line 22 through p. 3, line 3.

PPL's service territory by providing reimbursement funding for completed site development work and provide technical assistance in helping communities obtain additional state and federal funding.[41]

Q. WHAT IS THE BASIS FOR THE COMPANY'S ECONOMIC DEVELOPMENT PROPOSAL?

A. Company witness Jason Hunt opines that economic vitality in PPL's service territory is critical and that the Commission has an important role to play when it comes to economic development. Mr. Hunt asserts that economic development results in better paying jobs, increased tax revenue, and overall higher quality of life where the Company can help promote sustainable growth in its service territory. Additionally, Mr. Hunt states that economic development benefits customers by creating stronger, more resilient communities, and a more efficient and cost-effective electric system as when new companies connect to the grid, they will increase overall system utilization which will spread fixed costs across a larger customer base. Furthermore, Mr. Hunt states that the Program would help communities in its service territory by bringing about site development across both developed and underdeveloped regions. Finally, Mr. Hunt states that the Program is not only about powering new businesses, but also empowering opportunity as it strengthens the grid, supports affordability, and helps communities thrive.[42]

[41] PPL Statement No. 21, p. 5, line 2 through p. 6, line 15.
[42] PPL Statement No. 21, p. 3, line 6 through p. 4, line 17.

Q. WHAT IS THE EXPENSE CLAIM ASSOCIATED WITH PPL'S ECONOMIC DEVELOPMENT PROPOSAL?

A. PPL is proposing to collect $400,000 in distribution base rates.[43]

Q. HOW DID THE COMPANY DETERMINE THE $400,000 TO RECOVER IN BASE RATES?

A. PPL based its claim on market information provided by Company affiliates, Louisville Gas and Electric Company and Kentucky Utilities Company, as well as discussions with communities and vendors that have secured PA SITES funding where they stated that technical assistance ranged from $100,000 to $120,000 per site.[44] PPL states that the Company's claim of $400,000 is a reasonable and prudent amount to support a balanced portfolio of reimbursement and technical assistance grants.[45]

Q. DO YOU AGREE WITH THE COMPANY'S ECONOMIC DEVELOPMENT PROPOSAL?

A. No. I recommend the Commission reject the Company's Economic Development proposal. While PPL's proposal may be well-intentioned, it is not appropriate for ratepayers to fund the Company's proposal. The Company has not provided any

[43] PPL Statement No. 21, p. 3, lines 2-3.
[44] I&E Exhibit No. 2, Schedule 11.
[45] I&E Exhibit No. 2, Schedule 11.

support indicating that the Economic Development proposal will provide any benefits to ratepayers as a whole.

Q. EXPLAIN WHETHER PPL HAS PROPOSED SIMILAR ECONOMIC DEVELOPMENT PROGRAMS IN PRIOR PROCEEDINGS, AND IF SO, IDENTIFY THE OUTCOME.

A. In PPL's 2004 base rate case, the Company proposed a similar program, the Community Betterment Initiative (CBI), where PPL would establish a mandated ratepayer contribution to community development organizations and human service areas in PPL's service territory. Unlike the Company's Economic Development proposal in this proceeding, PPL would have matched ratepayer contributions dollar-for-dollar with a contribution from shareholders. The Commission in that proceeding stated the following in rejecting the Company's CBI proposal:

> The use of ratepayer funds in this regard is not appropriate because PPL has failed to provide concrete record evidence quantifying how the program will benefit ratepayers. Furthermore, in PPL's prior base rate proceeding, the costs associated with these socio-economic type programs were not allowed. As such, we shall grant the Exceptions of the OTS, reversing the ALJ recommendation, and deny recovery of the $1 million mandatory ratepayer funded portion of this program. We do, however, encourage PPL to contribute corporate funds into the CBI.[46]

[46] *Pa. PUC v. PPL Electric Utilities Corporation*, Docket No. R-00049255 (Order Entered December 22, 2004). *See generally* Disposition of Community Betterment Initiative, p. 47.

As noted above, the Commission has rejected similar proposals in prior PPL proceedings citing the lack of quantifiable evidence to demonstrate how the Company's proposal would benefit ratepayers. Therefore, I recommend the Company's Economic Development proposal be rejected and the $400,000 expense claim for the Economic Development proposal be disallowed.

CASH WORKING CAPITAL

Q. WHAT IS A CASH WORKING CAPITAL (CWC) ALLOWANCE FOR RATEMAKING PURPOSES?

A. CWC includes the amount of funds necessary to operate a utility during the interim between the rendition of service, including the payment of related expenses, and the utility's receipt of revenue in payment of services rendered.

Q. HOW DOES THE COMPANY CALCULATE ITS CWC CLAIM?

A. PPL calculates its CWC by using a lead/lag study. A lead/lag study measures the differences in time between: (1) the time services are rendered until payment of those services is received; and (2) the time between the point when a utility has incurred an expense and the actual payment of the expense. Stated differently, the lead/lag study measures how many days exist on average between the midpoint of the service period and the date the payment is made.

Q. DO YOU AGREE WITH THE COMPANY'S USE OF THE LEAD/LAG METHOD?

A. Yes.

Q. WHAT IS THE COMPANY'S CWC CLAIM?

A. The Company's claim for CWC is $16,775,000.[47]

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIM?

A. PPL's claim is based on an HTY lead/lag study, applying total revenues and total expenses for the FPFTY ending June 30, 2027.

Q. DID THE COMPANY ACKNOWLEDGE ANY ERRORS DURING DISCOVERY?

A. Yes. The Company identified an error in response to I&E-RE-I-2-D which would increase O&M expenses resulting in an increase in the average lag of operating expenses and a reduction in average lag days between payment of operating expense and receipt of revenue from 5.2 days to 5.1 days.[48] This correction has been reflected in I&E Exhibit No. 2, Schedule 12, p. 3.

[47] PPL Exhibit Fully Projected Future 1, Schedule C-4.
[48] I&E Exhibit No. 2, Schedule 13.

Q. DO YOU AGREE WITH THE COMPANY'S CLAIM?

A. No.

Q. WHAT DO YOU RECOMMEND?

A. I recommend an allowance of $11,297,000 or a decrease of $5,478,000 ($16,775,000 - $11,297,000) to the Company's claim.[49]

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on two adjustments. First, I recommend a change to the expense lag days corresponding to Affiliate Support from 35 days to 45 days. Second, my recommendation includes adjustments to O&M expenses as discussed in I&E witness Zachari Walker's direct testimony[50] and in my direct testimony.

Q. IS YOUR RECOMMENDED CWC ALLOWANCE A FINAL RECOMMENDATION?

A. No. All adjustments to PPL's claims for revenues, expenses, taxes, and rate base must be continually brought together in the Administrative Law Judge's Recommended Decision and again in the Commission's Final Order. This process, known as iteration, effectively prevents the determination of a precise calculation until all adjustments have been made to the Company's claim.

[49] I&E Exhibit No. 2, Schedule 12, p. 1.
[50] I&E Statement No. 1.

Q. WHY ARE YOU RECOMMENDING TO CHANGE THE LAG DAYS FOR AFFILIATE SUPPORT FROM 35 DAYS TO 45 DAYS?

A. The basis for my recommendation is to change the expense lag days corresponding to Affiliate Support costs from 35 day to 45 days. This change aligns payment timing with the terms of the service agreement and removes unnecessary early payment, to maximize the holding period of cash to the Company's and ratepayers' benefit. This recommended change is reflected in I&E Exhibit No. 2, Schedule 12, p. 3.

Q. PLEASE EXPLAIN THE PAYMENT TERMS OF THE AFFILIATE SUPPORT SERVICES AGREEMENT.

A. According to the Company's service agreement with the affiliate, services are payable within thirty (30) days after receipt of invoice.[51] The payment lag is the sum of the days to the midpoint of service period of one month, which is 15 days, plus the 30 day payment due date, which results in a total payment lag of 45 days.

Ratepayers should not bear costs associated with CWC increases that result from unnecessary and disadvantageous early payments, which in this instance are being paid to a PPL-affiliated company. Based on a recalculation of the average lag with this adjustment, the result indicates that the Company experiences no lag

[51] PPL Exhibit II-D-7, Attachment II-D-8b, p. 2.

in receipt of revenue relative to payment of O&M expenses. Accordingly, there should be no CWC requirement associated with this factor.

Q. WHAT O&M ADJUSTMENTS DID YOU INCORPORATE WHEN DETERMINING A RECOMMENDED CWC ALLOWANCE?

A. All O&M adjustments that are cash-based expense claims should be included when determining the Company's CWC requirement. Therefore, I have included cash-based O&M recommendations when computing the overall recommended CWC allowance.

Q. SUMMARIZE WHERE EACH OF THE RECOMMENDED O&M EXPENSE ADJUSTMENTS ARE REFLECTED IN THE CWC COMPUTATIONS.

A. The following recommended adjustments are reflected in the O&M Expense - Expense Lag Days calculation: payroll and benefits expense adjustment of $5,421,000, payroll taxes adjustment of $2,368,000, incentive compensation adjustment of $2,050,000, advertising expense adjustment of $130,000, payment transaction fees adjustment of $1,149,000, economic development adjustment of $400,000, rate case expense adjustment of $304,000, storm damage expense adjustment of $9,994,000, bank charges adjustment of $388,000, company sponsorships adjustment of $28,000, membership dues and subscriptions adjustment of $2,800,000, and vegetation management expense adjustment of

$15,579,000 as discussed above and in I&E witness Zachari Walker's direct testimony, producing a total decrease of $40,611,000[52] which is reflected in I&E Exhibit No. 2, Schedule 12, p. 2.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

[52] I&E Exhibit No. 2, Schedule 13, p. 4.

Cash Working Capital

PPL Electric Utilities Corporation
Response to the RE Set II Data Requests of the
Bureau of Investigation and Enforcement
Dated October 14, 2025
Docket No. R-2025-3057164

I&E-RE-II-1-D

Reference PPL Electric Utilities Corporation (PPL or Company) Exhibit II-D-10 and Exhibit Fully Projected Future 1, Schedule D-5 concerning salaries and wages expense and benefits expense. Provide the following:

A. Breakdown by expensed and capitalized for normal labor, overtime labor, by union and non-union, benefit expense, etc. and by PUC jurisdictional (distribution), transmission, and riders for TME June 30, 2023, June 30, 2024, HTY 2025, FTY ending June 30, 2026, and FPFTY ending June 30, 2027.

B. Similar breakdown of salaries and wages from Part A for the YTD beginning July 1, 2025.

PPL Electric Response

A. See I&E-RE-II-1-D Attachment 1 and I&E-RE-II-1-D Attachment 2 (FTY and FPFTY ending June 30, 2026 and 2027, respectively).

B. See I&E-RE-II-1-D Attachment 1.

PPL Electric

	Benefit Expense	35.8%	0.0%	24.2%	45.3%	0.0%	30.0%

The charge to expense is based on activities performed or expected to be performed during the applicable years.

I&E Exhibit No. 2
Schedule 1
Page 3 of 3

PPL Electric Utilities Corporation
Response to the RE Set II Data Requests of the
Bureau of Investigation and Enforcement
Dated October 14, 2025
Docket No. R-2025-3057164

I&E-RE-II-7-D	Reference PPL Exhibit Fully Projected Future 1, Schedules D-5 and D-11, PPL Exhibit II-D-10, and PPL Statement No. 18, pp. 10-14 concerning the adjustment for Universal Service Rider Salaries. State whether the Company incorporated a reduction in its salaries and wages expense claim in PPL Exhibit Fully Projected Future 1, Schedules D-5 and PPL Exhibit II-D-10 when calculating its FPFTY claim to reflect the removal of salaries and wages for universal service of $1,400,000 as shown in PPL Exhibit Fully Projected Future 1, Schedules D-11.
PPL Electric Response	PPL Electric Schedules D-5 and Exhibit II-D-10 are at a total company level and include all wages and benefits and, therefore, do not include a reduction for Universal Service Rider salaries shown in Schedule D-11.

PPL Electric Utilities Corporation
Response to the RE Set II Data Requests of the
Bureau of Investigation and Enforcement
Dated October 14, 2025
Docket No. R-2025-3057164

I&E-RE-II-3-D

Reference PPL Exhibit II-D-10 and Exhibit Fully Projected Future 1, Schedule D-5 concerning salaries and wages expense. State whether the Company incorporated a vacancy reserve when calculating its FPFTY claim. If yes, provide a detailed calculation that reflects the vacancy reserve in the Company's salaries and wages expense FPFTY claim.

PPL Electric Response

PPL Electric does not use a general vacancy reserve. Head count is done at a functional group level. Select functional groups that determined a vacancy reserve was appropriate used 5% as the vacancy reserve for salaries and wages expense.

PPL Electric Utilities Corporation
Response to the RE Set II Data Requests of the
Bureau of Investigation and Enforcement
Dated October 14, 2025
Docket No. R-2025-3057164

I&E-RE-II-2-D

Reference PPL Exhibit II-D-10 concerning salaries and wages expense. Provide the following:

A. Employee counts, total and broken down by union, non-union, etc. for TME June 30, 2023, June 30, 2024, HTY 2025, FTY ending June 30, 2026, and FPFTY ending June 30, 2027.

B. Similar breakdown of employee from Part A for the YTD beginning July 1, 2025.

C. Number of employee positions that have been eliminated, by month broken down by union, non-union, etc. since the commencement of the HTY and that are expected to be eliminated during the FTY and the FPFTY.

D. Vacancy rate and number of vacant positions, by month, by union, non-union, etc. for TME June 30, 2023, June 30, 2024, HTY 2025, FTY ending June 30, 2026, and FPFTY ending June 30, 2027.

PPL Electric Response

A. See response to I&E-RE-II-1-D.

B. See response to I&E-RE-II-1-D.

C. Positions eliminated:

Period	Union	Non-Union
July 2025	0	1
August 2025	2	3
September 2025	4	3
FTY	6	0
FPFTY	1	0

D. FTY & FPFTY positions are forecasted at a full employment level incorporating attrition.

PPL Electric Utilities Corporation
Response to the RE Set II Data Requests of the
Bureau of Investigation and Enforcement
Dated October 14, 2025
Docket No. R-2025-3057164

I&E-RE-II-11-D

Reference the PPL filing concerning incentive compensation. Provide the following:

A. Copy of all Company profit sharing, incentive compensation, and bonus pay plans.

B. Include each plan's criteria for participant eligibility and each plan's established criteria/goals that are to be met for payout.

C. Identify the amounts expensed and the amounts capitalized and by PUC jurisdictional (distribution), transmission, and riders by year for TME June 30, 2023, June 30, 2024, HTY 2025, FTY ending June 30, 2026, and FPFTY ending June 30, 2027 for each type of compensation and broken down by union, non-union, etc.

D. Breakdown of incentive compensation by financial results, safety results, and qualitative results by year for: TME June 30, 2023, June 30, 2024, HTY 2025, FTY ending June 30, 2026, and FPFTY ending June 30, 2027 claim for each type of compensation and broken down by union, non-union, etc.

E. Provide the line number(s) and amounts where the Company's claim for incentive compensation is included in its filing.

PPL Electric Response

A. See I&E-RE-II-11-D Attachment 1.

B. See I&E-RE-II-11-D Attachment 2a and I&E-RE-II-11-D Attachment 2b.

C. See I&E-RE-II-11-D Attachment 3 for PPL Electric employee compensation values. Note that the Company's compensation values include amounts charged to expense, capital, clearing, and various other accounts.

D. PPL Electric's incentive compensation is based on operational goals that include individual performance. The Company does not forecast incentive compensation by individual component of its incentive compensation criteria.

E. PPL Electric's incentive compensation is shown in the accounts where the time charging occurs; therefore, amounts are included throughout expense and capital lines. Note that amounts in the filing include amounts allocated from PPL Services not related to PPL Electric employee compensation.

Supplemental Response (12-10-2025)

A. See OCA X-8 CONFIDENTIAL Attachment 1.

C. See I&E-RE-II-11-D Attachment 3 – SUPPLEMENTAL for a supplemental response to part C. Note that the values provided for 2023, 2024, and 2025 in the original response included amounts for PPL Services for incentive cash awards and stock base compensation which should have been excluded as the response to part C in the initial response stated the values were for PPL Electric employees only. This has been corrected in this supplemental response.

Executive Annual Cash Short-term Incentive (STI) Program

- The executive STI award is a portion of the employee's pay that is "pay at risk" – it is not a guarantee. The STI awards measure and reward performance against the company's financial and operational goals for the year and the individual contributions towards the achievement of those goals.

Eligibility for Executive STI

- Employees in executive officer roles as of December 31 of the plan year.
- Employees in executive officer roles who died, became disabled, or retired during the plan year.

See separate 2025 Short-term Incentive Awards document for details, including eligibility, related to the non-executive STI program.

Long-term Incentive (LTI) Awards

Restricted Stock Unit (RSU) Program

Restricted Stock Units (RSUs) are awarded to employees in certain level roles. Restricted stock units are PPL stock-equivalent units representing a future delivery of a specified number of shares of PPL common stock delivered over a three-year period. The value of the shares that may ultimately vest over the three-year period may be greater than or less than the targeted value, depending on future increases or decreases in PPL's common stock share price.

Eligibility for RSUs

- Employees in executive officer roles and director level roles participate annually in the RSU grant process. Employees in manager level roles and a limited number of high-level individual contributor roles are in an eligibility pool and may be selected for an RSU grant in a given year based on top performance.

Performance Units (PUs) – Executives Only

Employees in executive level roles are also eligible for Performance Units. Performance units are awards in which executive officers receive a target number of performance units at the beginning of the performance period. The actual number of shares of common stock earned at the end of the performance period is determined based on PPL's actual three-year total shareowner return, or TSR, compared to the TSR of companies in a particular industry index or

performance peer group, PPL's three-year earnings growth compared to the projected midpoint of ongoing earnings for the three-year performance period, and long-term sustainability goals.

TSR reflects the combined impact of changes in stock price plus dividends reinvested over the performance period. The equity grant value is expressed as a percentage of base salary. The equity becomes a grant of units by dividing the equity dollar value by the closing price of PPL stock on the date of the grant. Earnings growth performance metrics align executive compensation with PPL's key strategic objective of earnings growth. For the 2025 grant, the PUs with long-term sustainability metrics align executive compensation with PPL's focus on leading indicators of employee and contractor safety and new generation efforts over the three-year performance period.

These PU grants are "at risk" because total shares distributed at the end of the performance period, may vary from zero to the program maximum of 200% of target. They are subject to potential risk of forfeiture under certain types of termination of employment. The performance period is three years, beginning on January 1st of the first year, ending on December 31st of the third year.

Winter 2024 holiday campaign and Lehigh Valley Business Women of Influence of advertisement

- FPFTY 2027 - $130,000

Through its Partners In Power campaign, PPL Electric aims to build trust and community connection that is rooted in partnership. By demonstrating the value behind investments that help safeguard reliability and build communities that thrive as well as to provide support through available tools, programs and resources that help them take control of their energy use and manage their bills, this campaign is the key mechanism to reach customers.

- The campaign would be deployed across a broad mix of channels, with tailored messages for each:
  - Broadcast Media (TV & Radio)
    - Purpose: Reach broad audiences with emotionally resonant stories.
    - Benefits: High reach, strong emotional impact, credibility.
    - Target: General public, older demographics, rural customers.
  - Digital Advertising (Display, Video, Social Media)
    - Platforms: Meta (Facebook/Instagram), YouTube, LinkedIn, streaming services, Programmatic Display.
    - Benefits: Precision targeting, measurable engagement, mobile-friendly.
    - Target: Younger and middle-aged customers, urban/suburban, tech-savvy users.
  - Owned Media (Website, Blog, Email)
    - Benefits: Deep engagement, SEO value, trust-building, audience targeting
    - Target: Customers seeking information, business partners, educators.
  - Out-of-Home (OOH) & Transit Advertising
    - Locations: Billboards, bus shelters, EV charging stations

- Benefits: High visibility, message reinforcement.
- Target: Commuters, urban dwellers, passive audiences.

B.

- HTY 2025 – $7,500

Paid digital ads promoting LIHEAP were deployed on Meta (Facebook and Instagram) targeting PPL Electric Utilities customers.

- FPFTY 2027 - $100,000.

Through an appropriate mix of marketing channels that are aligned to key customer groups who may qualify for or need assistance due to financial hardship, PPL Electric will deploy a recurring marketing campaign to reach customers in channels where they are. The campaign is tailored to customers who need help paying their bill and promotes the programs and payment arrangements available to help every family in need, regardless of income. (Payment arrangements, CARES, OnTrack, WRAP, LIHEAP, Operation HELP, Budget Billing)

- Paid and owned/earned channels will be used to effectively target key PPL Electric customer segments. Anticipated channels include and are not limited to:
  - Digital Advertising (Display, Video, Social Media)
    - Platforms: Meta (Facebook/Instagram), YouTube, LinkedIn, Programmatic Display.
    - Benefits: Precision targeting, measurable engagement, mobile-friendly.
    - Target: Younger and middle-aged customers, urban/suburban, tech-savvy users. Customers seeking information, income-eligible and customers facing temporary financial hardship.
    - Owned Media (Website, Blog, Email)
      - Benefits: Deep engagement, SEO value, trust-building, audience targeting
      - Target: Customers seeking information, income-eligible and

customers facing temporary financial hardship.

- Out-of-Home (OOH) & Transit Advertising
  - Locations: Billboards, bus shelters, EV charging stations
  - Benefits: High visibility, message reinforcement.
  - Target: Income-eligible and customers facing temporary financial hardship. Commuters, urban dwellers, passive audiences who may need assistance or know someone who can benefit from assistance.

C.

- HTY 2025 – $100,110

Paid digital campaigns were deployed on Meta (Facebook and Instagram) and Google. The ads promoted the following:

- Ease of doing business and digital tools: Creating an online account, resources to help manage the bill, start/stop/transfer service, paperless billing, variety of ways to pay, emergency preparedness, PPL Electric alerts, Seasonal Saving Solutions, shopping for a supplier, regional open houses, vegetation management and system maintenance, and a winter holiday campaign
  - Digital Advertising (Display, Video, Social Media)
    - Platforms: Meta (Facebook/Instagram), Google Ads
    - Benefits: Precision targeting, measurable engagement, mobile-friendly.
    - Target: Geotargeted to PPL Electric Utilities customers

- FPFTY 2027 – $500,000.

Through its Partners in Power campaign, PPL Electric aims to educate its customers regarding reliability, affordability, ease of doing business and safety.

- The campaign would expand the channel mix as compared to 2025, and includes a broad mix of paid channels including but not limited to:
    - Broadcast Media (TV & Radio)
        - Purpose: Reach broad audiences with emotionally resonant stories.
        - Benefits: High reach, strong emotional impact, credibility.
        - Target: General public, older demographics, rural customers.
    - Digital Advertising (Display, Video, Social Media, Influencer Marketing)
        - Platforms: Meta (Facebook/Instagram), YouTube, LinkedIn, streaming services, Programmatic Display.
        - Benefits: Precision targeting, measurable engagement, mobile-friendly.
        - Target: Younger and middle-aged customers, urban/suburban, tech-savvy users.
    - Owned Media (Website, Blog, Email)
        - Benefits: Deep engagement, SEO value, trust-building, audience targeting
        - Target: Customers seeking information, business partners, educators.
    - Out-of-Home (OOH) & Transit Advertising
        - Locations: Billboards, bus shelters, EV charging stations
        - Benefits: High visibility, message reinforcement.
        - Target: Commuters, urban dwellers, passive audiences.

D.

- HTY 2025 – $110,266

These charges include advertising agency production costs and fees.

- FPFTY 2027 – $193,000.

This would include advertising agency production costs and fees as well as any emergent communications requiring paid marketing.

E.

Samples of HTY 2025 for each of the advertising programs listed in response to Parts A through D, including, but not limited to brochures, notices, bill inserts, maintenance tips, and publications provided to customers under each of these advertising programs are attached. FPFTY 2027 – Future marketing samples are not yet available.

PPL Electric Utilities Corporation
Response to the RE Set II Data Requests of the
Bureau of Investigation and Enforcement
Dated October 14, 2025
Docket No. R-2025-3057164

I&E-RE-II-19-D

Reference PPL Statement No. 18, pp. 7-10 and Exhibit 6-1, concerning PPL's payment transaction fees proposal, provide the following:

A. The number of walk-in location payments such as Western Union, Fiserv, etc., online payments such as Venmo, PayPal, etc., and other payment methods that include a transaction fee by type for the TME June 30, 2023, June 30, 2024, HTY 2025, FTY ending June 30, 2026, and FPFTY ending June 30, 2027.

B. Transaction costs for payments such as Western Union, Fiserv, etc., online payments such as Venmo, PayPal, etc., and other payment methods by type that include a transaction fee for the TME June 30, 2023, June 30, 2024, HTY 2025, FTY ending June 30, 2026, and FPFTY ending June 30, 2027.

C. Detailed explanation and supporting documentation for the $4,980,000 to be recovered in base rates for the above proposal.

D. Explain where in the filing the above proposal is reflected in the Company's filing.

E. Detailed explanation and documentation to support the 30% increase in transactions fee activities due to the elimination of the transaction fee.

F. State whether PPL has begun obtaining any Request for Proposals (RFPs) from third-party vendors.

G. If the response to Part F is yes, provide a copy of the RFP that was prepared by PPL and all responses received.

H. If the response to Part F is no, provide an estimated date when PPL will begin the RFP process.

PPL Response

A. See I&E-RE-II-19-D Attachment 1- Tab A

B. See I&E-RE-II-19-D Attachment 1- Tab B

C. PPL Electric's original analysis of payment transaction fees used the period between November 2023 through October 2024. During this period customers using a payment method that incurs a transaction fee had 1,527,569 payment transactions and incurred payment fees of $3,832,647. (See I&E-RE-II-19-D Attachment 1– Tab C). PPL Electric used 30% as its estimated increase in payment transaction fees, as the Company assumed a higher level of these types of payment if approved to subsidize payment fees. Historically (2023–2025), PPL Electric has experienced a 15% growth in payment methods that require a customer fee at the time of transaction. Therefore, the Company reasonably projects that the growth in these payments will exceed that 15% growth rate if the transaction fees were eliminated.

D. Payment processing fees are budgeted to FERC account 910 - Miscellaneous Customer Service and Information Expenses. FTY: $0.0 million; FPFTY: $5.2 million.

E. See response to Part C above.

F. Please refer to PPL Electric Statement No. 18, Direct Testimony of Lisa Norden page 9 lines 6 through 11, PPL Electric currently uses third-party vendors for the processing of these fees. The Company anticipates continuing use of its current third-party vendors.

G. Not applicable.

H. PPL Electric does not currently anticipate issuing an RFP; however, a final determination will be made closer to contract termination for the current vendors. See response to Part F above.

PPL Electric Utilities Corporation
Response to the RE Set IV Data Requests of the
Bureau of Investigation and Enforcement
Dated October 31, 2025
Docket No. R-2025-3057164

I&E-RE-IV-1

Reference PPL Exhibit Fully Projected Future 1, Schedule D-7 and PPL Statement No. 21 concerning PPL's Economic Development Proposal. Provide a detailed breakdown, explanation, supporting documentation, and calculations used to develop the annual budget of $400,000.

PPL Electric Response

The annual budget was developed using market information for similar services offered by utilities in other states, including PPL Electric's affiliates, LG&E and KU. Also, discussions with communities and vendors that have successfully secured PA SITES funding indicate that the cost of such technical assistance typically ranges from $100,000 to $120,000 per site, depending on the complexity of the site and the availability of existing data.

Therefore, the Company determined that a $400,000 annual budget is a reasonable and prudent amount to support a balanced portfolio of reimbursement and technical assistance grants. This budget allows the Company to provide meaningful support to multiple communities each year.

PPL ELECTRIC UTILITIES CORPORATION

I&E Exhibit No. 2
Schedule 12
Page 1 of 4

Cash Working Capital - Base Distribution
As of June 30, 2027
(Thousands of Dollars)

Line No.	Description	Amount
1	Operation and maintenance expense (C-4, page 2)	$ 408
2	Average prepayments (C-4, page 3)	6,257
3	Accrued taxes (C-4, page 4)	19,631
4	Interest payments (C-4, page 5)	(15,000)
5	Total cash working capital requirement	$ 11,297

PPL Electric Utilities Corporation

Working Capital Required for Operation and Maintenance Expenses - Base Distribution
As of June 30, 2027
(Thousands of Dollars)

The Company bills its customers every month. On this basis, there is a considerable span of days between the time electricity is furnished to a customer and the time the customer pays for such electricity.

In many instances, the Company must pay its bills for payroll and other O&M expenses prior to the time it is able to collect the amount due for the service which requires the incurrance of such expenses. Thus, the Company has examined its records to determine, as to the major categories of expense, the average span of days which exists between the time an expense is incurred and the time it must be paid. Schedule C-4, page 2, of Exhibit Historic 1 sets forth the individual components which result in the days lag between payment of expenses and receipt of the related revenues used in the determination of the working capital required for the pro forma O&M expense for the test year ending June 30, 2025.

Line No.	Description		Amount	
1	Net pro forma O&M expense (a)		372,601	
2	O&M expense per day (line 1 divided by 365 days)		1,021	
3	Average lag in days between payment of O&M expenses and receipt of revenue (b)		0.4	(c)
4	Working capital requirement (line 2 x line 3)	$	408	

(a)	Total pro forma operation and maintenance expense (D-1 col. 5 lines 2-4)	$	680,922	(d)
	Less: Non-cash items			
	Uncollectible accounts expense		14,735	
	Deferred Storm Outage Costs (D-9)		3,779	
	Deferred IIJA Costs (D-10)		211	
	Depreciation (D-1 col. 5 line 3)		289,596	
	Net pro forma O&M expense	$	372,601	

(b) See Exhibit Historic 1, Schedule C-4, page 2.

(c) Ref. I&E Exhibit No. 2, Schedule 12, p. 3

(d) Ref. I&E Exhibit No. 2, Schedule 12, p. 4

PPL ELECTRIC UTILITIES CORPORATION

REVISED Working Capital Required for Operation and Maintenance Expenses
As of June 30, 2025
(Thousands of Dollars)

I&E Exhibit No. 2
Schedule 12
Page 3 of 4

Line No.	Description	Amount	Avg. Days		Weighted Amount
	Average Lag in Receipt of Operating Revenue				
1	Revenue from 15-day due date customers	$228,745	36	(a)	$8,266,751
2	Revenue from 20-day due date customers	730,500	59	(a)	42,935,489
3	Revenue from 30-day due date customers	976,398	42	(a)	41,279,133
4	Total Revenue (D-3)	$1,935,642			$92,481,374
	Average Lag in Payment of Operation and Maintenance Expense				
5	Payroll (D-5) + (II-D-10e)	$75,220	12		$902,640
6	Employee benefits (D-5) + (II-D-10e)	8,630	35		302,050
7	Affiliate support costs	221,478	45	(c)	9,966,500
8	Other operating expenses	167,439	67		11,230,537
9	Total pro forma O&M expense (b)	$472,767			$22,401,727
10	Average lag in receipt of revenue				47.8
11	Average lag in payment of operating expense				47.4
12	Average lag in days between payment of operating expense and receipt of revenue (line 10 - line 11)				0.4
13	Operating expense per day (line 9 ÷ 365 days)				$1,295
14	Working capital requirement (line 13 x line 12)				$518

	Customer Due Date		
	15 days	20 Days	30 Days
(a) Midpoint of 30-day service period	15	15	15
Lag between meter reading and billing date	1	1	1
Lag between billing date and payment date	20	43	26

PPL Electric Utilities Corporation
Response to the RE Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 10, 2025
Docket No. R-2025-3057164

I&E-RE-I-2-D

Reference PPL Volume V, Schedules D-1 through D-19. Provide similar schedules with additional columns for the fiscal years ended June 20, 2021 (FY 2021), June 30, 2022 (FY 2022), June 30, 2023 (FY 2023), and June 20, 2024 (FY 2024) in Microsoft Excel format with all formulas intact.

PPL Electric Response

See I&E-RE-I-2-D Attachment 1.

In the process of preparing this response, the Company identified an error in the Exhibit Historic 1, Schedule D-1 which resulted in an increase in the amount of O&M expense in Row 2, Column 5. The resulting change in the average lag in days between payment of O&M expenses and receipt of revenue value in the cash working capital calculation, which was reduced from 5.2 days to 5.1 days, has been used in the data provided in this response.

The Company will prepare and provide revised Exhibit Historic 1, Exhibit Future 1, and Exhibit Fully Future 1 schedules that correct this error in all impacted schedules as a supplement to this response.

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Drew Breuning. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. SUMMARIZE YOUR EDUCATION AND EMPLOYMENT HISTORY.

A. An outline of my education and employment history is attached as Appendix A.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for protecting the public interest in proceedings before the Commission. I&E's analysis in this proceeding is based on its responsibility to represent the public interest. This responsibility requires balancing the interests of ratepayers, the regulated utility, and the regulated community as a whole.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to review the base rate filing of PPL Electric Utilities Corporation (PPL Electric or Company), and make recommendations regarding the Company's rate of return, including capital structure, cost of long-term debt, the cost of equity, and the overall fair rate of return for the fully projected future test year (FPFTY) ending June 30, 2027.

Q. DOES YOUR TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 3 contains schedules that support my direct testimony.

BACKGROUND

Q. WHAT IS THE GENERAL DEFINITION OF RATE OF RETURN IN THE CONTEXT OF A BASE RATE CASE?

A. Rate of return is one of the components of the revenue requirement formula. Rate of return is the amount of revenue an investment generates in the form of net income. It is typically expressed as a percentage of the amount of an asset base at a particular point in time, which in base rate proceedings, is the projected rate base balance at the end of the test year.

Q. WHAT IS THE REVENUE REQUIREMENT FORMULA?

A. The revenue requirement formula used in base rate cases is as follows:

$$RR = E + D + T + (RB \times ROR)$$

Where:

RR = Revenue Requirement

E = Operating Expenses

D = Depreciation Expense

T = Taxes

RB = Rate Base

ROR = Overall Rate of Return

In the above formula, the rate of return is expressed as a percentage. The calculation of that percentage is independent of the determination of the appropriate rate base value for ratemaking purposes. As such, the appropriate total dollar return is dependent upon the proper computation of the rate of return and the proper valuation of the company's rate base.

Q. WHAT CONSTITUTES A FAIR AND REASONABLE OVERALL RATE OF RETURN?

A. A fair and reasonable overall rate of return is one that will allow the utility an *opportunity* to recover those costs prudently incurred by all classes of capital used to finance the rate base during the prospective period in which its rates will be in effect. The Commission has the authority to determine the fair revenue requirement and rate of return, which the utility has the opportunity to earn, but is not guaranteed to earn.

The *Bluefield Water Works & Improvements Co. v. Public Service Comm. of West Virginia,* 262 U.S. 679, 692-93 (1923), and the *Federal Power Commission et al v. Hope Natural Gas Co.,* 320 U.S. 591, 603 (1944) cases set forth the principles that are generally accepted by regulators throughout the country as the appropriate criteria for measuring a fair rate of return:

1. A utility is entitled to a return similar to that being earned by other enterprises with corresponding risks and uncertainties, but not as high as those earned by highly profitable or speculative ventures.
2. A utility is entitled to a return level reasonably sufficient to assure financial soundness.
3. A utility is entitled to a return sufficient to maintain and support its credit and raise necessary capital.
4. A fair return can change (increase or decrease) along with economic conditions and capital markets.

Q. EXPLAIN HOW THE OVERALL RATE OF RETURN IS TRADITIONALLY CALCULATED IN BASE RATE PROCEEDINGS.

A. In base rate proceedings, the overall rate of return is traditionally calculated using the weighted average cost of capital method. To calculate the weighted average cost of capital, a company's capital structure must first be determined by comparing the percentage of each capitalization component, which has financed rate base, to total capital. Next, the effective cost rate of each capital structure

component must be determined. The historical component of the cost rate of debt can be computed accurately, and any future debt issuances are based on estimates. The cost rate of common equity is not fixed and is more difficult to measure. Because of this difficulty, a proxy group is used as discussed later in this testimony. Next, each capital structure component percentage is multiplied by its corresponding effective cost rate to determine the weighted capital component cost rate. The I&E table in the *"I&E Position"* section below demonstrates the interaction of each capital structure component and its corresponding effective cost rate. Finally, the sum of the weighted cost rates produces the overall rate of return. This overall rate of return is multiplied by the rate base to determine the return portion of a company's revenue requirement.

COMPANY'S RATE OF RETURN CLAIM

Q. WHO IS THE COMPANY'S RATE OF RETURN WITNESS?

A. PPL Electric witness Jennifer E. Nelson is the primary witness addressing rate of return and cost of common equity for PPL Electric (PPL Electric Statement No. 10). Additionally, PPL Electric witness Julissa Burgos (PPL Electric Statement No. 9) provides testimony regarding the Company's cost of long-term debt and analysis for the claimed capital structures.

Q. PLEASE SUMMARIZE THE COMPANY'S RATE OF RETURN CLAIMS.

A. Ms. Nelson recommends the following rate of return for the Company based on the FPFTY ending June 30, 2027:[1]

Summary of Cost of Capital			
Type of Capital	**Ratio**	**Cost Rate**	**Weighted Cost**
PPL Electric Utilities Corporation			
Long-Term Debt	43.95%	5.08%	2.23%
Common Equity	56.05%	11.30%	6.33%
Total	100.00%		8.56%

I&E POSITION

Q. PLEASE SUMMARIZE YOUR RATE OF RETURN RECOMMENDATION.

A. I recommend the following rate of return for the Company:[2]

Summary of Cost of Capital			
Type of Capital	**Ratio**	**Cost Rate**	**Weighted Cost**
PPL Electric Utilities Corporation			
Long-Term Debt	45.00%	5.08%	2.29%
Common Equity	55.00%	10.32%	5.68%
Total	100.00%		7.97%

[1] PPL Electric Exhibit Fully Projected Future 1, Schedule B-8.
[2] I&E Exhibit No. 3, Schedule 1.

PROXY GROUP

Q. WHAT IS A PROXY GROUP AS USED IN BASE RATE CASES?

A. A proxy group is a set of companies that have similar traits in comparison to the subject utility. This group of companies acts as a benchmark for determining the subject utility's rate of return in a base rate case.

Q. WHAT ARE THE REASONS FOR USING A PROXY GROUP?

A. A proxy group's cost of equity is used as a benchmark to satisfy the long-established guideline of utility regulation that seeks to provide the subject utility with the opportunity to earn a return similar to that of enterprises with corresponding risks and uncertainties.

A proxy group is typically utilized since the use of data exclusively from one company may be less reliable. The lower reliability occurs because the data for one company may be subject to events that can cause short-term anomalies in the marketplace. The rate of return on common equity for a single company could become distorted in these circumstances and would therefore not be representative of similarly situated companies. Therefore, a proxy group has the effect of smoothing out potential anomalies associated with a single company.

Q. WHAT CRITERIA DID YOU USE IN SELECTING YOUR ELECTRIC UTILITY PROXY GROUP?

A. The criteria for my proxy group was designed to select companies that are representative of the Company. I applied the following criteria to Value Line's East, Central, and West Electric Utility groups:

1. Fifty percent or more of the company's revenues must be generated from the regulated electric utility industry.
2. The company's stock must be publicly traded.
3. Investment information for the company must be available from more than one source, which includes Value Line.
4. The company must not be currently involved in an announced merger or the target of an acquisition.
5. The company must have four consecutive years of historic earnings data.
6. The company must be operating in a state that has a deregulated electric utility market.

Q. WHAT CRITERIA DID MS. NELSON USE IN SELECTING HER ELECTRIC PROXY GROUP COMPANIES?

A. Ms. Nelson determined her proxy group of 24 electric companies by using the following criteria:[3]

[3] PPL Electric Statement No. 10, p. 14, line 21 through p. 15, line 22.

1. The company must consistently pay quarterly cash dividends and must not have cut their dividend in the last two years.
2. The company must have positive growth rates from at least two sources.
3. The company must be consistently covered by at least two utility industry equity analysts.
4. The company must have an investment-grade issuer or senior unsecured bond credit rating from S&P and Moody's
5. The company must have more than 60 percent of net operating income from regulated electric operations, on average, over the three years ended 2024.
6. The company must not have had recent significant merger activity or transactions that could affect their market data or financial conditions.

In addition to the above criteria, Ms. Nelson also excluded PPL Electric's parent company, PPL Corporation, for circularity concerns.[4]

Q. WHAT PROXY GROUP DID YOU USE IN YOUR ANALYSIS?

A. I include the following sixteen companies in my proxy group:[5]

[4] PPL Electric Statement No. 10, p. 15, lines 21-22.
[5] I&E Exhibit No. 3, Schedule 2.

Ameren Corp.	AEE
American Electric Power Company Inc.	AEP
CMS Energy Corp.	CMS
CenterPoint Energy Inc.	CNP
Dominion Energy	D
DTE Energy Company	DTE
Duke Energy Corp.	DUK
Consolidated Edison Inc.	ED
Eversource Energy	ES
Entergy Corp.	ETR
Exelon Corp.	EXC
FirstEnergy Corp.	FE
NorthWestern Energy	NWE
Public Service Enterprise Group Inc.	PEG
PPL Corporation	PPL
Xcel Energy Inc.	XEL

Q. WHAT PROXY GROUP DID MS. NELSON USE IN HER ANALYSIS?

A. Ms. Nelson included the following 24 companies in her Electric Group:[6]

[6] PPL Electric Statement No. 10, p. 16, line 3.

Ameren Corp.	AEE
American Electric Power Company Inc.	AEP
Avista Corp.	AVA
CMS Energy Corp.	CMS
CenterPoint Energy Inc.	CNP
Dominion Energy	D
DTE Energy Company	DTE
Duke Energy Corp.	DUK
Consolidated Edison Inc.	ED
Eversource Energy	ES
Entergy Corp.	ETR
Evergy Inc.	EVRG
Exelon Corp.	EXC
FirstEnergy Corp.	FE
IDACORP Inc.	IDA
Alliant Energy Corp.	LNT
NextEra Energy Inc.	NEE
NorthWestern Energy	NWE
OGE Energy Corp.	OGE
Public Service Enterprise Group Inc.	PEG
Pinnacle West Capital Corp.	PNW
Portland General Electric Company	POR
Southern Co.	SO
Xcel Energy Inc.	XEL

Q. DO YOU AGREE WITH MS. NELSON'S ELECTRIC PROXY GROUP?

A. No. While we do have fifteen companies that match, I include one company that Ms. Nelson does not, and Ms. Nelson includes nine companies that I do not.

Q. PLEASE LIST THE NINE COMPANIES MS. NELSON HAS INCLUDED THAT YOU DO NOT AND EXPLAIN WHY YOU HAVE EXCLUDED THEM FROM YOUR PROXY GROUP.

A. I have excluded the following companies from my proxy group: Alliant Energy Corp. (LNT), Avista Corp. (AVA), Evergy Inc. (EVRG), IDACORP Inc. (IDA), NextEra Energy Inc. (NEE), OGE Energy Corp. (OGE), Pinnacle West Capital (PNW), Portland General Electric (POR), and Southern Co. (SO). I excluded these companies from my electric proxy group because they violate my sixth criterion and do not operate in a state that has a deregulated electric utility market**.**

Q. EXPLAIN WHAT IS MEANT BY A DEREGULATED ELECTRIC UTILITY MARKET.

A. A deregulated electric market is a market in which the utility is responsible only for the distribution of electricity, not generation. Deregulation permits electric suppliers to compete and sell electricity directly to consumers and allows consumers the ability to seek competitive rates.

Q. WHY DID YOU INCLUDE THE CRITERION THAT A COMPANY MUST OPERATE IN A STATE THAT HAS A DEREGULATED ELECTRIC UTILITY MARKET?

A. I included the criterion that a company must operate in a deregulated market, like Pennsylvania, so that the companies included in my proxy group would all be of

similar risk to the Company. Unlike regulated markets, which contain largely vertically integrated utilities, deregulated markets permit electricity providers to compete and sell electricity directly to consumers. This criterion helps to ensure that each company in the proxy group is operating in a similar market and under similar circumstances as the Company. Furthermore, by virtue of the vertically integrated nature of regulated utilities, generation is owned and operated by the utility, which could place the companies in a substantially different risk profile based on the types and ages of generation plant owned and operated.

Q. PLEASE LIST THE COMPANIES YOU INCLUDE THAT MS. NELSON DOES NOT AND EXPLAIN WHY SHE HAS EXCLUDED THEM FROM HER PROXY GROUP.

A. As stated above, Ms. Nelson has excluded PPL Electric's parent company, PPL Corporation, for circularity concerns. I believe PPL Corporation should be included in my proxy group because concerns over circularity are negligible due to the Company having significant electric distribution operations in various states, including Pennsylvania, Kentucky, and Rhode Island.

CAPITAL STRUCTURE

Q. WHAT IS A CAPITAL STRUCTURE?

A. A capital structure represents how a firm has financed its rate base with different sources of funds. The primary funding sources are long-term debt and common

equity. A capital structure may also include preferred stock and/or short-term debt, which is not the case for the Company.

Q. WHAT IS THE CLAIMED CAPITAL STRUCTURE USED BY THE COMPANY?

A. The Company is proposing a forecasted capital structure which is summarized in the table below:[7]

Type of Capital	Ratio
Long-Term Debt	43.95%
Common Equity	56.05%
Total	**100.00%**

Q. WHAT IS THE BASIS FOR THE COMPANY'S CLAIMED CAPITAL STRUCTURE?

A. Ms. Nelson relies on Ms. Burgos' analysis which explains that the claimed capital structure is based on the Company's recent and projected actual capital structure.[8] Further, she claims the common equity ratio claimed by the Company is acceptable and consistent with the range of common equity ratios maintained by the companies that make up her proxy group.[9]

[7] I&E Exhibit No. 3, Schedule 3.
[8] PPL Electric Statement No. 10, p. 61, lines 11-14.
[9] PPL Electric Statement No. 10, p. 63, lines 9-19.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE COMPANY'S CAPITAL STRUCTURE?

A. I recommend using a capital structure of 55% common equity and 45% long-term debt as presented in the I&E recommendation.

Q. WHAT IS THE BASIS FOR YOUR CAPITAL STRUCTURE RECOMMENDATION?

A. It is my opinion that the Company's actual capital structure is unreasonable for ratemaking purposes, as the Company's equity ratio is well above the highest end of my proxy group's equity ratios. The Company's proposed capital structure falls outside the range of my proxy group's 2024 (most recent available) capital structures, where the most recent five-year average range contains individual company capital structure ratios from 50.19% to 69.80% long-term debt and 30.20% to 49.81% equity, with an overall five-year average of 58.60% long-term debt and 40.82% common equity.[10]

Q. WHY HAVE YOU LIMITED THE EQUITY RATIO PORTION OF THE CAPITAL STRUCTURE IN YOUR ANALYSIS TO 55%?

A. I believe that limiting a company's capital structure from becoming too equity heavy is reasonable and necessary for a fair ratemaking process. Implementing a capital structure that is closer to 50% long-term debt and 50% common equity is

[10] I&E Exhibit No. 3, Schedule 4.

commonly considered optimal when trying to balance the financial integrity of a utility and its impact on ratepayers. While it is not always possible to have a capital structure that is exactly 50/50, implementing a limit helps strike a balance between rewarding the company for carrying more equity while also reducing the costs that would be passed on to ratepayers. For that reason, it is my opinion that the Company's capital structure should not exceed 55% equity.

Further, a report issued by Regulatory Research Associates, a group within S&P Global Market Intelligence, shows that the average authorized equity ratio for electric utilities in the first nine months of 2025 was 48.74% equity. In addition, for perspective, the average authorized return on equity in the same time frame was 9.66.[11] These equity ratio and authorized return figures are both well below what PPL Electric is requesting in this proceeding.

Q. HAVE YOU CONSIDERED WHAT CAPITAL STRUCTURES ARE PROJECTED TO BE FOR THE ELECTRIC UTILITY INDUSTRY IN THE NEAR FUTURE?

A. Yes. According to Value Line's 2026 estimates, the projected capital structures for my proxy group are as follows:

[11] I&E Exhibit No. 3, Schedule 5.

Value Line 2026 Capital Structure Projections			
		Long-Term Debt Ratio	Common Equity Ratio
Ameren Corp	AEE	52.00%	47.50%
American Electric Power Company Inc	AEP	57.50%	42.50%
CMS Energy Corp	CMS	65.00%	34.00%
CenterPoint Energy Inc	CNP	62.00%	38.00%
Dominion Energy	D	59.00%	39.50%
DTE Energy Company	DTE	61.50%	38.50%
Duke Energy Corp New	DUK	61.00%	38.50%
Consolidated Edison Inc	ED	52.50%	47.50%
Eversource Energy	ES	62.50%	37.00%
Entergy Corp	ETR	63.50%	36.50%
Exelon Corp	EXC	62.00%	38.00%
FirstEnergy Corp	FE	65.50%	33.50%
NorthWestern Energy	NWE	50.50%	49.50%
Public Service Enterprise Group Inc	PEG	55.50%	44.50%
PPL Corporation	PPL	51.00%	49.00%
Xcel Energy Inc	XEL	61.00%	39.00%
Average		58.88%	40.81%

These future projections are consistent with the proxy group's historical five-year average capital structure of 40.82% equity and 58.60% debt.

PPL Electric's claimed capital structure of 56.05% equity and 43.95% debt is significantly more equity-heavy than the proxy group's five-year averages and 2026 projections. This equity-heavy capital structure must be recognized when considering PPL Electric's financial risk, as higher equity ratios generally correspond with lower financial risk as Ms. Nelson herself concedes. She agrees that all other things being equal, a company with a higher equity ratio faces less financial risk than a company with a lower equity ratio.[12]

[12] I&E Exhibit No. 3, Schedule 6.

Q. HAS THE COMMISSION COMMENTED ON PPL ELECTRIC'S CURRENT CAPITAL STRUCTURE?

A. Yes. Commissioner Barrow expressed particular concern regarding the financial impact to customers in relation to equity heavy capital structures. She also notes that straying too far from a 50/50 capital structure impacts the rates paid by utility customers by millions of dollars.[13]

Additionally, Commissioner Barrow commented on the recent Columbia Gas' requested capital structure of 54.4% equity and 45.6% debt. The Office of Consumer Advocate and CAUSE-PA argued in favor of a hypothetical 50/50 capital structure, citing their proxy group's average capital structure was 45% equity and 55% debt. Commissioner Barrow stated that the discrepancy between the proxy group and Columbia Gas' capital structure makes it necessary for an adjustment to the Company's capital structure, and that a 50/50 capital structure "is a better representation of the Company's **actual** financial risk and would have resulted in millions of dollars in reduced revenue requirement for the Company".[14]

For consideration when examining the Company's overall financial risk, the table below illustrates the cost savings to ratepayers if the Company were to employ an optimal 50% long-term debt and 50% common equity capital structure in its cost of capital while maintaining its claimed return on equity and rate base:

[13] I&E Exhibit No. 3, Schedule 7.
[14] I&E Exhibit No. 3, Schedule 8.

PPL Electric Utilities Corporation			
Summary of Cost of Capital			
Type of Capital	**Ratio**	**Cost Rate**	**Weighted Cost**
AS FILED CAPITAL STRUCTURE			
Long-Term Debt	43.95%	5.08%	2.23%
Common Equity	56.05%	11.30%	6.33%
Total	100.00%		8.56%
50/50 OPTIMAL CAPITAL STRUCTURE			
Long-Term Debt	50.00%	5.08%	2.54%
Common Equity	50.00%	11.30%	5.65%
Total	100.00%		8.19%
Difference In The Overall Rate of Return (8.56% - 8.19% = 0.37%)			0.37%
Impact Prior to Gross Up (Claimed Rate Base* x Difference In The Overall Rate of Return) ($5,817,887,000 x .0037)			$21,526,182
Gross Revenue Conversion Factor**			1.4809913
Total Impact To Ratepayers ($21,526,182 x 1.4809913)			**$31,880,088**
*PPL Electric Exhibit Fully Projected Future 1, Schedule C-1, Line 13. **I&E Exhibit No. 3, Schedule 9.			

In this example, if the Company were to employ a 50/50 capital structure and no change to the requested return on equity, the cost savings to ratepayers would be $31,880,088. While I understand that achieving and maintaining an exact 50/50 capital structure is not always feasible, this example is intended to demonstrate PPL Electric's financial security as compared to its peers.

COST OF LONG-TERM DEBT

Q. WHAT IS THE COMPANY'S CLAIMED COST RATE OF LONG-TERM DEBT?

A. The Company's claimed long-term debt cost rate is 5.08% for the FPFTY.[15]

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE COMPANY'S COST RATE OF LONG-TERM DEBT?

A. I recommend using the Company's claimed long-term debt cost rate of 5.08% for the FPFTY.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION TO USE THE COMPANY'S COST RATES OF LONG-TERM DEBT?

A. I accept PPL Electric's claimed debt cost because it falls within my proxy group's implied long-term debt cost range of 4.15% to 5.30%, with an average implied long-term debt cost of 4.72% for 2024.[16] The Company's cost rate of long-term debt is also below the Mergent Bond Record average yield of 5.75% for the period of October 2024 through September 2025 for A-rated public utility bonds.[17] I recommend that the Company's claimed cost rate of long-term debt be used since it is reasonable and falls within the metrics described above.

[15] PPL Electric Statement No. 9, p. 3, lines 19-20.
[16] I&E Exhibit No. 3, Schedule 10.
[17] I&E Exhibit No. 3, Schedule 11.

COST OF COMMON EQUITY

Common Methods

Q. WHAT METHODS ARE COMMONLY PRESENTED BY UTILITIES IN DETERMINING THE COST OF COMMON EQUITY?

A. Four methods commonly presented to estimate the cost of common equity are the Discounted Cash Flow (DCF) Method, the Capital Asset Pricing Model (CAPM), the Risk Premium (RP) Method, and the Comparable Earnings (CE) Method.

Q. WHAT IS THE THEORETICAL BASIS FOR THE DCF METHOD?

A. The DCF method is the "dividend discount model" of financial theory, which maintains that the value (price) of any security or commodity is the discounted present value of all future cash flows. The DCF method assumes that investors evaluate stocks in the traditional economic framework, which maintains that the value of a financial asset is determined by its earning power, or its ability to generate future cash flows. The DCF method is also considered a forward-looking model to estimate the cost of common equity.

Q. WHAT IS THE THEORETICAL BASIS FOR THE CAPM?

A. The CAPM describes the relationship between a stock's investment risk and its market rate of return. It identifies the rate of return investors expect so that it is comparable with returns of other stocks of similar risk. This method hypothesizes that the investor-required return on a company's stock is equal to the return on a

"risk free" asset plus an equity premium reflecting the company's investment risk. In the CAPM, two types of risk are associated with a stock: (1) firm-specific risk (unsystematic risk); and (2) market risk (systematic risk), which is measured by a firm's beta. The CAPM allows for investors to receive a return only for bearing systematic risk. Unsystematic risk is assumed to be diversified away, and therefore, does not earn a return.

Q. WHAT IS THE THEORETICAL BASIS FOR THE RP METHOD?

A. The theoretical basis for the RP method is a simplified version of the CAPM. The RP method's theory is that common stock is riskier than debt, thus, investors require a higher expected return on stocks than bonds. In the RP approach, the cost of equity is made up of the cost of debt and a risk premium. While the CAPM uses the market risk premium, it also directly measures the systematic risk of a company group through the use of beta. The RP method does not measure the specific risk of a company.

Q. WHAT IS THE THEORETICAL BASIS FOR THE CE METHOD?

A. The CE method utilizes the concept of opportunity cost. This means that investors will likely dedicate their capital to the investment offering the highest return with similar risk to alternative investments. Unlike the DCF, CAPM, and the RP methods, the CE method is not market-based and relies upon historic accounting data. Similar to the RP method, the CE method does not measure the specific risk

of a company. The most problematic issue with the CE method is determining what constitutes comparable companies.

Q. WHAT METHOD DO YOU RECOMMEND USING TO DETERMINE AN APPROPRIATE COST OF COMMON EQUITY FOR THE COMPANY?

A. I recommend using the DCF method as the primary method to determine the cost of common equity. Additionally, I provide a CAPM analysis to be used as a comparison, not as a check, to the DCF results. The DCF method has the most wide-spread regulatory acceptance, and while the Commission has more recently based some of its ROE decisions on a combination of the DCF and CAPM methods, I still recommend primary reliance on the DCF method due to the shortcomings associated with the CAPM method.

Q. PLEASE EXPLAIN WHY YOU CHOSE TO USE THE DCF TO DETERMINE YOUR RECOMMENDED RETURN ON EQUITY.

A. I have used the DCF for a variety of reasons. First, the DCF is appealing to investors as it is based upon the concept that the receipt of dividends in addition to the expected appreciation is the total return requirement determined by the market.[18] Second, the use of a growth rate and expected dividend yield are also strengths of the DCF, as this recognizes the time value of money and is forward-looking. Third, the use of the utilities' own, or in this case, the proxy group's

[18] David C. Parcell, "The Cost of Capital – A Practitioner's Guide," 2020 Edition, p. 153.

stock prices and growth rates directly in the calculation make the DCF industry and company specific. Finally, current inflationary and economic trends are most certainly reflected in a stock's price, which is used in determining the dividend yield, and by analysts who generate forecasted earnings growth rates. Therefore, the DCF contains the most up-to-date projected information of any model and is the superior method for determining the rate of return for the current economic market because it measures the cost of equity directly.

Q. PLEASE EXPLAIN WHY YOU CHOSE TO USE THE CAPM AS A COMPARISON TO THE DCF IN YOUR ANALYSIS.

A. I have included a CAPM analysis only as a comparison, and not as a basis, for my recommendation because both the CAPM and the DCF include inputs that allow the results to be specific to the utility industry. However, the CAPM is based on the performance of U.S. Treasury bonds and the performance of the market as measured through the S&P 500 and is company-specific only through the use of beta. Beta reflects a stock's volatility relative to the overall market, thereby incorporating an industry-specific aspect to the CAPM, but only as a measure of how reactive the industry is compared to the market as a whole. Although changes in the utility industry are more likely to be accurately reflected in the DCF, which uses the companies' actual prices, dividends, and growth rates, I have also included the results of my CAPM analysis because changes in the market, whether as a whole or specific to the utility industry, can affect the outcome of each

method in different ways. Although I have provided the results of the CAPM as a comparison, and not as a check, it does have several disadvantages and should not be given comparable weight to the DCF method.

Q. EXPLAIN THE DISADVANTAGES OF THE CAPM.

A. The CAPM, and the RP method by virtue of its similarities to the CAPM, give results that indicate to an investor what the equity cost rate should be if current economic and regulatory conditions are the same as those present during the historical period in which the risk premiums were determined. This is because beta, which is the only company-specific variable in the CAPM model, measures the *historical* volatility of a stock compared to the *historical* overall market return. Reliance on historical values is especially problematic now given the recent events that have impacted economic conditions. Although the CAPM and RP results can be useful to investors in making rational buy and sell decisions within their portfolios, the DCF method is the superior method for determining the rate of return for the current economic market and measuring the cost of equity directly. The CAPM, and similarly the RP method, are less reliable indicators because they measure the cost of equity indirectly and risk premiums vary depending on the debt and equity being compared. Additionally, regulators can never be certain that economic and regulatory conditions underlying the historical period during which the risk premiums were calculated are the same today or will be the same in the future.

Q. IS THERE ANY ACADEMIC EVIDENCE THAT QUESTIONS THE CREDIBILITY OF THE CAPM MODEL?

A. Yes. An article, "Market Place; A Study Shakes Confidence in the Volatile-Stock Theory," which appeared in the *New York Times* on February 18, 1992, summarized a CAPM study conducted by professors Eugene F. Fama and Kenneth R. French.[19] Their study examined the importance of beta, CAPM's risk factor, in explaining returns on common stock. In CAPM theory a stock with a higher beta should have a higher expected return. However, they found that the model did not do well in predicting actual returns and suggested the use of more elaborate multi-factor models.

A more recent article, "The Capital Asset Pricing Model: Theory and Evidence," which appeared in the *Journal of Economic Perspectives,* states that "the attraction of the CAPM is that it offers powerful and intuitively pleasing predictions about how to measure risk and the relation between expected return and risk. Unfortunately, the empirical record of the model is poor - poor enough to invalidate the way it is used in applications."[20] As a result, I conclude that the CAPM's relevance to the investment decision making process does not carry over into the regulatory rate setting process.

[20] Fama, Eugene F. and French, Kenneth R., "The Capital Asset Pricing Model: Theory and Evidence." *Journal of Economic Perspectives* (2004): Volume 18, Number 3, pp. 25-46.

Q. HAVE YOU IDENTIFIED ANY SPECIFIC PROBLEMS WITH THE COMMISSION'S RECENT USE OF THE CAPM METHOD AS A FACTOR IN ESTABLISHING A RETURN ON EQUITY?

A. Yes. The Commission indicated in Aqua Pennsylvania, Inc.'s (Aqua) 2021 base rate case order that its method "for determining Aqua's ROE shall utilize both I&E's DCF and CAPM methodologies"[21] and that "I&E's DCF and CAPM produce a range of reasonableness for the ROE …",[22] which deviates from the historical Commission practice of primarily relying on the DCF. Additionally, the Commission's Columbia Water Company (Columbia Water) base rate case order relied on the results of I&E's DCF and CAPM analyses for determining Columbia Water's ROE.[23] Finally, in the most recent Pennsylvania-American Water Company case, the Commission agreed with the ALJ's recommended ROE which was based on the average of I&E's DCF and CAPM analyses.[24]

In a report issued by Regulatory Research Associates, a group within S&P Global Market Intelligence,[25] Aqua's return on equity of 10.00% is stated as being above the national average for water utility base rate cases and above the Distribution System Improvement Charge (DSIC) authorized by the Commission

---

[21] *Pa. PUC v. Aqua Pennsylvania, Inc.,* Docket Nos. R-2021-3027385 & R-2021-3027386, p. 154 (Order Entered May 16, 2022).

[22] *Pa. PUC v. Aqua Pennsylvania, Inc.,* Docket Nos. R-2021-3027385 & R-2021-3027386, p. 178 (Order Entered May 16, 2022).

[23] *Pa. PUC v. Columbia Water Company,* Docket No. R-2023-3040258, p. 105 (Order Entered January 18, 2024).

[24] *Pa. PUC v. Pennsylvania-American Water Company,* Docket Nos. R-2023-30433189 & R-2023-3043190, p. 194 (Order Entered July 22, 2024).

[25] Regulatory Research Associates, "Commission authorizes management performance bonus for Aqua Pennsylvania," *S&P Global Market Intelligence*, May 16, 2022. CIQ Pro: RRA Regulatory Focus: Commission authorizes management performance bonus for Aqua Pennsylvania (spglobal.com) (Accessed January 23, 2024).

of 9.80%[26] for water and wastewater utilities based on a period ended March 31, 2022. The above referenced report also states that the average return on equity for water utility base rate cases that have been completed during the first four months of 2022 was 9.63% and for the twelve months ended April 30, 2022, was 9.53% which were well below the 10.00% return on equity authorized by the Commission for Aqua. Although this is related specifically to the water utility industry, it demonstrates the unreasonable skewing of results associated with using the CAPM as a ceiling for determining a utility's return on equity.

In the Columbia Water order, the Commission noted that I&E's DCF and CAPM produced a range of reasonableness for the ROE from 7.84% to 11.09% and approved an ROE of 9.75% as reasonable and appropriate for that company, which is based upon consideration of a variety of factors such as increasing inflation leading to increases in interest rates and capital costs.[27] I respectfully disagree with the Commission's basis (current inflation and interest rates) for determining Columbia Water's ROE of 9.75%. I have presented and discussed below the forecasted lower-level inflation rates, and the Federal Reserve's intention to cut interest rates in 2025-2026, which would have the effect of reducing potential inflation and interest rate risks on capital costs during 2026, when the Company's new rates will be in effect.

---

[26] PA Public Utility Commission, Bureau of Technical Utility Services Report on the Quarterly Earnings of Jurisdictional Utilities for the Year Ended March 31, 2022, approved at Public Meeting on August 4, 2022 at Docket No. M-2022-3032561.

[27] *Pa. PUC v. Columbia Water Company,* Docket No. R-2023-3040258, pp.108-109 (Order Entered January 18, 2024).

Additionally, as explained above, the CAPM should not be used as a primary method, and it should only be used as a comparison (not as a check) of the DCF. Also, as demonstrated below, the use of the CAPM in this proceeding would result in a significant burden to ratepayers during a time of increased levels of inflation. Therefore, I disagree with providing the CAPM with comparable weight to the DCF method.

Q. PLEASE EXPLAIN WHY YOU HAVE CHOSEN TO EXCLUDE THE RP METHOD FROM YOUR ANALYSIS.

A. The RP method is excluded because it is a simplified version of the CAPM and is subject to the same faults explained above. The RP method has a number of underlying assumptions and the most critical one, as well as the most disputed one, is the assumption that the equity risk premium is constant over the time.[28] More importantly, unlike the CAPM, the RP method does not recognize company-specific risk through beta.

Q. EXPLAIN WHY YOU HAVE CHOSEN TO EXCLUDE THE CE METHOD IN YOUR ANALYSIS.

A. The CE method is excluded because the choice of which companies are comparable is highly subjective, and it is debatable whether historic accounting values are representative of the future. Moreover, its historical usage in this regulatory forum has been minimal.

[28] David C. Parcell, "The Cost of Capital – A Practitioner's Guide," 2020 Edition, pp. 167-168.

SUMMARY OF THE COMPANY'S RESULTS

Q. WHAT ARE THE RESULTS OF THE COMPANY'S COST OF EQUITY ANALYSIS?

A. Ms. Nelson used the DCF, CAPM, and the Bond Yield Plus Risk Premium (BYPRP) methods in analyzing the Company's cost of equity. She used both the constant growth and quarterly growth forms of the DCF, as well as the Empirical Capital Asset Pricing Model (ECAPM) in forming her recommendation. Ms. Nelson applied these methods using her proxy group of regulated electric utilities. She then listed the results for each method and the average of the median and mean of the results of the methods. Finally, Ms. Nelson opines that the cost of equity should also be increased due to PPL Electric's planned capital expenditures, slightly smaller size, and flotation costs, although she does not make corresponding adjustment to her proposed cost of equity for these factors. Ultimately, Ms. Nelson's models determined a cost of equity range of 10.30% to 12.35% and opined that a cost of equity of 11.30% is warranted.[29]

[29] PPL Electric Statement No. 10, p. 3, line 8 through p. 4, line 6.

I&E RECOMMENDATION

Q. WHAT IS YOUR RECOMMENDED COST OF COMMON EQUITY FOR THE COMPANY?

A. Based upon my analysis, I recommend a cost of common equity of 10.32%.[30] It is worth noting that this recommendation is within the range that Ms. Nelson has presented as part of her recommendation.

Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?

A. My recommendation is based on the use of the DCF method. As explained above, I used my CAPM result only to present to the Commission a comparison and not as a check to my DCF results. My DCF analysis uses a spot dividend yield, a 52-week dividend yield, and earnings growth forecasts.

Discounted Cash Flow

Q. PLEASE EXPLAIN YOUR DCF ANALYSIS.

A. My analysis employs the constant growth DCF model as portrayed in the following formula:

$$K = D_1/P_0 + g$$

Where:

K = Cost of equity

D_1 = Dividend expected during the year

[30] I&E Exhibit No. 3, Schedule 1.

P_0 = Current price of the stock

g = Expected growth rate

When a forecast of D_1 is not available, D_0 (the current dividend) must be adjusted by one half of the expected growth rate to account for changes in the dividend paid in period one. As forecasts for each company in my proxy group were available from Value Line, no dividends were adjusted for the purpose of my analysis.

Q. PLEASE EXPLAIN HOW YOU DEVELOPED THE DIVIDEND YIELDS USED IN YOUR DCF ANALYSIS.

A. A representative dividend yield must be calculated over a time frame that avoids the problems of both short-term anomalies and stale data series. For my DCF analysis, the dividend yield calculation places equal emphasis on the most recent spot and the 52-week average dividend yields. The following table summarizes my dividend yield computations for the proxy group:[31]

Sixteen Company Proxy Group	Dividend Yield
Spot	3.41%
52-week Average	3.75%
Average	3.58%

[31] I&E Exhibit No. 3, Schedule 12.

Q. WHAT INFORMATION DID YOU RELY UPON TO DETERMINE YOUR EXPECTED GROWTH RATE?

A. I have used five-year earnings per share projected growth rate estimates from S&P, Zacks, and Value Line.

Q. WHAT WERE THE RESULTS OF YOUR FORECASTED EARNINGS GROWTH RATES?

A. The expected average growth rates for my proxy group ranged from 5.21% to 11.19% with an overall average of 7.07%. For the purpose of determining the growth estimate, I subsequently eliminated Dominion Energy's S&P growth estimate of 13.98% and Zacks growth estimate of 13.60% to determine a new adjusted average of 6.74%.[32]

Q. WHY DID YOU ELIMINATE DOMINION ENERGY'S S&P AND ZACKS PROJECTED GROWTH RATES?

A. While the use of a proxy group largely smooths out various anomalies, S&P's and Zacks' growth projections for Dominion Energy are extremely inconsistent and would have an unreasonable and unwarranted impact on my DCF analysis. The estimates of 13.98% and 13.60% are nearly double the originally calculated 7.04% overall average and greater than three standard deviations over the average. This inconsistency would adversely affect my recommendation for the Company's cost

[32] I&E Exhibit No. 3, Schedule 13.

of common equity by creating an unjustified increase in return on equity and consequently raise the proposed rates. Such an unjustified increase would be harmful to ratepayers and would not be in the public interest. Additionally, I was unable to find any explanation or justification of why these estimates were so high.

Q. WHAT IS THE RESULT OF YOUR DCF ANALYSIS BASED ON YOUR RECOMMENDED DIVIDEND YIELD AND GROWTH RATE?

A. The results of my DCF analysis are calculated as follows:[33]

K	=	D_1/P_0	+	g
10.32%	=	3.58%	+	6.74%

Capital Asset Pricing Model

Q. PLEASE EXPLAIN YOUR CAPM ANALYSIS.

A. My analysis employs the traditional CAPM as portrayed in the following formula:

$$K = R_f + \beta(R_m - R_f)$$

Where:

K = Cost of equity

R_f = Risk-free rate of return

R_m = Expected rate of return on the overall stock market

[33] I&E Exhibit No. 3, Schedule 14.

β = Beta measures the systematic risk of an asset

$R_m - R_f$ = Equity Risk Premium (ERP)

Q. WHAT IS BETA AS EMPLOYED IN YOUR CAPM ANALYSIS?

A. Beta is a measure of the systematic risk of a stock in relation to the rest of the stock market. A stock's beta is estimated by calculating the linear regression of a stock's return against the return on the overall stock market. The beta of a stock with a price pattern identical to that of the overall stock market will equal one. A stock with a price movement that is greater than the overall stock market will have a beta that is greater than one and would be described as having more investment risk than the market. Conversely, a stock with a price movement that is less than the overall stock market will have a beta of less than one and would be described as having less investment risk than the overall stock market.

Q. HOW DID YOU DETERMINE BETA FOR YOUR CAPM ANALYSIS?

A. In estimating an equity cost rate for my proxy group of seventeen electric companies, I used the average of the betas for the companies as provided in the Value Line Investment Survey. The average beta for my proxy group is 0.75.[34]

[34] I&E Exhibit No. 3, Schedule 15.

Q. WHAT RISK-FREE RATE OF RETURN HAVE YOU USED FOR YOUR FORECASTED CAPM ANALYSIS?

A. I used the risk-free rate of return (R_f) from the projected yield on 10-year Treasury Notes. While the yield on the short-term T-Bill is a more theoretically correct parameter to represent a risk-free rate of return, it can be extremely volatile. The volatility of short-term T-Bills is directly influenced by Federal Reserve policy. At the other extreme, the 30-year Treasury Bond exhibits more stability but is not risk-free. Long-term Treasury Bonds have substantial maturity risk associated with market risk and the risk of unexpected inflation. Long-term treasuries normally offer higher yields to compensate investors for these risks. As a result, I used the yield on the 10-year Treasury Note because it mitigates the shortcomings of the other two alternatives. Additionally, the Commission has historically agreed with I&E and recognized the 10-year Treasury Note as the superior measure of the risk-free rate of return.[35]

The forecasted yield on the 10-year Treasury Note, as seen in Blue Chip Financial Forecasts, remains steady at 4.10% from the first quarter of 2026 to the first quarter of 2027, and it is forecasted to be 4.00% from 2026-2030. For my

[35] *Pa. PUC v. UGI Utilities, Inc. – Electric Division*, Docket No. R-2017-2640058 (Order Entered October 25, 2018). *See generally* Disposition of Capital Asset Pricing Model (CAPM), p. 99; *Pa. PUC v. Aqua Pennsylvania, Inc.*, Docket Nos. R-2021-3027385 & R-2021-3027386, p. 154 (Order Entered May 16, 2022); *Pa. PUC v. Columbia Water Company*, Docket No. R-2023-3040258 (Order Entered January 18, 2024). *See generally* Disposition of Cost of Common Equity, pp. 107-108; *Pa. PUC v. Pennsylvania-American Water Company*, Docket Nos. R-2023-3043189 & R-2023-3043190 (Order Entered July 22, 2024). *See generally* Disposition of Capital Asset Pricing Model (CAPM), pp. 171-172.

CAPM analysis, I used 4.08%, which is the average of all the yield forecasts I observed.[36]

Q. HOW DID YOU DETERMINE THE RETURN ON THE OVERALL STOCK MARKET IN YOUR FORECASTED CAPM ANALYSIS?

A. To arrive at a representative expected return on the overall stock market, I observed Value Line's 1700 stocks and the historical returns of the S&P 500. Value Line expects its universe of approximately 1700 stocks to have an average yearly return of 10.88% over the next three to five years based on a forecasted dividend yield of 2.10% and a yearly index appreciation of 40%. The S&P 500 Index has had an average return of 12.29% over the past 99 years (1926-2024).[37] I have averaged these two figures, which results in an estimated market return of 11.59%.[38]

Q. WHAT IS THE COST OF EQUITY RESULT FROM YOUR CAPM ANALYSIS USING A FORECASTED OVERALL MARKET RETURN?

A. The result of my analysis is as follows:[39]

K	=	R_f	+	$\beta(R_m - R_f)$
9.71%	=	4.08%	+	0.75 (11.59% - 4.08%)

[36] I&E Exhibit No. 3, Schedule 16.
[37] I&E Exhibit No. 3, Schedule 17.
[38] I&E Exhibit No. 3, Schedule 18.
[39] I&E Exhibit No. 3, Schedule 19.

Q. HAVE YOU PROVIDED AN ADDITIONAL CAPM ANALYSIS?

A. Yes. I have provided an additional CAPM analysis using Kroll's (formerly Duff & Phelps) recommended U.S. Equity Risk Premium (ERP) paired with the 20-year U.S. Treasury yield. Kroll is a trusted and publicly available source that bases their recommended ERP on current and forecasted economic and financial market conditions.

Q. WHAT IS KROLL'S CURRENT RECOMMENDED ERP?

A. As of September 2, 2025, Kroll recommends an ERP of 5.00%.[40]

Q. WHAT IS THE CURRENT 20-YEAR U.S. TREASURY YIELD?

A. As of October 15, 2025, the 20-Year U.S. Treasury yield was 4.61%.[41]

Q. WHAT IS THE COST OF EQUITY RESULT FROM YOUR CAPM ANALYSIS USING KROLL'S RECOMMENDED ERP AND THE 20-YEAR U.S. TREASURY YIELD?

A. The result of my analysis is as follows:[42]

K	=	R_f	+	β(ERP)
8.36%	=	4.61%	+	0.75 (5.00%)

[40] I&E Exhibit No. 3, Schedule 20.
[41] I&E Exhibit No. 3, Schedule 21.
[42] I&E Exhibit No. 3, Schedule 19.

Q. WHAT IS THE RESULT OF YOUR CAPM ANALYSIS BASED ON THE AVERAGE OF USING A FORECASTED OVERALL MARKET RETURN AND USING KROLL'S RECOMMENDED ERP AND 20-YEAR TREASURY YIELD?

A. The average of my CAPM analyses is 9.04% ((9.71% + 8.36%) ÷ 2).

Q. DO YOU HAVE ANY ADDITIONAL COMMENTS REGARDING YOUR CAPM ANALYSIS?

A. Yes. As discussed earlier in my testimony, and as I&E has historically reasoned, my recommended cost of equity is based upon my DCF analysis. My CAPM analyses are only presented to the Commission as a comparison and not for recommendation purposes as the inputs are highly subjective, and other than beta, not company or industry specific.

Q. IS IT NECESSARY OR APPROPRIATE TO APPLY THE CAPM WITH SIMILAR WEIGHT TO THE DCF WHEN DETERMINING A SPECIFIC RETURN ON EQUITY DUE TO RECENT INFLATIONARY TRENDS?

A. No. My use of the DCF as a primary method in determining an appropriate return on equity already sufficiently takes inflationary trends into consideration. As mentioned above, the DCF includes a spot stock price in the dividend yield calculation and analysts who generate forecasted earnings growth almost certainly take inflation into consideration as well, so it contains the most up-to-date

projected information of any model. In other words, the inputs of the DCF capture all known economic factors, including inflation.

Q. WHAT WOULD YOUR COST OF EQUITY RECOMMENDATION BE IF THE COMMISSION INSISTED ON AVERAGING THE RESULTS OF YOUR DCF AND CAPM ANALYSES AS IT MOST RECENTLY HAS IN THE 2025 COLUMBIA GAS ORDER?[43]

A. This would result in a cost of equity recommendation of 9.68% ((10.32% DCF + 9.04% CAPM) ÷ 2 = 9.68%). The difference between this result and PPL Electric's requested ROE is 162 basis points (11.30% - 9.68% = 1.62%).

Q. BASED ON THE COMPANY'S FILED RATE BASE AND CLAIMED CAPITAL STRUCTURE, WHAT IS THE VALUE OF AN ADDITIONAL 162 BASIS POINTS TO THE COST OF EQUITY?

A. The example below illustrates the impact of 162 additional basis points to the Company's cost of equity:

[43] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.,* Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Cost of Equity Methods, p. 226.

PPL Electric Utilities Corporation	
Claimed Equity Percentage of Capital Structure	56.05%
Difference in Return on Equity Between I&E's DCF/CAPM Average and PPL Electric's Requested ROE (11.30% - 9.68% = 1.62%)	1.62%
Claimed Rate Base*	$5,817,887,000
Impact Prior to Gross Up (0.5605 x 0.0162 x $5,817,887,000)	$52,826,996
Gross Revenue Conversion Factor**	1.4809913
Total Impact ($52,826,996 x 1.4809913)	**$78,236,321**
*PPL Electric Exhibit Fully Projected Future 1, Schedule C-1, Line 13. **I&E Exhibit No. 3, Schedule 9.	

In this example, an addition of 162 basis points to the cost of equity would force ratepayers to fund an unwarranted additional amount of $78,236,321.

CRITIQUE OF MS. NELSON'S PROPOSED COST OF EQUITY

Q. DO YOU AGREE WITH MS. NELSON'S 11.30% PROPOSED COST OF EQUITY?

A. No. I disagree with Ms. Nelson's proposed cost of equity analysis for several reasons. First, I disagree with the weights given to the results of her CAPM, ECAPM, and Bond Yield Plus Risk Premium (BYPRP) analyses in her recommendation. Second, I disagree with her reliance on the 30-year Treasury

Bond for her risk-free rate. Third, I disagree with her claim that PPL Electric requires a higher authorized ROE due to their planned capital expenditures, as well as her opinion that a size adjustment and a flotation cost adjustment should be considered. Finally, I disagree with Ms. Nelson's claims regarding the current capital market environment.

Ms. Nelson's DCF Analysis

Q. PLEASE COMMENT ON MS. NELSON'S DCF ANALYSIS.

A. As stated above, Ms. Nelson presents both a constant growth and quarterly growth DCF analysis. The result of her constant growth DCF is an average of 10.20% (10.19% + 10.14% + 10.27%) / 3)[44] and the result for the quarterly growth DCF is 10.38% ((10.37% + 10.32% + 10.46%) / 3)[45] with an average of the two being 10.29% ((10.20% + 10.38%) / 2).

Although our DCF methodologies vary slightly, Ms. Nelson's average result of 10.29% is reasonable and almost identical to my DCF result of 10.32% on which I base my cost of equity recommendation. Since our DCF methodologies and results are similar, I will not offer specific critiques of Ms. Nelson's DCF analysis.

[44] PPL Electric Statement No. 10, p. 22, ln. 1.
[45] PPL Electric Statement No. 10, p. 24, ln. 1.

Weights Given to the CAPM, ECAPM and BYPRP Methods

Q. DO YOU AGREE WITH MS. NELSON'S RELIANCE ON THE CAPM, ECAPM, AND RP MODELS?

A. No. While I am not opposed to providing the Commission with the results of the CAPM for a point of comparison to the results of the DCF calculation, I am opposed to giving the CAPM, ECAPM, and BYPRP considerable weight. For the reasons discussed above, it is not appropriate to give the CAPM and BYPRP models similar weight to the DCF as Ms. Nelson has done in creating her recommended cost of equity range.[46] As discussed above, the CAPM measures the cost of equity indirectly and can be manipulated by the time period chosen. Since the BYPRP is a simplified version of the CAPM, it suffers these same flaws. Also, as discussed in more detail below, the results of the lesser-used ECAPM and BYPRP models should also be rejected. I have not used the ECAPM because it only weights the results of the CAPM in order to flatten the Security Market Line, but it does not correct the previously discussed problems with the CAPM. I have also not used Ms. Nelson's Bond Yield Plus Risk Premium approach, because it is not a widely accepted method.

[46] PPL Electric Statement No. 10, p. 4, ln. 23 through p. 5, ln. 6.

Bond Yield Plus Risk Premium Approach

Q. WHAT IS THE BOND YIELD PLUS RISK PREMIUM APPROACH?

A. The Bond Yield Plus Risk Premium approach is a method that relies on the theory that common stock is riskier than debt; thus, investors require a higher expected return on stocks than bonds to be properly compensated for the additional risk of holding equity as opposed to being a bondholder.

Q. DO YOU AGREE WITH MS. NELSON'S USE OF THE BYPRP APPROACH?

A. No. Beyond my criticism of this method above, Ms. Nelson cites to Commission proceedings in which the BYPRP was presented, but admits she is unaware of any instance in which it was accepted by the Commission.[47]

Empirical Capital Asset Pricing Model

Q. WHAT DOES MS. NELSON CLAIM IS THE BASIS FOR HER USE OF THE ECAPM?

A. Ms. Nelson opines that the Security Market Line (SML) defined by the CAPM is not as steeply sloped as the predicted SML.[48] She uses a formula to account for the systematic risk that is not accounted for with beta in the CAPM formula. This

[47] I&E Exhibit No. 3, Schedule 22.
[48] PPL Electric Statement No. 10, p. 30, lines 15-17.

methodology, called ECAPM, uses a factor, alpha, to account for the additional systematic risk not captured by beta.

Q. DO YOU AGREE WITH MS. NELSON'S USE OF THE ECAPM?

A. No. The use of the ECAPM in estimating the cost of capital does not increase the validity of the result, but instead it injects another measure of subjectivity to the CAPM in an attempt to make the Security Market Line more accurate. The ECAPM reduces the purpose of the beta, which is the only company-specific variable in the CAPM model. This additional layer of subjectivity provides an even stronger basis to rely on the DCF, as I have done, as the primary method to calculate a utility's cost of equity. Additionally, I am not aware of any instances where a utility commission overseeing base rate proceedings explicitly relied on the ECAPM when determining an appropriate cost of equity for a regulated utility.

Risk-Free Rate

Q. WHAT RISK-FREE RATE DOES MS. NELSON USE IN HER CAPM ANALYSIS?

A. Ms. Nelson used the 30-day average yield on 30-year Treasury bonds as of June 30, 2025 (4.92%), as well as a projected 30-year Treasury yield (4.52%) in the calculation of her estimates.[49]

[49] PPL Electric Statement No. 10, p. 26, lines 5-8.

Q. DO YOU AGREE WITH MS. NELSON'S USE OF THE 30-YEAR TREASURY BOND TO DETERMINE THE RISK-FREE RATE?

A. No. As discussed above, long-term Treasury Bonds have substantial maturity risk associated with the market risk and the risk of unexpected inflation and normally offer higher yields to compensate investors for these risks. Using the 10-year Treasury Note is more appropriate to balance the short-term volatility risk and the long-term inflation risk. Further, as noted above, the Commission has traditionally recognized the 10-year Treasury Note as the superior measure of the risk-free rate of return.

Capital Expenditure

Q. WHAT IS MS. NELSON'S CLAIM REGARDING ADDITIONAL RISK DUE TO THE COMPANY'S CAPITAL INVESTMENT PLANS?

A. Ms. Nelson claims that PPL Electric plans a major capital investment program totaling about $4.4 billion from 2025 to 2029. She also claims that PPL Electric requires a higher authorized ROE in order to support these expenditures, as a high level of expenditures could place pressure on PPL Electric's credit ratings and deter potential investors.[50]

[50] PPL Electric Statement No. 10, p. 37-43.

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S CLAIM REGARDING THE COMPANY'S CAPITAL EXPENDITURES?

A. Every electric utility faces the same issues of upgrading or replacing its infrastructure. As distribution costs increase, PPL Electric, like any other regulated electric utility, has the option to file a base rate case at any time to address revenue inadequacy due to maintaining, expanding, and modernizing infrastructure. Base rate cases allow a utility to recover its costs and provide it with the *opportunity* to earn a reasonable return on capital investments. Additionally, the Commission offers risk reducing mechanisms such as the DSIC and the FPFTY to help reduce any regulatory lag in recovery of infrastructure investment or other unforeseen expenditures. It should be noted that these mechanisms were not designed to eliminate the need for periodic base rate case filings, but only to mitigate regulatory lag and support increasing infrastructure replacement needs.

Size Effect

Q. PLEASE SUMMARIZE MS. NELSON'S DISCUSSION REGARDING THE COMPANY'S SIZE.

A. It is important to note that Ms. Nelson has not added any basis points for a "size adjustment" to her calculated return on equity, rather she offers the discussion as a consideration in determining an appropriate return on equity. Ms. Nelson opines that smaller companies are less able to cope with significant events affecting sales,

revenues, or earnings. Ms. Nelson points to technical literature including Kroll's Cost of Capital Navigator – U.S. Guide to Cost of Capital and a Fama and French study entitled "The Capital Asset Pricing Model: Theory & Evidence,". She quantified a "size premia" of 16 basis points based on the difference in Kroll's size risk premia for her proxy group's median market capitalization and PPL Electric's implied market capitalization. While Ms. Nelson's proxy group median fell in the 2nd decile, she asserted that the Company fell in the 3rd decile for size. Finally, while Ms. Nelson indicates an upward equity risk premium adjustment of 16 basis points would be justified, she has chosen not to make an adjustment for size to her ROE.[51]

Q. DO YOU AGREE WITH MS. NELSON'S CONSIDERATION OF THE COMPANY'S SIZE?

A. No. Consideration of the Company's size is unnecessary because the technical literature she cited supporting investment adjustments related to the size of a company is not specific to the utility industry; therefore, it has no relevance in this proceeding. Furthermore, any expense impact resulting from the lesser buying power of a smaller utility is reflected in the revenue requirement and the dollar-for-dollar recovery that applies to expenses. To apply an additional size adjustment to a smaller regulated utility would only duplicate the burden to ratepayers.

[51] PPL Electric Statement No. 10, p. 44-50.

Q. IS THERE ACADEMIC EVIDENCE THAT SUPPORTS YOUR CONCLUSION THAT THE SIZE ADJUSTMENT FOR RISK IS NOT APPLICABLE TO UTILITY COMPANIES?

A. Yes. In the article "Utility Stocks and the Size Effect: An Empirical Analysis," Dr. Annie Wong concludes:

> The objective of this study is to examine if the size effect exists in the utility industry. After controlling for equity values, there is some weak evidence that firm size is a missing factor from the CAPM for the industrial but not for utility stocks. This implies that although the size phenomenon has been strongly documented for the industriales, the findings suggest that there is no need to adjust for the firm size in utility rate regulation.[52]

The Company has presented no evidence to support application of a non-utility study regarding a size adjustment for risk to a utility setting. Absent any credible article to refute Dr. Wong's findings, Ms. Nelson's discussion of a size adjustment as it could be applied to the Company should be disregarded. Furthermore, the Commission has rejected the application of a size adjustment to the cost of equity calculation.[53]

[52] Dr. Annie Wong, "Utility Stocks and the Size Effect: An Empirical Analysis," *Journal of Midwest Finance Association* 1993, pp. 95-101.

[53] *Pa. PUC v. UGI Utilities, Inc. – Electric Division*, Docket No. R-2017-2640058 (Order Entered October 25, 2018). *See generally* Disposition of Capital Asset Pricing Model (CAPM), p. 100.

Q. PLEASE COMMENT ON MS. NELSON'S REFERENCE TO A STUDY CONDUCTED BY THOMAS M. ZEPP.

A. The 2002 study conducted by Thomas M. Zepp was developed in response to Dr. Wong's study mentioned above. However, the article Ms. Nelson references from Dr. Zepp[54] does not recreate Dr. Wong's study; it simply speculates on other possible reasons for her results and references the results of two other studies. The first study, completed by the California Public Utilities Commission Staff in 1991, is not included in the article, and, therefore, Dr. Zepp's opinions cannot be properly evaluated. Dr. Zepp also draws his conclusions about an entire industry based on the second study, which examines the effects of size on only four water utility companies. This article does not contain enough credible evidence to refute Dr. Wong's findings.

Flotation Cost Adjustment

Q. WHAT IS A FLOTATION COST?

A. Flotation costs are the expenses incurred when a company issues securities such as stocks or bonds when raising capital. These expenses can include legal fees, underwriting fees, auditing fees, administrative costs, or any other necessary and justifiable cost in the issuance process.

[54] PPL Electric Statement No. 10, p. 47

Q. EXPLAIN THE FLOTATION COST ADJUSTMENT MS. NELSON IS PROPOSING IN THIS PROCEEDING.

A. Ms. Nelson opines that PPL Electric should be able to recover flotation costs in the form of raising the common equity cost rate, as these costs are a permanent loss of investment to the utility and cannot be recovered without an adjustment to the common equity cost rate. Like her consideration for size, Ms. Nelson does not make an explicit adjustment to her cost of equity for flotation costs. However, she opines that it would be necessary to increase the authorized ROE by 10 basis points in order to recover these costs.[55]

Q. DO YOU AGREE WITH MS. NELSON'S FLOTATION COST ADJUSTMENT?

A. No. I am not aware of any particular instances where the Commission has approved a flotation cost adjustment to the cost of equity analysis results to recognize issuance expenses in a base rate case for the regulated utilities in Pennsylvania. Considering the impact of this addition to the cost of common equity, it is inappropriate to seek an increase to the cost of equity for stock issuance flotation costs, and therefore, I recommend that the Commission reject PPL Electric's claim that a flotation cost adder should be considered as an addition to the authorized cost of equity.

[55] PPL Electric Statement No. 10, p. 50-51.

Finally, although flotation costs effectively reduce the amount of funds a company actually receives to finance its capital projects, and therefore should be recoverable, they are operating expenses that should be recovered via normalization similar to the treatment of rate case expense, not factored in as an adjustment to the requested return on equity.

Q. ARE YOU RECOMMENDING A NORMALIZED FLOTATION COST EXPENSE IN THIS PROCEEDING?

A. No. Because Ms. Nelson did not make an actual adjustment and specific information regarding the actual flotation costs for PPL Electric was not provided, I am not making a normalized flotation cost recommendation in this proceeding.

<u>Capital Market Environment</u>

Q. WHAT ARE MS. NELSON'S CLAIMS REGARDING THE CURRENT AND PROSPECTIVE CAPTAL MARKET?

A. Ms. Nelson opines that the current capital environment is being affected by (1) the interest rate environment, (2) current and long-term inflation pressures, and (3) economic uncertainty due to geopolitical events. She opines that events such as the COVID-19 pandemic and the war in Ukraine, as well as trends such as higher than normal inflation and the Federal Reserve's monetary policy, contribute to

uncertainty in the capital market conditions and require multiple models in order to determine PPL Electric's cost of equity.[56]

Q. PLEASE COMMENT ON CURRENT INFLATION AND INTEREST RATE CONCERNS.

A. First, while I cannot dispute the recent economic conditions with respect to increased interest rates and government bond yields, it is important to note that all companies, including regulated utilities, are impacted by high interest rates. The Federal Reserve has cut interest rates in September, October, and December of this year, and is expecting to make two more cuts in 2026.[57] If the Federal Reserve decides to make multiple interest rate cuts in the next year as projected, it would impact the Company's FPFTY, when the new rates will be in effect.

With respect to inflation, per the most recent monthly Blue Chip Financial Forecasts,[58] the 2026 inflation rates by two measures are forecasted to be in the range of 2.3% to 3.0% as shown in the table below:

	Q4 2025	Q1 2026	Q2 2026	Q3 2026	Q4 2026	Q1 2027
Consumer Price Index	3.3%	3.0%	2.6%	2.5%	2.4%	2.4%
PCE Price Index	3.0%	2.9%	2.6%	2.4%	2.3%	2.3%

[56] PPL Electric Statement No. 10, p. 52-61.

[57] https://www.reuters.com/business/bofa-expects-december-fed-cut-two-more-2026-2025-12-01/#:~:text=Dec%201%20(Reuters)%20-%20BofA,hinting%20at%20an%20early%20cut. (accessed December 9, 2025).

[58] Blue Chip Financial Forecasts Vol. 44, No. 12, December 1, 2025.

Potential future reductions in interest rates could have the effect of reducing debt cost rates in the capital costs in 2026, when the Company's new rates will be in effect. Lastly, it is important to note that unlike unregulated companies, public utilities may file rate cases to address unforeseen or increased expenses, increases in the costs of borrowing, and equity and/or revenue shortfalls due to changes in market conditions.

Q. PLEASE COMMENT ON MS. NELSON'S GEOPOLITICAL EVENT CONCERNS.

A. PPL Electric faces the same exposure to these issues as all the other companies in our respective proxy groups. Investors voluntarily buy and hold shares of stocks in electric utility companies, indicating they are aware of these risks and the returns. The cost of equity I present for PPL Electric in this proceeding is adequately measured by my proxy group and adequately compensates investors for these risks.

Time Between Rate Cases

Q. DESCRIBE PPL ELECTRIC'S FINANCIAL POSITION IN THE TEN YEARS SINCE ITS LAST RATE CASE FILING.

A. PPL Electric's actual return on equity has increased year over year for the past three consecutive years, from 9.41% in 2022 to 10.49% in 2024. Since the last rate case filing in 2015, PPL Electric's actual ROE has trended upwards from

8.89% in 2015 to 10.49% in 2024.[59] This is an increase of 160 basis points. In addition, in the same time frame, their equity ratio has risen from 51.82% equity in 2015 to 56.13% equity in 2024.[60] Finally, in 2022, S&P upgraded PPL Electric's from "A-" to "A".[61]

Considering these solid and seemingly ever-increasing financial metrics, I believe any concern over a potential credit downgrade or access to capital markets is irrational.

OVERALL RATE OF RETURN RECOMMENDATION

Q. WHAT IS THE COMPANY'S PROPOSED COST OF EQUITY AND OVERALL RATE OF RETURN?

A. The Company recommends a cost of equity of 11.30% and an overall rate of return of 8.56%.[62]

Q. WHAT IS I&E'S RECOMMENDED COST OF EQUITY AND OVERALL RATE OF RETURN?

A. I&E Exhibit No. 3, Schedule 1, shows the calculation of an appropriate cost of equity to be 10.32% for the Company with an overall rate of return for PPL Electric of 7.97%.

[59] I&E Exhibit No. 3, Schedule 23.
[60] I&E Exhibit No. 3, Schedule 24.
[61] PPL Electric Statement No. 9, p. 6, lines 15-17.
[62] PPL Electric Statement No. 1, p. 8, ln. 14.

Q. DO YOU HAVE ANY FINAL COMMENTS REGARDING THE COMPANY'S PROPOSED RETURN ON EQUITY?

A. Yes. First, to reiterate, the same report issued by Regulatory Research Associates as cited above in the *"Capital Structure"* section, illustrates that the average authorized return on equity decided in the first nine months as 2025 was 9.66%. PPL Electric's recommendation far exceeds this average, and the position recommended by I&E of 10.32% is still well above the national average for 2025.

Second, when asked, Ms. Nelson indicated she was unaware if any electric utilities throughout the United States were granted a Commission authorized return of 11.30% or higher cost of common equity in the past two years.[63]

Third, as cited to above, the Commission has recently commented on the equity heavy capital structure of other utility companies, and specifically asked that PPL Electric's capital structure be subject to a careful evaluation.

Fourth, as mentioned above, PPL Electric's overall financial condition has significantly improved in the ten years since their last rate case filing.

Finally, I believe it is important to consider the impact of what the Company's excessive return on equity request of 11.30% would have on rates. Any additional basis points beyond the I&E recommended ROE of 10.32% based on a DCF (market-determined) result would be excessive and would put an enormous burden on ratepayers during these tough economic times.

[63] I&E Exhibit No. 3, Schedule 25.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

PPL Electric Utilities Corporation
Response to the RR Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 9, 2025
Docket No. R-2025-3057164

I&E-RR-9-D	Reference PPL Electric Statement No. 10, p. 4, lines 3-6, and Schedule B-7, p. 1. Please clarify whether the requested capital structure is 56.00% equity/44.00% debt or 56.05% equity/43.95% debt.
PPL Electric Response	The requested capital structure is 56.05% equity and 43.95% debt as detailed in Schedules B-7 and B-8 of Exhibit Fully Projected Future 1. Ms. Nelson's references to 56.00% common equity and 44.00% long-term debt were meant to be references to the Company's requested capital structure of 56.05% common equity and 43.95% long-term debt. Ms. Nelson will provide that clarification in her rebuttal testimony.

For detailed data

Access the RRA's electric and gas rate case decisions as of Sept. 30, 2025 and related data.

The return on equity averages calculated for the first nine months of 2025 indicate a drop in the electric authorized ROE compared with the full year 2024 average, while the average gas authorized return on equity remained largely unchanged.

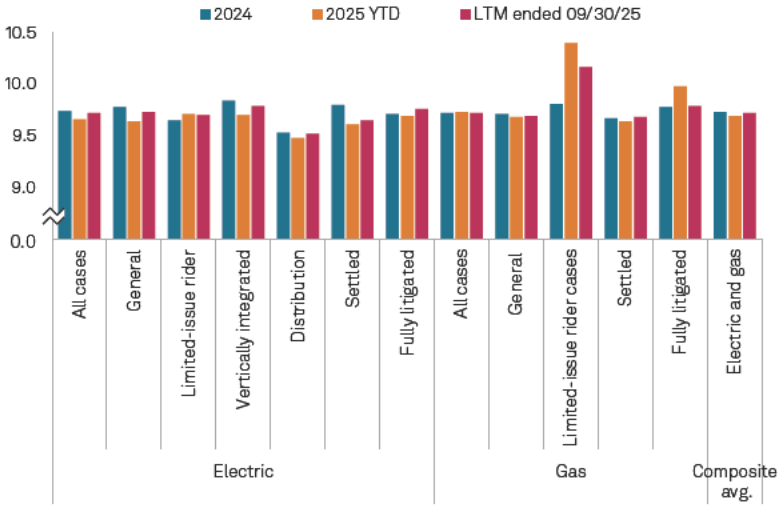
Executive Summary

Introduction

In the first nine months of 2025, the average authorized return on equity (ROE) for electric utilities decreased, while the authorized ROE for gas utilities was largely in line with that observed in calendar 2024.



As per calculations from Regulatory Research Associates, the average authorized ROE for electric utilities was 9.66% in rate cases decided in the first nine months of 2025, under the 9.74% average for full year 2024. There were 37 electric ROE authorizations in the first nine months of 2025 versus 55 in full year 2024.

The average ROE authorized for gas utilities was 9.73% in rate cases decided in the first nine months of 2025, largely in line with the 9.72% average for full year 2024. There were 26 gas ROE authorizations in the first nine months of 2025 versus 44 in full year 2024.

Rate case activity in 2024 remained elevated, with about 155 decisions issued by state public utility commissions, including 99 electric and gas equity-return determinations.

The primary driver for rate case filings continues to be capital expenditure recovery. Energy utilities are investing in infrastructure to modernize transmission and distribution systems; build new natural gas, solar and wind generation; and deploy new technologies to support the expansion of electric vehicles, battery storage and advanced metering infrastructure, all facilitating the transition toward decarbonization. Additional reasons for rate filings include rising expenses, revised cost-of-capital parameters, economic and sectorwide impacts on operations, recovery of costs related to storms and severe weather, and addressing rate treatment for generation facilities being retired early due to the energy transition. Many of the filings include proposals for alternative ratemaking frameworks to address volatile costs and mitigate regulatory lag.

Capital structure trends

The negative cash flow impact from federal tax changes that took effect in 2018 raised concerns regarding utility liquidity and credit metrics. In response, many utilities sought higher common equity ratios. Consequently, the authorized equity ratios adopted by utility commissions in 2019 averaged 49.94% for electric utilities and 51.86% for gas utilities, modestly higher than the averages for 2018 and 2017, and almost 300 basis points above the levels observed in 2005.

Since then, authorized ROEs for electric utilities have fluctuated at levels around 50%, with the average for 2024 coming in at 49.84%. For gas utilities, the average has been slightly higher, reaching 52.45% in 2023 and settling down at 52.13% in 2024.

Authorized equity ratios fell for both electric and gas utilities in the first nine months of 2025, with the average for electric utilities reaching a 15-year low of 48.74% and falling below 52% to 51.94% for gas.

A more granular look at ROE trends

So far, the discussion has focused on broad trends in authorized ROEs. The following sections provide a more detailed analysis.

RRA has noted significant differences in average ROEs based on the types of proceedings or decisions in which these ROEs were established.

Due to the restructuring of the electric industry, several states have unbundled electric rates and introduced retail competition for generation. In these states, commissions have jurisdiction only over return parameters and revenue requirements for distribution operations.

WITNESS: Jennifer Nelson/Julissa Burgos

PPL Electric Utilities Corporation
Response to the RR Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 9, 2025
Docket No. R-2025-3057164

I&E-RR-5-D

Confirm or deny whether Ms. Nelson agrees that generally, all other things being similar, a company with a capital structure containing a higher equity ratio faces less financial risk as compared to a company with a capital structure containing a lower equity ratio.

PPL Electric Response

Ms. Nelson agrees that, in theory and all else equal, a higher equity ratio generally reduces financial risk. However, this is only one component of a utility's overall risk profile. As Ms. Burgos explains on pages 2-3 of her Direct Testimony (PPL Electric Statement No. 9), PPL Electric's targeted capital structure is important to maintain credit metrics that support its strong investment grade credit ratings, which provide PPL Electric the ability to access capital at more favorable borrowing rates.

PENNSYLVANIA PUBLIC UTILITY COMMISSION
Harrisburg, Pennsylvania 17120

Pennsylvania Public Utility Commission
v.
PPL Electric Utilities Corporation

Public Meeting of October 23, 2025
3057164-TUS
Docket No. R-2025-3057164

STATEMENT OF VICE CHAIR KIMBERLY BARROW

Before us for consideration is the proposed rate increase request by PPL Electric Utilities Corporation (PPL or Company). PPL proposes an increase of $356.3 million (33.4%) in additional annual revenues to become effective December 1, 2025. The proposal will result in an increase in a residential customer's bill using 918 kWh per month from $177.01 to $189.40 (7%).[1]

I vote to approve the suspension and investigation of this filing, pursuant to 66 Pa. C.S.§1308(d). Further, I urge the parties to take a critical look at, *inter alia,* the following issues:

Extended Stay Out: PPL's last rate increase request was over 10 years ago in 2015.[2] This extended stay out coupled with the Commission's recent approval of the waiver of PPL's DSIC from 5% to 7.5%,[3] including the increase from the instant rate request has the potential to cause rate shock for PPL's customers, especially low-income customers in PPL's service territory. Therefore, I implore the parties to critically review the impact of the aforementioned factors and how they can be addressed in this proceeding and going forward.

Capital Structure: On several occasions, regulated utilities have requested to be awarded common equity ratio and debt capital outside of the apparently reasonable 50% equity and 50% debt capital structure, along with their requested return on equity (ROE). These deviations result in millions of dollars that go into the rates of utility customers as

[1] PPL has indicated that the requested increase is necessary, among other things, due to accelerated capital investment to maintain and improve system reliability and to reduce service outages.

[2] PPL's last base rate case was filed in March 2015, with new rates effective January 1, 2016. *See Pa. PUC v. PPL Electric Utilities Corporation,* Docket Nos. R-2015-2469275, et al. (Opinion and Order entered November 19, 2015).

[3] *See Petition of PPL Electric Utilities P-2024-3048732 Corporation for a Waiver of the Distribution System Improvement Charge Cap of 5% of Billed Revenues,* Docket No. P-2024-3048732 (Opinion and Order entered February 25, 2025) (*DSIC Waiver Order*). The increase of PPL's DSIC from 5% to 7.5% allows PPL to recover additional revenues of approximately $28 million annually. *DSIC Waiver Order* at 50.

higher common-equity ratio results in higher rates for public utility services. Therefore, a careful and detailed review of PPL's claimed capital structure and ROE, is warranted. [4]

Tracking Capital from Parent Company: I understand that utilities often file existing or relevant affiliated interest agreements involving financial transactions between or among them and their parent companies or subsidiaries/affiliates with the Commission. However, it is also important to note that often times these transactions may result in costs being inadvertently shifted to the utilities and ultimately gets passed to their ratepaying customers thereby negatively impacting such customers. Therefore, I implore the parties to critically review these transactions between PPL and its parents/affiliates in this investigation.

Customer Service Issues & Impact on ROE: The Commission recently addressed a settlement involving PPL's system-wide customer billing issues due to failure of PPL's meter data collection system.[5] Due to the failure, 48,168 PPL accounts, *inter alia*, did not receive a bill during one or more of their billing periods from December 2022 through April 2023. *Settlement Order* at 5. Good customer service is an important part of a utility's performance. That performance is a direct component of a just and reasonable ROE. The parties should assess this connection in the award of PPL's requested ROE.

Cost Allocation: Our grid is in the midst of major change. It is becoming more distributed, with new ordinary customer loads like building electrification and electric vehicles. At the same time, city-sized loads are placing new stresses on the system and driving new capital projects. Customers should pay for the facilities built to benefit them. Likewise, cost allocation for distribution system upgrades needs to ensure that no customers disproportionally benefit from a particular cost allocation system. Some of our methods may be outdated, with sophisticated customers able to avoid consumption in a few peak hours to avoid their entire contribution. Peak avoidance should be encouraged but, we should measure beyond just the top few peak hours to determine the true benefits that particular customers and customer classes receive from the system.

Universal Service: Large load additions and forecasts have substantially increased capacity prices in the last two PJM auctions. According to PJM's market monitor, 55% of the increase in capacity prices is attributable to large load growth. That is over $7 billion dollars. Those costs have begun to flow down to customers' bills. The change in rates as of June 1, 2025, will increase the cost paid by residential customers to support the CAP program by $37 million a year. This translates to increases ranging from 5 to 41%

[4] In its current filing, PPL requests a capital structure of 56% equity and 44% long-term debt. *See, Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation*, Docket No. R-2025-3057164, Exhibit Regs. § 53.53 Part III – Rate of Return, Attachment III-A-2, page 1 of 1.

[5] *See Pennsylvania Public Utility Commission, Bureau of Investigation and Enforcement v. PPL Electric Utilities Corporation,* Docket No. M-2023-3038060 (Opinion and Order entered May 16, 2024) (*Settlement Order*).

on a customer bill. I ask the Parties to address whether, consistent with the ratemaking principle of cost causation, whether cost causers should be allocated a share of the universal services charges, currently only charged to the residential rate class.

October 23, 2025

Kimberly Barrow, Vice Chair

PENNSYLVANIA PUBLIC UTILITY COMMISSION
Harrisburg, Pennsylvania 17120

Pennsylvania Public Utility Commission, et al.	**Public Meeting of December 4, 2025**
v.	**3053499-OSA**
Columbia Gas of Pennsylvania, Inc.	**Docket No. R-2025-3053499**

STATEMENT OF VICE CHAIR KIMBERLY BARROW

Before us for consideration is the proposed rate increase request by Columbia Gas of Pennsylvania, Inc. (Columbia Gas or Company). Columbia Gas proposed an increase of $110.4 million (12.02%) in additional annual revenues based on a fully projected future test year (FPFTY) ending December 31, 2026. The proposal would have resulted in an increase in a residential customer's bill using 70 Therms per month from $138.52 to $152.29 (an increase of $15.77 or 11.38%). Columbia Gas also requested an increase in its residential customer charge from $17.25 to $31.97 (an increase of $14.72 or 85.2%).

In their Recommended Decision, Administrative Law Judges (ALJs) Jeffery A. Watson and Chad L. Allensworth recommended that the Commission deny the Company's rate increase request in its entirety or alternatively grant an increase of $66,424,574. Exceptions and Reply Exceptions were filed.[1]

Below are a few issues of concern I would like to highlight.

Frequency of Rate Increase Filings:

The record in this case indicates that since 2008 Columbia Gas has requested an increase almost on an annual basis, including five rate increase requests since 2020.[2] Columbia Gas' rates have increased by almost $500 million during this period. The record further shows that Columbia Gas has the highest rates in the state and the highest revenue per unit of natural gas in the state and the third highest for the 25 natural gas distribution companies (NGDCs) offering service in the mid-Atlantic region, surpassed only by NGDCs offering service to New York City.[3] Columbia Gas' rates outpace inflation. Over the last 20 years, Columbia's residential customer rates for average heating customers (70 therms per month) have increased by 121% (from $47.58 in 2005 to $105.09 in 2025). During this period, the household income for a family of four at 150% FPL only increased 60% (from $30,000 to $48,225 per year). Columbia Gas has also filed 12 rate

[1] The Parties to this proceeding include Columbia Gas, the Office of Consumer Advocate (OCA), The Pennsylvania State University (PSU), the Commission's Bureau of Investigation and Enforcement (I&E), the OCA, the Office of Small Business Advocate (OSBA), and the Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania (CAUSE-PA).

[2] Including the instant proceeding, the Company has requested a rate increase twelve times since 2009: 2009, 2010, 2012, 2014, 2015, 2016, 2019, 2020, 2021, 2022, 2024, and now 2025. *See* OCA St. 5 at 7; OSBA M.B. at 5, Table IEc-1; Table 2, *supra*. Further, as noted in Table 2, the instant rate proceeding is the Company's thirteenth since 2008.

[3] OCA Ex. MWD-7; I&E St. 2 at 9; OCA M.B. at 36; OCA R.B. at 12; OCA Exh. MWD-7.

cases during this period totaling approved distribution rate increases of over $487 million.[4]

While I understand that Columbia Gas is entitled to recovery of the cost of investments made to its system, the Company's utilization of the FPFTY, as authorized under 66 Pa.C.S. § 315, and the availability of the distribution system improvement charge (DSIC), as authorized under 66 Pa.C.S. § 1350 and other rate recovery mechanisms, should be enough incentives to discourage Columbia Gas' current near-annual frequency of rate increase requests.

Capital Structure:

Columbia Gas requested a capital structure of 54.4% common equity and 45.60% debt (43.28% long-term debt and 2.32% short-term debt), along with a return on equity (ROE) of 11.35%. Although I&E accepts the Company's proposed capital structure, the OCA and CAUSE-PA, in opposition, argued that the Commission should instead award a hypothetical capital structure of 50% equity and 50% debt (47.68% long-term debt and 2.32% short-term debt).[5] According to the OCA, the average capital structure mix for the proxy group used in this case as shown on the Value Line consists of 55% debt and 45% equity, the inverse of the ratio proposed by Columbia. [6]

Here, the record clearly reflects that the proxy group's capital structure is composed of less equity than Columbia Gas' capital structure, highlighting reduced risk for the Company when compared to that of the proxy group, and, therefore, suggesting the need for a lower ROE for Columbia Gas. I agree with the OCA that the discrepancy between Columbia Gas' capital structure and the proxy group necessitates an adjustment to the Company's capital structure since Columbia Gas' equity profile has less financial risk than the proxy group. A 50/50 capital structure in this case is equal to the proxy group's average capital structure. [7] Also noteworthy, CAUSE-PA argued that if the Commission were to apply a hypothetical capital structure of 50% equity and 50% debt, the overall rate of return at the Company's desired ROE of 11.35% would be reduced by 0.27% (from 8.55% to 8.28%), which would have reduced the Company's overall annual revenue requirement increase by $17.7 million, or from the proposed increase of $110.5 million sought by Columbia to $92.8 million.[8] CAUSE-PA and the OCA propose an overall rate of return of 7.06%.[9]

---

[4] CAUSE-PA St. 2 at 21.
[5] OCA M.B. at 126; OCA St. 3 at 58; OCA Exh. DJG-16.
[6] OCA M.B. at OCA St. 3 at 50.
[7] Adoption of the OCA's recommended capital structure and ROE would result in a revenue requirement reduction of $54.6 million. OCA St. 3 at 3-4, 50. I agree with the OCA that in *Riverton Consol. Water Co. v. Pa. PUC, 140 A.2d 114 at 121 (Pa. Super. 1958)*, the Superior Court determined that the Commission may make adjustments to a utility's capital structure where circumstances indicate that the actual capital structure may be unfair to customers, such as when the actual capital structure may be weighted too heavily to the debt side or the equity side. See OCA M.B. at 125.
[8] CAUSE-PA M.B. at 35-38.
[9] The OCA's proposed overall rate of return was based upon a weighted average of a 5.20% rate of return on long-term debt, a 5.00% rate of return on short-term debt, and an 8.9% rate of return on common equity. OCA M.B. at 123, 127; OCA St. 3 at 58.

It is clear from the arguments put forward by the Parties in opposition to the Company's proposed capital structure that a 50% equity and 50% debt capital structure is a better representation of the Company's **actual** financial risk and would have resulted in millions of dollars in reduced revenue requirement for the Company and resultant lower rates for Columbia Gas' customers.

Rate of Return on Equity:

Columbia Gas proposed a rate of return on common equity of 11.35% inclusive of the Company's requested upward adjustment of 0.25% for management effectiveness.[10] As a result of its DCF analysis, I&E recommended a cost of common equity of 10.51%.[11] The OCA recommended a cost of common equity of 8.90%, based on its CAPM model and the use of a hypothetical capital structure. The OCA noted that an ROE of 8.90% and overall rate of return of 7.06% are sufficient to ensure Columbia Gas' ability to attract capital and continue investment to provide safe and reliable service, while guarding the interests of consumers.[12] The ALJs rejected Columbia Gas' proposed rate of return on common equity of 11.35% and adopted I&E's proposed DCF ROE of 10.51% ROE.[13]

I believe an ROE lower than the ALJs' recommended 10.51% is more appropriate in this case, given Columbia Gas' unique lack of regulatory lag, associated reduced business risk, and the commensurate impact of the Company's nearly annual rate increases in the past five years on customers' rates. Using informed judgment, an ROE of 9.6% is more appropriate. The most recent five-year average of I&E's proxy group companies' capital structure ranges from 39.33% to 57% long-term debt, 0.51% to 12.82% short-term debt, and 35.96% to 60.16% common equity, with an overall five-year average of 47.42 long-term debt, 7.85% short-term debt, and 44.73% common equity.[14] Since the proxy group's capital structure is composed of less equity than Columbia's capital structure (or the hypothetical capital structure) it is appropriate to adjust the equity return to account for the reduced risk of a capital structure that employs more equity. I&E's DCF results range from 9.06% to 11.68% (using an average dividend yield and average growth estimate for each company) with an average of 10.51% and a composite CAPM ROE of 9.935.

Based upon consideration of the competing evidence provided to the record, I believe an ROE that is in the range of the bottom of I&E's DCF range and the Composite CAPM ROE is appropriate. The 9.60% ROE is also an approximate median number between the OCA's proposed ROE of 8.90% and I&E's proposed ROE of 10.51%. With an ROE of 9.60% along with a 50/50 capital structure, the overall rate of return would be 7.40%, resulting in an overall rate increase of approximately $30,573,357. Accordingly, I would support an ROE of 9.60%.

Smart Remote Methane Detection Pilot: I&E recommended a Smart Remote Methane Detector pilot program in a region where Columbia has risky pipe for the installation of

[10] Columbia Gas St. 8 at 9-10.
[11] I&E M.B. at 40-41.
[12] OCA R. Exc. at 10-11; OCA M.B. at 137.
[13] R.D. at 337-38.
[14] I&E M.B at 37; I&E St. 2 at 20, citing I&E Exh. 2, Sch. 2.

500 to 1,000 Smart Remote Methane Detectors (SRMDs). Columbia stated that it could not commit to the Pilot as outlined by I&E, citing significant IT infrastructure costs and concerns, but was willing to evaluate technologies associated with the integration of Automated Metering Infrastructure and SRMDs for potential future deployment.

I support directing Columbia to implement an internal study to determine whether a methane detection pilot program would be feasible and how it would be implemented. With affordability always on our minds, it is very important for the company to fully understand the potential costs associated with the pilot prior to implementation. The usefulness and safety benefits of methane detectors are tremendous, allowing the ability of real-time smart reporting technology to simultaneously notify the customer and the emergency response officials of a potentially hazardous situation. I want to take the opportunity to thank I&E for putting forth this proposal and for Columbia to be willing to evaluate the pilot.

Additional CAP Screening: The OCA and CAUSE-PA proposed that Columbia conduct initial screening for all applicants applying for service or when transferring service to determine if they qualify as a low-income customer or may be eligible for assistance, such as customer assistance program (CAP). The record indicates that only 20,988 customers, or 23% of the estimated Columbia Gas' low-income customers, were enrolled in CAP and that additional screening is appropriate. I support this proposal and agree that additional screening is needed, and that any tool we can use to nudge customers into a healthy financial relationship with their utility is beneficial for everyone.

KROLL

Kroll Recommended U.S. Equity Risk Premium and Corresponding Risk-Free Rates to be Used in Computing Cost of Capital: January 2008 - Present

September 2, 2025

Share

DOWNLOAD THE LATEST REPORT

* We recommend using the spot 20-year U.S. Treasury yield as the proxy for the risk-free rate, if the prevailing yield as of the valuation date is higher than our recommended U.S. normalized risk-free rate of 3.5%. This guidance is effective when developing USD-denominated discount rates as of June 16, 2022 and thereafter.

The Equity Risk Premium (ERP) is a key input used to calculate the cost of capital within the context of the Capital Asset Pricing Model ("CAPM") and other models. Kroll regularly reviews fluctuations in global economic and financial market conditions that warrant a periodic reassessment of the ERP and the accompanying risk-free rate.

Duff & Phelps (Rebranded as Kroll) has published its recommended U.S. ERP and corresponding risk-free rate since 2008. Download a table summarizing these recommendations over the period January 2008 – present.

LATEST ON U.S. 20 YEAR TREASURY

WITNESS: Jennifer Nelson

PPL Electric Utilities Corporation
Response to the RR Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 9, 2025
Docket No. R-2025-3057164

I&E-RR-10-D

State whether Ms. Nelson is aware of any instances where the Commission relied upon the Bond Yield Plus Risk Premium or the ECAPM analyses to determine an appropriate cost of equity in a base rate proceeding. If yes, identify the specific cases, including the docket number.

PPL Electric Response

Although Ms. Nelson is unaware of a fully litigated proceeding in which the Commission explicitly relied on the Bond Yield Plus Risk Premium or the ECAPM analyses to determine the authorized ROE, Ms. Nelson is aware that these methodologies have been presented in the following proceedings: Docket Nos. R-2015-2469275 (Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation), R-2024-3046523 (Pennsylvania Public Utility Commission v. Duquesne Light Company), R-2024-3046931 (Pennsylvania Public Utility Commission v. PECO Energy Company – Electric Division), R-2024-3047068 (Pennsylvania Public Utility Commission v. FirstEnergy Pennsylvania Electric Company), and R-2022-3037368 (Pennsylvania Public Utility Commission v. UGI Utilities, Inc. – Electric Division). Every case is unique and based on the particular facts and circumstances unique to that case. *See also*, response to I&E-RR-7-D.

In Ms. Nelson's experience, regulatory commissions routinely review and consider the multiple methods presented by expert witnesses representing various parties and apply their judgment in assessing the analytical results and determining the authorized Return on Equity. Both the Bond Yield Plus Risk Premium and ECAPM approaches have been presented by ROE witnesses representing a variety of parties across the U.S. While Ms. Nelson has not performed an exhaustive search, she is aware that the Bond Yield Plus Risk Premium analysis has been accepted by commissions in North Carolina, Texas, Mississippi, and Virginia. Additionally, she is aware that the ECAPM has been accepted by commissions in North Carolina, New York, Mississippi, Alaska, and Maryland.

WITNESS: Katelyn Arnold

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Energy Justice Advocates (EJA)
Dated November 4, 2025
Docket No. R-2025-3057164

EJA-PPL-I-5

Please provide PPL's allowed and realized return on equity for each of the past ten (10) years. For each year, please quantify the impact of the differences in revenues by class. Please provide the requested quantitative information in Microsoft Excel spreadsheet format, with all cells unlocked, all formulae intact, and all assumptions, units, and referenced data sources or linked files specified and included.

PPL Electric Response

See EJA I-5 Attachment 1 for the Company's return on equity (ROE) provided in Schedule D-1 of the Company's Quarterly Financial Reports filed with the PA PUC.

PPL Electric's base distribution allowed ROE was determined in its prior rate case in 2015. The case was a black box settlement, and the ROE was not specifically defined.

Outside of the ratemaking process, Return on Equity is a result of a calculation using revenues and expenses to calculate income. Using income available for common equity, its common equity percentage as part of its capital structure, and its rate base, the Company calculates its actual ROE. The actual ROE itself does not impact the revenues collected by customer class.

The revenues collected by customer class are based on actual customer count and usage values.

12 mo. Ended 12/31	Actual Return on Equity
2024	10.49%
2023	9.84%
2022	9.41%
2021	9.69%
2020	11.10%
2019	10.53%
2018	11.10%
2017	11.07%
2016	10.45%
2015	8.89%

WITNESS: Katelyn Arnold

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Energy Justice Advocates (EJA)
Dated November 4, 2025
Docket No. R-2025-3057164

EJA-PPL-I-6	Please provide PPL's allowed and actual equity fraction for each of the past ten (10) years. Please provide the requested quantitative information in Microsoft Excel spreadsheet format, with all cells unlocked, all formulae intact, and all assumptions, units, and referenced data sources or linked files specified and included.
PPL Electric Response	See EJA-PPL-I-6 Attachment 1 for PPL Electric's actual equity fraction as provided in Schedule E of the Company's Quarterly Financial Reports filed with the PA PUC. The Company's allowed equity fraction was determined in its prior rate case in 2015. The case was a black box settlement, and the allowed equity fraction was not specified.

12 mo. Ended 12/31	Actual Equity Fraction
2024	56.13%
2023	56.09%
2022	55.96%
2021	55.88%
2020	54.52%
2019	54.62%
2018	54.58%
2017	54.70%
2016	54.57%
2015	51.82%

WITNESS: Jennifer Nelson

PPL Electric Utilities Corporation
Response to the RR Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated October 9, 2025
Docket No. R-2025-3057164

I&E-RR-11-D

Reference PPL Electric Statement No. 10, p. 3, lines 10-11:

A. State whether Ms. Nelson is aware of any electric distribution utilities throughout the United States that have been granted a Commission authorized 11.30% or higher cost of common equity in the past two years.

B. If the answer to Part A is yes, identify which company/companies have been authorized such cost of common equity and in what jurisdiction.

PPL Electric Response

While Ms. Nelson is not aware of an electric distribution-only utility receiving an authorized ROE of 11.30% or higher in the last two years, she is aware that vertically integrated electric utility Alaska Electric Light and Power (Alaska jurisdiction) was granted an 11.45 percent return on equity (with a 60.70% common equity ratio) in 2023. Every case is unique and based on the particular facts and circumstances unique to that case. *See also*, response to I&E-RR-7-D.

INTRODUCTION **1**

TEST YEAR **2**

LATE PAYMENT REVENUE **2**

CUSTOMER CHARGE **4**

REVENUE ALLOCATION **6**

SCALE BACK OF RATES **10**

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Ethan H. Cline. My business address is Pennsylvania Public Utility Commission, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission in the Bureau of Investigation and Enforcement (I&E) as a Fixed Utility Valuation Engineer.

Q. WHAT IS YOUR EDUCATION AND EMPLOYMENT EXPERIENCE?

A. An outline of my education and employment experience is attached as Appendix A.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for representing the public interest in rate and other proceedings before the Commission. I&E's analysis in this proceeding is based on its responsibility to represent the public interest. This responsibility requires the balancing of the interests of ratepayers, the utility company, and the regulated community as a whole.

Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?

A. The purpose of my direct testimony relates to PPL Electric Utilities Corporation's

("PPL" or "Company") request for an approximately $356 million distribution base rate revenue increase, and specifically addresses the Company's Customer Cost Analysis, the proposed fixed charges, the proposed revenue allocation, and scale back of rates.

TEST YEAR

Q. WHAT TEST YEARS HAS THE COMPANY USED IN THIS PROCEEDING?

A. PPL has selected the year ended June 30, 2025, as the historic test year ("HTY"), the year ending June 30, 2026, as the future test year ("FTY"), and the year ending June 30, 2027, as the fully projected future test year ("FPFTY")[1].

Q. WHAT TEST YEAR HAS THE COMPANY BASED ITS REVENUE REQUIREMENT ON IN THIS PROCEEDING?

A. PPL based its requested revenue requirement on the FPFTY ending June 30, 2027.[2]

LATE PAYMENT REVENUE

Q. WHAT IS LATE PAYMENT REVENUE?

A. Late Payment Revenue is revenue that is generated by the fees charged to

[1] PPL Statement No. 2, pp. 3-4.
[2] PPL Statement No. 2, pp. 3-4.

customers as a result of late payments. The Late Payment revenue is reflected as part of Other Electric Revenues and is not separated into individual rate classes.

Q. WHAT IS PPL'S CLAIM FOR PROPOSED RATE LATE PAYMENT REVENUE IN THE FPFTY ENDING JUNE 30, 2027?

A. PPL's claim for both present and proposed rate Late Payment Revenue in the FPFTY ending June 30, 2027, is $15,305,520.[3]

Q. DO YOU AGREE WITH THE COMPANY'S LEVEL OF PROPOSED RATE LATE PAYMENT REVENUE?

A. No. PPL did not reflect an increase to its late payment revenue in proposed rates despite the proposed increase in revenues. As described above, late payments are generated by fees charged to customers as a result of late payments. Therefore, when the level of revenue increases, it is reasonable to project that the level of late payments will also increase.

Q. WHAT DO YOU RECOMMEND REGARDING THE COMPANY'S CLAIM FOR LATE PAYMENT REVENUE UNDER PROPOSED RATES?

A. I recommend the Company's claim for late payment revenue under proposed rates be increased by $1,278,916 from $15,305,520 to $16,584,436.

[3] PPL Ex. Fully Projected Future 1, Sch. D-3, p. 3 of 3.

Q. HOW DID YOU DETERMINE YOUR RECOMMENDED INCREASE FOR LATE PAYMENT REVENUE UNDER PROPOSED RATES.

A. Under present rates, the $15,305,520 in late payments represents 0.4407% ($15,305,520 / $3,472,893,918) of the total operating revenues under present rates of $3,472,893,918. I determined my recommended level of late payment revenues under proposed rates of $16,584,436 by multiplying the total claimed operating revenues under proposed rates of $3,763,203,187 by 0.4407%.

Q. IF THE COMMISSION GRANTS LESS THAN THE REQUESTED INCREASE, WOULD YOUR RECOMMENDED LEVEL OF LATE PAYMENT FEES NECESSARILY BE ADJUSTED?

A. Yes. The level of late payment fees under proposed rates should be calculated to be 0.4407% of the total operating revenues under proposed rates granted by the Commission.

CUSTOMER CHARGE

Q. DESCRIBE THE COMPANY'S PROPOSED CHANGES TO THE CUSTOMER CHARGE OF EACH RATE CLASS.

A. The Company is proposing increases to the customer charges, inclusive of all existing riders, of the various rate classes as summarized in the table below.[4]

[4] PPL Statement No. 8, pp. 11-18.

PPL Current and Proposed Customer Charges (per Bill)			
Customer Charge	Current (base)	Current (with surcharges)	Proposed
RS	$14.09	$15.49	$17.00
GS-1	$22.00	$24.93	$30.00
GS-3	$60.00	$62.41	$78.00
LP-4	$169.80	$350.67	$235.00
LP-5	$994.00	$1,079.09	$973.44

Q. WHAT IS A CUSTOMER COST ANALYSIS AND HOW IS IT USED?

A. A customer cost analysis is part of a cost of service study that includes only direct customer costs. It is used to determine the appropriate customer charges for the various classes.

Q. DID THE COMPANY PROVIDE A TABLE SHOWING CUSTOMER COSTS IN ITS FILING TO SUPPORT INCREASING THE CUSTOMER CHARGES?

A. Yes. PPL included a table calculating the unit cost per bill for the Residential and GS-1 classes on page 24 of PPL Statement No. 7. Included in the build-up of customer costs were amounts for distribution primary, distribution secondary, line transformers, services, meters, lighting, meter reading, customer service, and billing and collections. However, the Company's table does not include specific costs by account number. The result of the Company's calculation shows a unit

cost per bill of $42.96 for the RS class and $43.05 per bill for the GS-1 class. The Company did not calculate the unit cost per bill for the other rate classes.

Q. ARE YOU RECOMMENDING ANY CHANGES TO THE COMPANY'S PROPOSED CUSTOMER CHARGES BASED ON THE RESULT OF THE CUSTOMER COST BUILD-UP?

A. No. The Company's proposed customer charges for the RS and GS-1, described above, fall within the unit cost per bill shown in the customer cost build-up table. However, I recommend that the customer charges that are proposed to increase be included in any scale back of rates, which I will discuss further below.

REVENUE ALLOCATION

Q. WHAT IS A COST OF SERVICE STUDY?

A. A cost of service study (COSS) is a formalized analysis of costs that attempts to assign to each customer or rate class its proportionate share of the company's total cost of service (i.e., the company's total revenue requirement). The results of such a study can be utilized to determine the relative cost of service for each class and help determine the individual class revenue requirements. Also, to the extent a particular class is above or below the system average rate of return, the study will show the additional revenues each class receives or conversely the additional revenues that each class contributes to the company's overall revenues. In addition to the relative provision of revenues, a relative rate of return is also

provided which shows how the rate of return for each class compares to the system average rate of return.

Q. DID THE COMPANY PERFORM A FULLY ALLOCATED COSS IN THIS PROCEEDING?

A. Yes. PPL included a jurisdictional COSS for the FPFTY ending June 30, 2027, as PPL Exhibit BR-1. This COSS included in the filing utilizes the Concentric Method, which is the same methodology used in PPL's 2015 base rate case. This methodology identifies costs and allocates them to the functional cost categories of customer, demand, and energy costs.[5]

Q. ARE YOU RECOMMENDING ANY ADJUSTMENTS TO THE COMPANY'S PROPOSED COSS?

A. No.

Q. WHAT ARE THE PROPOSED PERCENT INCREASES FOR EACH CUSTOMER CLASS AS PRESENTED IN THE COSS?

A. The following is a summary of the table provided by the Company on p. 22 of PPL Statement No. 7:

[5] PPL Statement No. 7, pp. 2-4.

Company Proposed Revenue Distribution				
Class	**Present Rates**	**Proposed Rates**	**Increase**	**Percent**
RS	$718,787,174	$972,760,160	$253,972,986	35.33%
RTS	$7,930,469	$12,071,032	$4,140,563	52.21%
GS-1	$78,435,579	$107,788,638	$29,353,059	37.4%
GS-3	$128,618,149	$170,381,802	$41,763,653	32.47%
LP-4	$38,791,942	$59,045,537	$20,253,595	52.21%
LP-5	$1,940,349	$1,940,349	$0	0.00%
GH-2	$1,301,175	$1,777,840	$476,665	36.64%
SL/AL	$24,366,203	$30,677,073	$6,310,870	25.90%
Total	**$1,000,171,041**	**$1,356,442,484**	**$356,271,391**	**35.62%**

Q. WHAT IS THE RELATIVE RATE OF RETURN AND HOW DOES IT FACTOR INTO REVENUE ALLOCATION TO RATE CLASSES?

A. The relative rate of return is determined by how the rate of return for each class compares to the system average rate of return. A relative rate of return of 1.00 is attained when the revenue received from a particular class is equal to the corresponding costs of providing service to that class. A relative rate of return above 1.00 for a class indicates that the cost of providing service is less than the revenue received from that class. A relative rate of return below 1.00 for a class indicates that the cost of providing service is more than the revenue received from that class. The

following table shows the relative rate of return under present and proposed rates for each class:[6]

PPL Relative Rates of Return by Class		
Class	**Present Rates**	**Proposed Rates**
RS	0.98	1.01
RTS	0.51	0.82
GS-1	0.91	1.01
GS-3	1.20	1.01
LP-4	0.80	0.89
LP-5	5.42	2.72
GH-2	1.02	1.01
SL/AL	1.33	1.01

Q. DO YOU HAVE ANY RECOMMENDATIONS REGARDING THE REVENUE ALLOCATION BY CLASS BASED ON THE RELATIVE RATE OF RETURN?

A. No. The Company's proposal generally moves each rate class towards the relative rate of return of 1.0.

[6] PPL Statement No 7, p. 20 and PPL Exhibit BR-1, p. 10 of 118.

SCALE BACK OF RATES

Q. WHAT DO YOU RECOMMEND IF THE COMMISSION GRANTS LESS THAN THE FULL INCREASE REQUEST OF $356 MILLION?

A. Should the Commission grant less than the fully requested $356 million, I recommend that the proposed increases by class, excluding rate class LP-5 which was not allocated an increase, be scaled back based on the Cost of Service Study ultimately approved by the Commission. I further recommend that the customer charges for each customer class, apart from rate class LP-4 which was not allocated a customer charge increase, be included in the scale back.

Q. WHY SHOULD THE CUSTOMER CHARGES BE INCLUDED IN ANY SCALE BACK OF RATES?

A. My recommendation to include customer charges in any scale back of rates is consistent with the precedent established by the Commission in the disposition of the 2017 UGI Utilities, Inc. – Electric Division base rate case. Specifically, in that case, the Commission agreed with the Company's proposed customer cost analysis, yet still included the customer cost in its scale back of rates.[7] While the customer charges proposed by the Company are supported by the customer cost analysis, as discussed above, I believe it is reasonable to follow Commission precedent and include the customer charges in any scale back.

[7] Docket No. R-2017-2640058, pp. 173-174, Order entered October 25, 2018.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

ETHAN H. CLINE

PROFESSIONAL EXPERIENCE AND EDUCATION

EXPERIENCE:

03/2009 - Present

Bureau of Investigation and Enforcement, Pennsylvania Public Utility Commission - Harrisburg, Pennsylvania

Fixed Utility Valuation Engineer – Assists in the performance of studies and analyses of the engineering-related areas including valuation, depreciation, cost of service, quality and reliability of service as they apply to fixed utilities. Assists in reviewing, comparing and performing analyses in specific areas of valuation engineering and rate structure including valuation concepts, original cost, rate base, fixed capital costs, inventory processing, excess capacity, cost of service, and rate design.

06/2008 – 09/2008

Akens Engineering, Inc. - Shiremanstown, Pennsylvania

Civil Engineer – Responsible, primarily, for assisting engineers and surveyors in the planning and design of residential development projects

10/2007 – 05/2008

J. Michael Brill and Associates - Mechanicsburg, Pennsylvania

Design Technician – Responsible, primarily, for assisting engineers in the permit application process for commercial development projects.

01/2006 – 10/2007

CABE Associates, Inc. - Dover, Delaware

Civil Engineer – Responsible, primarily, for assisting engineers in performing technical reviews of the sewer and sanitary sewer systems of Sussex County, Delaware residential development projects.

EDUCATION:

Pennsylvania State University, State College, Pennsylvania
Bachelor of Science; Major in Civil Engineering, 2005

- Attended NARUC Rate School, Clearwater, FL
- Attended Society of Depreciation Professionals Annual Conference and Training

TESTIMONY SUBMITTED:

I have testified and/or submitted testimony in the following proceedings:

I&E Statement No. 5
Witness: Benedict Tarr

PENNSYLVANIA PUBLIC UTILITY COMMISSION

v.

PPL ELECTRIC UTILITIES CORPORATION

Docket No. R-2025-3057164

Direct Testimony

of

Benedict Tarr

Bureau of Investigation & Enforcement

Concerning:

"Make Safe" and Wildfire Emergency Preparedness Programs

TABLE OF CONTENTS

INTRODUCTION..... 1

"MAKE SAFE" PROGRAM..... 2

WILDFIRE EMERGENCY PREPAREDNESS PROGRAM..... 6

INTRODUCTION

Q. PLEASE STATE YOUR NAME, OCCUPATION AND BUSINESS ADDRESS.

A. My name is Benedict Tarr. I am a Fixed Utility Valuation Engineer in the Electric Safety Division of the Pennsylvania Public Utility Commission's (Commission) Bureau of Investigation and Enforcement (I&E). My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. WHAT IS YOUR EDUCATION AND EMPLOYMENT BACKGROUND?

A. My education and employment background is attached as Appendix A.

Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?

A. The purpose of my direct testimony is to address the base rate filing of PPL Electric Utilities Corporation (PPL or Company) as it relates to safe and reliable service. I will comment on PPL's filing as it relates to promoting public safety programs and PPL's mitigation of wildfire risk.

Q. DOES YOUR TESTIMONY INCLUDE AN EXHIBIT?

A. Yes, I&E Exhibit No. 5 contains schedules that support my direct testimony.

Q. PLEASE DESCRIBE THE ROLE OF I&E IN RATE PROCEEDINGS.

A. I&E is responsible for representing the public interest in rate and other proceedings before the Commission. I&E's analysis in rate proceedings is based on its responsibility to represent the public interest. This responsibility requires the balancing of the interests of ratepayers, the regulated utility, and the regulated community as a whole.

"MAKE SAFE" PROGRAM

Q. HAVE YOU REVIEWED THE 2025 RATE FILING BY PPL INCLUDING THE DIRECT TESTIMONY OF NICOLE HOWELL?

A. Yes. I have reviewed PPL's rate filing, including the direct testimony of PPL witness Nicole Howell concerning PPL's vegetation management program and the Company-proposed safety plan to protect the public in areas with downed trees or wires caused by contact with vegetation.[1] Ms. Howell addresses various measures undertaken by the Company to ensure that the public is educated and protected from energized power lines. Ms. Howell stated that the Company safety program "Live Line Electrical Safety Exhibit" teaches first responders, contractors, businesses, students, and the public across its service territory to prevent them from contact with energized power lines. Ms. Howell explained in her direct testimony that PPL has taken initiatives to proactively identify and mitigate

[1] PPL Electric Statement No. 17.

potential vegetation-related risks, thereby improving system reliability and reducing the likelihood of outages and safety hazards.[2]

Q. PLEASE EXPLAIN THE IMPORTANCE OF THE "MAKE SAFE" PROGRAM FOR CONTRACTORS WORKING NEAR ENERGIZED FACILITIES.

A. The "make safe" program is a safety initiative provided by electric distribution companies (EDCs) to mitigate electrical hazards for contractors operating near energized facilities. EDCs either de-energize lines or install protective cover-up services on energized lines enabling contractors to work safely while maintaining the required safe approach distance. The cost of the service varies according to the scope of the job. The "make safe" program is designed to reduce the risk of electrical contact.

Q. ARE YOU AWARE IF PPL HAS A PROVISION IN ITS "MAKE SAFE" PROGRAM TO HELP ADDRESS THE COST OF "MAKE SAFE" SERVICES FOR CONTRACTORS?

A. No. It is unclear if PPL has a provision in its "make safe" program that covers the cost of cover-up services for contractors. Ms. Howell explained that PPL offers options for customers and private tree services to accelerate vegetation clearance

[2] PPL Electric Statement No. 17, pp. 6-7.

"make safe" requests outside of the routine maintenance program.[3] According to Ms. Howell, each request is quoted and provided to the customer prior to performing the work. Ms. Howell explained that customers have the option to either accelerate work or wait for the scheduled maintenance interval.[4] However, it is important to note that Ms. Howell's statement on the "make safe" program specifically focuses on vegetation management and does not appear to provide support for homeowners or small business, which use cranes, scaffoldings, and ladders while working near power lines.

I&E's Electric Safety Division has observed an increasing trend of accidental contact with powerlines, primarily because contractors often avoid the need for safe service due to the costs involved. Additionally, the cost of "make safe" service could cause a prohibitive economic barrier resulting in an underutilized safety-focused service. Unfortunately, many contractors, especially homeowners, are not aware of the "make safe" services available.

In contrast, Duquesne Light Company has successfully addressed these issues by offering a "limited" cover-up service. Duquesne Light Company provides up to $1,000 of the cost to contractors and homeowners, incentivizing them to engage these vital safety measures. This initiative not only established physical safety barriers for the power lines, but enhanced safety for everyone at the work site.[5]

---

3 I&E Exhibit 5, Schedule 1, p. 3.
4 *Id.*
5 See *Pa. PUC v. Duquesne Light Company*, Docket No. R-2024-3046523.

Q. PLEASE COMMENT BRIEFLY ON PPL'S DETERMINATION OF THE COST FOR "MAKE SAFE" SERVICE REQUESTS.

A. PPL did not provide an estimated cost for a "make safe" program for contractors and homeowners. While costs for this service can vary depending on the required scope of work, simple cover-up services provide a safe working environment for small tasks typically encountered by most small home improvement tasks. Furthermore, if PPL could initiate a reasonable standard fee for the cost for "make safe" work for contractors and homeowners, it could increase the number of customers who apply for the service. A standard fee for a small home improvement task will enable customers to utilize the service and may help to drastically reduce the number of accidental electrical contact incidents in PPL's operating territory.

Q. DO YOU HAVE ANY RECOMMENDATIONS RELATED TO PPL'S "MAKE SAFE" PROGRAM?

A. PPL should introduce a free or reduced cost "make safe" service, offering up to $1,000 or more for contractors and homeowners to encourage them to request "make safe" cover-up services. These free or reduced cost "make safe" and cover-up service programs could help alleviate the costs associated with make-ready cover-up services for contractors, similar to initiatives already implemented by Duquesne Light Company in its territory.

Additionally, PPL should establish a standard (reduced) fee for simple make-ready and cover-up services related to small home improvement tasks, allowing customers to more easily apply for the "make safe" program. PPL should also revisit its public education outreach programs and assess if it can enhance or bolster efforts to spread the message of "make safe" for work sites around overhead power utilities.

WILDFIRE EMERGENCY PREPAREDNESS PROGRAM

Q. HAS PPL BEEN PROACTIVE IN COMMUNITY SAFETY OUTREACH ON EMERGENCY PREPAREDNESS FOR WILDFIRES?

A. No, PPL has not conducted community outreach to educate agencies, customers and property owners about wildfires mitigation to reduce wildfire risk. However, Ms. Howell explained that PPL has a comprehensive wildfire mitigation drill plan that is conducted internally. According to Ms. Howell, the drill is designed to validate operational readiness and improve coordinated response to potential wildfire incidents.[6]

[6] I&E Exhibit 5, Schedule 2.

Q. DO YOU HAVE ANY RECOMMENDATIONS RELATED TO PPL'S COMMUNITY SAFETY OUTREACH ON EMERGENCY PREPAREDNESS FOR WILDFIRES?

A. PPL should initiate community safety outreach focused on emergency preparedness for wildfires. This initiative will assist local communities, community leaders and first responders in identifying their wildfire hazard mitigation priorities and enable them to take action to reduce wildfire threats to human life, homes, neighborhoods, businesses, and other community assets.

Q. PLEASE SUMMARIZE YOUR RECOMMENDATIONS MADE IN DIRECT TESTIMONY.

A. PPL's procedure for handling "make safe" work orders provides a good basis for protecting customers from accidental electrical contact. To help further reduce the number of electrical contacts in its service territory, PPL should consider implementing a free, or reduced cost, make-ready cover-up service. PPL should review all of its public outreach programs and assess how it can maximize homeowner and contractor education concerning the "make safe" service.

Additionally, PPL should consider initiating a community safety outreach focusing on emergency preparedness for wildfires. This initiative will foster an effective working relationship and communication between agencies, community, and stakeholders. Furthermore, the outreach efforts will identify specific actions and steps necessary to mitigate wildfires hazard and risks to community.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

Benedict Tarr
Professional Experience

Pennsylvania Public Utility Commission, Harrisburg, PA, February 2017 – Present
Electrical Engineer Safety Inspector

- Regulated electric utilities to ensure the safe delivery of utility services and safety accountability using engineering perspectives and methodologies.
- Advocate for vigorous enforcement of safety standards and investigate utility safety failures in proceedings where the Commission considers penalties.
- Conduct interviews during incident investigation in a way that yields valid and detailed information.
- Testify on the results of completed studies and findings at a formal hearing.
- Assists Administrative Law Judges on technical matters and provides assistance and advice on formal issues.
- Conduct an engineering review of safety-related plans and corrective actions proposed by utilities and established by the Commission.
- Develop data needs for analysis, prepare data requests from utilities, and analyze the data.
- Perform field inspections to assess utility compliance with safety standards.
- Examine utilities' safety inspection records and audit reports to ensure effective implementation of safety programs.
- Provide policy analysis and recommendations to the commission on a variety of regulatory issues related to utility safety, infrastructure projects, and general rate case proceedings.

AFL (Contractor), Philadelphia, PA, June 2013 – January 2017
Design/OSP Engineer

- Design and determine outside plant copper and fiber optic cable for existing AT&T facilities using appropriate tools such as ARES, OPED-JMS, DCP, and Mapview for U-verse, PBZ & FTTN.
- Obtain permits for an easement from the municipal cities' government for the U-verse Project.
- Design and development of grounding and bonding solutions to protect personnel and equipment.
- Prepare drawings for constructing new and existing fiber optics, cables, and conduits.
- Understand and read engineering prints to identify existing plant facilities.
- Performed QC on other engineering jobs and understood the bridged tap. Multiples and shotgun pairs.
- Coordinate with vendors and manufacturers and review technical documentation as required.

- Working together with electrical, civil designers and engineers, system protection, construction supervisors, and field personnel.
- Perform research and produce engineering drawings for underground structure/buried cable design of outside plant facilities for all types of projects.

PSEG Nuclear LLC, Hancock's Bridge, NJ, December 2008 – June 2013
Design/Nuclear Engineer

- Provide Design Engineering support for day-to-day activities at Hope Generating Station.
- Prepare, review, and/or update the configuration baseline document as required.
- Prepare, review, and/or update Design Basis Calculation as required.
- Prepare and review the Design Change Package as related to the Design Basis.
- Provide Design Engineering support as required during outages and plant evolutions.
- Performed engineering studies, technical analysis, and interpretation of data at Hope Creek Generating Station.
- Performed load flows, system simulations, and studies at Hope Creek Generating Station.
- Performed troubleshooting for electrical equipment and system communication database at Hope Creek Generating Station.
- Managed special Design Engineering Projects and provided technical assistance to field personnel and contractors.
- Check field conditions on the assigned projects and compare them to the latest revisions of drawings.
- Work with electrical, civil designers and engineers, system protection, construction supervisors, and field personnel on assigned project.
- Provide guidance and reviews of control and protection designs done by contractors.

AT&T, San Jose, CA, June 2007 – November 2008
Design/OSP Engineer

- Design of low, medium, and high voltage power distribution & transmission, including load flow, short circuit, grounding studies, breakers, transformer sizing, cable sizing, and switchgear.
- Prepare schematic and wire diagrams, protection & control schemes, grounding, lighting, cable trays, and conduit layout drawings.
- Field reviews of existing facilities to develop a conceptual design.
- Apply sound engineering judgment to create innovative solutions for the Lightspeed project.

- Determine the feeder routes for fiber and copper using existing conduits and aerial facilities.
- Design, provision, document, and direct Outside Plant Copper and Fiber Optic Cable (UG, Aerial, Buried) and manhole and conduit design.
- Support the design and engineering process by planning and preparing drawings for new construction, and removing or rearranging existing fiber optic and/or copper cables, and conduits.
- Works with outside agencies to obtain right-of-way approvals and coordinate projects with other utilities. Acquiring permits and or private easements.
- Read and understand highway/road prints, identify conflicts with existing outside plant facilities, and select the routing of lines and equipment required for work projects.

Sonic Electronic Company, Bensalem, PA, February 2001 – September 2003
Associate Engineering

- Responsible for the provision of the daily operation and support of the network.
- Perform other duties as requested, directed, or assigned.

Education

Temple University, Philadelphia, PA, 2007

Bureau of Investigation and Enforcement

Concerning:

MAKE SAFE PROGRAM

WITNESS: Nicole Howell

PPL Electric Utilities Corporation
Response to the RE Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated November 20, 2025
Docket No. R-2025-3057164

I&E-ES-1

Reference PPL Statement No. 17, page 8 where Ms. Howell describes how PPL's proposal promotes public safety:

A. Provide details on whether (and if so, how) PPL has conducted community outreach to educate agencies, customers, and property owners about downed power lines and gas leaks during a downed line incident.

B. Does PPL have a "Make Safe" procedure or line cover-up provision to help mitigate accidental electrical contact incidents within its operations area involving contractors and homeowners working near powerline? If yes:

Does PPL charge a fee for "make safe" requests from contractors and Homeowners?

If yes, how much is the fee? If not, how does PPL address the cost to carry out these requests?

How many "make safe" requests did PPL receive in the past 3 years?

What channels does PPL utilize for outreach and education of contractors and homeowners?

What is PPL's current budget to address this issue?

PPL Electric Response

PPL Electric conducts the following community outreach to educate agencies, customers and property owners about downed power lines.

WITNESS: Nicole Howell

Live Line Electrical Safety Exhibit

I&E-ES-2 The Company takes its mobile electrical safety exhibit across the service territory to teach first responders, contractors, businesses, school students and the public how to stay safe around electricity.

A. The exhibit is a scaled-down 7,200-volt electrical distribution system that was developed and built by employees. It features live electrical wires, utility poles, and transformers. The latest version of the exhibit is powered by batteries and incorporates safety lessons related to solar and battery power. The Company's trained employees use ladders, gloves, shovels and other tools in a controlled environment to show the spark, flames, smoke, and crackle that occurs when those items come in contact with live electrical lines.

B. Each year, PPL Electric provides over 100 demonstrations to First Responders, Contractors, trade school and at public events to educate attendees on electrical safety. In 2025, the exhibit made its first appearance at the Pennsylvania Farm Show. Joined by leaders from the PUC, the Department of Agriculture and PEMA, PPL Electric performed a demonstration in front of Farm Show attendees and a live audience on PPL Electric's Facebook account. Demonstrations are regularly documented across PPL Electric's social media channels and shared by the various involved organizations listed above.

Social Media

I&E-ES-3 Safety messaging, including downed wire safety, is abundant across PPL Electric's four main social media platforms – Facebook, Instagram, LinkedIn and X. Downed wire safety messaging is highlighted through posts about PPL Electric's Live Line Exhibit, National Theatre for Children show, storm preparedness/response messaging. This year, PPL Electric also created a video about staying safe around downed wires and shared across its channels.

WITNESS: Nicole Howell

Connect newsletter

I&E-ES-4 PPL Electric also communicates downed wire messaging through its monthly e-Connect and bimonthly print Connect newsletters. The print versions of these newsletters are included in customers' residential bills.

A. From June 2024 through July 2025, this messaging was included in five different issues, from preparing customers for potential hazards during winter storms to learning about the Live Line Exhibit. The Connect newsletters also highlighted overhead power line safety.

B. During scheduled vegetation maintenance activities, PPL Electric does assist customers by providing clearance of vegetation from the electric facilities to assist with private tree work.

C. PPL Electric does provide an option for customers and private tree services to accelerate vegetation clearance "make safe" requests outside of the routine maintenance program. Each request is quoted and provided to the customer prior to performing the work. Customers can choose to accelerate the work or wait until the scheduled maintenance interval.

PPL Electric does not separately track customers "make safe" requests.

D. PPL Electric regularly participates in on-site contractor / homeowners requested vegetation evaluations to discuss specific questions. For more general information and guidance, customers are provided with a fact sheet (in person) or are directed to the PPL Electric Line Clearing website.

Fact Sheet - https://pplelectric.com/site/-/media/PPLElectric/About-Us/Docs/DistributionVegMgmtBrochure.ashx

Website - https://pplelectric.com/site/More/About-Us/Reliability/Line-Clearing

E. The budget for this work is included within the vegetation maintenance program and is not separately tracked.

PPL Electric Utilities Corporation
Response to the RE Set I Data Requests of the
Bureau of Investigation and Enforcement
Dated November 20, 2025
Docket No. R-2025-3057164

I&E-ES-5 Reference PPL Statement No. 17 Page 8 regarding PPL's mitigation of wildfire risk:

A. Provide how many of these inspection locations have been targeted and are replanned to be completed for the next years.

B. Provide detailed information on PPL's mitigation measures aimed at reducing the likelihood of ignitions caused by electrical infrastructure in high fire risk areas, without relying on Public Safety Power Shutoff (PSPS).

C. Does PPL have a comprehensive wildfire mitigation drill plan that is conducted internally with first responders and communities to test and improve emergency response procedures?

If so, please provide detailed information about the drill exercises used to assess coordination and response to potential wildfires incidents.

WITNESS: Nicole Howell

PPL Electric

Response

A. All PPL Electric overhead distribution circuits are planned to be inspected and maintained within the next 5 years as part of its vegetation maintenance program.

B. PPL Electric's vegetation maintenance standard sets 15' of clearance around single phase conductor and 25' of clearance from ground to sky for multi-phase conductor. All necessary maintenance activities, including trimming, tree removal and brush control will be performed on overhead circuits, including high fire risk areas to address potential issues of ignition.

C. PPL Electric does maintain a comprehensive wildfire mitigation drill program that is exercised internally. This drill was designed to validate operational readiness, enhance interagency communication, and improve coordinated response to potential wildfire incidents.

PPL Electric conducted an enterprise-wide Wildfire Tabletop exercise involving all operating companies under the PPL Corporation title. This primarily promotes collaboration and operating company best practice sharing. The 2025 exercise included structured modules simulating Red Flag warnings, active wildfire conditions, and Public Safety Power Shutoff ("PSPS") decision making.

Each module includes internal debriefs and operating company breakout sessions to identify lessons learned and improvements. PPL Electric intends to keep the topic of Wildfire response in future routine exercise drills.

Exercise objectives include:

Operational Coordination: Evaluating internal processes and interdepartmental response procedures.

Operational Communications: Testing notification pathways during escalating wildfire risk.

Public Information & Warning: Practicing customer and community communication during PSPS considerations.

This exercise used scenario-based "injects" that progress from weather warnings to active fires near substations, transmission assets, and critical facilities.

They also incorporate social media monitoring, customer reports, EMS/fire scene coordination, and internal risk assessment tools.

PPL Electric wildfire exercises directly test operational procedures defined in:

Wildfire Mitigation Operations – OI 0152

SAF-400 Public Safety Power Shutoff (PSPS) Policy

Wildfire Fire Response Procedure | EU-ERP-1503

These documents outline the processes exercised during drills, including:

Activation of Wildfire Mitigation Operations based on risk levels

Escalation protocols for Red Flag Warnings

Interdepartmental strategy calls and cross-functional coordination

Use of checklists for PSPS evaluation and documentation.

D. PPL Electric has not done a proactive community safety outreach on emergency preparedness for wildfires.

INTRODUCTION **1**

RESPONSE TO CAUSE-PA WITNESS PATRICK CICERO **2**

RESPONSE TO CEO WITNESS JENNIFER WARABAK **9**

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Christopher Keller. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. ARE YOU THE SAME CHRISTOPHER KELLER WHO SUBMITTED THE DIRECT TESTIMONY CONTAINED IN I&E STATEMENT NO. 2 AND I&E EXHIBIT NO. 2?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?

A. The purpose of my rebuttal testimony is to respond to the direct testimony of the Coalition for Affordable Utility and Energy Efficiency in Pennsylvania (CAUSE-PA) witness Patrick M. Cicero regarding his recommendations to eliminate PPL Electric Utilities Corporation's (PPL or Company) maximum Customer Assistance Program (CAP) credit limits and his alternative recommendation to increase its

maximum CAP credit limits by a minimum of 60% for each category of CAP customers and his recommendation to increase PPL's Low-Income Usage Reduction Program (LIURP) budget.[1] I will also respond to the direct testimony of the Commission on Economic Opportunity (CEO) witness Jennifer Warabak concerning her recommended increases to PPL's LIURP and Hardship Fund budgets.[2]

Q. DOES YOUR REBUTTAL TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 2-R contains schedules that support my rebuttal testimony.

RESPONSE TO CAUSE-PA WITNESS PATRICK CICERO

Q. SUMMARIZE MR. CICERO'S RECOMMEDNATION REGARDING MAXIMUM CAP CREDITS AND PPL'S LIURP BUDGET.

A. Mr. Cicero recommends that PPL be required to eliminate maximum CAP credit limits[3] and that any additional universal service costs as a result of removing the maximum CAP credit limit can be mitigated by recovering universal service costs to all rate classes[4] rather than from only residential customers, which is currently how universal service costs are recovered through the Universal Service Rider. Alternatively, Mr. Cicero recommends that if the Commission rejects his

[1] CAUSE-PA Statement No. 1.
[2] CEO Statement No. 1.
[3] CAUSE-PA Statement No. 1, p. 60, lines 4-5.
[4] CAUSE-PA Statement No. 1, p. 82, lines 15-18.

recommendation to eliminate maximum CAP credits, that the Company increase its maximum CAP credit limits by a minimum of 60% for each category of CAP customers to account for the proposed rate increase in this proceeding along with the increase in the default service rate over the past several years and should continue to increase its maximum CAP credit limits when there are any increases in default service and base rates in the future.[5]

Mr. Cicero's recommendation is based on allowing CAP customers to remain in PPL's CAP program as long as they continue to pay their CAP bill. Mr. Cicero also states that more than 15% of CAP customers reach their max CAP credits prior to the end of the year, which limits the program's ability to provide affordable bills resulting in an increase in service termination of CAP customers.[6]

Additionally, Mr. Cicero recommends the Company increase its LIURP budget by 20% or $2,400,000. Mr. Cicero states that his recommendation is based on PPL currently not sufficiently meeting its low-income customers' need for LIURP services prior to any rate increase resulting from the instant base rate proceeding. Mr. Cicero states that of the 108,875 customers that meet the LIURP eligibility criteria, PPL served an approximate annual average of 3,757 households between July 2023 and June 2025. Mr. Cicero states that to address the nearly 97% [({108,875 – 3,757} ÷ 108,875) x 100] shortfall, he recommends that the

[5] CAUSE-PA Statement No. 1, p. 60, line 21 through p. 61, line 12.
[6] CAUSE-PA Statement No, 1, p. 60, lines 5-10.

Commission require the Company to increase its annual LIURP budget by 20%, or $2,400,000.[7]

Q. WHAT IS MEANT BY THE TERM "CAP CREDIT"?

A. The term "CAP credit" is the difference between a customer's actual bill amount and the payment the CAP customer is required to pay (percentage of gross household income, average bill, or minimum payment). The difference between the two amounts is the CAP credit which is then recovered in rates from non-CAP residential customers.

Q. WHAT IS A "MAXIMUM CAP CREDIT"?

A. The "maximum CAP credit" is the maximum amount of CAP credit a customer can receive. After a customer reaches the maximum CAP credit, the customer is moved to PPL's OnTrack Budget Billing rate. The Commission has a Policy Statement that states that maximum CAP credits are established in each individual utility's Universal Service and Conservation Plan (USECP) proceeding.[8] The maximum CAP credit is a control feature in CAP programs to ensure effective and efficient use of captive non-CAP residential rate funds.

[7] CAUSE-PA Statement No. 1, pp. 75-77.
[8] 52 Pa. Code § 69.265(3)(v).

Q. WHAT MAXIMUM CAP CREDIT LIMITS ARE CURRENTLY APPROVED FOR PPL?

A. In PPL's Universal Service and Energy Conservation Plan, the Commission approved maximum CAP credit limits are as follows:[9]

Federal Poverty Level	Type	Maximum CAP Credits
0% to 50%	Electric Heat	$3,150
51% to 100%	Electric Heat	$2,500
101% to 150%	Electric Heat	$2,150
0% to 50%	Non-Electric Heat	$1,950
51% to 100%	Non-Electric Heat	$1,500
101% to 150%	Non-Electric Heat	$1,250

Q. DO YOU AGREE WITH MR. CICERO'S RECOMMENDATION TO REMOVE MAXIMUM CAP CREDIT LIMITS OR HIS ALTERNATE RECOMMENDATION TO INCREASE MAXIMUM CAP CREDITS BY A MINIMUM OF 60% FOR EACH CATEGORY OF CAP CUSTOMERS?

A. No.

[9] PPL Electric Utilities Corporation. Universal Service and Energy Conservation Plan (USECP), Revised March 13, 2013, p. 14.

Q. WHAT IS YOUR POSITION WITH RESPECT TO MR. CICERO'S RECOMMENDATIONS REGARDING THE ELIMINATION OF OR INCREASE TO MAXIMUM CAP CREDIT LIMITS?

A. I recommend Mr. Cicero's proposal to eliminate maximum CAP credit limits or alternatively to increase its maximum CAP credit limits by a minimum of 60% for each category of CAP customers be disallowed due to the impact of increased CAP costs to non-CAP customers, especially non-CAP low-income customers.

Q. HOW WOULD ADOPTION OF MR. CICERO'S RECOMMENDATION IMPACT NON-CAP CUSTOMERS?

A. Mr. Cicero's proposal to remove maximum CAP credit limits or his alternative recommendation to increase PPL's maximum CAP credit limits by a minimum of 60% for each category of CAP customers impacts all non-CAP residential customers as they will bear the increased CAP costs. The additional cost will be particularly burdensome for non-CAP low-income customers. Mr. Cicero states in his testimony that 31% of confirmed low-income customers and an estimated 23% of estimated low-income customers are enrolled in CAP.[10] This would mean that 69% of confirmed low-income customers and an estimated 77% of estimated low-income customers are *not* enrolled in CAP.

[10] CAUSE-PA Statement No. 1, p. 24.

Mr. Cicero's proposal to remove maximum CAP credit limits or increase maximum CAP credit limits by a minimum of 60% for each category of CAP customers would harm the vast majority of low-income customers as these customers would be required to pay more for the additional CAP credits for which they are not receiving any benefit. When considering proposed revisions to the current CAP policy statement, the Commission stated the following:

> Given the significant past increase in EDC universal service spending – and the anticipated increases in both EDC and NGDC universal spending through 2021 – the Commission is concerned that recovering CAP costs (as well as other universal service costs) from only residential ratepayers will continue to make electric and/or natural gas bills increasingly unaffordable for non-CAP customers, especially those with incomes between 151-200% of the FPIG.[11]

As shown above, the Commission expressed concern about low-income customers just above 150% of the federal income poverty level who are not eligible for CAP but are required to pay for increased CAP costs. I&E is similarly concerned about these non-CAP customers who will be required to pay for the unquantified additional CAP costs proposed by CAUSE-PA. Such costs will be especially burdensome for low-income customers who are not enrolled in CAP or customers who are just above the CAP eligibility requirements.

[11] 2019 Amendments to Policy Statement on Customer Assistance Program, 52 Pa. Code §§ 69.261–69.267. Final Policy Statement and Order, Docket No. M-2019-3012599, p. 93 (Order Entered November 5, 2019).

Q. IS THERE ANY ADDITIONAL GUIDANCE THAT SUPPORTS YOUR RECOMMENDATION?

A. Yes. 52 Pa. Code § 69.265(3)(v), which addresses control features to limit program costs, states: "*Maximum CAP credits. These will be established in individual utility USECP proceedings, if deemed appropriate*. If applied, CAP credit limits should consist of a tiered structure based on the household's [Federal Poverty Income Guidelines] level such that lower income households receive higher CAP credit limits."[12] Therefore, it is inappropriate to consider a change in maximum CAP credits in this base rate case proceeding as a USECP proceeding would allow consideration and evaluation of all other related programs and comments of all stakeholders and interested parties.

Q. DO YOU HAVE ANY COMMENTS REGARDING MR. CICERO'S RECOMMENDATION TO INCREASE LIURP FUNDING?

A. Yes. While I may not specifically agree with the dollar amount recommended by Mr. Cicero, I agree that an increase in the LIURP budget *may* be necessary. In response to CAUSE-PA-II-7,[13] PPL confirmed it has exhausted its LIURP budget for 2023 and 2024 with the 2025 information not being available at the time of the Company's response. Although I believe that issues such as changes to LIURP funding are best addressed in the Company's USECP proceeding, which would

[12] 52 Pa. Code § 69.265(3)(v) (emphasis added).
[13] I&E Exhibit No. 1-R, Schedule 1.

allow for comments from stakeholders and interested parties and the consideration and evaluation necessary of all universal service-related programs, I am not opposing an increase in LIURP funding in this proceeding. However, it is important to consider that any increase in LIURP funding needs to be balanced against Universal Service Rider (USR Rider) costs for other customers.

RESPONSE TO CEO WITNESS JENNIFER WARABAK

Q. SUMMARIZE MS. WARABAK'S RECOMMEDNATION REGARDING PPL'S LIURP BUDGET AND HARDSHIP FUND.

A. Ms. Warabak recommends that the Company increase its LIURP budget by $900,000. Ms. Warabak opines that the Company's current LIURP budget is insufficient to meet the need for LIURP services and that the proposed increase further exacerbates that deficiency. Additionally, Ms. Warabak contends that LIURP is unique to other universal service programs in that it is a preemptive measure for low-income customers rather than reactive to arrearages or other crises. Finally, Ms. Warabak's testimony suggests that a 7.5% [($900,000 ÷ $12,000,000) x 100] increase in the LIURP budget will result in progress in meeting the need for LIURP services in the Company's service territory.[14]

Ms. Warabak also recommends that the Company increase its annual contribution to the Hardship Fund by $500,000. Ms. Warabak's recommendation

[14] CEO Statement No. 1, pp. 6-9.

aims to address her concerns that low-income customers' ability to afford the Company's rate increase is made worse by general inflationary pressures.[15]

Q. DO YOU HAVE ANY COMMENTS REGARDING MS. WARABAK'S RECOMMENDATION TO INCREASE LIURP FUNDING?

A. Yes. Similar to my comments made to Mr. Cicero, while I may not specifically agree with the dollar amount recommended by Ms. Warabak, I agree that an increase in the LIURP budget *may* be necessary. Again, although I believe that issues such as changes to LIURP funding are best addressed in the Company's USECP proceeding, which would allow for comments from stakeholders and interested parties and the consideration and evaluation necessary of all universal service-related programs, I am not opposing an increase in LIURP funding in this proceeding. However, it is also important to consider that any increase in LIURP funding needs to be balanced against USR Rider costs for other customers.

Q. DO YOU HAVE ANY CONCERNS ABOUT MS. WARABAK'S RECOMMENDATIONS REGARDING THE HARDSHIP FUND?

A. Yes. I am not opposed to Ms. Warabak's recommendation to increase funding for hardship grants, however, I am concerned that Ms. Warabak does not explicitly state how her increase is to be funded. As the current program for hardship grants

[15] CEO Statement No. 1, p. 10, lines 16-22.

is primarily funded by shareholders and not recovered from ratepayers, I recommend that this should continue and that any increase to funding of hardship grants be funded entirely by the Company and its shareholders.

Q. DO YOU HAVE ANY FINAL COMMENTS ABOUT MR. CICERO'S AND MS. WARABAK'S DIRECT TESTIMONIES?

A. Yes. Due to the length, depth, and number of issues addressed in Mr. Cicero's and Ms. Warabak's direct testimonies, my lack of response to any topic or recommendation should not be interpreted as agreement with any of their recommendations.

Q. DOES THIS CONCLUDE YOUR REBUTTAL TESTIMONY?

A. Yes.

Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania
(CAUSE-PA)
Dated October 16, 2025
Docket No. R-2025-3057164

CAUSE-PA II-7

Please indicate from 2023 to date, disaggregated by year, as of the last day of the year, whether:

a) PPL exhausted its LIURP budget,
b) If such budget was not exhausted, indicate the number of dollars not spent;
c) If PPL's LIURP budget was exhausted, indicate the number of LIURP applicants that did not receive LIURP services despite having been found to be LIURP eligible.

Please provide this data in a live Excel spreadsheet.

PPL Electric Response

a) 2023 & 2024 – Yes. 2025 is ongoing.

b) 2023, 2024, and 2025 – N/A

c) PPL Electric does not have a limit on the number of customers who can apply or be deemed eligible for WRAP in a calendar year. Applications are accepted year-round. Eligible applicants' cases are prioritized based on the date of their completed application and program priorities, such as high usage thresholds and the possibility of exhausting CAP credits. The Company does not track the number of open jobs at the end of the year. If the LIURP budget is exhausted in any given year, approved applications carry over to the following year and remain at the same prioritization.

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Zachari Walker, and my business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. ARE YOU THE SAME ZACHARI WALKER WHO SUBMITTED I&E STATEMENT NO. 1 AND I&E EXHIBIT NO. 1?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to respond to the rebuttal testimony of PPL Electric Utilities Corporation (PPL Electric or Company) witnesses Dennis Urban Jr.,[1] Bethany Johnson,[2] Daniel Dane,[3] Katelyn Arnold,[4] Joseph Lookup,[5]

---

1 PPL Electric Statement No. 2-R.
2 PPL Electric Statement No. 5-R.
3 PPL Electric Statement No. 6-R.
4 PPL Electric Statement No. 13-R.
5 PPL Electric Statement No. 16-R.

and Nicole Howell.[6] I also present I&E's updated position based on my updated recommended operating and maintenance (O&M) expense and rate base adjustments, and the updated adjustments of the other I&E witnesses identified below.

Q. DOES YOUR SURREBUTTAL TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 1-SR contains schedules that support my surrebuttal testimony. Additionally, I reference my direct testimony and accompanying exhibit as I&E Statement No. 1 and I&E Exhibit No. 1, respectively.

SUMMARY OF COMPANY'S UPDATED REQUEST

Q. PLEASE SUMMARIZE THE COMPANY'S UPDATED REQUESTED REVENUE INCREASE.

A. In rebuttal testimony, the Company opines that it can justify a higher revenue increase than originally requested of $386,221,000 to the updated claimed jurisdictional present rate revenues of $1,070,620,000 representing an overall revenue requirement of $1,456,841,000[7] due to errors identified in preparation of the Company's responses to OCA-I-1 and OCA-III-18.[8] However, PPL Electric is

[6] PPL Electric Statement No. 17-R.
[7] PPL Electric Rebuttal Exhibit No. 1, Schedule D-1.
[8] PPL Electric Statement No. 1-R, p. 2.

aware that it cannot receive an increase higher than the requested amount originally filed of $356,271,000.[9]

Q. SUMMARIZE YOUR RECOMMENDED ADJUSTMENTS TO THE COMPANY'S REBUTTAL POSITION.

A. The following table summarizes my updated recommended adjustments:

	PPL Electric FPFTY Claim	I&E Recommended Allowance	I&E Adjustment
O&M Expenses:			
Rate Case Expense	$741,000	$437,000	($304,000)
Storm Damage Expense	$3,779,000	$2,230,000	($1,549,000)
Bank Charges	$900,000	$512,000	($388,000)
Company Sponsorships	$28,000	$0	($28,000)
Membership Dues and Subscriptions	$2,000,000	$0	($2,000,000)

[9] PPL Electric Statement No. 1-R, pp. 2-3.

SUMMARY OF I&E'S OVERALL POSITION

Q. WHAT IS I&E'S UPDATED RECOMMENDED REVENUE REQUIREMENT?

A. I&E's recommended revenue requirement for PPL Electric is $1,368,742,000. This recommended revenue requirement represents an increase of $298,122,000 to the updated claim for present rate revenues of $1,070,620,000. This total recommended allowance incorporates my adjustments made in this testimony to O&M expenses, and those made in the surrebuttal testimony of I&E witnesses Christopher Keller[10] and Drew Breuning.[11]

An updated calculation of the I&E recommended revenue requirement is shown in the table below:

[10] I&E Statement No. 2-SR.
[11] I&E Statement No. 3-SR.

PPL Electric Utilities Corporation		TABLE I			
R-2025-3057164		INCOME SUMMARY			
	6/30/27 Proforma Present Rates	INVESTIGATION & ENFORCEMENT Adjustments	Present Rates	Allowances	Proposed
	$	$	$	$	$

RATE CASE EXPENSE

Q. SUMMARIZE YOUR RECOMMENDATION FOR RATE CASE EXPENSE IN DIRECT TESTIMONY.

A. I recommended a normalized annual allowance of $437,000 for rate case expense, based on adjusting the normalization period to match the historic average base rate case filing frequency of 61 months as determined by the filing data of this rate proceeding and that of the Company's three most recent rate cases. My recommendation is consistent with the Commission's emphasis on the importance of considering the utility's historic rate case filing frequency when determining the normalization period of rate case expenses. My recommended rate case expense

allowance of $437,000 represented a reduction of $304,000 ($741,000 - $437,000) to the Company's claim for rate case expense.[12]

Q. DID ANY WITNESSES RESPOND TO YOUR RECOMMENDATION?

A. Yes. PPL Electric witnesses Bethany Johnson[13] and Daniel Dane[14] disagree with my recommendation.

Q. SUMMARIZE PPL ELECTRIC WITNESS JOHNSON'S RESPONSE.

A. Ms. Johnson states that using a three-year normalization period for rate case expense is proper because it aligns with when the Company expects to file its next rate case and for the reasons stated in PPL Electric witness Dane's rebuttal testimony.[15]

Q. SUMMARIZE PPL ELECTRIC WITNESS DANE'S RESPONSE.

A. Mr. Dane opines the Company's proposed three-year normalization is reasonable as that is PPL Electric's anticipated filing frequency and for the reasons explained by PPL Electric witness Johnson. PPL Electric witness Dane also contends that if the most recent filing is excluded and a longer normalization period is used, that

[12] I&E Statement No. 1, pp. 6-8.
[13] PPL Electric Statement No. 5-R, pp. 28-29.
[14] PPL Electric Statement No. 6-R. pp. 23-26.
[15] PPL Electric Statement No. 5-R, pp. 28-29.

modified historical filing frequency matches the Company's proposed normalization period.[16]

Q. WHAT IS YOUR RESPONSE TO THE PPL ELECTRIC WITNESSES' TESTIMONY CONCERNING RATE CASE EXPENSE?

A. The normalization period granted in PPL Electric's 2012 base rate case is the textbook case for why using the historic filing frequency rather than an anticipated future filing date to determine the normalization period is necessary to protect ratepayers from over-recovery of rate case expense. Additionally, I pointed to numerous recent cases in my direct testimony where the Commission ruled in favor of actual historic filing frequency to determine a proper rate case expense allowance.[17]

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR RATE CASE EXPENSE?

A. No. I continue to recommend an allowance of $437,000 for rate case expense representing a reduction of $304,000 ($741,000 - $437,000) to the Company's claim.

[16] PPL Electric Statement No. 6-R, pp. 24-26.
[17] I&E Statement No. 1, pp. 8-10.

STORM DAMAGE EXPENSE AND RIDER

Q. SUMMARIZE YOUR RECOMMENDATION FOR STORM DAMAGE EXPENSE IN DIRECT TESTIMONY.

A. I recommended the following: (1) that the Commission deny the Company's proposal to include non-reportable storm-related expenses of $10,500,000 in the Storm Damage Expense Rider (SDER), and instead continue to allow these expenses to be recovered through base rates; (2) that the Commission require the Company to clarify the language in the tariff regarding a mandatory three-year recovery period for major storms to accurately indicate that this recovery period only applies to storms recovered via the SDER, and not residual balances when the SDER resets to zero in a base rate proceeding; (3) that the Commission require the Company to use its historical filing frequency to determine the appropriate amortization period, 61 months, and the reasonable total expense level for recovery of the $11,336,000 expenses in excess of the SDER cap representing an annual amortization expense over the SDER cap of $2,230,000; (4) an annual allowance of $1,622,000 related to the February 2024 storm for the amortized expenses included in the SDER; (5) that the reportable storm expenses included in the SDER be capped at $22,006,000, which is the result of combining the three-year historical average of reportable expenses, of $18,154,000, my recommended annual amortized amount for the expense over the SDER cap, of $2,230,000, and my recommended annual amortized expense allowance for the February 2024 storm damage expenses, of $1,622,000 – resulting in my recommended reduction

of $9,994,000 to the Company's fully projected future test year (FPFTY) storm damage expense claim in base rates; and (6) that the Commission require PPL Electric to remove the added language from its tariff that states, "[t]he Company will consider storm damage expenses exceeding 5% of annual distribution net income as extraordinary for SDER recovery purposes."[18]

My recommendations were based on setting an appropriate SDER baseline for reportable storm expenses, capped at $22,006,000, that considered the effects of hardening the distribution system from PPL Electric's capital spending increase to its Long-Term Infrastructure Improvement Plan, but did not afford the Company guaranteed dollar-for-dollar recovery of expenses related to routine storm conditions. Additionally, my recommendations did not affect the Company's opportunity to request recovery of future expenses in excess of 3% of the SDER cap and residual major storm amortizations in a future rate case. Finally, removing the added language from the tariff prevents large single-year rider recovery of storm damage expenses that would currently be designated major storms subject to the three-year rider recovery period.[19]

[18] I&E Statement No. 1, pp. 12-15; PPL Electric Exhibit GEO-1, p. 369.
[19] I&E Statement No. 1, pp. 15-16.

Q. DID ANY WITNESSES RESPOND TO YOUR RECOMMENDATIONS?

A. Yes. PPL Electric witnesses Bethany Johnson,[20] Daniel Dane,[21] Katelyn Arnold,[22] and Joseph Lookup[23] disagree with my recommendations.

Q. SUMMARIZE PPL ELECTRIC WITNESS JOHNSON'S RESPONSE.

A. Ms. Johnson disagrees with my recommended alternate amortization period and recommends that the Commission should use the previously approved three-year amortization period for expenses related to major and extraordinary storm events for expenses over the SDER cap.[24]

Q. SUMMARIZE PPL ELECTRIC WITNESS DANE'S RESPONSE.

A. Mr. Dane disagrees with my recommendation to use the historical three-year average storm damage expense to determine the SDER baseline. Next, he opines that the Company's proposal to include expenses for non-reportable storms of $10,500,000 in the SDER mechanism would allow for more timely recovery of storm-related expenses. Additionally, Mr. Dane states that including the expenses for non-reportable storms in the SDER mechanism provides the Company with financial flexibility and reduces the risk of regulatory lag. Finally, he states that the Company disagrees with my recommendation to recover storm-related

[20] PPL Electric Statement No. 5-R, p. 29.
[21] PPL Electric Statement No. 6-R, pp. 30-33.
[22] PPL Electric Statement No. 13-R, pp. 10-18.
[23] PPL Electric Statement No. 16-R, p. 44.
[24] PPL Electric Statement No. 5-R, p. 29.

expenses that exceed the 3% SDER cap over an amortization period matching the historic filing frequency of 61 months. Instead, he recommends the expenses be amortized over the Company's three-year amortization period based on the anticipated rate case interval rather than my recommended historic filing frequency.[25]

Q. SUMMARIZE PPL ELECTRIC WITNESS ARNOLD'S RESPONSE.

A. Ms. Arnold disagrees with my recommendation that the Commission deny the Company's proposal to include non-reportable storm damage expenses of $10,500,000 for recovery in the SDER mechanism, asserting that the volatility of the number of non-reportable storms and the associated costs warrants inclusion in the SDER. She also notes that allowing the non-reportable storm costs to be eligible for the SDER ensures that customers pay for the actual costs incurred.[26]

She also opposes my reasoning that the Company's investment in system hardening should mitigate the need for some of PPL Electric's proposed increase, claiming that the system improvements do not eliminate storm damage expense.[27]

She also spends a significant amount of time stating her concerns where she mischaracterized the method I used to calculate the SDER baseline in my direct

[25] PPL Electric Statement No. 6-R, pp. 29-33.
[26] PPL Electric Statement No. 13-R, p. 10.
[27] PPL Electric Statement No. 13-R, p. 11.

testimony,[28] which I will generally address in my response to her and the other Company witnesses regarding the SDER below.

Lastly, she disagrees with my recommendation that the Commission deny the Company's proposed revision to the SDER tariff regarding the consideration of storm damage expenses exceeding 5% of annual distribution net income to be extraordinary for SDER recovery purposes, stating that the proposed addition adds clarity for what costs are eligible for recovery through the SDER.[29]

Q. SUMMARIZE PPL ELECTRIC WITNESS LOOKUP'S RESPONSE.

A. Mr. Lookup disagrees with my reasoning that hardening the Company's distribution system would result in less storm damage expenses to be incurred and would thus make the amount of the Company's proposed increase to the SDER baseline unreasonable.[30]

Q. WHAT IS YOUR RESPONSE REGARDING STORM DAMAGE EXPENSES?

A. It is inappropriate to recover storm damage expenses for non-reportable storms through the SDER mechanism. As stated in my direct testimony, the Company's proposal to include expenses of $10,500,000 for non-reportable storms in the SDER guarantees PPL Electric dollar-for-dollar recovery on routine O&M

[28] PPL Electric Statement No. 13-R, pp. 13-16.
[29] PPL Electric Statement No. 13-R, p. 18.
[30] PPL Electric Statement No. 16-R, p. 44.

expenses, which the SDER was never intended to provide. Guaranteed recovery of routine expenses mitigates the normal risk of doing business. If the Commission were to approve the inclusion of expenses for non-reportable storms in the SDER baseline, this potentially opens a pathway to create additional riders to guarantee dollar-for-dollar recovery of other routine O&M expenses. PPL Electric, like all other Pennsylvania jurisdictional utilities, is given the opportunity to recover reasonable and prudent expenses, not a guarantee to recover all expenses.

Based on Ms. Arnold's expanded explanation of the SDER mechanism, I am withdrawing my recommended SDER baseline adjustment and accepting the Company's claim of $32,000,000 for storm damage expense for reportable storms. However, I continue to recommend that the $11,336,000[31] for SDER-eligible storm costs incurred in excess of the SDER cap be amortized over the historic filing frequency of 61 months. Thus, my recommended annual amortization for these costs incurred in excess of the SDER cap is $2,230,000 [($11,336,000 ÷ 61 months) x 12 months] which represents a reduction of $1,549,000 ($3,779,000[32] - $2,230,000) to the Company's FPFTY amortized expense claim.

Regarding my recommended changes to the language of the SDER tariff, I accept the Company's revisions except for the language that has been added in conjunction with the Company's recommendation to recover non-reportable storm

[31] PPL Electric Volume VII, Schedule D-9.
[32] PPL Electric Volume VII, Schedule D-9.

expenses through the SDER mechanism for the reasons stated above. Therefore, I recommend the following for the SDER tariff language: (1) that "Storm damage expenses form non-reportable storms will be recovered through base rates and not through the SDER" be restored;[33] (2) that "and non-reportable storms" be removed;[34] (3) that "42,500,000, consisting of: (1) $" be removed;[35] (4) that "; and (2) $10,500,000, which for purposes of this SDER constitutes the amount of expense from non-reportable storms currently recovered through base rates. The Company will consider storm damage expenses exceeding 5% of its annual distribution net income as extraordinary for SDER recovery purposes" be removed;[36] (5) that "and non-reportable storms" be removed;[37] (6) that "42,500" be replaced with "32,000";[38] and (7) that "42,500" be replaced with "32,000".[39]

Lastly, given Mr. Lookup's testimony stating that while storm hardening work does mitigate the impacts of storms, it does not demonstrate that the Company's SDER is unreasonable or unnecessary,[40] it will be important to reevaluate the base rate O&M expense level for reportable storms over the coming period to see what effect the Company's storm hardening efforts have on the reportable storm damage expense levels.

BANK CHARGES

Q. SUMMARIZE YOUR RECOMMENDED ALLOWANCE FOR BANK CHARGES IN YOUR DIRECT TESTIMONY.

A. I recommended an allowance of $512,000 based on the Company's three-year historical net average of the annual fiscal year bank charges incurred and bank credits received since the Company did not fully support its FPFTY bank charges expense claim. Using the three-year historical average of the net bank charges produced a more reasonable expense level than the Company's FPFTY claim.

Using this three-year average produced my recommended allowance for bank charges expense of $512,000, or a reduction of $388,000 ($900,000 - $512,000) to the Company's claim.[41]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION FOR BANK CHARGES?

A. Yes. PPL Electric witness Dennis Urban, Jr. disagrees with my recommendation.[42]

Q. SUMMARIZE PPL ELECTRIC WITNESS URBAN'S RESPONSE.

A. Mr. Urban clarifies that the Company's bank charges claim is based on the prior year's fees, adjusted for applicable increases in volume and fees. Additionally, he provides a list of the payees and the forecasted amount for each payee in the

[41] I&E Statement No. 1, pp. 18-19.
[42] PPL Electric Statement No. 2-R, p. 5.

Company's future test year (FTY) and FPFTY claims. Lastly, he states that PPL Electric's bank charges claim is derived from the necessity of the forward-looking nature of ratemaking, contending that a simple three-year average of historic data is not always the best method to estimate expense levels.[43]

Q. WHAT IS YOUR RESPONSE TO MR. URBAN'S CONCERNING BANK CHARGES?

A. Mr. Urban does not provide support for the increased bank charges, instead he only provides a list of estimates he used for each bank to derive his FTY claim.[44] The FTY claim is an increase of over 35% [($850,097 - $629,000[45]) ÷ $629,000] above the HTY claim. An increase in an expense of over 35% without detailed support is unacceptable; therefore, a simple three-year average of historic data provides a more appropriate allowance for future expenses.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR BANK CHARGES?

A. No. I continue to recommend using a three-year average of the Company's historical bank charges expense, an allowance of $512,000, or a reduction of $388,000 ($900,000 - $512,000) to the Company's claim.

[43] PPL Electric Statement No. 2-R, p. 5.
[44] PPL Electric Exhibit DAU-4R.
[45] I&E Statement No. 1, p. 19.

COMPANY SPONSORSHIPS

Q. SUMMARIZE YOUR RECOMMENDATION FOR COMPANY SPONSORSHIPS IN YOUR DIRECT TESTIMONY.

A. I recommended the entire $28,000 claim be disallowed based on PPL Electric's company sponsorships not being necessary for the safe and reliable provision of distribution service, that they contain funds for political advertising, and that they include charitable contributions that ratepayers should not be required to fund. Therefore, I recommended the entire $28,000 claim for company sponsorships expense be disallowed for ratemaking purposes.[46]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. PPL Electric witness Dennis Urban, Jr. states he is not opposed to accepting my recommendation.[47]

Q. WHAT IS YOUR RESPONSE TO MR. URBAN CONCERNING COMPANY SPONSORSHIPS?

A. While Mr. Urban stated that he does not oppose my recommendation, it is not apparent where that adjustment is made to the Company's O&M expenses. Therefore, I continue to recommend the entire $28,000 company sponsorships expense claim be disallowed for ratemaking purposes.[48]

---

[46] I&E Statement No. 1, pp. 20-24.
[47] PPL Electric Statement No. 2-R, pp. 6-7.
[48] PPL Electric Statement No. 2-R, p. 7.

MEMBERSHIP DUES AND SUBSCRIPTIONS

Q. SUMMARIZE YOUR RECOMMENDATION FOR MEMBERSHIP DUES AND SUBSCRIPTIONS IN DIRECT TESTIMONY.

A. I recommended disallowance of the entire $2,800,000 membership dues and subscriptions claim based on: (1) the lack of clarity for what was included in the Company's FPFTY claim; and (2) the items included could not be confirmed to be necessary for the provision of safe and reliable service to ratepayers.[49]

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. PPL Electric witnesses Dennis Urban, Jr.[50] and Daniel Dane[51] disagree with my recommendation.

Q. SUMMARIZE PPL ELECTRIC WITNESS URBAN'S RESPONSE.

A. First, Mr. Urban states that the Company's actual FPFTY membership dues and subscriptions claim is approximately $2,000,000 due to the correction of an $800,000 error.[52] He maintains that the remainder of the Company's claim is supported by the historic data provided.[53] He suggests that, while he does not agree with using this method to determine the reasonable expense level, a simple three-year average would at least provide an amount of approximately $1,700,000

[49] I&E Statement No. 1, p. 25.
[50] PPL Electric Statement No. 2-R, pp. 8-9.
[51] PPL Electric Statement No. 5-R, p. 14.
[52] PPL Electric Statement No. 5-R, p. 8.
[53] PPL Electric Statement No. 5-R, p. 8.

for membership dues and subscriptions.[54] Lastly, Mr. Urban notes that the approximately $98,492 in fees paid to the Pennsylvania Chamber of Business and Industry for the HTY and the previous two years does not warrant the disallowance of the entire membership dues and subscriptions claim.[55]

Q. SUMMARIZE PPL ELECTRIC WITNESS DANE'S RESPONSE.

A. Mr. Dane insists that the membership dues and subscription expense claim is necessary for safe and reliable distribution service and is supported by the historical data provided as it represents the level of cost the Company reasonably expects to incur in the FPFTY.[56]

Q. WHAT IS YOUR RESPONSE CONCERNING THE COMPANY'S MEMBERSHIP DUES AND SUBSCRIPTIONS CLAIM?

A. The Company did not produce additional support for its membership dues and subscriptions claim. It is the responsibility of the Company to provide support for the expenses it claims are incurred prudently and are reasonable to include for ratemaking purposes. Therefore, since the membership dues and subscriptions expense claim remains unsupported, I recommend the entire claim be disallowed for ratemaking purposes.

[54] PPL Electric Statement No. 2-R, p. 8.
[55] PPL Electric Statement No. 2-R, pp. 8-9.
[56] PPL Electric Statement No. 6-R, p. 14.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION?

A. Yes. I have updated my recommendation to disallow the Company's entire updated membership dues and subscriptions claim of $2,000,000 for ratemaking purposes.

VEGETATION MANAGEMENT EXPENSE

Q. SUMMARIZE YOUR RECOMMENDATION FOR VEGETATION MANAGEMENT EXPENSE.

A. I recommended an allowance of $34,420,000, or a reduction of $15,579,000 ($49,999,000 - $34,420,000) to the Company's claim based on: (1) PPL Electric's lack of support for its vegetation management expense claim; (2) an estimate of the reasonable vegetation management expense level using the three-year historical average of the annual fiscal year vegetation management expense incurred; and (3) it being supported by the Company's various integrated vegetation management (IVM) techniques, including herbicide application and aerial Light Detection and Ranging (LiDAR) inspections, that reduce the frequency of readdressing vegetation overgrowth in the same areas.[57]

I also noted that, if the Commission allows the Company to capitalize the first removal of hazard and danger trees after the acquisition of the additional rights as part of the Company's acquisition of off right-of-way (Off-ROW)

[57] I&E Statement No. 1, pp. 27-28.

program proposal, then it is unreasonable to suggest that the Company's vegetation management expense will increase drastically.[58]

Q. DID ANY WITNESSES RESPOND TO YOUR RECOMMENDATION?

A. Yes. PPL Electric witnesses Daniel Dane[59] and Nicole Howell[60] disagree with my recommendation.

Q. SUMMARIZE PPL ELECTRIC WITNESS DANE'S RESPONSE.

A. Mr. Dane opines that my recommendation does not adequately fund the Company's vegetation management program because the three-year historical average is not forward-looking and does not account for incremental drivers. He further asserts that my recommendation would lead to delaying work and risk potential cost increases in other expenses. Finally, Mr. Dane recommends the Commission reject my recommendation and rely on the Company's cost estimates for PPL Electric's vegetation management expenses.[61]

Q. SUMMARIZE PPL ELECTRIC WITNESS HOWELL'S RESPONSE.

A. Ms. Howell states that my recommendation to use a historical three-year average would not adequately fund the Company's vegetation management plan and is not

[58] I&E Statement No. 1, p. 28.
[59] PPL Electric Statement No. 6-R, pp. 34-36.
[60] PPL Electric Statement No. 17-R, pp. 2-4.
[61] PPL Electric Statement No. 6-R, pp. 34-36.

a reasonable method to determine the FPFTY vegetation management expense level. She also states my recommendation is inaccurate because the Company only performs LiDAR data collection on its transmission system and its herbicide application is not as effective as I suggest it is.[62] Finally, she disagrees with my opposition to the Company's FPFTY proposal to capitalize the first removal of hazard and danger trees after the acquisition of enhanced rights-of-way (ROW) of $25,000,000, opining that while the Company is not constructing new facilities, these costs will yield significant reliability improvements.[63]

Q. WHAT IS YOUR RESPONSE TO THE COMPANY WITNESSES' TESTIMONY CONCERNING VEGETATION MANAGEMENT EXPENSE?

A. Mr. Dane's argument that using a forward-looking approach for vegetation management expense could be plausible had the Company provided support for its claim. Absent that support, it is not possible to determine whether the claim is reasonable. Given that vegetation management is necessary to provide safe and reliable distribution service, and in lieu of other support, using the three-year historical average produces a reasonable expense level for vegetation management expense.

[62] PPL Electric Statement No. 17-R, pp. 2-3.
[63] PPL Electric Statement No. 17-R, pp. 4-5.

Contrary to Ms. Howell's rebuttal testimony, her direct testimony identifies LiDAR as one of the methods used to model vegetation risk presence and tree conditions/risk system wide.[64] It stands to reason that the Company would implement this technology when addressing the vegetation management for the enhanced ROW rights, which initially may not be fully accessible. With respect to herbicides, Ms. Howell's own testimony supports my recommendation that among the Company's other IVM techniques, herbicide application is effective in incrementally decreasing the frequency of addressing the same areas.[65]

Regarding PPL Electric's proposal to capitalize the first removal of $25,000,000 for enhanced ROW rights, as OCA witnesses Morgan[66] and Hoyt[67] referenced in their direct testimony, this is inconsistent with the Federal Energy Regulatory Commission (FERC) Uniform System of Accounts, Electric Plant Instructions, 7. *Land and Land Rights*, Paragraph A, which states, "[d]o not include in the accounts for land and land rights and rights-of-way costs incurred in connection with first clearing and grading of land and rights-of-way and the damage costs associated with the construction and installation of plant."[68] Therefore, I recommend the Commission disallow the Company's proposal to

64 PPL Electric Statement No. 17, p. 13.
65 PPL Electric Statement No. 17-R, p. 3.
66 OCA Statement No. 1, pp. 28-29.
67 OCA Statement No. 5, p. 96.
68 eCFR :: 18 CFR Part 101 -- Uniform System of Accounts Prescribed for Public Utilities and Licensees Subject to the Provisions of the Federal Power Act, p. 28, accessed January 28, 2026.

capitalize the FPFTY claim for the first removal of hazard and danger trees after the acquisition of the enhanced ROW of $25,000,000.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR VEGETATION MANAGEMENT EXPENSE?

A. Yes. First, I continue to recommend an allowance of $34,420,000, or a reduction of $15,579,000 ($49,999,000 - $34,420,000) to the Company's vegetation management expense claim since no additional support or explanation for the Company's increase has been provided and for the reasons addressed next.

However, I am presenting an updated recommendation that the Commission disallow the entire capitalized FPFTY claim for the first removal of hazard and danger trees after the acquisition of the enhanced ROW of $25,000,000. This FPFTY claim[69] is inconsistent with FERC's electric plant instructions as stated above.

ADDITIONAL RECOMMENDATIONS

Q. DID YOU HAVE ANY OTHER RECOMMENDATIONS?

A. Yes. I recommended that the Commission require the Company to provide the breakdown of its supporting schedules and standard data requirements to the jurisdictional distribution level with the original filing in all future proceedings.

[69] PPL Electric Statement No. 17-R, p. 14.

Doing so is in the public interest as it will reduce the cost of legal fees for the parties' attorneys to handle and disseminate discovery questions, it will reduce the time of all parties' witnesses preparing, evaluating, and responding to discovery questions, and it ensures I&E's, and all other parties', ability to analyze all utility claims at the granular level. Ultimately, I&E's analysis must balance the interests of the ratepayers, the regulated utility, and the regulated community as a whole, but this cannot be done without full evaluation of the accuracy and reasonableness of PPL Electric's claims at the jurisdictional level.

Q. DID ANY WITNESS RESPOND TO YOUR RECOMMENDATION?

A. Yes. PPL Electric witness Bethany Johnson responded to my recommendation.[70]

Q. SUMMARIZE PPL ELECTRIC WITNESS JOHNSON'S RESPONSE.

A. PPL Electric witness Johnson states: (1) that the Commission adopted revised filing requirements which the Company anticipates using in a subsequent rate case; and (2) that PPL Electric will consider my recommendation in future base rate proceedings to the extent that it does not violate compliance with those regulations.[71]

[70] PPL Electric Statement No. 5-R, p. 30.
[71] PPL Electric Statement No. 5-R, p. 30.

Q. WHAT IS YOUR RESPONSE TO MS. JOHNSON'S TESTIMONY CONCERNING THE REVENUE REQUIREMENT CALCULATION PRESENTATION?

A. The importance of having jurisdictional distribution level supporting data was reinforced in the preparation of surrebuttal testimony in the instant proceeding. PPL Electric witness Dennis Urban, Jr. provided the Company's cash working capital (CWC) calculation in Exhibit DAU-2R, Schedule C-4 to accompany his rebuttal testimony, but did not provide a breakdown of the jurisdictional calculation.[72] In order to properly incorporate I&E's recommended O&M adjustments into the Company's jurisdictional CWC calculation, I&E witness Christopher Keller was required to submit additional discovery requesting that data.[73] This example illustrates how the lack of jurisdictional distribution level supporting data can jeopardize the quality of the evaluation of the Company's claims, especially under the shortened surrebuttal testimony preparation timeline.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION REGARDING THE PRESENTATION OF THE REVENUE REQUIREMENT CALCULATION?

A. No. I continue to recommend that the Commission require PPL Electric to provide the breakdown of its supporting schedules and standard data requirements

[72] PPL Electric Exhibit DAU-2R, Schedule C-4, pp. 1-5.
[73] I&E Exhibit No. 2-SR, Schedule 1, pp. 1-7.

at the jurisdictional distribution level with the original filing in all future proceedings. There is no indication that my recommendation would contradict any of the revised filing requirements, nor would it be burdensome for the Company to do so. This would ensure that other parties, including I&E, can review and evaluate the Company's claims accurately and efficiently, which is in the best interest of the Company, the other parties, and the ratepayers.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

I&E Interrogatories

Dear Counsel:

Enclosed please find the Bureau of Investigation and Enforcement's (I&E) **Interrogatories RE Set VII (no. 1) – Keller** in the above-captioned proceeding. Please restate each Interrogatory before responding and start each Interrogatory and response on a separate page. The responses should identify the responding person(s).

The responses to these Interrogatories are due within five (5) calendar days of service. Please provide your responses via email to mpodskoch@pa.gov and adawilliam@pa.gov.

Copies are being served on parties per the attached Certificate of Service. Should you have any questions, please do not hesitate to contact me.

Sincerely,

Michael Podskoch

Instructions For Answers To Bureau of Investigation and Enforcement Interrogatories

1. These Bureau of Investigation and Enforcement (I&E) Interrogatories shall be deemed to be continuing. The Respondent is obliged to change, supplement and correct all answers to these interrogatories to conform to reasonably available information, including such information as becomes available to the Respondent after answers are filed.

2. Each answer should first restate the question asked and should also identify the person(s) supplying the information that constitutes any and all portions of the subject answer. If more than one person is listed, the primary sponsoring witness, for purposes of potential cross-examination at hearing, should be specifically identified.

3. All requested information within the knowledge, possession, control or custody of Respondent or that which may be reasonably ascertained by Respondent is to be provided. Specific references to the company or corporate name(s) or "the Company," or "you," as used herein includes agents, employees or other representatives.

4. As used herein, the word "document" or "workpaper" includes, but is not limited to, the original and/or all copies of memoranda, reports, books, manuals, instructions, directives, records, forms, notes, letters, notices, confirmations, telegrams, pamphlets, notations of any sort concerning conversations, telephone calls, e-mail messages, meetings or other communications, bulletins, transcripts, diaries, analyses, summaries, correspondence and enclosures, circulars, opinions, studies, investigations, questionnaires and surveys, worksheets, and all drafts, preliminary versions, alterations, modifications, revisions, changes, amendments and written comments concerning the foregoing, in whatever form, stored or contained in or on whatever medium including electronic hard disks, floppy disks, CD, internet resources and/or magnetic media.

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Christopher Keller. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. ARE YOU THE SAME CHRISTOPHER KELLER WHO SUBMITTED THE DIRECT TESTIMONY CONTAINED IN I&E STATEMENT NO. 2 AND I&E EXHIBIT NO. 2?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to respond to the rebuttal testimony of PPL Electric Utilities Corporation (PPL or Company) witnesses Dennis A. Urban,

Jr,[1] Daniel S. Dane,[2] Andrew Elmore,[3] Katelyn Arnold,[4] Lisa Norden,[5] Jason Hunt,[6] Sharon Leskowsky,[7] and Vincent Poplaski.[8]

Q. DOES YOUR SURREBUTTAL TESTIMONY INCLUDE AN EXHIBIT?

A. Yes. I&E Exhibit No. 2-SR contains schedules that support my surrebuttal testimony. In this surrebuttal testimony, I will also make references to my direct testimony[9] and its accompanying exhibit.[10]

Q. PLEASE SUMMARIZE YOUR ADJUSTMENTS AS CONTAINED IN THIS SURREBUTTAL TESTIMONY.

A. The following table summarizes my recommended adjustments to PPL's updated position.

---

1 PPL Statement No. 2-R.
2 PPL Statement No. 6-R.
3 PPL Statement No. 12-R.
4 PPL Statement No. 13-R.
5 PPL Statement No. 18-R.
6 PPL Statement No. 21-R.
7 PPL Statement No. 22-R.
8 PPL Statement No. 23-R.
9 I&E Statement No. 2.
10 I&E Exhibit No. 2.

	Company Claim	I&E Adjustment	I&E Recommended Allowance
O&M Expenses:			
Payroll and Benefits Expense	$81,900,000	($4,113,000)	$77,787,000
Payroll Taxes	$6,961,000	($2,268,000)	$4,693,000
Incentive Compensation	$4,412,000	($1,098,000)	$3,314,000
Advertising Expense	$923,000	($130,000)	$793,000
Infrastructure Investment & Jobs Act Cost Amortization	$211,000	($211,000)	$0
Payment Transaction Fees	$5,200,000	($1,200,000)	$4,000,000
Economic Development	$400,000	($400,000)	$0
Total O&M Expense Adjustments		($9,420,000)	
Rate Base Adjustments:			
Cash Working Capital	$16,529,000	($5,812,000)	$10,717,000
Total Rate Base Adjustments		($5,812,000)	

PAYROLL AND BENEFITS EXPENSE

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR PAYROLL AND BENEFTIS EXPENSE.

A. In direct testimony, I recommended an allowance of $76,479,000 for payroll and benefits expense, or a reduction of $5,421,000 ($81,900,000 - $76,479,000) to PPL's claim. My recommendation was based on an adjustment for average historic vacancy levels in order to reflect a more accurate employee complement in the Fully Projected Future Test Year (FPFTY).[11]

[11] I&E Statement No. 2, pp. 3-10.

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION FOR PAYROLL AND BENEFITS EXPENSE?

A. Yes. Company witnesses Dennis A. Urban, Jr. and Daniel S. Dane addressed my recommendation for payroll and benefits expense. Mr. Urban states that I did not account for the 5% vacancy rate that the Company applied to certain functional groups and that I did not consider that more expensive contractors would need to be used if the Company did not fill certain positions. Finally, Mr. Urban states that staffing levels are needed to effectively manage and maintain the Company's system to meet customer needs and would need to be balanced with external labor if these positions were not filled.[12]

Mr. Dane reiterates Mr. Urban's testimony by stating Mr. Urban provided support for the number of employees included in the Company's payroll and benefits expense claim and would need to hire outside labor to fill those vacancies.[13] Mr. Dane also states that I misunderstood the Company's response to I&E-RE-II-7-D[14] and that payroll related to the Universal Service Rider (USR) were removed from the Company's claim for payroll and benefits expense which would require an upward adjustment of $1,400,000 to payroll and benefits expense if the Commission were to reject the Company's proposal to recover these in its USR.[15]

[12] PPL Statement No. 2-R, pp. 10-13.
[13] PPL Statement No. 6-R, p. 18.
[14] I&E Exhibit No. 2, Schedule 2.
[15] PPL Statement No. 6-R, pp. 21-23.

Q. WHAT IS YOUR RESPONSE TO MR. URBAN'S ASSERTION THAT YOU DID NOT ACCOUNT FOR THE FIVE PERCENT VACANCY RATE APPLIED TO CERTAIN FUNCTIONAL GROUPS?

A. Mr. Urban references the Company's response to the Office of Consumer Advocate's (OCA) interrogatory OCA-XXV-23,[16] which provides the functional groups that the Company applied a 5% vacancy reserve. However, as I stated in my direct testimony, the Company failed to provide any calculations to reflect the vacancy reserve for those functional groups as was requested in the interrogatory referenced in I&E Exhibit No. 2, Schedule 3.[17] Therefore, there is no reasonable way to determine the amount of payroll and benefits expense where the Company applied a vacancy reserve to its claim. As a result, I continue to recommend the average vacancy rates of 4.3% for union employees and 10.3% for non-union employees to the Company's payroll and benefits expense claim.

[16] PPL Exhibit DAU-7R.
[17] I&E Statement No. 2, p. 5, line 14 through p. 6, line 2.

Q. WHAT IS YOUR RESPONSE TO MR. URBAN'S AND MR. DANE'S ASSERTION THAT YOU DID NOT ACCOUNT FOR THE NEED TO PAY FOR MORE EXPENSIVE CONTRACTORS IF THOSE POSITIONS ARE NOT FILLED AND THAT THE STAFFING LEVELS ARE NEEDED TO EFFECTIVELY MANAGE AND MAINTAIN THE COMPANY'S SYSTEM?

A. As I stated in my direct testimony, it is unreasonable to assume that the Company will maintain 100% full staffing based on its own historic vacancy records. Since there will always be search and placement time involved in filling vacancies, there will always be a certain level of vacancies on a day-to-day operating basis that should be reflected in PPL's payroll expense allowance. The adjustment for average historic vacancy levels is needed to reflect a more accurate employee complement in the FPFTY.[18] Additionally, as shown in I&E Exhibit No. 2, Schedule 4, the Company has not been fully staffed going back to at least July 2023, which according to Mr. Urban's logic, means the Company has been using "more expensive temporary contractors." If this was the case, the Company should have made a claim for these outside contractors in its initial filing. Finally, it is also worth mentioning that the Company's claim includes benefits that would probably not be applicable to temporary contractors.

[18] I&E Statement No. 2, p. 4, line 19 through p. 5, line 8.

Q. IS MR. DANE CORRECT THAT PAYROLL RELATED TO THE USR WERE REMOVED FROM THE COMPANY'S PAYROLL AND BENEFITS CLAIM AND WOULD NEED TO BE INCLUDED IF THE COMMISSION WERE TO REJECT THE COMPANY'S PROPOSAL TO INCLUDE THEM IN ITS USR?

A. Yes. I misunderstood the Company's response to I&E-RE-II-7-D and that payroll related to the USR was, in fact, removed from the Company's claim for payroll and benefits expense. Therefore, based on my recommendation that the Commission reject the Company's proposal to recover payroll expense of $1,400,000 related to employees that administer the Company's universal service programs through its USR, which I will discuss later in my testimony, I have adjusted my recommendation to reflect adding back in the $1,400,000 to my recommendation for payroll and benefits expense.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR PAYROLL AND BENEFITS EXPENSE?

A. Yes. Although I continue to recommend an adjustment for average historic vacancy levels in order to reflect a more accurate employee complement in the FPFTY, I am updating my recommendation to reflect the $1,400,000 in payroll expense related to employees that administer the Company's universal service programs through its USR less a vacancy adjustment. This results in an updated recommended allowance of $77,787,000 ($76,479,000 + $1,400,000 - $92,000)

for payroll and benefits expense, or a reduction of $4,113,000 ($81,900,000 - $77,787,000) to PPL's claim.

Q. PLEASE EXPLAIN HOW YOU CALCULATED YOUR UPDATED RECOMMENDATION FOR PAYROLL AND BENEFITS EXPENSE.

A. First, I started with my recommended allowance of $76,479,000 from my direct testimony.[19] Next, I included the $1,400,000 related to the payroll expense related to employees that administer the Company's universal service programs that the Company is proposing to be recovered through the USR that I did not include in my recommendation in my direct testimony. I then determined the average vacancy rate based on my recommended adjustment of $5,421,000 in my direct testimony divided by the Company's claim for payroll and benefits expense of $81,900,000 which is prior to the inclusion of the payroll expense of $1,400,000 related to employees that administer the Company's universal service programs. This results in an average vacancy rate of 6.6% ($5,421,000 ÷ $81,900,000). I used the average vacancy rate for union and non-union employees to determine the vacancy rate for payroll related to employees that administer the Company's universal service programs because I am unable to determine how much of the $1,400,000 is from union and non-union payroll expense. This results in a reduction to my updated recommended allowance of $92,400 ($1,400,000 x

[19] I&E Statement No. 2, p. 4, lines 16-17.

6.6%), which I rounded to $92,000. This results in an updated recommended allowance of $77,787,000 ($76,479,000 + $1,400,000 - $92,000), or a reduction of $4,113,000 ($81,900,000 - $77,787,000) to the Company's claim.

It should be noted that if the Commission were to allow the Company to recover payroll expense related to employees that administer the Company's universal service programs that the Company is proposing to be recovered through the USR, my recommendation for payroll and benefits expense would be my recommended allowance from my direct testimony of $76,479,000 as to exclude the amount that would be recovered through the USR.

PAYROLL TAXES

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR PAYROLL TAXES.

A. In direct testimony, I recommended an allowance of $4,593,000 for payroll taxes, or a reduction of $2,368,000 ($6,961,000 - $4,593,000) to the Company's claim. My recommendation was based on utilizing a payroll tax rate of 7.65% and the recognition of the payroll expense reduction from my vacancy adjustment and on the percentage of total payroll taxes to total payroll as well excluding employee benefits in the computation of payroll taxes.[20]

[20] I&E Statement No. 2, pp. 10-13.

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION FOR PAYROLL TAXES?

A. Yes. Company witnesses Daniel S. Dane and Andrew Elmore addressed my recommendation for payroll taxes. Mr. Dane agrees with my use of the 7.65% payroll tax rate and states that if the Commission were to reject my adjustment to payroll and benefits expense, that an adjustment to payroll tax expenses is not necessary as payroll tax expense is a direct function of total payroll.[21] Mr. Elmore also states that the Company is willing to accept my adjustment to payroll tax expense based on the 7.65% payroll tax rate. Mr. Elmore states that the Company disagrees with my assertion that a material percentage of employees' income will exceed the Social Security salary cap.[22] It should be noted that neither witness disagreed with my recommendation to remove employee benefits from the payroll tax expense computation.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR PAYROLL TAXES?

A. Yes. Based on my updated recommendation for payroll and benefits expense, I recommend an allowance of $4,693,000 for payroll taxes, or a reduction of $2,268,000 ($6,961,000 - $4,693,000) to PPL's claim based on utilizing a payroll tax rate of 7.65% and recognition of my inclusion of the $1,400,000 for

[21] PPL Statement No. 6-R, pp. 38-39.
[22] PPL Statement No. 12-R, pp. 2-4.

recognition of the payroll expense related to employees that administer the Company's universal service programs and to reflect my vacancy adjustment.

Q. PLEASE EXPLAIN HOW YOU CALCULATED YOUR PAYROLL TAX ADJUSTMENT.

A. First, I determined the Company's total payroll expense claim. As discussed in my direct testimony, the Company's claim for payroll expense of $64,357,000 (since the benefits portion should not be subject to payroll taxes). I then included the $1,400,000 related to salaries and wages from employees that administer the Company's universal service programs that the Company is proposing to be recovered through its USR, which results in a total claim for payroll expense of $65,757,000 ($64,357,000 + $1,400,000). I then applied my 7.65% payroll tax rate to the Company's claim for payroll expense of $65,757,000 for an updated payroll tax recommendation prior to reflecting my vacancy adjustment of $5,030,411 ($65,757,000 x 7.65%) which I rounded to $5,030,000.

As discussed in my direct testimony, I made a total downward adjustment to reflect my vacancy adjustment for payroll expense of $4,316,000 for payroll expense which did not include the salaries and wages expense of $1,400,000 related to employees that administer the Company's universal service programs. I also made a downward adjustment of $92,000 in this testimony to reflect a vacancy adjustment for the payroll expense of $1,400,000 related to employees that administer the Company's universal service programs. The result is a total

downward adjustment of $4,408,000 ($4,316,000 + $92,000) to payroll expense related to vacancy adjustments.

This results in a total payroll expense vacancy adjustment to the Company's claim for payroll expense of 6.7% ($4,408,000 ÷ $65,757,000). I then applied the 6.7% to my payroll tax recommendation prior to my vacancy adjustment of $5,030,000 which reflects my payroll tax rate of 7.65% resulting in a reduction of $337,010 ($5,030,000 x 6.7%), which I rounded to $337,000. The result is a recommended allowance of $4,693,000 ($5,030,000 - $337,000), or a reduction of $2,268,000 ($6,961,000 - $4,693,000) to the Company's claim.

UNIVERSAL SERVICE RIDER SALARIES AND WAGES

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR THE COMPANY'S PROPOSAL TO CHANGE ITS UNIVERSAL SERVICE RIDER RECOVERY.

A. In direct testimony, I recommended that the Commission reject the Company's proposal to move salaries and wages for employees that administer programs under its Universal Service and Energy Conservation Plan (USECP) from base rates to the USR for two reasons. First, moving these costs from base rates to the USR provides PPL a guaranteed recovery of USECP labor costs and eliminates the Commission's authority to review reasonableness and prudency of USECP labor costs. Second, shifting cost recovery of the salaries and wages from base rates to the Company's USR would allow the Company to add or remove employees without scrutiny. I

also referenced the most recent Columbia Gas of Pennsylvania, Inc. (Columbia Gas) base rate case proceeding where the Commission denied a similar proposal. Finally, I recommended that if the Commission decided to allow the Company's proposal, there would need to be corresponding downward adjustments to reflect a decrease in payroll and benefits expense as well as any other expenses that would be affected by the shift of the salaries and wages from base rates to the USR. Without the corresponding reduction, expenses related to the salaries and wages shifted from base rates to the USR would receive double recovery, once in base rates and again in its USR.[23]

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION TO DISALLOW INCLUSION OF SALARIES AND WAGES IN ITS USR?

A. Yes. Company witness Lisa Norden addressed my recommendation. Ms. Norden opines that moving the salaries and wages to the USR does not eliminate the review of the reasonableness and prudency of USECP labor costs as the USR is fully reconcilable, which is reviewed by the Commission. Ms. Norden also states that the Company would not be double recovering the $1,400,000 from salaries and wages in the USR and in payroll and benefits expense as the Company removed $1,400,000 from its payroll and benefits expense claim, but notes that if the Commission were to reject the Company's proposal, that $1,400,000 related to the salaries and wages that

[23] I&E Statement No. 2, pp. 13-17 (citing *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.*, Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Recovery of Energy Assistance Team/Rider Universal Service Plan (Rider USP), pp. 167-168).

were shifted to the USR under the Company's proposal would need to be reflected in the Company's payroll and benefits expense claim.[24]

Q. WHAT IS YOUR RESPONSE TO MS. NORDEN?

A. As discussed earlier in my testimony regarding payroll and benefits expense, I misunderstood the Company's response regarding the payroll related to the USR as it was, in fact, removed from the Company's claim for payroll and benefits expense. As a result, I updated my recommendation to include the $1,400,000 related to the payroll included in the USR in the base rate claim as I continue to recommend that the Company's proposal be rejected.

As discussed in my direct testimony, the Commission rejected a similar proposal in the most recent Columbia Gas base rate case proceeding where the Commission acknowledged I&E's argument that shifting labor costs to the Universal Service Plan Rider (Rider USP) would result in guaranteed cost recovery, stating "[a]s I&E observed, shifting the recovery of EAT costs from the Company's base rates to its Rider USP provides Columbia with a *guaranteed* recovery of EAT labor costs and eliminates the Commission's authority to review the reasonableness and prudency of such costs."[25]

[24] PPL Statement No. 18-R, pp. 44-47.

[25] I&E Statement No. 1, p. 15, line 7 through p. 16, line 8 (citing *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.*, Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Recovery of Energy Assistance Team/Rider Universal Service Plan (Rider USP), pp. 167-168).

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION REGARDING INCLUSION OF SALARIES AND WAGES IN THE COMPANY'S USR?

A. Yes. I am withdrawing my recommendation that there would need to be corresponding downward adjustment to reflect a decrease in payroll and benefits expense affected by the shift of the salaries and wages from base rates to the USR if the Company's proposal was approved by the Commission as the Company has already reflected this downward adjustment in its payroll and benefits expense claim.

However, I continue to recommend that the Commission reject the Company's proposal to move salaries and wages for employees that administer programs under its USECP from base rates to the USR for the reasons stated above and in my direct testimony.

INCENTIVE COMPENSATION

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR INCENTIVE COMPENSATION.

A. In direct testimony, I recommended an allowance of $2,362,000, or a reduction of $2,050,000 ($4,412,000 - $2,362,000) to the Company's FPFTY claim. My recommendation is based on the removal of 50% of the Company's claim related to cash awards and 100% removal of the Company's claim related to stock-based compensation as these are based on goals that are related to financial results, which do not provide any benefit to ratepayers. I also referenced the most recent

Columbia Gas base rate case proceeding where the Commission removed the portion of Columbia Gas' claim related to financial goals.[26]

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION REGARDING INCENTIVE COMPENSATION?

A. Yes. Company witnesses Daniel S. Dane and Vincent Poplaski addressed my recommendation for incentive compensation.

Q. SUMMARIZE MR. DANE'S AND MR. POPLASKI'S RESPONSE.

A. Mr. Dane opines that the Company must pay market-based compensation to attract and retain talent, which includes incentive compensation and other benefits. Mr. Dane provides examples of other public utility commission orders to support his argument that allow incentive compensation in rates. Finally, Mr. Dane asserts that the exclusion of incentive compensation based on financial performance goals is unreasonable as it promotes cost discipline, productivity, and effective risk management which contributes to cost efficiency and the maintenance of stable utility rates.[27]

Mr. Poplaski provides an overview of each form of incentive compensation the Company currently offers including eligibility and how each form of incentive compensation is awarded. Mr. Poplaski cites the Commission Order from the

[26] I&E Statement No. 2, pp. 17-20 (citing *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.*, Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Incentive Compensation, p. 123).

[27] PPL Statement No. 6-R, pp. 18-20.

Company's 2012 base rate case where the Commission allowed the Company's claim for incentive compensation. Mr. Poplaski asserts that both the short-term and long-term incentive compensation plans benefit ratepayers as it provides motivation for improving operational effectiveness. Mr. Poplaski disagrees with my assertion that incentive compensation based on financial results does not benefit ratepayers. He argues that a strong financial profile allows the Company to attract ongoing capital needed to make necessary upgrades and improvements to the Company's distribution system at a lower cost and that the Company achieves earnings goals by improving its O&M expenses which put a downward pressure on distribution rates. Finally, Mr. Poplaski states that the Commission Order that I referenced from the most recent Columbia Gas base rate case proceeding will be addressed in the Company's Briefs.[28]

Q. WHAT IS YOUR RESPONSE TO MR. DANE AND MR. POPLASKI?

A. As discussed in my direct testimony, I disagree with incentive compensation based on goals that are related to financial results to be paid for by ratepayers as I do not believe that they provide any benefit to ratepayers. Additionally, the public utility commission orders that Mr. Poplaski cites from other jurisdictions do not apply to Pennsylvania and the Commission Order from the Company's 2012 base rate case was more than thirteen years ago. I referenced the most recent Commission Order

[28] PPL Statement No. 23-R, pp. 2-8.

regarding incentive compensation where the Commission removed parts of Columbia Gas' incentive compensation claim related to financial goals finding that it was not necessary in providing safe and reliable service to ratepayers.[29]

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR INCENTIVE COMPENSATION?

A. Yes. Although I continue to recommend the removal of a portion of the Company's claim related to cash awards and 100% removal of the Company's claim related to stock-based compensation related to performance units as these are based on goals that are related to financial results, I am withdrawing my recommendation to disallow the Company's claim related to restricted stock units of $813,000 and modifying my recommendation to disallow $139,000 rather than $278,000 related to the cash awards. This results in an increase to my recommended allowance from my direct testimony of $2,362,000 by $952,000 ($813,000 + $139,000) resulting in an updated recommended allowance of $3,314,000 ($2,362,000 + $952,000), or a decrease of $1,098,000 ($4,412,000 - $3,314,000) to the Company's claim for incentive compensation.

I am withdrawing my recommendation for disallowance of the restrictive stock units as, upon further review, the award for restrictive stock units is based on longevity with the Company with the value of the restricted stock unit being tied

[29] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.*, Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Incentive Compensation, p. 123.

to PPL Corporation's stock price after the three-year vesting period.[30] Additionally, I am modifying my recommended allowance related to cash awards to $417,000, or a decrease of $139,000 to the Company's claim. My recommendation is based on removing $139,000 in cash awards as it appears that approximately 50% of the Company's claim for cash awards, or $278,000, is for executives where 50%, or $139,000 ($278,000 x 50%), is based on earnings per share with the remaining 50% of the cash awards related to eligible, non-executive employees, which is based on operational goals such as reliability, customer satisfaction, and individual performance, and not financial goals.[31]

ADVERTISING EXPENSE

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR ADVERTISING EXPENSE.

A. In direct testimony, I recommended an allowance of $793,000, or a reduction of $130,000 ($923,000 - $793,000) to the Company's FPFTY claim. My recommendation is based on the removal of goodwill and institutional advertising as these types of advertisements are typically more representative of goodwill advertising, or promotional advertising, that would provide little (if any) benefit to ratepayers. Ratepayers should not be required to finance PPL's decision to pay for such promotional advertising.[32]

[30] PPL Statement No. 23-R, p. 3, lines 8-13.
[31] PPL Statement No. 23-R, p. 2, line 10 through p. 3, line 6.
[32] I&E Statement No. 2, pp. 21-22.

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION FOR ADVERTISING EXPENSE?

A. Yes. Company witnesses Dennis A. Urban, Jr. and Daniel S. Dane addressed my recommendation for advertising expense.

Q. SUMMARIZE MR. URBAN'S AND MR. DANE'S RESPONSE.

A. Mr. Urban opines that I did not provide a full description of the Partners in Power Campaign. He states the full description explains that it aims to build trust and community connection that is rooted in partnership by demonstrating the value behind investments that help safeguard reliability and build communities that thrive as well as to provide support through available tools, programs and resources that help them take control of their energy usage and manage their bills, this campaign is the key mechanism to reach customers. Mr. Urban states that this program provides the tools and programs for customers to manage their bills and be efficient in their electric usage and therefore benefits ratepayers and educates them on the resources available.[33]

Mr. Dane states that although the Partners in Power campaign is classified as goodwill or institutional advertising, the program is aligned with customer operations and not enhancing PPL's corporate image.[34]

[33] PPL Statement No. 2-R, pp. 13-14.
[34] PPL Statement No. 6-R, p. 7.

Q. WHAT IS YOUR RESPONSE TO MR. URBAN AND MR. DANE?

A. While Mr. Urban is correct with the full description for the Partners in Power Campaign, the type of advertising referenced in this part of the interrogatory response only relates to part of the Company's Partners in Power campaign where the purpose is to "reach broad audiences with emotionally resonant stories" that offer "high reach, strong emotional impact, [and] credibility.[35] As I stated in my direct testimony, these types of advertisements are typically more representative of goodwill advertising, or promotional advertising, that would provide little (if any) benefit to ratepayers. Ratepayers should not be required to finance PPL's decision to pay for such promotional advertising.[36]

It should also be noted that the Company's historic test year (HTY) amount under this section of $49,400 was related to the Winter 2024 holiday campaign and Lehigh Valley Business Women of Influence of advertisement[37] which suggests that the type of advertising in this section is, in fact, for goodwill or institutional advertising contrary to Mr. Dane's assertion that it is aligned with customer operations and not enhancing PPL's corporate image.

Additionally, the portion of the description that Mr. Urban refers to appears to more closely resemble the Company's claim for advertising under Customer Education of $500,000 which the Company described as "[t]hrough its Partners in

[35] I&E Exhibit No. 2, Schedule 9, p. 2.
[36] I&E Statement No. 2, p. 18, line 18 through p. 19, line 9.
[37] I&E Exhibit No. 2, Schedule 9, p. 2.

Power campaign, PPL Electric aims to educate its customers regarding reliability, affordability, ease of doing business and safety."[38]

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR ADVERTISING EXPENSE?

A. No. I continue to recommend an allowance of $793,000, or a reduction of $130,000 ($923,000 - $793,000) to PPL's claim based on the removal of goodwill and institutional advertising for the reasons stated above and in my direct testimony.

INFRASTRUCTURE INVESTMENT & JOBS ACT (IIJA) COST AMORTIZATION

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR IIJA COST AMORTIZATION.

A. In direct testimony, I recommended disallowance of the Company's entire FPFTY claim of $211,000. My recommendation was based on my disagreement with the concept of a deferral for such cost as allowed by the Commission in general, because a regulatory asset should be used for items that are: (1) extraordinary; (2) unanticipated; (3) nonrecurring; and (4) substantial.[39] I also recommended that if the Commission were to allow the Company's proposed deferral treatment that

[38] I&E Exhibit No. 2, Schedule 9, p. 4.

[39] *Petition of Columbia Gas of Pa., Inc. for Authority to Defer for Accounting and Financial Purposes Certain Start Up Expenses Assoc. with the Redesign of Upgrade of Financial Processes and Info. Systems*, Docket No. P-2012-2319920, p. 5 (Order Entered December 5, 2012).

it would be amortized over a period of 61 months as opposed to three years, which is in line with the Company's actual historic filing frequency as discussed by I&E witness Zachari Walker in his direct testimony.[40] This recommendation would result in a recommended allowance of $124,525 ($633,000 ÷ 61 months x 12 months), which I rounded to $125,000, or a reduction of $86,000 ($211,000 - $125,000) to the Company's claim.[41]

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION FOR IIJA COST AMORTIZATION?

A. Yes. Company witnesses Daniel S. Dane and Sharon Leskowsky addressed my recommendation for IIJA cost amortization. Mr. Dane asserts that the IIJA-related costs should be included as these costs were prudently and reasonably incurred due to a new federal program and were incurred to protect ratepayer interest by preserving the Company's eligibility for federal infrastructure funding opportunities. Mr. Dane also states that participation required immediate action and upfront investment when these costs were incurred and opines that deferral and amortization of these costs is appropriate as to align cost recognition over the period in which the benefits are expected to occur.[42]

Ms. Leskowsky states that the Company has met all of the criteria necessary to recover the deferred IIJA costs in accordance with the Commission's

[40] I&E Statement No. 1, p. 7, lines 2-3.
[41] I&E Statement No. 2, pp. 22-24.
[42] PPL Statement No. 6-R, pp. 12-13.

Order at Docket No. P-2022-30329. Ms. Leskowsky states that the Company has applied for and received one grant under the IIJA over the past five years and that the $633,000 paid by PPL was a substantial expense by the Company in addition to the limited incurrence of this expense over the last five years which she contends demonstrates that these costs were substantial, extraordinary, and nonrecurring. Finally, Ms. Leskowsky disagrees with my alternative recommendation that if the Commission were to allow the Company deferral treatment, these costs should be amortized over a period of 61 months, which is in line with the Company's actual historical filing frequency. She opines that the three-year amortization is appropriate as it aligns with the Company's expectation to file base rate cases more frequently compared to the Company's historic filing frequency.[43]

Q. WHAT IS YOUR RESPONSE TO MR. DANE AND MS. LESKOWSKY?

A. Ms. Leskowsky is correct that the Commission Order she references allows the Company to record a regulatory asset for IIJA-related costs; however, it does not guarantee recovery of these costs and the Company must demonstrate that it meets all of the criteria for deferral treatment. The Commission stated:

> However, petitions seeking authorization for deferral accounting are not intended to create a factual record. As such, the burden of proof will remain with the utility to establish in any subsequent proceeding that costs associated with seeking federal funding made available by the IIJA are: (1)

[43] PPL Statement No. 22-R, pp. 3-6.

> extraordinary and substantial; (2) non-recurring; and (3) unanticipated. We are simply determining here that the IIJA-related expenses are within the scope of the type allowed to be deferred and tracked as a regulatory asset as an exception to retroactive recovery.
>
> Therefore, we find that allowing each utility to establish an IIJA-specific regulatory asset to track IIJA-related incremental expenditures is appropriate (similar to the regulatory asset that the Commission authorized for COVID-19-related costs incurred). To be clear, the establishment of an IIJA-specific regulatory asset is not a finding of prudency and does not provide a predetermined certainty of cost recovery for those expenses. Further the allowance granted is not a directive that a utility must defer these costs, nor is it making a determination of the appropriate treatment for the recovery of any allowable costs in a future period. Lastly, the OCA's stipulated approval conditions are similar to those required in previous filings of this kind; as such, they are included in the second Ordering Paragraph of this Opinion and Order. [44]

As stated in my direct testimony, I disagree with the concept of a deferral for such cost as allowed by the Commission in general, because a regulatory asset should be used for items that are: (1) extraordinary; (2) unanticipated; (3) nonrecurring; and (4) substantial. While I appreciate the pursuit of regulated utilities applying for such grant funding, companies should be required and expected to apply for such funding in all possible scenarios, and this is not limited to the IIJA. These costs are not extraordinary for PPL as the Company's claim of $633,000 represents less than 0.15% ($633,000 ÷ $434,760,000) of the Company's updated claim for O&M expenses of $434,760,000,[45] were not

[44] *Petition of the Office of Consumer Advocate, the Office of Small Business Advocate, and the Pennsylvania Utility Lew Project Requesting Initiation of a Proceeding on Federal Funding Opportunities for Utilities Under the Infrastructure Investment and Jobs Act*, Docket No. P-2022-3032929, pp. 10-11 (Order Entered July 13, 2023).

[45] PPL Exhibit DAU-2R, p. 15, line 2.

necessarily unanticipated, are most certainly recurring expenses because utilities should seek out such funding where available and likely do, and finally, I do not view these expenses as substantial as far as PPL is concerned ($633,000 spent over a two-year period).[46]

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR IIJA COST AMORTIZATION?

A. No. I continue to recommend disallowance of the Company's entire claim of $211,000 for the reasons discussed above and in my direct testimony. I also continue to recommend that if the Commission were to allow the Company's proposed deferral treatment, it should be amortized over a period of 61 months as opposed to three years, which is in line with the Company's actual historic filing. This recommendation would result in a recommended allowance of $124,525 ($633,000 ÷ 61 months x 12 months), which I rounded to $125,000, or a reduction of $86,000 ($211,000 - $125,000) to the Company's claim.

PAYMENT TRANSACTION FEES

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR THE COMPANY'S PAYMENT TRANSACTION FEES PROPOSAL.

A. In direct testimony, I recommended an allowance of $3,831,000, or a reduction of

[46] I&E Statement No. 2, pp. 23-24.

$1,149,000 ($4,980,000 - $3,831,000) to the Company's FPFTY claim. My recommendation is based on the removal of the additional 30% that PPL claimed will occur once the payment transaction fee is eliminated. While there may possibly be increased usage in payments that would have incurred a payment transaction fee due to the elimination of the payment transaction fee, the Company did not account for other benefits of eliminating the payment transaction fee that would offset the increase in usage.[47]

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION FOR PAYMENT TRANSACTION FEES?

A. Yes. Company witnesses Daniel S. Dane and Lisa Norden disagree with my recommendation. Mr. Dane disagrees with my adjustment to remove the additional 30% that PPL claimed will occur once the payment transaction fee is eliminated. Mr. Dane asserts that my adjustment does not take into account changes in customer behavior when price barriers such as transaction fees are removed and that historical transaction fee volumes are not predictive of future usage when the transaction fees are eliminated. Mr. Dane states that the Company reasonably expects an increase in electronic payments once transactions fees are eliminated.[48]

[47] I&E Statement No. 2, pp. 25-28.
[48] PPL Statement No. 6-R, pp. 15-16.

Ms. Norden clarifies that the Company's claim for the Company's payment transaction fee proposal is $5,200,000 and not $4,980,000. Ms. Norden explains that the Company's claim is based on payment transaction fees for the TME June 30, 2025 of $4,000,000, which the Company estimates there will be a 30% or $1,200,000 increase in payment transaction fees for a total claim of $5,200,000 ($4,000,000 + $1,200,000). Ms. Norden opines that the 30% increase is reasonable, if not conservative, due to the Company eliminating payment transaction fees as well as expanding its payment methods.[49]

Q. WHAT IS YOUR RESPONSE TO MR. DANE AND MS. NORDEN?

A. As stated in my direct testimony, while there may possibly be increased usage in payments that would have incurred a payment transaction fee due to the elimination of the payment transaction fee, the Company did not account for other benefits of eliminating the payment transaction fee that would offset the increase in usage. For example, Ms. Norden acknowledges that the Company's transaction fee proposal would improve customer satisfaction which would also help to reduce uncollectibles and possibly reduce cash working capital needed by the Company. Additionally, the Company's claim does not reflect the cost savings realized for costs associated with customer service such as the call center, mail handling,

[49] PPL Statement No. 18-R, pp. 42-43.

uncollectibles, collection costs, etc. Most importantly, the Company's proposed 30% increase is speculative and should be rejected.[50]

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR PAYMENT TRANSACTION FEES AS A RESULT OF MR. DANE'S AND MS. NORDEN'S REBUTTAL TESTIMONY?

A. Yes. While I continue to recommend the removal of the additional 30% that PPL claimed will occur once the payment transaction fee is eliminated based on the reasons stated above and in my direct testimony, I am updating my recommendation to reflect the Company's actual claim. This results in an updated recommended allowance of $4,000,000, or a reduction of $1,200,000 ($5,200,000 - $1,200,000) to the Company's claim. My recommendation is based on the removal of the additional 30% that PPL claims will occur once the payment transaction fee is eliminated of $1,200,000 ($4,000,000 x 30%) based on the reasons stated above and in my direct testimony.

ECONOMIC DEVELOPMENT

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR THE COMPANY'S ECONOMIC DEVELOPMENT PROPOSAL.

A. In direct testimony, I recommended that the Commission reject the Company's

[50] I&E Statement No. 2, p. 27, line 16 through p. 28, line 11.

Economic Development proposal. This resulted in disallowance of the Company's entire claim of $400,000 that the Company proposed to recover in distribution base rates. While PPL's proposal may be well-intentioned, it is not appropriate for ratepayers to fund the Company's proposal. The Company has not provided any support indicating that the Economic Development proposal will provide any benefits to ratepayers as a whole.[51]

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION FOR THE COMPANY'S ECONOMIC DEVELOPMENT PROPOSAL?

A. Yes. Company witnesses Daniel S. Dane and Jason Hunt disagree with my recommendation.

Q. SUMMARIZE MR. DANE'S AND MR. HUNT'S RESPONSE.

A. Mr. Dane states that the revenue requirement is intended to recover the reasonable and necessary costs incurred by the Company to provide electric distribution service during the period in which rates will be in effect. Mr. Dane asserts that the Company's Economic Development proposal satisfies this standard because it supports system utilization, long-term load stability, and efficient recovery of fixed distribution costs across a broader customer base.[52]

[51] I&E Statement No. 2, pp. 28-32.
[52] PPL Statement No. 6-R, p. 11.

Mr. Hunt asserts that the Company's Economic Development proposal would help communities complete essential site-readiness steps and compete for larger state and federal awards and when communities attract or expand businesses, it will help spread fixed costs to a broader base which could place a downward pressure on unit delivery costs and improve overall system efficiency. Mr. Hunt opines that I have a "narrow conception of ratepayer benefits" as the Company has not been able to quantify the benefits of the Economic Development proposal. Rather, Mr. Hunt opines that it should be viewed in a broader sense stating it is a reasonable and prudent way for the Company to assist the communities to prepare for future growth and reduce risk of declining system utilization. He then provides a list of other utilities that have implemented similar programs (none of which are in Pennsylvania). Mr. Hunt states that the Commission Order from PPL's 2004 base rate proceeding regarding its Community Betterment Initiative (CBI) differs from the Economic Development proposal in this proceeding as it focuses on site readiness, infrastructure-related due diligence, and alignment with public programs such as Pennsylvania SITES (PA SITES) and is not as broad as the CBI proposal in the Company's 2004 base rate case proceeding. Mr. Hunt states the Economic Development proposal is designed to complement Commonwealth initiatives, including PA SITES as it helps communities with early-state work where a small investment by the Company can help provide public and private funds for projects within the Company's service territory. Finally, Mr. Hunt disagrees with my assertion that

the Economic Development proposal does not offer any ratepayer benefits. He states that the customer benefits from improved system utilization and prudent planning that allow communities to attract load which allows fixed costs to be spread over a broader customer base resulting in a downward pressure on rates and improving long-term affordability for all customers.[53]

Q. WHAT IS YOUR RESPONSE TO MR. DANE AND MR. HUNT?

A. As stated in my direct testimony, while PPL's proposal may be well-intentioned, it is not appropriate for ratepayers to fund the Company's proposal.[54] Although the CBI may not be exactly the same as the Economic Development proposal, it still lacks any sort of quantifiable benefits to ratepayers, which neither Mr. Dane nor Mr. Hunt provide in their direct or rebuttal testimonies. If the Company wishes to pursue its Economic Development proposal, it should be funded by the shareholders, not the ratepayers.

Q. DO YOU HAVE ANY CHANGES TO YOUR RECOMMENDATION FOR THE COMPANY'S ECONOMIC DEVELOPMENT PROPOSAL AS A RESULT OF MR. DANE'S AND MR. HUNT'S REBUTTAL TESTIMONY?

A. No. I continue to recommend the Commission reject the Company's Economic Development proposal and the corresponding $400,000 expense claim for the

[53] PPL Statement No. 21-R, pp. 2-9.
[54] I&E Statement No. 2, p. 30, lines 17 through p. 31, line 2.

reasons discussed above and in my direct testimony.

CASH WORKING CAPITAL

Q. SUMMARIZE YOUR RECOMMENDATION IN DIRECT TESTIMONY FOR CASH WORKING CAPITAL (CWC).

A. In direct testimony, I recommended an allowance of $11,297,000 or a decrease of $5,478,000 ($16,775,000 - $11,297,000) to the Company's claim. My recommendation was based on changing the expense lag days corresponding to Affiliate Support from 35 days to 45 days and to include adjustments to O&M expenses made in I&E witness Zachari Walker's direct testimony and in my direct testimony. My recommendation to change the lag days corresponding to Affiliate Support was based on aligning payment timing with the terms of the service agreement and removes unnecessary early payment, to maximize the holding period of cash to the Company's and ratepayers' benefit.[55]

Q. DID THE COMPANY RESPOND TO YOUR RECOMMENDATION FOR CASH WORKING CAPITAL?

A. Yes. Company witness Katelyn Arnold responded to my CWC recommendation. Ms. Arnold states that while I reflected I&E's O&M adjustments in the CWC calculation, I did not reflect the changes in accrued taxes and interest.[56] Ms.

[55] I&E Statement No. 2, pp. 32-37.
[56] PPL Statement No. 13-R, p. 21.

Arnold disagrees with my recommendation to change the expense lag days for affiliate support costs from 35 days to 45 days. She asserts that the Company pays for its affiliate support costs and non-affiliate vendors on the 20th of each month and that the Company does not treat its affiliate support costs any differently than non-affiliate costs. Ms. Arnold opines that this simplifies its payment processes and gains efficiencies in its operations. Ms. Arnold states that a payment made within 30 days is reasonable and typical for the Company's vendors. Ms. Arnold opines that it would be unreasonable to pay its affiliates later than non-affiliates as it would be inefficient and not be as simplistic compared to how the Company makes its payments now. Finally, Ms. Arnold notes that the service agreement states that payment is due within 30 days and that it is not required to make the payment on the 30th day.[57]

Ms. Arnold also states that while the Company has agreed to some of I&E's recommended adjustments to certain O&M expenses, the Company has not agreed to adjustments to other O&M expenses, and Ms. Arnold provides a list of O&M adjustments and the Company's position on I&E's adjustments.[58]

Q. WHAT IS YOUR RESPONSE TO MS. ARNOLD'S ASSERTION REGARDING ACCRUED TAXES?

A. I&E did not recommend a change to the Company's deferred income taxes, and

[57] PPL Statement No. 13-R, pp. 23-24.
[58] PPL Statement No. 13-R, p. 24.

correspondingly, I did not reflect a change to accrued taxes in the CWC calculation. Upon reviewing PPL Exhibit Fully Projected Future 1, Schedule C-4, p. 4 and the Company's calculation for accrued taxes as a component of CWC that are based on present rate income tax amounts, I understand Ms. Arnold's concern. However, I&E's present rate income tax amounts are not determined until the CWC adjustment is entered into I&E's revenue requirement spreadsheet. Thus, any calculation to determine the accrued tax expense figure would not be based on I&E's final present rate income tax amounts; therefore, I had not reflected this adjustment in direct testimony. Furthermore, any I&E adjustment to accrued taxes as a component of CWC would serve to drive down I&E's recommended CWC allowance. As of the writing of this surrebuttal testimony, all components have not been brought together to allow for this type of recommended change. I would accept that accrued taxes be adjusted, however, as I&E always notes, and as noted at the conclusion of this section for the overall CWC recommendation, all adjustments to the Company's claims must be continually brought together in the Administrative Law Judge's Recommended Decision and again in the Commission's Final Order. This process, known as iteration, effectively prevents the determination of a precise calculation until all adjustments have been made to the Company's claims. If the Commission decides to reduce PPL's CWC allowance for accrued taxes based on all parties' recommendations and those that are accepted or rejected, I support such a change.

Q. WHAT IS YOUR RESPONSE TO MS. ARNOLD'S ASSERTION REGARDING INTEREST EXPENSE?

A. Ms. Arnold is correct that I did not reflect I&E's recommended change to the long-term debt ratio as claimed by the Company in PPL Exhibit Fully Projected Future 1, Schedule C-4, p. 5. I am updating my CWC calculation to reflect I&E's recommended long-term debt ratio of 45%.[59]

Q. WHAT IS YOUR RESPONSE TO MS. ARNOLD'S ASSERTION REGARDING ACCRUED TAXES?

A. Ms. Arnold may be correct that it would be simpler and more efficient and that the Company is not required to wait until the 30th day to make a payment to its affiliates, however, as stated in my direct testimony, for the Company to make its payments to affiliates earlier, ratepayers should not bear costs associated with CWC increases that result from unnecessary and disadvantageous early payments, which in this instance are being paid to a PPL-affiliated company. The change in expense lag days corresponding to Affiliate Support costs from 35 day to 45 days aligns payment timing with the terms of the service agreement and removes unnecessary early payment, to maximize the holding period of cash to the Company's and ratepayers' benefit.[60] Therefore, I continue to recommend

[59] I&E Exhibit No. 2-SR, Schedule 1, p. 3.
[60] I&E Statement No. 2, pp. 35-36.

changing the expense lag days corresponding to Affiliate Support costs from 35 days to 45 days for the reasons stated above and in my direct testimony.

Q. DID THE COMPANY PROVIDE AN UPDATE TO CWC?

A. Yes. The Company's updated claim for CWC is $16,529,000.[61] Mr. Urban states that CWC has been adjusted to correct an error in response to I&E-RE-I-2-D[62] which would increase O&M expenses resulting in an increase in the average lag of operating expenses and a reduction in average lag days between payment of operating expense and receipt of revenue from 5.2 days to 5.1 days.[63] Ms. Arnold states that the Company's updated CWC claim reflects adjustments for O&M expenses that were accepted by the Company.[64]

Q. DO YOU AGREE WITH THE COMPANY'S UPDATED CLAIM?

A. No.

Q. DO YOU HAVE AN UPDATE RELATED TO YOUR RECOMMENDED ADJUSTMENTS TO O&M EXPENSES?

A. Yes. As discussed earlier, I continue to recommend a change to the expense lag days corresponding to Affiliate Support from 35 days to 45 days. Additionally, all

[61] PPL Exhibit DAU-2R, p. 7.
[62] I&E Exhibit No. 2, Schedule 13.
[63] PPL Statement No. 2-R, p. 3, lines 17-22.
[64] PPL Statement No. 13-R, p. 24, lines 12-15.

O&M expense adjustments that are cash-based expense claims are included when determining the Company's overall CWC requirement. Therefore, I have included cash-based O&M recommendations when computing the overall recommended CWC allowance.

Q. SUMMARIZE WHERE EACH OF THE RECOMMENDED O&M EXPENSE ADJUSTMENTS ARE REFLECTED IN THE CWC COMPUTATIONS.

A. The following recommended adjustments are reflected in the O&M Expense - Expense Lag Days calculation: payroll and benefits expense adjustment of $4,113,000, payroll taxes adjustment of $2,268,000, incentive compensation adjustment of $1,098,000, advertising expense adjustment of $130,000, payment transaction fees adjustment of $1,200,000, economic development adjustment of $400,000, rate case expense adjustment of $304,000, bank charges adjustment of $388,000, company sponsorships adjustment of $28,000, membership dues and subscriptions adjustment of $2,000,000, and vegetation management expense adjustment of $15,579,000 as discussed above and in I&E witness Zachari Walker's surrebuttal testimony, producing a total decrease of $27,508,000[65] which is reflected in I&E Exhibit No. 2-SR, Schedule 1, p. 2.

[65] I&E Exhibit No. 2-SR, Schedule 1, p. 4.

Summary of I&E-Updated Recommended CWC Allowance:

Q. BASED ON THE ABOVE SURREBUTTAL TESTIMONY, WHAT IS YOUR UPDATED RECOMMENDED ALLOWANCE FOR CWC?

A. Based on reflecting all of I&E's recommended adjustments as discussed above, my updated recommendation for CWC is an allowance of $10,717,000 or a decrease of $5,812,000 ($16,529,000 - $10,717,000) to the Company's revised claim.[66]

Q. IS YOUR UPDATED RECOMMENDATION FOR CWC A FINAL RECOMMENDED ALLOWANCE?

A. No. Similar to what I stated in direct testimony and above, all adjustments to the Company's claims must be continually brought together in the Administrative Law Judge's Recommended Decision and again in the Commission's Final Order. This process, known as iteration, effectively prevents the determination of a precise calculation until all adjustments have been made to the Company's claims.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

[66] I&E Exhibit No. 2-SR, Schedule 1, p. 1.

PPL Electric Utilities Corporation

REBUTTAL Working Capital Required for Operation and Maintenance Expenses - *DISTRIBUTION ONLY*
As of June 30, 2027
(Thousands of Dollars)

The Company bills its customers every month. On this basis, there is a considerable span of days between the time electricity is furnished to a customer and the time the customer pays for such electricity.

In many instances, the Company must pay its bills for payroll and other O&M expenses prior to the time it is able to collect the amount due for the service which requires the incurrance of such expenses. Thus, the Company has examined its records to determine, as to the major categories of expense, the average span of days which exists between the time an expense is incurred and the time it must be paid. Schedule C-4, page 2, of Exhibit Historic 1 sets forth the individual components which result in the days lag between payment of expenses and receipt of the related revenues used in the determination of the working capital required for the pro forma O&M expense for the test year ending June 30, 2025.

Line No.	Description	Amount	
1	Net pro forma O&M expense (a)	384,888	
2	O&M expense per day (line 1 divided by 365 days)	1,054	
3	Average lag in days between payment of O&M expenses and receipt of revenue (b)	0.4	(c)
4	Working capital requirement (line 2 x line 3)	$ 422	

(a)	Total pro forma operation and maintenance expense (D-1 col. 5 lines 2-4)	727,769	(d)
	Less: Non-cash items		
	Uncollectible accounts expense	14,735	
	Deferred Storm Outage Costs (D-9)	3,779	
	Deferred IIJA Costs (D-10)	211

INTRODUCTION OF WITNESS

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Drew Breuning. My business address is Pennsylvania Public Utility Commission, Commonwealth Keystone Building, 400 North Street, Harrisburg, PA 17120.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by the Pennsylvania Public Utility Commission (Commission) in the Bureau of Investigation & Enforcement (I&E) as a Fixed Utility Financial Analyst.

Q. ARE YOU THE SAME DREW BREUNING WHO IS RESPONSIBLE FOR THE DIRECT TESTIMONY CONTAINED IN I&E STATEMENT NO. 3 AND THE SCHEDULES IN I&E EXHIBIT NO. 3?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to respond to the rebuttal testimony of PPL Electric Utilities Corporation (PPL Electric or Company) witnesses Ms. Jennifer E. Nelson (PPL Electric Statement No. 10-R) and Ms. Julissa Burgos (PPL Electric Statement No. 9-R).

Q. DOES YOUR SURREBUTTAL TESTIMONY INCLUDE AN EXHIBIT?

A. No, it does not.

UPDATED I&E POSITION

Q. HAS YOUR ROE RECOMMENDATION CHANGED FROM YOUR DIRECT TESTIMONY?

A. Yes. As will be explained later in my rebuttal testimony, an alteration to my electric company proxy group has changed my recommended ROE minimally from 10.32% to 10.31%.

Q. PLEASE SUMMARIZE YOUR UPDATED OVERALL RATE OF RETURN RECOMMENDATION.

A. My updated overall rate of return for the Company is as follows:

Type of Capital	Summary of Cost of Capital Ratio	Cost Rate	Weighted Cost
	PPL Electric Utilities Corporation		
Long-Term Debt	45.00%	5.08%	2.29%
Common Equity	55.00%	10.31%	5.67%
Total	100.00%		7.96%

SUMMARY OF MS. NELSON'S REBUTTAL TESTIMONY

Q. SUMMARIZE MS. NELSON'S RESPONSE IN REBUTTAL TESTIMONY TO YOUR RATE OF RETURN RECOMMENDATIONS.

A. First, Ms. Nelson disputes my recommendations regarding an overall fair rate of return. She again comments on the current capital market environment, including interest rates and inflation. Next, she claims that I failed to consider the results of cost of equity models other than the Discounted Cash Flow (DCF) model and disputes the forecasted growth rates I employed. She then criticizes my application of the Capital Asset Pricing Model (CAPM), claiming that I have incorrectly relied on the 10-year Treasury Bond for my risk-free rate, not employed the Empirical CAPM (ECAPM), and that I am incorrect in my use of the Kroll Equity Risk Premium (ERP) based CAPM model. Additionally, she disagrees with my dismissal of the Bond Yield Plus Risk Premium Method (BYPRP). Ms. Nelson also claims that I fail to account for PPL Electric's business risk and disagrees with my dismissal of her discussion regarding PPL Electric's size and a potential flotation cost adjustment to her proposed return on equity, although she does not make explicit adjustments to her recommendation for either of these issues. Finally, Ms. Nelson takes issue with my recommendation regarding an appropriate capital structure for the Company.

Q. HAS MS. NELSON'S ROE RECOMMENDATION CHANGED FROM HER DIRECT TESTIMONY?

A. No. Although Ms. Nelson provides an updated analysis, including updated market data[1] and an alteration of her proxy group,[2] she continues to recommend the same ROE of 11.30% that she recommends in her direct testimony.

CURRENT CAPITAL MARKET ENVIRONMENT

Q. SUMMARIZE MS. NELSON'S RESPONSE TO YOUR COMMENTS ON THE CURRENT CAPITAL MARKET.

A. Ms. Nelson opines that I am incorrect in my assertion that the Federal Reserve's intention to cut interest rates in the near future would also reduce inflation. In addition, she reiterates points made in her direct testimony regarding the current capital market, including long-term interest rates, inflation levels, and geopolitical uncertainty.[3]

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S COMMENTS REGARDING THE CURRENT CAPITAL MARKET?

A. Ms. Nelson is correct that there is an inverse relationship between interest rates and inflation, as the Federal Reserve routinely increases interest rates to curb raising inflation. The intent of my statement was to express that a reduction in

[1] PPL Electric Statement No. 10-R, p. 82, lines 14-16.
[2] PPL Electric Statement No. 10-R, p. 27, lines 10-14.
[3] PPL Electric Statement No. 10-R, pp. 17-21.

interest rates would ultimately lead to a reduction in debt costs, which I mention in direct testimony.[4] As for Ms. Nelson's comments on interest rates and inflation, all utility companies are impacted by interest rate changes and inflation and may file rate cases at any time to address issues resulting from changing market conditions. Similarly, regarding geopolitical events, PPL Electric faces the same risks as the rest of the proxy group, and these risks are already factored into the rate of return required by investors.

PROXY GROUP COMPOSITION

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING THE COMPOSITION OF OUR RESPECTIVE PROXY GROUPS.

A. Ms. Nelson removes NorthWestern Energy Group, Inc. (NWE) from her original proxy group, due to an announced merger she inadvertently overlooked. Next, she disagrees with my sixth proxy group screening criterion that excludes companies that do not operate in deregulated markets. Ms. Nelson then disagrees with my decision to screen my proxy group based on the percentage of regulated electric revenue instead of using the percentage of regulated operating income. Additionally, as she did in direct testimony, she opines that PPL Electric's parent company, PPL Corporation, should be removed from the proxy group for circularity reasons. Ultimately, however, Ms. Nelson concludes that the

[4] I&E Statement No. 3, p. 54, lines 1-3.

differences in methodologies between our two proxy groups are not a primary factor in the differences of our respective recommended ROEs.[5]

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S COMMENTS REGARDING YOUR PROXY GROUP?

A. First, I agree with Ms. Nelson that NWE should be excluded from the proxy group due to the announced merger, as its initial inclusion in my proxy group was also an oversight. However, as alluded to earlier, removing NWE from the proxy group reduces my recommended authorized ROE slightly from 10.32% to 10.31%. The removal of NWE also changes certain data such as the proxy group's average capital structure, average dividend yield, and average debt cost; however, these averages are impacted in extremely negligible amounts.

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S COMMENTS ON YOUR PROXY GROUP CRITERION THAT REQUIRES OPERATION IN A DEREGULATED MARKET?

A. Ms. Nelson comments that she disagrees with my proxy group criterion that requires a company to operate in a deregulated market. While this criterion may be subjective, I believe that since PPL Electric operates in a deregulated market, it

[5] PPL Electric Statement No. 10-R, pp. 27-32.

is important to ensure that the proxy group companies are operating in a similar regulatory environment and similar circumstances to PPL Electric.

Q. DO YOU AGREE WITH MS. NELSON'S ASSERTION THAT THE PERCENTAGE OF OPERATING INCOME IS A MORE APPROPRIATE PROXY GROUP CRITERION THAN REGULATED ELECTRIC DISTRIBUTION REVENUE?

A. No. Calculating the percentage of utility operating income that makes up the total operating income of a company is not always a reliable way of determining if a business is primarily a regulated utility. For example, operating income includes items such as depreciation, where it is possible for the regulated utility segment of a company to predominately have assets that are fully depreciated resulting in higher operating income. Although a utility may have assets that are significantly depreciated, it does not always indicate the level of business a company does. A parent company can have most of its utility assets depreciated but still do less business as a utility than it does in another business segment. Therefore, comparing the operating income of an electric utility segment to the total operating income of a company is not an appropriate criterion.

Q. DO YOU HAVE ANY FURTHER COMMENTS REGARDING MS. NELSON'S CLAIM THAT NET OPERATING INCOME IS A MORE APPROPRIATE PROXY GROUP CRITERION?

A. Yes. Not only do I respectfully disagree with this as I explained above, but the Commission has historically used utility revenue, and not operating income, to determine a company's validity in a proxy group. Most recently, in the Columbia Gas of Pennsylvania, Inc. 2025 base rate case, the Commission order states, "…the generation of revenue is the first step that drives the company's net income and cash flow… Therefore, a utility's revenue composition is a more appropriate measure than is the utility's operating income or net income for establishing a proxy group, because this measure represents the percentage of cash flow a company receives from each business segment."[6] The Commission then supports I&E's methodology by stating, "Accordingly, we shall adopt the ALJs' recommendation to utilize I&E's Natural Gas Utility proxy group in setting the appropriate rate of return for Columbia in this proceeding."[7]

[6] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.,* Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Proxy Groups, p. 204.

[7] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.,* Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Proxy Groups, p. 205.

Q. ARE THERE MORE INSTANCES OF THE COMMISSION ACCEPTING I&E'S METHODOLOGY IN DETERMINING A PROXY GROUP?

A. Yes. There are four recent instances where the Commission has accepted I&E's methodology to use percentage of revenues in selecting a proxy group. First, in *Pennsylvania Public Utility Commission, et. al v. Columbia Gas of Pennsylvania, Inc*., at Docket R-2020-3018835 (Order Entered February 19, 2021), pp. 110-112, the Commission adopted the ALJ's recommendation to use I&E's proxy group based on I&E's reasoning to exclude two companies based on a percentage of revenues as it most closely resembles the company.

Second, in *Pennsylvania Public Utility Commission, et. al v. PECO Energy Company – Gas Division*, at Docket R-2020-3018929 (Order Entered June 22, 2021, Public Version), pp. 137-139, the Commission again adopted the ALJ's recommendation to use I&E's proxy group based on I&E's reasoning to exclude two companies based on a percentage of revenues as it most closely resembles the company.

Third, in *Pennsylvania Public Utility Commission, et. Al v Columbia Water Company,* at Docket No. R-2023-3040258 (Order Entered January 18, 2024), pp. 74-77, the Commission adopted the ALJ's recommendation to use I&E's proxy group based on I&E's reasoning stating that "In our view, comparing the net operating income of a water utility segment to the total net operating income of a company is not an appropriate criterion to use in this proceeding."

Fourth, in *Pennsylvania Public Utility Commission, et. al v. Pennsylvania-American Water Company*, Docket Nos. R-2023-3043189 and R-2023-3043190 (Order Entered July 22, 2024), pp. 149-153, the Commission adopted the ALJ's recommendation to use I&E's proxy group based on I&E's reasoning citing Commission precedent and references the above Columbia Water Company case.

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S OMISSION OF PPL CORPORATION FOR CIRCULARITY REASONS?

A. As stated in my direct testimony, PPL Corporation has significant electric distribution operations in various states, making any circularity concerns insignificant.[8]

DISCOUNTED CASH FLOW

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING YOUR DCF ANALYSIS.

A. Ms. Nelson opines I have inappropriately relied solely on the DCF model for my cost of equity recommendation, and continues to opine that consideration of the CAPM, Risk Premium, and Quarterly DCF results are warranted in this proceeding.

[8] I&E Statement No. 3, p. 13, lines 13-17.

Ms. Nelson agrees with my use of earnings growth rate projections in the calculation of my DCF result and references the 2025 Columbia Gas proceeding in which the Commission agreed with the ALJs' conclusion to use EPS growth rates. She also agrees with my exclusion of S&P and Zacks' earnings growth rate projections for Dominion Energy, Inc., which as I explained in my direct testimony were significant outliers compared to the rest of the growth estimates of my proxy group. However, in her rebuttal testimony, Ms. Nelson has subsequently added Dominion Energy, Inc. (which had previously been excluded from the proxy groups of both Ms. Nelson and me for being an outlier) to her proxy group after its projected earnings growth rate dropped significantly after the submission of her direct testimony.[9]

ALLEGED SOLE RELIANCE ON THE DCF

Q. PLEASE RESPOND TO MS. NELSON'S ASSERTION THAT YOU RELIED SOLELY ON THE DCF.

A. As stated in my direct testimony, while my recommendation was based on the results of my DCF analysis, I also employed the CAPM only as a comparison because the DCF method is the most reliable.[10] The DCF method has the most wide-spread regulatory acceptance, and while no one method can capture every factor that influences an investor, including the results of methods less reliable

[9] PPL Electric Statement No. 10-R, p. 32-41.
[10] I&E Statement No. 3, pp. 23-25.

than the DCF does not make the end result more reliable or accurate. Further, as explained in my direct testimony, the Commission has more recently based its ROE decisions on a combination of methods, including averaging the DCF and CAPM. Therefore, I stand by my method of using the DCF with the CAPM as a comparison.

GROWTH RATES

Q. PLEASE EXPLAIN WHY YOU HAVE NOT ADDED DOMINION ENERGY, INC.'S PREVIOUSLY OMITTED PROJECTED EARNINGS GROWTH RATES TO YOUR ANALYSIS.

A. While I do not dispute Ms. Nelson's use of more recent information to provide an updated analysis, it is important to note that financial information from respected and commonly used sources such as Value Line, S&P, and Zacks, etc. is updated regularly (monthly, weekly, daily, hourly, etc. depending on the source). At the time of my analysis, I utilized the most recent financial information accessible to me. Throughout the course of a base rate case proceeding, information may change to some degree, but it is unreasonable to constantly change one's position aside from the occurrence of some major economic event or egregious oversight.

CAPITAL ASSET PRICING MODEL

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING YOUR CAPM ANALYSIS.

A. Ms. Nelson opines that the Commission should factor the CAPM into the determination of an authorized ROE. She also disagrees with my use of the 10-year Treasury note as the risk-free rate and claims that the 30-year Treasury bond is the most appropriate risk-free rate to use in the calculation of the CAPM. Ms. Nelson then requests that the Commission consider the use of the ECAPM. Finally, Ms. Nelson recommends that the Commission give no weight to my Kroll-based CAPM estimate.[11]

RISK-FREE RATE

Q. WHAT IS MS. NELSON'S RESPONSE TO YOUR USE OF THE YIELD ON THE 10-YEAR U.S. TREASURY NOTE?

A. Ms. Nelson claims her use of the yield on a 30-year U.S. Treasury Bond is more appropriate than my use of the yield on a 10-year Treasury Note because it better reflects the life of the underlying investment. She contends that since utility assets are long-duration investments, long-term Treasury bonds should be used as the risk-free rate.[12]

[11] PPL Electric Statement No. 10-R, p. 42-46.
[12] PPL Electric Statement No. 10-R, p. 46, lines 4-23.

Q. IS THE LIFE OF THE INVESTMENT THE ONLY FACTOR THAT SHOULD BE CONSIDERED IN THE CHOICE OF A RISK-FREE RATE?

A. No. The risk-free rate is the return that can be earned without accepting any risk, and while the life of the investment can be considered in the choice of risk-free rates, the most important consideration is that the rate be as risk-free as possible. As explained in my direct testimony, I chose the 10-year Treasury Note as it mitigates the shortcomings of the short-term Treasury Bill and the 30-year Treasury Bond.[13] Although long-term Treasury Bonds have less risk of being influenced by federal policies, they have substantial maturity risk associated with market risk. In addition, long-term Treasury Bonds bear the risk of unexpected inflation. As such, my choice of a 10-year Treasury Note is appropriate. Further, as also pointed out in my direct testimony, the Commission has agreed with I&E that the 10-year Treasury Note is the superior measure of the risk-free rate of return.[14]

Q. DOES THE PROJECTED RISK-FREE RATE NEED TO REPRESENT THE LONGEST PERIOD AVAILABLE?

A. No. The time period reflected in a projected risk-free rate should include the period in which rates will be in effect (the investment period), which is typically the Fully Projected Future Test Year (FPFTY), or the time determined by a

[13] I&E Statement No. 3, p. 36, lines 3-14.

[14] *Pa. PUC v. UGI Utilities, Inc. – Electric Division;* Docket No. R-2017-2640058 (Order Entered October 25, 2018). *See generally* Disposition of Capital Asset Pricing Model (CAPM), p. 99.

company's rate case filing frequency. Ideally, all factors in determining an appropriate ROE, including the risk-free rate, will be reassessed during each base rate filing. Therefore, while an investor may hold a utility stock for 30 years or more, the Commission authorized return determined in the base rate filing is likely reassessed many times within that 30-year period.

The yield on the 10-year Treasury Note is expected to remain level at 4.10% from the first quarter of 2026 through the first quarter of 2027 and is forecasted to be 4.00% from 2027-2031. For my forecasted CAPM analysis, I calculated 4.08%, which is the average of all the yields I observed.[15]

KROLL ERP

Q. WHAT IS MS. NELSON'S RESPONSE TO YOUR USE OF THE KROLL ERP CAPM ANALYSIS?

A. Ms. Nelson disagrees with Kroll's recommended equity risk premium because it is not clear that Kroll develops its market premium in relation to its risk-free rate and she notes the two are interrelated.[16] She further opines that my Kroll ERP CAPM result is too low to be considered in this proceeding.[17]

[15] I&E Exhibit No. 3, Schedule 16.
[16] PPL Electric Statement No. 10-R, p. 50, lines 11-16.
[17] PPL Electric Statement No. 10-R, p. 64, line 14 through p. 65, line 2.

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S REBUTTAL TESTIMONY CONCERNING THE KROLL ERP?

A. As discussed in my direct testimony, my recommendation is based on the DCF method as the primary method to determine the cost of common equity. I am providing the results of my CAPM analysis as a comparison to, and not as a check of, my DCF results.[18] My inclusion of the Kroll ERP in my CAPM analysis is to provide more information to the Commission as they have recently expressed increasing interest in the CAPM model. Kroll is a trusted and publicly available source that bases their recommended ERP on current and forecasted economic and financial conditions.[19]

Ms. Nelson's opposition to my use of Kroll's ERP further demonstrates that the inputs to the CAPM are highly subjective and can lead to wildly different results. This is not the case with the DCF model.

Q. HAS THE COMMISSION COMMENTED ON THE USE OF THE KROLL ERP CAPM ANALYSIS?

A. Yes. The Commission's Columbia Gas of Pennsylvania, Inc. 2025 base rate case order states, "…we are also persuaded to use informed judgment and to apply both I&E's traditional CAPM and its Kroll ERP CAPM analysis in setting the ROE for

[18] I&E Statement No. 3, p. 23, lines 4-12.
[19] I&E Statement No. 3, p. 38, lines 1-6.

Columbia".[20] The Commission also notes that due to their belief that the results of I&E's traditional CAPM analysis were overstated, "...we will use the average of I&E's traditional CAPM ROE of 10.51% and I&E's Kroll ERP based CAPM ROE of 9.36%.".[21]

Additionally, using Kroll's methodology eliminates the potential bias of any involved parties, as I use Kroll's recommended input of the 20-year Treasury yield in my analysis.

EXCLUSION OF THE ECAPM METHOD

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING THE USE OF THE ECAPM METHOD.

A. Ms. Nelson opines that her ECAPM analysis is a more accurate alternative to the CAPM for betas that are under 1.00.[22]

Q. WHY HAVE YOU NOT PERFORMED AN ECAPM ANALYSIS?

A. The ECAPM is a modified version of the CAPM which attempts to address the belief that the actual risk vs. return correlation is flatter than what is predicted by the CAPM. The implication is that the CAPM underestimates returns with lower levels of risk and over-estimates the returns associated with higher levels of risk.

---

[20] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.,* Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Rate of Return on Common Equity, p. 234.

[21] *Pa. PUC v. Columbia Gas of Pennsylvania, Inc.,* Docket No. R-2025-3053499 (Order Entered December 9, 2025). *See generally* Disposition of Rate of Return on Common Equity, p. 235.

[22] PPL Electric Statement No. 10-R, p. 60, lines 13-16.

The model entails assigning 25% weight to the market beta and 75% weight to the individual company or proxy group.[23]

Additionally, the use of the ECAPM in estimating the cost of capital does not increase the validity of the result but merely adds another measure of subjectivity to the CAPM, attempting to make the Security Market Line (SML) more accurate. The ECAPM reduces the purpose of the beta, which is the only company-specific variable in the CAPM model. This additional layer of subjectivity provides an even stronger basis to rely on the DCF as the primary method to calculate a utility's cost of equity.

Q. DO YOU HAVE ANY FURTHER COMMENTS ON MS. NELSON'S ECAPM ANALYSIS?

A. Yes. As stated in my direct testimony, I disagree with the use of the CAPM (including the ECAPM) in regulatory proceedings.[24] However, given that the Commission is now trending towards using both the DCF and the CAPM to determine an authorized ROE, I include my CAPM results as a comparison to the results of my DCF model.

As for Ms. Nelson's belief that the ECAPM should also be considered by the Commission,[25] I am unaware of any instance in which the Commission has used the ECAPM method in the determination of an authorized ROE. Therefore, I

[23] David C. Parcell, "The Cost of Capital – A Practitioner's Guide," 2020 Edition, p. 106.
[24] I&E Statement No. 3, p. 24, line 11 through p. 25, line 3.
[25] PPL Electric Statement No. 10-R, p. 63, lines 3-5.

do not recommend that the Commission take the ECAPM method into consideration in this proceeding.

Q. HAVE YOU CHANGED YOUR CAPM RETURN ON EQUITY RECOMMENDATION AS A RESULT OF MS. NELSON'S REBUTTAL TESTIMONY?

A. No. I continue to recommend using my CAPM result of 9.04%[26] only as a comparison to my DCF result of 10.31%.

EXCLUSION OF THE BYPRP METHOD

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING THE USE OF THE BYPRP METHOD.

A. Ms. Nelson's primary argument is that her Risk Premium analysis determines the appropriate risk premium based on the relationship between historical authorized ROEs and Treasury bond yields. She points back to her analysis provided in direct testimony, which incorporates 46 years of historical data. Ms. Nelson goes on to state that the model is a reliable predictor of the equity risk premium at various levels of interest rates.[27]

[26] I&E Statement No. 3, p. 39, line 5.
[27] PPL Electric Statement No. 10-R, p. 66, ln. 15 through p. 67, ln. 2.

Q. PLEASE EXPLAIN WHY YOU HAVE EXCLUDED A RISK PREMIUM METHOD IN YOUR ROE ANALYSIS.

A. I have excluded a Risk Premium method from my ROE analysis because it is a simplified version of the CAPM, therefore it suffers from the same criticisms. Most importantly, unlike the CAPM, the Risk Premium method does not recognize company specific, or proxy group specific risk through a beta coefficient. Further, the Commission has historically dismissed the Risk Premium method in determining an appropriate return on equity in base rate proceedings.

BUSINESS RISK

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING PPL ELECTRIC'S BUSINESS RISK.

A. In her rebuttal testimony, Ms. Nelson again clarifies that she does not make an explicit adjustment to her ROE recommendation for business risk. However, she continues to argue that PPL Electric is riskier than the proxy group due to its smaller size, should be allowed to recover flotation costs through the authorized ROE, and has regulatory mechanisms comparable to the companies in her proxy group.[28]

[28] PPL Electric Statement No. 10-R, pp. 69-81.

SIZE EFFECT

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING PPL ELECTRIC'S SMALLER RELATIVE SIZE.

A. Ms. Nelson presents additional literature in an attempt to support her claim that PPL Electric is exposed to greater risk due to its smaller relative size when compared to her proxy group.[29]

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S CLAIMS REGARDING PPL ELECTRIC'S SIZE?

A. The difficulty in predicting the effect of size is demonstrated in the variance from year to year of the measurement of difference between the annual returns on the large and small-capitalization stocks of the NYSE/AMEX/NASDAQ in the Ibbotson *Stocks, Bonds, Bills & Inflation: 2015 Yearbook*. As stated on page 100 of the SBBI Yearbook,

> While the largest stocks actually declined in 2001, the smallest stocks rose more than 30%. A more extreme case occurred in the depression-recovery year of 1933, when the difference between the first and 10th decile returns was far more substantial. The divergence in the performance of small- and large- cap stocks is evident. In 30 of the 89 years since 1926, the difference between the total returns of the largest stocks (decile 1) and the smallest stocks (decile 10) has been greater than 25 percentage points.

[29] PPL Electric Statement No. 10-R, pp. 72-76.

Page 109 states,

> In four of the last 10 years, large-capitalization stocks (deciles 1-2 of NYSE/AMEX/NASDAQ) have outperformed small-capitalization stocks (deciles 9-10). This has led some market observers to speculate that there is no size premium. But statistical evidence suggests that periods of underperformance should be expected.

Page 112 states,

> Because investors cannot predict when small-cap returns will be higher than large-cap returns, it has been argued that they do not expect higher rates of return for small stocks.

In my opinion, it is not appropriate to link the small size effect of non-regulated companies with the regulated utility industry because regulated utilities, small or large, have a market monopoly in the certificated service jurisdiction and are permitted to seek recovery of the full cost of service and a fair and reasonable rate of return on rate base. Furthermore, as I stated in direct testimony, any expense impact resulting from the lesser buying power of a smaller utility is reflected in the revenue requirement and the dollar-for-dollar recovery that applies to expenses. To apply an additional size adjustment to a smaller regulated utility would only duplicate the burden to ratepayers.

Finally, given Ms. Nelson's lack of an explicit size adjustment to her recommended ROE, I believe that any argument made regarding PPL Electric's size is irrelevant. I continue to recommend that the Commission give no weight to

the notion that an adjustment to the authorized ROE to account for size is necessary.

FLOTATION COST

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING FLOTATION COSTS.

A. Ms. Nelson again notes that she is not making an explicit adjustment to her recommended ROE for flotation costs. Then, she claims that my position stating that it is inappropriate to factor flotation costs into the cost of equity is unsupported. Finally, Ms. Nelson opines that flotation costs are appropriate to be recovered through an adjustment to the authorized ROE, because flotation costs are recorded on the balance sheet as paid-in capital.[30]

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S CLAIMS REGARDING FLOTATION COSTS?

A. Similar to the size effect, while Ms. Nelson disagrees with my stance on normalized expense flotation costs, she is not making any explicit adjustments to her recommended ROE for flotation costs. Therefore, any argument or discussion regarding the merits of flotation costs is irrelevant in this proceeding, and I continue to recommend that the Commission reject PPL Electric's claim that a

[30] PPL Electric Statement No. 10-R, p.77-79.

flotation cost adder should be considered as an addition to the authorized cost of equity.

REGULATORY MECHANISMS

Q. SUMMARIZE MS. NELSON'S REBUTTAL TESTIMONY REGARDING REGULATORY MECHANISMS.

A. Ms. Nelson states that it is necessary to compare the regulatory mechanisms available to PPL Electric to those that are available to the proxy group operating companies, and that many of these companies use regulatory mechanisms that PPL Electric does not. Nonetheless, Ms. Nelson concludes that PPL Electric has comparable regulatory risk to her proxy group and opines that PPL Electric's authorized ROE should not be lowered due to regulatory mechanisms.[31]

Q. WHAT IS YOUR RESPONSE TO MS. NELSON'S CLAIMS REGARDING REGULATORY MECHANISMS?

A. I agree with Ms. Nelson's conclusion that PPL Electric has comparable risk to that of our respective proxy group companies. My position is that mechanisms such as the FPFTY and the Distribution System Improvement Charge (DSIC) play a significant role in reducing a utilities regulatory lag and overall financial risk profile. These risk-reducing mechanisms should be considered in conjunction

[31] PPL Electric Statement No. 10-R, pp. 80-81.

with the fact that regulated utilities have the opportunity to recover all prudent expenses through a base rate case.

For clarity, I am not recommending that PPL Electric's authorized ROE be lowered due to its regulatory mechanisms; rather, I believe, no adjustment, upwards or downwards, is warranted since PPL Electric's risk profile is similar to that of the proxy group companies.

CAPITAL STRUCTURE

Q. SUMMARIZE MS. NELSON'S AND MS. BURGOS' REBUTTAL TESTIMONIES REGARDING PPL ELECTRIC'S CAPITAL STRUCTURE.

A. Ms. Nelson opines that my use of proxy group holding companies is incorrect, and that her use of operating companies is superior. Next, she contends that my use of Value Line's projected capital structures is flawed because those projections are also based on holding companies and asks that the Commission give no weight to my recommendation that PPL Electric's capital structure be limited to 55% equity. Finally, Ms. Nelson points to the recent Columbia Gas base rate case as an example of the Commission accepting a company's actual capital structure despite the proposal of multiple hypothetical capital structures by various parties.[32]

Similar to Ms. Nelson, Ms. Burgos opines that PPL Electric's proposed capital structure is within the proxy group's range of equity ratios due to the use of

[32] PPL Electric Statement No. 10-R, pp. 84-96.

operating companies rather than holding companies. Ultimately, she recommends that the Commission reject the hypothetical capital structures presented by myself and other witnesses and utilize PPL Electric's actual capital structure.[33]

Q. WHAT IS YOUR RESPONSE TO PPL ELECTRIC'S WITNESSES' COMMENTS REGARDING PPL ELECTRIC'S CAPITAL STRUCTURE?

A. As stated in my direct testimony, it is my opinion that PPL Electric's actual capital structure of 56.05% common equity and 43.95% long-term debt is unreasonable for ratemaking purposes due to the equity ratio being significantly higher than the highest end of my proxy group's equity ratios.[34] Given this, in addition to Commissioner Barrow's comments outlined in my direct testimony[35] regarding consideration of the financial impact to customers in relation to equity heavy capital structures, I continue to believe it is necessary to limit PPL Electric's (or any regulated utility's) capital structure to 55% equity to balance the interests of all parties without overburdening ratepayers.

[33] PPL Electric Statement No. 9-R, pp. 5-13.
[34] I&E Exhibit No. 3, Schedule 4.
[35] I&E Statement No. 3, p. 18.

Q. PLEASE RESPOND TO MS. NELSON'S AND MS. BURGOS' CRITICISMS REGARDING THE USE OF PARENT AND HOLDING COMPANY VS. OPERATING COMPANY CAPITAL STRUCTURE DATA.

A. Information used to determine a fair return on equity from commonly used sources such as Zacks, S&P, Value Line, etc., are all based on the publicly traded parent/holding companies. In fact, Ms. Nelson herself uses data pulled from these sources.[36] These sources have historically been common practice to use by almost all parties who perform rate of return and return on equity analysis in base rate proceedings. The Commission generally relies upon I&E methodologies, as cited at various points in my direct testimony as well as this surrebuttal testimony, which are crafted from data sourced from parent companies. As Ms. Nelson herself admits, "The regulated utility operating companies to which the authorized ROEs apply (e.g. PPL Electric) are not publicly traded, and thus their market value is not observable".[37]

Further, it seems illogical to use financial data from holding companies for every other variable of the analysis, then use data from subsidiary/operating companies to determine a proper capital structure.

Lastly, regarding Columbia Gas' requested equity ratio of 54.4%, which was adopted by the Commission, Commissioner Barrow stated, "I agree with the OCA that the discrepancy between Columbia Gas' capital structure and the proxy

[36] PPL Electric Exhibit 10-R, Schedule JEN-2.
[37] PPL Electric Statement No. 10-R, p. 26, lines 2-3.

group necessitates an adjustment to the Company's capital structure since Columbia Gas' equity profile has less financial risk than the proxy group. A 50/50 capital structure in this case is equal to the proxy group's average capital structure."[38] Therefore, I respectfully disagree with Ms. Burgos' claim that a hypothetical capital structure is not appropriate in this proceeding.[39]

OVERALL RATE OF RETURN

Q. PLEASE RESTATE I&E'S UPDATED RECOMMENDED COST OF EQUITY AND OVERALL RATE OF RETURN.

A. As noted earlier in my rebuttal testimony, I calculate the appropriate cost of equity to be 10.31% for PPL Electric, with an overall rate of return on 7.96%.

Q. DO YOU HAVE ANY FINAL COMMENTS?

A. Yes. Lack of response to any topic or recommendation should not be interpreted as agreement with the other parties' recommendations.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

[38] I&E Exhibit No. 3, Schedule 8, p. 2.
[39] PPL Electric Statement No. 9-R, p. 12, line 16.

I&E Statement No. 4-SR

PENNSYLVANIA PUBLIC UTILITY COMMISSION

v.

PPL ELECTRIC UTILITIES CORPORATION

Docket No. R-2025-3057164

Surrebuttal Testimony

of

Ethan H. Cline

Bureau of Investigation and Enforcement

Concerning:

Late Payment Charges
Customer Charge
Revenue Allocation
Scale Back of Rates

TABLE OF CONTENTS

LATE PAYMENT REVENUE 3

CUSTOMER CHARGE 5

REVENUE ALLOCATION 8

SCALE BACK OF RATES 9

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Ethan H. Cline. My business address is Pennsylvania Public Utility Commission, 400 North Street, Harrisburg, PA 17120.

Q. ARE YOU THE SAME ETHAN H. CLINE WHO SUBMITTED I&E STATEMENT NO. 4 AND I&E EXHIBIT NO. 4?

A. Yes.

Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?

A. The purpose of my surrebuttal testimony is to address the rebuttal testimony of Bethany L. Johnson, PPL Electric Utilities Corporation (PPL) Statement No. 5-R, Daniel S. Dane, PPL Statement No. 6-R, and Bickey Rimal, PPL Statement No. 7-R, which were submitted on behalf of PPL. I will also address the rebuttal testimony of Billie S. LaConte submitted on behalf of PP&L Industrial Customer Alliance (PPLICA), PPLICA Statement No. 1R.

Q. DOES YOUR SURREBUTTAL TESTIMONY INCLUDE AN EXHIBIT?

A. No.

LATE PAYMENT REVENUE

Q. WHAT IS LATE PAYMENT REVENUE?

A. Late Payment Revenue is revenue that is generated by the fees charged to customers as a result of late payments. The Late Payment revenue is reflected as part of Other Electric Revenues and is not separated into individual rate classes.

Q. WHAT DID YOU RECOMMEND REGARDING THE COMPANY'S CLAIM FOR LATE PAYMENT REVENUE UNDER PROPOSED RATES?

A. I recommended the Company's claim for late payment revenue under proposed rates be increased by $1,278,916 from $15,305,520 to $16,584,436. I also stated that the level of late payment fees under proposed rates should be calculated to be 0.4407% of the total operating revenues under proposed rates granted by the Commission.[1]

Q. DID ANY PARTIES RESPOND TO YOUR RECOMMENDATION?

A. Yes. PPL witness Dane agreed with my recommendation to adjust late payment revenues but disagreed with the calculation of the adjustment presented in I&E Statement No. 4. Instead, Mr. Dane proposed an increase to late payment revenues of $1,699,050 rather than my recommended $1,278,916.[2]

[1] I&E Statement No. 4, pp. 3-4.
[2] PPL Statement No. 6-R, pp. 5-6.

Q. WHAT IS THE BASIS FOR MR. DANE'S LATE PAYMENT REVENUE ADJUSTMENT?

A. Mr. Dane disagreed with my recommendation based on the late payment revenue factor of $0.4407 I calculated in direct testimony because it is based on the present rate revenue claimed in Company's original filing. Mr. Dane suggested that, because the Company provided updates to its present rate revenue in rebuttal testimony, the late payment revenue factor should also be updated to 0.4419% based on the Company's updated claims.[3]

Q. DO YOU AGREE WITH THE COMPANY'S POSITION THAT THE LATE PAYMENT CALCULATION SHOULD BE BASED ON THE MOST UP-TO-DATE INFORMATION AVAILABLE?

A. Yes. I agree that the most up-to-date data regarding present and proposed rate revenue available should be used to calculate the late payment revenue claim. Therefore, I recommend the Commission adopt the $1,699,050 increase to late payment revenue calculated by the Company. Additionally, as I stated in direct testimony and Mr. Dane stated in his rebuttal testimony, the late payment revenue claim should be updated automatically with every revenue requirement update in this proceeding.[4]

[3] PPL Statement No. 6-R, pp. 5-6.
[4] I&E Statement No. 4, p. 4 and PPL Statement No. 6-R, p. 6.

CUSTOMER CHARGE

Q. DID YOU RECOMMEND ANY CHANGES TO THE COMPANY'S PROPOSED CUSTOMER CHARGES BASED ON THE RESULT OF THE CUSTOMER COST BUILD-UP?

A. No. However, I recommended that the customer charges that are proposed to increase be included in any scale back of rates based on the Commission's 2018 Order from the UGI Utilities, Inc. – Electric Division (UGI Electric) base rate case.[5] Additionally, I noted that rate class LP-4 was not allocated a customer charge increase and indicated that it not be included in the scale back of rates.[6]

Q. DID ANY PARTY ADDRESS YOUR POSITION REGARDING THE SCALE BACK OF THE COMPANY'S CUSTOMER CHARGES?

A. Yes. PPL witness Johnson disagreed with my overall recommendation to include the customer charges in the scale back of rates.[7] PPLICA witness LaConte disagreed with my statement that the customer charge for LP-4 was not allocated an increase, claiming it was in fact increased by 38%. Nonetheless, she stated that the LP-4 customer charge should not be included in any scale back of rates.[8]

---

5 Docket No. R-2017-2640058, pp. 173-174, Order entered October 25, 2018.
6 I&E Statemen No. 4, p. 10.
7 PPL Statement No. 5R, pp. 20-22.
8 PPLICA Statement No. 1R, p. 11.

Q. WHY DID THE COMPANY NOT AGREE WITH YOUR RECOMMENDATION REGARDING THE SCALE BACK OF THE COMPANY'S CUSTOMER CHARGES?

A. Ms. Johnson disagreed with my recommendation because she claims that the current PPL case is distinct from the UGI Electric case and, therefore, that Commission Order should not be applied in this case. Specifically, Ms. Johnson disagreed for two reasons. First, I&E opposed the UGI Electric customer charge proposal, and I did not oppose the Company's proposal in this case. Second, UGI Electric requested a customer charge increase of 155% compared to the 20% increase over base customer charges requested by PPL.

Q. DO YOU AGREE THAT THE DIFFERENCES IN THE TWO BASE RATE CASES ARE A VALID REASON TO DISREGARD COMMISSION PRECEDENT?

A. No. Commission precedent provided through its Orders should be followed unless significant evidence exists to recommend overturning that precedent. Whether or not I&E opposed the customer charge proposal in the UGI Electric case has no bearing on whether reliance on the Commission Order from that case should be followed. Furthermore, the Commission, in rejecting I&E's recommendations, specifically stated in that case that gradualism must be considered in the context of the entire increase to a customer class, rather than to an individual element or

component of the rate design.[9] Therefore, the difference in the percent increase of the customer charges in the two cases described by Ms. Johnson is not support that the Commission precedent of including the customer charge in the scale back of rates should be overturned.

Q. IS PPLICA WITNESS LACONTE CORRECT THAT, CONTRARY TO YOUR STATEMENT, THAT THE COMPANY IS PROPOSING AN INCREASE TO THE LP-4 CLASS CUSTOMER CHARGE?

A. Yes. The Company is proposing an increase to the LP-4 class *base* customer charge. However, my statement was based on the LP-4 class customer charge with all surcharges included, which is not receiving a proposed increase. Regardless of this distinction, Ms. LaConte agreed with my recommendation not to include LP-4 class customer charge in the scale back of rates.

Q. DO YOU WISH TO CHANGE YOUR RECOMMENDATION TO INCLUDE THE CUSTOMER CHARGES, APART FROM CLASS LP-4, IN THE SCALE BACK OF RATES?

A. No. I continue to recommend that the customer charges that have been proposed an increase be included in any scale back of rates.

[9] Docket No. R-2017-2640058, p. 175, Order entered October 25, 2018.

REVENUE ALLOCATION

Q. DID YOU HAVE ANY RECOMMENDATIONS REGARDING THE REVENUE ALLOCATION BY CLASS BASED ON THE RELATIVE RATE OF RETURN?

A. No. The Company's proposal generally moves each rate class towards the relative rate of return of 1.0.

Q. DID THE COMPANY PROVIDE AN UPDATE TO ITS ALLOCATED COST OF SERVICE STUDY IN REBUTTAL TESTIMONY?

A. Yes. PPL witness Rimal described a correction to an error found in its allocated cost of service study (ACOSS) during the discovery phase in his rebuttal testimony. This correction adjusted the return and relative rate of return at present rates.[10]

Q. IS THE COMPANY'S UPDATE REASONABLE?

A. Yes. It is reasonable for the Company to provide corrections to errors found during discovery in its rebuttal testimony.

[10] PPL Statement No. 7-R, p. 25.

Q. DO YOU WISH TO CHANGE YOUR RECOMMENDATION REGARDING THE ACOSS?

A. No.

SCALE BACK OF RATES

Q. WHAT DID YOU RECOMMEND IF THE COMMISSION GRANTS LESS THAN THE FULL INCREASE REQUEST OF $356 MILLION?

A. Should the Commission grant less than the fully requested $356 million, I recommended that the proposed increases by class, excluding rate class LP-5, which was not allocated an increase, be scaled back based on the Cost of Service Study ultimately approved by the Commission. I further recommended that the customer charges for each customer class, apart from rate class LP-4, which was not allocated a customer charge increase, be included in the scale back.

Q. DID ANY PARTY OPPOSE YOUR SCALE BACK RECOMMENDATION?

A. Apart from my recommendation to include customer charges in the scale back of rates, which I discussed above, no parties opposed my scale back recommendation.

Q. DO YOU HAVE ANY FINAL COMMENTS?

A. Yes. Lack of response to any topic or recommendation should not be interpreted as agreement with recommendations made by the Company or other parties.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

I&E Statement No. 5-SR
Witness: Benedict Tarr

[1] PPL Electric Statement No. 17-R.
[2] PPL Electric Statement No. 16-R.

Q. DOES YOUR SURREBUTTAL TESTIMONY INCLUDE AN EXHIBIT?

A. No.

"MAKE SAFE" PROGRAM

Q. DID MS. HOWELL ACCEPT I&E'S RECOMMENDATIONS CONCERNING THE COMPANY'S "MAKE SAFE" PROGRAM?

A. No, Ms. Howell disagreed with my proposal for PPL to offer the "make safe" program at no cost or at a reduced rate.

Q. EXPLAIN THE RATIONALE FOR PPL'S DECISION TO DECLINE I&E'S RECOMMENDATIONS REGARDING THE COMPANY'S "MAKE SAFE" PROGRAM.

A. Ms. Howell states that "The Company has concerns with offering cover ups for the make safe program, as it can give homeowners and contractors who are not trained to work in the vicinity of energized lines a false sense of confidence. Rather, PPL Electric prefers that only qualified contractors work in and around its facilities."[3]

[3] PPL Electric Statement No. 17-R, p. 14.

Q. DO YOU AGREE WITH MS. HOWELL'S ASSESSMENT THAT PROVIDING A "MAKE SAFE" PROGRAM AT NO OR REDUCED COST MAY FOSTER A FALSE SENSE OF CONFIDENCE AMONG CONTRACTORS WORKING NEAR POWER LINES?

A. No. Providing a "make safe" program at no cost or at a reduced rate of up to $1,000 or more will not create a false sense of confidence among contractors working near power lines that have been properly de-energized, grounded, and identified by PPL line workers. The intention behind offering a reduced rate is to incentivize contractors' participation in the "make safe" program, particularly during construction or temporary work near energized lines when standard clearances cannot be maintained.

I&E investigations over the years have shown that a significant number of homeowners and small contractors are frequently involved in contact incidents. Post-incident findings often cite the absence of a formal "make safe" process prior to construction. Many homeowners and small contractors cannot afford the cost of a "make safe" program and instead use alternative methods or take the risk of working near the exposed and energized lines when normal clearances cannot be maintained. These unsafe work practices have led to several contact incidents. Following the implementation of a "limited" cover-up service (up to $1,000) by Duquesne Light Company, the frequency of accidental contacts has decreased. Small contractors and homeowners aware

of the program, and utilizing it, have helped to prevent accidental contact incidents.

I agree with Ms. Howell's statement that only qualified contractors should work around PPL's facilities to ensure compliance with applicable regulations. I&E acknowledges that cover-up measures alone are insufficient to prevent incidents and should be integrated into broader safety protocols. Proper training and the presence of qualified personnel working near power lines are essential. Consequently, non-utility workers, such as small contractors and homeowners, who lack familiarity with electrical hazards, could benefit greatly from a no-cost "make safe" program. In addition, training can be offered during PPL's annual Contractor Safety Training for small contractors to include clear electric safety rules and outline the contractors' responsibilities when working near power lines. All homeowners will be eligible, but only contractors that complete PPL's Contractor Training will be eligible for receiving the reduced rate "make safe" incentive.

Q. OVERALL, WHY SHOULD PPL RECONSIDER I&E'S RECOMMENDATIONS REGARDING THE "MAKE SAFE" PROGRAM?

A. I&E respectfully requests PPL reconsider offering the "make safe" program at no cost or at a reduced rate of up to $1,000 for homeowners and small contractors. This measure would enhance the safety of both contractors and

the public by reducing the risk of electrical contact incidents. Additionally, providing a reduced rate of up to $1,000 would help decrease the frequency of electrical contact incidents, as I&E has observed in the case of Duquesne Light Company customers. Rejection of this initiative may result in continued and repeated homeowner and small contractor electrical contact incidents. The reduced rate "make safe" program should help to reduce the risk and frequency of electrical contact incidents by homeowners and small contractors.

WILDFIRE EMERGENCY PREPAREDNESS PROGRAM

Q. DID ANY WITNESS RESPOND TO YOUR DIRECT TESTIMONY CONCERNING COMMUNITY SAFETY OUTREACH AND EMERGENCY PREPAREDNESS FOR WILDFIRES?

A. Yes. PPL witness Lookup discussed the Company's wildfire preparedness strategy.[4] Mr. Lookup noted that "The Company is always looking for ways to improve," and that the Company would consider my proposal to expand community outreach.

Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A. Yes.

DIRECT TESTIMONY OF BILLIE S. LACONTE

Introduction, Qualifications and Summary

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A My name is Billie LaConte. My business address is 14323 South Outer 40 Rd., Suite 206N, St. Louis, Missouri 63017.

Q WHAT IS YOUR OCCUPATION AND BY WHOM ARE YOU EMPLOYED?

A I am an energy advisor and Associate at J. Pollock, Incorporated.

Q PLEASE STATE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A I have a Bachelor of Arts degree in Mathematics from Boston University and a Master's degree in Business Administration from Washington University. Since graduating in 1995, I have been engaged in a variety of consulting assignments, including energy procurement and regulatory matters in both the United States and several Canadian provinces. More details are provided in **Exhibit ___(BSL-1)**. A list of my appearances is provided in **Exhibit ___(BSL-2)**.

Q ON WHOSE BEHALF ARE YOU TESTIFYING IN THIS PROCEEDING?

A I am testifying on behalf of PP&L Industrial Customers Alliance (PPLICA). PPLICA is an *ad hoc* group of large volume customers receiving electric service from PPL Electric Utilities Corporation (PPL) primarily under the Large General Service – 12 kV (LP-4) and Large General Service - 69 kV or Higher (LP-5) tariffs. PPLICA members require substantial amounts of electric energy for their operations, and the proposed rate increase and tariff modifications may have an adverse impact upon their operations.

Q WHAT ISSUES ARE YOU ADDRESSING IN YOUR TESTIMONY?

A I am addressing PPL's proposed class revenue allocation, proposed modifications to its Rules for Electric Service, specifically Rule 6 – Auxiliary Service for Non-Qualifying Facilities (Rule 6) and elimination of Rule 6A – Stand-By Service for Qualifying Facilities (Rule 6A), and its proposed modifications to the LP-5 tariff to accommodate very large load customers.

Q ARE YOU SPONSORING ANY EXHIBITS WITH YOUR TESTIMONY?

A Yes. I am sponsoring **Exhibit ___(BSL-1)** through **Exhibit ___(BSL-4)**. **Exhibit ___(BSL-4)** contains the relevant portion of responses to discovery from PPL which are relied upon herein. These exhibits were prepared by me or under my supervision and direction. Throughout my testimony and exhibits I refer to PPL's proposed revenue requirement to illustrate various concepts - this should not be interpreted as an endorsement of PPL's proposed revenue requirement. Additionally, any issue I'm not addressing should not constitute as an endorsement thereof.

Summary

Q PLEASE SUMMARIZE YOUR FINDINGS AND RECOMMENDATIONS.

A My findings and recommendations are as follows:

Revenue Allocation

- PPL's class cost-of-service study (CCOSS) generally comports with industry practice. It should be used to apportion any change in delivery revenues approved by the Pennsylvania Public Utility Commission (Commission).
- PPL's proposed overall rate increase is 38.73%.[1] Based on the results of PPL's CCOSS, its proposed mitigated rates result in substantial increases (almost 60%) to the Residential - Thermal Storage and LP-4 rate classes.

[1] PPL Response to I&E RE-I-14 D CONFIDENTIAL Attachment 1_Supplemental, a copy of which is provided in **Exhibit ___(BSL-4)** at 1.

- To prevent substantial increases to these two classes I recommend limiting the increase to any class that is below cost to 1.3 times the system average increase. The size of these classes is small as compared to the other rate classes, therefore, the impact to the larger classes due to the lower threshold is small.

Rule 6 Modification

- PPL proposes to modify Rule 6 by eliminating Rule 6A and consolidating its standby service in an effort to simplify the rate structure.
- PPL claims the changes will ensure that customers with on-site generation pay appropriately for the resources they require, including capacity that must be available to serve them when their generation is down.[2]
- PPL should clarify that the Rule 6 capacity reservation charge only impacts distribution demand charges.

LP-5 Tariff Modification

- PPL proposes to modify the LP-5 tariff to include the addition of very large load customers.
- The modifications would allow very large load customers (such as datacenters) to take service from PPL under the LP-5 tariff. PPL has included certain terms to protect other customers from potentially being liable for the additional costs required to connect very large load customers, including proposed language that would require a very large load customer to pay the total *socialized* cost of transmission infrastructure additions, even if the customer terminates its contract prior to paying the total socialized cost through base rates.
- PPL's proposal is premature because the Commission has a currently pending docket, *Interconnection and Tariffs for Large Load Customers* (Docket No. M-2025-3054271), in which it is developing the guidance for utilities to develop large load tariffs.
- In addition, PPL has not properly explained how it would quantify transmission costs that benefit all customers and, therefore, should be socialized, versus what costs should be paid for by the very large load customer.

[2] PPL Statement No. 8, Direct Testimony of Steven W. Wishart at 21.

- PPL should develop a separate tariff for very large load customers to protect other PPL customers from subsidizing the interconnection costs incurred due to these very large load customers. The process relied upon by PPL to determine interconnection costs that are socialized versus those paid for by the very large load customer should be clear and quantifiable.
- If the Commission approves PPL's proposal to modify Rate LP-5 to incorporate the large load provisions, PPL should be directed to modify its service agreements and tariff to better protect customers from unreasonable cost subsidization and avoid unintended consequences for traditional LP-5 customers.

Class Revenue Allocation

Q WHAT IS CLASS REVENUE ALLOCATION?

A Class revenue allocation is the process of determining how any base revenue change (*i.e.*, rate increase or decrease) the Commission approves should be spread to each customer class the utility serves. The revenue allocation is typically based on the results of a properly conducted CCOSS.

Q SHOULD THE RESULTS OF A COST-OF-SERVICE STUDY BE THE PRIMARY FACTOR IN DETERMINING HOW ANY BASE REVENUE CHANGE SHOULD BE ALLOCATED?

A Yes. Cost-based rate are: (1) fair because each class's rates reflect its cost to serve, no more and no less; (2) efficient because, when coupled with a cost-based rate design, customers are provided with the proper incentive to minimize their costs, which will, in turn, minimize the costs to the utility; (3) steady because they enhance revenue stability, as changes in revenues due to changes in sales will translate into offsetting changes in costs; and (4) appropriate because they encourage conservation through cost-based rates that send the proper price signals to customers, thereby allowing customers to make rational consumption decisions.

Q DOES THE CLASS COST-OF-SERVICE STUDY FILED BY PPL PROVIDE A PROPER STARTING POINT FOR DETERMINING THE REVENUE ALLOCATION IN THIS PROCEEDING?

A Yes. PPL's CCOSS generally comports with accepted principles and is a reasonable starting point to determine the appropriate revenue increase for each rate class.

Q HAVE YOU REVIEWED PPL'S PROPOSED REVENUE ALLOCATION AND RATES OF RETURN BY RATE CLASS?

A Yes. I reviewed Mr. Rimal's direct testimony which shows the current rate of return (ROR) by rate class, as well as its corresponding relative rate of return (RROR), as summarized in Table 1:

Table 1
Rate of Return and Relative Rate of Return at Current Rates

Rate Class	Rate of Return	RROR
Residential	3.91%	0.97
Residential -Thermal Storage	1.90%	0.47
Small General Service Sec. Voltage	3.60%	0.89
Large General Service Sec. Voltage	4.97%	1.23
Large General Service 12 kV	3.26%	0.81
Large General Service 69 kV or Higher	24.08%	5.96
Separate Meter Gen. Space Heating	4.11%	1.02
Street Lighting/Area Lighting	5.79%	1.43
System Average	4.04%	1.00

Source: PPL Response to IE RE-I-14-D Confidential Attachment 1_Supplemental.

Q PLEASE EXPLAIN THE TERMS "RATE OF RETURN" AND "RELATIVE RATE OF RETURN.

A The ROR measures the return on rate base for each customer class using their proposed revenues, allocated expenses, and allocated rate base. The RROR is each

class's ROR relative to the overall system average ROR. If a customer class's ROR is above the overall system average ROR, its RROR will be above one. If its RROR is one, then its ROR is equal to the overall system average ROR. If a customer class's ROR is below the overall system average ROR, its RROR will be below one.

Q WHAT IS THE BASIS FOR PPL'S REVENUE ALLOCATION PROPOSAL?

A PPL's proposal is based on the following factors:

1. The results of the CCOSS prepared by Mr. Rimal.
2. A cap of 1.5 times the system average increase for any rate class in an effort to mitigate rate shock.
3. Ensuring no class receives a rate decrease.[3]

PPL's proposed revenue allocation is summarized in Table 2.

Table 2
Cost Based Rate Increases vs.
Class Revenue Allocation

Rate Class	Proposed Increase		RROR
	Cost Based	Revenue Allocation	
Residential	37.98%	38.42%	1.00
Residential - Thermal Storage	72.21%	56.86%	0.91
Small General Service Sec. Voltage	40.27%	40.65%	1.00
Large General Service Sec. Voltage	35.06%	35.56%	1.00
Large General Service 12 kV	66.20%	56.86%	0.94
Large General Service 69 kV or Higher	-31.10%	0.00%	1.45
Separate Meter Gen. Space Heating	39.49%	39.89%	1.00
Street Lighting/Area Lighting	26.10%	26.79%	1.01
System Average	38.73%	38.73%	1.00

Sources: PPL Response to I&E RE-I-14-D Confidential Attachment 1_Supplemental.

[3] PPL Statement No. 7, Direct Testimony of Bickey Rimal at 21.

Q IS PPL'S PROPOSED REVENUE ALLOCATION TYPICAL?

A Yes. Limiting the increase to 1.5 times the system average, setting a floor where no class receives a decrease, and recognizing the principle of gradualism are common rules for revenue allocation. However, in this particular case, the increases to the Residential-Thermal Storage and LP-4 are substantial, almost 60%. Although the total proposed system average increase is 38.73%, the Residential – Thermal Storage and LP-4 classes would each receive a 56.86% increase, resulting in rate shock.

Q WHAT IS RATE SHOCK?

A Rate shock occurs when a class receives an overly large or abrupt rate increase.

Q WHAT IS THE PRINCIPLE OF GRADUALISM?

A Gradualism is a concept that is applied to avoid rate shock. Thus, rates should move gradually to cost rather than all at once because moving rates immediately to cost results in rate shock to the affected classes.

Q SHOULD THE COMMISSION AUTHORIZE PPL'S PROPOSED REVENUE ALLOCATION?

A No. Although PPL's proposed revenue allocation follows the principle of gradualism, it still results in rate shock for two classes as discussed above.

Q WHAT DO YOU RECOMMEND?

A I recommend that the rate increase cap on the system increase be limited to 1.3 times the system average increase. To illustrate this, I have developed **Exhibit ___(BSL-3)** which shows PPL's proposed increase allocated to rate classes in a manner that reduces the increases to the classes that would otherwise experience rate shock. Specifically, using the results of Mr. Rimal's CCOSS, I limit the increase to any rate

class to 1.3 times the system average increase and set the increase to zero for any class that would receive a decrease. The results of **Exhibit ___(BSL-3)** are summarized in Table 3.

Table 3
PPLICA Proposed Revenue Allocation

Rate Class	Proposed Increase	RROR
Residential	38.77%	1.01
Residential - Thermal Storage	49.26%	0.74
Small General Service Sec. Voltage	40.91%	1.01
Large General Service Sec. Voltage	36.03%	1.01
Large General Service 12 kV	49.26%	0.83
Large General Service 69 kV or Higher	0.00%	2.73
Separate Meter Gen. Space Heating	40.18%	1.01
Street Lighting/Area Lighting	27.64%	1.02
System Average	38.73%	1.00

Q DOES YOUR RECOMMENDED CLASS REVENUE ALLOCATION ACHIEVE THE OBJECTIVE OF MOVING ALL RATES TOWARD COST?

A No. However, my proposal moderates the increase to the Residential – Thermal Storage and LP-4 classes.

Q IF YOUR PROPOSAL REDUCES THE MOVEMENT TO COST, WHY ARE YOU PROPOSING A 1.3 CAP TO THE SYSTEM AVERAGE INCREASE?

A Typically, limiting the increase to 1.5 times the system average increase does not result in rate shock. However, in this particular case, because PPL's proposed increase is significant, the resulting increase to these two small classes is quite substantial. Limiting the increase to 1.3 times the system average increase to mitigate rate shock to the aforementioned classes does not result in significant impacts to the

remaining classes due to their size as compared to the Residential - Thermal Storage and LP-4 classes. Therefore, to limit rate shock, I am proposing a cap of 1.3 times the system average increase, rather than 1.5.

Q IF THE COMMISSION WERE TO APPROVE A LOWER INCREASE FOR PPL, HOW WOULD THIS AFFECT YOUR RECOMMENDATION?

A If the Commission approves a lower revenue increase than PPL has proposed, the delivery revenues shown in **Exhibit ___(BSL-3)** should be scaled down proportionately.

Rule 6 Modification

Q PLEASE DESCRIBE PPL'S PROPOSED CHANGES TO RULE 6.

A PPL proposes to eliminate Rule 6A which specifically provided for standby service obligations and, instead, consolidate it into Rule 6. The modification would charge customers with on-site generation facilities at or exceeding 3 megawatts for supplementary, back-up, and maintenance Power.[4] The proposed charges for back-up power include a capacity reservation charge set to recover 30% of a customer's demand charge.[5]

Q DO YOU HAVE ANY CONCERNS REGARDING PPL'S PROPOSED CHANGES TO RULE 6?

A Yes. Despite PPL's claimed intention to simplify the current standby rate structures, the proposed rule remains complex and unclear. The cost basis for the capacity reservation charge is unclear. For example, in a discovery response PPL suggests

[4] PPL Statement No. 8, Direct Testimony of Steven W. Wishart at 20-22.

[5] PPL Response to PPLICA I-4, a copy of which is provided in **Exhibit ___(BSL-4)** at 6.

that the capacity reservation component of the back-up power charge could impact a customer's Network Integration Transmission Service charge.[6] PPL should clarify that the demand charges impacted by its Rule 6 changes are limited to distribution demand charges.

LP-5 Tariff Modification

Q PLEASE DESCRIBE PPL'S PROPOSED MODIFICATION TO THE LP-5 TARIFF TO ACCOMMODATE VERY LARGE LOAD CUSTOMERS.

A PPL proposes to modify the current LP-5 tariff to "mirror what it is currently requiring in its ESA [Electric Service Agreement] with large customers."[7] PPL states under its proposed changes:

> [A]ny large load customer that requires upgrades that will be socialized through rates must provide adequate security that it will meet a revenue guarantee equal to the amount of costs placed into rates…this involves minimum load guarantees for the term of the service commitment and security instruments covering the obligation in the event the customer defaults.[8]

Q DO YOU HAVE ANY CONCERNS WITH PPL'S PROPOSED MODIFICATIONS TO THE LP-5 TARIFF?

A Yes. First, PPL's proposed tariff modifications to serve very large load customers are premature. Second, PPL has not explained nor quantified how it would determine which interconnection costs would be paid for by the very large load customer and which costs would be socialized.

Q HOW DOES PPL CURRENTLY HANDLE VERY LARGE LOAD CUSTOMERS?

A PPL currently provides service to very large load customers under LP-5 which it claims

[6] *Id.*

[7] PPL Statement No. 16, Direct Testimony of Joseph Lookup at 17.

[8] *Id.*

"generally requires the customer to pay for all interconnection costs."[9] In doing so it has been including load commitment guarantee terms in the customer's Electric Service Agreement (ESA), in addition to the customer's contribution in aid of construction (CIAC) obligation, the combination of which purportedly guarantees the customer pays rates equal to the upgrade costs that are socialized through transmission rates.[10]

Q WHY IS IT PREMATURE FOR PPL TO SEEK AUTHORIZATION FOR ITS PROPOSED MODIFICATIONS TO THE CURRENT LP-5 TARIFF?

A It is premature because the Commission has a separate pending docket in which it is currently contemplating the design of very large load tariffs. In fact, Comments on the Commission's November 6, 2025, Tentative Order are due the same day as the direct testimony in this proceeding. It is unfortunate that customers are not able to determine whether the proposed tariff modifications are appropriate when the Commission's guidance has not been finalized.

Q ARE OTHER PPL CUSTOMERS CURRENTLY PROTECTED FROM PAYING THE COSTS TO SERVE VERY LARGE LOAD CUSTOMERS?

A PPL asserts that providing large load customers service under LP-5 has historically worked well and kept the interconnection costs with the customer who caused the costs to be incurred. Further, it states that its load guarantee terms in the ESA along with CIAC obligation "is designed to ensure that the investments to interconnect these customers are justified and that other customers will not be left paying for stranded

[9] *Id.*

[10] *Id.* at 17-18.

assets."[11] Additionally, when asked in discovery if the large load customer would pay its share of the FERC allocated socialized cost or the total socialized upgrade costs, it confirmed that the large load customers must agree to pay the *total* socialized transmission upgrade costs.[12] However, while the proposed tariff outlines some very general indicators of infrastructure upgrades that could support socializing costs, PPL has not provided sufficiently specific guidance or analysis as to how it would determine which interconnection upgrades benefit only the very large load customers and which costs would be socialized.

Q SHOULD PPL MODIFY THE CURRENT LP-5 TARIFF TO SERVE VERY LARGE LOAD CUSTOMERS?

A No. PPL has elected to modify its LP-5 tariff to include very large load customers, such as hyperscale data centers. While such very large load customers take service at 69 kV (or above) voltage, policy and operational considerations that are unique to these customers may emerge requiring a distinction between a large load customer and a very large load customer. Accordingly, PPL should develop a separate tariff to serve very large load customers.

When presenting the new tariff, PPL should provide clear guidance that quantifies how it will recover the costs to interconnect the very large load customer. The tariff should be developed after the Commission makes its determination in the pending *Interconnection and Tariffs for Large Load Customers* proceeding, thereby allowing customers' advocates the opportunity to determine if the proposed tariff follows the Commission's guidelines.

[11] *Id*.

[12] PPL Response to CAUSE PA VIII-7, a copy of which is provided in **Exhibit ___(BSL-4)** at 7; PPL Response to PPLICA II-2, a copy of which is provided in **Exhibit___(BSL-4)** at 8.

Q WHAT DO YOU RECOMMEND REGARDING PPL'S PROPOSED MODIFICATIONS TO THE LP-5 TARIFF TO SERVE VERY LARGE LOAD CUSTOMERS?

A I recommend that PPL's proposed modifications to the LP-5 tariff be rejected. The proposed changes are premature because the Commission's guidance on very large load tariffs has not been determined. Further, PPL has not provided information as to how it would quantify the benefits of the interconnection costs and, thus, how these costs would be recovered from the very large load customer and PPL's other customers. Finally, PPL should develop a separate tariff for very large load customers to reflect policy and operating characteristics that may be unique to these customers.

Q IF THE COMMISSION APPROVES PPL'S PROPOSAL TO MODIFY THE LP-5 TARIFF TO ADDRESS LARGE LOAD CUSTOMERS, DO YOU HAVE AN ALTERNATIVE RECOMMENDATION?

A Yes. While the Commission should require PPL to develop a separate tariff rule specific for large load customers, I would alternatively recommend that PPL clarify the contract language used in its service agreement with large load customers to better protect other customers from unreasonable cost subsidization. PPL provided a copy of an Agreement for Construction of Large Load Electric Service Facilities (Large Load Agreement) for one of its large load customers which includes an estimate of the costs the customer must pay, including the amount the customer pays up front and the costs included in transmission rate base. The Agreement states:

[BEGIN HIGHLY CONFIDENTIAL] [redacted].[13]

[13] PPL Response to OCA VIII-1 HIGHLY CONFIDENTIAL Attachment 6, a copy of which is provided in **Exhibit ___(BSL-4)** at 10.

[redacted] **[END HIGHLY CONFIDENTIAL]**, customers would not be protected from subsidizing the very large load customers.

Q WHAT DO YOU RECOMMEND REGARDING THE LANGUAGE IN THE AGREEMENT?

A I recommend that PPL modify the language in its Large Load Agreement whereby **[BEGIN HIGHLY CONFIDENTIAL]**[redacted]. **[END HIGHLY CONFIDENTIAL]** Including this language ensures that PPL would recover the total cost of connecting and serving a very large load customer from the customer who incurred the expense and, therefore, prevents other PPL customers from unreasonably subsidizing the costs to serve very large load customers.

Q DO YOU HAVE ANY ADDITIONAL CONCERNS WITH PPL'S MODIFICATIONS TO THE LP-5 TARIFF?

A. Yes. PPL has elected to modify its LP-5 tariff to include very large load customers, such as hyperscale data centers. While such very large load customers take service at 69 kV (or above) voltage, policy and operational considerations that are unique to these customers may emerge requiring a distinction between a large load customer and a very large load customer. As noted in my primary recommendation, the Commission should address this concern by directing PPL to develop a separate tariff for very large load customers. However, in the alternative, PPL's tariff should include a definition of very large load customers so that, when appropriate, it can distinguish between very large load customers, such as hyperscale datacenters, and traditional LP-5 customers when implementing rule and policy changes.

Conclusion

Q WHAT FINDINGS SHOULD THE COMMISSION MAKE BASED ON THE RECOMMENDATIONS DISCUSSED IN YOUR TESTIMONY?

A The Commission should make the following findings:

- Reject PPL's proposed class revenue allocation.
- Adopt the class revenue allocation methodology illustrated in **Exhibit ___(BSL-3)**.
- In the event the Commission authorizes a rate increase lower than proposed by PPL, proportionally scale down the delivery revenues shown in column 1 of **Exhibit ___(BSL-3)** under my recommended class revenue allocation.
- Reject PPL's proposed modifications to the LP-5 tariff to include very large load tariffs.
- After the Commission has determined the guidelines for very large load customers in its pending proceeding, PPL should be required to develop a separate tariff for these customers, which includes the process used to quantify, designate, and recover the interconnections costs of very large load customers.
- If the Commission approves PPL's proposal to modify Rate LP-5 to address very large load customers, the services agreement and tariff should be modified as set forth above.

Q DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A Yes.

BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION

Pennsylvania Public Utility Commission

v.

Docket No. R-2025-3057164

PPL Electric Utilities Corporation

REDACTED – PUBLIC VERSION

BILLIE LACONTE

On Behalf of

PP&L Industrial Customer Alliance

December 22, 2025

J. POLLOCK
INCORPORATED

QUALIFICATIONS OF BILLIE S. LACONTE

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Billie S. LaConte. My business mailing address is 14323 S. Outer 40 Rd., Suite 206N Town and Country, Missouri 63017.

Q WHAT IS YOUR OCCUPATION AND BY WHOM ARE YOU EMPLOYED?

A I am an energy advisor and am currently employed by J. Pollock, Incorporated as Associate Consultant.

Q PLEASE STATE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A I have a Bachelor of Arts Degree in Mathematics from Boston University and a Master's degree in Business Administration from Washington University.

Upon graduation in May 1995, I joined Drazen Consulting Group, Inc. (DCGI). DCGI was incorporated in 1995 assuming the utility rate and economic consulting activities of Drazen Associates, Inc., active since 1937. I joined J.Pollock in May 2015.

During my tenure at DCGI and J.Pollock my work has focused on revenue requirement issues, cost of capital (return on equity and capital structure), cost allocation, rate design, sales and price forecasts, power cost forecasting, electric restructuring issues, integrated resource plans, formula rate plans, asset management agreements and contract interpretation.

I have been engaged in a wide range of consulting assignments including energy and regulatory matters in both the United States and several Canadian provinces. This has included advising clients on economic and strategic issues concerning the natural gas pipeline, oil pipeline, electric, wastewater and water utilities. I have testified on cost of capital issues, including return on equity, cost of

debt, and capital structure, as well as revenue requirement issues. I have prepared cost allocation and rate design studies to provide timely support to clients engaged in settlement negotiations in electric and gas utilities, provided power cost forecasting studies to assist clients in project planning and negotiated contracts with electric utilities for standby services and interruptible rates. I have also prepared studies on electric and gas utilities' performance-based rates (PBR) and benchmarking programs to evaluate their success and to provide recommendations on methods to be used. I worked on contract interpretation to resolve contract disputes for several clients. I have provided financial and cost of service analysis for natural gas pipelines certificate approval from the Federal Energy Regulatory Commission (FERC) and the Canadian National Energy Board (NEB). Additionally, I completed the Corporate Credit Rating Analysis course presented by Moody's Analytics.

I have worked on various projects located in many states and several Canadian provinces including Alberta, British Columbia, Saskatchewan, Nova Scotia and Quebec. I have testified before the state regulatory commissions of Arkansas, Florida, Georgia, Iowa, Louisiana, Michigan, Minnesota, Missouri, New Mexico, North Carolina, Pennsylvania, South Carolina, Texas, and Utah, as well as the provincial regulatory board of Nova Scotia. I similarly have appeared before the St. Louis Metropolitan Sewer District Commission and the City of Philadelphia Water, Sewer and Storm Water Rate Board.

Q PLEASE DESCRIBE J. POLLOCK, INCORPORATED.

A J. Pollock assists clients to procure and manage energy in both regulated and competitive markets. The J. Pollock team also advises clients on energy and regulatory issues. Our clients include commercial, industrial and institutional energy consumers. J. Pollock is a registered Class I aggregator in the State of Texas.

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
PP&L Industrial Customer Alliance (PPLICA)
Dated December 4, 2025
Docket No. R-2025-3057164

PPLICA I-4	Confirm that customers subject to Rule 6 will only pay the TSC for default service accounts.
PPL Electric Response	Only default service customers pay the TSC. However, customers subject to Rule 6 will have 30% of their back-up power amount added to their Network Integrated Transmission Service ("NITS") value. The amount that shopping customers pay for NITS depends on the customer's agreement with their Electric Generation Supplier.

PPL Electric Utilities Corporation
Response to the Set VIII Data Requests of the
Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania (CAUSE-PA)
Dated November 10, 2025
Docket No. R-2025-3057164

CAUSE-PA VIII-7

Refer to Lookup Direct Testimony p.18, stating "the customer guarantees to take service in an amount that the customer will pay electric service rates equal to the upgrade costs that are socialized through transmission rates."

a. Confirm if the referenced "upgrade costs…socialized through transmission rates" that the customer guarantees to pay are the *total* socialized transmission upgrade costs or if they are *the customer's FERC allocation* of the total socialized upgrade costs. Explain why in either case.
b. In live, unlocked Excel file format with all links and formulas intact, provide an example calculation demonstrating: 1) upgrade costs socialized through transmission rates, 2) the proportion of those upgrade costs for which the customer is responsible, and 3) the service guarantee formula demonstrating that the customer will cover those costs based on the terms described in Exhibit GEO-1 p.98.

PPL Electric Response

a. PPL Electric confirms that the large load customers agree to pay the total socialized transmission upgrade costs.

b. The provided Energy Service Agreements (ESA) at OCA VIII-1 HIGHLY CONFIDENTIAL Attachments 2 through 5 provide the upgrade costs to be socialized through rates, and the portion for which the customer is responsible for through CIAC. See OCA VIII-10 HIGHLY CONFIDENTIAL Attachment 1 that provides the analysis of which upgrades are socialized through rates, and which are paid for by the customer for the four provided ESAs.

PPL Electric Utilities Corporation
Response to the Set II Data Requests of the
PP&L Industrial Customer Alliance (PPLICA)
Dated December 5, 2025
Docket No. R-2025-3057164

PPLICA II-2

PPL's Statement No. 16, p.16, lines 16-17 states that PPL's electric service agreement process requires a minimum load guarantee of 80% of contracted load until a service commitment is satisfied.

a. Explain, in detail, when a service commitment is satisfied and how that deadline is determined.
b. Did PPL consider requiring a minimum guarantee of 85% of contracted load similar to the large load tariff approved by the Public Utilities Commission of Ohio ("PUCO") for AEP Ohio at PUCO Docket No. 24-508-EL-ATA?
c. If the answer to (b) is negative, explain why not. If the answer to (b) is positive, explain why PPL selected the 80% minimum load guarantee.

PPL Electric Response

a. The service commitment is satisfied when PPL Electric receives transmission revenues equal to the amount of socialized upgrade costs that are needed to interconnect the customer. The deadline is determined by the initial amount of socialized costs placed into rates, along with the customer's monthly transmission charges.

b. PPL Electric did not consider 85% of contracted load similar to the AEP Ohio large load tariff.

c. PPL Electric determined 80% of contracted load to be an adequate amount to timely recover the socialized upgrade costs. Ultimately, the customer is responsible for 100% of the socialized upgrade costs. The 80% minimum load guarantee sets the floor on transmission charges for the customer to ensure that the service commitment is satisfied in a timely fashion. The Company has found that the 80% minimum load guarantee has resulted in the customer paying transmission charges equal to the socialized upgrade costs in 5 years or less.

REBUTTAL TESTIMONY OF BILLIE S. LACONTE

Introduction

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A My name is Billie S. LaConte. My business address is 14323 South Outer 40 Rd., Suite 206N, St. Louis, MO 63017.

Q ARE YOU THE SAME BILLIE S. LACONTE WHO PREVIOUSLY SUBMITTED DIRECT TESTIMONY IN THIS PROCEEDING ON BEHALF OF PP&L INDUSTRIAL CUSTOMER ALLIANCE (PPLICA)?

A Yes.

Q WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?

A I address certain witness recommendations on various topics as listed below:

- **Class Cost-of-Service Study (CCOSS):** I address the changes proposed to PPL's CCOSS by Mr. Clarence L. Johnson on behalf of the Office of Consumer Advocate (OCA) and Mr. Karl R. Rabago on behalf of the Energy Justice Advocates (EJA).
- **Class Revenue Allocation:** I address the revenue allocations proposed by Mr. Ethan Cline on behalf of the Bureau of Investigation and Enforcement (I&E), Mr. Johnson on behalf of OCA, and Walmart witness, Mr. Matthew T. Lyon.
- **Universal Service Costs:** I address the recovery of Universal Service and Energy Conservation costs as proposed by Mr. Patrick M. Cicero, on behalf of the Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania (CAUSE-PA), Mr. Roger Colton on behalf of OCA, and Mr. Rabago on behalf of EJA.
- **LP-5 Tariff:** I address modifications to the Large General Service – 69 kV or Higher (LP-5) tariff due to inclusion of very large load customers as recommended by Mr. Ben Havumaki on behalf of CAUSE-PA, Mr. Matthew Hoyt on behalf of OCA, and Mr. Rabago on behalf of EJA.

Q DOES THE FACT THAT YOU ARE NOT ADDRESSING EVERY ISSUE RAISED BY THESE AND OTHER PARTIES CONSTITUTE AN ENDORSEMENT OF THEIR RECOMMENDATIONS?

A. No.

Class Cost-of-Service Study

Q WHAT CHANGES ARE BEING PROPOSED TO PPL'S CLASS COST-OF-SERVICE STUDY?

A The changes proposed to PPL's CCOSS are as follows:

- OCA witness Johnson rejects PPL's use of the minimum distribution method and instead supports the allocation of shared delivery facilities as 100% demand related and allocation of meters and services as 100% customer related. He rejects the minimum distribution method stating it "double allocates demand costs."[1] However, Mr. Johnson recognizes that PPL has historically used the minimum distribution method; therefore, he proposes to limit the minimum size plant to its labor installation percentage. As an alternative, he proposes to classify 100% of primary voltage plant as demand.[2]
- EJA witness Rabago rejects PPL's minimum distribution method to classify costs for inclusion in the fixed Customer charge for Residential customers and instead recommends a fixed Customer charge of $10.20 per customer, per month, for Residential customers. He further recommends that only those costs that vary entirely, or nearly entirely, with customer count should be customer-related. He further requests that PPL be required to use the basic customer method to calculate this charge in its next base rate case.[3]

Q DO YOU AGREE WITH THE PROPOSALS OF EITHER OCA WITNESS JOHNSON OR EJA WITNESS RABAGO?

A No. Mr. Johnson's proposals are arbitrary and not based on cost causation. Further,

[1] OCA Statement 4, Direct Testimony of Clarence L. Johnson at 3

[2] *Id*. at 3-4.

[3] EJA Statement No. 1, Direct Testimony of Karl R. Rabago at 6.

Mr. Rabago's proposal to use the basic customer method fails to recognize the essential role of the distribution network in providing electric delivery service and is, therefore, inconsistent with cost causation. I will discuss each of these issues in detail herein.

Q WHAT IS THE MINIMUM DISTRIBUTION METHOD?

A The minimum distribution method identifies the investment required to connect a customer to the distribution system. Absent such a connection, a customer cannot receive electricity. Thus, these connection costs do not vary with (and are not caused by) either the amount of power or energy received. They are caused by the mere existence of the customer.

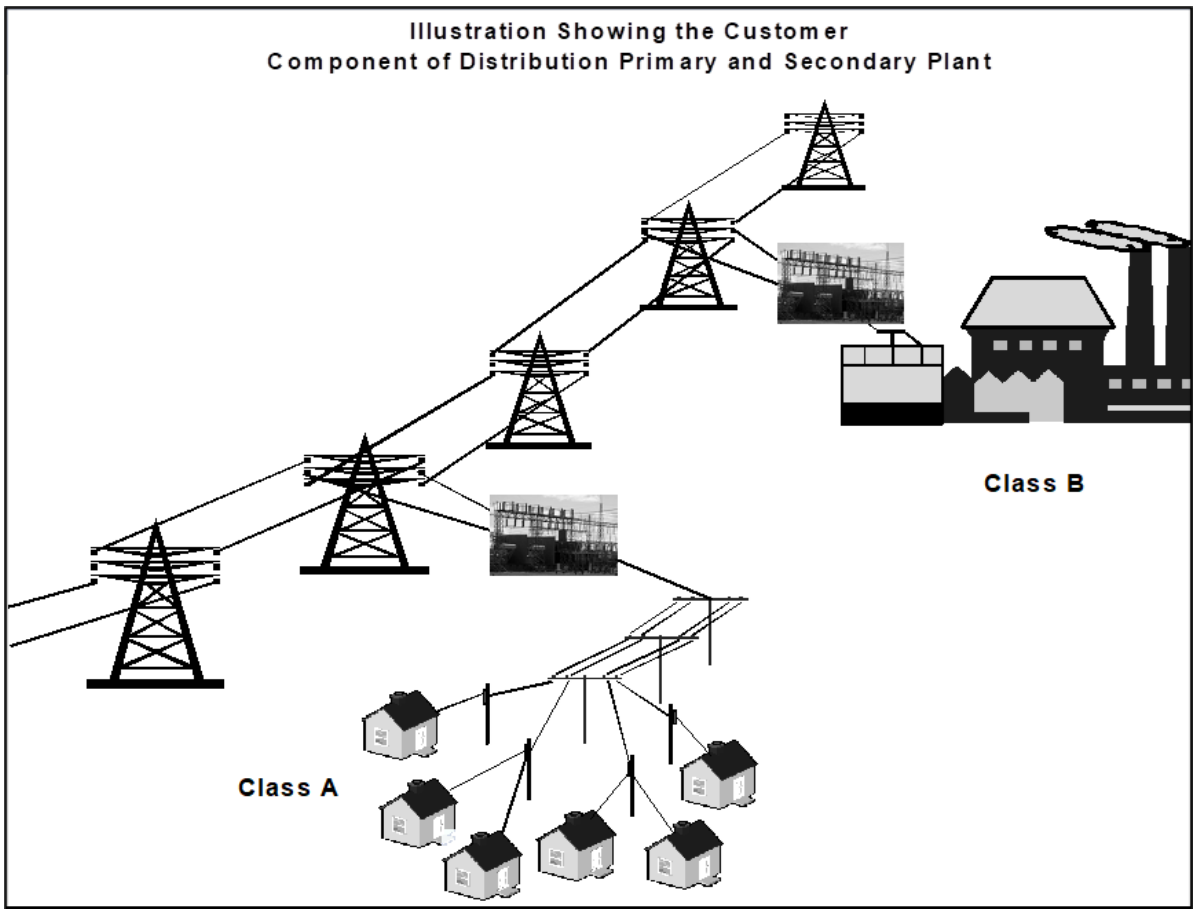
Q WHAT IS THE DISTRIBUTION NETWORK?

A The distribution network consists of PPL's investment in poles, towers, fixtures, overhead and underground lines, and line transformers. These investments are booked to FERC Account Nos. 364, 365, 366, 367 and 368.

Q WHAT FACTORS CAUSE A UTILITY TO INVEST IN A DISTRIBUTION NETWORK?

A Utilities invest in a distribution network to deliver power from the transmission grid to the customer, where it is eventually consumed. Thus, the central roles of the distribution network are to:

- Provide access to a delivery-ready power grid (*i.e.*, a customer-related cost); and
- Meet customers' peak electrical power needs (*i.e.,* a demand-related cost).



Providing access to a safe, delivery-ready power grid requires not only a physical connection that meets all construction and safety standards, but also the voltage support and readiness to serve, which is provided by the distribution network

infrastructure. Clearly, these costs are related to the existence of the customer. This is why classifying a portion of the distribution network as customer related is consistent with cost causation. In other words, investments that must be made solely to attach a customer to the system are clearly customer-related. These customer-related costs should be allocated based on the number of customers served rather than peak demand.

Q WHY WOULD CLASSIFYING ALL DISTRIBUTION NETWORK COSTS TO DEMAND AS PROPOSED BY OCA WITNESS JOHNSON NOT BE CONSISTENT WITH COST CAUSATION?

A Although the distribution network is sized to meet expected peak demand, it must also provide the necessary voltage support to allow power to flow to customers. Absent a distribution network and the voltage support it provides, electricity cannot flow to customers. Thus, this investment is essential and unrelated to the amount of power and energy consumed by customers, which is why classifying these costs entirely to demand is not consistent with cost causation.

If PPL were to provide only a minimum amount of electric power to each customer, it would still have to construct nearly the same miles of line because they are required to serve every customer. In other words, there are costs of the distribution network that are entirely unrelated to customer demand. PPL's poles, conductors and transformers would not need to be as large as they are now if every customer were supplied only a minimum level of service, but there is a definite limit to the size to which they could be reduced. Consider the following diagram which shows the distribution network for a utility with two rate classes, A and B.

In this example the physical distribution network necessary to attach Class A, a residential subdivision, is designed to serve the same load as the distribution feeder serving Class B, a large shopping center or small factory. Clearly, a much more extensive distribution system is required to attach a multitude of small customers than to attach a single larger customer, even though the total demand of each rate class is the same.

Q IS ALLOCATING DISTRIBUTION NETWORK COSTS ON A CUSTOMER BASIS CONSISTENT WITH ACCEPTED REGULATORY PRACTICE?

A Yes. The National Association of Regulatory Commissioners (NARUC) *Electric Utility Cost Allocation Manual* states:

> Distribution plant Accounts 364 through 370 involve demand and customer costs. The customer component of distribution facilities is that portion of costs which varies with the number of customers. Thus, the number of poles, conductors, transformers, services, and meters are directly related to the number of customers on the utility's system.[4]

Q DO UTILITIES OTHER THAN PPL ALSO CLASSIFY A PORTION OF THEIR DISTRIBUTION NETWORK AS CUSTOMER-RELATED?

A Yes. This practice has been approved by the Commission and is followed by many of the electric distribution utilities in Pennsylvania. Additionally, numerous utilities outside of Pennsylvania classify a portion of their distribution network as customer-related, such as Central Hudson Gas and Electric Company, Niagara Mohawk Power Company, and Northern States Power Company Minnesota (NSPM).

Q WHY DOES MR. JOHNSON DISAGREE WITH PPL'S MINIMUM DISTRIBUTION METHOD?

A Mr. Johnson rejects the minimum distribution method because he claims that PPL did not use true minimum sized components. Furthermore, he asserts that because select minimum size components have material load-carrying capability it "creates inequitable double counting of demand related costs."[5]

Q DO YOU AGREE WITH MR. JOHNSON'S CLAIM THAT PPL DID NOT USE TRUE MINIMUM SIZED COMPONENTS?

A No. Mr. Johnson claims that PPL did not use minimum sized components, and, therefore oversized the load-carrying capability of the minimum system. However, similar to its last rate case, PPL appropriately used minimum sized components for the primary and secondary conductors.

[4] NARUC, *Electric Utility Cost Allocation Manua*l at 90 (Jan. 1992).

[5] OCA Statement 4, Direct Testimony of Clarence L. Johnson at 16.

Q ASSUMING MR. JOHNSON'S CLAIM THAT SELECT MINIMUM SIZE COMPONENTS HAVE LOAD-CARRYING CAPABILITY, IS THIS A REASON TO REJECT THE MINIMUM DISTRIBUTION METHOD?

A No. Even assuming that the minimum system has some load-carrying capability, that does not justify rejecting the minimum distribution method. For example, in a pending rate case involving NSPM, NSPM used the minimum distribution method. However, in developing the demand allocation factors used to allocate the demand-related portion of distribution network costs, NSPM removed 1.5 kilowatts (kW) per customer. The 1.5 kW reflects NSPM's estimate of the load-carrying capability of the minimum system.

Q IS OCA WITNESS JOHNSON'S PROPOSAL TO CLASSIFY 100% OF PRIMARY DISTRIBUTION NETWORK COSTS TO DEMAND APPROPRIATE?

A No. There is no justification for treating the primary distribution network differently from the secondary network. The same cost-causation principles previously discussed apply to both the primary and secondary distribution network. Further, Mr. Johnson's proposal is not consistent with accepted practice in Pennsylvania, nor in other jurisdictions that use the minimum distribution method.

Q PLEASE EXPLAIN THE BASIC CUSTOMER METHOD PROPOSED BY EJA WITNESS RABAGO.

A The basic customer method classifies only the meter and service drop as customer-related. Thus, the vast majority of distribution network costs, including overhead lines, conductors, poles, towers, fixtures, and line transformers, would be classified as demand-related.

Q IS THE BASIC CUSTOMER METHOD REFLECTIVE OF COST CAUSATION?

A No. As previously discussed, the distribution network must be ready to serve customers while also providing a physical connection – irrespective of the amount of electric delivery service. Thus, the basic customer method fails to recognize these accepted cost-causation principles.

Q IS THERE ANY AUTHORITATIVE SUPPORT FOR THE BASIC CUSTOMER METHOD?

A No. The NARUC CAM clearly states the costs for facilities booked to FERC Account Nos. 364-370 involve both demand and customer costs. Although I am aware of other cost allocation manuals, the NARUC CAM was prepared by state regulatory commissions who, by definition, represent the broader public interest.

Q IS IT REASONABLE TO CLASSIFY AN OVERWHELMING MAJORITY OF DISTRIBUTION NETWORK COSTS AS DEMAND-RELATED?

A No. The distribution network is sized to meet expected peak demand and must also (and first) provide a direct connection to the customer while providing the necessary voltage support to allow electricity to flow to the customer. Accordingly, the minimum size method is intended to determine this minimum level of service associated with the distribution system's readiness to serve, irrespective of peak demands.

Q WHAT DO YOU RECOMMEND?

A The Commission should reject Mr. Johnson's and Mr. Rabago's proposed changes to PPL's CCOSS and it should adopt PPL's CCOSS.

Class Revenue Allocation

Q PLEASE SUMMARIZE THE CLASS REVENUE ALLOCATION PROPOSED BY PPL.

A Based on its CCOSS, PPL's proposed class revenue allocation limits the increase for any class to 1.5 times the system average and ensures no rate class receives a decrease.

Q WHAT IS I&E'S REVENUE ALLOCATION PROPOSAL?

A I&E witness, Mr. Cline, does not recommend any adjustments to PPL's proposed class revenue allocation stating that it "generally moves each rate class towards the relative rate of return of 1.0."[6] In the event the Commission authorizes a lower revenue requirement than proposed by PPL, I&E recommends a proportionate scale back of the rate increase.[7] Further, he supports a reduction to the Customer charge if the authorized revenue requirement is lower than PPL's requested revenue requirement, except for the LP-4.

Q HOW IS OCA PROPOSING TO ALLOCATE PPL'S PROPOSED REVENUE REQUIREMENT?

OCA's proposal is similar to PPL's in that it includes a gradualism constraint (*i.e.*, 1.5 times the system average increase cap and no class receives a decrease) – however, this is based on the results of OCA's flawed CCOSS as discussed previously.

[6] I&E Statement No. 4, Direct Testimony of Ethan H. Cline at 9.

[7] *Id.* at 10.

Q WHAT IS WALMART'S PROPOSED CLASS REVENUE ALLOCATION?

A Walmart supports PPL's proposed revenue allocation if the Company receives 100% of its requested increase. However, if PPL receives a lower revenue requirement than requested, Walmart proposes to assign 50% of the decrease to any class below its cost-of-service level, ensuring that no class receives an increase that exceeds their cost-of-service level.[8] The remaining 50% would be allocated to all rate classes on an equal percentage basis.[9]

Q DO YOU AGREE WITH THE CLASS REVENUE ALLOCATION PROPOSALS SUBMITTED BY THESE PARTIES?

A No. As discussed in my direct testimony, I have concerns with capping the increase to 1.5 times the system average increase because of the huge impact on the Residential – Thermal Storage and LP-4 classes. To avoid rate shock, the cap should be 1.3 times the system average increase. However, I do agree with both OCA and I&E that a proportionate scale-back should be applied if PPL is granted less than its requested increase.

As to Walmart's proposed class revenue allocation, if PPL receives a lower increase than it is requesting, Walmart's proposal should be modified to apply 50% of the decrease to any class that is *above* cost rather than assigned to classes already *below* cost, as proposed by witness Lyon. This will ensure that no class receives an increase that exceeds their cost-of-service level.

[8] Walmart Statement No. 1, Direct Testimony and Exhibits of Matthew T. Lyon at 16.

[9] *Id*. at 16-17.

Q DO YOU AGREE MR. CLINE'S PROPOSAL TO REDUCE CUSTOMER CHARGES IN THE EVENT OF A SCALE BACK?

A Although Mr. Cline asserts that PPL did not increase the Customer charge for LP-4, the Customer charge was, in fact, increased by 38% (from $169.80 per month to $235 per month).[10] Further, the proposed increase in the volumetric charge is 52.4% from $2.547 per kW to $3.881 per kW.[11] Therefore, in the event of a scale-back, I recommend that only the volumetric charge for LP-4 customers should be scaled back.

Q DO YOU AGREE WITH WALMART'S PROPOSAL?

A Yes. I agree that no class should receive an increase that exceeds their cost-of-service level in the event of a scale-back. However, I do not agree that 50% of the decrease should apply to rate classes that are below cost.

Q WHAT DO YOU RECOMMEND?

A I recommend that the Commission reject the parties' recommended class revenue allocations and support my recommendation to limit the increase to any rate class that is below cost to 1.3 times the system average to prevent substantial increases and limit rate shock to customers who are substantially below their cost to serve. In the event of a scale back in rates, I recommend that the Customer charge for LP-4 should not be scaled back.

Recovery of Universal Service and Energy Conservation Costs

Q WHAT ARE UNIVERSAL SERVICE AND ENERGY CONSERVATION COSTS?

A Universal Service and Energy Conservation (hereinafter "Universal Service") costs are

[10] PPL Statement No. 14, Direct Testimony of Gregory Olsen, PPL Electric Exhibit GEO-1 at 95 and 414.

[11] *Id.*

the expenses incurred from a suite of assistance programs intended to help low-income households as required by state law.

Q HOW ARE UNIVERSAL SERVICE COSTS RECOVERED?

A Universal Service costs are currently recovered from the Residential and small commercial customers who voluntarily take service under GS-1 and GS-3 rate classes through a rider.

Q HAVE ANY PARTIES PROPOSED RECOVERING UNIVERSAL SERVICE COSTS FROM RATE CLASSES OTHER THAN THE RESIDENTIAL AND CERTAIN GS-1 AND GS-3 CLASSES?

A Yes. CAUSE-PA, OCA, and EJA all propose alternative recovery of Universal Service costs.

Q WHAT DOES CAUSE-PA WITNESS CICERO PROPOSE WITH REGARD TO UNIVERSAL SERVICE COST RECOVERY?

A Mr. Cicero proposes recovering Universal Service costs from all rate classes based on their total distribution revenues. Further, he recommends to directly assign a portion of this expense to LP-5 customers because "[l]arge load additions fueled by data centers and other large load users are already driving higher costs for Pennsylvania consumers."[12] He estimates that large load growth has caused an approximate $10 million price increase annually. Therefore, he recommends assigning $10 million of Universal Service costs directly to the LP-5 class customers who are classified as Large Load Additions by PPL.[13]

[12] CAUSE-PA Statement 1, Direct Testimony of Patrick M. Cicero at 90.

[13] *Id.* at 94.

Q WHAT DOES OCA WITNESS COLTON PROPOSE REGARDING RECOVERY OF UNIVERSAL SERVICE COSTS?

A Mr. Colton proposes that PPL should recover "a substantial commitment of funds to offset the increased universal service costs that will be caused by the introduction of large load customers."[14] Therefore, he recommends that the Commission implement a two-step non-bypassable system benefits charge to very large load customers. He recommends that PPL submit a proposal for the non-bypassable system benefits charge within six months of a final order in this proceeding.[15]

Q WHY DOES MR. COLTON RECOMMEND A TWO-STEP NON-BYPASSABLE CHARGE FOR VERY LARGE LOAD CUSTOMERS?

A Mr. Colton asserts that very large load customers have direct adverse impacts on the affordability of electricity to PPL's low-income customers, as well as direct adverse impacts to Residential customers who receive assistance from PPL.[16]

Q WHAT IS MR. RABAGO'S PROPOSAL REGARDING THE RECOVERY OF UNIVERSAL SERVICE COSTS?

A Mr. Rabago supports revising the Universal Service Rider to recover Universal Service costs from all rate classes. He asserts that a useful starting point is the proposal of CAUSE-PA and TURN in the pending large load tariff proceeding (Docket No. M-2025-3054271) that utilities should be required to charge large load customers through a two-part rider that includes both a flat upfront fee and an on-going volumetric charge to recover Universal Service costs.[17]

---

[14] OCA Statement 8, Direct Testimony of Roger Colton at 87.

[15] *Id.* at 6.

[16] *Id*. at 88.

[17] EJA Statement No. 1, Direct Testimony of Karl R. Rabago at 18.

Q SHOULD PPL RECOVER UNIVERSAL SERVICE COSTS FROM NON-RESIDENTIAL CUSTOMERS?

A No. First, the Universal Service fund is used to subsidize electricity costs to qualifying low-income Residential customers. Spreading these subsidies to non-residential customers defeats the purpose of setting delivery rates to reflect cost. Second, the assertion that large loads are impacting distribution delivery rates is false because large loads take service at transmission voltages. Any rate pressures that could result from connecting new very large loads to the system would be limited to energy costs and transmission rates. However, these costs are not at issue in this proceeding.

Finally, policy surrounding the service to new very large loads is still evolving. Stakeholders are currently engaged in a process of determining policies applicable to new very large load customers. Further, PJM has agreed to hold separate long-term capacity auctions for new very large loads customers. Also, the Trump administration is pursuing a policy to compel technology companies to directly fund the energy infrastructure needs of new AI datacenters, aiming to prevent increased electricity costs for consumers. The administration is working with PJM to hold emergency auctions, forcing datacenters to pay for new power plants. This emerging policy has been embraced by at least one major technology company. Thus, the impacts of this evolving policy are unknown.

Q WHAT DO YOU RECOMMEND?

A I recommend that the Commission reject all proposals to recover Universal Service costs from rate classes other than the Residential and small commercial customers voluntarily taking service under GS-1 and GS-3 rate classes.

However, if the Commission finds that Universal Service costs will increase due to the addition of very large load customers, then I recommend that only customers with very large loads contribute to the recovery of this expense. Legacy LP-5 customers, LP-4 customers, and all other classes for whom the programs are not available, should be excluded.

Very Large Load Tariff

Q PLEASE SUMMARIZE THE PROPOSALS PUT FORTH BY CAUSE-PA WITNESS HAVUMAKI, OCA WITNESS HOYT, AND EJA WITNESS RABAGO REGARDING PPL'S PROPOSED MODIFICATIONS TO THE LP-5 TARIFF TO ACCOMMODATE VERY LARGE LOAD CUSTOMERS.

A CAUSE-PA witness Havumaki agrees that new very large load customers are different from legacy LP-5 customers and recommends that PPL create a separate rate class for very large load customers.[18]

OCA witness Hoyt recommends rejecting PPL's proposed revision to the LP-5 tariff and instead recommends an independent tariff for very large loads be litigated in a separate proceeding to allow for stakeholder review and comment. However, if the Commission accepts PPL's proposal to include very large load customers in Rate LP-5, he recommends various revisions, including the Commission retaining explicit review and approval authority of agreements entered into between PPL and very large load customers pursuant to the LP-5 tariff, as well as retaining explicit review and approval authority over determinations that interconnection-related upgrades provide benefits to the Company's transmission system.[19]

[18] CAUSE-PA Statement 2, Direct Testimony of Ben Havumaki at 4 and 25.

[19] OCA Statement 5, Direct Testimony of Matthew T. Hoyt at 7.

EJA witness Rabago supports various revisions to the LP-5 tariff within 90 days of the final order in this proceeding to make the tariff clearer and more robust. The revisions include large load customers' contributions in aid of construction, minimum contract term lengths, minimum demand charges, incentives for Grid-Enhancing Technologies and Alternative Transmission Technologies, provisions related to interruptible service, zero emissions for onsite generation and storage, and incentives for very large load customers to invest in new, time-matched, local clean energy programs and infrastructure. He also recommends that the revised LP-5 tariff be consistent with the draft model tariff published by the Commission in its tentative order in Docket No. M-2025-3054271.[20] However, Mr. Rabago also supports applying these provisions to existing LP-5 customers who seek to modify service.[21]

Q DO YOU HAVE ANY COMMENTS OR CONCERNS WITH THESE PROPOSALS?

A Generally, no. The issues outlined by these parties regarding the proposed revisions to the LP-5 tariff appear principally aligned with — and heavily underscore — PPLICA's concerns over PPL shoehorning the very large load customers into the existing LP-5 tariff with relatively minor changes, as discussed in my direct testimony. However, I do reject Mr. Rabago's recommendation to apply the provisions he outlined to existing LP-5 customers. Very large loads have policy and operating conditions that are unique and do not apply to existing LP-5 customers. As noted in my direct testimony, PPL needs a more comprehensive and targeted approach for very large load customers and should be required to create a separate tariff which addresses, among other things, the process used to quantify, designate, and recover the

[20] EJA Statement No. 1, Direct Testimony of Karl R. Rabago at 7, 78, 79.

[21] *Id.* at 81.

interconnection costs of these customers in the Commission's separate docket for very large customers.

Q WHAT DO YOU RECOMMEND?

A My primary recommendation is that the Commission reject PPL's proposed modifications to the LP-5 tariff and require PPL to create a separate tariff for very large load customers to recognize policy and operational considerations that are unique to these customers. The separate tariff should be developed after the Commission makes its determination in the pending *Interconnection and Tariffs for Large Load Customers* proceeding. However, if the Commission decides to modify the current LP- 5 tariff to accommodate very large load customers, I recommend that the tariff distinguish between very large load customers, such as hyperscale datacenters, and legacy LP-5 customers.

Conclusion

Q WHAT ADDITIONAL FINDINGS SHOULD THE COMMISSION MAKE BASED ON YOUR REBUTTAL TESTIMONY?

A The Commission should make the following additional findings:

- Reject OCA's revisions to the Class Cost-of-Service Study;
- Reject EJA's revisions to the Class Cost-of-Service Study;
- Reject the class revenue allocations recommended by I&E, OCA and Walmart;
- If the Commission approves a lower revenue increase than PPL requested, the revenues should be scaled down proportionately, with the exclusion of the Customer charge for LP-4 customers which should be increased as proposed by PPL;

- Reject the recommendations to recover Universal Service costs from rate classes other than the Residential and small commercial customers who voluntarily take service under GS-1 and GS-3 rate classes as recommended by CAUSE-PA, OCA, and EJA. Alternatively, the Commission should limit the extension of such cost recovery to the very large load customers; and

- Require PPL to create a separate tariff for very large load customers. If the Commission elects to revise the current LP-5 tariff, the tariff should distinguish between very large load customers and legacy LP-5 customers.

Q DOES THIS CONCLUDE YOUR REBUTTAL TESTIMONY?

A Yes.

SURREBUTTAL TESTIMONY OF BILLIE S. LACONTE

Introduction

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A My name is Billie LaConte. My business address is 14323 South Outer 40 Rd., Suite 206N, St. Louis, Missouri 63017.

Q ARE YOU THE SAME BILLIE S. LACONTE WHO PREVIOUSLY SUBMITTED DIRECT AND REBUTTAL TESTIMONIES IN THIS PROCEEDING ON BEHALF OF THE PP&L INDUSTRIAL CUSTOMER ALLIANCE (PPLICA)?

A Yes.

Q TO WHICH REBUTTAL TESTIMONY WITNESSES ARE YOU RESPONDING?

A I am responding to the rebuttal testimonies of Mr. Bickey Rimal, on behalf of PPL Electric Utilities Corporation (PPL), Mr. Mark D. Ewen, on behalf of the Pennsylvania Office of Small Business Advocate (OSBA), and Mr. Clarence Johnson, on behalf of Office of Consumer Advocate (OCA) regarding revenue allocation. I am also responding to PPL witness, Mr. Joseph Lookup, regarding the very large load tariff.

Q DOES THE FACT THAT YOU ARE NOT ADDRESSING EVERY ISSUE RAISED BY THESE AND OTHER PARTIES CONSTITUTE AN ENDORSEMENT OF THEIR RECOMMENDATIONS?

A No.

Revenue Allocation

Q DOES PPL WITNESS RIMAL AGREE WITH YOUR PROPOSED REVENUE ALLOCATION MODIFICATIONS?

A No. Mr. Rimal opposes my recommendation to limit the increase to any rate class to 1.3 times the system average increase.[1] He continues to support PPL's proposal to maintain adherence to a cap of 1.5 times the system average on any class increase.[2]

Q WHY DOES PPL WTINESS RIMAL REJECT YOUR PROPOSED REVENUE ALLOCATION?

A Mr. Rimal claims my proposal does not reduce the interclass subsidies sufficiently.[3]

Q DOES OSBA WITNESS EWEN AGREE WITH YOUR REVENUE ALLOCATION PROPOSAL?

A No. Mr. Ewen supports the Company's proposed revenue allocation using 1.5 times the system average increase.[4]

Q WHAT IS OCA WITNESS JOHNSON'S POSITION REGARDING YOUR REVENUE ALLOCATION PROPOSAL?

A Although Mr. Johnson rejects my revenue allocation based on the results of PPL's class cost-of-service study (CCOSS), he agrees that "varying mitigation cap levels can be tailored to the circumstances..."[5] However, he also states that my proposal

[2] *Id.* at 21-22.

[3] *Id.*

[4] OSBA Statement No. 1-R, Rebuttal Testimony of Mark D. Ewen at 4.

[5] OCA Statement No. 4-R, Rebuttal Testimony of Clarence L. Johnson at 7.

provides a "lessor recognition of cost-based results."[6] If the Commission were to accept mitigation of the cap, he supports the adoption of a cap that is 1.4 times the system average cap.

Q DO YOU AGREE WITH OCA WITNESS JOHNSON'S PROPOSAL?

A No. First, his proposed 1.4 times cap is based on the results of his proposed CCOSS, which is inappropriate for the reasons set forth and more fully explained in my rebuttal testimony. Second, his proposal to limit the increase to 1.4 times the system average increase, although a step in the right direction, still fails to fully account for the proposed extreme increase in rates for the Residential – Thermal Storage and Large General Service – 12 kV (LP-4) classes.

Q WHY SHOULD THE COMMISSION APPROVE YOUR PROPOSED REVENUE ALLOCATION CAP OF 1.3 TIMES THE SYSTEM AVERAGE INCREASE?

A In this circumstance, the proposed increases to the Residential-Thermal Storage and LP-4 classes, are substantial — over 50%. In fact, since its initial filing, PPL has updated its requested increase from 35.6% to 38.2%.[7] Using PPL's proposed revenue allocation, the increase to these classes is raised from 53.4% to an even higher 57.3%. This level of increase for any rate class would result in rate shock, whereby a class receives a substantial or abrupt rate increase. While in some cases it may be necessary for the Commission to authorize higher rate increases to certain customer classes in order to avoid unreasonable increases for other customer classes, applying the 1.3 times system average cap in this case does not materially impact other

[6] *Id.*

[7] Statement No. 7, Direct Testimony of Bickey Rimal at 22; PPL Statement No. 7-R, Rebuttal Testimony of Bickey Rimal at 26.

customer classes due to the relatively small size of the Residential-Thermal Storage and LP-4 customer classes compared to others. Applying my recommended 1.3 times the system average cap to the revised 38.2% system average increase lowers the increase for these classes to 49.7%, which is still a significant increase, albeit lower than PPL's proposal.

I additionally note that while the Commission has previously used PPL's proposed 1.5 times system average cap, the Commission has also demonstrated flexibility in approving lower caps based on the circumstances of individual rate increase proposals.[8]

Although PPL's proposed revenue allocation follows the principal of gradualism, it still results in rate shock for the Residential-Thermal Storage and LP-4 classes. The proposals of OSBA and OCA do nothing to mitigate the aforementioned rate shock.

Q WHAT DO YOU RECOMMEND?

A I recommend that the Commission reject the revenue allocations proposed by PPL, OSBA, and OCA and adopt my proposal to limit the increase to any class to 1.3 times the system average increase.

Very Large Load Tariff

Q WHAT IS PPL WITNESS LOOKUP'S POSITION REGARDING YOUR RECOMMENDATION TO DEVELOP A SEPARATE VERY LARGE LOAD TARIFF?

A Mr. Lookup states that PPL is not opposed to creating a separate rate class (LP-6) for

[8] *Pa PUC v. Columbia Gas of Pennsylvania, Inc.,* Docket No. R-2024-3046519, Opinion and Order at 42 (entered November 21, 2024).

customers with peak demands in excess of 100 megawatts.[9] It appears that the conceptual LP-6 tariff would adopt several of the recommendations supported by PPLICA, including defining a peak demand threshold for large load customers. However, PPL opposes review of PPL's allocation of upgrade costs by the Commission stating "the review should not include the ability for the Commission to review and reject the Company's allocation of interconnection costs between the customer and rates."[10]

Q SHOULD THE COMMISSION LIMIT REVIEW OF PPL'S POTENTIAL LP-6 TARIFF FOR VERY LARGE LOADS TO THIS PROCEEDING?

A No. The Commission created a separate docket, Docket No. M-2025-3054271, *Interconnection and Tariffs for Large Load Customers* (large load tariff proceeding), to determine the appropriate tariff for very large load customers in Pennsylvania. It is my recommendation that PPL's tariff for very large load customers should be developed in coordination with the Commission's action in that docket, and address the recovery of interconnection costs for those customers at that time. This separate pending docket is the appropriate proceeding to determine the design of the very large load tariff, as well any cost recovery, because it is designed to address very large load tariffs for *all* utilities in Pennsylvania that provide interconnection service for very large load customers, not just PPL. Furthermore, it provides the utilities, Staff, and other interested parties the opportunity to thoroughly address their concerns and recommendations for very large load tariffs in Pennsylvania.

[9] ERRATA PPL Statement No. 16-R, Rebuttal Testimony of Joseph Lookup at 29 (filed Jan. 30, 2026).

[10] PPL Statement No. 16-R, Rebuttal Testimony of Joseph Lookup.

Q WHAT DO YOU RECOMMEND?

A Unfortunately, although PPL has indicated a willingness to set forth a new rate, LP-6, it has not provided a revised or updated tariff reflecting this proposal for interested parties to review. Accordingly, my recommendation is that PPL's proposed LP-5 and conceptual LP-6 tariff modifications for large load customers should be rejected as premature in advance of the Commission finalizing a model tariff in the pending large load tariff proceeding. However, if the Commission approves PPL's conceptual LP-6 rate, the tariff should include the language proposed in my direct testimony regarding the minimum revenue guarantee and provide a detailed description of the methodology PPL will use to determine the benefits and allocate the interconnection costs between directly billed large load contribution in aid of construction costs and socialized transmission formula rate costs. The Commission's approval of PPL's conceptual LP-6 tariff should be limited to a "pilot" authorization until the pending large load tariff proceeding is concluded. At that time, PPL should be required to review the then-completed model tariff and file a revised LP-6 tariff supplement along with explanations for any deviations from the model tariff, within a reasonable time period (*e.g.*, 120 days) of the Commission's Final Order in Docket No. M-2025-3054271. The filing should occur in this docket and should be subject to a 60-day timeframe for comments or complaints.

Q DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?

A Yes.

BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION

Pennsylvania Public Utility Commission *et al*,	:	R-2025-3057164 *et al*

VIII. Conclusion 28

I. Introduction

Q. What is your name, and by whom are you employed?

A. John M. Costlow. The PP&L Sustainable Energy Fund employs me as President and Chief Executive Officer. My business address is 4250 Independence Drive, Schnecksville, PA 18078.

Q. Please describe your testimony.

A. My testimony is divided into sections to address various issues.

- **I. Introduction**
- **II. Background**
- **III. PPL Electric Masking the True Increase**
- **IV. Forecasting Future Weather**
- **V. Customer Charge Rate Design Results in Subsidization of Low-Use Customers**
- **VI. Electric Vehicle Time-of-Use (TOU) Charging Program**
- **VII. Standby Tariff for Large On-Site Generation**
- **VIII. Conclusion**

Q. Are you sponsoring any exhibits related to this testimony?

A. Yes, SEF Exhibit I, which includes various discovery responses that I cite in my Direct Testimony.

Q. Is your testimony complete?

A. No, I am waiting for replies to interrogatories from PPL Electric and will amend my testimony if needed after receiving PPL Electric's responses.

Q. Do you support or oppose PPL Electric's request for an increase of approximately $356 million or $3.56 billion over 10 years?

A. No, I neither support nor oppose PPL's proposed revenue requirement.

Q. Do you conclude that PPL Electric's proposed rate increase and rate design is just and reasonable?

A. No, I conclude that PPL Electric's proposed rate increase and rate design is neither just nor reasonable.

II. Background

Q. By whom are you employed, and in what capacity?

A. I am employed by the Sustainable Energy Fund ("SEF") as President/CEO. I assumed this position on June 21, 2014. I joined Sustainable Energy Fund as Director of Technical Services on October 27, 2008. I was previously employed

by Florida Public Utilities (West Palm Beach, FL) as Manager of Marketing and Manager of Energy Conservation.

Q. What are your duties as President?

A. As President of SEF, I am responsible for providing the vision, leadership, and overall management of the Sustainable Energy Fund.

Q. What is your educational background?

A. I am a U.S. Navy Nuclear Power School graduate, where my studies focused on nuclear physics, reactor principles, electrical power generation, electronic monitoring, and controls. I received a Bachelor of Science in Organizational Management from Palm Beach Atlantic University and a Masters in Executive Leadership from Liberty University. I have also completed work toward a Doctorate in Strategic Leadership.

Q. What professional certification or positions do you hold?

A. I have received professional certifications as a Certified Carbon Reduction Manager, a Certified Sustainable Development Professional, a Renewable Energy Professional, a Performance Contracting and Funding Professional, a Certified Passive House Consultant, a Carbon Accounting Professional, and a Mobile Power Professional Master Technician. In addition, I served on the Board of the Central Pennsylvania Chapter of the Association of Energy Engineers.

Q. Have you previously testified or provided comments before the PUC?

A. Yes. I entered comments to the working group discussion at

- Docket No. M-2008-2069887, relating to the implementation of Act 129
- Docket No. M-2012-2289411, concerning Act 129
- Docket No. M-2014-2424864, concerning the design and implementation of any future Act 129 EE&C program
- Docket No. M-2009-2093216 PPL Electric Utilities Corporation's ("PPL Electric" or "Company") EE&C Plan

I have participated in and entered comments to:

- The Commission's Low Income Working Group
- The Fuel Switching Working Group
- On-Bill Financing Working Group

I testified in:

- PPL Electric's Time of Use Rate proceedings at Docket Numbers R-2009-2122718, R-2011-2264771, P-2013-2389572, and M-2016-2578051.
- PPL Electric's Default Service proceedings at Docket Numbers P-2012-2302074, P-2014-2417907, and P-2020-0319356.

- Docket No. R-2008-2060309AEC
- Rate increase proceedings at Docket Numbers R-2010-2161694, R-2012-229057, and R-2015-2469275
- Proceeding establishing UGI Utilities – Electric Division's Energy Efficiency and Conservation Plan (at Docket No. M-2010-2210316).
- PPL Electric's Distributed Energy Management Pilot (at Docket No. P-2019-3010128) and PPL Electric's Distributed Energy Resource Management Plan (at Docket No. P-2024-3049223).

III. PPL Electric Masking the True Increase

Q. Is it your opinion that PPL Electric has been deceptive in advertising increases in electricity costs?

A. Yes, PPL Electric has posted media that highlighted increases in the cost of electricity are due to increasing energy supplier costs, which is correct. However, increases in electricity supply are not the driver of PPL's requested increase in distribution rates. PPL Electric emphasized that the total bill impact due to the requested rate increase ranges between 2.58% and 6.98% depending on customer class, which is accurate. Unfortunately, for transparency, PPL Electric has failed to promote the fact that it has asked for a 33% increase in distribution rates, or $ 3.56 billion over 10 years. Notably, PPL's customer notice only provides customer

class increase information on a total bill basis. The customer notice does not provide notice of the percentage increase in distribution rates, which is the impetus for the total bill increase.

Q. In its public statements and customer notice, does PPL Electric mask the increase in its portion of the electric bill (distribution rates)?

A. Yes, it cites the total increase in the bill of 6.98% for residential customers versus the increase in PPL's distribution rates, which is 33.42%.

Q. Has PPL Electric masked the actual increase in the past?

A. Yes. While I am not a lawyer, I understand that in *Lloyd v. Pa PUC*, 904 A.2d 1010 (Pa. Cmwlth. 2006) the court stated regarding PPL's 2004 rate increase request: "The request had an announced goal of limiting the rate increase for all classes of customers to below 10% of the total bill. Because the generation component was still under the rate caps imposed by the Competition Act and would not be going up at all, using the total bill as a measure masked the true overall percentage increase sought in distribution and transmission revenues which was 32.8%." *Id.* at 1015. Here, while the "generation component" also known as the Price-to-Compare ("PTC") is no longer capped, the PTC is not changing as a result of the proceeding. PPL should be required to disclose the actual impact on customer distribution rates.

Q. Does PPL Electric advertise an increase in electric supply costs (the PTC) the same as it has advertised increases?

A. No, it notes in its media that the increases in costs are due directly to electric generation suppliers.

Q. Did PPL Electric disclose in its publications relating to the rate increase the percentage of increase on the PPL Electric portion of the bill (distribution rates)?

A. No, the example provided in OCA VII-32 mentions the increase as compared to the total bill but does not disclose the rise due to PPL Electric's portion of the bill.

Q. Was it reasonable for PPL Electric to mask the increase in rates by focusing on the impact on the total bill?

A. No, it is neither reasonable nor just; it is downright deceptive.

Q. Do you have any recommendations?

A. Yes, PPL Electric should be required to advertise the actual impact of the rate increase on distribution rates. Furthermore, once this information is communicated to the media and customers, another in-person public hearing should be scheduled to gauge ratepayer response to the rate increase.

IV. Forecasting Future Weather

Q. What is one of the factors Ms. Martin states for PPL Electric's rate increase?

A. She cites "changing weather patterns."[1]

Q. Is PPL Electric proposing to harden its infrastructure against extreme weather events?

A. Yes.

Q. Did weather conditions result in higher sales as compared to actual weather conditions?

A. Mr. Schram states in his Direct Testimony on page 6, "… actual weather in the HTY resulted in higher sales compared to sales under normal weather conditions."

Q. Is Mr. Schram predicting warmer winter temperatures in the FPFTY?

A. Yes, Mr. Schram in Table 1 of his Direct Testimony cites actual July 2024-June 2025 Heating Degree Days (HDD) in January and February of 1,099 and 1,075, respectively. As shown in Mr. Schram's Table 1, PPL Electric predicts HDDs of

[1] PPL Electric Statement No. 1, Direct Testimony of Christine Martin p. 3.

1,006 and 1,003 for January and February, respectively, for the FPFTY. This is a decrease of 8.5% for January and 6.7% for February.

Q. Is PPL Electric's proposed decrease in HDD reasonable for the FPFTY?

A. No, it is not reasonable. The 2024 Pennsylvania Climate Impacts Assessment predicted that average annual daily temperature would decrease by 13.8% by 2050[2]. To predict, as Mr. Schram did, that HDD for January and February would decrease by 8.5% and 6.7% respectively, by the FPFTY is unreasonable.

Q. Are Cooling Degree Days (CDD) also decreasing?

A. No, as warming occurs, summer peaks will become more pronounced, and CDD will increase, which will result in an increase in electric consumption for cooling. Furthermore, nighttime temperatures are forecast to be higher, rising from "four (4) days to 26 days by mid-century…" above 68 degrees.[3]

Q. Do you agree with Mr. Schrim's projections?

A. No, he focused on HDD but failed to acknowledge the impact of increasing CDD.

[2] 2024 Pennsylvania Climate Impact Assessment by the Pennsylvania Department of Environmental Protection, p. 18.

[3] 2024 Pennsylvania Climate Impact Assessment by the Pennsylvania Department of Environmental Protection, p. 19.

Q. What do you recommend the Commission do?

A. Based on the lack of credible evidence that sales will decrease at the rate PPL Electric has forecast, the FPFTY should be set to a static sales forecast utilizing the historic test year consumption.

V. Customer Charge Rate Design Results in Subsidization of Low-Use Customers

Q. Does PPL's proposed customer charge result in high use customers, including electric heat and low income customers subsidizing lower use customers?

A. Yes. PPL has proposed an artificially low customer charge that does not recover all fixed charges and pushes fixed charges into volumetric rates. While many believe that a lower customer charge allows customer to better control their bills, that is only true where customers effectively have the means to be more efficient in their electric use. In PPL's largely rural territory where a significant amount of customers utilize electric heat and low income users typically use more electricity than non-low income users with little means to buy new, more efficient appliances or other fixture upgrades, a lower customer charge does not benefit low income or electric heat users. It results in these customers paying larger than their

fair share of fixed costs. I demonstrate this in detail in this section of my testimony.

Q. In the past, have you advocated for a smaller customer charge to incentivize high-use ratepayers to engage in energy efficiency?

A. Yes, this assumes that low-use customers were synonymous with low-income ratepayers and that higher-use customers have higher incomes and can afford to engage in energy efficiency measures. My analysis in this proceeding presented below demonstrates that confirmed low-income households are, in fact, higher usage ratepayers. This suggests that a higher customer charge is warranted because the customer charge PPL proposes, which is intended to recover fixed costs, is artificially low and pushes fixed costs into the volumetric rate. This means high use customers pay more than their fair share of PPL's fixed costs, which is subsidization. For low-income, high use customers, this subsidization is not only unfair but harmful. As further explained below, electric heat customers are also high use customers and there is a very high proportion of electric heat customers in PPL's territory because it is rural and customers lack access to natural gas as a heating source. I will also discuss the rate design principles that support a higher customer charge. I recommend that the customer charge be calculated utilizing the methodology proposed by PPL Witnesses Ms. Johnson and Ms. Rimal that results

in a customer charge of $42.96 per month at proposed rates, scaled back proportionally to the revenue increase ultimately approved.

Q. Do some programs help low-income households achieve energy efficiency upgrades?

A. Yes, but according to PPL Electric, one of these programs, WRAP, would take almost 30 years at the current rate to update all low-income households to higher efficiency.

Q. Have customers engaged in energy efficiency?

A. Yes, Act 129 was passed in 2008, and programs began in 2009. Over the last 15 years, many customers have engaged in energy-efficiency projects, including the use of high-efficiency and hyper-heat pump technology as a source of winter heating. Unfortunately, these technologies, although very efficient at moderate to warm temperatures, become significantly less efficient at lower temperatures. As a result, heating bills in the depths of winter are high, equivalent to those for electric resistance heat.

Q. Is it fair, due to PPL Electric's rate design for electric heat customers, to subsidize low-use customers?

A. No, it is not only unfair, but it is also unjust. Furthermore, while I am not an attorney, I understand that "…rates must be designed to furnish the most efficient

and satisfactory service at the lowest reasonable price for the greatest number of customers."[4]

Q. What is the PPL Electric residential customer count as of the last day of September 2025?

A. 1,290,755.[5]

Q. What is PPL Electric's confirmed low-income customer count?

A. As of September 2025, 249,033[6].

Q. What is the estimated low-income customer count?

A. Based on PPL Electrics LIURP needs assessment filed April 30, 2025, 347,882.[7]

Q. Does PPL Electric in the Direct Testimony of Ms. Johnson advocate for "fairness"[8] Within the customer class?

A. Yes.

[4] Philadelphia Suburban Transport Company v. Pennsylvania Public Utility Commission, 281 A.2d 179, 186 (Pa. Cmwlth. 1971)

[5] Cause PA I-9, Attachment 1.

[6] Cause PA I-7, Attachment 1.

[7] Cause PA I-11, Attachment 1.

[8] Direct Testimony of Ms. Johnson, p.7.

Q. Is there a difference in heating demand across the PPL Electric territory?

A. Yes, and it is significant stretching from Bucks and York to cooler areas such as Carbon and Wayne counties. In fact, the average temperature in Allentown during January and February is 30.8°F, according to the National Centers for Environmental Information, while Millville in Wayne County has an average temperature of 24.7°F.

Q. Why is this temperature difference significant when it comes to heating costs?

A. The temperature difference between the interior of a residence and the exterior drives energy consumption. The cooler the outdoor temperature, the greater the need for heat. In the case of heat pumps, this difference between Allentown and Millville, for example, decreases the coefficient of performance of a heat pump. In most cases, it is equivalent to electric resistance heat, the most expensive way to heat a residence. The result is that electric heat residential customers have significantly high heating costs during the winter.

Q. Do electric heating customers experience higher volumetric consumption?

A. Yes, significantly higher volumetric consumption. Based on information

contained in the 2023 Baseline Study from the Pennsylvania Public Utility Commission at Table 9.[9]

Q. Are there differences between urban areas in the southern part of Pennsylvania and the northeastern part of PPL Electric's territory?

A. Yes. There are significant differences due to climatic differences, such as temperature.

Q. Are there differences between PECO's and PPL Electric's service territories?

A. Yes, there is a significant difference between PECO and PPL Electric's 29-county territory. For example, 39% of residential domestic water heaters use electricity as a fuel source in the PECO territory, while 64% do in the PPL Territory[10]. Further, domestic space heating was fueled by electricity in 22% of homes in PECO's territory and 56% in PPL Electric's territory.[11] Much of PPL Electric's territory is rural and lacks natural gas service; therefore, a majority of customers rely on electricity for water and space heating.

[9] 2023 Pennsylvania Statewide Act 129 Residential Baseline Study (Mar. 21, 2024) available at https://www.puc.pa.gov/media/2883/2023_pa_residential_baseline_study.pdf

[10] *Supra* n. 9 at Baseline Study Table 231

[11] *Supra* n. 9 at Baseline Study Table 202

Q. Is the geographic distribution of low-income customers the same as in Philadelphia?

A. No, PPL Electric customers in urban areas often have the availability of natural gas to heat their homes. In contrast, rural customers in the PPL Electric territory usually lack access to the same low-cost natural gas.

Q. Within the PPL Electric territory, is the energy burden the same between rural and urban areas?

A. No, often rural areas suffer from a higher energy burden. See the map of Pennsylvania below.

Q. Are low-use customers synonymous with low-income customers?

A. No, low-use customers often have heating sources other than electricity According to the 2023 Pennsylvania Statewide Act 129 Residential Baseline Study, electric heat customers use 41% (in multifamily buildings) to 76% (in detached single-family homes) more electricity per year. Furthermore, residential customers in rural areas tend to reside in single-family homes more often than those in urban areas.

Q. Is the PPL Electric territory primarily rural, suburban, or urban?

A. PPL Electric witness Mr. Lookup stated that "… the PPL Electric system is broken up as follows:

Rural – 82%

Suburban – 17.5%

Urban – 0.4%"[12]

Q. Which two months of the year have the highest electricity bills?

A. In 2025, it was January and February[13].

Q. Is there a difference between the mean usage of low-income electric heat customers and the entire class of residential ratepayers?

A. Yes, for January 2025, the electric usage of low-income ratepayers with electric heat was 2,368.69 kWh, compared to all ratepayers, which was 1982.21 kWh. In February, confirmed low-income ratepayers used 2,483.83 kWh, while all ratepayers used 2,075.85 kWh. Confirmed low-income ratepayers used 19.4% and 19.6% more, respectively, during the worst months of winter.

[12] OCA IX-36

[13] Cause PA 1-20a

Q. Is there a difference between the mean usage of low-income non-electric heat customers and the entire residential class of ratepayers?

A. Yes, for January 2025, the electric usage of low-income ratepayers with non-electric heat was 1251.27 kWh, compared to all ratepayers, who were 963.85 kWh. In February, confirmed low-income ratepayers used 1250.16 kWh while all ratepayers used 944.88 kWh. Confirmed low-income ratepayers used 29.8% and 32.3% more, respectively, during the worst months of winter. Furthermore, this result compares to all ratepayers, which includes more than 300,000 estimated ratepayers, skewing results lower.

Q. When comparing low-income electric heat bills to all residential ratepayers' bills, is it true that low-income ratepayers incur higher bills in January and February?

A. Yes, confirmed low-income ratepayers incurred on average $166.13in January and $141.80 in February, while all ratepayers incurred $173.38 and $147.70, respectively[14]. As a result, low-income ratepayers paid 17.2% and 17.4%% more in January and February 2025, respectively, for distribution charges alone.

[14] Cause PA Attachment I-21a and b

Q. For the entire year, do low-income ratepayers use more or less electricity than all ratepayers?

A. For the latest available data, from October 2024 to September 2025[15] Low-income households use more electricity than all households, regardless of whether they use electric or non-electric heat. Low-income ratepayers who used electric heat used 16,181 kWh as compared to all households, which used 13,822 kWh annually. This also holds for non-electric heat customers, who used 11,376 kWh annually, as compared to all households, which used 9,331 kWh.

Q. What energy source do the majority of PPL Electric customers use to heat their homes?

A. In the PPL Electric territory, 56% of customers utilize electricity as the primary heating fuel, while 24% utilize natural gas and 18% oil. Additionally, in the PPL Electric Territory, 48% of baseline study respondents used electricity as a secondary source of heat.

[15] Cause PA Attachment I-21a and b

Q. What types of electric heat are used in the PPL Electric Territory?

A. Primarily air-source heat pumps and electric baseboard heat. The two worst sources in January and February.

Q. Has PPL Electric forecasted if the customer charge was increased, how many customers would participate by implementing energy efficiency measures?

A. No. The OCA in OCA IX-19 asked:" Has the Company analyzed, evaluated, or quantified the impact of increasing the residential customer charge on energy efficiency participation rates, participant bill savings, or program marketing and implementation?" PPL did not provide any analysis of the impact of increasing the residential customer charge on energy efficiency participation rates.

Q. What conclusion, if there is any, can you draw from the above information?

A. That PPL Electric's current and proposed rate design subsidizes low-use customers at the expense of higher-use low-income ratepayers. This rate design is not consistent with principles of cost of service, affordability, or fairness.

Q. What are two factors Ms. Johnson references in her testimony for rate design?

A. She references "…affordability and gradualism…"[16]

Q. Is gradualism the only factor to consider when setting rates?

A. No, the principle of gradualism cannot trump all other concerns. Furthermore, the increased rates paid by electric heat customers could not be classified as affordable.

Q. Should cost allocation follow cost causation?

A. Based on the Direct Testimony of PPL Electric witness Ms. Rimal[17], yes.

Q. What are two factors Ms. Johnson references in her testimony for rate design?

A. She references "…affordability and gradualism…"[18]

Q. Is Mr. Wishart accurate in his statement that PPL Electric's proposed "…approach reduces cross-subsidies among residential customers…"[19]

[16] Direct Testimony Ms. Johnson, p.5.

[17] Direct Testimony Ms. Rimal, pp. 4-11.

[18] Direct Testimony Ms. Johnson, p.5.

[19] Direct Testimony Mr. Wishart, p. 12.

A. No, this is not accurate as per my testimony, electric heat customers will see a much greater increase in their share of the class costs than non-electric heat customers.

Q. For the customer class RS, is PPL Electric proposing an increase in the customer charge?

A. Yes, from $15.58 per month to $17.00 per month[20]. This is an increase of $1.42 per month or $17.04 annually. This is a 9.7%[21] increase in the base customer charge.

Q. What is the proposed increase in PPL Electric's volumetric charge for residential customers?

A. Volumetric charges for residential customers are proposed to increase 23.2% from $0.05109/kWh to $0.06296/kWh[22]

Q. What has been the impact of inflation?

A. As stated by PPL Electric witness Mr. Wishart "…average residential delivery rate declined by approximately 19.7%..."[23]

[20] Direct Testimony Ms. Johnson, p. 6.

[21] Direct Testimony Mr. Wishart, p. 11.

[22] Direct Testimony Mr. Wishart, p. 12.

[23] Direct Testimony Mr. Wishart, p. 8.

Q. Does PPL Electric's cost of service study support a higher customer charge?

A. Yes, it supports a customer charge of $42.96 per month.[24],[25] in Ms. Johnson's and Ms. Rimal's testimony and $42.92 per month[26] in Mr. Wishart's testimony.

Q. If the customer charge was increased to $44.09, what would the volumetric rate be?

A. The volumetric rate would be $0.02205/kWh[27]. This represents a 35% decrease from the rate proposed by PPL Electric, which is a volumetric charge reduction.

Q. If the customer charge was increased to $44.09 and the volumetric rate lowered to $0.02205/kWh, what would be the impact on low-income electric ratepayers?

A. Based on usage from January and February 2025, their rates would decrease from the current rates of $166.13 and $173.38 to $97.77 and $100.31, respectively, during the worst two months of the year at the proposed revenue requirement.

[24] Direct Testimony Ms. Johnson, p. 6.

[25] Direct Testimony Ms. Rimal, p. 24.

[26] Direct Testimony Mr. Wishart, p. 10.

[27] SEF III-1

Q. Has PPL Electric taken steps in this proceeding to rectify the cross-subsidization?

A. No, it has put forth a proposal to increase the customer fee, which represents utility fixed costs, by a de minimus amount, $1.42 or 9.7%. Based on PPL Electric's testimony, considering the impact of inflation, the customer charge has actually decreased.

Q. Does a lower than justified customer charge align with PPL Electric's customer-related costs?

A. No. Customers, like those with electric heat, will see a more significant increase in their bills due to fixed costs being placed in volumetric rates. This shifts a greater burden on intraclass costs to electric heat customers.

Q. What conclusion can be drawn from the above differences between all ratepayers and confirmed low-income ratepayers?

A. Low-income ratepayers use more electricity during the worst two months of the year, as well as annually, and correspondingly have the highest bills before any customer assistance programs are applied. The perception that low-income households also have low usage or have the means to effectively lower their usage does not hold for the PPL Electric Territory. Furthermore, as low-income households are also high-volume households, a higher customer charge with a

corresponding lower volumetric rate would benefit low-income households. As high-usage households currently subsidize low-usage customers, this current design is unjust.

VI. Electric Vehicle Time-of-Use (TOU) Charging Program

Q. Do you support PPL Electric's proposed EV Pilot and Rebate Program?

A. Yes, to the extent that the proposed EV Program TOU On-Peak and Off-Peak times are synchronized with the existing Default Service TOU.

Q. What is your understanding of the Electric Vehicle Time-of-Use Charging Program?

A. The program allows residential customers to sign up online for the program and encourages vehicle owners to charge during off-peak periods.

Q. What is the purpose of this program?

A. To better manage grid and generation resources.

Q. Why are you requesting that the EV TOU and Default Service TOU be synchronized?

A. EV ratepayers looking to minimize their charging costs may participate in both the EV TOU and Default Service TOU. Any discrepancies in timing between the two programs are likely to confuse ratepayers. Furthermore, PPL Electric's early

TOU programs were unsuccessful and were litigated from 2009 through 2013. The issue was resolved, and the program has been stable since the settlement, with the existing Default Service TOU on-peak and off-peak hours.

Q. What is the basis for the Default Service TOU on-peak and off-peak hours?

A. The Default Service TOU on-peak and off-peak hours are based on PJM PPL Zone on-peak consumption periods, while PPL Electric's proposal in this proceeding regarding the EV TOU program is based on PPL Electric distribution peak periods.

Q. Was SEF a party to the settlement that established the Default Service Time of Use rate?

A. Yes, SEF was an active participant and supported the settlement at Docket No. P-2013-2389572.

Q. What is your recommendation?

A. That the Commission approve the Electric Vehicle Time-of-Use program with the Default Service TOU times.

VII. Standby Tariff for Large On-Site Generation

Q. What is your understanding of PPL's proposal for a standby tariff for large on-site generation?

A. PPL Electric is proposing a comprehensive new standby tariff structure for customers with substantial on-site generation.

Q. What does the proposal require?

A. That customers enter into contracts with three key points (1) Supplementary Contract Demand, (2) Back Up Contract Demand, and (3) Total Contract Demand.

Q. Do you have concerns about the proposal?

A. Yes, the proposal includes non-residential customers who do not qualify for net metering. This could include any non-commercial distributed generator, such as those with systems smaller than 3MW, including local businesses with a 100kW system. These small, distributed generators are less sophisticated than large generators and could easily be confused by standby charges and contract requirements.

Q. Do you have a recommendation?

A. Yes, PPL Electric eliminates the provision for including generators that do not qualify for net metering.

Q. If this provision were eliminated, would you support PPL Electric's proposal?

A. Yes.

VIII. Conclusion

Q. What are your recommendations to the Commission?

A. Based on my testimony herein, I recommend:

- that in the future PPL Electric be required to disclose the impacts of distribution base rate increases on a standalone basis not solely a total bill basis,

- that Ms. Martin's conclusion that sales will decline significantly because of the reduction in HDD be rejected as unreasonable and the Commission utilize HTY consumption to set rates,

- that PPL Electric's residential rate design be rejected as unjust and that the Commission design rates to allow for the customer charge to recover all fixed costs,

- that the Commission approve PPL Electric's proposed EV TOU Program modified such that the time frames match up with the residential TOU Program; and

- that the Commission approve PPL Electric's proposed standby charges for large on site generation modified to eliminates the provision for including generators that do not qualify for net metering.

Q. Does this conclude your testimony?

A. Yes. I reserve the right to update or amend my testimony.

PPL Electric Utilities Corporation
Response to the Set VII Data Requests of the
Office of Consumer Advocate (OCA)
Dated October 27, 2025
Docket No. R-2025-3057164

OCA VII-32 Please provide the notice provided to PPL Electric customers for this base rate case filing and identify all the distribution channels in which this notice was issued and the respective dates of issuance.

PPL Electric Response The public notice of the rate case filing was provided to customers as follows:

- **News release:** Posted on Sept. 30 to announce the filing of our distribution base rate request.
- **Bill insert:** Included in print bills beginning Sept. 30 and continuing for a full billing cycle, concluding on Oct. 28.
- **Email:** Included in email notification to all paperless billing customers beginning Sept. 30 and continuing for a full billing cycle, concluding on Oct. 28.
- **Start service emails and letters**: Included in start service confirmation emails or separate letters for new customers from Sept. 30 continuing through the entire rate case review period.
- **Print newspaper advertisement:** Placed in media outlets across PPL Electric Utilities' service territory as follows:

PPL Electric Utilities

NOTICE OF PROPOSED RATE CHANGE

To Our Customers:

PPL Electric Utilities is filing a request on September 30, 2025 with the Pennsylvania Public Utility Commission (PUC) to increase your electric distribution rates on or after December 1, 2025. This notice describes the Company's rate request, the PUC's role, and what actions you can take.

PPL Electric Utilities has requested an overall annual base rate increase of $356 million per year. If the Company's entire request is approved, the total bill for a residential customer receiving default service from PPL Electric Utilities and using 1,000 kilowatt-hours of electricity would increase from $191.49 to $204.86 per month, or by 6.98 percent.

The total bill for a commercial customer receiving default service from PPL Electric Utilities and using 1,000 kilowatt-hours with a maximum demand of 3 kilowatts would increase from $161.74 to $170.34 per month, or by 5.31 percent.

The total bill for an industrial customer receiving default service from PPL Electric Utilities and using 150,000 kilowatt-hours with a maximum demand of 500 kilowatts would increase from $19,965.77 to $20,480.18 per month, or 2.58 percent.

To find out your customer class or how the requested increase may affect your electric service bill, contact PPL Electric Utilities at 1-800-342-5775 from 8 a.m. to 5 p.m. Monday to Friday. The rates requested by PPL Electric Utilities may be found in Original Tariff-Electric Pa. PUC No. 202. You may examine the material filed with the PUC, which explains the requested increase and the reasons for it. Copies of this material are available on PPL Electric Utilities' Web site at ***pplelectric.com/RateInfo*** and are kept at the Company's office.

Upon request, PPL Electric Utilities will send you the Statement of Reasons for Original Tariff-Electric Pa. PUC No. 202, explaining why the rate increase has been requested.

The state agency that approves rates for public utilities is the PUC. The PUC will examine the requested rate increase and can prevent existing rates from changing until it investigates and/or holds hearings on the request. The Company must prove that the

(continued on back)

(continued from front)

requested rates are reasonable. After examining the evidence, the PUC may grant all, some, or none of the request, or it may reduce existing rates.

The PUC may change the amount of the rate increase or decrease requested by the utility for each customer class. As a result, the rate charged to you may be different than the rate requested by the company and shown above.

There are three ways to challenge a company's request to change its rates:

1. You can file a formal complaint. If you want a hearing before a judge, you must file a formal complaint. By filing a formal complaint, you assure yourself the opportunity to take part in hearings about the rate increase request. All complaints should be filed with the PUC before December 1, 2025. If no formal complaints are filed, the Commission may grant all, some or none of the request without holding a hearing before a judge.
2. You can send the PUC a letter telling it why you object to the requested rate increase. Sometimes there is information in these letters that makes the PUC aware of problems with the company's service or management. This information can be helpful when the PUC investigates the rate request. Send your letter or request for a formal complaint form to the Pennsylvania Public Utility Commission, Post Office Box 3265, Harrisburg, PA 17105-3265.
3. You can be a witness at a public input hearing. Public input hearings are held if the Commission opens an investigation of the company's rate increase request, and if there is a large number of customers interested in the case. At these hearings, you have the opportunity to present your views in person to the PUC judge hearing the case and the company representatives. All testimony given "under oath" becomes part of the official rate case record. These hearings are held in the service area of PPL Electric Utilities.

For more information, call the PUC at 1-800-692-7380. You may leave your name and address so you can be notified of any public input hearings that may be scheduled in this case.

Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania
(CAUSE-PA)
Dated October 16, 2025
Docket No. R-2025-3057164

CAUSE-PA I-11	As of the most recent available date, how many estimated low income customers reside within PPL's service territory? Please explain how PPL arrived at its estimated figures and include citation and/or copies of all workpapers used to perform the estimation.
PPL Electric Response	See CAUSE-PA I-11 Attachment 1. The Company filed its most recent LIURP needs assessment on April 30, 2025, which included the estimated number of low income customers in the Company's service territory. PPL Electric's estimated low income customer count is 347,822.

PPL Electric Utilities LIURP Needs Assessment		
1. Estimated number of low-income households between 0%-150% of the FPIG	347,822	Confirmed Low Income and Experian estimated customers that all below 150% of poverty.
2. Confirmed number of low-income households between 0%-150% of the FPIG	215,699	Customer received LIHEAP, participated in OnTrack, or reported level 1 income to the Company.
3. Number of confirmed low-income customers with usage above 6,000 kWh	157,868	
3a. Received WRAP in the past 5 years	14,936	
3b. Have less than 9 months of usage history	6,838	
3c. Have been deferred due to health and safety issues	NA	The Company is not able to report this data.
3d. Are renters	39,344	
4. Number of OnTrack customers with annual usage at or above 18,000 kWh	16,545	
4a. Received WRAP in the past 5 years	5,984	
4b. Have less than 9 months of usage history	142	
4c. Have been deferred due to health and safety issues	NA	The Company is not able to report this data.
4d. Are Renters	4,691	
5. The percentage of renters projected to be ineligible due to landlord refusal to participate	NA	Customers that do not have landlord consent are provided baseload measures. The customer is not refused WRAP services.
6. The percentage of customers projected to drop-out, including the factors used to determ	20%	The Company divided the number of unresponsive customers by the total number of jobs created.
7. Entire pool of eligible customers	157,868	
7a. Received WRAP/Act 129	14,936	
Subtotal	142,932	
7b. Have less than 9 months of usage history	6,838	
Subtotal	136,094	
7b. Dropout rate (20%)	27,219	
Remaining eligible customers	**108,875**	
8. Cost to serve calculation		
8a. Percentage of Heating jobs completed in 2024	45%	
8b. Percentage of Non-heating jobs completed in 2024	55%	
8c. Percentage applied to remaining eligible customers (heat)	49,410	
8d. Percentage applied to remaining eligible customers (non-heat)	59,465	
8e. Average cost of heating jobs in 2024	$5,012	2024 Method 2 cost as reported in LIURP Data Request
8f. Subtotal to serve projected heating customers	$247,640,926	
8g. Combined average cost of baseload and water heating jobs in 2024	$3,579	2024 Method 2 cost as reported in LIURP Data Request
8h. Subtotal to serve projected non heating customers	$212,826,659	
Total projected cost to serve remaining eligible pool of customers	**$460,467,585**	

As filed on April 30th 2025

PPL Electric Utilities Corporation
Response to the Set IX Data Requests of the
Office of Consumer Advocate (OCA)
Dated November 10, 2025
Docket No. R-2025-3057164

OCA IX-36

Please provide any documents or reports which estimate customers per mile of conductors for major cities served by PPL and rural areas served by PPL.

PPL Electric Response

PPL Electric utilizes the guidance in EEI's annual reliability surveys for categorizing circuits into Rural, Suburban, and Urban categories. The guidance is as follows:

Rural – 1 to 50 customers per mile
Suburban – 51 to 149 customers per mile
Urban – 150 or greater customers per mile

Using this criteria, the PPL Electric system is broken up as follows:
Rural – 82.0%
Suburban – 17.5%
Urban – 0.4%

In addition, the Company also has several Low-Tension Networks ("LTNs") in major cities within the service territory. These redundant electrical networks are not set up like traditional distribution circuits and therefore do not fit into the categorization above. These networks have an average of 4,365 customers per network in small, densely populated urban areas across the service territory.

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Coalition for Affordable Utility Services and Energy Efficiency in Pennsylvania
(CAUSE-PA)
Dated October 16, 2025
Docket No. R-2025-3057164

CAUSE-PA I-21

For each month from July 1, 2023, to date, please provide the average customer bill in dollars for PPL customers, for each of the following customer segments consistent with the response to CAUSE-PA 1-20:

a) Residential customers with Mean and Median usage levels for residential customers, separated by heating vs non-heating (baseload);
b) Confirmed Low Income Customers with Mean and Median usage for Confirmed Low Income Customers, separated by heating vs non-heating (baseload);
c) CAP customers with Mean and Median usage for CAP customers, separated by heating vs non-heating (baseload);
d) Confirmed Low Income Non-CAP customers with Mean and Median usage for Confirmed Low Income customers not enrolled in CAP separated by heating vs non-heating (baseload).

Please provide this data in a live Excel spreadsheet.

PPL Electric Response

See CAUSE-PA I-21 Attachment 1.

CAUSE-PA 1-21: a) Residential customers with Mean and Median usage levels for residential customers, separated by heating vs non- heating (baseload)

PPL Electric Utilities Corporation
Response to the Set IX Data Requests of the
Office of Consumer Advocate (OCA)
Dated November 10, 2025
Docket No. R-2025-3057164

OCA IX-19

(a) Has the Company analyzed, evaluated, or quantified the impact of increasing the residential customer charge on energy efficiency participation rates, participant bill savings, or program marketing and implementation?

(b) If "yes" summarize the Company's conclusions and provide all such studies.

(c) If "no," did PPL energy efficiency program personnel provide any input on the Company's residential rate design proposal?

PPL Electric Response

a) Participation – Company participation forecasts are limited by the established Act 129 budget caps.

Participant Bill Savings – While an energy efficiency measure may reduce energy consumption, actual bill savings are influenced by a variety of factors, including customer behavior, home and/or building type and condition, supply costs, and energy efficiency measures implemented.

Program Marketing and Implementation – There are no plans to integrate rate request elements into any energy efficiency customer marketing segmentation, campaign, or tactics.

(b) Not applicable.

(c) The Company's Energy Efficiency & Conservation team was consulted where appropriate, including the proposed electric vehicle time of use rate.

PPL Electric Utilities Corporation
Response to the Set III Data Requests of the
Sustainable Energy Fund (SEF)
Dated December 8, 2025
Docket No. R-2025-3057164

SEF III-1

PPL Electric witness Bethany Johnson states that "…ACOSS would support increases in these monthly fixed customer charges to $42.96 [RS] and 43.05 [GS-1] respectively, given the fixed costs incurred by the Company to provide service" PPL Electric St. No. 5 at 6.

(a) If PPL Electric were to receive the stated flat monthly customer charge, what would the corresponding volumetric distribution rate be for rate class RS and GS-1?

(b) Provide workpapers, analysis, and research relied on to determine the volumetric distribution rates identified in response to subpart (a).

PPL Electric Response

(a) Based on the updated ACOSS provided in response to OCA I-1 Supplemental, the analysis would support monthly fixed customer charges of $44.09 for Rate Schedule RS and $44.54 for Rate Schedule GS-1. Using those amounts for the response to this interrogatory, the amounts are as follows: (1) for RS, the value is $0.02205/kWh; and (2) for GS-1, the value is $3.435/kW.

(b) See SEF III-1 Attachment 1.

BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION

Pennsylvania Public Utility Commission *et al*,	:	R-2025-3057164 *et al*
v.	:	
PPL Electric Utilities Corporation	:	

Rebuttal Testimony of

John M. Costlow

on behalf of

The Sustainable Energy Fund

Date: January 23, 2025

TABLE OF CONTENTS

I. Introduction 1

II. PPL's WRAP Program 2

III. Affordability and Impacts of Increase in Customer Charge 3

IV. Conclusion 5

I. Introduction

Q. What is your name, and by whom are you employed?

A. John M. Costlow. The PP&L Sustainable Energy Fund ("SEF") employs me as President and Chief Executive Officer. My business address is 4250 Independence Drive, Schnecksville, PA 18078.

Q. Did you previously provide testimony in this proceeding?

A. Yes, I submitted Direct Testimony in this proceeding on behalf of SEF. My Direct Testimony addressed the following issues: The true level of PPL's proposed rate increase; PPL's future weather forecasts; PPL's proposed customer charge rate design and subsidization of low-use customers, PPL's proposed electric vehicle time-of-use program.

Q. What is the purpose of your Rebuttal Testimony?

A. I respond to the testimony of the Coalition on Economic Development ("CEO"), concerning PPL's program for low income customers to reduce energy usage ("LIURP"), known as the WRAP program. CEO St. No. 1, Warabak Direct at 7:1-9:16. I also address the impact of increasing the customer charge on affordability in response to various parties' contentions that the customer charge should not increase.

II. PPL's WRAP Program

Q. Do you believe PPL's WRAP program is adequately funded?

A. No. As cited by CEO witness Warabak PPL Electric exhausted its 2023 and 2024 WRAP budgets.

Q. How many WRAP projects did CEO complete for PPL customers?

A. CEO states that it completed 705 WRAP jobs on behalf of PPL Electric.[1]

Q. How long has it been since PPL Electric's previous rate case?

A. 10 years.

Q. CEO put forth that increasing the LIURP budget by $900,000 annually would result in an additional 300 WRAP jobs throughout the PPL Electric territory. Do you believe this level of funding will be adequate?

A. I do agree that the LIURP budget needs to be increased if the program is to make a meaningful contribution to the 300,000-plus low-income individuals and families. Unfortunately, $900,000 is simply insufficient given the increase in the PPL Electric portion of the bill.

[1] Exhibit SEF-1R (CEO Response to SEF Set I-1).

Q. What do you believe to be an adequate level of funding?

A. I recommend that the LIURP budget be increased at minimum $2 million in year one and increased each following year by an additional 5% until the program has assisted at least 50% of the low-income households or PPL's next base rate increase request.

III. Affordability and Impacts of Increase in Customer Charge

Q. Do you agree with EJA witness Karl Rabago regarding affordability?

A. Yes, I agree with Mr. Rabago that "PPL Electric's proposals will worsen the affordability crisis for hundreds of thousands of its customers."[2] I also agree that "[c]ustomers with high energy burdens are vulnerable to rate and bill volatility"[3]

Q. Do you agree with Mr. Rabago that "[f]ixed charges disproportionately impact low-income customers"[4]?

A. No. Too many experts associate low-income customers with low-usage customers and this is simply not true in the PPL Electric territory. As stated in my direct testimony the usage by low-income customers is higher than that of the total set of customers.

[2] EJA St. No. 1, Direct Testimony of Karl Rabago at 14.
[3] *Id.* at 13.
[44] *Id.* at 40.

Q. Do customers already conserve?

A. In the United States we started heavily promoting conservation of energy back in 1977 with Jimmy Carter's message to put on a sweater and turn down the thermostat. After almost 50 years conservation is common knowledge and those desiring to conserve are already doing so. In fact, if PPL Electric's educational efforts through the Act 129 EE&C plan had been successful, the efforts should have reinforced conservation since 2009. If not, then PPL Electric's efforts toward conservation education and related expenses need carefully examined. Raising the fixed charge will provide electric heat customers with the relief they need now without additional investment.

Q. Do you agree with the Environmental Justice Advocates (Witness Rabago), the Office of Consumer Advocate (Witness Johnson), , CAUSE-PA (Witness Cicero), …. that providing a greater opportunity for savings will persuade customers to engage in greater energy conservation and energy efficiency?

A. On the surface it appears to follow basic economics. Unfortunately, low-income customers who are struggling to survive are at the bottom of Maslow's Hierarchy of Needs. They are focused on food, shelter, medicine, transportation among other basic needs.

IV. Conclusion

Q. What are your recommendations to the Commission regarding the WRAP program?

A. Based on my testimony herein, I recommend:

- The funding for WRAP be increased $2 million dollars for the first year subsequent to PPL's rate increase; and
- That each year thereafter the WRAP budget is increased by an additional 5% until the WRAP program has assisted at least 50% of the low-income households or PPL's next base rate increase request

Q. Has your recommendation from your Direct Testimony regarding the customer charge changed?

A. No.

Q. Does this conclude your testimony?

A. Yes. I reserve the right to update or amend my testimony.

The Sustainable Energy Fund's

Exhibit SEF-1R

**SUSTAINABLE ENERGY FUND INTERROGATORIES, SET I,
TO COMMISSION ON ECONOMIC OPPORTUNITY**

Docket No. R-2025-3057164

Refer to CEO Statement No. 1, the Direct Testimony of Jennifer Warabak:

SEF Set I-1. In 2025, how many residents of Luzerne County were served by the CEO?

ANSWER: Approximately 75,000

a. How many were WRAP jobs?

ANSWER: 705

b. How many WRAP jobs for PPL?

ANSWER: 705

SEF Set I-2. For PPL Electric's Low-Income Renewable Energy Pilot

a. How many ratepayers in the PPL territory were served?

ANSWER: 215 solar systems (77 Photovoltaic and 138 Solar Water Heaters) were installed. All were PPL ratepayers.

b. Over what years?

ANSWER: 1999-2006

c. When did the program stop?

ANSWER: 2006

d. Why did it stop?

ANSWER: Pilot ended.

SEF Set I-3. Witness Warabak cites that the residential fixed monthly charge is increasing 9%.

Is that of the total bill or PPL's distribution charges?

ANSWER: PPL's proposal is to increase its fixed monthly customer charge for residential customers from $15.58 to $17.00, that would increase that fixed monthly customer charge 9%.

SEF Set I-4. Based on your experience with low-income customers, do they already lower their thermostat in the winter and raise it in the summer to conserve energy?

ANSWER: I do not know; however, the more a customer's bill is made up of fixed charges the less opportunity and motive they have to reduce their bill through

conservation

a. If so, is the customer's energy conservation, reducing their thermostat in the winter and raising it in the summer to a level that makes them uncomfortable in their homes from a temperature perspective? ANSWER: I do not know the comfort level of a customer.

b. How many low-income ratepayers are engaging in energy efficiency measures, such as sealing air leaks, adding more insulation, or installing a more efficient home heating unit? ANSWER: Unknown. There are so many ways in which a customer can add those energy efficiency measures, whether through the use of their own resources or through utility or government funded programs so CEO would not have information about this request.

SEF Set I-5. On behalf of clients, have you replaced any fossil fuel heating sources with electric ones during the last five years? ANSWER: Yes

a. Were any of these PPL Electric customers? ANSWER: One

b. Did PPL Electric fund these projects or promote electricity as a superior energy source? ANSWER: No, the project was funded through the PA Low-Income Home Energy Assistance Program

SEF Set I-6. In her testimony, Ms. Warabak advocates for increasing the number of WRAP jobs per year.

a. How many WRAP jobs would need to be performed by the CEO in the next ten years to retrofit all low-income ratepayer homes in Luzerne County? ANSWER: Unknown.

b. What would be the annual cost of completing these jobs? ANSWER: Unknown due to not knowing the number of WRAP jobs that would be needed nor the costs of those WRAP jobs over time.

c. Does the CEO have the resources needed to implement the number of jobs cited annually above? ANSWER: Unknown without knowing the number of jobs or the funding that would be available for such jobs

d. If not, what resources would the CEO need? ANSWER: See c. above.

SEF Set I-7. Sustainable Energy Fund funded a WRAP plus Health pilot. Does the CEO perform WRAP Plus health jobs? ANSWER: We have not.

a. If so, where is the funding from? See above.

b. Is the funding adequate? See above

SEF Set I-8. What are the barriers to completing WRAP jobs? ANSWER: Among the barriers are WRAP services were provided previously, health and safety issues and lack of cooperation on the part of the ratepayer.

SEF Set I-9. How many ratepayers are declined for WRAP services per year? ANSWER: In 2025, 238 PPL ratepayers were determined programmatically eligible for WRAP, referred to CEO for services, but did not cooperate with having the energy audit or work completed.

a. What was the reason for declining these ratepayers? ANSWER: See above.

SEF Set I-10. Of the 300 jobs per year cited in the recommended increase of $900,000, how many would be jobs performed by the CEO? ANSWER: PPL's WRAP serves a number of counites in Pennsylvania. CEO does WRAP for PPL in Luzerne County so it is unknown how many of the jobs would be performed by CEO.

SEF Set I-11. Since its inception, how many WRAP jobs have been completed by the CEO?

ANSWER: CEO does not keep data that would enable it to respond to this request.

How many WRAP jobs would need to be completed annually to cover Luzerne County completely in 10 years? ANSWER: Unknown for reasons stated above.

Surrebuttal Testimony of

John M. Costlow

on behalf of

The Sustainable Energy Fund

February 9, 2026

TABLE OF CONTENTS

I. Introduction 1

II. WRAP Funding Increase 2

III. EV TOU Program 3

IV. Increasing the Customer Charge 4

V. PPL Consumption Forecast 5

VI. Conclusion 6

I. Introduction

Q. What is your name, and by whom are you employed?

A. John M. Costlow. The PP&L Sustainable Energy Fund ("SEF") employs me as President and Chief Executive Officer. My business address is 4250 Independence Drive, Schnecksville, PA 18078.

Q. Did you previously provide testimony in this proceeding?

A. Yes, I submitted Direct Testimony and Rebuttal Testimony in this proceeding on behalf of SEF. My Direct Testimony addressed the following issues: The true level of PPL's proposed rate increase; PPL's future weather forecasts; PPL's proposed customer charge rate design and subsidization of low-use customers, PPL's proposed electric vehicle time-of-use program. My Rebuttal Testimony addressed the following issues: support for increasing PPL's Low-Income Usage Reduction Program ("LIURP") known as WRAP; and affordability of increase in the customer charge.

Q. What is the purpose of your Surrebuttal Testimony?

A. To address PPL's position regarding timing of increasing funding for WRAP, PPL St. No. 18-R at 51-52; PPL's position regarding alignment of TOU programs, PPL St. No. 2-R at 8, OCA's position regarding increasing the

customer charge, OCA St. No. 4-R and OCA St. No. 8-R, and PPL's position regarding its consumption forecast.

II. WRAP Funding Increase

Q. Do you agree with the result of PPL Witness Norden's rebuttal testimony that low-income customers wait until the next Universal Service Energy Conservation Program ("USECP") for additional WRAP funding?

A. No. PPL asserts that LIURP funding and budget issues may only be addressed in a USECP proceeding and not in a base rate case. *PPL Electric Statement No. 18-R (Norden)*, at 51–52. The Commission orders relied upon in that testimony were entered in 2012 and 2021 and predate the Commission's 2025 Final Form LIURP Rulemaking. Under the LIURP funding regulation, 52 Pa. Code § 58.4, the Commission may revise LIURP funding levels through Commission orders addressing recovery of program costs in utility rates, and LIURP cost recovery is determined in rate proceedings. § 58.4(b), (e). In the 2025 Final Form LIURP Rulemaking, the Commission expressly clarified that "it is necessary to evaluate the appropriateness of a LIURP funding requirement in non-USECP proceedings **such as rate cases.**" *Final Form Rulemaking Order*, Docket No. L-2016-2557886, at 123 (Order entered Mar. 13, 2025) (emphasis added).

III. EV TOU Program

Q. PPL Witness Conrad disagrees that the EV TOU rate on peak and off peak period should align with the Default Service generation TOU time periods, reasoning the EV TOU program is aimed at mitigating distribution constraints, not a generation-aligned program. Do you agree that the program timelines should not be aligned?

A. No. As stated in my Direct Testimony, I believe that unless timelines for the EV TOU and generation TOU program are aligned, customers will be confused. PPL's testimony does not address this confusion. Moreover, EV customers, like all other customers, have bills composed of distribution and generation. Although generation is not owned by PPL Electric as a result of deregulation, distribution service is worthless to the customer without generation. Simplifying PPL Electric's administration should not be a consideration. PPL Electric exists for its customers; the customers don't exist for PPL Electric. As the default service TOU program times cannot be changed in this proceeding, it is appropriate to align the EV TOU program with the Default Service TOU. If the program is truly designed to learn about customer behavior, synchronizing both EV TOU and Default Service TOU on-peak and off-peak times will simplify use for ratepayers and provide an additional incentive for customers to modify their behavior. Further, just

because the EV program is primarily aimed at mitigating distribution constraints, doesn't mean it can't be used to provide further benefits by prohibiting EV users from utilizing generation for charging during peak hours.

IV. Increasing the Customer Charge

Q. Do you agree that increasing the customer charge to more than $40 is unreasonable, as put forth in OCA St. 4-R at 10-12?

A. No, because I continue to believe high-use low-income ratepayers are subsidizing low-use customers; aid for high-use ratepayers cannot come soon enough. Given OCA concerns, I recommend that the customer charge rate increase be phased in over 5 to 7 years to allow customers to adjust. Simply following the current path is unacceptable.

Q. Do you agree that increasing the customer charge will reduce the signal for conservation as discussed in OCA St. 4R at 12?

A. No, conservation is well known. Customers who are not already conserving either do not desire to conserve or can't conserve. Moreover, generation is a very significant portion of customer bills which is by nature completely volumetric and with continually increase costs already provides more significant incentive for conservation than volumetric distribution rates.

Q. Is the data imperfect related to low-income ratepayers?

A. Yes, there are multiple categories of low-income ratepayers: those with and those without electric heat, and those in urban and rural areas. I recommend OCA, CAUSE-PA, and the CEO join SEF in its 2026 research project to investigate data, attitudes, and the ability of resource-constrained ratepayers to respond not just to price signals but to the overall impact of utility bills in the PPL Electric territory. From this research, a common approach could be developed on how to best address both low-use and high-use low-income ratepayers.

V. PPL Consumption Forecast

Q. PPL disagrees with your testimony regarding the accuracy of its consumption forecast. PPL St. No. 4-R, Schram Rebuttal at 5-7. How do you respond?

A. Mr. Schram, in his rebuttal testimony, continues to look back to a 20-year historical average to project the future. As climate and weather patterns are changing and are forecast to continue changing, Mr. Schram's antiquated analysis techniques are no longer accurate for forecasting future sales. Just because his analysis is commonly used does not make it right.

VI. Conclusion

Q. Do you have any changes to your recommendations to the Commission from your prior testimony?

A. Yes, one change. I believe the increase in the customer charge I recommended in Direct Testimony should be phased in over 5-7 years to allow customer time to adjust.

Q. Does this conclude your testimony?

A. Yes. I reserve the right to update or amend my testimony.

RE: Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation; Docket No. R-2025-3057164

Your Honors:

Attached for filing with the Pennsylvania Public Utility Commission ("Commission" or "PUC") is the Direct Testimony of Katie Guerry on behalf of Convergent Energy and Power LP ("Convergent"), in the above-referenced proceeding.

As evidenced by the attached Certificate of Service, all parties to this proceeding are being duly served with a copy of this document. Thank you.

Very truly yours,

Rebecca Kimmel

	:	
PPL Electric Utilities Corporation	:	
	:	

DIRECT TESTIMONY OF KATIE GUERRY
ON BEHALF OF CONVERGENT ENERGY AND POWER

Q. Please state your name, occupation and business address.

A. My name is Katie Guerry. I am the Senior Vice President of Convergent Energy and Power, located at 7 Times Square, Suite 3504 New York, NY. Convergent Energy and Power ("Convergent") is a leading provider of energy storage solutions in North America. Founded in 2011, Convergent has over a decade of experience financing, developing, constructing, and operating energy storage assets for commercial, industrial, and utility customers. Convergent is backed by ECP, a $31 billion energy-focused private equity firm.

Q. What is the purpose of your testimony today?

A. The purpose of my testimony is to explain Convergent's interest in this proceeding, specifically as it relates to PPL's obligation to effectuate just and reasonable rates for customers in its service territory with battery storage systems.

Q. Please describe the nature of Convergent's work, specifically as it relates to PPL's Rate Case proceeding at Docket No. R-2025-3057164.

A. Convergent works primarily with commercial and industrial ("C&I") customers to design, develop, construct, and operate non-exporting, behind-the-meter battery energy

storage systems ("non-exporting BTM BESS" or "battery"). These systems are specifically designed, configured, and operated so as to not export electricity onto the utility grid. Instead, they capture and store energy for later use by the host customer. These systems act as cost controls for customers and provide valuable grid flexibility.

Q. Are you sponsoring any exhibits?

A. Yes, I am sponsoring Exhibit___(KG-1), which includes a recent version of my curriculum vitae. I am also sponsoring Exhibit___(KG-2) and Exhibit___(KG-3), which are copies of PPL's responses to Convergent's Set I and Set II Interrogatories to PPL.

Q. Please explain the purpose of a non-exporting BTM BESS.

A. Non-exporting BTM BESS provides value by reducing customer reliance on the electric grid during targeted periods of system stress. Convergent uses these systems to help customers reduce electricity costs while simultaneously improving grid reliability. Customers realize savings in three primary ways: (1) reducing capacity costs, (2) reducing transmission costs, and (3) reducing overall electricity expenditures.

Q. Please explain how Convergent's non-exporting BTM BESS operates in an electric distribution company's ("EDC") service territory.

A. The operation of non-exporting BTM BESS is strategic and data driven. Batteries are charged during periods of lower system stress or lower prices and discharged to serve on-site customer load during peak demand periods or higher-priced hours. This allows customers to shift consumption without interrupting operations. When a battery serves customer load during peak system conditions, rather than relying on the distribution utility, the customer not only reduces future demand-based charges but also helps relieve stress on the utility system during times of highest demand.

Q. Please explain Convergent's planning process for the installation of non-exporting BTM BESS on a customer's property.

A. Before deploying capital, Convergent conducts a detailed economic analysis to determine whether a battery investment is justified. This analysis evaluates the customer's load profile, physical configuration, and applicable rate schedules, and compares the expected customer savings against the cost to build and interconnect the battery system. If the expected savings exceed the costs, Convergent deploys capital to develop and operate the system, and recovers its investment through a share of the realized savings.

Q. Are there interconnection costs to customers associated with non-exporting BTM BESS?

A. There is a cost and process required to interconnect the battery to the distribution system. Interconnection costs can vary significantly and must be understood early in development. Predictable, transparent, and stable interconnection rules are therefore essential. Unexpected interconnection requirements or late-stage cost increases introduce material risk and can render otherwise viable projects uneconomic.

Q. Please explain the interconnection process for non-exporting BTM BESS in PPL's service territory.

A. PPL's governing documents do not contain clear or transparent interconnection rules that are specifically applicable to non-exporting BTM BESS. As reflected in PPL's responses to Convergent's interrogatories, the Company relies on a patchwork of definitions, such as "distributed generation," "distributed energy resources," and general references to storage, that may be interpreted to apply to non-exporting battery systems. Please refer to Exhibit__(KG-2). This ambiguity creates uncertainty and may result in the application of

requirements that were developed for fundamentally different technologies than non-exporting BTM BESS.

Q. Please explain the operational challenges of PPL's approach to non-exporting BTM BESS.

A. Clear rules are essential to managing customer expectations and enabling informed investment decisions. PPL's approach to non-exporting BTM BESS is unclear on its face. It does not make sense to treat non-exporting BTM BESS as a generation resource. The physical and operational characteristics of battery storage differ materially from those of generation technologies such as solar. Generation produces energy that must be accommodated by the grid and managed to prevent unintended impacts. By contrast, batteries do not produce energy. They charge and discharge only when instructed to do so, and only within programmed operating constraints.

Q. Do Convergent's non-exporting BTM BESS function as a generation resource?

A. Convergent's non-exporting BTM BESS are specifically engineered to prevent export, with multiple layers of hardware and software controls designed to ensure compliance. There is no spontaneous or uncontrolled output, and no inherent risk profile comparable to that of generation resources that inject power into the system. It is therefore critical that interconnection rules distinguish between generation and non-exporting storage. Applying generation-oriented interconnection requirements to non-exporting BTM BESS ignores these physical realities and results in requirements and costs that are not aligned with actual system risk.

Q. Do you believe PPL's approach to interconnection of non-exporting BTM BESS is unjust and unreasonable pursuant to 66 Pa. Code § 1301?

A. PPL's current approach to the interconnection of non-exporting BTM BESS is unjust and unreasonable for two reasons. First, PPL has not established rules specifically applicable to this class of resource. Second, in the absence of such rules, PPL applies requirements developed for generation resources, resulting in interconnection costs that do not reflect the operational characteristics or risk profile of non-exporting storage.

Notably, PPL has acknowledged in its interrogatory responses that it does not perform anti-islanding or similar studies to evaluate the risk of inadvertent export for non-exporting battery systems. Please refer to Exhibit___(KG-3). Without such analysis, there is no demonstrated link between the interconnection requirements imposed and any actual reliability risk or cost-of-service impact. As a result, the costs imposed on customers cannot be considered just or reasonable.

Q. How can PPL remedy its approach to interconnection of non-exporting BTM BESS to ensure just and reasonable rates for customers in Pennsylvania?

A. Non-exporting BTM BESS represent a unique class of distributed resources. They are distinct from generation not only in physical operation, but also in the value they provide. These systems enable customers to manage costs while simultaneously supporting distribution system reliability during peak conditions. PPL should therefore be required to develop, and seek Commission approval for, interconnection rules specifically tailored to non-exporting behind-the-meter battery storage, rather than continuing to apply ill-fitting generation standards.

Q. Why should this issue be addressed within the context of this rate case and not in a generic proceeding on interconnection?

A. While Convergent supports a more general review of Pennsylvania EDCs' interconnection policies, including for non-exporting BTM BESS, we believe that this rate case is also appropriate place to review these issues given the concentrated review of PPL's business practices and impact on its costs and revenues as well as the connection with customers being charged just and reasonable rates.

Q. Does this conclude your Rebuttal Testimony today?

A. Yes.

Technical Conference on Distributed Energy Resource (DER) Aggregations: Docket **RM18-9-000** (*Order No. 2222*), 2018

Subject: Needs and best market practices for customer-sited distributed energy resources in wholesale and retail markets.

State-Related Engagement

Spoke at Summer NARUC on panel "Lessons Learned From DER Aggregations Nationwide" (7/18/23)

EXHIBIT KG-2

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Convergent Energy and Power LP
Dated November 17, 2025
Docket No. R-2025-3057164

Convergent I-1	Please refer to page 200 of Exhibit GEO-1 (General Tariff). Explain whether Rule 6 applies to customers with a battery energy storage system installed behind an end-use-customer meter that is specifically designed, used, and intended to not export power onto the utility grid so it can capture and store energy for use at another time only by that ("Non-exporting Battery Storage").
PPL Electric Response	Batteries and other energy storage equipment is not considered generation under the proposed Rule 6 and, therefore, is not subject to the provisions of Rule 6.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Convergent Energy and Power LP
Dated November 17, 2025
Docket No. R-2025-3057164

Convergent I-2	Please refer to page 200 of Exhibit GEO-1 (General Tariff). Explain how Respondent defines “batteries and other energy storage equipment.”
PPL Electric Response	PPL Electric considers “batteries and other energy storage equipment” as any technology that captures and stores energy for later use.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Convergent Energy and Power LP
Dated November 17, 2025
Docket No. R-2025-3057164

Convergent I-3	Based on the definition of "batteries and other energy storage equipment," explain in what other circumstances such "batteries and other energy storage equipment" would be excluded from other rules or standards?
PPL Electric Response	Batteries and other energy storage equipment are not permitted to participate in net metering when they do not meet the definition of "alternative energy system" under the Alternative Energy Portfolio Standards Act. *See* 73 P.S. § 1648.2. The Company is not aware of other rules and standards that batteries and other energy storage equipment would be excluded from.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Convergent Energy and Power LP
Dated November 17, 2025
Docket No. R-2025-3057164

Convergent I-4	Please explain whether Respondent interprets Non-exporting Battery Storage to be a generating facility.
PPL Electric Response	PPL Electric does not consider non-exporting battery storage as a generating facility.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set II Data Requests of the
Convergent Energy and Power LP
Dated December 5, 2025
Docket No. R-2025-3057164

Convergent II-1

Please refer to PPL's response to Question I-7 of Convergent Set I Interrogatories ("Set I"). Does PPL consider a battery energy storage system installed behind a retail customer meter that is specifically designed and used not to export power onto the utility grid but to capture and store energy for the retail customer's use at another time ("Non-exporting Battery Storage") to be a Distributed Energy Resource ("DER") under Rule 12?

a. If yes, please explain the basis for that conclusion and provide all supporting documentation.
b. Does the level of the customer's voltage connection affect whether Non-exporting Battery Storage behind a customer's meter is considered a DER?

PPL Electric Response

a. The Company considers non-exporting energy storage systems interconnected with the electric distribution grid, including batteries, to be classified as distributed energy resources ("DERs") under Rule 12 of the Retail Tariff. See Convergent I-10 Attachment 1 and Rule 12 of PPL Electric's Retail Tariff.
b. A non-exporting batter storage that is interconnected behind the meter at distribution level voltage is considered a DER under Rule 12 of the Retail Tariff.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set II Data Requests of the
Convergent Energy and Power LP
Dated December 5, 2025
Docket No. R-2025-3057164

Convergent II-2	Please refer to PPL's response to Question I-7 of Set I. Is PPL referring to a solar project plus a battery storage resource when it defines DER to include "storage resources (batteries)" under Rule 12? If not, to what type of configuration is PPL referring?
PPL Electric Response	No. "[S]torage Resources (batteries)" are classified as DERs which are subject to Tariff Rule 12, regardless of whether they are coupled with an alternative energy source or when interconnected as a standalone energy storage system.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set II Data Requests of the
Convergent Energy and Power LP
Dated December 5, 2025
Docket No. R-2025-3057164

Convergent II-3	Please refer to PPL's response to Question I-7 of Set I. Does Non-exporting Battery Storage without a solar component qualify as a DER under Rule 12?
PPL Electric Response	Yes. See responses to Convergent II-1 and 2.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set II Data Requests of the
Convergent Energy and Power LP
Dated December 5, 2025
Docket No. R-2025-3057164

Convergent II-7

Please refer to PPL's response to Question I-14 of Set I. Does PPL Electric consider Non-exporting Battery Storage behind a customer's meter to qualify under its provided definition of Behind the Meter Generation?

a. Does PPL's answer to this question change depending on whether the customer is transmission-level or distribution-level voltage?

PPL Electric Response

At a distribution level, the Company considers Non-Exporting Battery Energy Storage Systems ("BESS") to be Distributed Energy Resources ("DERs") as opposed to behind the meter generation. BESS is a resource that uses batteries to store electrical energy for later use. It is a non-renewable resource that can charge from the grid or from behind the meter generation. It can also discharge energy when needed, providing various functions, such as backup power or load leveling.

a. At a transmission level, Non-Exporting BESS is still considered a DER.

EXHIBIT KG-3

WITNESS: Greg Olsen

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Convergent Energy and Power LP
Dated November 17, 2025
Docket No. R-2025-3057164

Convergent I-15	Please identify whether Respondent performs anti-islanding studies or similar transient studies to analyze the actual risk of islanding when evaluating the interconnection of Non-exporting Battery Storage.
PPL Electric Response	On the distribution system, energy storage systems, including battery storage, are prohibited from exporting to the distribution grid. Therefore, the Company does not perform anti-islanding studies on these systems. On the transmission system, behind the meter energy storage systems (which would include battery storage systems) are prohibited from exporting to the transmission system. The Company installs protection systems to prevent unintentional export. Therefore, the Company does not perform anti-islanding studies on these systems.

WITNESS: Greg Olsen

PPL Electric Utilities Corporation
Response to the Set I Data Requests of the
Convergent Energy and Power LP
Dated November 17, 2025
Docket No. R-2025-3057164

Convergent I-16	Please identify whether Respondent performs anti-islanding studies or similar transient studies to analyze the actual risk of islanding when evaluating the interconnection of behind-the-meter generation.
PPL Electric Response	Interconnection of a behind-the-meter renewable generator which requires an Interconnection Impact Review will receive an anti-islanding study as part of the review process.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set II Data Requests of the
Convergent Energy and Power LP
Dated December 5, 2025
Docket No. R-2025-3057164

Convergent II-8

Please refer to PPL's response to Question I-15 of Set I. What are the referenced "protection systems to prevent unintentional export" the Company installs?

a. Are they installed on the customer side of the meter or on the Company's side?
b. How are the costs for these protection systems allocated?

PPL Electric Response

The Company requires Point of Contact ("POC") and Intertie Protective Relay ("IPR") protection packages with various sensing components and relays and may install a Direct Transfer Trip ("DTT") high-speed communication-based protection scheme to prevent export of power for energy storage systems on the referenced protection system for Transmission level customers.

a. DTT equipment is installed on the Company's side of the meter.
b. The full cost of these protection systems is fully allocated to the customer that is installing a non-exporting energy storage system.

WITNESS: Gregory Olsen

PPL Electric Utilities Corporation
Response to the Set II Data Requests of the
Convergent Energy and Power LP
Dated December 5, 2025
Docket No. R-2025-3057164

Convergent II-9	Please refer to PPL's response to Question I-15 of Set I. If the Company does not perform anti-islanding studies, please explain how the Company determines that the protection systems installed and their associated costs are necessary?
PPL Electric Response	On the distribution system, energy storage systems, including battery storage, are prohibited from exporting to the distribution grid. As a result, the Company does not install protection systems. On the transmission system, behind-the-meter energy storage systems (including battery storage) are prohibited from exporting to the transmission grid. To ensure compliance and prevent unintentional export, the Company installs protection systems as detailed in response to Convergent II-8 per the Company's engineering standards.

RE: Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation; Docket No. R-2025-3057164

Your Honors:

Attached for filing with the Pennsylvania Public Utility Commission ("Commission" or "PUC") is the Surrebuttal Testimony of Katie Guerry on behalf of Convergent Energy and Power LP ("Convergent"), in the above-referenced proceeding.

As evidenced by the attached Certificate of Service, all parties to this proceeding are being duly served with a copy of this document. Thank you.

Very truly yours,

Rebecca Kimmel

	:	

SURREBUTTAL TESTIMONY OF KATIE GUERRY ON BEHALF OF CONVERGENT ENERGY AND POWER

Q. Please state your name, occupation and business address.

A. My name is Katie Guerry. I am the Senior Vice President of Convergent Energy and Power, located at 7 Times Square, Suite 3504 New York, NY.

Q. Have you previously filed testimony in this proceeding?

A. Yes, I filed Direct Testimony on December 22, 2025.

Q. Are you sponsoring any Exhibits with your Surrebuttal Testimony?

A. Yes. PPL's "Energy Storage Interconnection Policy and Guidance" document is attached as Exhibit A.

Q. Do you agree with PPL's Rebuttal Testimony of Mr. Olsen that it is in PPL Electric Utilities Corporation's ("PPL Electric" or "PPL") best interest to treat and classify non-exporting behind-the-meter battery energy storage systems ("BTM BESS") as a generation source?

A. Please reference PPL St. No. 14-R pp. 9-11. No. That statement is inconsistent with PPL Electric's own discovery responses in this proceeding. PPL Electric has repeatedly stated that non-exporting battery storage is not generation and does not constitute a generating

facility (*see* Convergent Interrogatories Set I, I-1 and I-4). Treating non-exporting BTM BESS as generation for interconnection purposes contradicts those admissions and conflates resources with materially different physical and operational characteristics.

Q. Has PPL Electric otherwise acknowledged that non-exporting BTM BESS should be treated differently than generation?

A. Please reference PPL St. No. 14-R pp. 9-11. Yes. In addition to its discovery responses, PPL Electric's own "Energy Storage Interconnection Policy and Guidance" (*see* Exhibit A, Section 6 Inadvertent Export) expressly distinguishes between energy storage systems operating without on-site generation and those operating in conjunction with generation and evaluates those configurations differently for interconnection purposes. The policy identifies separate storage configurations and applies configuration-specific requirements, reflecting that PPL Electric recognizes meaningful differences in how storage without generation interacts with the distribution system.

Notably, that same policy addresses inadvertent export for non-exporting storage through control and verification requirements, e.g., equipment settings, relays, and energy management systems, rather than by presuming that storage without generation presents generation-level interconnection risk.[1] This configuration-based approach is inconsistent with Mr. Olsen's rebuttal testimony, asserting that non-exporting BTM BESS should be treated the same as generation for interconnection purposes.

[1] *See* PPL Electric Utilities, Energy Storage Interconnection Policy and Guidance, § 6 (Inadvertent Export), which addresses prevention of unauthorized export through customer-side controls and verification; *see also* Pacific Gas and Electric Company, Electric Rule No. 21 (Generating Facility Interconnections), which similarly manages inadvertent export risk for non-exporting battery storage through defined control and verification requirements rather than categorical treatment as generation.

Q. How do you respond to Mr. Olsen's assertion that non-exporting BTM BESS are electrically indistinguishable from traditional generation?

A. That assertion overlooks how non-exporting BTM BESS are designed and operated. Non-exporting BTM BESS do not inject energy into the grid and operate exclusively under programmed controls to serve on-site load. Unlike generation, they do not produce energy autonomously or require the grid to accommodate output. These operational differences are directly relevant to how interconnection risk should be evaluated.

Q. Mr. Olsen suggests that Convergent's concerns are better addressed in a separate Commission rulemaking proceeding at Docket No. M-2025-3059032, rather than in PPL Electric's Base Rate Case. Do you agree?

A. Please reference PPL St. No. 14-R pp. 10-11. I agree that the rulemaking may be a useful forum for broader, statewide discussion. However, I do not agree that this issue should be deferred entirely to that proceeding. PPL Electric previously took the position that concerns regarding non-exporting BTM BESS should be addressed in its Distributed Energy Resource Management Plan proceeding (Docket No. P-2024-3049223), yet that proceeding did not resolve these issues. Now, PPL suggests deferral to a new docket while simultaneously asserting that its current practice of treating non-exporting BTM BESS as generation is reasonable. Given this history, there is little assurance that further deferral will result in meaningful changes absent Commission direction.

Q. Why is it appropriate for the Commission to address this issue in the context of PPL Electric's Base Rate Case?

A. Because interconnection practices directly affect customer costs and therefore customer rates. The cost to interconnect behind-the-meter resources is increasingly material to

customers and directly impacts cost of service. PPL's application of generation-based interconnection requirements to non-exporting BTM BESS imposes costs that are not clearly tied to demonstrated system risk. As customers seek to invest in non-exporting storage to manage costs and contribute to reliability, it is incumbent on PPL to develop interconnection rules that reflect the actual physical characteristics of the resource being interconnected. Ensuring that those costs are just and reasonable is squarely within the Commission's responsibility in a rate case.

Q. Does this conclude your Surrebuttal Testimony today?

A. Yes.

1 BACKGROUND AND PURPOSE

PPL Electric has developed guidelines and acceptable energy storage system (ESS) configurations to be installed in PPL Electric's service territory to ensure safe and reliable service for all distribution customers.

This document provides the guidelines for the interconnection of ESSs installed in various configurations on the distribution system:

1a) Provide standby (back-up power) during power outages

1b) Parallel operation with the utility without on-site generation

1c) Parallel operation with the utility in conjunction with on-site generation

This PPL Electric Energy Storage Interconnection Policy and Guidance Document will be modified as needed to reflect the Company's interconnection policies and standards, tariff rules as well as state and Pennsylvania's Public Utility Commission (PUC) regulations.

2 NET-METERING STATUS

At the time of the publication of this policy and guidance document, PPL Electric's Tariff and the Alternative Energy Portfolio Standards (AEPS) Act of 2004, as enforced by the Pennsylvania Public Utilities Commission (PUC), does not qualify ESSs for net-metering.

3 EXCLUSIONS

This document applies to energy storage interconnections in PPL Electric's service territory that operate within the jurisdiction of PPL Electric's tariff. This document does not apply to energy storage interconnections that are operating within a Wholesale Market Participation Agreement (WMPA) between PJM, PPL Electric, and the customer.

4 INTERCONNECTION REVIEWS

Customers must submit an interconnection application for their prospective generation and/or energy storage Distributed Energy Resource (DER). An interconnection application consists of an interconnection review to ensure system safety and reliability as well as compliance with technical and operational requirements. Customers that intend to install an ESS in parallel with the PPL Electric grid are required to sign an Interconnection Agreement (IA).

When an ESS is installed alongside a generation system within the same application, such as solar plus storage, they will be reviewed simultaneously. For inverter-based generation, the interconnection review will be based solely on the rated capacity of the inverter directly connected to the generation system, not the combined capacity of the inverter-based generation and the ESS. At the time of publication of this document, the storage nameplate capacity will not be considered during interconnection review as ESSs are ineligible for net-metering and are prohibited from exporting energy to the grid. The non-export operating mode is a requirement and settings shall be provided at the time of application for ESSs operating in parallel with the distribution system. Any subsequent changes to the ESS's operating mode shall be communicated to PPL Electric and is subject to utility approval.

New interconnection applications must be submitted to modify or retrofit existing ESSs.

5 PPL ELECTRIC ENERGY STORAGE CONFIGURATIONS

The following are the only Energy Storage System (ESS) configurations permitted by PPL Electric's Tariff:

1a) Standby (backup) ESS without Generation

1b) ESS Operating in Parallel without Generation

1c) ESS Operating in Parallel with Generation

An Interconnection Agreement (IA) is required for any ESSs that are interconnected with the utility grid. ESSs that have no electrical connection to a PPL Electric system do not require an interconnection agreement. Consult your local Authority Having Jurisdiction (AHJ) for more information.

Each configuration is further elaborated in the following sections. Illustrations of the various configurations are shown in Section 7. The customer may have additional features at their facility that are not reflected in the diagrams, but the distinguishing operational features of any ESS installed by a customer shall be consistent with one of the following configurations. The functionality required for each configuration may be controlled by the inverter or control system programming. All configurations require that the customer/contractor utilize all necessary equipment and control system settings to ensure that

the ESS does not export to the grid. Verifiable proof of equipment installation and control system settings are required to ensure compliance with non-export of the ESS to the grid[1].

5.1 STANDBY (BACKUP) ENERGY STORAGE AS PERMITTED BY NEC 702 (1A)

Energy storage systems installed in this configuration with the grid do not need an interconnection agreement. This configuration is intended to supply power, automatically or manually, to the customer's facility in the event of a loss of power from the utility. This configuration does not qualify for net-metering and exporting energy to the grid using the ESS is strictly prohibited. This configuration can be charged by on-site generation or from the utility but may only discharge power to the customer's facility when electrically isolated from the PPL Electric grid. This configuration is typically used to power critical load panel(s), normally powered from the main panel, which can instead be powered by the standby (backup) ESS when there is a loss of power from the utility.

This configuration requires that the customer/contractor install an automatic or manual open transition (break-before-make) switch. This device will ensure that the ESS is able to be charged while connected to the utility and can only be discharged when a loss of power from the utility is detected.

An automatic transition switch is usually preferred to enable the automatic operation of the ESS when a loss of power from the utility is detected. National Electric Code (NEC) Article 702 addresses the transition device requirements for optional standby (backup) systems which this configuration must comply with. Manual Interlock kits and closed transition (make-before-break) switches are prohibited from being used for standby ESS applications. PPL EU approved open transition automatic switches can be found on the REMSI website. If a switch that does not appear on this list is to be used, the customer/contractor must provide the switch's model specification sheet for review and approval when submitting the interconnection application. Manual open transition switches are approved for use by PPL EU; however, an approved list of models is not maintained.

If the conditions for this energy storage configuration are met, PPL Electric recommends the following:

- Provide PPL EU with a one-line diagram
- Provide PPL EU with Electrical Inspection Cut-in Card indicating approval

To ensure the safety and reliability of the distribution system, PPL EU reserves the right to conduct an inspection to verify compliance. PPL Electric reserves the right to verify non-export status of ESSs by any means available to the utility.

[1] Verifiable proof should be provided when the interconnection application is submitted for review and approval. Verifiable proof can be in the form of one-line diagrams, equipment specification sheets and inverter operating mode and settings.

5.2 ENERGY STORAGE OPERATING IN PARALLEL WITHOUT GENERATION (1B)

This configuration allows the ESS to operate in parallel with the utility as a demand side management (DSM) resource but does not allow the ESS to export energy to the grid. This configuration does not qualify for net-metering and exporting energy to the grid using the ESS is strictly prohibited. Subject to the Inadvertent provisions below, the customer must provide the control system settings as part of the interconnection application to ensure that the ESS does not export to the grid. This configuration maybe charged from the utility and discharged to power the customer's facility while operating in parallel with the utility.

This configuration requires that the customer/contractor utilize all necessary equipment and control system settings to ensure that the ESS does not export to the grid. All inverters and ESSs must be Institute of Electrical and Electronics Engineers (IEEE) 1547 and Underwriters Laboratory (UL) 1741 SA certified as applicable.

To ensure safe interruption of the ESS, an AC disconnect switch must be installed between the load side of the utility billing meter and the ESS inverter to facilitate the immediate isolation of the system from the electric grid during emergencies.

If the conditions for this energy storage configuration are met, the following items must be provided to PPL EU prior to operating the system:

- Verifiable proof of equipment or control system settings to prevent net metering ineligible export from ESSs
- Approved Electrical Inspection Cut-in Card
- Signed Interconnection Agreement and Certificate of Completion

To ensure the safety and reliability of the distribution system, PPL EU reserves the right to conduct an inspection to verify compliance. PPL Electric reserves the right to verify non-export status of ESSs by any means available to the utility.

5.3 ENERGY STORAGE OPERATING IN PARALLEL WITH GENERATION (1C)

This configuration allows the combined generation and ESSs to operate in parallel with the utility as a DSM resource but does not allow the ESS to export energy to the grid. This design provides for the following:

- Allows the ESS to be charged by either the utility or the generator
- Allows the ESS to be discharged while operating in parallel with the utility.
- Applies only to systems that combine both generation and energy storage.
    - Types of generation include standby generation (i.e., backup diesel), self-generation[2] and net-metered generation[3] such as solar photovoltaic.

Energy exported from the ESS does not qualify for net-metering and exporting energy to the grid using the ESS is strictly prohibited. PPL EU requires the customer/contractor to utilize all necessary equipment and control system settings to ensure that the ESS does not export to the grid.

Subject to the Inadvertent Export provisions below, the customer must provide the control system settings as part of the interconnection review.

All inverters and ESSs must adhere to the most recent versions of IEEE 1547 and UL 1741 as applicable.

To ensure safe interruption of the ESS, an AC disconnect switch must be installed in between the load side utility meter and the DER/ESS inverter to facilitate the immediate isolation of the ESS and/or DER from the electric grid in case of emergencies.

If the conditions for this energy storage configuration are met, the following items must be provided to PPL EU prior to operating the system:

- Verifiable proof of equipment or control system settings to prevent net metering ineligible export from ESSs
- Approved Electrical Inspection Cut-in Card
- Signed Interconnection Agreement and Certificate of Completion

To ensure the safety and reliability of the distribution system, PPL Electric reserves the right to conduct an inspection to verify compliance at any time. PPL Electric reserves the right to verify non-export status of ESSs by any means available to the utility.

[2] Self-generation is generation supplying some or all of the customer's demand from onsite generation with no intent to export or to be compensated for export.
[3] Net-metered generation is generation at the customer's facility that is permitted to export to the grid and to be compensated for that export energy. Net-metered generation includes renewable generation that has been approved for net-metering.

6 INADVERTENT EXPORT

The customer is responsible for ensuring that the ESS is inhibited from exporting energy to the grid. Inadvertent export is defined as the unauthorized export of real power to the grid from an export ineligible power source, such as an ESS, operating in parallel with the utility. The customer/contractor is required to use any combination of equipment and control system settings such as transfer relays, energy management systems or any other customer facility hardware or software to prevent the ESS from exporting to the grid.

BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION

REBUTTAL TESTIMONY OF

KATHLEEN BOLCAR REVER

ON BEHALF OF
IGS SOLAR
("IGS")

PPL Electric Utilities Corporation Base Rate Case
Docket No. R-2025-3057164

TOPICS:

Solar Surcharge Proposal by CAUSE-PA

January 23, 2026

I. INTRODUCTION

Q. PLEASE STATE YOUR FULL NAME, POSITION, AND BUSINESS ADDRESS.

A. My name is Kathleen Bolcar Rever. My business address is 6100 Emerald Parkway, Dublin, Ohio 43016.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by IGS Energy as a director of legislative and regulatory affairs, primarily supporting our solar businesses.

Q. PLEASE DESCRIBE IGS ENERGY.

A. IGS Energy ("IGS") is licensed by the Pennsylvania Public Utility Commission. ("PUC" or "Commission") to sell electric energy to homes and businesses in several of the markets of Pennsylvania's major electric distribution companies ("EDCs"), including the service territory of PPL Electric Utilities Corporation's ("PPL" or the "Company").[1] IGS Solar, an affiliate of IGS Energy, provides solar photovoltaic ("PV") sited behind a residential or commercial customer's meter. IGS Solar's business model is focused on providing solar systems to residential or commercials who have meaningful on-site energy use, which I may refer to as "self-consuming generators." The solar PV systems provided by IGS Solar to self-consuming generators are sized to meet annual load (or some minimal percentage above annual load, such as 110% above annual load).

[1] IGS Solar is registered in Pennsylvania as a Foreign Limited Liability Company, and operates under the license granted by the PA PUC in Docket No A-2011-2228643 to Interstate Gas Supply, LLC to begin to offer, render, furnish, or supply electric generation services as a supplier to residential, small commercial (25 kW and under demand), large commercial (over 25 kW demand), industrial, and governmental customers in the electric distribution company service territories of Duquesne Light Company, Metropolitan Edison Company, PECO Energy Company, Pennsylvania Electric Company, Pennsylvania Power Company, PPL Electric Utilities Corporation, and West Penn Power Company in the Commonwealth of Pennsylvania.

IGS Solar is different from others who have oversized systems with no meaningful on-site energy use that export the vast majority of their generation to the grid.

No party has opposed IGS Solar's Petition to Intervene in this proceeding, which was granted in Prehearing Order #1.[2]

Q. PLEASE DESCRIBE YOUR EDUCATIONAL AND OCCUPATIONAL BACKGROUND.

A. I obtained a Bachelor of Arts in Biology and in Environmental Science from the University of Virginia and a Master of Environmental Management and a Master of Public Policy from Duke University. I have worked for IGS in my current capacity for over ten years. Prior to that, I worked for the Solar Energy Industries Association as a Director of State Affairs for four years. Prior to that, I worked at the United States Department of Energy in their Solar Energy Technologies Program for four years.

Q. HAVE YOU PREVIOUSLY PROVIDED TESTIMONY IN ANY PROCEEDING BEFORE THE PENNSYLVANIA PUBLIC UTILITY COMMISSION?

A. No.

Q. HAVE YOU PREVIOUSLY TESTIFIED IN OTHER UTILITY PROCEEDINGS?

A. Yes, I submitted testimony to the New Jersey Board of Public Utilities and the Ohio Public Utilities Commission.

Q. ARE YOU SPONSORING ANY EXHIBITS?

A. Yes, Exhibit KR-1, which are CAUSE-PA's responses to IGS Solar's interrogatories.

Q. WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?

I am submitting this testimony on behalf of IGS Solar to respond to one of the proposals made in the Direct Testimony of Patrick M. Cicero ("CAUSE-PA Statement 1").

[2] *PUC v. PPL Elec. Utils. Corp.*, Docket Nos. R-2025-3057164 (Order issued Nov. 14, 2025), at 6.

Specifically, I am responding to the proposal at CAUSE-PA Statement 1 at pages 116–17 that net metered customers pay the Universal Service Rider ("USR") and the Phase 4 Act 129 Compliance Rider ("ACR 4" or "ACR") based on their gross volumetric usage of electricity notwithstanding their self-generation.[3]

I am limiting the scope of my rebuttal testimony to that recommended solar surcharge proposal and I am not attempting to respond to other specific statements, proposals or recommendations made in CAUSE-PA Statement 1 or by the testimony of the other parties' witnesses. In the event that an issue is not addressed, this should not be viewed as my or IGS Solar's acceptance of their testimony. Rather it reflects my belief that a response in this rebuttal testimony is not warranted, either because it was adequately addressed by other rebuttal testimony or because it is a legal matter that is better addressed by counsel in briefs or other pleadings.

Q. DID YOU ADDRESS THIS ISSUE IN YOUR DIRECT TESTIMONY?

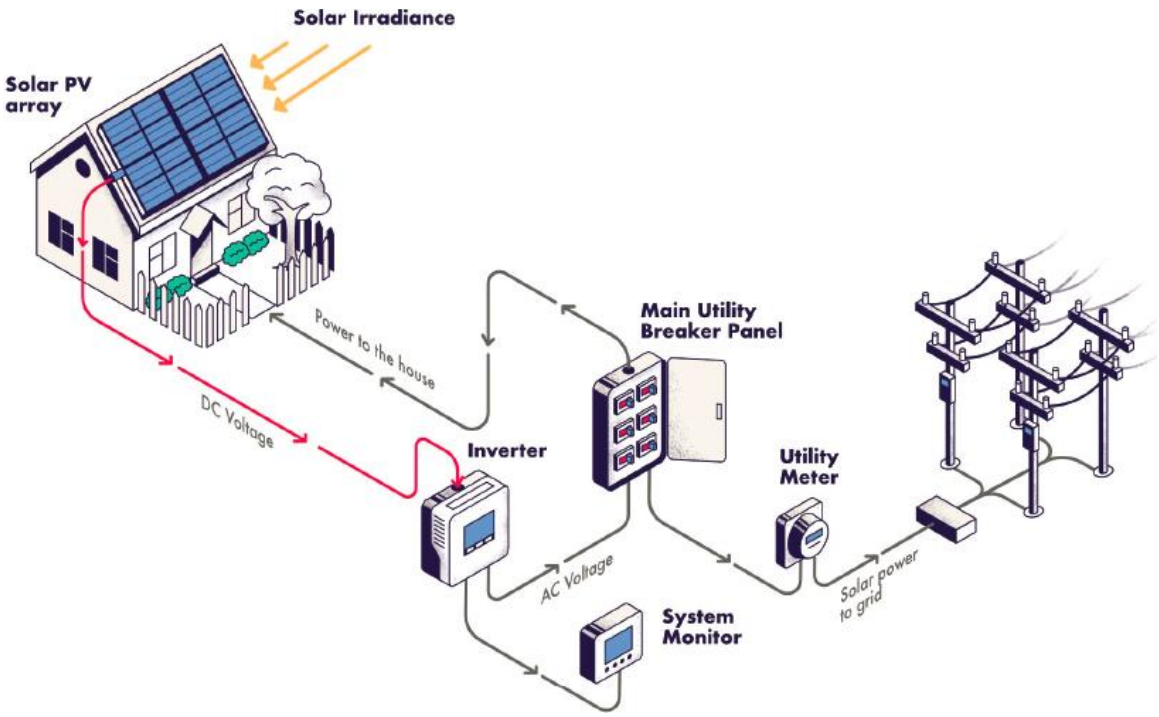
A. No. Mr. Cicero's proposal from his direct testimony was not something that PPL advanced or proposed in its own base rate case, and therefore, IGS Solar did not submit direct testimony on this issue because it had no idea that such a proposal would be the subject of this proceeding.

Q. HOW IS YOUR TESTIMONY STRUCTURED?

A. First, I explain how net metering is currently structured. Then, I discuss certain ambiguities in Mr. Cicero's proposed solar surcharge recommendation. Finally, I explain how the recommendations would be difficult to implement and would run afoul of Pennsylvania's existing net metering paradigm.

[3] CAUSE-PA St. 1 at 116.

Q. PLEASE SUMMARIZE YOUR RECOMMENDATION.



A. I recommend that the Commission reject Mr. Cicero's solar surcharge recommendations in their entirety. They are unworkable and unreasonable.

II. NET METERING IN PENNSYLVANIA

Q. HOW DOES NET METERING WORK IN PENNSYLVANIA?

A. The below line diagram shows how a "typical" residential net metered system is arranged.[4] This image shows a moment in time when the solar system is producing more than the customer is consuming and, therefore, exporting power to the grid:

Diagram 1 – Bi-Directional Meter

Any excess generation not consumed onsite is sent back through the utility meter and to the grid. These electrons then flow to the nearest point of load. Net metering ensures that

[4] *See* Chapter 2: Net Metering 101, *The Role of Net Metering in the Evolving Electricity System*, NATIONAL ACADEMIES (2023), https://www.nationalacademies.org/read/26704/chapter/4#31.

customers receive fair and reasonable compensation for energy they place on the electric grid. The system monitor is owned by the system owner – be it the customer or a third-party owner – and monitors the production of the solar system. The utility meter measures the net flow of electrons to or from the grid at the end of each month. In a month where the customer sends more power back to the grid than they consume, the customer accumulates a credit for each excess kilowatt-hour ("kWh"). In a month where the customer consumes more power from the grid than they send back, they pull from their bank of excess credits to cover the cost of these kWhs.

Q. DOES THE CUSTOMER SEND EVERY KWH PRODUCED BY THE SOLAR SYSTEM TO THE GRID?

A. No, they do not. First, they consume any generated electrons that are needed instantaneously. Any leftover kWhs are sent back to the grid. The net of these "leftover" kWhs sent to the grid and any kWhs consumed from the grid is what the utility meter measures at any given point in time.

Q. HAVE YOU DESCRIBED A SINGLE BI-DIRECTION METER ARRANGEMENT?

A. Yes. I have. I did so because, to my knowledge, PPL's most common or standard net metering arrangement uses a single bi-directional meter. That is what is called for in PPL's Electric Tariff.[5] The single bi-directional meter measures the flow of electricity in both directions at the same rate. It tracks energy drawn from the grid (when your generation is insufficient) and excess energy sent back to the grid (when you overproduce). The bi-directional meter measures the **net volumetric usage** of electricity.

[5] PPL Exhibit GEO-1 at Original Page No. 21A.

Q. PLEASE BRIEFLY DESCRIBE THE ACR 4 SURCHARGE.

A. The ACR 4 surcharge is intended to cover PPL's costs for PPL's Energy Efficiency and Conservation ("EE&C") Plan.[6] I understand that the ACR 4 is calculated on electricity ***supplied*** to customers.[7]

Q. PLEASE DESCRIBE THE USR SURCHARGE.

A. The USR charge is intended "for recovery of the costs, including internal administrative costs (i.e., employee salaries, wages, and benefits), associated with universal service programs provided by the Company to residential customers."[8]

I understand that the USR is calculated on electricity ***supplied*** to residential customers.[9] The USR does not apply to other rate schedules.[10]

Q. HOW ARE THE ACR 4 AND THE USR, IF APPLICABLE, APPLIED TO CUSTOMER-GENERATORS?

A. PPL's Tariff provides that the customer-generator is responsible for the customer charge, demand charge, and other applicable charges under the applicable Rate Schedule.[11] PPL has explained that:

> Customer generators are responsible for paying all riders under their applicable rate schedule. *See* PPL Electric Exh. GEO-1, at p. 50. Some riders are based on [gross] usage, and if a customer generator has low or zero usage, the charge for those riders will be low or zero, respectively.[12]

Residential net-metered customers receive service under Rate Schedule RS. They pay the USR and ACR 4 on the electricity that is delivered to them by the grid. They do not pay

---

7 PPL Exh. GEO-1 at Original Page No. 26.
8 PPL Exh. GEO-1 at Original Page No. 20.
9 PPL Exh. GEO-1 at Original Page No. 20; PPL Exh GEO-1 at Original Page No. 18 (Rider Matrix).
10 PPL Exh. GEO-1 at Original Page No. 18 (Rider Matrix).
11 PPL Exh. GEO-1 at Original Page No. 21.
12 PPL Response to CAUSE-PA X-17.

the USR and ACR 4 surcharges on their self-generated electricity because it was not delivered to them by the grid. The electricity that was not delivered to them by the grid is not subject to PPL's distribution charge.

The same is true for small C&I customers who are net-metered and receiving service under Rate Schedule GS-3. They pay the USR and ACR 4 on the electricity that is delivered to them by the grid. They do not pay the USR and ACR 4 surcharges for self-generated electricity because it was not delivered to them by the grid.

III. SOLAR SURCHARGE PROPOSAL

Q. PLEASE EXPLAIN YOUR UNDERSTANDING OF WHAT MR CICERO'S RECOMMENDATION WOULD LOOK LIKE.

A. Mr. Cicero's proposal is not completely clear, and there are two possible courses of action he is recommending based on his direct testimony.

Under one interpretation, Mr. Cicero's proposal would be to charge the USR and ACR on every kWh a customer uses, whether that kWh was supplied by the customer's solar system or the grid. In his words, "such that customers would still be responsible for these riders based on their volumetric usage notwithstanding their generation."[13]

Under another interpretation, Mr. Cicero is proposing that customers pay the USR and ACR on every electron that flows from the grid through the customer's meter.

In either case, the implementation of Cicero's proposal results in depriving customers of the full retail rate for their net metered energy. Cicero states that "PPL's net metering rider includes all riders in the full retail rate credited to these customers and only requires these customers to pay the monthly fixed customer charge."[14]

[13] CAUSE-PA St. 1 at 116.
[14] CAUSE-PA St. 1 at 116.

To help clarify which interpretation is actually being proposed, IGS Solar propounded interrogatories to CAUSE-PA. The responses that CAUSE-PA provided to IGS Solar's interrogatories, which are attached hereto as Exhibit KR-1, shed some light on the proposal but do not completely eliminate ambiguity. I read the responses by CAUSE-PA as advancing the first interpretation and not the second interpretation, yet there are still inconsistencies in the responses.[15] For example, even though small commercial customers are exempt from the USR per the terms of PPL's tariff (regardless of their net metering status), CAUSE-PA's responses to interrogatories nos. 5–8 state that small commercial customers would be responsible for the USR surcharge under a variety of hypothetical situations.[16]

Notwithstanding the ambiguity, I believe each of these interpretations of CAUSE-PA's solar surcharge proposals would be unjust and unreasonable, and the additional information below shows that potential unwieldy modifications to metering and billing would be required to implement Mr. Cicero's solar surcharge recommendations.

Q. HOW WILL CAUSE-PA'S PROPOSAL IMPACT IGS SOLAR AND CUSTOMER-GENERATORS?

A. CAUSE-PA's solar surcharge proposal, if approved, would have a significant negative effect on IGS Solar and competitive markets more broadly.

CAUSE-PA's proposal targets charges or surcharges on self-consuming generators and therefore presents a fundamental change from the current process under the Pennsylvania Alternative Energy Portfolio Standards ("AEPS") Act.

[15] *See, e.g.*, Exh. KR-1 at 3 (counting kWh towards USR / ACR 4 calculation, regardless of origin).
[16] Exh. KR-1 at 6–9.

If adopted, these proposals will have a significant impact on the ability of IGS Solar to continue to provide competitive solar energy service to residents and businesses in the PPL service territory given the likely reduced revenue, increased costs, and additional processes IGS Solar may be required to manage.

If adopted, the surcharge proposals would also cause customer-generators to pay the USR and ACR 4 on electricity that was not delivered to them from the grid. Mr. Cicero does not explain why self-generated electricity that is used before it reaches the grid should be subject to charges that are based on electricity supplied (delivered) from the grid.

Moreover, I am informed that the Commission does not have the authority to impose surcharges (or other fees) on self-generated electricity, as the self-generator is not a utility under PUC regulation and is not using electricity delivered by a utility under PUC regulation.

IV. CICERO'S PROPOSAL HAS FATAL IMPLEMENTATION ISSUES

Q. HOW HAS THE NEED FOR THE SOLAR SURCHARGES BEEN EXPLAINED?

A. In my opinion, the need for the solar surcharges has not been explained. When customers generate electricity behind the meter for their own use, they necessarily reduce their consumption of grid electricity. Reduced consumption of grid electricity leads to lost or decreased revenues (cost recovery) for the utility. That has always been the case, and CAUSE-PA has not explained how the facts and circumstances have changed so drastically since the passage of the Act 129 as to require charges or surcharges on a customer-generator's "avoided use" of grid electricity.

There is no actual cost-recovery problem. Mr. Cicero does not describe a problem with PPL's cost recovery for the ACR 4 or for the USR. He fails to provide any evidence that

surcharges as applied to grid electricity procured by PPL for customers are not adequate to support the universal service and/or alternative energy compliance programs of PPL. There is no established cost-causation. Mr. Cicero does nothing to show that self-generated electricity is the cause of any costs in the universal service and/or alternative energy compliance programs of PPL. He provides no evidence to support an allegation that customer-generators who use their own electricity cause PPL to incur costs for the ACR 4 or the USR that support charging them for their avoided use of grid electricity.

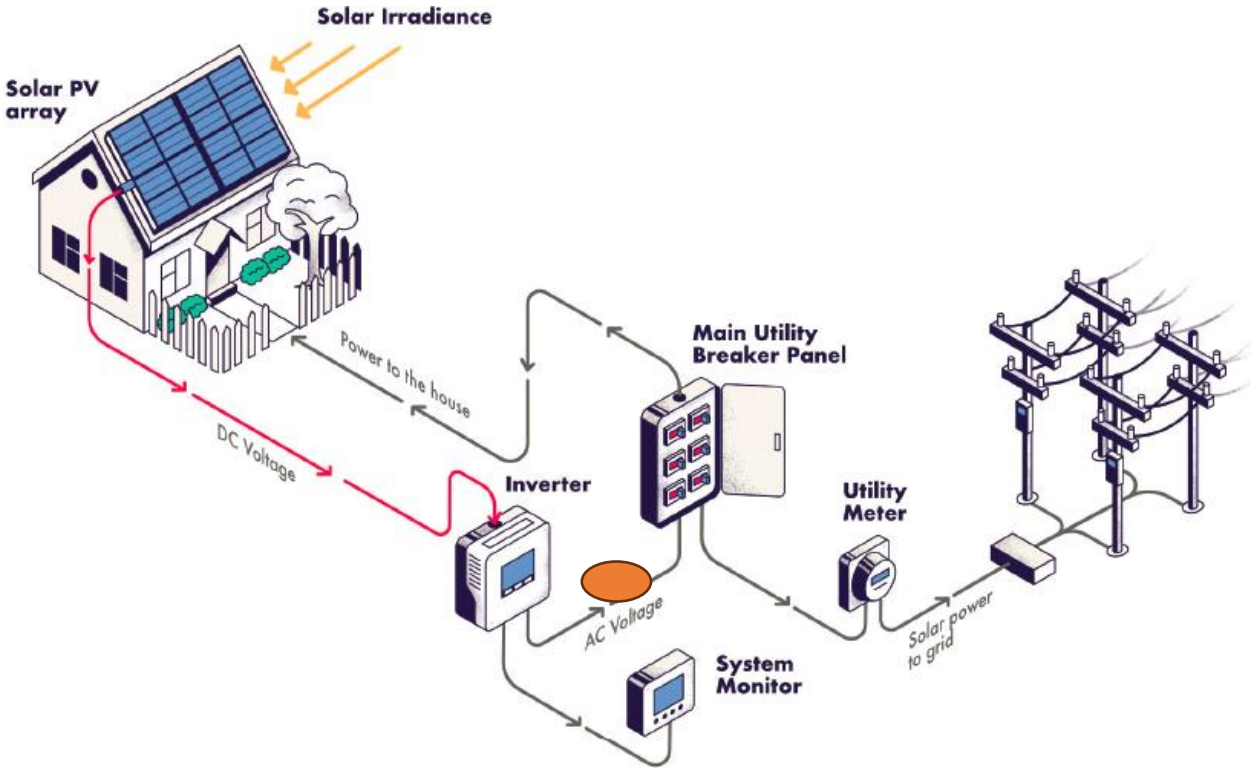
Q. WHAT FURTHER INFORMATION WOULD UTILITIES NEED TO KNOW TO BE ABLE TO CALCULATE THE AMOUNT OF USR AND ACR 4 OWED?

A. In order to bill customers the USR and ACR 4 for all of their usage – as if their on-site generation did not exist – utilities would need to know the production of the behind the meter solar system and then add the net consumption to the self-generated amount to get the total volume of electricity consumed by the customer.

Q. UNDER THE CURRENT STRUCTURE, DOES ANYONE KNOW THE PRODUCTION OF THE SOLAR SYSTEM?

A. That depends. In the case of the IGS Solar business model, where we own the solar system located on the customer's roof, we carefully monitor the output of the system to ensure that it is working and that the customer is getting value for the lease payments they are making to us. If production drops, we are able to troubleshoot and figure out how to get the system back online. For a system owned by the residential customer, presumably the residential customer is able to monitor the production of the system. I cannot speak for other third-party owners of systems, but presumably they monitor production as well.

Q. DOES THE UTILITY KNOW THE PRODUCTION OF THE SOLAR SYSTEM?



A. No. Under the current electrical configuration, I do not believe that the utility has any way of knowing the production of the solar system.

Q. WHAT WOULD HAVE TO CHANGE ON THE SOLAR SYSTEM IN ORDER TO IMPLEMENT MR CICERO'S RECOMMENDATION?

A. One would have to insert a utility-owned production meter into the arrangement, between the inverter and the main utility breaker panel, as shown by the orange circle in the diagram below. After ascertaining the customer's total energy usage, PPL would need to modify its billing system to include a separate line item for these charges. This line would be necessary because customer generators are billed the full retail rate based upon their net usage from the grid. Under the alternative interpretation of Mr. Cicero's testimony, PPL would still need to use a separate line item. In that case, PPL would cease to bill customers based upon their net usage.

[SEE DIAGRAM ON NEXT PAGE]

Diagram 2 – Dual Meter Arrangement

With a dual meter arrangement, all of the electricity generated by the customer-generator's system is exported to the grid and measured by one meter. A second meter measures only the electricity drawn from the grid for consumption (the so-called utility meter). The second meter measures the gross volumetric usage of electricity.

According to PPL's Electric Tariff, a dual-meter arrangement may be substituted for a single bi-directional meter at the Company's expense.[17] Mr. Cicero provides no estimate for the costs that would need to be incurred by PPL to substitute dual-meter arrangements for all of the bi-directional meter arrangements.

[17] PPL Exhibit GEO-1 at Original Page No. 21a.

Q. DO YOU THINK THAT MR. CICERO'S PROPOSAL IS CONSISTENT WITH THE GOALS AND OBJECTIVES OF THE STATE'S NET METERING LAW?

A. No, I do not. Pennsylvania has a well-developed, detailed net metering law that clearly supports customers receiving net metering based upon the full retail rate, i.e., receiving credits against all kilowatt hour generation, distribution, and transmission charges for each kWh the customer produces. The USR and ACR riders are kWh-based charges based on electricity supplied (delivered) from the grid. Under any interpretation of Mr. Cicero's testimony, customers would no longer receive a full credit for these charges when they produce their own electricity. *As such, Mr. Cicero's proposal would deprive customer generators of a credit based upon the full retail rate, as required by the law*.

Q. PLEASE EXPLAIN THE ECONOMIC IMPACTS OF MR CICERO'S PROPOSAL TO THE AVERAGE RESIDENTIAL CUSTOMER WITH NET-METERED SOLAR.

A. Under the first interpretation of his proposal, let's examine the example of a residential customer who uses 9,800 kWh/yr, which is roughly the average electricity consumption of Pennsylvania homes, according to the United States Energy Information Administration ("EIA").[18] This customer has a solar system which is sized to offset 100% of their annual electricity consumption. The additional cost of the USR and ACR 4 being applied to every kWh of energy consumed would equate to a customer paying $10.87 each month on average, which is the equivalent to increasing the proposed $17/month fixed charge by almost 64%.

[18] *2024 Average Monthly Bill - Residential*, UNITED STATES ENERGY INFORMATION ADMINISTRATION (2024) https://www.eia.gov/electricity/sales_revenue_price/pdf/table_5A.pdf .

Q. DOES MR CICERO'S PROPOSAL APPLY TO EXISTING SYSTEMS, AND IF SO, WHAT ARE THE IMPLICATIONS OF THIS?

A. Yes, Mr. Cicero's proposal seems to apply to existing systems, as well as new systems. To implement this, the utility would have to physically go to each existing net metered system in the Commonwealth and install a production meter. From the perspective of existing customers, this retroactive change to the net metering paradigm would negatively impact the financials of their existing system, effectively targeting them for an increase in their fixed charge of almost 60%.

Q. WOULD THIS INCREASE THE COST OF INSTALLING SOLAR IN PENNSYLVANIA?

A. Yes, absolutely it would.

Q. PLEASE EXPLAIN.

A. First, there is the cost to purchase the physical the meters themselves, then there is the cost of installing them – either by the solar installer or by, more likely, the utility. Further, there's the cost for the utility to read them and monitor that they are working correctly.

Q. WOULD THIS ADDITIONAL STEP ADD COSTS TO THE INSTALLATION PROCESS? PLEASE EXPLAIN.

A. Yes, it would add both hardware costs and 'soft costs' – the cost of people's time as well as the cost of delayed projects. Consider the scenario where a utility employee would have to install the production meter – rather than the utility allowing the installer to install it. Towards the end of the installation process, after the solar installer had to wire the system to allow for the production meter, the installation would have to halt until a utility worker could come out and install the production meter. If, for some reason, the installation of the production meter caused a "red flag" on the local permitting inspection,

then the installer would need to ask the utility to come back out again, delaying the process further.

Furthermore, this is one more piece of equipment that could fail. The utility would need to do some sort of monitoring/tracking to make sure the meter is working properly – since they are charging the customer based on the reading. And the utility would have to validate the readings with weather data to make sure the production meter is working correctly. There could be a myriad of reasons why the production meter is reporting lower than expected system output.

Q. ANYTHING ELSE TO ADD ABOUT CICERO'S PROPOSAL

A. Yes. Mr. Cicero's proposal would seem to single out net metering customers for special treatment with no justification. He does not, for example, suggest that a residential customer who installs a high efficiency heat pump and reduces electric usage compared to the use of electric baseboard heating would nonetheless be charged these surcharges on the usage levels he or she previously experienced. This proposal appears to discriminate against net meterers without any reasonable justification.

V. CONCLUSION

Q. DOES THAT COMPLETE YOUR REBUTTAL TESTIMONY?

A. Yes; however, I do reserve the right to supplement this testimony as may be appropriate.

CAUSE-PA RESPONSES TO

INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS PROPOUNDED BY IGS SOLAR

SET I

CAUSE-PA RESPONSES TO

INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS PROPOUNDED BY IGS SOLAR - SET I

Docket No. R-2025-3057164

1. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail the impact of CAUSE-PA's proposal on the customer in the following example:

   Residential customer (under Rate Schedule RS) is **not** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. Customer uses a total of zero kwh in a billing month. In that same billing month, customer generates zero kwh and PPL procures zero kwh for the customer. Customer's bill shows zero kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00220 per kwh.

   a. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   b. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

All calculations are in Attachment A. Based on the assumed facts stated in the question:

a. The customer's Universal Service Rider (USR) charge would be $0.00. **See Attachment A, Line 8.** This is because the customer used zero kwh in the month.

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.00. **See Attachment A, Line 7.** This is because the customer used zero kwh in the month.

Response prepared by or under the supervision of Patrick Cicero

Date: January 22, 2026

CAUSE-PA RESPONSES TO

INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS PROPOUNDED BY IGS SOLAR - SET I

Docket No. R-2025-3057164

2. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail how CAUSE-PA's proposal would impact the customer in the following example:

   Residential customer (under Rate Schedule RS) **is** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. Customer uses a total of 100 kwh in a billing month. In that same billing month, customer generates 100 kwh and PPL procures zero kwh for the customer. Customer's bill shows zero kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00220 per kwh.

   a. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   b. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

All calculations are in Attachment B. Based on the assumed facts stated in the question:

a. The customer's Universal Service Rider (USR) charge would be $1.11. **See Attachment B, Line 8.** This is because the customer used 100 kwh in the month.

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.22. **See Attachment B, Line 7.** This is because the customer used 100 kwh in the month.

Under Mr. Cicero's proposal, the customer would receive a bill credit for 100 kwh of their customer generation consisting of the sum of the calculated Energy Charge, SDER, GSC-1, and TSC charges. **See Attachment B, Line 20.**

CAUSE-PA RESPONSES TO

INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS PROPOUNDED BY IGS SOLAR - SET I

Docket No. R-2025-3057164

3. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail how CAUSE-PA's proposal would impact the customer in the following example:

   Residential customer (under Rate Schedule RS) **is** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. Customer uses a total of 100 kwh in a billing month. In that same billing month, customer generates 110 kwh and PPL procures zero kwh for the customer. Customer's bill shows negative 10 (-10) kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00220 per kwh.

   a. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   b. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

All calculations are in Attachment C. Based on the assumed facts stated in the question:

a. The customer's Universal Service Rider (USR) charge would be $1.11. **See Attachment C, Line 8.** This is because the customer used 100 kwh in the month.

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.22. **See Attachment C, Line 7.** This is because the customer used 100 kwh in the month.

Under Mr. Cicero's proposal, the customer would receive a bill credit for 100 kwh of their customer generation consisting of the sum of the calculated Energy Charge, SDER, GSC-1, and TSC charges and would bank 10 kwh to offset usage in a future month. **See Attachment C, Lines 20 and 21.**

INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS PROPOUNDED BY IGS SOLAR - SET I

Docket No. R-2025-3057164

4. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail how CAUSE-PA's proposal would impact the customer in the following example:

   Residential customer (under Rate Schedule RS) **is** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. Customer uses a total of 100 kwh in a billing month. In that same billing month, customer generates 90 kwh, PPL applies 10 kwh that were carried forward from a prior billing period, and PPL procures zero kwh for the customer. Customer's bill shows zero kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00220 per kwh.

   a. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   b. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

All calculations are in Attachment D. Based on the assumed facts stated in the question:

a. The customer's Universal Service Rider (USR) charge would be $1.11. **See Attachment D, Line 8.** This is because the customer used 100 kwh in the month.

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.22. **See Attachment D, Line 7.** This is because the customer used 100 kwh in the month.

Under Mr. Cicero's proposal, the customer would receive a bill credit for 100 kwh for their customer generation consisting of the sum of the calculated Energy Charge, SDER, GSC-1, and TSC charges for the 90 kwh of current month's generation and the 10 kwh carried over from the previous month. **See Attachment D, Lines 19 and 20.**

CAUSE-PA RESPONSES TO

INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS PROPOUNDED BY IGS SOLAR - SET I

Docket No. R-2025-3057164

5. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail how CAUSE-PA's proposal would impact the customer in the following example:

   Small commercial customer (under Rate Schedule GS-3) is **not** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. PPL supplies 100 kwh to customer in a billing month In that same billing month, customer delivers zero kwh to PPL and uses a total of zero kwh. Customer's bill shows zero kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00166 per kwh.

   a. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   b. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

The question is unclear because it states both that "PPL supplies 100 kwh to customer in a billing month" and that the "customer delivers zero kwh to PPL and uses a total of zero kwh. Customer's bill shows zero kwh delivered for that month." In responding to this question, I am assuming that the customer used the 100 kwh that was supplied by PPL. **All calculations are in Attachment E.**

a. The customer's Universal Service Rider (USR) charge would be $1.11. **See Attachment E, Line 8.** This is because they used 100 kwh in the month. Please note the question assumes a higher USR charge for GS-3 customers than was proposed by CAUSE-PA. See CAUSE-PA St. No. 2 at 24 (recommending $0.0032/kwh).

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.17. **See Attachment E, Line 7.** This is because they used 100 kwh in the month.

CAUSE-PA RESPONSES TO

INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS PROPOUNDED BY IGS SOLAR - SET I

Docket No. R-2025-3057164

6. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail how CAUSE-PA's proposal would impact the customer in the following example:

   Small commercial customer (under Rate Schedule GS-3) **is** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. PPL supplies 100 kwh to customer in a billing month In that same billing month, customer generates 100 kwh and uses a total of 100 kwh. Customer's bill shows zero kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00166 per kwh.

   a. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   b. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

This question is unclear because it says that PPL supplies 100 kwh, the customer generates 100 kwh, the customer uses 100 kwh, and the bill somehow shows 0 kwh delivered. In responding to this question, I assume only that the customer used 100 kwh and generated 100 kwh. **All calculations are in Attachment F.**

a. The customer's Universal Service Rider (USR) charge would be $1.11. **See Attachment F, Line 8.** This is because they used 100 kwh in the month. Please note the question assumes a higher USR charge for GS-3 customers than was proposed by CAUSE-PA. See CAUSE-PA St. No. 2 at 24 (recommending $0.0032/kwh).

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.17. **See Attachment F, Line 7.** This is because they used 100 kwh in the month.

Under Mr. Cicero's proposal, the customer would receive a bill credit for 100 kwh of their customer generation consisting of the sum of the calculated SDER, GSC-1, and TSC charges. **See Attachment F, Line 20.**

7. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail how CAUSE-PA's proposal would impact the customer in the following example:

   Small commercial customer (under Rate Schedule GS-3) **is** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. PPL supplies 100 kwh to customer in a billing month In that same billing month, customer generates 110 kwh and uses a total of 100 kwh. Customer's bill shows negative 10 (-10) kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00166 per kwh.

   a. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   b. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

This question is unclear because it says that PPL supplies 100 kwh in a month, the customer generated 110 kwh and used 100 kwh, but that the customer's bill shows a negative 10 (-10) kwh delivered. In answering this question, I am assuming simply that the customer used 100 kwh and generated 110 kwh. **All calculations are in Attachment G.**

a. The customer's Universal Service Rider (USR) charge would be $1.11. **See Attachment G, Line 8.** This is because they used 100 kwh in the month. Please note the question assumes a higher USR charge for GS-3 customers than was proposed by CAUSE-PA. See CAUSE-PA St. No. 2 at 24 (recommending $0.0032/kwh).

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.17. **See Attachment G, Line 7.** This is because they used 100 kwh in the month.

Under Mr. Cicero's proposal, the customer would receive a bill credit for 100 kwh of their customer generation consisting of the sum of the calculated SDER, GSC-1, and TSC charges and would bank 10 kwh to offset usage in a future month. **See Attachment G, Lines 20 and 21.**

Docket No. R-2025-3057164

8. Reference CAUSE-PA Statement 1 (Patrick M. Cicero) at 116-117: Please explain in detail how CAUSE-PA's proposal would impact the customer in the following example:

   Small commercial customer (under Rate Schedule GS-3) **is** a customer-generator under PPL's Net Metering for Renewable Customer-Generators Rider. Customer uses a total of 100 kwh in a billing month. In that same billing month, customer generates 90 kwh, PPL applies 10 kwh that were carried forward from a prior billing period, and PPL procures zero kwh for the customer. Customer's bill shows zero kwh delivered for that month.

   For purposes of this example, Universal Service Rider (USR) charge is $0.01111 per kwh; and the Phase 4 Act 129 Compliance Rider (ACR 4) charge is $0.00220 per kwh.

   c. Under CAUSE-PA's proposal: Please explain the applicable Universal Service Rider (USR) charge to the customer for that billing month and show your calculation.

   d. Under CAUSE-PA's proposal: Please explain the applicable Phase 4 Act 129 Compliance Rider (ACR 4) charge to the customer for that billing month and show your calculation.

Response:

All calculations are in Attachment H. Based on the assumed facts stated in the question:

a. The customer's Universal Service Rider (USR) charge would be $1.11. **See Attachment H, Line 8.** This is because they used 100 kwh in the month. Please note the question assumes a higher USR charge for GS-3 customers than was proposed by CAUSE-PA. See CAUSE-PA St. No. 2 at 24 (recommending $0.0032/kwh).

b. The customer's Phase 4 Act 129 Compliance Rider (ACR 4) charge would be $0.22. **See Attachment H, Line 7.** This is because they used 100 kwh in the month. Note: the ACR4 charge in question 8 is higher than was listed in questions 5-7.

Under Mr. Cicero's proposal, the customer would receive a bill credit for 100 kwh of their customer generation consisting of the sum of the calculated SDER, GSC-1, and TSC charges for the 90 kwh of current month's generation and the 10 kwh carried over from the previous month. **See Attachment H, Lines 19 and 20.**

Re: Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation / Docket No. R-2025-3057164

Dear Judge Pell and Judge Shadie Nause:

Enclosed please find the Direct Testimony and Exhibit of Mark Ewen, labelled OSBA Statement No. 1, and Exhibit IEc-1, on behalf of the Office of Small Business Advocate ("OSBA"), in the above-referenced proceeding.

As evidenced by the enclosed Certificate of Service, all known parties will be served, as indicated.

If you have any questions, please do not hesitate to contact me.

Sincerely,

/s/ Steven C. Gray

Steven C. Gray

DIRECT TESTIMONY AND EXHIBIT

of

MARK D. EWEN

On Behalf of the

Pennsylvania Office of Small Business Advocate

Topics:

Revenue Requirement
Cost Allocation
Revenue Allocation
Rate Design
Data Centers/Large Load Interconnections

Date Served: December 22, 2025

Date Submitted for the Record: _____

DIRECT TESTIMONY OF MARK D. EWEN

I. Introduction

Q. Mr. Ewen, please state your name and briefly describe your qualifications.

A. My name is Mark D. Ewen. I am a Principal and President of Industrial Economics, Incorporated ("IEc"), a consultancy headquartered at 2067 Massachusetts Avenue, Cambridge, MA 02140. My consulting practice focuses on regulatory and energy economics, expert case management and economic damages estimation in a variety of litigation contexts, and financial analysis. I obtained a B.A degree in Economics and Political Science from the University of North Dakota, and a Master of Public Policy degree from the University of Michigan. I have participated and provided testimony in a variety of proceedings before the PA Public Utilities Commission, including electric and gas base rates cases, 1307(f) purchased gas cost filings, energy efficiency and conservation cases, merger and acquisition cases, and default service provider ("DSP") petitions. My résumé and a listing of the expert testimony that I have filed in various litigation and utility regulatory proceedings are attached in Exhibit IEc-1.

Q. Please describe your assignment in this matter.

A. I am appearing in this proceeding on behalf of the Pennsylvania Office of Small Business Advocate ("OSBA"). The OSBA requested that I review the filing of PPL Electric Utilities Corporation ("PPL Electric" or the "Company") in this proceeding to evaluate whether the rates proposed for small business customers are consistent with sound economics and regulatory principles. If I have not addressed a particular issue, it cannot be inferred that I agree with PPL Electric's proposal for that topic.

Q. Before getting into the details of your analysis, please summarize the Company's rate classes.

A. PPL Electric's tariff has a number of schedules under which residential and non-residential customers take service. These tariff schedules are generally distinguished by voltage level, load characteristics, and type of service. Class data below is derived from the historical test year in PPL Electric Exhibit CRS-1.

RS (Residential Service): The residential class consists of standard RS and Residential Thermal Storage ("RTS"). The RS class has about 1.3 million customers with an average energy use of 11,164 kilowatt-hours ("kWh") per year, while the RTS class consisted of roughly 11,500 customers with an average energy use of 19,912 kWh per year.[1] The Company is proposing to eliminate the RTS class in this proceeding and move the RTS customers to the RS class.[2]

The following are the non-residential rate class groups specified by PPL Electric for its cost allocation analysis.

GS-1 (Small General Service – Secondary Voltage): This group consists of three tariff schedules for small commercial customers: Single-Phase General Service; Volunteer Fire/ Non-Profit; and Separate Meter General Space Heating ("GH-2"). The Company proposes to eliminate the GH-2 class in this proceeding.[3] For the purposes of this testimony, "GS-1" refers to all customers taking service under the three tariffs.

There were 147,715 customers in the GS-1 class averaging about 12,869 kWh per year.

GS-3 (Large General Service): This rate class group includes large commercial customers receiving secondary distribution system deliveries, divided into two groups: Three-Phase General Service and the Volunteer Fire/Non-Profit. There were 39,257 customers in the GS-3 rate class in the historical test year with an average energy use of 210,000 kWh.

LP-4 (Large General Service – 12,470 volts): This class includes the smaller of the commercial and industrial customers receiving service from lines of three phase 12,470 volts or single phase 7,200 volts.[4] There were 1,237 customers in the LP-4 class with an average energy consumption of 5 GWh per annum.

---

[2] PPL Statement No. 8 – Direct Testimony of Steven Wishart, p. 12.

[3] *Ibid*, p. 15.

[4] PPL Electric Volume XII, p. 95.

LP-5 (Large General Service – 69 kV or Higher): This class includes the larger of the commercial and industrial customers supplied from available lines of 69,000 volts or higher.[5] There were 162 customers in the LP-5 class with an average energy consumption of 37 GWh per annum. The LP-5 class is home to New Large Load Interconnections ("LLI"), whose projected sales are forecasted to increase by over 99 percent due to data center load demands.[6]

II. Summary of Recommendations

Q. Please summarize your recommendations.

A. I offer the following recommendations.

1. The Commission should reject the Company's economic development proposal, the Opportunity Pennsylvania Program. The program, at an annual cost of $400,000, should not be recovered through distribution rates.

2. I did not prepare an independent alternative cost allocation study in this proceeding because the Company's approach is consistent with the methodology that has been approved by the Commission. I therefore rely on the Company's allocated cost of service study ("ACOSS") for revenue allocation and rate design recommendations.

3. The Company's revenue allocation is reasonably consistent with its cost allocation results. However, the Company has revised its ACOSS results and increased requested revenues since its initial filing based on issues identified by the intervening parties (including OSBA). Based on the updated revenue requirement and revenue allocation, I recommend a slightly higher rate increase to the RS class and a correspondingly lower increase for the GS-1 class.

---

[5] PPL Electric Exhibit GEO-1, p. 97.

[6] PPL Electric Statement No. 4 – Direct Testimony of Charles Schram, p. 6. *See also* Exhibit CRS-1, p. 1.

4. For the LP-4, rate class, I recommend that the storm damage expense rider be assessed as a per-kilowatt ("kW") demand charge, consistent with the class's tariff structure.

5. I support the Company's proposal to classify default service customers between the General Service Charge ("GSC") rates GSC-1 and GSC-2 based on "net power flow from or into the Company's distribution or transmission system", determined by a threshold of 100 kW peak demand.

6. I recommend that the Company create a new LP-6 rate class for large data centers. The Company's proposed modifications to the LP-5 tariff are insufficient to meet the coming challenges of large loads from new data center interconnections.

7. Regarding Commission Vice Chair Kimberly Barrow's recommendation to evaluate whether large load cost causers should be allocated a share of universal service charges, I offer suggestions for how PPL Electric could allocate such costs to a new LP-6 rate class. Universal services costs could be allocated based on a large load customer's peak demand or recovered through a contribution-in-aid-of-construction charge.

III. Revenue Requirement

Q. Please provide some background regarding the Company's filing, in the context of recent base rates proceedings.

A. PPL Electric is proposing to raise its distribution rate revenues by $356.3 million, an increase of 35.6 percent, for the year ending June 30, 2027.[7] The Company's last request to increase its base rates was for $167.5 million in 2015, which ultimately settled at $124.0

[7] PPL Electric Statement No. 1, Direct Testimony of Christine Martin, p. 8. *See also* PPL Electric Statement No. 5, Direct Testimony of Bethany Johnson, pp. 5-6.

million in 2016.[8] In discovery, the Company increased its revenue requirement and proposed to raise distribution rate revenues by $389.3 million.

Q. Did you identify specific expenses that should not be included in the calculation of distribution rates?

A. Yes. The Company's economic development proposal in this proceeding should be rejected.

Q. What is the Company's economic development proposal?

A. As explained in Statement No. 21, PPL Electric proposes to implement its Opportunity Pennsylvania Program, which is an initiative to support job creation and private investment in the Company's service territory through strategic site development. The program would have an annual budget of $400,000.[9] PPL Electric would provide reimbursement funding for site development and technical assistance to communities seeking additional state and federal funding. The Company claims the program would support new businesses, strengthen the grid, and improve economic outcomes in communities.

Q. Why do you oppose the Company's proposal?

A. I do not oppose economic development initiatives in general. The issue is whether a base rates proceeding is the proper venue in which to propose, and recover the costs of, such programs. Fundamentally, PPL Electric should focus on its core mission as a utility to provide reliable service at a reasonable price. Economic development initiatives are a distraction from the core issues in base rates proceedings. In addition, these types of initiatives are generally not coordinated with government policy concerning economic development. Finally, once adopted, utilities' economic development programs are difficult to eliminate, even if their rationale no longer applies. Therefore, the Commission should reject the Company's proposal.

---

[9] PPL Electric Statement No. 21, Direct Testimony of Jason Hunt, pp. 2-3.

IV. Cost Allocation

Q. What is the purpose of a utility's ACOSS?

A. The most important criterion for setting regulated utility rates is the cost incurred by the utility for providing the service.[10] To assign costs to specific customers, utilities aggregate customers into rate classes, within which the customers have similar load sizes, seasonal consumption, peak demand patterns, and other characteristics. An ACOSS is an analytical tool with which the utility's total cost (or "revenue requirement") is allocated among each of the rate classes. These allocated costs are then used as a key input in determining the total revenues that the utility plans to recover from each rate class through tariff rates.

In using the results from an ACOSS to develop class revenue requirements, utilities and regulatory authorities usually have a longer-term goal of moving the revenue recovered from each class as close as possible to the costs allocated to that class. That is, in each proceeding, regulators try to move class revenues more into line with cost-based rates. Thus, rate classes whose revenues substantially exceed allocated costs are assigned either relatively low rate increases or rate decreases. Rate classes whose revenues are well below allocated costs are assigned relatively larger rate increases than those classes whose revenues are only slightly below allocated costs.

In addition to class revenue requirement issues, an ACOSS provides useful cost information regarding the specific nature of utility tariff charges. In particular, an ACOSS provides a cost basis for the relative magnitude of the various individual tariff charges, including the customer charge, demand charges and commodity charges.

Q. How does an ACOSS assign costs to the various rate classes?

A. The underlying principle of an ACOSS is that costs are assigned to the rate classes that cause the utility to incur those costs. This principle of cost causation is both equitable and economically efficient. It is equitable because costs are borne by those customers who

[10] The Commonwealth Court affirmed this basic principle, referring to cost of service as the "polestar" criterion. *See* Lloyd v. Pennsylvania Public Utility Commission, 904 A.2d 1010, 1020 (Pa. Cmwlth. 2006).

cause them. It is economically efficient because the price signal for consumption from a particular rate class is reasonably consistent with the cost incurred by the utility to provide the service. In that way, the consumer receives the correct price signal for determining whether to purchase more or less utility service. In effect, the consumer balances the value that it receives from the purchase of that service against the utility's cost of providing the service.

Q. What is the Company's approach to cost allocation in this proceeding?

A. The Company's ACOSS is presented by Bickey Rimay, the Vice President of Concentric Energy Advisors ("Concentric"). The Company uses the same Concentric Model from the 2015 base rate case ACOSS (R-2015-2469275).[11] Like in the last rate case, the Company utilizes a minimum system analysis to classify distribution plant costs as either customer related or demand related.

Q. Did the Company make any material changes to its ACOSS methodology since the previous base rate proceeding?

A. The Company's ACOSS methodology is largely the same. PPL Electric explains the differences in the minimum system study in response to OCA IX-3. The changes appear to be minor. Overall, because the Company's approach is consistent with the methodology that has been approved by the Commission, I did not prepare an independent alternative cost allocation study in this proceeding.

Q. Did you identify any errors or issues in the Company's ACOSS?

A. Yes. I identified an error in the Company's development of its services plant allocator. PPL Electric represents that it developed the weighting factors for the services allocator by calculating a cost per installation for each class.[12] However, based on the Company workpapers provided in response to OCA-I-1, Attachment 165 (Retail External Allocators), and Attachment 168 (Wire Installation Data), the Company appears to calculate the weighting factor based on the average cost per foot of service line within

[11] PPL Electric Statement No. 7, Direct Testimony of Bickey Rimal, p. 5.

[12] *Ibid*, p. 19.

each class. In response to OSBA II-2, the Company confirmed that the weighting factor should have been based on cost per installation and not cost per foot of service line.

The Company corrected this issue and provided updated ACOSS and revenue allocation results on December 18th.[13] The updated results also incorporate other corrections suggested by other parties. Notably, the Company's revenue requirement has increased by $38 million, which puts the Company's total requested revenue increase at $389.3 million. Unless otherwise noted, I refer to the Company's updated revenue requirement and revenue allocation in this testimony.

Q. Please summarize the results of the Company's ACOSS study.

A. **Table IEc-1** compares the relative rate of return at current rates between the Company's initial filed testimony and most recent ACOSS results provided in discovery.

Table IEc-1: Summary of PPL Electric ACOSS – Relative Rate of Return at Current Rates

Class	Initial Testimony	Updated Results Based on Discovery
RS	0.98	0.99
RTS	0.51	0.48
GS-1	0.91	0.79
GS-3	1.20	1.20
LP-4	0.80	0.81
LP-5	5.42	5.96
GH-2	1.02	0.96
SL/AL	1.33	1.43
Total	**1.00**	**1.00**

V. Revenue Allocation

Q. What is revenue allocation?

A. Revenue allocation is the assignment of the dollar net increase or decrease to each of the Company's rate classes in a base rates proceeding. In contrast, *rate design* determines how

[13] OSBA-II-2, and OSBA-II-2, Attachment 2.

the allocated revenue is recovered from individual ratepayers within each class. From a cost recovery standpoint, revenue allocation addresses *inter-class* cross-subsidization issues, while rate design addresses *intra-class* cross-subsidization issues.

Q. What are the primary economic and regulatory criteria for revenue allocation?

A. In general, allocated cost is the primary criterion used by regulators in the revenue allocation process. Most utilities and regulators adopt a policy in a base rates proceeding of attempting to move revenues more into line with allocated costs by varying the magnitude of the rate increases for the individual classes. However, regulators also subject the rate increases to other non-cost criteria of ratemaking. Of the traditional rate design criteria, the most common non-cost considerations in the revenue allocation process are:

- the *gradualism* principle (or avoidance of "rate shock"), in which large rate increases for individual customers or classes of customers are avoided; and

- the *value of service* principle, which is often used to mitigate rate increases for customers or customer classes with relatively elastic demand.[14]

Using these criteria, the utility will develop a proposal for assigning the increase in the revenue requirement among the classes that reflects both cost and non-cost considerations. With this proposal, the ACOSS can be simulated at both present and proposed rates to evaluate the magnitude of "progress" that has been made toward the policy of achieving cost-based rates.

Q. Please provide an overview of the Company's proposal to eliminate the RTS and GH-2 classes, and explain why it is relevant for revenue allocation.

A. The Company is proposing to eliminate the RTS and GH-2 classes in this proceeding.

[14] See, for example, Principles of Public Utility Rates, Second Edition, Bonbright, Danielsen, Kamerschen, 1988, pages 383 to 387. The criteria in this text apply to the overall development of a utility rate structure. The criteria that I discuss in this testimony are those that apply to the revenue allocation portion of the process, which is only one aspect of the overall development of utility rates.

Witness Steven Mishart explains the rationale for the RTS elimination:[15]

> RTS has been closed to new customers since December 31, 1995, and the Company currently has 11,509 residential customers taking service through this rate. Customers currently taking service through RTS will be migrated to schedule RS when the new rates established in this proceeding become effective.

The rationale for the GH-2 is similar:[16]

> Similar to the proposal for RTS, the Company is proposing that Schedule GH-2(R) be eliminated and that any customers taking service under that rate be migrated to Schedule GS-1. About 1,500 customers currently taking service through GH-2(R) and their annual energy use represents about 2% of the total load in the GS-1 customer class.

Should the Company succeed in eliminating these classes, the revenue allocation outputs provided by the Company will likely change. In my testimony, I rely on the Company's proposed revenue allocation with both RTS and GH-2 classes.

Q. Please summarize PPL Electric's proposed revenue allocation in this proceeding.

A. The Company explains its method in the Direct Testimony of Bickey Rimal, Statement No. 7. PPL Electric limits the overall increase to any class at 1.5 times the overall system increase, with the aim to reduce the inter-class subsidies and to move classes closer to their cost of service, while ensuring that impacts to any one class are moderated and gradual.[17] No rate class receives a rate reduction under the Company's proposal.

---

[15] PPL Electric Statement No. 8, Direct Testimony of Steve Wishart, p. 12.

[16] *Ibid*, p. 15.

[17] PPL Electric Statement No. 7, Direct Testimony of Bickey Rimal, p. 21.

The Company illustrates two revenue allocation methods. In the first approach, "Revenue Requirement based on ACOSS", class revenues are set directly equal to the cost-of-service results produced by the ACOSS. This approach does not explicitly consider factors such as rate stability, customer bill impacts, or gradualism. In the second approach, "Mitigated Revenue Requirement," PPL Electric uses the ACOSS as a refence point, but incorporates rate gradualism and stability into the final revenue increases.

As shown in **Table IEc-2**, based on the Company's updated revenue requirement, the total system increase is $389.3 million, or 38.8 percent. The Company proposes no rate increase for the LP-5 class, 56.9 percent for the LP-4 class, 37.1 percent for the GS-3 class, 37.7 percent for the residential class, and 45.0 percent for the GS-1 class.

Table IEc-2: Summary of PPL Electric Revenue Allocation Proposal - Mitigated Revenue Requirement

Class	Current	Proposed	Increase $mm	Increase %	Class-to-System Avg	Revenue/Cost Ratio
RS	$722.5	$994.6	$272.2	37.7%	0.97	99.5%
RTS	$8.0	$12.5	$4.5	56.9%	1.47	100.0%
GS-1	$78.8	$114.2	$35.4	45.0%	1.16	103.1%
GS-3	$129.2	$177.1	$47.9	37.1%	0.96	101.1%
LP-4	$39.0	$61.2	$22.2	56.9%	1.47	100.0%
LP-5	$2.0	$2.0	$0.0	0.0%	0.00	100.0%
GH-2	$1.3	$1.9	$0.6	42.5%	1.10	101.9%
SL/AL	$24.5	$31.0	$6.6	26.8%	0.69	100.0%
Total	**$1,005.22**	**$1,394.5**	**$389.3**	**38.73%**	**1.00**	**100.00%**

Source: IEc WP-1.
Note: Company's original filed revenue requirement was $356.3 million.

Q. What is your assessment of the Company's revenue allocation?

A. The Company's proposal is directionally consistent with the results of the ACOSS. Revenue-cost ratios are nearly at unity for most rate classes. However, the revenue-cost ratios indicate that the Company could move rates more into line with allocated cost by assigning a slightly higher rate increase to the RS class and a correspondingly lower increase for the GS-1 class. In addition, if the RTS and GH-2 classes are eliminated, the

final revenue allocation would change.

VI. Rate Design Issues

Q. What is rate design and how does it differ from revenue allocation?

A. Once revenues (i.e., costs) are assigned to the different customer classes through the revenue allocation process, classes must have pricing structures to collect said revenues from their class members. Sound rate design balances multiple objectives, attempting to reflect cost causation while sending price signals that encourage energy efficiency.

Q. Please describe the tariff structure for non-residential rate classes.

A. Within each class, the Company aligns rates such that fixed charges are closer to customer-related costs, and demand and energy charges recover demand- and energy-related costs. In instances where the ACOSS allocations indicate higher customer charges than current levels, the Company moderates rate increases to avoid excessive bill impacts.[18] **Table IEc-3** summarizes the current and proposed charges for non-residential classes based on the Company's initial filing. I have not seen an updated rate design proposal that incorporates the Company's revised revenue requirement.

Table IEc-3: Comparison of PPL Electric Proposed Non-Residential Rates

	GS-1	GS-3	LP-4
Current Rates			
Customer Charge (per Bill)	$22.00	$60.00	$169.80
Demand Charge (per kWh)	$4.361	$3.985	$2.547
Proposed Rates			
Customer Charge (per Bill)	$30.00	$78.00	$235.00
Demand Charge (per kWh)	$5.846	$5.272	$3.881
Percent Change			
Customer Charge (per Bill)	36.4%	30.0%	38.4%
Demand Charge (per kWh)	34.1%	32.3%	52.4%

Source: PPL Statement No. 8, Direct Testimony of Steven Wishart, SWW-1

[18] PPL Electric Statement No. 8, Direct Testimony of Steven Wishart, p. 13.

Q. Do you agree with the Company's proposal?

A. At the Company's initial requested revenue requirement, I do not object to the proposed changes for GS-1 and GS-3. While the percentage increases to the customer charges for Rates GS-1 and GS-3 are high, the customer charges remain well below allocated customer costs in the ACOSS. Statement No. 8 shows a cost-based customer cost of about $43 for GS-1 and $73 for GS-3.

For rate LP-4, I have concerns about the Company's methodology for applying the storm damage expense rider ("SDER"). The SDER reconciles the recovery of storm-related costs that are not reflected in the base rates revenue requirement. The Company assesses the SDER on a per-customer basis for LP-4 customers but assesses the SDER on a per-kWh basis for other rate classes. The Company's rationale for applying the SDER on a per-customer basis, implemented after the 2015 Rate Case Settlement Agreement, is flawed because the Company mistakenly states that "the base rate structure for the Large C&I customer class contained only a customer charge, i.e., there is no demand component in the Large C&I distribution rate structure."[19] This is true for the LP-5 class but not for the LP-4 class. In fact, the distribution charge accounts for over 90 percent of LP-4 class revenues.

Q. What is your recommendation for the LP-4 class (Large C&I - Primary)?

A. I recommend that the SDER be applied as a per-kW demand charge, consistent with the class's tariff structure.

VII. Net Metering

Q. Please explain what net metering is and explain the Company's proposed change for classifying customers under GSC-1 and GSC-2.

A. Net metering is a policy designed to encourage the adoption of renewable distributed generation, by allowing customer generators to set the kWh billing determinant for all energy charges on the bill (generation, transmission, distribution, universal service, etc.)

[19] Response to OSBA-II-1.

on a net basis, reflecting the difference between power delivered to the customer and power shipped back to the distribution system. Generally, credits for total generation in excess of consumption are constrained, as net metering is conceptually based on the idea of the customer meeting its own requirements. However, the Pennsylvania legislature (a) allows net generators to cash out excess generation at the generation "price to compare," and (b) allows general service customers to install up to 3 megawatts ("MW") of generating capacity regardless of the size of the actual loads.

PPL Electric has two GSC classes, GSC-1 ("Small C&I") and GSC-2 ("Large C&I"), determined by a threshold of 100 kW peak demand. Customers with demand below 100 kW are classified as GSC-1. Under the current rate structure, customers with significant net metering output but negligible demand are still assigned to the GSC-1 class.

PPL Electric proposes to categorize default service customers between the GSC-1 and GSC-2 rate categories based on "net power flow from or into the Company's distribution or transmission system", reflected in the Company's revised definition of "Maximum Registered Peak Load" in the tariff.[20] In other words, net power flow includes peak demand and peak export. As a result, any PPL Electric customer or customer-generator that imports or exports over 100 kW during the 12-month period ending September 30 will be assigned to the GSC-2 rate.

Q. Do you agree with the Company's proposal?

A, I do. PPL Electric's current classification results in Small C&I default service customers disproportionally subsidizing customer-generators that, based on their size and output, should be classified as Large C&I. When customers generate excess energy, the purchased excess power is treated as default service supply and the customer-generators receive compensation. Under existing regulations, these purchases are applied to the same class as the customer-generator from whom the power is purchased. Thus, if GSC-1 customers with minimal loads export large amounts of generation, the burden of the higher-cost default service supplies currently falls on GSC-1 default service customers, including non-net-

[20] PPL Electric Exhibit GEO-1, p. 11.

metering customers. The Company's proposal would appropriately classify large customer-generators as merchant generators.

OSBA has also supported a similar rate structure change in the recent UGI Utilities, Inc. Default Service Provider proceeding.[21]

VIII. Data Centers and Large Load Interconnections

Q. What role do data centers and large load interconnection play in this proceeding?

A. PPL Electric makes it clear that the integration of large load interconnections, namely data centers, represents an unprecedented increase to system load growth and presents new challenges to ratemaking. Data centers are currently part of the LP-5 rate class and receive service at the transmission level.[22] Load growth for the LP-5 class is forecasted to increase by 99.4 percent over the Fully Projected Future Test Year ("FPFTY").[23] The Company also expects the number of non-data center customers in the LP-5 class to *decline* by 4.5 percent.[24] New data centers are entirely responsible for the influx of load demand in the LP-5 class.

This issue is not isolated to the current FPFTY, as the Company describes in Statement No. 16. PPL Electric has an increasing number of data centers projected in advanced development seeking interconnection. In response, the Company states that it is preparing to more than double its system demand in just 5-6 years, which requires significant investments in the transmission system to interconnect these new customers. These new investments are paid in part by data center customers directly, and in part by other customers through the rate base, with the cost share determined by the extent to which the

[21] Docket P-2024-3049343.

[22] PPL Electric Statement No. 4, Direct Testimony of Charles Schram, pp. 11-12.

[23] PPL Electric Statement No. 4, CRS-1, p. 1

[24] PPL Electric Statement No. 4, Direct Testimony of Charles Schram, p. 6.

LP-5 customer interconnection results in networked bulk electric system upgrades and reliability benefits.

Q. How does the Company propose to handle new large load interconnections?

A. The Company proposes to revise its LP-5 rate schedule to isolate load center costs and reflect the requirements included in existing electric service agreements ("ESAs") with data centers. The Company believes that the ESA process has been successful in managing new interconnections, but wants to "memorialize its large load interconnection terms in its tariff for transparency and consistency."[25] The proposed LP-5 tariff terms provide that new customers enter into an agreement that includes, among other requirements, a revenue guarantee in the amount of line extension costs that were not directly charged to the customers and an initial term of no less than five years.[26]

Q. Do you agree with the Company that the LP-5 tariff changes are sufficient to protect other customers from the risk that a planned large load many not materialize?

A. The tariff changes are a welcome improvement but may not be sufficient given forecasted data center growth. Consistent with OSBA's position in the *En Banc* Hearing on Interconnection and Tariffs for Large Load Customers (Docket No. M-2025-3054271), I recommend that the Company develop a new LP-6 rate class specifically for data centers.[27] Data center load growth is expected to increase while non-data center LP-5 class load is expected to decline. Retaining heterogenous groups of customers with varying load characteristics, demand profiles, and investment risks within one rate class is not optimal in this context. Instead, the Company can incorporate some of the proposed changes to LP-5 into the new LP-6 tariff, with modifications. For example, to address the potential of "stranded costs" resulting from large data center loads not materializing, I endorse OSBA's recommendations that data center tariffs contain minimum load contracts, eight to ten-year contract terms, exit fees and advanced notice of contract

[25] PPL Electric Statement No. 16, Direct Testimony of Joseph Lookup, p. 18.

[26] PPL Electric Exhibit GEO-1, p. 98.

[27] See OSBA comments submitted on June 6, 2025.

termination, and financial security and collateral requirements to balance the need to mitigate risk of exposure to other customers and the allowance of non-discriminatory access to the grid. Creating a separate LP-6 rate class for data centers is the appropriate next step in order to implement these provisions. My proposal draws from legislation passed in Minnesota, which, among other reasonable regulations and protections, requires the Minnesota Public Utilities Commission to define "very large customers" and assign them to separate rate classes or sub classes for each public electric utility.[28]

IX. Universal Service Costs

Q. Commission Vice Chair Kimberly Barrow encouraged the parties in this proceeding to consider whether, consistent with cost causation, cost causers should be allocated a share of universal service charges. Please address this idea.

A. Vice Chair Barrow highlights the impacts of large load additions and forecasts on PJM capacity prices.[29] Currently, only residential customers pay for universal service costs, which support utilities' low-income assistance programs. In a Tentative Order concerning Interconnection and Tariffs for Large Load Customers issued on November 6, 2025, the Commission proposed a requirement that "Large Load Customers contribute to the utility's hardship fund annually, with the minimum amount to be contributed based on the Large Load Customer's peak demand."[30] I consider whether new large load customers – the cost causers – should contribute to universal service costs.

Ratemaking principles indicate that new customers' rates should be sufficient to recover the necessary costs to interconnect them. For "deep system" costs such as transmission grid upgrades and new generating capacity, it is less clear why existing customers should have rights to existing capacity while new customers pay the full incremental costs. It

[28] Minnesota Session Laws - 2025, 1st Special Session, CHAPTER 12--H.F.No. 16, https://www.revisor.mn.gov/laws/2025/1/Session+Law/Chapter/12/.

[29] Statement of Pennsylvania Public Utility Commission Vice Chair Kimberly Barrow in Docket No. R-2025-3057164, dated October 23, 2025.

[30] Tentative Order in the En Banc Hearing Concerning Interconnection and Tariffs for Large Load Customer matter, Pennsylvania Public Utility Commission, issued November 6, 2025, Docket No. M-2025-3054271, p.43.

depends on which customers enjoy the benefits of the network upgrades. An incremental cost approach sends the right price signals to the new load for evaluating its investment, but it sends the wrong price signals to existing customers. Therefore, if the Commission wishes to allocate universal service costs to large load customers in PPL Electric's service territory, such costs could be allocated to the new proposed LP-6 class based on a customer's peak demand, as the Commission's Tentative Order suggests.[31] Given cost causation uncertainties, and following the example set by Indiana, contributions to a hardship fund supporting low-income customers could be limited to a fixed period of time.[32]

Alternatively, universal service costs could be allocated to the new proposed LP-6 class on a one-time basis through an additional contribution-in-aid-of-construction ("CIAC") charge. A CIAC is an appropriate mechanism to address incremental universal service–related costs associated with new large loads, consistent with the principle of cost causation. While universal service programs are targeted to residential affordability, additions of large load can increase overall revenue requirements, accelerate infrastructure build-out, and place upward pressure on rates that, in turn, may increase the funding needs of income-based assistance programs. To the extent a new large load materially contributes to incremental universal service funding pressures, those impacts could be addressed through a CIAC. The two approaches are not mutually exclusive.

I should note that my position assumes that in the referenced statement Vice Chair Barrow is not inferring that PPL Electric's small business customers should start contributing to universal service programs. Such an outcome would be contrary to longstanding OSBA advocacy and Commission precedent. I note that small business customers cannot take advantage of the residential-only program. In addition, as set forth

[31] *Ibid,* pp. 42-43.

[32] Order of the Commission in the Matter of the Verified Petition of Indiana Michigan Power Company for Approval of Modifications to its Industrial Power Tariff – Tariff I.P, Cause No. 46097, approved February 19, 2025, p. 46. The Settlement Agreement provides annual funding for five years to support low-income customers.

in the Net Metering section of this testimony, the current price being paid by small business customers for the alternative-sourced electricity is rising rapidly. If that proposal is not changed, and if universal service charges are added to small businesses' bills, such an outcome will significantly burden small businesses in Pennsylvania.

Q. Does this conclude your direct testimony?

A. Yes, it does.

RÉSUMÉ AND EXPERT TESTIMONY LIST

FOR

MARK D. EWEN

IEc

MARK D. EWEN — PRESIDENT

Education

Master of Public Policy, University of Michigan

B.A., *summa cum laude*, Economics and Political Science, University of North Dakota

Select Project Experience

Examples of his project work include the following:

Mr. Ewen has participated in various proceedings concerning energy markets and regulated utilities. These efforts, which focus on issues related to cost allocation, revenue allocation, and rate design, include working on behalf of industry and consumer intervenor groups in rate-making cases before the public utility commissions in New York, Pennsylvania, Alberta, Canada, and the U.S. Postal Rate Commission. For example, for the **Pennsylvania Office of Small Business Advocate (OSBA)** and **New York Department of State's Utility Intervention Unit (UIU)** and the he has and continues to provide consulting and analytic support relating to electricity and natural gas tariff design, revenue requirements, and other regulatory initiatives concerning electrical and natural gas distribution utilities. For the **Rhode Island Attorney General**, Mr. Ewen conducted a due diligence review of PPL's proposed acquisition of Narragansett Electric Company and its potential impacts on the state's ratepayers.

For the **New York State Energy Research and Development Authority (NYSERDA) and Department of Public Service (DPS)**, Mr. Ewen provided expert services assessing the economic impacts to municipal governments of extended electricity outages related to Tropical Storm Isaias. As part of this work, he constructed a model to estimate various costs of incremental staffing requirements for over 500 localities, including excess overtime, surge time (i.e., bringing on extra staff for outage response coordination and logistics), and idle time (e.g., crews waiting extended periods for downed lines to be de-energized). The review also included consideration of other direct costs, including, among others: effects to water systems; delivery of bottled water; operation of generators; and other constraints on the provision of essential governmental services. The litigation was settled to the satisfaction of the involved parties.

For the **NYSERDA and New York DPS**, Mr. Ewen directed the development of a Generic Environmental Impact Statement (GEIS), pursuant to the requirement of the State Environmental Quality Review Act (SEQRA) that assessed the environmental and economic impacts of the "Reforming the Energy Vision" and "Clean Energy Fund" initiatives within the state. He also directed the preparation of a Supplemental EIS to assess the environmental and economic impacts of the newly proposed Clean Energy Standard (CES). The CES is being developed to support the state's goal of supplying 50 percent of electricity demand with renewable generation resources by the year 2030. More recently, he directed the development of a model to assess the financial viability of various waste-to-energy technologies, and related social welfare benefits. This model uses detailed capital budgeting scenarios for specific facilities to generate forecast scenarios.

For the **U.S. Department of the Interior, Bureau of Ocean Energy Management (BOEM)**, directing an assessment of the Bureau's approach to calculating and presenting the operating fee included in offshore wind leases under BOEM's jurisdiction. As part of this engagement, IEc provided a number of recommendations for simplifying the implementation of the operating fee formula and identified available data sources and approaches to estimating individual components of the fee formula. The review also addressed the structure and levels of fees associated with operations of renewable wind energy projects in the U.S. and worldwide. More recently, IEc has been supporting the development of Standard Operating Procedures for the fee calculation and lease management process. The overall goal is to provide information resources and a methodological approach that will allow lessees to derive accurate data for fee equation variables efficiently and consistently, and for BOEM to present the fee calculation clearly in the lease.

For **NYSERDA**, conducting a market analysis examining the potential economic development opportunities that could accrue in New York from hydrogen playing a role in achieving components of its Climate Leadership and Community Protection Act.

For the **U.S. Department of the Interior, Bureau of Ocean Energy Management**, managed the development of a model to assess the economic and fiscal impacts of offshore oil and gas activity in the Gulf of Mexico and other BOEM OCS regions. This model, the Lifecycle Impacts Model (LCIM), assesses the economic and fiscal impacts associated with a specific lease or group of leases, over the time horizon of the lease(s). IEc's framework for the model was to build a capital budgeting forecasting tool for lease development, yielding estimates of industry expenditures, OCS revenues, industry profits, and employment impacts for a single lease or a set of leases. A key component of model development was to dynamically simulate the complex and unique timing parameters of lease development, incorporating the influence of critical exogenous factors like market prices and lease geology.

For the **U.S. Coast Guard, National Pollution Funds Center**, Mr. Ewen provides ongoing support to the NPFC in adjudicating damages claims resulting from oil spills. These claims include damages for business interruption, lost profits, property damage or value diminution, increased costs, and lost wages or employment, among other categories. Cases have also included damages for contract delays to construction projects and shipping demurrage. Industry sectors that Mr. Ewen has evaluated include: *electricity generation (nuclear and coal); railroads; cruise ships; oil ship transport; lodging and tourism; food and beverage; gambling; fisheries; marinas; real estate development, oil and gas development; and oil refining.*

Mr. Ewen's analytic work includes expert financial analysis and economic damages estimation in the context of general litigation and environmental enforcement actions. These efforts include assessing damages in breach of contract, nuisance, and cost recovery actions, and assessing the financial capabilities and economic benefit of noncompliance of firms accused of environmental violations. Clients in this area of his practice include the **U.S. Department of Justice, U.S. Coast Guard, U.S. Environmental Protection Agency, States**, and private parties.

Testimony and Appearances

Mr. Ewen has provided testimony or appeared in the following cases and regulatory proceedings.

On behalf of New Hampshire's Office of Consumer Advocate (OCA), submitted direct testimony before the Public Utilities Commission in the Request for Change in Rates of Until Energy Systems, Inc. (Docket No. DE 25-025).

On behalf of New York Department of State's Division of Consumer Protection's Utility Intervention Unit (UIU), submitting testimony before the Public Service Commission concerning cost of service, revenue allocation, and rate design in electric and gas base rates cases of New York State Electric & Gas Corporation and Rochester Gas and Electric Corporation (Docket Nos. 25-E-0375, 25-G-0380, 25-E-0379 and 25-G-0378, October 2025).

On behalf of New York Department of State's Division of Consumer Protection's Utility Intervention Unit (UIU), submitting testimony before the Public Service Commission, concerning revenue allocation and rate design in electric and gas base rates case of Consolidated Edison, Inc. (Docket Nos. 25-E-0072 & 25-G-0073, May 2025).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning the distribution system improvement charge (DSIC) case for PPL Electric Utilities Corporation (Docket No. R-2024-3048732, July 2024).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning cost allocation, revenue allocation, and rate design in the base rates case for First Energy of PA (Docket No. R-2024-30447068, June 2024).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning cost allocation, revenue allocation, and rate design in the base rates case for PECO Gas (Docket No. R-2024-3046932, June 2024).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning cost allocation, revenue allocation, and rate design in the base rates case for Columbia Gas of Pennsylvania (Docket No. R-2024-3046519, June 2024).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning the Default Service Plan for PPL Electric (Docket No. P-2024-3047290, June 2024).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning the Default Service Plan for PECO Energy Company (Docket No. P-2024-3046008, April/May 2024).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning recovery of purchased gas costs and revenue sharing for National Fuel Gas Distribution Corporation (Docket No R-2024-3045177, March 2024).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning electricity price hedging under the default service plan for Pike County Light and Power (Docket No. P-2023-3039927; direct testimony June 2023; surrebuttal testimony August 2023).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning base tariff rate development for Columbia Gas of Pennsylvania, including issues of cost allocation, revenue allocation, and rate design. (Docket No. R-2022-3031211, June/July 2022).

On behalf of Attorney General of the State of Rhode Island, submitted testimony before the Rhode Island Division of Public Utilities and Carriers concerning due diligence and related reviews of PPL

Corporation's proposed acquisition of Narragansett Electric Company from National Grid USA (Docket No. D-21-09, November 2021).

Expert report and deposition testimony concerning economic damages and related financial matters, *Seaplane Adventures, LLC, vs. County of Marin, California*; expert report filed September 2021, deposition testimony given September 2021.

Expert reports and deposition testimony on bankruptcy reorganization plan feasibility and related financial matters, *in re: First Energy Solutions Corp., et al., Debtors, Case No. 18-50757*; expert reports filed July 2019, deposition testimony given August 9, 2019.

Expert declaration concerning economic damages and related financial matters, *in re: Outer Banks Power Outage Litigation, all actions, No. 4:17-CV-141-D*, March 2018.

Expert report and deposition testimony on Economic Damages in *State of Alaska v. Williams Alaska Petroleum, Inc., et al., Case No. 4FA-14-01544 CI*; expert report filed December 2016, deposition testimony given February 15, 2017.

Expert reports and deposition testimony on Economic Benefit in *Sierra Club v. Energy Future Holdings Corp. et al., Case No. 5:10-cv-156 (E.D. Tex.)* and *Sierra Club v. Energy Future Holdings Corp. et al., Case No. 6:12-cv-108 (W.D. Tex.)*; expert reports filed in June and July 2013, deposition testimony given August 2013. Trial testimony given in Case No. *6:12-cv-108 (W.D. Tex.) in March 2014*.

Expert testimony on ability-to-pay provided, in the matter of Mercury Vapor Processing Technologies, Inc., et al. (No. RCRA-05-2010-0015), July 2011.

Expert Declaration in a patent case concerning economic and financial matters in the context of environmental credits valuation – In re Patent Application of: Jeff Andrilenas et al., Application No.: 12/328,219, For: VALUING ENVIRONMENTAL CREDITS, submitted June 2011.

Export report and deposition testimony on financial matters in *Evansville Greenway and Remediation Trust v. Southern Indiana Gas and Electric Company, Inc., et al.* (03:07-cv-0066-SEB-WGH); expert report filed July 2009, deposition testimony given January 2010.

Expert testimony on ability-to-pay provided, in the matter of Robert J. Heser, Andrew J. Heser, and Heser Farms (No. CWA-05-2006-0002), May 2007.

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning tariff design issues for Columbia Gas of Pennsylvania (Docket No. R-00049783, May 2005).

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning cost allocation, revenue assignment, and rate design for Pennsylvania Power and Light (Docket No. R-00049255, August 2004).

Expert report on economic damages in *United States v. Southern California Edison No. CIV. F-01-5167 OWW DLB (E.D. Cal).*, July 2004; deposition testimony provided September 2004.

Expert testimony on ability-to-pay provided in *United States v. Peter Thorson, Managed Investments, Inc., Construction Management, Inc., and Gerke Excavating, Inc.* (No. 03-C-0074), May 2004.

Expert testimony on ability-to-pay provided in *United States v. Paul A. Heinrich and Charles Vogel Enterprises, Inc.* (No. 03-C-0075-S), October 2003.

Expert testimony on ability-to-pay provided in the matter of Dearborn Refining Company (No. RCRA-05-2001-0019), February 2003.

On behalf of Pennsylvania's Office of Small Business Advocate, submitting testimony before the Pennsylvania Public Utility Commission, concerning recovery of purchased gas costs and revenue sharing for PFG Gas and Northern Penn Gas (Docket No. R-00027389, July 2002).

Expert report and testimony on economic damages in *Carol Marmo et al. v. IBP, Inc.*; expert report filed March 2002, deposition testimony given June 2002, September 2004, and testimony at trial given February 2005.

Re: Pennsylvania Public Utility Commission v. PPL Electric Utilities Corporation / Docket No. R-2025-3057164

Dear Judge Pell and Judge Shadie Nause:

Enclosed please find the Rebuttal Testimony of Mark D. Ewen, labelled OSBA Statement No. 1-R, on behalf of the Office of Small Business Advocate ("OSBA"), in the above-referenced proceeding.

As evidenced by the enclosed Certificate of Service, all known parties will be served, as indicated.

If you have any questions, please do not hesitate to contact me.

Sincerely,

/s/ Steven C. Gray

REBUTTAL TESTIMONY

of

MARK D. EWEN

On Behalf of the

Pennsylvania Office of Small Business Advocate

Topics:

Cost Allocation
Revenue Allocation
Net Metering
Universal Service Cost Recovery

Date Served: January 23, 2026

Date Submitted for the Record: _____

REBUTTAL TESTIMONY OF MARK D. EWEN

I. Introduction

Q. Mr. Ewen, please state your name and briefly describe your qualifications.

A. My name is Mark D. Ewen. I submitted direct testimony and associated exhibits on behalf of the Pennsylvania Office of Small Business Advocate ("OSBA") earlier in these proceedings and my qualifications were presented therein.

Q. What is the purpose of this rebuttal testimony?

A. This rebuttal testimony responds to the following witnesses/topics:

- Pennsylvania Office of Consumer Advocate ("OCA") Witness Clarence Johnson and PP&L Industrial Customer Alliance ("PPLICA") Witness Bille LaConte on matters of cost allocation and revenue allocation.

- Joint Solar Advocates ("JSA") Witnesses Kevin Lucas and Justin Barnes, Customer-Generator Coalition ("CGC") Witness Guy Sharman, and Walmart Witness Matthew Lyon on PPL Electric's net metering and "maximum registered peak load" proposals.

- CAUSE-PA Witnesses Patrick Cicero and Ben Havumaki, and Earth Justice Advocates ("EJA") Witness Karl Rábago on universal service cost recovery.

II. Summary of Findings

Q. **Please summarize your findings**.

A. I offer the following observations and recommendations.

1. The OCA's modifications to the Company's allocated cost of service study ("ACOSS") and corresponding revenue allocation appear reasonable. However, the Company has revised its external customer services allocator, which will impact the OCA's ACOSS.

2. Given that the Company indicated it would provide a revised ACOSS and revenue allocation in rebuttal testimony, and the fact that the parties have not relied upon

identical ACOSS results, I have not prepared an alternative revenue allocation as part of this testimony.

3. I continue to support the Company's proposal to classify default service customers between the General Service Charge ("GSC") rates GSC-1 and GSC-2 based on "net power flow from or into the Company's distribution or transmission system." determined by a threshold of 100 kW peak demand. In doing so I acknowledge that customer-generators should be fairly compensated for the energy they supply to the Company's distribution system. Reclassifying large customer-generators as merchant generators under GSC-2 would offer these customers fair compensation without unduly burdening non-customer-generators under GSC-1.

4. The Commission should reject any proposal to allocate universal service costs to all rate classes. Small business customers should not contribute to universal service programs because these customers cannot take advantage of the residential-only programs. There is no causal relationship between PPL Electric's universal service costs and small business customers. However, a cost basis may exist to allocate universal service costs to large load customers.

III. Cost Allocation and Revenue Allocation

Q. What is OCA's position regarding the appropriate cost allocation method for this proceeding?

A. Witness Johnson prefers the basic customer method to PPL Electric's use of the minimum system method to classify shared distribution facilities. However, citing the Company's longstanding use of the minimum system method, Witness Johnson presents two different cost of service studies based on certain modifications to PPL Electric's minimum system study. In one version, Witness Johnson adjusts the minimum system to reflect only labor installation costs for the minimum size components, and in the second version, keeps this adjustment and also classifies primary voltage as 100 percent demand-related.

Q. Did the OCA address the error you identified in the Company's ACOSS regarding the customer services allocator?

A. Based on OCA's workpapers, it does not appear that Witness Johnson incorporated the revisions the Company identified in response to OSBA-II-2.

Q. Will incorporating this revision impact the OCA's cost and revenue allocation proposals?

A. Most likely. The Company has already updated its cost and revenue allocation based on this change, but has not yet provided a fully revised ACOSS model.

Q. Please summarize the revenue allocation proposals of the parties.

Witness Johnson developed a mitigated class revenue allocation based on the results of OCA's two cost of service studies. Witness Johnson accepts and implements the Company's rate increase mitigation measures, which are: (a) No class receives a percentage increase more than 150 percent of the system percentage increase; and (b) No class receives a revenue reduction.[1]

PPLICA Witness LaConte relies upon the Company's ACOSS but argues that limiting each class's rate increase to 1.5 times the system average is insufficient to prevent rate shock for the RTS and LP-4 rate classes. Witness LaConte developed an alternative revenue allocation that instead limits class rate increases to 1.3 times the system average.[2] Table IEc-1R summarizes the revenue allocation proposals from the Company, OCA, and PPLICA.

Table IEc-1R
Summary of Revenue Allocation Proposals

	PPL		OCA		PPLICA	
	$	%	$	%	$	%
RS	$272,166,404	37.7%	$251,080,309	34.8%	$280,096,497	38.8%
RTS	$4,534,895	56.9%	$4,566,465	57.3%	$3,928,164	49.3%
GS-1	$35,434,476	45.0%	$28,073,654	35.6%	$32,233,416	40.9%

[1] Direct Testimony of OCA Witness Johnson, p. 27.

[2] Direct Testimony of PPLICA Witness LaConte, pp. 6-9.

GS-3	$47,902,307	37.1%	$75,074,724	58.1%	$46,566,839	36.0%
LP-4	$22,174,356	56.9%	$22,328,724	57.3%	$19,207,613	49.3%
LP-5	$0	0.0%	$0	0.0%	$0	0.0%
GH-2	$555,450	42.5%	$646,344	49.5%	$525,155	40.2%

Total	**$389,320,106**	**38.7%**	**$389,320,105**	**38.7%**	**$389,320,104**	**38.7%**
Source: IEc WP1-R						

Q. Please address the various proposals.

A. First, I note that the parties appear to have relied upon different ACOSS results because PPL Electric has updated them throughout the discovery process.[3] Both the Company's and OCA's proposals are reasonably consistent with their respective ACOSS results. For the purpose of this proceeding, I also support the Company's cap limiting rate increases to 1.5 times the system average.

Q. Did you prepare an alternative revenue allocation proposal?

A. Given that the Company indicated it would provide a revised ACOSS and revenue allocation in rebuttal testimony,[4] and the fact that the parties have not relied upon identical ACOSS results, I have not prepared an alternative revenue allocation proposal. I may provide an alternative in surrebuttal testimony.

IV. Net Metering

Q. Which parties oppose the Company's proposed change for classifying customers under GSC-1 and GSC-2, and why?

A. By way of background, PPL Electric has two GSC classes determined by a threshold of 100kW peak demand: GSC-1 ("Small C&I") and GSC-2 ("Large C&I"). Customers with demand below 100 kW are classified as GSC-1. Under the current rate structure, customers with significant net metering output but negligible demand are still assigned to the GSC-1 class. PPL Electric proposes to categorize default service customers between the GSC-1

[3] For example, Witness LaConte bases revenue allocation on data provided by the Company on October 31, 2025 (I&E-RE-I-14-D), whereas I relied upon the data provided on December 18, 2025 in OSBA-II-2.

[4] Response to OSBA-II-2.

and GSC-2 rate categories based on "net power flow from or into the Company's distribution or transmission system", reflected in the Company's revised definition of "Maximum Registered Peak Load" in the tariff.[5]

JSA Witness Lucas, CGC Witness Sharfman, and Walmart Witness Lyon object to the Company's proposal. Witness Lucas states that the Company's arguments that customer-generator projects cause a cost-shift to non-customer-generators and cause "stress" on distribution grid do not withstand scrutiny. Witness Sharfman claims that the reclassification of GSC-1 customers to GSC-2 would expose these transitioned customers to a highly volatile and unpredictable wholesale electricity market. Witness Lyon is concerned that changing the classification with robust transition protections would retroactively alter the economics of generation investments. All three parties believe that PPL Electric's proposal would negatively impact customer-generators in the Company's service territory.

Q. What is your position?

A. I support the Company's proposed change for reasons I explained in direct testimony. In doing so I acknowledge that customer-generators should be fairly compensated for the energy they supply to the Company's distribution system. Reclassifying large customer-generators under GSC-2 would offer these customers fair compensation without unduly burdening non-customer-generators under GSC-1. The issue is whether PPL Electric's proposed tariff changes accurately classify customers for default service assignment, which should be based primarily on the load characteristics (peak demand and supply) of customers and how best to secure default service for similar customers, rather than on *a priori* judgements about the price at which customer-generators should be compensated for their generation.

I also disagree with Witness Sharfman about the degree of sophistication of customer-generators that would be impacted by the Company's proposal. The Company's proposed

[5] PPL Electric Exhibit GEO-1, p. 11.

100 kW threshold is intended to differentiate between small, behind-the-meter ("BTM") customer-generators that still may draw energy from the grid and larger front-of-meter ("FTM") customers that are essentially merchant generators (the Company terms them "no load net metering installations"). As such, the latter should be viewed as more sophisticated market actors for purposes of default service procurement. Currently, large GSC-1 customer-generators do not assume the same risks as GSC-1 default service suppliers yet receive the same price to compare. These suppliers have full requirements contracts and must (a) procure energy to meet the Small Commercial and Industrial ("C&I") load shape; (b) procure firm generation capacity to meet the Small C&I class requirements; (c) assume the risk for fluctuations in overall loads, customer shopping, and fluctuations in excess net metered generation; and (d) incur all of the operating and management costs associated with procuring power. Classifying large customer-generators under GSC-2 for default service procurement together with more sophisticated Large C&I customers reflects the risks of supplying this group.

V. Universal Service Costs

Q. Several parties have suggested that universal service costs should be allocated to all rate classes. Please summarize their reasoning.

A. CAUSE-PA Witness Cicero argues that universal service and low-income assistance programs benefit all of PPL Electric's customer classes, because they provide economic benefits to entire communities and not just customers that receive assistance.[6] For example, households that cannot afford their utility bills are also more prone to negative health and social consequences and therefore less likely to contribute economically to their communities. Similarly, EJA Witness Rábago states that energy insecurity is an issue that impacts every person and business in PPL Electric's service territory.[7] OCA Witness Colton makes the more targeted argument that PPL Electric's proposed large load tariffs should include a substantial commitment of funds to offset increased

[6] Direct Testimony of CAUSE-PA Witness Cicero, pp. 86-87.

[7] Direct Testimony of EJA Witness Rábago

universal services costs that will be caused by large load customers such as data centers. Witness Colton does not, however, suggest that all rate classes should contribute to universal service funding.[8]

Q. What is your position regarding the allocation of universal service costs?

A. By longstanding OSBA advocacy and Commission precedent, I maintain that small business customers should not contribute to universal service programs because these customers cannot take advantage of the residential-only programs. There is no causal relationship between PPL Electric's universal service costs and small business customers. In addition, assigning costs for the universal service programs to all rate classes would impose a burden on all hearing participants, including the OSBA, who would have an obligation to ensure that these programs are properly designed, effective, and necessary. Because most utilities in Pennsylvania do not assign universal service costs to all rate classes, the OSBA generally does not expend the resources to retain the necessary specialized experts in these fields.

Q. Is there a distinction between small businesses and large load customers with respect to this issue?

A. Yes. Vice Chair Barrow's October 23, 2025 statement explicitly indicates a link between large load additions and increased universal service costs.[9] Other parties, including CAUSE-PA Witness Cicero and OCA Witness Colton, in this proceeding have identified a *cost basis* for allocating universal service costs to large load customers. There is no evidence to support a policy/tariff change that requires small businesses to contribute to rising low-income customer assistance program costs.

Witness Cicero estimates that large load (data center) growth across PJM has caused a price increase of approximately $10 million annually, including energy, capacity, and transmission costs. Therefore, he recommends that PPL Electric first directly assign $10

[8] Direct Testimony of OCA Witness Colton, p. 87.

[9] Statement of PUC Vice Chair Kimberly Barrow, October 23, 2025, p. 2.
